ROUGH AND READY MOUNTAIN NICKEL DEPOSITS Waldo Area, Josephine &

Chetco Area, Curry Co. residuat etale se respectore

Introduction: The purpose of this report is to record the results An the posterior to i, pusi semblitagi of a preliminary geological reconnaissance of Rough and Ready Mountain inaria bizazikoan Panangizki gerbaida begun in April 1954. A total of 6 days have been spent in the field in this area as follows: April 14 Louis Chichester and John Reynolds of the U. S. Bureau of Mines and the author drove a jeep up McGrew trail to examine the Nickel Ridge claims in Sec. 31, and 32, T. 40 S., R. 9 W., at 3900 feet in elevation; April 21 the same men investigated the area along one branch of a road up Whiskey Creek (this road is not shown on the attached map) and then drove up Cooke road to Cedar Springs to check trail and road conditions on south end of Rough and Ready Mountain; May 12, 13, and 14 Len Ramp and the writer from a camp at Cedar Springs inwestigated the area southwest of Cedar Springs and from Cooke Road northeastward along Rough and Ready Mountain to the headwaters of Rock Creek; May 18 Louis Chichester helped reconnoiter the area from Rock Creek to Rough and Ready Creek on the northeast end of Rough and Ready Mountain.

Rough and Ready Mountain is in this report the name given to the ridge area between Rough and Ready Creek and its South Fork and the West Fork Illinois River and its tributary Whiskey Creek. This ridge has a maximum elevation of 4000 feet on Cooke road near Cedar Springs and slopes northeastward toward Rough and Ready Creek where it terminates about 2 miles northwest of O'Brien.

During this preliminary investigation areas of laterite, outcrops of quartz boxwork and fractured serpentine containing quartz boxwork veinlets or garnierite along fractures were noted and visual estimates were

made of the width of these along the traverse lines. No attempts were made to delineate these areas in detail as this information can only be obtained from a more lengthy geological study in conjunction with some exploration (trenching, drilling, and sampling). As the garnierite is usually weathered out of outcrops of quartz boxwork or fractured serpentine and as a few feet of depth must be obtained to accurately sample these outcrops, very few samples were taken.

General Geology: Rough and Ready Mountain is situated along the eastern side of the peridetite mass of Josephine and Curry counties for the most part in southwestern Josephine County. Wells and Walker (1953) call this mass the peridetite (ultramafic) sheet of Josephine Mountain. A body of granitic rocks which has intruded the peridetite begins at Buckskin Peak and extends four to five miles northward.

Numerous dark basic dikes cut the peridotite particularly in the vicinity of Cedar Springs, Hunters Camp and along Cooke road. These dikes are usually only a few feet wide and apparently are not very long, about 100 feet or less. These dikes usually occur along zones of shearing in peridotite or serpentine and generally trend north and south, parallel to the regional structure. Often quartz boxwork zones with garnierite veins or sheared serpentine containing garnierite occur in shear zones adjacent to these dikes.

The occurrence of laterite, quartz boxwork float and outcrops, small quartz boxwork veinlets in peridotite and serpentinized peridotite, and garnierite along fractures in various localities on Rough and Ready mountain indicate that laterization and subsequent supergene nickel silicate enrichment has taken place. The enrichment has been along shear

zones and fractures, and only isolated patches of the original laterite blanket remain.

Description of deposits: The localities of laterite, quartz box-work float and outcreps, and other indications of nickel silicate enrichment are described below in numerical order as shown on the sketch map:

Locality 1:

Laterite containing quartz boxwork veins is exposed along McGrew trail on the flat area approximately 2 miles southwest of Cedar Springs. This flat area lies north and west of the north fork of Diamond Creek between 3200 and 3300 feet in elevation. A 2-foot channel sample P-16478 (OG-164) of reddish brown laterite with quartz boxwork veins exposed along the trail contained 0.54 percent nickel. A fine-grained basic dike striking N. 75° E. is exposed 100 feet west of the location from which this sample was taken. The area of laterite on this flat is not as large as is indicated by the topography and will have to be determined by more detailed exploration.

Locality 2:

At approximately 3750 feet in elevation between the 9 and 10 mile markers about 1 mile southwest of Cedar Springs along McGrew trail thin quartz boxwork veins with some veinlets of garnierite were observed. A grab sample, P-16479 (OG-165), from one of these veins contained 0.000 percent nickel. This sample was taken from a surface outcrop and probably contains less nickel than a sample below the surface would. This fracture zone apparently is between 100 to 200 feet wide.

