Job No. 681

UNITED STATES DEPARTMENT OF AGRICULTURE  
FOREST SERVICE

REPORT OF MINERAL EXAMINATION

Bratcher No. 10 Lode Claim

Colver F. Anderson  
Mining Engineer

August 31, 1971

~~FOR OFFICIAL USE ONLY~~  
(UNTIL CASE CLOSED)

Claimant: Linzie A. Bratcher  
1775 Ashland Mine Road  
Ashland, Oregon 97520

Reason for Examination: Claimant wants to build an access road  
which will not cross private land.

Subject: Validity of mining claims

Lands Involved: Bratcher No. 10 lode claim, approximately  
18 acres in Sec. 30, T. 39 S., R. 1 E.,  
and Sec. 25, T. 39 S., R. 1 W., W.M.,  
Rogue River National Forest, Jackson  
County, Oregon

Land Status: National Forest land open to Mineral Entry

Location Data: The Bratcher No. 10 claim was located by  
Linzie A. Bratcher, July 21, 1951, and  
recorded in Jackson County Mines Book 55,  
Page 436.

Mining District: No organized district

Mining Engineer: Colver F. Anderson

Date of Examination: August 31, 1971

Accompanied By: Mr. Bratcher, claimant  
Bill Harbaugh, Forester, Ashland Ranger District

## ABSTRACT

This claim is about 8 miles from Talent, between Ashland and Medford, up Wagner Creek. The terrain is fairly steep and timbered.

The prevalent rock is diorite of the Mt. Ashland stock. The roots of numerous veins in this rock have attracted many prospectors but no profitable mines have been developed.

The subject claim has a fine quartz vein with mineral content too low to establish validity.

A discovery has not been demonstrated within the limits of the Bratcher No. 10 claim.

A special use permit for an improved access road is not in the best interest of forest management at this location.

### Location and Topography

This claim is about 8 miles from Talent up the Wagner Creek road and a road which goes into the upper part of Horn Gulch.

The hillsides are steep but fairly level benches occur occasionally.

### Surface Values

The benches are good meadowland, but timber on the hillsides is more valuable than any other surface use.

### Areal Geology

The area of the claim is within the Mt. Ashland quartz diorite stock. The nearest contact with other rocks is 2 miles to the west.

### Economic Geology

Mineralization is associated with the Mt. Ashland diorite. Better mineral zones are associated with the borders of intrusives and mainly in the intruded rocks. Veins found in the interior of intrusive rocks are the roots of veins which once extended into the overlying intruded rocks. Values and volumes in such veins decrease as the distance from the contact zone into the diorite increases.

### History and Production

The interior of the diorite mass has been subjected to prospecting for many years because of numerous quartz veins. The Skyline Mine is approximately one half mile northeasterly from the subject claim. Some millgrade gold ore was produced from this property but the volume available was never enough for a profitable operation. The production is estimated to have been only \$1000. The ore was produced nearly 50 years ago.

There is no other known production from the area.

### Occupancy

None

### Discovery

The Bratcher #10 claim is located on a large quartz vein within the Mt. Ashland diorite stock. The best appearing mineralization is exposed in

the large cut across the vein near the center of the claim. Pictures 1 and 2 show the vein and sample location. The vein is well exposed on the northwest strike for several hundred feet. Minor amounts of pyrite can be found in the quartz.

In the big cut a gray mineral occurs in sufficient quantity to be ore if all of it is molybdenite. Judging from the two samples, A71-1 and A71-2, much of the gray mineral is something else. The probable other mineral is graphite. Both can be very similar in visual examination.

A select portion of the 10 feet thick vein was selected for one sample and a "high grade" grab from a bucket was used for the second sample. The amount of molybdenum in the high grade sample is not enough to pay an appreciable part of mining costs in a vein deposit such as this. A channel sample across the 10 feet of quartz vein instead of a select four feet, which A71-1 is, would probably show less than one half pound per ton of molybdenum with a value of less than 86 cents per ton. A friable quartz such as this vein is can be mined for about \$10 per ton. Milling would be about at the same cost per ton.

#### Conclusions

The Bratcher #10 claim is located on a strong quartz vein containing minor amounts of molybdenite as the principal mineral. A vein in this geologic setting is expected to decrease in volume and value with increase in depth from the surface.

The values present do not constitute a discovery or a probable discovery.

#### Recommendations

The Forest Service is not justified in issuing a special use for road improvement to reach this claim.

The Government does not need to initiate a hearing under the existing circumstances.

## BRATCHER #10 PROSPECT (SiO<sub>2</sub>, Mo)

Jackson County  
Ashland District

Owners: L. A. Bratcher and Charles Rooker, Ashland.

Location: NE $\frac{1}{4}$  sec. 25, T. 39 S., R. 1 W., at about 4,100 feet elevation on the southwest side of Horn Gulch, a tributary to Wagner Creek. The prospect is reached via the Wagner Creek road, 5 miles south of Talent and then to the left on 3 miles of road to the prospect. The last  $\frac{1}{4}$  mile of road above Horn Gulch is quite steep and passable by jeep only when dry.

Development: Workings consist of a 170-foot tunnel and a new surface excavation which exposes the vein in the gully. Three smaller cuts were made at various places on the vein northwest of the main workings.

Geology: The deposit is a pegmatitic quartz vein in a coarse-grained, dark-colored quartz diorite containing abundant biotite and hornblende. The vein strikes N. 30° W. and dips 57° NE. Where exposed in the main open cut above the tunnel the vein is 8 feet thick. The northeast side of the vein consists of 4 feet of highly fractured, iron-stained quartz, and the southwest half is a fractured iron-stained pegmatite with minor sulphides including pyrite and molybdenite. The quartz vein is exposed intermittently over a distance of about 1000 feet along the strike. It outcrops mainly on the ~~x~~ hillside northwest of the gully, where widths of 8 to 12 feet of fairly pure quartz are exposed. A prominent joint pattern has developed parallel to the walls of the vein. A 10-foot chip sample was taken across the vein at the cut located on the northwest side of the ridge about 800 feet northwest of the gully. The sample (RG-500, P-22167) assayed 99.35 percent SiO<sub>2</sub> and 0.02 percent CaO.

The tunnel trends almost due west for 90 feet where it intersects

- 2 -

the vein. It then drifts to the northwest along the vein for 50 feet, and from this point turns west into the footwall, a distance of 30 feet. Where exposed in the tunnel the vein is from less than 2 feet to about 4 feet thick. The pegmatite portion of the vein was not recognized in the tunnel. A minor amount of copper stain was noted.

Assay samples include the following: A 4-foot chip sample across the pegmatite (southwest side of vein in gulch cut, RG-501, P-22168) assayed 0.02 oz./ton Au, Trace Ag, and Trace Mo. A 4-foot chip across the quartz vein at the gulch cut assayed Nil in both gold and silver as did a 2½-foot chip sample on the vein in the tunnel. A high-grade sample of pegmatite with molybdenite on the fractures (RG-336, P-21661) assayed 2.00 percent Mo.

Additional sampling of the vein especially in the tunnel may indicate zones or shoots in the vein which contain better gold values. Trenching of the apparently wider portions of the quartz vein to see if greater widths are available as a possible source of silica may also be advisable.

Visited: 10/18/57 -- with L. A. Bratcher and Charles Rooker.

Report by: L. R. - 11/18/57.

\* \* \* \* \*

Addendum Report

BRATCHER SILICA No. 10 (SiO<sub>2</sub>, Mo)

New development work by Bratcher and Bob Burns has exposed the persistent quartz vein for at least 1,500 feet along the strike and up to 15 feet depth. The vein averages about 8 feet wide but is up to 15 - 20 feet wide in places. Post vein faulting is apparent and slickensides showing dip-slip as well as small horizontal offsets have been exposed. A sample of iron-stained gouge at the contact of the vein and hanging wall was assayed with results as follows:

	<u>Au</u>	<u>Ag</u>
UG-105	Nil	Trace

Part of the excavation work was done by a group from Roseburg represented by

H. K. Thurber.

Visited: 5/12/60 N.V.P. & L.R.

## Butcher Tungsten -

Deposit is in tectite - etc between granite and Applegate sed. (?)

Location <sup>NE 1/4</sup> sec. 13 T395 R W

Prospect # 1 - appears to be a type of roof pendant or large block of gneiss type rock tectite surrounded by varieties of hornblende rich diorite and granite - pegmatite type veinlets appear as stringers through rock. Epidote, garnet, tourmaline, feldspar, quartz, biotite are prominent minerals. Scheelite has been reported from this hole.

The prospects are located in <sup>N 1/2</sup> sec. 13 and <sup>N 1/2</sup> sec 18 T. 395, R1E., and R1W.

Exploratory work consists of several bulldozed cuts which cross the strike of tectite zones near the contact of (diorite, granite) and Applegate sed. and Serpentine.

The tectite zones average about ten feet wide and normally are

stained with iron oxides - They are often associated with and cut by pegmatite dikes.

Garnet, epidote, <sup>micas</sup> and quartz are the predominate minerals in the <sup>tactite</sup> zones - Relatively large amounts of magnetite were found in 2 cuts.

Batcher and Rooker reported scheelite in small ~~am~~ to promising amounts in several of the tactites that have been opened.

In the NE $\frac{1}{4}$  NW $\frac{1}{4}$  sec 18, there is a small body of older serpentinite and granite that has been intruded by a diorite mass - along the contact a foot to 5 feet of good quality talc is found -

No real promising deposits were found - the talc could be commercial?

Talc - about \$3.00 per ton?

REQUEST FOR SAMPLE INFORMATION

The State Law governing free analysis of samples sent to State Assay Laboratories requires that certain information be furnished, the Laboratory regarding samples sent for assay or identification. A copy of the law will be found on the back of this blank. Please fill in the information called for as completely as possible, and submit it along with your sample. Keep a copy of the information on each sample for your own reference.

Your name in full H. D. Wolfe

Post office address Box 417 Grants Pass, Oregon

Are you a citizen of Oregon Yes Date on which sample is sent 6/16/50

Name (or names) of owners of the property Ashland Mining Co.

Name of claim sample obtained from \_\_\_\_\_

Location of property or source of sample (describe as accurately as possible below):  
(If legal description is not known, give location with reference to known geographical point.)

County Jackson Mining district Ashland

Township 39 S Range 1 E Section 6 Quarter section \_\_\_\_\_

How far from passable road and name of road \_\_\_\_\_

Channel (length) Grab Assay for WO<sub>3</sub> Description \_\_\_\_\_

Sample no. 1 can of concentrates WO<sub>3</sub> Mill concentrates

Sample no. 2 intervals in tailing pile WO<sub>3</sub> Tailings

(Samples for assay should be at least 1 pound in weight; clay samples for ceramic testing, at least 5 pounds.)

**IMPORTANT:** A vein sample should be taken in an even channel across the vein from wall to wall. Location of sample in the workings, together with the width measured, should be recorded.

(Signed) H. D. Wolfe
