

# INCENTIVE MEASURES PERFORMANCE OVERVIEW

The following dashboards provide overall summaries of performance across all incentive measures and all CCOs each year. **Light blue** shading indicates the CCO met its individual improvement target that year, and **dark blue** indicates the CCO met the benchmark. These displays offer an "at-a-glance" perspective on where performance is strong across CCOs, as well as potential areas for improvement.

## Notes:

- Colorectal cancer screening -
  - In 2013, CCOs did not have a common benchmark; performance was measured against individual improvement targets only (3 percent improvement over baseline).
  - In 2014, specifications were updated to use medical record data. Performance in 2014 performance was rewarded based on benchmark only; CCOs did not have individual improvement targets.
- Clinical quality measures (Controlling hypertension, Depression screening and follow-up plan, and Diabetes care: HbA1c poor control) -
  - In 2013, CCOs earned payment for the three clinical quality measures by submitting Year 2 Technology Plans and required data. The 2013 dashboard indicates achievement of this requirement with **dark blue**.
  - In 2014, CCOs again earned payment for the three clinical quality measures by submitting Year 2 Technology Plans and required data. However, because performance was publicly reported that year, the 2014 dashboard indicate achievement of data and technology plans submission with **light blue**, while achievement of the benchmark is indicated in **dark blue**.
  - In 2015, CCOs are held to a benchmark or improvement target for these measures.
- Patient-centered primary care home (PCPCH) does not have a benchmark. Instead, CCOs earn incentive payment by having at least 60 percent of their members enrolled in a PCPCH. CCOs who met that goal are shaded **dark blue** in these dashboards.
