

Information Management

It is recognized that the efficient and effective management of a road system requires the collection and management of a large amount of information about the system. Construction costs, maintenance costs, road condition information, construction plans and maintenance plans are a few of the many types of information that need to be collected and managed. Where possible, modern technology such as Global Positioning Systems, Geographic Information Systems, data recorders and data base software will be used to collect and manage the information.

The details of this chapter will be developed and added to the manual as soon as possible.
