August 2018

With Appreciation: The 2016 Oregon Traffic Crash Summary is dedicated to outgoing Transportation Data Section Manager, David Ringeisen, who retired in June 2017. This report is a reflection of Dave's 38 years of service to the agency, and more than 36 years working to improve ODOT's data and information products and services. We will miss Dave's vision, collaborative approach, and commitment to public service, and will strive to carry on his legacy of excellence. Thank you, Dave.

The Crash Analysis and Reporting Unit collects data and publishes statistics for reported motor vehicle traffic crashes per ORS 802.050(2) and 802.220(6). The data supports various local, county, and state traffic safety programs; engineering and planning projects; legislative concepts; and law enforcement services.

Legally reportable motor vehicle traffic crashes are those involving death, bodily injury, or damage to personal property in excess of \$500 (for crashes that occurred prior to 9/01/1997) or \$1,000 (for crashes that occurred between 9/01/1997 and 12/31/2003). As of January 1, 2004, drivers are required to file an Accident and Insurance Report Form with DMV within 72 hours when: injury or death resulted from the accident; damage to the driver's vehicle is over \$1,500; damage to any vehicle is over \$1,500 *and* any vehicle is towed from the scene as a result of said damage; or damage to any one person's property, other than a vehicle involved in the accident, is over \$1,500. As of 01/01/2018, the damage threshold was raised to \$2,500. For more information on filing requirements, please contact DMV at www.oregon.gov/odot/dmv.

Disclaimers: The Crash Analysis and Reporting Unit is committed to providing the highest quality crash data to customers. However, because submittal of crash report forms is the responsibility of the individual driver, the Crash Analysis and Reporting Unit cannot guarantee that all qualifying crashes are represented; nor can assurances be made that all details pertaining to a single crash are accurate.

INTRODUCTION

The State Highway Crash Rate Tables are published annually, to assist readers in computing crash rates for specific sections of Oregon mainline state highways. This publication is presented in four parts:

- I. Results of Analysis
- II. State Highway Crash Rates
- III. Statewide Fatal Traffic Crash Tables
- IV. Appendix

Part I, Results of Analysis, compares Oregon and national fatality rates per traveled miles and population. Table II summarizes state highway crash rates by functional classification for the past five years. Table III compares rates for freeways and non-freeways, for the past two years. Table IV lists crash and fatality counts and rates by functional classification for the most recent year. Table V lists fatal and serious injury data by functional classification. This section also contains cross-references tables of Route Numbers to ODOT State Highway Index Numbers.

Part II, State Highway Crash Rates, reports five years of crash rates for individual highways. Highways are divided into urban and rural sections based on federal aid urban boundaries and city limits. Sub-sections are defined by a starting milepoint and the segment length in hundredths of a mile. Crash counts and annual average daily traffic is provided for the most recent year, and rates for the previous four years are included for each segment.

Part III, Statewide Fatal Traffic Crash Tables, reports fatal crashes and fatalities for the current year by roadway system, jurisdiction, crash type, and traffic conditions.

Part IV, Appendix, contains a glossary of terms used in this publication.

The Oregon Department of Transportation began summarizing traffic crash data in 1941 and began publishing the results in 1948. The coding of traffic crash data is guided by the Crash Analysis and Reporting Unit's "Motor Vehicle Traffic Crash Analysis and Code Manual", and the American National Standards Institute Manual on Classification of Motor Vehicle Traffic Accidents (ANSI D16.1 – 2007), published by the National Safety Council.

PART I

RESULTS OF ANALYSIS

FACTS OF INTEREST

The State Highway System accounted for 21,369,834,896 vehicle miles traveled (VMT) during 2016, which is up 3.33% from the 2015 state highway VMT of 20,680,198,497. These are unofficial numbers from the highway inventory used for crash coding, and updated AADTs. For official state highway VMT, refer to the annual Transportation Volume Tables publication.

There were 261 fatal *crashes* on the state highway system during 2016 (including crashes on highway ramps, connections, and frontage roads). This is up 20.28% from the number of fatal *crashes* for 2015. There were 300 *fatalities* on the state highway system during 2016. This is an increase of 25.52% from 239 *fatalities* during 2015.

There were 1.68 crashes per million vehicle miles traveled on mainline highways classified as “Non-Freeway” during 2016. This is 2.85 times higher than the “Interstate Freeway” crash rate of 0.59, and 1.60 times higher than the crash rate of 1.05 for “Other Freeways and Expressways”. The difference between non-freeway and freeway crash rates indicates that freeway travel is safer.

