Note:
Human Health Screening Levels correspond to a target risk of 1E-06 for carcinogens and target hazard quotient of 1.0 for non-carcinogens for the selected receptor and pathway. MCLs incorporate considerations of risk as well as feasibility in attaining target level.
- = No benchmark available or available benchmark not needed, based on hierarchy of sources
DEQ = Oregon Department of Environmental Quality
USEPA = US Environmental Protection Agency
GW = groundwater
MCL = Maximum Contaminant Level
ug/L = microgram per liter
NOAA = National Oceanic and Atmospheric Administration
NRWQC = National Recommended Water Quality Criteria
ORNL = Oak Ridge National Laboratory
PAH = Polycyclic aromatic hydrocarbon
RBC = Risk Based Concentrations
RI = Remedial Investigation
RSL = Regional Screening Level
SLV = Screening Level Value
SQuiRTs = Screening Quick Reference Tables
WQC = Water Quality Criteria

[a] Total PCBs was used as a surrogate because there was no aroclor-specific SLV.
[b] Benzo(a)pyrene was used as a surrogate because there was no chemical-specific SLV, and benzo(a)pyrene had the lowest SLV of the high-molecular-weight PAHs.
[c] BHC alpha was used as a surrogate, because there was no chemical-specific SLV, and BHC alpha was the lowest BHC.
[d] Chlordane was used as a surrogate.
[e] Total PCBs was used as a surrogate because the SLV is more conservative than the individual aroclor SLVs.
[f] Endosulfan was used as a surrogate.
[g] Anthracene was used as a surrogate, because there was no chemical-specific SLV.
[h] Xylene (mixed) was used as a surrogate because there was no chemical specific SLV.
[i] 4,4'-DDT was used as a surrogate because the Aquatic Level II SLV is for DDT and its metabolites and is more conservative than the Avian Level II SLV for DDE.
[j] Acenaphthene was used as a surrogate because there was no chemical-specific SLV.
[k] Toxic Equivalency Factors for Benzo(g,h,i)perylene (0.01) was applied to the Benzo(a)pyrene SLV because there was no chemical specific SLV.
[l] Benzo(k)fluoranthene was used as a surrogate because there was no chemical-specific SLV.
[m] Benzo(b)fluoranthene was used as a surrogate because there was no chemical-specific SLV and benzo(b)fluoranthene had the lowest SLV of the benzofluoranthenes

[q] DEQ. Water Quality Criteria for freshwater organisms (Oregon Administrative rules, section 340-041, Tables 33A and 33B).
[r] 1,2,4- Trichlorobenzene was used as a surrogate because there was no chemical specific SLV.
[s] Groundwater and Surface Water HH Hierarchical SLV Selection for Groundwater Discharge to Surface Water/Surface Water Bioaccumulation: 1. USEPA NRWQC (minimum of Water+organism and Organism Only), 2. DEQ Table 33A (minimum of Water+organism and Organism Only), and 3. DEQ (minimum of Water+organism and Organism Only).
[t] 1,2- Dichloropropane was used as a surrogate because there was no chemical specific SLV.
[u] Phenol was used as a surrogate because there was no chemical specific SLV.
[v] 2- Methylphenol was used as a surrogate because there was no chemical specific SLV.
[x] Bromodichloromethane was used as a surrogate because there was no chemical specific SLV.
[y] Ethylbenzene was used as a surrogate because there was no chemical specific SLV.
[z] Bis(2-ethyl hexyl) phthalate was used as a surrogate because there was no chemical specific SLV, and Bis(2-ethyl hexyl) phthalate was the lowest of the pthalates.
[aa] Endrin was used as a surrogate because there was no chemical specific SLV.
[ab] Tributyltin was used as a surrogate because there was no chemical specific SLV.
[ac] Chlordane (CAS # 57749) was used as a surrogate because there was no chemical specific SLV.
[ad] Chromium (III) was used as a surrogate because there was no chemical specific SLV.
[ae] 2,4-D was used as a surrogate because there was no chemical specific SLV.

[ak] Ecological Hierarchical SLV Selection: 1. USEPA Freshwater NAWQC, 2. ODEQ Freshwater Table 33A WQC, 3. DEQ Level II SLVs (lowest), 4. ORNL Tier II Value, 5. USEPA PAH FCV, 6. Canadian Freshwater WQG, 7. NOAA SQuiRTs Freshwater Chronic.
[al] For organic analytes, most conservative of Human Health and Ecological Selected Water Screening Levels with Surrogates. For inorganic analytes, selected Human Health Selected Screening Level.
[am] For all analytes, most conservative of Human Health and Ecological Selected Water Screening Levels with Surrogates.
[an] As per EPA guidance, certain NRWQC were adjusted for hardness based on a site-specific hardness value of 60 mg/L (minimum value of 54 mg/L and maximum value of 64 mg/L).
[ao] For these two PAHs, the ecological SLV hierarchy presented in footnote "ak" was not followed. As per the response to DEQ's Specific Comment #26 (see Appendix P), EPA's FCVs were used instead (EPA 2003).

Note
- = No benchmark available
DEQ = Oregon Department of Environmental Quality
Eco = ecological
HH = human health
mg/kg = milligram per kilogram
SLV = screening level value
UPL = Upper Prediction Limit

[a] Eco SLV Sediment: Benzo(k)fluoranthene was used as a surrogate because there was no chemical specific SLV.
[b] Eco SLV Sediment: Di-n-butyl phthalate was used as a surrogate because there was no chemical specific SLV and di-n-butyl phthalate had the lowest SLV of the phthalates.
[c] Eco SLV Sediment: Total PCBs was used as a surrogate because the SLV is based on bioaccumulation and is more conservative than the DEQ Level II individual aroclor SLVs, which do not take into account bioaccumulation.
[d] Eco and HH SLV Sediment: Chlordane (technical) was used as a surrogate because there was no chemical specific SLV and chlordane (technical) was the lowest of the chlordanes.
[e] Eco SLV Sediment: BHC (gamma) Lindane was used as a surrogate because there was no chemical specific SLV and BHC (gamma) was the lowest of the BHCs.
[f] Eco and HH SLV Sediment: DDT (Total) was used as a surrogate because there was no chemical specific SLVs.
[g] HH SLV Sediment: Fluoranthene was used as a surrogate because there was no chemical specific SLV and fluoranthene had the lowest SLV of the low Molecular Weight PAHs.
[h] HH SLV Sediment: Pyrene was used as a surrogate because there was no chemical specific SLV and pyrene had the lowest SLV of the High Molecular Weight PAHs.
[i] HH SLV Sediment: Total Aroclors was used as a surrogate because there was no individual aroclor chemical specific SLV.
[j] DEQ. 1998. Updated 2001. Guidance for Ecological Risk Assessment: Levels I,II,III,IV. Waste Management and Cleanup Division.
[k] DEQ 2007. Guidance for Assessing Bioaccumulative Chemicals of Concern in Sediment. Land Quality Division. Final. January 31
[l] The lowest of the Eco Screening levels (DEQ II SLV, Birds Individual, Mammals Individual, and Fish Freshwater) was selected.
[m] Human Subsistence was used
[n] Site-Specific Reference UPLs are based are not based on toxicity values.
[o] For organics, the lower of the Lowest Eco and Lowest HH SLV was selected as the RI SLV.
For inorganics, the Lowest Eco and HH SLV was selected, unless the Site-Specific Reference UPL was greater, then the Site-Specific Reference UPL was selected as the RI SLV.
[p] Eco Sediment: Phenol was used as a surrogate because there was no chemical specific SLV and phenol had the lowest SLV of the phenols.
[q] HH SLV Sediment: Hexachlorobenzene was used as a surrogate because there was no chemical specific SLV.
[r] HH SLV Sediment: Dieldrin was used as a surrogate because there was no chemical specific SLV.

SLV = screening level value
UPL = Upper Prediction Limit

[b] Eco & HH SLV: Total Aroclors was used as a surrogate because there was no individual aroclor chemical specific SLV.
[d] DEQ 2007. Guidance for Evaluation of Bioaccumulative Chemicals of Concern in Sediment. Final. January 31
[e] The lowest of the Eco SLVs (DEQ Bird ATL, DEQ Mammal ATL, and DEQ Fish Freshwater CTL) was selected.
[f] The lowest of the HH SLVs (DEQ Subsistence/Tribal Carcinogen ATL and DEQ Subsistence/Tribal Non-Carcinogen ATL) was selected.
[g] The SLV for fluoranthene was selected as a surrogate because there was no chemical-specific SLV.
[h] The SLV for pyrene was selected as a surrogate because there was no chemical-specific SLV.
[i] The ATLs and CTLs were developed based on the procedures outlined in DEQ 2007; see Appendices L-2 and L-3.

Table J-2a
Calculation of Acceptable Tissue Levels Protective of Human Health for Selected SVOCs - Subsistence Fisher

- = no data
ARL_c = Acceptable Risk Level for Carcinogens
ARL_n = Acceptable Risk Level for Non - Carcinogens
AT = Averaging Time
ATL = Acceptable Tissue Level
BW = Body Weight
c = carcinogen
ED = Exposure Duration
IRp = Fish consumption rate for exposed population
kg = kilogram
kg/day = kilograms per day
mg/kg-day = milligrams per kilogram per day
mg/kg ww = milligrams per kilogram wet weight
n = noncarcinogen
RfD = Reference Dose
SFo = Cancer Slope Factor
yrs = years

Notes
$HH\ ATL_{carcinogen} = (ARLc*BW*AT)/(SFo*IRp*ED)$
$HH\ ATL_{noncarcin} = (ARLn*BW*RfD)/IRp$
Di-n-butylphthalate RfDo used as surrogate for di-n-octyl phthalate.
Hierarchy of SFo and RfD; 1. DEQ 2007 2. USEPA 2009
Exposure parameters come from DEQ 2007 table A-2.

Oregon Department of Environmental Quality (DEQ) 2007. Guidance for Assessing Bioaccumulative Chemicals of Concern in Sediment.
United States Environmental Protection Agency (USEPA) 2010. Regional Screening Table. May.

Notes:

ATL = Acceptable Tissue Level (developed to protect birds and mammals at the individual level as well as the population level)
CTL = Critical Tissue Level
TRV = Toxicity Reference Value
NOAEL = No-Observable-Adverse-Effects-Level
LOAEL = Lowest-Observable-Adverse-Effects-Level
IRw = Food ingestion rate for wildlife
BW = Body Weight
BCF = Water to Fish Bioconcentration Factor
WQC = Water Quality Criteria
$ATL_{wildlife}$ = TRV/(IR/BW)
CTL_{fish} = BCF*WQC
Bis(2-ethylhexyl) phthalate TRVs were used as a surrogate for butyl benzyl phthalate. The chronic LOAEL for bis(2-ethylhexyl) phthalate was estimated by applying a factor of 5.
Di-n-butyl phthalate TRVs and BCF were used as a surrogate for di-n-octyl phthalate.
TRVs come from Sample et al 1996. Mink and great blue heron were used as endpoint species to be consistent with the ATLs used from DEQ's guidance (2007).

Water to fish BCFs for bis(2-ethylhexyl) phthalate and butyl benzyl phthalate from: Oak Ridge National Laboratory's Risk Assessment Information System (RAIS) database URL:http://rais.ornl.gov/ (last updated 2009). BCF for di-n-butyl phthalate and di-n-octyl phthalate from WDOE URL:http://fortess.wa.gov/ecy/clarc/Reporting/CLARCReporting.aspx
WQC presented in Table H-3 (Appendix H) - criterion continuous concentrations protective of aquatic biota.
Sample, B.E., D.M. Opresko, and G.W Suter II. 1996. Toxicological Benchmarks for Wildlife: 1996 Revision. Oak Ridge National Laboratory, Oak Ridge, Tennessee. 227 pages. ES/ER/ TM-86/R3.

DEQ = Oregon Department of Environmental Quality
USEPA = United States Environmental Protection Agency
HMW = high molecular weight

Table J-4a - Human Health Soil SLVs
Bradford Island, Upland Operable Unit
(5 of 5)

Analyte	CAS #	Candidate Human Health Soil Screening Level Values (mg/kg)					Selected Soil SLVs (mg/kg)			Site-Specific Reference UPL
		DEQ Soil Direct Contact Occupational RBC	DEQ Soil Direct Contact Construction RBC	DEQ Soil Direct Contact Excavation RBC	DEQ Soil Volatilize Outdoor Occupational RBC	USEPA Soil Indust RSL	Outdoor Worker	Construction Worker	Excavation Worker	

LMW = low molecular weight
mg/kg = milligram per kilogram dry weight
PAH = polycyclic aromatic hydrocarbons
RBC = Risk Based Concentrations
RSL = Regional Screening Level
SLV = screening level value
UPL = upper prediction limit

Notes
Only analytes with one or more candidate SLVs is shown on this table. For the full list of analytes, see Appendix K-1.
Outdoor Worker hierarchical SLV selection for soil: 1. Minimum of DEQ Soil RBCs (Ingest Occupational and Volatilize Outdoor Occupational), 2. USEPA Soil Industrial RSL, 3. Surrogate used as noted.
Construction Worker hierarchical SLV selection for soil: 1. DEQ Soil RBCs (Direct Contact Construction,. 2. USEPA Soil Industrial RSL, 3. Surrogate used as noted.
Excavation Worker hierarchical SLV selection for soil: 1. DEQ Soil RBCs (Direct Contact Excavation), 2. USEPA Soil Industrial RSL, 3. Outdoor Worker SLV, 4. Surrogate used as noted.
LMW PAHs include: 2-Methylnaphthalene, Acenaphthene, Acenaphthylene, Anthracene, Fluorene, Naphthalene, and Phenanthrene.
HWM PAHs include : Benzo(a)anthracene, Benzo(a)pyrene, Benzo(b)fluoranthene, Benzo(g,h,i)perylene, Benzo(j,k)flouranthenes, Benzo(k)fluoranthene, Chrysene, Dibenzo(a,h)anthracene, Fluoranthene, Indeno(1,2,3-cd)pyrene, and Pyrene.
Human Health Screening Levels correspond to a target risk of 1E-06 for carcinogens and target hazard quotient of 1.0 for non-carcinogens for the selected receptor and pathway.
Oregon Department of Environmental Quality (DEQ) 2003. Risk-Based Decision Making for the Remediation of Petroleum-Contaminated Sites. Land Quality Division, Environmental Cleanup and Tanks Program. September. Updated 2009
United States Environmental Protection Agency (USEPA) 2010. Regional Screening Level. May.
For Arsenic and Vanadium, the Site-Specific Reference UPLs were greater than the SLVs based on health risk (DEQ and/or USEPA), therefore the Reference UPLs were used as the Selected SLVs.

Footnotes
[a] 1,3- Dichloropropene was used as a surrogate because there was no chemical specific SLV.
[b] 1,4- Dichlorobenzene was used as a surrogate because there was no chemical specific SLV.
[c] 1,2- Dichloropropane was used as a surrogate because there was no chemical specific SLV.
[d] Phenol was used as a surrogate because there was no chemical specific SLV.
[e] 2-Nitroaniline was used as a surrogate because there was no chemical specific SLV.
[f] Naphthalene was used as a surrogate because there was no chemical-specific SLV.
[g] Aroclor 1221 was used as a surrogate because there was no chemical specific SLV.
[h] Toxic Equivalency Factors for Benzo(g,h,i)perylene (0.01) was applied to the Benzo(a)pyrene SLV because there was no chemical specific SLV.
[i] BHC alpha was used as a surrogate, because there was no chemical-specific SLV, and BHC alpha was the lowest BHC.
[j] Bis(2-chloroethyl) ether was used as a surrogate because there was no chemical specific SLV.
[k] Bromodichloromethane was used as a surrogate because there was no chemical specific SLV.
[l] Cadmium (diet) was used as opposed to Cadmium (water).
[m] Chlordane (technical) was used as a surrogate because there was no chemical specific SLV.
[n] Bis(2-ethylhexyl) Phthalate was used as a surrogate, because there was no chemical-specific SLV, and Bis(2-ethylhexyl) Phthalate was the lowest phthalate.
[o] Endosulfan was used as a surrogate because there was no chemical specific SLV.
[p] Endrin was used as a surrogate because there was no chemical specific SLV.
[q] Xylene (mixed) was used as a surrogate because there was no chemical specific SLV.
[r] Manganese (water) was used as opposed to Manganese (diet).
[s] Tributyltin was used as a surrogate because there was no chemical specific SLV.
[t] The RSL for Total PCBs was selected as the SLV per DEQ.
[u] For metals only, the reference UPL was higher than the selected HH SLV.
[v] The SLV for 2,4,5-TP (Silvex) was selected as a surrogate because there was no chemical specific SLV.
[w] The SLV for dibenzofuran was selected as a surrogate because there was no chemical specific SLV.
[x] The SLV for anthracene was selected as a surrogate because there was no chemical specific SLV.
[y] The SLV for isopropylbenzene (cumene) was selected as a surrogate because there was no chemical specific SLV.
[z] Assumed worst case scenario, total Cr as 100% Chromium VI.
[aa] Benzo(k)fluoranthene was used as a surrogate because there was no chemical specific SLV.
[ab] Benzo(b)fluoranthene was used as a surrogate because there was no chemical-specific SLV and benzo(b)fluoranthene had the lowest SLV of the benzofluoranthenes.
[ac] Residual Range Organics for Construction Worker was used as a surrogate because receptor specific RBC is greater than the maximum (100,000 mg/kg).

- = No benchmark available or available benchmark not needed, based on hierarchy of sources
DEQ = Oregon Department of Environmental Quality
USEPA = US Environmental Protection Agency
GW = groundwater
MCL = Maximum Contaminant Level
ug/L = microgram per liter
PAH = Polycyclic aromatic hydrocarbon
RBC = Risk Based Concentrations
RSL = Regional Screening Level
SLV = Screening Level Value

Notes
Only analytes with one or more candidate SLVs is shown on this table. For the full list of analytes, see Appendix K-1.
Potable Water User hierarchical SLV selection for groundwater: 1. DEQ RBCs (the minimum of Ingest Residential, Ingest Occupational, Volatilize Outdoor, Vapor Intrusion, Excavation), 2. USEPA RSL, and 3. DEQ MCL.
Potable Water User hierarchical SLV selection for surface water: 1. DEQ RBCs (the minimum of Ingest Residential and Ingest Occupational), 2. USEPA RSL, and 3. DEQ MCL.
Human Health Screening Levels correspond to a target risk of 1E-06 for carcinogens and target hazard quotient of 1.0 for non-carcinogens for the selected receptor and pathway. MCLs incorporate considerations of risk as well as feasibility in attaining target level.
Oregon Department of Environmental Quality (DEQ) 2003. Risk-Based Decision Making for the Remediation of Petroleum-Contaminated Sites. Land Quality Division, Environmental Cleanup and Tanks Program. September. Updated 2009
DEQ 2010. Maximum Contaminant Level. Accessed online in January 2010 at: http://www.oregon.gov/DHS/ph/dwp/docs/pwsrules/61-0030.pdf
United States Environmental Protection Agency (USEPA) 2010. Regional Screening Level. May.

Footnotes
[a] Dichloropropene, 1,3- was used as a surrogate.
[b] 1,4-Dichlorobenzene was used as a surogate because there was no chemical specific SLV.
[c] 1,2- Dichloropropane was used as a surrogate because there was no chemical specific SLV.
[d] Phenol was used as a surrogate because there was no chemical specific SLV.
[e] 2- Nitroaniline was used as a surrogate because there was no chemical specific SLV.
[f] Naphthalene was used as a surrogate because there was no chemical-specific SLV.
[g] Toxic Equivalency Factors for Benzo(g,h,i)perylene (0.01) was applied to the Benzo(a)pyrene SLV because there was no chemical specific SLV.
[h] BHC alpha was used as a surrogate, because there was no chemical-specific SLV, and BHC alpha was the lowest BHC.
[i] Bromodichloromethane was used as a surrogate because there was no chemical specific SLV.
[j] Chlordane was used as a surrogate.
[k] Dibutyltin compounds was used as a surrogate because there was no chemical specific SLV.
[l] 4-(2,4-Dichlorophenoxy)butyric Acid was used as a surrogate because there was no chemical specific SLV.
[m] Diethyl Phthalate was used as a surrogate because there was no chemical specific SLV.
[n] Bis(2-ethyl hexyl) phthalate was used as a surrogate because there was no chemical specific SLV, and Bis(2-ethyl hexyl) phthalate was the lowest of the pthalates.
[o] Endosulfan was used as a surrogate because there was no chemical specific SLV.
[p] Endrin was used as a surrogate because there was no chemical specific SLV.

Table J-4b - Human Health Potable Water SLVs
Bradford Island, Upland Operable Unit
(6 of 6)

Analyte	CAS #	Candidate Human Health Water Screening Level Values for Direct Contact (ug/L)							Selected Potable Water User SLVs (ug/L)	
		DEQ GW Ingest Residential RBC	DEQ GW Ingest Occupational RBC	DEQ GW Volatilize Outdoor Air Occupational RBC	DEQ GW Vapor Intrusion Occupational RBC	DEQ GW Excavation Construct/Exca RBC	USEPA Tapwater RSL	DEQ MCL	Groundwater/Seep water	Surface Water

[q] Xylene (mixed) was used as a surrogate because there was no chemical specific SLV.
[r] The RSL for Total PCBs was selected as the SLV per DEQ.
[s] Tributyltin compounds was used as a surrogate because there was no chemical specific SLV.
[t] Cadmium (water) was used.
[u] Manganese (water) was used as opposed to Manganese (diet).
[v] Vanadium, Metallic was used.
[w] Anthracene was used as a surogate because there was no chemical specific SLV.
[x] Benzo(k)fluoranthene was used as a surrogate because there was no chemical specific SLV.
[y] Benzo(b)fluoranthene was used as a surrogate because there was no chemical-specific SLV and benzo(b)fluoranthene had the lowest SLV of the benzofluoranthenes.

- = No benchmark available or available benchmark not needed, based on hierarchy of sources
Bio = bioaccumulation
DEQ = Oregon Department of Environmental Quality
USEPA = US Environmental Protection Agency
GW = groundwater
MCL = Maximum Contaminant Level
ug/L = microgram per liter
NRWQC = National Recommended Water Quality Criteria
PAH = polycyclic aromatic hydrocarbon
SLV = screening level value
SW = surface water
WQC = Water Quality Criteria

Notes

Only analytes with one or more candidate SLVs is shown on this table. For the full list of analytes, see Appendix K-1.
Groundwater Discharge to Surface Water and Bioaccumulation hierarchical SLV selection for groundwater and surface Wwater: 1. Min EPA AWQC for water + organism and organism only, 2. Min DEQ WQC Table 33A, and 3. Min DEQ WQC Table 33B.
Human Health Screening Levels correspond to a target risk of 1E-06 for carcinogens and target hazard quotient of 1.0 for non-carcinogens for the selected receptor and pathway. MCLs incorporate considerations of risk as well as feasibility in attaining target level.
Oregon Department of Environmental Quality (DEQ) 2009 . Water Quality Criteria for freshwater organisms (Oregon Administrative rules, section 340-041, Tables 33A and 33B).
United States Environmental Protection Agency (USEPA) 2009. National Recommended Water Quality Criteria. Office of Water and Office of Science and Technology.

Footnotes

[a] 1,2,4- Trichlorobenzene was used as a surrogate because there was no chemical specific SLV.
[b] 1,2- Dichloropropane was used as a surrogate because there was no chemical specific SLV.
[c] Acenaphthene was used as a surrogate because there was no chemical-specific SLV.
[d] Phenol was used as a surrogate because there was no chemical specific SLV.
[e] Total PCBs was used as a surrogate because there was no aroclor-specific SLV.
[f] Toxic Equivalency Factors for Benzo(g,h,i)perylene (0.01) was applied to the Benzo(a)pyrene SLV because there was no chemical specific SLV.
[g] BHC alpha was used as a surrogate, because there was no chemical-specific SLV, and BHC alpha was the lowest BHC.
[h] Bromodichloromethane was used as a surrogate because there was no chemical specific SLV.
[i] Chlordane was used as a surrogate.
[j] Bis(2-ethyl hexyl) phthalate was used as a surrogate because there was no chemical specific SLV, and Bis(2-ethyl hexyl) phthalate was the lowest of the pthalates.
[k] Endosulfan was used as a surrogate.
[l] Endrin was used as a surrogate because there was no chemical specific SLV.
[m] Anthracene was used as a surogate because there was no chemical specific SLV.

- = No benchmark available
DEQ = Oregon Department of Environmental Quality
USEPA = US Environmental Protection Agency
RBC = Risk Based Concentrations
RSL = regional screening level
ug/m3 = microgram per cubic meter

Notes
Only analytes with one or more candidate SLVs is shown on this table. For the full list of analytes, see Appendix K-1.
Indoor Worker hierarchical SLV selection for Soil Gas: 1. DEQ Vapor Intrusion Occupational RBC, 2. Adjusted USEPA Industrial Air RSL

Oregon Department of Environmental Quality (DEQ) 2003. Risk-Based Decision Making for the Remediation of Petroleum-Contaminated Sites. Land Quality Division, Environmental Cleanup and Tanks Program. September. Updated 2009
United States Environmental Protection Agency (USEPA) 2010. Regional Screening Level. May.

Table J-4d - Human Health Soil Gas SLVs for Indoor Worker
Bradford Island, Upland Operable Unit
(2 of 2)

Analyte	CAS #	Candidate Soil Gas Screening Level Values (ug/m3)		Selected Soil Gas SLVs (ug/m3)
		DEQ Vapor Intru Occup RBC	Adjusted USEPA Industrial Air RSL[a]	

Footnotes

[a] Industrial Air RSL was multipled by a factor of 1000.

[b] 1,4-Dichlorobenzene was used as a surrogate.

[c] trans-1,2-Dichloroethene was used as a surrogate.

[d] Dichloropropene, 1,3- was used as a surrogate.

[e] Freon 113 was used as a surrogate.

[f] Xylene (mixed) was used as a surrogate.

[g] 1,2,4-trimethylbenzene was used as a surrogate.

[h] Hexane was used as a surrogate.

[i] Toluene was used as a surrogate.

- = No benchmark available
DEQ = Oregon Department of Environmental Quality
mg/kg = milligram per kilogram
SLV = screening level value
UPL = Upper Prediction Limit

Table J-4e - Human Health Sediment SLVs
Bradford Island, Upland and River Operable Unit
(2 of 2)

Analyte	CAS #	Candidate Sediment Screening levels (mg/kg)		Selected Mass Wasting SLVs (mg/kg)	Selected Subsistence Fisher SLVs (mg/kg)	Selected Recreational Fisher SLVs (mg/kg)	Site-Specific Reference UPL[a]
		DEQ SLVs Humans					
		General	Subsistence				

Notes

Only analytes with one or more candidate SLVs is shown on this table. For the full list of analytes, see Appendix K-1.

Mass Wasting hierarchical SLVs for sediment: 1. Minimum of DEQ HH Bioaccumulative SLVs.

Subsistence Fisher hierarchical SLVs for sediment: 1. Subsistence DEQ Bioaccumulative SLVs.

Recreational Fisher hierarchical SLVs for sediment: 1. General DEQ Bioaccumulative SLVs.

Oregon Department of Environmental Quality (DEQ) 2007. Guidance for Evaluation of Bioaccumulative Chemicals of Concern in Sediment. Final. January 31

Footnotes

[a] Site-Specific Reference UPLs are based are not based on toxicity values.

[b] DDT (Total) was used as a surrogate because there was no chemical specific SLVs.

[c] Fluoranthene was used as a surrogate because there was no chemical specific SLV and fluoranthene had the lowest SLV of the low Molecular Weight PAHs.

[d] Total Aroclors was used as a surrogate because there was no individual aroclor chemical specific SLV.

[e] Pyrene was used as a surrogate because there was no chemical specific SLV and pyrene had the lowest SLV of the High Molecular Weight PAHs.

[f] Chlordane (technical) was used as a surrogate because there was no chemical specific SLV and chlordane (technical) was the lowest of the chlordanes.

[g] Hexachlorobenzene was used as a surrogate because there was no chemical specific SLV.

[h] Dieldrin was used as a surrogate because there was no chemical specific SLV.

Note
Only analytes with one or more candidate SLVs is shown on this table. For the full list of analytes, see Appendix J-1.
- = No benchmark available
DEQ = Oregon Department of Environmental Quality
Eco SSL = Ecological Soil Screening Level
USEPA = US Environmental Protection Agency
HPAH = High Molecular Weight PAH
HPAHs include : Benzo(a)anthracene, Benzo(a)pyrene, Benzo(b)fluoranthene, Benzo(g,h,i)perylene, Benzo(j,k)flouranthenes, Benzo(k)fluoranthene, Chrysene, Dibenzo(a,h)anthracene, Fluoranthene, Indeno(1,2,3-cd)pyrene, and Pyrene.
LPAH = Low Molecular Weight PAH
LPAHs include: 2-Methylnaphthalene, Acenaphthene, Acenaphthylene, Anthracene, Fluorene, Naphthalene, and Phenanthrene.
mg/kg = milligram per kilogram dry weight
ORNL = Oak Ridge National Laboratory
PAH = Polycyclic Aromatic Hydrocarbons
PRG = Preliminary Remediation Goal
SLV = Screening Level Value
TRV = Toxicity Reference Value
UPL = Upper Prediction Limit

* = Eco SSL is dependent on pH.
** = Eco SSL is a determination of the geochemical conditions (i.e., pH and Eh at a minimum) of the environmental setting, as well as the presence of iron floc and the toxic metals, is critical to the determination of the relative importance of iron at a site.
*** = PAH Eco SSLs are based on Total LMW PAHs (Invert. Eco SSL = 29 mg/kg and Mammal Eco SSL = 100 mg/kg) and Total HMW PAHs (Invert. Eco SSL = 18 mg/kg and Mammal Eco SSL = 1.1 mg/kg).

[a] Endosulfan was used as a surrogate because there was no chemical specific SLV.
[b] 2-Methylphenol was used as a surrogate because there was no chemical specific SLV.
[c] Toluene was used as a surrogate because there was no chemical specific SLV.
[d] Heptachlor was used as a surrogate because there was no chemical specific SLV.
[e] Acetone was used as a surrogate because there was no chemical specific SLV.
[f] Total PCBs was used as a surrogate because there was no chemical specific SLV.
[g] PCB 1254 was used as a surrogate because there was no chemical specific SLV.
[h] The lowest PRGs (mammal and birds) for Total PCBs was used as a surrogate because the SLV is based on bioaccumulation and is more conservative than the DEQ Level II individual aroclor SLVs and Total PCB SLV, which do not take into account bioaccumulation.
[i] BHC gamma was used as a surrogate, because there was no chemical-specific SLV, and BHC gamma was the lowest BHC.
[j] di-n-butyl Phthalate was used as a surrogate because there was no chemical specific SLV.
[k] Chlordane (CAS # 57-74-9) was used as a surrogate.
[l] Tributyltin oxide was used as a surrogate, because there was no chemical-specific SLV.
[m] 1,3- Dichlorobenzene was used as a surrogate because there was no chemical specific SLV, and it had the SLV lowest of the non-methylbenzenes.
[n] 1,2- Dichloroethane was used as a surrogate because there was no chemical specific SLV.
[o] DDT (and metabolites) was used as a surrogate because there was no chemical specific SLV, and DDT was the lowest of the herbicides/pesticides.
[p] Dichloromethane was used as a surrogate because there was no chemical specific SLV.
[q] Carbon tetrachloride was used as a surrogate because there was no chemical specific SLV.
[r] The lowest Eco SSLs (avian and mammalian) for Dieldrin were used as surrogates because the SLVs are based on bioaccumulation and are more conservative than the DEQ Level II Endrin SLV, which does not take into account bioaccumulation.
[s] The lowest PRGs (avian and mammalian) for Mercury were used as surrogates because the SLVs are based on bioaccumulation and are more conservative than the DEQ Level II Mercury SLV, which does not take into account bioaccumulation.

Only analytes with one or more candidate SLVs is shown on this table. For the full list of analytes, see Appendix J-1.
- = No benchmark available or available benchmark not needed, based on hierarchy of sources
DEQ = Oregon Department of Environmental Quality
USEPA = US Environmental Protection Agency
ug/L = microgram per liter
HPAH = High Molecular Weight PAH
HPAHs include : Benzo(a)anthracene, Benzo(a)pyrene, Benzo(b)fluoranthene, Benzo(g,h,i)perylene, Benzo(j,k)flouranthenes, Benzo(k)fluoranthene, Chrysene, Dibenzo(a,h)anthracene, Fluoranthene, Indeno(1,2,3-cd)pyrene, and Pyrene.
LPAH = Low Molecular Weight PAH
LPAHs include: 2-Methylnaphthalene, Acenaphthene, Acenaphthylene, Anthracene, Fluorene, Naphthalene, and Phenanthrene.
NOAA = National Oceanic and Atmospheric Administration
NRWQC = National Recommended Water Quality Criteria
ORNL = Oak Ridge National Laboratory
PAH = Polycyclic aromatic hydrocarbon
SLV = Screening Level Value
SQuiRTs = Screening Quick Reference Tables
WQG = Water Quality Guidelines

[a] Benzo(a)pyrene was used as a surrogate because there was no chemical-specific SLV, and benzo(a)pyrene had the lowest SLV of the high-molecular-weight PAHs.

Table J-5b - Ecological Water SLVs
Bradford Island, Upland and River Operable Units
(5 of 5)

Analyte	CAS #	Canidate Ecological Water Screening Level Values (ug/L)							
		USEPA Freshwater NRWQC [k]	DEQ Freshwater Table 33A WQC[l]	Lowest DEQ Level II SLV[m]	ORNL Tier II Chronic Value[n]	USEPA PAH FCV[o]	Canadian WQG[p]	NOAA SQuiRTs Freshwater Chronic [q]	Selected Ecological Water SLV with Surrogates[r]

[b] Xylene (mixed) was used as a surrogate because there was no chemical specific SLV.
[c] 1,2- Dichloropropane was used as a surrogate because there was no chemical specific SLV.
[d] 2- Methylphenol was used as a surrogate because there was no chemical specific SLV.
[e] Ethylbenzene was used as a surrogate because there was no chemical specific SLV.
[f] Tributyltin was used as a surrogate because there was no chemical specific SLV.
[g] Chlordane (CAS # 57749) was used as a surrogate because there was no chemical specific SLV.
[h] Chromium (III) was used as a surrogate because there was no chemical specific SLV.
[i] 2,4-D was used as a surrogate because there was no chemical specific SLV.
[j] Total PCBs was used as a surrogate because the SLV is more conservative than the individual aroclor SLVs.

[r] Ecological Hierarchical SLV Selection: 1. USEPA Freshwater NAWQC, 2. ODEQ Freshwater Table 33A WQC, 3. DEQ Level II SLVs (lowest), 4. ORNL Tier II Value, 5. USEPA PAH FCV, 6. Canadian Freshwater WQG, 7. NOAA SQuiRTs Freshwater Chronic.
[s] As per EPA guidance, certain NRWQC were adjusted for hardness based on a site-specific hardness value of 60 mg/L (minimum value of 54 mg/L and maximum value of 64 mg/L). The equation and input parameters for calculating hardness-dependent freshwater dissolved metals criteria (i.e., Criteria Continuous Concentrations) presented in Appendix B of the NRWQC document were applied (EPA 2009) .

[t] For these two PAHs, the ecological SLV hierarchy presented in footnote "r" was not followed. As per the response to DEQ's Specific Comment #26 (see Appendix P), EPA's FCVs were used instead (EPA 2003).

Note
Only analytes with one or more candidate SLVs is shown on this table. For the full list of analytes, see Appendix J-1.
- = No benchmark available
DEQ = Oregon Department of Environmental Quality
Eco = ecological

Table J-5c - Ecological Sediment SLVs by Receptor
Bradford Island, Upland and River Operable Units
(3 of 3)

Analyte	CAS #	Sediment Screening Levels (mg/kg)											
		Site-Specific Reference UPL[i]	Benthic Community		Freshwater Fish		Birds				Mammals			
			DEQ Level II SLV [j]	Selected SLV with Surrogates[l]	DEQ Bioaccumulation SLV [k]	Selected SLV with Surrogates[l]	DEQ Bioaccumulation SLV [k]		Selected SLV with Surrogates[l]		DEQ Bioaccumulation SLV [k]		Selected SLV with Surrogates[l]	
							Individual	Population	Individual	Population	Individual	Population	Individual	Population

HH = human health
HPAH = High Molecular Weight PAH
HPAHs include : Benzo(a)anthracene, Benzo(a)pyrene, Benzo(b)fluoranthene, Benzo(g,h,i)perylene, Benzo(j,k)flouranthenes, Benzo(k)fluoranthene, Chrysene, Dibenzo(a,h)anthracene, Fluoranthene, Indeno(1,2,3-cd)pyrene, and Pyrene.
LPAH = Low Molecular Weight PAH
LPAHs include: 2-Methylnaphthalene, Acenaphthene, Acenaphthylene, Anthracene, Fluorene, Naphthalene, and Phenanthrene.
mg/kg = milligram per kilogram
SLV = screening level value
UPL = Upper Prediction Limit

[a] Benzo(k)fluoranthene was used as a surrogate because there was no chemical specific SLV.
[b] Di-n-butyl phthalate was used as a surrogate because there was no chemical specific SLV and di-n-butyl phthalate had the lowest SLV of the phthalates.
[c] Total PCBs was used as a surrogate because there were no individual aroclor SLVs.
[d] Chlordane (technical) was used as a surrogate because there was no chemical specific SLV and chlordane (technical) was the lowest of the chlordanes.
[e] BHC (gamma) Lindane was used as a surrogate because there was no chemical specific SLV and BHC (gamma) was the lowest of the BHCs.
[f] DDT (Total) was used as a surrogate because there was no chemical specific SLVs.
[g] Phenol was used as a surrogate because there was no chemical specific SLV and phenol had the lowest SLV of the phenols.
[h] PCB1254 was used as a surrogate because the SLV was the lowest of the individual aroclor SLVs and was lower than the Total PCBs SLV.
[i] **Site-Specific Reference UPLs are based are not based on toxicity values.**
[j] DEQ. 1998. Updated 2001. Guidance for Ecological Risk Assessment: Levels I,II,III,IV. Waste Management and Cleanup Division.
[k] DEQ 2007. Guidance for Assessing Bioaccumulative Chemicals of Concern in Sediment. Land Quality Division. Final. April 3.
[l] **For inorganics, the higher of the SLV and the Site-Specific Reference UPL was selected as the SLV.**

Note
Only analytes with one or more candidate SLVs is shown on this table. For the full list of analytes, see Appendix J-1.
- = No benchmark available
ATL = Acceptable tissue level
CTL = Critical tissue level (for fish)
DEQ = Oregon Department of Environmental Quality
Eco = ecological
HH = human health
HPAH = High Molecular Weight PAH

HPAHs include : Benzo(a)anthracene, Benzo(a)pyrene, Benzo(b)fluoranthene, Benzo(g,h,i)perylene, Benzo(j,k)flouranthenes, Benzo(k)fluoranthene, Chrysene, Dibenzo(a,h)anthracene, Fluoranthene, Indeno(1,2,3-cd)pyrene, and Pyrene.
LPAH = Low Molecular Weight PAH

LPAHs include: 2-Methylnaphthalene, Acenaphthene, Acenaphthylene, Anthracene, Fluorene, Naphthalene, and Phenanthrene.
mg/kg = milligram per kilogram
RI = Remedial Investigation
SLV = screening level value
UPL = Upper Prediction Limit

[a] DEQ 2007. Guidance for Evaluation of Bioaccumulative Chemicals of Concern in Sediment. Final. April 3.
[b] Total Aroclors was used as a surrogate because there was no chemical specific SLV.
[c] The SLV for fluoranthene was selected as a surrogate because there was no chemical-specific SLV.
[d] The SLV for pyrene was selected as a surrogate because there was no chemical-specific SLV.
[e] The ATLs and CTLs were developed based on the procedures outlined in DEQ 2007 (see DEQ Appendix L-3).

Notes

The potentially mass wasting soil subset is comprised of the following samples: BIL01USE through BIL09USE, BIL13SSI, and L-01 through L-04.

= The number of applicable MDLs > SLV are hightlighted yellow when they represent more than 10% of the data, recognizing that this does not take into account spacial density.

Table K-1
Human Health Data Sensitivity Analysis for Landfill AOPC Samples
Bradford Island - Upland Operable Unit
(20 of 20)

Medium	Analyte Group	Preparation Fraction	Analyte	Depth Category	Unit	Lowest HH SLV	Number of Samples	Number of Non-Detects (below MDL)	Number of Detects Between MDL and MRL	Minimum MDL of NDs	Maximum MDL of NDs	Number of MDLs > SLV	Minimum MRL of NDs and Detects below MRL	Maximum MRL of NDs and Detects below MRL	Number of MRLs > SLV

= When the number of applicable MRLs > SLV is higher than the number of applicable MDLs > SLV, they are highlited pink when the number of MDLs > SLV is zero or difference is more than 1.

HH = human health
MDL = method detection limit
mg/kg = milligrams per kilogram
MRL = methode reporting limit
MW Soil = Mass Wasting Soil
N/A = not applicable
ND = non-detect
NV = No value
NWTPH-Dx = northwest total petroleum hydrocarbon-diesel-extended
NWTPH-Gx =northwest total petroleum hydrocarbon-gasoline-extended
PCB = polychlorinated biphenyl
SLV = screening level value
SVOC = semi-volatile organic carbon
VOC = volatile organic carbon
ug/kg = micrograms per kilogram
ug/L = micrograms per liter

Notes
The erodible soil subset is comprised of the following samples: SB-EUA, SB-EUB, SB-EUA-02, SB-EUA-04, SB-EUA-06, SB-EUA-08, SB-EUB-02, SB-EUB-03, SB-EUB-12, SB-EUB-15, and SB-04.
= The number of applicable MDLs > SLV are hightlighted yellow when they represent more than 10% of the data, recognizing that this does not take into account spacial density.
= When the number of applicable MRLs > SLV is higher than the number of applicable MDLs > SLV, they are highlited pink when the number of MDLs > SLV is zero or difference is more than 1.

HH = human health
DP = Direct Push
MDL = method detection limit
mg/kg = milligrams per kilogram
MRL = methode reporting limit

Table K-2

Notes

= The number of applicable MDLs > SLV are hightlighted yellow when they represent more than 10% of the data, recognizing that this does not take into account spacial density.

HH = human health
DP = Direct Push
MDL = method detection limit
mg/kg = milligrams per kilogram
MRL = methode reporting limit
N/A = not applicable
ND = non-detect
SLV = screening level value
ug/L = micrograms per liter

Notes
(1) The SLV for Total LPAHs was used for the individual LPAHs.
(2) The SLV for Total HPAHs was used for the individual HPAHs.
The potentially mass wasting soil subset is comprised of the following samples: BIL01USE through BIL09USE, BIL13SSI, and L-01 through L-04.
= The number of applicable MDLs > SLV are hightlighted yellow when they represent more than 10% of the data, recognizing that this does not take into account spacial density.
= When the number of applicable MRLs > SLV is higher than the number of applicable MDLs > SLV, they are highlited pink when the number of MDLs > SLV is zero or difference is more than 1.

MDL = method detection limit
mg/kg = milligrams per kilogram
MRL = methode reporting limit
MW Soil = Mass Wasting Soil
N/A = not applicable
ND = non-detect
NV = No value
NWTPH-Dx = northwest total petroleum hydrocarbon-diesel-extended
NWTPH-Gx =northwest total petroleum hydrocarbon-gasoline-extended
PCB = polychlorinated biphenyl
SVOC = semi-volatile organic carbon
VOC = volatile organic carbon
ug/kg = micrograms per kilogram
ug/L = micrograms per liter

Notes
(1) The SLV for Total LPAHs was used for the individual LPAHs.
(2) The SLV for Total HPAHs was used for the individual HPAHs.
The erodible soil subset is comprised of the following samples: SB-EUA, SB-EUB, SB-EUA-02, SB-EUA-04, SB-EUA-06, SB-EUA-08, SB-EUB-02, SB-EUB-03, SB-EUB-12, SB-EUB-15, and SB-04.
= The number of applicable MDLs > SLV are hightlighted yellow when they represent more than 10% of the data, recognizing that this does not take into account spacial density.
= When the number of applicable MRLs > SLV is higher than the number of applicable MDLs > SLV, they are highlited pink when the number of MDLs > SLV is zero or difference is more than 1.

DP = Direct Push
MDL = method detection limit
mg/kg = milligrams per kilogram
MRL = methode reporting limit
N/A = not applicable
ND = non-detect

Notes
For SVOCs: Although the column and filter fractions are screened, in addition to the totals, the SLVs are based on exposure to totals.
= The number of applicable MDLs > SLV are hightlighted yellow when they represent more than 10% of the data, recognizing that this does not take into account spacial density.
= When the number of applicable MRLs > SLV is higher than the number of applicable MDLs > SLV, they are highlited pink when the number of MDLs > SLV is zero or difference is more than 1.

HH = human health
C+F = Column + Filter (MDL+MDL)
Dry = Dry weight
MDL = method detection limit
mg/kg = milligrams per kilogram
mg/L = milligrams per liter
MRL = methode reporting limit
ND = non-detect
ng/L = nanograms per liter
NV = No value
NWTPH-Dx = northwest total petroleum hydrocarbon-diesel-extended
NWTPH-Gx =northwest total petroleum hydrocarbon-gasoline-extended
PCB = polychlorinated biphenyl
SLV = screening level value
SVOC = semi-volatile organic carbon
ug/kg = micrograms per kilogram
ug/L = micrograms per liter
Wet = Wet Weight
KM, capped = Kaplan–Meier-based with Efron's bias correction, capped

Medium	Preparation Fraction	IUPAC Number	Analyte	Unit	Basis	Lowest HH SLV	Number of Samples	Number of NDs below RDL	Number of EMPC Results	Minimum RDL of NDs	Maximum RDL of NDs	Number of Applicable RDLs > SLV	Minimum EMPC Value	Maximum EMPC Value	Number of EMPCs > SLV

Notes
For C+F RDL values, the values shown are the sum of the RDLs and/or EMPCs for the ND column and filter results.
= The number of applicable RDLs > SLV are hightlighted yellow when they represent more than 10% of the data, recognizing that this does not take into account spacial density.
= The number of applicable EMPCs > SLV are hightlighted pink when they represent more than 10% of the data, recognizing that this does not take into account spacial density.

HH = human health
C+F = Column + Filter (RDL/EMPC + RDL/EMPC)
Dry = Dry weight
EMPC = The analyte was not positively identified; the associated numerical value is the Estimated Maximum Potential Concentration.
ND = non-detect
PCB = polychlorinated biphenyl
pg/kg = picograms per kilogram
pg/L = picograms per liter
RDL = reported detection limit
SLV = screening level value
Wet = Wet Weight

Notes
For SVOCs: Although the column and filter fractions are screened, in addition to the totals, the SLVs are based on exposure to totals.
= The number of applicable MDLs > SLV are hightlighted yellow when they represent more than 10% of the data, recognizing that this does not take into account spacial density.
= When the number of applicable MRLs > SLV is higher than the number of applicable MDLs > SLV, they are highlited pink when the number of MDLs > SLV is zero or difference is more than 1.

Eco = Ecological
C+F = Column + Filter (MDL+MDL)
Dry = Dry weight
MDL = method detection limit
mg/kg = milligrams per kilogram
mg/L = milligrams per liter
MRL = methode reporting limit
ND = non-detect
ng/L = nanogram per liter
NV = No value
NWTPH-Dx = northwest total petroleum hydrocarbon-diesel-extended
PCB = polychlorinated biphenyl
SVOC = semi-volatile organic carbon
ug/kg = micrograms per kilogram
ug/L = micrograms per liter
Wet = Wet Weight
KM, capped = Kaplan–Meier-based with Efron's bias correction, capped

Notes
For C+F RDL values, the values shown are the sum of the RDLs and/or EMPCs for the ND column and filter results.
= The number of applicable RDLs > SLV are hightlighted yellow when they represent more than 10% of the data, recognizing that this does not take into account spacial density.
= The number of applicable EMPCs > SLV are hightlighted pink when they represent more than 10% of the data, recognizing that this does not take into account spacial density.

Eco = Ecological
C+F = Column + Filter (RDL/EMPC + RDL/EMPC)
Dry = Dry weight
EMPC = The analyte was not positively identified; the associated numerical value is the Estimated Maximum Potential Concentration.
ND = non-detect
PCB = polychlorinated biphenyl
pg/kg = picograms per kilogram
pg/L = picograms per liter
RDL = reported detection limit
SLV = screening level value
Wet = Wet Weight

Notes

= The number of applicable MDLs > SLV are hightlighted yellow when they represent more than 10% of the data, recognizing that this does not take into account spacial density.

= When the number of applicable MRLs > SLV is higher than the number of applicable MDLs > SLV, they are highlited pink when the number of MDLs > SLV is zero or difference is more than 1.

Eco = Ecological
Dry = Dry weight
MDL = method detection limit
mg/kg = milligrams per kilogram
MRL = methode reporting limit
ND = non-detect
NV = No value
NWTPH-Dx = northwest total petroleum hydrocarbon-diesel-extended
PCB = polychlorinated biphenyl
SLV = screening level value
SVOC = semi-volatile organic carbon
ug/kg = micrograms per kilogram
Wet = Wet Weight

Notes

= The number of applicable EMPCs > SLV are hightlighted pink when they represent more than 10% of the data, recognizing that this does not take into account spacial density.

Eco = Ecological
Dry = Dry weight
EMPC = The analyte was not positively identified; the associated
numerical value is the Estimated Maximum Potential Concentration.
ND = non-detect
PCB = polychlorinated biphenyl
pg/kg = picograms per kilogram
RDL = reported detection limit
SLV = screening level value
Wet = Wet Weight

Notes

= When the number of applicable MRLs > SLV when they represent more than 10% of the data, recognizing that this does not take into account spacial density.

Eco = Ecological
Dry = Dry weight
MDL = method detection limit
mg/kg = milligrams per kilogram
MRL = methode reporting limit
ND = non-detect
NV = No value

NWTPH-Dx = northwest total petroleum hydrocarbon-diesel-extended
PCB = polychlorinated biphenyl
SLV = screening level value
SVOC = semi-volatile organic carbon
ug/kg = micrograms per kilogram
KM, capped = Kaplan–Meier-based with Efron's bias correction, capped

Notes:
Analytes shown include all compounds that were analyzed in one r more samples from MW-10.
µg/L = microgram per liter
mg/L = milligram per liter
MDL = method detection limit
- = Not Analyzed
J = The reported value is an estimate.
U = The analyte was not detected at or above the MDL.
UJ = The analyte was not detected. The reported MDL is an estimate.
bold = analyte detected above MDL.
When only one result was available for a given set of data, this value is shown under "Maximum Value" only.
= The AOPC value exceeds the Reference Area maximum result

Table L-4. Statistical Comparison of Forebay Data to Reference Area Data -- MDL Censored

							Reference Area										Forebay Area										Shapiro-Wilk W Test					Statistical Comparison (α = 5%)			If "No", Power Analysis (Normal Approximation)

Notes:

µg/kg = microgram per kilogram
mg/kg = milligram per kilogram
MDL = method detection limit
ND = Non Detect
MDL = method detection limit
RDL = reported detection limit
UPL = Upper Prediction Limit
- = Not Analyzed
bold = analyte detected above MDL/RDL.

[1] Only Aroclors 1248 and 1254 were included in summing sediment Total PCBs as Aroclors because all other aroclors were undected in Forebay sediment samples.
KM, capped = Kaplan–Meier-based with Efron's bias correction, capped
J = The reported value is an estimate.
U = The analyte was not detected at or above the MDL (except PCB congeners).
For PCB congeners, the analyte was not detected at or above the RDL/EMPC.
UJ = The analyte was not detected. The reported MDL (non-congeners) or RDL/EMPC (congeners) is an estimate.
EMPC = The analyte was not positively identified; the associated numerical value is the Estimated Maximum Potential Concentration.
= The maximum result exceeds the maximum Reference Area and the 95% UPL for the Reference Area.

Table L-8

UPL = Upper Prediction Limit
- = Not Analyzed
-- = SLV for analyte not available
bold = analyte detected above MDL/RDL.
KM, capped = Kaplan–Meier-based with Efron's bias correction, capped
J = The reported value is an estimate.
U = The analyte was not detected at or above the MDL (except PCB congeners). For PCB congeners, the analyte was not detected at or above the RDL/EMPC.
UJ = The analyte was not detected. The reported MDL (non-congeners) or RDL/EMPC (congeners) is an estimate.
EMPC = The analyte was not positively identified; the associated numerical value is the Estimated Maximum Potential Concentration.
= The reported concentration exceeds the Maximum Reference Area sediment concentation and the 95% UPL.

Sum non-carcinogenic C/RBC (HI)					**0.293**						
Sum carcinogenic C/RBC (ELCR)					**6.3E-05**						

Green highlight = Retained as a COPC
- = not evaluated since chemical was not detected in this medium at detection frequency greater than 5%
AOPC = area of potential concern
C = concentration
c = carcinogen
COPC = chemical of potential concern
DEQ = Oregon Department of Environmental Quality
ELCR = excess lifetime cancer risk = screening level estimate of carcinogenic risk based on Csoil/SLVsoil only (i.e. single medium).
ft bgs = feet below surface
gw = groundwater
HH = human health
HI = hazard index = screening level estimate of non-carcinogenic risk based on C_{soil}/SLV_{soil} only (i.e. single medium).
max =maximum
MCL = maximum contaminant level
mg/kg = milligrams per kilogram
mm = multimedia

Table M-1
Identification of COPCs in Soil at Landfill AOPC - Adult Outdoor Worker
Bradford Island -Upland Operable Unit
(3 of 3)

Chemicals of Interest	note	Detection Rate	Lower of the Maximum and 95% UCL	Selected HH SLV (Table J-4a)	Site concentration(C) / SLV					Retain as a COPC, Y/N?	Rationale
					$\frac{C_{soil}}{SLV_{soil}}$	$\frac{C_{gw}}{SLV_{gw}}$ (Potable Water User Table M-5)	$\frac{C_{gw}}{SLV_{gw}}$ (Bioaccumulation Table M-7)	Multimedia (direct contact) $sum(C/SLV_{soil} + C/SLV_{gw})$	Multimedia (bioaccumulation) $sum(C/SLV_{soil} + C/SLV_{gw})$		

n = non-carcinogen
NE = Multi-media was not evaluated since the chemical is already identified as a COPC.
NRWQC = national recommended water quality criteria
PAHs = polyaromatic hydrocarbons
PCBs = polychlorinated biphenyls
RBC = risk based concentration
RSL = regional screening level
SLV = screening level value
SVOCs = semivolatile organic chemicals
TPH = total petroleum hydrocarbon
ug/kg = micrograms per kilogram
UCL = 95% upper confidence limit
USEPA = United States Environmental Protection Agency
VOCs = volatile organic chemicals
WQC = water quality criteria

Notes
Only detected chemicals with a detection frequency greater than 5% and inorganics greater than reference are shown in this table. Reporting limits for non-detected chemicals are evaluated separately.
Outdoor Worker hierarchical SLV selection for soil: 1. Minimum of DEQ Soil RBCs (Ingest Occupational and Volatilize Outdoor Occupational), 2. USEPA Soil Industrial RSL, and 3. Surrogate used as noted in Appendix J-4a.
Potable Water User hierarchy was developed to determine Screening Levels Values for groundwater; 1. Minimum of DEQ Groundwater RBCs (Ingest Residential, Ingest Occupational, Volatilize Outdoor, Vapor Intrusion, Excavation), 2. USEPA tapwater RSLs, 3. DEQ MCLs, and 4. Surrogates used as noted in Appendix J-4b.
Hierarchy was developed to determine Screening Levels Values for Bioaccumulation pathway for groundwater; 1. Min USEPA NRWQC for water + organism and organism only, 2. Min DEQ WQC Table 33A, 3. Min DEQ WQC Table 33B, and 4. Surrogates used as noted in Appendix J-4c.
For inorganics, the higher of the 95% Upper Prediction Limit (UPL) and lowest HH SLV was selected as the HH SLV. For all other analytes the heirarchy described above was used.
Oregon Department of Environmental Quality (DEQ) 2003. Risk-Based Decision Making for the Remediation of Petroleum-Contaminated Sites. Land Quality Division, Environmental Cleanup and Tanks Program. September. Updated 2009

United States Environmental Protection Agency (USEPA) 2009. National Recommended Water Quality Criteria. United States Office of Water, Environmental Protection Agency, Office of Science and Technology.
USEPA 2010. Regional Screening Levels (RSL) for Chemical Contaminants at Superfund Sites. RSL Table Update. May.

COPC Selection
C/SLV = Site concentration divided by risk-based concentration where risk-based concentration equaled human health SLV
Sum cPAH C/RBC (ELCR) = includes only individual carcinogenic polyaromatic hydrocarbons selected as a COPC. Individual benzofluoranthenes, rather than total benzofluoranthenes, was used in the summation.
Sum non-carcinogenic C/SLV (HI) = summation of C/SLV of all non-carcinogens. Lead not included in summation because evaluated separately.
Sum carcinogenic C/SLV (ELCR) = summation of C/SLV of all carcinogens. Individual benzofluoranthenes, rather than total benzofluoranthenes, was used in the summation. Total aroclors, rather than individual aroclors, was used in the summation.
Ratios for SLVs based on Reference Upper Prediction Limits (UPLs) are not included in sum totals.
COPC selection process for human health follows the following criteria. Chemicals are included as COPCs if detection frequency exceeds 5% and sample size is greater than 20, inorganic site concentration exceeds reference and one of the following conditions:
[C/SLV] > 1.0 for an individual chemical in a given medium
[Sum non-carcinogenic C/SLV] >1.0 and individual non-carcinogen [C/SLV] >0.1 for multiple chemicals in a given medium
[Sum C/SLV] >1.0 for a single chemical in multiple media
For carcinogens only, eliminated as COPC if individual [C/SLV] < 1.0 (DEQ, 2010a).

(3 of 4)

Chemicals of Interest	note	Detection Rate	Lower of the Maximum and 95% UCL	Selected HH SLV (Table J-4a)	Site concentration(C) / SLV					Retain as a COPC, Y/N?	Rationale
					$\frac{C_{soil}}{SLV_{soil}}$	$\frac{C_{gw}}{SLV_{gw}}$ (Direct Contact Table M-4)	$\frac{C_{gw}}{SLV_{gw}}$ (Bioaccumulation Table M-7)	Multimedia (direct contact) sum(C/SLV_{soil} +C/SLV_{gw})	Multimedia (bioaccumulation) sum(C/SLV_{soil} +C/SLV_{gw})		
Sum non-carcinogenic C/RBC (HI)					**0.898**						
Sum carcinogenic C/RBC (ELCR)					**1.2E-05**						

Green highlight = Retained as a COPC
- = not evaluated since chemical was not detected in this medium at detection frequency greater than 5%
AOPC = area of potential concern
C = concentration
c = carcinogen
COPC = chemical of potential concern
DEQ = Oregon Department of Environmental Quality
ELCR = excess lifetime cancer risk = screening level estimate of carcinogenic risk based on Csoil/SLVsoil only (i.e. single medium).
ft bgs = feet below surface
gw = groundwater
HH = human health
HI = hazard index = screening level estimate of non-carcinogenic risk based on C_{soil}/SLV_{soil} only (i.e. single medium).
max =maximum
MCL = maximum contaminant level
mg/kg = milligrams per kilogram
mm = multimedia
n = non-carcinogen
NE = multi-media was not evaluated since the chemical is already identified as a COPC.
NRWQC = national recommended water quality criteria
PAHs = polyaromatic hydrocarbons
PCBs = polychlorinated biphenyls
RBC = risk based concentration
RSL = regional screening level
SLV = screening level value
SVOCs = semivolatile organic chemicals
TPH = total petroleum hydrocarbon
ug/kg = micrograms per kilogram
UCL = 95% upper confidence limit
USEPA = United States Environmental Protection Agency
VOCs = volatile organic chemicals
WQC = water quality criteria

Notes
Only detected chemicals with a detection frequency greater than 5% and inorganics greater than reference are shown in this table except for degradation products of PCE (see footnote 2). Reporting limits for non-detected chemicals are evaluated separately.
Construction Worker hierarchical SLV selection for soil: 1. DEQ Soil RBCs (Direct Contact Construction,. 2. USEPA Soil Industrial RSL, and 3. Surrogate used as noted in Appendix J-4a.
Screening Levels Values for Groundwater: 1. DEQ Groundwater in Excavation Construction/Excavation RBCs (Appendix J-4b), 2. USEPA Tapwater RSL, and 3. Surrogates used as noted in Appendix J-4b.

Hierarchy was developed to determine Screening Levels Values for Bioaccumulation pathway for groundwater; 1. Min USEPA NRWQC for water + organism and organism only, 2. Min DEQ WQC Table 33A, 3. Min DEQ WQC Table 33B, and 4. Surrogates used as noted in Appendix J-4c.
For inorganics, the higher of the 95% Upper Prediction Limit (UPL) and lowest HH SLV was selected as the HH SLV. For all other analytes the heirarchy described above was used.

Footnotes
(1) Degradation products of PCE are retained as COPCs if PCE is identified as a COPC, even if not detected or detected at less than 5% frequency per DEQ (2010a).

Table M-2
Identification of COPCs in Soil at Landfill AOPC - Construction Worker
Bradford Island -Upland Operable Unit
(4 of 4)

Chemicals of Interest	note	Detection Rate	Lower of the Maximum and 95% UCL	Selected HH SLV (Table J-4a)	Site concentration(C) / SLV					Retain as a COPC, Y/N?	Rationale

COPC Selection
C/SLV = Site concentration divided by risk-based concentration where risk-based concentration equaled human health SLV
Sum cPAH C/RBC (ELCR) = includes only individual carcinogenic polyaromatic hydrocarbons selected as a COPC. Individual benzofluoranthenes, rather than total benzofluoranthenes, was used in the summation.
Sum non-carcinogenic C/SLV (HI) = summation of C/SLV of all non-carcinogens. Lead not included in summation because evaluated separately.
Sum carcinogenic C/SLV (ELCR) = summation of C/SLV of all carcinogens. Individual benzofluoranthenes, rather than total benzofluoranthenes, was used in the summation. Total aroclors, rather than individual aroclors, was used in the summation.
Ratios for SLVs based on Reference Upper Prediction Limits (UPLs) are not included in sum totals.
COPC selection process for human health follows the following criteria. Chemicals are included as COPCs if detection frequency exceeds 5% and sample size is greater than 20, inorganic site concentration exceeds reference and one of the following conditions:
[C/SLV] > 1.0 for an individual chemical in a given medium
[Sum non-carcinogenic C/SLV] >1.0 and individual non-carcinogen [C/SLV] >0.1 for multiple chemicals in a given medium
[Sum C/SLV] >1.0 for a single chemical in multiple media
For carcinogens only, eliminated as COPC if individual [C/SLV] < 1.0 (DEQ, 2010a).

Chemicals of Interest	note	Detection Rate	Lower of the Maximum and 95% UCL	Selected HH SLV (Table J-4a)	Site concentration(C) / SLV					Retain as a COPC, Y/N?	Rationale
					$\frac{C_{soil}}{SLV_{soil}}$	$\frac{C_{gw}}{SLV_{gw}}$ (Direct Contact Table M-4)	$\frac{C_{gw}}{SLV_{gw}}$ (Bioaccumulation Table M-7)	Multimedia (direct contact) sum(C/SLV_{soil} +C/SLV_{gw})	Multimedia (bioaccumulation) sum(C/SLV_{soil} +C/SLV_{gw})		

- = not evaluated since chemical was not detected in this medium at detection frequency greater than 5%
AOPC = area of potential concern
C = concentration
c = carcinogen
COPC = chemical of potential concern
DEQ = Oregon Department of Environmental Quality
ELCR = excess lifetime cancer risk = screening level estimate of carcinogenic risk based on C_{soil}/SLV_{soil} only (i.e. single medium).
ft bgs = feet below surface
gw = groundwater
HH = human health
HI = hazard index = screening level estimate of non-carcinogenic risk based on C_{soil}/SLV_{soil} only (i.e. single medium).
max =maximum
MCL = maximum contaminant level
mg/kg = milligrams per kilogram
mm = multimedia
n = non-carcinogen
NE = multi-media was not evaluated since the chemical is already identified as a COPC.
NRWQC = national recommended water quality criteria
PAHs = polyaromatic hydrocarbons
PCBs = polychlorinated biphenyls
RBC = risk based concentration
RSL = regional screening level
SLV = screening level value
SVOCs = semivolatile organic chemicals
TPH = total petroleum hydrocarbon
ug/kg = micrograms per kilogram
UCL = 95% upper confidence limit
USEPA = United States Environmental Protection Agency
VOCs = volatile organic chemicals
WQC = water quality criteria

Notes
Only detected chemicals with a detection frequency greater than 5% and inorganics greater than reference are shown in this table. Reporting limits for non-detected chemicals are evaluated separately.
Excavation Worker hierarchical SLV selection for soil: 1. DEQ Soil RBCs (Direct Contact Excavation), 2. USEPA Soil Industrial RSL, 3. Outdoor Worker SLV, and 4. Surrogate used as noted in Appendix J-4a.
Screening Levels Values for Groundwater: 1. DEQ Groundwater in Excavation Construction/Excavation RBCs (Appendix J-4b), 2. USEPA Tapwater RSL, and 3. Surrogates used as noted in Appendix J-4b.

Hierarchy was developed to determine Screening Levels Values for Bioaccumulation pathway for groundwater; 1. Min USEPA NRWQC for water + organism and organism only, 2. Min DEQ WQC Table 33A, 3. Min DEQ WQC Table 33B, and 4. Surrogates used as noted in Appendix J-4c.
For inorganics, the higher of the 95% Upper Prediction Limit (UPL) and lowest HH SLV was selected as the HH SLV. For all other analytes the heirarchy described above was used.

COPC Selection
C/SLV = Site concentration divided by risk-based concentration where risk-based concentration equaled human health SLV
Sum non-carcinogenic C/SLV (HI) = summation of C/SLV of all non-carcinogens. Lead not included in summation because evaluated separately.
Sum carcinogenic C/SLV (ELCR) = summation of C/SLV of all carcinogens. Individual benzofluoranthenes, rather than total benzofluoranthenes, was used in the summation. Total aroclors, rather than individual aroclors, was used in the summation.
Ratios for SLVs based on Reference Upper Prediction Limits (UPLs) are not included in sum totals.
COPC selection process for human health follows the following criteria. Chemicals are included as COPCs if detection frequency exceeds 5% and sample size is greater than 20, inorganic site concentration exceeds reference and one of the following conditions:

Table M-3

UCL = 95% upper confidence limit
USEPA = United States Environmental Protection Agency
VOCs = volatile organic chemicals

Notes
Only detected chemicals with a detection frequency greater than 5% are shown in this table. Essential nutrients (calcium, magnesium, sodium, and potassium) are not included even if detected. Reporting limits for non-detected chemicals are evaluated separately.
Total metal results are reported.

Table M-4
Identification of COPCs in Groundwater at Landfill AOPC - Construction and Excavation Workers
Bradford Island -Upland Operable Unit
(3 of 3)

Chemicals of Interest	Note	Detection Rate	Lower of the Maximum and 95% UCL	Selected HH SLV (Table J-4b)	Site concentration(C) / SLV			Retain as a COPC, Y/N?	Rationale
					$\frac{C_{gw}}{SLV_{gw}}$ (direct contact)	$\frac{C_{soil}}{SLV_{soil}}$ (Construction Worker Table M-2)	Multimedia (1) (direct contact) $sum(C/SLV_{soil} + C/SLV_{gw})$		

Construction Worker hierarchical SLV selection for soil: 1. DEQ Soil RBCs (Direct Contact Construction,. 2. USEPA Soil Industrial RSL, and 3. Surrogate used as noted in Appendix J-4a.
Screening Levels Values for Groundwater: 1. DEQ Groundwater in Excavation Construction/Excavation RBCs (Appendix J-4b), 2. USEPA Tapwater RSL, and 3. Surrogates used as noted in Appendix J-4b.

Oregon Department of Environmental Quality (DEQ) 2003. Risk-Based Decision Making for the Remediation of Petroleum-Contaminated Sites. Land Quality Division, Environmental Cleanup and Tanks Program. September. Updated 2009
DEQ 2010a. Human Health Risk Assessment Guidance. Draft May 12.
United States Environmental Protection Agency (USEPA) 2010. Regional Screening Levels (RSL) for Chemical Contaminants at Superfund Sites. RSL Table Update. May.

Footnotes
(1) At the request of DEQ, COPC selection for groundwater is done separately for the on-site groundwater ingestion pathway and the groundwater discharge to surface water pathway. Therefore, this screening accounts only for on-site upland exposure to groundwater.
(2) The SLV for these chemcials are not available due to exceeding the solubility point in water.
(3) DEQ Maximum Contaminant Level (MCL) was used as a surrogate.

