# INTRODUCTION

*Appendix C–Technical Appendix* contains supporting data and explanatory materials used to develop Idaho Power's *2017 Integrated Resource Plan* (IRP).

The main document, the IRP, contains a full narrative of Idaho Power's resource planning process. Additional information regarding the 2017 IRP sales and load forecast is contained in *Appendix A–Sales and Load Forecast*, and details on Idaho Power's demand-side management efforts are explained in *Appendix B–Demand-Side Management 2014 Annual Report*. The IRP, including the three appendices, was filed with the Idaho and Oregon public utility commissions in June 2017.

For information or questions concerning the resource plan or the resource planning process, contact Idaho Power:

Idaho Power—Resource Planning

# IRP ADVISORY COUNCIL

Idaho Power has involved representatives of the public in the IRP planning process since the early 1990s. This public forum is known as the IRP Advisory Council (IRPAC). The IRPAC generally meets monthly during the development of the IRP, and the meetings are open to the public. Members of the council include regulatory, political, environmental, and customer representatives, as well as representatives of other public-interest groups.

Idaho Power hosted 8 IRPAC meetings, including a workshop designed to explore the potential for distributed energy resources to defer grid investment. Idaho Power values these opportunities to convene, and the IRPAC members and the public have made significant contributions to this plan.

Idaho Power believes working with members of the IRPAC and the public is rewarding, and the IRP is better because of public involvement. Idaho Power and the members of the IRPAC recognize outside perspective is valuable, but also understand that final decisions on the IRP are made by Idaho Power.

### Customer Representatives

| | |
|---|---|
| Agricultural Representative | Sid Erwin |
| Boise State University | Barry Burbank |
| Idaho National Laboratory | Kurt Myers |
| Micron | Clancy Kelley |
| Simplot | Don Sturtevant |

### Public Interest Representatives

| | |
|---|---|
| Boise Metro Chamber of Commerce | Ray Stark |
| Boise State University Energy Policy Institute | David Solan |
| City of Boise | Steve Burgos |
| Idaho Conservation League | Ben Otto |
| Idaho Legislature | Representative Robert Anderst |
| Idaho Office of Energy and Mineral Resources | John Chatburn/Scott Pugrud |
| Idaho Sierra Club | Mike Heckler/Zack Waterman/Casey Mattoon |
| Idaho Technology Council | Jay Larsen |
| Idaho Water Resource Board | Roger Chase |
| Northwest Power and Conservation Council | Shirley Lindstrom/Jim Yost |
| Oil and Gas Industry Advisor | David Hawk |
| Oregon State University—Malheur Experiment Station | Clint Shock |
| Snake River Alliance | Wendy Wilson/Chad Worth |
| University of Idaho Center for Ecohydraulics Research | Daniele Tonina |

**Regulatory Commission Representatives**

| | |
|---|---|
| Idaho Public Utilities Commission | Stacey Donohue |
| Public Utility Commission of Oregon | Nadine Hanhan |

# IRP Advisory Council Meeting Schedule and Agenda

| Meeting Dates | | Agenda Items |
|---|---|---|
| 2016 | Thursday, September 8 | Introductions/meeting overview<br>Welcome and opening remarks<br>IRP process explanation<br>Pilot projects update<br>Clean Power Plan update<br>Natural gas forecast |
| 2016 | Thursday, October 13 | Review of September IRPAC meeting<br>T&D deferral benefit<br>Demand-side resources<br>Streamflow forecast<br>Hydro production forecast |
| 2016 | Thursday, November 10 | Review of October IRPAC meeting<br>Transmission system overview<br>Boardman-Hemingway/Gateway West update<br>Load forecast<br>Contract purchased power forecast |
| 2016 | Thursday, December 19 | Deferral of Distribution Investment Workshop |
| 2017 | Thursday, January 12 | Review of November IRPAC meeting<br>Energy efficiency potential study<br>Recap/review<br>Resource stack of IRP resources<br>Final load and resource balance<br>Resource portfolio design |
| 2017 | Thursday, March 9 | Review of January IRPAC meeting<br>Revisit of natural gas price forecast<br>AURORA and portfolio analysis<br>NW Power and Conservation Council Regional Perspective<br>Flexibility analysis<br>500 kV transmission projects update<br>Overview of remaining steps |
| 2017 | Thursday, April 13 | Review of March IRPAC meeting<br>Stochastic risk analysis results<br>Demand response as a resource<br>Resource stack costs – IRP resources<br>Qualitative risk analysis discussion<br>Closing-remaining schedule |

| Meeting Dates | | Agenda Items |
|---|---|---|
| 2017 | Thursday, May 11 | Action plan (2017—2020)<br>Hells Canyon Complex relicensing<br>Spring runoff and power system operations<br>Energy imbalance market (EIM) overview<br>IPC sustainability programs<br>Loss-of-load analysis<br>Closing comments |

# SALES AND LOAD FORECAST DATA

## Average Annual Forecast Growth Rates

| | 2017–2022 | 2017–2027 | 2017–2036 |
|---|---|---|---|
| **Sales** | | | |
| Residential Sales | 1.48% | 1.40% | 1.24% |
| Commercial Sales | 0.87% | 0.79% | 0.75% |
| Irrigation Sales | 0.62% | 0.59% | 0.59% |
| Industrial Sales | 1.29% | 0.90% | 0.73% |
| Additional Firm Sales | 0.94% | 1.40% | 0.76% |
| System Sales | 1.13% | 1.04% | 0.91% |
| Total Sales | 1.13% | 1.04% | 0.91% |
| **Loads** | | | |
| Residential Load | 1.48% | 1.40% | 1.22% |
| Commercial Load | 0.86% | 0.78% | 0.74% |
| Irrigation Load | 0.62% | 0.59% | 0.58% |
| Industrial Load | 1.25% | 0.89% | 0.70% |
| Additional Firm Sales | 0.94% | 1.40% | 0.76% |
| System Load Losses | 1.12% | 1.03% | 0.91% |
| System Load | 1.12% | 1.04% | 0.89% |
| Total Load | 1.12% | 1.04% | 0.89% |
| **Peaks** | | | |
| System Peak | 1.57% | 1.49% | 1.36% |
| Total Peak | 1.57% | 1.49% | 1.36% |
| Winter Peak | 1.22% | 1.05% | 0.88% |
| Summer Peak | 1.78% | 1.66% | 1.53% |
| **Customers** | | | |
| Residential Customers | 2.11% | 2.02% | 1.78% |
| Commercial Customers | 1.86% | 1.90% | 1.77% |
| Irrigation Customers | 1.42% | 1.37% | 1.29% |
| Industrial Customers | 0.50% | 0.65% | 0.59% |

# Expected-Case Load Forecast

[1] The sales and load forecast considers and reflects the impact of existing energy efficiency programs on average load and peak demand. The new energy efficiency programs, proposed as part of the 2017 IRP, are accounted for in the load and resource balance. The peak load forecast does not include the impact of existing or new demand response programs, which are both accounted for in the load and resource balance.

[1] The sales and load forecast considers and reflects the impact of existing energy efficiency programs on average load and peak demand. The new energy efficiency programs, proposed as part of the 2017 IRP, are accounted for in the load and resource balance. The peak load forecast does not include the impact of existing or new demand response programs, which are both accounted for in the load and resource balance.

[1] The sales and load forecast considers and reflects the impact of existing energy efficiency programs on average load and peak demand. The new energy efficiency programs, proposed as part of the 2017 IRP, are accounted for in the load and resource balance. The peak load forecast does not include the impact of existing or new demand response programs, which are both accounted for in the load and resource balance.

[1] The sales and load forecast considers and reflects the impact of existing energy efficiency programs on average load and peak demand. The new energy efficiency programs, proposed as part of the 2017 IRP, are accounted for in the load and resource balance. The peak load forecast does not include the impact of existing or new demand response programs, which are both accounted for in the load and resource balance.

[1] The sales and load forecast considers and reflects the impact of existing energy efficiency programs on average load and peak demand. The new energy efficiency programs, proposed as part of the 2017 IRP, are accounted for in the load and resource balance. The peak load forecast does not include the impact of existing or new demand response programs, which are both accounted for in the load and resource balance.

[1] The sales and load forecast considers and reflects the impact of existing energy efficiency programs on average load and peak demand. The new energy efficiency programs, proposed as part of the 2017 IRP, are accounted for in the load and resource balance. The peak load forecast does not include the impact of existing or new demand response programs, which are both accounted for in the load and resource balance.

[1] The sales and load forecast considers and reflects the impact of existing energy efficiency programs on average load and peak demand. The new energy efficiency programs, proposed as part of the 2017 IRP, are accounted for in the load and resource balance. The peak load forecast does not include the impact of existing or new demand response programs, which are both accounted for in the load and resource balance.

[1] The sales and load forecast considers and reflects the impact of existing energy efficiency programs on average load and peak demand. The new energy efficiency programs, proposed as part of the 2017 IRP, are accounted for in the load and resource balance. The peak load forecast does not include the impact of existing or new demand response programs, which are both accounted for in the load and resource balance.

[1] The sales and load forecast considers and reflects the impact of existing energy efficiency programs on average load and peak demand. The new energy efficiency programs, proposed as part of the 2017 IRP, are accounted for in the load and resource balance. The peak load forecast does not include the impact of existing or new demand response programs, which are both accounted for in the load and resource balance.

# DEMAND-SIDE RESOURCE DATA

## Cost Effectiveness

Idaho Power considers cost-effectiveness to be the primary screening tool prior to demand-side management (DSM) program implementation. Idaho Power's goal is for all programs to have benefit/cost (B/C) ratios greater than one for the total resource cost (TRC) test, utility cost (UC) test, and participant cost test (PCT) at the program and measure level where appropriate. Each cost-effectiveness test provides a different perspective, and Idaho Power believes each test provides value when evaluating program performance. If a specific measure or program is found to be not cost-effective from each of the three tests. For resource planning Idaho Power primarily uses the total resource cost (TRC) test and the utility cost (UC) tests to determine the cost-effective energy efficiency for inclusion in the IRP. Each energy efficiency program and individual program measures are reviewed annually as part of preparation of an annual report that is submitted to both the Idaho Public Utilities Commission and Public Utilities Commission of Oregon. More information on Idaho Power's programs and cost-effectiveness is included in the *Demand-Side Management 2016 Annual Report* and its *Supplement 1: Cost-Effectiveness,* (idahopower.com/EnergyEfficiency/reports.cfm).

Incorporated into the cost-effectiveness analysis are inputs from various sources that represent the most current and reliable information available. Measure savings, measure life, and participant cost assumptions for prescriptive programs are usually sourced from the Regional Technical Forum (RTF), which is the regional advisory group and technical arm of the Northwest Power and Conservation Council (NPCC). For custom and non-prescriptive programs, annual energy savings can be derived from program evaluations, engineering estimates, or regionally deemed values. Participant costs for non-prescriptive programs are often actual costs from customer-submitted information. Other inputs used in the cost-effectiveness models are obtained from the IRP process, including the financial assumptions along with the value of DSM alternative costs.

For the 2017 IRP, non-energy related benefits (NEB) were included in the cost-effectiveness analysis of the program forecasts. NEB include savings from water savings, deferred maintenance and operational costs, avoided supplemental fuels, and other quantifiable benefits. NEB values from the 2016 portfolio of programs was used in the calculation of cost-effectiveness at the sector level. For a complete list of NEB and sources that Idaho Power currently uses for its program cost-effectiveness, see *Demand-Side Management 2016 Annual Report* and its *Supplement 1: Cost-Effectiveness,* (idahopower.com/EnergyEfficiency/reports.cfm).

The cost-effective analysis methods used at Idaho Power are consistent with published methods and standard practices. Idaho Power relies on the *Electric Power Research Institute End Use Technical Assessment Guide* (TAG) *Understanding Cost-Effectiveness of Energy Efficiency Programs,* and the *California Standard Practice Manual* for the cost-effectiveness methodology. As defined in the TAG and *California Standard Practice Manual*, the TRC and UC tests are most like supply-side cost analysis and provide a useful basis to compare demand-side and supply-side resources.

## Resource Development and Evaluation

When developing energy efficiency programs, Idaho Power uses data and experiences from other companies in the region, or throughout the country, where applicable, to help identify specific program parameters. This is accomplished through discussions with other utilities' program managers and researchers. Idaho Power also uses electric industry research organizations, such as E Source, the Consortium for Energy Efficiency (CEE), American Council for an Energy-Efficient Economy (ACEEE), and the Association of Energy Service Professionals (AESP), to identify similar programs and their results.

All programs are included in an ongoing evaluation schedule where a third-party consultant verifies the claimed savings from the program. Programs are also evaluated to review the program processes to assess the effectiveness of the program delivery. If an evaluation determines that savings are less than claimed or that there is potential for improvement in delivery of the program, then changes can be made based on the recommendations. Recent evaluations from the 2016 program year can be found in the *Demand-Side Management 2016 Annual Report* and its *Supplement 2: Evaluations,* (idahopower.com/EnergyEfficiency/reports.cfm).

## Planning Assumptions and Alternate Costs

All financial assumptions used in the cost-effectiveness analysis for energy efficiency resources included in the 2017 IRP are consistent with the financial assumptions made for supply-side resources, including the discount rate and cost escalation rates. The IRP is also the source of the DSM alternative costs, which is the basis for estimating the value of energy savings and demand reduction resulting from the DSM programs. The DSM alternative energy costs are based on either IRP forecast of fuel costs of a natural gas peaking unit for peak summer hours or future energy prices as determined by the AURORAxmp® Electric Market Model. The avoided capacity resource for peak summer hours is based on a 170 MW natural gas-fired, simple-cycle combustion turbine (SCCT) 35-year levelized cost.

The AURORAxmp® model is an electricity forecasting tool that simulates hourly economic dispatch of supply-side resources considering demand-side, and transmission resources. Idaho Power's planning model forecasts electric market prices throughout southern Idaho and theWestern Electricity Coordinating Council (WECC) region. Idaho Power modeled hourly, marginal electricity costs for the years 2017 through 2036 to estimate the potential system benefit of avoiding future cost production energy. An initial run of DSM Alternative costs is estimated during the preliminary analysis phase of the IRP process. The preliminary runs combined updated planning assumptions including load and natural gas price forecasts run using the preferred resource portfolio from the 2015 IRP. After the selection of the preferred portfolio a final run of marginal prices will be run which, once acknowledged, become the DSM alternative energy prices for energy efficiency valuation until the next IRP analysis is completed and acknowledged.

To simplify cost-effectiveness calculations, the DSM alternative costs are averaged and placed into five pricing categories. The resulting pricing categories include the following:

- Summer On-Peak (SONP)—Average of Idaho Power variable energy and operating costs of a 170 MW SCCT, which is the marginal resource for peak hour load deficits during summertime heavy load hours
- Summer Mid-Peak (SMP)—Average of heavy load prices from June to August (excluding the SONP hours)
- Summer Off-Peak (SOFP)—Average of light load prices from June to August
- Non-Summer Mid-Peak (NSMP)—Average of heavy load prices in January through May and September through December
- Non-Summer Off-Peak (NSOFP)—Average of light load prices in January through May and September through December

The SONP is treated differently than the other four pricing periods when valuing energy efficiency. The estimated levelized capacity cost of a new SCCT is $122 per kW/Year over a 35-year period. The $122 per kW/Year avoided capacity value is spread across the annual SONP hours to value the energy efficiency savings occurring during the hours.

## Forecast and Cost-Effectiveness Data

Table DSM-1 lists the financial assumptions used for the cost-effectiveness analysis.

**Table DSM-1. IRP financial assumptions**

| DSM Analysis Assumptions | |
|---|---|
| **Avoided 35-Year Levelized Capacity Costs** | |
| SCCT | $122/kW/year |
| **Financial Assumptions** | |
| Weighted average cost of capital (2016 year ending after tax) | 6.74% |
| Financial escalation factor | 2.10% |
| **Transmission Losses** | |
| Non-summer secondary losses | 9.60% |
| Summer peak loss | 9.70% |

Table DSM-2 shows the planning results of averaging forward energy prices over the 20-year planning period.

**Table DSM-2. DSM alternate costs by pricing period**

| Year | Summer On-Peak[1] (SONP) | Summer Mid-Peak (SMP) | Summer Off-Peak (SOFP) | Non-Summer Mid-Peak (NSMP) | Non-Summer Off-Peak (NSOFP) | Annual Average[2] |
|---|---|---|---|---|---|---|
| 2017 | $48.14 | $29.55 | $26.33 | $28.28 | $26.47 | $42.76 |
| 2018 | $53.96 | $31.32 | $28.28 | $29.94 | $27.92 | $44.64 |

Tables DSM-5 lists the 20-year cumulative forecasted of average energy (aMW) by customer class and total on-peak reduction potential (MW).

**Table DSM-5. Cumulative existing energy efficiency forecast 2017–2036**
*(aMW w/transmission losses and peak contributions [MW])*

| Year | Residential | Commercial/Industrial/ Special Contracts | Irrigation | Total | On Peak (MW) |
|---|---|---|---|---|---|
| 2017 | 2 | 9 | 2 | 13 | 20 |
| 2018 | 6 | 19 | 3 | 28 | 40 |
| 2019 | 10 | 29 | 5 | 44 | 60 |
| 2020 | 12 | 40 | 6 | 59 | 80 |
| 2021 | 14 | 51 | 8 | 73 | 102 |
| 2022 | 16 | 63 | 9 | 89 | 123 |
| 2023 | 18 | 75 | 11 | 104 | 146 |
| 2024 | 21 | 86 | 12 | 120 | 168 |
| 2025 | 24 | 98 | 14 | 135 | 192 |
| 2026 | 27 | 105 | 15 | 147 | 216 |
| 2027 | 31 | 112 | 17 | 160 | 240 |
| 2028 | 34 | 120 | 19 | 173 | 265 |
| 2029 | 38 | 126 | 20 | 184 | 290 |
| 2030 | 42 | 133 | 22 | 196 | 316 |
| 2031 | 46 | 140 | 23 | 208 | 343 |
| 2032 | 50 | 146 | 25 | 220 | 370 |
| 2033 | 54 | 154 | 26 | 234 | 397 |
| 2034 | 58 | 162 | 28 | 247 | 425 |
| 2035 | 62 | 169 | 29 | 261 | 454 |
| 2036 | 66 | 175 | 31 | 273 | 483 |

Table DSM-6 details the 20-year estimated utility or program administrator costs of the achievable potential energy efficiency forecast by customer class.

**Table DSM-6. Energy Efficiency Total Utility (Program Administrator) Costs 2017–2036 ($000s)**

| Year | Residential | Commercial/Industrial/ Special Contracts | Irrigation | Total |
|---|---|---|---|---|
| 2017 | $3,828 | $12,199 | $1,868 | $17,896 |
| 2018 | $5,718 | $13,638 | $1,916 | $21,273 |
| 2019 | $6,821 | $14,977 | $1,957 | $23,754 |
| 2020 | $3,907 | $15,785 | $1,999 | $21,691 |
| 2021 | $3,998 | $16,350 | $2,032 | $22,380 |
| 2022 | $3,840 | $17,482 | $2,087 | $23,410 |
| 2023 | $4,323 | $18,094 | $2,126 | $24,544 |
| 2024 | $5,690 | $18,174 | $2,167 | $26,031 |
| 2025 | $6,546 | $18,123 | $2,207 | $26,877 |
| 2026 | $8,183 | $11,837 | $2,251 | $22,271 |
| 2027 | $8,832 | $12,546 | $2,328 | $23,706 |
| 2028 | $9,297 | $12,886 | $2,365 | $24,548 |
| 2029 | $9,736 | $11,140 | $2,395 | $23,272 |
| 2030 | $11,500 | $12,028 | $2,472 | $26,001 |
| 2031 | $11,490 | $11,627 | $2,517 | $25,635 |
| 2032 | $11,983 | $12,178 | $2,572 | $26,733 |
| 2033 | $12,696 | $14,815 | $2,627 | $30,138 |
| 2034 | $13,278 | $14,982 | $2,684 | $30,943 |
| 2035 | $13,954 | $14,828 | $2,741 | $31,523 |
| 2036 | $14,616 | $12,726 | $2,800 | $30,142 |
| **20-Year NPV** | **$78,908** | **$157,520** | **$23,828** | **$260,255** |

Table DSM-7 details the 20-year estimated total resource costs of the achievable potential energy efficiency forecast by customer class.

**Table DSM-7. Energy Efficiency Total Resource Costs 2017–2036 ($000s)**

| Year | Residential | Commercial/Industrial/ Special Contracts | Irrigation | Total |
|---|---|---|---|---|
| 2017 | $8,015 | $23,432 | $6,428 | $37,874 |
| 2018 | $12,137 | $26,196 | $6,594 | $44,926 |
| 2019 | $14,548 | $28,767 | $6,733 | $50,048 |
| 2020 | $8,242 | $30,320 | $6,877 | $45,439 |
| 2021 | $8,331 | $31,405 | $6,990 | $46,727 |
| 2022 | $7,887 | $33,579 | $7,180 | $48,647 |
| 2023 | $8,731 | $34,754 | $7,316 | $50,801 |
| 2024 | $11,338 | $34,909 | $7,454 | $53,701 |
| 2025 | $12,891 | $34,811 | $7,595 | $55,296 |
| 2026 | $15,995 | $22,736 | $7,745 | $46,475 |
| 2027 | $17,132 | $24,098 | $8,008 | $49,238 |
| 2028 | $17,896 | $24,751 | $8,138 | $50,784 |
| 2029 | $18,614 | $21,398 | $8,240 | $48,253 |
| 2030 | $21,884 | $23,103 | $8,507 | $53,493 |
| 2031 | $21,758 | $22,333 | $8,661 | $52,753 |
| 2032 | $22,584 | $23,392 | $8,848 | $54,824 |
| 2033 | $23,821 | $28,456 | $9,038 | $61,315 |
| 2034 | $24,816 | $28,776 | $9,233 | $62,825 |
| 2035 | $25,990 | $28,482 | $9,431 | $63,903 |
| 2036 | $27,144 | $24,443 | $9,634 | $61,221 |
| **20-Year NPV** | **$155,425** | **$302,559** | **$81,981** | **$539,964** |

Table DSM-8 shows the cost-effectiveness analysis and levelized cost of saved energy for achievable potential energy efficiency by sector through the IRP planning period.

**Table DSM-8. Total Energy Efficiency Benefits 2017–2036 ($000s)**

| Year | Residential | Commercial/Industrial/ Special Contracts | Irrigation | Total |
|---|---|---|---|---|
| 2017 | $15,350 | $40,747 | $9,459 | $65,555 |
| 2018 | $22,620 | $43,135 | $9,265 | $75,020 |
| 2019 | $25,730 | $44,722 | $8,988 | $79,440 |
| 2020 | $13,491 | $44,331 | $8,668 | $66,490 |
| 2021 | $12,535 | $43,077 | $8,281 | $63,894 |
| 2022 | $10,887 | $43,208 | $8,001 | $62,096 |
| 2023 | $10,996 | $41,986 | $7,673 | $60,655 |
| 2024 | $13,068 | $39,472 | $7,313 | $59,853 |
| 2025 | $13,625 | $36,775 | $6,950 | $57,350 |
| 2026 | $15,557 | $22,459 | $6,613 | $44,629 |
| 2027 | $15,384 | $22,268 | $6,387 | $44,038 |
| 2028 | $14,873 | $21,412 | $6,071 | $42,356 |
| 2029 | $14,345 | $17,333 | $5,751 | $37,428 |
| 2030 | $15,667 | $17,508 | $5,548 | $38,723 |
| 2031 | $14,495 | $15,844 | $5,283 | $35,622 |
| 2032 | $14,017 | $15,555 | $5,057 | $34,629 |
| 2033 | $13,760 | $17,738 | $4,842 | $36,340 |

# Cost Inputs and Operating Assumptions

(All costs in 2017 dollars)

| Supply-Side Resources | Plant Capacity (MW) | Plant Capital ($/kW)[1,3] | Transmission Capital $/kW | Total Capital $/kW | Total Investment $/kW[2] | Fixed O&M $/kW[3] | Variable O&M $/kW | Other $/MWh | Heat Rate Btu/kWh | Economic Life |
|---|---|---|---|---|---|---|---|---|---|---|
| Biomass Indirect—Anaerobic Digester (35 MW) | 35 | 6,522 | 144 | $6,666 | $7,133 | 3 | 16 | 0 | 14,500 | 30 |
| Boardman to Hemingway (250 MW) | 350 | 0 | 734 | $734 | $734 | 0 | 0 | 0 | 0 | 55 |
| Canal Drop Hydro (1 MW) | 1 | 3,753 | 70 | $3,823 | $4,550 | 2 | 0 | 0 | 0 | 75 |
| CCCT (1x1) F Class (300 MW) | 300 | 1,246 | 98 | $1,344 | $1,574 | 1 | 0 | 0 | 6,714 | 30 |
| CCCT (2x1) F Class (550 MW) | 550 | 1,150 | 109 | $1,259 | $1,474 | 1 | 3 | 0 | 6,700 | 30 |
| CHP (35 MW) | 35 | 2,213 | 35 | $2,248 | $2,406 | 4 | 5 | 0 | 6,060 | 40 |
| Demand Response—Additional (25 MW) | 25 | 0 | 0 | $0 | $0 | 51 | 0 | 0 | 0 | 20 |
| Geothermal (30 MW) | 35 | 4,675 | 144 | $4,819 | $5,342 | 18 | 5 | 0 | 0 | 25 |
| Reciprocating Gas Engine (18.8 MW) | 18 | 775 | 112 | $887 | $945 | 1 | 7 | 0 | 8,370 | 40 |
| SCCT—Frame F Class (170 MW) | 170 | 878 | 117 | $995 | $1,060 | 1 | 11 | 0 | 10,300 | 35 |
| Small Modular Nuclear (50 MW) | 50 | 6,126 | 663 | $6,789 | $10,279 | 8 | 2 | 0 | 11,493 | 40 |
| Solar PV—Rooftop C&I (1 MW) | 1 | 2,925 | 0 | $2,925 | $3,040 | 1 | 0 | 1 | 0 | 25 |
| Solar PV—Rooftop Residential (0.005 MW) | 0 | 2,400 | 0 | $2,400 | $2,495 | 2 | 0 | 1 | 0 | 25 |
| Solar PV—Utility Scale 1-Axis Tracking (30 MW) | 30 | 1,375 | 144 | $1,519 | $1,579 | 1 | 0 | 1 | 0 | 25 |
| Storage—Ice Thermal Storage (10 MW) | 10 | 2,000 | 0 | $2,000 | $2,039 | 3 | 0 | 0 | 0 | 20 |
| Storage—Li Battery Residential (10 MW) | 10 | 3,114 | 0 | $3,114 | $3,175 | 4 | 0 | 0 | 0 | 10 |
| Storage—Pumped-Hydro (300 MW) | 300 | 2,352 | 183 | $2,535 | $3,017 | 4 | 0 | 0 | 0 | 50 |
| Storage—V Flow Battery (10 MW) | 10 | 3,736 | 0 | $3,736 | $3,809 | 6 | 0 | 0 | 0 | 10 |
| Storage—Zn Battery (10 MW) | 10 | 2,010 | 0 | $2,010 | $2,049 | 3 | 0 | 0 | 0 | 10 |
| Wind (100 MW) | 100 | 1,475 | 117 | $1,592 | $1,700 | 3 | 0 | 16 | 0 | 25 |

[1] Plant costs include engineering development costs, generating and ancillary equipment purchase, and installation costs, as well as balance of plant construction.

[2] Total Investment includes capital costs and AFUDC.

[3] Fixed O&M excludes property taxes and insurance (separately calculated within the levelized resource cost analysis)

# Transmission Cost Assumptions

## *Cost Assumptions by Supply-Side Resource Type*

| Capacity (MW Rating) | Overnight Transmission Capital Cost/kW[1] | Cost Assumptions Notes | Local Interconnection Assumptions | Backbone Transmission Assumptions |
|---|---|---|---|---|
| Biomass Indirect—Anaerobic Digester | | | | |
| 35 | $144 | Assume distribution feeder locations in the Magic Valley; displaces equivalent MW of portfolio resources in same region. | Assume $3.5 million of distribution feeder upgrades and $1.167 million in substation upgrades. | Assigns Pro-Rata share for transmission upgrades identified for east-of-Boise resources. |
| Geothermal (binary-cycle)—Idaho | | | | |
| 35 | $144 | Assume Raft River area location; displaces equivalent MW of portfolio resources in same region. | Requires 5-mile 138-kV line to nearby station with new 138-kV substation line terminal bay. | Assigns Pro-Rata share for transmission upgrades identified for east-of-Boise resources. |
| Hydro—Canal Drop (Seasonal) | | | | |
| 1 | $70 | Assume Magic Valley location connecting to 46-kV sub-transmission or local feeder. | Assume 4 miles of distribution rebuild at $150 thousand per mile plus $100 thousand in substation upgrades. | No backbone upgrades required. |
| Natural Gas—SCCT Frame F Class (Idaho Power's peaker plants use this technology) | | | | |
| 170 | $117 | Assume Mountain Home location; displaces equivalent MW of portfolio resources in same region. | Assume 2 mi of 230 kV line required to connect to nearby station. | Assigns Pro-Rata share for transmission upgrades identified for east-of-Boise resources. |
| Natural Gas—Reciprocating Gas Engine Wartsila 34SG | | | | |
| 18 | $112 | Assume Mountain Home location; displaces equivalent MW of portfolio resources in same region. | Interconnecting at RTSN 230-kV station. | Assigns Pro-Rata share for transmission upgrades identified for east-of-Boise resources. |
| Natural Gas—CCCT (1x1) F Class with Duct Firing | | | | |
| 300 | $98 | Assume Mountain Home location; displaces equivalent MW of portfolio resources in same region. | Assume 2 miles of 230-kV line required to connect to nearby station. | Assigns Pro-Rata share for transmission upgrades identified for east-of-Boise resources. |
| Natural Gas—CCCT (2x1) F Class | | | | |
| 550 | $109 | Build new facility south of Boise (assume Simco Road area). | New 230-kV switching station with a 22-mile; 230-kV line to Boise Bench Substation and wrap 230-kV DNPR-HRBD line into new station. | Rebuild RTSN-DRAM 230 kV line, BOBN-DRAM 230 kV line, MCRN-BOBN 138 kV line, and replace BOMT-SWPO wave trap. |
| Natural Gas—Combined Heat and Power (CHP) | | | | |
| 35 | $35 | Assumed location in Treasure Valley. | Assume 1 mile tap to existing 138-kV line and new 138-kV source substation. | No backbone upgrades required. |
| Nuclear—Small Modular Reactor (SMR) | | | | |
| 50 | $663 | Assume tie into ANTS 230-kV transmission substation; displaces equivalent MW of portfolio resources east of Boise. | Two 2-mile, 138-kV lines to interconnect to Antelope Substation. New 138-kV terminal at ANTS. | New parallel 55-mile, 230-kV line from Antelope to Brady Substation. New 230-kV terminal at Brady Substation. Assigns Pro-Rata share for transmission upgrades identified for east-of-Boise resources. |
| Pumped Storage—new upper reservoir and generation/pumping plant, pump water from existing lower reservoir to new upper reservoir and run water through new power plant) | | | | |
| 300 | $183 | Assume Anderson Ranch location; displaces equivalent MW of portfolio resources in same region. | 18 mi 230-kV line to connect to RTSN. | Assigns Pro-Rata share for transmission upgrades identified for east-of-Boise resources. |

| Capacity (MW Rating) | Overnight Transmission Capital Cost/kW[1] | Cost Assumptions Notes | Local Interconnection Assumptions | Backbone Transmission Assumptions |
|---|---|---|---|---|
| Solar PV—Utility Scale 1-Axis Tracking | | | | |
| 30 | $144 | Assume Magic Valley location; displaces equivalent MW of portfolio resources in same region. | Assume 1 mile 230 kV line and associated stations equipment. | Assigns Pro-Rata share for transmission upgrades identified for east-of-Boise resources. |
| Wind—Idaho | | | | |
| 100 | $117 | Assume location within 5 miles of Midpoint Substation; displaces equivalent MW of portfolio resources in same region. | Assume 5 mi of 230-kV transmission from MPSN to project site. | Assigns Pro-Rata share for transmission upgrades identified for east-of-Boise resources. |

# Levelized Cost of Energy

**30-Year Levelized Cost of Energy (at stated capacity factors)**

| Supply-Side Resources | Cost of Capital | Non-Fuel O&M[1] | Fuel | Wholesale Energy | Net of Tax Credit/Steam sales/Integration/ Transmission Revenue | Total Cost per MWh | Capacity Factor |
|---|---|---|---|---|---|---|---|
| Biomass Indirect—Anaerobic Digester (35 MW) | $98 | $35 | $0 | $0 | $0 | $133 | 85% |
| Boardman to Hemingway (250 MW) | $18 | $3 | $0 | $28 | -$9 | $39 | 33% |
| Canal Drop Hydro (1 MW) | $140 | $25 | $0 | $0 | $0 | $165 | 33% |
| CCCT (1x1) F Class (300 MW) | $26 | $6 | $28 | $0 | $0 | $59 | 70% |
| CCCT (2x1) F Class (550 MW) | $25 | $7 | $28 | $0 | $0 | $59 | 70% |
| CHP (35 MW) | $33 | $20 | $25 | $0 | -$6 | $71 | 80% |
| Demand Response—Additional (25 MW) | $0 | $706 | $0 | $0 | $0 | $706 | 1% |
| Geothermal (30 MW) | $64 | $47 | $0 | $0 | $0 | $111 | 88% |
| Reciprocating Gas Engine (18.8 MW) | $41 | $18 | $35 | $0 | $0 | $94 | 25% |
| SCCT—Frame F Class (170 MW) | $118 | $36 | $43 | $0 | $0 | $197 | 10% |
| Small Modular Nuclear (50 MW) | $124 | $31 | $8 | $0 | $0 | $163 | 90% |
| Solar PV—Rooftop C&I (1 MW) | $153 | $25 | $0 | $0 | $1 | $179 | 21% |
| Solar PV—Rooftop Residential (0.005 MW) | $126 | $26 | $0 | $0 | $1 | $153 | 21% |
| Solar PV—Utility Scale 1-Axis Tracking (30 MW) | $62 | $12 | $0 | $0 | $1 | $74 | 27% |
| Storage—Ice Thermal Storage (10 MW) | $595 | $147 | $0 | $0 | $0 | $742 | 4% |
| Storage—Li Battery Residential (10 MW) | $400 | $60 | $0 | $0 | $0 | $460 | 14% |
| Storage—Pumped-Hydro (300 MW) | $158 | $57 | $0 | $0 | $0 | $214 | 20% |
| Storage—V Flow Battery (10 MW) | $1,679 | $317 | $0 | $0 | $0 | $1,996 | 4% |
| Storage—Zn Battery (10 MW) | $516 | $92 | $0 | $0 | $0 | $608 | 7% |
| Wind (100 MW) | $64 | $24 | $0 | $0 | $22 | $111 | 28% |

[1] Non Fuel O&M includes fixed and variable costs, property taxes.

**30-Year Levelized Capacity (fixed) Cost per kW/Month**

| Supply-Side Resources | Cost of Capital | Non-Fuel O&M | Fuel | Net of Tax Credit/Steam sales/Integration/ Transmission Revenue | Total Cost per kW |
|---|---|---|---|---|---|
| Biomass Indirect—Anaerobic Digester (35 MW) | $61 | $9 | $0 | $0 | $70 |

# Peak-Hour Capacity Credit (Contribution to Peak)

## *Solar and Wind Resources*

Peak hour capacity credit (contribution to peak) for new IRP intermittent generation resources:

| New IRP intermittent generation—Peak hour capacity credit | |
|---|---|
| **Resource** | **Peak Hour Capacity Credit** |
| PV solar south orientation | 28.4% |
| PV solar southwest orientation | 45.4% |
| PV solar single-axis tracking | 51.3% |
| Wind | 5.0% |

# Energy Shape—Solar

## *2017 IRP Assumed Solar Capacity Factors*

Total nameplate: 298.3 MW
Total annual capacity factor: 27%

| Upper Salmon “B” | 18,000 | 16,500 | 16,500 | 16,560 |
| **Total Hydro** | **1,897,046** | **1,709,083** | | |

[1] A power factor rating of 0.8 is assumed on four units (Clear Lake, Shoshone Falls unit 2, and Thousand Springs units 1 and 2) with a total kVA rating of 6,125 kVA on which the nameplate rating is assumed.
[2] The two smaller units, 1 and 2, have nameplate ratings of 1.25 MVA and 1 MW have been taken out of service due to reduced flows from the springs and penstock integrity.
[3] The Swan Falls units have been limited to 24,170 kW as a result of vibration issues.
[4] Normal Rating is the normal kW output of the facility with all units on-line. This rating includes all equipment limitations and may be different than the nameplate rating. To operate at the Normal Rating, appropriate water and ambient conditions must exist and the FERC license requirements permit.
[5] The Emergency Rating is defined as the maximum kW output of the facility with all units on-line. The Emergency Rating is based on manufacturer guidelines, ANSI standards, and limited by auxiliary equipment ratings. To operate at the Emergency Rating, appropriate water conditions must exist and the FERC license requirements permit.
[6] The Shoshone Falls Unit #2 is out of service due to an exciter condition.

[1] Ratings for coal-fired generators are provided by Idaho Power's thermal partners who operate these plants.

[2] Net Dependable Capacity (NDC) is defined in the NERC Generating Availability Data System (GADS) as Gross Dependable Capacity (GDC) less the unit capacity utilized for that unit's station service or auxiliaries. GDC is the Gross Maximum Capacity (GMC) modified for seasonal limitations over a specified period. The GDC and Maximum Dependable Capacity (MDC) used in previous GADS reports are the same in intent and purpose. GMC is the maximum capacity a unit can sustain over a specified period when not restricted by seasonal or other de-ratings.

[3] Evander Andrews Power Plant is also known to Idaho Power as Danskin Power Plant (DNPR).

[4] Performance test numbers provided by the contractor corrected for the following rating conditions: 90.0 Deg. F, Relative Humidity 20%, Barometric pressure 13.378 psia, Duct Burners ON. Performance numbers were obtained from the Siemens report EC-12087, Thermal performance test results of SGT6-5000F GAs turbine in fuel gas at Langley Gulch, New Plymouth, ID for IPC (Unit # 1—Shop Order Number GT378521)

| **Total Wind Nameplate Rating 626.92 MW** | | | | | | | |
| **Total Nameplate Rating 1,135.84 MW** | | | | | | | |

The above is a summary of the Nameplate rating for the CSPP projects under contract with Idaho Power as of April 1, 2017. In the case of CSPP projects, Nameplate rating of the actual generation units is not an accurate or reasonable estimate of the actual energy these projects will deliver to Idaho Power. Historical generation information, resource specific industry standard capacity factors, and other known and measurable operating characteristics are accounted for in determining a reasonable estimate of the energy these projects will produce.

# Power Purchase Agreement Data

| Idaho Power Company Power Purchase Agreements Status as of April 1, 2017 | | | Contract |
|---|---|---|---|
| **Project** | **MW** | **On-Line Date** | **End Date** |
| **Wind projects** | | | |
| Elkhorn Wind Project | 101 | December 2007 | December 2027 |
| **Total wind nameplate MW rating** | 101 | | |
| **Geothermal Projects** | | | |
| Raft River Unit 1 | 13 | April 2008 | April 2033 |
| Neal Hot Springs | 22 | November 2012 | November 2037 |
| **Total geothermal nameplate MW rating** | 35 | | |
| **Total nameplate MW rating** | 136 | | |

1. Above is a summary of the nameplate ratings for the Power Purchase Agreements under contract with Idaho Power. Nameplate ratings of the actual generation units are not an accurate or reasonable estimate of the actual energy these projects will deliver to Idaho Power. Historical generation information, resource-specific industry standard capacity factors, and other known and measurable operating characteristics are accounted for in determining a reasonable estimate of the energy the projects will produce.
2. Not included in the above table is the energy exchange agreement between Idaho Power and the Clatskanie PUD. Under the exchange, Idaho Power receives energy from the 18-MW power plant at Arrowrock Dam on the Boise River and returns to Clatskanie PUD energy of an equivalent value delivered seasonally. The agreement began in January 2010 and extends through 2020. Idaho Power retains the right to renew the agreement through 2025.

# Flow Modeling

## Models

Idaho Power uses two primary models for forecasting future flows for the IRP. The Snake River Planning Model (SRPM) is used to forecast surface water flows and the Enhanced Snake Plain Aquifer Model (ESPAM) is used to forecast the impact of various aquifer management practices implemented on the Eastern Snake Plain Aquifer (ESPA). The SRPM was updated in late 2012 to include hydrologic conditions for years 1928 through 2009. ESPAM was also updated with the release of ESPAM 2.1 in late 2012. Beginning with the 2009 IRP, Idaho Power began running the SRPM and ESPAM as a combined modeling system. The combined model seeks to maximize diversions for aquifer recharge and system conversions without creating additional model irrigation shortages over a modeled reference condition.

## Model Inputs

The inputs for the 2017 IRP were derived from management practices outlined in an agreement between the Surface Water Coalition and Idaho Groundwater Appropriators (IGWA). The agreement set out specific targets for several management practices that include aquifer recharge, system conversions, and a total reduction in ground water diversions of 240,000 acre feet (acft). The 2017 IRP modeling also recognized ongoing declines in specific reaches and additional surface water from weather modification activities.

Recharge modeled for the 2017 IRP included new recharge diversions that have the capability of completely drying the Snake River below Milner Dam during the winter months. These diversions can have a significant impact to flows downstream of Milner Dam. Recharge diversions increased from 2017 and peaked at close to 249,000 acft in IRP year 2022. In IRP year 2022, approximately 67,000 acft of recharge occurs above American Falls Reservoir and 182,000 acft is diverted at Milner Dam. Recharge diversions are held steady until 2031 when declines in reach gains reduce the amount of water available for recharge operations.

System conversion projects involve the conversion of ground water supplied irrigated land to surface supplied irrigated land. The number of acres modeled and potential water savings was based on data provided by the Idaho Department of Water Resources. The current model assumes a total of 16,687 acres of converted land on the ESPA with a total water savings of 2.0 acre-ft or water per acre of irrigated land (acre-ft/acre). Diversions for conversion projects peak at approximately 33,000 acft. Diversions for conversion projects generally decline after 2021 as declines in reach gains reduces water availability for diversion.

The model accounted for a 240,000 acft decreases in ground water pumping from the Eastern Snake Plain Aquifer (ESPA). The decreases were spread evenly over ground water irrigated lands that are subject to the agreement between the Surface Water Coalition and the IGWA. This reduction in ground water diversions resulted in increased reach gains throughout much of the mid-Snake River.

The goal of the Surface Water Coalition agreement was to provide additional water to those entities diverting Snake River water from Minidoka Dam to Milner Dam. To simulate this delivery of additional water, a new diversion was added to the model. This diversion is not delivered to a specific entity in the model but is designed to simulate additional surface water diversions at Milner. The amount of this diversion was calculated to ensure that surface water diverters would receive water amounting to the 25 percent exceedance of diversions for years 1995 – 2009. These additional diversions were not allowed if either storage water or natural flow were not available in excess of existing modeled diversions. Water was not available in all years to fill these diversions.

Future reach declines were determined using a variety of statistical analyses. Trend data indicate reach gains into American Falls Reservoir and from Milner Dam to Lower Salmon Falls Dam demonstrated a statistically significant decline for the period of 1986 to 2015. On average, reach gains into American Falls Reservoir declined 29 cubic feet per second per year. Reach gains from Milner Dam to Lower Salmon Falls Dam declined on average 28 cubic feet per second per year. Declines in these two reaches met strict, predefined criteria, and were therefore included as inputs into the model.

Weather modification was added to the model at different levels of development. For IRP years 2017 through 2019, weather modification was increased to reflect projected levels of fully built-out programs in Eastern Idaho, the Wood River Valley and the Boise Basin. Beyond IRP year 2019, weather modification levels in these three basins were held constant through the rest of the IRP forecast period. The level of weather modification was held constant at the current level in the Payette River Basin throughout the IRP forecast period.

## Model Results

The combined model allows for the ability to include future management activities, and the resulting reach gains from those management activities into Idaho Power's 2017 IRP. Management activities, such as recharge and system conversions, do not significantly change the total annual volume of water expected to flow through the Hells Canyon Complex, but instead change the timing and location of reach gains within the system. Other future management activities, such as weather modification and a decrease in ground water pumping do directly impact the annual volume of water expected through the Hells Canyon Complex as well as the timing and location of gains within the system.

Overall inflow to Brownlee Reservoir increases from IRP year 2017 through 2018. These increases are a response to increased weather modification in the Upper Snake, Wood and Boise River Basins and increased reach gains resulting from a decrease in pumping on the ESPA. Flows peak in 2018 with the 50 percent exceedance flows into Brownlee Reservoir at just over 11.72 million acre-ft/year. In 2036, those flows have declined to approximately 11.3 million acre-ft/year. For the April through July volume the peak occurs in 2021 with a volume of 5.32 million acre-ft/year. By 2036 the April through July inflow to Brownlee decreases to 5.17 million acre-ft/year. The decline in inflow to Brownlee Reservoir after 2018 is likely due to the increased diversions for recharge, particularly winter time diversions that reduce flow at Milner Dam to zero. April through July volumes continue to increase as new reach gains from recharge and a decline in ground water pumping yield at springs tributary to the Snake River. However, there is a long-term decrease in Snake River flows which is attributable to

declining flows into American Falls and the Milner to Lower Salmon Falls reach. These long-term declines eventually overwhelm any new reach gains from management practices on the ESPA.

## 2017 Model Parameters

| IRP Year | Managed Recharge (acft/yr) | | | Weather Modification (acft/yr) | System Conversions (Ac) | CREP (Ac) | Reach Declines (acft/yr) | |
|---|---|---|---|---|---|---|---|---|
| | Above American Falls | Below American Falls | Total | | | | American Falls Inflows | Below Milner Inflows |
| 2017 | 700 | 56,444 | 57,144 | 888,301 | 16,700 | 240,000 | 167,000 | 161,700 |

# COMPLIANCE WITH STATE OF OREGON IRP GUIDELINES

## Guideline 1: Substantive Requirements

a. All resources must be evaluation on a consistent and comparable basis.
   - All known resources for meeting the utility's load should be considered, including supply-side options which focus on the generation, purchase and transmission of power - or gas purchases, transportation, and storage - and demand side options which focus on conservation and demand response.
   - Utilities should compare different resource fuel types, technologies, lead times, in-service dates, durations and locations in portfolio risk modeling.
   - Consistent assumptions and methods should be used for evaluation of all resources.
   - The after-tax marginal weighted-average cost of capital (WACC) should be used to discount all future resource costs.

**Idaho Power response:**

Supply-side and purchased resources for meeting the utility's load are discussed in *Chapter 3. Idaho Power Today—Existing Supply-side Resources*; demand-side options for are discussed in *Chapter 5. Demand-Side Resources*; and transmission resources are discussed in *Chapter 6. Transmission Planning—Existing Transmission System*.

New resource options including fuel types, technologies, lead times, in-service dates, durations and locations are described in *Chapter 4. Future Supply-side Generation and Storage Resources*, *Chapter 5. Demand-Side resources*, *Chapter 6. Transmission Planning*, and *Chapter 7. Planning Period Forecasts*.

The consistent modeling method for evaluating new resource options is described in *Chapter 7. Planning Period Forecasts—Resource Cost Analysis* and *Chapter 9. Modeling Analysis and Result—Planning Case Portfolio Analysis*.

The WACC rate used to discount all future resource costs is stated in *Chapter 9. Modeling Analysis and Results* Table 9.1 Financial Assumptions.

b. Risk and uncertainty must be considered.
   - At a minimum, utilities should address the following sources of risk and uncertainty:
     1. Electric utilities: load requirements, hydroelectric generation, plant forced outages, fuel prices, electricity prices, and costs to comply with any regulation of greenhouse gas emissions.
     2. Natural gas utilities: demand (peak, swing and baseload), commodity supply and price, transportation availability and price, and costs to comply with any regulation of greenhouse gas emissions.
   - Utilities should identify in their plans any additional sources of risk and uncertainty.

**Idaho Power response:**

Electric utility risk and uncertainty factors (load, NG and water conditions) for resource portfolios are considered in *Chapter 9b Modeling Analysis and Results—Stochastic Risk Analysis*. Plant forced outages are modeled in Aurora on a unit basis and is shown in the Technical Appendix, *Existing Resource Data—Hydroelectric and Thermal Plant Data*.

