FOOD CODE, OAR 603-25-0030, CHAPTER 6-202.15

A Pest Control Plan must be approved by Oregon Department of Agriculture prior to allowing open-air dining. The plan must include procedures that designate specific job positions such as the PIC to routinely monitor for animal activity when there is unprotected open-air dining.

PUBLIC HEALTH REASONS:

Animals carry disease-causing organisms and can transmit pathogens to humans through direct or indirect contamination of food and food contact surfaces. Animals may deposit liquid or fecal waste, creating a need for vigilance in monitoring animal activity and vigilance in frequent and vigorous cleaning.

Open-air dining increases the likelihood of animals and insects getting into the facility. A pest control plan with specific procedures of how to monitor and respond to any animal/insect activity is necessary to reduce the contamination of food. The plan should include a designated person at specific time periods to monitor and evaluate the dining room, food preparation and food storage areas for animal or insect activity inside the facility. Excluding animals/insects from getting into the facility is one of the critical factors to preventing food contamination and foodborne illness from occurring in your facility.

Pest Control Plans

Open-air dining is popular during warmer months. In the past it has been limited to outside seating on sidewalks and patios; however, some restaurants have put in large windows and walls that can be opened to the outdoors. While this

taminated food. The operator will also need to have the capacity to clean and sanitize any contaminated utensils, equipment, and any other food contact surfaces.

As the person in charge of the food establishment, it is your responsibility to keep pests out of the facility. When you find a problem, you are responsible to take care of it immediately. Do not wait for the food safety inspector to find the pest problem.

In creating the Pest Control Plan, you should consider:

- How are you going to protect food during preparation?
- How often will you evaluate all the food preparation areas and food storage areas for pest activity?
- What kind of cleaning schedule will you provide to prevent the collection of food debris throughout the facility?
- What are you going to do when flying insects, birds or rats gets into the facility?
- How are you going to inspect the facility for pests and how often?
- Who are you going to call to eliminate the problem?

may be popular with customers, it does present the operator potential problems with pests that will at some point become a reality. The Oregon Food Code 6-202.15 allows for outer openings that are protected with screens or air curtains to prevent flies, rodents, birds and other pest from coming inside.

Food establishments may provide open-air dining via unprotected outer openings if the facility has a pest control plan that has been approved by the Oregon Department of Agriculture and insects and rodents are not present in the facility. When pests are found in the facility, the operator must have the capability to close all openings to the outside and to take action to eliminate the pests and any con-
