Appendix F: OREGON AVIATION PLAN (OAP) INDIVIDUAL REPORT

Airport Master Plan Update

Aurora State Airport

Chapter 1 Introduction

The state of Oregon has an extensive aviation system spread throughout the state, providing valuable transportation options for the public, which range from small emergency use airports in remote regions to the extensive passenger enplanements at Portland International. Managing such a large and diverse system of airports can be a daunting task if a comprehensive plan is not in place to serve as a guide. In addition, with the ever-increasing demands for project funding, it is imperative that the Oregon Department of Aviation (ODA) have a solid inventory, understanding of need, and plan for development for the entire state aviation system to meet the needs of existing and future development.

This report is a combination of three studies, which will guide the development of the aviation system in Oregon for years to come. This document is organized into three distinct sections. *Chapter Two* summarizes the overall study goals, roles, and methodologies used to develop the study. *Chapter Three* is a summary of the various inventory efforts associated with the individual airport facilities. *Chapter Four* contains specific roles, recommendations, and funding options for the airport. This report will provide each community with information, which can guide the development of each facility in an orderly, economic, and environmentally friendly manner.

Aurora State – Individual Airport Report
This Page Intentionally Left Blank

Chapter 2

The growing aviation demand in Oregon has prompted the Oregon Department of Aviation (ODA) to update the previous State Aviation System Plan published in 2000 and develop economic impact assessments that gauge the benefits of aviation to the state. Oregon is currently experiencing an unprecedented growth in population as well as aircraft operations. In order for the state to continue to provide a safe and efficient aviation system while accommodating growth, it is important to evaluate what facilities and capabilities are here today and what will be needed for tomorrow.

This chapter is organized into the following sections:

- 2.1 Oregon Aviation Plan 2007 (OAP 2007) Study Components
- 2.2 Overall Study Goals & Objectives
- 2.3 Airport Functional Roles
- 2.4 Performance Measures
- 2.5 Summary

2.1 Oregon Aviation Plan 2007 (OAP 2007) Study Components

Three unique studies were originally undertaken which resulted in the development of the *OAP 2007*. This included a traditional state aviation system plan update which was developed to meet Federal Aviation Administration (FAA) requirements. An economic impact study was completed to assess the economic value of the aviation system at the state and local levels. The state aviation master plan component evaluated airports not included within the traditional state system plan criteria, as well as evaluating additional areas of interest or special consideration topics. The aforementioned goals were originally distributed over these three separate studies as outlined above, however, since there were numerous commonalities between the studies, they were combined into a single report for greater ease of use. Additional detail on each of these three studies is listed below. The information contained in the *OAP 2007* is the compilation of information, findings, and recommendations for all three studies.

2.1.a State Aviation System Plan

The *OAP 2007* addresses many different issues related to each individual airport and regional and state aviation system components. It is important to have a comprehensive understanding of the existing facilities, the need for future facilities, and the feasibility of reaching future goals. A state aviation system plan update is based upon sound evaluation of existing facilities, coupled with a clear understanding of the state and nation aviation interests, as well as the needs of the general public. The methodology used to evaluate the state system is consistent with that advocated for use by the FAA in Advisory Circular (AC) 150/5070-7 — *The Airport System*

Planning Process, issued November 10, 2004. All 97 public-use airports are listed in **Table 2.1** – **Public-Use Airports in Oregon**. Their associated city, FAA classification, and their type of ownership are noted within the table.

The *OAP 2007* includes 66 public-use airports, which are part of the National Plan of Integrated Airport Systems (NPIAS). The study group of airports was based upon extensive coordination with the ODA and the FAA. The study group includes the 57 airports currently listed on the NPIAS, eight state-owned airports which serve either a recreational/tourism base or have more than two based aircraft, and one privately owned airport, which serves a significant number of based aircraft.

2.1.b State Aviation Master Plan

The state aviation master plan element of the *OAP 2007* was included to ensure a comprehensive evaluation of all public-use airports within Oregon and was funded independently by the ODA. There are an additional 31 public-use airports in Oregon that were not included in the federally funded state aviation system plan component (NPIAS). These airports were evaluated using the same methodology of the state aviation system plan to provide the ODA a complete inventory of the state's aviation system resources. In addition to the evaluation of individual airports, the state aviation master plan was designed to evaluate broader, more conceptual issues related to the entire state aviation system. The evaluation of these issues will help the ODA better manage and improve the state system of airports.

