Re: Response to Comments on Cleaner Air Oregon Modeling Protocol and Risk Assessment Work Plan

Dear Mr. Giska:

On May 26, 2022, ENTEK International LLC (ENTEK) received your letter commenting on our Cleaner Air Oregon (CAO) modeling protocol and risk assessment work plan. This letter constitutes our timely response to your questions and comments. Each of your comments is reproduced below in italics and the answer follows. As the modeling protocol precedes the work plan, we address the modeling protocol first.

Modeling Protocol

1. *Submit a revised AQ520 CAO Emissions Inventory Form*

Section 3.6 'Natural-Gas-Fired Boilers (TEU-2.3 and TEU 2.1)' indicates, "The emission rates shown in Tables 3-1 and 3-2 correct cell reference errors identified in the DEQ-approved emission inventory that incorrectly looked up the annual natural gas fuel usage instead of annual diesel usage to calculate annual emissions." Please submit a revised Emissions Inventory with these corrections.

A revised emissions inventory reflecting the correct boiler emission rates is attached.

2. *Emission Rates*

Please provide the following information regarding the proposed emission rates:

a. In Table 3-2, the pounds per day [lb/day] emission rates incorrectly match the pounds per year [lb/year] rates in Table 3-1 – please revise.

b. In Table 3-3, the "Acute Risk Equivalent Emission Rate" are derived from the annual emission rates, rather than the daily emission rates – please revise.

A revised modeling protocol with revised tables is attached.

c. In Table 3-5, Acetone emissions from C-STK are allocated at 42%, please provide justification for the allocation of these emissions.

Allocation is based on historical use of acetone facility-wide. Approximately 42% of the acetone usage takes place within the permanent total enclosure and as a result acetone associated emissions are discharged through the main stack (C-STK).

d. Leak Detection and Repair (LDAR) emissions:

i. The LDAR analysis submitted along with the Stipulated Emissions Inventory, 2022 01-11 LDAR Component Emissions Spreadsheet_final.xlsx, indicates that Zone 12B, Solvent Tanks Phase Separator, is a fugitive emissions source that accounts for ~10% of the fugitive emissions; however, Table 3-4 only includes Zone 12A emissions, along with Zone 11, as being released from a modeling ID of STK_Z11 - Zone 12B is not included. Please provide support for this discrepancy.

Zone 12B emissions were excluded in error. The revised modeling protocol now includes Zone 12B as requested.

ii. The total emissions from the LDAR zones of 684.58 pounds per year are consistent between the LDAR analysis submitted with the Stipulate Emissions Inventory and the emission rates in the Modeling Protocol; however, the distribution of the emissions among the emission points, or Zones, is not consistent (see Attachment A). Please substantiate these discrepancies and revise the appropriate document for re-submittal.

Please find enclosed revised modeling protocol including all Zones with the correct distribution among the emission points.

3. Modeling Receptors and Exposure Location Assignment

a. Please address the following concerns related to determining the extent of the facility boundary:

i. Please provide information demonstrating that Taxlot 104 on Map Number 12S2W10B (see Attachment B, Figure 1), the land between the Entek manufacturing facility on Taxlot 1600 and the Entek warehouse located on Taxlot 100, is included on the lease of the warehouse from Western Warehousing LLC and should be considered as part of the Entek source; and

The land making up Tax Lot 104 is owned by an ENTEK affiliate, but is not part of the warehouse lease. ENTEK can remove Tax Lot 104 from consideration as part of the source, but that would leave the warehouse and the manufacturing site non-contiguous thereby calling into question whether the warehouse is appropriately part of the same source as the manufacturing site. To be a single source, the warehouse and the manufacturing facility must be, among other things, contiguous or adjacent. DEQ defines “adjacent” as nearby and interdependent. DEQ has previously defined “interdependent” in guidance as meaning that a manufacturing process is started at one facility and finished at the other. ENTEK performs no manufacturing at the warehouse so the warehouse and the manufacturing site would not be considered interdependent. We have treated the warehouse and the manufacturing sources as contiguous based on Tax Lot 104 being part of the same overall site, but if Tax Lot 104 is removed from the site, this calls into question whether the warehouse should be considered as part of the same risk assessment as the manufacturing facility. We have tentatively removed Tax Lot 104 from the

manufacturing site boundaries and retained the warehouse as part of the manufacturing facility. The new receptor locations are shown in Figure 4-5. However, this leaves open the question as to whether the warehouse should be considered part of the source subject to the risk assessment.

ii. Please provide information demonstrating that the operations and emissions associated with the Entek Manufacturing Inc facility on Taxlot 1100 on Map Number 12S2W10BA (see Attachment B, Figure 1) are included in the current Title V Air Quality permit in order for this facility to be considered as part of the Entek source for the purposes of this Risk Assessment. It is our understanding that Entek Manufacturing is not included in the Entek International TV permit.

ENTEK Manufacturing has been included as part of the ENTEK International Title V permit since August 2012 when the permit was modified to reflect that ENTEK Manufacturing LLC and ENTEK International LLC had recently come under common ownership and control. At that time, the ENTEK Manufacturing LLC emission points (BH-20 and pyrolysis oven) were added to the list of Aggregate Insignificant (AI) emissions units in the Title V permit where they remain today.

