The Norwood mine, near the Virtue, is in similar greenstone, which is more altered. There are several veins, most of them too small to be considered seriously. Quartz and calcite are the vein minerals which in many of the veins has been shattered and slickensides are present as a result of these movements since the vein was formed. The largest vein is an E-W. steep dipping vein, consisting of quartz, gouge and altered rock. The average width of this vein for 450 feet is about 2 feet. In 1913 a small mill was installed, but no idea of the value of the ore could be obtained and apparently no systematic sampling has been done recently.
NORWOOD MINE (Gold)
Virtue District

"The Norwood mine, in sec. 8, T. 9 S., R. 41 E., about 2 miles north of the Virtue, was caved and inaccessible in 1930. The property has been described as embracing two lode claims. The country rock is greenstone cut by several quartz and calcite veins, mostly rather small, and shows considerable post-mineral brecciation. The largest vein dips steeply, strikes west, and averages about 2 feet in width. A small mill was installed in 1913, but no production has been reported. Little or no work has been done for many years at this property."
