***Additional information provided on the record of the ASC prior to issuance of the draft proposed order, referred to as “errata” information, was incorporated into draft plans by the Department prior to issuance of the proposed order, to support review of the materials.**

1 **I. INTRODUCTION**
2

3 The Oregon Department of Energy (Department) issues this ~~draft~~ proposed order (~~DPO~~) in
4 accordance with Oregon Revised Statute (ORS) 469.370(~~44~~), based on its review of the
5 Application for Site Certificate (ASC) for the proposed Boardman to Hemingway Transmission
6 Line (proposed facility) and comments and recommendations received by state agencies, local
7 governments, and tribal governments. This PO also presents additional recommended findings
8 of facts and new or amended conditions from those presented in the draft proposed order
9 based on comments received on the record of the draft proposed order public hearing (May 22
10 through August 22, 2019 for public comments, and through November 7, 2010 for ~~The~~
11 ~~applicant is~~ Idaho Power Company (applicant), a wholly owned subsidiary of IDACORP, Inc). This
12 ~~DPO~~ includes recommended conditions of approval for inclusion in the site certificate to ensure
13 or maintain compliance with applicable rules and standards during the construction, operation
14 and retirement of the proposed facility.
15

16 The proposed facility, including four alternative route segments, would be an approximately
17 300 mile-long 500 kilovolt (kV) electric transmission line, plus related or supporting facilities
18 including access roads and other facility components. The ~~transmission line proposed and~~
19 ~~alternative routes~~ would extend from a switching station proposed to be constructed near
20 Boardman, Oregon to the existing Hemingway Substation located in Owyhee County, Idaho.
21 The ~~transmission line proposed and alternative routes~~ would cross five Oregon counties,
22 Malheur, Baker, Union, Umatilla, and Morrow counties and Owyhee County in Idaho. The
23 applicant must receive permitting approvals from the federal land management agencies as
24 well as the Energy Facility Siting Council (EFSC or Council) to satisfy Oregon’s requirements for
25 permitting energy facilities. The Council’s authority extends to all land in Oregon, regardless of
26 land ownership, except tribal reservation land.
27

28 The proposed facility qualifies as an “energy facility” under the definition in ORS 469.300(11)(C)
29 as it is a proposed high voltage transmission line of more than 10 miles in length with a capacity
30 of 230,000 volts or more to be constructed in more than one city or county in the State of
31 Oregon.¹ Approval of a site certificate by ~~the Energy Facility Siting Council (Council or EFSC)~~ is
32 required for the construction, operation, and retirement of energy facilities as defined in ORS
33 469.300(11).²
34

35 In addition to the conditions recommended in this ~~DPO~~, the ~~site~~-certificate holder is subject to
36 the conditions and requirements contained in the rules and standards of the Council and in
37 local ordinances and state laws in effect on the date the site certificate is executed. Under ORS
38 469.401(2), upon a clear demonstration of a significant threat to public health, safety, or the

¹ The definitions contained in ORS 469.300 and Oregon Administrative Rule (OAR) 345-001-0010 apply to terms used in this ~~DPO~~ order.

² ORS 469.320.

1 environment that requires application of later-adopted laws or rules, the Council may require
2 compliance with such later-adopted laws or rules. The Council recognizes that many specific
3 tasks related to the design, construction, operation, and retirement of the proposed facility
4 would be undertaken by the applicant’s agents or contractors. Nonetheless, the certificate
5 holder remains responsible for ensuring compliance with all provisions of the site certificate.
6 The Council does not have jurisdiction over matters that are not included in and governed by
7 the site certificate or amended site certificate, including design-specific construction or
8 operating standards and practices that do not relate to siting, as well as matters relating to
9 employee health and safety, building code compliance, wage and hour or other labor
10 regulations, or local government fees and charges.³ Also outside the Council’s jurisdiction are
11 matters of land-acquisition, land purchases, land leases, land access agreements, and right-of-
12 way easements. However, nothing in ORS chapter 469 shall be construed to preempt the
13 jurisdiction of any state agency or local government over matters that are not included in and
14 governed by the site certificate or amended site certificate.^{4, 5}

15
16 A site certificate is a binding agreement between the State of Oregon and the applicant,
17 authorizing the applicant to design, construct, operate, and retire a facility on an approved site,
18 incorporating all conditions imposed by the Council on the applicant.⁶ A site certificate issued
19 by the ~~Energy Facility Siting~~ Council binds the state and all counties, cities and political
20 subdivisions of Oregon. Once the Council issues the site certificate, any affected state agency,
21 county, city or political subdivision must, upon submission by the applicant of the proper
22 applications and payment of the proper fees, but without hearing or other proceeding,
23 promptly issue the permits, licenses and certificates addressed in the site certificate.⁷ The
24 Council has continued authority over the site for which the site certificate is issued and may
25 inspect, or direct Department to inspect, or request another state agency or local government
26 to inspect, the site at any time in order to ensure that the facility is being operated consistently
27 with the terms and conditions of the site certificate.⁸

28
29 Based upon its review, including conclusions and recommended conditions of compliance
30 presented in this DPO, the Department recommends that the Council approve the application
31 for site certificate and issue a site certificate for the proposed facility.

32

³ ORS 469.401(4).

⁴ Id.

⁵ Several comments provided at the public hearings and submitted in writing on the DPO expressed concerns about landowner compensation, the applicant’s process for negotiating with landowners for access agreements, utility easements, eminent domain, proprietary matters, and greater economic issues. These matters are all outside the Council’s jurisdiction and not related to a siting standard. B2HAPPDoc8-1 All DPO Comments Combined-Rec’d 2019-05-22 to 08-22; Aston, J., Foss, K., Jordan, F. et al.

⁶ ORS 469.300(26).

⁷ ORS 469.401(3).

⁸ ORS 469.430.

1 **II. PROCEDURAL HISTORY**

2
3 **II.A. Notice of Intent**

4
5 On July 6, 2010, the Department received a Notice of Intent (NOI) from Idaho Power Company
6 (applicant) to file an application for site certificate (ASC) for a new 500-kilovolt (kV)
7 transmission line.⁹ The proposed facility would be approximately 300 miles long and extend
8 from a switching station proposed to be constructed near Boardman, Oregon to the existing
9 Hemingway Substation located in Owyhee County, Idaho. The transmission line would cross five
10 Oregon counties, Malheur, Baker, Union, Umatilla, and Morrow counties and Owyhee County in
11 Idaho. Approximately 66 percent of the underlying land within the transmission line corridor
12 would be privately-owned, 32 percent would be managed by federal agencies, and one percent
13 would be owned by state government. The applicant must receive permitting approvals from
14 the federal land management agencies as well as the Energy Facility Siting Council (Council) to
15 satisfy Oregon’s requirements for permitting large-scale energy facilities. The Council’s
16 authority extends to all land in Oregon, regardless of land ownership, except tribal reservation
17 land.

18
19 On July 16, 2010, the Department issued a public notice of the NOI to the Council’s mailing lists
20 and to adjacent property owners as defined at OAR 345-020-0011(1)(f). This public notice was
21 distributed jointly with the U.S. Bureau of Land Management (BLM)—the lead agency
22 overseeing the National Environmental Policy Act (NEPA) federal review process—to satisfy
23 both EFSC and NEPA requirements. The Department also published the notice in multiple local
24 area newspapers within the vicinity of the proposed facility. The notice announced a series of
25 public scoping meetings that were held in several cities along the proposed transmission line
26 route, and requested public comments on the NOI. The public notice date also initiated a
27 reviewing agency comment period on the NOI. In accordance with OAR 345-020-0040, a review
28 request was issued by the Department and the applicant distributed the NOI to Special Advisory
29 Groups (SAG’s), state agencies, local governments, and tribal governments.¹⁰

30 **II.B. Project Order**

31
32 On March 2, 2012, the Department issued a project order in accordance with OAR 345-015-
33 0160, which requires the Department to specify the state statutes, administrative rules, and
34 local, state, and tribal permitting requirements applicable to the construction and operation of

⁹ In August 2008, the applicant submitted an NOI to the Department. Due to input received during the joint scoping meetings and the Community Advisory Process (CAP) with the BLM, USFS, the Department and other stakeholders, the applicant revised its-the transmission line route. The applicant withdrew the 2008 NOI and submitted the NOI in 2010 with revised proposed and alternative segment routes. See B2H-0054 07-06-10 Notice of Intent for Boardman to Hemingway Transmission Line. Section B3.

¹⁰ Pursuant to ORS 469.480, a special advisory group is the governing body of any local government within whose jurisdiction the facility is proposed to be located.

1 the proposed facility. The project order ~~also~~ outlines the application for site certificate
2 requirements from OAR 345-021-0010 that are relevant to the proposed facility. Under OAR
3 345-015-0160, the project order also establishes analysis areas for the proposed facility which
4 are areas containing resources that the proposed facility may significantly affect and that must
5 be evaluated in the application for site certificate.¹¹ A proposed facility might have different
6 analysis areas for different types of resources. Further, the Department considered the size and
7 type of the proposed facility in determining the study areas the applicant must evaluate in the
8 application.¹²

9
10 The project order was amended in May 2012, and amended a second time in July 2018. The
11 amendments were required to update applicable standards and rules, as discussed further
12 below.

13 **II.C. Preliminary Application for Site Certificate**

14
15 On February 27, 2013, the applicant submitted a preliminary application for a site certificate
16 (pASC) to the Department. Thereafter, and in compliance with OAR 345-021-0050(1), the
17 Department prepared a review request memorandum to reviewing agencies and compiled a
18 distribution list, including all SAGs, state and local governments and tribal government
19 reviewing agencies listed in OAR 345-001-0010. In accordance with ORS 469.350(2) and
20 OAR 345-021-0050, the applicant distributed the memorandum and a copy of the pASC to each
21 of the reviewing agencies.

22 **II.D. First Amended Project Order**

23
24 In May 2013, BLM issued a press release identifying the routes it intended to analyze in the
25 Draft Environmental Impact Statement (DEIS) for the proposed facility. BLM's preliminary
26 environmentally preferred alternative included two route segments not included in the pASC
27 submitted to the Department for the Council's review process. As a result, the applicant
28 indicated its intent to amend the pASC to include the alternative route segments identified in
29 the DEIS.

30
31 Under OAR 345-015-0160(3), the Department or Council may amend the project order at any
32 time. In light of changes and clarifications to the proposed facility since the Department issued
33 the project order in March 2012, and in anticipation of the applicant's amendment to the pASC,
34 the Department issued the first amended project order on December 22, 2014, establishing and
35 updating the requirements for the site certificate application.

36
37

¹¹ OAR 345-015-0160(1)(f) and OAR 345-001-0010(2).

¹² OAR 345-015-0160(2).

1 **II.E. Amended Preliminary Application for Site Certificate**

2
3 The ~~Bureau of Land Management~~BLM issued its Final Environmental Impact Statement in
4 November, 2016, and then published its Record of Decision (ROD) on November 17, 2017,
5 identifying the agency’s selected route. For additional discussion of the comparison between
6 the ~~deferral federal~~ NEPA review and permitting process and the ~~Oregon Energy Facility Siting~~
7 Council’s review and permitting process see section III.A, *Transmission Corridor Selection*, of this
8 order.

9
10 The applicant submitted to the Department an amended preliminary application for site
11 certificate (ApASC) on July 19, 2017. The ApASC reflected BLM’s selected route issued in the
12 ROD and other project modifications. In accordance with OAR 345-021-0090(2), a preliminary
13 application may be amended at any time. As required by OAR 345-021-0050, the Department
14 provided a reviewing agency memorandum that was distributed with copies of the ApASC to
15 SAGs, state and local governments and tribal government reviewing agencies. The reviewing
16 agency memorandum requested agencies and governments to comment by a specified
17 deadline on the sufficiency of the information in the ApASC and if additional information
18 needed to be provided for the application to be deemed complete, per OAR 345-015-0190(5).
19 The 45-day comment deadline was September 1, 2017, with an extended comment deadline of
20 October 2, 2017. However, several reviewing agencies provided ongoing comments as the
21 Department and the applicant consulted with them on the sufficiency of the information
22 provided. On September 15, 2017 the Department issued to the applicant a determination of
23 an incomplete ~~amended preliminary application for site certificate~~ApASC detailing required
24 information and noted ~~that pending~~ reviewing agency comments ~~were outstanding~~.

25 **II.F. Second Amended Project Order**

26
27 On July 26, 2018, the Department issued a second amended project order, which reflected
28 changes that resulted from rulemaking, specifically to OAR 345-021-0010(1)(p) and (q),
29 OAR 345-022-0010(1)(h), and OAR 345-022-0060. The second amended project order also
30 removed references to ORS 469.310 because it is a statutory policy rather than a Council
31 standard for siting energy facilities. It also updated the reviewing agency list based on the
32 proposed route and alternative route segmentss as proposed by the applicant in the ~~amended~~
33 ~~preliminary application for site certificate~~.ApASC.

34 **II.G. Application for Site Certificate**

35
36 The Department began reviewing the ApASC upon submission on July 19, 2017 and issued
37 formal requests for additional information (RAI’s) from September 15, 2017 to September 21,
38 2018. The Department issued RAI’s per exhibit of the ASC, however the Department also issued
39 RAI’s relating to reviewing agency, local and tribal government comment letters and RAI’s. The
40 applicant provided responses to all Department RAI’s and to all reviewing agency, local and
41 tribal government comments and RAI’s. The Department reviewed the applicants’ responses in
42 consultation with applicable agencies, where necessary, to verify the sufficiency of the

1 information as it relates to OAR 345-021-0010. After reviewing the applicant's responses and
2 portions of revised exhibits, the Department determined the ApASC to be complete on
3 September 21, 2018 and the applicant filed a complete ASC on September 28, 2018. Under OAR
4 345-015-0190(5), an ASC is considered complete when the Department finds that the applicant
5 has submitted information adequate for the Council to make findings or impose conditions on
6 all applicable Council standards.

7
8 Public notice of the complete ASC was issued on October 3, 2018 and public notice of the
9 complete ASC was also published in the Baker City Herald, La Grande Observer, East Oregonian,
10 Hermiston Herald, Hells Canyon Journal, Heppner Gazette Times, East Oregonian, Idaho Press,
11 Idaho Statesman, Vale Malheur Enterprise, and the Ontario Argus Observer. On October 3,
12 2018 the notice was issued via the Department's email list serve - GovDelivery - system to 1,562
13 email addresses and printed copies were mailed to approximately 8,300 physical addresses on
14 the Council's special mailing list for the proposed facility.

15
16 The Department held a series of public informational meetings on the complete ASC from ~~on~~
17 October 15, ~~2018~~ through October 18, 2018 in Ontario, Baker City, La Grande, Pendleton and
18 Boardman, Oregon. Pursuant to OAR 345-015-0200, the Department provided ~~to the applicant~~
19 a notice of the complete ASC to reviewing agencies ~~that the application is complete~~, along with
20 a request for agency reports on the complete ASC, distributed by the applicant. On or before
21 October 10, 2018, the applicant mailed all reviewing agencies copies of the complete ASC with
22 the notice and request for an agency report with a comment submission date of November 26,
23 2018.¹³ The Department received comments from the following reviewing agencies, including
24 special advisory groups and tribal governments:

- 25
- 26 • Baker County Planning Department/Board of Commissioners (Special Advisory Group)
 - 27 • City of La Grande Planning Department
 - 28 • Confederated Tribes of the Umatilla Indian Reservation
 - 29 • Confederated Tribes of the Warm Springs Reservation_of Oregon
 - 30 • Oregon Department of Aviation
 - 31 • Oregon Department of Environmental Quality
 - 32 • Oregon Department of Forestry
 - 33 • Oregon Department of Fish and Wildlife
 - 34 • Oregon Department of Transportation
 - 35 • Oregon Department of State Lands

¹³ Under ORS 469.360(2), pursuant to a written agreement, the Council may compensate reviewing agencies including state agencies and local governments for expenses directly related to the review of a notice of intent, application for site certificate, and participation in a council proceeding, excluding legal expenses of the agency or local government incurred as a result of participation by the state agency or local government as a party in a contested case. The Department interprets a "council proceeding" to include the public hearing(s) on a draft proposed order, the review of the draft proposed order, and contested case. Under ORS 469.360(4), pursuant to a written agreement, the Council may only compensate Tribal Governments identified as reviewing agencies for expenses directly related to the review of a notice of intent and application for site certificate.

- 1 • Oregon State Historic Preservation Office
- 2 • Oregon Water Resources Department
- 3 • Union County Planning Department/Board of Commissioners (Special Advisory Group)
- 4 • United States Bureau of Land Management
- 5 • United States Bureau of Reclamation
- 6 • United States Department of the Navy
- 7 • United States Forest Service

8
 9 Under OAR 345-015-0190(9), from March 6 to March 29, 2019, the applicant submitted
 10 additional information errata in response to the reviewing agency comments and additional
 11 information requests made by the Department.¹⁴ The additional information was submitted as
 12 errata sheets appending the applicable exhibit. On March 28, 2019, the Department issued a
 13 GovDelivery announcement and posted the errata information on the website. References to
 14 application exhibits and to the additional information errata are provided in this order.

15 Information from the errata sheets that were specific to an attachment or plan has been
 16 incorporated into the applicable plan.

17
 18 On May 16, 2019, the Council appointed Ms. Alison Greene Webster as the hearing officer to
 19 conduct the public hearing on the draft proposed order and to conduct the contested case
 20 proceeding, ~~if requested~~. Ms. Alison Greene Webster is a Senior Administrative Law Judge with
 21 the Oregon Office of Administrative Hearings.

22 **II.H. Council Review Process**

23
 24 On May 22, 2019, the Department issued The issuance of this a draft proposed order (DPO) and
 25 public notice of (DPO) initiateds a 62-day comment period on the ~~record for the proposed~~
 26 ~~facility~~DPO. The Council’s designated hearing officer ~~will conduct~~ed a series of public hearings
 27 on the DPO, one in each county crossed by the proposed facility. The details for each public
 28 hearing are provided below. Oral and written testimony ~~may be~~was provided at the public
 29 hearings.¹⁵ ~~A 62-day written comment period is also now opened, with a W~~ritten comment
 30 ~~deadline ending s must be received by the Department by 5 p.m. (PDT) on July 23, 2019.~~

31
Table 1: ~~Schedule of~~ Boardman to Hemingway Transmission Line DPO Hearings

Additional detail regarding the public hearings and how to comment can be found in the Public Notice that was released concurrently with this the DPO on May 22, 2019, as well as on the Department’s website for the proposed facility. Pursuant to OAR 345-015-0220, Notice of the DPO, hearings, and comment period was published in 10 newspapers within the vicinity of the proposed facility in Oregon and Idaho. The notice was also emailed or mailed to persons on the Council's general mailing list, persons on the special mailing list set up for the proposed facility; and print copies were mailed to the property owners listed in ASC Exhibit F.^{16,17}

20

At the June 26, 2019 DPO public hearing in Pendleton, Oregon, the Council extended the public comment period by 30-days from July 23 to August 22, 2019 in response to requests made by the public for additional time needed to review and evaluate the volume and substance of material contained in the DPO and ASC; and, extended the deadline for the applicant to respond to DPO public comments by 60-days, from July 23 to September 23, 2019, based on applicant’s request, to provide an adequate opportunity to respond to comments. On September 13, 2019, based on volume and substance of comments received on the DPO, the applicant requested to extend the deadline established for applicant responses to DPO comments from September 23 to November 7, 2019, which was granted by Chair Beyeler via emergency action and ratified by Council at the September 26-27, 2019 Council meeting.¹⁸ A comment index for all persons who commented on the DPO and all of the combined DPO

¹⁶ The notice of the DPO included the noticing requirements outlined in OAR 345-015-0220 and was mailed to the required persons. In addition, and as a courtesy not required by rule, the Department mailed notices to individuals identified in OAR 345-021-0010(x)(E), “A list of the names and addresses of all owners of noise sensitive property, as defined in OAR 340-035-0015...” Commenters assert proper notice was not provided for owners of noise sensitive properties. B2HAPPDoc8-381 DPO Public Comment Stop B2H Krieder F 2019-08-22, Gilbert, I., Howell, J., et al.

¹⁷ See Section III.C., Proposed Facility; Related or Supporting Facilities (Permanent and Temporary); Access Roads for a discussion of related or supporting facilities including roads proposed to be substantially modified. All related or supported facilities would be located within the proposed site boundary and therefore landowners within the notification distance established in OAR 345-021-0010(1)(f) from these related or supporting facilities were included in ASC Exhibit F and received notice of the DPO. Existing roads that require 0-20% improvements are not considered substantially modified, and therefore are not included in the site boundary under EFSC review. See also IV.M. Public Services; IV.M.6. Traffic Safety of this order.

¹⁸ OAR 345-015-0220(4)(b); states “A person who intends to raise any issue that may be the basis for a contested case must raise the issue with sufficient specificity to afford the Council, the Department, and the applicant an adequate opportunity to respond, including a statement of facts that support the person’s position on the issue.”

1 comments is provided as Attachment 2 to this order. The opportunity for the applicant to
2 respond to comments on the DPO, under OAR 345-015-0220(4)(b), is not mandatory and is
3 voluntary upon request to Council to extend the record. The applicant is not required to
4 provide a response to every unique comment on the DPO or duplicated comments on the DPO.
5 The applicant's responses to select DPO comments are included as Attachment 3 to this order,
6 submitted in table format. As a courtesy, the Department formatted these tables to serve as a
7 "crosswalk" between the DPO comments, applicant responses and Department responses
8 and/or proposed order revisions. The crosswalk tables are included as Attachment 4 to this
9 order.

10
11 ~~On July 2, 2020, Following the close of the record of the public hearing and Council's review of~~
12 ~~the draft proposed order,~~ the Department will issued a proposed order, taking into
13 consideration Council comments, ~~any~~ comments received "on the record of the public hearing"
14 (i.e., oral testimony provided at the public hearings and written comments received by the
15 Department after the date of the notice of the public hearing and before the close of the public
16 hearing written comment period), and agency consultation. Concurrent with the issuance of the
17 proposed order, the Department will issued a Notice of Proposed Order and Contested
18 ~~Case notice of contested case and a public notice of the proposed order.~~¹⁹ The Notice of
19 Proposed Order and Contested Case was issued via U.S. mail, email or both, dependent upon
20 individual's contact information on file, pursuant to OAR 345-015-0230(3), and sent to all
21 persons on the Council's general mailing list, the special mailing list established for the project
22 (i.e. individuals that signed up to receive electronic ODOE related notifications via govdelivery
23 or ClickDimensions for this project or all EFSC projects), all persons who commented in person
24 or in writing on the record of the DPO public hearings, and the property owners listed in Exhibit
25 F of the ASC, as requested by the Department.²⁰

Contested Case Proceeding Participation Eligibility

26
27
28
29 Only those persons who commented in person or in writing on the record of the DPO public
30 hearing may request to participate as a party or limited party in the contested case proceeding.
31 To raise an issue in a contested case proceeding, the issue must be within the jurisdiction of the
32 Council, and the person must have raised the issue in person or in writing on the record of the
33 public hearing, unless the Department did not follow the DPO noticing and public hearing
34 procedural requirements pursuant to ORS 469.370(2) or (3), respectively, or unless "[t]he action

¹⁹ See ORS 469.370(4) and OAR 345-015-0014

²⁰ Under OAR 345-015-0230(3)(b), following the issuance of the proposed order, the Department must issue a public notice
of the proposed order, sent via mail or email to (D) The property owners listed in Exhibit F of the site certificate
application, as updated by the applicant upon the request of the Department. On May 14, 2020, the Department
requested the applicant provide an updated property owner list of all owners of record, as shown on the most recent
property tax assessment roll provided by counties. Because OAR 345-015-0230(3) references ASC Exhibit F, and ASC
Exhibit F was derived from the previous rule requirements with distances from the site boundary, the Department
requested the same notification distances be used to update the ASC Exhibit F list.

1 recommended in the proposed order, including any recommended conditions of approval, differs
2 materially from that described in the draft proposed order, in which case only new issues
3 related to such differences may be raised [Emphasis added].²¹ These provisions are further
4 described in OAR 345-015-0016.

5
6 As emphasized above, ORS 469.370(5) and OAR 345-015-0016 allow persons eligible to
7 participate in the contested case proceeding to raise new issues related to material differences
8 between the actions recommended in the proposed order and the actions recommended in the
9 DPO. The Department interprets these provisions to only apply to any differences between the
10 DPO and the Proposed Order that could result in a substantive change to a recommended
11 Council action, including recommended findings of compliance with a standard or applicable
12 law, a site certificate condition, or the Council’s decision to approve or deny the site certificate.
13 The Department does not consider a change to its analysis of underlying facts to be a material
14 difference subject to the provisions of ORS 469.370(5)(b) unless there is a corresponding
15 substantive change to a recommended Council action.

16 17 Contested Case Proceeding

18
19 If the Council finds that a request for contested case identifies one or more properly raised
20 issues that justify a contested case proceeding, the Council shall grant a contested case
21 proceeding on the proposed order. To raise an issue in a contested case proceeding, the issue
22 must be within Council jurisdiction, and the person must have raised the issue on the record of
23 the public hearing with “sufficient specificity to afford the decision maker an adequate
24 opportunity to respond to the issue.”²² To raise an issue with sufficient specificity, a person
25 must have presented facts, on the record of the DPO public hearings, that support the person’s
26 position on the issue. The purpose of OAR 345-015-0016(3) is to ensure that commenters
27 provide the applicant, Department and Council all comments, including any documents or
28 statutory or regulatory citations, that the commenter believes are relevant to the analysis
29 conducted by the Department and Council at a point in the process where the Department,
30 Council and applicant have “an adequate opportunity to respond to the issue” (as stated in OAR
31 345-015-0220(5) – i.e., at a point when the Department, Council and applicant can address any
32 relevant issues raised by those comments in the proposed order.

33
34 The contested case proceeding will include the following general steps/opportunities (subject
35 to approval of and terms established by the hearing officer): discovery; motion for summary
36 determination; direct testimony; rebuttal testimony; request for cross examination; live cross
37 examination; and closing briefs. At the conclusion of a contested case proceeding, the hearing
38 officer will issue a proposed contested case order stating the hearing officer’s findings of fact,
39 conclusions of law and recommended site certificate conditions on the issues raised in the
40 contested case. Pursuant to OAR 345-015-0085(5), the hearing officer shall provide notification

²¹ ORS 469.370(5)(b)

²² OAR 345-015-0016(3)

1 to contested case parties of an opportunity to file an exception to the proposed contested case
2 order, file responses to exceptions once received and distributed, and of an opportunity to
3 provide written or oral testimony at a hearing, to occur at a regularly scheduled Council
4 meeting. Following Council’s review of exceptions, responses to exceptions and written and
5 oral testimony provided during the public hearing, ~~Based upon Council’s direction to adopt,~~
6 ~~modify or reject the hearing officer’s proposed contested case order,~~ the Council may adopt,
7 modify or reject the hearing officer’s proposed contested case order.²³ ~~T~~he findings of the
8 hearing officer’s proposed contested case order, and any modifications requested by Council
9 following the exception process, are then incorporated into the Council’s final order on the ASC.

10
11 Following the contested case proceeding, the Council will issue a final order either approving or
12 denying the ASC based upon the standards adopted under ORS 469.501, and any additional
13 state statutes, rules, or local government regulations or ordinances determined to be applicable
14 to the facility in the project order.²⁴ The Council’s final order is subject to judicial review by the
15 Oregon Supreme Court. Only a party to the contested case proceeding may request judicial
16 review and the issues on appeal are limited to those raised by the parties to the contested case
17 proceeding. A petition for judicial review must be filed with the Supreme Court within 60 days
18 after the date of service of the Council’s final order or within 30 days after the date of a petition
19 for rehearing is denied or deemed denied.²⁵

20 21 **III. DESCRIPTION OF THE PROPOSED FACILITY**

22
23 The information presented in this section is based upon details provided in the application for
24 site certificate (ASC). Section III.A., *Transmission Corridor Selection* describes the siting studies
25 and process the applicant employed to establish the transmission corridors (proposed and
26 alternative routes) and Section III.B., *Location and Site Boundary* provides a description of the
27 site boundary by county. Section III.D., *Survey Data Based on Final Design and Site Access*
28 discusses how the Council will evaluate the survey information necessary for the Council’s
29 review taking into account final facility design and site access restrictions experienced by the
30 applicant when preparing the ASC. Finally, Section III.C., *Proposed Facility* of this order
31 describes the proposed “energy” facility and related or supporting facilities.

32
33 As discussed in more detail in the below section, III.A., *Transmission Corridor Selection*, the
34 applicant underwent an extensive siting process over several years, evaluating several routing
35 and re-routing options. The result of the applicant’s siting studies, and outcome of the federal
36 review process, resulted in the routes proposed in the ASC. The applicant proposes a primary
37 route, and has named this route the proposed route. In some areas the applicant has requested
38 the Council also evaluate alternative routes so the applicant may select from these as options in
39 its final route selection (See Figures 2 and 3 in Section II.B.2). Therefore, in the ASC and this
40 order the Department refers to the primary route as the proposed route and the proposed

²³ OAR 345-015-0085

²⁴ ORS 469.370(7).

²⁵ ORS 469.403.

1 alternative routes as alternative routes generally, and by the specific route name as appropriate
2 in the analysis.

3 **III.A. Transmission Corridor Selection**

4
5 As discussed in section II.A. *Notice of Intent* above, approximately 32 percent of the proposed
6 facility crosses land owned by federal government agencies, therefore the applicant was
7 obligated to engage in the National Environmental Policy Act (NEPA) federal review process led
8 by the U.S. Bureau of Land Management (BLM). Code of Federal Regulations (CFR) §1502.14
9 tasks the lead federal agency to conduct an environmental impact assessment of the proposal
10 and the alternatives in a comparative form. The lead agency (BLM) then explores and evaluates
11 all reasonable alternatives based on the agency review and public feedback. The result of the
12 assessment is the identification of the agency's preferred alternative or alternatives, that is
13 issued in the draft and final environmental statement (DEIS and FEIS), and formalized in the
14 agency's record of decision (ROD). A location description of the proposed facility in each
15 Oregon county is provided below in Section III.B. The description in Morrow County outlines the
16 applicant's proposed route as well as two alternative routes in a segment along Bombing Range
17 Road, with portions on the Naval Weapons Systems Training Facility (NWSTF) Boardman,
18 property owned by the United States Department of the Navy (Navy). Rather than including this
19 portion in the NEPA review led by the BLM, the Navy led a separate NEPA review. If approved,
20 the separate NEPA review led by the Navy will result in a separate ROD, Section 106
21 consultation, and other applicant and federal obligations.

22
23 In comparison to the NEPA process, the EFSC standards for siting energy facilities do not require
24 that the applicant compare alternative corridors. Nor do they allow the Council to evaluate and
25 consider alternative routes not proposed in the application for site certificate. ORS 469.360
26 provides that the Council shall evaluate the application for site certificate. ORS 469.370(7)
27 directs the Council that, at the conclusion of a contested case, the Council shall issue a final
28 order either approving or rejecting the application for site certificate based on the EFSC
29 standards, applicable statutes, rules and local ordinances. This is also reiterated via the EFSC
30 General Standard of Review (OAR 345-022-000(1)(a)).²⁶ Therefore, in the application, an
31 applicant may propose any route, and alternative routes for Council's review, regardless of a
32 federal agency's selected route issued in the ROD for the NEPA review process. Further, the
33 Council may not recommend an alternative route that is not proposed in the application. The
34 Council shall approve or reject any route, as proposed in the application, based on the
35 applicable Council standards, statutes, rules and local ordinances.

36

²⁶ (1) To issue a site certificate for a proposed facility or to amend a site certificate, the Council shall determine that the preponderance of evidence on the record supports the following conclusions:

(a) The facility complies with the requirements of the Oregon Energy Facility Siting statutes, ORS 469.300 to 469.570 and 469.590 to 469.619, and the standards adopted by the Council pursuant to 469.501 or the overall public benefits of the facility outweigh any adverse effects on a resource or interest protected by the applicable standards the facility does not meet as described in section (2)***

1 Unless alternative routes are discussed, conditioned, and recommended separately in the
2 sections of this order, the Department’s recommendations for each applicable Council standard
3 and other applicable regulatory requirements relates to impacts associated with both the
4 proposed and alternative routes. Section IV.E., *Land Use*, of this order provides a description of
5 the land use evaluation for each affected county for the proposed route and alternative routes,
6 if there is an alternative route proposed in the county. Sections IV.F., *Fish and Wildlife Habitat*,
7 IV.F., *Protected Areas*, IV.I., *Threatened and Endangered Species*, IV.J., *Scenic Resources*, and
8 IV.K., *Historic, Cultural, and Archaeological Resources*, contain site certificate conditions of
9 approval specific to the applicable proposed or alternative route segments. The final
10 Department recommendations of approved routes is explained in of General Standard of
11 Review Condition 11 (Site-Specific Condition OAR 345-025-0010(5)), discussed in Section IV.A.,
12 *General Standard of Review*, of this order.

13
14 The Council’s application requirements of OAR 345-021-0010(b)(D), state that the applicant is
15 required to provide a “corridor selection assessment” when the proposed facility is a
16 transmission line subject to EFSC jurisdiction. OAR 345-021-0010(b)(D) outlines the information
17 necessary to include in the corridor assessment that the applicant must include in the
18 application.²⁷ While the assessment evaluation factors in OAR ~~345~~344-021-0010(1)(b)(D) are not
19 related to any Council standard, they inform the applicant’s reasoning and basis for the routes
20 proposed in the ASC, and are discussed further in this section. The applicant describes in great
21 detail in ASC Exhibit B and its attachments, the routing and siting process it conducted including
22 the evaluation of OAR ~~345~~344-021-0010(1)(b)(D) as the siting constraints and results of the
23 federal permitting process which contributed to the proposed and alternative routes the
24 applicant includes in the ASC. This is summarized below.

25
26 Initially, the applicant identified the northern endpoint of the proposed transmission line in the
27 Boardman, Oregon, area because it is the easternmost point at which the applicant could

²⁷ OAR 344-021-0010(1)(b)(D) requires the applicant to evaluate the following factors in discussing its reasons for its corridor selection:

- (i) Least disturbance to streams, rivers and wetlands during construction.
- (ii) Least percentage of the total length of the pipeline or transmission line that would be located within areas of Habitat Category 1, as described by the Oregon Department of Fish and Wildlife;
- (iii) Greatest percentage of the total length of the pipeline or transmission line that would be located within or adjacent to public roads and existing pipeline or transmission line rights-of-way.
- (iv) Least percentage of the total length of the pipeline or transmission line that would be located within lands that require zone changes, variances or exceptions.
- (v) Least percentage of the total length of the pipeline or transmission line that would be located in a protected area as described in OAR 345-022-0040.
- (vi) Least disturbance to areas where historical, cultural or archaeological resources are likely to exist.
- (vii) Greatest percentage of the total length of the pipeline or transmission line that would be located to avoid seismic, geological and soils hazards.
- (viii) Least percentage of the total length of the pipeline or transmission line that would be located within lands zoned for exclusive farm use.

1 feasibly interconnect to the Pacific Northwest market.²⁸ The applicant identified the southern
2 endpoint as applicant’s existing Hemingway Substation because it is the westernmost point in
3 the applicant’s existing transmission system that could accommodate termination of a 500-kV
4 transmission line. Within the parameters of the two end points, the applicant conducted an
5 extensive corridor selection process in order to determine the proposed route, and alternative
6 routes.

7
8 As discussed in detail in ASC Exhibit B, the applicant’s corridor selection process progressed
9 from a two-state, 11-county study area comprising over 31,000 square miles to 3,000 miles of
10 preliminary corridors in 2010, to selection of a proposed corridor in 2012, to modification of
11 that proposed corridor based on input from BLM and other developments in 2015 and 2016.
12 The applicant explains that during joint scoping meetings and during several process steps,
13 there have been opportunities for the public and agencies to comment and provide feedback
14 on the corridors.²⁹ The applicant explains that from the beginning of the process, prior to
15 submitting the NOI for the EFSC process, the applicant employed the eight factors identified in
16 OAR 345-021-0010(1)(b)(D) to filter through alternatives at an increasing level of detail. In the
17 initial phase, the applicant identified more than 225 constraints to and opportunities for siting,
18 including 124 that were directly related to the eight factors.³⁰ Using these constraints and
19 opportunities and working with the local citizens, the applicant identified over 3,000 miles of
20 alternative corridor for further analysis.

21
22 The applicant also used aerial photography to identify and avoid, where practical, irrigation
23 pivots, houses, barns, private runways, other structures (e.g., wind turbines), and land use
24 features. The corridors were adjusted using topographic maps to avoid or minimize distance
25 across very steep slopes and other physical features less desirable for transmission line
26 construction and operation. The corridors were again checked against the constraint and
27 opportunity geographic information system (GIS) database to avoid, where possible, exclusion
28 areas and areas of high permitting difficulty such as potential Oregon Department of Wildlife
29 (ODFW) Category 1 habitats. The applicant then grouped the alternative corridors into 14
30 regions and evaluated on the basis of permitting difficulty, construction difficulty and mitigation
31 costs. Using the constraint database, which incorporated the eight siting factors, the applicant
32 reviewed the alternatives to determine the most reasonable corridor within each region.

33
34 Figure 1, *Selected Key Constraints* below illustrates some of the siting constraints that the
35 applicant evaluated. Examples of siting constraints are ODFW Category 1 habitat, such as
36 Greater Sage Grouse habitat, agricultural and farming lands, protected areas, mountainous
37 areas with steep slopes, and or highly populated residential areas. Examples of siting
38 opportunities the applicant evaluated are siting the proposed facility within existing utility
39 corridors, co-locating the proposed facility adjacent to existing transmission lines, and co-

²⁸ B2HAPPDoc3-3 ASC 02a_Exhibit_B_Project Description_ASC 2018-09-28. Section 3.1.

After the applicant submitted its NOI to the Department in 2010, it continued its evaluation process to further reduce potential impacts, eliminate alternative corridor segments, and add several more substantial alternative corridor segments through the second phase of its siting assessment. These changes occurred as a result of extensive field studies, environmental analysis to better define areas of impact, and more detailed engineering studies to better define construction and operation requirements. The changes are documented in ASC Exhibit B, Attachment B-1, 2010 Siting Study, and Attachment B-2, 2012 Supplemental Siting Study. The changes reflect shifts in alignments and relocation of access roads and structure sites to avoid or reduce impacts to the resources, including but not limited to those relevant to the eight factors.

Following the applicant’s submittal of the pASC in 2013, the applicant completed a third phase of its siting assessment. The applicant undertook an additional significant evaluation of resources and made many changes to the proposed facility location, both macro and micro, to avoid and minimize impacts to resources identified by one or more of the eight factors in OAR 345-021-0010(1)(b)(D). This third phase of siting is documented in ASC Exhibit B, Attachment B-4, 2015 Supplemental Siting Study.

In 2016, the applicant completed its fourth assessment phase following the BLM’s development of a revised agency preferred alternative route.³¹ The BLM refined the agency preferred alternative based on input from public comments received on the BLM’s draft environmental impact statement (DEIS). This fourth phase of siting is documented in ASC Exhibit B Attachment B-6, 2017 Supplemental Siting Study. After completing the corridor selection process, the applicant performed more detailed engineering analyses of the proposed corridor that resulted in additional adjustments and changes to avoid sensitive resources as well as improve constructability. With the completion of these adjustments to the proposed corridor, the applicant developed the proposed route, and alternative routes submitted in the Amended pASC in July 2017.

The proposed route, and the four proposed alternative routes, are reflected in the final ASC, which the applicant filed with the Department on September 28, 2018.

III.B. Site Boundary, Right-of-Way, and Proposed Facility Location

III.B.1. Site Boundary and Right of Way Dimensions

The proposed facility and proposed alternative transmission line segments would be located within a site boundary as approved by Council. Site boundary is defined as “the perimeter of

³¹ B2HAPPDoc3-3 ASC 02a_ Exhibit_B_Project Description_ASC 2018-09-28. Section 3.1.

1 the site of a proposed energy facility, its related or supporting facilities, all temporary laydown
2 and staging areas and all corridors and micrositing corridors proposed by the applicant.”^{32, 33}
3

4 For this proposed EFSC facility, the site boundary is equivalent to a micrositing corridor. A
5 micrositing corridor means a continuous area of land within which construction of facility
6 components may occur, subject to site certificate conditions.³⁴ Historically, the Council has
7 recognized the need for certificate holders to have flexibility to “microsite” the final location of
8 facility components after issuance of a site certificate. Micro siting may be based on results of
9 final surveys, engineering considerations, avoidance of high-value wildlife habitat, and the
10 desire to reduce conflict with farming practices, or other considerations. The Council permits
11 final siting flexibility within a micrositing corridor (equivalent to the site boundary for this
12 facility) when the certificate holder demonstrates that requirements of all applicable standards
13 have been satisfied by adequately evaluating the entire corridor and location of facility
14 components anywhere within the corridor/site boundary, which has been demonstrated in the
15 ASC, as evaluated in this order.
16

17 For the 500-kV transmission line, the site boundary is a 500-foot-wide area within which the
18 transmission line, all transmission structures, and communication stations would be located.³⁵
19 The site boundary for the remaining facility features would vary, based on the type of feature
20 and use. For instance, the site boundary for the proposed Longhorn Station would be
21 approximately 190 acres. The site boundary for access roads would be either 100 or 200-feet in
22 width, depending on the nature of the road. The site boundary represents the area that the
23 applicant must evaluate for impacts to resources protected by the EFSC standards. However,
24 for certain resources, the applicant is also obligated to evaluate potential impacts that extend
25 beyond the site boundary, this area is described as the analysis area.³⁶ The analysis area
26 associated with specific resources may vary and is defined in the second amended project order
27 and described in each Council standard section of this order. If approved by Council, the
28 applicant may construct facility components anywhere within the approved site boundary.
29 Table PF-1 below, details the dimensions of the site boundary and estimates for impacts
30 associated with each type of proposed facility component.
31

32 The applicant proposed a right-of-way (ROW) width that is narrower than the evaluated site
33 boundary so the applicant may microsite the proposed ROW anywhere within the approved site
34 boundary. The ROW for the majority of the single-circuit 500-kV transmission line would be up
35 to 250 feet. In forested areas, the ROW width may extend up to 300 feet which includes
36 vegetative maintenance and the removal of hazardous trees. The ROW width requested by the

³² OAR 345-001-0010(55)

³³ OAR 345-001-0010(54)

³⁴ OAR 345-001-0010(32)

³⁵ B2HAPPDoc3-3 ASC 02a_Exhibit_B_Project Description_ASC 2018-09-28. Section 3.2.2.3 and 3.5.2.

³⁶ OAR 345-001-0010(2)

1 Navy along the east edge of Naval Weapons Systems Training Facility (NWSTF) Boardman would
 2 be up to 90 feet. The ROW width for the 1.1-mile rebuilding of existing 138-kV transmission line
 3 would be up to 100 feet. The existing 138-kV transmission line ROW would be widened to 250
 4 feet to facilitate placement of the 500-kV transmission line within it. The ROW width for the
 5 0.9-mile single-circuit 230-kV rebuilding portion would be up to 125 feet. Finally, the existing
 6 230-kV transmission line ROW would be widened to 250 feet to facilitate placement of the 500-
 7 kV line within it.³⁷ The applicant determined the proposed widths based on three criteria:

- 8
- 9 1. National Electrical Safety Code (NESC) requires sufficient clearance be maintained to the
- 10 edge of the ROW, so that during a wind event when the conductors are blown towards
- 11 the ROW edge they do not encounter other materials.
- 12 2. Sufficient room must be provided within the ROW to perform transmission line
- 13 maintenance.
- 14 3. Sufficient clearances must be maintained from the transmission line to the edge of the
- 15 ROW where structures or trees may be located and deemed a hazard or danger to the
- 16 transmission line. In some circumstances the ROW width may extend up to 300 feet in
- 17 forested areas, however, the ROW in many forested areas may be 250 feet. To maintain
- 18 reliability of the proposed transmission line, the applicant reiterates that vegetative
- 19 clearance including the ability to remove hazardous trees is essential and a wider ROW
- 20 is a way of achieving this in forested areas. This is discussed further in Sections IV.E,
- 21 IV.M, and IV.Q.4 of this order.
- 22

23 The applicant notes that specific localized conditions could result in slightly different ROW
 24 widths that will be finalized prior to construction.

25

Table PF-1: Site Boundary and Temporary/Permanent Disturbance Areas by Facility Component

Component	Length or Count	Site Boundary ¹	Construction Disturbance	Operations Disturbance
New, Bladed	88.8 miles (Proposed)/ 12.8 miles	200 feet (width)	35 feet (width)	14 feet (width)
New, Primitive	117.5 miles (Proposed)/ 12.8 miles	200 feet (width)	16 feet (width)	10 feet (width)
Permanent Facilities				
Communication Station	10 (Proposed)/ 2 (Alternative)	– ²	100 x 100 feet (0.2 acre)	75 x 75 feet (0.1 acre)
Distribution Power Lines to Communication Station ⁷	7 (Proposed)/ 2 (Alternative)	50 feet (width)	25 feet (width)	14 feet (width)
Temporary Facilities				
Multi-use Areas	30 (Proposed)/ 4 (Alternative)	Discrete site boundary; discontiguous from transmission line	23 acres	–
Light Duty Fly Yards	4 (Proposed)	Discrete site boundary; adjacent to transmission line site boundary	5 acres	–
Pulling and Tensioning Sites	299 (Proposed)/ 32 (Alternative)	Discrete site boundary; adjacent to transmission line site boundary	4 acres	–
¹ Site Boundary size may be less than indicated in specific areas to avoid impacts to protected areas or for other reasons. ² No temporary or permanent disturbance expected along centerline, other than for specific facility features indicated below. ³ Component will be sited entirely within the site boundary. ⁴ No permanent disturbance expected once existing towers are removed. ⁵ See the Road Classification Guide and Access Control Plan (Exhibit B, Attachment B-5) for more information about road types. ⁶ Existing roads with no substantial improvements are defined as existing roads that require improvements along 20 percent or less of the entire road segment. These roads have minimal to no temporary or permanent disturbance impacts beyond their existing road surface/profile, are not included in site boundary. ⁷ Applicant will construct distribution lines to communication stations within their service territory.				

1 *III.B.2. Proposed Facility Location by County*
2

3 The proposed site boundary would traverse five counties in Oregon including Morrow, Umatilla,
4 Union, Baker and Malheur, as described in detail in ASC Exhibit C, which includes maps of the
5 proposed facility location. As depicted in Table PF-2, *Route Mileage Summary by Land*
6 *Manager/Owner* below, the majority of the proposed site boundary would be located on
7 private land; however, portions of the proposed and alternative routes would also be located
8 on federal and state land throughout the five affected Oregon counties. Figure 2, *Proposed and*
9 *Alternative Transmission Line Routes* below presents the proposed facility site boundary,
10 including the overall proposed route and references to the locations of proposed alternative
11 routes. Figure 3, *Proposed Alternative Route Location Maps*, illustrates the proposed alternative
12 routes that are referenced in Figure 2.

13
14 In the ASC exhibits, the applicant describes specific design features associated with portions of
15 the proposed and alternative routes. Namely, ASC Exhibit B, Tables B-8 and B-9 identify
16 transmission towers and characteristics of the towers proposed to be constructed at specific
17 locations. Other ASC exhibits describe applicant proposed design features in more detail.
18 Specific design features and transmission line tower types are proposed to be constructed and
19 are based on:

- 20
21 1. Applicant proposed design features to reduce or mitigate potential impacts associated
22 with an applicable Council standard;
- 23 2. Applicant proposed design features not associated with an applicable Council standard
24 but nevertheless represented by the applicant;
- 25 3. Department recommended design features to reduce or mitigate potential impacts
26 associated with an applicable Council standard.

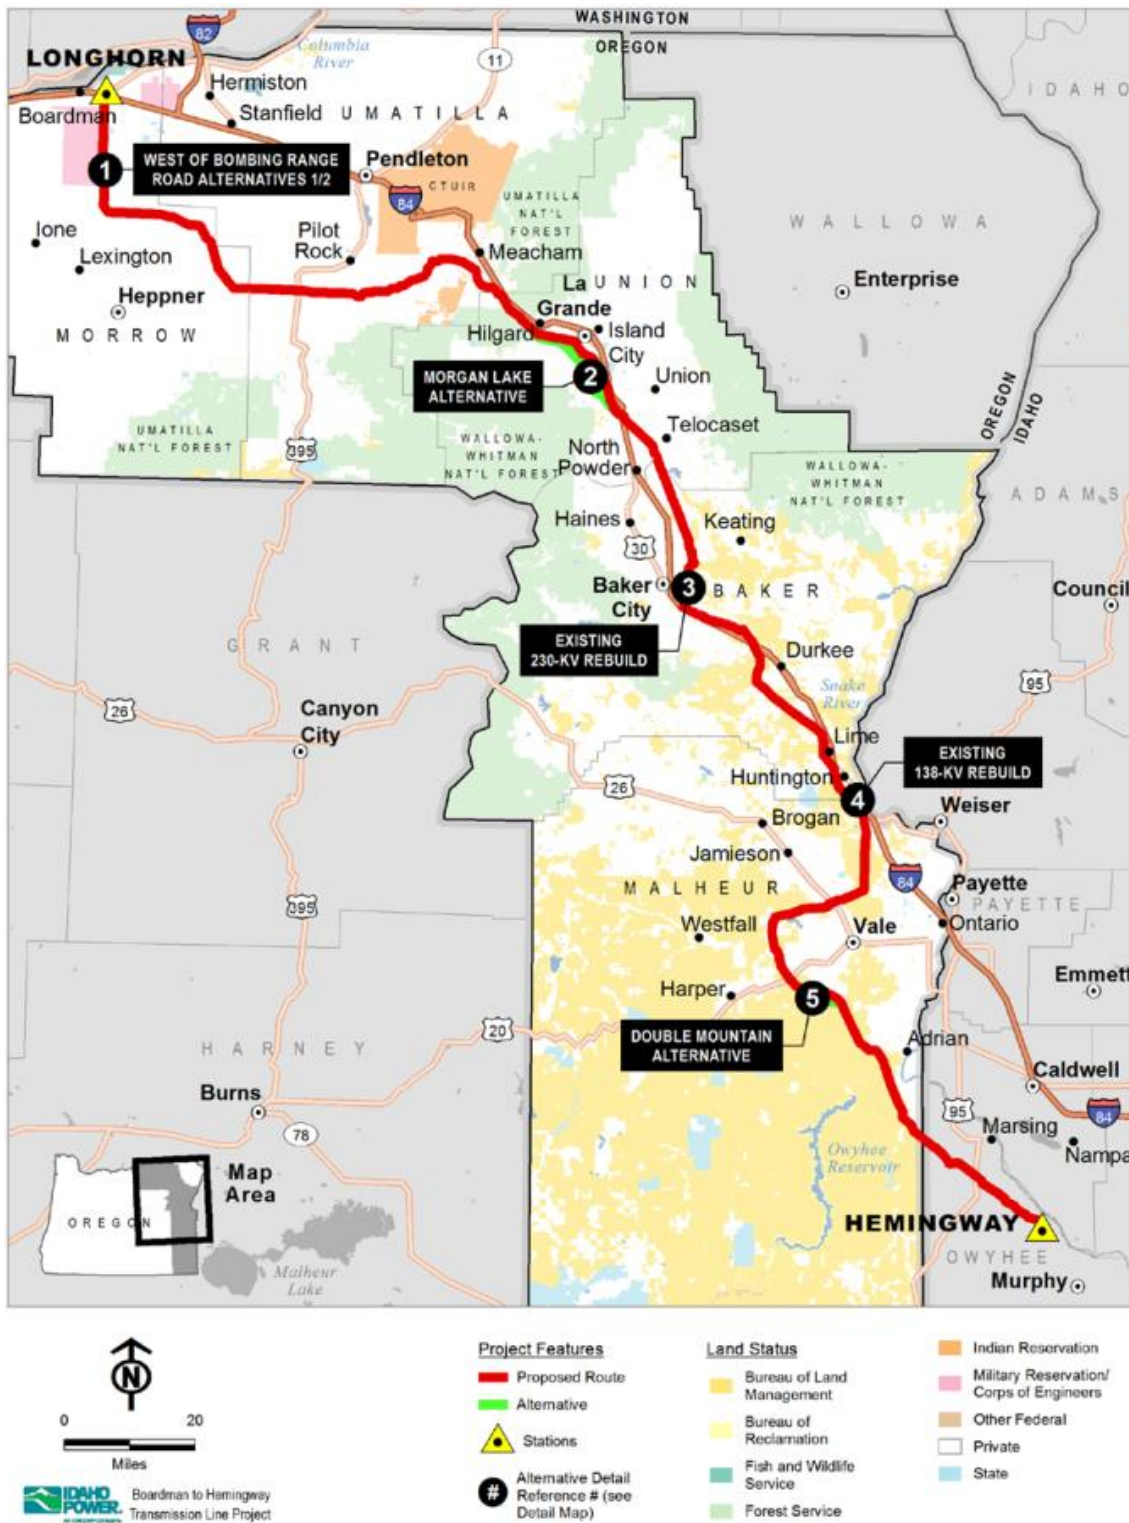

27
28 Mandatory Condition OAR 345-025-0006(3) recommended in this order as General Standard of
29 Review Condition 6, requires the applicant to, among other things, design, construct, operate,
30 and retire the proposed facility substantially as described in the site certificate. The following
31 section describes the proposed facility by county and is included in the description of the
32 proposed facility in the site certificate. The Department notes that there are design features
33 represented in the ASC and recommended site certificate conditions in this order, that are not
34 provided in the below section, which are applicable to General Standard of Review Condition 6
35 as well.

Table PF-2: Route Mileage Summary by Land Manager/Owner

Route Name	County	Total Miles	BLM		BOR		DoD/ USACE		State		Private		USFS	
			Miles	%	Miles	%	Miles	%	Miles	%	Miles	%	Miles	%

2

1 *Morrow County: Proposed Facility Routes and Components*

2
3 The proposed transmission line route would cross approximately 47.5 miles in Morrow County
4 beginning at the proposed Longhorn Station. The predominant land uses along the Morrow
5 County segment of the proposed route are irrigated agriculture, dryland farming, and
6 rangeland. The Navy (United States Department of Defense) owns and operates a training
7 range called the Naval Weapons Systems Training Facility Boardman (NWSTF Boardman) in this
8 area. The applicant proposes one communication station in Morrow County, which would be
9 located on Agriculture-Exclusive Farm Use (EFU) zoned land, currently used as a dryland wheat
10 field. As provided in Table PF-3, *Proposed Route Features – Morrow County* below, the
11 proposed route would include five multi-use areas in Morrow County, and none of the
12 proposed multi-use areas would include a light-duty fly yard.³⁸

13

The proposed facility would include the Longhorn Station, which the applicant proposes to construct and operate at the northern terminus of the transmission line in Morrow County. As the applicant explains, Bonneville Power Administration (BPA) has planned the Longhorn Station on approximately 20-acres of land it purchased from the Port of Morrow. The application includes a request to construct and operate that station if BPA does not develop it on a schedule consistent with the applicant proposed development schedule.

The proposed route exits the Longhorn Station to the west, generally paralleling an existing 500-kV transmission line for about 0.3 miles. The proposed route then turns south and crosses I-84, coming in parallel with Bombing Range Road on the east side until milepost (MP) 1.2. At that point, the proposed route crosses but stays in parallel with the west side of Bombing Range Road until MP 3.0, then the proposed route enters the NWSTF Boardman property utilizing the existing 90-foot-wide BPA 69-kV right-of-way (ROW). Structures for the portion of the proposed facility within the existing BPA ROW, in the area of Bombing Range Road and NWSTF Boardman will be 100 feet or less in height. From MP 7 to MP 9, the proposed route passes through the NWSTF Boardman approach zone easement. From MP 10 to MP 11.2, the proposed route crosses a portion of the Boardman Research Natural Area (RNA) located on NWSTF Boardman. The Boardman RNA was established in 1978 as part of a federal government system established for research and educational purposes. It is co-managed by the Navy and The Nature Conservancy.

From MP 11.7 to MP 13.5 the proposed route crosses a portion of the NWSTF Boardman’s Habitat Management Area (HMA). The Boardman HMA was established in 2016 as mitigation for training impacts to the Washington ground squirrel. At MP 13.5, the proposed route leaves the existing BPA 69-kV ROW and the NWSTF Boardman and proceeds in a southeasterly direction. At MP 15.4, the irrigated agriculture along the proposed route comes to an end and dryland farming becomes the dominant land use. At MP 18, the proposed route turns southeast and then at MP 19.3 turns due east crossing Bombing Range Road. The proposed route continues due east crossing lands under dryland farming practices. At MP 21.2 the proposed route crosses State Highway 207, at MP 27.5 it crosses ~~Pine City Road and~~ Little Butter Creek, at MP 28.3 it crosses Butter Creek and Big Butter Creek Lane, and at MP 34 it again crosses Big Butter Creek Lane and Butter Creek.

The applicant proposes two alternative routes in Morrow County. As described in ASC Exhibit C, the West of Bombing Range Road alternative 1 would be a 3.7-mile departure from the proposed route. It differs from the proposed route by shifting the proposed transmission line from Navy-owned land on the west side of Bombing Range Road to private land on the east side of the road before rejoining the proposed route south of the Navy-owned land. This alternative would avoid the Navy-owned land on the west side of the road that includes the Boardman Research Natural Area, but would result in impacts to agricultural operations on the east side that other would be avoided with the proposed route. See Figure 3 for an illustration of this alternative. As proposed by the applicant structures for the portion of the proposed facility within the area of Bombing Range Road will be 100 feet or less in height.

1
 2 The West of Bombing Range Road alternative 2 would also depart from the proposed route for
 3 3.7 miles. This alternative would be partially located on Navy-owned land on the west side of
 4 Bombing Range Road before crossing to the east side of that road. This alternative differs from
 5 the proposed route along the west side of Bombing Range Road by using an alternative Y-frame
 6 structure-type. After the alternative crosses to the private lands on the east side of Bombing
 7 Range Road, it would follow the same path as West of Bombing Range Road alternative 1. The
 8 applicant developed this alternative to avoid the agricultural impacts associated with West of
 9 Bombing Range Road alternative 1 on the east side of the Bombing Range, while also avoiding
 10 the Boardman Research Natural Area. See Figure 3 for an illustration of this alternative.

11
 12 *Umatilla County: Proposed Facility Route and Components*

13
 14 The transmission line proposed route would cross approximately 40.8 miles of land in Umatilla
 15 County. As discussed in ASC Exhibit C, at MP 64.7, the proposed route crosses East Birch Creek
 16 which is also approximately 5.5 miles south of Pilot Rock. Between MP 84 and MP 85,
 17 approximately 2.8 miles southwest of the community of Meacham, the proposed route remains
 18 west of a segment of the Blue Mountain Forest State Scenic Route, passing into Union County
 19 at MP 88.3. All of the impacted land in Umatilla County is privately owned. As described in
 20 Table PF-4 below, the proposed route would include seven multi-use areas in Umatilla County.³⁹
 21 One of the proposed multi-use areas in Umatilla County would include a light-duty fly yard,
 22 which would be located on land zoned by Umatilla County for Grazing Farm use. The applicant
 23 also proposes two communication stations in Umatilla County, both of which would be located
 24 on Agriculture-EFU-zoned land, currently used as a dryland wheat field. One of the proposed
 25 stations also is subject to a Critical Winter Range Overlay, as discussed further in Section IV.F.,
 26 *Fish and Wildlife Habitat* of this order. There are no alternative routes proposed in Umatilla
 27 County.

Union County: Proposed Facility Routes and Components

The transmission line proposed route would cross approximately 39.9 miles of land in Union County. As discussed in detail in ASC Exhibit C, at milepost (MP) 105.8, the proposed route angles to the south, away from the existing 230-kV transmission line, which continues east into the city limits of the City of La Grande. At this point, the proposed route extends approximately 0.4 mile west of the La Grande city limits. The proposed route continues south until reaching MP 107.9, at which point it again turns to the east. At MP 110, the proposed route turns to the southeast.⁴⁰ As noted in Section IV.L., *Recreation* and IV.E., *Land Use* of this order, in its comments on the ASC, the City of La Grande expressed its concerns with the location of the proposed route within the viewshed of the City. The applicant and the City of La Grande established a memorandum of agreement (MOA) outside of the EFSC process and the applicant proposes to use H-frame, weathered steel transmission towers between MP 105.3 to MP 107.9, within proximity to the City of La Grande.^{41, 42} For the next 43.4 miles from MP 110, the proposed route parallels at varying distances to the existing Quartz to La Grande 230-kV transmission line. Between MP 110.5 and MP 111.5, the proposed route crosses over the Glass Hill Unit of the Ladd Marsh Wildlife Management Area, as discussed in Section IV.F., *Protected Areas* and elsewhere in this order.

⁴⁰ B2HAPPDoc3-9 ASC 03 Exhibit C Project Location ASC 2018-09-28, Section 3.2.1.2.

⁴¹ B2HAPPDoc8-1 All DPO Comments Combined-Rec'd 2019-05-22 to 08-22; B2HAPPDoc8-011 DPO Agency Comment_City of La Grande Strobe 2019-08-21, B2HAPPDoc13 DPO IPC Responses to Select DPO Comments Rec'd by 2019-11-07; B2HAPP DPO IPC Responses - City of La Grande comments 2019-10-09 and B2HAPP DPO IPC Responses - StopB2H - 5. and indiv comments Scenic, Recreation, and Protected Areas -Morgan Lake Park 2019-11-07.

⁴² In its comments on the DPO, the applicant described the mileposts by tower location, MP 106/2 and MP 108/5. For consistency with this order and the ASC, the Department cross-referenced these locations with the maps in ASC Exhibit C to provide milepost locations.

1 As provided in Table PF-5 below, the proposed route would include three multi-use areas in
 2 Union County, however none of the proposed multi-use areas would include a light-duty fly
 3 yard. The applicant proposes two communication stations in Union County along the proposed
 4 route, one of which would be located on Timber-Grazing zoned land and the other of which
 5 would be located on Agriculture-Grazing zoned land.

7
 8 The Morgan Lake alternative is the only alternative route proposed in Union County and was
 9 developed based on input from landowners. The Morgan Lake alternative would be an 18.5-
 10 mile departure from the proposed route, located west of the proposed route, leaving that route
 11 approximately one mile west of the Hilgard Junction State Park and rejoining the proposed
 12 route southeast of Ladd Canyon. Compared to the proposed route, the Morgan Lake alternative
 13 would cross fewer parcels with residences, would not cross the Ladd Marsh Wildlife Area/State
 14 Natural Heritage Area (the “Ladd Marsh Wildlife Area”), would not cross Interstate-84 (I-84)
 15 and would be 0.5 mile shorter than the proposed route, however, the alternative is proposed to
 16 pass near Morgan Lake Park, a park managed by the City of La Grande. For additional
 17 description of Morgan Lake Park, see section IV.L., *Recreation*, of this order. The Morgan Lake
 18 alternative would include one alternative communication station in Union County, which would

1 be located approximately 0.3 mile south of Morgan Lake. That station would be located on
2 grass land, zoned Timber Grazing by Union County.

3
4 *Baker County: Proposed Facility Route and Components*

5
6 The transmission line proposed route would cross approximately 68.4 miles of land in Baker
7 County. ASC Exhibit C describes that the proposed route crosses into Baker County at
8 approximately MP 128.2. Between MP 146.2 and MP 146.9, the proposed route crosses the
9 Oregon Trail and passes west of the National Historic Oregon Trail Interpretive Center
10 (NHOTIC), for additional discussion of NHOTIC and the Oregon Trail, see Sections IV.F.,
11 Protected Areas and IV.K., Historic, Cultural, and Archaeological Resources, of this order.
12 Between MP 146.5 and 147.3, the existing 230-kV line would be rebuilt to allow both the 500-
13 kV and 230-kV towers to be co-located in a valley between ridgelines.⁴³ In addition to the
14 transmission line, the proposed route would include six multi-use areas in Baker County. One of
15 the proposed multi-use areas in Baker County would include a light-duty fly yard, which would
16 be located on land zoned by Umatilla County for Agriculture-EFU. The applicant proposes two
17 communication stations in Baker County, both of which would be located on Agriculture-EFU-
18 zoned land. There are no alternative routes proposed in Baker County.

1
2 *Malheur County: Proposed Facility Routes and Components*

3
4 The transmission line proposed route would cross approximately 74.1 miles of land in Malheur
5 County. At MP 196.5 the proposed route crosses into Malheur County and at MP 199 it passes
6 directly to the east of the Oregon Trail Birch Creek Area of Critical Environmental Concern
7 (ACEC). Between MP 197.6 and MP 198.8, the proposed route will be located in the existing IPC
8 138-kV transmission line ROW and the 138-kV transmission line will be relocated into a new
9 ROW.⁴⁴ Further, the applicant proposes to use H-frame transmission tower structures in this
10 area, as discussed further in Section IV.J., *Scenic Resources in this order.* -In addition to the
11 proposed transmission line, the proposed route would include nine multi-use areas in Malheur
12 County. The applicant summarizes the exact location, size and land status of each of these
13 proposed multi-use areas in ASC Exhibit C, Table C-14. Two of the proposed multi-use areas in
14 Malheur County would include light-duty fly yards, both of which would be located on land
15 zoned by Malheur County for Agriculture-Exclusive Range Use. The applicant proposes three
16 communication stations in Malheur County, one of which would be located on Agriculture-EFU-
17 zoned land and two of which would be located on Agriculture-Exclusive Range Use-zoned land.

1
 2 The applicant proposes one alternative route in Malheur County, the Double Mountain
 3 alternative. The Double Mountain alternative would be a 7.4-mile departure from the
 4 proposed route. That alternative would be located southwest of the proposed route, north of
 5 the Double Mountains. The proposed alternative would be located entirely on BLM-managed
 6 land, mostly on rangeland and in sagebrush. Almost the entire length of this alternative would
 7 be located within the BLM-designated Double Mountain Wilderness Characteristic Unit. The
 8 Double Mountain alternative would include one alternative communication station in Malheur
 9 County. That station would be located on shrub and grass land, zoned Agriculture-Exclusive
 10 Range Use by Malheur County.

11 **III.C. Proposed Facility**

12
 13 The proposed facility would include approximately 300 miles of electric transmission line, with
 14 approximately 272.8 miles proposed to be located in Oregon and 23.8 miles in Idaho. It would
 15 include 270.8 miles of single-circuit 500-kV transmission line, removal of 12 miles of existing 69-
 16 kV transmission line, rebuilding of 0.9 mile of a 230-kV transmission line, and rebuilding of 1.1
 17 miles of existing 138-kV transmission line into a new right-of-way (ROW).⁴⁵ Section III.B.2.,
 18 *Proposed Facility Location by County*, above, provides a description of the alternatives proposed
 19 as well as in ASC Exhibit C, Section 3.2
 20

⁴⁵ B2HAPPDoc3-3 ASC 02a_ Exhibit_B_Project Description_ASC 2018-09-28, Section 1.1.

1 As described in ASC Exhibit B, the applicant requests Council approval of the following major
2 facility components proposed to be located within Oregon (described in more detail below in
3 this section):

- 4
- 5 • Transmission Lines: The proposed route would consist of an approximately 270.8-mile-
6 long single-circuit 500-kV electric transmission line, removal of 12 miles of existing 69-kV
7 transmission line, rebuilding of 0.9 mile of a 230-kV transmission line, and rebuilding of
8 1.1 miles of an existing 138-kV transmission line into a new ROW. Four proposed
9 alternative routes would include approximately 33.3 miles of transmission line.
- 10
- 11 • Longhorn Station: A proposed 20-acre switching station, the Longhorn Station, would be
12 located near the Port of Morrow, Oregon. The proposed switching station would
13 provide a combination of switching, protection, and control equipment arranged to
14 provide circuit protection and system switching flexibility for the transfer of electric
15 power; it would not incorporate step-down or step-up voltage equipment. The
16 proposed station would connect the proposed transmission line to other 500-kV
17 transmission lines and the Pacific Northwest power market.
- 18
- 19 • Communication Stations: Ten proposed communication station sites (and two
20 alternative communication stations sites) would each consist of a communication
21 shelter and related facilities. Each proposed communication station site would be less
22 than 1/4-acre in size.
- 23
- 24 • Access Roads: The proposed facility would include permanent access roads for the
25 proposed route, including 206.3 miles of new roads and 223.2 miles of existing roads
26 requiring substantial modification. The proposed alternative routes would include 30.2
27 miles of new roads and 22.7 miles of existing roads requiring substantial modification.
- 28
- 29 • Temporary Features used during Construction: The proposed transmission line would
30 include 30 temporary multi-use areas and 299 temporary pulling and tensioning sites,
31 four of which would have light-duty fly yards within the pulling and tensioning sites.
- 32

33 ~~All of these are discussed further below.~~

34 35 *Transmission Lines*

36
37 The proposed transmission line system would include the proposed transmission line as
38 described above and towers within an established right-of-way (ROW), transmission and
39 foundation structures, conductors, grounding system, and associated hardware. In addition, the
40 applicant proposes to remove existing 69-kV structures along the eastern boundary of the
41 Naval Weapons System Training Facility Boardman (NWSTF Boardman).

1 *Transmission Towers*

2

3 ASC Exhibit B, Figures B-15 through B-20 illustrate the various types of tower structures the
4 applicant proposes to use along the proposed and alternative routes. The majority of the
5 proposed transmission line circuits would be supported by 500-kV single-circuit steel lattice
6 towers (Figure B-15). The applicant proposes alternative 500-kV structure types in specific
7 locations where using different tower structures may be necessary to reduce visual or other
8 impacts. ASC Exhibit B, Figures B-16 through B-20 illustrate structure alternatives to reduce
9 visual impacts, these structures are also the typical structures used for 230-kV and 138-kV
10 transmission line support. Different types of support structures are also used for special
11 purposes, including tangent, angle, and dead-end structures, tubular steel frames, transmission
12 line crossing structures and transposition structures.

13

14 *Structure and Conductor Clearances*

15

16 The applicant explains that its proposed conductor phase-to-phase and phase-to-ground
17 clearance parameters are determined in accordance with the applicant's company standards,
18 which are based on National Electrical Safety Code (NESC) requirements produced by the
19 American National Standards Institute (ANSI). These standards and requirements provide
20 minimum distances between the conductors and ground, crossing points of other lines and the
21 transmission support structure and other conductors, and minimum working clearances for
22 personnel during energized operation and maintenance activities. As described in Section
23 IV.P.1. Siting Standards for Transmission Lines of this order, At normal operating conditions, the
24 minimum clearance of conductors above ground is 34.5 feet for 500-kV transmission lines, 27
25 feet for 230-kV transmission lines, and 30 feet for 138-kV transmission lines under normal
26 operating conditions.

27

28 *Structure Foundations*

29

30 The applicant explains that the 500-kV single-circuit lattice steel structures would each require
31 four foundations, one on each of the four corners of the lattice towers. The applicant's
32 preliminary design indicates that the foundations for the single-circuit tangent lattice towers
33 would be composed of steel-reinforced concrete drilled piers with a typical diameter of four
34 feet and a depth of approximately 15 feet. The 500-kV H-frame structures would require two
35 foundations for each tangent structure, one for each pole that comprises the H-frame
36 structure. Angle and dead-end structures would use a three-pole structure, each with its own
37 foundation. These would be steel-reinforced drilled piers with a typical diameter of six to eight
38 feet and a depth of approximately 25 to 40 feet. The 138-kV H-frame structures would be wood
39 poles directly-embedded in the ground.

40

41 Typical direct-embedded foundations sizes would be 5 feet in diameter and 12 feet deep.
42 Tangent structures would be directly-embedded in the ground using a single drilled boring,
43 typically five feet in diameter and 15 feet deep. Angle and dead-end structures would be on
44 steel-reinforced drilled pier foundations with a typical diameter of five to six feet and a depth of

1 approximately 20 to 25 feet. For the 230-kV frame structures, each of the two poles for tangent
2 structures would be directly-embedded in the ground; each of the three poles that make up the
3 angle and dead-end structures would be also be direct-embedded and guyed. The exact
4 foundation style, diameter, and depth would be finalized during final design and dependent on
5 structure loading conditions and the type of soil or rock present at each specific site. The
6 applicant depicts the typical foundation diameters and depths for the proposed structure types
7 at ASC Exhibit B, Table B-10.

8 9 *Conductors*

10
11 The applicant proposes to use reinforced conductor steel for the proposed 500-kV lattice
12 structure lines. The applicant explains that each phase of a 500-kV three-phase circuit would be
13 composed of three sub-conductors in a triple bundle configuration. The triple-bundled
14 configuration would provide adequate current carrying capacity and provide for a reduction in
15 audible noise (corona effect) and radio interference as compared to a single large-diameter
16 conductor. In instances where multiple conductors would be used in a bundle for each phase,
17 the bundle spacing would be maintained through conductor spacers placed at intermediate
18 points along the conductor bundle between each structure. In addition to maintaining the
19 correct bundle configuration and spacing, the spacers are also designed to lessen wind-induced
20 vibration in the conductors.

21
22 The number of spacers required in each span between towers would be determined during the
23 final design of the transmission line. For the proposed rebuilt 230-kV line, each phase of the
24 230-kV three-phase circuit would be composed of one conductor. The applicant proposes to
25 use one conductor per phase for the proposed 138-kV rebuilt line.

26 27 *Other Hardware*

28 29 *Insulators*

30
31 The applicant explains in ASC Exhibit B and as noted above, insulators would be used to
32 suspend each conductor bundle (“phase”) from the structure, maintaining an appropriate
33 electrical clearance between the conductors, the ground, and the structure. Dead-end insulator
34 assemblies for the transmission lines would use an “I-shaped” configuration, which consists of
35 insulators hung from either a tower dead-end arm or a dead-end pole in the form of an “I.”
36 Insulators would be composed of green-tinted toughened glass. The typical insulator
37 assemblies for the 500-kV steel lattice tangent structures would consist of an insulator string
38 hung in the form of an “I”. However, for 500-kV H-frame structures insulator assemblies would
39 consist of two insulator strings hung in the form of a “V”. In ASC Exhibit B, Figure B-18, the
40 applicant illustrates that insulator assemblies for the alternative 500-kV H-frame would consist
41 of one insulator string hung in the form of an “I” on the outside and two insulator strings hung
42 in the form of “V” on the inside. Insulator assemblies for 230-kV H-frame structures would
43 consist of a single insulator suspended from the structure cross arm in the form of an “I.”

1 Finally, insulator assemblies for 138-kV tangent structures would consist of one insulator string
2 hung in the form of an “I” that extend vertically down from the crossbar.

3
4 *Grounding Systems*

5
6 As the applicant explains in ASC Exhibit B, the proposed transmission line would consist of
7 alternating current transmission lines, which have the potential to induce currents on adjacent
8 metallic structures such as other transmission lines, railroads, pipelines, fences, or structures
9 that are parallel to, cross, or are adjacent to the transmission line. Induced currents on those
10 facilities would occur to some degree during steady-state operating conditions and during a
11 fault condition on the transmission line. As the applicant explains that the magnitude of the
12 effects of the alternating current induced currents on adjacent facilities would be dependent on
13 the magnitude of the current flows in the transmission line, the proximity of the adjacent
14 facility to the line, and the distance (length) along which the two facilities parallel one another.
15 This is discussed further in section IV.P.1., *Siting Standards for Transmission Line*, of this order.

16
17 As described in ASC Exhibit DD, the methods and equipment needed to mitigate these
18 conditions would be determined through electrical studies of specific situations. As standard
19 practice and as part of the design of the proposed transmission line, the applicant explains that
20 electrical equipment and all fences, metal gates, pipelines, metal buildings, and other metal
21 structures adjacent to the ROW or that cross or are within the transmission line ROW, would be
22 grounded as determined necessary. Metallic objects outside of the ROW may also be grounded,
23 depending on the distance from the transmission line as determined through the electrical
24 studies. The applicant explains that these actions would address the majority of induced
25 current effects on metallic facilities adjacent to the line by shunting the induced currents to
26 ground through ground rods, ground mats, and other grounding systems, thereby reducing the
27 effect that a person may experience when touching a metallic object near the line. Potential
28 public health effects from transmission lines are discussed section IV.P.1., *Siting Standards for*
29 *Transmission Line*, of this order.

30
31 *Additional Hardware*

32
33 In addition to the conductors, insulators, and overhead shield wires, the applicant explains that
34 it would install other associated hardware on the tower as part of the insulator assembly to
35 support the conductors and shield wires. This hardware would include clamps, shackles, links,
36 plates, and other pieces composed of galvanized steel and aluminum.

37
38 A grounding system would be installed at the base of each transmission structure that would
39 consist of copper or copper-clad ground rods embedded into the ground in immediate
40 proximity to the structure foundation and connected to the structure by a buried copper lead.
41 When the resistance-to-ground for a grounded transmission structure is greater than a
42 specified impedance value, ground rods or counterpoise would be installed to lower the
43 resistance to below a specified impedance value. Counterpoise consists of a bare copper-clad or

1 galvanized-steel cable buried a minimum of 12 inches deep, extending from structures (from
2 one or more legs of structure) for approximately 200 feet within the ROW.

3
4 The applicant explains that it may install other hardware not associated with the transmission
5 of electricity, including aerial marker spheres or aircraft warning lighting as required for the
6 conductors or structures pursuant to Federal Aviation Administration (FAA) regulations.
7 Structure proximity to airports and structure height determine whether FAA regulations would
8 apply based on an assessment of wire/tower strike risk. The applicant does not anticipate that
9 structure lighting would be required because proposed structures would be less than 200 feet
10 tall and would not be near airports that require structure lighting.

11 *Removal of Existing 69-kV Structures*

12
13
14 The applicant proposes to remove the existing 69-kV transmission line structures along the
15 eastern boundary of the NWSTF Boardman in Morrow County. The majority of the structures
16 would be removed by taking down the overhead conductor and removing each of the wooden
17 poles at three inches below ground surface. The poles would be lifted by cranes onto trucks and
18 removed from the site.

19
20 Three H-frame structures located in Washington Ground Squirrel (WAGS) habitat would be
21 removed by cutting the poles into sections, transporting the pole sections by foot to the
22 nearest existing road, and driving the pole sections off-site. The construction contractor would
23 climb the poles and remove the sections starting at the top. The poles would be removed down
24 to slightly above ground level in order to eliminate their potential use as raptor perching
25 structures while avoiding ground disturbance. The below grade portions of the poles would be
26 left in place. For additional information on mitigating impacts to fish and wildlife habitat see
27 section IV.F., *Fish and Wildlife Habitat*, of this order. Alternatively, the wooden pole structures
28 could be removed by using a helicopter in conjunction with hand crews working on the ground.
29 A final decision on the methods used to remove the poles would be made by the applicant prior
30 to facility construction.

31 *Longhorn Switching Station*

32
33
34 The western terminus of the proposed transmission line would be the proposed Longhorn
35 Switching Station, or the Longhorn Station. As noted above, BPA has planned the Longhorn
36 Station on land it purchased from the Port of Morrow. The applicant is requesting authorization
37 to construct and operate the Longhorn Station if the BPA does not develop it within the
38 applicant's timeline.⁴⁶

39

⁴⁶ The Energy Facility Siting Council does not have jurisdiction over BPA projects and infrastructure. In the event that the Longhorn Station is built by BPA independent of an approved site certificate, Council approval would not be required. EFSC would not maintain compliance authority over the Longhorn Station aside from specific components at the station associated only with the approved facility site certificate.

1 Where the 500-kV transmission line terminates at the Longhorn Station, the applicant proposes
2 to install 500-kV circuit breakers, high-voltage switches, bus supports, and transmission line
3 termination structures, a 500-kV series capacitor bank, and 500-kV shunt reactor banks. The
4 500-kV transmission line termination structures would be approximately 125 to 135 feet tall.
5 The applicant proposes to construct a control house to accommodate the necessary system
6 communications, control equipment, and a restroom facility. A new all-weather access road
7 would be used to reach the station site. The station site would be supplied by distribution
8 power brought in from the nearby existing system as necessary and fiber optic signal
9 communication equipment and a backup propane-powered generator would be installed.

10
11 The applicant proposes to install fire protection systems at the Longhorn Station, which could
12 include:

- 13
- 14 • Automatic suppression systems such as fire sprinklers, foam, gaseous, explosion
15 suppression, or other specialized extinguishing systems and appropriate alarms.
- 16 • Adequate water supply, storage, and distribution systems for water-based extinguishing
17 systems.
- 18 • Automatic fire detection, occupant warning, manual fire alarm, and fire alarm reporting
19 systems combined with properly equipped and adequately trained fire departments.
- 20 • Fire barrier systems or combinations of physical separation and barriers for outdoor
21 locations.

22 23 *Communication Systems and Stations*

24 25 *Optical Ground Wire*

26
27 The applicant proposes to provide primary communications for relaying and control via the
28 optical ground wire that would be installed on the transmission lines. No new microwave sites
29 are proposed. Each 500-kV structure would have two lightning protection shield wires installed
30 on the structure peaks.

31 32 *Communication Station Sites*

33
34 As noted above, the applicant proposes ten communication stations (and two alternative
35 communication stations.) Each station would include a communication shelter and related
36 facilities and would be less than a quarter acre in size. All communication station sites are
37 proposed to be located on private lands, within the transmission line ROW.

38
39 The typical communication station site would be 100 feet by 100 feet, with a fenced area of 75
40 feet by 75 feet. The applicant would place a prefabricated concrete communications structure
41 with dimensions of approximately 11.5 feet by 32 feet by 12 feet tall on each site, and construct

1 access roads to the site.⁴⁷ Facility service power would be required at each of the ten
2 communication station sites ultimately selected for development, with power from the local
3 electric distribution circuits. A standby generator with a liquefied propane gas tank would be
4 installed at the site inside the fenced area. Two separate conduit (underground) or aerial cable
5 routes would be used for each fiber optic cable bundle between the transmission line and
6 communication station. Conduits would be two-inch-diameter polyvinyl chloride and would be
7 buried three feet below the surface extending from the communication shelter to two different
8 legs of the transmission structure maintaining a 10-foot separation between the cables. All
9 work would occur within the disturbance footprint for either the communication station or the
10 structure to which the cables would attach. The applicant illustrates the plan arrangement of a
11 typical communications station site layout at ASC Exhibit B, Figure B-26.

12
13 The applicant proposes to install smoke detectors at communication stations that would alarm
14 through the Supervisory Control and Data Acquisition (SCADA) system, which would
15 communicate to the certificate holder's System Dispatch Center along the fiber optic lines.

16 17 *Communication Station Distribution Lines*

18
19 Local electric distribution service providers would install distribution lines to serve the
20 proposed transmission line's communication stations. Where the local service provider is a
21 third party and not the certificate holder, the distribution lines would not be considered related
22 or supporting facilities under ORS 469.300(24). However, the application anticipates that the
23 certificate holder would be the local service provider in Malheur County and parts of Baker
24 counties, and would serve communication stations BA-02, and MA-01, MA-02, MA-03, as well
25 as alternative a communication station in Malheur County.⁴⁸ Therefore, those distribution lines
26 would be considered related or supporting facilities, and are included within the site boundary.

27 28 *Equipment and Systems for Fire Prevention and Suppression*

29
30 Construction activities could result in risk of fire danger from smoking, refueling activities,
31 operating vehicles and other equipment off improved roadways, welding activities, and the use
32 of explosive materials and flammable liquids. During operation, the risk of fire would be
33 primarily from vehicles and maintenance activities that require welding. As discussed further in
34 section IV.M, *Public Services*, the applicant has established protocols to ensure that all federal,
35 state, and county laws, ordinances, rules, and regulations pertaining to fire prevention and
36 suppression would be strictly adhered to; and that all personnel would be advised of their
37 responsibilities under the applicable fire laws and regulations. Specific fire protection systems
38 would be determined during final design of these facilities; however, a key component of fire
39 protection would be establishing and maintaining a right of way cleared of hazard trees and
40 other tall vegetation that could come into contact with the transmission line during a wind

⁴⁷ B2HAPPDoc3-3 ASC 02a_Exhibit_B_Project Description_ASC 2018-09-28, Section 3.2.2.3.

⁴⁸ B2HAPPDoc3-3 ASC 02a_Exhibit_B_Project Description_ASC 2018-09-28, Section 3.3.4.

1 storm or other event. Vegetative clearance of the right of way is further described in Sections
2 IV.E., *Land Use*, and IV.M., *Public Services*, of this order and applicable attachments.

3
4 The prevention and suppression of wildfires in eastern Oregon is carried out by BLM, U.S.
5 Forest Service (USFS), and local fire districts and agencies. The applicant has established
6 protocols to ensure that, if the certificate holder became aware of an emergency situation
7 caused by a fire on or threatening BLM-managed or National Forest lands, the certificate holder
8 would notify the appropriate agency contact. Specific construction-related activities and safety
9 measures would be implemented during construction of the transmission line to prevent fires
10 and to ensure quick response and suppression if a fire occurs. Typical practices to prevent fires
11 during construction and maintenance/repair activities could include brush clearing prior to
12 work, posting a fire watch and stationing a water truck at the job site to keep the ground and
13 vegetation moist in extreme fire conditions, enforcing red flag warnings, providing “fire
14 behavior” training to all construction personnel, keeping vehicles on or within designated roads
15 or work areas, and providing fire suppression equipment and emergency notification numbers
16 at each construction site. Additional information specific to vegetative maintenance, clearing,
17 and fire suppression are discussed in section IV.M., *Public Services*.

18
19 Under the proposed protocols, the certificate holder would require its contractor to maintain a
20 list, to be provided to local fire-protection agencies and the Department, of all equipment that
21 is either specifically designed for, or capable of, being adapted to fighting fires. It would require
22 its contractor to provide basic fire-fighting equipment on-site during construction, including fire
23 extinguishers, shovels, axes, and other tools in sufficient numbers so each employee on-site can
24 assist in the event of a fire-fighting operation. The applicant explains that during transmission
25 line operation, risk of fire danger would be minimal. The primary causes of fire within the ROW
26 would result from unauthorized entry by individuals for recreational purposes and from fires
27 started outside the ROW. In the latter case, authorities could use the ROW as a potential point
28 of attack for fighting a fire. During transmission line operation, access to the ROW would be
29 restricted in accordance with jurisdictional agency or landowner requirements to minimize
30 recreational use of the ROW. During maintenance operations, the certificate holder or its
31 contractor would equip personnel with basic fire-fighting equipment. Maintenance crews
32 would also carry emergency response/fire control phone numbers. Fire prevention and
33 suppression measures are discussed more in Attachment U-3, to this order, Fire Prevention and
34 Suppression Plan and section IV.M., *Public Services*.

35
36 *Related or Supporting Facilities (Permanent and Temporary)*

37
38 *Access Roads*

39
40 The proposed transmission line would require vehicular access during construction and
41 operation of the station, each communication station site, and each transmission structure, and
42 to temporary facilities including multi-use areas and pulling and tensioning sites. The applicant
43 describes the proposed access road classification and modification proposals in Attachment B-
44 5, Road Classification Guide and Access Control Plan, attached to this order. Proposed access

1 roads, which include both new roads and existing roads requiring substantial modification, are
 2 considered related or supporting facilities and are included within the site boundary. Existing
 3 roads that would be used for construction and operation of the facility but which would not
 4 require substantial modification are not “related or supporting facilities” and, therefore, are not
 5 included in the site boundary.⁴⁹ Table PF-8, *Summary of Access Road Classifications* below
 6 provides a summary of the road descriptions as proposed by the applicant.
 7

Table PF-8: Summary of Access Road Classifications

Access Road Classification		Site Boundary	Construction Disturbance	Operations Disturbance	Road Prism or Profile Changes	Extent of Work
New Roads	Primitive	200 feet	16 feet	10 feet	Yes	Clearing of vegetation or obstructions. Create roads by direct vehicle travel.
	Bladed	200 feet	16–35 feet	14 feet	Yes	Clearing of vegetation or obstructions. Create roads by cutting/filling existing terrain.
Existing Roads - Substantial Modification	Substantial Modification, 21-70% Improved	100 feet	16 feet	14 feet	Yes	Reconstruct portions of existing road to improve road function. Possible road prism widening, profile adjustments, horizontal curve adjustments, or material placement.
	Substantial Modification, 71-100% Improved	100 feet	16–30 feet	14 feet	Yes	Reconstruct portions of existing road to improve road function. Possible road prism widening, profile adjustments, horizontal curve adjustments, or material placement.

⁴⁹ OAR 345-001-0010(501) states that “related or supporting facilities does not include any structure existing prior to construction of the energy facility, unless such structure must be substantially significantly modified solely to serve the energy facility.”

Table PF-8: Summary of Access Road Classifications

Access Road Classification		Site Boundary	Construction Disturbance	Operations Disturbance	Road Prism or Profile Changes	Extent of Work
Existing Roads – No Substantial Modification	No Substantial Modification, 0-20% Improved	NA ¹	NA ¹	NA ¹	No	Repair of existing road to maintain original road function. No betterment of existing road function or design.
¹ Existing roads with no substantial modifications are not included in the Site Boundary and do not have an operation or construction disturbance width assigned to them. Source: B2HAPPDoc3-3 ASC 02a_Exhibit_B_Project Description_ASC 2018-09-28, Table B-12.						

1

2 *New Roads*

3

4 For purposes of describing the disturbance width, the applicant has classified new roads as
 5 either “primitive” or “bladed.” The site boundary for all new roads would be 200 feet wide (100
 6 feet on either side of the centerline). The typical construction disturbance for primitive roads
 7 would be 16 feet and the operational width would be maintained at 10 feet. For bladed roads,
 8 the typical construction disturbance would be 16 feet wide, but could be as wide as 35 feet as
 9 dictated by terrain and soil conditions, and the operational width for bladed roads would be 14
 10 feet.

11

12 *Existing Roads with No Substantial Modification*

13

14 Road maintenance activities will be limited to 20 percent or less of the road surface area and
 15 may include repair of the road prism to (i) produce a stable operating surface, (ii) ensure proper
 16 drainage and erosion control, and (iii) establish horizontal clearance, however will not include
 17 (i) increasing the width of the existing road prism, (ii) change the existing road alignment, (iii)
 18 use materials inconsistent with the existing road surface, and/or (iv) change the existing road
 19 profile.

20

21 *Existing Roads Requiring Substantial Modification*

22

23 As discussed in ASC Exhibit B, to determine whether existing roads would require substantial
 24 modification, the applicant conducted field reconnaissance and surveyed aerial photos of
 25 existing road segments. If the applicant determined improvements to an existing road would
 26 involve one or more of the following activities, the road segment was classified as requiring
 27 substantial improvements:

28

- 29 1. increasing the width of the existing road prism;
- 30 2. changing the existing road alignment;

- 1 3. using materials inconsistent with the existing road surface;
- 2 4. changing the existing road profile; or
- 3 5. involving repairs to more than 20 percent of the road surface area defined by road
- 4 prism width and longitudinal distance over a defined road segment.

5
6 Typical construction disturbance for existing roads requiring substantial modification would be
7 16 feet wide, but could be up to 30 feet wide when road modification exceeds 70 percent. The
8 operational width would be 14 feet. The site boundary for a substantially modified existing road
9 would be 100 feet wide (50 feet on either side of the centerline.)

10
11 Following construction, any new roads developed for access to multi-use areas would be
12 removed and restored to preconstruction conditions, unless the landowner requests otherwise.
13 Roads developed for pulling and tensioning sites would be permanent because they would also
14 provide access to structures for operations and maintenance.

15 *Temporary Multi-Use Areas*

16
17
18 The applicant proposes to begin construction of the proposed facility by establishing temporary
19 multi-use areas approximately every 15 miles along the ROW. The multi-use areas (MUAs)
20 would be temporary construction areas that would serve as field offices; reporting locations for
21 workers; parking space for vehicles and equipment; and sites for material delivery and storage,
22 fabrication assembly of towers, cross arms and other hardware, concrete batch plants, and
23 stations for equipment maintenance. Each proposed MUA would be approximately 30 acres in
24 size. MUAs would be temporary, and after construction is complete, would be restored to pre-
25 construction conditions in accordance with General Standard of Review Condition 9, as
26 discussed in applicable sections of this order.

27
28 The applicant proposes to stage helicopter operations out of some multi-use areas. The final
29 locations of helicopter operations at MUA's is discussed in section IV.M., *Public Services* and
30 Public Services Condition ~~2~~3. Construction activities facilitated by helicopters could include
31 delivery of construction laborers, equipment, and materials to structure sites; transmission
32 structure placement; hardware installation; and wire stringing operations. Helicopters could
33 also be used to support the construction and administration and management (either the
34 certificate holder or the construction contractor or both). Where construction access by truck
35 would not be practical due to steep terrain, all-terrain vehicle trails could be used to support
36 maintenance activities. The use of helicopter construction methods would not change the
37 length of the access road system required for operations because vehicle access would be
38 required to each tower site regardless of the construction method.

39
40 As explained in ASC Exhibit B and Exhibit G, during construction, gasoline, diesel fuel, crankcase
41 oil, lubricants, and cleaning solvents would be used along the transmission line corridor,
42 typically at multi-use areas, and at the Longhorn Station construction site. These products
43 would be used to fuel, lubricate, and clean vehicles and equipment and would be transported
44 to the multi-use sites in containerized trucks or in other federal and state approved containers.

1 Routine visual inspections for presence of petroleum leaks would be required for vehicles.
2 Diesel fuel tanks would be located at the MUAs for vehicle and equipment fueling. Each fuel
3 tank would be located within secondary containment and each station would be equipped with
4 a spill kit. Refueling within the ROW would be conducted away from waterways. Accidental
5 releases of hazardous materials would be prevented or minimized through proper containment
6 of these substances during use and transportation to the site. Enclosed containment would be
7 provided for petroleum products and chemicals to prevent spills and drainage. Waste products
8 and petroleum-related construction waste would be removed to a disposal facility authorized
9 to accept such materials. Materials, liquids, containment methods and the applicant's Spill
10 Prevention, Control and Countermeasures Plan (SPCC Plan) are discussed more in section IV.N.,
11 *Waste Minimization* and section IV.D., *Soil Protection* of this order.

12 *Temporary Pulling and Tensioning Sites and Light-Duty Fly Yards*

13
14
15 The applicant explains that the construction of the proposed transmission line would require
16 299 pulling and tensioning sites. Specifically, pulling and tensioning sites would be required
17 approximately every 1.5 to two miles along the ROW and at angle points greater than 30
18 degrees and would require approximately five acres at each end of the wire section to
19 accommodate required equipment.⁵⁰ Equipment at pulling and tensioning sites would include
20 tractors and trailers with spooled reels that hold the conductors and trucks with the tensioning
21 equipment.

22
23 The applicant proposes four pulling and tensioning sites to include light-duty fly yards. The
24 counties in which the light-duty fly ~~years-yards~~ are proposed to be located are Umatilla, Baker
25 and Malheur counties. The applicant explains that light-duty fly yards at these sites would be
26 similar to the fly yards proposed for the multi-use areas but smaller in size. All of the equipment
27 and activities that would occur at a multi-use area could also occur at a light-duty fly yard,
28 except that oil, gas and explosive storage would not occur and no batch plants would be
29 located at the light-duty fly yards within the pulling and tensioning sites. The light-duty fly yards
30 would be approximately five-acre sites spaced approximately 15 miles apart.

31
32 Light duty fly yards and pulling and tension sites would be temporary, and after construction is
33 complete, would be restored to pre-construction conditions in accordance with General
34 Standard of Review Condition as discussed in applicable sections of this order.

35 *Operations and Maintenance Activities*

36
37
38 Routine operations and maintenance activities would include vegetative maintenance, weed
39 control, and aerial and ground-based line inspection. Details about the applicant's proposed
40 maintenance inspection schedules is discussed in Section IV.B., *Organizational Expertise*;

⁵⁰ B2HAPPDoc3-3 ASC 02a_Exhibit_B_Project Description_ASC 2018-09-28, Section 3.3.3.

1 Experience and Expertise Constructing, Operating, and Maintaining Transmission Lines of this
2 order.

3 **III.D. Survey Data Based on Final Design and Site Access**

4
5 As noted in Section I., *Introduction*, of this order, Council does not have jurisdiction over
6 matters that are not included in and governed by the site certificate and practices that do not
7 relate to siting of an energy facility. Other matters outside the Council’s jurisdiction are issues
8 of land-use agreements, land-acquisition, land purchases, land leases, right-of-way easements,
9 and any other legal proceeding that allows the applicant legal access to lands within the site
10 boundary.

11
12 The following Council standards and applicable regulations require field-based surveys,
13 literature review, and agency consultation to support Council review of compliance:

- 14
15
 - 16 • Structural Standard (OAR 345-022-0020)
 - 17 • Fish and Wildlife Habitat (OAR 345-022-0060)
 - 18 • Threatened and Endangered Species (OAR 345-022-0070)
 - 19 • Historic, Cultural and Archaeological Resources (OAR 345-022-0090)
 - 20 • Oregon Removal-Fill Law (OAR 141-085-0500 through 141-085-0785; ORS 196.795 -
21 196.990)

22 Exhibits included in the ASC that correspond to these standards are: Exhibit H – Geologic
23 Hazards and Soil Stability (Structural Standard), Exhibit J – Waters of the State; Exhibit P - Fish
24 and Wildlife Habitat (Fish and Wildlife Habitat standard), Exhibit Q - Threatened and
25 Endangered Plant and Animal Species (Threatened and Endangered Plant and Animal Species
26 standard), and Exhibit S – Historic, Cultural and Archaeological Resources (Historic, Cultural and
27 Archaeological Resources standard).

28
29 Information on the resources protected by the EFSC standards listed above are typically
30 presented in an ASC based on the compilation of information based on a literature review and
31 field surveys as appropriate. An applicant may rely upon existing literature, databases, agency
32 consultation, agency data, aerial imagery, and geographic information system (GIS) data to
33 identify and describe resources that may be impacted by a proposed facility.⁵¹ Some resources
34 also require field surveys either during the preparation of as ASC, or prior to construction of a
35 proposed facility which incorporates the final design and placement of facility components.
36

⁵¹ For example, Exhibit Q (OAR 345-021-0010(1)(q)(A) requires and applicant submit information related to threatened or endangered plant and wildlife species that may be affected by a proposed facility “based on appropriate literature and field study.”

1 In ASC Exhibit B, the applicant explains that between the spring of 2011 and the summer of
2 2016, field surveys necessary to meet the submission requirements detailed in OAR 345-021-
3 0010(1) were conducted, where the results were used to inform the federal NEPA review
4 process.⁵² The applicant conducted field surveys on publicly-owned state and federal lands and
5 only on private property where the landowners granted access. Field surveys were not
6 conducted where sites could not be accessed due to safety concerns or timing restrictions with
7 landowners or the resource being surveyed. The applicant explains that access granted by
8 landowners differed for each type of resource survey. For instance, some landowners allowed
9 surveys on their lands for wetlands and waters of the state, but not for cultural and
10 archaeological resources; others allowed the opposite.⁵³ In some instances, access was revoked
11 by the landowner after one of the surveys had been completed, but not the other. For these
12 reasons, some portions of the site boundary have been surveyed for some resources, but not
13 for other resources.

14
15 -The Department recommends that the additional survey information be submitted as pre-
16 construction conditions of approval included in the site certificate based upon the extensive
17 and long-term, multi-year, comprehensive field-surveys, database reviews, and technical
18 evaluations completed to inform Exhibit H – Geologic Hazards and Soil Stability (Structural
19 Standard), Exhibit J – Waters of the State; Exhibit P - Fish and Wildlife Habitat (Fish and Wildlife
20 Habitat standard), Exhibit Q - Threatened and Endangered Plant and Animal Species
21 (Threatened and Endangered Plant and Animal Species standard), and Exhibit S – Historic,
22 Cultural and Archaeological Resources (Historic, Cultural and Archaeological Resources
23 standard). Under ORS 469.503, to issue a site certificate, the Council shall determine that the
24 preponderance of evidence on the record supports findings that the facility complies with the
25 applicable standards adopted by the Council. The ASC, reviewing agency comments, comments
26 from the public, and determinations/orders issued by EFSC/Department compile the
27 evidentiary record for the proposed facility. The record includes information on resources
28 compiled from literature review, agency consultation, GIS data, and other sources in
29 conjunction with the field based survey results conducted with established survey areas for
30 proposed and alternative facility component locations. Pursuant to OAR 345-015-0190(5), an
31 ASC is complete when the Department finds that the applicant has submitted information
32 adequate for the Council to make findings or impose conditions on all applicable Council
33 standards. Further, under ORS 469.401(2), the site certificate shall contain conditions that
34 ensure compliance with the standards, statutes and rules that apply to the facility. Therefore,
35 the Council may use the information in the record to make findings and impose conditions to
36 ensure compliance with the Council standards that require surveys, and the final survey
37 information may be submitted for review prior to construction.

⁵² ORS 469.370(13) requires that “for a facility that is subject to and has been or will be reviewed by a federal agency under the National Environmental Policy Act 42 USC Section 4321, et seq., the council shall conduct its site certificate review, to the maximum extent feasible, in a manner that is consistent with and does not duplicate the federal agency review...”

⁵³ B2HAPPDoc3-3 ASC 02a_Exhibit_B_Project Description ASC 2018-09-28, Section 3.8.

1 Pursuant to ORS 469.402, the Council may delegate future review and approval of compliance
2 with site certificate conditions to the Department. All recent Council-approved energy facilities
3 include conditions of approval in the site certificate that stipulate that pre-construction surveys
4 be completed based on final design. These conditions also include the finalization of draft plans,
5 including mitigation plans, which are submitted to the Department for approval in consultation
6 with the appropriate reviewing agencies (e.g., ODFW, SHPO, county planning departments, or
7 other agencies). For pre-construction conditions requiring review and approval by the
8 Department, the Council retains the authority to approve, reject, or modify any revision or
9 update of the plans or permits. For these reasons and the reasons discussed below associated
10 with specific resources, and contingent upon site certificate conditions, the Department
11 recommends that the additional survey information for all resources be submitted as pre-
12 construction conditions of approval. As such, the conditions of approval recommended to be
13 included in the site certified specific to field survey information will be described in each
14 applicable section of this order.⁵⁴

15

16 *Fish and Wildlife Habitat, Threatened and Endangered Species, and Structural Surveys*

17

18 The natural characteristics of resources evaluated by the Council’s Fish and Wildlife Habitat
19 standard, Threatened and Endangered Species standard, and Structural Standard allows the
20 characterization of certain parcels similar to adjacent and nearby parcels using existing data, or
21 by extrapolating from areas where field surveys can be conducted. For instance, fish and
22 wildlife habitat tends to remain similar across ecoregions; similarly, the underlying geotechnical
23 conditions trend the same based on similar topography and other known issues. For linear
24 facilities, such as the proposed facility, the applicant gained access to conduct field surveys on
25 several parcels within the site boundary but did not have access on some adjacent parcels. The
26 Council may rely on this information to represent and categorize larger areas within the site
27 boundary sufficient to make findings and impose conditions on the applicable standards.
28 Therefore, if the Council determines that there is sufficient information to evaluate resources
29 and potential impacts to such resources, it may be able to find compliance with its standards
30 and impose conditions in areas where site access and field surveys have been conducted, and in
31 the areas where surveys have not been conducted. The Council can impose conditions requiring
32 the applicant to conduct the necessary surveys prior to construction (pre-construction surveys)
33 and submit survey results to applicable reviewing agencies and the Department for review and
34 approval. For instance, under the Council’s Fish and Wildlife Habitat standard, it is possible for
35 Council to utilize a combination of field surveys plus a desktop evaluation of existing data, aerial
36 photography, and “over the fence” surveys may meet the information requirements of ASC
37 Exhibits P and Q for its evaluation. If the field survey coverage is sufficient for the Department
38 and the Oregon Department of Fish and Wildlife (ODFW) to consider that the information
39 provided is representative of the fish and wildlife habitat, sensitive species use, and threatened

⁵⁴ The approach described in this section provides an alternative to the recommendations outlined in the Departments’ Energy Facility Siting Council Decisions for Linear Facilities with Restricted Access within a Site Boundary: Boardman to Hemingway Transmission Line memo (April 2018).

1 and endangered plant and animal species occurrence or habitat, it is possible that this
2 information can be sufficient to be evaluated for compliance with the applicable Council
3 standards. The categorization of fish and wild life habitat and Threatened and Endangered
4 species and descriptions of the methodologies and surveys completed are discussed further in
5 Sections IV.F., *Fish and Wildlife Habitat* and Section IV. I., *Threatened and Endangered Species*
6 of this order. Recommended conditions in Fish and Wildlife and Threatened and Endangered
7 Species require additional field surveys over the entire site boundary once site access has been
8 secured, as well as finalization of mitigation plans and other management plans, all subject to
9 review and approval by the Department in consultation with ODFW prior to construction of a
10 phase or segment of the facility.

11
12 Similarly, the applicant includes information on geotechnical and seismic hazards in ASC Exhibit
13 H by using existing data, consultation with the Oregon Department of Geology and Mineral
14 Industries (DOGAMI), in conjunction with representative field work conducted in preparation of
15 a geotechnical report. The information present in the ASC is sufficient for the Council to make
16 findings and impose conditions in the site certificate to meet the Council’s Structural Standard.
17 Recommended Structural Standard Condition 1 requires the applicant to submit a pre-
18 construction site-specific geological and geotechnical investigation report to the Department
19 and DOGAMI for review and approval prior to construction of a phase or segment of the
20 proposed facility.

21
22 *Delineation Surveys for Wetlands and Waters of the State*

23
24 Under ORS 469.503(3) and under the Council’s General Standard of Review (OAR 345-022-
25 0000), the Council must determine whether the proposed facility complies with “all other
26 Oregon statutes and administrative rules..., as such, Oregon Removal-Fill Law (ORS 196.795
27 through 196.990) and Department of State Lands (DSL) regulations (OAR 141-085-0500 through
28 141-085-0785) fall under the Council’s jurisdiction. Therefore, as part of the Council’s
29 consolidated review, the Council must determine whether a removal-fill permit is needed and if
30 so, whether a removal-fill permit should be issued.

31
32 As discussed in Section IV.Q.2., *Removal Fill Law*, of this order, the applicant conducted desktop
33 studies and field investigations to delineate locations of wetlands and waters of the state
34 (WOS) located within the site boundary. The desktop study of potentially jurisdictional
35 wetlands and WOS included an evaluation of multiple existing data sources including the U.S.
36 Fish and Wildlife Service National Wetlands Inventory (NWI), the USGS National Hydrography
37 Dataset (NHD), the Oregon Department of Transportation Salmon Resources and Sensitive Area
38 Mapping, Oregon Spatial Data Library, and areas of hydric soil mapped by the Natural
39 Resources Conservation Service. The applicant and its consultant, Tetra Tech, conducted field
40 investigations in 2011, 2012, 2013, and 2016. On September 13, 2018, the Oregon Department
41 of State Lands (DSL) issued its letter of concurrence agreeing with the delineated boundaries in
42 the applicant’s wetland delineation reports. Construction and operation of the proposed facility
43 is expected to impact and generate more than 50 cubic yards of removal or fill activities in
44 wetlands or WOS, therefore a removal-fill permit is necessary and is governed by the site

1 certificate. The total of permanent and temporary impacts to wetlands and waters of the state
2 is less than one acre (0.793 acres).

3
4 The applicant proposes to mitigate the permanent impacts to wetlands and WOS through the
5 creation of functioning wetlands and enhancement of existing wetlands at a mitigation site
6 discussed in more detail in the Compensatory Wetland and Non-Wetland Mitigation Plan
7 (CWNWMP), Attachment J-1 to this order. The combined acreages at the mitigation parcel of
8 6.21 acres of created or enhanced wetlands equates to 3.66 acres of wetland mitigation credit,
9 this amount of wetland mitigation credit is significantly greater than the amount of impact to
10 field surveyed/delineated wetland features and non-wetland WOS. Recommended Removal-Fill
11 Condition 5 requires the applicant to comply with and update the impact tables in the removal
12 fill permit authorized by Council and issued by DSL (Attachment J-3 to this order). The expected
13 impacts associated with the construction and operation of the entire proposed facility is
14 expected to be substantially less than the mitigation parcel the applicant is proposing to
15 maintain as described in this order, site certificate conditions and in conditions of the removal
16 fill permit (also included as site certificate conditions).

17
18 Therefore, once the applicant gains access to the remaining sites, surveys will be conducted,
19 and submitted to DSL for concurrence, the only expected revisions to the removal-fill permit
20 are administrative, primarily to update the impact acreage tables (as stipulated in Attachment
21 J-3: Removal Fill Permit Conditions, Special Condition 3). Because the edits to the removal fill
22 permit would be administrative updates to the impact tables and not substantive revisions to
23 the permit conditions, and that the mitigation parcel exceeds the estimated impacts from the
24 proposed facility, the additional survey information for wetlands and WOS may be submitted
25 for Department review and approval in consultation with DSL prior to construction of a phase
26 or segment of the facility.

27
28 *Field Surveys for Cultural, Archaeological and Historic Resources*

29
30 Section IV.K., *Historic, Cultural, and Archaeological Resources*, of this order, presents a
31 discussion of the Council's statutory obligation under ORS 469.370(13), to conduct its site
32 certificate review in a manner that does not duplicate efforts for energy facilities that also are
33 subject to review by a federal agency under the National Environmental Policy Act (NEPA). The
34 Department, in consultation with the Oregon State Historic Preservation Office (SHPO) and in
35 coordination with the applicant, presents the information on cultural, archaeological and
36 historic resources in this order in a manner that aligns with the Section 106 compliance
37 obligations under the NEPA review. As such, Section IV.K., describes the methodologies and
38 results of surveys conducted to evaluate potential direct impacts (within the site
39 boundary/direct analysis area) and to evaluate indirect impacts (within 5 miles of the site
40 boundary/Visual Assessment analysis area). As part of the EFSC review and necessary under the
41 Section 106 compliance, and based on the applicant and its consultants' research and field
42 surveys, the applicant makes recommendations of eligibility to the National Register of Historic
43 Places (NRHP).

1 For energy facilities that are subject to the NEPA review process, lead federal agencies are
2 tasked with designating the final eligibility determinations in consultation with parties to the
3 Programmatic Agreement (PA) including Tribal governments and SHPO. In ASC Exhibit S and
4 associated attachments, the applicant proposes eligibility recommendations for the EFSC
5 review, including recommendations of eligible, not eligible and unevaluated (presumed likely
6 eligible for listing on the NRHP). Resources that are determined to be not eligible do not have
7 to be avoided or mitigated for impacts from this facility or future projects. Despite the
8 applicant’s analysis, for the EFSC review of its standard as proposed in this order, the
9 Department and SHPO assume that resources are either eligible or “unevaluated” (meaning,
10 the resources are treated as likely eligible or likely to be listed on the NRHP), and then evaluate
11 impacts to the resources and appropriate mitigation, if necessary. This is because under the
12 terms of the PA and Section 106 requirements, it is the federal lead agency (in this case, the
13 BLM) that makes a final determination on eligibility, and not SHPO. If the BLM and SHPO
14 disagree on a resource’s eligibility, the determination is made by another federal agency, the
15 Keeper of the National Register, a division of the National Park Service. And, again under the
16 terms of the PA, the determination of eligibility will not occur until site access has been gained
17 to all areas proposed for the facility, as a pre-construction condition.

18
19 An outcome of this proposal is that the impacts from the construction and operation of the
20 proposed facility will appear to be more than actually anticipated – it is very likely that many, or
21 all, of the resources that the applicant assessed as “not eligible” will ultimately be agreed by the
22 federal government as not eligible. Thus the evaluation in this order overestimates impacts and
23 mitigation for impacts to resources protected under OAR 345-022-0090. However, to reduce
24 duplicative efforts of eligibility determinations that will be made by the lead federal agencies,
25 the treatment of resources as “unevaluated” and therefore “likely to be listed” for the EFSC
26 review is consistent with the Council’s standard and streamlines eligibility determinations for
27 the Section 106 process. The applicant proposes appropriate mitigation for impacts to cultural,
28 archaeological and historic resources in its Historic Properties Management Plan (HPMP). The
29 HPMP serves as a framework to inform Council on how the applicant will avoid, minimize and
30 mitigate impacts to each resource type that may be protected under the EFSC standard.
31 Recommended Cultural, Archaeological and Historic Resources Condition 2 requires the
32 applicant to submit the HPMP for Department review and approval, in consultation with SHPO
33 and Tribal governments, prior to construction of a phase or segment of the facility. The HPMP
34 will be reconciled to include the final determinations from the lead federal agencies and will be
35 submitted to the Department to reflect the outcomes of the Section 106 compliance review. It
36 is anticipated that the impacts reflected in the HPMP will be substantially less than evaluated
37 by Council in this order because the lead federal agencies may concur with the applicant
38 recommendations of many resources as not eligible, therefore, the applicant is not obligated to
39 avoid or mitigate for impacts to these resources. As described in Section IV.K.4., Historic,
40 Cultural, and Archaeological Resources, and the recommended site certificate condition, the
41 HPMP will include the following information:

- 42
43 • Final eligibility determinations for resources from the lead federal agencies;

- 1 • Final avoidance and impact information based on the final design of a phase or segment
- 2 of the facility, or specific facility component;
- 3 • Final mitigation for impacts to resources based on final design of a phase or segment of
- 4 the facility, or specific facility component.

5 **IV. EVALUATION OF COUNCIL STANDARDS**

6
7 As discussed above, ORS 469.320 requires a site certificate from the Council before
8 construction of a “facility.” ORS 469.300(14) defines “facility” as an “energy facility together
9 with any related or supporting facilities.” The proposed Boardman to Hemingway Transmission
10 Line qualifies as an “energy facility” under the definition in ORS 469.300(11)(C).

11
12 To issue a site certificate for a proposed facility, the Council must determine that “the facility
13 complies with the applicable standards adopted by the council pursuant to ORS 469.501 or the
14 overall public benefits of the facility outweigh any adverse effects on a resource or interest
15 protected by the applicable standards that the facility does not meet.”⁵⁵ The Council must also
16 determine that the proposed facility complies with all other applicable Oregon statutes and
17 administrative rules, as identified in the second amended project order, excluding requirements
18 governing design or operational issues that do not relate to siting⁵⁶ and excluding compliance
19 with requirements of federally-delegated programs.⁵⁷ Nevertheless, the Council may consider
20 these programs in the context of its own standards to ensure public health and safety and
21 protection of the environment.⁵⁸

22
23 Under ORS 469.310, the Council is charged with ensuring that the “siting, construction and
24 operation of energy facilities shall be accomplished in a manner consistent with protection of
25 the public health and safety.” ORS 469.401(2) further provides that the Council must include in
26 the site certificate “conditions for the protection of the public health and safety, for the time
27 for completion of construction, and to ensure compliance with the standards, statutes and rules
28 described in ORS 469.501 and ORS 469.503.”⁵⁹ The Council implements this statutory
29 framework and ensures the protection of public health and safety by adopting findings of fact,
30 conclusions of law, and conditions of approval concerning the proposed facility’s compliance
31 with the EFSC Standards for Siting Facilities at OAR 345, Divisions 22, 24, 26, and 27.

32

⁵⁵ ORS 469.503(1).

⁵⁶ As stated above, such matters include design-specific construction or operation standards and practices that do not relate to siting, as well as matters relating to employee health and safety, building code compliance, wage and hour or other labor regulations, or local government fees and charges.

⁵⁷ ORS 469.401(4); ORS 469.503(3).

⁵⁸ The Council does not have jurisdiction over matters that are not included in and governed by the site certificate or amended site certificate. However, the Council may rely on the determinations of compliance and the conditions in the permits issued by these state agencies and local governments in deciding whether the facility meets other standards and requirements under its jurisdiction.

⁵⁹ ORS 469.401(2).

1 This ~~DPO~~proposed order includes the Department's ~~initial~~ analysis of whether the proposed
2 facility meets each applicable Council Standard (with mitigation and subject to compliance with
3 recommended conditions, as applicable), based on the information on the record for the
4 proposed facility including information in the ASC and reviewing agency comment letters on the
5 ASC, and public and agency comments submitted on the record of the DPO. ~~Following the~~
6 ~~written and oral comment period, the proposed order will include the Department's~~
7 ~~consideration of the comments and additional evidence received on the record of the DPO.~~

8 **IV.A. General Standard of Review: OAR 345-022-0000**

9
10 *(1) To issue a site certificate for a proposed facility or to amend a site certificate, the*
11 *Council shall determine that the preponderance of evidence on the record supports the*
12 *following conclusions:*

13
14 *(a) The facility complies with the requirements of the Oregon Energy Facility Siting*
15 *statutes, ORS 469.300 to ORS 469.570 and 469.590 to 469.619, and the standards*
16 *adopted by the Council pursuant to ORS 469.501 or the overall public benefits of the*
17 *facility outweigh the damage to the resources protected by the standards the facility*
18 *does not meet as described in section (2);*

19
20 *(b) Except as provided in OAR 345-022-0030 for land use compliance and except for*
21 *those statutes and rules for which the decision on compliance has been delegated by*
22 *the federal government to a state agency other than the Council, the facility*
23 *complies with all other Oregon statutes and administrative rules identified in the*
24 *second amended project order, as amended, as applicable to the issuance of a site*
25 *certificate for the proposed facility. If the Council finds that applicable Oregon*
26 *statutes and rules, other than those involving federally delegated programs, would*
27 *impose conflicting requirements, the Council shall resolve the conflict consistent with*
28 *the public interest. In resolving the conflict, the Council cannot waive any applicable*
29 *state statute.*

30 * * *

31 *(4) In making determinations regarding compliance with statutes, rules and ordinances*
32 *normally administered by other agencies or compliance with requirement of the Council*
33 *statutes if other agencies have special expertise, the Department of Energy shall consult*
34 *such other agencies during the notice of intent, site certificate application and site*
35 *certificate amendment processes. Nothing in these rules is intended to interfere with the*
36 *state's implementation of programs delegated to it by the federal government.*

37
38 **Findings of Fact**

39
40 OAR 345-022-0000 provides the Council's General Standard of Review and requires the Council
41 to find that a preponderance of evidence on the record supports the conclusion that the
42 proposed facility complies with the requirements of the Oregon Energy Facility Siting statutes
43 and the siting standards adopted by the Council and that the proposed facility complies with all

1 other Oregon statutes and administrative rules applicable to the issuance of a site certificate for
2 the proposed facility, as identified in the second amended project order.⁶⁰

3
4 In this ~~draft~~ proposed order, the Department recommends ~~draft~~ proposed findings of fact and
5 conclusions of law based on a staff evaluation of the proposed facility’s compliance with all
6 statutes, administrative rules and ordinances applicable to the issuance of this site certificate.
7 As discussed above, the Department consulted with other agencies during review of the ASC to
8 aid in the evaluation of the proposed facility’s compliance with statutes, rules and ordinances
9 otherwise administered by other agencies. Additionally, the Department relied upon the
10 reviewing agencies’ special expertise in evaluating the proposed facility’s compliance with the
11 requirements of the EFSC standards. This proposed order also includes the Department’s
12 assessment of public and agency comments submitted on the record of the DPO.

13
14 *Certificate Expiration [OAR 345-025-0006(4)]*

15
16 Under OAR 345-015-0006(4), a site certificate is effective upon execution by the Council and by
17 the applicant. ORS 469.370(12) requires the Council to “specify in the site certificate a date by
18 which construction of the facility must begin.” ORS 469.401(2) requires that the site certificate
19 contain a condition “for the time for completion of construction.” Under OAR 345-027-0000, in
20 order to avoid expiration of the site certificate, the certificate holder must begin construction
21 on the facility no later than the construction beginning date specified by Council in the site
22 certificate. “Construction” is defined in ORS 469.300(6) to mean “work performed on a site,
23 excluding surveying, exploration or other activities to define or characterize the site, the cost of
24 which exceeds \$250,000.” OAR 345-010-0010(12) adopts the statutory definition.

25
26 The applicant anticipates proposed facility construction would begin within three years of the
27 effective date of the site certificate, and construction would be completed within seven years
28 of that date.⁶¹ The applicant anticipates that switching and communication station construction
29 activities would begin on a schedule that would allow for completion at approximately the
30 same timeframe as the proposed transmission line.

31
32 Based on the Department’s experience with large energy facilities, a number of unforeseen
33 factors can cause delays to a facility’s construction commencement and completion timelines,
34 such as financial, economic, or technological changes. The Department acknowledges that the
35 size, scope and complexity of the proposed Boardman to Hemingway Transmission Line
36 exceeds that of other facilities that Council has review and approved. The Department also
37 points to the pre-construction obligations in conditions of approval that are recommended to

⁶⁰ If an applicant shows that the proposed facility cannot meet Council standards or has shown that there is no reasonable way to meet the Council standards through mitigation or avoidance of any adverse effects on a protected resource or interest, OAR 345-022-0000(2) and (3) establish criteria the Council may use to make a balancing determination. Here, the applicant does not assert that the proposed facility cannot meet an applicable Council standard. Therefore, OAR 345-022-0000(2) and (3) do not apply to this review.

⁶¹ B2HAPPDoc3-3 ASC 02a_Exhibit_B_Project Description_ASC 2018-09-28. Section 3.6.

1 Council in this order, as well as the pre-construction obligations imposed upon the facility by
2 the Bureau of Land Management and other federal government agencies. An applicant would
3 typically be obligated to comply with all pre-construction conditions prior to beginning any
4 construction activities.

5
6 Recommended pre-construction conditions include additional surveys related to wildlife
7 habitat, geotechnical, cultural, and wetland surveys, as well as the finalization of impact and
8 mitigation plans currently in draft form, as discussed in this order. The applicant would have to
9 gain access to currently restricted properties to conduct these remaining surveys, and the
10 Department notes that, depending on the pathway utilized to gain access, this may extend
11 timelines. Further, many pre-construction conditions for fish and wildlife habitat and
12 Threatened and Endangered Species are contingent upon seasonal activities of the specific
13 species (for example, Washington ground squirrel surveys must be conducted during a specific
14 time of year, in late spring).

15
16 As discussed in Section IV.K., *Historic, Cultural and Archaeological Resources*, the final Historic
17 Properties Management Plan (HPMP) which will include the final impact analysis and mitigation
18 proposals for Historic, Cultural and Archaeological Resources must be finalized based on field
19 surveys and coordination with the lead federal agencies. The final impact analysis and
20 mitigation obligations for the applicant will be rectified based on the final eligibility
21 determinations made by the lead federal agencies, consistent with the Programmatic
22 Agreement (PA), for Section 106 compliance as part of the NEPA review. As outlined in the PA,
23 the process for these eligibility determinations depend on consultations with participating
24 parties and may be appealed to the National Park Service for their final input and
25 determination. The Section 106 compliance efforts, in themselves, could be a lengthy process
26 and extend beyond the proposed timeline by the applicant. Therefore, to allow the applicant
27 sufficient time to complete all pre-construction commitments specified in the site certificate
28 and the obligations imposed by the federal government, and being able to complete
29 construction while also minimizing the potential for changes that could affect a Council finding,
30 the Department recommends that the Council approve a four-year deadline for the applicant to
31 begin construction, and an additional four years for the applicant to complete construction
32 once construction has begun. In compliance with OAR 345-025-0006(4), the Department
33 recommends that the Council adopt the following conditions:

34
35 **Recommended General ~~of Review~~ Standard of Review Condition 1:**

- 36 a. **Construction Commencement Deadline:** The certificate holder shall begin construction
37 of the facility within four years after the effective date of the site certificate. Under OAR
38 345-015-0085(8), the site certificate is effective upon execution by the Council chair and
39 the certificate holder. Prior to beginning construction as defined in OAR 345-010-
40 0010(12), the certificate holder shall provide the Department written verification of the
41 date that it will begin construction, acknowledge the commencement of the
42 construction completion timeline, and confirm the construction completion deadline as
43 stated in General Standard of Review Condition 1(b).

1 b. **Construction Completion Deadline:** The certificate holder shall complete construction
2 of the facility within four years after the construction commencement date outlined in
3 General Standard of Review Condition 1(a). Within 90 days of construction completion,
4 the certificate holder shall provide the Department written notification of the
5 anticipated date of construction completion.

6 c. Authorization to construct and operate facility components, including alternative
7 transmission line routes, expires if not construction by the construction completion
8 deadline~~Proposed and alternative facility routes approved in the final order and site~~
9 ~~certificate (per established in~~ General Standard of Review Condition 11), ~~but not~~
10 ~~selected for construction are deemed expired and no longer approved for construction~~
11 ~~once the construction completion deadline has passed.~~

12 [Mandatory Condition OAR 345-025-0006(4)]
13

14 Based on the complexities of gaining site access to all phases or segments of the transmission
15 line and completing all preconstruction conditions associated with each phase or segment, for
16 the purposes of meeting the beginning construction deadline as required by Recommended
17 General Standard of Review Condition 1, the applicant may meet all pre-construction
18 conditions specific to a phase or segment of the transmission line as referred to in
19 Recommended General Standard of Review Condition 2.
20

21 *Construction and Operation Rules for Facilities [OAR Chapter 345, Division 26]*
22

23 The Council has also adopted rules at OAR Chapter 345, Division 26 to ensure that construction,
24 operation, and retirement of facilities are accomplished in a manner consistent with the
25 protection of the public health, safety, and welfare and protection of the environment. These
26 rules include requirements for compliance plans, inspections, reporting and notification of
27 incidents. The certificate holder must construct, operate, and retire the facility in accordance
28 with all applicable rules adopted by the Council in OAR Chapter 345, Division 26.⁶²
29

30 The Department understands that the construction of the proposed facility including
31 transmission lines and station as well as the related or supporting facilities including access
32 roads, multi-use areas, etc., is expected to be complex and will require advance coordination
33 between the applicant, Department, reviewing agencies and construction contractors. The
34 Department recommends the Council adopt the following condition to support the
35 Department's execution of pre-construction planning and compliance by requiring information
36 be provided about construction phasing and planning as well as ongoing site certificate
37 compliance, in accordance with OAR Chapter 345, Division 26:
38

⁶² Applicable rule requirements established in OAR Chapter 345, Division 26 include OAR 345-026-0005 to OAR 345-026-0170.

1 **Recommended General ~~of Review~~ Standard of Review Condition 2:**

- 2 a. At least 180 days prior to beginning construction (unless otherwise agreed to by the
3 Department), the certificate holder shall submit to the Department a construction
4 plan outlining construction phasing or segments, activities and schedules for
5 completing construction of the facility consistent with the site certificate.
6 Submission of pre-construction surveys or plans shall be conducted in accordance to
7 site certificate conditions and may occur consistent with the phase or segment of
8 the facility that is being constructed.
- 9 b. Upon Department verification of compliance with applicable pre-construction
10 requirements in the site certificate for any phase or segment of the facility, the
11 Department shall notify the certificate holder in writing that pre-construction
12 requirements have been met and they may commence construction for that phase
13 or segment.

14

15 The Council's rules under OAR 345-026-0080 outline the general reporting requirements for
16 construction and operation of energy facilities. OAR 345-026-0080(1)(a) includes reporting
17 requirements be submitted to the Department every six months during construction including
18 updates on any major milestones, a site certificate compliance report, and construction
19 progress. OAR 345-026-0080(1)(b) outlines the reporting requirements the applicant submits to
20 the Department on an annual basis. This annual report includes updates on the status of the
21 facility, compliance with site certificate conditions, and a monitoring report for monitoring and
22 mitigation activities. The rules also stipulate that the applicant may include the construction
23 progress report within the annual report. The Department recommends Council include the
24 following conditions in the site certificate to clearly require the applicant to comply with the
25 semi-annual construction report and annual reporting requirements:

26

27 **Recommended General Standard of Review Condition 3:** Within six months after the
28 Construction Commencement Deadline in General Standard of Review Condition 1, and
29 every six months thereafter during construction of the facility and related or supporting
30 facilities, the certificate holder shall submit a semiannual construction progress report
31 to the Department consistent with OAR 345-026-0080(1)(a). To the extent that
32 information required by this rule is contained in reports the certificate holder submits to
33 other state, federal or local agencies, the certificate holder may submit excerpts from
34 such other reports to satisfy this rule, unless otherwise required by a site certificate
35 condition.

36

37 **Recommended General Standard of Review Condition 4:** After January 1 but no later
38 than April 30 of each year after beginning operation of the facility, unless otherwise
39 agreed upon by the certificate holder and the Council Secretary, the certificate holder
40 shall submit an annual report to the Department addressing the subjects listed in OAR
41 345-026-0080(1)(b). To the extent that information required by this rule is contained in
42 reports the certificate holder submits to other state, federal or local agencies, the
43 certificate holder may submit excerpts from such other reports to satisfy this rule,
44 unless otherwise required by a site certificate condition.

Other Site Certificate Mandatory Conditions [OAR 345-025-0006]

OAR 345-025-0006 lists certain conditions that the Council must adopt in every site certificate. Some mandatory conditions directly implement a Council standard and are therefore applied in this ~~draft-proposed~~ order within the discussion of the relevant standard. Mandatory conditions OAR 345-025-0006(7) through (9) and (16) are discussed and applied in Section IV.G., *Retirement and Financial Assurance*, of this order as they relate to the restoration of the site, Council approval of a retirement plan, and bonding requirements of the applicant. Mandatory conditions OAR 345-025-0006(12) through (14) are discussed and applied in Section IV.C, *Structural Standard*, because they are associated with the design, construction and the operation of the proposed facility to avoid dangers of seismic hazards, coordination with and notifications to the Department of Geology and Mineral Industries.

In addition, OAR 345-025-0006(10) requires that the Council include as conditions in the site certificate all representations in the ASC and supporting record the Council deems to be binding commitments made by the applicant.⁶³ Mandatory conditions that are not otherwise addressed in the evaluation of compliance with specific standards are listed below, in the context of the Council’s General Standard of Review. As stated in OAR 345-025-0006(1), “the Council shall not change the conditions of the site certificate except as provided for in OAR Chapter 345, Division 27.”

The following are mandatory conditions required under OAR 345-025-0006:

The Department recommends the Council modify General Standard of Review Condition 5 below to require the applicant to submit final design information to the Department as well as to the Planning Departments from each of the five affected counties, as per their requests.

Recommended General ~~of Review-Standard~~ of Review Condition 5: The certificate holder shall submit a legal description of the site to the Department, Malheur County Planning Department, Baker County Planning Department, Union County Planning Department, Umatilla County Planning Department, and Morrow County Planning Department within 90 days after beginning operation of the facility. The legal description required by this rule means a description of metes and bounds or a description of the site by reference to a map and geographic data that clearly and specifically identify the outer boundaries that contain all parts of the facility.

[Mandatory Condition OAR 345-025-0006(2)]

Recommended General Standard of Review Condition 6: The certificate holder shall design, construct, operate, and retire the facility:

⁶³ Applicant representations deemed necessary to satisfy an applicable standard are included in the appropriate corresponding section of this order.

- 1 a. Substantially as described in the site certificate;
- 2 b. In compliance with the requirements of ORS Chapter 469, applicable Council rules,
- 3 and applicable state and local laws, rules and ordinances in effect at the time the site
- 4 certificate is issued; and
- 5 c. In compliance with all applicable permit requirements of other state agencies.
- 6 [Mandatory Condition OAR 345-025-0006(3)]
- 7

8 The Department recommends the Council modify General Standard of Review Condition 7
9 below to remove the language of the condition that does not apply to transmission lines and
10 maintain the portion of the condition that would apply to the proposed facility.

11
12 **Recommended General Standard of Review Condition 7:** The certificate holder may begin
13 construction, as defined in OAR 345-001-0010, or create a clearing on a part of the site if
14 the certificate holder has construction rights on that part of the site and the certificate
15 holder would construct and operate part of the facility on that part of the site even if a
16 change in the planned route of transmission line occurs during the certificate holder's
17 negotiations to acquire construction rights on another part of the site.

18 [Mandatory Condition OAR 345-025-0006(5)]

19
20 **Recommended General Standard of Review Condition 8:** If the certificate holder becomes
21 aware of a significant environmental change or impact attributable to the facility, the
22 certificate holder shall, as soon as possible, submit a written report to the Department
23 describing the impact on the facility and any affected site certificate conditions.

24 [Mandatory Condition OAR 345-025-0006(6)]

25
26 **Recommended General Standard of Review Condition 9:** Upon completion of construction,
27 the certificate holder shall restore vegetation to the extent practicable and shall landscape
28 all areas disturbed by construction in a manner compatible with the surroundings and
29 proposed use. Upon completion of construction, the certificate holder shall remove all
30 temporary structures not required for facility operation and dispose of all timber, brush,
31 refuse and flammable or combustible material resulting from clearing of land and
32 construction of the facility. In the annual report, the certificate holder shall report to the
33 Department restoration activities, and applicable sections of the Reclamation and
34 Revegetation Plan provided as Attachment P1-3 of the Final Order on the ASC, by county
35 and area of temporary disturbance (i.e. multi-use areas, light duty fly yards, pulling and
36 tensioning sites).

37 [Mandatory Condition OAR 345-025-0006(11)]

38
39 **Recommended General Standard of Review Condition 10:** Before any transfer of
40 ownership of the facility or ownership of the site certificate holder, the certificate holder
41 shall inform the Department of the proposed new owners. The requirements of OAR 345-
42 027-0100 apply to any transfer of ownership that requires a transfer of the site certificate.

43 [Mandatory Condition OAR 345-025-0006(15)]

1 *Site Specific Conditions [OAR 345-025-0010]*
2

3 In addition to mandatory conditions imposed on all facilities, Council rules also include “site
4 specific” conditions at OAR 345-025-0010 that the Council may include, as appropriate, in the
5 site certificate to address issues specific to certain facility types or proposed features of
6 facilities.⁶⁴

7
8 Site-Specific Condition OAR 345-025-0010(4) addressing National Electrical Safety Code is
9 discussed in Section IV.P.1., *Siting Standards for Transmission Lines*, of this order. Site-Specific
10 Condition OAR 345-025-0010(5) is specific to pipelines and transmission lines and specifies that
11 the Council shall specify an approved corridor in the site certificate. The Department therefore
12 recommends the Council adopt General Standard of Review Condition 11 with revisions
13 describing the final Department recommended routes for Council approval. General Standard
14 of Review Condition 11 below incorporates OAR 345-025-0010(5) as applied to the proposed
15 facility.

16
17 **Recommended General Standard of Review Condition 11:** Subject to conditions of the site
18 certificate, the certificate holder may construct the facility anywhere within the site
19 boundary (approved corridor(s)), and as described in ASC Exhibit B and represented in ASC
20 Exhibit C Attachment C-2 and C-3 mapsets. The approved corridors include:

- 21 a. The ~~proposed transmission line route extending approximately 272-miles route~~
22 ~~in~~through Morrow, Umatilla, Union, Baker, and Malheur counties;
23 b. West of Bombing Range Road alternative 1 and the west of Bombing Range Road
24 alternative 2 in Morrow County;
25 c. Morgan Lake alternative in Union County; and
26 d. Double Mountain alternative in Malheur County.

27 [Site-Specific Condition OAR 345-025-0010(5)]

28
29 *Monitoring and Mitigation Conditions [OAR 345-025-0016]*
30

31 Under OAR 345-025-0016, the Council must include conditions in the site certificate that
32 address monitoring and mitigation to ensure compliance with the standards contained in OAR
33 Chapter 345, Division 22 and Division 24.⁶⁵ Monitoring and mitigation plans that are included in
34 the ASC, reviewed by the Department, reviewing agencies, and subject to Council approval
35 must be incorporated into applicable site certificate conditions. The site certificate must
36 contain conditions to ensure compliance with any laws and rules applicable to the facility,

⁶⁴ Site-Specific Conditions at OAR 345-025-0010(1)-(3), and (6)-(7) do not apply to the facility based on facility energy source/type.

⁶⁵ The requirements outlined in ORS 469.507 for testing and monitoring environmental and ecological effects of construction and operation of energy facilities to assure continued compliance with the terms and conditions of the certificate are implemented by OAR 345-025-0016 and OAR Chapter 345 Division 26 rules which establish requirements for applicants to develop and implement a plan for complying with each site certificate condition; and, establish reporting and incident notification requirements for applicants.

1 neither ORS 469.507 or the Council's Standards require that the Council impose additional
2 monitoring and testing requirements if there is no evidence to suggest that it is needed to
3 achieve compliance.

4
5 **Conclusions of Law**

6
7 Based on the foregoing findings of fact and conclusions of law, and subject to compliance with
8 recommended General Standard of Review conditions presented in the above section, the
9 Department recommends that the Council find that the proposed facility, including the
10 proposed and alternative routes, satisfies the requirements of OAR 345-022-0000.

11 **IV.B. Organizational Expertise: OAR 345-022-0010**

12
13 *(1) To issue a site certificate, the Council must find that the applicant has the*
14 *organizational expertise to construct, operate and retire the proposed facility in*
15 *compliance with Council standards and conditions of the site certificate. To conclude that*
16 *the applicant has this expertise, the Council must find that the applicant has*
17 *demonstrated the ability to design, construct and operate the proposed facility in*
18 *compliance with site certificate conditions and in a manner that protects public health*
19 *and safety and has demonstrated the ability to restore the site to a useful, non-*
20 *hazardous condition. The Council may consider the applicant's experience, the*
21 *applicant's access to technical expertise and the applicant's past performance in*
22 *constructing, operating and retiring other facilities, including, but not limited to, the*
23 *number and severity of regulatory citations issued to the applicant.*

24
25 *(2) The Council may base its findings under section (1) on a rebuttable presumption that*
26 *an applicant has organizational, managerial and technical expertise, if the applicant has*
27 *an ISO 9000 or ISO 14000 certified program and proposes to design, construct and*
28 *operate the facility according to that program.*

29
30 *(3) If the applicant does not itself obtain a state or local government permit or approval*
31 *for which the Council would ordinarily determine compliance but instead relies on a*
32 *permit or approval issued to a third party, the Council, to issue a site certificate, must*
33 *find that the third party has, or has a reasonable likelihood of obtaining, the necessary*
34 *permit or approval, and that the applicant has, or has a reasonable likelihood of entering*
35 *into, a contractual or other arrangement with the third party for access to the resource*
36 *or service secured by that permit or approval.*

37
38 *(4) If the applicant relies on a permit or approval issued to a third party and the third*
39 *party does not have the necessary permit or approval at the time the Council issues the*
40 *site certificate, the Council may issue the site certificate subject to the condition that the*
41 *certificate holder shall not commence construction or operation as appropriate until the*
42 *third party has obtained the necessary permit or approval and the applicant has a*

1 *contract or other arrangement for access to the resource or service secured by that*
2 *permit or approval.*

3
4 **Findings of Fact**

5
6 Subsections (1) and (2) of the Council’s Organizational Expertise standard require that the
7 applicant demonstrate its ability to design, construct, and operate the proposed facility in
8 compliance with Council standards and all site certificate conditions, as well as its ability to
9 restore the site to a useful, non-hazardous condition. The Council may consider the applicant’s
10 experience and past performance in constructing, operating and retiring other facilities in
11 determining compliance with the Council’s Organizational Expertise standard. Subsections (3)
12 and (4) address the applicant’s reliance upon third party permits.

13
14 To demonstrate compliance with the Council’s Organizational Expertise standard, the applicant
15 provides evidence regarding its experience and organizational expertise to construct, operate
16 and retire the proposed facility in Exhibit A (applicant Information); Exhibit D (applicant’s
17 Organizational, Managerial, and Technical Expertise); Exhibit E (Permits Required for
18 Construction and Operation); Exhibit M (Financial Assurance); and Exhibit W (Retirement and
19 Restoration).

20
21 *Demonstrated ability to design, construct and operate the proposed facility in compliance with*
22 *site certificate conditions and in a manner that protects public health and safety*

23
24 The applicant is a wholly owned subsidiary of IDACORP, Inc. Idaho Power Company (applicant)
25 was originally incorporated in 1915. As described in ASC Exhibit D, the applicant’s core business
26 is the generation, transmission, distribution, sale, and purchase of electric energy. The applicant
27 explains that it serves over 530,000 customers within a service territory of approximately
28 24,000 miles in southern Idaho and eastern Oregon. Its power supply system currently includes
29 4,868 miles of transmission lines, including 692 miles in Oregon. It also operates 305
30 transmission and other stations, and operates and maintains 27,072 miles of distribution lines,
31 2,212 miles of which are located in Oregon.⁶⁶

32
33 As stated above, in order to demonstrate compliance with the Organizational Expertise
34 standard, “the Council may consider the applicant’s experience, the applicant’s access to
35 technical expertise and the applicant’s past performance in constructing, operating and retiring
36 other facilities, including, but not limited to, the number and severity of regulatory citations
37 issued to the applicant.”

38

⁶⁶ B2HAPPDoc3-10 ASC 04_Exhibit D_Organization_ASC 2018-09-28, Section 3.1.

1 *Experience and Expertise in Permitting Transmission Lines*

2
3 In ASC Exhibit D, the applicant describes its permitting experience with both state and federal
4 authorities. The applicant has federally permitted multiple facilities; ASC Exhibit D, Table D-4
5 includes a representative list of the applicant's federally permitted project. Tables D-5 and D-6
6 include representative lists of administrative and local government permits for facilities in
7 Idaho. ASC Exhibit D, Table D-7 represents Oregon permits that the applicant has obtained and
8 complied with to construct or maintain energy facilities in Oregon.

9
10 *Experience and Expertise Constructing, Operating, and Maintaining Transmission Lines*

11
12 The applicant discusses in ASC Exhibit D that it constructed or oversaw the construction of
13 nearly the entirety of its 4,858-mile transmission system, including portions of the transmission
14 system in Oregon. Table OE-1, *Idaho Power's Recent 230 kV Transmission Line Projects* below
15 provides examples of recent (since 2000) 230 kV transmission line projects that the applicant
16 constructed.

17
Table OE-1: Idaho Power's Recent 230 kV Transmission Line Projects

Line No.	Line Name	Circuit	Mileage	Constructing Entity	Year
707	Brownlee-to-Ontario	Single	72.7	Mustang Construction	2000
710	Locust-to-Caldwell	Single	18.6	Wilson Construction	2003
711	Nampa Tap	Double	3.2	Wasatch Electric	2006
714	Brownlee-to-Oxbow	Single	11.0	Great Southwestern	2004
715	Langley Gulch	Double	2.8	IPC (lines); TBH & Assoc. (foundations)	2011
716	Bennett Mountain-to-Rattlesnake	Single	4.4	Wasatch Electric	2008

Source: B2HAPPDoc3-10 ASC 04_ Exhibit D_ Organization_ ASC 2018-09-28, Table D-1.

18
19 The applicant also provides an example of an older 345/500-kV transmission line that it
20 constructed in 1981, the Borah to Midpoint line, which is 84.4 miles in length. The transmission
21 line was constructed to 500 kV standards, but was initially energized and currently operates at
22 345 kV; however, the transmission line has the capability to be energized at 500 kV.

23
24 In addition to its operations in Idaho, the applicant owns and maintains approximately 692
25 miles of transmission lines in Oregon. Since 2009, the applicant has built approximately 27
26 miles of 69 kV transmission lines in Oregon. In addition, as part of the Sage Station project near
27 Ontario, Oregon, in 2011, the applicant built a 16-mile 138 kV transmission line that is currently
28 energized at 69 kV to a junction point known as Ontario Junction. The applicant explains that
29 the process for constructing 230 kV transmission lines is essentially the same as that for

1 constructing 500 kV transmission lines. Both 230 kV and 500 kV transmission lines involve the
2 same design process and similar considerations for selecting components, structures, and
3 structure locations. Both types of transmission lines require similar construction techniques and
4 materials. The primary differences in the construction of 230 kV and 500 kV transmission lines
5 are the requirements for clearances and conductor spacing.⁶⁷ The National Electrical Safety
6 Code (NESC) requirements for ground clearances and conductor spacing increase as the voltage
7 of the lines increase, so structures required for 500 kV transmission lines are typically taller
8 than those required for 230 kV transmission lines. Additionally, 500 kV insulator strings are
9 generally longer than those for 230 kV transmission lines. However, while there are some
10 requirement differences between 230 kV and 500 kV transmission lines, the processes for
11 design, construction, and operation are broadly similar for high-voltage transmission lines.
12

13 The applicant explains that it has assembled an experienced team of professional, technical,
14 and administrative personnel to manage all phases of the proposed facility. ASC Exhibit D
15 includes a brief description of the qualifications and experience of key individuals who
16 represent the applicant's expertise.
17

18 The applicant proposes to retain an outside contractor to complete the engineering, design,
19 procurement, and construction activities related to the proposed transmission line. The
20 applicant has not yet selected the contractor; however, its request for proposal package criteria
21 would ensure the selected contractor has the requisite skills and experience to engineer,
22 design, procure, and construct the proposed facility. The criteria and evaluation process for the
23 applicant's review of proposals is outlined in ASC Exhibit D. The applicant's administration team
24 would select the respondent that demonstrates the best ability to accomplish the requested
25 work scope on schedule, while meeting all safety, environmental, and permit requirements.
26

27 The applicant explains that its company is responsible for maintaining its transmission and
28 distribution system and for ensuring that all maintenance is performed in a manner that
29 protects public health and safety through compliance with applicable regulatory requirements.
30 The applicant lists that it implements a comprehensive maintenance program for each of its
31 transmission line facilities to ensure compliance with applicable safety and reliability standards,
32 including NESC, Federal Energy Regulatory Commission (FERC), North American Electric
33 Reliability Corporation (NERC), and Western Electricity Coordinating Council (WECC) standards.
34 The company's maintenance program is also designed to achieve compliance with all applicable
35 Oregon Public Utility Commission (OPUC) rules.
36

37 The applicant's maintenance program includes compliance with its Transmission Maintenance
38 and Inspection Plan (TMIP), which applicant developed and reviews annually. In addition, every
39 three years, WECC audits applicant's compliance with applicable NERC reliability standards. The
40 most recent WECC audit in 2015, which addressed the company's Transmission Maintenance

⁶⁷ B2HAPPDoc3-10 ASC 04_Exhibit D_Organization_ASC 2018-09-28, Section 3.1.2.

1 and Inspection Plan, did not result in any notices of alleged Transmission Maintenance and
2 Inspection Plan violations or penalties.

3
4 The applicant explains that, in accordance with its own TMIP, applicant conducts three types of
5 line maintenance patrols: routine line patrols/inspections, unscheduled emergency line patrols,
6 and aerial vegetation patrols.⁶⁸ The routine line patrols include a detailed visual inspection of
7 the entire line and are conducted at least once per year on all lines included in a WECC transfer
8 path in the bulk electric system. These inspections are conducted from either the ground or air
9 and are designed to ensure the integrity of the system by identifying obvious line threatening
10 defects. Emergency line patrols are performed in response to any unexplained system outage
11 or interruption, or whenever requested by a dispatcher, to identify ~~a~~ major structural failures or
12 issues. These typically would not involve inspection of the entire line, but only the portion of a
13 line where there is an indication or report of a possible problem. Finally, a transmission utility
14 arborist conducts aerial vegetation patrols to identify and manage vegetation encroachments
15 that threaten the transmission lines. The arborist normally completes the aerial vegetation
16 patrol alongside the line patrolman during routine line patrols/inspections.

17
18 In addition to the cyclical inspection cycles described above, Transmission Patrolmen patrol and
19 inspect transmission lines at a minimum once a year to identify any transmission defects and
20 any vegetation hazards that may develop between vegetation clearing cycles. The applicant
21 explains in ASC Exhibit P1, Attachment P1-4 and attached to this order that during these
22 inspections the Patrolman will identify hazardous vegetation needing maintenance, within or
23 adjacent to the ROW, that could fall in or onto the transmission lines or associated facilities. See
24 Section IV.H., *Fish and Wildlife Habitat*, of this order and proposed Fish and Wildlife Condition 2
25 that addresses the Vegetation Management Plan. The applicant proposed to complete a
26 comprehensive 10-year maintenance inspection on all of its transmission lines consistent with
27 its TMIP and includes detailed visual inspections of all transmission line components. The data
28 collected from these inspections would be compiled and evaluated, and identified issues are
29 addressed through general maintenance. The applicant explains that the inspection and
30 maintenance procedures required for applicant's transmission system, including its 230 kV and
31 345/500 kV transmission lines, are substantially the same as those proposed for the proposed
32 facility. Compliance with the applicant's TMIP would enable the certificate holder to operate
33 the proposed facility in a manner that protects public health and safety. The Department
34 recommends Council impose Organizational Expertise Condition 1 to provide the Department
35 the opportunity to review the results of inspections and corrective actions conducted in
36 accordance with the TMIP.

37
38 **Recommended Organizational Expertise Condition 1:** During operations, the certificate
39 holder shall provide documentation of inspection, including date inspection(s) occurred,
40 issues identified, and any corrective actions taken, within the annual report submitted to
41 the Department pursuant to OAR 345-026-0080 (1)(b), for the following:

⁶⁸ B2HAPPDoc3-10 ASC 04_Exhibit D_Organization_ASC 2018-09-28, Section 3.1.3.

- 1 a. Transmission line(s): Routine line patrols/inspections, unscheduled emergency line
2 patrols, aerial vegetation patrols, and comprehensive 10-year maintenance inspection
3 conducted in accordance with its Transmission Maintenance and Inspection Plan and
4 Transmission Vegetation Management Program.
- 5 b. Longhorn Station: Monthly inspections including visual inspections of buildings, fencing,
6 and electrical equipment; monitoring of all protective relays, gauges, counters, meters,
7 and communication devices; and, annual infrared assessment of bus and operating
8 equipment carrying capacity in accordance with the Station Maintenance Program.

9
10 Based on the above described analysis and compliance with the proposed conditions, the
11 Department recommends that the Council find that the applicant's experience designing,
12 construction, operating its existing transmission system demonstrates it has the experience and
13 expertise required for construction, operations and maintenance of the proposed facility in a
14 manner that protects public health and safety.

15
16 The Department recommends the Council find that the applicant has the requisite experience
17 and expertise to manage construction, operation and maintenance of the proposed facility.
18 However, because the applicant has not yet selected the contractors, engineers, and
19 manufacturers for the construction of the proposed facility, the applicant proposes, and the
20 Department recommends, that the Council adopt the following site certificate conditions in
21 order to ensure the major contractors are qualified to design, engineer, and construct the
22 proposed facility and all contractors and subcontractors operate in compliance with the site
23 certificate:

24
25 **Recommended Organizational Expertise Condition 2:** The certificate holder shall:

- 26 a. Prior to construction, notify the Department and affected counties of the identity and
27 qualifications of the major design, engineering, and construction contractor(s) for the
28 facility. The certificate holder shall select contractors that have substantial experience in
29 the design, engineering, and construction of similar facilities.
- 30 b. During construction, report to the Department in its semi-annual construction progress
31 report required pursuant to OAR 345-026-0080(1)(a) the identity and qualifications of
32 any new or changes to its design, engineering and construction contractors.

33
34 **Recommended Organizational Expertise Condition 3:** Prior to construction, the certificate
35 holder shall notify the Department of the identity and qualifications of any construction
36 managers, including the on-site construction manager(s), to demonstrate that the
37 construction manager is qualified in managing facility construction and has the capability to
38 ensure compliance with all site certificate conditions.

39
40 **Recommended Organizational Expertise Condition 4:** Prior to construction, the certificate
41 holder shall contractually require all construction contractors and subcontractors involved
42 in the construction of the facility to comply with all applicable laws and regulations and with
43 the terms and conditions of the site certificate. The certificate holder shall provide to the
44 Department a copy of the executed contract terms requiring legal/site certificate

1 ~~compliances to the Department~~. Copies of the relevant contract termss may redact business
2 confidential information. The contractors, on behalf of the certificate holder, may perform
3 the requirements set forth in these site certificate conditions. However, such performance
4 and sSuch contractual provisions shall not relieve the site certificate holder of responsibility
5 under the site certificate.

6
7 *Experience and Expertise in Station Construction, Operation and Maintenance*

8
9 The applicant describes that it has constructed, or overseen the construction of, nearly all of its
10 305 transmission and other electrical stations. ASC Exhibit D, Table D-2 describes the seven
11 transmission stations the company has constructed since 2000. The Hemingway Station, which
12 applicant constructed in 2010, is a 500/230 kV station similar in capacity and design to the
13 proposed Longhorn Station. The remaining stations in ASC Exhibit D Table D-2, while not 500 kV
14 stations, are similar in design and contain similar components to the proposed Longhorn
15 Station. Additional descriptions of the proposed Longhorn station can be found in ASC Exhibit B
16 and Section III., *Description of the Proposed Facility*, of this order.

17
18 As the applicant explains, its stations are subject to a standardized inspection and maintenance
19 program, in order to ensure the continued safe and reliable operation of applicant's
20 transmission system. The applicant's station maintenance program provides for monthly
21 inspections, including visual inspection of buildings, fencing, and electrical equipment, and
22 detailed monitoring of all protective relays, gauges, counters, meters, and communications
23 devices.⁶⁹ Applicant uses reliability-based maintenance schedules for each type of station
24 equipment. For instance, the applicant utilizes a process known as Reliability Centered
25 Maintenance, which analyzes the usage rates for the different types of station equipment and
26 determines when maintenance should be completed to avoid emergency repairs. The applicant
27 also performs annual infrared assessments of all current carrying busses and operating
28 equipment to identify issue areas that would indicate a potential problem.

29
30 The Department recommends that the Council find that the applicants' experience constructing
31 stations demonstrates that applicant possesses the experience and expertise required for the
32 design and construction of the proposed Longhorn Station. Additionally, based on the
33 applicant's illustrated operation and maintenance programs for existing stations, the
34 Department recommends the Council find that the applicant possesses the experience and
35 expertise to operate and maintain the proposed Longhorn Station.

36
37 *Experience and Expertise with Distribution Line Construction, Operation and Maintenance*

38
39 As discussed in ASC Exhibit D, the applicant operates 27,072 miles of distribution lines, 2,212
40 miles of which are in Oregon. The applicant anticipates it would be the local service provider
41 constructing, operating, and maintaining the distribution lines associated with the proposed

⁶⁹ B2HAPPDoc3-10 ASC 04_Exhibit D_Organization_ASC. 2018-09-28, Section 3.1.5.

1 facility serving the communication stations in Malheur County and parts of Baker County.
2 However, for the communication stations in Morrow County, Umatilla County, Union County,
3 and other parts of Baker County, the applicant proposes to rely on third-parties Umatilla
4 Electric Co-Op, Pacific Power and Oregon Trail Electric Cooperative to construct, obtain permits
5 to, operate and maintain the distribution lines serving those communications stations. The
6 third-party permits are addressed below.

7
8 *Experience and Expertise in Compliance*

9
10 *Compliance with Federal Reliability Standards*

11
12 As the applicant explains in Exhibit D, applicant’s transmission system is subject to three levels
13 of federal reliability enforcement: FERC, NERC and WECC.

14
15 The applicant explains that under the current reliability enforcement system, the first reliability
16 standards became mandatory and enforceable in 2007. Since then, applicant has participated in
17 one NERC audit and three WECC audits regarding its compliance with the reliability standards.
18 None of the possible issues identified in the audits presented a material risk to the bulk electric
19 system, nor were ~~not~~ they associated with a transmission service interruption, and nor did they
20 adversely impact distribution customers. In addition to audits, applicant conducts internal
21 monitoring of its compliance with federal reliability standards and self-reports any potential
22 issues. The applicant provides that any potential issues discovered in the applicant’s internal
23 monitoring processes have not presented more than minimal risk.

24
25 *Compliance with Oregon Reliability Standards*

26
27 The Oregon Public Utility Commission (OPUC) regulates the construction, operation, and
28 maintenance of electrical supply systems in Oregon, to ensure that the systems operate “in
29 such a manner as to protect and safeguard the health and safety of all employees, customers,
30 and the public.”⁷⁰ OPUC safety and reporting standards require compliance with NESC
31 standards for the construction and operation of all energy facilities in the state and require
32 records of all service interruptions and major events. As part of compliance with OPUC
33 regulations, the applicant must maintain records of all service interruptions, calculate system-
34 wide interruption indices, develop threshold levels for applicable interruption indices based on
35 past reliability data, demographic, geographic, and electrical characteristics, and the relative
36 performance of the circuits to each other.⁷¹ Finally, OAR 860-023-0151 and OAR 860-023-0161
37 require the applicant to file an annual report on the previous year’s reliability information
38 which includes a comparison of the year’s data to the determined thresholds and provides a
39 summary of the causes of interruptions on applicant’s system and all major events. In addition

⁷⁰ Oregon Revised Statute 757.035(1)

⁷¹ OAR 860-023-0100, 0110, and 0120

1 to annual reporting, the applicant must report each major outage event to the OPUC within 20
2 days of the occurrence.

3

4 *Other Regulatory Compliance*

5

6 The applicant must operate its generation, transmission, and distribution facilities in
7 compliance with the requirements of many regulatory agencies including the National Oceanic
8 and Atmospheric Administration, the Oregon Department of Fish and Wildlife (ODFW), Oregon
9 Department of State Lands, Occupational Safety and Health Administration (OSHA), ODEQ,
10 OPUC, as well as the requirements of each of the Oregon cities and counties in which its
11 facilities are located. In the past five years, applicant has been cited for only one compliance
12 violation related to its generation, transmission, and distribution facilities: On December 1,
13 2015, OSHA issued two citations related to a forklift accident at applicant's Boise Operations
14 Center.⁷² The applicant ~~sites~~ states that it settled the citations with OSHA.

15

16 The applicant's regulatory and operational compliance record establishes that it has the
17 organizational expertise to design, construct, operate and maintain the proposed facility.
18 However, in order to ensure continued compliance with all regulatory requirements, including
19 site certificate conditions, the applicant proposes, and the Department recommends that the
20 Council adopt the following site certificate conditions:

21

22 **Recommended Organizational Expertise Condition 5:** The certificate holder shall be
23 responsible for any matter of non-compliance under the site certificate. Any notice of
24 violation (NOV) issued under the site certificate will be issued to the certificate holder. Any
25 civil penalties under the site certificate will be levied on the certificate holder.

26

27 **Recommended Organizational Expertise Condition 6:** Within 72 hours after discovery of
28 incidents or circumstances that violate the terms or conditions of the site certificate, the
29 certificate holder must report the conditions or circumstances to the Department, in
30 addition to the requirements of OAR 345-026-0170.

31

32 *Mitigation Experience*

33

34 The applicant relies on mitigation to meet the Council standards. ASC Exhibit D presents the
35 applicant's experience implementing mitigation projects similar to the mitigation projects
36 proposed for the proposed transmission line. As the applicant explains, most of its mitigation
37 experience is related to hydroelectric facilities. The applicant currently owns 17 hydroelectric
38 facilities on the Snake River and its tributaries in southern Idaho and eastern Oregon, operating
39 the facilities under 12 Federal Energy Regulatory Commission (FERC) licenses. Most of the FERC
40 licenses include management and mitigation requirements to address water quality, recreation,
41 aquatic species, terrestrial species, and land management impacts. Examples in ASC Exhibit D of

⁷² B2HAPPDoc3-10 ASC 04_Exhibit D_Organization_ASC 2018-09-28, Section 3.3.3.

1 resource management plans that the applicant implements for compliance with FERC
2 requirements are a Riparian Habitat Acquisition Plan which outlines a riparian and wetland plan
3 for a 360-acre property, a Visual Resource Management Plan which provides visual resources
4 protection, mitigation, and enhancement measures, and a Historic Properties Management
5 Plan which implements an agreement among applicant, the State of Idaho, federal agencies,
6 and Tribal governments to identify and protect cultural resources.

7
8 The applicant employs almost 100 full-time staff biologists in its Environmental Affairs
9 Department as well as two full-time staff who track, manage, and document compliance with
10 FERC license requirements. The applicant states that in the past three years, FERC inspected at
11 least three of the applicant's mitigation sites, and, with minimal follow-up items, the applicant
12 passed each inspection. The applicant continues by explaining that it has not received a letter of
13 non-compliance for any FERC land management, fisheries, or recreational program mitigation
14 requirements.⁷³

15
16 Based on the size, scope and compliance with the applicant's past mitigation projects, the
17 Department recommends that the Council find that the applicant's mitigation experience
18 demonstrates that it has the organizational expertise to successfully complete mitigation
19 necessary for the proposed transmission facility.

20
21 *Demonstrated ability to restore the site to a useful, non-hazardous condition*

22
23 The Council's Organizational Expertise standard requires the Council find that the applicant has
24 demonstrated the ability to restore the site to a useful, non-hazardous condition. The
25 applicant's ability to retire the proposed facility and to restore the site, taking into account
26 mitigation, to a useful, nonhazardous condition is discussed in ASC Exhibit W and evaluated in
27 Section IV.G., *Retirement and Financial Assurance*, of this order.

28
29 The applicant explains in ASC Exhibit W that based on its experience as a utility company and
30 throughout the industry, transmission lines as a whole are expected to be operated for an
31 indefinitely long duration. Transmission line retirement is extremely rare primarily due to the
32 high demand for transmission services, the high cost of building new transmission lines, and the
33 fundamental value of transmission rights-of-way.⁷⁴ Transmission line components and related
34 facilities are replaced, as necessary, however the applicant states that transmission lines,
35 including the proposed facility, would likely remain in service in perpetuity. To comply with the
36 EFSC standards, the applicant estimates that the useful life of the proposed facility would be in
37 excess of 100 years.

38
39 Recommended Retirement and Financial Assurance Condition 2 (Mandatory Council condition
40 OAR 345-025-0006(9)) requires that the certificate holder shall retire the facility if the

⁷³ B2HAPPDoc3-10 ASC 04_Exhibit D_Organization_ASC 2018-09-28, Section 3.4.

⁷⁴ B2HAPPDoc3-40 ASC 23_Exhibit W_Retirement_ASC 2018-09-28, Section 3.1.

1 certificate holder permanently ceases construction or operation of the facility. The certificate
2 holder shall retire the facility according to a final retirement plan approved by the Council, as
3 described in OAR 345-027-0110. The certificate holder shall pay the actual cost to restore the
4 site to a useful, non-hazardous condition at the time of retirement, notwithstanding the
5 Council's approval in the site certificate of an estimated amount required to restore the site.
6

7 In the future event the applicant (certificate holder) is required to retire the proposed
8 transmission line, ASC Exhibit W demonstrates that the applicant has the expertise required to
9 do so in compliance with OAR 345-025-0006(9) (Retirement and Financial Assurance Condition
10 2), which requires the certificate holder to restore the site to a useful non-hazardous condition
11 in accordance with a retirement plan approved by Council. As explained further in Section IV.G.,
12 *Retirement and Financial Assurance*, of this order, the applicant's retirement plan would
13 provide for:
14

- 15 i. Removal of all facilities. For the transmission line, these facilities would include all support
16 structures, conductors, overhead shield wires, and communication sites. For the station,
17 these facilities would include an interconnecting bus system, switches, breakers, and
18 instrumentation for the control and protection of the equipment.
- 19 ii. Removal of the foundations for each support structure to a depth of three (3) feet below
20 grade in lands zoned Exclusive Farm Use (EFU). Any foundations in lands in other zones
21 would be removed to a depth of 1 foot below grade, depending on ground slope.
- 22 iii. Restoration of all structure locations and access roads to a useful, non-hazardous condition
23 consistent with site zoning, including EFU zoning (Attachment P1-3: Reclamation and
24 Revegetation Plan and Attachment K-1: Agricultural Lands Assessment). Restoration would
25 include restoring the site to a condition suitable for uses comparable with the surrounding
26 land uses, intended land use, and then-current technologies.
27

28 Retirement and Financial Assurance Conditions 1-3 (include Mandatory Conditions) along with
29 Recommended Retirement and Financial Assurance Conditions 4 and 5, would ensure the
30 proposed facility site, taking into account mitigation, can be restored adequately to a useful,
31 non-hazardous condition following permanent cessation of construction or operation of the
32 proposed facility.
33

34 Based on the information provided by the applicant and subject to compliance with the
35 recommended site certificate conditions, the Department recommends that the Council find
36 that the applicant has the organizational expertise to restore the site to a useful, non-
37 hazardous condition at the end of the proposed facility's useful life.
38

39 *ISO 900 or ISO 14000 Certified Program*

40

41 Subsection (b) is not applicable because the applicant does not have an ISO 9000 or ISO 14000
42 certified program.
43

1 *Third-Party Permits*

2

3 Under the Council’s Organizational expertise standard, the Council must find that each third
4 party has a reasonable likelihood of obtaining the necessary permits, and that the applicant has
5 a reasonable likelihood of entering into a contractual or other arrangement with the third party
6 for access to the resource or service secured by that permit.

7

8 The applicant proposes to rely on third party permits obtained by Umatilla Electric Co-Op,
9 Pacific Power, and Oregon Trail Electric Cooperative to install, operate, and maintain the
10 distribution lines serving the communications stations. As summarized in ASC Exhibit D,
11 distribution lines may require local permits or approvals if they cross a public right-of-way,
12 depending on the final design and alignment of those distribution lines. The third-party local
13 service provider will obtain any necessary utility crossing permits directly from the applicable
14 county department.

15

16 The applicant explains that local electrical service providers generally must provide service to
17 requesting customers within the utility’s service territory. The applicant indicates that Umatilla
18 Electric Co-Op, Pacific Power and Oregon Trail Electric Cooperative are required to provide
19 electrical service to applicant’s communication stations located within their service territory.
20 Therefore, the Department recommends Council find that the applicant has a reasonable
21 likelihood of entering into a contract or agreement with Umatilla Electric Co-Op, Pacific Power
22 and Oregon Trail Electric Cooperative for access to the distribution lines, once permitted,
23 constructed and operational.

24

25 As described in ASC Exhibit D, the distribution lines that could require local permits or approvals
26 are located in Morrow, Umatilla, Union and Baker counties. Accordingly, if they are needed, the
27 local permits or approvals would be subject to approval by the planning departments of each of
28 those counties. To ensure the necessary third-party permits or approvals are in place at the
29 time of construction, the applicant proposes, and the Department recommends, that the
30 Council adopt the following site certificate condition:

31

32 **Recommended Organizational Expertise Condition 7:** Prior to construction, the certificate
33 holder shall:

- 34 a. Submit to the Department and affected counties a list of third-party permits to be
35 obtained or that have been obtained by Umatilla Electric Co-Op, Pacific Power and
36 Oregon Trail Electric Cooperation for the communication station distribution lines.
37 b. Submit to the Department copies of all obtained third party permits, as identified in (a)
38 of this condition.

39

40 Based on this analysis and the information provided by the applicant, and subject to compliance
41 with the recommended site certificate conditions, the Department recommends that the
42 Council find that the applicant has the organizational expertise to design, construct, and
43 operate the facility in compliance with site certificate conditions and in a manner that protects
44 public health and safety and has demonstrated the ability to restore the site to a non-

1 hazardous condition. The Department further recommends that the Council find that each of
2 the third parties upon which it proposes to rely has a reasonable likelihood of obtaining the
3 necessary permits, and that the applicant has a reasonable likelihood of entering into, a
4 contractual or other arrangement with those third parties for access to the resource or service
5 secured by those permits.

6
7 **Conclusions of Law**

8
9 Based on the evidence in the record, and subject to compliance with the recommended
10 conditions of approval, the Department recommends that the Council find that the applicant
11 satisfies the Council’s Organizational Expertise standard.

12 **IV.C. Structural Standard: OAR 345-022-0020**

13
14 *(1) Except for facilities described in sections (2) and (3), to issue a site certificate, the*
15 *Council must find that:*

- 16
17 *(a) The applicant, through appropriate site-specific study, has adequately*
18 *characterized the seismic hazard risk of the site;*
19
20 *(b) The applicant can design, engineer, and construct the facility to avoid dangers to*
21 *human safety and the environment presented by seismic hazards affecting the*
22 *site, as identified in subsection (1)(a);*
23
24 *(c) The applicant, through appropriate site-specific study, has adequately*
25 *characterized the potential geological and soils hazards of the site and its vicinity*
26 *that could, in the absence of a seismic event, adversely affect, or be aggravated*
27 *by, the construction and operation of the proposed facility; and*
28
29 *(d) The applicant can design, engineer and construct the facility to avoid dangers to*
30 *human safety and the environment presented by the hazards identified in*
31 *subsection (c).*

32 ***75

33 **Findings of Fact**

34
35 As provided in section (1) above, the Structural Standard generally requires the Council to
36 evaluate whether the applicant has adequately characterized the potential seismic, geological
37 and soil hazards of a proposed site, and whether the applicant demonstrates that it can design,

⁷⁵ Section (2) and Section (3) of OAR 345-022-0020 apply to energy generation facilities and special criteria facilities, respectively. The proposed facility is neither an energy generation facility nor a special criteria facility. Therefore, Section (2) and Section (3) of OAR 345-022-0020 do not apply.

1 engineer and construct the proposed facility to avoid dangers to human safety and the
2 environment from these hazards.

3
4 As established in the second amended project order, the analysis area for the Structural
5 Standard is the area within the site boundary. "Site boundary," as defined in OAR 345-001-
6 0010(55), is the area within the perimeter of the proposed facility, its related or supporting
7 facilities, all temporary laydown and staging areas, and all micro-siting corridors proposed by the
8 applicant."

9
10 As noted in ASC Exhibit H, the applicant applies a larger analysis area for evaluation of seismic
11 hazards, including a 100-mile analysis area for magnitude 7.0 earthquakes, 50-mile analysis
12 area for magnitude 6.0 to 7.0 earthquakes, and 25-mile analysis area for magnitude 6.0 and
13 below earthquakes. The applicant also evaluates seismic and non-seismic hazards extending
14 half-mile of the proposed transmission line centerline. Therefore, while the analysis area is
15 defined as the site boundary, based on the analysis presented in ASC Exhibit H, the applicant
16 voluntarily extends the analysis area to half-mile from the proposed transmission line
17 centerline (or up to 2,390 feet on either side of the proposed site boundary).

18
19 *DOGAMI Consultation*

20
21 Council rules at OAR Chapter 345 Division 21 require the applicant to consult with the Oregon
22 Department of Geology and Mineral Industries (DOGAMI) on the appropriate methodology and
23 scope of the seismic hazards and geology and soil-related hazards assessments, and the
24 appropriate site-specific geotechnical work that must be completed to inform the ASC and
25 demonstrate compliance with the Council's Structural Standard. The applicant consulted with
26 DOGAMI and the Department during in-person and teleconference meetings on April 4, 2011
27 and October 5, 2017 and across various phone conversations over the duration of the ASC
28 process. In addition to the consultation, DOGAMI reviewed and provided comments on the
29 ApASC, for which the applicant responded. Based on review of the applicant's responses,
30 DOGAMI provided confirmation on March 9, 2018 and February 16, 2018 that the evaluation
31 provided in Exhibit H was sufficient to inform the evaluation under the Council's Structural
32 Standard.⁷⁶

33
34 In summary, through consultation, DOGAMI provided various recommendations on methods
35 for evaluating landslide, fault, and soil-related hazards. To evaluate landslide hazards within the
36 surrounding area, DOGAMI recommended use of the updated SLIDO 2 database and LIDAR. To
37 evaluate potentially active faults, DOGAMI recommended review of the most recent
38 information on regional seismic studies at the U.S. Department of Energy's Hanford Site and
39 Columbia and Snake River dams; identification of Quaternary faults and fault zones; and,
40 consideration of additional subsurface exploration at fault and fault zones and locations where

⁷⁶ B2HAPPDoc ApASC Reviewing Agency Comment DOGAMI to IPC Responses_Wang 2018-02-16 and B2HAPPDoc ApASC Reviewing Agency Comment DOGAMI to IPC Responses for Structural Rule Change_Wang 2018-03-09.

1 ground shaking can influence site response, such as river crossings and near drainages with
2 softer soil conditions. DOGAMI recommended that proposed boring locations be based on
3 potential for geo-seismic hazards such as liquefaction, lateral spreading, and seismic slope
4 instability. DOGAMI suggested that geologic and soil hazard analysis at each tower location was
5 not necessary, and should be based on type of hazards present at each location. Additionally,
6 DOGAMI recommended use and reference to most recent International Building Code (IBC) and
7 Oregon Structural Specialty Code (OSSC) requirements; and suggested that a transmission line
8 designed for wind and ice forces would be sufficient to account for typical seismic forces.

9
10 As evaluated below, the applicant presents an analysis and proposes methods, to be used in a
11 pre-construction site specific geotechnical investigation, consistent with DOGAMI
12 recommendations.

13 14 *Potential Seismic, Geologic, and Soil Hazards within Analysis Area*

15
16 OAR 345-022-0020(1)(a) requires the Council to find that the applicant has adequately
17 characterized the seismic, geologic, and soil hazards of a proposed site.

18 19 *Earthquake and Seismic Hazards*

20
21 To evaluate potential earthquake sources within the surrounding area, the applicant evaluated
22 published data, and field data and literature compiled by its consultants – Shannon & Wilson.
23 Shannon & Wilson reviewed data on historic earthquakes from the U.S. Geological Survey
24 (USGS) Earthquake Search Database, the National Geophysical Data Center, and the Pacific
25 Northwest Seismic Network. Based on this review, potentially three types of earthquake
26 sources exist within the vicinity of the site boundary: crustal, intraslab, and interplate events. Of
27 these, the Cascadia Subduction Zone (CSZ) interplate events have the potential to produce the
28 largest magnitude earthquake, up to 9.0 magnitude. However, this earthquake source is located
29 at a distance of 280 miles or more from the proposed site boundary.

30
31 Seismic hazards from earthquake events include seismic shaking or ground motion, ground
32 failure, landslides, liquefaction, subsidence and lateral spreading, which are described below.

33 34 *Seismic Shaking/Ground Motion*

35
36 Seismic shaking from a CSZ interplate event would attenuate over this distance and would
37 therefore not represent the most significant earthquake hazard for the proposed facility.
38 Crustal faults, which typically produce earthquakes of a maximum magnitude of 7.0, are located
39 in much closer proximity to the proposed alignment and therefore represent the most

1 significant seismic hazard to the proposed facility.⁷⁷ Given the maximum magnitude of historic
2 earthquakes in the vicinity of the proposed transmission line route, Shannon & Wilson
3 recommended the facility seismic design be based on earthquake magnitudes of 6.0 to 6.2.⁷⁸
4 Earthquake risk is greatest in the northern portion of the proposed transmission line route (in
5 Morrow County).⁷⁹

6

7 The applicant's consultant, Shannon & Wilson, performed a preliminary evaluation of short-
8 and long-period spectral response accelerations anticipated to affect the proposed facility
9 during the 2,500-year return period; these data are considered when designing facilities to
10 withstand ground shaking. In addition, Shannon & Wilson performed a preliminary evaluation
11 of the estimated probabilistic peak ground acceleration (PGA) for a 500- and 5,000-year return
12 period; these data are used to assess geo-seismic hazards such as seismic slope stability and
13 liquefaction. These preliminary evaluations are based on the USGS 2002 and 2014 National
14 Seismic Hazard Maps. The USGS developed these maps using a probabilistic seismic hazard
15 analysis (PSHA) that considered multiple specific sources and regional seismicity to predict the
16 probability of an earthquake of a given ground motion occurring anywhere in a given area
17 within a given return period.⁸⁰

18

19 The Department describes the results of Shannon & Wilson's evaluations that are based on the
20 more up-to-date data used in the USGS 2014 PSHA. The 500-year return period PGA values
21 range from 0.074g at the beginning of the proposed transmission line route near Boardman,
22 Oregon, to 0.045g at the end of the proposed transmission line route near Hemingway, Idaho.
23 The PGA values for the 5,000-year return period range from 0.261g the beginning of the
24 alignment to 0.169g at the end of the alignment.⁸¹

25

26 The 2,500-year return period PGA values range from 0.185g at the beginning of the proposed
27 transmission line route to 0.117g at the end of the proposed transmission line route. For the
28 same return period, the short period (0.2-second) spectral response acceleration values range
29 from 0.416g at the beginning of the proposed transmission line route to 0.262g at the end of
30 the proposed transmission line route, and the long period (1.0-second) spectral response
31 acceleration values range from 0.137g at the beginning of the proposed transmission line route
32 to 0.082g at the end of the proposed transmission line route.⁸²

33

⁷⁷ B2HAPPDoc3-14 ASC 08a_Exhibit H_Geology_ASC_Part 1 2018-09-28, Section 3.7.3 and B2HAPPDoc3-14 ASC 08a_Exhibit H_Geology_ASC_Part 1 2018-09-28, Attachment H-1, Section 4.2.

⁷⁸ B2HAPPDoc3-14 ASC 08a_Exhibit H_Geology_ASC_Part 1 2018-09-28, Section 3.7.4.

⁷⁹ The applicant performed a preliminary seismic risk assessment from a review of earthquake hazard zones included in Federal Emergency Management Agency data, prepared for the U.S. Department of Transportation, Office of Pipeline Safety. B2HAPPDoc3-14 ASC 08a_Exhibit H_Geology_ASC_Part 1 2018-09-28, Section 3.7.6.

⁸⁰ B2HAPPDoc3-14 ASC 08a_Exhibit H_Geology_ASC_Part 1 2018-09-28, Attachment H-1, Section 4.1.

⁸¹ B2HAPPDoc3-14 ASC 08a_Exhibit H_Geology_ASC_Part 1 2018-09-28, Attachment H-1, Section 4.1.

⁸² B2HAPPDoc3-14 ASC 08a_Exhibit H_Geology_ASC_Part 1 2018-09-28, Attachment H-1, Section 4.1.

1 Shannon & Wilson’s evaluations assumed that the site class along the proposed transmission
2 line route is at the boundary between site class B and site class C (site class B/C), which is a soft
3 rock profile, and used ground motion parameters that correspond to this profile.

4
5 *Ground Failure*

6
7 Seismic hazards from earthquake events could include ground failure and fault displacement
8 when an active fault ruptures. To evaluate the potential for ground failure and fault
9 displacement, the applicant evaluates presence of Quaternary faults (that is, faults likely to
10 have been active within the last 2.6 million years) within a 50-mile radius of the proposed site
11 boundary using USGS’s 2006 Quaternary Fault and Fold Database. The analysis presented in
12 ASC Exhibit H focuses on mapped Quaternary faults within a five-mile radius of the proposed
13 site boundary, which includes the following 8 faults: the Hite Fault System, Thorne Hollow
14 Section; Hite Fault System, Agency Section; West Grande Ronde Valley Fault Zone; Unnamed
15 East Baker Valley Faults; West Baker Valley Faults; South Grande Ronde Valley Fault Zone;
16 Cottonwood Mountain Fault; and, Faults Near Owyhee Dam. A map of Quaternary faults within
17 50 miles of the proposed alignment is presented in ASC Exhibit H (Attachment H-1, Appendix D,
18 Figure D11).

19
20 *Landslides*

21
22 Seismic hazards from earthquake events include landslides. To characterize the site based on
23 historic landslides, the applicant conducted a desktop review and field reconnaissance, as
24 summarized below:

- 25
- 26 • Review of GIS files compiled by Oregon Department of Geology and Mineral Industries
27 (DOGAMI) in the Statewide Landslide Information Database for Oregon (SLIDO),
28 version 3.4 (Burns and Watzig, 2017); the review included landslides within a one-mile
29 wide route corridor; initial work by Shaw utilized SLIDO, version 2 (Burns and others,
30 2011);
 - 31 • Review of existing geologic maps, including Engineering Geology of the La Grande
32 Area, Union County, Oregon, by Schlicker and Deacon (1971); the maps were compiled
33 and geo-referenced in GIS along the alignment to confirm the location of each SLIDO
34 landslide along the route and to check that each mapped landslide was included in the
35 SLIDO database;
 - 36 • Site reconnaissance (by Shaw) along portions of the original alignment, conducted on
37 October 26-28 and November 15-18, 2011;
 - 38 • Site reconnaissance (by Shannon & Wilson) along portions of new alignment alternatives
39 and select alignment changes, conducted July 30 through August 2, 2012, and October
40 16-18, 2013;
 - 41 • Review of aerial photography (Shaw reviewed 1:24,000 scale aerial photographs
42 provided by 3Di, LLC, of Eugene, Oregon (3Di), and the ESRI Microsoft Virtual Earth
43 Exhibit H - Attachment H-1 24-1-03820-006 E-2 layer in GIS; Shannon & Wilson reviewed
44 aerial photographs from both ESRI and Google Earth);

- 1 • Review of Digital Terrain Models (DTMs) along one-mile-wide route corridors; and
- 2 • DOGAMI LiDAR Data Viewer (relevant LiDAR data was only available for portions of
- 3 the Meacham Lake, Huron, Kamela SE, Hilgard, LaGrande SE, Glass Hill, Craig
- 4 Mountain, North Powder, Telocaset, Baker, Virtue Flat, and Owyhee Dam quadrangles);
- 5 No LiDAR data was available in Idaho⁸³

6

7 Based on a review of the above-described information, Shannon & Wilson mapped landslides

8 within one mile of the proposed transmission line route, alternative transmission segments,

9 and of multi-use areas located outside one mile of the proposed transmission line route (see

10 ASC Exhibit H, Attachment H-1, Appendix E). Based on mapping conducted to inform ASC

11 Exhibit H, more than 40 potential landslides were identified with a potential to affect proposed

12 facility components (see ASC Exhibit H, Attachment H-1, Appendix E).

13

14 *Liquefaction and Lateral Spreading*

15

16 Seismic hazards from earthquake events include liquefaction and lateral spreading. Liquefaction

17 refers to the saturation and cohesion of soils causing these soils to temporarily lose their

18 strength, resulting from intense and prolonged ground shaking and seismic activity. Areas with

19 a shallow water table (within 50 feet of the surface) and thick, unconsolidated sediments are

20 the most susceptible to liquefaction in the event of ground shaking. The majority of the site

21 boundary has a low susceptibility to liquefaction because it mostly consists of relatively stable

22 terrain with shallow bedrock and deep groundwater. Seismic activity also has the potential to

23 cause lateral spreading, which is the permanent horizontal movement of liquefiable soil. Lateral

24 spreading during seismic events is most likely to occur on gradual slopes or on flat sites with

25 liquefiable soils.

26

27 *Subsidence*

28

29 Subsidence is the sinking or the gradual downward settlement of the land surface, and is often

30 related to groundwater drawdown, compaction, tectonic movements, mining, or explosive

31 activity. Seismic activity in the area could lead to the settling of sediment and could also

32 exacerbate potential subsidence associated with groundwater withdrawal in more populous

33 regions. No historical cases of subsidence in the site boundary have been identified, and the

34 majority of the site has a low susceptibility to subsidence.

35

36 *Soil-Related and Geologic Hazards*

37

38 Non-seismic hazards include mass-wasting and landslides, flooding, and erosion.

⁸³ B2HAPPDoc3-14 ASC 08a_Exhibit H_Geology_ASC_Part 1 2018-09-28, Section 3.7.6 and Attachment H-1 (Section 5.1.1).

1 Landslides are a subset of mass wasting events, which describes processes that include the
2 downslope movement of masses of soil and rock. As previously discussed, seismic events have
3 the potential to result in landslides, but non-seismic factors may also trigger landslides (e.g.,
4 from heavy precipitation events at unstable areas). Shannon & Wilson mapped landslides
5 within one mile of the proposed alignment (seen ASC Exhibit H, Attachment H-1, Appendix E).⁸⁴
6

7 *Mass-wasting and Landslides*

8
9 Mass wasting is a generic term for landslides, rockslides, rockfall, debris flows, soil creep, and
10 other processes that include the downslope movement of masses of soil and rock. Mass
11 wasting can be initiated by precipitation events, sometimes in conjunction with land use. Slope
12 stability is a function of moisture content, slope gradient, rock and soil type, slope aspect,
13 vegetation, seismic conditions and ground-disturbing activities. The proposed facility, including
14 alternative route segments, would cross multiple landslide hazard areas, as identified in ASC
15 Exhibit H Attachment H-1 Appendix E. ASC Exhibit H Attachment H-1 contains a detailed
16 reconnaissance of the site boundary showing the locations of known landslides and soil
17 instabilities. The applicant explains that, in general, historic landslide hazard areas are stable
18 and have been revegetated, and are not likely to be reactivated based on the relatively small
19 loads and grade changes imparted by facility construction.
20

21 *Flooding*

22
23 Using data from the 2017 Federal Emergency Management Agency (FEMA) National Flood
24 Hazard Layer and the 2015 DOGAMI Statewide Flood Hazard Database for Oregon – FEMA
25 Flood Insurance Study inundation zones, the applicant overlaid the 100-year flood zone with
26 the facility temporary and permanent disturbance areas. As shown in Table H-4 of ASC Exhibit
27 H, some temporary work areas (multi-use areas, pulling and tensioning sites, and structure
28 work areas) within Morrow, Baker, and Malheur counties, and a little more than a mile of
29 permanent access roads, would be located within the 100-year flood zone.⁸⁵ In addition, as
30 described in ASC Exhibit K, it appears that the proposed route would cross a number of
31 floodplains and a SFHA in Malheur County (see ASC Exhibit K Figure K-56).
32

33 *Erosion*

34
35 Soils most susceptible to erosion by wind and water are typically non-cohesive soils with low
36 infiltration rates, residing on moderate to steep slopes, and soils that are sparsely vegetated.⁸⁶
37 The applicant evaluated erosion potential within the analysis area based on three factors: soil-
38 erodibility (K) factor, wind erodibility, and slope. The standard measurement condition is the
39 unit plot. The unit plot is 72.6 feet (22.1 meters) long on a 9 percent slope, maintained in
40 continuous fallow, tilled up and down hill periodically to control weeds and break crusts that

⁸⁴ B2HAPPDoc3-14 ASC 08a_Exhibit H_Geology_ASC_Part 1 2018-09-28, Section 3.7.6 and Attachment H-1 (Section 5.1.1).

⁸⁵ B2HAPPDoc3-14 ASC 08a_Exhibit H_Geology_ASC_Part 1 2018-09-28, Section 3.8.2.

⁸⁶ B2HAPPDoc3-14 ASC 08a_Exhibit H_Geology_ASC_Part 1 2018-09-28, Section 3.8.3.

1 form on the surface of the soil. The plots are plowed, disked, and cultivated the same for a row
2 crop of corn or soybeans except that no crop is grown on the plot.

3
4 The applicant reviewed the State Soil Geographic (STATSGO) database to characterize soil
5 erosion factors. The U.S. Department of Energy, Pacific Northwest National Laboratory website
6 (DOE 2003) guideline was used to segregate the mapped soils into low, moderate, or high K
7 Factor soils. Low K values ranged from 0.05 to 0.15, moderate K values were from 0.25 to 0.4,
8 and high K values were greater than 0.4. However, the closest category in the Natural
9 Resources Conservation Service (NRCS) geographic information system data file to 0.4 was 0.37.
10 As such, a K factor of 0.37 was used to define soils mostly likely to erode. ASC Exhibit H
11 Attachment H-1 Appendix B presents further information concerning soil erosion potential.
12 Areas of soils with high K factor that could be affected during construction and operations are
13 contained in ASC Exhibit I, Table I-5 and Table I-9.

14
15 The potential for soil erosion by wind was evaluated using NRCS wind erodibility group data,
16 which are based on the texture of the surface layer, the size and durability of surface clods, rock
17 fragments, organic matter, and a calcareous reaction. Soil moisture and frozen soil layers also
18 influence wind erosion. Project construction activities that could expose soils particularly
19 erodible to wind erosion include any surface disturbance (e.g., road construction and
20 improvements, vegetation clearing).

21
22 In general, steep slopes possess a greater potential for erosion by water or mass movements
23 than flat areas. Areas containing greater than 25 percent slope were considered to have greater
24 erosion potential.

25 26 *Expansive Soils*

27
28 Expansive soils, which swell when exposed to moisture and shrink when dried, may impact
29 structure foundations. The applicant represents that the pre-construction geological and
30 geotechnical report will evaluate expansive soils hazards and identify measures to mitigate
31 these hazards. It is possible to mitigate the hazards associated with expansive soils by removing
32 the layer of expansive soils, treating the soils to reduce their expansive properties, extending
33 structure foundations deep enough to bypass the layer of expansive soils, or isolating the soil
34 from changes in moisture using enhanced draining and/or coverings.⁸⁷

35 36 *Groundwater Hazards*

37
38 Groundwater may exacerbate slope instability, and may require hydrogeological mitigation
39 (such as surface drainage, shallow drainage, and deep drainage) to reduce the soil's water
40 content. Groundwater can also impact construction, particularly where excavations extend
41 below the water table. If shaft foundations for transmission line towers extend below the water

⁸⁷ B2HAPPDoc3-14 ASC 08a_Exhibit H_Geology_ASC_Part 1 2018-09-28, Section 3.9.2.3.

1 table in granular soils, casing and/or slurry may be necessary to prevent soil heave and
2 maintain shaft integrity.

3
4 *Corrosive Subsurface Conditions*

5
6 Corrosive soils can damage the metallic and concrete components of subsurface utilities and
7 structures. Shannon & Wilson overlaid data from the Natural Resources Conservation Service
8 Soil Survey Geographic Database with the proposed alignment. These data show that
9 susceptibility of concrete to corrosion when in contact with the on-site surficial soils is expected
10 to be low in most areas, and susceptibility of uncoated steel to corrosion when in contact with
11 the onsite surficial soils is expected to be moderate to high. Metal materials may be protected
12 through the addition of protective coatings or by increasing the metal thickness. Concrete can
13 also be protected, by coating the concrete with an asphalt emulsion, for example.

14
15 Based upon consultation with DOGAMI on the investigation methods utilized to evaluate
16 potential seismic and non-seismic risks of the site, and based on the summary of measures and
17 outcomes provided above and as further described in ASC Exhibit H, the Department
18 recommends Council find that the applicant has adequately characterized the seismic and non-
19 seismic risks of the site.

20
21 *Design, Engineer and Construct Proposed Facility to Avoid Potential Seismic Hazards within*
22 *Surrounding Area*

23
24 The Structural Standard requires the Council to find that, based on an adequate
25 characterization of the seismic risks of the site – as presented above, that the applicant
26 demonstrates an ability to design, engineer and construct the proposed facility to avoid
27 potential seismic hazards (i.e. ground motion, ground failure, fault displacement, landslides,
28 liquefaction, lateral spreading, and subsidence) within the surrounding area.

29
30 *Measures to Design Proposed Facility to Avoid Seismic and Non-Seismic Hazards*

31
32 The proposed facility could be impacted by the seismic and non-seismic hazards described in
33 this section. In particular, as described in ASC Exhibit H Section 3.7.3. Earthquake Sources (Table
34 H-2 USGS Quaternary Faults within 5 Miles of Project by County), the proposed facility would
35 cross some faults that are thought to have been active within the Quaternary period (meaning
36 there is geologic evidence that there has been movement on the fault within the last ~2.6
37 million years). As described in ASC Exhibit H and ASC Exhibit H Attachment H-1 Appendix E, the
38 proposed facility would cross several landslide hazard areas. To characterize the site and design
39 and construct the proposed facility to minimize potential environmental and public safety risks
40 from these hazards, the applicant proposes to, prior to construction of a phase or segment,

1 conduct a site-specific geologic and geotechnical investigation as presented in recommended
2 Structural Standard Condition 1.⁸⁸

3
4 The site-specific geologic and geotechnical investigation would include a geotechnical field
5 exploration program, laboratory testing, and detailed site reconnaissance to assess seismic risk.
6 The Department recommends that the Council require the investigation to be designed and
7 conducted by a professional engineer or geologist licensed in Oregon, to apply relevant
8 expertise in issues and conditions of the State. The principal mitigation strategy for surface
9 rupture hazards is modification of structure locations. All designs and subsequent construction
10 requirements would be modified based on the site-specific characterization of seismic,
11 geologic, and soil hazards. Some specific mitigation techniques for earthquake-induced
12 landslide and liquefaction hazards are presented below. To ensure the applicant conducts the
13 additional geological and geotechnical investigations and develops any necessary mitigation
14 and that the applicant provides notification to the Department and DOGAMI if site specific
15 investigations identify conditions significantly different from what's described in this ASC, ~~the~~
16 ~~applicant proposes and~~ the Department recommends that the Council include the following
17 condition in the site certificate:
18

19 **Recommended Structural Standard Condition 1: At least 90 days p**Prior to construction of a
20 phase or segment of the facility, unless otherwise agreed to by the Department:

- 21 a. ~~At least 90 days prior to construction of a phase or segment of the facility, unless~~
22 ~~otherwise agreed to by the Department,~~ the certificate holder shall submit an
23 investigation plan, prepared by a professional engineer or geologist licensed in
24 Oregon, for the pre-construction site-specific geologic and geotechnical investigation
25 to the Department for review in consultation with DOGAMI. The investigation plan
26 shall specify the investigation methods to be used to evaluate site-specific seismic
27 and non-seismic hazards identified in (b) of this condition and should, at a minimum,
28 be consistent with the Oregon State Board of Geologist Examiners Guideline for
29 Preparing Engineering Geologic Reports and include methods for literature review,
30 geotechnical field exploration program, laboratory testing, mapping and detailed
31 site reconnaissance.
- 32 b. ~~At least 90 days prior to construction of a phase or segment of the facility, unless~~
33 ~~otherwise agreed to be the Department,~~ the certificate holder shall submit to the
34 Department and DOGAMI a pre-construction site-specific geological and
35 geotechnical investigation report (report), prepared by a professional engineer or
36 geologist licensed in Oregon, for review, demonstrating that the facility site has
37 been adequately characterized and the facility and temporary construction
38 activities, such as blasting, have been designed and located to avoid seismic, soil and
39 geologic hazards.

⁸⁸ B2HAPPDoc13 DPO IPC Responses to Select DPO Comments Rec'd by 2019-11-07; B2HAPP DPO IPC Responses - StopB2H
- 6. Geology Soils Carbon 2019-10-31, Cosgrove Ross, T., Squire, L., Valentine, E., et al.

- 1 i. The report shall at a minimum include information derived from the geological
2 and geotechnical investigations regarding:
 - 3 1. Subsurface soil and geologic conditions within the site boundary;
 - 4 2. Site-specific geotechnical design criteria and data for the facility components
5 informed by a Probabilistic Seismic Hazard Assessment and based on, at a
6 minimum, identified fault sources, ground motion, site class for ground
7 motion, and response spectra;
 - 8 3. Potentially active faults that may affect the facility and their potential risk to
9 the facility;
 - 10 4. Potential slope instability and landslide hazards based on boring locations
11 spaced approximately 1 mile along the alignment; at dead-end structures;
12 any corners or changes in alignment heading (angles); crossings of highways,
13 major roads, rivers, railroads, and utilities as power transmission lines,
14 natural gas pipelines, and canals; locations where blasting may occur; and,
15 locations necessary to verify lithologic changes and/or geologic hazards such
16 as landslides, steep slopes, or soft soil area.
 - 17 5. Potential liquefaction hazards;
 - 18 6. Potential soil expansion hazards;
 - 19 7. Groundwater detections and any related potential risk to the facility;
 - 20 8. Corrosive soils detections and any related potential risk to the facility; and
 - 21 9. Facility components within the 100-year flood zone and any related potential
22 risk to the facility
 - 23 10. Define and delineate geological and geotechnical hazards to the facility, and
24 identify means to mitigate the identified hazards.
 - 25 11. The report shall identify the applicable codes (i.e. Oregon Building Code,
26 Oregon Structural Specialty Code), including name and reference number,
27 that the facility components will be designed to satisfy.
- 28 ii. In the electronic (email) submission of the report to the Department, as required
29 under (b)(i) of this condition, the certificate holder shall identify whether blasting
30 is recommended. For any recommended blasting locations, in table and map
31 format, specify the transmission line structure number, milepost and county;
32 and, either submit with the report the draft Framework Blasting Plan (Soil
33 Protection Condition 4, Attachment G-5 of this order), following the pre-
34 construction agency review process or provide the schedule for initiation of the
35 established agency review process, as provided in the draft Blasting Framework
36 Plan.

37
38 As described in Section IV.D. Soil Protection of this order, and in ASC Exhibits I and G,
39 construction blasting (use of explosives) may be necessary for site preparation in areas where
40 shallow bedrock is encountered. Consistent with the Structural Standard, to ensure that
41 proposed facility design and construction avoids dangers to human safety and environment
42 from risks such as subsidence, landslides, and slope instability which could be impacted by
43 blasting activities, the applicant developed a draft Framework Blasting Plan (see Attachment G-

1 5 of this order) which outlines safety procedures and a notification process, as summarized
2 below:

- 3
- 4 • The construction contractor would publish a proposed blasting schedule in the local
5 newspaper 1 week prior to any blasting activities. The schedule would identify the
6 location, dates, and times blasting would occur. No blasting would occur outside of the
7 published schedule, except in emergency situations.
- 8 • The construction contractor would post warning signs at all entry points near blasting
9 locations. Warning signs would include information on blasting, including the general
10 hours blasting might take place, and audible signals to be used warning of impending
11 blasting and to indicate the site is all clear.
- 12 • Access points to areas where blasting would take place would be blocked to prevent
13 access by the public at least 30 minutes prior to blasting. The site shall be swept 5
14 minutes prior to blasting to ensure no unauthorized personnel have wandered onto the
15 site. An audible warning signal, capable of carrying for 0.5 mile, shall be used at least 2
16 minutes prior to blasting. An “all-clear” signal will be given once it has been determined
17 the area is safe.
- 18 • Blasting in the vicinity of pipelines would be coordinated with the pipeline operator and
19 would follow operator-specific procedures, as needed.
- 20 • During right-of-way negotiations, the applicant would consult with underlying
21 landowners to confirm whether property to be crossed by proposed facility contains a
22 well or spring, and whether, if blasting is identified as a construction technique within
23 subject property, landowner requests pre-blast flow measurements to assess any
24 potential damages from blasting. If damages result solely from the blasting activity,
25 applicant would provide compensation for adequate repair or replacement.

26

27 Based on the Department’s review of state and local land use regulations within the five
28 counties crossed by the proposed facility, including alternative segments, there are no specific
29 local permits or requirements that apply to blasting or use of explosives. As explained in ASC
30 Exhibit I, there are several requirements that apply to handling and storage of explosive
31 materials including National Fire Protection Association (NFPA) 495: Explosive Materials Code
32 and OAR 837-012-1340 and -1360, to which the plan is required to adhere. In the absence of
33 specific state and local requirements applicable to blasting or use of explosives, based on
34 similarities in mine blasting to construction-blasting, the Department consulted with DOGAMI’s
35 Mineral Land Regulation and Reclamation Division staff Hydrogeologist;
36 Hydrocarbon/Geothermal Resources Geologist – Bob Brinkmann to evaluate the draft
37 Framework Blasting Plan.

38

39 Based on consultation with DOGAMI, the Department recommends several requirements be
40 added to the Risk Management section (Section 8) of the draft Framework Blasting Plan (see
41 Attachment G-5 of this order). Department recommendations to the plan include requiring
42 implementation of a seismic monitoring plan or application of scaled distance factors to
43 monitor and ensure ground vibration at the nearest structures do not exceed NFPA established

1 limits during blasting activities.⁸⁹ In addition, consistent with blasting plan requirements
2 established by the State Fire Marshall and local fire district within an Oregon city (Tualatin), the
3 Department recommends the plan require preparation and submittal of a post monitoring and
4 seismic report; and, that the contractor demonstrate active insurance coverage for a minimum
5 of \$1,000,000.⁹⁰

6
7 Consistent with OAR 345-025-0016 (Mitigation and Monitoring), the Department also
8 recommends the draft Framework Blasting Plan include an established agency review process
9 applicable to finalization of the draft plan and any future plan amendments, to allow adequate
10 opportunities for appropriate state and local agencies, with subject matter expertise, to review,
11 coordinate and ensure the plan complies with applicable requirements and minimizes potential
12 environmental and health and safety risks during facility construction.⁹¹

13
14 In addition, the applicant would utilize the Oregon Structural Specialty Code and the
15 International Building Code for seismic design of the substation, auxiliary buildings, and
16 facilities other than the transmission line towers.⁹² The Department recommends that the
17 Council impose the following condition to require the applicant to design the facility in
18 accordance with the versions of the Oregon Structural Specialty Code, International Building
19 Code, and local building codes in effect at the time of construction:

20
21 **Recommended Structural Standard Condition 2:** The certificate holder shall design,
22 engineer, and construct the transmission lines, Longhorn Station, and communication
23 stations in accordance with the International Building Code, Oregon Structural Specialty
24 Code, and local building codes that are most current at the time that final engineering of
25 each of these components is completed and in a manner that does not conflict with
26 National Electrical Safety Code identified Siting Standards for Transmission Lines Condition
27 3.

28
29 The transmission line would be designed and constructed in accordance with the National
30 Electric Safety Code (NESC) and applicable American Society of Civil Engineers (ASCE) standards
31 (including ASCE Standard 10-97; ASCE Standard 7, Chapters 13 and 16; and ASCE Manual of
32 Practice 74). The applicant explains that by designing the transmission towers in accordance
33 with the NESC, which requires that transmission lines be designed to withstand wind and ice

⁹¹ [OAR 345-025-0016 requires mitigation plans to be developed in consultation with the Department and, as appropriate,
other state agencies, local governments and tribes, to ensure compliance with Council standards. See also public
comment Collins, A. et al.](#)

⁹² [B2HAPPDoc3-14 ASC 08a_ Exhibit H_ Geology_ASC_Part 1 2018-09-28, Section 3.7.1 and 3.9.1.1.](#)

1 loading, the transmission line would also be able to resist earthquake loads. As support for its
2 assertion, the applicant refers to NESC Section 250.A.4, which states, “The structural capacity
3 provided by meeting the loading and strength requirements of Sections 25 (Loadings for Grades
4 B and C) and 26 (Strength Requirements) [of the NESC] provides sufficient capability to resist
5 earthquake ground motions.”
6

7 In addition, the applicant quotes from the *ASCE Guidelines for Electrical Transmission Line*
8 *Structural Loading*, which states, in part, “Transmission structures need not be designed for
9 ground-induced vibrations caused by earthquake motion because, historically, transmission
10 structures have performed well under earthquake events, and transmission structure loadings
11 caused by wind/ice combinations and broken wire forces exceed earthquake loads.”⁹³
12 Recommended Siting Standards for Transmission Lines Condition 3 would require the certificate
13 holder to design, construct, and operate the transmission line in accordance with the
14 requirements of the version of the NESC that is most current at the time that final engineering
15 of the facility is completed.
16

17 *Ground Failure and Fault Displacement*

18

19 The Quaternary faults within the surrounding area should be considered during final facility
20 design with regards to their potential to result in ground failure and fault displacement at or
21 near the proposed alignment. The applicant explains that it would evaluate ground failure
22 including landslide, lateral spreading, liquefaction, and surface rupture or settlement once
23 ground accelerations and subsurface conditions are known (following the pre-construction,
24 site-specific geologic and geotechnical investigations). Recommended Structural Standard
25 Condition 1 would require the pre-construction site-specific geological and geotechnical
26 investigation report to, in part, describe potentially active faults that may affect the facility,
27 their potential risk to the facility, and measures to mitigate the identified hazards.
28

29 *Landslides*

30

31 Landslides could potentially affect the stability of the proposed tower foundations or associated
32 work areas. The applicant explains that, if feasible, facility structures would be located with
33 sufficient setback from slopes to mitigate the potential for slope instability, and where
34 structures cannot be moved or realigned, mitigation techniques may include modification of
35 slope geometry (grading or removing soils), hydrogeological modification (drainage to reduce
36 the soil’s water content), and slope reinforcement methods.⁹⁴ Recommended Structural
37 Standard Condition 1 would require the pre-construction site-specific geological and
38 geotechnical investigation report to, in part, use agency approved investigation methods such
39 as LiDAR or field survey investigation of the site boundary to assess the potential for slope
40 instability and landslide hazards, and to identify measures to mitigate the identified hazards.

⁹³ B2HAPPDoc3-14 ASC 08a_Exhibit H_Geology_ASC_Part 1 2018-09-28, Sections 3.7.1 and 3.9.1.1.

⁹⁴ B2HAPPDoc3-14 ASC 08a_Exhibit H_Geology_ASC_Part 1 2018-09-28, Section 3.9.2.1.

Liquefaction and Lateral Spreading

The applicant proposes that the pre-construction, site-specific geological and geotechnical investigations include a site-specific evaluation of liquefaction hazards and identify any necessary mitigation measures.⁹⁵

Prior to the development of final engineering design, liquefaction studies will be conducted for susceptible areas, including areas that cross or approach rivers and areas where thick unconsolidated sediments are encountered in the field. Additional evaluation of liquefaction also may be needed as the final alignment and tower locations are chosen. The geotechnical engineer will recommend additional exploration and/or analysis as applicable to assess liquefaction hazards in the geotechnical design report for the transmission line.