The facilities are considered a single source based on the applicable definition of “major source.” Two sources must be considered collocated where they are located on one or more contiguous or adjacent properties and are owned or operated by the same person or persons under common control. Under Title V, but not Title III, the sources must also share a common SIC code or one be a support facility for the other. Where, as here, one of the two sources is a HAP major source, the more prescriptive Title III definition controls. Consistent with the Title III definition, the two facilities are contiguous and are under common control. There is shared management, common ownership and the properties are contiguous. For example, I am an officer of both companies with management responsibility, Mr. Figueroa is the site EHS Director, we have a common safety manager, we have one HR team, one IT team, one accounting team and we all operate on the same ERP platform. The two entities are treated as a single source for purposes of stormwater permitting, Form R reporting, Fire Marshal reporting, SPCC planning, hazardous waste counting/generator status, and Toxic Use and Hazardous Waste Reduction (TUHWR) planning—just to name a few. In short, ENTEK Manufacturing LLC and ENTEK International LLC are contiguous and under common control. As a major HAP source, that means they must be permitted as a single source and hold a joint Title V permit.

b. Regarding the property on Taxlot 1400 on Map Number 12S2W03C (see Attachment B, Figure 1):

i. Please provide documentation that Entek will restrict public access to this area by installing both physical (e.g., fencing) and administrative (e.g., signage) controls; and

ENTEK has engaged a contractor to install fencing around Tax Lot 1400. The fencing installation is expected to be complete this summer at which time signage will be installed. We can submit photos of the project when it is finished if necessary.

ii. Because exposure locations in the CAO program are assessed based on the underlying zoning, which in this case is Exclusive Farm Use, please request an exposure location change using AQ521 & 522 forms for modeling receptors on this taxlot consistent with its use.

We do not understand the basis for this question. We agree that exposure locations in CAO are assessed based on the underlying zoning but there are no exposure locations on Tax Lot 1400 as the public is excluded. This is not different from any other portion of ENTEK's property. Therefore we do not believe that it would be necessary or appropriate to request an exposure location change from Exclusive Farm Use as Tax Lot 1400 is not an exposure location. If there is something that we are not understanding, we welcome your clarification.

c. In Figure 4-9, there are homes labelled as 'Worker' exposure locations directly east of the facility (see Attachment B, Figure 2) – please update these to 'Residential' exposure locations.

A revised modeling protocol with a revised Figure 4-7 showing the requested change is attached.

d. Roadways should only be classified as "risk not evaluated" for receptors within the 25m and 50m spacing grid because further out the receptors are intended to characterize the general exposure location for an area. For example, if a modeling receptor at the 200-meter spacing interval happens to fall on a road inside a residential area, and there are few other receptors that are capturing that residential area, the receptor should be classified as a residential exposure location in order to more accurately characterize the people being exposed in that area. As an example, see the residential area in the southeast portion of figure 4-5. Please revise this figure, and the exposure location assignment of any receptors, accordingly.

A revised modeling protocol with revised figures and exposure location assignment of receptors is attached.

e. Please ensure correspondence between the exposure location figures provided and the modeling receptor/exposure location crosswalk provided.

A revised copy of the modeling receptor/exposure location crosswalk (Table 4-9) is included in the attached revised modeling protocol.

4. Building Downwash Modeling Parameters

In figure 4-3 there are a number of buildings not included in the downwash assessment (e.g., the building the Carbon Stack is attached to) – please substantiate why these buildings were excluded or revise the Modeling Protocol to include them in the downwash assessment.

Figure 4-3 and Table 4-6 in the attached modeling protocol have been updated to account for all downwash structures at the facility. Structures visible in the aerial imagery of the facility that are not identified as downwash structures are either open on two or more sides or are elevated structures that do not extend down to ground level.

5. Meteorological Data

Because on-site meteorological data is available beginning in 2017, please use all available full year meteorological data from 2018-2021 and revise the Modeling Protocol to reflect this update.

We have revised Section 4.2.1 of the modeling protocol to address your question. As it explains, the only available full year of on-site meteorological data is 2018. One requirement in order for meteorological data to be considered valid is that the meteorological station must pass quarterly audits so as to ensure the components are all working. ENTEK's meteorological station passed quarterly audits for all four quarters of 2018 and the first quarter of 2019. After the first quarter of 2019 the meteorological station was no longer maintained and no further audits were performed until August 2021. At that time, the first audit in roughly 2.5 years was performed and the wind sensor was identified as defective and had to be replaced. As a result, neither 2019, 2020 nor 2021 were full years of meteorological data. Section 4.2.1 of the modeling protocol has been revised to reflect this history.

Risk Assessment Work Plan

DEQ made two comments on the risk assessment work plan. The first expressed DEQ's agreement as to potential overstatement of risk and the second relates to acute impacts associated with TCE. In regards to the second comment (Bullet 3), DEQ suggests that ENTEK should not state in its final risk assessment that acute impacts are based on an assumption of 15 to 364 times the actual exposure. ENTEK respectfully disagrees with this comment and cites to the scientific literature as a basis for its comment.

As no changes to the work plan were requested, we have not included a revised work plan.

Please do not hesitate to contact me if you have any questions regarding this submittal.

Very truly yours,

Kimberly Medford
President
ENTEK Manufacturing

1 INTRODUCTION

ENTEK International LLC (ENTEK) owns and operates a polymer-based film manufacturing facility (“the facility”) located at 250 Hansard Avenue in Lebanon, Oregon. The facility currently operates under Title V Permit No. 22-6024-TV-01 (the “Title V permit”) issued by the Oregon Department of Environmental Quality (DEQ) on December 21, 2018.