COPC Selection
C/SLV = Site concentration divided by risk-based concentration where risk-based concentration equaled human health SLV
Sum non-carcinogenic C/SLV (HI) = summation of C/SLV of all non-carcinogens
Sum carcinogenic C/SLV (ELCR) = summation of C/SLV of all carcinogens
COPC selection process for human health follows the following criteria. Chemicals are included as COPCs if detection frequency exceeds 5% and sample size is greater than 20, inorganic site concentration exceeds reference and one of the following conditions:

[C/SLV] > 1.0 for an individual chemical in a given medium
[Sum non-carcinogenic C/SLV] >1.0 and individual non-carcinogen [C/SLV] >0.1 for multiple chemicals in a given medium
[Sum C/SLV] >1.0 for a single chemical in multiple media

For carcinogens only, eliminated as COPC if individual [C/SLV] < 1.0 (DEQ, 2010a).

Sum carcinogenic C/RBC (ELCR)					**3.2E-04**				

Green highlight = Retained as a COPC
- = not evaluated since chemical was not detected in this medium at detection frequency greater than 5%
AOPC = area of potential concern
C = concentration
c = carcinogen
COPC = chemical of potential concern
DEQ = Oregon Department of Environmental Quality
ELCR = excess lifetime cancer risk = screening level estimate of carcinogenic risk based on C_{gw}/SLV_{gw} only (i.e. single medium).
gw = groundwater
HH = human health
HI = hazard index = screening level estimate of non-carcinogenic risk based on C_{gw}/SLV_{gw} only (i.e. single medium).
max =maximum
MCL = maximum contaminant level
mg/L = milligrams per liter
mm = multimedia
n = non-carcinogen
PAHs = polyaromatic hydrocarbons
RBC = risk based concentration
RSL = regional screening level
SLV = screening level value
TPH = total petroleum hydrocarbon

Table M-5
Identification of COPCs in Groundwater at Landfill AOPC - Potable Water User
Bradford Island -Upland Operable Unit
(3 of 3)

Chemicals of Interest	Note	Detection Rate	Lower of the Maximum and 95% UCL	Selected HH SLV (Table J-4b)	Site concentration(C) / SLV			Retain as a COPC, Y/N?	Rationale
					$\frac{C_{gw}}{SLV_{gw}}$ (Potable Water User)	$\frac{C_{soil}}{SLV_{soil}}$ (Occupational Worker Table M-1)	Multimedia (1) (direct contact) $sum(C/SLV_{soil} + C/SLV_{gw})$		

ug/L = micrograms per liter
UCL = 95% upper confidence limit
USEPA = United States Environmental Protection Agency
VOCs = volatile organic chemicals

Notes
Only detected chemicals with a detection frequency greater than 5% are shown in this table except for degradation products of PCE (see footnote 4). Essential nutrients (calcium, magnesium, sodium, and potassium) are not included even if detected. Reporting limits for non-detected chemicals are evaluated separately.
Total metal results are reported.
Outdoor Worker hierarchical SLV selection for soil: 1. Minimum of DEQ Soil RBCs (Ingest Occupational and Volatilize Outdoor Occupational), 2. USEPA Soil Industrial RSL, 3. Surrogate used as noted in Appendix J-4a.
Potable Water User hierarchy was developed to determine Screening Levels Values for groundwater; 1. Minimum of DEQ Groundwater RBCs (Ingest Residential, Ingest Occupational, Volatilize Outdoor, Vapor Intrusion, Excavation), 2. USEPA tapwater RSLs, 3. DEQ MCLs, 4. Surrogates used as noted in Appendix J-4b.

Oregon Department of Environmental Quality (DEQ) 2003. Risk-Based Decision Making for the Remediation of Petroleum-Contaminated Sites. Land Quality Division, Environmental Cleanup and Tanks Program. September. Updated 2009
DEQ 2010a. Human Health Risk Assessment Guidance. Draft May 12.
DEQ 2010b. Maximum Contaminant Level. Accessed online in January 2010 at: http://www.oregon.gov/DHS/ph/dwp/docs/pwsrules/61-0030.pdf
United States Environmental Protection Agency (USEPA) 2010. Regional Screening Levels (RSL) for Chemical Contaminants at Superfund Sites. RSL Table Update. May.

Footnotes
(1) At the request of DEQ, COPC selection for groundwater is done separately for the on-site groundwater ingestion pathway and the groundwater discharge to surface water pathway. Therefore, this screening accounts only for on-site upland exposure to groundwater.
(2) There is no SLV for chromium, but it is likely to exist in the trivalent form in the aerobic surface water environment
(3) Degradation products of PCE are retained as COPCs if PCE is identified as a COPC, even if not detected or detected at less than 5% frequency per DEQ (2010a).

COPC Selection
C/SLV = Site concentration divided by risk-based concentration where risk-based concentration equaled human health SLV
Sum cPAH C/RBC (ELCR) = includes only individual carcinogenic polyaromatic hydrocarbons selected as a COPC.
Sum non-carcinogenic C/SLV (HI) = summation of C/SLV of all non-carcinogens. Lead not included in summation because evaluated separately.
Sum carcinogenic C/SLV = summation of C/SLV of all carcinogens
COPC selection process for human health follows the following criteria. Chemicals are included as COPCs if detection frequency exceeds 5% and sample size is greater than 20, inorganic site concentration exceeds reference and one of the following conditions:

[C/SLV] > 1.0 for an individual chemical in a given medium
[Sum non-carcinogenic C/SLV] >1.0 and individual non-carcinogen [C/SLV] >0.1 for multiple chemicals in a given medium
[Sum C/SLV] >1.0 for a single chemical in multiple media

For carcinogens only, eliminated as COPC if individual [C/SLV] < 1.0 (DEQ, 2010a).

gw = groundwater
HH = human health
HI = hazard index = screening level estimate of non-carcinogenic risk based on C_{gw}/SLV_{gw} only (i.e. single medium).
max =maximum
mg/L = milligrams per liter
n = non-carcinogen
NA = not analyzed
NRWQC = national recommended water quality criteria
PAHs = polyaromatic hydrocarbons
RBC = risk based concentration
RSL = regional screening level
SLV = screening level value
TPH = total petroleum hydrocarbon
ug/L = micrograms per liter
UCL = 95% upper confidence limit
USEPA = United States Environmental Protection Agency
VOCs = volatile organic chemicals
WQC = water quality criteria

Table M-7
Identification of COPCs in Groundwater at Landfill AOPC - Discharge and Bioaccumulation
Bradford Island -Upland Operable Unit
(3 of 3)

Chemicals of Interest	Note	Detection Rate	Lower of the Maximum and 95% UCL	Selected HH SLV (Table J-4c)	Site concentration(C) / SLV			Bioaccumulative Potential? (Y/N) (Table J-6)	Retain as a COPC, Y/N?	Rationale
					$\frac{C_{gw}}{SLV_{gw}}$ (Bioaccumulation)	$\frac{C_{soil}}{SLV_{soil}}$ (Occupational Worker Table M-1)	Multimedia (1) (bioaccumulation) $sum(C/SLV_{soil} + C/SLV_{gw})$			

Notes
Only detected chemicals with a detection frequency greater than 5% are shown in this table. Essential nutrients (calcium, magnesium, sodium, and potassium) are not included even if detected. Reporting limits for non-detected chemicals are evaluated separately
Total metal results are reported.
Outdoor Worker hierarchical SLV selection for soil: 1. Minimum of DEQ Soil RBCs (Ingest Occupational and Volatilize Outdoor Occupational), 2. USEPA Soil Industrial RSL, and 3. Surrogate used as noted in Appendix J-4a.
Hierarchy was developed to determine Screening Levels Values for Bioaccumulation pathway for groundwater; 1. Min USEPA NRWQC for water + organism and organism only, 2. Min DEQ WQC Table 33A, 3. Min DEQ WQC Table 33B, and 4. Surrogates used as noted in Appendix J-4c.
Oregon Department of Environmental Quality (DEQ) 2003. Risk-Based Decision Making for the Remediation of Petroleum-Contaminated Sites. Land Quality Division, Environmental Cleanup and Tanks Program. September. Updated 2009
DEQ 2009. Oregon Administrative Rule (OAR) 340-041. Chapter 340, Division 41: Water Quality Standards: Beneficial Uses, Policies, and Criteria for Oregon. Tables 33A, 33B, and 33C. November.
DEQ 2010a. Human Health Risk Assessment Guidance. Draft May 12.
United States Environmental Protection Agency (USEPA) 2009. National Recommended Water Quality Criteria. United States Office of Water, Environmental Protection Agency, Office of Science and Technology.
USEPA 2010. Regional Screening Levels (RSL) for Chemical Contaminants at Superfund Sites. RSL Table Update. May.

Footnotes
(1) At the request of DEQ, groundwater COPCs are selected separately for each pathway. This table provides COPCs selected for the pathway of groundwater discharge to surface water and subsequent use of surface water (river water) for ingestions plus fish consumption (bioaccumulation).
(2) There is no SLV for chromium, but it is likely to exist in the trivalent form in the aerobic surface water environment
(3) SLVs are based on aesthetic considerations and are not included in summations or as a COPCs.
(4) Degradation products of PCE are retained as COPCs if PCE is identified as a COPC, even if not detected or detected at less than 5% frequency per DEQ (2010a). If the chemcial lacks a Bioaccumulation based SLV and is not considered bioaccumulative, then it is not selected as a COPC.

COPC Selection
C/SLV = Site concentration divided by risk-based concentration where risk-based concentration equaled human health SLV
Sum non-carcinogenic C/SLV (HI) = summation of C/SLV of all non-carcinogens. Lead not included in summation because evaluated separately. Iron and manganese not included in summation, see footnote (3).
Sum carcinogenic C/SLV (ELCR) = summation of C/SLV of all carcinogens
COPC selection process for human health follows the following criteria. Chemicals are included as COPCs if detection frequency exceeds 5% and sample size is greater than 20, inorganic site concentration exceeds reference and one of the following conditions:
[C/SLV] > 1.0 for an individual chemical in a given medium
[Sum non-carcinogenic C/SLV] >1.0 and individual non-carcinogen [C/SLV] >0.1 for multiple chemicals in a given medium
[Sum C/SLV] >1.0 for a single chemical in multiple media
For carcinogens only, eliminated as COPC if individual [C/SLV] < 1.0 (DEQ, 2010a).

Diesel Range Organics	n	0.0300	50%	-	-	0.0143	0.0143	NA	N	Evaluated as PAHs
Sum non-carcinogenic C/RBC (HI)					**0**					
Sum carcinogenic C/RBC (ELCR)					**6.5E-05**					

Green highlight = Retained as a COPC
- = not evaluated since chemical was not detected in this medium at detection frequency greater than 5%
AOPC = area of potential concern
C = concentration
c = carcinogen
COPC = chemical of potential concern
DEQ = Oregon Department of Environmental Quality
ELCR = excess lifetime cancer risk = screening level estimate of carcinogenic risk based on C_{sw}/SLV_{sw} only (i.e. single medium).
HH = human health
HI = hazard index = screening level estimate of non-carcinogenic risk based on C_{sw}/SLV_{sw} only (i.e. single medium).
max =maximum
mg/L = milligrams per liter
n = non-carcinogen
NRWQC = national recommended water quality criteria
RBC = risk based concentration
RSL = regional screening level
SLV = screening level value
sw = surface water
TPH = total petroleum hydrocarbon
ug/L = micrograms per liter
UCL = 95% upper confidence limit
USEPA = United States Environmental Protection Agency
WQC = water quality criteria

Notes
Only detected chemicals with a detection frequency greater than 5% are shown in this table. Essential nutrients (calcium, magnesium, sodium, and potassium) are not included even if detected. Reporting limits for non-detected chemicals are evaluated separately.
Total metal results are reported.
Outdoor Worker hierarchical SLV selection for soil: 1. Minimum of DEQ Soil RBCs (Ingest Occupational and Volatilize Outdoor Occupational), 2. USEPA Soil Industrial RSL, and 3. Surrogate used as noted in Appendix J-4a.
Hierarchy was developed to determine Screening Levels Values for Bioaccumulation pathway for groundwater; 1. Min USEPA NRWQC for water + organism and organism only, 2. Min DEQ WQC Table 33A, 3. Min DEQ WQC Table 33B, and 4. Surrogates used as noted in Appendix J-4c.

Oregon Department of Environmental Quality (DEQ) 2003. Risk-Based Decision Making for the Remediation of Petroleum-Contaminated Sites. Land Quality Division, Environmental Cleanup and Tanks Program. September. Updated 2009

DEQ 2010a. Human Health Risk Assessment Guidance. Draft May 12.
United States Environmental Protection Agency (USEPA) 2009. National Recommended Water Quality Criteria. United States Office of Water, Environmental Protection Agency, Office of Science and Technology.

Table M-11
Identification of COPCs in Shoreline Surface Water at Landfill AOPC - Discharge and Bioaccumulation
Bradford Island -Upland Operable Unit
(2 of 2)

Chemicals of Interest	Note	Max Detected Value	Detection Rate	Selected HH SLV (Table J-4c)	Site concentration(C) / SLV			Bioaccumulative Potential? (Y/N)	Retain as a COPC, Y/N?	Rationale
					$\frac{C_{sw}}{SLV_{sw}}$ (Bioaccumulation)	$\frac{C_{soil}}{SLV_{soil}}$ (Occupational Worker Table M-1)	Multimedia (1) (bioaccumulation) sum(C/SLV_{soil} +C/SLV_{sw})			

USEPA 2010. Regional Screening Levels (RSL) for Chemical Contaminants at Superfund Sites. RSL Table Update. May.

Footnotes
(1) Surface water associated with the landfill AOPC refers to data from the two shoreline locations (S2, S4) and is evaluated as part of groundwater discharge to surface water pathway.
(2) SLVs are based on aesthetic considerations and are not included in summations or as COPCs.

COPC Selection
C/SLV = Site concentration divided by risk-based concentration where risk-based concentration equaled human health SLV
Sum non-carcinogenic C/SLV (HI) = summation of C/SLV of all non-carcinogens. Lead not included in summation because evaluated separately. Iron and manganese not included in summation, see footnote (2).
Sum carcinogenic C/SLV (ELCR) = summation of C/SLV of all carcinogens

COPC selection process for human health follows the following criteria. Chemicals are included as COPCs if detection frequency exceeds 5% and sample size is greater than 20, inorganic site concentration exceeds reference and one of the following conditions:
[C/SLV] > 1.0 for an individual chemical in a given medium
[Sum non-carcinogenic C/SLV] >1.0 and individual non-carcinogen [C/SLV] >0.1 for multiple chemicals in a given medium
[Sum C/SLV] >1.0 for a single chemical in multiple media
For carcinogens only, eliminated as COPC if individual [C/SLV] < 1.0 (DEQ, 2010a).

Table M-12
Summary of COPCs - Landfill AOPC
Bradford Island -Upland Operable Unit
(1 of 1)

Media	Receptor	HI	ELCR	COPCs
Soil	Adult Outdoor Worker	0.293	6.32E-05	Arsenic Benzo(a)anthracene Benzo(a)pyrene Benzo(b)fluoranthene Benzofluoranthenes, Total Dibenz(a,h)anthracene Indeno(1,2,3-cd)pyrene Lead #

	Subsistence Fisher and Recreational Fisher (Discharge and Bioaccumulation)	5.76	6.0E-04	Arsenic Bis(2-ethylhexyl) Phthalate Di-n-octyl Phthalate Tetrachloroethene (PCE) Vinyl Chloride Antimony # Barium # Thallium # Zinc # 1,2,4-Trimethylbenzene # Isopropylbenzene Lead # Mercury # n-Propylbenzene # Tributyltin 1,1-Dichloroethene # trans-1,2-Dichloroethene # Trichloroethene (TCE)
Seepwater	Onsite Worker (Potable Water User)	NE	NE	Arsenic Chloroform Diesel Range Organics # Lead # Manganese # Tetrachloroethene (PCE) Antimony # Residual Range Organics # 1,1-Dichloroethene # cis-1,2-Dichloroethene # trans-1,2-Dichloroethene # Trichloroethene (TCE) Vinyl Chloride
	Subsistence Fisher and Recreational Fisher (Discharge and Bioaccumulation)	NE	NE	Arsenic Tetrachloroethene (PCE) 1,1-Dichloroethene # trans-1,2-Dichloroethene # Trichloroethene (TCE) Vinyl Chloride Lead # Mercury #
Shoreline Surface Water	Onsite Worker (Potable Water User)	NE	NE	Arsenic
	Subsistence Fisher and Recreational Fisher (Discharge and Bioaccumulation)	NE	NE	Arsenic Lead #

Bold = COPCs ELCR >1E-04
# = non-carcinogenic COPC
C/SLV = Site concentration divided by risk-based concentration where risk-based concentration equaled human health SLV
COPC = chemicals of potential concern
ELCR = excess lifetime cancer risk
HI = hazard index
NE = Cumulative HI and ELCR not evaluated. These pathways were evaluated only to see if additional COPCs were identified for Landfill.
PCBs = polychlorinated biphenyls

Shaded indicates COPC rationales not based on C/SLV>1 (i.e., multi-media, C/SLV>0.1, degradation product, or No SLV) or the SLV was not available for the specific exposure pathways.

Sum non-carcinogenic C/RBC (HI)					**0.0866**						
Sum carcinogenic C/RBC (ELCR)					**2.2E-05**						

Green highlight = Retained as a COPC
- = not evaluated since chemical was not detected in this medium at detection frequency >5%
AOPC = area of potential concern
C = concentration
c = carcinogen
COPC = chemical of potential concern
DEQ = Oregon Department of Environmental Quality
ELCR = excess lifetime cancer risk = screening level estimate of carcinogenic risk based on C_{soil}/SLV_{soil} only (i.e. single medium).
ft bgs = feet below surface
gw = groundwater
HH = human health
HI = hazard index = screening level estimate of non-carcinogenic risk based on C_{soil}/SLV_{soil} only (i.e. single medium).
max =maximum
MCL = maximum contaminant level
mg/kg = milligrams per kilogram
n = non-carcinogen
NE = Multi-media was not evaluated since the chemical is already identified as a COPC.
NRWQC = national recommended water quality criteria
PAHs = polyaromatic hydrocarbons
PCBs = polychlorinated biphenyls
RBC = risk based concentration
RSL = regional screening level
SLV = screening level value

Table M-13
Identification of COPCs in Soil at Sandblast Area AOPC - Adult Outdoor Worker
Bradford Island -Upland Operable Unit
(4 of 4)

Chemicals of Interest	note	Detection Rate	Lower of the Maximum and 95% UCL	Selected HH SLV (Table J-4a)	Site concentration(C) / SLV: $\frac{C_{soil}}{SLV_{soil}}$	Site concentration(C) / SLV: $\frac{C_{gw}}{SLV_{gw}}$ (Potable Water User Table M-18)	Site concentration(C) / SLV: $\frac{C_{gw}}{SLV_{gw}}$ (Bioaccumulation Table M-19)	Site concentration(C) / SLV: Multimedia (direct contact) $sum(C/SLV_{soil} + C/SLV_{gw})$	Site concentration(C) / SLV: Multimedia (bioaccumulation) $sum(C/SLV_{soil} + C/SLV_{gw})$	Retain as a COPC, Y/N?	Rationale

SVOCs = semivolatile organic chemicals
TPH = total petroleum hydrocarbon
ug/kg = micrograms per kilogram
UCL = 95% upper confidence limit
USEPA = United States Environmental Protection Agency
VOCs = volatile organic chemicals
WQC = water quality criteria

Notes
Only detected chemicals with a detection frequency greater than 5% and inorganics greater than reference are shown in this table except for degradation products of PCE (see footnote 5). Reporting limits for non-detected chemicals are evaluated separately.
Outdoor Worker hierarchical SLV selection for soil: 1. Minimum of DEQ Soil RBCs (Ingest Occupational and Volatilize Outdoor Occupational), 2. USEPA Soil Industrial RSL, and 3. Surrogate used as noted in Appendix J-4a.
Potable Water User hierarchy was developed to determine Screening Levels Values for groundwater; 1. Minimum of DEQ Groundwater RBCs (Ingest Residential, Ingest Occupational, Volatilize Outdoor, Vapor Intrusion, Excavation), 2. USEPA tapwater RSLs, 3. DEQ MCLs, and 4. Surrogates used as noted in Appendix J-4b.
Hierarchy was developed to determine Screening Levels Values for Bioaccumulation pathway for groundwater; 1. Min USEPA NRWQC for water + organism and organism only, 2. Min DEQ WQC Table 33A, 3. Min DEQ WQC Table 33B, and 4. Surrogates used as noted in Appendix J-4c.
For inorganics, the higher of the 95% Upper Prediction Limit (UPL) and lowest HH SLV was selected as the HH SLV. For all other analytes the heirarchy described above was used.

Footnotes
(1) Due to the lack of speciation data, the chromium in soil were compared to the more conservative hexavalent chromium SLVs.
(2) Degradation products of PCE are retained as COPCs if PCE is identified as a COPC, even if not detected or detected at less than 5% frequency per DEQ (2010a).

COPC Selection
C/SLV = Site concentration divided by risk-based concentration where risk-based concentration equaled human health SLV
Sum cPAH C/RBC (ELCR) = includes only individual carcinogenic polyaromatic hydrocarbons selected as a COPC. Individual benzofluoranthenes, rather than total benzofluoranthenes, was used in the summation.
Sum non-carcinogenic C/SLV (HI) = summation of C/SLV of all non-carcinogens. Lead not included in summation because evaluated separately.
Sum carcinogenic C/SLV (ELCR) = summation of C/SLV of all carcinogens. Individual benzofluoranthenes, rather than total benzofluoranthenes, was used in the summation. Total aroclors, rather than individual aroclors, was used in the summation.
Ratios for SLVs based on Reference Upper Prediction Limits (UPLs) are not included in sum totals.
COPC selection process for human health follows the following criteria. Chemicals are included as COPCs if detection frequency exceeds 5% and sample size is greater than 20, inorganic site concentration exceeds reference and one of the following conditions:
[C/SLV] > 1.0 for an individual chemical in a given medium
[Sum non-carcinogenic C/SLV] >1.0 and individual non-carcinogen [C/SLV] >0.1 for multiple chemicals in a given medium
[Sum C/SLV] >1.0 for a single chemical in multiple media
For carcinogens only, eliminated as COPC if individual [C/SLV] < 1.0 (DEQ, 2010a).

Sum non-carcinogenic C/RBC (HI)					**0.115**						
Sum carcinogenic C/RBC (ELCR)					**7.0E-06**						

Green highlight = Retained as a COPC
- = not evaluated since chemical was not detected in this medium at detection frequency >5%
AOPC = area of potential concern
C = concentration
c = carcinogen
COPC = chemical of potential concern
DEQ = Oregon Department of Environmental Quality
ELCR = excess lifetime cancer risk = screening level estimate of carcinogenic risk based on C_{soil}/SLV_{soil} only (i.e. single medium).
ft bgs = feet below surface
gw = groundwater
HH = human health
HI = hazard index = screening level estimate of non-carcinogenic risk based on C_{soil}/SLV_{soil} only (i.e. single medium).

Table M-14
Identification of COPCs in Soil at Sandblast Area AOPC - Construction Worker
Bradford Island -Upland Operable Unit
(4 of 4)

Chemicals of Interest	note	Detection Rate	Lower of the Maximum and 95% UCL	Selected HH SLV (Table J-4a)	Site concentration(C) / SLV					Retain as a COPC, Y/N?	Rationale
					$\frac{C_{soil}}{SLV_{soil}}$	$\frac{C_{gw}}{SLV_{gw}}$ (Direct Contact Table M-17)	$\frac{C_{gw}}{SLV_{gw}}$ (Bioaccumulation Table M-19)	Multimedia (direct contact) $sum(C/SLV_{soil} + C/SLV_{gw})$	Multimedia (bioaccumulation) $sum(C/SLV_{soil} + C/SLV_{gw})$		

max =maximum
MCL = maximum contaminant level
mg/kg = milligrams per kilogram
mm = multimedia
n = non-carcinogen
NE = multi-media was not evaluated since the chemical is already identified as a COPC.
NRWQC = national recommended water quality criteria
PAHs = polyaromatic hydrocarbons
PCBs = polychlorinated biphenyls
RBC = risk based concentration
RSL = regional screening level
SLV = screening level value
SVOCs = semivolatile organic chemicals
TPH = total petroleum hydrocarbon
ug/kg = micrograms per kilogram
UCL = 95% upper confidence limit
USEPA = United States Environmental Protection Agency
VOCs = volatile organic chemicals
WQC = water quality criteria

Notes
Only detected chemicals with a detection frequency greater than 5% and inorganics greater than reference are shown in this table except for degradation products of PCE (see footnote 2). Reporting limits for non-detected chemicals are evaluated separately.
Construction Worker hierarchical SLV selection for soil: 1. DEQ Soil RBCs (Direct Contact Construction,. 2. USEPA Soil Industrial RSL, and 3. Surrogate used as noted in Appendix J-4a.
Screening Levels Values for Groundwater: 1. DEQ Groundwater in Excavation Construction/Excavation RBCs (Appendix J-4b), 2. USEPA Tapwater RSL, and 3. Surrogates used as noted in Appendix J-4b.
Hierarchy was developed to determine Screening Levels Values for Bioaccumulation pathway for groundwater; 1. Min USEPA NRWQC for water + organism and organism only, 2. Min DEQ WQC Table 33A, 3. Min DEQ WQC Table 33B, and 4. Surrogates used as noted in Appendix J-4c.
For inorganics, the higher of the 95% Upper Prediction Limit (UPL) and lowest HH SLV was selected as the HH SLV. For all other analytes the heirarchy described above was used.

United States Environmental Protection Agency (USEPA) 2009. National Recommended Water Quality Criteria. United States Office of Water, Environmental Protection Agency, Office of Science and Technology.
USEPA 2010. Regional Screening Levels (RSL) for Chemical Contaminants at Superfund Sites. RSL Table Update. May.

Footnotes
(1) Due to the lack of speciation data, the chromium in soil were compared to the more conservative hexavalent chromium SLVs.
(2) Degradation products of PCE are retained as COPCs if PCE is identified as a COPC, even if not detected or detected at less than 5% frequency per DEQ (2010a).

COPC Selection
C/SLV = Site concentration divided by risk-based concentration where risk-based concentration equaled human health SLV
Sum cPAH C/RBC (ELCR) = includes only individual carcinogenic polyaromatic hydrocarbons selected as a COPC. Individual benzofluoranthenes, rather than total benzofluoranthenes, was used in the summation.
Sum non-carcinogenic C/SLV (HI) = summation of C/SLV of all non-carcinogens. Lead not included in summation because evaluated separately.
Sum carcinogenic C/SLV (ELCR) = summation of C/SLV of all carcinogens. Individual benzofluoranthenes, rather than total benzofluoranthenes, was used in the summation. Total aroclors, rather than individual aroclors, was used in the summation.
Ratios for SLVs based on Reference Upper Prediction Limits (UPLs) are not included in sum totals.
COPC selection process for human health follows the following criteria. Chemicals are included as COPCs if detection frequency exceeds 5% and sample size is greater than 20, inorganic site concentration exceeds reference and one of the following conditions:
[C/SLV] > 1.0 for an individual chemical in a given medium
[Sum non-carcinogenic C/SLV] >1.0 and individual non-carcinogen [C/SLV] >0.1 for multiple chemicals in a given medium
[Sum C/SLV] >1.0 for a single chemical in multiple media
For carcinogens only, eliminated as COPC if individual [C/SLV] < 1.0 (DEQ, 2010a).

Green highlight = Retained as a COPC
- = not evaluated since chemical was not detected in this medium at detection frequency greater than 5%
AOPC = area of potential concern
C = concentration
c = carcinogen
COPC = chemical of potential concern
DEQ = Oregon Department of Environmental Quality
ELCR = excess lifetime cancer risk = screening level estimate of carcinogenic risk based on C_{soil}/SLV_{soil} only (i.e. single medium).
ft bgs = feet below surface
gw = groundwater
HH = human health
HI = hazard index = screening level estimate of non-carcinogenic risk based on C_{soil}/SLV_{soil} only (i.e. single medium).
max =maximum
MCL = maximum contaminant level

Table M-15
Identification of COPCs in Soil at Sandblast Area AOPC - Excavation Worker
Bradford Island -Upland Operable Unit
(4 of 4)

Chemicals of Interest	note	Detection Rate	Lower of the Maximum and 95% UCL	Selected HH SLV (Table J-4a)	Site concentration(C) / SLV					Retain as a COPC, Y/N?	Rationale
					$\frac{C_{soil}}{SLV_{soil}}$	$\frac{C_{gw}}{SLV_{gw}}$ (Direct Contact Table M-17)	$\frac{C_{gw}}{SLV_{gw}}$ (Bioaccumulation Table M-19)	Multimedia (direct contact) $sum(C/SLV_{soil} + C/SLV_{gw})$	Multimedia (bioaccumulation) $sum(C/SLV_{soil} + C/SLV_{gw})$		

mg/kg = milligrams per kilogram
mm = multimedia
n = non-carcinogen
NE = multi-media was not evaluated since the chemical is already identified as a COPC.
NRWQC = national recommended water quality criteria
PAHs = polyaromatic hydrocarbons
PCBs = polychlorinated biphenyls
RBC = risk based concentration
RSL = regional screening level
SLV = screening level value
SVOCs = semivolatile organic chemicals
TPH = total petroleum hydrocarbon
ug/kg = micrograms per kilogram
UCL = 95% upper confidence limit
USEPA = United States Environmental Protection Agency
VOCs = volatile organic chemicals
WQC = water quality criteria

Notes
Only detected chemicals with a detection frequency greater than 5% and inorganics greater than reference are shown in this table). Reporting limits for non-detected chemicals are evaluated separately.
Excavation Worker hierarchical SLV selection for soil: 1. DEQ Soil RBCs (Direct Contact Excavation), 2. USEPA Soil Industrial RSL, 3. Outdoor Worker SLV, and 4. Surrogate used as noted in Appendix J-4a
Screening Levels Values for Groundwater: 1. DEQ Groundwater in Excavation Construction/Excavation RBCs (Appendix J-4b), 2. USEPA Tapwater RSL, and 3. Surrogates used as noted in Appendix J-4b
Hierarchy was developed to determine Screening Levels Values for Bioaccumulation pathway for groundwater; 1. Min USEPA NRWQC for water + organism and organism only, 2. Min DEQ WQC Table 33A, 3. Min DEQ WQC Table 33B, and 4. Surrogates used as noted in Appendix J-4c
For inorganics, the higher of the 95% Upper Prediction Limit (UPL) and lowest HH SLV was selected as the HH SLV. For all other analytes the heirarchy described above was used.

Footnotes
(1) Due to the lack of speciation data, the chromium in soil were compared to the more conservative hexavalent chromium SLVs

COPC Selection
C/SLV = Site concentration divided by risk-based concentration where risk-based concentration equaled human health SLV
Sum non-carcinogenic C/SLV (HI) = summation of C/SLV of all non-carcinogens. Lead not included in summation because evaluated separately.
Sum carcinogenic C/SLV (ELCR) = summation of C/SLV of all carcinogens. Individual benzofluoranthenes, rather than total benzofluoranthenes, was used in the summation. Total aroclors, rather than individual aroclors, was used in the summation
Ratios for SLVs based on Reference Upper Prediction Limits (UPLs) are not included in sum totals.
COPC selection process for human health follows the following criteria. Chemicals are included as COPCs if detection frequency exceeds 5% and sample size is greater than 20, inorganic site concentration exceeds reference and one of the following conditions:
[C/SLV] > 1.0 for an individual chemical in a given medium
[Sum non-carcinogenic C/SLV] >1.0 and individual non-carcinogen [C/SLV] >0.1 for multiple chemicals in a given medium
[Sum C/SLV] >1.0 for a single chemical in multiple media
For carcinogens only, eliminated as COPC if individual [C/SLV] < 1.0 (DEQ, 2010a).

Table M-17
Identification of COPCs in Groundwater at Sandblast Area AOPC - Construction and Excavation Workers
Bradford Island -Upland Operable Unit
(2 of 3)

Chemicals of Interest	note	Medium	Detection Rate	Lower of the Maximum and 95% UCL	Selected HH SLV (Table J-4b)	Site concentration(C) / SLV			Retain as a COPC, Y/N?	Rationale
						$\frac{C_{gw}}{SLV_{gw}}$ (direct contact)	$\frac{C_{soil}}{SLV_{soil}}$ (Construction Worker Table M-14)	Multimedia (1) (direct contact) sum($C/SLV_{soil} + C/SLV_{gw}$)		

Green highlight = Retained as a COPC
- = not evaluated since chemical was not detected in this medium at detection frequency greater than 5%
AOPC = area of potential concern
C = concentration
c = carcinogen
COPC = chemical of potential concern
DEQ = Oregon Department of Environmental Quality
DP = direct push
ELCR = excess lifetime cancer risk = screening level estimate of carcinogenic risk based on C_{gw}/SLV_{gw} only (i.e. single medium).
gw = groundwater
HH = human health
HI = hazard index = screening level estimate of non-carcinogenic risk based on C_{gw}/SLV_{gw} only (i.e. single medium).
max =maximum
mg/L = milligrams per liter
n = non-carcinogen
NE = Multi-media was not evaluated since the chemical is already identified as a COPC.
PAHs = polyaromatic hydrocarbons
RBC = risk based concentration
RSL = regional screening level
SLV = screening level value
TPH = total petroleum hydrocarbon
ug/L = micrograms per liter
UCL = 95% upper confidence limit
USEPA = United States Environmental Protection Agency
VOCs = volatile organic chemicals

Notes

Only detected chemicals with a detection frequency greater than 5% are shown in this table. Essential nutrients (calcium, magnesium, sodium, and potassium) are not included even if detected. Reporting limits for non-detected chemicals are evaluated separately.
Total metal results are reported.
Construction Worker hierarchical SLV selection for soil: 1. DEQ Soil RBCs (Direct Contact Construction,. 2. USEPA Soil Industrial RSL, and 3. Surrogate used as noted in Appendix J-4a.
Screening Levels Values for Groundwater: 1. DEQ Groundwater in Excavation Construction/Excavation RBCs (Appendix J-4b), 2. USEPA Tapwater RSL, and 3. Surrogates used as noted in Appendix J-4b.
Oregon Department of Environmental Quality (DEQ) 2003. Risk-Based Decision Making for the Remediation of Petroleum-Contaminated Sites. Land Quality Division, Environmental Cleanup and Tanks Program. September. Updated 2009
DEQ 2010a. Human Health Risk Assessment Guidance. Draft May 12.
United States Environmental Protection Agency (USEPA) 2010. Regional Screening Levels (RSL) for Chemical Contaminants at Superfund Sites. RSL Table Update. May.

Footnotes

(1) At the request of DEQ, COPC selection for groundwater is done separately for the on-site groundwater ingestion pathway and the groundwater discharge to surface water pathway. Therefore, this screening accounts only for on-site upland exposure to groundwater.
(2) The SLV for these chemcials are not available due to exceeding the solubility point in water.

COPC Selection
C/SLV = Site concentration divided by risk-based concentration where risk-based concentration equaled human health SLV
Sum non-carcinogenic C/SLV (HI) = summation of C/SLV of all non-carcinogens
Sum carcinogenic C/SLV (ELCR) = summation of C/SLV of all carcinogens

COPC selection process for human health follows the following criteria. Chemicals are included as COPCs if detection frequency exceeds 5% and sample size is greater than 20, inorganic site concentration exceeds reference and one of the following conditions:
[C/SLV] > 1.0 for an individual chemical in a given medium
[Sum non-carcinogenic C/SLV] >1.0 and individual non-carcinogen [C/SLV] >0.1 for multiple chemicals in a given medium

Table M-17

Footnotes
(1) At the request of DEQ, COPC selection for groundwater is done separately for the on-site groundwater ingestion pathway and the groundwater discharge to surface water pathway. Therefore, this screening accounts only for on-site upland exposure to groundwater.
(2) SLV is based on aesthetic considerations and is not included in summations or as COPCs.
(3) Degradation products of PCE are retained as COPCs if PCE is identified as a COPC, even if not detected or detected at less than 5% frequency per DEQ (2010a).

COPC Selection
C/SLV = Site concentration divided by risk-based concentration where risk-based concentration equaled human health SLV
Sum cPAH C/RBC (ELCR) = includes only individual carcinogenic polyaromatic hydrocarbons selected as a COPC.
Sum non-carcinogenic C/SLV (HI) = summation of C/SLV of all non-carcinogens
Sum carcinogenic C/SLV (ELCR) = summation of C/SLV of all carcinogens
COPC selection process for human health follows the following criteria. Chemicals are included as COPCs if detection frequency exceeds 5% and sample size is greater than 20, inorganic site concentration exceeds reference and one of the following conditions:
[C/SLV] > 1.0 for an individual chemical in a given medium
[Sum non-carcinogenic C/SLV] >1.0 and individual non-carcinogen [C/SLV] >0.1 for multiple chemicals in a given medium

United States Environmental Protection Agency (USEPA) 2009. National Recommended Water Quality Criteria. United States Office of Water, Environmental Protection Agency, Office of Science and Technolog
USEPA 2010. Regional Screening Levels (RSL) for Chemical Contaminants at Superfund Sites. RSL Table Update. May

Footnotes
(1) At the request of DEQ, groundwater COPCs are selected separately for each pathway. This table provides COPCs selected for the pathway of groundwater discharge to surface water and subsequent use of surface water (river water) for ingestions plus fish consumption (bioaccumulation
(2) SLVs is based on aesthetic considerations and are not included as a COPC.
(3) Degradation products of PCE are retained as COPCs if PCE is identified as a COPC, even if not detected or detected at less than 5% frequency per DEQ (2010a).

COPC Selection
C/SLV = Site concentration divided by risk-based concentration where risk-based concentration equaled human health SLV
Sum cPAH C/RBC (ELCR) = includes only individual carcinogenic polyaromatic hydrocarbons selected as a COPC
Sum non-carcinogenic C/SLV (HI) = summation of C/SLV of all non-carcinogens. Iron not included in summation, see footnote (3
Sum carcinogenic C/SLV (ELCR) = summation of C/SLV of all carcinogen
COPC selection process for human health follows the following criteria. Chemicals are included as COPCs if detection frequency exceeds 5% and sample size is greater than 20, inorganic site concentration exceeds reference and one of the following condition
- [C/SLV] > 1.0 for an individual chemical in a given mediun
- [Sum non-carcinogenic C/SLV] >1.0 and individual non-carcinogen [C/SLV] >0.1 for multiple chemicals in a given mediur
- [Sum C/SLV] >1.0 for a single chemical in multiple medi

For carcinogens only, eliminated as COPC if individual [C/SLV] < 1.0 (DEQ, 2010a)

Table M-20
Summary of COPCs - Sandblast Area AOPC
Bradford Island -Upland Operable Unit
(1 of 1)

Media	Receptor	HI	ELCR	COPCs
Soil	Occupational Outdoor Worker	0.0866	2.2E-05	Arsenic Benzo(a)pyrene Benzofluoranthenes, Total Chromium Lead # Tetrachloroethene (PCE) 1,1-Dichloroethene # cis-1,2-Dichloroethene # Dibenz(a,h)anthracene trans-1,2-Dichloroethene # Trichloroethene (TCE) Vinyl Chloride
	Construction Worker	0.115	7.0E-06	Benzo(a)pyrene Tetrachloroethene (PCE) 1,1-Dichloroethene # cis-1,2-Dichloroethene # trans-1,2-Dichloroethene # Trichloroethene (TCE) Vinyl Chloride
	Excavation Worker	0.0718	8.1E-07	No COPCs

Sum carcinogenic C/SLV (ELCR) = summation of C/SLV of all carcinogens
COPC selection process for human health follows the following criteria. Chemicals are included as COPCs if detection frequency exceeds 5% and sample size is greater than 20, inorganic site concentration exceeds reference and one of the following conditions:

[C/SLV] > 1.0 for an individual chemical in a given medium
[Sum non-carcinogenic C/SLV] >1.0 and individual non-carcinogen [C/SLV] >0.1 for multiple chemicals in a given medium
[Sum C/SLV] >1.0 for a single chemical in multiple media

For carcinogens only, eliminated as COPC if individual [C/SLV] < 1.0 (DEQ, 2010a).

Table M-25
Identification of COPCs in Sediment at Pistol Range AOPC - Fish Consumer
Bradford Island -Upland Operable Unit
(1 of 1)

Chemicals of Interest	note	Detection Rate	Lower of the Maximum and 95% UCL	Selected HH SLV (Table J-4e)	Site concentration(C) / SLV $\frac{C_{sed}}{SLV_{sed}}$	Bioaccumulative Potential? (Y/N) (Table J-6)	Retain as a COPC, Y/N?	Rationale
INORGANICS (mg/kg)								
Copper	n	100%	25.4	55.6 (1)	0.457	N	N	C/SLV<1
Lead	n	100%	33.0	14.5 (1)	2.28	Y	Y	C/SLV >1
Nickel	c	100%	15.4	21.2 (1)	0.726	N	N	carc C/SLV <1
Zinc	n	100%	174	106 (1)	1.64	Y	Y	C/SLV >1

Green highlight = Retained as a COPC
- = not evaluated since chemical was not detected in this medium at detection frequency >5%
AOPC = area of potential concern
C = concentration
c = carcinogen
COPC = chemical of potential concern
DEQ = Oregon Department of Environmental Quality
ELCR = excess lifetime cancer risk = screening level estimate of carcinogenic risk based on C_{soil}/SLV_{sed} only (i.e. single medium).
gw = groundwater
HH = human health
HI = hazard index = screening level estimate of non-carcinogenic risk based on C_{soil}/SLV_{sed} only (i.e. single medium).
max =maximum
mg/kg = milligrams per kilogram
n = non-carcinogen
SLV = screening level value
sed = sediment
UCL = 95% upper confidence limit

Notes
Only detected chemicals with a detection frequency greater than 5% are shown in this table. Reporting limits for non-detected chemicals are evaluated separately.
Hierarchy was developed to determine Screening Levels Values for Sediment; 1. Minimum of DEQ HH Bioaccumulative SLVs and 2. Surrogates as used in Appendix J-4e.
Oregon Department of Environmental Quality (DEQ) 2007. Guidance for Evaluation of Bioaccumulative Chemicals of Concern in Sediment. Final. January 31.
DEQ 2010a. Human Health Risk Assessment Guidance. Draft May 12.

Footnotes
(1) Reference Sediment 95% Upper Prediction Limit (UPL) was used as the Selected HH SLV; see Appendix L-4, Sediment

COPC Selection
C/SLV = Site concentration divided by risk-based concentration where risk-based concentration equaled human health SLV
Sum non-carcinogenic C/SLV (HI) = summation of C/SLV of all non-carcinogens. Lead not included in summation because evaluated separately.
Sum non-carcinogenic C/SLV (ELCR) = summation of C/SLV of all non-carcinogens
Ratios for SLVs based on Reference Upper Prediction Limits (UPLs) are not included in sum totals. Since all selected HH SLVs are based on UPLs, sum totals are not shown.
COPC selection process for human health follows the following criteria. Chemicals are included as COPCs if detection frequency exceeds 5%, inorganic site concentration exceeds reference and one of the following
[C/SLV] > 1.0 for an individual chemical in a given medium
[Sum non-carcinogenic C/SLV] >1.0 and individual non-carcinogen [C/SLV] >0.1 for multiple chemicals in a given medium
For carcinogens only, eliminated as COPC if individual [C/SLV] < 1.0 (DEQ, 2010a).

Table M-26
Summary of COPCs - Pistol Range AOPC
Bradford Island -Upland Operable Unit
(1 of 1)

Media	Receptor	HI	ELCR	COPCs
Soil	Adult Outdoor Worker, Construction Worker, Excavation Worker	0.000477	4.2E-09	Lead #
Groundwater	Construction/Excavation Worker	0.0136	4.2E-12	None
	Potable Water User	0.0501	6.9E-08	Lead #
	Discharge and Bioaccumulation	NE	NE	Lead #
Sediment	Wader	NE	NE	Lead # Zinc #

Bold = COPCs ELCR >1E-04
# = non-carcinogenic COPC
C/SLV = Site concentration divided by risk-based concentration where risk-based concentration equaled human health SLV
COPC = chemicals of potential concern
ELCR = excess lifetime cancer risk
HI = hazard index
NE = Cumulative HI and ELCR not evaluated. These pathways were evaluated only to see if additional COPCs were identified for Pistol Range.
PCBs = polychlorinated biphenyls
Shaded indicates COPC rationales not based on C/SLV>1 (multi-media, C/SLV>0.1, degradation product, or No SLV)

Sum non-carcinogenic C/RBC (HI)						**0.123**						
Sum carcinogenic C/RBC (ELCR)						**5.0E-05**						

Green highlight = Retained as a COPC
- = not evaluated since chemical was not detected in this medium at detection frequency greater than 5%
AOPC = area of potential concern
C = concentration
c = carcinogen
COPC = chemical of potential concern
DEQ = Oregon Department of Environmental Quality
ELCR = excess lifetime cancer risk = screening level estimate of carcinogenic risk based on C_{soil}/SLV_{soil} only (i.e. single medium).
ft bgs = feet below surface
gw = groundwater
HH = human health
HI = hazard index = screening level estimate of non-carcinogenic risk based on C_{soil}/SLV_{soil} only (i.e. single medium).
max =maximum
MCL = maximum contaminant level
mg/kg = milligrams per kilogram
mm = multimedia
n = non-carcinogen
NE = multi-media was not evaluated since the chemical is already identified as a COPC.
NRWQC = national recommended water quality criteria
PAHs = polyaromatic hydrocarbons
PCBs = polychlorinated biphenyls
RBC = risk based concentration
RSL = regional screening level
SLV = screening level value
SVOCs = semivolatile organic chemicals
TPH = total petroleum hydrocarbon
ug/kg = micrograms per kilogram
UCL = 95% upper confidence limit
USEPA = United States Environmental Protection Agency
VOCs = volatile organic chemicals
WQC = water quality criteria

Notes
Only detected chemicals with a detection frequency greater than 5% and inorganics greater than reference are shown in this table except for degradation products of PCE (see footnote 5). Reporting limits for non-detected chemicals are evaluated separately.
Outdoor Worker hierarchical SLV selection for soil: 1. Minimum of DEQ Soil RBCs (Ingest Occupational and Volatilize Outdoor Occupational), 2. USEPA Soil Industrial RSL, and 3. Surrogate used as noted in Appendix J-4a.

Table M-28
Identification of COPCs in Soil at All Four AOPCs Combined - Adult Outdoor Worker
Bradford Island -Upland Operable Unit
(4 of 4)

Chemicals of Interest	note	Detection Rate	Already an AOPC-specific COPC? Y/N	Lower of the Maximum and 95% UCL	Selected HH SLV (Table J-4a)	Site concentration(C) / SLV					Retain as a COPC, Y/N?	Rationale
						$\frac{C_{soil}}{SLV_{soil}}$	$\frac{C_{gw}}{SLV_{gw}}$ (Potable Water User Table M-32)	$\frac{C_{gw}}{SLV_{gw}}$ (Bioaccumulation Table M-33)	Multimedia (direct contact) $sum(C/SLV_{soil} + C/SLV_{gw})$	Multimedia (bioaccumulation) $sum(C/SLV_{soil} + C/SLV_{gw})$		

Potable Water User hierarchy was developed to determine Screening Levels Values for groundwater; 1. Minimum of DEQ Groundwater RBCs (Ingest Residential, Ingest Occupational, Volatilize Outdoor, Vapor Intrusion, Excavation), 2. USEPA tapwater RSLs, 3. DEQ MCLs, and 4. Surrogates used as noted in Appendix J-4b.
Hierarchy was developed to determine Screening Levels Values for Bioaccumulation pathway for groundwater; 1. Min USEPA NRWQC for water + organism and organism only, 2. Min DEQ WQC Table 33A, 3. Min DEQ WQC Table 33B, and 4. Surrogates used as noted in Appendix J-4c.
For inorganics, the higher of the 95% Upper Prediction Limit (UPL) and lowest HH SLV was selected as the HH SLV. For all other analytes the heirarchy described above was used.

Footnotes
(1) Due to the lack of speciation data, the chromium in soil were compared to the more conservative hexavalent chromium SLVs.
(2) Lead in sieved soil samples corresponding to 250 micrometers or less size fraction.
(3) Lead in sieved soil samples corresponding to 2 millimeters or less size fraction.
(4) Lead in unsieved soil samples.
(5) Degradation products of PCE are retained as COPCs if PCE is identified as a COPC, even if not detected or detected at less than 5% frequency per DEQ (2010a).

COPC Selection
C/SLV = Site concentration divided by risk-based concentration where risk-based concentration equaled human health SLV
Sum cPAH C/RBC (ELCR) = includes only individual carcinogenic polyaromatic hydrocarbons selected as a COPC. Individual benzofluoranthenes, rather than total benzofluoranthenes, was used in the summation.
Sum non-carcinogenic C/SLV (HI) = summation of C/SLV of all non-carcinogens. Lead not included in summation because evaluated separately.
Sum carcinogenic C/SLV (ELCR) = summation of C/SLV of all carcinogens. Individual benzofluoranthenes, rather than total benzofluoranthenes, was used in the summation. Total aroclors, rather than individual aroclors, was used in the summation.
Ratios for SLVs based on Reference Upper Prediction Limits (UPLs) are not included in sum totals.
COPC selection process for human health follows the following criteria. Chemicals are included as COPCs if detection frequency exceeds 5% and sample size is greater than 20, inorganic site concentration exceeds reference and one of the following conditions:
- [C/SLV] > 1.0 for an individual chemical in a given medium
- [Sum non-carcinogenic C/SLV] >1.0 and individual non-carcinogen [C/SLV] >0.1 for multiple chemicals in a given medium
- [Sum C/SLV] >1.0 for a single chemical in multiple media

For carcinogens only, eliminated as COPC if individual [C/SLV] < 1.0 (DEQ, 2010a).

Sum carcinogenic C/RBC (ELCR)						**7.3E-06**						

Green highlight = Retained as a COPC
- = not evaluated since chemical was not detected in this medium at detection frequency greater than 5%
AOPC = area of potential concern
C = concentration
c = carcinogen
COPC = chemical of potential concern
DEQ = Oregon Department of Environmental Quality
ELCR = excess lifetime cancer risk = screening level estimate of carcinogenic risk based on C_{soil}/SLV_{soil} only (i.e. single medium).
ft bgs = feet below surface
gw = groundwater
HH = human health
HI = hazard index = screening level estimate of non-carcinogenic risk based on C_{soil}/SLV_{soil} only (i.e. single medium).
max =maximum
MCL = maximum contaminant level
mg/kg = milligrams per kilogram
n = non-carcinogen
NE = multi-media was not evaluated since the chemical is already identified as a COPC.
NRWQC = national recommended water quality criteria
PAHs = polyaromatic hydrocarbons
PCBs = polychlorinated biphenyls
RBC = risk based concentration
RSL = regional screening level
SLV = screening level value
SVOCs = semivolatile organic chemicals
TPH = total petroleum hydrocarbon
ug/kg = micrograms per kilogram
UCL = 95% upper confidence limit
USEPA = United States Environmental Protection Agency
VOCs = volatile organic chemicals
WQC = water quality criteria

Notes
Only detected chemicals with a detection frequency greater than 5% and inorganics greater than reference are shown in this table except for degradation products of PCE (see footnote 5). Reporting limits for non-detected chemicals are evaluated separately.

Table M-29
Identification of COPCs in Soil at All Four AOPCs Combined - Construction Worker
Bradford Island -Upland Operable Unit
(4 of 4)

Chemicals of Interest	note	Detection Rate	Already an AOPC-specific COPC? Y/N	Lower of the Maximum and 95% UCL	Selected HH SLV (Table J-4a)	Site concentration(C) / SLV					Retain as a COPC, Y/N?	Rationale
						$\frac{C_{soil}}{SLV_{soil}}$	$\frac{C_{gw}}{SLV_{gw}}$ (Direct Contact Table M-31)	$\frac{C_{gw}}{SLV_{gw}}$ (Bioaccumulation Table M-33)	Multimedia (direct contact) sum($C/SLV_{soil} + C/SLV_{gw}$)	Multimedia (bioaccumulation) sum($C/SLV_{soil} + C/SLV_{gw}$)		

Construction Worker hierarchical SLV selection for soil: 1. DEQ Soil RBCs (Direct Contact Construction,. 2. USEPA Soil Industrial RSL, and 3. Surrogate used as noted in Appendix J-4a.
Screening Levels Values for Groundwater: 1. DEQ Groundwater in Excavation Construction/Excavation RBCs (Appendix J-4b), 2. USEPA Tapwater RSL, and 3. Surrogates used as noted in Appendix J-4b.
Hierarchy was developed to determine Screening Levels Values for Bioaccumulation pathway for groundwater; 1. Min USEPA NRWQC for water + organism and organism only, 2. Min DEQ WQC Table 33A, 3. Min DEQ WQC Table 33B, and 4. Surrogates used as noted in Appendix J-4c.
For inorganics, the higher of the 95% Upper Prediction Limit (UPL) and lowest HH SLV was selected as the HH SLV. For all other analytes the heirarchy described above was used.

Footnotes
(1) Due to the lack of speciation data, the chromium in soil were compared to the more conservative hexavalent chromium SLVs.
(2) Lead in sieved soil samples corresponding to 250 micrometers or less size fraction.
(3) Lead in sieved soil samples corresponding to 2 millimeters or less size fraction.
(4) Lead in unsieved soil samples.
(5) Degradation products of PCE are retained as COPCs if PCE is identified as a COPC, even if not detected or detected at less than 5% frequency per DEQ (2010a).

COPC Selection
C/SLV = Site concentration divided by risk-based concentration where risk-based concentration equaled human health SLV
Sum cPAH C/RBC (ELCR) = includes only individual carcinogenic polyaromatic hydrocarbons selected as a COPC. Individual benzofluoranthenes, rather than total benzofluoranthenes, was used in the summation.
Sum non-carcinogenic C/SLV (HI) = summation of C/SLV of all non-carcinogens. Lead not included in summation because evaluated separately.
Sum carcinogenic C/SLV (ELCR) = summation of C/SLV of all carcinogens. Individual benzofluoranthenes, rather than total benzofluoranthenes, was used in the summation. Total aroclors, rather than individual aroclors, was used in the summation.
Ratios for SLVs based on Reference Upper Prediction Limits (UPLs) are not included in sum totals.
COPC selection process for human health follows the following criteria. Chemicals are included as COPCs if detection frequency exceeds 5% and sample size is greater than 20, inorganic site concentration exceeds reference and one of the following conditions:
[C/SLV] > 1.0 for an individual chemical in a given medium
[Sum non-carcinogenic C/SLV] >1.0 and individual non-carcinogen [C/SLV] >0.1 for multiple chemicals in a given medium
[Sum C/SLV] >1.0 for a single chemical in multiple media
For carcinogens only, eliminated as COPC if individual [C/SLV] < 1.0 (DEQ, 2010a).

Sum non-carcinogenic C/RBC (HI)						**0.198**						
Sum carcinogenic C/RBC (ELCR)						**6.2E-07**						

Green highlight = Retained as a COPC
- = not evaluated since chemical was not detected in this medium at detection frequency greater than 5%
AOPC = area of potential concern
C = concentration
c = carcinogen
COPC = chemical of potential concern
DEQ = Oregon Department of Environmental Quality
ELCR = excess lifetime cancer risk = screening level estimate of carcinogenic risk based on C_{soil}/SLV_{soil} only (i.e. single medium).
ft bgs = feet below surface
gw = groundwater
HH = human health
HI = hazard index = screening level estimate of non-carcinogenic risk based on C_{soil}/SLV_{soil} only (i.e. single medium).
max =maximum
MCL = maximum contaminant level
mg/kg = milligrams per kilogram
n = non-carcinogen
NE = multi-media was not evaluated since the chemical is already identified as a COPC.
NRWQC = national recommended water quality criteria
PAHs = polyaromatic hydrocarbons
PCBs = polychlorinated biphenyls
RBC = risk based concentration
RSL = regional screening level
SLV = screening level value
SVOCs = semivolatile organic chemicals
TPH = total petroleum hydrocarbon
ug/kg = micrograms per kilogram
UCL = 95% upper confidence limit
USEPA = United States Environmental Protection Agency
VOCs = volatile organic chemicals
WQC = water quality criteria

Notes
Only detected chemicals with a detection frequency greater than 5% and inorganics greater than reference are shown in this table. Reporting limits for non-detected chemicals are evaluated separately.
Excavation Worker hierarchical SLV selection for soil: 1. DEQ Soil RBCs (Direct Contact Excavation), 2. USEPA Soil Industrial RSL, 3. Outdoor Worker SLV, and 4. Surrogate used as noted in Appendix J-4a.
Screening Levels Values for Groundwater: 1. DEQ Groundwater in Excavation Construction/Excavation RBCs (Appendix J-4b), 2. USEPA Tapwater RSL, and 3. Surrogates used as noted in Appendix J-4b.
Hierarchy was developed to determine Screening Levels Values for Bioaccumulation pathway for groundwater; 1. Min USEPA NRWQC for water + organism and organism only, 2. Min DEQ WQC Table 33A, 3. Min DEQ WQC Table 33B, and 4. Surrogates used as noted in Appendix J-4c.
For inorganics, the higher of the 95% Upper Prediction Limit (UPL) and lowest HH SLV was selected as the HH SLV. For all other analytes the heirarchy described above was used.

Table M-30
Identification of COPCs in Soil at All Four AOPCs Combined - Excavation Worker
Bradford Island -Upland Operable Unit
(4 of 4)

Chemicals of Interest	note	Detection Rate	Already an AOPC-specific COPC? Y/N	Lower of the Maximum and 95% UCL	Selected HH SLV (Table J-4a)	Site concentration(C) / SLV					Retain as a COPC, Y/N?	Rationale
						$\frac{C_{soil}}{SLV_{soil}}$	$\frac{C_{gw}}{SLV_{gw}}$ (Direct Contact Table M-31)	$\frac{C_{gw}}{SLV_{gw}}$ (Bioaccumulation Table M-33)	Multimedia (direct contact) sum($C/SLV_{soil} + C/SLV_{gw}$)	Multimedia (direct contact) sum($C/SLV_{soil} + C/SLV_{gw}$)		

United States Environmental Protection Agency (USEPA) 2009. National Recommended Water Quality Criteria. United States Office of Water, Environmental Protection Agency, Office of Science and Technology.
USEPA 2010. Regional Screening Levels (RSL) for Chemical Contaminants at Superfund Sites. RSL Table Update. May.

Footnotes
(1) Due to the lack of speciation data, the chromium in soil were compared to the more conservative hexavalent chromium SLVs.
(2) Lead in sieved soil samples corresponding to 250 micrometers or less size fraction.
(3) Lead in sieved soil samples corresponding to 2 millimeters or less size fraction.
(4) Lead in unsieved soil samples.

COPC Selection
C/SLV = Site concentration divided by risk-based concentration where risk-based concentration equaled human health SLV
Sum non-carcinogenic C/SLV (HI) = summation of C/SLV of all non-carcinogens. Lead not included in summation because evaluated separately.
Sum carcinogenic C/SLV (ELCR) = summation of C/SLV of all carcinogens. Individual benzofluoranthenes, rather than total benzofluoranthenes, was used in the summation. Total aroclors, rather than individual aroclors, was used in the summation.
COPC selection process for human health follows the following criteria. Chemicals are included as COPCs if detection frequency exceeds 5% and sample size is greater than 20, inorganic site concentration exceeds reference and one of the following conditions:
[C/SLV] > 1.0 for an individual chemical in a given medium
[Sum non-carcinogenic C/SLV] >1.0 and individual non-carcinogen [C/SLV] >0.1 for multiple chemicals in a given medium
[Sum C/SLV] >1.0 for a single chemical in multiple media
For carcinogens only, eliminated as COPC if individual [C/SLV] < 1.0 (DEQ, 2010a).

RSL = regional screening level
SLV = screening level value
TPH = total petroleum hydrocarbon
ug/L = micrograms per liter
UCL = 95% upper confidence limit
USEPA = United States Environmental Protection Agency
VOCs = volatile organic chemicals

Notes
Only detected chemicals with a detection frequency greater than 5% are shown in this table. Essential nutrients (calcium, magnesium, sodium, and potassium) are not included even if detected. Reporting limits for non-detected chemicals are evaluated separately.
Total metal results are reported.
Construction Worker hierarchical SLV selection for soil: 1. DEQ Soil RBCs (Direct Contact Construction,. 2. USEPA Soil Industrial RSL, and 3. Surrogate used as noted in Appendix J-4a.
Screening Levels Values for Groundwater: 1. DEQ Groundwater in Excavation Construction/Excavation RBCs (Appendix J-4b), 2. USEPA Tapwater RSL, and 3. Surrogates used as noted in Appendix J-4b.
Oregon Department of Environmental Quality (DEQ) 2003. Risk-Based Decision Making for the Remediation of Petroleum-Contaminated Sites. Land Quality Division, Environmental Cleanup and Tanks Program. September. Updated 2009
DEQ 2010a. Human Health Risk Assessment Guidance. Draft May 12.
United States Environmental Protection Agency (USEPA) 2010. Regional Screening Levels (RSL) for Chemical Contaminants at Superfund Sites. RSL Table Update. May.

Footnotes
(1) At the request of DEQ, COPC selection for groundwater is done separately for the on-site groundwater ingestion pathway and the groundwater discharge to surface water pathway. Therefore, this screening accounts only for on-site upland exposure to groundwater.
(2) The SLV for these chemcials are not available due to exceeding the solubility point in water.

COPC Selection
C/SLV = Site concentration divided by risk-based concentration where risk-based concentration equaled human health SLV
Sum non-carcinogenic C/SLV (HI) = summation of C/SLV of all non-carcinogens
Sum carcinogenic C/SLV (ELCR) = summation of C/SLV of all carcinogens
COPC selection process for human health follows the following criteria. Chemicals are included as COPCs if detection frequency exceeds 5% and sample size is greater than 20, inorganic site concentration exceeds reference and one of the following conditions:

[C/SLV] > 1.0 for an individual chemical in a given medium
[Sum non-carcinogenic C/SLV] >1.0 and individual non-carcinogen [C/SLV] >0.1 for multiple chemicals in a given medium
[Sum C/SLV] >1.0 for a single chemical in multiple media

For carcinogens only, eliminated as COPC if individual [C/SLV] < 1.0 (DEQ, 2010a).

Sum non-carcinogenic C/RBC (HI)						**11.2**					
Sum carcinogenic C/RBC (ELCR)						**2.9E-04**					

Green highlight = Retained as a COPC
- = not evaluated since chemical was not detected in this medium at detection frequency greater than 5%
AOPC = area of potential concern
C = concentration
c = carcinogen
COPC = chemical of potential concern
DEQ = Oregon Department of Environmental Quality
ELCR = excess lifetime cancer risk = screening level estimate of carcinogenic risk based on C_{gw}/SLV_{gw} only (i.e. single medium).
gw = groundwater
HH = human health
HI = hazard index = screening level estimate of non-carcinogenic risk based on C_{gw}/SLV_{gw} only (i.e. single medium).
max =maximum
MCL = maximum contaminant level
mg/L = milligrams per liter
n = non-carcinogen
NE = multi-media was not evaluated since the chemical is already identified as a COPC.
PAHs = polyaromatic hydrocarbons
RBC = risk based concentration
RSL = regional screening level
SLV = screening level value
SVOCs = semivolatile organic chemicals
TPH = total petroleum hydrocarbon

Table M-32
Identification of COPCs in Groundwater at All Four AOPCs Combined - Potable Water User
Bradford Island -Upland Operable Unit
(3 of 3)

Chemicals of Interest	note	Detection Rate	Already an AOPC-specific COPC? Y/N	Lower of the Maximum and 95% UCL	Selected HH SLV (Table J-4b)	Site concentration(C) / SLV				Retain as a COPC, Y/N?	Rationale
						$\frac{C_{gw}}{SLV_{gw}}$ (Potable Water User)	$\frac{C_{soil}}{SLV_{soil}}$ (Occupational Worker Table M-28)	$\frac{C_{soil\ gas}}{SLV_{soil\ gas}}$ (Indoor Worker Table M-16)	Multimedia (1) sum(C/SLV_{soil} + C/SLV_{gw} + C/SLV_{sg})		

ug/L = micrograms per liter
UCL = 95% upper confidence limit
USEPA = United States Environmental Protection Agency
VOCs = volatile organic chemicals

Notes
Only detected chemicals with a detection frequency greater than 5% are shown in this table except for degradation products of PCE (see footnote 4). Essential nutrients (calcium, magnesium, sodium, and potassium) are not included even if detected. Reporting limits for non-detected chemicals are evaluated separately.
Total metal results are reported.
Outdoor Worker hierarchical SLV selection for soil: 1. Minimum of DEQ Soil RBCs (Ingest Occupational and Volatilize Outdoor Occupational), 2. USEPA Soil Industrial RSL, 3. Surrogate used as noted in Appendix J-4a.
Potable Water User hierarchy was developed to determine Screening Levels Values for groundwater; 1. Minimum of DEQ Groundwater RBCs (Ingest Residential, Ingest Occupational, Volatilize Outdoor, Vapor Intrusion, Excavation), 2. USEPA tapwater RSLs, 3. DEQ MCLs, 4. Surrogates used as noted in Appendix J-4b.
Hierarchy developed to select Screening Level Values for Soil gas; 1. DEQ Soil Gas Vapor Intrusion Occupational RBCs, 2. Adjusted USEPA Industrial Air RSLs, and 3. Surrogates used as noted in Appendix J-4d.

Footnotes
(1) At the request of DEQ, COPC selection for groundwater is done separately for the on-site groundwater ingestion pathway and the groundwater discharge to surface water pathway. Therefore, this screening accounts only for on-site upland exposure to groundwater.
(2) Chromium in water is likely to be Cr III because of aerobic conditions.
(3) Lead- unseived soil C/SLV was used.
(4) Degradation products of PCE are retained as COPCs if PCE is identified as a COPC, even if not detected or detected at less than 5% frequency per DEQ (2010a).

COPC Selection
C/SLV = Site concentration divided by risk-based concentration where risk-based concentration equaled human health SLV
Sum non-carcinogenic C/SLV (HI) = summation of C/SLV of all non-carcinogens. Lead not included in summation because evaluated separately.
Sum carcinogenic C/SLV (ELCR) = summation of C/SLV of all carcinogens
COPC selection process for human health follows the following criteria. Chemicals are included as COPCs if detection frequency exceeds 5% and sample size is greater than 20, inorganic site concentration exceeds reference and one of the following conditions:
[C/SLV] > 1.0 for an individual chemical in a given medium
[Sum non-carcinogenic C/SLV] >1.0 and individual non-carcinogen [C/SLV] >0.1 for multiple chemicals in a given medium
[Sum C/SLV] >1.0 for a single chemical in multiple media
For carcinogens only, eliminated as COPC if individual [C/SLV] < 1.0 (DEQ, 2010a).

Gasoline Range Organics	n	26%	N	0.0474	-	-	0.0355	-	0.0355	NA	N	Evaluated as VOCs
Residual Range Organics	n	36%	N	0.261	-	-	0.0508	-	0.0508	NA	N	Evaluated as PAHs
Sum non-carcinogenic C/RBC (HI)						**5.77**						
Sum carcinogenic C/RBC (ELCR)						**4.8E-04**						

Green highlight = Retained as a COPC
- = not evaluated since chemical was not detected in this medium at detection frequency greater than 5%
AOPC = area of potential concern
C = concentration
c = carcinogen
COPC = chemical of potential concern
DEQ = Oregon Department of Environmental Quality
ELCR = excess lifetime cancer risk = screening level estimate of carcinogenic risk based on C_{gw}/SLV_{gw} only (i.e. single medium).
gw = groundwater
HH = human health
HI = hazard index = screening level estimate of non-carcinogenic risk based on C_{gw}/SLV_{gw} only (i.e. single medium).
max =maximum
mg/L = milligrams per liter
n = non-carcinogen
NE = multi-media was not evaluated since the chemical is already identified as a COPC.
NRWQC = national recommended water quality criteria
PAHs = polyaromatic hydrocarbons
RBC = risk based concentration
RSL = regional screening level
SLV = screening level value
sg = soil gas
SVOCs = semivolatile organic chemicals
TPH = total petroleum hydrocarbon
ug/L = micrograms per liter
UCL = 95% upper confidence limit
USEPA = United States Environmental Protection Agency
VOCs = volatile organic chemicals
WQC = water quality criteria

Table M-33
Identification of COPCs in Groundwater at All Four AOPCs Combined - Discharge and Bioaccumulation
Bradford Island -Upland Operable Unit
(3 of 3)

Chemicals of Interest	note	Detection Rate	Already an AOPC-specific COPC? Y/N	Lower of the Maximum and 95% UCL	Selected HH SLV (Table J-4c)	Site concentration(C) / SLV				Bioaccumulative Potential? (Y/N) (Table J-6)	Retain as a COPC, Y/N?	Rationale
						$\frac{C_{gw}}{SLV_{gw}}$ (Bioaccumulation)	$\frac{C_{soil}}{SLV_{soil}}$ (Occupational Worker Table M-28)	$\frac{C_{soil\ gas}}{SLV_{soil\ gas}}$ (Indoor Worker Table M-16)	Multimedia (1) $sum(C/SLV_{soil} + C/SLV_{gw} + C/SLV_{sg})$			

Notes

Only detected chemicals with a detection frequency greater than 5% are shown in this table except for degradation products of PCE (see footnote 5). Essential nutrients (calcium, magnesium, sodium, and potassium) are not included even if detected. Reporting limits for non-detected chemicals are evaluated separately. Total metal results are reported.
Outdoor Worker hierarchical SLV selection for soil: 1. Minimum of DEQ Soil RBCs (Ingest Occupational and Volatilize Outdoor Occupational), 2. USEPA Soil Industrial RSL, and 3. Surrogate used as noted in Appendix J-4a.
Hierarchy was developed to determine Screening Levels Values for Bioaccumulation pathway for groundwater; 1. Min USEPA NRWQC for water + organism and organism only, 2. Min DEQ WQC Table 33A, 3. Min DEQ WQC Table 33B, and 4. Surrogates used as noted in Appendix J-4c.
Hierarchy developed to select Screening Level Values for Soil gas; 1. DEQ Soil Gas Vapor Intrusion Occupational RBCs, 2. Adjusted USEPA Industrial Air RSLs, and 3. Surrogates used as noted in Appendix J-4d.