Additional sources of risk and uncertainty are discussed in *Chapter 9. Modeling Analysis and Results*.

c. The primary goal must be the selection of a portfolio of resources with the best combination of expected costs and associated risks and uncertainties for the utility and its customers.
   - The planning horizon for analyzing resource choices should be at least 20 years and account for end effects. Utilities should consider all costs with a reasonable likelihood of being

included in rates over the long term, which extends beyond the planning horizon and the life of the resource.

- Utilities should use present value of revenue requirement (PVRR) as the key cost metric. The plan should include analysis of current and estimated future costs for all long-lived resources such as power plants, gas storage facilities, and pipelines, as well as all short-lived resources such as gas supply and short-term power purchases.
- To address risk, the plan should include, at a minimum:
  a. Two measures of PVRR risk: one that measures the variability of costs and one that measures the severity of bad outcomes.
  b. Discussion of the proposed use and impact on costs and risks of physical and financial hedging.
- The utility should explain in its plan how its resource choices appropriately balance cost and risk.

**Idaho Power response:**

The IRP methodology and the planning horizon of 20 years are discussed in *Chapter 1. Summary—Introduction*.

Modeling analysis of current and estimated future costs for all long-lived resources such as power plants, gas storage facilities, and pipelines, as well as all short-lived resources such as gas supply and short-term power purchases is discussed in *Chapter 9. Modeling Analysis and Results*.

The discussion of cost variability and extreme outcomes, including bad outcomes is discussed in *Chapter 9. Modeling Analysis and Risk*. Idaho Power's Risk Management Policy regarding physical and financial hedging is discussed in *Chapter 1a. Summary—Introduction*.

Idaho Power's plan is presented in *Chapter 1g. Summary—Action Plan* and in more detail in *Chapter 10. Preferred Portfolio and Action Plan.*

d. The plan must be consistent with the long-run public interest as expressed in Oregon and federal energy policies.

**Idaho Power response:**

Long-run public interest issues are discussed in *Chapter 2. Political, Regulatory, and Operational Issues*.

## Guideline 2: Procedural Requirements

a. The public, which includes other utilities, should be allowed significant involvement in the preparation of the IRP. Involvement includes opportunities to contribute information and ideas, as well as to receive information. Parties must have an opportunity to make relevant inquiries of the utility formulating the plan. Disputes about whether information requests are relevant or unreasonably burdensome, or whether a utility is being properly responsive, may be submitted to the Commission for resolution.

**Idaho Power response:**

The IRP Advisory Council meetings are open to the public. A roster of the IRP Advisory Council members along with meeting schedules and agendas is provided in the Technical Appendix, *IRP Advisory Council*.

b. While confidential information must be protected, the utility should make public, in its plan, any non-confidential information that is relevant to its resource evaluation and action plan. Confidential information may be protected through use of a protective order, through aggregation or shielding of data, or through any other mechanism approved by the Commission.

**Idaho Power response:**
Idaho Power makes public extensive information relevant to its resource evaluation and action plan in its plan. This information is discussed in IRP Advisory Council meetings and found throughout the 2017 IRP, the 2017 Load and Sales Forecast and in the 2017 Technical Appendix.

c. The utility must provide a draft IRP for public review and comment prior to filing a final plan with the Commission.

**Idaho Power response:**
Idaho Power provided copies to members of the IRPAC on Thursday, May 11, 2017. The company requested for comments to be provided no later than Friday, June 12, 2017.

## Guideline 3: Plan Filing, Review, and Updates

a. A utility must file an IRP within two years of its previous IRP acknowledgment order. If the utility does not intend to take any significant resource action for at least two years after its next IRP is due, the utility may request an extension of its filing date from the Commission.

**Idaho Power response:**
The OPUC acknowledged Idaho Power's 2015 IRP on April 28, 2016 in Order 16-160. The Idaho Power 2017 IRP will be filed by June 30, 2017.

b. The utility must present the results of its filed plan to the Commission at a public meeting prior to the deadline for written public comment.

**Idaho Power response:**
Idaho Power will schedule a public meeting at the OPUC following the June 30, 2017 filing of the 2017 IRP.

c. Commission staff and parties should complete their comments and recommendations within six months of IRP filing.

**Idaho Power response:**
No response needed.

d. The Commission will consider comments and recommendations on a utility's plan at a public meeting before issuing an order on acknowledgment. The Commission may provide the utility an opportunity to revise the plan before issuing an acknowledgment order.

**Idaho Power response:**
No response needed.

e. The Commission may provide direction to a utility regarding any additional analyses or actions that the utility should undertake in its next IRP.

**Idaho Power response:**
No response needed.

f. Each utility must submit an annual update on its most recently acknowledged plan. The update is due on or before the acknowledgment order anniversary date. Once a utility anticipates a significant deviation from its acknowledged IRP, it must file an update with the Commission, unless the utility is within six months of filing its next IRP. The utility must summarize the update at a Commission public meeting. The utility may request acknowledgment of changes in proposed actions identified in an update.

**Idaho Power response:**
In Order No. 16-160, the OPUC waived for Idaho Power the requirement to file an annual update to the 2015 IRP.

g. Unless the utility requests acknowledgement of changes in proposed actions, the annual update is an informational filing that:
   - Describes what actions the utility has taken to implement the plan;
   - Provides an assessment of what has changed since the acknowledgment order that affects the action plan, including changes in such factors as load, expiration of resource contracts, supply-side and demand-side resource acquisitions, resource costs, and transmission availability; and
   - Justifies any deviations from the acknowledged action plan.

**Idaho Power response:**
No response needed.

## Guideline 4: Plan Components

At a minimum, the plan must include the following elements:

a. An explanation of how the utility met each of the substantive and procedural requirements;

**Idaho Power response:**
Idaho Power provides information on how the company met each requirement in a table is presented in the Technical Appendix and will be provided to the OPUC staff in an informal letter.

b. Analysis of high and low load growth scenarios in addition to stochastic load risk analysis with an explanation of major assumptions;

**Idaho Power response:**
High-growth scenarios at the 90th and 95th percentile levels for peak hour, and at the 70th and 90th percentile levels for energy are provided in *Chapter 7. Planning Period Forecasts*. Stochastic load risk analysis is discussed in *Chapter 9. Modeling Analysis and Results—Stochastic Risk Analysis*. Major assumptions are discussed in *Chapter 7. Planning Period Forecasts* and *Chapter 9a. Modeling Analysis and Results—Planning Case Portfolio Analysis*.

c. For electric utilities, a determination of the levels of peaking capacity and energy capability expected for each year of the plan, given existing resources; identification of capacity and energy needed to bridge the gap between expected loads and resources; modeling of all existing transmission rights, as well as future transmission additions associated with the resource portfolios tested;

**Idaho Power response:**
Peaking capacity and energy capability for each year of the plan for existing resources is discussed in *Chapter 7. Planning Period Forecasts*. Detailed forecasts are provided in the Technical Appendix, *Sales and Load Forecast Data* and *Chapter 10. Existing Resource Data*, and *Chapter 5. Load and Resource Balance Data*. Identification of capacity and energy needed to bridge the gap between expected loads and resources is discussed in *Chapter 8. Portfolios*.

d. For natural gas utilities, a determination of the peaking, swing and base-load gas supply and associated transportation and storage expected for each year of the plan, given existing resources; and identification of gas supplies (peak, swing and base-load), transportation and storage needed to bridge the gap between expected loads and resources;

**Idaho Power response:**
Not applicable.

e. Identification and estimated costs of all supply-side and demand-side resource options, taking into account anticipated advances in technology;

**Idaho Power response:**
Supply-side resources are discussed in *Chapter 4. Future Supply-Side Generation and Storage Resources*. Demand-side resources are discussed in Chapter 5-Demand-Side Resources. Resource costs are discussed in *Chapter 7. Planning Period Forecasts – Resource Costs* and presented in the Technical Appendix, *Supply-Side Resource Data Levelized Cost of Energy*. Demand-side resources and their levelized costs and technologies are covered in *Chapter 5. Demand-Side Resources* and in the Technical Appendix, *Demand-Side Resource Data*.

f. Analysis of measures the utility intends to take to provide reliable service, including cost-risk tradeoffs;

**Idaho Power response:**
Resource reliability is covered in *Chapter 9. Modeling Analysis and Results*

g. Identification of key assumptions about the future (e.g., fuel prices and environmental compliance costs) and alternative scenarios considered;

**Idaho Power response:**

Key Assumptions including the natural gas price forecast are discussed in *Chapter 7. Planning Period Forecasts* and in the Technical Appendix, *Key Financial and Forecast Assumptions*. Environmental compliance costs are addressed in the Technical Appendix, *Portfolio Analysis, Results and supporting Documentation–Portfolio Emissions*. Compliance alternatives to SCR installation at Jim Bridger Units 1 and 2 are considered using portfolios with varying retirement dates of Jim Bridger Units 1 and 2 and are discussed in *Chapter 8 Portfolios*.

h. Construction of a representative set of resource portfolios to test various operating characteristics, resource types, fuels and sources, technologies, lead times, in-service dates, durations and general locations – system-wide or delivered to a specific portion of the system;

**Idaho Power response:**

Resource portfolios considered for the 2017 IRP are described in *Chapter 8. Portfolios*. Resource portfolios were developed using resources from the resource stack provided in *Chapter 7. Planning Period Forecasts—Resource Cost Analysis* and with guidance from the IRP Advisory Council and public participants.

i. Evaluation of the performance of the candidate portfolios over the range of identified risks and uncertainties;

**Idaho Power response:**

Evaluation of the portfolios over a range of risks and uncertainties is discussed in *Chapter 9. Modeling Analysis and Results*.

j. Results of testing and rank ordering of the portfolios by cost and risk metric, and interpretation of those results;

**Idaho Power response:**

Portfolio cost, risk results, interpretations and the selection of the preferred portfolio are provided in *Chapter 9. Modeling Analysis and Results*.

k. Analysis of the uncertainties associated with each portfolio evaluated;

**Idaho Power response:**

The quantitative and qualitative uncertainties associated with each portfolio are evaluated in *Chapter 9. Modeling Analysis and Results*.

l. Selection of a portfolio that represents the best combination of cost and risk for the utility and its customers

**Idaho Power response:**

The preferred resource portfolio is identified in *Chapter 10. Preferred Portfolio and Action Plan*.

m. Identification and explanation of any inconsistencies of the selected portfolio with any state and federal energy policies that may affect a utility's plan and any barriers to implementation; and

**Idaho Power response:**
Portfolio risk associated with the successful permitting to operate Jim Bridger Units 1 and 2 beyond their regional haze compliance dates without installation of SCR retrofits is discussed in *Chapter 9 Modeling Analysis and Results*.

n. An action plan with resource activities the utility intends to undertake over the next two to four years to acquire the identified resources, regardless of whether the activity was acknowledged in a previous IRP, with the key attributes of each resource specified as in portfolio testing.

**Idaho Power response:**
An action plan is provided in *Chapter 1. Summary—Action Plan* and in *Chapter 10 Preferred Portfolio and Action Plan.*

## Guideline 5: Transmission

Portfolio analysis should include costs to the utility for the fuel transportation and electric transmission required for each resource being considered. In addition, utilities should consider fuel transportation and electric transmission facilities as resource options, taking into account their value for making additional purchases and sales, accessing less costly resources in remote locations, acquiring alternative fuel supplies, and improving reliability.

**Idaho Power response:**
The fuel transportation and electric transmission required for each resource being considered is presented in the Technical Appendix, *Cost Inputs and Operating Assumptions*. Transmission assumptions for supply-side resources considered are included in *Chapter 6. Transmission Planning—Transmission assumptions in IRP portfolios*. Transportation for natural gas is discussed in *Chapter 7. Planning Period Forecasts—Natural Gas Price Forecast*.

## Guideline 6: Conservation

a. Each utility should ensure that a conservation potential study is conducted periodically for its entire service territory.

**Idaho Power response:**
Applied Energy Group (AEG) conducted a study for the 2017 IRP and is described in *Chapter 5 Demand-Side Resources*.

b. To the extent that a utility controls the level of funding for conservation programs in its service territory, the utility should include in its action plan all best cost/risk portfolio conservation resources for meeting projected resource needs, specifying annual savings targets.

**Idaho Power response:**
A forecast for energy efficiency effects in five-year blocks is provided in Cha*pter 5. Demand-Side Resources—Committed EE forecast*. Detailed monthly forecast values are a line item in the Technical Appendix, *Load and Resource Balance Data.*

c. To the extent that an outside party administers conservation programs in a utility's service territory at a level of funding that is beyond the utility's control, the utility should:
   - Determine the amount of conservation resources in the best cost/risk portfolio without regard to any limits on funding of conservation programs; and
   - Identify the preferred portfolio and action plan consistent with the outside party's projection of conservation acquisition.

**Idaho Power response:**

Treatment of third party market transformation savings was provided by the Northwest Energy Efficiency Alliance (NEEA) and is discussed in *Chapter 5. Demand-Side Resources*. NEEA savings are included as savings to meet targets because of the overlap of NEEA initiatives and IPC's most recent potential study.

## Guideline 7: Demand Response

Plans should evaluate demand response resources, including voluntary rate programs, on par with other options for meeting energy, capacity, and transmission needs (for electric utilities) or gas supply and transportation needs (for natural gas utilities).

**Idaho Power response:**

Demand response resources are evaluated in *Chapter 5. Demand-Side Resources*. Additional demand response above baseline levels is considered in select portfolios and discussed in *Chapter 5. Demand-Side Resources—Additional DR*.

## Guideline 8: Environmental Costs

Utilities should include, in their base-case analyses, the regulatory compliance costs they expect for carbon dioxide (CO2), nitrogen oxides, sulfur oxides, and mercury emissions. Utilities should analyze the range of potential CO2 regulatory costs in Order No. 93-695, from zero to $40 (1990$). In addition, utilities should perform sensitivity analysis on a range of reasonably possible cost adders for nitrogen oxides, sulfur oxides, and mercury, if applicable.

**Idaho Power response:**

Compliance with existing environmental regulation is discussed in *Chapter 9. Modeling Analysis and Results—Qualitative Risk Analysis*. Emissions for each portfolio is shown in the Technical Appendix, *Portfolio Analysis, Results, and Supporting Documentation*.

## Guideline 9: Direct Access Loads

An electric utility's load-resource balance should exclude customer loads that are effectively committed to service by an alternative electricity supplier.

**Idaho Power response:**

Idaho Power does not have any customers served by alternative electricity suppliers and Idaho Power has no direct access loads.

## Guideline 10: Multi-state Utilities

Multi-state utilities should plan their generation and transmission systems, or gas supply and delivery, on an integrated-system basis that achieves a best cost/risk portfolio for all their retail customers.

**Idaho Power response:**

Idaho Power's analysis was performed on an integrated-system basis discussed in *Chapter 9. Modeling Analysis and Results*. Idaho Power will file the 2017 IRP in both the Idaho and Oregon jurisdictions.

## Guideline 11: Reliability

Electric utilities should analyze reliability within the risk modeling of the actual portfolios being considered. Loss of load probability, expected planning reserve margin, and expected and worst-case unserved energy should be determined by year for top-performing portfolios. Natural gas utilities should analyze, on an integrated basis, gas supply, transportation, and storage, along with demand-side resources, to reliably meet peak, swing, and base-load system requirements. Electric and natural gas utility plans should demonstrate that the utility's chosen portfolio achieves its stated reliability, cost and risk objectives.

**Idaho Power response:**

The capacity planning margin is discussed in *Chapter 9. Modeling Analysis and Results—Capacity Planning Margin* followed by the discussion of flexible resource needs assessment at *Chapter 9g. Modeling Analysis and Results—Flexible Resource Needs Assessment* and the loss of load probabilities at *Chapter 9h. Modeling Analysis and Results—LOLE*.

## Guideline 12: Distributed Generation

Electric utilities should evaluate distributed generation technologies on par with other supply-side resources and should consider, and quantify where possible, the additional benefits of distributed generation.

**Idaho Power response:**

Idaho Power evaluated utility scale solar PV combined with reciprocating engines as resource options in four portfolios. In four other portfolios, reciprocating engines were paired with CCCT gas turbines. These portfolios are discussed in *Chapter 8. Portfolios.*

Other distributed generation technologies were evaluated in *Chapter 7. Planning Period Forecasts—Resource Cost Analysis*. Utility-scale solar and reciprocating engines were selected for further portfolio analysis based on their low-cost, scalability, and efficiency. As shown in our load and resource balance, resource need is beyond the immediate action plan. While utility scale solar and reciprocating engines are currently the low-cost choices, these future energy needs will continually be reevaluated.

## Guideline 13: Resource Acquisition

a. An electric utility should, in its IRP:
   - Identify its proposed acquisition strategy for each resource in its action plan.

- Assess the advantages and disadvantages of owning a resource instead of purchasing power from another party.
- Identify any Benchmark Resources it plans to consider in competitive bidding.

**Idaho Power response:**

Idaho Power continues to evaluate resource ownership along with other supply options. Idaho Power conducts its resource acquisition and competitive bidding processes consistent with the guidelines established by Oregon in Order No. 14-149 issued on April 30, 2014.

Idaho Power discusses asset ownership in *Chapter 10b. Preferred Portfolio and Action Plan—Action Plan (2017–2020).*

Idaho Power's action plan includes ongoing permitting, planning studies, and regulatory filings associated with the Boardman to Hemingway transmission line.

b. Natural gas utilities should either describe in the IRP their bidding practices for gas supply and transportation, or provide a description of those practices following IRP acknowledgment.

**Idaho Power response:**

Not applicable.

# COMPLIANCE WITH EV GUIDELINES

## Guideline 1: Forecast the Demand for Flexible Capacity

Forecast the Demand for Flexible Capacity: The electric utilities shall forecast the balancing reserves needed at different time intervals (e.g. ramping needed within 5 minutes) to respond to variation in load and intermittent renewable generation over the 20-year planning period;

**Idaho Power response:**

A discussion of the 2017 IRP's analysis for the flexibility guideline is provided in *Chapter 9. Modeling Analysis and Results—Flexible Resource Needs Assessment*.

## Guideline 2: Forecast the Supply for Flexible Capacity

Forecast the Supply of Flexible Capacity: The electric utilities shall forecast the balancing reserves available at different time intervals (e.g. ramping available within 5 minutes) from existing generating resources over the 20-year planning period;

**Idaho Power response:**

A discussion of the 2017 IRP's analysis for the flexibility guideline is provided in *Chapter 9. Modeling Analysis and Results—Flexible Resource Needs Assessment*.

## Guideline 3: Evaluate Flexible Resources on a Consistent and Comparable Basis

In planning to fill any gap between the demand and supply of flexible capacity, the electric utilities shall evaluate all resource options, including the use of EVs, on a consistent and comparable basis.

**Idaho Power response:**

The adoption rate of EVs is discussed in Appendix A Sales and Load Forecast, *Company System Load—Electric Vehicles*

# STATE OF OREGON ACTION ITEMS REGARDING IDAHO POWER'S 2015 IRP

## Action Item 1: B2H Transmission Line

Idaho Power will continue the ongoing permitting, planning studies and regulatory filings.

**Idaho Power response:**

Discussion specific to B2H is found in *Chapter 6. Transmission Planning—Boardman to Hemingway.* Portfolio design for the 2017 IRP provides a comparison of portfolios having B2H as a resource to portfolios not having B2H. A tabulation of resource portfolios with respect to B2H inclusion is provided in *Chapter 8. Portfolios*.

## Action Item 2: Gateway West Transmission Line

Idaho Power will continue the ongoing permitting, planning studies and regulatory filings.

**Idaho Power response:**

Discussion specific to Gateway West is found in Chapter 6e. Transmission Planning—Gateway West.

## Action Item 3: Energy Efficiency

Idaho Power will continue the pursuit of cost-effective energy efficiency—the forecast reduction for the 2015–2019 programs is 84 average megawatts (MW) for energy demand and 126 MW for peak demand.

**Idaho Power response:**

Discussion specific to energy efficiency is found in *Chapter 5. Demand-Side Resources*. All portfolios contain achievable energy efficiency. The monthly forecast is provided in the Technical Appendix, *Load and Resource Balance Data*.

## Action Item 4: Section 111(d)

Idaho Power will coordinate with government agencies on implementation planning for Section 111 (d).

**Idaho Power response:**

All portfolios meet current regulatory requirements. Portfolio Emissions are shown in the Technical Appendix, *Portfolio Emissions Graphs*.

## Action Item 5: Shoshone Falls License Amendment

Idaho Power will file to amend the FERC license regarding the 50-MW expansion.

**Idaho Power response:**
In April 2017, Idaho Power filed with FERC to amend the FERC's July 2010 License Order which authorized Idaho Power to upgrade the Shoshone Falls hydroelectric project changing the approved installed capacity from 50MW to 3.2MW.

## Action Item 6: Jim Bridger Unit 3

Idaho Power will complete the installation of selective catalytic reduction (SCR) emission-control technology.

**Idaho Power response:**
Installation of selective catalytic reduction emission-control technology was completed on Jim Bridger Unit 3 in November 2015.

## Action Item 7: Shoshone Falls Upgrades Study

Idaho Power will study options for smaller upgrades ranging in size up to approximately 4MW.

**Idaho Power response:**
In early 2016, Idaho Power explored a variety of smaller upgrade options. The most cost effective option was to replace units 1 and 2 with a single 3.2 MW unit.

## Action Item 8: Jim Bridger Unit 4

Idaho Power will complete installation of SCR emission-control technology.

**Idaho Power response:**
Installation of selective catalytic reduction emission-control technology was completed on Jim Bridger Unit 3 in November 2016.

## Action Item 9: North Valmy Units 1 and 2

Idaho Power will continue to work with NV Energy to synchronize depreciation dates and determine if a date can be established to cease coal-fired operations.

**Idaho Power response:**
In October and November 2016, Idaho Power filed applications with the IPUC an OPUC, respectively, requesting authorization to accelerate depreciation for the North Valmy coal-fired power plant. The approved settlement stipulations in both Idaho and Oregon agreed to an early shutdown of year-end 2019 for Unit 1 and year-end 2025 for Unit 2.

## Action Item 10: Shoshone Falls 2017 Upgrade

Idaho Power will commence construction of a smaller upgrade.

**Idaho Power response:**
The upgrade of Shoshone Falls is currently scheduled from May 2018 through June 2019

## Action Item 11: Jim Bridger Units 1 and 2

Idaho Power will evaluate the installation of SCR technology for units 1 and 2 at Jim Bridger in the 2017 IRP.

**Idaho Power response:**
The 2017 IRP focuses on evaluating the installation of SCR technology for units 1 and 2 at Jim Bridger. The discussion of portfolios is in Chapter 8 Portfolios and the results are in *Chapter 9. Modeling Analysis and Results*. The preferred portfolio and action plan, discussed in Chapter 10 does not include the installation of SCR equipment; rather it contemplates early shut down for the units in lieu of installing the SCRs.

## Action Item 12: Shoshone Falls 2019 On-Line Date

Idaho Power will place the smaller upgrade on-line.

**Idaho Power response:**
The upgrade of Shoshone Falls is currently scheduled from May 2018 through June 2019.

## Other Issues

Selection of Preferred Portfolio—Staff agrees with Idaho Power's position that the Commission should acknowledge Idaho Power's 2015 IRP Action Plan.

**Idaho Power response:**
No action needed.

Qualitative Risk Analysis: Staff recommends Idaho Power include a more systematic evaluation of the qualitative benefits of the resource portfolios in the 2017 IRP.

**Idaho Power response:**
Qualitative Risk Analysis is evaluated in *Chapter 10d. Modeling Analysis and Results—Qualitative Risk Analysis*.

2015 IRP Update Waiver: Staff agrees and recommends the Commission waive Idaho Power's obligation to file a 2015 IRP Update.

**Idaho Power response:**
No action needed.

# 2017 IRP

## APPENDIX D: B2H SUPPLEMENT

# ACKNOWLEDGEMENT

Resource planning is an ongoing process at Idaho Power. Idaho Power prepares, files, and publishes an Integrated Resource Plan (IRP) every two years. Idaho Power expects that the experience gained over the next few years will likely modify the 20-year resource plan presented in this document.

Idaho Power invited outside participation to help develop the 2017 IRP. Idaho Power values the knowledgeable input, comments, and discussion provided by the Integrated Resource Plan Advisory Council and other concerned citizens and customers.

It takes approximately one year for a dedicated team of individuals at Idaho Power to prepare the IRP. The Idaho Power team is comprised of individuals that represent many departments within the company. The IRP team members are responsible for preparing forecasts, working with the advisory council and the public, and performing all the analyses necessary to prepare the resource plan.

Idaho Power looks forward to continuing the resource planning process with customers, public-interest groups, regulatory agencies, and other interested parties. You can learn more about the Idaho Power resource planning process at idahopower.com.

# EXECUTIVE SUMMARY

The Boardman to Hemingway Transmission Line Project (B2H) is a planned 500-kilovolt (kV) transmission project that would span between the Hemingway 500-kV substation near Marsing, Idaho, and the proposed Longhorn Substation near Boardman, Oregon. Once operational, B2H will provide Idaho Power increased access to reliable, low-cost market energy purchases from the Pacific Northwest. Idaho Power's planned capacity interest in B2H will increase the availability of capacity and energy of the Pacific Northwest market by 500 megawatts (MW) during the summer months, when energy demand from Idaho Power's customers is at its highest. B2H (including early versions of the project) has been a cost-effective resource identified in each of Idaho Power's integrated resource plans (IRP) since 2006 and continues to be a cornerstone of Idaho Power's 2017 IRP preferred resource portfolio. In the 2017 IRP, as has been the case in prior IRPs, the B2H project is not simply evaluated as a transmission line, but rather as a *resource* that will be used to serve Idaho Power load. That is, the B2H project, and the market purchases it will facilitate, is evaluated in the same manner as a new combined-cycle gas plant, or a new utility-scale solar complex.

As a resource, the B2H project is demonstrated to be the most cost-effective method of serving projected customer demand. In the 2017 IRP, B2H was identified as the least-cost and least-risk resource to serve peak-hour load deficits forecast to occur beginning in 2026. As can be seen in Table 9.3, page 111 of the 2017 IRP, the four lowest-cost resource portfolios (P1, P4, P7, and P10) each included B2H. The information presented in Table 9.3 also indicates that the next lowest-cost portfolio that does not include B2H had a present-value portfolio cost of approximately $147 million dollars greater than Idaho Power's preferred resource portfolio, P7. When compared to other individual resource options, B2H is also the least-cost option in terms of both capacity cost and energy cost. B2H is expected to have a capacity cost that is 71 percent lower than either a combined-cycle gas plant or utility-scale solar alternatives.[1] B2H is also expected to have a levelized cost of energy that is 22 percent lower than a combined-cycle gas plant and 38 percent lower than utility-scale solar.[2] As a resource alone, B2H is the lowest-cost alternative to serve Idaho Power's customers in Oregon and Idaho. As a transmission line, B2H also offers incremental ancillary benefits and additional operational and resource integration flexibility.

In addition to being the least-cost, lowest-risk resource to meet Idaho Power' resource needs, the B2H project has received national recognition for the benefits it will provide. The B2H

[1] 2017 IRP, page 87, Figure 7.5.

[2] 2017 IRP, page 89, Figure 7.6.

Footnotes continued on the next page.

project was selected by the Obama administration as one of seven nationally significant transmission projects that, when built, will help increase electric reliability, integrate new renewable energy into the grid, create jobs, and save consumers money. Most recently, B2H was acknowledged as complementing the Trump Administration's America First Energy Plan, which addresses all forms of domestic energy production. In a November 17, 2017, United States (US) Department of the Interior press release,[3] B2H was held up as "a Trump Administration priority focusing on infrastructure needs that support America's energy independence…" The release went on to say, "This project will help stabilize the power grid in the Northwest, while creating jobs and carrying low-cost energy to the families and businesses who need it…" The benefits B2H is expected to bring to the region and nation have been recognized across both major political parties.

Under a 2012 B2H Permit Funding agreement, Idaho Power is allocated a 21.2-percent project interest, with PacifiCorp and Bonneville Power Administration (BPA) subscribed for the remainder of the line's capacity. The agreement will allow Idaho Power customers to benefit from the project's economies of scale and from load diversity between the project co-participants. While Idaho Power's 21.2-percent share would provide for an annual average of 350 MW of west-to-east import capacity, the agreement is structured to provide Idaho Power with 500 MW of import capacity during the summer months, when Idaho Power experiences peak demand, and 200 MW of import capacity in the winter months, when the load-serving need is less.

The total cost estimate for the B2H project is $1 to $1.2 billion dollars, which includes Idaho Power's allowance for funds used during construction (AFUDC). Co-participant AFUDC is not included in this estimate range. The total cost estimate includes a 20 percent contingency for unforeseen expenses. In the 2017 IRP, Idaho Power assumes a 21.2-percent share of the direct expenses, plus its entire AFUDC cost, which equates to approximately $258 million in B2H project expenses. Idaho Power also included costs for local interconnection upgrades totaling $16 million. The 2017 IRP was the first year for which the B2H route was relatively certain, resulting in a more accurate cost estimate compared to prior IRPs.

Idaho Power is the project manager for the permitting phase of the B2H project. The B2H project achieved a major milestone nearly 10 years in the making with the release of the Bureau of Land Management (BLM) Record of Decision (ROD) on November 17, 2017. The BLM ROD formalized the conclusion of the siting process at the federal level, as required by the *National Environmental Policy Act of 1969* (NEPA). The BLM ROD provides the ability to site the B2H project on BLM-administered land.

[3] blm.gov/press-release/doi-announces-approval-transmission-line-project-oregon-and-idaho

For the State of Oregon permitting process, Idaho Power submitted the amended application for Site Certificate to the Oregon Department of Energy in summer 2017. Oregon's Energy Facility Siting Council (EFSC) is tasked with establishing siting standards for energy facilities in Oregon and ensuring certain transmission line projects, including B2H, meet those standards.[4] Before Idaho Power can begin construction on B2H, it must obtain a Site Certificate from EFSC. The Oregon EFSC process is a standards-based process based on a fixed site boundary. For a linear facility, like a transmission line, the process requires the transmission line boundary be established (a route selected) and fully evaluated to determine if the project meets established standards. Idaho Power must demonstrate a need for the project before EFSC will issue a Site Certificate authorizing the construction of a transmission line (non-generating facility). Idaho Power's demonstration of need is based on the least-cost plan rule, for which the requirements can be met through a commission acknowledgement of the resource in the company's IRP.[5] In this case, Idaho Power seeks to satisfy EFSC's least-cost plan rule requirement through an acknowledgement of its 2017 IRP.

As of the date of this report, Idaho Power expects the Oregon Department of Energy (ODOE) to issue a Draft Proposed Order in 2018 and a Final Order and Site Certificate in 2020. To achieve an in-service date in the mid-2020s, preliminary construction activities must commence in parallel to EFSC permitting activities. Preliminary construction activities include, but are not limited to, geotechnical explorations, detailed ground surveys, sectional surveys, right-of-way (ROW) acquisition activities, and detailed design and construction bid package development. After the Oregon permitting process and preliminary construction activities conclude, construction activities can commence.

This B2H 2017 IRP Appendix D provides context and details that support evaluating this transmission line project as a supply-side resource, explores (qualitatively and quantitatively) many of the ancillary benefits offered by the transmission line, and considers the risks and benefits of owning a transmission line connected to a market hub in contrast to direct ownership of a traditional generation resource.

[4] See generally Oregon Revised Statute (ORS) 469.300-469.563, 469.590-469.619, and 469.930-469.992.

# RESOURCE NEED EVALUATION

## Capacity Needs

The entire Integrated Resource Plan (IRP) process is predicated on defining a need for resources in the future to serve projected customer demand.

The IRP analysis begins by developing a monthly load forecast, which incorporates the future electricity needs of our customers. The load forecast consists of both average monthly (energy) and monthly peak-hour (capacity) conditions. The existing Idaho Power resources (generating, demand side management [DSM], and transmission) are evaluated against the load forecast. The load less the available resources determines the load and resource balance. Times where the load exceeds the resources defines the need for resources to reliably serve our customers.

All resources on Idaho Power's system are considered in the load and resource balance, including hydro, gas, coal, existing cogeneration and small-power producer (CSPP) contracts, existing power purchase agreements (PPA) (including the *Public Utility Regulatory Policies Act of 1978* [PURPA]), and available import transmission capacity. All supply-side resources, all DSM and EE programs, and transmission import capacity are summed and subtracted from the appropriate load forecast—either peak hour or average monthly. If the result of load is greater than resources is, Idaho Power's system is resource insufficient and the need for a resource is established.

As detailed in Idaho Power's 2017 IRP, Idaho Power has a peak-demand capacity deficit in the year 2026. The Jim Bridger unit retirement evaluations in the 2017 IRP can accelerate the capacity deficit date depending on the retirement date assumptions.

Refer to Chapter 7 of Idaho Power's 2017 IRP for more information on the planning period forecasts and establishment of need.

## IRP Guideline Language—Transmission Evaluated on Comparable Basis

In Order No. 07-002, the Public Utility Commission of Oregon (OPUC) adopted guidelines regarding integrated resource planning.[6]

> Guideline 5: Transmission. Portfolio analysis should include costs to the utility for the fuel transportation and electric transmission required for each resource being considered. In addition, utilities should consider fuel transportation *and electric transmission facilities as resource options*, taking into account their value

[6] apps.puc.state.or.us/orders/2007ords/07-002.pdf

for making additional purchases and sales, accessing less costly resources in remote locations, acquiring alternative fuel supplies, and improving reliability.

## Boardman to Hemingway as a Resource

The Boardman to Hemingway Transmission Line Project (B2H) is one of the most cost-effective IRP resources Idaho Power has considered and proven through successive IRPs. When evaluating and comparing alternative resources, two major cost considerations exist: 1) the capacity cost of the project (fixed costs) and 2) the energy cost of the project (variable costs). The 2017 IRP details the results of each component of the various portfolios in Table 9.3 of the IRP. Capital costs are derived through cost estimates to install the various projects. Energy costs are calculated through a detailed modeling analysis, using the AURORA software. Energy prices are derived based on inputs into the model, such as gas price, coal price, nuclear price, hydro conditions, etc.

Illustrating the difference between capacity and energy, a diesel generator may have a very low cost to install; however, the cost of diesel fuel and the maintenance required would be significant. Alternatively, a utility-scale solar plant will have almost no energy cost; the fuel to run the plant—the sun—is free. However, in the case of a solar plant, the capacity cost to install the plant is quite expensive. The installed capacity needed to ensure the solar is available during the Idaho Power peak is even larger.

### *Capacity Costs*

Exploring the capacity costs of different resources, page 73 of the 2017 IRP *Appendix C—Technical Appendix* details the total capital cost per kilowatt (kW) for many various resources. This capital-cost data feeds into Table 9.3 of the main IRP report. Data from the technical appendix is copied into Table 1 below for illustrative purposes. Note that solar costs have been updated from those reported in the IRP with capital costs from the November 2017 Lazard energy cost report.[7] The capital costs for B2H in the table below reflect the inclusion of local interconnection costs for B2H, and consequently also differ from the per-kW cost reported in the IRP technical appendix. The local interconnection costs for B2H were included in portfolio cost modeling performed for the IRP.

**Table 1. Total capital $/kW for select resources considered in the 2017 IRP**

| Resource Type | Total Capital $/kW | Total Capital $/kw—peak | Depreciable Life |
|---|---|---|---|
| B2H | $783* | $548** | 55 years |
| Combined-cycle combustion turbine (CCCT) (1x1) F Class (300 megawatts [MW]) | $1,344 | $1,344 | 30 years |

[7] Lazard's Levelized Cost of Energy Analysis—Version 11.0, November 2017.

| | | | |
|---|---|---|---|
| Simple-cycle combustion turbine —Frame F Class (170 MW) | $995 | $995 | 30 years |
| Reciprocating Gas Engine | $887 | $887 | 30 years |
| Solar Photovoltaic (PV)— Utility-Scale 1-Axis | $1,382 | $2,692 | 25 years |

* Utilizes the B2H 350-MW average capacity

** Utilizes the B2H 500-MW average capacity

The B2H total capital cost per kilowatt at peak is 62 percent of the cost of the next lowest-cost resource. Additionally, B2H, as a transmission line, will depreciate over 55 years compared to 30 years for a gas plant or 25 years for a solar plant. The low up-front cost and slower depreciation further reduces the cost impact to Idaho Power's customers. Finally, the B2H cost estimate includes a 20 percent contingency, whereas none of the other resources evaluated in the 2017 IRP include a cost contingency. The summation of these factors suggest B2H is the lowest capital-cost resource by a substantial margin.

## *Energy Cost*

B2H provides Idaho Power with more capacity to the Pacific Northwest to purchase power from the Mid-Columbia (Mid-C) trading hub. Market power in the summer months is generally a function of the price of natural gas. Idaho Power, in a B2H future, would therefore pay a slight premium for market power compared to a future in which Idaho Power owned its own combined-cycle gas plant. This slight premium is reflected in the 2017 IRP by comparing the energy costs of B2H and the non-B2H gas portfolios: P1 and P3, P4 and P6, P7 and P9, and P10 and P12. In each of these cases, the B2H portfolio has a higher energy cost than the non-B2H portfolio. Higher energy costs for B2H portfolios are due to the following:

- Idaho Power will pay a slight premium to Pacific Northwest entities for purchased power (selling entities must recover some of their fixed costs).

- P3, P6, P9, and P12 include Idaho Power constructing power plants rather than B2H. In these portfolios, Idaho Power would have the opportunity to sell excess energy to the market and generate revenue to offset costs.

- Idaho Power must purchase transmission service (transmission wheeling) from a Pacific Northwest entity (likely Bonneville Power Administration [BPA]) to transmit the purchased power to the edge of Idaho Power's system at Longhorn Substation (once B2H is built). If Idaho Power and BPA can complete an asset swap, these transmission wheeling costs may be avoided, which would reduce the energy cost component of B2H portfolios. Refer to Appendix D-4 for the Memorandum of Understanding (MOU) relating to the potential Idaho Power–BPA asset swap.

The B2H portfolios' capacity costs are so low that capacity installation savings far outweigh the additional energy costs, leading B2H portfolios to be the lowest-cost option for Idaho Power's customers.

# Market Overview

## *Power Markets*

A power market hub is an aggregation of transaction points (often referred to as bus points or buses). Hubs create a common point to buy and sell energy, creating one transaction point for bilateral transactions. Hubs also create price signals for geographical regions.

Six characteristics of successful electric trading markets include the following:

1. The geographic location is a natural supply/demand balancing point for a particular region with adequate available transmission.
2. Reliable contractual standards exist for the delivery and receipt of the energy.
3. There is transparent pricing at the market with no single player nor group of players with the ability to manipulate the market price.
4. Homogeneous pricing exists across the market.
5. Convenient tools are in place to execute trades and aggregate transactions.
6. Most importantly, there is a critical mass of buyers and sellers that respond to the five characteristics listed above and actively trade the market on a consistent basis. This is the definition of liquidity, which is clearly the most critical requirement of a successful trading hub.

## *Mid-C Market*

The Mid-C electric energy market hub is a hub where power is transacted both physically and financially (derivative). Power is traded both physically and financially in different blocks: long term, monthly, balance-of-month, day ahead, and hourly. Much of the activity for balance-of-month and beyond is traded and cleared through a clearing exchange, the Intercontinental Exchange (ICE). For short-term transactions, such as day-ahead and real time (hourly), trades are made primarily between buyers and sellers negotiating price, quantity, and point of delivery over the phone (bilateral transactions). In the Pacific Northwest, most of the price negotiations begin with prices displayed for Mid-C on the ICE trading platform.

The Mid-C market exhibits all six characteristics of a successful electric trading market discussed above. Figure 1 shows the relative volume of energy in the Northwest.

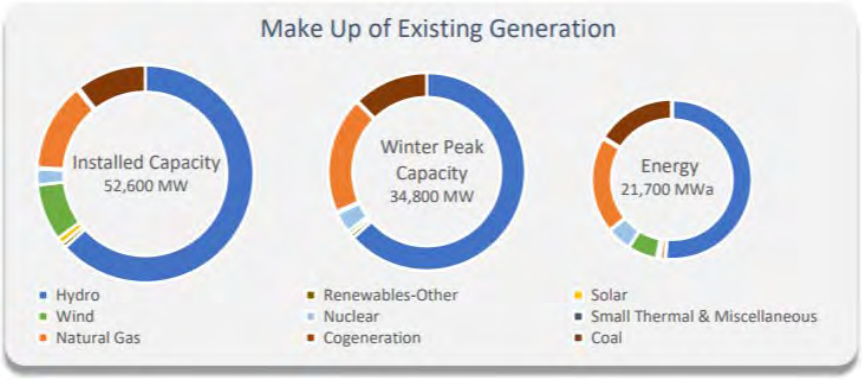

**Figure 1. Northwest regional forecast (Source: 2017 PNUCC)[8]**

In the western US, the other major market hubs are California–Oregon Border (COB), Four Corners (Arizona–New Mexico border), Mead (Nevada), Mona (Utah), Palo Verde (Arizona), and SP15 (California). The Mid-C market is very liquid. In 2017, on a day-ahead trading basis, daily average trading volume during heavy-load hours during June and July ranged from nearly 40,000 megawatt-hours (MWh) to over 51,000 MWh. When combining heavy-load hours with light-load hours, on a day-ahead trading basis, the monthly volumes for June and July were each approximately 2,000,000 MWhs. These volumes are in addition to month-ahead trading volumes. Mid-C is by far the highest volume market hub in the west; frequently, Mid-C volumes are greater than the other hubs combined.

The following market participants transact regularly at Mid-C. Additionally, numerous other independent power producers trade at Mid-C.

- Avista Utility
- BPA
- Chelan County Public Utility District (PUD)
- Douglas County PUD
- Eugene Electric Board
- Idaho Power
- PacifiCorp
- Portland General Electric

[8] pnucc.org/system-planning/northwest-regional-forecast

- Powerex
- Puget Sound Energy
- Seattle City Light
- Tacoma City Light

Energy traded at Mid-C is not necessarily physically generated in the Mid-Columbia River geographic area. For instance, Powerex is a merchant of BC Hydro in British Columbia and frequently buys and sells energy at Mid-C. A trade at Mid-C requires that transmission is available to deliver the energy to Mid-C. Transmission wheeling charges must be accounted for when transacting at Mid-C. Sellers at Mid-C must pay necessary transmission charges to deliver power to Mid-C, and buyers must pay necessary transmission charges to deliver power to load.

## *Mid-C and Idaho Power*

Historically, Idaho Power wholesale energy transactions have correlated well with the Mid-C hub due to Idaho Power's proximity to the market hub and because it is the most liquid hub in the region. Energy at Mid-C can be delivered to, or received from, Idaho Power through a single transmission wheel through the BPA or Avista. Additionally, long-term monthly price quotes are readily available for Mid-C, making it an ideal basis for long-term planning.

Idaho Power uses the market to balance surplus and deficit positions between generation resources and customer demand, and to take advantage of price differences across the region. For example, when market purchases are more cost-effective than generating energy within Idaho Power's generation fleet, Idaho Power customers benefit from lower net power supply cost through purchases instead of Idaho Power fuel expense. Idaho Power customers also benefit from the sale of surplus energy. Surplus energy sales are made when Idaho Power's resources are greater than Idaho Power customer demand and when the incremental cost of these resources are below market prices. Idaho Power customers benefit from these surplus energy sales as offsets to net power supply costs through the power cost adjustment (PCA).

In 2017, Idaho Power averaged approximately 55,000 MWh of Mid-C purchases in June and July. As stated previously, the average monthly volumes at Mid-C, on a day-ahead basis, were approximately 2,000,000 MWh. Based on these averages, Idaho Power's purchases represented less than 3 percent of the total market volumes in June and July. At 3 percent of total market volume on average in June and July, Idaho Power represents a very small fraction of the Mid-C volume during the months when Idaho Power relies on Mid-C the most.

The Mid-C market could be used more to economically serve Idaho Power customers, but Idaho Power's ability to transact at Mid-C is limited due to transmission capacity constraints between the Pacific Northwest and Idaho. In other words, sufficient transmission capacity is currently

unavailable during certain times of the year for Idaho Power to procure cost-effective resources from Mid-C for its customers, even though generation supply is available at the market.

### *Modeling of the Mid-C Market in the IRP*

As part of the IRP analysis, Idaho Power uses the AURORA to derive energy prices at the Mid-C market. Energy prices are derived based on inputs into the model, such as gas price, coal price, nuclear price, hydro conditions, etc. Refer to Chapter 9 of the 2017 IRP for more information on AURORA and modeling.

Energy purchases from the market require transmission to wheel the energy from the source to the utility purchasing the energy. Purchases from the Mid-C market would need to be wheeled across the BPA system to get the energy to the proposed Longhorn Substation near Boardman, Oregon.

Transmission wheeling rates and wheeling losses are included in the AURORA database and are part of the dispatch logic within the AURORA modeling. AURORA economically dispatches generating units, which can be located across any system in the West. All market energy purchases modeled in Aurora include these additional transmission costs and are included in all portfolios and sensitivities.

## B2H Comparison to Other Resources

The 2017 IRP provides an in-depth analysis of the B2H project compared to alternative resource options. Table 2 summarizes some of the high-level differences between B2H and other notable resource options.

**Table 2. High-level differences between resource options**

| | B2H | Reciprocating Engines | CCCT | Lithium batteries | 1-axis solar PV |
|---|---|---|---|---|---|
| Intermittent renewable | | | | | ✓ |
| Dispatchable capacity providing | ✓ | ✓ | ✓ | ✓ | |
| Non-dispatchable (coincidental) capacity providing | | | | | ✓ |
| Balancing, flexibility providing | ✓ | ✓ | ✓ | ✓ | |
| Energy providing | ✓ | ✓ | ✓ | ✓ | ✓ |
| Variable costs (primary variable cost driver) | Mid-C market | Natural gas | Natural gas | Mid-C market | No variable costs |
| Capital costs | $450/on-peak kW | $775/kW | $1,250/kW | $1,750/kW | $2,500/on-peak kW |
| Fuel price risk | | ✓ | ✓ | | |
| Wholesale power market price risk | ✓ | | | ✓ | |
| Other | Expanded access to market (Mid-C) providing abundant clean, renewable energy, highly reliable (low forced outage), as long-lived resources promote stability in customer rates, benefit to regional grid | Scalable (modeled generators 18.8-MW nameplate), relatively short-lead resource | Relatively short-lead resource with recent construction experience | Nascent, uncertainty related to performance (e.g., # of lifetime cycles), potential grid benefit depending on resource siting, scalable and potential for geographic dispersion | Renewable, clean, scalable (modeled plants 30-MW nameplate) |

Notes:

1. Idaho Power's 2016 solar integration study suggests modest impacts from solar intermittency. Study based on synthetic solar data. Actual production from currently on-line solar projects will be reviewed in 2018 to verify study findings.
2. Solar is not dispatchable but tends to produce at fairly high levels during periods of high customer demand (on-peak capacity factor or contribution to peak equal to 51.3 percent of installed capacity).
3. Lithium battery is a net energy consumer (roundtrip efficiency = 86 percent). Lithium battery provides energy during heavy load hours or other high energy demand/high energy value periods; battery recharge costs tied primarily to Mid-C market costs or variable costs of Idaho Power's system resources during light load hours.
4. B2H capital-cost estimate includes a 20-percent contingency. Lithium battery capital costs are on a declining trend; 2017 Lazard reporting projects 10 percent per year annual rate of capital cost decline. Solar capital cost decline slowing. B2H and solar capital costs are expressed in terms of $/on-peak kW, where on-peak kW for B2H are based on 500-MW summer capacity and for solar is based on on-peak capacity equal to 51 percent of installed capacity.

## Idaho Power's Transmission System

Idaho Power's transmission system is a key element to providing reliable, responsible, fair-priced energy services. A map of Idaho Power's transmission system is shown in Figure 6.1 on page 58 of the 2017 IRP and in Figure 2. Transmission lines facilitate the delivery of economic resources and allow resources to be sited where most cost effective. In most instances,

the most economic/best location for resources is not immediately next to major load centers (i.e., hydro along the Columbia River, wind in Wyoming, solar in the desert southwest). For much of its history, Idaho Power has taken advantage of resources outside of its major load pockets to economically serve its customers. The existing transmission lines between Idaho Power and the Pacific Northwest have been particularly valuable. Idaho Power has maximized its use of the transmission path between Idaho and the Pacific Northwest. Additional transmission capacity is required to access incremental resources to meet projected peak demand. The B2H project is the mechanism to increase capacity between the Pacific Northwest and Idaho Power's service area.

Transmission lines are constructed and operated at different operating voltages depending on purpose, location, and distance. Idaho Power operates transmission lines at 138 kV, 161 kV, 230 kV, 345 kV, and 500 kV. Idaho Power also operates sub-transmission lines at 46 kV and 69 kV, but these voltages will not be discussed further in this appendix; the focus of this appendix is on higher voltage transmission lines used for moving bulk electricity. The higher the voltage, the greater the capacity of the line, but also the greater the construction cost and physical size requirements.

The utility industry often compares transmission lines to roads and highways. Typically, lower-voltage transmission lines (138 kV) are used to facilitate delivery of energy to substations to serve load, like a two-lane highway. Much like roads and highways can become congested, so can transmission lines. High-voltage lines are used to facilitate the bulk delivery of power, sometimes referred to as backbone transmission. Depending on the capacity needs, economics, distance (higher voltages result in less losses for longer distances), and intermediate substation requirements, either 230-kV, 345-kV, or 500-kV transmission lines are used. A 230- or 345-kV line can be compared to a multi-lane interstate, whereas a 500-kV line can be compared to a major (6+ lane) freeway used to move as many vehicles as possible.

## Transmission Capacity Between Idaho Power and the Pacific Northwest

Idaho Power owns 1,280 MW of transmission capacity between the Pacific Northwest transmission system and Idaho Power's transmission system. Of this capacity, 1,200 MW are on the Idaho to Northwest path (Western Electricity Coordinating Council [WECC] Path 14), and 80 MW are on the Montana–Idaho path (WECC Path 18). A transmission path is one or more transmission lines that collectively transmit power to/from similar geographic areas. The Idaho to Northwest transmission path is comprised of three 230-kV lines, one 500-kV transmission line, and one 115-kV transmission line. The capacity limit on the path is established through a WECC rating process based on equipment overload ratings resulting from the loss of the most critical element on the transmission system. Collectively, these lines between Idaho and the Northwest have a transfer capacity rating that is greater than the individual rating of each line

but less than the sum of the individual capacity ratings of each line based on reliability limits. Figure 2 shows an overview of Idaho Power's transmission system.

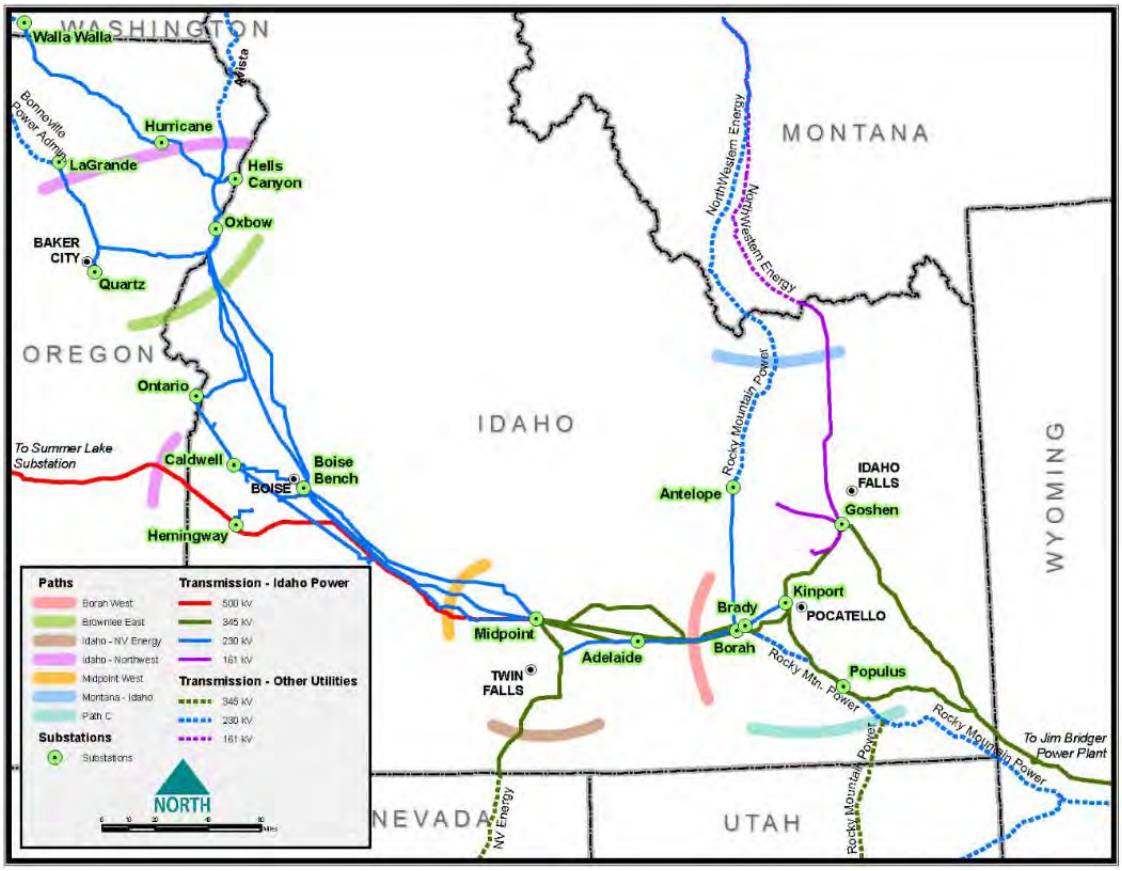

**Figure 2. Idaho Power transmission system map**

Table 3 details the capacity allocation between the Pacific Northwest and Idaho Power in 2017. The shaded rows represent capacity amounts that can be used to serve Idaho Power's native load. Although Idaho Power owns 1280 MW of transmission capacity between the Pacific Northwest and Idaho Power's system, after all other uses are accounted for, Idaho Power was only able to use 307 MW to serve Idaho Power's native load in 2017. Idaho Power used 361 MW to serve BPA or PacifiCorp network load on Idaho Power's system, 282 MW were allocated to transmission reserve margin (TRM), and 330 MW were allocated to capacity benefit margin (CBM).

**Table 3. Pacific Northwest to Idaho Power import transmission capacity from the 2016 transmission forecast**

| Firm Transmission Usage (Pacific Northwest to Idaho Power) | Capacity (July MW) |
|---|---|
| BPA Load Service (Network Customer) | 360 |
| Boardman Generation | 60 |
| Fighting Creek (PURPA) | 4 |

| | |
|---|---|
| Pallette Load (PacifiCorp—Network Customer) | 1 |
| TRM | 282 |
| CBM | 330 |
| **Subtotal** | **1,037** |
| Pacific Northwest Purchase (Idaho Power Load Service) | 243 |
| **Total** | **1,280** |

TRM is transmission capacity that Idaho Power sets aside as unavailable for firm use, for the purposes of grid reliability. Idaho Power's TRM methodology, approved by the Federal Energy Regulatory Commission (FERC) in 2002, requires Idaho Power to set aside transmission capacity based on the average loopflow on the Idaho to Northwest path. In the west, electrical power is scheduled through a contract-path methodology, which means if 100 MW is purchased and scheduled over a path, that 100 MW is decremented from the path's total availability. Physics dictate the actual power flow over the path (based on the path of least resistance), so actual flows don't always follow contract-path schedules. This unscheduled flow is sometimes referred to as loopflow. The average adverse loopflow across the Idaho to Northwest path during the month of July is 282 MW, which is equal to Idaho Power's TRM in July. Idaho Power reserves TRM to ensure a safe and reliable transmission system.

CBM is transmission capacity Idaho Power sets aside as unavailable for firm use, for the purposes of recovering from severe unexpected generation outages. Reserve generation capacity is critical to being able to recover from unexpected outages. CBM allows a utility to reduce the amount of reserve generation capacity on its system by providing transmission availability to another market, such as the Pacific Northwest, which is rich with surplus capacity necessary for emergency conditions. Idaho Power's 330 MW of CBM is based on Idaho Power's share of the unplanned loss of two Jim Bridger units. The loss of two Jim Bridger units results in the removal of over 1,000 MW of generation in Wyoming, leaving Idaho Power and PacifiCorp searching to replace approximately 330 MW and 670 MW, respectively. Recovering from such an event, especially during peak summer load, can be extremely difficult without access to Pacific Northwest generation capacity, hence the reserve margin.

## *Montana–Idaho Path Utilization*

To utilize Idaho Power's share of the Montana–Idaho 80 MW of capacity, Idaho Power must purchase transmission service from either Avista or BPA. This transmission system connects the purchased resource in the Pacific Northwest to Idaho Power's transmission system. Avista or BPA transmits, or wheels, the power across their transmission system and delivers the power to Idaho Power's transmission system. The Montana–Idaho path is identified in Figure 2 above.

### *Idaho to Northwest Path Utilization*

To utilize Idaho Power's share of the Idaho to Northwest capacity, Idaho Power must purchase transmission service from Avista, BPA, or PacifiCorp. Table 4 details a typical summer allocation of the Idaho to Northwest capacity:

**Table 4. The Idaho to Northwest Path (WECC Path 14) summer allocation**

| Transmission Provider | Idaho to Northwest Allocation (Summer West to East) (MW) |
|---|---|
| Avista (to Idaho Power) | 340 |
| BPA (to Idaho Power) | 350 |
| PacifiCorp (to Idaho Power) | 510 |
| **Total Capability to Idaho Power** | **1,200*** |

* During times of very low generation at Brownlee, Oxbow, and Hells Canyon hydro plants, the Idaho to Northwest path total capability can increase to as much as 1,340 MW; low generation at these power plants does not correspond with Idaho Power's system peak.

Avista, BPA and PacifiCorp share an allocation of capacity on the western side of the Idaho to Northwest path, and Idaho Power owns 100 percent of the capacity on the eastern side of the Idaho to Northwest path. For Idaho Power to transact across the path and serve customer load, Idaho Power's Load Servicing Operations must purchase transmission service from Avista, BPA, or PacifiCorp to connect the selling entity, via a contract transmission path, to Idaho Power.

Construction of B2H will add 1,050 MW of capacity to the Idaho to Northwest path in the west-to-east direction, of which Idaho Power will own 500 MW in the summer months (April–September), and 200 MW in the winter months (January–March and October–December). A total breakdown of capacity rights of the B2H permitting co-participants can be found in the Project Co-Participants section of this report. The Idaho to Northwest path is identified in Figure 2 above.

## Regional Planning—Studies and Conclusions

The Northern Tier Transmission Group (NTTG) and Columbia Grid are regional planning organizations that are organized and operate in compliance with FERC orders 890 and 1000. The purpose of these organizations is to consolidate each member's local transmission plans and determine a regional plan that can meet the needs of the combined member footprint in a more efficient or cost-effective manner. The NTTG and Columbia Grid develop transmission plans biennially.

B2H is a committed project in the most recent Columbia Grid 10-year plan, and it is part of the projects compromising the NTTG 2014–2015 Biennial Plan and the soon-to-be-published NTTG 2016–2017 Biennial Plan. The identified need for the B2H project in these regional planning organizations is based on transmission needs submitted by BPA, Idaho Power, and PacifiCorp.

At NTTG, all member utilities submit their load forecasts, generation forecasts, and transmission needs. NTTG studies the members' transmission footprints to determine the more efficient or cost-effective plan to meet those needs.

B2H has been, and remains, an integral part of NTTG's 10-year plan. NTTG's analysis indicated B2H is the most cost-effective and efficient project to meet the needs of the NTTG footprint.

Appendix D-5 contains the latest NTTG materials. For the most recent updates related to Idaho Power's regional planning organization, please refer to the NTTG website at nttg.biz/.

# THE B2H PROJECT

## Project History

The B2H project originated from Idaho Power's 2006 IRP. The 2006 IRP specified 285 MW of additional transmission capacity, increasing Idaho Power's connection to the Pacific Northwest power markets, as a resource in the preferred resource portfolio. A project had not been fully vetted at that time but was described as a 230-kV transmission line between McNary Substation and Boise. After the initial identification in the 2006 IRP, Idaho Power evaluated numerous capacity upgrade alternatives. Considering distance, cost, capacity, losses, and substation termination operating voltages, Idaho Power determined a new 500-kV transmission line between the Boardman, Oregon, area and the proposed Hemingway 500-kV substation would be the most cost-effective method of increasing capacity. Refer to Appendix D-1 for more information on the upgrade options considered.

Transmission capacity, especially at 500 kV, can be described as "lumpy" because capacity increments are relatively large between the different transmission operating voltages. In the 2009 IRP, Idaho Power assumed 425 MW of capacity, which was 50 percent of the assumed total rating. Idaho Power's long-standing preference was to find a partner or partners to construct B2H with to take advantage of economies of scale. In the 2011 IRP, Idaho Power assumed 450 MW of capacity. In 2012, Idaho Power achieved two major milestones: 1) PacifiCorp and BPA officially joined the B2H project as permitting co-participants and 2) Idaho Power received a formal capacity rating for the B2H project via the WECC Path Rating Process (more on this process in preceding section). In the 2013 IRP, Idaho Power began to use the negotiated capacity from the permitting agreement: 500 MW in the summer and 200 MW in the winter, a yearly average of 350 MW, for a cost allocation of 21 percent of the total project. Idaho Power used the same 21.2 percent interest in the 2015 and 2017 IRPs.

## Public Participation

The B2H project has involved considerable stakeholder involvement over the last 10 years. Idaho Power has hosted and participated in over 250 public and stakeholder meetings with an

estimated 3,000+ participants. After approximately a year of public scoping in 2008, Idaho Power paused the federal and state review process and initiated a year-long comprehensive public process to gather more input. This community advisory process (CAP) took place in 2009 and 2010. The four objectives and steps of the CAP were as follows:

1. Identify community issues and concerns.
2. Develop a range of possible routes that address community issues and concerns.
3. Recommend proposed and alternate routes.
4. Follow through with communities during the federal and state review processes.

Through the CAP, Idaho Power hosted 27 Project Advisory Team meetings, 15 public meetings, and 7 special topic meetings. In all, nearly 1,000 people were involved in the CAP, either through Project Advisory Team activities or public meetings. Additionally, numerous meetings with individuals and advocacy groups were held during and after the process.

Ultimately, the route recommendation from the CAP was the route Idaho Power brought into the *National Environmental Policy Act of 1969* (NEPA) process as the proponent-recommended route. The NEPA process included additional opportunities for public comment at major milestones, and Idaho Power worked with landowners and communities along the way. Ultimately, the route selected through the NEPA process was based on the Bureau of Land Management's (BLM) analysis and public input. For more information on the CAP, including the final report[9], and Idaho Power's initial scoping activities, visit the documents section[10] on the B2H website.

Throughout the BLM's NEPA process, including development of the Draft Environmental Impact Statement (EIS), issued Dec. 19, 2014, and prior to the Final EIS, issued Nov. 22, 2016, Idaho Power worked with landowners, stakeholders and jurisdictional leaders on route refinements and to balance environmental impacts with impacts to farmers and ranchers. For example, Idaho Power met with the original "Stop Idaho Power" group in Malheur County to help the group effectively comments and seek change from the BLM when the Draft EIS indicated a preference for a route across Stop Idaho Power stakeholder lands. BLM's decision was modified, and the route moved away from an area of highly valued agricultural lands in the Final EIS almost two years later.

[9] boardmantohemingway.com/documents/CAP%20Report-Final-Feb%202011.pdf

[10] boardmantohemingway.com/documents.aspx

Idaho Power worked with landowners in the Baker Valley, near the National Historic Oregon Trail Interpretive Center (NHOTIC), to move an alternative route along fence lines to minimize impacts to irrigated farmland, where practicable. This change was submitted by the landowners and included in the BLM's Final EIS and ROD (issued Nov. 17, 2017). Another change in Baker County was in the Burnt River Canyon and Durkee area, where Idaho Power worked with the BLM and affected landowners to find a more suitable route than what was initially preferred in the Draft EIS. Idaho Power is still working with landowners and local jurisdictional leaders to microsite in these areas to minimize impacts.

Unfortunately, the route preferences of Idaho Power and the local communities aren't always reflected in the BLM's Agency Preferred route. For example, Idaho Power had worked in the Baker County area to propose a route on the backside of the NHOTIC (to the east) to minimize visual impacts, and in the Brogan area, to avoid landowner impacts. However, both route variations went through priority sage grouse habitat and were not adopted in BLM's Agency Preferred route.

However, Idaho Power worked with Umatilla County, local jurisdictional leaders and landowners to identify a new route through the entire county, essentially moving the line further south and away from residences, ranches, and certain agriculture. This southern route variation through Umatilla County was included the BLM's Agency Preferred route.

At the urging of local landowners along Bombing Range Road in Morrow County, Idaho Power has been working with local jurisdictional leaders, delegate representatives, farmers, ranchers, and other interested parties to gain the Navy's consideration of an easement along the eastern edge of the Boardman Bombing Range. This cooperative effort with the local area has benefited the Project, providing an approach that meets the interests and common good for all in the area. Idaho Power is still working with the Navy to obtain that easement, but all indications point to receiving an authorization from the Navy in 2018.

Finally, in Union County Idaho Power worked with local jurisdictional leaders, stakeholder groups, such as the Glass Hill Coalition and some members of StopB2H (prior to that group's formation) to identify new route opportunities. The Union County B2H Advisory Commission agreed to submit a route proposal to the BLM that followed existing high-voltage transmission lines, which was later identified as the Millcreek Alternative. At the same time, Idaho Power met with a large landowner to adjust the Morgan Lake Alternative route to minimize impacts to the landowners. Idaho Power understood that both the Mill Creek and Morgan Lake route variations were favored over BLM's Agency Preferred Alternative (Glass Hill Alternative) by landowners, the Glass Hill Coalition, several stakeholders, and the Confederated Tribe of the Umatilla Indian Reservation due to concerns of impacts on areas that had no prior development. Idaho Power continued support of the community-favored routes in its amended preliminary Application for

Site Certificate. Idaho Power will work with Union County and local stakeholders to determine the route preference between the Morgan Lake and Millcreek alternatives.

## Project Activities

Below is a summary of notable activities by year since project inception. For more information about any of the activities, please visit the B2H website.

### *2006*

Idaho Power files its IRP with a transmission line to the Pacific Northwest identified in the preferred resource portfolio.

### *2007*

Idaho Power analyzes the capacity and cost of different transmission line operating voltages and determines a new 500-kV transmission line to be the most cost-effective option to increase capacity and meet customer needs. Idaho Power files a Preliminary Draft Application for Transportation and Utility Systems and Facilities on Federal Lands. Idaho Power scopes routes.

### *2008*

Idaho Power submits application materials to the BLM. Idaho Power submits a Notice of Intent to the EFSC. The BLM issues a Notice of Intent to prepare an EIS; officially initiating the BLM-led federal NEPA process. Idaho Power embarks on a more extensive public outreach program to determine the transmission line route.

### *2009*

Idaho Power pauses NEPA and EFSC activities to work with community members throughout the route as part of the CAP to identify a proposed route that would be acceptable to both Idaho Power and the public. Forty-nine routes and/or route segments were considered through CAP.

### *2010*

The CAP concludes. Idaho Power resubmits a proposed route to the BLM based on input from the CAP. The BLM re-initiates the NEPA scoping process and solicits public comments. Idaho Power publishes its B2H Siting Study. Idaho Power files a Notice of Intent with EFSC.

### *2011*

Additional public outreach resulted in additional route alternatives submitted to the BLM. The Obama Administration recognizes B2H as one of seven national priority projects[11].

[11] boardmantohemingway.com/documents/RRTT_Press_Release_10-5-2011.pdf

### 2012

The ODOE conducts informational meetings and solicits comments. The ODOE issues a Project Order outlining the issues and regulations Idaho Power must address in its Application for Site Certificate. Additional public outreach and analysis resulted in route modifications and refinements submitted to the BLM. Idaho Power issues a Siting Study Supplement. Idaho Power conducts field surveys for the EFSC application. WECC adopts a new Adjacent Transmission Circuits definition with a separation distance of 250 feet, which would later modify routes in the EIS process. Idaho Power receives a formal capacity rating from WECC.

### 2013

Public meetings are held. Idaho Power submits its Preliminary Application for Site Certificate to the ODOE. The BLM releases preliminary preferred route alternatives and works on a Draft EIS.

### 2014

The BLM issues a Draft EIS identifying an Agency Preferred Alternative. The 90-day comment period opens. Idaho Power conducts field surveys for EFSC application.

### 2015

The BLM hosts open houses for the public to learn about the Draft EIS, route alternatives, environmental analysis. The BLM reviews public comments. Idaho Power notifies the BLM of a preferred termination location, Longhorn Substation. Idaho Power submits an application to the Navy for an easement on the Naval Weapons System Training Facility in Boardman.
Idaho Power conducts field surveys for the EFSC application.

### 2016

Idaho Power submits a Draft Amended Application for Site Certificate to the ODOE for review. The BLM issues a Final EIS identifying an environmentally preferred route alternative and an Agency Preferred route alternative. Idaho Power incorporates the Agency Preferred route alternative into the EFSC application material. Idaho Power collaborates with local area stakeholders in Morrow County to find a routing solution on Navy-owned land. Idaho Power submits a revised application to the Navy. Idaho Power conducts field surveys for the EFSC application.

### 2017

Idaho Power submits an Amended Application for Site Certificate to the ODOE. The BLM issues a ROD.

For a detailed list of project activities by year, please refer to Appendix D-2.

## Route History

As stated previously, the B2H project was first identified in the 2006 IRP. At that time, the transmission line was contemplated as a line between Boise and McNary. The project evolved into a 500-kV line between the Boardman area and the Hemingway Substation. Several northern terminus substations were considered over the years, including the Boardman coal plant 500-kV yard, the proposed Grassland Substation to be constructed by Portland General Electric to integrate the then-proposed Carty Plant, and the proposed Longhorn Substation, which at the time was proposed by BPA to integrate wind onto the BPA 500-kV transmission system. During scoping, a considerable number of routes were considered to connect Hemingway and the Boardman area. Figure 3 is a snapshot of a number of routes considered early on during the CAP process (2009 timeframe). Numerous alternatives were considered, including routes through Idaho and through central Oregon. This large number of routes was further refined during the CAP process.

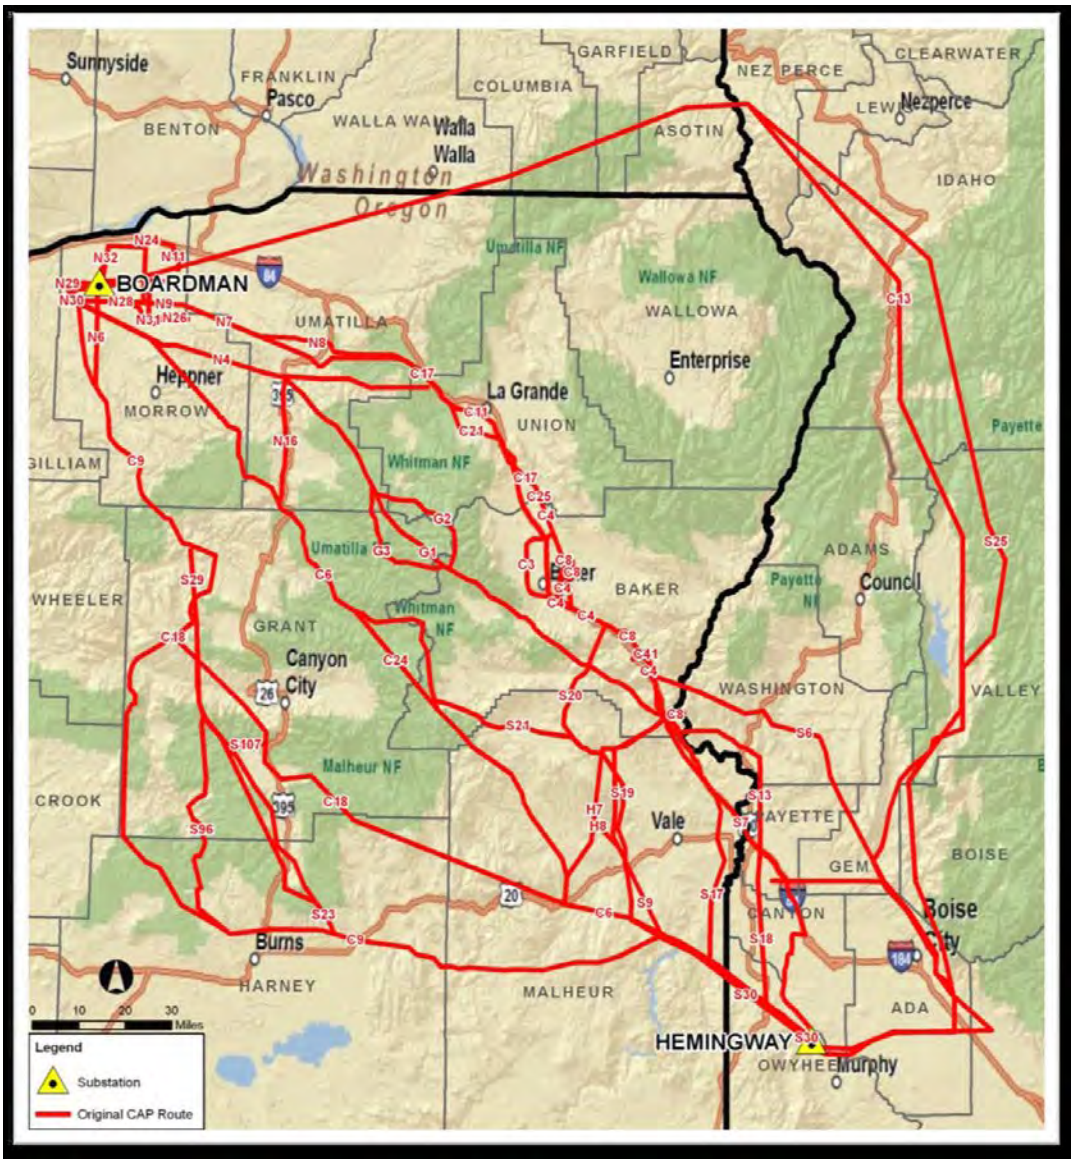

**Figure 3. Routes developed by the CAP advisory teams (2009 timeframe)**

The CAP process resulted in Idaho Power submitting the route shown in Figure 4 as the company's proposed route in the BLM-led NEPA process.

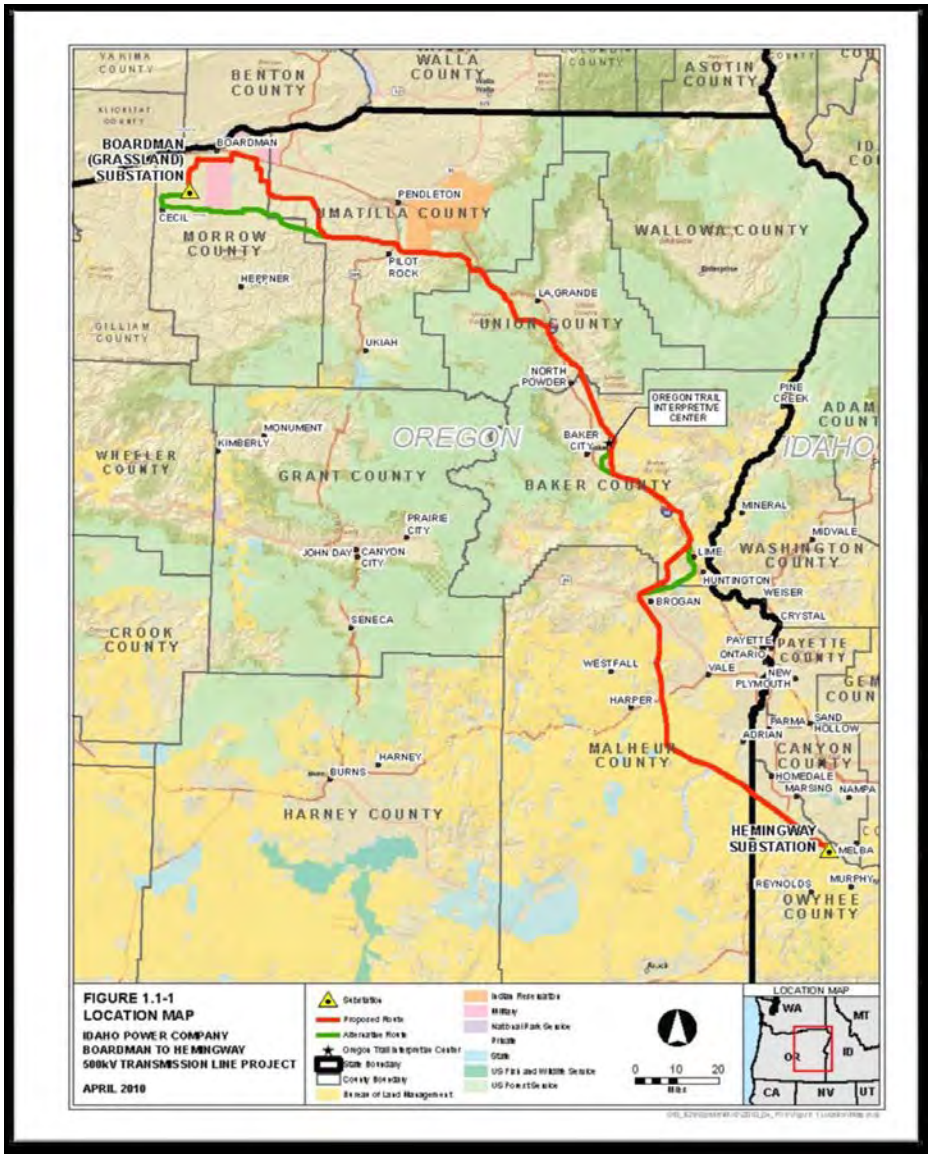

**Figure 4. B2H proposed route resulting from the CAP process (2010 timeframe)**

The BLM considered Idaho Power's proposed route, along with a number of other reasonable alternative routes, in the NEPA process. Figure 5 shows the route alternatives and variations considered in the BLM's November 2016 Final EIS.

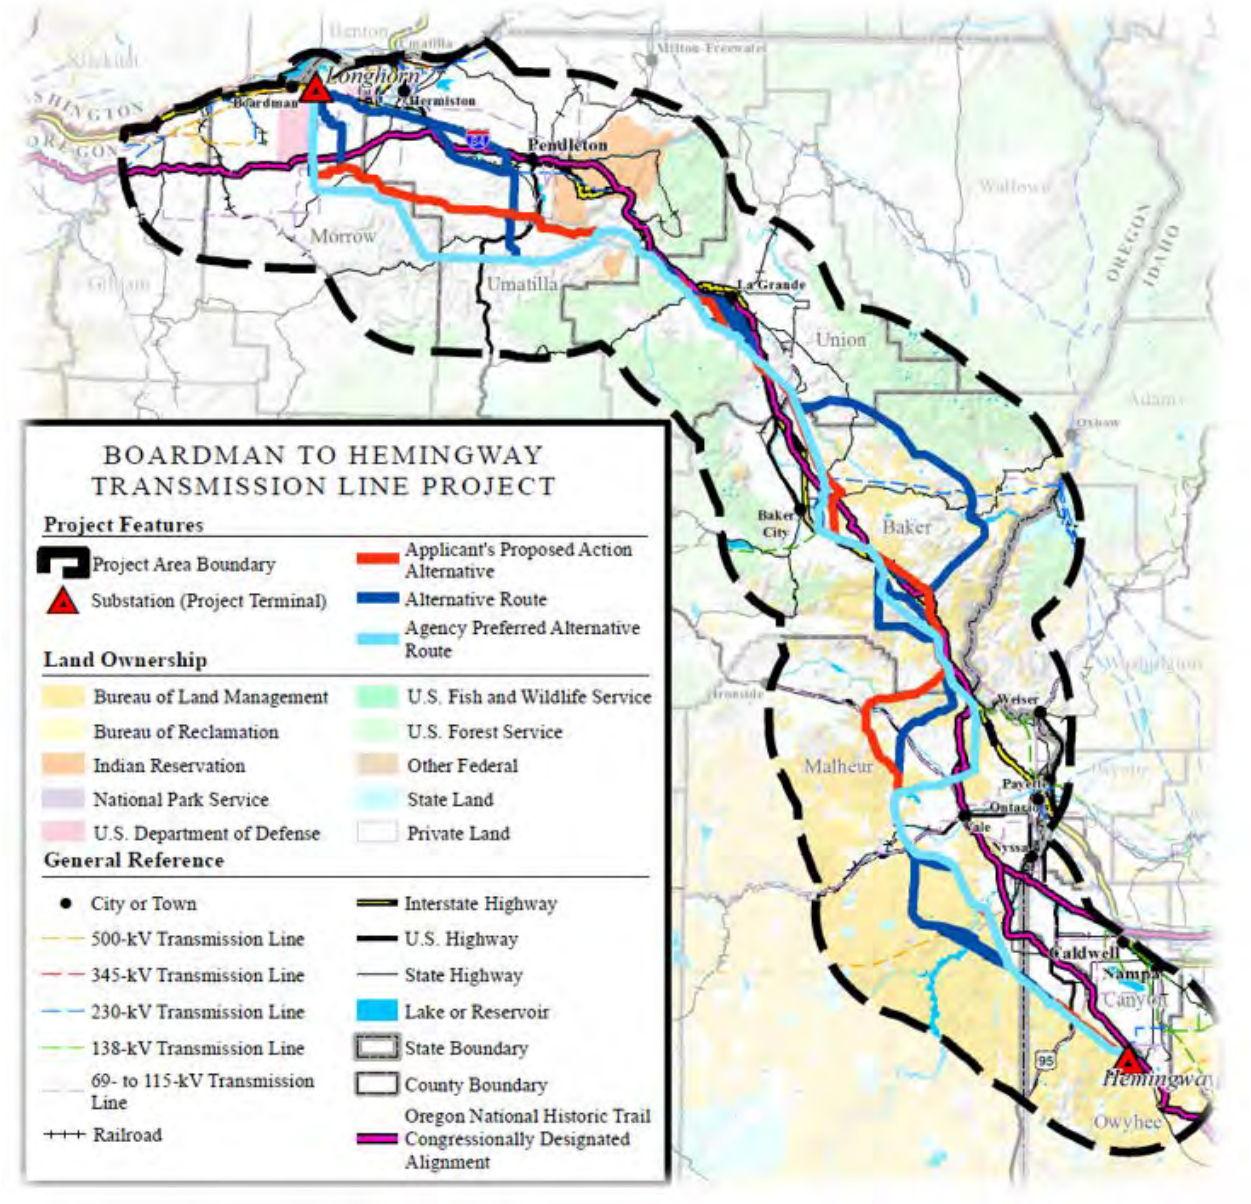

**Figure 5. BLM final EIS routes**

The conclusion of the BLM-led NEPA process, the BLM's ROD, resulted in a singular route—the BLM's Agency Preferred route. The 293.4-mile approved route will run across 100.3 miles of federal land (managed by the BLM, the U.S. Forest Service [USFS], the Bureau of Reclamation, and the U.S. Department of Defense), 190.2 miles of private land, and 2.9 miles of state lands. Figure 6 shows the BLM's Agency Preferred route.

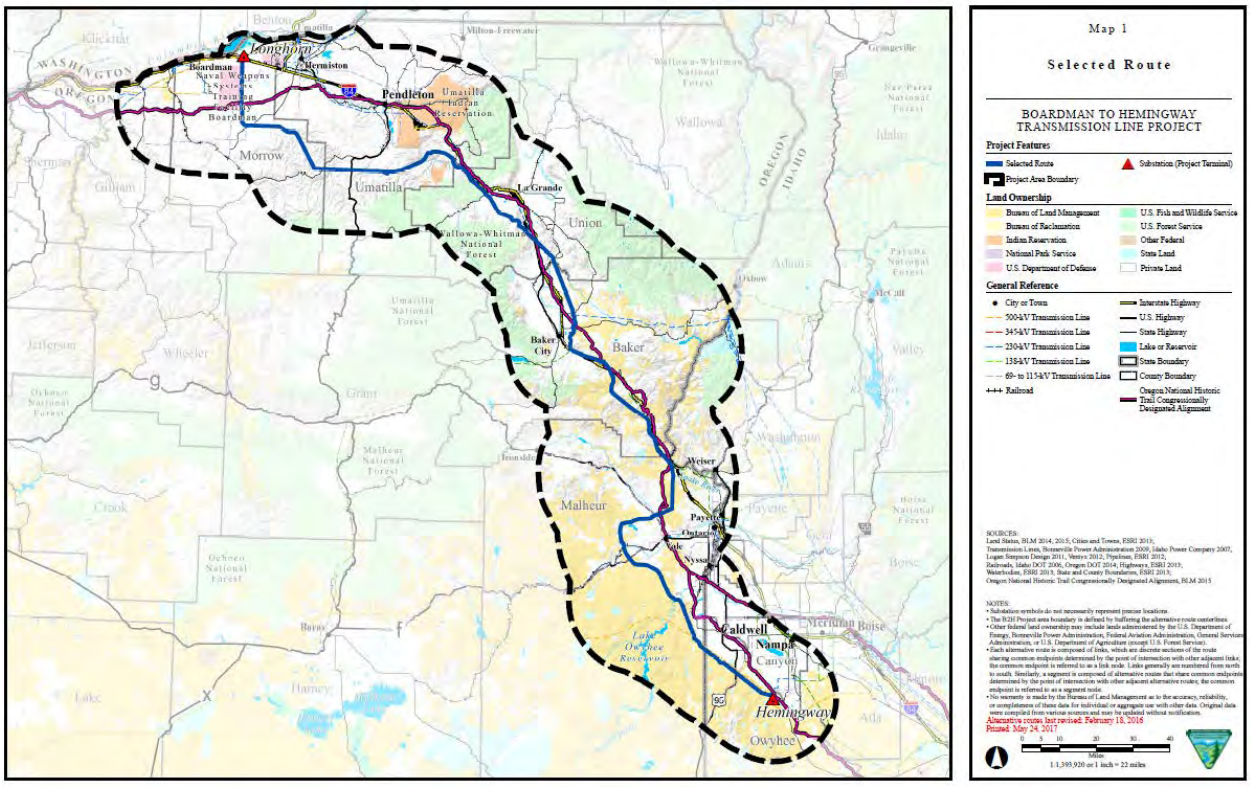

**Figure 6. BLM Agency Preferred route from the 2017 BLM ROD**

As discussed previously, the BLM-led NEPA process and the EFSC process are distinct processes. Idaho Power submitted its Amended Application for Site Certificate to the ODOE in summer 2017. The route Idaho Power submitted to the ODOE as part of the Application for Site Certificate is very similar to the BLM's Agency Preferred route, except for a small section of private property west of La Grande. The BLM's Agency Preferred route in this area was a surprise to Idaho Power and seemingly all stakeholders in the area. The section the BLM chose was not the county's stated preference, nor was it the variation Idaho Power had worked with a large local landowner to modify to minimize impacts to his property.

At the time of EFSC application finalization (which was prior to the Final EIS release), Idaho Power did not feel as if there was a stakeholder consensus preference between the County's preferred route and the modified route west of the City of La Grande. Therefore, Idaho Power brought both alternatives into the EFSC application. Idaho Power intends to continue to work with the community to finalize which of the two variations in this area will be constructed.

Figure 7 shows the route Idaho Power submitted in its 2017 EFSC Application for Site Certificate.

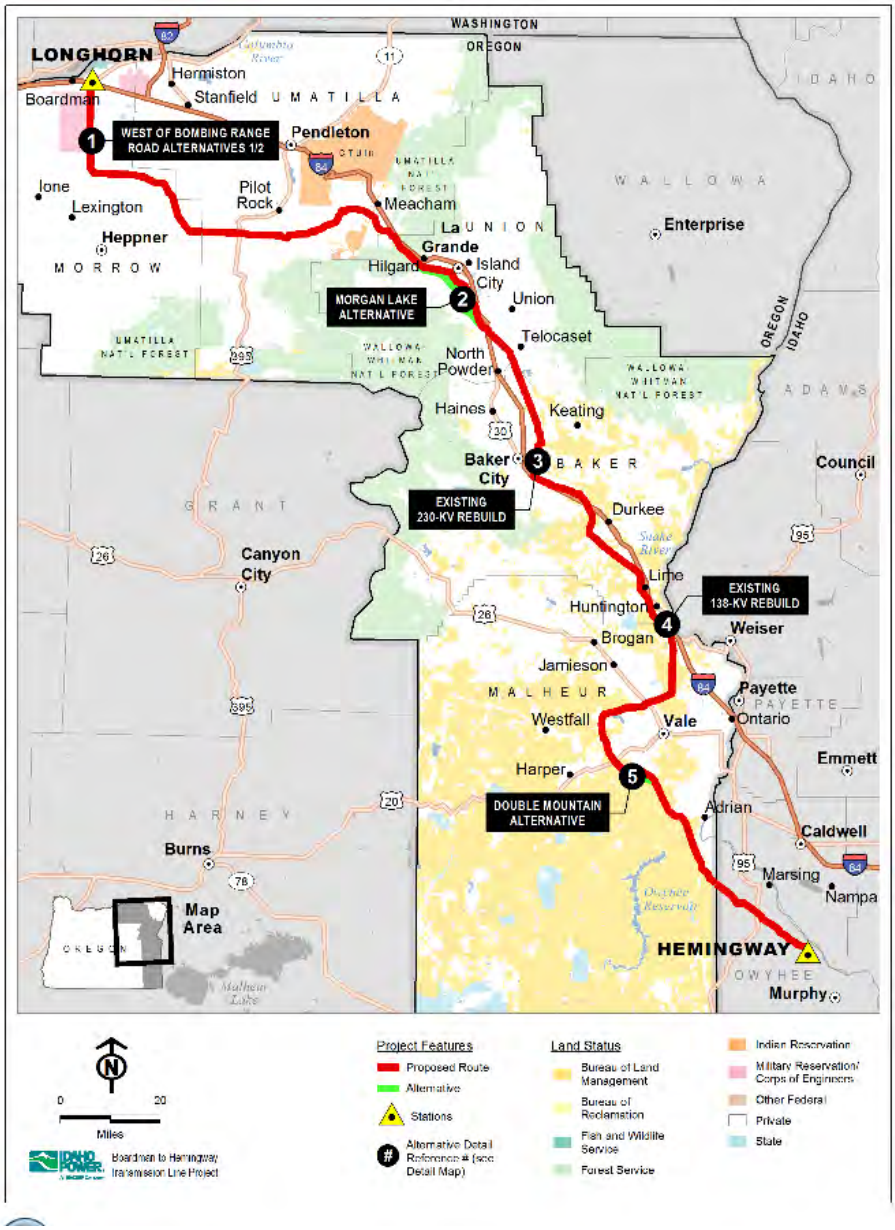

**Figure 7. B2H route submitted in 2017 EFSC Application for Site Certificate**

## B2H Capacity Interest

Per the terms of the Joint Permit Funding Agreement (see Appendix D-3), each co-participant (funder) is assigned a permitting interest based on the annual weighted capacity expressed in the project. The permitting interest is determined by the sum of a funder's eastbound capacity interest and westbound capacity interest, divided by the total of all eastbound and westbound capacity interest. Table 5 details the capacity interest of each funder.

**Table 5. B2H joint permit funding capacity interests by funder**

| | Capacity Interest (West-to-East) | Capacity Interest (East-to-West) | Ownership % |
|---|---|---|---|
| **Idaho Power** | 350 MW (Average)<br>500 MW (Summer)<br>200 MW (Winter) | 0 MW | 21.2% |
| **PacifiCorp** | 300 MW | 600 MW | 54.5% |
| **BPA** | 400 MW (Average)<br>250 MW (Summer)<br>550 MW (Winter) | 0 MW | 24.2% |
| **Unallocated** | 0 MW | 400 MW | |

Idaho Power's capacity interest is seasonally shaped, with 500 MW of eastbound capacity from April through September and 200 MW of eastbound capacity from January through March and October through December. BPA's capacity interest is seasonally shaped with 250 MW of eastbound capacity from April through September and 550 MW of eastbound capacity from January through March and October through December. PacifiCorp's capacity is constant throughout the year. The sum of the capacity interest in the east-to-west direction is less than the rating (1,000 MW), so the unallocated capacity is divided among the funders based on their respective percentage permitting interest.

The seasonal capacity shaping is a great benefit for Idaho Power's customers, and one of the reasons why the B2H project is such a competitive and cost-effective option in the IRP process. Idaho Power is effectively purchasing 500 MW of capacity (peak summer need) at a cost based on 350 MW of capacity.

## Capacity Rating—WECC Rating Process

Idaho Power coordinated with other utilities in the Western Interconnection via a peer-reviewed process known as the WECC Path Rating Process. Through the WECC Path Rating Process, Idaho Power worked with other western utilities to determine the maximum rating (power flow limit) across the transmission line under various stresses, such as high winter or high summer peak load, light load, high wind generation, and high hydro generation on the bulk power system. Based on industry standards to test reliability and resilience, Idaho Power simulated various outages, including the outage of B2H, while modeling these various stresses to ensure the power grid was capable of reliably operating with increased power flow. Through this process, Idaho Power also ensured the B2H project did not negatively impact the ratings of other transmission projects in the Western Interconnection. Idaho Power completed the WECC Path Rating Process in November 2012 and achieved a WECC Accepted Rating of 1,050 MW in the west-to-east direction and 1,000 MW in the east-to-west direction. The B2H project, when constructed, will add significant reliability, resilience, and flexibility to the Northwest power grid.

## B2H Design

B2H is routed and designed to withstand catastrophic events, including, but not limited to, the following:

- Lightning
- Earthquake
- Fire
- Wind/tornado
- Ice
- Landslide
- Flood
- Direct physical attack

The following sections provide more information about the design of the B2H transmission line and address each of the catastrophic events listed above.

### Transmission Line Design

The details below are not inclusive of every design aspect of the transmission line but provide a brief overview of the design criteria. The B2H project will be designed and constructed to meet or exceed all required safety and reliability criteria.

The basic purpose of a transmission line is to move power from one substation to another for eventual distribution of electricity to end users. The basic components of a transmission line are the structures/towers, conductors, insulators, foundations to support the structures, and shield wires to prevent lighting from striking conductors. See Figure 8 for a cross-section of a transmission line.

For a single-circuit transmission line, such as B2H, power is transmitted via three-phase conductors (a phase can also have multiple conductors, called a bundle configuration). These conductors are typically comprised of a steel core to give the conductor tensile strength and reduce sag and of aluminum outer strands. Aluminum is used because of its conductive properties, and it provides the ability to move more power using a smaller amount of material.

Shield wires, typically either steel or aluminum, and occasionally including fiber optic cables inside for communication between substation equipment, are the highest wires on the structure. Their main purpose is to protect the phase conductors from a lightning strike.

Structures are designed to support the phase conductors and shield wires and keep them safely in the air. For the B2H project, structures were chosen to be steel lattice tower structures,

which provide an economical means to support large conductors for long spans over long distances. The typical structure height for B2H is 135 feet tall (structure height will vary depending on location) with a structure located roughly every 1,200 feet on average. The tower height and span length were optimized to minimize ground impacts and material requirements; taller structures could allow for longer spans (less structures on average per mile) but would be costlier due to material requirements. Again, the B2H tower and conductors were engineered to maximize benefits and minimize costs and impacts.

Foundations are the support mechanism that bind the structures to the earth and safely keep the phase conductors and shield wires in the air. For the B2H project, the foundations at each lattice tower structure are planned to be concrete-drilled pier shafts. A cylindrical hole will be drilled at each tower footing of adequate diameter and depth to support the loads applied to the structure from the shield wires and phase conductors. The loads applied to structures via shield wires and conductors are discussed in further detail below.