Maul Foster & Alongi, Inc. (MFA) was retained by ENTEK to complete the Cleaner Air Oregon (CAO) permitting process for the facility. ENTEK was “called-in” to the CAO program by the DEQ on March 4, 2019. ENTEK submitted a toxic air contaminant (TAC) emissions inventory to the DEQ on June 3, 2019. A final emissions inventory was approved by the DEQ on January 18, 2022.

As stated in Oregon Administrative Rule (OAR) 340-245-0030(1)(b), a modeling protocol must be submitted no later than 30 days after receipt of DEQ approval of the emissions inventory. As the approval occurred on January 18, 2022, the modeling protocol is due February 17, 2022. ENTEK intends to conduct a Level 3 risk assessment to determine the potential excess cancer risk and chronic and acute noncancer risk (expressed numerically as the chronic and acute hazard index) impacts from the facility for comparison to the applicable risk action levels shown in OAR 340-245-8010 Table 1. The remainder of this modeling protocol outlines the proposed modeling methodology and specific information required by OAR 340-245-0210(1).

2 FACILITY DESCRIPTION

2.1 Facility Location

The facility is located approximately one-half mile northwest of downtown Lebanon, Oregon on the eastern edge of the Willamette Valley at the foothills of the Cascade Mountain range, and along the Santiam River. The area immediately surrounding the facility is characterized primarily by flat terrain. Agricultural and industrial land-use zones border the facility to the north and west, and a mixture of residential, mixed-use, and industrial land-use zones border the facility to the south and west. An aerial image showing the facility location overlaid with the proposed modeling boundary is shown in Figure 2-1. The topography of the area immediately surrounding the facility is presented in Figure 2-2.

2.2 Process Description

The facility manufactures microporous polymer-based films on 11 production lines. Dry raw materials and process oils are delivered to the facility by rail and trucks throughout the year and are stored in enclosures on site. The raw materials are transferred to the mix areas where the dry materials (such as polyethylene and silica) and process oils are mixed together before they enter the process line.

Once the correct mixture of raw materials is achieved, the mixture is transferred to a twin screw extruder via enclosed conveyors. The mix is extruded into a film which is then conveyed through an extractor which employs trichloroethylene (TCE) to remove oil from the film. Each extractor is contained inside a negatively pressurized permanent total enclosure.

After leaving the extractor, the polymer-based film goes through a heated dryer and hot air ovens to remove TCE from the film. Upon exiting the oven, the film passes through a vision and defect marking system. Once through the vision and defect marking system, the film is wound onto rolls to be put into boxes that are then stretch-wrapped. The stretch-wrapped boxes are transported from the production facility by truck to the finished goods warehouse or directly to the customer.

ENTEK maintains two certified Permanent Total Enclosures (PTEs) so as to prevent fugitive emissions. One of the two PTEs encompasses the film production operation and is identified as TEU-1A. Exhaust from equipment in the film production PTE is routed into a duct that discharges to the carbon bed adsorption system. The other of the two PTEs is the product storage warehouse which is identified as TEU-1C. Emissions from both PTEs are continuously monitored using certified monitors compliant with 40 CFR 60, Appendix F quality assurance procedures.

In addition to the film production operations, the facility operates a fiberglass mat lamination line, which consists of adhering a fiberglass mat (made offsite) to the finished film, drying the water-based glue on the fiberglass mat via an electric heater, and then packaging the finished product.

Process steam is provided by a high-efficiency natural-gas-fired boiler. A second high-efficiency natural-gas-fired boiler is maintained as backup for the primary boiler. Since the primary boiler supplies enough steam to heat all necessary processes at the facility, the secondary boiler is used only in instances where the primary boiler is shut down. Both boilers are fired primarily on natural gas; however, they have limited capability to operate on diesel in the event of natural gas curtailment.

3 EMISSION ESTIMATES AND MODEL SOURCES

Daily and annual TAC emission estimates for the process equipment and emission-control devices, considered to be toxic emissions units (TEUs) as defined in OAR 340-245-0020(59), were prepared as shown in the TAC emissions inventory. The annual and daily TAC emission estimates will be converted to units of grams per second (g/s) for purposes of conducting the Level 3 risk assessment, as shown in Tables 3-1 and 3-2. Only TACs that have a risk-based concentration (RBC) set forth in OAR 340-245-8010 Table 2 will be assessed. Additional detail regarding how the daily and annual TAC emission rates will be used to complete the Level 3 risk assessment will be provided in the risk assessment work plan submittal.

The TEUs identified in the TAC emissions inventory will be represented in the dispersion model developed to represent the facility. For annual (chronic cancer and noncancer) assessments, each TEU included in the dispersion model will be modeled using a unit emission rate equivalent to 1 g/s for all modeled sources. Additional details describing unit emission rate modeling are provided in Section

4.4. For the 24-hour (acute) assessment, a risk equivalent emission rate has been developed for each TEU, as shown in Table 3-3. Additional detail describing the risk equivalent emission rate modeling is also provided in Section 4.4.

3.1 Microporous Plastic Production Operation (Permanent Total Enclosure) (TEU-1A)

All process lines containing TCE are contained in the film production PTE located in the manufacturing building. The air in the PTE is constantly exhausted to the carbon bed adsorption system. The carbon bed exhausts to atmosphere through a single stack, which will be represented in the model as model ID C_STK. The proposed model exhaust parameters for the carbon bed stack are presented in Table 3-4.

