<sup>1</sup> The distinction between deaths classified to mental and behavioral disorders due to psychoactive substance use versus injury deaths is somewhat factitious. For example, deaths attributed to drug toxicity are classified to the former category while deaths attributed to poisoning are classified as injury deaths. If the certifying physician notes that a death is due to chronic drug abuse, then the death is classified to mental/behavioral disorders, but this may not be done in all applicable cases.

<sup>2</sup> Most deaths involving abusive alcohol use are attributed to other organ systems (e.g., alcoholic cirrhosis of the liver). See "Alcohol-induced deaths" under "Mental Disorders (F01-F99)" in Table 6-6 for a more inclusive count. Note that this figure, too, is an undercount, as it does not include injury deaths in which alcohol played a critical role (e.g., motor vehicle crashes, homicides).

<sup>3</sup> Most deaths resulting from tobacco use were attributed to other organ systems (e.g., lung cancer, emphysema, heart disease). See Tables 6-17 through 6-19 for a more complete account of tobacco-linked deaths.

<sup>4</sup> Including other drugs acting on the autonomic nervous system.

<sup>5</sup> Includes deaths resulting from poisoning from multiple substances in more than one category.

<sup>6</sup> HC = hydrocarbons.

<sup>7</sup> Hispanic decedents may be of any race; most were white.

— Quantity is zero.
