

(19) BAILEY MANGANESE

GOLD HILL AREA

A four-foot fracture zone contains manganite and psilomelane with traces of rhodonite. There is one trench 6 - 8 feet wide, following the mineral zone uphill and exposing it at 3 levels within a horizontal distance of 45 feet and a vertical distance of 30 feet. Association of the ore with rhodonite would make it difficult to get a manganese concentrate that will be low in silica.

Authority: Hodge (H 8) reports as follows:
