## Preface

## "What's past is prologue ... "

Sometimes the best way to determine what direction to take is to look at where we are and back at where we have been. This is as true in matters of public health as it is in navigation. Vital events - births, deaths, marriage, divorce - chart the course Oregonians take throughout their lives. In today's complex society, using this information for careful policy and resource planning is more important than it has ever been.

Each year, the Oregon Health Authority's Center for Health Statistics publishes the Oregon Vital Statistics Annual Report, an analytical look at the health of Oregon as measured by the health of its citizens. By this means, policymakers and health professionals have a source of important knowledge they can use to form the basis for action and benchmarks for assessing progress.

## Structure of the report

To improve ease of use and timeliness, the Vital Statistics Annual Report is issued in two volumes.

- Volume 1 presents data on births, abortions and teen pregnancy.
- Volume 2 presents data on deaths (all ages) and perinatal deaths.
The only marriage, divorce, domestic partnership and dissolution of domestic partnership data in the report are statewide occurrences and rates. Information by county and by month of occurrence - as well as a variety of year-to-date preliminary data on deaths, births, abortions and teen pregnancy - is available at the Center for Health Statistics (CHS) website:
http://public.health.oregon.gov/BirthDeathCertificates/ VitalStatistics.
Additional data are available in the form of simple crosstabulations. For information on availability or to request the data, call the Center for Health Statistics as listed on the previous credits page.

The more significant demographic and public health issues are discussed in the narrative sections that open each chapter. These narratives are accompanied by charts, graphs and sidebar tables. Readers can research their own areas of interest by using the tables following the chapter narratives.

## A cooperative effort

The presentation of data in this report is the final stage of a long, ongoing process that begins with the prompt, accurate recording of vital events. This registration system ensures that the information is collected, kept secure and made available to individuals and their families when needed for documentation. Tabulations and analyses of the data by the Oregon Center for Health Statistics provide useful information about the health and social changes occurring in Oregon.

Vital statistics has been called "the eyes and ears of public health," and is, in fact, the only organized system of health records covering the entire population. The collection of data is a highly cooperative effort that depends on the participation of a great many people throughout the state.

## The providers of services

Those who provide the services associated with vital events are the first participants in the collection system.

The birth attendant completes both the legal document and the confidential statistical section of the birth certificate. For deaths, the funeral director or person who first assumes responsibility for the body files the death or fetal death certificate. A physician completes the medical portion of these death certificates, except in cases of found bodies and those deaths due to external or "non-natural" causes, which are certified by medical examiners. Hospital medical records personnel help to ensure that all certificates are complete and accurate.
These service providers then file the completed certificates using a Web-based system that simultaneously transmits the records to the county and state registrar.
Abortions are treated differently. The providers of induced abortions file the completed statistical data (which contain no identifying information) directly with the state registrar.

## County officials

County registrars play an important role by further assuring the completeness and accuracy of death registrations. They check the certificates against other sources of information to make certain no events are missed. County registrars also follow up on any incomplete items before sending the certificates to the state registrar at the Center for Health Statistics.

## Center for Health Statistics

At the state level, the staff of the center perform additional checks for completeness and accuracy. A field representative makes contact with providers and county registrars. Clerical staff send correspondence seeking additional information on such matters as causes of death, birthweight and tobacco use. Microfilmers store certificates so that certified copies can be made. Coders and data entry personnel turn the collected information into computerized data, which are then retrieved by programmers, analyzed by researchers, and made available for demographic and public health needs.

## Other states

This report does not overlook events relating to Oregon residents that occurred in another state. The Centers for Health Statistics in each U.S. state and Canadian province have agreed to forward copies of birth, death and fetal death records to the state where the person usually resided. A cooperative agreement also exists for reports on induced termination of pregnancy; however, some states collect no resident information on these reports and, therefore, cannot participate in the exchange.
Among all these participants, it is clear there is no single recorder. The many hundreds of people throughout Oregon who record the major life events of our citizens have all played important roles in preparing this report. It could not have been achieved without them.

## Executive summary

Each year, the Oregon Health Authority's Center for Health Statistics publishes the Oregon Vital Statistics Annual Report, an analytical look at the health of Oregon as measured by the health of its citizens. By this means, policymakers and health professionals have a source of important knowledge that can be used to form the basis for action and benchmarks for assessing progress. Volume 1 of the report includes data on live births, induced terminations and teen pregnancy. In addition, Volume 1 contains counts of marriages, divorces, Oregon registered domestic partnerships and dissolutions of domestic partnership.

| SUMMARY OF VITAL STATISTICS, VOLUME 1 |  |  |
| :---: | :---: | :---: |
| Vital statistic | 2015 | 2014 |
| Population | 4,013,845 | 3,962,710 |
| Live births (residents) |  |  |
| Number Crude birth rate Fertility rate | $\begin{gathered} \hline 45,656 \\ 11.4 \\ 58.0 \end{gathered}$ | $\begin{gathered} 45,557 \\ 11.5 \\ 58.6 \end{gathered}$ |
| Low birthweight infants (residents) |  |  |
| Number <br> Rate | $\begin{gathered} 2,931 \\ 64.2 \end{gathered}$ | $\begin{gathered} 2,847 \\ 62.5 \end{gathered}$ |
| Births to unmarried mothers (residents) |  |  |
| Number <br> Ratio | $\begin{gathered} 16,380 \\ 359.6 \end{gathered}$ | $\begin{gathered} 16,349 \\ 359.6 \end{gathered}$ |
| Induced abortions (occurrences) |  |  |
| Number <br> Ratio to live births | $\begin{aligned} & 8,610 \\ & 186.8 \end{aligned}$ | $\begin{aligned} & 8,231 \\ & 178.5 \end{aligned}$ |
| Unions and dissolutions (occurrences)* |  |  |
| Marriages <br> Divorces <br> Domestic partnerships <br> Dissolutions of domestic partnership | $\begin{gathered} 27,794 \\ 13,831 \\ 103 \\ 88 \end{gathered}$ | $\begin{gathered} 27,735 \\ 13,489 \\ 189 \\ 137 \end{gathered}$ |
| Crude birth rates are per 1,000 population; fertility rates are per 1,000 15-44 year old females; unmarried mother ratio and low birthweight rate are per 1,000 live resident births; induced abortion ratio is per 1,000 live occurrence births. Rates and ratios exclude missing and unknown values. <br> *Same-sex marriage became legal in Oregon on May 19, 2014. |  |  |

## Table of contents

Endnote ..... 3-7
Section 4: Teen pregnancy ..... 4-1
Introduction ..... 4-1
Oregon females, aged 15-17 ..... 4-1
Births to teens, aged 15-17 ..... 4-2
Abortion rates among teens, aged 15-17 ..... 4-3
Oregon females, aged 18-19 ..... 4-3
Oregon vs. U.S. birth rates ..... 4-4
Level of infant health ..... 4-5
Low birthweight. ..... 4-5
Race and ethnicity ..... 4-6
Prenatal care ..... 4-6
Early prenatal care ..... 4-6
Inadequate prenatal care ..... 4-7
Late care or no prenatal care ..... 4-7
Low Apgar score ..... 4-9
Substance use during pregnancy ..... 4-9
Tobacco ..... 4-9
Alcohol ..... 4-9
Source of payment ..... 4-10
Age of father. ..... 4-10
Endnotes ..... 4-11

## Appendices

Appendix A: Population ..... A-1
Appendix B: Technical notes ..... B-1
Definitions ..... B-1
Methodology ..... B-4
Step-by-step instructions ..... B-8
Formulas ..... B-16
Appendix C: List of figures and tables ..... C-1
Appendix D: Sample forms ..... D-1
Certificate of Live Birth ..... D-1
Report of Induced Termination of Pregnancy ..... D-3
Application, License, and Record of Marriage ..... D-4
Declaration of Oregon Registered Domestic Partnership ..... D-5
Record of Dissolution of Marriage, Annulment or Registered Domestic Partnership ..... D-6

## Quick reference (Volume 1)

| Summary of Oregon vital events, 2015 |  |  |
| :---: | :---: | :---: |
| Population | 4,013,845 | The population increased 51,135, or 1.3\% over 2014. |
|  |  |  |
| Live births <br> Number Crude rate Fertility rate | $\begin{gathered} \hline \text { Residents } \\ 45,656 \\ 11.4 \\ 58.0 \\ \hline \end{gathered}$ | The number of births increased by 99. The crude rate decrease by $0.87 \%$ and the fertility rate decreased by $1.0 \%$. |
| Marriages <br> Number <br> Crude rate | $\begin{gathered} \hline \text { Occurrences } \\ 27,794 \\ 6.9 \\ \hline \end{gathered}$ | The number of marriages increased by 59 . The rate decreased by $1.4 \%$.* |
| Divorces <br> Number Crude rate | $\begin{gathered} \hline \text { Occurrences } \\ 13,831 \\ 3.4 \\ \hline \end{gathered}$ | The number of divorces increased by 342 . There was no change in the rate. |
| Domestic partnerships Number | $\begin{gathered} \hline \text { Occurrences } \\ 103 \\ \hline \end{gathered}$ | The number of domestic partnerships decreased by 86.* |
| Dissolutions of domestic partnership <br> Number | Occurrences <br> 88 | The number of dissolutions of domestic partnership decreased by 49 . |
| Unmarried mothers <br> Number <br> Ratio | $\begin{gathered} \text { Residents } \\ 16,380 \\ 359.6 \\ \hline \end{gathered}$ | The number of unmarried mothers giving birth increased by 31. The proportion of births to unmarried mothers was unchanged from 2014. |
| Low birthweight infants Number Rate | $\begin{gathered} \hline \text { Residents } \\ 2,931 \\ 64.2 \\ \hline \end{gathered}$ | The number of low birthweight infants increased by 84. The rate increased by $2.7 \%$. |
| Induced abortions <br> Number <br> Ratio | $\begin{gathered} \hline \text { Occurrences } \\ 8,610 \\ 186.8 \\ \hline \end{gathered}$ | The number of reported abortions increased by 379, an increase of $4.6 \%$ from 2014. The abortion ratio increased 4.6\%. |
| Crude birth, marriage, divorce and domestic partnership rates are per 1,000 population; fertility rates per 1,000 15-44 year old females; unmarried mother ratio and low birthweight rate per 1,000 live resident births; induced abortion ratio per 1,000 live occurrence births. Rates and ratios are calculated excluding missing and unknown values. <br> *Same-sex marriage became legal in Oregon on May 19, 2014. |  |  |

§ Indicates rate or ratio is significantly different from the state.
1 Rate per 1,000 population for live births, marriages and divorces.
2 Ratio per 1,000 live births for births to unmarried mothers, calculated excluding missing and unknown values. NOTE: Total live births includes five unknown county of residence.

| 2013 | 63.0 | 778.3 | 6.5 | 56.7 | 36.4 | 29.9 |
| 2014 | 62.5 | 774.6 | 7.4 | 60.2 | 40.3 | 32.3 |
| 2015 | 64.2 | 789.5 | 7.2 | 57.2 | 37.9 | 30.9 |

1 Inadequate prenatal care is defined as care that began in the third trimester or consisted of less than

* five prenatal visits.
* Starting in 2008 prenatal care calculations changed, see Appendix B for details

All rates are per 1,000 live births. Rates and percentages are calculated excluding missing and unknown values.

[^2]
## Natality

In 2015, Oregon recorded 45,656 resident births, 99 more than in 2014. The crude birth rate (the number of babies born divided by the total state population) was 11.4 per 1,000 population (see Table 1-2). Oregon's crude birth rate peaked in 1947 at 25.4 per 1,000 population. From 1975 to 2008, Oregon's rate was consistently in the mid- to lowteens, and has been under 13.0 for the last five years. Except for the period between 1976 and 1981, Oregon's crude birth rate has remained lower than the national rate for the past 50 years. In 2015, Oregon's rate was $8.1 \%$ lower than the national rate ( 11.4 vs. 12.4; see Figure 2-1).

Oregon's fertility rate decreased slightly from last year to 58.0 per 1,000 women aged 15-44 (see sidebar Table 2 -A, Table 2-2). The fertility rate is based on the number of births per 1,000 women aged $15-44$. The fertility rate is more precise than the crude birth rate in measuring changes in behavioral patterns. The fertility rate relates only to women of childbearing age, while the crude birth rate is based on the entire population. Age-specific birth rates decreased among all age groups of women except women aged $35-39$ which increased by $3.6 \%$. The largest percentage decrease was among women aged 20-24 (4.9\%), followed by women aged 15-19 (4.6\%; see Table 2-2, Figure 2-2).

## Oregon's crude birth rate and fertility rate both remain below the national rates.

Figure 2-2.
Age-specific birth rates, Oregon residents, 1980-2015

*Rate per 1,000 females

The youngest female to give birth in 2015 was 12 years old and the oldest was 53 . Mother's median age for all births was 29 and the mean age was 28.9. The median age at first birth was 27 and the mean age was 27. The rate of first births in 2015 decreased slightly from the previous year to 22.9 first births per 1,000 women aged 15-44. The proportion of first births among total births has been stable for the past decade. In 2000, $40.1 \%$ of births were first births; in 2015, 39.4\% were first births.

Father's median age for births was 31 and the mean age was 32 years. The birth rate per $\mathbf{1 , 0 0 0}$ men ages $15-54$ was 43.0 in 2015 for Oregon resident births. Information on the father was missing from $8.4 \%$ of birth certificates. Unknown father age was distributed in the same manner as national data (see Appendix B: "Technical notes - definitions"). The national birth rate for men in 2014 was 46.3 per 1,000 men aged 15-54.(2)

## Demographics

## Maternal race/ethnicity

Birth rates for racial and ethnic groups are not calculated in this report because precise population data by racial and ethnic groups are available only for census years. Instead, this report focuses on the race and ethnicity of women who gave birth as a proportion of total births.
Since 1990, the number of births to women of Hispanic ethnicity has almost tripled to $18.6 \%$ of total births (see Table 2-7, Figure 2-3). The method for reporting the Hispanic category has changed in Oregon over the years. From 1981 to 1988, "Hispanic" was a race category on the birth certificate. From 1989 to 2007, information regarding Hispanic ethnicity was reported separately from race. Starting in 2008, an individual could choose multiple race/ethnicity responses (see Appendix B: "Technical notes - methodology"). Persons of Hispanic ethnicity may belong to any race category (or categories). This change addressed the complexity of race and ethnicity and increased self-reporting accuracy for Oregon.
Perinatal differences by race and ethnicity of mother persist. These differences are noted within the topic areas discussed in the remainder of this chapter.

Note: A logarithmic scale is used for the vertical axis.

## Marital status of mother

Unmarried women as a group have historically poorer birth outcomes than married women. They generally have a greater proportion of babies with lower birthweight and lower Apgar scores than do their married counterparts. Infants born to unmarried mothers are more likely to require neonatal intensive care, have congenital anomalies or die before the age of 1 . In Oregon, the ratio of births to unmarried mothers in 2015 was 3.5 times higher than in 1975, and 5.7 times higher than in 1965 (see Table 1-2, Figure 2-4). While there has not been a matching increase in low birthweight rates and other indicators of poor health, the disparity in prenatal care, tobacco use and race/ethnicity between married and unmarried women continues.

In 2015, 36.0\% of all Oregon births were to unmarried women, unchanged from the previous year (see Table 1-2). Oregon has consistently had a lower percentage of births to unmarried women than the United States. Oregon's rate in 2015 was $10.6 \%$ lower than the national rate (see Figure 2-4).
Among women giving birth in 2015, the percentage of women that were unmarried varied widely by ethnic and racial group (see sidebar Table 2-B). Non-Hispanic American Indian women had the highest percentage of births to unmarried mothers (62.3\%), followed by nonHispanic African American women (53.4\%) and Hawaiian/ Pacific Islander women (53.0\%). Non-Hispanic Asian women had the lowest percentage of unmarried mothers (12.6\%; see Table 2-13).

Mothers under age 17 are likely to be unmarried, primarily because persons younger than age 17 cannot legally marry in Oregon. More than four-fifths of teens aged 15-19 that gave birth in 2015 were unmarried ( $86.4 \%$ ), compared to $60.6 \%$ for women aged $20-24$ and $34.3 \%$ for women aged 25-29. The percentage of unmarried women was lowest for mothers aged 35-39 (20.6\%) and 30-34 (20.7\%), while $26.2 \%$ of mothers aged 40-44 were unmarried (see Table 2-3). Fourteen of Oregon's 36 counties had proportions of non-marital births significantly higher than the state average (see Table 2-9). Among counties with statistically significant differences, Jefferson had the highest percentage (56.9\%)

| Table 2-B. Percent of unwed <br> mothers by race/ethnicity, <br> Oregon residents, 2015 |  |
| :--- | :---: |
| Total unmarried | $\mathbf{3 6 . 0}$ |
| Non-Hispanic |  |
| African American | 53.4 |
| American Indian | 62.3 |
| Asian | 12.6 |
| Hawaiian/Pacific Islander | 53.0 |
| Multiple races | 49.7 |
| White | 32.1 |
| Hispanic | 49.7 |

followed by Malheur (48.9\%) and Josephine (48.8\%; see Appendix B: "Technical notes - formulas" for information on statistical significance). Six Oregon counties had percentages of non-marital births significantly lower than the state average. Benton County had the lowest percentage of non-marital births (19.3\%). A county's non-marital birth proportion should be viewed, in part, as a function of its own specific population mix, especially age and race. Variations in population composition among counties will likely result in significant differences in non-marital births.

## Educational attainment

A mother's level of education was closely related to prenatal care patterns. Women with less than a high school education had the lowest percentages of first trimester prenatal care. As educational attainment increases, so does the percentage of women obtaining first trimester care. Women with a doctorate or professional degree had the highest percentage of first trimester care (see sidebar Table 2-C, Table 2-19).
More than four-fifths of women who gave birth in 2015 had at least a high school diploma or GED ( $86.2 \%$ ) and $30.8 \%$ had a bachelor's degree or higher. The racial/ethnic groups with the highest percentages of high school completion are non-Hispanic Asian (93.3\%) and non-Hispanic White (91.9\%) mothers. Hispanic mothers had the lowest percentage of completion of at least 12 years of education $(64.4 \%$; see Table 2-13).

| Table 2-C. Mothers' education and no first trimester <br> care, Oregon residents, 2015 |  |
| :--- | :---: |
| Education | No first trimester <br> care (\%) |
| 8th grade or less | 38.0 |
| 9th to 12th grade, no diploma | 33.5 |
| High school graduate or GED | 27.4 |
| Some college, no degree | 21.5 |
| Associate's degree | 16.2 |
| Bachelor's degree | 12.4 |
| Master's degree | 10.0 |
| Doctorate or professional degree | 7.6 |

## Maternal lifestyle and health characteristics

## Tobacco

\section*{National Healthy People 2020 objective <br> Percentage of infants whose mothers did not use tobacco during pregnancy (self-reported) <br> | 2020 target: | $98.6 \%$ |
| :--- | :--- |
| $2015:$ | $90.0 \%$ |}

Women who smoke when pregnant have a far higher incidence of low birthweight babies than nonsmokers. Low birthweight infants are more likely to experience serious health problems, including increased rates of infant mortality. Women who smoked had a low birthweight rate of 108.2 per 1,000 live births, compared to 59.1 per 1,000 among women who did not smoke. One in ten mothers (10.0\%) reported using tobacco during pregnancy, slightly less than the previous year ( $10.4 \%$ ) (see sidebar Table 2-D). The percentage of mothers that reported smoking during pregnancy generally decreased with age among married women. For unmarried women, smoking rates rose and fell with age, peaking in the early 20s. The percentage of tobacco use among unmarried women was more than five times that of married women ( $20.8 \%$ vs. $3.9 \%$ ). The highest percentage of tobacco use during pregnancy in 2015 was among unmarried mothers aged 20-24 and 25-29 (22.8\%)

Figure 2-5.

Women who smoked had a low birthweight rate of 108.2 per 1,000.

| Table 2-D. Percent of <br> maternal tobacco use <br> by year, Oregon <br> residents |  |
| :---: | :---: |
| 1990 | 22.4 |
| 1995 | 17.9 |
| 2000 | 13.5 |
| 2005 | 12.4 |
| 2006 | 12.3 |
| 2007 | 11.7 |
| 2008 | 11.8 |
| 2009 | 11.3 |
| 2010 | 11.3 |
| 2011 | 10.7 |
| 2012 | 10.6 |
| 2013 | 10.2 |
| 2014 | 10.4 |
| 2015 | 10.0 |

and unmarried mothers aged 30-34 (21.1\%). Married mothers aged 40 or older had the lowest percentage of smokers ( $1.3 \%$ ), followed by married mothers aged 35-39 $(2.2 \%)$. For the youngest mothers, aged $10-14,0.0 \%$ reported smoking during pregnancy (see Figure 2.5).
Smoking prevalence as reported on birth certificates also varied among racial and ethnic groups. In 2015, nonHispanic American Indian women (18.3\%) and nonHispanic women reporting multiple races ( $17.0 \%$ ) had the highest reported proportions for smoking during pregnancy, while non-Hispanic Asian women ( $0.9 \%$ ) and Hispanic women ( $3.2 \%$ ) reported the lowest (see Table 2-25).

## Maternal weight and weight gain

Appropriate maternal weight gain has been shown to be positively correlated with infant birthweight. Low maternal weight gain is associated with poor fetal growth, lower birthweight and the chance of a baby being born prematurely. High maternal weight gain is associated with higher infant birthweight and cesarean delivery. Excessive weight during pregnancy is often accompanied by chronic disease and is a health risk factor for both the mother and child.

In 2008, Oregon began collecting data on birth certificates about mothers' pre-pregnancy weight, weight at delivery and height. The availability of this new data allows for the calculation of body mass index (BMI) and provides a better

Figure 2-6.
Percentage of appropriate weight gain by BMI, Oregon residents, 2015

picture of pre-pregnancy BMI and gestational weight gain. In 2009, the Institute of Medicine (IOM) revised its guidelines for weight gain during pregnancy; the guidelines express ideal weight gain in pregnancy as a range for each category of pre-pregnancy BMI (see sidebar Table 2-E). Many Oregon mothers exceeded these recommendations. In 2015, 50.9\% of women gained more weight than recommended in the IOM guidelines. Additionally, $49.9 \%$ of Oregon women entered pregnancy overweight or obese and also had the highest percentage of weight gain above the recommended guidelines ( $65.9 \%$ and $56.0 \%$, respectively; see Figure 2-6). Women starting pregnancy underweight had the highest percentage of weight gain below the IOM recommendations (29.2\%) and had the highest percentage of low birthweight infants (9.3\%).

## Medical risk factors

Maternal medical risk factors influence pregnancy complications and infant health and vary greatly based on the mother's age, race and ethnicity. In 2015, the most frequently reported medical risk factors were previous cesarean delivery ( $13.0 \%$ ), gestational diabetes ( $8.0 \%$ ) and pregnancy-associated hypertension (6.9\%; see Table 2-23, Table 2-26).

## Medical services utilization

## Prenatal care

## National Healthy People 2020 objective

Percentage of infants whose mothers received prenatal care beginning in the first trimester

| 2020 target: | $77.9 \%$ |
| :--- | :--- |
| $2015:$ | $79.0 \%$ |

Public health services and private care providers seek to minimize the risk of death and disability to infants. Additionally, they seek reductions in costs associated with low birthweight infants by providing comprehensive prenatal care. The two ways Oregon measures prenatal care are:

- "Inadequate prenatal care," defined as no care until the third trimester or fewer than five total prenatal visits; or
- "First trimester care," defined as care beginning in the first 12 weeks of pregnancy, regardless of the number of total prenatal visits.

Overall, $79.0 \%$ of women who gave birth during 2015 received early prenatal care, which is $11.3 \%$ higher than the 2008 national number of $71.0 \%$ (see Table 2-17, Table $1-5)$. Moreover, this is $1.9 \%$ higher than Oregon's 2014 rate of $77.5 \%$.

In 2015, $5.7 \%$ of women giving birth received inadequate prenatal care and $21.0 \%$ received no first trimester care. The percentage of low birthweight infants was much higher for women who received inadequate prenatal care ( $10.8 \%$ ) compared to $6.1 \%$ of children born to mothers who received adequate prenatal care. The percentage of mothers who received no prenatal care remained unchanged from the previous year ( $0.7 \%$ ). Mothers who initiated care in the third trimester decreased from 4.0\% in 2014 to $3.8 \%$ in 2015 (see Figure 2-7).

Age, marital status, education and race/ethnicity continue to show important differences in accessing prenatal care (see tables 2-17, 2-18, 2-19 and 2-21). For example, the highest percentage of inadequate care is found among nonHispanic Hawaiian and Pacific Islander women (27.7\%) and non-Hispanic women of other or unknown race (20.7\%). Asian non-Hispanic and non-Hispanic White women had the lowest percentages of inadequate care ( $4.7 \%$ and $4.9 \%$, respectively; see Table 2-18).
Three of Oregon's 36 counties had first trimester care rates significantly higher than the statewide rate. Six
counties had rates significantly lower than the state: Curry (66.3\%), Jefferson (68.1\%), Malheur (65.1\%), Marion (74.6\%), Morrow (59.1\%) and Umatilla (71.9\%). (See Table 2-20.)
The Adequacy of Prenatal Care Utilization Index is an alternative measure of prenatal care based on the month prenatal care began and the number of prenatal visits, adjusting for gestational age. Care is determined to be intensive (exceeding recommended care by a ratio of expected visits to actual visits by at least $110 \%$ ), adequate, intermediate or inadequate (see sidebar Table 2-F). As with other measures of prenatal care, more women under the age of 20 received inadequate prenatal care, while more women aged 40 and older received intensive prenatal care. Women with medical risk factors such as diabetes and hypertension also were more likely to receive intensive prenatal care.