In particular, the evaluation of liquefaction hazards will include susceptible areas, such as areas with thick unconsolidated sediments and areas that cross or approach rivers.⁹⁶ Recommended Structural Standard Condition 1 would require the pre-construction site-specific geological and geotechnical investigation report to, in part, assess potential liquefaction hazards and to identify measures to mitigate the identified hazards.

The applicant states that its pre-construction, site-specific evaluation of liquefaction hazards will evaluate if lateral spreading is an additional hazard for areas susceptible to liquefaction.⁹⁷ Recommended Structural Standard Condition 1 would require the pre-construction site-specific geological and geotechnical investigation report to, in part, assess potential lateral spreading hazards and to identify measures to mitigate the identified hazards.

Subsidence

Seismic activity has the potential to cause subsidence, which is the sinking or gradual downward settlement of the land surface. The applicant explains that it does not currently propose to perform subsidence studies because the majority of the site boundary has a low susceptibility to subsidence and because the applicant has not identified any historical cases of subsidence in the site boundary. If the geotechnical investigation identifies any subsidence-prone areas, the applicant represents that it would design and site the transmission line to avoid subsidence hazards.⁹⁸

Mass Wasting and Landslides

Landslides could potentially affect the stability of the proposed tower foundations or associated work areas. The applicant explains that, if feasible, facility structures would be located with sufficient setback from slopes to mitigate the potential for slope instability, and where structures cannot be moved or realigned, mitigation techniques may include modification of slope geometry (grading or removing soils), hydrogeological modification (drainage to reduce the soil’s water content), and slope reinforcement methods.⁹⁹

Recommended Structural Standard Condition 1 would require the pre-construction site-specific geological and geotechnical investigation report to assess the potential for slope instability and landslide hazards, and to identify measures to mitigate the identified hazards.

Flooding

The applicant represents that it would set facility structures and towers back from areas of high flood risks during final design; or, where structures cannot be set back, the applicant would conduct a site-specific structural and erosion hazard assessment and would coordinate with local flood zone managers to determine mitigation requirements. Recommended Structural Standard Condition 1 would require the pre-construction site-specific geological and geotechnical investigation report to, in part, identify facility components within the 100-year flood zone, any related potential risk to the facility, and measures to mitigate the identified hazards.

Erosion

The applicant proposes to mitigate for potential soil impacts including wind and water related erosion and expansive soils. Erosion control measures would be designed based on mapped soil erosion hazards, with particular attention to areas with medium and high hazard ratings. Soil erosion would be minimized by constraining traffic, heavy equipment and construction to existing roads where possible. Where new road construction is required, road widths would be limited to the width necessary to accommodate construction equipment. New roads would be located to avoid steep areas as much as possible. Areas affected by construction will be reseeded with vegetation to minimize future erosion and to restore the systems to their natural state. Erosion and sediment control measures will be designed to remain intact until natural vegetation is sufficient to protect against erosion. The station operational footprint areas will be graveled to prevent erosion. The area outside the station fence may also be graveled where practical to prevent soil erosion during operations.

The applicant proposes to implement the following best management practices, in accordance with the DEQ-issued 1200-C General Stormwater permit:

⁹⁹ B2HAPPDoc3-14 ASC 08a_Exhibit H_Geology_ASC_Part 1 2018-09-28, Section 3.9.2.1.

- 1 • Avoid Highly Erodible Areas: Initial mitigation measures should include avoiding highly
2 erodible areas, such as steep slopes, where possible, and rerouting impacted drainages
3 to natural drainages to minimize erosion and sedimentation from runoff. Areas
4 impacted by construction should be reseeded and sediment fences, check dams, and
5 other BMPs will remain in place until impacted areas are well vegetated and the risk of
6 erosion has subsided.
- 7 • Stabilize Road Entrance/Exit: A stabilized construction entrance/exit should be installed
8 at locations where dirt (exposed, disturbed land) or newly constructed roads intersect
9 existing paved roads. Stabilized entrances should also be installed at the construction
10 laydown areas. The stabilized construction entrance/exits should be inspected and
11 maintained for the duration of the Project life.
- 12 • Preserve/Restore Vegetation: To the extent practicable, existing vegetation should be
13 preserved. In the event that vegetation is destroyed in temporary road locations or
14 laydown areas, stockpiled topsoils should be replaced and recontoured. Vegetation
15 should be reseeded to prevent erosion using an approved seed mixture specified by the
16 NRCS or the USFS as being capable of surviving in local conditions (see the Vegetation
17 Management Plan provided in Attachment P1-4 of this order).
- 18 • Control Dust: Dust should be controlled during construction through water application
19 to the disturbed grounds and access roads where necessary. Application of excess water
20 that could lead to erosion or sedimentation should be avoided. Other methods of dust
21 control may include the use of poly sheeting, vegetation, or mulching. Speed limits
22 should be kept to a minimum to prevent pulverization of road substrate.
- 23 • Install Silt Fencing: Silt fencing or an equivalent control measure should be installed at
24 various locations along the transmission line. The fencing should be installed on
25 contours downgradient of excavations, fill areas, or graded areas where necessary. Silt
26 fencing or an equivalent control measure should be installed around the perimeters of
27 material stockpiles and construction laydown areas.
- 28 • Install Straw Wattles: Straw wattles should be installed to decrease the velocity of sheet
29 flow from stormwater. The wattles should be used along the downgradient edge of
30 access roads adjacent to slopes or sensitive areas.
- 31 • Apply Gravel and Mulching: Gravel should be used where soil becomes wet or muddy to
32 prevent erosion and working of the soil. Mulch should be provided to immediately
33 stabilize soil exposed as a result of land disturbing activities. The mulch reduces the
34 potential for wind and raindrop erosion.
- 35 • Install Stabilization Matting: Jute mesh, straw matting, or turf reinforcement matting
36 should be used to stabilize slopes that could become exposed during installation of
37 access roads, during rainfall events, or to stabilize intermittent streams disturbed during
38 construction of road crossings. Erosion control matting should be combined with
39 revegetation techniques.
- 40 • Control Concrete Washout Area: Concrete washout should be appropriately managed to
41 prevent concrete washout water from impacting soils, water bodies, or wetlands.
- 42 • Manage Stockpiles: Soils excavated may be temporarily stockpiled. While the material is
43 stockpiled, perimeter controls should be established and the stockpiled material should

1 be covered as necessary with mulch, plastic sheeting, and/or other appropriate means
2 to prevent erosion and sedimentation.

- 3 • Install Check Dams, Sediment Traps, and Sediment Basins: Check dams and sediment
4 traps should be used during construction near tributaries and existing drainages. The
5 check dams and sediment traps will minimize downstream disturbances and
6 sedimentation of creeks. A sediment basin is a constructed temporary pond, built to
7 capture eroded soils that wash off from larger construction sites during rain storms. The
8 sediment-laden soil settles in the pond before the runoff is discharged

9
10 To mitigate the risk of accelerating soil erosion by wind in areas rated with wind erodibility, the
11 applicant proposes to implement reseeding efforts, apply mulch, and use water for dust
12 control. Areas that are susceptible to aeolian processes that will be disturbed by construction
13 activities and not permanently covered by aboveground facilities will be vegetated using a seed
14 mixture specified by the applicable agencies as being capable of surviving in local conditions,
15 and withstanding burial and deflation from aeolian processes. Disturbed areas susceptible to
16 wind erosion may be hydroseeded when temperatures and moisture levels are conducive to
17 seed germination. Vegetation protection actions and activities would be presented as part of
18 the applicant's final Vegetation Management Plan (see Attachment P1-4 of this order). To
19 ensure the protective measures set forth in the draft Vegetation Management Plan are
20 incorporated into the final Vegetation Management Plan and to ensure compliance with the
21 final Vegetation Management Plan, the Department recommends Council impose Fish and
22 Wildlife Condition 2.

23
24 The applicant describes that appropriate mitigation techniques would be selected for expansive
25 soil swell. In general, mitigation techniques for expansive soils include removal, bypass,
26 isolation, and treatment. If only a thin layer of expansive soil is present at a site, it may be
27 feasible to strip and remove it. For thicker layers of expansive soil, it is common practice to
28 extend foundations deep enough to effectively bypass the zone where moisture content is
29 likely to change. Another mitigation alternative is to isolate the soil from changes in moisture
30 content, through the use of enhanced drainage and/or coverings. Where only shallow
31 foundations are practical, another mitigation alternative is to treat the expansive soils with lime
32 or some other material that reduces their expansive properties. Recommended Structural
33 Standard Condition 1 includes a requirement that, as part of the pre-construction geotechnical
34 investigation, the certificate holder would address the potential of expansive soil impacts and
35 any necessary mitigation measures regarding the same.

36
37 Based upon the evidence provided, and subject to compliance with the recommended
38 conditions referenced above, the Department recommends the Council find that the applicant
39 can design, engineer, and construct the facility to avoid dangers to human safety and the
40 environment presented by the identified non-seismic hazards of the site.

41
42 Mandatory Structural Conditions

1 OAR 345-025-0006 lists certain conditions that the Council must adopt in every site certificate,
2 and includes conditions relevant to the consideration of seismic, geological, and soil hazards in
3 facility siting and design at OAR 345-025-0006(12) through (14). The Department recommends
4 that the Council adopt these mandatory conditions as Recommended Structural Standard
5 Conditions 2 through 4:¹⁰⁰

6
7 **Recommended Structural Standard Condition 3:** The certificate holder shall design,
8 engineer and construct the facility to avoid dangers to human safety and the environment
9 presented by seismic hazards affecting the site that are expected to result from all
10 maximum probable seismic events. As used in this rule “seismic hazard” includes ground
11 shaking, ground failure, landslide, liquefaction triggering and consequences (including flow
12 failure, settlement buoyancy, and lateral spreading), cyclic softening of clays and silts, fault
13 rupture, directivity effects and soil-structure interaction.

14 [Mandatory Condition OAR 345-025-0006(12)]

15
16 **Recommended Structural Standard Condition 4:** The certificate holder shall notify the
17 Department, the State Building Codes Division and the Department of Geology and Mineral
18 Industries promptly if site investigations or trenching reveal that conditions in the
19 foundation rocks differ significantly from those described in the application for a site
20 certificate. After the Department receives the notice, the Council may require the certificate
21 holder to consult with the Department of Geology and Mineral Industries and the Building
22 Codes Division to propose and implement corrective or mitigation actions.

23 [Mandatory Condition OAR 345-025-0006(13)]

24
25 **Recommended Structural Standard Condition 5:** The certificate holder shall notify the
26 Department, the State Building Codes Division and the Department of Geology and Mineral
27 Industries promptly if shear zones, artesian aquifers, deformations or clastic dikes are found
28 at or in the vicinity of the site. After the Department receives notice, the Council may
29 require the certificate holder to consult with the Department of Geology and Mineral
30 Industries and the Building Codes Division to propose and implement corrective or
31 mitigation actions.

32 [Mandatory Condition OAR 345-025-0006(14)]

33
34 Disaster Resilience and Climate Change Adaptation

35
36 OAR 345-021-0010(1)(h)(E) and OAR 345-021-0010(1)(h)(F)(i) require the applicant to discuss
37 the proposed facility’s disaster resilience (with respect to seismic hazards and non-seismic
38 geologic hazards, respectively) and OAR 345-021-0010(1)(h)(F)(ii) requires the applicant to
39 discuss the impacts of future climate conditions on the facility.

¹⁰⁰ The language of Recommended Structural Standard Condition 2 is based upon OAR 345-025-0006(12), but was modified to exclude reference to coastal sites because the site boundary is located far from coastal areas.

*Disaster Resilience*¹⁰¹

In ASC Exhibit H Section 3.8.4, the applicant explains that, by designing the transmission line to NESC-mandated engineering and construction standards, the transmission line would be designed to withstand earthquake hazards as well as severe wind and ice loading. As previously discussed, the applicant would utilize the OSSC and the IBC for seismic design of the substation, auxiliary buildings, and facilities other than the transmission line towers. Access roads would be sited away from areas of high geology- or soil-related hazards.

In the event of a disaster, the applicant would follow its Transmission Emergency Response Plan, which guides the applicant’s response to natural disasters and outage events that disrupt the transmission system. Through its membership in the Edison Electric Institute, the applicant has access to assistance from other investor-owned electric companies that would provide personnel and materials to restore electric service following a service disruption. The applicant also maintains spare materials and repair kits that allow it to restore power in the event of a transmission outage, including spools of spare conductors, lattice tower repair kits, and emergency towers that can be erected to temporarily replace damaged transmission towers.

In the event that an access road is damaged, the applicant would be able to access transmission line structures using alternative access roads or traveling to the structure by foot, overland travel, or using a helicopter. If the access road is located on private land, the applicant would repair the road as soon as possible and necessary. In the event that one of the facility’s communication stations is damaged, the applicant explains that it would still maintain full communications because the communications system for the transmission line is designed to be redundant and geographically diverse.

*Climate Change*¹⁰²

Based on a review of the Third Oregon Climate Assessment Report and literature on how climate change may impact soil erosion rates, the applicant determined that climate change is anticipated to change conditions in eastern Oregon by increasing drought, increasing wildfires, reducing summertime water supply, and increasing forest disturbance from disease, drought, and wildfire. Increased wildfire and forest disturbances may result in decreased vegetative cover on steep slopes, thereby increasing runoff and erosion rates. Extreme precipitation events are also expected to increase, resulting in an increased risk of flooding, runoff, soil erosion, landslides, and mass wasting events.

The applicant asserts that the mitigation measures listed in ASC Exhibit H Section 3.9 are sufficient to address any climate-change-induced increases in soil erosion or geology hazards.

¹⁰¹ B2HAPPDoc3-14 ASC 08a_Exhibit H_Geology_ASC_Part 1 2018-09-28, Section 3.8.4.

¹⁰² B2HAPPDoc3-14 ASC 08a_Exhibit H_Geology_ASC_Part 1 2018-09-28, Section 3.8.5.

1 The Department notes that these mitigation measures ~~includes measures to~~would reduce the
2 risks posed by flooding, soil erosion, landslides, and mass wasting events. Additionally, as
3 discussed in Section IV.E., *Land Use* of this order, maintaining vegetative clearance in the right
4 of way, and particularly maintaining a right of way free of hazard or danger trees, will further
5 reduce the risk of fire from, or to, the proposed facility.

6
7 **Conclusions of Law**

8
9 Based on the foregoing findings of fact and conclusions of law, and subject to compliance with
10 the recommended conditions referenced above, the Department recommends that the Council
11 find that the proposed facility, including the proposed and alternative routes, would comply
12 with the Council’s Structural Standard.

13 **IV.D. Soil Protection: OAR 345-022-0022**

14
15 *To issue a site certificate, the Council must find that the design, construction and*
16 *operation of the facility, taking into account mitigation, are not likely to result in a*
17 *significant adverse impact to soils including, but not limited to, erosion and chemical*
18 *factors such as salt deposition from cooling towers, land application of liquid effluent,*
19 *and chemical spills.*

20
21 **Findings of Fact**

22
23 The Soil Protection standard requires the Council to find that, taking into account mitigation,
24 the design, construction and operation of a facility are not likely to result in a significant
25 adverse impact to soils. The applicant’s assessment of potential soil impacts and compliance
26 with the Soil Protection standard are included in ASC Exhibit I. Additional information related to
27 the proposed facility’s potential effects to soils and proposed mitigation measures, as described
28 by the applicant, can be found in ASC Exhibit G (Materials Analysis) and Exhibit K (Land Use).

29
30 The analysis area for the Soil Protection standard includes the area within the site boundary.¹⁰³
31 Construction activities would disturb approximately 4,348 acres (temporary impacts) and the
32 footprint of the proposed facility would disturb approximately 757 acres (permanent impacts),
33 as shown in ASC Exhibit I, Table I-4.¹⁰⁴

34
35 *Existing Soil Conditions and Land Use*

36
37 Existing soil conditions within the analysis area are described and shown in ASC Exhibit I,
38 specifically in Section I.3.3. The majority of soil within the site boundary is classified either as
39 Aridisol or Mollisol. The applicant states that Aridisols are generally found in dry climates and
40 contain subsurface horizons in which clay, calcium carbonate, silica, salts, and/or gypsum have

¹⁰³ B2HAPPDoc3-16 ASC 09a_Exhibit I_Soil_ASC_ Part 1 2018-09-28, p. I-2

¹⁰⁴ B2HAPPDoc3-16 ASC 09a_Exhibit I_Soil_ASC_ Part 1 2018-09-28, Table I-4.

1 accumulated due to limited leaching. These soils are not generally suitable for agricultural
2 purposes unless irrigated, and revegetation in these areas is also considered to be difficult due
3 to the amount of water that would be necessary to aid in revegetation measures. Mollisols
4 include a variety of soils formed mainly under grasslands; these soils have a strong organic
5 component formed by the decomposition of grass and other vegetation. These soils maintain
6 high agricultural potential and are favorable for revegetation. Table I-1 indicates that most
7 (approximately 78 percent) of the soils within the proposed site boundary consists of Mollisols,
8 with Aridisols representing the second largest group of soils within the site boundary (at
9 approximately 14 percent). The remaining soils (approximately eight percent) are classified as
10 Andisols and Entisols, which represent a variety of soils with a predominantly volcanic origin
11 and recently developed soils, respectively.

12
13 Soils most susceptible to erosion by wind and water are typically non-cohesive soils with low
14 infiltration rates, residing on moderate to steep slopes, and soils that are sparsely vegetated.
15 Using the Natural Resources Conservation Service (NRSC) State Soil Geographic Database
16 (STATSGO) and the U.S. Geological Survey (USGS) National Elevation Dataset (NED), the
17 applicant evaluated soil erosion hazards throughout the site boundary.¹⁰⁵ Exhibit I, Tables I-5
18 and I-9 show the erosion potential for the soils within the temporary and permanent
19 disturbance areas, respectively.

20
21 In addition, the applicant evaluated factors that have the potential to affect the level of effort
22 required to reclaim disturbed soils, including soil compaction, the amount of stony-rocky soil,
23 droughty soil, depth to bedrock, and the presence of hydric soils.¹⁰⁶ No highly compaction-
24 prone soils were identified within the site boundary.¹⁰⁷ Exhibit I, Table I-6 identifies the amounts
25 of stony-rocky soils, droughty soils, shallow bedrock, and hydric soils within the temporary
26 disturbance areas.

27
28 While most (approximately 79 percent) of the land cover crossed by the proposed alignment
29 consists of shrubland and grassland, the proposed alignment would also cross land cover types
30 that may be representative of current land uses that require or depend on productive soils to
31 support the current use. These land cover types include cultivated cropland (which includes
32 dryland and irrigated agriculture; approximately 9 percent), forested/woodland areas
33 (approximately nine percent), and substantially smaller amounts of pasture, other agricultural
34 areas, and wetlands.¹⁰⁸ As shown in ASC Exhibit I, Table I-2, approximately 1,856 acres of high-
35 value farmland soils were identified within the site boundary for the proposed alignment.

36

¹⁰⁵ B2HAPPDoc3-16 ASC 09a_Exhibit I_Soil_ASC_Part 1 2018-09-28, Section 3.2.3.

¹⁰⁶ Data sources include STATSGO, the NRCS Soil Survey Geographic Database (SSURGO), and the Oregon Wetlands Database hydric soil data.

¹⁰⁷ B2HAPPDoc3-16 ASC 09a_Exhibit I_Soil_ASC_Part 1 2018-09-28, Section 3.2.4.

¹⁰⁸ B2HAPPDoc3-16 ASC 09a_Exhibit I_Soil_ASC_Part 1 2018-09-28, Table I-3. The applicant reviewed Regional Gap Analysis Project data and performed a desktop interpretation of 2012 National Agriculture Imagery Program imagery to determine the land cover types.

1 Prior to construction, the applicant would collect and assess additional soil data as part of the
2 site-specific geotechnical investigation (see Section IV.C., *Structural Standard* of this order) to
3 refine its understanding of existing soil conditions in the site boundary.

4

5 *Potential Adverse Impacts to Soil*

6

7 ASC Exhibit I, Section 3.5 includes the applicant’s assessment of how the proposed facility may
8 impact soils, and Section 3.6 contains the applicant’s proposed measures to avoid, minimize,
9 and mitigate those impacts.

10

11 *Construction*

12

13 Construction of the proposed facility would result in temporary disturbance to approximately
14 4,348 acres, which may result in increased erosion, soil compaction, loss of soil productivity,
15 and potentially the need for soil reclamation.¹⁰⁹ Clearing, grubbing, grading, backfilling, and
16 excavation activities along the ROW and at additional temporary workspaces would increase
17 the potential for erosion, topsoil loss, and sedimentation into surface water streams or lakes.¹¹⁰

18 Construction equipment and vehicles driving on native soil may result in soil compaction,
19 especially in areas under roadways, structures, and high-use areas. Compacted soil would need
20 to be ripped, loosened, or otherwise treated using BMPs to restore its productivity, and
21 extensive construction blasting (if necessary) could prolong the time to achieve successful
22 reclamation due to the creation of additional stony-rocky soils.¹¹¹

23

24 Some of the soils that could be impacted include productive soils used for agriculture and
25 forested areas (see ASC Exhibit I, Table I-7). In addition to preventing agricultural use of the
26 soils during construction, construction activities may impact productive soils by increasing the
27 potential for soil erosion, damage to the agricultural land drainage and irrigation systems,
28 mixing of topsoil and subsoil, loss of topsoil, and soil compaction. While productive soils could
29 support seasonal crops and replanted tree species within a growing season of construction
30 completion, the transmission line ROW would not be suitable for tree growth while the facility
31 remains in service, and aerial spraying routes may need to be modified or restricted in
32 agricultural areas adjacent to the transmission line. Productive soils located within the footprint
33 of permanent facility components would be unavailable for use throughout the life of the
34 proposed facility.¹¹²

35

36 In addition to temporary impacts, the placement of project components would permanently
37 disturb approximately 757 acres to account for the footprint of the transmission towers and

¹⁰⁹ B2HAPPDoc3-16 ASC 09a_Exhibit I_Soil_ASC_Part 1 2018-09-28, Table I-4 and Section 3.5.4.

¹¹⁰ B2HAPPDoc3-16 ASC 09a_Exhibit I_Soil_ASC_Part 1 2018-09-28, Section 3.5.1.1.

¹¹¹ B2HAPPDoc3-16 ASC 09a_Exhibit I_Soil_ASC_Part 1 2018-09-28, Sections 3.5.1.2 and 3.5.1.3.

¹¹² B2HAPPDoc3-16 ASC 09a_Exhibit I_Soil_ASC_Part 1 2018-09-28, Section 3.5.1.4.

1 related and supporting facilities.¹¹³ Temporarily disturbed areas would be restored following
2 completion of construction, and permanently disturbed areas would be restored following
3 permanent cessation of construction or operation of the facility (retirement of the proposed
4 facility).¹¹⁴

5
6 During facility construction, there would be a risk to soils from spills or leakage of chemicals,
7 petroleum products such as diesel fuel, or other materials.¹¹⁵ As provided in Table G-3, the
8 applicant expects that construction of the facility would require 72,000 gallons of gasoline;
9 216,000 gallons of diesel; 4,000 gallons of motor and gear oil; 400 gallons of antifreeze; 400
10 gallons of transmission fluid; 400 gallons of hydraulic fluid; and detergents. In addition,
11 construction of the facility would require the use of paint/solvents, herbicides, jet fuel for
12 helicopter use, and blasting materials (where needed to blast rock). Prevention and
13 management of spills and leaks is further discussed in the mitigation section below.
14 The proposed facility would be subject to the requirements of the National Pollutant Discharge
15 Elimination System (NPDES) 1200-C general stormwater permit, which requires the applicant to
16 develop and implement an Erosion and Sediment Control Plan (ESCP) to minimize impacts to
17 soils and the environment.¹¹⁶ Mitigation measures and recommended site certificate conditions
18 are discussed below.

19

20 *Operation*

21

22 The applicant states that proposed facility operation would have minimal soil erosion potential;
23 soil erosion could consist of soil disturbance at tower sites, Longhorn station, communication
24 stations, and/or access roads during repair and maintenance of facility components.¹¹⁷

25

26 Restoration of temporarily impacted areas would further reduce the potential for erosion
27 during facility operation. As discussed in Section IV.A., *General Standard of Review* of this order,
28 General Standard of Review Condition 9 requires the applicant to restore vegetation to the
29 extent practicable and landscape all areas disturbed by construction. As an example, the
30 applicant notes that the area surrounding the Longhorn Station site would be covered with free

¹¹³ B2HAPPDoc3-16 ASC 09a_Exhibit I_Soil_ASC_Part 1 2018-09-28, Table I-4.

¹¹⁴ B2HAPPDoc3-16 ASC 09a_Exhibit I_Soil_ASC_Part 1 2018-09-28, Section 3.6.10 and B2HAPPDoc3-40 ASC 23_Exhibit W_Retirement_ASC 2018-09-28, Section 3.2.

¹¹⁵ B2HAPPDoc3-16 ASC 09a_Exhibit I_Soil_ASC_Part 1 2018-09-28, Sections 3.5.1.6 and 3.6.3.

¹¹⁶ B2HAPPDoc3-16 ASC 09a_Exhibit I_Soil_ASC_Part 1 2018-09-28, Section 3.6.2.

¹¹⁷ B2HAPPDoc3-16 ASC 09a_Exhibit I_Soil_ASC_Part 1 2018-09-28, Section 3.5.2.1.

1 draining rock, which would isolate native soil from erosive conditions. Access roads used during
2 operations would be seeded with a grass mix and revegetated.¹¹⁸

3
4 The applicant expects that it would require approximately 3,400 gallons of liquid propane as
5 backup fuel for generators at communications stations; herbicide; gasoline; motor oil;
6 antifreeze; and transmission fluid. In addition, the applicant would use 14,800 gallons of PCB-
7 free insulating oil at the Longhorn Station to insulate shunt reactors and the neutral grounding
8 reactor.¹¹⁹ Hazardous materials management is further discussed in the mitigation section
9 below.

10
11 *Measures to Mitigate Potential Adverse Impacts to Soils*

12
13 *Erosion*

14
15 As noted above, the applicant represents that soil erosion could occur during construction but
16 that soil erosion would be minimal during operations.¹²⁰

17
18 There are a number of measures the applicant proposes to implement to reduce erosion during
19 construction. Proposed facility construction must be conducted in accordance with an NPDES
20 1200-C Construction Stormwater Permit, including an associated Erosion and Sedimentation
21 Control Plan (ESCP). NPDES 1200-C permits are federally-delegated from the U.S. Environmental
22 Protection Agency to DEQ, and are therefore not included in or governed by the site certificate.
23 The NPDES 1200-C permit is intended to regulate and manage stormwater during construction.
24 The NPDES 1200-C Construction Stormwater Permit Application and draft ESCP the applicant
25 submitted to the Oregon Department of Environmental Quality (DEQ) are included in ASC
26 Exhibit I, Attachment I-3. Based on its evaluation of the NPDES permit application and
27 associated ESCP, DEQ notified the applicant and the Department in December 2012 that DEQ
28 expects to be able to issue the NPDES 1200-C construction stormwater permit for the proposed
29 facility within two to three weeks of receiving the site certificate and the final version of the
30 ESCP.¹²¹

31
32 The applicant states that erosion would be minimized through the following general best
33 management practices (BMPs) in the ESCP. Traffic, heavy equipment, and construction would
34 be constrained to existing roads, when practicable.¹²² New roads would be constructed to avoid
35 steep areas; roads would be constructed so that proper drainage is not impaired.¹²³

¹¹⁸ B2HAPPDoc3-16 ASC 09a_ Exhibit I_Soil_ASC_Part 1 2018-09-28, Section 3.5.2.

¹¹⁹ B2HAPPDoc3-13 ASC 07_ Exhibit G_Materials_ASC 2018-09-28, Table G-3a and Section 3.2.

¹²⁰ B2HAPPDoc3-16 ASC 09a_ Exhibit I_Soil_ASC_Part 1 2018-09-28, Section 3.5.2.1.

¹²¹ B2HAPPDoc3-17 ASC 09b_ Exhibit I_Soil_ASC_Part 2 2018-09-28, Attachment I-4.

¹²² B2HAPPDoc3-16 ASC 09a_ Exhibit I_Soil_ASC_Part 1 2018-09-28, Section 3.6.4.

¹²³ B2HAPPDoc3-16 ASC 09a_ Exhibit I_Soil_ASC_Part 1 2018-09-28, Section 3.6.4.

1 Furthermore, the applicant represents that it would (a) avoid earth-disturbing activities during
2 wet weather; (b) implement sediment controls in work areas; (c) implement storm drain inlet
3 protection; and (e) implement non-stormwater pollution controls.¹²⁴ The ESCP would also
4 include specific BMPs to be implemented in areas with higher potential for soil erosion impacts.
5 Those BMPs would include:¹²⁵

- 6
- 7 • Seeding and Stabilization: Seeding would be conducted to stabilize disturbed areas. If
8 topsoil is removed, it would be separated from subsoils and stored separately. Topsoils
9 would be returned to the removal site and would not be spread in other areas. Seeding
10 measures would be evaluated after two growing seasons, and areas of inadequate cover
11 would be re-seeded.
- 12 • Silt Fencing: Silt fences would be used during construction to trap sediment, which
13 would be removed before it reaches one-third of the aboveground silt fence height.
14 Once the drainage area has become permanently stabilized, the fence materials and
15 sediment deposits would be removed. The disturbed area would be graded and re-
16 seeded.
- 17 • Vegetation Buffers: Vegetation buffers would be used to treat sheet flow from adjacent
18 surfaces by slowing runoff velocities, and allowing sediment and other pollutants to
19 partially infiltrate into underlying soils. Vegetation buffers would be inspected, as
20 necessary, to ensure uniform sheet flow and minimize any development of channels.
- 21 • Temporary Construction Entrances: Temporary construction entrance gravel pads would
22 prevent mud and sediment from leaving the construction site. After rainfall, structures
23 used to trap sediment will be inspected and cleaned out as necessary.
- 24 • Concrete Washouts: Concrete washouts would be located away from waterbodies. They
25 would be installed prior to concrete construction. Washouts would be repaired,
26 enlarged, or cleaned as necessary to maintain capacity for wasted concrete.

27

28 The applicant proposes, and the Department recommends, the following conditions relating the
29 DEQ-issued NPDES 1200, and as required by the NPDES 1200, the ESCP:

30

31 **Recommended Soil Protection Condition 1:** The certificate holder shall:

- 32 a. Prior to construction of the facility, submit to the Department a final copy of an
33 ODEQ-issued NPDES 1200-C General Construction Permit, including the final Erosion
34 Sediment Control Plan (ESCP). The protective measures described in the 1200-C
35 Permit Application and ESCP as provided in Attachment I-3 of the Final Order on the
36 ASC, shall be included in the final ESCP.
- 37 b. During construction of the facility, the certificate holder shall conduct all work in
38 compliance with the NPDES 1200-C General Construction Permit and ESCP.

¹²⁴ B2HAPPDoc3-16 ASC 09a_Exhibit I_Soil_ASC_Part 1 2018-09-28, Sections 3.6.

¹²⁵ B2HAPPDoc3-16 ASC 09a_Exhibit I_Soil_ASC_Part 1 2018-09-28, Section 3.6.4.

1
2 Compliance with the NPDES 1200-C permit and ESCP, as issued and approved by DEQ, would
3 reduce soil erosion by water. To minimize the potential for wind erosion during construction,
4 the applicant would apply seed, apply mulch, and use water to control dust in areas susceptible
5 to wind erosion.¹²⁶

6
7 As soon as construction is completed in any given area, the applicant would reclaim the area in
8 accordance with the Reclamation and Revegetation Plan (ASC Exhibit P1, Attachment P1-3)
9 unless that area is covered by an aboveground facility. In addition, following construction, the
10 applicant would limit surface erosion on the roads that would be retained for operation by
11 seeding and revegetating the roads in accordance with the Reclamation and Revegetation
12 Plan.¹²⁷ Recommended Fish and Wildlife Habitat Condition 1 would require the certificate
13 holder to submit a finalized Reclamation and Revegetation Plan to the Department for its
14 approval, and to conduct all work in compliance with that plan.

15
16 *Spills or Leaks*

17
18 Each multi-use area would contain up to one aboveground storage tank (AST) for gasoline or
19 diesel fuel. To contain potential spills, each AST would be located within secondary
20 containment with a capacity of at least ten percent greater than the volume of the AST. In
21 addition to ASTs, areas that may be used for storage of materials that could result in a spill
22 (such as vehicle maintenance areas) would be limited to multi-use areas, which would be
23 fenced with a locked gate.¹²⁸ Herbicides would not be stored on-site during facility operations
24 but would be brought in on an as-needed basis for vegetation management, and would be
25 applied, handled, and managed in accordance with the Noxious Weed Plan (ASC Exhibit P,
26 Attachment P1-5).¹²⁹ Recommended Fish and Wildlife Habitat Conditions 3 would require the
27 certificate holder to submit a finalized Noxious Weed Plan to the Department for its approval,
28 and to conduct all work in compliance with that plan.

29
30 The applicant would require its construction contractors to abide by a Spill Prevention, Control,
31 and Countermeasures Plan (SPCC). An SPCC Plan contains site-specific spill prevention,
32 response, and cleanup procedures to minimize the risk and impacts of spills or leaks of fuels,

¹²⁶ B2HAPPDoc3-16 ASC 09a_Exhibit I_Soil_ASC_Part 1 2018-09-28, Section 3.6.5 and B2HAPPDoc3-14 ASC 08a_Exhibit H_Geology_ASC_Part 1 2018-09-28, Section 3.9.2.2.

¹²⁷ B2HAPPDoc3-16 ASC 09a_Exhibit I_Soil_ASC_Part 1 2018-09-28, Sections 3.5.1.1 and 3.6.4.

¹²⁸ B2HAPPDoc3-13 ASC 07_Exhibit G_Materials_ASC 2018-09-28, Section 3.3.

¹²⁹ B2HAPPDoc3-16 ASC 09a_Exhibit I_Soil_ASC_Part 1 2018-09-28, Section 3.5.1.5.

1 lubricants, coolants, or solvents. The applicant provided its draft SPCC as Attachment G-4 to
2 ASC Exhibit G. The draft SPCC provides, in pertinent part, that:¹³⁰

- 3
- 4 • Liquids transfer and refueling would occur only at approved locations that are at least
- 5 100 feet away from any wetlands or surface waters, 200 feet from any private water
- 6 well and 400 feet from any municipal or community water well.
- 7 • Crews would maintain adequate spill response equipment available at the dispensing or
- 8 transfer location.
- 9 • Fuels in storage tanks would be located at least 100 feet from wetlands, 200 feet from
- 10 private water wells, and 400 feet from municipal water supply wells. Furthermore, the
- 11 applicant would install a temporary berm around the tank, which would be lined with
- 12 plastic, to provide for containment. The container would be inspected daily.
- 13 • A fuel truck with a maximum of 300 gallons of fuel may enter restricted areas to
- 14 refuel construction equipment; two trained personnel will be present during refueling to
- 15 reduce the potential for spill or accidents.
- 16 • Each contractor would be required to develop a detailed, site-specific Hazardous
- 17 Materials Management Plan prior to construction.
- 18

19 The applicant proposes, and the Department recommends, the following Conditions relating to
20 an SPCC Plan:

21

22 **Recommended Soil Protection Condition 2:** The certificate holder shall:

- 23 a. Prior to construction of the facility, submit to the Department a final copy of a
- 24 Construction Spill Prevention Control and Countermeasures Plan (SPCC Plan). The
- 25 protective measures described in the draft Construction SPCC Plan, as provided in
- 26 Attachment G-4 of the Final Order on the ASC, shall be included in the final SPCC
- 27 Plan, unless otherwise approved by the Department.
- 28 b. During construction of the facility, the certificate holder shall conduct all work in
- 29 compliance with the final SPCC Plan.
- 30

31 The applicant does not anticipate that it would be required to adhere to an SPCC Plan during
32 operations unless it were to operate the Longhorn Station instead of BPA.¹³¹ However, the
33 applicant proposes, and the Department recommends that the Council adopt the following
34 condition relating to the implementation of an SPCC Plan during operation of the Longhorn
35 Station, if necessary:

36

37 **Recommended Soil Protection Condition 3:** Prior to operation, if the certificate holder
38 is required by DEQ statutes or rules to implement a SPCC Plan for operation of the
39 facility, the certificate holder shall submit to the Department a copy of a DEQ-approved
40 operation-related SPCC Plan. The certificate holder shall maintain compliance with the

¹³⁰ B2HAPPDoc3-16 ASC 09a_Exhibit I_Soil_ASC_Part 1 2018-09-28, Section 3.6.3.

¹³¹ B2HAPPDoc3-16 ASC 09a_Exhibit I_Soil_ASC_Part 1 2018-09-28, Section 3.6.3.

1 operation-related SPCC Plan during operations at the Longhorn Station.

2
3 Based upon applicant representations, and compliance with the recommended conditions, any
4 spills are expected to be limited and contained, and would be unlikely to leave the site
5 boundary.

6
7 *Soil Compaction*

8
9 As previously discussed, no highly compaction-prone soils were identified within the site
10 boundary; however, all soil has some potential for compaction. As described in the applicant's
11 Agricultural Lands Assessment (ASC Exhibit K, Attachment K-1), it would avoid performing
12 activities that could result in soil compaction when soils are wet and therefore most susceptible
13 to compaction. Where construction activities result in soil compaction, the applicant would rip,
14 loosen, or otherwise relieve soil compaction to restore the productive potential of those soils
15 after construction completion. Once the facility is placed in service, vehicles would mostly
16 travel on already established travelways, thereby minimizing the potential for additional soil
17 compaction; however, local soil loosening may be necessary to facilitate reclamation of an area
18 disturbed during facility maintenance activities.¹³² As described in the Reclamation and
19 Revegetation Plan, measures to reduce compaction while preventing gully formation (i.e., a
20 landform created by running water) include road ripping, developing frequent water bars, and
21 using cross-ditching (e.g., rolling dips).

22
23 *Impacts to Farmland and Forested Areas*

24
25 The draft ESCP (ASC Exhibit I, Attachment I-3) would require, in part, salvaging and segregating
26 topsoil, which would reduce impacts to farmland and forested areas. Appendix B to the Section
27 IV.E., *Land Use* of this order and the applicant's Agricultural Lands Assessment (ASC Exhibit K,
28 Attachment K-1) details how the applicant would mitigate impacts to productive soils and the
29 agricultural and forest operations that require or depend on those soils. Recommended Land
30 Use Conditions 14 would requires the certificate holder to submit a finalized Agricultural Lands
31 Assessment to the Department for its approval, and to conduct all work in compliance with that
32 plan.

33
34 *Other Risks to Soils*

35
36 The proposed transmission line would require the use of explosives for blasting rock; the
37 applicant represents that use of explosives would conform to its draft Framework Blasting Plan,
38 a plan intended to prevent adverse impacts on human health and safety, property, and the
39 environment that could potentially result from the use of explosives during construction of the

¹³² B2HAPPDoc3-16 ASC 09a_Exhibit I_Soil_ASC_Part 1 2018-09-28, Section 3.6.6.

1 proposed facility. As described in Attachment G-5 of this order, the draft Framework Blasting
2 Plan would delineate procedures relating to the safe use and storage of explosives. Blasting
3 could be utilized in areas with rocky terrain to excavate tower footings, prepare station pads,
4 and to construction access roads.¹³³ The applicant states that blasting would only be utilized in
5 areas where traditional earth moving equipment and practices are unable to accomplish
6 excavation. If hard rock is encountered within the planned drilling depth, blasting may be
7 required to loosen or fracture rock to reach the required depth to install foundation structures.
8 Locations where blasting is expected would be identified within a site-specific geotechnical
9 investigation. Additionally, construction contractors may ~~to~~ use implosive sleeves during line
10 stringing to fuse conductor wires.¹³⁴

11
12 The Blasting Plan would be updated after site-specific geotechnical surveys are completed and
13 would avoid blasting in potential rockslide/landslide areas to the maximum extent possible.¹³⁵
14 The applicant proposes, and the Department recommends the Council adopt, the following
15 conditions related to blasting:

16
17 **Recommended Soil Protection Condition 4:**

- 18 a. Prior to construction, in accordance with the OAR 345-025-0016 agency
19 consultation process outlined in the draft Framework Blasting Plan (Attachment
20 G-5 of the Final Order on the ASC), the certificate holder shall finalize, and
21 submit to the Department for approval, a final Blasting Plan. ~~The protective~~
22 ~~measures described in the draft Blasting Plan in Attachment G-5 attached to the~~
23 ~~Final Order on the ASC, shall be included as part of the final Blasting Plan, unless~~
24 ~~otherwise approved by the Department.~~ The final Blasting Plan shall meet all
25 applicable federal, state and local ~~the~~ requirements ~~of the Oregon State Police~~
26 ~~and the Oregon Office of State Fire Marshal~~ related to the transportation,
27 storage, and use of explosives.
28 b. During construction, ~~t~~The certificate holder shall conduct all work in compliance
29 with the final Blasting Plan approved by the Department.

30
31 Soil Revegetation and Reclamation

32
33 As previously discussed, factors that have the potential to affect the level of effort required to
34 reclaim disturbed soils include soil compaction, the amount of stony-rocky soil, droughty soil,
35 depth to bedrock, and the presence of hydric soils. The applicant's proposed Vegetation
36 Management Plan (ASC Exhibit P, Attachment P1-4) describes the revegetation actions and
37 activities that would occur in areas where one or more of these factors apply. For example,
38 adaptive seed mixtures and fertilization, mulching, and monitoring may be necessary to
39 successfully reclaim areas with shallow bedrock.¹³⁶ Recommended Fish and Wildlife Habitat

¹³³ B2HAPPDoc3-13 ASC 07_Exhibit G_Materials_ASC 2018-09-28, Attachment G-5, p. 1.

¹³⁴ B2HAPPDoc3-13 ASC 07_Exhibit G_Materials_ASC 2018-09-28, Attachment G-5, Section 1.2.

¹³⁵ B2HAPPDoc3-16 ASC 09a_Exhibit I_Soil_ASC_Part 1 2018-09-28, Section 3.6.3.

¹³⁶ B2HAPPDoc3-16 ASC 09a_Exhibit I_Soil_ASC_Part 1 2018-09-28, Section 3.6.7.

1 Conditions 2 would require the certificate holder to submit a finalized Vegetation Management
2 Plan to the Department for its approval, and to conduct all work in compliance with that plan.

3
4 Monitoring Program

5
6 Each year for up to five years following construction completion, the applicant would perform
7 post-construction reclamation monitoring to evaluate the reclamation success of reclaimed
8 temporary disturbance areas and to determine if site soils are adequately protected or if
9 further monitoring and reclamation actions are warranted.¹³⁷ Following year five, the applicant
10 would be required to implement an adaptive long-term monitoring schedule based on habitat
11 type and revegetation success during initial five-year period. Recommended Fish and Wildlife
12 Habitat Condition 1 would require the certificate holder to submit a finalized Reclamation and
13 Revegetation Plan to the Department for its approval, and to conduct all work in compliance
14 with that plan.

15
16 The final DEQ-approved ESCP would include regular inspection requirements. The draft ESCP
17 (ASC Exhibit I, Attachment I-3) specifies the required frequency of inspections of ESCP controls
18 and practices to ensure that BMPs are in working order. For example, the draft ESCP would
19 require daily inspections when stormwater runoff is occurring, or every two weeks in dry
20 conditions.

21
22 Once the facility is placed in service, the applicant proposes to perform regular (generally bi-
23 annual) inspection of the facility to determine if facility structures are resulting in erosion and
24 whether or not any corrective or mitigation measures are necessary.¹³⁸ The applicant proposes,
25 and the Department recommends that the Council adopt, the following condition to ensure soil
26 impacts are monitored during facility operations:

27
28 **Recommended Soil Protection Condition 5:** During operation, the certificate holder
29 shall inspect the facility components for soil impacts as part of the certificate holder's
30 regular transmission line inspection process and shall implement corrective action and
31 mitigation measures, if necessary.

32
33 Subject to compliance with the recommended conditions above, the Department recommends
34 that the Council find the design, construction, and operation of the proposed facility would not
35 be likely to result in a significant adverse impact to soils.

36
37 Conclusions of Law

38
39 Based on the foregoing recommended findings of fact and conclusions of law, and subject to
40 compliance with the recommended site certificate conditions, the Department recommends

¹³⁷ B2HAPPDoc3-25 ASC 16A_Exhibit P1_Wildlife_ASC_Part 1_Main thru Attach P1-6 rev 2018-09-28, Attachment P1-3, Section 6.0.

¹³⁸ B2HAPPDoc3-16 ASC 09a_Exhibit I_Soil_ASC_Part 1 2018-09-28, Section 3.7.

1 that the Council find that the proposed facility, including the proposed and alternative routes,
2 would comply with the Council's Soil Protection standard.

3
4
5
6 **IV.E. Land Use: OAR 345-022-0030**

- 7
8 (1) *To issue a site certificate, the Council must find that the proposed facility complies with*
9 *the statewide planning goals adopted by the Land Conservation and Development*
10 *Commission.*
- 11 (2) *The Council shall find that a proposed facility complies with section (1) if:*
- 12 (a) *The applicant elects to obtain local land use approvals under ORS 469.504(1)(a) and*
13 *the Council finds that the facility has received local land use approval under the*
14 *acknowledged comprehensive plan and land use regulations of the affected local*
15 *government; or*
- 16 (b) *The applicant elects to obtain a Council determination under ORS 469.504(1)(b) and*
17 *the Council determines that:*
- 18 (A) *The proposed facility complies with applicable substantive criteria as described in*
19 *section (3) and the facility complies with any Land Conservation and*
20 *Development Commission administrative rules and goals and any land use*
21 *statutes directly applicable to the facility under ORS 197.646(3);*
- 22 (B) *For a proposed facility that does not comply with one or more of the applicable*
23 *substantive criteria as described in section (3), the facility otherwise complies*
24 *with the statewide planning goals or an exception to any applicable statewide*
25 *planning goal is justified under section (4); or*
- 26 (C) *For a proposed facility that the Council decides, under sections (3) or (6), to*
27 *evaluate against the statewide planning goals, the proposed facility complies*
28 *with the applicable statewide planning goals or that an exception to any*
29 *applicable statewide planning goal is justified under section (4).*
- 30 (3) *As used in this rule, the "applicable substantive criteria" are criteria from the affected*
31 *local government's acknowledged comprehensive plan and land use ordinances that are*
32 *required by the statewide planning goals and that are in effect on the date the applicant*
33 *submits the application. If the special advisory group recommends applicable*
34 *substantive criteria, as described under OAR 345-021-0050, the Council shall apply them.*
35 *If the special advisory group does not recommend applicable substantive criteria, the*
36 *Council shall decide either to make its own determination of the applicable substantive*
37 *criteria and apply them or to evaluate the proposed facility against the statewide*
38 *planning goals.*
- 39 (4) *The Council may find goal compliance for a proposed facility that does not otherwise*
40 *comply with one or more statewide planning goals by taking an exception to the*
41 *applicable goal. Notwithstanding the requirements of ORS 197.732, the statewide*
42 *planning goal pertaining to the exception process or any rules of the Land Conservation*

1 *and Development Commission pertaining to the exception process, the Council may take*
2 *an exception to a goal if the Council finds:*

3 *(a) The land subject to the exception is physically developed to the extent that the*
4 *land is no longer available for uses allowed by the applicable goal;*

5 *(b) The land subject to the exception is irrevocably committed as described by the rules*
6 *of the Land Conservation and Development Commission to uses not allowed by the*
7 *applicable goal because existing adjacent uses and other relevant factors make uses*
8 *allowed by the applicable goal impracticable; or*

9 *(c) The following standards are met:*

10 *(A) Reasons justify why the state policy embodied in the applicable goal should not*
11 *apply;*

12 *(B) The significant environmental, economic, social and energy consequences*
13 *anticipated as a result of the proposed facility have been identified and adverse*
14 *impacts will be mitigated in accordance with rules of the Council applicable to*
15 *the siting of the proposed facility; and*

16 *(C) The proposed facility is compatible with other adjacent uses or will be made*
17 *compatible through measures designed to reduce adverse impacts.*

18 *(5) If the Council finds that applicable substantive local criteria and applicable statutes and*
19 *state administrative rules would impose conflicting requirements, the Council shall*
20 *resolve the conflict consistent with the public interest. In resolving the conflict, the*
21 *Council cannot waive any applicable state statute.*

22 *(6) If the special advisory group recommends applicable substantive criteria for an energy*
23 *facility described in ORS 469.300(10)(a)(C) to (E) or for a related or supporting facility*
24 *that does not pass through more than one local government jurisdiction or more than*
25 *three zones in any one jurisdiction, the Council shall apply the criteria recommended by*
26 *the special advisory group. If the special advisory group recommends applicable*
27 *substantive criteria for an energy facility described in ORS 469.300(10)(a)(C) to (E) or a*
28 *related or supporting facility that passes through more than one jurisdiction or more*
29 *than three zones in any one jurisdiction, the Council shall review the recommended*
30 *criteria and decide whether to evaluate the proposed facility against the applicable*
31 *substantive criteria recommended by the special advisory group, against the statewide*
32 *planning goals or against a combination of the applicable substantive criteria and*
33 *statewide planning goals. In making the decision, the Council shall consult with the*
34 *special advisory group, and shall consider:*

35 *(a) The number of jurisdictions and zones in question;*

36 *(b) The degree to which the applicable substantive criteria reflect local government*
37 *consideration of energy facilities in the planning process; and*

38 *(c) The level of consistence of the applicable substantive criteria from the various zones*
39 *and jurisdictions.*

40
41 **Findings of Fact**

42
43 The Land Use standard requires the Council to find that a proposed facility complies with local
44 applicable substantive criteria and statewide planning goals adopted by the Land Conservation

1 and Development Commission (LCDC).¹³⁹ Applicable substantive criteria are criteria from the
2 affected local government’s acknowledged comprehensive plan and land use ordinance that
3 are required by the statewide planning goals identified as applicable to the proposed facility
4 based on facility type or facility component and land use zone, and that are in effect on the
5 date the applicant submits the application for site certificate (ASC), which in this instance
6 occurred on February 27, 2013. The affected local governments include the governing bodies of
7 the jurisdictions for which proposed facility components would be located, which in this
8 instance includes the governing bodies of five Oregon counties: Morrow, Umatilla, Union,
9 Baker, and Malheur; and two Oregon cities: North Powder and Huntington.

10
11 The analysis area for potential land use impacts, as defined in the second amended project
12 order, is the area within and extending half-mile from the site boundary, as presented in ASC
13 Exhibit K Figure K-1 and Figure 4, *Land Use Analysis Area* below.

14

¹³⁹ The Council must apply the Land Use standard in conformance with the requirements of ORS 469.504.

1 **Figure 4: Land Use Analysis Area**

2
3
4

1 *IV.E.1. Local Applicable Substantive Criteria*
2

3 The governing bodies of the affected local governments within whose jurisdiction the facility or
4 facility components are proposed to be located are considered “special advisory groups” (SAG)
5 and must be appointed by Council. The Council appointed the following SAGs for the proposed
6 facility:
7

- 8 • Morrow County Board of Commissioners (October 7, 2011)
- 9 • Umatilla County Board of Commissioners (October 7, 2011)
- 10 • Union County Board of Commissioners (October 7, 2011)
- 11 • Baker County Board of Commissioners (October 7, 2011)
- 12 • Malheur County Court (October 7, 2011)
- 13 • North Powder City Council (March 15, 2013)
- 14 • Huntington City Council (August 2, 2013)

15
16 Applicable substantive criteria identified by the SAGs for the proposed facility are presented
17 and evaluated in Section IV.E.1.1., *Morrow County* through IV.E.1.7., *City of Huntington* of this
18 order.
19

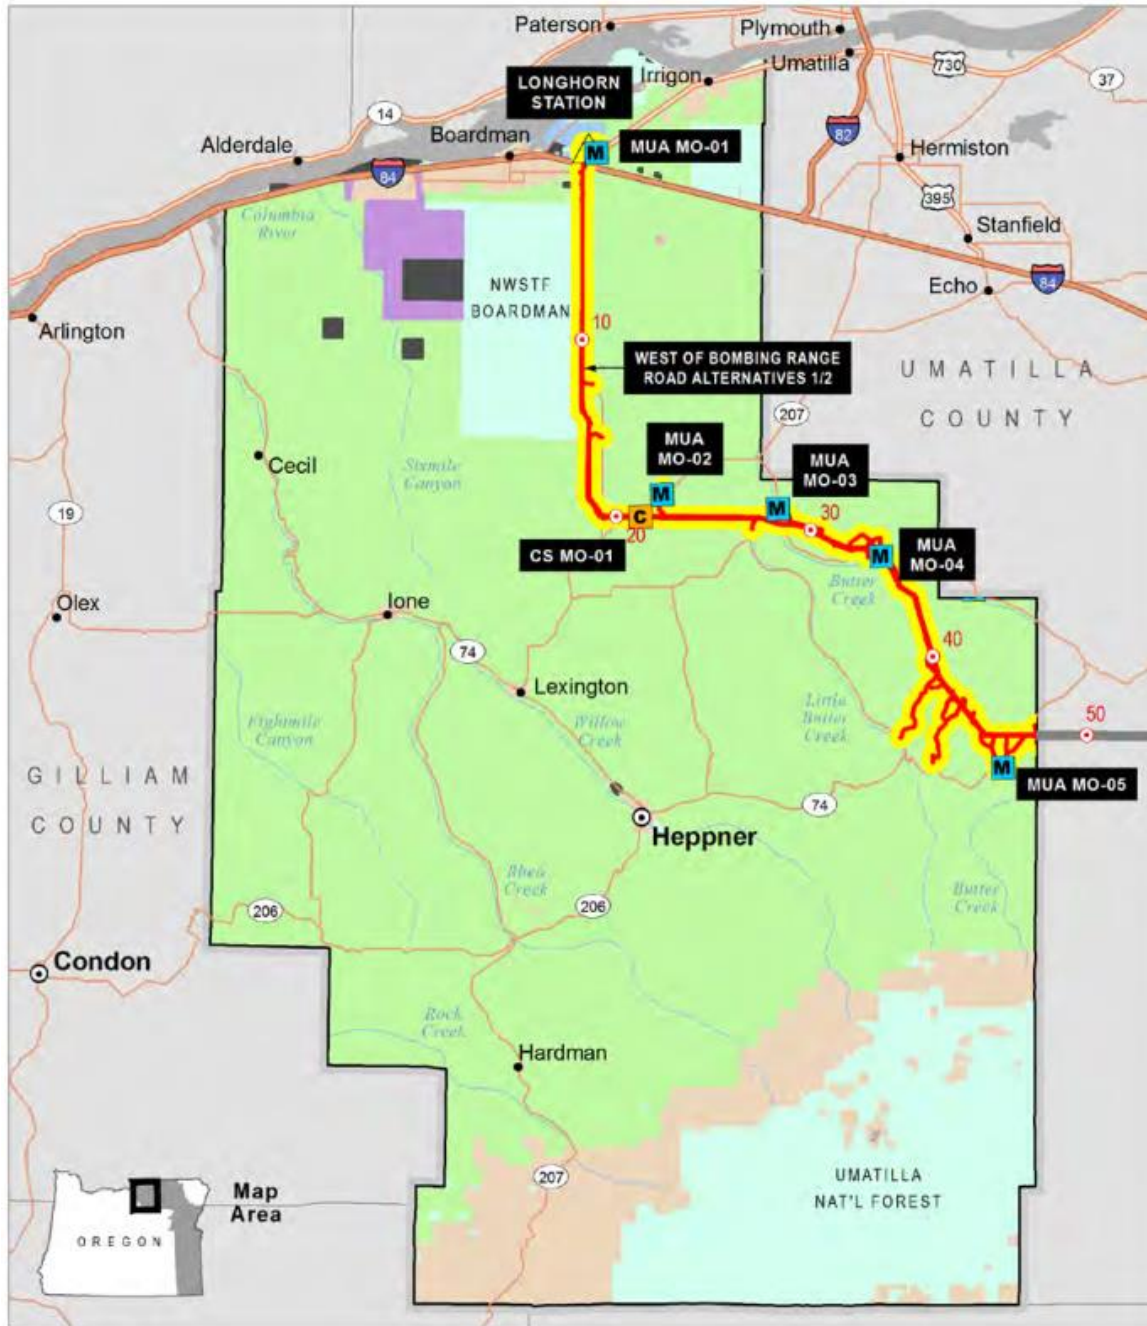

20 *IV.E.1.1. Morrow County*
21

22 Facility components proposed within Morrow County include approximately 47.5 miles of 500
23 kV transmission line; the Longhorn Station, if not developed by BPA; five temporary multi-use
24 areas; 37.5 miles of new access roads; 30.2 miles of substantially modified existing roads; 39
25 temporary pulling and tensioning sites; and, one communication station.¹⁴⁰ In addition, there
26 are two 3.7 mile transmission line segments proposed as alternatives to the proposed
27 transmission line route along Bombing Range Road – West of Bombing Range Road alternative
28 1 and 2. The locations of proposed and alternative facility components are represented in ASC
29 Exhibit K Figure K-8 and Figure 5, *Morrow County Zoning and Proposed Facility Components*
30 below.
31
32
33
34

¹⁴⁰ As described in ASC Exhibit B, if developed by the applicant, the Longhorn Station would permanently disturb approximately 20 acres and would include 500-kV circuit breakers, high-voltage switches, bus supports, transmission line termination structures, a 500-kV series capacitor bank, and 500-kV shunt reactor banks. The 500-kV transmission line termination structures would be approximately 125 to 135 feet tall. A control house to accommodate the necessary system communications, control equipment, and a restroom facility would also be constructed.

Multi-use areas would be approximately 30 acres in size and would include construction field offices, parking areas, construction vehicle maintenance area, helicopter operations (helipads), explosives storage, hazardous materials storage, water storage tank, portable concrete batch plant, concrete washout station, gravel tire scrub area, noxious weed wash-off station, and bulk materials storage area.

1 **Figure 5: Morrow County Zoning and Proposed Facility Components**

2
3
4

1 The above-described facility components proposed in Morrow County would be located on land
2 zoned Exclusive Farm Use (EFU), some of which would also be located within the Significant
3 Resource Overlay (SRO) zone and Special Flood Hazard Area (SFHA); General Industrial (MG);
4 and, Port Industrial (PI). Facility components would also be located in existing rights-of-way and
5 public land (restricted public access - federally-owned land by U.S. Navy). Proposed facility
6 components within each zone (with proposed land use category denoted in parenthesis) are as
7 follows:

8

9 Exclusive Farm Use Zone (Utility Facility Necessary for Public Service)

10 35.4 miles of 500 kV transmission line (Significant Resource Overlay [SRO])¹⁴¹

11 26 miles of substantially modified roads; 32.7 miles of new roads (SRO)

12 4 temporary multi-use areas (Special Flood Hazard Area [SFHA])¹⁴²

13 36 temporary pulling and tensioning sites

14

15 General Industrial Zone (Utility, transmission and communication towers less than 200 feet
16 in height)

17 0.3 miles of 500 kV transmission line

18 0.1 mile of new road

19

20 Port Industrial Zone (Power generating and utility facilities)

21 0.9 miles of 500 kV transmission line

22 1 switching station (Longhorn Station)

23 1 temporary multi-use area

24 2 temporary pulling and tensioning sites

25

26 Existing Rights of Way¹⁴³

27 0.3 miles of 500 kV transmission line

28 0.1 mile of new road

29

30 Public Zone (Federally-Owned and no applicable substantive criteria)

31 10.5 miles of 500 kV transmission line

32 5 miles of substantially modified roads; 4.5 miles of new road

33 1 temporary pulling and tensioning site

34

35 The two alternative 3.7 mile 500 kV transmission line segments, referred to as West of Bombing
36 Range Road alternative 1 and 2, would be located in EFU zoned land and public land.

¹⁴¹ The applicant proposes 5 temporary stream crossings (for transmission line installation) and substantial modification of an existing road and road/bridge within Goal 5 designated streams/riparian areas.

¹⁴² One of four multi-use area, MUA MO-02, would be located within the Sand Hollow Special Hazard Overlay Area.

¹⁴³ There are no MCZO provisions related specifically to the Major Road or Railroad Right-of-Way Zone—i.e., there are no approval criteria for uses in this zone. No analysis is required, and no standard must be met, to comply with the MCZO with respect to proposed facility components within the Major Road or Railroad Right-of-Way Zone.

1
 2 Applicable substantive criteria for proposed facility components in Morrow County, in effect on
 3 the date the applicant submitted the pASC (February 27, 2013), are presented in Table LU-1
 4 below.
 5

**Table LU-1: Applicable Substantive Criteria for Proposed Facility Components in Morrow County

Morrow County Comprehensive Plan²	
Agricultural Lands Element Policy 1	
Natural Hazards Element	
Utility Finding C; Policy C	
Goal 5 Resources	
Notes:	
1. ASC Exhibit K Table K-9 includes “potentially applicable substantive criteria” identified by the SAG and the applicant. The evaluation of applicable substantive criteria is based on the table above, and omits some potentially applicable substantive criteria identified by the applicant. Specifically, MCZO Sections 3.010(C) (utility and transmission towers), (G) (dimensional standards) and (H) (yard setbacks) were omitted because under ORS 215.283(1)(e), a utility facility necessary for public service is permitted subject only to the requirements of ORS 215.275 and the county cannot impose additional approval criteria; ORS 215.283 and 215.275 requirements are addressed later in this order. MCZO Article 4 provisions have not been included in this table, as Article 4 contains ministerial reviews for site plans and access (road, utility) permits to be conducted and issued directly by the county.	
2. MCCP elements, findings and policies omitted from this table include those that are not related to the proposed facility, including the Energy Conservation element (applies to projects serving the county), Finding 19 of the Agricultural Lands Element (applies to hydro-electric power and irrigated agriculture), General Policy	

Table LU-1: Applicable Substantive Criteria for Proposed Facility Components in Morrow County

F (applies to local electric distribution projects), Utility Finding and Policy D (applies to substations that would serve Morrow County).
--

1
2 The following analysis addresses the applicant’s ASC Exhibit K evaluation of compliance with
3 applicable substantive criteria.

4
5 **Morrow County Zoning Ordinance**

6
7 *Morrow County Zoning Ordinance Article 3 Section 3.010 Exclusive Farm Use Zone*

8
9 Proposed facility components within EFU-zoned land in Morrow County would include up to
10 35.4 miles of a single-circuit 500 kV transmission line; 32.7 mile of new access roads; 26 miles of
11 substantially modified existing roads; four temporary multi-use areas (with helipads); 36
12 temporary pulling and tensioning sites; and, one communication station.¹⁴⁴ Alternative facility
13 components within EFU-zoned land in Morrow County would include up to 2 miles of a single-
14 circuit 500 kV transmission line; 0.8 of a mile of substantially modified roads; and, 1.4 miles of
15 new roads. An evaluation of the applicable substantive criteria for these uses within EFU-zoned
16 land is presented below.

17
18 MCZO Section 3.010(D): Conditional Uses Permitted

19
20 *In an EFU Zone, the following uses and their accessory uses are permitted subject to the*
21 *demonstration of compliance with the requirements of Article 6 of this ordinance and*
22 *Section (G) below:*

23
24 *Section 3.010(D)(17) Utility facilities “necessary” for public service, excluding commercial*
25 *utility facilities for the purpose of generating power for public use by sale, and*
26 *transmission towers over 200 feet in height. A utility facility is necessary for public*
27 *service if the facility must be sited in an exclusive farm use zone in order to provide the*
28 *service. To demonstrate that a utility facility is necessary, an applicant must show that*

¹⁴⁴ In ASC Exhibit K, the applicant describes that Morrow County Planning Department confirmed that there were no separate applicable substantive criteria or permit requirements for the temporary multi-use areas/helipads, but requested confirmation through site certificate condition that the helipads would be removed and impacted area restored, unless otherwise requested by the landowner, following construction. If temporary helipads are not removed and used for operational purposes, the county may consider the use a “personal use airport” requiring a conditional use permit. Recommended General Standard of Review Condition 9 and Fish and Wildlife Habitat Condition 1,2 & 5 require restoration of temporarily impacted vegetation, and include requirements for monitoring and tracking to ensure successful vegetation within an appropriate duration.

1 *reasonable alternatives have been considered and that the facility must be sited in an*
2 *exclusive farm use zone due to one or more of the factors list in OAR 660-033-0130(16).*

3
4 MCZO Section 3.010(D)(17) identifies utility facilities “necessary” for public service as a
5 conditional use permitted on EFU zoned land, subject to the requirements of MCZO Article 6
6 Conditional Uses and Section 3.010(G) Dimensional Standards. Transmission lines are
7 considered utility facilities; utility facilities are considered “necessary” for public service if the
8 facility, after consideration of reasonable alternative locations, must be sited in EFU zoned land
9 due to one or more factors listed in OAR 660-033-0130(16) to provide a service.

10
11 As described in ASC Exhibit K, proposed facility components within EFU zoned land in Morrow
12 County would include up to 35.4 miles of a single-circuit 500 kV transmission line. In addition~~al~~
13 to the 500 kV transmission line, proposed facility components within EFU zoned land would
14 include 32.7 mile of new access roads; 26 miles of substantially modified existing roads; four
15 temporary multi-use areas (with helipads); 36 temporary pulling and tensioning sites; and, one
16 communication station, which the applicant requests be evaluated as ancillary facilities to the
17 transmission line as a utility facility. The applicant asserts that ancillary facilities, based on a
18 2001 and 2005 court decision, should be considered under the “utility facility necessary for
19 public service” land use category.¹⁴⁵ Based on review of the referenced court decision and
20 historic Council land use evaluations, the Department agrees and recommends Council find that
21 proposed and alternative facility components should be evaluated as a utility facility necessary
22 for public service and therefore would be a ~~conditionally~~ permitted use in EFU zoned land
23 under MCZO Section 3.010(D)(17).

24
25 Notwithstanding the language in the County’s code, the conditional use requirements beyond
26 those that are consistent with ORS 215.275 are not applicable to proposed and alternative
27 facility components because, as a utility facility necessary for public service under ORS
28 215.283(1)~~(g)~~, the use is permitted subject only to the requirements of ORS 215.275 and the
29 county cannot impose additional approval criteria. Therefore, the conditional use requirements
30 of MCZO Article 6 Conditional Uses and Section 3.010(G) Dimensional Standards are not
31 evaluated as applicable substantive criteria; however, it is noted that the applicant evaluates
32 these criteria and based on review, the Department considers the analysis to represent
33 consistency with these provisions.

34
35 Proposed facility components would be located in EFU zoned land across five Oregon counties
36 including Morrow, Umatilla, Union, Baker, and Malheur. For facility components located in EFU
37 zoned land, the land use compliance evaluation is limited to ORS 215.275, as presented in

¹⁴⁵ See *Save Our Rural Or. v. Energy Facility Siting Council*, 339 Or. 353, 384 (2005) (upholding Council’s determination that ancillary facilities are considered “utility facilities necessary for public service”); *Cox v. Polk County*, 174 Or. Ct. App. 332, 343-44 (2001) (“utility facilities necessary for public service” may include ancillary or off-site equipment).

1 Section IV.E.2.1., *ORS 215.283 and, ORS 215.275 and ORS 215.296 (Exclusive Farm Use*
2 *Requirements)* of this order.¹⁴⁶

3
4 *Morrow County Zoning Ordinance Article 3 Section 3.070 General Industrial (M-G) Zone*

5
6 MCZO 3.070(A): Uses Permitted Outright

7
8 *In an M-G Zone, the following uses and their accessory uses are permitted outright; except*
9 *as limited by subsection C of this section. A Zoning Permit is required and projects larger*
10 *than 100 acres are subject to Site Development Review (Article 4 Supplementary Provisions*
11 *Section 4.170 Site Development Review).*

12
13 *15. Utility, transmission and communications towers less than 200 feet in height.*

14
15 MCZO Section 3.070(A)(15) establishes utility and transmission towers less than or equal to 200
16 feet in height, and accessory uses, as a use permitted outright within a General Industrial (M-G)
17 zone, subject to the requirements established in MCZO Section 3.070(C).¹⁴⁷ MCZO Section
18 3.070(A)(15) also establishes that a zoning permit is required and, for projects larger than 100
19 acres, requires Site Development Review under MCZO Section 4.170.

20
21 As described in ASC Exhibit K, proposed facility components within Morrow County M-G zoned
22 land would include up to 0.3 miles of a single-circuit 500 kV transmission line with structures
23 that could extend up to 200 feet in height. Accessory uses to the transmission line would
24 include 0.1 of a mile of new access road. Therefore, the Department recommends Council find
25 that the proposed transmission towers and proposed 0.1 of a mile of new access road,
26 evaluated as an accessory use, would be a use permitted outright in M-G zoned land under
27 MCZO Section 3.070(A)(15).

28
29 The applicant would be required to obtain an M-G zoning permit and proposes Land Use
30 Condition 1, administratively amended by the Department for clarification, to demonstrate that
31 all ministerial county-level permits would be obtained prior to any phase or segment of the
32 facility where the permit is required (recommended conditions are presented under the
33 heading *Recommended Land Use Conditions – Morrow County* of this section). The proposed
34 facility would be subject to use limitations under MCZO Section 3.070(C), evaluated below. The
35 applicant confirms that proposed facility components within Morrow County M-G zoned land
36 would occupy less than 100 acres (estimated at approximately 7.9 acres); therefore while
37 MCZO Section 4.170 Site Development Review include applicable substantive criteria that

¹⁴⁶ Although beyond what is required to demonstrate compliance with ORS 215.275, the applicant performed a county-specific alternatives analysis. Please refer to ASC Exhibit K Section 6.4.5. for additional information specific to Morrow County.

¹⁴⁷ Accessory use, as defined in MCZO Article 1 Section 1.030 defines “accessory use” as a use or structure incidental and subordinate to the main use of the property and located on the same lot as the main use.

1 would apply to uses within M-G zoned land, it would not apply to the proposed facility based
2 on the area impacted by proposed facility components.

3
4 MCZO 3.070(C): Use Limitations

5
6 *In an M-G Zone, the following limitations and standards shall apply to all permitted uses:*

- 7
8 1. *No use permitted under the provisions of this section that requires a lot area exceeding*
9 *two (2) acres shall be permitted to locate adjacent to an existing residential lot in a duly*
10 *platted subdivision, or a lot in a residential zone, except as approved by the Commission.*
11 2. *No use permitted under the provisions of this section that is expected to generate more*
12 *than 20 auto-truck trips during the busiest hour of the day to and from the subject*
13 *property shall be permitted to locate on a lot adjacent to or across the street from a*
14 *residential lot in a duly platted subdivision, or a lot in a residential zone.*

15
16 MCZO Section 3.070(C) restricts the location of uses permitted outright on M-G zoned land
17 from siting adjacent to an existing residential lot on a duly platted subdivision or a lot in a
18 residential zone, when the lot area exceeds two acres or would generate more than 20 auto-
19 truck trips during the busiest hour of the day. The applicant explains that proposed facility
20 components and site boundary within Morrow County M-G zoned land would not be located
21 adjacent to an existing residential lot on a duly platted subdivision or a lot in a residential zone
22 and therefore, while the criteria apply to uses within M-G zoned land, they are not applicable to
23 the proposed facility based on adjacent uses.

24
25 MCZO 3.070(D): Dimension Requirements

26
27 *The following Dimensional requirements apply to all buildings and structures constructed,*
28 *placed or otherwise established in the MG zone.*

- 29
30 1. *Lot size and frontage: A minimum lot size has not been determined for this zone*
31 *although the lot must be of a size necessary to accommodate the proposed use,*
32 *however, it is anticipated that most, if not all uses will be sited on lots of at least two*
33 *acres. The determination of lot size will be driven by the carrying capacity of the land*
34 *given the proposed use. Minimum lot frontage shall be 300 feet on an arterial or*
35 *collector; 200 feet on a local street.*
36 2. *Setbacks: No specific side or rear yard setbacks are identified within this zone, but may*
37 *be dictated by provisions of the Building Code or other siting requirements. The*
38 *minimum setback between a structure and the right-of-way of an arterial shall be 50*
39 *feet. The minimum setback of a structure from the right-of-way of a collector shall be 30*
40 *feet, and from all lower class streets the minimum setback shall be 20 feet. There shall*
41 *be no setback requirement where a property abuts a railroad siding or spur if the siding*
42 *or spur will be utilized by the permitted use.*
43 3. *Stream Setback: All sewage disposal installations such as outhouses, septic tank and*
44 *drainfield systems shall be set back from the high-water line or mark along all streams*

1 *and lakes a minimum of 100 feet, measured at right angles to the high-water line or*
2 *mark. All structures, buildings, or similar permanent fixtures shall be set back from the*
3 *high-water line or mark along all streams or lakes a minimum of 10 feet measured at*
4 *right angles to the high-water line or mark.*

- 5 4. *Uses adjacent to residential uses. A sight-obscuring fence shall be installed to buffer uses*
6 *permitted in the General Commercial Zone from residential uses. Additional landscaping*
7 *or buffering such as diking, screening, landscaping or an evergreen hedge may be*
8 *required as deemed necessary to preserve the values of nearby properties or to protect*
9 *the aesthetic character of the neighborhood or vicinity.*

10
11 MCZO Section 3.070(D)(1) establishes minimum parcel lot sizes and frontage setback
12 requirements from the parcel to arterial and local roads within M-G zoned land. The applicant
13 proposes to secure easements for access to proposed facility component locations within M-G
14 zoned land; however, if it is not possible to obtain an easement, the applicant describes that it
15 would obtain approval directly from Morrow County to partition a parcel, which at that time
16 would be required to satisfy the minimum lot size and frontage setback requirements.

17
18 MCZO Section 3.070(D)(2) establishes minimum setback requirements of 50, 30, and 20 feet
19 between a structure and road (arterial, collector, and lower class street, respectively) right-of-
20 way. Proposed facility components within M-G zoned land include a short segment of 500 kV
21 transmission line and new access road. The applicant affirms that the setback requirements
22 apply to proposed transmission line structures, but not proposed new access road, as the road
23 would not be considered a structure. The applicant also identifies that the nearest collector
24 road would be Bombing Range Road, and therefore would require a minimum 30 foot setback
25 from transmission line structures. To demonstrate compliance with the setback requirement,
26 the applicant proposes Land Use Condition 2 (recommended conditions are presented under
27 the heading *Recommended Land Use Conditions – Morrow County* of this section).

28
29 MCZO 3.070(D)(3) establishes a minimum setback requirement of 10 feet between a structure
30 and the high water mark or line of a lake or stream. The applicant describes that there are no
31 streams or lakes within 10 feet of the portion of the proposed route that goes through the M-G
32 Zone.

33
34 MCZO 3.070(D)(4) establishes that fencing, landscaping, or buffering be implemented for uses
35 located adjacent to a residence. The applicant confirms that, for proposed facility components
36 located in M-G zoned land, there are no adjacent residences.

37
38 Based on the analysis presented above, the Department recommends Council find that
39 proposed facility components with M-G zoned land would satisfy MCZO Section 3.070(D)
40 dimensional requirements.

1 MCZO 3.070(E): Transportation Impacts
2

- 3 1. *Traffic Impact Analysis (TIA). In addition to the other standards and conditions set forth*
4 *in this section, a TIA will be required for all projects generating more than 400 passenger*
5 *car equivalent trips per day. Heavy vehicles - trucks, recreational vehicles and buses - will*
6 *be defined as 2.2 passenger car equivalents. A TIA will include: trips generated by the*
7 *project, trip distribution for the project, identification of intersections for which the*
8 *project adds 30 or more peak hour passenger car equivalent trips, and level of service*
9 *assessment, impacts of the project, and, mitigation of the impacts. If the corridor is a*
10 *State Highway, use ODOT standards. (MC-C-8-98).*
11

12 MCZO 3.070(E) establishes that for conditionally permitted uses within M-G zoned land, a
13 Traffic Impact Analysis (TIA) would be required for projects that would generate more than 400
14 passenger equivalent trips per day. Based on the applicant’s assessment provided in ASC Exhibit
15 U, construction-related traffic would generate less than 400 passenger car equivalents per day.
16 However, the applicant represents that it would work with the Morrow County Road
17 Department to identify specific construction traffic-related concerns, and would develop a
18 traffic management plan prior to construction which would specify necessary traffic control
19 measures to mitigate for the effects of the temporary increase in traffic volumes. The applicant
20 proposes, and the Department recommends, Council impose Recommended Public Services
21 Condition ~~24~~ to minimize potential construction-related traffic impacts, ensure coordination
22 with the County Planning Department and Road Master, ensure necessary road permits are
23 obtained, and that a road use agreement or similar legally binding document is obtained prior
24 to construction for use of and repair of potentially impacted local roads. The Department
25 recommends Council find that, because construction-related traffic would result in less than
26 400 passenger car equivalents per day, a TIA is not required.
27

28 *Morrow County Zoning Ordinance Article 3 Section 3.073 Port Industrial (PI) Zone*
29

30 Proposed facility components within Port Industrial zoned land in Morrow County would
31 include up to 0.9 miles of a single-circuit 500 kV transmission line, the Longhorn Station, and

1 one temporary multi-use area (with helipad). An evaluation of the applicable substantive
2 criteria for these uses within Port Industrial zoned land is presented below.¹⁴⁸

3
4 MCZO 3.073(A): Uses Permitted Outright with a Zoning Permit

5
6 *Outside activities are permitted within the scope of allowed uses outlined below. Projects*
7 *larger than 100 acres are subject to Site Development Review (Article 4 Supplementary*
8 *Provisions Section 4.170 Site Development Review)*

9 ***

10 *9. Power generating and utility facilities.*

11
12 MCZO Section 3.073(A) establishes uses permitted outright within Port Industrial zoned land,
13 and includes “power generating and utility facilities.” MCZO Section 3.073(A) also requires Site
14 Development Review per MCZO Section 4.170 for projects larger than 100 acres, and
15 adherence to the provisions outlined in MCZO Section 3.073(C) Limitation on Uses, (D)
16 Dimensional Standards and (G) Traffic Impact Analysis. Per the definition of a utility facility
17 under MCZO Section 1.030, the Department recommends Council find that the proposed
18 facility would be a utility facility and therefore a use permitted outright in Port Industrial
19 zoned land under MCZO Section 3.073(A).¹⁴⁹

20
21 The Site Development Review under MCZO Section 4.170 is a ministerial review conducted by
22 the county prior to issuance of a zoning permit, defined under MCZO 1.050 as “an
23 authorization issued prior to a building permit, or commencement of a use subject to
24 administrative review, stating that the proposed use is in accordance with the requirements of
25 the corresponding land use zone.” The applicant would be required to secure zoning permits
26 from Morrow County prior to construction of the facility.¹⁵⁰ While the applicant must comply
27 with the county’s applicable Site Development Review requirements and process, the county’s
28 administration of its Site Development Review process itself is not under Council jurisdiction
29 or review, and therefore, the Council cannot restrict or condition the county’s authority in
30 administering that process. The applicant proposes, and the Department recommends,
31 Council impose Recommended Land Use Condition 1 to ensure all applicable county permits
32 are obtained prior to construction of any phase or segment of the proposed facility.

33

¹⁴⁸ As described in ASC Exhibit B, the Longhorn Station would include 500-kV circuit breakers, high-voltage switches, bus supports, and transmission line termination structures, a 500-kV series capacitor bank, and 500-kV shunt reactor banks; control equipment, and a restroom facility.

¹⁴⁹ MCZO Section 1.030 defines a utility facility as “[a]ny major structure owned or operated by a public, private, or cooperative electric, fuel, communication, sewage, or water company for the generation, transmission, distribution, or processing of its products or for the disposal of cooling water, waste, or byproducts, and including power transmission lines, major trunk pipelines, power substations, dams, water towers, sewage lagoons, sanitary landfills, and similar facilities, but excluding local sewer, water, gas, telephone and power distribution lines, and similar minor facilities allowed in any zone.”

¹⁵⁰ Pursuant to ORS 469.401(3), the county must issue a zoning permit upon submittal of the proper applications and fees, but without hearings or other proceedings and subject only to conditions set forth in the site certificate.

1 An evaluation of the applicant’s compliance with MCZO Section 3.073(C) Limitation on Uses,
2 (D) Dimensional Standards and (G) Traffic Impact Analysis is presented below.

3
4 MCZO 3.073(C): Limitations on Uses

- 5
6 1. *Material shall be stored and grounds shall be maintained in a manner which will not*
7 *create a health hazard.*
8 2. *All related provisions of the Oregon Revised Statutes shall be complied with, particularly*
9 *those dealing with hazardous substances and radioactive materials.*

10
11 MCZO Section 3.073(C) establishes limitations on uses within Port Industrial zoned land and
12 specifies that permitted uses must safely store materials, safely maintain grounds, and comply
13 with all applicable ORS requirements for handling and storing hazardous materials.

14
15 As described above, proposed facility components within Port Industrial zoned land would
16 include the Longhorn Station and a temporary multi-use area, both of which would include use
17 and storage of hazardous and non-hazardous materials. As described in ASC Exhibit G,
18 hazardous explosive materials would be stored at the temporary multi-use area for potential
19 blasting activities during construction. All blasting materials would be stored in approved
20 containers per National Fire Protection Act (NFPA) 495 and OAR 837-012-1340. The Longhorn
21 Station would be equipped with a shunt reactor bank, which would include a total of
22 approximately 14,800 gallons of insulating oil. The applicant describes that safe storage of the
23 oil-containing equipment associated with the shunt reactor bank would include placement
24 within secondary containment consisting of a lined pit with sufficient capacity, filled with rock
25 to grade level.

26
27 The applicant describes compliance with Spill Prevention Countermeasure and Control (SPCC)
28 Plans during both construction and operation, which would ensure that hazardous and non-
29 hazardous materials, and the grounds within the proposed Longhorn Station and temporary
30 multi-use area, would be maintained in a manner which would not create a health hazard. Draft
31 SPCC Plans are provided in Attachment G-4 of this order and imposed in recommended Soil
32 Protection Conditions 2 and 3. Based on compliance with these conditions, the Department

1 recommends Council find that proposed facility components within Port Industrial zoned land
2 would satisfy the use limitations under MCZO Section 3.073(C).

3
4 MCZO 3.073(D): Dimension Requirements

5
6 *The following dimensional requirements apply to all buildings and structures constructed,*
7 *placed or otherwise established in the PI zone, subject to subsection F of this Section.*

- 8
9 1. *Minimum front yard setback: Thirty (30) feet. No structure shall be erected closer than*
10 *ninety (90) feet from the center line of any public, county or state road. Structures on*
11 *corner or through lots shall observe the minimum front yard setback on both streets.*
12 2. *Minimum side and rear yard setback: ten (10) feet.*
13 3. *Minimum lot coverage: No limitation.*
14 4. *Maximum building height: No limitation.*
15 5. *Exceptions to the setback regulations are as follows:*
16 *a. There shall be no setback requirement where a property abuts a railroad spur if the*
17 *spur will be utilized by the permitted use.*
18 *b. Side and rear lot requirements may be waived on common lot lines when adjoining lot*
19 *owners enter into a joint development agreement for coordinating vehicular access*
20 *and parking development. Party wall or adjoining building walls must meet fire*
21 *separation requirements of the State of Oregon Structural Specialty Code and Fire and*
22 *Life Safety Code. The joint development agreement must be approved by the Port of*
23 *Morrow as to form and content, recorded in the Morrow County Clerk's office and a*
24 *copy must be provided to the Planning Department.*

25
26 MCZO Section 3.073(D) establishes parcel size and setback requirements for buildings and
27 structures within Port Industrial zoned land. In ASC Exhibit K, the applicant describes that
28 buildings and structures proposed at the Longhorn Station and temporary multi-use area and,
29 transmission structures associated with the 0.9-mile of 500 kV transmission line would be
30 subject to MCZO Section 3.073(D) dimensional standards. The applicant affirms that proposed
31 facility component locations within Port Industrial zoned land contain sufficient area to meet
32 the parcel and setback requirements. However, to ensure compliance with the dimensional
33 standards, the applicant proposes, and the Department recommends, Council impose
34 recommended Land Use Condition 2, as presented under the *Recommended Land Use*
35 *Conditions – Morrow County* header of this section. Based on compliance with recommended
36 Land Use Condition 3, the Department recommends Council find that the proposed facility
37 would satisfy MCZO Section 3.073(D).

38
39 MCZO 3.073(G): Transportation Impacts Analysis

40
41 *In addition to the other standards and conditions set forth in this section, a TIA will be*
42 *required for all projects generating more than 400 passenger car equivalent trips per day.*
43 *Heavy vehicles B trucks, recreational vehicles and buses B will be defined as 2.2 passenger*
44 *car equivalents. A TIA will include: trips generated by the project, trip distribution for the*

1 *project, identification of intersections for which the project adds 30 or more peak hour*
2 *passenger car equivalent trips, and level of service assessment, impacts of the project, and,*
3 *mitigation of the impacts. If the corridor is a ~~18~~ State Highway, use ODOT standards. (MC-C-*
4 *8-98).*

5
6 MCZO Section 3.073(E) requires a Traffic Impact Analysis (TIA) for permitted uses within Port
7 Industrial zoned land that would generate more than 400 passenger equivalent trips per day.
8 Based on the applicant’s assessment provided in ASC Exhibit U, construction-related traffic
9 would generate less than 400 passenger car equivalents per day. However, the applicant
10 represents that it would work with the Morrow County Road Department to identify specific
11 construction traffic-related concerns, and would develop a traffic management plan prior to
12 construction which would specify necessary traffic control measures to mitigate for the effects
13 of the temporary increase in traffic volumes. The applicant proposes, and the Department
14 recommends, Council impose Recommended Public Services Condition 21 to minimize potential
15 construction-related traffic impacts, ensure coordination with the County Planning Department
16 and Road Master, ensure necessary road permits are obtained, and that a road use agreement
17 or similar legally binding document is obtained prior to construction for use of and repair of
18 potentially impacted local roads. The Department recommends Council find that, because
19 construction-related traffic would result in less than 400 passenger car equivalents per day, a
20 TIA is not required.

21
22 *Morrow County Zoning Ordinance Section 3.100 - Flood Plain Overlay Zone*

23
24 MCZO 3.100(4.1-1): Development Permit Required

25
26 *A development permit shall be obtained before construction or development begins within*
27 *any area of special flood hazard established in Section 3.2. The permit shall be for all*
28 *structures including manufactured homes, as set forth in the “DEFINITIONS”, and for all*
29 *development including fill and other activities, also as set forth in the “DEFINITIONS”.*

30
31 MCZO Section 3.100(4.1-1) establishes that a flood plain development permit is required for
32 construction activities within a Special Flood Hazard Area (SFHA). In ASC Exhibit K, the applicant
33 describes that a small portion of the temporary multi-use area and five substantially modified
34 access roads would be located within a SFHA (see ASC Exhibit K, Figure K-20 and K-21);
35 therefore, a flood plain development permit would be required.

36
37 The flood plain development permit would be reviewed and approved by Morrow County’s
38 floodplain manager and would include an evaluation of facility component location, potential
39 flood related impacts, and flood-proofing protection requirements to ensure protection of
40 public health and safety and minimize public and private losses due to flood conditions. The
41 applicant proposes, and the Department recommends, Council adopt Land Use Condition 1,

1 which ensures the development permit is secured and that a copy of the permit is maintained
2 onsite, and provided to the Department prior to construction.

3
4 The applicant describes that while the temporary multi-use area and 5 roads would be located
5 within the SFHA zone, no structures would be located within the SFHA zone. To ensure that
6 structures that would be located within the temporary multi-use area are not located within
7 the SFHA, the Department recommends Council impose Land Use Condition 2 restricting
8 structure placement within the SFHA or, in the alternative, if structures are placed within the
9 SFHA they must adhere to MCZO requirements for anchoring (MCZO Section 3.100(5.1-1) and
10 construction materials (MCZO Section 3.100(5.1-2) with the SFHA. Therefore, based on
11 compliance with recommended Land Use Condition 2, the Department recommends Council
12 find that the proposed facility would satisfy MCZO Section 3.100 requirements for development
13 within a SFHA.

14

15 *Morrow County Zoning Ordinance Section 3.200 - Goal 5 Resources*

16

17 Morrow County established a Significant Resource Overlay Map identifying the location of
18 designated Goal 5 resources, which the applicant evaluates and presents in relation to
19 proposed facility components in ASC Exhibit K Figure 22. Goal 5 resources include designated
20 natural resources, scenic and historic areas, and open spaces. Based on this evaluation, four
21 Goal 5 stream/riparian resources would be located on private/state land within the proposed
22 site boundary including: Butter Creek, Matlock Canyon Creek, Little Butter Creek, and Sand
23 Hollow Creek; and two Goal 5 habitat and wildlife related resources would be located on
24 federally-owned (public) land within the site boundary including: Naval Weapons System
25 Training Facility (NWSTF) Boardman and certain Washington ground squirrel (WAGS) habitat,
26 which are two Goal 5 resource designated for the protection of WAGS habitat resources but are
27 basically one in the same (i.e. the Goal 5 resource identified as “certain WAGS habitat” is
28 located within the NWSTF Boardman site and the NWSTF Boardman site is a Goal 5 resource for
29 WAGS habitat). There are no other Goal 5 resources located within the analysis area.¹⁵¹

30

31 In ASC Exhibit K, the applicant describes that Goal 5 resources located on private/state lands
32 are 3C resources and must be evaluated under MCZO Section 3.200(D)(3) and (E)(2), and
33 Section 3.020. Goal 5 resources located on federal land are 2A resources, where the county
34 relies on the federal management of these areas for protection of the resource and no local
35 provisions would apply. Therefore, potential impacts to the two Goal 5 resources on public
36 land, NWSTF Boardman and certain WAGS habitat, are not further evaluated under MCZO

¹⁵¹ B2HAPPDoc3-19 ASC 11_Exhibit K. Land Use_ASC 2019-09-28. In ASC Exhibit K Section 6.4.4.15 Historic Resources, the applicant identifies other historic Goal 5 resources of interest including Cecil General Store, Willow Creek Campground, and the Oregon Trail, all of which would be located at distances outside of the analysis area and therefore, while described in the ASC Exhibit K, are not evaluated in this order as the Council is not obligated to make findings on potential impacts outside of the Land Use analysis area (area within and extending half-mile from the site boundary).

1 Section 3.200.¹⁵² The evaluation of applicable substantive criteria for potential impacts from the
2 proposed facility to Goal 5 stream resources under MCZO Section 3.200 is presented below.

3
4 MCZO 3.200(D)(1): Review Criteria For All Significant Resources Sites

5
6 *(a) The resource site shall not be altered or impacted to the point where it no longer has*
7 *significant resource value. Such a point would be reached when the altered or impacted*
8 *site would no longer meet the significant resource requirements used to designate the*
9 *site in the comprehensive plan.*

10 *(b) The amount of alteration of or impact to the significant resource shall be the minimum*
11 *necessary to accomplish the purpose of the proposed use or activity.*

12 *(c) There shall be no significant loss of habitat for threatened or endangered species of*
13 *animals or plants as listed by the U.S. Fish and Wildlife Service or the Oregon*
14 *Department of Fish and Wildlife.*

15 *(d) An alternative site for the proposed use or activity, which would have less impact to the*
16 *resource value of the site, does not exist on the applicant's lot or parcel or on contiguous*
17 *lots or parcels. For purposes of this section, continuous means lots or parcels with a*
18 *common boundary, not separated by a public road, and in which greater than possessory*
19 *interests are held by the same person, spouse or single partnership or business entity,*
20 *separately or in tenancy in common.*

21
22 MCZO Section 3.200(D)(1) establishes review criteria for potential impacts of proposed projects
23 that could impact Goal 5 resources, including 3C-designated resources, which applies to the
24 Goal 5 streams described above. Review criteria requires a finding that the proposed facility:
25 would not significantly alter or impact the resource site, and would minimize potential impacts
26 to the resource; would not result in a significant loss of habitat for threatened and endangered
27 species; and, that an alternative site with a lesser impact to the resource site does not exist.
28 These criteria are evaluated below.

29
30 *Goal 5 Stream Resources (Butter Creek, Matlock Canyon Creek, Little Butter Creek, Sand Hollow*
31 *Creek)*

32
33 Proposed facility components that could impact Goal 5 designated streams in Morrow County
34 would include: temporary stream crossings for installation of the 500 kV transmission line at
35 Sand Hollow Creek (one temporary stream crossing), Little Butter Creek (two temporary stream
36 crossings), Butter Creek (two temporary stream crossings), and Matlock Canyon Creek (one

¹⁵² In ASC Exhibit K, the applicant describes that MCZO Section 3.200 review criteria does not apply to Goal 5 resources on public land, but then presents an evaluation of consistency with the review criteria. This analysis is omitted from the order because the Department agrees that the provisions do not apply and the Council is not tasked with making findings of compliance. However, potential impacts and mitigation related to WAGS is further evaluated in Section IV.I., *Threatened and Endangered Species* of this order.

1 temporary stream crossing); substantial modification of an existing road adjacent to Little
2 Butter Creek; and, temporary substantial modification of an existing bridge, that would be
3 temporarily modified through placement of an approximately 48-foot railcar bridge outside of
4 the high water mark, that crosses Butter Creek (see ASC Exhibit K, Figures K-23 through K-25).¹⁵³
5

6 Based on the proposed construction activity, and the presumed basis of Goal 5 protection as an
7 important water/riparian area, potential impacts from stream crossings and road modifications
8 would result from permanent and temporary removal and fill; and, erosion and vegetation
9 disturbance impacts associated with the temporary stream crossings. Permanent placement of
10 transmission structures within the Goal 5 stream high water mark could also result in erosion
11 and vegetation impacts. As described in Section IV.Q.2. *Removal Fill Law* of this order, the
12 applicant proposes to implement best management practices during stream crossings and work
13 near streams, such as minimizing excavation, stabilizing stream approaches with aggregate, and
14 stabilizing exposed soils. In addition, the applicant requests, through the site certificate process,
15 approval of a removal-fill permit authorizing impacts and imposing impact minimization
16 measures for removal-fill activities within delineated wetlands and other waters of the state,
17 which includes permanent and temporary impacts to Butter Creek. Further, to minimize
18 potential impacts to the Goal 5 streams from erosion and vegetation disturbance, the applicant
19 proposes to setback transmission line structures a minimum of 100 feet from the high water
20 level in accordance with MCZO Section 3.020(D)(3)(b) (see recommended Land Use Condition
21 2(a)).
22

23 As evaluated in ASC Exhibit P, suitable habitat used by state-listed Threatened and Endangered
24 (T&E) species is designated pursuant to ODFW's Habitat Mitigation Policy and the Council's Fish
25 and Wildlife Habitat standard as Category 1 habitat, where impacts are prohibited. Therefore,
26 the proposed facility is precluded from resulting in a loss of habitat for state-listed T&E species.
27 Moreover, the area within and around Butter Creek and Little Butter Creek is not considered
28 Category 1 habitat, and the applicant asserts that these streams are not used by state-listed
29 T&E species.
30

31 The applicant evaluated the availability of other existing roads on the same or contiguous lots,
32 for the purpose of determining whether impacts to the Goal 5-designated streams could be
33 avoided, and asserts that there are none that would provide similar access.
34

35 Based on the above analysis, the Department recommends Council find that the proposed
36 facility would satisfy MCZO Section 3.200(D)(1) review criteria.
37

38 MCZO 3.200(D)(3): Riparian Vegetation/Wetlands Review Criteria
39

40 *(a) Road construction within riparian zones shall be reviewed in cooperation with the*
41 *responsible agency listed in Section 3.200.F. Road construction shall seek alternative*

¹⁵³ B2HAPP Attachment BB-2 Fish Passage Plans and Design. Table 1. 2018-09-28.

1 *methods whenever possible, to avoid disturbing wildlife; reducing the size of the riparian*
2 *zone; and impacting water quality in the aquatic zone. New roads built along streams*
3 *shall be avoided whenever possible unless no other alternative route is available. The*
4 *safety and welfare of all road users shall be considered in determining the appropriate*
5 *management strategy.*

6 *(b) All dwellings and other non-water dependent structures shall be set back a minimum of*
7 *100 feet from the high water level of the stream or the water body reaches during*
8 *normal seasonal run-off.*

9 *(c) Permanent vegetation removal within the area defined as the riparian zone shall retain*
10 *75% of all layers or stratas of vegetation (e.g., deciduous trees, shrubs, sedges, rushes*
11 *and emergents).*

12
13 MCZO 3.200(D)(3)(a) requires that road construction activities avoid and minimize impacts to
14 Goal 5 stream riparian zones and consult with appropriate agencies regarding the same. The
15 Department interprets road construction as inclusive of the activities associated with
16 temporary stream crossings for installation of the 500 kV transmission line at Sand Hollow
17 Creek (1 temporary stream crossing), Little Butter Creek (1 temporary stream crossing), Butter
18 Creek (2 temporary stream crossings), and Matlock Canyon Creek (1 temporary stream
19 crossing); substantial modification of an existing road adjacent to Little Butter Creek; and,
20 temporary substantial modification of an existing bridge that crosses Butter Creek. The
21 appropriate agencies to consult with for potential impacts to riparian areas, as listed in MCZO
22 Section 3.200(F), include ODFW, DEQ and Soil Conservation Services.

23
24 In response to this criteria, the applicant describes that consultation with the appropriate
25 agencies would occur by obtaining the ministerial permits required for permanent road
26 construction for the road adjacent to Little Butter Creek, including an access approach permit
27 and permit to build on right-of-way. The Department considers the activities associated with
28 temporary stream crossings to be road construction that could impact riparian areas of the
29 Goal 5 inventoried streams. Therefore, the Department recommends Council impose Land Use
30 Condition 1 requiring consultation with ODFW to minimize potential riparian impacts and
31 determine process for measuring and monitoring maintenance of 75 percent of vegetation
32 layers (MCZO Section 3.200(D)(3)(c), and DEQ and Soil Conservation Services of Morrow County
33 if determined necessary, prior to construction of temporary stream crossings and substantial
34 road modifications adjacent to Goal 5 streams.

35
36 MCZO 3.200(D)(3)(b) establishes a 100-foot setback requirement from structures to the high
37 water level of Goal 5 streams. The applicant asserts that proposed transmission structure

1 locations would comply with the minimum 100-foot setback requirement, and proposes Land
2 Use Condition 1 to demonstrate compliance.

3
4 Based on the above analysis, the Department recommends Council find that the proposed
5 facility would satisfy MCZO Section 3.200(D)(3) review criteria.

6
7 MCZO 3.200(E)(2): List of Conflicting Uses and Activities

- 8
9 a. *Road construction.*
10 b. *Campgrounds.*
11 c. *Any long term use adversely impacting water quality and quantity (including*
12 *temperature).*
13 d. *Any use impeding the movement of wildlife from one habitat to another.*
14 e. *Any long term use adversely resulting in the loss of vegetation diversity within the*
15 *riparian zone.*
16 f. *Mining*

17
18 MCZO Section 3.200(E)(2) establishes conflicting uses within the Significant Resource Overlay
19 zone, and includes road construction and permanent vegetation loss within riparian zones,
20 which are the activities during proposed facility construction that could impact the identified
21 Goal 5 streams/riparian areas. MCZO Section 3.200(B) establishes that conflicting uses shall
22 become conditional uses subject to the provisions of MCZO Section 3.200 and Article 6.¹⁵⁴
23 However, as noted by the applicant in ASC Exhibit K, the proposed construction activities that
24 could impact Goal 5 streams would be located in EFU-zoned land. Because the proposed
25 construction activities are evaluated under the “utility facility necessary for public service” land
26 use category, the use is permitted subject only to the requirements of ORS 215.275 and the
27 county cannot impose additional approval criteria.¹⁵⁵ Therefore, while road construction and
28 potential permanent impacts to riparian areas within the Significant Resource Overlay zone
29 would be conflicting uses under MCZO Section 3.200(E)(2), the Department recommends
30 Council find that the criteria established under MCZO Section 3.200(B) would not apply.
31

¹⁵⁴ MCZO Section 3.200(B) establishes that uses permitted outright, or uses requiring a zoning permit, within an underlying zone but also located within the Significant Resource Overlay zone shall become a conditional use subject to MCZO Section 3.200 provisions and Article 6 if identified in MCZO Section 3.200(E) as a conflicting use.

¹⁵⁵ Brentmar v. Jackson County, 321 Or 481, 496 (1995).

1 **Morrow County Comprehensive Plan**

2
3 Agricultural Lands Element, Policy 1:

4
5 *It shall be the policy of Morrow County, Oregon, to preserve agricultural lands, to protect*
6 *agriculture as its main economic enterprise, to balance economic and environmental*
7 *considerations, to limit noncompatible nonagricultural development, and to maintain a high*
8 *level of livability in the County.*

9
10 The MCCP Agricultural Lands Element establishes a policy (Policy 1) to preserve and protect
11 agricultural lands and to maintain a high level of livability in the County, consistent with
12 statewide planning Goal 3.

13
14 The proposed facility would result in temporary and permanent impacts to agricultural lands
15 and agricultural practices. However, as described in ASC Exhibit K and evaluated in Section
16 IV.E.2.1., the applicant proposes to implement mitigation measures and conduct monitoring
17 during construction activities within EFU zoned land, in accordance with an Agricultural Land
18 Assessment and Mitigation Plan, to be finalized by the applicant and approved by the
19 Department in consultation with affected counties, prior to construction, as imposed in
20 recommended Land Use Condition 14. The applicant also provides an evaluation of consistency
21 with statewide planning Goal 3, as further evaluated in Section IV.E.3., *Statewide Planning*
22 *Goals* of this order. Therefore, based on the applicant’s proposed mitigation for temporary
23 agricultural impacts and overall minimal permanent impacts to agricultural lands from
24 proposed facility components (i.e. 38 of 3,391.5 acres), the Department recommends Council
25 find that the proposed facility would be consistent with MCCP Agricultural Lands Element Policy
26 1.

27
28 Natural Hazards Element

29
30 *Applies to “areas that are subject to natural events that are known to result in death or*
31 *endanger the works of man, such as stream flooding, ocean flooding, ground water, erosion*
32 *and deposition, landslides, earthquakes, weak foundation soils and other hazards unique to*
33 *local or regional areas”*

34
35 The MCCP Natural Hazards element establishes goals that projects not conflict with any
36 identified natural hazards, such as stream or ocean flooding, ground water, erosion and
37 deposition, landslides, earthquakes, weak foundation soils and other unique local or regional
38 areas.

39
40 The applicant describes that the siting process for the proposed facility represents consistency
41 with the MCCP Natural Hazards element because, as presented in ASC Exhibit H and evaluated
42 in Section IV.C. *Structural Standard*, natural hazards were evaluated and mapped and facility
43 component location is based on minimizing and avoiding such hazards. In addition, as described
44 above under MCZO Section 3.100, while some portions of the site boundary and facility

1 components, such as roads, would be located within a SFHA, the applicant confirms that no
2 facility structures would be placed within a SFHA. As described under the evaluation of MCZO
3 Section 3.100, if facility structures are constructed within the SFHA, MCZO Section 3.100(5)
4 construction standards would apply. Therefore, based on the analysis presented in ASC Exhibit
5 H and as evaluated in Section IV.C. *Structural Standard*, and compliance with Morrow County's
6 MCZO Section 3.100(5) construction standards for buildings and structures located in the SFHA
7 zone, the Department recommends Council find that the proposed facility would be consistent
8 with MCCP Natural Hazards element.

9
10 Utility Findings and Policies

11
12 *Finding C. Electrical power substations can create negative impacts on nearby property.*
13 *Careful site planning and physical design can minimize adverse environmental effects.*

14
15 *Policy C. Power substations should be planned and designed in a manner which will minimize*
16 *the negative environmental impacts on nearby properties and the public as a whole.*

17
18 MCCP Utility Finding and Policy C apply to substations and establish goals for careful site
19 planning and physical design to minimize environmental impacts. In ASC Exhibit K, the applicant
20 describes careful planning and consideration of proposed facility objectives in the selection of
21 the Longhorn Station site, which would permanently disturb approximately 20 acres within Port
22 Industrial zoned land. The proposed Longhorn Station site is surrounded by agricultural and
23 industrial uses; existing industrial uses include Union Pacific Railroad, transmission lines and a
24 substation. Given the similar existing impacts and land use zoning designations in the area, the
25 incremental impact of constructing and operation the Longhorn Station on the public and the
26 environment would be minimal. Therefore, the Department recommends Council find that the
27 proposed Longhorn Station would be consistent with MCCP Utility Finding and Policy C.

28
29 ***Recommended Land Use Conditions – Morrow County***

30
31 **Recommended Land Use Condition 1:** For facility components in Morrow County, the
32 certificate holder shall:

- 33 a. Prior to construction of any phase or segment of the facility, provide to the Department
34 a copy of the following Morrow County approved permits, if such permits are required
35 by Morrow County zoning ordinances:
- 36 i. Zoning permit for facility components to be located in General Industrial (MG)
37 and Port Industrial Zones.
 - 38 ii. Flood plain development permit, for work in the Flood Plain Overlay Zone;
 - 39 iii. Utility crossing permit;
 - 40 iv. Access approach site permit; and
 - 41 v. Construction permit to build on right-of-way.
- 42 b. Prior to construction of a stream crossing at, or substantial road modification adjacent
43 to, a Goal 5 stream including Sand Hollow Creek, Little Butter Creek, Butter Creek, and
44 Matlock Creek, consult with ODFW on construction methods, measures to minimize

1 riparian impacts, and measures to evaluate and monitor riparian impacts in order to
2 demonstrate maintenance of 75 percent of vegetation layers or stratas within the
3 defined riparian zone. Consultation with DEQ and Morrow County Soil Conservation
4 Services shall be completed if determined by the certificate holder, the Department, or
5 ODFW to be necessary based on extent of potential water and erosion impacts. (MCZO
6 Section 3.200(D)).

- 7 c. During construction, the certificate holder shall comply with the conditions of permits
8 and consultation requirements listed in (a) and (b), and if applicable (d).
- 9 d. During construction, if the certificate holder determines additional County-approved
10 permits are required, the certificate holder shall provide to the Department a copy of
11 those additional permits.
- 12 e. Prior to construction of any phase or segment of the facility, the certificate holder shall
13 provide to the Morrow County Weed Supervisor a list of the suppliers that will be
14 supplying the aggregate used in construction in Morrow County. The certificate holder
15 shall ensure that said suppliers provide the Morrow County Weed Supervisor reasonable
16 access to the aggregate sites for inspection for weeds.

17
18 **Recommended Land Use Condition 2:** For facility components in Morrow County, the
19 certificate holder shall design the facility to comply with the following setback distances
20 and other requirements:

21 Significant Resource Overlay Zone (MCZO Section 3.200(D)(3)(b))

- 22 a. Buildings and the fixed bases of the transmission line towers shall be setback
23 at least 100 feet from the high-water mark of all Goal 5 streams (i.e. Sand Hollow Creek,
24 Little Butter Creek, Butter Creek and Matlock Canyon Creek).

25 Sand Hollow Flood Plain Overlay Zone (MCZO Section 3.100(5.1-1))

- 26 b. Buildings and structures located within the multi-use area shall not be located within
27 the Sand Hollow Flood Plain Overlay Zone (see ASC Exhibit K Figure K-21) unless
28 anchored to prevent flotation, collapse or lateral movement of the structure.

29 In the EFU Zone (Based solely on certificate holder representations in the ASC)

- 30 c. Buildings and the fixed bases of the transmission line towers shall be setback
31 as follows:
32 (i) Front yards shall be set back at least 20 feet from minor collector
33 road rights-of-way, 30 feet from major collector road rights-of-way, 80 feet from
34 arterial road rights-of-way, and 100 feet from intensive agricultural uses;
35 (ii) Side yards shall be set back at least 20 feet from the property line, 30 feet for corner
36 lots, and 100 feet from intensive agricultural uses; and
37 (iii) Rear yards shall be set back at least 25 feet from the property line, and 100 feet
38 from intensive agricultural uses.
- 39 d. Buildings and the fixed bases of the transmission line towers shall be set back
40 at least 100 feet from the high-water mark of all streams and lakes.

41 In the General Industrial Zone (MCZO Section 3.070(D))

- 42 e. Buildings and the fixed bases of the transmission line towers shall be set back
43 at least 50 feet from arterial road rights-of-way, 30 feet from collector road rights of-
44 way, and 20 feet from lower-class road rights-of-way.

1 In the Port Industrial Zone (MCZO Section 3.073(D))

2 f. Buildings associated with the Longhorn Station and multi-use area, and the fixed bases
3 of the transmission line towers shall be setback as follows:

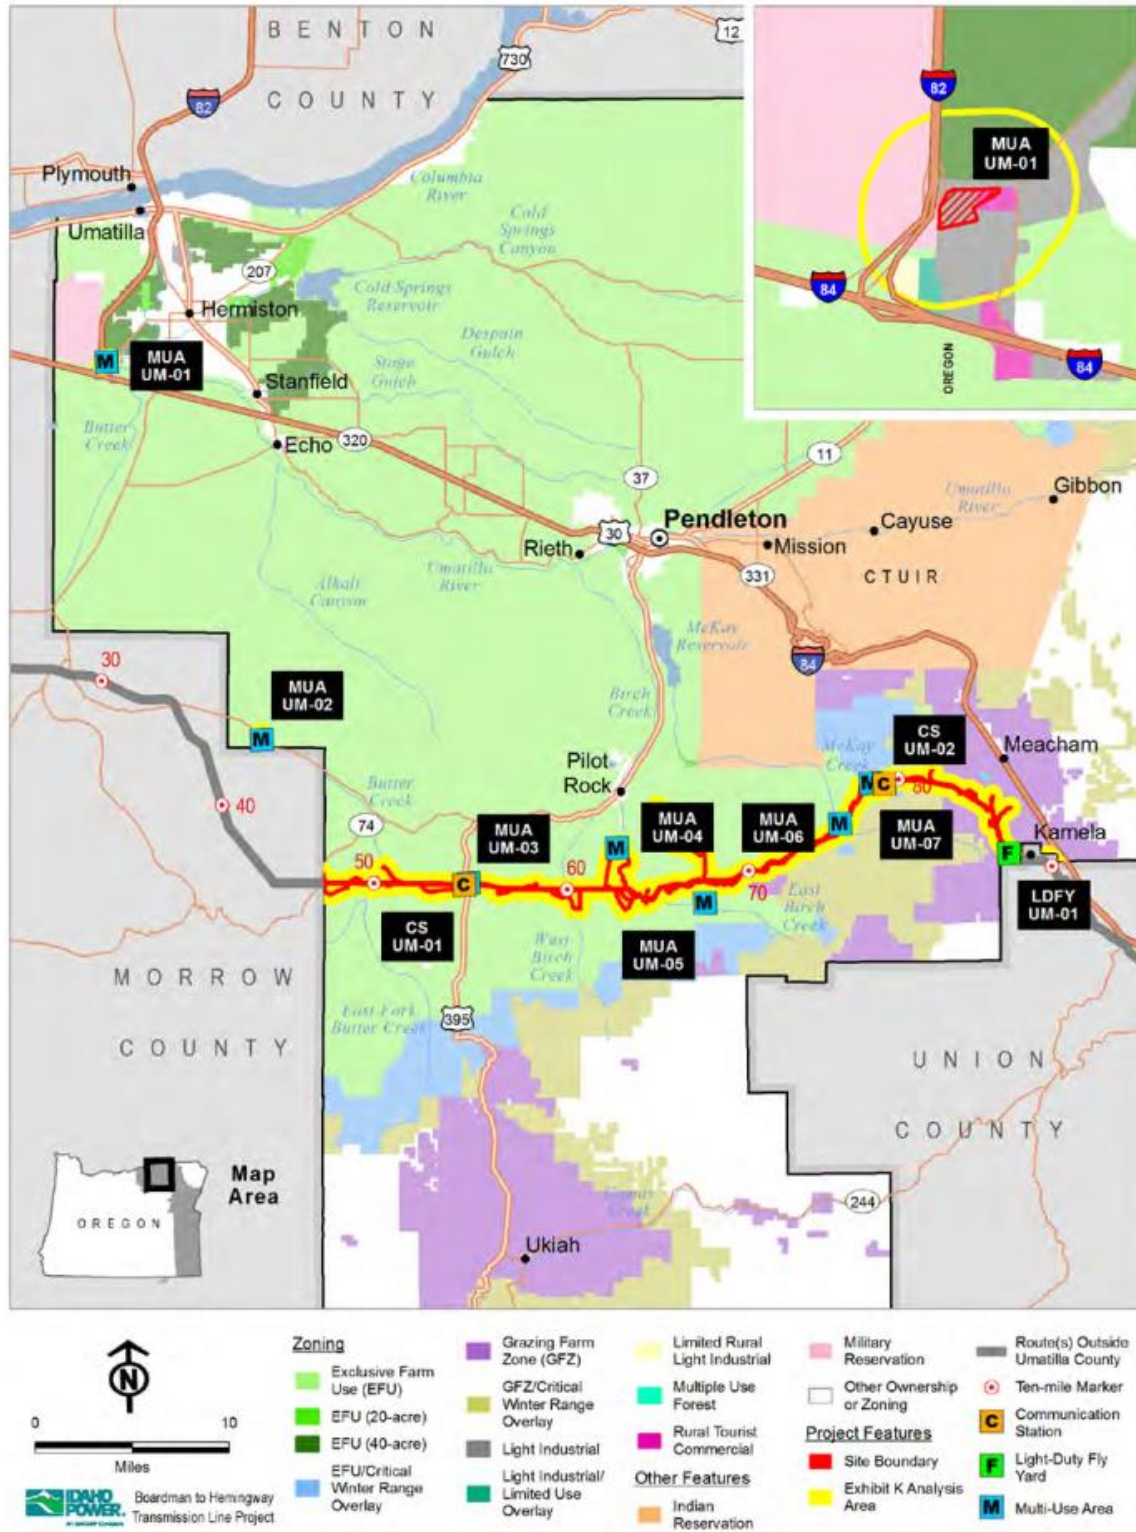

- 4 i. Front yards shall be set back at least 30 feet from the property line; buildings and
5 structures shall be setback at least 90 feet from the centerline of any public,
6 county, or state road;
7 ii. Rear and side yards shall be set back at least 10 feet from the property line.

8
9 IV.E.1.2. Umatilla County

10
11 Facility components proposed within Umatilla County include approximately 40.8 miles of 500
12 kV transmission line, seven multi-use areas, 33.8 miles of new access roads, 36.8 miles of
13 substantially modified existing roads, 41 pulling and tensioning sites, one light-duty fly yard,
14 and two communication station.¹⁵⁶ There are no alternate routes or facility components
15 locations requested for approval in Umatilla County. The locations of proposed facility
16 components are represented in ASC Exhibit K Figures K-28, and Figure 6 below.
17

¹⁵⁶ As described in ASC Exhibit B, multi-use areas would be approximately 30 acres in size and would include construction field offices, parking areas, construction vehicle maintenance area, helicopter operations (helipads), explosives storage, hazardous materials storage, water storage tank, portable concrete batch plant, concrete washout station, gravel tire scrub area, noxious weed wash-off station, and bulk materials storage area.

1 **Figure 6: Umatilla County Zoning and Proposed Facility Components**

2
3
4

1 The above-described facility components proposed in Umatilla County would be located on
2 land zoned Exclusive Farm Use/Critical Winter Range (Overlay), Grazing Farm Zone/Critical
3 Winter Range (Overlay), Light Industrial, and Rural Tourist Commercial. Proposed facility
4 components within each zone (with proposed land use category denoted in parenthesis) are as
5 follows:
6

7 Exclusive Farm Use Zone
8 (Utility Facility Necessary for Public Service)

9 31 miles of 500 kV transmission line (3.1 miles within Critical Winter Range (CWR) Overlay)
10 28.9 miles of substantially modified roads; 29.6 miles of new roads (1.2 miles of
11 substantially modified road, and 1.8 miles of new road within CWR Overlay)
12 6 multi-use areas (1 multi-use area within CWR Overlay)
13 33 pulling and tensioning sites (3 pulling and tensioning sites within CWR Overlay)
14 2 communication station (1 communication station within CWR Overlay)
15

16 Grazing Farm Zone
17 (Construction of new utility facilities, including transmission lines and towers, necessary for
18 public service as provided in Section 152.617(I)(C))

19 9.9 miles of 500 kV transmission line (2.8 miles within Critical Winter Range (CWR) Overlay)
20 8.0 miles of substantially modified roads; 4.3 miles of new roads (1.9 miles of substantially
21 modified roads, and 1.6 miles of new roads within CWR Overlay)
22 8 pulling and tensioning site (1 pulling and tensioning site would contain a helipad)
23 1 light-duty fly yard
24

25 Light Industrial Zone (Construction of..temporary storage, and processing sites)

26 1 (portion of) multi-use area
27

28 Rural Tourist Commercial Zone (Construction of..temporary storage, and processing sites)

29 1 (portion of) multi-use area
30

31 There are no alternative routes or facility components proposed in Umatilla County. As
32 presented in ASC Exhibit K, the proposed facility would not cross or be located within any
33 designated Special Flood Hazard Areas within Umatilla County; therefore, there are no flood
34 hazard area development requirements applicable to the proposed facility.¹⁵⁷
35

36 Applicable substantive criteria for proposed facility components in Umatilla County, in effect on
37 the date the applicant submitted the pASC (February 27, 2013), are presented in Table LU-2
38 below.

¹⁵⁷ B2HAPPDoc8-007 DPO Special Advisory Group Comment Umatilla County Waldher 2019-08-21. Re: comments on flood plain permit.

Transportation Element - Finding 20; Policy 20	
Notes:	
<ol style="list-style-type: none"> 1. ASC Exhibit K Table K-9 includes “potentially applicable substantive criteria” identified by the SAG and the applicant. The evaluation of applicable substantive criteria by county is based on the table above, and omits some potentially applicable substantive criteria identified by the applicant. Specifically, as evaluated in this section, the Department recommends Council find that ancillary facilities to the transmission line be evaluated as part of the utility facility, and therefore separate provisions that would apply to helipads, roads and batch plant, as individual uses, would not apply and therefore were not evaluated including UCDC 152.060, 152.061, 152.086, 152.616, 152.617, 152.062, 152.063, 152.545, 152.546, 152.547, 152.560, 152.061, 152.062. However, the Department reviewed the applicant’s assessment and, while not considered appropriate to recommend Council make findings of compliance, considers that the applicant demonstrates consistency with the requirements of these provisions. 	

1
 2 The following analysis addresses the applicant’s ASC Exhibit K evaluation of compliance with
 3 applicable substantive criteria.
 4

1 **Umatilla County Zoning Ordinance**

2
3 *Umatilla County Development Code Chapter 152 Exclusive Farm Use Zone, EFU*

4
5 Proposed facility components within EFU/critical winter range (CWR) overlay zoned land in
6 Umatilla County would include up to 31 miles of a single-circuit 500 kV transmission line with
7 structures that could extend up to 200-feet in height. The applicant identifies that ancillary
8 facilities to the proposed transmission line located within EFU-zoned land would include 29.6
9 miles of new access roads, 28.9 miles of substantially modified existing roads, six multi-use
10 areas, and two communication stations.¹⁵⁸ An evaluation of the applicable substantive criteria
11 for these uses within EFU-zoned land is presented below.

12
13 UCDC 152.059: Land Use Decision and Zoning Permit

14
15 *In an EFU zone the following uses may be permitted through a land use decision via*
16 *administrative review (§152.769) and subject to the applicable criteria found in §152.617.*
17 *Once approval is obtained a zoning permit (§ 152.025) is necessary to finalize the decision.*
18 *****

19
20 *(C) Utility facilities necessary for public service, including wetland waste treatment systems*
21 *but not including commercial facilities for the purpose of generating electrical power for*
22 *public use by sale or transmission or communication towers over 200 feet in height. A utility*
23 *facility necessary for public service may be established as provided in ORS 215.275 and in §*
24 *152.617(II)(7).*

25
26 UCDC 152.059(C) establishes that utility facilities necessary for public service may be are uses
27 permitted outright in through a land use decision in the EFU zone, subject to UCDC 152.769
28 administrative review; and compliance with applicable criteria in ORS 215.275 and UCDC
29 152.617(II)(7). UCDC 152.059 also specifies that a zoning permit under UCDC 152.025 is
30 necessary for uses permitted outright in EFU zoned land; applicable UCDC 152.059(C) zoning
31 requirements are reflected in recommended Land Use Condition 3 below.

32
33 As described in ASC Exhibit K, proposed facility components within EFU/CWR overlay-zoned
34 land in Umatilla County would include 31 miles of 500 kV transmission line. In addition, the

¹⁵⁸ In ASC Exhibit K, the applicant describes that Umatilla County identified UCDC Sub-section 152.060(G) *Personal Use Airports* as potentially applicable to the helipads to be located within each of six multi-use areas in EFU-zoned land. Because the multi-use area is an ancillary facility to the proposed facility, the Department recommends Council evaluate all facility components within EFU zoned land as a utility facility necessary for public service. In the alternative, however, the applicant provides a compliance demonstration if UCDC Sub-section 15.2060(G) is determined applicable, which is incorporated into ASC Exhibit C, K and the draft Helicopter Use Plan (Recommended Public Services Condition **23**, to be provided to the Department and applicable counties prior to helipad use).

1 applicant proposes 29.6 miles of new access roads, 28.9 miles of substantially modified existing
2 roads, six multi-use areas, and two communication stations, which based on a 2001 and 2005
3 court decision, the applicant asserts should be considered under the “utility facility necessary
4 for public service” land use category.¹⁵⁹ The Department agrees and recommends Council find
5 that the proposed facility components located in EFU-zoned land would be a land use decision
6 use under UCDC 152.059(C).

7
8 Notwithstanding the language in the County’s code, the conditional use requirements beyond
9 those that are consistent with ORS 215.275 are not applicable to the proposed facility because,
10 as a utility facility necessary for public service under ORS 215.283(1)(g), the use is permitted
11 subject only to the requirements of ORS 215.275 and the County cannot impose additional
12 approval criteria. Therefore, the conditional use requirements of UCDC 152.617 do not apply.¹⁶⁰
13 UCDC 152.769 provides procedural requirements for administrative review of uses permitted
14 outright, which do not apply when Council makes the land use decision.

15
16 Based on the analysis presented above, proposed facility components within EFU-zoned land
17 would be a use permitted outright and would require a zoning permit. The Department
18 recommends Council impose Land Use Condition 3 in accordance with UCDC 152.059.

19
20 Proposed facility components would be located in EFU-zoned land across five Oregon counties
21 including Morrow, Umatilla, Union, Baker, and Malheur. Therefore, for these locations, the land
22 use compliance evaluation is limited to ORS 215.275, as presented in Section IV.E.2.1., *ORS*
23 *215.283 and, ORS 215.275 and ORS 215.296 (Exclusive Farm Use Requirements)* of this order.¹⁶¹

24
25 *Umatilla County Development Code Chapter 152 Grazing/Farm Zone, GF*

26
27 Facility components proposed to be located in Umatilla County Grazing/Farm (GF) zoned land
28 include approximately 9.9 miles of transmission line, 4.3 miles of new access road, 8.0 miles of
29 substantially modified existing access roads, and one light-duty fly yard. An evaluation of
30 applicable substantive criteria for these proposed uses within GF zoned land is presented
31 below.

32
33 The GF zone in Umatilla County is a hybrid zone that includes forested land, agricultural land,
34 and rangeland. [Umatilla County Planning Department directed the applicant to analyze](#)

¹⁵⁹ See *Save Our Rural Or. v. Energy Facility Siting Council*, 339 Or. 353, 384 (2005) (upholding Council’s determination that ancillary facilities are considered “utility facilities necessary for public service”); *Cox v. Polk County*, 174 Or. Ct. App. 332, 343-44 (2001) (“utility facilities necessary for public service” may include ancillary or off-site equipment).

¹⁶⁰ In ASC Exhibit K, the applicant provides a compliance demonstration with UCDC 152.617, 152.062, and 152.063, which the Department reviewed and concurs that the analysis represents consistency with the standards.

¹⁶¹ [Although beyond what is required to demonstrate compliance with ORS 215.275, the applicant performed a county-specific alternatives analysis. Please refer to ASC Exhibit K Section 6.5.5. for additional information specific to Umatilla County.](#)

1 ~~p~~Proposed facility components ~~would be located on~~ as located on Goal 4 forested lands within
2 the GF zone.

3
4 UCDC 152.085: Conditional Uses Permitted

5
6 *In the GF Zone, the following uses may be permitted conditionally via administrative review*
7 *(§ 152.769), subject to the requirements of § 152.086, applicable supplementary regulations*
8 *in §§ 152.010 through 152.016 and §§ 152.545 through 152.562, and applicable §§ 152.610*
9 *through 152.615. Specific standards for some of the conditional uses listed below are*
10 *contained in § 152.616. A zoning permit is required following the approval of a conditional*
11 *use pursuant to § 152.025. Existing uses classified as conditional use and listed in this*
12 *section may be expanded subject to administrative review and subject to the requirements*
13 *listed in this section, except expansions on a parcel or tract meeting the definition of high*
14 *value farmland will not be permitted.*

15 ***

16 *(R) Construction of new utility facilities, including transmission lines and towers, necessary*
17 *for public service as provided in § 152.617(I)(C).*

18
19 UCDC 152.085(R) identifies new utility facilities necessary for public service, defined in UCDC
20 Chapter 152.617(1)(C) as commercial utility facilities for the purpose of generating and
21 distributing power for public use by sale, as a conditional use permitted on GF zoned land,
22 subject to the requirements of UCDC 152.086, 152.010 through 152.016, 152.545 through
23 152.562, 152.610 through 152.615, 152.616, and 152.025.

24
25 The applicant describes that Umatilla County identified UCDC 152.085(R) as potentially
26 applicable, but then argues that because it applies to commercial utility facilities for the
27 purpose of generating and distributing power, it would not apply to the non-energy generating
28 facility, or specific non-generating facility components proposed to be located in GF-zoned land.
29 The Department agrees and recommends Council conclude that UCDC 152.~~01~~85(R) does not
30 apply to facility components proposed to be located in GF zoned land. However, it is noted that
31 in the absence of UCDC 152.~~01~~85(R), there are no land use categories within UCDC 152.~~01~~85
32 for the proposed facility. However, in the absence of applicable local substantive criteria, state
33 rules apply. Because proposed facility components would be located in forest lands, OAR
34 Chapter 660, Division 006 would apply. In particular, LCDC Chapter 660 establishes authorized
35 uses within forest lands as inclusive of transmission lines within a 100 foot right-of-way, state
36 rules would apply directly. The applicant further identifies that the UCDC GF zone provisions do
37 not include a Goal 4 analysis methodology applicable to Goal 4 forest lands; therefore, the
38 applicable requirements for proposed facility components in GF zoned land are the directly
39 applicable administrative LCDC Chapter 660 for uses authorized in forest zones, as evaluated in
40 Section IV.E.2.2. ~~ORS 772.210 and~~ OAR 660-006-0025 of this order.

41
42 *Umatilla County Development Code Chapter 152 Light Industrial Zone, LI*
43

1 The proposed facility would include one temporary multi-use area within Umatilla County’s LI
2 zone, as presented in ASC Figure K-33. The temporary multi-use area would primarily be used
3 for equipment and vehicle storage. Ancillary uses to the primary use (i.e. equipment and vehicle
4 storage) would include a helipad for helicopter operations supporting equipment, laborer and
5 material delivery; fuel and lubricant storage (1,000-gallon aboveground storage tank (AST) for
6 gasoline; 1,000-gallon AST for diesel fuel; 500-gallon AST diesel fuel for the batch plant); and
7 temporary batch plant operation.¹⁶²

8

9 UCDC 152.303(A): Conditional Uses Permitted

10

11 *In a LI Zone, the following uses and their accessory uses are permitted, conditionally, subject*
12 *to the requirements of §§ 152.610 through 152.616, and upon the issuance of a zoning*
13 *permit:...*

14

15 *(19) Construction of . . . temporary storage, and processing sites;*

16

17 UCDC 152.303 establishes conditionally permitted uses within Light Industrial (LI) zoned land
18 and requires permitted uses to satisfy the requirements in UCDC 152.610 through 152.616, and
19 obtain a zoning permit.^{163,164} UCDC 152.303(A)(19) identifies construction of “...temporary
20 storage, and processing sites” as a conditionally permitted use in LI zoned land.

21

22 The applicant proposes a temporary multi-use area, of which a portion would be located in LI
23 zoned land, and requests that the use be evaluated under UCDC 152.303(A)(19), as provided
24 above. As explained in ASC Exhibit K, temporary multi-use areas would be used for equipment
25 and fuel storage, and could include temporary operation of a mobile batch plant during
26 transmission line foundation construction (i.e. activity considered aggregate processing).

27 Therefore, based on these uses, and because it is approximately 30 miles from other facility
28 components proposed in Umatilla County, the Department recommends Council evaluate this
29 multi-use area separately from the utility facility as a temporary storage and processing site
30 under UCDC 152.303(A)(19) and find that it is a conditionally permitted use within LI zoned
31 land. Further, the Department recommends Council impose recommended Land Use Condition

¹⁶² As explained in ASC Exhibit G, fuel ASTs would be located within secondary containment consisting of lined soil berms with capacity of at least 10 percent greater than the volume of the AST. The dimensions of the spill containment area would vary based on the volume of the materials stored with a capacity of at least 10 percent greater than the volume of materials stored.

¹⁶³ In ASC Exhibit K, the applicant provides UCDC 152.303(A)(19) as provided above, which references UCDC 152.610 through 152.616. However, instead of UCDC 152.610 through 152.616, the applicant provides zoning provision language for 152.303 through 152.306, which are the current code provisions referenced in UCDC dated August 2018. The Department evaluates the code referenced in ASC Exhibit K.

¹⁶⁴ UCDC 152.610 through 152.614 contain procedural requirements for conditionally permitted uses, which are superseded by the procedural requirements in OAR Chapter 345 Division 15. UCDC 152.615 contains additional restrictions the county could impose on conditionally permitted uses, and UCDC 152.616 contains standards for review of conditionally permitted uses, but does not establish standards of review for the temporary multi-use area evaluated as “construction of rest areas, weigh stations, temporary storage and processing sites.”

1 3 requiring that, prior to construction in Umatilla County, the applicant demonstrate that a
2 zoning permit has been obtained for the temporary multi-use area.

3
4 UCDC 152.303(B): General Criteria

5
6 *The following general criteria shall be used to review all conditional uses listed in the LI
7 Zone, notwithstanding any other criteria listed in this chapter for a particular use:*

8 *(1) The use will be compatible with other uses allowed in a LI Zone;*

9 *(2) The use will be in conformance with policies listed in the text of the Comprehensive Plan;;*

10 *(3) The use would not have an adverse impact on existing industrial uses in that it would not
11 be incompatible with the noise, dust, vibrations and odors that may emanate from or be
12 caused by the existing adjacent industrial uses.*

13
14 UCDC 152.303(B) establishes general criteria for conditional uses permitted in LI zoned land
15 including a demonstration that the use would be compatible with other allowed uses; that the
16 use would be consistent with applicable Comprehensive Plan policies; and, that the use would
17 not have adverse impacts, or be incompatible with, existing industrial uses.

18
19 The proposed temporary multi-use area would include use and storage of construction
20 equipment, transmission line structures, and worker vehicles, which is similar to the allowable
21 use under UCDC 152.302(B)(8) for a haul and truck yard or terminal. Additionally, as described
22 by the applicant, uses surrounding the multi-use area include County Road 1234, large
23 industrial and shipping distribution facilities to the east and south, and I-82 to the west. The
24 Hermiston Generating Plant is less than one-quarter mile to the east. These industrial uses are
25 similar to and would be consistent with the nature of activity proposed at the multi-use area.
26 Based on the proposed temporary use of the multi-use area, the Department recommends
27 Council find that the use would be compatible with other adjacent uses in the LI zone.

28
29 Policies listed in the Comprehensive Plan applicable to the LI zone include providing an
30 attractive zone for industry by providing direct access to the freeway system. The proposed
31 multi-use area was selected based on its location and access to the highway. Therefore, the
32 Department recommends Council find that the proposed use would be in conformance with
33 applicable Comprehensive Plan policies.

34
35 The proposed multi-use area would generate dust, noise and vibration consistent with other
36 allowable uses within LI zone, and therefore would be expected to be compatible with adjacent
37 uses. Therefore, for these reasons, the Department recommends Council find that the
38 proposed temporary multi use area would satisfy UCDC 152.303(B) general criteria.

39
40 UCDC 152.304: Limitations on Use

41
42 *(A) All business, commercial and industrial activities, and storage allowed in an LI Light
43 Industrial Zone shall be conducted wholly within a building or shall be screened from
44 view from adjacent public roads or surrounding properties in farm, residential or*

1 *commercial zones, unless the entire activity is conducted more than 500 feet from said*
2 *surrounding property or road. Outdoor storage of farm and forest products or*
3 *equipment shall not be subject to this limitation;*

4 *(B) All off-street loading areas shall be screened from view if adjoining properties are in a*
5 *residential zone;*

6 *(C) All noise, vibration, dust, odor, smoke, appearance or other objectionable factors*
7 *involved in any activity shall comply with appropriate state and federal regulations.*
8

9 UCDC 152.304 requires that views of permitted uses on LI zoned land be screened, or setback
10 500 feet, from surrounding properties or roads; and, that noise, vibration, dust odor, smoke
11 and other objectionable factors adhere to applicable state and federal requirements. UCDC also
12 requires that views of off-street loading be screened if adjoining properties are in a residential
13 zone, which, for the proposed site of the temporary multi-use area, would not apply as there
14 are no adjacent residential zoned areas.
15

16 The temporary multi-use area site would be surrounded by County Road 1234 to the north and
17 I-82 to the west. In ASC Exhibit K, the applicant describes that Umatilla County Planning
18 Department interprets the setback requirement to be inapplicable to temporary facilities.¹⁶⁵
19 Because it is unclear why only some UCDC LI zone provisions would apply to the temporary
20 multi-use area and because providing screening of the multi-use area uses (e.g. helicopter use
21 and batch plant operations, and general activities related to equipment delivery and storage),
22 the Department recommends Council consider visibility screening or a 500-foot setback to
23 provide necessary safety precautions for vehicles travelling on the above described roads,
24 which appear to be within 500 feet of the proposed site. In ASC Exhibit B, the applicant
25 describes that multi-use areas would be fenced, with locked gates. However, it is not clear
26 whether the fence would include visibility-reducing screens. Therefore, the Department
27 recommends Council impose recommended Land Use Condition 5 to ensure that the multi-use
28 area include a visibility obscuring fence or is designed to limit activities within 500 feet of
29 adjacent public roads.
30

31 UCDC 152.304 requires that all noise, vibration, dust, odor, smoke, appearance or other
32 objectionable factors involved in any activity must comply with appropriate state and federal
33 regulations. The applicant commits to complying with all required federal and state regulations.
34 More specifically, though, the applicant identifies that an Air Contaminant Discharge Permit
35 (ACDP) would be obtained from the Oregon Department of Environmental Quality for the
36 temporary mobile batch plant that would potentially be operated within the multi-use area.
37 The ACDP would include requirements and limits applicable to dust and smoke. Recommended
38 Condition 3 would ensure that, prior to construction, the applicant provide copies of all permits
39 obtained and, during construction, provide records demonstrating compliance with the non-site
40 certificate governed permit requirements. The applicant would not obtain any other permits
41 that would limit noise and vibration, and based on review of ASC Exhibit CC, there are no other

¹⁶⁵ ASC Exhibit K, page K-172; May 12, 2016 letter from Umatilla County Planning Department.

1 state or federal requirements applicable to the proposed facility that would limit noise and
2 vibration at the temporary multi-use area. Therefore, based on compliance with recommended
3 Land Use Condition 3, the Department recommends Council find that the temporary multi-use
4 area would satisfy the UCDC 152.304 use limitations.

5
6 UCDC 152.306: Dimensional Standards; Lot Size; Minimum Lot Width

7
8 *In a LI Zone, the following dimensional standards shall apply:*

9 (A) *Lot size. The minimum lot size shall be one acre unless written proof from the*
10 *Department of Environmental Quality is provided which shows that an approvable*
11 *subsurface disposal system can be located on less than one acre;*

12 (B) *Minimum lot width. The minimum average lot width shall be 100 feet with a minimum of*
13 *25 feet fronting on a dedicated county or public road or state highway;*

14
15 UCDC 152.306 establishes dimensional standards, lot size and minimum lot width for permitted
16 uses within LI zoned land. The applicant asserts that these provisions would only apply if a
17 partition was needed, which is not expected, and even if it were, would be obtained directly
18 from the county. Because any future partition would not be subject to and governed by the site
19 certificate, the Department recommends Council conclude that UCDC 152.306 is not applicable.

20
21 UCDC 152.306(C): Setback Requirements

22
23 *The minimum setback requirements shall be as follows:*

24 (1) *Front yard: 20 feet, except if the front yard area is used for off-street parking space, then*
25 *the front yard shall be a minimum of 40 feet;*

26 (2) *Side yard: 20 feet;*

27 (3) *Rear yard: 20 feet;*

28 (4) *The minimum side and rear yard setbacks may be modified upon the request of a*
29 *property owner, pursuant to § 152.625 through 152.630. Under no circumstance shall*
30 *the setback requirements be modified when the reduced setback would adjoin*
31 *residentially zoned property.*

32
33 UCDC 152.306(C) establishes minimum front, side and rear yard setback distances of 20 feet for
34 permitted uses in LI zoned land. The applicant represents that Umatilla County interprets UCDC
35 152.306(C) setback requirements to be inapplicable to temporary uses, including the temporary
36 multi-use area. However, because the temporary multi-use area may include helicopter and
37 batch plant operations, and other general construction equipment and material delivery and
38 storage, the Department considers setbacks to provide necessary distance between the
39 proposed use and adjacent properties. Therefore, the Department recommends Council find
40 that UCDC 152.306(C) would apply and impose setback limitations in Land Use Condition 5
41 consistent with UCDC 152.306(C) to demonstrate compliance with the requirements.

1 UCDC 152.306(D): Stream Setback

2

3 *To permit better light, air, vision, stream or pollution control, protect fish and wildlife areas,*
4 *and to preserve the natural scenic amenities and vistas along the streams, lakes and*
5 *wetlands, the following setbacks shall apply:*

6 *(1) All sewage disposal installations, such as septic tanks and septic drainfields, shall be*
7 *setback from the mean high-water line or mark along all streams, lakes or wetlands a*
8 *minimum of 100 feet, measured at right angles to the high-water line or mark. In those*
9 *cases where practical difficulties preclude the location of the facilities at a distance of*
10 *100 feet and the DEQ finds that a closer location will not endanger health, the Planning*
11 *Director may permit the location of these facilities closer to the stream, lake or wetland,*
12 *but in no case closer than 50 feet.*

13 *(2) All structures, buildings or similar permanent fixtures shall be set back from the high-*
14 *water line along all streams, lakes or wetlands a minimum of 100 feet measured at right*
15 *angles to the high-water line or mark.*

16

17 UCDC 152.306(D) establishes 100 foot setbacks from the high-water like or mark to streams,
18 lakes or wetlands to permitted uses in LI zoned land. The applicant represents that Umatilla
19 County interprets UCDC 152.306(C) setback requirements to be inapplicable to temporary uses,
20 including the temporary multi-use area. However, because the temporary multi-use area would
21 include helicopter and batch plant operations, and other general construction equipment and
22 material delivery and storage, the Department considers setbacks to provide necessary
23 protection from potential runoff resulting from activities at the multi-use area. However, based
24 on review of ASC Exhibit C Attachment C-2 Map 24, there are no streams, lakes or wetlands in
25 the vicinity of the proposed site. Therefore, while the Department considers that the setbacks
26 would apply, a condition specifying the setback to streams is not necessary given the lack of
27 streams, lakes or wetlands in the vicinity of the proposed site.

28

29 *Umatilla County Development Code Chapter 152 Subsection Rural Tourist Commercial Zone*
30 *RTC*

31

32 The proposed facility would include a portion of a temporary multi-use area within Umatilla
33 County's RTC zone, as presented in ASC Figure K-34. The temporary multi-use area would
34 primarily be used for equipment and vehicle storage. Ancillary uses to the primary use of
35 equipment and vehicle storage may include a helipad for helicopter operations supporting
36 equipment, laborer and material delivery; fuel and lubricant storage (1,000-gallon aboveground
37 storage tank (AST) for gasoline; 1,000-gallon AST for diesel fuel; 500-gallon AST diesel fuel for
38 the batch plant); and temporary batch plant operation.¹⁶⁶

39

¹⁶⁶ As explained in ASC Exhibit G, fuel ASTs would be located within secondary containment consisting of lined soil berms with capacity of at least 10 percent greater than the volume of the AST. The dimensions of the spill containment area would vary based on the volume of the materials stored with a capacity of at least 10 percent greater than the volume of materials stored.

1 UCDC 152.283: Conditional Uses Permitted

2

3 *In an RTC Zone, the following uses and their accessory uses are permitted subject to the*
4 *requirements of §§152.610 through 152.616 and 152.284 through 152.286 of this chapter,*
5 *and upon the issuance of a zoning permit:...*

6

7 *(G) Construction of..temporary storage, and processing sites.*

8

9 UCDC 152.283 establishes conditionally permitted uses within RTC zoned land and requires
10 permitted uses to satisfy the requirements in UCDC 152.610 through 152.616, 152.284 through
11 152.286, and obtain a zoning permit.¹⁶⁷ UCDC 152.283(G) identifies construction of...temporary
12 storage and processing sites as a conditionally permitted use in RTC zoned land.¹⁶⁸

13

14 The applicant proposes a temporary multi-use area, of which a portion would be located in RTC
15 zoned land – the remaining portion would be located in LI zoned land, and requests that the
16 use be evaluated under UCDC 152.283(CCC) – utility facility as provided in UCDC 152.616. As
17 explained in ASC Exhibit K, multi-use areas would be used for equipment and fuel storage, and
18 could be used by a mobile batch plant during foundation construction. Therefore, based on
19 these uses, and because it is approximately 30 miles from other facility components proposed
20 in Umatilla County, the Department recommends Council evaluate this multi-use area as a
21 temporary storage and processing site under UCDC 152.283(G) and find that it is a conditionally
22 permitted use within RTC zoned land. Further, the Department recommends Council impose
23 Land Use Condition 3 requiring that, prior to construction in Umatilla County, the applicant
24 demonstrate that a zoning permit has been obtained for the temporary multi-use area.

25

26 UCDC 152.284: Limitations on Uses

27

28 *In the RTC Zone, the following limitations on uses shall apply:*

29

30 *(A) Outside storage areas shall be screened with a site-obscuring fence so that the area shall*
31 *not be exposed to view from the traveling public and surrounding properties;*

32 *(B) Storage of scrap or salvage materials shall be prohibited.*

33 *(C) Except as provided in Paragraphs D and E of this Section, buildings shall not exceed*
34 *3,500 square feet of floor space.*

¹⁶⁷ UCDC 152.610 through 152.614 contain procedural requirements for conditionally permitted uses, which are superseded by the procedural requirements in OAR Chapter 345 Division 15. UCDC 152.615 contains additional restrictions the county could impose on conditionally permitted uses, and UCDC 152.616 contains standards for review of conditionally permitted uses, but does not establish standards of review for the temporary multi-use area evaluated as “construction of rest areas, weigh stations, temporary storage and processing sites.”

¹⁶⁸ In ASC Exhibit K, the applicant evaluates the temporary multi-use area as a “utility facility as provided in Section 152.616 (CCC)” under 152.283(D). However, as evaluated under 152.303(A) – uses within LI zone, because the temporary multi-use area would be more than 30 miles from the location of transmission structures within Umatilla County, the Department considers the appropriate land use category to be specific to the activities at the multi-use area (e.g. storage and processing) rather than the transmission line as a utility facility.

1 (D) Motels and hotels that existed on July 1, 2005 may expand up to 35 units or up to 50% of
2 the number of existing units, whichever is larger, with no limitation on square footage.

3 (E) Structures that existed on July 1, 2005 may expand to a building size of 4,500 square feet
4 or to a size that is 50% larger than the building size that existed on July 1, 2005,
5 whichever is larger.

6 (F) Notwithstanding the size limitations for structures contained in this chapter, a lawfully
7 approved or lawfully constructed structure existing as of July 1, 2005 shall not be
8 considered a non-conforming use, and in the event the structure is destroyed or
9 substantially damaged, the structure may be restored to its prior lawfully approved size.

10
11 UCDC 152.304 establishes limitations on conditionally permitted uses within RTC zoned land.
12 Applicable limitations include a requirement that outdoor storage areas be screened with a
13 site-obscuring fence; and restriction against the storage of scrap or salvage materials. In ASC
14 Exhibit K, the applicant argues that these provisions may not apply to temporary uses, such as
15 the temporary multi-use area.¹⁶⁹ However, because the temporary multi-use area site would be
16 surrounded by County Road 1234 to the north and I-82 to the west, the Department
17 recommends Council consider visibility screening necessary to provide safety precautions for
18 vehicles travelling on the above described roads, which appear to be within 500 feet of the
19 proposed site. In ASC Exhibit B, the applicant describes that multi-use areas would be fenced,
20 with locked gates. However, it is not clear whether the fence would include site-obscuring
21 screens. Therefore, the Department recommends Council impose Land Use Condition 5 to
22 ensure that the multi-use area in the RTC zone is properly screened from views by travelling
23 vehicles and from surrounding properties.

24
25 The primary use at the temporary multi-use area would be for temporary storage of equipment
26 and materials, including construction related waste. The Department recommends Council find
27 that construction related waste, such as packing materials, scrap conductors, and empty wire
28 spools, not be considered scrap or salvage materials. Moreover, if construction related waste is
29 stored at the temporary multi-use area, it would be stored for a short-term duration and then
30 hauled offsite for recycling or disposal at a landfill.

31
32 Based on the above analysis and reasoning, the Department recommends Council find that the
33 temporary multi-use area would satisfy the UCDC 152.284 use limitations.

34
35 UCDC 152.286: Dimensional Standards; Lot Size; Minimum Lot Width

36
37 *In an RTC Zone, the following dimensional standards shall apply:*

38 (A) *Lot size. The minimum lot size shall be one acre unless written proof from the*
39 *Department of Environmental Quality is provided that shows that an approvable*
40 *subsurface disposal system can be located on less than one acre;*

¹⁶⁹ ASC Exhibit K, page K-172; May 12, 2016 letter from Umatilla County Planning Department.

1 (B) *Minimum lot width. The minimum average lot width shall be 100 feet with a minimum of*
2 *25 feet fronting on a dedicated county or public road or state highway;*

3 (C) *No building shall be located closer than 20 feet from a property line, except on the*
4 *street/road side of a corner lot used for a side yard the setback shall be 55 feet from the*
5 *center line of the road, highway, or easement, or 25 feet from the property line,*
6 *whichever is greater. The minimum side and rear yard setbacks may be modified upon*
7 *the request of a property owner, pursuant to § 152.625 through 152.630. Under no*
8 *circumstance shall the setback requirements be modified when the reduced setback*
9 *would adjoin residentially zoned property.*

10 (D) *To permit better light, air, vision, stream or pollution control, protect fish and wildlife*
11 *areas, and to preserve the natural scenic amenities and vistas along the streams, lakes*
12 *or wetlands, the following setbacks shall apply:*

13 (1) *All sewage disposal installations, such as septic tanks and septic drainfields, shall be*
14 *set back from the mean high-water line or mark along all streams, lakes or wetlands*
15 *a minimum of 100 feet measured at right angles to the high water line or mark. In*
16 *those cases where practical difficulties preclude the location of the facilities at a*
17 *distance of 100 feet and the DEQ finds that a closer location will not endanger*
18 *health, the Hearings Officer may permit the location of these facilities closer to the*
19 *stream, lake or wetland, but in no case closer than 50 feet;*

20 (2) *All structures, buildings or similar permanent fixtures shall be set back from the high-*
21 *water line or mark along all streams, lakes or wetlands a minimum of 100 feet*
22 *measured at right angles to the high-water line or mark.*

23
24 UCDC 152.286 (A) and (B) describes the dimensional requirements for parcels in the RTC zone.
25 These provisions would apply only if the applicant were to require a partition of the impacted
26 RTC zoned parcel in Umatilla County. The applicant explains that it intends to secure easements
27 where necessary and does not expect to require the partitioning of any parcel in Umatilla
28 County. Because no partitions are proposed, UCDC 152.286(A) and (B) are not applicable to the
29 proposed multi-use area. Moreover, the applicant explains that in the event a partition
30 becomes necessary, the applicant would obtain approval of the partition directly from Umatilla
31 County, outside this siting process. Because any future partition would not be subject to and
32 governed by the site certificate, UCDC 152.283(A) and (B) are not applicable to this ASC.

33
34 UCDC 152.306(C) and (D) addresses setback requirements of 20 feet from a property line and
35 100 feet from structures or buildings to the high-water line or mark. In ASC Exhibit K, the
36 applicant asserts that the proposed multi-use area is not proposed to be located within 100
37 feet of any stream, lake or wetland. Therefore, while the Department recommends this criteria
38 be considered applicable to the proposed use, it would not apply to the proposed site.

39
40 *UCDC General Provisions*
41
42
43

1 UCDC 152.010: Access to Buildings; Private Driveways and Easements

2
3 *(A) Every building hereafter erected or moved shall be on a lot that abuts a public street or a*
4 *recorded easement. All structures shall be so located on lots as to provide safe and*
5 *convenient access for servicing, fire protection, and required off-street parking. In*
6 *commercial and industrial zones, access points shall be minimized. To accomplish this,*
7 *access shall be limited to one every 200 feet and shall be reviewed during the design*
8 *review stage or the conditional use hearing. If necessary to accomplish this, driveways*
9 *may be shared between two lots.*

10 *(B) Private driveways and easements that enter onto a public or county road or state or*
11 *federal highway shall be constructed of at least similar if not the same material as the*
12 *public or county road or state or federal highway to protect the edge of the road from*
13 *rapid deterioration. The improvements shall extend at least 25 feet back from the edge*
14 *of the existing travel lane surface.*

15
16 UCDC 152.010 establishes general provisions for site and building access applicable within all
17 zones. Proposed facility components in Umatilla County would include 7 temporary multi-use
18 areas and 2 communication stations, which would include buildings or structures. To ensure
19 compliance with UCDC 152.010 requirements, the applicant proposes, and the Department
20 recommends, Council impose Land Use Condition 5.

21
22 UCDC 152.016: Riparian Vegetation; Wetland Drainage

23
24 *(A) The following standards shall apply for the maintenance, removal and replacement of*
25 *riparian vegetation along streams, lakes and wetlands which are subject to the*
26 *provisions of this chapter:*

27 *(1) No more of a parcel's existing vegetation shall be cleared from the setback and*
28 *adjacent area than is necessary for uses permitted with a zoning permit, accessory*
29 *buildings, and/or necessary access.*

30 *(2) Construction activities in and adjacent to the setback area shall occur in such a*
31 *manner so as to avoid unnecessary excavation and/or removal of existing vegetation*
32 *beyond that required for the facilities indicated in subdivision (A)(1) above. Where*
33 *vegetation removal beyond that allowed in subdivision (A)(1) above cannot be*
34 *avoided, the site shall be replanted during the next replanting season to avoid water*
35 *sedimentation. The vegetation shall be of indigenous species in order to maintain the*
36 *natural character of the area.*

37 *(3) A maximum of 25% of existing natural vegetation may be removed from the setback*
38 *area.*

39 *(4) The following uses and activities are excepted from the above standards:...*

40
41 *(B) Minor drainage improvements necessary to ensure effective drainage on surrounding*
42 *agricultural lands shall be coordinated with the Oregon Department of Fish and Wildlife and*
43 *Soil and Water Conservation District. Existing drainage ditches may be cleared to original*
44 *specifications without review.*

1 UCDC 152.016 establishes standards for permitted uses in all zones that result in maintenance,
2 removal and replacement of riparian vegetation along streams, lakes and wetlands. Standards
3 include minimizing the extent of cleared vegetation within the designated 100-foot setback
4 area, limiting clearance of existing natural vegetation within the setback area to 25 percent,
5 and requiring that drainage improvements be coordinated with ODFW and the local Soil and
6 Water Conservation District.

7
8 The proposed facility would result in removal, replacement and maintenance of riparian
9 vegetation during construction where temporary stream crossings are needed to support
10 transmission line installation. The applicant describes that, during temporary stream crossing
11 activities, vegetation in riparian zones may be thinned or temporarily removed. Temporary
12 vegetation impacts would be restored with indigenous species in the next replanting season as
13 outlined in the draft Reclamation and Revegetation Plan, as provided in Attachment P1-3 of this
14 order. Vegetation clearance and management would be conducted in accordance with the draft
15 Vegetation Management Plan, as provided in Attachment P1-4 of this order, which would
16 ensure minimization of natural vegetation removal within the setback area. The applicant,
17 however, requests the ability to remove more than 25 percent of natural vegetation within
18 riparian areas if necessary to maintain safe facility operations.

19
20 In addition, the applicant proposes to coordinate minor drainage improvements necessary
21 within proposed stream crossing areas with ODFW and the Soil and Water Conservation District
22 where required. To ensure compliance with the relevant UCDC 152.016 requirements, the
23 applicant proposes, and the Department recommends, the Council impose Land Use Condition
24 5. Based on compliance with recommended Land Use Condition 5, the Department
25 recommends Council find that the proposed facility would comply with UCDC 152.016
26 standards.

27
28 UCDC 152.017: Conditions for Development Proposals

29
30 *(A) The proposed use shall not impose an undue burden on the public*
31 *transportation system. Any increase meeting the definition of significant change in trip*
32 *generation constitutes an undue burden.*

33
34 *For the purpose of this chapter, the following definitions shall apply unless the context*
35 *clearly indicates or requires a different meaning:...***SIGNIFICANT CHANGE IN TRIP**
36 **GENERATION.** *A change in the use of the property, including land, structures or facilities,*
37 *or an expansion of the size of the structures or facilities causing an increase in the trip*
38 *generation of the property exceeding:*

- 39 *(1) for gravel surfaced County roads, 30 vehicles of less than 10,000 pounds Gross*
40 *Vehicle Weight (GVW) and/or 20 vehicles of greater than 10,000 pounds GVW;*
41 *(2) for paved County roads, 75 vehicles of less than 10,000 GVW; and*
42 *(3) for State paved Highways, 150 vehicles Of 10,000 pounds GVW or less and/or 100*
43 *vehicles of greater than 10,000 pounds GVW.*

1 (B) For developments likely to generate a significant increase in trip generation, applicant
2 shall be required to provide adequate information, such as a traffic impact study or
3 traffic counts, to demonstrate the level of impact to the surrounding system. The scope
4 of the impact study shall be coordinated with the providers of the transportation facility.
5 Proposals that meet the requirements in §152.019(B) are subject to §152.019(C), Traffic
6 Impact Analysis Requirements.

7 (C) The applicant or developer may be required to mitigate impacts attributable to the
8 project. Types of mitigation may include such improvements as paving, curbing, bridge
9 improvements, drainage, installation or contribution to traffic signals, construction of
10 sidewalks, bikeways, accessways or paths. The determination of impact or effect should
11 be coordinated with the providers of affected transportation facilities;

12 (D) Dedication of land for roads, transit facilities, sidewalks, bikeways, paths, or accessways
13 may be required where the existing transportation system will be impacted by or is
14 inadequate to handle the additional burden caused by the proposed use.

15
16 UCDC 152.017(A) requires that a permitted uses in all zones not impose a significant change in
17 trip generation (i.e. 30 to 75 vehicle trips per day on gravel and paved county roads, and 150
18 vehicle trips per day on State paved highways) within the local transportation system. UCDC
19 152.017(B) requires that, for uses likely to generate a significant increase in trip generation, an
20 impact assessment be provided and shall include proposed mitigation. As noted in ASC Exhibit
21 K, construction-related traffic in and around the multi-use areas would be temporary and would
22 not, then, result in a long term impact on the ability of the local transportation system to
23 provide adequate capacity to users. In addition, the applicant describes that in 2016, Umatilla
24 County Planning Director confirmed that the county would not require a traffic impact analysis
25 for temporary construction-related traffic impacts.

26
27 In Umatilla County, the applicant proposes 7 temporary multi-use areas. Construction-related
28 traffic would predominately occur from worker and material/equipment delivery vehicles
29 travelling to and from the multi-use areas, which are estimated to generate up to 130 vehicles
30 trips per day. Typical activities at multi-use areas would include material deliveries, show-up
31 sites for construction workers, and the dispatching of material to tower work areas. If a batch
32 plant is co-located at a multi-use area, concrete trucks would also generate daily trips during
33 foundation construction.

34
35 The applicant identifies that construction-related traffic in Umatilla County may result in 75 or
36 more vehicle trips per day, which would exceed the UCDC 152.003(2) limit for vehicular traffic
37 on county paved roads. The applicant proposes to address potential impacts to local roadways
38 through a Road Use Agreement and through implementation of measures outlined in the draft
39 Transportation and Traffic Plan, provided as Attachment U-2 of this order, and as
40 recommended by imposed in Public Services Condition 21. Based on compliance with
41 recommends Public Services Conditions 1, the Department recommends Council find that the
42 proposed facility would satisfy UCDC 152.017.

1 *UCDC Historic, Archeological or Cultural Site/Structure Overlay Zone*

2
3 *UCDC 152.437(A): When a development, alteration or demolition is proposed for a HAC site*
4 *or structure, the Planning Director or Hearings Officer shall review the proposal to insure*
5 *that it meets the requirements of this section. A zoning permit is required for any alteration*
6 *or demolition of a HAC site or structure.*

7
8 UCDC 152.437(A) establishes requirements for proposed uses within the county's designated
9 Historic, Archeological or Cultural Site/Structure Overlay (HAC) zone, including a review by the
10 Planning Director if the proposed uses would alter or demolition a HAC site or structure. The
11 applicant asserts that the HAC zone is over 25 miles from the proposed site boundary and that
12 the county has not identified specific HAC sites or structures within the analysis area.
13 Therefore, the Department recommends Council find that, while potentially applicable to the
14 proposed facility, based on the distance from the HAC zone to the proposed site boundary, the
15 criterion does not apply to the proposed facility site.

16
17 *UCDC Critical Winter Range Overlay Zone, Section 152.458*

18
19 UCDC 152.458: Critical Winter Range Overlay Zone

20
21 *(A) Dwelling units shall be limited to a maximum density of three dwellings within a radius*
22 *of one half mile of any proposed dwelling. All requests for dwellings or land divisions that*
23 *will result in eventual placement of a dwelling, or administrative review of non-resource*
24 *dwellings, shall be referred to the Oregon Department of Fish and Wildlife (ODFW) for*
25 *review and recommendation.*

26 *(B) Dwellings shall be sited to minimize impact on critical winter range by application of the*
27 *following:...*

28
29 UCDC 152.458 establishes requirements for specific uses within the Critical Winter Range (CWR)
30 Overlay zone that would result in eventual placement of a dwelling, and administrative review
31 of non-resource dwellings. The CWR Overlay Zone was established for the protection of elk and
32 deer winter range, and aligns with ODFW's habitat designation.

33
34 Approximately 4.2 miles of the proposed 500 kV transmission line would cross CWR Overlay
35 Zone. However, the criteria under UCDC 152.458 for minimizing impacts with the CWR Overlay
36 Zone apply to dwellings, and therefore would not apply to the proposed facility. As noted in
37 ASC Exhibit K, however, under the Council's Fish and Wildlife Habitat standard, the applicant
38 evaluates potential impacts to elk and deer winter range and proposes mitigation that, as
39 described in Section IV.H. *Fish and Wildlife Habitat* of this order, the Department recommends
40 Council find would meet the standard. Proposed mitigation includes compensatory mitigation
41 for permanent and temporary habitat impacts; restricting construction activities during
42 sensitive deer and elk seasons (Dec 1 to March 31) and imposing speed limits to reduce risk of
43 vehicular collision. Therefore, while UCDC 152.458 would not apply to the proposed facility, the

1 applicant demonstrates that the proposed facility would be consistent with the provisions to
2 minimize potential impacts from development within the CRW Overlay Zone.

3
4 *Umatilla County Goal 5 Resources*

5
6 The proposed facility and site boundary would cross the following Goal 5 resources, as
7 identified by Umatilla County, and presented in ASC Exhibit K Figure K-35: five (5)
8 waterfowl/furbearer areas (Butter Creek, Bear Creek, West Birch Creek, East Birch Creek, and
9 McKay Creek); four (4) anadromous fish streams (Bear Creek, West Birch Creek, California Gulch
10 Creek, and East Birch Creek); a high density archaeological area near the Columbia River, and
11 the southwest corner of another high density area in the Blue Mountains; a medium density
12 archaeological area; and, a Big Game Critical Winter Range Habitat (included within CWR
13 Overlay Zone, as described above).

14
15 In ASC Exhibit K, the applicant represents that Umatilla County has not adopted any
16 Goal 5 protection program for furbearers and hunted non-game wildlife, or Goal 5 fish streams.
17 Nonetheless, as evaluated under UCDC 152.286 and 152.306 and imposed under recommended
18 Land Use Condition 5 – requiring a 100-foot setback from structures to the high water mark of
19 any stream, lake or wetland; minimization of cleared vegetation; and, restoration and
20 monitoring - impacts to streams and riparian vegetation would be minimized.

21
22 As evaluated above, UCDC 152.435 through 152.443 are the only applicable provisions to HAC
23 sites within the Historic, Archeological or Cultural Site/Structure Overlay Zone UCDC. UCDC
24 152.436 defines a HAC site as “any historic, archeological or cultural site or structure, or
25 geographic area listed on the Umatilla County Register of Historic Landmarks or recognized as
26 significant by the County Comprehensive Plan and Technical Report.” Umatilla County has not
27 identified any specific HAC sites or structures included in the Goal 5 inventory within the
28 analysis area. As evaluated under the Council’s Historic, Cultural and Archeological Resources
29 standard in Exhibit S and Section IV.K., *Historic, Cultural and Archeological Resources* of this
30 order, the applicant conducted extensive analysis of historic, cultural, and archeological
31 resources in the analysis area (see Exhibit S, Section 3.2 [discussing survey methods]). However,
32 because Umatilla County has not adopted specific provisions for Goal 5 HAC sites, no additional
33 analysis is required to comply with the County’s Goal 5 planning goals for historic resources.

34
35 ***Umatilla County Comprehensive Plan (UCCP)***

36
37 **Open Space, Scenic and Historic Areas, and Natural Resources Element**

38
39 *Finding 37: Areas specifically set aside for natural resource exploitation, future development*
40 *of reservoirs, energy generation and transmission facilities, and industry will lower the cost*
41 *of eventual use as compared to allowing incompatible development on the same lands*
42 *before such eventual use.*

1 *Policy 37: The County shall ensure compatible interim uses provided through Development*
2 *Ordinance standards, and where applicable consider agriculturally designated land as open*
3 *space for appropriate and eventual resource or energy facility use.*

4
5 The Open Space, Scenic and Historic Areas, and Natural Resources Element – Finding 37, Policy
6 37 – establishes that, based on the potential for energy generation and transmission facilities to
7 lower the cost of eventual use of areas protected under the element, the County ensure
8 compatible development. The proposed facility, including alternative routes, would
9 predominately be located on EFU zoned land within Umatilla County, which based on the
10 above-referenced text, may be considered open space appropriate for energy facility use.
11 Based on the analysis provided in Section IV.E.2.1., *ORS 215.283, ORS 215.275 and ORS 215.296*
12 of this order and ASC Exhibit K Section 4.0, Section 6.5.2.1, Section 6.5.2.2, and Section 6.5.5,
13 the Department recommends Council find that construction and operation of the proposed
14 facility would not significantly impact accepted farm practices, including costs.

15
16 Therefore, because the proposed facility would not result in significant adverse impacts to
17 accepted farm practices within the analysis area, and because agricultural lands may be
18 considered open space under this element, the Department recommends Council find that the
19 proposed facility would be consistent with UCCP Open Space, Scenic and Historic Areas, and
20 Natural Resources Element – Finding 37, Policy 37.

21
22 Public Facilities and Services Element

23
24 *Finding 19: Utility facilities can remove valuable resource lands and create development*
25 *problems for new developments and detract from existing development.*

26
27 *Policy 19: Where feasible, all utility lines and facilities shall be located on or adjacent to*
28 *existing public or private rights-of-way so as to avoid dividing existing farm or forest units;*
29 *and transmission lines should be located within existing corridors as much as possible.*

30
31 The Public Facilities and Services Element - Finding 19, Policy 19 – establish that, based on the
32 potential for utility facilities to remove valuable resource land and detract from existing
33 development, the county aim to permit utility lines and facilities adjacent to existing rights-of-
34 way or existing corridors, to the extent feasible. The applicant asserts that siting the proposed
35 facility within or adjacent to existing public or private ROWs is not feasible due to minimum
36 separation distances for high voltage transmission lines as established by NERC and WECC
37 reliability requirements. However, the applicant describes that the proposed route was
38 designed to avoid dividing existing farm or forest units, to the extent feasible. The Department
39 recommends that, while the proposed facility would not use existing ROWs, the applicant
40 demonstrates that it evaluated feasibility of using existing ROWs and therefore would be
41 consistent with Public Facilities and Services Element - Finding 19, Policy 19.

1 Transportation Element

2
3 *Finding 20: Major transmission lines (natural gas and electricity) traverse the county with*
4 *additional expansion proposed, and additional new lines or pipelines could be proposed*
5 *through the county.*

6
7 *Policy 20: The county will review right-of-way acquisitions and proposals for transmission*
8 *lines and pipelines so as to minimize adverse impacts to the community.*

9
10 The Transportation Element - Finding 20, Policy 20 – establishes that, based on the potential for
11 major transmission lines traversing the county to result in future development, the county
12 review ROW acquisitions for transmission lines to minimize adverse local impacts. As described
13 above, the applicant asserts that utilizing existing ROWs is not feasible due to minimum
14 separation distances for high voltage transmission lines as established by NERC and WECC
15 reliability requirements. However, the applicant underscores its planning history for the
16 proposed facility through the Community Advisory Process (CAP) process, where the applicant
17 worked extensively with local landowners in the siting process. Moreover, Umatilla County is a
18 Special Advisory Group for the proposed facility and has reviewed the ASC to date, and will
19 have the opportunity to review the Department’s recommendations. Therefore, through this
20 process the county will review the applicant’s proposal and Department’s recommendations
21 consistent with the Transportation Element Finding 20 and Policy 20.

22
23 ***Recommended Land Use Conditions – Umatilla County***

24
25 **Recommended Land Use Condition 3:** For facility components in Umatilla County, the
26 certificate holder shall:

- 27 a. Prior to construction of any phase or segment of the facility, provide to the Department
28 a copy of the following Umatilla-County issued permits:
- 29 i. Zoning Permit ~~for each tax lot crossed for by~~ facility components evaluated as a
30 Utility Facility Necessary for Public Service (UCDC 152.059) including transmission
31 line, new roads, substantially modified roads, multi-use areas (including batch plant
32 and helipads), and communication stations in EFU-zoned land.
 - 33 ii. Installation of Utilities on County and Public Roads Permits.
 - 34 ~~iii.~~ Road Approach and Crossing Permits as determined necessary by County Public
35 Works Department; and
 - 36 ~~iv.~~ ~~iii.~~ Flood Plain Development Permit.
- 37 b. If after construction commencement the certificate holder determines additional
38 County-approved permits are required, the certificate holder shall provide to the
39 Department a copy of those additional permits.
- 40 c. Prior to construction, provide to the Department and Umatilla County a copy of the
41 ODEQ issued Air Contaminant Discharge or General Permit for the mobile batch plant.
- 42 d. During construction, the certificate holder shall comply with all condition requirements
43 of permits identified under (a), (b), and (c) of this condition.
- 44

1 **Recommended Land Use Condition 4:** Prior to construction of any phase or segment of
2 facility components in Umatilla County, the certificate holder shall work with the Public
3 Works Department on building standards for the road improvements and construction, and
4 for any roads constructed in forest lands in Umatilla County, the certificate holder will
5 ensure road construction is consistent with the Oregon Forest Practices Act.
6

7 **Recommended Land Use Condition 5:** For facility components located in Umatilla County,
8 the certificate holder shall design the facility to comply with the following setback distances
9 and other requirements:

10 In All Zones:

- 11 i. Buildings, the fixed bases of transmission line towers, and new access roads shall be set
12 back from Class I streams at least 25-feet or one-half the stream width, whichever is
13 greater.
- 14 ii. Permanent vegetation removal within the riparian zone of all Class I streams
15 shall retain 75% of all layers or stratas of vegetation.
- 16 iii. Within the transmission line right-of-way, a maximum of 25% of existing natural
17 vegetation along streams, lakes, and wetlands may be removed, unless removal of a
18 greater quantity of vegetation is necessary for reliability purposes.
- 19 iv. The certificate holder shall coordinate with the Oregon Department of Fish and
20 Wildlife and Soil and Water Conservation District on minor drainage improvements
21 necessary to ensure effective drainage on surrounding agricultural lands. Existing
22 drainage ditches may be cleared to original specifications without review.
- 23 v. Access points to multi-use areas and communication stations shall be limited to one
24 every 200 feet.
- 25 vi. New roads that enter onto a public or county road or state or federal highway
26 shall be constructed of at least similar if not the same material as the public or
27 county road or state or federal highway, and the material shall extend at least 25
28 feet back from the edge of the existing travel lane surface.

29 In the EFU Zone (Based solely on certificate holder representations in the ASC):

- 30 vii. Buildings shall be setback as follows: (i) at least 30 feet from the property line
31 or private road easement boundary; or (ii) at least 60 feet from the center line of
32 the road, highway, or private road easement, whichever is greater.
- 33 viii. Buildings and the fixed bases of the transmission line towers shall be set back
34 at least 100 feet from the high-water mark of all streams, lakes, and wetlands.
- 35 ix. Parking lots shall be designed and operated as follows:
 - 36 i. areas used for standing and maneuvering of vehicles at the multi-use areas will have
37 paved surfaces maintained adequately for all weather use and will be drained as to
38 avoid flow of water across public sidewalks;
 - 39 ii. parking spaces along the outer boundaries of any multi-use area parking lot will be
40 contained by a curb at least four inches high and set back a minimum of four and
41 one-half feet from the property line, or by a bumper rail; and
 - 42 iii. artificial lighting, if provided, will not create or reflect glare in a residential zone or
43 on any adjacent dwelling.

44 In the LI zone:

- 1 j. The temporary multi-use area shall include visibility-obscuring fencing or shall setback
- 2 the fence or limit areas of activity a minimum of 500 feet from adjacent public roads.
- 3 k. The temporary multi-use area shall be designed to comply with front, side, and rear yard
- 4 setbacks of 20 feet.

5 In the RTC Zone:

- 6 l. The temporary multi-use area shall include a visibility-obscuring fencing as necessary to
- 7 limit views of the area by travelling public and from surrounding properties.

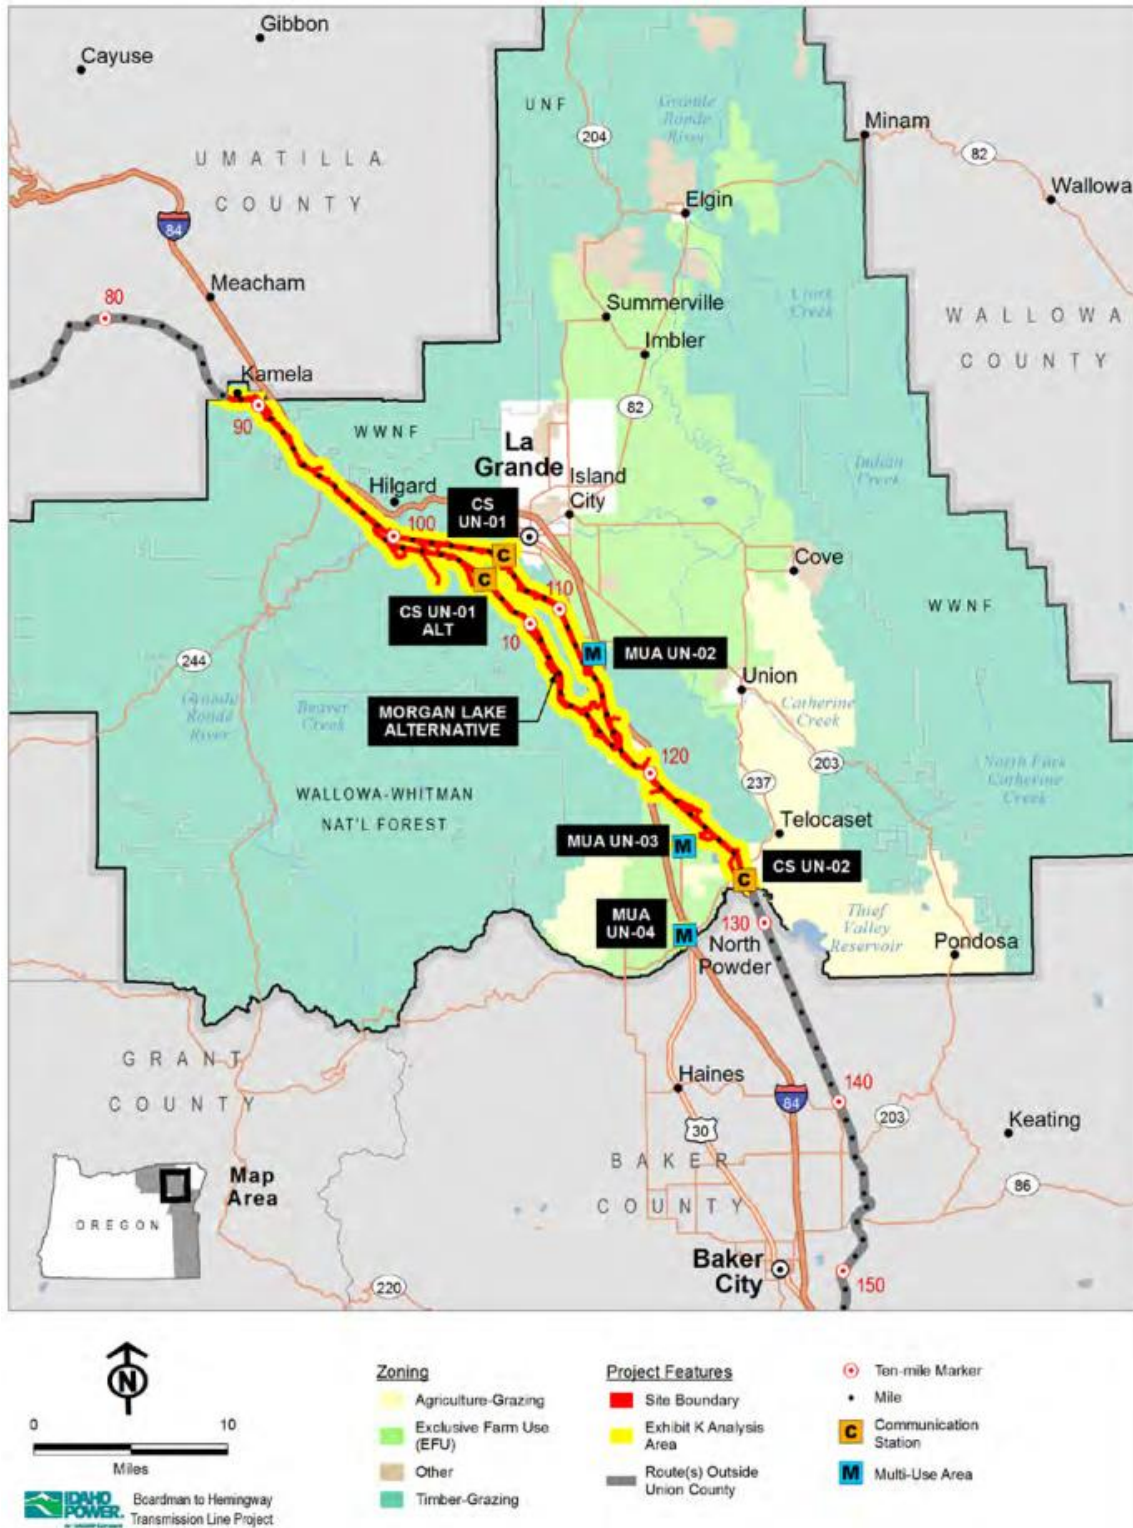

8
9 IV.E.1.3. Union County

10
11 Facility components proposed within Union County include approximately 39.9 miles of 500 kV
12 transmission line, three multi-use areas, 16.6 miles of new access roads, 37.5 miles of
13 substantially modified existing roads, and two communication stations.¹⁷⁰ There is an 18.5 miles
14 alternative 500 kV transmission line route segment, Morgan Lake ~~A~~ alternative, and one
15 alternative communication station site requested for approval in Union County. The locations of
16 proposed and alternative facility components are represented in ASC Exhibit K Figures K-36 and
17 Figure 7, *Union County Zoning and Proposed Facility Component Locations* below.

18
19
20
21
22
23
24
25
26
27
28
29
30

¹⁷⁰ As described in ASC Exhibit B, multi-use areas would be approximately 30 acres in size and would include construction field offices, parking areas, construction vehicle maintenance area, helicopter operations (helipads), explosives storage, hazardous materials storage, water storage tank, portable concrete batch plant, concrete washout station, gravel tire scrub area, noxious weed wash-off station, and bulk materials storage area.

1 **Figure 7: Union County Zoning and Proposed Facility Components**

2
3
4

1 The above-described facility components proposed in Union County would be located on land
2 zoned Exclusive Farm Use (A-1), Agricultural Grazing (A-2) and Timber-Grazing (A-4). Proposed
3 facility components within each zone (with proposed land use category denoted in parenthesis)
4 are as follows:

5
6 Exclusive Farm Use Zone (Utility Facility Necessary for Public Service)

- 7 1.5 miles of 500 kV transmission line
- 8 1.9 miles of substantially modified roads; 0.5 miles of new road
- 9 3 multi use areas
- 10 1 communication station

11
12 Agricultural Grazing Zone (Utility facilities, and similar minor facilities necessary for public
13 service and repair, replacement and maintenance thereof..)

- 14 6.1 miles of 500 kV transmission line
- 15 6.1 miles of substantially modified roads; 3.1 miles of new road
- 16 1 communication station

17
18 Timber Grazing Zone (Utility facilities, and similar minor facilities necessary for public
19 service and repair, replacement and maintenance thereof..)

- 20 32.1 miles of 500 kV transmission line
- 21 29.5 miles of substantially modified roads; 13.1 miles of new road

22
23 The Morgan Lake Alternative Route would cross the same zones as identified for the
24 proposed route; the alternative communication station site would be located in the Timber
25 Grazing zone.

26
27 Applicable substantive criteria for proposed facility components in Umatilla-Union County, in
28 effect on the date the applicant submitted the pASC (February 27, 2013), are presented in Table
29 LU-3 below.

Table LU-3: Applicable Substantive Criteria for Proposed Facility Components in Union County

Union County Zoning, Partition, and Subdivision Ordinance (UCZPSO)^{1,2}	
<i>Exclusive Farm Use Zone</i>	
Section 2.03	Administrative Uses
<i>Agricultural-Grazing Zone</i>	
Section 3.03	Administrative Uses
Section 3.07	Development Standards
Section 3.08	Development and Fire Siting Standards
<i>Timber-Grazing Zone</i>	
Section 5.03	Administrative Uses
Section 5.04	Predominately Forestland Conditional Uses
Section 5.06	Minimum Parcel Sizes
Section 5.07	Siting Standards for Dwellings and Structures
Section 5.08	Development and Fire Siting Standards
Section 21.06	General Standards Governing Conditional Uses
<i>Supplementary Provisions</i>	
Section 20.08	Riparian Zone Setbacks
Section 20.09	Significant Goal 5 Resource Areas
Notes:	
<ol style="list-style-type: none"> 1. ASC Exhibit K Table K-19 includes “potentially applicable substantive criteria” identified by the SAG and the applicant. The evaluation of applicable substantive criteria is based on the table above, and omits some potentially applicable substantive criteria identified by the applicant. Specifically, UCZPSO 2.07 (Development Standards), UCZPSO 2.06 (Minimum Parcel Size), UCZPSO 20.07 (Clear Vision Areas). While the applicant argues that the helipad and batch plant, which could be operated at multi-use areas, are ancillary facilities to the primary use of temporary storage and processing, an evaluation of criteria that could apply if these ancillary uses were evaluated under separate land use categories was provided, which the Department considers be used for information purposes rather applicable substantive criteria. These criteria include: UCZPSO 2.04 (Conditional Uses with General Review Criteria), 1.08 (Definitions), 21.06 (General Standards Governing Conditional Uses), 21.05 (Time Limit on a Conditional Use). Because the Council has jurisdiction over the site certificate, any required site plan or plat approvals or variance requests would be subject to Council, rather than County, procedures and requirements. Therefore, county review and procedural requirements under UCZPSO 20.10 (Site Plan Requirements), UCZPSO 20.40 (Nonfarm Use Partitions), UCZPSO 25.05(1) (Tentative Plan Requirements), UCZPSO 25.06(1) (Final Plat Requirements) and UCZPSO 30.01 (Authority to Grant or Deny Variances) would not apply. 2. In ASC Exhibit K, the applicant describes that Union County, as the SAG, has not identified policies, findings, or goals from the Union County Comprehensive Plan that would apply to the proposed facility. Because the applicant and Department rely upon the SAG to identify applicable substantive criteria, and none were identified from the UCCP, the Department recommends Council rely upon the provisions of the UCZPSO for the land use evaluation. 	

1

1 **Union County Zoning, Partition, and Subdivision Ordinance (UCZPSO)**

2
3 *UCZPSO Chapter 2 Exclusive Farm Use Zone, A-1 Zone*

4
5 Proposed facility components within Union County’s A-1 EFU zone include 1.5 miles of 500 kV
6 transmission line, ½-mile of new access road, 1.9 miles of substantially modified existing access
7 roads, and four multi-use areas (MUA UN-01, UN-02, MUA UN-03, and MUA UN-05), as
8 presented in ASC Exhibit K, Figures K-38a through K-38c.

9
10 UCZPSO 2.03: Administrative Uses

11
12 *The following uses may be established in an A-1 Zone subject to the review process identified*
13 *in Section 24.02 (Planning Director Land Use Decision). The USDA Natural Resources*
14 *Conservation Service soil information shall be used to determine the applicable standards to*
15 *identify rangeland vs. cropland...*

- 16
17 7. *Utility facilities, and similar minor facilities necessary for public service and repair,*
18 *replacement and maintenance thereof, except commercial facilities for the purpose of*
19 *generating power for public use by sale and transmission towers over 200 feet in height.*
20 *A facility is considered necessary if it must be situated in an agricultural zone in order for*
21 *the service to be provided.*

22
23 UCZPSO 2.03(7) establishes that utility facilities necessary for public service is an administrative
24 use permitted in Union County’s A-1 EFU zone, subject to county Planning Director review
25 under UCZPSO Section 24.02.

26
27 As described in ASC Exhibit K, proposed facility components within Union County’s A-1 EFU
28 zone would include up to 1.5 miles of 500 kV transmission line and ancillary facilities, which
29 based on a 2001 and 2005 court decision, the applicant asserts should be considered under the
30 “utility facility necessary for public service” land use category.¹⁷¹ Based on review of the
31 referenced court decision, the Department agrees and recommends Council find that proposed
32 facility components located in A-1 EFU-zoned land would be an administrative use permitted
33 under UCZPSO 2.03(7).

34
35 Notwithstanding the language in the County’s code, the conditional use requirements beyond
36 those that are consistent with ORS 215.275 are not applicable to proposed facility components
37 because, as a utility facility necessary for public service under ORS 215.283(1)(g), the use is
38 permitted subject only to the requirements of ORS 215.275 and the county cannot impose
39 additional approval criteria. Therefore, UCZSPO 2.06 (Minimum Parcel Size) and 2.07(1)-(4)

¹⁷¹ See *Save Our Rural Or. v. Energy Facility Siting Council*, 339 Or. 353, 384 (2005) (upholding Council’s determination that ancillary facilities are considered “utility facilities necessary for public service”); *Cox v. Polk County*, 174 Or. Ct. App. 332, 343-44 (2001) (“utility facilities necessary for public service” may include ancillary or off-site equipment).

1 Development Standards are not evaluated as applicable substantive criteria; however, it is
 2 noted that the applicant evaluates these criteria and based on review, the Department
 3 considers the analysis to represent consistency with these provisions.

4
 5 Proposed facility components would be located in EFU-zoned land across five Oregon counties
 6 including Morrow, Umatilla, Union, Baker, and Malheur. Therefore, for these locations, the land
 7 use compliance evaluation is limited to ORS 215.275, as presented in Section IV.E.2.1., ~~ORS~~
 8 ~~215.283 and ORS 215.275 and ORS 215.296~~ (Exclusive Farm Use Requirements) of this order.

9
 10 *UCZPSO Chapter 3 Agricultural Grazing Zone, A-2 Zone*

11
 12 Proposed facility components within Union County’s Agriculture-Grazing (A-2) zone, which
 13 includes both rangeland and cropland, includes approximately 6.1 miles of 500 kV transmission
 14 line, 3.1 miles of new access road, 6.1 miles of substantially modified existing access roads, and
 15 one communication station (CS UN-02), as presented in ASC Exhibit K Figures K-39a and K-39b.
 16 Alternative components are also proposed in the A-2 zone including 1.3 miles of 500 kV
 17 transmission line, 1.0 miles of new access roads and one communication station (CS UN-01).

18
 19 As requested by the Union County Planning Department, the applicant provides an analysis of
 20 the predominant use within the parcels crossed by the proposed facility in the A-2 zone, based
 21 on taxlot data from the county, soil type data from SSURGO, and 2011 aerial photography. The
 22 results of this evaluation are presented in Table LU-4, *Union County Agriculture-Grazing Zone*
 23 *Predominant Uses* below. As represented in the table, predominant use within the A-2 zone is
 24 rangeland.

25
Table LU-4: Union County Agriculture-Grazing Zone Predominant Uses

Predominant Use	No. of Parcels	Centerline (Miles)	Site Boundary (Acres)
Range	8	4.9	321.6
Other ¹	NA	<0.1	3.5
Agricultural-Grazing A-2 Zone Total	8	4.9	325.1
Notes:			
1. Includes rail and road parcels and therefore was not included in the analysis.			
2. Source: ASC Exhibit K, Table K-24			

26
 27 UCZPSO 3.03: Administrative Uses

28
 29 *The A-2 Agriculture-Grazing Zone allows the following uses to be established in an A-2 Zone*
 30 *subject to the review process identified in Section 24.02 (Planning Director Land Use*
 31 *Decision). The USDA Natural Resources Conservation Service soil information shall be used*
 32 *to determine the applicable standards to identify rangeland vs. cropland...*

- 1 7. *Utility facilities, and similar minor facilities necessary for public service and repair,*
2 *replacement and maintenance thereof, except commercial facilities for the purpose of*
3 *generating power for public use by sale and transmission towers over 200 feet in height.*
4 *A facility is considered necessary if it must be situated in an agricultural zone in order for*
5 *the service to be provided.*
6

7 UCZPSO 3.03 establishes administrative uses permitted within Union County’s A-2 zone and
8 includes utility facilities necessary for public service, subject to county Planning Director review.
9 The evaluation of whether the proposed facility is necessary for public service is provided in
10 Section IV.E.2.1., *ORS 215.283 and, ORS 215.275 and ~~ORS 215.296~~* (*Exclusive Farm Use*
11 *Requirements*) of this order. As evaluated in that section, the Department recommends that the
12 Council find that the proposed facility is a utility facility necessary for public service and
13 therefore would be a permitted use in the A-2 zone.¹⁷²
14

15 UCZPSO 3.07: Development Standards
16

- 17 (1) *Any proposed division of land included within the A-2 Zone resulting in the creation of*
18 *one or more parcels of land shall be reviewed and approved or disapproved by the*
19 *County (ORS 215.263).*
20 (2) *Setbacks from property lines or road rights-of-way shall be a minimum of 20-foot front*
21 *and rear yards and 10-foot side yards.*
22 (3) *Animal shelters shall not be located closer than 100 feet to an R-1 or R-2 Zone.*
23 (4) *Signs shall be limited to the following: a. All off-premise signs within view of any State*
24 *Highway shall be regulated by State regulation under ORS Chapter 377 and receive*
25 *building permit approval. b. All on-premise signs shall meet the Oregon Administrative*
26 *Rule regulations for on-premise signs which have the following standards:*
27 A. *Maximum total sign area for one business is 8% of building area plus utilized parking*
28 *area, or 2,000 square feet, whichever is less.*
29 B. *Display area maximum is 825 square feet for each face of any one sign, or half the*
30 *total allowable sign area, whichever is less.*
31 C. *Businesses which have no buildings located on the premises or have buildings and*
32 *parking area allowing a sign area of less than 250 square feet may erect and*
33 *maintain on-premises signs with the total allowable area of 250 square feet, 125*
34 *square feet maximum for any one face of a sign.*
35 D. *Maximum height of freestanding signs adjacent to interstate highways is 65 feet, for*
36 *all other highways is 35 feet, measured from the highway surface or the premises*
37 *grade, whichever is higher to the top of the sign.*
38 E. *All on-premise signs within view or 660 feet of any State Highway shall obtain permit*
39 *approval from the Permit Unit, Oregon State Highway Division. No sign shall be*

¹⁷² Although beyond what is required to demonstrate compliance with ORS 215.275, the applicant performed a county-specific alternatives analysis. Please refer to ASC Exhibit K Section 6.6.5. for additional information specific to Union County.

1 *moving, revolving or flashing, and all lighting shall be directed away from residential*
2 *use or zones, and shall not be located so as to detract from a motorists vision except*
3 *for emergency purposes.*
4

5 UCZPSO 3.07 establishes development standards for permitted uses within A-2 zoned land,
6 including requirements for review of land division, setbacks, and signage. UCZPSO(1) applies to
7 proposed development that includes land divisions in the A-2 zone and would apply only if the
8 applicant were to require a partition of any of the A-2-zoned property in Union County. The
9 applicant explains that it intends to secure easements where necessary and does not expect to
10 require any lot splits or partitioning of any A-2- zoned parcels in Union County. Because no
11 partitions are proposed, while applicable to the proposed facility, does not apply based on the
12 proposed site. Moreover, the applicant explains that in the event a partition becomes
13 necessary, the applicant would obtain approval of the partition directly from Union County,
14 outside this siting process.
15

16 UCZPSO 3.07(2) establishes that buildings in the A-2 zone be setback 20-feet from front and
17 rear yards and 10 feet from side yards. As described above, facility components proposed
18 within A-2 zoned land would include one communication station, which would include an
19 approximately 11.5 foot (L) by 32 foot (W) by 12 foot (H) prefabricated concrete structure. The
20 applicant assumes that the building setbacks under UCZPSO 3.07(2) apply to the buildings
21 associated with the proposed communications station.¹⁷³ Accordingly, the applicant proposes
22 to locate all buildings at the communication station in the A-2 zone in Union County to comply
23 with the lot line and yard setback requirements of UCZPSO 3.07(2). To ensure compliance with
24 this standard, the applicant proposes and the Department recommends that the Council adopt
25 Land Use Condition 7.
26

27 UCZPSO 3.07(4) regulates the placement of signs for the purpose of fire safety. The
28 requirements provide non-discretionary requirements based on the proposed location, with
29 which the site certificate holder must comply. To ensure compliance with this standard, the
30 applicant proposes and the Department recommends that the Council adopt Land Use
31 Condition 7. Based on the applicant’s representation and compliance with the recommended
32 condition, the Department recommends Council find that the proposed facility would satisfy
33 the UCZPSO 3.07 standards.
34
35
36
37

38 UCZPSO 3.08(4): Development and Fire Siting Standards

¹⁷³ Based on the UCZPSO 2.07(1) definition of “building setback line” it appears that the UCZPSO 2.07(2) setback requirements apply only to buildings and not to structures such as the proposed towers. UCZPSO 2.07(1) defines “building setback line” as “A line beyond which a building cannot be constructed. The building setback line is referenced by and measured from the property line or road or street right-of-way line where applicable. UCZPSO 1.08 defines “building” as “[a] structure built for the shelter or enclosure of persons, animals, chattels or property of any kind.”

- 1
2 (d) All dwelling addresses shall be uniquely designated in accordance with the Union County
3 Road Naming and Addressing Ordinance (Court Order 1988-03) on signs clearly visible
4 and placed at the intersection of the driveway and named road. Rural address markers
5 provided and installed by the Union County Public Works Department shall not be
6 removed, modified or obstructed.
- 7 (e) Signs identifying pertinent information such as "dead end road", "bridge out", and so
8 forth, shall be appropriately placed as designated by Union County.
- 9 (f) Signs identifying location of a fire-fighting water source and each assess to that source
10 shall be permanently identified and shall indicate whether it is a fire hydrant, a dry
11 hydrant, or another type of water supply

12
13 UCZPO 3.08(4)(d)-(f) identifies fire siting standards for structures including requirements for
14 placement of signs, specifying the location and size. The requirements provide non-
15 discretionary requirements based on the proposed location, with which the site certificate
16 holder must comply. To ensure compliance with these requirements, the Department
17 recommends Council impose Land Use Condition 7. Based on the applicant's representation
18 and compliance with the recommended condition, the Department recommends Council find
19 that the proposed facility would satisfy the UCZPSO 3.08(4) requirements.

20
21 *UCZPSO Chapter 5 Timber Grazing Zone, A-4 Zone*

22
23 Proposed facility components within Union County's A-4 Timber Grazing zone include
24 approximately 32.1 miles of 500 kV transmission line, 14.3 miles of new access road, 15.8 miles
25 of substantially modified existing access roads, and one communication station (CS UN-01), as
26 presented in ASC Exhibit K Figure K-40a and 40b.

27
28 Alternative facility components within Union County's A-4 Timber Grazing zone include 17.2
29 miles of 500 kV transmission line, 14.3 miles of new access roads, 15.8 miles of substantially
30 modified existing access roads and one alternative communication station (CS UN-01 ALT) –
31 referred to as the Morgan Lake alternative.

32
33 As requested by the Union County Planning Department, ~~t~~The applicant provides an analysis of
34 the predominant uses within the parcels crossed by the proposed facility in the A-4 zone, based
35 on taxlot data from the county, soil type data from SSURGO, and 2011 aerial photography. The
36 results of this evaluation are presented in Table LU-5, *Union County Timber-Grazing Zone*
37 *Predominant Uses* below. As presented in the table, predominant uses within the site boundary
38 are split between forest and rangeland with a negligible amount of high value cropland.

39
Table LU-5: Union County Timber-Grazing Zone Predominant Uses

Predominant Use	Number of Parcels ¹	Centerline (miles)	Site Boundary (acres)
Proposed Route			

Table LU-5: Union County Timber-Grazing Zone Predominant Uses

Predominant Use	Number of Parcels ¹	Centerline (miles)	Site Boundary (acres)
Forest	33	15.2	1,063.7
Range	28	16.5	1,205.2

Morgan Lake Alternative – Total	38	17.1	1,327.2

UCZPSO 5.03: Administrative Uses; Definitions

The A-4 Timber-Grazing Zone allows both farm and forest uses, is acknowledged to be in compliance with Statewide Planning Goals 3 (agriculture) & 4 (forestry) and is a qualifying exclusive farm use zone. The County shall apply either forest or farm standards for siting a dwelling in the A-4 Timber-Grazing Zone based on the predominant use of the tract on January 1, 1993. Predominant use shall be determined as defined in Section 1.08...¹⁷⁴

...The following uses may be established in an A-4 Zone subject to the Planning Director Land Use Decision review procedure identified in Section 24.02...

- 8. On predominantly farmland parcels utility facilities, and similar minor facilities necessary for public service and repair, replacement and maintenance thereof, except commercial facilities for the purpose of generating power for public use by sale and transmission towers over 200 feet in height. A facility is considered necessary if it must be situated in an agricultural zone in order for the service to be provided. [OAR 660-33-130(16)]*

UCZSPO 5.03 establishes administrative uses permitted within A-4 Timber Grazing zone in Union County, and includes utility facilities necessary for public service. As described above, proposed facility components within A-4 zoned land would predominately be located within forested and range lands. With the Morgan Lake alternative, 17.1-line miles of transmission line, 14.2 miles of new access roads, 15.9 miles of substantially modified existing access roads,

¹⁷⁴ UCZPSO 1.08 defines predominant use as, “the most common use of a parcel when differentiating between farmland and forest land. In determining predominant use NRCS Soil Conservation Service soil maps will be used to determine soil designations and capabilities. The results of this process will be the most important method in determining the predominant use of the parcel. Other factors which may contribute to determining predominant use include parcel characteristics such as a commercial stand of timber, and the current use of the property. Removing a commercial stand of timber from a property will not result in a conversion of predominant use unless the property is disqualified as forest land by the Oregon Department of Forestry...”

1 one communication station (CS UN-02 ALT) and one multi-use area (MUA UN-02) would be
2 located on predominantly forestland parcels. For the proposed and alternative facility
3 components located within forestland portions of the A-4 zone, the county code refers to OAR
4 Chapter 660 Division 6 – which is evaluated in Section IV.E.2.2. *ORS 552772.210 and OAR 660-*
5 *006-0025* of this order. Based on the evaluation presented in Section IV.E.2.2 of this order, the
6 Department recommends Council find that the proposed and alternative facility would be
7 consistent with OAR Chapter 660 Division 6 and therefore would be allowed on the
8 predominately forestland portions of A-4 zoned land.

9
10 For the facility components located on range land, the Department recommends Council find
11 that proposed facility components located in A-4 zoned land would be an administrative use
12 permitted under UCZPSO 5.03(8). For the Morgan Lake alternative components in A-4 zoned
13 land where the underlying land is predominately farmland (range), under UCZPSO 5.03(8), the
14 use is permitted as a utility facility necessary for public service under ORS 215.283(1)(c)(A) and
15 ORS 215.275.¹⁷⁵ Based on the evaluation presented in Section IV.E.2.1., *ORS 215.283 and, ORS*
16 *215.275 and ~~ORS 215.296~~ (Exclusive Farm Use Requirements)* of this order, the Department
17 recommends Council find that the proposed and alternative facility satisfies the ORS 215.275(2)
18 factors and is, therefore, allowed on the predominantly farmland portions of the A-4 zone.

19
20 UCZPSO 5.04: Predominantly Forestland Conditional Uses - Review Criteria

21
22 *The following uses may be established on predominantly forestland parcels or tracts in an A-*
23 *4 Zone subject to the review procedures identified in Section 24.03 and subject to approval*
24 *by the Planning Commission based on applicable standards in Article 21.00 and the*
25 *following criteria:...*

- 26
27 3. *New electrical transmission lines with right of way widths of up to 100 feet as specified*
28 *in ORS 772.210. New distribution lines (e.g., gas, oil, geothermal) with rights-of-way 50*
29 *feet or less in width*

30
31 *Criteria No. 1 - The proposed use will not force a significant change in, or significantly*
32 *increase the cost of, accepted farming or forest practices on agriculture or forest lands;*
33 *and*

34
35 *Criteria No. 2 - The proposed use will not significantly increase fire hazard or significantly*
36 *increase fire suppression costs or significantly increase risks to fire suppression*
37 *personnel; and*

38
39 *Criteria No. 3- A written statement recorded with the deed or written contract with the*
40 *county or its equivalent is obtained from the landowner which recognizes*

¹⁷⁵ UCZPSO 5.03 references OAR 660-33-0130(16), which implements the factors at ORS 215.275 for determining whether a utility facility is necessary for public service.

1 *the rights of adjacent and nearby landowners to conduct forest operations consistent*
2 *with the Forest Practices Act and Rules for 12. home occupations, 5. parks and*
3 *campgrounds, and 4. temporary hardship dwellings.*

4
5 UCZPSO 5.04(3) establishes review criteria for permitted uses within A-4 zoned land within
6 Union County, including new electrical transmission lines with right of way widths up to 100
7 feet as specified in ORS 772.210. UCZPSO 5.04(3) Criteria 1 and 2 mirror OAR 660-006-
8 0025(4)(q), which is evaluated in Section IV.E.2.2. ~~ORS 772.210 and~~ OAR 660-006-0025 of this
9 order. UCZPSO 5.04(3) Criteria 3 applies to home occupations, parks and campgrounds and
10 temporary hardship dwellings, and therefore because these uses do not ~~cover~~ apply to new
11 electrical transmission lines, would not apply to the proposed facility.

12
13 UCZPSO 5.06: Minimum Parcel Size

- 14
15 1. *For farmland not designated rangeland the minimum parcel size shall be*
16 *160 acres.*
17 2. *For land designated rangeland the minimum parcel size shall be 320 acres.*
18 3. *For new parcels which will be predominantly comprised of forest land the minimum*
19 *parcel size shall be 240 acres.*
20 4. *On predominantly agricultural parcels (cropland or rangeland) a variance application*
21 *may be submitted per Article 30.00 to create parcels per ORS 215.780(1) for resource*
22 *related purposes only.*
23 5. *New land divisions less than required in Section 5.06 3. above: [OAR 660-06-026(2)]*
24 a. *New land divisions on predominantly forest land parcels less than the parcel size in*
25 *5.06 3. may be approved only for the uses listed in 5.02 3. & 12.; 5.04 1., 2., 5., 6.,*
26 *10., & 11.; and 5.05 3. provided that such uses have been approved pursuant to 5.04*
27 *Criteria No's 1, 2 & 3.*
28 b. *Such divisions shall create a parcel that is the minimum size necessary for the use. 6.*
29 *Non-farm parcels on predominantly farmland parcels.*
30 a. *Predominantly farmland parcels that are not customarily provided in conjunction*
31 *with farm use may be created only if all of the following criteria can be satisfied:*
32 A. *No new lot or parcel may be created for this purpose until the dwelling to be*
33 *sited on the new parcel is first approved pursuant to Section 5.05 4. (non-*
34 *farm dwelling).*
35 B. *The new parcel is a preexisting substandard lot or parcel created prior to the*
36 *adoption of this ordinance and when the parcel is the result of a transfer of a*
37 *parcel of land between adjacent landowners as described in the definition of*
38 *a minor partition in Section 1.08.*

39
40 UCZPSO 5.06 establishes minimum lot sizes for permitted uses within A-4 zoned land and would
41 apply to the proposed facility if land division or portioning is necessary. In ASC Exhibit K, the
42 applicant asserts that the parcels to be used for siting of the proposed and alternative facility
43 components within A-4 zoned land would not likely involve partitioning. However, if

1 partitioning is necessary, the applicant would work directly with the county to obtain approval
2 and ensure the lot size satisfied UCZPSO 5.06 requirements.

3
4 UCZPSO 5.07: Siting Standards for Dwelling and Structures

5
6 *The following siting standards shall apply to all new dwellings and related structures in the*
7 *A-4 Zone where the predominant use is forestry [OAR 660-06-050(3)] and where dwellings*
8 *are on rangeland within one quarter mile of forest land areas. These standards are designed*
9 *to make such uses compatible with forest operations and agriculture, to minimize wildfire*
10 *hazards and risks, and to conserve values found on forest lands. The standards in Sections*
11 *5.07 and 5.08 shall be considered when identifying the building site...*

- 12
13 1. *Dwellings and structures shall be sited on the parcel so that:*
- 14 a. *They have the least impact on nearby or adjoining forest or agricultural lands;*
 - 15 b. *The siting ensures that adverse impacts on forest operations and accepted farming*
16 *practices on the parcel will be minimized;*
 - 17 c. *The amount of forest lands used to site access roads, service corridors, the dwelling*
18 *and structures is minimized; and*
 - 19 d. *The risks associated with wildfire are minimized.*
- 20
21 2. *Siting criteria satisfying subsection 5.07 1. may include setbacks from adjoining*
22 *properties, clustering near or among existing structures, siting close to existing roads*
23 *and siting on that portion of the parcel least suited for growing trees*

24
25 UCZPSO 5.07 establishes siting and setback standards for dwellings and related structures of
26 permitted uses within A-4 zoned land. The applicant argues that proposed facility components
27 would not be considered a dwelling or a structure related to a dwelling as defined in UCZPSO
28 1.08 as “buildings containing one or more rooms designed for occupancy by a family.” The
29 Department agrees and recommends Council find that UCZPSO 5.07 requirements would not
30 apply to the proposed or alternative facility components. However, because Union County
31 interprets the code provisions to be applicable to proposed structures at the communication
32 stations and because the applicant provides a compliance demonstration consistent with the
33 requirements, the Department provides the following summary.

34
35 UCZPSO 5.07(1) restricts the placement of structures on the property to minimize impact on
36 nearby or adjoining forest or agricultural lands. The proposed communication stations would be
37 located within the transmission line right-of-way, which would minimize potential adverse
38 impacts on forest operations. Siting the communication stations within the transmission line
39 right-of-way would also minimize the amount of forest lands used for access roads because the
40 station would use access roads that would already be used for accessing the transmission line.
41 As explained further In ASC Exhibit U, the risks associated with wildfire from or to the
42 communication station would be minimal.

1 UCZPSO 5.07(2) authorizes the use of setbacks from adjoining properties, or requiring clustering
2 of dwellings and related structures near or among existing structures, requiring that the
3 dwellings and related structures be sited close to existing roads or requiring them to be sited on
4 a portion of the parcel least suited for growing trees. However, because the communication
5 stations have been sited in a way to minimize any unnecessary cumulative impacts, the
6 Department recommends Council find that no additional limitations are warranted.

7 UCZPSO 5.08: Development and Fire Siting Standards
8

9 *The following standards shall apply to all development in an A-4 Timber Grazing Zone. Fire*
10 *siting standards (items 5-8) shall apply only to new dwellings and related structures in the A-*
11 *4 Zone where the predominant use is forestry [OAR 660-06-055(3)] and where dwellings are*
12 *on rangeland within one quarter mile of forest land areas...*
13

- 14 2. *Setbacks from property lines or road rights-of-way shall be a minimum of 20-foot front*
15 *and rear yards and 10-foot side yards...*
16
- 17 4. *Signs shall be limited to the following:*
18 *a. All off-premise signs within view of any State Highway shall be regulated by State*
19 *regulation under ORS Chapter 377 and receive building permit approval.*
20 *b. All on-premise signs shall meet the Oregon Administrative Rule regulations for on*
21 *premise signs which have the following standards:*
22 *A. Maximum total sign area for one business is 8% of building area plus utilized*
23 *parking area, or 2,000 square feet, whichever is less.*
24 *B. Display area maximum is 825 square feet for each face of any one sign, or half*
25 *the total allowable sign area, whichever is less.*
26 *C. Businesses which have no buildings located on the premises or have buildings*
27 *and parking area allowing a sign area of less than 250 square feet may erect and*
28 *maintain on-premises signs with the total allowable area of 250 square feet, 125*
29 *square feet maximum for any one face of a sign.*
30 *D. Maximum height of freestanding signs adjacent to interstate highways is 65 feet,*
31 *for all other highways is 35 feet, measured from the highway surface or the*
32 *premises grade, whichever is higher to the top of the sign.*
33 *c. All on-premise signs within view or 660 feet of any State Highway shall obtain permit*
34 *approval from the Permit Unit, Oregon State Highway Division. No sign shall be*
35 *moving, revolving or flashing, and all lighting shall be directed away from residential*
36 *use or zones, and shall not be located so as to detract from a motorist's vision except*
37 *for emergency purposes.*
38 *d. All dwelling addresses shall be uniquely designated in accordance with the Union*
39 *County Road Naming and Addressing Ordinance (Court Order 1988-03) on signs*
40 *clearly visible and placed at the intersection of the driveway and named road. Rural*
41 *address markers provided and installed by the Union County Public Works*
42 *Department shall not be removed, modified or obstructed.*

- 1 e. *Signs identifying pertinent information such as "dead end road", "bridge out", and so*
2 *forth, shall be appropriately placed as designated by Union County.*
3 f. *Signs identifying location of a firefighting water source and each assess to that*
4 *source shall be permanently identified and shall indicate whether it is a fire hydrant,*
5 *a dry hydrant, or another type of water supply..*
6

7 UCZPSO 5.08(2) establishes lot line and road setback requirements for permitted uses in the A-
8 4 zone. The proposed multi-use areas and communications stations would include buildings, to
9 which the UCZPSO 5.08 development standards apply. To ensure compliance with the setback
10 requirements of UCZPSO 5.08(2), the applicant proposes and the Department recommends the
11 Council adopt Land Use Condition 7.¹⁷⁶

12 UCZPSO 5.08(4) includes nondiscretionary siting and other standards for signs on uses in the A-
13 4 zone. The applicant agrees to comply with all signage requirements. To ensure compliance
14 with this standard, the applicant proposes and the Department recommends that the Council
15 adopt Land Use Condition 7.

16
17 UCZPSO 21.06: General Standards Governing Conditional Uses
18

19 *The following standards and criteria shall govern conditional uses, except as provided in*
20 *subsection 21.07:*

- 21 1. *A conditional use shall ordinarily comply with the standards of the zone concerned for*
22 *uses permitted outright except as specifically modified by the Planning Commission in*
23 *granting the conditional use.*
24 2. *Other uses similar to those enumerated within specified zones except in the A-1, A-2, A-3*
25 *and A-4 Zones which are consistent with the purposes and intent of the applicable zone*
26 *may be modified by the Planning Commission if the use is found:*
27 A. *To be compatible with outright or conditional uses of the applicable zone.*
28 B. *Not to interfere seriously with established and accepted practices on adjacent lands.*
29 C. *Not to materially alter the stability of the overall land use pattern of the area.*
30 D. *That the proposed use can comply with the standards of the zone, and*
31 E. *To comply with such other conditions as the Planning Commission or its designate*
32 *considers necessary to carry out the purposes of this ordinance.*
33

34 UCZPSO 21.06 applies to all conditional uses in Union County. UCZPSO 21.06(1) requires that
35 conditional uses meet the development standards relevant to uses permitted outright in the
36 zone, including UCZPSO 5.06 (Minimum Parcel Size), UCZPSO 5.07 (Siting Standards for
37 Dwellings and Structures), and UCZPSO 5.08 (Development and Fire Siting Standards), which

¹⁷⁶ The UCZPSO 1.08 definition of "building setback line" indicates that the lot line and road setback requirements of UCZPSO 5.08(2) apply only to buildings. The applicant explains that because the proposed access roads and transmission line would not be built to support, shelter or enclose anything and are, therefore, not considered buildings, the UCZPSO 5.08(2) setback requirements do not apply to those uses.

1 would be satisfied based on applicant representations and compliance with recommended Land
2 Use Condition 7.

3
4 *UCZPSO Chapter 20 Riparian Zone*

5
6 UCZPSO Chapter 20 establishes requirements for development within designated riparian
7 zones. The proposed and alternative facility components would impact land within riparian
8 zones during temporary stream crossings. ASC Exhibit K, Figure K-31a depicts the locations
9 within Union County where the proposed transmission line would cross or be located near Class
10 I streams. Applicable criteria for potential impacts from permitted uses to riparian zones is
11 evaluated below.

12
13 UCZPSO 20.08: Riparian Zone Setbacks

14
15 *In order to maintain vegetative cover along Class I streams, rivers and lakes known as*
16 *riparian habitat a setback for any new development such as structures or roads shall be*
17 *required on a sliding scale proportional to one-half the stream width, at right angles to the*
18 *annual high-water line or mark. A minimum of 25-feet either side of streams will be*
19 *recognized. Woody vegetation presently existing in the riparian zone shall be maintained,*
20 *however, thinning or harvesting of merchantable tree species may occur within the riparian*
21 *zone where 75 percent of the existing shade over the stream is maintained.*

22
23 UCZPSO 20.08 establishes setbacks for ‘structures’ proposed to be located near Class I streams,
24 rivers and lakes. UCZPSO 1.08 defines “structure” as “That which is built or constructed. An
25 edifice or building of any kind or any piece of work artificially built up or composed of parts
26 joined together in some manner and which requires location on the ground or which is
27 attached to something having a location on the ground. “It defines “building” as “[a] structure
28 built for the shelter or enclosure of persons, animals, chattels or property of any kind.”

29
30 UCZPSO 20.08 applies to all “new developments” including proposed new access roads,
31 transmission towers, multi-use areas and communications stations. Because substantially
32 modified existing roads are not “new developments,” the UCZPSO 20.08 setback requirements
33 do not apply those improvements.

34
35 To ensure compliance with the riparian area setback requirements of UCZPSO 20.08, the
36 applicant proposes and the Department recommends that the Council adopt Land Use
37 Condition 7.

38
39 *UCZPSO Chapter 17 Flood Plain Overlay Zone*

40
41 UCZPSO Chapter 17 establishes requirements for development proposed within Special Flood
42 Hazard Areas (SFHA). The proposed facility would span the Grande Ronde River (MP 95.7) and
43 Powder River (MP 124) SFHAs, as presented in ASC Exhibit K Figure K-42. Along the Morgan

1 Lake alternative, the transmission line would span the Grande Ronde SFHA (MP 0.8). Applicable
2 criteria for development with SFHAs is evaluated below.

3

4 UCZPSO 17.03(1)(A): Permit Requirement

5

6 *Filing of a development permit or building permit, where applicable, shall be obtained*
7 *before construction or development begins within any area of special flood hazard.*

8 *Development permits are required for all structures including manufactured homes and for*
9 *all other development including fill, except low investment structures; building permits shall*
10 *be for all structures. Application for a development and building permit shall be made to and*
11 *maintained by the County Building Inspector and findings submitted to the County Planning*
12 *Department.*

13

14 UCZPSO 17.03(1)(A) requires a flood plan development permit for activities within an SFHA. To
15 ensure that a flood plain development permit is obtained prior to construction activities within
16 an SFHA, the Department recommends Council impose Land Use Condition 6.

17

18 UCZPSO 17.03(1)(B)(1): Anchoring

19

20 *(1) All new construction and substantial improvements shall be anchored to prevent*
21 *flotation, collapse or lateral movement of the structure.*

22 *(2) All mobile homes shall be anchored to resist floatation, collapse, or lateral movement by*
23 *providing over-the-top and frame ties to ground anchors. Specific requirements shall be*
24 *that:...*

25 *(3) An alternative method of anchoring may involve a system designed to withstand a wind*
26 *force of 90 miles-per-hour or greater. Certification must be provided to the County*
27 *Building Inspector that this standard has been met.*

28 *(4) All manufactured homes must likewise be anchored to prevent flotation, collapse or*
29 *lateral movement*

30

31 UCZPSO 17.03(1)(B)(1) requires that all new construction and substantial improvements within
32 a SFHA be anchored to prevent flotation, collapse or lateral movement. As proposed, the lattice
33 and tubular steel structures of the proposed towers would be anchored to large drilled pier
34 foundations, which are designed to resist the heavy loads that are transferred from the
35 structure (from various temperature, wind, and icing conditions) to the conductors. The
36 foundations would also be designed to resist uplift pressures (buoyancy forces) that can occur
37 in areas with high water tables. UCZPSO 17.03(1)(B)(3) allows an alternative method of
38 anchoring to withstand wind forces of 90 miles per hour or more. The proposed transmission
39 structure foundation design would prevent flotation, collapse, or lateral movement of the
40 structure, as required under UCZPSO 17.03(1)(B)(1). The applicant does not anticipate requiring
41 the alternative method allowed under UCZPSO(1)(B)(3), but if it is determined necessary,
42 commits to complying with the requirements of that section. Based on the applicant's
43 representations of transmission tower design, the Department recommends Council find that
the proposed facility would satisfy UCZPSO 17.03(1)(B)(1) anchor requirements.

39
40
41
42

UCZPSO 17.03(1)(B)(2) and (4) involve the regulation of mobile and manufactured homes. Because none of the components of the proposed transmission line include the construction of mobile or manufactured homes, these criteria are not applicable.

UCZPSO 17.03(1)(C): Construction, Materials and Methods

- (1) All new construction and substantial improvements shall be constructed with materials and utility equipment resistant to flood damage.*
- (2) All new construction and substantial improvements shall be constructed using methods and practices that minimize flood damage.*
- (3) Electrical, heating, ventilation, plumbing, and air- conditioning equipment and other service facilities shall be designed and/or otherwise elevated or located so as to prevent water from entering or accumulating within the components during conditions of flooding.*

UCZPSO 17.03(1)(C)(1) and 17.03(1)(C)(2) establishes construction, material and method requirements for development within a SFHA. Specifically, construction materials and utility equipment must be resistant to flood damage; construction methods must minimize flood damage. In compliance with these standards, construction methods for the transmission towers would include use of concrete drilled piers that would be highly resistant to the presence of water and are commonly used in the utility industry for structures located in high water tables or standing or flowing water. The foundations would also have a minimum foundation reveal, and the length the foundation would extend above the ground by at least one foot to protect the steel structure from low levels of standing or flowing water. In the event of free-standing water extending above the top of the transmission tower foundation, the structures would be made of galvanized or weathering steel for corrosion protection.

UCZPSO 17.03(1)(C)(3) requires electrical and other service facilities to be designed to prevent water from entering its components during flooding conditions. As proposed, the transmission towers would be located above the elevation of the 100-year floodplain, and otherwise would be designed and located to prevent water from entering the equipment components during flooding conditions.

Based on the applicant’s facility design representations, the Department recommends Council find that the proposed facility would be designed in accordance with UCZPSO 17.03(1)(C) construction, material and method requirements for development within a SFHA.

UCZPSO 17.03(1)(D): Utilities

- (1) All new and replacement water supply systems shall be designed to minimize or eliminate infiltration of flood waters into the system.*

1 (2) *New and replacement sanitary sewage systems shall be designed to minimize or*
2 *eliminate infiltration of flood waters into the systems and discharge from the systems*
3 *into flood waters; and*

4 (3) *On-site waste disposal systems shall be located to avoid impairment to them or*
5 *contamination from them during flooding.*

6
7 UCZPSO 17.03(1)(D) establishes requirements for utility system development within a SFHA,
8 including systems for water supply, sanitary sewage, and on-site waste disposal. The proposed
9 facility would not include any of those systems and, therefore, this criterion is inapplicable.

10
11 UCZPSO 17.03(2)(B): Specific Standards; Non-Residential Construction

12
13 *New construction and substantial improvement of any commercial, industrial or non-*
14 *residential structure other than low investment accessory structures shall either have the*
15 *lowest floor, including the basement, elevated to the level of the base flood elevation, or*
16 *together with the attendant utility and sanitary facilities, shall:*

17 (1) *Be flood proofed so that below the base flood level the structure is watertight with walls*
18 *substantially impermeable to the passage of water.*

19 (2) *Have structural components capable of resisting hydrostatic and hydrodynamic loads*
20 *and effects of buoyancy, and*

21 (3) *Be certified by a registered professional engineer or architect that the standards of this*
22 *subsection are satisfied. Such certifications shall be provided to the County Building*
23 *Inspector.*

24
25 UCZPSO 17.03(2)(B) establishes specific standards for non-residential construction in a SFHA,
26 including requiring structure floor placement above the base flood elevation. As proposed, all
27 transmission line towers would be located above the elevation of the 100-year floodplain.
28 Therefore, while UCZPSO 17.03(2)(B) is applicable substantive criteria, would not apply based
29 on the proposed facility component location and design.

30
31 UCZPSO 17.03(2)(E): Floodways

32
33 *Since the floodway is an extremely hazardous area due to the velocity of flood waters which*
34 *carry debris, potential projectiles, and have erosion potential, the following provisions apply:*

35
36 (1) *Encroachments are prohibited, including fill, new construction, substantial*
37 *improvements, and other development unless certification by a registered professional*
38 *engineer or architect is provided demonstrating that encroachments shall not result in*
39 *any increase in flood levels during the occurrence of the base flood discharge. (2) If*
40 *Section (1) above is satisfied, all new construction and substantial improvements shall*
41 *comply with all applicable flood hazard reduction provisions of Section 17.03*
42 *limitations....*

1 UCZPSO 17.03(2)(E) prohibits encroachments into floodways unless certification by a registered
2 engineer or architect demonstrates that the encroachment(s) would not result in any increase
3 in flood levels. As proposed, it is unlikely that there would be any potential for any components
4 of the proposed transmission line to be located within a floodway. However, to the extent
5 transmission line components would be located in a floodway, the certificate holder agrees to
6 obtain certification by a registered professional engineer or architect providing that the
7 encroachments would not result in an increase in flood levels during the occurrence of the base
8 flood discharge, in compliance with this criterion. Therefore, the Department recommends
9 Council find that the proposed facility would satisfy UCZPSO 17.03(2)(E) floodway
10 requirements.

11
12 *Public Right-of-Way Access Provisions*

13
14 **ORS 374.305(1) Road Approach Permit:** *A person may not place, build or construct on the*
15 *right of way of any state highway or county road, any approach road, structure, pipeline,*
16 *ditch, cable or wire, or any other facility, thing or appurtenance, or substantially alter any*
17 *such facility, thing or appurtenance or change the manner of using any such approach road*
18 *without first obtaining written permission from the Department of Transportation with*
19 *respect to state highways or the county court or board of county commissioners with respect*
20 *to county roads.*

21
22 **UCZPSO 25.09(8) Road Widths and Improvements** *(a) Road standards shall not be less than*
23 *those set forth in Table 7-2 in the Transportation System Plan, except where it can be shown*
24 *that probable future traffic development or physical characteristics are such as to*
25 *unquestionably justify modification of the standards. (b) In areas designed and zoned for*
26 *commercial use, road widths may be increased by such amount as may be deemed*
27 *necessary by the Commission to provide for the free flow of through traffic without*
28 *interference by parked or parking vehicles, and to provide safe parking space for such*
29 *commercial or business districts. (c) Road and related improvements shall be completed or*
30 *bonded for completion prior to final plat consideration and shall be constructed under the*
31 *direction of the County Planning Department, according to the minimum Road Standard*
32 *Table 7-2***.*

33
34 UCZPSO 25.09(8) and ORS 374.305(1) establish provisions for development and access within a
35 ~~publically~~publicly owned right-of-way. An ODOT road approach permit or a permit from the
36 county to work in the county right of way would be required where the proposed access roads
37 intersect with public roads or if necessary updates to existing roads affect a public road. The
38 applicant would obtain all necessary approach permits in compliance with the statutory
39 requirements. As explained in ASC Exhibit E, any required state or local permit would not be
40 included in or governed by the site certificate. However, in order to provide assurance to the
41 Council that the certificate holder has complied with any requirements to obtain any necessary
42 approach permits or permits required to work in the county right of way, the applicant
43 proposes and the Department recommends that the Council adopt Land Use Condition 6.
44

1 UCZPSO 25.09(8) includes nondiscretionary county road width and improvement requirements.
2 Nondiscretionary county road permits are not included in or governed by the site certificate.
3 However, the applicant proposes, and the Department recommends Council adopt Land Use
4 Condition 6 and Public Services Condition ~~24~~ to ensure necessary nondiscretionary permits are
5 obtained prior to construction and that the applicant consult with and coordinate with the
6 county to minimize potential traffic-related impacts.

7
8 *Union County Goal 5 Resources*
9

10 The proposed facility and site boundary would be located within Union County's Big Game
11 Winter Range or Critical Habitat Zone, which is identified in the Union County Comprehensive
12 Plan (UCCP) Goal 5 Resources element. Big game habitat is mapped in the Union County
13 Comprehensive Plan as winter range (WR) and critical habitat (CH) Overlay areas. ASC Exhibit K,
14 Figure K-36 depicts the location of the WR and CH Overlays in the portion of Union County that
15 the proposed transmission line would cross. Union County has indicated that its mapping is
16 intended to be over-inclusive of possible habitat areas.¹⁷⁷

17
18 Within the Big Game Winter Range or Critical Habitat Zone, the proposed route would include
19 28 miles of 500 kV transmission line, 9.7 miles of new access roads, 25.5 miles of substantially
20 modified existing access roads, two communication stations (CS UN-01 and CS UN-02), and two
21 multi-use areas (MUA UN-02 and MUA UN-03). The Morgan Lake alternative would include 16.4
22 miles of 500 kV transmission line, 14.5 miles of new access roads, 13.1 miles of substantially
23 modified existing access roads, one communication station (CS UN-02 ALT) and one multi-use
24 area (MUA UN-02) in the Big Game Winter Range or Critical Habitat zone.¹⁷⁸

25
26 The County has indicated that under its Comprehensive Plan all big game habitat is considered
27 a 3C resource, which requires that conflicting uses be minimized. UCZPSO 20.09 implements
28 the County's Comprehensive Plan by providing a conditional use process when a 3A or 3C
29 decision has been made as indicated in the comprehensive plan, as evaluated below.

30
31 UCZPSO 20.09: Review Criteria
32

33 *(2) Review Classification*

- 34 *A. When a 3A or 3C (limit conflicting uses) decision has been made as indicated in the*
35 *comprehensive plan, the applicant must, in coordination with the responsible*
36 *agency, develop a management plan which would allow for both resource*
37 *preservation and the proposed use. If the responsible agency and the applicant*
38 *cannot agree on such a management plan, the proposed activity will be reviewed*
39 *through the conditional use process. 3A sites will be preserved where potential*
40 *conflicts may develop. Conflicts will be mitigated in favor of the resource on 3C sites.*

¹⁷⁷ B2HAPPDoc3-19 ASC 11 Exhibit K Land Use. P K-232. 2018-09-28.

¹⁷⁸ B2HAPPDoc3-19 ASC 11 Exhibit K Land Use. Table K-21, (page K-261) depicts the amount of Critical Habitat and Winter Range crossed by the Proposed Route. 2018-09-28.

1
2 *(4) Under the conditional use process land use decisions will consider the economic, social,*
3 *environmental, and energy consequences when attempting to mitigate conflicts between*
4 *development and resource preservation.*

5
6 *(5): The following criteria shall be considered, as applicable, during the appropriate decision*
7 *making process:*

8 A. *ECONOMIC: The use proposed is a benefit to the community and would meet a*
9 *substantial public need or provide for a public good which clearly outweighs*
10 *retention of the resources listed in Section 20.09 (1): . . .*

11 B. *SOCIAL: The proposed development would not result in the loss of or cause*
12 *significant adverse impact to, a rare, one of a kind or irreplaceable resource as listed*
13 *in Section 20.09(1).*

14 C. *ENERGY: The development, as proposed, would support energy efficient land use*
15 *activities for such things as transportation costs, efficient utilization of urban*
16 *services, and retention of natural features which create micro climates conducive to*
17 *energy efficiency.*

18 D. *ENVIRONMENTAL: If alternative sites in Union County for proposed development are*
19 *available which would create less of an environmental impact of any of the resources*
20 *listed in Section 20.09(1), major consideration should be given to these options.*

21
22 *(6) The reviewing body may impose the following conditions, as applicable upon a finding of*
23 *fact that warrants such restrictions: . . .*

24 C. *BIG GAME WINTER RANGE AND BIG GAME CRITICAL HABITAT: A proposed new*
25 *structure requiring a conditional use may be required to:*

26 1. *Be located as close as possible to an ADJACENT compatible structure (a*
27 *compatible structure shall be any structure which does not adversely affect the*
28 *intended use of another structure); . . .*

29 2. *Share a common access road or where it is impossible to share a common access*
30 *road, locate as closely as possible to the nearest existing public road in order to*
31 *minimize the length of access from the nearest road.*

32
33 UCZPSO 20.09 establishes review criteria for potential impacts to 3C designated Goal 5
34 resources. Under UCZPSO 20.09(3)(A), the County's 3C habitat designation requires limiting
35 potential conflicting uses to the designated resource and requires the applicant to develop a
36 management plan that allows both the proposed use and resource preservation. As evaluated
37 under the Council's Fish and Wildlife Habitat standard in Section IV.H. of this order and ASC
38 Exhibit P, the applicant proposes to implement a Fish and Wildlife Habitat Mitigation Plan
39 (provided as Attachment P1-6 of this order) that would mitigate temporary and permanent
40 direct and indirect impacts to the habitat and species protected and uses within the designated
41 big game winter range area.

1 UCZPSO 20.09(4) requires a consideration of the economic, social, environmental and energy
2 consequences “when attempting to mitigate conflicts between development and resource
3 preservation,” and is implemented by the specific criteria in UCZPSO 20.09(5).

4
5 UCZPSO 20.09(5)(A) ECONOMIC - requires a finding that the “proposed use is a benefit to the
6 community and would meet a substantial public need or provide for a public good which clearly
7 outweighs retention of the resource.”

8
9 The applicant ~~has~~ evaluated and demonstrated the public need for the proposed transmission
10 line in ASC Exhibit N. As discussed and explained in detail in that Exhibit and summarized in ASC
11 Exhibit K, the primary objective of the proposed transmission line is to create additional
12 transmission capacity that would allow the applicant to import power from the Pacific
13 Northwest market to serve its retail customers located in the states of Idaho and Oregon.
14 Historically, as described in the ~~Company’s applicant’s~~ 2015~~3~~ and 2017~~5~~ Integrated Resource
15 Plans (IRPs), the proposed transmission line would remedy a current transmission constraint in
16 the company’s on-peak purchases on the western side of its system by allowing it to import an
17 average of 350 megawatts (MW) (500 MW in the summer, 200 MW in the winter) of market
18 purchases to serve its native load.

19
20 The proposed transmission line would also serve as an integral component of regional
21 transmission planning because by serving as a crucial high-capacity connection between two
22 key points in the existing bulk electric system that currently lack sufficient transmission
23 capacity.

24
25 In addition, the transmission line would allow the applicant to comply with FERC requirements,
26 which require it to construct adequate transmission infrastructure to provide service to
27 wholesale customers in accordance with company’s Open Access Transmission Tariff (OATT).
28 The transmission line would provide sufficient capacity to: 1) transfer an additional 1,050 MW
29 of power from the BPA 500-kV transmission system in the Pacific Northwest west-to-east across
30 the Idaho-Northwest transmission path; 2) transfer an additional 1,000 MW of power east-to-
31 west across the Idaho-Northwest transmission path; and 3) allow for actual power flows on the
32 transmission line of up to approximately 1,500 MW, accounting for variations in actual power
33 flows of the various transmission lines comprising the Idaho-Northwest transmission path.

34
35 In addition, as discussed in ASC Exhibit U, construction of the proposed transmission line would
36 create direct economic benefits, including creation of new jobs, increased ad valorem taxes,
37 new dollars supporting the local economy, and a stimulus to the local economy in the form of
38 expenditures on materials and supplies. Construction of the transmission line would result in
39 the creation of up to 250 construction jobs during peak construction in Union County.

40
41 As discussed in ASC Exhibit P1, the applicant does not expect that the transmission line would
42 result in long-term adverse impacts to big game. Because expected impacts to big game would
43 be for a limited duration and would be mitigated, the Department recommends Council find
44 that the public benefit from the development outweighs the limited impacts on the resource.

1 UCZPSO 20.09(5)(B) SOCIAL - requires a finding that “the development would not result in the
2 loss of or cause significant adverse impact to, a rare, one-of-a kind or irreplaceable resource.”
3 UCZPSO 20.09(5) lists those resources that are designated as ‘irreplaceable’ for purposes of this
4 evaluation and does not include the big game habitat within the WR and CH Overlay areas. As
5 the applicant explains, land within the WR and CH Overlay areas provide big game areas
6 historically used by big game during periods of above normal snowfall and low temperatures.
7 As discussed in ASC Exhibit P1 and under the Fish and Wildlife standard, these areas of big
8 game habitat are regarded as Category 2 habitat in accordance with ODFW’s Fish and Wildlife
9 Habitat Mitigation Policy, and by definition are not “irreplaceable.”

10
11 UCZPSO 20.09(5)(C): ENERGY – requires a finding that the development “would support energy
12 efficient land use activities for such things as transportation costs, efficient utilization of urban
13 services, and retention of natural features which create micro climates conducive to energy
14 efficiency” The proposed transmission line would transmit power and enhance reliability of the
15 regional electric transmission system, which is only indirectly related to energy efficiency. As
16 the applicant describes, the proposed transmission line would have minimal impact to the
17 existing land uses in Union County. It would have no adverse impacts on the transportation
18 system or municipal facilities or services, including urban services.

19
20 UCZPSO 20.09(5)(D): ENVIRONMENTAL – requires that consideration should be given to
21 alternative sites in Union County for proposed development that which would create less of an
22 environmental impact of any on the resources listed in Section 20.09(1), if alternatives are
23 available. As discussed in greater detail in ASC Exhibits B, J, P, and Q, the applicant has
24 conducted a comprehensive avoidance and minimization analysis for all environmental
25 resources and other resources to create the least overall impact. As discussed further in those
26 exhibits, the applicant evaluated approximately 49 routes and route segments totaling over
27 3,000 miles before proposing the Proposed Route and alternatives.

28
29 In areas of big game winter range and critical habitat, UCZPSO 20.09(6) permits conditions to be
30 imposed to require that new structures be located near adjacent existing structures and to
31 share common access roads or locate near existing roads. As the applicant describes, new
32 structures related to the proposed transmission line would follow existing electric, natural gas,
33 and highway corridor as much as feasible in Union County. The Proposed Route follows
34 segments of the existing 230-kV transmission line from Baker to La Grande and then from La
35 Grande through the Wallowa-Whitman NF, deviating only to meet reliability criteria or to avoid
36 steep terrain or site-specific constraints.¹⁷⁹ Certain portions of the Union County Proposed
37 Route also follow the I-84 corridor, both adjacent to existing transmission lines and separately.

38
39 Proposed access roads (both new roads and existing roads needing improvements) are depicted
40 on maps in ASC Exhibit C, Attachment C-2. As demonstrated there, as part of the design of the

¹⁷⁹ To meet reliability criteria a minimum separation from existing transmission lines of 230-kV or greater is required except in limited circumstances. For siting purposes that distance was assumed to be 1,500 feet, thereby dictating the minimum distance between existing and proposed transmission lines serving the same load.

1 proposed transmission line, the applicant has attempted to use existing roads and to limit the
2 development of new roads in CH and WR overlay areas. These efforts have resulted in the
3 development of a proposed access road system to support the construction of the transmission
4 line that substantially relies on the system of publicly maintained roads as well as unimproved
5 roads on public and private lands.

6
7 Based on the applicant's detailed evaluation, the Department recommends that the Council
8 find that the proposed transmission line complies with the county's Goal 5 Resources
9 Comprehensive Plan Element, as implemented through the provisions UCZPSO 20.09.

10
11 ***Recommended Land Use Conditions – Union County***

12
13 **Recommended Land Use Condition 6:** For facility components in Union County, the
14 certificate holder shall:

- 15 a. Prior to construction of any phase or segment of the facility, provide to the Department
16 a copy of the following Union County-approved permits, if such permits are required by
17 Union County zoning ordinances:
- 18 i. Flood plain development permit;
 - 19 ii. Road approach permit; and
 - 20 iii. Work in county right-of-way permit.
- 21 b. During construction, the certificate holder shall comply with conditions of permits listed
22 in (a) and (c).
- 23 c. During construction, if the certificate holder determines additional County-approved
24 permits are required, the certificate holder shall provide to the Department a copy of
25 those additional permits.

26
27 **Recommended Land Use Condition 7:** During construction of any phase or segment of the
28 facility in Union County, the certificate holder shall construct the facility to comply with the
29 following setback distances and other requirements:

30 In All Zones:

- 31 a. Buildings, the fixed bases of transmission line towers, and new access roads
32 shall be set back from Class I streams at least 25-feet or one-half the stream
33 width, whichever is greater.
- 34 b. Permanent vegetation removal within the riparian zone of all Class I streams
35 shall retain 75% of all layers or stratas of vegetation.

36 In the EFU Zone (Based solely on certificate holder representations in the ASC):

- 37 c. Buildings shall be setback as follows: (i) front yards shall be set back at least
38 20 feet from property lines and road rights-of-way; (ii) and rear yards shall be set
39 back at least 10 feet from property lines and road rights-of-way.
- 40 d. A clear-vision area shall be maintained on the corners of all multi-use area
41 properties at the intersection of two or more streets or a street and a railroad as
42 follows: (i) the clear-vision area shall consist of a triangular area with the two lot
43 lines measuring a distance of 30 feet or at an intersection involving an alley of 10
44 feet; and (ii) the clear-vision area shall not contain any planting, fence, wall,

1 structure, or temporary or permanent obstruction exceeding 2.5 feet in height,
2 except for trees with branches removed to a height of 8 feet.

3 e. Concrete batch plants shall not be located within 2 miles of a vineyard totaling
4 at least 40 acres and which was planted as of February 27, 2013.

5 In the Agricultural Grazing Zone:

6 f. Buildings shall be setback as follows: (i) front yards shall be set back at least
7 20 feet from property lines and road rights-of-way; and (i) rear yards shall be set
8 back at least 10 feet from property lines and road rights-of-way.

9 g. All signage shall comply with the provisions of UCZPSO 3.08.

10 In the Timber-Grazing Zone:

11 h. Buildings shall be setback as follows: (i) front and rear yards shall be set back
12 at least 20 feet from property lines and road rights-of-way; (ii) and side yards
13 shall be set back at least 10 feet from property lines and road rights-of-way.

14 i. All signage shall comply with the provision_s of UCZPSO 5.08.

15

16 IV.E.1.4. Baker County

17

18 Facility components proposed within Baker County include approximately 68.4 miles of 500 kV
19 transmission line, five multi-use areas, one light-duty fly yard, 48.2 miles of new access roads,
20 63 miles of substantially modified existing roads, pulling and tensioning sites, and two
21 communication stations.¹⁸⁰ There are no alternative routes or facility component locations
22 requested for approval in Baker County. The locations of proposed facility components are
23 represented in ASC Exhibit K Figures K-47, and Figure 8 below.

24

25

26

27

28

¹⁸⁰ As described in ASC Exhibit B, multi-use areas would be approximately 30 acres in size and would include construction field offices, parking areas, construction vehicle maintenance area, helicopter operations (helipads), explosives storage, hazardous materials storage, water storage tank, portable concrete batch plant, concrete washout station, gravel tire scrub area, noxious weed wash-off station, and bulk materials storage area.

1 **Figure 8: Baker County and Proposed Facility Components**

2

1 Facility components proposed in Baker County would be located on land zoned Exclusive Farm
 2 Use (EFU) and Rural Service Area (RSA).

3
 4 In ASC Exhibit K, the applicant identifies potentially applicable substantive criteria based on
 5 underlying land use zone designation, in effect on the date the applicant submitted the pASC
 6 (February 27, 2013), which are also presented in Table LU-6, *Applicable Substantive Criteria for*
 7 *Proposed Facility Components in Baker County* below.

8
Table LU-6: Applicable Substantive Criteria for Proposed Facility Components in Baker County
Baker County Zoning and Subdivision Ordinance (BCZSO)¹

<i>Article 3: Use Zones</i>	
Section 301 Exclusive Farm Use Zone	
301.02	Conditional Uses
Section 305 Rural Service Area	
305.02	Conditional Uses
<i>Article 4: Supplementary Provisions</i>	
Section 401	Setbacks and Frontage Road Requirements Flood Plain Development
Section 412	Historic/Cultural and Natural Area Protection Procedure
Section 410	Flood Plain Provisions
<i>Article 6: Conditional Uses</i>	
Section 602	Standards for Granting a Conditional Use
Baker County Comprehensive Land Use Plan (BCCP)²	
Goal V Open Space, Scenic and Historic Areas and Natural Resources	
Open Spaces and Scenic Areas	
Natural Areas	
Historic and Cultural Sites, Structures, Districts	
Notes:	
1. Omitted zoning provisions include: 301.02 (Conditional Uses); 301.05 (Minimum Parcel Sizes); 1001.01 (Purpose), 1002 (Applications for Approval of Tentative Plans); 1006.01 (Approval of Preliminary Partition Plans); 1006.02 (Approval of Final Partition Plan); 1006.03 (Land Partition Flat Requirements). BCZSO 401(B)(1) requires minimum parcel widths; and BCZO 1001, 1002 and 1006 address subdivisions, partitions and lot line adjustments and the county’s tentative plan approval process. Those provisions would apply only if the applicant were to require a partition of any of the EFU-zoned property in Baker County. The applicant explains that it intends to secure easements where necessary and does not expect to require the partitioning of any parcel zoned EFU in Baker County. Because no partitions are proposed, BCZSO 301.05, BCZSO 401(B)(1) and BCZO 1001 are not applicable to the proposed transmission line.	

9
 10 The following analysis addresses the applicable substantive criteria identified in the BCZSO.
 11

1 **Baker County Zoning and Subdivision Ordinance**

2
3 *Baker County Zoning Ordinance Article 3 Section 301 Exclusive Farm Use Zone*

4
5 Proposed facility components within Baker County’s EFU zone include 69.2 miles of 500 kV
6 transmission line, five multi-use areas, one light-duty fly yard and two communication stations.

7
8 BCZSO Section 301 Exclusive Farm Use Zone

9
10 *Section 301.02 In the EFU zone the following uses may be permitted when authorized in*
11 *accordance with the requirements of Subsections 301.05 and 301.06 of this Section and*
12 *Article 6 of this Ordinance...*

13
14 *D. Major utility facilities as defined in Section 108(B) of this ordinance.*

15
16 BCZSO 301.02(D) establishes that “major utility facilities as defined in Section 108(B)” and their
17 accessory uses are conditional uses within Baker County’s EFU zone, subject to BCZSO 301.05,
18 301.06 and Article 6 of the ordinance.

19
20 As described above, proposed facility components within Baker County’s EFU zone include 69.2
21 miles of 500 kV transmission line. Accessory uses to the transmission line would include ~~and~~
22 five multi-use areas, one light-duty fly yard and two communication stations. The applicant
23 asserts that accessory uses, based on a 2001 and 2005 court decision, should be considered
24 under the “major utility facilities as defined in Section 108(B)” land use category. Based on
25 review of the referenced court decision and historic Council land use evaluations, the
26 Department agrees and recommends Council find that proposed facility components should be
27 evaluated as ~~, which the Department recommends Council find would be~~ a major utility facility
28 and therefore a conditionally permitted use within EFU zoned land under BCZSO Section
29 301.02(D).¹⁸¹ However, notwithstanding the language in the County’s code, the conditional use
30 requirements beyond those that are consistent with ORS 215.275 are not applicable to
31 proposed facility components because, as a utility facility necessary for public service under
32 ORS 215.283(1)(g), the use is permitted subject only to the requirements of ORS 215.275 and
33 the county cannot impose additional approval criteria. Therefore, BCZSO 301.05 (Minimum
34 Parcel Size), 301.06 and Article 6 of the ordinance are not evaluated as applicable substantive
35 criteria; however, it is noted that the applicant evaluates these criteria and based on review,
36 the Department considers the analysis to represent consistency with these provisions.
37

¹⁸¹ See Save Our Rural Or. V. Energy Facility Siting Council, 339 Or. 353, 384 (2005) (upholding Council’s determination that ancillary facilities are considered “utility facilities necessary for public service”); Cox v. Polk County, 174 Or. Ct. App. 332, 343-44 (2001) (“utility facilities necessary for public service” may include ancillary or off-site equipment)

1 Proposed facility components would be located in EFU-zoned land across five Oregon counties
2 including Morrow, Umatilla, Union, Baker, and Malheur. Therefore, for these locations, the land
3 use compliance evaluation is limited to ORS 215.275, as presented in Section IV.E.2.1., ORS
4 ~~215.283 and ORS 215.275 and ORS 215.296~~ (Exclusive Farm Use Requirements) of this order.¹⁸²

5
6 *Baker County Zoning Ordinance Article 3 Section 305 Rural Service Area Zone*

7
8 Proposed facility components within Baker County’s Rural Service Area (RSA) zone include
9 approximately 0.2 miles of substantially modified roads.

10
11 BCZSO Section 305.02: Conditional Uses

12
13 *In an RSA zone the following uses and their accessory uses are permitted when authorized in*
14 *accordance with the provisions of Article 6 of this Ordinance and the provisions of*
15 *Subsection 305.03 of this Section...*

16
17 *D. Major utility facilities as described in Section 108(B) of this Ordinance.*

18
19 BCZSO Section 305.02 identifies “major utility facilities as described in Section 108(B) of this
20 Ordinance” as a conditional use permitted in an RSA zone subject to the provisions of BCZO
21 Article 6 and 305.03. Based on the reasoning and analysis provided under BCZSO 301.02(D),
22 proposed facility components are collectively evaluated under the “major utility facility” land
23 use category. Therefore, the Department recommends Council find that the proposed facility
24 components within RSA zoned land is a conditionally permitted use under BCZSO Section
25 305.02(D). The applicable section of Article 6 is presented below.

26
27 BCZSO Section 602: Standards for Granting a Conditional Use

28
29 *To determine whether a Conditional Use proposal shall be approved or denied, the*
30 *Commission shall find that the following standards, where applicable, are met.*

- 31
32 A. *The proposal will be consistent with the Comprehensive Plan and objectives of this*
33 *Zoning and Subdivision Ordinance and other applicable policies of the County.*
34 B. *Taking into account location, size, design and operating characteristics, the proposal*
35 *will have a minimal adverse impact on the (1) livability, (2) value, and (3) appropriate*
36 *development of abutting properties and the surrounding area compared to the*
37 *impact of development that is permitted outright.*
38 C. *The location and design of the site and structures for the proposal will be as*
39 *attractive as the nature of the use and its setting warrant.*

¹⁸² Although beyond what is required to demonstrate compliance with ORS 215.275, the applicant performed a county-specific alternatives analysis. Please refer to ASC Exhibit K Section 6.8.5. for additional information specific to Baker County.

- 1 D. *The proposal will preserve assets of particular interest to the community.*
2 E. *In permitting a new Conditional Use or the alteration of an existing Conditional Use,*
3 *the Planning Commission may impose in addition to those standards and*
4 *requirements expressly specified by this Ordinance, additional conditions which the*
5 *Planning Commission considers necessary to protect the best interests of the*
6 *surrounding area or the County as a whole. These conditions may include, but are*
7 *not limited to,...*

8
9 BCZSO Section 602(A) – (E) establish approval standards for conditional uses within RSA zoned
10 land, including requiring a demonstration of consistency with zoning provisions and objectives
11 of the comprehensive plan; a demonstration if minimal adverse impacts on livability and value
12 of surrounding properties; and, a demonstration that community interests would be preserved.

13
14 Proposed facility components within Baker County RSA zone includes an accessory use to the
15 proposed utility facility, including 0.2 miles of substantially modified roads. Impacts resulting
16 from the proposed segment of substantially modified road would predominately occur from
17 short-term noise and traffic generated during construction activities, with operational impacts
18 limited to use of the substantially modified road approximately two times per year during line
19 inspection. As described in Section IV.M. *Public Services*, the applicant proposes and the
20 Department recommends Council impose a condition requiring that, prior to construction, the
21 applicant submit for review and approval by the Department in consultation with the affected
22 county of a Transportation and Traffic Plan. The condition also requires that, through county-
23 issued road-related permits, the applicant execute a formally binding agreement with the
24 county for use of and potential impacts to roads during construction activities. Moreover, the
25 substantially modified road would provide road improvements that would support livability,
26 value and access within the area. Neither the applicant nor the county have identified any
27 “assets of particular interest to the community’ that would be impacted by the location of the
28 proposed roads. Due to the limited potential impacts resulting during construction and
29 operation of proposed facility components within RSA zoned land, the Department
30 recommends Council find that the proposed facility would satisfy BCZSO Section 602(A) – (E)
31 approval standards; and, find that no additional conditions are necessary to protect the
32 interests of the surrounding community or ensure compliance with the conditional use criteria.

33
34 *Historic/Cultural and Natural Area Protection*

35
36 BCZSO Section 412: Historic/Cultural and Natural Area Protection Procedure

37
38 *This Section shall not apply to sites designated as 3A or 3B sites, pursuant to OAR 660-16-*
39 *010 (1) and (2), respectively. Major alteration or destruction of a Natural Area designated as*
40 *2A or 3C shall first require an ESEE analysis, justification, and Plan Amendment.*

41
42 *A permit shall be required to destroy or make major alteration to a historic/cultural/natural*
43 *site or structure inventoried as significant in the County Comprehensive Plan. Upon receipt*
44 *of an application for said permit, the Planning Department shall institute a 30-day hold.*

1 *During that time various actions will be initiated by the County depending upon the nature*
2 *of the threatened resource. All of the inventoried natural sites, historic sites and the cultural*
3 *sites identified with one, two or three stars will be subject to a public hearing. Notice of the*
4 *proposed change and public hearing will be provided to the general public, the State Historic*
5 *Preservation Office, the State Natural Heritage Advisory Council, the State Department of*
6 *Fish and Wildlife and/or affected local historical, cultural, or governmental entities. The*
7 *opportunity to educate, persuade, pay for, and/or require the preservation of a significant*
8 *resource will be provided by the County. At the hearing before the Planning Commission a*
9 *review will be conducted to determine:*

- 10 a. *If the change will destroy the integrity of the resource.*
11 b. *If the proposal can be modified to eliminate its destructive aspects.*
12 c. *If any agency or individual is willing to compensate the resource owner for the protection*
13 *of the resource.*
14 d. *If the resource can be moved to another location.*

15 *If, after this review, it is determined by the County that the integrity of a significant*
16 *historic/cultural structure or other to allow, allow with conditions, or disallow the proposed*
17 *change.*

18
19 *. . . FOR SIGNIFICANT HISTORIC/CULTURAL STRUCTURES AND TOWNSITES.*

- 20 A. *The historic/cultural structure or townsite constitutes a hazard to the safety of the public*
21 *occupants and cannot reasonably be repaired; or*
22 B. *The retention of the historic/cultural structure or townsite would cause financial*
23 *hardship to the owner which is not offset by public interest in the structure's/townsite's*
24 *preservation; or*
25 C. *The improvement project is of substantial benefit to the County and cannot be*
26 *reasonably located elsewhere, and overrides the public's interest in the preservation of*
27 *the historic/cultural structure or townsite; or*
28 D. *Major exterior alteration shall, to the extent possible, be consistent with the*
29 *historic/cultural character of the structure.*

30
31 BCZSO 412 requires an analysis of significant historic/cultural structures and townsites, as well
32 as significant natural areas and resources not inventoried or otherwise designated. To support
33 the assessment under this provision, the applicant reviewed Baker County's inventory of
34 Historic and Cultural Sites, Structures, Districts contained within the Baker County
35 Comprehensive Plan Goal V Supplement. ASC Exhibit K, Figure K-50 depicts the inventoried
36 historic and cultural resources in and around the analysis area. Baker County Goal 5 inventoried
37 resources within the 0.5-mile land use analysis area, and the Department's evaluation of the
38 applicant's impact analysis is presented below:¹⁸³

- 39
40 • The Rattlesnake Springs Landmark is located approximately 0.5 mile west of the
41 proposed facility and would largely be screened from view by Gold Hill. The proposed

¹⁸³ B2HAPPDoc3-19 ASC 11 ASC Exhibit K Land Use, page K-301. 2018-09-28.

1 transmission line would not destroy or alter the resource. Therefore, the Department
2 recommends that the Council find that the proposed facility would be consistent with
3 BCZSO Section 412 criteria.

- 4
- 5 • The Farewell Bend State Park is located more than a mile from proposed facility
6 components. The proposed facility would not destroy or alter the resource. Potential
7 impacts of the facility construction to the Farewell Bend State Park are evaluated in ASC
8 Exhibit T (Recreation), which explains that the transmission line would have no long-
9 term adverse effect on the opportunity for visitors to use Farewell Bend. Impacts would
10 be limited to visual resource effects, which would be minimal or nonexistent. Therefore,
11 the Department recommends that the Council find that the proposed facility would be
12 consistent with BCZSO Section 412 criteria.

- 13
- 14 • The Flagstaff Hill Monument is a National Register of Historic Places (NRHP)-eligible 18-
15 foot tall, stone monument on BLM land (Vale Baker Resource Area) erected in 1943 by
16 the Kiwanis Club as an Oregon Trail commemorative site.¹⁸⁴ The monument is near State
17 Highway (OR) 86, approximately 0.75 miles from the National Historical Oregon Trail
18 Interpretive Center, approximately 0.5 miles from the proposed transmission line
19 centerline and proposed rebuild segment (0.9-mile) of IPC's existing 230 kV Quartz-La
20 Grande transmission line. The applicant evaluates potential visual impacts of the
21 proposed facility to this Goal 5 resource in ASC Exhibit S Attachment S-10 Visual
22 Assessment of Historic Properties Intensive Level Survey (VAHP ILS) Appendix D
23 (Property Name 050305144SI Kiwanis Oregon Trail Monument); physical disturbance
24 impacts would not occur based on distance from resource to facility components.

25

26 The applicant's VAHP ILS methods included reconnaissance level surveys, a viewshed
27 analysis and line of site evaluation. The results of this analysis, as presented in ASC
28 Exhibit S Attachment S-10 Appendix D Visual Assessment of Above-ground Historic
29 Properties Form, identifies that 90 of 360 degrees within the viewshed have the
30 potential to include views of 5 transmission structures. The analysis does not appear to
31 address visual impacts of the proposed 0.9-mile of 230 kV transmission line rebuild of
32 the existing transmission line. However, the applicant's viewshed photograph from the
33 monument demonstrates that the resource is located on a hillside, which is expected to
34 limit views of the proposed facility, including the 230 kV transmission line rebuild. The
35 applicant recommends that, based on the VAHP ILS, potential visual impacts be
36 considered less than significant (i.e. no adverse effect).

37

38 Based on the Department's review of the applicant's viewshed photograph from the
39 monument, the existing 230 kV transmission line – within 500 feet of proposed route - is
40 not visible; based on the proximity of the existing 230 kV transmission line to the
41 proposed 500 kV line, the Department considers that the photograph reasonably

¹⁸⁴ B2HAPPDoc3-36 ASC 19 Attachment S-8 National Historic Trails Study; p.49. Exhibit S. Cultural ASC 2018-09-28.

1 represents that the proposed 230 kV rebuild and 500 kV transmission line would barely
2 be visible from the monument. The applicant's photograph documentation clearly
3 demonstrates that views of infrastructure from the monument would be partially
4 blocked by a hillside. Based on this analysis and reasoning, the Department
5 recommends Council find that the proposed facility would be consistent with BCZSO
6 Section 412 criteria and would not result in significant impacts to the integrity of the
7 resource.

8
9 As noted in Section IV.K., *Historic, Cultural and Archeological Resources* of this order,
10 through the terms of an executed Programmatic Agreement, as an NRHP-eligible
11 resource on public land, potential visual impacts from the proposed facility to the
12 monument would be reassessed by the BLM, Tribal Governments, and other agencies
13 prior to construction; and mitigation would be determined if necessary to avoid a
14 potentially significant visual impact. Further, the Flagstaff Hill Monument is in proximity
15 to and shares a viewshed with NHRP-eligible Oregon Trail/NHT resource B2H-BA-282
16 (Oregon Trail, Virtue Flat, Flat Segment and Flagstaff Hill), where the applicant identifies
17 potential adverse visual impacts. Recommended Historic, Cultural, and Archeological
18 Resources Condition 2 requires the submission of Attachment S-9, a final Historic
19 Properties Management Plan (HPMP), which includes mitigation measures such as:
20 design modifications; purchase of a conservation easement or land acquisition;
21 interpretive signage; or funding for public research or project benefiting the affected
22 area. These types of measures, as presented in Table HCA-4b of this order, are
23 consistent with Council's definition of mitigation (OAR 345-001-0010(33) and while
24 recommended to reduce visual impacts to the Oregon Trail resource, based on the
25 shared viewshed, would also mitigate visual impacts from the proposed facility to the
26 Flagstaff Hill Monument.

- 27
28 • Virtue Flat Oregon Trail segment consists of one-quarter mile of visible, undisturbed
29 wagon ruts on BLM land and two miles on private land between MP 146 and 146.5. The
30 Virtue Flat Oregon Trail segment is designated "of probable National Register eligibility
31 or local significance" in Baker County's inventory of Historic and Cultural Sites,
32 Structures, Districts. The trail segment would be crossed by the proposed facility; views
33 of the proposed facility would also impact the existing viewshed of the trail segment;
34 therefore, the applicant evaluates potential visual impacts of the proposed facility to
35 this Goal 5 resource in ASC Exhibit S Attachment S-10 Visual Assessment of Historic
36 Properties Intensive Level Survey (VAHP ILS) Appendix D (Property Name B2H-BA-282
37 Oregon Trail – Virtue Flat (Flagstaff Hill)). The applicant commits, and the Department
38 recommends that Council require, restriction of physical disturbance to any Oregon
39 Historic Trail resource, including the Virtue Flat Oregon Trail segment (see
40 recommended Historic, Cultural and Archeological Condition 1 which prohibits direct
41 impacts to all Oregon Historical Trail resources).

42
43 The applicant's VAHP ILS methods included reconnaissance level surveys, a viewshed
44 analysis and line of site evaluation. The results of this analysis, as presented in ASC

1 Exhibit S Attachment S-10 Appendix D Visual Assessment of Above-ground Historic
2 Properties Form, identifies that approximately 41 transmission line structures (lattice
3 towers) would be potentially visible from 180 of 360 degrees within the viewshed. The
4 analysis does not appear to address visual impacts of the proposed 0.9-mile of 230 kV
5 transmission line rebuild. However, the applicant's line of site evaluation is based on
6 lattice structures, which may overestimate potential visual impacts because the
7 applicant commits to utilizing H-frame structures between MP 145.1 to 146.7 as a
8 design modification to reduce visual impacts (see recommended Scenic Resources
9 Condition 3). Based on the applicant's viewshed analysis which includes various
10 photographs from the trail segment, the existing viewshed includes the applicant's 230
11 kV transmission line, which is proposed to be relocated within an expanded right-of-way
12 and rebuilt as part of the proposed facility, and agricultural fields. Based on these visual
13 impacts, the applicant identifies that the proposed facility would result in potential
14 adverse visual impacts to the resource and proposes various mitigation measures.

15
16 The Virtue Flat Oregon Trail segment is a Goal 5 resource and is also an NRHP-eligible
17 Oregon Trail/NHT trail segment evaluated in Section IV.K. *Historic, Cultural and*
18 *Archeological Resources* section of this order. As presented in Table HCA-4b,
19 *Department Recommended Mitigation for NRHP-Eligible Oregon Trail/NHT Segments,*
20 mitigation measures for impacts to NRHP eligible NHT/Oregon Trail resources would
21 include any of the following: design modification and one of the following; public
22 interpretation funding; print/media publication; publication of research focus article or
23 professional society presentation; public education and outreach (e.g., website, kiosk,
24 etc.); rehabilitation of off-site trail segment; recording including HABS/HAER/HALS;
25 additional literature or archival review (e.g. historic maps, local papers); remote sensing;
26 and, purchase of conservation easement or other land protection where trail traces
27 exist. This would be required through recommended Historic, Cultural and Archeological
28 Condition 2, which requires the review and approval of an HPMP, also discussed below.

29
30 In addition, as described in Section IV.K. *Historic, Cultural and Archeological Resources*
31 of this order, mitigation measures selected from those referenced above and the scale
32 of mitigation to offset the visual impacts from the proposed facility to the Virtue Flat
33 Oregon Trail segment within the affected area would be determined by the Department,
34 in consultation with SHPO prior to construction. The applicant's mitigation obligation
35 would then be incorporated into the HPMP.

36
37 Under the BCZO Section 412 criteria, the applicant identifies that the integrity of the
38 resource's setting would be diminished by proposed facility visibility, which based on
39 immediate overhead proximity/crossing of the facility over the trail segment, the
40 Department agrees. However, the Department recommends Council find that, with
41 proposed mitigation, the integrity would not be irretrievably destroyed. Therefore, the
42 Department recommends Council find that the proposed facility, with mitigation, would
43 be consistent with BCZSO Section 412 criteria.

- The Virtue Flat Mining Area is an NRHP-eligible historic mining area on BLM land located approximately 1.86 miles to the east of the proposed facility between MP 149 and MP 153. While the mining area is located outside of the established 0.5 mile analysis area established for the Council’s Land Use standard, if resources are identified at greater distances than could be impacted, the applicant is obligated to conduct an evaluation – while not included in ASC Exhibit K, the applicant includes a visual impact assessment for this resource in ASC Exhibit S which can be relied upon for the evaluation under BCZSO Section 412 criteria.

The applicant evaluates potential visual impacts of the proposed facility to this Goal 5 resource in ASC Exhibit S Attachment S-10 Visual Assessment of Historic Properties Intensive Level Survey (VAHP ILS) Appendix D (Property Name B2H-BA-283 Virtue Flat Mining Area)); physical disturbance impacts would not occur based on distance from resource to facility components. The applicant’s VAHP ILS methods included reconnaissance level surveys, a viewshed analysis and line of site evaluation. The results of this analysis, as presented in ASC Exhibit S Attachment S-10 Appendix D Visual Assessment of Above-ground Historic Properties Form, identifies that approximately 9 transmission line structures (lattice towers) would be potentially visible from 45 of 360 degrees within the viewshed. The analysis does not appear to address visual impacts of the proposed 0.9-mile of 230 kV transmission line rebuild.

Based on the applicant’s viewshed analysis which includes a photograph from the mining area, the mining area is within a valley setting of open space where, based on the nearly 2 mile distance, proposed facility visibility is expected to be limited with little contrast to the existing landscape. The applicant recommends that, based on the VAHP ILS, potential visual impacts be considered less than significant (i.e. no adverse effect). Based on review of the applicant’s viewshed photograph, the Department agrees with the applicant’s conclusion. Based on this analysis and reasoning, the Department recommends Council find that the proposed facility would be consistent with BCZSO Section 412 criteria and would not result in significant impacts to the integrity of the resource.

As noted in Section IV.K. *Historic, Cultural and Archeological Resources* of this order, through the terms of an executed Programmatic Agreement, as an NRHP-eligible resource on public land, the potential visual impacts from the proposed facility to the mining area would be reassessed by the BLM and other agencies prior to construction; if mitigation is determined necessary to avoid a potentially significant visual impact, likely measures would include public interpretive funding (such as funding for a kiosk, sign or exhibit) and print media publications and would be incorporated into the applicant’s Historic Properties Management Plan (HPMP), a mitigation plan required to be finalized and implemented through recommended Historic, Cultural and Archeological Condition 2.

1 Based on the information provided by Baker County, there are no inventoried natural areas
2 within the site boundary. Based on its analysis of historic, cultural, and archeological resources
3 in the analysis area the applicant is also unaware of any resources of unknown significance or
4 resources not on the inventory which are located within the analysis area of the proposed
5 transmission line. Based on the above-analysis, the Department recommends Council find that
6 the proposed facility would be consistent with BCZSO Section 412 criteria.

7
8 *Special Flood Hazard Area*

9
10 BCZSO Section 410: Flood Plain Provisions

- 11
12 A. *When during the planning, sanitation or building permit sign-off procedure the Planning*
13 *Director, by use of the Federal Insurance Administration (FIA) flood hazard*
14 *maps and SCS soil maps, determines that unusual soil or flooding conditions present a*
15 *hazard to the structure or land use being proposed, such conditions shall be noted on the*
16 *permit application and brought to the attention of the applicant. These conditions*
17 *include, but are not limited to: flood plain, slope, soil instability, shrink-swell, and high*
18 *water table.*
- 19 B. *For Exceptions areas, any application for a building permit in flood hazard areas or upon*
20 *soils judged unstable by SCS and inventoried as such by the County shall be denied. The*
21 *Planning Office shall inform the applicant of the reasons for denial within 30 days.*
22 *Before a building permit can subsequently be authorized, the County shall require*
23 *submittal of a method and plan to the Planning Commission to ensure a reasonably safe*
24 *building and site during and after construction; such a plan must be endorsed by an*
25 *appropriate professional such as a registered, professional engineer, licensed in the State*
26 *of Oregon or a professional engineer employed by a federal agency who is not required*
27 *to be licensed in the State of Oregon, or a registered surveyor or hydrologist. If*
28 *construction has already begun, construction shall not proceed until certification is*
29 *received.*
- 30 C. *For structures in resource zones, the Planning Office will provide the information*
31 *regarding inventoried hazardous soil conditions in an advisory capacity, on the premise*
32 *that resource lands offer a variety of building sites and that a safer site will be selected.*
- 33 D. *In addition to hazard procedures, described above, the Flood plain Ordinance of Baker*
34 *County, (Ordinance No. 84-3), will be implemented wherever applicable.*
- 35 E. *Requirements made pursuant to this Section may be appealed in conformance with*
36 *Section 1104 of this Ordinance.*
- 37

38 BCZSO 410 establishes requirements for developments within a flood plain or Special Flood
39 Hazard Area (SFHA), including obtaining a county-approved Flood Plain Development Permit.
40 The applicant explains that to the extent proposed facility components would be located within
41 a SFHA, the certificate holder would obtain any required Flood Plain Development Permit
42 directly from Baker County. That permit would not be included in or governed by the site
43 certificate. However, in order to provide assurance to the Council that the site certificate holder

1 has obtained any county-required Flood Plan Development permit(s), the applicant proposes
2 and the Department recommends that the Council adopt Land Use Condition 9.

3
4 *County Road Approach and Right-of-Way Permits*

5
6 Pursuant to ORS 374.305(1), Baker County requires a Road Approach Permit for improvements
7 to access roads that intersect with county road ROWs and requires a right-of-way permit for
8 construction activities within existing Baker County road ROWs. Access roads are proposed to
9 intersect with public roads and construction would require modifications within existing county
10 road ROW's, including improvements to county roads that may be used as access roads. The
11 applicant explains that site certificate holder would obtain any necessary Road Approach and
12 Right-of-Way permits directly from Baker County. As explained in ASC Exhibit E, required Road
13 Approach and Right-of-Way permit would not be included in or governed by the site certificate.
14 However, in order to provide assurance to the Council that the site certificate holder has
15 obtained any county-required Road Approach and Right-of-Way permits, the applicant
16 proposes and the Department recommends that the Council adopt Land Use Condition 9.

17
18 ***Baker County Comprehensive Plan***

19
20 The proposed facility and site boundary would be located within Baker County's Big Game
21 Overlay zone and could potentially impact several scenic resources protected under the Baker
22 County Comprehensive Plan Goal 5 Resources element.

23
24 *Goal 5 Inventoried Big Game Habitat*

25
26 Proposed facility components in Baker County would predominately be located in EFU zoned
27 land, ~~which with~~ a small segment (0.2 miles) of a substantially modified road to be located in
28 RSA zoned land. Within EFU zoned land, approximately 4,000 of 5,400 acres within the site
29 boundary would be located within Baker County's Big Game Overlay zone, as presented in ASC
30 Exhibit K Figure K-51. Except for riparian habitat setbacks, Baker County's comprehensive plan
31 finds that the County's land use regulations for the EFU zone are compatible with big game
32 habitat, and does not include any Goal 5 protection program applicable to permitted uses in the
33 EFU zone, including transmission line projects. To minimize potential impacts to riparian
34 vegetation, the applicant proposes and the Department recommends Council impose Land Use
35 Condition 9. Based on compliance with recommended Land Use Condition 9 and because the
36 proposed facility is a permitted use in the EFU Zone, the Department recommends Council find
37 that the proposed use would be in consistent with the county's Goal 5 planning goals for
38 protecting big game habitat.

39
40 *Goal 5 Inventoried Scenic Resources*

41
42 Goal 5 inventoried scenic resources within the analysis area includes Oregon Highway 86, a
43 portion of the NHOTIC ACEC and certain segments of I-84, as presented in ASC Exhibit K Figure
44 K-52. Baker County has not adopted any specific Goal 5 protection program for any of these

1 scenic areas that would constitute approval criteria subject to evaluation for compliance under
2 the County's comprehensive plan. In ASC Exhibit K, the applicant evaluates these resources to
3 confirm that the proposed facility would not result in significant adverse impacts. However, the
4 impact assessment is not evaluated in this section because, in the absence of a county adopted
5 protective ~~weed~~ program for these resources, there ~~is not~~ are no applicable criteria ~~for~~ by which to
6 evaluate the potential impacts.

7
8 *Noxious Weed Management Plan*

9
10 ORS 569.390: Noxious Weed Management Plan

11
12 *Each person, firm or corporation owning or occupying land within the district shall destroy or*
13 *prevent the seeding on such land of any noxious weed within the meaning of ORS 569.360 to*
14 *569.495 in accordance with the declaration of the county court and by the use of the best*
15 *means at hand and within a time declared reasonable and set by the court, except that no*
16 *weed declared noxious shall be permitted to produce seed.*

17 *THEREFORE, IT SHALL BE THE POLICY OF BAKER COUNTY TO:*

- 18 *1. Increase awareness of potential economic loss due to existing and new invading weeds*
19 *through continuous education with the public.*
- 20 *2. Rate and classify weeds at the county level*
- 21 *3. Prevent the establishment and spread of noxious weeds.*
- 22 *4. Encourage and implement the control or containment of infestations of designated weed*
23 *species and, where possible, their eradication. When budgets allow, offer a landowner*
24 *cost share program for "A" rated weeds, as well as those weeds designated appropriate*
25 *for cost share assistance by the Board of Commissioners.*
- 26 *5. Manage a biological control of weeds program for yellow starthistle, leafy spurge, St.*
27 *Johnswort, Canada thistle, rush skeletonweed, diffuse knapweed, spotted knapweed,*
28 *and others, in cooperation with ODA's Biological Control of Weeds Program. 6.*
29 *Cooperate with other states, federal agencies, private citizens, the Tri-County Weed*
30 *Management Area and other groups in enhancing the Baker County Vegetation*
31 *Management Program.*

32
33 Baker County implements a Weed Control Plan based on statutory requirements ~~for~~ imposed
34 under ORS 569. ~~530-350~~ through ORS 569.450. The applicant maintains that it would comply
35 with these statutory requirements through implementation of a Reclamation and Revegetation
36 Plan (Attachment P1-3 of this order) and Vegetation Management Plan (Attachment P1-4 of
37 this order), to be reviewed, finalized and approved by the Department in consultation with the
38 affected counties. Based on compliance with recommended Fish and Wildlife Conditions 2 and
39 3, the Department recommends Council find that the proposed facility would be in compliance
40 with Baker County's Weed Control Plan requirements.

1 **Recommended Land Use Conditions – Baker County**
2

3 **Recommended Land Use Condition 8:** Prior to construction of any phase or segment of the
4 facility in Baker County, the certificate holder shall provide to the Baker County Planning
5 Department a list of the suppliers that will be supplying the aggregate used in construction
6 in Baker County along with a copy of the suppliers’ land use permits.
7

8 **Recommended Land Use Condition 9:** For facility components in Baker County, the
9 certificate holder shall:

- 10 a. Prior to construction in Baker County, the certificate holder shall provide to the
11 department a copy of the following Baker County-approved permits, if such permits are
12 required by Baker County ordinances:
13 (i) Flood plain development permit;
14 (ii) Road approach permit; and
15 (iii) Work in county right-of-way permit.
16 b. If after commencement of construction the certificate holder determines
17 additional County-approved permits are required, the certificate holder shall
18 provide to the department a copy of those additional permits.
19 c. During construction, the certificate holder shall comply with conditions of permits listed
20 in (a) and (b).
21

22 **Recommended Land Use Condition 10:** During construction in Baker County, the certificate
23 holder shall construct the facility to comply with the following setback distances and other
24 requirements:

25 In the EFU Zone (Based solely on certificate holder representations in the ASC):

- 26 a. Buildings shall be setback as follows: front yards shall be set back at least 20
27 feet from property lines and road rights-of-way.
28 b. Buildings and the fixed bases of transmission line towers shall be set back at
29 least 60 feet from the center line of a road or street or 30 feet from any right-of-way in
30 excess of 60 feet.
31 c. Buildings and the fixed bases of transmission line towers shall be set back at
32 least 10 feet from property lines.
33 d. Buildings and the fixed bases of the transmission line towers shall be set back
34 at least 50 feet from the high-water mark of naturally-occurring riparian area, bog,
35 marsh, or waterway.
36

37 **IV.E.1.5. Malheur County**
38

39 Facility components proposed within Malheur County include approximately 75.1 miles of 500
40 kV transmission line, nine multi-use areas, two light-duty fly yards, 66.9 miles of new access

1 roads, 54.5 miles of substantially modified existing roads, pulling and tensioning sites, and three
2 communication stations.¹⁸⁵

3
4 In addition to proposed facility components, the applicant proposes a 7.4-mile alternative
5 segment, Double Mountain alternative, and ancillary facilities including five miles of new access
6 roads, seven miles of substantially modified roads, pulling and tensioning sites, and an
7 alternative communication station.

8
9 The locations of proposed and alternative facility components are represented in ASC Exhibit K
10 Figures K-54, and Figure 9, *Malheur County Zoning and Proposed Facility Components* below.

11

¹⁸⁵ As described in ASC Exhibit B, multi-use areas would be approximately 30 acres in size and would include construction field offices, parking areas, construction vehicle maintenance area, helicopter operations (helipads), explosives storage, hazardous materials storage, water storage tank, portable concrete batch plant, concrete washout station, gravel tire scrub area, noxious weed wash-off station, and bulk materials storage area.

1 **Figure 9: Malheur County and Proposed Facility Component Locations**

2
3

1 The above-described facility components proposed in Malheur County would be located on
 2 land zoned Exclusive Farm Use (EFU), Exclusive Range Use (ERU), and Heavy Industrial Zone
 3 Rural Industrial (RI-C-12) Uses. The applicable substantive criteria, as presented in Table LU-7,
 4 *Applicable Substantive Criteria for Proposed Facility Component in Malheur County* below, is
 5 identical for uses in EFU and ERU zoned land; ~~additionally, the County has not adopted specific~~
 6 ~~zoning provisions for uses within RI zoned land.~~ Alternative facility components would be
 7 located entirely within ERU zoned land. Proposed and alternative facility components are
 8 evaluated as a utility facility necessary for public service within EFU and ERU zoned land; and,
 9 an accessory use (multi-use area) to a utility facility necessary for public service in C-12, as
 10 further evaluated below.

11
 12 Applicable substantive criteria for proposed and alternative facility components in Malheur
 13 County, in effect on the date the applicant submitted the pASC (February 27, 2013), are
 14 presented in Table LU-7 below.
 15

Table LU-7: Applicable Substantive Criteria for Proposed Facility Components in Malheur County

Malheur County Code (MCC)^{1,2}	
<i>Exclusive Farm Use and Exclusive Range Use</i>	
MCC 6-3A-2	Permitted Uses
<u>Heavy Industrial Use</u>	
<u>MCC 6-31-4</u>	<u>Performance Standards</u>
<i>Flood Plain Management Zone</i>	
MCC 6-3K-3	Flood Plain Development Standards
MCC 5-2-5-1; 5-2-5-2	Flood Hazard Reduction
Malheur County Comprehensive Plan	
Goal 3 Agricultural Lands, Policies 2, 7, 8 and 9	
Notes:	
1. Code provisions identified by the applicant as potentially applicable substantive criteria include MCC 6-3A-5, 6-3A-6(A), and MCC 6-6-7. Based on review, the Department recommends Council not make findings of compliance with these requirements because they are not considered applicable substantive criteria. Malheur County identified MCC 6-3A-3(I) as applicable substantive criteria for the helipads at the light duty fly-yards and multi-use areas. However, the Department recommends Council evaluate the proposed facility comprehensively under one land use category – for the transmission line – and find that ancillary uses are necessarily evaluated as part of the land use category applied to the transmission line. Nonetheless, the applicant provides a compliance demonstration for these provisions in ASC Exhibit K, which the Department reviewed and considers representative of code provision consistency.	
2. In ASC Exhibit K Section 6.10.4 Malheur County Goal 5 Resources, the applicant describes that, to date, Malheur County has not responded to requests for confirmation of Goal 5 resource and resource location, and provides an assessment concluding that the County has not inventoried any Goal 5 resources.	

16 The following analysis addresses the applicable substantive criteria identified in the MCC.

17
 18
 19 **Malheur County Code Provisions**

20
 21 *Malheur County Code 6-3A Exclusive Farm Use Zone and Exclusive Range Zone*

1
2 Proposed facility components with EFU and ERU zoned land in Malheur County would include
3 approximately 75.1 miles of a single-circuit 500 kV transmission line with structures that could
4 extend up to 200-feet in height. The applicant identifies that ancillary facilities to the proposed
5 transmission line located within EFU and ERU-zoned land would include nine multi-use areas,
6 two light-duty fly yards, 66.9 miles of new access roads, 54.5 miles of substantially modified
7 existing roads, pulling and tensioning sites, and three communication stations.¹⁸⁶ An evaluation
8 of the applicable substantive criteria for these uses within EFU and ERU-zoned land is presented
9 below.

10
11 MCC 6-3A-2: Permitted Uses

12
13 *(A) The following uses may be permitted outright by ministerial permit in each of the three*
14 *(3) resource zones except as specifically added or excluded:...*

15
16 *(14) Utility facilities necessary for public service, including wetland waste treatment*
17 *systems but not including commercial facilities for the purpose of generating*
18 *electrical power for public use or sale or transmission towers over two hundred (200)*
19 *feet in height. A utility facility necessary for public service may be established as*
20 *provided in ORS 215.275 and section 6-6-8-8- "Wireless Communication Facilities" of*
21 *this title.*

22
23 MCC 6-3A-2 establishes that utility facilities necessary for public service are uses permitted
24 outright in the EFU and ERU zones, subject to compliance with applicable criteria in ORS
25 215.275.

26
27 As described in ASC Exhibit K, proposed facility components within EFU and ERU zoned land in
28 Malheur County would include 75.1 miles of a single-circuit 500 kV transmission line with
29 structures that could extend up to 200-feet in height. The applicant identifies that ancillary
30 facilities to the proposed transmission line located within EFU and ERU-zoned land would
31 include nine multi-use areas, two light-duty fly yards, 66.9 miles of new access roads, 54.5 miles
32 of substantially modified existing roads, pulling and tensioning sites, and three communication
33 stations, which based on a 2001 and 2005 court decision, the applicant asserts should be

¹⁸⁶ In ASC Exhibit K, the applicant describes that Umatilla County identified UCDC Sub-section 152.060(G) *Personal Use Airports* as potentially applicable to the helipads to be located within each of six multi-use areas in EFU-zoned land. Because the multi-use area is an ancillary facility to the proposed facility, the Department recommends Council evaluate all facility components within EFU-zoned land as a utility facility necessary for public service. In the alternative, however, the applicant provides a compliance demonstration if UCDC Sub-section 15.2060(G) is determined applicable, which is incorporated into ASC Exhibit C, K and the draft Helicopter Use Plan (Recommended Public Services Condition 32, to be provided to the Department and applicable counties prior to helipad use.

1 considered under the “utility facility necessary for public service” land use category.¹⁸⁷ The
2 Department agrees and recommends Council find that the proposed facility components
3 located in EFU and ERU-zoned land would be a use permitted outright under MCC 6-3A-2.
4 Proposed facility components would be located in EFU-zoned land across five Oregon counties
5 including Morrow, Umatilla, Union, Baker, and Malheur. Therefore, for these locations, the land
6 use compliance evaluation is limited to ORS 215.275, as presented in Section IV.E.2.1, ORS
7 215.283 and ORS 215.275.¹⁸⁸

8
9 Malheur County Planning Director Eric Evans confirmed that a zoning permit would be required
10 for facilities located within the EFU and ERU zones. Based on this local permit requirement, the
11 Department recommends Land Use Condition 11, to ensure necessary local permits are
12 obtained prior to facility construction.¹⁸⁹

13
14 *Malheur County Code 6-3K Flood Plain Management Zone*

15
16 The proposed route and alternative routes would cross several areas designated as Special
17 Flood Hazard Areas (SFHA) (ASC Exhibit K Figure K-56).

18
19 MCC 6-3K-3: Flood Plain Management

20
21 *The following standards shall be applicable to any area designated as being within the 100-*
22 *year flood plain:*

- 23 *A. Any development shall comply with Title 5, Chapter 2 of this Code and the Federal*
24 *Insurance Administration requirements for minimizing flood hazards.*
25 *B. Any development shall also comply with the standards of the underlying primary zone.*
26 *C. If a conflict in regulations or procedures occurs, the more restrictive provisions shall*
27 *govern.*

28
29 MCC 6-3K-3 establishes flood hazard minimization standards for development within SFHA’s,
30 including compliance with primary underlying zone development standards and MCC Title 5,
31 Chapter 2 and the Federal Insurance Administration.

187 See *Save Our Rural Or. v. Energy Facility Siting Council*, 339 Or. 353, 384 (2005) (upholding Council’s determination that ancillary facilities are considered “utility facilities necessary for public service”); *Cox v. Polk County*, 174 Or. Ct. App. 332, 343-44 (2001) (“utility facilities necessary for public service” may include ancillary or off-site equipment).

188 Although beyond what is required to demonstrate compliance with ORS 215.275, the applicant performed a county-specific alternatives analysis. Please refer to ASC Exhibit K Section 6.10.5. for additional information specific to Malheur County.

189 B2HAPPDoc8-009 DPO Special Advisory Group Comment Malheur County Evans 2019-08-21.

1 In ASC Exhibit K, the applicant explains that construction activities, such as temporary bridge
2 construction for stream crossings, could occur within SFHA's. However, permanent facility
3 structures would not be located within a SFHA. Nonetheless, if a flood plain development
4 permit is required for construction activities, the applicant would work directly with the County
5 to obtain the necessary permit, demonstrating compliance with MCC 6-3K-3. A single floodplain
6 development permit would be required within each regulatory floodplain where development
7 would occur.¹⁹⁰ The applicant proposes Land Use Condition 11, provided below, to demonstrate
8 a minimization of potential risk from flood hazards during facility construction.

9
10 Malheur County Code 6-3I Heavy Industrial Zone

11
12 Proposed facility components within Heavy Industrial zoned land in Malheur County would
13 include one multi-use area (MUA). An evaluation of the applicable substantive criteria for
14 this use within Heavy Industrial zoned land is presented below.

15
16 MCC 6-3I-3: Conditional Uses

17
18 The following uses and their accessory uses may be established when authorized in
19 accordance with Chapter 6 of this Title:

20 A. All conditional and permitted uses allowed in an M-1 Zone that are compatible with
21 a heavy industrial zone.

22
23 G. Any uses that may possess characteristics injurious to health and safety due to
24 emissions of smoke, dust, odor, fumes, refuse, noise or other effluents.

25
26 MCC 6-3I-3 establishes that the MUA is a conditional use in the Heavy Industrial (C-I2) Zone as
27 either a utility facility (which is a conditional use authorized in the Light Industrial M-1 Zone,
28 see MCC 6-3H-3.I) or a use involving smoke, dust, odor, fumes, refuse, noise, or other
29 effluents, subject to the requirements of MCC 6-3I-4.

30
31 MCC 6-3I-4

32
33 Each structure or use permitted or conditionally permitted in the M-2 Zone shall meet
34 the following performance standards:

35 A. Conduct of Use: No permitted or permissible use shall be conducted in any manner
36 which would render it noxious or offensive by reason of dust, refuse matter, odor,
37 smoke, gas fumes, noise, vibration or glare.

38 B. Enclosure: All manufacturing or processing activities shall be completely enclosed in
39 buildings, except as provided by the conditional use section of this Article.

40 C. Outdoor Storage: Junk, salvage, auto wrecking and similar operations shall be
41 fenced, screened or limited in height so as to block substantially any view of such

¹⁹⁰ B2HAPPDoc8-009 DPO Special Advisory Group Comment Malheur County Evans 2019-08-21.

1 material from any point located on an abutting street or from any point less than
2 eight feet (8') above grade within any abutting residential or commercial zone.
3 However, this subsection C shall not be deemed to require more than an opaque fence or
4 screen not more than ten feet (10') in height and not longer than the full perimeter of
5 the subject zoning lot, and further provided, such screening may be reduced in height so
6 as to avoid shading a solar collector on adjoining property when so requested by the
7 adjoining property owner or a government official. No outdoor storage of materials
8 which could be blown into the air or strewn about by wind shall be permitted.

9 D. Loading: Truck loading and unloading operations shall take place entirely within the site
10 and shall not be so located as to interfere with pedestrian routes.

11 E. Fire Hazard: No operation shall be established which constitutes a fire hazard.

12 F. Noise: Noise shall be muffled as available technology permits so as to not be
13 objectionable due to intermittence, beat frequency or shrillness and shall meet any State
14 standards.

15 G. Sewage and Liquid Waste: All operations shall comply with any applicable regulations of
16 the County, State or Federal agencies responsible for pollution control. No wastes of a
17 chemical, organic or radioactive nature shall be injected or buried in the ground or
18 stored in the open on the surface except in approved containers.

19 H. Odor: The emission odors that are generally agreed to be obnoxious to any considerable
20 number of people shall be abated with the latest feasible technology. As a general guide
21 to classification of odor, it is deemed that odors of putrefaction, hydrogen sulfide,
22 fermentation and rendering processes are objectionable while odors associated with
23 baking, coffee roasting or nut roasting are normally not considered obnoxious. To reduce
24 odors, the open air cooling of products with aromatic emissions shall be avoided. Floors,
25 machinery, storage containers and other surfaces shall be kept clean of material which is
26 potentially odor causing.

27 I. Vibration: All machines shall be mounted so as to minimize vibration. Vibration shall not
28 be so excessive as to interfere with heavy industrial operations on nearby premises.

29 J. Glare and Heat: Any glare producing operations, such as welding arcs, shall be shielded
30 so that they are not visible from the property line and surfaces near the glare source
31 shall be of a type which will minimize the reflection of such glare beyond the property
32 line. No heat from equipment or furnaces shall raise the temperature of materials or
33 ambient air at the property line more than three degrees Fahrenheit (3°F).

34 K. Interpretation: Whenever it cannot be decided by reasonable observation that a
35 performance standard is being met, it shall be the responsibility of the operator of the
36 use to supply evidence or engineering data to support the contention that a standard is
37 being met.

38
39 The standards are designed, except where referring to other codes, to be judged by ordinary
40 human senses and not by the minute detail of scientific quality instruments. Until such
41 evidence or engineering data is supplied and proves to be convincing, the judgment of the
42 Planning Director shall be the determining factor.

43
44 MCC 6-3I-4 establishes general criteria for conditional uses permitted in C-I2 zoned land. The

1 proposed temporary MUA would generate dust, refuse, smoke, fumes, noise, vibrations, and
2 glare consistent with other allowable uses within the CI-2 zone, such as concrete plants,
3 trucking freight terminals, and service stations each of which is a permitted use in the C-12 Zone
4 under MCC 6-3I-2. However, the noise, waste, odor, vibrations, and glare would not be
5 excessive or interfere with nearby operations.

6
7 Truck loading and unloading operations at the MUA would take place entirely within the MUA
8 site. The applicant provides a Transportation and Traffic Plan, in ASC Attachment U-2, to be
9 implemented in accordance with recommended Public Services Condition 2 which includes an
10 agency review process. The plan would address any traffic concerns that might impact
11 pedestrian routes. Finally, the Malheur County Planning Department indicated to the applicant
12 that, with respect to enclosures, the concrete batch plant activities would not need to be
13 enclosed in a separate building other than the plant itself. Based on the activities and use of the
14 MUA site, and traffic impact minimization measures to be implemented in accordance with the
15 above described plan, the Department recommends the Council find that the proposed
16 temporary MUA would satisfy MCC 6-3I-4 performance standards.

17
18 Malheur County Planning Director Eric Evans confirmed that a zoning permit would be required
19 for facilities located within the C-12 zone. Based on this local permit requirement, the
20 Department recommends Land Use Condition 11, to ensure necessary local permits are
21 obtained prior to facility construction.¹⁹¹

22 23 **Malheur County Comprehensive Plan Provisions**

24 25 Goal 3: Agricultural Lands

26
27 *Goal: To preserve and maintain the agricultural land in the county for agricultural purposes.*

- 28
29 1. *Public and private land classified by the Natural Resources Conservation Service*
30 *(formerly U.S. Department of Agriculture Soil Conservation Service) as being in Capability*
31 *Classes I through VI, as well as High Value Farmland as defined by applicable Oregon*
32 *Revised Statutes and Oregon Administrative Rules and any other lands determined to be*
33 *necessary and required for farm use, are considered to be agricultural lands.*
34 2. ***High Value Farmlands (ORS and OAR designated) shall be given the greatest***
35 ***protection. Lands classified by the Natural Resources Conservation Service, as***
36 ***Capability Classes through VI shall be afforded the next highest protection with Class I***
37 ***having the highest protection and Class VI the least.***
38 3. *In addition to the Natural Resources Conservation Service classification system, county*
39 *assessor's records may be considered in evaluating individual parcels for the purpose of*
40 *planning and zoning.*

¹⁹¹ B2HAPPDoc8-009 DPO Special Advisory Group Comment Malheur County Evans 2019-08-21.

- 1 4. *Urban growth boundaries, exclusive farm use zoning, and farm use tax assessment be*
2 *will be the major tools used to protect agricultural lands.*
- 3 5. *The county will support viable water resource projects for additional storage, power*
4 *generation, water quality, conservation and recreation.*
- 5 6. *The county will review and consult with the irrigation and drainage districts on land use*
6 *decisions to assure they will not negatively impact the integrity or operation of water for*
7 *irrigation or drainage purposes.*
- 8 **7. *In addition to county code and the State of Oregon’s land use laws and administrative***
9 ***rules for non-farm dwellings, it is the policy of Malheur County that there be no net***
10 ***loss of farmlands listed on the High Value Farmlands Soils list or soils classified as***
11 ***types I-III by the Natural Resources Conservation Service.***
- 12 **8. *Current and future accepted farming and ranching practices and activities shall have***
13 ***priority and continue without interference.***
- 14 **9. *Any utility transmission line should avoid adverse impacts on any agricultural***
15 ***operation in the entire agricultural area. This protection should prioritize High Value***
16 ***Farmland [ORS and OAR designated] and the Natural Resources Conservation soil***
17 ***classes I through III.***
- 18 10. *The County Court will appoint a citizens advisory committee on agriculture to review the*
19 *agricultural lands element of the comprehensive plan on an as needed basis.*
- 20 11. *The county will not discourage the creation of special land use districts so that*
21 *landowners can impose more restrictive land use regulations than those imposed by the*
22 *county.*

23
24 Malheur County’s Goal 3 provides policy direction to the county regarding its compliance with
25 Statewide Planning Goal 3 and is implemented through the County’s zoning code. Policies 2 and
26 9 direct the county to protect High Value Farmland and Natural Resources Conservation Service
27 (NRCS) Soil Classes I through III. Policy 9 specifically addresses transmission lines.

28
29 In furtherance of this policy direction, the applicant has worked with landowners in Malheur
30 County to avoid impacts to irrigated agricultural land located within the EFU zone. As the
31 applicant explains in ASC Exhibit K, throughout development of the proposed route, the
32 applicant has continued to avoid irrigated agricultural land to the extent possible.¹⁹² As
33 depicted on ASC Exhibit K, Figure K-57, the EFU zone encompasses both High Value Farmland
34 soil and the NRCS soil classes I through III across Malheur County. As shown in Table K-34 and
35 Figure K-57, the applicant has avoided High Value Farmland soils and NRCS soil classes I through
36 III to the extent possible.

37
38 Policy 7 expresses the County’s policy that there be no net loss of high value farmland. That
39 policy is implemented through the County’s code and through compliance with the statutory
40 framework. As discussed above, the proposed transmission line satisfies the requirements of
41 the Malheur County code and is permitted under ORS 215.283. In addition, the applicant has

¹⁹² B2HAPPDoc3-19 ASC 11 Exhibit K Land Use, page K-301. 2018-09-28.

1 attempted to avoid and minimize impacts to High Value Farmland and NCRS Soil Classes 1
2 through III to the extent practicable.

3
4 Policy 8 gives priority to current and future accepted farming and ranching practices to
5 “continue without interference.” As with policy 7, this policy is implemented through the code
6 and compliance with the statutory framework, which permits the proposed transmission line as
7 a use permitted under ORS 215.283(1). This policy is also furthered through compliance with
8 ORS 215.275(4) and (5), discussed above.

9
10 The Department recommends that the Council determine that the Malheur County
11 Comprehensive Plan provision provisions identified by the county constitutes the applicable
12 substantive approval criteria. Based on the applicant’s evaluation of the proposed transmission
13 line for compliance with the applicable substantive criteria, the Department further
14 recommends that the Council find that the proposed use satisfies those criteria.

15
16 ***Recommended Land Use Conditions – Malheur County¹⁹³***

17
18 **Recommended Land Use Condition 11:** For facility components in Malheur County, prior to
19 construction of any phase or segment of facility components, the certificate holder shall:

- 20 a. Obtain one zoning permit for development of facility components in both the EFU and
21 ERU zone, and one zoning permit for development of facility components in the Heavy
22 Industrial (C-12) zone; copies of zoning permits shall be provided to the Department.
23 b. Provide to the Department a copy of a Malheur County-approved Flood plain
24 development permits for each location where development would occur within a
25 regulatory floodplain.

26 a-c. If after construction commencement, the certificate holder determines additional
27 County-approved permits are required, the certificate holder shall provide a copy of
28 those permits to the Department.

29
30 **Recommended Land Use Condition 12:** For facility components in Malheur County, the
31 certificate holder shall design the facility to comply with the following setback distances and
32 other requirements:

33 In the EFU and ERU Zones (Based solely on certificate holder representations in the ASC):

- 34 a. Buildings shall be setback as follows:
35 (i) at least 40 feet from a street or road right-of-way; and
36 (ii) at least 125 feet from any other property line.
37 b. No sight obscuring fence exceeding three feet in height shall be placed within the 40-
38 foot street setback, also within this setback shrubbery other than trees shall be
39 maintained at heights not exceeding three feet.

40

¹⁹³ Applicant agrees to setback requirement requested by Malheur County Planning Director, as reflected in recommended Land Use Condition 12(a)(ii). B2HAPP DPO IPC Responses – Malheur County Comments 2019-10-09.

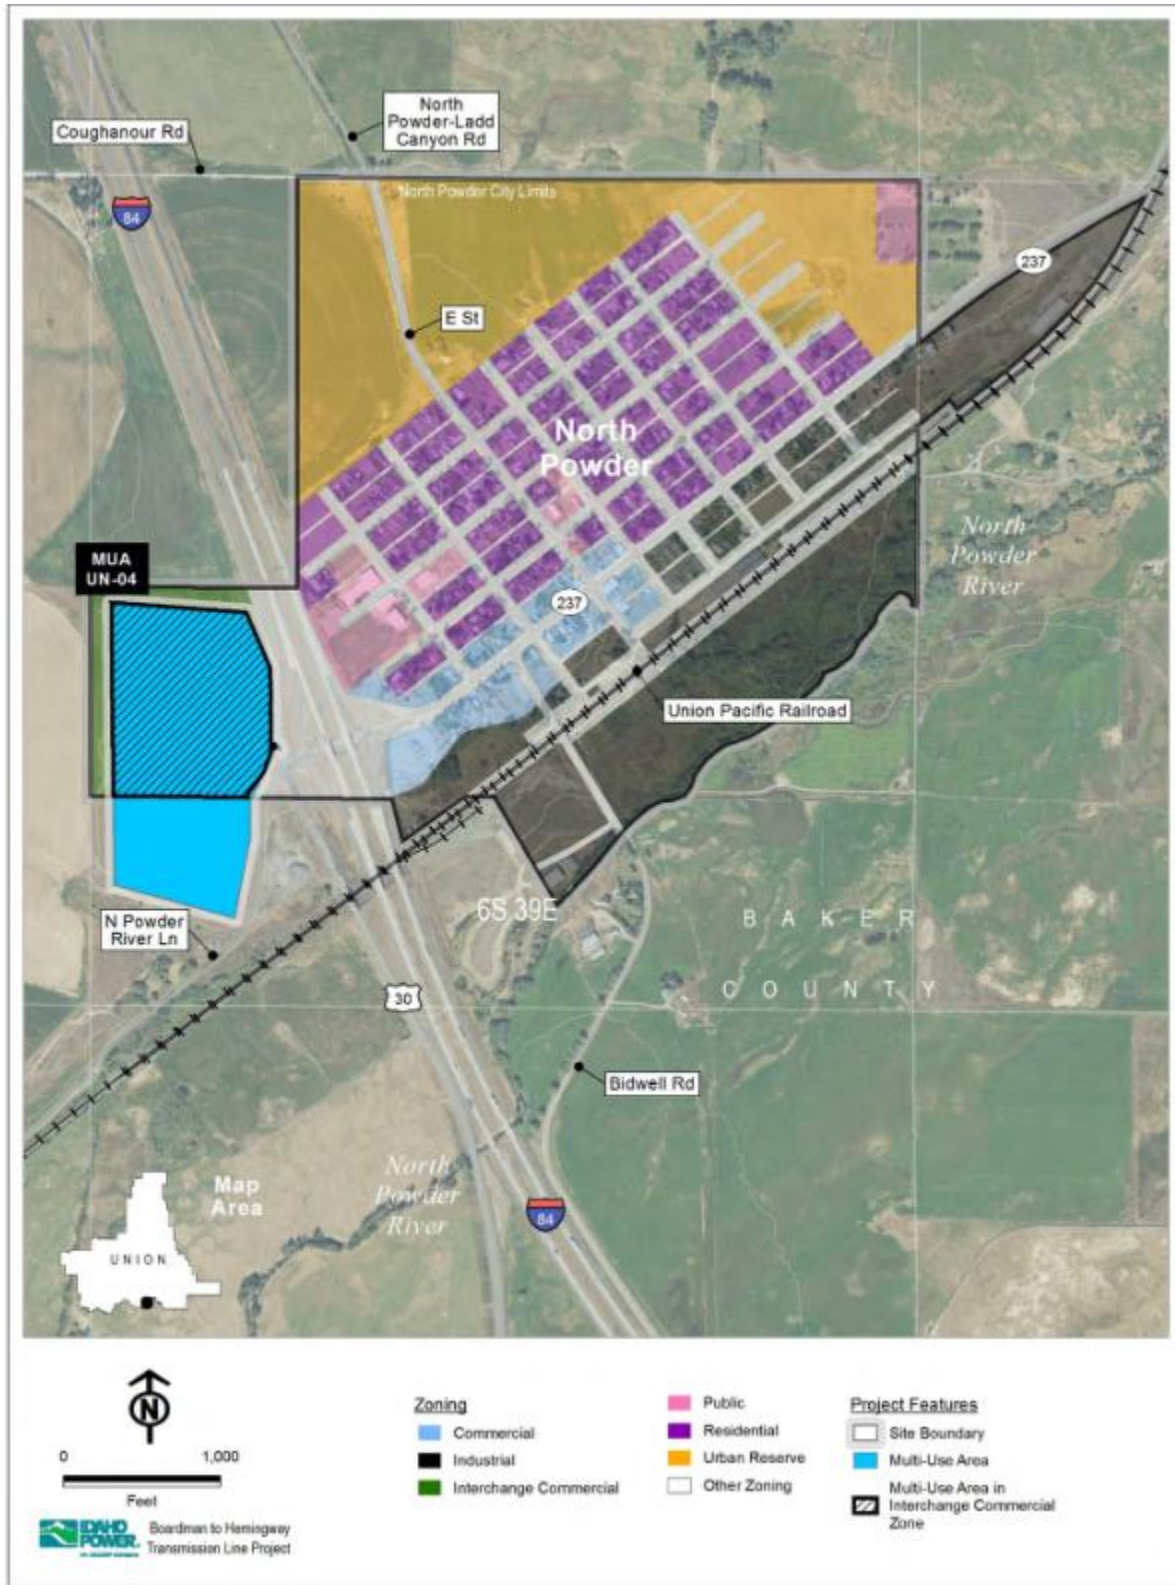

1 IV.E.1.6. City of North Powder
2

3 Facility components proposed within City of North Powder include an approximately 27.2-acre
4 portion of a multi-use area, with the remaining portion of the multi-use area located within
5 Union County, as evaluated in Section IV.E.1.3., *Union County* of this order.¹⁹⁴ There are no
6 alternative routes or facility component locations proposed within City of North Powder.
7

8 The proposed multi-use area would be located within the Commercial Interchange Zone, as
9 represented in ASC Exhibit K Figures K-46, and Figure 10, *City of North Powder Zoning and*
10 *Proposed Multi Use Area* below. The proposed multi-use area is evaluated as an “other use”
11 within the Commercial Interchange Zone.
12

¹⁹⁴ As described in ASC Exhibit B, multi-use areas would be approximately 30 acres in size and would include construction field offices, parking areas, construction vehicle maintenance area, helicopter operations (helipads), explosives storage, hazardous materials storage, water storage tank, portable concrete batch plant, concrete washout station, gravel tire scrub area, noxious weed wash-off station, and bulk materials storage area.

1 **Figure 10: City of North Powder Zoning and Proposed Facility Component Locations**

2

1 Applicable substantive criteria for proposed facility components in City of North Powder, in
 2 effect on the date the applicant submitted the pASC (February 27, 2013), are presented in Table
 3 LU-8, *Applicable Substantive Criteria for Proposed Facility Components in City of North Powder*
 4 below.
 5

Table LU-8: Applicable Substantive Criteria for Proposed Facility Components in City of North Powder

North Powder Zoning Ordinance (NPZO)¹	
<i>Commercial Interchange Zone</i>	
Section 4.02	Conditional Uses/Other Uses
Section 4.04	Development Standards; Signs
Section 3.02	Conditional Use Findings
Notes: 1. Code provisions identified by the applicant for informational purposes include NPZO Section 4.03 (dimension standards) and Section 8.06 (front yard exceptions); and therefore because these requirements were not identified by the City as applicable substantive criteria, compliance with these requirements is not further evaluated in this order. NPZO 10.02 (application requirements) include application requirements such as a site plan and adjacent property owner information, which are superseded by the Council’s application requirements under OAR Chapter 345 Division 21. Nonetheless, the Department reviewed the applicant’s compliance assessment with these provisions and considers the evaluation to be consistent with the requirements.	

6
 7 The following analysis addresses the applicable substantive criteria identified in the NPZO.
 8

9 ***North Powder Zoning Ordinance***

10 *North Powder Zoning Ordinance 4 Commercial Interchange Zone*

11 NPZO 4.02: Conditional Uses

12
 13 *In a (C-2) Commercial Interchange Zone the following uses and their accessory uses are permitted by conditional use approval when authorized in accordance with Articles VIII and X of this ordinance:...*

14
 15
 16
 17
 18
 19 *12. Other uses per criteria in Section 3.02(9).*

20
 21 NPZO Section 4.02 establishes conditional uses permitted within CI zoned land, and includes
 22 “other uses,” which the applicant describes as the appropriate land use category for the multi-
 23 use area, based on an April 10, 2013 memorandum from by the City of North Powder.
 24 Therefore, the Department recommends Council find that the proposed multi-use area within
 25 City of North Powder is a conditional use permitted within CI zoned land subject to the criteria
 26 in NPZO Section 3.02(9).
 27

1 NPZO 4.04(B): Development Standards

2
3 *In the (C-2) Commercial Interchange Zone, the following signs are permitted:*

- 4 *A. Businesses and firms in the Commercial Interchange Zone are permitted to use signs*
5 *provided the aggregate of the signs do not exceed an area equal to one square foot of*
6 *sign face for each foot of lot frontage or 300 square feet of sign face, whichever is the*
7 *least, and the sign is not in or extending over a street. Such sign shall not exceed a*
8 *maximum height of forty-five (45) feet above the grade below the sign. Such sign shall*
9 *be located on the premises of the business or firm which it advertises or identifies and*
10 *within 300 feet of the advertised activity.*
- 11 *B. On premise signs advertising the sale or lease of property provided the sign does not*
12 *exceed forty-two (42) square feet in area and the sign is not in or extending over a*
13 *street.*
- 14 *C. Signs in the Commercial Interchange Zone may be illuminated, but shall not be a flashing*
15 *or moving type of lighting.*
- 16 *D. Permitted signs may not be erected or maintained within one hundred (100) feet of an*
17 *occupied dwelling unless the owner thereof consents in writing to the erection or*
18 *maintenance of such a sign.*
- 19 *E. All off-premise signs within the view of any State Highway shall be regulated by State*
20 *regulations under ORS Chapter 377 and receive building permit approval.*
- 21 *F. All off-premise signs not within view of a State Highway shall be limited to identification*
22 *and location of a business and be no larger than sixteen (16) square feet in area and*
23 *receive building permit approval.*

24
25 NPZO Section 4.04(B), A-F, establish development standards for signs installed at permitted
26 uses within CI zoned land. The applicant describes that the multi-use area would include signs
27 identifying construction areas, “no trespassing” or similar, and signs warning of potential
28 danger; all signage would adhere to NPZO Section 4.04(B) requirements, as applicable. The
29 applicant proposes a condition to ensure compliance the NZPO Section 4.04(B), which is
30 referenced in Recommended Land Use Condition 13.¹⁹⁵ Based on compliance with
31 Recommended Land Use Condition 13, the Department recommends Council find that the
32 proposed facility would comply with NPCZ Section 4.04(B) development standards.

33
34 NPZO 3.02(9): Conditional Use Findings

35
36 *Based upon the following finding the City Council may approve other uses similar to those*
37 *enumerated and consistent with purpose and intent of this zone if:*

¹⁹⁵ As presented in Table LU-8 Applicable Substantive Criteria for Proposed Facility Components in the City of North Powder and as referenced in recommended Land Use 13, zoning requirements established under NPZO Section 4.03 Dimensional Standards do not include applicable substantive criteria for which Council needs to make a determination of compliance and therefore has not been evaluated in this section. However, the applicant proposes to comply with the dimensional standard and proposes Land Use Condition 13(b) to demonstrate that the proposed facility would be designed to satisfy yard setback requirements.

- 1 a. *The proposed use will be compatible with the traffic flow of vehicles and/or pedestrians*
- 2 *frequenting the area.*
- 3 b. *The site plan and use are compatible with the surrounding commercial uses and the*
- 4 *intent of this zone.*
- 5 c. *The proposed use will encourage an influx of people who are likely to benefit from the*
- 6 *availability of adjacent commercial wares and/or services.*

7

8 NPZO Section 3.02(9) includes criteria that must be satisfied for conditionally permitted uses

9 within CI zoned land. Criteria require a demonstration that the proposed use would be

10 compatible with traffic and pedestrian flow and surrounding uses and intent of the zone; and,

11 that the proposed use would encourage an influx of people likely to benefit from the availability

12 of commercial uses and services.

13

14 The proposed multi-use area would result in vehicular traffic to and from the site, using the on

15 and off-ramps for I-84, and Highway 30, to access equipment and materials such as fuel and

16 concrete. In ASC Exhibit K, the applicant represents that there is very limited pedestrian traffic

17 within the CI zone, and that most vehicular traffic is related to adjacent agricultural operations.

18 The applicant also describes, based on communication with ODOT, that potential increases in

19 construction-related traffic during use of the multi-use area would not be expected to impact

20 traffic flow because the predominant roadways to be used have sufficient capacity and the

21 increase in vehicular traffic would be temporary.

22

23 Surrounding uses within the CI zone, intended to provide a place for businesses to operate,

24 include a motel, restaurants, and convenience stores. These commercial uses are located on

25 the opposite side of I-84 where I-84 would act as a buffer between the adjacent commercial

26 uses and any construction related noise or dust generated at the multi-use area. The multi-use

27 area would be located within a historically vacant lot which, through use by the applicant,

28 would satisfy the intent of the zone.

29

30 The multi-use area would serve as field offices, reporting locations for workers, parking space

31 for vehicles and equipment, sites for material delivery and storage, fabrication assembly of

32 towers, cross arms and other hardware, concrete batch plants, and stations for equipment

33 maintenance. Accordingly, during use of the multi-use area, construction related workers

34 would result in an influx of people within the CI zone that would benefit from the proposed and

35 existing commercial uses within the surrounding area.

36

37 Based on the reasons and analysis provided above, the Department recommends Council find

38 that the proposed multi-use area would satisfy the NPZO Section 3.02(9) conditional use

39 findings.

40

41

42

43

1 **Recommended Land Use Conditions – City of North Powder**
2

3 **Recommended Land Use Condition 13:** For the multi-use area in City of North Powder, the
4 certificate holder shall design the site to comply with the following setback distance and
5 other requirements:

6 In the Commercial Interchange Zone

- 7 a. All signs shall comply with NPZO 4.04(B) development standards (ASC Exhibit K p. K-275)
8 b. Based solely on certificate holder representations in ASC, buildings shall not exceed 45
9 feet in height and shall be setback per NPZO Section 4.03 (ASC Exhibit K p. K-277):
10 i. Front yards shall be set back at least 30 feet from property lines;
11 ii. Side yards shall be setback at least 20 feet from a Residential Zone, street, or corner
12 lot; and
13 iii. Rear yards shall be set back at least 20 feet from a Residential Zone.

14
15 IV.E.1.7. City of Huntington

16
17 Facility components proposed within City of Huntington include one multi-use area.¹⁹⁶ There
18 are no alternative routes or facility component locations proposed within City of Huntington.
19

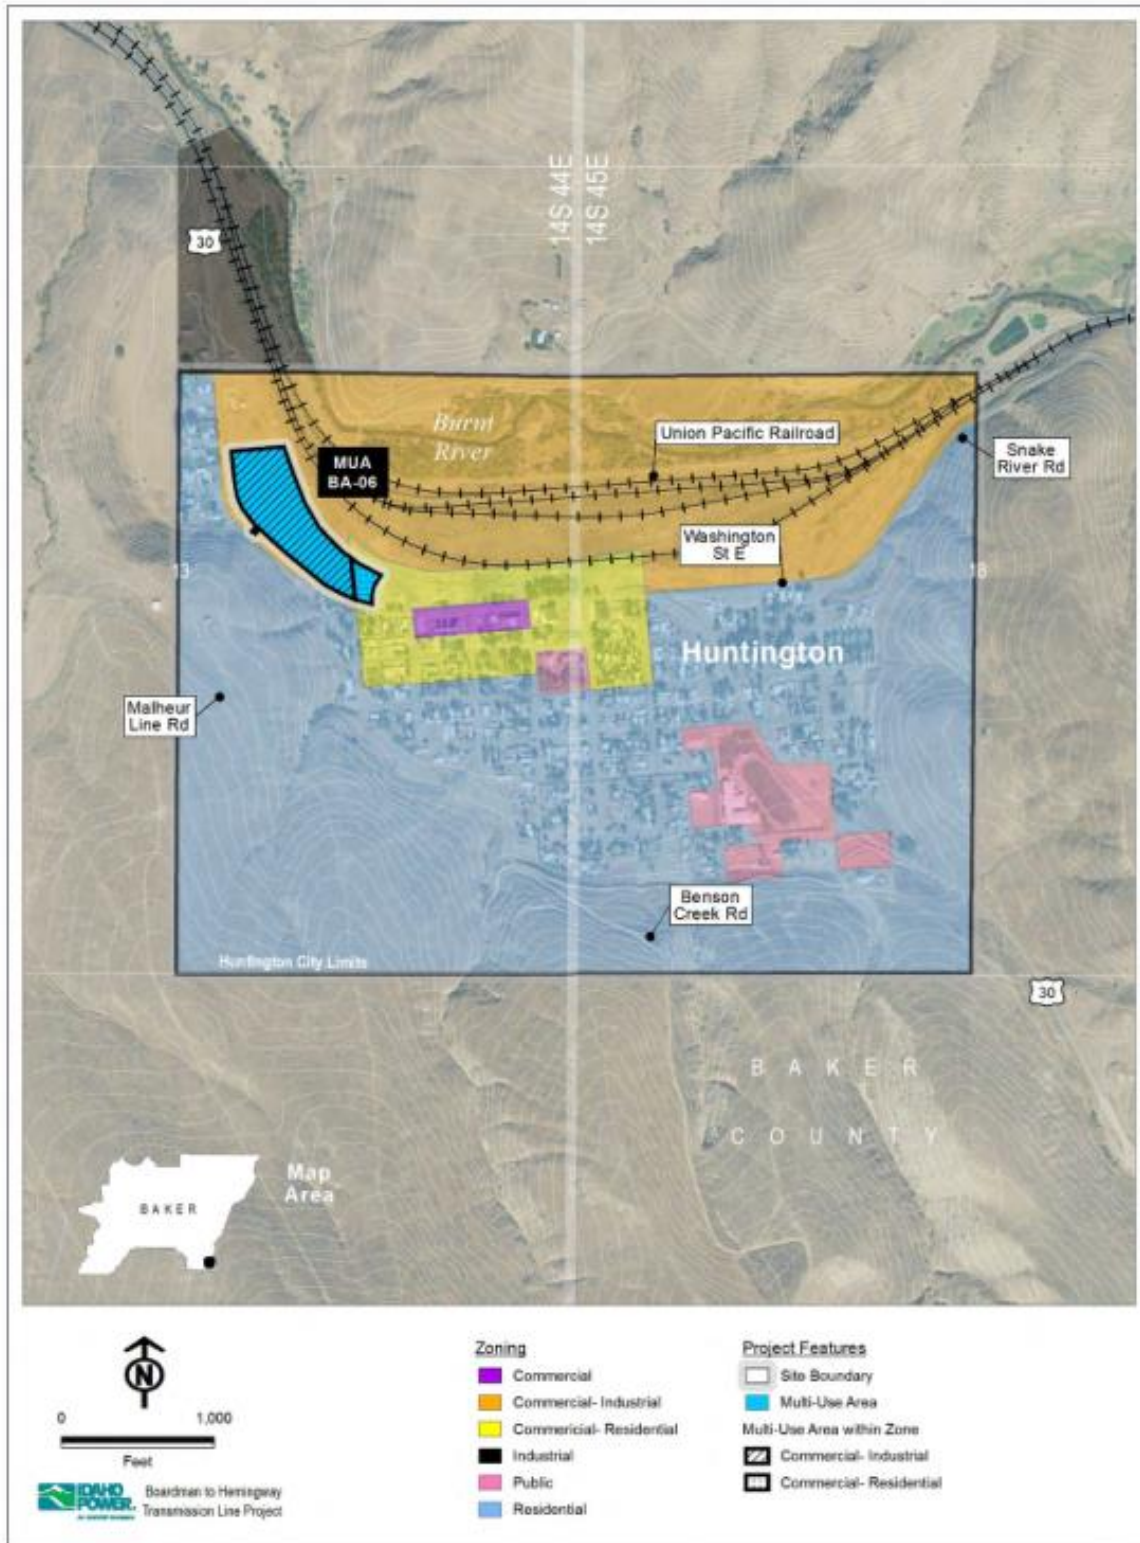

20 The proposed multi-use area would be located within both the Commercial Industrial (CI) Zone
21 and Commercial Residential (CR) Zone, as represented in ASC Exhibit K Figures K-53, and Figure
22 11, *City of Huntington Zoning and Proposed Multi Use Area* below. In ASC Exhibit K Section
23 6.9.2.1., the applicant describes that, in a June 2, 2016 email, the City of Huntington indicated
24 that because the multi-use area would be a temporary use, no provisions of the City of
25 Huntington Zoning Ordinance (CHZO) would apply and no City permits would be required.
26

27 For informational purposes only, the applicant provides an analysis demonstrating compliance
28 with CHZO provisions that would apply to an “industrial, manufacturing, compounding,
29 processing, repairing, packing or storing” land use within CI zoned land, including CHZO 153.082
30 (minimum lot size), CHZO 153.083 and -053 (property line setbacks). For informational
31 purposes only, the applicant provides an analysis demonstrating compliance with CHZO
32 provisions that would apply to conditional uses within CR zoned land, including CHZO 152.050
33 and -051.
34

35 Because there are no applicable substantive criteria for the multi-use area within City of
36 Huntington, the Council is not obligated to make findings of compliance for this temporary use
37 under the Land Use standard.
38

¹⁹⁶ As described in ASC Exhibit B, multi-use areas would be approximately 30 acres in size and would include construction field offices, parking areas, construction vehicle maintenance area, helicopter operations (helipads), explosives storage, hazardous materials storage, water storage tank, portable concrete batch plant, concrete washout station, gravel tire scrub area, noxious weed wash-off station, and bulk materials storage area.

1 **Figure 11: City of Huntington Zoning and Proposed Multi-Use Area**

2
3

1 IV.E.2. Directly Applicable State Statutes and Administrative Rules

2
3 IV.E.2.1. ORS 215.283 and, ORS 215.275 ~~and ORS 215.296~~ (Exclusive Farm Use Zone
4 Requirements)

5
6 Statutes which apply directly to the proposed facility include ORS 215.275 and 215.283; ~~ORS
7 215.296 has been adopted by the applicable counties, but because it is the same criteria across
8 counties, is addressed in this section.~~

9
10 ORS 215.283, in relevant part, states:

11
12 *(1) The following uses may be established in any area zoned for exclusive farm use:*

13 ***

14 *(c) Utility facilities necessary for public service, including wetland waste treatment
15 systems but not including commercial facilities for the purpose of generating electrical
16 power for public use by sale or transmission towers over 200 feet in height. A utility facility
17 necessary for public service may be established as provided in:*

18 *(A) ORS 215.275;*

19 ***

20
21 ORS 215.275 states:

22
23 *(1) A utility facility established under ORS 215.213 (1)(c)(A) or 215.283 (1)(c)(A) is necessary
24 for public service if the facility must be sited in an exclusive farm use zone in order to
25 provide the service.*

26 *(2) To demonstrate that a utility facility is necessary, an applicant for approval under ORS
27 215.213 (1)(c)(A) or 215.283 (1)(c)(A) must show that reasonable alternatives have been
28 considered and that the facility must be sited in an exclusive farm use zone due to one or
29 more of the following factors:*

30 *(a) Technical and engineering feasibility;*

31 *(b) The proposed facility is locationally dependent. A utility facility is locationally
32 dependent if it must cross land in one or more areas zoned for exclusive farm use in
33 order to achieve a reasonably direct route or to meet unique geographical needs that
34 cannot be satisfied on other lands;*

35 *(c) Lack of available urban and nonresource lands;*

36 *(d) Availability of existing rights of way;*

37 *(e) Public health and safety; and*

38 *(f) Other requirements of state or federal agencies.*

39 *(3) Costs associated with any of the factors listed in subsection (2) of this section may be
40 considered, but cost alone may not be the only consideration in determining that a utility
41 facility is necessary for public service. Land costs shall not be included when considering
42 alternative locations for substantially similar utility facilities. The Land Conservation and
43 Development Commission shall determine by rule how land costs may be considered
44 when evaluating the siting of utility facilities that are not substantially similar.*

- 1 (4) *The owner of a utility facility approved under ORS 215.213(1)(c)(A) or 215.283(1)(c)(A)*
2 *shall be responsible for restoring, as nearly as possible, to its former condition any*
3 *agricultural land and associated improvements that are damaged or otherwise disturbed*
4 *by the siting, maintenance, repair or reconstruction of the facility. Nothing in this section*
5 *shall prevent the owner of the utility facility from requiring a bond or other security from*
6 *a contractor or otherwise imposing on a contractor the responsibility for restoration.*
- 7 (5) *The governing body of the county or its designee shall impose clear and objective*
8 *conditions on an application for utility facility siting under ORS 215.213(1)(c)(A) or*
9 *215.283(1)(c)(A) to mitigate and minimize the impacts of the proposed facility, if any, on*
10 *surrounding lands devoted to farm use in order to prevent a significant change in*
11 *accepted farm practices or a significant increase in the cost of farm practices on the*
12 *surrounding farmlands.*

13
14 ORS 215.283(1)(c) establishes that a “utility facility necessary for public service” is a use
15 permitted in EFU zoned land subject to compliance with ORS 215.275. In order to demonstrate
16 that a facility is “necessary for public service” under ORS 215.275, an applicant must first
17 requires an evaluation of evaluate reasonable alternatives to determine whether the proposed
18 transmission line and its related or supporting facilities may be sited on land other than EFU-
19 zoned land. Then, following an evaluation of reasonable alternatives on non-EFU zoned land,
20 ORS 215.275 establishes a list of factors, of which one must be satisfied, that must be
21 considered to determine whether a utility facility is necessary for public service, and includes
22 standards related to mitigating the impact of the utility on farm uses and farm land.

23
24 Oregon case law was reviewed by both the applicant and the Department to determine
25 whether the Oregon Supreme Court or Land Use Board Appeals (LUBA) had made findings of
26 interpretation on the requirement to evaluate reasonable alternatives on non-EFU zoned land
27 under ORS 215.275. Two relevant cases were identified - Friends of Parrett Mountain v. Nw.
28 Natural Gas Co., 336 Or 93 (2003) and WKN Chopin, LLC v. Umatilla County, 66 Or LUBA 1
29 (2012). In the Friends of Parrett Mountain v. Nw. Natural Gas Co., 336 Or 93 (2003), the Oregon
30 Supreme Court determined that ORS 215.275 does not require a parcel by parcel analysis or
31 require an evaluation of every possible alternative route on non-EFU zoned land. In WKN
32 Chopin, LLC v. Umatilla County, 66 Or LUBA 1 (2012), LUBA determined that (ORS 215.275(2))
33 does not establish a requirement to compare various alternatives that would impact EFU zoned
34 land to determine which would have the least impact.

35
36 Therefore, supported by the above-referenced case law, tThe evaluation of “reasonable
37 alternatives” does not require an evaluation of all alternative EFU zoned routes on which the
38 proposed transmission line and its related or supporting facilities could be located. Rather, the
39 applicant must consider reasonable alternatives and show that the transmission line and its
40 related or supporting facilities must be sited on EFU-zoned land in order to provide the service.
41 The proposed facility is evaluated as a “utility facility necessary for public service.”

1 In ASC Exhibit K Section 4.1.1.4, *Non-EFU Alternatives*, the applicant describes consideration of
2 numerous alternative routes. The applicant conducted siting studies in 2010, 2012 and 2017, all
3 of which identified reasonable alternatives, but none that would be located entirely on non-EFU
4 zoned land (ASC Exhibit B Attachments B-1, B-2, and B-6). Based on review of the alternative
5 routes presented in ASC Exhibit B Attachment B-1, B-2 and B-6, the Department agrees with the
6 applicant's description ~~but~~ that unless the route were located almost entirely outside of the
7 state of Oregon, no route could avoid EFU zoned land entirely (displayed in ASC Exhibit K Figure
8 K-3).

9
10 Reasonable alternative routes on non-EFU zoned land is discussed in greater detail below under
11 the evaluation of the ORS 215.275(2)(b) and (c) factors for locational dependence and lack of
12 available non-resource lands.

13 14 *Technical and Engineering Feasibility*

15
16 ORS 215.275(2)(a) ~~requires-provides~~ that, ~~in order to site the proposed facility on EFU zoned~~
17 ~~land, the~~ the applicant may demonstrate that the proposed facility must be sited in an EFU
18 zone due to technical and engineering feasibility constraints. The Department interprets this
19 factor as requiring identification of specific technical reasons, such as extreme topographic
20 features, which cannot be overcome but for siting/engineering the proposed facility in EFU
21 zoned land.

22
23 In ASC Exhibit K, the applicant indicates that the need for siting the proposed facility in EFU-
24 zoned land was generally not driven by technical or engineering feasibility considerations, but
25 argues that the siting of communication stations, access roads, multi-use areas, pulling and
26 tensioning sites, and station distribution lines were based on technical and engineering
27 considerations.¹⁹⁷ Although the applicant argues that these features should be located on EFU
28 zoned land, due to required proximity to the proposed transmission line, the applicant has not
29 offered sufficient evidence or arguments that demonstrate the required transmission line must
30 be sited on EFU zoned land due to “technological and engineering feasibility” constraints. The
31 applicant did not provide examples or present a discussion of geophysical areas that would
32 present technical or engineering feasibility constraints; as such, the Department recommends
33 that the Council find that technical and engineering feasibility the applicant would not satisfy as
34 listed in ORS 215.275(2)(a) was not the primary factor for siting the proposed facility on EFU
35 zoned land.

36 37 *Locational Dependence*

38
39 ORS 215.275(2)(b) ~~requires-provides~~ that, ~~in order to site the proposed facility on EFU zoned~~
40 ~~land,~~ the applicant may demonstrate that the proposed facility must cross EFU zoned land to
41 achieve a reasonably direct route, and therefore is-considered locationally dependent.

¹⁹⁷ B2HAPPDco3-19 ASC 11 Exhibit K Land Use Section 4.1.2.1 2018-09-28.

1
2 In ASC Exhibit K, the applicant describes that, after consideration of siting constraints, the
3 proposed transmission route is “the most direct route” to interconnect the Hemingway
4 Substation to a proposed substation in Boardman, Oregon.¹⁹⁸ As demonstrated in ASC ~~Figure~~
5 ~~Exhibit~~ K Figure K-3, a large portion of the area between the two points of interconnection is
6 EFU zoned land, and the applicant explains in ASC Exhibit B that EFU lands cover approximately
7 77 percent of the seven-county study area in Oregon. Because large areas of EFU zoned lands
8 exist between the two points of interconnection, it would be impossible to construct the
9 proposed facility while avoiding all EFU zoned lands (with the exception that the transmission
10 line would be required to completely bypass Oregon and travel only within Washington and
11 Idaho states). Given that large areas of EFU zoned land exist between the two proposed
12 transmission endpoints, the Department agrees that there would be no reasonably direct route
13 that would allow the applicant to construct the transmission line while also avoiding all impacts
14 to EFU zoned land. As such, the Department recommends that the Council find the associated
15 transmission line is “locationally dependent” and therefore satisfies ORS 215.275(2)(b).

16 *Lack of Available Nonresource Lands*

17
18
19 ORS 215.275(2)(c) ~~requires-provides~~ that ~~, in order to site the proposed facility on EFU zoned~~
20 ~~land,~~ the applicant may demonstrate that the proposed facility must be sited on EFU zoned
21 land due to a lack of available urban and nonresource lands.

22
23 In ASC Exhibit K, the applicant describes that almost the entirety of the land between the two
24 transmission endpoints is “resource” land (i.e. Goal 3 agricultural lands and Goal 4 forest lands),
25 as presented in ASC Exhibit K Figure K-4, with only 1.2 percent of land within the study area
26 represents urban or nonresource lands. The Department agrees with the applicant’s review of
27 nonresource lands, which is limited to “reasonable proximity” to the proposed transmission
28 line. As such, the Department recommends that the Council find that the applicant has
29 demonstrated a “lack of available nonresource lands” for which to site the proposed facility and
30 therefore would satisfy ORS 215.275(2)(c).

31 *Availability of Existing Rights-of-Way*

32
33
34 ORS 215.275(2)(d) ~~requires-provides~~ that ~~, in order to site the proposed facility on EFU zoned~~
35 ~~land,~~ the applicant may demonstrate that the proposed facility must be sited in EFU zoned land
36 in order to utilize existing rights-of-way.

37
38 In ASC Exhibit K, the applicant notes that there was no existing right-of-way extending the
39 entire route between transmission endpoints in a “reasonably direct” route. The applicant
40 describes that it made “reasonable efforts” to locate to the proposed facility in or adjacent to
41 existing federal right-of-way utility corridors such as the BLM Vale District Utility Corridor, the

¹⁹⁸ B2HAPPDco3-19 ASC 11 Exhibit K Land Use Section 4.1.2.2 2018-09-28.

1 West-wide Energy Corridor, and the Wallowa-Whitman National Forest Utility Corridor; and,
2 further describes that the 35.1 miles of the proposed facility would be located in an existing
3 utility corridor. The applicant provides a map of “utility corridors” in ASC Exhibit K Figure K-5.
4

5 The Department acknowledges that the applicant proposed the route to utilize some available
6 rights-of-ways, and the proposed route follows an existing utility right-of-way for 35.1 miles.
7 Therefore, the Department recommends Council find that the proposed transmission line
8 would satisfy ORS 215.275(2)(d).
9

10 *Public Health and Safety*

11
12 ORS 215.275(21)(e) provides that ~~if~~ the applicant ~~can~~ may demonstrate that the proposed
13 facility must be sited in EFU zoned land due to specific health and safety reasons ~~that would~~
14 ~~require the siting of the utility facility on EFU zoned land, then the applicant meets its~~
15 ~~regulatory burden under the statute and may site the utility facility on EFU zoned land.~~
16

17 The applicant indicates that siting decisions were “generally not driven” by public health and
18 safety considerations but argues that “certain public health and safety considerations dictated
19 the need to site the multi-use areas in certain EFU lands” as discussed in Section 4.1.2.7. ASC
20 Exhibit K Section 4.1.2.7 relates to the proposed siting of communications stations, access
21 roads, multi-use areas, pulling and tensioning sites, and communication station distribution
22 lines. The applicant does not make a clear argument as to why the proposed transmission line
23 must be sited on EFU zoned land to respond to public health and safety issues; the mere reason
24 that a transmission line would not function without the previously listed related or supporting
25 facilities is not a sufficient “public health and safety” reason. As such, the Department
26 recommends that the Council find that public health and safety concerns in accordance with
27 ORS 215.275(2)€ were not the primary drivers for siting the proposed transmission line ~~is not~~
28 ~~required to be sited on EFU zoned land, to specifically respond to a public health or safety~~
29 ~~concern and therefore would not satisfy the criteria under ORS 215.275(21)(e).~~
30

31 *Other Requirements of State and Federal Agencies*

32
33 ORS 215.275(21)(f) provides that ~~if~~ the applicant ~~can~~ may demonstrate that the proposed
34 facility must be sited in EFU zoned land if there are specific requirements imposed by state or
35 federal agencies that would require the siting of the utility facility on EFU zoned land, ~~then the~~
36 ~~applicant meets its regulatory burden under the statute and may site the utility facility on EFU~~
37 ~~zoned land.~~
38

39 The applicant states that the proposed transmission line was not proposed on EFU zoned lands
40 due to state or federal requirements; however, the applicant indicates that it considered US
41 Fish and Wildlife Service preferences, EFSC protected areas, and environmentally sensitive

1 areas.¹⁹⁹ While the Department acknowledges that the applicant has proposed the transmission
2 line such that it would be consistent with the siting constraints imposed by these areas, and
3 that the applicant has attempted to utilize utility corridors, the applicant did not specifically
4 identify state or federal requirements other than the arguments already presented above in the
5 *locational dependence* and *lack of available nonresource lands* sections. As such, the
6 Department recommends that the Council find the proposed transmission line is not required
7 to be sited on EFU zoned land to comply with additional state or federal requirements and
8 therefore would not satisfy the criteria under ORS 215.275(~~2~~)(f).

9
10 ORS 215.275(2) Conclusion

11
12 As noted above, the applicant is required to meet one of the factors provided in subsection (~~2~~)
13 to demonstrate compliance with ORS 215.275. The Department recommends that the Council
14 find that the proposed facility is “locationally dependent” and that the applicant demonstrated
15 that there is a “lack of available urban or nonresource lands” for which to site the proposed
16 facility, and that siting was driven in part by the “availability of existing rights-of-way.”
17 Therefore, the Department recommends Council find that the proposed facility would satisfy
18 two of the factors set forth in subsection (~~2~~) and therefore demonstrates that the utility
19 facility must be sited on EFU zoned land.

20
21 *Costs*

22
23 Under ORS 215.275(3), cost may be a consideration associated with any of the factors listed in
24 subsection (2) but that it may not be the only consideration. As explained in ASC Exhibit B and
25 in the siting studies, the applicant considered numerous factors in determining the proposed
26 route. Consequently, based on the applicant’s analysis, the Department recommends that the
27 Council find that cost is not the only consideration associated with any of the ORS 215.275(2)
28 factors and the facility complies with ORS 215.275(3).

29
30 Restoration

31
32 ORS 215.275(4) provides that the owner of a utility facility shall be responsible for the
33 restoration of agricultural lands to their former condition. The applicant’s Agricultural
34 Mitigation Plan is discussed with the ORS 215.296 compliance section this section of the draft
35 proposed order; the applicant’s required facility retirement obligations are discussed in Section
36 IV.G., Retirement and Financial Assurance. The applicant is required to minimize impacts to
37 farming practices; the applicant must restore lands to a useful, nonhazardous condition and;
38 the applicant must maintain a bond or letter of credit in the unlikely scenario that a third party
39 would be required to decommission the facility and return lands to a pre-construction
40 condition. As such, the applicant has provided the relevant information and the conditions

¹⁹⁹ B2HAPPDoc3-19 ASC 11 Exhibit K Land Use Attachment K-1, Section 4.1.2.6. 2018-09-28.

1 contained within Section IV.G., Retirement and Financial Assurance would ensure that the
2 applicant restores agricultural lands.

3
4 ~~Under ORS 215.275(4), the owners of a utility facility must be responsible for restoring, as~~
5 ~~nearly as possible, to its former condition, any agricultural land and associated improvements~~
6 ~~that are damaged or otherwise disturbed. The applicant has prepared an Agricultural Lands~~
7 ~~Assessment (Attachment K-1 of this order), which describes the current agricultural uses within~~
8 ~~the analysis area and analyzes impacts of the proposed transmission line on those uses.~~ Most of
9 the impacts would be temporary; however, impacts on certain portions of agricultural crops
10 would extend through the life of the transmission line²⁰⁰ ASC Exhibit K, Table K-2 depicts the
11 acres of temporary and permanent impacts to agricultural lands, compared to the total acreage
12 of agricultural lands for each county.²⁰¹

13 The applicant further explains that, as proposed in the Agricultural Land Assessment, land used
14 during construction of the transmission line would be restored, as nearly as possible, to former
15 productivity. Where permissible, crop reestablishment and crop production would be expected
16 following construction. Structures (drainage systems, irrigation systems, fences, etc.) would be
17 repaired, or landowners would be compensated to make repairs. Damage to crops and other
18 crop losses due to construction of the transmission line would be assessed, and compensation
19 paid at fair market rates. Specific construction practices would be implemented to mitigate
20 construction impacts on soil productivity. A post-construction monitoring plan would identify
21 remaining soil and agricultural impacts associated with construction that require additional
22 mitigation. The applicant proposes to implement follow-up mitigation as necessary. The
23 department agrees that adherence to the construction plan and Agricultural Lands Assessment
24 would identify, minimize, and mitigate impacts to agricultural land. Specific measures to
25 minimize and mitigate agricultural impacts ~~in each County~~, and recommended conditions to
26 ensure compliance with those measures, are discussed below in the evaluation of compliance
27 with ~~each County's land use criteria~~ ORS 215.275(5). In addition, the applicant has provided
28 restoration plans in ASC Exhibit W, and the Department recommends conditions of approval to
29 ensure site restoration is completed consistent with the requirements of the Council's
30 standards.

31
32 *Clear and Objective Conditions to Mitigate Impacts on Surrounding Agricultural Land*

33
34 ORS 215.275(5) requires that the reviewing body impose clear and objective conditions of
35 approval on the application to mitigate the impacts of the proposed and alternative facility on
36 surrounding lands devoted to farm use in order to prevent a significant change in accepted
37 farm practices or a significant increase in the cost of farm practices on surrounding farmlands.
38 Based on the analysis and reasoning presented below, the Department recommends Council

²⁰⁰ B2HAPPDoc3-19 ASC 11 Exhibit K Land Use, page K-27. As explained in the Agricultural Lands Assessment, Attachment K-1, the applicant expects minimal disturbance to agricultural lands during operation of the transmission line. 2018-09-28.

²⁰¹ B2HAPPDoc3-19 ASC 11 Exhibit K Land Use P. K-28. 2018-09-28.

1 impose Land Use Condition 14, the Agricultural Assessment and Mitigation Plan, as the clear
2 and objective condition under ORS 215.275(5).

3
4 ~~ORS 215.296(1) requires that the local governing body or its designate (in this instance the~~
5 ~~Council) may approve a use permitted under ORS 215.283(2) only when it determines that the~~
6 ~~use: “(a) Will not force a significant change in accepted farm or forest practices on surrounding~~
7 ~~lands devoted to farm or forest use; and (b) Will not significantly increase the cost of accepted~~
8 ~~farm or forest practices on surrounding lands devoted to farm or forest use.”~~

9
10 ~~ORS 215.296, which is mirrored in applicable county zoning provisions presented in this order,~~
11 ~~establishes approval standards for all conditional uses within EFU-zoned land and requires the~~
12 ~~Council to find that the conditional use would not force a significant change in, or significantly~~
13 ~~increase the cost of, accepted farm or forest practices on surrounding lands. While there are~~
14 ~~forest practices employed on surrounding lands in Umatilla and Union counties, the underlying~~
15 ~~land use zone in these counties is Grazing Farm and Timber Grazing, respectively, and not EFU.~~
16 ~~Therefore, the analysis focuses on potential impacts to farm practices and the cost of farm~~
17 ~~practices on surrounding lands in EFU zone.~~

18
19 The applicant describes agricultural land as lands that are annually cultivated or rotated and
20 used in the production of crops; land in perennial field crops, orchards, or vineyards; land used
21 for small fruit, nursery crops, greenhouses, or Christmas trees; improved pasture/range and
22 hayfields; land in the CRP; and previously cultivated land in government-sponsored
23 environmental or conservation programs, not including land converted to wetlands. Cropland
24 includes all agricultural land except land used for pasture/range.

25
26 *Accepted Farm Practices on Surrounding Lands*

27
28 As provided in ASC Exhibit K Attachment K-1, the applicant assessed accepted farm practices
29 within and extending 500-feet of the site boundary (Agricultural Assessment Area) in EFU zoned
30 lands in Morrow, Umatilla, Union, Baker, and Malheur counties. The applicant’s methodology
31 for assessing accepted agricultural practices included mapping using aerial imagery from the
32 2014 and 2015 National Agriculture Imagery Program and 2016 Google Earth. Using aerial
33 imagery mapping, lands were then visually surveyed from public roads for confirmation of farm
34 practices. Customized data collection allowed for the recordation of field sites, crop types, and
35 irrigation practices. The applicant also, in 2011, conducted an online survey requesting
36 landowner feedback on agricultural practices; the applicant contacted 344 landowners of
37 parcels that would be crossed by the proposed facility. Of the 344 landowners contacted, 211
38 responded to the survey (61.3 percent). The survey data was compiled and separated into four
39 datasets including (1) individual parcels; (2) county boundaries; (3) field / land use boundaries
40 and (4) Agricultural Assessment Area. Additional information on the assessment methodology is
41 provided in ASC Exhibit K Attachment K-1 Sections 2.1 through 2.6.

42
43 Surrounding EFU zoned lands include both irrigated and non-irrigated agriculture. Accepted
44 farm practices within the analysis area include aerial spraying; field burning; crop production;

1 irrigation including center-pivot and wheel-line style mechanical center-pivot and GPS-operated
2 center-pivot irrigation; and livestock operations.

3 Most of the agricultural lands within the
4 Agricultural Assessment Area can be considered suitable for the production of field crops.
5 Accepted farm practices for establishing field crops include weed control; field preparation
6 including mowing or chopping using a plow, disc, field chisel, or harrow; seed bed preparation;
7 fertilization using ground-based equipment, a broadcast spreader, aerially, during seed
8 application, or by injection through irrigation lines; herbicide application; and, seeding or
9 planting using a seed drill of the crop. Field crops include a variety of different crop types, and
10 production techniques vary somewhat between each crop. Field crops include all plants grown
11 for agricultural purposes in cultivated fields but do not include orchards, Christmas trees,
12 vineyards, or nursery stock. The most common perennial field crops grown within the
13 Agricultural Assessment Area are field seed and grass seed crops (multiple types), wheat, and
14 alfalfa hay. Crops and uses within non-irrigated agriculture lands includes: rangeland; rangeland
15 timber; wheat; Conservation Reserve Program (CRP); fallow; road/transport ROW; pasture;
16 livestock; and, river/stream ROW.

17 Weeds, insects, plant diseases, and rodents are controlled as necessary with the use of
18 agricultural chemicals. Row crops are cultivated to remove weeds from between plant rows.
19 Additional fertilizer may be applied to increase crop production. Certain crops are
20 supplemented with irrigation water pumped from a well or nearby waterbody, generally
21 through an underground mainline. Sprinklers attached to the mainline deliver water to the
22 crops during dry summer growing periods. Sprinkler types vary by region and crop type, but the
23 most common types used within the Agricultural Assessment Area are center-pivot and side-
24 roll (wheel-line) lines. Center-pivot irrigation lines propel themselves automatically in a circular
25 pattern around the field and result in a round field (crop circle). Side-roll or wheel-line irrigation
26 systems are generally moved mechanically with the assistance of an operator. Other irrigation
27 methods used within the Agricultural Assessment Area are hose/pipe and sprinkler type, drip-
28 irrigation, and flood irrigation. Impacts to irrigated lands are discussed in Section 5.0, Potential
29 Impacts to Irrigated Lands.

30
31 Field crops are generally harvested from May to late fall, depending on the crop and annual
32 weather conditions. Certain crops, such as alfalfa hay, may be harvested several times during
33 the summer. Other field crops such as wheat, grass seed, and vegetables are harvested once
34 annually. Corn may be harvested as late as December or January depending on soil moisture
35 levels. Cereal grain crops, including wheat, oats, and barley, are harvested directly when the
36 grain is mature and are harvested from standing plants with a self-propelled field combine. In
37 eastern Oregon, wheat is most commonly planted in the fall and harvested in late summer to
38 early fall. Most dryland wheat fields are only farmed every other year, and the field is allowed
39 to lie fallow for one crop season between plantings to help increase soil moisture. Occasionally,
40 back-to back crops are grown when conditions or market demand are appropriate. Some
41 farmers use a “no-till” method where the field is sprayed with an herbicide following harvest.
42 Crop stubble is left on the field during periods when the field is fallow. This term is commonly
43 referred to as “chem-fallow.”
44

1 Grass seed is swathed into rows at maturity and allowed to dry until the seed is sufficiently dry
2 for safe storage. Self-propelled combines pick up the rows of cut plant material and separate
3 the seed from the straw. The harvested seed is transferred to a nearby truck and hauled to a
4 seed processing and storage facility. After harvest, the straw remaining in the field is baled or
5 burned, depending on seed type. Some grass seed fields are sanitized by propane flaming with
6 a propane-fueled burner that is pulled slowly over the field.

7
8 Forage crops such as alfalfa hay, grass hay, and silage are harvested at a time when forage
9 nutritional quality and crop yields are both relatively high. Hay crops are swathed by cutting the
10 plants close to ground level and placing the material into windrows. The windrows are allowed
11 to dry and then picked up and baled using a baling machine that is towed behind a tractor when
12 the crop is sufficiently dry. If moisture is high, windrows may be turned and fluffed using a hay
13 rake. If moisture levels become too low, baling may need to occur at night when dew is
14 present.

15
16 Bales are picked up mechanically or by hand and moved to a storage facility. After harvest,
17 alfalfa fields are usually irrigated to stimulate growth for the next cutting. Vegetable crops are
18 harvested at maturity by hand or with specialized mechanical equipment. Certain crops are
19 rotated with other crops on a regular basis to increase soil fertility and to prevent
20 establishment of certain pests and diseases. For instance, in potato cropping rotations, a crop
21 of mustard may be grown and incorporated into the soil to suppress nematodes, weeds,
22 and soil-borne fungal pathogens. Many farmers now use a GPS on farm equipment to increase
23 efficiency and to avoid over or under coverage of seed, herbicide, and other chemicals.

24
25 Crop types within irrigated agriculture land include: field crops; wheat; Christmas trees/woody
26 crops; alfalfa hay; fallow; and, irrigated pasture.²⁰² Specific agricultural practices for these crop
27 types is summarized below:

28
29 **Alfalfa hay:** the agricultural lands assessment indicates that application of herbicides are
30 generally only applied once per year. Otherwise, acceptable farm practices include
31 measures aimed to minimize leaf and root disease. These measures include removing
32 infested plant debris from farm equipment, mowing dry plants, rotating non-legume plants
33 for two or more years, and avoiding excessive irrigation.

34

²⁰² The applicant noted that some of the landowners have land currently under contract with U.S. Department of Agriculture reserve programs including the Farm Service Agency's CRP, Natural Resources Conservation Service Grassland Reserve Program, and the Wetland Reserve Program. These lands are not currently used for agriculture, but would potentially be converted to agricultural use in the future if not maintained under contract in reserve programs. The Food, Conservation and Energy Act limits the disclosure of information of individual landowners participating in the CRP program; using aerial imagery ranging from 1996 through 2014, the applicant determined whether lands underwent tilling, crop cycling, or harvest.

1 **Onions:** Onions are considered higher cost production because of its water requirements
2 and susceptibility to pests. Onions are generally harvested through the use of a harvesting
3 machine.

4
5 **Berries:** Berry crops include blueberries, strawberries, marionberries, blackberries, and
6 raspberries. Berry fields are “sometimes” fumigated to control pests.

7
8 **Canola:** Canola may be cultivated under dryland or irrigated conditions; seeds are planted
9 with a conventional grain drill and tilled into the field. Canola is generally planted in mid-
10 august or springtime.

11
12 **Livestock:** Cows are generally bred in late spring. During wintertime, pastures generally do
13 not provide adequate grazing and supplemental feed and shelter are often required. Sheep
14 are generally raised in pasture and bred in fall; lambs are born in the winter.

15
16 **Pasture / Rangeland:** some pastures are used annually, but soils that become excessively wet
17 or snow covered may be difficult to utilize. Pasture areas include areas of natural grass, seeded
18 grass, or grass and clover combinations. In eastern Oregon, livestock are generally allowed to
19 range freely across large tracts of land. In well managed pasture areas, livestock are allowed to
20 graze pasture plants to a certain height, and livestock are rotated between pastures to allow
21 plants to recover before the next grazing period.

22
23 *Potential Impacts to Accepted Farm Practices*

24
25 The applicant indicates that approximately 104 of the 993 parcels within the site boundary are
26 irrigated; 889 parcels are non-irrigated.²⁰³ Twenty-six of the proposed 1,461 towers are
27 proposed to be sited within an irrigated portion of an agricultural field. Potential impacts to
28 accepted farm practices within these parcels would primarily be temporary disturbance
29 resulting from construction activities, but would also result in permanent and indirect impacts.
30 The applicant describes indirect impacts as growth-inducing impacts such as changes in the
31 pattern of land use, population density or growth rate, and the related effects of those changes
32 on agriculture. As presented in ASC Exhibit K Attachment K-1 Tables 5-1 through 5-8, temporary
33 work sites and areas used during construction including multi-use areas, light duty fly yards,
34 pulling and tensioning sites, and structure work areas would temporarily disturb approximately
35 3,684 acres of agricultural land. Placement of transmission towers and access roads within
36 agricultural land would permanently disturb approximately 860 acres.²⁰⁴

203 B2HAPPDoc3-19 ASC 11 Exhibit K Land Use Attachment K-1 Agricultural Lands Assessment, p. 26. 2018-09-28

204 B2HAPP Attachment K-1 Agricultural Lands Assessment, Table 5-8. The Department notes that Table 5-8 presents 20 acres for the Longhorn Station. However, while the proposed Longhorn Station would be located in an area within existing agricultural use, the underlying land use designation is LI zone. The evaluation under ORS 215.283 and 215.275(5) ~~and 215.296~~ is specific to EFU and Agriculture-Grazing.

1 Direct temporary impacts to crops would occur during the construction phase. Direct
2 temporary impacts to field crops would arise from construction dust, damage to standing crops,
3 temporary access restrictions to farm equipment or livestock, temporary disruptions of
4 irrigation equipment, and disruptions to farm practices such as harvesting, field preparation,
5 spraying, and fertilization.

6

7 The presence of the transmission towers and transmission line is expected to result in an
8 increase in farming costs, which may be “one-time” costs as well as recurring costs. “One time”
9 costs depend on the crops grown and the month that construction begins in the relevant area.
10 Recurring costs will arise through loss of crops in tower footprint or access roads, as well as
11 from to added difficulty in traversing land around the towers. Furthermore, many crops such as
12 potatoes, onions, and corn require the use of large equipment; some equipment requires up to
13 40 feet on both ends to allow for ample maneuvering. Thus, some crops may be more difficult
14 to cultivate if they are located near transmission towers.²⁰⁵

15

16 Permanent direct impacts to crops would occur during the operations phase, although the
17 applicant represents that most types of agricultural operations would resume after
18 construction is complete. Although the applicant indicates that it does not expect transmission
19 towers to limit the type of field crops that may be cultivated directly below a tower, the
20 presence of transmission towers would result in some impacts to agricultural practices. For
21 instance, use of equipment taller than 15 feet would be restricted under transmission towers,
22 and field burning would not be allowed within the right-of-way. Additional permanent impacts
23 to agricultural land include the loss of farmable land dues to the presence of access roads or
24 transmission towers, loss of farmable acreage due to indirect impacts such as equipment
25 maneuverability, damage to drainage systems, a restricted range of irrigation systems, soil
26 erosion, distribution of noxious weeds, movement of soil-borne pathogens, vehicle dust,
27 restrictions on type of crop that may be farmed, safety issues, and yield loss due to water
28 restrictions. As described in Attachment K-1, construction would affect livestock access to
29 certain areas of the property, helicopter use could damage crops, noise levels could impact
30 livestock, and destructive plant diseases or insect outbreaks may affect the aerial application of
31 chemicals. Some of these impacts are discussed in further detail below.

32

33 The aerial application of chemicals through helicopter or airplane use would be affected by the
34 proposed facility. Some crops require the application of chemicals five to six times per year; the
35 applicant indicates that transmission towers would affect areas directly beneath the
36 transmission line, and may affect other areas of agricultural property depending on factors such
37 as tower orientation and wind direction. Specifically, aerial application of chemicals may be
38 useful to avoid soil damage if the soils are wet, or if crops are close to maturity and the use of
39 heavy equipment could damage crop quality. In an effort to reduce risk to aerial applicators,
40 the applicant represents that guy wires would not be attached to transmission towers.
41 Nevertheless, a “safe distance” between the aircraft and transmission towers must be

²⁰⁵ B2HAPPDoc3-19 ASC 11 Exhibit K Land Use Attachment K-1 Agricultural Lands Assessment, p. 34. 2018-09-28.

1 maintained, which may result in “less than optimal” coverage or application rate. Increased
2 costs could arise from its reduced ability to utilize aerial applications, which include costs
3 associated with acquiring specialized equipment, chemicals, and increased labor costs. The
4 applicant represents that the project would not meaningfully impact drone use.

5
6 Although the applicant represents that field burning of grass seed crops has declined during the
7 past two decades, it acknowledges that field burning has served purposes such as to clear crop
8 residue remaining after harvest, control disease and weeds, stimulate yield, and to recycle
9 nutrients into the soil. The applicant states that field burning would not be allowed within a 150
10 foot wide strip directly beneath the lines, so as to protect the lines and to reduce the possibility
11 that smoke would impact the lines. The applicant acknowledges that the presence of
12 transmission lines increases the cost of burning, and that “no-burn” areas are not as
13 productive.²⁰⁶ The applicant represents that no suitable alternative to burning exists
14 (specifically, in relation to grass seed agriculture), and that some landowners have preferred to
15 switch crops in affected areas.

16
17 The applicant indicates that the presence of transmission towers would affect mechanical
18 irrigation, and the severity of impacts would depend on the type of irrigation system that is
19 utilized. Production costs increase as farmers are required to divert equipment around
20 structures or make additional passes; some landowners may choose to skip irrigating some
21 acreage. Circular pivot irrigation is designed to complete an entire circle on a “permanent
22 basis;” application imbalance may occur if a transmission line is placed within a crop circle. The
23 placement of a transmission tower within a center-pivot style irrigated system would require
24 the irrigation line to stop and reverse direction when it reaches the tower, which results in a
25 “pie shaped” wedge that is not farmable. Figure 5-2 of Attachment K-1 (displayed at right)
26 shows an aerial photograph of the reduced farmable acreage if a transmission line is sited
27 within an irrigated circle. If a tower is placed within an area that is irrigated through a “wheel-
28 line” system, then the irrigation line must be partially disassembled, moved around the tower,
29 and reassembled for continued operation.

30
31 The applicant attests that “extraordinary effort” was utilized in proposing transmission towers
32 that would avoid irrigated areas. A review of the maps provided within Attachment K-1 confirm
33 that many towers are proposed at the edge of irrigated areas, in an effort to reduce impacts to
34 irrigation techniques. Maps 1 and 2 (portions displayed below) of Attachment K-2 demonstrate
35 how the proposed placement of tower would reduce agricultural impact.

36
37 *Potential Mitigation Measures to Reduce Impacts to, and Costs of, Accepted Farm*
38 *Practices*

39
40 As noted above, the applicant’s proposed route attempts to minimize impacts to irrigation
41 equipment, and the applicant has attempted to site towers along agricultural field boundaries

²⁰⁶ B2HAPPDoc3-19 ASC 11 Exhibit K Land Use Attachment K-1 Agricultural Lands Assessment, p. 24. 2018-09-28

1 when feasible. The applicant would negotiate with landowners to ameliorate impacts relating
2 to the placement of a transmission tower; when the preliminary design is complete,
3 landowners will have an opportunity to review the proposed tower locations. Landowners
4 would be consulted relating to the timing of the construction schedule, which would allow
5 landowners to alter crop practices to minimize the potential to soil damage. Landowners would
6 likewise be consulted relating to the use of helicopters, and the applicant would minimize
7 helicopter use in areas where tall crops are sensitive to rotor blow, and the applicant would site
8 fly yards in areas free from tall agricultural crops.

9
10 The applicant conducted a literature review to support its evaluation of the potential for the
11 proposed facility to interfere with GPS-operated agricultural equipment, such as GPS-operated
12 pivot irrigation system. Based on its literature review, the applicant confirms that a
13 transmission line and its structures could theoretically contribute to signal interference and
14 multipath.²⁰⁷ However, a study commissioned by the Electric Power Research Institute (EPRI)
15 found that signal interference is “unlikely” based on the design of GPS receivers and their ability
16 to separate the GPS signal from background noise (Silva and Olsen 2002). Another study
17 compared the accuracy of real-time kinematic GPS receivers at different locations to
18 transmission lines and towers (Gibblings et al. 2001). This study concluded that multipath from
19 transmission towers could result in GPS-initialization errors (e.g., the system reports the wrong
20 starting location) 1.1 percent to 2.3 percent of the time. This study also reported that GPS
21 software was able to identify and correct these initialization errors within the normal startup
22 time. This study reported initialization errors due to electromagnetic interference from
23 energized overhead transmission lines when the GPS receiver was located outside the vehicle
24 but concluded that “most, if not all of this effect can be eliminated by shielding the receiver and
25 cables.” Placing the receiver inside the vehicle significantly reduced initialization errors. In
26 responses to comments raised on the record of the DPO, the applicant commits to mitigate any
27 potential impacts to pivot-irrigation equipment through landowner consultation and agreement
28 to avoid, minimize or mitigate any impact. This representation has been incorporated into
29 Section 7.3.10 of the Agricultural Assessment and Mitigation Plan (Attachment K-2 of this
30 order).

31
32 The placement of towers could also damage agricultural drainage tiles, which are used to
33 control the water table to ensure that crops are not saturated in water. The applicant would
34 probe subsurface areas to determine the location of drainage tiles and would repair damage
35 that occurs to tiles from the probe. Likewise, any tiles damaged from construction related
36 activities would be repaired. The landowner may also repair drainage tiles, and the applicant
37 would provide a negotiated settlement to the landowner. Additionally, the applicant would

²⁰⁷ B2HAPPDoc8-1 All DPO Comments Combined-Rec'd 2019-05-22 to 08-22; B2HAPPDoc8-131 DPO Public Comment Foss
2019-06-18 to 08-21; Proesch, T. On the record of the draft proposed order, Mr. Foss expressed concern regarding
potential impacts from the proposed transmission line to a GPS-operated irrigation pivot system.
B2HAPPDoc13. B2HAPP DPO IPC Responses - Agricultural 2019-11-06. In response to this issue, the applicant provided an
evaluation of potential impacts from the transmission line to GPS-operated irrigation systems, based on a literature
review, as incorporated in this section of the proposed order.

1 restrict the operation of vehicles and heavy equipment to minimize deep rutting, which could
2 damage tiles.

3
4 Relating to soils, the applicant represents that agricultural land that is compacted by
5 construction equipment will be restored to its original condition using tillage equipment; rutted
6 land will be restored to its pre-construction condition as practicable. Topsoil removed would be
7 stored separately, and replaced after the cessation of construction. Otherwise, the applicant
8 must comply with reseeding efforts described in the Vegetation Management Plan in Exhibit P
9 of the ASC; must control excessive dust and; must implement stormwater and erosion control
10 best management practices. To reduce potential impacts from construction-related erosion,
11 the applicant would be required to implement the following measures, as presented in Section
12 7.3.17 of the Agricultural Assessment and Mitigation Plan (Attachment K-1 of this order):

- 13 • Implement erosion prevention and sediment control;
- 14 • Coordinate with the local Natural Resources Conservation Service soil conservation experts;
- 15 • Reseed and mulch non-cultivated agricultural land such as pastures and perennial grass
16 hayfields in consultation with landowners, or will make arrangements with landowners who
17 prefer to conduct the reseeding of these areas.
- 18 • Follow best management practices set forth in approved stormwater and erosion control
19 plans for the Project, which may include applying temporary mulch in the event of a
20 seasonal shutdown, if construction or restoration activity is interrupted or delayed for an
21 extended period, or if permanent seeding of non-cultivated areas is not completed during
22 the recommended seeding period prior to the winter season. Temporary straw mulch may
23 be applied to bare soil surfaces, including topsoil piles, at the rate of 4,000 pounds per acre.
24 Interim seeding of a cover crop may be used in lieu of temporary mulching in some areas.
- 25 • Work with the landowner or landowner's designee to prevent erosion on cultivated
26 agricultural lands in instances where the area disturbed by construction cannot be planted
27 before the first winter season;
- 28 • Excess soil and rock will be disposed of at an approved upland site within the Project
29 construction site. IPC and the landowner may negotiate placement of fill material on site
30 (within the Project construction site) on a case-by-case basis.

31
32 Relating to weed control, the applicant will assume responsibility for weed control in areas
33 where it maintains control of the land, such as areas that contain towers, access roads, or
34 substations. Herbicide application will be conducted through a state licensed contractor. To
35 prevent the introduction of new weeds, contractors must clean construction equipment with
36 high-pressure washing equipment prior to moving the equipment to the construction.
37 Otherwise, equipment would be cleaned periodically. As presented in Attachment P1-5 of this
38 order, the applicant proposes to implement a Noxious Weed Plan, to apply prior to and during
39 construction, and operation. The components of the Noxious Weed Plan are described in
40 Section IV.H.1. General Fish and Wildlife Habitat Mitigation; in summary, the plan requires that
41 the applicant or its contractor develop a preconstruction noxious weed inventory; apply
42 treatment; implement preventative measures (vehicle cleaning, flagging and access restrictions

1 in infestation areas; soil management; reclamation; and materials management); monitoring
2 and reporting.

3
4 If construction activities impact a spray irrigation system, the applicant would determine an
5 acceptable amount of time that a spray system service may be interrupted (after discussions
6 with the landowner); the maximum amount of time that construction would interrupt an
7 irrigation system would be 24 hours unless otherwise agreed upon by the landowner.
8 Temporary measures will be implemented to allow for the partial use of an irrigation system
9 during construction operations. Damaged irrigation lines would be repaired by the applicant.
10 Lastly, the applicant represents that it would reach an agreement with the relevant landowner
11 relating to preferred ingress and egress routes, as well as an agreement relating to the final
12 location of temporary roads used for construction. Efforts will be made to maximize the use of
13 existing roadways and farm lanes. Based on the evaluation presented in ASC Exhibit K and
14 reasoning and analysis presented in this order, and compliance with recommended Land Use
15 Condition 14, the Department recommends Council find that the proposed facility would not
16 result in significant adverse impacts to accepted farm practices nor result in a significant
17 increase in the cost of accepted farm practices within the surrounding area and therefore
18 would satisfy the requirements of ORS 215.~~275(5)296~~.

19
20 The proposed facility could result in fragmentation of existing agricultural parcels. The applicant
21 commits to working with landowners to assess potential economic impacts of agricultural land
22 fragmentation from proposed facility siting. As presented in ASC Exhibit K Attachment K-1
23 Section 6.4, in assessing the economic impact on a specific property, components include but
24 are not limited to annual costs including the fixed costs, lost profit, and weed control in the
25 tower footprint area plus the duplication of operations for the extra costs of farming around
26 the tower or towers, annual per-acre costs for land taken out of production other than that in
27 the tower footprint area, including land unable to be irrigated because of field obstructions,
28 and the costs of reorganizing irrigation systems, including increased labor requirements. The
29 Agricultural Assessment and Mitigation Plan Section 8.0 establishes procedures for determining
30 construction-related damages and for providing landowner compensation. Section 8 of the plan
31 does not address the valuation process described above. Because the applicant commits to
32 working with landowners of potentially fragmented agricultural parcels and providing
33 compensation based on the above-described valuation, the Department incorporated the
34 applicant's representations into Section 8.0 of the plan.²⁰⁸

35
36 The Agricultural Lands Assessment proposes specific measures to avoid, mitigate, and minimize
37 impacts to agricultural practices and uses on lands within the site boundary. These measures
38 are based upon the assessment of all agricultural crops and practices on lands within the
39 analysis area of the Agricultural Lands Assessment and are similar to the restoration measures
40 described above. The Department agrees that compliance with these measures would “prevent
41 a significant change in accepted farm practices or increase in the cost of farm practices on

²⁰⁸ B2HAPP DPO Applicant Response – ODOE Comments – Various Public Comments – Agricultural 2019-11-06.

1 surrounding farmlands” as required under ORS 215.275(5). To ensure compliance with the
2 Agricultural Lands Assessment, the applicant proposes and the Department recommends that
3 the Council adopt the following site certificate condition:
4

5 **Recommended Land Use Condition 14:** The certificate holder shall:

- 6 a. Prior to construction of any phase or segment of the facility, ~~the certificate holder in~~
7 ~~accordance with the OAR 345-025-0016 agency consultation process outlined in the~~
8 ~~draft Agriculture Assessment and Mitigation Plan (Attachment K-1 of the Final Order on~~
9 ~~the ASC),~~ submit to the Department a final Agricultural Assessment and Mitigation Plan
10 ~~(based on the draft plan included as Attachment K-1 of the Final Order on the ASC) for~~
11 ~~review and approval, in consultation with Morrow, Umatilla, Union, Baker and Malheur~~
12 ~~counties.~~
13 b. During construction and operation of any phase or segment of the facility, the certificate
14 holder shall implement the Agricultural Mitigation Plan as finalized per sub(a) of this
15 condition mitigation, monitoring and reporting measures as detailed in the final
16 Agricultural Assessment and Mitigation Plan.
17 ~~b.c.~~ During operation, implement a post-construction monitoring plan to identify any
18 remaining soil and agricultural impacts associated with construction that require
19 additional restoration or mitigation, in accordance with Section 7.0 of the Agricultural
20 Mitigation Plan, Attachment K-1 of the Final Order on the ASC.

21
22 ~~ORS 215.296 states:~~

23
24 ~~A use allowed under ORS 215.213 (Uses permitted in exclusive farm use zones in counties~~
25 ~~that adopted marginal lands system prior to 1993) (2) or (11) or 215.283 (Uses permitted in~~
26 ~~exclusive farm use zones in nonmarginal lands counties) (2) or (4) may be approved only~~
27 ~~where the local governing body or its designee finds that the use will not:~~

- 28
29 ~~i. Force a significant change in accepted farm or forest practices on surrounding lands~~
30 ~~devoted to farm or forest use; and~~
31 ~~ii. Significantly increase the cost of accepted farm or forest practices on surrounding lands~~
32 ~~devoted to farm or forest use.”~~

33
34 IV.E.2.2. ORS 215.276 (High Value Farmland Requirements)

35
36 ORS 215.276 states:

37
38 (1) As used in this section:

39 (a) “Consult” means to make an effort to contact for purpose of notifying the record
40 owner of the opportunity to meet.

41 (b) “High-value farmland” has the meaning given that term in ORS 195.300.

42 (c) “Transmission line” means a linear utility facility by which a utility provider transfers
43 the utility product in bulk from a point of origin or generation, or between transfer
44 stations, to the point at which the utility product is transferred to distribution lines

1 for delivery to end users.

2 (2) If the criteria described in ORS 215.275 for siting a utility facility on land zoned for
3 exclusive farm use are met for a utility facility that is a transmission line, or if the criteria
4 described in ORS 215.274 for siting an associated transmission line are met, the utility
5 provider shall, after the route is approved by the siting authorities and before
6 construction of the transmission line begins, consult the record owner of high-value
7 farmland in the planned route for the purpose of locating and constructing the
8 transmission line in a manner that minimizes the impact on farming operations on high-
9 value farmland. If the record owner does not respond within two weeks after the first
10 documented effort to consult the record owner, the utility provider shall notify the record
11 owner by certified mail of the opportunity to consult. If the record owner does not
12 respond within two weeks after the certified mail is sent, the utility provider has satisfied
13 the provider's obligation to consult.

14 (3) The requirement to consult under this section is in addition to and not in lieu of any other
15 legally required consultation process.

16
17 ORS 215.276 requires that, for transmission lines considered a utility facility necessary for
18 public service under ORS 215.275, the utility provider (or certificate holder) consult with record-
19 owners of high value farmland prior to construction to locate and construct the transmission
20 line in a manner that minimizes impacts on high-value farmland operations. In ASC Exhibit K
21 Attachment K-1 Agricultural Land Assessment , the applicant includes a draft Agricultural
22 Mitigation Plan. In the draft Agricultural Mitigation Plan, Section 7.2 General Provisions
23 establishes that the applicant would approach, coordinate and notify landowners in effort to
24 minimize and mitigate potential agricultural impacts.

25
26 ORS 215.276 is specific to landowners of high value farmland agriculture and requires that the
27 utility provider issue a notification of an opportunity to consult via certified mail, if after two
28 weeks of the initial notification, the landowner has not responded. Because this specificity was
29 not included in the draft mitigation plan, the Department recommends specific language be
30 incorporated into Section 7.2 to address ORS 215.276 notification requirements, as presented
31 below:

- 32 • Prior to construction, the applicant shall provide notification to the record
33 owner of any agricultural lands containing high-value farmland, as defined in
34 ORS 195.300(10), of the opportunity to consult with IPC for the purpose of
35 locating and constructing the transmission line in a manner that minimizes
36 impacts to high-value farmland farming operations.
 - 37 ○ The initial notification to the record owner shall allow two weeks to
38 respond to the opportunity to consult with applicant. If the record owner
39 does not respond to applicant within two weeks of the initial notification,
40 applicant shall provide a second notification of the opportunity to consult
41 with applicant via certified mail. If the record owner does not respond
42 within two weeks of the second notification, applicant will have satisfied
43 its obligation to consult pursuant to ORS 215.276(2).
 - 44 ○ Applicant shall establish the notification list using georeferenced maps

1 containing property owner taxlot information, obtained from the most
2 recent county tax assessor roll, and ORS 195.300(10) high value farmland
3 as mapped based on available state and local data sources.

- 4 ○ Applicant shall maintain the georeferenced map and notification list,
5 including a list of record owners that completed consultation and record
6 owners that failed to respond.

7
8 The Department recommends Council find that based upon inclusion of the above-referenced
9 process as a requirement in the draft Agricultural Assessment and Mitigation Plan (Attachment
10 K-1 of this order, imposed in recommended Land Use Condition 14), the applicant would satisfy
11 the requirements of ORS 215.276.

12
13 IV.E.2. ~~32. ORS 772.210 and~~ OAR 660-006-0025 (Forest Zone Requirements)

14
15 The Oregon Land Conservation and Development Department (LCDC) implemented rules in
16 OAR 660 Division 6 which apply to proposed uses within forest zones. In circumstances where a
17 county has not adopted LCDC rules into applicable code provisions, the LCDC rules apply
18 directly. Authorized uses and conditional requirements pursuant to OAR 660 Division 6 are
19 presented below.

20
21 OAR 660-006-0025(4): Uses Authorized in Forest Zones

22
23 *The following uses may be allowed on forest lands subject to the review standards in section*
24 *(5) of this rule: . . .*

25
26 *(q) New electric transmission lines with right of way widths of up to 100 feet as specified in*
27 *ORS 772.210. . . .*

28
29 OAR 660-006-0025(4)(q) establishes conditional uses authorized in forest zoned lands and
30 includes new electric transmission lines with right-of-way widths up to 100 feet as specified in
31 ORS 772.210, which is a statute establishing condemnation rights for transmission lines in forest
32 lands. OAR 660-006-0025(4)(q) and ORS 772.210 must be evaluated together and interpreted
33 consistently.

34
35 OAR 660-006-0025(4)(q) references transmission lines within a 100-foot right-of-way as a
36 conditional use authorized in forest zoned land. ~~ORS 772.210 establishes provides: that for~~
37 ~~new transmission lines with voltage rated at 330 kV or above, an applicant has condemnation~~
38 ~~rights on lands not to exceed 300 feet in width [Emphasis added]. ORS 772.210 then establishes~~
39 ~~that, for lands not exceeding 100 feet on either side of the 100 foot corridor, condemnation is~~
40 ~~limited to trees.~~

- 41
42 *(1) Any public utility, electrical cooperative association or transmission company may:*
43 *(b) Condemn such lands not exceeding 100 feet in width for its lines (including poles,*
44 *towers, wires, supports and necessary equipment therefor) and in addition thereto,*

1 other lands necessary and convenient for the purpose of construction of service
2 facilities. If the lands are covered by trees that are liable to fall and constitute a
3 hazard to its wire or line, any public utility or transmission company organized for
4 the purpose of building, maintaining and operating a line of poles and wires for the
5 transmission of electricity for lighting or power purposes may condemn such trees for
6 a width not exceeding 300 feet, as may be necessary or convenient for such purpose.
7 (2) Notwithstanding subsection (1) of this section, any public utility, electrical
8 cooperative association or transmission company may, when necessary or
9 convenient for transmission lines (including poles, towers, wires, supports and
10 necessary equipment therefor) designed for voltages in excess of 330,000 volts,
11 condemn land not to exceed 300 feet in width. In addition, if the lands are covered by
12 trees that are liable to fall and constitute a hazard to its wire or line, such public
13 utility or transmission company may condemn such trees for a width not exceeding
14 100 feet on either side of the condemned land, as may be necessary or convenient for
15 such purpose.
16

17 The Department recommends Council find that rule and statute authorize condemnation of a
18 transmission line corridor not to exceed 300-feet, but that proposed facility structures are
19 limited to a 100-foot right-of-way, and that the additional area within the right-of-way corridor
20 (100-feet on either side of the transmission line right-of-way) is limited to vegetative
21 maintenance.
22

23 The applicant first argues that interpretation of rule and statute authorizes a right-of-way width
24 of 500-feet (300-feet for structures, plus 100-feet on either side for vegetative maintenance),
25 and then secondarily argues that rule and statute authorize a right-of-way width of 300-feet
26 (100-feet for transmission line structures, plus 100-feet on either side for vegetative
27 maintenance but with no limitation on placement of potential non-transmission line structures
28 (e.g. roads, laydown areas)), which based on the above interpretation, the Department
29 disagrees.
30

31 Nonetheless, the applicant proposes a 500 kV transmission line within a 300-foot right-of-way,
32 mostly consistent with the Department's interpretation, but suggests that the 100-feet on
33 either side of the transmission line right-of-way not be limited to vegetative maintenance,
34 which the Department disagrees. Based on recommended Land Use Condition 15 below, the
35 Department recommends Council find that the proposed facility would qualify as a conditional
36 use in forest zoned lands under OAR 660-006-0025(4)(q):
37

38 **Recommended Land Use Condition 15:** The certificate holder shall limit its transmission line
39 right-of-way in Goal 4 forest lands to no wider than 300 feet.

- 40 d. During construction, the certificate holder shall limit its use of the portion of the
41 transmission line right-of-way located beyond the center 100 feet to vegetation
42 maintenance activities.

- 1 e. During operation, the certificate holder shall limit its use of the portion of the
2 transmission line right-of-way located beyond the center 100 feet to vegetation
3 maintenance activities.
4

5 The applicable conditional use requirements pursuant to OAR 660-006-0025(5) are evaluated
6 below.
7

8 OAR 660-006-0025(5): Uses Authorized in Forest Zones
9

10 *A use authorized by section (4) of this rule may be allowed provided the following*
11 *requirements or their equivalent are met. These requirements are designed to make the use*
12 *compatible with forest operations and agriculture and to conserve values found on forest*
13 *lands:*
14

- 15 *(a) The proposed use will not force a significant change in, or significantly increase the cost of,*
16 *accepted farming or forest practices on agriculture or forest lands;*
17

18 OAR 660-006-0025(5)(a) establishes requirements for conditional uses authorized in forest
19 zoned land and requires the Council to find that the proposed use will not force a significant
20 change or significantly increase the cost of accepted farming or forest practices on agriculture
21 or forest lands.²⁰⁹
22

23 To identify accepted farm and forest practices within surrounding agriculture or forested lands
24 areas within forest-zoned lands, the established a "Forested Lands Analysis Area" based on a
25 250-foot corridor for the proposed transmission line route and a 30-foot corridor for new
26 roads. Using the Forested Lands Analysis Area, the applicant reviewed aerial photos from the
27 2013 National Agriculture Imagery Program (NAIP), conducted a ground survey, and mailed
28 surveys to landowners of parcels in forest-zoned land that would be crossed by the proposed
29 facility. the owners of the forested parcels within the analysis area. Of the 60 landowners of
30 parcels that contain forest land, 19 responded; the applicant reviewed the responses to confirm
31 the results of field surveys and GIS imagery surveys.
32

33 As presented in ASC Exhibit K Attachment K-1, the applicant analyzed potential impacts from
34 proposed facility construction and operation on all Goal 3 (agriculture) and Goal 4 (forest)
35 lands, including rangeland. (See the Agricultural Assessment, Exhibit K, Attachment K-1 for
36 detailed analysis of impacts on Goal 3 lands and Attachment K-2 for a detailed analysis of
37 potential impacts on forest lands). Both local governing bodies within the forested portion of
38 the proposed facility, Umatilla County and Union County, have established agriculture/forest
39 zones. In Umatilla County, the zone is called the Grazing-Farm zone, and in Union County, the

²⁰⁹ OAR 660-006-0025(5)(a) also requires a finding that the proposed use would not force a significant change in accepted farm practices on adjacent lands used for agriculture, which is addressed under the ORS 215.275(5)296 evaluation of this order.

1 zone is called the Timber-Grazing zone. As explained further in Exhibit K (sections 6.5.2.2 and
2 6.6.2.3), for hybrid agricultural/forest zones, the applicant worked closely with the Umatilla
3 County Planning Department and Union County Planning Department to determine the
4 predominant use of the parcels in the applicable agriculture/forest zones and analyzed the
5 potential impacts of the proposed facility.

6
7 In Umatilla County, the Grazing/Farm (GF) Zone is a hybrid farm-forest zone that includes
8 agricultural land, rangeland, and forest land. The Umatilla County Development Code does not
9 specify an approach for determining whether a particular parcel zoned GF is Goal 3 or Goal 4
10 land. Consistent with Umatilla County Planning Department policy, therefore, county planning
11 staff reviewed aerial photographs and determined that the land within the site boundary in the
12 GF Zone is all forested Goal 4 land. Accordingly, in Umatilla County, the applicant classified all
13 “hybrid” zone land within the analysis area as forest land. All land that could potentially be
14 designated as forest land in the analysis area was analyzed.

15
16 In Union County, the Timber-Grazing Zone is a hybrid zone and includes both farm and forest
17 uses. The applicant worked closely with Union County to determine the predominant use on
18 each of the 61 parcels that are crossed by the site boundary that are located wholly or partially
19 within the Timber-Grazing Zone. In order to determine the predominant use on each parcel,
20 data from the Natural Resources Conservation Service (NRCS) Soil Survey Geographic Database
21 (SSURGO) was used along with the Union County tax lot data (parcel data). GIS mapping
22 software was used to determine which SSURGO soil type comprised the most acres within each
23 parcel. Accordingly, the analysis considered NRCS soil data when classifying land as either range
24 or forest. Union County provided the applicant with a table listing the SSURGO soil types found
25 throughout Union County and the corresponding predominant use value for each soil type. This
26 analysis resulted in a preliminary predominant use value for each parcel within the site
27 boundary based on SSURGO soils data. Union County then reviewed each parcel’s initial
28 predominant use value against 2011 aerial photography and tax lot records and adjusted the
29 predominant use to reflect current land use. In the Timber-Grazing zone, none of the parcels
30 involved in the analysis had their initial predominant use value adjusted through the Union
31 County review process. However, SSURGO data for 18 of the total 61 parcels was not available
32 and therefore the above analysis could not be performed. These 18 parcels are located in the
33 vicinity of the National Forest and were determined to have a predominant use of forest.
34 Accordingly, the applicant’s analysis of forest lands in Union County includes an analysis of
35 NRCS soil data, and to the extent the data was not available, made conservative assumptions
36 that the land should be classified as forest land.

37
38 Based on the above-described approach, and record of consultation with Union and Umatilla
39 Planning Departments to accurately identify and account for forest zoned lands within the
40 analysis area, the Department recommends Council find that the methods are valid for
41 assessing potential impacts to forest practices.

1 Potential Impacts to Accepted, and the Cost of Accepted, Farm/Forest Practices

2
3 As presented in the ASC, the applicant identifies that accepted farm practices in forest-zoned
4 lands within Union and Umatilla counties include range and pasture uses, exclusively. Potential
5 impacts from proposed facility construction and operation to these accepted farm practices
6 include temporary and permanent disturbance, changes in land use patterns, population
7 density or growth rate, and the related effects of those changes on agriculture.

8
9 As presented in the ASC, the applicant identifies that accepted forest practices in forest-zoned
10 lands within Union and Umatilla counties ~~within surrounding lands~~ include long-term forest
11 management for sawtimber, pole-sized trees, and reproduction. Potential impacts to these
12 accepted forest practices from right-of-way clearing; road construction, repair and use; and,
13 slash abatement during proposed facility construction include: increased operating risk to
14 future timber harvesting within a tree length of the proposed transmission line; loss in tree
15 volume along the edges of the transmission line corridor; increased wildlife risk; increased risk
16 of unauthorized use of land due to increased access from new roads (see Attachment K-2,
17 Section 3.6.1). In some areas, the transmission line may separate blocks of forest land, which
18 has the potential to impact access or the ability of landowners to perform forest practices. The
19 results of this analysis identified that approximately 245.6 acres and 530 acres, totaling 776
20 acres, of forested lands within Umatilla and Union counties, respectively, could be permanently
21 impacted by the proposed facility.

22
23 Based on the removal of approximately 776 acres of land from timber harvest production, the
24 applicant quantifies the estimated harvest value to then assess potential economic impacts
25 from the proposed facility. Potential impacts to the cost of accepted forest practices is then
26 based on the economic impact of the proposed facility. The applicant identifies the following
27 facts, obtained from a 2013 report issued by the Oregon Forest Resources Institute, to support
28 the analysis:²¹⁰

- 29
30
 - Union County # Forested Acres = 899,000 acres
 - Value of Forestland Economic Base = \$163,700,000
 - Value of Economic Base = \$182/acre
 - 530 acres lost x \$182/acre = \$97,000 lost plus or minus

 - Umatilla County # Forested Acres = 715,000 acres
 - Value of Forestland Economic Base = \$354,200,000
 - Value of Economic Base = \$495/acre
 - 246 acres lost x \$495/acre = \$120,000 plus or minus

31
32
33
34
35
36
37
38
39

²¹⁰ Based on the Department's website review, Oregon Forest Resources Institute is an educational organization created in
1991 by Oregon Legislature, to advance public understanding of forests, forest management and forest products.
Available at: <https://oregonforests.org/>.

1 The preliminary ASC was submitted in 2013, aligning with the reference date of the Oregon
2 Forest Resources Institute information source. However, due to the extended time interval
3 (2013 – 2020) of the ASC review, the Department was not able to locate an electronic version of
4 the referenced 2013 information source. Based on the Department’s review, electronic
5 information available from the Oregon Forest Resources Institute provides the following 2017
6 facts (see source references in footnotes):

- 7
- 8 • Union County # Forested Acres = 791,000 acres²¹¹
 - 9 ○ Value of Forestland Economic Base = \$317,500,000²¹²
 - 10 ○ Value of Economic Base = \$401/acre
 - 11 ○ 530 acres lost x \$401/acre = \$212,530/yr economic loss
 - 12 ○ \$212,530/yr x 100 yrs = \$21.3 million economic loss, over 100 years
 - 13
- 14 • Umatilla County # Forested Acres = 572,000 acres²¹³
 - 15 ○ Value of Forestland Economic Base = \$220,100,000²¹⁴
 - 16 ○ Value of Economic Base = \$385/acre
 - 17 ○ 246 acres lost x \$385/acre = \$94,710/yr economic loss
 - 18 ○ \$94,710/yr x 100 years = \$9.5 million economic loss, over 100 years
 - 19

20 Based on the Department’s evaluation of Oregon Forest Resources Institute’s 2017 timber
21 harvest and economic base data by county, as presented above, potential impacts to the cost of
22 accepted forest practices from the proposed facility include an annual economic revenue loss of
23 \$212,530 and \$94,710 in Union and Umatilla counties, respectively; and, based on the 100 year
24 (or more) estimated useful life of the proposed facility, a long-term loss of \$21.3 million and
25 \$9.5 million in Union and Umatilla counties, respectively. The applicant notes that the actual
26 value of a particular landowner’s timber would be valued based on a timber appraisal
27 completed at the time of land acquisition. As further described below, in addition to the land
28 acquisition process, which would provide compensation for the economic loss of timber harvest
29 area, the applicant proposes mitigation measures to minimize potential impacts to, and the
30 cost of, accepted forest practices.²¹⁵

211 Information source available at: <https://knowyourforest.org/sites/default/files/documents/Union-state-economic-19.pdf>. Accessed April 29, 2020.

212 See Table A21, p. 101 in report available at: <http://theforestreport.org/wp-content/uploads/2019/07/OFRI-2019-Forest-Sector-Economic-Report-Web.pdf>. Accessed April 29, 2020.

213 Information source available at: <https://knowyourforest.org/sites/default/files/documents/Umatilla-state-economic-19.pdf>. Accessed April 29, 2020.

214 See Table A21, p. 101 in report available at: <http://theforestreport.org/wp-content/uploads/2019/07/OFRI-2019-Forest-Sector-Economic-Report-Web.pdf>. Accessed April 29, 2020.

215 Public comments received on the record of the DPO questioned the information relied upon by the applicant to evaluate economic loss from acres removed from timber harvest production potential. B2HAPPDoc8-1 All DPO Comments Combined-Rec'd 2019-05-22 to 08-22: Molly Eekhoff, 8/21/19, 138-139; Tamson Ross, 8/22/19, 373; Carol Lauritzen, 8/14/19, 1342; Gilbert, et a.

1 To evaluate the significance of the removal of land from timber harvest potential, the applicant
2 assesses the quantity of forest land lost compared to total forest land available (in acres), per
3 county, resulting in approximately 0.07 and 0.4 percent loss in Union and Umatilla counties,
4 respectively. The Department’s evaluation of impact significance is presented after the
5 evaluation of applicant proposed mitigation.

6
7 *Proposed Mitigation for Potential Impacts to Accepted Forest Practices*

8
9 As presented in ASC Exhibit K Attachment K-1, the applicant proposes to finalize an Agricultural
10 Mitigation Plan, which would include measures to restore impacted agricultural lands to its
11 former condition, compensate landowners for damages and/or impacts to agricultural
12 operations caused as a result of proposed facility construction, micro-siting the towers to avoid
13 agricultural areas, instituting weed control measures, preventing soil erosion, and other
14 measures, all of which are consistent with the Council’s OAR 345-001-0010(33) definition of
15 mitigation.

16
17 The applicant represents that it would implement logging best management practices, including
18 seasonal restrictions, wildlife habitat restrictions, and riparian restrictions.

19
20 Relating to seasonal restrictions, the applicant states that it may restrict the hours of operations
21 during fire season, and that it may require water trailers on site, fire watches after operations,
22 and may restrict “spark emitting operations.” The applicant also represents that it may
23 implement restrictions during “freeze-thaw” conditions that could arise during the spring.
24 During a spring thaw, use of roads would cause significant damage and reconstruction cost;
25 however, the applicant represents that the duration of spring thaws are generally short.

26
27 Relating to wildlife habitat restrictions, the applicant represents that proposed Fish and Wildlife
28 Conditions adequately mitigate potential harm to fish and wildlife habitat. The Department
29 recommends that the Council adopt these Conditions in Section IV.H *Fish and Wildlife Habitat*
30 of this ~~draft proposed~~ order. These conditions require, in pertinent part, the restriction of
31 ground disturbing activities within elk or mule deer range between December 1 and March 31;
32 the restriction of ground disturbing activities within certain areas around nesting bird species
33 and during specific spring months; that biological surveys occur during avian migratory season,
34 and that the applicant submit mitigation protocols for approval to the Department, which
35 describes actions that would be implemented to avoid harming non-raptor bird species and
36 their nests; that mitigation protocols be submitted if a state sensitive bat species is observed
37 during biological surveys, which must describe actions that would be implemented to avoid the
38 harm to relevant bat species and bat roosts; that construction be restricted in areas that
39 include state protected plant species, wetlands and waterways, areas of seasonal restriction,
40 and category 1 habitat; that the applicant drive 25 hours per mile or fewer on access roads and;
41 that construction work be compliant with the final Vegetation Management Plan.

42
43 Relating to riparian restrictions, the applicant represents that, in some instances, it may not be
44 possible to maintain timber in stream buffers along powerline corridors if trees do not meet

1 minimum clearance requirements; coniferous trees could be trimmed, however “crown
2 reduction” of deciduous trees is not recommended. Additionally, the applicant represents that
3 slash debris within stream buffers would be removed to prevent the smothering of shrubs,
4 grass, and forb species.

5
6 Areas within the project boundary would be properly marked by flags to minimize the potential
7 that trees could be inappropriately logged. Areas that would be flagged include: property lines,
8 road centerlines, right-of-way corridor (clearing limits), critical area delineation, log landing
9 delineation, and “off right-of-way” hazard tree designation.

10
11 Logging operations would require the use of hazardous materials such as motor fuel, hydraulic
12 oil, and lubricants; these fluids could potentially leak during equipment operations or during
13 refueling, repair, or maintenance. However, the applicant acknowledges that it would abide by
14 ODF regulations regarding hazardous materials, including OAR Chapter 629, Division 620.

15
16 Herbicides would be used during logging operations. The right-of-way would be tailored to
17 encourage growth of low growing plant species. Deciduous tree stumps would be treated with
18 an herbicide to prevent re-sprouting; within 10 feet of a stream or other water source, the
19 applicant would use Garlon 3A mixed with 50 percent herbicide with water and applied to the
20 cambial region of the stump. In addition, herbicide would be applied to manage foliage.

21
22 Logging operations must abide by forest fire control rules prescribed by OAR 629-044-0200. In
23 pertinent part, the applicant must observe fire precaution levels and it may also be required to
24 institute a fire watch. The applicant must treat slash debris in a manner that minimizes fire risk,
25 and as noted within this section, the applicant must also file a “smoke management plan” and
26 obtain a burn permit to burn slash.

27
28 The applicant represents that it would protect existing access roads through road maintenance
29 in accordance with Best Management Practices as detailed in *The Forest Practices Notes* (No. 4,
30 1999- ODF), and that the applicant would leave the road in as good or better of a condition as it
31 was prior to use. Post-harvest betterment may include actions such as the cleaning of ditches
32 and culverts, grading to eliminate potholes, improving surface drainage, assisting in the melting
33 of snow and ice and drying of the surface, and moving road shoulders to improve visibility and
34 safety.

35
36 Loggers must abide by Oregon Occupational Safety and Health Administration provisions, OAR
37 Chapter 437 Division 7; the applicant must develop a logging safety plan and; in areas where
38 the corridor crosses electrical distribution or transmission facilities, operations must be
39 compliant with OAR 437-007-0230 and OSHA 1910.266 and 1910.269, which relate to
40 powerline safety. As established in the Right-of-Way Clearing Assessment (Attachment K-2 of
41 this order), the applicant would work with landowners to provide timber harvesting assistance
42 for removal of trees within the minimum approach distances for non-qualified electrical
43 workers. If the entire right of way is cleared and the line is situated in the center, then forestry

1 logging operators would be expected to have adequate clearances and be able to cut the
2 timber safely.

3
4 The applicant represents that roads present the highest risk of erosion potential; road
5 construction and maintenance is regulated by either the Oregon Department of Forestry or the
6 US Fish and Wildlife service rules. To prevent erosion potential, as presented in the draft Right-
7 of-Way Clearing Assessment, the applicant commits to seeding, mulching, placement of straw
8 wattles, and other erosion control measures prior to and during roadwork in forest areas. If any
9 roads require post-harvest or post-construction abandonment, the surface of the road would
10 be scarified, waterbars would be installed, the road would be seeded with an erosion control
11 seed mix, and mulched as required. The Department recommends Council impose
12 recommended Land Use Condition 16, requiring implementation of the draft Right-of-Way
13 Clearing Assesment, based on the Agency Review Process incorporated by the Department, as
14 follows:

15
16 **Recommended Land Use Condition 16:** The certificate holder shall:

- 17 a. Prior to construction, in accordance with the OAR 345-025-0016 agency consultation
18 process outlined in the draft Right-of-Way Clearing Assessment (Attachment K-2 of the
19 Final Order on the ASC), ~~finalize and~~ submit to the Department for its approval, a final
20 Right-of-Way Clearing Assessment. The protect~~ive~~ measures described in the draft
21 Right-of-Way Clearing Assessment in Attachment K-2 of the Final Order on ASC shall be
22 included and implemented as part of the final Right-of-Way Clearing Assessment, unless
23 otherwise approved by the Department.
24 b. During construction, the certificate holder shall conduct all work in compliance with the
25 final Right-of-Way Clearing Assessment.

26
27 In addition, the applicant would compensate underlying landowners for the loss of land and
28 timber production opportunity, for the life of the facility, based on a certified appraisal of the
29 land value. Compensation would be implemented via private easement agreement or through
30 negotiated settlement. Because this would occur during landowner negotiation or
31 condemnation proceedings under the Oregon Public Utilities Commission, it is not specifically
32 imposed as a site certificate condition or mitigation plan requirement. The Department
33 recommends, however, that Council consider these processes, which would be outside of EFSC
34 jurisdiction, to also provide mitigation consistent with OAR 345-010-0010(33) and would reduce
35 potential impacts to accepted forest practices.

36
37 Based on the evaluation presented in ASC Exhibit K and reasoning and analysis presented in this
38 order, and compliance with recommended Land Use Condition 16, the Department
39 recommends Council find that the proposed facility would not result in significant adverse
40 impacts to accepted forest practices nor result in a significant increase in the cost of accepted
41 forest practices within the surrounding area and therefore would satisfy the requirements of
42 OAR 660-006-0025(5)(a).

1 ***(b) The proposed use will not significantly increase fire hazard or significantly increase fire***
2 ***suppression costs or significantly increase risks to fire suppression personnel; and***
3

4 OAR 660-006-0025(5)(b) establishes requirements for conditional uses authorized in forest
5 zoned land and requires the Council to find that the proposed use will not significantly increase
6 fire hazard, significantly increase fire suppression costs, or significantly increase risks to fire
7 suppression personnel.

8
9 Proposed facility components in Umatilla and Union counties located within forest-zoned land
10 include approximately:

- 11
- 12 • 42 miles of 500 kV transmission line (9.9 miles in Umatilla County; 32.1 miles in Union
- 13 County)
- 14 • 37.5 miles of substantially modified roads (8 miles in Umatilla County; 29.5 miles in
- 15 Union County)
- 16 • 17.4 miles of new roads (4.3 miles in Umatilla County; 13.1 miles in Union County)
- 17 • 2 light-duty fly yards (Umatilla County)
- 18 • 1 communication station (Union County)
- 19

20 Construction activities would include right-of-way clearing; road construction, repair, and use;
21 and slash abatement. Right-of-way clearing would include timber felling, using mechanical
22 machines or hand-falling; ground based logging; and cable-based logging systems. Road
23 construction, repair and use would be completed in adherence to Oregon Forest Practices Act
24 road construction standards. Trees logged during right-of-way clearing and road construction,
25 referred to as slash, would be piled and burned, masticated using a mower, or lop and
26 scattered, as further described in Attachment K-2, Right of Way Clearing Assessment, of this
27 order. Maintenance activities during operations would include vegetative maintenance.

28
29 Potential wildfire risk from the above-described construction and operational activities and the
30 applicant's proposed measures to reduce potential wildfire risk are discussed in ASC Exhibits K –
31 Land Use, P – Fish and Wildlife, U – Public Services, and BB – Forest Practices Act. As described
32 in these sections, potential construction related wildfire risk could result from operation of
33 construction vehicles and equipment; refueling; welding activities necessary to repair
34 equipment; and workers smoking. Additionally, clearing of vegetation and resulting soil
35 disturbance during construction could create optimal conditions for the establishment of
36 invasive-plant species, which could result in changes in fire regime increasing the frequency and
37 severity of fires.²¹⁶ Potential operational related wildfire risk could result from siting the
38 proposed facility in forest lands where, wildfire risks increase if a tree were to fall on the
39 transmission line; overgrown vegetation; equipment failure; or from unauthorized users of new
40 roads constructed for the proposed facility.

41

²¹⁶ B2HAPPDoc3-25 ASC 16A_Exhibit P1_Wildlife_ASC_Part 1. 2018-09-28.

1 During construction, the applicant proposes to minimize potential increases in wildfire risk by
2 implementing a Fire Prevention and Suppression Plan, to be reviewed and approved by the
3 Department and affected counties. The draft Fire Prevention and Suppression Plan requires:
4 fire prevention and response worker training; designated smoking areas; construction
5 equipment be equipped with federally-approved spark arresters; and restriction of motorized
6 equipment, including worker transportation vehicles, within designated and approved work
7 limits.

8
9 The draft Fire Prevention and Suppression Plan also establishes response procedures in the
10 event of a fire, including:

- 11
- 12 • Site personnel would aid in extinguishing a fire ignition before it gets out of control and
13 take action that a prudent person would take to control the fire while still accounting for
14 their own and others safety.
- 15 • Immediately notify the nearest fire-suppression agency of the fire location, action taken,
16 and status.
- 17 • Immediately notify the construction contractor and applicant of the fire location and
18 action taken.
- 19 • Relinquish fire-suppression activities to agency fire-management officers upon their
20 arrival.

21

22 The draft Fire Prevention and Suppression Plan also establishes that on-site earthmoving
23 equipment could be used to combat any fires that occur and that could be used to assist local
24 fire departments and districts and that trucks with water holding tanks would be on-site during
25 construction so water would be in the immediate vicinity to be used to combat any fire that
26 may ignite. As further described in Section IV.M. *Public Services* of this order, the applicant
27 would be required to submit to the Department and affected counties, for review and approval,
28 a final Fire Prevention and Suppression Plan.

29

30 During operations, the applicant proposes to minimize potential wildfire risk in forested lands
31 from danger trees and overgrown vegetation by implementing a Vegetation Management Plan
32 designed to comply with the American National Standards Institute (ANSI) Pruning Standards
33 Best Management Practices for Utilities, Oregon Forest ~~Products-Practices~~ Act, the U.S.
34 Department of Labor Occupational Safety and Health Administration (OSHA), and the North
35 American Electric Reliability Council's (NERC) Standard FAC-003-3 Transmission Vegetation
36 Management Program (TVMP).²¹⁷

37

38 The applicant proposes to minimize potential wildfire risk in forested lands from potential
39 equipment failure through adherence to Public Utility Commission of Oregon (OPUC)
40 Construction Standards and National Electric Safety Code requirements pertaining to the
41 prevention of fire hazards related to outdoor public utility installations. In addition,

²¹⁷ B2HAPPDoc3-25 ASC 16A_Exhibit P1_Wildlife_ASC_Part 1_Main thru Attach P1-6 rev 2018-09-28, Attachment P1-4 p. 4.

1 transmission line protection and control systems would be incorporated into the system
2 designed to detect faults (such as arcing from debris contacting the line) and would rapidly shut
3 off power flow (in 1/60th to 3/60th of a second) if arcing is detected.

4
5 The applicant proposes to minimize potential wildlife risk in forested lands by strategic
6 installation of new gates on new and substantially modified access roads, as identified in the
7 Road Classification Guide and Access Control Plan provided as Attachment B-5 to this order, to
8 minimize wildfire risks from unauthorized use.

9
10 Based on compliance with the Fire Prevention and Suppression Plan, the impact minimization
11 measures included in the Right of Way Clearing Assessment, and Vegetation Management Plan,
12 the Department recommends Council find that the proposed use would not significant^{ly}
13 increase the wildfire hazards, fire suppression costs, or risk to fire suppression personnel within
14 the surrounding area.

15
16 *(c) A written statement recorded with the deed or written contract with the county or its*
17 *equivalent is obtained from the land owner that recognizes the rights of adjacent and*
18 *nearby land owners to conduct forest operations consistent with the Forest Practices Act*
19 *and Rules for uses authorized in subsections (4)(e), (m), (s), (t) and (w) of this rule.*

20
21 OAR 660-006-0025(5)(c) specifically applies to uses authorized under subsections (4)(e) (private
22 parks and campgrounds), (m) (reservoirs and water impoundments), (s) (home occupations), (t)
23 (hardship dwellings) and (w) (private fishing accommodations) of this rule. The proposed facility
24 is a conditional use authorized under (4)(q) of the rule. Therefore, this rule provision does not
25 apply.

26 27 *IV.E.3. Statewide Planning Goals*

28
29 As discussed above, under OAR 345-022-0030, which implements ORS 469.504(1)(b), the
30 Council must find either that:

31
32 *(A) The proposed facility complies with applicable substantive criteria as described I section*
33 *(3) and the facility complies with any Land Conservation and Development Commission*
34 *administrative rules and goals and any land use statutes directly applicable to the facility*
35 *under ORS 197.646(3);*

36 *(B) For a proposed facility that does not comply with one or more of the applicable*
37 *substantive criteria as described in section (3), the facility otherwise complies with the*
38 *statewide planning goals or an except ion to any applicable statewide planning goal is*
39 *justified under section (4); or*

40 *(C) For a proposed facility that the Council decides, under sections (3) or (6) to evaluate*
41 *against the statewide planning goals, the proposed facility complies with the applicable*
42 *statewide planning goals or that an exception to any applicable statewide planning goal*
43 *is justified under section (4).*

1 Based on the analysis above, the Department recommends that the Council evaluate the
2 proposed transmission line under OAR 345-022-0030(A) and conclude that the proposed facility
3 complies with the applicable substantive criteria discussed above. However, in the alternative,
4 if the Council determines that the applicant has not satisfied one or more of the substantive
5 criteria, or if the Council chooses to evaluate the proposed transmission line only against the
6 statewide planning goals, the applicant has addressed how the proposed transmission line
7 satisfies each of the applicable goals, or why an exception to goal compliance would be
8 justified.

9
10 **Goal 1: Citizen Involvement**

11
12 Statewide Planning Goal 1 requires each jurisdiction “[t]o develop a citizen involvement
13 program that insures the opportunity for citizens to be involved in all phases of the planning
14 process.”

15
16 Goal 1 applies to the jurisdictions with authority over the land use process, rather than to the
17 applicant. In this case, the EFSC process takes the place of each local jurisdiction through which
18 the proposed transmission line would cross. As the applicant explains, the EFSC site certificate
19 process provides public involvement opportunities through informational meetings, public
20 hearings, a written comment period, and the option of a contested case proceeding, if
21 requested by a participant in the process.

22
23 **Goal 2: Land Use Planning**

24
25 Statewide Planning Goal 2 requires each jurisdiction “[t]o establish a land use planning
26 process and policy framework as a basis for all decisions and actions related to use of land
27 and to assure an adequate factual base for such decisions and actions.”

28
29 As with Goal 1, Goal 2 applies to the jurisdictions with authority over the land use process,
30 rather than to the applicant. In this case, because the applicant has elected to obtain a Council
31 determination of compliance under ORS 469.504(1)(b) and OAR 345-022-0030(2)(b), the EFSC
32 process takes the place of each affected local jurisdiction. The framework of that statute and
33 implementing rule provide a reasoned basis for the Council’s factual evaluation and
34 determinations regarding compliance with the land use standard.

35
36 **Goal 3: Agricultural Lands**

37
38 Statewide Planning Goal 3 is “[t]o preserve and maintain agricultural lands.”

39
40 Goal 3 is implemented through applicable provisions of ORS Chapter 215 and each county’s
41 comprehensive plan and land use ordinances. As demonstrated above the proposed
42 transmission line is allowed as a ‘utility necessary for public service’ on EFU-zoned lands under
43 ORS 215.283(1)(c)(A) and ORS 215.275. As discussed above, and in compliance with ORS
44 215.275, the applicant’s Agricultural Lands Assessment (ASC Exhibit K, Attachment K-1)

1 demonstrates that the certificate holder would minimize impacts to accepted farming practices,
2 and mitigate temporary and permanent impacts where necessary, in order to preserve and
3 maintain agricultural lands consistent with the statutory framework developed to comply with
4 Goal 3.

5
6 **Goal 4: Forest Lands**

7
8 Statewide Planning Goal 4 is “[t]o conserve forest lands by maintaining the forest land base
9 and to protect the state’s forest economy by making possible economically efficient forest
10 practices that assure the continuous growing and harvesting of forest tree species as the
11 leading use on the forest land consistent with sound management of soil, air, water, and fish
12 and wildlife resources and to provide for recreational opportunities and agriculture.

13
14 Goal 4 is implemented through OAR 660, Division 6. As discussed above, most of the forest
15 lands impacted by the proposed transmission line are in Umatilla and Union counties, where it
16 would be conditionally permitted as a “new electric transmission line.” As discussed above, the
17 department recommends that the Council accept the applicant’s interpretation that the term
18 “new electric transmission line” includes all related and supporting facilities, including access
19 roads. Based on that interpretation, the proposed transmission line and each of its related and
20 supporting facilities are conditionally permitted in Goal 4 forest lands under OAR 660-006-
21 0025(4)(q). However, in the event that the Council finds that OAR 660-006-0025(4)(q) does not
22 cover access roads outside the transmission line corridor, the applicant demonstrates that the
23 substantially modified existing roads outside of the corridor nonetheless comply with statewide
24 planning Goal 4.

25
26 *Substantially Modified Existing Roads*

27
28 Under OAR 660-006-0025(3)(h) “[w]idening of roads within existing rights-of-way in
29 conformance with the transportation element of acknowledged comprehensive plans and
30 public road and highway projects as described in ORS 215.213(1) and 215.283(1)” are permitted
31 as allowed uses. The proposed transmission line’s “substantially modified existing roads” are
32 existing roads that would require improvements. As further discussed in Exhibit B, the exact
33 nature of the improvements would vary depending on the condition of the existing roads, but
34 generally would include widening of roads to provide a 14-foot-wide travel surface, with a 16-
35 to 20-foot-wide travel surface for horizontal curves. Additional improvements could be needed
36 for the passage of heavy equipment. None of these activities would result in the removal of a
37 significant amount of Goal 4 land from forest use. Accordingly, the department recommends
38 that the Council find that the substantially modified existing roads would appropriately be
39 considered “widening of roads,” permitted outright in forest lands under OAR 660-006-
40 0025(3)(h), and therefore in compliance with Goal 4.

41
42 Alternatively, in the event the Council were to conclude that the substantially modified existing
43 roads outside the transmission line corridor are not conditionally permitted as part of the new
44 electric transmission line or permitted outright under OAR 660-006-0025(3)(h), as discussed

1 below with regard to new access roads, the applicant has established that the substantially
2 modified roads nonetheless comply with Goal 4.

3
4 *New Access Roads*

5
6 As discussed above, the proposed new access roads needed to access the transmission line
7 would cross forest lands in Umatilla and Union counties. As discussed above in Exhibit B, the
8 applicant has attempted to minimize the development of new roads in forested areas, relying
9 on existing roads where possible. While the new access roads would inevitably require a certain
10 amount of forest lands to be removed from forest use, the overall acreage would not be
11 significant. Therefore, in the event the Council determines that the new access roads outside of
12 the transmission line corridor may not satisfy all applicable use criteria for siting in a forest
13 zone, there is substantial evidence to support a finding by the Council that the new access
14 roads are consistent with Goal 4 because the roads would remove minimal Goal 4 land from
15 forest use, would not restrict forest practices on adjacent land, and may even promote
16 economically efficient forest practices on and recreational use of adjacent forest lands.

17
18 Alternatively, in the event EFSC concludes that the new roads outside the transmission line
19 corridor are not conditionally permitted as part of the new electric transmission line and are
20 inconsistent with Statewide Planning Goal 4, the applicant has established a basis for the
21 Council to grant an exception to compliance with Goal 4 for the new access roads. That
22 exception request is addressed below.

23
24 **Goal 5: Natural Resources, Scenic and Historic Areas, and Open Space**

25
26 Statewide Planning Goal 5 is “[t]o conserve open space and protect natural and scenic
27 resources.”

28
29 Goal 5 requires Counties to inventory natural resources, based on DLCD Guidelines that identify
30 the following as Goal 5 resources: riparian corridors, wetlands, wildlife habitat, federal wild and
31 scenic rivers, state scenic waterways, groundwater resources, approved Oregon recreational
32 trails, natural areas, wilderness areas, mineral and aggregate resources, energy sources, and
33 cultural areas. In addition to the individual county inventories, most of the resources identified
34 in the DLCD guidelines are also addressed in and protected through compliance with other EFSC
35 Standards. As the applicant describes, the following EFSC Standards effectively establish
36 compliance with the objectives of Goal 5:

37
38 **Protected Areas:** Under OAR 345-022-0040, the Council must find that, taking into account
39 mitigation, the design, construction and operation are not likely to result in significant
40 adverse impact to the protected areas listed in the standard (including inventoried Goal 5
41 resources if enumerated in standard). The applicant establishes how the proposed
42 transmission line complies with this standard in ASC Exhibit L.

1 **Wildlife Habitat:** Under OAR 345-022-0060, the Council must find that the design,
2 construction, and operation of the facility, taking into account mitigation, are consistent
3 with ODFW’s habitat mitigation policy. This standard protects inventoried Goal 5 wildlife
4 and habitats that are also protected by ODFW’s habitat mitigation policy. The applicant
5 establishes how the proposed transmission line complies with this standard in ASC Exhibits
6 P1-P3.

7
8 **Scenic Resources:** Under OAR 345-022-0080, the Council must find that the design,
9 construction, and operation of the facility, taking into account mitigation, are not likely to
10 result in significant adverse impact to scenic resources and values identified as significant or
11 important in local land use plans, tribal land management plans, and federal land
12 management plans for any lands located within the analysis area. The applicant establishes
13 how the proposed transmission line complies with this standard in ASC Exhibit R.

14
15 **Historic, Cultural and Archaeological Resources:** Under OAR 345-022-0090, the Council
16 must find that the construction and operation of the facility, taking into account mitigation,
17 are not likely to result in significant adverse impacts to qualified historic, cultural, and
18 archaeological resources (including all inventoried Goal 5 cultural and historic resources
19 that fall within definitions of protected resources under the standard). The applicant
20 establishes how the proposed transmission line complies with this standard in ASC Exhibit S.

21
22 **Wetlands:** Under OAR 345-022-0000, and as identified in the Project Order, the Council
23 must conclude that the proposed transmission line would comply with the criteria required
24 for issuance of Removal/Fill permit by the Department of State Lands (DSL), including
25 impacts to any inventoried Goal 5 riparian corridors, wetlands. The applicant establishes
26 compliance with the DSL permit criteria in ASC Exhibit J.

27
28 **Recreation:** Under OAR 345-022-0100, the Council must find that the design, construction,
29 and operation of a facility, taking into account mitigation, are not likely to result in a
30 significant adverse impact to important recreational opportunities in the analysis area,
31 including inventoried Goal 5 recreation resources determined to be “important” resources
32 by the Council. The applicant establishes how the proposed transmission line complies with
33 this standard in ASC Exhibit T.

34
35 In addition, as discussed above, the applicant has established how the proposed transmission
36 line complies with applicable provisions of each County’s Goal 5 inventory, as determined
37 applicable by each County.

38
39 **Goal 6: Air, Water, and Land Resources Quality**

40
41 Statewide Planning Goal 6 is “[t]o maintain and improve the quality of the air, water and
42 land resources of the state.”
43

1 Goal 6 provides for the maintenance of the quality of air, water, and land resources, and is
2 implemented through applicable local state and federal environmental quality statutes, rules
3 and standards. The applicant has demonstrated compliance with those implementing measures
4 by demonstrating that its waste and process discharges do not violate, or threaten to violate
5 those applicable regulations. As discussed ASC Exhibit V (Waste and Waste Water), the
6 proposed transmission line would have minimal waste discharges and would not degrade any
7 air, water, or land resources. The applicant further demonstrates compliance with this goal in
8 Exhibit G (Materials Analysis), and Exhibit E (Other Permits).

9
10 **Goal 7: Areas Subject to Natural Hazards**

11
12 Statewide Planning Goal 7 is “[t]o protect life and property from natural disasters and
13 hazards.”

14
15 Goal 7 requires the protection of people and property from natural hazards, including floods,
16 landslides, earthquakes, tsunamis, coastal erosion, and wildfires. As discussed in Exhibit H
17 (Geological Hazards and Soil Stability) and under the Structural standard (OAR 345-022-0020),
18 the proposed transmission line has been designed and would be constructed to account for
19 floods, landslides, and earthquakes in a manner that would not pose a risk of injury to persons
20 or property. In Exhibit H, the applicant has proposed adequate safeguards for those portions of
21 the proposed transmission line that would cross hazardous areas, including addressing
22 geological risks and landslide hazards. Accordingly, the proposed transmission line complies
23 with Goal 7.