3.2 Microporous Plastic Production Operation (Component Fugitive Emissions) (TEU-1B1 & TEU-1B2)

TCE may be released in small amounts from components (e.g., valves, flanges, connectors) in TCE service located outside of the PTEs. Some of these components are located in structures that are maintained under negative pressure and that exhaust through elevated emission points. These components are within TEU-1B1. Other components are located outside of any structure and so release directly to the atmosphere and are identified as TEU-1B2.

Fugitive emissions will be represented in the model by ten volume sources (model IDs TCE1_1, TCE1_2, TCE4, TCE16, TCE17, and TCE15_1-5), four line volume sources (model IDs TCE3_V, TCE13_V, TCE19_V, and TCE20_V) and two point sources (model IDs STK_Z45, STK_Z11). The proposed model exhaust parameters for the fugitive emissions sources LD are presented in Table 3-4.

3.3 Warehouse (TEU-1C)

Polymer-based film awaiting shipment to customers is stored in the warehouse building located at the western side of the property, where trace amounts of TCE off-gas from the plastic stretch-wrapped and boxed product. The warehouse building is a certified PTE with an exhaust system that pulls air from inside the building and vents it through a stack located on the north end of the warehouse. The warehouse stack contains a continuous emissions monitor. The warehouse stack will be represented in the model as a point source, as model ID WHST. The proposed model exhaust parameters for the warehouse stack are presented in Table 3-4.

3.4 Welding for Metal Fabrication Activities (TEU-4)

Welding activities are conducted in building 2, which is located at the south end of the facility. There are 16 vents on the roof of building, including two that passively allow airflow into and out of the building. Emissions from the welding activities will be modeled as 16 discrete volume sources with model IDs (BLD2_1 through BLD2_16). The proposed model exhaust parameters for fugitive welding activities are presented in Table 3-4.

3.5 Coating Line (TEU-5)

The coating process takes place in an enclosed room, on the southeast corner of building 1. Air from the room is exhausted by a fan through a horizontal stack on the side of the building. The coating line will be represented in the model by a horizontal point source with the model ID COATLINE. The proposed model exhaust parameters for the coating line are presented in Table 3-4.

3.6 Natural-Gas-Fired Boilers (TEU-2.3 and TEU-2.1)

The facility uses two Cleaver Brooks high-efficiency natural-gas-fired boilers to provide process steam. The primary boiler (TEU-2.3) has a maximum heat input rating of 96.6 million British thermal units (MMBtu) per hour, while the secondary boiler (TEU-2.1) has a maximum heat input rating of 64.8 MMBtu per hour. The secondary boiler serves only as a backup to the primary boiler and does not operate unless the primary boiler is not operational. Both boilers fire primarily on natural gas; however, the Title V permit (condition 23.g) authorizes limited operation on diesel as a backup fuel during curtailment periods and up to 48 hours per calendar year for operator training and testing.

Because the secondary boiler operates only if the primary boiler is not operational, emissions from the secondary boiler will not be included in the risk assessment. For the purposes of estimating cumulative risk from the facility, emissions from the boiler when firing on diesel will be included in the Level 3 risk assessment. The emission rates shown in Tables 3-1 and 3-2 correct cell reference errors identified in the DEQ-approved emission inventory that incorrectly looked up the annual natural gas fuel usage instead of annual diesel usage to calculate annual emissions.

The primary boiler stack will be represented in the model with model ID BOILER. The proposed model exhaust parameters for the natural gas-fired boiler are presented in Table 3-4.

3.7 Miscellaneous TAC Fugitive Emissions (TEU-MISC)

Miscellaneous facility-wide fugitive emissions (TEU-MISC) occur from the use of various TAC-containing products at the facility. These emissions occur inside enclosed buildings and are released to atmosphere through specific known locations at the facility, such as wall vents. As a result, the facility-wide miscellaneous TAC fugitive emissions will be represented in the model by ten discrete volume sources (model IDs TCE1_1, TCE1_2, TCE4, TCE16, TCE17, and TCE15_1-5) which represent ten exhaust vents from building 1; 16 discrete volume sources (model IDs BLD2_1 through BLD2_16), which represent 16 exhaust vents from building 2; and four line volume sources (model IDs TCE3_V, TCE13_V, TCE19_V, and TCE20_V), which represent fugitive emissions from rooftop piping.

The proposed model exhaust parameters for the miscellaneous fugitive emissions are presented in Table 3-4. Fugitive TCE emissions from buildings 2 and 11 will be allocated to each applicable model source (model IDs TCE1_1, TCE1_2, TCE4, TCE16, TCE17, TCE15_1-5, TCE3_V, TCE13_V, TCE19_V, and TCE20_V). Table 3-5 presents the proposed model source allocation for the facility-wide fugitive emissions.

3.8 Parts Washer Fugitive Emissions (TEU-MISC)

Fugitive emissions may occur from the use of 2 parts washers that use a TAC-containing solvent for cleaning equipment on an as-needed basis. Emissions related to the parts washer occur inside the maintenance shop in Building 1 where they are released to atmosphere via a roll-up door and inside the forklift shop in Building 2 where they are released to the atmosphere through passive vents on the roof. As a result, fugitive emissions from the part washer in the maintenance shops are represented in the model as a volume source identified by model ID MSHOP and as 16 discrete volume sources (model IDs BLD2_1 through BLD2_16). Table 3-5 presents the proposed model source allocation for the parts washer fugitive emissions.