Locality 3:

Several narrow quartz boxwork veins outcrop in the vicinity of the 9 mile marker on McGrew trail about $\frac{1}{2}$ mile west of Cedar Springs between two basic dikes. These veins trend N. 15° E. No samples were taken.

Locality 4:

Quartz boxwork is exposed on the trail about 100 feet southwest of Cedar Springs and a heavy concentration of boxwork float lies on the surface for a distance of 300 feet west of Cedar Springs. Apparently a very thin blanket of laterite lies in small patches south and northeast of Cedar Springs toward Hunters camp.

U. S. Bureau of Mines sample R4-24, a piece of quartz boxwork almost entirely leached of its garnierite, contained .20 percent nickel. Some test pits or trenches will have to be dug to sample this area properly.

Locality 5:

West of the camp area at Hunters Camp some quartz boxwork float boulders and about 50 feet of peridotite containing widely spaced thin quartz boxwork veins were observed. This peridotite trends N. 25° E. Hunters camp is near the granodiorite-peridotite contact.

U. S. Bureau of Mines sample R4-25, 6 inches of red laterite from the road southwest of Hunters Camp contained .37 percent nickel.

Locality (No number):

Small patches of tan to red laterite were noted along McGrew trail approximately 1/2 to 3/4 mile east of its junction with Cooke road. This laterite occurs on a flat area about 3850 feet in elevation in the $N_{\overline{Z}}^{\frac{1}{2}}$, Sec. 1, T. 41 S., R. 10 W. No samples were taken.

Locality 6:

Quartz boxwork float lies in McGrew trail for about 50 to 100 feet at 3750 feet in elevation approximately in the NE corner of Sec. 1,

T. 41 S., R. 10 W. This locality is from 200 to 300 feet west of the 6 mile trail marker. (Note: Another 6 mile marker occurs to the east of

this one at 3825 feet in elevation).

Locality 7: The Annual Street Control of the Contro

Some quartz boxwork float occurs along McGrew trail a short distance east of the second 6-mile marker (see note under locality 6) at 3875 feet in elevation. This locality is along the northeast side of a small rounded knob.

Locality 8:

Only a few scattered pieces of boxwork float are at this locality (see map).

Locality 9:

Weathered partially serpentinized peridotite containing garnierite along fractures is exposed in the location pit of Nickel Ridge Claim No. 1 in the E2 sec. 31, T. 40 S., R. 9 W. A selected sample (U.S. Bureau of Mines sample R4-2) contained 1.52 percent nickel and .31 chromium. This sample consisted mainly of limonite and garnierite. Samples P-16348 (CG-125) and P-16349 (CG-126) of soft green serpentine with garnierite from this pit and submitted by Bill Evitt assayed 1.96 and 1.97 percent nickel, respectively. The fractures in the peridotite strike N. 75° E. and dip 58° SE. The location pit was 10 feet deep exposing two feet of laterite overlying 8 feet of fractured serpentinized peridotite. U. S. Bureau of Mines sample R4-3 of the peridotite without any visible garnierite from the north side of the pit contained 0.65 percent nickel. Sample P-16480 (CG-166) of the laterite on the south side of the pit contained 0.75 percent nickel. Some quartz boxwork float lies in the trail about 100 feet southwest of the location pit.

Five claims have been located on this ridge by Bill J. Evitt and

John F. Evitt of O'Brien, Oregon. Nickel Ridge No. 2 claim is southwest of No. 1 and numbers 3, 4, 5 are northeast of No. 1. Location pit at claim No. 3 shows some garnierite along fractures in peridotite. The other location pits were not found or the walls were covered by soil washed into them.

Locality 10:

On McGrew trail and on Nickel Ridge No. 4 claim 4.3 miles from Wimer Road a quartz boxwork vein about 2 feet wide is exposed. Quartz boxwork float occurs on the ridge north of this exposure in the trail and further to the north in the saddle between Nickel Ridge and the ridge on which locality 11 is situated. A grab sample (U.S.B.M. R4-5) of leached quartz boxwork float from the ridge a short distance north of the outcrop in the road assayed .28 percent nickel.

Locality 11:

An uprooted tree on top of the ridge north of Nickel Ridge No. 4 claim exposed some red soil and a few chunks of peridotite with thin veinlets of garnierite. This ridge apparently has only a very thin laterite cover, most of it being very rocky.

Localities 12, 13, and 14:

The attached map shows the location of these three occurrences of scattered quartz boxwork float. The amount of float is too meager to warrant any further investigation of these localities.