24
25 **Goal 8: Recreation Needs**

26
27 Statewide Planning Goal 8 is “[t]o satisfy the recreational needs of the citizens of the state
28 and visitors and, where appropriate, to provide for the siting of necessary recreational
29 facilities including destination resorts.”

30
31 The objective of Goal 8 is to ensure that the state’s recreational needs are satisfied. While the
32 proposed transmission line is not intended to satisfy recreational needs, the applicant’s
33 compliance with the Council’s Recreation standard ensures that existing important recreational
34 needs would not be adversely impacted by the proposed transmission line. Thus, to the extent
35 it is considered applicable, the proposed transmission furthers Goal 8 through ensuring
36 important recreational opportunities are protected.

37
38 The applicant represents a commitment demonstrating the proposed facility’s consistency with
39 Goal 8, specific to Morgan Lake Park, as evaluated in Section IV.L.4. Recreation of this order.
40 The applicant commits to executing a Memorandum of Agreement (MOA) with the City of La
41 Grande, a reviewing agency (OAR 345-001-0010(51)) that manages Morgan Lake Park in Union
42 County. Under the terms of the MOA, the applicant would distribute \$100,000 for recreational
43 improvements at Morgan Lake Park which include upgrades to the park access road, a new

1 entry gate, new vault toilets, day use area improvements, and signage.²¹⁸ Because the
2 applicant’s commitments described MOA, if executed, with the City of La Grande is part of the
3 evidence Council could rely on to determine that the proposed facility would be consistent with
4 Goal 8, the Department recommends Council impose the following condition:

5
6 **Recommended Land Use Condition 17:** Within 90-days of construction within Union
7 County, if the Morgan Lake alternative route segment is selected at final facility design, the
8 certificate holder shall provide the Department a copy of the Memorandum of Agreement,
9 if executed, between the City of La Grande and certificate holder for improvements at
10 Morgan Lake Park.

11
12 **Goal 9: Economic Development**

13
14 Statewide Planning Goal 9 is *“[t]o provide adequate opportunities throughout the state for a*
15 *variety of economic activities vital to the health, welfare and prosperity of Oregon’s*
16 *citizens.”*

17
18 As more fully described in ASC Exhibit N and under the Need standard (OAR 345-023-0005) the
19 purpose of the proposed transmission line is to strengthen the state and region’s critical
20 transmission infrastructure. Additionally, as discussed extensively above, the applicant has
21 proposed to locate the transmission line to maximize positive impacts to Oregon’s economy,
22 while minimizing impacts to protected resources, including agricultural and forest lands.
23 Additionally, as described in ASC Exhibit U and under the Public Services standard, construction
24 of the proposed transmission line would provide economic development opportunities through
25 the length of the transmission line, in compliance with Goal 9.

26
27 **Goal 10: Housing**

28
29 Statewide Planning Goal 10 is “[t]o provide for the housing needs of citizens of the state.”

30
31 The purpose of Goal 10 is to ensure that land use planning provides for the housing needs of
32 Oregon’s citizens. As discussed in Exhibit K (Land Use) and Exhibit U (Public Services), the
33 proposed transmission line would not be located in any residential zones and would not
34 otherwise have any adverse impact on local government’s ability to meet projected housing
35 needs. Therefore, the Department recommends Council find that the proposed facility would
36 be consistent with Goal 10.

1 **Goal 11: Public Facilities and Services**

2
3 Statewide Planning Goal 11 is “[t]o plan and develop timely, orderly and efficient
4 arrangement of public facilities and services to serve as a framework for urban and rural
5 development.”

6
7 Goal 11 requires local governing bodies to plan and develop a timely, orderly, and efficient
8 arrangement of public facilities and services to serve as a framework for urban and rural
9 development. The applicant’s compliance with the Public Services standard, including
10 safeguards addressing fire, police, and medical service impacts, ensures that the proposed
11 transmission line would not adversely impact public services. Accordingly, the Department
12 recommends Council find that the proposed facility would be consistent with Goal 11.

13
14 **Goal 12: Transportation**

15
16 Statewide Planning Goal 12 is “[t]o provide and encourage a safe, convenient and economic
17 transportation system.”

18
19 Goal 12 requires local governments to develop and implement transportation planning
20 consistent with LCDC’s rules in OAR Chapter 660, Division 12. To the extent the proposed
21 transmission line impacts compliance with any local government’s transportation-related
22 criteria, compliance with those local criteria also furthers Goal 12.

23
24 In addition, as discussed in ASC Exhibit U and the applicant’s Transportation and Traffic Plan
25 (Exhibit U, Attachment U-2), and as addressed under the Public Services standard, the proposed
26 transmission line does involve construction of both temporary and permanent access roads,
27 most of which would be private roads. Construction and operation of the proposed
28 transmission line would not result in any permanent impacts to local transportation systems,
29 other than improvements to public roads in some cases. As reflected in the Transportation and
30 Traffic Plan, and as would be reflected in the applicable recommended Land Use conditions,
31 during the final design phase and before construction, the certificate holder proposes to and
32 would be required to coordinate with the affected local public works and road departments
33 regarding any transportation-related improvements. Construction-related activities would have
34 only temporary short-term impacts, which are not addressed by Goal 12 or its implementing
35 rules. Accordingly, the proposed transmission line would be consistent with Goal 12.

36
37 **Goal 13: Energy Conservation**

38
39 Statewide Planning Goal 13 is “[t]o conserve energy.”

40
41 Goal 13 provides for land, and uses authorized on the land, to be managed and controlled so as
42 to maximize energy conservation. Beyond line losses which occur on all transmission lines, the
43 proposed line does not itself consume energy. However, Exhibit N (Need) demonstrates that
44 this resource fits into the applicant’s overall resource management strategy and is designed to

1 support the applicant’s efforts to promote energy efficiency and demand response as an
2 alternative to the construction of additional generation plants. Exhibit V (Waste and
3 Wastewater) also addresses the applicant’s efforts to reuse and recycle waste to the maximum
4 extent practicable. Thus, the Department recommends Council find that the proposed
5 transmission line would be consistent with Goal 13, to the extent it applies to the proposed
6 transmission line.

7
8 **Goal 14: Urbanization**

9
10 Statewide Planning Goal 14 is “[t]o provide for an orderly and efficient transition from rural to
11 urban land use.”

12
13 The purpose of Goal 14 is to provide for an orderly and efficient transition from rural to urban
14 land use, to accommodate urban population and urban employment inside urban growth
15 boundaries, to ensure efficient use of land, and to provide for livable communities. The
16 proposed transmission line is located primarily in rural areas and does not represent a
17 transition of those areas from rural to urban, as the proposed transmission line is consistent
18 with rural land uses and is not expected to result in any short-term or permanent urbanization
19 in the vicinity. Accordingly, the Department recommends Council find that the proposed facility
20 would be consistent with Goal 14, to the extent is it applicable.

21
22 *IV.E.4. Goal 4 Exception*

23
24 The proposed facility would include a 500 kV transmission line segment and related or
25 supporting facilities including new roads, substantially modified roads, communications
26 stations, light duty fly yards, and pulling and tensioning sites located on forest lands. OAR 660-
27 006-0025(4)(q) establishes conditional uses authorized in Goal 4 forest zoned lands and
28 includes new electric transmission lines with right-of-way widths up to 300 feet, limited to 100
29 feet for the transmission line and 200 feet for vegetative maintenance.

30
31 While the Department agrees that related or supporting facilities within Goal 4 forest land
32 should be considered ancillary facilities to the transmission line and evaluated as a conditional
33 use authorized in forest lands under OAR 660-006-0025(4)(q), permanent related or supporting
34 facilities beyond the designated 300 foot right-of-way, specifically proposed new and
35 substantially modified roads (spanning 10 to 14 feet in width), would not comply with OAR 660-
36 006-0025(4)(q) unless a goal exception is taken.²¹⁹

37
38 For Goal 4, the Department of Land Conservation and Development (DLCD) included
39 Implementation Guideline B(7), which states that “[m]aximum utilization of utility rights-of-way

²¹⁹ In ASC Exhibit K, the applicant requests a Goal 4 exception for new access roads, substantially modified roads, and light duty fly yards. Because light-duty fly yards would be a temporary use, and would be reforested in accordance with ODF’s Forest Practices Act, the Department does not consider a Goal 4 exception necessary, as the reforestation practices and temporal loss of forested lands would be replaced consistent with commercial forest practices.

1 should be required before permitting new ones.” Oregon’s Statewide Planning Goals &
2 Guidelines, Goal 4, at 2 (Oregon Department of Land Conservation and Development, March
3 2010) (hereinafter DLCD Guidelines). As DLCD explicitly acknowledges, however, the guidelines
4 in this document are not mandatory. DLCD Guidelines, Introduction, at 2; DLCD Guidelines, Goal
5 2, at 3. Rather, they serve as “suggested approaches designed to aid cities, counties, state
6 agencies and special districts in carrying out the goals.”²²⁰ Therefore, pursuant to ORS
7 469.504(1)(b)(B) which is implemented under OAR 345-022-0030(4), non-compliance with a
8 statewide planning goal requires a determination by the Council that an exception to Goal 4 is
9 warranted.

10
11 OAR 345-022-0030(4):

12
13 *The Council may find goal compliance for a proposed facility that does not otherwise comply*
14 *with one or more statewide planning goals by taking an exception to the applicable goal.*
15 *Notwithstanding the requirements of ORS 197.732, the statewide planning goal pertaining*
16 *to the exception process or any rules of the Land Conservation and Development*
17 *Commission pertaining to the exception process, the Council may take an exception to a goal*
18 *if the Council finds:*

19 (a) *The land subject to the exception is physically developed to the extent that the land is no*
20 *longer available for uses allowed by the applicable goal;*

21 (b) *The land subject to the exception is irrevocably committed as described by the rules of*
22 *the Land Conservation and Development Commission to uses not allowed by the*
23 *applicable goal because existing adjacent uses and other relevant factors make uses*
24 *allowed by the applicable goal impracticable; or*

25 (c) *The following standards are met:*

26 (A) *Reasons justify why the state policy embodied in the applicable goal should not*
27 *apply;*

28 (B) *The significant environmental, economic, social and energy consequences*
29 *anticipated as a result of the proposed facility have been identified and adverse*
30 *impacts will be mitigated in accordance with rules of the Council applicable to the*
31 *siting of the proposed facility; and*

32 (C) *The proposed facility is compatible with other adjacent uses or will be made*
33 *compatible through measures designed to reduce adverse impacts.*

34
35 The provisions of OAR 345-022-0030(4)(a) and (b) are not applicable to the proposed facility.
36 The certificate holder submitted an assessment as to why a goal exception under OAR 345-022-
37 0030(4)(c) is appropriate for the proposed facility; the Department’s evaluation of the OAR 345-
38 022-0030(4)(c) is provided below.
39

App. 173, 190-192, 423 P.3d 793, 803-804 (2018); 1000 Friends of Oregon v. Land Conservation & Dev. Com., 301 Ore. 447, 451-452, 724 P.2d 268, 273-274 (1986); Gordon et al v. Clackamas County, LUBA No. 83-115, at 54-55 n.21 (Mar. 16, 1984).

1 Reasons Supporting an Exception

2
3 Under OAR 345-022-0030(4)(c)(A) (and ORS 469.504(2)(c)(A)), in order for the Council to
4 determine whether to grant an exception to a statewide planning goal, the certificate holder
5 must provide reasons justifying why the state policy embodied in the applicable goal should not
6 apply. The state policy embodied in Goal 4 is the preservation and maintenance of forest land
7 for forest use. The certificate holder’s arguments relating to “reasons supporting an exception”
8 are discussed below.

9
10 *Proposed Facility Cannot be Built without Proposed Access Roads in Forest Lands*

11
12 The first reason relied upon to support the request for a Goal 4 exception is that the proposed
13 new and substantially modified roads outside of the 300-foot right-of-way must be sited in
14 forest land to, predominately, interconnect to existing roads to provide access to the proposed
15 transmission line during construction and operation; avoid extreme topographical features,
16 such as drainage areas and rivers within Umatilla National Forest Region; and, utilize the
17 designated utility corridor within the Wallowa-Whitman National Forest.²²¹ In ASC Exhibit K, the
18 applicant describes that a thorough evaluation of new and substantially modified road locations
19 was completed during the 2010 siting study (provided in ASC Exhibit B, Attachment B-1), which
20 is also supported by the forest clearance mapbook provided in ASC Exhibit BB Appendix A.

21
22 As the applicant describes in ASC Exhibit B, the proposed access roads are an essential
23 component of the proposed transmission line. During construction, the access roads would be
24 required to allow materials, equipment, and personnel to access the construction sites. During
25 operations, the access roads would be required to allow for necessary maintenance of the
26 transmission line and structures. Without the access roads, the proposed transmission line
27 could not be built or maintained.

28
29 The applicant also establishes that the location of the roads proposed to extend through Goal 4
30 forest lands cannot reasonably be avoided. As described in Exhibit B and Attachment B-1 (2010
31 Siting Study), the applicant has considered numerous alternatives and has proposed the
32 locations of the access roads following consideration of numerous constraints and locational
33 challenges. The proposed transmission line, and the roads to access that line, are locationally
34 dependent, in that there were a limited number of potential routes that would meet the
35 purpose and need. More specifically, the proposed transmission line’s fairly limited crossing of
36 Goal 4 forest lands is necessary for the transmission line to cross the Wallowa-Whitman NF in
37 the designated utility corridor. Alternative routes would have resulted in a far greater number
38 of acres of Goal 4 forest land being removed from forest or related uses.

²²¹ B2HAPPDoc3-19 ASC 11 Exhibit K Land Use 2018-09-28. As described in ASC Exhibit K, approximately 6.3 miles of the proposed transmission within Union County would be located within the designated Wallowa-Whitman National Forest utility corridor.

38
39

The applicant’s demonstration of the public interest is explained in ASC Exhibit N (Need) and further evaluated under the Need Standard. As summarized in Exhibit K, the applicant explains how the proposed transmission line would allow the company to accomplish critical objectives, including (1) serving native loads; (2) meeting transmission reliability standards; (3) providing transmission service to wholesale customers; and (4) providing sufficient capacity.²²² The applicant’s analysis establishes a public need for and a public interest in the proposed transmission line, which is dependent upon the access roads.

Finally, the applicant demonstrates that the access roads proposed to be improved or constructed in forest lands would impose relatively minor impacts. Significantly, the improvements proposed for existing roads would not remove any significant amount of forest lands from existing uses. They would not result in significant adverse impacts to, or significantly increase the cost of, commercial forest operations; and, in some cases the new and improved roads could actually assist commercial forest operations.

The department agrees with the applicant and recommends that the Council find that there are adequate reasons to find that the public interest in developing the transmission line would outweigh the state policy embodied in Goal 4.

Proposed Facility Serves a Critical Public Interest – Benefits Outweigh the Impacts

The second reason relied upon to support the request for a Goal 4 exception is that the proposed facility would meet critical public interest objectives including providing additional transmission capacity to serve the applicant’s retail customers; meet transmission reliability standards; and, provide transmission service to wholesale customers. This reason is not specific to the need for siting the proposed new and substantially modified roads outside of the 300-foot right-of-way in forest land to support the proposed transmission line. Therefore, the Department recommends Council not consider this a valid reason for justifying why the state embodies policy in Goal 4 should not apply.

Minimal Impact to Forest Lands

The third reason relied upon to support the request for a Goal 4 exception is that the proposed facility components outside of the 300-foot right-of-way would result in minimal impacts to forest lands and therefore would not result in significant adverse impacts to, or significantly increase the cost of, commercial forest operations. The applicant also asserts that in some cases the new and improved roads might actually assist commercial forest operations.

²²² B2HAPPDoc3-19 ASC 11 Exhibit K Land Use p.317-318. 2018-09-28.

1 Significant Environmental, Economic, Social and Energy Consequences

2
3 Prior to determining whether to grant an exception to the state policy embodied in LCDC’s
4 Statewide Planning Goal 4 for forest lands, the Council must find that the applicant has
5 evaluated “the significant environmental, economic, social and energy consequences” of the
6 proposed facility and proposed mitigation in accordance with Council standards.²²³

7
8 *Environmental Consequences*

9
10 Under the Council’s Land Use standard, in order for the Council to grant a Goal 4 exception, the
11 Council must find that the applicant has demonstrated that environmental consequences of the
12 proposed facility have been identified and mitigated in accordance with Council standards. For
13 this evaluation, the Department interprets the relevant environmental consequences of the
14 proposed facility as those that would occur within forest lands, rather than a general evaluation
15 of all potential impacts evaluated under applicable Council standards.

16
17 The applicant requests a Goal 4 exception for clearing of trees within forest lands for new and
18 substantially modified roads, outside of the 300-foot right-of-way (limited through Land Use
19 Condition 15 to 100 feet for the transmission line, and 200 feet for vegetative maintenance,
20 consistent with ORS 772.210). Potential environmental consequences would include loss of
21 trees suitable for production of commercial forest products during forest clearing activities and
22 loss of forest/woodland habitat. To mitigate these potential impacts to forest lands, the
23 applicant proposes to obtain approval of a Plan for Alternative Practice, in accordance with
24 ODF’s Reforestation Rules at OAR 629-610-0090, and mitigate temporary and permanent
25 forest/woodland habitat impacts in accordance with Council’s Fish and Wildlife Habitat
26 standard through implementation of a Fish and Wildlife Habitat Mitigation Plan, which the
27 Department recommends be imposed in Fish and Wildlife Condition 4.

28
29 Based on the above-reasoning and analysis, the Department recommends Council finds that the
30 proposed energy facility, including mitigation, would not cause significant adverse
31 environmental consequences or impacts.

32
33 *Economic Consequences*

34
35 Under the Council’s Land Use standard, in order for the Council to grant a Goal 4 exception, the
36 Council must find that the applicant has demonstrated that economic consequences of the
37 proposed facility have been identified and mitigated in accordance with Council standards.
38 The applicant indicates that construction and operation of the transmission line would result in
39 the conversion of approximately 245.6 acre of forestland in Umatilla County and approximately

²²³ OAR 345-022-0030(4)(c)(B); ORS 469.504(2)(c)(B).

1 530.1 acres of forestland in Union County. These losses correspond to approximately 0.0034
2 percent and 0.00059 percent of total forestland within the counties, respectively. Additionally,
3 the applicant estimates that the conversion of the above described forestland would result in
4 an “economic impact to forest sector jobs” in the amount of \$120,000 in Umatilla County and
5 \$97,000 in Union County.²²⁴ The Department interprets “economic impacts” as “opportunity
6 costs” to forestry industry due to land loss; the ASC does not appear to provide a specific dollar
7 estimate of the value of the land itself. The applicant also indicates that the project would
8 provide economic benefits to the greater Pacific Northwest region, and would create direct
9 economic benefits to the local communities through job creation, increased ad valorem taxes,
10 and local spending stimulus.²²⁵ According to the applicant, the project was selected as a “vital
11 transmission project” by the Council on Environmental Quality; projects designated as such as
12 expected to “address reliability and / or provide capacity for new commercial scale renewable
13 and clean energy sources.”
14

15 As described in Section 8.1.2.2 of Exhibit K of the ASC, the applicant represents that one of the
16 purposes of the transmission project is to provide transmission services to wholesale
17 customers; increased transmission capacity would result in the ability to accept electricity from
18 power producers, which would increase incentives to build and operate additional energy
19 facilities near transmission substations. As described in Section 8.1.2.1 of Exhibit K of the ASC
20 and within the *Reasons Supporting an Exception* subsection of the *Land Use Section* of this ~~draft~~
21 ~~proposed~~ order, the applicant argues that the project would not be feasible if access roads
22 were not allowed to be constructed on forest zoned lands outside the transmission right-of-way
23 corridor. Specifically, access roads beyond the statutorily allowed corridor are necessary to
24 allow for the delivery of materials, equipment, and personnel to the construction sites.
25

26 The Department agrees that the transmission facility would benefit the local economy through
27 job creation and increased tax base, and that the transmission facility would benefit the greater
28 Pacific Northwest economy through increasing transmission capacity to allow for it to provide
29 services to wholesale customers (potential energy sellers). Therefore, the Department
30 recommends that the Council conclude that the proposed transmission facility represents a net
31 economic benefit compared to the site’s existing uses.
32

33 *Social/Energy Consequences*

34

35 Under the Council’s Land Use standard, in order for the Council to grant a Goal 4 exception, the
36 Council must find that the applicant has demonstrated that social/economic consequences of
37 the proposed facility have been identified and mitigated in accordance with Council standards.
38

39 As further discussed in ASC Exhibit U (Public Services), the proposed transmission line would
40 have no significant adverse impacts on public services or facilities, including hospitals, schools,

²²⁴ B2HAPPDoc3-19 ASC 11_Exhibit K_Land Use_ASC_ 2018-09-28, Attachment K-2, Section 7.0

²²⁵ B2HAPPDoc3-19 ASC 11_Exhibit K_Land Use_ASC_ 2018-09-28, Section 8.1.3.2

1 or transportation systems. ASC Exhibit N (Need) demonstrates that the proposed transmission
2 line is a necessary part of the company's resource management strategy and is designed to
3 support IPC in its continuing efforts to promote energy efficiency and demand response as an
4 alternative to the construction of additional generation plants. Additionally, the proposed
5 transmission line is important for renewable resource development in northeastern Oregon
6 such as wind and geothermal resources. The 500-kV transmission line is expected to relieve
7 congestion on the existing 230-kV transmission system, which could facilitate transmission of
8 renewable energy.

9
10 Based on the applicant's analysis, the Department recommends that the Council find that the
11 applicant has identified the ESEE consequences of both the access roads, and that adverse
12 impacts would be mitigated in accordance with the Council's standards.

13
14 Compatibility with Other Adjacent Uses and Measures Designed to Reduce Adverse Impacts

15
16 In its exception request, the applicant explains how development of the proposed access roads
17 associated with the transmission line would be compatible with adjacent land uses. Although
18 there may be temporary disturbances to adjacent commercial forest operations during the
19 development of access roads, there would likely not be any long-term impacts.

20
21 Commercial forest operations on surrounding lands occur periodically and could continue
22 during road construction. Potential interference with commercial forest operations during
23 construction would be limited to traffic interference between logging activities—primarily log
24 hauling—and movement of construction equipment and supplies, or improvement of access
25 roads concurrent forest operations. To the extent necessary, the certificate holder would
26 coordinate with local road departments and other forest operators to time large-load deliveries
27 to the extent such deliveries could potentially conflict with other forest or agricultural uses on
28 surrounding lands. Ongoing forestland maintenance activities on surrounding lands are unlikely
29 to be impacted by the access road construction.

30
31 To further ensure compatibility, as explained in ASC Exhibit I (Soil Protection), Attachment I-3,
32 any grading to prepare the roads would be conducted under an NPDES 1200-C permit, and
33 which would incorporate an erosion and sediment control plan. As described in the
34 Reclamation and Revegetation Plan and the Vegetation Management Plan (Attachments P1-3
35 and P1-4), temporarily disturbed areas to preconstruction conditions would be restored and the
36 certificate holder would implement a weed control plan.

37
38 During operations, limited activities would occur on access roads. The certificate holder would
39 use the access roads to inspect the transmission line components located within the ROW and
40 manage vegetation, consistent with the Vegetation Management Plan (Attachment P1-4).
41 Generally, those activities would have relatively low impact and would be unlikely to cause
42 potential adverse impacts on surrounding forest operations. Access roads would be monitored
43 for drainage or erosion control problems and repaired as necessary.

1 Based on the applicant’s analysis, the Department recommends that the Council find that the
2 proposed access roads would be compatible with adjacent land uses, and that measures would
3 be taken to reduce any potential adverse impacts.

4
5 In the event that the Council determines that an Exception to Goal 4 is required for either the
6 proposed access roads outside the rights-of-way in the forest zones in Umatilla and Union
7 Counties, or for the three light duty fly yards in Umatilla and Malheur counties, the Department
8 recommends that the Council find that, based on the above analysis, the applicant has satisfied
9 the criteria in ORS 469.504(2)(C) and OAR 345-022-0030(2)(C) for a Goal 4 Reasons Exception.

10
11 *IV.E.5. Federal Land Management Plans*

12
13 In ASC Exhibit K, the applicant provides an evaluation of compliance with Federal Land
14 Management Plans including: Wallowa-Whitman National Forest Land and Resource
15 Management Plan, BLM Vale District Resource Management Plan, BLM Baker Resource
16 Management Plan, BLM Southeastern Oregon Resource Management Plan, and Sage-Grouse
17 Amendments to Resource Management Plans. The applicant also describes compliance and
18 consistency with applicable provisions of these plans was included and part of the BLM’s 2017
19 record of decision.

20
21 **Conclusions of Law**

22
23 Based on the foregoing findings and the evidence in the record, and subject to compliance with
24 the recommended conditions, the Department recommends the Council find that the proposed
25 facility, including the proposed and alternative routes, complies with the identified applicable
26 substantive criteria and the directly applicable state statutes and rules and, therefore, complies
27 with the Council’s Land Use standard.

28 **IV.F. Protected Areas: OAR 345-022-0040**

29
30 *(1) Except as provided in sections (2) and (3), the Council shall not issue a site certificate*
31 *for a proposed facility located in the areas listed below. To issue a site certificate for a*
32 *proposed facility located outside the areas listed below, the Council must find that,*
33 *taking into account mitigation, the design, construction and operation of the facility are*
34 *not likely to result in significant adverse impact to the areas listed below. References in*
35 *this rule to protected areas designated under federal or state statutes or regulations are*
36 *to the designations in effect as of May 11, 2007:*

19
20 *(2) Notwithstanding section (1), the Council may issue a site certificate for a transmission*
21 *line or a natural gas pipeline or for a facility located outside a protected area that*
22 *includes a transmission line or natural gas or water pipeline as a related or supporting*
23 *facility located in a protected area identified in section (1), if other alternative routes or*
24 *sites have been studied and determined by the Council to have greater impacts.*
25 *Notwithstanding section (1), the Council may issue a site certificate for surface facilities*
26 *related to an underground gas storage reservoir that have pipelines and injection,*
27 *withdrawal or monitoring wells and individual wellhead equipment and pumps located*
28 *in a protected area, if other alternative routes or sites have been studied and determined*
29 *by the Council to be unsuitable.*

30
31 *(3) The provisions of section (1) do not apply to transmission lines or natural gas*
32 *pipelines routed within 500 feet of an existing utility right-of-way containing at least one*
33 *transmission line with a voltage rating of 115 kilovolts or higher or containing at least*
34 *one natural gas pipeline of 8 inches or greater diameter that is operated at a pressure of*
35 *125 psig.*

36
37 **Findings of Fact**

38
39 The Protected Areas standard first prohibits Council from granting approval of a site certificate
40 if a proposed facility would be located within a designated protected area, unless the proposed
41 facility is a transmission line located within 500 feet of an existing utility right-of-way containing
42 at least one transmission line with a voltage rating of 115 kV or higher; and, if this cannot be
43 met, a demonstration that alternative routes have been studied and determined to result in
44 greater impacts. For proposed facilities located outside protected areas, including transmission

1 lines, the Protected Areas standard requires the Council to find that, taking into account
2 mitigation, the design, construction and operation of a proposed facility are not likely to result
3 in significant adverse impacts from noise, increased traffic, water use, wastewater disposal,
4 visual impacts of facility structures or plumes, and visual impacts from air emissions to any
5 protected area as defined by OAR 345-022-0040.²²⁶

6
7 In accordance with OAR 345-001-0010(59)(e) (definitions), and as defined in the second
8 amended project order, the analysis area is the area within and extending 20 miles from the
9 site boundary. The applicant addresses protected areas in ASC Exhibit L.²²⁷ The applicant’s
10 assessment of impacts to protected areas also relies on information presented in ASC Exhibit R
11 (Scenic Resources) and ASC Exhibit X (Noise).

12
13 To identify protected areas, the applicant reviewed geographic information system (GIS) data,
14 maps and other information on the 16 categories of protected areas listed in OAR 345-022-
15 0040(1). Based on this evaluation, the applicant identifies 80 protected areas within the
16 analysis area, of which 74 are located within Oregon (six are located in Idaho and Washington).
17 Table PA-1, *Protected Areas within Analysis Area and Distance from Proposed and Alternative*
18 *Transmission Line Routes* lists each of the protected areas within the analysis area and its
19 distance from the centerline of the proposed and alternative routes, as applicable.

²²⁶ OAR 345-001-0010(53) defines “Significant” as “...having an important consequence, either alone or in combination with other factors, based upon the magnitude and likelihood of the impact on the affected human population or natural resources, or on the importance of the natural resource affected, considering the context of the action or impact, its intensity and the degree to which possible impacts are caused by the proposed action. Nothing in this definition is intended to require a statistical analysis of the magnitude or likelihood of a particular impact.”

²²⁷ Additionally, the applicant submitted an Exhibit R eErrata sheet that contains additional information related to Protected Areas, specifically to provide additional information and assessment related to an ODOT request for more information on the facility’s potential impacts to the “Grande Tour Route” and other Oregon Scenic Byways.

1

1 As presented in Table PA-1, *Protected Areas within Analysis Area and Distance from Proposed*
2 *and Alternative Transmission Line Routes*, of the 74 protected areas identified within Oregon,
3 34 protected area would be located at distances greater than 10 miles from the proposed
4 facility. The remaining 40 protected areas would be located within 10 miles of the proposed
5 facility – including three protected areas located between five to 10 miles; 24 protected areas
6 located within five miles; and 13 protected areas location within one mile of the proposed
7 facility.

8
9 For proposed alternative routes (Morgan Lake, Double Mountain, West of Bombing Range Road
10 alternatives 1 and 2), there would be 42 protected areas within the analysis area, of which 41
11 would be located within Oregon. Of the 41 protected areas within Oregon within the analysis
12 area of the alternative route site boundary, 29 protected areas would be located 10 miles or
13 greater, seven protected areas would be located between five and 10 miles, and five protected
14 areas would be located within five miles.

15
16 Council rules do not prescribe specific methodology for assessing impacts to protected areas, or
17 outline specifically what constitutes a potential significant adverse impact from a proposed
18 facility to a protected area. In general, impacts to a protected area associated with the
19 proposed facility, or proposed alternative routes, are a function of distance from the protected
20 area, as well as impact duration (e.g., short-term construction, or long-term operation). The
21 applicant’s methodology for evaluated impacts under the Protected Areas standard is described
22 in Section IV.F.2., *Potential Noise Impacts* through IV.F.5., *Potential Visual Impacts from Facility*
23 *Structures* below.

24
25 *IV.F.1. Protected Areas Crossed by Transmission Line – Exceptions (OAR 345-022-0040(2) and*
26 *(3))*

27
28 The proposed facility would cross portions of two protected areas, including the Blue Mountain
29 Forest State Scenic Corridor and the Ladd Marsh Wildlife Management Area. A portion of the
30 site boundary for the Morgan Lake alternative route would cross the Ladd Marsh Wildlife
31 Management Area; as described in Section III.B.1., *Site Boundary and Right of Way Dimensions*
32 of this order, the site boundary is recommended for approval as a micrositing corridor,
33 authorizing construction and operation of facility components anywhere within the site
34 boundary based on the extent of the evaluation presented in the ASC. Therefore, the
35 Department evaluates the site boundary for the Morgan Lake alternative route that would
36 cross the Ladd Marsh Wildlife Management Area as a crossing of the protected area, similar to
37 the proposed route.²²⁹

38

²²⁹ In ASC Exhibit L, the applicant represents that alternative transmission line segment as being 0.4 miles from the protected area, which the Department corrects to 0.04 miles consistent with Table L-1-1, and as described above is based on distance from transmission line centerline and not site boundary.

1 As described above, Council is prohibited from issuing a site certificate for proposed facilities
2 within a designated protected area, unless the proposed facility is a transmission line located
3 within 500 feet of an existing utility right-of-way containing at least one transmission line with a
4 voltage rating of 115 kV or higher, or if this cannot be achieved, a demonstration that
5 alternative routes have been studied and determined to result in greater impacts (see OAR 345-
6 022-0040(2) and (3)). The Department’s analysis and recommendations to Council as to
7 whether the facility, including proposed and alternative routes, would satisfy OAR 345-022-
8 0040(2) and (3) is presented below.

9
10 *Blue Mountain Forest State Scenic Corridor (State Park and Wayside)*

11
12 The proposed facility includes a short crossing (approximately 1,000 feet) of the southernmost
13 parcel of the Blue Mountain Forest State Scenic Corridor, a designated state park and wayside
14 protected area, near milepost (MP) 94.6 to 94.8 (see ASC Exhibit C, Figure C-2, Map 47). The
15 applicant describes that at this location, the proposed facility would be located entirely within a
16 utility corridor designated by the Wallowa Whitman National Forest as a “Power and
17 Transportation Facility Retention Corridor;” however, while the utility corridor currently
18 includes a segment of Union Pacific Railroad, it does not include an existing transmission line.
19 Therefore, the evaluation of whether the proposed facility is authorized to cross this protected
20 area relies on OAR 345-022-0040(3), which authorizes siting based on a demonstration that an
21 evaluation of alternative locations was completed and determined to result in greater impacts.

22
23 In ASC Exhibit L Section 3.5.1.1, the applicant describes that, based on discussions with Oregon
24 Parks and Recreation Department (OPRD), a conceptual alternative route was evaluated, which
25 would extend approximately 3.2 miles and would avoid the Blue Mountain Forest State Scenic
26 Corridor (see ASC Exhibit L Figure L-2a). The conceptual alternative route would impact
27 approximately 16 more acres of forestland than the proposed route, and would require two
28 crossings of I-84 within approximately a one-mile stretch along the interstate. Under the
29 conceptual alternative route, at least one structure and a set of conductors would be visible
30 from viewpoints within the parcel of the Blue Mountain Forest State Scenic Corridor.²³⁰

31
32 As described in Exhibit L, Section 3.5.1.1, OPRD reported that a crossing accomplished in a
33 “discreet way is better than crossing the interstate twice from an aesthetic perspective.”²³¹ The
34 applicant describes that traffic and noise impacts during construction would be similar between
35 the proposed route and the conceptual alternative route, though due to the longer route of the
36 conceptual alternative route and the double-crossing of I-84, the conceptual alternative route
37 would likely take longer to construct and therefore construction-related local traffic and noise
38 impacts would be greater.

39

²³⁰ B2HAPPDoc3-20 ASC 12_Exhibit L_Protected Areas_ASC 2018-09-28, Section 3.5.1.1. Additional details are provided in
ASC Exhibit L, Attachment L-3.

²³¹ Id.

1 Based on the analysis presented in ASC Exhibit L, the Department recommends that Council find
2 that an alternative route was considered, the conceptual alternative route, and would result in
3 greater impacts than the proposed route, when considering visual impacts, two crossings of I-
4 84 and more disturbance to forestland (approximately 16 acres). As such, the Department
5 recommends that Council find that the proposed facility is allowed to be sited through the Blue
6 Mountain Forest State Scenic Corridor in accordance with OAR 345-022-0040(2).

7
8 *Ladd Marsh Wildlife Area/State Natural Heritage Area (SNHA)*
9

10 The proposed facility would cross the Ladd Marsh Wildlife Area (WA), a designated State
11 Wildlife and Management Area, between MP 110.4 and MP 111.5, approximately 0.5 mile east
12 of Foothill Road (see ASC Exhibit C Figure C-2 Map 54). The Oregon Department of Fish and
13 Wildlife (ODFW) owns and manages the WA. The proposed facility would be located within 500
14 feet of the applicant's existing utility right-of-way containing the 230 kV Quartz-La Grande
15 transmission line, satisfying the requirements of OAR 345-022-0040(3).²³² As such, the
16 Department recommends Council find that the proposed facility ~~is would be~~ allowed to be sited
17 through Ladd Marsh Wildlife Area. On the record of the ASC, ODFW provided a comment letter
18 which included two specific comments regarding the proposed facility crossing Ladd Marsh WA.
19 The first comment notes that the area crossed by the proposed facility is big game winter range
20 (considered Category 2 habitat), and as such, ODFW requests that mitigation plans and best
21 management practices be followed (see Attachment P1-6). As described in Section IV.H., *Fish*
22 *and Wildlife Habitat*, the requested mitigation and management practices will be followed.
23 ODFW additionally requests that facility construction activities be coordinate with the WA
24 manager. Finally, ODFW notes that it is aware of cultural resources at the WA that should be
25 protected during facility construction, and requests that the SHPO or federal government
26 concurrence be provided to ODFW prior to facility construction. Based on these requests, the
27 Department recommends the following condition:

28
29 **Recommended Protected Areas Condition 1:** During design and construction of the
30 facility, ~~if the proposed facility route is selected,~~ the certificate holder must:

- 31 a. Coordinate construction activities in Ladd Marsh Wildlife Area with the Wildlife
32 Area manager.
- 33 b. Provide evidence to ODFW of a determination of eligibility and findings of effect
34 pursuant to that the certificate holder has received Section 106 NRHP
35 compliance for the ~~proposed~~ facility and, including the final HPMP for the
36 portion of the facility that would cross Ladd Marsh Wildlife Area subject to
37 confidential material submission materials.

38
39

²³² OAR 345-022-0040(3); "The provisions of section (1) do not apply to transmission lines or natural gas pipelines routed within 500 feet of an existing utility right-of-way containing at least one transmission line with a voltage rating of 115 kilovolts or higher or containing at least one natural gas pipeline of 8 inches or greater diameter that is operated at a pressure of 125 psig."

1 In addition, a small segment of site boundary for the proposed Morgan Lake alternative route
2 would extend into the Ladd Marsh Wildlife Area (see ASC Exhibit C Figure C-3 Map 10), but that
3 would not be located within an existing utility right-of-way. In ASC Exhibit L, the applicant
4 assumes that because the site boundary of the proposed Morgan Lake alternative route would
5 cross the protected area, and not the transmission line, that the evaluation under OAR 345-
6 022-0040(3) is not applicable. However, as described above, the site boundary is recommended
7 as the micrositing corridor, resulting in the possibility that the alternative route could cross the
8 protected area. Because an evaluation of an alternative with greater impacts was not
9 completed, in order to satisfy OAR 345-022-0040(1), the Department recommends Council
10 restrict the site boundary of the Morgan Lake alternative to avoid crossing or siting of facility
11 components within the protected area, as follows:

12
13 **Recommended Protected Areas Condition 2:** During design and construction of the facility,
14 if the Morgan Lake alternative route is selected, the certificate holder shall ensure that
15 facility components are not sited within the boundary of the Ladd Marsh Wildlife Area. The
16 certificate holder shall provide to the Department a final design map for Union County
17 demonstrating that the site boundary and facility components are located outside of the
18 protected area boundary.

19
20 Based on compliance with the recommended condition, the Department recommends that
21 Council find that the proposed alternative route would not be sited within the protected area
22 and therefore would satisfy OAR 345-022-0040(1).

23
24 *IV.F.2. Potential Noise Impacts*

25
26 The applicant analyzes potential noise impacts during construction and operation of the
27 proposed facility at protected areas within the analysis area by discussing the predicted noise
28 levels, and by discussing the predicted operational noise levels in the context of the ODEQ noise
29 regulations at OAR Chapter 340, Division 35. The ODEQ noise regulations are used to inform the
30 potential operational noise impacts from the proposed transmission line at protected areas,
31 however, compliance with the DEQ noise regulations is not decisive under the Council's
32 Protected Areas standard.

33
34 *Construction*

35
36 Construction of the proposed facility, including proposed and alternative routes, would cause
37 short-term noise impacts to nearby protected areas. Potential noise impacts during
38 construction would predominately result from operation of construction vehicles and
39 equipment (i.e. auger drill rig, backhoe, crane, dump truck, grader, pickup truck, and tractor) at
40 a construction site. As described in Section IV.Q.1. *Noise Control Regulations*, the applicant
41 evaluates potential noise levels from general construction activities based on an assumed
42 operation of five construction vehicles, at 40 percent hourly usage. As presented in Table PA-2,
43 *Predicted Noise Levels from General Construction Activities*, the one-hour average predicted
44 noise level from the combined operation of five pieces of equipment is 83 dBA at 50 feet, 79

1 dBA at 100 feet, and attenuates to 46 dBA at 6,400 feet. Representative noise levels for general
 2 construction equipment was obtained from the Federal Highway Administration (FHWA)
 3 Roadway Construction Noise Model User’s Guide (FHWA 2006).

Table PA-2: Predicted Noise Levels from General Construction Activities

Noise Source and Assumptions	Distance from Construction Activity (feet)	Leq Noise Level (dBA)
5 construction vehicles at 40% usage factor: 1 at 50 ft 2 at 100 ft 2 at 200 ft	50	83
	100	79
	200	74
	400	69
	800	63
	1,600	58
	3,200	52
	6,400	46
Leq = Equivalent sound pressure level Usage factor = Percent of time equipment is in use over time period (1 hr)		

4
 5 Noise generating construction activities would also include blasting and rock breaking (140 dBA
 6 at the blast location or over 90 dBA within 500 feet), implosive devices used during conductor
 7 stringing, helicopter operations (62 to 84 dBA at 1,000 feet), and vehicular traffic.

8
 9 There are ten protected areas within half-mile of the centerline of the proposed facility; there
 10 are two protected areas within half-mile of the centerline of the proposed Morgan Lake
 11 alternative route. As listed in Table PA-1, *Protected Areas within Analysis Area and Distance*
 12 *from Proposed and Alternative Transmission Line Routes* above, these are:

13
 14 Proposed Route

- 15 • Blue Mountain Forest State Scenic Corridor
- 16 • Ladd Marsh Wildlife Area
- 17 • Oregon Trail ACEC²³³ – National Historic Oregon Trail Interpretive Center Parcel
- 18 (NHOTIC)
- 19 • Owyhee River Below the Dam ACEC
- 20 • Oregon Trail ACEC - Straw Ranch 1 Parcel
- 21 • Oregon Trail ACEC – Birch Creek Parcel
- 22 • Hilgard Junction State Recreation Area
- 23 • Deer Flat National Wildlife Refuge
- 24 • Oregon Trail ACEC - Tub Mountain Parcel

²³³ BLM designated Area of Critical Environmental Concern (ACEC).

- Columbia Basine Coyote Springs Wildlife Area

Morgan Lake Alternative Route

- Ladd Marsh Wildlife Area
- Hilgard Junction State Recreation Area

Construction of the proposed facility, including proposed and alternative routes, would cause short-term noise impacts to nearby protected areas. Construction activities that would cause noise impacts at protected areas include blasting and rock breaking, implosive devices used during conductor stringing, helicopter operations, and vehicular traffic. The construction activities would progress along the corridor of the proposed transmission line, and no area would be exposed to construction noise for the entire construction period.

At a distance of half-mile or less, these areas would experience noise impacts during facility construction. However, noise would attenuate with distance, topography, and vegetative screening so it is possible that the decibel volume represented in Table PA-2 may be lower during actual facility construction. Helicopter use during construction would be audible at nearby protected areas and would cause a short-term impact to users of protected areas at those areas near the helicopter fly-yards and MUAs, and during facility transmission line construction at times of helicopter use. However, construction noise including helicopter use would only occur during facility construction, which is a short-term impact likely only over a period of months at any one location.²³⁴

Operation

Potential noise impacts during facility operation would include inspections, vegetation maintenance (including chain saws or other power equipment), potential noise from operation of Longhorn Station, and corona noise from the proposed transmission line. Inspections typically occur once per year but could be more frequent during weather or emergency events, and ~~while~~ usually would consist of vehicle inspections, however helicopters could be used. ~~As~~ Similar to activities during construction, vegetative maintenance and inspection-related noise would only be short term.

The Longhorn Station would be approximately 0.7 miles from a protected area, the Columbia Basine Coyote Springs Wildlife Area. However, the Station would be located in the Port of Morrow industrial park, adjacent to I-84, and noise from the Station would not be distinguishable from other existing noise at the wildlife area.

²³⁴ B2HAPPDoc3-20 ASC 12_Exhibit L_Protected Areas_ASC 2018-09-28, Section 3.5.3.1.

1 During typical operating conditions, corona noise from the proposed transmission line is
 2 estimated at 27 dBA at the edge of the facility right of way (ROW). Twenty-seven dBA is barely
 3 audible and would not cause a significant noise impact at any protected area. As described
 4 further in Section IV.Q.1, *Noise Control Regulations*, during certain foul weather conditions and
 5 low wind, corona noise would be greater than 27 dBA at the edge of the ROW and certain
 6 noise-sensitive receptors.²³⁵ It is also possible that corona noise would be audible at certain
 7 locations in protected areas very near the proposed facility. However, corona noise is never
 8 anticipated to be above 50 dBA during foul weather at any noise sensitive receptor.²³⁶ For
 9 instance, Hilgard Junction State Recreation Area (Hilgard State Park) is located approximately .3
 10 miles from the proposed route and .4 miles from the Morgan Lake alternative, and includes
 11 campsites, therefore was evaluated in the applicant’s noise analysis for compliance with the
 12 DEQ noise regulations. The applicant evaluated potential noise impacts at Hilgard State Park by
 13 comparing it to the nearby NSR 29. NSR 29 has a modeled noise level of 37 dBA, with an
 14 estimated increase in corona noise from the proposed transmission line during foul weather,
 15 low wind events of 6 dBA, for a predicted noise level of 43 dBA. However, the applicant states
 16 that the campground at Hilgard State Park is located farther away from the proposed
 17 transmission line than NSR 29, therefore the predicted noise level would be less than 43 dBA
 18 because noise attenuation increases with distance from the noise source.²³⁷ At any nearby
 19 protected area, the conditions that give rise to a louder corona noise (namely, rainy weather)
 20 likely also limits the users at a protected area.

21
 22 For example, the National Historic Oregon Trail Interpretive Center (NHOTIC) includes an
 23 interpretive center open during daytime hours as well as adjacent land with walking and hiking
 24 trails with interpretive signage. The Department notes that operational noise would likely not
 25 be audible from inside the center and during foul weather conditions that would generate the
 26 loudest corona noise, it is anticipated that there would be fewer visitors outside on the walking
 27 trails. Further, the applicant’s noise analysis evaluates the “worse-case” noise generated from
 28 operation of the proposed transmission line by using baseline ambient noise levels during the
 29 quietest time of the night (12:00 a.m. to 5:00 a.m.), which for the noise analysis is assumed to
 30 be present at all times of the day. Such is not the case as during the daytime ambient noise
 31 levels are higher because they include noise from traffic, wildlife, and agricultural activities, etc.
 32 The higher ambient noise levels during the day would likely mask corona noise generated from
 33 the proposed transmission line that may be perceptible to individuals using the walking trails at

²³⁵ DEQ noise rules, OAR 340-35-0015(38), defines Noise Sensitive Property as “real property normally used for sleeping, or normally used as schools, churches, hospitals or public libraries...” The applicant refers to these as noise sensitive receptors (NSRs) and included seasonally used campsites in its evaluation. The applicant’s noise modeling evaluated the “worse-case” operational corona noise during foul weather, which generally decreases users of overnight camping. The Department also notes that walking trails and viewpoints are not normally used for sleeping and therefore not evaluated as NSRs.

²³⁶ Operational noise is discussed in the context of the DEQ noise regulations to inform the potential noise impacts under the Council’s Protected Areas standard, however, the analysis or compliance with the DEQ noise rules is not a requirement of the Protected Areas standard.

²³⁷ B2HAPPDoc13 DPO IPC Responses to Select DPO Comments Rec'd by 2019-11-07; B2HAPP DPO IPC Responses - StopB2H - 4. Noise 2019-10-29.

1 NHOTIC or any other protected area. Similarly, ~~W~~while the proposed route would cross the
2 Blue Mountain State Scenic Corridor, operational noise would not likely affect the primary user
3 experience of the protected area, which is driving along the road and experiencing the scenery,
4 because vehicles themselves mask noise. Other ~~designations of~~ protected areas could include
5 be designated as a protected area for the protection of wildlife or cultural resources; however,
6 the low-level of corona noise, during infrequent weather conditions, is unlikely to ~~cause a~~
7 significant noise impact at these areas; impact those resources protected within the area.

8 9 *IV.F.3. Potential Traffic Impacts*

10 11 *Construction*

12
13 Facility construction would cause short-term impacts to those protected areas that are near the
14 proposed facility, or where construction traffic routes pass near those protected areas. The
15 impacts would be short-term and limited in duration to construction related traffic.
16 Construction traffic would include multiple vehicle types, but the majority of traffic trips would
17 be for construction workers daily commuting to work sites. General traffic impacts from the
18 proposed facility is also discussed in Section IV.M, *Public Services*, which also includes a number
19 of recommended site certificate conditions that would manage and reduce potential impacts
20 from facility construction traffic, including finalizing county-specific traffic management plans.
21 Implementation of these measures ~~will~~would reduce facility traffic impacts.

22
23 Construction-related traffic impacts are expected to vary at each protected area. Some
24 protected areas would have no impacts from facility construction due to the distance from the
25 proposed facility as well as planned haul and commuting routes. Some protected areas would
26 have minor construction-related traffic impacts due to proximity of the facility, or
27 haul/commute routes, near the protected areas. However, in all circumstances, construction
28 traffic would be short term. See ASC Exhibit L, Attachment L-1, Table L-1-1 for specific
29 information related to each protected area and anticipated traffic. Additionally, recommended
30 conditions in Section IV.M, *Public Services*, specifically including the requirement to finalize a
31 county-specific traffic management plan prior to facility construction, would be expected to
32 mitigate potential construction traffic impacts at any particular protected area.

33 34 *Operation*

35
36 No traffic impacts to protected areas are anticipated during facility operation. Facility operation
37 would involve very infrequent maintenance and inspections by the certificate holder, expected
38 at one or two inspections per year.

1
2 *IV.F.4. Potential Impacts from Water Use and Wastewater Disposal*

3
4 *Construction and Operation*

5
6 Construction-related water use would include approximately 36.5 million gallons over an
7 approximately 36-month period for transmission line structure foundation and Longhorn
8 Station foundation; preparation of drilling slurry; moisture conditioning during access road
9 construction; dust control during right-of-way clearing; station grading and site work; drilling
10 and fire prevention; and re-seeding restoration upon construction completion. As explained in
11 ASC Exhibit O, construction-related water would be obtained from municipal sources, with
12 noted capacity to serve the applicant's construction-related water need. Operational water use
13 would be limited to the proposed Longhorn Station and would result in approximately 11,000
14 gallons per year for landscaping activities and potable employee-use purposes. As explained in
15 ASC Exhibit O Section 3.4., operational water would likely come from a direct connection to the
16 Port of Morrow's water system. Because facility related water use would be served by
17 municipal sources and not any protected area, the Department recommends Council find that
18 construction and operational water use would not result in significant adverse impacts to
19 protected areas within the analysis area.

20
21 Construction-related wastewater would predominately be generated during foundation
22 construction for transmission line towers and the Longhorn Station, from concrete wash water.
23 Concrete wash water would include water with residual concrete, concrete associated liquids,
24 and the wash water from cleaning trucks, hoppers, and chutes. As described in ASC Exhibit V,
25 washout liquids would generally be allowed to evaporate or would be pumped out and
26 properly disposed of by the construction contractor. Washout liquids would not be discharged
27 into storm drains, ditches, streams or other water bodies. Concrete washout areas would be
28 located in designated aboveground earthen berms or straw bale enclosures lined with plastic, a
29 storage tank, or other structure approved by the engineer or inspector. These washouts would
30 be located within each structure work area at least 50 feet away from storm drains, ditches,
31 streams, or other water bodies. Washouts would be visually inspected on a daily basis to ensure
32 there are no leaks and that they are operating effectively. They would be cleaned out when
33 they reach 75 percent of their design capacity.

34
35 As described in ASC Exhibit V, some foundations may require slurry to stabilize foundation
36 shafts during drilling. Slurry fluids would consist of a mixture of bentonite and water. Excess
37 and degraded slurry fluids would be contained in designated aboveground washouts similar to
38 those described above for concrete. The slurry fluids would be allowed to completely evaporate
39 or they would be pumped out and properly disposed of by the construction contractor. Slurry
40 fluids would not be discharged into storm drains, ditches, streams, or other water bodies.
41 Because the applicant would not utilize or rely upon a protected area for disposal of
42 construction related wastewater, and because the predominant source of construction-related
43 wastewater, while adjacent and in proximity to some protected areas, would be properly
44 managed and contained, the Department recommends Council find that proposed construction

1 related wastewater would not be likely to result in significant adverse impacts to any protected
2 areas.

3

4 *IV.F.5. Potential Visual Impacts from Facility Structures*

5

6 *Construction and Operation*

7

8 *Methodology for Visual Impact Assessment*

9

10 The analysis area for protected areas is 20 miles; however, the applicant’s visual impact
11 assessment extends five miles from the proposed site boundary in non-forested settings, and
12 10 miles in forested settings to account for the potential additional visibility of a cleared
13 forested right of way. Beyond those distances, the applicant asserts that visibility of the
14 proposed facility, including proposed alternative routes, would be negligible. Based on this
15 method, there are 28 protected areas that were carried forward for additional assessment of
16 visual impacts. These specific protected areas are shown in Table PA-3, *Summary of Protected*
17 *Areas with Potential Visual Impacts*, below (which is reprinted from ASC Exhibit L, Table L-2,
18 with edits).

19

20 In order to assess the anticipated impacts of the proposed facility to specific protected areas, in
21 the absence of specific Council methods, the applicant proposes a specific methodology based
22 on prescribed methods used by the BLM and the US Forest Service for assessing visual
23 impacts.²³⁸ For EFSC protected areas not located on BLM or USFS land, the applicant used one
24 of the two procedures based on whether the resource was located in forested or non-forested
25 areas; resources located in non-forested areas were analyzed using the BLM methodology, and
26 those located in forested areas were analyzed using the USFS methodology.²³⁹

27

28 ASC Exhibit L, Attachment L-3 includes the complete visual impact assessment methodology. To
29 determine whether potential visual impacts would be “significant,” the methodology considers
30 the combined outcome of context of the impact, impact intensity, and the degree to which the
31 possible impacts are caused by the proposed action. Additionally, the applicant applied the
32 EFSC definition of “significant” when conducting its evaluation. The definition of “significant” is
33 at OAR 345-001-0010(53): “significant” means having an important consequence, either alone

²³⁸ Id, Section 3.2.4.

²³⁹ For context, the BLM manages visual resources through its 1986 Visual Resource Management (VRM) System, which classifies scenic resources based on “Class Objectives,” which are based on scenic quality, visual sensitivity, and distance. Under this system, a Visual Resource Inventory process assigns visual resources to management classes with established objectives based on the level of change to the character of the landscape. The USFS manages scenic resources through its Visual Management System established in 1974 to inventory, classify, and manage lands for visual resource values. Visual resources are managed by visual quality objectives, which describe a degree of acceptable alteration of the natural landscape, ranging from preservation, retention or partial retention, and modification or maximum modification.

1 or in combination with other factors, based upon the magnitude and likelihood of the impact
2 on the affected human population or natural resources, or on the importance of the natural
3 resource affected, considering the context of the action or impact, its intensity and the degree
4 to which possible impacts are caused by the proposed action. Nothing in this definition is
5 intended to require a statistical analysis of the magnitude or likelihood of a particular impact.”

6 See Table SR- 2: Definition of Significance (per Council’s Rule OAR 345-001- 0005(53)) and
7 Interpretation for Visual Impacts in Exhibit L, R, T), in Section IV.J., Scenic Resources for a
8 breakdown of the Council’s definition of significant”.

9
10 The applicant implemented the visual impact methodology and impact assessment using a
11 three parts process:²⁴⁰

- 12
13 (1) Evaluation of baseline conditions, which involved collecting information related to:
14 a. Scenic Quality and Attractiveness. The characteristic is assigned a score or
15 ranking, based on the BLM and USFS methods.
16 b. Landscape Character. This is a USFS system. The BLM does not use a “landscape
17 character” classification, so this information was assessed for all protected areas
18 based on the USFS system.
19 c. Viewer groups and characteristics.
20 (2) Impact likelihood and assessment, which involved the following assessment criteria:
21 a. Likelihood of impact;
22 b. Magnitude of impact – duration;
23 c. Magnitude of impact – visual contrast and scale domination; and
24 d. Magnitude of impact – resource change and viewer perception.
25 (3) Consideration of intensity, causation, and context (based upon Council’s definition of
26 “significant” OAR 345-001-0010(53).
27 a. Impact intensity
28 b. Degree to which the possible impacts are caused by the proposed action
29 c. Context
30 d. Potential significance. “Significance” was determined based on if the valued
31 scenic attributes of the protected area could persist, or not, based on the
32 proposed facility’s potential impact.

33
34 The Department ~~agrees and supports the~~ concurs and recommends Council concur with the use
35 of these methods for the visual impact assessment for the proposed facility for the EFSC review;
36 specifically because;

- 37 • The proposed facility would cross both BLM and USFS land, and on those lands, the
38 applicant is required to utilize those agency’s respective visual resource impact
39 assessment methods;:-

²⁴⁰ B2HAPPDoc3-20 ASC 12_Exhibit L_Protected Areas_ASC 2018-09-28, Section 3.2.4.

- 1 • Both the BLM and USFS approved the proposed facility location in its ROD(s),
- 2 indicating compliance with the respective visual impact methodologies and
- 3 standards;
- 4 • The applicant adapted each of the methodologies to use evaluative criteria based
- 5 upon the Council’s definition of “significant” under OAR 345-001-0010(53);
- 6 • The BLM and USFS visual impact methodologies provide an objective system to
- 7 evaluate visual impacts;
- 8 • ~~As such, utilizing those~~Using the BLM and USFS same methods to assess visual
- 9 impacts to EFSC protected areas is consistent with the statutory direction at ORS
- 10 469.370(13) to conduct a site certificate review in a “manner that is consistent with
- 11 and does not duplicate the federal agency review.”
- 12

13 As is mentioned in Sections IV.J., *Scenic Resources* and IV.L, *Recreation*, the same visual

14 resource impact assessment methodology was used by the applicant to assess visual impacts

15 from the proposed facility to resources considered in those sections.

16 *Visual Impact Assessment*

17

18

19 The applicant provided a comprehensive visual impact assessment of all protected areas, these

20 are included in ASC Exhibit L, Attachment L-3. As shown on Table PA-3, of the 28 protected

21 areas evaluated for potential visual impacts due to the proximity of the protected areas to the

22 proposed facility, 12 protected areas were determined by the applicant to have a “low

23 intensity” visual impact, and as such, could not have a significant adverse impact (“low

24 intensity” is defined as not having the potential to alter scenic quality or landscape character, or

25 not be perceived by viewers). Four additional protected areas were determined to be located

26 outside of the modelled viewshed and would not have a significant adverse impact from

27 visibility because visibility of the proposed facility would be screened by topography. These 16

28 protected areas are not further evaluated in this order.²⁴¹

29

30 The applicant then determined that the remaining 12 of 28 protected areas could have a

31 potential adverse visual impact and therefore further evaluated impacts to these areas from

32 potential facility visibility to determine level of impact significance based on the management

33 and protection of the area. Assessment of these 12 protected areas is summarized below in

34 Table PA-3, *Summary of Protected Areas with Potential Visual Impacts* and assessment of the

35 significance of potential facility visibility for each protected area is included below the table.²⁴²

36 Additionally, while not required by Council rules, the applicant provided visual simulations from

37 certain protected areas, demonstrating what the proposed facility may look like once built. The

38 photo simulations are provided in ASC Exhibit L, Attachment L-4.

39

²⁴¹ Id. Section 3.2.4.

²⁴² Id. Section 3.5.6.

Table PA-3: Summary of Protected Areas with Potential Visual Impacts

Protected Area within Analysis Area ¹	Location of Protected Area Relative to Route Centerlines ²
Ladd Marsh Wildlife Area/SNHA	Crosses Proposed Route ⁵ / Morgan Lake Alt. within 200 ft SW
Oregon Trail ACEC – National Historic Oregon Trail Interpretive Center (NHOTIC) Parcel	123.4 ft NE of proposed route
Owyhee River Below the Dam ACEC	249 ft SW of proposed route
Oregon Trail ACEC – Straw Ranch 1 Parcel	0.1 mi SW of proposed route
Oregon Trail ACEC – Birch Creek Parcel	0.2 mi SW of proposed route
Oregon Trail ACEC – Tub Mountain Parcel	0.5 mi W of proposed route
Farewell Bend State Recreation Area	0.7 mi NE of proposed route
Oregon Trail ACEC – Powell Creek Parcel	1.2 mi E of proposed route
Umatilla National Wildlife Refuge	1.3 mi N of proposed route
Powder River Wild and Scenic (Scenic)	1.4 mi E of proposed route
Powder River Canyon ACEC	1.4 mi E of proposed route
Lindsay Prairie Preserve/ SNHA	1.6 mi SW of proposed route

¹ The analysis area for Exhibit L, as defined in the Second Amended Project Order, is “the area within the site boundary and 20 miles from the site boundary, including areas outside the state if applicable to the Council’s standard.”

² Location of each protected area is relative to each route segment's centerline, not the Site Boundary. There may be values greater than 20 miles listed because temporary Project features (multi-use areas, pulling and tensioning sites) are located several miles away from route centerlines. The Second Amended Project Order describes the analysis area as the “area within the site boundary and 20 miles from the site boundary, including areas outside the state if applicable to the Council’s standard” and therefore these features beyond 20 miles from centerline are still analyzed in Exhibit L.

³ Resource is greater than five miles from the proposed route and/or alternative route centerline and outside of the modeled cleared right-of-way viewshed so there will be no visual impacts to the resource.

⁴ Resource is completely outside of the modeled bare-earth viewshed so there will be no visual impacts to the resource.

⁵ Crossing of the protected area is allowed per OAR 345-022-0040(3).

ft – feet; mi – miles

- 1
- 2 *Visual Impact Assessment of Specific Protected Areas*
- 3

1 As described above, there are 12 protected areas (listed in Table PA-3) that would have
2 “medium to high intensity visual impacts” and as such, additional assessment of the significance
3 of those impacts is provided below.²⁴³

4
5 *Ladd Marsh Wildlife Area/State Natural Heritage Area (SNHA)*

6
7 Ladd Marsh Wildlife Area (WA) is an approximately 6,019 acre wildlife area and state natural
8 heritage area, managed for wildlife and habitat by ODFW, located in Grande Ronde Valley,
9 approximately six miles southeast of La Grande in southern Union County. Ladd Marsh WA
10 predominately consists of seasonally and permanently flooded wetlands, with the western
11 portion consisting of upland hillsides with mixed conifer forestland.²⁴⁴

12
13 The proposed route would cross the protected area, which is authorized under OAR 345-022-
14 0040(3) because, at this location, would be located within 500 feet of an existing utility right of
15 way containing a high-voltage transmission line of at least 115 kV. However, the proposed
16 Morgan Lake alternative route, which based on recommended Protected Areas Condition 1,
17 would be located outside of but within 200 feet of the protected area, requires an impact
18 assessment under OAR 345-022-0040(1).

19
20 Potential visual impacts of the proposed Morgan Lake alternative route would include the
21 introduction of moderate contrast and co-dominant visual features to natural and other man-
22 made features with the WA. Other man-made features within the WA include an existing 230
23 kV transmission line, four home sites, a wastewater treatment facility, and several scattered
24 buildings. In ASC Exhibit L, the applicant describes that views of the transmission line would be
25 intermittent or continuous, depending on vantage point within the WA, and that impacts to
26 viewer perception would be medium. However, the WA is a protected area because of its
27 importance for the protection of wildlife and habitat, which would not be impacted by facility
28 visibility. Therefore, while visitors could experience visual impacts – which is further evaluated
29 under the Council’s Recreation standard, the Department recommends that, based on the
30 purpose of the protected area for wildlife and habitat management, Council find that views of
31 the proposed Morgan Lake alternative route would not be likely to result in significant adverse
32 impacts to the protected area.

33
34 *Oregon Historic Trail ACEC - National Historic Oregon Trail Interpretive Center Parcel*

35
36 The National Historic Oregon Trail Interpretive Center (NHOTIC) Area of Critical Environmental
37 Concern (ACEC) parcel is 507 acres, managed by BLM for the preservation of its unique historic
38 resource and visual qualities. The NHOTIC is located on the north side of Oregon State Highway

²⁴³ Id.

²⁴⁴ Id. Section 3.5.1.2.

1 (OR) 86, approximately four miles northeast of Baker City, in Baker County. The NHOTIC is one
2 of the largest of the Oregon Trail ACEC parcels, characterized by high recreational use, and
3 includes the interpretive center itself as well as adjacent land with walking trails and viewpoints
4 surrounding the center.²⁴⁵ The landscape to the east and southeast of the NHOTIC parcel
5 consists of the open terrain of the Virtue Flat area, with flat to gently rolling terrain in the
6 foreground that subtly transitions to steeper terrain in the middleground, views to the west
7 include the Elkhorn Mountains, a major landform focal to the view.²⁴⁶ Existing modifications to
8 the natural landscape character in the foreground include portions of the paved NHOTIC trail
9 system, several light fixtures in the parking area, and the Lode Mine building on the NHOTIC
10 property. An existing 230-kV transmission line is located to the west, the same direction as the
11 proposed facility location, and OR Highway 86 is visible beyond the NHOTIC property,
12 particularly from the trail system to the east. Agricultural and residential development within
13 the Baker Valley to the west, is also visible from the NHOTIC parcel. According to the BLM, the
14 scenic quality of the existing landscape for Oregon Trail ACEC NHOTIC parcel is considered
15 medium (class B) (BLM 1989). Landscapes ranked as Class A have the highest apparent scenic
16 quality, while landscapes ranked as Class C have the lowest.²⁴⁷

17
18 The proposed facility would be located within one mile of the NHOTIC main building and within
19 130 feet of the western boundary of the NHOTIC Parcel. Potential visual impacts of the
20 proposed facility within the NHOTIC parcel would include visual impacts from intermittent
21 views of transmission structures, typically from elevated vantage points. Taking into account
22 the mitigation discussed below and in this order, the applicant states that the proposed facility
23 would introduce low to medium magnitude impacts depending on tower and viewer location
24 within the NHOTIC parcel. The highest magnitude impacts, evaluated as medium, would be
25 experienced from the western portion of the parcel near Panorama Point and level 2 and 3
26 trails, as presented in ASC Exhibit L Attachment L-4, photo simulations 5-25C, and 5-25D. Views
27 of the proposed facility would be experienced from an elevated vantage point and would be
28 predominantly peripheral or intermittent such that viewer perception would be up to medium.
29 Impacts would slightly reduce the scenery adjacent to the NHOTIC parcel but would not alter
30 the overall scenic quality of the NHOTIC parcel such that resource change would be medium. As
31 described above, based on descriptions in the ASC Exhibit S and L and based upon staff
32 familiarity of the site, the Department concurs with the applicant's conclusion that the
33 proposed facility would be one of several developments contributing to the overall landscape
34 character and quality, therefore the existing landscape character would be retained within the
35 boundary of the ACEC and resource change would be medium.²⁴⁸

²⁴⁵ B2HAPPDoc3-20 ASC 12_ Exhibit L_Protected Areas_ASC 2018-09-28, Section 3.5.6, and Section 3.6.1. See also ASC Exhibit L, Attachment L-3, Section 3.15.

²⁴⁶ B2HAPPDoc3-20 ASC 12 Exhibit L Protected Areas ASC 2018-09-28, Section 3.5.6.2.

²⁴⁷ B2HAPPDoc3-35 ASC 18 Exhibit R Scenic Resources ASC 2018-09-28, Section 3.2.2.

²⁴⁸ B2HAPPDoc3-20 ASC 12 Exhibit L Protected Areas ASC 2018-09-28, Section 3.5.6.

1 As the applicant explains, the NHOTIC parcel was designated to preserve the unique historic
2 resource and visual qualities. The Oregon Trail ACECs, including NHOTIC, ~~was~~were specifically
3 designated to preserve the unique historic resource, the Oregon Trail, and visual qualities
4 within this geographic area. Because no development is proposed within a half mile corridor
5 centered on the Oregon Trail within the ACEC, the resource values for which the NHOTIC parcel
6 was designated to protect would not be impacted by the proposed transmission line.²⁴⁹
7 Additionally, recommended Historic, Cultural, and Archaeological Resources Condition 1 would
8 require that the proposed facility avoid direct impacts to Oregon Trail and National Historic
9 Trail resources. The number of towers visible would also vary depending on viewer position
10 within the ACEC. As discussed in detail in ASC Exhibit L, to mitigate for potential visual impacts,
11 the applicant proposes to use a modified tower structure, consisting of H-frame structure type
12 with a natina (brown-weathered coloring) for towers proposed to be located directly west of
13 the NHOTIC. There is an existing H-frame 230 kV transmission line in this area, visible from
14 NHOTIC, and the proposed modified tower structure in this location would reduce visual
15 impacts of the proposed facility by mimicking the existing H-frame 230 kV transmission line,
16 though the proposed facility would have larger structures and would be made of steel, not
17 wood. The recommended condition is further discussed in Section IV.J, *Scenic Resources*, and is
18 recommended Scenic Resources Condition ~~32~~. The condition would require the applicant to use
19 the modified structure (shorter tower height, natina finish, H-frame).

20
21 Additionally, Recommended Historic, Cultural, and Archaeological Resources Condition 2,
22 requires the submission of Attachment S-9, a final Historic Properties Management Plan
23 (HPMP). The HPMP includes applicant-represented mitigation measures which include but are
24 not limited to, the purchase of a conservation easement or land acquisition; interpretive
25 signage; or funding for public research or project benefiting the affected area for impacted
26 NHT/Oregon Trail segments. These types of measures, as presented in Table HCA-4b of this
27 order, would be consistent with Council’s definition of mitigation (OAR 345-001-0010(33) and
28 would therefore mitigate visual impacts within the shared viewshed of NHOTIC and the trail
29 segment.

30
31 It is also important to note that there were alternative route options previously proposed in the
32 area around NHOTIC, including a route to the east of Flagstaff Hill and the NHOTIC center
33 (“Virtue Flat alternative”), and other routes near the current proposed route. The route to the
34 east of the center was eliminated from consideration due to impacts to sage grouse habitat and
35 potential impacts to an important OHV recreation area. Alternative routes near the current
36 proposed route were eliminated to reduce impacts to irrigated agriculture. The proposed route
37 follows very close to the existing 230 kV transmission line in this area, including using the
38 existing 230-kV line right of way for the proposed facility and rebuilding the 230-kV line. Public
39 comments received during the notice of intent (NOI) scoping phase and comments received on

²⁴⁹ Id. See Section 3.3.2.5, page R-82.

1 the ASC and DPO from Baker County as a special Advisory Group for the EFSC review expressed
2 concerns about visual impacts at NHOTIC from the proposed location of the facility and
3 requested the applicant provide an evaluation of undergrounding the transmission line in this
4 area.²⁵⁰ In response to the comments the applicant provided a Class 5 engineering report and
5 cost estimate (ASC Exhibit BB Errata) prepared by Power Engineers, an engineering firm and
6 transmission line engineering consulting group.²⁵¹ The applicant's study makes two general
7 conclusions: 1) the costs to underground the approximately 1.6 mile 500 kV segment in this
8 area would be very high, approximately \$98.6 to 107.6 million more than building the segment
9 traditional overhead configuration, and 2) the ground disturbance from underground

²⁵⁰ B2HAPPDoc13-17 ASC Reviewing Agency Comment Baker County_Kerns 2018-12-14. In a comment on the ASC, Baker County Planning Department expressed concerns of potential visibility of the proposed facility at NHOTIC. The County disagreed with the applicant's conclusion that the proposed facility, even with the mitigation measures as described here (H frame, weathered finish, shorter structures), would result in less than significant visual impacts. Additionally, the county requested that the applicant fund a study of the costs and feasibility of undergrounding the proposed transmission line in the short segment (approximately 1.6 miles) directly west of, and visible from, NHOTIC, which the applicant completed (see ASC Exhibit BB Errata). In its comments on the DPO, Baker County acknowledged the information provided in the errata documents describing the potential impacts of an underground line in the area, and that the impacts to landowners would be unacceptable along the proposed route in proximity to the NHOTIC, however they assert that the visual impacts would still be significant. The Department notes that the County did not provide a discussion of the visual impact analysis provided by the applicant to support its position of significant visual impacts, after consideration of the recommended mitigation measures. B2HAPPDoc8-1 All DPO Comments Combined-Rec'd 2019-05-22 to 08-22; B2HAPPDoc8-003 DPO Special Advisory Group Comment Baker County Kerns 2019-08-22.

²⁵¹ Commenters maintain that a Class 3 study needs to be conducted using specifications to meet Baker County's need to protect the viewshed of NHOTIC and agricultural operations by placing the overhead transition stations on BLM land. The Department notes that the commenters do not provide an evaluation of the visual impact analysis provided by the applicant to support their position that undergrounding is a necessary form of mitigation for visual impacts. The applicant explains that a Class 5 estimate is appropriate and sufficient at this stage in the project's development, because it gives an order of magnitude comparison that assesses the financial viability of constructing an alternate underground transmission line at the referenced location instead of the planned overhead transmission line installation. Further, the applicant maintains that in order to complete a more specific estimate, topographical surveys, geotechnical and thermal investigations, and final design would generally be required to obtain more specific material and cost estimates—steps that typically are not completed until after all local, state, and federal authorizations have been obtained and land access has been secured. The Department notes that Division 21 application information requirements do not specifically require information about undergrounding transmission lines. Information about potential mitigation measures to reduce potential impacts is required for Exhibit R, Scenic Resources and Exhibit T, Recreational opportunities, but is not specially requested for protected areas. The applicant provides represented mitigation measures to reduce potential visual impacts to scenic and recreational resources as noted in this section and order. In ASC Exhibit BB, the applicant provided the undergrounding engineering report in response to comments received. Under OAR 345-021-0010(1)(bb), is the ASC location for any other information that the Department requests in the project order. The second amended project order does not require an evaluation of undergrounding the proposed transmission line. B2HAPPDoc13 DPO IPC Responses to Select DPO Comments Rec'd by 2019-11-07; B2HAPP DPO IPC Responses - StopB2H - 8. Historic Cultural Pioneer Resources 2019-11-04; B2HAPP DPO IPC Responses - StopB2H - 6. Geology, Soils, Carbon - First Supplemental Response 2019-11-07.

1 installation would be “substantially greater” than for an overhead transmission line.²⁵² The
2 underground installation would require large amounts of cut-and-fill because the area contains
3 hillslopes, as well as aboveground transition stations at approximately 2 acres per station and
4 splicing vaults, which are required where the transmission line transitions from aboveground to
5 belowground. Assuming a corridor of 100-foot wide for the entire length of underground
6 segment, this would have a direct surface impact of over 30 acres along the 1.5-mile length.²⁵³
7 The Department notes that information about undergrounding the proposed facility is not
8 required under OAR 345, Division 21; and more importantly, undergrounding is not proposed
9 by the applicant as part of the proposed facility, as an alternative to the proposed facility, or as
10 a potential mitigation measure to reduce potential visual impacts. As discussed in Section III.A.,
11 Transmission Corridor Selection, the Council’s standards for siting energy facilities do not
12 require that the applicant compare alternative corridors. Nor do they allow the Council to
13 evaluate and consider alternative routes not proposed in the application for site certificate.²⁵⁴ It
14 is unclear if the Council could impose undergrounding as a mitigation measure. “Mitigation” is
15 defined in OAR 345-001-0010(33) as, in part, “(A) avoiding the impact altogether by not taking a
16 certain action or parts of an action,” and “(B) minimizing impacts by limiting the degree or
17 magnitude of the action and its implementation.” Undergrounding *could* be considered as
18 “minimizing” impacts of the action if it was found that undergrounding did, in fact, minimize
19 the visual impact of the proposed facility to the extent that the mitigation reduced a potentially
20 significant adverse impact to a level that was less than significant, in compliance with an
21 applicable Council standard.

22

23 However, to the extent that undergrounding is viewed as mitigation for potentially significant
24 adverse visual impacts at NHOTIC, the Department emphasizes that the technology and
25 infrastructure needed to underground a transmission line would themselves create visual
26 impacts as well as potential impacts to other resources protected under the Council’s standards
27 and not evaluated in the ASC. As described here, therefore, the Department does not find that
28 undergrounding, if a viable mitigation option, is necessary for the proposed facility to comply

²⁵² Commenters contest the accuracy of the information in the underground engineering report and cost estimate including
the length to cost comparison, installation techniques including directional drilling, and that the total cost estimate in
the report is grossly inflated. The applicant provided responses to the DPO comments, however, an evaluation of
installation techniques, engineering, and costs associated with an energy facility proposed by the applicant is generally
out of the Council’s scope of review. Under ORS 469.401(4), the Council does not have jurisdiction over matters that are
not included in and governed by the site certificate, including design-specific construction or operating standards and
practices that do not relate to siting, as well as matters relating to employee health and safety, building code
compliance*** B2HAPPDoc13 DPO IPC Responses to Select DPO Comments Rec'd by 2019-11-07; B2HAPP DPO IPC
Responses - StopB2H - 6. Geology, Soils, Carbon - First Supplemental Response 2019-11-07; B2HAPP DPO IPC Responses
- StopB2H - 8. Historic Cultural Pioneer Resources 2019-11-04.

²⁵³ B2HAPPDoc3-59 ASC Exhibit BB - Errata Info 2019-03-28.

²⁵⁴ ORS 469.360(1) requires that “The Energy Facility Siting Council shall evaluate each notice of intent, site certificate
application or request for expedited review.” OAR 345-021-0010(1)(b) requires “information about the proposed
facility... including (A) A description of the proposed facility...” ASC Exhibit B, Section 3.2, describes the proposed facility.
This is contrasted with the federal government’s NEPA process, in which the lead agency must consider alternatives to a
proposed project when conducting its analysis.

1 with the Council's Protected Areas standard. For the reasons described here, the Department
2 does not conclude that the visual impacts of the proposed facility (including recommended
3 Scenic Resources Condition 32) to NHOTIC are significant, and does not find that additional
4 mitigation in the form of undergrounding are necessary to comply with the Council's Protected
5 Area standard.

6
7 Finally, the Department notes that in its Record of Decision (ROD), the BLM has authorized the
8 proposed facility in this area, which is an important consideration because the BLM is the
9 landowner and manager of NHOTIC. The EFSC Protected Areas standard adopts as protected
10 areas those areas that are designated by other government agencies, including BLM ACECs. As
11 such, by authorizing the route in its ~~Record of Decision (ROD)~~, the federal agency (BLM) that
12 administers the Management Plan for NHOTIC is authorizing the placement of the proposed
13 facility in this location, and above-ground as permissible within the scenic designations in the
14 Management Plan. Considering that the agency that manages the NHOTIC land and has
15 identified the NHOTIC ~~has~~ having significant or important scenic value has authorized the
16 proposed facility in the location proposed in the ASC, the Department considers this relevant
17 information with regard to the EFSC Protected Areas standard. Based on this analysis, and
18 considering the recommended mitigation, the Department recommends that the Council find
19 that visual impacts to the protected area would be less than significant.

20
21 *Owyhee River Below the Dam ACEC*

22
23 The Owyhee River below the Dam ACEC encompasses 11,239 acres and includes public land of
24 the Owyhee River canyon and its associated viewshed located just north of the Owyhee Dam.
25 The applicant describes the dominant attributes of the Owyhee River below the Dam ACEC
26 include the Owyhee River, narrow canyon bottom, and rugged canyon slopes and walls, all of
27 which contribute to the scenery of the area. A paved two-lane asphalt road runs through the
28 Owyhee River below the Dam ACEC, paralleling the river.²⁵⁵

29
30 Citing BLM's 2002 Southeastern Oregon Resource Management Plan, in ASC Exhibit L the
31 applicant explains the relevant and important values of the Owyhee River below the Dam ACEC
32 are identified as "high scenic values of diverse landscape elements in a substantially natural
33 setting, a special status plant species (Mulford's milkvetch), the rare presence of a black
34 cottonwood gallery in a riverine system, and the combined wildlife values of diverse habitat
35 types supporting a large number of wildlife species and an important migratory corridor for
36 neotropical birds." The Owyhee River below the Dam ACEC receives some of the highest
37 recreational use within the Southeastern Oregon planning area and is also designated as a
38 Special Recreation Management Area. The area is managed for visual resources pursuant to
39 VRM Class II objectives under the Southeastern Oregon Resource Management Plan.²⁵⁶

40

²⁵⁵ Id. See also ASC Exhibit L, Attachment L-3, Section 3.20.

²⁵⁶ Id.

1 As described in ASC Exhibit L, in evaluating alternatives for the proposed transmission line, the
2 applicant concluded that, as originally proposed, the transmission line could potentially result in
3 significant visual impacts to the Owyhee River ACEC. Consequently, mitigation options were
4 considered aimed at minimizing adverse impacts, including: (1) relocating the 175-foot tower to
5 an alternate location (Option 1); and (2) reducing the height of the structure and moving it to
6 an alternate location (Option 2). As described below, the proposed facility incorporates Option
7 1 and is now located to the north of the previous proposal, aligned with the existing utility
8 corridor administered by the BLM.²⁵⁷

9
10 The proposed facility would be approximately 249 feet outside of the Owyhee River Below the
11 Dam ACEC. Two structures would be visible from the Lower Owyhee Canyon Watchable Wildlife
12 Area interpretive site. The structures would be sited approximately 0.75-1.0 mile from the
13 interpretive site. As described by the applicant, the geometrical form and smooth texture of the
14 tower, though visible, would introduce weak contrast against the surrounding steep to rolling
15 hills and valley walls, brown to red color, and rough texture of the rock. Because of the steep
16 canyon walls and enclosed landscape character at the interpretive site, the applicant concludes
17 the towers would appear “subordinate” on the landscape. The application includes a
18 photosimulation of this location in ASC Exhibit L, Attachment L-4, Figure L-4-9 and -10.

19
20 Considering the ACEC as a whole, the applicant explains that viewers would primarily be within
21 the background distance zone, and the steep topography and winding river valley would block
22 most views of the transmission line from the middleground distance zone. The Snively Hot
23 Springs recreation site is outside of the modeled viewshed and would not be impacted.

24
25 Views of the proposed facility from Owyhee Lake Road would be primarily intermittent due to
26 screening by topography. When viewed from the interpretive site, the transmission line
27 features would be primarily behind or adjacent to the viewer, and therefore considered
28 primarily peripheral. Viewer perception would be low. The application states that the proposed
29 facility would result in long-term visual impacts to the Owyhee River below the Dam ACEC,
30 which would be medium intensity as measured by medium resource change, and low viewer
31 perception. However, the Owyhee River Below the Dam ACEC would continue to provide the
32 scenic resource value and recreation opportunity identified as valued attributes of the Owyhee
33 River Below the Dam ACEC, since the transmission line features would not be visible from the
34 majority of the canyon where specific scenic features have been identified in the 2002
35 Southeastern Oregon Resource Management Plan. VRM Class II objectives would be achieved
36 within the Owyhee River below the Dam ACEC, since the landscape character and quality of the
37 resource would not change.²⁵⁸ It is also important to note that the proposed facility was
38 purposefully sited outside of the ACEC itself, and the Department understands that this
39 decision was made by the BLM and finalized on the Record of Decision (ROD). It is also noted
40 that this decision by the BLM moved the facility from public land (BLM land) onto a short

²⁵⁷ Id.

²⁵⁸ Id.

1 crossing of private land. Also, as shown on Attachment L, Figure L-3-20, the proposed facility is
2 within a BLM designated utility corridor until it must exit the corridor at the northern point of
3 the ACEC, which is the location where the proposed facility would cross Owyhee Lake Road and
4 be somewhat visible from the interpretive site; however, here, based on the BLM's decision,
5 the facility leaves public (BLM) land in order to avoid impacting the BLM ACEC, but as a
6 consequence, crosses private land. For purposes of the Council's Protected Area standard, this
7 routing decision does result in reduced visual impacts to the ACEC, but at a trade-off with
8 impacts to other resources, namely private farmland.

9
10 As described in Section IV.J., *Scenic Resources*, the BLM reclassified the area crossed by the
11 proposed facility from VRM Class II to VRM Class IV. By issuing this route in its ROD, the federal
12 agency (BLM) that administers the Management Plan for Owyhee River is authorizing the
13 placement of the proposed facility in this location indicating that it is permissible within the
14 scenic designations in the Management Plan. To the extent that the Council must consider the
15 visual impacts to a resource, decisions of land-managers who administer their management
16 plans and resource designations, the Council may consider this information in its evaluation of
17 visual impacts to protected areas. Considering that the agency that manages the Owyhee River
18 Below the Dam ACEC and has identified the Owyhee River as having significant or important
19 scenic value has also authorized the proposed facility in the location proposed in the ASC, the
20 Department considers this relevant information.²⁵⁹

21
22 Based on this analysis, and considering the proposed mitigation, the Department recommends
23 that the Council find that visual impacts to the protected area would be less than significant.

24 *Oregon Trail ACEC - Straw Ranch 1 Parcel*

25
26
27 The Straw Ranch Parcel 1 is one of the seven Oregon Trail ACEC parcels within the Baker
28 Resource Management Area. There are no recreation facilities within the Straw Ranch
29 Parcel 1.²⁶⁰

30
31 Existing development visible from the Straw Ranch ACEC Parcel 1 includes I-84 immediately to
32 the south, a gravel quarry to the northwest, scattered residential and ranching development,
33 gravel surface roads, and existing 69-kV and 138-kV transmission lines that cross through the
34 southern half of the Straw Ranch Parcel 1 in an east to west direction. The natural landscape
35 features are co-dominant with the development, with expansive views across the landscape in
36 all directions providing some evidence of the historic landscape of the Oregon Trail. BLM
37 ranked the scenic quality as low (class C).²⁶¹

²⁵⁹ B2HAPPDoc8-002 DPO Applicant Comment IPC Stokes 2019-06-20 to 08-22.

²⁶⁰ B2HAPPDoc3-20 ASC 12_Exhibit L_Protected Areas_ASC 2018-09-28, Section 3.5.6. See also Exhibit L, Attachment L-3, Section 3.17.

²⁶¹ Id.

1 The proposed transmission towers would lower the quality of Straw Ranch Parcel 1's adjacent
2 scenery. However, this change would result in only a small reduction in scenic quality. The
3 scenic quality class would not change and the cultural landscape character would be
4 maintained, as described in Exhibit L. Viewer perception would be medium, as views of the
5 proposed route would be equally head-on and peripheral and experienced generally from a
6 neutral vantage point.

7
8 As shown on ASC Exhibit L, Attachment L-3, Figure L-3-17, there are two existing transmission
9 lines that cross the parcel, and the proposed facility was purposefully routed to the north of
10 and to avoid directly crossing the Straw Ranch 1 ACEC. ~~Additionally, r~~Recommended Historic,
11 Cultural, and Archaeological Resources Condition 1 would require that the proposed facility
12 avoid direct impacts to Oregon Trail and National Historic Trail resources. Additionally,
13 Recommended Historic, Cultural, and Archaeological Resources Condition 2, requires the
14 submission of Attachment S-9, a final Historic Properties Management Plan (HPMP). The HPMP
15 includes applicant-represented mitigation measures which include but are not limited to, the
16 purchase of a conservation easement or land acquisition; interpretive signage; or funding for
17 public research or project benefiting the affected area for impacted NHT/Oregon Trail
18 segments. These types of measures, as presented in Table HCA-4b of this order, would be
19 consistent with Council's definition of mitigation (OAR 345-001-0010(33) and would therefore
20 mitigate visual impacts within the shared viewshed of the Straw Ranch parcel and the trail
21 segment. The BLM, the agency that manages the Straw Ranch 1 ACEC has approved the
22 facility in this location. Based on this analysis, the Department recommends that the Council
23 find that visual impacts to the protected area would be less than significant

24
25 *Oregon Trail ACEC – Birch Creek Parcel*

26
27 The Birch Creek Parcel of the Oregon Trail ACEC includes 119 acres encompassing the Oregon
28 National Historic Trail. It is located in Malheur County, approximately two miles south of
29 Farewell Bend and is an important landmark of the National Historic Oregon Trail. This segment
30 of the trail was historically used as a camping area on approach to the Snake River at Farewell
31 Bend. Features at the site include a parking turnout, a wagon rut swale within a fenced
32 enclosure, a short trail adjacent to the ruts, and interpretive panels. The area around the Birch
33 Creek Parcel is characterized by a mixture of privately owned rangeland and federal lands
34 managed by the BLM. The Birch Creek Parcel has a historic landscape character because of the
35 Historic Oregon Trail and relative lack of additional development in the foreground. A wind
36 power facility is present on the ridge to the north and is visible from the ACEC. The BLM Visual
37 Resource Management (VRM) system characterizes the overall scenic quality low (class C), due
38 to the simplicity and uniformity of land form, colors and textures of the landscape. Viewers
39 include tourists and historic trail enthusiasts.²⁶²

40

²⁶² B2HAPPDoc3-20 ASC 12_Exhibit L_Protected Areas_ASC 2018-09-28, Section 3.5.6 and Section 3.6.2 See also ASC Exhibit L, Attachment L-3, Section 3.13.

1 The proposed facility in this area would include the rebuild of 1.1 miles of the existing Quartz
 2 to Weiser 138-kV transmission line to a new ROW, and the 500 kV proposed transmission line
 3 would be located in the existing 138-kV transmission line ROW, which is owned and operated
 4 by the applicant. In proposing to site the proposed transmission line at this location, and to
 5 reduce visibility from the ACEC parcel, the applicant has located the line as far north as feasible
 6 without encroaching on active agricultural areas.²⁶³ The applicant has included visual
 7 photosimulations of the proposed facility in the area of Birch Creek ACEC, included in ASC
 8 Exhibit L, Attachment L-4, Figures L-4-7 and 8. To further reduce visibility, the applicant
 9 proposes to use shorter stature H-frame structures ranging in height from 65 to 100 feet for
 10 towers between MP 198 and MP 199. This structure type, combined with constructing towers
 11 at lower elevations than the ACEC, would minimize the proportion of the facility that could be
 12 viewed from the ACEC due to screening by topography.²⁶⁴ To ensure compliance with this
 13 proposal, Scenic Resources Condition 3-4 would require the applicant to incorporate these
 14 mitigation measures. Additionally, Recommended Historic, Cultural, and Archaeological
 15 Resources Condition 2, requires the submission of Attachment S-9, a final Historic Properties
 16 Management Plan (HPMP). The HPMP includes applicant-represented mitigation measures
 17 which include but are not limited to, the purchase of a conservation easement or land
 18 acquisition; interpretive signage; or funding for public research or project benefiting the
 19 affected area for impacted NHT/Oregon Trail segments. These types of measures, as presented
 20 in Table HCA-4b of this order, would be consistent with Council’s definition of mitigation (OAR
 21 345-001-0010(33) and would therefore mitigate visual impacts within the shared viewshed of
 22 the Birch Creek Parcel and the trail segment.

23
 24 With its proposed mitigation measures, views of the towers would still primarily be head-on
 25 and experienced by both stationary and transient viewers. The applicant’s analysis indicates
 26 that, though visible, the 500 kV transmission towers would not substantially lower the quality
 27 of the adjacent scenery outside the Birch Creek ACEC Parcel. The landscape character would
 28 remain historic due to the prominence of natural features in the viewshed; and the overall
 29 scenic quality of the landscape would remain low (“class C”). Because the proposed facility
 30 would be sited outside the Birch Creek ACEC Parcel, there would be no changes to the
 31 landscape within the boundary of the Birch Creek ACEC Parcel. The proposed facility would
 32 conform to VRM Class II objectives within the Birch Creek Parcel, and is therefore consistent
 33 with BLM’s VRM direction to protect visual values within the Birch Creek Parcel.²⁶⁵ As discussed

²⁶³ Upon review of a draft of the ASC, the Department requested that the applicant consider “potential mitigation measures such as alternative structure finishes (e.g., natina finish) and alternative structure types (e.g., H-frame) and then prepare visual simulation and re-conduct the impact assessment to scenic resources at Birch Creek ACEC.” ASC Exhibit L, pages L-45 through L-46. As discussed in detail in ASC Exhibit L, pages L-46 through L-47, the applicant evaluated different types and locations of structures and, ultimately, determined that the proposed “Birch Creek North Route” would effectively mitigate impacts and ensure no adverse visual impacts on this protected area.

²⁶⁴ B2HAPPDoc3-20 ASC 12_Exhibit L_Protected Areas_ASC 2018-09-28, Section 3.5.6.

²⁶⁵ Id.

1 elsewhere in the Protected Area and Scenic Resources sections of this order, the BLM approved
 2 the proposed facility route in this area and amended the Southeastern Oregon Resource
 3 Management Plan to reclassify the area potentially impacted by the proposed facility from VRM
 4 Class III to VRM Class IV. The Department considers this relevant information for Council to
 5 consider in its evaluation of the applicable standards.²⁶⁶ Additionally, as shown on ASC Exhibit L,
 6 Attachment L-3, Figure L-3-13, the proposed facility in this area exits a BLM designed utility
 7 corridor just east of the ACEC; the proposed facility would then utilize the existing 138 kV
 8 corridor so as to not create a new ROW, and then the proposed facility trends
 9 northwest/southeast in order to reenter the BLM utility corridor along I-84. In this area, the
 10 Department concludes that the proposed facility has been sited to reduce impacts to the Birch
 11 Creek ACEC parcel, while reducing impacts to other lands (including farming and sage grouse
 12 habitat in this area) as well as staying along the BLM utility corridor near I-84.²⁶⁷ Additionally,
 13 recommended Historic, Cultural, and Archaeological Resources Condition 1 would require that
 14 the proposed facility avoid direct impacts to Oregon Trail and National Historic Trail resources.
 15 Based on this analysis, and considering the proposed mitigation, the Department recommends
 16 that the Council find that visual impacts to the protected area would be less than significant.

17 *Oregon Trail ACEC – Tub Mountain Parcel*

18
 19
 20 The Oregon National Historic Trail Area of Critical Environmental Concern (ACEC) – Tub
 21 Mountain Parcel is a long, narrow geographic area located in northeastern Malheur County.
 22 The Tub Mountain Parcel includes approximately 5,900 acres of BLM-administered lands. The
 23 Tub Mountain Parcel includes one interpretive site at Alkali Springs, which was the “nooning”
 24 spot for wagon trains leaving Vale. The Tub Mountain Parcel is remote and accessible only by
 25 local gravel roads. The Tub Mountain Parcel is managed under the BLM’s Southeastern Oregon
 26 Resource Management Plan to maintain the integrity of the historic landscape; scenery is
 27 considered a valued attribute. BLM manages this area according to VRM Class II objectives,
 28 meaning that the change in landscape character should be low and the existing landscape
 29 character retained within the VRM Class II boundary.²⁶⁸

30
 31 The proposed facility would traverse along the eastern and southern boundary of the Tub
 32 Mountain Parcel at a distance of 0.5 mile at its closest point, approximately 1.5 miles east of
 33 the Alkali Springs interpretive site. The transmission towers and conductors would be partially
 34 screened from view by rolling terrain in the foreground. The transmission towers would be the
 35 primary source of visual contrast experienced from the Tub Mountain Parcel.

36
 37 Viewers from Alkali Springs would have views of the proposed route transmission towers to the
 38 east, which would be partially blocked by vegetation with the result that the proposed towers
 39 would appear co-dominant with the landscape and produce moderate visual contrast. While

²⁶⁶ [B2HAPPDoc8-002 DPO Applicant Comment_IPC Stokes 2019-06-20 to 08-22.](#)

²⁶⁷ Id. ASC Exhibit L, Attachment L-3, Figure L-3-13.

²⁶⁸ Id. See also ASC Exhibit L, Attachment L-3, Section 3.19.

1 traveling along Old Oregon Trail Road or the Oregon Trail route, the proposed facility would be
2 generally located to the east, and most towers would either not be visible or only the top
3 portions would be visible. Some towers would be sky-lined and some “backdropped” depending
4 on location within the Tub Mountain Parcel, which would introduce moderate to strong visual
5 contrast. Views of the proposed route would primarily be experienced from a neutral vantage
6 point and would be peripheral and intermittent due to topographic screening.

7
8 The transmission line has been sited outside the Tub Mountain Parcel, and there would be no
9 change to the landscape within the boundary of the lands managed under VRM Class II.
10 Consequently, the applicant concludes that the proposed facility would conform to the BLM
11 management standard and is consistent with BLM’s management of the Tub Mountain Parcel’s
12 visual qualities.²⁶⁹ As shown on ASC Exhibit L, Attachment L-3, Figure L-3-19, the proposed
13 facility has been sited in this area to avoid other impacts, specifically sage grouse habitat, and is
14 also located on BLM land to avoid private land. Additionally, the proposed route in this area
15 connects to a BLM designated utility corridor northeast of the Tub Mountain ACEC near I-84
16 Highway, and the location of the route minimizes impacts to multiple resources, recognizing
17 that there ~~would~~ will be visual impacts to the Tub Mountain ACEC. ~~Additionally,~~
18 ~~R~~Recommended Historic, Cultural, and Archaeological Resources Condition 1 would require that
19 the proposed facility avoid direct impacts to Oregon Trail and National Historic Trail resources.

20
21 Additionally, the Alkali Springs Trail Segment is discussed in Section IV.K., Historic, Cultural, and
22 Archaeological Resources and addressed in Recommended Historic, Cultural, and
23 Archaeological Resources Condition 2, which requires the submission of Attachment S-9, a final
24 Historic Properties Management Plan (HPMP). The HPMP includes applicant-represented
25 mitigation measures which include but are not limited to, the purchase of a conservation
26 easement or land acquisition; interpretive signage; or funding for public research or project
27 benefiting the affected area for impacted NHT/Oregon Trail segments. These types of
28 measures, as presented in Table HCA-4b of this order, would be consistent with Council’s
29 definition of mitigation (OAR 345-001-0010(33) and would therefore mitigate visual impacts
30 within the shared viewshed of the Alkali Springs Trail Segment. The BLM, the manager of Tub
31 Mountain ACEC and the land upon which the proposed route is located in this area (which is
32 not Tub Mountain ACEC) has approved the proposed facility route via its ROD. Based on this
33 analysis, the Department recommends that the Council find that visual impacts to the
34 protected area would be less than significant.

35
36 *Farewell Bend State Recreation Area*

37
38 Farewell Bend State Recreation Area is an Oregon state park administered by OPRD. It is
39 located about 3 miles southeast of Huntington in Baker County on the western shore of

²⁶⁹ Id.

1 Brownlee Reservoir (Snake River). Although there is no management plan for the Farewell Bend
2 State Recreation Area, OPRD includes scenery as one of the park’s attributes for visitor
3 enjoyment; therefore, visual resources are considered a valued attribute to this resource.²⁷⁰
4

5 The applicant states that the proposed facility would have “medium magnitude” impacts from
6 the proposed facility, specifically from 500-kV towers placed approximately 0.7 mile from the
7 Farewell Bend State Recreation Area, to the west and southwest of the park. The structures
8 would introduce moderate visual contrast and appear “co-dominant.”
9

10 As mitigation for the potential visual impacts to Birch Creek, located south of Farewell Bend, in
11 this area the applicant proposes to use H-Frame structures with heights of 65 to 100 feet in the
12 segment from MP 197.9 to MP 199.1 to reduce the scale of the structures (recommended
13 Scenic Resources Condition ~~43~~ 43). Although developed for impacts to Birch Creek, impacts to the
14 Farewell Bend protected area are also minimized by the reduced scale of these structures.
15

16 Views of the proposed transmission towers would be head-on and peripheral, depending on
17 where the viewer is located within the Farewell Bend State Recreation Area, and would
18 generally be experienced from a neutral vantage point such that viewer perception would be
19 medium. Views of the Brownlee Reservoir from the Farewell Bend State Recreation Area, the
20 primary scenic attribute, would not be affected. As is further described in Attachment L-3,
21 Section 3.6, and shown on Figure L-3-6, the primary views at the park are to the reservoir
22 (Snake River), while the proposed facility would be away from the reservoir and “behind” a
23 person looking towards the reservoir. Additionally, as shown on Figure L-3-6, I-84 is between
24 the park and the proposed facility.²⁷¹ Based on this analysis, the Department recommends that
25 the Council find that visual impacts to the protected area would be less than significant.
26

27 *Oregon Trail ACEC - Powell Creek Parcel*
28

29 The Powell Creek Parcel is one of the seven Oregon Trail ACEC parcels within the Baker
30 Resource Management Area and is located slightly east of I-84, approximately 0.6 mile
31 southeast of Dixie and 5 miles north of Lime, in Baker County.²⁷²
32

33 The Powell Creek Parcel sits slightly above I-84 and the Burnt River. Existing development
34 includes I-84 and existing 69- and 138-kV transmission lines located approximately 0.3 mile to
35 the west of the Powell Creek Parcel, and existing gravel-surfaced roads that travel through the
36 Powell Creek Parcel and along the western boundary. The application describes that this
37 existing development competes for visual attention with the natural features of the landscape

²⁷⁰ Id.

²⁷¹ Id. See also ASC Exhibit L, Attachment L-3, Section 3.6.

²⁷² B2HAPPDoc3-20 ASC 12_Exhibit L_Protected Areas_ASC 2018-09-28, Section 3.5.6. See also Exhibit L, Attachment L-3, Section 3.16.

1 and is co-dominant. The landscape provides some evidence of the historic landscape of the
2 Oregon Trail. The scenic quality of the existing landscape for the Oregon Trail ACEC – Powell
3 Creek Parcel is considered low (class C) by the BLM.²⁷³
4

5 The proposed facility would be located about 1.2 miles to the east of the Powell Creek Parcel.
6 However, as described in ASC Exhibit L, views of the proposed route would be largely shielded
7 by topography between the ACEC parcel and the facility. Improvements would be made to an
8 existing road located to the southwest of the parcel, across I-84. An approximately 735-acre
9 multi-use area would be located to the southwest along Rye Valley Road. Three sky-lined
10 towers would appear prominent on the ridgeline, as these structures support the span of the
11 conductor across Rye Valley Road.²⁷⁴
12

13 The Powell Creek Parcel was designated to preserve the unique historic resource of the Oregon
14 Trail, and visual qualities within this geographic area. Although the transmission line would
15 result in visual impacts to some locations at the Powell Creek Parcel, the applicant's assessment
16 is that these impacts would not preclude its ability to provide the scenic value for which it was
17 designated.²⁷⁵ As is shown on Exhibit L, Attachment L-3, Figure L-3-16, the Power Creek Parcel
18 is located across I-84 from the proposed facility. Additionally, recommended Historic, Cultural,
19 and Archaeological Resources Condition 1 would require that the proposed facility avoid direct
20 impacts to Oregon Trail and National Historic Trail resources. Additionally, while the large MUA
21 would be visible during construction, after construction was completed the MUA would be
22 restored. Based on this analysis, the Department recommends that the Council find that visual
23 impacts to the protected area would be less than significant.
24

25 *Umatilla National Wildlife Refuge*

26

27 The Umatilla National Wildlife Refuge is part of the Mid-Columbia River National Wildlife
28 Refuge complex in Morrow and Umatilla Counties. The Umatilla National Wildlife Refuge is
29 managed under the Umatilla National Wildlife Refuge Comprehensive Conservation Plan. The
30 first priority of each refuge, according to the comprehensive plan, is to conserve, manage, and
31 if needed, restore fish and wildlife populations and habitats. Scenery is not specifically
32 identified as a valued attribute for which the area was designated a National Wildlife Refuge.
33

34 The Columbia River is located along the northern boundary of the Umatilla National Wildlife
35 Refuge. Existing 500- and 230-kV transmission lines run north and south of the McCormack
36 Unit, located in the southeast portion of the Umatilla National Wildlife Refuge, along with
37 several major highways, including I-84 to the south.²⁷⁶
38

273 Id.

274 Id.

275 Id.

276 Id.

1 The proposed facility would be located approximately 1.3 miles from the National Wildlife
2 Refuge. In this area the towers would be “sky-lined,” meaning sited on or near a ridgeline and
3 silhouetted against the sky. It is also possible that views from the Refuge to the proposed
4 facility could include Longhorn Station. However, the facility would be partially obstructed by
5 the two existing transmission lines (BPA transmission lines) that are located between the
6 National Wildlife Refuge and the proposed transmission line. According to the comprehensive
7 plan, scenery is not considered a specific valued attribute for which the National Wildlife
8 Refuge was designated (rather, the primary purpose is to protect wildlife and habitat). It is
9 important to also note that most vantage points from the Umatilla National Wildlife Refuge to
10 the proposed facility would have to look across the Port of Morrow, urban development, state
11 route 730, a railroad, existing BPA transmission lines, and other development features.²⁷⁷ Based
12 on the analysis presented here, the Department recommends that the Council find that visual
13 impacts to the protected area would be less than significant.

14
15 *Powder River Wild and Scenic River*

16
17 The Powder River is designated as a scenic river for 11.7 miles, covering 2,385 acres, from the
18 Thief Valley Dam to Oregon Highway 203 within the BLM Vale District, in Baker County. Scenery
19 is identified as an “Outstandingly Remarkable Value” for this segment of the river. As the
20 applicant explains, the Powder River flows through a rugged canyon with scenic geologic
21 formations. Recreation opportunities include boating in the spring, fishing, and hunting,
22 although access is limited. The Wild and Scenic Rivers segment is located within the Powder
23 River Canyon ACEC.²⁷⁸

24
25 The applicant states that the proposed facility would have medium magnitude impacts
26 associated with 500-kV towers, but that the towers would be located at distances of 1.6 miles
27 or more. These medium magnitude impacts would be limited to the uplands portion of the river
28 and ACEC, and not affect the scenery within the river canyon itself, from which no visibility of
29 the proposed facility is anticipated. The proposed facility would lower the quality of adjacent
30 scenery in upland portions of the resource; however, the overall scenic quality and landscape
31 character would not change, and resource change would be medium. Viewers would primarily
32 be located near the bottom of the canyon where the transmission line would not be visible, so
33 viewer perception would be low. As such, visual impacts of the ACEC would be medium
34 intensity, but with low intensity impacts to the river corridor, the primary location of most
35 users of the ACEC and river. The application further explains that the scenic quality of this
36 resource following construction of the proposed transmission line is the result of the combined
37 influence of the transmission line along with other “past or present actions,” including an
38 existing 230-kV transmission line, which would appear subordinate to the natural appearing
39 landscape character.²⁷⁹

²⁷⁷ Id. See also ASC Exhibit L, Attachment L-3, Section 3.2.

²⁷⁸ Id.

²⁷⁹ Id.

1 The Powder River Canyon ACEC was designated to preserve scenic values of the Powder River
2 Canyon. As such, if the scenic resources within the geographic boundary of the Powder River
3 Canyon ACEC are maintained, the resource values for which the Powder River Canyon ACEC was
4 designated to protect would also continue. Additionally, because recreation activities would be
5 focused near the bottom of the canyon where the transmission line would not be visible, visual
6 impacts would not disrupt recreation activities for which the Powder River Canyon ACEC is also
7 managed to protect. The proposed transmission line would not preclude the scenic
8 Outstandingly Remarkable Value for which the Powder River Canyon ACEC was designated.²⁸⁰
9 Based on this analysis, the Department recommends that the Council find that visual impacts to
10 the protected area would be less than significant.

11
12 *Powder River Canyon ACEC*
13

14 The Powder River Canyon ACEC is managed to protect raptor habitat, wildlife habitat, and
15 cultural resources and to maintain scenic qualities while allowing for compatible recreation
16 uses. The Powder River Wild and Scenic Rivers segment is located within the Powder River
17 Canyon ACEC. The Powder River Canyon ACEC includes approximately 5,880 acres.²⁸¹ The
18 Powder River Wild and Scenic River was considered a separate protected area by the applicant,
19 and is described and evaluated above.

20
21 As explained by the applicant in Exhibit L, the 11.7 miles of the Powder River Wild and Scenic
22 Rivers segment of the Powder River flows through a rugged, incised canyon with steep walls,
23 jagged outcrops, and geologic formations recognized for their outstanding scenic quality. The
24 portion of the Powder River Canyon ACEC above the canyon appear flat to gently rolling with
25 low-growing grass and shrub vegetation that stipples the landscape. Existing development in
26 the area includes dirt roads within the Powder River Canyon ACEC and an existing 230-kV
27 transmission line visible to the west. Wind turbines are visible in the distance outside of the
28 Powder River Canyon ACEC boundary. Although there is existing development within and visible
29 from the Powder River Canyon ACEC, the landscape character is naturally appearing. The BLM
30 ranks the scenic quality of the Powder River Canyon ACEC as medium (class B).²⁸²

31
32 The proposed facility would be located approximately 1.4 miles or more from the ACEC. The
33 facility would be visible from the uplands portion of the ACEC, and would not affect the scenery
34 within the canyon itself. While the proposed facility would lower the quality of the Powder
35 River Canyon ACEC's adjacent scenery in upland portions of the ACEC, viewers would primarily
36 be located near the bottom of the canyon where the proposed route would not be visible, so
37 viewer perception would be low. The proposed facility would not be visible from the wild and
38 scenic river, which contains "Outstandingly Remarkable Value," and the primary importance of

²⁸⁰ Id.

²⁸¹ Id. See also ASC Exhibit L, Attachment L-3, Section 3.21.

²⁸² Id.

1 the ACEC is protecting the value of the Powder River and particularly the wild and scenic
2 portion of the river. The proposed facility would not visually impact the wild and scenic river.²⁸³
3 Based on this analysis the Department recommends that the Council find that visual impacts to
4 the protected area would be less than significant.

5

6 *Lindsay Prairie Preserve / State Natural Heritage Area*

7

8 The Lindsay Prairie Preserve/State National Heritage Area is a small preserve owned and
9 managed by The Nature Conservancy in Morrow County, south of the NWSTF Boardman. The
10 Lindsay Prairie Preserve includes approximately 377 acres and is dominated by bluebunch
11 wheatgrass and Sandberg's bluegrass, a habitat type that is extremely rare in the Columbia
12 Basin. According to The Nature Conservancy, the Preserve is not managed for scenery, and its
13 purpose is dedicated to preservation of rare grassland habitat. Therefore, scenery is not
14 considered a valued attribute for which the area was designated.²⁸⁴

15

16 While the Lindsay Prairie Preserve is primarily located within a small canyon, the landscape also
17 includes a small upland plateau above the canyon. Views from the upland plateau are open and
18 panoramic; however, human development includes roads, a gravel quarry, agricultural fields, an
19 existing 69-kV transmission line along the western border, and dispersed rural development.
20 The area has a cultural landscape character. The BLM VRM ranks the scenic quality as Class C.²⁸⁵

21

22 Proposed transmission towers would be located approximately 1.6 miles from the Lindsay
23 Prairie Preserve. Views from the majority of Lindsay Prairie Preserve would be experienced
24 from within the canyon and would be primarily blocked and intermittent such that viewer
25 perception would be low. Scenery is not considered a valued attribute for which the area was
26 designated. Additionally, an existing BPA transmission line is in the area adjacent to the
27 preserve.²⁸⁶ Based on this analysis, the Department recommends that the Council find that
28 visual impacts to the protected area would be less than significant.

29

30 **Conclusions of Law**

31

32 Based on the foregoing findings and the evidence in the record, and subject to compliance with
33 the recommended conditions of approval, the Department recommends the Council conclude
34 that, taking into account mitigation, the design, construction and operation of the proposed
35 facility, including proposed and alternative routes, is not likely to result in significant adverse
36 impacts to any protected areas, in compliance with the Council's Protected Areas standard.

²⁸³ Id.

²⁸⁴ Id.

²⁸⁵ Id. (citing 1986 BLM VRM inventory).

²⁸⁶ Id. See also ASC Exhibit L, Attachment L-3, Section 3.10

1 **IV.G. Retirement and Financial Assurance: OAR 345-022-0050**

2
3 *To issue a site certificate, the Council must find that:*

4
5 *(1) The site, taking into account mitigation, can be restored adequately to a useful, non-*
6 *hazardous condition following permanent cessation of construction or operation of the*
7 *facility.*

8
9 *(2) The applicant has a reasonable likelihood of obtaining a bond or letter of credit in a*
10 *form and amount satisfactory to the Council to restore the site to a useful, non-*
11 *hazardous condition.*

12
13 **Findings of Fact**

14
15 The Retirement and Financial Assurance standard requires a finding that the facility site can be
16 restored to a useful, non-hazardous condition at the end of the facility’s useful life, should
17 either the certificate holder stop construction or should the facility cease to operate.²⁸⁷ In
18 addition, it requires a demonstration that the applicant can obtain a bond or letter of credit to
19 restore the site to a useful, non-hazardous condition.

20
21 *Restoration of the Site Following Cessation of Construction or Operation*

22
23 OAR 345-022-0050(1) requires the Council to find that the proposed facility site can be restored
24 to a useful non-hazardous condition at the end of the proposed facility’s useful life, or if
25 construction of the facility were to be halted prior to completion. The applicant states that the
26 proposed facility’s useful life is in excess of 100 years. As noted in Section IV.B., Organizational
27 Expertise, the applicant is a wholly owned subsidiary of IDACORP, Inc. Idaho Power Company
28 that was originally incorporated in 1915. The applicant explains that it designs, constructs, and
29 operates its transmission system with the intent that the system’s transmission lines and
30 related facilities (including stations) will remain in service in perpetuity.²⁸⁸ The applicant has
31 never retired a transmission line because of the high demand for transmission services, high
32 cost of building new transmission lines, and the intrinsic value of transmission rights-of-way, it
33 rarely is logical to retire a transmission line project. The applicant explains that while
34 components of transmission facilities may be replaced over time with new materials and
35 hardware, the applicant designs, constructs, and operates the components of its transmission
36 system for indefinite service.²⁸⁹ Based on the applicants explanation of operating its
37 transmission system for over 100 years and maintains it to operate it in perpetuity, the

²⁸⁷ OAR 345-022-0050(1).

²⁸⁸ B2HAPPDoc3-40 ASC 23 Exhibit W Retirement_ASC 2018-09-28.

²⁸⁹ B2HAPPDoc3-40 ASC 23_Exhibit W_Retirement_ASC 2018-09-28, Section 3.1 and B2HAPPDoc3-21 ASC 13_Exhibit M_Financial Capability_ASC 2018-09-28, Section 3.2.1.

1 Department concurs that 100 year lifetime is a reasonable estimated useful life for the
2 proposed facility.

3
4 As described by the applicant in ASC Exhibit W, restoring the site to a useful, nonhazardous
5 condition would involve removal of the transmission line (including all support structures,
6 conductors, overhead shield wires, and communication sites) and the following components at
7 the switching station: interconnecting bus system, switches, breakers, and instrumentation for
8 the control and protection of the equipment.²⁹⁰ The foundations for each support structure
9 would be removed to a depth of three feet below grade within land zoned EFU and to a depth
10 of one foot below grade (depending on ground slope) in all other areas. All structure locations
11 and access roads would be restored to a useful, nonhazardous condition that would be
12 consistent with the site's zoning and suitable for uses comparable to surrounding land uses.²⁹¹
13 Following gravel removal at the locations of tower pads and communication stations, these
14 sites would be re-graded as necessary (for restoration of natural contours) and then re-
15 seeded.²⁹²

16
17 The majority of facility access roads would be primitive (non-graveled) overland travel roads.
18 Following construction of the primitive roads, vegetation may regrow adjacent to and within
19 the traveled roadway, and new or modified drainages may develop depending on the
20 construction and location of the roads. The applicant explains that re-grading or reshaping
21 primitive roads to match previous land contours would have the potential to create a greater
22 impact compared to leaving in place the contours that developed during the service life of the
23 transmission line. Therefore, restoration of primitive overland travel roads would consist of
24 only minimal re-grading, as well as reseeding and scarifying the road bed. In contrast, built-up
25 all-weather roads, including all communication station roads, would be fully restored. Following
26 gravel removal, built-up all-weather roads would be re-graded as necessary (for restoration of
27 natural contours) and then re-seeded.²⁹³

28
29 Even if the remainder of the facility were to be removed from service, the Hemingway
30 Substation, 230-kV line segment, and the 138-kV line segment all would remain necessary for
31 operation of the larger transmission grid; therefore, these components would not be removed
32 and would remain in place following decommissioning of the rest of the facility.²⁹⁴

33
34 The Council's rules include several mandatory site certificate conditions relating to the
35 obligation of the certificate holder to prevent the development of conditions on the site that

²⁹⁰ The applicant explains that if the transmission line was decommissioned, the switching station would remain in place and not be decommissioned because it would continue to be used by other transmission lines entering and exiting the station. 1 would preclude restoration of the site and requiring the certificate holder to obtain Council
2 approval of a retirement plan in the event that the facility ceases construction or operation.
3 The mandatory conditions are as follows:

4
5 **Recommended Retirement and Financial Assurance Condition 1:** The certificate holder
6 shall prevent the development of any conditions on the site that would preclude restoration
7 of the site to a useful, non-hazardous condition to the extent that prevention of such site
8 conditions is within the control of the certificate holder.

9 [Mandatory Condition OAR 345-025-0006(7)]
10

11 **Recommended Retirement and Financial Assurance Condition 2:** The certificate holder
12 must retire the facility in accordance with a retirement plan approved by the Council if the
13 certificate holder permanently ceases construction or operation of the facility. The
14 retirement plan must describe the activities necessary to restore the site to a useful,
15 nonhazardous condition, as described in OAR 345-027-0110(5). After Council approval of
16 the plan, the certificate holder must obtain the necessary authorization from the
17 appropriate regulatory agencies to proceed with restoration of the site.

18 [Mandatory Condition OAR 345-025-0006(9)]
19

20 **Recommended Retirement and Financial Assurance Condition 3:** The certificate holder is
21 obligated to retire the facility upon permanent cessation of construction or operation. If the
22 Council finds that the certificate holder has permanently ceased construction or operation
23 of the facility without retiring the facility according to a final retirement plan approved by
24 the Council, as described in OAR 345-027-0110, the Council must notify the certificate
25 holder and request that the certificate holder submit a proposed final retirement plan to
26 the department within a reasonable time not to exceed 90 days. If the certificate holder
27 does not submit a proposed final retirement plan by the specified date, the Council may
28 direct the department to prepare a proposed final retirement plan for the Council's
29 approval.

30
31 Upon the Council's approval of the final retirement plan, the Council may draw on the bond
32 or letter of credit described in OAR 345-025-0006(8) to restore the site to a useful,
33 nonhazardous condition according to the final retirement plan, in addition to any penalties
34 the Council may impose under OAR Chapter 345, Division 29. If the amount of the bond or
35 letter of credit is insufficient to pay the actual cost of retirement, the certificate holder must
36 pay any additional cost necessary to restore the site to a useful, nonhazardous condition.
37 After completion of site restoration, the Council must issue an order to terminate the site
38 certificate if the Council finds that the facility has been retired according to the approved
39 final retirement plan.

40 [Mandatory Condition OAR 345-025-0006(16)]
41

42 The mandatory condition at OAR 345-025-0006(7), which the Department recommends the
43 Council adopt as Retirement and Financial Assurance Condition 1, requires the certificate
44 holder to prevent the development of any conditions on the site that would preclude

1 restoration of the site to a useful, non-hazardous condition to the extent that prevention of
2 such site conditions is within the control of the certificate holder. Hazardous materials that
3 would be used during facility construction and operation would be limited to oils in the shunt
4 reactors at Longhorn station, propane tanks at communication sites, and small quantities of
5 lubricants, vehicle fuels, and herbicides used during facility construction and maintenance.
6 None of the oils in the reactors at the Longhorn Station would contain polychlorinated
7 biphenyls (PCB).²⁹⁵ Recommended Soil Protection Condition 2 would require the applicant and
8 its contractors to follow a Spill Prevention, Control, and Countermeasures Plan or similar type
9 of spill prevention and management plan to minimize and address and leakage or spills of these
10 materials during facility construction and operation.

11
12 In Section IV.B., *Organizational Expertise* of this order, the Department recommends that the
13 Council find that the applicant has the organizational expertise to construct, operate, and retire
14 the proposed facility in compliance with that Council standard. In addition, the Department
15 recommends that the Council find that the applicant meets the Council’s Soil Protection, Fish
16 and Wildlife Habitat, and Waste Minimization standards (Sections IV.D., IV.H., and IV.N. of this
17 order, respectively). Each of those sections imposes conditions on the applicant that are
18 designed so that the construction and operation of the proposed facility would minimize
19 adverse impacts on the surrounding land.

20
21 Based upon the evidence in the record, the Department recommends that the Council find that
22 the applicant has the ability to restore the site to a useful, non-hazardous condition following
23 permanent cessation of construction or operation of the proposed facility, subject to
24 compliance with the recommended conditions listed above.

25
26 *Estimated Cost of Site Restoration*

27
28 OAR 345-022-0050(2) requires the Council to find that the applicant has a reasonable likelihood
29 of obtaining a bond or letter of credit in a form and amount necessary to restore the proposed
30 facility site to a useful non-hazardous condition. A bond or letter of credit provides a site
31 restoration remedy to protect the state of Oregon and its citizens if the certificate holder fails
32 to perform its obligation to restore the site or abandons the proposed facility. The bond or
33 letter of credit must remain in force until the certificate holder has fully restored the site.

34
35 The applicant estimates that the total site restoration cost (calculated in 3rd Quarter 2016
36 dollars) would be approximately \$140,779,000. A summary of the applicant’s cost estimate
37 from Attachment W-1 of ASC Exhibit W, and attached to this order, is presented in Table RFA-1,
38 *Applicant’s Decommissioning and Site Restoration Cost Estimate* below.

39

²⁹⁵ B2HAPDoc3-40 ASC 23_ Exhibit W_Retirement_ASC 2018-09-28, Section 3.5, and B2HAPDoc3-13 ASC 07_ Exhibit G_Materials_ASC 2018-09-28, Section 3.2.

Table RFA-1: Applicant's Decommissioning and Site Restoration Cost Estimate

General Costs	
A. PERMITS	\$49,183
B. MOBILIZATION	\$5,226,223
C. ENGINEERING	\$188,799
D. PROJECT OVERHEAD	\$1,739,946
E. HAZARDOUS MATERIALS INSPECTIONS	\$60,000
F. PROTECTION	\$173,320
General Costs Subtotal	\$7,437,471
Site Construction	
A. UTILITY DISCONNECTS	\$64,692
B. PRELIMINARY WORK	\$71,100
C. SITE GRADING	\$10,698,452
C. UNDERGROUND UTILITY REMOVAL	\$41,212
Site Construction Subtotal	\$10,875,456
Concrete Wrecking	
A. REINFORCED CONCRETE	\$3,791,302
B. NON-REINFORCED CONCRETE	\$0
Concrete Wrecking Subtotal	\$3,791,302
Building Wrecking	\$95,337
Steel Wrecking	\$59,658,800
Timber Wrecking	\$0
Equipment Wrecking	\$22,062,320
Load & Haul	\$5,830,000
Costs Subtotal	\$109,750,686
Specialty Contracts (subcontracted work)	\$485,400
Subtotal	\$110,236,086
Subtotal Adjusted to Current Dollars	\$112,407,253
Performance Bond @ 1%	\$1,124,073
Gross Cost (Adjusted)	\$113,531,326
Administration and Project Management @ 4%	\$4,541,253
Future Developments Contingency @ 20%	\$22,706,265
Hazardous Materials Management Contingency	\$0
Total Site Restoration Cost (Q3 2016 dollars)	\$140,778,844
Total Site Restoration Cost (rounded to nearest \$1,000)	\$140,779,000

1 The applicant used, as a starting place, the Department’s former *Cost Estimating Worksheet* but
2 provided the required updated assumptions, labor rates, and unit costs.²⁹⁶ The applicant
3 estimated the number of days or hours to perform a site restoration activity, and then applied
4 loaded crew rates from RS Means construction cost estimating data to determine the unit costs
5 for the given activity.²⁹⁷

6
7 Based upon the applicant’s stated methods and assumptions, the loaded crew rates applied to
8 the applicant’s site restoration cost estimate include contractor overhead charges, profit, and
9 insurance costs.²⁹⁸

10
11 The applicant increased the sum of all line items (cost subtotal) by one percent (1%) to account
12 for the cost of a performance bond that would be posted by the contractor as assurance that
13 the work would be completed as agreed. An additional four percent (4%) was then added as
14 contingency funds for administrative and management expenses, which are the anticipated
15 direct costs borne by the State in the course of managing site restoration and would include the
16 preparation and approval of a final retirement plan; obtaining legal permission to proceed with
17 the demolition of the facility; legal expenses for protecting the State’s interests; preparing
18 specifications, bid documents, and contracts for demolition work; and managing the bidding
19 process, the negotiation of contracts, and other tasks. This administration and management
20 contingency is approximately \$4.5 million, as shown on Table RFA-1.

21
22 If it becomes necessary for the State to draw upon the bond, it might be many years in the
23 future. Other factors contribute to uncertainty; for example, different environmental standards
24 or other legal requirements might be in place in the future, new disposal sites might need to be
25 found for demolition debris, and the cost of labor and equipment available might increase at a
26 rate exceeding the standard inflation adjustment. The certificate holder’s decommissioning and
27 site restoration cost estimate applied a 20 percent (20%) future developments contingency to
28 account for these uncertainties.

29
30 The Department reviewed the applicant’s cost estimate and confirmed that the site restoration
31 tasks, unit costs, labor rates, and cost estimate assumptions constitute a reasonable site
32 restoration cost for the facility. Therefore, based on the preceding analysis, the Department
33 recommends that the Council find that \$140,779,000 (3rd Quarter 2016 dollars) is a reasonable
34 estimate of an amount satisfactory to restore the site to a useful, nonhazardous condition.

35
36 *Ability of the Applicant to Obtain a Bond or Letter of Credit*

²⁹⁶ The Department no longer maintains the *cost estimating worksheet*, and as such, the applicant’s updates to labor rates, unit costs, and other assumptions was necessary to reflect more current costs.

²⁹⁷ B2HAPPDoc3-40 ASC 23_Exhibit W_Retirement_ASC 2018-09-28, Section 3.4.

²⁹⁸ Loaded crew rates include wages and benefits, per diem, equipment rates, contractor overheads, and profit. B2HAPPDoc3-40 ASC 23_Exhibit W_Retirement_ASC 2018-09-28, Section 3.4 and Attachment W-1.

1 The applicant provided information about its financial capability in ASC Exhibit M. To
2 demonstrate its ability to receive a financial assurance bond or letter of credit in a form
3 approved by the Council, the applicant provided a letter from Wells Fargo Bank, N.A., dated
4 August 14, 2018, describing its “long standing” business relationship with the applicant.²⁹⁹ The
5 bank stated that it would be highly interested in arranging a syndicated letter of credit for the
6 facility in an amount up to \$141 million for a period not to exceed three years. The letter does
7 not constitute a commitment from Wells Fargo to issue the letter of credit.³⁰⁰ Wells Fargo is on
8 the Council’s list of pre-approved financial institutions.

9
10 As previously discussed, the Department recommends that the Council find that a cost of
11 \$140,779,000 (3rd Quarter 2016 dollars) is a reasonable estimate of an amount satisfactory to
12 restore the site to a useful, nonhazardous condition. The applicant proposes that the amount of
13 bond or letter of credit required at any given time be commensurate with the level of risk that
14 the facility would be abandoned or retired. The applicant argues that there is almost no risk
15 that the facility would ever be retired, for the following reasons:³⁰¹

- 16 • The facility would be designed, constructed, and operated to be in service in perpetuity
17 (with repair and replacement as needed throughout the life of the facility);
- 18 • Transmission line retirements occur only when a line is re-routed and are therefore
19 extremely rare;
- 20 • The facility would remain a valuable resource necessary to serve the region: The federal
21 Interagency Rapid Response Team for Transmission identified the proposed facility as one
22 of seven nationally significant transmission projects, the proposed facility is a part of the
23 Western Electric Coordinating Council regional foundational transmission projects, and the
24 Public Utility Commission of Oregon (OPUC) acknowledged the need for the facility through
25 the applicant’s Integrated Resource Plan. Due to the facility’s value as part of the regional
26 transmission system, in the unlikely event that the applicant were to cease to exist as a
27 company, the facility would remain in service under the ownership of another entity.

28
29 The applicant further asserts that even if the facility were to eventually be retired, there is very
30 little risk that the applicant would be unable to restore the site to a useful, non-hazardous
31 condition, for the following reasons:³⁰²

- 32 • For almost 100 years the applicant has remained in business without default or
33 interruption. As a utility, the applicant provides an essential service; therefore, in the
34 unlikely event of the applicant experiencing bankruptcy, the applicant would recapitalize

²⁹⁹ [Mandatory Condition OAR 345-025-0006\(8\) requires the certificate holder to submit a bond or letter of credit in a form and amount satisfactory to the Council to restore the site to a useful, non-hazardous condition. Council interprets “form” to include the bond or letter of credit as well as the issuing financial institution as a component of the form of the financial assurance. See May 15, 2015 EFSC Meeting Item D - Financial Assurance Staff Memo and Final EFSC Minutes 2015-05-14-15.](#)

³⁰⁰ B2HAPPDoc3-21 ASC 13_Exhibit M_Financial Capability_ASC 2018-09-28, Attachment M-2.

³⁰¹ B2HAPPDoc3-21 ASC 13_Exhibit M_Financial Capability_ASC 2018-09-28, Section 3.2.1.

³⁰² B2HAPPDoc3-21 ASC 13_Exhibit M_Financial Capability_ASC 2018-09-28, Section 3.2.1.

1 and continue operating, or a third-party would assume control of the applicant's business
2 (including its assets, such as the proposed facility).

- 3 • Both the Idaho Public Utilities Commission (IPUC) and the OPUC set rates for utilities that
4 include the costs associated with retiring facilities that are taken out of service. The
5 applicant is a rate-regulated utility under the jurisdiction of both IPUC and OPUC; therefore,
6 the costs of retiring the applicant's facilities are recoverable through the rates charged to
7 the utility's customers.
- 8 • The applicant's ability to finance construction of the proposed facility is indicative of their
9 financial capability to decommission and remove the facility, if necessary.
- 10 • The letter from Wells Fargo shows that the applicant is reasonably likely to secure a letter of
11 credit in an amount sufficient to restore the site to a useful, non-hazardous condition.

12
13 At the same time that the applicant argues that it is highly unlikely that the facility would ever
14 be retired or that the applicant would at any time become financially incapable of restoring the
15 site to a useful, non-hazardous condition, the applicant acknowledges that some level of risk
16 remains. While the risk that the proposed facility would be abandoned during the first 50 years
17 of operation is very low, this risk is slightly increased during the construction phase of the
18 facility (with some risk that the facility could be terminated after construction commencement
19 and prior to placement in service). In addition, this risk would also be slightly increased after
20 the first fifty years of operation, when there is some probability that an unforeseen disruption
21 (major change, e.g., from technological advances affecting the Northwest power grid) would
22 result in the need to retire the facility. As a result, the applicant proposes to obtain and
23 maintain a bond or letter of credit during the facility construction phase and then again after
24 the facility has been in service for 50 years.

25
26 The applicant proposes that the amount of bond or letter of credit required during the
27 construction phase be increased on a quarterly basis throughout the estimated four-year
28 construction period (comprised of 16 quarterly periods) to generally correspond with the
29 progress made on construction of the facility. As proposed, the amount of the bond or letter of
30 credit at the beginning of any such quarterly period would be equal to the product of (a) the
31 applicant's estimated facility decommissioning costs and (b) a fraction, the numerator of which
32 would be the number of quarters that have passed since commencement of construction, and
33 the denominator of which would be 16.0 (provided that in all cases the number resulting from
34 the calculation shall not exceed 1.0). For example, at the end of the first year of construction—
35 i.e., four quarters—the amount of the bond or letter of credit would be equal to four-sixteenths
36 (4/16) of the estimated decommissioning costs. The Department agrees that the farther along
37 construction progresses, the more of the facility would be on the landscape, and the greater
38 the cost would be to remove the components and restore the site. The Department further
39 agrees that adjusting the bond amount on a quarterly basis is a reasonable way to ensure that
40 the bond amount generally corresponds with the progress made on construction of the facility

1 (and therefore how much it could cost to remove the facility from the landscape).³⁰³
2 Accordingly, the applicant proposes and the Department recommends with modifications, that
3 the Council adopt the following site certificate condition:
4

5 **Recommended Retirement and Financial Assurance Condition 4:** Consistent with
6 Mandatory Condition OAR 345-025-0006(8), before beginning construction of the facility,
7 the certificate holder shall submit to the State of Oregon, through the Council, a bond or
8 letter of credit naming the State of Oregon, acting by and through the Council, as
9 beneficiary or payee. During the construction phase (defined as the period of time from the
10 beginning of construction as defined in ORS 469.300(6) to the date when the facility is
11 placed in service), the certificate holder shall adjust the amount of the bond or letter of
12 credit on a quarterly basis, as follows:

- 13 a. The amount of the bond or letter of credit will be increased on a quarterly basis to
14 correspond with the progress of the construction of the facility at the beginning of
15 each quarter. The amount of the bond or letter of credit at the beginning of any such
16 quarterly period will be equal to the product of (i) the estimated total
17 decommissioning cost for the facility, adjusted for inflation, as specified in section (c)
18 of this condition; and (ii) a fraction, the numerator of which is the number of
19 quarters that have passed since commencement of construction, and the
20 denominator of which will be the number of quarters during which the certificate
21 holder must complete the construction phase; provided that in all cases the number
22 resulting from the calculation shall not exceed 1.0.
- 23 b. The certificate holder and the Department shall assume a four-year construction
24 phase comprising sixteen quarterly periods. Therefore, for the first quarter of the
25 construction phase, the bond or letter of credit will be maintained in an amount
26 equal to one-sixteenth (1/16) of the total estimated decommissioning cost specified
27 in section (c) of this condition. At the end of the first year of construction—i.e., four
28 quarters—the amount of the bond or letter of credit will be equal to four-sixteenths
29 (4/16) of the total estimated decommissioning costs.
- 30 c. The estimated total decommissioning cost for the facility is \$140,779,000 (3rd
31 Quarter 2016 dollars), to be adjusted to the date of issuance of the bond or letter of
32 credit, and on a quarterly basis thereafter during the construction phase. For the
33 purposes of calculating the bond or letter of credit amount required by section (a) of
34 this condition, the certificate holder shall adjust the estimated total
35 decommissioning cost using the following calculation:
- 36 i. Adjust the estimated decommissioning cost to correspond with the progress of
37 the construction of the facility at the beginning of each quarter, based on the
38 unit costs identified in Tab 01 of Attachment W-1 of the Final Order on the ASC.
- 39 ii. Adjust the estimated total decommissioning cost (expressed in Q3 2016 dollars)
40 to present value, using the U.S. Gross Domestic Product Implicit Price Deflator,

³⁰³ Under Mandatory Condition OAR 345-025-0006(8), the Council may specify different amounts for the bond or letter of credit during construction and during operation of the proposed facility.

1 Chain-Weight, as published in the Oregon Department of Administrative
2 Services' "Oregon Economic and Revenue Forecast" or by any successor agency
3 and using the third quarter 2016 index value and the quarterly index value for
4 the date of issuance of the new bond or letter of credit. If at any time the index
5 is no longer published, the Council shall select a comparable calculation to adjust
6 third quarter 2016 dollars to present value.

7 iii. Round the result total to the nearest \$1,000 to determine the inflated-adjusted
8 estimated total decommissioning cost.

9 d. The certificate holder shall use an issuer of the bond or letter of credit approved by
10 the Council.

11 e. The certificate holder shall use a form of bond or letter of credit approved by the
12 Council. The certificate holder shall describe the status of the bond or letter of credit
13 in the annual report submitted to the Council under OAR 345-026-0080(1)(b). The
14 bond or letter of credit shall not be subject to revocation or reduction before the
15 facility has been placed in service, at which time the certificate holder must provide
16 the bond or letter of credit specified in Retirement and Financial Assurance
17 Condition 5.

18 f. The amount of the bond or letter of credit may be amended from time to time by
19 agreement of the certificate holder and the Department to account for adjustments
20 in the construction schedule. Subject to Department approval, the certificate holder
21 may request an adjustment of the bond or letter of credit amount based on final
22 design configuration of the facility by applying the unit costs presented in the
23 Attachment W-1 of the Final Order on the ASC, *Facilities Removal and Site*
24 *Restoration Cost Estimate*. Such adjustments may be made without amendment to
25 the site certificate. The Council authorizes the Department to agree to these
26 adjustments in accordance with this condition.

27
28 Once the facility is placed in service, the applicant proposes that its obligation to maintain a
29 bond or letter of credit terminate until the facility has been in service for 50 years. The
30 Department points to the mandatory condition in OAR 345-025-0006(8) which requires the
31 certificate holder to maintain a bond or letter of credit in a form and amount satisfactory to the
32 Council in effect at all times until the facility has been retired.³⁰⁴ However, in light of the very
33 low level of risk that the facility would be abandoned or retired after construction and before
34 50 years of service (as previously discussed), the Department recommends that the Council
35 require the certificate holder to submit a bond or letter of credit in the nominal amount of
36 \$1.00 by adopting section (a) of Retirement and Financial Assurance Condition 5 below.

37
38 After the facility has been in service for 50 years, the applicant proposes to begin maintaining a
39 bond or letter of credit in an amount that would increase on an annual basis for the next 50

³⁰⁴ Under Mandatory Condition OAR 345-025-0006(8), the certificate holder must maintain a bond or letter of credit in effect at all times until the facility has been retired. The Council may specify different amounts for the bond or letter of credit during construction and during operation of the proposed facility. Gillis, C. et al.

1 years. As proposed, in year 51 the amount of the bond or letter of credit would be set at one-
2 fiftieth (1/50) of the total estimated decommissioning costs. Each year, through the 100th year
3 of service, the bond or letter of credit would be increased by one-fiftieth (1/50) of the
4 estimated decommissioning costs. For example, in year 75, the bond or letter of credit would
5 be maintained in an amount equal to twenty-five fiftieths (25/50) or 50 percent of the
6 estimated decommissioning costs. Once the bond or letter of credit reaches an amount equal
7 to 100 percent of decommissioning costs, it would remain at that level for the remainder of the
8 facility's life.³⁰⁵

9
10 The Department agrees that the risk that the facility would be abandoned or would need to be
11 retired would increase after the transmission line is in service for 50 years. This risk would
12 continue to increase over time, as future unforeseen technological and electricity market
13 changes could affect the applicant's financial condition or the facility's performance in the
14 context of the greater Northwest power grid (and therefore the facility's continued viability).
15 The Department agrees that the applicant's proposed methodology to incrementally increase
16 the financial assurance instrument on an annual basis after the transmission line has been in
17 service for 50 years is a reasonable approach to accounting for the possibility that a facility
18 designed and constructed for an indefinite service life could eventually need to be retired.
19 However, the Department's position is based on our current understanding of the present
20 electric utility industry and technology and our assumptions about the power grid in the near
21 and medium terms. Major market disruptions that could impact the continued viability of the
22 facility or the applicant's financial condition could occur sooner than 50 years from the date the
23 transmission line would be placed in service. As a result, the applicant proposes, and the
24 Department concurs, that on the fifth anniversary of the facility's in-service date, and on each
25 subsequent fifth anniversary thereafter, the certificate holder would report (5-year report) to
26 the Council on the following subjects: (a) the physical condition of the facility; (b) any evolving
27 transmission or electrical technologies that could impact the continued viability of the facility;
28 (c) the facility's performance in the context of the larger Northwest power grid; and (d) the
29 certificate holder's financial condition, including the certificate holder's credit rating at that
30 time.³⁰⁶

31
32 At its review of the DPO at the January 2020 EFSC meeting, Council directed the Department to
33 include that the Department may engage its consultant in the review of the 5-year report as
34 well as the Department's ability to seek expert advice from other information available to the
35 Department. Other information includes but is not limited to; the expertise of other reviewing
36 agencies and internal Department Staff, consultation with industry experts, and other
37 consulting parties.³⁰⁷ Further, the Council clarified that the applicant would be responsible for
38 all costs associated with review of the 5-year report, in accordance with applicable rules and

³⁰⁵ B2HAPPDoc3-21 ASC 13_Exhibit M_Financial Capability_ASC 2018-09-28, Section 3.2.2.

³⁰⁶ B2HAPPDoc3-21 ASC 13_Exhibit M_Financial Capability_ASC 2018-09-28, Section 3.2.2.

³⁰⁷ See 2020-03-13-Approved-January-Minutes and 2020-01-24-EFSC-Meeting-Recording Pt 1 of 2; at approx. 11:00 minutes.

1 statutes. The Department recommends including this Council direction in Recommended
2 Retirement and Financial Assurance Condition 5 below. The Department agrees that ~~this the~~
3 applicant-represented report information and direction from Council for the Department to
4 seek expertise, if necessary, would allow the Council to consider whether or not the approach
5 towards the financial assurance instrument remains appropriate and would account for
6 unforeseen shifts in the power grid or the applicant's financial condition. Therefore, based
7 upon the preceding analysis, the Department recommends that the Council adopt the following
8 condition:

9
10 **Recommended Retirement and Financial Assurance Condition 5:** Consistent with
11 Mandatory Condition OAR 345-025-0006(8), no later than the date the facility is placed
12 in service (the In-Service Date), the certificate holder shall submit to the State of
13 Oregon, through the Council, a bond or letter of credit naming the State of Oregon,
14 acting by and through the Council, as beneficiary or payee. The certificate holder shall
15 maintain a bond or letter of credit as follows:

- 16 a. From the In-Service Date until In-Service Year 51, the amount of bond or letter of
17 credit shall be \$1.00.
- 18 b. On the 50th anniversary of the In-Service Date, the certificate holder shall begin
19 maintaining a bond or letter of credit in an amount that will increase on an annual
20 basis for the next 50 years. In year 51, the amount of the bond or letter of credit will
21 be set at one-fiftieth (1/50) of the total estimated decommissioning costs, adjusted
22 for inflation, as specified in section (d) of this condition. Each year, through the 100th
23 year of service, the bond or letter of credit shall be increased by one-fiftieth (1/50)
24 of the estimated decommissioning costs. Once the bond or letter of credit is in an
25 amount equal to 100 percent of decommissioning costs, it will remain at that level
26 for the life of the facility.
- 27 c. On the fifth anniversary of the In-Service Date, and on each subsequent
28 quinquennial thereafter, the certificate holder shall notify the Department 60 days
29 prior and report to the Council in writing or in-person on the following subjects: (i)
30 the physical condition of the facility; (ii) any evolving transmission or electrical
31 technologies that could impact the continued viability of the facility; (iii) the facility's
32 performance in the context of the larger power grid; and (iv) the certificate holder's
33 general financial condition, including the certificate holder's credit rating at that
34 time. The Department shall review the 5-year report and may engage its consultant
35 in the review of the 5-year report. The Department may also include other
36 information in its evaluation of the 5 year-report, including but not limited to;
37 expertise of other reviewing agencies and internal Department staff, consultation
38 with industry experts, or other consulting parties. The certificate holder shall be
39 responsible for all costs associated with review of the 5-year report, in accordance
40 with applicable rules and statutes. Based on the information provided in the 5-year
41 report, and the Department's review and recommendations such reports, the
42 Council will consider whether the certificate holder should be required to post a
43 bond or letter of credit that varies from the financial assurance requirements set
44 forth in sections (a) and (b) of this condition. The certificate holder shall be subject

1 to Council's determination. The Council's determination may include extending the
2 date on which the certificate holder would be required to begin posting the financial
3 assurances set forth in section (b) of this condition.

- 4 d. The estimated total decommissioning cost for the facility is \$140,779,000 (3rd
5 Quarter 2016 dollars), to be adjusted to the date of issuance of the bond or letter of
6 credit in In-Service Year 51, and on an annual basis thereafter. Subject to
7 Department approval, the certificate holder may request an adjustment of the bond
8 or letter of credit amount based on final design configuration of the facility by
9 applying the unit costs presented in, Attachment W-1 of the Final Order on the ASC,
10 *Facilities Removal and Site Restoration Cost Estimate*. Such adjustments may be
11 made without amendment to the site certificate. The Council authorizes the
12 Department to agree to these adjustments in accordance with this condition. The
13 certificate holder shall adjust the decommissioning cost for inflation using the
14 following calculation:

15 (i) Adjust the estimated total decommissioning cost (expressed in Q3 2016
16 dollars) to present value, using the U.S. Gross Domestic Product Implicit Price
17 Deflator, Chain-Weight, as published in the Oregon Department of
18 Administrative Services' "Oregon Economic and Revenue Forecast" or by any
19 successor agency and using the third quarter 2016 index value and the quarterly
20 index value for the date of issuance of the new bond or letter of credit. If at any
21 time the index is no longer published, the Council shall select a comparable
22 calculation to adjust third quarter 2016 dollars to present value.

23 (ii) Round the result total to the nearest \$1,000 to determine the inflated-
24 adjusted estimated total decommissioning cost.

- 25 e. The certificate holder shall use an issuer of the bond or letter of credit approved by
26 the Council.
- 27 f. The certificate holder shall use a form of bond or letter of credit approved by the
28 Council. The certificate holder shall describe the status of the bond or letter of credit
29 in the annual report submitted to the Council under OAR 345-026-0080(1)(b). The
30 certificate holder shall maintain a bond or letter of credit in effect at all times as
31 described in this condition and Retirement and Financial Assurance Condition 4 until
32 the facility has been retired.

33
34 Subject to compliance with Retirement and Financial Assurance Conditions 1 through 3, the
35 Department recommends the Council find that the proposed facility can be restored adequately
36 to a useful, non-hazardous condition following permanent cessation of construction or
37 operation of the proposed facility. Subject to compliance with Retirement and Financial
38 Assurance Conditions 4 and 5, the Department recommends that the Council find that the
39 certificate holder has a reasonable likelihood of obtaining a bond or letter of credit in a form
40 and amount satisfactory to the Council to restore the site to a useful, non-hazardous condition.

1 **Conclusions of Law**

2
3 Based on the foregoing findings of fact, and subject to compliance with the recommended
4 Retirement and Financial Assurance conditions, the Department recommends that the Council
5 find that the proposed facility, including the proposed and alternative routes, would comply
6 with the Council’s Retirement and Financial Assurance standard.

7 **IV.H. Fish and Wildlife Habitat: OAR 345-022-0060**

8
9 *To issue a site certificate, the Council must find that the design, construction and operation*
10 *of the facility, taking into account mitigation, are consistent with:*

- 11
12 (1) *The general fish and wildlife habitat mitigation goals and standards of OAR 635-415-*
13 *0025(1) through (6) in effect as of February 24, 2017, and*
14 (2) *For energy facilities that impact sage-grouse habitat, the sage-grouse specific habitat*
15 *mitigation requirements of the Greater Sage-Grouse Conservation Strategy for Oregon*
16 *at OAR 635-415-0025(7) and OAR 635-140-0000 through -0025 in effect as of February*
17 *24, 2017.*

18
19 *IV.H.1. General Fish and Wildlife Habitat Mitigation Goals and Standards*

20
21 **Findings of Fact**

22 The first part of the EFSC Fish and Wildlife Habitat standard requires the Council to find that the
23 design, construction and operation of a proposed facility is consistent with the Oregon
24 Department of Fish and Wildlife’s (ODFW) habitat mitigation goals and standards, as set forth in
25 OAR 635-415-0025. The ODFW Habitat Mitigation Policy and EFSC Fish and Wildlife Habitat
26 standard creates requirements to mitigate impacts to fish and wildlife habitat, based on the
27 quantity and quality of the habitat as well as the nature, extent, and duration of the potential
28 impacts to the habitat.³⁰⁸ The policy also establishes a habitat classification system based on
29 value the habitat would provide to a species or group of species. There are six habitat
30 categories; Category 1 being the most valuable and Category 6 the least valuable, as further
31 described below.

32
33 The Council’s Fish and Wildlife Habitat and T&E standards do not implement federal
34 requirements. There is not a Council standard authorizing Council to impose or enforce
35 regulations related to federally listed T&E species listed under 16 USC Section 1533. ODFW
36 could make recommendations under its Fish and Wildlife Habitat Mitigation Policy based on

³⁰⁸ OAR 635-415-0005 defines habitat as, “...the physical and biological conditions within the geographic range of occurrence of a species, extending over time, that affect the welfare of the species or any sub-population or members of the species.”

OAR 635-415-0005 defines habitat quality as, “the relative importance of a habitat with regard to its ability to influence species presence and support the life-cycle requirements of the fish and wildlife species that use it.”

1 information about federally-listed T&E species, which would then be implemented through the
2 Council’s standard. Federal wildlife laws must be adhered to by the applicant, which are under
3 the jurisdiction and authority of the United State Fish and Wildlife Service (USFWS).

4
5 The Fish and Wildlife Habitat standard also includes specific requirements for potential impacts
6 from proposed energy facilities to sage-grouse habitat. Those requirements are addressed in
7 Section IV.H.2.7 *Sage-Grouse Specific Habitat Mitigation Requirements* below.

8
9 The analysis area for the Fish and Wildlife Habitat standard includes all areas within the site
10 boundary; as described in Section III.B.1. *Site Boundary and Right of Way Dimensions*, the site
11 boundary generally includes a 500-foot wide area extending the length of the proposed route
12 and four alternative route segments (West of Bombing Range Road Alternative 1 (3.7 miles),
13 West of Bombing Range Road Alternative 2 (3.7 miles), Morgan Lake Alternative (18.5 miles),
14 and Double Mountain Alternative (7.4 miles)) and includes over 18,000 acres.³⁰⁹

15 16 *Methodology*

17
18 The applicant’s methodology for evaluating habitat quantity and quality within the analysis area
19 included a GIS-based habitat modeling tool based on Terrestrial Visual Encounter Survey (TVES)
20 data. The GIS-based habitat modeling tool was then used to identify ecological systems and
21 assign an initial habitat category based on vegetation characteristics. The applicant then
22 overlaid Washington Ground Squirrel Habitat (WAGS), raptor nest, and fish presence data
23 collected during surveys, as well as existing mapped big game ranges, onto the initial habitat
24 categorization using ArcGIS. For wildlife habitat subject to an overlay, the applicant moved that
25 habitat category “up” to the overlay category. The applicant assessed fish habitat using GIS-
26 mapping, incorporating data from the existing GIS data layers and sources such as StreamNet,
27 ODFW, and ODF. The applicant then created maps of fish-bearing streams along the proposed
28 and alternative routes, which were reviewed by local biologists at ODFW, USFS, and BLM.

29
30 The applicant also conducted a literature review using the Oregon Biodiversity Information
31 Center (ORBIC) (2016), StreamNet (2016), ODFW (2005, 2012, 2015a, 2016), Oregon
32 Department of Agriculture (2016), Oregon Department of Forestry (ODF; 2013), USFS (2015),
33 BLM (2015 and 2016), watershed basin plans, the Geographic Biotic Observation (GeoBOB)
34 database (2016), the Natural Resource Information System database (USFS 2016), the Federal
35 Register, BPA, Northwest Power and Conservation Council, and the National Oceanic and
36 Atmospheric Administration Fisheries Division (NOAA Fisheries).

37
38 The applicant consulted with State and Federal Department of Fish and Wildlife Habitat staff to
39 discuss State-sensitive species with a potential to occur within the analysis area and sought
40 concurrence with State-sensitive species survey protocols. The applicant’s methodology for

³⁰⁹ B2HAPPDoc ApASC Second Amended Project Order 2018-07-26 .Table 2, Page 23. [B2HAPPDoc3-25 ASC 16A Exhibit P1-5 Section 3.1. 2018-09-28.](#)

1 identifying and evaluating impacts on fish and wildlife habitat and presence of and use by
2 species within the analysis area is described in the Revised Final Biological Survey Work Plan
3 (ASC Exhibit P1, Attachment P1-2), which includes protocols reviewed and approved by ODOE,
4 ODFW, USFS, FWS, NOAA Fisheries and BLM. The Revised Final Biological Survey Work Plan
5 contains a list of the seven agency-required biological surveys, which are listed in Table P1-1
6 and described in Attachment P1-2. The survey areas are shown in Exhibit P1, Figures P1-1
7 through P1-5 and the details of the protocols and processes of each type of survey are
8 explained in Exhibit P1.³¹⁰

9

10 Surveys were conducted on all state and federal public lands. However, for the reasons
11 discussed below, field surveys have not yet been completed on some private lands within the
12 site boundary.

13

14 *Habitat Assessment*

15

16 The analysis area encompasses multiple general vegetation types that serve as fish and wildlife
17 habitats including (1) agriculture/developed, (2) bare ground, (3) open water/unvegetated
18 wetland, (4) riparian vegetation, (5) forest/woodland, (6) shrub/grass, and (7) wetland. ASC
19 Exhibit P1, Table P1-2 describes these general vegetation types as well as the habitat types
20 found within the analysis area.³¹¹

21

22 As the applicant explains in ASC Exhibit P1, agricultural/developed lands are common in
23 Morrow and Umatilla counties, and are less common in Union, Baker, and Malheur counties.
24 Bare ground, cliffs, and talus are rare in the analysis area. Open water/unvegetated wetland,
25 including streams and ponds, is also limited. Most streams in the analysis area are intermittent
26 and fed by stormwater. Riparian vegetation is associated with open water/unvegetated
27 wetlands and wetlands, and occurs between upland habitat and the edge of delineated
28 wetlands or delineated non-wetland waters. For more information on wetlands and waters of
29 the state see Section IV.Q.2., *Removal Fill Law*, of this order.

30

31 Forests are rare within the analysis area and occur primarily in the Blue Mountains region. Most
32 of the analysis area consists of shrub/grass, which differ in structure and species composition
33 depending on the ecoregion, elevation, soil conditions, moisture regimes, and fire history
34 present in the area. However, these communities typically occur on dry flats and plains, rolling
35 hills, saddles, and ridges where precipitation is low. They are dominated by forbs, grasses, and
36 shrub species. Fire has historically played an important role in maintaining grassland and
37 shrubland communities, and served as a cyclical disturbance regime.³¹²

³¹⁰ B2HAPPDoc3-25 ASC 16A_Exhibit P1_Wildlife_ASC_Part 1_Main thru Attach P1-6 2018-09-28. Section 3.2.3.

³¹¹ B2HAPPDoc3-25 ASC 16A_Exhibit P1_Wildlife_ASC_Part 1_Main thru Attach P1-6. 2018-09-28. Section 3.2.3.

³¹² B2HAPPDoc3-25 ASC 16A_Exhibit P1_Wildlife_ASC_Part 1_Main thru Attach P1-6. P. p1-21 (citing ODFW 2006 Oregon Conservation Strategy). 2018-09-28.

1
2 Wetlands include areas where water saturation is the dominant factor that determines the soil
3 type/development, as well as the types of plants and animals that can inhabit the area. As
4 described further in ASC Exhibit J (Waters of the State) and under the Removal Fill Law Section
5 IV.Q.2., wetlands are sparsely distributed in the analysis area, but are found in all Oregon
6 counties the proposed transmission line would cross.³¹³

7
8 *Identification of Habitat within Habitat Categories*

9
10 The ODFW Fish and Wildlife Habitat Mitigation Policy assigns the six Habitat Category types
11 based on the relative importance of these habitats to fish and wildlife species.³¹⁴ Those
12 categories are depicted in ASC Exhibit P1, Table P1-3.³¹⁵ Table P1-4 lists the acres of each
13 habitat type by ODFW habitat category.³¹⁶ The applicant classified each of the following habitats
14 within the analysis area in accordance with OAR 635-415-0025:

- 15
16 Category 1 Habitat:
- 17 • Trees or structures containing a special status raptor nest;³¹⁷
 - 18 • Occupied WAGS colonies, defined as a single hole or cluster of holes as well as the
19 required habitat for squirrel survival;³¹⁸ and
 - 20 • Caves that provide roosts and hibernacula for bats.

- 21
22 Category 2 Habitat:
- 23 • ODFW-identified elk (*Cervus canadensis nelson*) winter range;³¹⁹
 - 24 • ODFW-identified mule deer (*Odocoileus hemionus*) winter range;
 - 25 • Bighorn sheep (*Ovis canadensis*) herd ranges;

³¹³ Id. (citing US Department of Interior 1979 Classification of Wetlands and Deepwater Habitats).

³¹⁴ B2HAPPDoc3-25 ASC 16A_Exhibit P1_Wildlife_ASC_Part 1_Main thru Attach P1-6. In ASC Exhibit P, the applicant describes the metrics and habitat components the Applicant used to classify habitats into these six category types, based on the presence of habitat characteristics and species observations.

³¹⁵ B2HAPPDoc3-25 ASC 16A_Exhibit P1_Wildlife_ASC_Part 1_Main thru Attach P1-6. Rev 2018-09-28. Section 3.3.2.

³¹⁶ B2HAPPDoc3-25 ASC 16A_Exhibit P1_Wildlife_ASC_Part 1_Main thru Attach P1-6. Pp. Section 3.3.2. The applicant notes that the acreage numbers in Table P1-4 do not directly relate to impacts because portions of the analysis area would not be impacted. Rev 2018-09-28.

³¹⁷ Category 1 habitat would not be impacted by the proposed facility. Although trees or structures with raptor nests within the analysis area are ~~managed-designated~~ as Category 1 habitat, the applicant omitted the acreage estimate within ASC Exhibit P Table P1-4 they are not included in the habitat categorization calculations due to their relatively small size on the landscape.

³¹⁸ The required habitat for squirrel survival is a 785-foot buffer around the holes in suitable habitat.

³¹⁹ ASC Exhibit P3 further discusses elk habitat categorization at pages P3-5 (Table P3-1 (Habitat Categorization Types)).

- 1 • Areas of potential WAGS use;³²⁰
- 2 • Fish-bearing streams;³²¹
- 3 • Bat roosts and hibernacula other than cave; and
- 4 • Pygmy rabbit (*Brachylagus idahoensis*) colonies}

5
6 Category 3 Habitat:

- 7 • Elk summer range;³²²
- 8 • Mule deer summer range,³²³ and
- 9 • Non-fish-bearing streams.

10
11 The applicant's habitat categorization methodology is provided in ASC Exhibit P Attachment P-
12 1, which was thoroughly reviewed during the ASC phase by ODFW, including ODFW Fish
13 Biologist Greg Apke and Sage-Grouse Mitigation Coordinator Nigel Seidel.

14
15 *Potential Impacts to Fish and Wildlife Habitat*

16
17 Construction and operation of the proposed facility would result in temporary, temporal and
18 permanent habitat impacts to Categories 2, 3, 4, 5 and 6. Impacts to Category 6 habitat do not
19 require compensatory mitigation under the Council's Fish and Wildlife Habitat standard.

20 Temporary habitat impacts would result during construction and installation of some
21 transmission line components from vegetation clearing.³²⁴ Temporary vegetation clearing

³²⁰ Areas of potential WAGS use are defined as areas adjacent to and within 4,921 feet (1.5 kilometers [km]) of WAGS Category 1 habitat, but not occupied by any squirrels either for burrowing or foraging, which is of similar habitat type and quality to the adjacent WAGS Category 1 habitat;

³²¹ As noted in ASC Exhibit Q Table Q-3, a state-listed T&E fish species (Snake River Spring/Summer Chinook Salmon) is present within the analysis area (Grande Ronde River), and could be potentially impacted during proposed facility construction. Based on consultation with ODFW staff, fish species can exist within degraded habitat and, even with the presence of a state-listed T&E species, does not meet ODFW's definition of Category 1 habitat under OAR 635-415-0025(1) because it is replaceable (i.e. waterways could be rehabilitated). B2HAPP Proposed Order Agency Consultation ODFW 2020-07-01.

Fish categorization is further described in the Fish Habitat Report in Attachment P1-7B. As the applicant further describes in ASC Exhibit P1, Attachment P1-1, fish presence also informed the categorization of stream habitats. The applicant assumed the presence of fish in all perennial streams and in intermittent streams if the OSDAM data indicated that the stream contained macro-invertebrates, or if ODFW biologists indicated that an intermittent stream contained fish when water is present. Following this initial incorporation of fish presence into the habitat categorization data, the applicant refined its fish presence analysis through additional coordination with ODFW and field surveys.

³²² Elk summer range is defined by the 1999 Rocky Mountain Elk Foundation M.A.P. (Measure and Prioritize) Elk Habitat Project.

³²³ Mule deer summer range is defined by the 2002 Western Association of Fish and Wildlife Agencies Mule Deer Habitat of the Western United States.

³²⁴ B2HAPPDoc3-25 ASC 16A_Exhibit P1_Wildlife_ASC_Part 1_Main thru Attach P1-6 rev 2018-09-28. Section 3.5.3.2. The applicant explains that habitat cleared for construction would be restored and the duration of the impact would not exceed the life of the proposed transmission line and, therefore, clearing vegetation followed by restoration would

1 activities would encompass the entire footprint of pulling and tensioning sites, multi-use areas,
2 and light-duty fly yards. Vegetation clearing would also occur around the perimeter of
3 permanent facilities including transmission structures, the Longhorn station, communication
4 stations, and access roads. Temporary habitat impacts would vary in duration based on
5 recovery time but would be expected are those that would to last for less than the operational
6 lifetime of the proposed facility (e.g. general recovery time for: grasslands is 3 to 7 years;
7 shrublands is 30 to 100 years; forested and woodlands is 50 to many hundreds of years). ~~The~~
8 ~~duration of temporary impacts to habitat is variable, based on vegetation type and extent.~~
9 Temporary impacts to habitat requiring a longer restoration timeframe (+ five years) are
10 considered temporal impacts and typically require additional mitigation beyond revegetation to
11 account for the loss of habitat function and values from the time of impact to the time when
12 the restored habitat provides a pre-impact level of habitat function.

13
14 Permanent impacts are defined as impacts that would exist for the operational life of the
15 proposed facility and would result from placement of permanent facility structures and ongoing
16 vegetation management within the right-of way determined necessary to protect the proposed
17 facility from vegetation encroachment and hazards.

18
19 As presented in Table FW-1, *Estimated Temporary and Permanent Habitat Impacts and*
20 *Proposed Mitigation – Proposed Route*, the proposed facility would temporarily disturb
21 approximately 2,123, 948,345, 165 and 329 acres of Category 2, 3, 4 and 5 habitat, respectively,
22 resulting in temporary and temporal habitat impacts.³²⁵ The proposed facility would
23 permanently disturb approximately 883, 489, 26 and 43 acres of Category 2, 3, 4 and 5 habitat,
24 respectively.³²⁶ While the applicant requests Council approval of the proposed and four
25 alternative route segments, the proposed route represents the greatest permanent and
26 temporary habitat impacts. Nonetheless, temporary and permanent impacts from the
27 alternative route segments are presented in Table FW-2: *Estimated Temporary and Permanent*
28 *Habitat Impacts and Proposed Mitigation – Alternative Route Segments.* All Category 1 habitat
29 would be avoided; there are no proposed facility components that would destroy or remove
30 any trees with active raptor nests; and no components proposed to be located within WAGS
31 category 1 habitat.³²⁷

32

constitute a temporary impact to habitat. While restoration of certain habitat (e.g., forestlands) can take decades and restoration could span generations of wildlife, those impacts are considered temporary because they would last less than the life of the transmission line, which is expected to be in place indefinitely.

³²⁵ While temporal loss applies to habitat subtypes expected to require a longer restoration timeframe, and therefore would apply to impacted sagebrush steppe but not grasslands, the certificate holder did not delineate between habitat subtypes to be temporarily impacted and provides mitigation for temporal loss for Category 2, 3 and 4 regardless of habitat subtype.

³²⁶ ~~See Revised Table P-3, provided in Attachment B of this order.~~

³²⁷ B2HAPPDoc3-25 ASC 16A_Exhibit P1_Wildlife_ASC_Part 1_Main thru Attach P1-6 rev 2018-09-28. Section 3.5.1. The applicant's avoidance of WAGS Category 1 habitat is further described in ASC Exhibit Q (Threatened and Endangered Species) and evaluated under the Threatened and Endangered Species Standard.

Table FW-1: Estimated Temporary and Permanent Habitat Impacts and Proposed Mitigation – Proposed Route

Habitat Category and Vegetation Type	Proposed Route		Mitigation ²	
	<u>Temporary</u>	<u>Permanent</u>	<u>Temporal</u>	<u>Permanent</u>
	Acres		Acres	
<i>Category 2</i>				
Agriculture/Developed ¹	95.0	10.6	>1 acre: 1 acre	>1 acre: 1 acre

Source: ASC Exhibit P, Attachment P1-6 Table 1								

2

1 Retirement of the proposed facility would involve activities and equipment similar to those that
2 would be used during construction. Therefore, potential impacts on fish and wildlife habitat
3 during retirement would be similar to the temporary impacts described for construction.

4
5 *Proposed Habitat Mitigation – Temporary and Permanent Impacts*
6

7 The applicant proposes to reclaim areas temporarily cleared for construction activities, and not
8 encompassed by components or not needed for normal transmission line operation and
9 maintenance, through measures described in the applicant’s draft Reclamation and
10 Revegetation Plan (Reclamation and Revegetation Plan, Attachment P1-3 of this order). The
11 applicant describes that, if the facility were retired, temporary impacts resulting from
12 decommissioning activities would also be restored in accordance with the measures included in
13 the draft Reclamation and Revegetation Plan.

14
15 *Reclamation and Revegetation Plan*
16

17 The applicant’s draft Reclamation and Revegetation Plan identifies pre- and post-construction
18 reclamation actions based on similar habitat types but with varying species composition, or as
19 referred to by the applicant, reclamation zone.³²⁸ For example, the shrubland reclamation zone
20 contains an aggregation of desert shrub, shrub-steppe with big sage, and shrub-steppe without
21 big sage habitat types. The reclamation zones (and percentage composition within site
22 boundary) include shrublands (37 percent), grasslands (18 percent), agriculture (8 percent),
23 forest and woodland (13 percent), wetland and riparian (1 percent), and other (23 percent).³²⁹
24 Proposed pre-construction reclamation actions include pre-treatment of noxious weed
25 infestations of areas to be disturbed and any windrowed plant and soil materials; selective
26 clearing; and, topsoil segregation. Proposed post-construction reclamation activities include
27 management of waste materials; earthwork (slope stability, surface stability, desired
28 topographic diversity, and drainage features); topsoil replacement; seeding; alternative
29 seeding; vertical mulch/slash; weed management; signage; and, monitoring.
30

31 *Revegetation Monitoring*
32

33 As presented in the draft Reclamation and Revegetation Plan, prior to construction, the
34 applicant proposes to identify monitoring sites, including both a treatment and control site, for
35 each habitat type to be impacted by the proposed facility. The final number of monitoring sites
36 per habitat would be based on the extent and diversity of vegetation within each habitat type,
37 with an anticipated average of two to five paired monitoring sites per habitat type, to be

³²⁸ B2HAPPDoc3-25 Attachment P1-3 Draft Reclamation and Revegetation Plan. See Section 4.0 Reclamation Plan Methodology of draft Reclamation Plan for reclamation zone information.

³²⁹ B2HAPPDoc3-25 Attachment P1-3 Draft Reclamation and Revegetation Plan. “Other” includes introduced upland vegetation and burned areas; developed/disturbed; and, bare ground, cliffs, and Talus habitat subtypes.

1 reviewed and approved by the Department in consultation with ODFW. The applicant would
2 then be obligated to monitor and report on the success of revegetation and reclamation at the
3 identified monitoring sites; success would be measured based on percentage of desirable
4 vegetation cover and weed cover, as proposed by the applicant and amended by the
5 Department, based on ODFW comments on the DPO.³³⁰ Monitoring duration would vary based
6 on the identified reclamation zone and impacted habitat recovery period.

7
8 The applicant proposes to conduct annual monitoring of monitoring sites for the first 5-years
9 post-construction. As described in the draft Reclamation and Revegetation Plan Section 6.5,
10 effective monitoring is an essential element of adaptive management because it provides
11 reliable feedback on the effects of reclamation actions. If adaptive management measures are
12 determined to be necessary, monitoring data (both qualitative and quantitative) would provide
13 information on reclamation components that are deficient, such as desirable vegetation cover,
14 soil compaction, or lack of parent soil material due to erosion. Based on this information,
15 appropriate remedial reclamation actions may include measures such as supplemental seeding,
16 mulching, weed treatment, access control, herbivory prevention, and/or erosion control
17 measures. Recommendations could also include waiting to determine if favorable germination/
18 establishment conditions are expected such as ample seasonal moisture or favorable
19 temperatures.

20
21 As represented in the draft Reclamation and Revegetation Plan, if after 5 years, additional
22 reclamation actions are determined necessary by either the applicant, the Department or
23 ODFW, annual reporting would continue until reclamation actions have satisfied all success
24 criteria.³³¹ If, after 5-years of annual monitoring, some sites have not attained the success
25 criteria or if at any point during the annual monitoring it is clear that reclamation cannot be
26 successful, appropriate adaptive management including additional reclamation techniques,
27 strategies, monitoring, or, if necessary, additional compensatory mitigation to account for the
28 impact.

29
30 As explained above, habitat types (reclamation zones) including shrublands and
31 forest/woodlands would be expected to recover in 30 to 100 years following disturbance, and
32 therefore, is the Department and ODFW expect that results 5-year post-construction would
33 predominately be related to the success of grassland reclamation. Based on the recovery period
34 duration for non-grassland habitats, and for clarification, the Department recommends Council
35 amend the draft Reclamation and Revegetation Plan to specify (as presented in Attachment P1-
36 3 of this order), consistent with ODFW recommendations on the DPO, a long-term monitoring

³³⁰ B2HAPDoc8-13 DPO Agency Comment ODFW Reif 2019-08-21.

³³¹ *Id.* On the record of the draft proposed order, ODFW recommends that, because potentially impacted habitats such as sagebrush shrubland and forests could take 10 to 50 years to recover, the applicant utilize an adaptive monitoring schedule and management plan to address potential impacts as long as necessary. Revisions incorporated into the proposed order to address this comment.

1 frequency of every 1 to 2 years until vegetation is established in a similar species composition
2 as the paired control site, and then extending to every 5 to 10 years (depending on habitat
3 vegetation) until the vegetation reaches the same maturity as the paired control site.³³²

4
5 Revegetation Success

6
7 Attachment P1-3 draft Reclamation and Revegetation Plan Table 6 presents revegetation
8 success criteria for designated habitat subtype zones (i.e. grasslands, shrublands, forest lands,
9 etc) and describes that the success criteria requires a certain percentage of desirable
10 vegetation cover, 50 to 70 percent, compared to identified control sites, which equates to less
11 than full restoration of temporary impacts. The applicant’s draft Fish and Wildlife Habitat
12 Mitigation Plan (Attachment P1-6), however, provides compensatory mitigation for temporary
13 impacts to Categories 2-4 (see Table 10 in Attachment P1-6) to mitigate for temporal habitat
14 loss (i.e. the timeframe between the impact and successful restoration). Neither ASC Exhibit P
15 or Attachment P1-6 define temporal loss; however, other than the applicant’s proposed
16 compensatory mitigation for temporary Category 2 impacts, which would fully mitigate the
17 temporary impact as a permanent impact, the compensatory mitigation for temporary impacts
18 would not fully mitigate the impact (i.e. is less than ODFW mitigation goal per habitat category)
19 and therefore revegetation is also required to meet the Fish and Wildlife Habitat standard.

20
21 If applicant intends to apply temporal loss to any duration of time and include in its
22 compensatory mitigation site(s) acres for temporarily impacted Categories 2-4 habitat, for the
23 life of the facility, the Department then agrees with applicant’s proposed success criteria – as it
24 does not need to restore temporary impacts to pre-disturbance condition, and the temporary
25 impact is mitigated via a combination of compensatory mitigation and revegetation. In the draft
26 Reclamation and Revegetation Plan, the Department incorporated a requirement that the
27 applicant provide documentation demonstrating mitigation of temporary impacts based on
28 combination of compensatory mitigation and revegetation, if Table 6 success criteria of the
29 plan is intended to apply.

30
31 In the alternative, if mitigation of temporary habitat impacts is not achieved through the
32 combination of revegetation and compensatory mitigation under the HMP, based on
33 recommendations from ODFW, the Department incorporated agency preferred success criteria
34 including equal or better percent cover of desirable species within the monitoring sites,
35 compared to paired control sites. Desirable species to include native grasses, forbes, shrubs and
36 trees, to be defined prior to construction. In addition, the agency preferred success criteria
37 includes an additional parameter for sagebrush habitat (reclamation zone) of 15 percent
38 sagebrush cover on monitoring sites compared to paired control sites.³³³ The Department
39 recommends that the agency preferred success criteria apply if applicant is unable to

³³² B2HAPPDoc8-13 DPO Agency Comment ODFW Reif 2019-08-21.

³³³ B2HAPP Proposed Order Agency Consultation ODFW 2020-06-29.

1 demonstrate, prior to construction, satisfactory temporary mitigation based on combined
2 revegetation and compensatory mitigation under the HMP.

3
4 To ensure that pre-construction tasks and actions, and agency review and approval of tasks and
5 actions is completed, the protective measures in the draft are incorporated into the final
6 Reclamation and Revegetation Plan and to ensure compliance with the final Reclamation and
7 Revegetation Plan, the applicant proposes and the Department recommends the Council
8 include the following condition, as amended in the proposed order,s in the site certificate:
9

10 **Recommended Fish and Wildlife Condition 1:** The certificate holder shall:

- 11 a. Prior to construction of a phase or segment of the facility, finalize, in accordance
12 with the OAR 345-025-0016 agency consultation process outlined in the draft
13 Reclamation and Revegetation Plan (Attachment P1-3 of the Final Order on the ASC),
14 and submit to the Department for its approval, in coordination with ODFW, a final
15 Reclamation and Revegetation Plan for that phase or segment of the facility to be
16 constructed. The protective measures described in the draft Reclamation and
17 Revegetation Plan in Attachment P1-3 of the Final Order on the ASC shall be
18 included and implemented as part of the final Reclamation and Revegetation Plan,
19 unless otherwise approved by the Department. Components of the plan to be
20 finalized are as follows. All components can be specific to the phase or segment of
21 the facility to be constructed:
22 i. Habitat (type/subtype) and disturbance impact (acres) assessment based on final
23 facility design and layout and preconstruction field verification of disturbance
24 areas.
25 ii. Identification and mapping of reclamation treatment and control monitoring
26 sites per habitat type.
27 iii. Identification and mapping of transect size and quantity, based on size of
28 disturbance areas, to be paired with treatment and control monitoring sites per
29 habitat type.
30 iv. Collection of preconstruction qualitative and quantitative data at treatment and
31 control monitoring sites.
32 ii. Development of site-specific data analysis protocol for photographs and a
33 standardized data-recording form.
34 v. Identification, and confirmation of availability, of appropriate seed mixes per
35 impacted habitat type.
36 b. ~~During p~~Post-construction of a phase or segment of the facility, the certificate
37 holder shall conduct all work in compliance with the final Reclamation and
38 Revegetation Plan referenced in sub(a) of this condition.
39

40 The applicant proposes to control vegetation during construction and maintenance of the
41 proposed transmission line to ensure adequate ground-to-conductor clearances. The proposed
42 vegetation clearing would have the potential to benefit some wildlife species that prefer non-
43 forested habitat for foraging and breeding activities. However, to the extent that
44 forest/woodland areas are subject to ongoing vegetation clearing, the habitat types would be

1 considered permanently and directly impacted for purposes of the certificate holder's
2 mitigation obligations. The applicant's proposed Vegetation Management Plan, provided as
3 Attachment P1-4 of this order, describes protective measures and mitigation obligations. To
4 ensure compliance with the final Vegetation Management Plan, the applicant proposes and the
5 Department recommends the Council include the following condition in the site certificate:
6

7 **Recommended Fish and Wildlife Condition 2:** The certificate holder shall:

- 8 a. Prior to construction of a phase or segment of the facility, in accordance with the OAR
9 345-025-0016 agency consultation process outlined in the draft Vegetation
10 Management Plan (Attachment P1-4 of the Final Order on the ASC), finalize and submit
11 to the Department for its approval, in consultation with ODFW, a final Vegetation
12 Management Plan. The protective measures described in the draft Vegetation
13 Management Plan in Attachment P1-4 of the Final Order on the ASC, shall be included
14 and implemented as part of the final Vegetation Management Plan, unless otherwise
15 approved by the Department.
- 16 b. During construction, the certificate holder shall conduct all work in compliance with the
17 final Vegetation Management Plan referenced in sub(a) of this condition.
- 18 c. During operation, the certificate holder shall conduct all work in compliance with the
19 final Vegetation Management Plan referenced in sub(a) of this condition.
20

21 The applicant also proposes to implement noxious weed control measures in accordance with a
22 Noxious Weed Control Plan, as provided in Attachment P1-5 of this order, to support success of
23 revegetation efforts and to comply with statutory and local weed control requirement. The
24 draft Noxious Weed Plan provides for control of the two State-level weed lists - Class A and
25 Class B weeds (including those that have been T-designated), along with county-level Class A,
26 Class B, and Class C weeds (Attachment P1-5 Section 2.1 of this order). T-designated weeds
27 indicate that the weed is a priority target for control. Further, the Plan ensures that the list of
28 weeds being managed would be up to date, stating: "IPC will review the county lists on a
29 regular basis to ensure that monitoring and control actions are targeting the appropriate
30 species." If there are weeds listed at the State or county level that are not currently listed in the
31 plan, those weeds would be incorporated during plan finalization, in accordance with the
32 Agency Review Process incorporated by the Department.
33

34 The draft Noxious Weed Plan requires pre-construction noxious weed surveys (see Section 4.0
35 of the plan) for the purpose of establishing pre-disturbance treatment areas, to minimize
36 potential for weed dispersal following commencement of construction activities. The plan also
37 requires vehicle washing stations (wheel washing) in areas identified with noxious weeds, prior
38 to and during construction. During construction and operation, the plan requires control and
39 treatment measures. The final treatment methodologies would be developed based on state
40 and country regulations; applicable land use management requirements; consultation with land
41 managers, county weed boards, and ODOE; and site-specific circumstances; to occur based on
42 the pre-construction Agency Review Process incorporated by the Department consistent with
43 OAR 345-025-0016. The Agency Review Process includes a dispute resolution process to ensure
44 that the final plan appropriately satisfies applicable regulatory requirements. Any treatments

1 would be applied by a licensed pesticide applicator, with demonstrated knowledge and
2 experience of weeds within the affected area (county) and would be required to have readily
3 available copies of the appropriate safety data sheets for the herbicides used. All pesticide
4 applications must follow Environmental Protection Agency label instructions, as well as federal,
5 state, and/or county regulation, BLM and USFS recommendations, and landowner agreements.
6

7 The plan requires agency consultation to establish frequency for long-term monitoring, which
8 would be site-specific. In other words – there may be increased long-term monitoring
9 frequency in disturbance areas with identified noxious weed infestations, and decreased
10 monitoring frequency in disturbance areas without infestations. The plan also addresses ORS
11 Chapter 569, which imposes certain obligations onto occupiers of land within a weed district.
12 To address those obligations, the plan requires that the applicant work with landowners or land
13 management agencies to identify and address weed infestations within the site boundary.
14 Council cannot require the applicant to control weeds outside of the site boundary, either
15 under its standards or ORS Chapter 569, because Council’s jurisdiction covers the “site” of the
16 proposed facility.³³⁴ However, land owner consultation would be an ongoing mitigation process
17 under the Agricultural Mitigation Plan, Revegetation Plan and Noxious Weed Plan, where
18 adequate opportunities to evaluate potential offsite impacts could be discussed – additionally,
19 county weed districts have funding and the authority to support landowners with
20 recommendations and implementation of control measures.³³⁵
21

22 The Plan does not include a bond or letter of credit for the county or county weed district to
23 manage and control noxious weed infestations potentially resulting from proposed facility
24 construction or operation, and is not required under any applicable regulatory requirement. A
25 bond for weed management could be proposed if, based on site specific issues or other risk
26 factors, it was necessary to ensure adequate implementation of the Weed Control Plan – which
27 is necessary to satisfy requirements under the Council’s Land Use and Fish and Wildlife Habitat
28 standards. At this time, other than presence of noxious weeds within the analysis area, no
29 evidence has been provided on the record that questions the validity of the Noxious Weed Plan
30 or the applicant’s ability to implement and adhere to the requirements of the plan.
31

32 The applicant proposes and the Department recommends the Council include the following
33 condition in the site certificate:
34

³³⁴ ORS 469.300(25) “Site” means any proposed location of an energy facility and related or supporting facilities.

⁽²⁶⁾ “Site certificate” means the binding agreement between the State of Oregon and the applicant, authorizing the applicant to construct and operate a facility on an approved site, incorporating all conditions imposed by the council on the applicant.

³³⁵ Commenters maintain the applicant must be responsible for maintaining weeds outside the right-of-way (ROW) and that the applicant failed to include specific weeds and weed management items identified by counties. B2HAPPDoc8-142 DPO Public Comment Gilbert 2019-06-18 to 08-22, Giles, C., Antell, K., Lemon, D., Henderson, A., Brown, J., et al.

1 **Recommended Fish and Wildlife Condition 3:** The certificate holder shall:

- 2 a. Prior to construction of a phase or segment of the facility, in accordance with the OAR
3 345-025-0016 agency consultation process outlined in the draft Noxious Weed Plan(s)
4 (Attachment P1-5 of the Final Order on the ASC), finalize, and submit to the Department
5 for its approval, a final Noxious Weed Plan. The protective measures as described in the
6 draft Noxious Weed Plan provided as Attachment P1-5 to the Final Order on the ASC,
7 shall be included and implemented as part of the final Noxious Weed Plan, unless
8 otherwise approved by the Department.
- 9 b. During operation, the certificate holder shall conduct all work in compliance with the
10 final Noxious Weed Plan referenced in sub(a) of the condition.

11
12 To the extent compensatory mitigation would be required for temporary impacts, the applicant
13 addresses the recovery periods associated with lost habitat functionality in the draft Fish and
14 Wildlife Habitat Mitigation Plan, provided as Attachment P1-6 of this order. The applicant's
15 proposed Fish and Wildlife Habitat Mitigation Plan includes provisions to compensate for
16 impacts to Category 2 through 5 habitats that cannot be avoided or minimized. Through the
17 Fish and Wildlife Habitat Mitigation Plan, the applicant commits to provide mitigation for
18 permanent direct impacts resulting from construction and installation of all proposed
19 transmission line components, based on the methodology summarized in Table FW-1 above.

20
21 The applicant proposes offsetting fish and wildlife habitat impacts by either purchasing credits
22 or conducting its own compensatory mitigation projects. With respect to purchasing credits,
23 the applicant proposes that it may do so through one or both of the following mechanisms:

- 24
- 25 • Mitigation Banking: Purchasing mitigation credits from mitigation banks to address
26 proposed facility impacts where available; no mitigation banks are currently available
27 within the mitigation service area. In the event that a habitat mitigation bank becomes
28 available within the mitigation service area, the applicant would seek to accomplish all
29 or part of its mitigation for the proposed facility by participation in the bank.
 - 30 • In-Lieu Fee (ILF): Fees paid to an approved ILF sponsor which are then used to
31 develop an on the ground mitigation project within a certain time period. The applicant
32 is not aware of any ILF sponsors within the proposed facility mitigation service area. In
33 the event that an ILF sponsor becomes available within the mitigation service area, the
34 applicant would seek to accomplish all or part of its mitigation for the proposed facility
35 by participation through an ILF sponsor.

36
37 In addition to proposing compensatory mitigation, the certificate holder proposes to implement
38 and monitor specific enhancement actions within the HMA, such as stream habitat
39 enhancement, upland habitat enhancement, and Juniper removal, as further described in Table
40 12 of Attachment P1-6 of this order. Habitat enhancement actions are proposed to further
41 satisfy the Category 2 "net-benefit" mitigation goal.

42
43 The applicant also describes that it would seek out mitigation opportunities that would fund
44 private, state, or federal programs and/or proposed facility that would not necessarily involve a

1 land acquisition component. The applicant ~~will~~would work with the stakeholders to identify
2 any unfunded or underfunded projects that could benefit from additional funding sources, as
3 well as determining how much mitigation credit each of these projects ~~will~~would represent to
4 the proposed facility. These types of mitigation must remain functional and legally protected
5 through the duration of impacts being mitigated and cannot include programs that have
6 sufficient funding now or are likely to have sufficient funding in the future.

7
8 Prior to commencement of construction, the applicant would secure mitigation sites with
9 sufficient credits to offset the permanent and temporal habitat impacts of the proposed facility.
10 In order to show there are mitigation site opportunities sufficient to meet the needs of the
11 proposed facility and to demonstrate how the applicant's debiting and crediting approach
12 would be implemented, the applicant identified 14 potential mitigation sites, which
13 demonstrate that adequate mitigation opportunities exist to address all of the proposed
14 facility's impacts on wildlife habitat. The 14 mitigation sites included in this Fish and Wildlife
15 HMP collectively exceed the quantity of mitigation that would ultimately be needed for the
16 proposed facility by approximately ten- to twenty-fold. The draft HMP addresses credit
17 "stacking," which is the concept of utilizing a single mitigation "credit" to account for mitigation
18 obligations for multiple habitat types.

19
20 For example, if a mitigation credit (either a project, a fee-in-lieu payment or other acceptable
21 method) provides mitigation for multiple mitigation needs on a single location, such as elk
22 winter range and mule deer winter range, that single mitigation credit can provide the
23 mitigation obligation for both habitat type needs. However, it is important to note that the
24 EFSC Fish and Wildlife Habitat standard and ODFW Fish and Wildlife Habitat Mitigation policy
25 require mitigation corresponding to the habitat category in total. Meaning, for illustrative
26 purposes, for locations where the proposed facility would impact one acre of habitat that is
27 both elk winter range and mule deer winter range, the mitigation obligation is one-plus acre, to
28 meet the "no net loss plus net benefit" standard as applies to Category 2 habitat (big game
29 winter range is Category 2 habitat). The mitigation obligation is not one-plus acre of elk winter
30 range AND one-plus acre of mule deer winter range.

31
32 The mitigation credit could be a single location that provides the one-plus acre of mitigation
33 habitat for both elk and mule deer winter range, and that would meet the standard. To the
34 extent that "stacking" means what is described here, it is a concept that can be used to meet
35 the proposed facility's compensatory mitigation obligation. However, as a counter example, if
36 the proposed facility impacts one acre of elk winter range that is not also mule deer winter
37 range, and elsewhere, impacts one acre of mule deer winter range that is not elk winter range,
38 the mitigation obligation is for one-plus acre of elk winter range AND one-plus acre of mule
39 deer winter range, for a total of two-plus acres of compensatory mitigation obligation.

40
41 The applicant would continue to coordinate with the Department in preparation of a final Fish
42 and Wildlife HMP that would be sufficient to compensate for the proposed facility's impacts on
43 wildlife habitats and achieve the mitigation goals set forth in ODFW's Habitat Mitigation Policy.
44 The applicant would begin funding mitigation once a site certificate is issued by EFSC and prior

1 to construction of the proposed facility.

2

3 To ensure that the Fish and Wildlife Habitat Mitigation Plan is sufficient to meet the ODFW
4 habitat mitigation goals and standards described in OAR 635-415-0025, the applicant proposes
5 and the Department recommends the Council include the following condition in the site
6 certificate:

7

8 **Recommended Fish and Wildlife Condition 4:** The certificate holder shall:

9 a. Prior to construction of any phase or segment of the facility, finalize, and submit
10 to the Department for its approval, a final Fish and Wildlife Habitat Mitigation
11 Plan, based on the plan provided as Attachment P-6 of the Final Order on the
12 ASC. The final Fish and Wildlife Habitat Mitigation Plan shall include the
13 following, unless otherwise approved by the Department:

14 Information To Be Included in Final Habitat Mitigation Plan, based on the phase
15 or segment of the facility to be constructed:

- 16 i. The areas that were surveyed for biological resources;
- 17 ii. The location of all facility components and related and supporting facilities;
- 18 iii. The areas that will be permanently and temporarily disturbed during
19 construction;
- 20 iv. The protective measures described in the draft Fish and Wildlife Habitat
21 Mitigation Plan in Attachment P-6 of the Final Order on the ASC; and
- 22 v. The results of the biological surveys referenced in Fish and Wildlife
23 Conditions ~~134~~, 15 and 16.

24 Final Habitat Mitigation Plan Shall Address the Following: The final Fish and
25 Wildlife Habitat Mitigation Plan shall address the potential habitat impacts
26 through mitigation banking, an in-lieu fee program, development of mitigation
27 projects by the certificate holder, or a combination of the same.

- 28 i. To the extent the certificate holder shall develop its own mitigation
29 projects, the final Habitat Mitigation Plan shall:
 - 30 1. Identify the location of each mitigation site, including a map of the
31 same;
 - 32 2. Identify the number of credit-acres that each mitigation site will
33 provide for the certificate holder;
 - 34 3. Include a site-specific mitigation management plan for each mitigation
35 site that provides for:
 - 36 ~~B~~.A. A baseline ecological assessment;
 - 37 ~~C~~.B. Conservation actions to be implemented at the site;
 - 38 ~~D~~.C. An implementation schedule for the baseline ecological
39 assessment and conservation actions;
 - 40 ~~E~~.D. Performance measures;
 - 41 ~~F~~.E. A reporting plan; and
 - 42 ~~G~~.F. A monitoring plan.

- 1 ii. To the extent the certificate holder shall utilize a mitigation bank or in-lieu
2 fee program, the final Habitat Mitigation Plan shall:
- 3 1. Describe the nature, extent, and history of the mitigation bank or in-
4 lieu fee program; and
 - 5 2. Identify the number of credit-acres that each mitigation site will
6 provide for the certificate holder.
 - 7 3. Oregon’s Elk Mitigation Framework shall be used to calculate the
8 amount of elk habitat compensatory mitigation required for the facility.
 - 9 4. The final Fish and Wildlife Habitat Mitigation Plan may be amended
10 from time to time by agreement of the certificate holder and the
11 Department. Such amendments may be made without amendment to
12 the site certificate. The Council authorizes the Department to agree to
13 amendments of the plan and to mitigation actions that may be required
14 under the plan; however, the Council retains the authority to approve,
15 reject, or modify any amendment of the plan agreed to by the
16 Department.
- 17 b. During construction, the certificate holder shall commence implementation of
18 the conservation actions set forth in the final Fish and Wildlife Habitat Mitigation
19 Plan referenced in sub(a) of this condition.

20
21 **Recommended Fish and Wildlife Condition 5:** During the third year of operation,
22 the certificate holder shall provide to the Department a report demonstrating that
23 fish and wildlife habitat mitigation is commensurate with the final compensatory
24 mitigation calculations.

- 25 a. The final calculations shall be based on the as-constructed facility.
- 26 b. Oregon’s Elk Mitigation Framework shall be used to calculate the amount of elk
27 habitat compensatory mitigation required for the facility, and the information
28 from the pre- and post-construction traffic studies, as required by Fish and
29 Wildlife Conditions 21 and 22, shall be used in the calculation.

30
31 *Impact Assessment for Elk Habitat*

32
33 Due to specific requirements particularly for indirect impact assessment, the applicant
34 developed a subsection of Exhibit P to assess the proposed facility’s potential impacts to elk
35 habitat. This is called “Exhibit P3.” The exhibit includes assessment of both elk summer and
36 winter habitat, and provides the applicant’s assessment of facility impacts to that habitat based
37 on ODFW guidance. ODFW considers elk winter range (and all big game winter range) as habitat
38 Category 2, and elk summer range as habitat Category 3. In order to identify the elk winter
39 range habitat, the applicant relied on 2013 GIS data provided by ODFW; and to identify the
40 summer range habitat, the applicant relied on data from the 1999 Rocky Mountain Elk
41 Foundation Measure and Prioritize Elk Habitat Project, as requested by ODFW. Consistent with
42 ODFW’s 2015 Elk Mitigation Framework guidance document, the applicant then removed any
43 elk winter range and summer range identified in the GIS datasets that occurred within
44 developed areas, cultivated fields, and elk de-emphasis areas. Habitat not identified in the GIS

1 datasets were not included as either winter or summer range habit, even if the vegetation
2 could support elk.³³⁶

3
4 *Potential Impacts from the Proposed Transmission Line*

5
6 *Elk Winter Range:* As described in Exhibit P3, the proposed facility is anticipated to include
7 178.7 acres of permanent direct impacts and 237.6 acres of temporary direct impacts to elk
8 winter range. For this route, proposed components occurring in the elk winter range include:
9 69.17 line miles of the proposed transmission line, 42.47 miles of new access roads; 63.04 miles
10 of substantially modified existing roads; six multi-use areas, and three communication stations.
11 The Morgan Lake alternative would include 13.1 acres of permanent direct impacts and 76.5
12 acres of temporary direct impacts to elk winter range, including the following components:
13 16.54 line miles of the proposed transmission line; 14.69 miles of new access roads; 12.14 miles
14 of substantially modified existing roads; and one communication station. The applicant's
15 analysis shows that the Double Mountain alternative and the Bombing Range Road alternatives
16 would not include any facility components in elk winter range.³³⁷

17
18 *Elk Summer Range:* Exhibit P3 describes that for elk summer range, the proposed route would
19 include direct impacts of 189.1 acres of permanent direct impacts and 43 acres of temporary
20 direct impacts. Proposed components in elk summer range would include 28.89 line miles of
21 the proposed transmission line; 11.31 miles of new access roads; 24.88 miles of substantially
22 modified existing roads; and one multi-use area. The Morgan Lake alternative would include 9.5
23 acres of permanent direct impacts and 51.8 acres of temporary direct impacts to elk summer
24 range. For the Morgan Lake alternative, facility components that would occur in elk summer
25 range include 15.61-line miles of the proposed transmission line; 12.56 miles of new access
26 roads; 14.52 miles of substantially modified existing roads; and one communication station.
27 The applicant's analysis shows that the Double Mountain alternative and the Bombing Range
28 Road alternatives would not include any proposed components in elk summer range.³³⁸

29
30 *Potential Impacts from the Proposed Access Roads*

31
32 As described in Exhibit P3, Table P3-10, for the proposed route, 119.27 miles out of a total of
33 751 miles of new and existing roads would be within elk winter range or summer range. A total
34 of 27.88 miles of those roads do not have proposed access control and therefore are included
35 in the indirect impact calculation. The roads with access control are not included because
36 access control is anticipated to eliminate unauthorized and non-project related use of the
37 access roads during facility operation. For the Morgan Lake alternative, 31.06 miles out of a
38 total of 59 miles of new and existing roads would be within elk winter or summer range. Of
39 those, 8.5 miles of new and existing roads do not have proposed access control and therefore

³³⁶ B2HAPPDoc3-33 ASC 16C_Exhibit P3_Elk_ASC 2018-09-28, Section 3.3.

³³⁷ Id. See Section 3.5.3.3, Table P3-4.

³³⁸ Id.

1 are included in the direct impact calculation. The roads with access control are not included, for
2 the same reasoning, access control is assumed to eliminate unauthorized and non-project use
3 of facility access roads. The certificate holder is not responsible for unauthorized use of facility
4 access roads. The ODFW Elk Mitigation Framework only considers indirect impacts from roads
5 to elk, not from other facility components during facility operation.
6

7 *Elk Winter Range:* As described in Exhibit P3 and above in Table P3-10, for the proposed facility,
8 2.63 miles of new access roads and 15.28 miles of substantially modified existing roads are
9 included in the elk winter range indirect impact analysis. As depicted in Table P3-11, new roads
10 would result in 400.25 acres of indirect impacts. There would be no indirect impacts resulting
11 from substantially modified existing roads. For the Morgan Lake alternative, 2.42 miles of new
12 access roads and 4.43 miles of substantially modified existing roads are included in the elk
13 winter range indirect impact analysis. New roads would result in 17.26 acres of indirect impact.
14 There would be no indirect impacts resulting from substantially modified existing roads.³³⁹
15

16 *Elk Summer Range:* For the proposed facility, 1.69 miles of new access roads and 10.18 miles of
17 substantially modified existing roads without access control are included in the elk summer
18 range direct impact analysis. There are no indirect impacts resulting from new roads or
19 substantially modified roads. For the Morgan Lake alternative, 2.42 miles of new access roads
20 and 6.05 miles of substantially modified existing roads are included in the elk winter range
21 indirect impact analysis. New roads would result in 15.77 acres of indirect impact. There would
22 be no indirect impacts resulting from substantially modified existing roads.³⁴⁰
23

24 Direct Impacts

25
26 The applicant characterizes direct impacts as those impacts that would have an adverse effect
27 upon elk habitat or elk individuals, and that would occur at the same, or in close proximity in,
28 time and place. The applicant calculated direct impacts for winter range and summer range using
29 disturbance limits for construction (temporary impacts) and operation (permanent impacts) in
30 ASC Exhibit C, Table C-24. Temporary impacts are calculated from the edge of the permanent
31 disturbance; thus, there is no overlap of temporary and permanent impacts.
32

33 The applicant has calculated direct impacts separately between winter and summer range
34 habitat; however, as noted in Table P3-4, there is extensive overlap of winter range and summer
35 range, and impacts are also calculated for the overlapping ranges. Table P3-5 breaks down the
36 impacts by facility component.
37

³³⁹ Id. Section 3.5.4.3. Table P3-10.

³⁴⁰ Id.

1 *Permanent Direct Impacts*

2

3 Table P3-2 summarizes the type, timing, duration, quantification metric, and mitigation
4 measures related to the proposed transmission line’s potential permanent direct impacts in elk
5 winter range and summer range.

6

7 *Permanent Vegetation Clearing Direct Impacts:* The proposed facility would result in permanent
8 loss of elk habitat and would permanently and directly convert other elk habitat from one
9 habitat type to another. Permanent loss of habitat would occur within the operation
10 disturbance areas for transmission structures, the Longhorn Station, communication stations,
11 and access roads. In Exhibit B (and Attachment B-5; Road Classification Guide and Access
12 Management Plan;) and Exhibit U (and Attachment U-2, Traffic and Transportation Management
13 Plan), the applicant provides details regarding the permanent direct impacts from vegetation
14 clearing necessary for access road construction and modification, and includes information related
15 to road construction activities and methods, including types of improvements to existing roads
16 and projected traffic volumes.

17

18 *Direct Mortality:* While the risk is quite low, direct mortality to individual elk could occur as a
19 result of collisions with construction or maintenance vehicles. As further discussed in Exhibits
20 P1 and P2, through Recommended Fish and Wildlife Conditions 8, 21 and 22, the applicant
21 proposes to avoid or minimize impacts by restricting speeds and employing access controls in
22 elk winter range.

23

24 *Temporary Direct Impacts*

25

26 Table P3-3 summarizes the type, timing, duration, quantification metric, and mitigation
27 measures related to the proposed transmission line’s potential temporary direct impacts in elk
28 winter range and summer range.³⁴¹

29

30 *Temporary Vegetation Clearing Direct Impacts:* As described ASC Exhibit P3, construction-
31 related activities and installation of some facility components would require ROW clearing of
32 vegetation and forestlands that provide habitat for elk. In most areas there would be a 250-
33 foot-wide ROW in which to construct the 500-kV portions of the transmission line and a 100-
34 foot-wide ROW to construct the 138-kV portions of the line. Within that ROW, temporary
35 vegetation clearing activities would encompass the entire footprint of pulling and tensioning
36 sites, multi-use areas, and light-duty fly yards. Temporary clearing activities would also occur
37 around the perimeter of permanent facility components, including transmission structures, the
38 Longhorn station, communication stations, and access roads. Areas cleared for construction
39 activities, and not required for transmission line components or needed for maintenance,
40 would be reclaimed as described in the applicant’s Reclamation and Revegetation Plan

³⁴¹ B2HAPPDoc3-25 ASC 16A_Exhibit P1_Wildlife_ASC_Part 1_Main thru Attach P1-6 rev 2018-09-28. Section 3.5.3.3.

1 (Attachment P1-3; Recommended Fish and Wildlife Condition 1) and Vegetation Management
2 Plan (Attachment P1-4; Recommended Fish and Wildlife Condition 2).

3
4 Elk habitat that is cleared for construction would be restored. While restoration of certain elk
5 habitat (e.g., forestlands) could take decades and restoration could span generations of elk, the
6 applicant states that those impacts are considered temporary because they would last less than
7 the life of the transmission line which is expected to be in place indefinitely. However, the
8 Department requires that mitigation be provided for all vegetation clearing of forestlands
9 because of the very long time before the habitat is restored to pre-disturbance conditions.
10 Impact to forestlands would be quantified and mitigated as required by the Habitat Mitigation
11 Plan (Exhibit P1; Attachment P1-6; Recommended Fish and Wildlife Condition 4).

12
13 *Retirement:* Retirement of the transmission line would involve activities and equipment similar
14 to those that would be used during construction. Therefore, potential impacts on elk during
15 retirement of the transmission line would be similar to the temporary impacts described for
16 construction. As described in Mandatory Conditions 7 and 12, specific mitigation requirements
17 to address impacts incurred during retirement of the facility would be included in the
18 retirement plan, including a description of the activities necessary to restore the site to a
19 useful, non-hazardous condition, as required by OAR 345-027-110(5).

20 21 Indirect Impacts

22
23 Indirect impacts are those that would have an adverse effect upon elk habitat or elk individuals,
24 and that would occur later in time or in a different place than the facility construction activities.
25 Indirect impacts may be permanent or temporary and are typically associated with noise or
26 other disturbance that adversely impacts elk and elk habitat. In ASC P3, Table P3-6, the
27 applicant provides a summary of the type, timing, duration, quantification metric, and
28 mitigation measures related to the facility's potential permanent indirect impacts in elk winter
29 range and summer range.³⁴²

30 31 *Transmission Line-Related Permanent Indirect Impacts*

32
33 As explained in Exhibit P3, the applicant does not anticipate that, once constructed, the
34 transmission line would restrict elk movement or otherwise adversely impact elk habitat.
35 Accordingly, there would be no permanent indirect impacts related to the transmission line
36 itself. The ODFW Elk Mitigation Framework is specific to roads, as discussed below.

37 38 *Access Road Permanent Indirect Impacts*

39
40 New and substantially modified existing access roads are unlikely to act as a barrier to elk
41 movement of and by themselves. However, the introduction of traffic and the presence of

³⁴² Id. Section 3.5.4.1.

1 human activity on those roads may have a negative indirect impact on elk, including reduced
2 utilization of habitat, fragmentation of migration corridors, and the associated disruption of elk
3 life processes. Compliance with Recommended Fish and Wildlife Conditions 8, 20 and 21 would
4 help minimize those impacts through speed limits and access controls. In addition, ODFW has
5 developed a methodology in its Elk Mitigation Framework for quantifying indirect impacts to elk
6 habitat resulting from road use. The applicant would be required to implement the
7 methodology, quantify the indirect impacts from the access roads, and provide appropriate
8 mitigation including compensatory mitigation via the Elk Mitigation Framework as part of the
9 Habitat Mitigation Plan (Attachment P1-6; see also Recommended Fish and Wildlife Condition
10 4).

11

12 *Access Road Temporary Indirect Impacts*

13

14 ASC Exhibit P3, Table P3-7 includes a summary of the type, timing, duration, quantification
15 metric, and mitigation measures related to the facility's potential temporary indirect impacts in
16 elk winter range and summer range. The applicant explains that construction activities would
17 result in noise, visual disturbance from heavy equipment, traffic and people, fugitive dust
18 dispersing from the immediate construction area, and small amounts of air pollution from
19 construction equipment's exhaust. Indirect construction impacts may also include an increased
20 risk for the spread or establishment of invasive-plant species, which can degrade habitats and
21 exclude native species from areas; and increased access to areas previously inaccessible to the
22 public due to the construction of facility-related roads, which can further degrade habitats as a
23 result of increased human presence. These activities can impact elk behavior in areas beyond
24 the facility's construction areas, with noise impacts likely having the farthest-reaching effect.
25 Some construction activities would result in predicted noise levels of 80 to 90 A-weighted
26 decibels at 50 feet from the work site. Increases in noise would be concurrent with any
27 disturbance associated with the presence of humans and their activities (e.g., dust and visual
28 disturbances). Thus, construction activities may affect elk and reduce the functionality of
29 habitat at varying distances from the construction areas. These disturbances could render
30 habitats unsuitable during construction, with disturbances ceasing once construction or
31 maintenance activities have ceased. To minimize and mitigate those impacts, and as discussed
32 above relative to impacts on mule deer, Recommended Fish and Wildlife Conditions 8, 9 and 21
33 would impose spatial and timing restrictions near sensitive elk habitat, limiting the construction
34 window to time periods when elk are less sensitive to disturbances.³⁴³

35

36 Access roads would be used by maintenance crews and vehicles for inspection and
37 maintenance of the facility. Trips would be limited to regular inspection and maintenance of the
38 transmission line. During these maintenance trips, the noise, traffic, dust, and human presence
39 may adversely affect elk behavior around the relevant roads and work areas. As noted by

³⁴³ Id. Section 3.5.4.2. The applicant notes that it may seek exceptions from ODOE and ODFW to the timing restrictions if site conditions allow. For example, if elk are not using the sensitive habitat, the certificate holder may request permission to start work in the area sooner than what would normally be allowed.