The proposed model exhaust parameters for the parts washer fugitive emissions are presented in Table 3-4.

4 AIR DISPERSION MODELING METHODOLOGY

The following subsections detail the proposed air dispersion model configuration for the facility. This proposed air dispersion model configuration will be used in support of the Level 3 risk assessment.

4.1 Model Selection

MFA proposes to execute the facility dispersion modeling using the models shown in Table 4-1. Lakes Environmental, a third-party overlay software, will be used to set up and execute the AERMOD dispersion model.

Table 4-1. Proposed Model Selection

Model	Model Version
AERMOD	21112
AERMET	21112
AERMAP	18081
AERSURFACE	20060
AERMINUTE	15272
BPIP	04274

4.2 Meteorological Data

In preparation for air dispersion modeling, MFA developed the meteorological and terrain data files shown in Table 4-2 below.

Table 4-2. Proposed Meteorological and Terrain Data

Dataset	Station ID
Site-Specific	On-site meteorological station located on northwest corner of property boundary
Surface	Station ID 24232 for Salem, OR (National Oceanic and Atmospheric Administration)
Upper Air	Station ID 24232 for Salem, OR (National Oceanic and Atmospheric Administration/ Earth System Research Laboratory Radiosonde Database)
Terrain	USGS National Elevation Dataset (1/3-arc seconds with horizontal resolution of 10 [meters])

4.2.1 Site-Specific Meteorological Data

ENTEK owns and operates a meteorological tower, located at the northwest corner of the facility. The tower was sited in late 2016 and began collecting data in January 2017. Hourly averaged meteorological data, including wind speed, wind direction, temperature (2-meter and 10-meter), precipitation, relative humidity, and barometric pressure, are collected at the tower. MFA understands that ENTEK provided a meteorological dataset that had been monitored at the tower in April 2019 for the DEQ's review and approval. The April 24, 2019 email from the DEQ to ENTEK approving use of this meteorological data for dispersion modeling is provided in the Appendix to this report.

MFA proposes to use the approved site-specific meteorological data (approved meteorological dataset) for dispersion modeling. Section 8.4.2 "Recommendations and Requirements" of 40 CFR Appendix W to Part 51 (Appendix W) states: "The use of ... at least one year of site-specific ... meteorological data are required."

Acknowledging guidance from Appendix W, MFA proposes to use the one-year period of January 1, 2018 through December 31, 2018 from the approved meteorological dataset. This period was chosen as it represents the most current data monitored at the meteorological station that meets the quality assurance requirements identified in Table 0-10 of the Quality Assurance Handbook for Air Pollution Measurement Systems (Monitoring Handbook)¹. The Monitoring Handbook requires that equipment audits be conducted at a minimum of once every six months to verify the integrity of the monitoring equipment and confirm that the meteorological data are accurate. Equipment audits of the meteorological tower were not conducted between February 2019 and August 2021.

ENTEK re-initiated equipment audits in August 2021. Performance tests conducted during the August 2021 audit found that the wind sensor did not meet the acceptance criteria in Table 0-10 of the Monitoring Handbook, and required replacement. Because the wind sensor met all performance criteria during the audit in February 2019, but failed in August 2021, the accuracy of any met data

¹ EPA. Quality Assurance Handbook for Air Pollution Measurement Systems. Vol. IV, Meteorological Measurements, ver. 2.0. EPA-454/B-08-002. U.S. Environmental Protection Agency, March 2008.

collected between these dates cannot be certified, and the data are not suitable for use as part of regulatory dispersion modeling assessments.

4.2.2 Surface Meteorological Data

Surface meteorological data were used to supplement solar radiation and substitute for any missing on-site data. The surface meteorological data were collected from the Salem McNary Airport monitoring station (McNary met station) (ID 24232) located in Salem, Oregon. Hourly data for wind speed, wind direction, precipitation, solar radiation, relative humidity, barometric pressure, and temperature for the modeling period (January 1, 2018, through December 31, 2018) were collected and used to substitute for missing or unmonitored variables from the on-site data. The McNary met station data were determined the most representative, publicly available surface meteorological data because of the station's relatively close proximity to the facility.

4.2.3 Upper-Air Data

Upper-air meteorological data for Salem, Oregon (station ID 24232) were obtained in the Forecast Systems Laboratory format, from the National Oceanic and Atmospheric Administration Earth System Research Laboratory Radiosonde Database. Upper-air meteorological data were extracted for the modeling period (January 1, 2018, through December 31, 2018).

4.2.4 Data Processing—AERMET

MFA processed the meteorological data using AERMET to produce one year of model-ready meteorological data for use in the AERMOD model. The land-use surface characteristics were processed using AERSURFACE.

As outlined in the DEQ's April 2020 "Recommended Procedures for Air Quality Dispersion Modeling", Section 2.3, Table 2, "Adjusted surface friction velocity (u^*) can be used if no turbulence parameters will be passed to AERMOD." Appendix W specifies turbulence parameters as standard deviation of horizontal wind direction (sigma-theta) and vertical wind direction. Sigma-theta was not passed to AERMOD, and the adjustment to the surface frictional velocity option (i.e., ADJ_ U^*) was selected as part of the AERMET processing.

An analysis of the missing hours for the on-site meteorological dataset produced by AERMET was performed by running AERMOD for each calendar quarter and obtaining the number of missing hours from the model output file. To be considered complete and valid, each calendar quarter must have less than 10 percent missing hours. As shown in Table 4-3, all four quarters meet this criterion.