Locality 15:

Quartz boxwork float occurs for about 100 feet at an approximate elevation of 3240 feet along the bulldozer road (shown as a trail on the map) that begins at Wimer Road and follows along the ridge northeast of

Rock Creek. This float was first picked up about 200 feet uphill beyond the last fork in the road from which a spur road extends. The bulldozer road was apparently built to work the Molly Group Chrome Claim No. 1 which is located at its termination.

Locality 16:

The flat area at approximately 3050 feet in elevation is covered by red laterite which contains a very large amount of quartz boxwork boulders. The laterite and float occur for approximately 500 feet along the ridge top to about 3000 feet in elevation. This laterite area supports a moderate growth of large pine trees.

Locality 17:

Red laterite covers the ridge top between 2720 and 2800 feet in elevation on the northeast end of Rough and Ready Mountain. On this laterite covered area large pine trees are growing. No boxwork float was observed at this locality.

Locality 18:

Laterite covers the 3000-foot terrace north of Whiskey Creek in Sec. 7, T. 41 S., R. 9 W. Sample P-16352 (OG-129), a 4-foot channel sample of red laterite on the north side of Whiskey Creek road (not shown on map) contained only .28 percent nickel. This laterite may be colluvium or alluvium and not in place.

Conclusions and Recommendations: Although Rough and Ready Mountain has several small areas of laterite and some quartz-garnierite boxwork zones are indicated, the development of a commercial deposit of nickel silicate ore is doubtful. Apparently most of the former laterite blanket and the median zones of quartz-garnierite boxwork in limonite has been

eroded or never existed in any areas of large dimensions, and only the root zone of garnierite filled fractures in peridotite remain.

Some drill holes and some trenching should be done in the laterite areas in localities 1, 16, 17 and in the boxwork zone indicated at locality 4 near Cedar Springs in order to explore this area more thoroughly and to obtain appropriate samples for analysis. More detailed geological reconnaissance and delineation of the laterite areas and enriched zones by tracing surface indications is necessary in order to carefully plan an exploration program.

Report by: D. J. W., May 24, 1954.

### NICKEL EXPLORATION

Josephine County Waldo Area

Field work was done by Max Schafer, August 16, with Louie Chichester and Ernest Kinney, U.S.B.M. An area in sections 21, 22, 27 and 28, T. 40 S., R. 9 W. was sampled for nickel.

The location was made with the aid of an aneroid barometer. The two readings were made at 5 and 6 P.M. and should be pretty close.

The prospect is reached by turning right at O'Brien, going about 2 miles along Whiskey Creek road and then right up a very poor mining road which goes for about 3 miles to the top of the ridge. The condition of the road necessitated using the winch on a Willys Station-Wagon several times.

The area prospected is a ridge running NE-SW, and is south of Rough and Ready Creek. The ridge is underlain by peridotite and weathering has laterized the rock near and on top of the ridge. The laterite area is circular or ovate, following the direction of the ridge, in shape.

The laterite grades from dark red to light rust to "limonite" tan.

The width of the laterite is variable along the ridge and often narrows to around 50 feet. The maximum is probably around 300-500 feet. About 12-15 feet seems to be the maximum depth of the laterite. In places "roots" will probably extend to a greater depth. Hole #2 bottomed at 12 feet in serpentine. The appearance of the ground as it neared this depth changed from lateritic soil to brown to blue-green. Near the bottom relict structure in the serpentine got stronger down to the depth of 12 feet.

There the serpentine was solid. This appeared to be bedrock and not a boulder.

Very little boxwork float was seen. No good garnierite was identified.

Three samples were taken — two cores near the N or NW extremity of the deposit and a grab soil sample about a mile to the SE.

The samples were taken by U.S.B.M. and the results are as follows:

DOGAMI No.	U.S.B.M. No.	Туре	g ni
1 a	C-11-19	0-31 core	0.49
1 b	C-11-20	3-61 "	0.43
1 c	C-12-21	6-7.51 "	0.36
2 a	C-11-25	0-3' core	0.41
2 b	C-12- 1	3-6' "	0.66
2 c	C-12- 2	6-9' "	0.86
2 d	C-12- 3	9-12' "	0.88
3	C-12- 4	Grab soil sample	0.43

The whole first hole was in red then lighter red soil. It is suspected that this hole hit a boulder.

The second hole was drilled about 500 feet to the S. The first 3 feet was in granular hematitic soil. The 3-6 foot portion changed to a clayey soil which became blue-green near the 6 foot point. This blue-green stain could be ferrous iron. At 7.5 feet rotten serpentine was entered where serpentine structure became evident. The serpentine got more solid down to 12 feet where bedrock (?) was encountered.

All drilling was done with a hand auger.