## Place of delivery and birth attendant

Hospital births. Hospitals are the most frequent place of birth with $96.1 \%$ of Oregon occurrence births. Most in-hospital births were planned to occur in the hospital ( $99.2 \%$ ); 348 births were planned out-of-hospital at the onset of labor and subsequently delivered in the hospital. Medical doctors or osteopathic doctors delivered the majority ( $79.6 \%$ ) of planned hospital births; certified nurse midwives delivered $20.0 \%$ and other licensed medical professionals delivered $0.4 \%$ (see Table 2-38).

| Table 2-F. Adequacy of Prenatal Care Utilization Index |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: |
| Oregon 2010-2015 |  |  |  |  |

Out-of-hospital births. In 2015, 3.9\% of Oregon births occurred out of hospital. As in past years, the majority of out-of-hospital births occurred in the mother's home ( $56.4 \%$ ). Of those home births, $93.7 \%$ were planned home births, while the remaining $6.3 \%$ were not intended to occur at home. Freestanding birthing centers accounted for slightly more than two-fifths, or 742, of out-of-hospital births.

| Table 2-G. Out-of-hospital births <br> Oregon occurrence <br> Year Deliveries $^{2}$ |  |  |

| Rate per 1,000 births |  |  |
|  |  |  |

In 2011, the Oregon Legislature passed House Bill 2380, which required the Oregon Public Health Division to add two questions to the Oregon Birth Certificate to determine planned place of birth and birth attendant. Every mother who delivered in the hospital was asked if she planned to deliver at a private home or a freestanding birthing center and the planned primary attendant type at the time she went into labor. Overall, 2,035 births were planned to be out of hospital (4.4\%). Of these, 348 ( $17.1 \%$ ) planned out-of-hospital births ultimately delivered in hospital. Neonatal transfers were slightly more likely among women who planned an out-of-hospital birth ( $2.2 \%$ versus $1.0 \%$; see Table 2-40). Women who planned out-of-hospital births tended to be 30 years of age or older ( $56.1 \%$ ), White non-Hispanic ( $87.2 \%$ ), married (78.9\%) and college educated (43.2\%). (See Table 2-39.)

Women who planned out-of-hospital births generally experienced fewer medical interventions than women who planned in-hospital births. Medical intervention rates among planned out-of-hospital births included induction and augmentation of labor ( $9.7 \%$ ), epidural or spinal anesthesia ( $10.0 \%$ ), operative vaginal birth ( $1.7 \%$ ) and cesarean section (6.4\%). A woman planning to deliver in hospital was three times more likely to have a primary cesarean section than a woman planning on delivering out of hospital ( $17.1 \%$ vs. $5.5 \%$ ). In 2015, $30.7 \%$ of women planning out-of-hospital births did not have a Group B streptococcal test compared to $3.4 \%$ for women planning a hospital birth (see Table 2-40).

Outcomes generally have been positive for out-of-hospital births. Women who planned out-of-hospital births were more likely to deliver term infants (obstetric estimate of gestation of 37 completed weeks or more) and less likely to deliver low birthweight infants.

Birth attendant. There are three different types of midwives in Oregon: certified nurse midwives (CNM), licensed direct entry midwives (LDM) and direct entry midwives (DEM). CNMs have completed an accredited, university-affiliated nurse-midwifery program and have an active nurse practitioner license. They may attend deliveries in hospitals, freestanding birth centers and homes. LDMs are direct entry midwives who have volunteered for state licensure through the Oregon Health Licensing Agency.

They must meet qualifications and adhere to Oregon regulations. Other midwives are lay midwives not licensed in Oregon but registered with the Center for Health Statistics to certify births.

A major shift during the past few decades has been the increasing prevalence of births attended by certified nurse midwives (CNMs). In 2015, 20.0\% of planned hospital deliveries were CNM-attended. Women who planned out-of-hospital births reported the following planned attendants: CNMs (25.0\%), LDMs (52.3\%), naturopathic physicians ( $13.3 \%$ ) and other midwives ( $6.7 \%$ ). Non-medical attendants delivered 133 babies, including 7.0\% of out-of-hospital births (see Table 2-38).

## Method of delivery

In 2015, Oregon's rate of cesarean delivery was 27.1\%, well below the 2015 national rate of $32.0 \%$. The rate for vaginal delivery after a previous cesarean was only $2.3 \%$, while the repeat cesarean rate was $10.7 \%$. The majority of births ( $70.6 \%$ ) continue to be vaginal deliveries without prior cesarean (see Table 2-37). The number of vaginal deliveries (without prior cesarean) increased slightly ( $1.0 \%$ ) from 2014. Cesarean rates have declined slightly each year since their

| Table 2-H. Certified nurse midwife <br> deliveries, Oregon occurrence |  |  |  |

| 2014 | 8,456 | 8,059 | 397 |
| 2015 | 9,238 | 8,894 | 344 |
|  |  |  |  | peak, in 2009, of $29.4 \%$. The rate for 2015 is $1.1 \%$ lower than the previous year ( $27.4 \%$ ) and $7.8 \%$ lower than 2009.

## Infant health characteristics

## Period of gestation

Preterm births (infants born prior to completion of 37 weeks gestation) accounted for $7.6 \%$ of total births in 2015, lower than the national rate in 2015 (9.6\%; see Table 2-25). Proportions of preterm births are higher for non-Hispanic Hawaiian and Pacific Islanders ( $14.2 \%$ ) and non-Hispanic women with other or unknown race (12.3\%). Non-Hispanic Asian women had the lowest proportion of preterm births (6.9\%; see Table 2-25).

## Low birthweight

\section*{National Healthy People 2020 objective <br> Percentage of live births resulting in low birthweight infant <br> | 2020 target: | $7.8 \%$ |
| :--- | :--- |
| 2015: | $6.4 \%$ |}

Of the thousands of infants born each year, not all thrive and become healthy adults. Low birthweight is the major predictor of infant death, which is a fundamental measure of the health of a population. Infants with low birthweight are more likely to need extensive medical treatment and to have lifelong disabling conditions. (For more information, see "Oregon Vital Statistics Annual Report 2015, Volume 2: Mortality Fetal and Infant Mortality.") The low birthweight rate is the proportion of infants that weigh less than 2,500 grams (5 pounds, 8 ounces) at birth. In 2015, there were 2,931 low birthweight babies born to Oregon mothers (see Table 2-27). One of the National Healthy People 2020 objectives is to reduce the percentage of low birthweight infants nationwide to 7.8\%. In 2015, Oregon's rate remained well below this objective at $6.4 \%$, or 64.0 per 1,000 live births. This rate is $1.6 \%$ higher than the previous year. While annual changes have been small in the last 20 years, there has been a slight upward trend in low birthweight infants (see Table 1-5, Figure 2-8). Nevertheless, Oregon's low birthweight rates are typically $25 \%$ lower than national rates; in

2015, Oregon's rate was $20.4 \%$ lower than the
2015 national rate ( 64.2 vs. 80.7 per 1,000 births).(1)

## High birthweight

Birthweight is an important factor in the health of a newborn. Excessive birthweight, or fetal macrosomia, is a health risk factor for both the mother and child and is commonly defined as birthweight greater than 4,000 grams ( 8 pounds, 13 ounces).
Among Oregon residents in 2015, the overall incidence of fetal macrosomia at 4,000 grams was $10.4 \%$ (see tables 2-24 and 2-25). As maternal age increases, the risk of fetal macrosomia also tends to increase (see Table 2-24). The percentage of infants born weighing more than 4,000 grams to women 35 and older ( $11.8 \%$ ) was $13.5 \%$ greater than the state average and $71.0 \%$ higher than among women under 20 years of age ( $6.9 \%$; see Table 2-27).
In 2015, the prevalence of macrosomia was highest among non-Hispanic American Indian women (13.0\%; see Table 2-25). The lowest percentages of macrosomia were found in Asian women (4.6\%) and African American women (6.7\%).

## Apgar scores

The Apgar score is composed of measurements of five infant characteristics: heart rate, respiratory effort, muscle tone, reflex irritability and color. Each characteristic is rated $0-2$ and the scores are totaled. Total scores below 7 at five minutes after birth indicate poor to intermediate health at birth. In Oregon during 2015, 2.5\% of infants had Apgar scores below 7 (see tables 2-24 and 2-25).

## Abnormal conditions and congenital anomalies

The most frequently reported conditions on birth certificates were admission to the neonatal intensive care unit, assisted ventilation immediately after delivery, and antibiotics for suspected neonatal sepsis (see tables 2-33 and 2-34). Congenital anomalies reported on birth certificates are shown in Table 2-35. Although Oregon occurrences are somewhat higher than national rates for some anomalies, congenital anomalies are believed to be underreported nationally due to factors such as how recognizable and severe they are. Even at the national level, data users are advised to use caution in comparing annual occurrences for relatively small numbers.

## Among Oregon resident births in 2015, the biggest baby born was $13 \mathrm{lbs}, 3 \mathrm{oz}$.

| Table 2-I. Percentage of infants <br> born weighing more than 4,000 <br> grams, Oregon residents |  |  |

| 2014 | 52.2 | 1.9 | 44.7 |
| 2015 | 51.7 | 1.5 | 45.5 |
| Note: Denominator excludes births with unknown payor source, and multiple payor source. |  |  |  |

## Multiple births

Although 3.4\% of births in Oregon during 2015 were multiple births, the proportion varied widely by age, race and ethnicity. During 2015, mothers aged 45 and older had the highest percentage of multiple births. The percentage of multiple births for each age group ranged from $1.9 \%$ for mothers aged 15-19 to $21.6 \%$ of births to mothers aged 45 and older. The percentage of multiple births generally increased with each five-year age group (see Table 2-24). Non-Hispanic African American women had the highest percentages of multiple births at 4.6\% (see Table 2-25).

## Infertility treatment

Many fertility treatments increase a woman's chance of having twins, triplets or other multiples. Multiples are at higher risk for prematurity and low birthweight. During 2015, mothers aged 45 and older had the highest rate of infertility treatment (362.7 per 1,000 births; see Table 2-23).

## Source of payment

The source of payment is reported as the expected primary payment source at the time of labor and delivery. Primary source of payment for delivery is noted on Oregon birth certificates under five categories: public insurance (Medicaid/ Oregon Health Plan), private insurance, self-pay (no insurance), Indian Health Services, and other and unknown payment source. In 2015, birth certificate data reported that private insurance companies paid for the majority of deliveries in Oregon ( $51.7 \%$ ), down from $52.2 \%$ in 2014 (see sidebar Table 2-J). Medicaid programs (e.g., the Oregon Health Plan) paid for $45 \%$ of Oregon resident births. Delivery costs were more likely to be paid for by public insurance if the woman was under age 18 (see Table 2-14).

- Quantity is zero.

1 Total includes two births with unknown age of mother.
2 Less than five prenatal visits or care began in the third trimester.
3 Body Mass Index of greater than $25.0 \mathrm{~kg} / \mathrm{m}^{2}$ for women over 15.
4 Born prior to 37 completed weeks of gestation.
5 Birthweight of less than 1,500 grams ( 3 lb 4 oz ).
6 Birthweight of less than 2,500 grams ( 5 lb 8 oz ).
7 Birthweight of more than 4,000 grams ( 8 lb 13 oz ).
NOTE: Rates and percentages are calculated excluding missing and unknown values.

## Induced termination of pregnancy

## Current trends

During 2015, 8,610 induced terminations of pregnancy occurred in Oregon. This total represents a $4.6 \%$ increase from 2014, and a decrease of $45.3 \%$ from the record high of 15,735 abortions reported in 1980 (see Figure 3-1).
This chapter reports data for all abortions occurring in
Oregon whether obtained by Oregon residents or residents of another state. The percentage of abortions in Oregon obtained by out-of-state residents has been between $9.4 \%$ and $12.6 \%$ from 1994 to the present. In 2015, 964 patients ( $11.2 \%$ ) were out-of-state residents (see Table 3-6). Oregonians who obtained out-of-state abortions are not included in these data. Because rate calculations use Oregon population numbers, they substitute out-of-state residents for the unknown number of Oregonians that obtained an abortion in another state (see Appendix B: "Technical notes," for a more extensive discussion of the completeness of abortion data).

Behavioral changes are revealed more by shifts in rates, which account for population change, than changes in the number of events. The national abortion rate has been declining since 1980 from approximately 25 per 1,000 women aged 15-44 to 13.2 per 1,000 in 2012, the most recent data available.(1) In 2015, the Oregon rate increased to 10.9 per 1,000 women

aged $15-44$, a $5.8 \%$ increase from 2014, and a $56.6 \%$ decrease from the record high seen in 1980 (25.1 per 1,000). During the past 20 years, Oregon's abortion rate for women aged 15-44 has generally declined - from a high of 20.4 in 1995 to 10.9 per 1,000 women in 2015.

## Pregnancy outcomes

Figure 3-2 shows the ratio of abortions to births occurring in Oregon. It indicates the prevalence of unwanted pregnancies that occurred in the state. Both the highest abortion rate (number of abortions per 1,000 female population) and the highest ratio of abortions (number of abortions per 1,000 births) occurred in 1980. In 1984, the level of reporting increased due to new legislation that required providers to report all abortions performed. Although there have been periodic spikes in the overall abortion ratio (see Figure 3-2), it has been gradually declining since 1980 .

In 2015, there were 186.8 abortions per 1,000 occurrence births. This represents a $4.6 \%$ increase from 2014 and a $47.5 \%$ decrease from 1980 when this ratio was 355.8 per 1,000 births (see Table 3-2).

Oregon's abortion ratio was about one-fifth higher than that of the United States in 1973, when the U.S. Supreme Court's decision in Roe v. Wade legalized abortion. In the mid1980s, this trend changed as Oregonians terminated fewer pregnancies with induced abortions compared to the country

Figure 3-2.
Ratio of abortions per 1,000 live births, Oregon occurrence,1980-2015

Figure 3-3.
Trends in abortion rates by five-year age group, Oregon occurrence, 1985-2015

*Rate per 1,000 females in age group
as a whole. This trend reversed itself beginning in the late 1990s as Oregon's abortion ratio climbed past the national rate, reaching a maximum divergence of $+25 \%$ in 2001. Since the mid-2000s, however, Oregon's abortion ratio has fluctuated near the national ratio (see sidebar Table 3-A).

