Executive summary

2016 program highlights

Oregon’s surveillance for West Nile virus (WNV) in 2016 identified the following:

- 4 human cases
- 6 equine cases
- 12 avian cases
- 51 positive mosquito pools

Figure 1. Number of positive WNV tests, Oregon, 2016

Introduction

Oregon's surveillance program for West Nile virus (WNV) was launched in 2001. The virus was first identified in humans, birds and horses in Oregon in 2004. Our peak year followed two years later when 73 human cases were reported.

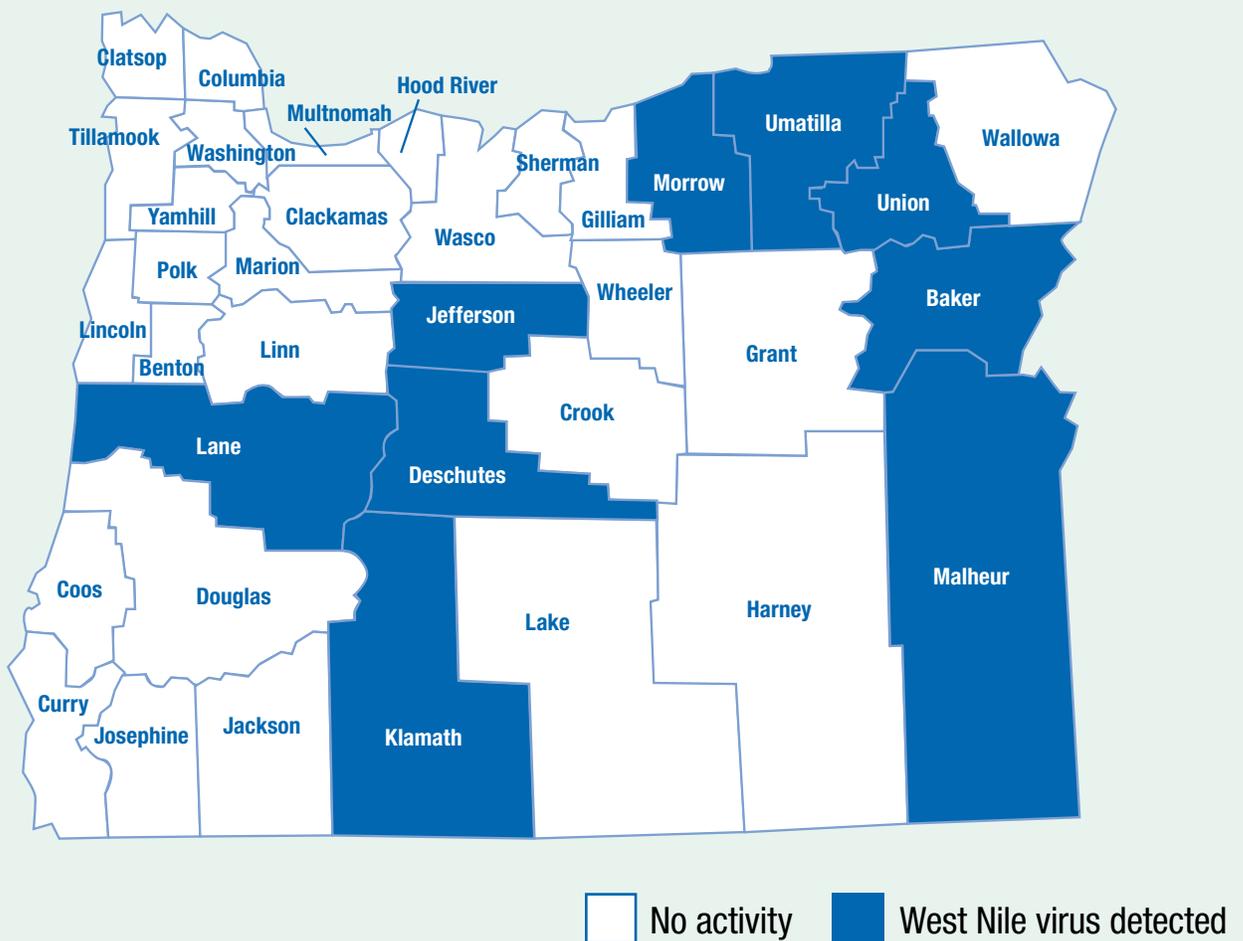

Incidence of human WNV disease remained low in Oregon in 2016. Four human cases, 12 birds, six horses and 51 mosquito pools tested positive for WNV in 2016.

