DEQ staff are pleased to issue the eighth quarterly data summary for the Clean Fuels Program. The aggregated quarterly data for the program is also posted on our website in an Excel spreadsheet.

Beginning with this summary, credits generated from residential charging of electric vehicles have been added. DEQ [calculates the credits](#) generated on an annual basis and distributes them amongst the electric utilities who have registered with the program and the Backstop Aggregator. The annual credits are then divided evenly between the 4 quarterly reports. In this summary, residential EV credits were added for 2016 and 2017.

The first graph shows the number of credits and deficits generated. Credits are generated by fuels that have a carbon intensity which falls below this year's target, while deficits are generated by fuels whose carbon intensity is higher than this year's target. In the fourth quarter of 2017, the market continued to generate more credits than deficits.

The second graph shows the breakdown of which fuels generated credits. The majority of credits came from Ethanol and Biodiesel which are blended into gasoline and diesel, respectively. The Other category includes alternative fuels such as Natural Gas, Electricity, Biogas and Propane.
