BACKGROUND / CONTEXT

Medicaid waiver

Medicaid (health coverage for people earning less than 138 percent of the federal level, and people with disabilities) is administered by individual states but must follow certain federal requirements. States may obtain an 1115 Medicaid Demonstration waiver from the federal government, which grants them extra flexibility in how they use federal Medicaid funds in their state, with the goal of improving health care programs. Oregon has had such a waiver since 1994. The 1115 Medicaid waiver allows Oregon to deliver Medicaid services in unique ways, such as through the coordinated care model. Some of the key elements of Oregon’s coordinated care model include: using best practices to manage and coordinate care; transparency in price and quality; and paying for better quality care and better health outcomes, rather than just more services. So what does coordinated care mean?

Coordinated care

A coordinated care organization (CCO) is a network of health care providers (physical, behavioral, and oral health care providers) who have agreed to work together in their local communities to serve people who receive health care coverage under the Oregon Health Plan (Medicaid). CCOs were formed in Oregon in late 2012. Today there are 16 CCOs operating in communities around Oregon (see maps on page 14).

CCOs have the flexibility to support new models of care that are patient-centered, team-focused, and reduce health disparities. CCOs are able to better coordinate services and also focus on prevention, chronic illness management and person-centered care. They have flexibility within their budgets to provide services alongside today's OHP medical benefits with the goal of meeting the triple aim of better health, better care and lower costs for the population they serve. Before Oregon’s CCOs were formed, physical, behavioral and other care were not integrated, making things more difficult for patients and providers and more expensive for the state.

Medicaid expansion

Beginning in 2014 many more Oregonians were able to join the Oregon Health Plan because of the Affordable Care Act, which increased the income eligibility limit. The number of people covered by CCOs increased by 63 percent, from about 614,000 in 2013 to almost 1 million in 2014.

Measuring progress

The measures in this report are an important piece of the coordinated care model. They increase transparency and help us know how well CCOs are improving the quality of care. The measures fall into three categories (see next page).
BACKGROUND / CONTEXT

**State performance metrics** (also known as quality and access metrics)

OHA is accountable to the Centers for Medicare & Medicaid Services (CMS) for statewide performance on these metrics as part of the 1115 Medicaid waiver. If performance on these measures declines, OHA must pay financial penalties.

**Core performance metrics**

There are no financial incentives or penalties for performance on these measures. OHA is required to measure and report performance on these metrics to CMS.

**$ CCO incentive metrics**

CCOs receive payment based on their performance on incentive metrics, which are selected by the Metrics and Scoring Committee. This is part of Oregon’s commitment to pay for better quality care and health outcomes.

Note that there is often crossover between the measure sets; a metric can fall into more than one category. To help readers identify which metrics belong in which measure set, each metric is accompanied by the icons shown.

**Measure specifications and more information**

- Information about the CCO incentive program, including specifications for the measures included in this report: [http://www.oregon.gov/oha/analytics/Pages/CCO-Baseline-Data.aspx](http://www.oregon.gov/oha/analytics/Pages/CCO-Baseline-Data.aspx)
- Metrics and Scoring Committee: [http://www.oregon.gov/oha/hpa/analytics/Pages/Metrics-Scoring-Committee.aspx](http://www.oregon.gov/oha/hpa/analytics/Pages/Metrics-Scoring-Committee.aspx)
- This and other metrics reports: [http://www.oregon.gov/oha/hpa/analytics-mtx/Pages/HST-Reports.aspx](http://www.oregon.gov/oha/hpa/analytics-mtx/Pages/HST-Reports.aspx)
This report lays out the progress of Oregon’s coordinated care organizations (CCOs) on quality measures in 2016. Measuring quality and access to care are key to moving health system transformation forward, to ensure high-quality care for Oregon Health Plan members. Measuring quality and holding CCOs accountable to key metrics is a cornerstone of Oregon’s health system transformation.

This is the fourth year of Oregon’s pay-for-performance program, under which the Oregon Health Authority (OHA) holds back a percentage of monthly payments to CCOs to form a “quality pool.” To earn their full incentive payment, CCOs have to meet benchmarks or improvement targets on at least 13 of the 18 measures and have at least 60 percent of their members enrolled in a patient-centered primary care home.

The quality pool model rewards CCOs for the quality of care provided to Medicaid members. This model increasingly rewards CCOs for outcomes, rather than utilization of services, and is one of several key health system transformation mechanisms for achieving Oregon’s vision for better health, better care, and lower costs.

The 2016 incentive measures set challenging goals for CCOs to continue to improve the quality of care of Medicaid members. As CCOs made large strides on existing measures in the first few years of the program, the aspirational benchmarks, often based on the most exceptional national performance, require focused, sustained efforts to improve quality and be successful on the measures. In addition, the 2016 challenge pool included two new measures: improve care for CCOs on two new measures: (1) cigarette smoking prevalence and (2) childhood immunization status.

