

OREGON DEPARTMENT OF AGRICULTURE CURRENT CRAB BIOTOXIN LAB RESULTS

The data below contain recent crab biotoxin data. Crab are much more susceptible to taking up Domoic Acid (DA) than Paralytic Shellfish Toxin (PST). Domoic Acid (DA) is measured in parts per million (ppm). The closure limit for DA in crab viscera (guts or “butter”) is 30 ppm, and the closure limit for crab meat is 20 ppm. Results in **RED** are above the closure limit for recreational and commercial harvesting. The coast is divided into 12 zones, A through L, which are defined in the table below. If one zone has a domoic acid result above the limit, the two adjacent zones (one north and one south) will also be closed. This is because crab are highly mobile and can travel fast. ODA and ODFW may re-open recreational harvesting in a zone if two consecutive sets of crab samples, at least one week apart, both have lab results below the closure limit and the lab results from the adjacent zones are also below the limit. Please see the Biotoxin Map on our website for recreational shellfish closure areas.