### Conclusions & Recommendations:

The low nickel content of the laterite, the relatively small size of the deposit, and the difficulty of access would seem to preclude this deposit from any further consideration at this time. If, at any time,

the price of nickel becomes more favorable, this deposit should be fully explored. The examination done at this time was incomplete as to grade and tonnage.

Report by: Max Schafer, 1954.

LATERITE INVESTIGATION

Waldo District

Josephine County

As a continuation of the Department's nickeliferous laterite investigation, a total of six localities were visited in the Rough and Ready Creek area of southern Josephine County and sampled during the latter part of June, 1949. The work was aimed at clearing up any likely looking areas not previously inspected. Results of the work were not very encouraging, since at every locality visited the preponderance of surface and subsurface boulders coupled with the paucity of lateritic soil was judged to be unfavorable for the existence of a deposit of either economic size or tenor. The presence of numerous boulders made it extremely difficult to drill the various localities and every hole attempted had to be abandoned far short of a suitable depth when rocks were encountered. In many cases, even if there had been a considerable thickness of laterite undiluted by the presence of boulders, the areal extent was so small that it would have been difficult to obtain a tonnage sufficiently large to justify its exploitation. Topography in the area is extremely rugged, and access to the flats developed on ridge tops is difficult. All of the areas visited lie within the boundaries of the U.S. National Forest (see map).

Results of analyzing all of the samples recovered are shown on the accompanying table. In several holes it will be noted that the highest nickel assays were obtained in the bottom of the hole, and the question is immediately raised as to whether the amount of nickel increases with greater depth. Drilling was done with an "Iwan" soil auger supplemented by a

chopping bit and coal twist auger. This equipment was used since it was readily portable and had proved satisfactory in the past where only a few subsurface boulders were found.

ROUGH AND READY GROUP

OWNERSHIP Inspiration Development Co., 1000 Bible Way, Suite 60, Reno, Nevada 89502;

W. B. Freeman, Cave Junction; Andy Johnson Estate, Cave Junction; and small parcels of private (patented) land of John Blake, M. Smith, Rod Cooley, M. Cooley, Chas. Edwards, and Blanch Freeman, all in the O'Brien area; other private land owners and a small patch of County land.

LOCATION: The group lies mainly in T. 40 S., R. 9 W., with outwash deposits extending into secs. 18 and 19, T. 40 S., R. 8 W., and laterite patches in secs. 1 and 12, T. 40 S., R. 10 W.

The group may be divided into eight areas as follows:

- Parker Ridge, containing about 15 hectares is located in secs. 11 and 14 between about 686 and 777 meters elevation on the ridge southwest of Parker Creek.
- 2. South Flanks of Rough Mountain including 4 patches in sections 8, 9, and 10, with about 54 hectares in sec. 8; 26 hectares in sec. 9, (parts of 3 patches); and 4 hectares in sec. 10; nearly all the deposits in this group are between about 853 and 1,036 meters elevation.
- 3. Rough and Ready Creek deposit includes about 13 hectares in the SW¹/₄ sec. 16 between about 541 and 686 meters elevation.
- 4. Rough and Ready Ridge, the main area includes about 96 hectares largely in sec. 22; but overlapping into secs. 15, 21, and 27, and lying mainly between 792 and 945 meters elevation.

  A few other thin patches of soil lie on up the ridge to the southwest in secs. 28, 29, 32, and 33 but appear from preliminary reconnaissance to be too thin and rocky to be included at this time.
- 5. Rough and Ready Outwash, a large (336 hectare)alluvial outwash of peridotite boulders and soil mainly in secs. 13, 14, 23, and 24; a smaller patch about 90 hectares extends into secs.

  18 and 19 of Range 8 W., and a 33-hectare patch in the N¹/₂ sec. 13.

This outwash area lies on the valley floor and is partially developed as residential.

Only a part of the area may ever be available for mining. The elevation is from about 427 to 488 meters.

- 6. Rough and Ready bench lies partially in the western portion of sec. 6 of T. 40 S., R. 9 W., and mainly in sec. 1, T. 40 S., R. 10 W. It is an erosionally disected bench with small residual patches of lateritic soil aggregating about 48 hectares, between about 732 and 910 meters elevation.
- 7. Buckskin Ridge includes two small patches of soil, about 8 hectares, in the SE¹/₄ sec. 12,
  T. 40 S., R. 10 W. These patches lie about 1.2 kilometers north of Mud Springs between about 975 and 1,067 meters elevation.
- 8. Rough and Ready Creek mixed slope debris and bench gravel deposits: including 5 patches in secs. 14, 15, and 16, between about 488 and 805 meters elevation. These rocky areas contain some soil and have been sampled by Inspiration Development Co. Cumulative size of the 5 areas mapped is about 75 hectares. The mapping here is very approximate and

incomplete.