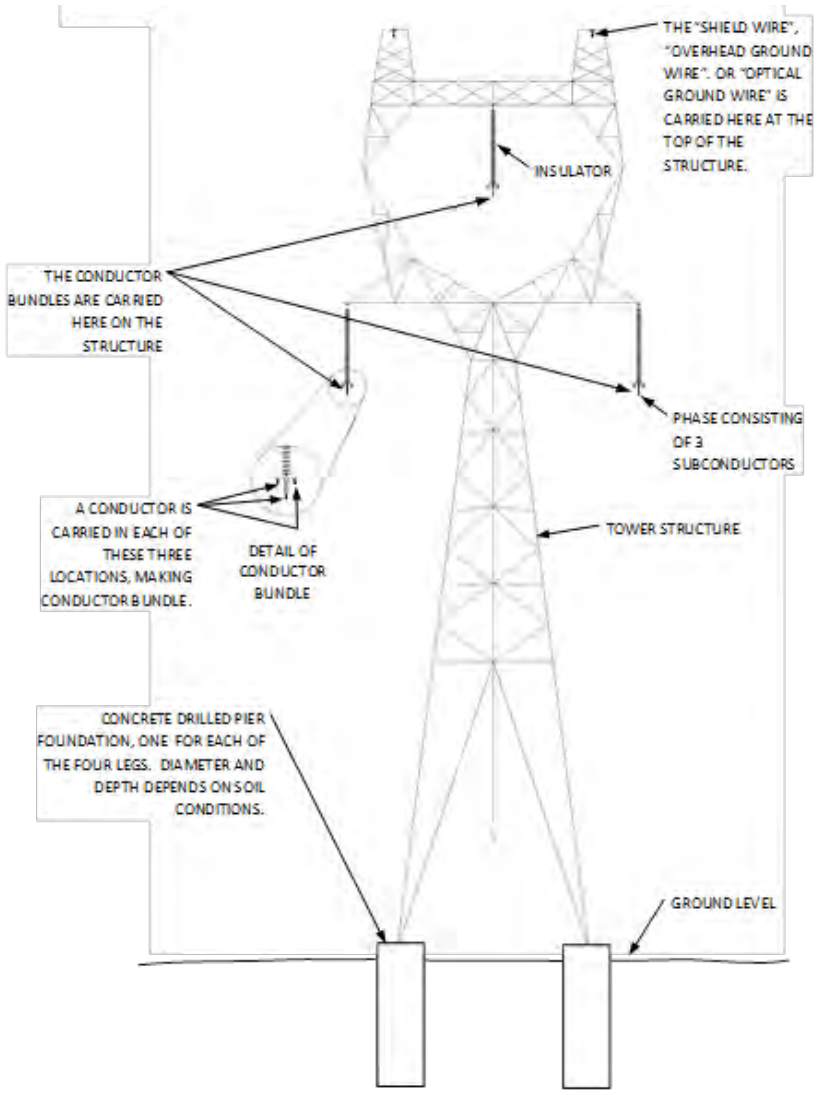

**Figure 8. Transmission tower components**

## Transmission Line Structural Loading Considerations

Reliability and resiliency are designed into transmission lines. Overhead transmission lines have been in existence for over 100 years, and many codes and regulations govern the design and operation of transmission lines. Safety, reliability, and electrical performance are all incorporated into the design of transmission lines. Idaho Power's EFSC application includes an exhaustive list of standards. Several notable standards are as follows:

- American Concrete Institute 318—*Building Code Requirements for Structural Concrete*
- American National Standards Institute (ANSI) standards (for material specs)
- American Society of Civil Engineers (ASCE) Manual No.74—*Guidelines for Electrical Transmission Line Structural Loading*

- National Electrical Safety Code (NESC)
- Occupational Safety and Health Administration (OSHA) 1910.269 April 11, 2014 (for worker safety requirements)
- National Fire Protection Association (NFPA) 780—*Guide for Improving the Lightning Performance of Transmission Lines*

NESC provides for minimum guidelines and industry standards for safeguarding persons from hazards arising from the construction, maintenance, and operation of electric supply and communication lines and equipment. The B2H project will be designed, constructed, and operated at standards that meet, and in most cases, exceed, the provisions of NESC.

Physical loads induced onto transmission structures and foundations supporting the phase conductors and shield wires for the B2H project are derived from three phenomena: wind, ice, and tension. Under certain conditions, ice can build up on phase conductors and shield wires of transmission lines. When transverse wind loading is also applied to these iced conductors, it can produce structural loading on towers and foundations far greater than normal operating conditions produce. Design weather cases for the B2H project exceed the provisions in the NESC. As an example, for a high wind case, NESC recommends 90 miles per hour (mph) winds. The criteria proposed for this project is 100 mph wind on the conductors and 120 mph wind on the structures. There are multiple loading conditions that will be incorporated into the design of the B2H project, including unbalanced longitudinal loads, differential ice loads, broken phase conductors, broken sub-phase conductors, heavy ice loads, extreme wind loads, extreme ice and wind loads, construction loads, and full dead-end structure loads.

### Transmission Line Foundation Design

The 500-kV single-circuit lattice steel structures require a foundation for each leg of the structure. The foundation diameter and depth shall be determined during final design and are dependent on the type of soil or rock present. The foundations will be concrete pier foundations designed to comply with the allowable bearing and shear strengths of the soil where placed. Soil borings shall be taken at key locations along the project route, and subsequent soil reports and investigations shall govern specific foundation designs as appropriate.

Common industry practices design transmission line structures to withstand wind and ice loads of NESC or greater, and are accepted as more stringent than the potential loads resulting from ground motion due to earthquakes. The 2017 NESC Rule 250A4 observes the structure capacity obtained by designing for NESC wind and ice loads at the specified strength requirements is sufficient to resist earthquake ground motions. Additionally, ASCE Manual No. 74 states transmission structures need not be designed for ground-induced vibrations caused by earthquake

motion; historically, transmission structures have performed well under earthquake events,[12, 13] and transmission structure loadings caused by wind/ice combinations and broken wire forces exceed earthquake loads.

### Lightning Performance

The B2H project is in an area that historically experiences 20 lightning storm days per year.[14] This is relatively low compared to other parts of the US. The transmission line will be designed to not exceed a lightning outage rate of one per 100 miles per year. This will be accomplished by proper shield wire placement and structure/shield wire grounding to adequately dissipate a lightning strike on the shield wires or structures if it were to occur. The electrical grounding requirements for the project will be determined by performing ground resistance testing throughout the project alignment, and by designing adequately sized counterpoise or using driven ground rods with grounding attachments to the steel rebar cages within the caisson foundations as appropriate.

### Earthquake Performance

Experience has demonstrated that high-voltage transmission lines are very resistant to ground-motion forces caused by earthquake, so much so that national standards do not require these forces be directly considered in the design. However, secondary hazards can affect a transmission line, such as landslides, liquefaction, and lateral spreading. The design process considers these geologic hazards using multiple information streams throughout the siting and design process. The current B2H route evaluated geologic hazards using available electronic (geographic information system [GIS]) data, such as fault lines, areas of unstable and/or steep soils, mapped and potential landslide areas, etc. Towers located in potential geologic hazards are investigated further to determine risk. Additional analysis may include field reconnaissance to gauge the stability of the area and subsurface investigation to determine the soil strata and depth of hazard. At the time of this report, no high-risk geologic hazard areas have been identified. If, during the process of final design, an area is found to be high risk, the first option would be to micro-site—route around or span over the hazard. If avoidance is not feasible, the design team would seek to stabilize the hazard. Engineering options for stabilization include designing an array of sacrificial foundations above the tower foundation to anchor the soil or improving the subsurface soils by injecting grout or outside aggregates into the ground. If the geotechnical

[12] Risk Assessment of Transmission System under Earthquake Loading. J.M. Eidinger, and L. Kemper, Jr. Electrical Transmission and Substation Structures 2012, Pg. 183-192 © ASCE 2013.

[13] Earthquake Resistant Construction of Electric Transmission and Telecommunication Facilities Serving the Federal Government Report. Felix Y. Yokel. Federal Emergency Management Agency (FEMA). September 1990.

[14] USDA RUS Bulletin 1751-801.

investigation determines the problematic soils are relatively shallow, the tower foundations can be designed to pass through the weaker soils and embed into competent soils.

### Wildfire

The transmission line steel structures are constructed of non-flammable materials, so wildfires do not pose a physical threat to the transmission line itself. However, heavy smoke from wildfires in the immediate area of the transmission line can cause flashover/arcing between the phase conductors and electrically grounded components. Standard operation is to de-energize transmission lines when fire is present in the immediate area of the line. Transmission lines generally remain in-service when smoke is present from wildfires not in the immediate vicinity of the transmission line. Alternatively, solar PV is susceptible to smoke, which can move into areas even if fires are not in the immediate vicinity of the solar generation. For example, the forest fires in the Pacific Northwest in 2017 caused much smoke along the proposed B2H corridor and in the Pacific Northwest in general. The B2H line would likely still operate for the fires not in the immediate area, whereas solar PV would likely operate at a much-reduced capacity while heavy smoke is covering the area.

### Wind Gusts/Tornados

Tornados are unlikely along the B2H route. As noted in the Transmission Line Structural Loading Considerations section above, the B2H transmission line is designed to withstand extreme wind loading combined with ice loading.

### Ice

Ice formation around the phase conductors and around the shield wires can add a substantial amount of incremental weight to the transmission line, putting extra force on the steel structures and foundations. As described in the Transmission Line Structural Loading Considerations section above, the B2H transmission line is designed to withstand heavy ice loading combined with heavy wind loading.

### Landslide

The siting and design process considers geologic hazards, such as landslides, liquefaction, and lateral spreading. See the Earthquake Performance section above. Through the siting and design process, steep, unstable slopes are avoided, especially where evidence of past landslides is evident. During the preliminary construction phase, geotechnical surveys and ground surveys (light detection and ranging [LiDAR] surveys) help verify potentially hazardous conditions. If a potentially hazardous area cannot be avoided, the design process will seek to stabilize the area.

### Flood

The identification and avoidance of flood zones was incorporated into the siting process and will be further incorporated into the design process. Foundations and structures can be designed to withstand flood conditions.

### Direct Physical Attack

A direct physical attack on the B2H transmission line will remove the line's ability to deliver power to customers. In the case of a direct attack, B2H is fundamentally no different than any other supply-side resource should a direct physical attack occur on a specific resource. However, because the B2H project is connected to the transmission grid, a direct physical attack on any specific generation site in the Pacific Northwest or Mountain West region will not limit B2H's ability to deliver power from other generation in the region. In this context, B2H provides additional ability for generation resources to serve load if a physical attack were to occur on a specific resource or location within the region and therefore increases the resiliency of the electric grid as a whole.

If a direct physical attack were to occur on the B2H transmission line and force the line out of service, the rest of the grid would adjust to account for the loss of the line. Per the WECC facility rating process, the B2H capacity rating is such that an outage of the B2H line would not overload any other system element beyond equipment emergency ratings. Idaho Power also keeps a supply of emergency transmission towers that can be very quickly deployed to replace a damaged tower allowing the transmission line to be quickly returned to service.

### B2H Design Conclusions

As evidenced in this section, the B2H project is designed to withstand a wide range of physical conditions and extreme events. Because transmission lines are so vital to our electrical grid, design standards are stringent. B2H will adhere to, and in most cases, exceed, the required codes or standards observed for high voltage transmission line design. This approach to the design, construction, and operation of the B2H project will establish utmost reliability for the life of the transmission line. Additionally, as discussed in the Direct Physical Attack section, transmission lines add to the resiliency of the grid by providing additional paths for electricity should one or more generation resources or transmission lines experience a catastrophic event.

# PROJECT CO-PARTICIPANTS

## PacifiCorp and BPA Needs

PacifiCorp and BPA are co-participants on the B2H project (also referred to as funders). Collectively, Idaho Power, PacifiCorp, and BPA represent a very large electric service footprint in the western US. The fact that three large utilities have each identified the value of the B2H

project indicates the regional significance of the project and the value the project brings to customers throughout the West. Idaho Power, PacifiCorp, and BPA have worked closely to assign the capacity rights of the project to correlate with each party's needs. More information about PacifiCorp's and BPA's needs and interest in the B2H project can be found in the following sections.

## PacifiCorp

PacifiCorp is a locally managed, wholly owned subsidiary of Berkshire Hathaway Energy Company. PacifiCorp is a leading western US energy services provider and the largest grid owner/operator in the West, serving 1.8 million retail customers in six western states. PacifiCorp is comprised of two business units: Pacific Power (serving Oregon, Washington, and California) and Rocky Mountain Power (serving Utah, Idaho, and Wyoming). Visit pacificorp.com for more information.

PacifiCorp has invested in the permitting of the B2H project because of the strategic value of the B2H corridor, which connects the Pacific Northwest to the Intermountain West. The existing transmission path between the two regions is fully used during key operating periods. As a potential owner in the project, PacifiCorp would be able to use its bidirectional capacity to increase reliability and efficiency for its customers. The following is a list of additional B2H benefits identified for PacifiCorp.

- **Customers**: PacifiCorp continues to invest to meet customers' needs, making only critical investments now to ensure future reliability, security, and safety. The B2H project is identified as an investment that will ensure future reliability, security, and safety for PacifiCorp customers.

- **Renewables**: PacifiCorp continues to grow their renewable resources and transition to a lower-carbon future. The B2H project has been identified as a strategic project to facilitate PacifiCorp's use of renewable resources across their two balancing authority areas.

- **EIM**: PacifiCorp was a leader in implementing the western energy imbalance market (EIM). The real-time market helps optimize the electric grid, lowering costs, enhancing reliability, and more effectively integrating resources. PacifiCorp believes the B2H project will help advance the objectives of the EIM, benefitting PacifiCorp customers and the broader region.

- **Regional Benefit**: PacifiCorp, as a member of the regional planning entity Northern Tier Transmission Group (NTTG), supports the conclusion that the B2H project is as a cost-effective project providing regional solutions to identified regional needs.

- **Balancing Area Consolidation**: PacifiCorp operates/controls two balancing areas in the West. After the addition of B2H and portions of Gateway West, more transmission capacity will exist between PacifiCorp's two balancing areas, providing the ability to increase operating efficiencies. B2H will provide PacifiCorp 300 MW of additional west-to-east capability and 600 MW of east-to-west capability to move resources between PacifiCorp's two balancing authority areas.

### *BPA*

BPA is a nonprofit federal power marketing administration based in the Pacific Northwest. BPA provides approximately 28 percent of the electric power used in the Pacific Northwest, which has-an estimated population of over 13 million people. BPA also operates and maintains about three-fourths of the high-voltage transmission in its service area. BPA's area includes Idaho, Oregon, Washington, western Montana, and small parts of eastern Montana, California, Nevada, Utah, and Wyoming. For more information, visit bpa.gov.

Similar to the Idaho Power IRP process for identifying cost-effective service alternatives, BPA identified the B2H project plus associated asset exchange as its top priority for pursuit for serving customers in southeast Idaho. BPA's load and resource mix in southeast Idaho results in a net winter peak demand that exceeds the summer peak demand. BPA's winter peak load couples well with Idaho Power's summer peak load to allow for seasonal shaping of the B2H capacity. Seasonal shaping of capacity would allow BPA to own 550 MW of B2H capacity in the winter and 250 MW of capacity in the summer, dramatically increasing the cost-effectiveness of the project for BPA customers. A recent analysis performed by BPA continues to support the B2H project plus the asset exchange as its top priority for pursuit. For more information about the southeast Idaho load service analysis, visit bpa.gov.[15]

As a federal agency, BPA has responsibilities to comply with NEPA and consider the environmental impacts of its actions, such as participating in transmission line construction. To that end, BPA was a cooperating agency in the development of the B2H EIS and continues to coordinate with the BLM and other federal agencies. BPA will ensure an appropriate environmental review has been conducted on any BPA-proposed action associated with the project and plans to prepare a ROD to the B2H EIS as appropriate and in accordance with the B2H project's permitting schedule.

## Co-Participant Expenses Paid to Date

Approximately $92 million, including allowance for funds used during construction (AFUDC), have been expended on the B2H project through September 30, 2017. Pursuant to the terms of

[15] Southeast Idaho Load Service analysis: bpa.gov/transmission/CustomerInvolvement/SEIdahoLoadService/Pages/default.aspx

the joint funding arrangements, Idaho Power has received approximately $48 million of that amount as reimbursement from the project participants as of September 30, 2017. Idaho Power has accrued in receivables approximately $18 million more that will be billed by Idaho Power in the future to the project co-participants for expenses Idaho Power has incurred, for a total amount reimbursable by co-participants of $66 million. Co-participants are obligated to reimburse Idaho Power for their share of any future project permitting expenditures incurred by Idaho Power.

## Co-Participant Agreements

Idaho Power, BPA, and PacifiCorp (collectively, the funders) entered a Joint Permit Funding Agreement on January 12, 2012, with the intent to be joint owners of the B2H line. The Joint Permit Funding Agreement provides for the permitting (state and federal), siting, and acquisition of right-of-way (ROW) over public lands. A copy of the Joint Permit Funding can be found in Appendix D-3.

Related to the project, but not specific to the B2H permitting activities, the B2H co-participants entered into an MOU on January 12, 2012, to 1) explore alternatives to establish BPA eastern Idaho load service from Idaho Power and PacifiCorp's Hemingway Substation and 2) consider whether to replace certain transmission arrangements involving existing assets with joint ownership transmission arrangements and other alternative transmission arrangements pursuant to definitive agreements mutually satisfactory to the co-participants. In other words, in conjunction with the project, the parties agreed to explore cost-effective methods to serve customers by jointly owning facilities other than the B2H project. A copy of the MOU can be found here or in Appendix D-4.

# Cost

## Cost Estimate

The total cost estimate for the B2H project is $1 to $1.2 billion dollars, which includes Idaho Power's allowance for funds used during construction (AFUDC). Co-participant AFUDC is not included in this estimate range. The total cost estimate includes a 20-percent contingency for unforeseen expenses.

In IRP modeling, Idaho Power assumes a 21.2-percent share of the direct expenses, plus its entire AFUDC cost, which equates to approximately $258 million. Idaho Power also included costs for local interconnection upgrades totaling $16 million. The 2017 IRP was the first year for which the B2H route was relatively certain. In prior years, the estimate was based on uncertain route and terminus location information.

## Transmission Line Estimate

Idaho Power has contracted with HDR to serve as the B2H project's third-party owners' engineer and prepare the B2H transmission line cost estimate. HDR has extensive industry experience, including experience serving as an owner's engineer for BPA for the last seven years. HDR has prepared a preliminary transmission line design that locates every tower and access road needed for the project. HDR used utility industry experience and current market values for materials, equipment, and labor to arrive at the B2H estimate. Material quantities and construction methods are well understood because the B2H project is utilizing BPA's standard tower and conductor design for 500-kV lines. BPA has used the proposed towers and conductor on hundreds of miles of lines currently in-service. HDR was the owner's engineer on recent BPA projects, so HDR is also familiar with the BPA towers and conductor the B2H project is using.

## Substation Estimates

Idaho Power prepared the substation cost estimate for the Hemingway Substation, and BPA prepared the Longhorn Substation estimate. Idaho Power used experience designing and constructing the Hemingway Substation in 2013. The Hemingway Substation is designed to accommodate the B2H line terminal in the future. New equipment must be ordered and installed, but no station expansion will be required. The Longhorn Substation is a station proposed by BPA near Boardman, Oregon. BPA owns the land for the Longhorn Substation, but the station has yet to be constructed. BPA proposed the Longhorn Substation to integrate certain wind projects in the immediate area. BPA has extensive experience designing and constructing substations.

## Calibration of Cost Estimates

The B2H estimate was reviewed and approved by BPA and PacifiCorp. BPA and PacifiCorp both have recent transmission line construction projects to calibrate against. The recent projects included the following:

- BPA: Lower Monumental–Central Ferry 500-kV line (38 miles, in-service 2015)
- BPA: Big Eddy–Knight 500-kV line (39 miles, in-service 2016)
- PacifiCorp: Sigurd to Red Butte 345-kV line (160 miles, in-service 2015)
- PacifiCorp: Mona to Oquirrh 500-kV line (100 miles, in-service 2013)

Additionally, in early 2017 Idaho Power visited with NV Energy and Southern California Edison to learn from each company's recent experience constructing 500-kV transmission lines in the West. As part of the discussions with each company, Idaho Power calibrated cost estimates and resource requirements.

The two projects were as follows:

- NV Energy: ON Line project (235 miles, 500 kV, in-service 2014)
- Southern California Edison: Devers to Palo Verde (150 miles, 500 kV, in-service 2013)

### Costs Incurred to Date

Approximately $92 million, including AFUDC, has been expended on the Boardman-to-Hemingway project through September 30, 2017. Refer to the Co-Participant Expenses Paid to Date section for co-participant reimbursements. The $92 million incurred through September 30, 2017, is included in the $1 to $1.2 billion total estimate. Idaho Power's share of the costs incurred to-date is included B2H IRP portfolio modeling.

### Cost-Estimate Conclusions

The cost estimate for B2H has been thoroughly vetted. Idaho Power used third-party contractors with industry experience, relied on PacifiCorp and BPA recent transmission line construction experience, and benchmarked against multiple recent high-voltage transmission line investments in the West to arrive at the B2H construction cost estimate. Material quantities and construction methods are well understood because the B2H project is using BPA's standard tower and conductor design for 500-kV lines. As a conservative measure, Idaho Power has added a 20 percent contingency to cover any unanticipated expenses. As a reminder, Idaho Power's IRP analysis escalates all resource costs at a 2.1-percent inflation rate into the future so future labor and material cost escalations are accounted for in B2H IRP portfolio modeling.

## Transmission Revenue

The B2H transmission line project is modeled in AURORA as additional transmission capacity available for Idaho Power energy purchases from the Pacific Northwest. In general, for new supply-side resources modeled in the IRP process, surplus sales of generation are included as a cost offset in the AURORA portfolio modeling. However, historically, additional transmission wheeling revenue has not been quantified for transmission capacity additions. For the 2017 IRP, Idaho Power modeled the additional transmission wheeling revenue for the B2H project. After the B2H line is in-service, the cost of Idaho Power's share of the transmission line will go into Idaho Power's transmission rate base as a transmission asset. Idaho Power's transmission assets are funded by native-load customers, network customers, and transmission wheeling customers based on a ratio of each party's usage of the transmission system. In the IRP modeling, the estimated incremental transmission wheeling revenue from non-native-load customers was modeled as an annual revenue credit for B2H portfolios.

In the B2H analysis, Idaho Power chose to conservatively assume that third-party use (network customers and transmission wheeling customers) across Idaho Power's transmission system would remain static following the construction of B2H. Idaho Power's FERC transmission rate is calculated as follows:

$$Transmission\ Rate = \frac{Transmission\ Costs\ (\$)}{Transmission\ Usage\ (MW * year)}$$

Per the formula above, since transmission costs will go up following the installation of B2H, and transmission usage is assumed to remain the same, Idaho Power's transmission rate will increase. Idaho Power's *existing* transmission customers will pay this higher transmission rate, resulting in incremental transmission revenue to Idaho Power.

As a specific example, based on current third-party long-term usage, Idaho Power forecasts 611 MW of third-party long-term transmission wheeling customers. Idaho Power also forecasts 250 average MW of network customers for a combined total of 861 MW usage. For each $1,000 per MW per year increase to the transmission rate (transmission costs in the equation above), Idaho Power will gain about $861,000 in transmission revenue. B2H will increase Idaho Power's rate by over $6,000 per MW per year.

An alternative way to understand the FERC transmission rate, and B2H's impact, is to look at the transmission system from a total load prospective. Native load, network load, and transmission customers must pay their respective share based on their usage of the system. Native load and network load usage is measured in peak MW (averaged by month), and transmission customer usage is measured by reservation amount. The total transmission usage in 2026 is forecast to be approx. 3,900 MW (including Idaho Power's native load usage); therefore, the 861 MW of network load and transmission customer usage results in approximately 22 percent of the total transmission system usage. As such, non-Idaho Power customers are estimated to pay about 22 percent of the costs associated with B2H.

This transmission revenue will offset the cost of B2H for retail customers. In a similar manner, other portfolios include revenues from market sales of newly installed supply resources, which act to offset costs in those portfolios. This section provides a high-level explanation of the workings of Idaho Power's FERC transmission rate. When determining the annual transmission revenue credit for B2H portfolios, Idaho Power ran a full corporate financial model, including rate of return, depreciation expense, operation and maintenance (O&M), etc.

Idaho Power believes short-term usage of the Idaho Power transmission system by third parties could substantially increase because additional capacity is created, further reducing Idaho Power customer rates. However, to be conservative, Idaho Power assumed there would be no increased short-term or long-term third-party transmission usage and only applied the higher transmission rate to the existing usage.

## Potential BPA and Idaho Power Asset Swap

Corresponding with the construction of B2H, Idaho Power and BPA are working to complete an asset swap that would allow Idaho Power to directly access the Mid-C market and avoid a BPA transmission wheeling charge. Such a swap would result in lower purchased-power prices for

Idaho Power's customers. In return, BPA would be able to directly serve their load in southeastern Idaho and avoid an Idaho Power wheeling charge. As part of the 2017 IRP analysis, Idaho Power conservatively assumed there would be a wheeling charge to access Mid-C resources across B2H. If an asset swap were to take place, the cost of energy in B2H portfolios would be further reduced and make B2H an even more attractive project. Refer to Appendix D-4 for the MOU relating to the potential Idaho Power–BPA asset swap.

# BENEFITS

High-voltage transmission lines, such as B2H, are used to serve customer demand and to move energy between major markets hubs in the Western Interconnection. If the existing western US were to be overlaid with thousands of new miles of high-voltage transmission lines, the entire WECC could be optimized such that all customers would be served with the most economic resources at all times of the year. The long-term need for new supply-side resources would greatly diminish due to the vast diversity of the loads and resources across the Western Interconnection. Such a grid, of course, is economically infeasible, but projects such as B2H are being developed to allow economic resources to be shared between regions. The existing transmission grid is not perfect and many areas of the transmission grid are congested. Transmission congestion causes both economic and reliability issues.

## Capacity

High-voltage transmission lines provide many significant benefits to the Western Interconnection. The most significant benefit of the B2H project is the capacity benefit of the transmission line. Idaho Power is developing the B2H project to create capacity to serve peak customer demand. The capacity benefit is described in more detail in the Resource Need section.

The Pacific Northwest is a winter peaking region. Pacific Northwest utilities continue to install and build generation capacity to meet winter peak regional needs. Idaho Power operates a system with a summer peak demand. Idaho Power's peak occurs in the late June/early July timeframe, which aligns well with spring hydro runoff conditions when the Pacific Northwest is flush with surplus power capacity. The existing transmission system between the Pacific Northwest and Idaho Power is constrained. Constructing B2H will alleviate this constraint and add 1,050 MW of transfer capability between the Pacific Northwest and Idaho Power. Both the Pacific Northwest and Idaho Power will significantly benefit from the addition of transmission capacity between the regions. The Pacific Northwest has already built the power plants and would benefit from selling energy to Idaho Power. Idaho Power needs resources to serve peak load, and a transmission line to existing, underutilized power plants is much more cost effective than building a new power plant.

## Avoid Constructing New Resources (and Potentially Carbon-Emitting Resources

In the early days of the electric grid, utilities built individual power plants to serve their local load. Utilities quickly realized that if they interconnected their systems with low-cost transmission, the resulting diversity of load reduced their need to build power plants. Utilities also realized transmission allowed them to build and share larger, more cost-effective and more efficient power plants. The same opportunities exist today. In fact, B2H is being developed to take advantage of existing diversity.

Table 6 illustrates peak-load estimates, by utility and season, for 2026. The shading represents winter-peaking utilities. As seen in the table, there is significant diversity of load between the regions. The Maximum (MW) column illustrates the minimum amount of generating capacity that would be required if each region were to individually plan and construct generation to meet their own peak load need: 69,000 MW. When all regions plan together, the total generating capacity can be reduced to 63,800 MW, a nearly 10 percent reduction. Transmission connections between the regions, such as B2H, are the key to sharing installed generation capacity.

**Table 6. 2026 peak load estimates—illustration of load diversity between western regions**

| Region | Summer Peak (MW) | Winter Peak (MW) | Maximum (MW) |
|---|---|---|---|
| Avista | 2,200 | 2,400 | 2,400 |
| BPA | 9,200 | 11,000 | 11,000 |
| British Columbia | 10,300 | 13,100 | 13,100 |
| Chelan | 600 | 800 | 800 |
| Grant | 900 | 900 | 900 |
| Idaho Power | 3,800 | 2,800 | 3,800 |
| Nevada | 9,000 | 6,500 | 9,000 |
| Northwestern Energy | 2,000 | 1,900 | 2,000 |
| PacifiCorp—East | 9,500 | 7,900 | 9,500 |
| PacifiCorp—West | 3,600 | 4,000 | 4,000 |
| Portland General | 4,000 | 4,100 | 4,100 |
| Puget Sound | 4,000 | 5,400 | 5,400 |

| Tacoma | 800 | 1,100 | 1,100 |
| **Total** | **61,400** | **63,800** | **69,000** |

Note: 2026 regional peak load data extracted from the WECC TEPPC 2026 Common Case.

Load diversity occurs seasonally, as illustrated in Table 6, but it also occurs sub-seasonally and daily. An additional major variable in the Northwest is hydroelectric generation diversity. Over the winter, water accumulates in the mountains through snowpack. As this snow melts, water

flows through the region's hydroelectric dams, and northwest utilities generate a significant amount of power. During the spring runoff, generation capacity available in the Pacific Northwest can be significantly higher than generation capacity available during the winter, or even during late summer. Idaho Power is fortunate to have a peak load that is coincident with the late spring / early summer hydro runoff. Idaho Power's peak load occurs in late June/early July, when hot weather causes major air-conditioning load coincident with agricultural irrigation/pumping load. Idaho Power's time window for a significant peak is quite short, with agricultural irrigation/pumping load starting to ramp down by mid-July.

Utilities have an obligation to serve customer load. This means that utilities are planning to meet peak load needs. As discussed previously, transmission congestion can cause utilities to build additional generation to serve load. Due to transmission congestion, utilities may be unable to leverage their transmission system to access dormant generation already constructed by their neighbors. The B2H project is an alternative to building new supply-side resources. As demonstrated in the 2017 IRP, the portfolios that are the most cost-effective other than B2H are portfolios with natural gas generation. In this case, B2H is an alternative to building a carbon-emitting supply-side resource.

## Improved Economic Efficiency

Transmission congestion causes power prices on opposite sides of the congestion to diverge. Transmission congestion is managed by dispatching less economically efficient resources to ensure the transmission system is operating securely and reliably. Congestion can have a significant cost. During peak summer conditions, the Idaho to Northwest path in the west-to-east direction becomes constrained and power prices in Idaho and to the east will generally be high, while power prices in the Pacific Northwest will be depressed due to a surplus of power availability without adequate transmission capacity to move the power out of the region. The construction of B2H will alleviate much of this constraint and create a win–win scenario where generators in the Pacific Northwest will be able to gain further value from their existing resource, and load-serving entities in the Mountain West region will be able to meet load service needs at a lower cost. The reverse situation could be true as well—the Pacific Northwest could benefit from economical resources from the Mountain West region during certain times of the years.

## Renewable Integration

Transmission capacity is critical to the integration of renewable generation that, at times, is curtailed due to a lack of transmission capacity to move the energy to load. Transmission is a facilitator for future generation development.

## Grid Reliability/Resiliency

Transmission grid disturbances do occur. B2H will increase the robustness and reliability of the regional transmission system by adding additional high-capacity bulk electric facilities designed with the most up-to-date engineering standards. Major 500-kV transmission lines, such as B2H, substantially increase the grid's ability to recover from major unexpected disturbances. Unexpected disturbances are difficult to predict, but below are a few examples of disturbances whose impacts would be reduced with the addition of B2H:

1. Loss of the Hemingway–Summer Lake 500-kV line with heavy west-to-east power transfer into Idaho. The loss of the Hemingway–Summer Lake 500-kV transmission line, the only 500-kV connection between the Pacific Northwest and Idaho Power, during peak summer load is one of the worst possible contingencies the Idaho Power transmission system can experience. Once Hemingway–Summer Lake 500-kV disconnects, the transfer capability of the Idaho to Northwest path is reduced by over 700 MW in the west-to-east direction. After the addition of B2H, there will be two major 500-kV connections between the Pacific Northwest and Idaho Power. The Hemingway–Summer Lake 500-kV outage would become much less severe to Idaho Power's transmission system.

2. Loss of the Hemingway–Summer Lake 500-kV line with heavy east-to-west power transfer out of Idaho to the Pacific Northwest. In this disturbance, an existing remedial action scheme (power system logic used to protect power system equipment) will disconnect over 1,000 MW of generation at the Jim Bridger Power Plant to reduce path transfers and protect bulk transmission lines and apparatus. Due to the magnitude of the generation loss, recovery from this disturbance can be extremely difficult. After the addition of B2H, this enormous amount of generation shedding will no longer be required. With two 500-kV lines between Idaho and the Pacific Northwest, the loss of one can be absorbed by the other.

3. Loss of a single 230-kV transmission tower in the Hells Canyon area. Idaho Power owns two 230-kV transmission lines, co-located on the same transmission towers, that connect Idaho to the Pacific Northwest. Because these lines are on a common tower, Idaho Power must consider the simultaneous loss of these lines as a realistic planning event. Historically, such an outage did occur on these lines in 2004 during a day with high summer loads. By losing these lines, Idaho Power's import capability was dramatically reduced, and Idaho Power was forced to rotate customer outages for several hours due to a lack of resource availability. After the addition of B2H, the impact of this outage would be substantially reduced.

## Resource Reliability

Transmission unavailability and unexpected forced outages have historically been a fraction of a traditional generation resource. Availability, and contribution to resource adequacy on the power grid, vary significantly by resource type. The North American Electric Reliability Corporation (NERC) has historically tracked transmission availability through a Transmission Availability Data System (TADS) and generation availability through a Generation Availability Data System (GADS) in North America. A telling sign of the reliability of a resource is the equivalent forced outage rate (EFOR). The EFOR is calculated based on the amount of time a transmission line, or generator, is either de-rated, or forced out of service while needed. De-rating a generator would be considered a partial outage, based on the de-rate amount as a percentage of the total capacity.

Table 7 provides the NERC TADS data for different transmission operating voltages. From the NERC TADS data, a 300-mile, 500-kV transmission line (B2H) would be expected to have an outage rate of 0.4 percent. Stated differently, the B2H transmission line is expected to have 99.6 percent availability.

**Table 7. NERC—AC transmission circuit sustained outage metrics**

| Voltage Class | Circuit Miles | No. of Circuits | No. of Outages | Total Outage Time (hr) | Frequency (SCOF) (per 100 CM per yr) | Frequency (SOF) (per circuit per yr) | MTTR or Mean Outage Duration (hr) |
|---|---|---|---|---|---|---|---|
| 200–299 kV | 103,558 | 4,477.5 | 876 | 14,789.6 | 0.8459 | 0.1956 | 16.9 |
| 300–399 kV | 56,791 | 1,623.6 | 394 | 19,766.8 | 0.6938 | 0.2427 | 50.2 |
| 400–599 kV | 32,184 | 594.7 | 141 | 3,957.9 | 0.4381 | 0.2371 | 28.1 |
| 600–799 kV | 9,451 | 110.0 | 28 | 342.4 | 0.2963 | 0.2545 | 12.2 |
| All Voltages | 201,985 | 6,805.8 | 1,439 | 38,856.7 | 0.7124 | 0.2114 | 27.0 |

By comparison, Table 8, lists the average EFOR for traditional fossil fuel power plants (coal, oil, gas, etc.) and the average EFOR for gas power plants.

**Table 8. NERC forced-outage rate information for a fossil or gas power plant**

| Generation Type | Unit Size | EFOR |
|---|---|---|
| Fossil (general) | All Sizes | 7.96% |
| Fossil (general) | 100–199 MW | 7.49% |
| Fossil (general) | 200–299 MW | 5.85% |
| Gas | All Sizes | 9.61% |
| Gas | 1–99 MW | 9.72% |
| Gas | 100–199 MW | 6.85% |

A transmission line with an EFOR of less than 1 percent, on the high end, is significantly more reliable than a power plant, which has an EFOR of 7 to 10 percent. A transmission line, of

course, requires a resource to source the line and serve load. However, the resources purchased at the end of the transmission line can be purchased as firm, whereby the seller must be able to supply the generation no-matter what (which may require purchasing someone else's generation if the primary unit experiences an outage). Therefore, if the resource is purchased as firm, the purchased resource would have an EFOR consistent with the transmission line, which is much more reliable than traditional supply-side generation. In the management of cost and risk, B2H will provide Idaho Power's operators additional flexibility when managing the Idaho Power resource portfolio.

## Reduced Electrical Losses

During peak summer conditions, with heavy power transfers on the Pacific Northwest and Idaho Power transmission systems, the addition of the B2H project is expected to reduce electrical losses by more than 100 MW in the Western Interconnection. This is a considerable savings for the region; 100 MW of generation, that customers ultimately pay for, does not need produced to supply losses alone.

Losses on the power system are caused by electrical current flowing through energized conductors, which in turn create heat. Losses are equal to the electrical current squared times the resistance of the transmission line:

$$Electrical\ Losses = Current^2 \times Resistance$$

From the electrical losses equation above, if the current doubles, the electrical losses will increase by a factor of four. By constructing the B2H line, less efficient (i.e., lower voltage) transmission lines with very large transfers are relieved, reducing the electrical current through these lines and dramatically reducing the losses due to heat.

## Flexibility

Advances in technology are pushing certain existing generation resources toward economic obsolescence. Any supply-side resource alternative could face the same economic obsolescence in the future. B2H is an alternative to constructing a new supply-side resource and therefore, reduces the risk of technological obsolescence. B2H will facilitate the transfer of any generation technology, ensuring Idaho Power customers always have access to the most economic resources, regardless of the resource type.

B2H capacity, when not used by B2H owners, will be available (for purchase) to other parties to make economic interstate west-to-east and east-to-west power transfers for more efficient regional economic dispatch. This provides a regional economic benefit to utilities around Idaho Power that is not factored into the analysis. Specifically, the B2H project will make additional capacity available for Pacific Northwest utilities to sell energy to southern and eastern markets in the West, and for Pacific Northwest utilities to purchase energy from southern and eastern

markets to meet their winter peak load service needs (southern and eastern WECC entities are mostly summer peaking). Idaho Power customers benefit from any third-party transmission purchases as the incremental transmission revenue acts to offset retail customer costs.

The existing electric system is heavily used. Because the system is so heavily used, new transmission line infrastructure, like B2H, creates additional operational flexibility. B2H will increase the ability to take other system elements out of service to conduct maintenance and will provide additional flexibility to move needed resources to load when outages occur on equipment.

## EIM

Idaho Power views the regional high-voltage transmission system as critical to the realization of EIM benefits, and the expansion of this transmission system (i.e., B2H) facilitates the realization of these benefits. As fluctuations in supply and demand occur for EIM participants, the market system will automatically find the best resource(s) from across the large-footprint EIM region to meet immediate power needs. This activity optimizes the interconnected high-voltage system as market systems automatically manage congestion, helping maintain reliability while also supporting the integration of intermittent renewable resources and avoiding curtailing excess supply by sending it to where demand can use it.

Idaho Power notes that EIM participation does not alter its obligations as a balancing authority (BA) required to comply with all regional and national reliability standards. Participation in the western EIM does not change NERC or WECC responsibilities for resource adequacy, reserves, or other BA reliability-based functions for a utility.

### *B2H Complements All Resource Types*

Utility-scale resource installations allow economies of scale to benefit customers in the form of lower cost per watt. For instance, residential rooftop solar is growing in popularity, but the economics of rooftop solar are outweighed by the economics of utility-scale solar installation.[16] Large transmission lines allow the most economical resources to be sited in the most economical locations. As an example, single-axis tracking utility-scale solar in Salem, Oregon, is expected to have a capacity factor of approximately 15 percent (where the capacity factor is the amount of time the system generates over the course of a year). Comparatively, the same single-axis tracking utility-scale solar system in Boise, Idaho, has a capacity factor of approximately 19 percent[17]. If solar system prices are assumed to be equivalent in Salem and Boise, a Boise

[16] The National Renewable Energy Laboratory (NREL) estimates the cost of residential rooftop solar (PV) is approximately 2.5 times the cost of utility-scale solar on a $/Watt basis (NREL, U.S. Solar Photovoltaic System Cost Benchmark: Q1 2017).

[17] NREL, System Advisory Model

installation would generate over 30 percent more energy over the course of the year. Transmission lines provide the ability to move the most economical resources around the region.

Idaho Power views transmission lines like B2H as a complement to any resource type that allows access to the least-cost and most efficient resource, as well as regional diversity, to benefit all customers in the West.

# B2H Benefits to Oregon

## *Economic and Tax Benefits*

The B2H project will result in positive economic impacts for eastern Oregon communities in the form of new jobs, economic support associated with infrastructure development (i.e., lodging and food), and increased annual tax benefits to each county for project-specific property tax dollars. The annual tax benefit for the non-BPA owned portion of the line is shown in Table 9 below. BPA, as a federal entity, does not pay taxes, so BPA's 25 percent project interest is excluded from the estimates. Idaho Power anticipates the project will add about 500 construction jobs, which will provide a temporary increase in spending at local businesses.

**Table 9. Projected annual B2H tax expenditures by county**

| Oregon County | Property Tax (excluding BPA's 25% ownership interest) |
|---|---|
| Morrow | $270,295 |
| Umatilla | $569,656 |
| Union | $629,410 |
| Baker | $1,778,282 |
| Malheur | $893,567 |
| **Total Oregon Tax Benefit** | **$4,141,210** |

## *Local Area Electrical Benefits*

The B2H project will add 1,050 MW of additional transmission connectivity between the BPA and Idaho Power systems. Currently, the transmission connections between BPA and Idaho Power are fully used for existing customer commitments. Idaho Power currently serves customers in Owyhee County, Idaho, and Malheur County and portions of Baker County in Oregon. PacifiCorp, through Pacific Power, serves portions of Umatilla County. BPA provides transmission service to local cooperatives in the remainder of the project area in Morrow, Umatilla, Union, and Baker counties. Below is a summary of how these areas will benefit directly from B2H.

La Grande and Baker City are served by the Oregon Trails Electric Cooperative (OTEC). Portions of Morrow County and Umatilla County are served by Umatilla Electric Cooperative (UEC) and Columbia Basin Electric Cooperative (CBEC). OTEC, UEC, and CBEC pay BPA's

network transmission rate to receive power and transmission service from the BPA system. If BPA finds less expensive solutions to meet service obligations to customers in southeast Idaho and Wyoming, costs are kept low for other BPA customers, including OTEC, UEC, and CBEC. In other words, BPA customers in Oregon benefit by finding a low-cost solution for customers in Idaho and Wyoming. BPA's financial analysis to date has projected that a share of the B2H project with asset exchange appears the most cost-effective, long-term solution to serve customers in southeast Idaho and eastern Wyoming. Correspondingly, OTEC, UEC, and CBEC customers would also benefit from this cost-effective solution.

The B2H project provides economic development opportunities. The cost of power is a major factor in economic development and, as discussed previously, B2H, as a low-cost resource alternative, will keep power costs low compared to more expensive alternatives.

Capacity must be available on the existing system for additional economic development to take place. In Union and Umatilla counties, BPA's McNary–Roundup–La Grande 230-kV line has limited ability to serve additional demand in the Pendleton and La Grande areas but is currently capable of meeting the 10-year load forecast. The B2H project will increase the transfer capability through eastern Oregon by 1,050 MW. This capacity will provide a significant regional benefit to the entire Northwest and specifically benefit load service to eastern Oregon and southern Idaho. It is possible this added capacity resulting from the B2H project could be used to serve additional demand in Union and Umatilla counties.

Portions of Baker County are served by Idaho Power, from Durkee to the east. BPA currently provides energy to OTEC, which serves Baker City via transmission connections between the Northwest and Idaho Power's transmission system. At this point, the existing transmission connections between the Northwest and Idaho Power are fully used for existing load commitments, with very little ability to meet load growth requirements. The B2H project will increase the transmission connectivity between the Northwest and Idaho Power by 1,050 MW, which will allow BPA to serve additional demand in Baker City.

Finally, additional transmission capacity can create opportunities for new energy resources, which can add to the county tax base and create new jobs.

## RISK

Risk is inherent in any infrastructure development project. The sections below address various risks associated with the B2H project. Combining the analysis below with the risk analysis conducted in the 2017 IRP, Idaho Power believes B2H is the lowest-risk resource to meet Idaho Power' resource needs.

## Capital-Cost Risk

The capital-cost estimate for the B2H project has been well vetted. See the Cost section for an explanation of how the B2H project cost estimate was determined. Idaho Power's share of the B2H project is $274 million, including Idaho Power's AFUDC and local interconnection costs. For illustrative purposes, Figure 9 compares total portfolio costs for the 2017 IRP 20-year planning horizon. To determine the fixed costs associated with each portfolio, costs for each resource are levelized over the asset life, and costs beyond 2036 are not included in the analysis. The information from Figure 9 was extracted directly from the IRP Table 9.3.

The B2H project has considerable capital-cost bandwidth. The least-cost B2H portfolio (Portfolio 7) outperforms the least-cost B2H-alternative portfolio (Portfolio 9) by a 2017 net present value (NPV) of $147 million. Note that the B2H estimate already includes 20-percent capital-cost contingency. No other resources evaluated in IRP portfolios include a contingency. Based on NPV analysis over the 20-year planning horizon, Idaho Power's cost share of the B2H project could more than double, and the least-cost B2H portfolio would still be more cost-effective than the least-cost B2H-alternative portfolio.

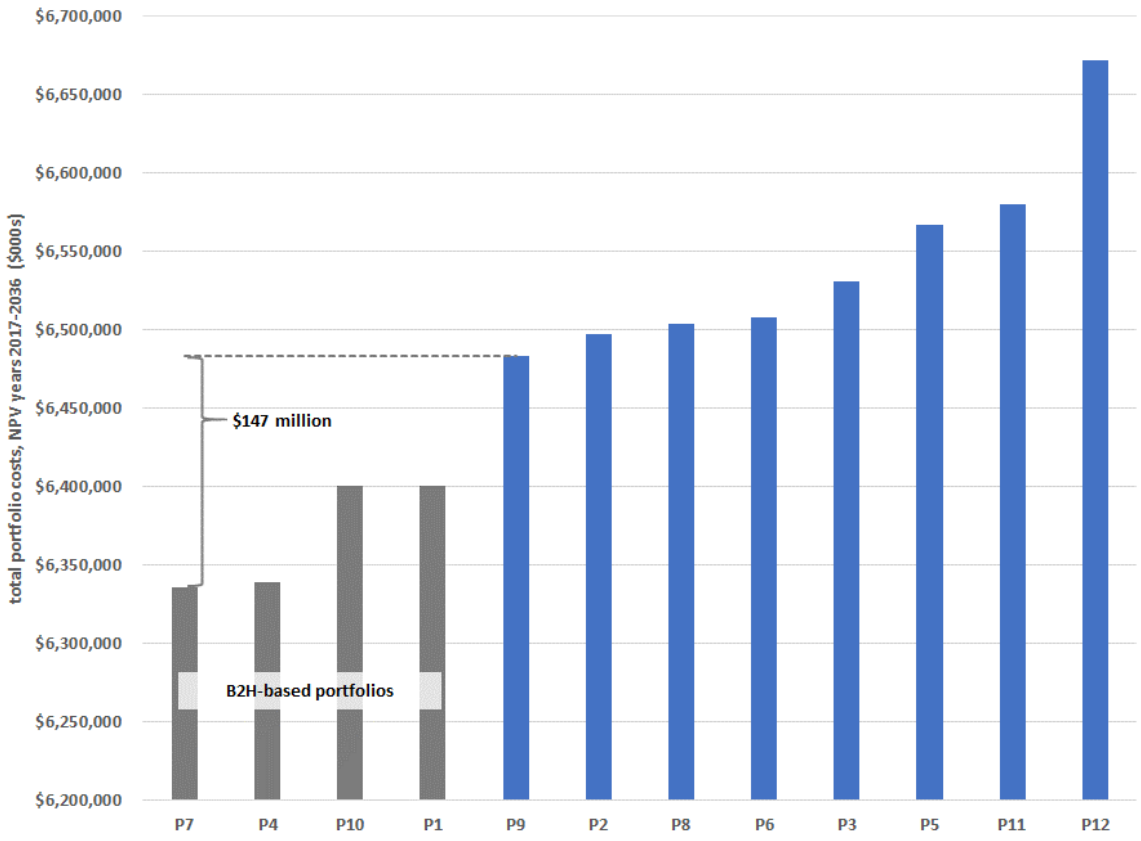

**Figure 9. Comparison of total portfolio costs from 2017 IRP (Table 9.3 in 2017 IRP)**

## Market Price Risk

The cost of dispatching gas-fired generation typically sets the market price of power at Mid-C. A stochastic risk analysis was conducted on all 2017 Idaho Power IRP portfolios, with natural gas prices ranging up to 400 percent of the planning case. Refer to IRP Table 9.4 and Table 9.5 for more information. The natural gas stochastic risk analysis in the 2017 IRP is a market price stochastic analysis because natural gas prices set the energy market prices. Figure 10 below shows three stochastic iterations comparing natural gas prices and Mid-C market prices. The solid lines represent Mid-C energy hub prices, and the dotted lines represent Sumas hub natural gas prices; the natural gas prices and market prices are very closely correlated.

