

Multi-use Path Options

Option 1: Cut Slope

This requires us to clear and cut back the slopes to make the pedestrian path. The slope would be re-vegetated. Normal guardrail would be installed on highway to protect vehicles from dropping off into the stream should they leave the road.

Option 2: Structure

This option includes a new structure. The existing slope will remain in place. Guardrail would be installed on the highway to protect vehicles from dropping off into the stream should they leave the road.

Option 3: Curb, Sidewalk and Wall

This option is a typical sidewalk adjacent to the highway as in other urban sections, with barrier to protect vehicles from the vertical drop off to the stream should they leave the road. This option requires a retaining wall be built to keep the sidewalk out of the stream.

Bicycle and pedestrian facilities will be provided throughout the length of the project.