2.1.c State Aviation Economic Impact Study

With the movement towards a global economy, it is now recognized that airports are no longer just another mode of transportation. Airports are vital components of the economic engine that drives the state, regional, and local economic climate and it is essential the state system of airports support these economies by providing adequate facilities and services. This study will provide the ODA, individual communities, airports and governmental agencies, and politicians the opportunity to assess the economic value of the aviation system as a whole as well as each individual airport. All 97 public-use airports, as shown in **Table 2.1**, are included in the analysis.

Table 2.1 Public-Use Airports in Oregon

	<u> </u>		
Associated City	Airport Name	NPIAS Status	Ownership
Albany	Albany Municipal Airport	Yes	Publicly Owned
Alkali Lake	Alkali Lake State Airport	No	Publicly Owned

Waldport	Wakonda Beach State Airport	No	Publicly Owned
Wasco	Wasco State Airport	Yes	Publicly Owned

2.2 Overall Study Goals & Objectives

The primary goal of the three studies is to provide a comprehensive plan which addresses all public-use airports in the state of Oregon and which identifies how to improve individual airports as part of the larger state system, to meet the needs of tourism, economic development, and transportation services for each community and the state as a whole.

This information provides the framework that supports informed decisions related to planning and developing the Oregon aviation system. The objectives of these studies are to:

- Assess aviation facilities: including airside, landside, and ground facilities and services, and general aviation needs
- Assess the economic value of airport facilities to the host community as well as the overall importance to the state
- Provide guidance for the development of the Oregon system of airports to meet the state's future aviation needs to ensure the safety and efficiency of the state aviation system
- Enhance communication opportunities among ODA, airport sponsors, local government, other state and federal agencies, and airport users so that the future development of the state aviation system can be more readily accomplished
- Provide each airport the direction to develop their airport to meet the needs of the state aviation system and local community as well as promote the airport for the purposes of economic development and tourism

Each of these individual studies is a portion of the overall process necessary to create a systematic approach to meeting the improvements which are identified, as well as proposing development strategies. This report provides a summary of the results of three planning studies undertaken by ODA to assess the condition of the existing aviation infrastructure, the economic benefit of the aviation industry, and the passenger demands for air service.

2.3 Airport Functional Roles

Each airport in the state impacts the overall operational capacity and efficiency of the state aviation system by supporting different types and levels of aviation activity. The types of facilities and services that should be provided at each category of airport were determined throughout the development of this plan. Airport functional roles have been broken out into five categories and the following criteria were utilized to classify the airports:

- Current airport infrastructure, facilities, and services
- Aviation activity levels and type of aviation demand served
- Ability to accommodate future growth
- · Accessibility and geographic service area

The five airport functional roles are defined on the following page.

Category I - Commercial Service Airports

These airports support some level of scheduled commercial airline service in addition to a full range of general aviation aircraft. This includes both domestic and international destinations.

Category II - Urban General Aviation Airports

These airports support all general aviation aircraft and accommodate corporate aviation activity, including business jets, helicopters, and other general aviation activity. These airports' primary users are business related and service a large geographic region or they experience high levels of general aviation activity.

Category III - Regional General Aviation Airports

These airports support most twin- and single-engine aircraft and may also accommodate occasional business jets. These airports support a regional transportation need.

Category IV – Local General Aviation Airports

These airports support primarily single-engine, general aviation aircraft, but are capable of accommodating smaller twin-engine general aviation aircraft. These airports support local air transportation needs and special use aviation activities.

Category V – RAES (Remote Access/Emergency Service) Airports

These airports support primarily single-engine, general aviation aircraft, special use aviation activities, and access to remote areas or provide emergency service access.

Volume I of the *OAP 2007* displays all airports within their various categories.

2.4 Performance Measures

Airport performance measures were developed for the functional roles. These objectives were developed in cooperation with ODA and the state aviation system plan and master plan Advisory Committee. The purpose of the performance measures is to compare existing airport facilities to the minimum and desired facility criteria for each functional role. The performance measures should not be considered a requirement for development standards and any development would require additional support and justification through the airport master planning process as well as environmental documentation.