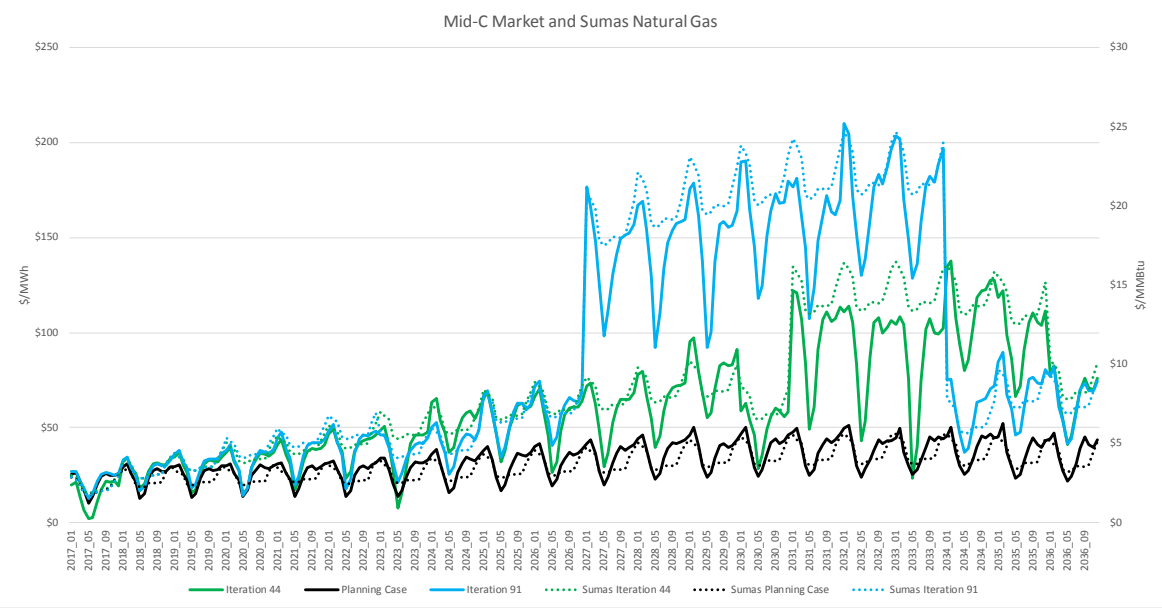

**Figure 10. Correlation between Mid-C market prices and natural gas prices**

Based on the correlation of natural gas prices and market prices, market price risk analysis was considered for the B2H project in Idaho Power's 2017 IRP. Results of the stochastic analysis show B2H portfolios remain the low-cost portfolios for all natural gas price sensitivities, except a 400 percent price sensitivity. However, Idaho Power believes a 400 percent energy market price increase is unlikely because a 400 percent increase in natural gas prices, along with the associated increase in energy prices, would likely result in the development of alternative resources in place of natural gas (that is, developers of more cost-effective resources would take advantage of financial opportunities if market prices increased 400 percent due to natural gas costs).

## Liquidity and Market Sufficiency Risk

The Pacific Northwest is a winter peaking region. Pacific Northwest utilities continue to install and build generation capacity to meet winter peak regional needs. Idaho Power operates a system

with a summer peak. Idaho Power's peak occurs in the late June/early July timeframe. The Idaho Power summer peak aligns with the Mid-C hydro runoff conditions when the Pacific Northwest is flush with surplus power capacity. The existing transmission system between the Pacific Northwest and Idaho Power is constrained. Constructing B2H will alleviate this constraint and add 1,050 MW of total transfer capability between the Pacific Northwest and the Intermountain West region. The Pacific Northwest and Idaho Power will significantly benefit from the addition of transmission capacity between the regions. The Pacific Northwest has constructed power plants to meet winter needs and would benefit from selling energy to Idaho Power in the summer. Idaho Power needs generation capacity to serve summer peak load, and a transmission line to existing underutilized power plants is much more cost-effective than building a new power plant.

See the Market Overview section of this appendix for more information about the Mid-C market hub liquidity. Based on the risk assessment, Idaho Power believes sufficient market liquidity exists.

The following data points will address the market sufficiency risk.

### *Data Point 1. Peak Load Analysis from Table 6*

Referencing Table 6 from the Benefits section above, British Columbia and other utilities in the Pacific Northwest have forecast 2026 winter peaks that exceed their forecast 2026 summer peaks by a combined 7,600 MW. Given the difference in seasonal peaks, coupled with Columbia runoff hydro conditions aligning with Idaho Power's summer peak, resource availability in the Pacific Northwest during Idaho Power's summer peak is likely.

### *Data Point 2. Pacific Northwest Power Supply Adequacy Assessment for 2022—Northwest Power Conservation Council Report*

The Northwest Power and Conservation Council (NWPCC) recently studied the Northwest power system to determine resource adequacy using a five-year forecast. In July 2017, the NWPCC published their 2022 Assessment.[18] The report suggests the Northwest must install 400 MW of new effective capacity by 2021 to meet the NWPCC standard.

The NWPCC, through their analysis, attempted to quantify resource adequacy through a loss-of-load probability (LOLP) analysis. In Figure 11 below, a higher LOLP indicates worse performance (more customer risk), and a lower LOLP indicates better performance. Idaho Power's peak load occurs in a narrow window in the late June/early July timeframe. Figure 11 illustrates the Northwest has a 0 percent LOLP for the June and July months. This indicates that

[18] nwcouncil.org/media/7491213/2017-5.pdf

the Northwest will continue to have sufficient resources available for Idaho Power to purchase and deliver to Idaho Power customers across the B2H line.

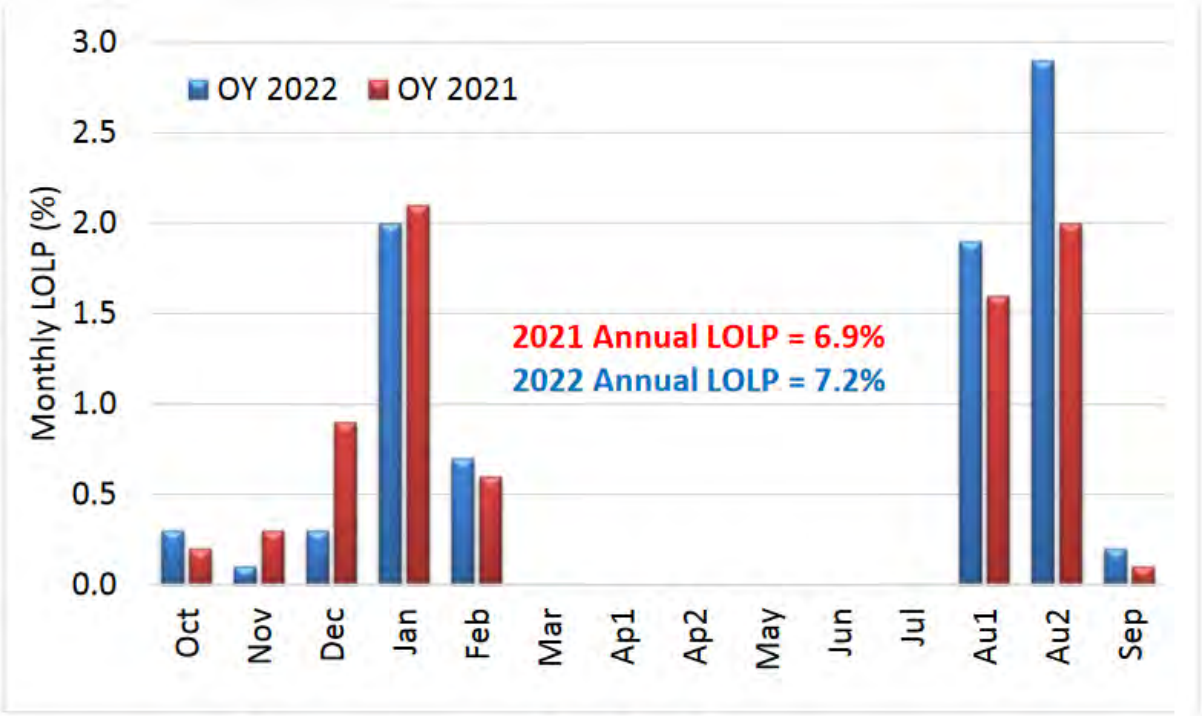

**Figure 11. 2021–22 LOLP by month (Source: NWPCC northwest analysis)**

Evaluating Figure 11 further, the NWPCC information suggests the Northwest region, as a whole, must add resources to address deficiencies in the winter and late summer. Resource additions to address these needs will further increase resource availability in late June/early July. This argument is further stressed in Data Point 3.

## *Data Point 3: 2016 Pacific Northwest Loads and Resources Study—BPA*

The Pacific Northwest Loads and Resources Study[19], commonly called "The White Book," is BPA's annual publication of the federal system and the Pacific Northwest regions loads and resources for the upcoming 10-year period.

Data detailing whether Pacific Northwest resources will be available to purchase post-2025 can be found in the 2016 Pacific Northwest Loads and Resources Technical Appendix, Volume 2,

[19] bpa.gov/power/pgp/whitebook/2016/index.shtml

Footnotes continued on the next page.

Capacity Analysis[20]. This appendix evaluates the Pacific Northwest resource and generation balance to determine a monthly surplus/deficit for the next 10 years. Given the importance of hydro generation in the Pacific Northwest, BPA makes a conservative assumption that there will be a water year equivalent to 1937, one of the worst water years on record.

The BPA capacity metrics are defined as follows:

- **120-Hour Capacity**—Calculated by averaging the generation forecasts from the six highest heavy load hours per day, five days per week, for four weeks per month (6 x 5 x 4 = 120 hours).

- **1-Hour Capacity**—Calculated using the highest single one-hour generation per month.

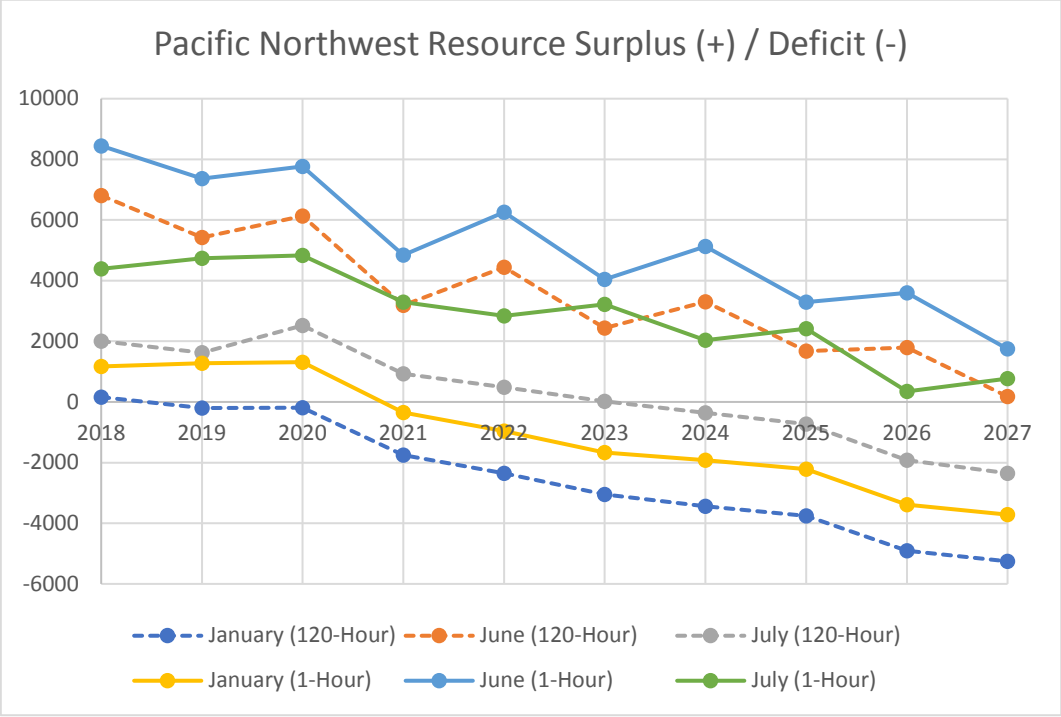

**Figure 12. January, June, and July forecast Pacific Northwest resource surplus/deficit (Source: 2016 BPA White Book)[21]**

Exploring Figure 12 further, Table 10 below lists the critical 2027 data points.

[20] bpa.gov/power/pgp/whitebook/2016/2016-WBK-Technical-Appendix-Volume%20-2-Capacity-Analysis-20161222.pdf

[21] bpa.gov/power/pgp/whitebook/2016/2016-WBK-Technical-Appendix-Volume%20-2-Capacity-Analysis-20161222.pdf

**Table 10. 2027 data points from Figure 12**

| Month | 120-Hour Capacity (MW) | 1-Hour Capacity (MW) |
|---|---|---|
| January | -5,255 | -3,716 |
| June | 177 | 1,748 |
| July | -2,349 | 770 |

Assuming a critical water year equivalent to 1937, BPA forecasts a 2027 January deficit of 5,255 MW in the 120-hour capacity evaluation and a deficit of 3,716 MW in the one-hour capacity evaluation. July is much better than January; BPA forecasts a 2027 deficit of 2,349 MW in the 120-hour capacity evaluation and a surplus in the 1-hour capacity evaluation. BPA forecasts a surplus for June in both the 120-hour and 1-hour capacity evaluations.

Several BPA considerations are built into the analysis:

- Analysis includes a 1,000+ MW export to Canada (summer and winter). In practice, at peak, Canada is typically exporting to the Northwest.
- Renewables are assumed to have a capacity factor near zero.
- California solar exports to the Pacific Northwest are zero.
- Analysis includes committed generation retirements. There are no assumptions for replacement generation.

Given BPA's analysis, Idaho Power believes there will be sufficient resources in the future based on the following:

- Northwest utilities will need to address their severe January deficit. Adding resources to address this deficit will improve the July deficit. A similar argument was made in Data Point 2.
- Canada generally exports 1,000+ MW over summer peak, rather than importing over 1,000 MW per BPA assumptions in the analysis. This reduces the July deficit to almost zero.
- Solar resources should have a summer capacity factor (should not be zero). Idaho Power assumed a 51-percent summer capacity factor in the 2017 IRP for potential Idaho Power utility-scale solar resources.
- All signs point to California exporting solar output to the Pacific Northwest, especially if renewable portfolio standards (RPS) increase.

The 2016 Pacific Northwest Loads and Resources Study can be found on BPA's website.

### *Data Point 4: Northwest and California Renewable Portfolio Standards*

The adoption of more aggressive RPS goals by states such as Oregon, California, and Washington will drive policy-driven resource additions. The RPS goals will also likely result in the addition of dispatchable flexible ramping resources, such as the recently constructed Port Westward 2 power plant installed by Portland General Electric.

### *Market Sufficiency and Liquidity Conclusions*

Based on the analysis summarized above and in the Markets section of this report, Idaho Power believes there will be sufficient resources in the future to source the B2H transmission line. Also, because the market balances supply and demand based on a market clearing price, liquidity risk can be modeled in economic terms. Should demand be greater than supply at the Mid-C energy hub in the future, market hub prices would reflect the scarcity accordingly (higher prices). As discussed in the Market Price Risk section, a sensitivity analysis conducted in the 2017 IRP indicates B2H remains the low-cost resource portfolio over a wide range of market price sensitivities.

## Co-Participant Risks

Idaho Power, BPA, and PacifiCorp, collectively referred to as co-participants or funders, are fully engaged in permitting activities but have not yet entered into construction and operating agreements. Per the 2012 Joint Funding Agreement, Idaho Power has 60 days following the publication of the BLM ROD to issue a Notice of Completion (Notice), which triggers the commencement of construction negotiations. The funders are allotted two 180-day periods (360 days total), following receipt of the Notice, to negotiate one or more definitive development and construction agreements. The BLM ROD was published on November 17, 2017. Idaho Power, PacifiCorp, and BPA have been in negotiations regarding a possible amendment to the Joint Funding Agreement that would clarify ongoing payment terms, update the milestone schedule, and modify construction agreement triggers and negotiation durations.

The funders may withdraw from the Joint Permitting Agreement at any time and for no reason, and the withdrawing funder(s) shall pay all costs up to the last day of the month of withdrawal. If one or more of these funders does not move forward with construction, withdrawals from the project, all rights, title, and interest will be transferred to the remaining funder(s) such that the remaining funder(s) shall have 100 percent of the permitting interest in the permitting project. The remaining funders may then seek other funder(s) and/or proceed with construction.

Although funder commitments are not a guarantee at this point, Idaho Power believes other parties may have interest in potential ownership in the project should one or more of the funders decide not to move forward with construction. At least one additional party was involved in the

original negotiations that ultimately lead to the current three-party 2012 Joint Funding Agreement. Additionally, Idaho Power has been approached by at least one entity that may have interest in the B2H project. Any consideration of additional project co-participants would be discussed and agreed on by current funders.

Changes in ownership structure could change cost allocation percentages. Refer to the Capital-Cost Risk section of this appendix for more information about capital-cost risk. For any potential changes in ownership structure, Idaho Power will evaluate the potential ownership cost and capacity allocation, and assuming cost-effective for Idaho Power customers, would request approval from the Oregon and Idaho public utility commissions for any modification in ownership.

## Siting Risk

Siting any new infrastructure projects comes with siting risk. The BLM ROD, which was released on November 17, 2017, was a significant milestone in the B2H project development and greatly minimized siting risk. It provided the project authorization to cross BLM land and provided the BLM Agency Preferred alternative for the remainder of the route. The USFS and Navy will tier off of the BLM's analysis to conclude their NEPA processes. The State of Oregon EFSC process is the next major step to ensure siting risk is minimized for privately owned land in Oregon.

## Schedule Risk

As of the date of this appendix, Idaho Power has schedule scenarios for B2H in-service dates in 2024 or later. At a high level, activities prior to energization are permitting, co-participant agreements, preliminary construction, and material procurement and construction.

The B2H project is currently in the permitting phase of the project. For federal permitting, the B2H project recently achieved the biggest schedule milestone to date with the release of BLM's ROD on November 17, 2017. The ROD formalized the BLM-led NEPA process and established a BLM Agency Preferred route on public and private property. The USFS ROD and a Navy ROD and easement are the next major federal permitting milestones. At this point, neither the USFS ROD nor Navy ROD are expected to be critical path schedule activities.

For the State of Oregon permitting process, the B2H project also achieved a considerable milestone in summer 2017 with the submittal of the amended Application for Site Certificate to the ODOE. The ODOE is expected to issue a Draft Proposed Order in 2018 and a Final Order and Site Certificate in 2020. The EFSC permitting process is a critical path schedule activity. Schedule risk exists for the EFSC permitting process if the ODOE does not issue a Site Certificate by late 2020.

With the receipt of the BLM ROD and submittal of the amended Application for Site Certificate, which is expected to be deemed complete in the near future, sufficient route certainty exists to begin preliminary construction activities. Assuming co-participant agreements are in place, the current B2H schedule plans to commence preliminary construction activities prior to the receipt of a Site Certificate to achieve an in-service date in the mid-2020s. The B2H co-participants have not formally decided on the contracting method for the project, so the preliminary construction and construction schedule activities remain preliminary until contracts are in place.

Idaho Power believes schedule flexibility exists if the EFSC process is delayed. For instance, certain schedule activities could be condensed by employing more resources or certain activities. Additionally, certain schedule activities could overlap if planned appropriately, such as ROW acquisition and construction.

Currently, Idaho Power believes there is sufficient schedule flexibility to achieve a 2026 in-service date. Idaho Power, BPA, and PacifiCorp plan to negotiate construction agreements in 2018, which should provide additional clarity to the schedule.

## Catastrophic Event Risk

As detailed in B2H Design section, the B2H transmission line is designed to withstand a variety of extreme weather conditions and catastrophic events. Like most infrastructure, the B2H project is susceptible to direct physical attack. However, unlike some other supply-side resources, B2H adds to the resiliency of the electrical grid by providing additional capacity to transfer energy throughout the region should a physical attack or other catastrophic event occur elsewhere on the system. Additionally, Idaho Power also keeps a supply of emergency transmission towers that can be quickly deployed to replace a damaged tower, allowing the transmission line to be quickly returned to service.

# PROJECT ACTIVITIES

## Schedule Update

### *Permitting*

The B2H projected achieved a major milestone with the release of the BLM ROD on November 17, 2017. The BLM ROD formalized the conclusion of the siting process and federally required NEPA. The BLM ROD provides the B2H project the ability to site the project on BLM-administered land. The BLM-led NEPA process took nearly 10 years to complete and involved extensive stakeholder input. Refer to the Project History and Route History sections of this report for more information on project history and public involvement. The next steps in the federal permitting process include a USFS ROD and Navy ROD; both are expected in 2018. Both the USFS and Navy will use the BLM's environmental analysis.

For the State of Oregon permitting process, Idaho Power submitted the amended application for Site Certificate to the ODOE in summer 2017. As of the date of this report, Idaho Power expects the ODOE to issue a Draft Proposed Order in 2018 and a Final Order and Site Certificate in 2020.

The NEPA and EFSC processes are very distinct permitting processes and not necessarily designed to work simultaneously. At a high level, the NEPA EIS process evaluates reasonable alternatives to determine the best alternative (the Agency Preferred Alternative) at the end of the process. Comparative analysis is conducted at a "desktop" level. Information is brought into the process on a phased-approach. Detailed analysis must be conducted on the final route prior to construction, generally once final design is complete.

The Oregon EFSC process is a standards-based process based on a fixed site boundary. For a linear facility, like a transmission line, the process requires the transmission line boundary to be established (a route selected) and fully evaluated to determine if the project meets established standards. The practical effect of the EFSC standards-based process required the NEPA process be far enough along to conduct field studies and other technical analysis to comply with standards. Idaho Power conducted field surveys and prepared the EFSC application in parallel with the NEPA process. The EFSC application is lengthy. Idaho Power estimates the application submitted in 2017 was roughly 17,000 pages long.

### *Post-Permitting*

To achieve an in-service date in the mid-2020s, preliminary construction activities must commence parallel to EFSC permitting activities. Preliminary construction activities include, but are not limited to, the following:

- Geotechnical explorations
- Detailed ground surveys
- Sectional surveys
- ROW acquisition activities
- Detailed design
- Construction bid package development and construction contractor selection

After the Oregon permitting process and preliminary construction activities conclude, construction activities can commence. Construction activities include, but are not limited to, long-lead material acquisition, transmission line construction, and substation construction. The preliminary construction activities must commence several years prior to construction.

The material acquisition and construction activities are expected to take 3 to 4 years. The specific timing of each of the preliminary construction and construction activities will be coordinated with the project co-participants.

## CONCLUSIONS

This B2H 2017 IRP appendix provides context and details that support evaluating the B2H transmission line project as a supply-side resource, explores (qualitatively and quantitatively) many of the ancillary benefits offered by the transmission line, and considers the risks and benefits of owning a transmission line connected to a market hub in contrast to direct ownership of a traditional generation resource.

As discussed in this report, once operational, B2H will provide Idaho Power increased access to reliable, low-cost market energy purchases from the Pacific Northwest. B2H (including early versions of the project) has been a cost-effective resource identified in each of Idaho Power's Integrated Resource Plans (IRP) since 2006 and continues to be a cornerstone of Idaho Power's 2017 IRP preferred resource portfolio. In the 2017 IRP, B2H was identified as the least-cost and least-risk resource to serve peak-hour load to resource deficits that are forecast to occur beginning in 2026. When compared to other individual resource options, B2H is also the least-cost option in terms of both capacity cost and energy cost. B2H is expected to have a capacity cost that is 71 percent lower than either a combined-cycle gas plant or utility-scale solar alternatives.[22] B2H is also expected to have a levelized cost of energy that is 22 percent lower than a combined-cycle gas plant and 38 percent lower than utility-scale solar.[23]

B2H project brings additional benefits beyond cost-effectiveness. The B2H project will increase the efficiency, reliability, and resiliency of the electric system by creating an additional pathway for energy to move between major load centers in the West. The B2H project also provides the flexibility to integrate any resource type and move existing resources during times of congestion, benefiting customers throughout the region. Idaho Power believes B2H provides value to the system beyond any individual resource because it enhances the flexibility of the existing system and facilitates the delivery of cost-effective resources not only to Idaho Power customers, but also to customers throughout the Pacific Northwest and Mountain West regions.

The company must demonstrate a need for the project before EFSC will issue a Site Certificate authorizing the construction of a transmission line. The need demonstration can be met through a commission acknowledgement of the resource in the company's IRP.[24] In this case, Idaho Power

[22] 2017 IRP, Page 87, Figure 7.5.

[23] 2017 IRP, Page 89, Figure 7.6.

[24] OAR 345-023-0020(2).

seeks to satisfy EFSC's least-cost plan rule's requirement through an acknowledgement of its 2017 IRP.

## Appendix D-1. Transmission line alternatives to the proposed B2H 500-kV transmission line

**Table D-1**

Comparison of Transmission Line Capacity Scenarios—New Lines from Longhorn to Hemingway

| Scenario | Line Capacity[1] | Potential Path 14 West-East Increase[2] | Losses on New Circuit(s)[3] |
|---|---|---|---|
| a. Longhorn to Hemingway 230 kV single circuit | 956 MW | 525 MW | 10.8% |
| b. Longhorn to Hemingway 230 kV double circuit | 1,912 MW | 915 MW | 9.5% |
| c. Longhorn to Hemingway 345 kV single circuit | 1,434 MW | 730 MW | 6.6% |
| d. Longhorn to Hemingway 500 kV single circuit | 3,214 MW | 1,050 MW | 4.2% |
| e. Longhorn to Hemingway 500 kV—two separate lines | 6,428 MW | 2,215 MW | 3.7% |
| f. Longhorn to Hemingway 500 kV double circuit | 6,428 MW | 1,235 MW | 2.9% |
| g. Longhorn to Hemingway 765 kV single circuit | 4,770 MW | 1,200 MW | 2.4% |

[1] Line Capacity is the thermal rating of the assumed conductors and does not account for system limitations of voltage, stability, or reliability requirements.

[2] Potential Rating is based upon study results to date to meet reliability design requirements for the WECC ratings processes, not including simultaneous interaction studies.

[3] Estimated Losses are percent losses for the new line at the Potential Rating loading level. Annual energy losses are dependent on total system loss reductions. All of the scenarios would likely yield a total system loss reduction for the flow levels above.

**Table D-2**

Comparison of Transmission Line Capacity Scenarios – Rebuild Existing Lines to the Northwest

| Scenario | Line Capacity[1] | Potential Path 14 Increase[2] | Losses on New Circuit(s)[3] | Length of Line/ New ROW[4] |
|---|---|---|---|---|
| h. Replace Oxbow-Lolo 230 kV with Hatwai - Hemingway 500 kV | 3,214 MW | 430 MW W-E<br>675 MW E-W | 3.8% | 255 Miles/136 Miles |
| i. Replace Oxbow-Lolo 230 kV with Hatwai - Hemingway 500 kV - No double circuiting with existing lines | 3,214 MW | 710 MW W-E<br>745 MW E-W | 4.1% | 255 Miles/167 Miles |
| j. Replace Walla Walla to Brownlee 230 kV with Sacajawea Tap-Hemingway 500 kV | 3,214 MW | 400 MW W-E<br>675 MW E-W | 3.5% | 288 Miles/150 Miles |
| k. Replace Walla Walla to Pallette 230 kV with Sacajawea Tap-Hemingway 500 kV - No double circuiting with existing lines | 3,214 MW | 720 MW W-E<br>730 MW E-W | 3.8% | 288 Miles/181 Miles |
| l. Build double circuit 500 kV/230 kV line from McNary to Quartz. Build 500kV from Quartz to Hemingway. | 3,214 MW | 765 MW W-E<br>870 MW E-W | 3.9% | 298 Miles/168 Miles |

[1] Line Capacity is the thermal rating of the assumed conductors and does not account for system limitations of voltage, stability, or reliability requirements.

[2] Potential Rating is based upon study results to date to meet reliability design requirements for the WECC ratings processes, not including simultaneous interaction studies.

[3] Estimated Losses are percent losses for the new line at the Potential Rating west-east loading level. Annual energy losses are dependent on total system loss reductions. All of the scenarios would likely yield a total system loss reduction for the flow levels above.

[4] In addition to utilizing existing 230 kV right-of-way (“ROW”), each of the scenarios above will require new ROW to be obtained.

**Appendix D-2. Detailed list of notable project milestones**

- June, 2006 – Idaho Power files the 2006 IRP – Transmission line between Boise and Pacific Northwest identified in preferred resource portfolio (this transmission line eventually became the Boardman to Hemingway project)
- December 19, 2007 – Idaho Power Completes the B2H Preliminary Plan of Development
- 2008 – Idaho Power files the 2008 IRP Update
- August 28, 2008 – Idaho Power submits Notice of Intent to EFSC to submit an Application for Site Certificate.
- September 12, 2008 – Notice of Intent published in the Federal Register for BLM to prepare an Environmental Impact Statement for B2H
- April 10, 2009 – Public Scoping Report for B2H EIS completed by Tetra Tech
- December 30, 2009 – Idaho Power files the 2009 IRP – B2H Project identified in preferred resource portfolio
- June 2010 – Idaho Power completes the B2H Preliminary Plan of Development
- July 2010 – Idaho Power submits a NOI to apply for a Site Certificate for B2H to ODOE
- August 2010 – Idaho Power completes the B2H Siting Study
- August 2010- February 2011 – Idaho Power completes the Community Advisory Process
- February 2011 – Idaho Power completes a Revised Plan of Development for B2H
- June 30, 2011 – Idaho Power files the 2011 IRP – B2H Project identified in preferred resource portfolio
- October 5, 2011 – Obama administration recognizes B2H as one of seven national priority projects that when built, will help increase electric reliability, integrate new renewable energy into the grid, create jobs and save consumers money. See news release.
- November 2011 – Idaho Power completes a Revised Plan of Development for B2H
- January 12, 2012 – Idaho Power, BPA and PacifiCorp enter into Joint Permit Funding Agreement
- March 2, 2012 – ODOE issues a Project Order for B2H

- June 2012 – Idaho Power completes a Supplemental Siting Study for B2H
- October 2, 2012 – BPA identifies B2H as the best option for meeting load growth in southeastern Idaho
- November 27, 2012 – Idaho Power receives formal capacity rating from Western Electricity Coordinating Council (WECC)
- February 28, 2013 – Idaho Power submits Preliminary Application for Site Certificate to Oregon Department of Energy
- June 28, 2013 – Idaho Power files the 2013 IRP
- December 19, 2014 – Draft EIS and Land-use Plan Amendments Published in Federal Register
- December 22, 2014 – ODOE issues amended Project Order for B2H
- June 22, 2015 – Idaho Power submits easement application to Navy to site on Naval Weapons System Training Facility Boardman (aka "Bombing Range")
- June 30, 2015 – Idaho Power files the 2015 IRP – B2H Project identified in the preferred resource portfolio
- November 25, 2016 – BLM issues the Final EIS for B2H
- November 18, 2016 – Idaho Power submits revised application to Navy, updating the route on Navy property based on collaborative routing solution
- January 20, 2017 – Donald Trump inaugurated as 45th President of the United State
- June 29, 2017 – Idaho Power submits electronic version of Amended Preliminary Application for Site Certification to ODOE
- June 30, 2017 – Idaho Power files the 2017 Integrated Resource Plan (IRP) – B2H Project identified in the preferred resource portfolio
- July 19, 2017 – Idaho Power submits hard copies of Amended Preliminary Application for Site Certification to ODOE.
- November 17, 2017 – BLM issues a Record of Decision (ROD) for the B2H. The Record of Decision was signed by the Assistant Secretary of Lands and Minerals, U.S. Department of Interior.

# BOARDMAN TO HEMINGWAY TRANSMISSION PROJECT JOINT PERMIT FUNDING AGREEMENT

This Boardman to Hemingway Transmission Project Joint Permit Funding Agreement (the "Agreement") is entered into this 12th day of January, 2012 (the "Effective Date"), by and between Idaho Power Company, an Idaho corporation ("Idaho Power"), PacifiCorp, an Oregon corporation ("PAC"), and the Bonneville Power Administration ("BPA"), a United States government power marketing administration. Idaho Power, PAC, and BPA are hereinafter sometimes individually referred to as a "Funder" and collectively as the "Funders."

## RECITALS

WHEREAS, Idaho Power, PAC, and BPA have independent obligations to plan for and expand their respective transmission systems to provide safe, reliable and cost-effective service to their native load customers, network customers, and/or eligible customers;

WHEREAS, Idaho Power, PAC and BPA recognize the potential to fulfill their respective service obligations through the development of certain new transmission facilities;

WHEREAS, the proposed Boardman to Hemingway Transmission Project is a 500 kV single circuit transmission line located from the vicinity of Boardman, Oregon to the existing Hemingway substation near Melba, Idaho (as further described in Exhibit A, the "Boardman to Hemingway Transmission Project"), that if constructed could assist Idaho Power, PAC, and BPA in fulfilling their respective service obligations;

WHEREAS, Idaho Power, PAC, and BPA recognize that obtaining appropriate and necessary Governmental Authorizations and completing other necessary work is an essential component to developing the Boardman to Hemingway Transmission Project;

WHEREAS, Idaho Power, PAC, and BPA desire to support and contribute funds, with the intent to be joint owners subject to the terms of this Agreement, to the processes associated with obtaining the necessary Governmental Authorizations and completing other necessary work to develop, permit, site, and acquire Rights-of-Way over public lands for the Boardman to Hemingway Transmission Project;

WHEREAS, Idaho Power, PAC, and BPA are entering into this Agreement for the purposes of providing the definitive terms and conditions by which Idaho Power, PAC, and BPA will jointly support and contribute funds, with the intent to be joint owners subject to the terms of this Agreement, to permit, site and acquire Rights of Way over public lands for the development of Boardman to Hemingway Transmission Project;

WHEREAS, Idaho Power has submitted applications to the United States Department of Interior, Bureau of Land Management ("BLM"), serving as the lead permitting agency under the

National Environmental Policy Act ("NEPA"), to obtain authorizations for the Boardman to Hemingway Transmission Project to cross federal lands. The United States Forest Service, United States Department of the Navy and the United States Bureau of Reclamation are cooperating agencies with the BLM in preparing an Environmental Impact Statement ("EIS") for the Boardman to Hemingway Transmission Project;

WHEREAS, Idaho Power has submitted its notice of intent to apply for an energy facility site certificate with the Oregon Department of Energy, Energy Facility Siting Council, to construct the portions of the Boardman to Hemingway Transmission Project located in the State of Oregon;

WHEREAS, Idaho Power, PAC, and BPA intend for the express purpose of this Agreement to facilitate the successful completion of the Project Permitting Objectives (as further defined herein);

WHEREAS, Idaho Power and PAC recognize that, although BPA is entering into this Agreement, BPA has certain obligations and responsibilities under NEPA and other federal laws that it must fulfill before it can make a decision concerning whether to participate in the development and construction of the Boardman to Hemingway Transmission Project, and BPA intends to be a cooperating agency under NEPA on the Environmental Impact Statement being prepared by the BLM and other federal agencies to facilitate completion of BPA's obligations and responsibilities under NEPA;

WHEREAS, Idaho Power and PAC acknowledge that BPA is considering various transmission and other alternatives to meet its service obligations in eastern Idaho and that BPA's decision whether to participate in the development and construction of the Boardman to Hemingway Transmission Project may be based on BPA's evaluation of such alternatives;

WHEREAS, upon the completion of the Project Permitting Objectives, any of the Funders that decide to proceed with the development and construction of the Boardman to Hemingway Transmission Project intend to negotiate in good faith further agreement(s) for the purposes of providing the definitive terms and conditions by which such Funders may jointly design, engineer, procure, construct, commission, own and operate the Boardman to Hemingway Transmission Project (the "Definitive Development and Construction Agreements"); and

WHEREAS, nothing in this Agreement shall affect any other existing or proposed projects, expansions, or developments that are not a part of this Agreement.

NOW, THEREFORE, in consideration of the promises and the mutual covenants and agreements herein contained, the adequacy of which is hereby acknowledged, Idaho Power, PAC, and BPA agree as follows:

## ARTICLE I
## DEFINITIONS; RULES OF INTERPRETATION

1.1 Definitions. As used in this Agreement, the following capitalized terms have the meanings specified in this Section 1.1:

"Advance Contribution" has the meaning set for in Section 4.2(a).

"Affected Party" has the meaning set forth in Section 9.1.

"Affiliate" means, with respect to a Person, each other Person that, directly or indirectly, controls, is controlled by or is under common control with, such designated Person; provided, however, that in the case of PAC "Affiliate" includes MidAmerican Energy Holdings Company and its direct and indirect subsidiaries. For the purposes of this definition, "control" (including with correlative meanings, the terms "controlled by" and "under common control with"), as used with respect to any Person, shall mean (a) the direct or indirect right to cast at least fifty percent (50%) of the votes exercisable at an annual general meeting (or its equivalent) of such Person or, if there are no such rights, ownership of at least fifty percent (50%) of the equity or other ownership interest in such Person, or (b) the right to direct the policies or operations of such Person.

"Agreement" has the meaning set forth in the Preamble.

"Bankrupt" means, with respect to any Person, that such Person: (a) files a petition or otherwise commences, authorizes or acquiesces in the commencement of a proceeding or cause of action under any bankruptcy, insolvency, reorganization or similar law, or has any such petition filed or commenced against it, (b) makes an assignment or any general arrangement for the benefit of creditors, (c) otherwise becomes insolvent (however evidenced), (d) has a liquidator, administrator, receiver, trustee, conservator or similar official appointed with respect to it or any substantial portion of its property or assets, or (e) is generally unable to pay its debts as they fall due.

"BLM" has the meaning set forth in the Recitals.

"Boardman to Hemingway Transmission Project" has the meaning set forth in the Recitals.

"BPA" has the meaning set forth in the Preamble.

"Business Day" means any day other than Saturday, Sunday and any day which is not a federal holiday or a day on which banking institutions in New York, New York are authorized or obligated by Governmental Requirements to close.

"Claims" has the meaning set forth in Section 11.1.

"Commercially Reasonable Efforts" means the level of effort that a reasonable electric utility would take in light of the then known facts and circumstances to accomplish the required action at a then commercially reasonable cost (taking into account the benefits to be gained thereby).

"Completion Funding Payment" has the meaning set forth in Section 3.1(a)(ii) and Exhibit B.

"Completion Notice" has the meaning set forth Section 3.3(a).

"Defaulting Funder" has the meaning set forth in Section 8.1.

"Dispute" has the meaning set forth in Section 13.1.

"Dispute Notice" has the meaning set forth in Section 13.2.

"Disputing Party" has the meaning set forth in Section 13.2.

"Definitive Development and Construction Agreements" has the meaning set forth in the Recitals.

"Effective Date" has the meaning set forth in the Preamble.

"Environmental Impact Statement" has the meaning set forth in the Recitals.

"Event of Default" has the meaning set forth in Section 8.1.

"Executives" has the meaning set forth in Section 13.3(a).

"FERC" means the Federal Energy Regulatory Commission.

"Final Environmental Impact Statement" means the Final Environmental Impact Statement for the Boardman to Hemingway Transmission Project.

"Force Majeure" has the meaning set forth in Section 9.1.

"Funders" has the meaning set forth in the Preamble.

"Funding Committee Representative" has the meaning set forth in Section 3.2(b).

"Funding Invoice" has the meaning set forth in Section 3.1(b)(i).

"Final Expense True-Up" has the meaning set forth in Section 3.1(b)(iii) and Exhibit B.

"Good Utility Practice" means any of the practices, methods and acts engaged in or approved by a significant portion of the electric utility industry during the relevant time period, or any of the practices, methods and acts which, in the exercise of reasonable judgment in light of the facts known at the time the decision was made, would have been expected to accomplish the desired result at a reasonable cost consistent with good business practices, reliability, safety and expedition. Good Utility Practice is not intended to be limited to the optimum practice, method, or act to the exclusion of all others, but rather to be acceptable practices, methods, or acts generally accepted in the region, including those practices required by Federal Power Act section 215(d).

"Governmental Authority" means any federal, state, local or municipal governmental body; any governmental, quasi-governmental, regulatory or administrative agency, commission, body or other authority exercising or entitled to exercise any administrative, executive, judicial, legislative, policy, regulatory or taxing authority or power, including FERC, NERC or any regional reliability council; or any court or governmental tribunal, in each case, having jurisdiction over any Funder (whether as Funder or as Permitting Project Manager) or any of its Affiliates or the development, permitting, siting, acquisition of Rights-of Way, or preliminary design of the Boardman to Hemingway Transmission Project.

"Governmental Authorizations" means any license, permit, order, approval, filing, waiver, exemption, variance, clearance, entitlement, allowance, franchise, or other authorization from or by a Governmental Authority.

"Governmental Requirements" means all laws, statutes, ordinances, rules, regulations, codes, and similar acts or promulgations or other legally enforceable requirements of any Governmental Authority.

"Idaho Power" has the meaning set forth in the Preamble.

"Joint Defense Agreement" has the meaning set forth in Section 11.1.

"Joint Defense Agreement Notice" has the meaning set forth in Section 11.2.

"Manager" has the meaning set forth in Section 13.3(a).

"Mandatory Payments" has the meaning set forth in Section 3.1(a) and Exhibit B.

"Negotiations End Date" has the meaning set forth in Section 3.3(b).

"NEPA" means the National Environmental Policy Act, as the same may be amended from time to time.

"NERC" means the North American Electric Reliability Corporation.

"Non-Defaulting Funders" means a Funder(s) that is not a Defaulting Funder(s).

"Non-Permitting Project Manager Funders" means PAC and BPA.

"Notice of Payment" has the meaning set forth in Section 3.1(b)(ii).

"PAC" has the meaning set forth in the Preamble.

"Person" means an individual, partnership, corporation, limited liability company, joint venture, association, trust, unincorporated organization, Governmental Authority, or other form of entity

"Permit Funding Committee" has the meaning set forth in Section 3.2.

"Permit Funding Payment Schedule" has the meaning set forth in Section 3.1(a)(iii) and Exhibit B.

"Permitting Interest" means, with respect to each of the Funders, their Permitting Interest as set forth in Exhibit D.

"Permitting Project" has the meaning set forth in Section 2.1.

"Permitting Project Manager" means Idaho Power.

"Private Property Interest" has the meaning set forth in Section 2.1.

"Project Costs" has the meaning set forth in Section 3.1(d)

"Project Cost Records" has the meaning set forth in Section 3.1(d).

"Project Permitting Objectives" has the meaning set forth in Section 2.2.

"Project Permitting Timetable" has the meaning set forth in Section 2.2.

"Purchase and Sale Date" has the meaning set forth in Section 3.3(c).

"Purchase and Sale End Date" has the meaning set forth in Section 3.3(c).

"Purchasing Funder" has the meaning set forth in Section 3.3(c).

"Representatives" means, in respect of a Funder or Permitting Project Manager, the directors, officers, shareholders, partners, members, employees, agents, consultants, contractors or other representatives of such Funder or Permitting Project Manager.

"Response Notice" has the meaning set forth in Section 3.3(c).

"Rights-of-Way" means all rights-of-way, easements, grants and other interests on which the Boardman to Hemingway Transmission Project is or will be constructed that are owned or to be owned by Funders or their Affiliates. Private Property Interests are expressly excluded from this Agreement.

"Selling Funder" has the meaning set forth in Section 3.3(c).

"Subchapter K" has the meaning set forth in Section 14.4(b).

"Term" has the meaning set forth in Section 6.1.

"WECC Rating Process" has the meaning set forth in Section 3.3(a)(iii)(A).

"Withdrawal Date" has the meaning set forth in Section 7.2(a).

"Withdrawal Payment" has the meaning set forth in Section 7.2(a).

"Withdrawing Funder" has the meaning set forth in Section 7.1.

1.2 Interpretation. The following rules of interpretation and construction shall apply in this Agreement:

(a) The masculine shall include the feminine and neuter.

(b) References to "Articles," "Sections" and "Exhibits" shall be to articles and sections of and exhibits to this Agreement.

(c) The Exhibits and Schedule 2.2 attached hereto are incorporated in and are intended to be a part of this Agreement.

(d) This Agreement was negotiated and prepared by Idaho Power, PAC, and BPA with the advice and participation of counsel. Idaho Power, PAC, and BPA have agreed to the wording of this Agreement and none of the provisions hereof shall be construed against one Funder on the ground that such Funder is the author of this Agreement or any part hereof.

(e) Each reference in this Agreement to any agreement or document or a portion or provision thereof shall be construed as a reference to the relevant agreement or document as amended, supplemented or otherwise modified from time to time with the written approval of Idaho Power, PAC, and BPA.

(f) Each reference in this Agreement to Governmental Requirements and to terms defined in, and other provisions of, Governmental Requirements shall be references to the same (or a successor to the same) as amended, supplemented or otherwise modified from time to time.

(g) The term "day" shall mean a calendar day, the term "month" shall mean a calendar month, and the term "year" shall mean a calendar year. Whenever an event is to be performed, a period commences or ends, or a payment is to be made on or by a particular date and the date in question falls on a day which is not a Business Day, the event shall be performed, or the payment shall be made, on the next succeeding Business Day; provided, however, that all calculations shall be made regardless of whether any given day is a Business Day and whether any given period ends on a Business Day.

(h) Each reference in this Agreement to a Person includes its successors and permitted assigns; and each reference to a Governmental Authority includes any Governmental Authority succeeding to its functions and capacities.

(i) In this Agreement, the words "include," "includes" and "including" are to be construed as being at all times followed by the words "without limitation." References to "or" shall be deemed to be disjunctive but not necessarily exclusive.

(j) The words "hereof," "herein" and "hereunder" and words of similar import when used in this Agreement shall, unless otherwise specified, refer to this Agreement as a whole and not to any particular provision of this Agreement.

## ARTICLE II
## THE PERMITTING PROJECT

2.1 Joint Permitting. The Funders desire to jointly fund and support, with the intent to be joint owners pursuant to this Agreement, the process of obtaining Governmental Authorizations and completing other necessary work directly related to the siting, permitting, preliminary designing and acquiring Rights-of-Way for the Boardman to Hemingway Transmission Project (collectively, the "Permitting Project"), in accordance with the terms of this Agreement. The planning, design, procurement, and acquisition of private rights of way, private easements, private licenses, and similar private property interests are expressly excluded from this Agreement ("Private Property Interests"). Neither the Funders nor the Permitting Project Manager shall acquire Private Property Interests for the Boardman to Hemingway Transmission Project without the written agreement, not to be unreasonably withheld, of the then current Funders. Idaho Power, BPA, and PAC will define the terms of any acquisition of Private Property Interests by

amending this Agreement in accordance with Section 14.7, entering into a separate agreement expressly for the purpose of acquiring Private Property Interests, or through the incorporation of Private Property Interests into one or more Definitive Development and Construction Agreements. The Funders intend the terms of the acquisition of Private Property Interests to be consistent with the Permitting Interests established in Exhibit D to this Agreement.

2.2 Project Permitting Objectives and Timetable. The objectives (the "Project Permitting Objectives") and timetable (the "Project Permitting Timetable") that Idaho Power, PAC, and BPA desire to achieve with respect to the Permitting Project pursuant to this Agreement are set forth in Schedule 2.2. Idaho Power, PAC and BPA agree to use Commercially Reasonable Efforts to achieve the Project Permitting Objectives and Project Permitting Timetable in accordance with Schedule 2.2.

## ARTICLE III
## FUNDERS & PERMIT FUNDING COMMITTEE

3.1 Funders' Rights & Obligations.

(a) Payment Obligations. Subject to the provisions of Article VII and after the Effective Date:

(i) Each Funder is required to pay the mandatory funding payments as set forth in Exhibit B (the "Mandatory Payments"). Any payment made by a Funder will accrue interest, per annum, on behalf of the Funder calculated in accordance with Idaho Power's AFUDC rate to be credited to the Funder. Any credit shall be included in the funding invoice provided pursuant to Section 3.1(b)(i) and, as applicable, Section 3.1(b)(iii).

(ii) A Funder may elect, but is not required, to pay the final funding payment as set forth in Exhibit B (the "Completion Funding Payment"). A Funder that does not elect to pay the Completion Funding Payment set forth in Exhibit B consistent with Sections 3.1(b)(ii) and a Funder that pays such Completion Funding Payment but does not pay the Final Expense True-Up payment consistent with Section 3.1(b)(iii), shall be deemed a Withdrawing Funder under Article VII of this Agreement.

(iii) A Funder may, in its sole and absolute discretion, elect to make any of the Mandatory Payments or the Completion Funding Payment, in whole or in part, in advance of the date due identified in the Permit Funding Payment Schedule set forth in Exhibit B, in accordance with Section 3.1(b). In the event a Funder elects to make an early payment which includes an

AFUDC accumulation component, accumulation of AFUDC will cease upon receipt of the payment by the Permitting Project Manager.