United States Environmental Protection Agency (USEPA) 2009. National Recommended Water Quality Criteria. United States Office of Water, Environmental Protection Agency, Office of Science and Technology.

Footnotes
(1) At the request of DEQ, COPC selection for groundwater is done separately for the on-site groundwater ingestion pathway and the groundwater discharge to surface water pathway. Therefore, this screening accounts only for on-site upland exposure to groundwater.
(2) There is no SLV for chromium, but it is likely to exist in the trivalent form in the aerobic surface water environment
(3) SLVs are based on aesthetic considerations and are not included in summations or as a COPCs.
(4) Lead- unseived soil C/SLV was used.
(5) Degradation products of PCE are retained as COPCs if PCE is identified as a COPC, even if not detected or detected at less than 5% frequency per DEQ (2010a).

COPC Selection
C/SLV = Site concentration divided by risk-based concentration where risk-based concentration equaled human health SLV
Sum non-carcinogenic C/SLV (HI) = summation of C/SLV of all non-carcinogens. Lead not included in summation because evaluated separately. Iron and manganese not included in summation, see footnote (3).
Sum carcinogenic C/SLV (ELCR) = summation of C/SLV of all carcinogens
COPC selection process for human health follows the following criteria. Chemicals are included as COPCs if detection frequency exceeds 5% and sample size is greater than 20, inorganic site concentration exceeds reference and one of the following conditions:
[C/SLV] > 1.0 for an individual chemical in a given medium
[Sum non-carcinogenic C/SLV] >1.0 and individual non-carcinogen [C/SLV] >0.1 for multiple chemicals in a given medium
[Sum C/SLV] >1.0 for a single chemical in multiple media
For carcinogens only, eliminated as COPC if individual [C/SLV] < 1.0 (DEQ, 2010a).

Table M-34
Summary of COPCs - All Four AOPCs Combined
Bradford Island -Upland Operable Unit
(1 of 1)

Media	Receptor	HI	ELCR	COPCs
Soil	Adult Outdoor Worker	0.123	5.0E-05	Arsenic Benzo(a)anthracene Benzo(a)pyrene Benzo(b)fluoranthene Benzofluoranthenes, Total Chromium Dibenz(a,h)anthracene Indeno(1,2,3-cd)pyrene Tetrachloroethene (PCE)
				Lead # Trichloroethene (TCE) 1,1-Dichloroethene # cis-1,2-Dichloroethene # trans-1,2-Dichloroethene # Vinyl Chloride
	Construction Worker	0.254	7.3E-06	Benzo(a)pyrene Tetrachloroethene (PCE)
				1,1-Dichloroethene # cis-1,2-Dichloroethene # trans-1,2-Dichloroethene # Trichloroethene (TCE) Vinyl Chloride
	Excavation Worker	0.198	6.2E-07	No COPCs
Groundwater	Construction/Excavation Worker	3.26	1.0E-06	Antimony # Iron # Mercury # Thallium # Vanadium # Zinc # Di-n-octyl Phthalate
	Potable Water User	11.2	**2.9E-04**	Arsenic Bis(2-ethylhexyl) Phthalate Chloroform Diesel Range Organics # Di-n-octyl Phthalate Manganese # Tetrachloroethene (PCE) Trichloroethene (TCE) Vinyl Chloride
				1,2,4-Trimethylbenzene # Antimony # cis-1,2-Dichloroethene # Gasoline Range Organics # Iron # Lead # Residual Range Organics # Thallium # Vanadium # Zinc # 1,1-Dichloroethene # trans-1,2-Dichloroethene #
	Discharge and Bioaccumulation	NE	NE	Arsenic Bis(2-ethylhexyl) Phthalate Di-n-octyl Phthalate # Tetrachloroethene (PCE)
				Antimony # Barium # Thallium # Zinc # 1,2,4-Trimethylbenzene # Isopropylbenzene # Lead # Mercury # n-Propylbenzene # Tributyltin # Vanadium # 1,1-Dichloroethene # cis-1,2-Dichloroethene # trans-1,2-Dichloroethene # Trichloroethene (TCE) Vinyl Chloride

Bold = COPCs ELCR >1E-04
- = Not evaluated
= non-carcinogenic COPC
C/SLV = Site concentration divided by risk-based concentration where risk-based concentration equaled human health SLV
COPC = chemicals of potential concern
ELCR = excess lifetime cancer risk
HI = hazard index
NE = Cumulative HI and ELCR not evaluated. These pathways were evaluated only to see if additional COPCs were identified for All Four Combined AOPCs.
PCBs = polychlorinated biphenyls
Shaded indicates COPC rationales not based on C/SLV>1 (multi-media, C/SLV>0.1, degradation product, or No SLV)

RBC = risk based concentration
RSL = regional screening level
SLV = screening level value
SVOCs = semivolatile organic chemicals
sw = surface water
UCL = 95% upper confidence limit
ug/kg = micrograms per kilogram
USEPA = United States Environmental Protection Agency
ww = wet weight

Notes

Only detected chemicals with a detection frequency greater than 5% and inorganics greater than reference (see Table 8-3) are shown in this table. Reporting limits for non-detected chemicals are evaluated separately.
Potable Water User hierarchy was developed to determine Screening Levels Values for groundwater; 1. Minimum of DEQ Groundwater RBCs (Ingest Residential, Ingest Occupational, Volatilize Outdoor, Vapor Intrusion, Excavation), 2. USEPA tapwater RSLs, 3. DEQ MCLs, 4. Surrogates used as noted in Appendix J-4b.
Hierarchy was developed to determine Screening Levels Values for Tissue; 1. Minimum of DEQ HH Bioaccumulative ATLs (human subsistence/tribal) (Appendix J-4f).

Table M-35
Identification of COPCs in Tissue at Forebay AOPC – Subsistence Fisher
Bradford Island - River Operable Unit
(4 of 4)

Medium	Chemicals of Interest	note	IUPAC #	Detection Rate	Lower of the Maximum and 95% UCL	Selected HH SLV (Table J-4f)	Site concentration(C) / SLV			Retain as a COPC, Y/N?	Rationale
							$\frac{C_{tissue}}{SLV_{tissue}}$	$\frac{C_{sw}}{SLV_{sw}}$ (Potable Water User Table M-39)	Multimedia (direct contact) $sum(C/SLV_{sw} + C/SLV_{tissue})$		

United States Environmental Protection Agency (USEPA) 2010. Regional Screening Levels (RSL) for Chemical Contaminants at Superfund Sites. RSL Table Update. May.

Footnotes
(1) SLVs were calculated ATLs using DEQ Methodology (DEQ 2007); see Section 11.3.4.1.1 and Appendix J-2.
(2) An individual dioxin-like congener may not qualify as a COPC based on DEQ's screening methodology. However, all dioxin-like congeners are retained as COPCs since they contribute to Total PCBs as Congeners and TEQs which are selected as COPCs
(3) PCB Congener 157 co-elutes with PCB Congener 156.

COPC Selection
C/SLV = Site concentration divided by risk-based concentration where risk-based concentration equaled human health SLV
Sum cPAH C/RBC (ELCR) = includes only individual carcinogenic polyaromatic hydrocarbons selected as a COPC. Only shown for a receptor if cPAH(s) have been selected as COPC.
Sum non-carcinogenic C/SLV (HI) = summation of C/SLV of all non-carcinogens. If methyl mercury was available, it was the only form of mercury used in the summation, otherwise total mercury was usec
Sum carcinogenic C/SLV (ELCR) = summation of C/SLV of all carcinogens. Total PCBs As Congeners were the only form of PCB that were used in the summation.
COPC selection process for human health follows the following criteria. Chemicals are included as COPCs if-inorganic site concentration exceeds reference and one of the following conditions:
[C/SLV] > 1.0 for an individual chemical in a given medium
[Sum non-carcinogenic C/SLV] >1.0 and individual non-carcinogen [C/SLV] >0.1 for multiple chemicals in a given medium
[Sum C/SLV] >1.0 for a single chemical in multiple media
For carcinogens only, eliminated as COPC if individual [C/SLV] < 1.0 (DEQ, 2010a).

Table M-36
Identification of COPCs in Sediment at Forebay AOPC – Subsistence Fisher
Bradford Island - River Operable Unit

Sum non-carcinogenic C/RBC (HI)						-					
Sum carcinogenic C/RBC (ELCR)						**7.5E-05**					

Green highlight = Retained as a COPC
- = not evaluated since chemical was not detected in this medium at detection frequency >5%
C = concentration
c = carcinogen
COPC = chemical of potential concern
DEQ = Oregon Department of Environmental Quality

Table M-36
Identification of COPCs in Sediment at Forebay AOPC – Subsistence Fisher
Bradford Island - River Operable Unit
(2 of 2)

dw = dry weight
ELCR = excess lifetime cancer risk = screening level estimate of carcinogenic risk based on C_{sed}/SLV_{sed} only (i.e. single medium).
HH = human health
HI = hazard index = screening level estimate of non-carcinogenic risk based on C_{sed}/SLV_{sed} only (i.e. single medium).
KM, capped = Kaplan–Meier-based with Efron's bias correction, capped
max =maximum
MCL = maximum contaminant level
MDL = method detection limit
mg/kg = milligrams per kilogram
n = non-carcinogen
NA = not applicable
ND = non detect
PAHs = polyaromatic hydrocarbons
PCBs = polychlorinated biphenyls
RBC = risk based concentration
RSL = regional screening level
sed = sediment
SLV = screening level value
SVOCs = semivolatile organic chemicals
sw = surface water
TPH = total petroleum hydrocarbon
UCL = 95% upper confidence limit
ug/kg = micrograms per kilogram
USEPA = United States Environmental Protection Agency

Notes
Only Subsitence Tissue COPCs with a detection frequency >5% are shown in this table (see Table M-35). Reporting limits for non-detected chemicals are evaluated separately.
Sum non-carcinogenic is not calculated because there are no non-carcinogenic Chemicals of Interest.
Hierarchy was developed to determine Screening Levels Values for Sediment; 1. DEQ HH Subsistence Bioaccumulative SLVs and 2. Surrogates used as noted in Appendix J-4e.
Potable Water User hierarchy was developed to determine Screening Levels Values for groundwater; 1. Minimum of DEQ Groundwater RBCs (Ingest Residential, Ingest Occupational, Volatilize Outdoor, Vapor Intrusion, Excavation), 2. USEPA tapwater RSLs, 3. DEQ MCLs, 4. Surrogates used as noted in Appendix J-4b.
Oregon Department of Environmental Quality (DEQ) 2003. Risk-Based Decision Making for the Remediation of Petroleum-Contaminated Sites. Land Quality Division, Environmental Cleanup and Tanks Program. September. Updated 2009
DEQ 2007. Guidance for Evaluation of Bioaccumulative Chemicals of Concern in Sediment. Final. January 31.
DEQ 2010a. Human Health Risk Assessment Guidance. Draft May 12.
DEQ 2010b. Maximum Contaminant Level. Accessed online in January 2010 at: http://www.oregon.gov/DHS/ph/dwp/docs/pwsrules/61-0030.pdf
United States Environmental Protection Agency (USEPA) 2010. Regional Screening Levels (RSL) for Chemical Contaminants at Superfund Sites. RSL Table Update. May.

Footnotes
(1) Sample size was less than 20 so detection frequency was not taken into consideration for COPC selection.
(2) An individual dioxin-like congener may not qualify as a COPC based on DEQ's screening methodology. However, all dioxin-like congeners are retained as COPCs since they contribute to Total PCBs as Congeners and TEQs which are selected as COPCs.
(3) PCB Congener 157 co-elutes with PCB Congener 156.
(4) Non-cancer based sediment SLVs may not be adequately protective of cancer endpoint.

COPC Selection
C/SLV = Site concentration divided by risk-based concentration where risk-based concentration equaled human health SLV
Sum non-carcinogenic C/SLV (HI) = summation of C/SLV of all non-carcinogens
Sum carcinogenic C/SLV (ELCR) = summation of C/SLV of all carcinogens. Total PCBs As Congeners were the only form of PCB that were used in the summation.
COPC selection process for human health follows the following criteria. Chemicals are included as COPCs if-inorganic site concentration exceeds reference and one of the following conditions:
- [C/SLV] > 1.0 for an individual chemical in a given medium
- [Sum non-carcinogenic C/SLV] >1.0 and individual non-carcinogen [C/SLV] >0.1 for multiple chemicals in a given medium
- [Sum C/SLV] >1.0 for a single chemical in multiple media

For carcinogens only, eliminated as COPC if individual [C/SLV] < 1.0 (DEQ, 2010a).

Green highlight = Retained as a COPC
- = not evaluated since chemical was not detected in this medium at detection frequency >5%
ATL = acceptable tissue level
BCF = bioconcentration factor
C = concentration
c = carcinogen
COPC = chemical of potential concern
DEQ = Oregon Department of Environmental Quality
ELCR = excess lifetime cancer risk = screening level estimate of carcinogenic risk based on C_{tissue}/SLV_{tissue} only (i.e. single medium).
HH = human health
HI = hazard index = screening level estimate of non-carcinogenic risk based on C_{tissue}/SLV_{tissue} only (i.e. single medium).
KM, capped = Kaplan–Meier-based with Efron's bias correction, capped
max =maximum
MCL = maximum contaminant level
MDL = method detection limit
mg/kg = milligrams per kilogram
n = non-carcinogen
ND = non detect
PAHs = polyaromatic hydrocarbons
PCBs =polychlorinated biphenyls
RBC = risk based concentration
RSL = regional screening level
SLV = screening level value
SVOCs = semivolatile organic chemicals
sw = surface water
UCL = 95% upper confidence limit
ug/kg = micrograms per kilogram
USEPA = United States Environmental Protection Agency
ww = wet weight

Notes

Only detected chemicals with a detection frequency greater than 5% and inorganics greater than reference are shown in this table. Reporting limits for non-detected chemicals are evaluated separately.
Potable Water User hierarchy was developed to determine Screening Levels Values for groundwater; 1. Minimum of DEQ Groundwater RBCs (Ingest Residential, Ingest Occupational, Volatilize Outdoor, Vapor Intrusion, Excavation), 2. USEPA tapwater RSLs, 3. DEQ MCLs, 4. Surrogates used as noted in Appendix J-4b.
Hierarchy was developed to determine Screening Levels Values for Tissue; 1. Minimum of DEQ HH Bioaccumulative ATLs (human general/recreational) (Appendix J-4f).

							$\frac{C_{tissue}}{SLV_{tissue}}$	$\frac{C_{sw}}{SLV_{sw}}$ (Potable Water User Table M-39)	Multimedia (direct contact) $sum(C/SLV_{sw} + C/SLV_{tissue})$		

DEQ 2010a. Human Health Risk Assessment Guidance. Draft May 12.
DEQ 2010b. Maximum Contaminant Level. Accessed online in January 2010 at: http://www.oregon.gov/DHS/ph/dwp/docs/pwsrules/61-0030.pdf
United States Environmental Protection Agency (USEPA) 2010. Regional Screening Levels (RSL) for Chemical Contaminants at Superfund Sites. RSL Table Update. May.

Footnotes
(1) SLVs were calculated ATLs using DEQ Methodology (DEQ 2007); see Section 11.3.4.1.1 and Appendix J-2.
(2) An individual dioxin-like congener may not qualify as a COPC based on DEQ's screening methodology. However, all dioxin-like congeners are retained as COPCs since they contribute to Total PCBs as Congeners and TEQs which are selected as COPCs
(2) PCB Congener 157 co-elutes with PCB Congener 156.

COPC Selection
C/SLV = Site concentration divided by risk-based concentration where risk-based concentration equaled human health SLV
Sum cPAH C/RBC (ELCR) = includes only individual carcinogenic polyaromatic hydrocarbons selected as a COPC. Only shown for a receptor if cPAH(s) have been selected as COPC.
Sum non-carcinogenic C/SLV (HI) = summation of C/SLV of all non-carcinogens. If methyl mercury was available, it was the only form of mercury used in the summation, otherwise total mercury was used
Sum carcinogenic C/SLV (ELCR) = summation of C/SLV of all carcinogens. Total PCBs As Congeners were the only form of PCB that were used in the summation.
COPC selection process for human health follows the following criteria. Chemicals are included as COPCs if inorganic site concentration exceeds reference and one of the following conditions:
[C/SLV] > 1.0 for an individual chemical in a given medium
[Sum non-carcinogenic C/SLV] >1.0 and individual non-carcinogen [C/SLV] >0.1 for multiple chemicals in a given medium
[Sum C/SLV] >1.0 for a single chemical in multiple media
For carcinogens only, eliminated as COPC if individual [C/SLV] < 1.0 (DEQ, 2010a).

United States Environmental Protection Agency (USEPA) 2010. Regional Screening Levels (RSL) for Chemical Contaminants at Superfund Sites. RSL Table Update. May.

Footnotes
(1) Sample size was less than 20 so detection frequency was not taken into consideration for COPC selection.
(2) An individual dioxin-like congener may not qualify as a COPC based on DEQ's screening methodology. However, all dioxin-like congeners are retained as COPCs since they contribute to Total PCBs as Congeners and TEQs which are selected as COPCs.
(3) PCB Congener 157 co-elutes with PCB Congener 156.
(4) Non-cancer based sediment SLVs may not be adequately protective of cancer endpoint.

COPC Selection
C/SLV = Site concentration divided by risk-based concentration where risk-based concentration equaled human health SLV
Sum non-carcinogenic C/SLV (HI) = summation of C/SLV of all non-carcinogens
Sum carcinogenic C/SLV (ELCR) = summation of C/SLV of all carcinogens. Total PCBs As Congeners were the only form of PCB that were used in the summation.
COPC selection process for human health follows the following criteria. Chemicals are included as COPCs if inorganic site concentration exceeds reference and one of the following conditions:
- [C/SLV] > 1.0 for an individual chemical in a given medium
- [Sum non-carcinogenic C/SLV] >1.0 and individual non-carcinogen [C/SLV] >0.1 for multiple chemicals in a given medium
- [Sum C/SLV] >1.0 for a single chemical in multiple media

For carcinogens only, eliminated as COPC if individual [C/SLV] < 1.0 (DEQ, 2010a).

United States Environmental Protection Agency (USEPA) 2010. Regional Screening Levels (RSL) for Chemical Contaminants at Superfund Sites. RSL Table Update. May

Footnotes
(1) PCB Congener 157 co-elutes with PCB Congener 156.

COPC Selection
C/SLV = Site concentration divided by risk-based concentration where risk-based concentration equaled human health SLV
Sum cPAH C/RBC (ELCR) = includes only individual carcinogenic polyaromatic hydrocarbons selected as a COPC
Sum non-carcinogenic C/SLV (HI) = summation of C/SLV of all non-carcinogens. Lead not included in summation because evaluated separately
Sum carcinogenic C/SLV (ELCR) = summation of C/SLV of all carcinogens. Total PCBs As Congeners were the only form of PCB that were used in the summatior
COPC selection process for human health follows the following criteria. Chemicals are included as COPCs if inorganic site concentration exceeds reference and one of the following conditions:
[C/SLV] > 1.0 for an individual chemical in a given medium
[Sum non-carcinogenic C/SLV] >1.0 and individual non-carcinogen [C/SLV] >0.1 for multiple chemicals in a given mediun
[Sum C/SLV] >1.0 for a single chemical in multiple media
For carcinogens only, eliminated as COPC if individual [C/SLV] < 1.0 (DEQ, 2010a).

Green highlight = Retained as a COPC
- = not evaluated since chemical was not detected in this medium at detection frequency >5%
C = concentration
c = carcinogen
C+F = Column + Filter
COPC = chemical of potential concern
DEQ = Oregon Department of Environmental Quality
ELCR = excess lifetime cancer risk = screening level estimate of carcinogenic risk based on C_{gw}/SLV_{gw} only (i.e. single medium).
HH = human health

Table M-40
Identification of COPCs in Surface Water at Forebay AOPC - Bioaccumulation Exposure
Bradford Island - River Operable Unit
(2 of 2)

HI = hazard index = screening level estimate of non-carcinogenic risk based on C_{gw}/SLV_{gw} only (i.e. single medium).
KM, capped = Kaplan–Meier-based with Efron's bias correction, capped
MDL = method detection limit
max =maximum
min = minimum
n = non-carcinogen
ND = non detect
ng/L = nanograms per liter
NRWQC = national recommended water quality criteria
PAHs = polyaromatic hydrocarbons
PCBs = polychlorinated biphenyls
pg/L = picograms per liter
SLV = screening level value
sw = surface water
TPH = total petroleum hydrocarbon
ug/L = micrograms per liter
USEPA = United States Environmental Protection Agency
WQC = water quality criteria

Notes
All detected chemicals are shown in this table. Reporting limits for non-detected chemicals are evaluated separately. Essential nutrients (calcium, magnesium, sodium, and potassium) are not included even if detected.
Dissolved metals were shown if total metals were non-detect.
Hierarchy was developed to determine Screening Levels Values for Bioaccumulation pathway for groundwater; 1. Min USEPA NRWQC for water + organism and organism only, 2. Min DEQ WQC Table 33A, 3. Min DEQ WQC Table 33B, and 4. Surrogates used as noted in Appendix J-4c
Oregon Department of Environmental Quality (DEQ) 2009. Oregon Administrative Rule (OAR) 340-041. Chapter 340, Division 41: Water Quality Standards: Beneficial Uses, Policies, and Criteria for Oregon. Tables 33A and 33B. November
DEQ 2010a. Human Health Risk Assessment Guidance. Draft May 12.
United States Environmental Protection Agency (USEPA) 2009. National Recommended Water Quality Criteria. United States Office of Water, Environmental Protection Agency, Office of Science and Technology

Footnotes
(1) PCB Congener 157 co-elutes with PCB Congener 156.
(2) An individual dioxin-like congener may not qualify as a COPC based on DEQ's screening methodology. However, all dioxin-like congeners are retained as COPCs since they contribute to Total PCBs as Congeners and TEQs which are selected as COPCs

COPC Selection
C/SLV = Site concentration divided by risk-based concentration where risk-based concentration equaled human health SLV
Sum non-carcinogenic C/SLV (HI) = summation of C/SLV of all non-carcinogens. Lead not included in summation because evaluated separately.
Sum carcinogenic C/SLV = summation of C/SLV of all carcinogens. Total PCB as Congeners was used in the summation since Dioxin-like Congener C/SLV are not available.
COPC selection process for human health follows the following criteria. Chemicals are included as COPCs if inorganic site concentration exceeds reference and one of the following conditions:
[C/SLV] > 1.0 for an individual chemical in a given medium
[Sum non-carcinogenic C/SLV] >1.0 and individual non-carcinogen [C/SLV] >0.1 for multiple chemicals in a given medium
[Sum C/SLV] >1.0 for a single chemical in multiple media
For carcinogens only, eliminated as COPC if individual [C/SLV] < 1.0 (DEQ, 2010a).

Table M-41
Identification of COPCs in Sediment at Eagle Creek - Direct Contact
Bradford Island - River Operable Unit
(1 of 2)

Chemicals of Interest [2]	note	Max Detected Value	Detection Rate	Reference UPL (Table I-20a)	Site Concentrations Exceed Reference?	Retain as a COPC, Y/N (1,2,3)?	Rationale

TPH (mg/kg dw)							
Diesel Range Organics	n	13.0	100%	31.7	N	Y	Detected COI [3]

This table does not include metals because they were detected below the reference area (Table L-7)
Green highlight = Retained as a COPC
- = Not Evaluated
c = carcinogen
COPC = chemical of potential concern
DEQ = Oregon Department of Environmental Quality
dw = dry weight
HH = human health
max = maximum
MDL = method detection limit
mg/kg = milligrams per kilogram
n = non-carcinogen
ND = non detect
PAHs = polyaromatic hydrocarbons
PCBs = polychlorinated biphenyls
SVOCs = semivolatile organic chemicals
TPH = total petroleum hydrocarbon

Table M-41
Identification of COPCs in Sediment at Eagle Creek - Direct Contact
Bradford Island - River Operable Unit
(2 of 2)

ug/kg = micrograms per kilogram
UPL = 95% upper prediction limit

Notes
Only detected chemicals are shown in this table. Reporting limits for non-detected chemicals are evaluated separately.

Footnotes
(1) COPCs from Eagle Creek Sediment will be retained for evaluation of direct contact with sediment for waders.
(2) All Inorganics are lower than reference area and are eliminated as COPCs.
(3) All detected organic COIs are retained as COPCs.
(4) For analytes with no detections (0% detection rate), the maximum method detection limit (MDL) was assessed as the non-parametric UPL.

COPC Selection
COPC selection process for human health follows the following criteria. Chemicals are included as COPCs if -inorganic site concentration exceeds reference, and all detected organic compounds.

Table M-42

sed = sediment
SLV = screening level value
SVOCs = semivolatile organic chemicals
TPH = total petroleum hydrocarbon
ug/kg = micrograms per kilogram
UPL = 95% upper prediction limit

Notes

Only detected chemicals selected as a Goose Island-Crayfish Tissue COPC or Forebay-Smallmouth Bass Tissue COPC are shown in this table. Reporting limits for non-detected chemicals are evaluated separately.
Sum non-carcinogenic is not calculated because there are no non-carcinogenic Chemicals of Interest.
Hierarchy was developed to determine Screening Levels Values for Sediment; 1. DEQ HH Subsistence Bioaccumulative SLVs and 2. Surrogates used as noted in Appendix J-4e.
Oregon Department of Environmental Quality (DEQ) 2007. Guidance for Evaluation of Bioaccumulative Chemicals of Concern in Sediment. Final. January 31.
DEQ 2010a. Human Health Risk Assessment Guidance. Draft May 12.

Footnotes

(1) Sample size was less than 20 so detection frequency was not taken into consideration for COPC selection.
(2) An individual dioxin-like congener may not qualify as a COPC based on DEQ's screening methodology. However, all dioxin-like congeners are retained as COPCs since they contribute to Total PCBs as Congeners and TEQs which are selected as COPCs.
(3) PCB Congener 157 co-elutes with PCB Congener 156.
(4) Non-cancer based sediment SLVs may not be adequately protective of cancer endpoint.

COPC Selection

C/SLV = Site concentration divided by risk-based concentration where risk-based concentration equaled human health SLV
Sum non-carcinogenic C/SLV (HI) = summation of C/SLV of all non-carcinogens
Sum carcinogenic C/SLV (ELCR) = summation of C/SLV of all carcinogens. Total PCBs As Congeners were the only form of PCB that were used in the summation.
COPC selection process for human health follows the following criteria. Chemicals are included as COPCs if-inorganic site concentration exceeds reference and one of the following conditions:
[C/SLV] > 1.0 for an individual chemical in a given medium
[Sum non-carcinogenic C/SLV] >1.0 and individual non-carcinogen [C/SLV] >0.1 for multiple chemicals in a given medium
For carcinogens only, eliminated as COPC if individual [C/SLV] < 1.0 (DEQ, 2010a).

Sum non-carcinogenic C/RBC (HI)							0.0898		
Sum carcinogenic C/RBC (ELCR)							1.5E-07		

Green highlight = Retained as a COPC
- = not evaluated since chemical was not detected in this medium at detection frequency >5%
ATL = acceptable tissue level
C = concentration
c = carcinogen
COPC = chemical of potential concern
DEQ = Oregon Department of Environmental Quality
ELCR = excess lifetime cancer risk = screening level estimate of carcinogenic risk based on C_{tissue}/SLV_{tissue} only (i.e. single medium).
HH = human health
HI = hazard index = screening level estimate of non-carcinogenic risk based on C_{tissue}/SLV_{tissue} only (i.e. single medium).
KM, capped = Kaplan–Meier-based with Efron's bias correction, capped
max =maximum

Table M-44
Identification of COPCs in Tissue at Goose Island - Recreational Fisher
Bradford Island - River Operable Unit
(2 of 2)

mg/kg = milligrams per kilogram
n = non-carcinogen
PAHs = polyaromatic hydrocarbons
PCBs =polychlorinated biphenyls
SLV = screening level value
ug/kg = micrograms per kilogram
ww = wet weight

Notes
Only detected chemicals are shown in this table. Reporting limits for non-detected chemicals are evaluated separately.
Hierarchy was developed to determine Screening Levels Values for Tissue; 1. Minimum of DEQ HH Bioaccumulative ATLs (human general/recreational) (Appendix J-4f).
Oregon Department of Environmental Quality (DEQ) 2007. Guidance for Evaluation of Bioaccumulative Chemicals of Concern in Sediment. Final. January 31.
DEQ 2010a. Human Health Risk Assessment Guidance. Draft May 12.

Footnotes

(1) An individual dioxin-like congener may not qualify as a COPC based on DEQ's screening methodology. However, all dioxin-like congeners are retained as COPCs since they contribute to Total PCBs as Congeners and TEQs which are selected as COPCs.
(2) PCB Congener 157 co-elutes with PCB Congener 156.
(3) SLVs were calculated ATLs using DEQ Methodology (DEQ 2007); see Appendix J-2.

COPC Selection
C/SLV = Site concentration divided by risk-based concentration where risk-based concentration equaled human health SLV
Sum non-carcinogenic C/SLV (HI) = summation of C/SLV of all non-carcinogens
Sum carcinogenic C/SLV (ELCR) = summation of C/SLV of all carcinogens. Total PCBs As Congeners were the only form of PCB that were used in the summation.
COPC selection process for human health follows the following criteria. Chemicals are included as COPCs if inorganic site concentration exceeds reference and one of the following conditions:
[C/SLV] > 1.0 for an individual chemical in a given medium
[Sum non-carcinogenic C/SLV] >1.0 and individual non-carcinogen [C/SLV] >0.1 for multiple chemicals in a given medium
For carcinogens only, eliminated as COPC if individual [C/SLV] < 1.0 (DEQ, 2010a).

Sum carcinogenic C/RBC (ELCR)						3.4E-06			

Green highlight = Retained as a COPC
- = not evaluated since chemical was not detected in this medium at detection frequency >5%
C = concentration
c = carcinogen
COPC = chemical of potential concern
dw = dry weight
ELCR = excess lifetime cancer risk = screening level estimate of carcinogenic risk based on C_{sed}/SLV_{sed} only (i.e. single medium).
HH = human health
HI = hazard index = screening level estimate of non-carcinogenic risk based on C_{sed}/SLV_{sed} only (i.e. single medium).
KM, capped = Kaplan–Meier-based with Efron's bias correction, capped
max =maximum
mg/kg = milligrams per kilogram

Table M-45
Identification of COPCs in Sediment at Goose Island - Recreational Fisher
Bradford Island - River Operable Unit
(2 of 2)

n = non-carcinogen
NA = not applicable
PAHs = polyaromatic hydrocarbons
PCBs = polychlorinated biphenyls
sed = sediment
SLV = screening level value
SVOCs = semivolatile organic chemicals
TPH = total petroleum hydrocarbon
ug/kg = micrograms per kilogram
UPL = 95% upper prediction limit

Notes
Only detected chemicals selected as a Goose Island-Crayfish Tissue COPC or Forebay-Smallmouth Bass Tissue COPC are shown in this table. Reporting limits for non-detected chemicals are evaluated separately.
Sum non-carcinogenic is not calculated because there are no non-carcinogenic Chemicals of Interest.
Hierarchy was developed to determine Screening Levels Values for Sediment; 1. DEQ HH General/Recreational Bioaccumulative SLVs and 2. Surrogates used as noted in Appendix J-4e.
Oregon Department of Environmental Quality (DEQ) 2007. Guidance for Evaluation of Bioaccumulative Chemicals of Concern in Sediment. Final. January 31.
DEQ 2010a. Human Health Risk Assessment Guidance. Draft May 12.

Footnotes
(1) Sample size was less than 20 so detection frequency was not taken into consideration for COPC selection.
(2) An individual dioxin-like congener may not qualify as a COPC based on DEQ's screening methodology. However, all dioxin-like congeners are retained as COPCs since they contribute to Total PCBs as Congeners and TEQs which are selected as COPCs.
(3) PCB Congener 157 co-elutes with PCB Congener 156.
(4) Non-cancer based sediment SLVs may not be adequately protective of cancer endpoint.

COPC Selection
C/SLV = Site concentration divided by risk-based concentration where risk-based concentration equaled human health SLV
Sum non-carcinogenic C/SLV (HI) = summation of C/SLV of all non-carcinogens
Sum carcinogenic C/SLV (ELCR) = summation of C/SLV of all carcinogens. Total PCBs As Congeners were the only form of PCB that were used in the summation.
COPC selection process for human health follows the following criteria. Chemicals are included as COPCs if-inorganic site concentration exceeds reference and one of the following conditions:
[C/SLV] > 1.0 for an individual chemical in a given medium
[Sum non-carcinogenic C/SLV] >1.0 and individual non-carcinogen [C/SLV] >0.1 for multiple chemicals in a given medium

For carcinogens only, eliminated as COPC if individual [C/SLV] < 1.0 (DEQ, 2010a).

Bold = COPCs with ELCR >1E-04 or HQ >10
-- = no data
= non-carcinogenic COPC
C/SLV = Site concentration divided by risk-based concentration where risk-based concentration equaled human health SLV.
COPC = chemicals of potential concern
ELCR = excess lifetime cancer risk based on Sum of C/SLV x 1E-06 for carcinogenic COPCs
HI = hazard index based on Sum of C/SLV for non-carcinogenic COPCs
HQ = hazard quotient
NE = Cumulative HI and ELCR not evaluated. These pathways were evaluated only to see if additional COPCs were identified for River OU.
PCBs = polychlorinated biphenyls

This table only includes COIs detected > 5% and above the reference area (metals only).
CPEC = chemical of potential ecological concern
COI = chemical of interest
HPAH = high molecular weight polycyclic aromatic hydrocarbons
KM, capped = Kaplan–Meier-based with Efron's bias correction, capped
LPAH = low molecular weight polycyclic aromatic hydrocarbons
MDL = method detection limit
NA = not available
ND = non detect
SLV = screening level value
T&E = threatened and endangered
- - = not applicable

Hierarchy of Terrestrial Plant SLV Selection (see Appendix J-5a)
For metals only, the higher of the Reference Area 95% UPL and the hierarchical SLV was selected.

Table N-1
Identification of CPECs in Soil at Landfill AOPC - Individual COIs for Plants
Bradford Island - Upland Operable Unit
(6 of 6)

Chemical of Interest	Depth Category (Soil)	Max Detected Conc in Soil	Level II SLVs for Plants Exposed to Soil (1,2,3,4)	Toxicity Ratio for Plants (Tij)	Concern for Threatened or Endangered Plants? (Tij>1)	Concern for Non-threatened or Endangered Plants? (Tij>5)	COI is Identified as a CPEC? (5) (Q = 1)

(4) USEPA. 1999. Screening Level Ecological Risk Assessment Protocol for Hazardous Waste Combustion Facilities, Peer review Draft. EPA530-D-99-001A. August.

Individual COIs in a Given Media

(5) Any individual COI in any given media with Tij > Q, where Tij = Cij/SLVij, must be identified as a CPEC.

Where: Cij = concentration of contaminant *i* in medium *j*

SLVij = Level II Screening Level Value from DEQ for contaminant *i* in medium *j* .

Tij = Risk ratios for contaminant *i* in medium *j*

Q = Receptor designator

Assumptions: Cij = Maximum detected concentration for immobile species (plants and invertebrates).

Q = 1 for terrestrial T&E species and all aquatic species

Q = 5 for all common terrestrial species

For this project, Q = 1 for terrestrial plants, soil invertebrates, and birds; Q = 5 for mammals. Although no T&E plant or soil invertebrates species are potentially present, Q = 1 applied for these receptor groups at request of DEQ due to basis of SLVs (Eco-SSLs).

(6) The SLV for naphthalene was used to screen the individual and total LPAHs without SLVs.

(7) The SLV for the benzo(a)pyrene was used to screen the individual HPAHs without SLVs.

Residual Range Organics	0-3 ft	9,450	NA	- -	- -	- -	Yes - No SLV

This table only includes COIs detected > 5% and above the reference area (metals only).
CPEC = chemical of potential ecological concern
COI = chemical of interest
HPAH = high molecular weight polycyclic aromatic hydrocarbons
KM, capped = Kaplan–Meier-based with Efron's bias correction, capped
LPAH = low molecular weight polycyclic aromatic hydrocarbons
MDL = method detection limit
NA = not available
ND = non detect
SLV = screening level value
T&E = threatened and endangered
- - = not applicable

Hierarchy of Terrestrial Invertebrate SLV Selection (see Appendix J-5a)
For metals only, the higher of the Reference Area 95% UPL and the hierarchical SLV was selected.
(1) United States Environmental Protection Agency (USEPA), 2005 -2007. Ecological Soil Screening Levels. U.S. Environmental Protection Agency Office of Solid Waste and Emergency Response. OSWER Directive 9285.7-72. Last Update July 2007.

Individual COIs in a Given Media
(5) Any individual COI in any given media with Tij > Q, where Tij = Cij/SLVij, must be identified as a CPEC.
Where: Cij = concentration of contaminant *i* in medium *j*
SLVij = Level II Screening Level Value from DEQ for contaminant *i* in medium *j* .

Table N-2
Identification of CPECs in Soil at Landfill AOPC - Individual COIs for Soil Invertebrates
Bradford Island - Upland Operable Unit
(6 of 6)

Chemical of Interest	Depth Category (Soil)	Max Detected Conc in Soil	Level II SLVs for Invertebrates Exposed to Soil (1,2,3,4)	Toxicity Ratio for Invertebrates (Tij)	Chemical is a Concern for Threatened or Endangered Invertebrates? (Tij>1)	Chemical is a Concern for Non-threatened or Endangered Invertebrates? (Tij>5)	COI is Identified as a CPEC? (5) (Q = 1)

Tij = Risk ratios for contaminant *i* in medium *j*

Q = Receptor designator

Assumptions: Cij = Maximum detected concentration for immobile species (plants and invertebrates).

Q = 1 for terrestrial T&E species and all aquatic species

Q = 5 for all common terrestrial species

For this project, Q = 1 for terrestrial plants, soil invertebrates, and birds; Q = 5 for mammals. Although no T&E plant or soil invertebrates species are potentially present, Q = 1 applied for these receptor groups at request of DEQ due to basis of SLVs (Eco-SSLs).

(6) The SLV for Total LPAHs was used to screen the individual LPAHs to determine which individuals are driving Total LPAH risk, if any.

(7) The SLV for Total HPAHs was used to screen the individual HPAHs to determine which individuals are driving Total HPAH risk, if any.

This table only includes COIs detected > 5% and above the reference area (metals only).
CPEC = chemical of potential ecological concern
COI = chemical of interest
HPAH = high molecular weight polycyclic aromatic hydrocarbons
KM, capped = Kaplan–Meier-based with Efron's bias correction, capped
LPAH = low molecular weight polycyclic aromatic hydrocarbons
MDL = method detection limit
NA = not available
ND = non detect
SLV = screening level value
T&E = threatened and endangered
UCL = upper confidence limit on the mean
Yes-Bio = Identified as potential CPEC because COI is bioaccumulative but SLV is does not account for bioaccumulation or there is no SLV
- - = not applicable

(1) The lower of the maximum detected concentration and the calculated 95% UCL (for COIs with at least 8 samples).

Hierarchy of Avian SLV Selection (see Appendix J-5a)
For metals only, the higher of the Reference Area 95% UPL and the hierarchical SLV was selected.

Individual COIs in a Given Media

(5) Any individual COI in any given media with Tij > Q, where Tij = Cij/SLVij, must be identified as a CPEC.

Where: Cij = concentration of contaminant *i* in medium *j*

SLVij = Level II Screening Level Value from DEQ for contaminant *i* in medium *j* .

Tij = Risk ratios for contaminant *i* in medium *j*

Q = Receptor designator

Assumptions: Cij = Lower of 95% UCL and maximum concentration for wildlife species (birds and mammals).

Q = 1 for terrestrial T&E species and all aquatic species

Q = 5 for all common terrestrial species

For this project, Q = 1 for terrestrial plants, soil invertebrates, and birds; Q = 5 for mammals. Although no T&E plant or soil invertebrates species are potentially present, Q = 1 applied for these receptor groups at request of DEQ due to basis of SLVs (Eco-SSLs).

This table only includes COIs detected > 5% and above the reference area (metals only).
CPEC = chemical of potential ecological concern
COI = chemical of interest
HPAH = high molecular weight polycyclic aromatic hydrocarbons
KM, capped = Kaplan–Meier-based with Efron's bias correction, capped
LPAH = low molecular weight polycyclic aromatic hydrocarbons
Incl in tHPAH = COI is included in the Total HPAH Screening
Incl in tLPAH = COI is included in the Total LPAH Screening
MDL = method detection limit
NA = not available
ND = non detect
SLV = screening level value
T&E = threatened and endangered
UCL = upper confidence limit on the mean
Yes-Bio = Identified as potential CPEC because COI is bioaccumulative but SLV is does not account for bioaccumulation or there is no SLV
- - = not applicable

Table N-4
Identification of CPECs in Soil at Landfill AOPC - Individual COIs for Mammals
Bradford Island - Upland Operable Unit
(5 of 5)

Chemicals of Interest	Depth Category (Soil)	Lower of Maximum and 95% UCL (1)	Level II SLVs for Mammals Exposed to Soil (2,3,4)	Toxicity Ratio for Mammals (Tij)	Concern for Threatened or Endangered Mammals? (Tij>1)	Concern for Non-threatened or Endangered Mammals? (Tij>5)	Is COI Bioaccum-ulative?	SLV Accounts for Bioaccum-ulation?	COI is Identified as a CPEC? (5) (Q = 5)

(1) The lower of the maximum detected concentration and the calculated 95% UCL (for COIs with at least 8 samples).

Hierarchy of Mammalian SLV Selection (see Appendix J-5a)

For metals only, the higher of the Reference Area 95% UPL and the hierarchical SLV was selected.

(2) United States Environmental Protection Agency (USEPA), 2005 -2007. Ecological Soil Screening Levels. U.S. Environmental Protection Agency Office of Solid Waste and Emergency Response. OSWER Directive 9285.7-72. Last Update July 2007.

(3) Oregon Department of Environmental Quality (DEQ), 1998. Guidance for Ecological Risk Assessment: Levels I, II, III, IV. Waste Management and Cleanup Division. Final. April. Updated December 2001.

(4) Efroymson RA, GW Suter II, BE Sample, DS Jones. 1997. Preliminary Remediation Goals for Ecological Endpoints. August. ORNL. ES/ER/TM-162/R2.

Individual COIs in a Given Media

(5) Any individual COI in any given media with Tij > Q, where Tij = Cij/SLVij, must be identified as a CPEC.

Where: Cij = concentration of contaminant *i* in medium *j*

SLVij = Level II Screening Level Value from DEQ for contaminant *i* in medium *j*.

Tij = Risk ratios for contaminant *i* in medium *j*

Q = Receptor designator

Assumptions: Cij = Lower of 95% UCL and maximum concentration for wildlife species (birds and mammals).

Q = 1 for terrestrial T&E species and all aquatic species

Q = 5 for all common terrestrial species

For this project, Q = 1 for terrestrial plants, soil invertebrates, and birds; Q = 5 for mammals. Although no T&E plant or soil invertebrates species are potentially present, Q = 1 applied for these receptor groups at request of DEQ due to basis of SLVs (Eco-SSLs).

(6) The SLV for Total LPAHs was used to screen the individual LPAHs to determine which individuals are driving Total LPAH risk, if any.

(7) The SLV for Total HPAHs was used to screen the individual HPAHs to determine which individuals are driving Total HPAH risk, if any.

This table only includes COIs detected > 5% and above the reference area (metals only).
CPEC = chemical of potential ecological concern
COI = chemical of interest

Table N-5
Identification of CPECs in Groundwater, Seep Water, and Surface Water at Landfill AOPC - Individual COIs for Aquatic Organisms
Bradford Island - Upland Operable Unit
(3 of 3)

Chemicals of Interest	Medium	Dissolved or Total (D or T)	Lower of Maximum and 95% UCL (1)	Level II SLVs for Aquatic Organisms Exposed to Surface Water (2,3,4,5,6,7,8)	Toxicity Ratio for Aquatic Organisms (Tij)	Chemical is a Concern for Aquatic Organisms (Tij>1)?	Is COI Bioaccum-ulative?	COI is Identified as a CPEC? (9) (Q = 1)

NA = not available
SLV = screening level value
T&E = threatened and endangered
UCL = upper confidence limit on the mean
Yes-Bio = Identified as potential CPEC because COI is bioaccumulative but SLV is does not account for bioaccumulation or there is no SLV
- - = not applicable

(1) In addition to seep water and surface water concentrations, concentrations in groundwater were compared to Selected Level II SLVs for surface water as a conservative measure (in the event that groundwater discharges to surface water).

Individual COIs in a Given Media

(9) Any individual COI in any given media with Tij > Q, where Tij = Cij/SLV ij, must be identified as a CPEC.
Where: Cij = concentration of contaminant *i* in medium *j*
SLVij = Level II Screening Level Value from DEQ for contaminant *i* in medium *j* .
Tij = Risk ratios for contaminant *i* in medium *j*
Q = Receptor designator
Assumptions: Cij = Lower of Maximum detected concentration and 95% UCL (for aquatic receptors).
Q = 1 for terrestrial T&E species and all aquatic species
Q = 5 for all common terrestrial species

Table N-6
Identification of CPECs in Soil at Landfill AOPC - Multiple COIs for Plants
Bradford Island - Upland Operable Unit
(5 of 5)

Chemical of Interest	Depth Category (Soil)	Max Detected Conc in Soil	Level II SLVs for Plants Exposed to Soil (1,2,3,4)	Toxicity Ratio for Plants (Tij)	(Tij/Tj) (5)	Chemical is a Concern for Threatened or Endangered Plants? (Tij/Tj >= [1/Nij] x Q when Q = 1)	Chemical is a Concern for Non-Threatened or Endangered Plants? (Tij/Tj >= [1/Nij] x Q when Q = 5)	COI is Identified as a CPEC? (5) (Q = 1)

(3) Efroymson RA, ME Wil, GW Suter II, and AC Wooten. 1997. Toxicological Benchmarks for Screening Contaminants of Potential Concern for Effects on Terrestrial Plants: 1997 Revision. November. ORNL. ES/ER/TM-85/R3.

(4) USEPA. 1999. Screening Level Ecological Risk Assessment Protocol for Hazardous Waste Combustion Facilities, Peer review Draft. EPA530-D-99-001A. August.

Multiple COIs Simultaneously within a Given Medium

(5) COIs with Tij/Tj values >= 1/Nij*Q must be retained as a CPEC, provided Tj>Q.

Where: Tij = toxicity ratio for contaminant *i* in medium *j* = chemical specific

Q = Receptor designator

0-1 ft bgs Soil Interval

Nij = total number of *i* contaminants in medium *j* = 37

Tj (0-1 ft bgs) = sum of toxicity ratios for all contaminants in medium *j* = 347

0-3 ft bgs Soil Interval

Nij = total number of *i* contaminants in medium *j* = 39

Tj (0-3 ft bgs) = sum of toxicity ratios for all contaminants in medium *j* = 402

Assumptions: Q = 1 for terrestrial T&E species and all aquatic species

Q = 5 for all common terrestrial species

For this project, Q = 1 for terrestrial plants, soil invertebrates, and birds; Q = 5 for mammals. Although no T&E plant or soil invertebrates species are potentially present, Q = 1 applied for these receptor groups at request of DEQ due to basis of SLVs (Eco-SSLs).

(6) The SLV for naphthalene was used to screen the individual and total LPAHs without SLVs.

(7) The SLV for the benzo(a)pyrene was used to screen the individual HPAHs without SLVs.

Residual Range Organics	0-3 ft	9,450	NA	- -	- -	- -	- -	Yes - No SLV

This table only includes COIs detected > 5% and above the reference area (metals only).
CPEC = chemical of potential ecological concern
COI = chemical of interest
HPAH = high molecular weight polycyclic aromatic hydrocarbons
KM, capped = Kaplan–Meier-based with Efron's bias correction, capped
LPAH = low molecular weight polycyclic aromatic hydrocarbons
Incl in tHPAH = COI is included in the Total HPAH Screening
Incl in tLPAH = COI is included in the Total LPAH Screening
MDL = method detection limit
NA = not available
ND = non detect
SLV = screening level value
T&E = threatened and endangered
- - = not applicable

Hierarchy of Terrestrial Invertebrate SLV Selection (see Appendix J-5a)
For metals only, the higher of the Reference Area 95% UPL and the hierarchical SLV was selected.

Table N-7
Identification of CPECs in Soil at Landfill AOPC - Multiple COIs for Soil Invertebrates
Bradford Island - Upland Operable Unit
(5 of 5)

Chemical of Interest	Depth Category (Soil)	Max Detected Conc in Soil	Level II SLVs for Invertebrates Exposed to Soil (1,2,3,4)	Toxicity Ratio for Invertebrates (Tij)	(Tij/Tj) (5)	Chemical is a Concern for Threatened or Endangered Invertebrates? (Tij/Tj >= [1/Nij] x Q when Q = 1)	Chemical is a Concern for Non-Threatened or Endangered Invertebrates? (Tij/Tj >= [1/Nij] x Q when Q = 5)	COI is Identified as a CPEC? (5) (Q = 1)

Multiple COIs Simultaneously within a Given Medium

(5) COIs with Tij/Tj values >= 1/Nij*Q must be retained as a CPEC, provided Tj>Q.

Where: Tij = toxicity ratio for contaminant *i* in medium *j* = chemical specific

Q = Receptor designator

0-1 ft bgs Soil Interval

Nij = total number of *i* contaminants in medium *j* = 14

Tj (0-1 ft bgs) = sum of toxicity ratios for all contaminants in medium *j* = 71.5

0-3 ft bgs Soil Interval

Nij = total number of *i* contaminants in medium *j* = 14

Tj (0-3 ft bgs) = sum of toxicity ratios for all contaminants in medium *j* = 76.2

Assumptions: Q = 1 for terrestrial T&E species and all aquatic species

Q = 5 for all common terrestrial species

For this project, Q = 1 for terrestrial plants, soil invertebrates, and birds; Q = 5 for mammals. Although no T&E plant or soil invertebrates species are potentially present, Q = 1 applied for these receptor groups at request of DEQ due to basis of SLVs (Eco-SSLs).

This table only includes COIs detected > 5% and above the reference area (metals only).

Table N-8
Identification of CPECs in Soil at Landfill AOPC - Multiple COIs for Birds
Bradford Island - Upland Operable Unit
(4 of 4)

Chemicals of Interest	Depth Category (Soil)	Lower of Maximum and 95% UCL (1)	Level II SLVs for Birds Exposed to Soil (2,3,4)	Toxicity Ratio for Birds (Tij)	(Tij/Tj) (5)	Chemical is a Concern for Threatened or Endangered Birds? (Tij/Tj >= [1/Nij] x Q when Q = 1)	Chemical is a Concern for Non-Threatened or Endangered Birds? (Tij/Tj >= [1/Nij] x Q when Q = 5)	Is COI Bioaccum-ulative?	SLV Accounts for Bioaccum-ulation?	COI is Identified as a CPEC? (5) (Q = 1)

CPEC = chemical of potential ecological concern
COI = chemical of interest
HPAH = high molecular weight polycyclic aromatic hydrocarbons
KM, capped = Kaplan–Meier-based with Efron's bias correction, capped
LPAH = low molecular weight polycyclic aromatic hydrocarbons
MDL = method detection limit
NA = not available
ND = non detect
SLV = screening level value
T&E = threatened and endangered
UCL = upper confidence limit on the mean
Yes-Bio = Identified as potential CPEC because COI is bioaccumulative but SLV is does not account for bioaccumulation or there is no SLV
- - = not applicable

(1) The lower of the maximum detected concentration and the calculated 95% UCL for COIs with at least 8 samples was used.

Hierarchy of Avian SLV Selection (see Appendix J-5a)
For metals only, the higher of the Reference Area 95% UPL and the hierarchical SLV was selected.
(2) United States Environmental Protection Agency (USEPA), 2005 -2007. Ecological Soil Screening Levels. U.S. Environmental Protection Agency Office of Solid Waste and Emergency Response. OSWER Directive 9285.7
72. Last Update July 2007.
(3) Oregon Department of Environmental Quality (DEQ), 1998. Guidance for Ecological Risk Assessment: Levels I, II, III, IV. Waste Management and Cleanup Division. Final. April. Updated December 2001.
(4) Efroymson RA, GW Suter II, BE Sample, DS Jones. 1997. Preliminary Remediation Goals for Ecological Endpoints. August. ORNL. ES/ER/TM-162/R2.

Multiple COIs Simultaneously within a Given Medium
(5) COIs with Tij/Tj values >= 1/Nij*Q must be retained as a CPEC, provided Tj>Q.
Where: Tij = toxicity ratio for contaminant *i* in medium *j* = chemical specific
Q = Receptor designator
0-1 ft bgs Soil Interval
Nij = total number of *i* contaminants in medium *j* = 21
Tj (0-1 ft bgs) = sum of toxicity ratios for all contaminants in medium *j* = 181
0-3 ft bgs Soil Interval
Nij = total number of *i* contaminants in medium *j* = 22
Tj (0-3 ft bgs) = sum of toxicity ratios for all contaminants in medium *j* = 184
Assumptions: Q = 1 for terrestrial T&E species and all aquatic species
Q = 5 for all common terrestrial species
For this project, Q = 1 for terrestrial plants, soil invertebrates, and birds; Q = 5 for mammals. Although no T&E plant or soil invertebrates species are potentially present, Q = 1 applied for these receptor groups at request of DEQ due to basis of SLVs (Eco-SSLs).

This table only includes COIs detected > 5% and above the reference area (metals only).
CPEC = chemical of potential ecological concern
COI = chemical of interest
HPAH = high molecular weight polycyclic aromatic hydrocarbons
KM, capped = Kaplan–Meier-based with Efron's bias correction, capped
LPAH = low molecular weight polycyclic aromatic hydrocarbons

Table N-9
Identification of CPECs in Soil at Landfill AOPC - Multiple COIs for Mammals
Bradford Island - Upland Operable Unit
(4 of 4)

Chemicals of Interest	Depth Category (Soil)	Lower of Maximum and 95% UCL (1)	Level II SLVs for Mammals Exposed to Soil (2,3,4)	Toxicity Ratio for Mammals (Tij)	(Tij/Tj) (5)	Chemical is a Concern for Threatened or Endangered Mammals? (Tij/Tj >= [1/Nij] x Q when Q = 1)	Chemical is a Concern for Non-Threatened or Endangered Mammals? (Tij/Tj >= [1/Nij] x Q when Q = 5)	Is COI Bioaccum-ulative?	SLV Accounts for Bioaccum-ulation?	COI is Identified as a CPEC? (5) (Q = 5)

Incl in tHPAH = COI is included in the Total HPAH Screening
Incl in tLPAH = COI is included in the Total LPAH Screening
MDL = method detection limit
NA = not available
ND = non detect
SLV = screening level value
T&E = threatened and endangered
UCL = upper confidence limit on the mean
Yes-Bio = Identified as potential CPEC because COI is bioaccumulative but SLV is does not account for bioaccumulation or there is no SLV
- - = not applicable

(1) The lower of the maximum detected concentration and the calculated 95% UCL (for COIs with at least 8 samples).

Hierarchy of Mammalian SLV Selection (see Appendix J-5a)
For metals only, the higher of the Reference Area 95% UPL and the hierarchical SLV was selected.

(4) Efroymson RA, GW Suter II, BE Sample, DS Jones. 1997. Preliminary Remediation Goals for Ecological Endpoints. August. ORNL. ES/ER/TM-162/R2.

Multiple COIs Simultaneously within a Given Medium
(5) COIs with Tij/Tj values >= 1/Nij*Q must be retained as a CPEC, provided Tj>Q.
Where: Tij = toxicity ratio for contaminant *i* in medium *j* = chemical specific
Q = Receptor designator
0-1 ft bgs Soil Interval
Nij = total number of *i* contaminants in medium *j* = 32
Tj (0-1 ft bgs) = sum of toxicity ratios for all contaminants in medium *j* = 757
0-3 ft bgs Soil Interval
Nij = total number of *i* contaminants in medium *j* = 33
Tj (0-3 ft bgs) = sum of toxicity ratios for all contaminants in medium *j* = 755
Assumptions: Q = 1 for terrestrial T&E species and all aquatic species
Q = 5 for all common terrestrial species
For this project, Q = 1 for terrestrial plants, soil invertebrates, and birds; Q = 5 for mammals. Although no T&E plant or soil invertebrates species are potentially present, Q = 1 applied for these receptor groups at request of DEQ due to basis of SLVs (Eco-SSLs).

This table only includes COIs detected > 5% and above the reference area (metals only).
For lead, the maximum concentration is from unseived samples.
CPEC = chemical of potential ecological concern
COI = chemical of interest
HPAH = high molecular weight polycyclic aromatic hydrocarbons
KM, capped = Kaplan–Meier-based with Efron's bias correction, capped
LPAH = low molecular weight polycyclic aromatic hydrocarbons
MDL = method detection limit
NA = not available

Table N-11
Identification of CPECs in Soil at Sandblast Area AOPC - Individual COIs for Plants
Bradford Island - Upland Operable Unit
(6 of 6)

Chemical of Interest	Depth Category (Soil)	Max Detected Conc in Soil	Level II SLVs for Plants Exposed to Soil (1,2,3,4)	Toxicity Ratio for Plants (Tij)	Concern for Threatened or Endangered Plants? (Tij>1)	Concern for Non-threatened or Endangered Plants? (Tij>5)	COI is Identified as a CPEC? (5) (Q = 1)

ND = non detect
SLV = screening level value
T&E = threatened and endangered
- - = not applicable

Hierarchy of Terrestrial Plant SLV Selection (see Appendix J-5a)
For metals only, the higher of the Reference Area 95% UPL and the hierarchical SLV was selected.
(1) United States Environmental Protection Agency (USEPA), 2005 -2007. Ecological Soil Screening Levels. U.S. Environmental Protection Agency Office of Solid Waste and Emergency Response. OSWER Directive 9285.7-72. Last Update July 2007.
(2) Oregon Department of Environmental Quality (DEQ), 1998. Guidance for Ecological Risk Assessment: Levels I, II, III, IV. Waste Management and Cleanup Division. Final. April. Updated December 2001.
(3) Efroymson RA, ME Wil, GW Suter II, and AC Wooten. 1997. Toxicological Benchmarks for Screening Contaminants of Potential Concern for Effects on Terrestrial Plants: 1997 Revision. November. ORNL. ES/ER/TM-85/R3.

(4) USEPA. 1999. Screening Level Ecological Risk Assessment Protocol for Hazardous Waste Combustion Facilities, Peer review Draft. EPA530-D-99-001A. August.

Individual COIs in a Given Media
(5) Any individual COI in any given media with Tij > Q, where Tij = Cij/SLVij, must be identified as a CPEC.
Where: Cij = concentration of contaminant *i* in medium *j*
SLVij = Level II Screening Level Value from DEQ for contaminant *i* in medium *j*.
Tij = Risk ratios for contaminant *i* in medium *j*
Q = Receptor designator
Assumptions: Cij = Maximum detected concentration for immobile species (plants and invertebrates).
Q = 1 for terrestrial T&E species and all aquatic species
Q = 5 for all common terrestrial species
For this project, Q = 1 for terrestrial plants, soil invertebrates, and birds; Q = 5 for mammals. Although no T&E plant or soil invertebrates species are potentially present, Q = 1 applied for these receptor groups at request of DEQ due to basis of SLVs (Eco-SSLs).
(6) The SLV for naphthalene was used to screen the individual and total LPAHs without SLVs.
(7) The SLV for the benzo(a)pyrene was used to screen the individual HPAHs without SLVs.

This table only includes COIs detected > 5% and above the reference area (metals only).
For lead, the maximum concentration is from unseived samples.
CPEC = chemical of potential ecological concern
COI = chemical of interest

Table N-12
Identification of CPECs in Soil at Sandblast Area AOPC - Individual COIs for Soil Invertebrates
Bradford Island - Upland Operable Unit
(6 of 6)

Chemical of Interest	Depth Category (Soil)	Max Detected Conc in Soil	Level II SLVs for Invertebrates Exposed to Soil (1,2,3,4)	Toxicity Ratio for Invertebrates (Tij)	Chemical is a Concern for Threatened or Endangered Invertebrates? (Tij>1)	Chemical is a Concern for Non-threatened or Endangered Invertebrates? (Tij>5)	COI is Identified as a CPEC? (5) (Q = 1)

HPAH = high molecular weight polycyclic aromatic hydrocarbons
KM, capped = Kaplan–Meier-based with Efron's bias correction, capped
LPAH = low molecular weight polycyclic aromatic hydrocarbons
MDL = method detection limit
NA = not available
ND = non detect
SLV = screening level value
T&E = threatened and endangered
- - = not applicable

Hierarchy of Terrestrial Invertebrate SLV Selection (see Appendix J-5a)
For metals only, the higher of the Reference Area 95% UPL and the hierarchical SLV was selected.
(1) United States Environmental Protection Agency (USEPA), 2005 -2007. Ecological Soil Screening Levels. U.S. Environmental Protection Agency Office of Solid Waste and Emergency Response. OSWER Directive 9285.7-72. Last Update July 2007.
(2) Oregon Department of Environmental Quality (DEQ), 1998. Guidance for Ecological Risk Assessment: Levels I, II, III, IV. Waste Management and Cleanup Division. Final. April. Updated December 2001.
(3) RA Efroymson. Toxicological Benchmarks for Screening Contaminants of Potential Concern for Effects on Soil and Litter Invertebrates and Heterotrophic Process, Nov 1997 Revision. ORNL ES/ER/TM-126/R2.

(4) USEPA. 1999. Screening Level Ecological Risk Assessment Protocol for Hazardous Waste Combustion Facilities, Peer review Draft. EPA530-D-99-001A. August.

Individual COIs in a Given Media
(5) Any individual COI in any given media with Tij > Q, where Tij = Cij/SLVij, must be identified as a CPEC.
Where: Cij = concentration of contaminant *i* in medium *j*
SLVij = Level II Screening Level Value from DEQ for contaminant *i* in medium *j*.
Tij = Risk ratios for contaminant *i* in medium *j*
Q = Receptor designator
Assumptions: Cij = Maximum detected concentration for immobile species (plants and invertebrates).
Q = 1 for terrestrial T&E species and all aquatic species
Q = 5 for all common terrestrial species
For this project, Q = 1 for terrestrial plants, soil invertebrates, and birds; Q = 5 for mammals. Although no T&E plant or soil invertebrates species are potentially present, Q = 1 applied for these receptor groups at request of DEQ due to basis of SLVs (Eco-SSLs).
(6) The SLV for Total LPAHs was used to screen the individual LPAHs to determine which individuals are driving Total LPAH risk, if any.
(7) The SLV for Total HPAHs was used to screen the individual HPAHs to determine which individuals are driving Total HPAH risk, if any.

This table only includes COIs detected > 5% and above the reference area (metals only).
For lead, the 95% UCL and maximum concentrations are from unseived samples.
CPEC = chemical of potential ecological concern
COI = chemical of interest
HPAH = high molecular weight polycyclic aromatic hydrocarbons
KM, capped = Kaplan–Meier-based with Efron's bias correction, capped
LPAH = low molecular weight polycyclic aromatic hydrocarbons
MDL = method detection limit
NA = not available
ND = non detect
SLV = screening level value
T&E = threatened and endangered

Table N-13
Identification of CPECs in Soil at Sandblast Area AOPC - Individual COIs for Birds
Bradford Island - Upland Operable Unit
(6 of 6)

Chemicals of Interest	Depth Category (Soil)	Lower of Maximum and 95% UCL (1)	Level II SLVs for Birds Exposed to Soil (2,3,4)	Toxicity Ratio for Birds (Tij)	Concern for Threatened or Endangered Birds? (Tij>1)	Concern for Non-threatened or Endangered Birds? (Tij>5)	Is COI Bioaccum-ulative?	SLV Accounts for Bioaccum-ulation?	COI is Identified as a CPEC? (5) (Q = 1)

UCL = upper confidence limit on the mean
Yes-Bio = Identified as potential CPEC because COI is bioaccumulative but SLV is does not account for bioaccumulation or there is no SLV
- - = not applicable

(1) The lower of the maximum detected concentration and the calculated 95% UCL (for COIs with at least 8 samples).

Hierarchy of Avian SLV Selection (see Appendix J-5a)
For metals only, the higher of the Reference Area 95% UPL and the hierarchical SLV was selected.
(2) United States Environmental Protection Agency (USEPA), 2005 -2007. Ecological Soil Screening Levels. U.S. Environmental Protection Agency Office of Solid Waste and Emergency Response. OSWER Directive 9285.7-72. Last Update July 2007.
(3) Oregon Department of Environmental Quality (DEQ), 1998. Guidance for Ecological Risk Assessment: Levels I, II, III, IV. Waste Management and Cleanup Division. Final. April. Updated December 2001.
(4) Efroymson RA, GW Suter II, BE Sample, DS Jones. 1997. Preliminary Remediation Goals for Ecological Endpoints. August. ORNL. ES/ER/TM-162/R2.

Individual COIs in a Given Media
(5) Any individual COI in any given media with Tij > Q, where Tij = Cij/SLVij, must be identified as a CPEC.
Where: Cij = concentration of contaminant *i* in medium *j*
SLVij = Level II Screening Level Value from DEQ for contaminant *i* in medium *j* .
Tij = Risk ratios for contaminant *i* in medium *j*
Q = Receptor designator
Assumptions: Cij = Lower of 95% UCL and maximum concentration for wildlife species (birds and mammals).
Q = 1 for terrestrial T&E species and all aquatic species
Q = 5 for all common terrestrial species
For this project, Q = 1 for terrestrial plants, soil invertebrates, and birds; Q = 5 for mammals. Although no T&E plant or soil invertebrates species are potentially present, Q = 1 applied for these receptor groups at request of DEQ due to basis of SLVs (Eco-SSLs).

This table only includes COIs detected > 5% and above the reference area (metals only).
For lead, the 95% UCL and maximum concentrations are from unseived samples.
CPEC = chemical of potential ecological concern
COI = chemical of interest

Table N-14
Identification of CPECs in Soil at Sandblast Area AOPC - Individual COIs for Mammals
Bradford Island - Upland Operable Unit
(6 of 6)

Chemicals of Interest	Depth Category (Soil)	Lower of Maximum and 95% UCL (1)	Level II SLVs for Mammals Exposed to Soil (2,3,4)	Toxicity Ratio for Mammals (Tij)	Concern for Threatened or Endangered Mammals? (Tij>1)	Concern for Non-threatened or Endangered Mammals? (Tij>5)	Is COI Bioaccum-ulative?	SLV Accounts for Bioaccum-ulation?	COI is Identified as a CPEC? (5) (Q = 5)

HPAH = high molecular weight polycyclic aromatic hydrocarbons
KM, capped = Kaplan–Meier-based with Efron's bias correction, capped
LPAH = low molecular weight polycyclic aromatic hydrocarbons
Incl in tHPAH = COI is included in the Total HPAH Screening
Incl in tLPAH = COI is included in the Total LPAH Screening
MDL = method detection limit
NA = not available
ND = non detect
SLV = screening level value
T&E = threatened and endangered
UCL = upper confidence limit on the mean
Yes-Bio = Identified as potential CPEC because COI is bioaccumulative but SLV is does not account for bioaccumulation or there is no SLV
- - = not applicable

(1) The lower of the maximum detected concentration and the calculated 95% UCL (for COIs with at least 8 samples).

Hierarchy of Mammalian SLV Selection (see Appendix J-5a)
For metals only, the higher of the Reference Area 95% UPL and the hierarchical SLV was selected.
(2) United States Environmental Protection Agency (USEPA), 2005 -2007. Ecological Soil Screening Levels. U.S. Environmental Protection Agency Office of Solid Waste and Emergency Response. OSWER Directive 9285.7-72. Last Update July 2007.