The performance measures for each functional role are defined below. Many airports have multiple runways; therefore, the primary runway for each airport was used to evaluate the facility against the performance measures.

Category I – Commercial Service Airports

These airports support some level of scheduled commercial airline service in addition to a full range of general aviation aircraft. This includes both domestic and international destinations.

Performance criteria were evaluated by analyzing each airport's primary runway. A complete description of airport facilities is located below.

Airside Facilities	Minimum Criteria	Desired Criteria

2.5 Summary

Each of these study efforts will provide valuable information to the state as well as the individual airports as stand-alone documents. Combined together, these studies provide a comprehensive resource for airport development throughout the entire state.

Chapter 3

As outlined in the Federal Aviation Administration (FAA) Advisory Circular 150/5070-7, *The Airport System Planning Process*, the process of system planning for aviation is based upon the collection and evaluation of information about each airport within the overall system and the area they serve. The inventory task is accomplished through physical inspection of the facilities, field interviews and surveys, telephone conversations, and review of previous studies.

The objective of the inventory task is to document existing conditions, thereby providing the background information essential to the development and recommendations for the *Oregon Aviation Plan 2007 (OAP 2007)*. The inventory information covers a broad spectrum and includes information on the following elements of the Airport:

- Airside and landside facilities and their uses
- Navigational aids
- Auxiliary support facilities and services
- Environmental observations
- Air traffic activity data
- Survey analyses

A large volume of data was collected, reviewed, and analyzed during the inventory effort. This chapter presents an overall summary of this information and is organized in the following sections:

- 3.1 General Airport Description and Location
- 3.2 Existing Airport Facilities
- 3.3 Current and Forecast Demand
- 3.4 Survey Responses

3.1 General Airport Description and Location

Aurora State Airport is located approximately one mile northwest of the city of Aurora, within Marion County (**Figure 3.1**). Regionally, the Airport is located approximately 25 miles south of Portland, 25 miles north of Salem, and 90 miles north of Eugene. The airport has easy access to Interstate Highway 5, which is the critical North/South ground transportation link through the Willamette Valley.

According to the State of Oregon Office of Economic Analysis, Marion County contained 305,265 residents in 2005, up 7.2 percent from 284,834 in 2000. Oregon has grown from 3,436,750 residents in 2000 to 3,618,200 residents in 2005, up 5.3 percent. This indicates that Marion County is growing at a faster pace than the state as a whole.

Figure 3.1

Marion County Location Map

The Airport is owned and operated by the Oregon Department of Aviation and is included in the National Plan of Integrated Airport Systems (NPIAS), making this airport eligible for federal funding. Aurora State Airport, designated by the airport code UAO, occupies approximately 144 acres of land.

Historical Development. The Aurora State Airport was constructed by the Oregon State Highway Department during wartime in 1943 as an emergency airfield for air carrier aircraft. The Airport has evolved into the busiest state-owned airport and the fifth overall busiest airport in the state.

3.2 Existing Airport Facilities

Existing airport facilities are presented in three categories: airside, landside, and support facilities. The airside facilities include such areas as the runways, taxiways, aprons, aircraft parking and storage areas, airfield lighting, and navigational aids. The landside facilities include items such as the airport terminal building, vehicular access, auto parking, and support facilities. The support facilities may include fuel facilities, aircraft rescue and firefighting (ARFF) facilities, airport maintenance, snow removal equipment (SRE) and facilities, and utilities. The existing airside, landside, and support facilities are detailed below.

3.2.a Airside Facilities

The airfield consists of many components that are required to accommodate safe aircraft operations. This consists of runways, taxiways, and an apron network; the visual and electronic navigational aids associated with runways; runway protection zones; and general aviation facilities.

Runways. Aurora State Airport has a single paved runway, Runway 17-35. The runway is 5,004 feet long and 100 feet wide with an asphalt surface. The Airport currently has an Airport Reference Code (ARC) of B-II. Additional runway information such as pavement strength and condition are located in **Section 4.2**, *Definition of Airport System Role*.

Taxiways. The existing taxiway system at the Airport consists of a full-length parallel taxiway and entrance/exit taxiways.

Aprons. There are three aprons used for aircraft parking. The north terminal apron has approximately 12 small aircraft tie down spaces. The central terminal apron has 38 small tie-down spaces and four large aircraft parking positions. The southern terminal apron has approximately 10 small aircraft tie-down spaces and five large aircraft parking positions. All three aprons are constructed of asphalt.