(b) Method of Payment. All payments required under the terms of this Agreement shall be made to an account or accounts designated by the Permitting Project Manager to which payment is owed by electronic transfer in immediately available funds in the lawful currency of the United States. The Permitting Project Manager shall invoice the payments set forth in Exhibit B of this Agreement as follows:

(i) Mandatory Payments. The Permitting Project Manager shall deliver to the Funders an invoice ("Funding Invoice") ten (10) days in advance of each of the Mandatory Payment dates as set forth in Exhibit B. The invoice shall provide a sufficient level of detail describing the activities to be performed by the Permitting Project Manager, as requested by the receiving Funder. With the exception of Mandatory Payment 1 which is due twenty (20) days after the Effective Date, Funders shall tender payments to the Permitting Project Manager within forty (40) days of receipt of the Funding Invoice. Any payment past due will accrue interest, per annum, calculated in accordance with Section 3.1(a)(i). The failure of the Permitting Project Manager to timely deliver an invoice shall not relieve any Funder of its payment obligations in respect to the Mandatory Payments or Completion Funding Payment shown on such invoice.

(ii) Completion Funding Payment. The Permitting Project Manager shall provide the Funders with written notice of the expected date of completion of the Project Permitting Objectives and an invoice for the Completion Funding Payment within sixty (60) days after the publication of a Final Record of Decision by the BLM in the *Federal Register* for the Boardman to Hemingway Transmission Project (the "Final Payment Invoice"). The Final Payment Invoice shall provide a sufficient level of detail describing the activities performed or to be performed by the Permitting Project Manager, as requested by the receiving Funder. The Funders shall provide written notice to the Permitting Project Manager of its intent to pay the Completion Funding Payment within twenty (20) days from receipt of the Final Payment Invoice for the Completion Funding Payment (the "Notice of Payment"). Any Funder who fails to issue a Notice of Payment within such twenty (20) day period or issues a Notice of Payment within such twenty (20) day period but fails to tender payment to the Permitting Project Manager within forty (40) days of the Notice of Payment shall be deemed a Withdrawing Funder pursuant to Article VII, provided,

however, that Idaho Power may not withdraw from this Agreement pursuant to Article VII. The Funders electing to make the Completion Funding Payment shall tender payment to the Permitting Project Manager within forty (40) days of the Notice of Payment.

(iii) Final Expense True-Up Payment. Except where a Funder has withdrawn from this Agreement pursuant to Article VII, the Permitting Project Manager shall deliver to the Funders an invoice one hundred and eighty (180) days following the Notice of Payment relating to a Completion Funding Payment to include a final true up payment as provided in Exhibit B (the "Final Expense True-Up"). The Final Expense True-Up payment shall include all cost adjustments to Mandatory Payments 1, 2 and 4 approved by the Permit Funding Committee and not previously paid by the Funders to the Permitting Project Manager and any credit for any accrued interest not previously received by the Funders pursuant to Section 3.1(a)(i). The invoice shall provide the Funders sufficient level of detail describing the activities performed by the Permitting Project Manager, as requested by the receiving Funder. The Funders shall tender payment to the Permitting Project Manager within thirty (30) days of receipt of the invoice. The failure by the Permitting Project Manager to timely deliver an invoice shall not relieve any Funder of its payment obligations in respect to the Final Expense True-Up payment shown on such invoice. Any true up associated with a Funder's withdrawal from the Agreement is subject to Article VII. In the case of any overpayment by the Non-Permitting Project Manager Funders, the Permitting Project Manager shall promptly return the amount of the overpayment to the Non-Permitting Project Manager Funder, together with interest for the period from the date of overpayment until such amount has been paid, calculated in the manner prescribed for calculating interest in Section 3.1(a).

(c) Disputed Amounts. If a Funder disputes any portion of any amount described in Exhibit B, the Funder shall pay its total amount of the invoice when due, and, if actually known at the time by the Funder, identify the disputed amount and state that the disputed amount is being paid under protest. Any disputed amount shall be resolved pursuant to the provisions of Article XIII. If it is determined pursuant to Article XIII that an overpayment or underpayment has been made by the Funder or any amount allocated to a Funder on an invoice is incorrect, then (i) in the case of any overpayment by a Funder, the Permitting Project Manager shall promptly return the amount of the overpayment (or credit the amount of the overpayment on the next invoice) to the Funder; and (ii) in the case of an underpayment by the Funder, the Funder shall promptly pay the amount of the

underpayment to the Permitting Project Manager (in each case, together with interest for the period from the date of overpayment, underpayment, or incorrect allocation, until such amount has been paid or credited against a future invoice calculated in the manner prescribed for calculating interest in Section 3.1(a)).

(d) Audit Rights. Each Funder may, at its cost, at any time during normal business hours and with reasonable prior notice to the Permitting Project Manager and the other Funders, of not less than ten (10) Business Days, but not more often than twice in any twelve (12) month period, inspect and audit the books and records of the Permitting Project Manager and any of its Affiliates (and the Permitting Project Manager shall secure such rights for the Permitting Project Manager from its Affiliates) relating: (1) to the determination of the payments set forth in Exhibit B for which the Funders are responsible under this Agreement, including the costs set forth in Exhibit C (the "Project Costs"), within twelve (12) months prior to the date of the audit notice; and (2) directly related to and involved in formulating the Mandatory Payments, Completion Funding Payment, and any applicable true up payment pursuant to this Agreement ("Project Costs Records"). Audit findings shall be provided to each Funder to this Agreement. If any audit discloses that, during such twelve (12)-month period, an overpayment or underpayment of Project Costs has been made by the Funders or the amount of any Project Costs allocated to the Funders on an invoice is incorrect, then such overpayment, underpayment or incorrect amount shall be resolved pursuant to Article XIII. The Funders requesting the audit shall reimburse one hundred percent (100%) of all reasonable costs and expenses (including internal costs and expenses) incurred by or on behalf of the Permitting Project Manager and any of its Affiliates in complying with the provisions of this Section 3.1(d), provided, however, that such Funders shall not be required to reimburse any such costs if the audit determines that Funders, in combination, have made more than Twenty-Five Thousand Dollars ($25,000) in overpayments of Project Costs or more than Twenty-Five Thousand Dollars ($25,000) in Project Costs have been incorrectly allocated to Funders.

(e) Access. The Permitting Project Manager shall, to the extent possible under any Rights-of-Ways, provide each Funder and its designees reasonable access to the Boardman to Hemingway Transmission Project sites to permit the Funders and their designees to inspect the development, preliminary design, siting, Rights-of-Way acquisition and permitting of the Boardman to Hemingway Transmission Project, provided that (i) the Funders and their designees do not interfere with the development, preliminary designing, siting, Rights-of-Way acquisition and permitting of the Boardman to Hemingway Transmission Project or any portion thereof or pose a safety hazard; (ii) the Funders and their designees comply with

any requirements of any Rights-of-Ways applicable to the Boardman to Hemingway Transmission Project; and (iii) the Funders and their designees performing the inspection comply with the Permitting Project Manager's or any other contractor's safety and security rules, notice of which the Permitting Project Manager shall provide to the Funders.

3.2 Permit Funding Committee.

(a) Scope and Authority. The Permit Funding Committee shall consider, evaluate and take action with respect to mutually resolving the following matters: (1) any and all changes in the scope or schedule of the Permitting Project that directly affect the cost of the Mandatory Payments, Completion Funding Payment or the costs otherwise associated with the Permitting Project; (2) any and all proposed cost adjustments to the Mandatory Payments, Completion Funding Payment or costs otherwise described in Exhibit B; (3) any and all technical specifications and other matters related to the Permitting Project; (4) requests from and provide guidance to the Permitting Project Manager from time to time as necessary or when requested relating to the advancement of the Project Permitting Objectives and Project Timetable, or the Permitting Project; (5) general development of policy and strategy with respect to the Permitting Project; and (6) any and all direct or indirect effects of the development of other regional transmission projects (including project schedule and location of potential interconnection points), including, but not limited to, the Cascade Crossing Project and Gateway West Project, on the development and permitting of the Boardman to Hemingway Transmission Project.

(b) Membership. The Permit Funding Committee shall be comprised of a representative of each Funder (each a "Funding Committee Representative"). Each Funder's Funding Committee Representative shall be a senior level representative or designee with authority to consider and act to resolve issues that arise between or among the Funders.

(c) Permitting Project Manager. The Permitting Project Manager shall inform the Permit Funding Committee and the Funding Committee Representatives through formal and informal communication, of the ongoing progress and matters that impact the Governmental Authorizations or other necessary work relating to the Permitting Project. The Permitting Project Manager shall confer and communicate with the Permit Funding Committee and Funding Committee Representatives as to the matters described in Section 3.2(a) or as otherwise provided in this Agreement.

(d) Funding Committee Meetings. The Permit Funding Committee will meet at least monthly, in person or telephonically, or as deemed necessary by the Funding Committee Representatives. Any Funding Committee Representative may request a meeting of the Permit Funding Committee at any time and for any reason. The Permitting Project Manager shall provide the Permit Funding Committee with regular statements, at least monthly, regarding the Permitting Project that include future expense projections.

(e) Funding Committee Procedures. The Funding Committee Representatives shall work in good faith to consider, evaluate and make best efforts to mutually resolve any issues that are raised before the Permit Funding Committee. If the Funding Committee Representatives are unable to mutually resolve any issue, they shall refer the matter to the Executives that have the authority to settle the issue. If the Executives are unable to mutually resolve the issue, the Funders may move to dispute resolution as set forth in Article XIII. All communications and writings exchanged between and/or among the Permitting Project Manager, Funding Committee Representatives, and Executives in connection with the Permit Funding Committee shall be treated as Confidential Information in accordance with Article XII.

(f) Joint Working Groups. Joint working groups may be established by the Permit Funders Committee on an ad hoc basis when the need arises to advance certain specific tasks related to the Permitting Project and the Boardman to Hemingway Transmission Project, including, but not limited to, consultation on technical specifications and other matters related to the Permitting Project.

(g) Committee Conversion. Within sixty (60) days after one or more Funders tenders Mandatory Payment 3 and the Completion Funding Payment set forth in Exhibit B, the Funders shall amend this Agreement, or enter into a new agreement, that establishes a committee structure that is consistent with the Permitting Interests of the Funders.

3.3 Future Agreements

(a) Negotiation Process

(i) Completion Notice. Unless this Agreement is terminated pursuant to Article VI, the Permitting Project Manager shall provide the Funders with written notice within sixty (60) days following the publication of a Final Record of Decision by the BLM in the *Federal Register* for the Boardman to Hemingway Transmission Project (the "Completion Notice") of the expected date of completion of the Project Permitting Objectives.

Notwithstanding the foregoing, any Funder may commence negotiations pursuant to this Section 3.3 for reaching Definitive Development and Construction Agreements at any time by providing written notice of its desire to do so to the other Funders pursuant Section 14.10.

(ii) Negotiation Period. Upon receipt of the Completion Notice, the Funders shall meet, subject to Section 3.3(a)(iii), to negotiate one or more Definitive Development and Construction Agreements for up to one hundred eighty (180) days (the "Negotiation Period"). Upon the termination of the Negotiation Period, the Funders may agree to extend the Negotiation Period for an additional period not to exceed one hundred eighty (180) days.

(iii) Negotiations. During the Negotiation Period, the Funders will attempt, to the greatest extent possible, but subject to the other provisions of this Section 3.3(a)(iii), to keep the Definitive Development and Construction Agreements consistent with the terms and conditions of this Agreement, including the Permitting Interests set forth in Exhibit D, as may be amended from time to time by mutual agreement of the Funders pursuant to Section 14.7. In negotiating the Definitive Development and Construction Agreement the Funders shall also consider the following:

(A) Path Rating. The Funders acknowledge and agree that the Permitting Interest set forth in Exhibit D may be impacted by the WECC Three Phase Project Rating Process (the "WECC Rating Process") and that each Funder's Permitting Interest is subject to the results of the WECC Rating Process. Subject to the outcome of the WECC Rating Process, the Funders may, using the Permitting Interests set forth in Exhibit D as a baseline for allocation, mutually agree to further negotiate, revise, or adjust the Permitting Interest set forth in Exhibit D for purposes of negotiating Definitive Development and Construction Agreements, including adjustments to Mandatory Payments, the Completion Funding Payment or the Final Expense True-Up paid pursuant to this Agreement. The Funders shall cooperate and support each other in the WECC Rating Process in a manner consistent with Section 4.5.

(B) Alternative Analysis. BPA is considering various transmission and other alternatives to meet their service obligations in eastern Idaho. BPA's decision whether to participate in and timing associated with participation in the development and construction of the

Boardman to Hemingway Transmission Project may be based on BPA's evaluation of such alternatives.

(C) BPA NEPA Requirements. BPA has certain obligations and responsibilities under NEPA and other applicable Governmental Requirements that must be fulfilled before it can make a definitive decision concerning whether to participate in development and construction of the Boardman to Hemingway Transmission Project. Nothing in this Agreement shall be construed as obligating or committing BPA to enter into the Definitive Development and Construction Agreement before the NEPA review process for the Boardman to Hemingway Transmission Project has been completed and BPA has made a decision regarding how to proceed. Additionally, PAC's participation in the Boardman to Hemingway Transmission Project may be impacted by the schedule and design specifications of the Cascade Crossing Project and/or the Gateway West Project. As a result, or for other reasons, BPA or PAC may decide not to proceed further and to withdraw from this Agreement in accordance with Article VII at any time.

(D) Additional Materials. The Funders may request the Permitting Project Manager or other Funders to make available, and the Permitting Project Manager or other Funders will make available, on mutually agreed to terms (such agreement not to be unreasonably withheld) additional information related to the design, engineering, construction, or procurement of materials related to the Boardman to Hemingway Transmission Project that are not part of this Agreement.

(b) Negotiation Termination. Any negotiations pursuant to this Section 3.3 shall automatically terminate, unless the Negotiation Period is extended as provided in Section 3.3(a)(ii) (the "Negotiations End Date").

(c) Transfer of Interest. Following the Negotiations End Date and notwithstanding Article V herein, to the extent a Definitive Development and Construction Agreement is not executed, any Funder who has made all payments pursuant to Exhibit B may issue a written notice to proceed with the development and construction of the Boardman to Hemingway Transmission Project to the other Funders (the "Notice to Proceed"). Notwithstanding anything to the contrary in Article VII, within thirty (30) days of the receipt of the Notice to Proceed, each Funder shall notify the other Funders whether it does or does not desire to proceed with the development and construction of the Boardman to Hemingway

Transmission Project (each a "Response Notice"). Within two (2) years of receipt of the last Response Notice (the "Purchase and Sale End Date") the Funders who desire to proceed with the development and construction of the Boardman to Hemingway Transmission Project (each a "Purchasing Funder") shall purchase and the Funders who do not desire to proceed with the development and construction of the Boardman to Hemingway Transmission Project (each a "Selling Funder") shall sell all of the Selling Funder's rights, title, and interests in and to the Permitting Project, including all reports, studies, and Governmental Authorizations, Rights of Way, and any other property whatsoever of whatever nature and kind, whether real or personal, tangible or intangible, acquired or perfected by the Permitting Project Manager for the benefit of the Funder(s) pursuant to the terms of this Agreement. Purchasing Funders shall select the date for the purchase and sale (the "Purchase and Sale Date") which shall occur before the Purchase and Sale End Date, written notice of which they shall provide to the Selling Funders. On the Purchase and Sale Date, the Purchasing Funders shall pay immediately available funds pro-rata (based on their Permitting Interest after giving effect to the sale) and the Selling Funders shall receive the aggregate amount of all payments made pursuant to Exhibit B. The Funders shall execute such agreements and documents as may be reasonably required to facilitate the purchase and sale contemplated pursuant to this Section 3.3 (c).

(d) If two or more Purchasing Funders remain pursuant to Section 3.3(c), the Purchasing Funders shall meet to negotiate one or more Definitive Development and Construction Agreements pursuant to Sectiond 3.3(a)(ii), (a)(iii), (b), (c) and (d).

(e) In the event no Funder has issued a Notice to Proceed, the Funders retain their respective right, title and interest in the Permitting Project pursuant to this Agreement.

3.4 Other Projects. Nothing in this Agreement shall preclude a Funder from taking any action (or having its Affiliates take any action) with respect to any other transmission project, including a transmission project that may compete with the Permitting Project.

## ARTICLE IV
## PERMITTING PROJECT MANAGER

4.1 Appointment of Permitting Project Manager.

(a) Appointment. The Funders hereby appoint Idaho Power, and Idaho Power hereby accepts appointment, to serve as Permitting Project Manager of the Permitting

Project and will perform the obligations of the Permitting Project Manager expressly set forth in this Agreement, in accordance with the terms and conditions of this Agreement.

(b) Duty. The Funders agree that the Permitting Project Manager shall not have any obligations, responsibilities or duties to the Funders other than as are expressly provided for in this Agreement.

4.2 Authority of Permitting Project Manager.

(a) Role of Permitting Project Manager. The Permitting Project Manager shall administer and oversee the Permitting Project and shall be responsible for the day to day activities involved in advancing the Permitting Project to achieve the Project Permitting Objectives and Project Permitting Timetable, including the responsibility for obtaining all required Governmental Authorizations, siting, and Rights-of-Way acquisition relating to the Boardman to Hemingway Transmission Project. The Permitting Project Manager will advance funds in anticipation of receiving the Mandatory Payments from Funders, as necessary, to fulfill the Permitting Project Objectives ("Advance Contributions"). Idaho Power's Advance Contributions will accrue interest, per annum, calculated in accordance with Idaho Power's AFUDC rate. The Advance Contributions and accrued AFUDC will be reimbursed as part of the Funder's Mandatory Payments 2 or 4 as set forth in Exhibit B, as applicable. The Permitting Project Manager shall not collect payments other than those described in Exhibit B or as approved by the Permit Funding Committee. The Permitting Project Manager will exercise or enforce all benefits, rights and remedies under this Agreement for the benefit of the Funders pro rata (in accordance with their respective Permitting Interests) and without adverse distinction or undue discrimination between or against the Funder's respective Permitting Interests. In furtherance and not in limitation of the immediately preceding sentence, the Permitting Project Manager agrees to transfer, assign, distribute, pay over or otherwise make available to the Non-Permitting Project Manager Funders, the Non-Permitting Project Manager Funder's pro rata share (based on its respective Permitting Interests) in any payments or proceeds obtained pursuant to this Agreement.

(b) Communication. The Permitting Project Manager shall have the duty to communicate the status of the Permitting Project, including the Project Permitting Objectives, on a regular basis with the Permitting Funding Committee in a manner consistent with Section 3.2(c).

(c) Reporting. The Permitting Project Manager shall be responsible for preparing and distributing monthly reports to the Permitting Project Committee (or less

frequently if mutually required by the Permit Funding Committee) regarding (i) Project Costs paid and projected to be incurred, and, to the extent necessary, recommend to the Permit Funding Committee adjustments to the Permit Funding Schedule to satisfy expected Project Costs to be incurred in relation to the Project Permitting Objectives and (ii) activity and progress with respect to achieving the Project Permitting Objectives and the Project Permitting Timetable. The Permitting Project Manager shall be responsible for preparing and distributing reports to the Permit Funding Committee at such other times as any material change occurs or is contemplated that affects the achievement of the Project Permitting Objectives.

(d) Project Coordination. Notwithstanding anything to the contrary contained in this Agreement, the Permitting Project Manager shall work diligently, consult with and obtain the express written approval of the Funders with respect to the location, technical design and engineering specifications relating directly to the interconnection point of the Boardman to Hemingway Transmission Project and the proposed Cascade Crossing Project and Gateway West Project.

4.3 Funder's Ownership Interests.

(a) Perfection of Existing Ownership Interests. Commencing on the Effective Date of this Agreement, the Permitting Project Manager will take all necessary and reasonable action, unless prohibited by applicable Governmental Requirements, to perfect and vest, on behalf and in the name of the Funders, in accordance with the Funders' Permitting Interest set forth in Exhibit D, an undivided ownership interest as tenants-in-common in all right, title, and interest in all reports, studies, Governmental Authorizations (including permits) and other property of whatever nature and kind, whether real or personal, tangible or intangible, purchased or acquired prior to the Effective Date by or on behalf of the Permitting Project Manager or Idaho Power for the Boardman to Hemingway Transmission Project, including all Governmental Authorizations and Rights-of-Way required for the Boardman to Hemingway Transmission Project and acquired by Idaho Power hereunder.

(b) Perfection of Future Ownership Interests. Following the Effective Date of this Agreement, the Permitting Project Manager shall acquire, unless prohibited by applicable Governmental Requirements, on behalf and in the name of the Funders, in accordance with the Funders' respective Permitting Interests set forth in Exhibit D, an undivided ownership interest as tenants-in-common in all right, title, and interest in all reports, studies, Governmental Authorizations (including permits) and other property of whatever nature and kind, whether real or personal,

tangible or intangible, for the Boardman to Hemingway Transmission Project, including all Governmental Authorizations and Rights-of-Way required for the Boardman to Hemingway Transmission Project and acquired by the Permitting Project Manager hereunder. The Funders and the Permitting Project Manager agree that any reports, studies and Governmental Authorizations shall be issued in the names of all Funders. Notwithstanding any provision to the contrary contained in this Agreement, the Permitting Project Manager shall make all applications for Government Authorizations, and shall obtain all such Government Authorizations, reports, and studies, in the name of the Funders, to the extent permitted by applicable Governmental Requirements. In the event a Governmental Authorization, report or study is not issued in the name of all Funders, the Funders and Permitting Project Manager agree to take all necessary and reasonable actions to perfect and vest, on behalf and in the name of the Funders, in accordance with the Funders' respective Permitting Interests, an undivided ownership interest as tenants-in-common in all right, title and interest in all such Governmental Authorizations, reports, and studies.

(c) Forfeiture of Ownership Interests. In the event any Funder elects not to make all of the payments set forth in Exhibit B, or otherwise withdraws from this Agreement pursuant to Article VII, the Withdrawing Funder shall convey to the remaining Funders all right, title, and interest in this Agreement, as well as all right title and interest in all reports, studies, Governmental Authorizations (including permits), Rights of Way, and any other property whatsoever of whatever nature and kind, whether real or personal, tangible or intangible, acquired or perfected by the Permitting Project Manager for the benefit of the Funders pursuant to the terms of this Agreement pursuant to Section 7.2. If and to the extent the right, title, or interest in any permit or Governmental Authorization is by its terms or pursuant to applicable law not assignable, the Withdrawing Funder shall execute such reasonable agreements, licenses, or other instruments as shall be deemed reasonably necessary by the remaining Funders to otherwise convey all use and enjoyment of the Withdrawing Party's right, title, and interest in such permit or Governmental Authorization.

4.4 Standard of Work. The Permitting Project Manager shall perform all of its obligations under this Agreement as an independent contractor and in accordance with Good Utility Practice and applicable Governmental Requirements and Governmental Authorizations and without adverse distinction among the Funders.

4.5 Assistance. Each Funder shall cooperate with the Permitting Project Manager promptly, as and when reasonably requested by the Permitting Project Manager, to assist the Permitting Project Manager in the performance of its duties, responsibilities and

obligations under this Agreement, including executing and delivering from time to time such additional documents, certificates or instruments, and taking such additional actions, as may be reasonably requested by the Permitting Project Manager. Each Funder shall bear its own costs for providing such cooperation and assistance as requested by the Permitting Project Manager unless all of the Funders agree otherwise in writing. Each Funder shall provide internal personnel, services, know how, intellectual property or other internal resources as may be reasonably necessary or appropriate to carry out the intent of and to perform the Funders' and Permitting Project Manager's obligations under this Agreement or as all of the Funders may otherwise agree to in writing; provided however, to the extent the Permitting Project Manager desires to use for the purposes of this Agreement services of a Funder that are the subject of a separate agreement, such Funder shall consent, in its sole and absolute discretion, to such use and be reimbursed by the other Funders and the Permitting Project Manager as mutually agreed to by all the Funders. No Funder (other than Idaho Power in its role as Permitting Project Manager) shall have the right to invoice the other Funders for the costs or expenses associated with the utilization of internal personnel, services, know how intellectual property or other internal resources necessary or appropriate to carry out the intent of and to perform its obligations under this Agreement, unless otherwise agreed upon in writing by the Funders. Nothing in this Agreement shall preclude a Funder from exercising any rights expressly granted it under this Agreement or taking any action (or having its Affiliates take any action) with respect to any other transmission project, including any such project that may compete with the Permitting Project. The Permitting Project Manger shall request assistance under this Section 4.5 without adverse distinction of the Funders.

4.6 Remedies.

(a) Notwithstanding any provision to the contrary contained in this Agreement, the Permitting Project Manager shall not have any liability to the Non-Permitting Project Manager Funders in connection with the performance of its covenants and obligations under this Agreement, provided, however, the Permitting Project Manager shall be liable for any direct actual damages resulting from its own negligence or breach of this Agreement. The Funders agree that each Funder has a duty to mitigate any damages and shall use Commercially Reasonable Efforts to minimize any damages it may incur as a result of the Permitting Project Manager's failure to perform or breach of any of its covenants or obligations under this Agreement.

(b) The Funders and the Permitting Project Manager acknowledge that the obligations and covenants performed by the Permitting Project Manager hereunder are unique and that the Non-Permitting Project Manager Funders will be irreparably injured should such obligations and covenants not be performed in accordance with the

terms and conditions of this Agreement. Consequently, the Non-Permitting Project Manager Funders will not have an adequate remedy at law if the Permitting Project Manager shall fail to perform its obligations and covenants hereunder. The Non- Permitting Project Manager Funders shall have the right, in addition to any other remedy available under this Agreement, to specific performance of the Permitting Project Manager's obligations and covenants hereunder, and the Funders and the Permitting Project Manager agree not to take a position in any proceeding arising out of this Agreement to the effect that the Non-Permitting Project Manager Funder has an adequate remedy at law.

4.7 Injury to Third Parties. Idaho Power and PAC shall be responsible for obtaining and maintaining during the Term insurance covering their respective legal liabilities to third persons or the property of third persons related to their respective obligations under this Agreement in amounts consistent with Good Utility Practice and any applicable Governmental Requirements. Insurance coverage required by this Section 4.7 for Idaho Power and PAC may be through a carrier or self-insured, or any combination of carrier insured and self-insured. BPA shall be responsible for injury or damage to third persons or the property of third parties related to its obligations under this Agreement and caused by BPA in accordance with the provisions of the Federal Tort Claims Act.

## ARTICLE V
## TRANSFER OF RIGHTS AND INTERESTS; ASSIGNMENT

5.1 Prohibited Transfers and Assignments. Except as provided in Section 3.3(c) and Section 5.2, no Funder may, without the express written consent of the other Funders (such consent not to be unreasonably withheld, conditioned or delayed) sell, assign, transfer, convey or otherwise dispose of, directly, in whole or in part, any of its rights, titles or interest in and to (a) this Agreement including its rights, duties and obligations hereunder, or (b) the Permitting Project. Any sale, assignment, transfer, conveyance or other disposition in violation of this Article V shall be null and void.

5.2 Permitted Assignments and Transfers. Notwithstanding anything to the contrary contained in this Agreement, Section 5.1 shall not restrict:

(a) the right of any Funder to transfer voluntarily (and without the consent of the other Funders) all of its Permitting Interest in the Permitting Project and all of its rights, titles and interests in and to this Agreement (including all of its rights and obligations in this Agreement as Permitting Project Manager, if any) in connection with any sale, merger or other transfer of substantially all of such Funder's electric transmission facilities as an operating entity; provided, however, that the effectiveness of such assignment shall be conditioned upon the assignee

agreeing in writing to assume all of the rights and obligations of the assigning Funder under this Agreement (including all of its rights and obligations in this Agreement as Permitting Project Manager, if any) as of the effective date of assignment;

(b) the right of any Funder to transfer voluntarily (and without the consent of the other Funders) all of its Permitting Interest in the Permitting Project and all of its rights, titles and interests in and to this Agreement (including all of its rights and obligations in this Agreement as Permitting Project Manager, if any) to an Affiliate of the Funder; provided, however, that the effectiveness of such assignment shall be conditioned upon the assignee agreeing in writing to assume all of the rights and obligations of the assigning Funder under this Agreement (including all of its rights and obligations in this Agreement as Permitting Project Manager, if any) as of the effective date of assignment;

(c) the right of any Funder to transfer voluntarily all of its Permitting Interest in the Permitting Project and all of its rights, titles and interest in and to this Agreement (including all of its rights and obligations in this Agreement as Permitting Project Manager, if any) to a third party that is financially and technically capable of performing the transferring Funder's (and, Permitting Project Manager's, if any) obligations under this Agreement; provided that: (i) the other Funders approve, in their sole discretion, such transfer, and (ii) the other Funders are offered the right of first refusal to purchase such Permitting Interest and all of the transferring Party' rights, titles and interests in and to this Agreement (including all of its rights and obligations in this Agreement as Permitting Project Manager, if any) at the amounts set forth in the Permitting Funding Schedule; provided, however, that the effectiveness of such assignment shall be conditioned upon the third-party purchaser agreeing in writing to assume all of the rights and obligations of the assigning Funder under this Agreement (including all of its rights and obligations in this Agreement as Permitting Project Manager, if any) as of the effective date of assignment.

5.3 Release. Upon any assignment or transfer pursuant to this Section 5.2, no Funder transferring or assigning its right, title and interest in this Agreement and the Permitting Project shall have any further obligations or responsibilities under this Agreement.

## ARTICLE VI
## TERM

6.1 Term. The term of this Agreement ("Term") shall commence on the Effective Date and shall continue in full force and effect until the successful completion of the duties and obligations under this Agreement in accordance with the terms of this Agreement, unless

terminated earlier as set forth in this Article VI. Notwithstanding the foregoing, this Agreement shall terminate not later than January 1, 2022.

6.2 Early Termination.

(a) The Term of this Agreement shall terminate effective upon the occurrence of any of the following:

(i) Withdrawal of two (2) Funders, if there are three (3) Funders at the time, or one (1) Funder, if there are only two (2) Funders at the time, in each case, pursuant to Article VII;

(ii) the mutual written consent of the Funders; or

(iii) The effective date of a separate written agreement among all of the then current Funders which by its terms supersedes this Agreement.

(b) If this Agreement is terminated pursuant to this Section 6.2, then, except as for those provisions that are expressly intended to survive termination pursuant to this Agreement, this Agreement shall terminate and become void and of no further force and effect, without further action by any Funder, provided that no Funder shall be relieved from any of its obligations or liabilities hereunder accruing prior thereto.

(c) If this Agreement is terminated pursuant to Section 6.2(a)(i), then the Non-Withdrawing Funder may, in its sole and absolute discretion, proceed with the Permitting Project.

## ARTICLE VII
## WITHDRAWAL

7.1 Withdrawal. PAC or BPA may withdraw from this Agreement at any time and for any reason, or for no reason, subject to the limitations of this Article VII (a "Withdrawing Funder"). Idaho Power shall have no right to withdraw from this Agreement under any circumstance or at any time, including if it is a Defaulting Funder pursuant to Article VIII. A Withdrawing Funder shall provide reasonable prior written notice to the other Funders of its intent to withdraw from this Agreement ("Notice of Withdrawal"), and the Notice of Withdrawal shall specify the effective date of withdrawal, which in no event shall be less than five (5) Business Days after the date of delivery of the Notice of Withdrawal.

7.2 Effect of Withdrawal. The Withdrawing Funder's withdrawal from this Agreement shall be subject to the following:

(a) Withdrawal will become effective as of the last day of the month the Withdrawing Funder provides its Notice of Withdrawal ("Withdrawal Date"). As of the Withdrawal Date, the Withdrawing Funder shall be obligated to pay the Permitting Project Manager any outstanding Mandatory Payments identified in Exhibit B, including a true up that shall include all cost adjustments to Mandatory Payments 1, 2 and 4 approved by the Funding Committee and not previously paid by the Withdrawing Funder as of the Withdrawal Date and any credit for any accrued interest pursuant to Section 3.1(a)(i) (the "Withdrawal Payment"). The Permitting Project Manager shall invoice, in a manner consistent with Section 3.1(b), the Withdrawing Funder for the Withdrawal Payment within one hundred twenty (120) days following the Withdrawal Date.

(b) Except as otherwise provided in Article III of this Agreement, effective as of the Withdrawal Date, a Withdrawing Funder shall forfeit and transfer to the remaining Funders all of its right, title and interest in: (i) the Permitting Project, including all Governmental Authorizations, and amounts paid to the Permitting Project Manager through the Withdrawal Date; (ii) all Rights-of-Way issued by the BLM and other federal agencies (including any other permits, licenses, options, permissions); and (iii) any and all reports and studies. The Withdrawing Funder's Permitting Interest (including all project investments associated therewith) shall be allocated to the remaining Funders at no cost to the remaining Funders, such that the remaining Funders shall have 100% of the Permitting Interest in the Permitting Project.

(c) The Withdrawing Funder shall execute such documents and instruments as may be reasonably requested by the remaining Funders in connection with the withdrawal, including as may be necessary to evidence the Withdrawing Funder's relinquishment of its rights, titles and interest in the Permitting Project; provided, however, that the remaining Funders shall not be obligated to pay or reimburse the Withdrawing Funders for any Project Costs or the Withdrawal Payment paid to the Permitting Project Manager through the Withdrawal Date or to otherwise compensate the Withdrawing Funder for its rights, titles and interest in the Project.

## ARTICLE VIII
## EVENT OF DEFAULT

8.1 Event of Default. Each of the following events shall constitute an event of default ("Event of Default") by the defaulting Funder, including the Permitting Manager Funder, (a "Defaulting Funder"):

(a) Subject to Section 3.1(b)(ii), the failure to make, when due, any payment required pursuant to this Agreement, if such failure is not remedied within ninety (90) days after written notice thereof from a Non-Defaulting Funder;

(b) any material representation or warranty made by a Defaulting Funder herein that is false or misleading in any material respect when made, unless (i) the fact, circumstance or condition that is the subject of such representation or warranty is made true within thirty (30) days after notice thereof from a Non-Defaulting Funder, provided that if the fact, circumstance or condition that is the subject of such representation or warranty reasonably cannot be corrected within such thirty (30) day period, then the Defaulting Funder shall have an additional period of time (not to exceed sixty (60) days) in which to correct the fact, circumstance or condition that is the subject of such representation or warranty so long as the Defaulting Funder commences good faith activities to correct the fact, circumstance or condition that is the subject of such representation or warranty during the initial 30-day cure period and continues thereafter to utilize Commercially Reasonable Efforts to effect a cure, and (ii) (A) such cure removes any adverse effect on the Non-Defaulting Funders of such fact, circumstance or condition being otherwise than as first represented, or (B) such fact, circumstance or condition being otherwise than as first represented does not materially adversely affect the Non-Defaulting Funders;

(c) a transfer, assignment or other disposition of its interest in this Agreement or its Permitting Interest in the Permitting Project, in each case, in violation of Article V;

(d) the failure to perform or breach of any material covenant or obligation set forth in this Agreement (other than provided for in this Section 8.1), if such failure is not remedied within thirty (30) days after written notice thereof from a Non-Defaulting Funder, provided that if such failure or breach cannot reasonably be cured within thirty (30) days, then the Defaulting Funder shall have an additional period of time (not to exceed ninety (90) days) in which to cure such failure or breach so long as the Defaulting Funder commences good faith activities to cure the failure or breach during the initial 30-day cure period and thereafter continues to utilize Commercially Reasonable Efforts to effect a cure; or

(e) the Defaulting Funder or the Permitting Project Manager becomes Bankrupt.

8.2 Cure by Non-Defaulting Funders. If a Defaulting Funder fails to cure an Event of Default, then the Non-Defaulting Funders may, individually or together, in their respective sole discretion, attempt to cure the Event of Default, provided that the

Defaulting Funder shall reimburse the Non-Defaulting Funders for all costs and expenses incurred by or on behalf of the Non-Defaulting Funders pursuant to this Section 8.2.

8.3 Remedies.

(a) If an Event of Default occurs and is continuing, then each of the Non-Defaulting Funders shall be entitled to exercise any of its remedies provided for in this Agreement and any of its remedies at law or in equity, including recovery from the Defaulting Funder of any damages suffered as a result of the Event of Default, subject to Section 11.6. The Non-Defaulting Funders shall use Commercially Reasonable Efforts to mitigate any damages suffered as a result of the Event of Default.

(b) If an Event of Default by BPA or PAC occurs and is not cured as provided in this Article VIII, then BPA or PAC, as the Defaulting Funder, shall be deemed to be a Withdrawing Funder under and subject to the terms of Article VII.

(c) The Funders acknowledge that the obligations and covenants performed by Idaho Power (as a Funder and Permitting Project Manager) hereunder are unique. If an Event of Default by Idaho Power occurs and is not cured as provided in this Article VIII, BPA and PAC shall have the right, in addition to any other remedy available under this Agreement, at law, or in equity, to seek specific performance of Idaho Power's obligations and covenants hereunder, and the Non-Defaulting Funders agree not to take a position in any proceeding arising out of this Agreement to the effect that the Non-Defaulting Funders have an adequate remedy at law.

## ARTICLE IX
## FORCE MAJEURE

9.1 Force Majeure Defined. For purposes of this Agreement, "Force Majeure" means an event or circumstance beyond the reasonable control of, and without the fault or negligence of, a Funder or Permitting Project Manager claiming Force Majeure ("Affected Party"), which, despite the exercise of reasonable diligence, cannot be or be caused to be prevented, avoided or removed by such Affected Party including, to the extent satisfying the above requirements, acts of God; earthquake; abnormal weather condition; hurricane; flood; lightning; high winds; drought; peril of the sea; explosion; fire; war (declared or undeclared); military action; sabotage; riot; insurrection; civil unrest or disturbance; acts of terrorism; economic sanction or embargo; civil strike, work stoppage, slow-down, or lock-out that are of an industry or sector-wide nature and that are not directed solely or specifically at the Affected Party; the binding order of any Governmental Authority, provided that the Affected Party has in good faith reasonably

contested such order; the failure to act on the part of any Governmental Authority, provided that such action has been timely requested and diligently pursued; unavailability of equipment, supplies or products, but only to the extent caused by Force Majeure; failure of equipment, provided that the equipment has been operated and maintained in accordance with Good Utility Practice; and transportation delays or accidents, but only to the extent otherwise caused by Force Majeure; provided, however, that neither insufficiency of funds, financial inability to perform nor changes in market conditions shall constitute Force Majeure.

9.2 Effect of Force Majeure.

(a) If an Affected Party is rendered wholly or partly unable to perform its obligations under this Agreement or its performance is delayed because of Force Majeure, such Affected Party shall be excused from, and shall not be liable for, whatever performance it is unable to perform or delayed in performing due to the Force Majeure to the extent so affected, provided that:

(i) The Affected Party, as soon as reasonably practical after the commencement of the Force Majeure, gives the other Funders (s) and/or the Project Manager prompt written notice thereof, including a description of the particulars of the Force Majeure;

(ii) The suspension of performance is of no greater scope and of no longer duration than is required by the Force Majeure; and

(iii) The Affected Party uses Commercially Reasonable Efforts to overcome and remedy its inability to perform as soon as reasonably practical after the commencement of the Force Majeure.

(b) Notwithstanding anything in this Article IX to the contrary, no payment obligation arising under this Agreement prior to the date of an event of Force Majeure shall be excused by such event of Force Majeure.

(c) Whenever an Affected Party is required to commence or complete any action within a specified period and is prevented or delayed by Force Majeure from commencing or completing such action within the specified period, such period shall be extended by an amount equal to the duration of such event of Force Majeure occurring or continuing during such period.

## ARTICLE X
## REPRESENTATIONS AND WARRANTIES

10.1 Representations and Warranties of Idaho Power. Idaho Power represents and warrants to PAC and BPA as of the Effective Date as follows:

(a) It is duly formed, validly existing and in good standing under the laws of the jurisdiction of its formation.

(b) It has all requisite corporate power necessary to own its assets and carry on its business as now being conducted or as proposed to be conducted under this Agreement.

(c) It has all necessary corporate power and authority to execute and deliver this Agreement and to perform its obligations under this Agreement, and the execution and delivery of this Agreement and the performance by it of this Agreement have been duly authorized by all necessary corporate action on its part.

(d) The execution and delivery of this Agreement and the performance by it of this Agreement do not: (i) violate its organizational documents; (ii) violate any Governmental Requirements applicable to it; or (iii) result in a breach of or constitute a default of any material agreement to which it is a party.

(e) This Agreement has been duly and validly executed and delivered by it and constitutes its legal, valid and binding obligation enforceable against it in accordance with its terms, except as the same may be limited by bankruptcy, insolvency or other similar laws affecting creditors' rights generally and by principles of equity regardless of whether such principles are considered in a proceeding at law or in equity.

(f) All material Governmental Authorizations required by Governmental Requirements to have been obtained by it prior to the date hereof in connection with the due execution and delivery of, and performance by it of its obligations under, this Agreement, have been duly obtained or made and are in full force and effect.

10.2 Representations and Warranties of PAC. PAC represents and warrants to BPA and Idaho Power as of the Effective Date as follows:

(a) It is duly formed, validly existing and in good standing under the laws of the jurisdiction of its formation.

(b) It has all requisite corporate power necessary to own its assets and carry on its business as now being conducted or as proposed to be conducted under this Agreement.

(c) It has all necessary corporate power and authority to execute and deliver this Agreement and to perform its obligations under this Agreement, and the execution and delivery of this Agreement and the performance by it of this Agreement have been duly authorized by all necessary corporate action on its part.

(d) The execution and delivery of this Agreement and the performance by it of this Agreement do not: (i) violate its organizational documents; (ii) violate any Governmental Requirements applicable to it; or (iii) result in a breach of or constitute a default of any material agreement to which it is a party.

(e) This Agreement has been duly and validly executed and delivered by it and constitutes its legal, valid and binding obligation enforceable against it in accordance with its terms, except as the same may be limited by bankruptcy, insolvency or other similar laws affecting creditors' rights generally and by principles of equity regardless of whether such principles are considered in a proceeding at law or in equity.

(f) All material Governmental Authorizations required by Governmental Requirements to have been obtained by it prior to the date hereof in connection with the due execution and delivery of, and performance by it of its obligations under, this Agreement, have been duly obtained or made and are in full force and effect.

10.3 Representations and Warranties of BPA. BPA represents and warrants to PAC and Idaho Power as of the Effective Date as follows:

(a) It is duly formed, validly existing and in good standing under the laws of the jurisdiction of its formation.

(b) It has all requisite statutory and administrative power necessary to own its assets and carry on its business as now being conducted or as proposed to be conducted under this Agreement.

(c) It has all necessary statutory and administrative power and authority to execute and deliver this Agreement and to perform its obligations under this Agreement, and the execution and delivery of this Agreement and the performance by it of this Agreement have been duly authorized by all necessary statutory or administrative action on its part.

(d) The execution and delivery of this Agreement and the performance by it of this Agreement do not: (i) violate its organizational documents; (ii) violate any Governmental Requirements applicable to it; or (iii) result in a breach of or constitute a default of any material agreement to which it is a party.

(e) This Agreement has been duly and validly executed and delivered by it and constitutes its legal, valid and binding obligation enforceable against it in accordance with its terms, except as the same may be limited by bankruptcy, insolvency or other similar laws affecting creditors' rights generally and by principles of equity regardless of whether such principles are considered in a proceeding at law or in equity.

(f) All material Governmental Authorizations required by Governmental Requirements to have been obtained by it prior to the date hereof in connection with the due execution and delivery of, and performance by it of its obligations under, this Agreement, have been duly obtained or made and are in full force and effect.

## ARTICLE XI
## COMMON DEFENSE & LIMITATION OF LIABILITY

11.1 Common Defense. The Funders shall, at such time as specified in this Section 11, enter into a Joint Defense Agreement that is consistent with applicable Governmental Requirements and that provides for the common defense, as well as payment for the common defense, including actual damages, for any and all suits, actions, liabilities, legal proceedings, claims, demands, losses, costs and expenses of whatsoever kind or character ( including reasonable attorneys' fees and expenses of third parties) of third parties, for injury or death of persons or physical loss of or damage to property of persons (other than of the Funders or the Permitting Project Manager) arising from the performance by the Permitting Project Manager of its obligations under this Agreement ("Claims"); provided, however, that the Funders shall not be obligated to enter into a Joint Defense Agreement or otherwise be responsible for any Claims arising from the Permitting Project Manager's own negligence or willful misconduct in connection with the performance of its obligations under this Agreement. The Joint Defense Agreement shall set forth the terms under which the Funders shall provide a common defense for the Claims described in this Section 11.1, including, but not limited to, the retention of appropriate legal counsel, advisors, and experts and the resolution of any such Claims. Each Funder shall contribute under the Joint Defense Agreement, in proportion to its Permitting Interest set forth in Exhibit D, or as otherwise mutually agreed to by the Funders in writing, to such common defense.

11.2 Notice and Participation. The Permitting Project Manager shall give the other Funders prompt written notice of any Claim upon the receipt of actual knowledge or information by the Permitting Project Manager of a Claim (the "Joint Defense Agreement Notice"). Upon the issuance of the Joint Defense Agreement Notice, the Funders and Permitting Project Manager shall use all Commercially Reasonable Efforts to agree to the terms of and enter into a Joint Defense Agreement consistent with the provisions of this Section 11 as soon as practicable. Except as otherwise provided in Section 11.1, during such period as the Funders shall not be a party to a Joint Defense Agreement but a Joint Defense Agreement Notice or Joint Defense Agreement Notices shall have been delivered, each of the Funders shall contribute funds and otherwise support the common defense of the Claims that are the subject of such Joint Defense Agreement Notice, in proportion to its Permitting Interest set forth in Exhibit D or as otherwise mutually agreed to by the Funders in writing, and during such period all costs incurred by or on behalf of the Permitting Project Manager for the defense or resolution of any such Claims (including, but not limited to, actual damages to be paid to resolve such Claims and reasonable attorneys' fees and costs) shall be considered Project Costs and payable to the Permitting Project Manager in proportion to the Funders' Permitting Interest set forth in Exhibit D and pursuant to the terms of this Agreement.

11.3 Control of Defense Prior to Joint Defense Agreement. After delivery of a Joint Defense Agreement Notice but before the Funders have entered into a Joint Defense Agreement, the Permitting Project Manager shall have the right to assume the defense of the Claim, with counsel designated by the Permitting Project Manager and reasonably satisfactory to the Funders, and contest or, with or without the prior consent of the Funders, settle such Claim, provided that the Permitting Project Manager shall not settle any Claim with respect to which it has sought or is entitled to seek recovery pursuant to Section 11.1 unless it has obtained the prior written consent of the Funders.

11.4 Failure to Provide Timely Joint Defense Agreement Notice. The Funders shall have no obligation to enter into a Joint Defense Agreement for any Claim for which a Joint Defense Agreement Notice is not timely provided, but only to the extent that such failure to give such notice materially and prejudicially impairs the ability of the Funders to jointly defend the applicable Claim. To the extent that failure to provide a timely Joint Defense Agreement Notice materially and prejudicially impairs a Funder's ability to jointly defend the applicable Claim, the Permitting Project Manager shall not be entitled to recover any costs incurred by or on behalf of the Permitting Project Manager in respect of such Claim as such Claim shall not be considered a Project Cost.

11.5 Survival of Obligation. The duty to provide for the common defense and enter into a Joint Defense Agreement shall continue in full force and effect for a period of one year after the expiration or termination of this Agreement, unless a Funder withdraws pursuant to Article VII in which case the duties and obligations under Sections 11.1 and 11.2 shall

not apply to the Withdrawing Funder for any Claim where it receives the Joint Defense Agreement Notice after the Notice of Withdrawal.

11.6 Limitation on Liability.

(a) In the case of breach or default by a Funder or Permitting Project Manager hereunder for which an express remedy or measure of damages is provided, such express remedy or measure of damages shall be the sole and exclusive remedy, and the Funder's or Permitting Project Manager's liability shall be limited as set forth in such provision and all other remedies or damages at law or in equity are hereby irrevocably waived, unless the provision in question provides that the express remedies are in addition to other remedies that may be available. Unless otherwise provided in this Agreement, if no remedy or measure of damages is expressly provided herein (and a remedy or damages is otherwise permitted), then the Funder's or Permitting Project Manager's liability shall be limited to direct actual damages only, and such direct actual damages shall be the sole and exclusive remedy and all other remedies or damages at law or in equity are hereby irrevocably waived.

