

ROYAL WHITE MINE

GREENHORN
MT. REGION
VICINITY OF
GREEN'S CITY

At the *Royal White*, the chief development is 95 feet below the outcrop. The country rock is a gray, thin-bedded, thoroughly-fractured siliceous argillite. In two places the vein, which is in widths up to 3 feet, has been stoped, one about 150 feet long and the other 30 feet. Considerable faulting and movement has occurred. In one place the vein has formed an arch. The ore is said to be of good grade.