The results in this report demonstrate that as the quality pool model continues, the targets and benchmarks become even harder to meet or exceed. This ensures that CCOs continue to focus on metrics and strive toward improvement and better health outcomes for members.

The quality pool amount increased to 4.25 percent of monthly payments in 2016, for a total of almost $179 million. While all CCOs showed improvement on a majority of measures, only seven earned 100 percent of their quality pool dollars. The results from the quality pool model are demonstrating that this is not just another program to pay CCOs for service, but to push CCOs to focus on performance and improving the health outcomes of members.

This report indicates that through the coordinated care model, there have been continued improvements in a number of areas, such as:

- **Adolescent well-care visits.** CCOs continue to make large strides on this measure, with 15 of 16 CCOs improving in 2016 and 13 achieving their individual improvement target. Statewide, performance on this measure has increased 47 percent since 2013. While CCOs are improving, overall performance remains low, with less than half of adolescents receiving a well-care visit as recommended by clinical guidelines.
EXECUTIVE SUMMARY

- **Dental sealants.** The percentage of children ages 6-14 who received a dental sealant on a permanent molar in the past year continued to increase. Statewide performance surpassed the aspirational benchmark in 2016.

- **Developmental screening in the first three years of life.** CCOs continue to make large strides in the percentage of children who are screened for risks of developmental, behavioral, and social delays. In 2011, only 21 percent of young children received an appropriate screening. Since then, the percentage has more than tripled to over 62 percent in 2016.

- **Effective contraceptive use among women at risk of unintended pregnancy.** A new measure in 2015, the percentage of women ages 18-50 who are using an effective contraceptive has increased 19 percent in two years.

- **Health assessments for children in DHS custody.** The percentage of children in foster care who received a mental, physical, and dental health assessment has increased 168 percent in two years.

Measures to watch:

- **Emergency department utilization.** For the first time since 2011, emergency department utilization increased slightly over the previous year. Statewide, the rate of patient visits to the emergency department returned to 2014 levels. However, it is also important to note that emergency department rates remain relatively low overall; the CCO benchmark is the national Medicaid 90th percentile. Moreover, avoidable emergency department utilization (which looks at the rate of patient visits for conditions that could have been more appropriately managed or referred to by a primary care provider) continues to decline. So, while the overall rate of emergency department utilization increased, members continued to use the emergency department for appropriate reasons. OHA will continue to monitor these trends.
Measures in this report that highlight room for improvement:

- **Initiation and engagement of alcohol or other drug treatment.** The percentage of members newly diagnosed with alcohol or other drug dependences who began treatment within 14 days of the initial diagnosis decreased slightly. Statewide, Oregon remains below the national Medicaid median. Meanwhile, the percentage of members who continued their treatment and had two or more visits within 30 days of their initial treatment was just 11.1%. This is a forty percent decline since 2015.

- **Prevention quality indicators.** After a sharp decline in 2014, the rate of adult members who had a hospital stay because of congestive heart failure or short-term diabetes complications increased again slightly in 2016. Lower is better on this measure.

**Oregon is leading the nation in transforming our health care system to create better access and better care at a lower cost for all Oregonians.** We have long had a national reputation for innovative health system solutions and the reforms that we have made in recent years continue to show Oregon’s innovation and leadership. The CCO quality pool model is a hallmark of Oregon’s health transformation and a key component in our commitment to transparency and accountability. By measuring Oregon’s progress and identifying both success and challenges, the state can identify how we can continue to push for greater health transformation and ways that can we can create better health outcomes for Oregon Health Plan members.

</table>

- **CCO achieved BENCHMARK in 2016**
- **CCO achieved IMPROVEMENT TARGET in 2016**
- **Top performing CCO in each measure**
- **Bolded CCOs earned 100% quality pool**
- ^ indicates challenge pool measure
The Oregon Health Authority has established the quality pool—Oregon’s incentive payments to coordinated care organizations. Each CCO is being paid for reaching benchmarks or making improvements on incentive measures. This is the fourth time Oregon has paid CCOs for better care, rather than just the volume of services delivered.

The 2016 quality pool is almost $179 million. This represents 4.25 percent of the total amount all CCOs were paid in 2015. The quality pool is divided among all CCOs based on their number of members (see page 15 for CCO enrollment numbers) and their performance on the 18 incentive metrics (see Appendix A).

**Quality Pool: Phase One Distribution**

CCOs can earn 100 percent of their quality pool in the first phase of distribution by:

- Meeting the benchmark or improvement target on 13 of 18 measures; and
- Having at least 60 percent of their members enrolled in a patient-centered primary care home (PCPCH).