(b) Notwithstanding any provision in this Agreement to the contrary, no Funder, whether in its capacity as Funder or Permitting Project Manager, shall be liable under this Agreement in any action at law or in equity, whether based on contract, tort or strict liability or otherwise, for any special, incidental, indirect, exemplary, punitive or consequential damages or losses, including any loss of revenue, income, profits or investment opportunities, loss of the use of equipment, or the cost of temporary equipment or services, provided that any Claims shall not be excluded under this Section 11.6(b) as special, incidental, indirect, exemplary, punitive or consequential damages or losses.

## ARTICLE XII
## PROPRIETARY INFORMATION

12.1 Disclosure of Proprietary Information Prohibited. The Funders agree that all information exchanged in connection with this Agreement (but not this Agreement) shall be treated as "Confidential Information" subject to the terms and conditions of the Nondisclosure Agreement, dated March 15, 2010, between the Funders (the "Confidentiality Agreement"), the provisions of which are incorporated herein by reference.

12.2 Publicity. Each Funder shall provide reasonable advance notice to, and shall consult with, the other Funders of any planned press release, public statement or meeting with the public or Governmental Authorities by such Funder in which discussion of the Permitting Project is expected to be a material part, provided that nothing herein shall prevent, limit, or delay any Funder from making any disclosure required by Governmental

Requirements or Governmental Authorizations. Each Funder shall provide notice to the other Funders as promptly as possible of the nature and content of any significant unplanned communications about the Permitting Project with the public or with Governmental Authorities. Notwithstanding the foregoing, when the information provided at a meeting is part of a previously agreed to public affairs plan or otherwise previously approved for disclosure by the Funders, notice of each such meeting or communication is not required.

## ARTICLE XIII
## DISPUTE RESOLUTION

13.1 Exclusive Procedure. Any dispute, controversy or claim arising out of or relating to this Agreement or the breach, interpretation, termination, performance or validity of this Agreement (each, a "Dispute") shall be resolved pursuant to the procedures of this Article XIII.

13.2 Dispute Notices. If a Dispute arises between the Funders or between the Permitting Project Manager and the Non-Permitting Project Manager Funders, then any Funder or Permitting Project Manager to such Dispute (each, a "Disputing Party") may provide written notice thereof to the other Disputing Parties, including a detailed description of the subject matter of the Dispute (the "Dispute Notice"). Any Disputing Party may seek a preliminary injunction or other provisional judicial remedy to the extent allowed by law if such action is necessary to prevent irreparable harm or preserve the status quo, in which case the Disputing Party nonetheless will continue to pursue resolution of the Dispute pursuant to this Article XIII.

13.3 Informal Dispute Resolution.

(a) The Disputing Parties shall make a good faith effort to resolve the Dispute by prompt negotiations between and/or among each Disputing Party's representative so designated in writing to the other Disputing Party or Disputing Parties (each a "Manager"). If the Managers are not able to resolve the Dispute within thirty (30) days after the date of the Dispute Notice, they shall refer the matter to the designated senior officers of the Disputing Parties (the "Executives"), who shall have authority to settle the Dispute. If the Executives are not able to resolve the Dispute within sixty (60) days after the date of the Dispute Notice, then the Dispute shall be resolved pursuant to Section 13.4.

(b) All communications and writings exchanged between and/or among the Disputing Parties in connection with these negotiations shall be confidential and shall not be used or referred to in any subsequent binding adjudicatory process between the

Disputing Parties, either with respect to the current Dispute or any future Dispute between the Funders and/or the Permitting Project Manager.

13.4 Remedies. If any Dispute arising under this Agreement cannot be resolved as provided in Section 13.3, then any Disputing Party may, in its sole discretion, pursue any available remedy at law or equity.

13.5 Continued Performance. During the pendency of any Dispute, each Funder and the Permitting Project Manager shall continue to perform all of its respective obligations under this Agreement.

## ARTICLE XIV
## MISCELLANEOUS

14.1 Counterparts. This Agreement may be executed in counterparts, each of which shall be considered an original, but all of which together shall constitute the same instrument. Electronic transmission of any signed original document, and retransmission of any signed electronic transmission, shall be the same as delivery of an original. At the request of any Funder or the Permitting Project Manager, the other Funders or Permitting Project Manager, as applicable, will confirm electronically transmitted signatures by signing an original document.

14.2 Headings. The Article and Section headings used in this Agreement (including headings used in any Exhibits attached hereto) are for convenience of reference only and shall not affect the construction of the Agreement or limit the scope of the particular provisions to which they refer.

14.3 Waiver. No waiver by any Funder of any breach or default by any other Funder or the Permitting Project Manager of its obligations herein shall be construed as a waiver of any other breach or default whether of a like kind or different nature. Any delay by a Funder, less than any applicable statutory period of limitations, in asserting or enforcing any rights or remedies under this Agreement shall not be deemed a waiver of such rights or remedies. Failure of any Funder or Permitting Project Manager to enforce any provision hereof shall not be construed to waive such provision, or to affect the validity of this Agreement or any part hereof, or the right of any Funder thereafter to enforce each and every provision hereof.

14.4 Relationship of Funders.

(a) Several and not Joint. The covenants, obligations, and liabilities of the Funders are intended to be several and not joint or collective, and nothing herein contained shall be construed to create an association, joint venture, trust or partnership, or to impose a trust or partnership covenant, obligation or liability on or with regard to

any of the Funders. Each Funder shall be individually responsible for its own covenants, obligations and liabilities as herein provided. No Funders shall be under the control of, or shall be deemed to control, the other Funders. No Funder shall have a right or power to bind any other Funder without such other Funder's express written consent.

(b) No Partnership. None of the provisions of this Agreement shall be deemed to constitute a partnership among or between the Funders and none of the Funders shall have any authority to bind the other Funders in any way, and the Funders agree that the arrangement contemplated by this Agreement shall be excluded from subchapter K of the U.S. Internal Revenue Code of 1986, as amended ("Subchapter K"). Idaho Power and PAC agree to report their respective Permitting Interest of any items of income, deductions and credits of the arrangement contemplated by this Agreement in a manner consistent with the exclusion of such arrangement from Subchapter K beginning with the taxable year which includes the Effective Date.

(c) Additional Funders. This Agreement may be amended to include one or more additional parties as Funders upon mutual written agreement of the then current Funders.

14.5 Severability. In the event that any provision of this Agreement or the application thereof becomes or is declared by a court of competent jurisdiction to be illegal, void or unenforceable, the remainder of this Agreement will continue in full force and effect and the application of such provision to other persons or circumstances will be interpreted so as reasonably to effect the intent of Idaho Power, PAC, and BPA. The Funders and Permitting Project Manager further agree to replace such illegal, void or unenforceable provision of this Agreement with a valid and enforceable provision that will achieve, to the maximum extent possible, the economic, business and other purposes of such illegal, void or unenforceable provision.

14.6 Binding Effect. Upon execution by all Funders, this Agreement shall be binding upon each of the Funders and the Permitting Project Manager and their respective successors and permitted assigns. This Agreement is null and void unless it is executed by all Funders.

14.7 Amendments. This Agreement shall not be modified, amended, supplemented or otherwise changed in any respect except by a written document signed by the Funders and the Permitting Project Manager.

14.8 No Third Party Beneficiary. This Agreement is for the exclusive benefit of the Funders and the Permitting Project Manager, and is not intended to nor shall be construed to

confer upon or give to any Person (other than the Funders and the Permitting Project Manager) any rights or remedies under or by reason of this Agreement or any transaction contemplated herein.

14.9 Entire Agreement. This Agreement, including the Exhibits and Schedule 2.2 attached hereto, constitutes the entire agreement of the Funders and the Permitting Project Manager with respect to the transactions contemplated by this Agreement and supersedes all prior agreements (other than the Confidentiality Agreement), oral or written, with respect thereto.

14.10 Notices.

(a) Except as otherwise provided herein, any notice, demand, request or other communication required or permitted to be given pursuant to this Agreement shall be in writing and signed by the Funder or Permitting Project Manager giving such notice, demand, request or other communication and shall be hand delivered or sent by certified mail, return receipt requested, or overnight courier to the other Funders and/or Permitting Project Manager at the address set forth below:

(b) Each Funder and the Permitting Project Manager shall have the right to change the place to which any notice, demand, request or other communication shall be sent or delivered by similar notice sent in like manner to the other Funder(s) and Permitting Project Manager. The effective date of any notice, demand, request or other communication issued pursuant to this Agreement shall be when: (i) delivered to the address of the Funders or Permitting Project Manager personally, by messenger, by a nationally or internationally recognized overnight delivery service or otherwise; or (ii) received or rejected by the Funders or Permitting Project Manager, if sent by certified mail, return receipt requested, in each case, addressed to the Funders or Permitting Project Manager at its address and marked to the attention of the person designated above (or to such other address or person as a Funders or Permitting Project Manager may designate by notice to the Funders and/or Permitting Project Manager effective as of the date of receipt by such Funders).

14.11 Choice of Law. This Agreement shall be governed by and construed in accordance with the laws of the State of Idaho, without giving effect to conflicts of laws principles. Notwithstanding the foregoing, for so long as BPA is a Funder, this Agreement shall be governed and construed in accordance with the laws of the United States.

14.12 Further Assurances. Each Funder and the Permitting Project Manager agrees to execute and deliver from time to time such additional documents, and to take such additional actions, as may be reasonably required by the other Funders or the Permitting Project Manager to give effect to the purposes and intent hereof.

14.13 Conflict of Interest. Nothing in this Agreement shall prohibit any Funder or the Permitting Project Manager from engaging in or possessing any interest in other projects or business ventures of any nature and description, independently or with others.

Exhibit A

Description of Boardman to Hemingway Transmission Project

The development, siting, and acquisition of permits and Rights-of-Way over public land, construction, operation, and maintenance of a single circuit 500kV overhead electric transmission line and facilities beginning near Boardman, Oregon, and terminating near Melba, Idaho

.

Exhibit B

Permit Funding Schedule

The cost allocation of the Payment Schedule is determined by each Funder's Permitting Interest as of the Effective Date, which shall be calculated using the methodology described in Exhibit D.

Table B.1. Permit Funding Payment Schedule

| Payment | Type | Idaho Power Amount | BPA Amount | PAC Amount | Date |
|---|---|---|---|---|---|
| 1 | Mandatory Payment | $1,608,839 | $ 1,838,673 | $4,137,015 | Due Twenty (20) days following the Effective Date |
| 2 | Mandatory Payment | $1,608,839 | $ 1,838,673 | $4,137,015 | 10/1/2012 |
| 3 | Mandatory Payment* | $2,255,155 | $ 2,577,320 | $5,798,969 | 3/1/2013 |
| 4 | Mandatory Payment | $804,420 | $ 919,337 | $2,068,508 | 10/1/2013 |
| 5 | Completion Funding Payment* | $3,945,498 | $ 4,509,141 | $10,145,567 | Due One hundred twenty (120) days following publication of Final BLM Record of Decision in the *Federal Register* |
| 6 | Final Expense True-up | TBD | TBD | TBD | Two hundred ten (210) days following Notice of Payment |

* The payment amounts shown for Mandatory Payments 3 and Completion Funding Payment 5 include estimated AFUDC accruals. The actual invoice may differ from the amount shown based on the actual monthly AFUDC accrued during the period.

Exhibit C

Project Costs

Project Costs are included as part of the payments set forth in Exhibit B. Project Costs associated with Governmental Authorizations and other necessary work include as relating to the Permitting Project, but are not limited to:

i. Governmental Authorization costs;

ii. NEPA compliance activity;

iii. public involvement activity;

iv. reasonable attorney's fees;

v. third party contractor work for EIS development and support of the Boardman to Hemingway Transmission Project, including, but not limited to, the NEPA process;

vi. Preliminary design and engineering work in support of the Boardman to Hemingway Transmission Project, including, but not limited to, the NEPA process;

vii. Any other costs approved by the Permit Funding Committee associated with services to be coordinated by the Permitting Project Manager (and not provided for above), as set forth in this Agreement; and

viii. Overheads incurred by the Permitting Project Manager for the Permitting Project will be calculated at a 10% rate.

Exhibit D

Permitting Interest Work Paper

Each Funder is assigned a Permitting Interest based on the annual weighted capacity expressed in the Permitting Project. The Permitting Interest is determined by the sum of a Funder's eastbound capacity interest and westbound capacity interest, divided by the total of all Funders' eastbound and westbound capacity interests.

**Table 1: Boardman to Hemingway Weighted Interest**

| | Total Requested Capacity (MW) | Idaho Power Capacity Interest (MW) | BPA Capacity Interest (MW) | PacifiCorp Capacity Interest (MW) |
|---|---|---|---|---|
| **West to East** | **1050** | 350* | 400* | 300 |
| **East to West** | **600** | 0 | 0 | 600 |
| **Permitting Interest** | | 21.21% | 24.24% | 54.55% |

* Seasonally shaped capacity.

The capacity interests are based on:

- Idaho Power's capacity interest is seasonally shaped with 500 MW of eastbound capacity during the months of April through September and 200 MW of eastbound capacity during the months of January through March and October through December.
- BPA's capacity interest is seasonally shaped with 250 MW of eastbound capacity during the months of April through September and 550 MW of eastbound capacity during the months of January through March and October through December.
- PacifiCorp's capacity interest is constant throughout the entire calendar year.
- The sum of all Permitting Interest will equal one hundred percent.
- The sum of capacity interest may or may not equal the total rated capacity of project.

Additional Considerations:

- If the capacity interests are less than the total rated capacity of the Boardman to Hemingway Transmission Project, the unallocated capacity will be divided among the Funders based on the Funders Permitting Interest.
- The total rated capacity of the Boardman to Hemingway Transmission Project is subject to the results of the WECC Rating Process.

**Assumed B2H Ratings and Unassigned Capacity**

| | Assumed Rating (MW) | Unallocated Capacity (MW) |
|---|---|---|
| **West to East** | 1050 | 0 |
| **East to West** | 1000 | 400 |

**Allocation of Unassigned Capacity**

| | Percentage | Allocation of W-E Unassigned Capacity (MW) | Allocation of E-W Unassigned Capacity (MW) |
|---|---|---|---|
| **IPCO** | 21.21% | 0 | 85 |
| **BPA** | 24.24% | 0 | 97 |
| **PAC** | 54.55% | 0 | 218 |

# MEMORANDUM OF UNDERSTANDING

This Memorandum of Understanding (this "MOU") is entered into as of January 12th, 2012 (the "Effective Date"), by and among PacifiCorp, an Oregon corporation ("PacifiCorp"), Idaho Power Company, an Idaho corporation ("Idaho Power"), and the Bonneville Power Administration, a United States government power marketing agency ("BPA"). PacifiCorp, Idaho Power and BPA are sometimes referred to in this MOU individually as a "Party" and, collectively, as the "Parties".

## RECITALS

A. PacifiCorp owns and operates facilities for the transmission of electric power and energy in interstate commerce ("PacifiCorp Transmission System");

B. BPA owns and operates facilities for the transmission of electric power and energy in interstate commerce ("BPA Transmission System");

C. Idaho Power owns and operates facilities for the transmission of electric power and energy in interstate commerce ("Idaho Power Transmission System");

D. The PacifiCorp Transmission System, BPA Transmission System and the Idaho Power Transmission System, are sometimes referred to in this MOU individually as a "Transmission System" and, collectively, the "Transmission Systems;"

E. PacifiCorp, BPA and Idaho Power each have an independent obligation or authority to plan for and expand their respective Transmission Systems based upon the needs of their native load customers, network customers, and eligible customers that agree to expand the Transmission System;

F. The Parties are considering whether to permit and construct new transmission projects in the West, including, but not limited to, jointly owning the proposed Boardman to Hemingway Transmission Project, which is a 500kV single circuit transmission line that is proposed to run from Boardman, Oregon to Melba, Idaho that if constructed could assist Idaho Power, PacifiCorp, and BPA in fulfilling their respective service obligations;

G. The Parties desire to (i) explore alternatives to establish eastern Idaho load service from Hemingway in exchange for similar service from the BPA Transmission System and (ii) consider whether to replace certain transmission arrangements involving existing assets with joint ownership transmission arrangements and other alternative transmission arrangements pursuant to definitive agreements mutually satisfactory to the Parties (collectively, the "Definitive Agreements");

H. Idaho Power and PAC acknowledge that BPA is considering various transmission and other alternatives to meet its service obligations in eastern Idaho, including alternatives that would involve Open Access Transmission Service, and that BPA's decision whether to participate

in development and construction of the Boardman to Hemingway Transmission Project may be based on BPA's evaluation of such alternatives; and

I. The Parties are entering into this MOU to set forth a process by which the Parties will negotiate in good faith to attempt to reach mutually satisfactory agreement on the terms and conditions of the Definitive Agreements.

**NOW THEREFORE**, the Parties agree as follows:

1. Effective Date; Term.

(a) This MOU shall become effective on January 12th 2012 (the "Effective Date").

(b) This MOU shall remain in effect until December 31, 2014, at which time it will terminate (the "Termination Date"), unless one of the following occurs:

(i) All Parties execute and deliver each of the Definitive Agreements before the Termination Date, in which case the Termination Date shall be the date that the last Definitive Agreement is fully executed;

(ii) The Parties, by mutual written agreement, agree to extend the Termination Date, in which case the Termination Date shall be a mutually agreed date after December 31, 2014;

(iii) The Parties, by mutual written agreement, agree that the MOU will be terminated before December 31, 2014, in which case the Termination Date shall be a mutually agreed date before December 31, 2014; or

(iv) Two Parties exercise their unilateral right to withdraw from this MOU pursuant to Section 2, in which case the Termination Date shall be thirty (30) days after the second withdrawing Party provides written notice of withdrawal.

(c) Upon termination, this MOU shall have no further force or effect, provided that the rights and obligations set forth in Sections 3(f) and 4 shall survive the termination of this MOU and remain in full force and effect.

2. Unilateral Withdrawal Rights.

Any Party may withdraw from this MOU at any time, for any reason whatsoever or for no reason, after thirty (30) days written notice to the other Parties of the intent to do so.

3. Responsibilities of the Parties.

(a) During the term of this MOU, the Parties meet regularly (either by teleconference or in person), proceed diligently and in good faith to negotiate mutually satisfactory terms of the Definitive Agreements and all such other agreements and documents necessary to fully document the transactions contemplated by the Definitive Agreements by no later than December 31, 2014. The Parties seek to meet the following milestones:

(i) By no later than January 15, 2012, the Parties commence regular meetings to discuss the subject matters described in Exhibit A hereto;

(ii) By no later than March 31, 2012, the Parties identify scenarios and any potential assets, the methodology for valuing capacity and assets, and any required criteria or conditions for execution of Definitive Agreements to achieve the alternatives described in Exhibit A.

(iii) By no later than September 30, 2012, BPA informs Idaho Power and PacifiCorp whether it intends to pursue a plan of service for its eastern Idaho load service requirements that would require the availability of project(s) contemplated herein.

(b) Each Party shall select a senior-level representative (each, a "Representative") to be responsible for coordinating activities under this MOU. Each Party commits to provide its Representative with the support and resources necessary to further the purposes of this MOU.

(c) Any Party would be free to use the rights granted it by another Party under a Definitive Agreement for any legitimate transmission service permitted by its respective OATT, provided, however, that rights granted under a Definitive Agreement would not include any additional rights to receive transmission service that would require use of any portion of the other's system not specifically acknowledged in a Definitive Agreement.

(d) Based on the information currently known to the Parties, it is proposed that negotiations of the Definitive Agreements include the alternatives set forth in Exhibit A. Exhibit A sets forth the Parties' current general understanding with respect to these alternatives, but is not intended to represent a binding agreement or final contractual language, or to address every provision which the Parties may wish to incorporate into the Definitive Agreements.

(e) Each of the Parties acknowledges and agrees that each other Party's decision to proceed with the Definitive Agreements and any other decision with respect to the Definitive Agreements is within such Party's sole and absolute discretion.

(f) The Parties agree that all information exchanged in connection with this MOU (but not this MOU) shall constitute, and be treated by the Parties as, "Confidential Information" subject to the terms and conditions of that certain Nondisclosure Agreement, dated as of March 15, 2010, between the Parties (the "Confidentiality Agreement"), the provisions of which are incorporated herein by reference.

4. General Provisions.

(a) This MOU is not a binding or enforceable contract but is instead an understanding that broadly states the expected responsibilities and objectives of the Parties.

(b) Nothing in this MOU shall limit, repeal, or in any manner modify the existing legal rights, privileges, and duties of each of the Parties as provided by agreement (including the Confidentiality Agreement), statute or any other law or applicable court or regulatory decision. Further, the concepts contemplated by this MOU and any Definitive Agreements, if any, are intended to be consistent with applicable statutes, rules, orders, regulations or other similar requirements or obligations.

(c) Each of the Parties acknowledges and agrees that no Party shall be liable to the other Parties for any claim, loss, cost, liability, damage or expense, including any direct damage or any special, indirect, exemplary, punitive, incidental or consequential loss or damage (including any loss of revenue, income, profits or investment opportunities or claims of third party customers), arising out of or directly or indirectly related to a Party's decision to terminate this MOU, the other Parties' performance or failure thereof under this MOU, or any other decision with respect to proceeding or not proceeding with the Definitive Agreements.

(d) This MOU may not be amended except in writing signed by the Parties.

(e) Any waiver on the part of a Party to this MOU of any provision or condition of this MOU must be in writing signed by each Party to be bound by such waiver, shall be effective only to the extent specifically set forth in such writing and shall not limit or affect any rights with respect to any other or future circumstance.

(f) This MOU is for the sole and exclusive benefit of the Parties and shall not create a contractual relationship with, or cause of action in favor of, any third party.

(g) Nothing in this MOU will be deemed to establish any right or provide a basis for any action, either legal or equitable, by any person or class of persons against the United States, its departments, agencies, instrumentalities or entities, or its officers or employees, challenging a government action or failure to act.

(h) Nothing in this MOU will be construed as limiting or affecting in any way the authority or responsibility of the Parties to perform within their authorities, and nothing in this MOU shall be construed as committing the Parties to take any action concerning the items identified in Exhibit A before they have complied with all applicable statutes and regulations such as the National Environmental Policy Act ("NEPA").

(i) Each Party shall be solely responsible for and shall pay its own costs and expenses incurred by it in connection with the negotiation of this MOU, the Definitive Agreements and all other agreements, documents and instruments related hereto and thereto, including all legal fees and expenses and expenses associated with such Party's own due diligence activities.

(j) Whenever this MOU requires or provides that (i) a notice be given by a Party to another Party or (ii) a Party's action requires the approval or consent of the other Parties, such notice, consent or approval shall be given in writing and shall be given by personal delivery, by recognized overnight courier service, or by certified mail (return receipt requested), postage prepaid, to the recipient thereof at the address given for such Party as set forth below, or to such other address as may be designated by notice given by any Party to the other Parties in accordance with the provisions of this Section 4(j):

If to PacifiCorp:

PacifiCorp
825 NE Multnomah Street, Suite 1600
Portland, OR 97232
Attention: Vice President Transmission Services
Fax No.: (503) 813-6893

If to Idaho Power:

Idaho Power
1221 West Idaho Street
Boise, Idaho 83702
Attention: Manager Delivery Planning
Fax No.: 208-388-6647

If to BPA:

Bonneville Power Administration
5411 NE Highway 99
Vancouver, Washington 98663
Attention: Senior Vice President, Transmission Service
Fax No.: 360 418-8433

Each notice, consent or approval shall be conclusively deemed to have been given (A) on the day of the actual delivery thereof, if given by personal delivery or overnight delivery, and (B) date of delivery shown on the receipt, if given by certified mail (return receipt requested).

Each Party shall have the right to change the place to which any notice, demand, request or other communication shall be sent or delivered by similar notice sent in like manner to the other Parties.

(k) This MOU may be executed in one or more counterparts (including by facsimile or a scanned image), each of which when so executed shall be deemed to be an original, and all of which shall together constitute one and the same instrument.

(l) Nothing contained in this MOU shall be construed as creating a corporation, company, partnership, association, joint venture or other entity, nor shall anything contained in this MOU be construed as creating or requiring any fiduciary relationship between the Parties. No Party shall be responsible hereunder for the acts or omissions of the other Party. Nothing herein shall preclude a Party from taking any action (or have its affiliates take any action) with respect to any other transmission project, including any such project that may compete with the Project.

(m) Unless otherwise expressly provided, for purposes of this MOU, the following rules of interpretation shall apply:

(i) any reference in this MOU to gender includes all genders, and the meaning of defined terms applies to both the singular and the plural of those terms;

(ii) the insertion of headings are for convenience of reference only and do not affect, and will not be utilized in construing or interpreting, this MOU;

(iii) all references in this MOU to any "Section" are to the corresponding Section of this MOU unless otherwise specified;

(iv) words such as "herein," "hereinafter," "hereof," and "hereunder" refer to this MOU (including the Exhibits to this MOU) as a whole and not merely to a subdivision in which such words appear unless the context otherwise requires; and

(v) the word "including" or any variation thereof means "including, without limitation" and does not limit any general statement that it follows to the specific or similar items or matters immediately following it.

EXHIBIT A

PRELIMINARY ALTERNATIVES FOR NEGOTIATION

This Exhibit A identifies the preliminary alternatives to be explored in negotiations under this MOU of the Definitive Agreements. The preliminary alternatives described in this Exhibit A are intended to be consistent with and subject to (i) all applicable statutory and governmental obligations of the Parties, including, as relating to PacifiCorp and Idaho Power, state and Federal Energy Regulatory Commission rules, regulations and orders; (ii) stakeholder and customer interests; and (iii) the Western Electricity Coordinating Council Three-phase rating process.

The Parties envision that PacifiCorp and Idaho Power may agree to jointly purchase and sell assets to achieve the objectives of the alternatives described in this Exhibit A. Any purchase and sale of existing assets between PacifiCorp and Idaho Power may involve some or all of the assets currently defined in existing contracts between Idaho Power and PacifiCorp, including, but not limited to, the Second Restated and Amended Transmission Facilities Agreement, Restated Transmission Service Agreement and the Agreement for Interconnection and Transmission Services. The service arising from any alternative may or may not be contingent upon the timing or physical construction of new assets.

Alternative 1:

- BPA would obtain a network service option from the Hemingway substation to the existing BPA service points in eastern Idaho. Idaho Power would sell and PacifiCorp would acquire Idaho Power's existing assets necessary to provide BPA's long-term load service.

- The Parties' intent is to minimize potential rate pancakes.

- BPA would work to plan an amount of BPA Transmission System capacity sufficient to enable PacifiCorp and Idaho Power to utilize their capacity shares (up to 650 MW in total) of the Boardman to Hemingway transmission project pursuant to standard OATT terms and conditions.

Alternative 2:

- Idaho Power and PacifiCorp, in combination, would provide BPA 600 MW of firm eastbound ownership rights of assets or other terms and conditions associated with the combined systems of Idaho Power and PacifiCorp in southern Idaho for the primary purpose of serving the BPA service points in eastern Idaho.

- BPA would provide to PacifiCorp and Idaho Power equivalent value of capacity rights, ownership rights of assets or other terms and conditions associated with the BPA Transmission System to the western terminus of the Boardman to Hemingway

Transmission Project, or other interconnection points jointly determined by the Parties. Such rights would originate at BPA's NW Market Hub (Mid-C) unless alternatives can be accommodated to serve load elsewhere over the BPA Transmission System.

- To achieve the objectives described in Alternative 2, the Parties would evaluate and consider interim measures and final approaches, including but not limited to the joint ownership of portions of the Gateway West Project, with BPA's minimum eastbound firm ownership rights of 250 MW, combined with the balance of ownership rights on a combination of Idaho Power and PacifiCorp's existing systems, as required to establish ownership rights from the Hemingway substation to BPA's existing eastern Idaho load points.

# Executive Summary

Would it be more efficient or cost-effective to meet future transmission needs in the Northern Tier Transmission Group (NTTG) footprint through a regional planning framework rather than the aggregate of local planning processes[1]? The 2015-2017 NTTG Regional Transmission Plan (RTP) poses this question and seeks to answer it. Developed in accord with NTTG Transmission Providers' Attachment K, which includes FERC Order 1000 regional and interregional transmission planning requirements, the plan analyzes whether NTTG's transmission needs in 2026 could best be satisfied with projects of a regional or interregional scope.

To arrive at a conclusion, NTTG used a two-year process of identifying transmission requirements and performing reliability and economic analyses on several collections of transmission projects, or plans: the prior (2014-2015) RTP, an Initial RTP[2] made up of projects from the prior RTP and projects included in the Full Funders' Local Transmission Plans, and a number of Change Case plans. A Null Change Case, which tests the NTTG footprint's current transmission system stressed by the addition of loads and resources projected for 2026-27, showed that the NTTG system performed acceptably in only one of seven stressed conditions studied. All the other conditions suffered performance issues that required correction.

A technical study found that the 2014-2015 prior RTP, which included two Non-Committed Projects (Boardman to Hemingway and portions of Energy Gateway), was not fully reliable with the 2026-27 load and resource projections. The study then evaluated 23 Change Cases that explored ways to reliably meet the transmission system needs through various combinations of the Non-Committed Projects in the Initial RTP or three proposed Interregional Transmission Projects, or both.

Reliability analyses narrowed the potentially acceptable solutions to the Initial RTP. These Change Cases were created to explore the relationship of a build-out of wind generation in Wyoming to meet NTTG load with its impact on the transmission system west of Wyoming and a potential expansion of the transmission system (i.e., the Gateway West and Gateway South projects). The study also examined three Interregional Transmission Projects as Alternative Projects to determine whether these projects would yield a more efficient or cost-effective regional transmission plan for NTTG and as a part of interregional coordination and planning. The analysis found, however, that none of the Interregional Transmission Projects could replace or enhance the Non-Committed Projects more efficiently or cost effectively to satisfy NTTG's regional transmission needs.

Subsequent economic analyses identified one of the Change Cases as the more-efficient or cost-effective case. Known in the study as Change Case 23, this case includes Boardman to Hemingway, Gateway South, portions of Gateway West, and the Antelope projects.

[1] NTTG's regional transmission planning process is not intended to be a replacement for local transmission or resource planning.

[2] Terms are capitalized to be consistent with Attachment K. All capitalized terms are defined in the glossary.

Stakeholder input on the RTP was accepted and evaluated throughout the biennial planning cycle. NTTG posted the Draft RTP in December 2016 (Quarter 4) for stakeholder comment and the Draft Final RTP in Quarter 6 for public comment. The Planning Committee will vote to recommend submittal of the RTP to the NTTG Steering Committee in Quarter 7. Steering Committee approval of the RTP will be requested in Quarter 8.

## The Northern Tier Transmission Group

The Northern Tier Transmission Group (NTTG) was formed in 2007 to promote effective planning and use of the multi-state electric transmission system within the Northern Tier footprint. NTTG provides a forum where all interested stakeholders, including transmission providers, customers and state regulators, can participate in planning, coordinating and implementing a robust transmission system.

NTTG fulfills requirements of the Federal Energy Regulatory Commission (FERC) Order 1000 for each public utility transmission provider to participate in a regional transmission planning process that produces a regional transmission plan and, if appropriate, includes a regional cost-allocation method.

NTTG evaluates transmission projects that move power across the regional bulk electric transmission system, serving load in its footprint and delivering electricity to external markets. The transmission providers belonging to Northern Tier serve more than 4 million retail

customers with more than 29,000 miles of high-voltage transmission lines. These

Figure 1. Map of western North America showing NTTG members' transmission lines.

members provide service across much of Utah, Wyoming, Montana, Idaho and Oregon, and parts of Washington and California.

NTTG works with other entities—the Western Electricity Coordinating Council (WECC) for reliability planning and neighboring Planning Regions (e.g., ColumbiaGrid, WestConnect and California Independent System Operator (CAISO)) for interregional project coordination.

### Participating Utilities

Deseret Power Electric Cooperative
Idaho Power
Montana Alberta Tie Ltd. (MATL)
NorthWestern Energy
PacifiCorp
Portland General Electric
Utah Associated Municipal Power Systems (UAMPS)

## Purpose of the Plan

The NTTG Regional Transmission Plan (RTP) aims to produce, if possible, a more efficient or cost-effective regional plan to transmit energy compared with a plan that rolls up the local Transmission Providers' transmission plans and other Change Case transmission plans studied. This study process complies with FERC Order No. 1000, Attachment K—Regional Planning Process. This planning cycle marks the first time that NTTG implemented FERC Order 1000 interregional project coordination with the other western regional transmission planning organizations.

## Plan Development Process

The Regional Transmission Plan is developed through a two-year process:

1) Identification of the transmission requirement for the NTTG footprint, derived from the data submissions

2) Reliability analysis and evaluation of the Initial RTP and Alternative Projects (including interregional projects) through Change Cases

3) Economic analysis and evaluation comparing the annualized incremental costs of the Initial RTP and the two most-efficient Change Cases

4) Selection of the project or projects that yield a regional transmission plan that is more efficient or cost-effective than the other regional transmission plans studied

5) Any projects that were submitted for the purposes of cost allocation and selected into the RTP will go through the cost allocation process if they are deemed to be eligible for cost allocation.

## Biennial Cycle

NTTG follows a two-year, eight-quarter planning cycle to produce the 10-year Regional Transmission Plan. In the first step, the Planning and Cost Allocation Committees pre-qualify[3] Transmission Developers who properly submit their transmission project to be considered for regional cost allocation (should the sponsor's project be selected in the Regional Transmission Plan for cost allocation). The biennial cycle includes steps to collect, evaluate and analyze transmission and non-transmission data, produce and publish a draft plan, gather stakeholder and public input, update the plan and complete the cycle with the publishing of a RTP.

**Figure 2. NTTG uses an eight-quarter biennial planning cycle.**

## Biennial Study Plan

The Biennial Study Plan outlines the process that NTTG follows to develop its 10-year RTP. It provides the framework to guide plan development. It also describes NTTG's process to determine if a properly submitted Interregional Transmission Project (ITP) would yield a transmission plan that is a more cost-effective or efficient solution to NTTG's regional transmission needs.

The NTTG Planning Committee manages the study plan. The Planning Committee establishes the Technical Work Group (TWG) subcommittee to develop the study plan. The TWG also performs the necessary technical evaluations for the RTP and assesses any projects, including ITPs, submitted to NTTG. TWG members are NTTG Planning Committee members or their

[3] A project sponsor must have their project pre-qualified before the beginning of the 2016-2017 biennial planning cycle (i.e., the last quarter of the prior planning cycle) pursuant to Attachment K, Section Pre-Qualification for Cost Allocation.

designated technical representatives. They have access to and expertise in power-flow analysis for power systems or production-cost modeling, or both.

Developed during Quarter 2 of the biennial planning cycle, the study plan establishes the:

- Study methodology and criteria
- Study assumptions based on the loads, resources, point-to-point transmission requests, desired flows, constraints and other technical data submitted in Quarter 1 and updated in Quarter 5 of the regional planning cycle
- Software analysis tools
- 2026 production-cost-model database and hours to be selected for reliability analysis
- Evaluation criteria for reliability and transmission service obligations
- Capital cost, energy losses and reserve-sharing metric calculations
- Public policy requirements and considerations

The study plan was posted for stakeholder comment, recommended for approval by the Planning Committee and approved by the Steering Committee during Quarter 2 of the biennial cycle. Due to data submission changes provided in Quarter 5, the study plan was revised in Quarter 6. Any differences between what is stated in the study plan and the process stated in Attachment K of the NTTG FERC Order 1000 defer to Attachment K.

## Study Methodology

To determine the more efficient or cost-effective transmission plan, the TWG subcommittee conducted reliability and economic studies in accordance with the 2016-2017 Study Plan. The Study Plan and ultimately the RTP reflect the Full Funder's Attachment K requirements to satisfy its transmission needs. NTTG's regional transmission planning does not investigate local transmission planning or generation decisions related to integrated resource planning. Rather, NTTG's methodology uses a regional perspective to question the Initial RTP's roll-up of Non-Committed regional transmission project(s) to identify, if possible, a regional transmission plan that is more efficient or cost effective than the aggregated Full Funder's transmission plans. In conducting its regional studies, NTTG uses regional transmission and non-transmission alternatives (if any) to honor the local transmission needs. As part of the study, NTTG assumed that the local existing and new generation additions have (or will have) firm transmission rights to move their power from the generator to load. NTTG's reliability studies did not re-dispatch existing generation down to relieve congestion such that the new generation additions could move their power to load without potentially creating congestion.

The reliability studies used production-cost modeling and power-flow studies. The production-cost and power-flow models represent data for the western interconnection load, resource and transmission topology. In developing the data for these two models, NTTG started with a WECC production cost model (version TEPPC CC1.3) and WECC power-flow model (version 25hs1a) and modified the modeling data in NTTG's footprint for its regional studies. For the studies including one or more interregional transmission project that relied on increased wind

generation within NTTG's footprint (e.g., adding new wind resource in Wyoming), NTTG adjusted generation levels down in the region receiving the power. The goal of the adjustments was to ensure western interconnection load and resource balance. NTTG consulted with the planning region receiving the power (i.e., California ISO) for their generation reductions.

The results of the production-cost modeling were used to identify seven hours of high stress on the transmission system. These seven hours were then subjected to reliability analysis using a power-flow model. The input and output data for these selected hours were transferred from the production-cost model (i.e., GridView) to a power-flow model (i.e., PowerWorld) to perform the technical reliability analysis. By taking these steps, a consistent set of analysis tools can be engaged to evaluate the reliability performance.

Next, economic studies employed the Attachment K's three metrics—capital-related costs, energy losses, and reserves—to analyze Change Case plans that were deemed reliable to further determine the cost effectiveness of the NTTG transmission plan.

### Production-Cost Modeling

The TWG examined 8,760 hours of data using GridView[4] production-cost software to establish stressed conditions within the NTTG footprint. To set the stressed conditions, TWG used and modified a dataset from the Transmission Expansion Planning Policy Committee (TEPPC) of the Western Electricity Coordinating Council (WECC). The TEPPC case included a representation of the load, generation and transmission topology of the WECC interconnection-wide transmission system 10 years into the future.

The study plan identified seven stressed conditions that affect the NTTG area for study. After all hours of data were run through the GridView production-cost program, the results were analyzed and the hours representative of the seven stressed conditions were identified. For a more detailed discussion of the conditions and hours, see the section on stress-conditioned case study results.

### Power-Flow Cases

For the next step in the process, the TWG used PowerWorld[5] simulation software to convert the production-cost model for the seven stressed hours into power-flow cases. Each of the stressed cases was then reviewed by the TWG to ensure that the case met steady-state system performance criteria (no voltage issues or thermal overloads). Bubble diagrams showing the inter-area flows for each of the stressed cases are included in the Draft Final RTP, available on the NTTG website.

[5] PowerWorld is a registered trademark of PowerWorld Corp.

## Data Submission

Information flows in to NTTG during quarters 1 and 5 of the biennial cycle. Transmission Providers and stakeholders may supply data on forecasted firm energy obligations and commitments required to support the transmission system within the NTTG footprint. The data may include load forecasts, resources, transmission topology, transmission service and public policy requirements submissions. Regional transmission projects submitted in Quarter 1 are shown in Table LMJ and include those from the prior Regional Transmission Plan, Full Funder Local Transmission Plans (LTP), Sponsored Projects, unsponsored projects and Merchant Transmission Developer projects. No projects that were eligible for cost allocation were submitted into NTTG's 2016-17 regional planning process.

**JANUARY 2016 DATA SUBMITTAL – TRANSMISSION ADDITIONS BY 2026**

| Sponsor | From | To | Voltage | Circuit | Type | Regionally Significant[6] | Committed | Projects |
|---|---|---|---|---|---|---|---|---|

**Table LMJ**

## Forecasted Loads

Participating load-serving entities provide forecasts of loads for balancing authority areas internal to the NTTG footprint. These loads are generally the same as those found in the participants' official load forecasts (such as those in integrated resource plans) and are similar to those provided to the Load and Resource Subcommittee of the WECC Planning Coordination Committee. Chart CCC summarizes the load forecast used in the 2016-2017 planning cycle.

[Chart CCC: 2026 forecasted loads: bar graph to be created from Table 1, below, January 2016-2017 Data Submittal – Load Comparison, on page 8 of DFRTP, v2.6.]

| SUBMITTED BY: | 2015 Actual Peak Demand (MW) | 2024 Summer Load Data Submitted in 2014-15 (MW) | 2026 Summer Load Data Submitted in Q1 2016 (MW) | 2026 Summer Load Data Submitted in Q5 2017 (MW) | Difference (MW) 2024-2026 |

NTTG received 3,200 MW of proposed new generation resources from its funding Transmission Providers for consideration in the RTP. Figure 3 displays these incremental resources within the

NTTG footprint and compares submissions from the prior RTP with submissions for quarters 1 and 5 of the current cycle.

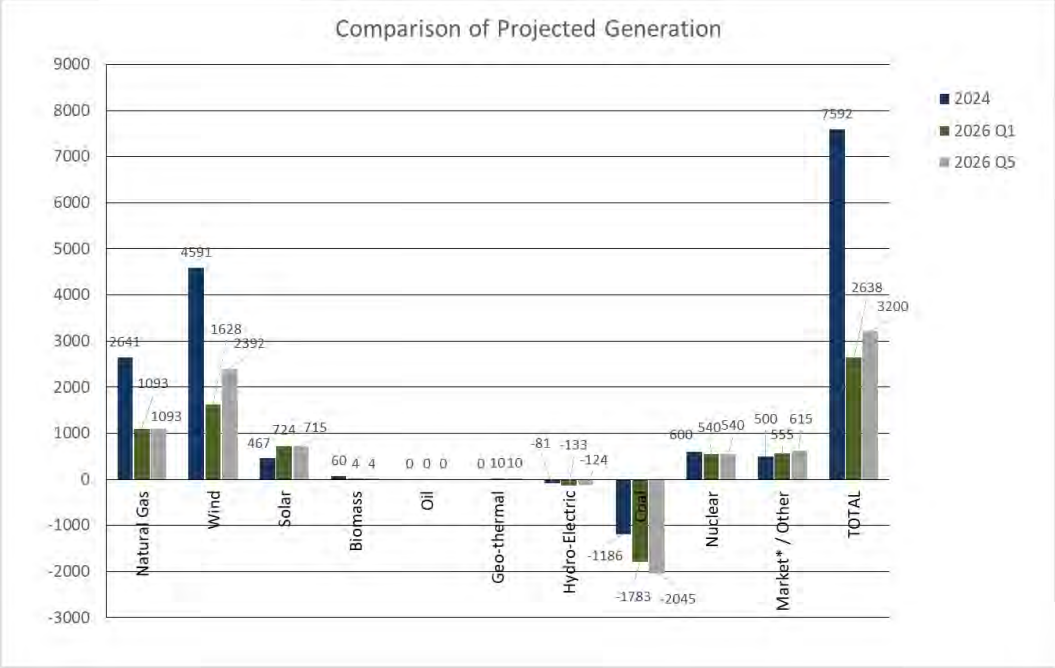

**Figure 3. Comparison of forecasted resources**

In Quarter 5, Northwestern submitted 550 MW of new Montana wind generation. Also PacifiCorp indicated that its recently submitted integrated resource plan increased the amount of Wyoming wind power from 887 MW to 1,100 MW. As shown in Figure 3, the total resource forecast of 3,200 MW submitted this cycle was reduced by 392 MW, or 12.25 percent, from the 3,592 MW forecast in 2024. Following the Quarter 1 data submittal, the owners of the Colstrip 1 and 2 coal-fired plants announced a plan to retire the units before 2026. The owners of the Valmy 1 and 2 coal plants in Nevada also plan to decommission the plants by 2025, a decade earlier than originally planned. Both sets of retirements were assumed in the 2016-2017 studies and are reflected in Quarter 5 values shown in Figure 3.

In the 2014-15 study cycle, Power Company of Wyoming (PCW) submitted 3,000 MW of wind resources associated with the TransWest Express project. PCW asked that those resources not be included in the NTTG 2014-15 Regional Plan. Those resources, to serve loads outside the NTTG footprint in California, have been submitted with an Interregional Transmission Project in the 2016-17 study cycle.

In support of the proposed transmission additions or upgrades, NTTG received four firm transmission-service-obligation submissions (contractual requirements to provide service)—two each from Idaho Power and PacifiCorp. These are shown in the following map. [Reference Report 2.6 Table 4. Map will need to be created. Use the map from page 9 of the 2014-15 RTP

as a guide. Two vectors West to East across ID-Northwest to Boise area and to Idaho Falls area, another vector North to South from Arco to Utah, and a fourth vector east to west from Wyoming.]

| Submitted by | MW | Start Date | POR | POD |
|---|---|---|---|---|
| Idaho Power | 500/200 | 2021 | Northwest | IPCo |
| | 250/550 | 2022 | LGBP | BPASEID |
| PacifiCorp East | 540 | 2024 | Antelope | Network |
| | 1100 | 2026 | Miners / Point of Rocks | Network |

**Table 4 – Transmission Service Obligations**

## Public Policy Consideration Scenario Requests

In Quarter 1, Renewable Northwest (RNW) and the Northwest Energy Coalition (NWEC) jointly submitted a Public Policy Consideration request for a scenario analysis study. The group asked NTTG to study a faster phase-out of coal plants while developing utility-scale renewable resources and replacing Colstrip units 1, 2 and 3 with either wind only or a combination of wind and natural gas combustion.

Members of the TWG and representatives from RNW and NWEC reviewed the request and agreed to some modifications. These modifications, and the associated study assumptions, are documented in the NTTG 2016-2017 Study Plan, Attachment 3 of the Draft Final RTP.

The study results suggested that a replacement of wind or a combination of wind and gas for coal may be feasible. This study, however, neither constituted a path study nor conveyed or implied transmission rights. Additional analysis would be required to understand the full impacts of coal plant decommissioning.

Public Policy Considerations are considered to be relevant factors not established by local, state or federal laws or regulations. The results of PPC analysis may inform the RTP but do not result in the inclusion of additional projects in the RTP.

A full report of the study can be found in Appendix D of the NTTG 2016-2017 Draft Final RTP.

## Regional Economic Study Requests

NTTG received no regional economic study requests.

## Initial Regional Transmission Plan Development

The starting point for the biennial planning process was development of the Initial RTP. This exercise used a bottom-up approach to merge the projects in the prior RTP (2014-2015) and

the Full Funding Transmission Providers' local transmission plans into a single regional transmission plan. Next, the TWG analyzed the Initial RTP through Change Case plans, which included or excluded Non-Committed regional projects and Interregional Transmission Projects. These Change Case plans helped to determine whether Alternative Projects could be added or substituted, or if one or more Non-Committed Projects could be deferred, or both, to yield a regional transmission plan more efficient or cost effective than the Initial RTP. The results of this analysis led to the formation of the Draft RTP.

