 700 NE Multnomah St., Portland, OR 97232

DEQ staff are pleased to issue this quarterly data summary for the Clean Fuels Program. The aggregated quarterly data for the program is also posted on our website in an Excel spreadsheet.

The first graph shows the number of credits and deficits generated. Credits are generated by fuels that have a carbon intensity which falls below this year’s target, while deficits are generated by fuels whose carbon intensity is higher than this year’s target. In the first quarter of 2018, the market continued to generate more credits than deficits.

Credits generated from residential charging of electric vehicles are added once per year and are not included in the Q1 2018 data. DEQ [calculates the credits](#) generated on an annual basis and distributes them amongst the electric utilities who have registered with the program and the Backstop Aggregator. They are issued in the first quarter of the following year and are then divided evenly between the 4 quarterly reports. In this summary, residential EV credits are present for 2016 and 2017.

The second graph shows the breakdown of which fuels generated credits. The majority of credits came from Ethanol and Biodiesel which are blended into gasoline and diesel, respectively. The Other category includes alternative fuels such as Natural Gas, Electricity, Biogas and Propane.