CCOs must meet both of these conditions to earn 100 percent of their quality pool.

**Challenge Pool: Phase Two Distribution**

The challenge pool includes funds remaining after quality pool funds are distributed in phase one. The 2016 challenge pool is $27.4 million. Challenge pool funds are distributed to CCOs that meet the benchmark or improvement target on four measures:

1. Alcohol and drug misuse screening (SBIRT)
2. Depression screening and follow-up plan
3. Developmental screenings
4. Diabetes HbA1c poor control

Through the challenge pool, some CCOs earn more than 100 percent of their maximum quality pool funds. The next page shows the percentage and dollar amounts earned by each CCO.

Appendix A

$ CCO Incentive Measures
In some cases, depending on the difference between the CCO’s baseline and the benchmark, the Minnesota method may result in a very small improvement that may not represent a statistically significant change. Using the example above, suppose the benchmark was only 75 percent. In this case, CCO A’s improvement target using the formula would be:

\[
\frac{75\% - 60\%}{10} = 1.5\%
\]

\[
60\% + 1.5\% = 61.5\%
\]

Where the Minnesota method results in small improvement targets like this, the Metrics and Scoring Committee has established a “floor” or minimum level of required improvement before the CCO would meet its improvement target. In this example, suppose the floor is 3 percentage points. The Minnesota method formula only results in 1.5% increase. Instead of 61.5%, CCO A’s improvement target with the 3% floor applied would be:

\[
[\text{baseline} + \text{floor}] = [60\% + 3\%] = 63\%.
\]
Access to care (CAHPS)

Percentage of members (adults and children) who thought they received appointments and care when they needed them.

2016 data

- Statewide change since 2015: **+0.1%**
- Number of CCOs that improved: **7**
- Number of CCOs achieving target: **4**

Access to care, statewide.

2015 national Medicaid 75th percentile: 86.7%

Access to care among children and adults, statewide.
### Access to care among CHILDREN in 2015 and 2016, by race and ethnicity.

Grey dots represent 2014 / Each race category excludes Hispanic/Latino

Ambulatory care: Emergency department utilization

Rate of patient visits to an emergency department. Rates are reported per 1,000 member months and a lower number suggests more appropriate use of care.

**2016 data** (n=10,560,968 member months)

- Statewide change since 2015: **+3.3%** (lower is better)
- Number of CCOs that improved: 5
- Number of CCOs achieving target: 2

Data notes: 2015 results have been revised and differ from previously published reports due to algorithm refinements for better capturing visits billed with ED-specific procedure codes, as well as better exclusion for ED resulted in inpatient stays. The result is a 6 percent increase in ED visit count for 2015, statewide. Comparing results prior to 2015 should be done with caution, since the specifications are different.

Cigarette smoking prevalence

Cigarette smoking prevalence is a new incentive measure in 2016. This bundled measure is intended to address both cessation benefits offered by CCOs and cigarette smoking prevalence. The bundled measure has three components, each worth a certain score. CCOs must meet a certain threshold score to meet the measure in a given year. The scoring, or weighting, of the components changes over the years, to allow CCOs time to phase in efforts to reduce prevalence (see table below).

The intent of the measure is to address tobacco prevalence (including cigarette smoking and other tobacco products such as chew, snuff, and cigars). However, due to variation in how EHRs capture smoking and tobacco use data, and to ensure comparability across EHRs and CCOs, the measure looks at two separate rates: 1) cigarette smoking; and 2) tobacco use. As not all EHRs are able to report on tobacco use, only the cigarette smoking prevalence is used for comparison to the benchmark.

Avoidable emergency department utilization

Rate of patient visits to an emergency department for conditions that could have been more appropriately managed by or referred to a primary care provider in an office or clinic setting.

Rates are derived from the Ambulatory care: emergency department utilization measure and are reported per 1,000 member months. A lower number suggests more appropriate emergency department utilization.

2016 data (n=10,560,686 member months)
- Statewide change since 2015: -2.8% (lower is better)
- Number of CCOs that improved: 12

Avoidable emergency department utilization in 2015 and 2016, by race and ethnicity.
Grey dots represent 2014 / Race and ethnicity data missing for 33.1% of respondents / Each race category excludes Hispanic/Latino

2015 national Medicaid 90th percentile: 64.0%
HEALTH STATUS (CAHPS SURVEY)

Health status (CAHPS)
Percentage of Medicaid members (adults and children) who report their overall health as good, very good, or excellent.

The Consumer Assessment of Healthcare Providers and Systems (CAHPS) surveys ask consumers and patients to report on and evaluate their experiences with health care. These surveys cover topics that are important to consumers and focus on aspects of quality that consumers are best qualified to assess, such as the communication skills of providers and ease of access to health care services.

2016 data