A wind rose for the complete meteorological dataset is presented in Figure 4-1, which indicates a trimodal wind distribution with winds blowing from the south, southwest, and north. This is generally consistent with the north-south orientation of the Willamette Valley, and the proximity of the Cascade Mountain range to the east.

4.3 Land Use

AERSURFACE was used to generate seasonal values for albedo, Bowen ratio, and surface roughness heights required as part of the AERMET processing. State of Oregon National Land Cover Dataset, 2016 (NLCD16) land cover class definitions, along with concurrent percent impervious surface and percent tree canopy data, were downloaded from the U.S. Geological Survey (USGS) and processed using AERSURFACE in order to generate the surface characteristics necessary to run AERMET. The NLCD16 data were processed in AERSURFACE using the settings described in Table 4-4.

Because surface meteorological data were processed from both the site-specific station and the McNary met station, AERSURFACE requires that soil moisture be included for both locations. Soil moisture conditions were determined following the methodology set forth in Section 3.2.8 of the U.S. Environmental Protection Agency (EPA) AERSURFACE User's Guide dated February 2020 (AERSURFACE User's Guide).

[surface moisture] should be entered as either WET, DRY or AVERAGE, where, in general, WET is defined as precipitation amounts equal to or greater than the 70th percentile of the 30-year climatological records; DRY is equal to or less than the 30th percentile; and AVERAGE is between the 30th and 70th percentiles.”

Annual precipitation data for the Lacombe, Oregon (ID: 354606) met station were retrieved from the Western Regional Climate Center for the proposed modeling period to assess soil moisture conditions for the site-specific meteorological data. The Lacombe met station was chosen because of its proximity to the modeling domain—approximately 7 miles northeast of the facility. As shown in Table 4-5, the total precipitation collected during the modeling period at the Lacombe station was 42.64 inches, which is less than the 30th percentile annual precipitation of 47.35 inches. As a result of this analysis, AERSURFACE was executed assuming dry soil moisture conditions for the site-specific meteorological data.

Annual precipitation data for the Salem, Oregon (ID: 354606) COOP met station were retrieved from the Western Regional Climate Center to assess soil moisture conditions for the surface McNary met data. As shown in Table 4-5, the total precipitation collected during the modeling period at the Salem COOP station was 31.06 inches, which is less than the 30th percentile annual precipitation of 33.69 inches. As a result of this analysis, AERSURFACE was executed assuming dry soil moisture conditions for the surface meteorological data.

MFA proposes to execute the air dispersion model using rural dispersion coefficients. To make this determination, MFA followed the land-use procedure, as recommended by EPA's “Guideline on Air Quality Models,” found in Section 7.2.1.1(b) of Appendix W, to conclude that less than 50 percent of the land use in the modeling domain is represented by the urban land-use type.

4.4 Proposed Model Emission Rates

MFA proposes to execute the dispersion model using unit emission rates for all TEUs for annual (chronic cancer and noncancer) assessments. The maximum modeled unit concentration in micrograms per cubic meter ($\mu\text{g}/\text{m}^3$) at each modeled receptor for the annual averaging period will be

considered a modeled “dispersion factor” in units of $\mu\text{g}/\text{m}^3$ per g/s . When this dispersion factor is multiplied by the g/s TAC emission rate for the modeled TEU, the result is the modeled concentration of the TAC. Therefore, a single unit emission rate model result can be used to calculate the modeled concentration for each TAC. The dispersion factors, in combination with TAC emission rates for each TEU in g/s and the RBCs in $\mu\text{g}/\text{m}^3$ set forth under OAR 340-245-8010 Table 2, will be used to conduct the chronic cancer and noncancer Level 3 risk assessments.

For the 24-hour (acute) assessment, MFA developed risk equivalent emission rates for each TEU. The proposed risk equivalent emission rates were calculated by dividing the individual TAC emission rate for each TEU by their respective acute RBC. The resulting value for each TAC was then summed together to create a total risk equivalent emission rate for the TEU. This process was repeated for each TEU at the facility. The risk equivalent emission rates will be modeled for the 24-hour averaging period to assess the cumulative acute risk from the facility. The proposed risk equivalent emission rates are provided in Table 3-3.

4.5 Emissions Source Locations

The location of each TEU to be included in the dispersion model is shown in Figure 4-2. For volume sources that are located on or adjacent to buildings, initial horizontal dimension (YSINIT) and initial vertical dimension (ZSINIT) will be calculated using the EPA method specified in the “User’s Guide for the Industrial Source Complex (ISC3) Dispersion Models—Volume II—Description of Model Algorithms” (1995). EPA-454/B-95-003a. Release heights will be set to half the building height.

4.6 Building Downwash

The current version of BPIP, shown in Table 4-1, will be used.

The proposed locations for structures that are projected to influence downwash are presented in Figure 4-3. All stacks at the facility meet good engineering practice design parameters. Table 4-6 presents a summary of the proposed building heights to be included in the air dispersion model.

4.7 Receptor Locations and Terrain

Dispersion factors and cumulative acute risk will be determined for each modeling receptor identified outside the facility property boundary. MFA proposes to place modeling receptors at potential exposure locations in the surrounding area up to 10 kilometers away from the center of the facility. Figure 4-4 presents the proposed receptor spacing and locations for the modeling domain. Figure 4-5 presents the proposed receptor locations in the area immediately surrounding the facility.