1 ODFW and as the applicant acknowledges, human activity on those roads could indirectly
2 impact elk habitat through reduced habitat utilization, fragmentation of migration corridors,
3 and disruption of elk life processes. The applicant has calculated the quantity of indirect impacts
4 related to the access roads using the methods set forth in the Elk Mitigation Framework, which
5 provides the area of indirect impact by comparing the increase in traffic volume to the baseline
6 traffic volume of an existing road. As depicted in ASC Exhibit P3, Table P3-8 (reprinted in the
7 ASC from the ODFW Elk Mitigation Framework), the higher the increase in traffic volume during
8 operation, the larger the disturbance buffer.

9
10 In order to confirm and quantify the amount of required mitigation, the applicant proposes to
11 conduct a traffic study to evaluate pre- and post-construction traffic on public roads used for
12 the proposed facility. As explained above with regard to the sage-grouse habitat, that traffic
13 study would be conducted for one year in the year prior to construction and for one year during
14 the second year the transmission line is in operation. The details of the proposed traffic study
15 are included in the applicant's Road Classification Guide and Access Control Plan, Attachment B-
16 5 of Exhibit B. Recommended Fish and Wildlife Condition 20 would require that the traffic study
17 be conducted, and Recommended Fish and Wildlife Condition 9 would require that the results
18 of the traffic study inform final facility mitigation obligation.

19
20 The applicant explains the proposed traffic studies, which include a traffic monitoring program,
21 are necessary to ensure that indirect impacts to elk winter Range and Summer range, are
22 adequately mitigated in accordance with the EFSC Fish and Wildlife Habitat standard and ODFW
23 policy. Compliance with Recommended Fish and Wildlife Conditions 4, 9 and 20 would ensure
24 compliance with those proposed traffic studies and ensure adequate mitigation. As is described
25 in the general fish and wildlife habitat section with regards to compensatory mitigation, the
26 Department has assessed the applicant proposed mitigation projects and concludes that the
27 proposed mitigation projects are sufficient representations to demonstrate compliance with
28 the EFSC Fish and Wildlife Habitat standard. Recommended Fish and Wildlife Condition 4 would
29 obligate the applicant to finalize and implement a Habitat Mitigation Plan, as outlined in the
30 condition, which would include mitigation for both direct and indirect impacts to big game
31 winter and summer range.

32 33 *Temporary Invasive Species Impacts*

34
35 The applicant explains that the initial clearing of vegetation and resulting soil disturbance
36 during construction could create optimal conditions for the establishment of invasive-plant
37 species. The establishment of invasive-plant species can affect the quality of wildlife habitat
38 through competition with, and the eventual replacement of, desirable native plant species. The
39 replacement of native plant species with invasive species could have environmental effects on
40 wildlife habitat, including changes in fire regime, changes in the nutrient regime of soils,
41 increased soil erosion, or reductions in the abundance of important forage species (due to
42 invasive species excluding them from the area). These alterations to habitat quality can extend
43 beyond the area of initial impacts. Finalization and implementation of the Noxious Weed Plan
44 (Attachment P1-5; Recommended Fish and Wildlife Condition 3) and the Reclamation and

1 Revegetation Plan (Exhibit P1, Attachment P1-3; Recommended Fish and Wildlife Condition 1)
2 would minimize the risk of invasive-plant species spread or establishment.

3

4 Analysis and Recommended Conclusion Regard Elk Habitat

5

6 Based on the evidence in the record and the assessment provided here, and subject to
7 compliance with the recommended site certificate conditions, the Department recommends
8 the Council find that the proposed facility would comply with the EFSC Fish and Wildlife Habitat
9 standard at OAR 345-022-0060(1) with regards to elk habitat.

10

11 *Identification of Sensitive Species*

12

13 EFSC rules require an applicant to identify all ODFW-listed State Sensitive Species that might be
14 present in the analysis area and to establish a baseline survey of the use of the habitat in the
15 analysis area by those species. ODFW defines State Sensitive Species as “wildlife species,
16 subspecies, or populations that are facing one or more threats to their populations, habitat
17 quantity or habitat quality or that are subject to a decline in number of sufficient magnitude
18 such that they may become eligible for listing on the state Threatened and Endangered Species
19 List.”³⁴⁴ ODFW further defines State Sensitive Species as either Sensitive or Sensitive Critical.
20 Sensitive species are defined as having small or declining populations, are at-risk, and/or are of
21 management concern. Sensitive Critical species are those with current or legacy threats that are
22 significantly impacting their abundance, distribution, diversity, and/or habitat. Sensitive Critical
23 species may decline to the point of qualifying for threatened or endangered status if
24 conservation actions are not taken.³⁴⁵

25

26 The applicant’s list of State Sensitive Species that could potentially occur within the analysis
27 area is included in ASC Exhibit P1, Table P1-5.³⁴⁶ The sensitive species within the analysis area
28 include 11 mammals (two of which have been documented in the analysis area), 23 birds (20 of
29 which have been documented or potentially documented in the analysis area), five
30 reptiles/amphibians (two of which have been documented in the analysis area), and six fish
31 (one of which has been documented in the analysis area).³⁴⁷

32

³⁴⁴ OAR 635-100-0040(1).

³⁴⁵ The ODFW Sensitive Species list is available on the ODFW website:
https://www.dfw.state.or.us/wildlife/diversity/species/sensitive_species.asp.

³⁴⁶ B2HAPPDoc3-25 ASC 16A_ Exhibit P1_Wildlife_ASC_Part 1_Main Thru Attach P1-6 rev 2018-09-28, Table P1-5. The applicant developed this list through a review of pertinent literature and databases (including 2016 Oregon Biodiversity Information Center data), consultation with applicable land-management agencies, and the results of field surveys. Baseline surveys were conducted to better determine habitats that could support State Sensitive Species within the analysis area.

³⁴⁷ Id. Additional details regarding locations of State Sensitive Species detected during surveys are included in the biological survey summary report at Attachment P1-7A.

1 *General Impacts to State Sensitive Species*

2

3 There are a number of general impacts that could affect state sensitive species during
4 construction and operation of the proposed facility, including both direct and indirect impacts.
5 These general impacts, including specific mitigation measures proposed by the applicant to
6 reduce and minimize these impacts, are discussed here.

7

8 In general, the applicant has proposed and the Department supports a worker training program
9 that ~~will~~would inform and train all workers on the project of their obligations under the site
10 certificate and other permits of approval. As part of new employee worker orientation and
11 training, the applicant would require that all construction personnel attend mandatory training
12 on protection of sensitive resources, as well as the need to adhere to all applicable restrictions
13 and permit requirements. The training would ensure that all construction and maintenance
14 personnel understand and are aware of the environmental requirements, protection measures,
15 and compliance. To ensure compliance with the environmental training program, the applicant
16 proposes and the Department recommends the Council include the following condition in the
17 site certificate:

18

19 **Recommended Fish and Wildlife Condition 6:** Prior to construction of any phase or
20 segment of ~~construction~~the facility, the certificate holder shall train all construction
21 personnel on the protection of cultural, paleontological, ecological, and other natural
22 resources such as (a) federal and state laws regarding antiquities, paleontological resources,
23 and plants and wildlife, including collection and removal; (b) the importance of these
24 resources; (c) the purpose and necessity of protecting them; and (d) reporting and
25 procedures for stop work. Prior to the training, the certificate holder must provide the
26 Department with a copy of training materials that will be used such as Power Point slides,
27 information hand-outs, maps, and other materials.

28

29 Traffic-Related Mortality: Direct mortality to individual species could occur as a result of
30 collisions with vehicles during construction or operation of the proposed facility. The applicant
31 explains in Exhibit P1 that it expects this risk to be very low, since most species would likely
32 avoid the work sites.³⁴⁸ However, species or individuals that are less mobile or less sensitive to
33 these disturbances could be directly threatened by construction activities. In order to avoid or
34 minimize the risk of traffic-related direct mortality, the applicant proposes to require drivers of
35 construction and maintenance vehicles to reduce speed to a level sufficient to anticipate and
36 avoid striking individual wildlife. Accordingly, to avoid or minimize direct mortality to wildlife,
37 the applicant proposes and the Department recommends the Council include the following
38 conditions in the site certificate establishing speed limits on access roads when applicable:

39

40 To ensure Category 1 Habitat in particular, as well as other environmentally sensitive areas, are
41 clearly identified during construction activities, the applicant proposes to flag sensitive wildlife

³⁴⁸ Id. Section 3.5.3.1.

1 resources that occur within or adjacent to the ROW and work areas to ensure they are avoided.
2 To ensure compliance with that proposal, the applicant proposes and the department
3 recommends the Council include the following condition in the site certificate:

4
5 **Recommended Fish and Wildlife Condition 7:** Prior to and during construction, the
6 certificate holder shall flag the following environmentally sensitive areas as
7 restricted work zones:

- 8 a. State protected plant species;
- 9 b. Wetlands and waterways that are not authorized for construction impacts;
- 10 c. Areas with active spatial and seasonal restrictions; and
- 11 d. Category 1 habitat.

12 Prior to construction of a phase or segment of the facility, the certificate holder
13 shall submit a mapset showing the location of environmentally sensitive areas and
14 restricted work zones to the Department for its approval. The certificate holder
15 shall make the mapset available to all construction personnel.

16
17 **Recommended Fish and Wildlife Condition 8:** During construction and operation, the
18 certificate holder shall employ a speed limit of 25 miles per hour or less on private facility
19 access roads.

20
21 In addition, the applicant proposes to minimize and substantially reduce potential vehicle-
22 wildlife collisions on facility access roads through controlling the use of those roads. The
23 applicant proposes to implement access control as set forth in the draft Road Classification
24 Guide and Access Control Plan (Exhibit B, Attachment B-5). Access control may involve fencing,
25 gates, barriers, and/or signage as preferred by the landowner while maintaining effectiveness.
26 To avoid or minimize indirect impacts related to access roads with respect to species that may
27 be particularly sensitive to vehicle access (i.e., elk and sage-grouse), consistent with the Road
28 Classification Guide and Access Control Plan, the applicant proposes and the Department
29 recommends the Council include the following condition in the site certificate:

30 **Recommended Fish and Wildlife Condition 9:** During operation, the certificate
31 holder shall employ access control on facility access roads within elk habitat (elk
32 summer range and elk winter range) and sage-grouse habitat (areas of high
33 population richness, core area habitat, low density habitat, or general habitat),
34 subject to approval by the applicable land-management agency or landowner.

35
36 Electrocution-Related Mortality: The applicant notes in ASC Exhibit P1 that concerns have been
37 raised regarding the risk of bird electrocutions (especially raptors) along electrical lines. As the
38 applicant explains, the risk of avian mortalities occurring as a result of electrocutions is very low
39 for extra high-voltage transmission lines because a bird would need to contact two phases of
40 the line simultaneously; and that the spacing between phases of the proposed transmission line
41 is much larger than the wing span of any North American bird.

1 Nonetheless, the applicant is required to comply with the federal *Migratory Bird Treaty Act of*
2 *1918 (MBTA), the *Bald and Golden Eagle Protection Act of 1940 (BGEPA), and the *Endangered***
3 *Species Act of 1973 (ESA), which establish requirements for the protection of migratory bird*
4 *species from electrocutions and collision risk. These laws prohibit killing or otherwise harming*
5 *all birds native to North America, with the exception of introduced house sparrows (*Passer**
6 *domesticus), European starlings (*Sturnus vulgaris*), rock doves (*Columba livia*), mute swans*
7 *(*Cygnus olor*), monk parakeets (*Myiopsitta monachus*), and non migratory upland game birds.*
8 *Violation of the acts can result in misdemeanor or felony charges. To address these*
9 *requirements, the applicant proposes to comply with its Avian Protection Plan (Attachment P1-*
10 *9 of this order) (imposed in recommended Fish and Wildlife Habitat Condition 9, below).*

11
12 As explained in the plan, birds are electrocuted when they make contact between two
13 energized conductors or between an energized conductor and grounded hardware, thereby
14 providing a pathway for electricity to flow between two points of contact. Many factors
15 influence electrocution risk including 1) body size, 2) habitat, 3) age, 4) weather, and 5)
16 powerline configurations with inadequately spaced conductors and/or ground wires.
17 Birds with large wingspans, such as eagles, are more susceptible to electrocution than smaller
18 birds. However, small birds can be electrocuted on transformers or other poles with tightly
19 spaced hardware. Power poles located in open habitats lacking natural perches provide sites for
20 hunting, feeding, resting, roosting, and nesting. Birds using these structures have a greater
21 electrocution risk. Habitats with a large prey base are attractive to raptors. Powerline structures
22 located in these areas have increased use and, therefore, increased electrocution risk. Young
23 birds are less adept at taking off and landing on power poles and may choose more dangerous
24 locations on a pole, increasing their risk. Wet weather can increase electrocution risk, since wet
25 feathers are electrically more conductive than dry feathers and can elicit wing spreading
26 behavior.

27
28 The applicant's proposed Avian Protection Plan (Attachment P1-9 of this order) includes an
29 established set of construction design guidelines for raptor-use areas (see the *Overhead*
30 *Manual* and the *Transmission Manual*). Engineering diagrams for each type of distribution
31 structure used by the applicant are classified as either Zone 1—Not Avian Protected, Zone 2—
32 40-inch Guideline, or Zone 3—60-inch Guideline. If a structure is not considered raptor safe,
33 modifications must be made to make the structure raptor-safe in raptor-use areas. The zones
34 are presented below:

- 35
- 36 • Zone 1: No raptor restrictions (city limits)
- 37 • Zone 2: A 40-inch separation between conductors or between conductors and grounded
- 38 parts where hawks and owls are potentially present (large agricultural areas)
- 39 • Zone 3: A 60-inch separation between conductors or between conductors and grounded
- 40 parts where eagles are likely to be present (i.e., rangeland, agricultural land surrounded
- 41 by rangeland or shrub steppe vegetation, federal land, and 0.25 miles from all rivers and
- 42 major bodies of water [based on a modeled golden and bald eagle distribution]).
- 43

1 The 60-inch separation between energized and/or grounded parts is intended to allow
2 sufficient clearance to accommodate an eagle's wrist-to-wrist span (APLIC 2006). APLIC (2006)
3 noted that, in areas where eagles do not occur, 40 inches provides adequate separation for
4 raptors other than eagles.

5
6 Any new line extensions or rebuilds in Zone 3 or eagle-use areas, such as rangeland or on
7 federal land, shall use construction with at least 60 inches of spacing between conductors or
8 between conductors and grounded hardware. If such spacing is not possible, energized parts
9 and hardware must be covered to prevent bird electrocutions.

10
11 Areas where eagles are not found but other raptors, such as hawks and owls, are present
12 require at least 40 inches of spacing between conductors or between conductors and grounded
13 hardware. This area includes large blocks of agricultural land outside the city limits. The major
14 difference between the 2 areas relates to tangent structures. The 40 inches of separation
15 allows the use of 8-foot-wide crossarms. For exceptions to the 60-inch standard, see Appendix
16 1 of the Avian Protection Plan.

17
18 Structure modification may be necessary when dead and/or injured protected birds are found
19 under powerline structures. Retrofitting to prevent electrocutions can include the following:

- 20
- 21 • Reframing (lowering the crossarm, changing to a 10-foot-wide arm, or adding a pole
22 top extension)
- 23 • Covering jumper wires, conductors, and equipment
- 24 • Discouraging perching in unsafe locations
- 25 • Modifying ground wires (moving/removing grounds, adding a down-guy insulator)
- 26 • Replacing a structure or equipment
- 27 • Providing a perch above energized wires (recommended in combination with diverters)
- 28

29 The wildlife protection equipment industry is a developing industry. Therefore, some products
30 have not been tested thoroughly enough to ensure durability, effectiveness, and ease of
31 installation. The Manual Review Committee meets semi-annually to discuss and evaluate
32 changes to construction manuals and provide feedback on new and existing materials. The
33 committee is composed of a cross-section of applicant employees, including linemen,
34 line crew foremen, Methods and Materials (M&M) engineers, distribution designers, and skills
35 instructors. This committee also provides feedback on wildlife protection equipment, such as
36 conductor covers, cutout covers, triangle diverters with different attachment types, and
37 collision markers, such as the Firefly™ Bird Flapper. The applicant describes that the Manual
38 Review Committee evaluates the effectiveness of avian protection equipment and any
39 problems associated with the equipment during avian protection training. This feedback is used
40 to refine installation protocols, identify problem products, replace problem products with
41 products that have increased durability and ease of application, and compile information to
42 evaluate the effectiveness of various retrofit measures.

1 As explained in the plan, the applicant identifies that permits would be required from ODFW
2 and the USFWS, which would include requirements to report avian fatalities and communicate
3 with the agencies on retrofit actions the applicant proposes to implement in response to
4 collision or electrocution related avian fatalities, which provides an opportunity for ODFW to
5 provide input on retrofit technologies such as ultraviolet light technology, as recommended by
6 ODFW for implementation in areas of Sandhill crane nocturnal migration (e.g. Ladd Marsh
7 Wildlife Area).³⁴⁹ In the event that permits are not required from ODFW or USFWS, consistent
8 with the OAR 345-025-0016 mitigation and monitoring agency consultation process, the
9 Department recommends Council require that the applicant report avian fatalities where the
10 causal factor is assumed to be electrocution or collision and consult on suitable retrofit
11 technologies or other adaptive management strategies to minimize future risks to avian
12 species.

13
14 ODFW has historically provided guidance to ODOE that its Fish and Wildlife Habitat Mitigation
15 Policy, implemented under Council’s standard, applies to terrestrial (land-based) environments,
16 and has not developed guidance to date supporting or recommending assessment of airspace
17 (or bird flight corridors) as habitat, for which to then assign a habitat category and evaluate
18 impacts and mitigation goal obligations. Therefore, the Department does not consider imposing
19 a requirement for specific technology (UV light technology) appropriate under the Council’s
20 standard, but considers it consistent with OAR 345-025-0016 to require agency consultation
21 during implementation of the Avian Protection Plan. Accordingly, the applicant proposes and
22 the Department recommends the Council adopt the following condition in the site certificate:
23

24 **Recommended Fish and Wildlife Condition 10:** ~~During construction, I~~the certificate holder
25 shall construct the transmission line to avian-safe design standards, consistent with the
26 certificate holder’s Avian Protection Plan (Idaho Power 2015) as provided in Attachment P1-
27 9 of the Final Order on the ASC. Within 30-day of identification of avian fatalities within the
28 site boundary, where predicted causal factor is electrocution or collision, the certificate
29 holder shall report the species name and location identified (Milepost) and shall consult
30 with ODFW and the Department on retrofit technologies or other adaptive management
31 strategy to minimize fatality risk.

32
33 *Indirect Impacts*

34
35 As the applicant explains, indirect impacts are defined as the impacts that would have an
36 adverse effect upon fish and wildlife habitat or individuals that would occur later in time or in a
37 different place than the construction activities. Permanent indirect impacts would exist for the
38 entire life of the transmission line, while temporary indirect impacts would last for less than the
39 entire life.
40

³⁴⁹ B2HAPPDoc8-013 DPO Agency Comment ODFW Refi 2019-08-21. See also public comment Wehrle, S. et al.

1 *Permanent Indirect Impacts*

2
3 The applicant explains that the permanent loss or alteration of habitats could result in habitat
4 fragmentation. Because most of the proposed transmission line crosses through low-lying
5 vegetation that would not be permanently cleared, the applicant expects habitat fragmentation
6 to be minimal in this ecosystem. However, vegetative clearing and maintenance in
7 forested/woodland areas (mostly found in the Blue Mountains region) would result in
8 undisturbed forest/woodland patches separated by 250-foot-wide areas around the line,
9 resulting in habitat fragmentation in those habitats.³⁵⁰ As is addressed in Exhibits P2 and P3 and
10 evaluated by the Department below, the applicant has assessed, based on ODFW guidance and
11 rule, that indirect impacts from the proposed facility are specifically considered for sage-grouse
12 and elk habitats.

13
14 *Temporary Indirect Impacts*

15
16 The temporary indirect impacts are depicted in ASC Exhibit P1, Table P1-17. The applicant
17 states in Exhibit P1 that temporary indirect impacts could result from both access roads and
18 invasive species, if not appropriately controlled and managed. As noted above, based on ODFW
19 guidance and rule, the applicant's impact assessment and mitigation for indirect impacts from
20 the facility is focused on sage-grouse and elk habitat.

21
22 *Temporary Invasive Species Indirect Impacts*

23
24 The applicant explains that the initial clearing of vegetation and resulting soil disturbance
25 during construction could create optimal conditions for the establishment of invasive-plant
26 species, which can affect the quality of wildlife habitat through competition with, and the
27 eventual replacement of, desirable native plant species. The replacement of native plant
28 species with invasive species can have effects on wildlife habitat that can extend beyond the
29 area of initial impacts. In addition to compliance with the Reclamation and Revegetation Plan
30 (Attachment P1-3; Recommended Fish and Wildlife Conditions 1) to avoid or minimize the risk
31 of invasive-plant species spread or establishment, the applicant proposes to implement the
32 Noxious Weed Plan (Attachment P1-5). To ensure compliance with that plan, the applicant
33 proposes and the Department recommends the Council include Fish and Wildlife Condition 3 in
34 the site certificate.

³⁵⁰ Id. The applicant explains that the transmission line could be perceived by raptor and raven prey species as a form of habitat fragmentation in low-lying shrub and grassland habitats due to the potential for increased predation rates near the line as a result of increased perching opportunities. This effect would be most prominent where the transmission line is proposed to be located in areas that do not contain other tall structures, such as existing transmission lines or trees. Of the 147 miles of the proposed route that are not located within one mile of an existing line, about 115 miles are located within shrubland/grassland habitats. Of the 10 miles of the Morgan Lake alternative that are not located within one mile of an existing line, about four miles are located within shrubland/grassland habitats. Of the 7.4 miles of the Double Mountain alternative that are not located within one mile of an existing line, about seven miles are located within shrubland/grassland habitats.

1
2 *Analysis of Direct and Indirect Impacts to State Sensitive Species*

3
4 In addition to the impacts applicable to all species, ASC Exhibit P1 also describes the additional
5 specific potential impacts and proposed mitigation to avoid or minimize impacts that apply
6 specifically to State Sensitive Species.

7
8 *Big Game*

9
10 Big game species with potential to occur within the analysis area include elk, mule deer,
11 bighorn sheep, and pronghorn antelope.³⁵¹ The only big game species listed by ODFW as state
12 sensitive is Rocky Mountain Bighorn Sheep. Nevertheless, the applicant included in Exhibit P an
13 assessment of the proposed facility's potential impacts to all big game species, and as such the
14 Department includes its analysis here. Mule deer are expected to occur within the analysis area
15 within seasonal ranges as depicted in ASC Exhibit P1, Figure P1-6. Figure P1-7 depicts the
16 habitat of the Burnt River herd of California bighorn sheep within the Burnt River Canyon
17 between the Bridgeport Valley and the Durkee Valley. Typical habitat characteristics of bighorn
18 sheep include steep, rugged terrain associated with mountains, canyons, and escarpments.
19 Pronghorn antelope are associated with sagebrush and grassland steppes of the intermountain
20 and Great Basin regions. ODFW has not delineated important pronghorn habitat for eastern
21 Oregon; therefore, the applicant has not specifically described acres of impacts to the
22 pronghorn's habitat. However, as described below, the proposed transmission line's reduction
23 of native habitat types within the shrub/grass general vegetation type has the potential to
24 impact the pronghorn.

25
26 For big game species present during construction, there is a risk of mortality due to wildlife-
27 vehicle collisions; however, as discussed above, and through compliance with Recommended
28 Fish and Wildlife Condition 8, the risk of vehicle collisions would be minimized. In addition,
29 displacement of big game from both winter and parturition areas can affect winter survival by
30 causing animals to use energy reserves that are needed to survive the winter. The applicant
31 proposes to minimize the risk of disturbing big game during sensitive periods through limiting
32 construction periods and through seasonal restrictions, and ~~will~~would provide compensatory
33 mitigation for impacts to big game winter range, which is considered Category 2 habitat. To
34 ensure compliance with the restrictions, the applicant proposes and the Department
35 recommends the Council adopt the following condition:

36
37 **Recommended Fish and Wildlife Condition 11:** During construction, the certificate
38 holder shall not conduct ground-disturbing activities within elk or mule deer winter
39 range between December 1 to March 31. Upon request by the certificate holder, the
40 Department in consultation with ODFW may provide exceptions to this restriction.

³⁵¹ Id. Section 3.5.5.1. The applicant discusses impacts to elk in Exhibit P3 and those impacts are addressed elsewhere in this order.

1 The certificate holder's request must include a justification for the request, including
2 any actions the certificate holder will take to avoid, minimize, or mitigate impacts to
3 elk and mule deer in the relevant area.

4 The proposed facility crosses through ODFW-mapped elk and mule deer winter and summer
5 ranges and likely crosses migration routes and calving/fawning areas, which could result in
6 some loss and fragmentation of habitat. ROW clearing for construction in forested/woodland
7 habitats could remove thermal and hiding cover for big game. However, the applicant argues
8 that this clearing of vegetation has the potential to benefit big game species in some situations
9 by providing clearings for use in foraging or traveling. The duration of these permanent impacts
10 to habitat for big game species is expected to be indefinite, although areas cleared within the
11 ROW may provide forage after three to seven years. The duration of temporary impacts to
12 habitat for big game species would vary by vegetation type.³⁵² However, while the Department
13 acknowledges that it is possible that the proposed facility could create some usable habitat for
14 big game, the overall loss of Category 2 habitat must be mitigated appropriately. Mitigation for
15 these impacts would be commensurate with impact duration as described in the Fish and
16 Wildlife Habitat Mitigation Plan (Attachment P1-6; Recommended Fish and Wildlife Condition
17 4).

18
19 The applicant states that mule deer and pronghorn antelope are expected to readily pass under
20 transmission lines and associated structures, so the applicant does not expect transmission line
21 structures to limit the movement or distribution of big game species through fragmentation.
22 Bighorn sheep utilizing the Burnt River Canyon also would not likely be affected, since the
23 transmission line would span the canyon and the tower structures would be set back from the
24 steep rock escape habitat preferred by bighorn sheep. Similarly, the applicant does not expect
25 new and altered existing roads to act as a barrier to big game movement in and of themselves.
26 However, as discussed above, the introduction of vehicles and human activity could have the
27 potential to negatively impact big game.

28
29 As the applicant notes, indirect impacts to big game from increased traffic rates may include
30 reduced utilization of habitat, fragmentation of migration corridors, and the associated
31 disruption of important big game life processes. These indirect impacts from roads to big game
32 and their habitat can be significantly reduced with the implementation of a traffic management
33 plan and BMPs. In addition, as addressed above, the applicant proposes to implement access
34 controls to minimize the effects that roads have on big game and big game habitat. Specific
35 road segments proposed for access control are described in applicant's Road Classification
36 Guide and Access Control Plan (Exhibit B, Attachment B-5; Recommended Fish and Wildlife
37 Condition 9).³⁵³ Indirect impact assessment to elk habitat is addressed elsewhere in this order.

38

³⁵² Id. Agricultural and disturbed areas would likely recover in 1 to 3 years, grasslands and herbaceous wetlands would likely recover within 3 to 7 years, shrublands may require 30 to 100 years to recover, and forested and woodland areas could take anywhere from 50 to many hundreds of years to reach pre-construction conditions.

³⁵³ Id.

1 *Small Fur-bearing Mammals*

2
3 As depicted on ASC Exhibit P1, Table P1-5, during field surveys one white-tailed jackrabbit was
4 observed within the analysis area. No pygmy rabbits, martens, or fishers were observed,
5 although potential habitat for these species is present, indicating there is some potential for the
6 proposed transmission line to have impacts on the species.

7
8 As the applicant explains, many small fur-bearers are fossorial animals (i.e., living
9 underground). Construction equipment could result in the crushing of burrows and
10 underground tunnels that could contain small mammals, resulting in direct mortality. The
11 disturbance of soils and loss of vegetative cover could make these species more obvious to
12 predators (i.e., removing hiding cover), indirectly increasing their predation rates. These species
13 could also experience a higher predation rate during operation, since they are likely to be a
14 prey source for raptors and ravens that could consolidate along the transmission line due to
15 increased perching opportunities.

16
17 Temporary impacts to habitat for State Sensitive small fur-bearing mammal species would vary
18 by species and habitat type, and depend on the pre-construction conditions. Pygmy rabbit
19 habitat requires dense stands of sagebrush, so temporary impacts to that habitat would likely
20 last more than 50 years. For white-tailed jackrabbits, the grass and forb habitat component
21 would likely recover relatively quickly, within three to seven years, while the shrubs required
22 for winter forage would likely take over 30 years to establish. Martens and fisher require
23 mature, unfragmented forest, so temporary impacts to habitat for these State Sensitive Species
24 would likely to last 50 to many hundreds of years. Mitigation for both temporary and
25 permanent impacts to habitat would be commensurate with impact duration as described in
26 the Fish and Wildlife Habitat Mitigation Plan (Attachment P1-6; Recommended Fish and Wildlife
27 Condition 4).³⁵⁴

28
29 *Bats*

30
31 The applicant explains that impacts to bats have been minimized by routing the proposed
32 facility to avoid mines, caves, and known bat hibernacula. However, bats would utilize habitats
33 outside of these structures and areas as well, and the sensitive bat species in the analysis area
34 could utilize trees and snags as habitat. As depicted on ASC Exhibit P1, Table P1-5, State
35 Sensitive bat species likely to use the analysis area include California myotis, long-legged
36 myotis, hoary bat, silver-haired bat, fringed myotis, spotted bat, pallid bat, and Townsend's big-
37 eared bat.³⁵⁵ The applicant did not observe these species during field surveys, although two
38 records from existing databases indicate past presence of long-legged myotis within the
39 analysis area in ponderosa pine habitat within Union County. If present during construction,
40 impacts could include disturbance at roosts and hibernacula sites, and a reduction in foraging

³⁵⁴ Id. Section 3.5.5.2.

³⁵⁵ Id. Section 3.5.5.3.

1 habitat as a result of vegetation removal. In order to minimize disturbance at bat roosts and
2 hibernacula, the applicant proposes and the Department recommends the Council adopt the
3 following condition:

4
5 **Recommended Fish and Wildlife Condition 12:** During construction, if active pygmy rabbit
6 colonies or the roost of a State Sensitive bat species is observed during the biological
7 surveys set forth in Fish and Wildlife Conditions ~~s-14, 15 and~~ 16, the certificate holder shall
8 submit to the Department for its approval a notification addressing the following:

- 9 a. Identification of the State Sensitive bat species observed;
- 10 b. Location of pygmy rabbit colony or bat roost; and
- 11 c. Any actions the certificate holder will take to avoid, minimize, or mitigate
12 impacts to pygmy rabbit colony or bat roost.
- 13 d. The Department in consultation with the Oregon Department of Fish and Wildlife
14 (ODFW) will review and approve the proposed avoidance, minimization, or mitigation
15 measures prior to the action by the certificate holder to impact State Sensitive bat
16 species roosts or hibernacula.

17
18 The applicant anticipates that direct mortality during construction would be low, since bats
19 would likely flush from trees and snags during construction. However, flushing of bats from day
20 roosts or maternity colonies could result in the bats using up their bodily energy reserves,
21 exposing themselves to predation, and potentially causing them to permanently abandon a
22 suitable site. If disturbance occurs near winter hibernacula, bats could leave their roost and
23 venture out to find a new one. This could result in mortality of the bats as bodily energy
24 reserves are often low during winter and they may not find another suitable hibernaculum
25 before their reserves are spent. Because all known bat hibernacula were avoided during
26 routing, the applicant does not anticipate any direct impacts. Disturbance at maternity colonies
27 could have a negative impact if the bats are induced to abandon the colony, as suitable
28 maternity colony structures have specific characteristics and another suitable structure may not
29 exist nearby.

30
31 Removal of vegetation, especially around riparian areas, could impact prey abundance for
32 foraging bats. The duration of impacts to riparian habitat that would be removed during
33 construction, but restored following construction would likely be 50 or more years depending
34 on the tree species composition and sensitivity of the habitat to disturbance. Riparian habitats
35 with fast growing tree and shrub species such as willow or alder could recover in less than 50
36 years, while riparian habitats with slower growing species or located in harsher conditions for
37 plant growth could take hundreds of years to recover. Mitigation for both temporary and
38 permanent impacts to riparian habitat would be commensurate with impact duration as

1 described in the Fish and Wildlife Habitat Mitigation Plan (Attachment P1-6; Recommended
2 Fish and Wildlife Condition 4).³⁵⁶

3
4 *Avian Species*

5
6 As presented in ASC Exhibit P1, Table P1-5, there are 25 State Sensitive bird species, including
7 eight raptor species, with suitable habitat within the analysis area. In addition to these State
8 Sensitive bird species, ODFW identified an additional State Sensitive species - Sandhill cranes –
9 as having suitable habitat within the analysis area.³⁵⁷ The applicant observed several State
10 Sensitive bird species during field surveys, and confirmed breeding activity for four species
11 within the analysis area: Swainson’s hawk, long-billed curlew, burrowing owl, and Lewis’
12 woodpecker.³⁵⁸

13
14 The applicant anticipates that, compared to other species, avian species could be more
15 sensitive to direct mortality and disturbance during nesting than other species. In order to limit
16 direct mortality and disturbance during nesting, the applicant proposes to limit construction
17 activities to time periods outside of the primary avian breeding period to the extent practical.
18 Maintenance and vegetation management activities during operations also have the potential
19 to cause direct mortality and disturbance during nesting. Accordingly, the applicant proposes to
20 conduct routine line maintenance and vegetation clearing activities outside the breeding
21 season when possible. If construction and operation activities must be performed during the
22 primary aviation breeding period, the applicant proposes and the Department recommends the
23 Council adopt the following condition in order to identify presence of active raptor nest and
24 avoid impacts to state sensitive raptors and other raptors during the nesting season:

25
26 **Recommended Fish and Wildlife Condition 13:** During construction, if the certificate
27 holder will be conducting ground-disturbing activities during the migratory bird
28 nesting season between April 1 and July 15, the certificate holder shall conduct, as
29 applicable, biological surveys for native, non-raptor bird species nests on all
30 portions of the site boundary a maximum of 7 days prior to ground-disturbing
31 activities, regardless of whether those portions have been previously surveyed. If
32 the certificate holder identifies a native, non-raptor bird species nest, the
33 certificate holder shall submit to the Department for its approval a notification
34 addressing the following:

- 35 a. Identification of the native, non-raptor species observed;
36 b. Location of the nest; and
37 c. Any actions the certificate holder will take to avoid, minimize, or mitigate
38 impacts to the nest.

³⁵⁶Id. The applicant noted that there is a single a record of a bat mortality resulting from a collision with a transmission line in 1989, indicating that there is a theoretical possibility of an adverse impact during operations. However, potential mortalities to State Sensitive bats are expected to be low to non-existent.

³⁵⁷ B2HAPPDoc8-013 DPO Agency Comment ODFW Reif 2019-08-21.

³⁵⁸ Id. Section 3.5.5.4.

4
5
6
7
8

Recommended Fish and Wildlife Condition 14: During construction, the certificate holder shall not conduct ground-disturbing activities within the following timeframes and spatial buffers surrounding occupied nests of certain raptor species. Upon request by the certificate holder, the Department in consultation with ODFW may provide exceptions to this restriction. The certificate holder's request must include a justification for the request, including any actions the certificate holder will take to avoid, minimize, or mitigate impacts to the raptor and its nest.

Raptor Nest Buffers		
Nesting Species	Spatial Buffers (radius around nest site):	Temporal Restrictions
Bald eagle	0.5 mile	January 1 to August 15
Golden eagle	0.5 mile	February 1 to August 15
Ferruginous hawk	0.50 mile	March 15 to August 15
Flammulated owl	0.25 mile	March 1 to August 15
Great gray owl	0.25 mile	March 1 to August 15
Northern goshawk	0.5 mile	May 1 to August 15
Peregrine falcon	0.25 mile	January 1 to July 1
Prairie falcon	0.25 mile	March 15 to July 1
Red-tailed hawk	300 to 500 feet	March 1 to August 15
Swainson's hawk	0.25 mile	April 1 to August 15
Western burrowing owl	0.25 mile	April 1 to August 15

24
25
26

If vegetation-clearing activities are performed during the primary avian breeding period, direct mortality and disturbance to native, non-raptor migratory bird nesting attempts could occur. To address that possibility, Recommended Fish and Wildlife Condition 13 requires the certificate holder to survey for native, non-raptor bird species no more than seven days before any ground-disturbing activities, if construction must occur during the migratory bird nesting season (between April 1 and July 15).

The applicant's analysis indicates the duration of impacts to habitat for State Sensitive avian species would vary by habitat type. As depicted in ASC Exhibit P1, Table P1-5, the State Sensitive avian species likely to use the analysis area require a range of habitat types, including grasslands, wetlands, and shrublands, as well as forests and riparian corridors.³⁵⁹ As described above, temporary impacts to grasslands and herbaceous wetlands would likely last between three and seven years, shrublands may require 30 to 100 years to recover, and forested areas could take anywhere from 50 to many hundreds of years to reach pre-construction conditions. Mitigation must be provided commensurate with impact duration as described in the Fish and Wildlife Habitat Mitigation Plan (Attachment P1-6; Recommended Fish and Wildlife Condition 4).

The applicant notes that there is a potential risk of avian collisions with transmission lines or other facility-related structures, which could result in elevated mortality rates for some avian species. The applicant explains that a variety of factors influence avian transmission line collisions. The applicant’s existing Avian Protection Plan (Attachment P1-9 [of this order](#)) is in compliance with Avian Power Line Interaction Committee suggested practices, and includes measures that would be taken if avian mortalities are discovered (either as an incidental observation or during routine maintenance and monitoring), and modification and/or additions to the line that could be made if elevated mortalities of avian species are discovered. Compliance with that plan is required under ~~r~~Recommended Fish and Wildlife Condition 10.³⁶⁰

Reptiles and Amphibians

As depicted in ASC Exhibit P1, Table P1-5, State Sensitive reptile and amphibian species that may be present within the analysis area include the northern sagebrush lizard, western toad, Rocky Mountain tailed frog, northern leopard frog, western painted turtle, and Columbia spotted frog.³⁶¹ The applicant field surveys did not observe any of these species, although an observed sagebrush lizard, which was unidentifiable as to subspecies, could have been a northern sagebrush lizard. If present during construction or operation, direct impacts to State Sensitive reptiles and amphibians could include direct mortality and habitat loss.

The applicant anticipates that, compared to other species, State Sensitive reptile and amphibian species could be more susceptible than other species to direct mortality because of their defense method of remaining still when threatened. The impact of individual mortalities would vary depending on the reproductive strategy of the species and the robustness of the population. Mortality of an individual could have no discernible effect on a large, quickly reproducing population, but could have an effect that lasts generations on a small, vulnerable, or slowly reproducing population such as the northern sagebrush lizard.³⁶²

The applicant explains that the four State Sensitive amphibians and one of the reptiles (western painted turtle) likely to use the analysis area may be affected by impacts to waterbodies. Potential impacts to waterbodies including a description of the duration of impacts, and their effects to aquatic species, are addressed below in the discussion of impacts to State Sensitive

³⁶⁰ Id. The potential impacts caused by the transmission line structures providing additional nesting and perching opportunities for raptors and ravens is discussed above in the general discussion of direct and indirect impacts.

³⁶¹ [B2HAPPDoc3-25 ASC 16A Exhibit P1 Wildlife ASC Part 1 Main thru Attach P1-6 rev 2018-09-28](#)id. Section 3.5.5.5.

³⁶² B2HAPPDoc3-25 ASC 16A_ Exhibit P1_Wildlife_ASC_Part 1_Main thru Attach P1-6 rev 2018-09-28. The applicant explains that most reptiles produce a moderate number of young per year (e.g., a few to a dozen, occasionally two dozen or more), do not reach maturity until their second or third year, and do not always reproduce every year. Amphibians may not reproduce until their second year, but can lay up to 1,000 eggs. Therefore, both reptiles and amphibians are moderate in their ability to recover from population perturbations such as the death of individuals, but amphibians are likely better able to recover than reptiles due to the greater number of young that they produce. A small population, however, would experience a greater impact than a large one, regardless of the species, due to the number of reproductive individuals remaining after the impact.

1 fish species and also in Section IV.Q.2., *Removal-Fill*. The two State Sensitive reptiles and the
2 Western Toad may be affected by impacts to terrestrial habitats. Because northern sagebrush
3 lizards require shrubs, as well as rocks, logs, or burrows of other animals for perching and
4 hiding, habitat for this species could take 30 to 100 years to recover, both for the shrubs to re-
5 establish and for other animals to burrow into the disturbed soil. Western painted turtles use
6 terrestrial habitat for nesting and hibernation, with nesting habitat being sparsely vegetated
7 with little to no canopy cover within 325 feet of aquatic habitat. Terrestrial habitat for western
8 painted turtles includes shrubland and grassland areas adjacent to waterbodies; temporary
9 disturbance to grasslands would likely last between three and seven years and temporary
10 disturbances to shrublands between 30 and 100 years. Western toads use a variety of
11 grassland, shrubland, woodland, and forest habitats outside of the breeding season; temporary
12 impacts to these habitats would likely last between three and seven years in grasslands,
13 between 30 and 100 years in shrublands, and between 50 and many hundreds of years in
14 woodland and forest habitats. Mitigation would be commensurate with impact duration as
15 described in the Fish and Wildlife Habitat Mitigation Plan (Attachment P1-6; Recommended
16 Fish and Wildlife Condition 4).

17

18 *Fish*

19

20 As depicted in ASC Exhibit P1, Table P1-5, State Sensitive fish species with potential to occur
21 within the analysis area include bull trout, Columbia Basin rainbow trout, Lower Snake River
22 summer steelhead, Middle Columbia River summer steelhead, Pacific lamprey, and western
23 brook lamprey.³⁶³ State-listed T&E fish species with potential to occur within the analysis area
24 include the Snake River Spring/Summer Chinook Salmon. Habitat would vary among these fish
25 species depending on their distribution. Based on results presented in the Fish Habitat Report
26 (ASC Exhibit P1, Attachment P1-7B), the most complete known distribution for any of the State
27 Sensitive fish species in the analysis area is for the trout and steelhead species. Pacific lamprey
28 and western brook lamprey habitat is not well documented in the analysis area, but would not
29 extend outside of streams known to contain rainbow trout. Therefore, the applicant used
30 potential impacts to the known rainbow trout habitat as a proxy for potential effects to Pacific
31 lamprey and western brook lamprey habitat within the analysis area.

32

33 The applicant explains that impacts to State Sensitive and State-listed T&E fish species and their
34 habitat could occur at locations where the proposed transmission line either crosses areas that
35 contain fish, at crossings directly upstream of occupied areas (approximately 600 feet
36 upstream), as well as occupied areas that are not directly crossed but which are located
37 adjacent to general soil disturbance and vegetation clearing that would occur during facility
38 construction. The amount of soil disturbance adjacent to waterbodies, as well as the number of
39 waterbody crossings, the types of waterbodies crossed (e.g., intermittent or seasonally dry
40 ephemeral streams versus perennial streams), and the methods used to cross these
41 waterbodies (i.e., transmission line spanning waterbodies versus access roads directly crossing

³⁶³ B2HAPPDoc3-25 ASC 16A-Exhibit P1_ASC_Part 1_Main Thru Attach P1-6 rev 2018-09-28, Section 3.5.5.6.

1 them), could affect the type and magnitude of impacts that could occur to fish species and their
2 habitats. Specific potential impacts to fish species and their habitats could include alterations to
3 large woody debris input, temperature, suspended sediment, sedimentation, as well as the
4 toxic effect of spills and use of chemicals adjacent to or within waterbodies.³⁶⁴

5
6 As depicted in ASC Exhibit P1, Table P1-18, the proposed transmission line would span 47 fish-
7 bearing streams and 18 roads would require road or crossing modifications involving fish-
8 bearing streams.³⁶⁵ All of these crossings could potentially include Columbia Basin rainbow
9 trout. The fish passage plans and designs for the seven temporary road crossing structures that
10 would require review by the ODFW are included in Exhibit BB, Attachment BB-3. The
11 Department's evaluation of compliance with ODFW Fish Passage rules is found at Section
12 IV.Q.4., *Fish Passage*. There, the Department recommends Council find that the applicant's
13 proposed fish passage compliance plan is sufficient to demonstrate compliance with the ODFW
14 Fish Passage rule, that the plan should be finalized prior to construction based on final facility
15 design, and that the plan should be implemented during construction.

16
17 Of these seven temporary crossings, none would require work inside the channel bankfull
18 margins. In addition, there are two road crossings proposed to be located 600 feet upstream of
19 fish-bearing streams; however, only the roads would be improved, so there would be no
20 improvement to the existing crossing structures at these two crossings.³⁶⁶

21
22 The applicant explains that removal of riparian vegetation can have several potential adverse
23 effects to aquatic systems, including an increase in erosion, reduced filtration of run-off,
24 destabilization of stream banks, reduction of stream shade, reduced input of important
25 terrestrial food source (i.e., allochthonous input), and a decrease in the availability of large
26 woody debris. Riparian vegetation loss would initially occur during construction; however,
27 ongoing vegetation maintenance in forested habitats would result in a permanent loss of taller
28 trees within the analysis area. Because the proposed facility would cross through mostly low-
29 lying shrubland vegetation, and forested/woodland habitats are mostly restricted to the Blue
30 Mountains region, the removal of trees in riparian areas would be limited to the segments of
31 the facility in the Blue Mountains.³⁶⁷

32
33 Construction of new and improvement of existing access roads across forested riparian areas
34 could also result in removal of trees within the extent of the road bed. Of the 18 crossings over
35 fish-bearing streams, two would be on new roads, three would be on roads needing 21 to 70
36 percent improvement, seven would be on roads needing 71 to 100 percent improvement, and
37 six would be on existing roads not requiring improvements other than temporary structures at
38 the crossing locations. As a result of the limited disturbance, road location, and vegetation type

³⁶⁴ B2HAPPDoc3-25 ASC 16A_Exhibit P1_Wildlife_ASC_Part 1_Main thru Attach P1-6 rev 2018-09-28.

³⁶⁵ Id.

³⁶⁶ Id.

³⁶⁷ Id. In areas spanned by the transmission line, trees would not be removed if the height of the tree (once mature) would not come within 50 feet of the wires (Attachment P1-4, Vegetation Management Plan).

1 present at each of the 18 crossings, Exhibit P1, Table P1-18 shows that there would be some
2 removal of woody vegetation from riparian areas at five of these crossings.

3
4 As the applicant describes, stream temperature can be affected by removal of streamside
5 vegetation. For example, cool stream temperatures are required for proper completion of the
6 life cycle functions of some fish species (e.g., salmon and trout in Northwest streams), while
7 warm water temperatures can limit rearing, spawning, egg incubations, and migration of
8 salmon and trout.³⁶⁸ Temperatures changes from loss of riparian vegetation would likely to be
9 varied among streams. It is noted that most riparian areas in the analysis area currently consist
10 of shrubs and grasses, and much of this vegetation would not be permanently cleared or would
11 be allowed to regrow in accordance with the Vegetation Management Plan (Attachment P1-4).
12 Retained streamside vegetation may remain suitable to maintain adequate shade to prevent
13 substantial temperature increases. As a result, construction activities are not anticipated to
14 result in a substantial temperature increase that could result in a biological effect at most
15 stream crossing locations with State Sensitive fish species.

16
17 The applicant further explains that the clearing of riparian vegetation, installation or
18 modification of stream crossing structures, and the presence and use of access roads could
19 increase the input of sedimentation into adjacent waterbodies. If not appropriately controlled,
20 increased turbidity and sedimentation could impact fish behavior and physiological processes,
21 and could result in reduced growth, health, and an increase in the risk of mortality. Sediment
22 entering the water column could be redeposited on downstream substrates, which could bury
23 aquatic macroinvertebrates (an important food source for some fish species). Additionally,
24 downstream sedimentation could impact spawning habitat, spawning activities, eggs, larvae,
25 and juvenile fish survival, as well as benthic community diversity and health. Because the
26 impacts of increased sedimentation and turbidity are often limited to the period of soil
27 disturbance, the duration of these impacts is expected to be relatively short. However, specific
28 site characteristics including flow, substrate composition, relative disturbance, and other
29 factors could extend the duration of construction impacts. Construction of access roads across
30 waterbodies and installation or modification of stream crossing structures, as well as any other
31 in-water work, would typically contribute to waterbody sedimentation. As depicted in Table P1-
32 18, seven roads would cross fish-bearing streams that would require temporary structures over
33 the road crossings. None of these seven crossings would require work inside the channel
34 bankfull margins; no other instream work would occur for the other 11 crossings on fish-
35 bearing streams.³⁶⁹

36

³⁶⁸ Id.

³⁶⁹ Id. In addition to those 7 crossings over fish-bearing streams, there are 2 road crossings located 600 feet upstream of fish-bearing streams; however, at these 2 crossings only the roads would be improved so there would be no improvement to the existing crossing structure.

1 Use of existing access roads, soil disturbance adjacent to waterbodies, as well as clearing of
2 riparian vegetation in areas where the transmission line would span waterbodies would
3 contribute to the risk of erosion and sedimentation. The applicant explains that the most
4 important factors in determining the risk of erosion and sedimentation to streams are soil
5 disturbance, distance from the stream, and the presence of vegetation between the
6 disturbance and the stream. ASC Exhibit P1 includes extensive analysis and reports
7 documenting the potential impacts from erosion and sedimentation.³⁷⁰ The applicant's
8 Vegetation Management Plan (Attachment P1-4; Recommended Fish and Wildlife Condition 2)
9 and the Reclamation and Revegetation Plan (Attachment P1-3; Recommended Fish and Wildlife
10 Condition 1) would reduce the potential for the proposed transmission line to increase
11 sedimentation and turbidity resulting from clearing of riparian vegetation, installation or
12 modification of stream crossing structures, as well as the presence and use of access roads.
13 Implementation of the NPDES 1200-C Erosion and Sediment Control Plan (Attachment I-3 to
14 this order) would further reduce erosion and sediment transport during construction, providing
15 additional protections to waterways crossed and near the proposed facility.

16
17 The applicant also notes that unrestricted access to habitat is important for both resident and
18 anadromous salmonids. Upstream-migrating fish require access to suitable spawning gravel and
19 juvenile fish must be able to disperse upstream and downstream to take advantage of available
20 rearing habitat. If culverts or other types of road crossing structures are poorly designed,
21 constructed, or maintained, they can affect the population of entire stream drainages. As
22 discussed above, Exhibit P1, Table P1-18 depicts each of the road crossings of fish-bearing
23 streams. If any future route modifications require road crossing improvement or modifications
24 beyond those identified in the fish passage plans, as explained in the Fish Passage Plan, the
25 applicant proposes to install all culverts or other stream crossing structures in accordance with
26 ODFW fish passage rules and approvals.³⁷¹ Based on the applicant's designs to minimize the
27 number of fish-bearing crossings, and subject to compliance with these fish passage plans and
28 designs, the proposed transmission line is unlikely to adversely affect fish passage. See Section
29 IV.Q.4., *Fish Passage*, for the Department's assessment of compliance with the ODFW Fish
30 Passage rules and requirements.

31
32 Hazardous materials entering surface water supplies could also impact fish habitat during
33 construction. The use of heavy and light equipment within the analysis area creates the
34 potential for spills of fuel and oils from storage containers, equipment working in or near
35 streams, and fuel transfers. In addition, construction of the tower footings would require
36 concrete. Wet concrete or concrete cleaning water entering streams could have an adverse
37 effect on fish and other aquatic organisms from elevation of pH levels (e.g., stress, injury).
38 Herbicides used near waterbodies (used to control invasive-plant species) could leach into
39 waterbodies or run off into waterbodies during rain events, resulting in reduced fitness or

³⁷⁰ Id.

³⁷¹ Id. The applicant also notes that in addition to ODFW Fish Passage requirements, on federally managed lands, any crossing structure not already approved would be installed in accordance with BLM and USFS requirements.

1 mortality. To reduce the risk of oils, wet concrete, or wash water entering streams, and as
2 discussed in ASC Exhibit J (Waters of the State) and Section IV.D., *Soil Protection Standard*, the
3 applicant proposes to follow the avoidance and minimization measures outlined in the
4 SPCC Plan (Attachment G-4). Use of herbicides would be subject to and regulated under the
5 Noxious Weed Plan; (Recommended Fish and Wildlife Condition 3), and the Vegetation
6 Management Plan (Recommended Fish and Wildlife Condition 2), which include restrictions on
7 where herbicides could be used.

8
9 Finally, the applicant explains that fish salvage (i.e., removal or exclusion of fish from an area)
10 would likely be necessary during installation of culverts or other crossing structures on
11 perennial streams. Potential adverse effects of fish salvage include fish injury, stress, and direct
12 mortality. Injury and stress could result in the individual fish becoming more susceptible to
13 infection or predation, thereby resulting in mortality. However, as proposed, all structure
14 installations at the identified crossings would be temporary and require ODFW approval and
15 none of the crossings would require work within the bankfull channel. Therefore, the proposed
16 facility would not likely require any work area isolation and fish salvage. Although no fish
17 salvage is currently proposed, if that became necessary, work area isolation and fish salvage
18 would be subject to compliance with the Fish Passage Plan, which requires adherence to the
19 ODFW-approved methods and therefore limit potential adverse effects to fish species (See
20 Section IV.Q.4., *Fish Passage*).

21
22 To identify presence of State-sensitive species within the analysis area and ensure adequate
23 protection and mitigation if identified, the applicant proposes and the Department
24 recommends Council impose the following conditions.^{372, 373} Field surveys required per
25 recommended Fish and Wildlife Conditions 15 and 16 would be conducted in accordance with
26 the Revised Final Biological Survey Work Plan provided in ASC Exhibit P Attachment P1-2
27 following Phase 2 protocol in survey area based on Phase 3 data collection.

28
29 **Recommended Fish and Wildlife Condition 15:** Prior to construction of a phase or segment
30 of the facility, the certificate holder shall conduct, as applicable, the following biological
31 surveys on those portions of the site boundary that have not been surveyed at the time of
32 issuance of the site certificate, based on the survey protocols included in ASC Exhibit P
33 Attachment P1-2 Revised Final Biological Survey Work Plan, unless otherwise approved by
34 the Department in consultation with ODFW:

- 35 a. Northern Goshawk;
- 36 b. American Three-Toed Woodpecker;
- 37 c. Great Gray Owl;
- 38 d. Flammulated Owl;
- 39 e. Terrestrial Visual Encounter Surveys;

³⁷² B2HAPPDoc3-51 ASC Exhibit P - Errata Info 2019-03-28.

³⁷³ State Sensitive bat species Included in recommended Fish and Wildlife Condition 16 to be consistent with
Recommended Fish and Wildlife Condition 12.

- 1 f. Wetlands; and
- 2 g. Fish Presence and Crossing Assessment Surveys.

3
4 **Recommended Fish and Wildlife Condition 16:** Prior to construction of a phase or segment
5 of the facility, the certificate holder shall conduct, as applicable, the following biological
6 surveys on all portions of the site boundary, regardless of whether those portions have
7 been surveyed at the time of issuance of the site certificate, based on the survey protocols
8 included in ASC Exhibit P Attachment P1-2 Revised Final Biological Survey Work Plan, unless
9 otherwise approved by the Department in consultation with ODFW:

- 10 a. Washington ground squirrels;
- 11 b. Raptor nests;
- 12 c. Pygmy rabbits;
- 13 ~~e.d.~~ State Sensitive bat species;
- 14 ~~d.e.~~ State-listed Threatened and Endangered plants ~~(in areas of known or anticipated~~
15 ~~occurrences)~~
- 16 e.f. Greater sage-grouse, as necessary for the State of Oregon to calculate the amount of
17 sage-grouse habitat compensatory mitigation required for the facility using
18 Oregon's Sage-Grouse Habitat Quantification Tool.

19
20 In order to further avoid or minimize any impact to State Sensitive Fish species, the applicant
21 proposes to observe seasonal fisheries restrictions, which are depicted in ASC Exhibit P1,
22 Table P1-19,³⁷⁴ and required per compliance with the Fish Passage Plan. In addition to the
23 seasonal fisheries restrictions associated with in-water work actions, under the Fish Passage
24 Plans and designs (Exhibit BB, Attachment BB-3), additional seasonal restrictions may apply to
25 operational use of each of the seven crossings.

26 27 *IV.H.2. Sage-Grouse Specific Habitat Mitigation Requirements*

28
29 The EFSC Fish and Wildlife Habitat standard has two parts. Sub(1), as described in the section
30 above, relates to all fish and wildlife habitat except for sage-grouse habitat. Sub(2) of the
31 standard is specific to sage-grouse habitat, and states:

32
33 *To issue a site certificate, the Council must find that the design, construction, and operation*
34 *of the facility, taking into account mitigation, are consistent with:*

35 *****

36 *(2) For energy facilities that impact sage-grouse habitat, the sage-grouse specific habitat*
37 *mitigation requirements of the Greater sage-grouse conservation strategy for Oregon at*

³⁷⁴ Id. Section 3.5.6.1.

1 OAR 635-415-0025(7) and OAR 635-140-0000 through -0025 in effects as of February 24,
2 2017.

3
4 In July 2015, the Oregon Fish and Wildlife Commission (OFWC) ~~Oregon Department of Fish and~~
5 ~~Wildlife (ODFW)~~ ~~adopted~~ ~~amended its~~ sage-grouse conservation rules at OAR 635, Division 140,
6 to specifically address the impacts of development to the sage grouse. In March 2016, the Fish
7 and Wildlife Commission ~~adopted~~ ~~amended~~ its Fish and Wildlife Habitat Mitigation Policy to
8 reference the rules at OAR 635, Division 140 and provide specific guidance for developments in
9 sage-grouse habitat~~Sage Grouse Conservation Policy~~, which states, at OAR 635-415-0025(7):

10
11 *For proposed developments subject to this rule with impacts to greater sage-grouse habitat*
12 *in Oregon, mitigation shall be addressed as described in OAR 635-140-0000 through 635-*
13 *140-0025, except that any energy facility that has submitted a preliminary application for*
14 *site certificate pursuant to ORS 469.300 et seq. on or before the effective date of this rule is*
15 *exempt from fulfilling the avoidance test contained in 635-140-0025, Policy 2, subsections*
16 *(a), (b), (c) and (d)(A). Other mitigation provisions contained in 635-140-0025, Policy 2,*
17 *subsections (d)(B) and (e), and Policies 3 and 4 remain applicable.*

18
19 OAR 635-415-0025(7) became effective upon its adoption in March 2016. The pASC for the
20 proposed transmission line was submitted in February 2013. Therefore, the requirements of
21 OAR 635-140-0025, Policy 2, subsections (a), (b), (c), and (d)(A) are not applicable to the
22 proposed facility.

23
24 The applicable provisions of OAR 635-140-0025(2) and (3) state:

25
26 (2) Policy 2. *The Department [ODFW] may approve or recommend approval of mitigation*
27 *for impacts from a large-scale development permitted by a county; or development*
28 *actions permitted by a state or federal government entity on public land, within sage-*
29 *grouse habitat only after the following mitigation hierarchy has been addressed by the*
30 *permitting entity, with the intent of directing the development action away from the*
31 *most productive habitats and into the least productive areas for sage-grouse (in order of*
32 *importance: core area, low density, general, and non-habitat).*

33 . . .

34 (d) *Minimization. If after exercising the above avoidance tests, the permitting*
35 *entity finds the proposed development action cannot be moved to non-habitat or*
36 *into a habitat category that avoids adverse direct and indirect impacts to a*
37 *habitat category of greater significance (i.e., core or low density), then the next*
38 *step applied in the mitigation hierarchy will be minimization of the direct and*
39 *indirect impacts of the proposed development action. Minimization consists of*
40 *how to best locate, construct, operate and time (both seasonally and diurnally)*
41 *the development action so as to avoid or minimize direct and indirect impacts on*
42 *important sage-grouse habitat and sage-grouse.*

43 . . .

1 (B) *Minimizing impacts from development actions in general habitat shall*
2 *include consultation between the development proponent and the*
3 *Department that considers and results in recommendations on how to*
4 *best locate, construct, or operate the development action so as to avoid*
5 *or minimize direct and indirect impacts on important sage-grouse habitat*
6 *within the area of general habitat.*

7 (e) *Compensatory Mitigation. If avoidance and minimization efforts have been*
8 *exhausted, compensatory mitigation to address both direct and indirect impacts*
9 *will be required as part of the permitting process for remaining adverse impacts*
10 *from the proposed development action to sage-grouse habitat, consistent with*
11 *the mitigation standard in (3) Policy 3 below.*

12 (3) Policy 3. *The standard for compensatory mitigation of direct and indirect habitat*
13 *impacts in sage-grouse habitat (core low density, and general areas) is to achieve net*
14 *conservation benefit for sage-grouse by replacing the lost functionality of the impacted*
15 *habitat to a level capable of supporting greater sage-grouse numbers than that of the*
16 *habitat which was impacted. Where mitigation actions occur in existing sage-grouse*
17 *habitat, the increased functionality must be in addition to any existing functionality of*
18 *the habitat to support sage-grouse. When developing and implementing mitigation*
19 *measures for impacts to core, low density, and general sage-grouse habitats, the project*
20 *developers shall:*

21
22 (a) *Work directly with the Department [ODFW] and permitting entity to obtain*
23 *approval to implement a mitigation plan or measures, at the responsibility of*
24 *the developer, for mitigating impacts consistent with the standard in OAR*
25 *635-140-0025 (3) or,*

26 (b) *Work with an entity approved by the Department [ODFW] to implement, at*
27 *the responsibility of the developer, “in-lieu fee” projects consistent with the*
28 *standard in OAR 635-140-0025 (3).*

29 (c) *Any mitigation undertaken pursuant to (a) or (b) above must have in place*
30 *measures to ensure the results of the mitigation activity will persist (barring*
31 *unintended natural events such as fire) for the life of the original impact. The*
32 *Department will engage in mitigation discussions related to development*
33 *actions in a manner consistent with applicable timelines of permitting*
34 *entities.*

35
36 (4) Policy 4. *The Department shall follow the Fish and Wildlife Habitat Mitigation Policy*
37 *(OAR 635-415-0000) when defining habitat categories and providing recommendations*
38 *to address potential site-level impacts to species other than greater sage-grouse that*
39 *occur within sage-grouse core area habitat or sage-grouse low density habitat, except*
40 *that if there is a resulting conflict between OAR 635-415-0000 and this rule, then this*
41 *rule shall control.*

42
43 OAR 635-140-0002 defines the sage grouse habitat categories as:

- 1 • *Areas of High Population Richness: Mapped areas of breeding and nesting habitat within*
2 *core habitat that support the 75th percentile of breeding bird densities (i.e., the top*
3 *25%).*
- 4 • *Core Area: Mapped sagebrush types or other habitats that support greater sage-grouse*
5 *annual life history requirements that are encompassed by areas: a) of very high, high,*
6 *and moderate lek density strata; b) where low lek density strata overlap local*
7 *connectivity corridors; or c) where winter habitat use polygons overlap with either low*
8 *lek density strata, connectivity corridors, or occupied habitat.” Core area maps are*
9 *maintained by the Department.*
- 10 • *Low Density: Mapped sagebrush types or other habitats that support greater sage-*
11 *grouse that are encompassed by areas where: a) low lek density strata overlapped with*
12 *seasonal connectivity corridors; b) local corridors occur outside of all lek density strata; c)*
13 *low lek density strata occur outside of connectivity corridors; or d) seasonal connectivity*
14 *corridors occur outside of all lek density strata. Low density area maps are maintained*
15 *by the Department.*
- 16 • *General Habitat: Occupied (seasonal or year-round) sage-grouse habitat outside impact*
17 *core and low density habitats. As explained in Exhibit P2 of the ASC, the analysis area for*
18 *sage grouse includes the entire Site Boundary, which the ASC defines as “the perimeter*
19 *of the site of a proposed energy facility, its related or supporting facilities, all temporary*
20 *laydown and staging areas, and all corridors and micro-siting corridors proposed by the*
21 *applicant” (OAR 345-001-0010(55)).*

22
23 ODFW’s Sage-Grouse Conservation Strategy focuses primarily on preserving the species’ habitat
24 and not on impacts to individual birds. As applicable to the proposed transmission line, OAR
25 635-140-0025(2), Policy 2 requires compliance with a mitigation hierarchy, which is intended to
26 “direct[] the development action away from the most productive habitats and into the least
27 productive areas for sage-grouse (in order of importance: core area, low density, general, and
28 non-habitat).” In areas where impacts cannot be avoided, Policy 2(d) requires the impacts to be
29 minimized. As described in the rule, “[m]inimization consists of how to best locate, construct,
30 operate and time (both seasonally and diurnally) the development action so as to avoid or
31 minimize direct and indirect impacts on important sage-grouse habitat and sage-grouse.” Policy
32 3 requires compensatory mitigation in the event avoidance and minimization efforts have been
33 exhausted.

34
35 As explained in Section III.A., *Transmission Corridor Selection*, and above with regard to fish and
36 wildlife habitat generally, the applicant conducted a series of siting studies in order to designate
37 a proposed transmission line route to best reduce, minimize, and avoid, to the extent practical,
38 sensitive species and resources, including sage-grouse habitat.³⁷⁵ As described in the application

³⁷⁵ B2HAPPDoc3-23 ASC 16B-Exhibit P2 GRSG ASC 2018-09-28, Table P2-1 identifies the specific sage grouse surveys the applicant has conducted, the survey protocols used, the dates of the surveys, the approximately acreage of area requiring surveys, the total acreage that has been surveyed to date, and the strategy the applicant proposes to follow in order to complete a 100% survey coverage of the necessary area. Figure P2-1 depicts the sage-grouse habitat survey areas.

1 and Section III.A, there are ~~competing~~^{ete} interests and trade-offs that have been made with
 2 the route selection proposed ~~in~~^{by} the application. While it is important to note that the
 3 proposed facility must comply with applicable EFSC standards and rules, it is also recognized
 4 that it is not possible to completely avoid all impacts to all resources and interests. For
 5 example, in areas of sage-grouse habitat, the proposed facility has often been routed to
 6 minimize or avoid impacts to the Oregon Trail, ~~or~~^{and} in particular, to private farmland
 7 including irrigated farmland. Additionally, in many locations on BLM land, the proposed route
 8 was directed by the BLM, understanding that there are trade-offs in potential impacts to the
 9 BLM's own resources and land uses.

10
 11 The applicant explains in ASC Exhibit P2 that designing the proposed route to avoid or minimize
 12 impacts to sage-grouse habitat was particularly challenging because of the dynamic and
 13 evolving nature of Oregon's sage-grouse habitat protection policy. In ASC Exhibit P2, the
 14 applicant summarizes the numerous changes in the sage grouse policy and the applicant's
 15 attempt to route the proposed transmission line to comply with the policy changes since
 16 2010.³⁷⁶ The current policy, which the ~~ODFW~~^{Oregon Fish and Wildlife} Commission adopted in
 17 March 2016 based on the ODFW July 2015 conservation strategy, includes the rules applicable
 18 to the ASC, upon which these findings are based. As discussed above, these policies provide
 19 mitigation measures for avoiding and minimizing sage-grouse habitat impacts, and for
 20 compensating for unavoidable impacts.

21
 22 Based on the current and applicable EFSC and ODFW rules, the applicant demonstrates that
 23 while the proposed route would impact some sage-grouse habitat; there is no reasonable
 24 alternative location that would avoid ~~the sage-grouse~~ habitat entirely. Based on the following
 25 analysis and findings, the Department agrees that the proposed facility route complies with the
 26 EFSC standard and ODFW rules, including the sage-grouse mitigation hierarchy. The proposed
 27 facility ~~primarily~~ avoids sage grouse habitat except in cases where there is no reasonable
 28 alternative route, or when considering trade-offs and potential impacts to other important
 29 resources. In those instances, the proposed facility route minimizes the direct and indirect

³⁷⁶ B2HAPPDoc3-23 ASC 16B-Exhibit P2 GRSG ASC 2018-09-28 Section 3.7.5.1. The applicant explains that, in 2010, ODFW called for avoiding all areas within two miles of a lek. In 2012, ODFW changed its approach to address "core areas" based on the *Greater Sage-Grouse Conservation Assessment and Strategy for Oregon: A Plan to Maintain and Enhance Populations and Habitat* (ODFW 2011) (the "2011 Strategy"). Applying the 2011 Strategy, ODFW designated "core areas" of sage-grouse habitat and recommended that all mapped core areas be considered Category 1 habitat, subject to site-specific analysis. The proposed facility route in the applicant's 2013 pASC avoided most, but not all, Category 1 sage-grouse habitat. For remaining Category 1 impacts, the applicant worked with ODFW and the Department to determine the extent of Category 1 sage-grouse habitat within the Site Boundary, to minimize disturbance to Category 1 habitat through micro-siting. If this policy was still in place, the ODFW mitigation policy for Category 1 habitat is "no impact." However, as described in this section, this policy is no longer applicable to sage-grouse habitat. Concurrent with the applicant's siting efforts, BLM developed alternative routes designed to avoid sage-grouse habitat (see Exhibit B, Attachment B-4, 2015 Supplemental Siting Study), and those alternative routes became part of the agency's preferred alternative. To align with the BLM, the applicant incorporated the BLM's preferred sage-grouse avoidance alternatives into the route proposed to EFSC.

1 impacts of the proposed ~~transmission line facility on to~~ sage-grouse habitat, in compliance with
2 OAR 625-140-0025(2)(d). To reiterate, the “typical” ODFW habitat categorizations, upon which
3 ~~the-sub(1) of the~~ EFSC Fish and Wildlife Habitat standard is based, are not applicable in sage-
4 grouse habitat per sub(2) of the EFSC Fish and Wildlife Habitat standard and the ODFW Sage-
5 Grouse Habitat Conservation Plan. Instead, the EFSC standard and ODFW rules rely upon
6 habitat categorization of “areas of high population richness,” “core,” and “low-density.” These
7 habitat categories are defined above.

8
9 Proposed Route Facility Components within Sage-Grouse Habitat³⁷⁷

10
11 ASC Exhibit P2, Figure P2-2 includes a map of the sage grouse habitat within the site boundary.
12 Figure P2-3 includes a map of the sage grouse lek locations near the proposed transmission
13 line. The applicant describes the locations of all facility components proposed to be located
14 within sage-grouse habitat as follows:³⁷⁸

15
16 *Sage-Grouse Areas of High Population Richness*

17
18 The proposed facility would include 0.28 miles of existing access road that ~~will~~would be
19 substantially modified within sage grouse areas of high population richness. No transmission
20 line, new access roads, multi-use areas, communication stations, or light-duty fly yards are
21 proposed to be located in sage-grouse area of high population richness.

22
23 *Sage-Grouse Core Area Habitat*

24
25 The proposed facility would include the following facility components within sage-grouse core
26 area habitat: 20.77-line miles of transmission line; 12.85 miles of new access roads; and 12.34
27 miles of substantially modified existing roads. No multi-use areas, communication stations or
28 light-duty fly yards are proposed to be located in sage grouse core area habitat.

29
30 *Sage-Grouse Low Density Habitat*

31
32 The proposed facility would include the following facility components within sage-grouse low
33 density habitat: 23.69-line miles of transmission line; 16.21 miles of new access roads; 11.28
34 miles of substantially modified existing roads, two communication stations (CS BA-01 and CS
35 MA-01 ALT), and one light-duty fly yard (LDFY BA-01). No multi-use areas are proposed to be
36 located in sage grouse low-density habitat.

37

³⁷⁷ No facility components associated with any alternative routes are proposed in any sage-grouse habitat; as such, the analysis here refers only to the proposed facility route.

³⁷⁸ B2HAPPDoc3-32 ASC 16B_ Exhibit P2 GRSG_ASC 2018-09-28, Section 3.7.1.

1 Evaluation of Sage-Grouse and Sage-Grouse Habitat Impacts

2

3 Impacts to sage-grouse habitat would be both permanent and temporary. Permanent impacts
4 are defined as those impacts that ~~will~~would exist for the entire life of the transmission line.
5 Temporary impacts are those impacts that ~~will~~would last for a time less than the life of the
6 transmission line; however, impacts to sage-brush habitat are typically very long to recover.³⁷⁹

7

8 *Direct Impacts*

9

10 OAR 635-140-0002(4) defines direct impacts to sage grouse as those impacts that have “an
11 adverse effect of a development action upon sage-grouse habitat which is proximal to the
12 physical footprint of the development action in time and place.” As with other fish and wildlife
13 species, direct impacts would be both permanent and temporary. As the applicant explains in
14 Exhibit P2, vegetation removal, access road activity, and direct mortality from the proposed
15 transmission line would potentially result in temporary or permanent direct impacts to sage-
16 grouse habitat. Exhibit P2, Table P2-3 depicts the types of sage-grouse direct impacts associated
17 with the proposed development.³⁸⁰

18

19 *Permanent Direct Impacts*

20

21 ASC Exhibit P2, Table P2-3 summarizes the types, timing, duration, quantification metrics and
22 proposed mitigation measures related to permanent direct impacts to sage-grouse habitat from
23 the proposed transmission line.³⁸¹

24

25 *Permanent Vegetation Clearing Impacts:*

26

27 As discussed above regarding fish and wildlife habitat generally, the applicant explains that
28 vegetation clearing to accommodate facility components required for operation would result in
29 some permanent direct impacts to fish and wildlife habitat through habitat loss. Permanent loss
30 of habitat would occur within the operations disturbance areas for transmission structures,
31 communication stations, and access roads. Also as explained above, with respect to ~~the~~
32 permanent direct impacts specifically from access road construction and modification, the
33 applicant provides details on road construction activities and methods, including types of
34 improvements to existing roads and projected traffic volumes in the Road Classification Guide

³⁷⁹ The applicant explains that the recovery period for directly disturbed agricultural areas could be as short as one to three years; grasslands and herbaceous wetlands generally recover within three to seven years; shrublands may require 30 to 100 years to recover (with the longer recovery periods associated with disturbances in mature sage-brush habitats located in arid regions or for specific sage-brush species). Arid sites with naturally sparse vegetation, as well as those with saline or alkaline soils, shallow soils, compacted soils, or areas that have a high erosion potential may be difficult to restore and could require special techniques or repeated revegetation efforts.

³⁸⁰ B2HAPPDoc3-32 ASC 16B_Exhibit P2 GRSG_ASC 2018-09-28, Section 3.7.3.1.

³⁸¹ Id.

1 and Access Management Plan (Attachment B-5), and in the Traffic and Transportation
2 Management Plan (Attachment U-2).

3
4 As applied specifically to sage-grouse habitat, the applicant is required to provide mitigation for
5 permanent direct and indirect impacts resulting from construction of facility components as set
6 forth in the Greater Sage-Grouse Habitat Mitigation Plan (Attachment P2-3 of this order). As
7 discussed in the plan, ODFW is currently developing a Sage-Grouse Habitat Quantification Tool
8 (HQT) that would be used to estimate direct and indirect impacts to sage-grouse habitat
9 resulting from transmission lines and roads, as well as associated compensatory mitigation
10 obligations. Under ODFW's Greater Sage-Grouse Conservation Strategy, the applicant must
11 account for direct and indirect impacts using the Sage-Grouse Habitat Quantification
12 Tool HQT.³⁸²

13
14 Recommended Fish and Wildlife Condition 17 would require that prior to construction, the
15 applicant finalize the Greater Sage-Grouse Habitat Mitigation Plan, however, initially, the
16 certificate holder has also proposed that it would not provide mitigation, either in the form of
17 applicant-implemented mitigation project, or fee-in-lieu, or mitigation bank credits, until three
18 years after facility operation which is the time necessary to conduct an operational traffic
19 management study (see Fish and Wildlife Conditions 20 and 21 below). The Department agrees
20 that the operational traffic management study is necessary in order to verify the mitigation
21 obligation is accurate, for both sage-grouse habitat and for elk habitat impacts. In a comment
22 letter on the ASC, the Oregon Department of Fish and Wildlife (ODFW) noted that delaying
23 mitigation for the entire facility's impacts until three years after operation would result in a loss
24 of functional habitat for three years without mitigation. Rather, ODFW suggested a "two-step"
25 mitigation process, whereas the applicant/certificate holder provides mitigation prior to or at
26 the time of facility construction based on the known facility impacts at that time, such as direct
27 impacts from structures, roads, pulling and tensioning sites, multi-use areas (MUAs), and other
28 facility components. Then, after three years and after completion of the operational traffic
29 study, ODFW suggests that the certificate holder provide any additional mitigation based on the
30 results of the traffic study.³⁸³ All impacts would be calculated using the ODFW HQT, as described
31 in this order. The applicant agreed with the ODFW comment, as does the Department.

32
33 For the initial facility impact assessment, ODFW would assume that new roads within sage-
34 grouse habitat not equipped with access control structures would result in public use and
35 consequently indirect impacts to sage-grouse. ODFW requests mitigation at the lowest level for
36 indirect impacts (HQT assumes greater indirect impacts with more greater use) for new roads.
37 Upon completion of the traffic study in year-3 of operation, ODFW will request additional
38 mitigation as appropriate for any identified increase in traffic volume above pre-construction
39 conditions for both substantially modified roads or assumed low traffic volumes on new road.

³⁸² Id; ODFW Executive Order No. 15-18.

³⁸³ B2HAPPDoc13-21 ASC Reviewing Agency Comment ODFW_Reif 2019-01-25.

1 Additional edits have been made to recommended Fish and Wildlife Conditions 17 and 18
2 based on the applicant's response to ODFW comments made on the record of the DPO. The
3 Department has made minor clarifications in recommended Fish and Wildlife Condition 19 to
4 clarify the requirements of the condition.³⁸⁴
5

6 The Department recommends the Council include the following conditions in the site
7 certificate:
8

9 **Recommended Fish and Wildlife Condition 17:** At least 90 days prior to construction
10 of a facility phase or component in sage-grouse habitat as mapped by ~~T~~the Oregon
11 Department of Fish and Wildlife (ODFW) at that time, unless otherwise agreed to by
12 the Department, the certificate holder shall finalize, and submit to the Department
13 for its approval, in consultation with ODFW, a final Sage-Grouse Habitat Mitigation
14 Plan for the phase or segment to be constructed.

- 15 a. The certificate holder shall provide to the Department the information necessary
16 for the State of Oregon to calculate the amount of sage-grouse habitat
17 compensatory mitigation required for the facility using Oregon's Sage-Grouse
18 Habitat Quantification Tool (HQT).
- 19 b. The final Sage-Grouse Habitat Mitigation Plan shall address the potential sage-
20 grouse habitat impacts through mitigation banking, an in-lieu fee program,
21 development of mitigation projects by the certificate holder, or a combination of
22 the same.
- 23 i. To the extent the certificate holder develops its own mitigation projects,
24 the final Sage-Grouse Habitat Mitigation Plan shall:
- 25 1. Identify the location of each mitigation site, including a map of the
26 same;
 - 27 2. Identify the number of credit-acres that each mitigation site will
28 provide for the certificate holder, including results of the HQT results
29 for the site and mitigation actions;
 - 30 3. Include a site-specific mitigation management plan for each mitigation
31 site that provides for:
 - 32 A. A baseline ecological assessment;
 - 33 B. Conservation actions to be implemented at the site;
 - 34 C. An implementation schedule for the baseline ecological assessment
35 and conservation actions;
 - 36 D. Performance measures and success criteria for mitigation actions;
 - 37 E. Adaptive management considerations for changes in habitat
38 conditions or a results of catastrophic fire;
 - 39 ~~D.F.~~ Weed management plan;
 - 40 ~~E.G.~~ A reporting plan; ~~and~~

³⁸⁴ ODFW comment: B2HAPPDoc8-013 DPO Agency Comment ODFW Reif 2019-08-21; Idaho Power response:
B2HAPPDoc13. B2HAPP DPO IPC Responses - ODFW 2019-10-03.

- 1 H. A monitoring plan; ~~And~~
2 F.I. A description of how the durability of the mitigation site will be
3 achieved, including but not limited to, any long-term stewardship
4 plans and financial assurances.
- 5 ii. To the extent the site certificate utilizes a mitigation bank or in-lieu fee
6 program, the final Sage-Grouse Habitat Mitigation Plan shall:
7 1. Describe the nature, extent, and history of the mitigation bank or in-
8 lieu fee program; ~~and~~
9 2. Identify the number of credit-acres that each mitigation site will
10 provide for the certificate holder; and-
11 2.3. Demonstrate that ODFW has approved the program to fulfill
12 sage-grouse habitat mitigation requirements.
- 13 iii. The final Sage-Grouse Habitat Mitigation Plan shall include compensatory
14 mitigation sufficient to address direct impacts from, at a minimum, all
15 facility components except indirect impacts from existing access roads
16 substantially modified for the facility (related or supporting facilities). For
17 calculation purposes, new facility roads without access control will be
18 assigned a “no-traffic” designation, and new roads with access control will
19 be assigned a “low-traffic” designation. As referenced in Fish and Wildlife
20 Condition 19, the certificate holder shall demonstrate during or about the
21 third year of operation that sage-grouse habitat mitigation shall be
22 commensurate with the final compensatory mitigation calculations, ~~which~~
23 ~~will be based on the as-constructed facility and will include indirect~~
24 ~~impacts from access roads,~~ either by showing the already-implemented
25 mitigation is sufficient to cover all facility component impacts, or by
26 proposing additional mitigation to address any ~~uncovered~~ impacts
27 incremental to the initial calculation. The final compensatory mitigation
28 calculations must be based on the as-constructed facility as well as the pre-
29 and post- construction traffic studies, and must include the addition of
30 indirect impacts from substantially modified existing access roads.
- 31 c. Oregon’s Sage-Grouse Habitat Quantification Tool shall be used to calculate the
32 amount of sage-grouse habitat compensatory mitigation required for the facility
33 and the number of credit-acres that each mitigation site will provide for the
34 certificate holder.
- 35 d. Prior to ~~facility~~ construction of a phase or segment in sage-grouse habitat as
36 mapped by the Oregon Department of Fish and Wildlife (ODFW) at that time and
37 based on final facility design, Oregon’s Sage-Grouse Development Registry shall
38 be used to calculate and verify compliance with the metering and disturbance
39 thresholds established at OAR 660-023-0115(17) and (18). Evidence of
40 compliance must be provided to the Department prior to construction.
- 41 e. The Sage-Grouse Habitat Mitigation Plan may be amended from time to time by
42 agreement of the certificate holder and the department. Such amendments may
43 be made without amendment to the site certificate. The Council authorizes the
44 Department to agree to amendments of the plan and to mitigation actions that

1 may be required under the plan; however, the Council retains the authority to
2 approve, reject, or modify any amendment of the plan agreed to by the
3 Department.

4
5 **Recommended Fish and Wildlife Condition 18:** During construction facility phase or
6 component in sage-grouse habitat as mapped by the Oregon Department of Fish and
7 Wildlife (ODFW) at that time, the certificate holder shall implement the conservation
8 actions set forth in the final Sage-Grouse Habitat Mitigation Plan referenced in Fish
9 and Wildlife Condition 17 within six months of the impact actions.

10
11 **Recommended Fish and Wildlife Condition 19:** During the third year of operation,
12 the certificate holder shall provide to the Department and ODFW the data from the
13 traffic studies Fish and Wildlife Conditions 21 and 22 -information necessary for
14 ODFW to calculate the final amount of indirect impact from facility roads that are
15 considered related or supporting facilities to sage-grouse habitat and corresponding
16 compensatory mitigation required using Oregon’s Sage-Grouse Habitat
17 Quantification Tool. After receiving the calculations from the State, the certificate
18 holder shall provide to the Department a report demonstrating that sage-grouse
19 habitat mitigation shall be commensurate with the final compensatory mitigation
20 calculations.

- 21 a. The final calculations shall be based on the as-constructed facility.
22 b. Oregon’s Sage-Grouse Habitat Quantification Tool shall be used to calculate
23 the amount of sage-grouse habitat compensatory mitigation required for the
24 facility, and the information from the pre- and post-construction traffic
25 studies shall be used in the calculation.

26
27 *Direct Habitat Impact – LCDC Metering Rule and Disturbance Threshold Rule*

28
29 The Land Conservation and Development Commission (LCDC) implemented,
30 concurrently with ODFW and the Oregon Fish and Wildlife Commission, sage-grouse
31 habitat conservation rules into the Oregon land use planning rules. These rules are
32 directly applicable to county-level and state-level permitting of projects and facilities
33 that impact sage-grouse habitat. While the rules are housed in the LCDC rule division at
34 OAR 660, Division 23, they are discussed in this section of the order because they are
35 related to sage-grouse habitat. OAR 660-023-0115 is the rule section related sage-
36 grouse habitat conservation. Subsection 2 of that rule lists exempt activities from most
37 provisions of the rule, including 2(b), energy facilities that submitted a preliminary
38 application for site certificate to EFSC prior to the effective date of the rule. This
39 includes the proposed facility. Nevertheless, subsection 16 and 17 of the rule related to
40 “metering” and “disturbance thresholds” do apply to the proposed facility, by rule.

41
42 *OAR 660-023-0115(16) Metering. This rule is intended to ensure that the area of*
43 *direct impact levels in any PAC [priority area for conservation], including energy*
44 *facilities exempted under subsection (2)(b), does not increase by an amount greater*

1 *than 1.0 percent of the total area of the PAC in any ten-year period. The initial period*
2 *shall commence upon the effective date of this rule and continue for ten consecutive*
3 *years, where upon the process shall be successively repeated. The commission will*
4 *consider revisions to this rule if the department's yearly reports required by section*
5 *(15) indicate that the development trends in any PAC indicate that the 1.0 percent*
6 *direct impact threshold is in jeopardy of being exceeded before the ten-year period*
7 *has expired. Any proposal to amend this rule undertaken by the department shall be*
8 *developed in coordination with all affected counties and other stakeholders.*

9
10 *OAR 660-023-0115(17) Disturbance Threshold. This rule is intended to ensure that*
11 *direct impact level, including energy facilities exempted under subsection (2)(b), does*
12 *not exceed three percent of the total area in any PAC. If this three-percent threshold*
13 *is approached, then the department must report that situation to the commission*
14 *along with a proposal to amend this rule to adapt the standards and criteria such*
15 *that the threshold is not exceeded.*

16
17 The applicant has demonstrated that the proposed facility can comply with the metering
18 and disturbance threshold rule requirements. Exhibit P2, Table P2-5, reprinted here as
19 Table FW-2, shows that in both priority areas for conservation (PACs) that would be
20 impacted by the proposed facility (Baker PAC and Cow Valley PAC), based on a
21 conservative estimate of facility design, there would remain sufficient acreage under
22 both the metering and disturbance threshold caps, in compliance with the LCDC rules.
23 The calculations were conducted by the Institute for Natural Resources, based on
24 methods established by INR on contract to ODFW. The applicant states that the
25 calculations were conservative and overestimate the proposed facility's impacts,
26 particularly because the calculations by INR included access roads that ~~will~~would be
27 used for facility construction that are existing and require no or limited improvements,
28 such that they are not considered related or supporting facilities under EFSC jurisdiction.
29 Regardless, the calculations demonstrate that the proposed facility would be well under
30 the 1% and 3% thresholds. Since the time of the application development, INR and The
31 Nature Conservancy, on contract to ODFW and the State of Oregon, have developed a
32 tool called the Sage-Grouse Development Registry, which is used to quantify a facility's
33 direct impacts to sage-grouse habitat for purposes of complying with the LCDC metering
34 and threshold rules. To validate compliance with the rules after the facility has been
35 constructed, the Department recommends Fish and Wildlife Condition 17, 18 and 19, to
36 verify compliance with the LCDC rules using the Sage-Grouse Development Registry.

Table FW-3: Direct Impacts to Sage-grouse Habitat in Oregon

Existing Conditions (acres)	Baker PAC	Cow Valley PAC
Total area	336,415	368,442
Total development	2,938	1,501
Development percent of total	0.87%	0.41%
Project Direct Impacts (acres)	Baker	Cow Valley
Permanent (operations)	347	179
Temporary (construction)	24	30
Overlap with existing baseline	(28)	(9)
Net Project impacts	343	200
Area Remaining for Development after the Project		
Acres remaining to the 3% threshold ¹	6,811	9,352
Percent remaining to the 3% threshold	2.02%	2.54%
Acres remaining to the 1% threshold ²	3,021	3,484
Percent remaining to the 1% threshold	0.90%	0.95%
Notes		
<ol style="list-style-type: none"> 1. The 3% disturbance cap is intended to ensure that direct impacts do not exceed 3% of the total area in any Priority Area of Concern (PAC) (see OAR 660-023-0115(17)). The 1% metering threshold provides that the area of direct impact levels in any PAC does not increase by an amount greater than 1% of the total area of the PAC in any ten-year period (see OAR 660-023-0115(16)). The initial period commenced on the effective date of OAR 660-023-0115, which was July 24, 2015. 2. The 1% metering threshold provides that the area of direct impact levels in any PAC does not increase by an amount greater than 1% of the total area of the PAC in any ten-year period (see OAR 660-023-0115(16)). The initial period commenced on the effective date of OAR 660-023-0115, which was July 24, 2015. 		

1

2 *Traffic-Related Direct Mortality*

3

4 Direct mortality to sage-grouse individuals may occur as a result of collisions with facility-
5 related vehicles during construction or operation of the proposed facility; however, this risk is
6 considered very low, as sage-grouse would likely avoid the work sites and vehicles. The risk of
7 traffic-related direct mortality can be avoided or minimized by having facility-related vehicles
8 reduce speed to a level sufficient to anticipate and avoid striking sage-grouse individuals.

1 Recommended Fish and Wildlife Condition 8 would establish speed limits on access roads in
2 order to avoid or minimize direct mortality to sage-grouse.

3
4 Additionally, vehicle-wildlife collisions on facility-related access roads can be substantially
5 reduced through controlling use of such roads. As discussed above, the applicant proposes to
6 implement access control as set forth in the draft Road Classification Guide and Access Control
7 Plan (Attachment B-5). Access control may involve fencing, gates, barriers, and/or signage as
8 preferred by the landowner while maintaining effectiveness. Recommended Fish and Wildlife
9 Condition 9 would establish access controls in order to avoid or minimize indirect impacts
10 related to access roads, consistent with the Road Classification Guide and Access Control Plan.

11
12 *Transmission-Line-Collision Mortality*

13
14 Direct mortality to individual sage-grouse may occur from collisions with facility-related
15 structures (e.g., birds flying into wires). The risk of mortality from such collisions is anticipated
16 to be very low. As the applicant explains, the risk of sage-grouse mortalities occurring as a
17 result of electrocutions is negligible for extra high-voltage transmission lines because a bird
18 would need to contact two phases of the line simultaneously to be electrocuted and the
19 spacing between phases of the proposed transmission lines is much larger than the wing span
20 of sage-grouse. Therefore, electrocution due to the transmission line is not considered likely to
21 occur. Even so, Recommended Fish and Wildlife Condition 10, which requires compliance with
22 practices set forth in IPC's Aviation Protection Plan and certain other avian protection
23 guidelines, would ensure that avoid or minimize direct mortality to avian species is avoided or
24 minimized.

25
26 *Temporary Direct Impacts*

27
28 ASC Exhibit P2, Table P2-4 summarizes the type, timing, duration, quantification metric, and
29 mitigation measures related to the proposed transmission line's potential temporary direct
30 impacts to sage-grouse habitat.³⁸⁵

31
32 *Temporary Vegetation Clearing Impacts*

33
34 The applicant explains in Exhibit P2 that clearing of vegetation that provides sage grouse
35 habitat within the right of way of the proposed transmission line would be required for
36 construction-related activities and installation of some facility components. As described in
37 Exhibit P2, in most areas there would be a 250-foot-wide right-of-way in which to construct the
38 500-kV portions of the transmission line and a 100-foot-wide right-of-way to construct the 138-
39 kV portions of the line. Temporary vegetation clearing activities would encompass the entire
40 footprint of pulling and tensioning sites, multi-use areas and light-duty fly yards. Temporary
41 clearing activities would also occur around the perimeter of permanent facility components.

³⁸⁵ B2HAPDoc3-32 ASC 16B_ Exhibit P2 GRSG_ASC 2018-09-28, Section 3.7.3.2.

1 Areas cleared for construction activities, and not required for transmission line components or
2 needed for maintenance, would be reclaimed as described in the applicant’s Reclamation and
3 Revegetation Plan (Attachment P1-3).

4
5 The applicant characterizes the proposed clearing as a temporary impact because restoration of
6 all temporarily impacted areas is required by EFSC rules. However, restoration of sage-brush
7 habitat can take decades and restoration to pre-construction conditions could span several
8 generations of sage-grouse, and the benefit of restoration are unlikely to be realized by sage-
9 grouse in the short-term. As such, mitigation including compensatory mitigation must be
10 provided in accordance with the Greater Sage Grouse Habitat Mitigation Plan (Attachment P2-
11 3; and Recommended Fish and Wildlife Conditions 17, 18 and 19).

12
13 *Retirement:* The applicant explains in ASC Exhibit P2 that retirement of the proposed
14 transmission line would involve activities and equipment similar to those that would be used
15 during construction. Accordingly, potential temporary impacts on sage-grouse during
16 retirement of the transmission line would be similar to the temporary impacts described for
17 construction. As described in Mandatory Conditions 7 and 12, specific mitigation requirements
18 to address impacts incurred during retirement of the facility would be included in the
19 retirement plan, including a description of the activities necessary to restore the site to a
20 useful, non-hazardous condition, as described in OAR 345-027-110(5).

21
22 *Indirect Impacts to Sage-Grouse Habitat*

23
24 OAR 635-140-0002(6) defines indirect impacts to sage-grouse habitat as impacts that have
25 “adverse effects to sage-grouse and their habitat that are caused by or will ultimately result
26 from implementation of a development action, with such effects usually occurring later in time
27 or more removed in distance as compared to direct effects.” Indirect impacts to sage-grouse
28 and sage-grouse habitat can result from multiple sources of sensory disturbance, typically such
29 as noise and human presence during construction and on access roads during operation.
30 Additionally, there is evidence that suggests that tall structures such as transmission lines
31 provide perching habitat for corvids, particularly ravens and other predatory species, and that
32 these birds use the perch provided by transmission lines to predate on sage-grouse eggs and
33 chicks and generally disturb habitat. The application argues that the science linking tall
34 structures to indirect sage-grouse disturbance including predation from corvids as being
35 unsettled and unclear. Nevertheless, ODFW has incorporated an indirect disturbance
36 consideration into the Habitat Quantification Tool and as such, use of the HQT for calculating
37 the facility’s impacts and corresponding mitigation obligation ~~will~~would account for indirect
38 effects.³⁸⁶
39

³⁸⁶ Id. Section 3.7.4.1.

1 *Permanent Indirect Impacts*

2
3 ASC Exhibit P2, Table P2-6 summarizes the types, timing, duration, quantification metrics and
4 proposed mitigation measures related to permanent indirect impacts to sage grouse habitat
5 from the proposed facility. ASC Exhibit P2 notes two studies that indicate that transmission
6 lines and other tall structures could indirectly impact sage-grouse by offering opportunities for
7 increased predator use thereby generating aversion behaviors among sage-grouse. It also
8 includes references to studies indicating no evidentiary support that the transmission lines
9 create an adverse indirect impact to sage grouse. As stated above, ODFW has concluded that
10 transmission lines have indirect impacts on sage-grouse habitat and, as discussed further
11 below, the HQT ~~will~~would account for these indirect impacts. As discussed above,
12 Recommended Fish and Wildlife Conditions 17, 18 and 19 require that the applicant's Sage
13 Grouse Mitigation Plan (Attachment P2-3) rely on, and provide mitigation commensurate with,
14 the HQT results.

15
16 *Permanent Indirect Impacts from Access Roads*

17
18 The applicant explains in ASC Exhibit P2 that it does not anticipate that new and substantially
19 modified existing access roads would act as a barrier to sage-grouse movement. However, the
20 introduction of traffic (i.e., motorized on- or off-road vehicles) and the presence of human
21 activity on roads used for the proposed facility could have negative indirect impacts on sage-
22 grouse and sage-grouse habitat. Those indirect impacts could include reduced utilization of
23 habitat, fragmentation of migration corridors, and the associated disruption of important sage-
24 grouse life processes. As discussed in the applicant's Road Classification Guide and Access
25 Control Plan (Exhibit B, Attachment B-5), and as would be required under Recommended Fish
26 and Wildlife Conditions 8 and 9, speed limits and controlled access on facility access roads
27 within sage-grouse habitat would help mitigate indirect impacts from roads to sage-grouse and
28 sage-grouse habitat. In addition, the Sage-Grouse HQT would include permanent indirect
29 impacts from roads in its calculation, including mitigation obligations for indirect impacts to
30 sage-grouse and sage-grouse habitat.

31
32 *Temporary Indirect Impacts*

33
34 ASC Exhibit P2, Table P2-7 summarizes the types, timing, duration, quantification metrics, and
35 proposed mitigation measures related to permanent indirect impacts to sage grouse habitat
36 from the proposed transmission line.

37
38 *Temporary Indirect Impacts from Access Roads*

39
40 The applicant explains in ASC Exhibit P2 that construction activities would result in road-related
41 surface disturbances that could directly impact sage-grouse. Those disturbances include noise,
42 visual disturbance from heavy equipment, traffic and people, dust dispersing from the
43 immediate construction area, and some air pollution from construction equipment exhaust.
44 Individual sage-grouse may be disturbed if the species are located in or near the site boundary

1 and the habitat near the construction area may temporarily be unsuitable during the
2 construction period.

3
4 Noise would likely have a greater impact and extend further from the construction sites than
5 other road-related disturbances. Some construction activities would likely result in sound levels
6 with a maximum instantaneous predicted noise level of 80 to 90 A-weighted decibels at 50 feet
7 from the work site. Increases in noise would be concurrent with any disturbance associated
8 with the presence of humans and their activities (e.g., dust and visual disturbances). Surface
9 disturbance has been associated with declines in sage-grouse lek attendance and negative
10 population persistence, reducing the functionality of habitat at varying distances from the
11 disturbance. These disturbances could render habitats unsuitable during construction, though
12 this level of the disturbance would only occur construction or heavy maintenance.³⁸⁷

13
14 Recommended Fish and Wildlife Conditions 8 and 9, which require speed limits and access
15 controls on facility-related roads in sage-grouse habitat, would help mitigate and minimize
16 those impacts, though would not eliminate the impacts. In addition, the applicant proposes
17 spatial and timing restrictions near sensitive sage-grouse habitat, which would limit the facility
18 construction time to periods when sage-grouse are less sensitive to disturbances. The applicant
19 proposes to develop a set of maps that depict the extent of spatial and temporal restriction
20 areas within the analysis area. As required under Recommended Fish and Wildlife Condition 7,
21 these maps would be maintained on-site to ensure construction workers are aware if and when
22 their activities would occur within sage-grouse habitat and the applicability of the spatial and
23 temporal restrictions. Recommended Fish and Wildlife Condition 7 requires flagging of
24 environmentally sensitive areas. In addition, to prevent ground-disturbing activities within sage-
25 grouse areas during high-sensitivity periods, the applicant proposes and the Department
26 recommends the Council adopt the following condition:

27
28 **Recommended Fish and Wildlife Condition 20:** During construction, the certificate holder
29 shall not conduct ground-disturbing activities within sage-grouse areas of high population
30 richness, core area habitat, low density habitat, or general habitat between March 1 to
31 June 30. Upon request by the certificate holder, the Department in consultation with
32 ODFW may provide exceptions to this restriction. The certificate holder's request must
33 include a justification for the exception, including any actions the certificate holder will
34 take to avoid, minimize, or mitigate impacts to sage-grouse in the relevant area.

35
36 *Temporary Invasive Species Impacts*

37
38 As the applicant explains in Exhibit P2, the initial vegetation clearing and resulting soil
39 disturbance during construction could create optimal conditions for the establishment of
40 invasive-plant species, which if established, would affect the quality of wildlife habitat,
41 including sage grouse habitat. The replacement of native plant species can have various

³⁸⁷ Id. Section 3.7.4.2.

1 environmental effects on sage grouse habitat, including changes in fire regime (e.g., increasing
2 the frequency and severity of fires), changes in the nutrient regime of soils (thereby reducing
3 the quality of forage species), increased soil erosion (resulting in additional loss of vegetated
4 areas, as well as sedimentation to aquatic habitats), or reductions in the abundance of
5 important forage species (due to invasive species excluding them from the area). These
6 alterations to habitat quality can extend beyond the area of initial impacts (e.g., fires or
7 invasive-plant species can spread to areas far beyond the initial area). Compliance with the
8 applicant's proposed Noxious Weed Plan (Attachment P1-5; Recommended Fish and Wildlife
9 Conditions 3) and Reclamation and Revegetation Plan (Attachment P1-3, Recommended Fish
10 and Wildlife Conditions 2) would minimize the risk of invasive-plant species spread or
11 establishment. Additional discussion of those two plans is included in the general fish and
12 wildlife habitat section above.

13 14 Mitigation of Impacts

15
16 The Sage-Grouse Habitat Quantification Tool ~~will be will~~would be used to quantify both direct
17 and indirect impacts from the proposed facility. It will also be used to determine the amount of
18 compensatory mitigation required for impacts to sage-grouse and sage-grouse habitat.

19
20 The Sage-Grouse Habitat Quantification Tool analysis will include consideration of traffic
21 volumes on facility-related roads ~~in~~ the calculation of facility habitat impact and corresponding
22 mitigation obligation. Accordingly, the applicant proposes to conduct a traffic study to evaluate
23 pre- and post-construction traffic on public roads used for the proposed facility. To most
24 accurately characterize traffic pattern changes, if any, the traffic study would be conducted for
25 one year in the year prior to construction and for one year during the second year the facility is
26 operation. The results of the study will be used to assess the volume of traffic on access roads
27 that can be attributed to the proposed facility (note that the traffic study will also assess traffic
28 impacts in elk habitat, in addition to sage-grouse habitat, for purposes of finalizing mitigation
29 obligations for both habitats). To ensure compliance with the proposed traffic monitoring
30 program, the applicant proposes and the Department recommends the Council adopt the
31 following conditions. The results of these studies will be used to inform final habitat mitigation
32 as required by Recommended Fish and Wildlife Condition 1.

33
34 **Recommended Fish and Wildlife Condition 21:** Prior to construction of a phase or
35 segment of the facility, the certificate holder shall conduct a one-year traffic study in
36 elk habitat (elk summer range and elk winter range, based on the most recent ODFW
37 maps available at the time) and sage-grouse habitat (areas of high population
38 richness, core area habitat, low density habitat, and general habitat, based on most
39 recent ODFW maps available at the time). The certificate holder shall submit the
40 traffic study to the Department for its review and approval in consultation with
41 ODFW.

42
43 **Recommended Fish and Wildlife Condition 22:** During the second year of facility
44 operation, the certificate holder shall conduct a one-year traffic study in elk habitat

1 (elk summer range and elk winter range, based on the same maps used for the pre-
2 construction traffic study) and sage-grouse habitat (areas of high population
3 richness, core area habitat, low density habitat, general habitat, based on the same
4 maps used for the pre-construction traffic study).

5
6 In addition to developing thresholds, the EFSC Fish and Wildlife Habitat standard for sage
7 grouse habitat at OAR 345-022-0060(2) and OAR 635-140-0025(2)(e) requires compensatory
8 mitigation for unavoidable impacts to sage-grouse habitat. OAR 635-140-0025(3) provides
9 procedures and standards for developing compensatory mitigation. As discussed above, the
10 amount of sage-grouse habitat compensatory mitigation required for the proposed
11 transmission line would be determined by the Sage-Grouse Habitat Quantification Tool. The
12 applicant's Greater Sage-Grouse Habitat Mitigation Plan (Attachment P2-34; Recommended
13 Fish and Wildlife Condition 17, 18 and 19) identifies compensatory mitigation for the proposed
14 facility's unavoidable impacts consistent with the mitigation standard in OAR 635-140-0025(3)
15 and the Sage-Grouse Habitat Quantification Tool.

16
17 As described above, the applicant is required to provide mitigation for impacts resulting from
18 construction of facility components to sage grouse habitat. The applicant's proposed approach
19 to providing the required mitigation is set forth in its Sage-Grouse Habitat Mitigation Plan
20 (Attachment P2-3). Recommended Fish and Wildlife Condition 17 would require that prior to
21 construction, the applicant finalize the Sage-Grouse Habitat Mitigation Plan. The applicant must
22 use the ODFW Sage Grouse Habitat Quantification Tool to calculate the required quantity of
23 compensatory mitigation. The final mitigation obligation would incorporate the results of the
24 pre-and post- construction traffic management study (recommended Fish and Wildlife
25 Conditions 20 and 21). Compensatory mitigation may take the form of applicant-provided
26 mitigation projects, mitigation banking, or ODFW-managed fee-in-lieu mitigation, as described
27 in recommended Fish and Wildlife Condition 17 and the Sage-Grouse Habitat Mitigation Plan
28 (Attachment P2-3).

29 30 Monitoring Plan

31
32 In order to evaluate the success of measures to minimize and mitigate impacts, the applicant
33 proposes to conduct post-construction surveys for a three-year period following the conclusion
34 of ground-disturbing activities. If pre-designated success criteria are not met after three years,
35 the applicant proposes to conduct monitoring and any necessary re-vegetation efforts (as
36 applicable) until pre-designated success criteria are met. As described in ASC Exhibit P2, the
37 applicant's draft Reclamation and Revegetation Plan (Attachment P1-3; Recommended Fish and
38 Wildlife Condition 1) includes a description of the proposed monitoring plan, including the
39 evaluation methods and success measures to determine whether post-construction
40 revegetation efforts have been successful. The applicant also proposes to monitor mitigation
41 actions to determine if mitigation success criteria have been met. The Greater Sage-Grouse
42 Habitat Mitigation Plan (Attachment P2-43; Recommended Fish and Wildlife Conditions 16, 17
43 and 18) further discusses this monitoring commitment and requirement. As discussed above,
44 based on ODFW comment on the record of the DPO, the Department recommends

1 amendments to Fish and Wildlife Condition 1 that would require adaptive monitoring of
2 revegetation and restoration actions, commensurate with the anticipated recovery period of
3 specific habitat types.

4
5 Conclusions regarding Sage-Grouse and Sage-Grouse Habitat

6
7 Based on the evidence in the record and the assessment provided here, and subject to
8 compliance with the recommended site certificate conditions, the Department recommends
9 the Council find that the proposed facility would satisfy the applicable provisions of the ODFW
10 Sage-Grouse Conservation Strategy set forth in OAR 635-140-0025 as adopted in the EFSC Fish
11 and Wildlife Habitat standard at OAR 345-022-0060(2), and that the proposed facility would
12 comply with OAR 660-023-0115(16) and (17).

13
14 Conclusions of Law

15
16 Based on the foregoing findings of fact, and subject to compliance with the recommended
17 conditions of approval, the Department recommends the Council conclude that, taking into
18 account mitigation, the design, construction, and operation of the proposed facility, including
19 proposed and alternative routes, is in compliance with the Council's Fish and Wildlife Habitat
20 standard.

21 IV.I. Threatened and Endangered Species: OAR 345-022-0070

22
23 *To issue a site certificate, the Council, after consultation with appropriate state agencies,*
24 *must find that:*

25
26 *(1) For plant species that the Oregon Department of Agriculture has listed as*
27 *threatened or endangered under ORS 564.105(2), the design, construction and*
28 *operation of the proposed facility, taking into account mitigation:*

29
30 *(a) Are consistent with the protection and conservation program, if any, that the*
31 *Oregon Department of Agriculture has adopted under ORS 564.105(3); or*

32
33 *(b) If the Oregon Department of Agriculture has not adopted a protection and*
34 *conservation program, are not likely to cause a significant reduction in the*
35 *likelihood of survival or recovery of the species; and*

36
37 *(2) For wildlife species that the Oregon Fish and Wildlife Commission has listed as*
38 *threatened or endangered under ORS 496.172(2), the design, construction and*
39 *operation of the proposed facility, taking into account mitigation, are not likely to*
40 *cause a significant reduction in the likelihood of survival or recovery of the species.*
41

1 **Findings of Fact**

2
3 The Threatened and Endangered Species standard requires the Council to find that the design,
4 construction, and operation of the proposed facility is not likely to cause a significant reduction
5 in the likelihood of survival or recovery of a fish, wildlife, or plant species listed as threatened or
6 endangered by Oregon Department of Fish and Wildlife (ODFW) or Oregon Department of
7 Agriculture (ODA). For threatened and endangered plant species, the Council must also find
8 that the proposed facility is consistent with an adopted protection and conservation program
9 from ODA. Threatened and endangered species are those listed under ORS 564.105(2) for plant
10 species and ORS 496.172(2) for fish and wildlife species. For the purposes of this standard,
11 threatened and endangered species are those identified as such by either ODA or the Oregon
12 Fish and Wildlife Commission.³⁸⁸

13
14 The Council’s Fish and Wildlife Habitat and T&E standards do not implement federal
15 requirements. There is not a Council standard authorizing Council to impose or enforce
16 regulations related to federally listed T&E species listed under 16 USC Section 1533. ODFW
17 could make recommendations under its Fish and Wildlife Habitat Mitigation Policy based on
18 information about federally-listed T&E species, which would then be implemented through the
19 Council’s standard. Federal wildlife laws must be adhered to by the applicant, which are under
20 the jurisdiction and authority of the United State Fish and Wildlife Service (USFWS).

21
22 The analysis area for threatened or endangered plant and wildlife species was established in
23 the second amended project order as the area within and extending ½-mile from the site
24 boundary. The applicant’s assessment of the proposed facility’s compliance with the
25 Threatened and Endangered Species standard is included in ASC Exhibit Q.

26
27 The methodology for conducting desktop research, field surveys, analyzing potential facility
28 impacts, and developing appropriate mitigation under the Threatened and Endangered Species
29 standard broadly followed the same approach as described above in Section IV.H., *Fish and*
30 *Wildlife Habitat*. The applicant first conducted a literature and database review to identify
31 threatened or endangered species that could be present in the analysis area, then conducted
32 field surveys to identify species and habitat, and then conducted an impact assessment and
33 developed mitigation measures including a Fish and Wildlife Habitat Mitigation plan (HMP)
34 (Attachment P1-6).³⁸⁹

35
36 Based on the desktop reviews, database searches, and consultation with agencies, the applicant
37 identified a list of state-listed threatened or endangered species that are potentially present in
38 the analysis area, and for which field surveys and additional assessment were conducted. These

³⁸⁸ Although the EFSC standard does not address federally-listed threatened or endangered species, certificate holders must comply with all applicable federal laws, including laws protecting those species, independent of the site certificate. [See public comment Wehrle, S., Antell, K., et al.](#)

³⁸⁹ B2HAPPDoc3-34 ASC 17_ Exhibit Q_TES Plant_Animal_ASC 2018-09-28, Section 3.2.

1 species include two mammals (Washington ground squirrel and wolverine), one fish (Snake
2 River spring/summer chinook salmon), and eight plants.

3

4 *Field Survey Methods and Initial Desktop Review*

5

6 The applicant first conducted searches of multiple databases in order to identify endangered
7 and threatened species that could occur within the analysis area. The applicant also consulted
8 ODFW, Oregon Department of Agriculture, and federal land management agencies in order to
9 gather existing information regarding the potential location and previous recorded instances of
10 threatened or endangered species and their habitats. The list of databases reviewed by the
11 applicant are included in ASC Exhibit Q. Based on the initial database review and agency
12 consultations, the applicant conducted a GIS exercise to overlay the proposed facility, the
13 analysis area, previous locations of known occurrences, and habitat. Wildlife species were
14 considered potentially present if there was a previous known occurrence within the analysis
15 area, or if the species range and suitable habitat overlapped with the analysis area. Plant
16 species were considered potentially present if their range and suitable habitat overlapped with
17 a five-mile distance from the site boundary, or if the species was previously identified with five
18 miles of the site boundary. The applicant explains in ASC Exhibit Q that a larger identification
19 distance was used than the analysis area due to a high level of uncertainty in existing databases
20 regarding plant locations. For fish species, potential fish-bearing streams that crossed the
21 analysis area were considered for additional study.³⁹⁰

22

23 As further described in Section IV.H, *Fish and Wildlife Habitat*, as well as in Exhibit Q, the
24 applicant prepared a ~~Biologist-Biological~~ Survey Work Plan to guide field surveys that would be
25 used in support of the application. The Plan was reviewed by both federal and state agencies,
26 including the Department, ODFW, BLM, US Forest Service, US Fish and Wildlife Service, and
27 NOAA Fisheries Service.

28

29 *Field Surveys*

30

31 The applicant conducted field surveys in the analysis area for threatened or endangered species
32 and associated habitats between 2014 and 2016. A summary of field surveys conducted for
33 threatened or endangered species and habitats is shown on Table TE-1, *Field Surveys Related to*
34 *Threatened or Endangered Species*, (recreated from ASC Exhibit Q, Table Q-1). It is important to
35 note that, as also described in Section IV.H., *Fish and Wildlife Habitat*, and in Section III.D.,
36 *Survey Data Based on Final Design and Site Access*, the applicant has not and does not have
37 access to all land proposed to be included in the site boundary. The proposed facility would cross
38 both public and private land; field surveys have been conducted on all public land, but on
39 privately-owned land, not all landowners granted survey access to the applicant. As such,
40 segments of the route have not been fully surveyed for threatened or endangered species and
41 habitats, and cannot be surveyed until site access is either secured or granted. However, as

³⁹⁰ B2HAPPDoc3-34 ASC 17_Exhibit Q_TES Plant_Animal_ASC 2018-09-28, Section 3.2.1.

1 described in III.D., *Survey Data Based on Final Design and Site Access*, the Council's statutes
 2 allow proposed conditions in this order ensure compliance with the applicable Council
 3 standards via site certificate conditions requiring Department review and approval of future
 4 information associated with the construction of a phase or segment of the proposed facility.
 5

6 ASC Exhibit Q includes three figures (figures Q-1, Q-2, and Q-3) that show where specific
 7 surveys have been conducted for threatened or endangered species and where surveys have
 8 not been conducted due to site access limitations or seasonal unavailability to survey.

9 Additionally, specific species surveys are only necessary in areas where those species have
 10 potential to occur and be impacted by the proposed facility; for example, Washington ground
 11 squirrel and its habitat, a state-listed endangered species, only occurs west of the Blue
 12 Mountains in specific habitat type in Umatilla and Morrow counties. As shown on ASC Exhibit Q,
 13 Figure Q-1, field surveys for Washington ground squirrel have occurred, or are planned to occur
 14 (once site access is granted for a phase or segment of the facility), for all areas along the site
 15 boundary where the habitat and species could occur in Umatilla and Morrow counties.
 16

Table TE-1: Field Surveys Related to Threatened or Endangered Species

Survey Name	Total Area Requiring Surveys (acres)	Surveys Completed to Date (acres / date)	Future Survey Efforts
Washington ground squirrel	18,263	1,757 / May 2014	Applicant will perform pre-construction WAGS surveys of all previously surveyed and unsurveyed areas of ground squirrel habitat within the three years prior to scheduled construction.
T&E Plant Survey	22,904	14,727 / June 2016	Applicant will perform pre-construction T&E plant surveys of all previously surveyed and unsurveyed areas with potential habitat and where species were previously observed and/or areas with known occurrences.
Terrestrial Visual Encounter Survey	22,904	15,331 / June 2016	Applicant will survey all previously unsurveyed parcels prior to construction.
Fish Presence and Crossing Assessment Surveys	Not Applicable	Not Applicable / August 2016	Applicant will survey all previously unsurveyed parcels prior to construction.

17
 18 As described in Section IV.H., *Fish and Wildlife Habitat* and in Section III.D., *Survey Data Based*
 19 *on Final Design and Site Access*, of this order, the applicant represents that it would 1) conduct

1 additional field surveys on those portions of the site boundary where site access has restricted
 2 surveys at the time of application (pASC and ASC), and 2) conduct field surveys for specific
 3 species on the entirety of the site boundary, regardless of whether surveys have been
 4 conducted on those areas or not (due to site access or other restrictions). The Department’s
 5 recommended Fish and Wildlife Habitat Condition 15 would require surveys on those areas not
 6 surveyed at the time of site certificate application, and Fish and Wildlife Condition 15 would
 7 require field surveys for specific species in areas where these species are anticipated or
 8 potential to occur, regardless of whether those areas have been surveyed at the time of
 9 application: Washington ground squirrel, raptor nests, and state-listed threatened and
 10 endangered plant species. With the imposition of these two conditions, the entirety of the
 11 proposed site boundary would be surveyed prior to construction (once site access has been
 12 gained), and for some species and habitats, multiple surveys ~~will~~would have been conducted.

13
 14 *Identified Species*

15
 16 Table TE-2 (recreated from ASC Exhibit Q, Table Q-3) lists those species, their listed status
 17 (threatened or endangered) and the documented use of the analysis area based on both
 18 database searches and field surveys.

Table TE-2: State-listed Threatened or Endangered Species Potentially Present in Analysis Area

Common Name <i>Scientific Name</i>	State Status	Documented Use of Analysis Area ¹
WILDLIFE		
Wolverine <i>Gulo</i>	Threatened	No records in existing databases. Not found during surveys. Potential habitat in analysis area.
Washington Ground Squirrel <i>Urocitellus washingtoni</i>	Endangered	Multiple records in existing databases, mostly along the Boardman Bombing Range; three active colonies identified in the analysis area during surveys.
FISH		
Snake River Spring/Summer Chinook Salmon <i>Oncorhynchus</i> <i>tshawytscha</i>	Threatened	ORBIC record in the Grande Ronde River. Current literature states that this species occurs in streams or drainages within the analysis area.

Table TE-2: State-listed Threatened or Endangered Species Potentially Present in Analysis Area

Common Name Scientific Name	State Status	Documented Use of Analysis Area¹
PLANTS		
Cronquist's Stickseed <i>Hackelia cronquistii</i>	Threatened	Eleven occurrences within the analysis area in Malheur County, based on BLM and ORBIC databases, as well as observations from 2012, 2013, and 2016 field surveys. Estimated 877 acres and 9,833 individuals within the analysis area.
Howell's Spectacular Thelypody <i>Thelypodium howellii</i> ssp. <i>spectabilis</i>	Endangered	One ORBIC occurrence in Union County within the analysis area. Not found during surveys. Estimated 40 acres and 1,000 individuals within the analysis area, based on a 1995 field visit reported by ORBIC. More recent field visits were made from the roadside, where only a few individuals were observed.
Lawrence's Milkvetch <i>Astragalus collinus</i> var. <i>laurentii</i>	Threatened	Three occurrences within the analysis area in Morrow and Umatilla counties, based on ORBIC database and observations from 2016 surveys in Umatilla County. Estimated 3 acres and 61 individuals within the analysis area.
Mulford's Milkvetch <i>Astragalus mulfordiae</i>	Endangered	Two occurrences within the analysis area in Malheur county, based on BLM and ORBIC databases and observations from 2016 surveys. Estimated 173 acres and 4,753 individuals within the analysis area.
Oregon Semaphore Grass <i>Pleuropogon oregonus</i>	Threatened	No existing database records or survey observations within the analysis area. Closest known occurrence is 0.2 mile away from the analysis area.
Smooth Mentzelia <i>Mentzelia mollis</i>	Endangered	No existing database records or survey observations within the analysis area. Closest known occurrence is 0.2 mile away from the analysis area.

Table TE-2: State-listed Threatened or Endangered Species Potentially Present in Analysis Area

Common Name <i>Scientific Name</i>	State Status	Documented Use of Analysis Area ¹
Snake River Goldenweed <i>Pyrrocoma radiata</i>	Endangered	Four occurrences within the analysis area in Baker County, based on BLM and ORBIC databases, as well as observations from 2012, 2013, and 2016 field surveys. Estimated 500 acres and 12,155 individuals within the analysis area.
Sterile Milkvetch (a.k.a. Cusick's Milkvetch) <i>Astragalus cusickii var. sterilis</i>	Threatened	No existing database records or survey observations within the analysis area. Closest known occurrence is nearly 5 miles west of the analysis area.

1

2 *Potential Impacts to Identified Threatened and Endangered Species*

3

4 The applicant describes potential impacts to identified threatened and endangered species
 5 from the proposed facility in ASC Exhibit Q, section 3.4.2. The Department describes the
 6 potential impacts here, as well as proposed and recommended mitigation measures to reduce
 7 impacts. ODFW commented on the record of the ASC regarding potential facility impacts to
 8 state-listed fish and wildlife species; those comments are referenced in this section. The Oregon
 9 Department of Agriculture is responsible for managing and conserving state-listed threatened
 10 and endangered plant species in Oregon; however, ODA did not respond to requests for review
 11 and comment on the ASC. ODFW provided comments on many of the draft management plans
 12 referenced in this section, including the draft Habitat Mitigation Plan (Attachment P1-6),
 13 Noxious Weed Plan (Attachment P1-5), and draft Reclamation and Revegetation Plan
 14 (Attachment P1-3). These comments have been addressed in Section IV.H., *Fish and Wildlife*
 15 *Habitat* above and are not repeated in this section.

16

17 A number of recommended site certificate conditions included in Section IV.H., *Fish and*
 18 *Wildlife Habitat* would also provide protection and mitigation related to threatened or
 19 endangered species. Specific conditions are referenced in the analysis that follows, as
 20 applicable.

21

22 **Wolverine**

23

24 As noted in Table TE-2, *State-listed Threatened or Endangered Species Potentially Present in*
 25 *Analysis Area*, while there are no known documented occurrences of wolverines in the analysis
 26 area, and no individuals were noted during facility-specific field surveys, ASC Exhibit Q, notes
 27 that there is potential habitat in the analysis area specifically in Union County (in the Blue
 28 Mountains). Additionally, it is stated that due to the species large home ranges and dispersal
 29 distances, and the potentially suitable habitat, the applicant concludes that wolverines may
 30 occur in the analysis area.

Direct impacts to wolverines is highly unlikely during construction or operation of the facility due to anticipated lack of high numbers of species in the area, but also because the species, if present in the analysis area, is likely to avoid construction of the facility due to noise and other disturbance. The applicant also notes that in the area that is likely potential wolverine habitat, the proposed facility would roughly parallel I-84, which is an existing disturbance on the landscape that wolverine likely already avoids and that causes an existing barrier to the species movement.³⁹¹

The proposed facility could cause an indirect impact to wolverine mostly from removal of, and alteration of, potentially suitable habitat. However, as noted, the proposed facility roughly parallels I-84 in the area of potential wolverine habitat in Union County. Following completion of construction, while there would remain a cleared corridor for the transmission line and access roads, areas of temporary impact would be restored. Additionally, operation of the facility would require only infrequent maintenance inspections. It is possible that, if present in the area, wolverines could cross the transmission line corridor.³⁹²

Washington Ground Squirrel

As noted in Table TE-2, *State-listed Threatened or Endangered Species Potentially Present in Analysis Area*, Washington ground squirrel (WAGS), a state-listed endangered species, is present in the analysis area. In addition~~a~~ to records of the species occurring in the analysis area, facility-specific field surveys identified three active WAGS colonies in Morrow County on or adjacent to the NWSTF Boardman. As described in Section IV.H., *Fish and Wildlife Habitat*, active WAGS burrows and an associated 785-foot buffer around the active burrows are considered habitat Category 1 by ODFW, and as such, cannot be impacted in accordance with the EFSC Fish and Wildlife Habitat standard. Additionally, 4,921 feet (1,500 meters) beyond the Category 1 habitat is considered Category 2 habitat, if in suitable WAGS habitat and not otherwise a break in habitat.³⁹³ Habitat breaks include certain roads, active agriculture fields, and other development features. As described in Exhibit Q (and Exhibit P), large areas of potential WAGS habitat have not been surveyed due to site access restrictions and route changes in Umatilla and Morrow counties. The ODFW comment on the ASC confirmed that areas of active agriculture are not WAGS habitat due to ground disturbance from farming precluding occupancy of WAGS.³⁹⁴

The proposed facility could impact WAGS through direct mortality during construction, and through both temporary and permanent habitat impacts. As is described in Section IV.H., *Fish and Wildlife Habitat*, impacts to Category 1 habitat are not allowed and must be avoided, and

³⁹⁴ B2HAPPDoc13-21 ASC Reviewing Agency Comment ODFW_Reif 2019-01-25.

1 impacts to Category 2 habitat are allowed if appropriate mitigation is implemented, including
2 compensatory mitigation in the form of “no net loss plus net benefit.” In order to determine
3 the extent of WAGS habitat, the applicant would be required to conduct pre-construction field
4 surveys to identify active WAGS burrows and associated Categories 1 and 2 habitat. The ODFW
5 comment on the record of the ASC also confirmed that all areas of potential WAGS habitat
6 need to be re-surveyed, even if previously surveyed, as WAGS surveys are only valid for three
7 years.³⁹⁵

8
9 Recommended Fish and Wildlife Habitat Condition 15 would require these surveys and
10 associated reporting requirements be met as a pre-construction condition of the site certificate.
11 Additionally, the applicant has proposed a habitat mitigation plan (HMP), which is included as
12 Attachment P1-6 to this order, which must be finalized, approved, and implemented prior to
13 facility construction. As described in that plan, the applicant ~~will~~would microsite the facility in
14 order to avoid Category 1 habitat based on pre-construction surveys for WAGS. As described in
15 Section III., *Description of the Proposed Facility*, on the west side of Bombing Range Road, the
16 removal of the existing BPA 69 kV transmission line would be done in manner to reduce impacts
17 to WAGS habitat. The removal work would be accomplished either by hand-crews on foot, or by
18 using helicopters to remove the structures without ground disturbance, or by cutting off poles
19 but leaving foundations in place.³⁹⁶

20
21 The HMP estimates 22.4 acres of Category 2 WAGS habitat would be impacted by facility
22 construction, of which 2.7 acres would be permanent and 19.7 acres would be temporary (and
23 restored after facility construction consistent with Attachment P1-3, Reclamation and
24 Revegetation Plan). However, as described in Section III.D., *Survey Data Based on Final Design
25 and Site Access*, these numbers would be finalized upon final design and after site access is
26 granted for a phase or segment of the proposed facility, when field surveys can be conducted
27 along the entire route in potential WAGS habitat. As is further described in Section IV.H., *Fish
28 and Wildlife Habitat*, compensatory mitigation would be required for permanent impacts and
29 temporary impacts that are not expected to recover within approximately two years (typically,
30 this includes grasslands habitats). As such, the compensatory mitigation obligation for WAGS
31 habitat may not be 22.4 acres plus a net benefit, and the exact mitigation obligation ~~will~~would
32 be finalized prior to construction based on pre-construction field surveys and in accordance
33 with the HMP. However, the applicant has identified potential compensatory mitigation
34 projects in the HMP that could provide sufficient mitigation credit to account for any required
35 mitigation obligations for facility impacts. Specific to WAGS habitat, the HMP identifies a
36 potential compensatory mitigation project called the “Olex” site that potentially offers
37 approximately 1,400 acres of available mitigation, and while it is stated in the HMP that not all
38 the site is available for mitigation, the Department notes that the expected mitigation
39 obligation for WAGS Category 2 habitat is likely available at the Olex property or other similar
40 types of properties in the area.

³⁹⁵ Id.

It is noted in ASC Exhibit Q that during operation, the facility could cause an impact to WAGS if the transmission lines are used as perching habitat by raptors and ravens, which are known to predate on WAGS and other small mammals. However, as discussed above, in the area along the NWSTF Boardman, the proposed facility would largely replace an existing BPA transmission line and would not be a “new” perching opportunity for birds; additionally, field surveys in support of the ASC conducted along NWSTF Boardman identified active WAGS burrows under the existing BPA transmission line.³⁹⁷

The applicant proposes a condition related to protection of WAGS habitat to clarify that no ground-disturbing actions can occur in Category 1 WAGS habitat. Sub(b) of the recommended condition would allow actions in Category 1 habitat that do not cause ground-~~disturbing~~disturbance; this is particularly related to removing the existing BPA 69 kV transmission structure on NWSTF Boardman, which as described in this order and in Exhibit Q, is located in WAGS habitat with active WAGS burrows underneath the existing transmission line. ~~Sub(c)...~~The existing structures would be removed by hand-crews or by helicopter, cutting poles off at the base and not digging up foundations, eliminating anyreducing ground disturbance.

Category 1 habitat would be established during pre-construction field surveys as required by recommended Fish and Wildlife Condition 16. Results of those surveys, which must be conducted in accordance with an ODFW-approved WAGS survey protocol, would be considered valid for three years. After three years, if facility construction is not complete in areas of WAGS suitable habitat, additional protocol-level WAGS surveys would be required to confirm habitat categorization. Within three years of the protocol-level WAGS surveys, during facility construction, if an occupied WAGS colony is discovered, the applicant may rely on its survey results for habitat categorization and its mitigation obligation. In other words, the applicant is not required to continue updating the habitat categorization and the associated mitigation obligation based on changes in habitat conditions within the three year time period following date of protocol-level survey. However, in the unexpected event of habitat quality changes, the applicant must propose avoidance, minimization, and mitigation actions to the Department and ODFW for review and approval. The Department has clarified this process in (c) of recommended Threatened and Endangered Species Condition 1.³⁹⁸

~~The applicant has proposed, and t~~The Department recommends that Council include Threatened and Endangered Species Condition 1 in the site certificate, as follows:

Recommended Threatened and Endangered Species Condition 1: During construction, the certificate holder shall not conduct ground-disturbing activities within Category 1 Washington ground squirrel (WAGS) habitat, subject to the following:

³⁹⁷ B2HAPPDoc3-34 ASC 17_ Exhibit Q_TES Plant_Animal_ASC 2018-09-28, Section 3.4.2.1.

³⁹⁸ B2HAPPDoc8-013 DPO Agency Comment ODFW Refi 2019-08-21

- 1 a. The identification and categorization of WAGS habitat shall be based on the surveys
2 referenced in Fish and Wildlife Condition 16 and the results of the surveys shall
3 apply for up to three years.
- 4 b. The certificate holder may span Category 1 WAGS habitat and may work within
5 Category 1 WAGS habitat, provided such work does not cause any ground
6 disturbance.
- 7 c. The results of the surveys completed per Fish and Wildlife Condition 16 shall remain
8 valid for 3 years. If, during construction and within three years of the protocol
9 survey, an occupied WAGS colony is encountered ~~in non-Category 1 habitat (based~~
10 ~~on the surveys referenced in Fish and Wildlife Condition 16), the habitat category~~
11 identified during the protocol survey shall remain valid (i.e. habitat not considered
12 Category 1); the certificate holder shall submit to the ~~D~~ department for its approval,
13 in consultation with ODFW, a notification addressing the following:
 - 14 i. Location of the burrow or colony; and
 - 15 ii. Any actions the certificate holder will take to avoid, minimize, or mitigate impacts
16 to the colony.

17
18 In addition, recommended Fish and Wildlife Condition 7 would require the certificate holder to
19 flag Category 1 habitat as an environmentally sensitive restricted work zone. Flagging ~~will~~would
20 provide on-the-ground notice to construction workers that the Category 1 area cannot be
21 impacted, in accordance with the findings presented here.

22 23 **Snake River Spring/Summer Chinook Salmon**

24
25 The applicant has identified one state-listed threatened fish species with the potential to occur
26 in the analysis area, the Snake River spring/summer chinook salmon evolutionarily significant
27 unit (ESU). The species may be present in the Grande Ronde River. As described in Exhibit Q,
28 the Grande Ronde River provides migration and rearing corridor for the species, but is not
29 considered a spawning area. Tributaries of the Grande Ronde River are also not considered
30 habitat for the species. Exhibit Q, Table Q-5 lists the potential crossings of the Grande Ronde by
31 the proposed facility; as shown in the table, the proposed transmission line route and the
32 Morgan Lake alternative would both cross the Grande Ronde River. Additionally, a proposed
33 new access road would cross an unnamed stream that is not fish-bearing, but is within 600 feet
34 upstream distance from the Grande Ronde River and as such, is considered in the Exhibit Q
35 impact assessment.

36
37 The applicant conducted and submitted a detailed Fish Habitat and Stream Crossing
38 Assessment Report (ASC Exhibit P, Attachment P1-7B). The report documents the assessment
39 the applicant conducted to determine the habitat of streams crossed by the proposed facility,
40 and potential fish presence in those streams. Additionally, the report describes measures that
41 the applicant would take to reduce potential impacts to streams and waterways crossed by the
42 proposed facility. While the report was included as an attachment to Exhibit P of the ASC and is
43 primarily focused on demonstrating compliance with the Council's Fish and Wildlife Habitat

1 standard, it is also used to document the assessment conducted by the application to
2 demonstrate compliance with the Council's Threatened and Endangered Species standard.

3
4 As described in ASC Exhibit Q, the proposed facility may impact waterways (including the
5 Grande Ronde River, habitat for the Snake River spring/summer chinook salmon) in multiple
6 ways, including riparian vegetation removal, removal of a source of large wood and organic
7 inputs, increased turbidity and sedimentation from soil disturbance that migrates into the
8 waterway, barriers to fish passage (associated with roads, not transmission line spanning), and
9 potential spills of hazardous or toxic materials during construction that migrates into the
10 waterway. Potential impacts to waterways and avoidance measures are described in additional
11 detail in Exhibit Q, Section IV.H., *Fish and Wildlife Habitat*, and Section IV.Q.4., *Fish Passage*, of
12 this order. The transmission line crossing at the Grande Ronde River would involve removal of
13 riparian vegetation including trees. Removal of vegetation and trees also slightly reduces the
14 availability of large wood and organic material that could fall into the river. Riparian vegetation
15 loss impacts waterways in multiple ways, including an increased potential for streambank
16 erosion and a reduction in streamside shade, which could affect water temperature particularly
17 during summer. ASC Exhibit Q describes that salmon in particular rely upon cooler water and
18 that increased temperature can adversely impact the species.

19
20 ASC Exhibit Q Table Q-5 shows that the applicant estimates that the crossing of the Grande
21 Ronde River could result in up to 0.88 acres of impact to forested riparian habitat for the
22 proposed route, and 0.68 acres of impact to forested riparian habitat for the Morgan Lake
23 alternative route. While areas of temporary impact would be restored after facility
24 construction, there would remain areas of permanent disturbance that would require
25 compensatory mitigation in accordance with the HMP, as described in Section IV.H *Fish and*
26 *Wildlife Habitat* of this order. No tall trees would be allowed to grow under or near the
27 transmission line, which would cause a permanent reduction in shade trees along the Grande
28 Ronde River as well as a source of large wood and organic matter available to the river.
29 However, following restoration, lower-height vegetation including shrubs and bushes will
30 provide some shade cover and a source of organic material. While there is anticipated to be a
31 reduction of shade cover, large wood, and organic material associated with construction of the
32 facility and long-term vegetation clearance of tall trees, the impact would be localized and
33 focus on the single area of the transmission line crossing on the Grande Ronde River.

34
35 Increased turbidity and sedimentation could result from the construction of the transmission
36 line crossing of the Grande Ronde River, as well as the construction of an access road along an
37 unnamed and non-fish bearing stream but that is within 600 feet of the river. The applicant
38 references studies that show that increased sedimentation is only likely to occur within 600 feet
39 downstream of a project impact, and as such, the area of impact is anticipated to be limited to
40 that 600 feet downstream zone. This 600 foot buffer was used by the applicant to consider
41 potential facility impacts from sedimentation and increased turbidity on fish-bearing streams
42 such as the Grande Ronde River.

1 Sedimentation and erosion, and in turn, turbidity, would be reduced and managed in multiple
2 ways. Specifically, the applicant would be required to comply with a 1200-C NPDES permit,
3 which includes an erosion and sediment control plan (ESCP) (See Attachment I-3 to this order).
4 The NPDES and ESCP compliance is described in Section IV.D., *Soil Protection* standard section
5 of this order. Additionally, there are measures included in the Reclamation and Revegetation
6 Plan (Attachment P1-3), Vegetation Management Plan (Attachment P1-4), and Spill Prevention
7 and Control and Countermeasure Plan (Attachment G-4) that would all further guide and
8 manage reduction of sediment and erosion, as well as revegetation, further reducing potential
9 impacts from sedimentation and turbidity to waterways.

10
11 It is possible that if spilled or otherwise released, toxic or hazardous materials could migrate to
12 waterways and cause an adverse impact to the habitat and listed fish species. However,
13 compliance with the Recommended Soil Protection Condition 2 and the Spill Prevention and
14 Control Plan (Attachment G-4), as well as compliance with measures included in the Removal-
15 Fill permit related to wetlands and waterways impacts as reflected in Recommended Removal
16 Fill Conditions 5 and 6, ~~will~~would help reduce and manage potential spills and control releases
17 if such accidental spills do occur.

18
19 ODFW fish passage requirements apply to actions by developers that would potentially cause a
20 restriction on the movement of fish on a waterway; typically, this means that roads crossing
21 fish-bearing streams must include adequate fish passage design such as appropriately-designed
22 culverts. The applicant has requested Council approval of the fish passage requirements, and
23 this is discussed in Section IV.Q.4., *Fish Passage*, of this order. The single crossing of the Grande
24 Ronde River is by the transmission line and as such, fish passage requirements would not affect
25 listed fish species.

26 27 **Plant Species**

28
29 The applicant has identified five state-listed threatened or endangered plant species that are
30 likely to occur in the analysis area based on historic database records and facility-specific field
31 surveys; Cronquist's stickseed, Howell's spectacular thelypody, Lawrence's milkvetch, Mulford's
32 milkvetch, and Snake River goldenweed. Three additional threatened or endangered plant
33 species were identified during pre-survey reviews by the applicant as either possibly occurring
34 or as having suitable habitat in the analysis area; of these, two species, Oregon semaphore
35 grass and smooth mentzelia have no records of occurring in the analysis area and were not
36 found during field surveys, but do have suitable habitat in the analysis area and recorded
37 occurrences 0.2 miles from the analysis area. The third species, Sterile milkvetch or Cusick's
38 milkvetch has no known occurrences in the analysis area, was not found during field surveys,
39 and the closest document occurrence is five miles from the analysis area. As such, the proposed
40 facility is not expected to impact the Sterile milkvetch.

41
42 The applicant's assessment of surveys results and anticipated impacts is included in Exhibit Q,
43 Section 3.4.2.3. The applicant describes that occurrences of plant species are considered
44 "separate" occurrences if greater than one kilometer (0.6 miles) apart, and considered the

1 same occurrence if less than 1 km distance. Maps showing the location of the five species with
2 historical records or field-identified occurrences in the analysis area are shown on ASC Exhibit
3 Q, Figures Q-4 to Q-8.³⁹⁹

4
5 The applicant's impact analysis to each plant species with historic or field-verified occurrences
6 in the analysis area is included in a series of tables in Exhibit Q. It is noted that not all areas of
7 the proposed facility have been field-surveyed, due to site access restrictions.

8
9 As shown in ASC Exhibit Q, Howell's spectacular thelypody and Lawrence's milkvetch are not
10 anticipated to occur within the disturbance footprint of the proposed facility and as such,
11 would not be expected to be directly impacted by the facility. One occurrence of the
12 Cronquist's stickseed may be present in the disturbance footprint of the facility and possibly
13 impacted, but it is estimated by the applicant that less than 0.01 acre of disturbance and one
14 plant may be impacted by the facility impact, which in this case would involve constructing an
15 access road. The applicant estimates that one occurrence of the Mulford's milkvetch may occur
16 in the disturbance footprint and be impacted by the facility, but this impact would be
17 anticipated to be approximately 0.1 acres and a total of 52 plants. The applicant estimates that
18 there are approximately 1,313 acres of occurrences of the Mulford's milkvetch. As noted above,
19 two other species, Oregon semaphore grass and smooth mentzelia are not known to occur in
20 the analysis area (or disturbance footprint) and are not anticipated to be directly impacted by
21 the facility.

22
23 Snake River goldenweed is more prevalent than other listed plant species in the analysis area
24 and direct disturbance footprint of the facility. The applicant estimates that the facility could
25 impact up to 2.4 acres of occurrence of the species, and approximately 1,131 individual plants.
26 However, the applicant also states that the total rangewide occurrences of the species include
27 approximately 5,779 acres, and an impact of 2.4 acres represents 0.04 percent of the occupied
28 habitat. The species occurs along the Baker/Malheur county border region, near the
29 communities of Huntington and Lime. In this area, the proposed transmission line follows
30 closely to I-84. Locating close to the freeway reduces impacts to other resources in this area,
31 specifically sage grouse and sage grouse habitat. Avoiding the Snake River goldenweed
32 occurrences in this area would involve a trade-off in impacts, likely to sage grouse habitat.

33
34 In addition to direct impacts to individual species and habitats, the applicant describes in
35 Exhibit Q that there could be indirect impacts to rare plant species, including habitat
36 fragmentation, introduction of noxious weeds, potential for fire, change in vegetation

³⁹⁹ The second amended project order and ASC Exhibit E note that if action on state-managed public land that could significantly impact state-listed plant species may require a permit ("public land action permit"), or, consultation with the Oregon Department of Agriculture. As is shown in ASC Exhibit Q, no state-listed threatened or endangered plant species are anticipated to occur on state-managed land in the analysis area. As such, the public land action permit is not required and additional consultation with the Oregon Department of Agriculture is not required for the proposed facility.

1 community, or dust deposition during construction. These indirect impacts would be common
2 to all plants.

3
4 The applicant proposes a number of mitigation measures to reduce potential impacts to rare
5 plants. Specifically, as described in Section IV.H, *Fish and Wildlife Habitat*, recommended Fish
6 and Wildlife Condition 16 would require preconstruction field surveys for a number of species
7 and habitat, including threatened and endangered plants. The surveys for threatened and
8 endangered plants would occur prior to construction on the entire route of the proposed
9 facility, including those areas that have been previously surveyed in connection with the
10 application, in areas of known or anticipated occurrences of the plant species. This survey
11 information would be used to microsite facility components, to the extent possible, to avoid
12 direct impacts to resources includinge threatened and endangered plants. Additionally, the
13 certificate holder would be required to implement measures including a plan (Attachment P1-5
14 Noxious Weed Management Plan) to reduce the introduction and spread of noxious weeds.
15 While reducing the introduction and spread of noxious weeds is important to protect native
16 including rare plant species, herbicide used to control weeds can also impact desirable species
17 such as rare plants and native plants.

18
19 In order to reduce impacts to rare plant species, the applicant proposes the following site
20 certificate condition, which the Department recommends Council implement, with minor edits.

21
22 **Recommended Threatened and Endangered Species Condition 2:** During construction, the
23 certificate holder shall not conduct ground-disturbing activities within a 33-foot buffer
24 around threatened or endangered plant species, based on pre-construction field surveys
25 required per site certificate condition Fish and Wildlife Habitat 16, subject to the following:

- 26 a. If complete avoidance is not possible (for example, if the threatened or endangered
27 plant species is located within 33 feet of an existing road where upgrades are
28 authorized), the certificate holder shall install temporary construction mats over
29 soils where the threatened or endangered plant species have been observed and
30 where construction vehicles will be operated; and
31 b. If herbicides are used to control weeds, the certificate holder shall follow agency
32 guidelines including guidelines recommended by the herbicide manufacturer, in
33 establishing buffer areas around confirmed populations of threatened or
34 endangered plant species and refrain from using herbicides within those buffers.

35
36 Additionally, as would be required by Fish and Wildlife Condition 1, the applicant must finalize
37 and implement a Reclamation and Revegetation Plan (Attachment P1-3) which would require,
38 among other beneficial actions to rare plants, that site specific reclamation revegetation,
39 reseeding, and soil stabilization plans are developed for areas of disturbance with 100 feet of
40 identified occurrences of threatened or endangered plants. Additionally, as would be required
41 under the Reclamation and Revegetation Plan, site specific reclamation monitoring would be
42 required after construction in order that areas of temporary disturbance area be restored.

1 *Impact Assessment Conclusions*

2

3 The Council's Threatened and Endangered Species standard (OAR 345-022-0070) requires that
4 the design, construction and operation of a proposed facility, taking into account mitigation, is
5 consistent with the protection and conservation program that the Oregon Department of
6 Agriculture has adopted for any specific threatened or endangered plant species under ORS
7 564.105(3). In this case, the Oregon Department of Agriculture has not adopted a protection or
8 conservation program for any of the identified plant species.

9

10 As such, the EFSC standard for the threatened and endangered plant species identified in the
11 analysis area, and the threatened and endangered fish and wildlife species (wolverine,
12 Washington ground squirrel, and Snake River spring/summer chinook salmon), is that the
13 design, construction, and operation of the facility taking into account mitigation, is not likely to
14 cause a significant reduction in the likelihood of survival or recovery of the species.

15

16 Based on the analysis presented here, in consideration of the information in the record, the
17 Department recommends that subject to the recommended site certificate conditions, that the
18 Council conclude that the design, construction and operation of the proposed facility is not
19 likely to cause a significant reduction in the likelihood of survival or recovery of the species.

20

21 **Conclusions of Law**

22

23 Based on the foregoing findings of fact and conclusions of law, and subject to compliance with
24 the recommended site certificate conditions, the Department recommends that the Council
25 find that the proposed facility, including the proposed and alternative routes, complies with the
26 Council's Threatened and Endangered Species standard.

27 **IV.J. Scenic Resources: OAR 345-022-0080**

28

29 *(1) Except for facilities described in section (2), to issue a site certificate, the Council*
30 *must find that the design, construction and operation of the facility, taking into*
31 *account mitigation, are not likely to result in significant adverse impact to scenic*
32 *resources and values identified as significant or important in local land use plans,*
33 *tribal land management plans and federal land management plans for any lands*
34 *located within the analysis area described in the project order.*

35 ***

36 **Findings of Fact**

37

38 OAR 345-022-0080 requires the Council to determine that the design, construction and
39 operation of the proposed facility, taking into account mitigation, will not be likely to have a
40 "significant adverse impact" to any significant or important scenic resources and values in the
41 analysis area. In applying the standard set forth in OAR 345-022-0080(1), the Council assesses
42 the visual impacts of facility structures on significant or important scenic resources described in
43 "local land use plans, tribal land management plans and federal land management plans for any

1 lands located within the analysis area described in the second amended project order.” For
2 purposes of this rule, “local land use plans” includes applicable state ~~and federal~~ management
3 plans.⁴⁰⁰
4

5 The analysis area as described in the second amended project order, for Exhibit R is the site
6 boundary and 10 miles from the site boundary. The site boundary is defined as “the perimeter
7 of the site of a proposed energy facility, its related or supporting facilities, all temporary
8 laydown and staging areas, and all corridors and micrositing corridors proposed by the
9 applicant” (OAR 345-001-0010(55)).
10

11 Applicable Land Use Management Plans

12

13 The Council’s Scenic Resources standard requires an analysis of the proposed facility’s potential
14 visual impact to “scenic resources and values identified as significant or important in local land
15 use plans, tribal land management plans and federal land management plans for any lands
16 located within the analysis area described in the project order.” The analysis area is the site
17 boundary and 10 miles from the site boundary. The applicant evaluated multiple land use
18 planning documents and management plans to determine whether scenic resources were
19 identified as significant or important within the analysis area. The plans that were reviewed are
20 shown in ASC Exhibit R, Table R-1. The reviewed plans include the following:
21

- 22 • The comprehensive plans for the five counties crossed in Oregon: Morrow, Umatilla,
23 Union, Baker, and Malheur.
- 24 • Comprehensive plans for three counties in Idaho and one county in Washington that are
25 within the analysis area: Owyhee, Canyon, and Washington in Idaho, and Benton County
26 in Washington state.
- 27 • Comprehensive plans for multiple cities in Oregon that are within the analysis area:
 - Boardman
 - Lone
 - Hermiston
 - Pilot Rock
 - La Grande
 - Union
 - Haines
 - Huntington
 - Adrian
 - Irrigon
 - Umatilla
 - Stanfield
 - Pendleton
 - Island City
 - North Powder
 - Baker City
 - Vale

⁴⁰⁰ [The applicant asserts that the Council’s Scenic Resources standard applies to scenic resources and values identified as significant or important “in local land use plans, tribal land management plans, and federal land management plans.” The applicant explains that, based on the language in the standard, it does not appear that scenic resources managed through a state plan, such as a Corridor Management Plan, should automatically be covered under the standard, unless the scenic resource is also identified as significant or important in a local, tribal, or federal management plan. B2HAPPDoc13 DPO IPC Responses to Select DPO Comments Rec'd by 2019-11-07; B2HAPP DPO IPC Responses - ODOT Comments 2019-11-06.](#)

Identification and description of the scenic resources identified as significant or important in the applicable management plans

In order to identify significant or important scenic resources within the analysis area, ASC Exhibit R includes a detailed review of all applicable local, state, tribal, and federal plans for lands within the analysis area. ASC Exhibit R, Table R-1 lists each of the local, state, tribal, and federal plans the applicant evaluated, and the scenic resources identified as significant or important, if any, in each of those plans. Table SR-1, *Scenic Resources within Analysis Area*, below, lists the designated management plans that identify Scenic Resources potentially protected under OAR 345-022-0080. ~~that~~ The identified resources were evaluated by the applicant in ASC Exhibit R, and are assessed by the Department in this order.

Table SR-1: Scenic Resources within Analysis Area

Scenic Resource	Distance to Proposed Route	Designating Plan
Blue Mountain Forest Wayside (SR U1)	Crossed	Union County Comprehensive -Plan and Oregon Parks and Recreation Department
OR Highway 203 (SR B1)	3.3 miles	Baker County Comprehensive Plan
OR Highway 86 (SR B2)	Crossed	Baker County Comprehensive Plan
OR Highway 245 (SR B3)	7 miles	Baker County Comprehensive Plan
Interstate 84, Pleasant Valley Durkee area (SR B4)	Crossed	Baker County Comprehensive Plan
Interstate 84, Huntington to Baker/Malheur County line (SR B5)	0.2 mile	Baker County Comprehensive Plan
Hells Canyon Scenic Byway	Crossed	ODOT Hells Canyon Scenic Byway Management Plan
Grande Tour Route	0.2 miles	ODOT Grande Tour Route Management Plan
Powder River Canyon – Keating (VRM B2)	5.7 miles	BLM – Vale District, Baker Resource Area Management Plan
Burnt River Canyon (VRM B3)	Crossed	BLM – Vale District, Baker Resource Area Management Plan
Brownlee Reservoir West (VRM B7)	2.1 miles	BLM – Vale District, Baker Resource Area Management Plan
Oregon Trail ACEC – Blue Mountain Parcel (SR B6)	0.9 mile	BLM – Vale District, Baker Resource Area Management Plan
Oregon Trail ACEC – NHOTIC Parcel (SR B6)	0.02 mile	BLM – Vale District, Baker Resource Area Management Plan
Oregon Trail ACEC – White Swan Parcel (SR B6)	2.9 miles	BLM – Vale District, Baker Resource Area Management Plan
Oregon Trail ACEC – Straw Ranch 2 Parcel (SR B6)	1.1 mile	BLM – Vale District, Baker Resource Area Management Plan
Oregon Trail ACEC – Straw Ranch 1 Parcel (SR B6)	0.1 mile	BLM – Vale District, Baker Resource Area Management Plan
Oregon Trail ACEC – Powell Creek Parcel (SR B6)	1.2 mile	BLM – Vale District, Baker Resource Area Management Plan
Powder River Canyon ACEC and WSR (SR B7)	1.4 mile	BLM – Vale District, Baker Resource Area Management Plan
Oregon Trail ACEC – Birch Creek parcel (VRM M1)	0.2	BLM, Vale District, Malheur Resource Area Management Plan

Table SR-1: Scenic Resources within Analysis Area

Scenic Resource	Distance to Proposed Route	Designating Plan
Oregon Trail ACEC – Tub Mountain Parcel (VRM M2)	0.5 mile	BLM, Vale District, Malheur Resource Area Management Plan
Sugarloaf Butte (VRM M3)	1.6 mile	BLM, Vale District, Malheur Resource Area Management Plan
Five Points Creek (WSR1)	2.0 miles	BLM, Vale District, Malheur Resource Area Management Plan
Lower Owyhee River (VRM M5)	Crossed	BLM, Vale District, Malheur Resource Area Management Plan
Succor Creek (VRM M8)	3.9 miles	BLM, Vale District, Malheur Resource Area Management Plan
Jump Creek Canyon and Jump Creek ACEC (VRM O1)	4.9 mile (in State of Oregon)	BLM, Owyhee Resource Area Management Plan
Brownlee Reservoir Southeast (VRM C1)	0.6 mile	BLM, Boise District, Cascade Resource Area Management Plan
Brownlee Reservoir Northeast (VRM C2)	6.0 miles	BLM, Boise District, Cascade Resource Area Management Plan

OR 244 Corridor – Red Bridge East (VQO 4)	1.4 miles	USFW Wallowa Whitman National Forest Management Plan
Mt Emily (VQO 6)	5.2 miles	USFW Wallowa Whitman National Forest Management Plan
OR 203 Corridor – Catherine Creek (VQO 8)	8.0 miles	USFW Wallowa Whitman National Forest Management Plan

1

2 **County Plans**

3

4 The comprehensive plans, transportation plans, and land use ordinances for each of the
5 counties within the analysis area were reviewed, including counties outside Oregon but within
6 the proposed facility's analysis area. The counties are: Morrow, Umatilla, Union, Baker, and
7 Malheur counties in Oregon, Owyhee, Canyon, and Washington counties in Idaho, and Benton

1 County, Washington. Based on its evaluation, only Union and Baker county plans identify
2 significant or important scenic resources within the planning documents.⁴⁰¹

3
4 Union County has identified the Blue Mountain Forest Wayside and the Minam River as
5 important scenic resources in its comprehensive plan. The Blue Mountain Forest Wayside is
6 within the analysis area and, therefore, is evaluated below. The Minam River is located more
7 than 10 miles outside the analysis area, and therefore, is not evaluated. Union County has not
8 adopted specific applicable substantive criteria or zoning ordinances for either of these
9 resources that inform an evaluation of development criteria.

10
11 Baker County has identified several highway segments as scenic routes, and specifically
12 recognizes those routes as having particular significance for their scenic values. Those highway
13 segments include two locations along I-84; and segments along US Highway 26, Oregon State
14 Highway (OR) 245, OR 86, OR 203, OR 96 and the Halfway-Cornucopia Highway. Each of these
15 segments is at least partially within the analysis area and all are evaluated by the applicant in
16 Exhibit R and included in the Department's assessment below. Baker County has not adopted
17 specific applicable substantive criteria or zoning ordinances for either of these resources that
18 inform an evaluation of development criteria.

19
20 **City Plans**

21
22 The same review of land use management plans was conducted for each of the cities within the
23 analysis area. These cities include: Boardman, Irrigon, Lone, Umatilla, Hermiston, Stanfield, Pilot
24 Rock, Pendleton, La Grande, Island City, Union, North Powder, Haines, Baker City, Huntington,
25 Vale, and Adrian.⁴⁰² Only one city's planning documents identified important or significant
26 scenic resource. Specifically, the City of Pendleton identified the Umatilla River and its
27 tributaries as an important or significant scenic resource. ~~and, therefore, this was addressed in~~
28 ~~Exhibit R and is included in the Department's assessment.~~⁴⁰³ Pendleton is located at the
29 northern edge of the analysis area, and the distance between the proposed route and the
30 Umatilla River is at least 15 miles. Due to the distance between the proposed facility and the
31 scenic resource, no visual impact analysis was conducted for this resource and as such, is not
32 further evaluated in ASC Exhibit R or in the Scenic Resources section of this order.

33

⁴⁰¹ B2HAPPDoc3-35 ASC 18_Exhibit R_Scenic Resources_ASC 2018-09-28, Section 3.3.1.1.

⁴⁰² Morgan Lake Park is managed by the City of La Grande and is discussed further, including potential noise impacts, visual impact analysis, and condition requiring shorter H-frame towers for the proposed Morgan Lake alternative near the Park, in Section IV.L., Recreation of this order.

⁴⁰³ Id, Section 3.3.1.2.

1 **State Plans**

2
3 The Council’s Scenic Resources standard requires an evaluation of scenic resources and values
4 identified as significant or important in local land use plans, tribal land management plans and
5 federal land management plans as described in the project order. The second amended project
6 order issued by the Department explains that, “For the purposes of Exhibit R [scenic resources],
7 “local” land use plans include state, county, and city planning documents or inventories,”
8 therefore, the applicant provided an evaluation of state and city management plans in the ASC
9 and Errata.⁴⁰⁴ The applicant reviewed the management plans for the Oregon State Parks
10 system, State Wildlife Areas, State Scenic Waterways, and State Scenic Byways for significant or
11 important scenic resources identified within those plans.

12
13 Oregon State Parks System

14
15 Seven state parks or other areas within the Oregon State Park system and administered by the
16 Oregon Parks and Recreation Department (OPRD) are located within the analysis area, including
17 Emigrant Springs State Heritage Area, Blue Mountain Forest State Scenic Corridor, Hilgard
18 Junction State Recreation Area, Red Bridge State Wayside, Farewell Bend State Recreation
19 Area, Lake Owyhee State Park, and Succor Creek State Natural Area. OPRD has not included any
20 of those areas in a completed or draft land management plan. However, based on an OPRD
21 comment, the Blue Mountain State Scenic Corridor (which encompasses both the Blue
22 Mountain Forest State Scenic Corridor and the Blue Mountain Forest Wayside) are considered
23 by OPRD to be significant or important scenic resources based on the aesthetic quality of
24 contiguous old growth forest.⁴⁰⁵ The applicant has evaluated the proposed facility’s impact to
25 these resources in Exhibit R. Additionally, the Blue Mountain Forest Wayside is identified in the
26 Union County Comprehensive Plan as an important scenic resource. However, the Department
27 notes that in order to be considered a “scenic resource” for purposes of evaluation under the
28 EFSC Council’s Scenic Resources standard, a resources must be “identified as significant or
29 important in local land use plans, tribal land management plans, and federal land management
30 plans. Therefore, because the OPRD does not have a land management plan for the Blue
31 Mountain State Scenic Corridor or Blue Mountain Forest Wayside, a statement by OPRD
32 representatives that the areas are considered important scenic resources is not sufficient to
33 qualify for evaluation in the EFSC review process. However, the Blue Mountain Forest wayside
34 is considered important by Union County Comprehensive Plan, and so is evaluated further in
35 this section. The Blue Mountain Forest State Scenic Corridor is an EFSC Protected Area and is
36 further evaluated in Section IV.F, *Protected Areas*.

⁴⁰⁴ The Department notes that an evaluation of scenic resources identified as significant or important in local land use plans
(county plans) is already a requirement of the Council’s Scenic Resources standard.

⁴⁰⁵ Id., Section 3.3.1.3

1 State Wildlife Areas

2

3 Portions of five state wildlife areas managed by the Oregon Department of Fish and Wildlife
4 (ODFW) are located within the Exhibit R analysis area, including Columbia Basin - Coyote
5 Springs, Columbia Basin - Irrigon, Ladd Marsh, Elkhorn - Auburn, and Rogers. ODFW has
6 prepared management plans addressing the Elkhorn, Coyote Springs, and Ladd Marsh wildlife
7 areas. However, those plans do not discuss either scenic resources or the visual qualities of the
8 environment, either as an existing resource value or as a management objective for these
9 areas.

10

11 State Scenic Byways

12

13 As noted above, the second amended project order issued by the Department explains that
14 “local” land use plans include state and city planning documents or inventories for scenic
15 resources. Therefore, the applicant provided an evaluation of state management plans,
16 including the Oregon Department of Transportation (ODOT) managed scenic byways. The
17 Oregon Department of Transportation (ODOT) administers the Oregon Scenic Byways Program,
18 which includes 24 highway routes that have been designated as All-American Roads, National
19 Scenic Byways, Oregon State Scenic Byways, or Oregon Tour Routes. Portions of five of those
20 routes are located within the Exhibit R analysis area: the Grande Tour Route, the Hells Canyon
21 Scenic Byway All-American Road, the Journey through Time Scenic Byway, Blue Mountain
22 Scenic Byway, and Elkhorn Drive Scenic Byway.⁴⁰⁶

23

24 Hells Canyon Scenic Byway All-American Road: This 208-mile route includes portions of OR 82,
25 86, and 350, and Forest Road 39 in Union, Wallowa, and Baker counties, including areas within
26 the analysis area. The Hells Canyon Scenic Byway is identified in ODOT’s corridor management
27 plan as a scenic route of national significance.⁴⁰⁷ A portion of the western part of Hells Canyon
28 Scenic Byway is within the analysis area, along highway OR-86 near Baker City, including the
29 view from the byway to NHOTIC.⁴⁰⁸ The proposed facility, including 500 kV and 230 kV rebuild
30 transmission structures, would be visible from the Hells Canyon Scenic Byway on OR 86 just
31 west of Baker City, between highway MP 5 and MP 6. Because the Hells Canyon Management
32 Plan identifies the byway as a scenic route of national significance, the Department considers
33 the resource to be significant under the Council’s Scenic Resources standard and includes an

⁴⁰⁶ The Oregon Department of Transportation (ODOT), a reviewing agency for the proposed facility, submitted a comment letter during the ASC review which stated that Exhibit R did not include accurate or complete information regarding state scenic byways that were near the proposed facility. B2HAPPDoc13-18 ASC Reviewing Agency Comment ODOT_Davis 2018-12-21. In response to the ODOT comment, the applicant submitted an errata document to Exhibit R, which specifically addresses the comments from ODOT. Additional information regarding the Oregon Scenic Byways Program, and the state scenic byways that were evaluated by the applicant under the EFSC Scenic Resources standard, is included in the Exhibit R Errata information at B2HAPPDoc3-53 ASC Exhibit R – Errata Info 2019-03-28.

⁴⁰⁷ Hells-Canyon-Management-Plan Jan 2004, Route Description.

⁴⁰⁸ The roadway segment of Hells Canyon Scenic Byway on OR-86 is acknowledged, as OR 86, in the Baker County Comprehensive Plan Goal 5 inventory; the plan does not identify applicable substantive criteria for the Goal 5 resource.

1 evaluation of the visual impacts of the proposed facility to this resource in this section of the
2 order.

3 ~~Exhibit R includes a detailed discussion of the corridor management plan for this byway, which~~
4 ~~includes visual resource management and recreation opportunities. The byway was further~~
5 ~~evaluated by the applicant in ASC Exhibit R (errata) and is included in the Department’s~~
6 ~~evaluation in this order.~~

7
8 The Grande Tour Route: this route is an 80-mile route in Union and Baker counties and includes
9 parts of OR 82, 203, and 237, and passes through the cities of La Grande, Cove, Medical Springs,
10 and Union. The Grand Tour Route Management Plan (Management Plan) states that the scenic
11 qualities of the Grand Tour are of statewide significance. The Management Plan describes the
12 general landscape and scenic qualities within the route region and identifies four specific
13 locations of scenic quality. One of the areas of scenic quality is Thief Valley Reservoir, where the
14 proposed facility would be located 3.75 miles to the west and a small portion of the proposed
15 facility would be visible from the east side of reservoir.⁴⁰⁹ Another area with scenic qualities, as
16 identified in the Management Plan, is Ladd Marsh State Wildlife Management Area (Ladd
17 Marsh WMA), which, as described in Section IV.F, Protected Areas, is crossed by the proposed
18 facility and very close within 200 feet of to the Morgan Lake alternative route. The proposed
19 facility would be closest to the Grande Tour Route at approximately 0.2 miles from Ladd Marsh
20 WMA. The existing landscape surrounding Ladd Marsh WMA includes I-84 which crosses the
21 eastern edge of the area and an existing 230-kV transmission line that crosses along the base of
22 the adjacent hills just west of Foothill Road then continues up the slope of Glass Hill Ridge. A
23 viewpoint accessed off Foothill Road is located at the northwest corner of Ladd Marsh WMA
24 providing a view over the marsh to the south and east and the plan describes it as “... the view
25 from the overlook above Ladd Marsh Wildlife Area is exceptional.”⁴¹⁰ Because the Management
26 Plan identifies the byway as a scenic resource, the Department considers the resource to be
27 significant under the Council’s Scenic Resources standard and includes an evaluation of the
28 visual impacts of the proposed facility to this resource in this section of the order.

29
30 Journey through Time Scenic Byway: This byway is a 286-mile route through north-central
31 Oregon, extending from the Columbia River at Biggs to Baker City, and includes segments of
32 U.S. Highways 97 and 26 and OR 218, 19, and 7. Approximately 10 miles of OR 7 approaching
33 Baker City, at the eastern end of the byway, are within the analysis area. The “management
34 plan” for the Journey through Time Tour Route is not a land management plan and does not
35 grant or imply authority for land use management for any lands, including those within the
36 highway right-of-way. The plan lists 23 “highlights” along the route and includes references to
37 scenic views, but it does not identify any specific scenic resources or views within the Exhibit R
38 analysis area. Additionally, the applicant conducted a viewshed analysis and determined that
39 the proposed facility would not be visible from the Journey Through Time Scenic Byway, and as
40 such, is not further evaluated in ASC Exhibit R or in the Scenic Resources section of this order.

⁴⁰⁹ B2HAPPDoc3-53 ASC Exhibit R - Errata Info 2019-03-28.

Blue Mountain Scenic Byway: This 145-mile route through north-central Oregon extends from Arlington on the Columbia River to Baker City. The route includes part of OR 74 and segments of multiple county highways and United States Forest Service (USFS) roads. The eastern end of the byway overlaps with the Elkhorn Drive Scenic Byway. The proposed facility crosses the byway twice near Cecil in western Morrow County, and approximately 30 miles at the western end of the byway are within the analysis area but approximately 9.5 miles from the proposed facility. The applicant conducted a viewshed analysis and determined that the proposed facility would not be visible from the Blue Mountain Scenic Byway, and as such, it is not further evaluated in ASC Exhibit R or in Scenic Resources section of this order.

Elkhorn Drive Scenic Byway: This 106-mile loop route begins west of Baker City and extends through parts of Baker, Union, and Grant counties. The route includes parts of U.S. Highway 30, OR 7, multiple county highways, and Forest Road 73. The byway overlaps with parts of the Blue Mountain and Journey through Time Scenic Byways. The eastern part of the byway is within the analysis area; however, the applicant’s viewshed analysis determined that the proposed facility would not be visible from the Elkhorn Drive Scenic Byway and as such, it is not further evaluated in ASC Exhibit R or in the Scenic Resources section of this order.

Tribal Plans

The Confederated Tribes of the Umatilla Indian Reservation (CTUIR) is located within the analysis area for ASC Exhibit R. The Tribe adopted a Comprehensive Plan for the Reservation in 2010. However, as described in Exhibit R, the Plan does not identify any features as significant or important scenic resources that appear within the analysis area.⁴¹¹

Federal Plans

Federal lands within the analysis area include USFS and BLM owned and managed land. The Department of Defense, Bureau of Reclamation (BOR), and the US Fish and Wildlife Service (USFWS) have smaller areas of land within the Exhibit R analysis area.⁴¹²

Bureau of Land Management (BLM)

Exhibit R explains that the Scenic Resources analysis area overlaps with the geographic boundaries of the BLM Vale (Baker and Malheur Resource Areas), Boise (the Owyhee and Cascade Resource Areas), and Spokane Districts. As discussed in the below section, ~~T~~the BLM manages scenic resources on the federal lands under its jurisdiction through application of the

⁴¹¹ B2HAPPDoc3-35 ASC 18_Exhibit R_Scenic Resources_ASC 2018-09-28, Section 3.3.1.4

⁴¹² Id. Section 3.3.1.5

1 Visual Resource Management (VRM) system. For its ASC Exhibit R analysis, the applicant
2 considered federal lands in VRM Classes I and II as important scenic resources, based on the
3 level of visual resource protection afforded to those lands.⁴¹³ As stated above and in ASC Exhibit
4 R, the goal for a VRM Class I area is “to preserve the existing character of the landscape... the
5 level of change to the characteristic landscape should be very low and must not attract
6 attention,” and the goal for a VRM Class II area is “to retain the existing character of the
7 landscape...the level of change to the characteristic landscape should be low. Management
8 activities may be seen but should not attract the attention of the casual observer...”

9
10 *Vale District, Baker Resource Area; BLM Baker RMP*

11
12 The Baker Resource Area Resource Management Plan (RMP) designates almost 152,000 acres
13 of the Baker Resource Area as VRM Class II. The Baker RMP and South Fork Walla Walla River
14 Area Plan Amendment designate 10 areas totaling 40,244.69 acres as Areas of Critical
15 Environmental Concern (ACECs). The RMP indicates that scenic qualities or visual resources are
16 among the primary reasons for designating two of those ACECs that are in the analysis area for
17 the proposed facility: Powder River Canyon and Oregon Trail ACECs. The ACEC segments of the
18 Oregon Trail are distributed among seven separate parcels in Umatilla, Union, and Baker
19 counties, including Blue Mountain Parcel, the National Historic Oregon Trail Interpretive Center
20 (NHOTIC) Parcel, White Swan Parcel, Straw Ranch Parcel 2, Straw Ranch Parcel 1, and Powell
21 Creek Parcel within the analysis area.⁴¹⁴ Within the analysis area, the Baker RMP also designates
22 the Grande Ronde and Powder Wild and Scenic Rivers (WSR) corridors and the Burnt, Powder,
23 and Snake River canyons as Visual Resources Management (VRM) Class II areas with high scenic
24 values.⁴¹⁵

25
26 *Vale District, Malheur Resource Area; BLM SEORMP*

27
28 Lands administered by the BLM Vale District (Malheur and Jordan Resource Areas) are managed
29 under the 2001 Southeastern Oregon Resource Management Plan (SEORMP) and Final
30 Environmental Impact Statement (FEIS). The Exhibit R analysis area includes a substantial
31 portion of the Malheur Resource Area.

32
33 The SEORMP also designates approximately 309,600 acres in the Malheur Resource Area (15
34 percent of the total acreage) to be managed as VRM Class I, and 144,400 acres (seven percent
35 of the total) as VRM Class II. The SEORMP designates 20 areas totaling over 160,000 acres as
36 ACECs. The RMP identifies scenic qualities or visual resources among the primary reasons for
37 designating three ACECs within the analysis area for Exhibit R: Oregon National Historic Trail
38 (three separate segments), Owyhee River below the Dam, and Owyhee Views.⁴¹⁶

⁴¹³ Id.

⁴¹⁴ BLM ACEC's are also considered Protected Areas; see Section IV.F, *Protected Areas* of this order.

Boise District, Owyhee Resource Area (Owyhee Resource Management Plan)

BLM-administered lands in Owyhee County, Idaho, are located at the southeastern end of the analysis area for the Council’s evaluation of scenic resources, within the Owyhee Resource Area of the Boise District.

Approximately 71,000 acres of lands subject to the Owyhee RMP (six percent of the total acreage) are to be managed as VRM Class I, and 242,000 acres (20 percent) are to be managed as VRM Class II. The Owyhee RMP also designates 12 areas totaling over 167,000 acres as ACECs. The RMP indicates that scenic qualities or visual resources are identified among the primary reasons for designating seven of the ACECs. One of those ACECs, the Jump Creek Canyon ACEC, is located within the Exhibit R analysis area.⁴¹⁷

Boise District, Cascade Resource Area (Cascade RMP)

Some BLM-administered lands located in Idaho along the eastern side of Brownlee Reservoir are located within the Exhibit R analysis area. These lands are currently managed by the Four Rivers Field Office of the Boise District and are managed under the Cascade RMP.

Spokane District (Spokane RMP)

As the applicant explains in Exhibit R, the Badger Slope is the only scenic resource within the Spokane District RMP that has been specifically identified as an important or significant scenic resource, based on the VRM classification. This area is located south of the Yakima River between Prosser and Richland and is well beyond the Exhibit R 10-mile analysis area.⁴¹⁸

U.S. Forest Service (USFS)

The Exhibit R analysis area overlaps with the geographic boundaries of the USFS Wallowa-Whitman and Umatilla National Forests. The proposed facility crosses lands within the Wallowa-Whitman National Forest. Neither the proposed facility nor any alternate facility routes cross lands within the Umatilla National Forest, but some Umatilla National Forest lands are within the 10-mile analysis area for Scenic Resources. Therefore, review of area-specific USFS planning direction for scenic resources applies to both the Wallowa-Whitman and Umatilla National Forests.

As explained below, the USFS uses a Visual Management System (VMS) to inventory, classify and manage lands for visual resource values. Based on an inventory and evaluation of visual resources associated with national forest lands, under that plan the USFS established Visual

⁴¹⁷ BLM ACEC’s are also considered Protected Areas; see Section IV.F, *Protected Areas* of this order

⁴¹⁸ Id.

1 Quality Objectives (VQOs) to provide a measurable standard or objective form for management
2 of visual resources. VQOs for areas of land are assigned by combining the variety class, distance
3 zone, and sensitivity level. Each VQO indicates the acceptable degree of landscape alteration
4 and classifies land in one of five categories: Preservation, Retention, Partial Retention,
5 Modification, or Maximum Modification.

6
7 Each management area (MA) of the forests has a specific resource emphasis and management
8 objective guidelines to provide protection and management of the resource. There are several
9 overlapping MAs along the proposed route. As described in Exhibit R, where MAs overlap, the
10 VQOs that provide the highest level of visual quality protection take precedence. For its Exhibit
11 R analysis, lands managed as “Preservation” or “Retention” were considered to be important
12 scenic resources, based on the level of visual resource protection afforded to those lands by the
13 USFS.⁴¹⁹

14
15 *Wallowa-Whitman National Forest Land and Resource Management Plan*

16
17 The Wallowa-Whitman Forest management plan indicates that “Management of the Forest’s
18 scenic resources is emphasized within the viewsheds of federal and state highways and major
19 forest roads. The visible land areas adjacent to selected travel routes are managed for a variety
20 of VQOs including retention, partial retention and modification.” Lands within the Wallowa-
21 Whitman Forest assigned a VQO of Preservation or Retention (VQO 1 or 2) are further assessed
22 in Exhibit R and the Department’s assessment is included below.

23
24 *Umatilla National Forest Land and Resource Management Plan*

25
26 As explained in Exhibit R, there are no Umatilla Forest lands within the analysis area that are
27 assigned a VQO of Preservation or Retention and as such, no land in the Umatilla Forest is
28 identified as important scenic resources for purposes of the Council’s evaluation of the
29 proposed facility.

30
31 *Department of Defense/US Navy*

32
33 The U.S. Navy administers the Naval Weapons Systems Training Facility (NWSTF) Boardman.
34 The facility includes more than 47,000 acres located south of Boardman in Morrow County and
35 is used for training and testing by the Navy and Oregon National Guard.

36
37 The Navy has developed and implemented an Integrated Natural Resources Management Plan
38 (INRMP) for the NWSTF Boardman that identifies management goals for the NWSTF. That plan
39 does not include scenic resources as an applicable subject for management direction. A 2012

⁴¹⁹ BLM ACEC’s are also considered Protected Areas; see Section IV.F, *Protected Areas* of this order

1 environmental impact statement (EIS) addressing military training activities at NWSTF that was
2 issued by the Navy in September 2012 also does not address scenic or visual resources. Based
3 on the specific content of these documents, there are no features associated with NWSTF
4 Boardman identified as important or significant scenic resources or values for purposes of the
5 EFSC Council's Scenic Resources evaluation.⁴²⁰

6
7 *Bureau of Reclamation (BOR)*

8
9 The BOR has jurisdiction over and operates a small portion of the Owyhee River Canyon
10 associated with Owyhee Dam and Reservoir. The current management direction for this area is
11 included in the Owyhee Reservoir Resource Management Plan (RMP). A visual resources
12 inventory within the RMP recognizes the entire study area as outstandingly remarkable, and
13 notes that adjacent BLM-administered lands are managed as VRM Class II. The RMP references
14 landscape features known as the Honeycombs, Leslie Gulch, Painted Canyon, Three Fingers
15 Gulch, and Carlton Canyon as “outstanding visual features” along with several visually dominant
16 peaks and buttes. However, the BOR-managed lands comprise a narrow band along the
17 immediate margins of the Owyhee River and Reservoir, and the specified landscape features
18 are entirely or predominantly located on the adjacent BLM-administered lands. The adjacent
19 BLM-administered lands in this area are designated as VRM Class I or II, and as such, the scenic
20 features referenced in the Owyhee Reservoir RMP are incorporated within the important scenic
21 resources identified through the BLM Malheur Resource Area planning direction.⁴²¹

22
23 *U.S. Fish and Wildlife Service (USFWS)*

24
25 The USFWS manages three national wildlife refuges that are partially or entirely located within
26 the Exhibit R analysis area: the Umatilla National Wildlife Refuge (NWR) in Morrow County, the
27 McKay Creek NWR in Umatilla County, and the Deer Flat NWR in multiple counties of
28 southwestern Idaho and southeastern Oregon. The primary mission of the FWS as manager of
29 the national wildlife refuge system is to provide valuable habitat for fish and wildlife. Various
30 types of recreation are allowed or provided on many refuges.

31
32 *Umatilla National Wildlife Refuge (NWR)*

33
34 The Umatilla NWR, located to the north and northeast of Boardman, Oregon, encompasses
35 approximately 25,000 acres with a mix of open water sloughs, shallow marsh, seasonal
36 wetlands, cropland, islands, and shrub-steppe upland habitats. The Umatilla National Wildlife
37 Refuge Comprehensive Conservation Plan identifies potential scenic resources on FWS-
38 managed lands in the refuge. The plan identifies management direction relative to several
39 categories of wildlife species, multiple types of habitat present within the refuge, recreational
40 activities compatible with the refuge purposes, and cultural resources; however, the plan does

⁴²⁰ Id.

⁴²¹ Id.

1 not prescribe management for visual resources or address visual resource conditions, or
2 identify significant or important scenic resources or values. As such, Umatilla NWR is not
3 further considered in the EFSC Council's Scenic Resources evaluation.

4
5 *McKay Creek National Wildlife Refuge (NWR)*

6
7 The McKay Creek NWR includes 1,837 acres within and adjacent to McKay Creek Reservoir, a
8 Bureau of Reclamation water storage facility located between Pilot Rock and Pendleton in
9 Umatilla County. The refuge provides a variety of open water, riparian, and shrub-steppe
10 habitat and supports considerable recreational use, primarily for fishing and upland bird
11 hunting. The applicant states that the USFWS has started a process to develop a
12 Comprehensive Conservation Plan for the refuge, but that there is no plan that currently
13 manages the McKay Creek NWR. However, the first priority of each refuge is to conserve,
14 manage, and if needed, restore fish and wildlife populations and habitats according to its
15 purpose. Based on the limited documentation available to date and the lack of a plan specific to
16 this refuge, as well as the general primary purpose of national wildlife refuges to preserve
17 wildlife and habitat, McKay Creek NWR is not further considered in the Council's Scenic
18 Resources evaluation.

19
20 *Deer Flat National Wildlife Refuge (NWR)*

21
22 The Deer Flat NWR includes approximately 11,000 acres within two refuge units. The Lake
23 Lowell Unit consists of approximately 9,000 acres surrounding Lake Lowell, a reservoir located
24 west of Nampa in Canyon County, Idaho and outside the analysis area. The remaining acreage is
25 within the Snake River Islands Unit and is distributed among more than 100 islands within a
26 long reach of the Snake River from near Walter's Ferry in Idaho to Farewell Bend near
27 Huntington, Oregon. Some islands within the Snake River Unit are within the ASC Exhibit R
28 analysis area. The refuge provides a variety of habitat types for more than 200 species of birds
29 and 30 species of mammals, and supports diverse, wildlife-oriented recreational opportunities.
30 The Deer Flat NWR 2015 Final Comprehensive Conservation Plan indicates that the purposes of
31 this NWR include enhancing, maintaining and protecting refuge habitats for the benefit of
32 migratory birds and other wildlife; gathering scientific information to guide management
33 decisions; providing visitors with recreation opportunities, and initiating and nurturing
34 relationships to promote the wildlife habitat and support refuge stewardship. As noted with the
35 other wildlife refuges above, the management plan does not identify important or significant
36 scenic resources or values and as such, Deer Flat NWR is not further considered in the EFSC
37 Council's Scenic Resources evaluation.

38
39 **Methodology for Evaluation of Scenic Resources**

40
41 In order to evaluate the impact of the proposed transmission line on each of the scenic
42 resources identified above, the applicant developed a visual impact methodology based on the
43 BLM and USFS visual impact assessment methods. It is noted that the Council's rules do not
44 require, or provide, a specific methodology for evaluating visual impacts to Scenic Resources (or

1 Protected Areas or Recreation resources). As described in Section IV.F., Protected Areas;
 2 Potential Visual Impacts from Facility Structures, the applicant utilized the Council’s definition
 3 of “significant” for the impact assessment. The definition of “significant” is at OAR 345-001-
 4 0010(53): “significant” means having an important consequence, either alone or in combination
 5 with other factors, based upon the magnitude and likelihood of the impact on the affected
 6 human population or natural resources, or on the importance of the natural resource affected,
 7 considering the context of the action or impact, its intensity and the degree to which possible
 8 impacts are caused by the proposed action. Nothing in this definition is intended to require a
 9 statistical analysis of the magnitude or likelihood of a particular impact.” Table SR- 2: Definition
 10 of Significance (per Council’s Rule OAR 345-001- 0005(53)) and Interpretation for Visual Impacts
 11 in Exhibit L, R, T), breaks down the applicant’s interpretation of the Council’s definition. These
 12 criteria were used to assess the magnitude of visual impacts from the proposed facility.
 13

Table SR- 2: Definition of Significance (per Council’s Rule OAR 345-001- 0005(53)) and Interpretation for Visual Impacts in Exhibit L, R, T)

<u>Excerpt</u>	<u>Interpretation for Exhibit L, R, T</u>
<u>“having an important consequence.”</u>	<u>An important consequence is considered a significant impact.</u>
<u>“either alone or in combination with other factors,”</u>	<u>Qualifying language suggests that an “important consequence” may be caused by the proposed development either alone or in combination with other past or present actions.</u>
<u>“based upon the magnitude and likelihood of the impact”</u>	<u>Magnitude represents the size and scale of the impact, and is measured in terms of visual contrast and scale dominance. Likelihood represents the probability of occurrence of an impact; for the purposes of Exhibit L, impacts analyzed were assumed to be likely to occur.</u>
<u>“on the affected human population”</u>	<u>The impact on the human population is measured in terms of the viewer’s perception of impacts to valued scenic attributes of the protected area.</u>
<u>“or [on the] natural resources”</u>	<u>The impact to the natural resource is measured in terms of the potential change in scenic quality and/or landscape character of the protected area.</u>
<u>“or on the importance of the natural resource affected”</u>	<u>The disjunction of the magnitude of the impact from the importance of the natural resource suggests that an impact to scenic values may not result in an “important consequence” if the scenic value affected is not considered important to the protected area.</u>
<u>“Considering the context of the action or impact,”</u>	<u>The Council shall also consider the other “mitigating” (or “aggravating”) contextual factors, such as the extent to which impacts to visual values are consistent with the standards and guidelines of relevant land management objectives of the protected area.</u>

Table SR- 2: Definition of Significance (per Council’s Rule OAR 345-001- 0005(53)) and Interpretation for Visual Impacts in Exhibit L, R, T)

<u>Excerpt</u>	<u>Interpretation for Exhibit L, R, T</u>
<u>“[the impact’s] intensity...”</u>	<u>The intensity of the impact considers how impacts would manifest on the landscape by assessing the combined effect of resource change and viewer perception.</u>
<u>“...and the degree to which the possible impacts are caused by the proposed action.”</u>	<u>Consider the extent to which adverse impacts are caused by the proposed facility, as opposed to other past or present actions. The contribution of this action to potential cumulative (additive) impacts should be disclosed.</u>

If a local land use plan, state, tribal, or federal land management plan identifies scenic resources and values as significant or important, the resource(s) may be protected under OAR 345-022-0080. In ASC Exhibit R, the applicant provides excerpts from the applicable plans and provides an overview of its visual impact assessment methodology which considers the combined outcome of context of the impact, impact intensity and the degree to which the possible impacts are caused by the proposed facility to determine whether impacts are potentially significant. Because the proposed facility would cross land managed by both the Bureau of Land Management (BLM) and the United States Forest Service (USFS), the applicant established a baseline inventory, impact assessment procedures, and management objectives/criteria using both the BLM’s Visual Resource Management (VRM) System and the USFS Visual Management System. Resources not administered by either agency were assessed using one of the two procedures based on whether the resource was located in forested or non-forested areas; resources located in nonforested areas were analyzed using the BLM methodology, whereas those located in forested areas were analyzed using the USFS methodology.⁴²² The applicant also evaluated the land management plans for designated development standards or criteria to inform it’s evaluation.

Below is a summary of the management objective and evaluative development criteria established in federal management plans used in the applicant’s analysis of scenic resources.

Bureau of Land Management (BLM) Visual Resource Management (VRM) System:

The BLM inventories and manages visual resources through the VRM System defined in the 1986 Manual 8400 - Visual Resource Management (Manual). Visual values are established through the Visual Resource Inventory process, which classifies scenery based on the assessment of three components: scenic quality, visual sensitivity, and distance. Visual

⁴²² B2HAPPDoc3-35 ASC 18 Exhibit R Scenic Resources ASC 2018-09-28, Section 3.2.2.

1 resources are then assigned to management classes with established objectives. These are
2 summarized below from ASC Exhibit R and Department review of the Manual:⁴²³

- 3 • **Class I Objective:** To preserve the existing character of the landscape. This class provides
4 for natural ecological changes; however, it does not preclude very limited management
5 activity. The level of change to the characteristic landscape should be very low and must
6 not attract attention.
- 7 • **Class II Objective:** To retain the existing character of the landscape. The level of change
8 to the characteristic landscape should be low. Management activities may be seen but
9 should not attract the attention of the casual observer and changes must repeat the
10 basic elements of form, line, color, and texture found in the predominant natural
11 features of the characteristic landscape.
- 12 • **Class III Objective:** To partially retain the existing character of the landscape. The level
13 of change to the characteristic landscape should be moderate. Management activities
14 may attract attention but should not dominate the view of the casual observer. Changes
15 should repeat the basic elements found in the predominant natural features of the
16 characteristic landscape.
- 17 • **Class IV Objective:** To provide for management activities that require major
18 modification of the existing character of the landscape. The level of change to the
19 characteristic landscape can be high. These management activities may dominate the
20 view and be the major focus of viewer attention. However, every attempt should be
21 made to minimize the impact of these activities.

22
23 Scenic quality on BLM-administered lands was quantified by the applicant through the scoring
24 of seven key factors: landform, vegetation, water, color, adjacent scenery, scarcity, and cultural
25 modifications. Scenic quality was classified as Class A, B, or C, where landscapes ranked as Class
26 A have the highest apparent scenic quality, while landscapes ranked as Class C have the lowest,
27 based on the Manual.

28
29 United States Forest Service (USFS) Visual Management System (VMS):

30
31 The USFS manages scenic resources through the Visual Management System (VMS) established
32 in The National Forest Management, Volume 2, 1974 Agricultural Handbook 462 (Handbook) to
33 inventory, classify, and manage lands for visual resource values. As provided in ASC Exhibit R
34 and by the Department's review of the Handbook, the visual resources are managed by the
35 following five visual quality objectives, which describe a degree of acceptable alteration of the
36 natural landscape:⁴²⁴

37

⁴²³ B2HAPPDoc3-35 ASC 18 Exhibit R Scenic Resources ASC 2018-09-28, Section 3.2.2 and Department of the Interior Bureau of Land Management, Manual H-8410-1 - Visual Resource Inventory, 01-17-1986; https://www.blm.gov/sites/blm.gov/files/program_recreation_visual%20resource%20management_quick%20link_%20BLM%20Handbook%20H-8410-1%2C%20Visual%20Resource%20Inventory.pdf Accessed 06-26-2020.

⁴²⁴ B2HAPPDoc3-35 ASC 18 Exhibit R Scenic Resources ASC 2018-09-28, Section 3.2.2 and the National Forest Landscape Management Volume 2, April 1974; <https://www.nrc.gov/docs/ML1224/ML12241A372.pdf> Accessed 06-26-2020.

1 **Preservation:** Allows for ecological changes only. Management activities, except for very
2 low visual impact recreation facilities, are prohibited.

3 **Retention:** Provides for management activities that are not visually evident. Activities under
4 retention may only repeat form, line, color, and texture which are frequently found in the
5 characteristic landscape.

6 **Partial Retention:** Provides for management activities that remain subordinate to the
7 characteristic landscape. Activities may repeat form, line, color, or texture common to the
8 characteristic landscape but changes in their qualities of size, amount, intensity, direction,
9 pattern, etc., remain visually subordinate to the characteristic landscape.

10 **Modification:** Activities may visually dominate the original characteristic landscape.
11 However, activities of vegetative and landform alteration must borrow from naturally
12 established form, line, color, or texture so completely and at such a scale that its visual
13 characteristics are those of natural occurrences within the surrounding area of character
14 type. Activities such as facilities, buildings, signs, roads, etc., should borrow naturally
15 established form, line color, and texture that are compatible with the natural surroundings.

16 **Maximum Modification:** Allows for management activities may visually dominate the
17 original characteristic landscape. Activities of vegetation and landform alteration that
18 dominate the characteristic landscape; however, when viewed as background, the visual
19 characteristics must be those of natural occurrences within the surrounding area or
20 character type.

21
22 The Department concurs and recommends Council concur with the use of these methods for
23 the visual impact assessment for the proposed facility for the EFSC review because:

- 24 • The proposed facility would cross both BLM and USFS land, and on those lands, the
25 applicant is required to utilize those agency’s respective visual resource impact
26 assessment methods;
- 27 • Both the BLM and USFS approved the proposed facility location in its ROD(s),
28 indicating compliance with the respective visual impact methodologies and
29 standards;
- 30 • The applicant adapted each of the methodologies to use evaluative criteria based
31 upon the Council’s definition of “significant” under OAR 345-001-0010(53);
- 32 • The BLM and USFS visual impact methodologies provide an objective system to
33 evaluate visual impacts;
- 34 • Using the BLM and USFS methods to assess visual impacts to EFSC scenic resources
35 is consistent with the statutory direction at ORS 469.370(13) to conduct a site
36 certificate review in a “manner that is consistent with and does not duplicate the
37 federal agency review.”

38
39 ASC Exhibit R, Attachment R-1 includes the complete visual impact assessment methodology
40 developed for Exhibit R. The visual impact assessment methodology is further described in
41 Section IV.F, *Protected Areas; Potential Visual Impacts from Facility Structures* of this order and
42 is not repeated in its entirety here; the applicant used the same methodology for assessing
43 visual impacts from the proposed facility to EFSC-designated scenic resources, protected areas,
44 and recreation resources (Section IV.L, *Recreation*).

Analysis of Scenic Resources and Values

ASC Exhibit B describes the components of the proposed facility, including the proposed transmission structures, conductors, Longhorn station, access roads, and other supporting facilities. The proposed facility would mainly use lattice towers constructed of galvanized steel to support the 500-kV conductors. The proposed facility would use deglared galvanized steel, a finish treatment that provides a duller appearance than is typically associated with galvanized steel, which would reduce the visible contrast of the structures with the surrounding environment. The applicant notes that the deglared steel is darker, less reflective, and better able to recede into the landscape when seen against a terrain backdrop. The conductors would have a “non-specular” finish that would reduce reflectivity and the potential for glare.⁴²⁵ To reduce overall visual impacts related to transmission structure design, the applicant proposes and the Department recommends that the Council include the following condition in the site certificate:

Recommended Scenic Resources Condition 1: The certificate holder shall use dull-galvanized steel for lattice towers and non-specular conductors.

The applicant has also proposed landscape treatment measures that would attempt to reduce the visual impact of the proposed facility; a description of these measures is included in the draft Vegetation Management Plan (see Attachment P1-4 to this order).

The applicant analyzed each of the significant or important scenic resources identified as such in applicable management plans, as shown on Table SR-1, to determine compliance with the Council’s Scenic Resources standard. The applicant’s visual resources assessment of the proposed facility to EFSC Scenic Resources is included in summary form in ASC Exhibit R, Section 3.3.2, and a comprehensive visual resources impact assessment evaluation is included in ASC Exhibit R, Attachment R-3. The Department’s evaluation is included below in this order.

It is important to note that many of the Scenic Resources considered by the EFSC Council standard and assessed in this section are owned and managed by agencies of the federal government, including the BLM and US Forest Service. The EFSC Council’s Scenic Resources standard is based on “scenic resources and values identified as significant or important in...federal land management plans...” As such, by issuing this route in its Records of Decision (ROD), the federal agencies (BLM and USFS) that administers the Management Plans for many of the EFSC Council Scenic Resources described in this section are authorizing the placement of the proposed facility in locations that are permissible within the scenic designations in the respective agency Management Plans. The language of the EFSC Scenic Resources standard relies upon scenic values identified in others’ management plans, so the Council may rely on

⁴²⁵ BLM ACEC’s are also considered Protected Areas; see Section IV.F, *Protected Areas* of this order, Also Ssee ASC Exhibit L, Section 3.3.3.

1 the decisions of the land-managers who administer their plans to inform its evaluation of the
2 Scenic Resources standard. Considering that the agencies that manages many of these Scenic
3 Resources have already authorized the proposed facility in the location proposed in the EFSC
4 application, the Department considers this relevant information particularly to the EFSC Council
5 Scenic Resources standard. The BLM and USFS have already issued records of decisions (RODs)
6 authorizing the proposed facility. The Department also evaluates the potential visual impacts
7 and the level of significance under OAR 345-001-0005(53).

8
9 Union County: Blue Mountain Forest Wayside and Blue Mountain Forest State Scenic Corridor

10
11 Union County, in its Union County Comprehensive Plan, identifies the Blue Mountain Forest
12 Wayside as an important scenic resource.⁴²⁶ The applicant notes that the wayside is coextensive
13 with the larger Blue Mountain Forest State Scenic Corridor, which is administered by the OPRD.
14 For analysis purposes, the applicant has evaluated both as the Blue Mountain Forest State
15 Scenic Corridor (“Blue Mountain Corridor”). However, as noted above, the Blue Mountain
16 Forest State Scenic Corridor is not independently considered a EFSC Council Scenic Resource
17 because it is not identified as important or significant in a management plan. The Blue
18 Mountain Forest State Scenic Corridor is considered an EFSC Protected Area and is evaluated in
19 Section IV.F, *Protected Areas* of this order. The Morgan Lake alternative is located
20 approximately 3.7 miles southeast of the Blue Mountain Scenic Corridor. However, because of
21 topography and vegetative screening, the Morgan Lake route would not be visible from the
22 Blue Mountain Scenic Corridor.

23
24 The Blue Mountain Corridor is located along segments of the Old Emigrant Hill Scenic Frontage
25 Road in the Blue Mountains in Union County. It includes approximately 990 acres within five
26 separate parcels, all of which are within the analysis area. As discussed in ASC Attachment R-3,
27 Figure R-3-1, the proposed transmission line would cross the fifth parcel between MP 94.6 and
28 94.8 near KOP 4-5.⁴²⁷ Two towers would be located outside the scenic corridor and support the
29 line span across the resource. No towers would be placed within the corridor. Additional
30 evaluation of the crossing of the corridor is included in Section IV.F, *Protected Areas*.

31
32 The Old Emigrant Hill Scenic Frontage Road is a narrow, two-lane road that winds along the
33 upper portion of a steep valley wall. The roadway runs adjacent to a heavy-rail line to the
34 south. Views to the southwest across the valley are primarily blocked by dense vegetation along
35 the perimeter. Intermittent views across the valley are characterized by open meadows, forest
36 patches, and a network of forest roads. Views to the north/northwest of the Frontage Road are
37 dominated by the steep slope of the valley wall. With one exception in Parcel 4, this steep
38 viewing angle precludes views to the ridgeline along the majority of the corridor. At the
39 northern extent of Parcel 4, eastbound travelers experience temporary views of rock

⁴²⁶ Id. See Section 3.3.2.1 and Attachment R-3 Section 1.0 for the applicant’s evaluation of the proposed facility’s anticipated impacts to the resource.

⁴²⁷ A photograph of the crossing location and simulation is included in Attachment R-4, Figure R-4-1b.

1 outcroppings along the ridgeline that extend briefly to the foreground-middleground distance
2 zone. The eastern-most terminus of the Blue Mountain Corridor crosses I-84.

3
4 Because of the screening of forest vegetation, the visibility of the towers from the Old Emigrant
5 Hill Scenic Frontage Road near the northern and southern ends of Parcel 4 are anticipated to be
6 limited to the tops of some towers. The perimeter of the roadway within all five parcels would
7 remain forested, which, coupled with steep viewing angles from many locations along the
8 roadway, would limit the visibility of the towers.

9
10 The visual impact assessment conducted by the applicant indicates that short-term visual
11 impacts would include construction-related vehicles and personnel, with localized, medium
12 intensity impacts. Long-term impacts would be primarily associated with the transmission
13 towers and clearing of forest vegetation required in the ROW and pulling and tensioning sites.
14 ASC Exhibit R includes a detailed evaluation of the magnitude of impact, viewer perception, and
15 resource change, and an analysis of the impact intensity, context and degree to which the
16 impacts would be caused by the proposed development. The proposed facility, particularly
17 where it crosses the corridor, will-would cause an impact to visual resources. The forest would
18 be cleared in an area where the transmission conductors would cross the corridor at Old
19 Emigrant Hill Scenic Frontage Road. A photosimulation of the crossing is included in ASC Exhibit
20 R, Attachment R-4, Figure R-4-2. Additionally, during construction, Old Emigrant Hill Scenic
21 Frontage Road would be used as an access road to the proposed facility, which would bring
22 construction traffic to the area. Construction traffic would be temporary.

23
24 Car drivers are the primary user experiencing the resource, and is the primary reason the
25 wayside is designated as a Scenic Resource to protect views for drivers. The crossing of the
26 resource by the proposed facility would cause a visual impact to drivers along the byway.
27 However, drivers would be expected to pass along the road and only experience the visual
28 impact of the proposed facility for a short extent along the road. Additionally, the proposed
29 facility would cross the wayside at a location in the southern portion of the corridor Parcel 6, as
30 shown on ASC Exhibit R, Attachment R-3, Figure R-3-1, very close to I-84. Based on the analysis
31 presented here, the Department recommends that the Council find that the proposed facility
32 would not cause a significant adverse impact to the scenic resources and values of the Blue
33 Mountain Forest Wayside.

34
35 *Baker County: State Highway 203*

36
37 Baker County Comprehensive Plan recognizes an eight-mile segment of OR 203, from MP 22.9
38 to MP 31.09 for its scenic value.⁴²⁸ The proposed facility would not cross OR 203 and is located
39 over three miles from the southern end of the Scenic Resource.

40

⁴²⁸ Id. See Section 3.3.2.2 and Attachment R-3 Section 2.0 for the applicant's evaluation of the proposed facility's anticipated impacts to the resource.

1 As described in ASC Exhibit R, Attachment R-3, Section 2.0, visibility of the proposed facility
2 from the designated scenic portion of SR 203 ~~will~~would be low, with only intermittent views of
3 some facility components visible at any time and no visibility of facility components for the
4 majority of the route. The proposed facility would be, at its closest, approximately three miles
5 from the resource. Finally, the user experience of the resource is drivers along the highway,
6 which would presumably pass through at high speeds and only experience views of the facility,
7 at distance, for brief periods of time. Based on this analysis, the Department recommends the
8 Council find that the proposed facility would not cause a significant adverse impact to the
9 scenic resources and values of the designated scenic portion of SR 203.

10
11 *Baker County: Oregon Highway 86*

12
13 The Baker County Comprehensive Plan designates an approximately 36-mile portion of OR 86
14 (from MP 4.81 to 40.64), extending between Baker City and the towns of Richland and Keating,
15 as a scenic corridor.⁴²⁹ Baker County Board of Commissioners has not adopted or established
16 review criteria in its Comprehensive Plan to inform the protection measures or level of impacts
17 considered significant to the scenic corridor.

18
19 The location of OR 86 is represented in ASC Exhibit R Attachment R-2 Map Figures – Map 2 –
20 resource identification number SR B2. The existing viewshed along the scenic corridor includes
21 high desert with flat, rolling terrain, agriculture, Baker Valley, and the Blue Mountains. The
22 existing viewshed contains existing infrastructure, including the applicant’s existing 230 kV
23 transmission line, residential structures, out buildings, and NHOTIC. Proposed facility
24 components, including H-frame transmission line structures extending 130 ft (500 kV) and up to
25 90 feet (230 kV rebuild) in height, would be visible where the proposed facility would cross the
26 scenic corridor between highway MP 5 and 6, near the western terminus at the entrance to the
27 Baker Valley, and for approximately 1-mile along the scenic corridor. During construction,
28 vegetation loss and disturbance at pulling and tensioning sites, new primitive roads and a small
29 segment of new, bladed road would be visible.

30
31 As presented in ASC Exhibit R, the applicant identifies that construction-related actions
32 including a new bladed road and pulling and tensioning site, to be located to the south of OR
33 86, would result in strong visual contrast in line and texture of existing land and viewshed
34 features and close proximity in which they are viewed. Drivers along OR 86 would experience
35 construction-related impacts episodically as they pass through the area. The applicant identifies
36 that the potential short-term visual impact during construction would be “high magnitude,”
37 resulting from the strong visual contrast in line and texture of these features and close
38 proximity in which they are viewed.⁴³⁰ However, these impacts would be temporary to short-
39 term.

⁴²⁹ Id. See Section 3.3.2.2 and Attachment R-3 Section 3.0 for the applicant’s evaluation of the proposed facility’s anticipated impacts to the resource.

⁴³⁰ B2HAPPDoc3-53 ASC Exhibit R - Errata Info 2019-03-28, Section 3.3.2.10.

1
2 As provided in ASC Exhibit R Attachment R-1 (p. R-3-16 through R-3-22), the user experience of
3 the resource is drivers along the highway, which would presumably pass through at high speeds
4 and only experience views of the proposed facility for brief periods of time. The applicant states
5 that the proposed facility would be visible for approximately one mile *along the scenic corridor,*
6 *or approximately 1-minute traveling at 45 miles per hour. Based on the applicant’s impact*
7 *assessment, visual impacts of the proposed facility from the scenic corridor would result in*
8 *medium intensity from low viewer perception and medium resource change. The applicant’s*
9 *impact assessment accounts for visual impact minimization measures including use of reduced*
10 *structure height (from 200 to 130 feet) with a natina finish, which has a rustic brown,*
11 *appearance. In addition, as described in Section IV.K.1.1., Oregon Trail and National Historic*
12 *Trails, the Department recommends Council consider mitigation evaluated under other Council*
13 *standards to mitigate impacts equally under separate Council standards when the impact (e.g.*
14 *visual) and resource are the same or (when the resources) are within the same viewshed, which*
15 *applies to this scenic resource.*

16
17 OR 86 parallels an NRHP-eligible Oregon Trail/NHT segment (Oregon Trail, Virtue Flat, Flat
18 Segment and Flagstaff Hill (B2H-BA-282)) – these two resources (OR 86 and B2H-BA-282) would
19 share a viewshed based on proximity. Based on visual impacts to the trail segment, as
20 evaluated in Section IV.K., Council’s Historic, Cultural and Archeological Resources standard, the
21 Department recommends Council require, in addition to the applicants’ proposed design
22 modification (recommended Scenic Resources Condition 43), that visual impact mitigation also
23 include purchase of a conservation easement or land acquisition; interpretive signage; or
24 funding for public research or project benefiting the affected area. These types of measures, as
25 presented in Table HCA-4b of this order and found in Attachment S-9, would be consistent with
26 Council’s definition of mitigation (OAR 345-001-0010(33) and would therefore mitigate visual
27 impacts within the shared viewshed of OR 86 and the trail segment.

28
29 Considering that the visual impact of the proposed facility would be limited to a relatively short
30 segment of visibility to drivers along the overall length of the 36-mile scenic highway, and
31 further mitigated through design modifications and measures such as a conservation easement,
32 land acquisition, or public funding benefiting the affected area, as detailed in Table HCA-4b of
33 this order, the Department recommends Council find that the proposed facility would not cause
34 a significant adverse impact to the scenic resources and values of the designated scenic
35 resource portion of OR 86.

