

## THE GRIZZLEY LIMESTONE DEPOSIT

The Grizzley Limestone deposit near the south end of the area was located on the George and Katherine Ruffner Ranch,  $2\frac{1}{2}$  miles west of Grizzly, and about  $\frac{3}{4}$  mile across the fields east of the road, just east of an old barn. Approximately in sec. 21, T. 12 S., R. 15 E. The limestone occurs as a discontinuous lens from a few inches to at least 2 feet wide, standing nearly vertical, with walls of altered grey porphyritic andesite, probably of Clarno age. The extent of the excavations suggest that the lens was mined 10' deep for about 40 feet, other lenses are said to occur farther to the north west.
