702 Woodlark Building Portland, Oregon

TAKILMA MINING CO.

H. D. Beasley of the Takilma Mining Co., has put a great deal of time and money into that enterprise with no returns as yet and indications are that if he doesn't get the dredge into successful operation soon they may run into financial difficulties. Beasley states that no real testing has been done on the ground which they plan to work.

Reported by H. D. Wolfe
December 1, 1947

702 Woodlark Building Portland, Oregon

Grants pass, Oreg., Oct. 1, 1900

Mr. Adam Hay Anderson Apartado 866 Mexico, D. F.

My dear Sir:

As per your request, I submit the following report on the ground formerly known as the "Chinese Derrick Ground", situated about forty miles west of Grants Pass, Oregon, and about 12 miles from the town of Waldo; lying adjacent to the celebrated Simmons & Wymer Hydraulic Placer Property, which has been worked for nearly forty years and can be worked on a large scale for a much longer period.

The ground known as the "Sailor Digings" or "Chinese Derrick" ground has been from its inception as is today the richest ground in Oregon, and for that metter in the Pacific Coast. In the early '50s, 1851 and 1852, who was discovered here by a party of sailors who deserted the wessel at Crescent City, and making their way inland saturables, found coarse gold in "Sailor Gulch" at the present town of Waldo. The news spreading, soon brought a rush of twenty or thirty men to the locality; thence they branched out in the Althouse, Scott's Gulch, Allen's Gulch and numerous small gulches in the vicnity, where the sruface clear to the top of the hills adjacent to these draws and gulches paid a handsom return from the grass roots. But like all placer camps, as soon as the rich shallow dirty in the gulches was exhausted of the cream of its wealth, the camps were deserted for new Eldorados, yet today mining is carried on in a desultory fashion in the same gulches and

and remunerating a few men for their labor.

At the foot of these gulches is a large flat or basin, quite deep and varying in width from one-fourth of a mile to several miles, through which flows the Illinois River. In a few places, notably the mouth of Sailor's Gulch, where the gold was first discovered and the richest of all the gulches, the sruface was worked by excavating to a depth of 15 feet; but the ground being so flat and there being no dump for the tailings, it was never worked to any extent by white men and no one knew the values or even the depth of this ground until a Chinamen, named Wong Back Fong, leased the ground from one James Lyttle, the owner by location for a period of ninety-nine years. This was some ten years ago. By building a dam on the creek and constructing some ditches, he was enable to get water from his sluice wates and Chinese wheels, of which he had built three; two perate pumps and one for the derrick. He hired mostly chindmen, occasionally white men and would generally commence operations about May 15th and be in active operation until about the middle of September, a period of four months, during which time the water in the Illinois river was at its lowest stage. This work, slow and laborious, was the crudest kind of placer mining; hoisting the dirt out of the pit witha derrick and dumping the same into sluice boxes fitted with ordinary pole riffles, which involved great loss in the tailings, as subsequent examination has shown. After nine years of operation his excavation was forty-one feet deep and from which was taken about 50,000 cubic yards. The heavy material was piled back in the hole and a large force of Chinamen were employed forking the

remainder out of the boxes to keep it from choking the riffles, as the boxes were set on a grade of only two inches to twelve feet. On account of the limited power of the pumps, they were unable to raise from a greater depth than forty-one feet, consequently could not mine below this level. However they sunk a shaft fifty feet deep in the bottom of the excavation, which gave a total depth at this point of ninety-one feet. At this depth quick-sand was encountered and the shaft abandoned. There was an eye witness to the fact that this shaft penetrated exceedingly rich ground and from various strata, pans of dirt were taken, which would wash \$1.00 to the pan; but here again was a problem with which the Chinamen and getting rid of the could not contend, working to this deoth tailings, so he contented himself with working the upper forty feet a short time every year dor the dry season, and was in continual fear of having is ground jumped or hose it on some legal Chinamen wir in disfavor throughout this part of Oregon and on several accesions some them had been run out of the country by mobs, when it was known that they were making wages out of placer ground. This Chinaman had had his sluice boxes robbed several times and was very wary about making known the richness of his ground. It is a well known fact that for two or three years he was in debty not making enough while stripping the upper fifteen feet of ground overlying the rich gravel to pay the enpenses of his numerous laborers and the cost of improvements, consisting of dams, flumes, ditches, Chinese wheels, derrick, etc. In the meanwhile, after he had sunk his shaft forty feet find rich pay below him and on the strength of which Wymer Beothers, who operated a store

at Waldo, after making a survey and examination, backed him in his enterprise, so that in the spring of 1899, when the sale of this ground was consummated, the Chinaman's books showed an expenditure of \$59,000 for labor and supplies. What his profits were, no one can tell, but today he is a Banker in Hong Kong, doing a large business and reputed to be worth \$250,000, all of which he must have taken from this ground.