Individual COIs in a Given Media
(5) Any individual COI in any given media with Tij > Q, where Tij = Cij/SLVij, must be identified as a CPEC.
Where: Cij = concentration of contaminant *i* in medium *j*
SLVij = Level II Screening Level Value from DEQ for contaminant *i* in medium *j*.
Tij = Risk ratios for contaminant *i* in medium *j*
Q = Receptor designator
Assumptions: Cij = Lower of 95% UCL and maximum concentration for wildlife species (birds and mammals).
Q = 1 for terrestrial T&E species and all aquatic species
Q = 5 for all common terrestrial species
For this project, Q = 1 for terrestrial plants, soil invertebrates, and birds; Q = 5 for mammals. Although no T&E plant or soil invertebrates species are potentially present, Q = 1 applied for these receptor groups at request of DEQ due to basis of SLVs (Eco-SSLs).
(6) The SLV for Total LPAHs was used to screen the individual LPAHs to determine which individuals are driving Total LPAH risk, if any.
(7) The SLV for Total HPAHs was used to screen the individual HPAHs to determine which individuals are driving Total HPAH risk, if any.

This table only includes COIs detected > 5% and above the reference area (metals only).
For lead, the 95% UCL and maximum concentrations are from unseived samples.

Table N-15
Identification of CPECs in Groundwater at Sandblast Area AOPC - Individual COIs for Aquatic Organisms
Bradford Island - Upland Operable Unit
(2 of 2)

Chemicals of Interest	Medium	Dissolved or Total (D or T)	Lower of Maximum and 95% UCL (1)	Level II SLVs for Aquatic Organisms Exposed to Surface Water (2,3,4,5,6,7,8)	Toxicity Ratio for Aquatic Organisms (Tij)	Chemical is a Concern for Aquatic Organisms (Tij>1)?	Is COI Bioaccum-ulative?	COI is Identified as a CPEC? (9) (Q = 1)

CPEC = chemical of potential ecological concern
COI = chemical of interest
NA = not available
SLV = screening level value
T&E = threatened and endangered
UCL = upper confidence limit on the mean
Yes-Bio = Identified as potential CPEC because COI is bioaccumulative but SLV is does not account for bioaccumulation or there is no SLV
- - = not applicable

(1) In addition to seep water and surface water concentrations, concentrations in groundwater were compared to Selected Level II SLVs for surface water as a conservative measure (in the event that groundwater discharges to surface water).

Individual COIs in a Given Media
(9) Any individual COI in any given media with Tij > Q, where Tij = Cij/SLV ij, must be identified as a CPEC.
Where: Cij = concentration of contaminant *i* in medium *j*
SLVij = Level II Screening Level Value from DEQ for contaminant *i* in medium *j*.
Tij = Risk ratios for contaminant *i* in medium *j*
Q = Receptor designator
Assumptions: Cij = Lower of Maximum detected concentration and 95% UCL (for aquatic receptors).
Q = 1 for terrestrial T&E species and all aquatic species
Q = 5 for all common terrestrial species

Residual Range Organics	0-3 ft	2,300	NA	- -	- -	- -	- -	Yes - No SLV

This table only includes COIs detected > 5% and above the reference area (metals only).
For lead, the maximum concentration is from unseived samples.
CPEC = chemical of potential ecological concern
COI = chemical of interest
NA = not available
SLV = screening level value
T&E = threatened and endangered
- - = not applicable

Hierarchy of Terrestrial Plant SLV Selection (see Appendix J-5a)

Table N-16
Identification of CPECs in Soil at Sandblast Area AOPC - Multiple COIs for Plants
Bradford Island - Upland Operable Unit
(6 of 6)

Chemical of Interest	Depth Category (Soil)	Max Detected Conc in Soil	Level II SLVs for Plants Exposed to Soil (1,2,3,4)	Toxicity Ratio for Plants (Tij)	(Tij/Tj) (5)	Chemical is a Concern for Threatened or Endangered Plants? (Tij/Tj >= [1/Nij] x Q when Q = 1)	Chemical is a Concern for Non-Threatened or Endangered Plants? (Tij/Tj >= [1/Nij] x Q when Q = 5)	COI is Identified as a CPEC? (5) (Q = 1)

For metals only, the higher of the Reference Area 95% UPL and the hierarchical SLV was selected.

(1) United States Environmental Protection Agency (USEPA), 2005 -2007. Ecological Soil Screening Levels. U.S. Environmental Protection Agency Office of Solid Waste and Emergency Response. OSWER Directive 9285.7-72. Last Update July 2007.

(2) Oregon Department of Environmental Quality (DEQ), 1998. Guidance for Ecological Risk Assessment: Levels I, II, III, IV. Waste Management and Cleanup Division. Final. April. Updated December 2001.

(3) Efroymson RA, ME Wil, GW Suter II, and AC Wooten. 1997. Toxicological Benchmarks for Screening Contaminants of Potential Concern for Effects on Terrestrial Plants: 1997 Revision. November. ORNL. ES/ER/TM-85/R3.

(4) USEPA. 1999. Screening Level Ecological Risk Assessment Protocol for Hazardous Waste Combustion Facilities, Peer review Draft. EPA530-D-99-001A. August.

Multiple COIs Simultaneously within a Given Medium

(5) COIs with Tij/Tj values >= 1/Nij*Q must be retained as a CPEC, provided Tj>Q.

Where: Tij = toxicity ratio for contaminant *i* in medium *j* = chemical specific

Q = Receptor designator

0-1 ft bgs Soil Interval

Nij = total number of *i* contaminants in medium *j* = 43

Tj (0-1 ft bgs) = sum of toxicity ratios for all contaminants in medium *j* = 242

0-3 ft bgs Soil Interval

Nij = total number of *i* contaminants in medium *j* = 43

Tj (0-3 ft bgs) = sum of toxicity ratios for all contaminants in medium *j* = 319

Assumptions: Q = 1 for terrestrial T&E species and all aquatic species

Q = 5 for all common terrestrial species

For this project, Q = 1 for terrestrial plants, soil invertebrates, and birds; Q = 5 for mammals. Although no T&E plant or soil invertebrates species are potentially present, Q = 1 applied for these receptor groups at request of DEQ due to basis of SLVs (Eco-SSLs).

(6) The SLV for naphthalene was used to screen the individual and total LPAHs without SLVs.

(7) The SLV for the benzo(a)pyrene was used to screen the individual HPAHs without SLVs.

This table only includes COIs detected > 5% and above the reference area (metals only).
For lead, the maximum concentration is from unseived samples.
CPEC = chemical of potential ecological concern
COI = chemical of interest
HPAH = high molecular weight polycyclic aromatic hydrocarbons
KM, capped = Kaplan–Meier-based with Efron's bias correction, capped
LPAH = low molecular weight polycyclic aromatic hydrocarbons
Incl in tHPAH = COI is included in the Total HPAH Screening
Incl in tLPAH = COI is included in the Total LPAH Screening
MDL = method detection limit

Table N-17
Identification of CPECs in Soil at Sandblast Area AOPC - Multiple COIs for Soil Invertebrates
Bradford Island - Upland Operable Unit
(6 of 6)

Chemical of Interest	Depth Category (Soil)	Max Detected Conc in Soil	Level II SLVs for Invertebrates Exposed to Soil (1,2,3,4)	Toxicity Ratio for Invertebrates (Tij)	(Tij/Tj) (5)	Chemical is a Concern for Threatened or Endangered Invertebrates? (Tij/Tj >= [1/Nij] x Q when Q = 1)	Chemical is a Concern for Non-Threatened or Endangered Invertebrates? (Tij/Tj >= [1/Nij] x Q when Q = 5)	COI is Identified as a CPEC? (5) (Q = 1)

NA = not available
ND = non detect
SLV = screening level value
T&E = threatened and endangered
- - = not applicable

Hierarchy of Terrestrial Invertebrate SLV Selection (see Appendix J-5a)
For metals only, the higher of the Reference Area 95% UPL and the hierarchical SLV was selected.

Multiple COIs Simultaneously within a Given Medium
(5) COIs with Tij/Tj values >= 1/Nij*Q must be retained as a CPEC, provided Tj>Q.
Where: Tij = toxicity ratio for contaminant *i* in medium *j* = chemical specific
Q = Receptor designator
0-1 ft bgs Soil Interval
Nij = total number of *i* contaminants in medium *j* = 18
Tj (0-1 ft bgs) = sum of toxicity ratios for all contaminants in medium *j* = 117
0-3 ft bgs Soil Interval
Nij = total number of *i* contaminants in medium *j* = 18
Tj (0-3 ft bgs) = sum of toxicity ratios for all contaminants in medium *j* = 119
Assumptions: Q = 1 for terrestrial T&E species and all aquatic species
Q = 5 for all common terrestrial species
For this project, Q = 1 for terrestrial plants, soil invertebrates, and birds; Q = 5 for mammals. Although no T&E plant or soil invertebrates species are potentially present, Q = 1 applied for these receptor groups at request of DEQ due to basis of SLVs (Eco-SSLs).

This table only includes COIs detected > 5% and above the reference area (metals only).
For lead, the 95% UCL and maximum concentrations are from unseived samples.
CPEC = chemical of potential ecological concern

Table N-18
Identification of CPECs in Soil at Sandblast Area AOPC - Multiple COIs for Birds
Bradford Island - Upland Operable Unit
(5 of 5)

Chemicals of Interest	Depth Category (Soil)	Lower of Maximum and 95% UCL (1)	Level II SLVs for Birds Exposed to Soil (2,3,4)	Toxicity Ratio for Birds (Tij)	(Tij/Tj) (5)	Chemical is a Concern for Threatened or Endangered Birds? (Tij/Tj >= [1/Nij] x Q when Q = 1)	Chemical is a Concern for Non-Threatened or Endangered Birds? (Tij/Tj >= [1/Nij] x Q when Q = 5)	Is COI Bioaccum-ulative?	SLV Accounts for Bioaccum-ulation?	COI is Identified as a CPEC? (5) (Q = 1)

COI = chemical of interest
HPAH = high molecular weight polycyclic aromatic hydrocarbons
KM, capped = Kaplan–Meier-based with Efron's bias correction, capped
LPAH = low molecular weight polycyclic aromatic hydrocarbons
MDL = method detection limit
NA = not available
ND = non detect
SLV = screening level value
T&E = threatened and endangered
UCL = upper confidence limit on the mean
Yes-Bio = Identified as potential CPEC because COI is bioaccumulative but SLV is does not account for bioaccumulation or there is no SLV
- - = not applicable

(1) The lower of the maximum detected concentration and the calculated 95% UCL for COIs with at least 8 samples was used.

Hierarchy of Avian SLV Selection (see Appendix J-5a)
For metals only, the higher of the Reference Area 95% UPL and the hierarchical SLV was selected.
(2) United States Environmental Protection Agency (USEPA), 2005 -2007. Ecological Soil Screening Levels. U.S. Environmental Protection Agency Office of Solid Waste and Emergency Response. OSWER Directive 9285.7-72. Last Update July 2007.
(3) Oregon Department of Environmental Quality (DEQ), 1998. Guidance for Ecological Risk Assessment: Levels I, II, III, IV. Waste Management and Cleanup Division. Final. April. Updated December 2001.
(4) Efroymson RA, GW Suter II, BE Sample, DS Jones. 1997. Preliminary Remediation Goals for Ecological Endpoints. August. ORNL. ES/ER/TM-162/R2.

Multiple COIs Simultaneously within a Given Medium
(5) COIs with Tij/Tj values >= 1/Nij*Q must be retained as a CPEC, provided Tj>Q.
Where: Tij = toxicity ratio for contaminant *i* in medium *j* = chemical specific
Q = Receptor designator
0-1 ft bgs Soil Interval
Nij = total number of *i* contaminants in medium *j* = 31
Tj (0-1 ft bgs) = sum of toxicity ratios for all contaminants in medium *j* = 94.6
0-3 ft bgs Soil Interval
Nij = total number of *i* contaminants in medium *j* = 31
Tj (0-3 ft bgs) = sum of toxicity ratios for all contaminants in medium *j* = 82.9
Assumptions: Q = 1 for terrestrial T&E species and all aquatic species
Q = 5 for all common terrestrial species
For this project, Q = 1 for terrestrial plants, soil invertebrates, and birds; Q = 5 for mammals. Although no T&E plant or soil invertebrates species are potentially present, Q = 1 applied for these receptor groups at request of DEQ due to basis of SLVs (Eco-SSLs).

This table only includes COIs detected > 5% and above the reference area (metals only).
For lead, the 95% UCL and maximum concentrations are from unseived samples.
CPEC = chemical of potential ecological concern
COI = chemical of interest
HPAH = high molecular weight polycyclic aromatic hydrocarbons
KM, capped = Kaplan–Meier-based with Efron's bias correction, capped

Table N-19
Identification of CPECs in Soil at Sandblast Area AOPC - Multiple COIs for Mammals
Bradford Island - Upland Operable Unit
(5 of 5)

Chemicals of Interest	Depth Category (Soil)	Lower of Maximum and 95% UCL (1)	Level II SLVs for Mammals Exposed to Soil (2,3,4)	Toxicity Ratio for Mammals (Tij)	(Tij/Tj) (5)	Chemical is a Concern for Threatened or Endangered Mammals? (Tij/Tj >= [1/Nij] x Q when Q = 1)	Chemical is a Concern for Non-Threatened or Endangered Mammals? (Tij/Tj >= [1/Nij] x Q when Q = 5)	Is COI Bioaccum-ulative?	SLV Accounts for Bioaccum-ulation?	COI is Identified as a CPEC? (5) (Q = 5)

LPAH = low molecular weight polycyclic aromatic hydrocarbons
Incl in tHPAH = COI is included in the Total HPAH Screening
Incl in tLPAH = COI is included in the Total LPAH Screening
MDL = method detection limit
NA = not available
ND = non detect
SLV = screening level value
T&E = threatened and endangered
UCL = upper confidence limit on the mean
Yes-Bio = Identified as potential CPEC because COI is bioaccumulative but SLV is does not account for bioaccumulation or there is no SLV
- - = not applicable

(1) The lower of the maximum detected concentration and the calculated 95% UCL (for COIs with at least 8 samples).

Hierarchy of Mammalian SLV Selection (see Appendix J-5a)
For metals only, the higher of the Reference Area 95% UPL and the hierarchical SLV was selected.
(2) United States Environmental Protection Agency (USEPA), 2005 -2007. Ecological Soil Screening Levels. U.S. Environmental Protection Agency Office of Solid Waste and Emergency Response. OSWER Directive 9285.7-72. Last Update July 2007.
(3) Oregon Department of Environmental Quality (DEQ), 1998. Guidance for Ecological Risk Assessment: Levels I, II, III, IV. Waste Management and Cleanup Division. Final. April. Updated December 2001.
(4) Efroymson RA, GW Suter II, BE Sample, DS Jones. 1997. Preliminary Remediation Goals for Ecological Endpoints. August. ORNL. ES/ER/TM-162/R2.

Multiple COIs Simultaneously within a Given Medium
(5) COIs with Tij/Tj values >= 1/Nij*Q must be retained as a CPEC, provided Tj>Q.
Where: Tij = toxicity ratio for contaminant *i* in medium *j* = chemical specific
Q = Receptor designator
0-1 ft bgs Soil Interval
Nij = total number of *i* contaminants in medium *j* = 56
Tj (0-1 ft bgs) = sum of toxicity ratios for all contaminants in medium *j* = 102.4
0-3 ft bgs Soil Interval
Nij = total number of *i* contaminants in medium *j* = 54
Tj (0-3 ft bgs) = sum of toxicity ratios for all contaminants in medium *j* = 154
Assumptions: Q = 1 for terrestrial T&E species and all aquatic species
Q = 5 for all common terrestrial species
For this project, Q = 1 for terrestrial plants, soil invertebrates, and birds; Q = 5 for mammals. Although no T&E plant or soil invertebrates species are potentially present, Q = 1 applied for these receptor groups at request of DEQ due to basis of SLVs (Eco-SSLs).

Individual COIs in a Given Media

(5) Any individual COI in any given media with Tij > Q, where Tij = Cij/SLVij, must be identified as a CPEC.

Where: Cij = concentration of contaminant *i* in medium *j*

SLVij = Level II Screening Level Value from DEQ for contaminant *i* in medium *j* .

Tij = Risk ratios for contaminant *i* in medium *j*

Q = Receptor designator

Assumptions: Cij = Maximum detected concentration for immobile species (plants and invertebrates).

Q = 1 for terrestrial T&E species and all aquatic species

Q = 5 for all common terrestrial species

For this project, Q = 1 for terrestrial plants, soil invertebrates, and birds; Q = 5 for mammals. Although no T&E plant or soil invertebrates species are potentially present, Q = 1 applied for these receptor groups at request of DEQ due to basis of SLVs (Eco-SSLs).

Multiple COIs Simultaneously within a Given Medium
(5) COIs with Tij/Tj values >= 1/Nij*Q must be retained as a CPEC, provided Tj>Q.
Where: Tij = toxicity ratio for contaminant *i* in medium *j* = chemical specific
Q = Receptor designator
0-1 ft bgs Soil Interval
Nij = total number of *i* contaminants in medium *j* = 3
Tj (0-1 ft bgs) = sum of toxicity ratios for all contaminants in medium *j* = 2.43
Assumptions: Q = 1 for terrestrial T&E species and all aquatic species
Q = 5 for all common terrestrial species
For this project, Q = 1 for terrestrial plants, soil invertebrates, and birds; Q = 5 for mammals. Although no T&E plant or soil invertebrates species are potentially present, Q = 1 applied for these receptor groups at request of DEQ due to basis of SLVs (Eco-SSLs).

Table N-30

Individual COIs in a Given Media

(5) Any individual COI in any given media with Tij > Q, where Tij = Cij/SLVij, must be identified as a CPEC.

Where: Cij = concentration of contaminant *i* in medium *j*

SLVij = Level II Screening Level Value from DEQ for contaminant*i* in medium *j* .

Tij = Risk ratios for contaminant *i* in medium *j*

Q = Receptor designator

Assumptions: Cij = Lower of 95% UCL and maximum concentration for wildlife species (birds and mammals).

Q = 1 for terrestrial T&E species and all aquatic species

Q = 5 for all common terrestrial species

For this project, Q = 1 for terrestrial plants, soil invertebrates, and birds; Q = 5 for mammals. Although no T&E plant or soil invertebrates species are potentially present, Q = 1 applied for these receptor groups at request of DEQ due to basis of SLVs (Eco-SSLs).

Table N-39
Identification of CPECs in Soil at Bulb Slope AOPC - Multiple COIs for Plants
Bradford Island - Upland Operable Unit
(1 of 2)

Chemical of Interest	Depth Category (Soil)	Max Detected Conc in Soil	Level II SLVs for Plants Exposed to Soil (1,2,3,4)	Toxicity Ratio for Plants (Tij)	(Tij/Tj) (5)	Chemical is a Concern for Threatened or Endangered Plants? (Tij/Tj >= [1/Nij] x Q when Q = 1)	Chemical is a Concern for Non-Threatened or Endangered Plants? (Tij/Tj >= [1/Nij] x Q when Q = 5)	COI is Identified as a CPEC? (5) (Q = 1)
INORGANICS (mg/kg)								
Lead	0-1 ft	597	120	4.98	0.493	Yes	No	**Yes**

This table only includes COIs detected > 5% and above the reference area (metals only).
CPEC = chemical of potential ecological concern
COI = chemical of interest
HPAH = high molecular weight polycyclic aromatic hydrocarbons
KM, capped = Kaplan–Meier-based with Efron's bias correction, capped
LPAH = low molecular weight polycyclic aromatic hydrocarbons
MDL = method detection limit

Table N-43
Identification of CPECs in Soil at All Four AOPCs Combined - Individual COIs for Birds
Bradford Island - Upland Operable Unit
(6 of 6)

Chemicals of Interest	Depth Category (Soil)	Lower of Maximum and 95% UCL (1)	Level II SLVs for Birds Exposed to Soil (2,3,4)	Toxicity Ratio for Birds (Tij)	Concern for Threatened or Endangered Birds? (Tij>1)	Concern for Non-threatened or Endangered Birds? (Tij>5)	Is COI Bioaccum-ulative?	SLV Accounts for Bioaccum-ulation?	COI is Identified as a CPEC? (5) (Q = 1)

NA = not available
ND = non detect
SLV = screening level value
T&E = threatened and endangered
UCL = upper confidence limit on the mean
Yes-Bio = Identified as potential CPEC because COI is bioaccumulative but SLV is does not account for bioaccumulation or there is no SLV
- - = not applicable

(1) The lower of the maximum detected concentration and the calculated 95% UCL (for COIs with at least 8 samples).

Hierarchy of Avian SLV Selection (see Appendix J-5a)
For metals only, the higher of the Reference Area 95% UPL and the hierarchical SLV was selected.
(2) United States Environmental Protection Agency (USEPA), 2005 -2007. Ecological Soil Screening Levels. U.S. Environmental Protection Agency Office of Solid Waste and Emergency Response. OSWER Directive 9285.7-72. Last Update July 2007.
(3) Oregon Department of Environmental Quality (DEQ), 1998. Guidance for Ecological Risk Assessment: Levels I, II, III, IV. Waste Management and Cleanup Division. Final. April. Updated December 2001.
(4) Efroymson RA, GW Suter II, BE Sample, DS Jones. 1997. Preliminary Remediation Goals for Ecological Endpoints. August. ORNL. ES/ER/TM-162/R2.

Individual COIs in a Given Media
(5) Any individual COI in any given media with Tij > Q, where Tij = Cij/SLVij, must be identified as a CPEC.
Where: Cij = concentration of contaminant *i* in medium *j*
SLVij = Level II Screening Level Value from DEQ for contaminant *i* in medium *j*.
Tij = Risk ratios for contaminant *i* in medium *j*
Q = Receptor designator
Assumptions: Cij = Lower of 95% UCL and maximum concentration for wildlife species (birds and mammals).
Q = 1 for terrestrial T&E species and all aquatic species
Q = 5 for all common terrestrial species
For this project, Q = 1 for terrestrial plants, soil invertebrates, and birds; Q = 5 for mammals. Although no T&E plant or soil invertebrates species are potentially present, Q = 1 applied for these receptor groups at request of DEQ due to basis of SLVs (Eco-SSLs).

This table only includes COIs detected > 5% and above the reference area (metals only).
CPEC = chemical of potential ecological concern
COI = chemical of interest
HPAH = high molecular weight polycyclic aromatic hydrocarbons
KM, capped = Kaplan–Meier-based with Efron's bias correction, capped
LPAH = low molecular weight polycyclic aromatic hydrocarbons
Incl in tHPAH = COI is included in the Total HPAH Screening
Incl in tLPAH = COI is included in the Total LPAH Screening

Table N-44
Identification of CPECs in Soil at All Four AOPCs Combined - Individual COIs for Mammals
Bradford Island - Upland Operable Unit
(6 of 6)

Chemicals of Interest	Depth Category (Soil)	Lower of Maximum and 95% UCL (1)	Level II SLVs for Mammals Exposed to Soil (2,3,4)	Toxicity Ratio for Mammals (Tij)	Concern for Threatened or Endangered Mammals? (Tij>1)	Concern for Non-threatened or Endangered Mammals? (Tij>5)	Is COI Bioaccum-ulative?	SLV Accounts for Bioaccum-ulation?	COI is Identified as a CPEC? (5) (Q = 5)

MDL = method detection limit
NA = not available
ND = non detect
SLV = screening level value
T&E = threatened and endangered
UCL = upper confidence limit on the mean
Yes-Bio = Identified as potential CPEC because COI is bioaccumulative but SLV is does not account for bioaccumulation or there is no SLV
- - = not applicable

(1) The lower of the maximum detected concentration and the calculated 95% UCL (for COIs with at least 8 samples).

Hierarchy of Mammalian SLV Selection (see Appendix J-5a)
For metals only, the higher of the Reference Area 95% UPL and the hierarchical SLV was selected.
(2) United States Environmental Protection Agency (USEPA), 2005 -2007. Ecological Soil Screening Levels. U.S. Environmental Protection Agency Office of Solid Waste and Emergency Response. OSWER Directive 9285.7-72. Last Update July 2007.
(3) Oregon Department of Environmental Quality (DEQ), 1998. Guidance for Ecological Risk Assessment: Levels I, II, III, IV. Waste Management and Cleanup Division. Final. April. Updated December 2001.
(4) Efroymson RA, GW Suter II, BE Sample, DS Jones. 1997. Preliminary Remediation Goals for Ecological Endpoints. August. ORNL. ES/ER/TM-162/R2.

Individual COIs in a Given Media
(5) Any individual COI in any given media with Tij > Q, where Tij = Cij/SLVij, must be identified as a CPEC.
Where: Cij = concentration of contaminant *i* in medium *j*
SLVij = Level II Screening Level Value from DEQ for contaminant *i* in medium *j*.
Tij = Risk ratios for contaminant *i* in medium *j*
Q = Receptor designator
Assumptions: Cij = Lower of 95% UCL and maximum concentration for wildlife species (birds and mammals).
Q = 1 for terrestrial T&E species and all aquatic species
Q = 5 for all common terrestrial species
For this project, Q = 1 for terrestrial plants, soil invertebrates, and birds; Q = 5 for mammals. Although no T&E plant or soil invertebrates species are potentially present, Q = 1 applied for these receptor groups at request of DEQ due to basis of SLVs (Eco-SSLs).
(6) The SLV for Total LPAHs was used to screen the individual LPAHs to determine which individuals are driving Total LPAH risk, if any.
(7) The SLV for Total HPAHs was used to screen the individual HPAHs to determine which individuals are driving Total HPAH risk, if any.

Table N-45
Identification of CPECs in Soil at All Four AOPCs Combined - Multiple COIs for Birds
Bradford Island - Upland Operable Unit
(5 of 5)

Chemicals of Interest	Depth Category (Soil)	Lower of Maximum and 95% UCL (1)	Level II SLVs for Birds Exposed to Soil (2,3,4)	Toxicity Ratio for Birds (Tij)	(Tij/Tj) (5)	Chemical is a Concern for Threatened or Endangered Birds? (Tij/Tj >= [1/Nij] x Q when Q = 1)	Chemical is a Concern for Non-Threatened or Endangered Birds? (Tij/Tj >= [1/Nij] x Q when Q = 5)	Is COI Bioaccum-ulative?	SLV Accounts for Bioaccum-ulation?	COI is Identified as a CPEC? (5) (Q = 1)

This table only includes COIs detected > 5% and above the reference area (metals only).
CPEC = chemical of potential ecological concern
COI = chemical of interest
HPAH = high molecular weight polycyclic aromatic hydrocarbons
KM, capped = Kaplan–Meier-based with Efron's bias correction, capped
LPAH = low molecular weight polycyclic aromatic hydrocarbons
MDL = method detection limit
NA = not available
ND = non detect
SLV = screening level value
T&E = threatened and endangered
UCL = upper confidence limit on the mean
Yes-Bio = Identified as potential CPEC because COI is bioaccumulative but SLV is does not account for bioaccumulation or there is no SLV
- - = not applicable

(1) The lower of the maximum detected concentration and the calculated 95% UCL for COIs with at least 8 samples was used.

Hierarchy of Avian SLV Selection (see Appendix J-5a)
For metals only, the higher of the Reference Area 95% UPL and the hierarchical SLV was selected.

(2) United States Environmental Protection Agency (USEPA), 2005 -2007. Ecological Soil Screening Levels. U.S. Environmental Protection Agency Office of Solid Waste and Emergency Response. OSWER Directive 9285.7-72. Last Update July 2007.
(3) Oregon Department of Environmental Quality (DEQ), 1998. Guidance for Ecological Risk Assessment: Levels I, II, III, IV. Waste Management and Cleanup Division. Final. April. Updated December 2001.
(4) Efroymson RA, GW Suter II, BE Sample, DS Jones. 1997. Preliminary Remediation Goals for Ecological Endpoints. August. ORNL. ES/ER/TM-162/R2.

Multiple COIs Simultaneously within a Given Medium
(5) COIs with Tij/Tj values >= 1/Nij*Q must be retained as a CPEC, provided Tj>Q.
Where: Tij = toxicity ratio for contaminant *i* in medium *j* = chemical specific
Q = Receptor designator
0-1 ft bgs Soil Interval
Nij = total number of *i* contaminants in medium *j* = 33
Tj (0-1 ft bgs) = sum of toxicity ratios for all contaminants in medium *j* = 182
0-3 ft bgs Soil Interval
Nij = total number of *i* contaminants in medium *j* = 33
Tj (0-3 ft bgs) = sum of toxicity ratios for all contaminants in medium *j* = 175
Assumptions: Q = 1 for terrestrial T&E species and all aquatic species
Q = 5 for all common terrestrial species
For this project, Q = 1 for terrestrial plants, soil invertebrates, and birds; Q = 5 for mammals. Although no T&E plant or soil invertebrates species are potentially present, Q = 1 applied for these receptor groups at request of DEQ due to basis of SLVs (Eco-SSLs).

Residual Range Organics	0-3 ft	2,030	NA	- -	- -	- -	- -	- -	- -	Yes - No SLV

This table only includes COIs detected > 5% and above the reference area (metals only).
CPEC = chemical of potential ecological concern
COI = chemical of interest
HPAH = high molecular weight polycyclic aromatic hydrocarbons
KM, capped = Kaplan–Meier-based with Efron's bias correction, capped
LPAH = low molecular weight polycyclic aromatic hydrocarbons
Incl in tHPAH = COI is included in the Total HPAH Screening
Incl in tLPAH = COI is included in the Total LPAH Screening
MDL = method detection limit
NA = not available
ND = non detect

Table N-46
Identification of CPECs in Soil at All Four AOPCs Combined - Multiple COIs for Mammals
Bradford Island - Upland Operable Unit
(5 of 5)

Chemicals of Interest	Depth Category (Soil)	Lower of Maximum and 95% UCL (1)	Level II SLVs for Mammals Exposed to Soil (2,3,4)	Toxicity Ratio for Mammals (Tij)	(Tij/Tj) (5)	Chemical is a Concern for Threatened or Endangered Mammals? (Tij/Tj >= [1/Nij] x Q when Q = 1)	Chemical is a Concern for Non-Threatened or Endangered Mammals? (Tij/Tj >= [1/Nij] x Q when Q = 5)	Is COI Bioaccum-ulative?	SLV Accounts for Bioaccum-ulation?	COI is Identified as a CPEC? (5) (Q = 5)

SLV = screening level value
T&E = threatened and endangered
UCL = upper confidence limit on the mean
Yes-Bio = Identified as potential CPEC because COI is bioaccumulative but SLV is does not account for bioaccumulation or there is no SLV
- - = not applicable

(1) The lower of the maximum detected concentration and the calculated 95% UCL (for COIs with at least 8 samples).

Hierarchy of Mammalian SLV Selection (see Appendix J-5a)
For metals only, the higher of the Reference Area 95% UPL and the hierarchical SLV was selected.
(2) United States Environmental Protection Agency (USEPA), 2005 -2007. Ecological Soil Screening Levels. U.S. Environmental Protection Agency Office of Solid Waste and Emergency Response. OSWER Directive 9285.7-72. Last Update July 2007.
(3) Oregon Department of Environmental Quality (DEQ), 1998. Guidance for Ecological Risk Assessment: Levels I, II, III, IV. Waste Management and Cleanup Division. Final. April. Updated December 2001.
(4) Efroymson RA, GW Suter II, BE Sample, DS Jones. 1997. Preliminary Remediation Goals for Ecological Endpoints. August. ORNL. ES/ER/TM-162/R2.

Multiple COIs Simultaneously within a Given Medium
(5) COIs with Tij/Tj values >= 1/Nij*Q must be retained as a CPEC, provided Tj>Q.
Where: Tij = toxicity ratio for contaminant *i* in medium *j* = chemical specific
Q = Receptor designator
0-1 ft bgs Soil Interval
Nij = total number of *i* contaminants in medium *j* = 56
Tj (0-1 ft bgs) = sum of toxicity ratios for all contaminants in medium *j* = 631
0-3 ft bgs Soil Interval
Nij = total number of *i* contaminants in medium *j* = 54
Tj (0-3 ft bgs) = sum of toxicity ratios for all contaminants in medium *j* = 631
Assumptions: Q = 1 for terrestrial T&E species and all aquatic species
Q = 5 for all common terrestrial species
For this project, Q = 1 for terrestrial plants, soil invertebrates, and birds; Q = 5 for mammals. Although no T&E plant or soil invertebrates species are potentially present, Q = 1 applied for these receptor groups at request of DEQ due to basis of SLVs (Eco-SSLs).

Individual COIs in a Given Media

(9) Any individual COI in any given media with Tij > Q, where Tij = Cij/SLV ij, must be identified as a CPEC.
Where: Cij = concentration of contaminant *i* in medium *j*
SLVij = Level II Screening Level Value from DEQ for contaminant *i* in medium *j*.
Tij = Risk ratios for contaminant *i* in medium *j*
Q = Receptor designator
Assumptions: Cij = Lower of Maximum detected concentration and 95% UCL (for aquatic receptors).
Q = 1 for terrestrial T&E species and all aquatic species
Q = 5 for all common terrestrial species
(10) The lowest surface water SLV for 2,3,7,8-TCDD is protective of mammals (DEQ's 2001 SLV for surface water, as cited in Appendix J, Table J-5). Therefore, the mammalian TEQ for dioxin-like PCBs in Forebay surface water is used appropriately for comparison to the lowest surface water SLV.

Multiple COIs Simultaneously within a Given Medium

(9) COIs with Tij/Tj values >= 1/Nij*Q must be retained as a CPEC, provided Tj>Q.

Where: Tij = toxicity ratio for contaminant *i* in medium *j* = chemical specific

Q = Receptor designator

Nij = total number of *i* contaminants in medium *j* = 17

Tj = sum of toxicity ratios for all contaminants in medium *j* = 6.30

Assumptions: Q = 1 for terrestrial T&E species and all aquatic species

Q = 5 for all common terrestrial species

(10) The lowest surface water SLV for 2,3,7,8-TCDD is protective of mammals (DEQ's 2001 SLV for surface water, as cited in Appendix J, Table J-5). Therefore, the mammalian TEQ for dioxin-like PCBs in Forebay surface water is used appropriately for comparison to the lowest surface water SLV.

Note: Both the fish PCB TEQ and total PCB congener toxicity ratios were included in the sum of all toxicity ratios, which may double-count affects from PCBs.

Table N-51
Identification of Bioaccumulative CPECs in Forebay Tissue - Fish and Shellfish
Bradford Island - River Operable Unit
(1 of 5)

Tissue	Chemicals of Interest	IUPAC #	Lower of Maximum and 95% UCL (1)	CTLs for Fish & Shellfish Exposed to Tissue (2)	Toxicity Ratio for Fish & Shellfish (R_{Bac})	Is COI Bioaccumulative? (BCF>300 or Log Kow >3.5)	COI is Identified as a Bioaccumulative CPEC? (3)

This table only includes COIs detected > 5% and above the reference area (metals only).

Table N-51
Identification of Bioaccumulative CPECs in Forebay Tissue - Fish and Shellfish
Bradford Island - River Operable Unit
(5 of 5)

Tissue	Chemicals of Interest	IUPAC #	Lower of Maximum and 95% UCL (1)	CTLs for Fish & Shellfish Exposed to Tissue (2)	Toxicity Ratio for Fish & Shellfish (R_{Bac})	Is COI Bioaccumulative? (BCF>300 or Log Kow >3.5)	COI is Identified as a Bioaccumulative CPEC? (3)

CPEC = chemical of potential ecological concern
COI = chemical of interest
CTL = critical tissue level (for fish)
KM, capped = Kaplan–Meier-based with Efron's bias correction, capped
MDL = method detection limit
NA = not available
ND = non detect
TEQ = Toxicity Equivalence Quotient
UCL = upper confidence limit on the mean
- - = not applicable

(1) The lower of the maximum detected concentration and the calculated 95% UCL for COIs with at least 8 samples was used.
(2) DEQ 2007. Guidance for Evaluation of Bioaccumulative Chemicals of Concern in Sediment. Final. January 31 (see Appendix J-5d).

Bioaccumulative COIs in a Given Media

(3) Any individual COI in any given media with $R_{Bac} > 0.1$ and Sum $R_{Bac} > 1$, where R_{Bac} = Cij/SLVij, must be identified as a CPEC.

Where: Cij = concentration of contaminant *i* in medium *j*

SLVij = Level II Screening Level Value from DEQ for contaminant *i* in medium *j*.

R_{Bac} = bioaccumulation index for an individual COI

Sum R_{Bac} = Cumulative Bioaccumulation Index for all COIs

(4) The SLV for Fluoranthene was used as a surrogate for the individual LPAHs without SLVs. Fluoranthene is considered an HPAH in the RI, HHRA, and ERA and used to calculate Total HPAH; however, fluoranthene is more accurately a PAH that borders the two with a molecular weight more similar to HPAHs and but a structure more similar to LPAHs. Therefore, use of fluoranthene as a surrogate for LPAHs is appropriate in the absence of any LPAH SLVs.
(5) The SLV for pyrene was used as a surrogate for the individual HPAHs without SLVs.
(6) The Sum R_{Bac} is the sum of the individual $R_{Bac.}$ Three ways of calculating Sum R_{Bac}: Total PCBs as Aroclors, individual metals, SVOCs, and PAHs : Total PCBs as Congeners, individual metals, SVOCs, and PAHs : PCBs as Fish TEQs, individual metals, SVOCs, and PAHs.

PCBs As Fish TEQ (KM, capped; NDs at MDL)	-	0.00000759	0.000560	0.0136	Yes	No
SVOCs (ug/kg)						
Bis(2-ethylhexyl) Phthalate	-	180	NA	- -	Yes	**Yes - Bio - No SLV**
Sum R_{Bac}^{4} = 1.30 : 0.163 : 0.0136						

This table only includes the CPECs detected > 5% from the Tissue - Fish Table (Table N-51).
CPEC = chemical of potential ecological concern
COI = chemical of interest
KM, capped = Kaplan–Meier-based with Efron's bias correction, capped
MDL = method detection limit
NA = not available
ND = non detect
SLV = screening level value
TEQ = Toxicity Equivalence Quotient
UCL = upper confidence limit on the mean

Table N-52
Identification of Bioaccumulative CPECs in Forebay Sediment - Fish
Bradford Island - River Operable Unit
(2 of 2)

Chemicals of Interest	IUPAC #	Lower of Maximum and 95% UCL (1)	SLVs for Freshwater Fish Exposed to Sediment (2)	Toxicity Ratio for Fish (R_{Bac})	Is COI Bioaccumulative? (BCF>300 or Log Kow >3.5)	COI is Identified as a Bioaccumulative CPEC? (3)

Yes-Bio = Identified as potential CPEC because COI is bioaccumulative but SLV is does not account for bioaccumulation or there is no SLV
- - = not applicable

(1) The lower of the maximum detected concentration and the calculated 95% UCL for COIs with at least 8 samples was used.
(2) The greater of the site-specific reference 95% UPL concentration (inorganics only) and the bioaccumulative freshwater fish SLVs from (see Appendix J-5c):

Oregon Department of Environmental Quality (DEQ), 2007. Guidance for Assessing Bioaccumulative Chemicals of Concern in Sediment. Land Quality Division. Final. January 31.

Bioaccumulative COIs in a Given Media

(3) Any individual COI in any given media with $R_{Bac} > 0.1$ and Sum $R_{Bac} > 1$, where R_{Bac} = Cij/SLVij, must be identified as a CPEC.

Where: Cij = concentration of contaminant *i* in medium *j*

SLVij = Level II Screening Level Value from DEQ for contaminant *i* in medium *j* .

R_{Bac} = bioaccumulation index for an individual COI

Sum R_{Bac} = Cumulative Bioaccumulation Index for all COIs

(4) The Sum R_{Bac} is the R_{Bac} for Total PCBs as Aroclors, Total PCBs as congeners, and PCBs as TEQ (respectively), since there are no other COIs with toxicity ratios.

					Crayfish Sum R_{Bac}^4 =	- - : 1.86 : 0.867	
					Sculpin Sum R_{Bac}^4 =	15.0 : 93.4 : 4.13	
					Smallmouth Bass Sum R_{Bac}^4 =	122 : 556 : 41.1	

This table only includes COIs detected > 5% and above the reference area (metals only).
ATL = acceptable tissue level
CPEC = chemical of potential ecological concern

Table N-53
Identification of Bioaccumulative CPECs in Forebay Tissue - Birds (Individual)
Bradford Island - River Operable Unit
(4 of 4)

Medium	Chemicals of Interest	IUPAC #	Lower of Maximum and 95% UCL (1)	ATLs for Individual Birds Exposed to Tissue (2)	Toxicity Ratio for Birds (R_{Bac})	Is COI Bioaccumulative? (BCF>300 or Log Kow >3.5)	COI is Identified as a Bioaccumulative CPEC? (3)

COI = chemical of interest
KM, capped = Kaplan–Meier-based with Efron's bias correction, capped
MDL = method detection limit
ND = non detect
NA = not available
TEQ = Toxicity Equivalence Quotient
UCL = upper confidence limit on the mean
Yes-Bio = Identified as potential CPEC because COI is bioaccumulative but SLV is does not account for bioaccumulation or there is no SLV
- - = not applicable

(1) The lower of the maximum detected concentration and the calculated 95% UCL for COIs with at least 8 samples was used.
(2) DEQ 2007. Guidance for Evaluation of Bioaccumulative Chemicals of Concern in Sediment. Final. January 31 (see Appendix J-5d).

Bioaccumulative COIs in a Given Media

(3) Any individual COI in any given media with $R_{Bac} > 0.1$ and Sum $R_{Bac} > 1$, where $R_{Bac} = Cij/SLVij$, must be identified as a CPEC.

Where: Cij = concentration of contaminant *i* in medium *j*
SLVij = Level II Screening Level Value from DEQ for contaminant *i* in medium *j* .
R_{Bac} = bioaccumulation index for an individual COI
Sum R_{Bac} = Cumulative Bioaccumulation Index for all COIs

(4) The Sum R_{Bac} is the sum of the individual R_{Bac}. Three ways of calculating Sum R_{Bac}; Total PCBs as Aroclors, individual metals, SVOCs, and PAHs : Total PCBs as Congeners, individual metals, SVOCs, and PAHs : PCBs as Fish TEQs, individual metals, SVOCs, and PAHs.

					Sculpin Sum R_{Bac}^4 =	1.49 : 3.02 : 2.00	
					Smallmouth Bass Sum R_{Bac}^4 =	4.43 : 12.9 : 19.5	

This table only includes COIs detected > 5% and above the reference area (metals only).
ATL = acceptable tissue level
CPEC = chemical of potential ecological concern

Table N-54
Identification of Bioaccumulative CPECs in Forebay Tissue - Birds (Population)
Bradford Island - River Operable Unit
(4 of 4)

Medium	Chemicals of Interest	IUPAC #	Lower of Maximum and 95% UCL (1)	ATLs for Bird Populations Exposed to Tissue (2)	Toxicity Ratio for Birds (R_{Bac})	Is COI Bioaccumulative? (BCF>300 or Log Kow >3.5)	COI is Identified as a Bioaccumulative CPEC? (3)

COI = chemical of interest
KM, capped = Kaplan–Meier-based with Efron's bias correction, capped
MDL = method detection limit
NA = not available
ND = non detect
TEQ = Toxicity Equivalence Quotient
UCL = upper confidence limit on the mean
Yes-Bio = Identified as potential CPEC because COI is bioaccumulative but SLV is does not account for bioaccumulation or there is no SLV
- - = not applicable

(1) The lower of the maximum detected concentration and the calculated 95% UCL for COIs with at least 8 samples was used.
(2) DEQ 2007. Guidance for Evaluation of Bioaccumulative Chemicals of Concern in Sediment. Final. January 31 (see Appendix J-5d).

Bioaccumulative COIs in a Given Media

(3) Any individual COI in any given media with $R_{Bac} > 0.1$ and Sum $R_{Bac} > 1$, where R_{Bac} = Cij/SLVij, must be identified as a CPEC.

Where: Cij = concentration of contaminant *i* in medium *j*
SLVij = Level II Screening Level Value from DEQ for contaminant *i* in medium *j*.
R_{Bac} = bioaccumulation index for an individual COI
Sum R_{Bac} = Cumulative Bioaccumulation Index for all COIs

(4) The Sum R_{Bac} is the sum of the individual R_{Bac}. Three ways of calculating Sum R_{Bac}; Total PCBs as Aroclors, individual metals, SVOCs, and PAHs : Total PCBs as Congeners, individual metals, SVOCs, and PAHs : PCBs as Fish TEQs, individual metals, SVOCs, and PAHs

Table N-55

This table only includes COIs detected > 5% and above the reference area (metals only).
ATL = acceptable tissue level
CPEC = chemical of potential ecological concern
COI = chemical of interest

Table N-57
Identification of Bioaccumulative CPECs in Forebay Tissue - Mammals (Individual)
Bradford Island - River Operable Unit
(4 of 4)

Medium	Chemicals of Interest	IUPAC #	Lower of Maximum and 95% UCL (1)	ATLs for Individual Mammals Exposed to Tissue (2)	Toxicity Ratio for Mammals (R_{Bac})	Is COI Bioaccumulative? (BCF>300 or Log Kow >3.5)	COI is Identified as a Bioaccumulative CPEC? (3)

KM, capped = Kaplan–Meier-based with Efron's bias correction, capped
MDL = method detection limit
NA = not available
ND = non detect
TEQ = Toxicity Equivalence Quotient
UCL = upper confidence limit on the mean
Yes-Bio = Identified as potential CPEC because COI is bioaccumulative but SLV is does not account for bioaccumulation or there is no SLV
- - = not applicable

(1) The lower of the maximum detected concentration and the calculated 95% UCL for COIs with at least 8 samples was used.
(2) DEQ 2007. Guidance for Evaluation of Bioaccumulative Chemicals of Concern in Sediment. Final. January 31 (see Table J-5d).

Bioaccumulative COIs in a Given Media

(3) Any individual COI in any given media with $R_{Bac} > 0.1$ and Sum $R_{Bac} > 1$, where R_{Bac} = Cij/SLVij, must be identified as a CPEC.

Where: Cij = concentration of contaminant *i* in medium *j*

SLVij = Level II Screening Level Value from DEQ for contaminant *i* in medium *j*.

R_{Bac} = bioaccumulation index for an individual COI

Sum R_{Bac} = Cumulative Bioaccumulation Index for all COIs

(4) The SLV for Fluoranthene was used as a surrogate for the individual LPAHs without SLVs. Fluoranthene is considered an HPAH in the RI, HHRA, and ERA and used to calculate Total HPAH; however, fluoranthene is more accurately a PAH that borders the two with a molecular weight more similar to HPAHs and but a structure more similar to LPAHs. Therefore, use of fluoranthene as a surrogate for LPAHs is appropriate in the absence of any LPAH SLVs.
(5) The SLV for pyrene was used as a surrogate for the individual HPAHs without SLVs.
(6) The Sum R_{Bac} is the sum of the individual R_{Bac}. Three ways of calculating Sum R_{Bac}: Total PCBs as Aroclors, individual metals, SVOCs, and PAHs : Total PCBs as Congeners, individual metals, SVOCs, and PAHs : PCBs as Fish TEQs, individual metals, SVOCs, and PAHs.

This table only includes COIs detected > 5% and above the reference area (metals only).
ATL = acceptable tissue level
CPEC = chemical of potential ecological concern
COI = chemical of interest
KM, capped = Kaplan–Meier-based with Efron's bias correction, capped
MDL = method detection limit
NA = not available
ND = non detect

Table N-58
Identification of Bioaccumulative CPECs in Forebay Tissue - Mammals (Population)
Bradford Island - River Operable Unit
(4 of 4)

Medium	Chemicals of Interest	IUPAC #	Lower of Maximum and 95% UCL (1)	ATLs for Mammal Populations Exposed to Tissue (2)	Toxicity Ratio for Mammals (R_{Bac})	Is COI Bioaccumulative? (BCF>300 or Log Kow >3.5)	COI is Identified as a Bioaccumulative CPEC? (3)

TEQ = Toxicity Equivalence Quotient
UCL = upper confidence limit on the mean
Yes-Bio = Identified as potential CPEC because COI is bioaccumulative but SLV is does not account for bioaccumulation or there is no SLV
- - = not applicable

(1) The lower of the maximum detected concentration and the calculated 95% UCL for COIs with at least 8 samples was used.
(2) DEQ 2007. Guidance for Evaluation of Bioaccumulative Chemicals of Concern in Sediment. Final. January 31 (see Appendix J-5d).

Bioaccumulative COIs in a Given Media

(3) Any individual COI in any given media with $R_{Bac} > 0.1$ and Sum $R_{Bac} > 1$, where R_{Bac} = Cij/SLVij, must be identified as a CPEC.

Where: Cij = concentration of contaminant *i* in medium *j*

SLVij = Level II Screening Level Value from DEQ for contaminant *i* in medium *j* .

R_{Bac} = bioaccumulation index for an individual COI

Sum R_{Bac} = Cumulative Bioaccumulation Index for all COIs

(4) The SLV for Fluoranthene was used as a surrogate for the individual LPAHs without SLVs. Fluoranthene is considered an HPAH in the RI, HHRA, and ERA and used to calculate Total HPAH; however, fluoranthene is more accurately a PAH that borders the two with a molecular weight more similar to HPAHs and but a structure more similar to LPAHs. Therefore, use of fluoranthene as a surrogate for LPAHs is appropriate in the absence of any LPAH SLVs.
(5) The SLV for pyrene was used as a surrogate for the individual HPAHs without SLVs.
(6) The Sum R_{Bac} is the sum of the individual R_{Bac}. Three ways of calculating Sum R_{Bac}; Total PCBs as Aroclors, individual metals, SVOCs, and PAHs : Total PCBs as Congeners, individual metals, SVOCs, and PAHs : PCBs as Fish TEQs, individual metals, SVOCs, and PAHs.

This table only includes COIs detected above the reference area (metals only).
CPEC = chemical of potential ecological concern
COI = chemical of interest

Table N-70
Identification of Bioaccumulative CPECs in Tissue at Goose Island - Fish and Shellfish
Bradford Island - River Operable Unit
(3 of 3)

Tissue	Chemicals of Interest	IUPAC #	Max Detected Conc	CTLs for Fish & Shellfish Exposed to Tissue (1)	Toxicity Ratio for Fish & Shellfish (R_{Bac})	Is COI Bioaccumulative? (BCF>300 or Log Kow >3.5)	COI is Identified as a Bioaccumulative CPEC? (3)

CTL = critical tissue level (for fish)
KM, capped = Kaplan–Meier-based with Efron's bias correction, capped
MDL = method detection limit
NA = not available
ND = non detect
Yes-Bio = Identified as potential CPEC because COI is bioaccumulative but SLV is does not account for bioaccumulation or there is no SLV
- - = not applicable

(1) DEQ 2007. Guidance for Evaluation of Bioaccumulative Chemicals of Concern in Sediment. Final. January 31 (see Appendix J-5d).
(2) Inorganics with maximum detected concentrations less than the site-specific reference 95% UPL concentration were not considered CPECs and are not evaluated.

Bioaccumulative COIs in a Given Media
(3) Any individual COI in any given media with $R_{Bac} > 0.1$ and Sum $R_{Bac} > 1$, where R_{Bac} = Cij/SLVij, must be identified as a CPEC.
Where: Cij = concentration of contaminant *i* in medium *j*.
SLVij = Level II Screening Level Value from DEQ for contaminant *i* in medium *j*.
R_{Bac} = bioaccumulation index for an individual COI.
Sum R_{Bac} = Cumulative Bioaccumulation Index for all COIs.

(4) The SLV for Fluoranthene was used as a surrogate for the individual LPAHs without SLVs. Fluoranthene is considered an HPAH in the RI, HHRA, and ERA and used to calculate Total HPAH; however, fluoranthene is more accurately a PAH that borders the two with a molecular weight more similar to HPAHs and but a structure more similar to LPAHs. Therefore, use of fluoranthene as a surrogate for LPAHs is appropriate in the absence of any LPAH SLVs.
(5) The SLV for pyrene was used as a surrogate for the individual HPAHs without SLVs.
(6) The Sum R_{Bac} is the sum of the individual R_{Bac}. Two ways of calculating Sum R_{Bac}; Total PCBs as Congeners, individual metals, SVOCs, and PAHs : PCBs as Fish TEQs, individual metals, SVOCs, and PAHs.

Table N-76
Identification of Bioaccumulative CPECs in Tissue at Goose Island - Mammals (Individual)
Bradford Island - River Operable Unit
(2 of 2)

This table only includes COIs detected above the reference area (metals only).
ATL = acceptable tissue level
CPEC = chemical of potential ecological concern
COI = chemical of interest
KM, capped = Kaplan–Meier-based with Efron's bias correction, capped
MDL = method detection limit
NA = not available
ND = non detect
- - = not applicable

(1) DEQ 2007. Guidance for Evaluation of Bioaccumulative Chemicals of Concern in Sediment. Final. January 31 (see Appendix J-5d).
(2) Inorganics with maximum detected concentrations less than the site-specific reference 95% UPL concentration were not considered CPECs and are not evaluated.

Bioaccumulative COIs in a Given Media

(3) Any individual COI in any given media with $R_{Bac} > 0.1$ and Sum $R_{Bac} > 1$, where R_{Bac} = Cij/SLVij, must be identified as a CPEC.

Where: Cij = concentration of contaminant *i* in medium *j*.

SLVij = Level II Screening Level Value from DEQ for contaminant *i* in medium *j*.

R_{Bac} = bioaccumulation index for an individual COI.

Sum R_{Bac} = Cumulative Bioaccumulation Index for all COIs.

(4) The SLV for Fluoranthene was used as a surrogate for the individual LPAHs without SLVs. Fluoranthene is considered an HPAH in the RI, HHRA, and ERA and used to calculate Total HPAH; however, fluoranthene is more accurately a PAH that borders the two with a molecular weight more similar to HPAHs and but a structure more similar to LPAHs. Therefore, use of fluoranthene as a surrogate for LPAHs is appropriate in the absence of any LPAH SLVs.
(5) The SLV for pyrene was used as a surrogate for the individual HPAHs without SLVs.
(6) The Sum R_{Bac} is the sum of the individual R_{Bac}. Two ways of calculating Sum R_{Bac}; Total PCBs as Congeners, individual metals, and PAHs : PCBs as Mammal TEQs, individual metals, and

O.3-12 Ecological Risk-Based Screening for Metals with High MDDs - River OU

O.3-13 Summary of COIs with Recently Updated SLVs that have Decreased

Uncertainties are inherent in any risk-based approach to evaluation and decision-making for potentially contaminated sites. The uncertainties may be general and systemic as well as specific to the site. The objective of the uncertainty assessment is to identify the sources of uncertainty in the risk assessment (RA) process, understand their potential to contribute to either underestimation or overestimation of risk for the selected receptors and pathways and describe how the uncertainty is addressed. By describing the nature and magnitude of the uncertainties, the findings and conclusions of the RA can be better understood and used as a tool for decision-making.

Both the human health risk assessment (HHRA) and ecological risk assessment (ERA) use essentially the same process for chemicals of potential concern (COPCs) identification, or chemicals of potential ecological concern (CPECs), and screening level risk evaluation. The process includes 4 elements: compilation of useable analytical data, identification of receptors and exposure pathways, selection and application of media-specific screening level values (SLVs), and identification of COPCs and CPECs from the broader list of chemicals of interest (COIs) that were analyzed. Therefore, some uncertainties are common to both the HHRA and the ERA. These uncertainties are described first followed by more extensive discussion of uncertainties that apply specifically to either the HHRA or ERA.

O.1 Uncertainties Common to the HHRA and ERA

The sources of uncertainty that are common to the HHRA and ERA include issues related to data quality, estimation of exposure point concentrations (EPCs), and the selection and application of SLVs to identify COPCs. For simplicity, the term COPCs is used in reference to both the HHRA and ERA in this section. The uncertainties common to the HHRA and ERA that are not specific to the Upland or River Operable Units (OUs) are in Section O.1.1, and those that are OU-specific are described in Sections O.1.2 and O.1.3.

O.1.1 Upland and River OUs

O.1.1.1 Data Adequacy and Data Quality

Section 7.0 of the main remedial investigation (RI) text provides a thorough evaluation of the adequacy and quality of the data used in the Upland and River OU RAs. Specifically, the following elements were assessed for each data set included in the RAs:

- Sample size
- J-flagged Data
- Variable method detection limits (MDLs) and method reporting limits (MRLs)
- MDLs of undetected data (U-flagged) greater than SLVs
- MRLs of undetected (U-flagged) and estimated (J-flagged) data greater than SLVs
- Analytes without SLVs

The findings of the data adequacy and quality evaluations are described in detail in Section 7.0. In summary, the majority of sample sizes for each analyte measured in media of the Upland and River OUs are considered to be sufficient for their intended uses since they meet the minimum required sample size for statistical evaluation. Analytes for which the sample sizes were limited include, but are not limited to, those that were targeted (i.e., Goose Island and Eagle Creek), focused (i.e., groundwater, seep water, and surface water), or limited based on the ability to collect (i.e., sculpin and sucker) and were included for non-statistical use.

Eight samples is the minimum necessary to calculate a 95% upper confidence limit on the mean (UCL) as the exposure point concentration (EPC), and 14 samples is the minimum desired for the population-to-population statistical comparison to identify COIs that are above Reference concentrations. Limited sample sizes were noted for some analytes in samples intended for these statistical analyses. For human and ecological receptors for which the UCL is an appropriate EPC, the maximum detected concentration was used to represent the EPC for analytes with less than 8 samples and represents the best effort to avoid underestimation of risk. Analytes for which at least 14 samples are not available were not included in the statistical comparison, and a qualitative comparison to Reference concentrations was performed.

The use of J-flagged data and analytical MDLs and MRLs with respect to SLVs are associated with some potential for underprediction of risk but have been mitigated to the extent possible by the RA methodology by including J-flagged data as detected values in the data comparisons. The treatment of analytes without SLVs may also have the potential to underpredict risk, but these analytes and media are evaluated qualitatively in the RAs. Sections O.2 and O.3 provide a

more detailed discussion of the MDLs in exceedance of the SLVs specific to the HHRA and ERA, as well as COPCs that lack SLVs protective of either human or ecological receptors. Overall, data quality issues have been addressed in a manner that tends to overestimate the occurrence and concentrations of COIs in the screening-level HHRA and ERA.

O.1.1.2 COPC Selection Process

The extensive COPC selection process includes consideration of detection frequency (for Upland media and analytes with more than 20 samples), comparison with Reference levels for inorganics, and a concentration-risk screen. The use of the 5% detection frequency criterion may underestimate risk by omitting some COIs that are present at low frequency but may potentially contribute to human and ecological risk if exposures to those COIs were to occur. Several of the COIs omitted on the basis of detection frequency (a number of volatile organic compounds [VOCs] and semivolatile organic compound [SVOCs]) are generally of low toxicity and do not bioaccumulate. Bioaccumulation of COIs in soil is only a concern for ecological receptors in the Upland OU, and bioaccumulation of COIs in groundwater that could discharge to surface water of the River is a concern for both human and ecological receptors. Overall, the selection process tends to retain more COPCs than are actually expected to contribute significantly to human health or ecological risks.

O.1.1.3 Exposure Point Concentrations

As with all site characterizations for RA, there is uncertainty that the maximum and minimum detected concentrations for COPCs may potentially not be the actual highest and lowest concentrations in each medium. Since the actual high and low concentrations may not have been detected, the calculation of the EPC (e.g., maximum detected concentrations and 95% UCLs) may overestimate or underestimate the risk at the site to human and ecological receptors, but is assumed to represent an upper-bound estimate of the mean.

O.1.1.4 Selection and Use of SLVs

The human or ecological screening value represents a constituent concentration in a given medium (e.g., soil) that is considered to be protective of humans or the ecological community, provided that the ecological screening value is not exceeded. However, some of the SLVs used in the Human Health Problem Formulation and Level II ERA screening may be based on the protection of a single, most-sensitive receptor or species in a specific medium, which may not be an exposure pathway or species likely to be present on Bradford Island (e.g., potable use of shallow perched groundwater in a residential setting).

In addition, SLVs protective of ecological receptors were not available to evaluate species-specific toxicity for all of the COIs evaluated in the HHRA and ERA. When appropriate, surrogate SLVs were selected from chemically-similar COIs to assess risk for the COIs without chemical-specific SLVs. However, the exposed organisms may respond differently to exposures to different toxicants, and responses from exposures to COIs with surrogate SLVs may be different from the response for the COIs for which toxicity data were reported. The direction and magnitude of this uncertainty are not measurable, although the choice of conservative SLVs is likely to skew the evaluation toward more protective conclusions.

O.1.2 Upland OU

O.1.2.1 Exposure to Undiluted Groundwater

The assumption that aquatic organisms, fish, aquatic-based wildlife, and humans utilizing the River could be exposed to undiluted groundwater concentrations likely overestimated risk. However, risk to these receptors is more accurately assessed through the evaluation of the seep water and adjacent shoreline surface water (i.e., Landfill area of potential concern [AOPC]), thereby minimizing the uncertainty surrounding risk to aquatic receptors from groundwater. Also the assumption of potable use of unfiltered groundwater in a hypothetical on-site residential setting is an unlikely exposure scenario but is built in to the unavoidable use of residential water use SLVs for evaluation of the potable use pathway for occupational receptors.

O.1.2.2 Overland Transport Pathway from Upland to River

The majority of the Landfill AOPC is flat and well vegetated, with no evidence of runoff or erosion. While there is no visual evidence of current sloughing along the northern perimeter of the Landfill AOPC, if mass wasting were to occur (i.e., catastrophic event) on the steep slopes, the soils may reach the river. During a site visit in 2009, an area northeast of the Sandblast Building was observed to have been recently disturbed and was identified as erodible, whereby contaminated surface soil is transported to the river via stormwater drainage and surface water runoff. However, this area has become revegetated (see the photo in Appendix C) and the soils are no longer considered erodible. The majority of the Bulb Slope AOPC exhibits no evidence of surface runoff or overland flow to the River. However, wave erosion at the base of the slope has resulted in mass wasting (small slope failures) of material into the river and appears to be a potential mechanism for transport of debris and/or contaminated soil into the river.

For these reasons, the evaluation to address the potential transport of soil from the Landfill, Sandblast Area, and Bulb Slope AOPCs to the River through a comparison of COI concentrations detected in soil samples collected in-place from these three AOPCs to sediment SLVs protective of aquatic organisms, aquatic-dependent wildlife, and humans utilizing the River likely overestimates risk for exposure to these receptor groups. Risk to these receptors is more accurately assessed through the evaluation of the sediment and tissue data collected from River OU, thereby minimizing the uncertainty surrounding risk to aquatic receptors from Upland soil transport. The findings of the receptor-specific evaluation of the overland transport pathway are provided in Sections O.2 and O.3.

O.1.3 River OU

O.1.3.1 Large Scale Sucker Data

The large scale sucker is a higher trophic level fish that represents a different feeding guild than either the sculpin or smallmouth bass, and may conceivably be exposed to COIs from different prey items than the smallmouth bass. The sucker is considered to be an edible sport fish of low attraction to anglers. One composite sample of large scale sucker was collected and analyzed prior to the interim sediment and equipment removal. The sample size was limited due to the inability to collect sufficient tissue from the Forebay. Due to the limited sample size and time of collection, the large-scale sucker data are not considered representative of current Forebay conditions. However, the data are evaluated qualitatively here to address two concerns expressed

by Oregon Department of Environmental Quality (DEQ): whether there are any CPECs unique to large-scale sucker that were not found in other fish species sampled, and whether concentrations of any COIs are higher in large-scale sucker than in other tissue matrices.

Table O.1-1 shows a comparison of the COI concentrations in large scale sucker tissue to smallmouth bass tissue, and to tissue SLVs protective of human and ecological receptors. Total polychlorinated biphenyls (PCBs) as well as individual dioxin-like congeners were substantially higher (by 1 to 3 orders of magnitude) in the bass than the sucker. The only exception detected in the sucker that was not reported in bass was PCB congener 169. PCB 169 was detected in sucker tissue at a concentration of 0.011 µg/kg, which is higher than the human health tissue SLVs of 0.00025 micrograms per kilogram (µg/kg) and 0.0021 µg/kg for subsistence and recreational fishers, respectively, and lower than the lowest ecological tissue SLV of 0.02 µg/kg. All other chemicals detected in sucker were also reported in bass, the majority of which were higher in the bass. No other COIs in large scale sucker tissue exceeded the tissue SLVs.

Based on this analysis, it is concluded that the addition of large-scale sucker data to the RAs (in addition to smallmouth bass) is not likely to add either precision or accuracy to the risk estimates, and excluding it did not result in underestimation of risk.

O.1.3.2 Use of Tissue Data

A major source of uncertainty for the River OU is whether the tissue and sediment data utilized in the RAs represent current conditions in the Forebay. The risk characterization is based upon post-sediment removal clam tissue, crayfish tissue, and sculpin tissue, as well as smallmouth bass tissue data that were collected prior to the 2007 sediment removal. The crayfish tissue was collected after the sediment removal but may represent exposure periods that date back to pre-removal conditions. These factors may overestimate the number of COPCs and the magnitudes of their exceedances above SLVs for smallmouth bass and crayfish. Crayfish, smallmouth bass and other receptors that may have been exposed to both pre-removal and post-removal conditions are likely to show a trend of declining tissue concentrations over time. However, crayfish and smallmouth bass populations that are hatched after the removal will be exposed only to post-removal conditions and will furnish a more accurate estimate of bioaccumulation potential under current conditions.

O.1.3.3 Pre-Removal Sediment

Five sediment samples (termed pre-removal sediment samples) were collected from within the footprint of the sediment removal area before the removal action (Table 6-7). These samples are not representative of current conditions in the Forebay. Therefore, it is inappropriate to use these data as part of the COPC selection process. However, the data were reviewed on a qualitative basis herein.

In Table O.1-2, the data from the five pre-removal samples are screened against the lowest SLV (applicable to ecological or human health). The only COIs that exceed these most-conservative SLVs are Aroclor 1254, Total PCBs as Aroclors, and mercury. Mercury, Aroclor 1254 and Total PCBs are already identified as COPCs for the River OU. Although mercury levels in Forebay sediment are comparable to Reference Area concentrations, mercury was retained as a bioaccumulative COPC for sediments based on its selection as a COPC for fish tissues.

If the pre-removal sediment data were included for evaluation of PCBs, the benthic invertebrate EPC (the maximum detected concentration) for Aroclor 1254 would change from 29.0 to 130 µg/kg and the EPC for Total PCBs as Aroclors would change from 29.7 to 131 µg/kg. This would have resulted in toxicity ratios (Tij) above 1 for both Aroclor 1254 and total PCBs as Aroclors. However, Aroclor 1254 is already identified as a CPEC for benthic invertebrates exposed to multiple COIs, so there is no change in the overall outcome (identification of PCBs as CPECs) of the current ERA.

Although the pre-removal data are not representative of current conditions, and should not be used quantitatively in the RAs, the United States Army Corps of Engineers (USACE) agreed to calculate the area-weighted average 95% UCL for the Forebay, both with and without the pre-removal data (URS Corporation [URS] 2010d). The 95% UCL for Total PCBs as Congeners, characterizing the Forebay using the 19 random sediment samples is 3.63 µg/kg. The area of nearshore Forebay sediments represented by the five pre-removal samples is 5% of the total area. Only PCB Aroclor data is available for these samples, but if the Total PCBs as Aroclors data from the pre-removal data is used to characterize 5% of the Forebay, the area-weighted average 95% UCL for Forebay sediments is 9.05 µg/kg.

The area-weighted 95% UCL for Total PCBs as Aroclors in pre-removal sediment (9.05 µg/kg), is roughly 3 times lower than post-remediation Total PCBs as Aroclors maximum concentration (28.7 µg/kg) . Therefore, it is unlikely that risk has been underestimated in the evaluation for PCBs as Aroclors performed in the HHRA or ERA. .

O.1.3.4 Bioaccumulative Metals Without SLVs

Several metals (aluminum, thallium, vanadium, and zinc) were detected in tissue that are bioaccumulative (bioconcentration factor [BCF] > 300) or potentially bioaccumulative (no BCF available) but do not have DEQ Acceptable Tissue Levels (ATLs) protective of humans and wildlife that consume fish and shellfish, or Critical Tissue Levels (CTLs) protective of piscivorous fish. Ecological ATLs and CTLs were not developed for these metals for the following reasons:

- Concentrations of thallium and vanadium in Forebay sediment and tissue were not elevated above the Reference Area concentrations.
- Concentrations of aluminum and zinc were not elevated relative to Reference Area concentrations for sediment, clams, crayfish, or sculpin.
- Although aluminum and zinc concentrations in Forebay bass tissue were found to be statistically higher than the Reference Area bass tissue concentrations in the population-to-population evaluation, the Forebay smallmouth bass tissue had 95% UCL concentrations (Table N-55) lower than the Reference Area:
    - Aluminum – Small mouth bass 95% UCL for the Forebay was 7.11 milligrams per kilogram (mg/kg) compared to the Reference Area 95% UCL of 10.1 mg/kg.
    - Zinc – Small mouth bass 95% UCL for the Forebay was 14.9 mg/kg compared to the Reference Area 95% UCL of 15.5 mg/kg.