The USDOT reports that 37,461 people were killed in traffic crashes nationwide during 2016. This is up 5.57% from the final 2015 national death toll of 35,485. In Oregon traffic crashes statewide, 498 people were killed during 2016. This is up 11.91% from Oregon’s 2015 death toll of 445.

TABLE I: MOTOR VEHICLE TRAFFIC AND POPULATION FATALITY RATES, 1986 - 2016
OREGON and NATIONAL

Table I compares Oregon and national traffic fatality rates based on vehicle miles traveled and on population. The figures shown are estimates from state traffic authorities, the U.S. Census Bureau, and the Federal Highway Administration. Fatality rates are calculated using adjusted vehicle miles traveled (VMT) to account for mileage from county roads and city streets. They are not comparable to the rates shown on Table IV, which reports data for the state highway system only and excludes county roads, city streets, connections and frontage roads.

PART II

STATE HIGHWAY CRASH RATES

COMMENTS

CRASH RATE FORMULA

The State Highway Rate Section reports crash rates for mainline state highways. The **crash rate** is the number of crashes per million vehicle miles traveled (VMT). VMT is calculated by multiplying the highway segment length, annual average daily traffic for the segment, and the number of days the segment was open for travel. Crash rates are calculated using either of the following formulas, where:

- **CRASHES** = the number of crashes that occurred on the given highway segment,
- **SEGMENT LENGTH** = the distance between the segment's beginning and ending milepoint, to the nearest one-hundredth of a mile,
- **AADT** = the annual average daily traffic for the highway segment, and
- **DAYS OPEN** = the number of days the highway segment was open for travel for the year, i.e., 365

$$\frac{\text{Crashes} * 1,000,000}{\text{Segment Length} * \text{AADT} * \text{Days Open}} \quad \text{or} \quad \frac{\text{Crashes} * 1,000,000}{\text{VMT}}$$

When comparing crash rates, choose highways with the same functional classification, jurisdiction (see next page), and similar traffic volume. To identify a highway segment's functional classification, refer to the report titled *Functional Classification and NHS on Oregon State Highways*, published by the ODOT Road Inventory and Classification Services (RICS) Unit, and available on their web page at

<http://www.oregon.gov/ODOT/TD/TDATA/Pages/rics/FunctionalClassification.aspx>

Refer to Rate Table II (page 7) to find the statewide average rates for similar highways.

SEGMENTS CONTAINING COUPLETS

Some highway segments contain couplets. A **couplet** is defined as the two roadways of a divided highway, usually named differently, bearing the same highway number, running approximately parallel to each other, providing for traffic flow in opposite directions, and separated by accessible land. The roadway that bears traffic in the direction of **increasing milepoints** is considered to be the **add mileage** side of the highway. The roadway that bears traffic in the opposite direction is the **non-add mileage** side of the highway.

In this publication, couplets are identified by a directional abbreviation at the end of the segment description, indicating the direction of vehicle travel on that side of the couplet (NBD for northbound, EBD for eastbound, SBD for southbound, WBD for westbound).

The **non-add mileage** side of the couplet is indicated by the letters "**CP**" to the left of the segment length ("Miles").

When summarizing AADT for a group of highway segments (i.e. section totals),

the couplet's non-add mileage is included in the calculation of weighted average AADT. However, the couplet's non-add mileage **is not used** for calculating the section's **total miles**. "Total miles" represent add mileage only. Crash totals represent crashes from **both** sides of the couplet.

SEGMENT CRASH COUNTS

Crashes are attributed to highway segments based on the beginning ("start") milepoint of the segment. Crashes that occur at a segment's end milepoint are attributed to the following segment, which begins with the same milepoint. The exceptions are ending segments of the **non-add** side of a couplet, Z mileage end segments, segments that end state jurisdiction of a highway, and the final end segment of each highway.

A blank in the "Crash" column means no crashes were recorded for that segment during the given data year.

Crashes that occurred at indeterminate ("unknown") milepoints within an urban or rural area are included in the summary for each highway.

EQUATIONS AND OVERLAPPING ('Z') MILEAGE

Milepoint equations are used to indicate the loss of mileage in areas where a highway was shortened due to realignment, somewhere other than at the beginning or ending milepoint of the highway. When the "Miles" column displays a number that is less than the difference between the segment's start and end milepoint, one or more milepoint equations exist in that milepoint range. See Highway 33, milepoint range 23.18 to 34.35.