Lighting and Navigational Aids. The Airport's lighting and navigational systems extend the Airport's usefulness into night and/or poor visibility.

Pavement edge lighting consists of light fixtures located near the edge of the runway/taxiway to define the lateral limits of the pavement. This lighting is essential for the safe and efficient movement of aircraft during periods of darkness or poor visibility. Runway 17-35 is equipped with medium intensity runway lighting (MIRL). Taxiways at the Airport are equipped with reflectors.

A four-light visual approach slope indicator (VASI) is installed both ends of Runway 17-35. A VASI system provides the pilot with a red, red/white, or white signal that indicates if the pilot is below, above, or on the glide path to the runway.

The ominidirectional approach lighting system (ODALS) is the minimum approach lighting system necessary to achieve three-quarters of a mile non-precision approaches. It consists of seven omnidirectional flashing lights located in the approach area of a non-precision runway. ODALS are installed on the approach end of Runway 17.

A Localizer approach is an Instrument Landing System (ILS) approach without the glide slope. Because there is no glide slope information provided, the Localizer approach is considered a non-precision approach. The Localizer signal provides azimuth, or lateral, information to guide the aircraft to the centerline of the runway. It is similar to a VOR signal except that it provides radial information for only a single course, the runway heading. The Airport has a Localizer approach to Runway 17.

GPS uses satellites placed in orbit around the earth to transmit electronic signals, which properly equipped aircraft use to determine altitude, speed, and position information. GPS allows pilots to navigate to any airport in the country, and they are not required to navigate using a specific navigational facility. The Airport has GPS approaches to both runway ends.

In addition to lighting and navigational aids, the Airport is also equipped with an automated surface observation system (ASOS). The ASOS provides automated aviation weather observations 24-hours a day. The system updates weather observations every minute, continually reporting significant weather changes as they occur. The ASOS system reports cloud

ceiling, visibility, temperature, dew point, wind direction, wind speed, altimeter setting, and density altitude (airfield elevation corrected for temperature).

3.2.b Landside Facilities

General Aviation Facilities. General aviation services at the Airport are provided by three fixed based operators (FBO); Aurora Aviation, General Aviation Services, and Willamette Aviation LLC. They offer aviation fuel, aircraft parking (ramp or tie-down), flight training, aircraft rental, aircraft maintenance, pilot supplies, catering, off site rental cars, and courtesy transportation.

Hangar space at the Airport is comprised of both corporate and T-Hangars. There are approximately 275 hangar facilities at the Airport. Additionally, there is considerable adjacent private development activity that is enhancing hangar facilities and drawing more Aurora based aircraft.

The majority of the landside developments at Aurora State Airport are privately owned and operated and located off airport property. Through the fence operations at the airport are discussed in detail in *Section 4.1.b General Observations and Recommendations*.

3.2.c Support Facilities

Parking. Vehicle parking is located next to each of the FBO buildings. There are moderate parking facilities at the Airport.

Fuel Facilities. All aircraft fuel storage facilities at the Airport are privately owned and operated. The FBOs provide both 100 LL and Jet A fuel.

3.3 Current and Forecast Demand

This element of the report provides projections of future aviation demand at the Airport. Projections of short-, intermediate-, and long-term activity at the Airport are based on 5-, 10-, and 20-year milestones, using 2005 as the base year of analysis as it is the most recent year for which a full year of activity data is currently available.

Projections of aviation demand are an important element of the system planning process as they provide the basis for several key analyses, including:

- Determining the role of the Airport with respect to the type of aircraft to be accommodated in the future
- Evaluating the capacity of existing airport facilities and their ability to accommodate projected aviation demand
- Estimating the extent of airside and landside improvements required in future years to accommodate projected demand

This analysis uses the most recent aircraft activity available to project future levels of aviation demand through the year 2025. The forecast analysis contained in this section includes methodologies based on historical aviation trends at the Airport, as well as other socioeconomic trends related to the state of Oregon. National projections of aviation activity developed by the FAA were also reviewed within the context of this forecast analysis, where available.

This section provides discussions of the methodologies and findings used for projecting passenger enplanements, aircraft operations, and based aircraft at the Airport. The projections of aviation demand are documented below in **Table 3.1**.

3.3.a Forecasting Approach

There are a number of different forecasting techniques available for use in the projection of aviation activity, ranging from subjective judgment to sophisticated mathematical modeling. Because a large number of variables affect a facility plan, it is important that each variable be considered in the context of its use in the plan. For variables that significantly affect the nature and extent of facilities, redundancy has been achieved through the utilization of several forecasting techniques to minimize the uncertainty associated with the range of the forecast variable.

The analysis includes the assessment of historical trends on aviation activity data at the local, regional, and national level. Aviation activity statistics on such items as passenger enplanements, aircraft operations, and based aircraft are collected, reviewed, and analyzed. Similarly, socioeconomic factors such as population and income are analyzed for the effect they may have on aviation growth. The comparison of relationships among these various indicators provides the initial step in the development of realistic forecasts of aviation demand.

The following general methodologies were used in projecting various components of aviation demand at the Airport.

Time Series Methodology. Historical trend lines and linear extrapolation are some of the most widely used methods for forecasting. These techniques utilize time-series types of data and are most useful for a pattern of demand that demonstrates a historical relationship with time. In utilizing this technique, an assumption is made that the same factors that have influenced demand will continue to affect future demand. While this is a rather broad assumption, it often provides a reliable benchmark for comparing the results of other analyses. Linear extrapolation established a linear trend by fitting a straight line using the least squares method to known historical data. Historic trend lines, as utilized in these analyses, examine historic compounded annual growth rates and extrapolate future data values by assuming a similar compounded annual growth rate in the future.

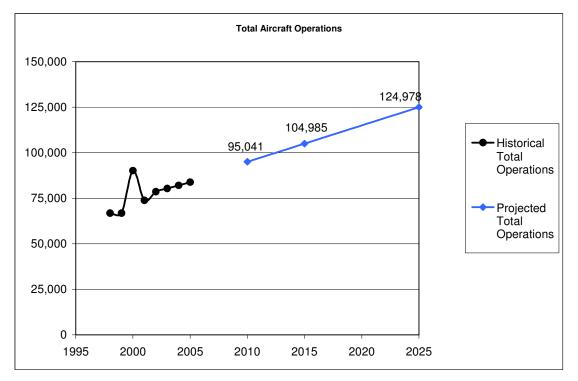

Market Share Methodology. Market share, ratio, or top-down models are utilized to scale large-scale aviation activity down to a local level. Inherent to the use of such a method is the demonstration that the proportion of the large-scale activity that can be assigned to the local level is a regular and predictable quantity. This method has been used extensively in the aviation industry for aviation demand forecasting at the local level. Its most common use is in the determination of the share of total national traffic activity that will be captured by a particular region or airport. Historical data is examined to determine the ration of local airport traffic to total national traffic. From outside data sources, in this case the FAA, projected levels of national activity are determined and then proportioned to the Airport based upon the observed and projected trends.

Socioeconomic Methodology. Socioeconomic or correlation analysis examines the direct relationship between two or more sets of historical data. In this case, socioeconomic analyses have been performed, relating historical aviation activity to historical population levels within the Airport region. Based upon the observed and projected correlation between historical aviation activity and the socioeconomic data sets, future aviation activity projections are developed based upon the projected socioeconomic data sets. In this case, projected population levels were obtained from Woods & Poole Economics, Inc. (W&P), an independent firm that specializes in long-term economic and demographic projections. This forecasting methodology is subject to how accurately an airport's activity reflects local demographic makeup.

Table 3.1 Summary of Aviation Projections

Aurora State Airport (UAO)

Year	Commercial Air Carrier	General Aviation	Military	Total	Based Aircraft
Historical:					
1995					
1996					
1997					
1998	8,791	57,850	180	66,821	233
1999	8,791	57,850	180	66,821	233

3.4 Survey Responses

As previously discussed, surveys were a critical part of the data collection effort. Below is a summary of the surveys and staff interviews that provide the context that surrounds the *OAP 2007*. Surveys were sent to state, local, and county government officials, businesses, airport managers, pilots, chamber of commerce members, and host communities to solicit input of the state aviation system from diverse interests groups.