Receptors will be defined in the dispersion model according to the spacing identified in Table 4-7. The facility property boundary is bordered on all sides by public rights-of-way – rail tracks to the north, and public roads to the east, south and west. As a result, MFA proposes to utilize an “exposure assessment boundary” that will be placed on opposite side of the public rights-of-way adjacent to the property boundary. This method will ensure that acute risk will be adequately assessed in the areas

closest to the facility. The 25-m receptor grid will extend out at least 200 m past the exposure assessment boundary in all directions.

Table 4-7. Proposed Receptor Spacing

Receptor Spacing	Receptor Distance
25 m	Along exposure assessment boundary and out to at least 200 m
50 m	200 m to 1,000 m
100 m	1,000 to 2,000 m
200 m	2,000 to 5,000 m
500 m	5,000 to 10,000 m

MFA identified multiple locations considered to be “sensitive areas” (e.g., schools) within approximately 1 kilometer of the facility property boundary, as shown in Table 4-7. Each identified sensitive area will be accounted for in the air dispersion model by a discrete receptor location centered on the sensitive area.

Table 4-8. Identification of Sensitive Exposure Locations

UTM Coordinates (m)		Sensitive Area
Easting	Northing	
50,6832.91	4,933318.21	Samaritan Lebanon Health Center—Pediatrics
50,6817.00	4,933,005.00	Pioneer School
50,6417.98	4,932,587.67	Cascade Performing Arts Center (acute only)
50,7244.00	4,932,409.00	Lebanon Public Library (acute only)
50,6721.00	4,933199.00	Oregon Veterans' Home
50,7220.22	4,932968.07	Samaritan Urgent Care Walk-in
50,7021.73	4,932317.58	Meadowlark Senior Living
50,6999.16	4,932095.21	Boys and Girls Club of the Greater Santiam
50,6258.90	4,931704.27	Green Acres Elementary School
NOTE: UTM = universal transverse mercator.		

Terrain elevations for model receptors, source base elevations, and base elevations of downwash structures will be taken from the USGS National Elevation Dataset data at a resolution of 1/3 arc-seconds (a horizontal resolution of roughly 10 m) and processed using the current version of AERMAP, shown in Table 4-1.

4.8 Land-Use Zoning Classification Data for Determining Exposure Types

In anticipation of dispersion modeling, the Department of Land Conservation and Development's statewide zoning data were reviewed to determine land-use classifications for areas in the modeling domain. The Oregon statewide zoning classifications provide the basis for the initial categorization of exposure classifications (i.e., residential, nonresidential worker, nonresidential child, or acute).

The zoning data were further evaluated against local data such as the Linn County zoning and school-location information. MFA also reviewed aerial imagery, using Esri ArcGIS and Google Earth software to determine whether the existing zoning information reflects actual land use and the corresponding exposure type categorization.

The zoning data and internal MFA review process indicate that multiple proposed receptor locations fall within roadway and/or rail right-of-way interstitial spaces, which are identified in blue in Figures 4-4 and 4-5. These locations are proposed for dispersion modeling in order to maintain a uniform receptor grid. MFA does not propose to conduct risk evaluations for any receptor locations in roadways or rail rights-of-way. In the crosswalk-of-receptors, which will be provided to the DEQ in spreadsheet format because of the number of receptor locations, these locations are labeled as "Risk Not Assessed," even though they will be modeled. MFA has reviewed receptor locations near the facility where it is expected that the maximally exposed receptors will be located. If there are receptors farther from the proposed facility that are located in roadways or rail rights-of-way that have been unknowingly identified as an exposure location by the automated zoning evaluation process, and these locations have an impact on the risk assessment evaluation, these will be excluded from evaluation in the risk assessment report.

Figure 4-6 presents the existing land-use zoning identified for the modeling domain, and Figure 4-7 is provided for the area immediately surrounding the proposed facility. Figures 4-8 and 4-9 present the corresponding exposure location categorization for the modeling domain and the immediate area surrounding the proposed facility, respectively. For additional clarification, Table 4-9 shows all proposed receptor locations and their exposure classification.

5 CLOSING

MFA looks forward to working with the DEQ throughout the CAO process. If there are any questions or comments regarding this modeling protocol, please contact Andrew Rogers at (503) 407-6406 or at arogers@maulfoster.com.

TEU Risk Equivalent Emission Rate ^(b) (g/s per ug/m³)				7.1E-06	7.1E-06	7.1E-06	7.1E-06	1.9E-03	1.1E-03	1.8E-05	1.8E-05	2.8E-04	6.8E-07	2.6E-04	2.6E-04	2.6E-04	2.6E-04	2.6E-04	1.9E-08	4.9E-08	2.0E-08	1.4E-05	9.5E-05

NOTES:
g/s = grams per second.
TAC = toxic air contaminant.
ug/m³ = micrograms per cubic meter.

(a) TAC acute risk equivalent emission rate (g/s per ug/m³) = (daily emissions estimate [g/s]) / (acute risk based concentration [ug/m³])
Daily emissions estimate (g/s) = (2)
(b) TEU Risk Equivalent Emission Rate (g/s per ug/m³) = Σ (TAC acute risk equivalent emission rates [g/s per ug/m³])

REFERENCES:
⁽¹⁾ Oregon Administrative Rule 340-245-8010 Table 2.
⁽²⁾ See Table 3-2, Proposed Daily Emission Rates.
⁽³⁾ TAC does not have an acute based concentration listed in OAR 340-245-8010 Table 2.