36
37 ~~As discussed above under the Protected Areas Standard and below as it relates to the National~~
38 ~~Historic Oregon Trail Interpretive Center (NHOTIC), the proposed route has been revised since~~
39 ~~the pASC was originally submitted in order to mitigate potentially significant visual impacts to~~
40 ~~the NHOTIC ACEC. In order to reduce visual impacts to NHOTIC ACEC, but also reducing impacts~~
41 ~~to OR 86, the applicant proposed to use a shorter (100-129 feet), H frame structure with a~~
42 ~~natina finish in this area. A natina finish reacts with galvanized metal and colors into a rustic,~~
43 ~~brown finish that is low maintenance in outdoor environments.~~

~~In response to BLM and local government comments, in addition to mitigation through the proposed finish, the proposed facility was relocated to the east from a prior considered route, to avoid impacts to agricultural areas. As discussed below, recommended Scenic Resources Condition 2 would require the site certificate holder to incorporate low stature (100-129 feet) H-Frame structures to mitigate impacts.~~

Baker County: Oregon Highway 245

Baker County Comprehensive Plan designates portions of OR 245 as a designated scenic corridor. The designated scenic segment of OR 245 applicable to this analysis extends for approximately 37 miles, from the junction with OR 245 to the junction with U.S. Highway 26 near Unity. Approximately four miles of this segment are within the analysis area.⁴³¹ However, the applicant's modeling shows the proposed facility would not be visible from the designated scenic portions of OR 245, and the proposed facility is approximately seven miles away. As such, the Department recommends Council find that the proposed facility would not cause an adverse impact to the scenic resources and values of the designated scenic resource portion of OR 245.

Interstate 84, from Pleasant Valley to Durkee Area

Baker County Comprehensive Plan designates an approximately 12-mile section of Interstate 84 between Pleasant Valley and Durkee as a scenic corridor. The proposed facility would roughly parallel the scenic segment of I-84 approximately one mile from the freeway. A multi-use area would be located approximately 0.2 miles southwest of the I-84 overpass at Old Highway 30, which could be visible from I-84.⁴³²

Temporary impacts associated with construction related actions, including clearing of ROW and pulling and tensioning sites, would include construction-related vehicles and personnel. Short-term impacts may result from clearing of the ROW through grassland areas. Impacts from ROW clearing would persist until grassland areas are restored (estimated at approximately seven years following construction). Long term impacts would be associated with the proposed transmission line itself, and would extend for the life of the transmission line.

The applicant states that transmission towers would introduce high magnitude impacts for approximately one mile of the 12-mile scenic corridor. Within the one-mile segment near the crossing of I-84, the landscape character would appear more urban, and inconsistent with the remainder of the scenic highway segment due to the dominant appearance of the transmission towers. Outside of this segment, the applicant states that visual contrast would primarily be

⁴³¹ BLM ACEC's are also considered Protected Areas; see Section IV.F, *Protected Areas* of this order, See Section 3.3.2.2.

⁴³² Id. See Section 3.3.2.2 Attachment R-3 Section 4.0 for the applicant's evaluation of the proposed facility's anticipated impacts to the resource.

1 low due to screening from surrounding topography and the steep viewing angle and peripheral
2 view of the towers experienced by roadway travelers.

3
4 In addition to the towers several segments of new, graded access road would be located
5 between the proposed route and I-84 within this segment of scenic highway. While visible,
6 these roads would appear consistent with existing roads in the area.

7
8 The user experience of the resource is drivers along the freeway, which would presumably pass
9 through at very high speeds and only experience views of the facility for brief periods of time.
10 The applicant states that the proposed facility would be visible for approximately one mile of
11 the designated scenic area. The designated scenic area of I-84 in this area extends for
12 approximately 12 miles. Considering that the visual impact of the proposed facility would be
13 limited to a relatively short segment of visibility to drivers along the overall length of the 12
14 mile interstate freeway, the Department recommends Council find that the proposed facility
15 would not cause a significant adverse impact to the scenic resources and values of the
16 designated scenic resource portion of I-84.

17
18 Interstate 84, Huntington to Baker/Malheur County Line

19
20 Baker County Comprehensive Plan designates an approximately six-mile section of Interstate 84
21 between Huntington and the Baker/Malheur County line as a scenic corridor.⁴³³ The proposed
22 facility would run adjacent to the southwest of this entire scenic segment of I-84,
23 approximately 0.2 to 0.5 miles from the interstate freeway. A multi-use area (MUA) would be
24 located near Huntington, but would likely not be visible from the designated scenic portion of I-
25 84 in this area due to topographical screening.

26
27 Temporary construction-related activities, including clearing of ROW and pulling and tensioning
28 sites, would include construction-related vehicles and personnel. Impacts from ROW clearing
29 would persist until grassland areas are restored (estimated at approximately seven years
30 following construction). Long-term impacts would result from the operation of the facility and
31 new, bladed access roads located to the east, between I-84 and the facility. The transmission
32 towers would introduce a high level of contrast due to their proximity, size and color, and
33 would appear dominant in the landscape, according to the applicant. Access roads would be
34 located as close as 0.1 mile from I-84. The proposed facility would also affect the adjacent
35 scenery of the scenic corridor, with an overall change in scenic quality of the scenic highway.

36
37 The proposed facility would cause an impact to the scenic quality of the designated scenic
38 portion of the interstate freeway. However, in this area, as shown on Figure R-3-37 in ASC
39 Exhibit R Attachment R-3, the proposed facility passes in and out of a designated BLM utility
40 corridor. Utility corridors are designated with the intention of siting utility infrastructure such as

⁴³³ Id. See Section 3.3.2.2 and Attachment R-3 Section 5.0 for the applicant's evaluation of the proposed facility's anticipated impacts to the resource.

1 transmission lines, roads, pipelines, etc. Additionally, just south of the designated scenic I-84
2 corridor, the proposed facility would be located in an existing 138 kV utility line that would be
3 rebuilt adjacent to the 500 kV line; and, in order to avoid crossing I-84, the proposed route
4 stays to the west of the freeway, and thus stays mostly within the BLM designated utility
5 corridor. In general, collocating with existing infrastructure, such as an interstate freeway, is
6 supported as way of consolidating utility infrastructure and avoiding the impacts that would
7 from locating facilities elsewhere, away from the existing corridors. Finally, the area around this
8 region is Greater sage grouse habitat and so the proposed facility has been located near I-84 to
9 minimize impacts to habitat.

10
11 Based on the assessment provided here, the Department recommends the Council find that the
12 proposed facility would not cause a significant adverse impact to the scenic resources and
13 values of the designated scenic resource segment of I-84 in Baker County.

14
15 *Hells Canyon Scenic Byway All-American Road:*

16
17 The Hells Canyon Scenic Byway is a 208-mile horseshoe shaped route that includes portions of
18 OR 82, OR 86, and OR 350, and Forest Road 39 in Union, Wallowa, and Baker counties. The Hells
19 Canyon Management Plan (Management Plan) describes that the scenic quality of the route is
20 of national significance and is truly outstanding from any point of the byway. As explained in
21 the Management Plan, the Wallowa Whitman National Forest, Hells Canyon National
22 Recreation Area, Union County, Wallowa County and Baker County each have a primary
23 responsibility to identify, evaluate, protect, document, manage and review land use plans for
24 their jurisdiction along the route. As noted in this section for Baker and Union counties, the
25 counties have not adopted specific development criteria for the route. Other entities, including
26 ODOT, are responsible for evaluating, reviewing and implementing strategies to ensure that the
27 byway road is designed and maintained for safety and convenience including the needs of
28 bicyclists.⁴³⁴ The Management Plan only identifies Visual Quality Objectives designed to provide
29 measurable standards for development of US Forest lands, under the Visual Resource
30 Management section, and does not provide other development criteria for other areas along
31 the byway. The proposed facility, including 500-kV and 230-kV rebuild transmission structures,
32 would be visible from the Hells Canyon Scenic Byway on OR 86 just west of Baker City, between
33 highway MP 5 and MP 6.

34
35 The Management Plan states that the National Historic Oregon Trail Interpretive Center
36 (NHOTIC) is an important first stop when driving the scenic byway and is located just five miles
37 out of Baker City. Under the Scenic Views and Landmarks section it explains that NHOTIC is
38 located at Flagstaff Hill east of Baker City. This outstanding interpretive center honors the many
39 pioneers who passed this way on the Oregon Trail.⁴³⁵ In the Management Plan, NHOTIC is

⁴³⁴ Hells-Canyon-Management-Plan Jan 2004, Road Review, Highway Design and Maintenance and Commerce Plans.

⁴³⁵ Hells-Canyon-Management-Plan Jan 2004, 3. Scenic Views and Landmarks.

1 identified as a stopping point along the byway with scenic views, but does not establish that
2 views of NHOTIC from the scenic byway are important.

3
4 Viewer groups include roadway travelers commuting between Baker City and the towns of
5 Richland and Keating or touring on the scenic byway. Construction-related actions would be
6 visible to the north of the byway, including pulling and tensioning sites and construction of new
7 primitive roads and a small segment of new, bladed road located to the south. Construction-
8 related actions would be of high magnitude, resulting from the strong visual contrast in line and
9 texture of these features and close proximity in which they would be viewed.⁴³⁶ However, these
10 impacts would be temporary to short-term, lasting for the duration of short-term construction
11 in this area.

12
13 Where the proposed route crosses the scenic byway between highway MP 5 and MP 6, there is
14 an existing 230-kV transmission line which would be relocated and rebuilt in an expanded right-
15 of-way as part of the proposed facility. The applicant explains that the proposed 500-kV
16 transmission structures would appear large in scale and co-dominant within the landscape,
17 including existing transmission structures when viewed at close distances, thereby introducing
18 moderate visual contrast, and that the impact magnitude would be medium.⁴³⁷ The medium
19 magnitude impact would be visible for less than one minute, approximately 1 mile, when
20 traveling in either direction on the byway at approximately 45 mph by vehicle. The applicant
21 explains that bicyclists would experience views of the proposed facility for a short duration,
22 approximately 4 minutes, for less than 1 mile, traveling 15 mph in either direction on the
23 byway.⁴³⁸ The applicant asserts that viewer perception of the proposed facility would be
24 variable and would be experienced from a head-on vantage point, and within the foreground
25 (0.5-5 miles), therefore the viewer perception for all travelers would be medium.

26
27 The applicant's impact assessment accounts for minimization measures including transmission
28 structure design intended to minimize visual impacts including use of reduced structure height
29 (from 200 to 130 feet) with a natina finish, which has a rustic brown, appearance. In addition,
30 as described in Section IV.K.1.1., *Oregon Trail and National Historic Trails*, the Department
31 recommends Council consider applicant-proposed mitigation evaluated under other Council
32 standards to mitigate impacts equally under separate Council standards when the impact (e.g.
33 visual) and resource are the same or (when the resources) are within the same viewshed.

34
35 Hells Canyon Scenic Byway parallels an NRHP-eligible Oregon Trail/NHT segment (Oregon Trail,
36 Virtue Flat, Flat Segment and Flagstaff Hill (B2H-BA-282)) – these two resources would share a
37 viewshed based on proximity. Based on visual impacts to the trail segment, as evaluated in

⁴³⁶ B2HAPPD0c3-53 ASC Exhibit R - Errata Info 2019-03-28, Section 3.3.2.10.

⁴³⁷ B2HAPPD0c3-53 ASC Exhibit R - Errata Info 2019-03-28, Section 3.3.2.10.

⁴³⁸ In its comments on the DPO, the Oregon Department of Transportation (ODOT), maintains that views of the proposed facility are predominately head on (for auto traffic and bicyclists), which would put the transmission line in the foreground (up to 0.5 miles), and that the impact is medium. The applicant and Department concur. B2HAPPD0c8-1 All DPO Comments Combined-Rec'd 2019-05-22 to 08-22; B2HAPP DPO IPC Responses - ODOT Comments 2019-11-06.

1 Section IV.K., Council's Historic, Cultural and Archeological Resources standard, the Department
2 recommends Council require, in addition to the applicants' proposed design modification
3 (recommended Scenic Resources Condition 43), that visual impact mitigation also include
4 purchase of a conservation easement or land acquisition; interpretive signage; or funding for
5 public research or project benefiting the affected area. These types of measures, as presented
6 in Table HCA-4b of this order and found in Attachment S-9, would be consistent with Council's
7 definition of mitigation (OAR 345-001-0010(33) and would therefore mitigate visual impacts
8 within the shared viewshed of Hells Canyon Scenic Byway and the trail segment.

9
10 Additionally, the Hells Canyon Scenic Byway scenic resource is 208 miles long, and considering
11 the resource as a whole, the visual impacts of the proposed facility to approximately 1-mile of
12 the byway would affect 0.4 percent of the total byway length.⁴³⁹ The applicant maintains, and
13 the Department concurs, that given the limited overall visual impact to the byway and the
14 medium change in viewer perception, visual impacts would not preclude the Hells Canyon
15 Scenic Byway from providing the scenic value for which it is recognized.

16
17 Based on the reasoning and analysis presented above, and mitigated impact achieved through
18 design modifications and measures such as a conservation easement, land acquisition, or public
19 funding benefiting the affected area, as detailed in Table HCA-4b of this order, the Department
20 recommends the Council find that the proposed facility would not be likely to result in a
21 significant adverse visual impact to the Hells Canyon Scenic Byway.

22
23 *The Grande Tour Route:*

24
25 The Grande Tour Route is designated as an Oregon Tour Route and is an 80-mile loop route east
26 and southeast of La Grande through parts of Union and Baker counties and includes parts of
27 highways OR 82, OR 203, and OR 237. The Grand Tour Route Management Plan (Management
28 Plan) states that the scenic qualities of the Grand Tour Route are of statewide significance. The
29 Management Plan describes the general landscape and scenic qualities within the route region
30 and identifies four specific locations of scenic quality. One of the areas of scenic quality is Ladd
31 Marsh State Wildlife Management Area (Ladd Marsh WMA), which, as described in Section IV.F,
32 Protected Areas, would be crossed by the proposed facility and within 200 feet of the Morgan
33 Lake alternative route. The Management Plan specifies that scenic qualities of the byway are
34 managed through the county's land use regulations. As noted in the discussion under Union
35 County, the county has not designated Grande Tour Route as a Goal 5 resource nor adopted
36 specific development criteria for scenic resources or scenic byways. Moreover, the Ladd Marsh
37 WMA is managed by Oregon Department of Fish and Wildlife (ODFW). The Department
38 reviewed the ODFW Ladd Marsh Wildlife Area Management Plan and confirms that Ladd Marsh

⁴³⁹ B2HAPPDoc8-1 All DPO Comments Combined-Rec'd 2019-05-22 to 08-22; B2HAPP DPO IPC Responses - ODOT
Comments 2019-11-06.

1 is managed for wildlife and wetland preservation and is not managed for its scenic values or
2 resources.^{440, 441}

3
4 The proposed facility would be visible within 0.2 miles of the western most portion of the
5 Grand Tour Route along Foothills Road near Ladd Marsh WMA in Union County. A viewpoint
6 accessed off Foothill Road is located at the northwest corner of Ladd Marsh WMA and provides
7 a view over the marsh to the south and east. An existing 230-kV transmission line crosses along
8 the base of the hills just west of Foothill Road and then climbs the brush and forested slope of
9 Glass Hill Ridge. An existing buried gas pipeline also descends the hillside from the northwest
10 and crosses Foothill Road near the northwest corner of Ladd Marsh WMA.⁴⁴²

11
12 Construction-related actions would be visible to the west, including pulling and tensioning sites
13 and construction of new bladed road spurs. Construction-related actions would be of high
14 magnitude, resulting from the strong visual contrast in line and texture of these features and
15 close proximity in which they would be viewed. Viewers on Foothill Road would experience
16 construction-related impacts continuously as they pass through this localized impact area,
17 however, these impacts would be temporary and short-term.

18
19 Near Ladd Marsh WMA, potential visual impacts from the proposed facility would include views
20 of proposed 500-kV transmission structures, which would appear large in scale and co-
21 dominant with the landscape, including existing 230-kV H-frame transmission structures when
22 viewed at close distances, thereby introducing moderate visual contrast. By vehicle, bicycle, and
23 foot traffic on the scenic byway, the proposed facility would be visible for approximately three
24 miles when traveling northbound on Foothill Road, for approximately two miles when traveling
25 southbound, and would be present in the foreground distance zone (up to 0.5 miles). Although
26 the proposed facility would be viewed from a neutral or low position, the change in viewer
27 perception is described as high magnitude due to its location primarily in the
28 foreground/middle ground distance zone.

⁴⁴⁰ Ladd Marsh ODFW LMWA Management Plan April 2008.

⁴⁴¹ In its comments, ODOT disagrees that the impacts of the scenic byway would be less than significant because the Ladd Marsh Wildlife Management Area is one of four areas of scenic quality identified in the Grande Tour Management Plan. However, the Department reiterates that the scenic resource evaluated under the Council's Scenic Resources standard is the scenic byway, and not Ladd Marsh itself. ODOT continues by explaining that its recommended mitigation would be an alternative alignment to avoid all impacts to the intrinsic values of the Grande Tour Scenic Route. As discussed in Section III.A., *Transmission Corridor Selection*; EFSC standards for siting energy facilities do not require that the applicant compare alternatives to the proposed facility. Nor do they allow the Council to evaluate and consider alternatives not proposed in the application for site certificate. Further, Council's standard requires that the construction and operation of the facility, taking into account mitigation, are not likely to result in significant adverse impact to scenic resources or values, not that all impacts must be avoided.

⁴⁴² B2HAPPDoc3-53 ASC Exhibit R - Errata Info 2019-03-28, Section 3.3.2.10.

1 Based on the applicant’s assessment, views of the proposed facility from the Ground Tour
2 Route within the vicinity of Ladd Marsh WMA would result in a high magnitude change in
3 viewer perception because the proposed towers would appear dominant and would lower the
4 scenic quality component score for cultural modification.⁴⁴³ Importantly, due to existing utility
5 and road/highway infrastructure in this area (existing 230-kV transmission line and I-84), the
6 scenic byway would retain its cultural appearance, therefore the predicted overall resource
7 change would be medium. Of the approximately 80-miles of the scenic byway, the visual
8 impacts from the proposed facility from any mode of transportation would result for
9 approximately 4 percent of the Grande Tour Scenic Route (0.5-5 miles). Therefore, the
10 Department recommends Council find that, based on the relatively short segment of scenic
11 byway potentially impacted by proposed facility visibility compared to the overall byway length,
12 visual impacts of the proposed facility to the scenic byway would not preclude the scenic byway
13 from providing the overall scenic value for which it is recognized.⁴⁴⁴

14
15 To minimize potential adverse visual impacts from the proposed facility to the byway, in the
16 vicinity of Ladd Marsh WMA, the applicant proposes, and the Department recommends Council
17 impose, Scenic Resources Condition 2, requiring that, if the proposed route is selected by the
18 applicant, it would utilize design modifications (lattice frames with a natina finish), as follows:

19
20 **Recommended Scenic Resources Condition 2:** If, at final facility design, the transmission
21 line route crosses Ladd Marsh Wildlife Management Area in Union County, the certificate
22 holder shall select transmission structures to be constructed between approximately
23 Milepost 108 and Milepost 113 with design modifications including Lattice-frames with a
24 Natina finish.

25
26 Based on the above reasoning and evaluation of the applicant’s visual impact assessment, and
27 the reduced impact from design modifications imposed in recommended Scenic Resources
28 Condition 2, the Department recommends Council find that the proposed facility would not be
29 likely to result in significant adverse visual impacts to the Grand Tour Route.

30
31 *BLM, Baker Resource Area: Powder River Canyon – Keating*

32
33 The Powder River Canyon area includes approximately 5,500 acres of VRM Class II-managed
34 parcels within the Powder River.⁴⁴⁵ As described above, the VRM Class II designation means
35 that in accordance with the applicant’s proposed methods for establishing scenic resources that
36 should be afforded review and protection under the EFSC-Council’s Scenic Resources standard,
37 VMRM Class II managed areas should be considered under the EFSC-Council’s Scenic Resources

⁴⁴³ Applicant’s assessment provided in its responses to ODOT comments on the DPO, see B2HAPPDoc8-1 All DPO Comments Combined-Rec'd 2019-05-22 to 08-22; B2HAPP DPO IPC Responses - ODOT Comments 2019-11-06.

⁴⁴⁴ B2HAPPDoc8-1 All DPO Comments Combined-Rec'd 2019-05-22 to 08-22; B2HAPP DPO IPC Responses - ODOT Comments 2019-11-06.

⁴⁴⁵ BLM ACEC’s are also considered Protected Areas; see Section IV.F, *Protected Areas* of this order, See Section 3.3.2.5

1 standard. The western end of this area is approximately 5.7 miles east of the proposed facility;
2 the eastern end is more than 10 miles away.

3
4 As described in ASC Exhibit R, the Powder River Canyon scenic area covers the roadway corridor
5 and adjacent terrain near the Powder River, but indicated by the applicant’s viewshed model
6 analysis, views of the proposed facility would be blocked from a large portion of the area due to
7 topography and also due to distance from the proposed facility. Because of the combination of
8 both the limited visibility, as indicated by the viewshed models, and the distance of the
9 resource from the proposed facility, the Department recommends Council find that the
10 proposed facility would retain the existing character of the landscape, and the level of change
11 to the characteristic landscape would be low, therefore it is not likely to cause a significant
12 adverse impact to the scenic resources and values of the BLM Powder River Canyon – Keating
13 VRM Class II managed lands.

14
15 BLM, Baker Resource Area: Burnt River Canyon

16
17 Burnt River Canyon includes 10,700 acres of BLM-administered lands in the Burnt River Canyon
18 area, approximately 2.6 miles west of the community of Durkee in Baker County. The VRM Class
19 II management area includes the Burnt River, the surrounding canyon walls, and some of the
20 upland areas that sit above the canyon.⁴⁴⁶ The proposed facility would cross the Burnt River
21 Canyon area in two locations between MP 170.1-171.5 (two towers) and 172.5-173.0 (one
22 tower). However, in 2017, the BLM amended the Burnt River Canyon resource management
23 plan via the Record of Decision on the B2H-proposed facility and changed the VRM from Class II
24 to Class IV along the 250-foot wide right of way for the B2H-proposed facility. As such, the right
25 of way should not be considered an ~~EFSC~~ Scenic Resource under the Council’s standard.

26
27 In the eastern portion of the area, V-shaped canyon encloses the narrow valley floor. The
28 landscape is rugged with rough and varying textures of rock throughout the canyon. Further
29 west, the topography becomes less steep and enclosed. Burnt River Canyon Road follows the
30 Burnt River throughout the canyon; other human development within Burnt River Canyon
31 includes scattered rural development and native surface and paved roads. Views of the
32 proposed facility would be most visible where it crosses Burnt River Canyon Road, the primary
33 viewing platform in the area. The towers would be visible on the ridgeline of the canyon.
34 Temporary work areas and access roads may be visible from high elevation areas throughout
35 the area.

36
37 Finally, the Department notes that the BLM has authorized the proposed facility in this area,
38 which is an important consideration because the BLM is the landowner and manager of the
39 Burnt River area. The ~~EFSC~~ Council’s Scenic Resources standard is based on “scenic resources
40 and values identified as significant or important in...federal land management plans...” As such,

⁴⁴⁶Id. See Section 3.3.2.5 and Attachment R-3 Section 6.0 for the applicant’s evaluation of the proposed facility’s anticipated impacts to the resource.

1 considering that the agency that manages the Burnt River land and has identified the area has
2 having significant or important scenic value has authorized the proposed facility in the location
3 proposed in the EFSC application, the Department considers this relevant information
4 particularly to the EFSC Council's Scenic Resources standard. The language of the Council's
5 Scenic Resources standard relies upon scenic values identified in other agency's management
6 plans, so the Council may rely on the decisions of the land-managers who administer their plans
7 to inform its evaluation of the Scenic Resources standard.

8
9 Because the BLM has authorized the proposed facility to cross BLM-owned land in this area,
10 and specifically changed its own management plan for visual resources from VRM Class II to
11 VRM Class IV which means that activities may modify the landscape and changes can be high,
12 the Department recommends that the Council find that the proposed facility would not cause a
13 significant adverse impact to the scenic resources and values of the specific area within the
14 Burnt River Canyon Class IV~~I~~ managed area.

15
16 *BLM, Baker Resource Area: Brownlee Reservoir West*

17
18 The Brownlee Reservoir West area includes over 4,200 acres in four parcels of BLM-VRM Class II
19 managed land located west of and directly adjacent to Brownlee Reservoir, northeast of
20 Huntington in southeastern Baker County. The reservoir is on the Snake River. The proposed
21 facility would be located 2.1 miles from Brownlee Reservoir West at its closest point at the
22 southern end of the resource, and would parallel an existing 138-kV transmission line in this
23 area.⁴⁴⁷

24
25 The Snake River and Brownlee Reservoir and surrounding canyon are distinct natural features
26 within the landscape. Views are primarily enclosed by the valley; however, on the highlands
27 above the river, more expansive views of adjacent mountains are visible. Towers would likely
28 be visible but more than two miles distant, at the closest point, and would be visible only from
29 the higher elevations of Brownlee Reservoir West and not from the surface of the reservoir or
30 along the shore, which is the primary use and focus point for most visitors.

31
32 Because of the limited visibility of the proposed facility from Brownlee Reservoir West and
33 particularly because the proposed facility would not be visible from the reservoir or shoreline
34 the Department recommends that the Council find that the proposed facility would retain the
35 existing character of the landscape, and the level of change to the characteristic landscape
36 would be low and therefore would not cause a significant adverse impact to the scenic
37 resources and values of the Brownlee Reservoir West VRM Class II managed area.

38

⁴⁴⁷ Id. See Section 3.3.2.5 and Attachment R-3 Section 7.0 for the applicant's evaluation of the proposed facility's anticipated impacts to the resource. The BLM also manages land with VRM Class II at Brownlee Reservoir Northeast and Southeast, but these areas are in Idaho and located across the reservoir from the proposed facility in Oregon.

1 Oregon Trail ACEC

2

3 The Oregon Trail ACEC includes approximately 1,500 acres among seven separate parcels
4 located in Umatilla, Union, and Baker counties. Six of those parcels are within the analysis area
5 with potential visibility of the proposed facility. Some of the ACEC parcels were also included in
6 Section IV.F, *Protected Areas* and Section IV.L, *Recreation*. As described at the beginning of this
7 section, the visual resources impact assessment methodology was the same for all three
8 Council standards (Scenic Resources, Protected Areas, and Recreation) which include a visual
9 resources impact assessment as a component of the standard. Additionally, the National
10 Historic Oregon Trail is included in the assessment under the EFSC Council's Cultural, Historic,
11 and Archaeological Resources standard.

12

13 Each of the parcels in this ACEC is managed to preserve the historic resources and visual
14 qualities of these areas and as such, the applicant considers the parcels to be considered under
15 the EFSC Council's Scenic Resources standard. The Department agrees. The Baker Resource
16 Area RMP indicates that “[n]ew uses incompatible with maintaining visual qualities or providing
17 public interpretation will be excluded in a mile corridor.” The parcels within this ACEC also
18 include historic sites identified in the National Historic Oregon Trail Management Plan, each
19 with a high degree of visual sensitivity. Exhibit R further quotes from the Plan, stating that
20 “locations on the Oregon Trail which have few contemporary intrusions are particularly notable
21 examples of that landscape encountered by emigrants. These areas should be considered to
22 have a high degree of visual sensitivity; and the foreground and middleground should be
23 managed for protection of the historic landscape as a contributing feature of the Oregon Trail.”
24 It is important to note that in most instances, the ACEC is much larger than the Oregon Trail
25 segments that can be found within the ACEC.⁴⁴⁸

26

27 *Oregon Trail ACEC – Blue Mountain Parcel*

28

29 The Blue Mountain parcel is approximately 80 acres located in the Blue Mountains, on the
30 northeast side of I-84 about 12 miles northwest of La Grande in Umatilla County. The Blue
31 Mountain Parcel is located on a forested ridge. Views are enclosed due to vegetation; the
32 Oregon Trail runs through the parcel. The proposed facility would be less than a mile (0.9 mile)
33 from the Blue Mountain Parcel, but the proposed facility would be on the west side of I-84. The
34 proposed facility would not cross the parcel. Additionally, it is unlikely that the proposed facility
35 would be visible from the Blue Mountain Parcel as there is a ridge and existing conifer trees
36 that would screen the view. Because of the limited or absent visibility of the proposed facility
37 from Oregon Trail ACEC - Blue Mountain Parcel and because the proposed facility would be on
38 the other side of I-84 from the parcel, the Department recommends that the Council find that
39 the proposed facility would not cause a significant adverse impact to the scenic resources and
40 values of the Oregon Trail ACEC – Blue Mountain Parcel.

⁴⁴⁸ Id. See Section 3.3.2.5 and Attachment R-3 Section 8.0-12.0 for the applicant’s evaluation of the proposed facility’s anticipated impacts to the Oregon Trail ACECs.

41

Oregon Trail ACEC – NHOTIC Parcel

The National Historic Oregon Trail Information Center (NHOTIC) ACEC parcel is approximately 507 acres and is located on the north side of OR 86, approximately four miles northeast of Baker City. The NHOTIC Parcel contains the information center building and parking lot, as well as surrounding land with walking trails. The NHOTIC parcel is managed per VRM Class II objectives, requiring that the change in landscape character should be low such that the existing landscape character is retained. The proposed facility is located within a mile of the NHOTIC main building and within 0.02 mile of the western boundary of the NHOTIC parcel. The NHOTIC ~~was~~is also discussed in Section IV.F, *Protected Areas*.

As described in more detail in Section IV.F, *Protected Areas* standard the NHOTIC is located on the top of Flagstaff Hill and has extensive background views to the west across Baker Valley to the Blue Mountains and to the southeast across Virtue Flat. A trail network within the NHOTIC parcel provides visitor access to areas within the ACEC. Panorama Point is a lookout established outside of the NHOTIC parcel but included as a recreational opportunity within the NHOTIC. This lookout directs view to the west, which would be towards the proposed facility. The applicant has prepared visual photosimulations to demonstrate what the proposed facility may look like from certain vantage points at NHOTIC. See ASC Exhibit R, Attachment R-4, Figure R-4-4.

As the applicant explains, the NHOTIC parcel was designated to preserve the unique historic resource and visual qualities. The Oregon Trail ACEC specifically was designated to preserve the unique historic resource, the Oregon Trail, and visual qualities within this geographic area. Because no development is proposed within a half mile corridor centered on the Oregon Trail within the ACEC, the resource values for which the NHOTIC parcel was designated to protect would not be impacted by the proposed transmission line.⁴⁴⁹

The number of towers visible would also vary depending on viewer position within the ACEC. As discussed in detail in Exhibit L and in the discussion of the Protected Areas standard, to mitigate for potential visual impacts, the applicant proposes to use a modified tower structure, consisting of H-frame structure type with a natina (brown-weathered coloring) for towers proposed to be located directly west of the NHOTIC. There is an existing H-frame 230 kV transmission line in this area, visible from NHOTIC, and the proposed modified tower structure in this location would reduce visual impacts of the proposed facility by mimicking the existing H-frame 230 kV transmission line, though the proposed facility would have larger structures and would be made of steel, not wood.

To reduce potential visual impacts to the Oregon Trail ACEC – NHOTIC Parcel, NHOTIC recreation site, and VRM II area, and to incorporate the proposed mitigation measures, the

⁴⁴⁹ Id. See Section 3.3.2.5, page R-82.

1 applicant has proposed, and the Department recommends, that the Council include the
2 following condition in the site certificate:

3
4 **Recommended Scenic Resources Condition 32:** ~~At final facility design, During~~
5 ~~construction, to avoid significant adverse impacts to the scenic resources at the National~~
6 ~~Historic Oregon Trail Interpretative Center,~~ the certificate holder shall ~~select~~ construct
7 ~~the facility using tower transmission structures, to be constructed that meet the~~
8 ~~following criteria in the vicinity of the National Historic Oregon Trail Interpretive Center~~
9 between approximately Milepost 145.1 and Milepost 146.6, with the following design
10 modifications:

- 11 a. H-frames;
- 12 b. Tower height no greater than 130 feet; and
- 13 c. Weathered steel (or an equivalent coating).

14 Additionally, the certificate holder shall construct the facility using tower structures that
15 meet the following criteria between approximately Milepost 146.6 and Milepost 146.7:

- 16 a. H-frames;
- 17 b. Tower height no greater than 154 feet; and
- 18 c. Weathered steel (or an equivalent coating).

19
20 Additionally, recommended Historic, Cultural, and Archaeological Resources Condition 2,
21 requires the submission of Attachment S-9, a final Historic Properties Management Plan
22 (HPMP). The HPMP includes applicant-represented mitigation measures which include but are
23 not limited to, the purchase of a conservation easement or land acquisition; interpretive
24 signage; or funding for public research or project benefiting the affected area for impacted
25 NHT/Oregon Trail segments, including the Virtue Flat and the Flagstaff Hill segments. These
26 types of mitigation measures, as presented in Table HCA-4b of this order, would be consistent
27 with Council’s definition of mitigation (OAR 345-001-0010(33) and would therefore mitigate
28 visual impacts within the shared viewshed of NHOTIC and the trail segment.

29
30 It is also important to note that there were alternative route options previously proposed in the
31 area around NHOTIC, including a route to the east of Flagstaff Hill and the NHOTIC center
32 (“Virtue Flat alternative”), and other routes near the current proposed route. The route to the
33 east of the center was eliminated from consideration due to impacts to sage grouse habitat and
34 impacts to an important Off Highway Vehicle (OHV) recreation area. The alternatives near the
35 current proposed route were eliminated to reduce impacts to irrigated agriculture. The
36 proposed route follows very close to the existing 230 kV transmission line in this area, including
37 using the existing 230 kV line right of way for the proposed facility and rebuilding the 230 kV
38 line. Finally, the Department notes that the BLM has authorized the proposed facility in this
39 area, which is an important consideration because the BLM is the landowner and manager of
40 NHOTIC. The ~~EFSC Council’s~~ Scenic Resources standard is based on “scenic resources and values
41 identified as significant or important in...federal land management plans...” As such, by
42 authorizing the route in its Record of Decision (ROD), the federal agency (BLM) that administers
43 the Management Plan for NHOTIC is authorizing the placement of the proposed facility in this
44 location as permissible within the scenic designations in the Management Plan. The language of

1 the Council’s Scenic Resources standard relies upon scenic values identified in other agency’s
2 management plans, so the Council may rely on the decisions of the land-managers who
3 administer their plans to inform its evaluation of the Scenic Resources standard. Considering
4 that the agency that manages the NHOTIC land and has identified the NHOTIC has having
5 significant or important scenic value has authorized the proposed facility in the location
6 proposed in the ASC, the Department considers this relevant information particularly to the
7 EFSC Scenic Resources standard.

8
9 Based on the assessment presented here, and incorporating recommended mitigation, the
10 Department recommends that the Council find that the proposed facility would not cause a
11 significant adverse impact to the scenic resources and values of the Oregon Trail ACEC –
12 NHOTIC.

13
14 *Oregon Trail ACEC – White Swan Parcel*

15
16 The White Swan parcel of the ACEC is approximately 2.9 miles northeast of the proposed
17 facility, east of NHOTIC and south of “Virtue Flat” area. Based on the results of the applicant’s
18 viewshed modelling, the proposed facility would not be visible from the White Swan parcel of
19 the ACEC. As such, there would be no impact to the scenic resources and values of the Oregon
20 Trail ACEC – White Swan Parcel.

21
22 *Oregon Trail ACEC – Straw Ranch 2 Parcel*

23
24 The Straw Ranch 2 Parcel is an approximately 230- to 240-acre parcel located approximately 1.1
25 miles from the proposed facility. The Straw Ranch 2 Parcel is not accessible from existing roads,
26 and there are no recreational facilities located within the parcel, and is mostly surrounded by
27 private land. The proposed route does not cross the parcel.

28
29 Long term impacts would be primarily associated with the transmission line and towers. Where
30 the proposed route would be visible, it would generally follow the alignment of existing 69- and
31 138-kV transmission lines. Potential views to the south toward the proposed facility would be
32 primarily blocked by a ridgeline approximately 0.4 mile southwest of the ACEC. Views to the
33 west and northwest toward the proposed facility would not be blocked; however, in this area,
34 the proposed facility would be located four miles or more from the ACEC. Further,
35 Recommended Historic, Cultural, and Archaeological Resources Condition 2, requires the
36 submission of Attachment S-9, a final Historic Properties Management Plan (HPMP). The HPMP
37 includes applicant-represented mitigation measures which include but are not limited to, the
38 purchase of a conservation easement or land acquisition; interpretive signage; or funding for
39 public research or project benefiting the affected area for impacted NHT/Oregon Trail
40 segments. These types of mitigation measures, as presented in Table HCA-4b of this order,
41 would be consistent with Council’s definition of mitigation (OAR 345-001-0010(33) and would
42 therefore mitigate visual impacts within the shared viewshed of Straw Ranch 2 trail segment.
43

1 Based on the assessment presented here, and particularly considering the distance from the
2 proposed facility to the area, the lack of ~~publically~~publicly available access points and that the
3 BLM has approved the proposed facility route in this area, the Department recommends that
4 the Council find that the proposed facility would not cause a significant adverse impact to the
5 scenic resources and values of the Oregon Trail ACEC – Straw Ranch 2.

6
7 *Oregon Trail ACEC – Straw Ranch 1 Parcel (Hill Creek Road)*

8
9 The Straw Ranch Parcel 1 is approximately 160 acres, and the proposed route would pass the
10 Straw Ranch ACEC Parcel 1 approximately 0.1 mile to the north. New primitive and graded
11 roads associated with the proposed route would be developed immediately north of and
12 approximately 0.4 mile east of the ACEC. It has unimproved road access at the south end of the
13 parcel, and no recreation facilities. The proposed facility was purposefully routed to avoid
14 crossing the Straw Ranch 1 parcel. The route in this area passes close to the Straw Ranch 1
15 parcel in order to avoid sage grouse core habitat. Straw Ranch 1 parcel was also considered in
16 Section IV.F, *Protected Areas*.

17
18 The applicant states that the proposed facility would create moderate visual contrast against
19 the existing landscape and appear co-dominant with I-84 to the southwest and the existing
20 transmission line crossing through the ACEC. The proposed towers would reduce the quality of
21 the scenery immediately adjacent to the ACEC, but would be consistent with the existing
22 landscape modification, including the existing 69-kV and 138-kV transmission lines that cross
23 the ACEC. The existing transmission lines cross the National Historic Oregon trail in the Straw
24 Ranch 1 ACEC, see ASC Exhibit R, Attachment R-3, Figure R-3-11. The BLM, which manages the
25 Straw Ranch 1 ACEC as well as surrounding land, has approved the proposed facility in this area.
26 As noted above, Recommended Historic, Cultural, and Archaeological Resources Condition 2,
27 requires the submission of Attachment S-9, a final Historic Properties Management Plan
28 (HPMP). The HPMP includes applicant-represented mitigation measures which include but are
29 not limited to, the purchase of a conservation easement or land acquisition; interpretive
30 signage; or funding for public research or project benefiting the affected area for impacted
31 NHT/Oregon Trail segments. These types of mitigation measures, as presented in Table HCA-4b
32 of this order, would be consistent with Council’s definition of mitigation (OAR 345-001-0010(33))
33 and would therefore mitigate visual impacts within the shared viewshed of Straw Ranch 1
34 Parcel and trail segment. Based on the assessment presented here, and particularly considering
35 that the BLM has approved the proposed facility route in this area and that the route was sited
36 close to the Straw Ranch 1 parcel in order to avoid sage grouse core habitat, the Department
37 recommends that the Council find that the proposed facility would not cause a significant
38 adverse impact to the scenic resources and values of the Oregon Trail ACEC – Straw Ranch 1.

39
40 *Oregon Trail ACEC – Powell Creek Parcel*

41
42 The Powell Creek Parcel includes approximately 70 acres and is located slightly east of I-84 and
43 the Burnt River, about 0.6 miles southeast of Dixie and five miles north of Lime. The proposed
44 facility would be located approximately 1.2 miles from the parcel; however, it is important to

1 note that I-84 would be between the Powell Creek parcel and the proposed facility. The
2 proposed facility does not cross Powell Creek parcel, and in this area, the National Historic
3 Oregon Trail is east of I-84, while the proposed facility is west of I-84. There are no recreation
4 facilities within the Powell Creek Parcel. Existing development includes I-84 and existing 69- and
5 138-kV transmission lines located approximately 0.3 miles to the west of the parcel, and
6 existing gravel-surfaced roads that travel through the parcel and along the western boundary.
7

8 It is described by the applicant that views of the proposed facility would be equally head-on and
9 peripheral, depending on the viewer's location and viewing direction from within the Powell
10 Creek Parcel, and would be experienced from an inferior vantage point. Three sky-lined towers
11 would support the span of the conductor across Rye Valley Lane and therefore would appear
12 prominent on the ridgeline. Additionally, an approximately 735-acre work area would be
13 located to the southwest along Rye Valley Road and would introduce strong visual contrast
14 during the temporary construction period. However, impacts from ROW clearing and other
15 construction-related activities are short-term and would be restored after completion of
16 construction.
17

18 Considering that the proposed facility is over one mile from the Powell Creek parcel and that I-
19 84 is between the parcel and the proposed facility, as well as the limited public access to Powell
20 Creek, the Department recommends that the Council find that the proposed facility would not
21 cause a significant adverse impact to the scenic resources and values of the Oregon Trail ACEC –
22 Powell Creek.
23

24 Powder River Canyon Wild and Scenic River and ACEC

25

26 The Powder River is designated as a Wild and Scenic River (WSR) for 11.7 miles, covering 2,385
27 acres, from the Thief Valley Dam to Oregon Highway 203 within the BLM Vale District. The WSR
28 is part of Powder River Canyon ACEC. The proposed facility is located approximately 1.4 miles
29 from the upland border of the Powder River Canyon ACEC. The Powder River ACEC and WSR is
30 also considered in Section IV.F *Scenic Resources* and Section IV.L, *Recreation*.⁴⁵⁰ In this area, the
31 proposed facility would be parallel to an existing 230 kV transmission line.
32

33 The ACEC includes dirt roads and an existing 230-kV transmission line to the west. Wind
34 turbines are visible in the distance outside the ACEC boundary. Although there is existing
35 development within and visible from the ACEC, the landscape character is described by the
36 applicant as naturally appearing.
37

38 The applicant's modeling concludes that the proposed facility would not be visible within the
39 Powder River canyon or from the river; therefore, there would be no impacts to the scenery of
40 the Powder River WSR. In the upland portion of the ACEC, the proposed facility would be visible

⁴⁵⁰ Id. See Section 3.3.2.5 and Attachment R-3 Section 13.0 for the applicant's evaluation of the proposed facility's anticipated impacts to the resource.

1 approximately 1.4 miles away. In this area, the proposed facility would be located parallel to an
2 existing 230-kV transmission line, though some towers would be sky-lined.

3
4 The purpose of the WSR is to protect the river and the user experience from the river. The
5 proposed facility would not be visible from the WSR portion of the river. Views from the upland
6 portion of the ACEC to the proposed facility would occur, but at a distance greater than one
7 mile. Based on this assessment, the Department recommends that the Council find that the
8 proposed facility would not cause a significant adverse impact to the scenic resources and
9 values of the Powder River Canyon WSR and ACEC.

10

11 BLM Malheur Resource Area: Oregon Trail ACEC - Birch Creek

12

13 The Birch Creek ACEC includes segments of the Oregon National Historic Trail. It is located
14 approximately two miles south of Farewell Bend, west of I-84. As shown in ASC Exhibit R,
15 Attachment R-3, Figure R-3-14 the proposed facility would be located 0.2 miles northeast of the
16 Birch Creek Parcel.⁴⁵¹ Birch Creek ACEC is also considered in Section IV.F., *Protected Areas*.

17

18 As described in Section IV.F., *Protected Areas*, the proposed facility in this area would include
19 the rebuild of 1.1 miles of the existing ~~Quarts-Quartz~~ to Weiser 138-kV transmission line to a
20 new ROW, and the 500 kV proposed transmission line would be located in the existing 138-kV
21 transmission line ROW, which is owned and operated by the applicant. In proposing to site the
22 proposed transmission line at this location, and to reduce visibility from the ACEC parcel, the
23 applicant has located the line as far north as feasible without encroaching on active agricultural
24 areas.⁴⁵² To further reduce visibility, the applicant proposes to use shorter stature H-frame
25 structures ranging in height from 65 to 100 feet for towers between MP 198 and MP 199. This
26 structure type, combined with constructing towers at lower elevations than the ACEC, would
27 minimize the proportion of the facility that could be viewed from the ACEC due to screening by
28 topography.⁴⁵³ To ensure compliance with this proposal, recommended Scenic Resources
29 Condition ~~43~~, provided below, would require the applicant to incorporate these mitigation
30 measures. The applicant has included visual photosimulations of the proposed facility in the
31 area of Birch Creek ACEC, included in ASC Exhibit L, Attachment L-4, Figures L-4-7 and 8.

32

⁴⁵¹ Id. See Section 3.3.2.6 and Attachment R-3 Section 14.0 for the applicant’s evaluation of the proposed facility’s anticipated impacts to the resource.

⁴⁵² Upon review of a draft of the ASC, the Department requested that the applicant consider “potential mitigation measures such as alternative structure finishes (e.g., natina finish) and alternative structure types (e.g., H-frame) and then prepare visual simulation and re-conduct the impact assessment to scenic resources at Birch Creek ACEC.” ASC Exhibit L, pages L-45 through L-46. As discussed in detail in ASC Exhibit L, pages L-46 through L-47, the applicant evaluated different types and locations of structures and, ultimately, determined that the proposed “Birch Creek North Route” would effectively mitigate impacts and ensure no adverse visual impacts on this protected area.

⁴⁵³ B2HAPPDoc3-20 ASC 12_Exhibit L_Protected Areas_ASC 2018-09-28, Section 3.5.6.

1 With its proposed mitigation measures, views of the towers would still primarily be head-on
2 and experienced by both stationary and transient viewers. The structures would result in weak
3 visual contrast and appear subordinate to the landscape. The applicant's analysis indicates that,
4 though visible, the 500 kV transmission towers would not substantially lower the quality of the
5 adjacent scenery outside the Birch Creek ACEC Parcel. The landscape character would remain
6 "historic" due to the prominence of natural features in the viewshed; and the overall scenic
7 quality of the landscape would remain low ("class C"). Because the proposed facility would be
8 sited outside the Birch Creek ACEC Parcel, there would be no changes to the landscape within
9 the boundary of the Birch Creek ACEC Parcel. The magnitude of impact to both resource change
10 and viewer perception would be medium. The proposed facility would conform to VRM Class II
11 objectives within the Birch Creek Parcel, and is therefore consistent with BLM's VRM direction
12 to protect visual values within the Birch Creek Parcel.⁴⁵⁴

13
14 Additionally, as shown on ASC Exhibit L, Attachment L-3, Figure L-3-13, the proposed facility in
15 this area exits a BLM designed utility corridor just east of the ACEC; the proposed facility would
16 then utilize the existing 138 kV corridor so as to not create a new ROW, and then the proposed
17 facility trends northwest/southeast in order to reenter the BLM utility corridor along I-84. In
18 this area, the Department concludes that the proposed facility has been sited to reduce impacts
19 to the Birch Creek ACEC parcel, while reducing impacts to other lands (including farming and
20 sage grouse habitat in this area) as well as staying along the BLM utility corridor near I-84.⁴⁵⁵

21 Further, Recommended Historic, Cultural, and Archaeological Resources Condition 2, requires
22 the submission of Attachment S-9, a final Historic Properties Management Plan (HPMP). The
23 HPMP includes applicant-represented mitigation measures which include but are not limited to,
24 the purchase of a conservation easement or land acquisition; interpretive signage; or funding
25 for public research or project benefiting the affected area for impacted NHT/Oregon Trail
26 segments. These types of mitigation measures, as presented in Table HCA-4b of this order,
27 would be consistent with Council's definition of mitigation (OAR 345-001-0010(33) and would
28 therefore mitigate visual impacts within the shared viewshed of Birch Creek Parcel and trail
29 segment.

30
31 The BLM approved the proposed facility route in this area and amended the Southeastern
32 Oregon Resource Management Plan to reclassify the area potentially impacted by the proposed
33 facility from VRM Class III to VRM Class IV. The language of the Scenic Resources standard relies
34 upon scenic values identified in others' management plans, so the Council may rely on the
35 decisions of the land-managers who administer their plans to inform its evaluation of the Scenic
36 Resources standard.⁴⁵⁶ ~~Finally, it is important to note that the BLM has approved the proposed~~
37 ~~facility route in this area.~~ Based on this assessment and the applicant-represented design
38 modification, the Department recommends that the Council find that the proposed facility

⁴⁵⁴ Id.

⁴⁵⁵ Id. ASC Exhibit L, Attachment L-3, Figure L-3-13.

⁴⁵⁶ B2HAPPDoc8-002 DPO Applicant Comment IPC Stokes 2019-06-20 to 08-22.

1 would not cause a significant adverse impact to the scenic resources and values of the Birch
2 Creek ACEC.

3
4 To minimize potential adverse visual impacts to the Birch Creek ACEC, and to incorporate the
5 applicant’s proposed mitigation measures, the applicant proposes, and the Department
6 recommends, that the Council include the following condition in the site certificate:

7
8 **Recommended Scenic Resources Condition 43:** ~~At final facility design, During~~
9 ~~construction, to avoid significant adverse impacts to the scenic resources at the Birch~~
10 ~~Creek Area of Critical Environmental Concern,~~ the certificate holder shall select
11 transmission structures, to be constructed in the vicinity of Birch Creek Area of Critical
12 Environmental Concern ~~construct the facility using tower structures that meet the~~
13 ~~following criteria~~ between approximately Milepost 197.9 and Milepost 199.1, with
14 design modifications including H-frame structures, with structure height not to exceed
15 100 feet. ~~Milepost 199.1 and Milepost 197.9:~~
16 ~~a. H-frames; and~~
17 ~~b. Tower Hheight no greater than 100 feet.~~

18
19 BLM Malheur Resource Area: Oregon Trail ACEC – Tub Mountain

20
21 Tub Mountain Parcel ACEC includes approximately 5,900 acres of BLM-administered VRM Class
22 II land, in a long, narrow geographic area in northeastern Malheur County. The Tub Mountain
23 parcel is located between I-84 and U.S. Highway 26. The ACEC includes one interpretive site at
24 Alkali Springs, which was the “nooning” spot for wagon trains leaving Vale. The ACEC is remote
25 and accessible only by local gravel roads. The proposed facility would run along the eastern and
26 southern boundary of the ACEC approximately 0.5 mile from the ACEC at its closest point and
27 approximately 1.5 miles east of the Alkali Springs interpretive site.⁴⁵⁷

28
29 The applicant describes the view to the northwest from the Tub Mountain Parcel as gently
30 rolling terrain in the foreground that subtly transitions to steeper terrain in the background.
31 The Old Oregon Trail Road travels north-south through the majority of the Tub Mountain Parcel
32 and is a native-surfaced, two-track maintained by Malheur County that is roughly parallel to the
33 Oregon Trail route. The landscape character is natural appearing. Scenic quality of the existing
34 landscape for the Oregon Trail ACEC – Tub Mountain Parcel is considered low (Class C). The
35 parcel has no developed recreation facilities, and from lower elevation spots, the views are
36 limited; however, views from higher elevations extend to the background distances throughout
37 the parcel.

38
39 The proposed facility would be the visible from certain portions from the ACEC. Viewers from
40 Alkali Springs would have views of the proposed facility transmission towers to the east that

⁴⁵⁷ B2HAPPDoc3-35 ASC 18_Exhibit R_Scenic Resources_ASC 2018-09-28, Section 3.3.2.6 and Attachment R-3 Section 15.0 for the applicant’s evaluation of the proposed facility’s anticipated impacts to the resource.

1 would be partially blocked by vegetation, at approximately 1.5 miles distant. From the Old
2 Oregon Trail Road or the Oregon Trail route, the proposed facility would be generally located to
3 the east, and most towers would either not be visible or only the top portions would be visible.
4 The applicant explains that some towers would be sky-lined and some backdropped depending
5 on location within the Tub Mountain Parcel.
6

7 As assessed in Section IV.F., *Protected Areas*, the transmission line has been sited outside the
8 Tub Mountain ACEC Parcel, and there would be no change to the landscape within the
9 boundary of the lands managed under VRM Class II. However, Recommended Historic, Cultural,
10 and Archaeological Resources Condition 2, requires the submission of Attachment S-9, a final
11 Historic Properties Management Plan (HPMP). The HPMP includes applicant-represented
12 mitigation measures which include but are not limited to, the purchase of a conservation
13 easement or land acquisition; interpretive signage; or funding for public research or project
14 benefiting the affected area for impacted NHT/Oregon Trail segments. These types of
15 mitigation measures, as presented in Table HCA-4b of this order, would be consistent with
16 Council's definition of mitigation (OAR 345-001-0010(33) and would therefore mitigate visual
17 impacts within the shared viewshed of Alkali Springs trail segment. Consequently, the applicant
18 concludes that the proposed facility would conform to the BLM management standard and is
19 consistent with BLM's management of the Tub Mountain Parcel's visual qualities.⁴⁵⁸ As shown
20 on ASC Exhibit R, Attachment R-3, Figure R-3-14, the proposed facility has been sited in this
21 area to avoid other impacts, specifically sage grouse habitat, and is also located on BLM land to
22 avoid private land. Additionally, the proposed route in this area connects to a BLM designated
23 utility corridor northeast of the Tub Mountain ACEC near I-84 Highway, and the location of the
24 route minimizes impacts to multiple resources, recognizing that there ~~will~~would be visual
25 impacts to the Tub Mountain ACEC. The BLM, the manager of Tub Mountain ACEC and the land
26 upon which the proposed route is located in this area (which is not Tub Mountain ACEC) has
27 approved the proposed facility route via its ROD. Based on this assessment, the Department
28 recommends that the Council find that the proposed facility would not cause a significant
29 adverse impact to the scenic resources and values of the Birch Creek ACEC.
30

31 BLM Malheur Resource Area: Sugarloaf Butte

32

33 Sugarloaf Butte includes approximately 400 acres of BLM-administered VRM Class II lands north
34 of Bully Creek Reservoir in Malheur County. The proposed facility would be located 1.6 miles
35 south of Sugarloaf Butte.⁴⁵⁹
36

37 As explained in Exhibit R, Sugarloaf Butte terrain consists of flat-to-rolling foothills dissected by
38 numerous small drainages that create sloping soft, horizontal, and undulating lines. Vegetation
39 consists of low-growing grasses stippled with sagebrush. The landscape appears vast and open

⁴⁵⁸ Id.

⁴⁵⁹ Id. See Section 3.3.2.6 and Attachment R-3 Section 16.0 for the applicant's evaluation of the proposed facility's anticipated impacts to the resource.

1 with panoramic views. Human development is limited and primarily includes native surface
2 roads. The landscape lacks distinct features and variety and is naturally evolving, due to the
3 very limited human intervention. Scenic quality of the existing landscape ~~for~~is considered low.
4 Viewers are limited and may include individuals traveling along the roads or participating in
5 dispersed recreation.

6
7 The proposed facility transmission towers would be sky-lined in certain locations visible from
8 Sugarloaf Butte. Viewers traveling along roads within Sugarloaf Butte would see towers both
9 head-on and peripherally from a neutral vantage points; dispersed recreators could see towers
10 either head-on or peripherally. However, because of the remoteness of this resource, actual
11 viewer exposure would be limited.

12
13 There would be no changes to the landscape within the geographic area designated as VRM
14 Class II. The proposed facility in this area is not located on the Sugarloaf Butte VRM II area, but
15 is still located on BLM land. The proposed facility route in this area was specifically designed to
16 avoid impacts to irrigated agriculture and private land near Vale, while also minimizing impacts
17 to sage grouse core habitat. The BLM has approved the proposed route in this area, on BLM
18 land, via its record of decision. Based on this assessment, the Department recommends that the
19 Council find that the proposed facility would not cause a significant adverse impact to the
20 scenic resources and values of the BLM Sugarloaf Butte VRM II area.

21
22 *BLM Malheur Resource Area: Oregon Trail – Keeney Pass ACEC*

23
24 The Keeney Pass area includes approximately 1,015 acres of BLM-administered VRM Class II
25 lands southeast of Vale. This area forms a long, narrow corridor extending for more than six
26 miles in a generally northwest-southeast direction. The southern boundary of this linear ACEC is
27 approximately 6.3 miles from the proposed facility at its closest point. While the applicant's
28 analysis has shown that the proposed facility may be visible from the Keeney Pass ACEC, at a
29 distance of over 6 miles, visibility ~~will~~would be limited and ~~will~~would not dominate the
30 viewshed. As such, the Department recommends that the Council find that the proposed facility
31 would not cause a significant adverse impact to the scenic resources and values of the BLM
32 Keeney Pass ACEC VRM II area.

33
34 *BLM Malheur Resource Area: Lower Owyhee River*

35
36 The Lower Owyhee River resource area includes 11,291.17 acres. The area crossed by the
37 proposed facility was formerly designated as VRM Class II, but the BLM amended its plan as
38 part of its ROD for the B2H project, and the area is now designated VRM Class IV. The resource
39 is coincident with the Owyhee River below the Dam ACEC and SRMA, with the exception of the
40 areas located to the north and west of the ACEC/SRMA. The proposed route crosses the
41 northern portion of the Lower Owyhee River area and would be visible from the Lower Owyhee
42 Canyon Watchable Wildlife Area and Owyhee Lake Road. A ridgeline at the northern portion of
43 the Lower Owyhee River area provides a "gateway" to the resource. The proposed route would
44 be located on the northern side of this ridgeline; consequently, visibility is limited to two towers

1 located approximately 1.0 mile away. Additional assessment is included in Section IV.F,
2 *Protected Areas*.

3
4 As described in Section IV.F., *Protected Areas*, views of the proposed facility from Owyhee Lake
5 Road would be primarily intermittent due to screening by topography. When viewed from the
6 interpretive site, the transmission line features would be primarily behind or adjacent to the
7 viewer, and therefore considered primarily peripheral. Viewer perception would be low. The
8 application states that the proposed facility would result in long-term visual impacts to the
9 Owyhee River below the Dam ACEC, which would be medium intensity as measured by medium
10 resource change, and low viewer perception. However, the Owyhee River Below the Dam ACEC
11 would continue to provide the scenic resource value and recreation opportunity identified as
12 valued attributes of the Owyhee River Below the Dam ACEC, since the proposed transmission
13 line features would not be visible from the majority of the canyon where specific scenic
14 features have been identified in the 2002 Southeastern Oregon Resource Management Plan.
15 VRM Class II objectives would be achieved within the Owyhee River below the Dam ACEC, since
16 the landscape character and quality of the resource would not change.

17
18 It is also important to note that the proposed facility was purposefully sited outside of the ACEC
19 itself, and the Department understands that this decision was made by the BLM and finalized
20 on the Record of Decision (ROD). It is also noted that this decision by the BLM moved the
21 facility from public land (BLM land) onto a short crossing of private land. Also, as shown on
22 Attachment L, Figure L-3-20, the proposed facility is within a BLM designated utility corridor
23 until it must exit the corridor at the northern point of the ACEC, which is the location where the
24 proposed facility would cross Owyhee Lake Road and be somewhat visible from the interpretive
25 site; however, here, based on the BLM's decision, the facility leaves public (BLM) land in order
26 to avoid impacting the BLM ACEC, but as a consequence, crosses private land. Finally, as
27 described in ASC Exhibit R and here, the BLM has reclassified the area crossed by the proposed
28 facility from VRM Class II to VRM Class IV. The EFSC Scenic Resources standard is based on
29 "scenic resources and values identified as significant or important in...federal land management
30 plans..." As such, by issuing this route in its ROD, the federal agency (BLM) that administers the
31 Management Plan for Owyhee River is authorizing the placement of the proposed facility in this
32 location is permissible within the scenic designations in the Management Plan. The language of
33 the Scenic Resources standard relies upon scenic values identified in others' management
34 plans, so the Council may rely on the decisions of the land-managers who administer their plans
35 to inform its evaluation of the Scenic Resources standard. Considering that the agency that
36 manages the Owyhee River land and has identified the Owyhee River as having significant or
37 important scenic value has authorized the proposed facility in the location proposed in the EFSC
38 application, the Department considers this relevant information particularly to the Scenic
39 Resources standard.

40
41 Based on this analysis, the Department recommends that the Council find that the proposed
42 facility would not cause a significant adverse impact to the scenic resources and values of the
43 Owyhee River Below the Dam.

44

1 BLM Malheur Resource Area: Succor Creek

2

3 Succor Creek is a BLM VRM Class II area, with 10,800 acres that include the highlands
4 surrounding the Succor Creek State Natural Area (SNA).⁴⁶⁰ The area is approximately 4 miles
5 southwest of the proposed facility. The proposed route would not be visible from a majority of
6 the area. Where visible, at a distance of more than four miles, the views would be limited and
7 the proposed facility would not dominate the landscape. Considering the limited visibility, the
8 Department recommends that the Council find that the proposed facility would not cause a
9 significant adverse impact to the scenic resources and values of the Succor Creek VRM Class II
10 area.

11

12 BLM Owyhee Resource Area: Jump Creek Canyon and Jump Creek ACEC

13

14 The Jump Creek Canyon area includes two parcels of BLM-administered lands located in
15 western Owyhee County, Idaho.⁴⁶¹ Most of the area is managed as VRM Class II; with a narrow
16 band along Jump Creek managed as VRM Class I. This ACEC is located approximately seven
17 miles southwest of Marsing, Idaho. While the proposed facility would run adjacent to the
18 northern edge of the ACEC, this portion is entirely within the State of Idaho and therefore out
19 of EFSC jurisdiction. The nearest Oregon-portion of the proposed facility to the Jump Creek
20 Canyon ACEC is approximately five miles distant. At this distance, the proposed facility is
21 unlikely to be visible and as such, the Department recommends that the Council find that the
22 proposed facility would not cause a significant adverse impact to the scenic resources and
23 values of the Jump Creek Canyon and Jump Creek ACEC VRM Class II and I areas.

24

25 USFS, Wallowa-Whitman National Forest: VQO 1

26

27 The VQO 1 area is an approximately 185-acre linear corridor managed by the USFS as “VQO
28 Retention.”⁴⁶² This area overlaps with a portion of the Blue Mountain Forest Wayside identified
29 by Union County, and Blue Mountain State Scenic Corridor managed by OPRD; however, it
30 includes some additional areas along the Old Emigrant Hill Scenic Frontage Road within the
31 Wallowa-Whitman National Forest. The proposed facility would be located on the crest of the
32 ridgeline to the northeast of the area. The proposed facility in this area would be located in the

⁴⁶⁰ Id. See Section 3.3.2.6 and Attachment R-3 Section 22.0 for the applicant’s evaluation of the proposed facility’s anticipated impacts to the resource.

⁴⁶¹ Id. See Section 3.3.2.7 and Attachment R-3 Section 22.0 for the applicant’s evaluation of the proposed facility’s anticipated impacts to the resource.

⁴⁶² As explained at ASC Exhibit R, page R-109, the Retention (R) VQO provides for management activities that are not visually evident. Activities may only repeat form, line, color and texture that are frequently found in the characteristic landscape. “Changes in qualities of size, amount, intensity, direction, pattern, etc., should not be evident.” United States Forest Service, 1974 Agricultural Handbook Number 462 – National Forest Landscape Management, Volume 2, Chapter 1, The Visual Management System.

1 USFS Wallowa-Whitman National Forest, and the USFS has approved the proposed facility in ~~its~~
2 ROD. Additionally, in this area, the proposed facility would be located in a USFS designated
3 utility corridor, which was established to locate utility facilities such as transmission lines.⁴⁶³
4

5 The applicant explains that most viewers in this area are drivers along Old Emigrant Hill Scenic
6 Frontage Road, which passes through the forest. From the road, due to the steep hillside and
7 angle of crossing of the proposed facility, the applicant describes that most drivers would not
8 see the proposed facility or would have fleeting and limited views of the proposed facility and
9 cleared right of way.
10

11 Based on the analysis presented here, the Department recommends that the Council find that
12 the proposed facility would not cause a significant adverse impact to the scenic resources and
13 values of the USFS Wallowa-Whitman National Forest VQO 1 area.
14

15 USFS, Wallowa-Whitman National Forest: VQO 2, I-84 Travel Corridor
16

17 Wallowa-Whitman VQO 2 area includes approximately 4,800 acres of the Wallowa-Whitman
18 National Forest in northwestern Union County. The area spans I-84 and is approximately eight
19 miles long and typically one to two miles wide. The proposed facility would cross through VQO
20 2 in two locations between MP 94.4 and MP 95, in the first parcel of the Blue Mountain State
21 Scenic Corridor. Two towers would be sited within the parcel.⁴⁶⁴
22

23 The proposed route would be most visible along the western boundary of the area, where both
24 the towers and the cleared ROW would be visible. However, most viewing areas within the VQO
25 2 are almost entirely out of the viewshed due to topographic and vegetative screening; the
26 landscape would retain its cultural character and the scenic attractiveness would remain Class B
27 (Typical.)
28

29 As with the Wallowa-Whitman VQO1 area, the proposed facility in the VQO2 area would be
30 located in the USFS Wallowa-Whitman National Forest, and the USFS has approved the
31 proposed facility in ~~its~~its ROD. Additionally, in this area, the proposed facility would be located
32 in a USFS designated utility corridor, which was established to locate utility facilities such as
33 transmission lines. Based on the analysis presented here, the Department recommends that the
34 Council find that the proposed facility would not cause a significant adverse impact to the
35 scenic resources and values of the USFS Wallowa-Whitman National Forest VQO 2 I-84 Travel
36 Corridor area.

⁴⁶³ B2HAPPDoc3-35 ASC 18_Exhibit R_Scenic Resources_ASC 2018-09-28, Section 3.3.2.9 and Attachment R-3 Section 23.0 for the applicant's evaluation of the proposed facility's anticipated impacts to the resource.

⁴⁶⁴ Id. VQO 2 overlaps with the first parcel of the Blue Mountain Forest State Scenic Corridor and is managed as VQO Retention. See Section 3.3.2.9 and Attachment R-3 Section 24.0 for the applicant's evaluation of the proposed facility's anticipated impacts to the resource. The Applicant notes that the Morgan Lake Alternative is located approximately three miles southeast of VQO 2. However, vegetation and topography would screen the ROW associated with this alternative from this resource.

USFS, Wallowa-Whitman National Forest: Five Points Creek

Five Points Creek encompasses 3,763 acres and begins approximately one mile northeast of Hilgard, Oregon in Union County. The USFS has recommended its inclusion in the WSR system with a “Wild” classification; and is recognized for its scenery. Both the proposed facility and the Morgan Lake alternative would be located approximately two miles southwest of the Five Points Creek. The proposed and Morgan Lake alternative would be located west of I-84 in this area, while Five Points Creek is east of the freeway. Also, in this area the proposed route is mostly located in the ~~USFW-USFS~~ designated utility corridor, which was established for siting utility facilities such as transmission lines.⁴⁶⁵

As the applicant explains in ASC Exhibit R, The Five Points Canyon is 500 to 800 feet deep with steep, rugged walls with prominent vertical and diagonal lines. The area is primitive and undisturbed. Landscape character is naturally evolving and scenic integrity is considered Class A (Distinctive). There is a network of hiking trails within the canyon that is accessible from roads above the plateau. The creek receives light recreation use from hikers and hunters because of its high-quality scenery and remote experience.

As the applicant describes in ASC Exhibit R, Attachment R-6a, the entire river channel is outside of the modeled viewshed of both the proposed facility and Morgan Lake alternative; however, the towers and cleared ROW could be visible from the outer edges of the corridor in the southwestern portion of the corridor, at the top of the canyon. Five Points Creek has been recognized to protect the outstanding scenery within the enclosed creek canyon. Because the towers would not be visible from within the canyon of either the proposed facility or Morgan Lake alternative, the landscape character, scenic integrity, and scenic quality of the WSR corridor of Five Points Creek would not change and would have no or only minor contributions on visual impacts to the resource. As such, the Department recommends that the Council find that the proposed facility would not cause a significant adverse impact to the scenic resources and values of the Five Points Creek area.

USFS, Wallowa-Whitman National Forest: OR 244 Corridor – Red Bridge West and East

The OR 244 Corridor – Red Bridge West and East includes approximately multiple parcels of national forest lands along the corridor of OR 244 (the Union-Hilgard Highway.) OR 244 generally follows the Grande Ronde River in this area. Both the proposed route and the Morgan Lake alternative would be located approximately 4.4 miles east of OR 244 Corridor – Red Bridge

⁴⁶⁵ Id. See Section 3.3.2.9 and Attachment R-3 Section 17.0 for the applicant’s evaluation of the proposed facility’s anticipated impacts to the resource.

1 West at its closest point and slightly more than 1 mile from OR 244 Corridor – Red Bridge East.
2 Neither route would cross through OR 244 Corridor – Red Bridge West or East.⁴⁶⁶

3
4 The applicant states that both the proposed route and the Morgan Lake alternative would be
5 visible from portions of OR 244 Corridor Red Bridge West and East, but at more than 4 miles
6 from West and 1 mile from East. However, both are primarily outside of the viewshed due to
7 shielding from vegetation and topography. As with the Wallowa-Whitman VQO1 and VQO2
8 areas described above, the proposed facility near OR 244 Corridor Red Bridge West and East is
9 located in the USFS Wallowa-Whitman National Forest, and the USFS has approved the
10 proposed facility in its ROD. Additionally, in this area, the proposed facility would be located in
11 a USFS designated utility corridor, which was established to locate utility facilities such as
12 transmission lines. Based on the analysis presented here, the Department recommends that the
13 Council find that the proposed facility would not cause a significant adverse impact to the
14 scenic resources and values of the USFS Wallowa-Whitman National Forest OR 244 Corridor
15 Red Bridge West and East.

16
17 USFS, Wallowa-Whitman National Forest: Mt. Emily

18
19 The Mt. Emily scenic resource includes approximately 1,060 acres around Mt. Emily and
20 includes the Grandview Picnic Area and Indian Trail Canyon that are managed by the USFW as
21 VQO “retention.” The proposed facility would be located 5.2 miles from Mt. Emily. The Morgan
22 Lake alternative would be located 5.9 miles from the area. The proposed facility and the
23 Morgan Lake alternative would not cross the Mt. Emily scenic area.⁴⁶⁷ At over five miles, and
24 considering the mature tree cover, it is unlikely that the proposed facility or Lake alternative
25 would be visible from the Mt. Emily scenic resource. As such, the Department recommends that
26 the Council find that the proposed facility would not cause a significant adverse impact to the
27 scenic resources and values of the USFS Wallowa-Whitman National Forest Mt. Emily scenic
28 area.

29
30 USFS, Wallowa-Whitman National Forest: OR 203 Corridor – Catherine Creek

31
32 OR 203 Corridor – Catherine Creek includes approximately 590 acres of National Forest land in
33 two parcels along OR 203 near Catherine Creek State Park managed as VQO “retention.” This
34 area is located approximately eight miles east of the proposed facility and based on the
35 applicant’s viewshed analysis, would not be visible from the OR 203 Corridor – Catherine Creek.
36 As such, the proposed facility would not impact OR 203 Corridor – Catherine Creek.

37

⁴⁶⁶ Id. See Section 3.3.2.9 and Attachment R-3 Section 20.0 for the applicant’s evaluation of the proposed facility’s anticipated impacts to the resource.

⁴⁶⁷ Id. See Section 3.3.2.9 for the applicant’s evaluation of the proposed facility’s anticipated impacts to the resource.

1 **Conclusions of Law**

2

3 Based on the foregoing findings of fact, and subject to compliance with the recommended
4 conditions of approval, the Department recommends the Council conclude that, taking into
5 account mitigation, the design, construction and operation of the proposed facility, including
6 proposed and alternative routes, is not likely to result in significant adverse impacts to any
7 scenic resource, in compliance with Council’s Scenic Resources standard.

8 **IV.K. Historic, Cultural, and Archaeological Resources: OAR 345-022-0090**

9

10 *(1) Except for facilities described in sections (2) and (3), to issue a site certificate, the*
11 *Council must find that the construction and operation of the facility, taking into account*
12 *mitigation, are not likely to result in significant adverse impacts to:*

13

14 *(a) Historic, cultural or archaeological resources that have been listed on, or would*
15 *likely be listed on the National Register of Historic Places;*

16

17 *(b) For a facility on private land, archaeological objects, as defined in ORS*
18 *358.905(1)(a), or archaeological sites, as defined in ORS 358.905(1)(c); and*

19

20 *(c) For a facility on public land, archaeological sites, as defined in ORS 358.905(1)(c).*

21

22 * * *468

23

24 **Findings of Fact**

25

26 Section (1) of the Historic, Cultural and Archaeological Resources standard requires the Council
27 to find that the proposed facility, taking into account mitigation, is not likely to result in
28 significant adverse impacts to identified historic, cultural, or archaeological resources. The
29 applicant provided information regarding historic, cultural and archaeological resources in ASC
30 Exhibit S and its attachments.⁴⁶⁹ Mitigation means one or more of the following, in order of
31 priority: avoidance; minimization; partial or complete restoration of affected resource;

⁴⁶⁸ Subsections (2) and (3) of the Historic, Cultural, and Archaeological Resources Standard apply to power generation facilities and special criteria facilities, respectively. Since the proposed facility does not include a power generation or special criteria facility, subsections (2) and (3) of OAR 345-022-0090 do not apply to the proposed facility.

⁴⁶⁹ Pursuant to OAR 345-021-0010(1)(s), information concerning the location of archaeological sites or objects may be exempt from public disclosure under ORS 192.502(4) or 192.501(11). Therefore, the applicant submitted confidential resource reports as Attachment S-4 (High Probability Areas), Attachment S-6 (Cultural Resources Technical Report) Attachment S-7 (Reconnaissance Level Survey – Visual Assessment of Historic Properties Report), and Attachment S-10 (Intensive Level Survey – Visual Assessment of Historic Properties Report), Attachment S-11 (Analysis Area, Construction Footprint, and Resource Location Maps), and Attachment S-12. (CTUIR Traditional Use Study for the B2H Project) to ASC Exhibit S.

1 preservation and maintenance; partial or complete compensation for replacement or
2 comparable substitute for the resource; or implementing other measures as approved by
3 Council.⁴⁷⁰
4

5 Pursuant to OAR 345-015-0190(9), on March 6, 2019, the applicant submitted to the
6 Department an additional information Errata for Exhibit S and Attachment S-9, the Historic
7 Properties Management Plan (HPMP).⁴⁷¹ The Department requested the applicant provide
8 descriptions of Oregon Trail segments, this information is provided in the Exhibit S Errata and
9 pursuant to OAR 345-021-0010(1)(s), information concerning the location of archaeological
10 sites or objects may be exempt from public disclosure under ORS 192.502(4) or 192.501(11),
11 some portions of the text have been redacted in the version available to the public.⁴⁷²
12

13 As described in Section III., *Description of the Proposed Facility*, of this order a substantial
14 portion of the proposed facility is located on private lands (approximately 69 percent) however,
15 the proposed facility also crosses stretches of land managed by the Bureau of Land
16 Management (BLM), the Bureau of Reclamation (BOR), the Department of Defense/United
17 States Army Corps of Engineers (DOD/USACE), the State of Oregon, and the United States
18 Forest Service (USFS) (24 percent BLM-managed land, 0.2 percent BOR-managed lands, 4
19 percent DOD/USACE managed lands, 3 percent National Forest System lands, and 0.4 percent
20 State lands).
21

22 *Aligning EFSC and Section 106 Review:*⁴⁷³ *ORS 469.370(13)*
23

24 Under ORS 469.370(13), for facilities that are subject to review by a federal agency under the
25 National Environmental Policy Act (NEPA), the Council shall conduct its site certificate review,
26 to the maximum extent feasible, in a manner that is consistent with and does not duplicate the
27 federal agency review. Such coordination shall include the elimination of duplicative application
28 materials, study and reporting requirements; and the Council use of information generated and
29 documents prepared for the federal agency review. Additionally, the Council, to the extent
30 consistent with applicable standards, shall coordinate to establish site certificate conditions
31 that are consistent with the conditions established by the federal agency.
32

⁴⁷⁰ OAR 345-001-0010(33)

⁴⁷¹ OAR 345-015-0190(9) states, "After a determination that an application is complete, the applicant shall submit additional information to the Department if the Department identifies a need for that information during its review of the application. Submission of such information does not constitute an amendment of the application."

⁴⁷² B2HAPPDoc3-55 ASC Exhibit S_Errata Info_Redacted 2019-03-06.

⁴⁷³ Section applicable to OAR 345-022-0090(1)(a): "(1) Except for facilities described in sections (2) and (3), to issue a site certificate, the Council must find that the construction and operation of the facility, taking into account mitigation, are not likely to result in significant adverse impacts to:

(a) Historic, cultural or archaeological resources that have been listed on, or would likely be listed on the National Register of Historic Places"***

1 The Bureau of Land Management (BLM) is the lead federal agency responsible for completing
2 the National Environmental Policy Act (NEPA) environmental analysis. The BLM issued its Final
3 Environmental Impact Statement (FEIS) in November, 2016. BLM then published its Record of
4 Decision (ROD) on November 17, 2017. The FEIS and ROD included the results of the BLM’s
5 government-to-government tribal consultations and consultations with other parties. The NEPA
6 review addresses, among other things, cultural, historic, and archaeological impacts from the
7 proposed facility and compliance with Section 106 of the National Historic Preservation Act
8 (NHPA). Under 36 CFR 800.4(c)(1) and as part of the Section 106 process, the BLM is responsible
9 for final eligibility determinations for listing on the National Register of Historic Places (NRHP).
10 As part of the Section 106 compliance, the BLM issues determinations of eligibility for eligible
11 resources or determines that a resource is not eligible for listing on the NRHP. Upon the BLM’s
12 final determinations, cultural resources may remain with the designation of “unevaluated” if
13 there are no potential impacts from the proposed facility. A resource designation of
14 unevaluated indicates that the resource may have been investigated, however, additional
15 investigations or evaluations are recommended so the resource is assumed to be likely eligible
16 for listing on the NRHP.

17
18 The executed Programmatic Agreement (PA) is the binding document to the signatory parties
19 that outlines the process for identification and evaluation of historic and cultural properties,
20 eligibility determinations of specific impacts on historic properties, and measures to avoid,
21 minimize, or mitigate any adverse impacts for the proposed facility. The PA is included as
22 Attachment S-5 of ASC Exhibit S. The Oregon Department of Energy is a concurring party to the
23 PA and the provisions outlined in the PA may be used to assist the Council in its review of the
24 Council’s Historic, Cultural and Archaeological Standard; and while the PA is not a binding
25 document upon the Department and EFSC, as is described in this section, the Department is
26 recommending use of the PA process, including the HPMP, to align to the maximum extent
27 feasible, the EFSC review with the federal government review as directed, by ORS
28 469.370(13).⁴⁷⁴ The PA allows for the final determinations of the potential impacts from the
29 proposed facility to historic and cultural properties (including NRHP-listed, -eligible, and
30 unevaluated resources) and the mitigation of adverse impacts that will be outlined in a Historic
31 Properties Management Plan (HPMP). A HPMP required by the PA will be submitted to the BLM
32 and will be reviewed by all PA parties, it is anticipated to be specific to compliance with Section
33 106 of the National Historic Preservation Act.

34
35 In order to address resources that are also protected under the EFSC standard (archaeological
36 resources and objects on private lands, regardless of NRHP-eligibility status), an EFSC-specific
37 HPMP for private and state lands ~~has been drafted and~~ is included as Attachment S-9 to Exhibit
38 S and this order. The EFSC-specific HPMP is intended to maintain compliance with the EFSC
39 standard as well as align with the evaluation, determinations, and mitigation that ~~will~~ would be
40 included in the HPMP required by the PA. The HPMP includes an Inadvertent Discovery Plan

⁴⁷⁴ In accordance with 36 CFR §800.6(c)(3), a concurring party is a consulting party invited to concur in the agreement document but who does not have the authority to amend or terminate the agreement.

1 (IDP) which specifies ~~what~~ steps will to be taken if a previously unidentified cultural resource is
2 discovered during construction, including stopping construction in the resource vicinity, agency
3 and Tribal government notification and consultation, and data recovery or other mitigation and
4 protection measures. The HPMP, with IDP, is discussed in more detail later in this section.
5

6 As discussed in Section III.A. Transmission Corridor Selection, the Navy is leading a separate
7 NEPA review from the BLM for the portion of the proposed facility located on lands owned and
8 managed by the Navy in Morrow County, therefore, it is responsible for Section 106 of the
9 NHPA compliance. Equivalent to the process described above, eligibility determinations for
10 cultural, historical and archaeological resources identified on Navy lands will be determined as
11 part of the Navy's Section 106 compliance, in consultation with SHPO and affected Tribes.
12

13 Studies and surveys conducted for Section 106 of the NHPA compliance are utilized in the ASC
14 and EFSC review to support compliance with OAR 345-022-0090(1)(a), the Council's Historic,
15 Cultural and Archaeological standard protecting resources that have been listed on, or would
16 likely be listed on the NRHP. Conversely, studies, surveys, and revised information based on
17 comments from the Department and the Oregon State Historic Preservation Office (SHPO)
18 conducted during the EFSC review may be used by the BLM in its final evaluation of Section 106
19 compliance. During the review of the amended preliminary application for site certificate
20 (discussed in Section II.E) and the application for site certificate (discussed in Section II.G),
21 comment requests were sent to reviewing agencies, including SHPO and affected Tribes. The
22 Department enlisted assistance of its consultant, Golder Associates (Golder) and their sub-
23 consultant, Historical Research Associates, Inc. (HRA) to support SHPO with the review for the
24 proposed facility. During the review of the ApASC and ASC, HRA reviewed Exhibit S, technical
25 and archaeological reports, and SHPO site forms for sufficient and complete information
26 consistent with SHPO guidelines and EFSC standard. HRA then submitted requests for additional
27 information (RAI's) to the Department and SHPO for its review and SHPO provided a letter
28 concurring and adding any additional information to HRA's comments. All comment letters
29 were provided to the applicant, who then provided responses to all RAI's including new data,
30 studies, and updated information in the applicable format for SHPO to conduct its review. This
31 process went through several iterations, resulting in the information in site forms and isolate
32 forms, the information in the ASC, and associated Exhibit S eErrata.
33

34 The applicant included recommendations of eligibility and supporting documentation in ASC
35 Exhibit S and materials submitted to SHPO and the Department for all identified resources.
36 Applicant recommendations, in general, include recommendations of eligible for listing on the
37 NRHP, and not eligible for listing, and unevaluated (presumed or treated as likely eligible for
38 listing). Table S-2 in ASC Exhibit S represents all of the resources the applicant evaluated within
39 the analysis area as well as the applicant's eligibility recommendations. The Department, in
40 consultation with SHPO and the applicant, determined that recommendations of "not eligible"
41 will be treated as "unevaluated" for purposes of the Council's review. A resource designation of
42 "unevaluated" means that it is treated as likely eligible for listing on the NRHP and the impact
43 analysis and mitigation (if any) is evaluated based on that designation. In its comment letters on

1 the ASC, SHPO outlined and described this approach.⁴⁷⁵ Applicant recommendations will be
2 completed and the BLM and Navy will verify final eligibility determinations as part of Section
3 106 compliance. The final eligibility determinations will be provided to the Council, as discussed
4 later in this section related to the HPMP. The primary reasons that the Department and SHPO
5 agree to treat resources recommended as not eligible as unevaluated for the Council’s review
6 are:

- 7 1.) Treating resources as likely eligible for listing (unevaluated) is a conservative approach
8 for evaluating potential impacts and mitigation of impacts from the proposed facility;
9 and
- 10 2.) Treating resources as likely eligible for listing (unevaluated) and then updating Council
11 information based on lead federal agency Section 106 final determinations is consistent
12 with Council’s obligations under ORS 469.370(13).

13
14 However, it is important to point out that it is very likely that many, most, or even all the
15 resources identified as “not eligible” by the applicant may ultimately be determined and agreed
16 by SHPO and the lead federal agency as “not eligible.” As such, the analysis presented in this
17 section by the Department is in all likelihood an over-estimate of the proposed facility’s
18 potential impacts to historic, cultural, and archaeological resources.

19 *Methodology and Surveys for Historic, Cultural, and Archaeological Resources*

20
21
22 As stated in the second amended project order, for the Council’s review, the analysis area
23 includes the area within the site boundary. However, as discussed above, the applicant
24 provided information in the ASC that was also used for the NEPA environmental analysis,
25 including an evaluation of cultural, historic, and archaeological resources. As part of the Section
26 106 evaluation, the BLM established an Area of Potential Effects (APE) for an evaluation of
27 indirect visual effects to be five miles or to the visual horizon, whichever is closer, on either side
28 of the centerline of the proposed alignment and alternative routes. The applicant provided this
29 evaluation in its Visual Assessment of Historic Properties (VAHP) Study Plan (Attachment S-2 to
30 this order). Therefore, the area that the applicant evaluated in ASC Exhibit S includes all areas
31 within the site boundary as well as the area that extends 5 miles or to the visual horizon. The
32 applicant refers to the area within the site boundary as the direct analysis area which
33 encompasses the proposed construction footprint. The construction footprint is the only
34 portion of the analysis area that is anticipated to experience direct impacts and the final
35 construction footprint ~~will~~would be smaller than the site boundary (direct analysis area)
36 evaluated. The site boundary (direct analysis area) combined with the five-mile analysis area is
37 referred to as the Visual Assessment analysis area. These areas were used to inventory
38 resources and conduct an impacts analysis to inform the ASC whether or not the construction
39 and operation of the proposed facility would cause direct or indirect impacts. An example of a
40 direct impact is an impact to a resource by ground disturbing construction activities or

⁴⁷⁵ B2HAPPDoc13-28 ASC Reviewing Agency Comment SHPO Case No. 08-2232_Pouley 2019-04-29 and B2HAPPDoc13-29
ASC Reviewing Agency Comment SHPO Case No. 08-2232 Response to IPC_Schwartz 2019-05-13.

1 permanent infrastructure placement. Examples of indirect impacts are visual impacts such as
2 being able to see the proposed transmission line, towers, or proposed access road from a
3 resource or trail location.

4
5 The historic, cultural, and archaeological resource studies were initiated by a record search and
6 literature review to identify previous surveys and recorded resources within the analysis area.
7 The searches gathered information on previously recorded historic, cultural, and archaeological
8 resources, properties that are eligible or listed on the National Register of Historic Places
9 (NRHP), historic cemeteries, historic trails, and previously surveyed areas. Data were collected
10 for both archaeological and historic sites and included site location, age, type, ownership, NRHP
11 status, and a brief description of site attributes. Research was conducted at the Oregon State
12 historic Preservation Office (SHPO), CTUIR THPO (Confederated Tribes of the Umatilla Indian
13 Reservation Tribal Historic Preservation Office), USFS (United States Forest Service), and BLM
14 offices. The Oregon SHPO databases consulted include Oregon Archaeological Records Remote
15 Access and Oregon Historic Sites Database. Additional information was provided by the
16 applicant, Bonneville Power Administration (BPA), U.S. Fish and Wildlife Service (UFWS), the
17 Oregon Historic Trails website, U.S. Geological Survey (USGS) Mineral Resource Data System,
18 General Land Office plats, early USGS and state maps, other historic maps and aerial
19 photographs, ethnographic literature, and historical contexts.

20
21 Following completion of the background research, the Archaeological Survey Plan (ASP) and
22 Visual Assessment of Historic Properties Study Plan (VAHP) were prepared to guide the field
23 surveys and documentation of cultural resources. The record searches highlighted two unique
24 study areas: a two-mile study area and five-mile study area. The two-mile study area focused
25 on collecting information pertaining to archaeological and aboveground resources, as well as
26 any traditional cultural properties (TCPs) or Historic Properties of Religious and Cultural
27 Significance to Indian Tribes (HPRCSIT), within two miles of the proposed and alternative routes
28 centerline. This study area was utilized for the cultural resources pedestrian field survey and is
29 documented in the Cultural Resources Technical Report. The five-mile study area focused on
30 collecting information pertaining to above ground resources and cultural resources that had the
31 potential to be TCPs and/or HPRCSITs between the two-mile study area and up to five miles
32 from the proposed and alternative routes centerline. The Visual Assessment utilized this study
33 area as well as applicable results from the two-mile study area. The five-mile study area is
34 documented in the Reconnaissance Level Survey – Visual Assessment of Historic Properties
35 (RLS) and Intensive Level Survey – Visual Assessment of Historic Properties (ILS), except for a
36 portion located on CTUIR tribal lands, these were conducted in compliance with the VAHP and
37 focused on the Visual Assessment analysis area. ASC Exhibit S, Section 3.2 provides a
38 description for the survey/study methodologies employed for each study. The applicable
39 attachments also provide additional details about survey methodologies. However, all survey
40 efforts are and ~~will~~ would be carried out according to the methods and standards required by
41 the Oregon SHPO Guidelines for Conducting Field Archaeology in Oregon. One exception is a

1 more conservative definition of a historic archaeological site.⁴⁷⁶ The SHPO guidelines define an
 2 historic archaeological site as a site that has been abandoned for at least 75 years. To maintain
 3 consistency with studies completed for federal regulatory compliance and for a more
 4 conservative evaluation of historic and archaeological resources, the applicant assumed an
 5 historic archaeological site must have been constructed or created 50 years ago or more.

6
 7 Table HCA-1 below outlines the studies and surveys the applicant conducted, when they were
 8 conducted, a description of the survey and the attachment to the ASC or this order, if
 9 applicable.

Table HCA-1: Historic, Cultural, and Archaeological Resource Studies

Study	Description	Completed/ To Be Completed
Archaeological Survey Plan (ASP) – (Attachment S-1)	Survey plan for archaeological studies.	Completed (2012)
Visual Assessment of Historic Properties Study Plan (VAHP) – (Attachment S-2)	Survey plan for aboveground/built environment sites.	Completed (2013)
High Probability Areas Assessment – (Attachment S-4 Confidential)	Identifies areas of high sediment deposition or poor ground surface visibility with increased likelihood of subsurface archaeological resources. High Probability Areas will be systematically probed subsurface during the Enhanced Archaeological Survey.	Completed (2017) Subject to change based on CTUIR and SHPO input.
Cultural Resources Technical Report (Technical Report) – (Attachment S-6 Confidential)	Report of cultural resources identified in pedestrian survey area (i.e., Proposed and alternative routes, roads, and attendant facilities with buffers defined by the Programmatic Agreement [PA]). Preliminary report completed 2017. Will be amended with results of the Enhanced Archaeological Survey after the site certificate, prior to construction. To avoid unnecessary ground disturbance of archaeological resources, the enhanced archaeological survey will be conducted within the selected route only.	Completed (2017) / Update after site certificate issuance, prior to construction

⁴⁷⁶ Archaeological site: A type of cultural resource consisting of a concentration of a minimum of 10 artifacts within the ground or in ruins or a feature (Oregon State Historic Preservation Office [SHPO] 2013a). A geographic locality in Oregon, including but not limited to submerged and submersible lands and the bed of the sea within the state’s jurisdiction, that contains archaeological objects and the contextual associations of the archaeological objects with each other or biotic or geological remains or deposits (ORS 358.905(1)(c)).

Table HCA-1: Historic, Cultural, and Archaeological Resource Studies

Study	Description	Completed/ To Be Completed
Reconnaissance Level Survey – Visual Assessment of Historic Properties (RLS) – (Attachment S-7 Confidential)	Report of previously recorded built environment sites (buildings, structures, and trails) as well as traditional cultural properties and archaeological sites with above-ground features (such as cairns, trails, and intact water conveyance features) within the Visual Assessment analysis area.	Completed (2015) (Additional RLS work required on CTUIR tribal lands, anticipated in September-November 2018.)
National Historic Trails Study (NHT Study) – (Attachment S-8)	Report of federally designated NHT resources on federal lands in Visual Assessment analysis.	Completed (2014). (Additional information on non- NHT trails presented in ILS Report).
Historic Properties Management Plan (HPMP with Inadvertent Discovery Plan) – (Attachment S-9)	Management and mitigation plan for avoiding, minimizing, and mitigating resources.	To be completed prior to facility construction.
Intensive Level Survey – Visual Assessment of Historic Properties (ILS) – (Attachment S-10 Confidential)	Report providing detailed analysis of those resources from the RLS that have sufficient integrity, for which an NRHP criterion might apply, and have the potential to be affected by the Project. Preliminary Report completed in 2017. Will be amended when RLS and ILS of CTUIR tribal lands are completed.	Completed (2017) (Additional ILS work required on CTUIR tribal lands, anticipated in September-November 2018.)
Enhanced Archaeological Survey	Report of subsurface probing in high probability areas, archaeological site boundary probing, isolated find probing, and National Register of Historic Places (NRHP) eligibility testing. Anticipated to be presented as amendment to Technical Report. To avoid unnecessary ground disturbance of archaeological resources, the enhanced archaeological survey will be conducted within the selected route only.	After site certificate, prior to construction
Source: B2HAPPDoc3-36 ASC 19_Exhibit S_Cultural_ASC_Public 2018-09-28. Table S-1. Reorganized by the Department.		

- 1
- 2 The archaeological survey is being conducted in two phases. Phase 1 has been completed, and
- 3 consisted of an intensive pedestrian inventory of the entire direct analysis area to which the
- 4 applicant had right of entry to access for surveys. Any additional surveys required to complete
- 5 an inventory of 100 percent of the final selected route, as well as any necessary subsurface
- 6 inventory or evaluation efforts, will-would be conducted during Phase 2. Phase 2 is anticipated

1 to occur after the site certificate has been issued, but prior to construction, when site access
2 has been secured for all properties. See Section III.D., *Survey Data Based on Final Design and*
3 *Site Access*, for additional discussion of survey data and site access in the Council’s review
4 process for linear facilities. Continued survey efforts ~~will~~would focus on high probability areas,
5 confirming archaeological site boundaries, confirming archaeological isolated finds, NRHP-
6 eligibility testing, and 100 percent inventory of any route modifications or alterations identified
7 subsequent to the completed surveys.

8
9 Based on the information submitted to the Department and SHPO and provided in ASC Exhibit
10 S, Table S-2, the Department estimates that a total of 501 cultural, archaeological, and
11 historical resources in the analysis area were inventoried and evaluated as part of the Section
12 106 and EFSC review. All Oregon Trail or Oregon National Historic Trails are identified in the
13 below section regardless of potential impacts to the trail or segment. Other than trail
14 resources, of the 501 cultural, archaeological, and historical resources inventoried in the
15 analysis area, only resources that may be impacted or affected directly or indirectly by the
16 construction or operation of the proposed facility are discussed further in this order. In other
17 words, resources inventoried in the analysis area that ~~will~~would not experience a direct or
18 indirect impact, are not evaluated. The information in the tables below was taken from ASC
19 Exhibit S, Table S-2 and modified by the Department. Consistent with the discussion in the
20 above section, the Department and SHPO determined that resources recommended as not
21 eligible will be termed as unevaluated (presumed or treated as likely eligible for listing) for the
22 Council’s review. This change is reflected in the tables presented below, for a representation of
23 the applicant’s recommendations, see Table S-2 in ASC Exhibit S. As described above, this
24 decision to consider resources as “unevaluated” if the applicant described as “not eligible” will
25 likely greatly increase the estimated impacts from the proposed facility, however, the actual
26 impacts to resources will be finalized as discussed in the HPMP and are anticipated to be
27 substantially less than presented below.

28
29 *IV.K.1. Potential Impacts to Historic, Cultural, and Archaeological Resources Under OAR 345-*
30 *022-0090(1)(a)*

31
32 Under OAR 345-022-0090(1)(a), to issue a site certificate, the Council must find that the
33 construction and operation of the proposed facility, taking into account mitigation, is not likely
34 to result in significant adverse impacts to historic, cultural and archaeological resources that
35 have been listed on, or would likely be listed on the National Register of Historic Places (NRHP).
36 The resources discussed in the below section apply to protections under OAR 345-022-
37 0090(1)(a). The Department points to the language of the EFSC standard, specifically,
38 “...resources that have been listed on, or would likely be listed on...” the common term used by
39 SHPO and throughout the profession, is eligible or likely eligible for listing on the NRHP.
40 Therefore, the terms eligible or likely eligible meet the ~~the~~meaning of likely to be listed on the
41 *NRHP* in the EFSC standard.

1 IV.K.1.1. Oregon Trail and National Historic Trails

2
3 Historic trails within the analysis area, as listed in ORS 358.057, include the Oregon National
4 Historic Trail (NHT), Lewis and Clark NHT, Meek Cutoff, Nathaniel Wyeth Route, and Upper
5 Columbia Route. Congress declared the 2,170-mile-long Oregon Trail a National Historic Trail in
6 1978. These trails are depicted in ASC Exhibit S, Figure S-11. The applicant states that the
7 ~~proposed facility site boundary analysis area will would~~ cross the Oregon NHT 17 times along
8 the route.⁴⁷⁷ Separate from the NHT, the ~~site boundary analysis area~~ crosses 12 segments of the
9 Oregon Trail identified by the applicant and its consultants during the field evaluation for
10 Exhibit S and the assessment of impacts to trails for the BLM’s NEPA review. Of these total
11 Oregon Trail resources, 9 NRHP-eligible segments would be crossed by the proposed facility
12 and, for some segments, would be impacted by views of the proposed facility within the 5-mile
13 geographic area visible from the resource (viewshed) (see Table HCA-3: NRHP-Eligible Oregon
14 Trail/NHT Inventory in Analysis Area with Potential Indirect Impacts below).⁴⁷⁸ The Department
15 notes that the proposed facility crossing a listed or likely-NRHP eligible trail portion or segment,
16 does not equate to a direct, physical impact to the trail, as the proposed facility ~~can be~~would
17 ~~spanned~~ (stretched) across portions of trail segments.

18
19 The applicant and its consultants conducted an evaluation of segments, sites, and side trails
20 associated with the Oregon Trail consistent with the currently proposed Multiple Property
21 Documentation Form (MPDF) for the Oregon Trail, Oregon and SHPO Guidance for Recording
22 and Evaluating Linear Cultural Resources.⁴⁷⁹ Similar to the SHPO guidance document, the MPDF
23 also considers the Oregon Trail a single linear historic district, to evaluate- (cumulative impacts,) }
24 that contains contributing and non-contributing resources located within its historic
25 boundaries. Further, the Oregon Trail analysis consisted of a literature review, survey and field
26 recordation through the Reconnaissance Level Survey - Visual Assessment of Historic Properties
27 (RLS) and Intensive Level Survey - Visual Assessment of Historic Properties (ILS), which include
28 photographs and maps, evaluation, integrity assessment, and an impacts assessment.

29
30 Utilizing various Oregon Trail GIS data sets from the National Park Service, Oregon SHPO, and
31 BLM, data were collected on a cumulative basis to provide a general indication of potential
32 cumulative visual impacts from within the Visual Assessment analysis area based on a bare
33 earth digital elevation model. The applicant compiled the data to illustrate the potential for
34 cumulative indirect impacts but is not truly reflective of the magnitude of impacts. The
35 applicant’s overview of the cumulative impacts analysis found that of the 177.97 miles of the
36 Congressionally Designated Route of the Oregon NHT, 43.89 miles would have a potential view
37 that is within 0.5 mile of the site boundary. For “Contributing Trail Segments” or segments of
38 the Oregon Trail that have been previously identified by surveys or listed on the NRHP,

⁴⁷⁷ B2HAPPDoc3-36 ASC 19_Exhibit S_Cultural_ASC_Public 2018-09-28. Section 3.4.1.1.

⁴⁷⁸ B2HAPPDoc3-36 ASC 19 Exhibit S Cultural ASC 2018-09-28.

⁴⁷⁹ SHPO OR Linear Resources Guidance Oregon SHPO, December, 2013b.

1 approximately 89.35 miles of these segments are located within the Visual Assessment analysis
2 area (areas within 5 miles or to the visual horizon) and about 27.43 of those miles would have a
3 potential view of the proposed facility.

4
5 After the ASC was deemed complete and under OAR 345-015-0190(9), the Department
6 requested that the applicant provide additional information to the Department.⁴⁸⁰ In December
7 2018, the Department issued a requests for additional information (RAIs), requesting that the
8 applicant re-visit the information provided in ASC Exhibit S, Table S-2 and re-evaluate whether
9 or not there ~~will-would~~ indeed be any direct impacts to eligible resources, including Oregon
10 Trail segments.⁴⁸¹ The applicant responses to the Department's RAI's came in the Exhibit S
11 Errata and Errata to the HPMP. For instance, the applicant provided site-specific measures to
12 avoid direct impacts to Oregon Trail resources located within the site boundary. Table 6-1 of
13 the HPMP Errata includes avoidance measures to be employed for 10 Oregon Trail-related
14 resources. The Department incorporated the information and representations from Exhibit S
15 and the errata into the HPMP Attachment S-9 of this order. These measures include reducing or
16 relocating facility components and/or activities, avoiding construction activities within 100 feet
17 of the identified resource characteristics, flagging resource boundaries, and staying within
18 existing areas of disturbance.

19
20 The applicant provides an impact assessment to satisfy OAR 345-022-0090(1)(a) which
21 considers the likely NRHP-eligible Oregon Trail/NHT resources as a linear resource, consistent
22 with SHPO's Linear Resources Guidelines, and by individual trail segment, as summarized in
23 Table HCA-3, *NRHP-Eligible Oregon Trail/NHT Inventory in Analysis Area with Potential Indirect*
24 *Impacts*, ~~represents the Oregon Trail as one linear resource for this evaluation, provides a~~
25 ~~discussion of the individual trail segments as well. As noted above, assessing the Oregon Trail as~~
26 ~~linear resource is consistent with SHPO, and federal guidelines, and t~~TheThe BLM, in
27 consultation with SHPO, ~~may-would~~ determine appropriate mitigation for impacts based on a
28 cumulative impact analysis from treating trail ~~segmentss~~ as a linear resource. Because BLM and
29 SHPO review, during the Section 106 process, would evaluate cumulative impacts to the Oregon
30 Trail/NHT as a linear resource and not necessarily the impacts of the proposed facility to
31 individual trail segments within the affected area (i.e. location or county), Council must
32 evaluate potential impacts and appropriate mitigation in this order, consistent with OAR 345-
33 001-0010(33), based on potential impacts to listed or likely NRHP-eligible individual trail
34 segments within the affected area.

35
36 The applicant highlights that impacts to individual Oregon Trail-related resources or segments
37 vary by individual site due to a number of variables including distance, intervening topography,
38 vegetation, overall condition of the site, atmospheric conditions, and the built environment. In
39 addition, in many instances, the physical setting and/or landscape surrounding the Oregon Trail

⁴⁸⁰ OAR 345-015-0190(9) states, "After a determination that an application is complete, the applicant shall submit additional information to the Department if the Department identifies a need for that information during its review of the application. Submission of such information does not constitute an amendment of the application."

⁴⁸¹ B2HAPPDoc18 ASC ODOE RAIs_ Exhibit S_AA_U_W 2018-12-08 to 2019-04-06.

1 has been diminished through the introduction of roads, an interstate highway, pipeline rights-
2 of-way, electrical distribution and transmission lines, fencelines, and other forms of
3 development. As discussed further in Section IV.F.1., *Protected Areas*, of this order, the
4 applicant provided a visual impact analysis with photo simulations to illustrate the potential
5 visual impacts of the proposed facility. In many circumstances, existing energy infrastructure,
6 anthropogenic structures, and agricultural activities accompany the viewshed where the
7 proposed facility would be located.

8
9 To inform the Council and interested parties about the specific segments of the NHT and
10 Oregon Trail resources that were discovered in the applicant’s analysis and to also to evaluate
11 any potential impacts and appropriate mitigation to ~~them~~ the trail segments, the Department
12 agrees with the applicant’s approach to provide a cumulative analysis ~~(above)~~ as well as an
13 analysis of each segment for trail resources. In December, 2018, the Department requested
14 that the applicant provide descriptions of the Oregon Trail segments evaluated and provided in
15 the confidential attachments in the ASC. ORS 192.345 exempts certain documents from public
16 disclosure, however, based on the Department’s review of ORS 192.345(11), the Department
17 requested that the applicant provide descriptions of the trail segments for the public’s review,
18 and redact location information as necessary.⁴⁸² The applicant provided additional descriptions
19 as ~~e~~Errata to ASC Exhibit S.⁴⁸³

20
21 *Oregon Trail Resources: Impact Assessment*⁴⁸⁴

22
23 As presented below, the proposed facility would not result in direct physical disturbance to
24 directly impact any listed or likely NRHP-eligible Oregon Trail segments. The proposed facility
25 ~~will~~would, however, indirectly (crossing/visibility) impact some Oregon Trail segments. The
26 Department developed Table HCA-2: *Oregon Trail/NHT Inventory in Analysis Area with*
27 *Avoided/No Impacts*, based ~~off-on~~ a compilation of information from ASC Exhibit S, Table S-2,
28 SHPO comment letters, and the updated ASC Errata information. Table HCA-2 identifies 29
29 trail resources within the analysis area (includes site boundary/direct and visual impact areas).
30 Table HCA-2 specifies the trail segment, general resource description, existing and proposed
31 NRHP recommendations, and descriptions of the closest project-proposed facility component
32 that was evaluated for impacts. Consistent with the discussion provided in the above section,

⁴⁸² (11) Information concerning the location of archaeological sites or objects as those terms are defined in ORS 358.905 (Definitions for ORS 358.905 to 358.961), except if the governing body of an Indian tribe requests the information and the need for the information is related to that Indian tribe’s cultural or religious activities. This exemption does not include information relating to a site that is all or part of an existing, commonly known and publicized tourist facility or attraction.”

⁴⁸³ B2HAPPDoc3-55 ASC Exhibit S_Errata Info_Redacted 2019-03-06 and B2HAPPDoc3-54 ASC Exhibit S_Att. S-9_HPMP Errata Info 2019-03-06.

⁴⁸⁴ An example of a direct impact is an impact to a resource by ground disturbing construction activities or permanent infrastructure placement. Examples of indirect impacts are visual impacts such as being able to see the proposed transmission line, towers, or proposed access road from a resource or trail location.

1 *Aligning EFSC and Section 106 Review: ORS 469.370(13)*, in this section, some of the
 2 aboveground (trail) resources are treated as unevaluated/likely eligible for the Council’s review
 3 pending the outcome of the Section 106 determinations. In its comment letter on the ASC,
 4 SHPO states that “Regarding above ground resources, after reviewing the Intensive Level
 5 Surveys (ILS) provided to our office we concur with all determinations of eligibility for listing in
 6 the NRHP except the following.”⁴⁸⁵ SHPO then remarks in its letter that resources on federal
 7 lands that are recommended as not eligible by the applicant, shall be treated as
 8 unevaluated/likely eligible and avoided or mitigated, pending the determinations of the Section
 9 106 review process. In a clarification letter to SHPO from the applicant, the applicant represents
 10 that that resource B2H-MA-003 Meek Cutoff and resource B2H-UN-005 (Whiskey Creek
 11 Segment) will-would remain unevaluated (likely eligible) for the NRHP and avoided by facility
 12 activities until a federal agency makes a final determination of eligibility, in concurrence with
 13 the SHPO during the Section 106 process.

14
 15 This approach and determinations are reflected in the tables below. If the lead federal agency
 16 determines that the resource is not eligible then the resource would not be protected under
 17 the EFSC standard or mitigated in the Section 106 process for potential impacts. If the lead
 18 federal agency determines that the resource is likely eligible or eligible, the resource will-would
 19 be avoided or mitigated for any impacts as designated in the Historic Properties Management
 20 Plan (HPMP), Attachment S-9 and addressed in recommended Historic, Cultural, and
 21 Archaeological Resources Condition 2 discussed below. The far right column in Table HCA-2
 22 provides additional descriptions and specifics about how the applicant will-would avoid direct
 23 and indirect impacts to each segment. To read site descriptions for these segments, and their
 24 relation to the Oregon or other trails, see the Redacted Exhibit S Errata. Resources identified in
 25 Table HCA-2 are assumed to be likely eligible therefore are protected under the EFSC standard
 26 OAR 345-022-0090(1)(a)), however impacts to these resources are not expected or are avoided
 27 entirely, consequently there are not any impacts to protected resources for Council to evaluate
 28 for avoidance, minimization or mitigation.

29
 30 SHPO concurred with the applicant’s NRHP-ineligibility recommendations that for some
 31 aboveground resources the Oregon Historic Trail/NHT resources, as presented in Table HCA-2;
 32 are not eligible, therefore the Department reiterates that the Oregon Historic Trail/NHT
 33 resources presented as not likely eligible for NRHP-listing they are not protected under OAR
 34 345-022-0090(1)(a)), and do not need to be further evaluated. As discussed below in Section,
 35 IV.K.4., *Mitigation for Historic, Cultural, and Archaeological Resources: Historic Properties*
 36 *Management Plan (HPMP)*, the final resource eligibility determinations and appropriate
 37 mitigation measures will-would be verified or established in the Section 106 compliance review
 38 and this information will be provided in the final HPMP and will-would be submitted to the
 39 Department for its review and approval, in consultation with SHPO, per Historic, Cultural, and
 40 Archaeological Resources Condition 2 discussed below. In Attachment S-9, which includes the
 41 HPMP Errata, the applicant also reiterates that its proposed Scenic Resources Condition 1,

⁴⁸⁵ B2HAPPDoc13-28 ASC Reviewing Agency Comment SHPO Case No. 08-2232_Pouley 2019-04-29.

- 1 recommended to Council, ~~will~~would require the applicant to construct the proposed facility
- 2 using dull-galvanized steel for lattice towers and non-specular conductors to reduce the visual
- 3 impacts of the transmission line and components.

Table HCA-2: Oregon Trail/NHT Inventory in Analysis Area with Avoided/No Impacts

Assigned Trinomial or Other ID	Pedestrian Survey or Visual Assessment Temporary Resource #	County	Resource Type and Generalized Resource Description	NRHP Recommendation	Project Route(s)	Project Component	Land Ownership	Avoided Impact	<u>Attachment S-9 Errata</u> -Avoidance Measure or/and Management Recommendations (HPMP)
35MW00224 (Well Spring, Oregon Trail Site)	N/A	Morrow	Archaeological Site - Homestead & Trail	Listed (Criterion A - Draft MPDF)	Proposed Route, West of Bombing Range Road Alternative 1, West of Bombing Range Road Alternative 2	Visual Assessment analysis area	DOD	Yes	No further management
35MW00227	N/A	Morrow	Archaeological Site - Road	Unevaluated	Proposed Route	Direct Analysis Area (Construction Footprint); Visual Assessment analysis area Proposed Route: Structure work area; Pulling & tension site; Existing road needing 21-70% modification West of Bombing Range Road Alternatives 1 & 2: No impacts	DOD	Yes	Avoid. Subsurface probing needed. If the Section 106 determination is eligible, applicant will avoid Site # 35MW227 as follows: Proposed Route: For the structure work area and pulling & tension site, applicant will relocate or reduce the size of those areas to avoid Site # 35MW227; for the existing road, all improvements will be made within the existing road prism thereby avoiding any new impacts; applicant will flag any portion of the boundary of Site # 35MW227 that occurs within 100 feet of construction activity. West of Bombing Range Road Alternatives 1 & 2: No avoidance measures are necessary as there are no direct impacts proposed for these alternatives.

Proposed Route	Direct Analysis Area (Construction Footprint); Visual Assessment analysis area	PV	Yes	No further management

1 *Oregon Trail Resources: Potential Indirect Impacts*

2

3 As discussed in the above section, *Oregon Trail Resources: Impact Assessment*, the applicant
 4 conducted an inventory of all NHT, Oregon Trail, and linear resources within the site
 5 boundary/direct analysis area and evaluated potential visual impacts of the proposed facility
 6 from any crossing locations and to the resource from facility visibility within the a 5-mile visual
 7 impact assessment area.⁴⁸⁶ Visual impacts were evaluated through a Visual Assessment of
 8 Historic Properties Intensive Level Survey (VAHP ILS) as provided in ASC Exhibit S Attachment S-
 9 10 Appendix D, and included reconnaissance level surveys, a viewshed analysis and line of site
 10 evaluation for each resource. Table HCA-2 above lists the inventoried trail resources within the
 11 analysis area that will are either not likely eligible for NRHP-listing; or, would not experience
 12 indirect (visual) and-or direct (permanent/ground disturbing) impacts. Table HCA-3 below lists
 13 the inventoried NRHP or likely-NRHP eligible Oregon Trail/NHT trail resources that, based on
 14 the applicants' VAHP ILS, could experience adverse indirect impacts from proposed facility
 15 visibility.

16
 17 Table HCA-3 includes resource identification numbers, general resource description, facility
 18 location and components associated with the impact, and the expected visual impact from the
 19 proposed facility. Based on review of the VAHP ILS in ASC Exhibit S Attachment D-10 Appendix
 20 D, the Department agrees with the applicant's visual impact assessment, including visual
 21 impacts directly above the resource (crossing) and within a 5-mile viewshed, and concludes
 22 that, without mitigation, the proposed facility would result in adverse indirect impacts to the 9
 23 NRHP-listed or eligible Oregon Trail/NHT trail segments identified in Table HCA-3.⁴⁸⁷ The far
 24 right column includes a compilation of mitigation information from the ~~framework~~ HPMP,
 25 provided as Attachment S-9 to this order and the ASC, as well as which incorporates information
 26 from Exhibit S and the HPMP Errata, ~~Attachment S-9-1 to this order~~. The mitigation proposals
 27 are discussed further in the below section detailing the recommended site certificate condition
 28 for the submission, review and approval of the final ~~Historic Properties Management Plan~~
 29 ~~(HPMP)~~. In addition, Table HCA-3: NRHP Eligible Oregon Trail/NHT Inventory in Analysis Area
 30 with Potential Indirect Impacts, below reflects ~~these~~ applicant representations to avoid direct
 31 impacts to Oregon Trail resources. Therefore, and compared to the information presented in
 32 ASC Exhibit S, Table HCA-2 and Table HCA-3 represent updated applicant representations about
 33 avoidance measures for impacts to Oregon Trail resources. These tables are included in the
 34 draft HPMP (Attachment S-9 of this order).

⁴⁸⁶ An example of a direct impact is an impact to a resource by ground disturbing construction activities or permanent infrastructure placement. Examples of indirect impacts are visual impacts such as being able to see the proposed transmission line, towers, or proposed access road from a resource or trail location.

⁴⁸⁷ Commenters expressed concerns about potential direct and indirect impacts to NHT/Oregon Trail segments. OAR 345-022-0090 provides that "...the Council must find that the construction and operation of the facility, taking into account mitigation, are not likely to result in significant adverse impacts..." Applicant represents avoidance of direct impacts to Oregon Trail features. Applicant-proposed design modification mitigation measures are discussed throughout this order and additional mitigation measures for visual impacts at NHT/Oregon Trail segments is addressed below. B2HAPPDoc8-1 All DPO Comments Combined-Rec'd 2019-05-22 to 08-22; B2HAPPDoc8-066 DPO Public Comment Carbiener 2019-05-22 to 08-19, Jackson, P., Marlette, J., et al.

Evaluation of Mitigation for Indirect Impacts per NRHP-Eligible Oregon Trail/NHT Segment

As presented in Table HCA-3: NRHP Eligible Oregon Trail/NHT Inventory in Analysis Area with Potential Indirect Impacts, the applicant represents that Oregon Trail/NHT segment locations were the proposed facility would cross, or be substantially visible from, would result in adverse visual impacts to the resource. To support review of the applicant’s proposed visual impact mitigation, the Department recommends Council rely on its definition of mitigation. As presented in Table HCA-4a: Evaluation of Applicant’s Visual Impact Mitigation for NRHP-Eligible Oregon Trail/NHT Segments, consistent with OAR 345-001-0010(33), the applicant’s proposed mitigation includes minimization measures; restoration measures; preservation and maintenance measures; and, compensation.

Table HCA-4a: Evaluation of Applicant’s Visual Impact Mitigation for NRHP-Eligible Oregon Trail/NHT Segments

<u>Applicant Proposed Mitigation</u>	<u>Consistency with OAR 345-001-0010(33)</u>
<u>Design modifications</u>	<u>(b)</u>
<u>Purchase of conservation easement or other land protection where trail traces exist</u>	<u>(c)</u>
<u>Historic trails restoration within and outside the facility area</u>	<u>(c)</u>
<u>Land acquisition</u>	<u>(d)</u>
<u>Public signage, publication/print/media, and/or interpretive plans</u>	<u>(c)</u>
<u>Trail segment management plans</u>	<u>(d)</u>
<u>Additional literature or archival review (e.g. historic maps, local papers);</u>	<u>(d)</u>
<u>Remote sensing</u>	<u>(d)</u>
<u>National Register nomination</u>	<u>(d)</u>
<u>Recording—including HABS/HAER/HALS</u>	<u>(d)</u>
<u>Funding for public interpretation, archeological resource, or other program benefiting Oregon Trail resources</u>	<u>(e)</u>
<p><u>Acronyms: HABS – Historic American Building Survey; HAER – Historic American Engineering Record; HALS –Historic American Landscape Survey</u></p> <p><u>Notes:</u></p> <p>1. <u>OAR 345-001-0010(33) defines “mitigation” as taking one or more of the following actions listed in order of priority:</u></p> <ul style="list-style-type: none"> <u>(a) Avoiding the impact altogether by not taking a certain action or parts of an action;</u> <u>(b) Minimizing impacts by limiting the degree or magnitude of the action and its implementation;</u> <u>(c) Partially or completely rectifying the impact by repairing, rehabilitating or restoring the affected environment;</u> <u>(d) Reducing or eliminating the impact over time by preservation and maintenance operations during the life of the action by monitoring and taking appropriate corrective measures;</u> <u>(e) Partially or completely compensating for the impact by replacing or providing comparable substitute resources or environments; or</u> <u>(f) Implementing other measures approved by the Council.</u> 	

1 Based on the extent of potential adverse visual impacts to the NRHP-eligible Oregon Trail/NHT
 2 resources and within the 5-mile viewshed of the resource identified in Table HCA-3, as
 3 presented in ASC Exhibit S Attachment S-10, the Department recommends Council require that
 4 mitigation include at least one minimization measure (design modification) and one measure
 5 resulting in restoration; preservation and maintenance; or compensation (OAR 345-001-
 6 0010(33)(b) and; (c), (d) or (e)) directly benefiting the affected area – which the Department
 7 recommends be defined as the county within which the impacted resource is located. The
 8 Department notes that mitigation established through the federal Section 106 compliance
 9 review may be used to satisfy the EFSC mitigation requirement for listed or likely NRHP-eligible
 10 Oregon Trail/NHT trail segments if applicant can demonstrate that it addresses both the design
 11 modifications and the restoration; preservation and maintenance; or compensation mitigation
 12 within affected area (county), as included in the below Table HCA-4b (included in the HPMP). If
 13 not duplicated through the federal Section 106 process, the applicant shall establish the scope
 14 and scale of Table HCA-4b mitigation, prior to construction, subject to Department review and
 15 approval, in consultation with SHPO, its consultants, or other entities with expertise with
 16 historic trails. To impose this requirement, the Department recommends Council require that
 17 the HPMP (Attachment S-9 of this order) include Table HCA-4b as presented below.

**Table HCA-5b: Department Recommended Mitigation
for NRHP-Eligible Oregon Trail/NHT Segments**

<u>Mitigation</u>
<u>The HPMP shall establish the following mitigation for each impacted NHRP-Eligible Oregon Trail/NHT Segment:¹</u>
<u>At least one of the following (OAR 345-001-0010(33)(b)):²</u>
<u>Design modification</u>
<u>And, at least one of the following (OAR 345-001-0010(33)(c)-(e)), with a demonstrated direct benefit to affected area (county of resource site), in order of priority:</u>
<u>Purchase of conservation easement or other land protection where trail traces exist</u>
<u>Historic trails restoration within and outside the facility area</u>
<u>Land acquisition</u>
<u>Public signage, publication/print/media, and/or interpretive plans</u>
<u>Trail segment management plans</u>
<u>Additional literature or archival review (e.g. historic maps, local papers);</u>
<u>Remote sensing</u>
<u>National Register nomination</u>
<u>Recording—including HABS/HAER/HALS</u>
<u>Funding for public interpretation, archeological resource, or other program benefiting Oregon Trail resources</u>

**Table HCA-5b: Department Recommended Mitigation
for NRHP-Eligible Oregon Trail/NHT Segments**

<u>Mitigation</u>
<p>Acronyms: HABS – Historic American Building Survey; HAER – Historic American Engineering Record; HALS –Historic American Landscape Survey</p> <p>Notes:</p> <ol style="list-style-type: none">1. <u>Required mitigation established through the federal Section 106 compliance review may be used to satisfy the EFSC mitigation requirement for listed or likely NRHP-eligible Oregon Trail/NHT trail segments if applicant can demonstrate that it addresses both the design modifications and the restoration; preservation and maintenance; or compensation mitigation within affected area (county), as included in this table [Table HCA-4b of the HPMP]. If not duplicated through the federal Section 106 process, the applicant shall establish the scope and scale of Table HCA-4b mitigation, prior to construction, subject to Department review and approval, as part of the EFSC-specific HPMP, as outlined in recommended Historic, Cultural and Archeological Resources Condition 2.</u>2. <u>OR 345-001-0010(33) defines “mitigation” as taking one or more of the following actions listed in order of priority:</u><ol style="list-style-type: none">(a) <u>Avoiding the impact altogether by not taking a certain action or parts of an action;</u>(b) <u>Minimizing impacts by limiting the degree or magnitude of the action and its implementation;</u>(c) <u>Partially or completely rectifying the impact by repairing, rehabilitating or restoring the affected environment;</u>(d) <u>Reducing or eliminating the impact over time by preservation and maintenance operations during the life of the action by monitoring and taking appropriate corrective measures;</u>(e) <u>Partially or completely compensating for the impact by replacing or providing comparable substitute resources or environments; or</u>(f) <u>Implementing other measures approved by the Council.</u>

Applicability of Visual Impact Mitigation for Protected Resources with Shared Viewsheds

As described throughout this order, many NRHP-eligible Oregon Trail/NHT segments identified in Table HCA-3 are also protected under, or located within resources protected under, the Council’s Protected Areas, Recreation, Scenic and Land Use standards. Based on the applicant’s visual impact assessment and proposed mitigation, mitigation measures are intended to reduce impacts to the resource and within the 5-mile viewshed of the resource. The Department recommends that, to minimize unnecessary duplication in mitigation and appropriately apply mitigation for the same or similar visual impact, Council find that mitigation proposed by the applicant and recommended by the Department for visual impacts to NRHP-eligible Oregon Trail/NHT segments listed in Table HCA-3 would also reduce proposed facility visual impacts to protected resources for which the trail resource is within, parallel to, or where the resources share the same 5-mile viewshed.

For example, the proposed facility would result in potential adverse visual impacts to the NHRP-eligible Oregon Trail/NHT resource B2H-BA-282 (Oregon Trail, Virtue Flat, Flat Segment and Flagstaff Hill) at the point of crossing and within the existing 5-mile viewshed of the resource. This resource is within the parcel boundary of NHOTIC, parallels OR 86 and Hells Canyon Scenic Byway (OR 86 and Hells Canyon Scenic Byway overlap for the route segment within the analysis area). These resources are protected under the Council’s Protected Areas, Recreation, Scenic

1 Resources or Land Use standards, which also, in some instances, require a visual impact
2 assessment. Design modifications are already proposed as site certificate conditions to reduce
3 visual impacts in the viewshed of NHOTIC. In Section IV.J., *Scenic Resources*, recommended
4 Scenic Resources Condition 43 mirrors applicant-represented mitigation measures to minimize
5 visual impacts with design modifications including site-specific transmission tower heights,
6 frame types, and materials that would collectively reduce the visual intrusions at NHOTIC and
7 the Birch Creek Area of Critical Environmental Concern (ACEC). Based on this analysis and
8 reasoning, because B2H-BA-282 is within the NHOTIC parcel boundary, where resources have
9 the same or similar viewshed, to minimize unnecessary duplication in the applicant’s mitigation
10 obligation for the same visual impact, the Department recommends Council find that
11 compliance with recommended Scenic Resources Condition 43 would satisfy the design
12 modification mitigation requirement established in Table HCA-4b for B2H-BA-282. Similarly, the
13 Department recommends Council find that the additional mitigation outlined in Table HCA-4b
14 above, which would require the applicant to restore or rehabilitate; preserve or maintain; or
15 compensate for the visual impact using an entity or project that would directly benefit the
16 county for which the resource is located, would also further mitigate visual impacts to NHOTIC,
17 OR 86 and Hells Canyon Scenic Byway.

18
19 In summary, due to the commonalities in visual impact within the same/overlapping viewshed
20 area, and the recommended mitigation – which would both minimize visual impacts through
21 design modification within a 5-mile viewshed area of the identified resource – and, within the
22 same affected area, restore; preserve or maintain; or compensate for the visual impact using an
23 entity or project that would directly benefit the same county, the Department recommends
24 Council evaluate potential visual impacts to resources with shared viewsheds, but protected
25 under other Council standards, based on a reduced impact from the mitigation presented in
26 Table HCA-4b above.⁴⁸⁸

27
28 *Evaluation of Mitigation for Indirect Impacts per NRHP-Eligible Oregon Trail/NHT as a*
29 *Linear Resource*

30
31 As discussed in the below Section IV.K.4., *Mitigation for Historic, Cultural, and Archaeological*
32 *Resources: Historic Properties Management Plan (HPMP)*, the final resource eligibility
33 determinations ~~will~~would be verified or established in the Section 106 compliance review and
34 this information ~~will~~would be provided in the final HPMP, ~~and will be~~ submitted to the
35 Department for its review and approval, in consultation with SHPO, per ~~r~~RRecommended

⁴⁸⁸ Commenters express concerns about visual impacts from the proposed facility at NHT/Oregon Trail segments and at
EFSC: Protected Areas, Scenic Resources, and Recreational opportunities, such at The National Historic Oregon Trail
Interpretive Center (NHOTIC), Birch Creek ACEC, etc., and other eligible Oregon Trail segments. OAR 345-022-0090
specifies that mitigation may be considered to reduce potential adverse impacts to less than significant. As explained in
this section, the applicant-proposed design modification mitigation measures and other mitigation measures designated
in the HPMP apply to the EFSC definition of mitigation. B2HAPPDoc8-1 All DPO Comments Combined-Rec'd 2019-05-22
to 08-22; B2HAPPDoc8-066 DPO Public Comment_Carbiener 2019-05-22 to 08-19, B2HAPPDoc8-003 DPO Special
Advisory Group Comment_Baker County Kerns 2019-08-22, Kreider, F., Miller, M., Deschner, W., et al.

1 Historic, Cultural, and Archaeological Resources Condition 2 discussed below. The Department
2 notes that its review and approval would include: resources evaluated under OAR 345-022-
3 0090(1)(a) and (b), discussed later in this section; appropriate mitigation measures for those
4 resources. The information contained in Table HCA-3, includes how the sensitive Oregon Trail
5 resources ~~will~~would be avoided, reduced, and/or mitigated consistent with the requirements
6 of Section 6.2.2 of the HPMP and includes the site-specific measures contained in Table 6-3
7 from the HPMP and the framework outlined in Table 6-4 of the HPMP. This compiled
8 information has been included in the HPMP.

9
10 As noted in the beginning of this section, Table HCA-3 reflects information from ASC Exhibit S,
11 HPMP Attachment S-9, ~~and the~~ which includes the ~~Errata~~ for the HPMP Attachment S-9. This
12 information includes applicant proposed avoidance measures that would avoid direct impacts
13 to Oregon Trail/NHT resources. To verify that these direct impact avoidance measures are
14 observed by the applicant, the Department recommends the Council adopt the following site
15 certificate condition:

16
17 **Recommended Historic, Cultural, and Archaeological Resources Condition 1:** During final
18 design and construction of the facility, the certificate holder shall design and locate facility
19 components to avoid direct impacts to Oregon Trail/National Historic Trail resources
20 consistent with ASC Exhibit S Attachment S-9 Historic Properties Management Plan
21 (HPMP) Errata and Table HCA-3 of the Final Order on the ASC.

22
23 Based on the foregoing analysis of Oregon Trail resources and subject to Recommended
24 Historic, Cultural, and Archaeological Resources Condition 1 imposing avoidance measures for
25 direct impacts to the Oregon Trail, and Recommended Historic, Cultural, and Archaeological
26 Resources Condition 2 which accounts for mitigation for indirect impacts to these resources,
27 the Department recommends the Council find that the construction and operation of the
28 proposed facility is not likely to result in significant adverse impacts to Oregon Trail/NHT
29 resources protected under OAR 345-022-0090(1)(a).

30 IV.K.1.2. Tribal Resources

31
32
33 Under OAR 345-001-0010(52) any tribe identified by the Legislative Commission on Indian
34 Services (LCIS) that may be affected by the proposed facility is identified as a reviewing agency
35 and the Department requests the Tribal government to provide comments on the proposed
36 facility at the notice of intent (NOI), preliminary application for site certificate (pASC) and at the
37 complete application for site certificate (ASC).⁴⁸⁹ As discussed in Section II., *Procedural History*,
38 in this order the applicant submitted a pASC and an amended pASC (ApASC) to reflect route
39 changes resulting from the federal NEPA review and issuance of its ROD. Therefore, the
40 Department also requested reviewing agencies and Tribal Governments provide comments on

⁴⁸⁹ ORS 469.360(4), "Pursuant to a written agreement, the council may compensate a tribe identified by the Commission on Indian Services as affected by the application for expenses directly related to the tribe's review of a notice of intent, site certificate application or request for expedited review."

1 the ApASC as well. The following Tribes were identified by LCIS as being potentially affected by
2 the proposed facility:

- 3
- 4 • Confederated Tribes of the Umatilla Indian Reservation
- 5 • Confederated Tribes of the Warm Springs Indian Reservation of Oregon
- 6 • Burns Paiute Tribe

7 The federal government's consultation process was initiated by the BLM and the BLM will
8 continue its government-to-government consultation with these Tribes as well as other tribes
9 as designated in the Programmatic Agreement, discussed in this section and in Section III.D., of
10 this order. The Navy is engaging in a separate government-to-government consultation process
11 for its NEPA and Section 106 compliance review. For the EFSC review process for large energy
12 facilities, the State's consultation requirements are fulfilled by the Council's designation of
13 Tribal Government's as reviewing agencies and requests for comments and ongoing outreach
14 conducted by the Departments during the phases of review of a proposed facility, as discussed
15 above.

16
17 The Department sent requests for comments to the above listed Tribes when the applicant
18 submitted the ApASC in July 2017. The Department requested comments on the content of the
19 ApASC and if there is any missing or deficient information within the Tribes documentation and
20 consistent Division 21. The Confederated Tribes of the Warm Springs Indian Reservation of
21 Oregon (CTWSRO) and Burns Paiute Tribe did not submit comments on the ApASC. The
22 Confederated Tribes of the Umatilla Indian Reservation (CTUIR) provided a comment letter on
23 the ApASC to the Department expressing its concern about the information gathered and the
24 level of engagement in the Section 106 consultation process, which is outside the scope of
25 Council's jurisdiction. However, one of the concerns of the CTUIR is that the applicant did not
26 accurately represent tribal resources within the materials in the ApASC, and they were unable
27 to determine whether the numbers of sites and eligibility are correct. They expressed further
28 concerns that Exhibit S did not addresses historic properties of religious and cultural
29 significance to Indian tribes (HPRCSITs), and only discussed HPRCSITs that were available in
30 SHPO's database.⁴⁹⁰ The CTUIR suggested that the applicant represent HPRCSITs that may be
31 protected under the Council's Historic, Cultural, and Archaeological standard in the application
32 based on coordination and information exchange with the Tribe.⁴⁹¹ The applicant provided
33 responses to all of the Tribes comments and requests for additional information (RAIs), in the
34 form of response tables and revised draft Exhibit S, that the Tribe then reviewed and provided

⁴⁹⁰ ASC Exhibit S addresses HPRCSITs as Traditional Cultural Properties (TCP's). Traditional Cultural Properties (TCPs) are a class of National Register-eligible properties that possess association with cultural practices or beliefs of a living community that (a) are rooted in that community's history, and (b) are important in maintaining the continuing cultural identity of the community. (See National Register Bulletin 38: Guidelines for Evaluating and Documenting Traditional Cultural Properties). B2HAPPDoc3-36 ASC 19_Exhibit S_Cultural_ASC_Public 2018-09-28. Attachment S-1.

⁴⁹¹ B2HAPPDoc ApASC Reviewing Agency Comment Tribal Govt CTUIR_Quaempts 2017-09-01.

1 additional comments on the revisions. Table HCA-54 below provides information that the
2 applicant provided on three HPRCSITs identified in ASC Exhibit S, Table S-2. The CTUIR explained
3 in its comment letters the existence of additional HPRCSITs within the analysis area, the
4 resolution for evaluating these resources is discussed below. Table HCA-54 only represents the
5 HPRCSITs described by the applicant in Exhibit S and that are available for public disclosure in
6 this order and associated application materials.⁴⁹²

⁴⁹² As stated in the second amended project order, the analysis area includes the area within the site boundary. As part of the Section 106 evaluation, the BLM established an Area of Potential Effects (APE) for an evaluation of indirect visual effects to be five miles or to the visual horizon, whichever is closer, on either side of the centerline of the proposed alignment and alternative routes.

1

Table HCA-6: Exhibit S Historic Properties of Religious and Cultural Significance to Indian Tribes

Assigned Trinomial or Other ID	Visual Assessment Temporary Resource #	County	Generalized Resource Description	NRHP Recommendation	Project Route(s)	Project Component	Land ownership	Impact Avoided?/ Project Effect	Management Recommendation
Nisxt	SL-MO-003	Morrow	TCP/ HPRCSIT	Unevaluated	Proposed Route	Visual Assessment analysis area	PV	No - Potential visual impact	Consultation with Confederated Tribes of the Yakama Nation
Sisupa	SL-MO-004	Morrow	TCP/ HPRCSIT	Eligible (Criteria A and D)	Proposed Route, West of Bombing Range Road Alternative 1, West of Bombing Range Road Alternative 2, Proposed Route	Direct Analysis Area (Construction Footprint); Visual Assessment analysis area	DOD, PV	No - Potential visual impact	Public Archaeology Funding, Consultation.
Sand Hollow Battle-ground	SL-MO-001, SL-MO-005	Morrow	TCP/ HPRCSIT	Eligible (Criteria A and B)	Proposed Route, West of Bombing Range Road Alternative 1, West of Bombing Range Road Alternative 2, Proposed Route	Direct Analysis Area (Construction Footprint); Visual Assessment analysis area	BLM, DOD, PV	No - Potential visual impact	Public Archaeology Funding, Public Interpretation Funding, Consultation.

2

3

1 The applicant and CTUIR provided ongoing comments and Exhibit revisions and the two parties
2 agreed to meet in-person to facilitate information exchange, with the request for the
3 Department and SHPO to attend. A meeting between the CTUIR, the applicant, the
4 Department, and SHPO was held on May 3, 2018 at the CTUIR's Nixyáawii Governance Center.
5 After the meeting the applicant and the CTUIR exchanged information and, with the facilitation
6 of the Department, agreed to continue working to address the Tribes concerns after the ApASC
7 was deemed complete. The two parties continued working directly with each other to address
8 the Tribes concerns about the potential impacts from the proposed facility. On February 12,
9 2019, the Department sent a guidance document to the CTUIR and to the applicant outlining
10 how Council may address HPRCSITs in its process.⁴⁹³ Specifically, the guidance document is
11 intended to outline how Council may evaluate whether HPRCSITs are protected under OAR 345-
12 022-0090 based on a spectrum of information on the record for a facility, while respecting a
13 Tribal Government's desire to maintain confidentiality concerning such resources.

14
15 Alternatively, an applicant and Tribe may coordinate independently about Tribal resources
16 (HPRCSITs and other resources under OAR 345-022-0090(1)(a) where SHPO and the lead federal
17 agency would defer to a Tribe for eligibility determinations) potentially impacted by the
18 proposed facility and come to an agreement about impacts and any mitigation for impacts to
19 resources. If the applicant and Tribe come to such agreement they may submit a letter to
20 Council identifying that the construction and operation of the proposed facility, taking into
21 account mitigation, are not likely to result in significant adverse impacts to historic, cultural or
22 archaeological resources that have been listed on, or would likely be listed on the NRHP. And
23 Council may rely upon the Tribe's letter indicating its concerns have been satisfied and
24 therefore, OAR 345-022-0090(1)(a) has been met. On April 19, 2019 the CTUIR submitted a
25 letter to the Department stating:

26
27 *"The CTUIR is pleased to inform the ODOE and the federal agencies that the CTUIR's*
28 *concerns have been addressed and will be mitigated by Idaho Power pursuant to a*
29 *confidential mitigation agreement between the CTUIR and Idaho Power. Therefore, the*
30 *construction and operation of the proposed B2H project, taking into account mitigation, are*
31 *not likely to result in significant adverse impacts to eligible or likely eligible historic*
32 *properties of religious and cultural significance or resources identified by the CTUIR."*^{494, 495}
33

⁴⁹³ B2HAPPDoc20 ASC ODOE Guidance Doc for HPRCSITs in the EFSC Process 2019-02-12.

⁴⁹⁴ B2HAPPDoc13-27 ASC Reviewing Agency Comment CTUIR_Burke 2019-04-19.

⁴⁹⁵ The confidential mitigation agreement occurred outside of the site certificate process, and is directly between the CTUIR and the applicant. As such, neither the Department nor Council will have any ongoing involvement in the implementation of the agreement, as it is outside the site certificate process. However, Council may rely on the Tribe's satisfaction that the Council's standard has been met specific to HPRCSITs that would otherwise be evaluated as part of the ASC and potentially protected under OAR 345-022-0090(1)(a).

1 The Confederated Tribes of the Warm Springs of Oregon, Tribal Historic Preservation Office
2 (THPO) provided a comment letter on the ASC explaining that the area of potential effects is
3 within the areas of concern for the CTWSRO, however they are aware of the conversations
4 between the CTUIR and the applicant and, “defer to them with regard to cultural resource
5 issues associated with B2H.”⁴⁹⁶
6

7 In its April 19, 2019 letter, the CTUIR indicated they and the applicant also agreed upon
8 revisions to an applicant-proposed condition in the site certificate regarding the information
9 included, submission, and review process for the Historic Property Management Plan (HPMP).
10 The CTUIR’s condition language specified that they and the applicant agree that the HPMP and
11 the High Probability Areas Assessment will be shared with the CTUIR prior to the Department
12 receipt of the final HPMP for Department review and approval, in coordination with the Tribe
13 and SHPO. The suggested condition language also includes review timelines for the CTUIR and
14 applicant to review and respond to the HPMP and High Probability Areas Assessment. The
15 confidential mitigation agreement between the CTUIR and the applicant is outside of the site
16 certificate process. As such, neither the Department nor Council will have any ongoing
17 involvement in the implementation of the agreement, including enforcement authority over the
18 measures within the agreement.
19

20 Council may rely on the Tribe’s satisfaction that the EFSC standard has been met specific to
21 HPRCSITs and tribal resources that may otherwise be evaluated as part of the ASC and
22 potentially protected under OAR 345-022-0090(1)(a). The Tribe’s request to include the High
23 Probability Areas Assessment with the submission of the final HPMP has been included in
24 Recommended Historic, Cultural, and Archaeological Resources Condition 2 discussed below in
25 Section IV.K.4., *Mitigation for Historic, Cultural, and Archaeological Resources: Historic*
26 *Properties Management Plan (HPMP)*. Recommended Historic, Cultural, and Archaeological
27 Resources Condition 2 also requires the applicant to submit the HPMP (with Inadvertent
28 Discovery Plan and High Probability Areas Assessment, subject to confidential procedure
29 submission) to the Tribe, SHPO and the Department for review and final approval by the
30 Department. At the time of submission the Department will coordinate with the CTUIR to
31 ensure that its concerns has been addressed. The Department encourages the applicant to
32 submit the draft final HPMP and High Probability Areas Assessment to the CTUIR in advance of
33 the submission to the Department subject to the CTUIR and applicant agreed review timelines,
34 as consistent with any other agreements outside the EFSC and site certificate process, however
35 the Department is not making this a site certificate condition for the reasons outlined here.⁴⁹⁷
36

37 Based on the foregoing discussion of the procedural history of Department coordination with
38 affected Tribal Governments, the evaluation of Tribal Resources in the ASC, the letter to EFSC

⁴⁹⁶ B2HAPPDoc13-6 ASC Reviewing Agency Comment CTWS_Nauer 2018-11-16.

⁴⁹⁷ In its comments on the DPO the applicant requested to include condition language that includes review timelines for the CTUIR and applicant to review and respond to the HPMP prior to submitting it to the Department, as well as specified review timelines. The Department did not include this language in Recommended Historic, Cultural, and Archaeological Resources Condition 2 for the reasons provided in this paragraph.

1 from the Confederated Tribes of the Umatilla Indian Reservation, and subject to Recommended
2 Historic, Cultural, and Archaeological Resources Condition 2 discussed below, the Department
3 recommends the Council find that the construction and operation of the proposed facility is not
4 likely to result in significant adverse impacts to Tribal resources, including HPRCSITs, protected
5 under OAR 345-022-0090(1)(a).

6
7 IV.K.1.3. Other Resources Potentially Impacted under OAR 345-022-0090(1)(a)
8

9 Table HCA-~~65~~, *Potentially Impacted Resources under OAR 345-022-0090(1)(a)*, below represents
10 all the resources inventoried in the site boundary/direct analysis area, and within the visual
11 impact area/Area of Potential Effect (APE) that may experience a direct or indirect impact.
12 Table HCA-~~65~~ is generated from the information provided in ASC Exhibit S~~i~~; Table S-2~~1~~, and the
13 Exhibit S and HPMP Errata. Table HCA-~~65~~ includes resources that may potentially be protected
14 under OAR 345-022-0090(1)(a) and OAR 345-022-0090(1)(b) of the ESFC standard. As discussed
15 in the below Section IV.K.2., *Potential Impacts to Historic, Cultural, and Archaeological*
16 *Resources Under OAR 345-022-0090(1)(b)*, if a resource is not eligible for listing on the NRHP, it
17 may qualify as an archaeological object or archaeological site as defined in statute and covered
18 under sub (b) of the EFSC standard. Table HCA-~~65~~ does not include resources that the applicant
19 proposes would only be potentially protected under sub (b) of the standard. These are
20 discussed in the next section. Table HCA-~~65~~ also excludes Oregon Trail/NHT and historic
21 properties of religious and cultural significance to Indian tribes (HPRCSITs), because these are
22 discussed in the previous sections. The table provides the resource identification, generalized
23 description, the project component that may create the impact, whether there is a potential
24 direct or indirect impact, and some management notes represented for additional activities and
25 avoidance measures.

Table HCA-7: Potentially Impacted Resources under OAR 345-022-0090(1)(a)

Temporary Resource #: Ped. Survey/Visual Assessment <u>OR Assigned Trinomial</u>	County	Generalized Resource Description/ Resource Type	NRHP Recommendation	Project Route(s)	Project Component	Land ownership	Applicable EFSC Standard	Project Impacts and Management Comments
Segment 4B2H-EK-26/ OWR&N Roundhouse and OWR&N/OSL Joint Railyard	Baker	Railroad Segment & Structure/ Historic Archaeological Site	Unevaluated (Criterion D); Not Eligible (Criteria A, B, and C)	Proposed Route	Direct Analysis Area (Construction Footprint); Visual Assessment analysis area	PV	a) Potential Historic Property; b) Archaeological site on private land	Potential direct/indirect impact. Avoid direct impact until eligibility determined. Testing Needed.

1

⁴⁹⁸ Committer provided survey result information resulting from applicant surveys of private property and maintains that resource 6B2H-MC-10 was evaluated but was not included in the ASC or DPO. The Department concurs that the evidence provided demonstrates the resource was evaluated by the applicant but was not included in the ASC or DPO. The applicant explains that 6B2H-MC-10 is 5.14 meters south of the direct analysis southern boundary. It is therefore not included in the direct effects APE. The scale of Figure 14 likely makes it appear that the site is on or at the boundary. However, based on recording the site with a sub-meter accurate GPS unit, it is outside. The Department notes that, although the applicant represents the resource will not be directly impacted, consistent with its evaluation in of cultural, archaeological, and historical resources, an evaluation of indirect impacts is warranted. B2HAPPDoc13 DPO IPC Responses to Select DPO Comments Rec'd by 2019-11-07; B2HAPP DPO IPC Responses - Various Public Comments - Second Set 2019-11-07.

1 Based on the above presentation of other resources inventoried and potentially impacted and
2 protected under OAR 345-022-0090(1)(a), and subject to Recommended Historic, Cultural, and
3 Archaeological Resources Condition 2 which accounts for mitigation for impacts to these
4 resources, the Department recommends the Council find that the construction and operation
5 of the proposed facility is not likely to result in significant adverse impacts to resources
6 protected under OAR 345-022-0090(1)(a).

7
8 *IV.K.2. Potential Impacts to Historic, Cultural, and Archaeological Resources Under OAR 345-*
9 *022-0090(1)(b)*

10
11 Under OAR 345-022-0090(1)(b), for a proposed facility located on private land, the Council must
12 find that the construction and operation of the facility, taking into account mitigation, are not
13 likely to result in significant adverse impacts to archaeological objects, as defined in ORS
14 358.905(1)(a)⁴⁹⁹, or archaeological sites, as defined in 358.905(1)(c).⁵⁰⁰ The applicant explains
15 that to maintain consistency with studies completed for the ASC Exhibit S for Council's
16 evaluation and for the federal regulatory compliance, it assumed historic archaeological objects
17 and sites must have been constructed or created 50 years ago or more, compared to 75 years
18 as identified in 358.905(1)(a).⁵⁰¹ The Department notes that this approach is conservative and
19 may over-estimate the amount of resources identified and potentially evaluated under the
20 EFSC standard in this section.

21
22 This section evaluates resources identified in ASC Exhibit S, Table S-2 that only have a
23 designation of protection under OAR 345-022-0090(1)(b). Several resources in Table S-2 state
24 that they may be protected under (a) and (b) of the standard. As discussed in the beginning of
25 this section, to align the EFSC process with the federal Section 106 compliance review, many
26 resources that the applicant recommended as "not eligible" have been changed and evaluated
27 in this order as "unevaluated/likely eligible", therefore protected under OAR 345-022-
28 0090(1)(a). The Department anticipates that several resources ~~will~~would result in a final
29 determination of "not eligible", therefore not protected under OAR 345-022-0090(1)(a),
30 however, the resources may qualify for protections under OAR 345-022-0090(1)(b) because
31 they may meet the definition of archaeological objects or archaeological sites as defined in
32 statute. This information will be submitted to the Department of as outlined in Recommended
33 Historic, Cultural, and Archaeological Resources 2, discussed below. The measures for impact
34 avoidance, minimization and mitigation for these resources as outlined in this section and in the

⁴⁹⁹ ORS 358.905(1)(a) states "'Archaeological object' means an object that: (A) Is at least 75 years old; (B) Is part of the physical record of an indigenous or other culture found in the state or waters of the state; and (C) Is material remains of past human life or activity that are of archaeological significance including, but not limited to, monuments, symbols, tools, facilities, technological by-products and dietary by-products."

⁵⁰⁰ ORS 358.905(1)(c) states "(A) 'Archaeological site' means a geographic locality in Oregon, including but not limited to submerged and submersible lands and the bed of the sea within the state's jurisdiction, that contains archaeological objects and the contextual associations of the archaeological objects with: (i) Each other; or (ii) Biotic or geological remains or deposits. (B) Examples of archaeological sites described in subparagraph (A) of this paragraph include but are not limited to shipwrecks, lithic quarries, house pit villages, camps, burials, lithic scatters, homesteads and townsites."

⁵⁰¹ B2HAPPDoc3-36 ASC 19_Exhibit S_Cultural_ASC_Public 2018-09-28. Section 3.4.2.

1 framework HPMP, would extend to any resources not covered under OAR 345-022-0090(1)(a)
2 but protected under OAR 345-022-0090(1)(b).

3
4 Table HCA-~~76~~, *Inventoried Resources under OAR 345-022-0090(1)(b)*, includes resources that
5 the applicant recommends as not eligible for listing on the NRHP, but that may be evaluated
6 and protected under OAR 345-022-0090(1)(b). If the lead federal agency disagrees with the not
7 eligible determination, the resource would be considered eligible for listing on the NRHP and
8 therefore protected under OAR 345-022-0090(1)(a), and addressed as such in the framework
9 HPMP. However, the Department is presenting an evaluation of the resources that may qualify
10 under OAR 345-022-0090(1)(b) in Table HCA-~~76~~. These resources located on private land were
11 evaluated against the criteria identified in ORS 358.905(1)(a) and ORS 358.905(1)(c). Specific
12 resource and site descriptions are provided in ASC Exhibit S Attachment S-6, Cultural Resources
13 Technical Report. Pursuant to ORS 192.501(11) Information concerning the location of
14 archaeological sites or objects are exempt from public disclosure, the applicant therefore
15 submits this information under a confidential cover and the Department maintains the
16 information confidential to the fullest extent of the law.

17
18 The types of resources listed in the below table ~~will~~would not likely be eligible for listing on the
19 NRHP because they do not have or lack contributing attributes under the four criteria that must
20 be evaluated by SHPO and the lead feral agency for listing on the NRHP. The Department
21 provides a summary of the type of resource and a brief description that is provided in the
22 confidential ASC Exhibit S Attachment S-6. The Department provides this information for
23 Council to evaluate the merits of the protection under its standard. Location information these
24 resources is not provide consistent with ORS 192.501(11).

Table HCA-8: Inventoried Resources under OAR 345-022-0090(1)(b)

Cultural Resources Pedestrian Survey Temporary Resource #	County	Resource Type	Generalized Resource Description (Attachment S-6)	Project Route(s)	Project Component	Protected Under OAR 345-022-0090(1)(b)	Potential Impact	Management Recommendation
35BA1351 / B2H-JF-13	Baker	Archaeological Site	Historic /Ranching: Vegetated wooden corral -concentration of manufactured metal and wood parts, metal truck/ tractor cab - manual pump to well head replaced with electric pump- appears to still be in use for cattle.	Proposed Route	Direct Analysis Area (Construction Footprint)	No	May be directly impacted	No further management.

3

1 Based on the above presentation and evaluation under ORS 358.905(1)(a) and ORS
2 358.905(1)(c) of resources inventoried on private lands that may qualify for protection under
3 OAR 345-022-0090(1)(b), the applicant proposed archaeological sites 6B2H-MC-03 and 6B2H-
4 SA-06 may qualify as an “archaeological site” under ORS 358.905(1)(c) because they may
5 contain archaeological objects and the contextual associations of the archaeological objects
6 with each other. The Department notes that these sites may be evaluated in the federal Section
7 106 review and determined eligible for listing on the NRHP, and therefore also protected under
8 OAR 345-022-0090(1)(a). If the lead federal agency concurs with the applicant’s
9 recommendation that these sites are not eligible, they may otherwise be protected under OAR
10 345-022-0090(1)(b). However, the Department recommends the sites either be avoided
11 pending SHPO concurrence with this designation based on final design and any other necessary
12 measures to determine the sites significance. The Department recommends the Council find
13 that sites 6B2H-MC-03 and 6B2H-SA-06 may qualify as an archaeological site and under OAR
14 345-022-0090(1)(b), therefore impacts shall be avoided or mitigated pending the concurrence
15 from SHPO as specifically designated in Recommended Historic, Cultural, and Archaeological
16 Resources Condition 2, discussed below.

17
18 The Department also recommends Council find that all other resources listed in HCA-~~76~~ do not
19 qualify as an archaeological object or site on private lands under ORS 358.905(1)(a) and
20 358.905(1)(c), therefore OAR 345-022-0090(1)(b) does not apply to these resources.

21
22 The Department recommends Council find that, subject to Recommended Historic, Cultural,
23 and Archaeological Resources Condition 2, the construction and operation of the proposed
24 facility is not likely to result in significant adverse impacts to resources protected under OAR
25 345-022-0090(1)(b).

26
27 *IV.K.3. Potential Impacts to and Mitigation for Historic, Cultural, and Archaeological Resources*
28 *Under OAR 345-022-0090(1)(c)*

29
30 OAR 345-022-0090(1)(c), the Council’s Historic, Cultural and Archaeological Resources standard
31 addresses and protects archaeological sites on public lands under OAR 345-022-0090(1)(c) as
32 defined in ORS 358.905(1)(c).⁵⁰² ASC Exhibit S, Table S-2 identifies only one archaeological site
33 located on public (state) lands. This is resource 35UM00365 the Meacham Pioneer Memorial
34 Cemetery Site, managed by the Oregon Department of Transportation (ODOT). This resource is
35 also identified in Table HCA-2, *Oregon Trail/NHT Inventory in Analysis Area with Avoided/No*
36 *Impacts*, in Section IV.K.2 above. There will-would not be direct or indirect impacts to this
37 resource, therefore, OAR 345-022-0090(1)(c) does not apply.

⁵⁰² ORS 358.905(1)(c) states, “(A) “Archaeological site” means a geographic locality in Oregon, including but not limited to submerged and submersible lands and the bed of the sea within the state’s jurisdiction, that contains archaeological objects and the contextual associations of the archaeological objects with: (i) Each other; or (ii) Biotic or geological remains or deposits. (B) Examples of archaeological sites described in subparagraph (A) of this paragraph include but are not limited to shipwrecks, lithic quarries, house pit villages, camps, burials, lithic scatters, homesteads and townsites. B2HAPPDoc3-36 ASC 19_Exhibit S_Cultural_ASC_Public 2018-09-28. Section 3.4.2.

1
2 *IV.K.4. Mitigation for Historic, Cultural, and Archaeological Resources: Historic Properties*
3 *Management Plan (HPMP)*
4

5 As discussed in this section and in Section III.D., Survey Data Based on Final Design and Site
6 Access, the applicant prepared an EFSC-specific Historic Properties Management Plan (HPMP) in
7 addition to the HPMP developed for the federal Section 106 compliance review, as designated
8 in the Programmatic Agreement (PA). The HPMP is included as Attachment S-9 to the ASC and
9 to this order and not only serves as a framework for how to address resource surveys, evaluate
10 impacts to resources, avoid, minimize and mitigate impacts to resources protected under OAR
11 345-022-0090, but also identifies all the inventoried resources, proposed avoidance and
12 mitigation measures associated with resource type, which include more specific mitigation
13 requirements for Oregon Trail segments in each county. After the application was deemed
14 complete and pursuant to OAR 345-015-0190(9), the applicant provided two Errata for Exhibit
15 S, one provided additional descriptions of Oregon Trail segments inventoried and the other
16 Errata was to the HPMP, clarifying specific avoidance and mitigation measures included.⁵⁰³
17

18 Section 1.1 of the HPMP outlines the ~~framework and~~ purposes of the Historic Properties
19 Management Plan and items that will be finalized and submitted to the Department, these
20 ~~including~~ but are not limited to:

- 21 • Summarize methods for determination and documentation of impacts/effects that have
22 been used to inventory and evaluate resources and will-would be used in the event of
23 inadvertent discoveries;
- 24 • Identify resources potentially protected under OAR 345-022-0090(1);
- 25 • Document final eligibility determinations from the Section 106 compliance review for
26 newly identified resources and previously inventoried resources, with supporting
27 documentation;
- 28 • Propose mitigation measures based on the requirements in Table HCA-4b for
29 NHT/Oregon Trail resources in Table HCA-3 included in Appendix A.1: Resource
30 Inventory Tables with Management Recommendations for Resources Potentially
31 Protected under OAR 345-022-0090 attached to the HPMP.
- 32 • Identification of resources on private and public lands under OAR 345-022-0090(1)(b)
33 and (c);
- 34 • Final site-specific impact (direct and indirect) avoidance measures and an impact
35 assessment;
- 36 • Final site-specific impact (direct and indirect) minimization measures based on final
37 design;
- 38 • Final site-specific impact (direct and indirect) mitigation measures based on final design;
- 39 • Document the measures the applicant has taken and will-would take to avoid and
40 minimize impacts to resources protected by EFSC's standards;

⁵⁰³ Attachment S-9, HPMP, to this order includes the Errata to the HPMP.

- 1 • Document the applicant’s goals for managing and protecting resources subject to EFSC
- 2 standards within the analysis area;
- 3 • Provide management guidelines for categories of impacts to cultural resources
- 4 protected by EFSC’s standards;
- 5 • Present a Monitoring Plan which includes guidelines for how avoidance and
- 6 minimization measures will-would be implemented during construction, reclamation,
- 7 and O&M; how the effectiveness of these methods will-would be documented;
- 8 procedures for halting construction, including agency notification in the event of
- 9 unanticipated discoveries during construction; and under what circumstances cultural
- 10 resources monitors will-would be present;
- 11 • Present an Inadvertent Discovery Plan (IDP), which specifies the procedures to follow in
- 12 the event that resources are found during construction, reclamation, and O&M, which
- 13 were not detected during surveys conducted prior to ground-disturbing activities

14
 15 In the HPMP Attachment S-9 Errata and in Table HCA-3 of this order, the applicant proposes
 16 avoidance measures to avoid direct impacts to Oregon Trail/NHT resources. To also address
 17 resource evaluation, impact minimization and mitigation the HPMP serves as a framework to
 18 guide how this will-would be applied based on the resource type and whether a direct or
 19 indirect impact is expected. Table HCA-87 through Table HCA-109 outline these items and are
 20 included in the HPMP.

21
Table HCA-9: Potential Minimization and Mitigation of Direct Impacts to Resource Site Types Identified within the Direct Analysis Area*

Site Type	Potential Minimization/Mitigation Measure
Pre-Contact Sites	
Lithic Scatter, Lithic/Tool Scatter, Quarry, Temporary Camp	Data recovery (controlled excavation), or in-place preservation/protection (capping with clean fill). Off-Site: publish research-focus article or professional society presentation, or public education and outreach (e.g., website,
Multicomponent Sites	
Lithic Scatter/Tool & Refuse Scatter, Ranching Complex, Water Conveyance, Possible Rock Art, Utility Line, Quarry & Refuse Scatter, Temporary Camp	Data recovery (controlled excavation), or in-place preservation/protection (capping with clean fill). Off-Site: publish research-focus article or professional society presentation, or public education and outreach (e.g., website, kiosk, etc.).
Historic-Era Sites	

Table HCA-9: Potential Minimization and Mitigation of Direct Impacts to Resource Site Types Identified within the Direct Analysis Area*

Agriculture, Bridge, Homestead, Ranching, Logging Railroad, Mining, Railroad and Utility Line, Refuse Scatter, Road, Structure, Survey Marker, Trail Segment, Water Conveyance	Update recordation (if necessary), data recovery (if applicable). Off-Site: publish research focus article or professional society presentation, or public education and outreach (e.g., website, kiosk, etc.).
Undetermined Sites	
Rock Circle	Update recordation (if necessary), data recovery (if applicable). Off-Site: publish research focus article or professional society presentation, or public education and outreach (e.g., website, kiosk, etc.).
* Applies to OAR 345-022-0090(1) (a) through (c) Source: B2HAPPDoc3-36 ASC 19_Exhibit S_Cultural_ASC_Public 2018-09-28. Attachment S-9. Table 6-2.

Table HCA-10 Potential Minimization and Mitigation Methods for Indirect Impacts*

Resource Category	Example Resource Types	Potential Management Methods for Indirect Impacts
Trails (NHT, stage trails, freight roads, etc.)	<ul style="list-style-type: none"> • Trail remnants/ segments • Associated trail sites or features (stations, burials, inscriptions) 	<ul style="list-style-type: none"> • Recording—including HABS/HAER/HALS** • Additional literature or archival review (e.g. historic maps, local papers) • Remote sensing • Purchase of conservation easement or other land protection where trail traces exist • Historic trails restoration within and outside Project area • Public signage, publication/print/media, and/or interpretive plans
Historic Buildings and Structures	<ul style="list-style-type: none"> • Farm and ranch sites/homesteads • Historic districts • Utility lines • Water conveyance systems • Mining sites • Bridges, etc. 	<ul style="list-style-type: none"> • Photo documentation and scale drawings • National Register Nomination (if owner consents) • HABS/HAER/HALS documentation • Additional archival and literature review • Restoration of historic building or structure • Relocation of historic building or structure • Public interpretation (with owner permission)

Table HCA-10 Potential Minimization and Mitigation Methods for Indirect Impacts*

Resource Category	Example Resource Types	Potential Management Methods for Indirect Impacts
Historic Property of Religious or Cultural Significance to Indian Tribes (TCPs; limited to those subject to EFSC standards)	<ul style="list-style-type: none"> • Ceremonial areas • Vision quest sites • Hunting and gathering areas 	<ul style="list-style-type: none"> • Additional literature/archival review • Ethnographic documentation • Oral histories • Public archaeology funding • As recommended by impacted tribes
<p>* Applies to OAR 345-022-0090(1) (a) ** HABS – Historic American Building Survey; HAER – Historic American Engineering Record; HALS – Historic American Landscape Survey Source: B2HAPPDoc3-36 ASC 19_Exhibit S_Cultural_ASC_Public 2018-09-28. Attachment S-9. Table 6-3.</p>		

1
2

Table HCA-11 Potential Minimization and Mitigation Methods for Indirect and Direct Impacts to Aboveground Resources*

Built Environment Resource Type	Potential Minimization/ Mitigation (Indirect and Direct impacts)
Trails (Oregon NHT, Lewis and Clark NHT, stage trails, freight roads, etc.)	Recordation in HABS/HAER/HALS**; metal detector surveys, additional historical research, information pamphlets, trail segment management plans; conservation easements; land acquisition; National Register nomination
Historic Buildings (Store, bank, Cabins, Homestead, etc.)	Recordation in HABS/HAER/HALS; restoration of historic building; relocation of historic building; oral histories; public interpretation; print publication; video media publication; National Register nomination
Historic Structures (Railroad, mining, resources, bridge, utility lines, water conveyance, etc.)	Recordation in HABS/HAER/HALS; restoration of historic structure; relocation of historic structure; oral histories; public interpretation; print/media publication; National Register nomination
Historic Districts (residential, commercial, industrial, agricultural)	Historic district design guidelines for utilities, repair and maintenance guidelines, print publication, video media publication (website/podcast/video); National Register nomination

Table HCA-11 Potential Minimization and Mitigation Methods for Indirect and Direct Impacts to Aboveground Resources*

Built Environment Resource Type	Potential Minimization/ Mitigation (Indirect and Direct impacts)
Archaeological resources with above ground features (Cemeteries, cairns, rock alignments, house pits, hunting blinds, middens, camp, quarry, rock art, rock shelter)	Ethnographic documentation; resource management plan; recordation in HABS/HAER/HALS (if appropriate); partnership and funding for public archaeology projects; print publication, video media publication (website/podcast/video)
Traditional Cultural Properties (Ceremonial areas, vision quest, or gathering areas, etc.)	Ethnographic documentation; resource management plan; recordation; oral histories, etc.
<p>* Applies to OAR 345-022-0090(1) (a) through (c) ** HABS – Historic American Building Survey; HAER – Historic American Engineering Record; HALS – Historic American Landscape Survey Source: B2HAPPDoc3-36 ASC 19_ Exhibit S_Cultural_ASC_Public 2018-09-28. Attachment S-9. Table 6-4.</p>	

1
 2 ~~Attachment S-9 and the HPMP Errata compile the applicant’s framework for historic, cultural,~~
 3 ~~and archaeological resources. However, the Department refers to the discussion titled, *Aligning*~~
 4 ~~*EFSC and Section 106 Review: ORS 469.370(13)*, in this order and points out that this concept~~
 5 ~~and process was not contemplated in the applicant’s versions of the HPMP. The Department, in~~
 6 coordination with SHPO and the BLM, and to be consistent with EFSC statute, determined the
 7 most prudent pathway to evaluate EFSC historic, cultural, and archaeological resource
 8 information is to align with the Section 106 federal review, ~~and as such, this is not reflected in~~
 9 ~~the applicant’s proposal. Further, t~~The Confederated Tribes of the Umatilla Indian Reservation
 10 (CTUIR) and the applicant finalized their agreement and submitted a letter to the Department
 11 after the ASC was deemed complete and after the ASC Errata was received from the applicant,
 12 therefore many of the consultation efforts referenced in the ASC have been resolved pursuant
 13 to the confidential mitigation agreement between the Tribe and applicant. ~~To reflect the~~
 14 ~~aforementioned process updates and to better account for the information that will be~~
 15 ~~required to be submitted in the final HPMP,~~

16
 17 As discussed throughout this section, the Department compiled information from the ASC,
 18 attachments, agency letter, and Errata into the analysis and tables in this order. The
 19 Department included the applicable descriptions, inventory tables, impact assessments, and
 20 proposed mitigation measures and requirements into Attachment S-9, the Historic Properties
 21 Management Plan attached to this order. As summarized above, Section 1.1 of the HPMP
 22 outlines the purposes of the Historic Properties Management Plan (HPMP). To ensure that,
 23 based on the Section 106 compliance review, the resource inventory tables are provided to the
 24 Department and include updated impact assessment and mitigation measures via the HPMP to
 25 verify compliance with OAR 345-022-0090, the Department recommends the Council adopt

1 Recommended Historic, Cultural, and Archaeological Resources Condition 2, outlined further
2 below. Final impact avoidance, minimization, and mitigation measures depends on which, if
3 any, of the subsection of the EFSC Historic, Cultural, and Archaeological Resources standard
4 apply (OAR 345-022-0090(1)(a) through (c)). Because the EFSC standard relies upon the
5 determinations that will result from the Section 106 compliance review, the Department
6 recommends Historic, Cultural, and Archaeological Resources Condition 2, require the final
7 HPMP to be submitted to the Department, SHPO and applicable Tribal government reviewing
8 agencies once the lead federal agency eligibility determinations have been established and
9 based upon final design of the phase or segment of the proposed facility. The Department
10 recommends the applicant provide county-specific mitigation measures for impacts to
11 NHT/Oregon Trail resources. The Department also recommends that the final HPMP follow the
12 guidance and framework for resource management outlined in the Attachment S-9 and in the
13 tables in this section. Finally, the Department recommends Historic, Cultural, and
14 Archaeological Resources Condition 3, which would obligate the certificate holder to submit to
15 the Department within one-three years of facility operation a final Cultural Resources Technical
16 Report, which would include, in a single consolidated document, the results of all construction
17 monitoring, unanticipated discovery testing results, and other relevant information as
18 described in the condition.

19
20 Based on the analysis above, the Department recommends the Council adopt the following
21 conditions:

22
23 **Recommended Historic, Cultural, and Archaeological Resources Condition 2:** Prior to
24 construction of a phase or segment of the facility, subject to confidential material
25 submission procedures, and based on 1) new survey data from previously unsurveyed areas
26 and 2) the final design of the ~~proposed~~ facility, the certificate holder shall submit to the
27 Department, the State Historic Preservation Office (SHPO), and applicable Tribal
28 Governments, for review and Department approval a final Historic Properties Management
29 Plan (HPMP) Attachment S-9 of the Final Order on ASC. The Department may engage its
30 consultant to assist in review of the HPMP.

31 The final HPMP shall include, unless otherwise approved by the Department:

- 32 ~~a. The provisions outlined in the Attachment S-9 to the Final Order on the ASC,~~
33 ~~updated as applicable;~~
- 34 ~~b. A revised High Probability Areas Assessment and revised Inadvertent Discovery~~
35 ~~Plan;~~
- 36 ~~c. Updated information to reflect process updates described in the Final Order on~~
37 ~~the ASC with respect to EFSC historic, cultural, and archaeological resource~~
38 ~~information to align with the Section 106 federal review;~~
- 39 ~~d. Final eligibility determinations for newly identified resources and previously~~
40 ~~inventoried resources, with supporting documentation (final Cultural Resources~~
41 ~~Technical Report, ILS, RLS), from the lead federal agencies;~~
 - 42 ~~i. Based on the final eligibility determinations, identify which resources~~
43 ~~qualify for protections under OAR 345-022-0090(1)(a) through (c);~~

1 ii. ~~Submit a revised table of resources inventoried including, at a minimum,~~
2 ~~the resource information included in ASC Exhibit S, Table S-2 or Table~~
3 ~~HCA 3 of the Final Order on the ASC;~~

4 e. ~~Identification of resources not protected under OAR 345-022-0090(1)(a) due to a~~
5 ~~final eligibility determination of “not eligible for listing on the National Register~~
6 ~~of Historic Properties Places (NRHP),” yet may qualify for protections under OAR~~
7 ~~345-022-0090(1)(b) or (c). The HPMP shall also include the following information~~
8 ~~for resources on private and public lands under OAR 345-022-0090(1)(b) and (c)~~
9 ~~for Department approval, in consultation with SHPO:~~

10 i. ~~Applicant recommendations and supporting documentation to~~
11 ~~demonstrate if the resource on private or public lands qualifies as an~~
12 ~~archaeological object or site under ORS 358.905(1)(a) and ORS~~
13 ~~358.905(1)(c).~~

14 ii. ~~A proposed site specific impact assessment including avoidance,~~
15 ~~minimization and/or mitigation measures for the resource.~~

16 f. ~~Final site specific impact (direct and indirect) avoidance measures and an impact~~
17 ~~assessment for a phase or segment of the facility, or specific facility component,~~
18 ~~including avoidance measures in Historic, Cultural, and Archaeological Resources~~
19 ~~Condition 1;~~

20 g. ~~Final site specific impact (direct and indirect) minimization measures based on~~
21 ~~final design of a phase or segment of the facility, or specific facility component;~~

22 h. ~~Final site specific impact (direct and indirect) mitigation measures based on final~~
23 ~~design of a phase or segment of the facility, or specific facility component;~~

- 24 1. The certificate holder shall conduct all construction activities in compliance with the
25 final Department-approved HPMP.

26
27 In ASC Exhibit S, the applicant provides a description of the activities it ~~will~~would conduct prior
28 to, during and after construction of the proposed facility. The applicant also proposes site
29 certificate conditions that reflect the submission, review and approval of survey information,
30 and the HPMP. The Department notes that, as discussed above and captured in Recommended
31 Historic, Cultural, and Archaeological Resources Condition 2, the submission of the final HPMP
32 will include the information outlined in the applicant-proposed conditions found in ASC Exhibit
33 S, including the final High Probability Areas Assessment, Cultural Resources Technical Report,
34 Intensive Level Survey (ILS), Reconnaissance Level Survey (RLS), and Inadvertent Discovery Plan.
35 However, the applicant proposes and the Department recommends, with edits, Council adopt
36 Historic, Cultural, and Archaeological Resources Condition 3 which stipulates the submission of
37 implementation, monitoring efforts, and outcomes based in the final HPMP and Inadvertent
38 Discovery Plan.

39
40 **Recommended Historic, Cultural, and Archaeological Resources Condition 3:** Within
41 ~~one~~three years after construction is completed, the certificate holder shall finalize, and
42 submit to the Department for its approval, a final Cultural Resources Technical
43 Report.

- 1 a. The results of all cultural resource monitoring required by the Historic
- 2 Properties Management Plan (HPMP) referenced in Historic, Cultural, and
- 3 Archaeological Resources Condition 2; and
- 4 b. The results of all cultural resources testing or data recovery conducted as a
- 5 result of unanticipated discoveries as required by the Historic Properties
- 6 Management Plan and Inadvertent Discovery Plan referenced in Historic, Cultural,
- 7 and Archaeological Resources.

8

9 **Conclusions of Law**

10

11 Based on the foregoing findings of fact, and subject to compliance with the recommended

12 conditions of approval, the Department recommends the Council conclude that, taking into

13 account mitigation, the construction and operation of the proposed facility, including proposed

14 and alternative routes, is not likely to result in significant adverse impacts to any historic,

15 cultural, or archaeological resources, in compliance with the Council’s Historic, Cultural, and

16 Archaeological Resources standard.

17 **IV.L. Recreation: OAR 345-022-0100**

18

19 *(1) Except for facilities described in section (2), to issue a site certificate, the Council must*

20 *find that the design, construction and operation of a facility, taking into account*

21 *mitigation, are not likely to result in a significant adverse impact to important*

22 *recreational opportunities in the analysis area as described in the project order. The*

23 *Council shall consider the following factors in judging the importance of a recreational*

24 *opportunity:*

- 25
- 26 *(a) Any special designation or management of the location;*
 - 27 *(b) The degree of demand;*
 - 28 *(c) Outstanding or unusual qualities;*
 - 29 *(d) Availability or rareness;*
 - 30 *(e) Irreplaceability or irretrievability of the opportunity.*

31 ***

32

33

34 **Findings of Fact**

35

36 The Recreation standard requires the Council to find that the design, construction and

37 operation of a facility are not likely to result in significant adverse impacts to ‘important’

38 recreational opportunities. Therefore, the Recreation standard applies to only those recreation

39 areas that the Council finds “important” using the factors listed in the sub-paragraphs of

40 section (1) of the standard. The second amended project order identified the analysis area for

41 the Recreation standard as the area within and extending two miles from the site boundary.

42 The applicant provides evidence about potential impacts to recreation opportunities

43 determined by the applicant to be important in Exhibit T of the ASC. The site boundary is

1 defined as “the perimeter of the site of a proposed energy facility, its related or supporting
2 facilities, all temporary laydown and staging areas, and all corridors and micro-siting corridors
3 proposed by the applicant.”
4

5 OAR 345-022-0100 requires the Council to determine that the design, construction and
6 operation of the proposed facility will not have a significant adverse impact to any recreational
7 opportunities in the analysis area. OAR 345-001-0010(53) defines “significant” as:
8

9 “having an important consequence, either alone or in combination with other factors, based
10 upon the magnitude and likelihood of the impact on the affected human population or
11 natural resources, or on the importance of the natural resources affected, considering the
12 context of the action or impact, its intensity and the degree to which possible impacts are
13 caused by the proposed action. Nothing in this definition is intended to require a statistical
14 analysis of the magnitude or likelihood of a particular impact.”
15

16 To analyze the proposed facility against this standard, the Department must first evaluate
17 whether the identified recreational opportunity is important. The Department must then
18 evaluate whether the design, construction ~~or~~ and operation of the proposed facility could
19 adversely impact the identified important recreational opportunity. If the proposed facility
20 could adversely impact the resource, then the Department must consider the significance of the
21 possible impact using the definition of significance above.
22

23 Recreational Opportunities within the Analysis Area

24

25 In order to identify “important” recreational opportunities, the applicant first identified
26 recreational opportunities occurring within the two-mile analysis area. This was conducted
27 using data, maps, reports, guide books, websites, and similar sources likely to provide site-
28 specific information about recreational opportunities in the analysis area. The search focused
29 primarily on information sources maintained by likely or potential recreation providers,
30 including federal land management agencies, ODFW and OPRD, county and municipal
31 governments, non-governmental organizations, and private-sector associations with a
32 recreation focus, and included recreational opportunities provided by both public and private-
33 sector entities. The applicant then evaluated each of the identified recreational opportunities
34 against the importance criteria listed in OAR 345-022-0100(1)(a)–(e), which are: a) any special
35 designation or management of the location, b) the degree of demand, c) outstanding or
36 unusual qualities, d) availability or rareness, e) irreplaceability or irretrievability of the
37 opportunity.
38

39 The applicant identified 26 recreation opportunities located within the analysis area. Three
40 recreational opportunities are within the site boundary and are crossed by the proposed
41 facility: The Blue Mountain Forest State Scenic Corridor (Blue Mountain Corridor), Burnt River
42 Extensive Recreation Management Area (ERMA), and the Ladd Marsh Wildlife Area.
43

1 The remaining recreation areas are outside the site boundary, but within the two-mile analysis
 2 area. ASC Exhibit T, Attachment T-1 includes a set of maps depicting the locations of
 3 recreational opportunities within the analysis area. ASC Exhibit T, Attachment T-2 includes a list
 4 of the recreational opportunities identified within the analysis area and their distance from and
 5 direction to the proposed facility, as well as the alternative routes.

6
 7 As discussed below, and in accordance with the importance criteria outlined in OAR 345-022-
 8 0100(1), the applicant concluded that 21 of the 26 recreational opportunities inventoried are
 9 considered important recreational opportunities. The Department reviewed and concurs with
 10 the applicant’s assessment of importance for the listed recreational opportunities. The
 11 importance assessment for each opportunity considered was based on the combined
 12 contribution of all five importance factors, weighed equally. All of the opportunities determined
 13 to be important have clear indications of importance for at least two of the five importance
 14 factors. The five resources the applicant determined not to be important are considered
 15 replaceable, provide relatively common recreation opportunities within the surrounding area,
 16 and have relatively limited use and/or capacity; the Department agrees with this assessment
 17 and has not carried forward these five recreation opportunities for additional assessment in
 18 this section of the order.⁵⁰⁴

19
 20 Many of the identified important recreation opportunities are also considered EFSC protected
 21 areas and/or scenic resources. To reduce repetition, the Department has incorporated the
 22 analysis from Section IV.F, *Protected Areas* and Section IV.J, *Scenic Resources*, as appropriate, in
 23 the impact assessment section below.

24
 25 Table R-1 below, recreated from ASC Exhibit T, Table T-1, lists the name of the important
 26 recreation opportunities in the analysis area and a summary of the applicant’s impact
 27 assessment.

Table R-1: Important Recreation Opportunities

Important Recreational Opportunity	Distance to Route Centerline	County
Blue Mountain Forest State Scenic Corridor	Crossed (proposed route)	Union
Ladd Marsh Wildlife Area	Crossed (proposed route)	Union
Burnt River Extensive Recreation Management Area	Crossed (proposed route)	Baker
Grand Tour Scenic Bikeway	Crossed (proposed route)	<u>Union and Baker</u> Morrow and Umatilla

⁵⁰⁴ The assessment of importance for these opportunities, including qualitative ratings for the five importance criteria for each opportunity and the Applicant’s conclusions as to whether it determined the opportunity to be important, is documented in Attachment T-3, Table T-3-1. The areas determined to not be “important” in accordance with the EFSC Recreation standard are: Coyote Springs Wildlife Area, Lindsay Prairie Preserve, Blue Mountain Crossing Day-Use Area and Sno-Park, Spring Creek campground, and Blue Bucket Lost Dutchman’s mining association camp.

Table R-1: Important Recreation Opportunities

Important Recreational Opportunity	Distance to Route Centerline	County
Blue Mountain Scenic Bikeway	Crossed (proposed route)	Union and Baker <u>Morrow and Umatilla</u>
Oregon Trail Area of Critical Environmental Concern – National Historic Oregon Trail Interpretive Center Parcel	106 feet (proposed route)	Baker
Ladd Marsh Wildlife Area	208 feet (Morgan Lake alternative)	Union
Owyhee River Below Dam Special Recreation Management Area	250 feet (proposed route)	Malheur
Morgan Lake Park	0.2 mile (Morgan Lake alternative)	Union
Oregon Trail Birch Creek Special Recreation Management Area	0.2 mile (proposed route)	Malheur
Hilgard Junction State Park	0.3 mile (proposed route)	Union
Hilgard Junction State Park	0.4 mile (Morgan Lake alternative)	Union
Deer Flat National Wildlife Refuge – Snake Island Unit	0.4 mile (proposed route)	Malheur
Weiser Dunes Off-highway Vehicle Play Area	0.5 mile (proposed route)	Washington County (Idaho)
Oregon Trail Tub Mountain Special Recreation Management Area	0.5 mile (proposed route)	Malheur
Morgan Lake Park	0.6 mile (proposed route)	Union
Bully Creek Reservoir	0.7 mile (proposed route)	Malheur
Farewell Bend State Recreation Area	0.7 miles (proposed route)	Baker
Snake River Breaks Extensive Recreation Management Area	0.8 mile (proposed route)	Baker
Snake River Islands (Huffman Island) Wildlife Area	0.9 mile (proposed route)	Malheur
Oregon Trail Interpretive Park at Blue Mountain Crossing	1.0 mile (Proposed Route)	Union
Umatilla National Wildlife Refuge	1.3 miles (Proposed Route)	Morrow
Powder River WSR, Area of Critical Environmental Concern	1.4 miles (proposed route)	Union and Baker
Virtue Flat Off-highway Vehicle Area	1.5 miles (proposed route)	Baker

Impact Analysis Methodology

For each recreation opportunity deemed “important,” the EFSC standard requires an evaluation of whether there were any significant potential adverse impacts based on, but not limited to, the following:

- (i) Direct or indirect loss of a recreational opportunity as a result of facility construction or operation.
- (ii) Noise resulting from facility construction or operation.
- (iii) Increased traffic resulting from facility construction or operation.
- (iv) Visual impacts of facility structures or plumes.⁵⁰⁵

As with the EFSC Protected Areas standard and Scenic Resources standard, the EFSC rules do not prescribe a specific methodology for assessing potentially significant adverse impacts to recreation opportunities, beyond the four impact categories listed above. As such, the applicant has developed a methodology to conduct the impact assessment, as described below. The Department agrees with these methods. The visual impact assessment methodology is the same as has been used in Section IV.F., *Protected Areas* and Section IV.J., *Scenic Resources*.

Direct or Indirect Loss of Recreational Opportunities

The applicant evaluates impacts from the proposed facility that may result in potential loss of an important recreational opportunity based on review of the proposed route relative to the locations of the important recreational opportunities. A direct loss of opportunity could occur where the proposed facility or alternative routes result in permanent alteration such that the resource no longer exists in its current state. Similar to the assessment of direct loss, indirect loss would result if construction or operation of a proposed facility would impact a recreational opportunity by indirectly altering the resource or some component of it. The methodology assumed losses to be significant potential adverse impacts if permanent displacement of (total or partial) or change in access to an important recreation opportunity resulted in changes to any of the five factors used to judge importance of the recreation opportunity per OAR 345-022-0100 such that the recreation opportunity was no longer considered important.

Noise Impact Assessment

The applicant analyzes the potential noise impacts on recreational opportunities by discussing predicted noise levels resulting from the construction and operation of the proposed facility and by ~~analyzing-discussing the potential-predicted noise impacts-levels under-in the context of~~ the ODEQ noise regulations at OAR Chapter 340, Division 35. ~~While the ODEQ noise regulations are not decisive under the Recreation standard, the acoustic noise analysis is relevant-Evidence of complying with the DEQ regulations is not necessarily definitive of compliance with the~~

⁵⁰⁵ OAR 345-021-0010(1)(t)(B).

1 ~~Recreation standard; however, it is relevant to that analysis~~, along with other factors (e.g.,
2 frequency and duration), as discussed below.

3
4 *Traffic Impact Assessment*

5
6 The applicant evaluated each recreational opportunity for traffic impacts based on the
7 proximity to multi-use areas, access roads, proposed haul roads, and the proposed facility and
8 alternative routes where construction will occur.

9
10 *Visual Impact Assessment*

11
12 The applicant evaluated visual impacts to important recreational opportunities using the
13 methodology described in Exhibit L (Protected Areas) and Exhibit R (Scenic Resources), which
14 considered the combined outcome of context of the impact, impact intensity and the degree to
15 which the possible impacts are caused by the proposed action. Exhibit T, Attachment T-4
16 includes the complete visual impact assessment methodology used for Exhibit R (and also
17 applied to the visual impact analysis for protected areas in Exhibit L and recreation sites in
18 Exhibit T). As discussed above in the findings of compliance with Section IV.F., *Protected Areas*
19 and Section IV.J., *Scenic Resources*, the applicant implemented the visual impact methodology
20 in a series of three parts, including (1) consideration of baseline conditions; (2) assessment of
21 impact likelihood and magnitude; and (3) consideration of intensity, causation and context.
22 Important recreational opportunities outside the modeled viewshed were screened from the
23 analysis and not evaluated in detail. The applicant's methods concluded that an impact would
24 be "less than significant" if the valued scenic attributes of the resource could persist.

25
26 *IV.L.1. Potential Direct and Indirect Loss*

27
28 Four recreational opportunities would be crossed by the proposed facility: The Blue Mountain
29 Corridor, Grande Tour Scenic Bikeway, Burnt River Extensive Recreation Management Area
30 (ERMA), and the Ladd Marsh Wildlife Area. While the proposed facility would cross four
31 important recreational opportunities and would result in a direct loss of a small portion of the
32 area included within the boundaries of the important recreational opportunities, the extent of
33 the loss would not result in a change to the overall use or importance of the resource.
34 Therefore, the Department recommends Council find that the proposed facility would not be
35 likely to result in significant adverse impacts from potential direct losses to these important
36 recreational opportunities.

37
38 Indirect loss could result from temporary traffic and noise impacts, and permanent visual
39 impacts of proposed facility structures. Indirect loss from traffic and noise impacts would be
40 reduced by measures outlined in the Traffic Management and Control Plan, imposed in Public
41 Services Condition ~~21~~, and from noise attenuation due to the linear nature of construction
42 activities. As described in the evaluation of the applicant's visual impact assessment for each of
43 the four recreational opportunities crossed by proposed facility components, permanent visual
44 impacts of the facility would not result in ~~alternation-alteration~~ of the recreational opportunity

1 such that the resources would no longer be considered important. Therefore, while the
 2 proposed facility would result in an indirect loss to these recreational opportunities, the
 3 Department recommends that Council find that the proposed facility would not be likely to
 4 result in significant adverse indirect loss impacts.

5
 6 *IV.L.2. Potential Noise Impacts*

7
 8 *Construction*

9
 10 The Department reiterates the noise impact assessment from Section IV.F., *Protected Areas*.
 11 The noise impact assessment to recreation opportunities would be the same. In general,
 12 construction of the proposed facility would cause some noise impact at recreation opportunity
 13 sites that are close to the proposed facility, but construction would be short-term and
 14 temporary. The applicant’s noise impact assessment to recreation opportunities is found in ASC
 15 Exhibit T, Section 3.4.2.

16
 17 Potential noise impacts during construction would predominately result from operation of
 18 construction vehicles and equipment (i.e. auger drill rig, backhoe, crane, dump truck, grader,
 19 pickup truck, and tractor) at a construction site. As described in Section IV.Q.1., *Noise Control*
 20 *Regulations*, the applicant evaluates potential noise levels from general construction activities
 21 based on an assumed operation of five construction vehicles, at 40 percent hourly usage. As
 22 presented in Table R-2, *Predicted Noise Levels from General Construction Activities*, the one-
 23 hour average predicted noise level from the combined operation of five pieces of equipment is
 24 83 dBA at 50 feet, 79 dBA at 100 feet, and attenuates to 46 dBA at 6,400 feet. Representative
 25 noise levels for general construction equipment was obtained from the Federal Highway
 26 Administration (FHWA) Roadway Construction Noise Model User’s Guide (FHWA 2006).

27
Table R-2: Predicted Noise Levels from General Construction Activities

Noise Source and Assumptions	Distance from Construction Activity (feet)	Leq Noise Level (dBA)
5 construction vehicles at 40% usage factor: 1 at 50 ft 2 at 100 ft 2 at 200 ft	50	83
	100	79
	200	74
	400	69
	800	63
	1,600	58
	3,200	52
	6,400	46
Leq = Equivalent sound pressure level Usage factor = Percent of time equipment is in use over time period (1 hr)		

28

1 Noise generating construction activities would also include blasting and rock breaking (140 dBA
2 at the blast location or over 90 dBA within 500 feet), implosive devices used during conductor
3 stringing, helicopter operations (62 to 84 dBA at 1,000 feet), and vehicular traffic.

4
5 Construction of the proposed facility, including proposed and alternative routes, would cause
6 short-term noise impacts to nearby recreational opportunities, and particularly at those areas
7 crossed by the proposed facility. Construction activities that would cause noise impacts at most
8 recreation opportunities include blasting and rock breaking, implosive devices used during
9 conductor stringing, helicopter operations, and vehicular traffic. The construction activities
10 would progress along the corridor of the proposed transmission line, and no area would be
11 exposed to construction noise for the entire construction period.

12
13 At a distance of half-mile or less, these areas would experience noise impacts during facility
14 construction. However, noise would attenuate with distance, topography, and vegetative
15 screening so it is possible that the decibel volume represented in Table PA-2 may be lower
16 during actual facility construction. Helicopter use during construction would be audible at
17 nearby recreation opportunity sites and would cause a short-term impact to users of those
18 areas at those areas near the helicopter fly-yards and MUAs, and during facility transmission
19 line construction at times of helicopter use. However, construction noise including helicopter
20 use would only occur during facility construction, which is a short-term impact likely only over a
21 period of months at any one location.

22 23 *Operation*

24
25 Potential noise impacts during facility operation would include vegetation maintenance
26 (including chain saws or other power equipment), inspections, corona noise from the
27 transmission line, and potential noise from operation of Longhorn Station. Inspections typically
28 occur once per year, but could be more frequent during weather or emergency events, and
29 while usually would consist of vehicle inspection, helicopters could be used. As during
30 construction, vegetative maintenance and inspection-related noise would only be short term.

31
32 During typical operating conditions, corona noise is estimated at 27 dBA at the edge of the
33 facility right of way (ROW). Twenty-seven dBA is barely audible and would not cause a
34 significant noise impact at any recreation opportunity. In ASC Exhibit T Section 3.4.2.2, the
35 applicant discusses potential noise impacts from corona noise at important recreational
36 opportunities including the Blue Mountain State Scenic Corridor, Burnt River ERMA, and Ladd
37 Marsh Wildlife Area/State Natural Heritage Area and describes that operational noise would be
38 lessened by site-specific factors at each opportunity (e.g. noise would be less from the inside of
39 a moving car on the Scenic Corridor).

40
41 As described further in Section IV.Q.1., *Noise Control Regulations*, which discusses the proposed
42 facility's compliance with the Department of Environmental Quality (DEQ) Noise Regulations,
43 during certain foul weather conditions and low wind, corona noise would be greater than 27

1 dBA at the edge of the ROW and at certain noise-sensitive receptors, including campsites.⁵⁰⁶
2 The applicant evaluates potential noise impacts from operation of the proposed transmission
3 line at campsites, as potential noise-sensitive receptor locations, at Hilgard State Park and
4 Morgan Lake Park for the evaluation under the DEQ noise rules. At these locations, the
5 applicant provides updated noise modeling using H-frame tower structures for the Morgan Lake
6 alternative and identified campsites as noise sensitive receptors (NSRs); 142, 143, 147, and 148
7 at Morgan Lake Park.

8
9 The Department verified with the City of La Grande that these areas are not campgrounds but
10 are day use areas, therefore are not evaluated for compliance with the DEQ noise rules. The
11 results of the applicant’s acoustic noise analysis using H-frames for the Morgan Lake alternative
12 segment at Morgan Lake Park is 44-45 dBA, which is the noise level of a soft whisper or an
13 urban residence.⁵⁰⁷ The Department notes that ambient noise levels are higher during the day
14 and activities such as fishing and picnicking at the day use areas would involve common noises,
15 thus any perceptible corona noise would likely not be audible. Further, the applicant’s acoustic
16 noise analysis evaluated the “worse-case” operational corona noise during foul weather, which
17 generally decreases users of overnight camping. It is also possible that corona noise would be
18 audible at certain locations in recreation opportunity sites very near the proposed facility or
19 crossed by the proposed facility. However, corona noise is never anticipated to be above 50
20 dBA during foul weather at any noise sensitive receptor.⁵⁰⁸ At any nearby recreation
21 opportunity, the conditions that give rise to a louder corona noise (namely, rainy weather)
22 likely also would ~~limits~~ the users at a recreation area. The low-level of corona noise, during
23 infrequent weather conditions, is unlikely to cause a significant noise impact at these
24 recreational areas.

25 26 *IV.L.3. Potential Traffic Impacts*

27 28 *Construction*

29
30 Facility construction could cause short-term impacts to those recreation opportunity sites that
31 are near or crossed by the proposed facility, or where construction traffic routes pass near

⁵⁰⁶ The applicant questions whether seasonally used campsites should be considered NSRs and evaluated for compliance with the DEQ noise regulations, nonetheless, the applicant includes campsites in its evaluation of noise from the proposed transmission line. For a discussion of potential noise impacts at Hilgard State Park, see Section IV.F., *Protected Areas* of this order. B2HAPPDoc13 DPO IPC Responses to Select DPO Comments Rec'd by 2019-11-07; B2HAPP DPO IPC Responses - StopB2H - 4. Noise - 2nd Supplemental Response 2019-11-06, B2HAPPDoc1 Proposed Order Agency Consultation City of La Grande Spence 2020-04-15.

⁵⁰⁷ See Section IV.Q.1., *Noise Control Regulations*; Figure 12: Common Noise Sources and Expected Noise Levels.

⁵⁰⁸ 50 dBA is the maximum allowable L50 sound level standard defined in the DEQ noise regulations under OAR 340-035-0035(1)(b)(B)(i). Operational noise is discussed in the context of the DEQ noise regulations to inform the potential noise impacts under the Council’s Recreation standard, however, the analysis or compliance with the DEQ noise rules is not a requirement of the Recreation standard.

1 those areas. The impacts would be short-term and limited in duration to construction related
2 traffic. Construction traffic would include multiple vehicle types, but the majority of traffic trips
3 would be for construction workers daily commuting to work sites. General traffic impacts from
4 the proposed facility and a description of the construction phasing is ~~also~~ discussed in Section
5 IV.M., *Public Services*; The applicant explains it would use traffic control measures including
6 flaggers, pilot vehicles, and temporary closures if necessary, and that road closures would be
7 publicized in advance and coordinated with land owners, emergency services, and law
8 enforcement.⁵⁰⁹ Recommended Public Services Condition 21 ~~which also includes a number of~~
9 ~~recommended site certificate conditions that would manage and reduce potential impacts from~~
10 ~~facility construction traffic, including~~ requires the finalization of a county-specific traffic
11 management plans, ~~Implementation of these~~ which outlines these and additional measures
12 that will would reduce facility traffic impacts. The applicant's traffic impact assessment to
13 recreation opportunities is found in ASC Exhibit T, Section 3.4.3.

14
15 Construction-related traffic impacts are expected to vary at each recreation opportunity. Some
16 areas would have no impacts from facility construction due to the distance from the proposed
17 facility as well as planned haul and commuting routes. Some would have minor construction-
18 related traffic impacts due to proximity of the facility, or haul/commute routes. However, in all
19 circumstances, construction traffic would be short term and limited. Additionally,
20 recommended conditions in Section IV.M., *Public Services*, specifically including the
21 requirement to finalize a county-specific traffic management plan prior to facility construction,
22 would be expected to mitigate potential construction traffic impacts at any particular
23 recreation opportunity.⁵¹⁰ See Section IV.M.6., *Public Services*; IV.M.6., Traffic Safety, and
24 Recommended Public Services Condition 21 which requires the applicant to generate and
25 submit for ~~approve approval~~ a county-specific Transportation and Traffic Plan, which would
26 identify final construction routes and include traffic controls.

27 *Operation*

28
29
30 No traffic impacts to protected areas are anticipated during facility operation. Facility operation
31 would involve very infrequent maintenance and inspections by the certificate holder, expected
32 at one or two inspections per year.

⁵⁰⁹ B2HAPPDoc13 DPO IPC Responses to Select DPO Comments Rec'd by 2019-11-07; B2HAPP DPO IPC Responses - City of La Grande comments 2019-10-09.

⁵¹⁰ In its comments on the DPO, the City of La Grande explains that it cannot adequately address potential recreational impacts that may occur at Morgan Lake Park until the county-specific Transportation and Traffic Plan is submitted and reviewed. As discussed further in Section IV.M. *Public Services*; IV.M.6. *Traffic Safety*, the applicant is not proposing to substantially modify Morgan Lake Road for construction or operation of the proposed facility, therefore the road is not included in the site boundary under EFSC review. However, prior to construction if it is determined, in consultation with the City and Union County, that the road would require substantial modifications, the applicant must submit a request to amend the site certificate to include the road in the site boundary governed by the site certificate.

1 *IV.L.4. Potential Visual Impacts*

2

3 As described in the Section III, *Description of the Proposed Facility*, the applicant conducted a
4 comprehensive study to assess potential route locations for the facility which attempted to
5 balance multiple constraints and opportunities (such as existing utility corridors) in determining
6 the proposed location of the facility. As explained in ASC Exhibit B (Table B-1, Attachment B-1)
7 in determining the proposed route, the applicant identified more than 35 location-specific
8 constraints related to sensitive viewers and scenic resources. Sensitive viewers and viewing
9 locations addressed in the siting study included scenic byways, intact segments of the Oregon
10 National Historic Trail, BLM ACECs, community parks, and local communities. Sensitive
11 resources included Wild and Scenic Rivers, Oregon State Scenic Waterways, wilderness lands,
12 BLM VRM Class I and II lands, and USFS VQO Preservation and Retention areas. Existing utility
13 and transportation corridors were identified as potential siting opportunities in order to
14 minimize proliferation of potential visual impacts across the landscape. The proposed and
15 alternative routes were informed by the siting study.

16

17 As shown above on Table R-1, the applicant provided a summary of potential impacts to
18 important recreational opportunities. Additionally, for each of the 21 recreational opportunities
19 that are identified as important recreational opportunities, the applicant conducted a site-
20 specific assessment of the nature and degree of potential visual impacts and the significance of
21 those visual impacts. ASC Exhibit T, Attachment T-4 includes the complete visual impact
22 methodology and analysis sheets for all important recreation opportunities. Anticipated
23 impacts are evaluated below for important opportunities.⁵¹¹

24

25 Umatilla National Wildlife Refuge

26

27 The recreational use area of the McCormack Unit of the Umatilla National Wildlife Refuge
28 (NWR) is located approximately 1.3 miles from proposed facility, in Morrow County.⁵¹² There
29 are no proposed temporary haul routes in the vicinity of the NWR and there would be no
30 temporary or permanent disruption of access to the NWR from local roads. The Umatilla NWR
31 is also discussed in Section IV.F., *Protected Areas*.

32

33 As further described under the Protected Areas standard, towers from the proposed route
34 would be sky-lined (sited on or near a ridgeline so they are silhouetted against the sky) but
35 partially obstructed by two existing transmission lines currently located between the NWR and
36 the proposed facility. Although scenery of and from the McCormack unit is considered an
37 important aspect of the overall recreation experience at the Umatilla NWR, the proposed route
38 would not cause a noticeable change in the landscape to visitors of the McCormack Unit and

⁵¹¹ No important recreation opportunities were identified within two miles of the Double Mountain Alternative. Potential impacts from the West of Bombing Range Road Alternative 1 and Alternative 2 are considered the same as the Proposed Route due to the proximity of these segments to each other.

⁵¹² B2HAPPDoc3-37 ASC 2_Exhibit T_Recreation_ASC 2018-09-28, Section 3.4.4.1 and Attachment T-3 Section 3.1 for the applicant's evaluation of the proposed facility's anticipated impacts to the resource.

1 would not preclude the McCormack Unit from continuing to function as a focal point for
2 Umatilla Refuge wildlife viewing activities. Additionally, the proposed facility's closest location
3 would be Longhorn Station, located in the Port of Morrow. While it may be possible to see the
4 proposed facility from the Umatilla NWR, a viewer would have to look through the existing port
5 facilities, which includes industrial manufacturing and other existing development.
6

7 Based on the analysis presented here, the Department recommends that the Council find that
8 the proposed facility would not cause a significant adverse impact to the recreational
9 opportunities at the Umatilla National Wildlife Refuge.
10

11 Oregon Trail Interpretive Park at Blue Mountain Crossing

12
13 As noted above, the Oregon Trail Interpretive Park is located approximately one mile from the
14 proposed facility, in Union County.⁵¹³ General construction traffic may cause a temporary,
15 noticeable increase in traffic in this area; however, these impacts would be temporary, would
16 not impact access to the park. The applicant's analysis shows that the top portions of several
17 towers would be visible from the picnic area at the park, but the cleared ROW would be
18 shielded from view by the forested ridgeline. The interpretive park is located on the east side of
19 I-84, while the proposed facility in this location would be west of I-84. An existing 230 kV
20 transmission line is also in between the park and the proposed facility. Considering these
21 intervening features, and the distance from the park to the proposed facility (approximately
22 one mile), the Department recommends that the Council find that the proposed facility would
23 not cause a significant adverse impact to the recreational opportunities at the Oregon Trail
24 Interpretive Park at Blue Mountain Crossing.
25

26 Blue Mountain Forest State Scenic Corridor

27
28 As discussed at length in Section IV.F., *Protected Areas*, the proposed facility would cross the
29 Blue Mountain Corridor, in Union County.⁵¹⁴ As more fully described in Exhibit T and under the
30 Protected Areas and Scenic Resources standards, the proposed transmission line would span
31 the Blue Mountain Corridor and Old Emigrant Hill Scenic Frontage Road and no facility
32 components would be located within the Blue Mountain Corridor. The applicant explains that
33 construction activity in the vicinity of the Blue Mountain Corridor would result in temporary,
34 intermittent traffic delays along the frontage road at the crossing location and near both ends
35 of the parcel as a result of a preliminary haul road proposed to be located nearby. The analysis
36 presented in Section IV.F., *Protected Areas* provide rationale as to why the proposed facility
37 route is more impactful than alternatives in the area and as such, should be allowed by EFSC to
38 pass through the Blue Mountain Forest State Scenic Corridor in compliance with the EFSC
39 Protected Areas standard. The same analysis holds for recreation opportunities under the EFSC

⁵¹³ Id. See Section 3.4.4.2 and Attachment T-3 Section 3.2 for the applicant's evaluation of the proposed facility's anticipated impacts to the resource.

⁵¹⁴ Id. See Section 3.4.4.3 and Attachment T-3 Section 3.3 for the applicant's evaluation of the proposed facility's anticipated impacts to the resource.

1 Recreation standard, and is incorporated here by reference. The presence of the proposed
2 facility would cause a visual impact to drivers along the Corridor, but views would be fleeting
3 and limited, and would occur at a location very close to the junction with I-84.

4
5 Based on the analysis presented here, the Department recommends that the Council find that
6 the proposed facility would not cause a significant adverse impact to the recreational
7 opportunities at the Blue Mountain Forest State Scenic Corridor.

8
9 Hilgard Junction State Park

10
11 The proposed facility would be located approximately 0.8 miles west of the Hilgard Junction
12 State Park and approximately 0.~~34~~4 miles from the Morgan Lake alternative, in Union
13 County.⁵¹⁵ Both routes would be sufficiently separated from the developed part of the park that
14 neither would cause a direct loss of recreation opportunity. Construction traffic may use the
15 same highway exit as park users, resulting in possible delays at the park entrance. However, the
16 park would remain accessible, and these impacts to access and traffic would be temporary and
17 less than significant.

18
19 The proposed facility would be both partially sky-lined and partially obstructed by existing
20 topography. However, the majority of the campsites and areas of the park near the Grande
21 Ronde River would not have views of the proposed facility due to the steep topography that
22 limits views to the foreground. Towers would be visible only from the highlands along the
23 southern boundary of the park, south of the camping area. Visual impacts from the Morgan
24 Lake alternative would be similar to the proposed facility.⁵¹⁶ However, due to the steep
25 topography and forest vegetation adjacent to the Hilgard Junction State Park, views would be
26 very limited. The proposed facility in this area parallels an existing 230 kV transmission line.
27 Additionally, Hilgard Junction State Park runs along I-84, and so there is likely existing
28 disturbance from the freeway. Finally, the proposed facility and Morgan Lake alternative
29 enter/exit a USFS Wallowa-Whitman NF designated utility corridor very near the park, and as
30 such, the facility must transit close to the park in order to utilize the utility corridor.

31
32 Based on the analysis presented here, the Department recommends that the Council find that
33 the proposed facility would not cause a significant adverse impact to the recreational
34 opportunities at Hilgard Junction State Park.

35

⁵¹⁵ Id. See Section 3.4.4.4 and Attachment T-3 Section 3.4 for the applicant's evaluation of the proposed facility's
| anticipated impacts to the resource. As also noted above, the ~~P~~roposed ~~R~~oute is located approximately 0.3 miles from
the closest point of Hilgard Junction State Park; however, that parcel is used for administrative purposes and does not
have any recreational uses.

⁵¹⁶ For additional evaluation of Hilgard State Park, see Section IV.F., Protected Areas., of this order.

1 Morgan Lake Park
2

3 Morgan Lake Park is managed by the City of La Grande Parks and Recreation Department,
4 though the park is outside of the city limits by about three miles. The park includes Morgan
5 Lake and Little Morgan Lake (also known as Twin Lake). Little Morgan Lake is located
6 immediately west of Morgan Lake connected by a short foot trail and is managed as a wildlife
7 area; there are no recreation facilities at Little Morgan Lake.⁵¹⁷ The park has campsites, fishing
8 piers, and a boat launch. No motorized boats are allowed on the lake. Fishing ~~is~~ and camping
9 are popular recreational activities at the lake.⁵¹⁸ In ASC Exhibit T, the applicant provides a
10 description of the Morgan Lake Recreational Use and Development Plan, which is discussed
11 further in this section.