## Abortion patients

Similar to birth rates, abortion rates differ by age group, race, ethnicity, marital status and prior pregnancy. Almost three-quarters of abortion patients have never been married (see Table 3-3), and half have previously given birth (see Table 3-5).

## Age

There is wide variation in abortion rates among age groups. The highest rate in 2015 occurred among women aged 2024 (20.7 per 1,000). The lowest rates were among women under age 15 and women aged 45-49 (0.2 per 1,000; see sidebar Table 3-B).

The 2015 abortion rate among teens aged $10-17$ was $89.5 \%$ lower than the rate in 1980, when the statewide abortion rate was highest; the rate for 18-19-year-olds was 78.2\% lower (see Figure 3-4). The absence of a corresponding increase in the birth rates among teens suggests success in avoiding unwanted pregnancy, rather than an increase

| Table 3-B. Abortion rates by age and percentage distribution, Oregon occurrence ${ }^{1}, 2015$ |  |  |
| :---: | :---: | :---: |
| Age | Rate ${ }^{2}$ | \% |
| <15 | 0.2 | 0.2 |
| 15-19 | 7.3 | 10.5 |
| 20-24 | 20.7 | 30.5 |
| 25-29 | 16.9 | 26.7 |
|  |  | 0.0 |
| 30-34 | 11.5 | 18.0 |
| 35-39 | 6.5 | 10.1 |
| 40-44 | 2.4 | 3.7 |
| 45-49 | 0.2 | 0.3 |
| 15-44 | 10.9 | 99.5 |
| ${ }^{1}$ Occurrence data include all abortions reported by providers located in Oregon, regardless of the patient's residence. Because rate calculations employ Oregon population figures, these calculations, in effect, substitute out-of-state residents for Oregonians who may have obtained an abortion in another state. |  |  |
| ${ }^{2}$ Per 1,000 females in age group |  |  |

in decisions to carry unwanted pregnancies to term. In contrast, among women age 35-39, abortion rates were $10.2 \%$ higher in 2015 than in 1980.

## Race and ethnicity

Beginning in 2008, collection of race and ethnicity data on Oregon birth certificates changed to obtain more precise information about an individual's race and Hispanic ethnicity. In prior years, only one race category could be selected. Now multiple race and ethnicity categories may be chosen. For this reason, pregnancy data (births and abortions) by race/ethnicity since 2008 are not directly comparable to years before 2008.

The frequency with which abortion procedures were used to terminate pregnancies varied among ethnic and racial groups. African American and White women had the highest percentages of terminated pregnancies in 2015 with $32.9 \%$ and $16.1 \%$, respectively. Because of Oregon's predominately White demographic composition, White women obtained the majority of abortions by count in 2015; however, they had the second highest percentage of terminations overall, $51.1 \%$ lower than African American women. The lowest percentage of terminated pregnancies was for women of two or more races ( $11.1 \%$ ) followed by women of Hispanic ethnicity (11.6\%; see Figure 3-5).

Figure 3-5.
Percentage of pregnancies terminated by induced abortion by race/ethnicity, Oregon occurrence, 2015

## Contraceptive use

In the majority of abortions that occur in Oregon, the pregnancy is not a result of contraceptive failure. In 2015, based upon data obtained from abortion reports, 33.9\% of women used some method of contraception to avoid pregnancy. Of the $66.1 \%$ of abortion patients who did not report using contraceptives, $39.8 \%$ had previously obtained an abortion (see Table 3-5).

## Medical procedures

For abortions with known gestation periods, $88.9 \%$ were performed prior to the 13 th week of pregnancy. About one in $20(4.7 \%)$ induced terminations where gestation was known were performed after 16 weeks. Medical (nonsurgical) was the procedure used in $41.8 \%$ of terminations prior to the 13 th week where method was reported. Dilation and evacuation was the procedure in $91.0 \%$ of terminations occurring after 16 weeks gestation. Women younger than 20 obtained $10.4 \%$ more abortions after 16 weeks gestation than women aged 20 and older (see Table 3-4). The percentage of abortions occurring after 16 weeks gestation decreased for all age groups (see Figure 3-6).

Complications at the time of the induced termination procedure were reported for 281 terminations ( $3.3 \%$ of abortion patients). Retained products ( 52 patients) and failure of first method (39 patients) were the most common complications. In Oregon, no woman has died as the result of a legally induced termination.

## Geographic distribution

Abortion rates varied widely within Oregon, with 35 of 36 counties reporting at least one resident who obtained an abortion in 2015. Service providers, conversely, were geographically concentrated. In 2015, abortions were reported in eight counties. The concentration was evident in the fact that $94.6 \%$ of all abortions were obtained in the five counties of highest occurrence: Jackson, Lane, Marion, Multnomah and Washington (see Table 3-7). Although abortions often may be sought outside a patient's community to help ensure anonymity, this degree of concentration suggests that access to abortion services may be limited for some Oregon women.

## Teen pregnancy

## Introduction

In 2015, 3,139 pregnancies occurred among Oregon females under the age of 20 . Thirty-five pregnancies occurred among females under age 15 . Fifteen girls aged 10-14 gave birth during 2015, five fewer than the previous year (see Table 4-2). The youngest female to give birth was 12 and the youngest female to obtain an abortion was 12 .
Due to differences in risk and severity of outcomes, this report bases its analysis on two separate age groups to aid in understanding teen pregnancy trends: females aged 15-17 and females aged 18-19. These two groups are compared to each other and to women aged 20 and older. For the purposes of this report, the number of pregnancies is determined by adding the number of births and abortions reported for Oregon residents. Because some neighboring states (e.g., California) do not exchange abortion reports with Oregon, out-of-state abortions are not always included in this count (see Appendix B).

## Oregon females, aged 15-17

Efforts to prevent teen pregnancies focus primarily on females aged 15-17. During 2015, 804 pregnancies were recorded for Oregon females aged 15-17, 85 fewer than in 2014. The statewide pregnancy rate among women aged 15-17 decreased 9.7\%, from 12.4 in 2014 to a current low of 11.2 (see Table 4-1). Historically, the teen pregnancy rate has trended downward and the 2015 rate is $68.2 \%$ lower than it was in 2000 (see Figure 4-1). Pregnancy rates for teens aged 15-17 varied by county. Six counties had rates significantly different than the state rate (see Table 4-3). The 2015 rate for teens $15-17$ was $37.8 \%$ below the Oregon Benchmark goal for the year 2015 of 18 pregnancies per 1,000 females (see sidebar Table 4-A).

## Pregnancy rates for Oregonians ages 15 to 17 decreased by 9.7\% from 2014.

|  |  |
|  |  |

## Births to teens, aged 15-17

Of pregnancies to teens aged 15-17, $71.8 \%$ resulted in a live birth, compared to $46.2 \%$ in 1980 (see Table 4-1). There were 577 births to Oregon teens aged 15-17 in 2015. It was the mother's first child in $94.1 \%$ of these births (see Table $4-9$ ). The birth rate for females aged $15-17$ was 8.0 per 1,000 females, a decrease of $5.9 \%$ from the previous year. Among those who took their pregnancies to term, $94.6 \%$ were unmarried at the time of birth (see Table 4-10).

## Abortion rates among teens, aged 15-17

Abortion rates among teens decreased 17.9\% from 2014. For females aged 15-17, the abortion rate was historically low in 2015 at 3.2 per 1,000 (see Table 4-1, Figure 4-2). There were 227 abortions among Oregon females aged 15-17 reported during 2015, 51 fewer abortions than in 2014. Since the record high abortion rate in 1980, the rate for females aged $15-17$ has decreased by more than $90.0 \%$ (from 31.9 to 3.2 per 1,000 females).
Figures 4-3 and 4-4 present historical pregnancy outcomes (birth and abortion). As Figure 4-4 indicates, a higher percentage of teen pregnancies were carried to term in recent years than in 1985. Since 1985, the younger the teen, the higher the percentage of terminated pregnancies. However, among teens under 15, $42.9 \%$ of the pregnancies resulted in a live birth in 2015 (see Table 4-2, Figure 4-4).

## Birth rates for teens age 18 to 19 decreased by 4.6\% from 2014.

## Oregon females, aged 18-19

In 2015, the pregnancy rate for Oregonians aged 18-19 was 44.5 per 1,000 females, a $2.0 \%$ decrease from 2014.
Comparisons with the 2014 figures show a $4.6 \%$ decrease in the birth rate and a $7.5 \%$ increase in the abortion rate among women aged 18-19 (see Table 4-1).
Of the 2,300 pregnancies among women aged 18-19, $74.4 \%$ $(1,712)$ resulted in a live birth (see Figure 4-4). It was the first child for $83.7 \%$ of this group.

## Oregon vs. U.S. birth rates

In Oregon, the birth rate among 15- to 19-year-olds (commonly used in historical and national comparisons) decreased $4.6 \%$ in 2015 ( 18.5 vs. 19.4 per 1,000 females in 2014; see Table 4-1). The 2015 rate was $66.5 \%$ lower than the 1991 rate of 55.2 per 1,000 , which is the highest rate recorded during the past quarter century (see Figure 4-5).

Oregon's 2015 birth rate for 15-19-year-old teens was $17.0 \%$ below the national rate(1) ( 18.5 vs. 22.3 per 1,000 females; see sidebar Table 4-B). Oregon's lower teen birth rate continued to decrease at the same time the state became more diverse. Historically, African American and Hispanic populations have had higher teen birth rates and have been underrepresented in the state's population. Between the 1990 and 2010 census, the proportion of racial minorities was relatively stable while the proportion of Hispanic residents tripled from $4 \%$ to $12 \% .(2,3)$ Nevertheless, during this period of increased diversity, Oregon's teen pregnancy rate for 15-19-year-olds fell from 86.0 per 1,000 females in 1990 to 25.1 in 2015, a $70.8 \%$ decrease (see Table 4-1; for further discussion of Oregon's demographic characteristics and teen pregnancy rates, see Appendix B: "Methodology").

## Level of infant health

## Low birthweight

The best single measure of newborn infant health is low birthweight, which is defined as less than 2,500 grams or 5.5 pounds. Low birthweight is closely related to premature delivery and small size for gestational age. Changes in the low birthweight rate for a group might indicate aggregate changes in the mother's personal behavior during

Figure 4-6.
Rates of low birthweight birth, Oregon residents <20 and 20+, 2010-2015

| Table 4-B. Teen birth rates $^{\mathbf{1}}$ |  |  |  |
| :--- | ---: | ---: | ---: |
| Age | Oregon |  | U.S. |
|  | $\mathbf{2 0 1 5}$ | $\mathbf{2 0 1 4}$ | $\mathbf{2 0 1 5}$ |
| $15-17$ | 8.0 | 8.5 | 9.9 |
| $18-19$ | 33.2 | 34.8 | 40.7 |
|  | 18.5 | 19.4 | 22.3 |
| $15-19$ |  |  |  |
| All rates per 1,000 females. |  |  |  |

pregnancy, or it could indicate other conditions that affect fetal health, such as nutrition or access to prenatal care.
In 2015, the low birthweight rate for teen mothers aged $15-19$ was 79.1 per 1,000 births (see Table $4-7$ ), a $6.3 \%$ increase from 2014. For 15-17-year-olds, the rate (83.2 per 1,000 ) decreased by $5.9 \%$. The teen rate for low birthweight remained higher than for mothers aged 20 and older ( 63.5 per 1,000; see Table 2-27). The difference in the low birthweight rates between teen and older mothers continued to increase slightly in 2015 (see Figure 4-6).

## Race and ethnicity

Demographic factors such as race, ethnicity and marital status combine with age to influence the likelihood a teenager will receive early prenatal care. In 2015, for example, $53.3 \%$ of unmarried Hispanics aged 15-17 started prenatal care during their first trimester, compared to $72.0 \%$ of married non-Hispanic White women aged 18-19 (see Table 4-7).

Low birthweight rates among teen mothers by racial/ethnic grouping are displayed in Table 4-7. Between 2014 and 2015, the rate of low birthweight infants for Hispanic teens aged $15-17$ decreased by $37.1 \%$. The low birthweight rate for Hispanic teens aged 18-19 during this same period decreased by $9.1 \%$. Among non-Hispanic, non-White groups, the low birthweight rate for teens aged 15-17 increased by $233.3 \%$, while the rate for 18-19-year-olds decreased by $32.6 \%$.

## Prenatal care

Table 4-6 shows the association between inadequate prenatal care and frequency of low birthweight infants for teens that gave birth in 2015. Among mothers aged 15-19, those who received inadequate prenatal care had a greater number of low birthweight babies than those who had received adequate care ( 82.6 vs. 79.0 per 1,000 live births). Figure $4-7$ shows low birthweight rates per 1,000 live births by adequate and inadequate prenatal care. For mothers 15-17, the rates were 74.3 vs. 142.9; for mothers 18-19, the rates were 80.6 vs. 58.1.

## - Early prenatal care

Prenatal care should begin within the first 12 weeks

of pregnancy to allow early detection of complications and to ensure the health of both mother and infant. An Oregon benchmark goal is $90 \%$ of pregnant women, regardless of age, will begin medical care during the first trimester of pregnancy by the year 2015. Teens are further from this goal than any other age group. In 2015 , only $65.6 \%$ of teen mothers started prenatal care during the first trimester, compared to $79.7 \%$ for women aged 20 and older (see sidebar Table 4-C). Only 57.6\% of those $15-17$ received first trimester prenatal care, an increase from $56.7 \%$ in 2014 (see Table 4-10).

## - Inadequate prenatal care

Inadequate prenatal care is defined as no prenatal care, care beginning after the second trimester of pregnancy or care involving fewer than five prenatal visits. By this measure, $11.1 \%$ of $15-17$-year-old teens and $9.2 \%$ of 18-19-year-old teens received inadequate prenatal care in 2015. This compares with $5.5 \%$ of women aged 20 or older who received inadequate care (see Table 4-10). The proportion of women under age 20 that received inadequate prenatal care decreased by $14.5 \%$ in 2015, to $9.8 \%$ from $11.5 \%$ in 2014.

## - Late care or no prenatal care

From 2014 to 2015, the proportion of teens aged 15-17

Figure 4-8.
Rates of late prenatal care
by age group, Oregon residents, 2012-2015

that began prenatal care during the third trimester decreased $21.1 \%$ to 80.8 per 1,000 live births (see Figure $4-8)$. In 2015, the rate of no prenatal care among teens $15-17$ was 12.3 per 1,000 live births, almost twice the rate among women aged 20 and older ( 6.9 per 1,000 live births; see Table 4-10, Figure 4-9).

## Low Apgar score

The Apgar score recorded by the birth attendant five minutes after birth provides another measure of infant health at the time of delivery. A score of less than 7 is considered low and indicates an infant at greater than normal risk for morbidity and mortality. In 2015, the low five-minute Apgar rate for newborns of mothers aged $15-17$ was 24.3 per 1,000 births (Table $4-9$ ), a $47.1 \%$ decrease from 2014 ( 45.9 per 1,000). The low five-minute Apgar rate for infants born to women under age 20 was $19.0 \%$ higher than the rate for infants born to women 20 years or older ( 30.0 compared to 25.2 per 1,000 ).

## Substance use during pregnancy

Estimates of tobacco and alcohol use during pregnancy are presumed to be minimum counts due to underreporting on birth certificates. The legal age to purchase alcohol in Oregon is 21. The legal age to purchase tobacco products is 18 . Teen mothers may be deterred by Oregon legal age limits placed on the purchase and/or possession of these substances.

## Tobacco

The percentage of teens aged 15-19 that reported smoking during pregnancy in 2015 was just over 1.5 times higher than the percentage reported by women aged 20 and older ( $15.0 \%$ vs. $9.7 \%$; see Table $4-9$ ). Women who smoked during pregnancy had a higher rate of low birthweight babies than nonsmokers. Mothers aged 20 or older show the greatest difference between low birthweight rates by tobacco use ( 107.7 vs. 58.4 per 1,000 live births). This is partly because the low birthweight rate
 for teen mothers is higher than for women aged 20 and older (see sidebar Table 4-D). Tobacco use remains one of the most important preventable causes of low birthweight infants for teen mothers.

## Alcohol

Teens aged 15-19 reported less use of alcohol during pregnancy than women aged 20 and older ( 2.7 per 1,000 births vs. 9.4 per 1,000 births).

## Source of payment

The source of payment is reported as the expected primary payment source at the time of labor and delivery. The percentage of teen mothers that reported the use of public funds to pay the costs associated with birth was nearly twice that of older mothers. In 2015, birth certificate data reported that Medicaid/Oregon Health Plan paid for 77.4\% of births to teens aged 15-19 and 43.8\% of births to women aged 20 and older where source of payment was reported (see Table 4-10).

## Age of father

Between 2011 and 2015, 36.6\% of birth records for babies born to teens aged 15-17 did not indicate father's age, or the father was not identified on the birth certificate (see Figure 4-10, Table 4-13). Two-thirds (67.0\%) of the birth records in which the mother was under age 15 did not list the father's age. When the father's age was reported for teen mothers under age $15,31.1 \%$ were younger than age 18 and $1.9 \%$ were aged 18 or older. Birth records for mothers aged 15-17 reported father's age for $63.4 \%$ of births. Where the father's age was reported, $33.3 \%$ of fathers were under age 18 and $66.7 \%$ were aged 18 or older.
For all teens, including the youngest mothers (less than 15 years of age), the father was more than six years older than the mother in $10.6 \%$ of the births during 2011-2015 where the father's age was reported. The percentage of births to teen mothers where the father was more than six years

Figure 4-11.
Father's age compared to teen mother's age, Oregon residents, 2011-2015

Percent based on births in which father's age was reported. $\mathrm{N}=20,076$.
older than the mother ranged from a low of $0 \%$ of births to mothers under age 15 , to a high of $13.6 \%$ for 19 -year-old teens (see Figure 4-11).

| 2015 | 35 | 839 | 4.4 | 15 | 592 | 3.1 | 20 | 247 | 1.3 | 42.9 | 70.6 |

1 Pregnancy estimates are based on the total number of births and abortions. See also footnote (2) below regarding changes in estimating abortions.
2 Abortion estimates are based on reports for Oregon residents whether occurring in Oregon or another state. For years prior to 1985
(and in 1986-1987) abortion estimates were based on Oregon occurrences only, but included abortions obtained by out-of-state residents. Because some neighboring states do not report abortions to the state of residence (especially California), this results in minimal estimates for both abortions and pregnancies.
3 Percentage of pregnancies resulting in a live birth.
NA = Not Available
All rates are per 1,000 females.

TABLE 4-3. Pregnancy rates of teens by county of residence, Oregon, 2015

| County of residence | Total pregnancies (all ages) | Age |  |  |  | Pregnancy rate ${ }^{1}$ |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

- Quantity is zero.

1 All rates per 1,000 females.
2 Total includes eight pregnancies where county of residence was unknown.
$\S_{\star}^{\S}$ Pregnancy rate is significantly different from the state.
Detailed reporting of small numbers may breach confidentiality.
WARNING: Rates based on less than five events are unreliable.
NOTE: Includes births and reported abortions including those obtained out-of-state by Oregon residents. Because some states (e.g., California) do not record data on residence for abortion patients, not all out-of-state abortions are included.

TABLE 4-4. Birth rates of teens by county of residence, Oregon, 2015

- Quantity is zero.

1 Less than five prenatal visits or care began in the third trimester.
2 Rates per 1,000 females 15-19 years of age.
3 Rates per 1,000 births to 15-19 year olds.
$\S_{\star}$ Rate is significantly different from the state rate.

* Detailed reporting of small numbers may breach confidentiality.

WARNING: Rates based on less than five events are unreliable.
NOTE: Rates and percentages are calculated excluding missing and unknown values.

## Appendix B: Technical notes - definitions

## Births

- Apgar Score is a summary measure of the infant's condition based on heart rate, respiratory effort, muscle tone, reflex irritability, and color. The highest possible score is ten. A low Apgar score (seven or less), measured five minutes after birth, indicates the infant is at increased risk of morbidity and mortality.
- Births to Unmarried Mothers Ratio is the number of births to unmarried mothers per 1,000 live births. Ratios differ from rates.
- Crude Birth Rate is the number of live births per 1,000 total population.
- Live Birth is the complete expulsion or extraction from its mother of a product of conception, irrespective of the duration of pregnancy, which, after such a separation, breathes or shows any other evidence of life such as beating of the heart, pulsation of the umbilical cord, or definite movement of voluntary muscles, whether or not the umbilical cord has been cut or the placenta is attached; each product of such a birth is considered live born. ${ }^{1}$
- Low Birthweight Infant is a live born infant with a birthweight of less than 5 pounds, 8 ounces (2,500 grams) as reported on the birth certificate.
- Birth rate per $\mathbf{1 , 0 0 0} \mathbf{~ m e n}$ is the number of births per 1,000 males in Oregon. In computing birth rates by age of father, births tabulated as age of father not stated are distributed in the same proportions as births with known age within each five-year-age classification of the mother. The male birth rate is used to facilitate comparisons between Oregon and the national rate.

NCHS uses this procedure to avoid distortion in rates resulting from the disregard of the relationship between the mother and fathers' age.

## Deaths

- Crude Death Rate is the number of deaths per 1,000 or 100,000 total population.
- Fetal Death is death prior to the complete expulsion or extraction from its mother of a product of conception of at least 20 weeks gestation, except where such expulsion results from a therapeutic abortion; the death is indicated by the fact that after such separation, the fetus does not breathe or show any other evidence of life such as beating of the heart, pulsation of the umbilical cord, or definite movement of voluntary muscles.
- Fetal Death Ratio is the number of fetal deaths per 1,000 live births. Ratios differ from rates.
- Infant Death is the death of a child prior to its first birthday.
- Infant Death Rate is the number of infant deaths per 1,000 live births.
- Maternal Death Rate is the number of female deaths attributed to childbirth or to complications of pregnancy or the puerperium, per 100,000 live births.
- Neonatal Death is the death of a child within the first 27 days of life.
- Neonatal Death Rate is the number of neonatal deaths per 1,000 live births.
- Postneonatal Death is the death of a child after 27 days of life and before its first birthday.
- Postneonatal Death Rate is the number of postneonatal deaths per 1,000 live births.
- Perinatal Death is the death of a fetus after 20 weeks gestation or the death of a live-born infant prior to the 28th day of life. Other medical literature may include different time periods.
- Perinatal Death Ratio is the number of perinatal deaths per 1,000 total live births. Ratios differ from rates.

## Medical personnel abbreviations used in tables

- G.N.M. - certified nurse midwife
- D.C. - doctor of chiropractic medicine
- D.O. - doctor of osteopathic medicine
- L.D.M. - licensed direct entry midwife
- M.D. - medical doctor
- N.D. - naturopathic doctor
- R.N. - registered nurse

## Endnote

"That, sir, is the good of counting; it brings everything to a certainty, which before floated in the mind indefinitely. "
-Samuel Johnson

## Induced termination of pregnancy

The induced termination of pregnancy data in this report represents nearly all abortions performed in Oregon during the current data year. Missing data is due to incomplete reporting by providers. Another consideration is the place of occurrence (Oregon) versus the mother's place of residence (residence could be anywhere). That is, the data constitute events associated with the place of occurrence rather than the "residence data" used in estimating births. This is necessary because many abortions obtained out-of-state by Oregon residents are not reported to Oregon's Center for Health Statistics. It reflects the great variation in abortion reporting procedures among states (e.g., some states do not record the patient's residence) as well as the fact that a comprehensive data collection network among all states, similar to that used in reporting births, does not exist in regard to abortions.

| Number of First-Time Abortions By Year and Age Group, Oregon |  |  |  |  |  |  |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| Occurrence, 1991-2005 |  |  |  |  |  |  |

In using "occurrence" data rather than "residence" data to estimate abortion rates for Oregon residents, an implicit assumption is made that the number of Oregon residents who leave the state to obtain an abortion equals the number of out-of-state residents who obtain an abortion in Oregon. In formulating generalizations which involve trends or longterm behavioral patterns, annual totals are treated as sample values generated by ongoing social, economic, or political processes and thus subject to "chance" variability. For most purposes, numbers offered in this report should be viewed only as careful approximations and interpreted only within the framework of statistical safeguards developed to take sampling variability into account.
Some rates in this section are based on relatively few events and for most comparisons may be used only with extreme caution-due to the chance fluctuations associated with small numbers. A small percentage of abortion reports lack certain data items. This may greatly affect the estimation of rates. To minimize the potential bias inherent in such estimates, unknown events in some cases (Table 4-1) are assigned to the categories of analysis proportional to the distribution of known events. In this way, rates calculated for subsets (e.g., "abortions per thousand teen females") are, on average, less affected by incomplete data.

## Estimation of the cumulative proportion of females who have experienced an abortion

This figure is estimated by tracing the abortion experience of a specific cohort of females over an extended time period. In the table on the previous page, an approximation of the "cumulative total" of first-time abortions by one of the cohorts may be obtained by summing the figures in the boxed area.

To obtain this value, it is necessary to sum the number of first-time abortions for 15- to 19-year-olds from 1991 to 1995 and those of 20- to 24-year-olds from 1996 to 2000 with those of 25- to 29- year-olds from 2001 to 2005. This provides an estimate of the numerator in the following equation:

Cumulative proportion of females who have had an abortion

[^41]The denominator may be estimated by averaging the size of the cohort during 1991 to 1995. Table A-1 lists the annual estimate of the number of females within each cohort. For example, in 1991, the number of 15 - to 19 -year-old females was estimated to be 93,043 ; in the next year, it was 95,064 . The average size of this age group from 1991 to 1995 was 98,540 . Similarly, the number of 20 - to 24 - year-old women between 1996 and 2000 was 104,214 on average; the number of 25 - to 29 -year-olds averaged 93,065 between 2001 and 2005. Thus, between 1991 and 2005 the cohort of interest had an average population size of 98,606.
Substituting into the formula given above:

$$
C p=\frac{\text { Sum of First Abortions }}{N ~ 98,606}=\underline{32,162}=0.326 \text { or } 32.6 \text { percent }
$$

This figure approximates the proportion of females in the 25 - to 29-year-old cohort who, by 2005, had ever had an abortion. This method of estimation assumes factors such as deaths and migration have not altered the composition of the female population in Oregon - that is, the women who left the state displayed the same characteristics as those who have moved into Oregon. It also assumes patients with a history of previous abortions do not report the current procedure as a first abortion.

## Teen pregnancy

Pregnancy estimates are based upon the estimated number of teen births and induced terminations among Oregon teens; they do not include the number of fetal deaths or miscarriages (spontaneous abortions) which occur. The estimation of teen births is considered to be relatively complete and includes births to resident teens even when they occur out-of-state. The estimation of teen abortions is based on all reported abortions to teenage residents of Oregon; however, because states often do not report abortions obtained within their borders to the state of residence as occurs with vital events such as birth and death, an unknown number of Oregon teens obtain abortion services out-of-state. As a consequence, estimates of teen abortions and teen pregnancies should be considered minimal in nature.

Furthermore, because estimates of abortion for teens are based on "residence data," figures given in Chapter 4 do not correspond exactly to those in Chapter 3, which are based on "occurrence data." (See Induced Termination of Pregnancy methodology section.) The estimation of rates requires an estimate of the size of the appropriate population. Such estimates are now available for 15 - to 17 -year-olds and 18 - to 19 -year-olds for each county on an annual basis. Because estimated rates based on a small population may vary greatly due to chance factors, rates of teen pregnancy, birth, and abortion were calculated for these age groups only if there were 50 or more female residents of the appropriate age group in the county. Similarly, rates for 15 - to 19-year-olds were calculated whenever a county had 50 or more female residents in this age group.
Great caution must be taken in the use of pregnancy statistics associated with females under 15 years of age. This is due to the fact that relatively few events are recorded each year for this group. Also, rates are based on the estimated population cohort of 10 - to 14 -year-old females - many of whom are physiologically not yet at risk of pregnancy. Thus, any direct comparison of rates between this group and another age group-e.g., 15- to 17-year-olds-would be inappropriate.

## Demographics

The extent to which Oregon's demographic composition may affect its national ranking is indicated by comparisons shown in the sidebar. In 1990, Oregon's birth rate for all teens (regardless of race or ethnic affiliation) was 9 percent lower than that of the U.S. and, among all 50 states, it had the 24th lowest teen birth rate. Yet, if comparisons were made in terms of births to non-Hispanic white teens only, Oregon would have been 36th and the rate would have been 19 percent higher than that of the U.S. This results from the fact that 87 percent of 15 - to 19-year-old females in Oregon were non-Hispanic whites and only 7 percent were either Hispanic or non-Hispanic African Americans. By comparison, 70 percent of the U.S. female population of that age were non-Hispanic whites, and 26 percent were Hispanics or non-Hispanic African Americans.

## Appendix B: Technical notes - step-by-step instructions

"Through and through the world is infested with quantity: To talk sense is to talk quantities. It is no use saying the nation is large-How large? It is no use saying that radium is scarce-How scarce? You cannot evade quantity. You may fly to poetry and music, and quantity and number will face you in your rhythms and your octaves."
—Alfred North Whitehead

Data users are diverse, including public health officials evaluating a program by using death data, demographers projecting school enrollments with birth data, and business people deciding to open a formalwear shop based on marriage data. Many of these users have a thorough knowledge of statistics. But others find the entire subject matter confusing and intimidating. For either group, a misunderstanding of what vital statistics mean can lead to wrong conclusions. Therefore, this section is included to provide an overview of how to use vital statistics. It is addressed to the person looking at vital events for the first time, but the experienced user may also find a review helpful.

## Step 1: Finding the correct number

The first step is to determine how many instances of a particular vital event took place during the year. This involves asking two questions:

## Which event or events are appropriate?

This may not be as simple as it sounds. For one thing, examining more than one type of event may be required. For example, someone concerned with teenage pregnancies will have to consider the number of induced abortions as well as the number of births that occur among teens. Taken together, they provide a useful measure of the number of pregnancies. ${ }^{1}$

Deciding which events to use is important since sometimes the choice of one event over another can easily lead to different conclusions. To determine which events are appropriate, read the "Technical Notes: Definitions" section. The narratives also contain useful examples.

## Who should be counted?

If you are a hospital planner who is deciding to expand or contract delivery services, you want to count the number of births that occurred in your area, regardless of where the parents live. If you are projecting school enrollment, you want to count only how many children will potentially be residing in your area. Fortunately, vital events are usually reported so that both of these data needs can be met.

## Occurrence data:

The event (the death, birth, marriage, etc.) actually took place in the geographic region indicated (either Oregon or a particular county). The person participating in the event may have lived in Podunk, New York.

## Residence data:

The person involved in the event lived in the geographic region mentioned, but the event itself may have taken place anywhere in the United States or Canada. In other words, a resident of Marion County who died in an accident while on vacation in Michigan has been added to the Marion County resident death figure.

When in doubt about which type of data to use, resident figures are usually the best choice. Most birth and death data are published by residence, which means that comparisons with other states or the United States as a whole will be easier. Exceptions to this rule are listed in the individual sections.

Once the right event has been determined, and the choice between occurrence and residence data has been made, the statistician can find the correct figures in the table(s) in this book. If the needed table is not listed, contact the Center for Health Statistics for more information.

## Step 2: Making the number meaningful with rates and ratios

In many instances simply knowing the number of events is not sufficient. For example, we know more people died in Multnomah County than in Wheeler County, because Multnomah County has a much larger population. But what is the likelihood of dying in each county?

In order to answer this question, statisticians calculate rates. This means that the number of events that occurred is compared to the population for which that event could have occurred, and the figure is then standardized to some number (such as 1,000 or 100,000 ) for convenience.

Here is an example:

The more specifically a statistician can define the "population at risk" (the denominator or bottom part of the formula), the more meaningful the rate is. For example, the crude birth rate, which compares the number of births to the population, is not nearly as informative as the fertility rate, which uses only the number of women of childbearing age (15-44) for comparative purposes. The fertility rate is not distorted by changes in the number of men or prepubescent or post-menopausal women in the population. (The turn of the century notion that only married women between the ages of 15 and 44 would be considered at risk of pregnancy has been abandoned for obvious reasons.)

When calculating rates and ratios, great care must be taken to make certain that the appropriate time periods, geographical boundaries, and populations are used.

Unfortunately we do not always have the correct denominator for the equation. In these situations a substitute is used. For example, how many people are at risk of getting divorced? The number of married people is only available for census years. As a substitute, the crude divorce rate is calculated using the total population regardless of marital status. In other situations, the event is simply compared to another related number. For instance, the abortion ratio compares the number of abortions to the number of births. This is easier and more accurate than trying to determine the true denominator, which is the total number of pregnant women.

## Step 3: Comparing two or more numbers

Numbers are more meaningful when they are converted into rates and ratios. But problems can arise when rates or ratios are compared for different geographical areas, different time periods, or different categories such as men versus women.

## Chance variation

Statisticians expect a certain amount of chance variation and have methods to take this into account. The confidence interval uses the number of cases and their distributions to determine what the rate "really is." For example, a statistician will say, "We are $95 \%$ sure that the true infant death rate for Oregon in 1986 was $9.47 \pm 0.97$; that is, it lies somewhere between 8.50 and 10.44." If two rates have overlapping confidence intervals, then the difference between them may be due to this chance variation. In other words the difference is not statistically significant.

## When comparing rates and ratios, differences should be tested for statistical significance. Formulas are listed in the next section of this chapter.

## Small numbers

Chance variation is a common problem when the numbers being used to calculate rates are extremely small. Large swings often occur in the rates that do not reflect real changes. Consider Clatsop County's infant mortality rates for a five-year period.

| CLATSOP COUNTY |  |  |  |  |  |
| ---: | ---: | ---: | ---: | ---: | :---: |
| YEAR | BIRTHS |  | INFANT DEATHS | INFANT DEATH <br> RATES |  |
| 2001 | 380 | 1 | 2.63 |  |  |
| 2002 | 432 | 6 | 13.89 |  |  |
| 2003 | 367 | 6 | 16.35 |  |  |
| 2004 | 397 | 2 | 5.04 |  |  |
| 2005 | 411 | 1 | 2.43 |  |  |
|  |  |  |  |  |  |
| $\mathbf{2 0 0 1 - 2 0 0 5}$ | $\mathbf{1 , 9 8 7}$ | $\mathbf{1 6}$ | $\mathbf{8 . 1}$ |  |  |

Clatsop county's five year infant death rate is 8.1 , which is 2.5 percentage points higher than the state rate (5.6). Yet, for some years Clatsop's rate is more than six times as high as the rate of other years simply because five additional infants died. Public health officials would waste a good deal of energy reacting to these annual rates.
Many rates based on small numbers are published in this book because readers demand them. But, anyone preparing to make important decisions based on these rates should be wary. Consider this rule of thumb: a rate based on 20 cases has a 95 percent confidence interval about as wide as the rate itself (i.e., the interval for a rate of 50 is between 25 and 75). Even large differences between two rates based on 20 cases or less are probably not statistically significant.
If 20 is too few, how many cases are sufficient to say that a true difference exists? Unfortunately, we have no easy rules for this. To be safe, the vital statistician should always try to combine several years of data or consolidate geographical areas. Confidence intervals should be calculated, and differences should be tested for statistical significance.

## Changes in measurement

Another problem is that the numbers being compared have not always been based on the same type of measurement. Definitions, population estimates, certificates, and coding procedures change from time to time as the need arises. This can create "artificial" differences and can disguise "real" differences. The cause-of-death item provides an excellent example in comparability:

It appears that the incidence of hypertensive disease increased. But actually, a new coding scheme resulted in more deaths being coded as due to hypertensive disease.

$$
\begin{array}{ll}
\begin{array}{l}
\text { During the late } 1970 \mathrm{~s},
\end{array} & \begin{array}{l}
\text { Rate }=3.3 \text { per } 100,000 \\
\text { popproximately } 80 \text { to } 85 \\
\text { people died each year due }
\end{array} \\
\text { po hypertensive disease. }
\end{array} \quad \begin{aligned}
& \text { Rate }=9.8 \text { per } 100,000 \\
& \text { population }
\end{aligned}
$$

## Taking age, sex, and race into account

Mr. G.C. Whipple noted in 1923 that, "We might find that the death rate of bank presidents was higher than that of newsboys; but this would not be because of different occupations, but because of different ages." We expect older people to die at a higher rate than younger people. We also expect people in their twenties to have more babies than the very young or the very old. Sex and race, as well as age, can affect rates drastically.

When comparing two places or two points in time, it is necessary to take these influencing characteristics into account. To the right is an example.

The crude death rate increased between 1950 and 1960 from 9.1 to 9.5 deaths per 1,000 population. But, an examination of the agespecific death rates for each

|  | $\mathbf{1 9 5 0}$ | $\mathbf{1 9 6 0}$ |
| :---: | ---: | ---: |
| Crude death rate | 9.1 | 9.5 |
| Age-specific <br> death rates |  |  |
| $0-4$ | 5.9 | 5.7 |
| $5-14$ | 0.6 | 0.4 |
| $15-24$ | 1.5 | 1.1 |
| $25-44$ | 2.4 | 2.1 |
| $45-64$ | 11.1 | 10.6 |
| $65+$ | 58.4 | 56.8 | group indicates that all these rates decreased. This apparent contradiction is explained by the fact that in 1960 a larger proportion of the population was older. Because the risk of death is higher in older persons, the crude death rate increased.

Before comparing two places or two time periods, always compare the population characteristics first. If discrepancies are noted in any relevant variables, then the rates should be adjusted or standardized in order to make the comparisons free of differences in the structure of the populations. The formulas for doing this are listed in the following section.

## Step 4: Analyzing the data

The first three steps have been fairly mechanical:
(1) = Choose the correct events and the correct group to determine the number of events which took place for the geographical areas and time periods.
(2) = Calculate the rates.
(3) = Compare these rates to determine if the differences are statistically significant.
NOW the vital statistician must begin to ask the difficult questions. If we find that two rates are statistically significantly different, how can we find out why they are different? If the differences that we expected did not prove to be significant, is there another item which perhaps is masking an actual difference? Frequently, the statistician has to refine the research question and begin all over again.

Consider the researcher who asks, "Since 2005, has chronic lower respiratory disease posed a greater risk to Oregonians?" If the researcher looked at the overall rate, the answer would be "yes," but closer examination reveals that the death rate for males has declined. It is among women that the rate has moved sharply upward, reflecting their increased smoking prevalence during recent decades. This gender dichotomy would need to be addressed in a study of CLRD fatalities.

## Help

Several sources of help are available. Many of the widely used rates and ratios are presented in the Quick Reference section, and narratives and figures are included throughout this report to illustrate changes. And finally, the staff of the Center for Health Statistic's are available for data users who need assistance.

## Endnote

${ }^{1}$ A more complete and accurate estimate of pregnancies based on outcomes would include: (1) births; (2) fetal deaths (stillbirths); (3) induced abortions; and (4) spontaneous abortions (miscarriages). However, fetal deaths occur in less than 1 percent of all pregnancies and are relatively constant in relation to births (see the Fetal and Infant Mortality chapter in Volume 2) and the number of miscarriages that occur is not available in vital records. Nevertheless, a measure that excludes these outcomes provides an adequate indicator of the number of pregnancies.

## Appendix B: Technical notes - formulas

## GENERAL:

$$
\text { PERCENT CHANGE }=\frac{\text { New Data }- \text { Old Data }}{\text { Old Data }} \times 100
$$

Birth rate, Oregon, $1993=13.7$
Birth rate, Oregon, $1994=13.6$

Percent change $=\frac{13.6-13.7}{13.7} \times 100=-0.7 \%$

## PREGNANCY:

1. (CRUDE) BIRTH RATE $=\frac{\text { Resident Births }}{\text { Population }} X 1,000$

$$
\text { Oregon, } 1994=\frac{41,832}{3,082,800} X 1,000=13.6
$$

2. AGE-SPECIFIC BIRTH RATE $=\frac{\text { Resident Births To Mothers in Age Category }}{\text { Female Population in Age Category }} X 1,000$

$$
\text { Oregon, 1994, Age } 20-24=\frac{10,999}{104,718} \text { X 1,000 }=105.0
$$

3. FERTILITY RATE $=\frac{\text { Resident Births to Mothers Aged 15-44 }}{\text { Female Population Aged 15-44 }} X 1,000$

NOTE: Some publications use the following: $\frac{\text { All Resident Births }}{\text { Female Population Aged 15-44 }}$

$$
\text { Oregon, } 1994=\frac{41,659}{682,428} X 1,000=61.0
$$

4. TOTAL FERTILITY RATE $=\binom{$ The Sum of Age Specific Birth Rates in }{ 5- Year Categories between 15 and 44}$\quad X 5$ Oregon, $1994=5(51.3+105.0+115.4+78.5+30.2+6.0)=1,932.0$
5. FETAL DEATH RATIO $=\frac{\text { Resident Fetal Deaths }(350+\text { grams Birthweight })}{\text { Resident Live Births }} X 1,000$

Oregon, $1994=\frac{224}{41,832}$ X 1,000 $=5.4$
6. FETAL DEATH RATE $=\frac{\text { Resident Fetal Deaths }(350+\text { grams Birthweight })}{\text { Resident Live Births }+ \text { Resident Fetal Deaths }} X 1,000$

$$
\text { Oregon, } 1994=\frac{224}{43,591+224} X 1,000=5.1
$$

7. PERINATAL DEATH RATE $=\frac{\begin{array}{c}\text { Resident Neonatal Deaths }+ \text { Resident } \\ \text { Fetal Deaths }(350+\text { grams Birthweight })\end{array}}{\text { Resident Live Births + Resident Fetal Deaths }} X 1,000$

$$
\text { Oregon, } 1994=\frac{148+203}{41,566+203} \times 1,000=8.4
$$

Note: Publications vary in the definition of fetal deaths. In addition, some measures employ gestational age in place of birthweight. Fetal and perinatal death rates are based on year of birth.
8. ABORTION RATIO $=\frac{\text { Resident Abortions }}{\text { Resident Births }} X 1,000$ or $\frac{\text { Occurrence Abortions }}{\text { Occurrence Births }} X 1,000$

Oregon, 1994, Occurrence $=\frac{13,392}{43,591}$ X 1,000 $=307.2$
9. ABORTION RATE $=\frac{\text { Resident Abortions or Occurrence Abortions }}{\text { Female Resident Population Aged 15-44 }} \times 1,000$

Oregon 1994, Occurrence

$$
\begin{aligned}
& \text { gon 1994, Occurrence } \\
& \text { with total adjusted } \\
& \text { for unknown ages }
\end{aligned}=\frac{13,300}{682,428} X 1,000=19.5
$$

## DEATHS:

10. (CRUDE) DEATH RATE $=\frac{\text { Resident Deaths }}{\text { Population }} X 1,000$

$$
\text { Oregon, } 1994=\frac{27,361}{3,082,000} X 1,000=8.9
$$

11. INFANT DEATH RATE $=\frac{\text { Resident Infant Deaths }}{\text { Resident Births }} X 1,000$

$$
\text { Oregon, } 1994=\frac{295}{41,832} \times 1,000=7.1
$$

12. NEONATAL DEATH RATE $=\frac{\text { Resident Neonatal Deaths }}{\text { Resident Births }} X 1,000$

$$
\text { Oregon, } 1994=\frac{164}{41,832} \text { X 1,000 }=3.9
$$

13. POSTNEONATAL DEATH RATE $=\frac{\text { Resident Postneonatal Deaths }}{\text { Resident Births }} X 1,000$

$$
\text { Oregon, } 1994=\frac{131}{41,832} X 1,000=3.1
$$

14. CAUSE-SPECIFIC DEATH RATE $=\frac{\text { Resident Deaths Due to Specific Cause }}{\text { Population }} X 100,000$

$$
\text { Oregon, 1994, Heart Disease }=\frac{7,417}{3,082,000} X 100,000=240.7
$$

15. AGE AND SEX-SPECIFIC DEATH RATE $=\frac{\text { Resident Deaths in Age-Sex Category }}{\text { Population in Age-Sex Population }} X 1,000$ Oregon, 1994, Males Aged 5-14 $=\frac{63}{225,880} X 100,000=27.9$

## MARRIAGE AND DIVORCE:

16. MARRIAGE RATE $=\frac{\text { Marriages }}{\text { Population }} X 1,000$

Oregon, $1994=\frac{25,194}{3,082,000} \times 1,000=8.2$
17. DIVORCE RATE $=\frac{\text { Divorces }}{\text { Population }} X 1,000$

Oregon, $1994=\frac{15,844}{3,082,000} X 1,000=5.1$

Beginning with 1998 data, the following methodology is being used for calculating confidence intervals and statistical significance. This explanation is paraphrased from "Public Health Data: Our Silent Partner", a training manual from the Public Health Practice Program Office of the National Center for Health Statistics. ${ }^{1}$

## CALCULATING CONFIDENCE INTERVALS FOR RATES:

## Confidence limits for rates based on less than 100 events

When the number of events in the numerator is less than 100, the confidence interval for a rate can be estimated using the two formulas which follow and the values in Table B-1.
Lower Limit $=R \times L$
Upper Limit $=R x U$
where:
$R=$ the rate
$L$ = the value in Table $B-1$ that corresponds to the number $N$ in the numerator of the rate
$U=$ the value in Table B-1 that corresponds to the number $N$ in the numerator of the rate

## Example: Confidence limits for rates based on less than 100 events

In Baker County, the teen pregnancy rate for 10-to 17-year-old teens in 1998 was 13.0 per thousand, based on 12 live births in the numerator. Using Table B-1:

Lower Limit $=13.0 \times 0.51671=6.7$
Upper Limit $=13.0 \times 1.7468=22.7$
This means that the chances are 95 out of 100 that the pregnancy rate in Baker County for teens 10-17 lies between 6.7 and 22.7 per 1,000. So if there were 100 counties like Baker County, the teen pregnancy rate would be expected to lie between 6.7 and 22.7 per 1,000 in 95 of these counties.

TABLE B-1.
Values of $L$ and $U$ for calculating $95 \%$ confidence limits for the numbers of events and rates when the number of events is less than 100

| N | L | U | N | L | U | N | L | U |

## Confidence limits for rates based on 100 or more events

In this case, use the following formula for the rate (R) based on the number of events $(\mathrm{N})$ :
Upper Limit $=\mathrm{R}+[1.96 \times \mathrm{R} / \sqrt{\mathrm{N}}]$
where:
$R=$ the rate (birth rate, mortality rate, teen pregnancy rate, etc.)
$\mathrm{N}=$ the number of events (births, deaths, teen pregnancy, etc.)

## Example: Confidence limits for rates based on 100 or more events

In Jackson County, the teen pregnancy rate for teens 10-17 was 13.7 in 1998 based on 143 pregnancies. Therefore, the confidence interval would be:

```
Lower Limit \(=13.7-[1.96 \times(13.7 / \sqrt{143})]\)
    \(=13.7\) - [1.96 x (13.7/11.96)]
    \(=13.7\) - [1.96 x 1.15 ]
    \(=13.7-2.25\)
    \(=11.5\)
Upper Limit \(=13.7+[1.96 \times(13.7 / \sqrt{143})]\)
    \(=13.7+[1.96 \times(13.7 / 11.96)]\)
    \(=13.7+[1.96 \times 1.15]\)
    \(=13.7+2.25\)
    \(=16.0\)
```

So if there were 100 counties like Jackson County with similar populations, the teen pregnancy rate would be expected to lie between 11.5 and 16.0 per 1,000 in 95 of these counties.

## DETERMINING STATISTICAL SIGNIFICANCE FOR RATES:

If the difference between two rates would occur due to random variability less than 5 times out of 100 , then we say that the difference is statistically significant at the $95 \%$ level. Otherwise the difference is not statistically significant.

## Computing statistical significance when at least one of the rates is based on fewer than 100 events

To compare two rates, when one or both rates are based on fewer than 100 events, compute the confidence intervals for both rates. If the intervals overlap, the difference is not statistically significant.

## Example: comparing rates when one is based on fewer than 100 events

Baker County teen pregnancy rate for age 10-17
Lower Limit $=6.7$
Upper Limit $=22.7$
Jackson County teen pregnancy rate for age 10-17
Lower Limit $=11.5$
Upper Limit $=16.0$
The confidence intervals overlap - the interval for Jackson County is entirely within the range of the interval for Baker County. Therefore, the difference between the teen pregnancy rate for age 1017 in Baker County and the rate for Jackson County is not statistically significant.

## Computing statistical significance when both rates are based on 100 or more events

When both rates are based on 100 or more events, calculate the difference between the two rates by subtracting the lower rate from the higher rate. The difference is considered statistically significant if it exceeds 1.96 times the standard error for the difference between the two rates.
$1.96 \sqrt{\frac{R_{1}^{2}}{N_{1}}+\frac{R_{2}^{2}}{N_{2}}}$
where:
$\mathrm{R}_{1}=$ the first rate
$\mathrm{R}_{2}=$ the second rate
$\mathrm{N}_{1}=$ the first number
$\mathrm{N}_{2}=$ the second number
If the difference is greater than the statistic, the difference would occur by chance less than 5 times out of 100 . The difference is statistically significant at the 95 percent confidence level.

If the difference is less than the statistic, the difference might occur by chance more than 5 times out of 100 . The difference is not statistically significant at the 95 percent confidence level.

## Example: comparing rates when both are based on 100 or more events

The teen pregnancy rate for Oregon teens age 10-17 in 1997 was 18.0 and the comparable rate for 1998 was 17.2. Both rates are based on more than 100 pregnancies ( 3,197 in 1997 and 3,176 in 1998). The difference between the rates is $18.0-17.2=0.8$. The statistic is calculated as follows:

$$
\begin{aligned}
& 1.96 \sqrt{\frac{18.0^{2}}{3,197}+\frac{17.2^{2}}{3,176}} \\
& 1.96 \sqrt{\left(\frac{324}{3,197}+\frac{295.84}{3,176}\right)} \\
& 1.96 \sqrt{(0.101+0.093)}
\end{aligned}
$$

$$
1.96 \sqrt{0.194}
$$

$=1.96 \mathrm{x} .44$
$=0.86$
The difference between the rates (0.8) is less than this statistic (0.9). Therefore, the difference is not statistically significant. A difference of 0.8 between these two rates might occur by chance more than 5 times out of 100 .

## CALCULATING RATES ADJUSTED FOR SEX/AGE/RACE:

When comparing rates and ratios, the influences of sex, age, and race differences in the populations must be taken into account. Comparing many different age-sex-race specific rates can be cumbersome. The following techniques are used by vital statisticians to summarize these rates into one number.

The direct adjusted rate applies each of the specific rates for a particular population (such as a county or a Health Service Area) to a standard population distribution (such as the state).

The standard mortality ratio compares the number of deaths for a particular population (such as a county or a Health Service Area) to the number of deaths which would be expected if some standard set of rates (such as the state or the U.S. rates) had occurred. ${ }^{2}$

Both of these techniques have their advantages and disadvantages. The easiest to calculate is the direct adjusted rate. The following example shows how to adjust a county's death rate for sex so that it may be compared to the state rate.

The same logic can be used to adjust for age and/or race.