10. others West Fork mixed slope debris deposit in sees 27 and 34 between 1520 and 1640 feet elevation CLIMATE, VEGETATION AND LAND USE: The annual precipitation is about 95 cm, most of which

occurs between October and June. Summer temperatures will average about 19° C. and winter about 5° C. Between November and March some snow usually accumulates above 1,000 meters. Vegetation is generally sparce and includes a few pine (knob cone, Jeffry, sugar, white and ponderosa), fir and cedar with underbrush including azalea, ceanothus, live oak, tan oak, myrtle, cascara, etc. There is a lack of commercial-grade timber and the land has little or no established use other than some residential development in the outwash area near O'Brien.

Creek have been held by placer claims for many years by Andy Johnson and Walt Freeman and some minor work was done in attempts to recover gold and platinum metals, probably during the 1930's. Nickel exploration probably began in the early 1950's (Appling, 1955).

The first systematic exploration activity in the area was by Cominco during 1968–1970.

Mapping, trenching, color aerial photography was used as well as augering and churn drilling..

The more recent exploration activity has been by Inspiration Development Company mainly during the period from 1973 to present. Their work has included all of the above procedures and in addition back-hoe sampling, the use of a 6-inch screening and weighing device to determine weight percent of the intermixed rock, extensive seismic surveys to determine the depth of soil and saprolite development, and metallurgical testing of bulk samples. Inspiration Development Co. continues to show an interest in the area.

GENERAL GEOLOGY AND DESCRIPTION OF THE DEPOSITS: The area is underlain by partly serpentinized harzburgite of the Josephine Ultramafic Sheet. The ultramafic rocks are in fault contact with the Upper Jurassic Galice Formation which underlies the outwash area and low lands to the east.

The fault strikes about N. 20° E. and appears to be nearly vertical in this area. The peridotite has zones of nearly complete serpentinization that are more or less sheared. A few small dikes intruding the ultramatics are mainly of diabasic texture and intermediate to basic composition.

Soil areas occur has residual patches of an old upland weathered surface and in lower slumps and benches as well as outwash deposits on the valley floor mixed with sand and gravel.

Some surface accumulations of iron shot occur in the upper deposits on ridge tops and benches.

Silica box work float also occurs in a few of the more deeply weathered areas. Deposits on the steeper slopes are generally more rocky and of lower grade. The better developed ridge-top and bench deposits generally increase in grade with depth up to a point but the transported and outwash gravel deposits do not.

## TONNAGE AND GRADE: (This material should be treated as confidential)

Tonnage and grade estimations are based on the following:

- 1. Parker Ridge area 15 hectares
  - (a) estimated maximum soil & saprolite depth = 5 meters
  - (b) estimated average soil & saprolite depth = 2 meters
  - (c) estimated quantity of unweathered rock in soil by weight = 50 %
  - (d) gross quantity of soil, saprolite and rock to 2 meters depth using a factor of 1.8 mt/m³ equals 540,000 metric tons.
  - (e) net tonnage (excluding rock) using 1.6 mt/m³ = 240,000 tonnes
  - (f) grade of net tonnage DOGAMI assays = 1.00 % Ni weighted Inspiration assays = .93 % Ni
  - (g) Calculated grade of gross tonnage (rock included) = .58 % Ni; 1.02% Cr; 0.05% Co; 19% Fe.
     (Co in net tonnage is reported to be about 0.1% and Cr about 2 %) (assay AJG-54 = 2.56% Cr and 36.1% Fe)
- South flanks of Rough Mountain including 4 patches from E to M. Patch A (largest) mainly in sec. 8; area = 56 hectares.
  - (a) estimated maximum depth = 12 meters
  - (b) estimated average depth over the 56 hectares = 3 meters.
  - (c) estimated quantity of rock = 45% by weight
  - (d) estimated gross amount of soil and rock (using 1.8 mt/m 3 ) gross tonnage = 3,024,000 mt.
  - (e) net amount of soil and saprolite excluding rock (1.6 mt/m³) net tonnage = 1,478,400 mt.
  - (f) grade of net tonnage soil and saprolite averages about 0.97 % Ni; 0.14 % Co; 2.00 % Cr and 35 % Fe.
  - (g) Calculated grade of gross tonnage is about 0.60% Ni; 0.07 Co; 1.06 % Cr. and 18 % Fe.

AREA B (two small patches)  $W_2^1$  sec. 9, area = 17 hectares.

- (a) estimated maximum depth = 5 meters
- (b) estimated average depth = 1.5 meters
- (c) estimated quantity of rock = 60 %
- (d) estimated gross tonnage (soil & rock)  $(1.86 \text{ mt/m}^3) = 474,300 \text{ mt}$ .
- (e) estimated net tonnage soil & saprolite  $(1.6 \text{ mt/m}^3) = 163,200 \text{ mt}$ .
- (f) calculated grade of gross tonnage = 0.47 % Ni.
- (g) calculated grade of net tonnage = 0.90 % Ni.

PATCH C east  $\frac{1}{4}$  sec. 9 and west edge sec. 10; about 14 hectares.

- (a) estimated maximum depth = 10 meters.
- (b) estimated average depth = 3 meters.
- (c) estimated amount rock in soil = 45 %.
- (d) estimated gross tonnage (soil and rock)  $(1.86 \text{ mt/m}^3) = 781,200 \text{ mt}$ .
- (e) estimated net tonnage (soil & saprolite)  $(1.6 \text{ mt/m}^3) = 369,600 \text{ mt}$ .
- (f) calculated grade gross tonnage = 0.60 % Ni.
- (g) calculated grade net tonnage = 1.00 % Ni; 0.08 % Co; 2.24 % Cr and 30 % Fe.

Aggregate tonnage and grade - 3 areas on the southern flank of Rough Mountain are:

- (a) aggregate area = 87 hectares
- (b) Total aggregate gross tonnage soil & rock mixed = 4,279,500 mt.
- (c) Total aggregate net tonnage soil & saprolite = 2,011,200 mt.
- (d) calculated average grade of the gross tonnage = 0.59 % Ni; 0.07 % Co; 1.00 % Cr₂O₃; and 18 % Fe.
- (e) Calculated average grade of the net tonnage = .97 % Ni; 0.08 % Co; 2.00 % Cr, and about 28 % Fe.

- 3. Rough and Ready Creek area of 13 hectares in the SW¹/₄ sec. 16.
  - (a) estimated maximum depth = 5 meters.
  - (b) estimated average depth = 2 meters.
  - (c) estimated gross tongage soil and rock (1.86 mt/m³) = 483,600 mt
  - (d) estimated % of rock in soil = 40 %.
  - (e) estimated net tonnage soil and saprolite, excluding rock (1.6 mt/m³) = 249,600 mt.
  - (f) grade of soil and saprolite = 0.80 % Ni; 1.06 % Cr; 23 % Fe
  - (g) calculated grade of gross tonnage = 0.53 % Ni; .66% Cr; 15 % Fe and trace Co.
- 4. Rough and Ready Ridge area of about 96 hectares in secs 21, 22, 27.
  - (a) estimated maximum depth of soil and saprolite = 8 meters.
  - (b) estimated average depth = 2 meters.
  - (c) estimated gross tonnage of mixed soil and rock (1.86 mt/ $m^3$ ) = 3,571,200 mt.
  - (d) estimated amount of rock to this depth = 55 % by weight
  - (e) calculated net tonnage of soil and saprolite, excluding rock  $(1.60 \text{ mt/m}^3) = 1,382,400 \text{ mt}$ .
  - (f) approximate grade of net tonnage = 0.85 % Ni; 2.0 % Cr; 35 % Fe ( no Co assays, but probably equals about 0.1 % ).
  - (g) Calculated grade of gross tonnage = 0.48 % Ni; 0.93 % Cr; 17 % Fe, and about 0.04 % Co.
- 7 (5.) Rough and Ready outwash about 300 hectares (a significant portion; but not the entire area)
  - (a) estimated maximum depth = 20 meters
  - (b) estimated average depth = 8 meters.
  - (c) estimated percentage of rock and unweathered coarse material = 90 %.
  - (d) estimated gross quantity of rock, sand, and soil  $(1.9 \text{ mt/m}^3) = 45,600,000 \text{ mt}$ .
  - (e) estimated net quantity of soil weathered rock and fines  $(1.6 \text{ mt/m}^3) = 3,840,000 \text{ mt}$ .
  - (f) grade of soil and fines (net tonnage) are estimated at about 0.45 % Ni; 16 % Fe; 1 % Cr; 0.03 % Co

(g) approximate grade of the coarse fraction (gross tonnage) are 0.3 % Ni; 7 % Fe; 0.3 % Cr; and 0.02 % Co.

It should be noted that significantly greater tonnage of this outwash material may be available in this area.