12
13 The City of La Grande is identified as a reviewing agency to assist the Council in its review of the
14 ASC. The City provided comments throughout the review process including on the ASC and
15 record of the DPO.⁵¹⁹ Both the applicant and the City of La Grande provided comments on the
16 DPO identifying that, in light of the City's continued opposition to the proposed facility in Union
17 County, the City and applicant executed a Memorandum of Agreement (MOA) outside the EFSC
18 process. Part of the MOA addresses the City's concerns about potential impacts at Morgan Lake
19 Park, if the Morgan Lake alternative is selected for construction. The City and applicant agreed
20 that, if this route is selected, the applicant would provide the City with \$100,000 for
21 recreational improvements at Morgan Lake Park. The improvements include upgrades to the
22 access road to the Park as well as a new entry gate, the installation of new vault toilets at the
23 campground, day use improvements, signage, and other improvements to the recreational
24 opportunities within the Park. The improvements outlined in the MOA between the City of La
25 Grande and applicant are discussed further in Section IV.E., Land Use; IV.E.1.3., Union County,
26 under the analysis of the Union County Zoning, Partition, and Subdivision Ordinance (UCZPSO).
27 Section 20.09(5)(A) discusses how a proposed use is a benefit to the community and would

⁵¹⁷ B2HAPPDoc13 DPO IPC Responses to Select DPO Comments Rec'd by 2019-11-07; B2HAPP DPO IPC Responses - StopB2H
- 5. and indiv comments Scenic, Recreation, and Protected Areas -Morgan Lake Park 2019-11-07.

⁵¹⁸ Id. See Section 3.4.4.5 and Attachment T-3 Section 3.5 and 3.6 for the applicant's evaluation of the proposed facility and
Morgan Lake Alternative's anticipated impacts to the resource.

⁵¹⁹ In its comments on the ASC, the City of La Grande requested the applicant use H-frame structures as a mitigation design
feature if the applicant selects the proposed facility route in areas that are visible from the City of La Grande. However,
the Department points to the specific Council rules and standards that would require such mitigation for viewshed
impacts to the City itself based on requirements stipulated in the rule or standard. The Council has three standards that
consider visual impacts: Recreation, Scenic Resources, and Protected Areas. The City of La Grande is not a recreation
resource, scenic resource, or protected area, and the Department does not recommend that visual impact mitigation in
the form of H-frame towers or other mitigated structure types in the viewshed of La Grande are warranted because any
impacts are not associated with an applicable Council standard. However, as discussed in Section III.B.2., Proposed
Facility Location by County, of this order, the applicant proposes using H-frame structures within the viewshed of the
City of La Grande based on an outside memorandum of agreement (MOA) between the City and the applicant, and is
therefore, represented as a description of the proposed facility. B2HAPPDoc8-1 All DPO Comments Combined-Rec'd
2019-05-22 to 08-22; B2HAPPDoc8-002 DPO Applicant Comment IPC Stokes 2019-06-20 to 08-22, B2HAPPDoc8-011

1 meet a substantial public need or provide for a public good which clearly outweighs retention
2 of the resource.

3
4 *Proposed Route*

5
6 The proposed facility would be located 0.6 miles north of the Morgan Lake Park at its closest
7 point.

8
9 New, bladed roads and pulling and tensioning sites would be located approximately one-mile
10 northeast of the park. Construction-related traffic may cause a temporary, noticeable increase
11 in traffic along roads leading to the park. However, these impacts would be temporary and
12 would not be anticipated to affect access to the park and interrupt recreational activities. See
13 Section IV.M.6., *Public Services – Traffic Safety*, and Recommended Public Services Condition 24
14 which requires the applicant to generate and submit for approve a county-specific
15 Transportation and Traffic Plan, which would identify final construction routes and include
16 traffic controls; adoption and compliance of these plans will-would manage and reduce
17 potential facility construction traffic impacts.

18
19 Vegetation north of the park would largely screen views of proposed facility structures. Views
20 of the bladed roads and pulling and tensioning sites would all be blocked by vegetation, and
21 vegetation would block views of the towers from most locations in the park. Additionally, the
22 proposed facility route in this area would mostly parallel an existing 230 kV transmission line.

23
24 Based on the analysis presented here, the Department recommends that the Council find that
25 the proposed facility would not cause a significant adverse impact to the recreational
26 opportunities at Morgan Lake Park.

27
28 *Morgan Lake Alternative*

29
30 The Morgan Lake alternative would be located 0.2 mile southwest of ~~the park~~ Little Morgan
31 Lake at its closest point. ASC Exhibit T describes that the City of La Grande Morgan Lake
32 Recreational Use and Development Plan specifies that the Park “shall be managed and
33 improved in a manner consistent with the objective of providing a quality outdoor recreational
34 experience harmonious with a natural forest and lake area... A goal of minimal development of
35 Morgan Lake Park should be maintained to preserve the maximum natural setting and to
36 encourage solitude, isolation, and limited visibility of users...”⁵²⁰ The Department notes that the
37 applicant is not proposing any facility components within the Park boundaries.⁵²¹

⁵²⁰ B2HAPPDoc3-37 ASC 20 Exhibit T Recreation ASC 2018-09-28, Section 3.3.9.

⁵²¹ B2HAPPDoc13 DPO IPC Responses to Select DPO Comments Rec'd by 2019-11-07; B2HAPP DPO IPC Responses - StopB2H
- 5. and indiv comments Scenic, Recreation, and Protected Areas -Morgan Lake Park 2019-11-07. B2HAPPDoc8-1 All DPO
Comments Combined-Rec'd 2019-05-22 to 08-22; B2HAPPDoc8-046 DPO Public Comment Barry L 2019-06-20 to 08-22,
Cooper, M., Eekhoff, M., et al.

1 Improvements would be made to existing roads located to the southwest of the park. New,
2 bladed roads and pulling and tensioning sites would be located approximately 0.3 mile south of
3 the park. Construction-related traffic may cause a temporary, noticeable increase in traffic in
4 the area and along roads leading to the park. However, these impacts would be temporary and
5 access to the park would not be affected. See Section IV.M.6., *Public Services – Traffic Safety*,
6 and Recommended Public Services Condition 24 which requires the applicant to generate and
7 submit for approve a county-specific Transportation and Traffic Plan, which would identify final
8 construction routes and include traffic controls.

9

10 The applicant's visual impact assessment in ASC Exhibit T, Map 1 of Attachment T-6a shows that
11 the facility components of the Morgan Lake alternative would be visible from portions of the
12 park, primarily the access road and parking areas located to the south of the lake. The applicant
13 provides an impact and magnitude assessment in Attachment T-4 of ASC Exhibit T and provides
14 an updated analysis it in its responses to comments on the DPO which explains that views of
15 the proposed alternative route will be experienced from a neutral position and will be
16 peripheral and head-on, intermittent and continuous depending on viewer position and
17 activity. Vegetation located along the southern perimeter of the lake would screen views from
18 the campsites and locations on the water of the lake. Though much of the park will have low
19 visibility of the proposed facility components, visual contrast will vary from weak to strong
20 throughout the park, depending on the level of vegetation screening provided at each location.
21 The applicant explains the only recreational opportunity at Little Morgan Lake is a short foot
22 trail between Morgan Lake and Little Morgan Lake, thereby limiting viewers to areas primarily
23 located east of Little Morgan Lake near the foot trail. Therefore; viewer perception from Little
24 Morgan Lake would be medium due to location of viewers.⁵²² However, at 0.2 miles distance
25 the Department is uncertain if vegetation screening will completely block all views to the
26 Morgan Lake alternative, such as during winter when deciduous vegetation falls from trees.

27

28 The applicant's assessment of visual impacts continues by explaining that vegetation will screen
29 of the towers from most locations in the park, so viewers moving through the park seeing the
30 proposed facility could be intermittent and peripheral, however for viewers engaging in
31 stationary activities such as camping, picnicking, and fishing the viewer perception could be
32 continuous and/or head-on. The Department highlights that the primary purpose of Morgan
33 Lake Park is to provide the citizens of Union County an inexpensive, easily accessible area for a
34 broad range of outdoor recreational activities, including fishing, camping, and nature hikes.
35 Therefore, the primary activities experienced by users of the Park are those that are stationary
36 so the viewer perception could be continuous and/or head-on for most of the users of the
37 recreational opportunity. The applicant maintains that visual impacts to viewers will be
38 medium, however, depending on location the experienced perception could be higher. The
39 applicant's revised analysis changes the previous conclusion low resource change to a
40 conclusion of high resource change because the landscape character and scenic attractiveness

⁵²² B2HAPP DPO IPC Responses - StopB2H - 5. and indiv comments Scenic, Recreation, and Protected Areas -Morgan Lake Park 2019-11-07.

1 of the park will be reduced due to areas where the proposed facility will be close (within 0.2-
2 mile) and vegetation will provide no or limited screening, primarily around the southern and
3 southwestern shores of Little Morgan Lake where visual contrast will be strong and the
4 proposed facility will appear dominant. Based on the applicant’s methodology and revised
5 conclusions under visual contrast and scale dominance, resource change, and viewer
6 perception the applicant maintains the impacts are still less than significant.⁵²³ However, the
7 Department points to the definition of significance under the Council’s rules, namely; “...having
8 an important consequence...based upon the magnitude and likelihood of the impact on the
9 affected human population...”⁵²⁴ Several comments on the record of the DPO expressed
10 concerns about visual impacts from the proposed Morgan Lake alternative on users of Morgan
11 Lake Park. In totality, the Department maintains that this indicates the magnitude and
12 likelihood of an impact on the affected human population.⁵²⁵

13
14 In its comments on the record of the DPO, the applicant provided additional maps and visual
15 simulations for the proposed Morgan Lake alternative route. The simulations illustrate the
16 visual impacts of towers potentially visible from the main parking lot area at the lake where the
17 boat dock and restroom facilities are located and assume an average height of 80-feet for
18 existing trees. The applicant chose this location because it represents a high-traffic area where
19 most users of the park will interact with the park’s recreation opportunities.⁵²⁶ Importantly, the
20 visual simulations provided by the applicant model a combination of H-frame and lattice tower
21 structures, where the shorter H-frames are represented in areas potentially visible and not
22 entirely screened by vegetation.⁵²⁷ Therefore, based on the applicant-modeled H-frame towers
23 in specific locations and to reduce the overall potential visual impacts to the affected human
24 population of user of the Morgan Lake Park recreational opportunity, the Department

25
26 ~~In a letter on the record of the ASC, the City of La Grande objected to the proposed Morgan~~
27 ~~Lake alternative’s impacts, particularly visual impacts, to the recreational opportunities at~~
28 ~~Morgan Lake Park.~~⁵²⁸ ~~The city asked that a condition of approval be included in the site~~

⁵²³ B2HAPP DPO IPC Responses - StopB2H - 5. and indiv comments Scenic, Recreation, and Protected Areas -Morgan Lake Park 2019-11-07.

⁵²⁴ OAR 345-001-0010(53).

⁵²⁵ This position does not assert sufficient specificity of any particular comment about visual impacts at Morgan Lake Park.

⁵²⁶ B2HAPPDoc8-1 All DPO Comments Combined-Rec'd 2019-05-22 to 08-22; B2HAPPDoc8-002 DPO Applicant Comment IPC Stokes 2019-06-20 to 08-22 and B2HAPP DPO IPC Responses - StopB2H - 5. and indiv comments Scenic, Recreation, and Protected Areas -Morgan Lake Park 2019-11-07. B2HAPPDoc8-1 All DPO Comments Combined-Rec'd 2019-05-22 to 08-22; B2HAPPDoc8-046 DPO Public Comment Barry L 2019-06-20 to 08-22, Cooper, M., Whitaker, W., et al.

⁵²⁷ In its comments on the DPO, the applicant states that for the simulation it modeled H-frames for towers ML 7/4, ML 7/3, ML 7/2, and ML 7/1, but for the remaining three towers (ML 6/3, 6/2, and ML 6/1), it modeled lattice towers. This description and simulation use the mileposts by tower location, for consistency with this order and the ASC, the Department cross-referenced these locations with the maps in ASC Exhibit C to provide milepost (MP) locations.

⁵²⁸ B2HAPPDoc ApASC Reviewing Agency Comment City of La Grande_Strope 2018-04-27.

~~certificate requiring that, if approved by Council and chosen to be built by the applicant, that the Morgan Lake alternative use H-frame structures with natina finish (which mimics a wood-like look).⁵²⁹ The Department agrees with the City of La Grande's assessment and request, and in order to reduce potential visual impacts of the Morgan Lake alternative to the recreational opportunities at Morgan Lake Park,~~ recommends that Council include the following condition as Recreation Condition 1.

Recommended Recreation Condition 1: If the Morgan Lake alternative facility route is selected, the certificate holder shall construct the facility using tower structures that meet the following criteria for the transmission line that would be visible from Morgan Lake Park, specifically between milepost (MP) 6.0 to MP 6.9~~miles 5-7~~ of the Morgan Lake alternative, as shown on ASC Exhibit C, Attachment C-3, Map 8.

- a. H-frames;
- b. Tower height no greater than 130 feet; and
- c. Weathered steel (or an equivalent coating).

Based on the analysis presented here, the Department recommends that the Council find that the proposed Morgan Lake alternative facility with recommended mitigation would not cause a significant adverse impact to the recreational opportunities at Morgan Lake Park.

Ladd Marsh Wildlife Area/State Natural Heritage Area

Proposed Route

The proposed facility would cross the Ladd Marsh WA/SNHA in Union County. This is discussed extensively in Section IV.F., *Protected Areas*. The proposed facility would be located within 500 feet of an existing 230-kV transmission line and as such, is allowed by EFSC rules in the Protected Areas standard to cross the WA/SNHA. Two multi-use areas are proposed to be located approximately one mile north and one mile south of the Ladd Marsh WA/SNHA boundaries. Temporary traffic impacts may occur during construction; construction activity

⁵²⁹ ~~The City of La Grande, in the same comment letter, also asked for the applicant to provide mitigation to enhance the recreational experience at Morgan Lake Park. The City did not identify specific enhancements, but the Department does not believe enhancements to the Park are warranted considering that the Morgan Lake alternative route would not directly impact Morgan Lake Park, only indirectly impact via visibility impacts. Recommended Recreation Condition 1 would provide mitigation for the visibility impacts. The City of La Grande has also asked for the H-frame structure mitigation design feature to be used if the applicant selects the proposed facility route in areas that are visible from the City of La Grande. However, the Department points to the specific Council rule and standard that would require such mitigation for viewshed impacts to the City itself based on requirements stipulated in the rule or standard. The Council has three standards that consider visual impacts: Recreation, Scenic Resources, and Protected Areas. The City of La Grande is not a recreation resource, scenic resource, or protected area, and the Department does not find that visual impact mitigation in the form of H-frame towers or other mitigated structure types in the viewshed of La Grande are warranted. B2HAPPDoc ApASC Reviewing Agency Comment City of La Grande_Strope 2018-04-27.~~

1 would occur near the multi-use areas and increased construction traffic on I-84 would
2 temporarily affect travel to and from the wildlife area. Access to the Wildlife Area from Foothill
3 Road would not be expected to be disrupted.⁵³⁰

4
5 The proposed facility would be visible from the majority of the WA/SNHA; however, the
6 proposed facility would be parallel to an existing 230 kV transmission line. The Ladd Marsh
7 Wildlife Area is a recreation opportunity for multiple reasons, but particularly wildlife viewing in
8 the marsh and wetlands on the valley floor, as well as hunting and fishing, which again are
9 primarily focused on the wetlands and marsh along the valley floor. The proposed facility would
10 cross the WA/SNHA on the upland hill portion, to the west of the area, away from the main
11 recreational opportunities. While the proposed facility would likely be visible from the wetlands
12 and marshes along the valley floor, the visibility would not detract from the main recreational
13 purposes of Ladd Marsh.

14
15 *Morgan Lake Alternative Route*

16
17 The proposed Morgan Lake alternative would be located approximately 208 feet southwest of
18 the Ladd Marsh WA/SNHA, where it traverses a higher elevation plateau just outside the
19 WA/SNHA boundary. No facility components of the Morgan Lake alternative would be located
20 in the WA/SNHA. Moderate improvements are proposed for existing roads, and temporary
21 traffic and access impacts may occur during construction. A proposed multi-use area would be
22 located approximately 2.2 miles northeast of the Morgan Lake alternate, in the lower elevation
23 agricultural areas near Highway 30. Construction-related traffic would primarily be routed
24 south of the Ladd Marsh WA/SNHA and would not disrupt recreation opportunities.

25
26 As with the proposed facility route, while it is possible that some facility components of the
27 Morgan Lake alternative would be visible from the marshes and wetlands on the valley floor,
28 the primary recreational opportunity sites, visibility would be limited by trees and topography
29 and would not detract from the primary recreational opportunities at Ladd Marsh.

30
31 Based on the analysis presented here, the Department recommends that the Council find that
32 the proposed facility and Morgan Lake alternative would not cause a significant adverse impact
33 to the recreational opportunities at Ladd Marsh WA/SNHA.

34
35 Powder River ACEC and Wild and Scenic River (WSR)

36
37 The proposed facility would run west of the Powder River and at its closest point would be
38 within 1.4 miles of the Powder River designated Wild and Scenic River (WSR) scenic corridor, in
39 Baker County and Union County. The Powder River ACEC and WSR are BLM owned and

⁵³⁰ B2HAPPDoc3-37 ASC 2_Exhibit T_Recreation_ASC 2018-09-28, Section 3.4.4.6 and Attachment T-3 Section 3.7 and 3.8 for the applicant's evaluation of the proposed facility and Morgan Lake alternative's anticipated impacts to the resource.

1 managed. Temporary construction activity in the vicinity could result in intermittent delay of
2 traffic accessing the area on OR 203 via I-84, with no significant impact. The Powder River ACEC
3 and WSR were also considered under Section IV.F., *Protected Areas* and Section IV.J., *Scenic*
4 *Resources*.⁵³¹

5
6 The Powder River designated scenic corridor is discussed in detail under the Protected Areas
7 and Scenic Resources standards. The applicant's analysis shows that the proposed facility would
8 not be visible at the WSR, and since recreation activities would be focused along the river
9 where the facility would not be visible, visual impacts would not disrupt recreation activities
10 occurring within the Powder River WSR.

11
12 Based on the analysis presented here, the Department recommends that the Council find that
13 the proposed facility would not cause a significant adverse impact to the recreational
14 opportunities at the Powder River.

15
16 Oregon Trail ACEC – NHOTIC Parcel

17
18 The proposed facility would be located within one mile of the National Historic Oregon Trail
19 Interpretive Center (NHOTIC) main building, and within 0.02 miles of the western boundary of
20 the NHOTIC Parcel. Temporary traffic and access impacts may occur during construction, but
21 would be temporary and less than significant. Construction activities would include
22 improvements to existing roads located approximately 0.02 miles directly north and west of the
23 western boundary of the NHOTIC Parcel.⁵³²

24
25 The applicant has conducted a detailed evaluation of potential impact to the NHOTIC, and has
26 made adjustments to both the route and the proposed towers in order minimize any visual
27 impact. Additional analysis is provided in Section IV.F., *Protected Areas* and Section IV.J., *Scenic*
28 *Resources*. In order to minimize and mitigate the potential visual impact from the proposed
29 facility to NHOTIC, and as discussed under the Protected Areas and Scenic Resources standards,
30 the applicant proposes to use modified tower structures in the NHOTIC vicinity in order to
31 minimize and mitigate the visual impact of those towers. Recommended Scenic Resources
32 Condition 2-3 would require H-frame towers, weathered steel, and reduced tower heights in
33 specified locations within view of the NHOTIC information center. Additionally, Baker County, in
34 a comment on the ASC to the Department, requested a study of the option to locate the 500 kV
35 transmission line underground in the area directly in the viewshed of NHOTIC. This study was
36 commissioned by the applicant, and is included in the Exhibit BB- eErrata and further discussed
37 in Section IV.F., *Protected Areas*.

38

⁵³¹ Id. See Section 3.4.4.7 and Attachment T-3 Section 3.9 for the applicant's evaluation of the proposed facility's anticipated impacts to the resource.

⁵³² Id. See Section 3.4.4.8 and Attachment T-3 Section 3.10 for the applicant's evaluation of the proposed facility's anticipated impacts to the resource.

1 Additionally, Recommended Historic, Cultural, and Archaeological Resources Condition 2,
2 requires the submission of Attachment S-9, a final Historic Properties Management Plan
3 (HPMP). The HPMP includes applicant-represented mitigation measures which include but are
4 not limited to, the purchase of a conservation easement or land acquisition; interpretive
5 signage; or funding for public research or project benefiting the affected area for impacted
6 NHT/Oregon Trail segments, including Virtue Flatt and Flagstaff Hill segments. These types of
7 mitigation measures, as presented in Table HCA-4b of this order, would be consistent with
8 Council’s definition of mitigation (OAR 345-001-0010(33) and would therefore mitigate visual
9 impacts within the shared viewshed of NHOTIC and the trail segment.

10
11 As described in Section IV.F., *Protected Areas*, It is also important to note that there were
12 alternative route options previously proposed in the area around NHOTIC, including a route to
13 the east of Flagstaff Hill and the NHOTIC center (“Virtue Flat alternative”), and other routes
14 near the current proposed route. The route to the east of the center was eliminated from
15 consideration due to impacts to sage grouse habitat and potential impacts to an important OHV
16 recreation area. Alternative routes near the current proposed route were eliminated to reduce
17 impacts to irrigated agriculture. The proposed route follows very close to the existing 230 kV
18 transmission line in this area, including using the existing 230 kV line right of way for the
19 proposed facility and rebuilding the 230 kV line. Finally, the Department notes that the BLM has
20 authorized the proposed facility in this area, which is an important consideration because the
21 BLM is the landowner and manager of NHOTIC. By authorizing the route in its Record of
22 Decision (ROD), the federal agency (BLM) that administers the Management Plan for NHOTIC is
23 authorizing the placement of the proposed facility in this location as permissible within the
24 scenic designations in the Management Plan. Considering that the agency that manages the
25 NHOTIC land and has identified the NHOTIC as having significant or important scenic value has
26 authorized the proposed facility in the location proposed in the ASC, the Department considers
27 this relevant information with regard to the EFSC Recreation standard.

28
29 Based on the analysis presented here, the Department recommends that the Council find that
30 the proposed facility, with mitigation, would not cause a significant adverse impact to the
31 recreational opportunities at the Oregon Trail ACEC – NHOTIC Parcel.

32
33 Virtue Flat Off-Highway Vehicle (OHV) Area

34
35 The proposed facility would be located approximately 1.5 miles west of the western boundary
36 of the Virtue Flat OHV Area, in Baker County. Temporary construction activity could cause
37 minor and intermittent delays for those traveling to Virtue Flat from OR 86. The OHV area is
38 completely outside the viewshed of the proposed facility and would have no visual impact.⁵³³
39

⁵³³ Id. See Section 3.4.4.9 for the applicant’s evaluation of the proposed facility’s anticipated impacts to the resource.

1 Based on the analysis presented here, the Department recommends that the Council find that
2 the proposed facility would not cause a significant adverse impact to the recreational
3 opportunities at the Virtue Flat OHV area.

4
5 Burnt River Extensive Recreation Management Area (ERMA)

6
7 The proposed facility would cross the Burnt River ERMA in two locations between MP 170.7
8 and MP 171.5 (two towers) and between MP 172.5 and MP 173.0 (one tower). The ERMA is
9 located in Baker County and is owned and managed by the BLM. A new access road and an
10 improved existing road would be used to access work areas along the ridgeline during
11 construction. Temporary construction activity could cause minor, intermittent delays for
12 travelers along Burnt River Road.⁵³⁴

13
14 The Burnt River Canyon BLM area is described in further detail in Section IV.J., *Scenic Resources*
15 standard. As summarized in Exhibit T, due to the steep, enclosed nature of the canyon and
16 rugged terrain of the Burnt River Canyon area, visibility of the towers would primarily be limited
17 to the eastern area of the resource. The proposed facility would be most visible where it
18 crosses Burnt River Canyon Road, the primary access point for visitors in the ERMA. New and
19 improved access roads would be located along and near the proposed facility in this area;
20 however, they would not be expected to be visible from the Burnt River Canyon Road.

21
22 As was described in Section IV.J., *Scenic Resources*, the Department notes that the BLM has
23 authorized the proposed facility in this area where the facility crosses the ERMA, which is an
24 important consideration because the BLM is the landowner and manager of the Burnt River
25 ERMA. Considering that the agency that manages the Burnt River ERMA has already authorized
26 the proposed facility in the location proposed in the EFSC application, through the ERMA, the
27 Department considers this relevant information particularly to the EFSC Recreation standard.
28 Additionally, the BLM has specifically changed its own management plan for visual resources
29 from VRM Class II to VRM Class IV.

30
31 Based on the analysis presented here, the Department recommends that the Council find that
32 the proposed facility would not cause a significant adverse impact to the recreational
33 opportunities at the BLM Burnt River ERMA.

34
35 Snake River Breaks Extensive Recreation Management Area (ERMA)

36
37 The proposed facility would be located approximately 0.2 mile from one of the Snake River
38 Breaks ERMA parcels, at the southern end of the area at Brownlee Reservoir, in Baker County.
39 The proposed facility would parallel an existing 138-kV transmission line in this area. Access

⁵³⁴ Id. See Section 3.4.4.10 and Attachment T-3 Section 3.11 for the applicant's evaluation of the proposed facility's anticipated impacts to the resource.

1 roads and work areas associated with the proposed facility would be located on the west side
2 of I-84, and therefore would not impact recreation opportunities within the ERMA. The ERMA is
3 BLM land.⁵³⁵

4
5 The proposed facility would be visible only from the higher elevations of the ERMA and would
6 not be visible from the surface of the reservoir or along the shore, which is the primary
7 recreational area. Visual impacts would not preclude the ability of the resource to provide
8 recreational value for which it is recognized. There would be no visual impacts to the Oxbow
9 and Hells Canyon reservoirs. Additionally, the proposed facility would be located west of I-84,
10 and the Snake River Breaks ERMA is east of I-84.

11
12 Based on the analysis presented here, the Department recommends that the Council find that
13 the proposed facility would not cause a significant adverse impact to the recreational
14 opportunities at the Snake River Breaks ERMA.

15
16 Farewell Bend State Recreation Area (SRA)

17
18 The proposed facility would be located about 0.7 mile southwest of the public use areas at
19 Farewell Bend SRA, in Baker County. Construction activity may cause temporary intermittent
20 traffic and access delays for those traveling to Farewell Bend SRA. Farewell Bend SRA is also
21 considered in Section IV.F., *Protected Areas* and Section IV.J., *Scenic Resources*.⁵³⁶

22
23 The proposed facility could potentially be visible from anywhere within the Farewell Bend SRA.
24 However, as described above with respect to the Protected Areas and Scenic Resources
25 standards to mitigate the visual impact, the applicant has proposed to use H-frame structures
26 as mitigation for the Birch Creek ACEC (recommended Scenic Resources Condition ~~43~~), which
27 would result in a reduced visual impact. I-84 and a band of mature trees at the western
28 boundary of the SRA are situated between the SRA and the proposed facility where they are in
29 closest proximity to one another, would further mitigate the impact. Additionally, the proposed
30 facility would likely be visible only when looking west from the parking area, and not towards
31 the river/reservoir. Finally, it is important to note that in this area the proposed facility is
32 located partially in a BLM designated utility corridor, which was established to locate utility
33 facilities such as transmission lines.

34
35 Based on the analysis presented here, the Department recommends that the Council find that
36 the proposed facility would not cause a significant adverse impact to the recreational
37 opportunities at the Farwell Bend SRA.

⁵³⁵ Id. See Section 3.4.4.11 and Attachment T-3 Section 3.12 for the applicant's evaluation of the proposed facility's anticipated impacts to the resource.

⁵³⁶ Id. See Section 3.4.4.12 and Attachment T-3 Section 3.13 for the applicant's evaluation of the proposed facility's anticipated impacts to the resource.

39

Weiser Dunes Off-Highway Vehicle (OHV) Play Area

The Weiser Dunes OHV Play Area would be located about 0.5 miles from the proposed facility. The OHV area is on BLM land, in Idaho, across the Snake River from Oregon. Because the OHV play area is in Idaho, across the river, construction activity would not be expected to cause delays for visitors accessing the play area.⁵³⁷

While it is possible that users of the OHV play area could see the proposed facility, once built, the views would be across the Snake River and also across I-84. The proposed facility in this area would follow the right of way of an existing transmission line. The presence of the proposed facility would not diminish the user experience of the OHV play area. Based on the analysis presented here, the Department recommends that the Council find that the proposed facility would not cause a significant adverse impact to the recreational opportunities at the Weiser Dunes OHV Play Area.

Oregon Trail Birch Creek ACEC/Special Recreation Management Area (SRMA)

The proposed facility would be located approximately 0.2 miles northeast of the Birch Creek SRMA, in Malheur County. The SRMA is the same parcel as the Birch Creek ACEC, discussed at length in Section IV.F., *Protected Areas* and Section IV.J., *Scenic Resources*. In this area, the facility would be located in the right of way of an existing 138 kV transmission line, and a rebuild of 1.1 miles of the existing Quartz to Weiser 138-kV transmission line. During construction, access to the site would be maintained, but travelers may experience temporary delays accessing the interpretive site.⁵³⁸

As discussed under the Protected Areas and Scenic Resources standards, in order to reduce visibility from this ACEC parcel, the applicant has proposed to locate the proposed facility as far north as feasible, without encroaching on active agricultural areas. In addition, to further mitigate the visual impact, and as described above, the applicant proposes to use shorter stature H-~~farm~~-frame structures to maximize the proportion of the transmission line screened from view by existing topography. The mitigation measures included in recommended Scenic Resources Condition 43 would reduce visibility of the proposed facility from this ACEC parcel as well as utilize a shorter, H-frame structure with natina finish. With the proposed mitigation, though somewhat visible from the Birch Creek ACEC/SRMA, the proposed facility would not substantially lower the quality of the adjacent scenery outside the Birch Creek ACEC/SRMA. The proposed facility with mitigation would also preserve the scenic value of views to the north toward Farewell Bend and the Snake River. Features at the site include a parking turnout, a wagon rut swale, a short trail adjacent to the ruts, and interpretive panels marking the site.

⁵³⁷ Id. See Section 3.4.4.13 and Attachment T-3 Section 3.14 for the applicant’s evaluation of the proposed facility’s anticipated impacts to the resource.
⁵³⁸ Id. See Section 3.4.4.14 and Attachment T-3 Section 3.15 for the applicant’s evaluation of the proposed facility’s anticipated impacts to the resource.

1 Visual photosimulations of the Birch Creek ACEC/SRMA were produced by the applicant and
2 included in ASC Exhibit L, Attachment L-4, Figures L-4-7 and L-4-8. The simulations were
3 produced from the interpretive panel looking north towards the proposed facility. With the
4 mitigation, very little of the proposed facility is anticipated to be visible from this location.
5 ~~Additional assessment is included in~~ As discussed in Section IV.F., *Protected Areas* and Section
6 IV.J., *Scenic Resources*, the BLM approved the proposed facility route in this area and amended
7 the Southeastern Oregon Resource Management Plan to reclassify the area potentially
8 impacted by the proposed facility from VRM Class III to VRM Class IV. The Department
9 considers this relevant information for Council to consider in its evaluation of the applicable
10 standards.

11
12 Based on the analysis presented here, the Department recommends that the Council find that
13 the proposed facility, with recommended mitigation, would not cause a significant adverse
14 impact to the recreational opportunities at the Oregon Trail Birch Creek ACEC/SRMA.

15
16 Snake River Islands (Huffman Island) Wildlife Area

17
18 The Snake River Islands Wildlife Area consists of three main islands, one of which (Huffman
19 Island) would be located within the proposed facility analysis area. The Wildlife Area is near
20 Farewell Bend State Park, in Malheur County. The proposed facility would be located
21 approximately 0.9 miles west and south of Huffman Island. The Wildlife Area is managed by
22 ODFW to preserve wildlife, primarily, as well as hunting, fishing, and wildlife viewing. I-84 is
23 located between Huffman Island and the proposed facility. Construction activities would
24 involve use of existing roads, which would require no substantial improvements and no access
25 constraints.⁵³⁹

26
27 The applicant's visual analysis shows that while the base of some towers would be shielded by
28 topography, views from the island of the proposed facility structures would appear sky-lined.
29 However, the overall landscape character of the Snake River islands wildlife area would remain
30 naturally appearing, and the proposed facility would not detract from the recreational
31 opportunities at the Wildlife Area. And again, as noted, the proposed facility would be west of I-
32 84 in this area, while the Wildlife Area is east of I-84.

33
34 Based on the analysis presented here, the Department recommends that the Council find that
35 the proposed facility would not cause a significant adverse impact to the recreational
36 opportunities at the Snake River Islands (Huffman Islands) Wildlife Area.

37
38 Oregon Trail Tub Mountain ACEC and Special Recreation Management Area (SRMA)
39

⁵³⁹ Id. See Section 3.4.4.15 and Attachment T-3 Section 3.16 for the applicant's evaluation of the proposed facility's anticipated impacts to the resource.

1 The proposed facility would be located 0.5 miles from the closest point of the Oregon Trail Tub
2 Mountain ACEC/SRMA, along the SRMA's eastern and southern boundary, and approximately
3 1.5 miles east of the Alkali Springs interpretive site. The ACEC and SRMA are the same parcel.
4 Tub Mountain ACEC/SRMA was also discussed in Section IV.F., *Protected Areas* and Section IV.J.,
5 *Scenic Resources*. The primary recreation users of the SRMA are visitors to the Oregon Trail
6 segments and the interpretive site at Alkali Springs, OHV users, and local residents traveling
7 through the area. Construction activity would occur to the east and south, resulting in
8 intermittent access and traffic delays to this site.⁵⁴⁰

9

10 The proposed facility would be partially screened from view of the Tub Mountain SRMA by
11 topography. Views of the proposed facility from Alkali Springs interpretive site in the SRMA
12 would be partially blocked by vegetation. While traveling along Old Oregon Trail Road or the
13 Oregon Trail route, the proposed facility would be generally located to the east and most
14 towers would either not be visible or only the top portions would be visible. Some towers
15 would be sky-lined and some backdropped, depending on location within the SRMA.

16

17 As assessed in Section IV.F., *Protected Areas*, and Section IV.J., *Scenic Resources*, the proposed
18 facility has been sited outside the Tub Mountain ACEC/SRMA Parcel, and there would be no
19 change to the landscape within the boundary of the lands managed under VRM Class II.
20 Consequently, the applicant concludes that the proposed facility would conform to the BLM
21 management standard and is consistent with BLM's management of the Tub Mountain Parcel's
22 visual qualities. As shown on ASC Exhibit R, Attachment R-3, Figure R-3-14, the proposed facility
23 has been sited in this area to avoid other impacts, specifically sage grouse habitat, and is also
24 located on BLM land to avoid private land. Additionally, the proposed route in this area
25 connects to a BLM designated utility corridor northeast of the Tub Mountain ACEC near I-84
26 Highway, and the location of the route minimizes impacts to multiple resources, recognizing
27 that there will be visual impacts to the Tub Mountain ACEC. The BLM, the manager of Tub
28 Mountain ACEC and the land upon which the proposed route is located in this area (which is
29 not Tub Mountain ACEC) has approved the proposed facility route via its ROD.

30

31 Based on the analysis presented here, the Department recommends that the Council find that
32 the proposed facility would not cause a significant adverse impact to the recreational
33 opportunities at the Oregon Trail Tub Mountain ACEC/SRMA.

34

35 Deer Flat National Wildlife Refuge (NWR) – Snake Island Unit

36

37 One island within the Snake Island Unit of the Deer Flat NWR is located less than one mile from
38 the proposed facility, in Malheur County. One tower of the proposed facility would be located
39 approximately 0.4 mile from this island near Farewell Bend, and a multi-use area is proposed to
40 be located within 0.2 mile to the southwest of this island. Recreation at the NWR includes

⁵⁴⁰ Id. See Section 3.4.4.16 and Attachment T-3 Section 3.17 for the applicant's evaluation of the proposed facility's anticipated impacts to the resource.

1 wildlife viewing, hunting, and fishing, primarily, and access is only available via boat, which
2 limits visitors. Construction activity in the vicinity could result in intermittent delay of traffic
3 heading to and from the boat ramps that provide access to the Snake Island Unit, but
4 construction is temporary and intermittent.⁵⁴¹

5
6 The proposed facility, once constructed, would be visible at some limited areas in the NWR. In
7 the northern portion, near Farewell Bend, views to the proposed facility from the NWR would
8 be limited and would be crossing I-84. At the southern portion of the NWR, near the town of
9 Adrian, the proposed facility would be mostly located in a BLM-designated utility corridor,
10 which is intended to site utility facilities such as transmission lines.

11
12 Based on the analysis presented here, the Department recommends that the Council find that
13 the proposed facility would not cause a significant adverse impact to the recreational
14 opportunities at the Deer Flat NWR – Snake Islands Unit.

15
16 Bully Creek Reservoir

17
18 The proposed facility would be located approximately 0.7 mile west of the Bully Creek Reservoir
19 and approximately 1.75 mile from the park campground. The reservoir is in Malheur County
20 and serves as a water storage reservoir as well as county park. There are campsites, a boat
21 launch, and fishing. Construction activity in the vicinity could result in minor traffic delays and
22 congestion on Bully Creek Road, which surrounds the northern side of the reservoir.⁵⁴²

23
24 The applicant states that the tops of some transmission towers would be visible from certain
25 locations in the park, but it is unlikely that the campground would have visibility to the
26 proposed facility. Topography will also screen views of some portions of the facility. Visibility of
27 some number of transmission towers would not detract from the recreational opportunities at
28 Bully Creek Reservoir. It is important to note that in this area, the proposed facility route has
29 been sited to avoid irrigated agriculture and private farmland in the area around Vale, and also
30 sited to minimize impacts to sage grouse habitat. The proposed facility at the points closest to
31 Bully Creek reservoir are on BLM land, and the BLM has already approved the facility route via
32 its ROD.

33
34 Based on the analysis presented here, the Department recommends that the Council find that
35 the proposed facility would not cause a significant adverse impact to the recreational
36 opportunities at the Bully Creek Reservoir.

37

⁵⁴¹ Id. See Section 3.4.4.17 and Attachment T-3 Section 3.18 for the applicant’s evaluation of the proposed facility’s anticipated impacts to the resource.

⁵⁴² Id. See Section 3.4.4.18 and Attachment T-3 Section 3.19 for the applicant’s evaluation of the proposed facility’s anticipated impacts to the resource.

1 Owyhee River Below the Dam ACEC and Special Recreation Management Area (SRMA)
2

3 The proposed facility would be located to the north of the ACEC/SRMA, aligned with the
4 existing utility corridor administered by the BLM. The ACEC/SRMA is in Malheur County. Two
5 structures would be visible from the Lower Owyhee Canyon Watchable Wildlife Area
6 interpretive site, and would be sited approximately 0.75 -1.0 miles from an interpretive site at a
7 parking lot/turn-out area along the main road. The ACEC and SRMA are the same. The Owyhee
8 River Below the Dam is discussed extensively in Section IV.F., *Protected Areas* and Section IV.J.,
9 *Scenic Resources* and is incorporated here by reference. The Owyhee River Below the Dam
10 ACEC ACEC/SRMA is owned and managed by the BLM, and the Owyhee River is identified as
11 having significant or important scenic value. and the BLM ~~has authorized the proposed~~
12 facility in this location already approved the facility in this area via its ROD, and the Department
13 considers this relevant information for Council to consider in its evaluation of the Council's
14 Recreation standard. Temporary impacts to traffic and access to Lake Owyhee may occur during
15 construction.⁵⁴³

16
17 The proposed facility would be visible as it crosses the access road to the ACEC/SRMA, but
18 would not be visible or have very limited visibility from the Owyhee River itself, as well as most
19 areas within the canyon. The proposed facility would be located outside the ACEC/SRMA, but
20 mostly on BLM land within an existing BLM-designated utility corridor. Visibility of the proposed
21 facility as it crosses the access road to the ACEC/SRMA would not detract from the recreational
22 opportunities.

23
24 Based on the analysis presented here, the Department recommends that the Council find that
25 the proposed facility would not cause a significant adverse impact to the recreational
26 opportunities at the Owyhee River Below the Dam ACEC/SRMA.

27
28 Blue Mountain Century Scenic Bikeway
29

30 The proposed facility would cross the Blue Mountain Century Scenic Bikeway at two locations,
31 at approximately milepost 48.0 and milepost 55 in Morrow County and Umatilla County. Scenic
32 Bikeways are designated routes, established by Cycle Oregon, ODOT, Oregon State Parks, and
33 Travel Oregon. There are 15 bikeways in the state. The bikeways are designated routes along
34 existing state highways and other roads, in this case, mostly along highway 74 and 395. The
35 proposed facility would be visible on approach to each crossing and riders would pass under
36 each crossing. The bikeway would also pass two multi-use sites and one communication site.
37 Visibility of the proposed facility would be brief, at two locations, out of the 108 mile overall
38 bikeway route. Such brief, limited, and fleeting visibility of the proposed facility would not
39 detract from the recreational opportunity of the scenic bikeway. It is possible that during

⁵⁴³Id. See Section 3.4.4.19 and Attachment T-3 Section 3.20 for the applicant's evaluation of the proposed facility's anticipated impacts to the resource.

1 facility construction, particularly the construction of crossings of highways 74 and 395, bike
2 riders would experience delays, as well as noise and other construction-related issues such as
3 dust. However, construction of the specific crossings would be temporary and likely only lasting
4 a few days, and would be coordinated with ODOT to reduce impacts to drivers on the state
5 highways as well as bikers along the scenic bikeway.⁵⁴⁴

6

7 Based on the analysis presented here, the Department recommends that the Council find that
8 the proposed facility would not cause a significant adverse impact to the recreational
9 opportunities at the Blue Mountain Century Scenic Bikeway.

10

11 Grande Tour Scenic Bikeway

12

13 The proposed facility would cross the Grande Tour Scenic Bikeway at approximately milepost
14 126, near the City of North Powder in Union County. Transmission towers and conductors
15 would be visible on approach to the crossing, and riders would pass under the crossing. The
16 Morgan Lake alternative would be located within five miles of portions of the bikeway.⁵⁴⁵

17

18 Scenic Bikeways are designated routes, established by Cycle Oregon, ODOT, Oregon State Parks,
19 and Travel Oregon. There are 15 bikeways in the state. The bikeways are designated routes
20 along existing state highways and other roads, in this case, mostly along highways 203 and 237
21 in Union and Baker counties. The proposed facility would be visible on approach to the crossing
22 and riders would pass under the crossing, along highway 237. Visibility of the proposed facility
23 would be brief, at one location, out of the 134 mile overall bikeway route. Such brief, limited,
24 and fleeting visibility of the proposed facility would not detract from the recreational
25 opportunity of the scenic bikeway. It is possible that during facility construction, particularly the
26 construction of the crossing of highway 237, bike riders would experience delays, as well as
27 noise and other construction-related issues such as dust. However, construction of the specific
28 crossings would be temporary and likely only lasting a few days, and would be coordinated with
29 ODOT to reduce impacts to drivers on the state highway as well as bikers along the scenic
30 bikeway.

31

32 Based on the analysis presented here, the Department recommends that the Council find that
33 the proposed facility would not cause a significant adverse impact to the recreational
34 opportunities at the Grande Tour Scenic Bikeway.

35

⁵⁴⁴ Id. See Section 3.4.4.20 and Attachment T-3 Section 3.21 for the applicant's evaluation of the proposed facility's anticipated impacts to the resource. [The Department notes that the applicant indicates it and Morrow County have entered into an agreement outside of the EFSC process for certain improvements along the Blue Mountain Century Scenic Bikeway. B2HAPPDoc8-002 DPO Applicant Comment_IPC Stokes 2019-06-20 to 08-22.](#)

⁵⁴⁵ Id. See Section 3.4.4.21 and Attachment T-3 Section 3.22 for the applicant's evaluation of the proposed facility's anticipated impacts to the resource.

1 **Conclusions of Law**

2

3 Based on the foregoing findings of fact, and subject to compliance with the recommended site
4 certificate condition, the Department recommends that the Council find that the design,
5 construction and operation of the proposed facility, including the proposed and alternative
6 routes, is not likely to result in a significant adverse impact to any important recreational
7 opportunities in the analysis area and therefore the proposed facility complies with the
8 Council’s Recreation standard.

9 **IV.M. Public Services: OAR 345-022-0110**

10

11 *(1) Except for facilities described in sections (2) and (3), to issue a site certificate, the*
12 *Council must find that the construction and operation of the facility, taking into*
13 *account mitigation, are not likely to result in significant adverse impact to the ability*
14 *of public and private providers within the analysis area described in the second*
15 *amended project order to provide: sewers and sewage treatment, water, storm*
16 *water drainage, solid waste management, housing, traffic safety, police and fire*
17 *protection, health care and schools.*

18 ****546*

19

20 **Findings of Fact**

21

22 The Council’s Public Services standard requires the Council to find that the proposed facility is
23 not likely to result in significant adverse impacts on the ability of public and private service
24 providers to supply sewer and sewage treatment, water, stormwater drainage, solid waste
25 management, housing, traffic safety, police and fire protection, health care, and schools. The
26 applicant addresses the impacts to public services in ASC Exhibit U.

27

28 The analysis area for public services is the area within and extending 10-miles from the site
29 boundary. As explained in detail in ASC Exhibits B and C, the proposed facility would extend
30 approximately 270 miles through Oregon. The proposed facility would cross through five
31 Oregon counties: Morrow, Umatilla, Union, Baker, and Malheur. Additionally, two multi-use
32 construction staging areas would be located in the City of North Powder and the City of
33 Huntington.⁵⁴⁷

34

⁵⁴⁶ OAR 345-022-0110(2) and (3) of the Council’s Public Services Standard address wind, solar, or geothermal energy facilities and special criteria facilities. Because the Proposed Facility does not include wind, solar, or geothermal energy facilities or special criteria facilities, neither of those rules apply to this energy facility.

⁵⁴⁷ As described in ASC Exhibit B, multi-use areas would be approximately 30 acres in size and would include construction field offices, parking areas, construction vehicle maintenance area, helicopter operations (helipads), explosives storage, hazardous materials storage, water storage tank, portable concrete batch plant, concrete washout station, gravel tire scrub area, noxious weed wash-off station, and bulk materials storage area.

1 *Construction Activities and Impact Assumptions*

2
 3 To evaluate potential impacts from the construction and operation of the proposed facility, the
 4 applicant used and compiled data from federal, state, and local government agencies and
 5 private service providers related to sewers and sewage treatment, water, stormwater drainage,
 6 solid waste management, police and fire protection, health care, and schools. The applicant’s
 7 public services impact analysis is based on its proposal to concurrently construct the proposed
 8 facility in two, approximately 150-mile-long construction “spreads.” “Construction Spread 1”
 9 would extend from the proposed Longhorn Station in Morrow County at the north (western)
 10 end of the proposed transmission line through Umatilla and Union Counties and a portion of
 11 Baker County. “Construction Spread 2” would cover the remaining portion of Baker County and
 12 Malheur County before concluding in Owyhee, County, Idaho at the south (eastern) end of the
 13 line. Table PS-1 provides a summary of the mileage and counties ~~proposed~~ in each proposed
 14 Construction Spread.
 15

Table PS-1: Construction Spread and Affected Oregon Counties

Construction Spread	Milepost	Miles (Proposed Route)	Miles (alternative route)	Counties
1	0 to 150	150	19 (Morgan Lake) 2 (West of Bombing Range Road)	Morrow, Umatilla, Union, Baker
2	151 to 299	145	8 (Double Mountain)	Baker, Malheur

16
 17 The applicant estimates that some construction work is projected to begin simultaneously in
 18 Construction Spread 1 and 2 with activities such as material marshaling, ROW clearing, and road
 19 and site work starting first. Then other construction activities may occur simultaneously within
 20 each Construction Spread including foundation installation, tower erection, and wire stringing.
 21 The proposed station ~~expansion~~ construction and the communication station work will begin on
 22 a schedule that will allow for completion at approximately the same timeframe as the proposed
 23 transmission line.⁵⁴⁸ Some workers, such as the construction foremen and inspectors, would
 24 stay for the duration of the proposed facility’s construction. Most of the workforce would be
 25 employed for four to six months conducting construction activities such as clearing and road
 26 building, material hauling, restoration, and security services. Based on the applicant’s
 27 experience constructing linear facilities, such as transmission lines, workers employed tend to
 28 relocate along the transmission line route as necessary, staying in each location for a short
 29 period. For this reason, workers do not typically bring children but may bring significant others
 30 if they do not have dependents.

⁵⁴⁸ [Applicant is requesting Council approval for the construction of the Longhorn Station if the Bonneville Power Administration \(BPA\) does not construct the Station. If BPA constructs the Station, the Council would not have jurisdiction over this portion of the proposed facility, including any necessary expansions. See III.C. Proposed Facility – Longhorn Switching Station, of this order.](#)

1
2 The applicant explains that construction will generally occur between 7 a.m. and 7 p.m.,
3 Monday through Saturday. Additional hours may be necessary to make up schedule deficiencies
4 or to complete critical construction activities.

5
6 To evaluate the impact on public services, the applicant's analysis estimates that approximately
7 25 percent of the projected workforce would be hired from the local workforce (i.e., those
8 currently residing within commuting distance of the job sites), and that those workers would
9 likely commute to and from their homes to work each day. The remaining 75 percent of the
10 workforce would either temporarily relocate or commute in from their permanent residences
11 and stay in temporary overnight lodging.

12
13 Although the applicant expects that very few workers temporarily relocating would be
14 accompanied by their families, for the purposes of its analysis, the applicant estimated that 10
15 percent of relocating workers would bring families, including school-aged children.⁵⁴⁹ Table PS-2
16 below summarizes the estimated temporary workers and commuters within the analysis area
17 based on the proposed or alternative routes.⁵⁵⁰ Peak construction generally occurs during
18 summer months and, as the Department recommends in General Standard of Review Condition
19 1, the applicant would have up to four years after beginning construction to complete all
20 phases of construction.

21

Table PS-2: Estimated Workers and Population Change during Peak Construction

Workers	Proposed Route		Alternative Routes		
			Double Mountain	Morgan Lake	West of Bombing Range Road
	Spread 1	Spread 2	Spread 2	Spread 1	Spread 1
Commute to Job Site Daily	61	49	2	8	1
Move to the Analysis Area alone	164	131	5	21	1
Move to the Analysis Area with family	18	15	1	2	0
Total	243	194	8	32	2
Population					
2015 Population (Analysis Area)	129,516	46,385	30,380	25,790	11,190
Number of People Temporarily Relocating	182	146	8	31	2
As a Percent of 2015 Population	0.1%	0.3%	0.0%	0.1%	0.0%

⁵⁴⁹ Based on data compiled by the applicant from the U.S. Census Bureau (2009) as part of the 2008 American Community Survey, the average relocating family consists of two adults and one school-aged child.

⁵⁵⁰ See ASC Exhibit U, page U-4, Table U-2 for a complete list of assumptions used to provide information in the table.

1 In ASC Exhibit U, the applicant explains that Baker County requested that the applicant contact
2 public and private service providers operating within existing rights-of-way. As part of its
3 application, the applicant has included a number of draft management plans that will guide
4 development of the proposed facility, if approved. As recommended conditions of approval, the
5 Department would require that each draft plan be finalized prior to facility construction. The
6 finalization process would involve consultation between the applicant, the Department, and
7 each affected county. During its review of each plan, the counties may further coordinate with
8 any specific public or private provider of services, as it determines appropriate. In ASC Exhibit U,
9 the applicant proposes conditions to be included in the site certificate to consult with public
10 and private service providers during construction and operation of the proposed facility. The
11 Department notes that these applicant representations are satisfied in the applicable
12 conditions for review of the management plans and does not include them as proposed by the
13 applicant in this order. As such, Baker County and the other four affected counties and
14 applicable reviewing agencies will have an opportunity to review and provide input on each
15 management plan in order to further reduce potential impacts to public service providers. The
16 five specific management plans discussed below in this section of the order are: 1) Construction
17 Waste Management Plan, 2) Transportation and Traffic Management Plan, 3) Helicopter Use
18 Plan, 4) Environmental and Safety Training Plan, and 5) Fire Prevention and Suppression Plan.

19

20 *Operational Activities and Impact Assumptions*

21

22 The applicant maintains that, during operation of the proposed facility, currently employed
23 Idaho Power staff will be primarily responsible for operations and maintenance of the proposed
24 transmission line, Longhorn Station and associated facilities. One additional part-time position
25 may be filled locally, but the applicant does not anticipate that any current employees will be
26 required to relocate to the area.

27

28 *IV.M.1. Sewers and Sewage Treatment*

29

30 The applicant explains in ASC Exhibit V that temporary sanitation during construction activities
31 will consist of portable toilets located at multiuse areas and construction sites. There will not be
32 any connections to a municipal sewage system during construction. Portable toilets will be
33 provided by a subcontractor, who will be responsible for servicing the facilities at regular
34 intervals and disposing of wastewater in accordance with local jurisdictional regulations. The
35 selected construction contractor will ensure that a sufficient number of toilets is provided for
36 the estimated amount of workers that would be on-site. Sanitary wastewater from portable
37 toilets will be handled by a sanitary system subcontractor used to provide the sanitary facilities.
38 This service will consist of scheduled removal of the sanitary waste using a vacuum truck and
39 disposal in accordance with the sanitary system subcontractor's permits and applicable
40 regulations such as the use of holding tanks for biological waste that conform to Oregon

1 Department of Environmental Quality (ODEQ) regulations at OAR Chapter 340, Division 71; and
2 transports waste in accordance with Oregon Revised Statute (ORS) Chapters 465 and 466.⁵⁵¹

3
4 Effluent generated during operation of the proposed facility there will be approximately 11,000
5 gallons of wastewater annually for operation of a restroom facilities at the Longhorn Station in
6 Morrow County. The restroom facilities at the Station will be connected to the Port of
7 Morrow’s water and sewer transport and treatment system. Attachment U-1 of ASC Exhibit U
8 provides correspondence verification with public service providers, including the Port of
9 Morrow. Representatives from the Port states that they have “plenty of capacity” to handle the
10 wastewater associated with operations of the proposed Longhorn Station.

11
12 Based on the analysis presented here, the Department recommends the Council find that the
13 construction and operation of the proposed facility is not likely to result in significant adverse
14 impacts to the ability of public and private sewer and sewage treatment providers within the
15 analysis area.

16
17 *IV.M.2. Water ~~Supply~~ Service Providers*

18
19 ~~The applicant states that the e~~Construction of the proposed facility, including related or
20 supporting facilities, ~~will~~would require approximately 54.8 million gallons of water under a
21 worst-case scenario.⁵⁵² Water ~~will~~would be required for dust control, sanitation purposes,
22 foundation construction, Longhorn Station construction, communication station construction,
23 access road construction, dust control during right-of-way clearing, station grading and site
24 work, and re-seeding restoration work upon construction completion. The applicant explains in
25 ASC Exhibit O that a minor amount of water may be necessary during construction for
26 landscaping at the Longhorn Station and may be used for drilling lubricant (slurry) and fire
27 prevention activities.

28
29 Worst-case water use for the construction of the proposed facility are assumed to be if the
30 weather were exceptionally dry with high temperatures, which would require additional water
31 for dust control. Dust control water application may also include eco-safe biodegradable, liquid
32 copolymers to stabilize unpaved road surfaces and manage fugitive dust where extended use is
33 anticipated. Concrete for the tower foundations ~~will~~would be provided by off-site commercial
34 sources, however, to estimate the “worst case” amount of water use, the applicant assumes
35 that concrete ~~will~~would be prepared at the batch plants located at multi-use areas (MUAs). In
36 this circumstance, water would be transported to the concrete batch plant sites at the MUAs
37 where it will be used to mix concrete. From the batch plants, the concrete (ready-mix) ~~will~~
38 would be transported to the structure sites in concrete trucks for use in foundation
39 installations.

40

⁵⁵¹ B2HAPPDoc3-39 ASC 22_ Exhibit V_ Waste_ ASC 2018-09-28, Section 3.3.2.1.

⁵⁵² B2HAPPDoc3-38 ASC 21_ Exhibit U_ PublicServices_ ASC 2018-09-28, Section 3.5.1.

1 Public providers of water identified as potential water sources for the above-described uses
2 include the following municipalities: City of Boardman, City of Pendleton, City of La Grande,
3 Baker City, and the City of Ontario. In addition, an irrigation waterway (Kingman Lateral)
4 managed by the Owyhee Irrigation District, who provided comments on the DPO, and Bureau of
5 Reclamation, which provides water for irrigated agricultural uses within Malheur County, would
6 be crossed by the proposed facility. Therefore, potential impacts from construction and
7 operation of the proposed facility on the ability of the Owyhee Irrigation District, -to provide
8 water for irrigation within Malheur County is evaluated in this section.

9
10 *Impacts on Water Service Providers from Proposed Facility Water Use*

11
12 In Attachment O-1 of ASC Exhibit W, the applicant provides documentation of correspondence
13 with municipal water providers. In 2011, 2015, and 2016, the applicant sent letters to municipal
14 water providers requesting if the estimated water amounts that were needed for the
15 construction of the proposed facility would significantly impact the provider’s ability to meet
16 other water needs or provide water for other users. The municipal water service providers
17 contacted along the proposed and alternative routes are the Public Works Departments at the
18 City of Boardman, City of Pendleton, City of La Grande, Baker City, and the City of Ontario. All
19 service providers provided a response in 2015/16 confirming their ability to provide sufficient
20 water to meet the applicant’s estimated needs.

21
22 Because water will be procured from municipal suppliers along the proposed route, no
23 groundwater permit, surface water permit, or water right transfer will be required. Municipal
24 water rights held by the water service providers allow use for industrial purposes including
25 facility construction purposes. The applicant states that because no new water rights will be
26 necessary for the construction or operation of the proposed facility, neither a limited license for
27 construction use nor other water right permits will be required.⁵⁵³ It is noted that decisions on
28 issuance of a limited license or other water right permit for an energy facility, if necessary, are
29 subject to Council jurisdiction.

30
31 The applicant estimates that operation of the proposed Longhorn Station would use
32 approximately 11,000 gallons per year (30 gallons per day) of water for operation of restroom
33 facilities at the Station.⁵⁵⁴ Attachment U-1 of ASC Exhibit U provides correspondence with the
34 Port of Morrow. Representatives from the Port states that they have “plenty of capacity” to
35 provide potable water for operations of the proposed Longhorn Station.

36
37 *Impacts on Water Service Providers from Proposed Facility Construction and Operation*

38
39 The proposed facility would cross and be located in proximity to Owyhee Irrigation District
40 water infrastructure, including an irrigation waterway (Kingman Lateral) and access road to the

⁵⁵³ B2HAPPDoc3-24 ASC 15_Exhibit O_Water_Use_ASC 2018-09-28, Section 3.6.

⁵⁵⁴ B2HAPPDoc3-39 ASC 22_Exhibit V_Waste_ASC 2018-09-28, Section 3.4.2.

1 North Canal of the Owyhee Project (see ASC Exhibit C Attachment C-2 Proposed Road Location
2 Maps – Malheur County – Map 117). As described in ASC Exhibit H Attachment H-1, the
3 proposed route and its associated work area (near milepost 256) would be located on the
4 eastern margin of a mapped landslide (MLS-002) which, based on comments received on the
5 DPO from the Owyhee Irrigation District, historically impacted the Kingman Lateral. Potential
6 impacts identified by the Owyhee Irrigation District to the Kingman Lateral could occur during
7 construction and operation, including loss of the irrigation canal from further landslide impacts.

8
9 The Owyhee Irrigation District, a water service provider, requests that, prior to construction of
10 the transmission line in Malheur County, particularly the segment that extends from milepost
11 255 to 258, the applicant be required to consult with the District to ensure minimal structural
12 interference with existing irrigation canals, structures and roadways and establish appropriate
13 mitigation, including potential piping of the irrigation canal in the event of structural damage.⁵⁵⁵
14 Seismic and non-seismic hazards are evaluated under the Council’s Structural Standard, where
15 the Council must find that an applicant has adequately characterized the seismic and non-
16 seismic hazards of a proposed site, and demonstrated an ability to design, construct and
17 operate a proposed facility in a manner that minimizes potential public health and safety risks
18 from identified hazards. Concerns raised by the Owyhee Irrigation District would be further
19 ameliorated following completion of pre-construction, site specific geotechnical studies,
20 completed in accordance with a DOGAMI approved protocol, that further evaluates slope
21 stability and landslide hazards, as would be required under recommended Structural Standard
22 Condition 1. In addition, based on applicant representations of consultation and mitigation to
23 impacts to the Kingman Lateral managed by the Owyhee Irrigation District, the Department
24 proposes Council impose the following condition:⁵⁵⁶

- 25
26 Recommended Public Services Condition 1: Prior to construction within Malheur County,
27 a. The certificate holder shall consult with the Owyhee Irrigation District on the segment
28 between milepost 255 and 258. Consultation shall present results of the geotechnical
29 studies within this segment area, evaluate structure interference with irrigation
30 structures, and confirm adequate clearance to minimize impacts to irrigation canal
31 structures.
32 b. The certificate holder shall develop mitigation for any agreed upon impacts from
33 construction and operation of the facility to the South Canal of the Owyhee Project and
34 any other impacted irrigation pipelines or equipment as determined appropriate by the
35 certificate holder and Owyhee Irrigation District. A copy of any finalized agreement shall
36 be submitted to the Department.

37
38 Based on the analysis presented here, the Department recommends that the Council find that
39 the construction and operation of the proposed facility is not likely to result in significant

⁵⁵⁵ B2HAPPDoc8-1 All DPO Comments Combined-Rec'd 2019-05-22 to 08-22. B2HAPPDoc8-074 DPO Public Comment Chamberlain 2019-06-18 to 08-19 (PDF Page 938/6396).

⁵⁵⁶ B2HAPPDoc13 DPO IPC Responses to Select DPO Comments Rec'd by 2019-11-07; B2HAPP DPO IPC Responses - Various Public Comments - Agricultural 2019-11-06.

1 adverse impacts to the ability of public and private water supply providers within the analysis
2 area.

3
4 *IV.M.3. Stormwater Drainage*

5
6 The applicant describes in ASC Exhibit U that the proposed facility will not cross areas that are
7 served or maintained by stormwater drainage providers and that the construction and
8 operation of the proposed facility will not require construction or expansion of stormwater
9 drainage facilities. Information on avoidance, minimization and mitigation measures for
10 potential impacts to soils is discussed further in section IV.D, *Soil Protection*, of this order.

11
12 Potential impacts associated with the construction of the proposed facility that may aggravate
13 stormwater drainage, runoff and erosion are soil compaction from construction equipment,
14 vegetation removal, blasting, spills, and concrete washout water produced during construction
15 of tower and substation foundations at MUAs. Potential minor impacts associated with the
16 operation of the proposed facility that may aggravate stormwater drainage, runoff and erosion
17 would consist of soil disturbances at tower sites, Longhorn Station, communication stations,
18 and/or access roads necessary to maintain and inspect the proposed facility.

19
20 Stormwater discharges from construction activities that disturb one or more acres are
21 regulated under the Environmental Protection Agency (EPA) National Pollutant Discharge
22 Elimination System (NPDES) stormwater program. Prior to discharging stormwater,
23 construction operators must obtain coverage under an NPDES permit. Oregon is authorized by
24 the EPA to implement a statewide stormwater program under the NPDES. The ODEQ
25 stormwater program has permits and requirements modeled after EPA's NPDES program.
26 ODEQ will require adherence to NPDES stormwater requirements, submittal of a 1200-C
27 construction stormwater permit application, and preparation of an Erosion and Sediment
28 Control Plan (ESCP) that describes construction activities and methods proposed to comply with
29 stormwater requirements. The draft ESCP Plan is in ASC Exhibit I, Attachment I-3 and attached
30 to this order. The ASC and draft ECSP describes that temporary construction disturbance areas
31 will be minimized through the use of related erosion and sedimentation best management
32 practices (BMPs) and restoration efforts to restore soil surfaces and vegetation following
33 disturbances. As discussed in section IV.D, *Soil Protection*, of this order Soil Protection Condition
34 1 ensures the protective measures set forth in the draft ESCP are incorporated into the final
35 ESCP and to ensure compliance with the final ESCP.

36
37 Based on the analysis presented here, the Department recommends that the Council find that
38 the construction and operation of the proposed facility is not likely to result in significant
39 adverse impacts to the ability of public and private stormwater drainage providers within the
40 analysis area.

1 *IV.M.4. Solid Waste Management*
2

3 In ASC Exhibit U, the applicant identifies landfills along the proposed transmission line route in
4 Oregon, these are summarized in Table PS-3 below. The applicant notes that one landfill is
5 located in nearby Idaho and will be used because the landfill located within Malheur County has
6 a limited daily capacity. The applicant provides correspondence verifications with landfill
7 operators as Attachment U-1 to ASC Exhibit U.
8

Table PS-3: Solid Waste Disposal Sites within the Analysis Area

Facility Name	County	Current Volume of Waste Received (Tons/Day)	Current Volume of Waste Permitted to Receive (Tons/Day)
Finley Buttes Landfill	Morrow, OR	1,923 tons	No permitting restriction
Baker Sanitary Landfill	Baker, OR	50 to 60 tons	No permitting restriction
Lytle Boulevard Landfill	Malheur, OR	15 to 16 tons	20 tons
Clay Peak Landfill	Payette, ID	184 tons	No permitting restriction

9
10 All municipal solid waste landfill facilities must comply with the federal regulations in 40 Code
11 of Federal Regulations (CFR) Part 258 (Subtitle D of the Resource Conservation and Recovery
12 Act [RCRA]), or equivalent state regulations. The disposal of solid waste in Oregon must be
13 conducted in accordance with ORS Chapter 459 and OAR Chapter 340, Divisions 93 through
14 97.
15

16 The applicant describes that the types of waste generated from the construction of the
17 proposed facility are primarily vegetative waste from clearing of the right-of-way, pulling and
18 tensioning sites, and MUAs. The applicant states that it will be able to mulch up to 80 percent
19 of the vegetative materials and spread the materials around the site boundary, reducing the
20 amount of vegetative waste that will be disposed of. Other materials generated by the
21 construction of the proposed facility are native earth materials consisting of excess soils, fill
22 material, and aggregates that may be generated from access road construction and foundation
23 excavations. The applicant estimates that approximately 90 percent of material excavated for
24 foundations and 50 percent of material removed from tower pad and work area grading will be
25 disposed of at landfills within the vicinity of the construction or used for daily cover at county
26 municipal solid waste landfills. The construction contractor may also opt to arrange for native
27 material disposal at local sand and gravel/aggregate pits where the materials could be recycled
28 for fill or aggregate sources on unrelated projects.⁵⁵⁷ Finally, the applicant explains that up to 80
29 percent of household wastes such as scrap metal, wire, wood, concrete, packing materials such
30 as crates, pallets, and paper wrapping to protect equipment during shipping will be recycled,
31 and the remaining 20 percent, which includes minor amounts of worker personal items, such as

⁵⁵⁷ B2HAPPDoc3-39 ASC 22_Exhibit V_Waste_ASC 2018-09-28, Section 3.3.1.2.

1 meal residue, cups, and debris will be taken to landfills. See Table WM-1: *Materials from*
2 *Construction Activities, Recycled Totals and Disposal Locations*, in section IV.N., *Waste*
3 *Minimization*, of this order, for estimates of the types of waste expected to be generated from
4 construction of the proposed facility. Table WM-1: *Materials from Construction Activities,*
5 *Recycled Totals and Disposal Locations*, also provides estimates of the total quantities
6 estimated to be disposed of at landfills after the applicant has recycled and reused vegetative
7 materials.

8
9 Solid waste suitable for disposal at municipal facilities will be transported by a waste disposal
10 subcontractor. Below is a discussion of each disposal site as provided in ASC Exhibit V, see also
11 section IV.N., *Waste Minimization*, of this order:

- 12
13 • Morrow and Southern Umatilla Counties: Morrow County and southern Umatilla County
14 use the Finley Buttes Landfill for waste disposal. Finley Buttes Landfill is a modern
15 municipal solid waste disposal facility permitted by the ODEQ. The landfill is privately
16 owned, but approved by Morrow County in 1987. The landfill is expected to provide
17 service in its current configuration for the next 200 years.⁵⁵⁸ Finley Buttes accepts
18 municipal solid waste, construction/demolition waste, and special waste including
19 liquids with proper approvals. Waste in Morrow and Umatilla counties will either be
20 hauled directly to the landfill, or first moved to transfer stations.
- 21 • Union County: There is no operating municipal landfill in Union County. Residential and
22 commercial waste is transferred to the Baker Sanitary Landfill, the applicant anticipates
23 the waste disposal subcontractor will transport waste generated in Union County to this
24 disposal site.
- 25 • Baker County: Baker County maintains the Baker Sanitary Landfill near Baker City,
26 permitted by the ODEQ. Waste generated in Baker County will be disposed of at this
27 location.
- 28 • Malheur County: Malheur County holds permits from ODEQ for the operation of the
29 Lytle Boulevard Landfill located approximately 10 miles south of Vale, Oregon. The daily
30 operation is conducted by a private contractor. Lytle Boulevard is permitted to receive
31 only 20 tons per day and currently receives 15 to 16 tons per day. Waste generated in
32 Malheur County will not be disposed of at Lytle Boulevard Landfill, but at a nearby
33 landfill (Clay Peak Landfill) in Payette County, Idaho.

34
35 As discussed further in section IV.N., *Waste Minimization*, of this order the applicant represents
36 measures it will install during construction to reduce the amount of waste generated by
37 implementing a Construction Waste Management Plan. This is addressed in Waste
38 Minimization Conditions 1.

39
40 Minor amount of solid waste generated during operation of the proposed facility would include
41 replaced equipment and components, packing materials associated with transmission line and

⁵⁵⁸ B2HAPPDoc3-39 ASC 22_Exhibit V_Waste_ASC 2018-09-28, Section 3.4.3.

1 Station repairs and maintenance. Minimal amount of solid waste, such as household wastes
2 listed above will be generated by the operation ~~personal~~personnel at the Longhorn Station. An
3 estimated 850 cubic yards of vegetative debris would be generated during vegetative
4 management intervals as discussed in section IV.H., *Fish and Wildlife Habitat*, and Attachment
5 P1-4, Vegetation Management Plan, of this order.

6
7 Based on the analysis presented here, the Department recommends that the Council find that
8 the construction and operation of the proposed facility is not likely to result in significant
9 adverse impacts to the ability of public and private solid waste disposal sites and providers
10 within the analysis area.

11 *IV.M.5. Housing*

12
13
14 The availability of temporary housing varies seasonally and geographically within the counties
15 in the analysis area. Demand for temporary housing is generally greatest during the tourism
16 season in the summer, which is also the time of year expected for peak construction impacts.
17 Table U-4 in ASC Exhibit U summarizes data the applicant provides for housing availability
18 including houses, apartments, mobile homes or trailers, groups of rooms, or a single room
19 occupied or intended to be occupied as separate living. Table U-4 does not include housing
20 units only available for seasonal, recreational, or occasional use in the total estimate of
21 available housing units. Table U-5 in ASC Exhibit U summarizes data that the applicant's
22 consultant compiled for hotels, motels, and bed and breakfast inns with 15 or more rooms
23 within the analysis area, and provides an estimate of available rooms based on a statewide
24 average occupancy of 70.3 percent. Table U-6 in ASC Exhibit U summarizes several recreational
25 vehicle (RV) and other types of campsites within the analysis area. The applicant notes that
26 data on the vacancies at these sites is not readily available and that the data provided in the
27 Table are for participating businesses only and do not necessarily represent all the RV spaces
28 within 25 miles of the proposed transmission line or the number of spaces that could be
29 available for use during construction of the proposed facility.

30
31 Table PS-4 below combines the data from Tables U-1 (Table PS-3), U-2 (Table PS-2), U-4, U-5,
32 and U-6 to demonstrate the totals of all available housing options for temporary workers
33 associated with each construction spread. Table PS-4, then provides the results of Table PS-3
34 compared with the total estimated temporary workers associated with each construction
35 spread. The results of this comparison illustrate that, based on the applicants' estimates of
36 occupancies during peak construction season, temporary workers would occupy 9.5 percent of
37 the total available housing options for Construction Spread 1 and 18.4 percent of the total
38 available housing options for Construction Spread 2. Conversely, this leaves approximately
39 1,734 available housing and rental options within Morrow, Umatilla, Union and Baker counties
40 during the summer season for other non-project-related individuals or families. And it leaves
41 approximately 648 housing and rental options within Baker and Malheur counties during the
42 summer season for other non-project-related individuals or families.

Table PS-4: Available Housing Options based on Construction Spread

Construction Spread- Counties	Estimated Housing Units Available to Rent ¹	Estimated Hotel and Motel Rooms Available ²	Estimated Spaces at RV Parks and Campsites ³	Total Combined Available Housing Options for Temporary Workers
Construction Spread 1				1916
Morrow County	80	30	166	
Umatilla County	366	342	94	
Union County	319	39	199	
Baker County	96	48	137	
Total	861	459	596	
Construction Spread 2				794
Baker County	96	48	137	
Malheur County	262	172	79	
Total	358	220	216	

¹ House, apartment, mobile home or trailer, group of rooms, or single room
² Data includes hotels, motels, and bed and breakfasts with 15 or more rooms. Average number of rooms based on 2016 statewide average hotel occupancy rate (i.e., 70.3%).
³ Recreational vehicle (RV) and other types of campsite data are for participating businesses only and do not necessarily represent all the RV spaces within 25 miles of the proposed transmission line or the number of spaces that could be available for use during construction of the proposed facility.

2

Table PS-5: Total Temporary Workers Needing Housing Compared to Available Housing Options

Construction Spread- Counties	Estimated workers move to analysis area ¹	Total Combined Available Housing Options for Temporary Workers ²	Estimated Impact of Workers on Available Rental Options ³
Construction Spread 1	182	1916	9.5%
Morrow County			
Umatilla County			
Union County			
Baker County			
Construction Spread 2	146	794	18.4%
Baker County			
Malheur County			

Table PS-5: Total Temporary Workers Needing Housing Compared to Available Housing Options

Construction Spread- Counties	Estimated workers move to analysis area ¹	Total Combined Available Housing Options for Temporary Workers ²	Estimated Impact of Workers on Available Rental Options ³
<p>¹ Includes workers who move alone and with families for the proposed route.</p> <p>² Numbers derived from Table PS-4</p> <p>³ Estimated Temporary workers divided by total combined available housing options provides an estimate for the impact of construction of the proposed facility on the total available rentals in the analysis area for each construction spread.</p>			

1
2 As demonstrated in the tables and analysis here, there is sufficient capacity in short-term
3 housing options for construction workforce. Additionally, the applicant’s analysis
4 underestimates the available short-term housing options because it is limited to a 10 mile
5 analysis area and as shown on Tables PS-4 and PS-5, only housing options in the affected
6 Oregon counties are considered. The Department notes that there are additional short-term
7 housing options available within reasonable commuting distance to the facility including in
8 Washington and Idaho.⁵⁵⁹

9
10 Based on the analysis presented here, the Department recommends that the Council find that
11 the construction and operation of the proposed facility is not likely to result in significant
12 adverse impacts to the ability of public and private housing and rental providers within the
13 analysis area.

14
15 *IV.M.6. Traffic Safety*

16
17 The primary impact to the transportation system within the analysis area will be the additional
18 traffic associated with the construction of the proposed facility. Construction equipment and
19 materials will be transported from primary sources to multi-use areas (MUAs) and individual
20 tower construction sites, as well as the construction sites for the station and communication
21 station sites. There will be an increase in traffic related to construction workers commuting to
22 and from the job sites. The potential for construction-related impacts to traffic is greatest
23 where construction will involve regular use of public roads between local communities and
24 multi-use areas, such as I-84, US 20, Oregon State highways, and well-used local roads.

25
26 To identify preliminary haul routes and access roads to determine which roads would be
27 included in the site boundary evaluated in the ASC, the applicant identified the minimum
28 access-road requirements for the proposed transmission line and station construction and
29 operation. A 14-foot-wide road surface and 16 to 20-foot-wide road surface for turns were
30 determined by the largest piece of equipment, an aerial lift crane, involved in construction.⁵⁶⁰

⁵⁵⁹ B2HAPPDoc3-38 ASC 21_ Exhibit U_PublicServices_ASC 2018-09-28, Section 3.5.4.

⁵⁶⁰ B2HAPPDoc3-38 ASC 21_ Exhibit U_PublicServices_ASC 2018-09-28, Attachment U-2; Transportation and Traffic Plan Section 3.3.1 and Figure 2.

1 Roads that had barriers to the movement of the crane vehicle included roads that are too
2 narrow or steep, have intersections with inadequate turning radii, inadequate surfacing, narrow
3 bridges or other existing road structures, and therefore were not selected as a preliminary haul
4 or access route. As discussed in Section III.C., *Proposed Facility; Related or Supporting Facilities*
5 *(Permanent and Temporary); Access Roads*, and in Attachment B-5, Road Classification Guide
6 and Access Control Plan, the applicant determined if existing roads need substantial
7 modification to be used for construction and operation of the proposed facility.⁵⁶¹ The applicant
8 classified road segments for existing roads to determine the extent of improvements needed
9 and whether or not the road would then be included in the site boundary as a related or
10 supporting facility. Existing roads that would be used for construction and operation of the
11 proposed facility but would not require substantial modification are not “related or supporting
12 facilities” and, therefore, are not included in the site boundary.⁵⁶²

13

14 The applicant explains that the proposed facility would be constructed in phases, and that for
15 each phase specific traffic controls will be utilized as described in the below section and the
16 county-specific Transportation and Traffic Plan:

- 17 • Phase I - Civil construction – Activities along the transmission line will involve clearing
18 the corridor and constructing access roads and, if applicable, harvestable timber will be
19 cleared then hauled off.
- 20 • Phase II – Foundation Construction – Foundations will be constructed at each structure
21 site to support the steel towers. Track mounted drills and excavators will be mobilized

⁵⁶¹ OAR 345-001-0010(50) states that “related or supporting facilities does not include any structure existing prior to
construction of the energy facility, unless such structure must be substantially modified solely to serve the energy
facility.”

⁵⁶² Commenters, including Union County and the City of La Grande, expressed concerns about impacts from traffic and to
roads including but not limited to Morgan Lake Road, Glass Hill Road, Old Oregon Trail Road, Olsen Road, Modelaire-
Hawthorne Loop, and Sunset Drive. The Department notes that the applicant identifies these existing public roads as
potential connecting access roads assumed to be maintained to meet road maintenance standards of the owner
(County, ODOT, etc.). The applicant is not representing to substantially modify these roads; therefore, they are not
included in the site boundary proposed by the applicant in the ASC, under EFSC review. See Recommended Public
Services Condition 24 which requires a county-specific Transportation and Traffic Plan that identifies final haul routes,
documentation of existing road conditions, and the requirement that if the applicant must substantially modify roads
not currently within the site boundary, it must submit an Amendment Determination Request or submit a Request for
Amendment of the Site Certificate receive Council approval via an amendment, if necessary. Hawthorne Lane is included
in the site boundary, requiring substantial modification, 21-70% improvements which may include reconstruction of
portions of the road to improve road function. Possible road prism widening, profile adjustments, horizontal curve
adjustments, or material placement. Final road improvements would be reviewed and approved by the Department, in
consultation with each County as part of the county-specific Transportation and Traffic Plan. B2HAPPDoc8-1 All DPO
Comments Combined-Rec'd 2019-05-22 to 08-22; B2HAPPDoc8-008 DPO Special Advisory Group Comment Union
County Hartel, Horst, J., Mammen, V. Howell, J., Valentine, E., et al. 2019-07-10 to 08-21.

1 to each structure site to excavate the site and concrete trucks will then deliver concrete
2 to the sites to construct the foundations.

- 3 • Phase III – Structure Erection – Steel lattice towers will be assembled at each site and
4 erected on the foundations. Material will be delivered via flatbed trucks to each
5 structure site and unloaded with forklifts and cranes where it will be assembled in
6 pieces in the work area around the foundations.
- 7 • Phase IV – Conductor Pulling/Tensioning – Conductor will be pulled along the corridor
8 and through the structures via helicopters while large man lift trucks provide work
9 crews access to each structure.⁵⁶³

10
11 The following is an applicant-provided summary of anticipated equipment used for each
12 transmission-line construction activity that will be driven, moved or transported along the
13 construction route:

- 14
- 15 • Survey work: pickup trucks or ATVs,
- 16 • Timber removal: pickup trucks, feller bunchers, dump trucks, wood chippers,
- 17 • Road construction: pickup trucks, bulldozers, motor graders, and water trucks,
- 18 • Hole digging, installation of directly embedded structures, or foundation installation:
19 pickup trucks, 2-ton trucks, digger derrick trucks, hole diggers, bulldozers, concrete
20 trucks, water trucks, cranes, hydro cranes, wagon rock drills, dump trucks, and front-end
21 loaders,
- 22 • Hauling lattice steel members, tubular poles, braces, and hardware to the structure
23 sites: steel haul trucks, carry alls, cranes, and forklifts,
- 24 • Assembly and erection of structures: pickup trucks, 2-ton trucks, carry alls, cranes, and a
25 heavy lift helicopter,
- 26 • Wire installation: pickups, wire reel trailers, diesel tractors, cranes, 5-ton boom trucks,
27 splicing trucks, three drum pullers, single drum pullers, tensioner, sagging dozers,
28 carryalls, static wire reel trailers, bucket trucks, and a light duty helicopter,
- 29 • Final cleanup, reclamation, and restoration: pickup trucks, 2-ton trucks, bulldozers,
30 motor graders, dump trucks, front-end loaders, hydro-seed truck, and water trucks.⁵⁶⁴

31
32 The larger potential impact to traffic levels is associated with daily trips in and out of multi-use
33 areas by construction workers personal vehicles, material delivery vehicles, concrete trucks,
34 and construction vehicles moving from work area to work area within the section or
35 Construction Spread. Construction will generally occur between 7 a.m. and 7 p.m., Monday
36 through Saturday. Additional hours may be necessary to make up schedule deficiencies or to
37 complete critical construction activities. Given the early start times and late finish times,
38 construction commuting traffic likely will overlap with only a portion of local community peak
39 traffic hours.

⁵⁶³ [B2HAPPDoc13 DPO IPC Responses to Select DPO Comments Rec'd by 2019-11-07; B2HAPP DPO IPC Responses - City of La Grande comments 2019-10-09.](#)

⁵⁶⁴ B2HAPPDoc3-38 ASC 21_Exhibit U_PublicServices_ASC 2018-09-28, Attachment U-2, p. 19.

1
2 For the purposes of the applicant's traffic impact analysis, Construction Spreads 1 and 2 are
3 divided into smaller sections that are assumed to be sufficiently separate (geographically) so
4 that the use of local access routes will not overlap between smaller sections. In other words,
5 the traffic impacts will not be additive between adjacent sections. Work crews will include
6 those involved in construction activities, as well as workers providing vehicle and equipment
7 maintenance and repairs, refueling, dust control, construction inspection, construction
8 materials testing, and environmental compliance and surveying, the various types of work
9 crews are listed in Table PS-6 below. The Department highlights that the applicant provided
10 vehicle trips associated with all phases on construction, but that it is not likely that all of these
11 activities will occur at once. Rather, certain types of construction activities may occur
12 simultaneously between Construction Spreads such as ROW clearing, road/pads grading, dust
13 control and refueling. Table 4 and Table 6 in Attachment U-2: Transportation and Traffic Plan,
14 attached to this order, provide the estimated quantities of personal vehicles, construction
15 pickups, and other construction equipment, as well as the total number of one-way trips per
16 day. Table PS-6 below provides a summary of the applicants' estimates from Tables 4 and 6 for
17 personal vehicle trips, light construction vehicle trips and heavy construction vehicle trips.
18

Table PS-6: ~~Personal~~ Vehicle Trips per Day per Construction Spread

Construction Crew Type	Personal Vehicles	Light Construction Vehicles	Heavy Construction Vehicles
	Total One- way Trips (per day)	Total One- way Trips (per day)	Total One- way Trips (per day)
Substation Construction	98	40	10
ROW Clearing	18	36	20
Road/Pads Grading	18	36	18
Foundations	22	18	40

Refueling	10	0	20
Dust Control	10	0	20
Construction Inspection	10	40	0
Materials Testing	10	20	0
Environmental Compliance	10	54	0
Surveyors	10	30	0
Total	486	620	188

Table PS-6: ~~Personal~~ Vehicle Trips per Day per Construction Spread

Construction Crew Type	Personal Vehicles	Light Construction Vehicles	Heavy Construction Vehicles
	Total One- way Trips (per day)	Total One- way Trips (per day)	Total One- way Trips (per day)
Total Estimated Maximum Daily Trips Associated with each Construction Spread: 1,294			

1
2 According to the 2008 Oregon Department of Transportation (ODOT) Transportation System
3 Guidelines, roadway and road facility congestion and performance standards may be expressed
4 as level of service (LOS) standards or as volume-to-capacity (V/C) ratios. LOS characterizes the
5 performance of roads, intersections, interchanges, and other transportation facilities. LOS
6 ratings range from “A” (ideal conditions, with free-flowing traffic) to “F” (complete failure or
7 gridlock). V/C ratios are defined as the peak traffic volume (vehicles/hour) on a highway section
8 divided by the maximum volume that the highway section can handle. The closer the V/C ratio
9 is to 1.0, the more congested traffic is. The 1999 ODOT Oregon Highway Plan and later
10 amendments guide state highway development and management for a 20-year planning
11 horizon. The Plan’s highway mobility policy adopted V/C ratio rather than LOS to measure
12 highway performance because V/C ratio is a more precise and consistent measure. Therefore,
13 the applicant conducted and presents its traffic impact estimates in V/C ratios.

14
15 To determine the “worst case” impacts of the estimated vehicle traffic associated with
16 construction of the ~~prosed~~ proposed facility, the applicant separated the two Construction
17 Spreads into five smaller sections based on the locations of the multi-use areas that could have
18 additive traffic impacts with similar construction windows and seasonal weather restrictions. To
19 estimate the localized traffic impacts with estimating the volume-to-capacity ratio, the
20 applicant divided the total estimated daily trips, 1,294 trips per day, into five sections
21 associated with the MUA locations and potential hauling or commuting routes.⁵⁶⁵ The 1,294
22 daily one-way trips divided over five sections of more concentrated traffic results in 259 daily
23 one-way vehicle trips per group of adjacent multi-use areas. As noted above, not all
24 construction sections will have the same number or type of concurrent construction activities,
25 depending on how construction is sequenced and executed. Some sections will have fewer daily
26 vehicle trips.

27
28 The applicant’s engineering contractor estimated that 50 percent of the construction vehicle
29 trips will begin and end at work areas other than multi-use areas. This assumption is based on
30 standard practices during the construction of large, linear project, work crews often leave
31 construction equipment at MUAs instead of driving to and from them daily. Additionally, work
32 crews may meet in central locations and drive together to individual MUAs. This reduces the

⁵⁶⁵ See appendix A of the attachment U-2 Transportation and Traffic Plan for figures of the preliminary haul routes.

1 number of one-way trips for each group of adjacent multi-use areas to 130 per day. Of these,
2 111 vehicles are anticipated to be less than 10,000 pounds gross vehicle weight and 19 vehicles
3 are anticipated to be greater than 10,000 pounds gross vehicle weight.⁵⁶⁶
4

5 The applicant incorporated these estimates into a planning-level analysis of worst-case
6 potential impacts from construction of the proposed facility on V/C ratios and presented its
7 findings in Table 8 of Attachment U-2 ASC, provided below as Table PS-7. Existing peak traffic
8 volumes and V/C ratios were identified or calculated for the routes most likely to be used by
9 trucks hauling construction materials or logs, and by construction workers commuting to
10 construction work sites. Calculations were based on conservative assumptions detailed in the
11 footnotes to Table PS-7. Existing V/C ratios on these routes range from 0.02 to 0.48. The
12 numbers of daily vehicle trips related to construction of the proposed facility were estimated
13 and added to existing peak traffic volumes for each potential hauling or commuting route. The
14 resulting “with facility” traffic volumes were divided by road capacities for each route to arrive
15 at the worst-case V/C ratios that could be expected, by route, during construction of the
16 proposed facility. These peak-hour, “with facility” V/C ratios range from 0.04 to 0.61, resulting
17 from increases of 0.01 to 0.13. Each “with facility” V/C ratio was compared to ODOT’s maximum
18 V/C ratio for that type of road (based on ODOT 1999; V/C ratios last amended in May 2015).
19 Factoring in traffic levels generated from construction activities, none of the potential facility-
20 related hauling or commuting routes exceed a maximum V/C ratio. Given the low V/C ratios on
21 existing roads proposed to be used for construction of the proposed facility and the relatively
22 dispersed distribution of truck traffic and workers near any specific location at any given time,
23 the additional traffic generated during construction of the proposed facility is not anticipated to
24 cause notable congestion or otherwise significantly impact local communities, or service
25 providers for traffic safety.

Table PS-7: Evaluation of Facility Impacts on Volume-to-Capacity Ratios for Roads Potentially Used during Facility Construction

Multi-use Areas	Potential Hauling or Commuting Route	Road Classification ¹	Existing Peak Traffic Volume ²	Road Capacity ²	Existing V/C Ratio ²	Estimated Daily Personal and Construction Vehicles	With Facility Peak Traffic Volume ³	With Facility V/C Ratio ⁴	Increase in V/C Ratio From Facility Construction ⁵	ODOT Maximum V/C Ratio ⁶	V/C Ratio Exceeds ODOT Maximum with Facility?
	Johnstone Road	District/Local Interest Road, Rural Lands	120	1,000	0.12	130	250	0.25	0.13	0.75	No

¹ Road classifications were selected conservatively based on the most rural segment of each route (the segment with the smallest capacity).

² Existing peak traffic volumes, capacities, and V/C ratios (representing peak a.m. and p.m. conditions) were estimated using conservative assumptions with the methods described in ODOT's Highway Design Manual (ODOT 2012) or taken directly based on the exact road or roads with similar characteristics from local transportation plans. Where peak traffic volumes are unavailable, peak volumes are assumed to be 15 percent of average daily trips, based on the local transportation plans.

³ "With facility" peak traffic volume is calculated by adding existing peak traffic volume plus the number of facility-related truck and car trips assumed to occur during the same timeframes.

⁴ "With facility" V/C ratio is calculated by dividing the "with facility" peak traffic volume by the road capacity.

⁵ The increase in V/C ratio from the facility construction is calculated by subtracting the existing V/C ratio from the "with facility" V/C ratio.

⁶ From ODOT (1999).

Travel routes less than a mile from large roads and highways are addressed in Table 5 and 7 and are not in the V/C ratios in this table.

Source: B2HAPPDoc3-38 ASC 21_ Exhibit U_ PublicServices_ ASC 2018-09-28, Attachment U-2.

1
2

1 The applicant discusses in the draft Transportation and Traffic Plan (Plan) (Attachment U-2 of
2 this order) that construction of the proposed facility would not overlap with public
3 transportation systems, such as public bus routes and impacts to railroads or pipelines are not
4 anticipated because construction activities will not be performed on railroad ROWs or near
5 pipelines. Delivery of large equipment and materials via truck could require temporary closures
6 to selected local roads. However, multi-use areas and both tower and station construction sites
7 are located away from high-use public roads, so any closures during construction are
8 anticipated to have minimal impact on local communities and traffic safety providers. Two-lane
9 roads would be most impacted by temporary closures because they provide only one lane of
10 travel per direction.

11
12 Construction vehicle traffic on public roadways will be limited to off-peak commuting times as
13 practicable to minimize impacts on local commuters. To minimize conflicts between
14 construction-related traffic and background traffic, movements of heavy trucks will be
15 minimized to the extent practicable during these peak times. If possible and in consideration of
16 worker safety, such oversize deliveries will occur during other parts of the day, when
17 background traffic tends to be lower, such as early morning and late afternoon. To reduce
18 traffic congestion and roadside parking hazards, multi-use areas will provide for parking for
19 construction employee personal vehicles.

20
21 In addition, the applicant outlines other provisions in its Plan that the construction contractor
22 will implement, including:

- 23
24
- 25 • Coordinating the timing and locations of road closures in advance with emergency
26 services such as fire, paramedics, and essential services such as mail delivery and school
27 buses.
 - 28 • Maintaining emergency vehicle access to private property.
 - 29 • Developing plans as required by county or state permits to accommodate traffic where
30 construction would require closures of state or county-maintained roads for longer
31 periods.
 - 32 • Posting caution signs on county and state-maintained roads, where appropriate, to alert
33 motorists of construction and warn them of slow traffic.
 - 34 • Using traffic control measures such as traffic control flaggers, warning signs, lights, and
35 barriers during construction to ensure safety and to minimize localized traffic
36 congestion. These measures will be required at locations and during times when trucks
37 will be entering or exiting highways frequently.
 - 38 • Using chase vehicles as required (or police vehicles, if required by ODOT) to give drivers
39 additional warning.
 - 40 • Notifying landowners prior to the start of construction near residences.
 - 41 • Fencing construction areas near residences at the end of the construction day, and
42 restoring residential roads damaged by construction activities as soon as possible.
 - 43 • Installing access control devices at locations shown in the Road Classification Guide and
Access Control Plan (Attachment B-5 of this order).

- 1 • All construction personnel will be required to obey local speed limits and traffic
2 restrictions to ensure safe and efficient traffic flow. Construction vehicles on un-posted
3 project roads will travel at speeds that are reasonable and prudent for the conditions.
4 The applicant will work with ODOT and affected counties to establish reduced
5 construction speed limits on impacted roads.⁵⁶⁷
6

7 The applicant states that it and its construction contractors will be required to comply with all
8 conditions and requirements stipulated in road use permits, encroachment permits,
9 oversize/overweight permits or similar documents and agreements, including rehabilitation or
10 reconstruction of roadways and structures damaged during construction. The applicant and its
11 construction contractors will be required to obtain these permits and agreements from local
12 jurisdictions and agencies. Work on existing county, state, or federal roads, or construction of
13 new roads, may require permits from affected jurisdictions. These types of permits including
14 road encroachment permits and oversize/overweight transportation permits, are outside of
15 Council jurisdiction and are the responsibility of the applicant to secure independent of the
16 EFSC process. However, to address concerns about potential impacts from construction traffic
17 on roads managed by public service providers, the Department recommends that a list of these
18 permits and agreements be provided to the Department as part of the final county-specific
19 Transportation and Traffic Plan addressed below in Recommended Public Services Condition 2.
20 These agreements/permits commonly include documentation of existing road conditions prior
21 to construction, to ensure impacts to public and private service providers for road
22 maintenance. Also discussed in Section IV.E., Land Use, and required by recommended
23 conditions for each applicable jurisdiction, copies of access approach site permits/road
24 approach permits and construction permits to build on right-of-way/work in county right-of-way
25 permits are required to be submitted to the Department.
26

27 For new access roads, the design of higher-standard roads will conform to the most current
28 edition of AASHTO's Guidelines for Geometric Design of Very Low-Volume Local Roads, for
29 access roads with an anticipated average daily traffic of less than 400 vehicles. Roads on federal
30 lands will meet USFS and BLM standards for roads that will be added to federal jurisdiction.
31 Existing USFS and BLM roads which cannot be used in their existing condition will be brought up
32 to these standards. For instance, road improvements and new road construction will meet the
33 OAR Chapter 629, Division 625 road construction standards, and standards on USFS lands will
34 be similar to ODF standards.⁵⁶⁸ For roads on state forest land, the applicant states that it will
35 work with ODOT, Oregon Department of Forestry, and other agencies to ensure compliance
36 with applicable road standards and to obtain any necessary approvals or permits. Roads that
37 remain in the applicant's jurisdiction (ROW) may not be designed to all federal standards. Roads
38 developed specifically for the proposed facility that are identified by the applicant as no longer

⁵⁶⁷ See also section IV.H., *Fish and Wildlife Habitat*, Fish and Wildlife Habitat Condition 8, imposing a 25 MPH speed limit during construction.

⁵⁶⁸ B2HAPPDoc3-19 ASC 11_Exhibit K_Land Use_ASC 2018-09-28, Attachment K-2, p. 11.

1 necessary will be reclaimed as specified in the Reclamation and Revegetation Plan (Attachment
2 P1-3 and recommended Fish and Wildlife Condition 1).

3
4 The applicant will require its construction contractors to comply with the provisions in the
5 Transportation and Traffic Plan and submit the following information based on final design and
6 the construction logistics of a phase or segment of the proposed facility, this information will
7 also be included in the Plan submitted to the Department, counties, and local jurisdictions:

- 8 • Materials and equipment;
- 9 • Final material/equipment transportation routes;
- 10 • Total number of trips associated with delivery of materials and equipment;
- 11 • Total number of construction workers and their distribution throughout the
12 construction schedule;
- 13 • Likely commuting routes and total number of trips for construction workers;
- 14 • Specific road improvements needed to allow use of transportation routes;
- 15 • Dust suppression techniques, such as watering construction areas and removing dirt
16 tracked onto a paved road as necessary to prevent safety hazards or nuisances on
17 access roads and in construction zones near residential and commercial areas and along
18 major highways and interstates and
- 19 • Construction Best Management Practices (BMPs) that will be required.

20
21 As discussed above and in Section III.C., Proposed Facility; Related or Supporting Facilities
22 (Permanent and Temporary); Access Roads, in Attachment B-5, Road Classification Guide and
23 Access Control Plan, the applicant describes the process it employed to determine which roads
24 will be used and whether or not the roads will require substantial modification and therefore
25 would be included in the site boundary. To provide the final haul routes and list of road
26 improvements as stated in the draft Transportation and Traffic Plan, the applicant must apply
27 the same methodologies to categorize roads, therefore, the Department recommends the Road
28 Classification Guide and Access Control Plan be updated and provided as part of the final
29 Transportation and Traffic Plan, outlined in Recommended Public Services Condition 2 below.

30
31 To assist in the review and use of the Road Classification Guide and Access Control Plan mapset
32 and Appendix A: Access Road Segment Attribute Table, the Department also recommends the
33 inclusion of public road names. As requested by the applicant in Section 2.2.2, Classifying Road
34 Segments, in the Road Classification Guide and Access Control Plan, if it is determined that
35 roads currently proposed to meet the definition of substantial modification will not require
36 improvements over the 20% threshold, the Department recommends that those roads may be
37 reclassified as “no substantial modification.” However, if the applicant must substantially
38 modify roads not currently within the site boundary, it must submit an Amendment
39 Determination Request or submit a Request for Amendment of the Site Certificate receive
40 Council approval via an amendment, if necessary, as provided Recommended Public Services
41 Condition 2.

1
 2 The applicant explains that construction of the proposed facility is not expected to result in
 3 damage to existing roads, bridges, or overhead power distribution lines, however there will be
 4 the need to improve some local roads to accommodate oversize truck deliveries.⁵⁶⁹ In its letters
 5 on the ApASC and on the ASC, the City of La Grande a reviewing agency for the proposed
 6 facility, expressed concerns about impacts to proposed access roads within its jurisdiction and
 7 requested that the applicant provide detailed information and coordinate with the City.⁵⁷⁰
 8 To ensure the information and protective measures set forth in the draft Transportation and
 9 Traffic Plan are finalized and implemented to avoid and reduce impacts to traffic service
 10 providers and reduce impacts to roads maintained by local jurisdictions, the applicant proposes,
 11 and the Department recommends, Public Services Condition 21 below. This condition stipulates
 12 that, prior to construction of a phase or segment off the proposed facility within a county or
 13 local jurisdiction, the protective measures in the Plan are approved by the Department in
 14 consultation with each affected County and jurisdiction. Prior to construction of a phase or
 15 segment of the proposed facility, the applicant will provide the draft Plan to each affected
 16 County and jurisdiction and the Department for review and Department approval. To reduce
 17 potential traffic impacts and ensure adequate coordination with the applicable Counties and
 18 other jurisdictions (including the Planning Department, Road Department, or Public Works
 19 Department) during construction of the proposed facility, the Department recommends Council
 20 impose the following condition:

- 21
 22 **Recommended Public Services Condition 21:** At least 90 days prior to construction of a
 23 facility phase or segment in each affected county and jurisdiction, unless otherwise
 24 approved by the Department, the certificate holder shall complete the following to address
 25 traffic impacts and transportation coordination in each county and jurisdiction:
- 26 a. The certificate holder shall, in accordance with the OAR 345-025-0016 agency
 27 consultation process outlined in the draft Transportation and Traffic Plan (Attachment
 28 U-2 of the Final Order on the ASC), submit to the Department, ~~appropriate county, and~~
 29 ~~jurisdiction,~~ a final county-specific Transportation and Traffic Plan associated with the
 30 phase or segment of the facility to be constructed. The protective measures described in
 31 the draft Transportation and Traffic Plan, Attachment U-2 to the Final Order on the ASC,
 32 shall be included and implemented as part of the final county-specific Plan, unless
 33 otherwise approved by the Department, in consultation with the county or jurisdiction;
 - 34 b. The final county-specific Transportation and Traffic Plan submitted to the Department,
 35 county, and jurisdiction shall include:
 - 36 i. The identification of the final material/equipment transportation, access, and
 37 haul routes and ~~the~~ documentation of the existing condition of the routes/roads;
 - 38 ii. Attachment B-5 Road Classification Guide and Access Control Plan attached to
 39 the Final Order on the ASC updated to reflect the final design of the ~~proposed~~
 40 facility. Include applicable road segment maps with road names for existing

⁵⁶⁹ B2HAPPDoc3-38 ASC 21_Exhibit U_PublicServices_ASC 2018-09-28. Attachment U-2, Section 4.1.

⁵⁷⁰ B2HAPPDoc13-11 ASC Reviewing Agency Comment City of La Grande_Strope 2018-11-26.

1 public roads, road names in Appendix A: Access Road Segment Attribute Table,
2 road improvements designations, and final access control device description and
3 locations;

- 4 1. If, at final facility design, substantial modification of existing roads not
5 identified as related or supporting facilities in Attachment B-5 (maps) of
6 the Final Order on the ASC is necessary, the certificate holder must
7 submit an Amendment Determination Request (OAR 345-027-0357), or
8 submit a site certificate amendment request to the Department, prior to
9 the modification to determine whether the road modifications are
10 related or supporting facilities. Substantial modification of existing roads
11 shall be as defined in Attachment B-5, which includes repairs to more
12 than 20 percent of road surface, defined by the road prism width and
13 longitudinal distance over a defined road segment.

14 ii.iii. List any road use permits, encroachment permits, oversized/overweight permits,
15 or road use or other legal agreements obtained by the construction contractor or
16 applicant.

- 17 c. The final Transportation and Traffic Plan for a phase or segment of the facility must be
18 approved by the Department, in consultation with each county or jurisdiction, prior to
19 construction.
20

21 The applicant explains that the operations phase will have little to no effect to local and
22 regional traffic. During operations, vehicle traffic will be limited to inspections and maintenance
23 of the transmission line and communication stations and regular operation of the Longhorn
24 Station. Following construction of the proposed facility and during operations, existing and new
25 permanent access roads will be used by maintenance crews and vehicles for inspections and
26 maintenance of the new facilities. Most inspections of the transmission line will be conducted
27 aerially. If major maintenance and repair work requires lane restrictions and/or roadway
28 closures, the applicant will coordinate with landowners and service providers to allow access to
29 private property. The applicant estimates that it will use existing staff for operations so traffic
30 from staff during operations will not affect traffic within the analysis area.
31

32 Based on the analysis presented here, and in compliance with recommended conditions, the
33 Department recommends that the Council find that the construction and operation of the
34 proposed facility is not likely to result in significant adverse impacts to the ability of public and
35 private traffic safety providers within the analysis area. Additionally, the construction and
36 operation of the proposed facility is not likely to result in significant adverse impacts to traffic
37 volumes and congestion on proposed commuting and hauling routes proposed to be used by
38 the applicant during construction.
39

40 *Air Traffic*

41

42 The applicant proposes to use 30 temporary multi-use areas (MUAs) spaced along the proposed
43 and alternative routes. The applicant proposes to stage helicopter operations out of some
44 MUAs and four of the pulling and tensioning sites will be equipped and used as light-duty fly

yards (LDFY), with similar operations as helicopter uses at MUAs. Construction activities facilitated by helicopters could include delivery of construction laborers, equipment, and materials to structure sites; transmission structure placement; hardware installation; and wire stringing operations. Helicopters could also be used to support the construction and administration and management. Heavy-lift and light duty helicopters may be used during construction of the proposed facility in areas where access roads and/or rough terrain will not permit the delivery of equipment, materials or personnel. If used, heavy lift and light duty helicopters would deploy from multi-use areas or light duty fly yards.

The frequency of helicopter use depends on whether the proposed facility structure would be assembled at a structure site or a multi-use area. If assembly takes place at the structure site, daily helicopter operations at the relevant multi-use areas and light-duty fly yards would typically involve approximately 15 to 20 flights per day and last for approximately 2 to 3 months. If assembly takes place at the multi-use areas, daily helicopter operations would typically involve approximately 10 to 15 flights per day and might last for a year but trips would not take place every day and would be more sporadic. The applicant states that helicopter operations are expected to be limited to daylight hours.⁵⁷¹ As discussed further in section IV.E., *Land Use*, all of the MUAs and two of the LDFYs yards are located within areas zoned as Exclusive Farm Use (EFU) and two of the LDFYs are located in Umatilla County within forest areas and considered Goal 4 Forest Lands.

If not coordinated, helicopter use could interfere with flights to and from local regional airports. Table PS-8 below identifies airports within the analysis area and the distances of proposed facility components to the nearest airport.

Table PS-8: Airport Distances from Facility Components

Airport Name	Code	County	Distance (miles)
Boardman Airport	M50	Morrow	9.1
Hermiston Municipal Airport	HRI	Umatilla	5.7
Lexington Airport	9S9	Morrow	9.4
La Grande Municipal Airport/Union County Airport	LGD	Union	2.5
Baker City Municipal Airport	BKE	Baker	3.1
Miller Memorial Airpark	S49	Malheur	7.3
Source: B2HAPPDoc3-38 ASC 21_Exhibit U_PublicServices_ASC 2018-09-28, Table U-8.			

26

⁵⁷¹ B2HAPPDoc3-41 ASC 24_Exhibit X_Noise_ASC 2018-09-28, Section 3.1.1.

1 The applicant states that it would require its construction contractor to develop a Helicopter
2 Use Plan that would address the helicopter operations during construction and include
3 information regarding the type of helicopter use, duration and timing of helicopter use, flight
4 data management, and other requirements of both the Oregon Department of Aviation and the
5 FAA. The applicant represents that all helicopters must be compliant with the noise certification
6 and noise level limits set forth in the Code of Federal Regulations 14 CFR § 36.11 which outlines
7 the requirements needed to demonstrate compliance with the regulations including the
8 measuring, evaluation and calculation of noise levels in accordance with the applicable
9 procedures and conditions. For additional discussion of noise associated with proposed
10 helicopter use during construction of the proposed facility see section IV.Q.1., *Noise Control*
11 *Regulations and Variances*, of this order.

12
13 The Helicopter Use Plan would identify that if the helicopters would be lifting external loads
14 and carrying them over roads or residences they might need to complete a congested area plan
15 and provide that to the FAA. The Helicopter Use Plan would also specify that the applicant or its
16 aviation contractor should provide notices to airmen regarding the location and nature of work
17 being performed. This notice would be posted at each of the airports in the vicinity of the
18 proposed facility to alert other aviators of the location and timing of facility-related helicopter
19 construction activities. The applicant proposes, and the Department recommends with
20 revisions to reflect applicant representations, the Council adopt the following site certificate
21 condition providing for the development of the Helicopter Use Plan:

22
23 **Recommended Public Services Condition 32:** At least 90 days prior to use of a helicopter(s)
24 during construction, the certificate holder shall submit to the Department and each affected
25 County Planning Department a proposed Helicopter Use Plan. The plan must be approved
26 by the Department, in consultation with each county where helicopter use is proposed,
27 prior to use of a helicopter during construction. The certificate holder shall conduct all work
28 in compliance with the approved Helicopter Use Plan. The Helicopter Use Plan shall identify
29 or provide:

- 30 a. The type of helicopters to be used (all helicopters must be compliant with the noise
31 certification and noise level limits set forth in 14 CFR § 36.11);
- 32 b. The duration of helicopter use;
- 33 c. Approximate helicopter routes to be used;
- 34 d. Protected areas and recreation areas within two miles of the approximate
35 helicopter routes;
- 36 e. Roads or residences over which external loads will be carried;
- 37 f. Multi-use areas and light-duty fly yards containing helipads shall be located: (i) in
38 areas free from tall agricultural crops and livestock; (ii) at least 500 feet from
39 organic agricultural operations; and (iii) at least 500 feet from existing dwellings on
40 adjacent properties;
- 41 g. Flights shall occur only between sunrise and sunset;
- 42 h. At least 30 days prior to initiating helicopter operations at any multi-use area or
43 light-duty fly yard, the certificate holder shall contact adjacent property owners
44 within 1,000 feet of the relevant multi-use area or light-duty fly yard;

- 1 i. At least 30 days prior to initiating helicopter operations, the certificate holder shall
2 consult with the Oregon Department Aviation regarding the preparation and
3 posting of ~~provide~~ notices to airmen regarding the location and nature of work
4 being performed. The notice will be posted at each of the public airports in the
5 vicinity of the facility to alert other aviators of the location and timing of facility-
6 related helicopter construction activities; and
7 j. The certificate holder shall maintain a customer service telephone line to address,
8 among other things, complaints regarding helicopter operations.
9

10 In its comment letter on the ASC, the Oregon Department of Aviation (ODA) requested that the
11 Council include a condition of approval requiring the applicant to file FAA Form 7460-1 with the
12 FAA and the Oregon Department of Aviation and to determine if any facility structures or
13 power lines, within 5 miles of airports, will pose a hazard to aviation safety.⁵⁷² Upon review of
14 the FAA Form 7460-1, ODA will evaluate the FAA Part 77 Imaginary Surfaces for the La Grande
15 /Union County Airport and Baker City Airport and determine if marking lights or other
16 notification measures will be necessary for any facility structures or transmission lines. Under
17 the Public Services Standard, the Council must consider a facility's potential impact to public
18 service providers to provide traffic safety, including air traffic safety. In order to ensure that the
19 proposed facility would not result in adverse impacts to the ability of the La Grande /Union
20 County Airport and Baker City Airport to provide service, and to address the concerns of the
21 Oregon Department of Aviation regarding impacts to air navigation safety, the Department
22 recommends the Council adopt the following condition:
23

24 **Recommended Public Services Condition 43:** Prior to construction of any phase or segment
25 of the facility, the certificate holder shall submit to the Federal Aviation Administration
26 (FAA) and the Oregon Department of Aviation (ODA) a FAA Form 7460-1 Notice of Proposed
27 Construction or Alteration for transmission structures within 5-miles of a public airport (La
28 Grande /Union County Airport and Baker City Airport) and cranes exceeding 200 feet in
29 height. The certificate holder shall submit to the Department a copy of the FAA and ODA
30 hazard determination.
31

32 Helicopters may also be used during the operations phase to transport crews (e.g., to support
33 on-site safety inspections) and identify areas where maintenance activities are necessary.⁵⁷³
34 Other information regarding how inspections will be conducted is provided in Section IV.B.,
35 *Organizational Expertise*.
36

37 Based on the analysis presented here, and in compliance with recommended conditions, the
38 Department recommends that the Council find that the construction and operation of the
39 proposed facility is not likely to result in significant adverse impacts to the ability of public and
40 private air traffic safety providers within the analysis area.

⁵⁷² B2HAPPDoc13-24 ASC Reviewing Agency Comment ODA_Caines 2019-03-07.

⁵⁷³ B2HAPPDoc3-41 ASC 24_Exhibit X_Noise_ASC 2018-09-28, Section 3.3.2.

IV.M.7. Police Protection

Five county sheriff's departments are within the Oregon portion of the analysis area. The Oregon portion of the analysis area also includes United States Forest Service (USFS) and Bureau of Land Management (BLM)-managed lands, which are subject to federal law enforcement. ASC Exhibit U Table U-9 identifies the staffing levels at the county level sheriff's departments and Attachment U-1B provides the applicant's correspondence with law enforcement agencies who provided feedback. The Oregon State Police Department also has State troopers that patrol the analysis area, however, the applicant focused its analysis on local law enforcement agencies.

Several of the law enforcement agencies expressed concerns about adverse impacts to their departments resulting from a potential increase in crime associated with the construction of the facility. These concerns are primarily from the potential for the construction sites (MUAs and LDFYs) to be a target for theft of materials or equipment and that the construction will attract people, which may increase thefts at other properties. The applicant describes that transmission lines, stations, and associated facilities could be targets of intentional destructive acts, such as sabotage, terrorism, vandalism, and theft.⁵⁷⁴ Such acts include firing at insulators, powerlines, transmission towers, or station equipment; vandalism; and theft of equipment, supplies, tools, or materials. Of these acts, vandalism and thefts are most common. The applicant explains that it will require its construction contractor to develop an Environmental and Safety Training Plan that will include specific rules of conduct applicable to workers and management of construction work sites.

The Plan will include measures for securing multi-use areas and work sites when not in use such as locked gates, fencing and securing portable items in locked storage containers. The Plan will also address safety policies for personnel addressing drug, alcohol, firearm violations with clear consequences. The applicant explains that, in the event of an emergency, the communication that would occur with local authorities would be dependent on the type of emergency that arose. For major incidents, 911 would be called; for vandalism and theft, the local Sheriff's office would be contacted. The applicant proposes to include an emergency and medical response plan as part of the Environmental and Safety Training Plan. The emergency and medical response plan will contain contact information for federal, state, and county emergency management services. The applicant also explains it will contain emergency response procedures for helicopter emergency response, spill reporting, hospitals closest to the transmission line route and other emergency response procedures. In its comment letter on the ASC Baker County expressed concerns about the medical response times for helicopters and ambulances, and suggested that landing locations along the site boundary should be pre-identified for medical emergency life-flights.⁵⁷⁵ The Department recommends this information

⁵⁷⁴ B2HAPPDoc3-38 ASC 21_Exhibit U_PublicServices_ASC 2018-09-28, Section 3.5.6.1.

⁵⁷⁵ B2HAPPDoc13-17 ASC Reviewing Agency Comment Baker County_Kerns 2018-12-14.

1 be provided in the in the emergency and medical response plan as part of the Environmental
2 and Safety Training Plan.

3
4 The applicant proposes conditions to ensure compliance with the Environmental and Safety
5 Training Plan during construction to address the concerns raised by sheriff's departments.
6 Therefore, the applicant proposes, and the Department recommends with additional
7 clarification language, the following site certificate condition:

8
9 **Recommended Public Services Condition 54:** At least 90 days prior to construction of a
10 facility phase or segment, the certificate holder shall submit to the Department ~~and each~~
11 ~~—affected County Planning Department—~~a proposed Environmental and Safety Training
12 Plan, for review and approval by the Department, in consultation with each county and the
13 medical response entities identified in the plan. The plan must be approved by the
14 ~~Department, in consultation with each affected county planning department, prior to~~
15 ~~construction of a facility phase or segment.~~ The plan must include at a minimum, the
16 following elements:

- 17 a. Measures for securing multi-use areas and work sites when not in use;
18 b. Drug/alcohol/firearm policies with clear consequences for violations; and
19 c. An emergency and medical response plan including:
20 i) Contact information for federal, state, and county emergency management services;
21 ii) Emergency response procedures for helicopter emergency response, spill reporting,
22 hospitals closest to the transmission line route, and any other emergency response
23 procedures;
24 iii) Landing locations for medical emergency life-flights.
25 d. Requirements for training workers on the contents of the plan.
26 e. The certificate holder shall maintain copies of the Environmental and Safety Training
27 Plan onsite and conduct all work in compliance with the plan during construction and
28 operation of the facility.

29
30 It is possible that during operation of the proposed transmission line unauthorized access to
31 facility-related roads may increase the risk of wildfire, dumping, timber theft, and vandalism,
32 which may place increased demands on local law enforcement. Additional operational
33 maintenance roads allow access to more area for authorized and unauthorized users of the
34 land. Strategic placement of gates will help to control this potential increased risk and will be
35 utilized consistent with Exhibit B, and Attachment B-5 to this order. For instance, access roads
36 on private land will have some form of access control (gate, barrier, signage) as preferred by
37 the property owner. These access controls are assumed to be an effective deterrent against
38 trespassing; therefore, minimal increased demands are anticipated for local law enforcement.
39 No access control is proposed for improved existing roads on BLM-managed and USFS lands.
40 New roads will have access control based on travel management plan designations for the area,
41 and the likelihood of access control being effective. Improved existing roads and some open
42 new roads on BLM-managed and USFS lands are not anticipated to increase demands on law
43 enforcement because they are not anticipated to result in a significant increase in public use.
44 Recommended Public Services Condition ~~24~~ above, is intended to maintain compliance during

1 construction with the final approved County-Specific Transportation and Traffic Plan, which
2 references also the Road Classification Guide and Access Control Plan (Attachment B-5), which
3 will be maintained during construction and operation of the proposed facility to reduce
4 potential impacts to law enforcement agencies.

5
6 During operation of the proposed Longhorn Station and communication stations, physical
7 deterrents such as fencing, cameras, and signs will be employed to prevent theft, vandalism,
8 and unauthorized access.⁵⁷⁶ Use of these deterrents during operation of the proposed facility
9 will minimize demands on local law enforcement services. In the event of intentional
10 destructive acts, operational protocols will be implemented with detailed procedures in
11 accordance with the applicant's emergency response procedures as discussed above in Public
12 Services Condition 4 above outlining the information required in the Environmental and Safety
13 Training Plan.

14
15 Several of the potentially affected sheriff's departments expressed concerns that the temporary
16 influx of construction workers could result in short-term increases in traffic incidents and other
17 disturbances. The Morrow County Sherriff's Office expects temporary increased traffic impacts
18 would require speed trailers, signage, and other measures to increase safety.⁵⁷⁷ As discussed in
19 the above section relating to the potential impacts to traffic safety providers and
20 Recommended Public Services Condition ~~4~~2, the applicant represents it will develop and
21 comply with a Transportation and Traffic Plan (Plan). Several of the provisions in the Plan are
22 intended to avoid, minimize and mitigate impacts to law enforcement agencies due to the
23 expected increase in construction-related traffic. These provisions include: coordinating the
24 timing and locations of road closures in advance with emergency services, posting caution signs
25 on county and state-maintained roads to alert motorists of construction, and using traffic
26 control measures such as traffic control flaggers, warning signs, lights, and barriers during
27 construction to ensure safety and to minimize localized traffic congestion. The Plan also
28 outlines that the applicant will fence construction areas near residences at the end of the
29 construction day, and restoring residential roads, and install access control devices at locations
30 shown in the Road Classification Guide and Access Control Plan, Attachment B-5 to this order
31 and discussed in the same condition above. Finally, all construction personnel will be required
32 to obey local speed limits and traffic restrictions to ensure safe and efficient traffic flow, as
33 noted in the Plan.

34
35 Following construction of the proposed facility, existing and new permanent access roads will
36 be used during facility operations by maintenance vehicles for inspection and maintenance of
37 the proposed facility and related or supporting facilities. The applicant explains that the
38 operations phase will have little to no effect on local and regional traffic because vehicle trips

⁵⁷⁶ B2HAPPDoc3-38 ASC 21_Exhibit U_PublicServices_ASC 2018-09-28, Section 3.5.6.1.

⁵⁷⁷ B2HAPPDoc3-38 ASC 21_Exhibit U_PublicServices_ASC 2018-09-28, Attachment U-1B.

1 will be limited to inspections and maintenance of the transmission line and facilities. Regular
2 hauling over time of materials and equipment is not necessary so would not occur. The
3 applicant will provide staff at the operations and maintenance with existing staff so operational
4 staff will not affect community peak hour traffic. Operation of the proposed facility will not
5 cause emergency access restrictions or impacts to area public transit services, nor will they
6 increase roadway hazards or cause damage to existing roads or bridges.⁵⁷⁸

7
8 Based on the analysis presented here, and in compliance with recommended conditions, the
9 Department recommends that the Council find that the construction and operation of the
10 proposed facility is not likely to result in significant adverse impacts to the ability of public and
11 private police and public safety providers to provide services within the analysis area.

12
13 *IV.M.8. Fire Protection*

14
15 *Fire Management within Analysis Area*

16
17 The prevention and suppression of wildfires in eastern Oregon on federal land is carried out by
18 the Bureau of Land Management (BLM), and United States Forest Service (USFS), For private
19 and state forested, and much of the non-forested, lands, the Oregon Department of Forestry
20 (ODF) in conjunction with the Rangeland Fire Protection Associations (RFPA), and Rural Fire
21 Protection Districts (RFPD), and local fire districts and agencies are the primary wildfire
22 protection agencies. The agencies' activities are closely coordinated, primarily through the
23 Pacific Northwest Wildfire Coordinating Group. Coordination of firefighting resources also
24 occurs under Oregon's Emergency Conflagration Act that allows the state fire marshal to
25 mobilize and dispatch structural firefighting personnel and equipment when a significant
26 number of structures are threatened by fire and local structural fire-suppression capability is
27 exhausted.⁵⁷⁹

28
29 As described in ASC Exhibit U, federal agencies are responsible for fire suppression efforts on
30 federal lands in the analysis area, including BLM-managed and National Forest (NF) lands. The
31 BLM has jurisdiction over fire suppression on BLM-managed lands; the USFS has jurisdiction
32 over fire suppression on NF lands.⁵⁸⁰ ~~The State of Oregon is responsible for fire suppression on~~
33 ~~state lands.~~ The Oregon Department of Forestry is the primary wildland fire protection agency
34 on forested private and state lands and much of the nonforested lands. Municipal fire
35 departments and rural and rangeland fire districts are the primary responders for incidents on
36 private land. The applicant explains that approximately 72 percent of the land within the site
37 boundary is privately owned. The BLM manages about 25 percent of the land in the site
38 boundary, with the remaining three percent managed by other federal (USFS and U.S. Bureau
39 of Reclamation) or State agencies. Table PS-9, below, summarizes staffing levels, equipment,

⁵⁷⁸ B2HAPPDoc3-38 ASC 21_Exhibit U_PublicServices_ASC 2018-09-28, Attachment U-2, p. 26.

⁵⁷⁹ B2HAPPDoc3-38 ASC 21_Exhibit U_PublicServices_ASC 2018-09-28, Attachment U-3, p. 1.

Fire Protection Districts Service Territory and Proposed Facility

The vast majority of the proposed facility would be located either within the boundaries of a local fire response organization or on federal land where fire response is managed by BLM or the Forest Service, as presented in Figure 12: Fire Protection Districts within Analysis Area.

1 **Figure 12: Fire Protection Districts within Analysis Area**

2
 3 As provided by the applicant, Table PS-10, Fire Response Providers, per County and Route, and
 4 Provider Distance from Site Boundary supports Figure 12 above and provides, in tabular format,
 5 the length of the proposed facility located within a fire response organizations' service
 6 territory.⁵⁸¹ As presented in Table PS-10, there are portions of the line that would be located
 7 outside of a designated service territory (44 miles within Morrow County, 5 miles in Baker
 8 County, and 7 miles in Malheur County).

During construction, in those areas covered by a fire response organization or located on federal land, the certificate holder would attempt to negotiate an agreement with the relevant fire response organization or federal agencies as presented in Table PS-10 above, outlining communication and response procedures for potential fires within their boundaries. In those areas not covered by a fire response organization and not located on federal land, the certificate holder would attempt to negotiate an agreement with nearby fire response organizations or the federal agencies to provide fire response. If no such agreements can be reached, the certificate holder would propose alternatives such as contracting with a private fire response company or providing additional firefighting equipment at those sites. These commitments are represented in Section 1.4 Fire Response Agreements of the draft Fire Prevention and Suppression Plan (see Attachment U-3 of this order), referenced in recommended Public Services Condition 6 below.

In accordance with OAR 345-025-0016, the Department incorporated an agency review process, inclusive of a dispute resolution component, into the draft Fire Prevention and Suppression Plan, to allow appropriate federal, state and local agencies an opportunity to review and comment on the plan, including identification of appropriate fire district contacts and agreement components.

~~Not all lands in the analysis area fall within a designated fire district. In those cases, the closest or best situated fire district responds to fires. Mutual aid agreements have been established between local fire districts and adjacent counties to pool resources, ensure cooperation between these entities, and respond to fires on a county and state level instead of isolating efforts to local districts.⁵⁸² As a result of these mutual aid agreements, the fire district that responds to a fire may not be the district that the fire occurs in, or even the closest district; instead, response is based on the district that is best situated and suited to respond.~~

Construction-related Impacts on Fire Protection Providers Ability to Provide Service

The applicant provided correspondence summaries with fire departments, rural fire protection districts, and rangeland fire protection associations in ASC Exhibit U, Attachment U-1C. The

⁵⁸² ~~B2HAPPDoc3-38-ASC-21-Exhibit U-Public Services-ASC 2018-09-28, Attachment U-1C.~~

1 majority of fire protection providers discussed that the proposed facility would not adversely
2 impact their ability to provide fire prevention services. There were concerns expressed from
3 some fire protection providers that fire districts within the analysis area are comprised of
4 volunteers, so it may take considerable time to collect and mobilize an entire fire crew and that
5 response times to fires in the analysis area vary depending on the time of day, the priority of
6 the emergency/call and the location of the emergency and the type of available access. The
7 Department notes that the response times provided in Table PS-9: *Fire Departments, Rural Fire
8 Protection Districts, and Rangeland Fire Protection Associations*, are estimates that may not
9 contemplate a busy fire season with longer delays or response times. Addressed below is the
10 discussion of the draft Fire Prevention and Suppression Plan and measures the applicant would
11 be required to take to minimize on-site fire risks and the applicant's ability to provide fire
12 protection measures itself until responders arrive.

13 14 Potential Construction-related Fire Risk

15
16 Construction of the proposed transmission line would take place year-round, however, most
17 activities would occur during summer when the weather may be hot and dry. Much of the
18 proposed construction would occur in grassland and shrub-dominated landscapes where the
19 potential for naturally occurring fire is high in summer. Construction-related activities, including
20 the use of vehicles, chainsaws, and other motorized equipment, could increase this potential
21 risk in some areas within the site boundary. Fire hazards can also be related to workers
22 smoking, refueling, and operating vehicles and other equipment off roadways. Welding on
23 broken construction equipment could also potentially result in the combustion of native
24 materials near the welding site.

25 26 Construction Fire Prevention and Suppression

27
28 To reduce the potential for construction-related fires and provide a plan for responding to any
29 fires, the applicant developed a draft Fire Prevention and Suppression Plan (Attachment U-3 to
30 this order) to coordinate fire prevention and suppression measures ~~are carried out~~ in
31 accordance with federal, state, and local regulations. The draft Fire Prevention and Suppression
32 Plan (Plan) stipulates that the applicant and its construction contractor ~~will~~would train all
33 personnel in regular safety briefings; training would include proper use of extinguishers and
34 equipment and process of fire response and control. In the event of a fire during construction,
35 ~~t~~he contractor and applicant would immediately proceed to control and extinguish any fire
36 started resulting from their activity and ~~will~~would inform crew member of fire dangers,
37 locations of extinguishers and equipment, and individual responsibilities for fire prevention and
38 suppression during regular safety briefings. Additionally, wildfire training would be conducted
39 by individuals that are National Wildfire Coordination Group and Federal Emergency
40 Management Agency certified. In the event of a fire during construction.⁵⁸³

All personnel would be informed of the smoking policy on-site during construction as discussed in Section 2.1.2 in the Plan. The construction contractor and applicant’s Incident Management Team will train all personnel on the measures to take in the event of a fire. All construction equipment operating with an internal combustion engine ~~will~~would be equipped with federally-approved spark arresters and motorized equipment, including worker transportation vehicles and ~~will~~would not be allowed to be driven or parked outside the designated and approved work limits.

Section 2.1.5 of the Plan describes the fire suppression equipment that would be provided to each construction vehicle. Based on comments provided from the Oregon Department of Forestry (ODF), the applicant updated the information in the Plan to be consistent with current administrative rules for fire prevention.⁵⁸⁴ The applicant updated and represents that during construction of the proposed facility it would comply with the requirements for water supply and equipment for fire suppression under OAR 629-043-0020 and requirements for Firewatch under OAR 629-043- 0030. For example, during construction, larger water supplies of 300 gallons or larger (self- propelled) or 500 gallons (not self-propelled) with a pump capable of providing not less than 20 gallons per minute at a pressure of at least 115 pounds per square inch at pump level would be made available as conditions warrant. A nozzle, and enough serviceable hose of not less than ¾ inch inside diameter, to reach from the water supply to any location in the operation area affected by any power driven machinery, or 500 feet, whichever is greater, would be made available. In its comment letter, ODF found that fire prevention measures and vegetation management objectives (proposed by the applicant) are consistent with current policies, laws and rules under Oregon Revised Statute Chapters 477 (Fire Protection of Forests and Vegetation) and 527 (Forest Practices) and Oregon Administrative Rules Chapter 629 (Department of Forestry), applicable to all areas and vegetation types (i.e. forested and non-forested lands) during facility construction.⁵⁸⁵

The applicant explains in its draft Fire Prevention and Suppression Plan that in the event of a fire, the Incident Management Team may request local assistance in firefighting if personnel have required training including the use of construction equipment on the facility site. In the event where there is a construction-related fire within the analysis area, the construction contractor and applicant would take the following actions:

- Site personnel would aid in extinguishing a fire ignition before it gets out of control and take action that a prudent person would take to control the fire while still accounting for their own and others safety.
- Immediately notify the nearest fire-suppression agency of the fire location, action taken, and status.

⁵⁸⁴ B2HAPPDoc13-22 ASC Reviewing Agency Comment ODF_Fields 2019-02-04, and B2HAPPDoc13-23 ASC Reviewing Agency Comment ODF_Fields 2019-02-19.

⁵⁸⁵ B2HAPPDoc13-23 ASC Reviewing Agency Comment ODF_Fields 2019-02-19.

- 1 • Immediately notify the construction contractor and applicant of the fire location and
2 action taken.
- 3 • Relinquish fire-suppression activities to agency fire-management officers upon their
4 arrival.

5
6 In addition to the provisions outlined in the Plan and discussed above, the applicant describes
7 other measures the applicant and its construction contractor would implement that may
8 reduce fire risks and adverse impacts to fire departments and districts during proposed facility
9 construction. Some of these measures include use of on-site earthmoving equipment to combat
10 any fires that occur and to assist local fire departments and districts and that trucks with water
11 holding tanks would be on-site during construction so water would be in the immediate vicinity
12 to be used to combat any fire that may ignite.

13
14 To ensure compliance with the protective measures identified in the draft Fire Prevention and
15 Suppression Plan and reduce the potential adverse impacts to fire protection providers during
16 construction, the applicant proposes, and the Department recommends, the Council include
17 the following condition in the site certificate:

18
19 **Recommended Public Services Condition 65:** ~~At least 90 days p~~Prior to construction of a
20 facility phase or segment, in accordance with the OAR 345-025-0016 agency consultation
21 process outlined in the plan (Attachment U-3 of the Final Order on the ASC), the certificate
22 holder shall submit final Fire Prevention and Suppression Plan(s) ~~for review and approval by~~
23 ~~the Department, in consultation with each county planning department to the Department.~~
24 The final Fire Prevention and Suppression Plan shall include the following, unless otherwise
25 approved by the Department:

- 26 a) The protective measures as described in the draft Fire Prevention and Suppression Plan
27 as provided in Attachment U-3 of the Final Order on the ASC. The final plan shall
28 establish that wildfire training for onsite workers and facility personnel be conducted by
29 individuals that are National Wildfire Coordination Group and Federal Emergency
30 Management Agency certified.
- 31 b) A description of the fire districts and rural fire protection districts that will provide
32 emergency response services during construction and copies of any agreements
33 between the certificate holder and the districts related to that coverage.
- 34 c) All work must be conducted in compliance with the approved plan during construction
35 ~~and operation~~ of the facility.

36
37 Operations

38
39 Operational Impacts on Ability to Fire Protection Providers to Provide Service

40
41 Representatives from fire departments within the analysis area expressed concerns about the
42 impact on their departments due to the operation of the proposed transmission line. The
43 general concerns reported were concerning potential delays in fire-fighting efforts the
44 departments may experience due to waiting for the proposed transmission line to be de-

1 energized, so they may safely fight fires in the vicinity of transmission lines. The applicant
2 describes that it will provide relevant fire departments and agencies its emergency 24/7
3 dispatch center contact information.

4
5 Upon being notified of a fire within the vicinity of the proposed transmission line, the applicant
6 would dispatch and send personnel on site. Once onsite, and if requested, applicant
7 representatives would confirm facilities to be removed from service, the applicant's control
8 center and dispatch then removes the proposed transmission line from service (de-energizes
9 the transmission line). Once onsite, applicant representatives requesting a line outage from
10 dispatch for safety concerns can expect a line outage within a few minutes. The proposed
11 transmission line would then be considered unavailable to return to service until onsite
12 applicant personnel are able to verify with onsite emergency agencies that all personnel and
13 equipment are no longer in danger of electrical contact.⁵⁸⁶

14
15 *Potential Operational Fire-related Risks*

16
17 The applicant explains that during operation the primary causes of fire in the ROW is likely to
18 result from unauthorized entry by individuals for recreational purposes and from fires started
19 from other sources outside the ROW. The applicant explains in its Right-of-Way Clearing
20 Assessment, Attachment K-2 to this order, that additional roads allow access to more area for
21 authorized and unauthorized users of the land. Unauthorized access to facility-related roads
22 may increase the risk of wildfire, dumping, timber theft, and vandalism. As addressed in Public
23 Services Condition ~~21~~ above, the strategic placement of access controls will help to control the
24 potential increased risk of public access and possibly an increase in fire risks. Further, the
25 applicant ~~is will be required to compliant comply~~ with the Oregon Forest Practices Act (FPA)
26 rules, Oregon Revised Statute 527, OAR chapter 629, divisions 605 through 665 which provide
27 regulations that govern the location, construction, maintenance, and repair of roads on non-
28 federal forest lands.

29
30 Vegetation, including trees, limbs, and branches, may create safety and service reliability risks
31 because vegetation touching power lines can spark, start fires and cause interruptions in
32 electric supply. While uncommon, the operational risk of the proposed facility igniting a wildfire
33 may be caused by overgrown vegetation contacting the transmission line, a tree falling on the
34 transmission line, or from equipment failure.

35
36 *Operational Fire Protection Management*

37
38 In the ASC, the applicant describes and provides practices, protocols and management plans to
39 manage wildfire risk, all of which would apply to the proposed facility. For instance, the
40 applicant provides a draft Vegetation Management Plan (Attachment P1-4 of this order; see
41 recommended Fish and Wildlife Condition 1) that focuses on tree trimming to ensure poles and

⁵⁸⁶ B2HAPPDoc3-56 ASC Exhibit U - Errata Info 2019-03-28.

1 lines are clear of vegetation. As identified in the draft Vegetation Management Plan,
2 Attachment P1-4 of this order, vegetation that would require management would be conducted
3 in compliance with the American National Standards Institute (ANSI) Pruning Standards Best
4 Management Practices for Utilities, Oregon Forest Products Act, the U.S. Department of Labor
5 Occupational Safety and Health Administration (OSHA), and the North American Electric
6 Reliability Council's (NERC) Standard FAC-003-3 Transmission Vegetation Management Program
7 (TVMP).⁵⁸⁷ As such, following the guidelines of the draft Vegetation Management Plan would
8 reduce the potential for an increase in wildfire as a result of proposed facility operation. The
9 draft Vegetation Management Plan is discussed further in section IV.H., *Fish and Wildlife*
10 *Habitat*.

11
12 Forest and woodlands make up 13 percent of the area within the site boundary and would
13 account for the majority of the vegetation management activities. Methods for clearing
14 vegetation within forested areas to reduce the risk that combustible materials that would come
15 into contact with the conductors and ignite a fire is discussed in the Right-of-Way Clearing
16 Assessment (Attachment K-2 of this order). All logging operations, methods and procedures
17 outlined in the Right-of-Way Clearing Assessment follow guidance in ODF's Fire Prevention
18 Rules, OAR Chapter 629, Division 43, such as fire equipment requirements, treatment of slash
19 for protection of adjacent lands, filing of a "smoke management plan" (OAR 629-048-0001) and
20 obtaining a burn permit. The Right-of-Way Clearing Assessment is discussed further in section
21 IV.E., *Land Use*, and is addressed in recommended Land Use Condition 16.

22
23 As discussed in section IV.P.1., *Siting Standards for Transmission Lines*, the proposed
24 transmission line and structures used to support overhead transmission lines must meet the
25 requirements of the Public Utility Commission of Oregon Construction Standards and the
26 National Electrical Safety Code. These codes and standards also include actions to design,
27 construct and operate the proposed facility to minimize the risks of fire hazard. These include
28 requirements pertaining to the prevention of fire hazards related to outdoor public utility
29 installations and the National Fire Protection Association Uniform Fire Code Handbook
30 guidance related to the clearance of brush and vegetative growth in and around transmission
31 lines.⁵⁸⁸ Further, the applicant explains that the steel towers proposed will-would not burn and
32 are designed to dissipate lightning strikes and that the integrity of the grounding and other
33 hardware will be tested on a regular basis during scheduled maintenance, thereby minimizing
34 the potential for fire ignitions. Transmission line protection and control systems will be
35 incorporated into the overall operating system and are designed to detect faults (such as arcing
36 from debris contacting the line) and will rapidly shut off power flow (in 1/60th to 3/60th of a
37 second) if arcing is detected.⁵⁸⁹ As described in Section IV.B., *Organizational Expertise of this*
38 *order, the applicant also has a documented line inspection program for its transmission lines,*
39 *requiring two patrols per year (twice the number required by regulators), which are*

⁵⁸⁷ B2HAPPDoc3-25 ASC 16A_Exhibit P1_Wildlife_ASC_Part 1_Main thru Attach P1-6 rev 2018-09-28, Attachment P1-4 p. 4.

⁵⁸⁸ B2HAPPDoc3-19 ASC 11_Exhibit K_Land Use_ASC 2018-09-28, Attachment K-2, p. 22.

⁵⁸⁹ B2HAPPDoc3-38 ASC 21_Exhibit U_PublicServices_ASC 2018-09-28, Attachment U-3, p. 7.

1 complimented by a variety of line maintenance programs involving infrastructure replacement
2 and installation of protection equipment (Attachment U-4 of this order; see recommended
3 Organizational Expertise Condition 1).

4
5 The applicant describes its intent to develop and implement a Wildfire Mitigation Plan that
6 identifies strategies to further mitigate fire-related risks associated with its transmission
7 operations and how the company prevents and responds to fire events. The Wildfire Mitigation
8 Plan would utilize a risk-based approach that focuses on assessing wildfire risk and then taking
9 actions to prevent wildfires and damage to infrastructure from wildfires. Operations and
10 maintenance practices, programs, and activities would have specific targeted actions in those
11 high wildfire threat areas.⁵⁹⁰ The Wildfire Mitigation Plan would also identify performance
12 metrics and monitoring to ensure actual actions are consistent with those set forth in the plan.

13
14 Consistent with the applicant's representations and to minimize impacts to fire protection
15 service providers' ability to provide services, the Department recommends Council impose the
16 following condition requiring that the applicant, prior to and annually during facility operations,
17 provide its Wildfire Mitigation Plan to the Department and affected counties, as follows:

18
19 **Recommended Public Services Condition 7:** The certificate holder shall:

- 20 a. Prior to operation, provide a copy of its Wildfire Mitigation Plan to the Department and
21 each affected county which provides a wildfire risk assessment and establishes action
22 and preventative measures based on the assessed operational risk from and of wildfire
23 in each county affected by the facility. The plan shall address facility and emergency
24 contacts, agency coordination and responsibilities, necessary fire-fighting equipment,
25 and long-term agreements with service providers, as needed.
26 b. During operation, the certificate holder shall update the Wildfire Mitigation Plan on an
27 annual basis, or frequency determined acceptable by the Department in consultation
28 with the Oregon Public Utilities Commission.
29 c. During operation, for the service territories the facility would be located within, the
30 certificate holder shall provide to each of the fire districts and rural fire protection a
31 contact phone number to call in the event a district needs to request an outage as part
32 of a fire response.
33 d. Any Wildfire Mitigation Plan required by the Oregon Public Utilities Commission shall be
34 considered by EFSC as meeting the requirements of this condition.

35
36 Based on the analysis presented here, and in compliance with recommended conditions, the
37 Department recommends that the Council find that the construction and operation of the

⁵⁹⁰ Commenters expressed concerns of increased fire risk associated with the operation of the proposed facility and adverse
impacts to local fire districts, particularly in areas prone to wildland fires. B2HAPPDoc8-142 DPO Public
Comment Gilbert 2019-06-18 to 08-22, Giles, C., Rosenbaum, M., et al. B2HAPPDoc13 DPO IPC Responses to Select
DPO Comments Rec'd by 2019-11-07; B2HAPP DPO IPC Responses - StopB2H - 9. Wildfire and Public Safety - First
Supplemental Response 2019-11-07.

1 proposed facility is not likely to result in significant adverse impacts to the ability of public and
2 private fire protection providers to provide fire response services within the analysis area.

3
4 *IV.M.9. Health Care*

5
6 Workers suffering minor injuries needing medical attention will be treated at local medical
7 facilities or emergency rooms. Workers suffering more serious injuries, were they to occur, will
8 be taken to one of the major hospitals in the project vicinity. Two medical facilities serve the
9 communities within the analysis area along the proposed and alternative routes. Two major
10 hospitals capable of treating serious injuries are located within the five counties in the Oregon
11 portion of the analysis area: Grande Ronde Hospital in La Grande and Saint Alphonsus Medical
12 Center in Ontario. One additional major hospital, Saint Anthony Hospital in Pendleton, could
13 also be utilized in the case of emergencies, it is capable of treating serious injuries. The
14 applicant provided correspondence with local medical service providers in ASC Exhibit U,
15 Attachment U-1D.

- 16
17
- 18 • Saint Anthony Hospital (Pendleton) is a Level III hospital licensed for 49 beds, 5 of which
19 are intensive care beds. The hospital employs approximately 80 nurses, and 30
20 physicians have staffing privileges. Medical transportation is provided by Life Flight. One
21 Life Flight helicopter is stationed at the hospital and one is stationed at the Pendleton
22 airport. The hospital also has access to a fixed-wing craft. Flight times between the
23 hospital and the Project area are about 15 minutes for the portions of the proposed
24 facility located near Pilot Rock, and 40 minutes for areas located further east. As
25 provided in ASC Attachment U-1D, per hospital staff, patients suffering major injuries,
26 such as severed limbs or electrical burns, are stabilized at Saint Anthony Hospital and
27 then transported to a regional hospital for treatment.
 - 28 • Grande Ronde Hospital (La Grande) is a Level IV hospital licensed for 25 beds, 6 of which
29 are intensive care beds. The hospital employs about 137 nurses, and 45 physicians have
30 staffing privileges. Medical transportation is provided by Airlink. An Airlink fixed-wing
31 craft is stationed at the local airport, and flight times between the airport and the
32 Project area are about 20 to 90 minutes. Patients suffering major injuries, such as
33 severed limbs or electrical burns, are stabilized at Grande Ronde Hospital and then
34 transported to a regional hospital for treatment.
 - 35 • Saint Alphonsus Medical Center (Baker City) is a 25 bed, critical access hospital with a
36 skilled nursing-type facility called a swing bed. They offer inpatient services and
37 outpatient services. It staffs approximately 160 full-time employees and has a total
38 headcount of 200 employees. The medical center periodically conducts emergency
39 preparedness drills with the county, utilizing the county's resources. They have
40 approximately 7,000 ER visits per year. They could likely serve 3,500 more ER visits a
41 year and would have capacity to still serve the community.

42 As would be required by recommended Public Services Condition [54](#), prior to construction the
43 applicant would be required to finalize an Environmental and Safety Training Plan. The plan
44 would contain emergency response procedures for helicopter emergency response, spill

1 reporting, hospitals closest to the transmission line route and other emergency response
 2 procedures. In its comment letter on the ASC Baker County expressed concerns about the
 3 medical response times for helicopters and ambulances, and suggested that landing locations
 4 along the site boundary should be pre-identified for medical emergency life-flights. The
 5 Department agrees with Baker County's comment and the finalized Environmental and Safety
 6 Training Plan would be required to contain such information.

7
 8 Based on the analysis presented here, and in compliance with recommended conditions, the
 9 Department recommends that the Council find that the construction and operation of the
 10 proposed facility is not likely to result in significant adverse impacts to the ability of public and
 11 private health care providers to provide health care services within the analysis area.

12 *IV.M.10. Schools*

13
 14
 15 There are 10 school districts within the analysis area. Table PS-10 below identifies each school
 16 district, the student enrollments, student/teacher ratio and general enrollment trends in 2016.
 17 The student/teacher ratios and enrollment trends were provided by the applicable school
 18 district and is evidenced by correspondence in ASC Exhibit U, Attachment U-1E.

19
Table PS-11: School District Information

School District	County	Student Enrollment in 2015-2016	Student/ Teacher Ratio 2015-2016	Enrollment Trends
Morrow School District 001	Morrow	2,238	21	flat
Ione School District	Morrow	197	11.5	increasing
Pilot Rock School District 002	Umatilla	372	14	declining
La Grande School District 001	Union	2,203	18.6	increasing
Union School District 005	Union	335	15	declining
Baker School District	Baker	1,692	16	flat to declining

Source: B2HAPPDoc3-38 ASC 21_Exhibit U_PublicServices_ASC 2018-09-28, Table U-11.

20
 21 As discussed above under the, *Construction Activities and Impact Assumptions*, and in Table PS-
 22 1: *Construction Spread and Affected Oregon Counties*, construction of the proposed facility is
 23 assumed for the purposes of analysis to involve two construction spreads that will be built
 24 concurrently. The applicant assumes that approximately 10 percent of non-local construction

1 personnel would be relocated to the analysis area with their families. The applicant provides that
2 based on data compiled from the 2009 U.S. Census Bureau, as part of the 2008 American
3 Community Survey, the average relocating family consists of two adults and one school-aged
4 child. Consistent with the estimates provided in Table PS-2: *Estimated Workers and Population*
5 *Change during Peak Construction*, this would mean up to 18 children may need to be enrolled in
6 local schools along Construction Spread 1 and up to 15 children along Construction Spread 2.
7 The applicant states that the likelihood that construction workers will temporarily relocate their
8 families to the area is low and the school districts that responded to enquiries all indicated that
9 they will be able to accommodate the low levels of estimated additional students.

10
11 During operation the applicant states that it will staff the Longhorn Station with existing staff
12 who will be primarily responsible for operation and maintenance of the new transmission line
13 and associated facilities. They note that potentially one additional part-time position may be
14 filled locally, but no existing employees will be required to relocate to the analysis area,
15 therefore local school districts will not be impacted from the operation of the proposed facility.

16
17 Based on the analysis presented here, and in compliance with recommended conditions, the
18 Department recommends that the Council find that the construction and operation of the
19 proposed facility is not likely to result in significant adverse impacts to the ability of public and
20 private education providers to provide education services within the analysis area.

21 **Conclusions of Law**

22
23
24 Based on the foregoing findings of fact, and the evidence in the record, and subject to
25 compliance with the recommended conditions, the Department recommends that the Council
26 find that the construction and operation of the proposed facility, including the proposed and
27 alternative routes, is not likely to result in significant adverse impact to the ability of public and
28 private providers within the analysis area to provide public services and therefore the proposed
29 facility complies with the Council's Public Services standard.

30 31 32 **IV.N. Waste Minimization: OAR 345-022-0120**

33
34 *(1) Except for facilities described in sections (2) and (3), to issue a site certificate, the*
35 *Council must find that, to the extent reasonably practicable:*

36
37 *(a) The applicant's solid waste and wastewater plans are likely to minimize*
38 *generation of solid waste and wastewater in the construction and operation of the*
39 *facility, and when solid waste or wastewater is generated, to result in recycling and*
40 *reuse of such wastes;*
41

1 ***(b) The applicant’s plans to manage the accumulation, storage, disposal and***
2 ***transportation of waste generated by the construction and operation of the facility***
3 ***are likely to result in minimal adverse impact on surrounding and adjacent areas.***
4

5 ***(2) The Council may issue a site certificate for a facility that would produce power from***
6 ***wind, solar or geothermal energy without making the findings described in section (1).***
7 ***However, the Council may apply the requirements of section (1) to impose conditions on***
8 ***a site certificate issued for such a facility.***

9 ***

10 **Findings of Fact**

11
12 The Waste Minimization standard requires the Council to find that the certificate holder will
13 minimize the generation of solid waste and wastewater, and that the waste generated will be
14 managed to result in minimal adverse impacts on surrounding and adjacent areas. The
15 applicant provided information about waste minimization in ASC Exhibits G, V, and U. Exhibit V
16 includes the applicant’s plans for solid waste and wastewater management during construction
17 and operation of the proposed facility, ASC Exhibit U discusses solid waste providers, and ASC
18 Exhibit G provides additional information relating to the management of potentially hazardous
19 materials.

20
21 ***Solid Waste***

22
23 The applicant discusses anticipated generation of non-hazardous and hazardous solid wastes in
24 ASC Exhibits V and G. Primary sources of nonhazardous construction waste include vegetation
25 waste, native earth materials, and household-type waste.

26
27 Numerous areas along the proposed transmission line would require vegetative clearing and
28 possible grading; these areas include areas associated with the Longhorn Station, access roads,
29 multi-use areas, temporary pulling and tensioning site, fly yards, and other temporary and
30 permanent disturbance areas. Vegetative waste would consist mainly of herbaceous plant
31 materials scraped from disturbance areas. Additionally, vegetative waste would include trees
32 and shrubs that are removed to allow for the construction of transmission line infrastructure, to
33 allow for transmission line stringing, and to minimize risk of interference with energized
34 circuits. As noted in Table WM-1, the applicant expects to generate approximately 3,516,256
35 cubic yards of vegetative waste; the applicant represents that it could mulch up to 80 percent
36 of vegetative materials and spread the mulch within the site boundary, thereby substantially
37 reducing the amount of material that would otherwise be disposed at a landfill.

38
39 Native earth materials would consist of excess soil, fill material, and aggregates that may be
40 generated from access road construction, as well as from the construction of foundations and
41 tower pads. The applicant represents that it would balance soil cuts and fills to the greatest
42 extent possible to minimize excess waste, but also acknowledges that surplus native earth
43 material would require disposal. As noted in Table WM-1, the applicant expects to generate
44 approximately 197,218 cubic yards of native earth material waste; the applicant estimates that

1 it would be required to dispose of approximately 90 percent of material excavated for
 2 foundations, and approximately 50 percent of the material excavated for tower pad
 3 construction and work area grading. Construction contractors may elect to dispose native
 4 material at local sand or gravel / aggregate pits where native materials could be recycled for
 5 other projects.⁵⁹¹

6
 7 Household-type solid waste would include materials such as scrap metal, wire, wood, concrete,
 8 incidental litter, and other debris. As noted below in Table WM-1, the applicant expects to
 9 generate approximately 6,235 cubic yards of solid waste; up to 80 percent could be recycled
 10 while approximately 20 percent would be disposed at a landfill.⁵⁹²

11
 12 The applicant provides estimates of waste materials generated from retirement and
 13 decommissioning of the proposed facility in Table V-2 in Exhibit V of the ASC.

14
 15 As described in Section IV.M., *Public Services* of this ~~draft proposed~~ order, four solid waste
 16 landfills are located within the analysis area as listed in Table PS-3; all municipal landfill facilities
 17 must comply with the Code of Federal Regulations (CFR) Part 258, as well as relevant state
 18 statutes and administrative rules.

19
 20 Table WM-1, below (reprinted from ASC Exhibit V, Table V-1), provides anticipated vegetation
 21 waste, native material waste, and solid waste that would be generated in each affected county.
 22

Morrow County Solid Waste Management Ordinance

One of the counties for which proposed and alternative facility components would be located, Morrow County, has adopted a Solid Waste Management Ordinance establishing requirements for the transportation and disposal of hazardous solid waste generated or accumulated during construction and operation. To ensure that the applicant adheres to applicable solid waste requirements within Morrow County, the Department recommends Council impose Waste Minimization Condition 1, which includes various measures but also addresses Morrow County’s applicable requirements.

The Department notes that the applicant has proposed conditions in the ASC, however, in this section the Department recommends Council consider alternative condition language that includes more details and the provisions proposed by the applicant. While the applicant would recycle and reuse materials to the extent possible, in order to further reduce waste and to establish procedures for recycling, material handling and disposal, and management of hazardous and non-recyclable waste, the applicant proposes to develop and implement a Construction Waste Management Plan. The applicant proposes and the Department recommends that the following conditions be included within the Site Certificate:

- Recommended Waste Minimization Condition 1:** At least 90 days prior to construction of a facility phase or segment, the certificate holder shall submit to the Department a Construction Waste Management Plan. The Department must review and approve the plan prior to construction of a facility phase or segment. The site certificate holder shall conduct all work in compliance with the approved Plan. The Plan must address, at a minimum:
- a. The number and types of waste containers to be maintained at multi-use areas and pulling and tensioning sites;
 - b. Waste segregation methods for recycling or disposal;
 - c. Names and locations of appropriate recycling and waste disposal facilities, collection requirements, and hauling requirements to be used during construction;

- 1 d. Recycling steel and other metal scrap;
- 2 e. Recycling wood waste;
- 3 f. Recycling packaging wastes such as paper and cardboard;
- 4 g. Collecting non-recyclable waste for transport to a local landfill by a licensed waste
- 5 hauler or by using facility equipment and personnel to haul the waste;
- 6 h. Segregating all hazardous and universal wastes such as used oil, oily rags and oil-
- 7 absorbent materials, mercury-containing lights and lead-acid and nickel cadmium
- 8 batteries for disposal by a licensed firm specializing in the proper recycling or
- 9 disposal of hazardous and universal wastes;
- 10 i. When possible, discharging concrete truck rinse-out within foundation holes,
- 11 completing truck wash-down off-site, and burying other concrete waste as fill on-
- 12 site whenever possible; and
- 13 j. For waste hauling and disposal within Morrow County, the certificate holder shall
- 14 ensure its personal or third party contractors adhere to the applicable
- 15 requirements in the Morrow County Solid Waste Management Ordinance Section
- 16 5.000 Public Responsibilities, 5.010 Transportation of Solid Waste and 5.030
- 17 Responsibility for Propose Disposal of Hazardous Waste which requires that all
- 18 loads be covered and secured and that operators be responsible for hazardous
- 19 waste disposal in accordance with applicable regulatory requirements.
- 20 k. If required by county ordinance, solid waste transported on public roads must be
- 21 covered and secured during transporting, including:
 - 22 i. Loads which are totally contained within an enclosed vehicle or container;
 - 23 ii. Loads of solid waste contained in garbage cans with tightly fitting lids, tied plastic
 - 24 bags or similar totally enclosed individual containers that are completely contained
 - 25 within the walls of a vehicle or container, such that no solid waste can reasonably be
 - 26 expected to escape during hauling;
 - 27 iii. Loads of brush, building materials and similar bulky materials which are secured in
 - 28 or on the hauling vehicle or completely contained within the walls of a vehicle or
 - 29 container, such that none can reasonably be expected to escape during hauling; or
 - 30 iv. Loads consisting entirely of rock, concrete, asphalt paving, stumps and similar
 - 31 materials that are completely contained within the walls of a vehicle or container,
 - 32 such that none can reasonably be expected to escape during hauling.
- 33 l. A requirement that the certificate holder report to the Department on the
- 34 implementation of the Plan during construction must be included in the six month
- 35 construction report required pursuant to OAR 345-026-0080(1)(a).

36
37 Hazardous materials, industrial materials, and explosives are expected to be used during
38 construction; estimated quantities of hazardous materials and disposal methods are described
39 in Exhibit G, Table G-3, of the ASC. The applicant states that hazardous materials would be
40 segregated and stored in approved containers within multi-use areas. As described in *Section*
41 *IV.D. Soil Protection* of this ~~draft proposed~~ order, the applicant expects that construction of the
42 facility would require approximately 72,000 gallons of gasoline; 216,000 gallons of diesel; 4,000
43 gallons of motor and gear oil; 400 gallons of antifreeze; 400 gallons of transmission fluid; 400
44 gallons of hydraulic fluid; and detergents. In addition, construction of the facility would require

1 the use of paint/solvents, herbicides, jet fuel for helicopter use, and blasting materials to blast
2 rock. As discussed in Exhibits G and V of the ASC, the applicant represents that construction
3 contractors must maintain an inventory of all hazardous materials with corresponding material
4 safety data sheets (MSDS), that it would minimize use of hazardous materials through the use
5 of alternative nonhazardous substances as appropriate, that it would ensure handlers and
6 transporters of hazardous materials are familiar with State Fire Marshal and ODEQ laws, and
7 that hazardous releases would be promptly cleaned and reported, if required by law, to ODEQ
8 and the Department.⁵⁹³

9
10 As noted in Section IV.D., *Soil Protection*, of this order, the applicant would require its
11 construction contractors to adhere to a Spill Prevention, Control, and Countermeasures Plan
12 (SPCC) as well as a Blasting Plan. An SPCC Plan contains site-specific spill prevention, response,
13 and cleanup procedures to minimize the risk and impacts of spills or leaks of fuels, lubricants,
14 coolants, or solvents; the SPCC is discussed in further detail in Section IV.D. *Soil Protection* of
15 this ~~draft-proposed~~ order, and the draft SPCC plan is also included as Attachment G-4 to ASC
16 Exhibit G. The applicant proposes, and the Department recommends, Soil Protection Conditions
17 2, and 3, which relate to the approval of and compliance with an SPCC plan. A blasting plan
18 would delineate procedures relating to the safe use and storage of explosives; blasting may be
19 required to loosen or fracture rock to reach the required depth to install foundation structures.
20 The blasting plan is discussed in further detail in Section IV.D., *Soil Protection* of this ~~draft~~
21 ~~proposed~~ order and the draft Framework Blasting Plan is included as Attachment G-5 to ASC
22 Exhibit G and this order. The applicant proposes, and the Department recommends, Soil
23 Protection Condition 4 which relates to the approval of and compliance with blasting plan.

24
25 During operations, the applicant represents that the facility would generate an insignificant
26 amount of solid waste, which would include replaced equipment and components, packing
27 materials, and soils.

28 29 30 *Wastewater*

31
32 Construction-related wastewater would predominately be generated during foundation
33 construction for transmission line towers and the Longhorn Station, from concrete wash water.
34 Concrete wash water would include water with residual concrete, concrete associated liquids,
35 and the wash water from cleaning trucks, hoppers, and chutes. As described in ASC Exhibit V,
36 washout liquids would generally be allowed to evaporate or would be pumped out and
37 properly disposed of by the construction contractor. Washout liquids would not be discharged
38 into storm drains, ditches, streams or other water bodies. Concrete washout areas would be
39 located in designated aboveground earthen berms or straw bale enclosures lined with plastic, a
40 storage tank, or other structure approved by the engineer or inspector. These washouts would
41 be located within each structure work area at least 50 feet away from storm drains, ditches,

⁵⁹³ B2HAPPDoc3-39 ASC 22_Exhibit V_Waste_ASC 2018-09-28, Section 3.10

1 streams, or other water bodies. Washouts would be visually inspected on a daily basis to ensure
2 there are no leaks and that they are operating effectively. They would be cleaned out when
3 they reach 75 percent of their design capacity.

4
5 As described in ASC Exhibit V, some foundations may require slurry to stabilize foundation
6 shafts during drilling. Slurry fluids would consist of a mixture of bentonite and water. Excess
7 and degraded slurry fluids would be contained in designated aboveground washouts similar to
8 those described above for concrete. The slurry fluids would be allowed to completely evaporate
9 or they would be pumped out and properly disposed of by the construction contractor. Slurry
10 fluids would not be discharged into storm drains, ditches, streams, or other water bodies.

11
12 Sanitary wastewater would also be generated during construction from portable toilets.
13 Wastewater associated with portable toilets will be disposed by a local contractor in
14 accordance with state law.⁵⁹⁴ The subcontractor would ensure that a sufficient number of
15 portable toilets are provided.

16
17 During operations, the restroom facility at the Longhorn Station would generate approximately
18 11,000 gallons of wastewater annually. As noted in Section IV.Q.3., *Water Rights*, of this ~~draft~~
19 ~~proposed~~ order, the Longhorn Station would connect to the Port of Morrow's water and sewer
20 system. The Port of Morrow has confirmed that it could adequately serve the facility.

21 **Conclusions of Law**

22
23
24 Based on the analysis presented here and the evidence in the record and subject to compliance
25 with the recommended conditions of approval, the Department recommends that the Council
26 find that the proposed facility, including the proposed and alternative routes, would satisfy the
27 Council's Waste Minimization standard.

28 **IV.O. Division 23: Need Standard for Nongenerating Facilities**

29
30 The Division 23 standards apply only to "nongenerating facilities" as defined in ORS
31 469.503(2)(e)(K), except nongenerating facilities that are related or supporting facilities.

32 33 *IV.O.1. Need for a Facility: OAR 345-023-0005*

34
35 **** To issue a site certificate for a facility described in sections (1) through (3), the*
36 *Council must find that the applicant has demonstrated the need for the facility. The*
37 *Council may adopt need standards for other nongenerating facilities. This division*
38 *describes the methods the applicant shall use to demonstrate need. In accordance with*
39 *ORS 469.501(1)(L), the Council has no standard requiring a showing of need or cost-*
40 *effectiveness for generating facilities. The applicant shall demonstrate need:*

(1) For electric transmission lines under the least-cost plan rule, OAR 345-023-0020(1), or the system reliability rule for transmission lines, OAR 345-023-0030, or by demonstrating that the transmission line is proposed to be located within a “National Interest Electric Transmission Corridor” designated by the U.S. Department of Energy under Section 216 of the Federal Power Act;

The Least-Cost Plan Rule, OAR 345-023-0020, states:

*(1) The Council shall find that the applicant has demonstrated need for the facility if the capacity of the proposed facility or a facility substantially similar to the proposed facility, as defined by OAR 345-001-0010, is identified for acquisition in the short-term plan of action of an energy resource plan or combination of plans: adopted, approved or acknowledged by a municipal utility, people's utility district, electrical cooperative, other governmental body that makes or implements energy policy****

(2) The Council shall find that a least-cost plan meets the criteria of an energy resource plan described in section (1) if the Public Utility Commission of Oregon has acknowledged the least cost plan.

The System Reliability Rule for Electric Transmission Lines, OAR 345-023-0030, states:

The Council shall find that the applicant has demonstrated need for an electric transmission line that is an energy facility under the definition in ORS 469.300 if the Council finds that:

- (1) The facility is needed to enable the transmission system of which it is to be a part to meet firm capacity demands for electricity or firm annual electricity sales that are reasonably expected to occur within five years of the facility's proposed in-service date based on weather conditions that have at least a 5 percent chance of occurrence in any year in the area to be served by the facility;*
- (2) The facility is consistent with the applicable mandatory and enforceable North American Electric Reliability Corporation (NERC) Reliability Standards in effect as of September 18, 2015 as they apply either internally or externally to a utility system; and*
- (3) Construction and operation of the facility is an economically reasonable method of meeting the requirements of sections (1) and (2) compared to the alternatives evaluated in the application for a site certificate.*

Findings of Fact

Under the Need Standard for Nongenerating Facilities, an applicant shall demonstrate need for the facility under the least-cost plan rule (OAR 345-023-0020), the system reliability rule for electric transmission lines (OAR 345-023-0030), or by demonstrating that the transmission line is proposed to be located within a National Interest Electric Transmission Corridor designated

1 by the U.S. Department of Energy under Section 216 of the Federal Power Act.⁵⁹⁵ As described
2 in Section III.C., Proposed Facility, the proposed facility includes approximately 270 miles of
3 single-circuit 500- kilovolt (kV) transmission line, removal and rebuild of 230-kV and 138-kV
4 transmission line, as well as related or supporting facilities. Although an applicant must
5 demonstrate need for a facility under only one of these three pathways, in ASC Exhibit N the
6 applicant ~~elects to provide~~ information demonstrating need for the “Project” (proposed
7 facility) and request EFSC review and approval under both the least-cost plan rule and the
8 system reliability rule. The Department therefore provides an assessment under each of those
9 two pathways in this order.

10
11 *Least-Cost Plan Rule*

- 12
13 1. *The Council shall find that the applicant has demonstrated need for the facility if the*
14 *capacity of the proposed facility or a facility substantially similar to the proposed facility,*
15 *as defined by OAR 345-001-0010, is identified for acquisition in the short-term plan of*
16 *action of an energy resource plan or combination of plans adopted, approved or*
17 *acknowledged by a municipal utility, people's utility district, electrical cooperative, other*
18 *governmental body that makes or implements energy policy, or electric transmission*
19 *system operator that has a governance that is independent of owners and users of the*
20 *system and if the energy resource plan or combination of plans...*

21 *****

22
23 Section (1) of the least-cost plan rule requires the applicant to demonstrate that the capacity of
24 the proposed facility (defined in OAR 345-001-0010) is identified for acquisition in an energy
25 resource plan. OAR 345-001-0010 (18) and (21) points to the statutory definitions in ORS
26 469.300 for “energy facility,” where ORS 469.300(11)(a)(C) defines a high voltage transmission
27 line as an energy facility if it is more than 10 miles in length with a capacity of 230,000 volts or
28 more to be constructed in more than one city or county in this state.⁵⁹⁶ As noted above, the
29 applicant is proposing a single-circuit transmission line with a capacity of 500-kilovolts (kV).⁵⁹⁷

⁵⁹⁵ ORS 469.501 states (1) The Energy Facility Siting Council shall adopt standards for the siting, construction, operation and
retirement of facilities. The standards may address but need not be limited to the following subjects:***

(L) The need for proposed nongenerating facilities as defined in ORS 469.503, consistent with the state energy policy set
forth in ORS 469.010 and 469.310. The council may consider least-cost plans when adopting a need standard or in
determining whether an applicable need standard has been met.***

⁵⁹⁶ ORS 469.300(11)(a) provides the definitions for energy facilities under EFSC jurisdiction. Power generating facilities are
defined using various metrics to describe facility capacity, depending on the type of facility. For instance, an electric
power generating plant is defined by its capacity in megawatts (MW), wind energy generating facilities are defined by an
average electric generating capacity in MW, solar photovoltaic power generation facilities are defined by the impacted
acreage, soil types, and whether it is proposed on high-value farmland, etc. Nongenerating facilities are defined with
differing metrics; high voltage transmission lines are defined by length, jurisdictions crossed, and voltage capacity.

⁵⁹⁷ Commenters assert the applicant is requesting that EFSC issue a site certificate for a transmission line with 2,050
megawatts (MW) of capacity. The Department notes that the applicant is not requesting Council review and approve the

1 Section (1) of the rule also lists the criteria a least-cost plan must meet to be considered an
2 energy resource plan for the purposes of this rule. Section (2) states that the Council shall find
3 that a least-cost plan meets the criteria of an energy resource plan described in Section (1) if
4 the Oregon Public Utility Commission (OPUC) has acknowledged the least cost plan:

- 5
6 2. *The Council shall find that a least-cost plan meets the criteria of an energy resource plan*
7 *described in section (1) if the Public Utility Commission of Oregon has acknowledged the*
8 *least cost plan.*

9
10 OAR 860-038-0080 outlines OPUC rules for resource policies and plans electric companies
11 operating in Oregon must comply with, including integrated resource plans (IRPs). Information
12 included and evaluated by OPUC in an IRP includes, but is not limited to; existing supply-side
13 resources, future supply-side generation resources, demand-side resources, planning period
14 forecasts for its service territory, load and resource balances, and transmission planning which
15 includes a description of its existing transmission system and transmission import capacity (in
16 MW).⁵⁹⁸ The applicant's 2017 IRP also provides a discussion of proposed transmission line
17 projects under review, including the proposed Boardman to Hemingway Transmission Line.
18 Under the IRP section titled, B2H, the applicant explains that the proposed facility will create
19 greater access to the Pacific Northwest electric market, improve transmission system reliability
20 and resiliency, and will reduce capacity limitations on the regional transmission system as
21 demands on the system continue to grow.⁵⁹⁹ The applicant explains, and the Department
22 agrees, if the bidirectional MW transmission capacity of a proposed transmission line needed to
23 be scaled to meet the precise need of the applicant at a specific time there may not be
24 remaining bidirectional MW capacity for expansion to meet utility and public needs, which
25 could then trigger the need for another transmission line where it otherwise could be
26 avoided.⁶⁰⁰

proposed facility with transmission capacity of 2,050 MW, but rather is requesting Council review and approve a
predominantly 500-kV transmission line. B2HAPPDoc8-1 All DPO Comments Combined-Rec'd 2019-05-22 to 08-22;
B2HAPPDoc8-381 DPO Public Comment Stop B2H Krieder F 2019-08-22.

⁵⁹⁸ Commenters maintain that the applicant must demonstrate that the 2,050 MW capacity of the proposed facility is
supported by an acknowledged plan or plans. As noted above, the applicant is not requesting Council review and
approve a proposed transmission line with 2,050 MW capacity, yet requests Council review and approve a 500-kV
transmission line. In the IRP, the metric for capacity is discussed using megawatts (MW) for generating capacity, transfer
capacity, historical capacity and load, Available Transmission Capacity, transmission capacity to import energy, peak
capacity, and annual capacity factors in MWh in the evaluation of various portfolios. However, also in the IRP, the
applicant presents the "B2H project" as part of its preferred portfolio for acknowledgment by the OPUC for the project
which includes permitting, constructing, operating, and maintaining a new, single-circuit 500-kV transmission line
approximately 300 miles long, which is supported by discussion of the facility transmission capacity.

⁵⁹⁹ B2HAPPDoc3-23 ASC14b Exhibit N Need ASC Part 2 2018-09-28; Attachment N-5.

⁶⁰⁰ Commenters note that the applicant has not identified a combination of other participants least-cost energy resource
plans that would utilize the remaining 80% of the capacity of the project as required per OAR 345-023-0020(1).
B2HAPPDoc8-1 All DPO Comments Combined-Rec'd 2019-05-22 to 08-22; B2HAPPDoc8-381 DPO Public Comment Stop

In its 2017 OPUC IRP, the applicant also includes information about its proposed permitting cost sharing and transmission capacity agreement with project participants, Bonneville Power Administration (BPA), and PacificCorp.⁶⁰¹ The Department notes, however, that the project participant information discussed in the IRP are for informational purposes for the Council’s review. The project participants are not the applicant proposing the facility in the application, and therefore not under consideration by Council. Further, the Council’s statutes and rules do not support an evaluation of the project participant information when making its decision on compliance with applicable Council rules and standards, including OAR 345-023-0005.^{602, 603} Finally, as discussed in this section, it is the Department’s position and recommendation to Council, that the capacity of the proposed facility, in accordance with ORS 469.300(11)(a)(C), is defined for purposes of the Council’s review of the Need Standard and in the application, as 500-kV transmission line, and not, as asserted by commenters (and discussed in the IRP) as the bidirectional transmission MW capacity. As described throughout this order, when the PUC acknowledged the 2017 IPC IRP, it acknowledged construction of a 500-kV transmission line.

The applicant explains in ASC Exhibit N that the IRP process requires a utility to identify several portfolios of different combinations of resources that can be used to meet the utility’s load and demand over a 20-year planning horizon. Each of the portfolios are analyzed and a preferred portfolio is identified, representing the optimal combination of costs and risks from the perspective of impacts to rate payers and the OPUC. As explained in OPUC Order No. 18-176 (Docket LC 68), the objective of the IRP is to ensure an adequate and reliable supply of energy at the least cost to the utility and customers in a manner consistent with the long-run public

⁶⁰¹ BPA is a federal entity that is not subject to requirements of an energy resource plan acknowledged by PUC or other governmental body. The applicant explains that PacifiCorp, as a regulated utility, received acknowledgement of B2H in its 2017 IRP, as action Item 2b for continued permitting of PacifiCorp’s Energy Gateway Transmission Expansion Plan, which includes a number of separate segments, including B2H (also identified as “Segment H). B2HAPPDoc13 DPO IPC Responses to Select DPO Comments Rec’d by 2019-11-07; B2HAPP DPO IPC Responses - StopB2H - 2. Need 2019-10-29.

⁶⁰² As described throughout this order, the applicant for site certificate is Idaho Power Company. See, for example, Section IV.B, *Organizational Expertise* of this order, which assesses the applicant, Idaho Power Company, ability to “construct, operate and retire the proposed facility in compliance with Council standards and conditions of the site certificate.” OAR 345-022-0010(1).

⁶⁰³ Commenters explain that, based on information provided in its 2017 OPUC acknowledged IRP (ASC Exhibit N, Attachment N-5), because the applicant is only one third (approximately 21%) permitting cost partner with a portion of the 2,050 MW transmission capacity for the transmission line, it cannot demonstrate that the proposed transmission line is needed under the Council’s Least-Cost Plan Rule. ORS 469.501(1)(L) states that the Council may consider least-cost plans when adopting need standards and does not require an evaluation of transmission capacity or potential partnerships. Further, the information requirements for Exhibit N does not require a demonstration of allocated transmission capacity, funding, or development partnerships, see OAR 345-021-0010(1)(n) under sub (B) that states that If the applicant chooses to demonstrate need for the proposed facility under OAR 345-023-0020(1), the least-cost plan rule:

- (iii) For each plan reviewed by a regulatory agency, the agency's findings and final decision, including:
- (l) For a plan reviewed by the Oregon Public Utility Commission, the acknowledgment order***

1 interest and that the Commission’s (OPUC) acknowledgement of the IRP means that the
2 Commission finds that the utility's preferred portfolio is reasonable at the time of
3 acknowledgement.⁶⁰⁴ The language of OAR 345-023-0030 (Council rules) references that a least-
4 cost plan meets the criteria of an energy resource plan or combination of plans if the OPUC has
5 acknowledged the least cost plan. An IRP as defined in the OPUC’s rules meets the definition of
6 an energy resource plan or combination or least cost plan in the Council’s rules.

7
8 The applicant attached its IRPs for the following years to ASC Exhibit N: 2009, 2011, 2013,
9 2015, and 2017.⁶⁰⁵ The OPUC previously acknowledged each of these plans;⁶⁰⁶ therefore, the
10 applicant can rely on these plans to support its argument under Section (1) of the least-cost
11 plan rule. The applicant must next demonstrate that the capacity of the proposed facility or a
12 facility substantially similar to the proposed facility is identified for acquisition in one or more of
13 these IRPs.

14
15 Each of these IRPs (2009, 2011, 2013, 2015, and 2017) identifies the proposed Boardman to
16 Hemingway Transmission Line as part of the applicant’s preferred resource portfolio. The OPUC
17 acknowledged the ongoing permitting, planning studies, and regulatory filings for the proposed
18 facility as part of the 2013 IRP, but at that time declined to acknowledge the construction phase
19 of the proposed facility because the timing of the construction phase was beyond the two-to-
20 four year period for action items specified by IRP Guidelines.⁶⁰⁷ In a January 2018 request for
21 additional information, the Department informed the applicant that the Department and
22 Council would not consider OPUC acknowledgement of only ongoing permitting, planning, and
23 regulatory filings associated with the proposed facility as meeting the requirements in OAR 345-
24 023-0020.⁶⁰⁸ The Department informed the applicant that it and the Council would only
25 consider the Least Cost Plan Rule and Need Standard met if the OPUC acknowledged the
26 ongoing permitting, planning studies, and regulatory filings for the proposed facility as well as
27 an acknowledgement of construction of the proposed facility.

28
29 OPUC Order No. 18-176 (OPUC acknowledgement of the applicant’s 2-017 IRP) acknowledges
30 both the ongoing permitting, planning, and regulatory filings and to conduct preliminary
31 construction activities, acquire long-lead materials, and to construct the proposed facility.⁶⁰⁹
32 Therefore, because the OPUC’s order included acknowledgment of construction-related
33 activities, the applicant has demonstrated the need for the facility under the Department points
34 the Council to the language of the standard and that because OAR 345-023-0020(2) has been

1 ~~met~~, “The Council shall find that a least-cost plan meets the criteria of an energy resource plan
2 described in section (1) if the Public Utility Commission of Oregon has acknowledged the least
3 cost plan,” ~~that~~ and accordingly the applicant has demonstrated the need for the facility under
4 OAR 345-023-0005(1), and the Council must find that the Need Standard has been met.

5
6 *System Reliability Rule*

7
8 *The Council shall find that the applicant has demonstrated need for an electric*
9 *transmission line that is an energy facility under the definition in ORS 469.300 if the*
10 *Council finds that:*⁶¹⁰

- 11
12 1. *The facility is needed to enable the transmission system of which it is to be a part*
13 *to meet firm capacity demands for electricity or firm annual electricity sales that*
14 *are reasonably expected to occur within five years of the facility's proposed in-*
15 *service date based on weather conditions that have at least a 5 percent chance of*
16 *occurrence in any year in the area to be served by the facility;*

17
18 The proposed facility includes approximately 270 miles of single-circuit 500- kilovolt (kV)
19 transmission line, removal and rebuild of 230-kV and 138-kV transmission line, as well as
20 related or supporting facilities.⁶¹¹ To demonstrate need for the facility under section (1) of the
21 system reliability rule, an applicant must show that the transmission line is needed to enable
22 the transmission system of which it is to be a part to meet to meet the firm capacity demands
23 for electricity or firm annual electricity sales anticipated to occur within five years of the
24 facility’s proposed in-service date based on weather conditions that have at least a five percent
25 chance of occurrence in any year in the area to be served by the facility.⁶¹² In its 2017 IRP (ASC

⁶¹⁰ ORS 469.300(11)(a)(C) defines a high voltage transmission line as an energy facility if it is more than 10 miles in length with a capacity of 230,000 volts or more to be constructed in more than one city or county in this state.

⁶¹¹ Commenters assert that the applicant has not met the EFSC System Reliability Rule and the Need Standard because the information provided relates to a transmission line that has only approximately 20% of the capacity of the proposed facility, and that the applicant has requested a site certificate for a transmission line with a nominal capacity of 2,050 MW. The Department points to the discussion under the Least Cost Plan above under the Need Standard, the applicant requests Council review and approval of a predominantly 500-kV transmission line, not a proposed transmission line with a maximum MW bidirectional transmission capacity. B2HAPDoc8-1 All DPO Comments Combined-Rec'd 2019-05-22 to 08-22; B2HAPDoc8-381 DPO Public Comment Stop B2H Krieder F 2019-08-22.

⁶¹² Commenters maintain that the information provided by the applicant in the ASC to demonstrate compliance with the system reliability rule, including load-resource balance tables for the area to be served by the proposed facility, is only a subset of the area to be served by the proposed transmission line. Specifically, the area served by the proposed facility are the service territories of BPA and PacifiCorp Western Balancing Authority Area in the Pacific Northwest, and the service territories of the applicant and PacifiCorp Eastern Balancing Authority Area in the Intermountain (eastern) region of WECC. The Department points to the discussion about the structure of transmission systems provided in this section derived from information in the applicant’s 2017 IRP. The nature of regional and individual utility transmission systems is that it is common for utilities to share ownership and maintenance of transmission lines as well as hold ownership of bidirectional transmission capacity for transmission lines to meet seasonal fluctuations to meet the demands of

1 Exhibit N, Attachment N-5), the applicant explains that its transmission system extends from
2 eastern Oregon through southern Idaho to western Wyoming and is composed of 115-, 138-,
3 161-, 230-, 345-, and 500-kV transmission facilities.

4
5 Figure 6.1 illustrates the applicant’s transmission system and also shows transmission paths
6 which are one or more transmission lines that collectively transmit power to/from one
7 geographic area to another. Utilities own energy generating assets or purchase generated
8 power and provide electric service to customers in its service territory via its transmission
9 system. Based on peak and low usage differences in seasons, it is common for utilities to
10 purchase power when there is a deficit and sell power when there is an excess in its system to
11 meet the energy demands of its system and other systems of different utilities. To facilitate the
12 transfer of power, a common attribute of transmission systems is for utilities to own
13 transmission capacity for transmission lines with other utilities.⁶¹³ For instance, the Midpoint
14 West transmission path is internal to the applicant’s transmission system and is a jointly owned
15 path between the applicant and PacifiCorp, where the applicant owns transmission capacity of
16 1,710 megawatts (MW) of the path and PacifiCorp owns 1,090 MW of the path.⁶¹⁴ Further, the
17 applicant owns 1,280 MW of transmission capacity between the broader Pacific Northwest
18 transmission system and the applicant’s transmission system. Of this capacity, 1,200 MW are on
19 the Idaho to Northwest path and 80 MW are on the Montana–Idaho path. The applicant
20 explains that to utilize its share of the Montana–Idaho 80 MW of capacity and to connect the
21 purchased power resources, it must purchase transmission service from either Avista Utility or
22 the Bonneville Power Administration (BPA), a federal entity.⁶¹⁵ Avista or BPA transmits, or
23 wheels, the power across their transmission system and delivers the power to the applicant’s
24 transmission system to meet its demands.⁶¹⁶

25

customers. The commenters position is not supported by ORS 469.501(1)(L). To infer that the applicant must provide the
information required in OAR 345-021-0010(1)(n)(F) for any service area that may be served by the power transmitted by
the proposed facility, would require information not just from BPA and PacificCorp, but also from Avista Utility, and
other utilities that have a connected nexus to the Pacific Northwest and Intermountain regional transmission system.
Similar to the Department’s position and recommendation to Council under the Least-Cost Plan Rule, the applicant is
proposing the facility in the application not project participants that may have ownership of transmission capacity. The
applicant has the burden of proof to provide the information requirements in the ASC and demonstrate that the
proposed transmission line is needed to enable the applicant’s transmission system of which it is to be a part to meet to
meet the demands of the applicant’s service territory. B2HAPPDoc8-1 All DPO Comments Combined-Rec’d 2019-05-22
to 08-22; B2HAPPDoc8-381 DPO Public Comment Stop B2H Krieder F 2019-08-22.

⁶¹³ The applicant states that does not own exclusive rights to all the transmission capacity available on each path, it is either
a partial owner of a path shared with other partners, or other entities have acquired long-term purchased capacity for a
portion of a path. B2HAPPDoc3-23 ASC14b Exhibit N Need ASC Part 2 2018-09-28, Attachment N-5.

⁶¹⁴ B2HAPPDoc3-23 ASC14b Exhibit N Need ASC Part 2 2018-09-28, Attachment N-5, Existing Transmission System.

⁶¹⁵ Avista is a utility that provides energy services to its customers in eastern Washington, northern Idaho, and parts of
Oregon.

⁶¹⁶ Wheeling is the transportation of electric energy (megawatt-hours) from within an electrical grid to an electrical load
outside the grid boundaries.

1 Application information requirements for an applicant to demonstrate compliance with the
 2 system reliability rule include, in part, load-resource balance tables for the area to be served by
 3 the proposed facility, firm capacity demands and existing and committed firm resources,
 4 forecast of firm capacity demands for electricity and firm annual electricity sales for the area to
 5 be served by the proposed facility. The applicant must separate firm capacity demands and firm
 6 annual electricity sales into loads of retail customers, system losses, reserve margins and each
 7 wholesale contract for firm sale.⁶¹⁷ The applicant explains that the load-resource balance tables
 8 contained in Appendix C of its 2017 IRP (Attachment N-5 of ASC Exhibit N) are based upon ~~these~~
 9 ~~data~~the criteria/data required in OAR 345-023-0030(1).⁶¹⁸ The tables reflect a 20-year planning
 10 period that begins in 2017 and extends through 2036. The earliest anticipated facility in-service
 11 date is 2024,⁶¹⁹ therefore, the forecast extends twelve years from the earliest date the facility is
 12 expected to be in service. The load-resource balance tables compare the anticipated energy
 13 load (demand) against the available resources (from generation units and market purchases) to
 14 determine if, on balance, there will be surplus or deficit of resources for any given month
 15 during the planning period. The forecast accounts for factors that would reduce firm capacity
 16 demands and firm annual electricity sales (such as energy conservation programs) as well as the
 17 anticipated retirement of over 700 MW of coal-fired generating capacity during the first 15
 18 years of the planning period. The load-resource balance tables show that additional supply-side
 19 resources or the inclusion of demand response programs are necessary to avoid a resource
 20 deficiency (unmet peak-hour load) of up to 34 MW in 2026, 94 MW in 2027, 159 MW in 2028,
 21 397 MW in 2029, and 986 MW by 2036.^{620, 621}
 22

⁶¹⁷ OAR 345-021-0010(1)(n)(F).

⁶¹⁸ The monthly average energy load-resource balance values are reported on pages 19 through 38 and the monthly peak hour load-resource balance values are reported on pages 40 through 59 of Appendix C of the 2017 IRP. B2HAPPDoc3-23 ASC14b_ Exhibit N_Need_ASC_Part 2 2018-09-28, Attachment N-5.

⁶¹⁹ B2HAPPDoc3-22 ASC 14a_ Exhibit N_Need_ASC_Part 1 2018-09-28, Section 3.3.9.

⁶²⁰ B2HAPPDoc3-22 ASC 14a_ Exhibit N_Need_ASC_Part 1 2018-09-28, Section 3.3.1.

⁶²¹ Commenters assert that the applicant must demonstrate that the entirety of the 2,050 MW of bidirectional transmission capacity must needed and used by the applicant and other project participates that share transmission capacity to meet their forecasted demands. The applicant states that; "... it would be counterproductive and short-sighted for the Council to interpret its rules such that capacity must be scaled precisely to the applicant's need. The current proposal to meet needs of all three partners—Idaho Power, BPA, and PacifiCorp—with one transmission line would result in far smaller impacts than three separate transmission lines each scaled to meet the individual utility needs... the capacity of the transmission line needed to be scaled to meet the precise need of the applicant, there would be no extra capacity for expansion, which could then trigger the need for another transmission line where it otherwise could be avoided." The Department concurs with the applicant's position that to demonstrate that, if constructed and upon operation of the proposed facility, the total transmission capacity is utilized, this defeats the intent of long-term transmission system planning. The system reliability rule, OAR 345-023-0030, and application requirements in OAR 345-021-0010(1)(n)(F) clearly require forecasting energy demands and generating resources supporting the position that the applicant must demonstrate that the proposed transmission line *will be* needed to meet its energy demands in the future and not that the entirety of the transmission capacity will be utilized upon operation. B2HAPPDoc13 DPO IPC Responses to Select DPO Comments Rec'd by 2019-11-07; B2HAPP DPO IPC Responses - StopB2H - 2. Need 2019-10-29.

1 In addition to needing sufficient resources to meet forecasted load, the applicant states that it
2 also requires additional transmission capacity in order to comply with the minimum operating
3 criteria for reliability and to provide transmission service to its wholesale customers.⁶²² The
4 applicant maintains 330 MW of transmission import capacity above the forecasted peak load to
5 cover the worst single planning contingency, which is defined as an unexpected loss (generator
6 downtime) equal to the applicant's share of two units at the Jim Bridger coal facility or the loss
7 of the Langley Gulch combined-cycle natural gas facility. This additional transmission capacity
8 allows for the applicant to import energy during such an emergency.⁶²³ In addition, the
9 additional transmission capacity enables the applicant to comply with a FERC tariff requiring the
10 utility to construct and provide transmission service to wholesale customers.⁶²⁴ As discussed by
11 the applicant, the proposed facility (along with other resource additions beginning in 2031)
12 would enable it to meet these needs by adding 500 MW of transfer capacity in the months of
13 April through September and 200 MW of transfer capacity from October through March.⁶²⁵

14
15 Based upon the preceding analysis, the Department recommends that the Council find that the
16 proposed transmission line is needed to enable the transmission system of which it is to be a
17 part to meet the firm capacity demands for electricity or firm annual electricity sales
18 anticipated to occur within five years of the facility's proposed in-service date based on
19 weather conditions that have at least a five percent chance of occurrence in any year in the
20 area to be served by the facility.

- 21
22 *2. The facility is consistent with the applicable mandatory and enforceable North*
23 *American Electric Reliability Corporation (NERC) Reliability Standards in effect as*
24 *of September 18, 2015 as they apply either internally or externally to a utility*
25 *system; and*

26
27 As previously discussed, the proposed facility would enable the applicant to maintain 330 MW
28 of transmission import capacity above forecasted peak load to cover the worst single planning
29 contingency. If the applicant's system sustained the loss of a major generation resource, the
30 proposed facility would enable the applicant to import energy in order to continue to serve
31 load (demand for electricity). A 330-MW reserve margin also results in a loss of-load
32 expectation (LOLE, the anticipated number of days per year for which available generating
33 capacity is insufficient to serve the daily peak demand) of roughly one day in 10 years, a
34 standard industry measurement. Therefore, the proposed facility would enable the applicant to
35 meet LOLE performance requirements and would provide sufficient resource adequacy for
36 forecasted customer demands.⁶²⁶

622 B2HAPPDoc3-22 ASC 14a_Exhibit N_Need_ASC_Part 1 2018-09-28, Section 3.3.1.

623 B2HAPPDoc3-22 ASC 14a_Exhibit N_Need_ASC_Part 1 2018-09-28, Section 3.3.2.2.

624 B2HAPPDoc3-23 ASC14b_Exhibit N_Need_ASC_Part 2 2018-09-28, Attachment N-5, p. 2.

625 B2HAPPDoc3-23 ASC14b_Exhibit N_Need_ASC_Part 2 2018-09-28, Attachment N-5, p. 7 (Table 1.2).

626 B2HAPPDoc3-22 ASC 14a_Exhibit N_Need_ASC_Part 1 2018-09-28, Sections 3.3.2.2 and 3.3.6.

1 As a utility subject to NERC and WECC reliability criteria and compliance, the applicant must not
2 only reliably serve customer demand, but must also ensure system stability during both normal
3 system operations and contingency/emergency events. The NERC transmission planning (TPL)
4 standards prescribe acceptable system operating limits for a wide range of system conditions,
5 including loss of generator units and transmission facilities. The applicant states that it has
6 evaluated the proposed facility annually as part of NERC TPL compliance requirements, and
7 those modeling results demonstrate that, with the proposed facility in service, it can meet
8 NERC TPL criteria for the planning horizon.⁶²⁷

9
10 In order to purchase sufficient resources from the Northwest electric power market to serve
11 load while maintaining the necessary contingency reserves and capacity margins, the applicant
12 states that historically it needed to utilize nearly 100 percent of the available transmission
13 capacity on its intertie lines. Therefore, currently little or no available transmission capacity
14 exists on the applicant's intertie lines. By increasing the applicant's transmission import
15 capacity, the proposed facility would be consistent with NERC transmission operations
16 standards requiring that transmission schedules across WECC transmission paths do not exceed
17 system operating limits.⁶²⁸

18
19 The applicant maintains that the additional transmission import capacity provided by the
20 proposed facility would reduce the load on its existing transmission lines. Heavily loaded
21 transmission lines consume large amounts of reactive power. Without sufficient reactive
22 power, voltage collapse and regional blackouts may occur. The WECC standard *TPL-001-WECC-*
23 *RBP-2 – System Performance Criterion Under Normal Conditions, Following Loss of a Single BES*
24 *Element, and Following Extreme BES Events* contains reactive power/voltage stability adequacy
25 criteria applicable to the applicant's transmission system. The applicant states that its Ten-Year
26 Transmission Reliability Assessments demonstrates that, with the addition of the proposed
27 facility, its future transmission system would have sufficient reactive power resources to ensure
28 system performance as defined in this WECC standard. Furthermore, a regional project review
29 group reviewed the proposed facility as part of the WECC Project Coordination, Path Rating and
30 Progress Report Process and determined that the proposed facility would meet regional
31 performance criteria.⁶²⁹

32
33 Based upon the preceding analysis, the Department recommends that the Council find that the
34 proposed facility is needed to meet NERC and WECC reliability criteria requiring the applicant to
35 reliably serve customer demand, maintain acceptable system operating limits, maintain voltage
36 through reactive power control, and maintain adequate contingency/emergency reserves.
37 Therefore, the Department recommends that the Council find that the proposed facility is
38 consistent with the applicable mandatory and enforceable NERC Reliability Standards in effect
39 as of September 18, 2015 as they apply either internally or externally to a utility system.

⁶²⁷ B2HAPPD0c3-22 ASC 14a_ Exhibit N_Need_ASC_Part 1 2018-09-28, Section 3.3.6.

⁶²⁸ B2HAPPD0c3-22 ASC 14a_ Exhibit N_Need_ASC_Part 1 2018-09-28, Section 3.3.6.

⁶²⁹ B2HAPPD0c3-22 ASC 14a_ Exhibit N_Need_ASC_Part 1 2018-09-28, Section 3.3.6.

1
2 3. *Construction and operation of the facility is an economically reasonable method*
3 *of meeting the requirements of sections (1) and (2) compared to the alternatives*
4 *evaluated in the application for a site certificate.*
5

6 As discussed earlier in this section, the integrated resource planning process requires an
7 investor-owned utility to compare multiple potential resource portfolios and to select the
8 resource portfolio for the planning period that provides an adequate and reliable supply of
9 energy at the least cost and risk to the utility and its customers.⁶³⁰ In its 2017 IRP, the applicant
10 evaluated one dozen different resource portfolios to determine 1) the cost-effectiveness of
11 installing selective catalytic reduction (SCR) emissions-control technology on the applicant's
12 share of two units at the Jim Bridger coal facility versus retiring that facility early, and 2) the
13 cost-effectiveness of the Boardman to Hemingway Transmission Line in meeting resource needs
14 versus practicable resource alternatives. Each resource portfolio considered either retiring or
15 making SCR investments in the applicant's share of the Jim Bridger coal facility. Of the 12
16 resource portfolios evaluated, four portfolios contained the proposed facility as part of the
17 resource mix (the B2H-based portfolios), while eight portfolios contained alternative resource
18 mixes (the B2H alternative portfolios). Each of the "B2H alternative portfolios" contained either
19 only natural gas-powered generating capacity or a mix of solar- and natural gas-powered
20 generating capacity as alternatives to the proposed facility. All "B2H alternative portfolios"
21 included expanded demand response capacity.
22

23 As shown in ASC Exhibit N, the applicant's cost analysis demonstrated that its preferred
24 portfolio (P7, which includes the proposed facility) would be the least cost portfolio over the
25 planning period.⁶³¹
26

27 In its order acknowledging the 2017 IRP, the OPUC stated that "we acknowledge Idaho Power's
28 selection of the B2H project as a least cost, least risk resource to meet the needs of its
29 customers." The OPUC went on to state:
30

31 *Our decision does not mean that Action Item 6 [the preliminary construction activities,*
32 *acquisition of long-lead materials, and construction of the proposed facility] is the only*
33 *possible option for meeting Idaho Power's resource needs, [it] simply means that we are*
34 *satisfied that it is the least cost, least risk resource for meeting the demonstrated*
35 *resource needs of Idaho Power's customers. We recognize that there may be other ways*
36 *of meeting the capacity needs identified in this IRP that may not have the same impacts*
37 *to eastern Oregon as B2H. In this proceeding, however, we do not find that any such*
38 *alternatives have been demonstrated to be lower cost and lower risk, based on the*
39 *information presented...Our decision is supported by the fact that B2H has been*

⁶³⁰ Oregon Public Utility Commission_Frequently Asked Questions_General IRP Information.
https://www.puc.state.or.us/admin_hearings/IRP-FAQs.pdf Accessed 04-10-2019.

⁶³¹ B2HAPPD0c3-23 ASC14b_Exhibit N_Need_ASC_Part 2 2018-09-28, Attachment N-5, Table 9.3

1 *prioritized over multiple portfolios in different IRPs using numerous different modeling*
2 *concepts and reflecting many different assumptions. While presence in numerous IRPs is*
3 *not determinative for our acknowledgement judgement, it is indicative to us of sustained*
4 *value that has remained robust across industry and market changes to date. In each of*
5 *these portfolios, B2H has proven to be a low-cost resource that provides considerable*
6 *value to the system. While we are sensitive to the arguments that the utility industry is in*
7 *flux, and that technological changes are impacting the system in unanticipated ways, we*
8 *have not seen information presented as part of this IRP process indicating that large-*
9 *scale transmission resources will not be an important part of future utility systems. We*
10 *recognize that B2H has the potential to create significant regional benefits and could*
11 *represent a tool for allocating and moving a diverse set of new low-carbon resources*
12 *across the west.*

13
14 In addition to evaluating expanded demand response capacity and development of new electric
15 generating facilities (including natural gas and solar) as alternatives to construction and
16 operation of the proposed facility, the applicant evaluated a range of transmission line
17 capacities for the facility. The proposed facility would include, in part, 270.8 miles of single-
18 circuit 500-kV transmission line. The applicant evaluated other options for this transmission
19 line, including constructing the facility as a 230-kV single circuit, 230-kV double circuit, 345-kV
20 single circuit, 500-kV double circuit, 765-kV single circuit, or two separate 500-kV transmission
21 lines from Longhorn to Hemingway. As shown in Table N-2a of ASC Exhibit N, the applicant
22 must design the transmission line for an operating voltage of 500 kV or greater for the
23 proposed facility to be capable of providing the needed 1,050 MW of west-to-east capacity.
24 Therefore, according to the applicant's analysis, designing the transmission line for a lower
25 operating voltage than currently proposed is not a practicable alternative.

26
27 The applicant also evaluated rebuilding an existing transmission line as an alternative to
28 construction and operation of the proposed facility. Each rebuild scenario considered would
29 require a minimum of 136 miles of new construction in a new ROW. As shown in Table N-2b of
30 ASC Exhibit N, none of the transmission line rebuild scenarios evaluated would be capable of
31 providing the needed 1,050 MW of west-to-east capacity. Therefore, according to the
32 applicant's analysis, none of the transmission line rebuild scenarios would be a practicable
33 alternative to the proposed facility.

34
35 Based upon this alternatives assessment, and in consideration of the OPUC's determination
36 that the proposed facility would be a least cost, least risk resource to meet the needs of the
37 applicant's customers, the Department recommends that the Council find that construction and
38 operation of the proposed facility is an economically reasonable method of meeting the
39 requirements of sections (1) and (2) of the system reliability rule compared to the alternatives
40 evaluated in the application for a site certificate.

41
42 As previously discussed, the Department recommends that the Council find that the facility
43 would meet the requirements of sections (1), (2), and (3) of the system reliability rule; the

1 Department therefore also recommends that the Council find that the applicant has
2 demonstrated the need for the facility under the system reliability rule.

3
4 **Conclusions of Law**

5
6 Based on the foregoing findings of fact and conclusions of law, the Department recommends
7 that the Council find that the proposed facility, including the proposed and alternative routes,
8 meets the requirements of OAR 345-023-0020 and OAR 345-023-0030, and therefore, would
9 comply with the Council's Need Standard for Nongenerating Facilities.

10 **IV.P. Division 24 Standards**

11
12 The Council's Division 24 standards include specific standards for siting certain facilities.

13
14 *IV.P.1. Siting Standards for Transmission Lines: OAR 345-024-0090*

15
16 *To issue a site certificate for a facility that includes any transmission line under Council*
17 *jurisdiction, the Council must find that the applicant:*

- 18
19 *(1) Can design, construct and operate the proposed transmission line so that*
20 *alternating current electric fields do not exceed 9 kV per meter at one meter above*
21 *the ground surface in areas accessible to the public;*
22 *(2) Can design, construct and operate the proposed transmission line so that induced*
23 *currents resulting from the transmission line and related or supporting facilities will*
24 *be as low as reasonably achievable.*

25
26 **Findings of Fact**

27
28 The Siting Standards for Transmission Lines address safety hazards associated with electric and
29 magnetic fields generated by high-voltage transmission lines. OAR 345-024-0090(1) sets a limit
30 for electric fields from transmission lines of not more than 9 kV per meter at one meter above
31 the ground surface in areas that are accessible to the public. Section (2) requires the certificate
32 holder to design, construct and operate the line in a manner that reduces the risk posed by
33 induced current. The applicant provided information on the Siting Standards for Transmission
34 Lines in ASC Exhibits AA and DD.

35
36 *Electric Fields*

37
38 The electric charge (measured as voltage) on an energized transmission line conductor
39 produces electric fields. The greater the overall transmission line voltage, the greater the
40 strength of the electric field. In contrast, the amount of current flowing on the conductor,
41 which fluctuates daily and seasonally with changes in electricity usage, does not impact the
42 strength of electric fields produced by the conductor. Electric fields diminish in strength
43 proportional to distance from the transmission line conductors (the greater the distance from

1 the conductors, the lower the electric fields), and are weakened or blocked by conductive
2 objects (such as trees or buildings).⁶³²

3

4 In Oregon, there has been prior concern by the public about the potential health effects of
5 exposure to low frequency electric and magnetic fields (EMF). As a response to this concern,
6 ORS 469.480 and OAR 345-001-0035 were adopted to require the establishment of an EMF
7 Committee to “monitor information available and being developed on the health effects of
8 exposure to low frequency electric and magnetic fields and report the committee’s findings
9 periodically to the Council.” The Council in turn is required to report the findings of the
10 committee to the Legislative Assembly. The EMF Committee was last discussed by Council at
11 the April, 2016 Council meeting. During that meeting Council took note of: 1) the history of the
12 statute and rule; 2) the prior EMF Committee meetings; and 3) the last literature review
13 commissioned by the Department in 2009 which concluded that while there is a need to
14 continue to monitor the science on EMF, low cost prudent avoidance measures of public EMF
15 exposure is appropriate and that health-based exposure limits are not appropriate with the
16 scientific data available to date. Based on this information, the Council declined to reform the
17 EMF Committee at that time but understood that it could do so at any point in the future if it
18 determined there is a need.⁶³³

19

20 ASC Exhibit AA discusses potential long-term health effects to people and animals from
21 exposure to EMFs. The applicant cites several studies and conclusions of studies conducted on
22 animal populations located near transmission lines finding that reproductive functions, milk
23 production, and general health were not impacted.⁶³⁴

24

25 The standard related to EMF under OAR 345-024-0090(1) continues to be a low cost prudent
26 avoidance measure of public EMF exposure based on available scientific data.

27

28 The applicant used a model developed by the Electric Power Research Institute⁶³⁵ (which utilizes
29 a methodology developed by the Bonneville Power Administration) to calculate the electric
30 fields, measured in units of kilovolts per meter (kV/m), which would be produced by the
31 proposed new 500 kV transmission line, rebuilt 230-kV transmission line, and rebuilt 138-kV

⁶³² B2HAPPDoc3-44 ASC 27_Exhibit AA_EMF_ASC 2018-09-28, Section 3.2.1.

⁶³³ This procedural history of the Electric and Magnetic Field Committee is for informational purposes. The Department notes that ORS 469.480(4) and OAR 345-001-0035 are general provisions that designate the Council’s authority to appoint Special Advisory Groups and form the Electric and Magnetic Field Committee. This statute and rule may not be used to approve or deny an application for site certificate. B2HAPPDoc8-1 All DPO Comments Combined-Rec’d 2019-05-22 to 08-22; B2HAPPDoc8-379 DPO Public Comment Squire 2019-08-13 to 08-22, et al.

⁶³⁴ B2HAPPDoc8-1 All DPO Comments Combined-Rec’d 2019-05-22 to 08-22. On the record of the draft proposed order, commenters expressed concern regarding potential impacts from EMF exposure from the proposed transmission line on animal livestock. B2HAPPDoc3-44 ASC 27 Exhibit AA EMF ASC 2018-09-28. Section 3.10.1. B2HAPPDoc8-1 All DPO Comments Combined-Rec’d 2019-05-22 to 08-22; B2HAPPDoc8-301 DPO Public Comment Myers S 2019-06-23 to 08-22, et al.

⁶³⁵ The model is EMFWorkstation: ENVIRO (Version 3.52).

1 transmission line. The model considered the following line geometries that the applicant
 2 expects to use in Oregon:

- 3
- 4 • 500-kV transmission line on a single-circuit lattice tower (delta configuration; ASC
 5 Exhibit B, Figure B-15) with a minimum ground clearance of 34.5 feet
- 6 • 230-kV transmission line on a single-circuit H-frame structure (horizontal configuration;
 7 ASC Exhibit B, Figure B-19) with a minimum ground clearance of 20 feet
- 8 • 138-kV transmission line on a single-circuit H-frame structure (horizontal configuration;
 9 ASC Exhibit B, Figure B-20) with a minimum ground clearance of 20 feet

10
 11 In addition, the applicant modeled the electric fields from one alternative geometry that would
 12 be used when unique siting concerns require the use of special structures:

- 13
- 14 • 500-kV transmission line on a single-circuit H-frame or Y-frame structure (horizontal
 15 configuration; see ASC Exhibit B, Figures B-16 and B-17) with a minimum ground
 16 clearance of 34.5 feet

17
 18 The model used the nominal voltage of the 230-kV and 138-kV transmission lines, but evaluated
 19 a more conservative (higher) voltage of 550-kv for the 500-kv transmission line to account for
 20 overvoltage situations.⁶³⁶ The model provided the predicted electric field levels out to distances
 21 of 200 feet on either side of each proposed transmission line structure type. Table SSTL-1,
 22 reproduced from ASC Exhibit DD, Table DD-1, summarizes the electric field strengths at the
 23 peak and edge of the ROW for each of these transmission line configurations.⁶³⁷ The 500-kV
 24 single-circuit lattice tower configuration would produce the highest electric fields. As shown in
 25 Table SSTL-1, the maximum electric field modeled is 8.9 kV/m at one meter above the ground.
 26 This value is below the limit for electric fields from transmission lines (set at OAR 345-024-
 27 0090(1)) of not more than 9 kV per meter at 1 meter above the ground surface in areas that are
 28 accessible to the public. For this assessment, it is assumed the areas under the 500 kV line are
 29 “accessible to the public,” though not all areas would be accessible to the public due to private
 30 property access restrictions.