The bed rock is seppentine, cut by some prophyry dikes, schist and trap rock. The gravel below the first eleven feet is a medium size and composed of pebbles of diorite, chlorite, schist, clay etc., lying in beds or strata. The first stratum is about eleven feet thick, consists of wash from the Illimia River and contains gold to the value of about 10 cents per and which is sufficient to Tais overlies a stratum of reddish pay the expense of its removal, sulting from the decomposition clay, well emixed with graye of an iron bearing porplacy. The gold in this is medium size, being coarser than that lying below it. This stratum is two feet in thickness and have value of \$2.75 per cubic yard. This rests on a rather heavy and compact clay, carrying a value of more than \$1.00 per cubic yard, but which is not counted on for value whatever, although it can be waved. Under this is a very rich stratum of the celebrated red gravel, containing gold to the value of \$16.03 per cubic yard, places in this gravel actually panning 75 cents per pan, or approximately \$75.00 per yard. The balance of the ground to the 41 foot level being clay intermixed with sufficient gravel to permit thorough disintegration during the provess of washing and carrying a value of 27 cents per cubic yard.

Below this is a fifty foot shaft, at the bottom of which, quicksand was encountered precluding further sinking operations. Throughout its entire depth the shaft averaged \$1.00 per cubic yard and like the upper forty-one feet, the gravel was in numerous strata or pay streaks, some of which were exceedingly rich.

These results were obtained by an expert placer miner, a

Cornishman of many years experience in sampling placer mines, and are verified by Mr. I. D. Hammond of the Hammond Manufacturing Company, who at one time offered to lease the ground of the English Canadian Company and pay \$5000.00 for this privilege, which was refused. A dredge was purchased of the Hamson Manufacturing Co. and placed upon the ground, but it provad to be too weak and in every way inadequate to handling the pavel, breaking down so often that it was impossible to run out mually for forty-eight hours. As it was set up on the lower end of the claim on worked out ground. no values were obtained and the breaks in the machinery caused delays for repairs of from two to six weeks. This dredge was recommended by a man named J. S. Windell, who posed as a placer mining and dredge experty; but testimoney in a trial, in September, 1900. in the case of J. S. Windell against the English Canadian Company. proved that the said J. S. Windell had been an assistant and bookkeeper in a produce and commission house in Seattle, from which place he went to North Bned, British Columbia, and worked as a laborer and roustabout for four months on a dredge owned by the Beatty Gold Dreding Company, managed by Mr. Symmes. This dredge was of the dipper type, taking in sufficient material in the bed of the river.

702 Woodlark Building Portland, Oregon

6

From this position he came to Waldo, on the recommendation of Mr. Harry White, an intimate friend of his, who vouched for him. A subsequent operation of the dredged showed his utter incapacity to manage it, as well as the inability of the dredge to dig even in the lightest material on the tailings ground. At this time I was employed by Mr. W. J. Harris to ascertain what the difficulty was and to examine and take charge of the property, he having in the meantime discharge. I saw at once that it would be an impossibility ot dig with this machinery and suggested some improvements. which were carried out and were successful as far as they went. reducing by \$12.00 the daily running expense and permitting the digging of ground that could not be excava a before. dredge could not be made strong enough with remodeling the entire hull and machinery; realizing the t, I advised Mr. Harris to confine himself to shallow operations until he got in to the Chinese pit and there make that run, if practicable, before the machine became a total week. This was done, although a great deal of time was cooking by stop ages for repairs, whilst skimming the top soil. The main shaft was twishted and the lower shaft on the diggin ladder was broken several times, also the end of the digging ladder breaking off caused a great deal of expense in delay. On getting into the excavation and pumping the water down witha pump on the dredge, it was disdovered that the tailings piles in the pit prevented the turning of the boat, so that a small area only could be excavated. This was partly due to the fact that a point of clay extended out into the excavation from top to bottom and this had to be dug away before a face could be had to work to.

702 Woodlark Building Portland, Oregon

7

Therefore the amount of gravel excavated was not a fair test as the part of the time was consumed in squaring off this obstruction to the boat, and also the material excavated carried the least value, only a small portion of the rich stratum being dug.

Two clean ups were made, the first from the upper eleven feet before lowering the water, the second from the thirty feet below this.

The accompanying table shows the value per cubic yard, the number of yards excavated and the number of hours run. The net result is $57\frac{1}{2}$ cents per cubic yard, a splendid showing, even under these adverse circumstances and giving some idea of the immense richness of the ground.

With proper dredging mackiner, which can easily be bought to handle 1,000 or more cubic yards per day, this ground can be made to pay handsomely in a short time and be a very bonanza for its owners. There are other ways by which this deep and mich deposit might be worked, namely, the hydraulic elevator system. Water could be obtained from a high ditch under 400 feet head, but it would have to be purchased from the ditch company. However, dredging is no experiment, as the handsome returns in New Zealand, on ground very poor compared with this, will show. There is in addition to this original claim of sixty acres, 180 acres adjacent which is nearly, if not quite, as rich. The deep channel runs through this and some of the surface ground has paid handsomely, with rockers.

8

702 Woodlark Building Portland, Oregon

This is a valuable acquisition, making the property, when properly equipped, worth at the lowest estimate \$1,000,000.00 and one of the most valuable blocks of placer ground on the Pacific Coast.

Respectfully submitted,

Signed

Geo. M. Williams

Copy of report lent to St. Dept.
of Geol. by Howard Beasley of the