Based on this analysis, the uncertainty regarding these metals is manageable and is unlikely to substantively underestimate risk.

In addition to the comparison with Reference Area concentrations, human health-protective ATLs were calculated for aluminum, antimony, barium, chromium, copper, nickel, and zinc since they were detected in either crayfish or smallmouth bass tissue in the Forebay, as described in Section 11.3.4.1. The human health-based values were developed by multiplying the water quality criterion that is protective of consumption of organisms (and water, if organism only-based criteria are not available) by the BCF for each of these metals. In all cases, the measured tissue concentrations were well below the ATLs. All the ATLs developed in this manner are not specific to the subsistence or recreational fisher, they are a useful tool in demonstrating that these poorly bioaccumulative chemicals were reported at low concentrations in the tissues and that elimination of these COIs is not a concern for human receptors.

O.1.3.5 Ubiquitous Presence of PCBs

The most abundant PCB congener in the majority of the River OU samples was PCB 11. This PCB congener constituted from approximately 7 to 27% of the total PCB congener burden, and contributes a larger percentage to samples with lower total PCB concentrations. This is consistent with the results of other regional studies have noted that airborne PCBs in the Willamette airshed have contributed to the ubiquitous occurrence of PCBs in sediments and that PCB 11 is one of the indicator PCB congeners for evidence of airborne deposition (Hope 2007, 2008). PCB 11 has also been found in water and air in urban environments (Hu et al. 2008, Du et al. 2009, Rodenburg et al. 2010), the great lakes watershed (Basu et al. 2009), and even the polar regions (Choi et al. 2008). Part of the reason it is so ubiquitous may be that it is not derived by Aroclor mixtures, but is instead found in unregulated paints and pigments (Fraser 2010, Hu and Hornbuckle 2010, Rodenburg et al. 2010).

PCB 118, another ubiquitous PCB congener in the Willamette airshed, was also observed in all river media (surface water, sediment, clam, crayfish, sculpin, and smallmouth bass). Therefore, risk from PCBs in the River OU likely includes both site-related sources, and non-site related sources, including those from upstream as well as from the ubiquitous presence of PCBs in the Willamette airshed

O.2 HHRA Uncertainty Assessment

O.2.1 Upland OU

The sources of uncertainty in the problem formulation for the HHRA are described in this section. The major potential sources of uncertainty in the problem formulation process are associated with the level of confidence in the adequacy of the analytical data used for site characterization, the identified receptors and exposure pathways, selection and use of SLVs and the level of confidence in the COPC selection and screening risk characterization.

O.2.1.1 Data Sensitivity Analysis for HHRA

In Section 7.4, the analytical data used for the HHRA were evaluated with regard to the sensitivity of the data for RA use. The goal was to understand whether COIs reported as not detected could be reliably assumed to not be present in the individual sample or medium at levels of concern to human health. Evaluating this issue necessarily requires an understanding of how close the analyte's MDLs are to the SLV for that analyte. This evaluation was performed for analytes reported as non-detect at least once in any medium.

The following datasets were considered in the Upland OU data quality evaluation:

- Landfill AOPC: soil, groundwater, and co-located (adjacent) seep water and surface water
- Sandblast Area AOPC: soil, soil gas, and groundwater.
- Pistol Range AOPC: soil and groundwater (All COIs analyzed for in lagoon sediments were detected in all samples, so no MDL comparison was required)
- Bulb Slope AOPC: soil

Tables K-1 through K-4 in Appendix K present the results of this analysis for the Landfill, Sandblast Area, Pistol Range, and Bulb Slope AOPCs, respectively. At all the AOPCs, one metal (thallium), one SVOC (N-nitrosodimethylamine), and three VOCs (1,2,3-trichlorobenzene, 1,2,-dibromo-3-chloropropane, trichloroethene [TCE]) had a few observations where the MDL exceeded the SLVs for soil. For all of these analytes, except the SVOC, the number of samples with MDLs exceeding the SLV formed only a subset of the total number of samples. Therefore, it did not affect the evaluation of the analytes as to whether they should be identified as COPCs. In groundwater, MDLs for antimony, arsenic and thallium sometimes exceeded their SLVs. Arsenic is retained as a COPC for landfill groundwater while thallium and antimony are of less human health concern and were not associated with high exceedances. The magnitude of MDL exceedance above the SLV is generally less than a factor of ten for the analytes. MDLs for pesticides, Aroclors, and many SVOCs and VOCs routinely exceeded the SLVs for groundwater, seep water and shoreline surface water. These are analytes that are poorly soluble in water and generally are best evaluated based on their occurrence in the solid phase, such as soils, sediments or tissue. These limits to analytical technology are well understood and are inherent in the RA process. The SLVs for some chemicals such as pesticides are sometimes based on literature-based estimates of toxicity and threshold values and do not necessarily take the feasibility of analytical detection limits into consideration. This only means that the limitations and uncertainties associated with concentrations detected or not detected at the low end of the concentration gradient should be understood.

O.2.1.2 Statistical Background Comparison Screening

As discussed in Section 8.1 of the main text, the goal established in the remedial investigation/ feasibility study (RI/FS) management plan (MP) (URS 2007a) for statistical power associated with the background comparison was achieved (i.e., to detect "one-standard-deviation-away"). However, for some Upland soils, this one-standard-deviation is high due to the high data variability, which could not be controlled because of the inherent heterogeneity of the Upland soils. As an artifact of this high data variability, minimum detectable differences (MDDs) greater than 100% of the reference mean were calculated for several metals in soil of the Landfill, Sandblast Area, and the four combined AOPCs (Table L-1), and include the following:

Landfill AOPC

- 0 to 3 feet below ground surface (ft bgs) – chromium, copper, magnesium, nickel, and silver
- 0 to 10 ft bgs – arsenic, chromium, copper, magnesium

Sandblast Area AOPC

- 0 to 3 ft bgs and 0 to 10 ft bgs – antimony, copper, magnesium, and mercury

All Four AOPCs Combined

- 0 to 3 ft bgs and 0 to 10 ft bgs – antimony, copper, magnesium, mercury, and silver

Although the null hypothesis was not rejected, the statistical power to detect substantial differences between the site and Reference Area datasets for metals with MDDs greater than 100% of the reference mean might be limited.

Magnesium is an essential nutrient in soil, it was eliminated from the risk-based evaluation and no further investigation is recommended. Examination of the box-and-whisker plots in Appendix L indicated that silver (0-3 ft bgs, Landfill AOPC), antimony (0-3 and 0-10 ft bgs, Sandblast AOPC), and antimony, mercury, and silver (0-3 and 0-10 ft bgs, All Four AOPCs Combined) should be considered as having higher concentrations than the Reference Area concentrations even though the population-to-population comparison indicated that they were the same or equal to Reference Area concentrations; therefore, these analytes were compared included in the HHRA screening evaluation and compared to SLVs (Section 11.2.4). However, they were not retained as COPCs as a result of the screening.

Since the results of the statistical background comparisons (population-to-population and box-and-whisker plot) indicated that concentrations of the remaining metals were present below or equal to that of the Reference Area levels, these metals were not carried to the COPC SLV screening step in Section 11 (HHRA). However, the high MDDs (greater than 100% of the reference mean) present an uncertainty with this finding.

To address the uncertainty with the results of the statistical background comparison, the remaining metals were subjected to a risk-based screening evaluation, herein. The purpose of this evaluation is to explore whether or not these metals should be included as COPCs, and ultimately advanced to the next level of RA or directly to the FS. A weight-of-evidence approach similar to the one implemented in Section 11 (HHRA) was used to evaluate these metals.

The following sequential steps summarize the risk screening process used to evaluate these metals with MDDs greater than 100% of the reference mean:

- SLVs protective of human health receptors were compared to the appropriate EPCs , which are the lower of the 95% UCLs and maximum detected concentrations for each analyte.
- Magnitude of SLV exceedances, detection frequency, confidence in the SLV, comparison of AOPC versus Reference Area concentration ranges, and other lines of evidence were evaluated.
- Spatial distribution of the concentrations relative to the site-specific background upper prediction limits (UPLs) and SLVs was assessed by referencing existing figures presented in the main RI report.

The human health SLVs presented in Appendix J were compared to the EPCs calculated for soil from 0 to 3 ft bgs (adult outdoor worker), and soil from 0 to 10 ft bgs soils (construction workers and excavation workers) (Table O.2-1). SLVs for construction workers and excavation workers varied due to exposure duration differences, but the more conservative SLV was initially used in the screening for this analysis.

Based on this weight-of-evidence approach, those COPCs that truly warrant additional investigation or risk management were identified and discussed below.

Landfill AOPC

Of the three metals (chromium, copper, nickel) in 0 to 3 ft bgs soils with high MDDs, only the EPC for chromium exceeded the SLV. Of the three metals (arsenic, chromium, copper) in 0 to 10 ft bgs soils with high MDDs, none of the EPCs exceeded the SLV.

Chromium. The MDD generated for chromium in soil during the statistical background comparison is 1559% for 0 to 3 ft bgs (Table L-1).

The 95% UCL of 594 mg/kg was used as the chromium EPC, which exceeds the SLV of 190 mg/kg (based on the DEQ soil ingestion for occupational Risk Based Concentrations [RBC]).

Concentrations of chromium in Landfill AOPC soils from 0 to 3 ft bgs range from 14.7 mg/kg to 1,950 mg/kg (Table I-1). Concentrations of chromium in Upland Reference Area soils range from 15.5 mg/kg to 27.3 mg/kg (Table I-6). Highest levels of chromium occur in the Gully Test Pit and just downgradient of this area (Figure 11-5): BIL07 (0.5 ft bgs), BIL18 (2 ft bgs), and BIL-22 (3 ft bgs). BIL05 (0 to 0.5 ft bgs), located just east of Lead Hot Spot Test Pit #1, also has elevated chromium (237 mg/kg). Chromium concentrations in the remaining samples from 0 to 3 ft bgs are below the SLV, and many are equivalent to or below the Reference Area UPL.

In the absence of site-specific chromium speciation data, it was conservatively assumed that all the detected chromium was the more toxic hexavalent chromium rather than the more common and much less toxic trivalent chromium. Chromium is recommended for further evaluation.

Summary. Of the metals with high MDDs demonstrated for Landfill AOPC soils, only chromium in soil from 0 to 3 ft bgs is recommended for further evaluation in the form of either a baseline HHRA or remediation of the locations above the UPL.

Sandblast Area AOPC

Of the two metals (copper, mercury) in the 0 to 3 ft bgs and 0 to 10 ft bgs soils with high MDDs; there were no exceedances of their SLVs. Therefore, further evaluation is not warranted.

All Four AOPCs Combined

Of the single metal (copper) in the 0 to 3 ft bgs and 0 to 10 ft bgs soils with a high MDD. There was no exceedance of the SLV, therefore, further evaluation is not warranted.

O.2.1.3 COPC Selection and Screening Risk Characterization

Detection Frequency

The extensive COPC selection process includes consideration of detection frequency, comparison with reference soils and a concentration-risk screen. The use of the 5% detection frequency criterion may omit some COIs that are present in the Landfill and Sandblast AOPCs that were at low frequency but may potentially contribute to human health risk if exposures to those COIs were to occur. An evaluation of these COIs, which were detected in soil, groundwater, or both, was performed to understand the implications of not including these COIs in the quantitative screening assessment. In Tables O.2-2 and O.2-3, concentrations of these COIs were compared to SLVs protective of the relevant receptor groups:

- soil: outdoor worker, construction worker, and excavation worker
- groundwater: potable water user and bioaccumulation

In addition, whether or not these COIs were detected in both soil and groundwater from the same AOPC is also considered. Only bioaccumulative COIs (as defined in Table J-7) were compared to SLVs. Although the criteria used to identify bioaccumulative COIs for the River OU indicate selenium is not bioaccumulative in aquatic environments, selenium was included in the screening tables because it is included as a bioaccumulative COI in DEQ's sediment bioaccumulation guidance (2007).

Landfill AOPC

As shown in Tables O.2-2, Aroclor 1248 in 0-10 ft bgs soil interval and 4,4'-DDE, total DDTs, dieldrin, and carbon tetrachloride in groundwater at the Landfill AOPC were eliminated on the basis of detection frequency and were detected above the SLV.

The maximum detected soil concentration for Aroclor 1248 (968 µg/kg) exceeded the construction and excavation worker SLV (740 µg/kg). Based on earlier discussions with DEQ and as outlined in the RI/FS MP, 95% UCL values are used to represent site concentrations of COIs when there were at least two detections and a sample size of eight. The 95% UCL is based on United States Environmental Protection Agency (USEPA) recommendations and is consistent with the USACE's desire to maintain compatibility with the Comprehensive Environmental Response, Compensation and Liability Act (CERCLA) process. It is slightly different from DEQ's recommendation to use the 90% UCL. Since use of the 95% UCL will not lead to underestimation of risk when compared to the 90% UCL, the technical advisory group (TAG) agreed that representation of the 95% UCL is acceptable. The 95% UCL was not calculated in Appendix I because the detection frequency was below 5%; however, because there were two detections (in a sample size of 43), a 95% UCL could be calculated. Using the latest ProUCL

4.1.01, a 95% UCL of 211 µg/kg was calculated by using the Chebyshev KM method. The 95% UCL for Aroclor 1248 does not exceed the construction and excavation worker SLV. Therefore, elimination of Aroclor 1248 from the SLV screening for 0-10 ft bgs soil interval based on detection frequency is not expected to present a significant uncertainty in the HHRA.

The groundwater concentration of total DDTs is attributed to the one detection (out of 22 samples) for 4,4'-DDE, as the other DDT isomers were not detected in any of the 22 groundwater samples (Table I-1) collected at the Landfill AOPC. The 4,4'-DDE detected concentration of 0.00246 µg/L that exceeded the bioaccumulation SLV (0.00022 µg/L) was detected at a single well (MW-03, see Figure 11-7) and down gradient wells closer to the river were all non-detect for 4,4'-DDE. Furthermore, no DDT isomers were detected in the seep sample collected from the Landfill. The non-detect groundwater MDLs, which range from 0.00195 to 0.1 µg/L, all exceed the bioaccumulation SLV, indicating that the theoretically based SLV is lower than analytical methods can achieve. In addition, as discussed in Section 11.2.4.1.5 (of the main text), the potential for discharge of COPCs in Landfill AOPC groundwater into the river surface at levels of concern appears to be low. Based on the low, single detection of 4,4'-DDE in groundwater of the Landfill and lack of detected DDT isomers in seep water, elimination of this COI from the SLV screening for groundwater based on detection frequency is not expected to present a significant uncertainty in the HHRA.

Dieldrin was detected (0.00982 µg/L) in one of 22 groundwater samples collected at the Landfill AOPC, which exceeded the bioaccumulation SLV (0.000052 µg/L). Dieldrin was detected in MW-03 on May 1, 2002. MW-03 is located on the eastern edge of the Landfill debris (Figure 11-7) and the down gradient wells closer to the river were all non-detect for dieldrin. The non-detect MDLs, which range from 0.000294 to 0.100 µg/L, all exceed the bioaccumulation SLV, indicating that the theoretically based SLV is lower than analytical methods can achieve. As stated previously in section O.2.1.1, SLVs for some chemicals such as pesticides are sometimes based on literature-based estimates of toxicity and threshold values and do not necessarily take the feasibility of analytical detection limits into consideration. In addition, as discussed in Section 11.2.4.1.5 (of the main text), the potential for discharge of COPCs in Landfill AOPC groundwater into the river surface at levels of concern appears to be low. Elimination of dieldrin based on detection frequency is not expected to present a significant uncertainty in the HHRA.

Carbon tetrachloride was detected (1.4 µg/L) in one of 22 groundwater samples collected at the Landfill AOPC, which exceeded both the potable water user and bioaccumulation SLVs (0.19 and 0.23 micrograms per liter (µg/L), respectively). Carbon tetrachloride was detected in MW-04 on January 1, 2000. MW-04 is located in the Lead Hot-Spot Test Pit #2 (Figure 11-7). Wells down gradient and closer to the river were all non-detect for carbon tetrachloride. The non-detect MDLs, which range from 0.500 to 1 µg/L, which all exceed the potable water user and bioaccumulation SLVs, indicating that the theoretically based SLVs are lower than analytical methods can achieve. In addition, as discussed in Section 11.2.4.1.5 (of the main text), the potential for discharge of COPCs in Landfill AOPC groundwater into the river surface at levels of concern appears to be low. The single detection of carbon tetrachloride in only one medium of the Landfill AOPC likely demonstrates that elimination of carbon tetrachloride based on detection frequency is not expected to present a significant uncertainty in the HHRA.

Sandblast Area AOPC

As shown in Tables O.2-3, benzo(b)fluoranthene in groundwater at the Sandblast AOPC was eliminated on the basis of detection frequency and was detected above the SLV.

Benzo(b)fluoranthene was detected (0.0180 µg/L) in one of 20 direct push groundwater samples collected at the Sandblast AOPC, which exceeded the bioaccumulation SLV (0.0038 µg/L). Benzo(b)fluoranthene was detected in MW-12, which is located at an intermediate location between the upgradient and downgradient edges (Figure 11-13). This exceedance, however, was relatively low (corresponding to an excess lifetime cancer risk [ELCR] of 4.7E-06). The direct push groundwater data is considered to be of low quality for RA use due to matrix interferences (i.e. influence of particulate-related concentrations in unfiltered samples). For these reasons, elimination of benzo(b)fluoranthene based on detection frequency is not expected to present a significant uncertainty in the HHRA.

In summary, none of the COIs eliminated as soil and groundwater COPCs in the Landfill and Sandblast AOPCs on the basis of frequency of detection represent a significant uncertainty in the HHRA.

Three-Step Concentration-Risk Screen

The use of the single chemical, multi-chemical and multi-media COPC selection process is a comprehensive approach that greatly minimizes the potential for omission of qualified COPCs or underestimation of risks and hazards at a screening level. Many of the selected COPCs are unlikely to contribute significant risk or hazard if they were to be further evaluated in a baseline human health risk assessment (BHHRA). The summation of concentration over screening level value (C/SLV) ratios, where C is the concentration of the COI, for non-carcinogens provides an approximate estimate of the non-cancer hazard index (HI). This may be an underestimate since the non-cancer effects of carcinogenic COPCs are not included in this summation. However, this does not affect the COPC selection process since the cancer SLVs are typically lower than the non-cancer-based SLV for most carcinogens.

Degradation Products of PCE and TCE

Per DEQ guidance, degradation products of tetrachloroethylene (PCE) and trichloroethene (TCE) (cis,1,2-dichloroethene, trans-1,2-dichloroethene, 1,1-dichloroethene and vinyl chloride) were identified as COPCs (even if they were not detected) in all media where PCE or TCE was identified as a COPC. The retention of the degradation products as COPCs adds to the number of COPCs without necessarily demonstrating that they actually occur in these media.

Total Benzofluoranthenes

There is also uncertainty related to the use of historical and recently collected data for benzofluoranthenes at the Upland AOPC soils for the Landfill and Sandblast Area AOPCs. This sub-group of carcinogenic polycyclic aromatic hydrocarbon (cPAHs) is reported as total benzofluoranthenes in the historical data but is more precisely reported as the individual compounds in recent data: benzo(b)fluoranthene, benzo(j)fluoranthene and benzo(k)fluoranthene. The level of confidence in the quality of the summed analyte in the historical data, collected in 2001 and 2002, is unknown, but results in higher C/SLV ratios for total benzofluoranthenes than when the individual constituents are added (Tables M-1, M-2, and M-3). For the Landfill AOPC soils, in particular, the total benzofluoranthenes are a significant contributor to the cumulative C/SLV ratio and screening risks for cPAHs. There is greater

confidence in the sensitivity and representativeness of the recent data for polycyclic aromatic hydrocarbon (PAH) analysis. Therefore, the estimated C/SLV ratios and screening level risk estimate for the total benzofluoranthenes, cumulative cPAHs and cumulative carcinogenic risks for the Landfill and Sandblast AOPCs soils are likely to be substantial overestimates. The COI and COPC selection tables present the results separately for the older total benzofluoranthenes data and the recent individual benzofluoranthene to illustrate and clearly define the results of the screening.

Chromium

Total chromium in Upland soils was evaluated on the assumption that it is comprised entirely of the more toxic hexavalent form. This is a conservative assumption that is unlikely to be true and will overestimate risks related to chromium.

Direct-Push Groundwater Data for Sandblast AOPC

Groundwater samples from soil borings at the Sandblast AOPC were analyzed for the full analytical suite, while monitoring well groundwater samplers were only analyzed for a subset of COIs. The direct push groundwater data is considered to be of low quality for RA due to matrix interferences (i.e. influence of particulate-related concentrations in unfiltered samples). Only monitoring well data were included in the RAs, for which both filtered and unfiltered data are available. However, the direct push groundwater PAH data was used in the screening to address the sampling data gap for PAHs in monitoring well data for this AOPC. In the HHRA tables, benzo(a)pyrene (Tables M-17, M-18, and M-19), dibenzo(a,h)anthracene (Tables M-18 and M-19), and indeno(1,2,3-cd)pyrene (Table M-19) were screened using direct push data and were retained as COPCs. These were generally low exceedances (ELCR less than 3.1E-06) or retained due to multi-media selection process. Using direct push groundwater data would likely result in an overestimate the risk of the exposure to PAHs in groundwater due to the presence of suspended particulates.

Residential SLVs for Potable Water

The use of residential SLVs to identify COPCs for the potable water use pathway, even though no residential use will occur on the island, and the use of National Recommended Water Quality Criteria (NRWQC; USEPA 2009) (for consumption of water and organisms) to screen COPCs for the groundwater discharge to surface water pathway are both conservative since it is based on undiluted groundwater data. Both of these screening methods are likely to overestimate the number of COPCs that may actually qualify for these pathways.

HI and ELCR Estimates

As described in Section 11, the cumulative C/SLV ratios for a single medium were presented separately for the noncarcinogenic and carcinogenic COPCs. They were then further presented and discussed as screening-level estimates of the non-cancer hazard HI and the carcinogenic ELCR (after multiplying by 1E-06). These estimates are presented for initial comparison and to enable a screening-level discussion of whether an AOPC may be estimated to fall within USEPA's and DEQ's risk management range (1E-06 to 1E-04 ELCR, HI less than 1.0) or warranting remedial response (ELCR greater than 1E-04) or below the acceptable risk level (1E-06 ELCR). . .

Several chemical-specific attributes in interpreting these ratios are described in Section 11. They include issues such as not estimating ELCR values for C/SLV ratios for arsenic since the SLV is based on a Reference Area soil value and not a risk-based concentration; caution in interpreting C/SLV ratios for COIs in groundwater for which the SLV is based on an maximum contaminant level (MCL) since MCLs are not necessarily risk-based (e.g., lead and thallium) and ascribing bioaccumulation potential to COIs based solely on octanol-water partition coefficient (log K_{ow})greater than 3.5 or BCF greater than 300. The net effect of many of these assumptions is to increase the number of COIs that are initially identified as COPCs.

Infant Milk Ingestion Pathway

There is uncertainty regarding the pathway of infant exposure to bioaccumulative COIs through the human milk ingestion pathway. Although this is recognized as a viable pathway, there is no established federal guidance on quantitative evaluation methodology for this pathway. However, DEQ's recent guidance has suggested a method for evaluation of this pathway for PCBs. The suggested methodology in DEQ's guidance would generate a non-carcinogenic PCB hazard quotient (HQ) for this pathway for infants that would be approximately 25 times the HQ of the mother for the types of occupational and groundwater ingestion pathways considered for the Upland (Appendix D, DEQ 2010b). The subchronic PCB ELCR for the infant would be approximately similar to, or potentially lower than, the ELCR for the mother because of the shorter exposure duration of the infant. If DEQ's draft methodology were to be applied to the problem formulation, there would be no difference to the results of the COPC selection for carcinogens since PCBs are already considered for their carcinogenic potential.

For the Upland OU, PCBs in soil were evaluated by comparison to the USEPA cancer-based regional screening levels (RSL) (0.740 mg/kg for industrial soil, USEPA 2010). The non-cancer RSL for PCBs in industrial soil is 11 mg/kg, primarily based on Aroclor 1254 (Supporting Tables, USEPA 2010). Dividing the non-cancer RSL by a factor of 25 provides a soil SLV for the milk ingestion pathway of 0.44 mg/kg or 440 µg/kg. The UCL is lower than 440 µg/kg for all the Aroclors and Total PCBs as Aroclors that were reported in Landfill and Sandblast Area AOPCs soils for the Outdoor Occupational Worker, Construction Worker and Excavation Worker (Tables M-1, M-2, M-3, M-13, M-14 and M-15). Therefore, applying this SLV would not result in the addition of PCBs as COPCs at the Landfill or Sandblast Area AOPCs. The non-cancer C/SLV ratio would increase (e.g., C/SLV for Total PCBs for the Outdoor Occupational Worker at the Landfill AOPC from 0.554 [Table M-1] to 0.932 when the SLV of 410 µg/kg is used). The cumulative non-cancer HI would increase from 0.293 to 1.22 which would still be considered an acceptable HI that is only marginally higher than 1.0. Similarly, the increase in the HI for the Occupational Outdoor Worker at the Sandblast Area AOPC would be from 0.0866 to 1.04 when the C/SLV for Total Aroclors is applied to the UCL value of 0.419 mg/kg (Table M-13). In summary, consideration of the milk ingestion pathway does not add PCBs as COPCs to the Upland OUs nor does it increase the non-cancer HI to unacceptable levels.

O.2.1.4 Site Characterization Data

Use of the data from the two test pit mercury lamp area samples at the Landfill AOPC adds some uncertainty. The data were used in this HHRA to assess risk to human receptors exposed to shallow and deeper soil intervals (0-3 and 0-10 ft bgs) since there is no way to assign a depth at which the results for these samples occur.

Extensive discussion of the adequacy of the data with regard to representativeness, intended uses, and associated uncertainties is presented in Section 7 (in conjunction with Appendix K).

O.2.1.5 Receptors and Exposure Pathways

As shown in the Conceptual Exposure Models (CEMs) (Figures 11-1 to 11-4), numerous types of employees are present at Bradford Island and may engage in soil intrusive activities. There is a high degree of confidence in excluding residential land uses from the receptors due to the long history of industrial use at the Island and its continuing use for the foreseeable future. Therefore, there is little uncertainty or potential for underestimation of risk regarding the lack of consideration of residential receptors. .

Among the occupational uses at the site, construction workers engaged in activities that would fall within DEQ's exposure assumptions are unlikely (250 days for one year) and risks may be overestimated (DEQ 2010b). However, existing excavation workers may be engaged in activities that exceed DEQ's assumptions for excavation workers (9 days for one year) since they may actually perform such activities for multiple years. This may underestimate risks to excavation workers. For this reason, use of the construction worker SLVs is considered more appropriate for evaluation of soil-intrusive occupational exposures.

RAs following USEPA methodology often include a trespasser as a receptor even if public access is restricted at a site. A trespasser is not included here since the evaluation of the more highly exposed Occupational Outdoor Worker will encompass lesser exposures for other receptors, including trespassers.

All groundwater-related pathways are accompanied by a high level of uncertainty as to whether the pathways may actually occur. There is currently no use of on-site groundwater for potable use and no such use is planned for the foreseeable future. Similarly, although groundwater discharge to the river does occur, the use of untreated river water for potable water use is also unlikely and is not known to occur. Consideration of these pathways is part of the intentional conservatism of the problem formulation, complies with evaluation of the designated beneficial uses of groundwater and surface water and would overestimate risks for these pathways.

O.2.1.6 Erodible/Mass Wasting Soil

As discussed in Section O.1.2.2, an evaluation of the overland transport pathway to the River OU was conducted for the Landfill, Sandblast Area, and Bulb Slope AOPCs. Under current and likely future conditions, the only viable exposure route for human receptors for the mass wasting pathway is through bioaccumulation and subsequent consumption of smallmouth bass and crayfish. Direct exposure to eroded soils in the River OU is unlikely for humans. Selection of COPCs for the mass wasting pathway was based on multiple lines of evaluation including a comparison to reference sediments and a comparison to sediment bioaccumulation SLVs.

In the first step of this evaluation, the data from surface soils (0 to 1 ft bgs) that were collected from areas that may potentially be subject to erosion or mass wasting (as identified in Sections 3.5 and 10.1 of the main text) were compared to the inorganic concentrations in the site-specific Reference Area sediment (Table L-8). Those inorganic COIs that were detected less than the Reference Area were not retained as COPCs and were not evaluated further. The organic COIs and remaining inorganic COIs identified as potentially bioaccumulative were then compared to

sediment SLVs protective of human health and the results are presented in Tables O.2-4 to O.2-6. The following describes the erodible/mass wasting evaluation at each of the three AOPCs.

Landfill AOPC (0-1 ft bgs)

Bioaccumulative COIs in surface soils that exceed sediment SLVs included cadmium, lead, manganese, thallium, zinc, 4,4'-DDT, total DDTs, dieldrin, PCBs (Aroclor 1254, Aroclor 1260, and total PCBs as Aroclors), bis(2-ethyl hexyl)phthalate (B2EHP), carbazole, dibenzofuran, and di-n-butyl phthalate (Table O.2-4) were retained as COPCs. All of these COPCs, except for 4,4'-DDT, total DDTs, and dieldrin, were already evaluated for the River OU using Forebay data. PCBs and B2EHP were identified as COPCs for the River OU (Table M-46). In the absence of SLVs for cadmium, lead, manganese, thallium, and zinc, reference UPLs were used as surrogates. For these chemicals, C/SLV does not indicate that an acceptable risk level was exceeded, only that the site concentration is greater than the Reference UPL. Carbazole, dibenzofuran, and di-n-butyl phthalate were retained as COPCs due to lack of SLVs. Three pesticides, 4-4'-DDT, total DDTs, and dieldrin were retained because they exceeded the sediment SLVs. DDT and total DDTs were detected in 7 of 10 erodible soil samples and dieldrin in one of 10 samples. The magnitude of exceedance above the sediment SLV was more than two orders of magnitude, primarily because the SLVs are low. Due to the finite mass of erodible soils and the fact that erosion potential at this AOPC is low (Section 10), it is unlikely that these three COIs would actually have much potential to be released to the River OU.

However, due to the exceedances of human health SLVs and/or their potential to bioaccumulate, as well as the potential for these areas to be sources of contamination (e.g., erosion or mass wasting), further evaluation of this area is recommended for the Upland OU, which may include a BHHRA.

Sandblast Area AOPC (0-1 ft bgs)

The bioaccumulative COIs in surface soils that exceeded sediment SLVs included cadmium, lead, manganese, zinc, tributyltin, chlorinated pesticides, PCBs (Aroclor 1260 and total PCBs as Aroclors), 1,2,4-trimethylbenzene, 4-isopropyltoluene, B2EHP, and carbazole were retained as COPCs (Table O.2-5). All of these COPCs, except for tributyltin, chlorinated pesticides, and two VOCs, were already evaluated for the River OU using Forebay data. PCBs and B2EHP were identified as COPCs for the River OU (Table M-46). In the absence of SLVs for cadmium, lead, manganese, and zinc, reference UPLs were used as surrogates. For these chemicals, C/SLV does not indicate that an acceptable risk level was exceeded, only that the site concentration is greater than the Reference UPL. A few bioaccumulative pesticide compounds and tributyltin were also retained since they were detected in the erodible soils at concentrations exceeding the bioaccumulation SLVs, but had not been analyzed in the River OU media. Since the potential for mass wasting to actually occur is low, as described in Section 10, the chlorinated pesticides and tributyltin are unlikely to be released in significant quantities to the River OU. Two VOCs (1,2,4-trimethylbenzene and 4-isopropyltoluene) did not have SLVs but are eliminated from bioaccumulation concerns since VOCs are typically not persistent in the aquatic environment after release. Carbazole was retained as COPCs due to lack of an SLV.

However, due to the exceedances of human health SLVs and/or their potential to bioaccumulate, as well as the potential for these areas to be sources of contamination (e.g., erosion or mass

wasting), further evaluation of this area is recommended for the Upland OU, which may include a BHHRA.

Bulb Slope AOPC (0-1 ft bgs)

As shown in Table O.2-6, lead, mercury and PCBs (Aroclor 1260 and Total PCBs as Aroclors) exceeded the sediment SLVs and were retained as COPCs for the bioaccumulation pathway (if mass wasting soils from the Bulb Slope AOPC were to enter the Forebay). PCBs and mercury are already included as COPCs for the River OU. In the absence of SLVs for lead and mercury, reference UPLs were used as surrogates. For these chemicals, C/SLV does not indicate that an acceptable risk level was exceeded, only that the site concentration is greater than the Reference UPL. Although mercury in Forebay sediments is not elevated in comparison to the Reference Area sediments, it has been retained as a COPC because of its selection as a COPC for fish tissues. Because the Bulb Slope area is well vegetated, erosional activities are unlikely to occur (Section 10).

O.2.1.7 Selection and Use of SLVs

SLVs were identified for the majority of the COIs by following the hierarchical process of SLV selection (Appendix J). To the extent possible, surrogate chemicals were used to identify SLVs for COIs lacking their own SLVs. Only a few COIs remained without SLVs, and are identified in Table 7-4.

Human health-protective SLVs were available for all COIs that were detected in soil and groundwater in the Upland OU media (Table 7-4). Among COIs that were never detected, a small number of VOCs and SVOCs did not have SLVs, primarily some alkylbenzenes, chloroethers, and chlorotoluenes. Due to the lack of toxicity information for these chemicals, no further evaluation of the uncertainty related to them can be done. However, the fact that they were never detected lessens the potential for underestimation of risk.

DEQ SLVs for the evaluation of the construction workers and excavation workers were available only for a limited number of COIs and were supplemented with industrial soil RSLs that assume a much higher duration of exposure with a slightly lower level of soil ingestion. The effect of using the RSLs is likely to overestimate the number of COPCs and overestimate the screening-level risks and hazards for these receptors.

O.2.1.7.1 Updates to SLVs

As part of the uncertainty assessment, there have been updates to the agreed upon sources of SLVs. These include updates to DEQ RBCs (2011) (affecting direct contact pathways for soil and groundwater), DEQ RBCs for petroleum hydrocarbons (2011), DEQ's Water Quality Criteria (WQC; 2011) (affecting groundwater and surface water SLVs for fish ingestion pathway), and USEPA RSLs (2012) (affecting direct contact pathways for soil and groundwater). Since USEPA RSLs are likely to update again prior to a Level III baseline for the Upland OU, a comparison of SLVs was not conducted at this time. If these updates contain more stringent SLVs, those analytes will be considered for further evaluation as to whether they should be included in the BHHRA for the Upland OU or in a separate document. They will also be considered during future monitoring activities for the River OU, if additional surface water data are collected.

O.2.2 River OU

The uncertainties associated with tissue and sediment data as well as with the confidence in available screening criteria or COIs without SLVs are discussed in further detail in this section.

O.2.2.1 Sensitivity Analysis for HHRA

The following data sets were considered for the data quality evaluation:

- Random Forebay Data: surface water, sediment, crayfish, smallmouth bass, and largescale sucker
- Targeted Forebay Data:
    - Eagle Creek: sediment
    - Goose Island: sediment and crayfish

Tables K-9 through K-12 provide an analysis of MDLs in relation to SLVs for the River OU media. Analytes with MDLs that exceeded the SLVs included Aroclors in sediment, crayfish, smallmouth bass and large-scale sucker. Antimony and vanadium had MDLs exceeding SLVs in surface water. PCB Congeners 126 and 169 generally had MDLs exceeding the SLVs in all media. The SLVs for PCB Aroclors and congeners are drawn from DEQ's bioaccumulation-based SLVs (DEQ 2007) and are extremely low since they are based on literature-derived toxicity values and exposure assumptions, without regard to whether the SLVs are analytically achievable. The use of congener data to evaluate PCBs in the River OU greatly reduces dependence on the Aroclor data, thus the uncertainties related to the Aroclor MDLs do not affect the HHRA. PCB congeners 126 and 169 were reported in many samples, thus increasing the level of confidence in the sensitivity of the data. Therefore, no further assessment of uncertainty regarding these analytes is needed.

O.2.2.2 Statistical Background Comparison Screening

As discussed in Section 8.1 of the main text, the goal established in the RI/FS MP (URS 2007a) for statistical power associated with the background comparison was achieved (i.e., to detect "one-standard-deviation-away"). However, for some Forebay media, this one-standard-deviation is high due to the high data variability, which could not be controlled because of the inherent heterogeneity. As an artifact of this high data variability, MDDs greater than 100% of the reference mean were calculated for several metals in Forebay tissue (Table L-4) and included the following:

Forebay Tissues

- Crayfish – lead
- Smallmouth Bass – chromium

Although the null hypothesis was not rejected, the statistical power to detect substantial differences between the site and Reference Area datasets for metals with MDDs greater than 100% of the reference mean might be limited. Since the results of the statistical background comparison indicated that concentrations of these metals were present below or equal to that of the Reference Area levels, these metals were not carried to the COPC SLV screening step in

Section 11 (HHRA). However, the high MDDs (greater than 100% of the reference mean) present an uncertainty with this finding.

To address the uncertainty with the results of the statistical background comparison, these metals were subjected to a risk-based screening evaluation, herein. The purpose of this evaluation is to explore whether or not these metals should be included as COPCs, and ultimately advanced to the next level of RA or directly to the FS. A weight-of-evidence approach similar to the one implemented in Section 11 (HHRA) was used to evaluate these metals.

The following sequential steps summarize the risk screening process used to evaluate metals with MDDs greater than 100% of the reference mean:

- SLVs protective of human health receptors were compared to the appropriate EPCs, which are the lower of the 95% UCLs and maximum detected concentrations) for each analyte.
- Magnitude of SLV exceedances, detection frequency, confidence in the SLV, comparison of AOPC vs. Reference Area concentration ranges, and other lines of evidence were evaluated.
- Spatial distribution of the concentrations relative to the site-specific background UPLs and SLVs was assessed by referencing existing figures presented in the main RI report.

The human health SLVs presented in Appendix J were compared to the EPCs calculated for Forebay tissues (subsistence and recreational fisher) (Tables O.2-7). SLVs for subsistence and recreational fisher varied due to rates of consumption differences, the more conservative SLV was initially used in the screening of this analysis.

Based on this weight-of-evidence approach, those COPCs that truly warrant additional investigation or risk management were identified and discussed below.

Forebay Tissues

Crayfish. Lead was the only metal with a high MDD with a generated statistical background comparison of 108% (Table L-4), which is just slightly over 100%. The 95% UCL of 0.925 mg/kg was used as the lead EPC, which exceeds the SLV of 0.5 mg/kg (based on the DEQ non-carcinogen for subsistence ATLs). Nine of seventeen crayfish tissue samples, located throughout the Forebay, were above the lead SLV. However, crayfish lead concentrations within the Forebay range from 0.0980 mg/kg to 2.66 mg/kg (Table L-4) and were similar to lead concentrations in Reference Area crayfish tissue, which ranged from 0.0560 mg/kg to 1.55 mg/kg (Table L-4). There are uncertainties involved as to whether this pathway is complete. Shellfish consumption appears to be relatively minor or minimal, relative to finfish consumption. Crayfish have a large home range and may be exposed to COPCs from sources other than the Forebay. Crayfish may live to 5 or 6 years and often may live as long as 10 years (URS 2007a). Therefore, although the Forebay crayfish random samples were collected after the sediment removal action, they are very likely to have had exposure to pre-removal concentrations of Forebay COPCs for several years prior to their sample collection. Therefore, lead is not recommended for further evaluation.

Smallmouth Bass. Only one metal, chromium, had a MDD greater than 100% of the reference mean. There was no exceedance of the SLV, therefore, further evaluation is not warranted.

Summary. None of the metals with high MDDs demonstrated for Forebay tissues are recommended for further evaluation in the form of either a baseline HHRA or remediation of the locations above the UPL.

O.2.2.3 COPC Identification and Screening Risk Estimates

Similar to the discussion presented in Section O.2.1.5, a major uncertainty for PCBs in the River OU is that evaluation of the human milk ingestion pathway has not been performed and the non-cancer hazards to infants have not been estimated in this problem formulation. Evaluation of this pathway is unlikely to increase estimates of ELCR but is likely to increase non-cancer HQs by up to a factor of 25, according to DEQ (2010b). The non-cancer values corresponding to DEQ's tissue and sediment SLVs for PCBs are not available. Therefore, a non-cancer SLV could not be readily estimated in the manner that was done for the Upland OU soils. However, PCBs have already been included as COPCs for all the River OU media even without consideration of the milk ingestion pathway.

As noted earlier, all estimates of C/SLV ratios, HI and ELCR based on crayfish tissue and, more importantly, the smallmouth bass tissue, must be interpreted with caution and should not be assumed to represent current exposure conditions in the Forebay. Use of these data likely overestimates the potential risks.

Although they are generally considered to be readily metabolized in fish tissues, a number of PAHs were reported in the tissue of smallmouth bass. ATLs for the subsistence and recreational fish consumer were developed for the PAHs (Table J-4f) and the lower of the UCL and maximum were compared to the ATLs. The magnitude of exceedance was relatively small and was generally less than a factor of 4. The only exceptions were benzo(a)pyrene and dibenzo(a,h)anthracene which had higher ratios. Whether these cPAHs are likely to pose a threat to human health is uncertain. PAH levels in fish are usually low because this group rapidly metabolizes PAHs (Lawrence and Weber 1984); furthermore, higher molecular weight PAHs, which include the largest class of chemical carcinogens, do not seem to accumulate in fish (West et al. 1984). In general, free (unmetabolized) PAHs are detected at lower concentrations in muscle than in liver, gonads, stomach, or gall bladder (bile), although liver concentrations are probably more associated with short-term exposure and muscle concentrations are probably more associated with long-term bioaccumulation (Hellou 1996). Whether the PAHs in the smallmouth bass are present in the edible portions of the fish such as muscle, or in the portions that are discarded during cooking (e.g., viscera) is unknown since the smallmouth bass data for the Forebay are based on whole-body analyses.

Since PAHs in the Forebay sediments were not elevated in relation to Reference Area sediments, the source of PAHs to elevated concentrations in Forebay smallmouth bass is unknown. It may be related to pre-removal concentrations of PAHs in sediments and feeding range habits of the bass among other factors.

B2EHP

B2EHP was reported in several media including groundwater in the Upland AOPCs, and in sediment and smallmouth bass tissue in the River OU. It was not retained as a COPC based on an understanding of its properties, its spatial distribution and its potential to contribute to human health risk by the fish consumption pathway.

In the aquatic environment, lipophilic organic compounds (Log K_{ow} > 5; DEQ 1998) such as phthalates would be expected to bioaccumulate in aquatic organisms. However, B2EHP is not as readily absorbed into fish as are other phthalates. For example, gill uptake efficiencies in English sole (Parophrys vetulus) from single-pass exposures to phthalates ranged from 42% for butylbenzyl phthalate (Log K_{ow} =5.8), 12% for di-n-octyl phthalate (Log K_{ow} =9.2), 11% for diethylphthalate (Log K_{ow} =3.2), and 3% for B2EHP (Log K_{ow} =8.7) (Boese 1984). If absorbed into fish, there is little bioaccumulation of B2EHP or its first metabolic degradation product (monoethylhexyl phthalate [MEHP]) due to an efficient biotransformation mechanisms (Barron et al. 1989). Relative to other components of a model aquatic ecosystem (snails, clams, Daphnia, and aquatic plants), B2EHP was rapidly metabolized in a guppy species (*Lebistes reticulatus*) (Metcalf et al. 1973). Similarly, B2EHP and MEHP were reduced to near-background concentrations within one week after a four-week dietary exposure of Atlantic salmon (*Salmo salar*) (Norman et al. 2007). Perhaps due to its relatively rapid metabolism, there are no readily available data on the specific distribution of B2EHP among tissues within a fish. However, butylbenzyl phthalate bioconcentrated in viscera of bluegill sunfish (*Lepomis macrochirus*) approximately 5-fold greater than in fillet, following a 3-day exposure period (Carr et al. 1997). In general, these collective data indicate that B2EHP is not highly bioaccumulative in fish, and within fish, tends to occur to a lesser extent in muscle (fillet) than in the viscera.

Arsenic

Arsenic in fish and crayfish tissue was initially evaluated on the basis of SLVs that assume all the arsenic is present as the more toxic inorganic arsenic. In reality, the majority of arsenic in shellfish and finfish tissue is likely to be organic arsenic, which exerts minimal toxicity. This initial assumption is likely to overestimate risks related to arsenic by the shellfish and finfish consumption pathway.

O.2.2.4 Site Characterization Data

Extensive discussion of the quality and sensitivity of the data used to characterize the River OU media has been provided in Sections 7, 8, 9 (in conjunction with Appendix K).

O.2.2.5 Receptors and Exposure Pathways

A common uncertainty for subsistence and recreational fishers is that although site-specific consumption of shellfish tissue from the Forebay is theoretically possible, the actual occurrence of shellfishing and rates of consumption have been difficult to establish with certainty.

Another uncertainty is that actual use of the Forebay area for subsistence fishing use appears to be unlikely. As noted in the RI/FS MP (URS, 2007a), the Forebay area is of low habitat quality and is not considered to be as attractive for fishing as other portions of the Columbia River. Although tribal fishers may use the area to some degree, it is unlikely that sole usage of the Forebay for subsistence fishing actually occurs.

Although it is theoretically possible, the likelihood of potable use of unfiltered, untreated river water by receptors in the Forebay area or immediately downstream is also unlikely.

O.2.2.6 Selection and Use of SLVs

SLVs were identified for the majority of the COIs by following the hierarchical process of SLV selection (Appendix J). To the extent possible, surrogate chemicals were used to identify SLVs for COIs lacking their own SLVs. Only a few COIs remained without SLVs, and are identified in Table 7-6.

Bioaccumulative COIs without human health SLVs in the River OU consist primarily of several phthalate compounds, carbazole and p-cresol, as well as a few metals (Table J-7). The potential for bioaccumulation was evaluated by first identifying COPCs in the tissue data and using the results to guide the identification of COPCs for sediments. The phthalates were evaluated by reference to B2EHP. Although B2EHP is classified as a carcinogen, it has a relatively high soil SLV of 150 mg/kg for direct contact pathways unlike many other more potent carcinogens (Table J-4a). ATLs were developed for B2EHP in tissue for the subsistence and recreational fishers. Its occurrence is widespread and it was reported in both the Forebay and Reference media. Therefore it was evaluated in the context of whether it exceeded the ATLs and whether Forebay sediment concentrations exceeded Reference Area sediment concentrations. This multiple lines of evidence approach was useful in minimizing the level of uncertainty associated with these COIs. However, all COIs without SLVs or ATLs or surrogates were retained as COPCs.

COIs for which the appropriate speciation data were not available were screened using the more conservative of available SLVs, e.g., chromium was evaluated by using SLVs based on the more toxic hexavalent chromium rather than trivalent chromium. In addition, fluoranthene and pyrene bioaccumulation SLVs were used as surrogates for the other PAHs detected in tissue. This uncertainty is minimized by that fact that the detected concentrations of all PAHs in fish tissue are generally very low. Arsenic in crayfish and fish tissue is also likely to occur as the less toxic organic form of arsenic than the more toxic inorganic form. By applying the arsenic SLV that is based on inorganic arsenic, the potential risk associated with arsenic in tissue is likely overestimated.

The subsistence fisher and recreational fisher SLVs for sediment and tissue are based on estimated rates of finfish and shellfish consumption that are likely higher than actual consumption for these fishers in the Forebay. Therefore, the screening level risk estimates for these receptors are likely to be overestimated.

O.2.2.6.1 Updates to SLVs

As part of the uncertainty assessment, there have been updates to the agreed upon sources of SLVs, DEQ WQC (2011) (affecting surface water SLVs for fish ingestion pathway). If this update contains more stringent SLVs, they will be considered for further evaluation as to whether they should be included in subsequent River OU evaluations (e.g., future monitoring activities) if additional surface water data are collected.

O.3 ERA Uncertainty Assessment

This section describes the uncertainties specific to the ERAs conducted for the Upland and River OUs.

O.3.1 Upland OU

O.3.1.1 Data Sensitivity Analysis for ERA

To evaluate the quality of the data for specific use in the Level II ERA, the MDLs for the non-detect results from the Upland OU were compared with the lowest of the ecologically protective screening levels available for each receptor group (Appendix J). The MDL evaluation was only performed for analytes with a detection frequency of less than 100%; those with at least one non-detect sample. The data for analytes that have actual measurable detections above MDLs at every location are less uncertain than those that were not quantifiable in some samples. For individual chemicals that are consistently non-detect or estimated, there is uncertainty that is discussed further in Section 7.0, of the main RI, and below. There is relatively less uncertainty for chemicals for which there are some detected results above the MDL.

The following datasets were considered in the Upland OU data quality evaluation:

- Landfill AOPC: soil, groundwater, and co-located (adjacent) seep water and surface water
- Sandblast Area AOPC: soil and groundwater.
- Pistol Range AOPC: soil and groundwater (All COIs analyzed for in lagoon sediments were detected in all samples, so no MDL comparison was required)
- Bulb Slope: soil

Tables K-5 through K-8 in Appendix K present the results of this analysis for the Landfill, Sandblast Area, Pistol Range, and Bulb Slope AOPCs, respectively. Various MDLs for soils, groundwater, seep water and potentially mass wasting soils exceeded the lowest ecological SLVs at the Landfill AOPC (Table K-5). At the Sandblast Area AOPC, two metals, two SVOCs, various pesticides, and seven VOCs had MDLs greater than the lowest ecological SLVs (Table K-6). Of these, only three VOCs in soils that had 100% nondetects had MDLs greater than the lowest ecological SLV (Table K-6). For groundwater at the Sandblast Area AOPC, two VOCs, two SVOCs, and one pesticide had MDLs greater than the lowest ecological SLVs (Table K-6). Several SVOCs, pesticides and PCBs in the potentially erodible soils at the Sandblast Area AOPC also had MDLs greater than the lowest ecological SLV (Table K-6). At the Pistol Range AOPC, only antimony had MDLs greater than the lowest screening level (Table K-7). All MDLs at the Bulb Slope AOPC were below the screening levels (Table K-8).

In general, the majority of the MDLs are equal to or lower than the SLVs, but a few analytes (some PAHs, pesticides, herbicides, PCB-Aroclors) exceed their corresponding SLVs for certain media. Exceedance of the lowest ecological SLV does not mean that the MDL exceeds the screening level for all receptors. It is unlikely that additional analysis will be needed for the analytes and media with elevated MDLs, as shown in the data usability tables presented in Appendix K, for the following reasons:

- Elevated MDLs demonstrated for a specific analyte in one medium, but not in any other media may not be an issue due to the chemical properties of that particular analyte. For example, elevated MDLs for PCB-Aroclors in groundwater with 0% non-detects may reflect a combination of factors: the limits of analytical technology for detecting PCBs in water samples, the generally low solubility of PCBs in water and the use of extremely low, theoretically estimated risk screening values for comparison.
- Analytes for which the MDLs are exceeded in all samples (e.g., high molecular weight PAHs [HPAHs]) likely reflect the current analytical technology limitations.
- The lowest ecological SLVs were used, which may be replaced with more relevant screening levels in the RI Report and RAs.
- Many of the analytes were detected at a frequency greater than 5% (and were greater than background levels for metals) and will already be included as COIs in the ERA.

The use of flagged data increases the level of uncertainty associated with the EPC; however, none of the data were R flagged. In general, the historical and more recent data utilized in this ERA represents the best available analytical data and, as detailed in Section 7.0 of the main RI, the quality of the data was sufficient to provide for a defensible ERA.

O.3.1.2 Statistical Background Comparison Screening

As discussed in Section 8.1 of the main text, the goal established in the RI/FS MP (URS 2007a) for statistical power associated with the background comparison was achieved (i.e., to detect "one-standard-deviation-away"). However, for some Upland soils, this one-standard-deviation is high due to the high data variability, which could not be controlled because of the inherent heterogeneity of the Upland soils. As an artifact of this high data variability, MDDs greater than 100% of the reference mean were calculated for several metals in soil of the Landfill, Sandblast Area, and the four combined AOPCs (Table L-1). Although the null hypothesis was not rejected, the statistical power to detect substantial differences between the site and Reference Area datasets for metals with MDDs greater than 100% of the reference mean might be limited.

For metals with data sets containing a large numbers of non-detects, the statistical methodology used in the background comparison may present limitations. Therefore, comparisons also included an examination of the data distributions using box-and-whisker plots. These plots are included in Appendix L. Examination of these plots allowed for the identification of data sets in which the analyte concentrations in the site data were clearly higher than the reference area concentrations, even when the population-to-population comparisons were inconclusive. These metals were ultimately included in the SLV comparison presented in Section 12 (ERA). The final list of metal COIs considered to have concentrations higher than the Reference Area are provided in Table 8-1 of the main report.

The results of the statistical background comparison indicated that concentrations of several metals with high MDDs (greater than 100% of the reference mean) were present below or equal to that of the Reference Area levels. These metals were not carried to the SLV comparison step (not presented in Table 8-1). Since the high MDDs present an uncertainty with this approach, these metals were evaluated further below.

Metals with MDDs greater than 100% of the reference mean that were not included in the SLV comparison in Section 12 (ERA) include the following:

Landfill

- 0 to 1 ft bgs – arsenic, chromium, copper, and nickel
- 0 to 3 ft bgs – chromium, copper, magnesium, and nickel

Sandblast Area

- 0 to 1 ft bgs and 0 to 3 ft bgs – copper, magnesium, and mercury

Four Combined AOPCs

- 0 to 1 ft bgs and 0 to 3 ft bgs – copper and magnesium

Magnesium is an essential nutrient; therefore, it was eliminated from further evaluation and no further investigation is recommended. To address the uncertainty with the results of the statistical background comparison, the remaining metals were subjected to a risk-based screening evaluation. The purpose of this evaluation is to explore whether or not these metals should be included as CPECs, and ultimately advanced to the next level of RA or directly to the FS. A weight-of-evidence approach similar to the one implemented in Section 12 (ERA) was used to evaluate these metals.

The following sequential steps summarize the risk screening process used to evaluate metals with MDDs greater than 100% of the reference mean that were not included in the SLV comparison:

- SLVs protective of ecological receptors were compared to the appropriate EPCs (i.e., 95% UCLs for mobile receptors and maximum concentrations for stationary receptors) for each analyte.
- Magnitude of SLV exceedances, detection frequency, confidence in the SLV, comparison of AOPC vs. Reference Area concentration ranges, and other lines of evidence were evaluated.
- Spatial distribution of the concentrations relative to the site-specific background UPLs and SLVs was assessed by referencing existing figures presented in the main RI report.

The ecological SLVs presented in Appendix J were compared to the EPCs calculated for 0 to 1 ft bgs and 0 to 3 ft bgs soils (Table O.3-1). Based on this weight-of-evidence approach, those CPECs that truly warrant additional investigation or risk management were identified and discussed below. A unitless receptor designator that dictates the level of protection appropriate for a certain site: Q of 1 is applicable to all receptors with the exception of mammals, for which a Q of 5 was used.

Landfill AOPC

. . EPCs for the four metals in 0 to 1 ft bgs soils and three metals in 0 to 3 ft bgs soils with high MDDs exceed at least one receptor-specific SLV:

- 0 to 1 ft bgs – arsenic, chromium, copper, and nickel
- 0 to 3 ft bgs – chromium, copper, and nickel.

Arsenic. The MDD generated for arsenic in soil during the statistical background comparison is 148% for 0 to 1 ft bgs, while the MDD for 0 to 3 ft bgs is below 100% (i.e., no uncertainty needs to be addressed) (Table L-1).

As shown in Table O.3-1, toxicity ratios (EPC/SLV) for all receptors with the exception of plants are below 1.0. The toxicity ratio for plants is very low at 1.7. Concentrations of arsenic in Landfill soils from 0 to 1 ft bgs range from 1.5 mg/kg to 30.1 mg/kg, and concentrations in Upland Reference Area soils range from 1.09 mg/kg to 5.18 mg/kg (Table L-1). The location with the maximum detected concentration of 30.1 mg/kg is BIL05, just east of the Lead Hot Spot Test Pit #1. This is the only sample with a concentration greater than the plant SLV. No other samples exceed SLVs for any receptors.

Based on the relatively low MDD, low arsenic concentrations, and general lack of SLV exceedances in 0 to 1 ft soils (and 1 to 3 ft soils), arsenic is not recommended for further evaluation at the Landfill AOPC.

Chromium. The MDDs generated for chromium in soil during the statistical background comparison are 598% for 0 to 1 ft bgs and 1559% for 0 to 3 ft bgs (Table L-1).

As shown in Table O.3-1, toxicity ratios for plants and soil invertebrates range from 29 (0 to 1 ft bgs) to 69 (0 to 3 ft bgs), with the highest concentrations of chromium occurring between 1 to 3 ft bgs. The toxicity ratios for birds range from 8.6 (0 to 1 ft bgs) to 21 (0 to 3 ft bgs). With the exception of the SLV for mammals, all risk-based SLVs for chromium are below the site-specific background UPL of 28.1 mg/kg. Therefore, the UPL was used as the default soil SLV for these receptors. The soil SLV for mammals of 34 mg/kg is similar to the site-specific UPL, and when adjusted for a receptor designator (i.e., Q) of 5.0 (i.e., an SLV of 170 mg/kg), the toxicity ratios for mammals range from 1.4 (0 to 1 ft bgs) to 3.5 (0 to 3 ft bgs).

Concentrations of chromium in Landfill AOPC soils from 0 to 1 ft bgs range from 14.7 mg/kg to 801 mg/kg, and soils from 0 to 3 ft bgs range from 14.7 mg/kg to 1950 mg/kg (Table L-1). Concentrations of chromium in Upland Reference Area soils range from 15.5 mg/kg to 27.3 mg/kg (Table L-1). Highest levels of chromium occur in the Gully Test Pit and just downgradient of this area (Figure 12-6): BIL07 (0 to 1 ft bgs maximum), BIL08, BIL17, BIL18 (1 to 3 ft bgs maximum), and BIL-22. . BIL05, located just east of Lead Hot Spot Test Pit #1, also has elevated chromium (237 mg/kg), as well as BIL11 (50 mg/kg) to a lesser extent. Chromium concentrations in the remaining samples from 0 to 3 ft bgs are equivalent to or below the Reference Area UPL.

Elevated toxicity ratios were calculated for plants, soil invertebrates, and birds, which also reflect the high chromium levels in certain areas of the Landfill AOPC compared to Reference Area concentrations. Therefore, chromium is recommended for further evaluation.

Copper. The MDDs generated for copper in soil during the statistical background comparison are 195% for 0 to 1 foot bgs and 228% for 0 to 3 ft bgs (Table L-1).

As shown in Table O.3-1, respective toxicity ratios for plants and soil invertebrates are 7.1 and 6.2, respectively, for both depth intervals because the maximum concentration of copper, i.e., the EPC, occurs at the surface between 0 and 1 foot bgs. The toxicity ratios for birds range from 3.0 (0 to 1 foot bgs) to 3.4 (0 to 3 ft bgs) and are below 5.0 for mammals (the point of departure, or Q designator, for this receptor group). Toxicity ratios for birds and mammals are based on the

Reference Area UPL, as their risk-based SLVs are below the site-specific background UPL of 56.7 mg/kg. Therefore, the UPL was used as the default soil SLV for these receptors.

Concentrations of copper in Landfill AOPC soils for both depth intervals range from 23.5 mg/kg to 494 mg/kg (Table L-1). Concentrations of copper in Upland Reference Area soils range from 22.8 mg/kg to 58.2 mg/kg (Table L-1). The maximum concentration of copper occurs at BIL05, just east of Lead Hot Spot Test Pit #1, and the next highest concentration of 378 mg/kg was detected between 1 and 3 ft bgs at BIL22 in the Gully Test Pit (Figure 12-6). Elevated copper was also detected at BIL11 to the west of Lead Hot Spot Test Pit #1; BIL06 within Lead Hot Spot Test Pit #2; and BIL03 near the southern boundary of the Landfill AOPC. Copper concentrations in the remaining samples from 0 to 3 ft bgs are similar to or below the Reference Area UPL.

Elevated toxicity ratios were calculated for plants, soil invertebrates, and birds, which also reflect the high copper levels in specific areas of the Landfill AOPC compared to Reference Area concentrations. Therefore, copper is recommended for further evaluation.

Nickel. The MDDs generated for nickel in soil during the statistical background comparison are 492% for 0 to 1 foot bgs and 1458% for 0 to 3 ft bgs (Table L-1).

As shown in Table O.3-1, toxicity ratios for plants and soil invertebrates range from 2.0 (0 to 1 ft bgs) to 42 (0 to 3 ft bgs), with the highest concentrations of nickel occurring between 1 to 3 ft bgs. The toxicity ratios for birds range from 0.83 (0 to 1 ft bgs) to 2.2 (0 to 3 ft bgs) and are below 5.0 for mammals (the point of departure, or Q designator, for this receptor group).

Concentrations of nickel in Landfill AOPC soils from 0 to 1 ft bgs range from 13.4 mg/kg to 570 mg/kg, and Landfill AOPC soils from 0 to 3 ft bgs range from 13.4 mg/kg to 1610 mg/kg (Table L-1). Concentrations of nickel in Upland Reference Area soils range from 11.5 mg/kg to 26.1 mg/kg (Table L-1). Highest levels of nickel in Landfill AOPC soils appear to be co-located with highest concentrations of chromium and occur in the Gully Test Pit and just downgradient of this area (Figure 12-6): BIL07 (0 to 1 ft bgs maximum), BIL08, BIL17, BIL18 (1 to 3 ft bgs maximum), and BIL-22. . BIL05, located just east of Lead Hot Spot Test Pit #1, also has elevated nickel (170 mg/kg), as well as BIL11 (42.4 mg/kg) and BIL01 (40 mg/kg) to a lesser extent. Nickel concentrations in the remaining samples from 0 to 3 ft bgs are equivalent to or below the Reference Area UPL.

Elevated toxicity ratios were calculated for plants, soil invertebrates, and birds to a lesser degree at depth only, which also reflect the high nickel levels in certain areas of the Landfill AOPC compared to Reference Area concentrations. Therefore, nickel is recommended for further evaluation.

Summary. Of the metals with high MDDs demonstrated for Landfill soils, the following are recommended for further evaluation in the form of either a Level III Baseline Ecological Risk Assessment (BERA) (for all Upland receptors) or remediation of the locations above the UPL:

- Chromium
- Copper
- Nickel

In a Level III BERA, these metals should be evaluated for both soil depth intervals for Landfill soils. . . . . .

Sandblast Area AOPC

. EPCs for the two metals in 0 to 1 ft bgs soils and 0 to 3 ft bgs soils with high MDDs exceed at least one SLV: copper and mercury.

Copper. The MDDs generated for copper in soil during the statistical background comparison are 148% for 0 to 1 ft bgs and 134% for 0 to 3 ft bgs (Table L-1).

As shown in Table O.3-1, respective toxicity ratios for plants and soil invertebrates are 4.6 and 4.0, respectively (same for both depth intervals). The highest concentrations of copper occur at the surface. The toxicity ratios for birds range from 1.6 (0 to 3 ft bgs) to 1.8 (0 to 1 ft bgs), and are below 5.0 for mammals (Q designator for this receptor group). Risk-based SLVs for birds and mammals are below the site-specific background UPL for copper of 56.7 mg/kg. Therefore, the UPL was used as the default soil SLV for these receptors.

Concentrations of copper in Sandblast Area AOPC soils for both depth intervals range from 13.2 mg/kg to 319 mg/kg (Table L-1). Concentrations of copper in Upland Reference Area soils range from 22.8 mg/kg to 58.2 mg/kg (Table L-1). Highest levels of copper (greater than 100 mg/kg) occur near the HMSA (SBB18, maximum detection), in the eastern portion of the Equipment Laydown Area (LD-01, LD-02, LD-03, LD-05, LD-10, and LD-11), west side of the Equipment Laydown Area (TRA-04), near the former HMSA (DSA11), and near the southern boundary of the Spent Sandblast Grit Disposal Area (SBB12). Several other exceedances of the Upland Reference Area UPL are scattered throughout the Sandblast Area AOPC.

Given that no special status plant or soil invertebrate species are present in the Upland OU (protection is afforded at the community level), the 95% UCL concentration of copper at the Sandblast Area was considered. When the UCL for the 0 to 1 ft interval is used as the EPC instead of the maximum concentration of copper, the toxicity ratios decrease to 1.47 for plants and 1.29 for soil invertebrates.

The approach for the Level II Screening Assessment focused on protection of birds at the individual level to account for the bald eagle, and possible transient juvenile spotted owls, but these special-status species are not likely to forage at the 3.1-acre Sandblast Area AOPC. Owls have not been documented to occur on the island, and bald eagles have been seen roosting in the Upland OU, but these piscivorous birds would be much more likely to forage in the adjacent River OU. Therefore, the minor toxicity ratio exceedances of 1.8 and 1.6 are not considered significant and no exceedances are noted at a Q designator of 5.0, which is more applicable to the birds of the Upland OU. Piscivorous birds were evaluated in the Level II Screening Assessment for the River OU (Section 12.5 of the main text).

Based on the relatively low MDDs, low toxicity ratios based on the 95% UCL, lack of special status species in the Upland OU, and the fact that copper is an essential nutrient for plants and animals (USEPA 2005-2008), copper is not recommended for further evaluation at the Sandblast Area AOPC.

Mercury. The MDDs generated for mercury in soil during the statistical background comparison are 229% for 0 to 1 ft bgs and 209% for 0 to 3 ft bgs (Table L-1).

As shown in Table O.3-1, respective toxicity ratios for plants and soil invertebrates are 2.4 and 7.2, respectively (same for both depth intervals). The highest concentrations of mercury occur at the surface. The toxicity ratios for birds range from 1.7 (0 to 3 ft bgs) to 1.5 (0 to 1 ft bgs) and are below 5.0 for mammals (Q designator for this receptor group). The risk-based SLV for birds is below the site-specific background UPL for mercury of 0.066 mg/kg. Therefore, the UPL was used as the default soil SLV for birds.

Concentrations of mercury in Sandblast Area AOPC soils for both depth intervals range from 0.0114 mg/kg to 0.723 mg/kg (Table L-1, Appendix L). Concentrations of mercury in Upland Reference Area soils range from 0.034 mg/kg to 0.068 mg/kg (Table L-1). Highest levels of mercury occur in the eastern portion of the Equipment Laydown Area (LD-01, LD-02, LD-05, which has the maximum detection, and LD-10) and near the former HMSA (DSA09 and DSA10), and several other exceedances of the Upland Reference Area UPL are scattered throughout the Sandblast Area AOPC.

Elevated toxicity ratios were calculated for plants, soil invertebrates, and birds, which also reflect the high mercury levels in certain areas of the Sandblast Area AOPC compared to Reference Area concentrations. Therefore, mercury is recommended for further evaluation.

Summary. Of the two metals with high MDDs demonstrated for Sandblast Area soils, only mercury is recommended for further evaluation in the form of either a Level III BERA (for all Upland receptors) or remediation of the locations above the UPL. In a Level III BERA, mercury should be evaluated for both soil depth intervals.

All Four AOPCs Combined

As shown in Table O.3-1, copper is the only metal with a high MDD demonstrated for soil from the four combined AOPCs that was not included in the Section 12 (ERA) SLV evaluation. For all four AOPCs combined, toxicity ratios were calculated for the wide ranging receptors that might be exposed to soils from all four AOPCs. The toxicity ratios for all four AOPCs combined were greater than 1 for birds in both soil intervals. However, the toxicity ratio for birds is very low at 1.7. The all four COPCs combined evaluation did not identify any additional CPECs not already identified in the individual AOPC evaluations (see above).

Summary. In summary, although copper was identified as a CPEC for all four AOPCs combined, the toxicity ratio was very low (1.7) and copper was already retained as a CPEC recommended for further evaluation at the Landfill AOPC. Copper is recommended for further evaluation in the form of either a Level III BERA (for birds and mammals that could forage over all four AOPCs) or remediation of the locations above the UPL. In a Level III BERA, this CPEC should be evaluated for both soil depth intervals.

O.3.1.3 CPEC Selection Process

As part of the Level II Screening process (DEQ 2001), several COIs were eliminated as CPECs in soil and groundwater on the basis of detection frequency for the Landfill and Sandblast Area. An evaluation of these COIs, which were detected in soil, groundwater, or both, was performed to understand the implications of not including these COIs in the quantitative screening assessment. In Tables O.3-2 and O.3-3, concentrations of these COIs were compared to SLVs protective of the relevant receptor groups:

- soil: plants, soil invertebrates, and terrestrial birds and mammals

- groundwater: aquatic organisms and aquatic-dependent birds and mammals

In addition, whether or not these COIs were detected in both soil and groundwater from the same AOPC is also considered. Only bioaccumulative COIs (as defined in Table J-7) were compared to SLVs protective of birds and mammals, with the exception of selenium. Although the criteria used to identify bioaccumulative COIs for the River OU indicate selenium is not bioaccumulative in aquatic environments, selenium was included in the screening tables because it is included as a bioaccumulative COI in DEQ's sediment bioaccumulation guidance (2007).