CERTIFICATE OF LIVE BIRTH

# Appendix D: Sample form - Report of Induced Termination of Pregnancy 

## Health

INDUCED TERMINATION OF PREGNANCY

12. Is patient of Hispanic origin?
$\square$ No, not Spanish/Hispanic/Latina
$\square$ Yes, Mexican, Mexican-American, Chicano
$\square$ Yes, Puerto Rican
Yes, Cuban
Yes, other Hispanic Origin
(specify): $\qquad$
13. Patient's race (select one or more):
$\square$ White $\quad \square$ Black or African American
$\square$ American Indian or Alaska Native
(specify tribes)):
$\square$ Asian Indian $\square$ Japanese
$\square$ Other Asian (specify)
Korean $\quad \square$ Vietnamese
$\qquad$ $\square$ Samoan $\quad \square$ Guamanian or Chamorro Other Pacific 1
$\square$ Other (specify):

14. Was birth control being used at the time patient became pregnant? $\square$ Yes W No $\square$ Unknown If yes, specify methods) below (check all that apply):
$\square$ Birth Control Pill $\square$ Hormone Implant $\square$ IUD/IUC
 $\square$ Non-surgical sterilization; egg., Essure $\square$ Emergency Contraception $\square$ Contraceptive Injection; egg., Depo-Provera $\square$ Other (specify):

15. Name of facility where termination occurred
16. Location of termination: $\qquad$

17. Primary procedure that terminated this pregnancy (check only one):
$\square$ Suction Curettage $\quad$ Medical - Mifepristone $\quad \square \varnothing$ the medical (Nonsurgical); specify medications):
$\square$ Dilation and Evacuation (D \& E) $\square$ Vaginal Prostagiandin $\quad \square$ Sharp Curettage (D \& C) $\quad \square$ Hysterotomy/Hysterectomy $\square$ Other (specify):
8. Other procedures used for this termination (check all that apply):
$\square$ Suction Curettage $\quad \square$ Medical - Mifepristone $\quad \square$ Other medical (Nonsurgical); specify medications): $\square$ Dilation and Evacuation (D \& E) $\quad$ Vaginal Prostaglandin $\quad \square$ Sharp Curettage (D \& C) $\quad \square$ Hysterotomy/Hysterectomy $\square$ None $\quad \square$ Other (specify): 9. Was follow-up visit recommended? $\square$ Yes $\square$ No 20. Was post-operative/after-care information provided? $\square$ Yes $\square$ No

1. Were there complications at the time of the procedure? $\quad$ Yes $\quad \square$ No
If yes, specify complications (check all that apply):

| $\square$ Hemorrhage | $\square$ Infection | $\square$ Uterine perforation | $\square$ Cervical laceration |
| :--- | :--- | :--- | :--- |
| $\square$ Retained products | $\square$ Failure of first method | $\square$ Other (specify): |  |

22. At time of completion of this report, had follow-up visit occurred at this facility? $\square$ Yes $\square$ No $\square$ Unknown If yes, specify complications (check all that apply):
22a. Complications:

23. At time of completion of this report, had follow-up visit occurred outside this facility? $\quad$ Yes $\quad \square$ No $\quad \square$ Unknown

If yes, specify location of follow-up visit AND specify complications (check all that apply):
23a. Type of location of follow-up visit:

| $\square$ Physician's Office | $\square$ Clinic $\quad \square$ Hospital | $\square$ Unknown | $\square$ Other (specify): |
| :--- | :--- | :--- | :--- |
| 23b. Complications: |  |  |  |
| $\square$ None $\quad \square$ Hemorrhage | $\square$ Infection | $\square$ Uterine perforation $\quad \square$ Cervical laceration |  |
| $\square$ Retained products | $\square$ Failure of first method | $\square$ Unknown $\quad \square$ Other (specify): |  |

PLEASE COMPLETE THIS FORM NO SOONER THAN 2 WEEKS FOLLOWING THE DATE OF TERMINATION. FORM MUST BE SUBMITTED NO LATER THAN 30 DAYS FOLLOWING THE DATE OF TERMINATION OF PREGNANCY.

## Appendix D: Sample form - Application, License, and Record of Marriage

|  | ORS.432.010 required statistical information: The information below will not appear on the certified copies of the record. |  |  |  |  |

Local file number
Declaration of Oregon Registered Domestic Partnership
This declaration of domestic partnership must be registered with an Oregon county clerk to be valid.

The information below is optional and will not appear on certified copies of the RECORD.

## Appendix D: Sample form - Record of Dissolution of Marriage, Annulment or Registered Domestic Partnership

Heazlth Center for Health Statistics

## RECORD OF DISSOLUTION OF MARRIAGE, ANNULMENT OR REGISTERED DOMESTIC PARTNERSHIP <br> 136 <br> State file number

## Do you want Oregon's most Up-to-date info available from the

## Center for Health Statistics?

## On the web you can find the most recent data available both preliminary and final tables.

## Check out our

 websitehttp://public.health.oregon.gov/BIRTHDEATHCERTIFICATES/ VITALSTATISTICS/Pages/index.aspx

## Vital Reports Data

Births Adequacy of prenatal care *Final method of delivery by facility
Deaths Manner of death
*Age of decedent by county and ZIP code
Teen Pregnancy rates by county of residence
Pregnancy *Rolling pregnancy rate for past 12 months by county of residence
*These reports (and many others) available only online.

Individual tables and chapters of the annual reports, county data book and survey data are made available on the Web as soon as finalized. The complete report usually takes much longer to publish. Making the data available online increases the timeliness and decreases the cost of publications.

[^0]:    * Provisional data.

    1 Rate per 1,000 population for live births, marriages and divorces.
    2 Ratio per 1,000 live births for births to unmarried mothers.

[^1]:    * Complete listings for years 1908-1944 can be found in annual reports before 2001.

    1 Rate per 1,000 population for live births, marriages and divorces.
    2 Ratio per 1,000 live births for births to unmarried mothers calculated excluding unknown marital status.

    - Data not available.

[^2]:    - Quantity is zero.

[^3]:    * All rates are per 1,000 female population within the specific age group.

    Births to mothers under 15 or over 44 are not included in total fertility rate.
    See Technical Notes section for the definition of 'total fertility rate.'

[^4]:    - Quantity is zero.
    N.S. $=$ Not stated.

[^5]:    Total 2015 Oregon occurrence births: 46,102

[^6]:    - Quantity is zero.
    N.S. = Not stated.

    1 Pregnancies include live births and induced abortions reported for Oregon residents.

    * Detailed reporting of small numbers may breach confidentiality.

[^7]:    * Data not available.

    1 Includes any race (1 or more) and ethnicity mention.
    NOTE: Before 1981, neither Hispanic race nor ethnicity were recorded. Between 1981 and 1988, Hispanic was recorded as a race category. Since 1989, Hispanic ethnicity has been recorded separately from race. For consistency, single mention race includes any ethnicity. In 2008, the method for collecting race/ethnicity data changed dramatically, see Appendix B for more details.

[^8]:    - Quantity is zero.

    See footnotes at end of table.

[^9]:    - Quantity is zero.

    1 Includes American Indian \& Alaskan Native.
    2 Includes Native Hawaiian \& Pacific Islander.
    3 NS indicates race not stated.
    4 Non-Hispanic, two or more mention race
    5 Includes any race.
    6 Includes any race (1 or more) and ethnicity mention. NOTE: Total births includes five unknown county of residence.

[^10]:    1 Percent of total live births where marital status is known.
    § Percent unmarried is significantly different from the state.
    WARNING: Rates/percentages based on less than five events are unreliable. NOTE: Rates/percentages are calculated excluding missing and unknown values.

[^11]:    - Quantity is zero.
    N.S. = Not stated.

[^12]:    - Quantity is zero.

[^13]:    * Quantity is zero.

    Detailed reporting of small numbers may breach confidentiality.

[^14]:    1 Less than five prenatal visits or care began in the third trimester.
    2 Includes any race (1 or more) and ethnicity mention.

[^15]:    - Quantity is zero.

    See footnotes at end of table.

[^16]:    - Quantity is zero.

    2 Hispanic includes any mention of race.
    3 Less than five prenatal visits or care began in the third trimester.
    4 Body Mass Index of greater than $25.0 \mathrm{~kg} / \mathrm{m}^{2}$.
    5 Born prior to 37 completed weeks of gestation.
    6 Birthweight of less than 1,500 grams ( 3 lb 4 oz ).
    7 Birthweight of less than 2,500 grams ( 5 lb 8 oz ).
    8 Birthweight of more than 4,000 grams ( 8 lb 13 oz ).

[^17]:    - Quantity is zero.

    1 Includes any race (1 or more) and ethnicity mention.
    2 Hispanic includes any mention of race.
    3 Less than five prenatal visits or care began in the third trimester.
    4 Body Mass Index of greater than $25.0 \mathrm{~kg} / \mathrm{m}^{2}$.
    5 Born prior to 37 completed weeks of gestation.
    6 Birthweight of less than 1,500 grams ( 3 lb 4 oz ).
    7 Birthweight of less than 2,500 grams ( 5 lb 8 oz ).
    8 Birthweight of more than 4,000 grams ( 8 lb 13 oz ).

[^18]:    NOTE: Rates and percentages are calculated excluding missing and unknown values.

[^19]:    - Quantity is zero.

    1 Total includes mothers with unstated race/ethnicity.
    2 Hispanic includes any race.
    3 Gestation less than 37 completed weeks.
    4 Includes pregnancies resulting from fertility enhancing drugs and/or assisted reproductive technology.
    5 Includes any race (1 or more) and ethnicity mention. NS = Not stated.

[^20]:    Quantity is zero.
    Includes any race (1 or more) and ethnicity mention.

[^21]:    - Quantity is zero.

    1 Expressed in complete weeks.
    2 Non-Hispanic single mention race and Hispanic ethnicity.
    3 The subtotals for gestation period may not add to the total because of births of unknown gestation periods.

[^22]:    1 Quantity is zero.
    1 Expressed in complete weeks.
    2 Non-Hispanic single mention race and Hispanic ethnicity.
    3 The subtotals for gestation period may not add to the total because of births of unknown gestation periods.
    NOTE: Rates and percentages are calculated excluding missing and unknown values.

[^23]:    - Quantity is zero.

    1 For single mention race, Hispanic includes any race.
    2 Includes any race (1 or more) and ethnicity mention. NS = Not stated.

[^24]:    - Quantity is zero.

    1 Total includes mothers with unstated age.
    NOTE: More than one type of malformation may be reported for a given birth.

[^25]:    - Quantity is zero.

    For planned hospital births, actual attendant type is used. For planned out-of-hospital births with intrapartum transfer to hospitals, planned attendant type is reported by mother and not verified.
    2 Total includes 111 births that occurred en route, were unplanned home deliveries, or were other out-of-hospital births not otherwise classified.
    3 Includes reported clinical estimate of gestation in completed weeks and missing or unknown gestations.

[^26]:    - Quantity is zero.

    1 Total includes 111 births that occurred en route, were unplanned home deliveries, or other out-of-hospital births not otherwise classified. Total also includes 26 births with unknown gestation.
    2 Non-Hispanic single mention race. The Hispanic category may include any mention of race
    3 Expected principal method of payment for delivery. Actual method of payment may differ.
    4 Adequate care: Care that began in the first or second trimester and included at least five visits. Inadequate care: No care, or care that began in the third trimester or fewer than five visits.

[^27]:    - Quantity is zero.

    1 Total includes 111 births that were unplanned home deliveries, occurred en route, or were out-of-hospital births not otherwise classified. Total also includes 26 births with unknown gestation.
    2 Rupture of the membranes $\geq 12$ hours.
    3 Precipitous labor < 3 hours.
    4 Prolonged labor $\geq 20$ hours.
    5 Vaginal birth after a cesarean section.

[^28]:    * Quantity is zero.

    Detailed reporting of small numbers may breach confidentiality.

[^29]:    * The increase in the 1980 total reflects improved reporting rather than an increase in the number of abortions performed. Approximately 1,000-1,400 of the abortions were performed by providers who did not participate in the voluntary abortion reporting system prior to 1980 even though they performed abortions in previous years.
    **The increase in the 1984 total is probably a consequence of the implementation of ORS 435.496, which requires that an induced termination of pregnancy report be filed by abortion providers whenever an induced abortion is performed.

[^30]:    - Quantity is zero.

    1 Reported complications. Categorized as none if no specific complication was reported
    2 Patients having more than one complication are listed here. Their individual complications are not listed above.

[^31]:    - Quantity is zero.
    N.S. $=$ Not stated.

    1 Rows will not add to total due to some patients having an unknown number of children.

[^32]:    - Quantity is zero. N.S. $=$ Not stated.
    * Detailed reporting of small numbers may breach confidentiality.

[^33]:    1 Pregnancy estimates are based on the total number of births and abortions.
    See footnote (2) on the next page regarding changes in estimating abortions.
    All rates are per 1,000 females.
    NA = Not Available

[^34]:    2 Abortion estimates are based on reports for Oregon residents whether occurring in Oregon or another state. For years prior to 1985 (and in 1986-1987) abortion estimates were based on Oregon occurrences only, but included abortions obtained by out-of-state residents. Because some neighboring states do not report abortions to the state of residence (especially California), this results in minimal estimates for both abortions and pregnancies.
    NA = Not Available
    All rates are per 1,000 females.

[^35]:    - Quantity is zero.

    1 All rates per 1,000 females.
    2 Total includes three abortions where county of residence was unknown.
    § Abortion rate is significantly different from the state.
    Detailed reporting of small numbers may breach confidentiality.
    WARNING: Rates based on less than five events are unreliable.
    NOTE: Includes abortions obtained out-of-state by Oregon residents. Because some states (e.g., California) do not record data on residence for abortion patients, not all out-of-state abortions are included.

[^36]:    - Quantity is zero.

    1 Less than five prenatal visits or care began in the third trimester.
    2 Total includes cases with unknown birthweight.
    3 Hispanic ethnicity includes any race.
    4 Includes any race (1 or more) and ethnicity mention.

[^37]:    - Quantity is zero.

    1 The subtotals of an age group may not add to the total for that age group because of unstated characteristics such as marital status or race/ethnicity.
    2 All rates per 1,000 births.
    3 Less than five prenatal visits or care began in the third trimester.
    4 Includes Asian, Native Hawaiian and Pacific Islander.
    5 Includes any race.
    6 Includes any race (1 or more) and ethnicity mention.
    WARNING: Rates based on less than five events are unreliable.
    NOTE: Rates and percentages are calculated excluding missing and unknown values.

[^38]:    - Quantity is zero.

    1 The birthweight was unknown for ten infants.
    2 Less than five prenatal visits or care began in the third trimester.
    3 Prenatal care began prior to the third trimester; patient made at least five visits to a medical provider. N.S. $=$ Not stated.

[^39]:    - Quantity is zero.

    1 Includes all abortions known to have been obtained by Oregon residents.
    2 Includes Chinese, Japanese, Filipino, other Asian and Pacific Islander. N.S. $=$ Not stated.

[^40]:    - Quantity is zero.

[^41]:    Total number of first time abortions $=$ among a specific cohort of females

    Number of females in cohort