Overlapping mileage, also known as 'Z' mileage, is created when a highway is lengthened due to realignment, somewhere other than at the beginning or ending milepoint of the highway. Segment lengths that display a higher number in the "Miles" column than is calculated by subtracting the start milepoint from the end milepoint, are indicative of the existence of 'Z' mileage in that milepoint range, or some combination of equations and 'Z' mileage. For example, see Highway 33, milepoint range 39.39 to 44.57.

JURISDICTION

Section breaks occur at Federal Aid Urban Transportation Boundaries (FAUB), and when entering or exiting city limits. This results in the following four jurisdictions for the purpose of this publication:

- **URBAN CITY:** segment occurs at or inside urban transportation boundary, and at or inside city limits.
- **SUBURBAN AREA:** segment occurs at or inside urban transportation boundary, but outside city limits.
- **RURAL CITY:** segment occurs outside urban transportation boundary, but inside city limits.
- **RURAL AREA:** segment occurs outside urban transportation boundary and outside city limits.

Data for these areas are summarized for each highway, as are crashes that occurred at indeterminate ("unknown") milepoints within an urban or rural area.

PART IV

APPENDIX

GLOSSARY

A

AADT

Annual average daily traffic is the total volume of vehicle traffic for a given highway segment and year.

Add Mileage

The term "add-mileage" generally applies to the roadway that carries milepoints that have increasing values in the direction of travel. The term originated from the fact that the direction of increasing milepoints is used for mileage summarization, whereas separate roadways mileposted in the opposite direction are not counted in totals. The Pacific Highway 1, Interstate 5, is the only exception in that the add-mileage is accumulated in the direction of decreasing milepoints.

Alignment

The horizontal and vertical control of a section of roadway or other transportation facility (e.g. multi-use paths, railway, etc.).

At Grade

Used to represent that a feature and a roadway meet at the same elevation.

B

Beginning Milepoint

The milepoint notation, to the nearest 0.01 mile, that describes the location of the beginning of a linear feature or attribute

C

Common Alignment

Any length of roadway upon which more than one state highway is designated.

Connection

A street or road, open to vehicular travel, which joins a road from the State of Oregon Highway System to any other road, entity, or another state owned road. A connection is usually much shorter than a spur or frontage road.

Couplet

The two roadways of a divided highway, named differently, approximately parallel with traffic flow in opposite directions and separated by accessible land uses. In I.T.I.S. all couplets are divided highways.

GLOSSARY

CP

Non-add mileage side of couplet.

Crash

Any motor vehicle collision or non-collision event which results in a fatality, bodily injury, or damage to a person's property. Crashes that are considered "reportable" for the purposes of ODOT's Statewide Crash Data System must meet the criteria described on the initial page of this publication.

E

EBD

Eastbound direction of travel

ECL

East city limits

Ending Milepoint

The milepoint notation, to the nearest 0.01 mile, that describes the location of the end of a linear feature or attribute

F

FHWA

Federal Highway Administration

Freeway

State highway which meets federal freeway standards

Frontage Road

A road secondary to and generally parallel to a highway, providing service to abutting property and adjacent areas and for control of access. A frontage road may or may not be directly connected to the highway it services.

Functional Classification

The federal system by which roads are grouped into functional systems according to the type of service and amount of traffic the facility carries. This system determines the level of federal funding available for maintenance and improvements. Federal functional classification is determined using federal guidelines and is approved by FHWA.

GLOSSARY

H

Highway

Every public way, road, street, thoroughfare and place, including bridges, viaducts and other structures within the boundaries of this state, open for use of the general public for vehicles or vehicular traffic as a matter of right. Some highways are designated by the Oregon Transportation Commission as State Highways. Refer to the definition of "State Highway" for more information.

Highway Number

See State Highway Index Number.

Hwy

State Highway

I

INT

Interchange

Interchange

A system of interconnecting roadways and structures in conjunction with one or more grade separations that provides for the movement of traffic between two or more roadways on different levels.

Intersection

The area where two or more roadways join or cross at the same elevation.

Interstate Route

A route system that consists of all presently designated freeway routes meeting the Interstate geometric and construction standards for future traffic, except for portions in Alaska and Puerto Rico. The interstate System is the highest classification of arterial roads and streets, and provides the highest level of mobility, at the highest speed, for a long uninterrupted distance. This system is intended for through traffic, has full access control, and has grade separations at major intersections. Interstate Routes are signed routes. All Interstate Routes are state highways.