Landfill AOPC

As shown in Table O.3-2 for Landfill AOPC soils, only ethylbenzene was detected at a concentration in exceedance of the SLV protective of soil invertebrates (0-3 ft bgs interval). However, this exceedance is low (resulting in a toxicity ratio of 1.19, Table N-2). Ethylbenzene was detected in one of 20 soil samples (0 to 3 ft bgs) collected from the Landfill AOPC (Table I-1), and the detection was in a surface sample (0 to 1 ft bgs). Because less than 20 samples are available for the 0 to 1 ft depth interval, ethylbenzene was already included in the screening for this depth interval in Section 12.0. The concentration in soil of 2700 µg/kg was detected at BIL04TPG in the Gully Test Pit (Figure 12-7).

Ethylbenzene was detected in one of 22 groundwater samples of the Landfill AOPC as well. The concentration in groundwater of 1 µg/L was detected from MW-05, which is east of the Gully Test Pit (Figure 12-10). This concentration is below the SLV protective of aquatic organisms, and ethylbenzene was not detected in the seep sample collected from the Landfill AOPC.

Based on the low, single detection of ethylbenzene in soil and groundwater at the Landfill AOPC, elimination of this COI from the SLV screening for shallow soils (0 to 3 ft bgs) and groundwater based on detection frequency is not expected to present a significant uncertainty in the ERA, especially since the single detection in soil was already included in the 0-1 ft bgs soil interval evaluation in Section 12.

4,4'-DDE and Total DDTs in groundwater at the Landfill AOPC were eliminated on the basis of detection frequency and were detected above the SLV (Table O.3-2). The concentration of Total DDTs is attributed to the one detection (out of 22 samples) for 4,4'-DDE, as the other DDT isomers were not detected in the 22 groundwater samples from the Landfill. No DDTs were detected in the seep water (Table I-1).

The groundwater 4,4'-DDE concentration of 0.00246 µg/L was detected at a single well (MW-03; Figure 12-10) and down gradient wells closer to the river were all non-detect for 4,4'-DDE. The non-detect MDLs, which range from 0.00195 to 0.1 µg/L, all exceed the surface water benchmark of 0.001 µg/L, indicating that the theoretically based SLV is lower than analytical methods can achieve. In addition, as discussed in Section O.1.2, the assumption that aquatic organisms are exposed to undiluted groundwater concentrations is highly conservative.

4,4'-DDE was detected in one of 23 soil samples (0 to 3 ft bgs) collected from the Landfill AOPC, and this sample is a surface sample (0 to 1 ft bgs). The detected concentration (17 µg/kg) was in surface soil (0 to 1 ft bgs) at BIL04SSI in the Lead Hot-Spot Test Pit #1 (Figure 12-7). Due to the higher detection frequency for 4,4'-DDT in Landfill AOPC soils, 4,4'-DDE was already included in the screening for both depth intervals in Section 12.0 (4,4'-DDE is included in the calculation of Total DDTs). As noted above, 4,4'-DDT (and 4,4'-DDD) was not detected

in groundwater of the Landfill AOPC. Furthermore, no DDT isomers were detected in the seep sample collected from the Landfill.

Based on the low, single detection of 4,4'-DDE in groundwater of the Landfill AOPC and lack of DDT isomers in seep water, elimination of this COI from the SLV screening for groundwater based on detection frequency is not expected to present a significant uncertainty in the ERA.

The remaining COIs that were eliminated on the basis of detection frequency and were detected above the SLV for the Landfill AOPC are two SVOCs (2-methylphenol and p-cresol) and one VOC (carbon disulfide) (Table O.3-2). 2-Methylphenol and p-cresol were detected in one of 23 groundwater samples collected from the Landfill AOPC, and carbon disulfide was detected in one of 22 groundwater samples.

The single detections of the two SVOCs occurred at MW-05, and the single detection of carbon disulfide occurred at MW-09 (Figure 12-10). 2-Methylphenol and p-cresol were not detected in wells closer to the River and were not detected in the seep sample (Table I-1). 2-Methylphenol was not detected in soil at the Landfill AOPC, and p-cresol was only detected in one of 29 soil samples collected from 0 to 3 ft bgs (BIL17, Gully Test Pit; see Figure 12-7). The single detection of p-cresol is below the corresponding soil SLV (Table O.3-2). Neither of these SVOCs is considered to be potentially bioaccumulative (Table O.3-2).

Carbon disulfide was not detected in the seep sample or in any soil samples collected from the Landfill AOPC (Table I-1). In addition, this VOC is not expected to persist once discharged to surface water and is not considered to be potentially bioaccumulative (Table O.3-2).

Based on the single detections of 2-methylphenol, p-cresol, and carbon disulfide in groundwater at the Landfill AOPC, lack of detections in seep water, and the fact that none of these COIs are potentially bioaccumulative, elimination of these COIs from the SLV screening for groundwater based on detection frequency is not expected to present a significant uncertainty in the ERA.

Several pesticides in soil and anthracene in groundwater of the Landfill are potentially bioaccumulative but lack dietary-based SLVs. For these COIs, the uncertainty associated with the low detection frequency was not as easily quantified. Most of the pesticides were detected once in soil, however, none were detected in groundwater (Table I-1). The single detection of these COIs in only one medium of the Landfill AOPC likely demonstrates that elimination of these COIs based on detection frequency is not expected to present a significant uncertainty in the ERA.

Sandblast Area AOPC

None of the COIs eliminated on the basis of detection frequency in soil and groundwater at the Sandblast Area AOPC exceed the corresponding SLVs (Table O.3-3). However, a few butyltins, pesticides, and VOCs in soil and two PAHs in groundwater of the Sandblast Area AOPC are potentially bioaccumulative but lack dietary-based SLVs. In addition, seven COIs in soil lack SLVs protective of plants and soil invertebrates that are exposed through direct contact. For these COIs, the uncertainty associated with the low detection frequency was not as easily quantified. All of these potentially bioaccumulative COIs in soil (with the exception of isopropylbenzene in the direct push groundwater data set) (Table I-2), however, were never detected in groundwater, and the two potentially bioaccumulative COIs (PAHs) in groundwater were detected below the direct toxicity-based SLVs. For these reasons, elimination of these COIs based on detection frequency is not expected to present a significant uncertainty in the ERA.

O.3.1.4 Calculation of Total LPAHs and Total HPAHs

USEPA (2005-2008) included fluoranthene in the development of the Total low molecular weight PAH (LPAH) Ecological Soil Screening Levels (EcoSSL). However, fluoranthene is more often considered a HPAH (Agency for Toxic Substances and Disease Registry [ATSDR] 1995; Washington State Department of Ecology [Ecology] 2008; USEPA 1998; Canadian Council of Ministers of the Environment [CCME] 2008) and was evaluated as an HPAH in the ERA and used to calculate Total HPAH. Exposure to LPAHs and HPAHs due to inclusion of fluoranthene in the totaling of HPAHs does not underestimate risk and may actually overestimate risk because the EcoSSLs for HPAHs are lower than those for LPAHs and grouping fluoranthene as a HPAH is actually more conservative (e.g., HPAH totals are higher and screened against a lower SLV).

O.3.1.5 Erodible/Mass Wasting Soil

As discussed in Section O.1.2, an evaluation of the overland transport pathway to the River OU was conducted for the Landfill, Sandblast Area, and Bulb Slope AOPCs. In the first step of this evaluation, the data from surface soils (0 to 1 ft bgs) that were collected from areas that may potentially be subject to erosion or mass wasting (as identified in Sections 3.5 and 10.1 of the RI Report) were compared to the inorganic concentrations in the site-specific Reference Area sediment (Table L-8). Those COIs that were detected less than the Reference Area were not retained as CPECs and were not evaluated further.

The organic COIs and remaining inorganic COIs were then compared to sediment SLVs protective of the four receptor groups relevant to the River OU, and the results are summarized below. For fish and wildlife, only the COIs identified as potentially bioaccumulative were evaluated through a comparison of soil concentrations to DEQ's bioaccumulation SLVs:

- Benthic Invertebrates - (Tables O.3-4 and O.3-5). Soil CPECs for benthic invertebrates that could be exposed if mass wasting of debris and soil from the Landfill or Bulb Slope AOPCs were to occur or through soil erosion at the Sandblast Area AOPC include arsenic, cadmium, chromium, cobalt, copper, lead, mercury, nickel, selenium, thallium, zinc, 4,4'-DDT, Total DDTs, Aroclor 1254, Aroclor 1260, Total Aroclors, carbazole, bis(2-ethylhexyl) phthalate, di-n-butyl phthalate, and most PAHs.
- Fish - (Tables O.3-6). Soil CPECs for fish that could be exposed through their diet if mass wasting of debris and soil from the Landfill or Bulb Slope AOPCs were to occur or through soil erosion at the Sandblast Area AOPC include arsenic, cadmium, lead, mercury, selenium, thallium, zinc, tributyltin, 4,4'-DDE, 4,4'-DDT, Total DDTs, dieldrin, Aroclor 1254, Aroclor 1260, Total Aroclors, and most HPAHs.
- Birds – Individuals and Populations - (Tables O.3-7 and O.3-8). Soil CPECs for piscivorous birds that could be exposed through their diet if mass wasting of debris and soil from the Landfill or Bulb Slope AOPCs were to occur or through soil erosion at the Sandblast Area AOPC include arsenic, cadmium, lead, mercury, selenium, thallium, zinc, 4,4'-DDE, 4,4'-DDT, Total DDTs, dieldrin, Aroclor 1254, Aroclor 1260, Total Aroclors.
- Mammals – Individuals and Populations - (Tables O.3-9 and O.3-10). Soil CPECs for piscivorous mammals that could be exposed through their diet if mass wasting of debris and soil from the Landfill or Bulb Slope AOPCs were to occur or through soil erosion at

the Sandblast Area AOPC include arsenic, cadmium, lead, mercury, selenium, thallium, zinc, 4,4'-DDT, Total DDTs, dieldrin, Aroclor 1254, Aroclor 1260, Total Aroclors.

As shown in Tables O.3-4 and O.3-5, several COIs in soil were identified as CPECs for the benthic community exposed through direct contact because they lacked SLVs: selenium, butyltins, a few pesticides, most VOCs, two SVOCs, 2-methylnaphthalene, and total petroleum hydrocarbons (TPH). As shown in Tables O.3-6 through O.3-10, several COIs in soil were identified as CPECs for upper trophic level fish and shellfish and aquatic-dependent birds and mammals solely due to their bioaccumulation potential; they either lacked SLVs or their SLVs were not dietary-based (i.e., do not account for bioaccumulation). These primarily include manganese, TPH, and a few VOCs, SVOCs, and pesticides, as well as PAHs for birds. In addition, TPH was identified as a CPEC due to the lack of reliable SLVs protective of fish and shellfish and aquatic-dependent birds and mammals that could be exposed through direct contact. Naphthalene is the other CPEC identified for birds based on direct contact due to the lack of reliable SLVs for PAHs and birds.

The CPECs in soil identified through the evaluation of the overland transport pathway were evaluated for their potential to bioaccumulate in the ERA for the River OU (Section 12.5 of the main RI), with the exception of pesticides, and the protection of fish and aquatic-dependent wildlife is discussed in that section of the ERA. The lack of data for the Forebay for pesticides constitutes an additional source of uncertainty that was discussed previously.

Due to the elevated toxicity ratios for the CPECs listed above and/or their potential to bioaccumulate, as well as the potential for these areas to be sources of contamination (e.g., erosion or mass wasting), further evaluation of these CPECs within their respective AOPCs (i.e., Landfill, Sandblast Area, and Bulb Slope) is recommended for the Upland OU.

The magnitude of the potential for mass wasting/erosion and the mass of CPECs from the mass wasting/erodible soils that may actually enter the River OU are both highly uncertain. Therefore, the toxicity ratios associated with CPECs in the erodible soils do not provide a reliable evaluation (even at a screening level) of the potential risks and hazards associated with this pathway. The primary purpose of this exercise was to identify CPECs that may warrant further evaluation and discussion of the magnitude of the ratios is not appropriate.

O.3.1.6 Selection and Use of SLVs

The general uncertainties associated with the selection of SLVs were described in Section O.1, and this section specifically addresses those uncertainties related to SLVs used in the Level II ERA.

The applicability of the selected SLVs to the habitats and receptors present or likely to be present in the Upland (and River) OUs presents an uncertainty in the ERA because the inherent assumption in these SLVs is that a site is comprised of high-quality habitats, which is not always the case given current and future land use conditions. For example, most of the AOPCs in the Upland OU generally provide good habitat for animals that occur in the Lower Columbia River watershed, i.e., Landfill, which is managed as wildlife habitat (primarily for Canada geese) and the Pistol Range. Applying the generic SLVs for plants and animals at the more highly disturbed Sandblast Area (i.e., less desirable areas for ecological receptor use) poses more uncertainty in the ERA than applying them at the areas with higher quality, more attractive and diverse habitat.

In the absence of avian toxicity data for dichloroprop and MCPP (herbicides), the SLV for 4,4-DDT (a pesticide) was used as a surrogate. Use of DDT as a surrogate for these herbicides is expected to be very conservative due to the high bioaccumulation potential associated with DDTs, which is the basis of the SLV, compared to that of the two herbicides, which are not expected to bioaccumulate (log K_{ow} < 3.5) and likely overestimated risk.

In the absence of reliable PAH toxicity data for birds, the potential hazards to birds exposed to PAHs are addressed qualitatively in this section. Because PAHs can accumulate in tissues, the potential for PAH exposure by birds (of the Upland or River OUs) is of potential concern. However, the chemical behavior of PAHs may impact the bioavailability of PAHs and overall exposure. In general, both LPAHs and HPAHs are expected to significantly adsorb to soil due to their strong affinity for organically enriched substrates (i.e., organic carbon) and other ligands (e.g., sulfides) (Eisler 1987). In addition, significant bioaccumulation of PAHs by vertebrate species has not been reported in the literature (Hartung 1995) most likely due to the rapid metabolism of PAHs. As noted in the EcoSSL document for PAHs (USEPA 2005-2008), the recommended bioaccumulation factor (BAF) for PAHs is zero for estimating PAH concentrations in mammalian prey tissue because of the rapid metabolism of these compounds after ingestion by birds and mammals. Therefore, ingestion of PAHs in prey items for the birds evaluated in the ERA, especially predatory birds of the Upland OU, is likely to be minimal and the lack of PAH toxicity reference values (TRVs) for birds would not significantly impact the findings of the Level II ERA.

Potential impacts from generic classes of petroleum hydrocarbons (as TPH purgeable and extractable), are difficult to quantify because of uncertainty due to the analytical problems frequently encountered when characterizing the petroleum mixture and because of the change in composition of the petroleum hydrocarbons with exposure to the environment (i.e., weathering). As such, the focus of this ERA was on evaluating the chemical-specific hazards from the most toxic components (i.e., VOC, SVOCs, PAHs) of TPH.

O.3.1.7 Bioaccumulative COIs without Dietary-based SLVs

Table O.3-11 lists the bioaccumulative COIs detected at the Landfill and Sandblast Area AOPCs that had SLVs and were evaluated for ecological risk in this Level II ERA do not have dietary-based SLVs. The lack of dietary-based SLVs for bioaccumulative COIs may result in the underestimation of risk to wildlife from exposure to the following COIs since the non-dietary-based SLVs do not account for bioaccumulation. However, these COIs were retained as CPECs for the Landfill and Sandblast Area AOPCs and warrant further consideration for birds and mammals. As discussed above, ingestion of PAHs in prey items for the birds evaluated in the ERA, especially predatory birds of the Upland OU, is likely to be minimal and the lack of PAH TRVs for birds would not significantly impact the findings of the Level II ERA.

O.3.1.8 Bioavailability, Absorption, and Metabolism of CPECs

The bioavailability and absorption of all of the CPECs was assumed to be 100% in the Level II ERA, while the metabolism of COIs was assumed to be 0%. There were no adjustment factors to account for CPECs binding onto soil/sediment particles, or being present in a form that is not biologically available or active, or for the ability of vertebrates to metabolize certain CPECs (e.g., PAHs). Assumption of 100% bioavailability/absorption of CPECs, as well as the assumption that there is no metabolism of COIs, likely results in the overestimation of risk.

O.3.1.9 Area and Seasonal Use Factors

This Level II ERA conservatively assumed that all of the ecological receptors were present at each AOPC all day and year-round. However, some receptors (e.g., migratory birds and fish or mammals/birds with home ranges larger than the AOPCs) may be only present at each AOPC during a portion of the day and/or year. Accounting for the area use and seasonal migration habits of receptors would influence the degree of risk associated with exposure of this receptor.

O.3.2 River OU

Many of the uncertainties discussed above for the Upland OU also apply to the River OU, such as those that originate from assumptions regarding the selection and use of SLVs, the absence of bird SLVs for PAHs, lack of a quantitative evaluation for petroleum hydrocarbons, bioavailability and metabolism of CPECs, and area use factors.

O.3.2.1 Data Sensitivity Analysis for ERA

To evaluate the quality of the data for specific use in the Level II ERA, the MDLs for the non-detect results from the River OU were compared with the lowest of the ecologically protective screening levels available for each receptor group (Appendix J). As described in Section O.3.1 for the Upland OU, the MDL evaluation was only performed for analytes with a detection frequency of less than 100%.

The following data sets were considered for the data quality evaluation:

- Random Forebay Data: surface water, sediment, clams, crayfish, sculpin, smallmouth bass, and largescale sucker
- Targeted Forebay Data:
    - Eagle Creek: sediment
    - Goose Island: sediment, clam, crayfish, and sculpin

Tables K-14 and K-15 in Appendix K presents the results of this analysis for the pre-removal, Random Forebay Data, Targeted Eagle Creek Data, and Targeted Goose Island Data, respectively.

For the Random Forebay Data, aluminum in surface water, one SVOC in sediment, and several PCB Aroclors and congeners in sediment, clam, sculpin, and smallmouth bass had MDLs greater than the lowest ecological SLVs (Tables K-13 and K-14). For the Goose Island data, two metals, two SVOCs, various pesticides and 7 VOCs had MDLs the PCB Aroclors and 1 PCB congener had MDLs greater than the lowest ecological SLVs (Table B-2c). All MDLs for Random Forebay crayfish and sucker, Eagle Creek sediment, Goose Island clam, crayfish, and sculpin, and pre-removal clam were below the lowest ecological SLVs (Tables K-13 through K-15).

In general, the majority of the MDLs are equal to or lower than the SLVs, but some analytes (PCB-Aroclors and a few individual PCB congeners) exceed their corresponding SLVs for certain media. Exceedance of the lowest ecological SLV does not mean that the MDL exceeds the screening level for all receptors.

It is unlikely that additional analysis will be needed for the analytes and media with elevated MDLs, as shown in the data usability tables presented in Appendix K, for the following reasons:

Sediment

The lowest Aroclor ecological SLV for total PCBs (Aroclor 1254) was applied as a surrogate value to all Aroclors except for Aroclor 1248 (for which a chemical-specific level was available). This approach is conservative given the lower toxicity potential associated with the other Aroclors compared to Aroclor 1254 SLV is designed to be protective of the additive toxicity of all individual Aroclors. Many of the Aroclors have MDL exceedances for sediment sample; however, they are minor exceedances based on the lowest ecological SLV. This data quality issue is further minimized when screening levels for total PCBs are considered. As previously discussed, the PCB congener data collected is expected to provide more representative concentrations in sediments than the Aroclor data.

Of the PCB congener MDLs, only PCB 126 in the Random Forebay and Goose Island sediment had MDLs that exceeded the lowest ecological SLV. For this reason, the potential for risk to ecological receptors may be underestimated for PCB 126 as an individual dioxin-like congener in sediment. PCB 126 was, however, was detected in most tissue samples. Given that the MDLs for all other PCB congeners were less than the lowest ecological SLVs, the exceedance of the MDL for PCB 126 above the lowest ecological SLV is not expected to present a substantive issue for data quality in terms of estimated risk from PCBs as the sum of all 209 congeners.

Tissue

The ecological screening levels for total PCBs were applied as a surrogate value to all Aroclors. All of the Aroclors in the smallmouth bass data and several of the Aroclors in the clam and sculpin data have MDLs that exceed the lowest ecological SLV; however, the exceedances in clam and sculpin are minor. As is the case for sediment, the PCB congener data collected is expected to provide more representative concentrations in sediments than the Aroclor data.

None of the MDLs for PCB congeners were exceeded in the crayfish, clam, or sucker data. Only PCBs 126 and 169 in the Random Forebay smallmouth bass and PCBs 81, 126, 169 in the Random Forebay sculpin data had a few MDLs that exceeded the lowest ecological SLV. Given the following, these exceedances are not expected to present a substantive issue for data quality:

- Smallmouth bass – The lowest ecological SLV is exceeded in only one sample for PCB 126 and only three samples for PCB 169. While PCB 126 was detected in the remaining samples, PCB 169 was never detected, of which, 16 samples had MDLs well below the ecological SLV.
- Sculpin – The lowest ecological SLV is exceeded by only one MDL for PCB 81, one MDL for PCB 126, and three MDLs for PCB 169. While PCB 126 was detected in the remaining samples, PCBs 81 and 169 were not detected in 16 of 17 samples, of which, the majority of MDLs were less than the lowest ecological SLV. The potential for ecological risk from exposure to these two congeners may be underestimated.

In summary, the MDLs are considered acceptable for the majority of the constituents, with some exceptions due to the limits of analytical technology or the use of unrealistically low screening benchmarks. The data for analytes that have actual measurable detections above MDLs at every location are less uncertain than those that were not quantifiable in some samples. For individual chemicals that are consistently non-detect, there is uncertainty that risk for these COIs may be

underestimated. There is relatively less uncertainty for chemicals for which there are some detected results above the MDL.

O.3.2.2 Statistical Background Comparison Screening

As discussed in Section 8.1 of the main text, the goal established in the RI/FS MP (URS 2007a) for statistical power associated with the background comparison was achieved (i.e., to detect "one-standard-deviation-away"). However, for some randomly-collected Forebay tissues, this one-standard-deviation is high due to the high data variability, which could not be controlled because of the inherent heterogeneity of the Upland soils. As discussed in detail for the Upland OU (Section O.3.1.2), this high data variability resulted in MDDs greater than 100% of the reference mean. Since the results of the statistical background comparison indicated that concentrations of lead in crayfish and chromium in smallmouth bass were present below or equal to that of the Reference Area levels, these metals were not carried to the SLV comparison step. However, the high MDDs (greater than 100% of the reference mean) present an uncertainty with this finding.

To address the uncertainty with the results of the statistical background comparison, these metals were subjected to a risk-based screening evaluation. The purpose of this evaluation is to explore whether or not these metals should be included as CPECs, and ultimately advanced to the next level of RA or directly to the FS. A weight-of-evidence approach similar to the one implemented in Section 12 (ERA) was used to evaluate these metals (see Section O.3.1.2 for further detail regarding the general approach).

Lead in Crayfish

The ecological SLVs for tissue protective of upper trophic level fish and shellfish and aquatic-dependent birds and mammals presented in Appendix J were compared to the EPCs calculated for lead in crayfish (Table O.3-12). The MDD generated for lead in crayfish during the statistical background comparison is 108% (Table L-4). Concentrations of lead in Forebay crayfish range from 0.098 mg/kg to 2.66 mg/kg, and in crayfish from the Reference Area they range from 0.056 mg/kg to 1.55 mg/kg (Table L-4).

As shown in Table O.3-12, R_{BACs} (i.e., tissue EPC divided by bioaccumulation SLV) for lead are below one for all receptors. This finding is consistent with the results for all COIs in crayfish tissue evaluated in the Level II Screening presented in Section 12.5.4 of the main report (also see Tables N-51, N-53, and N-58). R_{BACs} for crayfish were the lowest of all the tissue types collected from the Forebay, and the sum R_{BACs} (estimate simultaneous exposure to multiple COIs) were also low. The sum R_{BACs} for crayfish were below one for predatory fish and shellfish that could consume crayfish (Table N-51) and for populations of aquatic-dependent mammals (Table N-58), such that if lead were included as a COI in the sum R_{BACs}, these values would remain low or below one. The sum R_{BACs} for individual aquatic-dependent birds that could consume crayfish is only slightly greater than 1.0 at 1.86 (Table N-53). Given the low sum R_{BACs} for crayfish and low R_{BACs} for lead in crayfish, adverse effects to receptors from the Forebay from exposure to lead in crayfish are not expected to occur.

Based on the low MDD, low R_{BACs} and sum R_{BACs}, and similarity between Forebay and Reference Area tissue concentrations, lead in Forebay crayfish is not recommended for further evaluation.

Chromium in Smallmouth Bass

Ecological SLVs for tissue protective of upper trophic level fish and shellfish and aquatic-dependent birds and mammals are not available for chromium (Table O.3-12). Therefore, R_{BACs} for chromium in smallmouth bass could not be calculated.

The MDD generated for chromium in bass during the statistical background comparison is 201% (Table L-4). Concentrations of chromium in Forebay bass range from 0.19 mg/kg to 0.86 mg/kg, and in bass from the Reference Area they range from 0.04 mg/kg to 7.15 mg/kg (Table L-4). The mean concentration of lead for the Forebay is 0.235 mg/kg, which is lower than yet similar to, the mean for the Reference Area (0.458 mg/kg) (Table O.3-12).

Sediment and other species in the Forebay were also analyzed for chromium: clams and crayfish. Concentrations of chromium in Forebay sediment and clams are less than concentrations from the Reference Area. Although chromium levels in crayfish were demonstrated to be elevated above Reference Area concentrations based on the statistical background comparison, the concentration ranges between the two areas are extremely similar: 0.2 to 1.2 for the Forebay and 0.12 to 1.23 for the Reference Area (Table L-4).

Based on the similarity between Forebay and Reference Area bass tissue concentrations, and all tissue types for that matter, chromium in Forebay bass is not recommended for further evaluation.

O.3.2.3 Selection and Use of SLVs

For the PAHs detected in tissue and sediment that do not have ATLs/CTLs), surrogate SLVs were selected. The ATL and CTL for pyrene were selected for individual HPAHs without SLVs and the ATL and CTL for fluoranthene were selected for individual LPAHs without SLVs. The ATL for pyrene protective of mammals is lower than the ATL for fluoranthene, so selection of pyrene ATL is conservative and does not underestimate risk for mammals. The CTL for pyrene protective of fish is higher than the CTL for fluoranthene. However, HPAHs would not be retained as CPECs for fish even if the CTL for fluoranthene was utilized instead. Therefore, risk to fish from HPAHs is not underestimated. Although fluoranthene is considered an HPAH in the RI, HHRA, and ERA and used to calculate Total HPAH, fluoranthene is more accurately a PAH that borders the two with a molecular weight more similar to HPAHs and but a structure more similar to LPAHs. Therefore, use of fluoranthene as a surrogate for LPAHs is appropriate in the absence of any LPAH ATLs/CTLs.

O.3.2.4 Updates to SLVs for Water

As part of the uncertainty assessment, updates to the agreed upon sources of SLVs were reviewed (Table O.3-13). The only medium for which updates were noted is surface water. DEQ's WQC protective of aquatic organisms (Oregon Administrative Rules, Section 340-041, new Table 20) (DEQ 2011) now appears to be more current than USEPA's NRWQC (2009) and DEQ's previous WQC tables. As shown in Table O.3-13, which only presents COIs that have updated water SLVs, seven of these 22 COIs have more stringent DEQ water SLVs. These updates will be considered upon further evaluation of Upland source control (i.e., groundwater discharging to surface water of the River), which may be included in the Level III baseline for the Upland OU or in a separate document. They will also be considered during future monitoring activities for the River OU if additional surface water data are collected. Furthermore, any

updates to other SLV sources (e.g., soil SLVs) will be considered during the Level III baseline for the Upland OU.

O.3.2.5 Absence of Direct Toxicity Evaluation for Birds and Mammals

Wildlife receptors do not "live in" sediment and are therefore do not spend much time in direct contact with sediments or surface water. Additionally, they are likely protected from direct toxicity exposure by their fur and feathers. In the absence of direct toxicity evaluation for birds and mammals, the direct toxicity evaluation for sediments and surface water using benthic invertebrates and aquatic organisms SLVs indirectly covers this pathway for wildlife. This minimizes the potential for risk to be underestimated from direct toxicity to ecological receptors.

O.4 Summary and Conclusions

The intentional conservatism of the COPC and CPEC selection process, as described in Sections 11 and 12 of the main report, resulted in the retention of COPCs/CPECs for many reasons including exceedances of SLVs in a single medium, multi-media exposure, and lack of SLVs. During this process, the uncertainties inherent in the COPC selection and RA process can result in over- or under-estimates of risk. Among the many sources of uncertainty described in this evaluation, only a few factors contributed to the addition of a small number of additional COPCs/CPECs. These factors included a few metals with high MDDs and some COPCs/CEPCs associated with mass-wasting and erodible soil pathways. The effect of the remaining sources of uncertainty generally tended towards overestimation of risk or, in a few cases, could lead to either overestimation or underestimation of risk.

In general, the data adequacy and quality for the Upland AOPCs is sufficient to provide for a defensible HHRA and ERA. Further evaluation is recommended for the COPCs/CPECs in the potentially erodible/mass wasting areas of the Upland OU due to their high toxicity ratios and potential for future contamination of the River. The attempt to optimize the probability of detecting the maximum concentrations at each AOPC with judgmental sampling and the use of undiluted groundwater results in the likelihood that the EPCs are overestimated.

The majority of SLVs utilized in the RAs are developed to be conservatively protective of human and ecological receptors. Bioaccumulative COIs that lacked dietary based SLVs in the Upland OU were retained as COPCs/CPECs for further evaluation for humans and wildlife. Bioaccumulation of COIs in soil is only a concern for ecological receptors in the Upland OU, and bioaccumulation of COIs in groundwater that could discharge to surface water of the River is a concern for both human and ecological receptors. The assumptions of 100% bioavailability/absorption of all COIs, the assumption of zero metabolism of COIs, and no adjustment for area/seasonal use are all conservative assumptions utilized in this screening assessment.

Selected metal COIs in the Upland OU that were originally eliminated as COPCs/CPECs based on the findings of the statistical background comparison presented in Section 8.0 of the main text were retained for further evaluation after a more rigorous assessment of these metals due to elevated MDDs. However, none of the COIs eliminated based on frequency of detection were found to present a significant uncertainty in the HHRA or ERA.

Considering the number of uncertainties and number of conservative assumptions applied throughout the RA process, the HHRA and ERA adequately assesses risk to human and ecological receptors and indicates the COPCs/CPECs, receptors, and media that warrant further evaluation, remediation, or monitoring.

- = not evaluated since chemical was not detected in this medium at detection frequency >5%
MDD = minimum detectable differences
mg/kg = milligram per kilogram
NA = not applicable
NE = Multi-media was not evaluated since the chemical is already identified as a COPC
UCL = upper confidence limit on the mean
UPL = upper prediction limit

Notes
Outdoor Worker hierarchical SLV selection for soil: 1. Minimum of DEQ Soil RBCs (Ingest Occupational and Volatilize Outdoor Occupational), 2. USEPA Soil Industrial RSL, and 3. Surrogate used as noted in Appendix J-4
Construction Worker hierarchical SLV selection for soil: 1. DEQ Soil RBCs (Direct Contact Construction,. 2. USEPA Soil Industrial RSL, and 3. Surrogate used as noted in Appendix J-4
Excavation Worker hierarchical SLV selection for soil: 1. DEQ Soil RBCs (Direct Contact Excavation), 2. USEPA Soil Industrial RSL, 3. Outdoor Worker SLV, and 4. Surrogate used as noted in Appendix J-4

Oregon Department of Environmental Quality (DEQ) 2003. Risk-Based Decision Making for the Remediation of Petroleum-Contaminated Sites. Land Quality Division, Environmental Cleanup and Tanks Program. September. Updated 20
United States Environmental Protection Agency 2010. Regional Screening Levels (RSL) for Chemical Contaminants at Superfund Sites. RSL Table Update. Ma

Footnotes
(1) The lower of the maximum detected concentration and the calculated 95% UCL (for COIs with at least 8 samples)
(2) The minimum of the soil SLVs was selected
(3) Due to the lack of speciation data, the chromium in soil were compared to the more conservative hexavalent chromium SLVs

COPC Selection
C/SLV = Site concentration divided by risk-based concentration where risk-based concentration equaled human health SLV
COPC selection process for human health follows the following criteria
[C/SLV] > 1.0 for an individual chemical in a given mediun
[Sum non-carcinogenic C/SLV] >1.0 and individual non-carcinogen [C/SLV] >0.1 for multiple chemicals in a given mediu
[Sum C/SLV] >1.0 for a single chemical in multiple medi
For carcinogens only, eliminated as COPC if individual [C/SLV] < 1.0 (DEQ, 2010a)

= Retained as a COPC
- = no data
AOPC = area of potential concern
COIs = chemicals of interest
C = concentration
c = carcinogen
COPC = chemical of potential concern
DEQ = Oregon Department of Environmental Quality
HH = human health
mg/kg = milligrams per kilogram
n = non-carcinogen
PAHs = polyaromatic hydrocarbons
PCBs = polychlorinated biphenyls
SLV = screening level value
SVOCs = semivolatile organic chemicals
ug/kg = micrograms per kilogram
UCL = 95% upper confidence limit
UPL = 95% Upper Prediction Limit

Notes
Only detected chemicals with a detection frequency greater than 5%, inorganics greater than reference, and are considered bioaccumulative (Appendix J-7) are shown in this table. Essential nutrients (calcium, magnesium, sodium, and potassium) are not included even if detected. Reporting limits for non-detected chemicals are evaluated separately.
The Landfill AOPC potentially erodible soil subset is comprised of the following samples: BIL01USE through BIL09USE, BIL13SSI, and L-01 through L-04.
Hierarchy was developed to determine Screening Levels Values for erodible soil against Sediment SLVs; 1. Minimum DEQ HH Bioaccumulative SLVs and 2. Surrogates used as noted in Appendix J-4e.
Oregon Department of Environmental Quality (DEQ) 2007. Guidance for Evaluation of Bioaccumulative Chemicals of Concern in Sediment. Final. January 31.
DEQ 2010a. Human Health Risk Assessment Guidance. Draft May 12.

Footnotes
(1) COIs were retained as COPCs if they met detection frequency (>5%), exceeded Reference UPL, exceeded HH SLV, and identified as bioaccumulative. See Section O.2.1.
(2) Reference Sediment 95% Upper Prediction Limit (UPL) was used as the Selected HH SLV; see Appendix I-20a, Sediment.
(3) In the absence of a Reference Sediment 95% UPL for the HH SLV, the freshwater inorganic background suggested by DEQ was used (DEQ 2007)
(4) Fluoranthene was used as a surrogate because there was no chemical specific SLV and fluoranthene had the lowest SLV of the low Molecular Weight PAHs.

COPC Selection
C/SLV = Site concentration divided by risk-based concentration where risk-based concentration equaled human health SLV
Sum non-carcinogenic C/SLV (HI) = summation of C/SLV of all non-carcinogens. Lead not included in summation because evaluated seperately.
Sum carcinogenic C/SLV = summation of C/SLV of all carcinogens. Total aroclors, rather than individual aroclors, was used in the summation.
Ratios for SLVs based on Reference Upper Prediction Limits (UPLs) are not included in sum totals.
COPC selection process for human health follows the following criteria. Chemicals are included as COPCs if inorganic site concentration exceeds reference and under the following condition:
[C/SLV] > 1.0 for an individual chemical in a given medium

Residual Range Organics	n	100%	232	-	-	N	Evaluated as VOCs

= Retained as a COPC
- = no data
AOPC = area of potential concern
COIs = chemicals of interest
C = concentration
c = carcinogen
COPC = chemical of potential concern
DEQ = Oregon Department of Environmental Quality
HH = human health
mg/kg = milligrams per kilogram
n = non-carcinogen
PCBs = polychlorinated biphenyls
SLV = screening level value
TPH = total petroleum hydrocarbon
ug/kg = micrograms per kilogram
UCL = 95% upper confidence limit
UPL = 95% Upper Prediction Limit

Notes
Only detected chemicals with a detection frequency greater than 5%, inorganics greater than reference, and are considered bioaccumulative (Appendix J-7) are shown in this table. Essential nutrients (calcium, magnesium, sodium, and potassium) are not included even if detected. Reporting limits for non-detected chemicals are evaluated separately.
The entire Bulb Slope AOPC is potentially
Hierarchy was developed to determine Screening Levels Values for erodible soil against Sediment SLVs; 1. Minimum DEQ HH Bioaccumulative SLVs and 2. Surrogates used as noted in Appendix J
Oregon Department of Environmental Quality (DEQ) 2007. Guidance for Evaluation of Bioaccumulative Chemicals of Concern in Sediment. Final. January 31.
DEQ 2010a. Human Health Risk Assessment Guidance. Draft May 12.

Footnotes
(1) COIs were retained as COPCs if they met detection frequency (>5%), exceeded Reference UPL, exceeded HH SLV, and identified as bioaccumulative. See Section O.2.1.
(2) Reference Sediment 95% Upper Prediction Limit (UPL) was used as the Selected HH SLV; see Appendix I-20a, Sediment.

COPC Selection
C/SLV = Site concentration divided by risk-based concentration where risk-based concentration equaled human health SLV
Sum non-carcinogenic C/SLV (HI) = summation of C/SLV of all non-carcinogens. Lead not included in summation because evaluated separately.

Table O.2-6
Identification of COPCs in Soil at Bulb Slope AOPC
Bradford Island -Upland Operable Unit
(2 of 2)

Sum carcinogenic C/SLV = summation of C/SLV of all carcinogens. Total aroclors, rather than individual aroclors, was used in the summation.
Ratios for SLVs based on Reference Upper Prediction Limits (UPLs) are not included in sum totals.
COPC selection process for human health follows the following criteria. Chemicals are included as COPCs if inorganic site concentration exceeds reference and under the following condition:
[C/SLV] > 1.0 for an individual chemical in a given medium

Table O.2-7
Human Health Risk-Based Screening for Metals with High MDDs - Bradford Island - River Operable Unit
(1 of 1)

Medium	Chemicals of Interest	note	Lower of Maximum and 95% UCL (1)	Site-Specific Reference UPL	Selected Screening Level Values (SLV) in mg/kg (Table J-4f)		Site concentration (C)/SLV (2)			Should COI be considered further as a COPC?	Rationale
					Subsistence Fisher	Recreational Fisher	$\frac{C_{tissue}}{SLV_{tissue}}$	$\frac{C_{sw}}{SLV_{sw}}$ (Potable Water User Table M-39)	Multimedia (direct contact) $sum(C/SLV_{tissue}+C/SLV_{sw})$		
Crayfish	Lead	n	0.925	1.14	0.5	0.5	1.85	0.0117	1.86	Yes	C/SLV >1
Smallmouth Bass	Chromium	c	0.302	7.15	20 (3)	20 (3)	0.0151	-	0.0151	No	carc C/SLV <1

= Retained as a COPC
- = not evaluated since chemical was not detected in this medium at detection frequency >5%
MDD = minimum detectable differences
mg/kg = milligram per kilogram wet weight
UCL = upper confidence limit on the mean
UPL = upper prediction limit

Notes
Potable Water User hierarchy was developed to determine Screening Levels Values for surface water; 1. Minimum of DEQ Groundwater RBCs (Ingest Residential, Ingest Occupational, Volatilize Outdoor, Vapor Intrusion, Excavation), 2. USEPA tapwater RSLs, 3. DEQ MCLs, 4. Surrogates used as noted in Appendix J-4b.
Subsitence Fisher hierarchy was developed to determine Screening Levels Values for Tissue; 1. Minimum of DEQ HH Bioaccumulative ATLs (human subsistence/tribal) (Appendix J-4f).
Recreational Fisher hierarchy was developed to determine Screening Levels Values for Tissue; 1. Minimum of DEQ HH Bioaccumulative ATLs (human general/recreational) (Appendix J-4f).

DEQ 2007. Guidance for Evaluation of Bioaccumulative Chemicals of Concern in Sediment. Final. January 31.
DEQ 2010a. Human Health Risk Assessment Guidance. Draft May 12.
DEQ 2010b. Maximum Contaminant Level. Accessed online in January 2010 at: http://www.oregon.gov/DHS/ph/dwp/docs/pwsrules/61-0030.pdf
USEPA 2010. Regional Screening Levels (RSL) for Chemical Contaminants at Superfund Sites. RSL Table Update. May.

Footnotes
(1) The lower of the maximum detected concentration and the calculated 95% UCL (for COIs with at least 8 samples).
(2) The minimum of the SLVs was selected.
(3) SLVs were calculated ATLs using DEQ Methodology (DEQ 2007); see Section 11.3.4.1.1 and Appendix J-2.

COPC Selection
C/SLV = Site concentration divided by risk-based concentration where risk-based concentration equaled human health SLV
COPC selection process for human health follows the following criteria:
[C/SLV] > 1.0 for an individual chemical in a given medium
[Sum non-carcinogenic C/SLV] >1.0 and individual non-carcinogen [C/SLV] >0.1 for multiple chemicals in a given medium
[Sum C/SLV] >1.0 for a single chemical in multiple media
For carcinogens only, eliminated as COPC if individual [C/SLV] < 1.0 (DEQ, 2010a).

AOPC = area of potential concern
CPEC = chemical of potential ecological concern
COI = chemical of interest
Eco-SSL = ecological soil screening level
EPC = exposure point concentration
ft = feet
MDD = minimum detectable difference
mg/kg = milligrams per kilogram
NE = Not evaluated (only wide-ranging receptors are evaluated for all four AOPCs combined)
SLV = screening level value
T&E = threatened and endangered
UCL = upper confidence limit on the mean
UPL = upper prediction limit
- - = not applicable

(1) The lower of the maximum detected concentration and the calculated 95% UCL.

Hierarchy of SLV Selection (see Appendix J-5a)
For metals only, the higher of the Reference Area 95% UPL and the hierarchical SLV was selected.

(2) United States Environmental Protection Agency (USEPA), 2005 -2007. Ecological Soil Screening Levels. U.S. Environmental Protection Agency Office of Solid Waste and Emergency Response. OSWER Directive 9285.7-72. Last Update July 2007.

Bioaccumulative COIs in a Given Media
Any individual COI in any given media with Tij > Q, where Tij = Cij/SLVij, must be identified as a CPEC.
Where: Cij = concentration of contaminant *i* in medium *j*
SLVij = Level II Screening Level Value from DEQ for contaminant *i* in medium *j* .
Tij = Risk ratios for contaminant *i* in medium *j*
Q = Receptor designator
Assumptions: Cij = Maximum concentration for plants and invertebrates; Lower of 95% UCL and maximum concentration for wildlife species (birds and mammals).
(7) Receptor designator (Q) as defined in DEQ guidance (1998):
Q = 1 for terrestrial T&E species and all aquatic species
Q = 5 for all common terrestrial species
For this project, Q = 1 for terrestrial plants, soil invertebrates, and birds; Q = 5 for mammals. Although no T&E plant or soil invertebrates species are potentially present, Q = 1 applied for these receptor groups at request of DEQ due to basis of SLVs (Eco-SSLs).

-- = Not applicable/evaluated
BHC = hexachlorocyclohexane
ft = feet
Max = maximum
mg/kg = milligrams per kilogram
mg/L = milligrams per liter
Min = minimum
No. = number
NV = No value
SVOC = semi-volatile organic carbon
ug/kg = micrograms per kilogram
ug/L = micrograms per liter
VOC = volatile organic carbon
Yes-Bio = Identified as potential CPEC because COI is bioaccumulative but SLV is does not account for bioaccumulation or there is no SLV

[a] 1,1,1-Trichloroethane (TCA) was detected at a frequency greater than 5% in soils from 0 to 1 foot bgs and groundwater, but less than 5% in soils from 0 to 3 feet bgs.

[b] trans-1,2-Dichloroethene was detected at a frequency greater than 5% in groundwater, but less than 5% in soils from 0 to 3 feet bgs (not detected at all in soils from 0 to 1 foot bgs).

This table only includes COIs detected > 5% and above the reference area (metals only).
CPEC = chemical of potential ecological concern
COI = chemical of interest
HPAH = high molecular weight polycyclic aromatic hydrocarbons
KM, capped = Kaplan–Meier-based with Efron's bias correction, capped
LPAH = low molecular weight polycyclic aromatic hydrocarbons
MDL = method detection limit
NA = not available
ND = non detect
SLV = screening level value
T&E = threatened and endangered
- - = not applicable

The Landfill AOPC potentially erodible soil subset is comprised of the following samples: BIL01USE through BIL09USE, BIL13SSI, and L-01 through L-04.

The Sandblast Area AOPC potentially erodible soil subset is comprised of the following samples: SB-EUA, SB-EUB, SB-EUA-02, SB-EUA-04, SB-EUA-06, SB-EUA-08, SB-EUB-02, SB-EUB-03, SB-EUB-12, SB-EUB-15, and SB-04.

The entire Bulb Slope AOPC is potentially erodible.
(1) The greater of the site-specific reference 95% UPL concentration (inorganics only) and the DEQ Level II SLV (see Appendix J-5c):

Oregon Department of Environmental Quality (DEQ), 1998. Guidance for Ecological Risk Assessment: Levels I, II, III, IV. Waste Management and Cleanup Division. Final. April. Updated December 2001.

Individual COIs in a Given Medium
(2) Any individual COI in any given medium with Tij > Q, where Tij = Cij/SLVij, must be identified as a CPEC.
Where: Cij = concentration of contaminant *i* in medium *j*
SLVij = Level II Screening Level Value from DEQ for contaminant *i* in medium *j*.
Tij = Risk ratios for contaminant *i* in medium *j*
Q = Receptor designator
Assumptions: Cij = Maximum detected concentration for immobile species (plants and invertebrates).
Q = 1 for terrestrial T&E species and all aquatic species
Q = 5 for all common terrestrial species

Bulb Slope	Residual Range Organics	0-1 ft	410	NA	- -	- -	- -	Yes - No SLV

This table only includes COIs detected > 5% and above the reference area (metals only).
CPEC = chemical of potential ecological concern
COI = chemical of interest
NA = not available
SLV = screening level value
T&E = threatened and endangered
- - = not applicable

The Landfill AOPC potentially erodible soil subset is comprised of the following samples: BIL01USE through BIL09USE, BIL13SSI, and L-01 through L-04.

The Sandblast Area AOPC potentially erodible soil subset is comprised of the following samples: SB-EUA, SB-EUB, SB-EUA-02, SB-EUA-04, SB-EUA-06, SB-EUA-08, SB-EUB-02, SB-EUB-03, SB-EUB-12, SB-EUB-15, and SB-04.
The entire Bulb Slope AOPC is potentially erodible.

(1) The greater of the site-specific reference 95% UPL concentration (inorganics only) and the DEQ Level II SLV (see Appendix J-5c):

Oregon Department of Environmental Quality (DEQ), 1998. Guidance for Ecological Risk Assessment: Levels I, II, III, IV. Waste Management and Cleanup Division. Final. April. Updated December 2001.

Multiple COIs Simultaneously within a Given Medium
(2) COIs with Tij/Tj values >= 1/Nij*Q must be retained as a CPEC, provided Tj>Q.
Where: Tij = toxicity ratio for contaminant *i* in medium *j* = chemical specific
Q = Receptor designator
Landfill AOPC Mass Wasting Soil Subset
Nij = total number of *i* contaminants in medium *j* = 36
Tj (LF) = sum of toxicity ratios for all contaminants in medium *j* = 1697
Sandblast AOPC Erodible Soil Subset
Nij = total number of *i* contaminants in medium *j* = 29
Tj (SB) = sum of toxicity ratios for all contaminants in medium *j* = 686
Bulb Slope Mass Wasting Soil Subset
Nij = total number of *i* contaminants in medium *j* = 3
Tj (BS) = sum of toxicity ratios for all contaminants in medium *j* = 60.1

Tj is the sum of the individual toxicity ratio (Tij) for individual metals, pesticides (except Total DDTs was used instead of the individual DDT isomers), individual PCBs as Aroclors, VOCs, SVOCs, and individual PAHs.
Assumptions: Cij = Maximum detected concentration for immobile species (plants and invertebrates).
Q = 1 for terrestrial T&E species and all aquatic species
Q = 5 for all common terrestrial species

This table only includes COIs detected > 5% and above the reference area (metals only).
CPEC = chemical of potential ecological concern
COI = chemical of interest
HPAH = high molecular weight polycyclic aromatic hydrocarbons
KM, capped = Kaplan–Meier-based with Efron's bias correction, capped
LPAH = low molecular weight polycyclic aromatic hydrocarbons
MDL = method detection limit
NA = not available
ND = non detect
SLV = screening level value
UCL = upper confidence limit on the mean
Yes-Bio = Identified as potential CPEC because COI is bioaccumulative but SLV is does not account for bioaccumulation or there is no SLV
- - = not applicable

Table O.3-6
Identification of Bioaccumulative CPECs in Mass Wasting and Erodible Soil at Upland OU - Individual COIs for Fish Shellfish
Bradford Island - Upland Operable Unit
(4 of 5)

AOPC	Chemicals of Interest	Depth Category (Soil)	Lower of Maximum and 95% UCL (1)	Sediment SLVs for Freshwater Fish Exposed to Erodible Soil (2)	Toxicity Ratio for Fish & Shellfish (R_{Bac})	Is COI Bioaccum-ulative?	SLV Accounts for Bioaccum-ulation?	COI is Identified as a Bioaccumulative CPEC? (3)

The Landfill AOPC potentially erodible soil subset is comprised of the following samples: BIL01USE through BIL09USE, BIL13SSI, and L-01 through L-04.

Table O.3-6
Identification of Bioaccumulative CPECs in Mass Wasting and Erodible Soil at Upland OU - Individual COIs for Fish Shellfish
Bradford Island - Upland Operable Unit
(5 of 5)

AOPC	Chemicals of Interest	Depth Category (Soil)	Lower of Maximum and 95% UCL (1)	Sediment SLVs for Freshwater Fish Exposed to Erodible Soil (2)	Toxicity Ratio for Fish & Shellfish (R_{Bac})	Is COI Bioaccum-ulative?	SLV Accounts for Bioaccum-ulation?	COI is Identified as a Bioaccumulative CPEC? (3)

The Sandblast Area AOPC potentially erodible soil subset is comprised of the following samples: SB-EUA, SB-EUB, SB-EUA-02, SB-EUA-04, SB-EUA-06, SB-EUA-08, SB-EUB-02, SB-EUB-03, SB-EUB-12, SB-EUB-15, and SB-04.
The entire Bulb Slope AOPC is potentially erodible.
(1) The lower of the maximum detected concentration and the calculated 95% UCL for COIs with at least 8 samples was used.
(2) The greater of the site-specific reference 95% UPL concentration (inorganics only) and the bioaccumulative freshwater fish SLVs from (see Appendix J-5d):
In the absence of a site-specific reference UPL for selenium, the freshwater inorganic background concentration suggested by DEQ was used (DEQ 2007).
Oregon Department of Environmental Quality (DEQ), 2007. Guidance for Assessing Bioaccumulative Chemicals of Concern in Sediment. Land Quality Division. Final. April 3.

Bioaccumulative COIs in a Given Medium
(3) Any individual COI in any given medium with RBac > 0.1 and Sum RBac > 1, where RBac = Cij/SLVij, must be identified as a CPEC.
Where: Cij = concentration of contaminant *i* in medium *j*
SLVij = Level II Screening Level Value from DEQ for contaminant *i* in medium *j* .
R_{Bac} = bioaccumulation index for an individual COI
Sum R_{Bac} = Cumulative Bioaccumulation Index for all COIs

(4) The SLV for Fluoranthene was used as a surrogate for the individual LPAHs without SLVs. Fluoranthene is considered an HPAH in the RI, HHRA, and ERA and used to calculate Total HPAH; however, fluoranthene is more accurately a PAH that borders the two with a molecular weight more similar to HPAHs and but a structure more similar to LPAHs. Therefore, use of fluoranthene as a surrogate for LPAHs is appropriate in the absence of any LPAH SLVs.
(5) The SLV for pyrene was used as a surrogate for the individual HPAHs without SLVs.
(6) The Sum R_{Bac} is the sum of the R_{Bac} for Total PCBs as Aroclors and the individual metals, butyltins, PAHs, and pesticides (except Total DDTs was used instead of the individual DDT isomers).

					Landfill Sum R_{Bac}^4 =	285		
					Sandblast Area Sum R_{Bac}^4 =	174		
					Bulb Slope Sum R_{Bac}^4 =	82.2		

This table only includes COIs detected > 5% and above the reference area (metals only).
CPEC = chemical of potential ecological concern
COI = chemical of interest
HPAH = high molecular weight polycyclic aromatic hydrocarbons
KM, capped = Kaplan–Meier-based with Efron's bias correction, capped
LPAH = low molecular weight polycyclic aromatic hydrocarbons
MDL = method detection limit
NA = not available
ND = non detect
SLV = screening level value
UCL = upper confidence limit on the mean
Yes-Bio = Identified as potential CPEC because COI is bioaccumulative but SLV is does not account for bioaccumulation or there is no SLV
- - = not applicable

The Landfill AOPC potentially erodible soil subset is comprised of the following samples: BIL01USE through BIL09USE, BIL13SSI, and L-01 through L-04.

The Sandblast Area AOPC potentially erodible soil subset is comprised of the following samples: SB-EUA, SB-EUB, SB-EUA-02, SB-EUA-04, SB-EUA-06, SB-EUA-08, SB-EUB-02, SB-EUB-03, SB-EUB-12, SB-EUB-15, and SB-04.
The entire Bulb Slope AOPC is potentially erodible.
(1) The lower of the maximum detected concentration and the calculated 95% UCL for COIs with at least 8 samples was used.

Table O.3-7

AOPC	Chemicals of Interest	Depth Category (Soil)	Lower of Maximum and 95% UCL (1)	Sediment SLVs for Individual Birds Exposed to Erodible Soil (2)	Toxicity Ratio for Birds (R_{Bac})	Is COI Bioaccum-ulative?	SLV Accounts for Bioaccum-ulation?	COI is Identified as a Bioaccumulative CPEC? (3)

(2) The greater of the site-specific reference 95% UPL concentration (inorganics only) and the bioaccumulative bird (individual) SLVs from (see Appendix J-5c):

In the absence of a site-specific reference UPL for selenium, the freshwater inorganic background concentration suggested by DEQ was used (DEQ 2007).

Oregon Department of Environmental Quality (DEQ), 2007. Guidance for Assessing Bioaccumulative Chemicals of Concern in Sediment. Land Quality Division. Final. April 3.

Bioaccumulative COIs in a Given Medium

(3) Any individual COI in any given medium with RBac > 0.1 and Sum RBac > 1, where RBac = Cij/SLVij, must be identified as a CPEC.

Where: Cij = concentration of contaminant *i* in medium *j*

SLVij = Level II Screening Level Value from DEQ for contaminant *i* in medium *j*.

R_{Bac} = bioaccumulation index for an individual COI

Sum R_{Bac} = Cumulative Bioaccumulation Index for all COIs

(4) The Sum R_{Bac} is the sum of the R_{Bac} for Total PCBs as Aroclors and the individual metals, butyltins, and pesticides (except Total DDTs was used instead of the individual DDT isomers).

					Landfill Sum R_{Bac}^4 =	91.7		
					Sandblast Area Sum R_{Bac}^4 =	57.2		
					Bulb Slope Sum R_{Bac}^4 =	25.7		

This table only includes COIs detected > 5% and above the reference area (metals only).
CPEC = chemical of potential ecological concern
COI = chemical of interest
HPAH = high molecular weight polycyclic aromatic hydrocarbons
KM, capped = Kaplan–Meier-based with Efron's bias correction, capped
LPAH = low molecular weight polycyclic aromatic hydrocarbons
MDL = method detection limit
NA = not available
ND = non detect
SLV = screening level value
UCL = upper confidence limit on the mean
Yes-Bio = Identified as potential CPEC because COI is bioaccumulative but SLV is does not account for bioaccumulation or there is no SLV
- - = not applicable

The Landfill AOPC potentially erodible soil subset is comprised of the following samples: BIL01USE through BIL09USE, BIL13SSI, and L-01 through L-04.

The Sandblast Area AOPC potentially erodible soil subset is comprised of the following samples: SB-EUA, SB-EUB, SB-EUA-02, SB-EUA-04, SB-EUA-06, SB-EUA-08, SB-EUB-02, SB-EUB-03, SB-EUB-12, SB-EUB-15, and SB-04.
The entire Bulb Slope AOPC is potentially erodible.
(1) The lower of the maximum detected concentration and the calculated 95% UCL for COIs with at least 8 samples was used.

Table O.3-8
Identification of Bioaccumulative CPECs in Mass Wasting and Erodible Soil at Upland OU - Individual COIs for Birds (Population)
Bradford Island - Upland Operable Unit
(4 of 4)

AOPC	Chemicals of Interest	Depth Category (Soil)	Lower of Maximum and 95% UCL (1)	Sediment SLVs for Bird Populations Exposed to Erodible Soil (2)	Toxicity Ratio for Birds (R_{Bac})	Is COI Bioaccum-ulative?	SLV Accounts for Bioaccum-ulation?	COI is Identified as a Bioaccumulative CPEC? (3)

(2) The greater of the site-specific reference 95% UPL concentration (inorganics only) and the bioaccumulative bird (population) SLVs from (see Appendix J-5c):

In the absence of a site-specific reference UPL for selenium, the freshwater inorganic background concentration suggested by DEQ was used (DEQ 2007).

Oregon Department of Environmental Quality (DEQ), 2007. Guidance for Assessing Bioaccumulative Chemicals of Concern in Sediment. Land Quality Division. Final. April 3.

Bioaccumulative COIs in a Given Medium

(3) Any individual COI in any given medium with RBac > 0.1 and Sum RBac > 1, where RBac = Cij/SLVij, must be identified as a CPEC.

Where: Cij = concentration of contaminant *i* in medium *j*

SLVij = Level II Screening Level Value from DEQ for contaminant *i* in medium *j* .

R_{Bac} = bioaccumulation index for an individual COI

Sum R_{Bac} = Cumulative Bioaccumulation Index for all COIs

(4) The Sum R_{Bac} is the sum of the R_{Bac} for Total PCBs as Aroclors and the individual metals, butyltins, and pesticides (except Total DDTs was used instead of the individual DDT isomers).

					Landfill Sum R_{Bac}[6] =	36.5		
					Sandblast Area Sum R_{Bac}[6] =	29.5		
					Bulb Slope Sum R_{Bac}[6] =	26.9		

This table only includes COIs detected > 5% and above the reference area (metals only).
CPEC = chemical of potential ecological concern
COI = chemical of interest
HPAH = high molecular weight polycyclic aromatic hydrocarbons
KM, capped = Kaplan–Meier-based with Efron's bias correction, capped
LPAH = low molecular weight polycyclic aromatic hydrocarbons
MDL = method detection limit
NA = not available
ND = non detect
SLV = screening level value
UCL = upper confidence limit on the mean
Yes-Bio = Identified as potential CPEC because COI is bioaccumulative but SLV is does not account for bioaccumulation or there is no SLV
- - = not applicable

Table O.3-9
Identification of Bioaccumulative CPECs in Mass Wasting and Erodible Soil at Upland OU - Individual COIs for Mammals (Individual)
Bradford Island - Upland Operable Unit
(4 of 5)

AOPC	Chemicals of Interest	Depth Category (Soil)	Lower of Maximum and 95% UCL (1)	Sediment SLVs for Individual Mammals Exposed to Erodible Soil (2)	Toxicity Ratio for Mammals (R_{Bac})	Is COI Bioaccum-ulative?	SLV Accounts for Bioaccum-ulation?	COI is Identified as a Bioaccumulative CPEC? (3)

The Landfill AOPC potentially erodible soil subset is comprised of the following samples: BIL01USE through BIL09USE, BIL13SSI, and L-01 through L-04.

Table O.3-9
Identification of Bioaccumulative CPECs in Mass Wasting and Erodible Soil at Upland OU - Individual COIs for Mammals (Individual)
Bradford Island - Upland Operable Unit
(5 of 5)

AOPC	Chemicals of Interest	Depth Category (Soil)	Lower of Maximum and 95% UCL (1)	Sediment SLVs for Individual Mammals Exposed to Erodible Soil (2)	Toxicity Ratio for Mammals (R_{Bac})	Is COI Bioaccum-ulative?	SLV Accounts for Bioaccum-ulation?	COI is Identified as a Bioaccumulative CPEC? (3)

The Sandblast Area AOPC potentially erodible soil subset is comprised of the following samples: SB-EUA, SB-EUB, SB-EUA-02, SB-EUA-04, SB-EUA-06, SB-EUA-08, SB-EUB-02, SB-EUB-03, SB-EUB-12, SB-EUB-15, and SB-04. The entire Bulb Slope AOPC is potentially erodible.

(1) The lower of the maximum detected concentration and the calculated 95% UCL for COIs with at least 8 samples was used.

(2) The greater of the site-specific reference 95% UPL concentration (inorganics only) and the bioaccumulative mammalian (individual) SLVs from (see Appendix J-5c):

In the absence of a site-specific reference UPL for selenium, the freshwater inorganic background concentration suggested by DEQ was used (DEQ 2007).

Oregon Department of Environmental Quality (DEQ), 2007. Guidance for Assessing Bioaccumulative Chemicals of Concern in Sediment. Land Quality Division. Final. April 3.

Bioaccumulative COIs in a Given Medium

(3) Any individual COI in any given medium with RBac > 0.1 and Sum RBac > 1, where RBac = Cij/SLVij, must be identified as a CPEC.

Where: Cij = concentration of contaminant *i* in medium *j*

SLVij = Level II Screening Level Value from DEQ for contaminant *i* in medium *j*.

R_{Bac} = bioaccumulation index for an individual COI

Sum R_{Bac} = Cumulative Bioaccumulation Index for all COIs

(4) The SLV for Fluoranthene was used as a surrogate for the individual LPAHs without SLVs. Fluoranthene is considered an HPAH in the RI, HHRA, and ERA and used to calculate Total HPAH; however, fluoranthene is more accurately a PAH that borders the two with a molecular weight more similar to HPAHs and but a structure more similar to LPAHs. Therefore, use of fluoranthene as a surrogate for LPAHs is appropriate in the absence of any LPAH SLVs.

(5) The SLV for pyrene was used as a surrogate for the individual HPAHs without SLVs.

(6) The Sum R_{Bac} is the sum of the R_{Bac} for Total PCBs as Aroclors and the individual metals, butyltins, and pesticides (except Total DDTs was used instead of the individual DDT isomers).

					Bulb Slope Sum R_{Bac}[6] =	25.8		

This table only includes COIs detected > 5% and above the reference area (metals only).
CPEC = chemical of potential ecological concern
COI = chemical of interest
HPAH = high molecular weight polycyclic aromatic hydrocarbons
KM, capped = Kaplan–Meier-based with Efron's bias correction, capped
LPAH = low molecular weight polycyclic aromatic hydrocarbons
MDL = method detection limit
NA = not available
ND = non detect
SLV = screening level value
UCL = upper confidence limit on the mean
Yes-Bio = Identified as potential CPEC because COI is bioaccumulative but SLV is does not account for bioaccumulation or there is no SLV
- - = not applicable

Table O.3-10
Identification of Bioaccumulative CPECs in Mass Wasting and Erodible Soil at Upland OU - Mammals (Population)
Bradford Island - Upland Operable Unit
(4 of 5)

AOPC	Chemicals of Interest	Depth Category (Soil)	Lower of Maximum and 95% UCL (1)	Sediment SLVs for Mammal Populations Exposed to Erodible Soil (2)	Toxicity Ratio for Mammals (R_{Bac})	Is COI Bioaccum-ulative?	SLV Accounts for Bioaccum-ulation?	COI is Identified as a Bioaccumulative CPEC? (3)

The Landfill AOPC potentially erodible soil subset is comprised of the following samples: BIL01USE through BIL09USE, BIL13SSI, and L-01 through L-04.

Table O.3-10
Identification of Bioaccumulative CPECs in Mass Wasting and Erodible Soil at Upland OU - Mammals (Population)
Bradford Island - Upland Operable Unit
(5 of 5)

AOPC	Chemicals of Interest	Depth Category (Soil)	Lower of Maximum and 95% UCL (1)	Sediment SLVs for Mammal Populations Exposed to Erodible Soil (2)	Toxicity Ratio for Mammals (R_{Bac})	Is COI Bioaccum-ulative?	SLV Accounts for Bioaccum-ulation?	COI is Identified as a Bioaccumulative CPEC? (3)

The Sandblast Area AOPC potentially erodible soil subset is comprised of the following samples: SB-EUA, SB-EUB, SB-EUA-02, SB-EUA-04, SB-EUA-06, SB-EUA-08, SB-EUB-02, SB-EUB-03, SB-EUB-12, SB-EUB-15, and SB-04. The entire Bulb Slope AOPC is potentially erodible.

(1) The lower of the maximum detected concentration and the calculated 95% UCL for COIs with at least 8 samples was used.

(2) The greater of the site-specific reference 95% UPL concentration (inorganics only) and the bioaccumulative mammalian (population) SLVs from (see Appendix J-5c):

In the absence of a site-specific reference UPL for selenium, the freshwater inorganic background concentration suggested by DEQ was used (DEQ 2007).

Oregon Department of Environmental Quality (DEQ), 2007. Guidance for Assessing Bioaccumulative Chemicals of Concern in Sediment. Land Quality Division. Final. April 3

Bioaccumulative COIs in a Given Medium

(3) Any individual COI in any given medium with RBac > 0.1 and Sum RBac > 1, where RBac = Cij/SLVij, must be identified as a CPEC.

Where: Cij = concentration of contaminant *i* in medium *j*

SLVij = Level II Screening Level Value from DEQ for contaminant *i* in medium *j* .

R_{Bac} = bioaccumulation index for an individual COI

Sum R_{Bac} = Cumulative Bioaccumulation Index for all COIs

(4) The SLV for Fluoranthene was used as a surrogate for the individual LPAHs without SLVs. Fluoranthene is considered an HPAH in the RI, HHRA, and ERA and used to calculate Total HPAH; however, fluoranthene is more accurately a PAH that borders the two with a molecular weight more similar to HPAHs and but a structure more similar to LPAHs. Therefore, use of fluoranthene as a surrogate for LPAHs is appropriate in the absence of any LPAH SLVs.

(5) The SLV for pyrene was used as a surrogate for the individual HPAHs without SLVs.

(6) The Sum R_{Bac} is the sum of the R_{Bac} for Total PCBs as Aroclors and the individual metals, butyltins, and pesticides (except Total DDTs was used instead of the individual DDT isomers).