- 5 6. ROUGH AND READY BENCH AREA of 48 hectares; mostly in sec 1, T. 40 S., R. 10 W.
  - (a) estimated maximum depth = 8 meters.
  - (b) estimated average depth of soil and saprolite = 2.5 meters.
  - (c) estimated percentage of unweathered rock in soil zone = 50 %.
  - (d) estimated gross tonnage of rock and soil mixed (1.86 mt/m³) = 2,232,000 mt.
  - (e) estimated net tonnage of soil and saprolite  $(1.6 \text{ mt/m}^3) = 960,000 \text{ mt}$ .
  - (f) approximate grade of net tonnage = 0.70 % Ni; 1.4 % Cr; 30 % Fe; and 0.1 % Co.
  - (g) Calculated grade of gross tonnage = 0.45 % Ni; 0.75 % Cr; 16 % Fe; and 0.05 Cp.
- BUCKSKIN RIDGE AREA in SE¹/₄ sec. 12 T. 40 S., R. 10 W. containing about 8 hectares in two patches.
  - (a) estimated maximum depth = 4 meters.
  - (b) estimated average depth = 1.5 meters
  - (c) estimated unweathered rock in soil = 60 %.
  - (d) estimated gross soil and rock  $(1.9 \text{ mt/m}^3) = 228,000 \text{ mt}$ .
  - (e) estimated net soil and saprolite (1.6 mt/m³) = 76,800 mt.
  - (f) approximate grade of net tonnage (soil & saprolite) = 0.99 % Ni. (no other elements obtained)
  - (g) calculated grade of gross tonnage = 0.50 % Ni.
  - 8. ROUGH AND READY CREEK (mixed slope and stream bench deposits)

Aggregate of 5 patches include approximately 75 hectares

- (a) estimated maximum depth = 7 meters.
- (b) estimated average depth = 2 meters.

- (c) estimated unweathered rock included = 70 %.
- (d) estimated gross tonnage  $(1.9 \text{ mt/m}^3) = 2,850,000 \text{ mt}$ .
- (e) estimated net tonnage (1.6 mt/m³) excluding rock = 720,000 mt.
- (f) approximate grade of net tonnage = 0.70 % Ni.
- (g) Approximate grade of gross tonnage = 0.36 % Ni.

9. West Fork Illinois 10: Various scattered thin

Total calculated net and gross tonnage for the group are shown below:

		Net metric t	ons	Gross metric tons	
		saprolite	% Ni	lite & rock	% Ni
1.	Parker Ridge	240,000	1.00	540,000	0.58
2.	Rough Mountain	2,011,200	0.97	4,279,500	0.59
3.	Rough & Ready Creek	249,600	0.80	483,600	0.53
4.	Rough & Ready Ridge	1,382,400	0.85	3,571,200	0.48
5.	Rough & Ready Outwash	3,840,000	0.45	45,600,000	0.30
6.	Rough & Ready Bench	960,000	0.70	2,232,000	0.45
7.	Buckskin Ridge	76,800	0.99	228,000	0.50
8.	R & R Creek slope slump &				
	bench	720,000	0.70	2,850,000	0.36
	Totals & weighted average				
	% Ni.	9,480,000	0.69	59,784,300	0.35

By excluding the outwash deposits and the rocky slope slump and bench areas near the creek, the total net tonnage would be 4,920,000 tonnes with an average grade of about 0.88 % Ni; 1.8 % Cr; 0.11 % Co; and 34 % Fe.

The gross tonnage excluding these same areas would be 11,334,300 tonnes with calculated grade of 0.48 % Ni; 0.89 % Cr; 0.06 % Co; and 21 % Fe.

### REFERENCES AND COMMENTS

Appling, R. N., Jr. 1955, A reconnaissance of nickel deposits of southwest Oregon and north-west California, U. S. BuMines open-file report, unpublished.

Data for this report and map were gathered by the writer using U. S. Forest Service color infrared aerial photos to outline the areas, on the ground reconnaissance sampling and mapping and later comparison of preliminary estimated depth, area, tonnage, and grade figures with private company confidential data of Inspiration Development Co. obtained from personal communication with Boies Hall in Reno, Nevada on November 13 and 14, 1975. The figures used in this report are not their figures; but are influenced by their data; so we are obliged to treat the data as confidential.

REPORT BY: Len Ramp 1-5-76

- Rough and Ready Outwash about 300 hectares (This is a significant portion of the 5.
  - (b) estimated average depth = 10 meters
  - (c) estimated quantity of rock = 90%
  - (d) estimated quantity of rock & soil = 48,060,000 metric tons
  - (e) estimated quantity soil & saprolite - 4,806,000 metric tons estimated average grade soil & saprolite = .5 % Ni (?) (one sample only, more to come (f)

estimated average grade rock & soil = .275 % Ni (?) (g)

In my judgement there could easily be 50,000,000 metric tons of .3 percent Nickel in this deposit.

