	Trends:							
	We saw corn coming in with low protein in the range of 6.5-7%. Firms were slow to compensate in formulation. There was also a shift in Phosphorus levels, likely in dical. Selenium continues to run much higher than label guarantees. The screening for heavymetals on 20% of the samples is showing an occasional spike of cobalt in the premixes that was unexpected, but not beyond safe levels.							
	Root Cause on a lot of these is the formulation computer is overvaluing the nutrients in ingredients -or- the tag and formula have not been reconciled as required by GMP's. Recommend renewal forms for 2013 include the following affidavit: I declare the enclosed labels are true copies of those being used in trade in Oregon. I declare all formula's have been compared to their corresponding labels and accurately reflect the ingredients used and intended nutrient content.