Table O.3-11
Summary of Upland OU Bioaccumulative COIs that Lacked Dietary-based SLVs
Bradford Island - Upland Operable Unit
(1 of 1)

Butyltins	Pesticides	VOCs	SVOCs

APPENDIX P

RESPONSES TO DEQ COMMENTS ON THE DRAFT REMEDIAL INVESTIGATION REPORT

Comment Number	Comments by Jennifer Peterson, Paul Seidel and Bob Schwarz, DEQ Cleanup Program April 22, 2011	US Army Corps of Engineers Response/Action Taken
General Comments		
1.	**Slope stability near the landfill.** As DEQ has mentioned previously, we are concerned about the findings in a May 2001 draft document by URS entitled, Draft *Geotechnical Design report, North Slope Regrade and Stabilization, Bradford Island Landfill.* Of particular interest are the following: - **Page 1-1, paragraph 1:** URS states that the purpose of the report is "to evaluate the stability of the slope north of the landfill and prepare a geotechnical design for regrading and stabilizing the slope." [This statement indicates that at the time, the need to regrade this slope was considered a foregone conclusion.] - **Page 4-2:** Table 1 on this page shows that even if the slope were reduced to 2:1 (horizontal to vertical), the factor of safety would be only 1.4, less than the recommended 1.5. This analysis did not consider seismic effects. Both Table 1 and Table 3 (which considers seismic effects) suggest that the slope should be reduced to 2.5:1. [As noted on in section 5.2.1.3 of the draft RI report, slopes on this part of the island are greater than 1:1.] The draft RI report discusses this issue in sections 5.2.1.3, 9.1.1 and 13.1. The draft RI report states qualitatively that "mass wasting" is possible but that the risk is low. This issue is also discussed in the following two URS documents: - January 19, 2007 draft memorandum: *Upland Source Evaluation – Bradford Island Landfill, Bulb Slope and Site 7,* - August 9, 2007, memorandum: *Upland Source Evaluation - Bradford Island Landfill.* Again, the discussions in these documents are qualitative. We are concerned that the project record includes a 2001 report containing a quantitative geotechnical analysis indicating that the slope is unstable and discussing measures to be taken to make it stable. And then the issue appears to be dropped. If the 2001 study is incorrect, a quantitative rebuttal needs to be (cont'd)	Comment noted. The May 2001 Draft *Geotechnical Design report, North Slope Regrade and Stabilization, Bradford Island Landfill* was not completed as a Final Report in 2001. The Portland District instead decided to investigate the potential for contamination to reside in the Landfill area where the geotechnical work was conducted. Based on the findings of the Draft Final *Upland and River Operable Units Remedial Investigation Report, Bradford Island Cascade Locks, Oregon,* "The majority of the ground surface at the Landfill AOPC is relatively flat, well vegetated, and shows minimal evidence of surface runoff, soil erosion, or sediment deposition, indicating that the ground surface is stable and there is minimal potential for off-site migration of contaminated soil or buried debris. The north and east sides of the Landfill AOPC include steep slopes leading down to the Columbia River. Although the potential for mass wasting appears low, soil on these slopes has the potential to migrate to the Columbia River via mass wasting." The recommendation for the Landfill AOPC presented in Section 13.7 of the draft final Remedial Investigation report (RI) was: "Based on the screening level risk assessments at the Landfill AOPC, implementation of one of two options is recommended: 1. Perform a feasibility study (FS) to identify targeted soil removal or other remedial actions which will decrease residual concentrations to acceptable risk levels or 2. Perform a site-specific BHHRA and a Level III BERA to determine if risks to human and ecological receptors are unacceptable. " For the Upland AOPCs the Portland District is planning to perform option 2 above and perform a site-specific BHHRA and a Level III BERA to determine if risks to human and ecological receptors are unacceptable. Further evaluation of the mass wasting and erosion pathways from Upland soils to the River will be performed in the BHHRA and Level III BERA because chemicals of potential concern (COPCs) were identified for these exposure pathways in the screening-level human and ecological risk assessments that were presented in (cont'd)

1. (cont'd)	(cont'd) presented showing why it is incorrect. The draft RI suggests that, if a massive slope failure were to occur and a large portion of the landfill were to end up in the Columbia River, contaminant levels in the waste are not high enough to cause significant environmental harm. We believe that contaminant concentrations are beside the point. If there is reason to think a significant portion of a landfill could end up in the river, measures must be taken to prevent the slope failure from happening.	(cont'd) Appendix O of the RI. Based on the future findings of the BHHRA and Level III BERA, the Portland District plans to revisit the North slope regrade and stabilization issue as part of the Upland FS for the Bradford Island Landfill.
2.	**Use and interpretation of qualified data.** DEQ continues to disagree with the interpretation of EMPC qualifiers. It is our understanding that the following reasoning was followed: If all laboratory QA criteria were met indicating the presence of an analyte, but the ion-abundance ratio was greater than method-defined ion ratios, the analyte was qualified as an EMPC, and then subsequently identified as a non-detection. DEQ's opinion is that the EMPC value can be corrected to account for the elevated ion abundance ratio. Depending on the amount of the deviation, the concentration may be valid and should be used in further calculations. Certainly, analytical results with ion abundance ratios less than 25 percent should be used as a full detected value. By evaluating the actual deviation of the ion ratio and the corrected EMPC value, results can be validated and used on a case by case basis. In many cases, the use of the EMPC as non-detected concentration significantly and inappropriately elevates the detection limits of the analytical results. In the future, all congener data should be provided to the DEQ laboratory for independent validation, and the instrument estimated detection limit (EDL) and analyte-specific reporting limit (MRL) should be provided. Validation of analytical data should be conducted by an independent third party. Moreover, additional cleanup procedures should be considered that have the potential to reduce the occurrence of EMPCs. Information presented in Appendix H suggests that the impact of this decision on calculation of total PCBs appears to be limited. However, the decision to treat EMPCs as non-detects adds ambiguity to the interpretation of Forebay-to-Reference Area hypothesis tests, exposure point concentration (EPC) calculations in the risk assessment and, toxicity equivalent (TEQ) estimates. Further, it may complicate an assessment (cont'd)	Comment noted. The treatment of the EMPC qualified data in the RI is consistent with the agreed upon approach, as outlined in the RI/FS MP, 22 April 2010 Memorandum (see pages 16-18), and 30 September 2010 Memorandum.

2. (cont'd)	(cont'd) of congener profiles, should this be needed in the future. Therefore, we believe decision rules for treatment of method reporting limits and estimated detection limits should be agreed on in advance of future monitoring. In addition to EMPC qualifiers, only the RDL, defined here as the "reported detection limit," was reported for high resolution data. Please confirm that the RDL is equivalent to the estimated detection limit (EDL). It appears that method reporting limit (MRL) was not reported for the high resolution data set. The MRL and EDL data provide the information necessary to "J"-flag data. Since this is not reported, it is unclear how "J" flags were assigned in the dataset. In summary, the database should be updated consistent with the above comments on treatment of EMPC qualifiers and inclusion of the MRL. **Follow-up DEQ Response:** Concerning the February 10, 2010 and the September 30, 2010 memos, the September 30 memo addressed the approach to calculation of total PCB and PAHs. DEQ agrees with the approach outlined in that memo to calculate totals, which was used in the RI report. The February 10 memo discusses the point of disagreement, which is with respect to interpretation of EMPC qualifiers as non-detections. DEQ appreciates the detailed discussion and presentation on this issue provided in the February 10 memo as well as the fact that there is limited guidance on how to handle EMPC qualified results. DEQ believes that peaks that would otherwise be qualified as EMPC may be resolvable from instrument noise and used on a case by case basis. As discussed during a meeting on June 15, 2011, DEQ prepared a proposal for management of PCB congener data to be used in future monitoring. This proposal was intended as basis for discussion between USACE and DEQ analytical laboratory staff, regarding analysis and management of future PCB congener data for the project. The proposal was transmitted in a memo from Jennifer Peterson, Paul Seidel and Bob Schwarz, to Mark Dasso and Mike Gross on July 12, 2011.	Comment accepted. DEQ's proposed approach for treatment of EMPC data will be adopted for all future monitoring activities in the River, while the approach currently used will be maintained to finalize the RI/RAs.
3.	**Forebay sediment risk assessment.** The 19 randomly collected sediment samples are intended to characterize the forebay as a single unit. However, relatively few of these samples happened to be in the vicinity of the source (cont'd)	Comment noted. The Portland District is planning to conduct future sampling in the 2007 sediment removal areas as part of the River OU FS. As stated, the additional investigation work will be conducted in the (cont'd)

3. (cont'd)	(cont'd) area (i.e., P4, P5, and P6). To the extent that residual contaminants remain in these source areas they are not adequately represented by the existing random sediment samples. The omission of source area sediment samples around Bradford Island confounds important evaluations in the RI report related to COPC selection, risk assessment and source evaluation Therefore, we believe it is appropriate for sediment to remain a relevant medium for future monitoring. There is some additional uncertainty in the risk assessment with respect to the contributions from the source area sediment to tissue body burdens. Although contaminants are distributed throughout the forebay, the most significant concentrations remain near Bradford Island, as indicated by the random samples closest to Bradford Island and source samples presented in Appendix G. Future sediment sampling will need to include more substantial sampling around Bradford Island. This should include the area dredged in 2007, so that we can evaluate whether contaminant levels have rebounded. **Clarification of DEQ Response:** DEQ's concern as expressed in the comment, relates to the adequacy of the 19 random forebay samples in capturing potential source areas. In particular, DEQs concern is focused on the older detections of PCBs outside the removal areas and along the northern shore of Bradford Island that range up to 500 ug/kg (e.g. S1-39 and S1-41; S2-72-75 and TR series). Additional COIs such as Aroclor 1260, phthalates, butyltins and metals were detected in the areas below source areas (sandblast AOPC, bulb slope, etc.) USACE proposed in an email dated July 28th, 2011, new sediment sampling locations to address this concern with the following objectives: 1) Confirm that the 19 random samples accurately represent the in-water OU. If deemed yes, then these samples would remain as the baseline condition for future monitoring. 2) As a secondary objective, detection of localized areas of contamination in the removal areas. Six new locations are proposed to address the Corps' two objectives. However, these sample locations are within previous removal areas. DEQ proposes an additional objective for sample selection: to characterize source area sediment (cont'd)	(cont'd) former sediment removal areas. The investigation will look into whether sediment has been redeposited in the former sediment removal areas and whether clams have repopulated the area. If sediment has been redeposited and accumulated in the removal areas and/or clams have repopulated the area, then both sediment and clam samples will be collected. The samples will be analyzed for PCBs, metals, PAHs, pesticides, butyltins and SVOCs. The intent of the sediment sampling will be to confirm that the 19 randomly collected sediment samples are representative of the Forebay as a single operable unit. Additionally, the Portland District is planning to collect another round of bass samples from the Forebay and Reference Areas. The intent of this sampling is to assess current bass contamination levels and set a baseline for potential bass monitoring as part of the River OU FS Alternatives. Comment noted. As part of the pre-feasibility study work, the Corps has collected additional River OU sediment and clam samples at seven locations along the north-shore of Bradford Island. The samples were collected in the areas suggested by DEQ in the October 13, 2011 email from Bob Schwarz. The intent of the samples is to verify data used in the RI characterization of the areas in and around the removal areas to verify COIs and COPCs identified in the RI/RA. The sediment and clam sampling was completed in October 2011. Sediment samples were successfully collected at all seven proposed sample locations. While clams were located and collected at all seven proposed sample locations, only six of the locations yielded enough clam tissue for the planned analysis. It is the Corps' understanding that DEQ's comments pertaining to the sampling effort in the River OU have been adequately addressed. For this reason, historical data collected outside of the removal areas will not be used in the RI and RAs. Further, as discussed in Section 5.4 in the RI Report, there are numerous data quality concerns associated with use of the historical data in terms of their ability to represent current spatial (cont'd)

3. (cont'd)	(cont'd) around Bradford Island outside the removal areas for the source control evaluation and to validate the COIs and COPCs identified in the remedial investigation and risk assessment. Additional samples should be added to address DEQ's stated objective above, and should be placed to ensure that they can be considered replacement for the older pre-RI data and address DEQ concern about runoff from different areas of concern (e.g. the Sandblast area and bulb slope AOPCs) and remaining PCB contamination outside removal areas. For example, sandblast area source samples should be placed closer to shore and more proximal to previous sampling near SBDS-19, S1-32 and S1-43. Similar samples should be placed just offshore of former pile #3 (S1-39, S1-41). Recharacterization of areas with elevated PCB sediment concentrations contamination between removal area 2 and 3 is also needed. [Proposed sample P115 may address this concern for former pile #3, but without a map that includes historical sediment samples it is difficult to verify this]. For source control, if any one composite sample indicated the potential for a localized area of elevated concentrations, then that potential source would be the subject of addition actions. If data indicate that one location is elevated relative to RI data, it should be re-screened to ensure no COPCs or CPECs have been missed in the risk assessment. If sampling cannot be completed to meet these objectives in the fall of 2011, a screening of historical Bradford Island source area sediment data for all contaminants of interest outside the removal action areas should be completed as a part of RI and risk assessment revisions. Maps should be provided that show the historical sampling locations along with more recent fore bay sampling efforts. Currently, it is difficult to determine how current sampling plans line up with historical samples.	(cont'd) distributions. These concerns include the fact that collection of data occurred over many years and multiple sampling events, and there is variation in sampling methods, analytical methods, suite of included analytes, and reporting limits. These data were collected from the dynamic forebay environment and more than one interim removal actions has also occurred since the collection data. Therefore, inclusion of the historical data is expected to introduce additional uncertainty into the RI evaluation.
4.	**Goose Island.** The sampling around Goose Island provides limited information about contaminant levels in sediment and small home range species such as clam, sculpin and crayfish. Data on these receptors was hampered by problems collecting tissue on these species. The lines of evidence available, however, do show elevated levels of contaminants around Goose Island in sediment, surface water, and tissue. Contaminants of interest in the Goose Island area appear similar to those found around Bradford Island, (cont'd)	Comment noted.

4. (cont'd)	(cont'd) and include cadmium, mercury, phthalates, PCBs, and PAHs. The magnitude of these exceedances and contribution to fish tissue are unclear at this time given uncertainty in bass habitat use. Until more post-removal data is collected to refine exposure estimates, Goose Island should remain an area of concern.	
5.	**Censoring level.** Because a J-flagged detection contains useful information, as described in Section 7.2.1, it is our preference to censor data at the method detection limit (MDL), not the method reporting limit (MRL), for EPC calculations. While this could be interpreted as less precise, it is standard risk assessment practice, and should be done consistently in any future risk calculations.	Clarification provided. In general, calculation of the 95% upper confidence limit on the mean (UCL) was relatively insensitive to the choice of censoring level. Based on the data review presented in Section 7.2, the more statistically-robust UCL calculation using the MDL as the censoring level, plus using the J-flagged data as-is, was indeed employed in the EPC calculations for the risk assessments, as suggested by the commenter.
6.	**Data sets not used in the RI.** Data collected in earlier phases of investigation and not used in the RI are presented in Appendix G. Additional explanation of these data sets is needed to ensure important data are not omitted. Alternatively, these data should be reviewed as part of a weight of evidence evaluation to ensure no additional contaminants of potential concern (COPCs) or contaminants of potential ecological concern (CPECs) would have been included, if these data were considered. For example, data should not be removed when evaluating areas of concern (e.g. landfill, sandblast area, River OU) except when they are superseded by newer data that represent the same locations or analytes list. As specific examples for the Sandblast Area and River OU, the older data sets include analyses for butyltins in soil, sediment, pore water and catch basin samples that were not included in more recent forebay sediment samples. These appear to be associated with a source in the sandblast area, and would not have been addressed as an element of the risk assessment. Even where similar lists of COPCs were identified, such as the Landfill Area, omitted datasets provide additional information on the heterogeneity and magnitude of contamination not captured by the most recent data collection.	Comment noted. The data utilization strategy was presented in detail in the agreed upon RI/FS MP (URS, 2007). As discussed in Section 5.0 of the RI, except where data quality does not meet the standards outlined in the RI/FS MP (URS 2007a) and where comparable data were superseded by newer data at the same location, analytical results from investigations in the Upland OU from 1999 to 2009 are included in the RI data set and were evaluated in the Upland OU risk assessments. The relatively static physical environment of the Upland OU means that environmental data collected over the past decade can be considered representative of current conditions. Historical Upland OU data not utilized in the RI due to poor data quality are provided in Appendix G. In contrast to the Upland OU, the physical environment of the River OU is much more dynamic and the primary (in-water) contamination sources (the electrical equipment, debris, and the majority of the contaminated sediment) have been removed from the river. Additionally, the sampling methods used to collect the historical data from the River OU are not comparable to the recent sampling which was conducted in accordance with the procedures outlined in the River OU QAPP (URS 2007b), Revised Sculpin Analysis Strategy Technical Memorandum (URS 2009b), and In Water QAPP Addendum (URS 2009c). Therefore, only analytical results from investigations in the River OU after 2007, with the exception of smallmouth bass and sucker collected in 2006, are included (cont'd)

6. (cont'd)		(cont'd) in the RI data set and used in the River OU risk assessments to evaluate current conditions. As discussed above, based on the future findings of the BHHRA and Level III BERA the Portland District plans to revisit the North slope regrade and stabilization issue as part of the Upland OU FS for the Bradford Island Landfill AOPC (see the response to General Comment 1) and is planning to conduct future sampling in the 2007 sediment removal areas as part of the River OU FS (see the response to General Comment 3). The initial FS samples in the sediment removal areas will be analyzed for PCBs, metals, PAHs, organochlorine pesticides, butyltins and SVOCs. Also see the response to General Comment 9 (Source Control), below.
	Clarification of DEQ Response: DEQ does not object to replacing older data with newer data to represent current conditions, and using consistent sampling and analytical methods and detection and reporting limits that are lower and using recent data that were collected to meet specific RI objectives. To complete resolution of the comment, DEQ requests more specific information on the particular reasons why each data set not used in the RI was excluded. This information should be presented in Appendix G. We suggest a table by date, sampling event and environmental medium that presents the reason for exclusion of each data set, and references the newer data that replaces it. For the in-water data, in cases where some analytes and media may not be replaced by newer data, a reference to the inclusion of the same analytes in the planned sediment sampling and tissue monitoring would also be appropriate. Some of the data sets that represent catch basins or sediments near the sandblast and landfill AOPCs should be considered in assessing source control from these AOPCs.	Comment noted. One main objective of the RI/FS MP (URS 2007) was to review the all of the existing data collected from the River (both qualitative and quantitative) during previous investigations and remedial activities in order to develop a clear understanding of the COIs, their present locations, and their potential future fate and transport. Much of this information was presented in Section 5.0 of the RI/FS MP. The list of COIs developed for each medium in the River was used to identify data gaps and facilitate the sampling efforts described in the RI/FS MP and River QAPP (URS 2007). As described in Section 8.0 of the RI/FS MP, all existing information was used to identify data gaps that would allow for the achievement of 3 main goals: nature and extent delineation, completion of the HHRA, and completion of the ERA. The Corps feels that the sampling efforts performed in support of RI and RAs were adequate to achieve the 3 main goals and does not believe additional efforts are warranted to re-justify the sampling design and approach. With the exception of the additional sampling activities described in the response to General Comment 3, which will supplement the proposed pre-FS sampling effort, no further attempt will be made to re-characterize the site or justify the exclusion of historical data. (cont'd)

6. (cont'd)		(cont'd) As stated previously, including the historical data (or any data collected independently of the random sampling design) would introduce bias into the Ras since the purpose of the random sampling strategy was to generate a dataset that represents the Forebay as a whole. Each random sample was spatially-distributed equally across the entire unit. However, all chemicals will be analyzed for in pre-FS sediment and clam samples that will be collected from the north side of the island and bass tissue collected from the Forebay and Reference Area (PCBs [Aroclors and congeners], metals, PAHs, pesticides, butyltins, and SVOCs). If the results of these analyses indicate a potential source of contamination that was overlooked based on evaluation of the random Forebay datasets included in the RI/RA, the list of sediment and tissue COPCs and CPECs may be modified to reflect the new information. URS. 2007. Remedial Investigation/Feasibility Study (RI/FS) Management Plan (MP), Bradford Island, Bonneville Lock and Dam Project, Cascade Locks, Oregon. September. URS. 2007. Quality Assurance Project Plan (QAPP), River Operable Unit Remedial Investigation, Bradford Island, Bonneville Lock and Dam Project, Cascade Locks, Oregon. September.
7.	**Reference area.** The reference area does have some elevated metals, PAH, and 4-methylphenol concentrations, indicating some degree of impacts from these constituents. In particular the bass samples are substantially elevated over the forebay in lead and nickel.	Comment noted.
8.	**Statistical comparison between site and reference area.** There are several instances where the statistical comparison between site and reference exhibits a high minimum detectable difference (MDD). In these cases the hypothesis test had very low power to detect a difference. However, examination of the data further clearly shows a difference in the range and magnitude of contamination. In these cases, contaminants of interest (COIs) should be carried forward to the risk assessment for screening. A few examples are provided below, but corrections should be made to all exposure areas and media (soil, sediment, surface water, groundwater, seep water, and tissue samples). Some examples include: (cont'd)	Comment noted. The goal of the statistical comparison was to compare the central tendency (mean or median) of two populations, as opposed to comparing the tail-end or the maximum observed values. This is analogous to the use of 95% UCL (an estimate of average concentration) to reflect the EPC (i.e., average exposure). Hence, even though a few elevated concentrations were observed for the site, as noted by the reviewer, the *average* concentrations did not appear to be significantly different between the two populations. Given the large number of statistical comparisons, it was conceivable that some MDDs were not as desirable; though currently a minimum level of MDD was not established (cont'd)

8. (cont'd)	(cont'd) Landfill, surface (0-1ft): Arsenic, chromium, copper, nickel and silver were detected at maximum concentrations of 30, 801, 494, 570 and 570 parts per million (ppm), respectively. MDDs were 148 percent, 598 percent, 195 percent, 492 percent and 370 percent. The report concluded there was no statistical difference, and these COIs were not carried forward into the risk assessment. The 0-3 ft interval had similar results with higher-magnitude detections and larger MDDs. Sandblast, Surface (0-1ft): The issue described above for the landfill samples is also true here, for copper, mercury, nickel and antimony. **Follow-up DEQ Response:** DEQ notes that this issue was considered in the February 10, 2010 memorandum responding to DEQ comments on the data sufficiency report as well as in this comment response. We note that minimum detectable differences were acceptable in many cases, and we acknowledge that the purpose of the hypothesis testing was to evaluate whether central tendency concentrations were different, and that the assessment generally accomplished this objective, although there are some instances where minimum detectable differences (MDDs) are relatively elevated (i.e., more than 100 percent). We also agree that in these cases, a large number of samples would be required to reduce the MDDs, which we are not requesting. Notwithstanding the foregoing, DEQs primary concern with these tests is the adequacy of statistical power to detect a difference when variability is higher. In particular, the response to our comments on the data sufficiency report notes that the probability of making both Type I and Type II errors is controlled, and therefore it does not matter how the null hypothesis is defined. To clarify the DEQ concern, we note the following from USEPA ProUCL guidance: "if the variance estimate used in the planning state was too low, the statistical test is unlikely to reject the null hypothesis due to the lack of sufficient power". "If large uncertainties exist concerning the variability of the contaminant concentration in potentially impacted areas, the Background Test Form 1 (null is that concentrations in potentially impacted site areas do not exceed (or are less than)) may lead to inconclusive results". For the (cont'd)	(cont'd) by published guidances. For some constituents, it was plausible that the inherent natural variation was high, and an unrealistically large number of samples would then be required to reduce the MDD. In any case, for these constituents with higher MDDs, a review of the respective box-and-whisker plots presented in Appendix L did not suggest strong evidence that the site's *central tendency* was significantly higher than the reference area's. As for the current statistical comparison, it should be noted that a conservative alpha level (false positive rate) of 0.05 was already in use for each "individual" comparison, which provided a balancing act to reduce the false negative error. Comment noted. The errors rates selected were based on the previously submitted RI/FS MP (URS 2007), and the ProUCL guidance was not published at that time. Nevertheless, given the large number of comparisons that were performed, the current alpha level (0.05) was conservative for each "individual" comparison, as the site-wide alpha level (or exposure area alpha level) would be much higher (more conservative), based on the Bonferroni correction. In terms of the power of the statistical comparison, the goal established in the RI/FS MP (i.e., to detect one-standard-deviation-away) was achieved. However, for Upland soils only, this one-standard-deviation happened to be large due to the high data variability, which could not be controlled because of the inherent heterogeneity of the Upland soil environment. (It should be noted that the data variability for sediment and tissue samples from the River are low and the MDDs are generally well within acceptable range.) Currently, there is no established state or EPA guidance on what level (ceiling) of MDD one must achieve. For analytes with a high MDD (such as greater than 100% of the reference mean), which affects the comparison for metals in the Upland OU (Landfill, Sandblast, and 4 AOPCs only – see Table L-1), we agree that further desk-level evaluation should be done. The metals (with high MDDs) include: antimony, arsenic, chromium, copper, magnesium, mercury, nickel, and silver; which represents 41 out of 378 combinations (cont'd)

8. (cont'd)

(cont'd)

Background Test Form 1, the error rates selected by EPA as the minimum recommended performance measures are "the confidence level should be at least 80 percent (alpha = 0.20) and the power should be at least 90 percent".

We suspect that this issue has been considered. To address the DEQ concern regarding potentially inadequate power, DEQ proposes that the statistical power be included in the Figure L-1, Appendix L so it can be seen directly along with the MDD and a more detailed explanation of how the probability of making both Type I and Type II errors is simultaneously controlled to avoid the potential of inappropriately making a Type II error. If there are cases with low power, then these COI can be re-screened, and the comment will be resolved.

One specific case where we suspect the hypothesis test may be leading to an inappropriate conclusion is mercury, which shows some elevated samples in the sandblast area, has high MDD, was selected as a preliminary COPC, but was not in the "site-related" list due to similarity in central tendency site and reference sediment concentrations (See DEQ's response on the response to General Comment 10).

(cont'd)

of metals and exposure depths. These metals were compared to the following depth-specific criteria:

- 0 to 1 foot bgs – ecological SLVs
- 0 to 3 feet bgs – lower of human health and ecological SLVs
- 0 to 10 feet bgs – human health SLVs

The higher of these depth-specific SLVs and the Upland background UPL was used as the final SLV for the comparison.

Of the eight metals, magnesium is an essential nutrient, and all detected results of silver are below the lowest, depth-specific screening criteria; hence, these two metals do not warrant any further investigation. The remaining six metals affect the following Upland exposure areas:

Site AOPC	**Depth Group**	**Antimony**	**Arsenic**	**Chromium**	**Copper**	**Mercury**	**Nickel**
Landfill	0-1 ft		X	X	X		X
	0-3 ft			X	X		X
	0-10 ft		X	X			
Sandblast	0-1 ft	X			X	X	
	0-3 ft	X			X	X	
	0-10 ft						
4 AOPCs	0-1 ft	X			X	X	
	0-3 ft	X			X	X	
	0-10 ft						

None of the metals with high MDDs associated with 0 to 10 foot bgs soils from the Sandblast Area and 4 combined AOPCs exceed human health SLVs. Arsenic and chromium both exceed human health SLVs for the Landfill, but were already demonstrated to be above background based on the statistical comparison and were already included in the HHRA (thus, not shown with an X for the Sandblast Area and 4 AOPCs).

Given that the data variability is "uncontrolled" and high data variability leads to uncertainty, we suggest that the aforementioned 21 combinations of metals and exposure depths be evaluated in the risk assessment uncertainty section (Appendix O). This focused analysis allows us to explore whether these compounds should be included as COPCs and thereby be advanced to the next level of risk assessment. This focused (cont'd)

8. (cont'd)		(cont'd) evaluation will assure that these uncertainties have been explicitly considered, be less disruptive to the current main report, and should help to ease the review effort by ODEQ for the next submittal. Per the telephone conference on Nov 14, 2011 between ODEQ, USACE, and URS, the following three items will be provided to ODEQ subsequent to this response-to-comment letter for further consideration: • text that will be inserted into the main report in either Section 8 or 9 that briefly describes the additional evaluation that has been conducted to address the uncertainty associated with the 8 metals with high MDDs; reference to Appendix O will be made in this section • a draft outline/approach for the revised uncertainty section that addresses these COPCs (e.g., screening against SLVs) • evaluation of one of the metals as an example of the lines of evidence that will be used to make decisions regarding these COPCs
9.	**Source control.** Certain decision criteria have confounded the interpretation of the RI data in terms of the conceptual site model and comprehensive evaluation of Bradford Island sources. A more rigorous evaluation of source control should be presented in the report. Of note are the sandblast area, bulb slope and the landfill. The data clearly show that migration from these areas has occurred (e.g., sandblast COIs were found in river sediment and porewater), and it is important to show and confirm that these pathways have been controlled. Some of the tissue (sculpin, clam, crayfish) appear to be impacted by antimony, arsenic, barium, copper, chromium, mercury, methyl mercury, cadmium, lead, nickel, zinc, phthalates and PAHs, relative to the reference area. These were also the same constituents that were elevated in the landfill and bulb slope areas of potential concern (AOPCs). Further, the following points indicate a need for a specific consideration of source control: • Section 8.3.4 describes a comparison of soils in the landfill, bulb slope and sandblast area AOPCs to reference area soils. One conclusion is that concentrations of hazardous substances in these AOPC soils do exceed those in the reference area. In particular, the evaluation shows that metals including mercury and lead as well as PAHs are elevated in these soils. We also note that copper was (cont'd)	This response is organized into the three main topics discussed in the comment. **Data Gaps and Insufficiencies to Assess Upland Soil Migration to the River.** Comment accepted. The overland runoff pathway for the Landfill, Sandblast Area, and Bulb Slope will be subjected to a more site-specific evaluation in the BHHRA and Level III BERA that will be performed for the Upland OU. Aquatic-related target receptors from the Forebay will be assessed in the baseline risk assessments for the Upland OU in order to identify the list of COPCs/CPECs that should comprise the focus of source control measures evaluated in the FS. The HHRA recommended no further evaluation for the Bulb Slope (one of the three AOPCs included in the runoff pathway evaluation), and therefore only this potential soil-to-river transport and exposure pathway will be included in the BHHRA for the Bulb Slope. The findings of the Upland BHHRA and Level III BERA for this runoff pathway will be carried into the Upland OU FS, where these findings will be considered in parallel with the initial FS data that will be collected from the former removal area (and bass from the Forebay). (cont'd)

9. (cont'd)	(cont'd) detected at 13,100 ppm in sediment off the bulb slope area, as documented in Appendix G. As described in Section 9.1.1, the inorganics in upland soil were compared to reference area sediment from the River operable unit (OU) as a means of screening for potential impacts to the River OU. These soils exceeded reference area sediments for some contaminants, including lead and mercury. While not used for COPC selection, Table L-8 also shows PAHs are elevated in upland AOPC soils relative to reference area sediment. • The data set from groundwater seeps is limited. However, the results suggest that seep water is likely elevated relative to reference area groundwater with respect to metals including lead and mercury and petroleum hydrocarbons. Section 9.3.2 presents the interpretation that groundwater exceeding screening level values (SLVs) may be discharging to surface water. • As described in Section 9.3.1.1, discharge to catch basins is believed to be a historic and potentially current mechanism of transport from the sandblast AOPC to the River OU. Elevated levels of metals, including lead and cadmium, Aroclor 1260, phthalates and butyl tins are associated with the sandblast area AOPC. Post-removal sediment and tissue samples collected near this source (P04) continue to show elevation of these contaminants in sediment, clam and crayfish tissue. Nickel was detected in sandblast area catch basin solids at up to 374 ppm and in river sediment at one outfall at up to 630 ppm (SBDS-19). Chromium was detected at up to 620 ppm and nickel at up to 520 ppm in sediment (S1-43) off the sandblast area. • Post removal sediment butyl tin and organochlorine pesticide data were not collected and represents a data gap. Pre-removal sediment (P-44) showed detections of Aroclor 1260 up to 380 parts per billion (ppb) in sediment in this area and catch basin soils and filter sock material up to 173 and 144 ppb respectively. • Lead, mercury and PCBs (Aroclor 1260) are elevated in the bulb slope AOPC. • Metals including lead and mercury, and PAHs were detected in (cont'd)	(cont'd) Upland source control will be considered during the Upland OU FS. As described above in the response to General Comment 6, the initial FS samples in the sediment removal areas and bass tissue samples from the entire Forebay will be analyzed for PCBs, metals, SVOCs (including PAHs), organochlorine pesticides, and butyltins. Collection of new data for these chemical classes will address the concerns regarding specific analytes expressed throughout this comment. **Upland Groundwater Transport to River (Groundwater and Seep and Co-locate Surface Water Data).** Clarification provided. Concentrations of most COIs at the Landfill exhibit a decreasing trend from groundwater monitoring wells located distally from the river, to groundwater wells closer to the river, to the seeps, and thence to the river surface water. This trend occurrence and the COIs in exceedance of the SLVs for humans and aquatic organisms is discussed in further detail in Sections 11.2.4.1.5 and 12.3.4.1.1. Based on the findings of the HHRA and ERA, no further evaluation of COIs in groundwater from the Landfill is necessary to address the discharge to surface water pathway. Section 9.3.2 describes groundwater quality at the Sandblast Area and conditions regarding groundwater discharge to surface water of the River. Sections 11.2.4.2.5 and 12.3.4.1.2 provide more detailed descriptions of this groundwater to surface water transport pathway as it relates to human health and ecological risk. Based on the findings of the HHRA and ERA, no further evaluation of COIs in groundwater from the Sandblast Area is necessary to address the discharge to surface water pathway, with the exception of PAHs. As described in the response to Specific Comment 12 (below), concentrations of PAHs in direct push groundwater samples from the Sandblast Area will be added to the groundwater screening tables (HHRA Tables M-17, M-18, and M-19 and ERA Tables N-15 and N-20) to address the sampling data gap for PAHs in monitoring well data for this AOPC. **Implied Correlation Between Upland Sources/COIs and PCBs in River.** Comment noted. The Upland OU was not identified as the source of PCB contamination in the River OU. The primary site-related source of the River OU PCB contamination is from equipment disposal along the northern shoreline. A statistical correlation between PCBs and (cont'd)

9. (cont'd)	(cont'd) erodible soil around the landfill, suggesting the landfill as a potential source to the River OU. • A number of the preliminary COPCs and CPECs were statistically higher in forebay tissue samples relative to the reference area. As described in Section 9.6.2.2, cadmium and various PAHs in forebay clams were significantly higher than in reference area clams. In crayfish, various metals and PAHs were significantly higher than in the reference area crayfish. In sculpin, cadmium, lead and mercury were statistically higher. For bass, various metals and PAHs were higher in the forebay relative to the reference area. • Total PCBs (the Kaplan-Meier based sum) appears to have some correlation to cadmium, lead and mercury in the forebay sediment, which may suggest a common source. Based on the various lines of evidence presented above, it appears that there is a plausible source and mechanism of transport of metals, butyl tins, phthalates, PCBs and PAHs from several of the upland AOPCs to the River OU and these same constituents may be elevated in some biotic tissues. Moreover, it appears that some of these constituents are correlated to total PCBs, indicating a potential common source. Based on these concerns we believe it is appropriate to carry those substances identified as preliminary COPCs and CPECs forward for some additional consideration in the RI/FS process and to address them as part of a more comprehensive source control evaluation. **Follow-up DEQ Response:** • **Data gaps and insufficiencies to assess upland soil migration to the river.** DEQ's comment will be resolved by the additional sampling proposed (July 28, 2011 email from Mark Dasso) to collect new samples along the northern side of Bradford Island, including the potential source areas outside the former removal area. We understand this sampling will be a component of the source control evaluation consider as part of the Upland OU FS. The sandblast area is an example of an area that needs assessment for source to control to ensure migration to River OU is not occurring. (cont'd)	(cont'd) metals may not obligatorily indicate causation. Comment noted.

9. (cont'd)	(cont'd) • **Upland groundwater transport to river (groundwater and seep).** DEQ Groundwater and seep data were screened for risk to the river, but screening was conducted using a 95 percent UCL. For source control, each seep and well should be screened separately.	(cont'd) Comment noted. The maximum detected concentrations in groundwater, seep water, and co-located surface water were compared to the lowest of the human health and ecological SLVs for purposes of nature and extent delineation (Section 9.0). In addition, COPCs with concentrations in these Upland water media that exceeded the lowest SLVs were plotted on figures that illustrate the point by point comparison to SLVs (i.e., each well and seep/co-located surface location), and the text in this section discusses point by point exceedances for all COPCs. Furthermore, in the HHRA and ERA sections (Section 11 and 12), maximum detected concentrations or 95% UCLs (groundwater from the Landfill and Sandblast Area only) in the Upland water media were compared to the respective SLVs and selected COPCs were plotted on figures that illustrate point by point exceedances for all wells (sample locations). Wells closest to the point of discharge, and seep/co-located water samples available for the Landfill only, comprise the main focus of the detailed evaluation of the Upland groundwater transport pathway. The process used to evaluate Upland water media followed in the report concurs with DEQ guidance for conducting ERAs (2001), and an adjustment to this process is not warranted for purposes of this document. However, additional evaluation specifically for source control purposes may be considered in FS or in a separate document.
	• **Implied correlation between upland sources/COIs and PCBs in river.** DEQ agrees that correlation does not necessarily imply causation. However, because Aroclor 1260 was detected in the landfill, bulb slope and sandblast area soils, and a stormwater and a potentially complete erosion pathway exists, we do consider the correlation to suggest potentially complete migration pathways from the upland OU.	Comment noted. All COI classes, including PCBs (each Aroclor and 209 congeners) metals, PAHs, pesticides, butyltins, and SVOCs, will be analyzed in the River OU to evaluate potential contribution from Upland sources.
10.	**Preliminary versus site-related COPCs/CPECs.** Section 11.2.3.5 discusses the approach used to identify site-related COPCs. Strictly speaking, this is not a determination of which COPCs are associated with site releases. The approach described is a filter to identify those constituents that are more likely to pose significant risk potential, based on relative risk. We do not think that this filter is an adequate basis for dropping the preliminary COPCs from further consideration. Although it is common to focus risk management on one (cont'd)	Clarification provided. The use of the terminology "Preliminary COPCs" and "site-related COPCs" may contribute to confusion and will be revised to say COIs and COPCs respectively. The term "site-related" will be deleted from the text and tables. Additional clarifying text will be added to 11.2.3.5 to reflect the fact that the process that was followed consisted of a weight-of-evidence approach that evaluated site-specific patterns of chemical distribution and exceedance *in addition* to the (cont'd)

10. (cont'd)	(cont'd) or a few substances, other COPCs posing less risk potential are also addressed. For example, where it can be shown that COPCs are spatially co-located, risk management actions aimed at substances posing the highest risk potential can also be demonstrated to address other contaminants. Alternatively, additional risk evaluation may demonstrate risk below acceptable levels for less significant COPCs. We believe additional consideration of preliminary COPCs is warranted, in particular for metals, PAHs and phthalates.	(cont'd) relative-risk filter. The resulting conclusions were used to identify which chemicals should be considered COPCs warranting further evaluation or consideration for each AOPC on the basis of human health concerns. The site-specific discussions are presented in each of the AOPC discussions are presented in each of the AOPC discussions (e.g., the rationale for elimination of lead and VOCs as COPCs in landfill soils is discussed in Section 11.2.4.1). All of the COPCs identified in the HHRA (specific metals, PAHs, and phthalates) are proposed for additional evaluation in a baseline HHRA for the Upland AOPC (Landfill and Sandblast AOPCs). Part of this evaluation will include a more detailed assessment of the COPCs identified through the evaluation of mass wasting and erodible soils performed for the Landfill, Sandblast Area and Bulb Slope AOPCs (see Tables O.2-1 through O.2-3, as well as Sections O.2.1.4). The sediment data, which will be collected in the removal footprint area and immediate vicinity (i.e., where historic and, potentially, recent Upland soils have been transported), and the bass data, which will be collected from the entire Forebay as part of the initial FS sampling effort, will be evaluated in the Upland OU FS in conjunction with the list of chemicals identified as Upland COPCs/CPECs for the overland runoff pathway (see the response to General Comment 9). These sediment data will be used to identify which chemicals, if any, may have been or may currently be transported from Upland erodible/mass wasting soil to the Forebay and will be used to assess the extent to which any bioaccumulative COPCs may have impacted the aquatic food web. Similarly, these initial FS sediment and bass samples will provide a more current data set for the River OU FS.
	Follow-up DEQ Response: The proposed resolution of changing the terminology from "preliminary COPCs and site related COPCs" to "COIs and COPCs" is not appropriate. DEQ Human Health Risk Assessment Guidance (ODEQ 2010) states "chemicals detected at the site which have not been screened should be designated as "Chemicals of Interest" (COIs), while those that have been screened-in should be designated as "Chemicals of Potential Concern" (COPCs). (cont'd)	Comment accepted. The weight-of-evidence approach to selection of COPCs is a scientifically sound method that utilizes the HHRA guidance (DEQ 2010) and also uses the Problem Formulation to identify priority chemicals and to make defensible decisions regarding further risk assessment needs. The WOE approach may be used to screen out chemicals as well as to screen in chemicals that may otherwise be excluded (e.g., commenter's discussion of arsenic and cadmium above) (cont'd)

10. (cont'd)	(cont'd) According to EPA and DEQ Guidance, chemicals that exceed risk based levels are COPCs regardless of additional analysis on "site specific patterns of chemical distribution". This type of analysis may be used in the feasibility study, but the contaminants should be retained in the risk assessment. Some discussion may be included with the uncertainty section of the risk assessment to prioritize and identify the primary risk drivers. Specifically, uncertainties in the SLVs or toxicity information can also be discussed in the uncertainty section. The following discussion provides some examples of COPCs that were not designated as site-specific, but for which DEQ believes the overall evidence suggests that they need to be carried forward in the risk assessment. • **Mercury.** Mercury has an association with the bulb slope and landfill, detection in groundwater seeps, occurrence in bass over risk-based levels and relatively greater variability than reference variability in sediment. Therefore, regardless of comparison of the central tendency in sediment, mercury should be retained as a significant COPC warranting focus at these upland AOPCs and the in-water OU. • **Arsenic.** Arsenic was screened out in crayfish based on low risk potential, given that that portion of the arsenic exists in the organic form. Because arsenic is associated with the sandblast area, and the crayfish samples nearest to the north shore of Bradford Island were the most elevated, arsenic should be a focus of source control from upland AOPCs and retained as a COPC. • **Cadmium.** Clams and sculpin from the forebay show higher levels of cadmium relative to the reference area. Visual inspection of surface water data suggests it may be higher in forebay surface water, and cadmium is elevated in the landfill and sandblast AOPCs. The reference area bass appear to represent two separate populations with respect to several metals, including cadmium. Therefore, the bass result is somewhat ambiguous. We recommend retaining cadmium for source control and monitoring. (cont'd)	(cont'd) and allows a more holistic view of the data. The weight of evidence text will remain in the RI Report since it is defensible and sound and is consistent with the approach described in the RI Management Plan. As noted in the responses to General Comments 3 and 6, however, the sampling plan for the pre-FS data collection effort has been revised based on discussions with DEQ to allow for better characterization of sediment and clams outside of the in-water removal areas and areas most likely to be influenced by Upland sources. All chemicals, including arsenic, mercury and cadmium, will be analyzed for in pre-FS sediment and tissue samples. If the results of these analyses indicate a potential source of contamination that was overlooked based on evaluation of the random Forebay datasets included in the RI/RA, the list of sediment and tissue COPCs may be modified to reflect the new information. Additionally, a more thorough evaluation of the potential for mass wasting of Upland soils will be conducted during the FS to support conclusions made regarding the likelihood and magnitude of the overland runoff pathway. Text describing the purpose of the pre-FS sample collection and use of the data (i.e., to confirm list of COPCs) and the additional investigation of the mass wasting scenario will be added in the revised RI/RA.

10. (cont'd)	(cont'd) **Additional Follow-up DEQ Response:** **CPEC selection.** In response to CPEC designations in the ERA, **Table 1 (attached)** presents a list of CPECs identified in the risk assessment. These CPECs are further evaluated in Section 12 to determine if they should be retained for either a Baseline Level III Risk Assessment or remediation. These CPECs are all COIs that exceeded ecological risk based levels. Many of these chemicals screen in for several different receptor groups in one AOPC, which is a strong line of evidence that these chemicals are present at effect levels for many species and the community as a whole. For example, in the landfill mercury screens in for plants, soil invertebrates, birds and mammals, but is only retained for mammals as a CPEC for further assessment. Many chemicals also screen in across different AOPCs. For example, antimony screens in for the landfill and the sandblast area, but is not retained as a CPEC in either case. However, it shows up as a CPEC in the exposure area of four AOPCs combined addition weight that the individual AOPCs are impacted. All CPECs should be identified as such carried forward to the FS unless a baseline ecological risk assessment (to identify COCs) is completed for these chemicals.	Comment accepted. The purpose of the weight of evidence approach used to identify CPECs in the ERA is scientifically sound and serves to focus the forthcoming Upland Level III BERA on the CPECs, receptors, and exposure pathways that warrant a more site-specific evaluation. It is not necessary, and not common practice, to carry all chemicals into a BERA simply based on an exceedance of a SLV. However, to address one of the main concerns expressed in this comment and allow for a more comprehensive (less piece-meal) Upland BERA, any CPEC recommended for further evaluation for a particular AOPC and specific receptor group will be retained for all receptor groups in the BERA. See the response to the first part of General Comment 10, which addresses specific concerns raised by DEQ about the influence of Upland sources on River media. Based on evaluation of the pre-FS data that will be collected, the list of sediment and tissue CPECs may be modified to reflect the new information.
11.	**TEQ screening.** A TEQ screening for dioxin-like PCB congeners is not included in the risk assessment. Please include this screening in a revision for both human health and ecological assessment. TEQ values should be compared to the 2,3,7,8-TCDD values presented in DEQ's Guidance for the Evaluation of Bioaccumulative Chemicals of Concern.	Comment accepted. The screening already performed in the risk assessment for the individual dioxin-like PCB congeners will be augmented through evaluation of the total TEQ expressed as the summation of these 12 congeners for both human health and ecological receptors.
12.	**COCs.** In addition to other contaminants of concern (COCs), all PCB congeners, total PCBs and dioxin-like PCBs as TEQ should be considered contaminants of concern for the site.	Clarification provided. Total PCBs expressed as the sum of 209 congeners and dioxin-like PCBs, which will also be expressed as a total PCBs TEQ (see the response to General Comment 11), are considered COCs in the Forebay. All 209 congeners will be analyzed for in the initial FS samples collected from the Forebay and Reference Area. The comparison of individual PCB congener concentrations in the Forebay and Reference Area was performed to determine which congeners measured in River OU media have concentrations that are elevated relative to the reference area, and, thus, potentially attributable to Bradford Island, and which have concentrations that are indistinguishable from more widespread conditions, which are likely due to other sources not related to the site. This information may be useful for the next phase of the project (i.e., FS), but the intention was not to immediately screen out certain congeners from further investigation.

Specific Comments		
1.	**Section 6.2.2.** The second sentence in the first paragraph is incomplete.	Comment accepted. The text "starting on" will be deleted at the end of the second sentence.
2.	**Section 6.2.3.2, surface water.** Why were historical water samples collected outside of the removal area (e.g. Goose Island, upstream) not included in the RI?	Clarification provided. See the response to General Comment 6, above.
3.	**Table 6-6a, bass and largescale sucker results.** Organochlorine pesticides and butyltins were not analyzed in tissue. Future monitoring should include these COIs; they have been detected in sediment during previous rounds of sampling (e.g., near the sandblast area). Upland sources include the sandblast area (soil and catch basins) and the landfill (up to 9,500 ppb DDT was found in test pit TP1-01).	Comment accepted. As discussed in the response to General Comment 3, the Portland District is planning to conduct future sampling in the 2007 sediment removal areas as part of the River OU FS. The initial FS samples in the sediment removal areas will be analyzed for PCBs, metals, PAHs, organochlorine pesticides, butyltins and SVOCs. Also see the response to General Comment 9 (Source Control).
4.	**Section 7.2.1, Upland OU.** Please clarify what is meant by "more conservative" at the top of page 7-7, and why censoring at the MRL is more conservative. DEQ prefers that non-detects be censored at the MDL. While results below the MRL are less precise, they contain information about the presence of the contaminant, and should not be considered non-detect.	Clarification provided. The intent of the statement "censoring using the MRL is a more conservative approach" was to describe that the UCL results were generally higher when the MRL was used as the censoring limit. We agreed with DEQ that censoring using the MDL was the preferred statistical method for the risk assessments since it preserved the rank order of the data, plus the information from the J-flagged data were properly maintained. The preferred MDL-censoring method was indeed used in the subsequent EPC calculations for risk assessments.
5.	**Section 8, comparisons between the forebay area and reference area.** DEQ prefers that hypothesis tests take the alternate form, with the null hypothesis stating that the site concentrations are greater than (1-sided) or different from (2–sided) the reference area. We acknowledge that power tests are performed under a normal approximation. Many, perhaps most, of the data sets are not normal. Moreover, in many cases, the minimum detectable differences were too high to detect meaningful differences that exist. Therefore, we believe the best approach for any future comparisons, if needed is to use the alternate hypothesis form.	Comment noted. The current hypothesis testing set-up controlled both the probability of incorrectly concluding that a clean site was contaminated and the probability of incorrectly concluding that a contaminated site was clean. When both of these probabilities were controlled, it did not matter how one defined the null hypothesis. The conclusion of whether the mean Forebay concentrations were higher than the mean Reference Area concentrations would be the same even if the null hypothesis and the alternative hypothesis were to be switched. The same level of detectable differences would also be achieved in either set-up. In the future, if new data are collected and a new statistical comparison is warranted, the reverse hypothesis testing set-up suggested in the comment will be considered. (cont'd)

5. (cont'd)	**Follow-up DEQ Response:** See response on General Comment 8.	(cont'd) The minimum detectable differences for inorganic constituents in the River OU (which were some of the key comparison results, as their conclusions were being used in the COI selection process) were very good – and most minimum detectable differences were within the 20% to 30% range. Comment noted.
6.	**Section 8.1.** It is unclear why a median MDL or MRL was used for censoring, as opposed to a sample- and analyte-specific value, or why a detected concentration would be re-set to a higher value. Intuitively, it seems that would introduce an artificial bias into the comparisons.	Clarification provided. It was key to have a single censoring limit for population-to-population comparison purposes. For a vast majority of the statistical evaluations, there was only a single MDL or MRL, and hence, it was not an issue here. Where there were multiple MDLs or MRLs, the range of the limits was narrow and the median limit was close to the highest limit. Based on these considerations, we believed that the use of a single censoring limit (i.e., a single "common-bottom-line") was an acceptable simplification. Given the narrow range of the censoring limits, the main conclusions of the statistical evaluations would be unaffected even if other methods were considered.
7.	**Section 8.3.1, sediment.** URS did not identify a significant difference in sediment for total PCBs in the forebay random samples relative to the reference area. In this case, DEQ recommends trying a nonparametric permutation test, which shows much stronger evidence for the mean forebay concentration being higher than the reference area, a result more consistent with the other media. Nevertheless, Figure L-2F clearly shows much greater variability in the forebay samples, consistent with the source of PCBs being localized to specific samples within the forebay. Based on all available lines of evidence, sediment remains a medium of concern. **Follow-up DEQ Response:** Response acceptable. As a point of clarification, DEQ provided the comment with the intent to clarify that we don't think the sediment data indicates an absence of impacts for total PCBs. We concur with the selection of PCBs as the primary COPC and CPEC.	Comment noted. Since the statistical comparison results for PCBs were not used in the COI selection process and PCBs were carried forward into the risk assessment, the additional level of analysis using nonparametric tests is not considered to be necessary. Comment noted.
8.	**Page 8-9, Section 8.3.3, downstream sediments.** This section acknowledges that the number of downstream samples (six) is too small for statistical comparison. The section should explain why only six samples were collected downstream of the dam relative to the forebay and reference areas, where 18 and 19 were collected.	Clarification provided. The following text from the RI/FS MP will be added to this section in the RI: "The objective of the downstream sampling was to determine whether or not contaminated sediments from the Forebay may have migrated and accumulated in the Downstream area and whether further sampling might (cont'd)

8. (cont'd)		(cont'd) be needed to assess the potential contamination. Unlike the Forebay and Reference areas, a non-statistical sampling approach was implemented Downstream, whereby areas of the river most conducive to sedimentation were targeted for sampling (depositional areas identified by lower river velocities) in an attempt to collect from locations most likely to be impacted by Forebay sediment transport. During the post-removal in-water sampling that occurred in March 2008, sediment was collected from six Downstream locations. These samples were collected from 1,200 feet below the dam to approximately 26,500 feet (5.0 miles) downstream of the dam. All Downstream sediment samples were analyzed for the same chemicals that were analyzed in the Forebay and Reference areas: semi-volatile organic compounds (SVOCs) (including polycyclic aromatic hydrocarbons [PAHs]), metals, polychlorinated biphenyls (PCBs) as Aroclors, total petroleum hydrocarbons (TPH), and sediment quality parameters (i.e., total organic compounds [TOC] and grain size). See Section 9.6.1, which provides an evaluation of the Downstream sediment."
9.	**Section 9.1.** The upper prediction limit or maximum concentration from the reference area is used to screen erodible soil. This evaluation should be included as part of a source control evaluation, which will be necessary for the landfill and sandblast areas. In that evaluation, contaminant concentrations in erodible soils and catch basin sediment should be evaluated against screening levels presented in Appendix D in the Stormwater Evaluation Guidance found at this website: http://www.deq.state.or.us/lq/cu/stmwtrguidance.htm. In the event that exceedances of these screening levels are found, a review of best management practices will be needed to evaluate how to reduce contaminant releases to the river.	Comment Noted. The mass wasting/erodible soil pathway will be further evaluated in the Upland BHHRA and BERA (see the response to General Comment 9), and source control measures will be considered during the Upland OU FS.
10.	**Section 9.3.2.** Some constituents in groundwater (metals, VOCs) appear to be discharging to the river. Please clarify where these may be exceeding ambient water quality criteria (AWQC). We note that AWQC exceedances are significant issues under Oregon Administrative Rule.	Clarification provided. The direction of groundwater flow beneath the Sandblast Area is to the north and northwest (Section 3.1.3 and Appendix D). Groundwater data from the Sandblast Area was evaluated in further detail in Sections 11.2.4.2.5 and 12.3.4.1.2 (see Tables M-18, M-19, N-15, and N-20). While in Section 9.3.2, the lowest of the selected human health- and ecologically-based SLVs are compared to water data from the Sandblast Area AOPC, the relevant human health and ecological SLVs (cont'd)

10. (cont'd)		(cont'd) are used separately in the HHRA (Section 11) and ERA (Section 12). In these risk assessment sections, the COIs in exceedances of the SLVs for humans and aquatic organisms are more thoroughly evaluated and discussed. The following excerpt is from the HHRA, Section 11.2.4.2.5: "Only arsenic was retained as a COPC for the bioaccumulation pathway, even though it was only marginally higher than upgradient arsenic concentrations (Table M-20). The bioaccumulation potential for the remaining chemicals was considered to be negligible since they were not supported by evidence of bioaccumulation in the River OU (Section 11.3.4). However, the potential for bioaccumulation is best evaluated by review of the River OU data. Since arsenic was not selected as a site-related COPC for any of the River OU media (Section 11.3.4), it was not retained as a site-related COPC for this discharge and bioaccumulation pathway at the Sandblast AOPC (Table 11-2)." Additionally, in Section 11.3.4.1.3 of the HHRA, surface water data is evaluated for the potable use pathway and no COPCs were identified. The following excerpt is from the ERA, Section 12.3.4.1.2: "The toxicity ratio for cis-1,2-dichloroethene is only slightly greater than 1.0 (at 1.12, Table N-15), and since this is the only CPEC with a detection above the benchmark, no further investigation is recommended to assess the potential for adverse effects to aquatic organisms or wildlife that could be exposed to surface water that has been impacted by COIs in groundwater of the Sandblast Area AOPC. Arsenic is the only bioaccumulative COI that was retained as a CPEC due to the lack of SLVs that address the dietary pathway." Based on the findings of the HHRA and ERA, no further evaluation of COIs in groundwater from the Sandblast Area is necessary. However, as described in the response to Specific Comment 12 (below), concentrations of PAHs in direct push groundwater samples from the Sandblast Area will be added to the groundwater screening tables (cont'd)

10. (cont'd)	**Follow-up DEQ Response:** Arsenic in groundwater should not be dropped for the groundwater discharge pathway at the Sandblast AOPC based on the determination that arsenic was not selected as a site-related CPEC for the River OU data. Contaminants in water discharging above ecological and risk-based levels on a point basis and a Q=1 should be retained as CPECs. This applies to the sandblast area and landfill AOPCs. (See General Comment 9 on upland groundwater transport).	(cont'd) (HHRA Tables M-17, M-18, and M-19 and ERA Tables N-15 and N-20) to address the sampling data gap for PAHs in monitoring well data for this AOPC. In addition, future sediment samples collected in the former removal areas and bass samples collected from the entire Forebay as part of the initial FS sampling effort (please see response to General Comment 6 above) will be analyzed for all metals and PAHs. Comment noted. Arsenic in groundwater from the Sandblast Area did not exceed the surface water SLV protective of aquatic organism exposed through direct contact based on the UCL and Q=1 (toxicity quotient of 0.0202; Table N-15) or the maximum detected concentration and Q=1 (toxicity quotient of 0.06). Arsenic is potentially bioaccumulative in aquatic tissues, but was only identified as a COI in crayfish collected from the Forebay (not a COI in clams, sculpin, or smallmouth bass). The maximum detected concentration in crayfish is lower than DEQ's bioaccumulation SLVs protective of fish/shellfish, birds, and mammals. Therefore, arsenic is not a CPEC in groundwater from the Sandblast Area based on the evaluation of direct toxicity and bioaccumulation.
11.	**Page 12-42, Section 12.5.4, fish and shellfish.** The comparison of cadmium, lead and mercury in forebay to reference sediment is somewhat confounded by the fact that cadmium, lead and nickel are elevated in the some of the reference area bass. The tissue levels should be used to determine whether these substances are CPECs. We believe that considering the overall evidence in tissue, reference tissue samples and upland sources, cadmium, lead, and mercury should be retained as CPECs in sediment.	Comment noted. Concentrations of cadmium in Forebay and Reference Area sediment and bass tissue are below DEQs suggested default background concentration for cadmium in sediment (Table B-1 of DEQ 2007) and the ATLs protective of humans and wildlife. Concentrations of lead in sediment and bass tissue from the Forebay and Reference Area exceed the default background concentrations and ATLs in some samples. None of the bass samples collected from the Forebay exceed ATLs for lead, and none of the bass samples collected from the Reference exceed wildlife-based ATLs for lead. Sediment and bass tissue concentrations of mercury from the Forebay and Reference Area also exceed the default background concentrations and ATLs in some samples. However, concentrations of mercury in sediment of the Forebay versus the Reference area, and in tissue of the Forebay versus the Reference Area, are very similar. See the response to Specific Comment 32 (below). (cont'd)

11. (cont'd)		(cont'd) In the absence of ATLs for nickel, the evidence to support a conclusion that nickel is elevated in tissue is unclear (it is possible that "mercury" was the intended COPC for this statement). Based on this information, it is unclear whether or not a source of cadmium, lead, and/or mercury originates from Bradford Island. Therefore, future samples collected in the former removal areas as part of the initial FS sampling effort (please see response to General Comments 3 and 6) will be analyzed for all metals. If a contaminant source does exist upstream, these contaminants could potentially migrate downstream and impact Forebay media. As per CERCLA guidance, it is legitimate to account for ongoing upstream sources that could contribute to a site, as it is impossible to maintain remedial goals that are below upstream concentrations.
	Follow-up DEQ Response: This comment is directed to a larger problem identified in Specific Comment 15 that the selected reference location does not meet the definition of background per DEQ guidance. This is shown by the elevations of COI in sediment and tissue (e.g. metals) in the selected reference location of Cascade Locks and the location of the sampling near known industrial activities. Please specify that the selected background location is in fact anthropogenic (EPA, 2002) because there are "natural and human-made substances present in environment as a result of human activities". The selected upstream area is not a background location as outlined in DEQ rule as "the concentration of hazardous substance, if any, existing in the environment in the location of the facility before the occurrence of any past or present release or releases." Therefore, following CERCLA Guidance, all COIs including metals above risk levels should be retained as COPCs for further evaluation. CERCLA Guidance, states that chemicals above risk levels that also may be above reference locations are not removed from the risk assessment, but rather the full risk of these chemicals are determined in the risk assessment. EPA 2002 states "when concentrations of naturally occurring elements at a site exceed risk-based screening levels, that information should (cont'd)	Comment noted. A new upstream reference location or the previous reference location mentioned in the comment will not be incorporated into the revised RI for the reasons previously described in the original response to this comment. Additionally, the Reference area represents ambient conditions upstream of the Bradford Island Forebay. This allows for the comparison of potential contaminate contributions from upstream sources, so that the Forebay contaminate contributions can be assessed more accurately.

11. (cont'd)	(cont'd) be discussed qualitatively in the risk characterization" and "the COPCs retained in the quantitative risk assessment should include those hazardous substances, pollutants, and contaminants with concentrations that exceed risk based screening levels." However, background metals can be evaluated using the previous selected background location at RM 147 (RF-91 through RF-110), since these samples are away from known sources and meet the definition of DEQ background.	
12.	**Section 9.3.2, Page 9-18.** This section states that groundwater monitoring was limited to three PAHs. Is this a typo? With respect to TPH and PAHs in groundwater, the text is unclear. Is TPH currently or reasonably likely to reach seeps and impact the Columbia River?	Clarification provided. Text will be added to this section clarifying that groundwater samples from soil borings at the Sandblast Area were analyzed for the full analytical suite, while the monitoring well groundwater samples were only analyzed for a subset of those COIs. All TPH analytes (DRO, GRO, and RRO) were measured in monitoring well samples collected from the Sandblast Area, and DRO and GRO were detected. As stated in Section 9.3.2, lack of PAH groundwater data from monitoring wells in the Sandblast Area introduces a data gap for this AOPC. Three PAHs (benzo[b]flouranthene, benzo[k]flouranthene, and phenanthrene) were analyzed for in groundwater samples collected from monitoring wells, and benzo[b]flouranthene and phenanthrene were detected in 1 of 20 samples (5% detection frequency). All PAHs were analyzed for in direct push groundwater samples, and several detections were reported in these samples. The direct push groundwater data are considered to be of low quality for risk assessment due to matrix interferences (i.e., influence of particulate-related concentrations in unfiltered samples) and were not utilized in the HHRA and ERA. Only the monitoring well data were included in the risk assessments, for which both filtered and unfiltered data are available. However, the direct push groundwater PAH data will be evaluated for the Sandblast Area in the revised screening level tables (HHRA Tables M-17, M-18, and M-19 and ERA Tables N-15 and N-20) to address the sampling data gap for PAHs in monitoring well data for this AOPC. This approach will result in an overestimate of exposure to PAHs in approach will result in an overestimate of exposure to PAHs in groundwater potentially discharging to the River OU (assumed to be more bioavailable for uptake) due to the presence of suspended particulates in the direct push samples. The uncertainties introduced in the risk (cont'd)

12. (cont'd)	(cont'd) **Follow-up DEQ Response:** DEQ agrees with the approach to use the direct push groundwater PAH data in order to address the sampling data gap for the monitoring wells. However, please clarify the decision rules for evaluation of the data, if there are exceedances of applicable criteria.	(cont'd) assessments by using direct push groundwater will be discussed in the revised text. Comment accepted. If the direct push groundwater data from the Sandblast Area exceed SLVs, and the resulting toxicity quotients (based on Q=1) are greater than 1.5, then additional samples will be collected from monitoring wells to provide a more meaningful evaluation of these PAHs. Given the influence of the suspended solids in these direct push samples on the PAH concentrations detected, which leads to an overestimate of exposure, if toxicity quotients are between 1 and 1.5, it may be determined that additional sampling is not necessary. The direct-push data for the sub-set of PAHs will also be compared to human health SLVs. If exceedances are noted, additional considerations such as whether these are carcinogenic PAHs, whether suspended solids and other parameters which may affect PAH concentrations are present and so on, will be considered and a recommendation will be developed as to whether additional sampling is warranted.
13.	**Section 9.0 figures.** The forebay PCB congener profile distribution charts are difficult to interpret. The main conclusion from these appears to be that the majority of the total PCB concentrations in each matrix are attributable to a subset of PCBs. As an alternative presentation, we recommend that within each media, principle component analysis (PCA) score plots be produced for all the randomly collected samples, and that you color code forebay versus reference area samples. These would show the relative similarities (and differences) of each of the sampling locations. For these score plots, a subset of individual samples that are relatively different (i.e., "end members") can be selected and homologue profiles plotted for this subset of samples. In this way, the homologue profiles of samples that are known to be relatively different can be compared and the forebay samples can be compared to reference samples. This may also provide insight in a visual manner into which congeners have accumulated into tissue and could therefore merit consideration in any future monitoring program. An example PCA score plot for sediment is included below showing distinctiveness of samples nearest to Bradford Island. Homologue profiles for selected samples in sediment and fish tissue might also be compared using 3-D bar charts, where the third (cont'd)	Comment noted. The multivariate PCA analysis may provide additional insight into the PCB congener profiles; however, the associated results/plots may be difficult to interpret, and at times, may require subjective judgment. At present, the PCB congener profile distribution charts were considered to be part of an exploratory data analysis (EDA) effort. Given that information regarding the source of PCB was available through other aspects of site investigation, additional PCB profiling analysis based on multivariate statistical analysis was not deemed to be necessary to complete the current remedial investigation.

13. (cont'd)	(cont'd) dimension is the analytical matrix, (i.e., sediment vs. tissue).  **Follow-up DEQ Response:** Response acceptable. DEQ agrees with the response, and understands the absence of a need to source profile in the remedial investigation. The comment was intended as a suggested method to create a focused subset of figures that might be more informative to illustrate relative similarities and differences between samples. We also note that source profiling may potentially become a more relevant issue in the future as declining PCB concentrations approach some level at which the project may be considered "complete". The source profile or congener-specific ratios could have utility as an additional line of evidence in addition to central tendency comparisons because of the possibility that there may be a component of central tendency sourced from the site release, and these methods may allow a more refined understanding of PCB congeners in the River OU.	Comment noted.
14.	**Page 9-4, groundwater, seeps, and /or surface water.** Frequency of detection should not be applied to water, because aquatic life standards apply on a point basis.	Comment noted. Since DEQ guidance (DEQ 2001 and DEQ 2010b) allows for the removal of COIs detected at a frequency of less than 5% from further consideration, the RI only dropped COIs in a given medium if there were 20 or more samples. See Tables I-1, I-2, and I-5 in Appendix I. Twenty or more water samples are available for COIs in Landfill groundwater (Table I-1) and a subset of COIs in Sandblast Area groundwater (Table I-2) and, therefore, only these datasets were subjected to the 5% detection frequency screening. As discussed in the (cont'd)

14. (cont'd)	(cont'd) **Follow-up DEQ Response:** As indicated, DEQ guidance discussion is pulled from EPA guidance (see also Specific Comment 25), and the intention of the Department is to use frequency detection screening in identifying potential errors associated with the sampling, not chemicals known to be associated with the site. As EPA 1989 states in the evaluation of frequency of detection that "chemicals expected to be present should not be eliminated. The risk assessor should consider whether the chemical is expected to be present based on historical data or any other relevant information (e.g. known degradation products of chemicals present at the site, modeling results)". The text goes on to say "a chemical that is infrequently detected in soil (a potential groundwater contamination source) probably should not be eliminated as a site contaminant if the same chemical is frequently detected in ground water. In addition, infrequently detected chemicals with concentrations that greatly exceed reference concentrations should not be eliminated". Spatial application should be broad, so as not to confound data distribution and CSM analysis. Any removal based on frequency of detection must provide an analysis as to why the detection is believed to be in error, and information of detections in other media (soil, groundwater, seeps, surface water, tissue, etc.).	(cont'd) response to Specific Comment 23, bioaccumulative COIs detected in less than 5% of groundwater samples collected from the Landfill and Sandblast Area were compared to dietary-based SLVs protective of aquatic biota when available (Appendix O, Tables O.3-1 and O.3-2) as a precautionary measure. Comment accepted. The 5% detection frequency screening only applied to soil and groundwater of the Landfill and Sandblast Area (and soil of the combined AOPCs), as these are the only two AOPCs with 20 or more samples. Furthermore, to address concerns regarding spatial application, the combined dataset for all four AOPCs was evaluated for wide-ranging receptors. In addition to the bioaccumulative COIs in soil and groundwater of the Landfill and Sandblast Area that were eliminated based on the 5% detection frequency screening but were evaluated for ecological risk in Appendix O as a precautionary measure, all COIs in these media (regardless of their potential to bioaccumulate) will be included in Appendix O. An explanation as to why their removal does not influence the findings of the ERA will be provided, and any connections between COIs in soil that may influence concentrations of these same COIs in groundwater will be discussed.
15.	**Page 9-4, forebay random sediment samples.** Because the source area around Bradford Island is not densely sampled, and there may be COIs that are relatively spatially localized, we believe that COIs should not be eliminated solely using the frequency of detection rule for River OU samples (sediment, tissue). For example, Aroclor 1260 and phthalates were removed on this basis even though they were detected in other datasets not included in the RI, but presented in Appendix G. These two COIs can be found in the outfalls that drain the sandblast area and are relevant for source control to the River OU. Thus, the Appendix G data should be considered in COI selection to identify those contaminants that may not be sufficiently widespread to be detected in the random samples, but do have an upland source and spatially localized impacts in sediment.	Clarification provided. The first sentence of the first bullet (regarding detection frequency) will be deleted and replaced with the following text: "1. *Frequency* – Although DEQ guidance (DEQ 2001 and DEQ 2010b) allows for the removal of COIs detected at a frequency of less than 5% from further consideration, none of the River OU media samples had greater than 20 samples. Therefore, none of the COIs detected in the River OU media were removed from evaluation due to detection frequency." Source control will be evaluated in the Upland BHHRA and BERA, and considered during the Upland OU FS. Please note, as discussed in response to General Comment 6, historical River OU data were not used in the RI, with the exception of the bass and sucker data.