Thirteen vector control districts (VCDs) collect, identify and test mosquitoes and dead birds for WNV surveillance (Figure 4). Some VCDs conduct initial WNV tests for mosquito pools and dead birds using the Rapid Analyte Measurement Platform (RAMP). The Oregon State Public Health Laboratory (OSPHL) performs confirmatory testing of WNV for human specimens. Oregon State University's (OSU's) Veterinary Diagnostic Laboratory performs WNV testing of mosquitoes, dead birds, horses and other mammals.

The following sections summarize Oregon WNV surveillance findings for humans, horses, birds and mosquitoes in 2016.

Figure 2. Map of Oregon with shaded counties reporting WNV, 2016

County	Mosquitoes	Birds	Horses	Human
Umatilla	34	0	3	0

Total	51	12	6	4

See <https://public.health.oregon.gov/DiseasesConditions/DiseasesAZ/Pages/disease.aspx?did=8> for more information about West Nile virus.

WNV surveillance and related activities

Human surveillance

In 2016, four Oregon residents tested positive for WNV by immunoglobulin M (IgM) antibody; one had neuroinvasive disease. Illnesses related to neuroinvasive disease are usually characterized by the acute onset of fever with stiff neck, altered mental status, seizures, limb weakness, cerebrospinal fluid (CSF) pleocytosis or abnormal neuroimaging. Acute flaccid paralysis (AFP) may result from anterior (“polio”) myelitis, peripheral neuritis or post-infectious peripheral demyelinating neuropathy (i.e., Guillain-Barré syndrome). Less common neurological manifestations, such as cranial nerve palsies, also occur.

Table 2. Trend data for Oregon residents who contracted WNV in Oregon, 2004–2016

Year	All cases	Neuroinvasive	Deaths
2004	5	0	0
2005	8	1	0
2006	73	13	1
2007	27	7	1
2008	15	3	0
2009	12	0	0
2010	0	0	0
2011	0	0	0
2012	12	1	0
2013	16	8	0
2014	8	2	0
2015	1	0	0
2016	4	1	0
TOTAL	181	36	2

Veterinary surveillance

WNV surveillance in Oregon’s equine population resulted in six positive tests. Positive test results by county are summarized in Table 3. No other mammals tested positive for WNV in 2016.

Table 3. Positive equine WNV test results, Oregon, 2016

County	Horses tested for WNV	Horses with positive WNV test results
Benton	1	0
Clackamas	2	0

Avian surveillance

WNV surveillance in Oregon’s avian population resulted in 12 positive test results out of 44 birds tested by OSU’s Veterinary Diagnostic Laboratory and the VCDs. Of the 44 birds collected, 30 were of the family Corvidae (a.k.a. corvids), while the remaining 14 were American species other than corvid. Table 4 shows Oregon’s avian species collection totals by county for 2016. Trend data for avian WNV testing and positive test results for Oregon counties for the years 2004–2016 are presented in Table 5.

Table 4. Avian WNV test results by county, Oregon, 2016

Sentinel chicken surveillance

Sentinel chicken surveillance was discontinued in 2011.

Mosquito surveillance

In 2016, the VCDs conducted WNV surveillance in Oregon's mosquito population. Figure 4, page 10 shows the counties with participating VCDs and their activities. Statewide, 159,847 mosquitoes were sampled (see Table 7, page 7). Of those, 108,174 mosquitoes in 3,071 mosquito pools were tested for WNV (see Table 8, page 7). The tested mosquitoes comprise 29 mosquito species. OSU conducted polymerase chain reaction (PCR) testing, and some VCDs performed RAMP. Table 6 below displays the number of Oregon mosquito pools by species that tested positive for WNV in 2016. Table 9, page 8 displays Oregon mosquito species between 2004 and 2016 found positive for WNV. Figure 3, page 9 indicates the efficiency of vector transmission for various mosquito species (information obtained from the Centers for Disease Control and Prevention).