31

Table SSTL-1: Electric Field Strength for Each Considered Structural Configuration

Structure Type	ROW Width (feet)	South/West ROW Edge (kV/m)	Maximum within ROW (kV/m)	North/East ROW Edge (kV/m)
500-kV lattice	250	0.8	8.9	0.8
500-kV tubular steel H-frame and Y-frame monopole	250	0.9	8.8	0.9

⁶³⁶ B2HAPPDoc3-44 ASC 27_Exhibit AA_EMF_ASC 2018-09-28, Section 3.5.2.

⁶³⁷ ASC Exhibit AA provides electric field profiles illustrating how the strength of the electric field will vary across the ROW for each transmission line configuration.

Table SSTL-1: Electric Field Strength for Each Considered Structural Configuration

Structure Type	ROW Width (feet)	South/West ROW Edge (kV/m)	Maximum within ROW (kV/m)	North/East ROW Edge (kV/m)
230-kV wood H-frame	125	0.8	5.0	0.8
138-kV wood H-frame	100	0.5	2.3	0.5
Electric field strength calculated at standard height of one meter above ground surface. kV/m = kilovolt per meter; ROW = right-of-way				

1

2 The applicant’s position is that post-construction monitoring of electric fields is unnecessary
 3 because the modeling results assumed worst-case conditions of line overvoltage and minimum
 4 ground clearance, and those conservative calculations show that the electric fields would be
 5 below the threshold established at OAR 345-024-0090(1).⁶³⁸ Because the model shows that the
 6 maximum electric field strength that would be produced by the 500-kV lattice single-circuit
 7 lattice tower configuration is 8.9 kV/meter at one meter above the ground when the line is
 8 modeled at 34.5 feet from the ground, a lesser minimum conductor clearance could result in
 9 electric fields that exceed 9 kV/m at one meter above the ground. The applicant therefore
 10 commits to designing the transmission line to meet specific minimum ground clearances under
 11 all operating conditions, including maximum load conditions, maximum sag conditions, and
 12 locations where the line crosses or is adjacent to other transmission lines.⁶³⁹ Accordingly, the
 13 applicant proposes, and the Department recommends the Council adopt, the following
 14 condition:

15

16 **Recommended Siting Standards for Transmission Lines Condition 1:** To reduce or
 17 manage human exposure to electromagnetic fields, the certificate holder shall design
 18 and construct:

- 19 a. All aboveground 500-kV transmission lines with a minimum clearance of 34.5 feet
- 20 from the ground under all operating conditions;
- 21 b. All aboveground 230-kV transmission lines with a minimum clearance of 20 feet
- 22 from the ground under all operating conditions; and
- 23 c. All aboveground 138-kV transmission lines with a minimum clearance of 20 feet
- 24 from the ground under all operating conditions.
- 25 d. In areas where an aboveground transmission line will cross an existing
- 26 transmission line, the certificate holder shall construct the transmission line at a
- 27 height and separation that would ensure that alternating current electric fields do
- 28 not exceed 9-kV per meter at one meter above the ground surface.

⁶³⁸ B2HAPPDoc3-44 ASC 27_ Exhibit AA_EMF_ASC 2018-09-28, Section 3.8.

⁶³⁹ B2HAPPDoc3-58 ASC Exhibit AA - Errata Sheet 2019-03-28.

- 1 e. The Department may authorize a lower conductor clearance in areas determined
2 to not be accessible to the public or otherwise demonstrated by the applicant to
3 be compliant with the standard.
4

5 In areas where an existing transmission line would parallel a proposed transmission line, the
6 electric fields within the transmission line ROW may increase or decrease depending on the
7 proximity, load, and phasing of the parallel line.⁶⁴⁰ Therefore, in addition to modeling the
8 electric fields that would be produced by each transmission line alone, the applicant also
9 modeled the interactions between the electric fields that would be produced by the 500-kV
10 lattice structures and the electric fields that would be produced by parallel transmission lines.⁶⁴¹
11 ASC Exhibit AA, Figure AA-9 shows that existing parallel lines located near the proposed 500-kV
12 corridors will not result in exceedances of 9 kV/m at one meter above the ground surface, in
13 compliance with OAR 345-024-0090(1). The proposed 500-kV transmission line has the
14 potential to exceed this threshold, however, where the line would cross (rather than parallel)
15 existing transmission lines. The applicant explains that it would design the transmission line
16 with a vertical height and separation that would maintain electric fields in the area of any
17 crossing at below the 9 kV/m at one meter above the ground threshold. Recommended Siting
18 Standards for Transmission Lines Condition 1 would impose this requirement as a condition of
19 the site certificate.
20

21 Based upon review of the applicant's evaluation presented in Exhibit AA, and subject to the
22 Recommended Siting Standards for Transmission Lines Condition 1, the Department
23 recommends that the Council find that electric fields generated by the proposed new 500 kV
24 transmission line, rebuilt 230-kV transmission line, and rebuilt 138-kV transmission line would
25 not exceed 9-kV per meter at one meter above ground level.
26

27 *Induced Voltage and Current* 28

29 The Siting Standards for Transmission Lines requires the Council to find that the applicant "can
30 design, construct and operate the proposed transmission line so that induced currents resulting
31 from the transmission line and related or supporting facilities will be as low as reasonably
32 achievable."
33

⁶⁴⁰ A single-circuit transmission line carries one phase in each of its three conductors. The voltage and current in each phase conductor is out of sync with the other two phases by 120 degrees, or one-third of the 360 degree cycle. The fields from these conductors tend to cancel out because of this phase difference. Therefore, depending on the geometry and arrangement of the conductors in the parallel transmission line, a parallel transmission line can either increase or decrease the electric fields within the transmission line ROW. B2HAPPDoc3-44 ASC 27_Exhibit AA_EMF_ASC 2018-09-28, Section 3.2.1.

⁶⁴¹ The 500-kV lattice configuration would produce the highest electric fields; therefore, the applicant modeled the interaction of electric fields from parallel transmission lines with the electric fields from this transmission line configuration. B2HAPPDoc3-44 ASC 27_Exhibit AA_EMF_ASC 2018-09-28, Section 3.5.3.

1 As explained in ASC Exhibit DD, the flow of electricity in a transmission line can induce a small
 2 electric charge, or voltage, in nearby conductive objects, such as metallic objects (e.g., vehicles,
 3 equipment, metal fences, signs, and metallic roofs). An induced electric charge can flow, or
 4 become electric current, when a path to ground is presented. For example, a vehicle that is
 5 insulated from grounding by its tires and is parked under a transmission line long enough to
 6 build up a charge can cause humans that touch the vehicle to experience a momentary shock as
 7 the person becomes the conducting path for the current to flow to ground. A person can
 8 generally notice induced current if the available electrical charge is greater than one milliampere
 9 (mA), and at five mA most children (99.5 percent) are able to still let go of an electrified
 10 object.⁶⁴² The National Electric Safety Code (NESC) sets a performance standard at Rule 234G.3
 11 limiting the steady-state current due to electrostatic effects to five mA.

12
 13 The strength of the induced current in an object is positively related to the electric field strength
 14 of a nearby transmission line. The applicant therefore calculated the induced current expected
 15 to result for various objects located near the 500-kV lattice configuration, because this
 16 configuration would produce the strongest electric fields. Table SSTL-2 below, reproduced from
 17 Table DD-2 of ASC Exhibit DD, shows the maximum current that could be induced in several
 18 types of vehicles and agricultural equipment if those objects were located in the transmission
 19 line ROW. The maximum induced current is calculated by multiplying the factors in the middle
 20 column (derived from an Electric Power Research Institute publication) by the maximum
 21 expected electric field strength from the proposed facility (under normal operating conditions).
 22 As shown in Table SSTL-2, cars, pickup trucks, and combines located within the ROW of the 500-
 23 kV lattice transmission line configuration would build up an inducible charge that would be less
 24 than the 5-mA threshold established by the NESC. If a large tractor-semitrailer were located
 25 parallel to and directly under the transmission line, it would have the potential to build up an
 26 inducible charge that would exceed the 5-mA threshold. However, the applicant explains that
 27 tractor-semitrailers are unlikely to drive directly under and parallel to the line; tractor-
 28 semitrailers may briefly cross under the line where the transmission line crosses a road, but in
 29 these circumstances the tractor-semitrailer would be under the transmission line for only a short
 30 duration and would not be parallel to the line. If the transmission line crossed a location where
 31 tractor-semitrailers may be parked long enough to build up an inducible charge (such as at a gas
 32 station or a parking lot), the resulting induced current may exceed the 5-mA threshold;
 33 therefore, the applicant represents that at these locations it would alter the transmission line
 34 design if necessary to ensure that the line complies with the 5-mA threshold established by the
 35 NESC.

36

Table SSTL-2: Induced Current Factors

Object	Isc/E (mA/kV/m)	Maximum Induced Current (mA) ¹
Car—L 4.6 m x W 1.78 m x 1.37 m	0.088	0.78
Pickup Truck—L 5.2 m x W 2.0 m x H 1.7m	0.10	0.89

Table SSTL-2: Induced Current Factors

Object	Isc/E (mA/kV/m)	Maximum Induced Current (mA) ¹
Large Tractor-Trailer—Total Length 15.75 m Trailer: 12.2 m x W 2.4 m x H 3.7 m	0.64	5.70
Combine—L 9.15 m x W 2.3 m x H 3.5 m	0.38	3.38
Source: Table 7-8.2, EPRI AC Transmission Line Reference Book: 200 kV and Above (EPRI 2005) ¹ Maximum induced current calculated for strongest predicted electric field of 8.9 kV/m, associated with the proposed lattice segment. Isc = short-circuit current E = AC electric field m = meter		

1
2 To reduce the risk of induced current and nuisance shocks, the applicant proposes to inform
3 landowners of the risks of induced current, develop and implement a program to ground or
4 bond conductive objects or structures that could become charged by the electric fields from the
5 transmission line, and to follow NESC grounding requirements. The applicant therefore
6 proposes, and the Department recommends, that the Council impose the following site
7 certificate condition:

8
9 **Recommended Siting Standards for Transmission Lines Condition 2:** Prior to placing the
10 facility in service, the certificate holder shall take the following steps to reduce the risk of
11 induced current and nuisance shocks:

- 12 a. Provide to landowners a map of overhead transmission lines on their property and
13 advise landowners of possible health and safety risks from induced currents caused
14 by electric and magnetic fields.
15 b. Implement a safety protocol to ensure adherence to National Electric Safety Code
16 grounding requirements.

17
18 In addition, the applicant states that it would design, construct, and operate the facility in
19 accordance with the version of the NESC that is most current at the time final engineering of
20 the facility is completed. Like the proposed transmission lines (the new 500 kV transmission
21 line, rebuilt 230-kV transmission line, and rebuilt 138-kV transmission line), the Longhorn
22 Station and communication stations have the potential to generate induced currents in nearby
23 conductive objects. The applicant would follow the NESC requirements for employee training
24 about shock hazards as well as NESC requirements for grounding, bonding, shielding, signage,
25 and physical barriers such as fencing around the Longhorn Station and communication stations.
26 As discussed in Section IV.A, General Standard of Review of this order, under OAR 345-025-
27 0010, the Council may include site-specific conditions in the site certificate. The site-specific
28 condition at OAR 345-025-0010(4) provides reference to the 2012 edition of the NESC ~~and~~
29 ~~requires that conductive structures (such as gates and fences) be grounded or bonded. The~~
30 ~~Department acknowledges that the 2012 version of the NESC has already been updated, so to~~
31 ~~design, construct and operate the proposed facility in compliance with the most up to date~~
32 ~~NESC code may create a compliance issue with the site-specific condition as written in rule, as~~
33 ~~such, the Department recommends clarifying language be added to the condition provided~~
34 ~~below.~~

1
 2 The language of the site-specific condition OAR 345-025-0010(4)(b) also requires the applicant
 3 to develop and implement a program that provides reasonable assurance that objects or
 4 structures of a permanent nature that could become inadvertently charged with electricity are
 5 grounded or bonded throughout the life of the line. The applicant explains that, as part of right
 6 of way negotiations, it educates landowners about induced currents and negotiates mutually
 7 acceptable ways, including payment, to address infrastructure on the private property that is at
 8 risk for induced currents.⁶⁴³ The applicant raises concerns about the site-specific condition
 9 requiring the applicant to ground or bond objects or structures that are outside if it's
 10 permanent right of way, which may cause property access issues.⁶⁴⁴ The Department provides
 11 clarification that under OAR 345-025-0010(4), the applicant is responsible for grounding
 12 equipment or objects that are in place at the time of construction, that the condition only
 13 applies to equipment within the permanent right-of-way for the proposed transmission line,
 14 and that the applicant is responsible for costs associated with grounding structures or objects.
 15 The applicant is required to develop and implement a program that provides reasonable
 16 assurance that all fences, gates, cattle guards, trailers, or other objects or structures of a
 17 permanent nature are grounded or bonded. That program may include provisions that it
 18 traditionally implements as part of its ROW negotiations. The condition also expressly states
 19 that these requirements are for the life of the proposed transmission line.

20
 21 Therefore, based upon the applicant's representations, ~~and~~ to align the site-specific condition
 22 with the most current version of the NESC, and to clarify requirements for grounding structures
 23 or objects for the life of the proposed transmission line, the Department recommends that the
 24 Council adopt the following condition:

25
 26 **Recommended Siting Standards for Transmission Lines Condition 3:**

- 27 a. The certificate holder shall design, construct, and operate the transmission lines,
 28 Longhorn Station, and communication stations in accordance with the requirements
 29 of the version of the National Electrical Safety Code that is most current at the time
 30 that final engineering of each of these components is completed; and
 31 b. The certificate holder shall develop and implement a program that provides
 32 reasonable assurance that all fences, gates, cattle guards, trailers, or other objects
 33 or structures of a permanent nature in place at the time of construction and within
 34 the right-of-way, that could become inadvertently charged with electricity are
 35 grounded or bonded throughout the life of the line. The certificate holder shall be
 36 responsible for ~~any~~ costs associated with grounding or bonding of permanent
 37 infrastructure in place at the time of construction ~~such as are required for~~
 38 ~~compliance with this condition.~~

⁶⁴³ As noted in Section I., *Introduction* and III.D., *Survey Data Based on Final Design and Site Access*, of this order, land-use agreements, land-acquisition, land purchases, land leases, right-of-way easements, and any other legal proceeding that allows the applicant legal access to lands within the site boundary are matters outside the Council's jurisdiction.

⁶⁴⁴ B2HAPPDoc8-1 All DPO Comments Combined-Rec'd 2019-05-22 to 08-22; B2HAPPDoc8-002 DPO Applicant Comment IPC Stokes 2019-06-20 to 08-22.

1 [Site-Specific Condition OAR 345-025-0010(4)]

2
3 The applicant is an operator of electrical supply lines (i.e., power lines) and is subject to the
4 jurisdiction of the Oregon Public Utility Commission (under ORS 757.035) for the entire life of
5 the proposed facility. As an electric supply operator, the operator must comply with Oregon
6 Public Utility Commission safety rules in OAR Chapter 860, Division 024. To ensure compliance
7 with applicable Oregon Public Utility Commission safety requirements, and in order to maintain
8 compliance with OAR 345-024-0090, the Department recommends the Council adopt the
9 following conditions:

10
11 **Recommended Siting Standards for Transmission Lines Condition 4:** Prior to
12 construction, the certificate holder shall schedule a time to brief the Public Utility
13 Commission Safety, Reliability, and Security Division (Safety) Staff as to how it will
14 comply with OAR Chapter 860, Division 024 during design, construction, operations, and
15 maintenance of the facilities. The certificate holder shall notify the Department how and
16 when it briefed the Public Utility Commission staff.

17
18 **Recommended Siting Standards for Transmission Lines Condition 5:** During operation,
19 the certificate holder shall:

- 20 a. Annually update the Public Utility Commission Safety Staff as to how the operator
21 will comply with OAR Chapter 860, Division 024 considering future operations,
22 maintenance, emergency response, and alterations until project retirement.
- 23 b. File ~~the following required~~ information with the Commission before January 2 of
24 each even-numbered year, as required by ORS 758.013:
25 ~~758.013 Operator of electric power line to provide Public Utility Commission with~~
26 ~~safety information; availability of information to public utilities. (1) Each person who~~
27 ~~is subject to the Public Utility Commission's authority under ORS 757.035 and who~~
28 ~~engages in the operation of an electric power line as described in ORS 757.035 must~~
29 ~~provide the commission with the following information before January 2 of each~~
30 ~~even-numbered year:~~
- 31 i. The name and contact information of the person that is responsible for the
32 operation and maintenance of the electric power line, and for ensuring that the
33 electric power line is safe; and
- 34 ii. The name and contact information of the person who is responsible for
35 responding to conditions that present an imminent threat to the safety of
36 employees, customers and the public.
- 37 iii. In the event that the contact information described in above in Siting Standards
38 for Transmission Lines Condition 5(b) subsection (1) of this section changes or
39 that ownership of the electric power line changes, the person who engages in
40 the operation of the electric power line must notify the commission of the
41 change as soon as practicable, but no later than within 90 days.
- 42 ~~iv. If the person described in subsection (1) of this section is not the public utility, as~~
43 ~~defined in ORS 757.005, in whose service territory the electric power line is~~
44 ~~located, the commission shall make the information provided to the commission~~

~~under subsection (1) of this section available to the public utility in whose service territory the electric power line is located. [2013 c.235 §3]~~

- c. Provide Public Utility Commission Safety Staff with:
- i. Maps and drawings of routes and installation of electrical supply lines showing:
 - Transmission lines and structures (over 50,000 Volts)
 - Distribution lines and structures - differentiating underground and overhead lines (over 600 Volts to 50,000 Volts)
 - Substations, station, roads and highways
 - ii. Plan and profile drawings of the transmission lines (and name and contact information of responsible professional engineer).
- (d) Document compliance with the above provisions in its annual report to the Department as provided in General Standard of Review Condition 4.

Based upon review of the applicant’s evaluation presented in ASC Exhibits AA and DD, and subject to recommended Siting Standards for Transmission Line Conditions 1 through 5, the Department recommends that the Council find that the applicant can design, construct and operate the proposed facility so that induced currents would be as low as reasonably achievable.

Conclusions of Law

Based on the foregoing findings of fact and conclusions of law, and subject to compliance with the recommended site certificate conditions, the Department recommends that the Council find that the proposed facility, including the proposed and alternative routes, complies with the Council’s Siting Standards for Transmission Lines.

IV.Q. Other Applicable Regulatory Requirements Under Council Jurisdiction

Under ORS 469.503(3) and under the Council’s General Standard of Review (OAR 345-022-0000), the Council must determine whether the proposed facility complies with “all other Oregon statutes and administrative rules..., as applicable to the issuance of a site certificate for the proposed facility.” This section addresses the applicable Oregon statutes and administrative rules that are not otherwise addressed in Council standards, including Oregon Noise Control Regulations, Removal Fill Law, Water Rights, and Fish Passage.

In ASC Exhibit BB, the applicant requests Council review of compliance with the requirements of the Oregon Forest Practices Act (FPA) as implemented under ORS 527.610 to 527.770, 527.990(1) and 527.992, and the implementing rules at OAR Chapter 629. More specifically, the applicant requests Council grant an exemption from FPA’s reforestation requirements and approve a Plan for an Alternative Practice, as in forest lands for uses not meeting reforestation requirements.

The requirements of the FPA include providing notification to the State Forester prior to commencement of operation; submitting a request for a permit to operate power driven

1 machinery; submittal of a written plan; and obtaining approval of a Plan for Alternative
2 Practice, if a use would not meet reforestation requirements. While compliance with these
3 requirements supports minimization of impacts to forest lands, as evaluated in IV.E. *Land Use*
4 and IV.M. *Public Services* of this order, the Department recommends Council not assert
5 jurisdiction of the FPA and refer the applicant to submits its request for exemption directly to
6 the Oregon Department of Forestry, consistent with the approach described in ASC Exhibit K
7 and BB where the applicant represents it would work directly with the state agency on FPA
8 requirements.⁶⁴⁵

9
10 *IV.Q.1. Noise Control Regulations: OAR 340-035-0035, OAR 340-035-0010 and OAR 340-035-*
11 *0100*

12
13 **OAR 340-035-0035: Noise Control Regulations for Industry and Commerce**

14
15 *(1) Standards and Regulations:*

16 ***

17 *(b) New Noise Sources:*

18
19 *(A) New Sources Located on Previously Used Sites:*

20 *No person owning or controlling a new industrial or commercial noise source*
21 *located on a previously used industrial or commercial site shall cause or*
22 *permit the operation of that noise source if the statistical noise levels*
23 *generated by that new source and measured at an appropriate measurement*
24 *point, specified in subsection (3)(b) of this rule, exceed the levels specified in*
25 *Table 8, except as otherwise provided in these rules. For noise levels*
26 *generated by a wind energy facility including wind turbines of any size and*
27 *any associated equipment or machinery, subparagraph (1)(b)(B)(iii) applies.*

28
29 *(B) New Sources Located on Previously Unused Site:*

30 *(i) No person owning or controlling a new industrial or commercial noise*
31 *source located on a previously unused industrial or commercial site shall cause*
32 *or permit the operation of that noise source if the noise levels generated or*
33 *indirectly caused by that noise source increase the ambient statistical noise*
34 *levels, L10 or L50, by more than 10 dBA in any one hour, or exceed the levels*
35 *specified in Table 8, as measured at an appropriate measurement point, as*
36 *specified in subsection (3)(b) of this rule, except as specified in subparagraph*
37 *(1)(b)(B)(iii).*

⁶⁴⁵ As detailed in this order, the applicant recommends, and the Department supports, that Council impose various conditions related to compliance with FPA requirements, where compliance with the requirements would minimize potential impacts and hazards in forest lands during construction and operation of the proposed facility. However, the Department's recommendation that Council impose such conditions is not intended to assume enforcement authority over FPA requirements, but that Council find that compliance with the FPA requirements would reduce potential impacts evaluated under Council's Land Use and Protected Areas standards.

1 (ii) *The ambient statistical noise level of a new industrial or commercial noise*
2 *source on a previously unused industrial or commercial site shall include*
3 *all noises generated or indirectly caused by or attributable to that source*
4 *including all of its related activities. Sources exempted from the*
5 *requirements of section (1) of this rule, which are identified in subsections*
6 *(5)(b) - (f), (j), and (k) of this rule, shall not be excluded from this ambient*
7 *measurement.*

8 ***

9 (c) *Quiet Areas. No person owning or controlling an industrial or commercial noise*
10 *source located either within the boundaries of a quiet area or outside its boundaries*
11 *shall cause or permit the operation of that noise source if the statistical noise levels*
12 *generated by that source exceed the levels specified in Table 9 as measured within*
13 *the quiet area and not less than 400 feet (122 meters) from the noise source.*

14 ***

15 (2) *Measurement:*

16 (a) *Sound measurements procedures shall conform to those procedures which are*
17 *adopted by the Commission and set forth in Sound Measurement Procedures*
18 *Manual (NPCS-1), or to such other procedures as are approved in writing by the*
19 *Department;*

20 (b) *Unless otherwise specified, the appropriate measurement point shall be that*
21 *point on the noise sensitive property, described below, which is further from the*
22 *noise source:*

23 A. *25 feet (7.6 meters) toward the noise source from that point on the noise*
24 *sensitive building nearest the noise source;*

25 B. *That point on the noise sensitive property line nearest the noise source.*

26 (3) *Monitoring and Reporting:*

27 (a) *Upon written notification from the Department, persons owning or controlling*
28 *an industrial or commercial noise source shall monitor and record the statistical*
29 *noise levels and operating times of equipment, facilities, operations, and*
30 *activities, and shall submit such data to the Department in the form and on the*
31 *schedule requested by the Department. Procedures for such measurements shall*
32 *conform to those procedures which are adopted by the Commission and set*
33 *forth in Sound Measurement Procedures Manual (NPCS-1);⁶⁴⁶*

34 ***

35 (5) *Exemptions: Except as otherwise provided in subparagraph (1)(b)(B)(ii) of this rule,*
36 *the rules in section (1) of this rule shall not apply to:*

37 ***

⁶⁴⁶ In ASC Exhibit X, the certificate holder argues that OAR 340-035-0035(4) does not apply to the proposed facility because it would only apply where the ODEQ Director has required specific noise sources to meet certain monitoring and reporting requirements, which has not occurred. In contrast, because Council assumes the authority as the decision maker to implement ODEQ noise rules, the Department recommends Council consider this rule provision applicable and assume notification would be directed from the Department on behalf of the Council versus ODEQ.

1 *(b) Warning devices not operating continuously for more than 5 minutes;*
2 *(c) Sounds created by the tires or motor used to propel any road vehicle complying*
3 *with the noise standards for road vehicles;*

4 *****

5 *(g) Sounds that originate on construction sites.*

6 *(h) Sounds created in construction or maintenance of capital equipment;*

7 *****

8 *(j) Sounds generated by the operation of aircraft and subject to pre-emptive federal*
9 *regulation. This exception does not apply to aircraft engine testing, activity*
10 *conducted at the airport that is not directly related to flight operations, and any*
11 *other activity not pre-emptively regulated by the federal government or controlled*
12 *under OAR 340-035-0045;*

13 *(k) Sounds created by the operation of road vehicle auxiliary equipment complying*
14 *with the noise rules for such equipment as specified in OAR 340-035-0030(1)(e);*

15 *****

16 *(m) Sounds created by activities related to the growing or harvesting of forest tree*
17 *species on forest land as defined in subsection (1) of ORS 526.324*

18
19 *(6) Exceptions: Upon written request from the owner or controller of an industrial or*
20 *commercial noise source, the Department may authorize exceptions to section (1) of*
21 *this rule, pursuant to rule 340-035-0010, for:*

22 *(a) Unusual and/or infrequent events;*

23 *(b) Industrial or commercial facilities previously established in areas of new*
24 *development of noise sensitive property;*

25 *(c) Those industrial or commercial noise sources whose statistical noise levels at the*
26 *appropriate measurement point are exceeded by any noise source external to the*
27 *industrial or commercial noise source in question;*

28 *(d) Noise sensitive property owned or controlled by the person who controls or owns*
29 *the noise source;*

30 *(e) Noise sensitive property located on land zoned exclusively for industrial or*
31 *commercial use.*

32
33 **OAR 340-035-0010: Exceptions**

34
35 *(1) Upon written request from the owner or controller of a noise source, the Department*
36 *may authorize exceptions as specifically listed in these rules.*

37
38 *(2) In establishing exceptions, the Department shall consider the protection of health,*
39 *safety, and welfare of Oregon citizens as well as the feasibility and cost of noise*
40 *abatement; the past, present, and future patterns of land use; the relative timing of land*
41 *use changes; and other legal constraints. For those exceptions which it authorizes the*
42 *Department shall specify the times during which the noise rules can be exceeded and the*
43 *quantity and quality of the noise generated, and when appropriate shall specify the*
44 *increments of progress of the noise source toward meeting the noise rules.*

OAR 340-035-0100: Variances

(1) Conditions for Granting. The Commission may grant specific variances from the particular requirements of any rule, regulation, or order to such specific persons or class of persons or such specific noise source upon such conditions as it may deem necessary to protect the public health and welfare, if it finds that strict compliance with such rule, regulation, or order is inappropriate because of conditions beyond the control of the persons granted such variance or because of special circumstances which would render strict compliance unreasonable, or impractical due to special physical conditions or cause, or because strict compliance would result in substantial curtailment or closing down of a business, plant, or operation, or because no other alternative facility or method of handling is yet available. Such variances may be limited in time.

(2) Procedure for Requesting. Any person requesting a variance shall make his request in writing to the Department for consideration by the Commission and shall state in a concise manner the facts to show cause why such variance should be granted.

Findings of Fact

Noise control requirements established in OAR 345-035-0035 apply to new industrial and commercial noise sources, which are defined as “noise generated by a combination of equipment, facilities, operations or activities employed in the production, storage, handling, sale, purchase, exchange, or maintenance of a...service.”⁶⁴⁷ The proposed facility would be a new industrial noise source and therefore the noise control requirements established in OAR 345-035-0035 are applicable.⁶⁴⁸

Pursuant to OAR 345-015-0160(2), in determining the application and study area requirements to be included in the project order, the Department shall consider the size, type, and significant potential impacts of the proposed facility as well as establish the analysis area(s) for the proposed facility.⁶⁴⁹ For this proposed facility, the noise impact analysis area covers approximately 209,000 acres, inclusive of the area within a 500-foot transmission line corridor spanning 300 miles (i.e. proposed site boundary), and the area extending one-half mile from

⁶⁴⁷ OAR 340-035-0015(24).

⁶⁴⁸ As provided in OAR 340-035-0110, in 1991, the Legislative Assembly withdrew all funding for implementing and administering DEQ’s noise program; therefore, Council assumes the authority as the decision maker to interpret and implement the DEQ noise rules.

⁶⁴⁹ See Section II.B., Project Order, of this order for a discussion of noticing requirements. OAR 345-021-0010(1)(x)(E) (Noise) establishes, as an information requirement, that Exhibit X contain a list of names and addresses of noise sensitive properties; however, this information requirement provides no direction for use of the information and does not require use of identified names and addresses for the Department’s procedurally required public noticing established in OAR Chapter 345 Division 15.

1 the proposed site boundary, as presented in Figure 2, *Proposed and Alternative Transmission*
2 *Line Routes*.⁶⁵⁰ As stated in the second amended project order (see Section II.B. Project Order),
3 the applicant must assess potential impacts beyond the analysis area if non-compliant noise
4 impacts from facility operation are predicted. As further described below, *Methods and*
5 *Assumptions for Corona Noise Analysis*, in some locations, the applicant expanded the analysis
6 area to one mile, based on low existing ambient noise levels at noise sensitive receptor (NSR)
7 locations.

8
9 Expected noise levels from common noise sources are presented in Figure 12, *Common Noise*
10 *Sources and Expected Noise Levels* and indicate, for example, that noise levels of 40 A-weighted
11 decibels (dBA) represent a soft whisper at a distance of 5-feet, and noise levels of 80 dBA
12 represent a freight train at 100-feet.

13
14 **Figure 13: Common Noise Sources and Expected Noise Levels**

39 Accessed 01-14-2019

40
⁶⁵⁰ OAR 345-001-0010(2) and OAR 345-015-0160

1 *Construction Noise*

2

3 Construction noise would occur during general construction activities, blasting and rock
4 breaking, use of implosive devices during conductor stringing, helicopter operations, and
5 vehicle traffic. However, construction noise is exempt from the noise standards pursuant to
6 OAR 340-035-0035(5)(g) and (h).⁶⁵¹ The evaluation of construction-related noise, including
7 methodology and assumptions, is an informational requirement per OAR Chapter 345 Division
8 21 and can be utilized to inform the evaluation of construction-related noise impacts under the
9 Council’s Protected Areas and Recreation standard of this order. ASC Exhibit X discusses
10 construction-related noise sources, predicted noise levels, methods and assumptions for the
11 construction noise analysis.

12

13 Construction activities would be phased and linear. Construction phases would generally
14 include site access and preparation, transmission tower foundation installation, support
15 structure erection, conductor stringing, and wiring installation (including installation of shield
16 wires and fiber-optic ground wires). Construction phases may overlap, with construction crews
17 operating simultaneously along the transmission line route and at different construction areas
18 such as access roads, structure sites, conductor pulling sites, and staging and maintenance
19 areas (referred to as multi-use areas).

20

21 *General Construction Activities*

22

23 General construction activities including operation of construction vehicles and equipment (i.e.
24 auger drill rig, backhoe, crane, dump truck, grader, pickup truck, and tractor) would occur at a
25 construction site and would be the result of construction of capital equipment. Pursuant to OAR
26 340-035-0035(5)(g) and (h), these noise generating activities would be exempt from DEQ noise
27 rules. Noise generated from construction activities is also temporary. However, potential noise
28 levels from general construction activities are described below.

29

30 In ASC Exhibit X, the applicant evaluates potential noise levels from general construction
31 activities based on an assumed operation of 5 construction vehicles, at 40 percent hourly usage.
32 As presented in Table NC-1, *Predicted Noise Levels from General Construction Activities*, the 1-
33 hr average predicted noise level from the combined operation of five pieces of equipment is 83
34 dBA at 50 feet, 79 dBA at 100 feet, and attenuates to 46 dBA at 6,400 feet. Representative
35 noise levels for general construction equipment was obtained from the Federal Highway
36 Administration (FHWA) Roadway Construction Noise Model User’s Guide (FHWA 2006).

⁶⁵¹ Because construction related noise is exempt from the DEQ noise rules, an evaluation of construction noise generated from auxiliary vehicle use on new or improved roads, and multi-use areas, and helicopter use at NSRs is not required.

Table NC-1: Predicted Noise Levels from General Construction Activities

Noise Source and Assumptions	Distance from Construction Activity (feet)	Leq Noise Level (dBA)
5 construction vehicles at 40% usage factor: 1 at 50 ft 2 at 100 ft 2 at 200 ft	50	83
	100	79
	200	74
	400	69
	800	63
	1,600	58
	3,200	52
	6,400	46
Leq = Equivalent sound pressure level Usage factor = Percent of time equipment is in use over time period (1 hr)		

1
2 *Blasting, Rock Breaking, and Implosive Devices*
3
4 Blasting, rock breaking, and use of implosive devices during construction could occur at a
5 construction site and would be the result of construction of capital equipment. Pursuant to OAR
6 340-035-0035(5)(g) and (h), these noise generating activities would be exempt from the DEQ
7 noise rules.⁶⁵² However, potential noise levels from blasting activities are described below.
8
9 ASC Exhibit X Section 3.3.1.1 describes that blasting would be a short-duration event compared
10 to rock removal methods, such as using track rig drills, rock breakers, jackhammers, rotary
11 percussion drills, core barrels, or rotary rock drills. The applicant anticipates that tower
12 foundations would typically be installed using drilled shafts or piers; however, blasting may be
13 needed if hard rock is encountered. In such circumstances, impulse noise from blasts could
14 reach up to 140 dBA at the blast location or over 90 dBA within 500 feet of the blast location.⁶⁵³
15 The applicant may use an implosive conductor splice consisting of a split-second detonation
16 with sound and flash; this activity is anticipated to occur during daytime hours. The applicant
17 addresses protective measures for blasting and implosive devices in its draft Framework
18 Blasting Plan provided in Attachment G-5 to this order, and discussed in Section IV.D. *Soil*
19 *Protection*.
20

⁶⁵² OAR 340-035-0035(5) *** (g) Sounds that originate on construction sites; (h) Sounds created in construction or maintenance of capital equipment***.

⁶⁵³ B2HAPPDoc3-41 ASC 24_Exhibit X_Noise_ASC 2018-09-28, Section 3.3.1.1.

1 *Helicopter Use for Construction*

2

3 Helicopter use during construction would occur at a construction site and would be the result
4 of construction of capital equipment. Pursuant to OAR 340-035-0035(5)(g) and (h), these noise
5 generating activities would be exempt from DEQ noise rules. Further, OAR 340-035-0035(5)(j)
6 provides that sounds generated by aircraft operation and subject to pre-emptive federal
7 regulation are also exempt from DEQ noise rules. However, potential noise levels from
8 construction-related helicopter use is described below for informational purposes.

9

10 Heavy-lift and light duty helicopters may be used during construction of the proposed facility in
11 areas where access roads and/or rough terrain would not permit the delivery of equipment,
12 materials or personnel. Helicopters may also be used for structure/tower placement; hardware
13 installation; and wire-stringing operations. If used, heavy-lift and light duty helicopters would
14 deploy from multi-use areas or light duty fly yards; the frequency of helicopter trips depends on
15 whether the proposed facility structure would be assembled at a structure site or a multi-use
16 area. If assembly takes place at the structure site, daily helicopter operations at the relevant
17 multi-use areas and light-duty fly yards would typically involve approximately 15 to 20 flights
18 per day and last for approximately two to three months. If assembly takes place at the multi-
19 use areas, daily helicopter operations would typically involve approximately 10 to 15 flights per
20 day and might last for a year, but trips would not take place every day and would be more
21 sporadic.

22

23 Audible noise from light duty and heavy-lift helicopters ranges between 62 and 84 dBA,
24 respectively, at a 1,000-foot distance. The applicant states that helicopter operations are
25 expected to be limited to daylight hours.⁶⁵⁴ The applicant represents that all helicopters must
26 be compliant with the noise certification and noise level limits set forth in the Code of Federal
27 Regulations 14 CFR § 36.11 which outlines the requirements needed to demonstrate
28 compliance with the regulations including the measuring, evaluation and calculation of noise
29 levels in accordance with applicable procedures and conditions. These are discussed further in
30 Section IV.M., *Public Services*, of this order and secured in recommended Public Services
31 Condition ~~32~~ which outlines an applicant represented Helicopter Use Plan to be provided to the
32 Department, affected County Planning Department, Oregon Department of Aviation, and the
33 Federal Aviation Administration (FAA).

34

35 *Operational Noise*

36

37 Operational noise would include potential corona noise generated from the proposed
38 transmission line and operations and maintenance (O&M) activities.⁶⁵⁵ Maintenance activities
39 would include vegetation management, transmission line inspections, transmission line repair

⁶⁵⁴ B2HAPPDoc3-41 ASC 24_Exhibit X_Noise_ASC 2018-09-28, Section 3.3.1.1.

⁶⁵⁵ Noise from stations or substations is typically a result of transformer operation; the proposed Longhorn Station would not include transformers.

1 and maintenance activities, and access road repair. Regular maintenance activities would also
2 include but are not limited to traffic noise from routine inspections, the use of helicopters to
3 perform inspections, the inspections themselves, repairs or replacement of equipment and
4 vegetation management within the ROW. The ambient statistical noise level of the proposed
5 facility includes corona noise. Noises generated during maintenance activities, as described, are
6 exempt based on the OAR 340-035-0035(5)(h) exemption for maintenance of capital
7 equipment, which reasonably includes transmission lines as an asset used in the production of
8 electrical transmission services.⁶⁵⁶

9
10 OAR 340-035-0035(1)(b)(B)(ii) establishes that the ambient statistical noise level of the
11 proposed facility include all noises generated by, indirectly caused by, or attributable to the
12 source including all of its related activities, including attributable noises otherwise exempt from
13 the regulation specifically identified in OAR 340-035-0035(5)(b)–(f), (j), and (k), where (j) and (k)
14 include aircraft and auxiliary vehicles,⁶⁵⁷ which are sources identified by the applicant as those
15 used during operational maintenance activities. Maintenance of capital equipment is exempted
16 under -0035(5)(h) and specifically not included in the -0035(b)(B)(ii) list of exempted noise
17 sources required to be included in the industrial sources’ ambient statistical noise level.

18
19 The Department recommends Council find that these two categories of exempted operational
20 noise – (1) auxiliary vehicle and helicopter noise; and (2) maintenance of capital equipment
21 noise – be considered mutually exclusive. In other words, to avoid internal conflict with the
22 rule, the identification of aircraft under -0035(5)(j) and auxiliary vehicles under -0035(5)(k) in -
23 0035(1)(b)(B)(ii) as sources that must be included in the evaluation of a proposed industrial

⁶⁵⁶ This interpretation is also consistent with the rulemaking record. The exemption for “sounds created in construction or maintenance of capital equipment under OAR 340-035-0035 was established in rules effective May 6, 1977. A similar exemption was previously included in the definitional rule. This new exemption replaced the previous version of section (5)(h) which provided that OAR 340-035-0035(1) did not apply to “[s]ounds created in repairing or replacing the capital equipment of a public utility distribution system.” In staff reports provided to the Environmental Quality Commission in support of the rulemaking, these changes were described as clarifying amendments, and the Department believes the changes were intended to clarify that the capital equipment of a public utility distribution system should be treated as equivalent to other capital equipment. See Staff Report to Agenda Item K of the May 27, 1977 Environmental Quality Commission Meeting.

⁶⁵⁷ OAR 340-035-0035(5):***

(j) Sounds generated by the operation of aircraft and subject to pre-emptive federal regulation. This exception does not apply to aircraft engine testing, activity conducted at the airport that is not directly related to flight operations, and any other activity not pre-emptively regulated by the federal government or controlled under OAR 340-035-0045;

(k) Sounds created by the operation of road vehicle auxiliary equipment complying with the noise rules for such equipment as specified in OAR 340-035-0030(1)(e)***.

1 sources' ambient statistical noise levels would only apply in circumstances where these sources
2 were not used in capital equipment maintenance.⁶⁵⁸

3
4 *Operational Noise Rules*

5
6 The DEQ noise rules set noise limits for new industrial or commercial noise *sources* based upon
7 whether those sources would be developed on a previously used or unused *site* [Emphasis
8 added]. A "New Industrial or Commercial Noise Source" is any industrial or commercial noise
9 source for which installation or construction commenced after January 1, 1975 on a site not
10 previously occupied by the proposed industrial or commercial noise source.⁶⁵⁹ A "previously
11 unused industrial or commercial site" is property which has not been used by any industrial or
12 commercial noise source during the 20 years immediately preceding commencement of
13 construction of a new industrial or commercial source on that property.⁶⁶⁰ Based on the
14 applicability of the DEQ noise rules to the noise source at a site, as defined above, the
15 evaluation of compliance is based on operational noise from the proposed facility, in its
16 entirety, as the noise source and, rather than limited to the property for which the proposed
17 facility would be located, the site includes the 209,000 acres within the analysis area.

18
19 The applicant assumed the proposed facility would be a new industrial or commercial noise
20 source located on previously unused industrial or commercial sites. The standards for noise
21 sources proposed to be located on previously unused industrial or commercial sites are more
22 restrictive than on sites of previous industrial or commercial use. While historic use was not
23 evaluated for the entire ~~proposed facility site~~ analysis area, based on land use zoning
24 designations presented in ASC Exhibit K and the applicant's application of the more restrictive
25 noise standards, the Department recommends Council evaluate the proposed facility under
26 OAR 340-035-0035(b)(B) as a new noise source located on a previously unused industrial or
27 commercial site.

28
29 Operational noise generated by a new industrial or commercial noise source to be located on a
30 previously unused site must comply with two standards: the "ambient antidegradation
31 standard" and the "maximum allowable noise standard." Under the ambient antidegradation
32 standard, facility-generated noise must not increase the ambient hourly L10 or L50 noise levels
33 at ~~any noise sensitive properties~~ an appropriate measurement point by more than 10 dBA. In
34 ASC Exhibit X, the applicant identifies 132 measurement points based on potential locations

⁶⁵⁸ Commenters assert that the noise analysis was flawed and non-compliant because it did not include helicopter and auxiliary vehicle use during routine operation and maintenance activities. B2HAPPDoc8-1 All DPO Comments Combined- Rec'd 2019-05-22 to 08-22; B2HAPPDoc8-381 DPO Public Comment_Stop B2H Krieder F 2019-08-22, (Watson, S., Gilbert, I., et.al.).

⁶⁵⁹ OAR 340-035-0015(33).

⁶⁶⁰ OAR 340-035-0015(47).

1 meeting the OAR 340-035-0015(38) definition of a noise sensitive property. ⁶⁶¹~~refers to noise-~~
 2 ~~sensitive properties as noise sensitive receptors (NSRs).~~

3
 4 Under the maximum allowable noise standard at OAR 340-035-0035(1)(b)(B)(i), a new industrial
 5 or commercial noise source to be located on a previously unused site may not exceed the noise
 6 levels specified in Table 8 of the noise rules, as represented in Table NC-2, *Statistical Noise*
 7 *Limits for Industrial and Commercial Noise Sources* below.
 8

Table NC-2: Statistical Noise Limits for Industrial and Commercial Noise Sources

Statistical Descriptor ¹	Maximum Allowable Noise Standards (dBA)	
	Daytime (7:00 AM - 10:00 PM)	Nighttime (10:00 PM - 7:00 AM)
L50	55	50
L10	60	55
L1	75	60

Notes:
 1. The hourly L50, L10 and L1 noise levels are defined as the noise levels equaled or exceeded 50 percent, 10 percent, and 1 percent of the hour, respectively.
 Source: OAR 340-035-0035, Table 8

9
 10 *Proposed Transmission Line - Corona Noise*

11
 12 The corona effect (corona) is audible noise that emits from transmission lines and facility
 13 structures caused from the partial electrical breakdown of the insulating properties of air
 14 around the conductors of a transmission line. Heat and energy are dissipated in a small volume
 15 near the surface of the conductors - part of this energy is in the form of small local pressure
 16 changes that result in audible noise.⁶⁶² Corona-generated audible noise is characterized by a low
 17 hum, hissing, frying, or crackling sound. Corona is a function of transmission line voltage,
 18 altitude, conductor diameter, condition of the conductor, suspension hardware and specific
 19 damp weather conditions.

20
 21 As explained in ASC Exhibit X, other sources of corona may include a “burn in period,” which
 22 typically occurs within a year of the transmission line being operational, in which dirt or oil from
 23 construction wears off. Corona noise generated during the “burn-in period” would be
 24 minimized through conductor design, using a non-specular finish which is a method of
 25 sandblasting to artificially “age” the conductor to make it less reflective. Further, conductors
 26 would be protected during construction to minimize scratching and nicking as discussed later in

⁶⁶¹ OAR 340-35-0015(38) defines Noise Sensitive Property as “real property normally used for sleeping, or normally used as schools, churches, hospitals or public libraries. Property used in industrial or agricultural activities is not Noise Sensitive Property unless it meets the above criteria in more than an incidental manner.”

⁶⁶² B2HAPPDoc ApASC Exhibit X - Idaho Power's Responses to ODOE's RAI-4 2017-11-06.

1 this section.⁶⁶³ Corona may be associated with irregularities (such as nicks and scrapes on the
 2 conductor surface), or sharp edges on suspension hardware that concentrate the electric field
 3 and corona at these locations. Other irregularities that may cause corona are contamination on
 4 the conductor surface, such as dust or insects, raindrops, snow, fog, or condensation.

5
 6 The highest levels of audible corona noise would occur in wet and raining weather conditions
 7 when the transmission lines are wet, which the applicant refers to as foul weather events. The
 8 applicant notes that during heavy rain events, the ambient noise from the rain would be
 9 greater than the noise generated by the corona effect, and therefore not audible at NSR's.
 10 However, to assume a "worse-case" scenario, the applicant anticipates that during occasional
 11 foul weather events, noise associated with corona may be perceptible at certain NSRs and
 12 therefore this is the focus of the applicant's noise analysis, rather than evaluating temporary
 13 operational corona noise associated with the "burn-in period" or surface contamination of the
 14 proposed transmission line. ASC Exhibit X provides substantial details about the applicants'
 15 noise analysis including a discussion, justification of the methods and assumptions used for
 16 identifying NSR's, estimating the expected noise levels at NSR's during differing times of the
 17 day, weather conditions and representative locations along the proposed and alternative
 18 routes. The Department provides a summary of the analysis and the results in the below
 19 section.

20 21 *Methods and Assumptions for Corona Noise Analysis*

22
 23 To demonstrate compliance with OAR 340-035-0035(1)(b)(B)(i), the ambient antidegradation
 24 standard and the maximum permissible sound level standard (Table 8 of OAR 340-035-0035),
 25 the applicant conducted a noise (acoustic) analysis using a multistep process (Steps 1-6
 26 summarized below) as described in detail in ASC Exhibit X Section 3.2.1 thru Section 3.2.4 and
 27 Attachments X-1 through X-6.

28
 29 Pursuant to OAR 340-035-0035(1)(b)(B)(i) and -0035(3), noise standards must be evaluated at
 30 specific measurement points (i.e. 25 feet from noise source from NSR point nearest to the noise
 31 source, or point on NSR nearest to the noise source) using the DEQ Commission approved
 32 Sound Measurement Procedures Manual, NPCS-1 (Manual), unless other measurement points
 33 are specified or other measurement procedures are approved in writing by the Department,
 34 respectively.⁶⁶⁴ The Manual was developed in 1974 and last modified in 1983 and includes

⁶⁶³ B2HAPPDoc13 DPO IPC Responses to Select DPO Comments Rec'd by 2019-11-07; B2HAPP DPO IPC Responses - StopB2H
 - 4. Noise 2019-10-29, Gilbert, I.

⁶⁶⁴ As previously described, because DEQ does not fund, administer, or enforce the noise control requirements established
 in OAR 345-035-0035, yet they are applicable OARs to the proposed facility, the Council assumes authority to review,
 interpret, and apply the rules. Therefore, the Council has authority to review and approve sound measurement
 procedures that differ from the Sound Measurement Procedures Manual (NPCS-1). ASC Exhibit X Attachment X-6
 provides Department approval from Mr. Maxwell Woods of sound measurement procedures that differ from the Sound

1 methodology based on hand tallies, which have largely become outdated.⁶⁶⁵ Neither the rule
2 nor the Manual address or provide methods for establishing ambient noise levels specific to a
3 linear facility. Therefore, the applicant’s noise consultant developed its own methodology to
4 specify other ambient measurement points and other measurement procedures, summarized
5 below (and outlined in Step 4 below), which was repeatedly vetted with the Department and
6 two noise consultants’ acoustical engineers, Standlee and Associates and Golder Associates.⁶⁶⁶
7 In preparation of the ASC, based on recommendations obtained from Standlee and Associates,
8 the Department reviewed and concurred with the applicant’s noise analysis methodology, as
9 presented in ASC Exhibit X, Attachments X-1 through X-3, and X-6, as summarized below.

10
11 *Sound Measurement Points (ASC Exhibit X, Attachments X-1 – X-3)*

12
13 The applicant developed a sound monitoring protocol (ASC Exhibit X Attachment X-1) to
14 support the acoustic noise analysis provided in ASC Exhibit X and demonstrate compliance with
15 DEQ’s noise rules for new industrial sources on a previously unused site. A sound monitoring
16 protocol was necessary because, while DEQ’s noise rules specify 26 dBA as an ambient noise
17 level that may be used for wind energy facilities, the allowance for use of an assumed 26 dBA
18 ambient noise level does not apply to the proposed facility as a linear, non-wind energy
19 facility.⁶⁶⁷ Therefore, non-wind energy facilities are required to establish ambient noise levels
20 through noise monitoring.⁶⁶⁸ For noise monitoring, DEQ’s noise rules establish specific
21 measurement points for ambient noise measurements (i.e. 25 feet from noise source), while
22 allowing use of other specified measurement points, but do not address whether and how an
23 applicant may establish specific measurement points to represent ambient noise levels at
24 multiple noise sensitive receptor locations for a linear facility.⁶⁶⁹ Therefore, based on the
25 Departments’ review, supported by two consultants (Standlee and Associates and Golder
26 Associates, Inc), the applicant selected 17 monitoring positions (MPs) with acoustic
27 environments representative of the acoustic environments of NSRs identified within the
28 analysis area (totaling 132 NSR locations) (note: Attachments X-2 and X-3 identify 30 total MPs;
29 however, due to changes in the alignment of the proposed facility and alternative segments,

Measurement Procedures Manual caveating that EFSC makes the final decision on compliance with the noise regulations, including the methodologies implemented to demonstrate compliance with the rules.

⁶⁶⁵ B2HAPP. DEQ Noise Manual and Tables NPC5-1.

⁶⁶⁶ Exhibit X Consultant Review Memo 2015-04-15; Exhibit X Consultant Review Memo 2016-03-06; Consultant Review Memo (Golder) 2017-12-19.

⁶⁶⁷ OAR 340-035-0035(1)(b)(B)(iii)(I).

⁶⁶⁸ Commenters assert that DEQ’s Noise Control Regulation authorizes use of 26 dBA as an assumed ambient noise level, which the applicant and Department disagree, as the allowance for use of an assumed 26 dBA is specific to wind energy facilities. B2HAPPDoc8-1 All DPO Comments Combined-Rec’d 2019-05-22 to 8-22; B2HAPPDoc8-381 DPO Public Comment Stop B2H Krieder F 2019-08-22.

⁶⁶⁹ OAR 340-035-0035(3)(b)(A) and (B) define noise measurement points as 25 feet from noise source from NSR point nearest to the noise source, or point on NSR nearest to the noise source. Figures 4-1 and 4-2 of the Manual depict how the distance between the noise source and the noise sensitive property is maximized, where a distance of 25 feet is intended in part to ensure the sound measurement isn’t overly influenced by noises emanating from the building itself.

1 the final acoustic noise analysis relies solely on 17 MPs, as identified in Attachment X-6 and
2 presented in Table NC-3 below).

3
4 As outlined in Step 4 below, MP location selection was based on an initial acoustic noise
5 modeling analysis using an assumed ambient noise level of 20 dBA, where NSR locations with
6 potential noise standard exceedances were identified. Based on identification of potential non-
7 compliant NSR locations, the applicant identified acoustic noise study areas. Then, the applicant
8 evaluated the ambient noise conditions within the acoustic noise study areas and grouped NSRs
9 and MPs based on similar acoustic environments. The applicant established MPs at the
10 specified 25-foot distance from the NSR oriented towards the noise source, wherever possible.
11 When property owners expressed preferences for the placement of the monitoring equipment
12 on their property, the applicant located the equipment farther away than the specified 25 feet.
13 The applicant established these MPs at greater distances than 25-feet to ensure that ambient
14 noise levels were not being overstated by household noises (e.g. heat pumps,
15 televisions/radios, etc.)

16
17 As presented in ASC Exhibit X Attachments X-5 and X-6, individual MPs with acoustic noise
18 environments similar to an individual or grouping of NSRs were identified. Because of changes
19 in transmission line alignment throughout the ASC process, the applicant had ambient noise
20 data at 30 MPs within the general project area; when multiple MPs were in proximity to NSRs,
21 the MP with the lower ambient noise level was selected to provide more conservative
22 representative ambient noise levels of identified NSRs and NSR groups.

23
24 The Department's technical noise consultant, Standlee and Associates, recommended that
25 approval or concurrence with the applicant's approach for use of measured ambient noise
26 levels at designated MPs to represent ambient noise levels at one or many NSRs be based on
27 the representativeness of the MP acoustic environments, specifically proximate noise sources,
28 topography and land cover, compared to that of the NSRs and NSR groups.⁶⁷⁰ As presented in
29 Table NC-3: *Department Evaluation of Acoustic Noise Environments of Ambient Noise*
30 *Monitoring Positions and NSR Groups*, based on ASC Exhibit X, the Department evaluated the
31 representativeness of the MP and NSR group acoustic environments.

⁶⁷⁰ Exhibit X Consultant Review Memo 2016-03-06.

Notes:

1. The DEQ regulations utilize the L₅₀ metric. The L₅₀ is a statistical metric that represents the sound level that is exceeded for 30 minutes of every hour (i.e., median sound level). The L₅₀ is therefore unaffected by intermittent pass-by sounds that do not occur for more than 30 minutes in the hour, be it a train, truck, or jet aircraft. In other words, intermittent noises (such as a train) do not result in a higher baseline L₅₀ sound level—and would only influence the overall sound levels to the extent that the particular sound persisted for 30 minutes for every hour.
2. Ambient noise sources in proximity to several NSRs grouped with MP11 include major roadways, creeks, and transmission lines; however, because NSRs 57-63 were located in areas with no apparent noise sources, the ambient noise environment for this NSR group is represented as containing no noise sources.
3. Maps presenting noise sources and topography were not specifically provided for several NSRs grouped with MP11 (NSR 114, 116-118, 120, 122-124, 126-131 – all of which are located more than 1,900 feet from the proposed transmission line). NSRs that were mapped with sufficient data, NSR 115, 121, 125 and 132, represent locations of predicted exceedance of the ambient antidegradation standard, which as evaluated in this section, is recommended be established as the appropriate measurement points for evaluating compliance of the noise source with the ambient antidegradation standard.

1
2 As presented in the above-table, MP acoustic noise environments were provided in narrative in ASC Exhibit X Attachments X-2 and
3 X-3 and presented using aerial imagery maps supporting review of proximate noise sources (e.g. road/highways, railroads,
4 transmission lines, and creeks), topography (e.g. hilly, flat) and land cover type (e.g. agriculture, forested, bareground and low
5 vegetation). Similarly, the Department reviewed aerial imagery maps presenting NSR location along with proximate noise sources
6 and topography as provided in ASC Exhibit X Attachment X-5. The ASC Exhibit X Attachment X-5 maps were created using geospatial
7 data layers obtained from Esri, USDA, ODOT and Ventyx. Based on the Department’s review of acoustic environments of MPs
8 compared to the respective NSR groups, in all instances except MP11, the acoustic environment of the MP appear to represent
9 locations with similar noise sources but located at greater distances than NSRs to noise sources and therefore a more conservative
10 and acceptable ambient noise level for use in the evaluation of compliance with the DEQ noise rules.

1 At MP11, several NSRs (NSR 38, 39, 62, 63 and 132) appear to be located in areas without any
2 proximate noise sources (see ASC Exhibit X Attachment X-5 Map 14 and 17), raising question of
3 the representativeness of the MP11 acoustic environment (including Old US Highway 30 within
4 10 feet and Union Pacific Railroad within 200 feet) to that of the referenced NSRs. Additionally,
5 as noted in Table NC-3 above (see footnote 3), sufficient mapping was not provided for several
6 NSRs (NSR 114, 116-118, 120, 122-124, 126-131) grouped with MP11 to afford the Department
7 the opportunity to verify representativeness of NSR to MP acoustic environments, although
8 these specific NSRs were located between 1,900 and 3,000 feet from the proposed
9 transmission line alignment. Nonetheless, for all other NSRs grouped with MP11, based on the
10 Department's review of ASC Exhibit X Attachment X-5 (Maps 11-17), the NSR acoustic noise
11 environments contained similar or more noise sources within similar or closer proximity than
12 the noise sources contributing to MP11.

13
14 The fact that ambient noise levels at certain NSRs grouped with MP11 may be lower than 32
15 dBA, as measured at MP11, does not invalidate or underestimate potential impacts because
16 ambient antidegradation standard exceedances were predicted at NSRs grouped with MP11. As
17 further evaluated below, predicted exceedances at NSRs are used as a proxy to evaluate
18 compliance with the ambient antidegradation standard of the line, as a noise source, within the
19 analysis area as the "site." Based on the representativeness of the acoustic noise environment,
20 verified through Department review of ASC Exhibit X Attachment X-5, at MP11 to NSRs 21-63,
21 115, 119, 121, 125, 5004, and the allowance of measurement points to be "otherwise specified"
22 under OAR 340-035-0035(3)(b), the Department recommends Council find that the MP11
23 measured ambient noise level is reasonable and allowable for use in the evaluation of
24 compliance with the DEQ noise rules.

25 *Sound Measurement Procedure*

26
27
28 As provided in ASC Exhibit X Attachment X-1, the applicant developed a Baseline Sound
29 Monitoring Protocol to establish an appropriate methodology for noise monitoring duration,
30 conditions and instrumentation at each MP. In summary, at each MP, a pre-field calibrated
31 Larson Davis 831 real-time sound level analyzer equipped with a PCB model 377B02 0.5-inch
32 precision condenser microphone was set up and programmed to data log continuously. Field
33 equipment was calibrated with American National Standards Institute (ANSI) Type 1 calibrators,
34 which have accuracy traceable to the National Institute of Standards and Technology. Each
35 sound analyzer was programmed to measure and log broadband A-weighted statistical sound
36 levels (L10 and L50) sound pressure levels. Multiple baseline monitoring stations were also
37 equipped with Vaisala meteorological sensor units. The Vaisala meteorological sensor monitors
38 and collects data on wind speed and direction via its ultrasonic anemometer, barometric
39 pressure, temperature and humidity, as well as a rain gauge via a pressure plate which
40 measures total rainfall, intensity, and duration of rainfall. The Vaisala unit is also able to
41 distinguish between precipitation type such as rain, hail, and snow.

42
43 Sound measurements at each monitoring position were collected continuously over a 2- to 4-
44 week duration. The initial measurement period commenced March 6, 2012, and ended on May

1 10, 2012, and the supplemental measurement period commenced March 11, 2013 and ended
2 on June 12, 2013.

3
4 The Department relied upon its third-party consultant, Golder Associates, to review the
5 protocol. Based on review, Golder Associates confirmed that the sound measurement
6 procedures and baseline noise measurements were technically accurate.⁶⁷¹ Based on the
7 Department's third-party consultant recommendations and review, and review of facts
8 represented in ASC Exhibit X, the Department recommends Council approve the applicant's
9 sound monitoring points and measurement procedures, as allowed under OAR 340-035-
10 0035(3)(a) and (b).

11
12 As provided in ASC Exhibit X Section 3.2.1, the methods of the acoustic (modeling) analysis are
13 summarized below (Steps 1-6). To evaluate compliance with the ambient antidegradation
14 standard, the applicant evaluates compliance with the L50 noise standard, versus the L10 noise
15 standard, because it is more restrictive.

16
17 **Step 1:**⁶⁷² NSRs, including properties normally used for sleeping, schools, churches, hospitals
18 public libraries, and campsites were identified within the one-half mile analysis area based
19 on aerial imagery, GIS analysis, property records databases, and visual verification. The
20 applicant questions if seasonally used campsites (particularly if the campsite is not open for
21 more than half of the year) should be considered property normally used for sleeping under
22 the DEQ noise rules, nonetheless, the applicant provided a supplemental analysis evaluating
23 the campsites at Morgan Lake and Hilgard State Park, discussed in this section and Section
24 IV.L., Recreation and Section IV.F., Protected Areas, respectively, of this order.⁶⁷³ On a case-
25 by-case basis, in areas where the late-night baseline sound level was unusually low (e.g.,
26 less than 26 dBA), noise sensitive properties within one mile were identified and included in
27 the analysis.⁶⁷⁴

⁶⁷¹ B2HAPPDoc ApASC Golder Noise Memo 1788390_B2H_Exhibit X 2017-12-19.

⁶⁷² Where it was unclear if a structure was noise sensitive (e.g., residence, school, campground) vs. non-noise sensitive (e.g., barn, garage), the applicant attempted to visually verify from public right-of-way (ROW) the use of each structure. B2HAPPDoc3-41 ASC 24 Exhibit X Noise ASC 2018-09-28, Section 3.2.1.

⁶⁷³ The applicant explains that Hilgard Junction State Park provides seasonal camping from April 18 – October 15, approximately half the calendar year. Nonetheless, the applicant analyzed potential noise impacts at the park by comparing it to the nearby School/Correctional Facility identified as NSR 29 in the ASC. The modeling for NSR 29 showed a foul weather increase of 6 dBA. However, the park is farther from the proposed transmission line than NSR 29, which means the expected noise increase at the park would be less than at NSR 29, because noise attenuation increases with distance from the noise source. Because the increase at NSR 29 was less than 10 dBA, the increase at the park would similarly be less than 10 dBA and therefore compliant with the ambient antidegradation standard.

⁶⁷⁴ Based on the applicant's acoustic modeling analysis, foul weather sound level at an elevation of 4,000 feet and a distance of one-half mile is 36 dBA. At an elevation of 1,500 feet and a distance of one-half mile the modeled sound level is 34 dBA. The applicant notes that while the vast majority of NSRs are at elevations less than 4,000 feet, the modeled level of 36 dBA is supportive of a one-half mile distance when using 26 dBA as a proxy for a quiet rural ambient baseline. On a case-by-case basis, in areas where the late-night baseline sound level was unusually low (e.g., less than 26

1 Step 2: Sound source characteristics for noise modeling of the transmission line during foul
2 weather conditions were determined. The highest audible noise levels occur in conditions of
3 foul weather, therefore, to the applicant compared the maximum corona sound level
4 expected during meteorological conditions conducive to corona generation background and
5 sound levels must be presented as a function of meteorological conditions. Principal
6 contributors to the existing acoustic environment included motor vehicle traffic, railroad
7 traffic, streams and rivers, mobile farming equipment and activities, farming irrigation
8 equipment, ATVs, periodic aircraft flyovers, residential yard sounds (i.e., people and pets),
9 ranch animals, and natural sounds such as birds, insects, and wind interaction with
10 vegetation and/or terrain.

11 Step 3: Initial screening-level modeling results of the transmission line were calculated
12 based on the foul weather conditions, and an assessment was completed to determine the
13 likely maximum received sound at NSRs within the monitoring analysis area. As a first-level
14 screening review for NSRs, the applicant then conservatively assumed and Department
15 recommended an ambient hourly L50 noise level of 20 dBA.⁶⁷⁵ Because ambient L50 noise
16 levels at any NSR cannot increase by more than 10 dBA in one hour, the associated
17 “threshold” to establish if there would be an exceedance to the ambient antidegradation
18 standard is 30 dBA.

19 Step 4: For NSRs that showed a potential exceedance based on the assumed 20 dBA
20 ambient hourly L50 noise level (30 dBA threshold) requested by the Department,
21 representative baseline sound measurements were conducted at or near 17 locations. As
22 discussed above, a sound monitoring protocol was developed in consultation with the
23 Department. Measurements were conducted over a period of 2 to 4 weeks at preselected
24 and approved monitoring positions in targeted areas.

25 Step 5: From the baseline measurements, the representative existing L50 sound levels were
26 calculated and new compliance thresholds were defined to assess conformance with the
27 ambient antidegradation standard. The representative existing L50 sound levels were
28 calculated by taking the average of the measured L50 sound levels for the late nighttime
29 period (12:00 a.m. to 5:00 a.m.). This late nighttime period demonstrates the quietest time
30 period and is conservatively assumed to be present at all times of the day. Atypical sources
31 of extraneous sound, such as sound produced by field crews setting up or calibrating the

dB(A), noise sensitive properties further than one-half mile were identified and included in the analysis. The applicant
performed this broader review of potentially affected NSRs beyond one-half mile and out to 1 mile for five areas
assigned to monitoring points with low late-night baseline sound levels (MP06, MP11, MP15, MP34, and MP35), and
identified NSRs beyond the one-half mile analysis area in Exhibit X. In response to comments on the DPO, the applicant
performed a secondary review using the same methodologies and assumptions, which resulted in the identification of
one potential additional exceedance at an NSR that was not previously addressed in Exhibit X.

⁶⁷⁵ The Department requested the applicant use 20 dBA as an assumed ambient sound level for the applicant to filter NSRs
in its initial screening level analysis, because 20 dBA is near silence thus a highly conservative assumption. B2HAPPDoc13
DPO IPC Responses to Select DPO Comments Rec'd by 2019-11-07; B2HAPP DPO IPC Responses - StopB2H - 4. Noise - 1st
Supplemental Response 2019-11-05.

1 equipment and periods when the wind speed exceeded 10 miles per hour (mph), were
2 removed from the dataset.

3 **Step 6:** The L50 sound level for each NSR was assigned based on measurements performed
4 in Step 5 for monitoring positions in a similar acoustic environment. An assessment of the
5 ambient antidegradation standard was then conducted for each NSR. The assigned ambient
6 baseline sound level was compared to the predicted audible corona noise during foul
7 weather to assess compliance with the ambient degradation standard. The applicant also
8 provided a supplemental analysis which verified NSRs, provided additional analysis, and
9 modeled H-frame transmission line towers instead of lattice towers in the vicinity of the City
10 of La Grande for the proposed route and near Morgan Lake Park for the Morgan Lake
11 alternative. ⁶⁷⁶

12
13 The applicant's noise modeling (~~referred to in ASC Exhibit X as "initial screening-level~~
14 ~~modeling~~) included two separate analytical methods to determine anticipated corona noise
15 source levels and noise attenuation. The first method used the US Department of Energy's
16 (DOE) Corona and Field Effects (CAFE) program developed by the Electric Power Research
17 Institute (EPRI), which the applicant used to determine anticipated corona noise source levels.
18 The second method used the Datakustik Computer-Aided Noise Abatement Program (CadnaA)
19 program, which conforms to the Organization for International Standardization (ISO) standard
20 9613-2, Attenuation of Sound During Propagation Outdoors.⁶⁷⁷ CadnaA was used to model how
21 sound travels outward (attenuates) from the transmission line to receivers in multiple
22 dimensions.

23
24 The applicant predicted audible noise generated from corona in fair and foul weather
25 conditions at the edge of the right of way (ROW) and directly under the transmission line using
26 the ENVIRO program, which utilizes the BPA CAFE calculation method.⁶⁷⁸ The applicant modeled
27 sound levels from the proposed transmission line using the maximum voltage levels of 550 kV,
28 representing the maximum operational corona noise. However, the applicant explains that it
29 expects the proposed transmission line would operate at the normal operating voltage of 525
30 kV approximately 50 percent of the time, with the voltage reaching 550 kV only approximately
31 0.01 percent of the time and that operating conditions at 525 kV would yield approximately 2

⁶⁷⁶ The applicant provided a mapset illustrating additional NSRs evaluated in response to comments received on the DPO
(see Attachment X-5 of this order). B2HAPPDoc13 DPO IPC Responses to Select DPO Comments Rec'd by 2019-11-07;
B2HAPP DPO IPC Responses - StopB2H - 4. Noise - 1st Supplemental Response 2019-11-05.

⁶⁷⁷ B2HAPPDoc3-41 ASC 24 Exhibit X Noise ASC 2018-09-28, Attachment X-3, p.4.

⁶⁷⁸ The US Department of Energy's Corona and Field Effects (CAFE) program was used to model sound levels from the
proposed transmission line and includes, but is not limited to, data for elevation or altitude, weather including humidity,
tower and conductor configurations, and voltage. B2HAPPDoc3-41 ASC 24 Exhibit X Noise ASC 2018-09-28 and
B2HAPPDoc13 DPO IPC Responses to Select DPO Comments Rec'd by 2019-11-07; B2HAPP DPO IPC Responses - StopB2H
- 4. Noise - 1st Supplemental Response 2019-11-05.

1 dba less noise than 550 kV, which was used in the noise modeling.⁶⁷⁹ The edge of the ROW
 2 represents the closest point of the site boundary where the proposed transmission line may be
 3 located. During fair weather conditions, predicted operational noise levels for single-circuit 500-
 4 kV lattice structure transmission lines, operating at a 550-kV voltage, are approximately 27 dBA
 5 at the ROW edge. Under foul weather conditions, audible noise levels are expected to be
 6 approximately 52 dBA at the ROW edge.⁶⁸⁰ These noise levels can be compared to Figure 12,
 7 *Common Noise Sources and Expected Noise Levels*, which illustrates that a soft whisper three
 8 feet away has a noise level of approximately 40 dBA and a conversation at three feet away is
 9 approximately 60 dBA.

10
 11 To determine the frequency of foul weather events in the vicinity of potentially impacted NSRs,
 12 the applicant conducted an analysis of the historical meteorological data at four data collection
 13 stations located in proximity to the proposed facility. The applicant assumed foul weather to be
 14 a rain rate ranging from 0.8 to five millimeters (mm)/hour because it is a more conservative
 15 definition of the weather conditions likely to result in maximum corona noise used by the CAFE
 16 program (one mm/hour), and is consistent with EPRI guidance.⁶⁸¹ It also excludes precipitation
 17 heavy enough that it could be expected that the noise from the weather would increase
 18 ambient sound levels to the extent that the corona noise would be masked and not audible.

19
 20 The Department engaged its consultant, Golder Associates Inc. (Golder), appointed by the
 21 Council, to assist in ASC review. The Department requested that Golder provide an evaluation
 22 of ASC Exhibit X, specifically on the applicants' methodologies for conducting baseline surveys
 23 and analysis for identifying the frequency of foul weather. Golder provided a technical
 24 memorandum stating that, "...sound measurement procedures... found the baseline noise
 25 analysis to be properly performed from a technical standpoint and the use of the "late night"
 26 noise level to be conservative in nature for use as the baseline noise level for comparison to the
 27 ambient antidegradation standard."⁶⁸² Additionally, Golder's technical memorandum expressed
 28 that historical weather data is the preferred standard to use to perform similar noise analyses
 29 and that the weather stations chosen for analysis were complete and accurate. The results of
 30 the applicants' noise analysis are presented below.

31 *Results of Noise Analysis*

32
 33
 34 The results of the corona noise analysis are presented in ASC Exhibit X, Attachment X-4 which is
 35 also attached to this order. The tabulated summary of the noise modeling analysis in
 36 Attachment X-4 identifies the NSR number, distance to the proposed transmission line (edge of
 37 the site boundary), baseline late night sound pressure levels, predicted sound levels during fair
 38 and foul weather, and the estimated increase in ambient noise during foul weather conditions

1 at the late night baseline. ASC Exhibit X Attachment X-5 (also attached to this order) provides
 2 aerial maps showing all of the NSR's identified and evaluated during the study, and indicates if
 3 there is an expected exceedance of the ambient antidegradation standard. The evaluation
 4 provided in the ASC identified 36 NSRs with potential noise exceedances to the ambient
 5 antidegradation standard and the applicant's evaluation provided in response to comments on
 6 the DPO identified potential exceedances at four previously identified NSRs and one additional
 7 NSR not identified in the ASC, for a total of 41 NSRs that may experience an exceedance during
 8 foul weather conditions.⁶⁸³ Table NC-43, *Summary of Acoustic Modeling Results – Comparison of*
 9 *Predicted Facility Sound Levels to Late Night Baseline L50* below specifies the NSR's where the
 10 ambient L50 noise level is expected to increase by 10 dBA or more in one hour, which would
 11 represent an exceedance of the ambient antidegradation standard.

Table NC-4: Summary of Acoustic Modeling Results—Comparison of Predicted Facility Sound Levels to Late Night Baseline L50 (NSR Exceedances)

125	1,378	7.4	32	43	+11
<i>Baker County</i>					

⁶⁸³ In a supplemental noise evaluation, the applicant modeled H-frame towers for the Morgan Lake alternative resulting in predicted noise exceedances at campgrounds at Morgan Lake Park, identified as NSRs: 142, 143, 147, and 148. However, based on consultation with City of La Grande, the Department verified that the identified NSR locations are day use areas and not campgrounds, and therefore would not be considered a property “normally used for sleeping,” which defines an NSR under the DEQ noise rules. The Department omitted these day use areas from Table NC-3 and in the evaluation of compliance with the DEQ noise rules. The applicant identified and provided results from its noise modeling analysis at other campsites at Morgan Lake Park and identifies them as NSRs 133, 134, 135, 136, 137, 138, 140 and 141. There are not anticipated noise exceedances at any of these campsites, therefore these NSRs are not listed in Table NC-4. Source: B2HAPPDoc3-41 ASC 24_ Exhibit X_Noise_ASC 2018-09-28, Table X-5, and B2HAPPDoc13 DPO IPC Responses to Select DPO Comments Rec'd by 2019-11-07; B2HAPP DPO IPC Responses - StopB2H - 4. Noise - 2nd Supplemental Response 2019-11-06.

1
2
3*Compliance with DEQ Noise Rules: Maximum Allowable Sound Level Standard*

4 The maximum allowable L50 sound level standard is 50 dBA. ASC Exhibit X [Attachment-Table X-](#)
5 [54](#) provides the results of the applicants' noise modeling analysis and demonstrates that at the

1 relevant NSRs, the maximum sound level in a “worse-case scenario” (during foul weather) will
2 be no greater than ~~47~~6 dBA. The Department recommends that the Council find that because
3 the maximum L50 sound levels would be less than the “Table 8” maximum allowable sound
4 level, 50 dBA, even during foul weather conditions, the proposed facility would be in
5 compliance with the maximum allowable sound level standard identified in OAR 340-035-
6 0035(1)(b)(B)(i).

7
8 *Compliance with DEQ Noise Rules: Ambient Antidegradation Standard*
9

10 The ambient antidegradation standard under OAR 340-035-0035(1)(b)(B)(ii) allows a maximum
11 increase in ambient statistical noise of 10 dBA, as measured at an “appropriate measurement
12 point” from noise generated from a new industrial source. “Appropriate measurement point” is
13 defined in -0035(3)(B) as a point on the noise sensitive property (NSR) nearest to the noise
14 source. Based on the applicant’s analysis, operational noise from the proposed facility, during
15 foul weather, ~~and~~ low wind, and quietest times during the early morning, may exceed the
16 ambient antidegradation standard as represented by the evaluation at 36-41 NSRs.

17
18 OAR 340-035-0035(6)(a) allows the Council to consider exceptions to the rule, if the owner of a
19 noise source submits a written request for an exception meeting the criteria in the rules.
20 Additionally, OAR 340-035-0100 allows specific variances from particular requirements of any
21 rule, regulation, or order under certain circumstances as described in the DEQ noise rules.
22

23 The applicant requests that Council grant an exception to the ambient antidegradation
24 standard (L50 ambient sound level) for unusual or infrequent events, as authorized under OAR
25 340-035-0035(6)(a), for the entirety of the proposed facility. The Department first evaluates
26 whether the exception should be granted for the entirety of the proposed transmission line
27 route; and, then whether the identified foul weather events should be considered unusual or
28 infrequent.

29
30 *Request for Exception to the Ambient Antidegradation Standard – Entirety of*
31 *Proposed Transmission Line Route [OAR 345-035-0035(6)(a)]*
32

33 The applicant requests Council authorization of an exception from compliance with the ambient
34 antidegradation standard due to unusual or infrequent foul weather events, as authorized
35 under OAR 340-035-0010 and OAR 345-035-0035(6)(a), for the entirety of the proposed
36 transmission line route. In the alternative, as most appropriate for non-linear industrial noise
37 sources such as natural-gas, wind or solar energy facilities, because -0035(1)(b)(B)(i) establishes
38 that compliance with the ambient antidegradation standard be based on noise levels measured
39 (predicted) at a point 25 feet from the NSR closest to the noise source, Council could evaluate
40 the exception request specific only to the NSR locations where an exceedance is predicted. The
41 ambient antidegradation standard does not address the difference between a non-linear and
42 linear facility, but those differences should be acknowledged through Council interpretation.
43

1 Consistent with the applicant’s interpretation, the Department recommends Council interpret -
2 0035(1)(b)(B)(i) for linear facilities, such as transmission lines, as establishing a 10 dBA ambient
3 statistical noise level at identified NSRs but that NSRs would only establish the measurement
4 point for use as a proxy in determining compliance of the entire line, as the noise source. For
5 this analysis, consistent with -0035(3)(b), the applicant conducted multiple desktop and ground
6 surveys throughout the ASC process, as described in ASC Exhibit X, in efforts to identify all
7 potential NSR locations for use as appropriate measurement points to evaluate the proposed
8 facility’s compliance with the ambient antidegradation standard. The applicant identified 132
9 NSR locations, or points, within the analysis area~~to evaluate proposed facility compliance with~~
10 ~~the standard;~~ of the 132 NSR locations, 41 NSR locations resulted in a predicted exceedance.

11
12 Given the extent of exceedances predicted to occur in each of the five counties crossed by the
13 proposed facility, including alternative segments, as presented in Table NC-4, Summary of
14 Acoustic Modeling Results – Comparison of Predicted Facility Sound Levels to Late Night
15 Baseline L50 above, Therefore,~~the Department recommends Council~~ evaluate the exception
16 request for the entirety of the transmission line alignment based on its interpretation that the
17 ambient antidegradation standard under -0035(1)(b)(B)(i) applies to the transmission line as the
18 noise source, where identified NSRs represent the appropriate measurement points for which
19 to determine overall compliance of the line. The Department agrees that OAR 340-035-0035
20 applies to new industrial or commercial noise sources, and in this instance, the noise source is
21 the proposed transmission line. However, in the absence of a formal definition of “noise
22 source” within the rule and given the extent of the linear facility, the Department interprets
23 noise source as the source of noise and specific noise level at identified NSR locations. Based on
24 this interpretation, the exception would only apply at the identified NSR locations or grouping
25 of NSRs where the specific noise level from the noise source exceeds the ambient
26 antidegradation noise standard, which is estimated to occur at 36 specific NSR locations. An
27 exception for the entirety of the proposed transmission line is not necessary as the noise source
28 would not exceed the ambient antidegradation standard at other NSR locations along the
29 route. Therefore, the Department recommends Council evaluate and apply the requested
30 exception to the noise source at the 36 identified NSR locations, and not for the entire
31 alignment of the proposed. evaluate and apply the identified NSR locations, and not for the
32 entire alignment of the proposed.

33
34 *Request for Exception to the Ambient Antidegradation Standard – Unusual or*
35 *Infrequent Events (OAR 340-035-0035(6)(a))*
36

37 The applicant requests Council authorization of an exception from compliance with the ambient
38 antidegradation standard due to unusual or infrequent foul weather events, as authorized
39 under OAR 345-035-0035(6)(a). To predict the frequency of foul weather conditions in the
40 analysis area, the applicant evaluated hourly meteorological data, from 2008-2012, including
41 precipitation, wind speed, wind direction, average air temperature, relative humidity, and solar
42 radiation from the following four Western Regional Climate Center (WRCC) meteorological
43 stations - Flagstaff Hill, La Grande, Owyhee Ridge, and Umatilla Northwest Wildlife Refuge. In
44 ASC Exhibit X, the applicant utilized the meteorological datasets for each WRCC station to

1 ascertain diurnal and seasonal variations in weather conditions. Additionally, the applicant
2 identified periods of rainfall events over the course of consecutive days and consecutive hours
3 to inform their definition of infrequent. The applicant averaged the data from the
4 meteorological stations and found that foul weather (i.e. weather conditions comprised of a
5 rain rate of 0.8 to five millimeters per hour [mm/hr]) occurred for at least one hour during 13
6 percent of the days (or approximately 48 days per year).

7
8 The applicant conducted a sensitivity analysis during the late night-time period and provided
9 the results in ASC Exhibit X, Table X-9. Based on historic average rainfall conditions measured at
10 the 4 WRCC meteorological stations, the frequency of foul weather conditions lasting one hour
11 or more ranges from 22 to 80 days per year, with foul weather occurring in the late night hours
12 (for a period of one hour or more), between two and seven percent of the time.

13
14 The Department utilized a third-party consultant, Golder Associates, to support technical
15 review of the exception request, specifically the accuracy of weather data relied upon and
16 applicant's evaluation of foul weather frequency. The Department's consultant utilized a
17 trained meteorologist for the evaluation and determined the meteorological data to be
18 complete and accurate, and the assumed rain rate of 0.8 to 55 mm/hr used in the acoustic
19 modeling, based on the meteorological data, to be conservative for a predominately arid
20 region. Based on its review, the consultant recommended the Department consider that,
21 because the applicant applied a higher than average rain rate, the likelihood of ambient
22 antidegradation standard exceedance could reasonably be limited to infrequent or unusual
23 events.⁶⁸⁴

24
25 The phrase "infrequent or unusual" is not defined in DEQ's statutes (ORS 467.030) or noise
26 rules.⁶⁸⁵ Therefore, to resolve ambiguity, the Department considers it necessary to interpret the
27 phrase based on the regulatory interpretation methodology described in *PGE v. Bureau of Labor*
28 *and Industries*, 317 Or 606, 610-12 (1993) and modified in *State v. Gaines*, 346 Or 160 (2009)
29 *("Gaines")*. Consistent with the methodology, the Department considers the text and context of
30 the phrase within the rule, and applies the general maxims of regulatory language construction
31 to support its interpretation. The relevant dictionary definition of "infrequent" and "unusual"
32 is: "occurring at wide intervals in time," and "uncommon" or "rare."⁶⁸⁶ The definitions includes
33 the concept that the circumstances ~~While there is no definition of "infrequent" or "unusual,"~~
34 ~~based in rule, the Department interprets infrequent or unusual events as events that are not~~
35 constant, not continuous, and not representative of normal operating conditions.

⁶⁸⁴ B2HAPPDoc ApASC Golder Noise Memo 1788390 B2H Exhibit X 2017-12-19

⁶⁸⁵ B2HAPPDoc13 DPO IPC Responses to Select DPO Comments Rec'd by 2019-11-07; B2HAPP DPO IPC Responses - StopB2H
- 4. Noise - 1st Supplemental Response 2019-11-05, Kreider, F. Gilbert, I.

⁶⁸⁶ "Infrequent." *Merriam-Webster.com Dictionary*, Merriam-Webster, <https://www.merriam-webster.com/dictionary/infrequent>. Accessed 21 May. 2020. "Unusual." *Merriam-Webster.com Dictionary*, Merriam-Webster, <https://www.merriam-webster.com/dictionary/unusual>. Accessed 21 May. 2020.

1 Having considered the text of the rule, the Department considers the contextual rule provisions
2 under OAR 340-035-0005 which states that the underlying policy of the noise rules is to protect
3 the health, safety and welfare of Oregon citizens from the hazards and deterioration of the
4 quality of life imposed by excessive noise emissions. Given that the -0005 policy is to protect
5 citizens from excessive noise emissions which, under typical meteorological conditions for the
6 region, is not expected from the proposed facility, it appears contrary not to consider foul
7 weather events - the contributing factors of excessive noise emissions - unusual or infrequent
8 under OAR 340-035-0035(6)(a). Therefore, based on the Department's review, technical
9 review and recommendations of its third-party consultant, Golder Associates, analysis
10 presented in ASC Exhibit X and the analysis described presented above, the Department
11 recommends Council find that exceedances of the ambient antidegradation standard during
12 foul weather events would be infrequent or unusual under OAR 340-035-0035(6)(a) and that
13 Council grant an exception to the proposed facility. from compliance with the ambient
14 antidegradation standard during foul weather events to the ambient antidegradation standard
15 at the identified 36 NSR locations pursuant to OAR 345-035-0035(6)(a) because the
16 circumstances where foul weather conditions would generate audible corona noise represent
17 unusual or infrequent events.

18
19 OAR 340-035-0010(2) provides a directive to DEQ for establishing exceptions, which the
20 Department interprets as applying to DEQ in the assessment of exceptions established pursuant
21 to OAR 345-035-0035(6)(a). However, the applicant interprets the directive as additional
22 considerations to be evaluated by Council in determining whether to grant an exception; these
23 considerations include:

- 24
- 25 • the protection of health, safety, and welfare of Oregon citizens;
- 26 • the feasibility and cost of noise abatement;
- 27 • the past, present, and future patterns of land use;
- 28 • relative timing of land use changes; and
- 29 • other legal constraints.
- 30

31 In the event Council considers OAR 340-035-0010(2) to represent evaluative criteria for
32 determining whether to grant an exception, the Department presents its review of the
33 applicant's evaluation below.

34
35 *Protection of Health, Safety, and Welfare of Oregon Citizens*

36
37 The applicant requests that Council consider that granting an exception to DEQ's ambient
38 antidegradation standard would not preclude the protection of health, safety and welfare of
39 Oregon citizens otherwise afforded through compliance, based on the following reasons
40 discussed in this section. Potential impacts from the ambient antidegradation standard
41 exceedance along the proposed transmission line and at 36-41 NSR locations would be
42 infrequent estimated under worse-case conditions anticipated to occur two to seven percent of
43 the time; and, Further, actual noise-related impacts are assumed-anticipated to be minimal as
44 residents are assumed to be indoors at the time of the exceedance at during late night and very

1 early mornings (12:00 a.m. to 5:00 a.m.) and during foul weather (i.e. when it is raining).
2 Therefore it's expected that NSRs would experience noise levels inside their houses 10 dBA
3 (with windows open) to 20 dBA (with windows closed) lower than modeled in ASC Exhibit X due
4 to noise attenuation and absorption of by residential structures.⁶⁸⁷

5
6 As represented in ASC Exhibit X, the applicant also commits to working with impacted NSRs to
7 attempt to resolve concerns, avoid, monitor, and mitigate noise at NSRs caused by audible
8 corona noise and potential exceedances.^{688, 689} The mitigation plan may include micrositing the
9 relevant portions of the proposed transmission line within the site boundary; however, the
10 applicant reiterates that the micrositing may not affect other landowners, unless agreed-to in
11 writing by those other landowners. Other mitigation measures include, but are not limited to
12 the installation of, or cash equivalent of, certain window treatments shown to be effective in
13 reducing indoor sound pressure levels.⁶⁹⁰ Further, the applicant represents that it would
14 establish a system to receive and respond to complaints associated with potential operational
15 corona noise from landowners not identified in Attachment X-5 of this order. The complaint
16 response plan includes a process for complaint filing, receipt, review and response for NSR
17 exceedances evaluated in the ASC and NSRs that are not identified in the ASC.

18
19 Based on the applicant's representations, the Department recommends Council impose the
20 following conditions related to Noise Exceedance Mitigation Plans and a complaint response
21 plan:

22
23 **Recommended Noise Control Condition 1:** Prior to construction, the certificate holder will
24 work with the 4136 NSR property owners identified in Attachment X-5 of the Final Order on
25 the ASC (NSR: 8, 9, 10, 11, 5002, 69, 70, 5004, 46, 119, 121, 125, 5010, 5011, 92, 93, 94, 95,
26 96, 97, 98, 99, 100, 101, 102, 103, 104, 105, 106, 107, 108, 109, 110, 518, 111, 112, 133,
27 5008, 5009, 113, and 115) to develop mutually agreed upon Noise Exceedance Mitigation
28 Plans, specific to each NSR location. The site-specific Noise Exceedance Mitigation Plans will

⁶⁸⁷ The Federal Highway Administration (FHWA) guidance for estimating the reduction of traffic noise provided by buildings is 10 dBA with the windows open and 20 to 25 dBA for ordinary windows or storm windows, respectively. See U.S. Department of Transportation, Federal Highway Administration, Highway Traffic Noise: Analysis and Abatement Guidance, Table 6 (2011). B2HAPPDoc13 DPO IPC Responses to Select DPO Comments Rec'd by 2019-11-07; B2HAPP DPO IPC Responses - StopB2H - 4. Noise 2019-10-29.

⁶⁸⁸ In accordance with the OAR 345-021-0010(1)(x) information requirement for DEQ's noise rules, the evaluation of compliance (and potential exceedances) is based on "predicted" noise levels – "predicted" noise levels are derived from acoustic noise modeling, as presented in ASC Exhibit X; monitoring of actual noise levels would only be necessary if required by the Department's or represented by the applicant.

⁶⁸⁹ The Department notes that, while the DEQ noise rules do not expressly require mitigation for noise exceedances, an evaluation of the rule language related to the "Protection of Health, Safety, and Welfare of Oregon Citizens" for an exception to the noise rules may result in Department-recommended mitigation for impacts from operational noise if an applicant did not propose a mitigation and complaint programs, or if the applicant proposal is determined to be insufficient.

⁶⁹⁰ B2HAPPDoc3-41 ASC 24 Exhibit X Noise ASC 2018-09-28, Section 3.5.

1 include agreed upon measures that would be implemented at the NSR location to minimize
2 or mitigate the ambient antidegradation standard noise exceedance.

- 3 a. If the certificate holder executes an agreement with the NSR property owner, the
4 certificate holder will submit a signed acknowledgement from the property owner to
5 the Department for its records.
6 b. If the certificate holder cannot reach an agreement with the NSR property owner, the
7 certificate holder will submit to the Department a list of the dates that the certificate
8 holder communicated with, or attempted to communicate with, the NSR property
9 owners; and the names, addresses, and phone numbers of the NSR owners.

10
11 **Recommended Noise Control Condition 2:** During operation, the certificate holder shall
12 develop and implement a complaint response plan to address noise complaints. The plan
13 shall be submitted to the Department and shall include the following:

- 14 a. Scope of the complaint response plan, including process for complaint filing, receipt,
15 review and response. The scope shall clearly describe how affected persons will be
16 provided necessary information for filing a complaint and receiving a response.
17 b. The certificate holder shall notify the Department within three working days of
18 receiving a noise complaint related to the facility. The notification shall include the date
19 the certificate holder received the complaint, the nature of the complaint, weather
20 conditions of the date for which the complaint is based (including wind speed,
21 temperature, relative humidity, and precipitation) as described by the complainant,
22 duration of perceived noise issue, the complainant's contact information, the location
23 of the affected property, and a schedule of any actions taken or planned to be taken by
24 the certificate holder (including inspection and maintenance actions, or actions taken or
25 planned to be taken pursuant to the processes described in subsections c and d of this
26 condition).
27 c. If a noise complaint is received, the certificate holder shall follow the following
28 process to determine if corona noise exceeds the ambient antidegradation
29 standard:
30 i. If the complainant's noise sensitive property or properties are included
31 in Attachment X-5 of the Final Order on the ASC, the modeled sound level
32 increases as presented in Attachment X-4 of the Final Order on the ASC may be
33 relied upon to determine whether the corona noise exceeds the ambient
34 antidegradation standard, unless the complainant voluntarily provides
35 alternative noise data.
36 ii. If the complainant's noise sensitive property or properties are not
37 included in Attachment X-5 of the Final Order on the ASC, the certificate holder
38 shall model the sound level increases using the methods set forth in ASC Exhibit
39 X, unless the complainant voluntarily provides alternative noise data.
40 iii. If the complainant voluntarily provides alternative noise data and it represents
41 noise levels greater than the certificate holder's modeling results conducted per
42 (ii), the complaint shall be verified through site specific sound monitoring
43 conducted by the certificate holder. If site specific sound monitoring is not

1 authorized by the complainant, the certificate holder's modeling results may be
2 relied upon to determine compliance.

3 iii-iv. In the event of a dispute regarding complainant's noise data and the
4 certificate holder's data from site specific sound monitoring, the Department, in
5 consultation with its consultant, if necessary, shall make the final determination
6 regarding which data will be used to determine whether corona noise exceeds
7 the ambient antidegradation standard.

8 d. If it is determined pursuant to the process described in subsection c of this condition
9 that corona noise exceeds the ambient antidegradation standard, the certificate holder
10 shall address the exceedance by the following process:

11 i. The certificate holder will work with the NSR property owner to develop a
12 mutually agreed upon mitigation plan to include agreed upon measures that
13 would be implemented at the NSR location to minimize or mitigate the ambient
14 antidegradation standard noise exceedance. If the certificate holder executes an
15 agreement with the NSR property owner, the certificate holder will submit a
16 signed acknowledgement from the property owner to the Department for its
17 records. If the certificate holder cannot reach an agreement with the NSR
18 property owner, the certificate holder will submit to the Department: (1) the
19 certificate holder's proposed measures, if any, to avoid, minimize, or mitigate
20 the ambient antidegradation standard noise exceedances at the relevant NSRs;
21 and (2) a list of the dates that the certificate holder communicated with, or
22 attempted to communicate with, the NSR property owners; and (3) the names,
23 addresses, and phone numbers of the NSR owners.

24 e. The certificate holder shall provide necessary information to the complainant to support
25 understanding of corona noise, corona noise levels and effects, and of the process to
26 verify actual noise levels of events resulting in complaints. If the complainant opts not to
27 authorize the certificate holder to conduct monitoring, and it is otherwise determined
28 pursuant to the process described in subsection c of this condition that corona noise
29 does not exceed the ambient antidegradation standard, the noise complaint shall be
30 considered fully resolved and no mitigation shall be required.

31
32 Based on the above analysis and compliance with the recommended conditions, the
33 Department recommends Council consider that granting the exception would not preclude the
34 protection of health, safety, and welfare of Oregon citizens otherwise afforded through
35 compliance with DEQ's noise control regulation.

36
37 *Feasibility and Cost of Noise Abatement*

38
39 The applicant requests that Council consider that granting an exception to DEQ's ambient
40 antidegradation standard is appropriate due to the limitations of the feasibility and cost of
41 noise abatement. The applicant represents that the design of the proposed transmission line
42 would minimize corona noise, specifically a design that includes a triple bundled configuration
43 with sufficient subconductor spacing. The triple-bundled configuration and subconductor

1 spacing would provide adequate current carrying capacity and provide for a reduction in
2 audible noise (corona effect) and radio interference.

3
4 The applicant describes that typical noise abatement technologies, such as insulators, silencers,
5 and shields, are not reasonable technologies for transmission lines due to length; and, safety
6 and operational limitations. To ensure the applicant constructs the proposed transmission line
7 using materials to reduce corona noise, the applicant proposes, and the Department
8 recommends, the Council impose the following condition:

9
10 **Recommended Noise Control Condition 3:** During construction, the certificate holder shall
11 implement the following design measures and construction techniques to minimize
12 potential corona noise during operations:

- 13 a. For 500 kV transmission lines, use a triple bundled conductor configuration.
- 14 b. Maintain tension on all insulator assemblies to ensure positive contact between
15 insulators.
- 16 c. Protect conductor surface to minimize scratching or nicking.

17
18 Because the applicant proposes to design and construct the proposed facility in a manner that
19 reduces audible corona noise, and has described the limitations of noise abatement
20 technologies, the Department recommends that Council consider that noise abatement
21 technology is not feasible when granting the exception to compliance with DEQ's noise control
22 regulation.

23
24 *Past, Present, and Future Patterns of Land Use and Relative Timing of Land Use Changes*

25
26 For the purposes of the Council's consideration of the past, present, and future patterns of land
27 use and relative timing of land use changes for evaluating an exception to the DEQ noise rules,
28 the Department presumes this evaluation may be the most informative in the context of
29 residential areas because of the increased potential to impact NSRs. The applicant explains that
30 the location of the NSR's where there is an expected exceedance would be in natural resource
31 zones (Goal 3 agricultural lands/EFU or Goal 4 forest lands) and that none of the anticipated
32 exceedances occur on residential use zoned land.⁶⁹¹ Further, the applicant states that it has no
33 information to indicate that significant future land use changes are likely to occur at or near the
34 relevant NSRs.

35
36 The Department recommends that the Council consider-conclude that because the proposed
37 facility is not located within residential use zoned land and there is no indication that any of
38 these land use areas will be changed to residential zoning in the future, that ~~this factor not be~~
39 ~~considered relevant to the request for exception~~ there is a diminished likelihood of impacting
40 additional NSRs in in the future.

41

⁶⁹¹ B2HAPPDoc3-19 ASC 11_Exhibit K_Land Use_ASC 2018-09-28, Section 7.10.

1 *Other Legal Constraints*

2
3 In ASC Exhibit X, the applicant summarizes legal constraints that directed or contributed to the
4 final location of the proposed and alternative routes for the Council’s review. -These constraints
5 include the following:

- 6
7 • Federal land management agency requirements, including the federal land management
8 plans governing many of the federal lands in the analysis area;
- 9 • The transmission line route on lands managed by the Bureau of Land Management as
10 issued in the BLM’s Record of Decision (ROD);
- 11 • Western Electricity Coordinating Council Common Corridor Criteria and prudent utility
12 practice, including minimum separation distances from existing transmission lines to
13 ensure reliability of facilities;
- 14 • Council’s Fish and Wildlife Habitat Standard, adopts the Oregon Department of Fish and
15 Wildlife’s habitat mitigation policy; which does not permit siting of an energy facility on
16 lands designated Category 1 habitat and recommends avoidance and minimizing
17 impacts to Greater Sage Grouse habitat; ~~and~~
- 18 • Council’s Protected Area Standard, which does not permit siting of an energy facility in
19 certain protected areas, such as parks, scenic waterways, and wildlife refuges, and
20 certain federally designated areas, such as areas of critical environmental concern,
21 wilderness areas, wild and scenic rivers, BLM Class I and U.S. Department of Agriculture,
22 Forest Service Retention visual management areas, national monuments, and National
23 Wildlife Refuges (NWRs); and
- 24 • Requirements imposed as part of the EFSC review process and compliance with site
25 certificate conditions.
- 26

27 In addition to the summary of the legal constraints provided above, the applicant provides site-
28 specific descriptions of the siting constraints and obligations that directed the placement of the
29 proposed and alternatives routes in proximity to the NSRs that are predicted to experience
30 exceedances. The below site-specific and NSR-specific descriptions inform the above analysis
31 and also are relied upon for the later analysis of the applicant’s request for a variance to the
32 DEQ noise rules. The Department recommends that the Council consider that other legal
33 constraints directed the placement of the proposed transmission line with respect to NSR²s, and
34 meets the evaluation for an exception to the DEQ noise rules.

35

36 NSR-8, -9, -10, -11, and -5002 (Attachment X-5, Map 6): Comments from Morrow and Umatilla
37 counties, provided to the Bureau of Land Management (BLM) during the NEPA review in the
38 Draft Environmental Impact Statement (DEIS), recommended the locations of this portion of
39 the proposed facility. As shown in ASC Exhibit X, Figure X-5, the proposed route threads
40 between NSR-11 and NSR-9/-10 at a point that is approximately halfway between those NSRs.
41 Moving the proposed route immediately to the north would increase the noise levels at NSR-
42 11, and moving the proposed route immediately to the south would increase the noise levels at
43 NSR-9/-10. Moving the proposed route to the north or south and beyond these NSRs would

1 result in a route that no longer follows the route recommended by the counties. Moving the
2 proposed route would impact new landowners, potentially impact new resources including new
3 NSRs, and would potentially trigger additional permitting requirements. With respect to NSR-
4 8/-5002, the applicant estimates that the noise levels at these NSRs would potentially increase
5 by 11 dBA, which is one dBA above the regulatory threshold (requiring no more than a 10 dBA
6 increase). The applicant states they may be able to microsite the proposed route near the
7 southern edge of the site boundary to lessen the noise levels at NSR-8/-5002 to potentially
8 avoid an exceedance.

9
10 NSR-69 and -70 (Attachment X-5, Map 21): The proposed route parallels existing transmission
11 lines to the north and south of this portion of the proposed facility. In the vicinity of NSR-69 and
12 NSR-70, the proposed route bumps out from existing transmission lines to avoid affecting an
13 Oregon Department of Transportation (ODOT) rock quarry. As shown In ASC Exhibit X, Figure X-
14 6, if the proposed route continued along the path paralleling the existing transmission line it
15 would affect the operations of the ODOT quarry. Additionally, the relevant area is designated
16 Greater Sage-Grouse Core Area Habitat; a state sensitive and protected species with protected
17 habitat. Re-routing to the east would result in greater impacts the Sage Grouse habitat.

18
19 NSR-5004 and -46 (Attachment X-5, Map 15; Attachment 1 Mapset):⁶⁹² The proposed route
20 runs northwest to southeast near NSR- 5004 and NSR-46, tracing the foothills above the City of
21 La Grande. As shown in ASC Exhibit X, Figure X-7, the location of the proposed route in this
22 vicinity was a result of a route-variation recommended by Union County provided in the BLM's
23 Final Environmental Impact Statement (FEIS). The recommendation was to parallel the existing
24 230-kV transmission line except in the general area of the City of La Grande. The relevant
25 section of the proposed route may be visible from the City of La Grande, and rerouting may
26 increase the visibility of the proposed transmission line from the City. In its updated noise
27 assessment for this area, the applicant modeled H-frame tower structures on this portion of the
28 proposed route based on an agreement between the applicant and the City of La Grande
29 discussed in Section III.B.2., Proposed Facility Location by County in this order. The City of La
30 Grande and Union County have expressed their concerns about the visual impacts of the
31 proposed facility, in particular the visual impacts from the proposed route on the City of La
32 Grande.

33
34 NSR-119, -121, -125 (Attachment X-5; Attachment 1 Mapset):⁶⁹³ At MP 4.7, the Morgan Lake
35 alternative turns southeast and at MP 6.3 passes about 0.2 mile southwest of Morgan Lake
36 Park. In comparison with the proposed route, the Morgan Lake alternative crosses fewer

⁶⁹²B2HAPPDoc13 DPO IPC Responses to Select DPO Comments Rec'd by 2019-11-07; B2HAPP DPO IPC Responses - StopB2H
- 4. Noise - 1st Supplemental Response 2019-11-05, responses in table and Attachment 1 – Mapset.

⁶⁹³B2HAPPDoc13 DPO IPC Responses to Select DPO Comments Rec'd by 2019-11-07; B2HAPP DPO IPC Responses - StopB2H
- 4. Noise - 1st Supplemental Response 2019-11-05, responses in table and Attachment 1 – Mapset.

1 parcels with residences and was developed in consultation with landowners.⁶⁹⁴ In its updated
2 noise assessment for this area, the applicant modeled H-frame tower structures based on
3 Recommended Recreation Condition 1, which requires the use of H-frame towers near Morgan
4 Lake Park to reduce visual impacts. The use of H-frame towers to reduce potential visual
5 impacts to recreational users at Morgan Lake Park resulted in an approximately 3 dBA
6 increase over the previously modeled lattice towers, which resulted in potential exceedances at
7 NSRs-119, -121, -125.⁶⁹⁵

8
9 NSR-5010 (Attachment X-5, Map 34): The proposed route runs northwest to southeast near
10 NSR- 5010, through the hills west of Durkee. This portion of the proposed route was developed
11 in response to comments received on the BLM’s Draft EIS and in coordination with Baker
12 County. The route is intended to reduce impacts on agricultural land uses, high-value soils for
13 agricultural uses, and privately-owned lands in and around Durkee. As shown in ASC Exhibit X,
14 Figure X-8, moving the proposed transmission line to the east may increase the visibility of the
15 proposed transmission line from the Durkee; moving the proposed route to the west may
16 increase impacts to Bighorn Sheep Occupied Range, which is Category 2 habitat designated by
17 the Oregon Department of Fish and Wildlife (ODFW).

18
19 NSR-92 through -110, and -518 (Attachment X-5, Map 30 and Map 31 and Attachment 1
20 Mapset).⁶⁹⁶ In earlier versions of the proposed transmission line route, the applicant proposed
21 to avoid the Willow Creek valley area due to the presence of several NSR’s. The applicant
22 proposed to locate the route primarily on Bureau of Land Management (BLM) lands to the
23 north and west of the proposed route location. However, these proposals were in Greater Sage-
24 Grouse habitat and near known Sage-Grouse leks (Sage-Grouse Core Area Habitat and Sage-
25 Grouse Areas of High Population Richness). As a result, the BLM required the applicant to avoid
26 those areas. The BLM then identified the current proposed route (as shown in ASC Exhibit X,
27 Figure X-9 and X-10), which required crossing the Willow Creek valley. The BLM chose the
28 current crossing (proposed route) because it represented the location where BLM lands
29 encroached furthest into the valley thereby having the proposed route cross the fewest miles of
30 private property. The applicant evaluated route options through the private property but the
31 options appeared to have similar effects with respect to the number of affected NSRs, property
32 owners, and transmission line miles on private property. Accordingly, the proposed route
33 represented the best option for minimizing impacts to NSRs and to avoid affecting center-pivot

⁶⁹⁴ B2HAPPDoc3-9 ASC 03 Exhibit C Project Location ASC 2018-09-28, Section 3.2.2.3.

⁶⁹⁵ B2HAPPDoc13 DPO IPC Responses to Select DPO Comments Rec'd by 2019-11-07; B2HAPP DPO IPC Responses - StopB2H
- 4. Noise - 1st Supplemental Response 2019-11-05.

⁶⁹⁶ As discussed in *Methods and Assumptions for Corona Noise Analysis* of this section, the applicant performed a secondary
review applying its methodologies which, on a case-by-case basis, extended out to one mile from the site boundary. This
verification review identified NSR 518, which was not previously identified in the ASC, therefore similar site-specific
siting considerations as other nearby NSRs applies. B2HAPPDoc13 DPO IPC Responses to Select DPO Comments Rec'd by
2019-11-07; B2HAPP DPO IPC Responses - StopB2H - 4. Noise - 1st Supplemental Response 2019-11-05, responses in
table and Attachment 1 – Mapset.

1 irrigated agricultural plots, threading its way past NSR-92 through -110, and NSR-518, and then
2 connecting with the relevant BLM lands.

3
4 NSR-5011 (Attachment X-5, Map 35): The proposed route runs northeast to southwest near
5 NSR- 5011. This portion of the proposed route was developed as part of the Willow Creek valley
6 route (discussed above), intended to avoid the more developed areas of the Vale valley, near
7 Vale, Oregon (ASC Exhibit X, Figure X-11). The applicant states that it may be possible to micro-
8 site the proposed transmission line to the east or west of NSR-5011 to avoid or minimize the
9 exceedance.

10
11 NSR-111, -112, -133, -5008, and -5009 (Attachment X-5, Map 32): Regarding NSR-111, the
12 applicant's modeling estimates that the noise levels at this NSR may potentially increase by 11
13 dBA, which is 1 dBA above the DEQ regulatory threshold. The applicant states that it may be
14 able to microsite the transmission line near the western edge of the site boundary to lessen the
15 noise levels at NSR-111 and potentially avoid an exceedance. For NSR-112, -133, -5008, and -
16 5009, the BLM developed this route section as mitigation to avoid and minimize visual impacts
17 to the Owyhee River Below the Dam, which is a BLM designated Area of Critical Environmental
18 Concern (ACEC). This moved the proposed facility to the east while also trying to maximize the
19 use of the designated utility corridor and avoiding new private land impacts, as is illustrated in
20 ASC Exhibit X, Figure X-12. Where the transmission line threads between NSR-112/-5008/-5009
21 and -133, it is approximately equidistant between those NSR groups. Moving the transmission
22 line to the north would increase the noise levels at the NSR-112/-5008/-5009 group, and
23 moving the transmission line to the south would increase the noise levels at NSR-133. Where
24 the transmission line passes to the east of NSR-133, the applicant may be able to microsite the
25 transmission line near the eastern edge of the site boundary to lessen the noise levels at NSR-
26 133.

27
28 NSR-113 (Attachment X-5, Map 33): The BLM directed applicant to maximize its use of existing
29 designated utility corridors throughout the proposed transmission line routes, where possible.
30 In the vicinity of NRS-113 (shown in ASC Exhibit X, Figure X-13), the proposed transmission line
31 will-would be located near the edge of the utility corridor that is farthest from NSR-113. The
32 applicant's modeling estimates that the noise levels at this NSR potentially will increase by 11
33 dBA, which is 1 dBA above the regulatory threshold of a 10 dBA increase. The applicant may be
34 able to microsite the transmission line near the western edge of the site boundary to lessen the
35 noise levels at NSR-113 and potentially avoid an exceedance. However, the BLM likely will not
36 allow the applicant to move the site boundary to the west outside the utility corridor.

37
38 NSR-115 (Attachment X-5, Map 15)⁶⁹⁷: The applicant's modeling, which includes modeling H-
39 frame tower structures in this area, estimates that the noise levels at NSR-115 potentially will
40 would increase by 141 dBA, which is 31 dBA above the regulatory threshold. The applicant

⁶⁹⁷ [B2HAPPDoc13 DPO IPC Responses to Select DPO Comments Rec'd by 2019-11-07; B2HAPP DPO IPC Responses - StopB2H
- 4. Noise - 1st Supplemental Response 2019-11-05.](#)

1 points to the conservative assumptions included in the noise modeling and baseline
2 measurements and states that it also may be able to microsite the transmission line near the
3 northeastern edge of the site boundary to lessen the noise levels at NSR-115 and potentially
4 avoid an exceedance. However, the proposed transmission line threads between NSR-115 and
5 Twin Lake at a point that is approximately equidistant between the two (as illustrated in ASC
6 Exhibit X, Figure X-14). The applicant must avoid micrositeing the transmission line too close to
7 the lake so as to avoid any direct impacts to it. Additionally, the transmission line in this area is
8 also close to Morgan Lake and moving the transmission line to the northeast may also impact
9 the scenic-recreational resources at ~~that the lake, which the applicant has been requested to~~
10 ~~avoid and minimize by Union County.~~

11
12 *Timing of an Exception*

13
14 OAR 340-035-0010(2) stipulates that for exceptions, if granted, Council shall specify:

- 15
16
- 17 • the times during which the noise rules can be exceeded;
 - 18 • the quantity and quality of the noise generated;
 - 19 • when appropriate shall specify the increments of progress of the noise source toward
20 meeting the noise rules.

21 The applicant requests that an exception not be limited to a specific time of day or in any other
22 temporal or weather-dependent manner. The applicant requests Council not impose time
23 limitations because the proposed transmission line would operate 24 hours a day, day and
24 night, and may emit audible corona noise at any time of the day based on infrequent foul
25 weather conditions.

26
27 The applicants' noise analysis made conservative assumptions to create a "worse-case"
28 scenario in which corona noise could be heard. This scenario is based on particular foul weather
29 conditions occurring during late night hours where the ambient noise levels surrounding NSRs is
30 lower, allowing the potential for any corona noise to be heard. It is possible that there may
31 circumstances during daytime hours in which the specific foul weather conditions in
32 conjunction with low ambient noise levels could render corona noise audible. Further, the
33 applicant maintains that, regardless of the time of day, the proposed transmission line would
34 remain below the 50 dBA maximum allowable noise standard. Because foul weather conditions
35 may occur at any point during the day or night at any point along the proposed transmission
36 line, and the proposed transmission line would operate 24 hours a day, year-round, the
37 Department recommends Council establish that the ambient antidegradation standard may be
38 exceeded at any time during infrequent or unusual foul weather events, as authorized through
39 the OAR 340-035-0035(6)(a) exception at the identified NSR locations. In accordance with OAR
40 340-035-0010(2), the Department further recommends Council specify that the exceedance, as
41 measured at any NSR location within the analysis area, at each identified NSR location shall not
42 be more than 10 dBA above the ambient antidegradation standard (or ambient plus 20 dBA)
43 and consist of corona noise, as follows:
44

1 **Recommended Noise Control Condition 4:** During operation:

- 2 a. An exception to compliance with the ambient antidegradation standard at OAR 340-
3 035-0035(1)(b)(B) (i.e. an increase of 10 dBA above ambient sound pressure levels) is
4 granted for infrequent or unusual foul weather events during facility operation,
5 pursuant to OAR 345-035-0035(6)(a) ~~36 NSR locations identified in Attachment X-5 of~~
6 ~~the Final Order on the ASC (NSR: 8, 9, 10, 11, 5002, 69, 70, 5004, 5010, 5011, 92, 93, 94,~~
7 ~~95, 96, 97, 98, 99, 100, 101, 102, 103, 104, 105, 106, 107, 108, 109, 110, 111, 112, 133,~~
8 ~~5008, 5009, 113, and 115).~~
- 9 b. The ambient antidegradation standard at OAR 340-035-0035(1)(b)(B) may be exceeded
10 by the transmission line at the 36 NSR locations identified in Attachment X-5 of the Final
11 Order on the ASC at any time of day or night during infrequent or unusual foul weather
12 events. [OAR 340-035-0010(2)]
- 13 c. The quantity and quality of noise generated in exceedance of the ambient
14 antidegradation standard (ambient plus 10 dBA) at OAR 340-035-0035(1)(b)(B), during
15 infrequent or unusual foul weather events, shall not be more than 10 dBA (or ambient
16 plus 20 dBA), as measured at any NSR location, and from corona noise consisting of a
17 low hum and hissing, frying or crackling sound, respectively. [OAR 340-035-0010(2)]

18
19 *Request for Variance to the Ambient Antidegradation Standard* [OAR 340-035-
20 0100]

21
22 As previously described in this section, the ambient antidegradation standard authorizes an
23 ambient noise level increase of 10 dBA. Operational noise from the proposed facility, during
24 foul weather and low wind conditions at the quietest times during the early morning, may
25 exceed the ambient antidegradation standard at any point along the proposed transmission
26 line, represented by the analysis at 4136 NSRs. As discussed in the preceding section, OAR 340-
27 035-0035(6)(a) allows for exceptions to the DEQ noise rules if the owner of a noise source
28 submits a written request for an exception meeting the criteria in the rules. Additionally, and as
29 discussed below, OAR 340-035-0100 allows specific variances from particular requirements of
30 any rule, regulation, or order in the DEQ noise rules, under certain circumstances. Although the
31 specific circumstances are limited, In addition to the exception request discussed above, the
32 applicant also the applicant first seeks an exception and, then, in the alternative, seeks a
33 variance from Council for non-compliance with the ambient antidegradation standard. The
34 evaluation of the applicant's request for an exception is presented above; the evaluation of the
35 applicant's request for a variance is presented below which relies on the site-specific evaluation
36 of NSRs provided above.

37
38 The applicant requests that Council grant a variance to the ambient antidegradation standard
39 (L50 ambient sound level) for the entirety of the proposed facility. The Department first
40 evaluates whether the variance should be granted for the entirety of the proposed transmission
41 line route; and, then whether the variance should be granted.

1 *Request for Variance to the Ambient Antidegradation Standard – Entirety of*
2 *Proposed Transmission Line Route [OAR 340-035-0100]*

3
4 The applicant requests Council authorization of a variance under OAR 340-035-0100 from
5 compliance with the ambient antidegradation standard for the entirety of the proposed
6 transmission line route. ~~While exceedances are only predicted at 36 NSR locations, the variance~~
7 ~~is requested for the entirety of the proposed transmission line route because the applicant~~
8 ~~interprets the noise control regulations to apply to the “noise source,” or the entire proposed~~
9 ~~transmission line route, and not to specific NSR locations. In the alternative, as most~~
10 appropriate for non-linear industrial noise sources such as natural-gas, wind or solar energy
11 facilities, because -0035(1)(b)(B)(i) establishes that compliance with the ambient
12 antidegradation standard be based on noise levels measured (predicted) at a point 25 feet from
13 the NSR closest to the noise source, Council could evaluate the variance request specific only to
14 the NSR locations where an exceedance is predicted. The ambient antidegradation standard
15 does not address the difference between a non-linear and linear facility, but those differences
16 should be acknowledged through Council interpretation.

17
18 Consistent with the applicant’s interpretation, the Department recommends Council interpret -
19 0035(1)(b)(B)(i) for linear facilities, such as transmission lines, as establishing a 10 dBA ambient
20 statistical noise level at identified NSRs but that NSRs would only establish the measurement
21 point for use as a proxy in determining compliance of the entire line, as the noise source. For
22 this analysis, consistent with -0035(3)(b), the applicant conducted multiple desktop and ground
23 surveys throughout the ASC process, as described in ASC Exhibit X, in efforts to identify all
24 potential NSR locations for use as appropriate measurement points to evaluate the proposed
25 facility’s compliance with the ambient antidegradation standard. The applicant identified 132
26 NSR locations, or points, within the analysis area; of the 132 NSR locations, 41 NSR locations
27 resulted in a predicted exceedance.

28
29 Given the extent of exceedances predicted to occur in each of the five counties crossed by the
30 proposed facility, including alternative segments, as presented in Table NC-4, *Summary of*
31 *Acoustic Modeling Results – Comparison of Predicted Facility Sound Levels to Late Night*
32 *Baseline L50* above, the Department recommends Council evaluate the variance request for the
33 entirety of the transmission line alignment based on its interpretation that the ambient
34 antidegradation standard under -0035(1)(b)(B)(i) applies to the transmission line as the noise
35 source, where identified NSRs represent the appropriate measurement points for which to
36 determine overall compliance of the line.

37
38 ~~The Department agrees that OAR 340-035-0035 applies to new industrial or commercial noise~~
39 ~~sources, and in this instance, the noise source is the proposed transmission line. However, in~~
40 ~~the absence of a formal definition of “noise source” within the rule and given the extent of the~~
41 ~~linear facility, the Department interprets noise source as the source of noise and specific noise~~
42 ~~level at identified NSR locations. Based on this interpretation, the variance would only apply at~~
43 ~~the identified NSR locations or grouping of NSRs where the specific noise level from the noise~~
44 ~~source exceeds the ambient antidegradation noise standard, which occurs at 36 specific NSR~~

1 ~~locations. A variance for the entirety of the proposed transmission line is not necessary as the~~
2 ~~noise source would not exceed the ambient antidegradation standard at other NSR locations~~
3 ~~along the route. Therefore, the Department recommends Council evaluate and apply the~~
4 ~~requested variance to the noise source at the 36 identified NSR locations.~~

5
6 Council may grant a variance to specific DEQ noise rules or portions of rules if the Council finds
7 that strict compliance with such rule or regulation:

- 8
- 9 • is inappropriate because of conditions beyond the control of the persons granted such
10 variance, or;
 - 11 • because of special circumstances which would render strict compliance unreasonable,
12 or impractical due to special physical conditions or cause, or;
 - 13 • because strict compliance would result in substantial curtailment or closing down of a
14 business, plant, or operation, or because no other alternative facility is yet available.
- 15

16 The Department notes that to grant a variance, the person requesting the variance (the
17 applicant) only needs to demonstrate one of the above-listed criteria. In the ASC, the applicant
18 provides an evaluation of all the criteria and requests Council grant a variance based on its
19 evaluation, therefore, the Department presents an evaluation of the applicant's variance
20 request below.

21
22 *Conditions beyond the Control of the Persons, Special Circumstances and Physical Conditions*

23
24 The applicant seeks a variance from compliance with the ambient antidegradation standard
25 because, the applicant argues, the conditions where the exceedance would occur along the
26 proposed transmission line would be beyond the applicant's control. As the applicant's noise
27 analysis illustrates, ambient antidegradation standard exceedance are predicted during foul
28 weather conditions. The applicant explains that it cannot be accountable for weather
29 conditions that may cause audible corona noise, as the weather is a condition beyond its
30 control.

31
32 As discussed elsewhere in this section under *Other Legal Constraints*, the proposed and
33 alternative transmission line routes, as presented in the ASC, were derived from a lengthy siting
34 process, much of which was directed by the BLM, in consultation with agencies, landowners,
35 and affected counties. Further, the routes proposed for Council's review were also constrained
36 by resources protected under the EFSC standards. These constraints include the following:

- 37
- 38 • Federal land management agency requirements, including the federal land management
39 plans governing many of the federal lands in the analysis area;
 - 40 • Input on route locations from local governments, counties, and landowners;
 - 41 • The transmission line route on lands managed by the Bureau of Land Management as
42 issued in the BLM's Record of Decision (ROD);

- 1 • Western Electricity Coordinating Council Common Corridor Criteria and prudent utility
2 practice, including minimum separation distances from existing transmission lines to
3 ensure reliability of facilities;
- 4 • EFSC’s Fish and Wildlife Habitat Standard, adopts the Oregon Department of Fish and
5 Wildlife’s habitat mitigation policy; which does not permit siting of an energy facility on
6 lands designated Category 1 habitat and recommends avoidance and minimizing
7 impacts to Greater Sage Grouse habitat; and
- 8 • EFSC’s Protected Area Standard, which does not permit siting of an energy facility in
9 certain protected areas, such as parks, scenic waterways, and wildlife refuges, and
10 certain federally designated areas, such as areas of critical environmental concern,
11 wilderness areas, wild and scenic rivers, BLM Class I and U.S. Department of Agriculture,
12 Forest Service Retention visual management areas, national monuments, and National
13 Wildlife Refuges (NWRs).⁶⁹⁸

14
15 Specific directions and constraints that impacted the proposed route and alternative routes in
16 proximity to each NSR or grouping of NSR’s is also discussed in the above section evaluating the
17 applicant’s exception request. and those constraints apply to the analysis of the applicant’s
18 request for a variance to the DEQ noise rules. The Department considers the constraints and
19 obligations listed above and described for each NSR as special circumstances, because the
20 applicant was directed to route the proposed transmission line on federal lands and is obligated
21 to avoid and minimize impacts to resources protected by EFSC standards. The applicant is also
22 obligated to design and construct the proposed facility in compliance with applicable safety and
23 engineering standards, which directs the placement of the proposed routes as well. The
24 Department considers the above listed constraints and obligations as well as the descriptions
25 associated with the proposed transmission line location related to each NSR as special physical
26 conditions and special circumstances. Locating the proposed facility as to avoid and minimize
27 impacts to protected areas are special physical conditions that directed the placement of the
28 proposed transmission line in proximity to NSR’s, because protected areas are based on their
29 physical locations. Other special physical conditions that influenced the siting of the
30 transmission line are actual physical and engineering limitations such as avoiding steep cliffs,
31 ravines and geotechnical vulnerable areas.

32
33 Greater Sage Grouse habitat, including Areas of High Population Richness and Core Areas, are
34 protected under the Council’s Fish and Wildlife Habitat Standard and Oregon Department of
35 Fish and Wildlife’s habitat mitigation policy with an emphasis on avoiding and minimizing
36 impacts. Sage Grouse habitat is location dependent and is determined by field surveys and
37 habitat that is most suitable for Sage Grouse, and therefore can be considered a special physical
38 condition. Special circumstances that informed the placement of the proposed transmission
39 line near NSRs are the combination of all of the siting constraints (listed above) and siting
40 opportunities (co-locating the transmission line, using existing right-of-ways, etc.).

41

⁶⁹⁸ B2HAPPDoc3-41 ASC 24_Exhibit X_Noise_ASC 2018-09-28, Section 3.4.5.1.

1 As discussed in this section and in ~~great~~ detail in ASC Exhibit B, the applicant describes the siting
2 process and studies they conducted since 2008 as a result of the federal and state permitting
3 processes. The Department considers that the applicant's voluntary consideration to minimize
4 impacts to some resources and landowners, in combination with the legal direction from the
5 federal review process and obligations for avoidance of resources in the EFSC process
6 constitutes a special circumstance that resulted in the proposed route and alternative routes in
7 proximity to NSR's. The Department recommends the Council find that strict compliance with
8 the ambient antidegradation standard in DEQ rule is inappropriate, unreasonable, or
9 impractical because of special physical conditions and special circumstances contributed to the
10 applicant's proposed transmission line location relating to NSRs that may experience noise
11 exceedances.

12
13 *Strict Compliance Resulting in Substantial Curtailment of Operation and Alternative Facility*

14
15 The applicant seeks a variance from compliance with the ambient antidegradation standard
16 because strict compliance would terminate the facility from becoming operational if the
17 proposed transmission line could not receive the necessary permitting approvals, and therefore
18 could not proceed with construction and operations. Similarly, the applicant argues that there
19 is not another alternative facility available to achieve the goals for the proposed facility, such as
20 providing reliable and redundant transmission services. The Department recommends the
21 Council find that strict compliance with the OAR 340-035-0035(1)(b)(B)(i) associated with the
22 ambient antidegradation standard, would result in the substantial curtailment or closing down
23 (never building) the proposed transmission line and that, based on the routing discussion
24 presented in this section order that there is not another alternative facility available.

25
26 Based on the evaluation of the variance criteria, the Department recommends Council impose
27 the following condition:

28
29 **Recommended Noise Control Condition 5:** During operation:

- 30 a. A variance to compliance with the ambient antidegradation standard at OAR 340-035-
31 0035(1)(b)(B) (i.e. an increase of 10 dBA above ambient sound pressure levels) is
32 granted pursuant to OAR 345-035-0100(1) for the transmission line. at 36 NSR locations
33 identified in Attachment X 5 of the Final Order on the ASC (NSR: 8, 9, 10, 11, 5002, 69,
34 70, 5004, 5010, 5011, 92, 93, 94, 95, 96, 97, 98, 99, 100, 101, 102, 103, 104, 105, 106,
35 107, 108, 109, 110, 111, 112, 133, 5008, 5009, 113, and 115).
36 b. The ambient antidegradation standard at OAR 340-035-0035(1)(b)(B) may be exceeded
37 by the transmission line at the 36 NSR locations identified in Attachment X 5 of the Final
38 Order on the ASC at any time of day or night. [OAR 340-035-0100]

39
40 **Conclusions of Law**

41
42 Based on the foregoing findings and conclusions of law, and subject to compliance with the
43 recommended site certificate conditions, the Department recommends that the Council find
44 that an OAR 340-035-0035(6)(a) exception (unusual or infrequent events) ~~or and~~ variance to

1 compliance with the ambient antidegradation standard (OAR 340-035-0035(1)(b)(B)(i)) be
2 granted for the proposed facility ~~-36 NSR locations~~ and that the proposed facility, including the
3 proposed and alternative routes, would otherwise comply with the Noise Control Regulations in
4 OAR 340-035-0035(1)(b)(B).

5
6 *IV.Q.2. Removal Fill Law: OAR 141-085-0500 through -0785*

7
8 Under ORS 469.503(3) and under the Council’s General Standard of Review (OAR 345-022-
9 0000), the Council must determine whether the proposed facility complies with “all other
10 Oregon statutes and administrative rules..., as applicable to the issuance of a site certificate for
11 the proposed facility.” The Oregon Removal-Fill Law (ORS 196.795 through 196.990) and
12 Department of State Lands (DSL) regulations (OAR 141-085-0500 through 141-085-0785)
13 require a removal-fill permit if 50 cubic yards or more of material is removed, filled, or altered
14 within any “waters of the state.”⁶⁹⁹ The Council, must determine whether a removal-fill permit
15 is needed and if so, whether a removal-fill permit should be issued. The analysis area for
16 wetlands and other waters of the state is the area within the site boundary.

17
18 **Findings of Fact**

19
20 The applicant provides information regarding wetlands and other waters of the state (WOS)
21 within the site boundary in ASC Exhibit J. Additionally, Exhibit J includes evidence supporting
22 issuance of a DSL Removal-Fill Permit under ORS 469.401(3). The applicant’s Joint Permit
23 Application (JPA) to DSL and U.S. Army Corps of Engineers is included as ASC Exhibit J
24 Attachment J-3.⁷⁰⁰ In ASC Exhibit J, the applicant proposes conditions to be included in the site
25 certificate including conditions stipulating that a removal-fill permit be obtained from DSL, that
26 a JPA be obtained and submitted to the Department, and that construction activities be
27 conducted in compliance with removal fill permit conditions.⁷⁰¹ The Department notes that the
28 applicant has proposed these conditions, however, in this section the Department recommends

⁶⁹⁹ ORS 196.800(15) defines “Waters of this state” as “all natural waterways, tidal and nontidal bays, intermittent streams, constantly flowing streams, lakes, wetlands, that portion of the Pacific Ocean that is in the boundaries of this state, all other navigable and nonnavigable bodies of water in this state and those portions of the ocean shore, as defined in ORS 390.605 (Definitions), where removal or fill activities are regulated under a state-assumed permit program as provided in 33 U.S.C. 1344(g) of the Federal Water Pollution Control Act, as amended.”

⁷⁰⁰ Federal law may require a nationwide or individual fill permit for the project if waters of the United States (U.S.) are affected. The U.S. Army Corps of Engineers administers Section 404 of the Clean Water Act, which regulates the discharge of fill into waters of the U.S. (including wetlands), and Section 10 of the Rivers and Harbors Appropriation Act of 1899, which regulates placement of fill in navigable waters. A single application form (a Joint Permit Application) is used to apply for both the state and federal permits. IPC’s Joint Permit Application for the project was included in ASC Exhibit J (Attachment J-3). The lateral extent of federal jurisdiction of waterbodies under Section 404 of the Clean Water Act is delineated by the ordinary high water mark. The Council does not have jurisdiction over the federal permits that may be required for the project, and federal permits are not included in or governed by the site certificate.

⁷⁰¹ B2HAPPDoc3-18 ASC 10a_B2H_2018 Exhibit J Waters of the State Part 1 2018-09-28. Section 4.0.

1 Council consider alternative condition language that includes more details in addition to
2 condition language proposed by the applicant.

3
4 In response to the size and complexity of the proposed facility and after consultation with
5 applicable federal and state agencies, the applicant determined that data collection and field
6 surveys would be conducted via a phased study approach which utilizes three distinct phases.
7 During Phase 1, the applicant obtained existing information regarding the occurrence of
8 wetlands and other waters within the site boundary. The applicant used this information to
9 conduct desktop studies, which were used for preliminary facility siting. In Phase 2, the
10 applicant's consultants undertook comprehensive field surveys of all portions of the site
11 boundary to which the applicant was granted access.⁷⁰² During Phase 3, the applicant ~~will~~would
12 perform pre-construction surveys to microsite route changes, or to close data gaps on
13 previously unsurveyed parcels for which the applicant did not have right-of-entry prior to
14 conducting wetland delineations in support of the application. This is discussed further below.

15
16 *Delineation of and Impacts to Wetlands and Waters of the State*

17
18 The applicant conducted desktop studies and field investigations to delineate potential
19 locations of wetlands and WOS located within the site boundary. The desktop study of
20 potentially jurisdictional wetlands and WOS included an evaluation of multiple existing data
21 sources including the U.S. Fish and Wildlife Service National Wetlands Inventory (NWI), the
22 USGS National Hydrography Dataset (NHD), the Oregon Department of Transportation Salmon
23 Resources and Sensitive Area Mapping, and areas of hydric soil mapped by the Natural
24 Resources Conservation Service.⁷⁰³ The applicant and its consultant, Tetra Tech, conducted field
25 investigations in 2011, 2012, 2013, and 2016.⁷⁰⁴ Prior to conducting the field surveys, Tetra Tech
26 plotted data from the Oregon Spatial Data Library (Oregon Wetlands database) and the NHD on
27 high-resolution aerial photography to identify locations of probable wetlands and non-wetland
28 waters within the site boundary. Field staff identified wetland presence using the methodology
29 provided by the 1987 U.S. Army Corps of Engineers (USACE) *Wetlands Delineation Manual* as
30 well as the USACE *Arid West Regional Supplement* (used in the majority of the analysis area)
31 and the *Western Mountains, Valleys, and Coast Regional Supplement* (for the higher elevation
32 areas of the analysis area around the Wallowa-Whitman National Forest).

33
34 As presented in ASC Exhibit J (Section 3.4.3), Tetra Tech identified 177 potential wetlands and
35 425 potential non-wetland WOS. ASC Exhibit J, Attachment J-2 Tables J-2-1A through J-2-5B
36 provide the wetland type (Cowardin class) and stream type (e.g., intermittent) for each of these
37 wetlands and other WOS.⁷⁰⁵ Of the potential wetlands and non-wetland WOS identified, Tetra

⁷⁰² See DPO Section III.D., Survey Data Based on Final Design and Site Access.

⁷⁰³ B2HAPPDoc3-18 ASC 10a_B2H_2018 Exhibit J Waters of the State Part 1 2018-09-28, Section 3.3.1.

⁷⁰⁴ B2HAPPDoc3-18 ASC 10a_B2H_2018 Exhibit J Waters of the State Part 1 2018-09-28, Section 3.4.1.

⁷⁰⁵ B2HAPPDoc3-18 ASC 10c_B2H_2018 Exhibit J Waters of the State Part 3 2018-09-28, Section 3.4.3.

1 Tech field delineated 45 wetlands, 54 waterways, and five ponds within the analysis area. On
 2 September 13, 2018, DSL issued a letter concurring with the wetland and waterway boundaries
 3 mapped by the applicant.⁷⁰⁶ As noted in DSL's letter, Tetra Tech also delineated 51 ephemeral
 4 waterways; however, DSL stated that ephemeral waterways are not subject to current state
 5 removal-fill requirements per OAR 141- 085-0515(3).

6
 7 Tetra Tech delineated 11 wetlands and 26 non-wetland WOS in the field that may be subject to
 8 some temporary or permanent impact. Construction activities that would cause temporary
 9 impacts to wetlands and WOS, include the preparation and construction of roads, laydown
 10 areas, staging areas; temporary contouring allowing for equipment access; and stream
 11 crossings. ASC Exhibit J, Attachment J-2 Tables J-2-6 through J-2-7 provide the temporary and
 12 permanent impact amounts for each delineated wetland and non-wetland WOS.

13
 14 As summarized in Tables RF-1 and RF-2 below, the estimated impact to field
 15 surveyed/delineated wetland features includes 0.21 acres of total permanent impacts and
 16 0.386 acres of total temporary impacts. The impact tables provide estimates in acres and in
 17 cubic yards (cy), the volume metric that DSL also uses to evaluate in a removal-fill permit. The
 18 estimated impact to field surveyed/delineated non-wetland waters of the state (WOS) includes
 19 0.07 acres of total permanent impacts and 0.139 acres of total temporary impacts.⁷⁰⁷ The
 20 combined total permanent and temporary impacts to wetlands and waters of the state is less
 21 than one acre (0.793 acres).

Notes: 1. Stream in Morrow County is a Goal 5 inventoried stream (Butter Creek). 2. Streams in Umatilla County are Goal 5 inventoried waterfowl/furbearer areas (Butter Creek, West Birch Creek); and anadromous fish streams (West Birch Creek, California Gulch Creek) Source: ASC Exhibit J, Attachment J-3 Part 3, Appendix O, Table O-2A				

1
 2 As discussed in Section III.D., *Survey Data Based on Final Design and Site Access*, the Council's
 3 review process requires several types of survey data, including wetland delineation report
 4 information. This information is typically provided to the Department based on field surveys
 5 conducted once site access is granted and upon final design. As noted at the beginning of this
 6 section, the applicant explains the phased approach to collect and submit the additional survey
 7 data to the Department and the Oregon Department of State Lands (DSL). To ensure that
 8 additional wetland delineation reports are submitted to the Department and to DSL prior to any
 9 construction activities on any unsurveyed parcels within the site boundary the Department
 10 recommends the below condition. Recommended Removal-Fill Condition 1 also includes
 11 stipulations to ensure that, prior to construction, the Department receives a copy of the DSL
 12 Letter of Concurrence associated with the wetland delineation reports submitted by the
 13 applicant for a phase or segment of the facility.

14
 15 **Recommended Removal-Fill Condition 1:** The certificate holder shall:

- 16 a. Prior to construction of a phase or segment of the facility, submit updated
 17 electronic wetland delineation report(s) to the Department and to the Oregon
 18 Department of State Lands. All wetland delineation report(s) submitted to the
 19 Oregon Department of State Lands shall follow its submission and review
 20 procedures.
- 21 b. Prior to construction of a phase or segment of the facility, the Department must
 22 receive a Letter of Concurrence issued by the Oregon Department of State Lands
 23 referencing the applicable wetland delineation for the phase or segment of the
 24 facility ~~comply with removal fill permit requirements in Removal-Fill Condition 6.~~

25
 26 The applicant explains that there ~~will~~would not be any new removal or fill activities of wetlands
 27 or WOS during operation of the proposed facility and therefore there ~~will~~would not be any
 28 adverse impacts to wetland or WOS during operations. The permanent impacts to wetlands and
 29 WOS are from the placement of permanent facility components.

30
 31 *Avoidance and Mitigation Measures for Impacts to Wetlands and Waters of the State*
 32

1 As discussed in ASC Exhibit J, the applicant utilized the information from the desktop analysis
2 and field delineation surveys to inform the preliminary engineering and location of towers,
3 roads, and other facility components. Based on updated data, the applicant relocated
4 components to avoid or minimize impacts. Indirect impacts to wetlands and other waters of the
5 state would be avoided and minimized by employing the Best Management Practices (BMPs)
6 for erosion and sediment control listed in the Erosion and Sediment Control Plan (ESCP) that
7 would be part of the National Pollutant Discharge Elimination System (NPDES) 1200-C
8 Construction Stormwater Permit for the facility. Recommended Soil Protection Condition 1
9 would require compliance with the NPDES 1200-C permit and a DEQ- approved ESCP (see
10 Section IV.D., *Soil Protection*, of this order).

11
12 In addition to the measures established in the NPDES permit and ESCP, the applicant proposes
13 to implement additional measures to reduce and avoid potential temporary impacts to
14 wetlands and other waters of the state during facility construction, including the following best
15 management practices for stream crossings, as presented in Appendix L of the Joint Permit
16 Application (also see Section IV.Q.5., *Fish Passage*, of this order):

- 17
- 18 • No streams would be dewatered.
- 19 • Avoid crossing streams when practical.
- 20 • Cross at right angles at a point where the stream bed is straight and uniform.
- 21 • Minimize the use of equipment in the stream bed.
- 22 • Limit construction activity to periods of low flow or when streams are dry.
- 23 • Avoid activity in streams outside of preferred in-stream work windows.
- 24 • Minimize excavation and fill at stream crossings and other disturbances to stream banks
25 and channels.
- 26 • Use materials that are clean, non-erodible and non-toxic.
- 27 • Avoid using soil as fill except when installing culverts.
- 28 • Avoid altering stream flow.
- 29 • Divert runoff from roads and trails leading to stream crossings into undisturbed
30 vegetation. Avoid directing runoff directly into streams, including ephemeral streams.
- 31 • Stabilize approaches to stream crossings with aggregate or other suitable material.
- 32 • Stabilize exposed soil as soon as practicable.
- 33 • Maintain crossings in safe, functional condition.
- 34 • Restore natural stream flow as soon as temporary crossings are no longer needed.
- 35 • The use of a temporary matting may be considered to accommodate construction
36 traffic.
- 37

38 The estimated 0.511 acres of temporary impacts to wetlands and WOS associated with the
39 construction of the proposed facility would be mitigated by restoring the sites to existing
40 conditions so long-term adverse effects to these sites are not anticipated. The restoration of
41 these areas would be in accordance with DSL's *A Guide to the Removal-Fill Permit Process*,
42 included in the applicant's draft Site Rehabilitation Plan (Attachment J-2 to this order and
43 included in the JPA). Impacts to wetlands and non-wetland WOS would be mitigated within 24

1 months of disturbance of a phase or segment of the facility. The draft Site Rehabilitation Plan
2 describes how the applicant would prepare sites prior to construction including topsoil
3 collection, separation and storing, and the use of certified weed-free erosion control blankets
4 and/or certified weed-free straw bales will be used to contain and limit erosion at the
5 stockpiles as needed. Measures in the draft Site Rehabilitation Plan that address site
6 restoration include re-establishing pre-existing contours of the site, decompaction of soils to a
7 minimum depth of 6-12 inches, re-establish the pre-existing vegetation community, and to
8 provide for rapid site stabilization to prevent erosion.

9
10 Following the final engineering of the facility or a phase or segment of the facility, the applicant
11 commits to preparing a final Site Rehabilitation Plan for submittal to state and federal agencies.
12 Accordingly, and so that temporary impacts to wetlands and non-wetland WOS are sufficiently
13 mitigated and restored, the Department recommends that the Council adopt the following
14 condition:

15
16 **Recommended Removal-Fill Condition 2:** The certificate holder shall:

- 17 a. Prior to construction of a phase or segment of the facility, submit to the
18 Department and Oregon Department of State Lands (DSL) a final Site
19 Rehabilitation Plan (Plan), consistent with the draft Plan provided in Attachment
20 J-2 of the Final Order on the ASC. The Department shall provide written
21 verification of its review of the final Plan, confirming that the Plan is consistent
22 with the draft Site Rehabilitation Plan.
- 23 b. Following construction and during operation of a phase or segment of the
24 facility, the certificate holder shall ensure that temporary impacts to wetlands
25 and non-wetland waters of the state are restored in accordance with the final
26 Plan.
- 27 c. The Department will provide updates to Council on the certificate holder's
28 implementation of the final Plan and of any Plan revisions at Council meetings,
29 following submittal of the certificate holder's six-month construction progress
30 report per General Standard of Review Condition 3 or annual report per General
31 Standard of Review Condition 4.

32
33 Permanent impacts from the proposed facility are associated with the permanent placement of
34 facility components such as towers and roads associated with operations. To mitigate for the
35 estimated 0.282 acres of permanent impacts to wetlands and WOS from removal and fill
36 activities, the applicant would implement the Compensatory Wetland and Non-Wetland
37 Mitigation Plan (CWNWMP). A draft of the CWNWMP is part of the JPA in ASC Exhibit J, and
38 attached to this order as Attachment J-1.⁷⁰⁸ To meet DSL requirements for stream functional
39 assessments, the applicant developed a stream function assessment tool specifically for the
40 proposed facility and includes it in the CWNWMP.

41

⁷⁰⁸ B2HAPDoc3-18 ASC 10f_B2H_2018 JPA Part 3 2018-09-28. Joint Permit Application, Attachment J-3, at Appendix T.

1 The CWNWMP is also intended to mitigate permanent impacts to wetland functions and values
2 through the creation of functioning wetlands and enhancement of existing wetlands at a
3 mitigation site (referred to as the Hassinger Mitigation Site) adjacent to Catherine Creek in the
4 Grande Ronde Basin in Union County, Oregon.⁷⁰⁹ The applicant would create approximately
5 0.57 acres of Palustrine Forested, 1.69 acres of Palustrine Scrub-Shrub, and 2.50 acres of
6 Palustrine Emergent wetlands, and would enhance approximately 1.45 acres of existing
7 Palustrine Emergent wetlands. In addition, the applicant would construct a side-channel
8 between Catherine Creek which is a tributary to the Grande Ronde River and an oxbow to
9 improve hydrologic connectivity.

10
11 Additional activities at the site are to remove invasive species to improve the wetlands and
12 wetland functions. Utilizing DSL's compensatory wetland mitigation ratios for created and
13 enhanced wetlands, the combined acreages of 6.21 acres of created or enhanced wetlands
14 equate to 3.66 acres of wetland mitigation credit.⁷¹⁰ This amount of wetland mitigation credit
15 (3.66 acres) is greater than the estimated impacts to field surveyed/delineated wetland
16 features and non-wetland WOS (see Tables RF-1 and RF-2). The total of permanent impacts to
17 wetlands and waters of the state is less than one acre (0.282 acres). The applicant explains that
18 it believes this is a conservative estimate of the impacts to both field surveyed/delineated
19 wetlands and WOS and those potential wetland and WOS in areas that the applicant has not yet
20 obtained survey access.⁷¹¹ On November 2, 2018, the Department received an email from DSL
21 stating that the CWNWMP is "well done and meets [DSL's] requirements."⁷¹²

22
23 Based upon the applicant's representations, and so that permanent impacts to wetlands and
24 non-wetland WOS from removal and fill activities are mitigated, the Department recommends
25 that the Council adopt the following condition:

26
27 **Recommended Removal-Fill Condition 3: The certificate holder shall:**

- 28 a. Prior to construction of a phase or segment of the facility, submit an updated
29 final Compensatory Wetland and Non-Wetland Mitigation Plan (CWNWMP),
30 consistent with the draft CWNWMP (Attachment J-1 to the Final Order on the
31 ASC), for review and approval by the Department, in consultation with
32 Department of State Lands (DSL). The Department shall provide written
33 verification of its review and approval of the final CWNWMP. The final amount of
34 wetland mitigation credit required shall be based on the final design
35 configuration of the phase or segment of the facility and the estimated acres of
36 wetlands and non-wetland waters of the state that would be permanently
37 impacted, unless otherwise agreed to by the Department.

⁷¹¹ B2HAPPDoc3-18 ASC 10a_B2H_2018 Exhibit J Waters of the State Part 1 2018-09-28, Section 3.4.6.

⁷¹² B2HAPPDoc13-3 ASC Reviewing Agency Comment DSL_Cary 2018-11-02.

- 1 b. Following construction and during operation of a phase or segment of the
- 2 facility, the certificate holder shall implement the actions described in the final
- 3 CWNWMP.
- 4 c. The Department will provide updates to Council on the certificate holder's
- 5 implementation of the final CWNWMP and of any Plan revisions at Council
- 6 meetings, following submittal of the certificate holder's six-month construction
- 7 progress report per General Standard of Review Condition 3 or annual report per
- 8 General Standard of Review Condition 4.
- 9 d. The final CWNWMP version approved when the facility begins operation may be
- 10 revised or updated from time to time by agreement of the certificate holder and
- 11 the Oregon Energy Facility Siting Council. Such revisions or updates may be made
- 12 without amendment of the site certificate. The Council authorizes the
- 13 Department to agree to revisions or updates to this plan, in consultation with
- 14 DSL. The Department shall notify the Council of all revisions or updates, and the
- 15 Council retains the authority to approve, reject, or modify any revisions or
- 16 updates of the plan agreed to by the Department.

17
18 Further based upon the applicant's representations of compliance with the measures outlined
19 in the JPA and its commitment to provide updates to the JPA to the Department, the
20 Department recommends the Council adopt the following condition requiring the certificate
21 holder to provide an electronic copy of the updated JPA to the Department:

22
23 **Recommended Removal-Fill Condition 4:** Prior to construction of a phase of segment
24 of the facility, the certificate holder shall provide an electronic copy of the updated Joint
25 Permit Application (JPA) to the Department.

26
27 *Removal-Fill Permit*

28
29 A removal-fill permit is required for the proposed facility because 50 cubic yards or more of
30 material would be removed, filled or altered within waters of the state. The removal-fill permit
31 is a state permit within the Council's jurisdiction as discussed in the introduction to Section
32 IV.Q. Pursuant to ORS 469.503(3) and ORS 469.401(3), the Council must determine whether DSL
33 should issue the removal-fill permit and, if so, the Council must determine the conditions of
34 that permit.⁷¹³ The Department conducted ongoing consultation with DSL during the review of
35 the preliminary applications and the ASC. On April 4, 2019 DSL submitted the draft removal-fill
36 permit with project-specific conditions based on its technical review for the facility and the
37 mitigation site. Upon Council approval of the removal-fill permit, DSL would have continuing
38 enforcement authority over the permit with the Council.

39
40 Oregon Administrative Rules 141-085-0565 details the requirements for DSL issuance and
41 enforcement of removal fill authorizations. Written findings are required in specific

⁷¹³ See also OAR 345-021-0010(1)(j)(E).

1 circumstances stipulated in OAR 141-085-0565(7), including subsection (b) of the rule in
2 circumstances where an individual removal-fill permit decision for a project ~~will~~would
3 permanently fill two or more acres in wetlands. As discussed above, the estimated permanent
4 impacts to wetlands from the proposed facility is 0.282 acres, less than the two-acre threshold
5 requiring DSL (Council) to provide written findings defined in OAR 141-085-0565(4) for the
6 issuance of a removal-fill permit.⁷¹⁴ However, in ASC Exhibit J Section 3.6, the applicant provides
7 information for the determinations under OAR 141-085-0565(1) based on the considerations
8 outlined in OAR 141-085-0565(4).⁷¹⁵ Additionally, the Council's statutory obligations under ORS
9 469.503(3) requires it to evaluate compliance with applicable Oregon statutes and
10 administrative rules. Therefore, the Department provides recommendations for the Council to
11 make the determinations based on the considerations under OAR 141-085-0565.

12
13 Issuance of a removal-fill permit requires the following determinations: the project "(a) Is
14 consistent with the protection, conservation and best use of the water resources of this state as
15 specified in ORS 196.600 to 196.905; and; (b) Would not unreasonably interfere with the
16 paramount policy of this state to preserve the use of its waters for navigation, fishing and public
17 recreation." These criteria are outlined in ORS 196.825. The implementing rules at OAR 141-
18 085-0565 require these same determinations as well as a determination that the project (as
19 defined in OAR 141-085-0510(80)) has independent utility. To make these three
20 determinations, nine criteria must first be considered in evaluating individual removal-fill
21 permit decisions, as outlined in OAR 141-085-0565(4). Therefore, the Department recommends
22 Council consider the following factors as proposed by the applicant and supported by the
23 information in the ASC:

24
25 *(4) Department Considerations. In determining whether to issue a permit, the*
26 *Department will consider all of the following:*

27
28 *(a) The public need for the proposed fill or removal and the social, economic or other*
29 *public benefits likely to result from the proposed fill or removal. When the applicant for a*
30 *permit is a public body, the Department may accept and rely upon the public body's*
31 *findings as to local public need and local public benefit;*

32
33 Under OAR 141-085-0565(4)(a), the Council considers the public need for, and the social,
34 economic or other public benefits of, the proposed removal-fill activities. The applicant explains
35 that the proposed removal and fill associated with the construction of the proposed facility
36 would provide social, economic, or other public benefits. The applicant's reasons are that the
37 facility would provide cost-effective electric service, improve inter-regional access to power

⁷¹⁴ The 0.282 acres is the estimated permanent impacts to wetland and waters of the state. Although OAR 141-085-0565(7), provides that written findings be provided for project that impact two acres or more in wetlands, the Department included impacts to waters of the state as well into the total provided.

⁷¹⁵ ORS 196.825(1) and ORS 196.825(3)

1 markets, facilitate the applicant's compliance as a utility company with electric service
2 reliability standards, and provide transmission service to its customers, including customers in
3 Oregon.⁷¹⁶ As discussed in more detail in Section IV.O.1., *Need for a Facility* of this order, the
4 Need Standard for Nongenerating Facilities, specifies that the Need for a Facility may be met by
5 two pathways, the Least-Cost-Plan Rule and the System Reliability Rule. The Least-Cost-Plan
6 Rule is met if the Oregon Public Utility Commission (OPUC) determines that the proposed
7 facility would be a least cost, least risk resource to meet the needs of the applicant's customers
8 by acknowledging the applicant's Integrated Resource Plan (IRP). The objective of the IRP is to
9 ensure an adequate and reliable supply of energy at the least cost to the utility and customers
10 in a manner consistent with the long-run public interest.

11
12 In ASC Exhibit N and in this order, the applicant provides documentation that the ongoing
13 permitting as well as the construction of the proposed facility has been acknowledged by the
14 OPUC in its IRP, therefore the Council's Need for a Facility under OAR 345-023-0005 has been
15 met. Section IV.O.1., *Need for a Facility*, also evaluates the applicant's request to meet the
16 Council's Need for a Facility under the System Reliability Rule. The Council's System Reliability
17 Rule requires an evaluation of the applicant's capacity demands, compliance with North
18 American Electric Reliability Corporation (NERC) Reliability Standards, and an economic
19 evaluation of the route and alternative routes. Based on the Department's assessment of the
20 information the applicant provided, the Department recommends the Council find the
21 applicant has also met the System Reliability Rule. Thus, the Need for a Facility is met by both
22 pathways in Council's rules. Based upon the Department's assessment in that section of this
23 order and on the information the applicant provides in ASC Exhibit J, the Department
24 recommends the Council conclude that the public need, and social, economic and other public
25 benefits likely to result from the proposed removal and fill activities was considered.

26
27 *(b) The economic cost to the public if the proposed fill or removal is not accomplished;*

28
29 This consideration is a mirror to the second part of (a). As explained in Section IV.O.1, *Need for*
30 *a Facility* of this order, the facility would provide the additional transmission capacity necessary
31 for the applicant to meet forecasted load, comply with the minimum operating criteria for
32 reliability, and to provide transmission service to its wholesale customers. The applicant asserts
33 that if the proposed facility (for which the applicant states removal and fill are necessary) is not
34 constructed, the applicant would need to develop additional generation resources or make
35 higher cost market purchases to meet its forecasted load and regulatory obligations. As a result,
36 the applicant states that failure to develop the facility would result in higher power costs to
37 electric utility customers in the Pacific Northwest.⁷¹⁷

38
39 As discussed in more detail in Section IV.O.1, *Need for a Facility* in this order, the applicant
40 compared multiple potential resource portfolios as part of the integrated resource planning

⁷¹⁶ B2HAPPDoc3-18 ASC 10a_B2H_2018 Exhibit J Waters of the State Part 1 2018-09-28, Section 3.6.2.1.

⁷¹⁷ B2HAPPDoc3-18 ASC 10a_B2H_2018 Exhibit J Waters of the State Part 1 2018-09-28, Section 3.6.2.2.

1 process and selected the resource portfolio for the planning period that provides an adequate
2 and reliable supply of energy at the least cost and risk to the utility and its customers. In its
3 2017 IRP, the applicant evaluated one dozen different resource portfolios, including eight
4 portfolios that included alternative resource mixes (as alternatives to the proposed facility). As
5 discussed, the applicant's cost analysis demonstrated that its preferred portfolio (P7, which
6 includes the proposed facility) would be the least cost portfolio over the planning period. In
7 other words, every resource portfolio that did not contain the proposed facility would cost
8 more than the preferred portfolio that includes the proposed facility. Therefore, the applicant's
9 assertion that failure to develop the facility would result in higher electricity costs to electric
10 utility customers in the Pacific Northwest appears reasonable to the Department and has been
11 vetted and acknowledged by the OPUC. Based upon the Council's review of the Department's
12 assessment in Section IV.O.1 of this order and on the information the applicant provides in ASC
13 Exhibit J and N, the Department recommends Council conclude the economic cost to the public
14 if the proposed fill or removal is not accomplished was considered.

15
16 *(c) The availability of alternatives to the project for which the fill or removal is proposed;*
17

18 As previously discussed, the applicant evaluated one dozen different resource portfolios as part
19 of its 2017 IRP, including eight portfolios that included alternative resource mixes (as
20 alternatives to the proposed facility). The results of this evaluation show that every resource
21 portfolio that did not contain the proposed facility would cost more than the preferred
22 portfolio that includes the proposed facility. In addition to evaluating expanded demand
23 response capacity and development of new electric generating facilities (including natural gas
24 and solar) as alternatives to construction and operation of the proposed facility in the IRP
25 portfolios, the applicant evaluated a range of transmission line capacities for the facility. The
26 applicant also evaluated rebuilding an existing transmission line as an alternative to
27 construction and operation of the proposed facility.⁷¹⁸ For the reasons discussed in Section
28 IV.O., *Need for Nongenerating Facilities* of this order, designing the transmission line for a lower
29 operating voltage than currently proposed or rebuilding an existing transmission line are not
30 practicable alternatives.

31
32 Furthermore, the applicant describes in detail in ASC Exhibit B (and its attachments) the routing
33 and siting process it conducted and results of the federal permitting process which contributed
34 to the proposed and alternative routes the applicant includes in the ASC. This is summarized in
35 Section III.A., *Transmission Corridor Selection* of this order, which describes the siting studies
36 and process the applicant employed to establish the transmission corridors (proposed and
37 alternative routes) for the proposed facility. This effort was conducted for the federal NEPA
38 review process and for the ASC and included planning for avoidance and minimization of
39 impacts to numerous resources including but not limited to waters of the state, visual
40 resources, and NHPA Section 106 resources.⁷¹⁹ Other siting constraints included ODFW Category

⁷¹⁸ B2HAPPD0c3-22 ASC 14a_ Exhibit N_Need_ASC_Part 1 2018-09-28, Section 3.3.8.

⁷¹⁹ B2HAPPD0c3-18 ASC 10e_B2H_2018 JPA Part 2 2018-09-28, Appendix I.

1 1 habitat, Greater sage grouse habitat, agricultural and farming lands, protected areas,
2 mountainous areas with steep slopes, and highly populated residential areas. These siting
3 constraints are also discussed in Section IV.Q.1., *Noise Control Regulations*, which also provides
4 the siting constraints and considerations around noise sensitive properties, such as residences,
5 within the analysis area. The proposed and alternative transmission line routes included in the
6 ASC were selected to avoid or reduce impacts to these resources. Based upon a review of the
7 assessments in the applicable sections of this order and on the information the applicant
8 provided in ASC Exhibits, the Department recommends Council conclude the availability of
9 alternatives to the project for which the fill or removal is proposed was considered.

10
11 *(d) The availability of alternative sites for the proposed fill or removal;*

12
13 The availability of alternative sites for the permanent removal or fill activities relates to the
14 section directly above that provides a description of the siting process the applicant used to
15 establish the proposed and alternative routes, which employed the siting opportunities and
16 siting ~~restrictions-constraints~~ that informed or directed the routes. Section III.B.1., *Site*
17 *Boundary and Right of Way Dimensions*, of this order provides a discussion of the site
18 boundary, micrositing corridor and right-of-way dimensions for the proposed facility and
19 related or supporting facilities, such as roads. As stated in that section, the micrositing corridor
20 is the site boundary for the proposed transmission line. This means that the entire width of the
21 site boundary is evaluated for impacts to the resources protected under the EFSC standards.
22 This allows the applicant to “microsite” within the site boundary for the final placement of the
23 ROW to avoid and minimize impacts to resources, including activities that involve removal or fill
24 activities in wetlands. Taking into account the micrositing, as discussed in the above section,
25 the applicant states that the estimated permanent impacts to wetlands and WOS from the
26 proposed facility is 0.282 acres. Because the applicant engaged in the siting process to inform
27 the proposed and alternative routes, the applicant also evaluated alternative sites for the
28 proposed removal or fill activities because wetland and WOS impacts was one of the
29 considerations the applicant evaluated in its route selection process. The Department notes as
30 well, that for portions of the routes located on federal lands, that the lead federal agencies
31 direct the final routes in the issued Record of Decision (ROD).

32
33 The applicant also explains that the total acreage of wetlands and other waters that would be
34 temporarily or permanently impacted by the proposed removal and fill activities has decreased
35 due to efforts to avoid and minimize those impacts. Attachment I (Tables I-1 through I-5) of the
36 Joint Permit Application shows wetlands and other waters in each county that were avoided
37 during facility siting or to which impacts would be minimized.⁷²⁰ Based upon the Department’s
38 assessments in the applicable sections of this order, the consideration of criterion (c) above,
39 and on the information the applicant provided in ASC Exhibits, the Department recommends
40 Council conclude the availability of alternative sites for the proposed fill or removal activities
41 was considered.

⁷²⁰ B2HAPPDoc3-18 ASC 10e_B2H_2018 JPA Part 2 2018-09-28.

(e) Whether the proposed fill or removal conforms to sound policies of conservation and would not interfere with public health and safety;

ORS 196.805 outlines the policy for the Oregon Department of State Lands, which, in relevant part states; “The protection, conservation and best use of the water resources of this state ...including not only water and materials for domestic, agricultural and industrial use but also habitats and spawning areas for fish, avenues for transportation and sites for commerce and public recreation...Unregulated filling in the waters of this state for any purpose, may result in interfering with or injuring public navigation, fishery and recreational uses of the waters.”

The EFSC standards the applicant has to demonstrate that it meets provide protections for a wide array of resources and require compliance with a variety of state and federal conservation strategies and policies. The standards and sections in this order that specifically address the best uses for water resources of the state that DSL’s statutory requirements require to protect and conserve are listed in the following table:

Table RF-3: Department of State Lands Best Uses for Water Resources and EFSC Standards

DSL Designated Water Use⁷²¹	Council Standard or Regulation	Location in this Order
Water and materials for domestic and industrial use	Public Services Water Rights	Section IV.M., subsection <i>Water Supply</i> Section IV.Q.3.
Water for agricultural use	Land Use	Section IV.E., subsections IV.E.1., <i>Local Applicable Substantive Criteria</i> , and IV.E.2. <i>Directly Applicable State Statutes and Administrative Rules</i>
Habitats and spawning areas for fish Fisheries/fishing	Fish and Wildlife Habitat Threatened and Endangered Species Fish Passage	Section IV.F. Section IV.I. Section IV.Q.4.

⁷²¹ ORS 196.805 and ORS 196.825(1)(b)

Table RF-3: Department of State Lands Best Uses for Water Resources and EFSC Standards

DSL Designated Water Use ⁷²¹	Council Standard or Regulation	Location in this Order
Avenues for transportation, sites for commerce and public recreation	Land Use	Section IV.E.
Public navigation, and recreational uses of the waters	Recreation	Section IV.L.

1
2 Each of these sections discusses the applicable resources, potential impacts to the resources
3 and avoidance, minimization and mitigation measures to address any potential impacts from
4 the construction and operation of the proposed facility. Each of these resources is evaluated
5 and addressed in a manner that encourages, requires, and implements conservation,
6 preservation, enhancement and mitigation strategies. These are also discussed in the
7 evaluation of OAR 141-085-0565(4)(f) below.

8
9 As discussed in Section, IV.B., Organizational Expertise, of this order OAR 345-022-0010
10 requires the Council to find that the applicant has the organizational expertise to construct,
11 operate and retire the proposed facility in compliance with Council standards and conditions of
12 the site certificate. To reach this finding, the Council must find that the applicant has
13 demonstrated the ability to design, construct and operate the proposed facility in compliance
14 with site certificate conditions and in a manner that protects public health and safety and has
15 demonstrated the ability to restore the site to a useful, non-hazardous condition. As outlined in
16 that section and relying upon information provided in the ASC, the Department provides a
17 discussion of the applicant’s experience and expertise permitting, constructing, operating, and
18 maintaining ~~facilitates facilities~~ similar to the proposed facility, as well as the applicant’s
19 experience in compliance with state and federal safety and reliability standards for similar
20 facilities. Based on the information and analysis provided, the Department recommends that
21 the construction and operation, and retirement of the proposed facility ~~will-would~~ be
22 consistent with the organizational expertise standard and thus in a manner that protects public
23 health and safety. Additional safety standards specific to transmission lines is discussed further
24 in Section IV.P.1., *Siting Standards for Transmission Lines*.

25
26 The applicant explains in ASC Exhibit J that the proposed removal and fill would conform to the
27 sound policies of conservation because of the evaluation and planning it employed to inform its
28 wetland analysis to avoid and minimize impacts to wetlands and WOS.⁷²² Based on the
29 information gathered from the desktop analysis and field surveys, the applicant committed to
30 avoiding wetlands and other waters and to minimizing impacts to those wetlands and other
31 waters that are not practicable to avoid. To mitigate the impacts that would occur, the

⁷²² B2HAPPDoc3-18 ASC 10a_B2H_2018 Exhibit J Waters of the State Part 1 2018-09-28, Section 3.6.2.5.

1 applicant developed the draft CWNWMP as discussed above and implemented via
2 Recommended Removal-Fill Condition 3. The CWNWMP would mitigate permanent impacts to
3 wetland functions and values through the creation of functioning wetlands and enhancement
4 of existing wetlands at a mitigation site connected to a tributary to the Grande Ronde River.
5 The applicant also points to its commitments to implement best management practices (BMPs)
6 to avoid adverse impacts to wetlands, WOS and other natural resources from construction and
7 operation activities associated with the proposed facility. These BMPs are discussed in the
8 above section as well as in Sections IV.D., *Soil Protection*, of this order. The proposed facility
9 would be subject to the requirements of the NPDES 1200-C general stormwater permit, which
10 requires the applicant to develop and implement an ESCP to minimize impacts to soils and the
11 environment (including to resources adjacent to removal-fill sites and areas near WOS). The
12 applicant ~~will~~would also be required to comply with a DEQ-approved construction-related final
13 Spill Prevention, Control, and Countermeasures Plan (SPCC Plan). The BMPs discussed in this
14 order and covered in the NPDES 1200-C general stormwater permit, SPCC and ESCP are
15 consistent with the states polices for conservation and to safeguard public health and safety.
16

17 Based upon the Council’s review of the Department’s assessments in the applicable sections of
18 this order, on the information the applicant provided in ASC J and other ASC Exhibits, the
19 Department recommends Council conclude that the proposed fill or removal conforms to sound
20 policies of conservation and would not interfere with public health and safety and has been
21 considered.
22

23 *(f) Whether the proposed fill or removal is in conformance with existing public uses of*
24 *the waters and with uses designated for adjacent land in an acknowledged*
25 *comprehensive plan and land use regulations;*
26

27 In ASC Exhibit J, the applicant lists the existing public uses of the waters subject to the proposed
28 removal and fill associated with the proposed facility include withdrawals of surface water,
29 agricultural use, boating, and fishing.⁷²³ As discussed in the Water Supply portion of Section
30 IV.M., *Public Services* and in Section IV.Q.3., *Water Rights*, of this order, the applicant provides a
31 description of the estimated amount of water used during construction and operation of the
32 proposed facility, the uses for the water, and the public sources of water that ~~will~~would supply
33 the water needs. The applicant will not need a groundwater permit, surface water permit, or
34 water right transfer, and as evidenced with correspondence in ASC Exhibit O and in the Public
35 Services section of this order, the applicant ~~will~~would supply water for construction and
36 operation of the proposed facility from municipal sources and the sources have verified they
37 have adequate water supplies to meet the demands of the project. The Department
38 recommends in this section that the construction and operation of the proposed facility ~~will~~
39 would not adversely affect public and private water service providers.
40

⁷²³ See ORS 196.805. See also ORS 196.825(1)(b) which states; “Would not unreasonably interfere with the paramount policy of this state to preserve the use of its *waters for navigation, fishing and public recreation.*” Emphasis added.

1 Section IV.E., *Land Use*, of this order evaluates land use compliance for the proposed facility,
2 including an evaluation of applicable land use state statutes and Land Conservation and
3 Development Commission rules. Many applicable state statutes are adopted by county
4 governments in their comprehensive plans, however, if a statute is not adopted in the plan it is
5 nonetheless evaluated in the Land Use section of this order. Section IV.E.2., *Directly Applicable*
6 *State Statutes and Administrative Rules* and in Section IV.E.1., *Local Applicable Substantive*
7 *Criteria*, for each affected county there is a discussion of ORS 215.283, ORS 215.275 and ORS
8 215.275(5)296, as they apply to the facility according to the zoning designation crossed. A
9 component of this evaluation requires a discussion of potential impacts to adjacent agricultural
10 uses, adjacent landowners and agricultural practices in the vicinity of the proposed facility, and
11 therefore in the vicinity of the proposed removal or fill activities. As referenced in that section
12 and attached to this order is Attachment K-1, *Agricultural Lands Assessment*. The Agricultural
13 Lands Assessment (Agricultural Assessment) describes agricultural crops and existing
14 agricultural practices within the analysis area and analyzes the temporary and permanent
15 impacts that would occur as a result of the construction and operation of the proposed facility.
16 Finally, the Agricultural Assessment describes in detail the measures the applicant will
17 implement to avoid, minimize and mitigate and adverse impacts to agricultural practices.

18
19 The applicant discusses the potential impacts of the removal or fill activities from the proposed
20 facility on navigation and recreational opportunities such as boating and fishing, in ASC Exhibit
21 J. The applicant states that no existing public use of affected waters of the state would be
22 eliminated or degraded.⁷²⁴ The applicant would site facility components as to avoid impacts to
23 all streams, rivers, or lakes currently used for navigation. For instance the applicant can propose
24 to span (stretch the transmission lines cross) all streams, rivers, or lakes currently used for
25 navigation. Therefore, removal or fill activities associated with the proposed facility would not
26 result in any loss of navigability of waters of the state, including boating. Neither removal nor
27 fill activities are proposed inside the bankfull channel on any fish-bearing streams.⁷²⁵ As
28 described in Section IV.Q.4, *Fish Passage* of this order, the applicant has designed all crossings
29 of fish-bearing streams so that the movement of native migratory fish would not be restricted.
30 The BMP's proposed by the applicant discussed in this section and in this order also would
31 avoid potential negative impacts to fish and fish-bearing streams. The applicant states that the
32 public's opportunity to fish or otherwise recreate on any water of the state would be neither
33 impeded nor reduced, and may instead be improved. Implementation of the CWNWMP would
34 result in the creation of functioning wetlands and enhancement of existing wetlands at the
35 Hassinger Mitigation Site. This mitigation would improve in-stream and riparian habitat
36 conditions, which may improve public fishing opportunities by increasing salmon and steelhead
37 access to in-stream and off-channel habitat in the Grande Ronde River.⁷²⁶

⁷²⁴ B2HAPPDoc3-18 ASC 10a_B2H_2018 Exhibit J Waters of the State Part 1 2018-09-28, Section 3.6.2.6.

⁷²⁵ B2HAPPDoc3-18 ASC 10a_B2H_2018 Exhibit J Waters of the State Part 1 2018-09-28, Section 3.6.1.3.

⁷²⁶ B2HAPPDoc3-18 ASC 10a_B2H_2018 Exhibit J Waters of the State Part 1 2018-09-28, Section 3.6.1.3.

1 To evaluate whether the proposed fill or removal activities is in conformance with uses
2 designated for adjacent land in an acknowledged comprehensive plan and land use regulations,
3 the Department points to Section IV.E., *Land Use*, of this order which provides a land use
4 evaluation demonstrating how the applicant has proposed to meet the applicable substantive
5 criteria from each affected county that is crossed by the ~~prosed~~proposed facility. Applicable
6 substantive criteria are criteria from the affected local government's acknowledged
7 comprehensive plan and land use ordinances that are required by the statewide planning goals.
8 An evaluation of the statewide planning goals is provided in the Land Use section, including
9 Goal 5 resources that are identified and adopted by the County.⁷²⁷ Wetlands, streams, and WOS
10 are generally identified as Goal 5 resources and the evaluation and protection measures for
11 these resources are discussed in the applicable county in the Land Use section of this order. In
12 that section, the Department recommends the Council find that the facility complies with the
13 identified applicable substantive criteria and the directly applicable state statute and rule and,
14 therefore, complies with the Council's Land Use standard. As such, and relying upon the
15 Council's review of the Department's assessments in the applicable sections of this order, on
16 the information the applicant provided in ASC J and other ASC Exhibits, the Department
17 recommends Council conclude that the proposed fill or removal is in conformance with existing
18 public uses of the waters and with uses designated for adjacent land in an acknowledged
19 comprehensive plan and land use regulations and was considered.

20
21 *(g) Whether the proposed fill or removal is compatible with the acknowledged*
22 *comprehensive plan and land use regulations for the area where the proposed fill or*
23 *removal is to take place or can be conditioned on a future local approval to meet this*
24 *criterion;*

25
26 The Department provides an overview of the Council's land use evaluation in the section
27 directly above which applies to this criterion as well. Also in Section IV.E, *Land Use* of this order,
28 the Department recommends that the Council find that construction (during which the removal
29 and fill activities would occur) and operation of the proposed facility would comply with the
30 local applicable substantive criteria and any directly applicable statewide planning goals. The
31 Council's approval is subject to compliance with the conditions recommended to be included in
32 the site certificate, consistent with the Council's review and approval process describe further
33 in Section III.D., *Survey Data Based on Final Design and Site Access* in this order. The
34 Department recommends approval of the Council's Land Standard, which includes conditions of
35 approval. Conditions for a future approval for compatibility with the acknowledged
36 comprehensive plan and land use regulations, is not necessary, as stated in OAR 141-085-
37 0565(4)(g). Therefore and founded upon the Council's review of the Department's assessments
38 in the above section, applicable sections of this order, on the information the applicant
39 provided in ASC J and other ASC Exhibits, the Department recommends Council conclude that
40 the proposed fill or removal is compatible with the acknowledged comprehensive plan and land
41 use regulations for the area where the proposed fill or removal is to take place or can be

⁷²⁷ Goal 5 resources include designated natural resources, scenic and historic areas, and open spaces.

1 conditioned on a future local approval to meet this criterion, and therefore this criterion has
2 been considered.

3
4 *(h) Whether the proposed fill or removal is for stream bank protection; and*

5
6 Based on the response provided by the applicant in ASC Exhibit J, the proposed removal and fill
7 is not for stream-bank protection.⁷²⁸ Therefore this criterion is not applicable.

8
9 *(i) Whether the applicant has provided all practicable mitigation to reduce the adverse*
10 *effects of the proposed fill or removal in the manner set forth in ORS 196.800.*

11
12 The applicant must provide practicable mitigation measures to reduce any adverse effects from
13 the removal or fill activities associated with the proposed facility as prescribed by ORS 196.800:

- 14
15 • Avoidance
16 • Minimization
17 • Repair, rehabilitation, or restoration
18 • Monitoring and corrective measures; and
19 • Compensatory mitigation

20
21 The Department addresses each of these considerations:

22
23 **Avoidance:** As discussed throughout this section and in ASC Exhibit J, through desktop
24 analysis and field surveys within the site boundary the applicant and its consultant
25 delineated wetlands and other waters of the state. Based on this information, and the
26 wetland delineation review concurrence from DSL, the applicant committed to avoiding
27 many of these wetlands and other waters. Measures the applicant will utilize to avoid
28 impacts to wetland and WOS are micro-siting and placing facility components to avoid
29 wetlands and WOS. The applicant explains they can also avoid impacts to wetlands and
30 WOS by spanning them, meaning they can avoid direct impacts by only crossing over
31 them with the transmission line and not placing structures in wetlands.

32
33 **Minimization:** After applying all possible avoidance measures, the applicant commits to
34 minimizing impacts to those wetlands and other waters that are not practicable to
35 avoid. The applicant may implement the same measures stated above to also minimize
36 impacts to wetlands and WOS. For instance, to minimize an unavoidable impact from a
37 tower pad foundation, the applicant may be able to span portion of the wetland area,
38 thus reducing the impact. The proposed facility would be subject to the requirements of
39 the NPDES 1200-C general stormwater permit, which requires the applicant to develop
40 and implement an ESCP to minimize impacts to soils and the environment (including to
41 resources adjacent to removal-fill sites). Recommended Soil Protection Condition 1

⁷²⁸ B2HAPPDoc3-18 ASC 10a_B2H_2018 Exhibit J Waters of the State Part 1 2018-09-28, Section 3.6.2.8.

1 would require compliance with the NPDES 1200-C permit and a DEQ- approved ESCP
2 (see Section IV.D., *Soil Protection*, of this order). In addition, the applicant represents
3 that it would implement the best management practices for stream crossings listed in
4 Appendix L of the Joint Permit Application and in this section of the order.
5

6 **Repair, rehabilitation, or restoration:** Effects of the removal or fill activities would be
7 rectified in accordance with the draft Site Rehabilitation Plan (Attachment J-2 to this
8 order). Temporary impacts to wetlands and WOS would be repaired, rehabilitated, and
9 restored within 24 months of the disturbance. The draft Site Rehabilitation Plan
10 describes how the applicant would re-establish the pre-existing contours of the site, re-
11 establish the pre-existing vegetation community, and provide for rapid site stabilization
12 to prevent erosion. Recommended Removal-Fill Condition 2 would require the
13 certificate holder to ensure that temporary impacts to wetlands and non-wetland
14 waters of the state are mitigated in accordance with the final Site Rehabilitation Plan for
15 a phase or segment of the facility.
16

17 **Monitoring and corrective measures:** The Site Rehabilitation Plan would require the
18 certificate holder to monitor temporary impact sites for three years using the guidance
19 in DSL's *Routine Monitoring Guidance for Vegetation*. As described in the draft
20 monitoring plan within the draft Site Rehabilitation Plan, the purpose of monitoring is to
21 evaluate vegetative survival and establishment, soil moisture, sustaining hydrology, and
22 occurrence of noxious weeds and to identify corrective measures that may be required
23 to ensure successful restoration. The draft monitoring plan contains goals, objectives,
24 and performance standards for rehabilitation. The certificate holder would document
25 the monitoring results in an annual report that would provide a summary of reclamation
26 activities and observations, discuss progress towards or achievement of success, identify
27 any specific problem areas, and include recommendations for additional corrective
28 actions if necessary. The draft Site Rehabilitation Plan also lists contingency measures
29 (such as reseeding, replacing, live cuttings, and transplanting) that may be required
30 where initial restoration and plant establishment efforts fail to meet the performance
31 standards.
32

33 **Compensatory mitigation:** The applicant developed the draft CWNWMP, which would
34 mitigate permanent impacts to wetland functions and values through the creation of
35 functioning wetlands and enhancement of existing wetlands at a compensatory
36 mitigation site. The proposed mitigation site described in this section and in the
37 CWNWMP would compensate for the impacts to wetlands and WOS by creating,
38 restoring, enhancing and preserving substitute functions and values for the waters of
39 the state. Recommended Removal-Fill Condition 3 would require the certificate holder
40 to implement the actions described in the CWNWMP.
41

42 Based upon the Council's review of the Department's assessments in the applicable sections of
43 this order, on the information the applicant provided in ASC J and other ASC Exhibits, the
44 Department recommends Council conclude the applicant has provided all practicable mitigation

1 to reduce the adverse effects of the proposed fill or removal in the manner set forth in ORS
2 196.800.

3

4 *OAR 141-085-0565(3): The Department [DSL] will issue a permit if it determines the*
5 *project described in the application:*

6

7 Based upon the nine considerations discussed above, the Department recommends that the
8 Council make the following three determinations required by OAR 141-085-0565(3):

9

10 *(a) Has independent utility;*

11

12 In accordance with OAR 141-085-0510(43), independent utility “means that the project
13 accomplishes its intended purpose without the need for additional phases or other projects
14 requiring further removal-fill activities.”⁷²⁹ Under ORS 469.503(3) and under the Council’s
15 General Standard of Review (OAR 345-022-0000), the Council must determine whether the
16 proposed facility complies with “all other Oregon statutes and administrative rules..., as such,
17 Oregon Removal-Fill Law (ORS 196.795 through 196.990) and Department of State Lands (DSL)
18 regulations (OAR 141-085-0500 through 141-085-0785) fall under the Council’s jurisdiction.
19 Therefore, because of this consolidated review, the Council must determine whether a
20 removal-fill permit is needed and if so, whether a removal-fill permit should be issued.
21 The applicant seeks Council approval for the construction and operation of the entirety of the
22 proposed facility. The applicant’s request and the Council’s consolidated review of the
23 proposed facility encompasses all the necessary phases including desktop analysis and field
24 surveys conducted based on site access and final design. As outlined in Section III.D., *Survey*
25 *Data Based on Final Design and Site*, and the subsection titled, *Delineation Surveys for Wetlands*
26 *and Waters of the State*, pursuant to ORS 469.503, ORS 469.401, and ORS 469.402, the Council
27 may approve a facility subject to the conditions in the site certificate. Further, the Council may
28 delegate future review of draft plans and survey information to the Department in consultation
29 with reviewing agencies. If approved by Council, the site certificate authorizes the applicant to
30 construct, operate and retire the facility subject to the conditions set forth in the site
31 certificate. Therefore, consistent with OAR 141-085-0510(43) and under OAR 141-085-
32 0565(3)(a) the Department recommends the Council determine that its review of the proposed
33 facility and issuance of the site certificate accomplishes the intended purpose of the applicant’s
34 request to review the facility in its entirety, without the need for additional phases or other
35 projects that require further removal-fill activities.

36

37 In the section directly above, the Department presents the nine criteria from DSL’s rules and
38 statutes to inform Council’s determinations about whether to issue a removal-fill permit. The
39 evaluation of the considerations is based on the information provided by the applicant in ASC
40 Exhibits, on the Department’s analysis in the applicable sections of this order, and on the

⁷²⁹ OAR 141-085-0510(80) defines project as the “primary development or use, having independent utility, proposed by one person. A project may include more than one removal-fill activity.”

1 recommended site certificate conditions of approval. Upon review of these criteria in totality,
2 the Council has considered the public need for the facility, the economic costs to the public if
3 the facility is not constructed, an evaluation of alternative routes and the siting of facility
4 components to avoid impacts to wetlands. The Council has also considered the conformance of
5 the proposed facility consistent with state conservation policies, as well as the facility's
6 compatibility with land use regulations. Finally, the Council has considered the practicable
7 mitigation to reduce the adverse effects of the fill or removal activities associated with the
8 proposed facility. Therefore, the Department recommends the Council determine, based on the
9 considerations set forth in this section identified in OAR 141-085-0565(4), that the proposed
10 facility has independent utility.

11
12 *(b): Is consistent with the protection, conservation and best use of the water resources of*
13 *this state as specified in ORS 196.600 to 196.905; and*

14
15 ORS 196.805 outlines DSL's policy for the protection, conservation and best use of the water
16 resources of this state. As explained in the above evaluation of considerations under OAR 141-
17 085-0565(4)(e) and (f), the best uses established in DSL's rules include uses for water including
18 domestic, agricultural and industrial use, fisheries and fish habitat, navigation and recreational
19 uses of waters of the state. In the evaluation of these considerations as provided above, the
20 Department points to the applicable sections of this order and ASC Exhibit that address the
21 protection and conservation these resources. As discussed above in the analysis under OAR
22 141-085-0565(4)(i), the applicant would reduce the adverse impacts of the proposed facility
23 through avoidance; minimization; repair, rehabilitation, or restoration; monitoring or corrective
24 measures; and compensatory mitigation. For the reasons provided in the above consideration
25 assessment, the Department recommends that the Council determine that the construction
26 and operations of the proposed facility is consistent with the protection, conservation and best
27 use of the water resources of this state as specified in ORS 196.600 to 196.905.

28
29 *(c): Would not unreasonably interfere with the paramount policy of this state to preserve*
30 *the use of its waters for navigation, fishing and public recreation, when the project is on*
31 *state-owned lands.*

32
33 In the analysis under OAR 141-085-0565(3)(b) above, the Department recommends that the
34 Council determine that the proposed removal or fill activities associated with the proposed
35 facility is in conformance with the protection, conservation and best uses of water resources in
36 the state. The determination under this subsection OAR 141-085-0565(3)(c) is more limited in
37 that it is only applicable to state-owned lands. The applicant does not propose removal or fill of
38 WOS on any state-owned land inside the site boundary.⁷³⁰ The applicant does not propose any
39 removal or fill activities within the bankfull channel of any fish bearing streams. Further
40 protections specific to fish habitat and provisions to protect streams and waterways from
41 crossings or impacts from the construction of the ~~prosed-proposed~~ facility are discussed in

⁷³⁰ B2HAPDoc3-18 ASC 10a_B2H_2018 Exhibit J Waters of the State Part 1 2018-09-28, Section 3.6.1.3.

1 Sections IV.H. and IV.Q.4. The applicant reiterates that the construction and operation of the
2 proposed facility ~~will-would~~ not result in any loss of navigability on any WOS because the
3 proposed facility ~~will-would~~ span all streams, rivers, or lakes currently used for navigation. The
4 proposed facility ~~will-would~~ also avoid and minimize impacts to recreational opportunities as
5 discussed in Section IV.L. Because the applicant does not propose any removal or fill activities
6 on state-owned land, the Department recommends that the Council determine that the
7 construction and operations of the proposed facility would not unreasonably interfere with the
8 paramount policy of this state to preserve the use of its waters for navigation, fishing and public
9 recreation, when the project is on state-owned lands.

10
11 On April 1, 2019, the Department received from the Oregon Department of State Lands (DSL),
12 the recommended conditions for the removal-fill permit to include in the site certificate.^{731 732}
13 The recommended removal-fill permit conditions are included in Attachment J-3 of this order.
14 The recommended conditions include numbered General Conditions that appear in all removal-
15 fill permits issued by DSL as well as numbered Special Conditions that are specific to the
16 applicant's application and project. DSL uses information from the applicant's wetland
17 delineation reports, DSL's Letter of Concurrence and the JPA when determining the conditions.

18
19 The conditions in the removal-fill permit are conditions of approval in the site certificate that
20 the applicant must comply with. Therefore, the Department recommends Removal-Fill Permit
21 Condition 5, specifying that the conditions set forth in the removal-fill permit are conditions of
22 approval in the site certificate.

23
24 **Recommended Removal-Fill Condition 5:** Prior to construction of a phase of segment
25 of the facility and during operation, the certificate holder shall maintain compliance
26 with the General and Special Conditions set forth in the removal-fill permit (Attachment
27 J-3 to the Final Order on the ASC).

28
29 Special Condition 3 in the recommended removal-fill permit addresses the wetland data gap
30 created by site access restrictions within the site boundary and stipulates that the additional
31 wetland delineation data must be provided to DSL for concurrence prior to any construction
32 activities in area not previously surveyed. This condition mirrors Recommended Removal-Fill
33 Condition 6 in this section. The approved and issued removal-fill permit must be updated prior
34 to any construction activities on currently unsurveyed parcels. The permit information must be
35 updated to reflect final impacts to and mitigation accounting for a phase or segment of the
36 proposed facility the applicant intends to construct. The Department, therefore recommends
37 Council adopt the following condition to ensure that the removal-fill permit is updated prior to
38 construction of the facility and any impacts to wetlands or WOS.⁷³³

⁷³¹ B2HAPPDoc13-25 ASC Reviewing Agency Comment DSL_61621 RF Authorization 2019-04-01.

⁷³² Removal/Fill Permit No. 61621-RF.

⁷³³ The Department notes that the version of the Removal Fill Permit attached as Attachment J-3 to the Final Order on the ASC is the version that will be provided to DSL for them to issue to the applicant.

Recommended Removal-Fill Condition 6: The certificate holder shall:

- a. Prior to construction of a phase or segment of the facility, comply with procedures in all Removal-Fill Conditions, and receive an updated removal-fill permit (Attachment J-3 of the Final Order on the ASC) reviewed and approved by the Department in consultation with the Oregon Department of State Lands.
- b. Prior to construction of a phase or segment of the facility, submit a final copy of the updated removal-fill permit issued by the Oregon Department of State Lands.
- c. Following construction and during operation of a phase or segment of the facility, the certificate holder shall implement the actions described in the removal-fill permit.
- d. The Department will provide updates to Council on the certificate holder’s implementation of the removal-fill permit and of any permit revisions at Council meetings, following submittal of the certificate holder’s six-month construction progress report per General Standard of Review Condition 3 or annual report per General Standard of Review Condition 4.
- e. The removal-fill permit version approved when the facility begins operation may be revised or updated from time to time by agreement of the certificate holder and the Oregon Energy Facility Siting Council. Such revisions or updates may be made without amendment of the site certificate. The Council authorizes the Department to agree to revisions or updates to this permit. The Department shall notify the Council of all revisions or updates, and the Council retains the authority to approve, reject, or modify any revisions or updates of the permit agreed to by the Department.

Conclusions of Law

Based on the foregoing findings of fact and conclusions of law, and subject to compliance with the recommended conditions to the site certificate, the Department recommends that the Council find the proposed facility, including the proposed and alternative routes, would comply with Oregon removal-fill law; and that DSL shall issue a removal-fill permit that includes the recommended conditions contained in Attachment J-3 of this order.

IV.Q.3. Water Rights: OAR 690-310-0000; OAR 690-380-0000

Under ORS Chapters 537 and 540 and OAR Chapter 690, the Oregon Water Resources Department (OWRD) administers water rights for appropriation and use of the water resources of the state. Under OAR 345-022-0000(1)(b), the Council must determine whether the facility would comply with these statutes and administrative rules identified in the second amended project order. The second amended project order identifies OAR 690, Divisions 310 and 380 (Water Resources Department permitting requirements) as the administrative rules governing use of water resources and water rights as applicable to the proposed facility.

1 **Findings of Fact**

2

3 OAR 690 establishes the procedures and standards which shall be applied by the OWRD in the
4 evaluation of applications for a permit to appropriate surface water, ground water, to construct
5 a reservoir and store water, to use reserved water, or to use water stored in a reservoir.

6

7 As explained in ASC Exhibit O, the applicant does not request a groundwater permit, a surface
8 water permit, or a water right transfer; the applicant would procure water for use during
9 construction and operations from municipal sources. This analysis and the applicant's
10 evaluation in ASC Exhibit O and E of water use and demand during proposed facility
11 construction and operation is not intended to address water rights of existing landowners or
12 the potential of water rights necessitating transfer as a result of proposed facility location, as
13 such water right transfer is not required for or related to construction and operation of the
14 proposed energy facility and therefore not within EFSC jurisdiction.⁷³⁴

15

16 During construction, water use would include dust suppression measures, drinking and sanitary
17 purposes, concrete mixing for foundations, access road construction, as well as reseeded and
18 restoration efforts. The applicant estimates that facility construction would require
19 approximately 36.5 million gallons over a 36-month construction period under annual average
20 conditions; the applicant estimates that it would require 54.8 million gallons under worst-case
21 conditions.⁷³⁵ The worst case estimate could occur if the weather is especially hot and dry,
22 which would result in a higher level of water use for dust suppression.⁷³⁶ For comparative
23 reference, the applicant represents that the estimate of 36.5 million gallons of water is the
24 amount of water that 83 typical families would use over the same time period, and the worst
25 case estimate of 54.8 million gallons would be equivalent to the amount of water required to
26 farm approximately two to three acres of alfalfa for one season.

27

28 The majority of expected water use 26,280,000 gallons (approximately two-thirds of the total)
29 would be used for dust suppression; approximately 3,898,125 gallons for foundation
30 construction; approximately 4,425,000 for restoration and; approximately 1,701,600 gallons for
31 road construction.⁷³⁷ The worst case estimates for these sub-categories are approximately
32 39,420,000 gallons for dust suppression; 5,847,188 gallons for foundation construction;
33 6,637,500 gallons for restoration and; 2,552,400 gallons for road construction.⁷³⁸ The applicant
34 indicates that the amount of water used for dust control purposes would not result in water
35 runoff outside the site boundary.

⁷³⁴ [B2HAPPDoc8-074 DPO Public Comment Chamberlin J Owyhee Irrigation District 2019-06-18 to 08-19.](#)

⁷³⁵ B2HAPPDoc3-24 ASC 15_Exhibit O_Water_Use_ASC 2018-09-28, Table O-1a, Footnote 7. The applicant notes that it calculated its worst case estimates by multiplying its expected water use estimates by 150 percent.

⁷³⁶ B2HAPPDoc3-24 ASC 15_Exhibit O_Water_Use_ASC 2018-09-28, Section 3.4.

⁷³⁷ B2HAPPDoc3-24 ASC 15_Exhibit O_Water_Use_ASC 2018-09-28, Table O-1a.

⁷³⁸ The Department estimates water use sub-categories based on estimated water use multiplied by 150 percent.

40

During construction, all water would be obtained through contracts with municipal sources including the City of Boardman, the City of Pendleton, the City of La Grande, Baker City, and the City of Ontario.⁷³⁹ Water would be pumped into tanker trucks and transported to multi-use areas. The applicant represents that it contacted all potential municipal suppliers of water (listed above), and that each supplier provided either written or oral assurances that the amounts requested by the applicant could be provided at the time of construction. As explained in ASC Exhibit V, portable toilets would be located at construction sites; portable toilets would be provided by a subcontractor that would service the facilities and dispose of wastewater in accordance with local regulations.⁷⁴⁰

During facility operations, the water use would be limited to the restroom facility at the Longhorn Station, which would be connected to the Port of Morrow’s water and sewer system. The restroom facility would use approximately 30 gallons per day, and would not require the construction of a well. The Port of Morrow confirmed that it could adequately serve the facility.

Based on the applicant’s analysis and calculations, the Department recommends the Council find that the applicant has established that it can obtain adequate water for construction and operation of the proposed facility and does not need a groundwater permit, surface water permit, or water right transfer. If such a permit is required by the applicant at a later time, a site certificate amendment would be required to review and consider such a permit application.

Conclusions of Law

Based on the foregoing findings of fact, the Department recommends Council conclude that the proposed facility, including the proposed and alternative routes, would not need a groundwater permit, surface water permit, or water right transfer.

IV.Q.4. Fish Passage: OAR 635-412-0035

Pursuant to ORS 469.503(3) and under the Council’s General Standard of Review (OAR 345-022-0000), the Council must determine whether the proposed facility complies with “all other Oregon statutes and administrative rules..., as applicable to the issuance of a site certificate for the proposed facility.” Under OAR 635-412-0020, new construction affecting fish-bearing streams in Oregon will trigger fish passage rules and regulations and require review by the Oregon Department of Fish and Wildlife (ODFW). This requires upstream and downstream fish passage at all existing or new artificial obstructions in Oregon waters in which migratory native fish are currently or have historically been present, except under certain circumstances. The applicant identified areas (primarily stream crossings), where this requirement would be triggered, therefore the applicant requests that under ORS 469.401(3) and ORS 469.503(3)

⁷³⁹ B2HAPPDoc3-24 ASC 15_Exhibit O_Water_Use_ASC 2018-09-28, Section 3.4.
⁷⁴⁰ B2HAPPDoc3-39 ASC 22_Exhibit V_Waste_ASC 2018-09-28, Section 3.3.2.1

1 Council approve the applicant’s Fish Passage Plan in ASC Exhibit BB, and Attachment BB-2 to
2 this order.

3
4
5

4 **Findings of Fact**

6 In ASC Exhibit BB, the applicant describes that the design, construction and operation of the
7 proposed facility ~~will-would~~ require the construction of new roads and the modification of
8 existing roads, as discussed in Section III.C., *Proposed Facility*, and also described in the Road
9 Classification Guide and Access Control Plan (ASC Attachment BB-2, and to this order). To
10 construct these access roads, crossings may involve the design and construction of new
11 crossing structures, modifications to existing structures, or use of existing structures with no
12 improvements. A Report titled, Fish Habitat and Stream Crossing Assessment Summary Report,
13 was submitted to the Department and ODFW in 2014.⁷⁴¹ The report was updated in 2016 and
14 identified a total of 58 fish-bearing streams that would be crossed by access routes within the
15 states of Oregon and Idaho, of which seven crossing sites were identified as potentially
16 triggering ODFW fish passage. Table 1 in ASC Exhibit BB, provides the stream name, proposed
17 crossing type, and fish passage information. Crossing Types 3A and 3B were the crossing
18 designs selected ~~as proposed alternatives~~ for the seven crossing sites; these crossings were
19 deemed likely to trigger ODFW review because they would require some new construction.
20 Section 3.2 further describes these crossing types. Section 4.1 describes the existing stream
21 conditions, the criteria applied to evaluate the stream crossing and the proposed type of
22 crossing for the follow streams or stream segments:

- 23 • Little Rock Creek, Site R-33010
- 24 • 4.1.2 Rock Creek, Site R-33011
- 25 • 4.1.3 Rock Creek, Site R-33033
- 26 • 4.1.4 Rock Creek, Site R-33147
- 27 • Goodman Creek, Site R-65725
- 28 • Cavanaugh Creek, Site R-66818
- 29 • Benson Creek, Site R-68790

30

31 Appendix C of the Fish Passage Plan (Attachment B-2) provides the design drawings for these
32 crossings. In its comment letter on the ASC the Oregon Department of Fish and Wildlife (ODFW)
33 stated that its Fish Division and local District Fish Programs reviewed the Fish Passage Plan and,
34 subject to finalization prior to construction, “ODFW finds fish impacts to be adequately
35 considered and addressed. It is ODFW’s understanding that fish passage plans and approvals
36 have yet to be finalized prior to construction.”⁷⁴²

37

38 The applicant also notes that unrestricted access to habitat is important for both resident and
39 anadromous salmonids. Upstream-migrating fish require access to suitable spawning gravel and
40 juvenile fish must be able to disperse upstream and downstream to take advantage of available

⁷⁴¹ B2HAPDoc3-45 ASC 28_Exhibit BB_Other_Info_ASC 2018-09-28.

⁷⁴² B2HAPDoc13-21 ASC Reviewing Agency Comment ODFW_Reif 2019-01-25.

1 rearing habitat. If culverts or other types of road crossing structures are poorly designed,
2 constructed, or maintained, they can affect the population of entire stream drainages. As
3 discussed above, Table P1-18 depicts each of the road crossings of fish-bearing streams. If any
4 future route modifications require road crossing improvement or modifications beyond those
5 identified in the fish passage plans, as explained in the Fish Passage Plan, the applicant
6 proposes to install all culverts or other stream crossing structures in accordance with ODFW fish
7 passage rules and approvals.⁷⁴³ Furthermore, comments received by the public suggest that
8 certain culverts on Ladd Creek, which was not identified in the application as supporting
9 anadromous fish, were recently modified and as a result Ladd Creek now contains anadromous
10 fish. To ensure any such new information about stream status and related fish passage is
11 addressed prior to construction, the applicant proposes to request any new information about
12 stream status from ODFW and seek ODFW concurrence on stream status prior to finalizing the
13 Fish Passage Plan.⁷⁴⁴

14
15 Based on the applicant's designs to minimize the number of fish-bearing crossings, and subject
16 to compliance with these Fish Passage Plans and designs (Attachment BB-2 to this order) to
17 avoid impacts to fish bearing streams from the construction of the proposed facility, and
18 ODFW's December 30, 2015 approval of the fish passage designs and operational provisions,
19 the applicant proposes and the Department recommends following site certificate condition:

20
21 **Recommended Fish Passage Condition 1:**

- 22 a. Prior to construction, the certificate holder shall finalize, and submit to the
23 Department for its approval in consultation with ODFW, a final Fish Passage Plan.
24 As part of finalizing the Fish Passage Plan, the certificate holder shall request from
25 ODFW any new information on the status of the streams within the site boundary
26 and shall address the information in the final Fish Passage Plan. The protective
27 measures described in the draft Fish Passage Plan in Attachment BB-2 to the Final
28 Order on the ASC, shall be included as part of the final Fish Passage Plan, unless
29 otherwise approved by the Department.
- 30 b. The certificate holder shall maintain compliance with the measures outlined in the
31 final Fish Passage Plan approved by the Department in consultation with ODFW.
- 32 c. The certificate holder shall comply with the following operational provisions, as
33 required per ODFW's fish passage approval (December 30, 2015), per Attachment
34 BB-2 Appendix A of the Final Order on the ASC:
- 35 1. All in water work shall occur during the ODFW in-water work windows for
36 each waterbody.
 - 37 2. Temporary water management and fish rescue, salvage, and recovery, is
38 required (as prescribed in OAR 635-412-0035(10)) prior to all in-water work
39 activities (defined as all work at or below the ordinary high water elevation)

⁷⁴³ B2HAPPDoc3-25 ASC 16A_Exhibit P1_Wildlife_ASC_Part 1_Main thru Attach P1-6 rev 2018-09-28. Section 3.5.5.6. In addition, on federally managed lands, any crossing structure not already approved would be installed in accordance with BLM and USFS requirements.

⁷⁴⁴ B2HAPP DPO Applicant Responses – ODOE Comments – StopB2H – 7.F&W Habitat and T&E

- 1 associated with the project. Fish salvage activities require the certificate
- 2 holder to obtain State of Oregon Scientific Take Permits from ODFW.
- 3 3. Wildlife rescue, salvage, and recovery activities associated with the facility
- 4 require the applicant to obtain State of Oregon Wildlife Rescue Salvage
- 5 Permits from ODFW.
- 6 4. Fish passage design standards, as defined in OAR 635-412-0035(1) and (3),
- 7 shall be implemented for all fish passage components of these projects.
- 8 5. The certificate holder shall be responsible for all maintenance required such
- 9 that projects provide adequate passage for native migratory fish. If
- 10 monitoring by the certificate holder or ODFW indicates that fish passage is
- 11 not being provided, the certificate holder in consultation with ODFW, shall
- 12 determine the cause and, during a work period approved by ODFW, shall
- 13 modify the structure as appropriate to rectify problems as necessary. Failure
- 14 to maintain fish passage for the duration of these approvals shall constitute a
- 15 violation of these approvals and applicable fish passage laws (ORS 509.610).
- 16 6. After construction completion, the certificate holder or its designee, shall
- 17 maintain, monitor, evaluate and report on the effectiveness of fish passage
- 18 as required under ORS 509.610, and shall provide written status reports to
- 19 ODFW's Fish Passage Program annually for the first three (3) years and then a
- 20 final report at Year 5, or as determined by ODFW. Reports shall include
- 21 photographs from established photo-points as part of the fish-passage
- 22 evaluation and monitoring. Monitoring, evaluation, and reporting shall be
- 23 conducted annually unless problems are observed that may require
- 24 additional analysis. Fish passage reports shall consist of visual observations,
- 25 photographs, as-built plan reviews, and future site visits with regards to fish
- 26 passage at and through the project sites. Reports shall be submitted to the
- 27 State Fish Passage Coordinator and the La Grande and Malheur Watershed
- 28 District Fish Biologists. Electronic or hard copy submissions are acceptable.
- 29 7. Failure to maintain fish passage at these locations shall constitute a violation
- 30 of these approvals and applicable fish passage laws (ORS 509.585 and
- 31 509.610).
- 32 8. ODFW shall be allowed to inspect the crossing sites at reasonable times for
- 33 the duration of the approval Unless prompted by emergency or other exigent
- 34 circumstances, inspection shall be limited to regular and usual business
- 35 hours, including weekends.
- 36 9. The appropriate ODFW District Fish Biologist shall be contacted 2-weeks in
- 37 advance and prior to implementation of fish passage projects.
- 38 4-10. These fish passage approval in no way purports or authorize take of a
- 39 federally listed species.

40 **Conclusions of Law**

41 Based on the foregoing analysis and findings of fact, and subject to the site certificate
42 conditions, the Department recommends Council conclude that the proposed facility, including
43
44

- 1 the proposed and alternative routes, would comply with the Fish Passage ~~Plan~~ Requirements of
- 2 OAR 635, Division 412.

1 **V. PROPOSED CONCLUSIONS AND ORDER**

2
3 The applicant has submitted an application for site certificate to construct and operate a
4 transmission line and its related or supporting facilities (Longhorn Station, communication
5 stations, new and substantially modified roads, and temporary multi-use areas) to be located in
6 the counties of Morrow, Umatilla, Union, Baker, and Malheur; and the cities of North Powder
7 and Huntington. Subject to compliance with the recommended site certificate conditions, the
8 Department recommends that the Council find that preponderance of evidence on the record
9 supports the following conclusions:

- 10
11 1. The proposed Boardman to Hemingway Transmission Line complies with the
12 requirements of the Oregon Energy Facility Siting Council Statutes, ORS 469.300 to
13 469.520.
14
15 2. The proposed Boardman to Hemingway Transmission Line complies with the
16 standards adopted by the Council pursuant to ORS 469.501.
17
18 3. The proposed Boardman to Hemingway Transmission Line complies with all other
19 Oregon statutes and administrative rules identified in the second amended project
20 order as applicable to the issuance of a site certificate for the proposed facility.
21

22 Based on the recommended findings of fact, reasoning, recommended conditions and
23 conclusions of law in this proposed order, the Department recommends that the Council
24 conclude that the applicant has satisfied the requirements for issuance of a site certificate for
25 the proposed Boardman to Hemingway Transmission Line. The Department further
26 recommends that, pursuant to ORS 469.401, the Chairperson execute the certificate
27 authorizing the applicant to construct, operate and retire the facility subject to the conditions
28 set forth in the site certificate.

Issued this 2nd day of July 2020