3.4.a Community Information

Currently, agriculture, timber, and manufacturing were noted as the primary industries in the Aurora area. Survey respondents indicate that the Airport is perceived to be a valuable economic asset to the community. The respondents also indicated that if there were no longer an airport available to the public, they would use the next closest airport. Survey results identified noise, security, safety, and expansion of the Airport as the main concerns regarding the future development of the Airport.

3.4.b Economic Development

The importance of aviation for growth from an economic perspective is ranked moderately high. The survey respondents noted that airport upgrades would increase economic growth for the surrounding communities. According to the survey results, the single most important item that the Airport could do to promote economic growth is to increase runway length. In addition, it was perceived that the impact to the economy would be negative if the Airport was no longer available. Businesses would depreciate in size, relocate, or use the next closest airport. Respondents were unsure if the city of Aurora and Marion County would be supportive of a funding mechanism to finance future airport developments.

3.4.c Airport Development and Use

Survey respondents indicate that the airport users of Aurora State Airport are local business, recreation, tourism, out-of-town business, and agriculture. Surrounding communities rely on the Airport for medical rescue flights and fire protection.

Survey respondents highlighted three areas of concern regarding the Airport. These concerns are outline below:

- There are perceived operational limitations of runway length, terminal amenities, navigational aids, taxiways, aircraft parking/storage, and availability of fuel
- Inclement weather significantly reduces the "usability" of the Airport
- Lack of infrastructure (sewer and water) was noted as a concern to the future of the Airport

3.4.d Air Shuttle

Upon the request of ODA, Mead & Hunt is investigating the feasibility of a state operated and subsidized air shuttle service. This air shuttle service would link various communities within the state. Traditionally, air shuttle services do not compete with regular commercial service, their intent is to commute between smaller local communities instead of large regional airports, therefore, they are viewed as a supplement to air service for airports.

Survey Respondents indicate that some form of an air shuttle service would be considered a convenience and would likely promote economic growth for communities. Survey results indicate that the primary users of the shuttle would be business, emergency services, and health services, transportation of cargo, higher education, and governmental services. Survey results provided the order of importance of issues for potential shuttle passengers. Most important to travelers was schedule, followed by cost, reliability, type of aircraft, and comfort. Survey results identified Bend, Eugene, and Portland as the destination cities for shuttle service originating in Aurora with service being provided daily. Survey results also indicate that the city of Aurora and Marion County would be willing to "guarantee" seats for their community on the air shuttle service; however, they would expect users to pay between \$151 and \$200 per seat, with a potential of over 20 users per flight.

3.5 Summary

Providing a comprehensive summary of the existing airport facility is an essential part of the planning process. The information contained in this chapter provides the foundation for the recommendations found in *Chapter Four*.

Aurora State – Individual Airport Report
This Page Intentionally Left Blank

Chapter 4

As discussed, the inventory and forecasts provide a basis from which recommendations can be made for future development. The recommendations illustrated within the *Oregon Aviation Plan 2007 (OAP 2007)* reflect the Oregon Department of Aviation's (ODA) desire to create a comprehensive aviation system that adequately services the aviation needs of the state and the various interest groups associated with this resource. This chapter is organized in the following sections:

- 4.1 Airport Facility and Service Needs
- 4.2 Definition of Airport System Role
- 4.3 Economic Impact Analysis

4.1 Airport Facility and Service Needs

A primary focus of this report is to identify and evaluate airside, landside, and other general facility needs and deficiencies at the Airport utilizing information collected through the physical inspection of the facility, field interviews and surveys, telephone conversations, review of previous studies, and review of appropriate airport records. The following section presents the recommended airport facility and service needs identified during the study process.

4.1.a Recommendations Based on Performance Criteria

The Aurora State Airport has been classified as a *Category II – Urban General Aviation* airport and should provide appropriate facilities and services commensurate with its system role. The existing airport facilities were compared to the minimum and desired criteria for a *Category II* airport, which identified the following airport facility and service needs:

- Increase Airport Reference Code from B-II to C-II (associated safety area improvements)
- Correct parallel taxiway / runway centerline separation
- Install Medium Intensity Taxiway Lighting (MITL)
- Construct designated cargo apron

4.1.b General Observations and Recommendations

The Aurora State Airport is one of the busiest general aviation airports in the state. A vast majority of the traffic at the Airport is conducted by corporate jets and due to its prime location between the Portland Metropolitan area and Salem, the state capital; the Airport will continue to attract business/corporate aircraft. Therefore, it should be made a priority to increase the margin of safety by developing the Airport with C category aircraft design standards.