NOTES:

K = kelvin.

m = meter.

m/s = meters per second.

m³/s = cubic meters per second.

UTM = Universal Transverse Mercator.

(a) Exit flowrate (m³/s) = (π/4) x (stack diameter [m])² x (exit velocity [m/s])

(b) Initial lateral dimension [m] = (length of side [m] / 4.3) [4]

(c) Initial vertical dimension [m] = (building height [m] / 2.15) [4]

REFERENCES:

⁽¹⁾ Value based on information provided by ENTEK International LLC.

⁽²⁾ Base elevation derived from the US Geological Survey National Elevation Dataset downloaded and processed in AERMET.

⁽³⁾ See "Users Guide for the AMS/EPA Regulatory Model (AERMOD)," EPA-454/B-18-001 dated April 2018. Assumes release height for elevated volume source is half of the building height.

⁽⁴⁾ See "User's Guide for the Industrial Source Complex (ISC3) Dispersion Models - Volume II – Description of Model Algorithms." (1995) EPA-454/B-95-003a.

⁽⁵⁾ Line volume height is equal to the height of the building.

Table 4-5
Soil Moisture Condition Assessment
ENTEK International LLC — Lebanon, Oregon

30-Year Climate Precipitation Data ⁽¹⁾	Rain Gauge Sites	
	Site-Specific	Surface
	Lacomb (ID: 354606)	Salem (ID: 357500)
Average Annual Precipitation ⁽²⁾	55.4	40.0
Lower: 30th Percentile Annual Precipitation ⁽³⁾	47.4	34.0
Upper: 70th Percentile Annual Precipitation ⁽⁴⁾	58.6	46.1
Total Measured Precipitation for the Proposed Modeling Period (2018)		
2018 Total Precipitation ⁽⁵⁾	42.6	31.0
Climatic Significance ⁽⁶⁾	Below 30th Percentile	Below 30th Percentile
Calendar Year Soil Moisture (in) ⁽⁷⁾	Dry	Dry

REFERENCES:

- ⁽¹⁾ Climatological data obtained from the Western Regional Climate Center for the Lacomb, OR (ID: 354606) and Salem, OR (ID: 357500) meteorological stations. Due to both on-site and surface files being used in AERMET, soil moisture conditions are required for both locations. Data represent the 30-year period between January 1989 and December 2018.
- ⁽²⁾ Represents average annual precipitation during the 30-year climatological period.
- ⁽³⁾ Represents upper limit of the 30th percentile annual precipitation during 30-year climatological period.
- ⁽⁴⁾ Represents lower limit of the 70th percentile annual precipitation during 30-year climatological period.
- ⁽⁵⁾ Represents proposed model period (January 1, 2018 - December 31, 2018).
- ⁽⁶⁾ Climatic significance represents annual precipitation compared to 30-year climatological period.
- ⁽⁷⁾ Surface moisture conditions correspond to DRY, AVERAGE or WET soil content determined by comparing annual precipitation to 30-year climatological period. This method is consistent with the methodology set forth in the current version of the EPA AERSURFACE User's Guide dated February 2020.

APPENDIX

MET DATA DEQ APPROVAL LETTER

Wright, Monica/PDX

From: GISKA Jonathan <Jonathan.R.GISKA@state.or.us>
Sent: Wednesday, April 24, 2019 3:28 PM
To: Wright, Monica/PDX
Cc: WHITE-FALLON Karen; ALLEN Philip; RHODES Thomas
Subject: [EXTERNAL] ENTEK Met data

Monica,

Thank you for providing the met data for approval for ENTEK, and all of the follow-up to ensure DEQ had the relevant data we needed to finalize a response.

As far as the siting of the met station, the ENTEK Meteorological Tower appears to meet the guidelines and should be sufficient for Meteorological Monitoring. DEQ does note the following:

- The distance of the boxcars and the frequency in which they are near the met tower. The summary provided by Jacobs states that site is adjacent to a rail line with box cars that sometimes sit adjacent to the plant for several days. The box cars are as much as 17 feet tall and located at a distance as close as 75 feet. Jacobs believes that most of the stationary box cars are located at a distance much farther than this. Though they state most of the boxcars are typically located at a distance much greater than 75 feet away, the boxcars' height of 17 feet would require their distance to be 170 or more feet away from the meteorological tower based on EPA's Meteorological Monitoring Guidance for Regulatory Modeling Applications. It unclear as to the frequency with which the boxcars occupy positions closer than 170 feet away and those periods technically may not comply with the siting criteria guidance. The implication is that unknown periods of wind speed and wind direction data may have been impacted.

In regards to the compiled data set for modelling purposes DEQ finds the following:

- The summary of on-site meteorological data collected from 2017 to 2019 at a site near ENTEK, which was submitted to DEQ by Jacobs Engineering Group on 4/18/2019, has been reviewed. The summary description documents the completeness of valid meteorological variables including wind speed, wind direction, temperature (2 meters), temperature (10 meters), precipitation, relative humidity, and barometric pressure. Of these, the critical parameters for AERMET of windspeed, wind direction, and 2 meter temperature, show a completeness of 99% or greater by month over the full two-year period 2/1/2017 – 3/1/2019. This satisfies EPA criteria for completeness, and these data are approved for processing in AERMET and subsequent use in AERMOD for modeling concentrations from ENTEK facility emissions.

In summary, DEQ finds both the siting of the station and the data set to be approved for monitoring and modeling, respectively.

Please feel free to contact me if you have any questions or feedback.