Distribution and bionomics based on and generalized from information in Carpenter and LaCasse (1955), Darsie and Ward (1981), and Moore et al. (1993).

^a Known association with other viruses with a similar transmission cycle. EEE, eastern equine encephalomyelitis virus; JE; Japanese encephalitis virus; SLE; St. Louis encephalitis virus; WEE; western equine encephalomyelitis virus. Based on Karabatsos (1985).

^b Efficiency with which this species is able to transmit WNV in the laboratory. 0, incompetent; +, inefficient; +++++, extremely efficient vector. Based on 1 (Turell et al. 2000), 2 (Sardelis and Turell 2001), 3 (Turell et al. 2001), 4 (Sardelis et al. 2001), 5 (Goddard et al. 2002), 6 (Sardelis et al. 2002), 7 (Turell et al. 2003), or 8 (present study).

^c Relative number of WNV-positive pools detected. 0, none; +, few; +++++, many.

^d Potential for this species to be an enzootic or maintenance vector based on virus isolations from the field, vector competence, feeding behavior, etc. 0, little to no risk; +++++, this species may play a major role.

^e Potential for this species to be an epizootic or bridge vector based on virus isolations from the field, vector competence, feeding behavior, etc. 0, little to no risk; +++++, this species may play a major role.

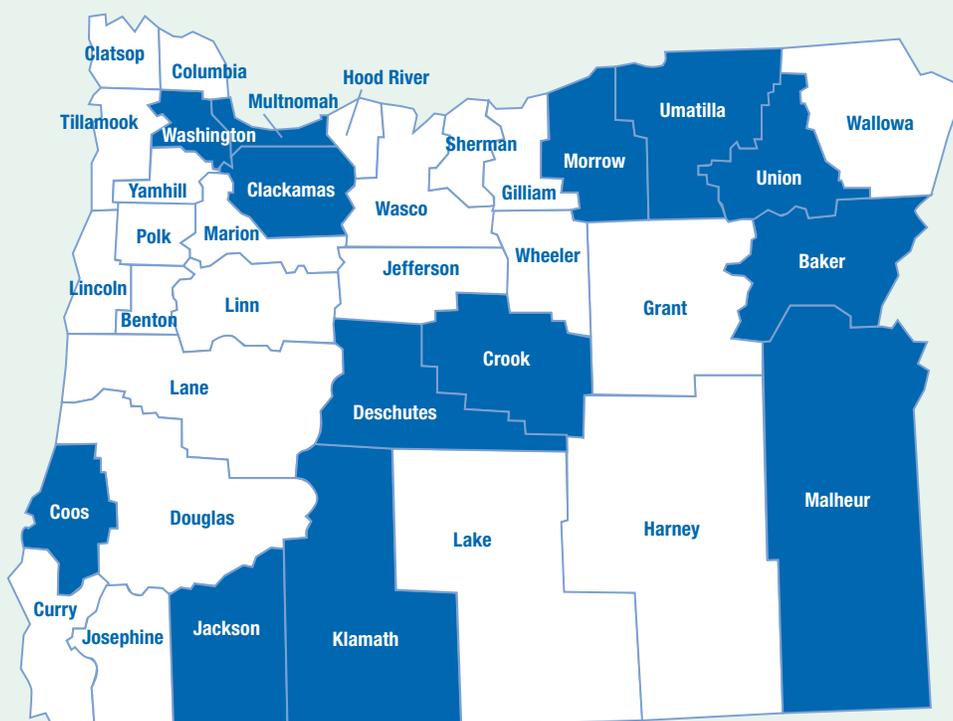

^f Feeds primarily on avian hosts in spring and early summer and mixed between avian and mammalian hosts in late summer and fall.

* Turell MJ, Dohm DJ, Sardelis MR, Oquinn ML, Andreadis DJ, Blow JA. An update on the potential of North American mosquitoes (Diptera: Culicidae) to transmit West Nile virus. J Med Entomol 2005; 42: 57–62. Used with permission.