The majority of the landside developments at Aurora State Airport are privately owned and operated. However, some areas of the airfield are owned by the state of Oregon and leased to private business. The businesses that are located off airport property are entering the airfield from private property, more commonly known as a "through the fence" operations.

Through the fence agreements provide access onto the airfield for off-airport businesses or individuals who utilize the airport infrastructure but do not lease space at the airport or contribute financially to support the airport through ground leases or operational leases like those located on airport property.

General aviation airports often have difficulty generating revenue to offset the costs of operating, maintaining, and improving the airport. An important revenue generator at many airports is the lease of airport property for private or commercial use. Private property owners adjacent to an airport that are granted access to the airport infrastructure are typically not contributing to the airport fund through the normal lease process. This often results in an economically competitive advantage to off-airport businesses. They are allowed to access the airport without paying a lease rate which often reduces their overhead, allowing them to charge lower rates than their on-airport counterparts. This creates a situation which is first and foremost noncompliant with FAA policies but more importantly, often results in a weaker airport economy.

The FAA does not have a formal policy against "through the fence" operations; however they do strongly discourage their use. To maintain an economically viable business environment the airport sponsor should require all off field businesses or individuals to compensate the sponsor similarly to those being paid by on airport tenants. A yearly fee, percentage of gross profits, or access fees are common methods of collecting compensation from off airport businesses or individuals.

ODA is currently discussing Senate Bill 680 to address the "through the fence" operations at Aurora State Airport.

4.1.c Airport Capital Improvement Program

The Airport Capital Improvement Program (ACIP) is the primary planning tool the FAA utilizes to identify, prioritize, and assign funds to capital airport development and associated capital needs for all NPIAS airports. The 2006 ACIP for Aurora State Airport includes the following projects:

- Construct taxiway Phase 06 and 07
- Relocate taxiway including purchasing land
- Update Exhibit A Property Plan
- Update airport layout plan
- Implement Phase 2 land purchase

4.1.d Other Potential Improvements for Consideration

No other airport improvement projects were being considered at the time of publication.

4.2 Definition of Airport System Role

Category II - Urban General Aviation

These airports support all general aviation aircraft and accommodate corporate aviation activity, including business jets, helicopters, and other general aviation activity. These airports' primary users are business related and service a large geographic region or they experience high levels of general aviation activity.

Performance criteria were evaluated by analyzing each airport's primary runway. A complete description of airport facilities is located in **Section 3.2**, *Existing Airport Facilities*.

Airside Facilities	Existing Facilities	Minimum Criteria	Desired Criteria
FAA - ARC	B-II	C-II	Varies
NPIAS	Yes	Yes	Yes
Based Aircraft	397	Not an Objective	Not an Objective
Runway Orientation	17/35	Not an Objective	Not an Objective
Runway Length	5,004 feet	5,000 feet	Varies by Aircraft
Runway Width	100 feet	100 feet	Varies by Aircraft
Runway Pavement Type	Bituminous	Bituminous, Concrete	Bituminous, Concrete
Runway Strength	30,000 (SW)	Not an Objective	Not an Objective
Runway Pavement PCI	84	Not an Objective	Not an Objective

FBO	Full Service (3)	Full Service	Full Service, 24-hour service
Ground Transportation	Rental Car, Taxi	Offsite Rental Car, Taxi	Rental Car, Taxi, or Other
Food Service	Vending, Coffee Shop	Vending	Coffee Shop/Deli & Cold Foods
Restrooms	Yes	Yes	Yes
Pilot Lounge	Yes w/Weather Reporting	Yes w/ Weather Reporting	Yes w/ Weather Reporting
Snow Removal	Yes	Yes	Yes
Telephone	Yes	Yes	Yes

4.3 Economic Impact Analysis

The economic impact analysis of airports in Oregon was developed for each airport, measuring economic impacts of airport facilities, within regions and throughout the state. Airports that are part of the Port of Portland were not part of this study, except for the regional-based analysis of aviation dependent businesses. This study used the five regions of *ConnectOregon* to measure local/regional economic impacts of airports and for dependent non-aviation businesses. The regions are shown by the accompanying map.

Total economic impacts are the sum of on-airport economic activities, off-airport spending by visitors who arrive by air, and spin-off impacts (multiplier effect). Airport impacts are provided by region and state to show the contribution of each airport to the regional and state economies. In addition, aviation dependent impacts are provided by region to show the importance of airports in each region to non-aviation businesses. All impacts reported represent a base year of 2005. Each type of impact is defined in the following paragraphs.

On-Airport direct impacts represent economic activities that occur on airport grounds. By separating aviation related activities from non-aviation activities, The *OAP 2007* illustrates the regional economic contribution of aviation by airport in the regional and state economies, as well as the overall impact of each airport as a facility. Aviation related activities are those that would not occur without the airport, such as airlines, fixed base operators (FBO), government, and other tenants located at the airport or directly dependent on the airport. This category also includes airport management and other individuals employed directly by the airport, as well as retail and service operations for passengers, pilots, and other airport employees. In some cases, airports provide land or building space for companies that are not affiliated with aviation. These tenants are not related to the aviation mission of the airport, but are using the facility as a convenient and affordable business or industrial parks.

Off-Airport visitor spending (Direct Impacts) are expenditures made by air travelers who are visiting from outside the region, and occurs off the airport-in the regional economy. Visitor spending includes lodging, food, entertainment, retail purchases and ground transportation (retail purchases and on-airport car rentals are captured by on-airport impacts). Visitor spending is analyzed for commercial passengers as well as for general aviation pilots and passengers. Visitors flying into Oregon from another state or nation contribute to the airport's regional economy as well as to the state. However, passengers flying within Oregon, from one region to another, contribute to the region of their destination airport, but are not bringing additional money into Oregon. Therefore, in regions with air carrier airports, the direct impact of visitor spending for the region is higher than the impact of visitor spending for the state.

Airport dependent impacts represent area businesses that are dependent on an airport for incoming and outgoing, and for business travel. These businesses may relocate or suffer substantial loss if the airport were not available. This impact is not included in traditional economic impact methodology and is analyzed and reported by region for this study. Thus the

economic dependence of a region on aviation represents the cumulative impacts of all airports within a region. The analysis is provided as an indicator of the importance of airports to regional economies.

Spin-off impacts (Multiplier Affect) are calculated using impact multipliers, which are used to reflect the recycling of dollars through both the regional and state economy. A dollar spent in the economy does not disappear; rather, it continues to move through the local economy in successive rounds until it is incrementally exported from the community. As the expenditures described above are released into the economy, they circulate among other industry sectors, creating successive waves of additional economic benefit in the form of jobs, payroll, and output (expenditures). These successive rounds of spending are known as spin-off impacts, and help to represent the full impact of each dollar spent in a region. An example would be an airport employee spending his or her salary for housing, food, and other services. Spending occurring outside the area is considered economic leakage and is not reflected in the multiplier. Spin-off impacts are often reported as indirect and induced impacts. Indirect impacts reflect the purchase of goods and services by businesses. Induced impacts reflect worker making consumer purchases.

The project team analyzed the economic contributions of 91 airports under the jurisdiction of the Oregon Department of Aviation (ODA). In addition, the Port of Portland commissioned a separate economic impact studies of Portland International Airport, Portland Hillsboro Airport and Portland Troutdale Airport, which are administered by the Port. The sum of economic impacts derived from the OAP 2007 and the Port of Portland studies account for economic impacts generated by all public use airports in Oregon.

4.3.a Contribution of Airports to the Economy of Oregon

As shown in **Table 4.1**, Oregon public-use airports contributed a total economic impact of \$8.3 billion to the state economy, including \$3 billion from ODA airports and more than \$5 billion from Port of Portland airports. Following Table 4.1 is a summary entitled *Airport Role in Economy*, which illustrates the individual airport economic impact.

Additional study highlights include:

- Oregon ODA public-use airports, including airport tenants, directly employ 7,000 people for aviation related activities and expend \$259 million in wages
- Oregon ODA public-use airport employees and tenants earned an average annual salary of \$36,000 per year for aviation activities and \$35,000 per worker, when including nonaviation jobs
- Off-airport visitor industry employees earn an average annual salary of \$15,000 per year

Table 4.1 Economic Contribution of Airports to the Oregon Economy