Rough and Ready Bench about 50 hectares (mostly in sec 1, T.40 5, R. 100). 6.

estimated maximum depth = 10 meters (far-out guess)

estimated average depth = 3 meters (far-out guess) (b)

estimated average depth = 3 hierers (tal=out goess)
estimated percentage of rock in soil = 30% (this estimate could be way off) (c)

(d) estimated quantity of rock and soil = 2,403,000 metric tons

estimated average grade soil and saprolite = 1,682,100 metric tons (e)

estimated average grade soil and saprolite = 0.70% Ni. (f)

estimated average grade rock & soil = .56 % Ni. (g)

### ROUGH AND READY NICKEL GROUP

The group includes six areas which lie mostly in T. 40 S., LOCATION: R. 9 W., as follows:

- Parker Ridge, containing about 15 hectares is located in secs. 11 and 14 1. between 2,250 and 2,550 feet elevation on the ridge southwest of Parker Creek . 1686 777 meters dont
- South flanks of Rough Mountain including 4 patches in sections 8, 9, and 10, 2. with about 54 hectares in sec. 8; hectares in sec. 9, (parts of 3 patches); and hectares in sec. 10; nearly all the deposits in this group are between about 2,800 and 3,400 feet elevation. 853 1,036 meters
- Rough and Ready Creek deposit includes about hectares in the SW 4 sec. 16 3. between 1,720 and 2,240 feet elevation. 686 meters about 541
- 4. Rough and Ready Ridge, the main area includes about % hectares largely in sec. 22; but overlapping into secs. 15, 21, and 27, and lying mainly between 2,600 and 3,100 feet elevation. A few other thin patches of soil lie on up the ridge to the southwest in secs. 28, 29, 32, and 33 but appear from preliminary reconnaissance to be too thin and rocky to be included at this time.
- Rough and Ready Outwash, a large (336 hectare) aluvial outwash of peridotite 5. boulders and soil mainly in secs. 13, 14, 23, and 24 a smaller patch about 90 hectares extends into secs. 18 and 19 of Range 8 W. This outwash area lies on the valley floor and is partially developed as residential. Only a Part of the area may ever be available for mining, The elevation is fallout 427 to 4 meters.
- Rough and Ready bench lies partially in the western portion of Sec. 6 of T. 40 S., 6. R. 9 W., and mainly in sec. 1, T. 40 S., R. 10 W. It is an erosionally disected bench with small residual patches of lateritic soil aggregating about 🕬 hectares, between, 2,400 and 3,150 feet elevation. about 732 960 meters

Tonnage and grade estimations of these areas calculated as follows:

1. Parker Ridge

estimated maximum soil depth = 4 meters

average depth of soil & saprolite is estimated to be 1.5 meters (b)

(c)

- estimated quantity of rock at this depth = 50% (by rolling) gross estimated quantity rock and soil to 150 meters = 1,201,500 metric tons (d)
- net estimated quantity soil & saprolite excluding rock = 240,600 metric tons (e)
- estimated average grade of net tonnage = 1.00% Ni
- Southern flanks of Rough Mountain including 4 patches from W to E 2. Patch A (largest) mainly in sec. 8 = area of 55 hectares
  - (a) estimated maximum depth = 15 meters
  - (b) estimated average depth = 4 meters
  - estimated quantity of rock = 55% (c)

(d)	estimated gross amount soil & rock = 3,524,400 metric tons
(e)	net amount of soil & saprolite excluding rock = 1,585,980 metric tons
(f)	estimated average grade of soil & saprolite = 1.16% Ni; 0.14% Co
DILDT	I'l
	o small patches in W½ sec. 9 which total about 18 hectares.
(a)	estimated maximum depth = 5 meters
(b)	estimated average depth = 1.5 meters
(c)	estimated quantity of rock = 70% 60
(q)	estimated gross tonnage = 432,540 metric tons
(e)	estimated net tonnage = 129,762 metric tons
(f)	estimated average grade = .90% Ni.
arch C Co	estimated average grade = .90% INI. entains about 14 hectares on both sides see line between see 9 \$ 10.
(a)	estimated maximum depth = 15 meters
(b)	estimated average depth = 4 meters
(c)	estimated amount rock with soil = 65%
(d)	estimated gross tonnage rock & soil = 897,120 metric tons
(e)	estimated net tonnage soil & saprolite = 313,992 metric tons
(f)	estimated average grade soil & saprolite = 1.18% Ni; 0.20% Co
	701
Agaregate to	onnage and grade of three areas on the southern flanks of