15. (cont'd)	(cont'd) **Follow-up DEQ Response:** See response to General Comments 3 and 6.	(cont'd) Comment noted.
16.	**Use of frequency of detection rule.** Frequency of detection should not be applied to tissue analysis. Crayfish, clam, sculpin, and bass samples represent localized exposure areas that should be carried forward if the contaminant concentrations exceed SLVs regardless of frequency of detection.	Clarification provided. See the response to Specific Comment 15. Although DEQ guidance (DEQ 2001 and DEQ 2010b) allows for the removal of COIs detected at a frequency of less than 5% from further consideration, none of the River OU media samples had greater than 20 samples. Therefore, none of the COIs detected in the River OU media were removed from the evaluation due to detection frequency.
17.	**Page 9-26 and 11-25, mercury.** Please clarify why mercury is not selected as "site-related", as there is a source of mercury in the sandblast area Upland AOPC, concentrations in forebay tissues were elevated over reference, and exceeded human health based screening values. **Follow-up DEQ Response:** Please see response to General Comment 10 with respect to mercury. DEQ agrees with the proposed approach for additional mercury sampling.	Comment noted. See the response to Specific Comment 11. Concentrations of mercury in Forebay sediments were demonstrated to be below Reference Area sediment concentrations based on the population to population statistical comparison. Concentrations of mercury in other Forebay media, such as bass, are also similar to Reference Area concentrations (Forebay range = 0.071 to 0.512 mg/kg and Reference range = 0.0548 to 0.333 mg/kg). As per CERCLA guidance, it is legitimate to consider upstream sources that could contribute to a site, as it is impossible to maintain remedial goals that are below upstream concentrations. It is unclear whether or not a source of mercury, and other metals, originates from the Upland portion of the site, including at the Sandblast AOPC. Therefore, future samples collected in the former removal areas as part of the River OU initial FS sampling effort will be analyzed for all metals. Comment noted.
18.	**Page 9-29, Section 9.6.4.** This section describes a correlation analysis of three parameters: PCBs, total organic carbon and percent fines in sediment. We suspect a more useful correlation may be PCBs, TPH and PAHs. **Clarification of DEQ Response:** This comment was directed at correlations in sediment, not upland source control. Upland source control will not address further analysis that may be needed to assess in-water sediment.	Comment noted. See the response to General Comment 9 regarding Upland source control. Comment noted. The suggestion to correlate PCBs, TPH, and PAHs in sediment of the Forebay will be considered in the FS.

19.	**Section 9.3.3, hazardous materials storage area.** The report emphasizes VOC levels in soil gas in samples SB-10 and SB-12. These are north of the hazardous materials storage area (HMSA). Note that the highest PCE concentration in soil (420,000 ug/kg, per Table 5-4b) was found at soil boring SBB18, which is south of the HMSA. With this in mind, the soil VOC data should be considered in addition to the soil gas results when considering future remedial action decisions for this area. Table 5-4c also indicates that PAH concentrations in soil are particularly high in portions of the sandblast area.	Comment noted. Additional discussion of the Sandblast Area is provided in Section 11.2.4.2, in which further evaluation of these COPCs in the baseline HHRA is recommended.
20.	**Page 11-38.** The text states "five specimens of large-scale sucker, collected by USACE in 2006, were archived. They were collected from two locations, the south shore of Cascade Island and the south shore of Bradford Island. These samples will be analyzed for the range of bioaccumulative and other site-related COIs requested by DEQ." Are there additional largescale sucker that have not been analyzed? **Follow-up DEQ Response:** The response indicates "the specimens were composited in order to generate enough tissue mass for analytical testing". Please clarify; DEQ does not recall that tissue mass requirements were a concern for largescale sucker.	Clarification provided. There are no additional largescale sucker samples that have not yet been analyzed. The text above will be modified to indicate the following: "As discussed in Section 6.2.1, in June and August 2006, the USACE used one sucker composite sample from the Forebay (URS 2008c). The sucker sample is the composite of the five specimens from two locations that were collected by USACE in 2006. The specimens were composited in order to generate enough tissue mass for analytical testing. The analytical results of the composite sample are included in Table 6-6 and were considered qualitatively in the risk assessments." Clarification provided. As stated in the response, the five individual sucker specimens were composited so that all of analyses that were conducted on the other species could be performed on the sucker.
21.	**Page 12-5.** The soil exposure media for birds should also be evaluated using surface soil (e.g. 0-1 foot). An exposure soil horizon of 0-3 ft. would not normally occur for birds, and the use of a the deeper horizon may dilute out risk at the surface. For example, only evaluating truly surface soil would be an important evaluation in the sandblast area.	Clarification provided. As shown in Tables N-3, N-8, N-13, N-18, N-43, and N-45 of Appendix N, both soil depth intervals (0 to 1 and 0 to 3 feet bgs) were evaluated for all terrestrial receptors. The text in Section 12.2.2 (Page 12-5) will be clarified as follows (see text in italics): "Rooting depths for plants and burrowing depths for invertebrates and mammals were assumed to occur within the upper 3 feet of soil, and it will be assumed that all terrestrial receptors are exposed to soils from this depth interval. This is a conservative assumption for birds, which typically do not burrow and forage on the ground surface, and mammals that burrow are more likely to consume organisms that are exposed to soils below the surface. *For plants, soil invertebrates, birds, and mammals,* the Landfill and Sandblast Area AOPCs were evaluated for both the surface (0-1 foot bgs) and shallow (0 to 3 feet bgs) intervals."

22.	**Page 12-8, Section 12.3.2.2, assessment endpoints.** A higher trophic level mammal, such as fox or mink, should be included in the evaluation. Is there evidence that predatory mammals would not be feeding on the terrestrial mammals (shrew, etc) on the island? **Follow-up DEQ Response:** An upper trophic level terrestrial mammal should be used to represent this guild for the risk assessment. For the upland risk assessment, a scenario could be added (separate of the in water exposure area) that evaluates a mink exposed to the upland areas of Bradford Island. Alternatively, a separate receptor such as a fox could be added to represent this pathway. In water exposure to the mink does not address the upland pathway. Quantitative changes are required to the screening tables for the upland AOPCs.	Comment accepted. Protection of higher trophic-level mammals (such as mink) that may forage in the Upland OU will be added to the assessment endpoints described in this section. Since the SLVs for mammalian receptors as a generic receptor class were already used in the screening-level ERA, no changes to the quantitative evaluation are necessary. Clarification is needed on the last statement in this comment. Soil SLVs protective of mammals (as a generic receptor group) were already applied in the ERA for the Upland AOPCs; therefore, it is unclear what quantitative changes are required to the Upland screening tables. In regards to adding a large terrestrial mammal to the assessment endpoints for the Upland OU, this request will be incorporated in the revised ERA. As the Upland OU has been recommended for a Level III BERA, identification of a specific large mammal is needed for purposes of the BERA. According to Section 3.5 of the Level I Scoping Assessment that was performed for the Landfill (URS 2002), which included a thorough biological characterization of the Landfill and all habitats on the island, "large mammalian predators do not occur on the island." The only mammals on the island that are mentioned in the Scoping Assessment are small mammals (rodents) and feral cats: "Although the island harbors small mammals, feral cats, Canadian geese, and other bird species, the minimal amount of available habitat (~12 acres) makes it unsuitable for supporting viable populations of wildlife species with larger home ranges." For this reason, large mammals were not included in the assessment endpoints described in the approved RI MP (URS 2007). However, because mink are present in the area and could feasibly access the island and forage there, exposure by this species through consumption of rodents will be included in the Level III BERA. The following information was identified regarding the mink's diet: • Crayfish most important mink food in Columbia River study area, followed by fish, birds, and mammals; of 7 taxa of mammals eaten by mink, bushy-tailed woodrats, microtines (rodents that eat primarily grasses and forbs, and pocket mice consumed most frequently (Henny, Grove, and Hedstrom, 1996) (cont'd)

22. (cont'd)		(cont'd) • Prey of mink in Lower Columbia River include small mammals (e.g., muskrat), fish (including crayfish), and birds; diet varies by season and is localized (Lower Columbia River Bi-State Program, 1996) • Assumption of 15% crayfish and 85% fish used for Portland Harbor; many studies cited that demonstrate range of prey consumed by mink, including muskrats, fish, frogs, crayfish, small mammals, and birds found near water; region-specific studies on dietary proportions not available (Lower Willamette Group, 2007) • Assumption of 90% fish and 10% terrestrial food chain used for derivation of mammalian wildlife values for bioaccumulative chemicals; proportion of mink's diet strictly from terrestrial sources can vary from almost none to one third of diet (EPA 1995); • River in Michigan (year round diet) – 85% fish, 7% crustaceans and amphibians, 6% birds and mammals, 1% vegetation, and 1% unidentified (EPA 1993) Based on the information gathered regarding carnivorous (large mammal) predators in the Upland OU, the mink is the selected receptor based on likelihood of presence and sensitivity to environmental contaminants. To be conservative, a dietary composition of 15% small mammals from the Upland OU will be assumed as a first step, even though a lower proportion may actually be more realistic for site conditions (i.e., permanent water source; riverine habitat). In addition, contribution from crayfish and fish from the river will be considered to provide a more comprehensive evaluation of the chronic exposure dose to this species. EPA. 1995. 23.	**Page 12-11, Section 12.3.3.3, Identification of CPECs.** Comparison between background and the site should be done for inorganics only. Frequency of detection should not be used to screen out COIs associated with known sources at Bradford Island. While DEQ is in the process of phasing out the frequency-of-detection screen, the objective (as cited in the report) is to really identify COIs that are infrequently detected (less than 5 percent of samples), that may be artifacts in the data due to sampling, analytical, or other errors and need not be selected as COPCs (DEQ 2000, 2010). In addition, the mixture of sources, analytical results and the heterogeneity of the source material relative to the sampling confound this evaluation. COIs found in localized areas still need to be evaluated for small home range receptors or those exposed on a point basis (e.g. plants, invertebrates). In addition, in Tables 9-1 to 9-6 where soils and groundwater were evaluated for frequency of detection, the data summary statistics are omitted for those where detection frequency was less than 5 percent. Therefore, an evaluation on the magnitude and occurrence of these chemicals could not be made. Number of samples and concentration statistics should be presented for these COIs. Identification of CPECs in the Tables appears to be based on a screening that considers a mixture of human health and ecological SLVs. It is difficult to review the adequacy of the SLVs with these tables. A master table showing a (cont'd)	Clarification provided. As described in the second paragraph of Section 12.3.3.3, "The objective of the statistical analysis was to assess whether the mean <u>inorganic</u> COI concentrations in soil within each AOPC, as well as the mean soil COI concentrations for all four AOPCs combined, were significantly higher than the mean Reference Area concentrations." Use of the 5% detection frequency rule concurs with DEQ guidance (2001, 2010b). This step of the screening process was also described in the agreed upon RI/FS MP (URS 2007) and follows precedent that has been set in ERAs for other sites lead by DEQ, including the Level II Screening Assessment that was previously performed for the Landfill AOPC (comment letter from Matt McClincy, previous DEQ PM, to Mark Dasso, USACE PM dated November 4, 2004). Only a few media in specific AOPCs (e.g., soil and groundwater of Landfill and Sandblast Area) were subject to this step, due to the absence of 20 samples for most media per AOPC. This approach was not applicable for any of the River OU media. As a precautionary measure, bioaccumulative COIs detected in less than 5% of soil (0 to 1 foot bgs and 0 to 3 feet bgs) and groundwater samples collected from the Landfill and Sandblast Area, but detected at least (cont'd)

23. (cont'd)	(cont'd) comprehensive list of human health and ecological screening values for water, soil and sediment should be presented along with the selected SLV.	(cont'd) once, were compared to dietary-based SLVs when available (Appendix O, Tables O.3-1 and O.3-2). As shown in these tables, the only COI omitted on the basis of detection frequency and detected above the SLV is 4,4'-DDE in groundwater at the Landfill AOPC (Table O.3-1). However, 4,4'-DDE was only detected at a single well (MW-03; Figure 5-1) at a concentration of 0.00246 µg/L, and down gradient wells closer to the River were all non-detect for 4,4'-DDE. The non-detect MDLs for 4,4'-DDE, which range from 0.00195 to 0.1 µg/L, all exceed the surface water benchmark of 0.001 µg/L, indicating that the theoretically based SLV is lower than analytical methods can achieve. In addition, as discussed in Section O.1.2, the assumption that aquatic organisms are exposed to undiluted groundwater concentrations is highly conservative. No sensitive plants or invertebrates are known to exist at the Site and, therefore, no further assessment of the COPC selection process based on the 5% rule is necessary. The data summary and statistics tables for all analytes are presented in Appendix I. The tables in Appendix J provide all of the human health- and ecologically-based SLVs for all media evaluated in the RI. The selected SLVs are presented in these tables, as well as all sources of SLVs considered. In Section 9.0 (Nature and Extent), the lower of the final selected human health- and ecologically-based SLVs were used in the third step of the screening process, while in Sections 11 (HHRA) and 12 (ERA) only the human health- or ecologically-based SLVs were used, as appropriate, for the final selection of COPCs and CPECs, respectively.
	Follow-up DEQ Response: The appropriate exposure point concentration for plants and invertebrates is point by point and therefore frequency of detection over a larger area does not apply. Alternative information can be provided if a particular detected analyte is believed to be in error (e.g. see response to Specific Comment 14. DEQ requests that all COIs removed due to frequency of detection or Q=5 should be added to tables of data summary statistics as this provides important information on detections across different media.	Comment accepted. See the responses to Specific Comment 14, and Specific Comments 24 and 25. The tables presented in Appendix I provide summary statistics for all AOPCs, including detection frequency.

24.	**Page 12-12, Section 12.3.3.3.1 and 12.3.3.3.2.** A multiplier of 5 should not be used for water media. (Refer to the note at the beginning of section II of DEQ's *Guidance for Ecological Risk Assessment: Levels I, II, III, IV*: "In Task 9(c), page II-8 of the Level II Ecological Risk Assessment Guidance, please note that the Q = 5 guidance applies only to soil, and does not apply to water and sediment. Until other screening level values become available, water and sediment screening should be done using the SLVs provided in Tables 1 and 2.") This reason for the multiplier in DEQ guidance is to estimate a lowest observed effect concentration (LOAEL) based on a no observed effect concentration (NOAEL). NOAELs are used to screen threatened and endangered species, whereas LOAELs are used to screen for population level effects. Water SLVs are typically based on AWQC values, which are community-based toxicity values. For plants and invertebrates, the toxicity values are more commonly based on Maximum Acceptable Toxicant Concentrations (MATC) and therefore the 5 x factor does not apply. (cont'd)	Comment regarding first part accepted (about aquatic organisms and benthic invertebrates exposed to water/sediment), and comment noted regarding second part (about terrestrial plants and invertebrates exposed to soil). For aquatic and benthic organisms, Q=1 will be used to identify CPECs, and Q=5 will be maintained to identify CPECs for terrestrial plants and invertebrates**.** Toxicity ratios based on both Q=1 and Q=5 were provided in the screening tables created for soil, water, and sediment for plants and soil invertebrates, aquatic organisms, and benthic invertebrates, respectively. To accommodate DEQ guidance, the columns presenting toxicity ratios based on Q=5 will be deleted from the water and sediment tables for aquatic organisms and benthic invertebrates. Identification of CPECs for aquatic organisms is already based on Q=1 and, therefore, the findings for water will not change (e.g., Table N-5). Additional CPECs may be identified for benthic invertebrates, as Q=5 was used to identify CPECs for this receptor group. Based on the absence of threatened and endangered, or otherwise protected, species in the Upland OU, use of a Q=5 to identify CPECs for plants and soil invertebrates complies with DEQ guidance (2001) and the agreed upon RI/FS MP (URS 2007). This approach also follows precedent that has been set in ERAs for other sites led by DEQ, including the Level II Screening Assessment that was previously performed for the Landfill AOPC (comment letter from Matt McClincy, previous DEQ PM, to Mark Dasso, USACE PM dated November 4, 2004). Additionally, plant and soil invertebrate SLVs are based on different toxicity endpoints depending on the SLV source, and mainly include the EcoSSLs derived from a geometric mean of the effective concentration that affects 20% of the test population (EC_{20}), effective concentration that affects 10% of the test population (EC_{10}), or MATCs (EPA 2005), or DEQ's SLVs derived from an EC_{20} (DEQ 2001; Efroymson et al. 1997). Plant and soil invertebrate SLVs from these sources are intended for screening purposes and are intentionally conservative. No additional evaluation for plants or soil invertebrates is warranted for this site. (cont'd)

24. (cont'd)	(cont'd) **Follow-up DEQ Response:** A Q=5 should not be used for plant and invertebrate SLVs based on MATCs (Maximum Acceptable Toxicant Concentrations). A Q of 5 can be used for SLVs derived with a no observed adverse effect level (NOAEL) where threatened and endangered species are not present.	(cont'd) Comment accepted. The SLVs potentially based on MATCs (i.e., the geometric mean of the NOAEL and LOAEL) are EPA's EcoSSLs for the following COIs: arsenic, cadmium, cobalt, copper, lead, manganese, nickel, pentachlorophenol, selenium, silver, zinc, Total LPAHs, and Total HPAHs. Although DEQ's 2001 guidance explicitly states that a Q=5 may be used for species that are not threatened or endangered, and does not exclude plants and soil invertebrates, a Q=1 will be used for these receptor groups. However, the concept of using LOAEL-based benchmarks for non-threatened and endangered plants and soil invertebrates will be incorporated in the weight of evidence for assessing risk to these receptor groups.
25.	**Page 12-13, Section 12.3.4.1.1, landfill AOPC – Individual and multiple CPEC Table N-1** and Table O.3-10**:** • Plants: For plants, all COIs should be screened on a sample by sample basis, consistent with the appropriate exposure point concentration. o Plant values should not be multiplied by 5 since they are based on maximum acceptable toxicant concentrations. • Soil Biota: o TPH: Use 100 mg/kg for gasoline range and 200 mg/kg for diesel range TPH screening levels (Washington DOE, MTCA Table 749-3). o Eco SSL (soil screening level) values for Total LPAHs and Total HPAHs should have been used for evaluating each individual PAH and the total values. The values are 29 mg/kg total LPAHs and 18 mg/kg total HPAHs. This will change the results of the risk screening for individuals. • Birds: o SLVs: If a national Eco SSL is available, this value should be used instead of DEQ Level II SLVs. This was discussed in the planning process. This will change the SLVs for lead and zinc. (cont'd)	Plants: Comment noted. Maximum COI concentrations were used to assess risk to plants per ERA guidance (DEQ, 2001). This approach also follows precedent that has been set in ERAs for other sites lead by DEQ, including the Level II Screening Assessment that was previously performed for the Landfill AOPC (comment letter from Matt McClincy, previous DEQ PM, to Mark Dasso, USACE PM dated November 4, 2004). Neither DEQ nor EPA guidance requires the screening level risk assessment to be conducted on a sample by sample basis. o Comment noted. See the response to Specific Comment 24. • Soil Biota: o Comment noted. This is not one of the SLV sources identified in the 22 April 2010 Memorandum (see page 3). Individual components of TPH that represent the most toxic chemicals contained in petroleum mixtures (i.e., PAHs, metals, VOCs) were screened to assess risk to soil biota for the reasons described in Section O.3.1.5. o Comment noted. The screening of soil biota included the screening of individual PAHs to the LPAH and HPAH SLVs; however, none of the individual SLVs exceeded the total SLVs. See Tables N-2 and N-12. (cont'd)

25. (cont'd)	(cont'd) o DDT and metabolites (DDE and DDD and total DDX): There is an EPA Eco SSL available of 0.093 mg/kg, which should have been used. This was discussed during planning. This will change the results of the screening. o Eco SSL values for Total LPAHs and Total HPAHs should have been used for each individual PAH and the total values. The values are 29 mg/kg total LPAHs and 18 mg/kg total HPAHs. This will change the results of the risk screening for individuals. o TPH: Use 5,000 mg/kg for gasoline range and 6,000 mg/kg for diesel range, except that the concentration shall not exceed residual saturation at the soil surface (WA DOE, MTCA Table 749-3). • Mammals: o Butyltins: A Region 5 Ecological Screening Level is available for total butyltins for a shrew: 7,620 ug/kg. o DDT and metabolites (DDE and DDD and total DDX): There is an EPA Eco SSL available of 0.021 mg/kg, which should have been used. This was discussed during planning. o TPH: Use screening levels of 5,000 mg/kg for gasoline range and 6,000 mg/kg for diesel range, except that the concentration shall not exceed residual saturation at the soil surface (WA DOE, MTCA Table 749-3). o PCBs: DEQ's Level II SLVs do not address bioaccumulation. Therefore, they can only be used to address direct toxicity. The data must also be screened based on a bioaccumulation value. EPA Region 5 ecological screening levels include a SLV of 0.332 ug/kg for the shrew. ORNL PRGs should also be considered. The PRG for the shrew is 0.371 mg/kg. (cont'd)	(cont'd) • Birds: o Clarification provided. EPA Eco SSLs were the preferred source of SLVs for terrestrial receptors; however, for lead and zinc (among other metals) the reference area UPL was selected as detailed in Appendix J of the RI (higher of SLV and reference UPL for inorganics). See Table J-5 in Appendix J. o Clarification provided. EPA Eco SSLs were the preferred source of SLVs for terrestrial receptors. The EPA Eco SSL for DDT and metabolites was used in the avian screening. See Table J-5 in Appendix J. Also see Tables N-3 and N-13. o Clarification provided. There are no EPA Eco SSLs for PAHs available for birds. The SLVs listed in this comment are for soil invertebrates. Based on discussions with Jennifer Peterson, as documented in an email from Usha Vedagiri to Paul Seidel and Jennifer Peterson (December 10, 2009), PAHs were dropped from quantitative risk estimation for all bird receptors due to the lack of reliable TRVs. o Comment noted. This is not one of the SLV sources identified in the 22 April 2010 Memorandum (see pages 3 and 5). Also see Table J-5 in Appendix J. Individual components of TPH (the most toxic chemicals contained in petroleum mixtures) for which reasonably reliable SLVs are available (i.e., metals, SVOCs) were screened to assess risk to birds for the reasons described in Section O.3.1.5. • Mammals: o Comment noted. This is not one of the SLV sources identified in the 22 April 2010 Memorandum (see pages 3 and 5). Also see Table J-5 in Appendix J. (cont'd)

25. (cont'd)	(cont'd) o Since EPA Region 5 provides additional SLVs for soil, these should be used in evaluating the data: ▪ Bis (2-ethylhexyl phthalate) is 0.95 mg/kg. ▪ Di-n-butyl phthalate 0.150 mg/kg di-n-octyl phthalate 709 mg/kg ▪ Diethyl phthalate 24.8 mg/kg ▪ Butylbenzyl phthalate 0.239 mg/kg	(cont'd) As stated in Section 12.3.5 of the RI and in Section O.3.1.6 of Appendix O, those COIs without dietary based SLVs (listed in Table O.3-10) were retained as CPECs for the Landfill and Sandblast Area AOPCs and warrant further consideration for birds and mammals in the Level III BERA for the Upland OU. EPA Region 5 TRVs, as well as other sources of TRVs, and their uncertainties will be considered in the BERA. o Clarification provided. EPA Eco SSLs were the preferred source of SLVs for terrestrial receptors. The EPA Eco SSL for DDT and metabolites was used in the avian screening. See Table J-5 in Appendix J. Also see Tables N-4 and N-9. o Comment noted. This is not one of the SLV sources identified in the 22 April 2010 Memorandum (see pages 3 and 5). Also see Table J-5 in Appendix J. Individual components of TPH (the most toxic chemicals contained in petroleum mixtures, i.e., PAHs, metals, VOCs) were screened to assess risk to mammals for the reasons described in Section O.3.1.5. o Clarification provided. EPA Region 5 SLVs are not one of the SLV sources identified in the 22 April 2010 Memorandum (see pages 3 and 5). ORNL PRGs, which do account for dietary exposure, were used in the ERA, and the PRG for PCBs of 0.371 mg/kg was the selected SLV for evaluating risk to mammals. See Table J-5 in Appendix J. Also see Tables N-4 and N-9. o Comment noted. EPA Region 5 SLVs are not one of the SLV sources identified in the 22 April 2010 Memorandum (see pages 3 and 5). See Table J-5 in Appendix J. As stated in Section 12.3.5 of the RI and in Section O.3.1.6 of Appendix O, those COIs without dietary based SLVs (listed in Table O.3-10) were (cont'd)

25. (cont'd)	(cont'd)	(cont'd) retained as CPECs for the Landfill and Sandblast Area AOPCs and warrant further consideration for birds and mammals in the Level III BERA for the Upland OU. EPA Region 5 TRVs, as well as other sources of TRVs, and their uncertainties will be considered in the BERA.
	Follow-up DEQ Response:	
	• **Appropriate exposure point concentration.** For "plants, aquatic, and soil invertebrates that are immobile or nearly immobile, the maximum detected concentration (MDC) in soil or sediment is the appropriate value for comparison" to the screening level value (DEQ, Guidance for Ecological Risk Assessment: LEVELS I, II, III, IV, 2001). Therefore, screening must be completed on a sample-by-sample basis. The screening should identify which samples and how many samples exceed screening levels.	Comment noted. The MDC was used as the EPC for immobile or nearly immobile receptors, as per the guidance. The guidance does not state that a sample by sample comparison is necessary for all COIs, especially if the MDC does not exceed the SLV. Figures were created illustrating SLV exceedances for immobile receptors for many CPECs; primarily those CPECs with elevated concentrations at more than one sample location (e.g., Figures 12-6, 12-7, 12-11, 12-12, 12-16, and 12-17).
	• **Additional SLVs.** It was not possible to identify the complete list of COIs and SLVs in upfront discussions without submission of a work plan screening level table for DEQ review. Based on the risk assessment, these additional SLVs are presented here and allow for COIs to be evaluated in a risk based context. Unless there is a technical problem with the cited SLV sources, these should be used in the risk assessment. Uncertainties can be discussed in the uncertainty section.	Comment accepted. The additional SLVs will be used in the absence of a value that was already included in the hierarchy of sources approved by DEQ prior to completion of the RI/RA, with the exception of the WA DOE SLVs for TPH. In other words, the SLVs recommended by DEQ will be used for COIs that were retained as CPECs based solely on the fact that a SLV was not available. Due to the low confidence in SLVs for TPH for purposes of blanket application to sites with petroleum hydrocarbons, the chemical indicator approach whereby the most toxic components of TPH mixtures (e.g., VOCs and PAHs) are used to assess risk will be maintained. If the potential for risk is demonstrated for the indicator chemicals, then an evaluation of TPH results along with results for these indicator chemicals will be performed in the FS to confirm co-location.
	• **DDT and metabolites for birds and mammals.** The original comment indicated that the SLV should be compared to a Total DDX value (total of all DDD, DDE and DDT isomers) and not just comparisons of individual isomers to the SLV. Please revise.	Comment accepted. All detected DDT isomers in soil of the Landfill and Sandblast Area will be summed to generate a value for Total DDTs, which will be compared to the receptor-specific EcoSSLs.
	• **PCBs.** Agree with response.	Comment noted.

26.	**Table N-5, Identification of CPECs in Groundwater, Seep Water and Surface Water.** Please use the following hierarchy of SLVs for water: • 1.) National Ambient Water Quality Criteria (NAWQC), hardness adjusted to 25 mg/L calcium carbonate for hardness dependent COIs • 2.) Tier II Chronic Values from Suter and Tsao, 1996 (ORNL) 3.) EPA, 2003. Final Chronic Values (FCV) for PAHs. The outdated DEQ values for acenaphthene and naphthalene should not be used. • 4.) EPA, 2006b, EPA Region III BTAG, Freshwater Screening Criteria References: Suter and Tsao, 1996. Toxicological Benchmarks for Screening Potential Contaminants of Concern for Effects on Aquatic Biota: 1996 Revision EPA, 2003. Procedures for the Derivation of Equilibrium Partitioning Sediment Benchmarks (ESBs) for the Protection of Benthic Organisms: PAH Mixtures. Table 3-4 • EPA, 2006, Region III BTAG, Freshwater Screening Criteria, http://www.epa.gov/reg3hwmd/risk/eco/btag/sbv/fw/R3_BTAG_FW_Benchmarks_07-06.pdf **Follow-up DEQ Response:** • National Ambient Water Quality Criteria must be hardness adjusted. Please revise. (cont'd)	Comment noted. This is not the agreed upon hierarchy for water SLVs, as presented in the 22 April 2010 Memorandum (see pages 3 and 6). However, the agreed upon hierarchy, which is provided in Section J.2.3 of Appendix J, is similar to the hierarchy described in this comment and the latest NAWQC (EPA 2009) were the preferred source of SLVs for water. Comment accepted. The AWQC for cadmium, chromium, copper, lead, nickel, and zinc will be adjusted for a site-specific mean hardness value of 60 mg/L (as calcium carbonate). This mean hardness value is based on 11 surface water samples collected in April 2003: 8 from the Forebay (pre-sediment removal), 1 from the vicinity of Goose Island, and 2 from the former reference location (RM 147). Hardness data for these 11 samples range from 56 to 64. The selected hardness value of 60 mg/L is supported by a 2008 USFWS study that reported a mean hardness value for the Columbia River of 64 mg/L. (cont'd)

26. (cont'd)	(cont'd) • DEQ's outdated values for acenaphthene and naphthalene should be replaced with risk based values. These are currently not listed in DEQ's table 33A. ORNL Tier II values should be used for these chemicals instead. • National Ambient Water Quality Criteria for isomers of DDT apply in addition to individual isomers or congeners. Therefore, the sum of DDT, DDE and DDD should be screened against 0.001 ug/L.	(cont'd) USFWS. 2008. Columbia River Basin Asian Carps Risk Evaluation. February. Comment accepted. There is no Tier II chronic value for acenaphthene, only for naphthalene (Suter and Tsao, 1996). However, the more up-to-date freshwater chronic values presented in EPA 2003 will be used as SLVs to be protective of aquatic biota: acenaphthene (55.85 ug/L) and naphthalene (193.5 ug/L). Comment accepted. All detected DDT isomers in groundwater of the Landfill and Sandblast Area will be summed to generate values for Total DDTs, which will be compared to the chronic AWQC.
27.	**Page 12-5, Section 12.3.4.1.2, sandblast area AOPC (Tables N-11 through N-15).** Please refer to the comments for the landfill area on SLVs.	Comment noted. See the responses to the SLV-related comments for the Landfill AOPC above.
28.	**Page 12-42, Section 12.5.4, Benthic Invertebrates.** The removal of the sediment datasets except the random 18 samples reduces the areas that can be evaluated for benthic invertebrates. Sediment pore-water concentrations and river sediment at outfalls are relevant for butyltins but not included in the screening. For example see Table G-2e (dibutyltin and monobutyltin detected in porewater at 0.0820 ug/L and 0.570 ug/L, respectively) and Table G-7 as well as samples SBDS-18, SBDS-19, SBDS-24. At S1-43, dibutyltin was found at 4.60 ug/kg and tributyltin at 13 ug/kg. **Follow-up DEQ Response:** Please see response to Specific Comment 3 and 6. Areas outside the former removal action areas must be considered.	Comment noted. As discussed in the response to General Comment 6, initial FS samples collected in the former removal areas as part of the River OU FS will be analyzed for butyltins to better characterize this area of the Forebay. These data will be especially useful for understanding exposure conditions for the benthic community adjacent to the island. Comment noted. See the responses to General Comments 3 and 6.
29.	**Page 12-42, Section 12.5.4, Table N-50, Aquatic Organisms.** Please see comments above for groundwater / seep water for the hierarchy for water SLVs.	Comment noted. See the response to the SLV comments for groundwater/seep water, above (Specific Comment 26).
30.	**Page 12-42, Section 12.5.4, Table N-51, Fish and Shellfish:** (cont'd)	• Comment accepted. Please see the responses to General Comments 11 and 12, above (TEQs will be included in the risk (cont'd)

30. (cont'd)	(cont'd) • Dioxin-like PCB congeners in tissue need to be screened on a total TEQ basis against the 2,3,7,8-TCDD value in DEQ guidance for aquatic biota of 0.00646 ug/kg or 6.46 ng/kg. TEQ needs to be calculated for each sample. If the total TEQ screens in, then all dioxin-like congeners need to be carried forward. In Table N-51 an SLV of 430 mg/kg is used for all dioxin-like congeners and total PCBs, which inappropriately screens out PCBs. All dioxin-like congeners should be screened; Table N-51 only has a reduced list. • PAHs: DEQ's PAH screening list was developed based on PAHs that are detected regionally. However, PAHs detected on a site-specific basis in tissue are considered bioaccumulative. • The largescale sucker data are presented in Table 6-6a but are not included in the screening tables or conclusions. Even though there is only one composite sample of these fish, these data are appropriate for a screening level risk assessment and should be added to the screening tables for fish and piscivorous birds and mammals. • Sculpin analysis was limited to four metals (arsenic, cadmium, lead and mercury) and PCBs. These were not analyzed for PAHs or phthalates. We acknowledge that this was due to limited availability of sculpin. However, this represents a significant data gap. During future monitoring, an effort should be made to collect and analyze sculpin for all COIs (metals, PAHs, TPH, phthalates and PCBs).	(cont'd) assessment and will be screened against the TEQ SLV). Similar methodology used to calculate the sum 209 Congeners total will be used to calculate the TEQs based on all 12-dioxin like congeners. To clarify, the SLV of 430 µg/kg (i.e., DEQ's CTL for total PCBs as Aroclors) was used to screen total PCBs and the dioxin-like PCB congeners in the absence of CTLs for each individual dioxin-like PCB congener. In the revised Tables N-51 (Forebay fish/shellfish screening) and N-71 (Goose Island fish/shellfish screening), the SLV of 0.00646 µg/kg for the total TEQ based on 2,3,7,8-TCDD will be compared to the total PCB TEQ concentration. The individual dioxin-like PCBs concentrations will not be screened against the SLV for total PCBs of 0.43 µg/kg, but the concentrations of the individual dioxin-like PCBs will remain in the table for informational purposes. • Clarification provided. As shown in Tables J-6 and J-7, all PAHs were identified as bioaccumulative, except naphthalene, based on DEQ and EPA guidance and following the agreed upon approach for identifying bioaccumulative COIs in the 22 April 2010 Memorandum (see page 8). • Comment noted. As agreed upon and outlined in the 22 April 2010 Memorandum, the single sucker composite was evaluated qualitatively in the screening level RAs (see pages 12 and 13). In Table O.1-1 of Appendix O, the sucker data were compared to the smallmouth bass data collected from the Forebay to verify that COI concentrations in bass are higher than in suckers. Of the 58 COIs measured in both bass and sucker tissue (metals, PCBs as congeners and Aroclors, and SVOCs, including PAHs), nine were detected at a higher concentration in sucker tissue based on a comparison of the maximum detected concentration in bass versus the concentration in the sucker sample (PCB 169, (cont'd)

30. (cont'd)	(cont'd) **Follow-up DEQ Response: Largescale sucker.** The largescale sucker should be included as a receptor of concern, just as bass and sculpin, and screened in the risk assessment. Since this species is a separate receptor of concern, it should be included in the main document and not considered only in the uncertainly section. Largescale sucker tissue concentrations should be compared to both DEQ critical tissue levels (CTLs) and acceptable tissue levels (ATLs).	(cont'd) benzo[k]fluoranthene, indeno[1,2,3-cd]pyrene, pyrene, aluminum, cadmium, cobalt, lead, and vanadium). With the exception of PCB 169, which was not detected in bass tissue or in any other media sampled in the Forebay or the upstream Reference Area, the concentrations of the remaining eight COIs in sucker tissue are remarkably similar to the maximum concentrations in bass tissue. A screening evaluation of the sucker data will be added to the uncertainty section in the revised RI (Appendix O). On this basis, it is assumed that evaluation of bass, which are expected to exhibit higher site fidelity, is assumed to be protective of humans and wildlife that consume fish. • Comment noted. Appropriate future monitoring, if any, will be determined as part of the River OU FS. Comment noted. Large-scale sucker tissue concentrations will be compared to both CTLs and ATLs, and this evaluation will remain in Appendix O. The large-scale sucker was not one of the fish species identified for inclusion in the RAs in the RI/FS MP, but was analyzed at the specific request of DEQ after the RI/FS MP was approved. It was agreed that this species would be analyzed to verify the assumption that the smallmouth bass is the most appropriate and conservative species for purposes of the RA, and this agreement was upheld by including an evaluation of the sucker data in the uncertainty section.
31.	**Page 12-43, 12-44, Piscivorous Birds, Tables N-52-N-56.** Total dioxin TEQ for birds, mammals and fish needs to be compared to the 2,3,7,8-TCDD screening level for each species group in DEQ guidance (this comment applies to all tables) including sediment and acceptable tissue levels (ATLs). ALL dioxin-like PCB congeners need to be carried forward where TEQ exceeds the SLV. ALL 12 dioxin-like congeners (not a reduced list of 7) need to be included and a total TEQ for birds, mammals and fish calculated. If total TEQ screens in, then all dioxin-like congeners need to be carried through the screening. Analytes detected in tissue should not be screened out based on a comparison between site and reference <u>sediment</u>. Instead, tissue-to-tissue comparisons (cont'd)	Comment noted. Please see the response to General Comments 11 and 12, above (TEQs will be included in the risk assessment). Please see the responses to General Comments 3 and 6 and Specific Comment 11, which indicate that initial FS samples collected in the former removal areas as part of the River OU FS will be analyzed for all metals. None of the bass samples collected from the Forebay exceed ATLs for lead, and the evidence to support a conclusion that nickel is elevated in tissue is unclear considering the absence of ATLs for nickel. It is unclear whether or not a source of nickel or lead originates from the site, and future sampling efforts are planned to investigate this issue. (cont'd)

31. (cont'd)	(cont'd) should be made between an appropriate background area and site. However, tissue comparisons are confounded for this site given that the selected reference area is elevated in metals (e.g., smallmouth bass nickel concentrations were detected up to 1,480 ppb, and lead was found up to 1,810 ppb). • TEQ from all dioxin-like PCB congeners needs to be calculated and screened against the 2,3,7,8-TCDD screening level sediment SLVs and tissue ATLs. • Table N-53 and N-54: The only tissue compared to bird ATLs are smallmouth bass. Bird exposure to other tissue such as sculpin, crayfish and largescale sucker should have been evaluated. Birds other than osprey and eagle will feed on crayfish and provide different spatial resolution than the bass. Largescale sucker data, while more limited, provides additional information on other guilds of fish that have also have a different habitat use than the bass. **Follow-up DEQ Response: Identification of tissue COPCs.** As mentioned in previous comments, uncertainties related to the use of only forebay-wide sediment data in the risk assessment results in uncertainty in evaluations between sediment and tissue. Smallmouth bass primarily use the habitat around the island, but contaminants detected in tissue were not evaluated using co-located sediment data from the source areas. Therefore, COPCs in tissue cannot be eliminated based only on the fact that they are not also determined to be a forebay-wide sediment COPC.	(cont'd) • Comment accepted. Please see the responses to General Comments 11 and 12, above (TEQs will be included in the risk assessment). • Comment accepted, in part. Although the approach used to evaluate aquatic-dependent birds concurs with the methodology for the ERA described in Appendix C of the RI/FS MP (URS 2007), sculpin and crayfish will be added to the screening tables for birds. Physical conditions in the river may hinder access to these food sources in many areas of the Forebay, including the northshore of Bradford Island, but wading birds (e.g., heron) could forage in areas along the Forebay shoreline where water is shallower and moves slower. Please see the response to Specific Comment 30 regarding evaluation of the largescale sucker sample. Comment noted. Regardless of the phased screening approach used to identify COPCs and CPECs in tissue, all chemicals will be analyzed for in sediment and clams collected from the north side of the island and bass tissue collected from the Forebay and Reference Area (PCBs [Aroclors and congeners], metals, PAHs, pesticides, butyltins, and SVOCs). If the results of these analyses indicate a potential source of contamination for tissue that was overlooked based on evaluation of the random Forebay datasets included in the RI/RA, the list of tissue COPCs and CPECs may be modified to reflect the new information. All chemicals detected in tissue based on the results of the forthcoming pre-FS sampling effort that are greater than DEQ's ATLs and CTLs will be considered for continued monitoring in the FS.
32.	**Page 12-44, Piscivorous Mammals, Tables N-57 through N-58:** • Phthalate screening levels are not available in DEQ's bioaccumulation guidance. What is the reference for these SLVs? • TEQ from all dioxin-like PCB congeners needs to be calculated and screened against the 2,3,7,8-TCDD screening level sediment SLVs and tissue ATLs. (cont'd)	• Clarification provided. Please refer to Section J.2.4 of Appendix J, which describes the ATLs that were calculated for phthalates detected in crayfish and smallmouth bass. These ATLs were estimated by applying DEQ's methodology for ATL development (2007) and using mammalian TRVs from the Oak Ridge National Laboratory (Sample et al 1996) to calculate ATLs for piscivorous mammals (see Tables J-3). Mink and (cont'd)

32. (cont'd)	(cont'd) • Mercury was significantly higher in site bass tissue when compared to the reference area. Therefore, mercury should be retained as a COPC in future sampling. • PAHs detected in fish and shellfish tissue should be evaluated with appropriate toxicity information. The use of pyrene as a surrogate for HPAHs is not representative of the toxicity of the HPAH group. EPA Eco SSL TRVs should be used to develop an acceptable tissue levels applied to tissue concentrations for protection of mammals. For example, the Eco SSL TRV is 65.6 mg dw/kg bw/d [milligrams as dry weight per kilograms of body weight per day] for LPAHs and 0.615 mg dw/kg bw/d for HPAHs.	(cont'd) great blue heron were used as endpoint species to be consistent with the ATLs used from DEQ's guidance (2007); exposure factors for the mink and heron from DEQ's guidance were used. • Comment accepted. Please see the responses to General Comments 11 and 12 (TEQs will be included in the risk assessment). • Comment noted. See the response to Specific Comment 11. Concentrations of mercury in Forebay and Reference Area sediment (Forebay range = 0.008 to 0.373 mg/kg and Reference range = 0.041 to 0.225 mg/kg; Table L-4) and bass (Forebay range = 0.071 to 0.512 mg/kg and Reference range = 0.0548 to 0.333 mg/kg) are very similar, and sediment concentrations of mercury in the Forebay were demonstrated to be below Reference Area sediment levels. To better understand the concentrations of mercury in the former removal area, initial FS samples collected as part of the River OU FS will be analyzed for mercury (see the responses to General Comments 3 and 6). The smallmouth bass samples that will be collected from the Forebay and Reference Area as part of this effort will also be analyzed for mercury. As per CERCLA guidance, it is legitimate to consider upstream sources that could contribute to a site, as it is impossible to maintain remedial goals that are below upstream concentrations. • Comment noted. This is not the agreed upon SLV screening approach based on discussions with Jennifer Peterson, as documented in an email from Usha Vedagiri to Paul Seidel and Jennifer Peterson (December 10, 2009). Since the detected concentrations of PAHs in fish and shellfish are so low, it is unlikely that utilizing a different surrogate mammalian TRV would result in different conclusions in the ERA. The current toxicity ratios, or R_{Bacs}, for mammals based on consumption of crayfish, sculpin, and bass from the Forebay containing PAHs and protection at the individual level range from $1.2x10^{-8}$ to (cont'd)

32. (cont'd)		(cont'd) 0.00006. The R_{Bacs} for mammals calculated from Goose Island crayfish and sculpin tissue concentrations range from $1.2x10^{-8}$ to $4.3x10^{-6}$. In addition, the EcoSSL TRVs were compiled by EPA from a database of TRVs in which aquatic-related studies on mammals (e.g., mink) were specifically omitted from the final list of TRVs used to ultimately derive the TRV that was incorporated into the EcoSSLs. EPA specifically states that the "wildlife TRVs are derived for use in assessments conducted for a terrestrial rather than aquatic environment" (EPA 2005). For this reason, using the EcoSSL TRVs for mammals exposed to HPAHs and LPAHs is not expected to reduce the level of uncertainty in the assessment of risk to mammals from consumption of aquatic fish/shellfish tissue. The Portland District believes the agreed upon methodology for assessment of fish/shellfish was followed and feels that the use of aquatic- based ATLs as surrogates (i.e., pyrene and fluoranthene), which are also derived from TRVs based on rodent studies, introduces a similar level of uncertainty into the ERA.
	Follow-up DEQ Response:	
	• **Mercury.** Please see the response to General Comment 10. Based on all available evidence mercury should be retained as COPC and CPEC.	Comment noted. See the response to Specific Comment 31. Mercury will also be analyzed for during the pre-FS sampling effort and will be considered for continued monitoring in the FS if detected concentrations in tissue are greater than DEQ's ATLs and CTLs.
	• **PAH TRVs.** If mammalian EPA Eco SSL TRVs for high molecular weight polycyclic aromatic hydrocarbons (HPAHs) and low molecular weight polycyclic aromatic hydrocarbons (LPAHs) are not used to evaluate acceptable tissue levels in aquatic biota, use either a PAH chemical specific toxicity reference value (e.g. benzo(a) pyrene) or an appropriate surrogate more for each detected PAH. The EPA Eco SSLs TRVs for LPAH and LPAH are 65.6 mg/kg bw/day and 0.615 mg/kg bw/day dry weight.	Comment noted. The agreed upon methodology for assessment of PAH exposure by mammals consuming fish/shellfish was followed: use of aquatic- based ATLs as surrogates (i.e., pyrene and fluoranthene). The current toxicity ratios (R_{Bacs}) for mammals based on consumption of crayfish, sculpin, and bass from the Forebay containing PAHs and protection at the individual level range from 1.17E-08 to 6.21E-05. The R_{Bacs} for mammals calculated from Goose Island crayfish and sculpin tissue concentrations range from 1.16E-08 to 4.32E-06. Since the detected concentrations of PAHs in fish and shellfish are so low, utilizing a different surrogate mammalian TRV would not result in different conclusions in the ERA. DEQ's mammalian TRV for (cont'd)

32. (cont'd)		(cont'd) fluoranthene (surrogate for LPAHs) is 26 mg/kg-bw/day for protection at the individual level, which is lower than the suggested EcoSSL TRV for LPAHs of 65.6 mg/kg-bw/day. DEQ's mammalian TRV for fluoranthene is 130 mg/kg-bw/day for protection at the population level, which is approximately 2 times higher than the EcoSSL TRV for LPAHs. Using the EcoSSL TRV for LPAHs would result in lower R_{Bacs} for individual LPAHs based on protection of individual mammals. Given that the highest R_{Bac} of all individual LPAHs for mammals based on protection at the population level is 1.24E-05, using the EcoSSL TRV for LPAHs would result in a maximum R_{Bac} of all individual LPAHs of 2.48E-05 (assuming similar bioaccumulation factors), i.e., 1.24E-05 x 2. Therefore, the findings of the evaluation for mammals consuming tissue containing LPAHs from the Forebay and Goose Island would not change if the EcoSSL TRV for LPAHs is used. DEQ's mammalian TRVs for pyrene are 1,300 mg/kg-bw/day for protection at the individual level and 6,500 for protection at the population level. These DEQ TRVs are approximately 2,100 and 10,600 times higher than the EcoSSL TRV for HPAHs of 0.615 mg/kg-bw/day. Given that the highest R_{Bac} of all individual HPAHs for mammals based on protection at the individual level is 4.43E-07, using the EcoSSL TRV for HPAHs would result in a maximum R_{Bac} of all individual HPAHs of 9.31E-04 (assuming similar bioaccumulation factors), i.e., 4.43E-07 x 1,300. Given that the highest R_{Bac} of all individual HPAHs for mammals based on protection at the population level is 8.96E-08, using the EcoSSL TRV for HPAHs would result in a maximum R_{Bac} of all individual HPAHs of 9.49E-04, i.e., 8.96E-08 x 10,600. Therefore, the findings of the evaluation for mammals consuming tissue containing HPAHs from the Forebay and Goose Island would also not change if the EcoSSL TRV for HPAHs is used.
33.	**Page 12-46, Goose Island Slough.** For fish and piscivorous birds and mammals, the division between the random forebay samples and the Goose Island area is not appropriate These should be treated as one exposure unit for more mobile receptors (e.g. bass, sucker, birds and mammals), and Goose Island media should be included in 90 percent EPCs.	Comment noted. Including the Goose Island data would introduce bias into the ERA since the random samples were designed to represent the Forebay as a whole and each random sample was spatially-distributed equally across the entire unit. In addition, the targeted samples near Goose Island had lower COI concentrations, and if they had been included, the resulting EPCs would have likely been lower than the random Forebay EPCs presented and used in the RI and risk assessments.

33. (cont'd)	**Follow-up DEQ Response:** Please provide a list of COIs for which the inclusion of the Goose Island data would change either the outcome of the risk screening or the comparison to reference. Ideally, this would be completed with the Bradford Island sediment data as well.	Comment noted. As described previously, the targeted samples near Goose Island had lower COI concentrations and fewer COIs than in the random Forebay dataset. If the Goose Island samples were combined with the random Forebay samples, the resulting EPCs would have likely been lower than the random Forebay EPCs presented and used in the RI and risk assessments. There may be a decrease in the number of COPCs/CPECs (based on detection frequency considerations since the combined sample size will exceed 20) and a decrease in the estimated risks (since forebay EPCs may be "diluted" by the lower Goose Island concentrations), if data for Goose Island media were combined with the random Forebay dataset. The same outcome would likely result by combining the targeted Eagle Creek samples with the random Forebay samples, for the same reasons described for Goose Island. No COIs were ignored in the HHRA and ERA evaluation of Goose Island and Eagle Creek sediment and tissue. All detected chemicals from these areas were included in the COPC/CPEC identification process as described below. The HHRA and ERA completed risk screenings for Goose Island sediment and tissue and Eagle Creek sediment that was similar in process to the screening conducted for the random Forebay media. In the RAs, COI concentrations in Eagle Creek and Goose Island media were compared to SLVs, following DEQ's COPC identification methodology. The results are shown in Tables M-41 through M-44 for the HHRA and in Tables N-61 through N-79 for the ERA. There would be no change in the outcomes of the risk screening or COPC selection by inclusion of these data, since these data <u>were</u> already included and considered in the RAs. The RAs did not perform a new comparison of Goose Island and Eagle Creek media to Reference media, but incorporated the results of the earlier comparison, as discussed in Section 8.3.2 (Table L-7).
34.	**Page 12-49, Section 12.5.4.3, Risk Interpretation:** • **Risk screening ratios for benthic and aquatic receptors**. A toxicity ratio >5 for benthic invertebrates in order to be identified as a CPEC should not be used. All COIs with a hazard quotient >1 should be retained as CPECs in the risk assessment. (Refer to the note at the beginning of section II of DEQ's Guidance for Ecological Risk (cont'd)	• Comment noted. See the response to Specific Comment 24, which indicates a Q=1 will be used to identify CPECs for benthic invertebrates and was the target hazard value already used for aquatic organisms. The agreed upon hierarchy for water SLVs and sources of sediment SLVs, as presented in the 22 April 2010 Memorandum (previously referenced in the responses to Specific Comments 25 and 26), were used in the ERA. (cont'd)

34. (cont'd)	(cont'd) Assessment: Levels I, II, III, IV: "In Task 9(c), page II-8 of the Level II Ecological Risk Assessment Guidance, please note that the Q = 5 guidance applies only to soil, and does not apply to water and sediment. Until other screening level values become available, water and sediment screening should be done using the SLVs provided in Tables 1 and 2.") • **Phased risk screening for tissue.** The text states (first bullet on this page) that, "*If a CPEC in tissue is also present in sediment at concentrations in exceedance of the bioaccumulation SLV (i.e., it is also a CPEC in sediment), then further risk assessment may be helpful to evaluate the actual potential for adverse effects to occur from exposure to site-related CPEC concentrations.*" Tissue CPECs should be considered site related regardless of results of the sediment evaluation. Tissue CPECs should not be screened out based on a comparison between site and reference sediment. • The second bullet on this page says that, *If a CPEC in tissue is either undetected, present below Reference Area concentrations (inorganics only), or present below sediment SLVs, further risk assessment may not be helpful because tissue concentrations likely do not correlate with current sediment concentrations at the site. If this is the case, the tissue levels could reflect exposure to other sources in the river or could reflect historical body burdens.* The Reference Area bass are elevated for cadmium, lead and nickel, and do not therefore do not meet the conditions of a Background location. Tissue levels are considered site related regardless of the sediment comparisons.	(cont'd) • Comment noted. See the response to Specific Comment 11 and the response to the following bullet. The objective of this first bullet referenced in the comment is not to differentiate between tissue CPECs that are site-related and those that are not site-related, but to recommend a way to interpret the findings of both the tissue and sediment evaluations for the River. The point of this statement is that further risk assessment on a CPEC identified for tissue that is also detected in sediment above the Reference concentration and SLV may be helpful because the results of the screening-level risk assessment indicate that some relationship may exist between site sediment and tissue concentrations. Likewise, further risk assessment on a CPEC identified for tissue that is not detected in sediment, or is detected below the Reference concentration and/or SLV may not provide much insight because the results of the screening-level risk assessment indicate that no apparent relationship exists between site sediment and tissue concentrations (as referenced in the second bullet discussed in the following comment). • First point in comment accepted, and second point regarding Reference Area is noted. Please see the response to Specific Comments 11, which address these specific metals in Reference Area bass. Based on the available information, it is unclear whether or not a source of these metals originates from Bradford Island. Therefore, initial FS samples that will be collected in the former removal areas as part of the River OU FS will be analyzed for all metals (see the responses to General Comments 3 and 6). Clarification on DEQ's definition of a "background" location for a riverine environment is needed. Although it is more feasible to identify relatively pristine background locations for Upland sites, as was accomplished for this project, under conditions of constant change and influence from upstream sources, the Portland District feels the Reference Area selected for the River OU does meet the criteria applicable to this (cont'd)

34. (cont'd)		(cont'd) environment. If a contaminant source does exist upstream, these contaminants could potentially migrate downstream and impact Forebay media. As per CERCLA guidance, it is legitimate to account for ongoing upstream sources that could contribute to a site, as it is impossible to maintain remedial goals that are below upstream concentrations. The response to the comment above ("Phased risk screening for tissue") addresses the purpose of the statements made in the second bullet referenced in this comment.
	Follow-up DEQ Response: • **Phased screening for tissue.** The decision rules for tissue in relation to sediment would be relevant if the sediment and tissue under evaluation were co-located. For the RI and risk assessment presentation, this is not the case (see General Comments 3 and 6). Therefore, tissue CPECs should not be screened out based on comparison to sediment (SLVs or comparison to reference).	Comment noted. See the response to Specific Comment 31.
	• **Background location.** DEQ's definition of background level (DEQ Rule, 340-122-0115) "means the concentration of hazardous substance, if any, existing in the environment in the location of the facility before the occurrence of any past or present release or releases." DEQ Guidance (1994) goes on to say "background samples are taken to determine the level of a particular compound that naturally occurs in the area of a site. Background samples should not be collected from areas where other anthropogenic sources may have contributed the same consistently as those encountered at the site in question". The reference Area selected by the Corps does not represent naturally occurring background concentrations and does not meet the criteria outlined above. Contaminants may exist upstream at other contaminated sites, but this evaluation should be included as a part of the feasibility study to determine if upstream contaminants are moving and would impact the Bradford Island site.	Comment noted. According to EPA's *Guidance for Comparing Background and Chemical Concentrations in Soil for CERCLA Sites*, EPA's definition of background is "background refers to substances or locations that are not influenced by the release from the site, and are usually described as naturally occurring or anthropogenic" (EPA, September 2002) Please see response to Comment 33.

35.	**Page 12-44 through 12-46, mouth of Eagle Creek and Goose Island slough.** Screening these areas separately from Bradford is defensible only for benthic invertebrates and small home range aquatic biota such as crayfish and sculpin. For other receptors the areas should be combined into one relevant exposure unit. **Follow-up DEQ Response:** Please identify any COPCs/CPECs that would have been identified if the combined dataset including Goose Island and Eagle Creek been evaluated for humans and wildlife.	Comment noted. Please see the response to Specific Comments 33, which describes the purpose and reasoning for maintaining separate datasets for the random and targeted samples. Combining the data from Eagle Creek and Goose Island slough would not likely change the findings of the RAs due to the generally lower concentrations of COIs measured in these targeted areas relative to the greater Forebay (random samples). It is likely that fewer COPCs/CPECs would have been identified if the combined datasets had been evaluated for humans and wildlife. Comment accepted. Protection of higher trophic-level mammals (such as mink) that may forage in the Upland OU will be added to the assessment endpoints described in this section. Since the SLVs for mammalian receptors as a generic receptor class were already used in the screening-level ERA, no changes to the quantitative evaluation are necessary.
36.	**Page 12-52, Tissue.** All COPCs (e.g. mercury, lead, cadmium, PAHs, P2EHP, PCBs in bass) that exceed risk screening levels or for which there are no SLVs should be retained for future monitoring and assessment. These should not be dropped as sediment COPCs. **Follow-up DEQ Response:** COIs that exceed risk levels or do not have SLVs are COPCs and should not be dropped as COPCs in the risk assessment. Please see response to comments 3 and 6. This will ensure that monitoring, even though repeatedly termed an FS task, will provide more refined risk estimates and address data gaps for in the risk assessment for source area COPCs.	Comment noted. Please see the responses to General Comments 3 and 6, which describe the initial River OU FS sampling effort that will be conducted and will include analysis of these chemicals in sediments at the former removal area and in bass collected from the Forebay and Reference Areas. Comment noted. See the response to Specific Comment 31.
37.	**Page 12-57 through 12-62, Goose Island and mouth of Eagle Creek.** The screening and conclusions should be re-done to include all COIs, and not be limited to "only additional CPECs that have not already been identified as a part of the random forebay event". (cont'd)	Clarification provided. All COIs detected in Eagle Creek and Goose Island media were included in the risk-based screening for these targeted exposure areas, and the same methodology used to screen the random Forebay data was used for these two targeted datasets. The random Forebay data were included in the discussions for Eagle Creek and Goose Island to provide context for the CPECs identified in these two targeted locations relative to the broader and more robust tissue and sediment random Forebay datasets. Clarification on this comment would be helpful to identify the statement in quotes, which could not be found in Section 12. No changes are needed to address this comment. (cont'd)

37. (cont'd)	(cont'd) **Follow-up DEQ Response:** The text the comment is referring to is on Page 12-45, which states "because tissue data have been collected from the greater Forebay (the random samples), the purpose of the bioaccumulation evaluation for eagle Creek sediment was to identify any additional CPECs that have not already been identified through the random Forebay sampling event. Any bioaccumulative CPEC identified in Eagle Creek sediments (i.e. maximum sediment concentration above the bioaccumulation SLV) were compared to the tissue data to determine their actual presence in measured tissue data from the forebay." For this area, Aroclor 1248 is detected in sediment above screening levels but appears to have been dropped given Aroclor 1248 was not detected in bass tissue. PCBs should be carried forward as a COPC for this area.	(cont'd) Comment accepted. Given the influence of weathering and metabolic processes on the ability to identify PCBs measured as Aroclors in tissue, Aroclor 1248 will not be dropped as a COPC or CPEC in Eagle Creek sediments. However, Aroclor 1248 was not detected in pre-removal Forebay sediment samples (Table I-7) or random Forebay and Goose Island sediment and tissue samples (Tables I-8 and I-9), indicating that the source of Aroclor 1248 detected in Eagle Creek sediments is not likely associated with former activities at Bradford Island. If the findings of the pre-FS sampling also indicate the absence of Aroclor 1248, this information will be considered in the FS.
38.	**Reference to bis(2-ethylhexyl)phthalate.** The text of the report, and the list of acronyms, refers to bis(2-ethylhexyl)phthalate as B2EHP, but some of the figures refer to it as BEHP. Please revise the abbreviation in the figures to be consistent with that in the text.	Comment accepted. The text will be corrected to be consistent.
39.	**Section 13.5.** The source of metals, including mercury as well as PAHs that were determined to be elevated in forebay tissue compared to reference area tissue has not been determined. However, several of these elevated concentrations appear correlated to PCB in sediment and there is a plausible connection to the sandblast area or landfill. Therefore, DEQ recommends retaining antimony, arsenic, cadmium, copper, chromium, lead, nickel, mercury, zinc, phthalates and PAHs for additional evaluation and monitoring.	Comment noted. Please see the response to General Comment 9, which acknowledges the benefit of collecting additional data from the removal area to further assess runoff, erosion, and mass wasting from the Upland OU to the River. These additional data will be further evaluated in the Upland OU FS in conjunction with the findings of the overland runoff pathway evaluation that will be performed in the Upland OU baseline risk assessments. The chemicals listed in the comment will be analyzed for in sediment and bass tissue, and the need for additional monitoring of these chemicals will be explored in the River OU FS (also see the responses to General Comments 3 and 6 that describe the initial FS sampling effort). Although a plausible source and transport mechanism for COIs may exist at three of the Upland AOPCs (most notably the Sandblast Area), the Portland District does not agree that there is enough data conclude that the source of PCBs in the River is the same as the source of other Upland non-PCB chemicals. The primary Bradford Island source of the River OU PCB contamination is from equipment disposal along the northern shoreline (see the response to General Comment 9). The mass wasting/erodible soil pathway will be further evaluated in the Upland (cont'd)

39. (cont'd)	(cont'd) **Follow-up DEQ Response:** COIs elevated in tissue from the forebay may be related to source areas around Bradford Island as indicated. For example, in addition to PCBs, metals and phthalates are elevated in source area sediment. As outlined in General Comment 3, additional sampling of these areas will help will help evaluate these additional chemicals, and assist in the interpretation of tissue data. For metals, several localized species such as clams and crayfish are elevated in the forebay relative to the reference location (e.g. antimony/crayfish; arsenic/crayfish; clams and crayfish/cadmium; crayfish/chromium; crayfish/lead; crayfish/nickel; crayfish/mercury.	(cont'd) BHHRA and BERA, and source control measures will be considered during the Upland OU FS. Comment noted. See the response to Specific Comment 31.
40.	**Appendix O, Uncertainty Analysis.** The uncertainty in the use of the random forebay samples instead of samples around Bradford Island is addressed by re-evaluation of data collected from within the footprint of the sediment removal area before the removal action. This analysis was limited to only 5 samples within the removal area. Instead, this analysis should be completed using the larger dataset collected around Bradford Island, some of which were not removed as a part of the early action, and may represent current conditions in those locations. This evaluation will change the results of the COPC identification process. **Follow-up DEQ Response:** Please see the response to General Comments 3 and 6. The uncertainty analysis should be revised to evaluate results using the existing larger dataset of historical sediment data, some of which is present outside the removal action areas.	Comment noted. Please see the response to Specific Comment 33, which discusses the purpose and reasoning for maintaining separate datasets for the random and targeted samples. Also see the responses to General Comments 3 and 6, which describe the initial River OU FS sampling effort that will be conducted in the removal area and greater Forebay. Comment noted. See the responses to General Comments 3 and 6.
41.	**Appendix O, Tables O.2-1, O.2-2, O.2-3, Erodible Soil Evaluation for the Landfill, Sandblast Grit, and Bulb Slope AOPCs.** As one example, it appears that Aroclor 1260 was not screened in these tables where detected, but is instead termed "not a tissue COPC" based on the in-water evaluation. Aroclor 1260 is detected in sediment collected around Bradford Island, and was detected in tissue. PAHs detected in the landfill AOPC is another example. The random forebay sediment samples are not appropriate in determining the COPC list for erodible soil. All COIs from the source areas should be screened and the tables updated.	Comment noted. Tables O.2-1 to O.2-3 will be revised to show a more accurate statement describing the rationale for the selection of COPCs for the mass wasting pathway. Bioaccumulative COPCs that were retained on the basis of exceedance of SLVs or lack of SLVs will be clearly noted. The term "not a tissue COPC" will be removed from the tables since it was never used as a basis for identification of COPCs. In addition, to avoid confusion, Aroclor-1260 will be indicated as a retained COPC and will be footnoted to show that all Aroclor mixture components are also included in "Total PCBs" which are retained as COPCs for the mass-wasting pathway for all three Upland AOPCs. The text in Section O.2.1.4 of Appendix O will also be expanded to (cont'd)

41. (cont'd)		(cont'd) incorporate the discussion provided below. Under current and likely future conditions, the only viable exposure route for human receptors for the mass wasting pathway is through bioaccumulation and subsequent consumption of smallmouth bass and crayfish. Direct exposure to eroded soils in the River OU is unlikely for humans. Selection of COPCs for the mass wasting pathway was based on multiple lines of evaluation including a comparison to Reference sediments and a comparison to sediment bioaccumulation SLVs. Whether or not a chemical was selected as a tissue COPC was not the sole reason for identifying COPCs for the mass wasting pathway but was included in the tables primarily to provide context and a deeper understanding of the issues based on sediment and tissue data collected to date. As noted in the RI/FS MP (URS 2007), tissue data for consumable species is a legitimate and necessary means of confirming whether uptake of chemicals released to the Forebay is actually occurring or could occur. Although Aroclor 1260 is shown as not a selected COPC in Table O.2-1, the table shows that Total PCBs (using congener data) are retained as COPCs for the mass wasting pathway for all the three Upland AOPCs (also described in Section O.2.1.4). Aroclor 1260 was detected in soils of the three Upland AOPCs, but was not detected in any Forebay (random or targeted) or Reference Area media collected in support of the RI and risk assessments (see the tables in Appendices I and L). Similarly, Table O.2-1 also shows that carcinogenic PAHs were retained as COPCs for the mass wasting pathway. Some bioaccumulative chemicals in erodible soils could not be evaluated due to a lack of bioaccumulation-based SLVs and were retained as COPCs (e.g. 2-methylnaphthalene in Table O.2-1) with a few exceptions. The only bioaccumulative organic chemicals without SLVs that were eliminated as COPCs are carbazole and di-n-butylphthalate for the Landfill erodible soils and carbazole in the Sandblast Area erodible soils. Carbazole and di-n-butyl phthalate were eliminated based on their extremely low toxicity to humans (e.g., the US EPA residential screening level [RSL] of di-n-butyl phthalate is 6100 mg/kg); there is no RSL for (cont'd)

41. (cont'd)	**Clarification of DEQ Response: Aroclor** 1260 was detected in Stage 1 source area drain outfall samples, several sediment samples, and in one high-volume water sample. Some of these data were not included as part of the RI data set. DEQ wishes to confirm that analytes detected in upland samples and in non-RI data are addressed as part of source control evaluation and that there are not COPC/CPECs that are overlooked on this basis. Relevant sediment data should be used to assess the migration of these chemicals into the River OU.	(cont'd) carbazole but its oral LD_{50} for rats is greater than 5,000 mg/kg (HSDB database). Therefore, the lack of bioaccumulation-based SLVs for these chemicals was not viewed as sufficient reason for retaining them as COPCs. Bioaccumulative metals without SLVs (and that also exceeded reference sediment concentrations) include cadmium, lead, mercury, thallium and zinc in Landfill AOPC erodible soils, cadmium, lead and zinc in Sandblast Area erodible soils, and lead in Bulb Slope erodible soils. The tables and text will be revised to identify these COPCs. Also see the responses to General Comments 3, 6, and 9, which describes the additional data that will be collected from the removal area to further assess potential runoff, mass wasting, and erosion from the Upland OU to the river. These data will be evaluated in the Upland OU FS in conjunction with the findings of the overland runoff pathway evaluation that will be performed in the Upland OU baseline risk assessments. Comment noted. See the responses to General Comments 3, 6, and 9.
42.	**Appendix O, Table O.3-10.** DEQ guidance includes screening level values for many of these COIs. At the minimum, DEQ values should have been used, but since these values do not include a full evaluation of bioaccumulation, USEPA Region 5 values should be used for these chemicals (e.g. pesticides, SVOCs, tributyltin). **Follow-up DEQ Response:** DEQ would prefer that relevant screening levels be used in the ERA to evaluate COIs instead of listing them as CPECs without SLVs (See Specific Comment 25 and responses for discussion of SLVs). This (cont'd)	Comment noted. EPA Region 5 values were not one of the SLV sources identified in the 22 April 2010 Memorandum (see pages 3 and 5). As stated in Section 12.3.5 of the RI and in Section O.3.1.6 of Appendix O, those COIs without dietary based SLVs (listed in Table O.3-10) were retained as CPECs for the Landfill and Sandblast Area AOPCs and warrant further consideration for birds and mammals in the Level III BERA for the Upland OU. EPA Region 5 TRVs, as well as other sources of TRVs, and their uncertainties will be considered in the BERA. Comment accepted. See the response to Specific Comment 25. As discussed in Section 12.3.5, "... the bioaccumulative CPECs at the Landfill and Sandblast Area AOPCs for which dietary-based SLVs are (cont'd)

42. (cont'd)	(cont'd) limits the focus of a Level III evaluation to those chemicals that are known to exceed risk based levels. In the case of bioaccumulation, COIs cannot be screened out unless an bioaccumulative SLV is used in the analysis.	(cont'd) not available (Tables N-3, N-4, N-13, and N-14) also warrant further consideration for birds and mammals." The list of bioaccumulative CPECs for which appropriate SLVs are unavailable will be retained for the Level III BERA. Dietary-based SLVs were available for all bioaccumulative CPECs identified for the Bulb Slope and Pistol Range.
43.	**Appendix O, Tables O.3-3 and O.3-4, Mass Wasting Evaluation, Benthic Invertebrates.** A multiplier of 5 ("Q"=5) should not be used for benthic invertebrates as specified by DEQ guidance. This will designate several additional chemicals as CPECs. As an additional line of evidence, sediment samples off these sources should be screened (Appendix G).	Comment noted. Please refer to the response to Specific Comment 24, which indicates a Q=1 will be used to identify CPECs for benthic invertebrates. Sediment samples from the former removal areas will be collected as part of the initial River OU FS sampling effort. These new sediment data will be evaluated in the Upland OU FS in conjunction with the findings of the overland runoff pathway evaluation that will be performed in the Upland OU Level III BERA, which will include a more site-specific evaluation for the benthic community.