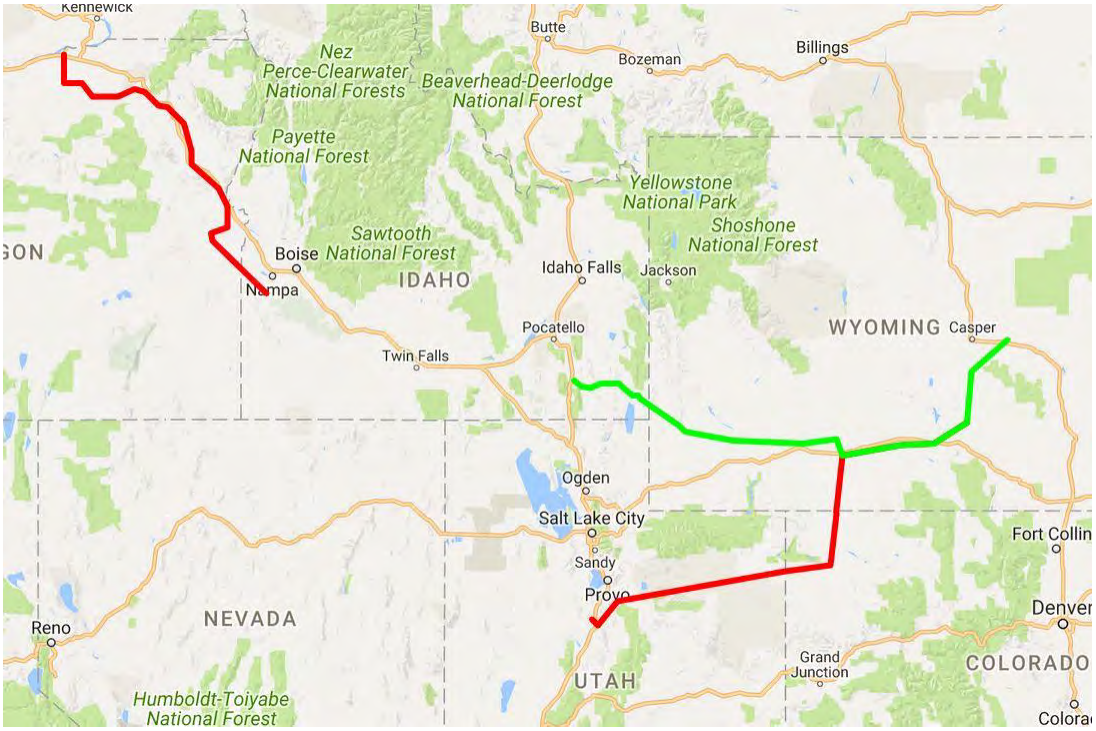

**Figure 4. The red and green lines represent the projects comprising the prior RTP from 2014-2016. These include Boardman to Hemingway, in the northwest sector of the above map, and an Alternative Project with four transmission elements across four states.**

The following Non-Committed regional projects comprised the Initial RTP:

- Boardman to Hemingway (Longhorn-Hemingway) 500 kV (red)
- Gateway West
    - Windstar-Aeolus 230 kV (green)
    - Aeolus-Anticline (Jim Bridger) 500 kV (green)
    - Anticline-Populus 500 kV (green)
    - Populus-Borah 500 kV (blue)
    - Populus- Cedar Hill 500 kV (green)
    - Cedar Hill-Hemingway 500 kV (green)
    - Cedar Hill- Midpoint 500 kV (green)
    - Borah-Midpoint 345 to 500 kV conversion (dark green)

- Midpoint-Hemingway #2 500 kV (blue)

- Gateway South
  - Aeolus-Clover 500 kV (red)
- Antelope
  - Goshen-Antelope 345 kV (red)
  - Antelope-Borah 345 kV (red)

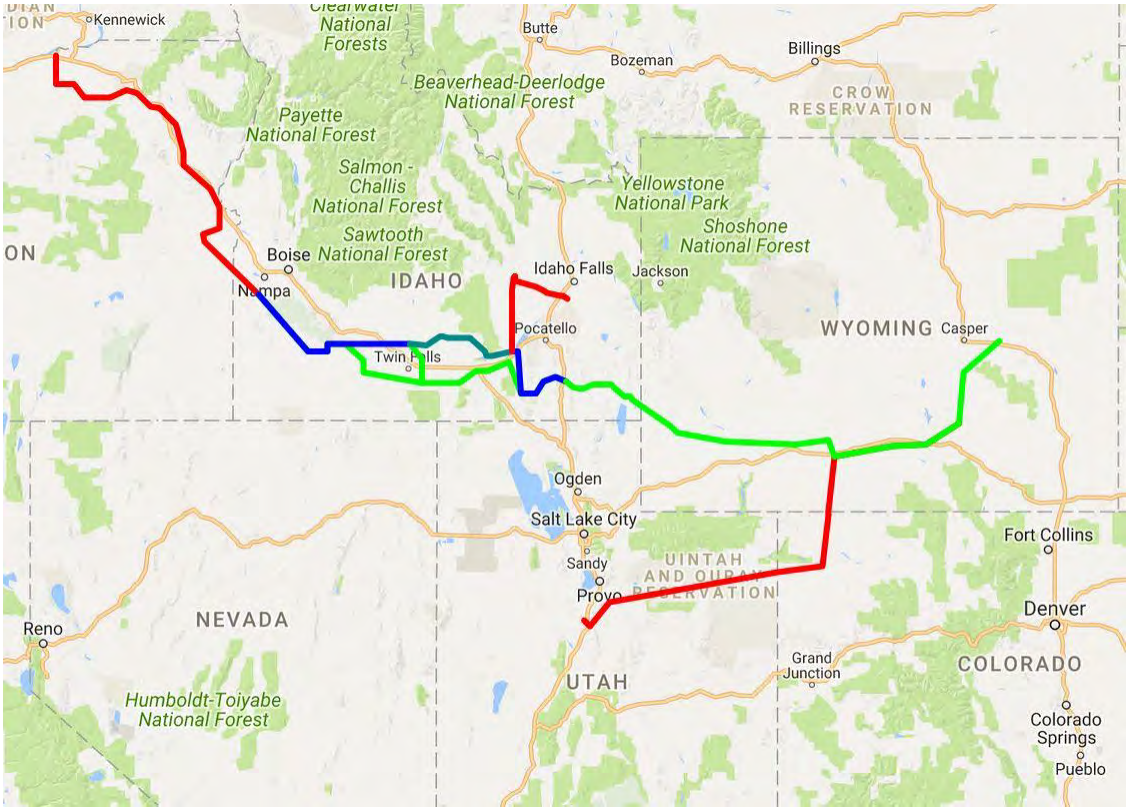

**Figure 5. Map showing Non-Committed regional projects comprising the 2016-2017 Initial RTP.**

## Interregional Project Coordination

As part of interregional coordination, NTTG and the other regional entities in the Western Interconnection collaborate during their transmission planning processes to coordinate their interregional transmission planning data. These coordination efforts inform each planning region's transmission plans. A properly submitted Interregional Transmission Project is evaluated as an Alternative Project in NTTG's regional planning process. The set of uncommitted projects (regional, interregional or both) that results in the more efficient or cost-effective regional transmission plan forms the basis of NTTG's Regional Transmission Plan.

| SUMMARY OF Q1-2016 INTERREGIONAL PROJECTS SUBMITTED TO NTTG | | | | | | |
|---|---|---|---|---|---|---|
| Project Name | Company | Relevant Planning Region(s) | Termination From | Termination to | Status | In Service Date |
| Cross-Tie Transmission Project | TransCanyon, LLC | NTTG, WC | Clover, UT | Robinson Summit, NV | Conceptual | 2024 |
| SWIP-North | Great Basin Transmission LLC | NTTG, WC | Midpoint, ID | Robinson Summit, NV | Permitted | 2021 |
| TransWest Express Transmission Project | TransWest Express, LLC | NTTG, WC and CAISO | Sinclair, WY | Boulder City, NV | Conceptual | 2020 |

Table X. Three Interregional Transmission Projects were submitted for consideration during formation of the Initial RTP in Quarter 1 of the biennial cycle.

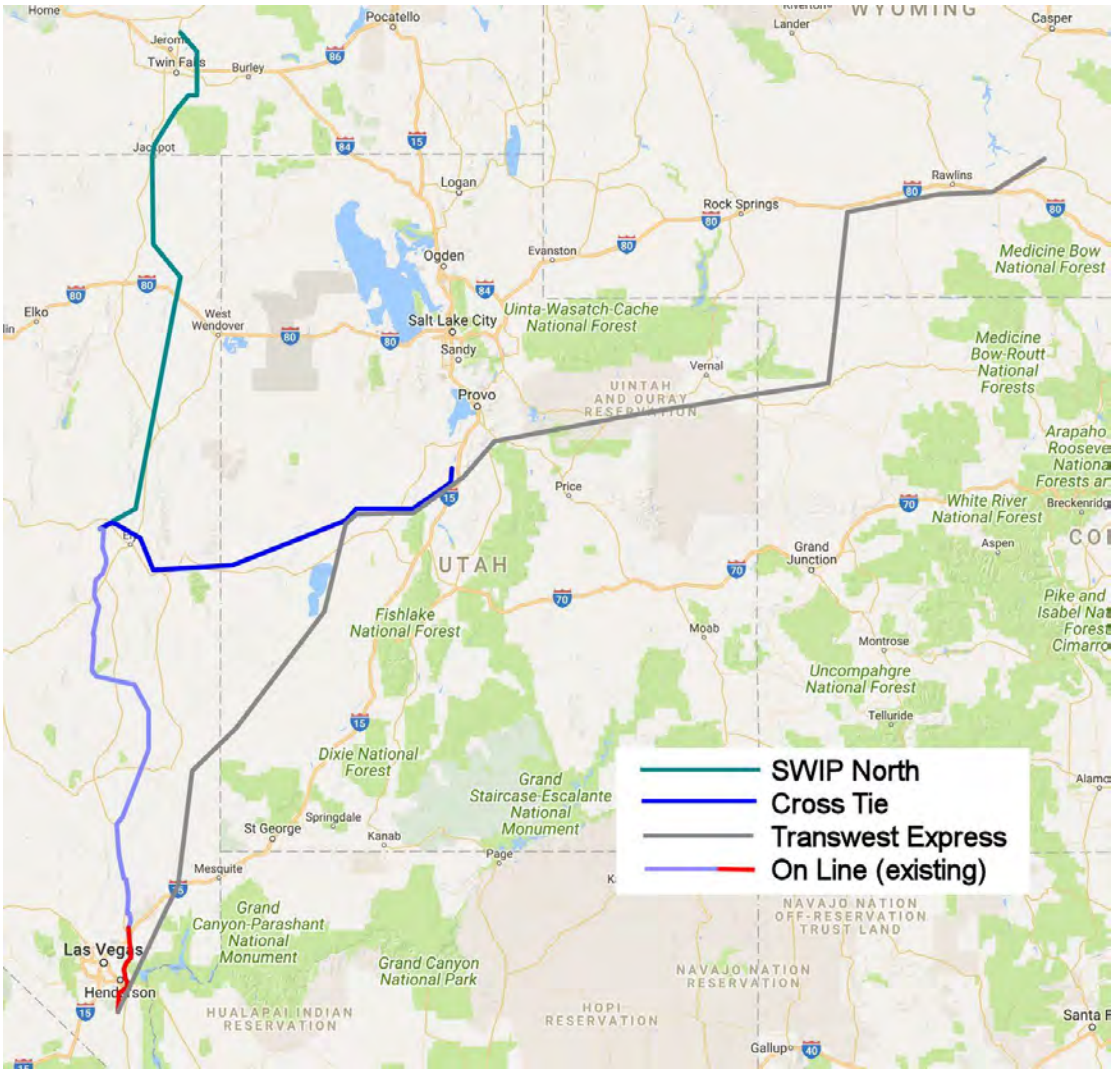

Figure 6. Three Interregional Transmission Projects were evaluated during the planning cycle.

**Southwest Intertie Project (SWIP).** Great Basin Transmission, LLC (GBT), an affiliate of LS Power, submitted the 275-mile northern portion of the Southwest Intertie Project (SWIP) as an ITP. SWIP-North would connect the Midpoint 500-kV substation in NTTG's planning area to the Robinson Summit 500-kV substation in the WestConnect area with a 500-kV single-circuit AC transmission line. The SWIP is expected to have a bi-directional WECC-approved path rating of approximately 2,000 MW. If GBT is selected to build SWIP-North, development, final design and construction activities could be completed to support energizing the project within an estimated 36-42 months.

**Cross-Tie Transmission Line.** TransCanyon submitted the 213-mile Cross-Tie Transmission Line for consideration as an ITP. TransCanyon proposes to build a 1500-MW, 500-kV high-voltage alternating current (HVAC) line between central Utah and east-central Nevada. The line would connect PacifiCorp's proposed 500-kV Clover substation with the existing 500-kV Robinson Summit substation. TransCanyon expects the project to be in-service by the end of 2024.

**TransWest Express Transmission Project.** TransWest proposed a 730-mile, phased 1,500/3,000 MW, ±600 kV, high-voltage direct current (HVDC) transmission system with terminals in south-central Wyoming and southeastern Nevada. The federal Bureau of Land Management and Western Area Power Administration published the Final Environmental Impact Statement (FEIS) for the TWE Project in May 2015.

## Stress-conditioned Case Study Results

### Stressed Hours for Study with Production-Cost Modeling

The TWG used GridView production-cost software to review 8,760 hours of data to identify stressed conditions within the NTTG footprint. A case representing the year 2026 was obtained from the WECC TEPPC. This case included a representation of the load, generation and transmission topology of the WECC interconnection-wide transmission system 10 years in the future. The TWG identified corrections to the data needed to align with data submitted in the first quarter of the biennial planning cycle. TWG shared these changes with the other regional planning entities and WECC to include in their future studies. The TWG then agreed to use this modified TEPPC case in creating the stressed cases discussed below.

After processing all 8,760 hours through the production-cost program, the TWG analyzed the data and identified seven stressed conditions to study:

- High NTTG summer peak
- High NTTG winter peak
- High Montana-Northwest (Path 8) flows
- High southern Idaho import (Idaho-Northwest Eastbound)
- High southern Idaho-Northwest export (Idaho-Northwest westbound)
- High NE-SE (Path Tot2) flows
- Other conditions the might warrant transmission system reinforcement

| Stressed Condition | Date | Hour | TWG Label |
|---|---|---|---|
| **Max. NTTG Summer Peak** | July 22, 2026 | 16:00 | A |
| **Max. NTTG Winter Peak** | December 8, 2026 | 19:00 | B |
| **Max. MT to NW** | September 10, 2026 | Midnight | C |
| **High Southern Idaho Import** | June 11,2026 | 14:00 | D1 |
| **High Southern Idaho Export** | September 17, 2026 | 2:00 | D2 |
| **High Tot2 Flows** | November 11, 2026 | 17:00 | E |
| **High Wyoming Wind** | September 17, 2026 | 2:00 | F |

**Table XYZ – Hours Selected from 2026 WECC TEPPC Case to Represent Different NTTG System Stresses**

High Summer Peak (NTTG Case A)

- 24,100 MW load
- 17,851 MW resources
- -6,250 import
- 4 p.m., July 22, 2026

This case showed a need to import energy during high summer air-conditioning loads. The transmission projects in the Initial RTP performed reasonably well; however, system performance proved inadequate without transmission system additions by 2026 to meet NTTG's summer peak load. This case accounted for wind resources of 2,175 MW to check the performance of the set of projects comprising the Draft RTP.

High Winter Peak (NTTG Case B)

- 22,468 MW load
- 19,261 MW resources
- -3,208 MW import
- 7 p.m., Dec. 8, 2026

A few local system violations occurred when tested against the transmission projects comprising the Initial RTP. This case puts\ less stress on the NTTG system than did the summer peak. This case also accounted for wind resources of 2,175 MW to check the performance of the Draft RTP projects.

High Montana-NW (Path 8) Flows (NTTG Case C)

- 13,097 MW load
- 12,138 MW resources

- -959 MW import
- 12:00 midnight, Sept. 10, 2026

This case tested transmission system capabilities with high electricity flows from Montana to the Northwest. This scenario was used for the public policy consideration study, which analyzed the impact of an accelerated phase-out of Colstrip units 1, 2 and 3 with either wind only or a combination of wind and gas. See the Public Policy Consideration Scenario Requests section for results of the study.

High Southern Idaho Import (NTTG Case D1)

- 16,382 MW load
- 9,159 MW resources
- -7,223 MW import
- 2 p.m., June 11, 2026

Under conditions with the eastbound path from the Northwest to Idaho operating at a 2,244 MW deficit, and the NTTG system importing 7,223 MW, the NTTG transmission topology could not import enough power to support load service obligations in southern Idaho. With the addition of transmission projects comprising the Initial RTP, however, the NTTG system would perform well, with a few local violations.

High Southern Idaho Export ( NTTG Case D2)

- 11,935 MW load
- 14,683 MW resources
- 2,748 MW export
- 2 a.m., Sept 17, 2026

In this export scenario, with the Idaho to Northwest Path 8 flow at 3,391 MW, the existing NTTG system would be incapable of supporting expected transfers and meeting transmission requirements in 2026. Adding in the projects from the Initial RTP, the system performed well, with one contingency that caused a series cap bank to overload. That bank, however, has reached the end of its useful life and is likely to be replaced before 2026.

High NE-SE (Path Tot2) flows (NTTG Case E)

- 16,625 MW load
- 16,620 MW resources
- 5 MW export
- 5 p.m., Nov. 11, 2026

This case evaluated the performance of the Interregional Transmission Projects in supporting transfers between regions. These additional interregional transfers were not identified in Q1 to meet or defer NTTG's 2026 footprint resource requirements. The case showed near balance in the NTTG footprint between loads and resources, with a small 5 MW import, along with a Tot2

flow of 1,566 MW. This case accounted for wind resources of 2,175 MW to check the performance of the Draft RTP.

High Wyoming wind production (NTTG Case F)

- 11,935 MW load
- 15,015 MW resources
- 3,081 MW export
- 2 a.m., Sept. 17, 2026

This case, as others, was studied at the 2,175-MW wind level, which includes the addition of 1,100 MW of wind capacity. The added wind generation in the Wyoming area worsened reliability issues observed in Wyoming and confirmed the need for additional transmission to use these resources to their fullest extent. The RTP addresses these reliability concerns and relieves the transmission constraints.

## Development of Change Cases

For each of the seven stress-conditioned cases, the TWG prepared a Null Change Case and analyzed reliability results. The Null case represents roughly today's transmission topology made to serve loads and resource requirements in 2026. Only the Heavy Winter case performed acceptably. All the other conditions revealed performance issues that required varying degrees of correction, with the heavy summer case needing the least correction and the high Wyoming wind case needing the most. In instances where the transmission system was not adequately stressed to historical norms, the TWG slightly modified system conditions to ensure that the transmission system was studied under reasonably stressed conditions.

## Change Case Results

To efficiently study the wide range of potential combinations of Non-Committed Projects, the TWG proposed a Change Case matrix in the study plan. Once the stressed power-flow cases had been selected and developed, the TWG modified the matrix to better reflect the recommended analysis. The TWG provided stakeholders with the opportunity for input on whether a particular combination of uncommitted regional or interregional projects should be analyzed. No comments were received. The matrix was subsequently vetted through the Planning Committee and the Steering Committee.

Table XX, below, is the Change Case matrix used by the TWG.

| Case | B2H* | Gateway S* | Gateway W* | Antelope Projects | SWIP N | Cross-Tie | TWE | Case(s): |

**Figure 7. Change Case matrix used in the development of the RTP.**

In all, the TWG performed more than 100 reliability studies on more than 410 contingencies. To better communicate the results of these studies, the TWG created heat maps, which present a

weighted[7] graphical performance of a Change Case on a specific flow condition. A full heat map analysis of the Change Cases is included in the final Draft RTP.

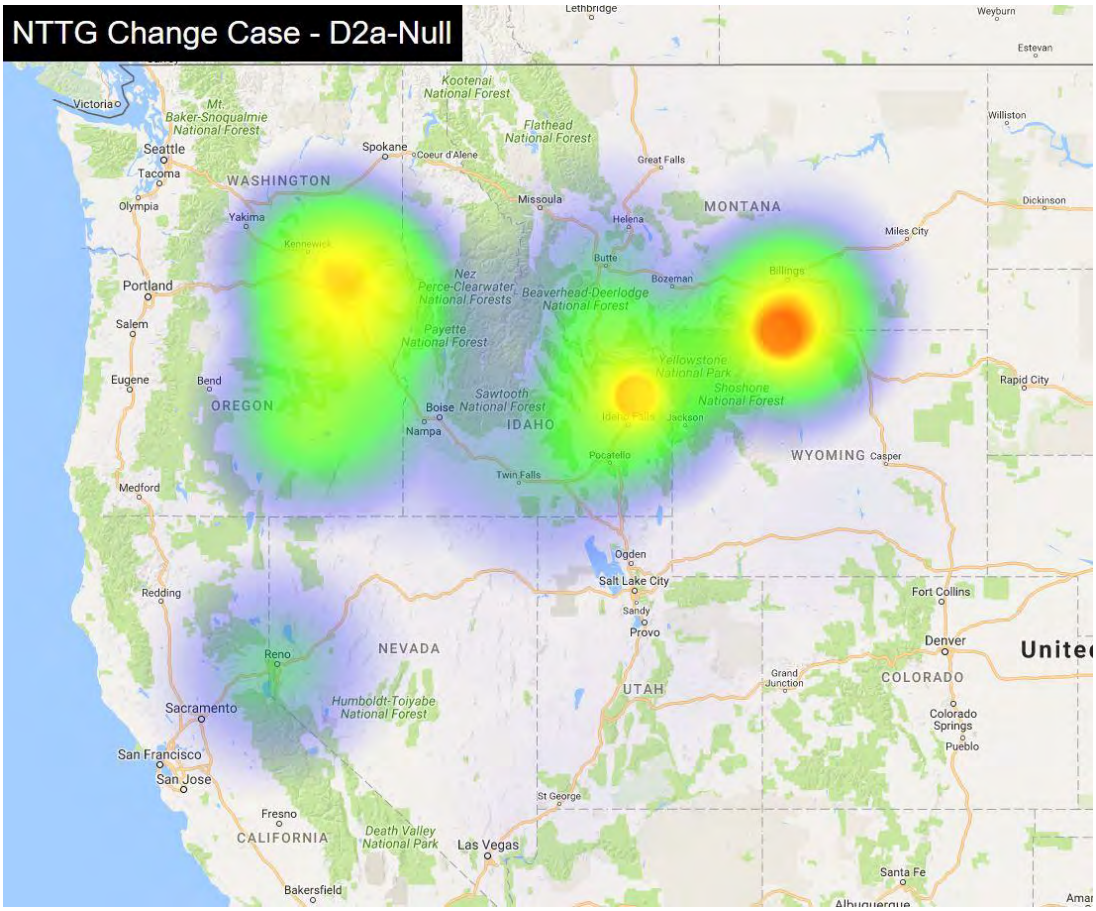

**Figure 8. Heat map of the D2-Null Case**

Figure 8, for example, shows the general location where performance issues (e.g., an overloaded transmission line) occurred for a contingency. The accumulation of overloads and voltage issues are represented by the color spectrum from blue to red, or "cooler" to "hotter." These violations occur when transmission systems cannot handle anticipated transfers across that area's transmission lines. In particular, this heat map, using existing Wyoming wind resources dispatched at about 600 MW, indicates that transmission additions are necessary to integrate the projected wind resources.

[7] High voltage conditions had a weighting of 1; Low voltage conditions had a weighting of 3; and overloads of branches had a weighting of 5. For example, a zone in which 10 contingencies caused an overload of one branch in that zone would receive a total weight of 50 (i.e., 10 x 5), which would then be translated into a color on the map. A blue color represents a weighted total of about 10, green is a count up to 30, yellow is a count up to 50 and red is for a weighted count exceeding about 70.

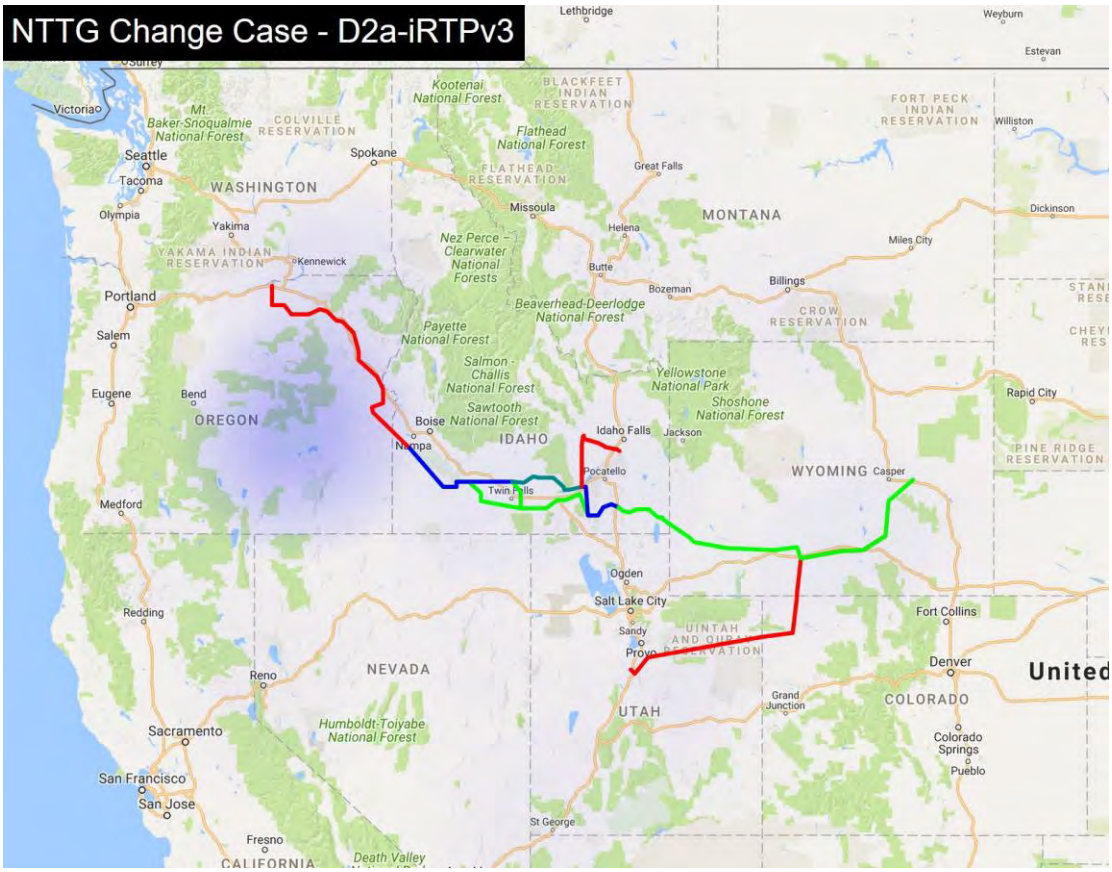

Figure 9. Heat map of the High Southern Idaho export case with the Initial RTP facilities included

The heat map in Figure 9 shows how the addition of the Initial RTP projects produced a dramatic improvement of transmission performance when compared with the Null Case.

### High Southern Idaho Import Case

Combining the Boardman to Hemingway project with the Gateway West and Gateway South Non-Committed Projects eliminated violations in flow conditions visible in the Null Case. Change Case 3 tested whether Gateway West or Gateway South, or both, could replace or compare with the Boardman-to-Hemingway line. They couldn't. The projects contained in the prior RTP also failed to alleviate the violations.

### High Southern Idaho Export Case

Adding the Boardman-to-Hemingway project relieved stress across the Idaho-Northwest cutplane, but significant issues remained east of Hemingway. Adding the eastern portion of Gateway West and Gateway South outlined in the prior RTP eliminated the performance issues in Wyoming and between Idaho and Montana, but those additions increased the stress across southern Idaho. The Initial RTP and Change Cases 21 and 23 resolved these issues.

### High Wyoming Wind Case

Without significant reinforcements, the transmission system in Wyoming could not handle both existing and future planned wind resources while maintaining all other Wyoming area generating resources at their typical high capability in an export scenario.

With wind production at the 1,300-MW level in the Null Case (no new transmission supporting 2026 loads), the system performed poorly. Nor did the projects in the prior RTP solve problems. Adding the Initial RTP projects resolved all violations except for a series capacitor bank. That bank has reached the end of its useful life, however, and is due for replacement.

In Quarter 6, the case was tested to see if Change Cases 1 through 4 would support the increased level of Wyoming wind. The Null Case (no new transmission) was unable to be solved with wind above 1,800 MW. Testing Change Case 4 required adding the Aeolus-Anticline 500-kV line to eliminate a number of contingencies that failed to solve in Wyoming. Change Case 23, which is essentially Change Case 4a with Gateway South added, performed well with Wyoming wind modeled at 2,175 MW.

### Interregional Transmission Projects

Change Cases 5 through 20 tested whether the three Interregional Transmission Projects (ITP)—alone, in combination with other ITPs or in combination with the Non-Committed Projects—could satisfy NTTG's transmission needs on a regional or interregional basis more efficiently or cost effectively than through local planning processes. The ITPs were added to the null cases without any additional resources to serve NTTG load beyond those resources identified in the Quarter 1 and Quarter 5 data submittals. The ITPs did not provide the NTTG footprint with regional benefits, the testing showed, either by significantly reducing performance issues or by displacing NTTG Non-Committed Projects.

The Initial RTP also was analyzed to determine whether it would be capable of supporting the interregional resource transfers proposed by the ITPs. Given the relatively long distances of the ITPs, the local integration performance issues identified in Wyoming were solvable.

## Reliability Conclusions

Based on the above study results, the TWG concluded that both Change Cases 21 and 23 and the Initial RTP satisfy NTTG reliability criteria. In Quarter 5, the TWG tested Change Case 23 and the wind resource additions at various load and flow levels on the Heavy Summer, Heavy Winter, High Tot2 and High Wyoming wind cases. The TWG study found the NTTG area would be reliably served in the year 2026 only by including the following Non-Committed regional projects:

- Boardman to Longhorn (formerly Hemingway)
- The Energy Gateway projects including segments:
    - Windstar-Aeolus 230 kV
    - Aeolus-Clover 500 kV
    - Aeolus-Anticline 500 kV
    - Anticline-Populus 500 kV
    - Populus-Cedar Hill-Hemingway 500 kV

- Antelope Transmission Project including:
  - Antelope – Borah 345 kV
  - Antelope – Goshen 345 kV
  - Antelope 345/230 kV transformers and interconnection facilities

The ITPs were evaluated to determine whether one or more of them could defer or replace NTTG's Non-Committed Projects. The TWG concluded that none of the ITPs solved NTTG's reliability performance issues and, thus, were included in the final NTTG RTP.

## Economic Evaluations

To determine whether the Initial RTP or a Change Case transmission plan was more cost effective, the TWG used three economic metrics, as determined in the Biennial Study Plan. The three metrics—capital-related costs, power flow losses and reserves—and results are discussed below.

### Capital-related Cost Metric

Development of the capital-related cost metric required three steps. The first step validated the capital cost of the Project Sponsor's Q1 submitted project. The second step used those results to estimate the annual capital-related costs. The third step levelized the net present value annual capital-related costs for the Initial RTP and the Change Case plans.

### Energy-loss Metric

The energy-loss metric captures the change in energy generated, based on system topology, to serve a given amount of load. A reduction in losses for a Change Case would represent a benefit, since less energy would be required to serve the same load. The two Change Cases with fewer Gateway West transmission segments—Change Cases 21 and 23—had losses higher than, or in some cases equal to, the Initial RTP. Losses were higher in the two Change Cases because the electrical flows in the Initial RTP were redistributed to fewer lines. From a loss perspective alone, the Initial RTP case had fewer losses and as such was the more efficient case.

### Reserve Metric

The reserve metric evaluates the opportunities for two or more parties to save money by sharing a generating resource that would be enabled by transmission. The metric is a 10-year look at the increased load and generation additions in the NTTG footprint and the incremental transmission additions that may be included in the Draft RTP.

In the study cycle, the TWG analyzed Gateway West, Gateway South, Boardman to Hemingway, SWIP North and the Cross-Tie projects. To evaluate these projects, the NTTG footprint was segmented into five zones, and a sixth external zone was included to study the SWIP North and the Cross-Tie projects. The six zones produced 122 viable sharing combinations. Of those, the analysis of the annual net savings over each theoretical participant's standalone alternative suggested that only 34 viable combinations were economic.

Note that this metric includes generation capital costs in its evaluation and, as such, may only be appropriate for cost allocation purposes. It should not drive the selection of a Draft RTP. Whether these cost savings warrant jointly sharing the costs of reserve capacity is up to the parties to decide.

For the NTTG metric analysis, the Initial RTP and the two alternative Change Cases each supported viable economic combinations. Since these Change Cases could contain the same benefit value, the Change in Reserve metric did not factor into the Draft RTP selection decision.

### Economic Metric Analysis Conclusion

The sum of the annual capital-related cost metric, loss metric (monetized) and reserve metric (monetized) yielded an incremental cost for the Initial RTP and the Change Case plans. The set of projects with the lowest incremental cost, after adjustment by the plan's effects on neighboring regions—Change Case 23 (see Figure 10, below)—was then incorporated into the Draft RTP. Note that the incremental cost was computed as the levelized annual capital-related cost, minus NTTG loss benefit, minus monetized reserve benefit.

**Figure 10. Change Case 23, comprising Boardman to Hemingway, Gateway South, portions of Gateway West, and the Antelope projects, produced the lowest incremental cost.**

## Planning Process Flow Map (Coming)

## Final Regional Transmission Plan

Based on the study assumptions and reliability and economic conclusions discussed above, the more efficient or cost-effective plan is Change Case 23. Change Case 23 is a staged variant of the Initial RTP. For the transfers submitted in Quarter 1 and Quarter 5, the facility segments shown in Figure 11, below, were not necessary for the transfers studied in the Change Cases. These segments would likely be necessary at higher transfer levels.

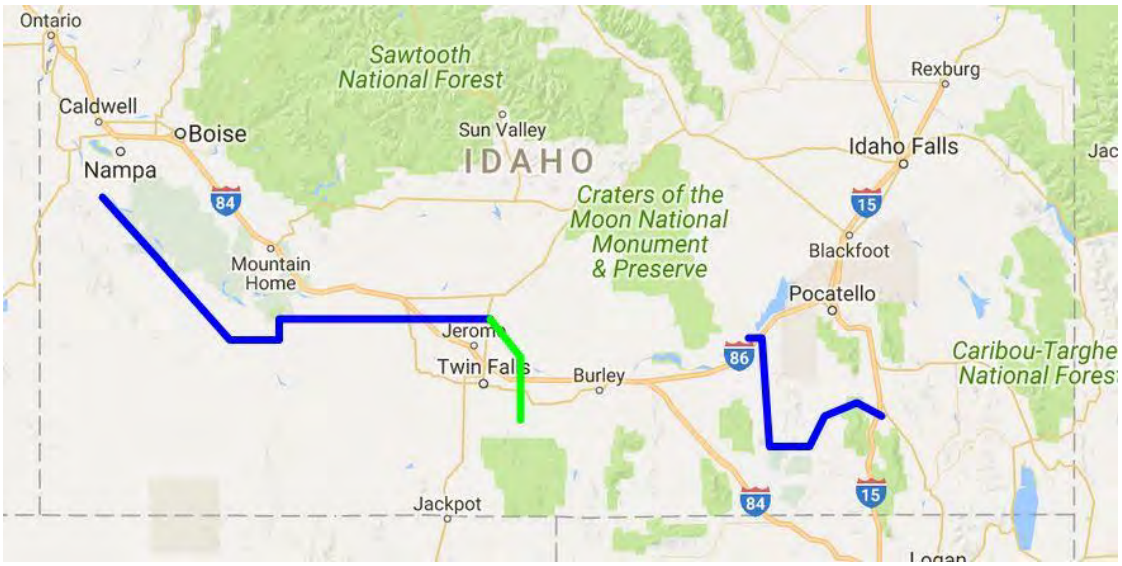

**Figure 11. These transmission line segments from the Initial RTP were not included in the final RTP.**

NTTG's final Draft RTP emerged after a rigorous reliability analysis of the NTTG Transmission Providers' rollup of their local area plans and assumption of Non-Committed regional transmission projects, augmented with stakeholder Interregional Transmission Projects. This technical analysis was followed by an economic metric analysis that selected NTTG's more efficient and cost-effective regional transmission plan, shown below in Figure 12.

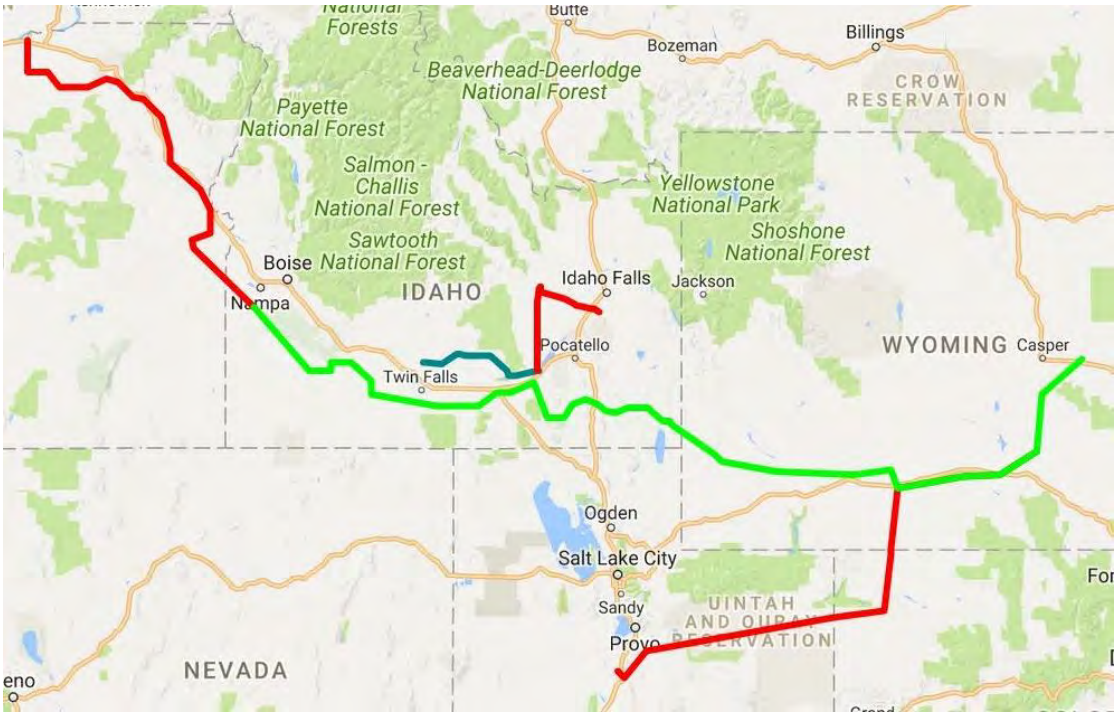

**Figure 12. These projects comprise NTTG's final RTP. See the legend for the identity of individual projects.**

Legend for Fig. 12

Red in upper left: Boardman to Hemingway

Green: Gateway West

Red at bottom: Gateway South Gate

Dark green in middle: Gateway West—upgrade of existing line from 345 kv to 500 kv

Red at center: Antelope projects

## Cost Allocation

The SWIP-North project sponsors were the only project sponsors to request cost allocation; however, they failed to comply with the requirement to submit pre-qualification data by Oct. 31, 2015. As a result, no projects that were eligible for cost allocation were submitted into NTTG's 2016-17 regional planning process.

## Next Steps

Publication of the NTTG Regional Transmission Plan completes the two-year planning process begun in January 2016. The 2016-2017 NTTG RTP identified a need for new transmission capacity to serve forecasted load in 10 years. The plan also identified a set of transmission

projects known in this report as Change Case 23 as the more efficient or cost-effective transmission plan to meet that need. While the RTP is not a construction plan, it provides valuable regional insight and information for all stakeholders (including developers) to consider and use in their respective decision-making processes.

The next biennial regional transmission planning cycle for NTTG started October 1, 2017 and will culminate with the publication of the 2018-2019 RTP in December 2019.

## NTTG 2016-2017 Regional Transmission Plan Supporting Materials

The supporting materials referenced in this report have been posted on the NTTG website and can be found using the following link:

## Glossary

Note: This Glossary is for the benefit of readers and neither supplements nor modifies any defined terms contained in any entity's filed Open Access Transmission Tariff (OATT), including the Attachment K to that tariff. To the extent that a term diverges from any entity's OATT, defer to the OATT.

**Alternative Project** Alternative Project refers to Sponsored Projects, projects submitted by stakeholders, projects submitted by Merchant Transmission Developers and unsponsored projects identified by the Planning Committee (if any).

**Change Case** A Change Case is a scenario where one or more of the Alternative Projects is added to or replaces one or more Non-Committed projects in the Initial RTP. The deletion or deferral of a Non-Committed Project in the Initial RTP without including an Alternative Project can also be a Change Case.

**Committed Project** A Committed Project is a project that has all permits and rights of way required for construction, as identified in the submitted development schedule, by the end of Quarter 1 of the current regional planning cycle.

**Draft Regional Transmission Plan** Draft Regional Transmission Plan refers to the version of the Regional Transmission Plan that is produced by the end of Quarter 4 and presented to stakeholders for comment in Quarter 5.

**Draft Final Regional Transmission Plan** Draft Final Regional Transmission Plan refers to the version of the Regional Transmission Plan that is produced by the end of Quarter 6, presented to stakeholders for comment in Quarter 7 and presented, with any necessary modifications, to the Steering Committee for adoption in Quarter 8.

**Initial Regional Transmission Plan** Initial Regional Transmission Plan comprises projects included in the prior Regional Transmission Plan and projects included in the Full Funders Local Transmission Plans and accounts for future generation additions and deletions (e.g., announced coal retirements).

**Interregional Transmission Project** An Interregional Transmission Project is a proposed new transmission project that would directly interconnect electrically to existing or planned transmission facilities in two or more planning regions and that is submitted into the regional transmission planning processes of all such planning regions.

**Merchant Transmission Developer** Merchant Transmission Developer refers to an entity that assumes all financial risk for developing and constructing its transmission project. A Merchant Transmission Developer recovers the costs of constructing the proposed transmission project through negotiated rates instead of cost-based rates.

**Non-Committed Project** A project that is not a Committed Project

**Sponsored Project** A Sponsored Project is a project proposed by a Project Sponsor.

| In the Matter of<br><br>IDAHO POWER COMPANY<br><br>2009 Integrated Resource Plan. | ORDER |

DISPOSITION: PLAN ACKNOWLEDGED WITH REQUIREMENTS

## I. INTRODUCTION

Idaho Power Company (Idaho Power or Company) seeks acknowledgement of its 2009 Integrated Resource Plan (IRP). This filing is in accordance with Public Utility Commission of Oregon (Commission) Order No. 07-002, as corrected by Order No. 07-047,[1] which requires all regulated energy utilities operating in Oregon to engage in integrated resource planning.

We acknowledge Idaho Power's 2009 IRP and its preferred portfolio as presenting the best combination of expected costs and associated risks and uncertainties for the Company and its customers, and as satisfying the procedural and substantive requirements of this Commission. At the same time, we recognize that the assumptions for several key factors remain uncertain. For this reason, we require that Idaho Power perform further analyses in its 2011 IRP consistent with our discussion below.[2]

### A. Requirements for Integrated Resource Planning

The Commission requires regulated energy utilities to prepare integrated resource plans within two years of acknowledgment of the last plan. Utilities must involve the Commission and the public in their planning process prior to resource decision-making.

Substantively, the Commission requires that energy utilities: (1) evaluate resources on a consistent and comparable basis; (2) consider risk and uncertainty; (3) make the primary goal of the process to select a portfolio of resources with the best combination of

[1] The Commission originally adopted least-cost planning in Docket No. UM 180, *See* Order No. 89-507 (Apr 20, 1989). The Commission updated the least-cost planning process in 2007 in Docket No. UM 1056. *See* Order No. 07-002 (Jan 8, 2007).

[2] The original due date for the filing of the Company's 2009 IRP was June 2009. That date was extended by Commission order to December 2009. The Company will file its 2011 IRP in June 2011.

expected costs and associated risks and uncertainties for the utility and its customers; and (4) create a plan that is consistent with the long-run public interest as expressed in state and federal energy policies.[3]

**B. Effect of Acknowledgement of an IRP on Future Ratemaking Actions**

The Commission's role in reviewing an IRP is to determine whether the IRP meets the substantive and procedural guidelines in Order Nos. 89-507 and 07-002. The Commission generally does not address the need for specific resources, but rather determines whether the utility has proposed a portfolio of resources to meet its energy demand that presents the best combination of cost and risk.[4] Commission acknowledgement of an IRP means only that the Commission finds that the utility's preferred portfolio is reasonable at the time of acknowledgement.[5]

In Order No. 89-507, the Commission described its role in reviewing and acknowledging a utility's least-cost plan:

> The establishment of Least-Cost Planning in Oregon is not intended to alter the basic roles of the Commission and the utility in the regulatory process. The Commission does not intend to usurp the role of utility decision-maker. Utility management will retain full responsibility for making decisions and for accepting the consequences of the decisions. Thus, the utilities will retain their autonomy while having the benefit of the information and opinion contributed by the public and the Commission.
>
> * * * * *
>
> Acknowledgment of a plan means only that the plan seems reasonable to the Commission at the time the acknowledgment is given. As is noted elsewhere in this order, favorable rate-making treatment is not guaranteed by acknowledgment of a plan.[6]

This order does not constitute a determination on the ratemaking treatment of any resource acquisitions or other expenditures undertaken in accordance with Idaho Power's 2009 IRP. As a legal matter, the Commission must reserve judgment on all ratemaking issues. Notwithstanding these legal requirements, we consider the integrated resource planning process to complement the ratemaking process. In ratemaking proceedings in which the reasonableness of resource acquisitions is considered, the Commission will give considerable weight to utility actions that are consistent with acknowledged integrated

[4] *See id.* at 25.
[5] *See id.* at 16.
[6] *See* Order No. 89-507 at 6, 11. The Commission affirmed these principles in Docket UM 1056. *See* Order No. 07-002 at 24.

resource plans. A utility is also expected to explain actions they take that are inconsistent with Commission-acknowledged plans.

## C. Idaho Power's 2009 IRP

The Commission's IRP Guidelines state that a utility must file its IRP two years from the date of acknowledgement of the previous plan. Idaho Power received acknowledgement of its 2006 IRP on September 12, 2007.[7] Due to substantial changes in economic conditions and permitting delays for the Boardman to Hemingway 500 kV transmission project (B2H Project or Boardman to Hemingway), the Company requested a delay in its September 12, 2009 filing deadline. On May 26, 2009, the Commission approved Idaho Power's motion to delay its filing of the 2009 IRP until December 2009.[8] On December 30, 2009, Idaho Power filed its 2009 IRP.

This is Idaho Power's first plan under the Commission's newly adopted Guidelines.[9] In developing its 2009 plan, Idaho Power worked with an IRP advisory group comprised of major stakeholders representing the environmental community, major industrial customers, irrigation customers, state legislators, Commission representatives, and others.

Idaho Power's 2009 IRP analyses the potential cost of carbon emissions in two ways: cap-and-trade and carbon tax adders. While Idaho Power modeled both a cap-and-trade system and carbon tax adders in future scenarios, the Company primarily focuses on cap-and trade as the most likely regulatory outcome. The Company's analysis uses the Waxman-Markey Bill[10] as the basis for its assumptions on emission targets and allowances.

Idaho Power uses the AURORAxmp (AURORA) market model as the primary tool for determining future resource operations and to estimate the portfolio cost for the twenty-year IRP. Using the AURORA model, the Company performed a quantitative risk analysis of the following variables: third-party transmission subscription; renewable energy credit prices; natural gas prices; carbon emission costs; load growth; and conservation. Additionally, Idaho Power performed a qualitative risk analysis that looked at carbon regulation, technology, market risk, and resource siting.

For the first time, Idaho Power bifurcated the required twenty-year planning period into two ten-year planning periods—2010 through 2019 and 2020 through 2029. The Company believes that this approach prevents near-term decision making from being unduly influenced by resource decisions in the second ten-year planning period.

In the first ten-year planning period (2010 through 2019), Idaho Power examines four resource portfolios, classified as Solar, Gas Peaker, Gas Peaker and B2H,

[7] *See* Order No. 07-394 (Docket No. LC 41).
[8] *See* Order No. 09-183 (Docket No. UM 1428).
[9] *See* Order No. 07-002.
[10] The Waxman-Markey Bill, named after its authors, Representatives Henry A. Waxman of California and Edward J. Markey of Massachusetts, was introduced as an energy bill in the 111th United States Congress. The bill was approved by the House of Representatives on June 26, 2009.

and B2H. The labeling of these portfolios defines the type of supply-side resource that would be used to meet Idaho Power's forecasted energy and capacity deficits. Originally evaluated in the Company's 2006 IRP, and common to all resource portfolios as "committed" resources, are (1) the Langley Gulch combined-cycle combustion turbine (CCCT), (2) up to 150 megawatts (MW) of wind generation, and (3) two 20 MW increments of geothermal energy coming on-line in 2012 and 2016.

In the second ten-year planning period (2020 through 2029), Idaho Power examines five resource portfolios. Idaho Power uses its preferred portfolio for the first ten-year planning period as the basis for designing the second period portfolios. The load forecast for the second planning period is relatively flat. The primary driver for new resources in the second period is carbon emission reductions due to coal curtailment, as identified in the Waxman-Markey Bill.

New energy efficiency programs included in the 2009 IRP are forecast to reduce annual load by 127 average MW (MWa) by the year 2029. This reduction represents a 53 percent increase over the measures included in the Company's 2006 IRP. New and expanded demand response programs are expected to reduce peak summer load by 323 MW by the year 2012, once the programs mature. This reduction represents significant growth over the 2006 IRP when demand response programs were estimated to provide only 78 MW of peak reduction by 2026. All estimated reductions in load due to energy efficiency and demand response programs are included in Idaho Power's 2009 load forecast.

Using an August 2009 load forecast, Idaho Power projects peak-hour load will grow at an average annual rate of 53 MW or 1.5 percent. Average system load is forecasted to grow by 13 MWa or 0.64 percent on an average annual basis over the twenty-year planning period. Idaho Power projects that its system will become short on capacity in 2013 and, on an energy basis, the system begins to experience a short position by 2014.[11]

Based on its analysis, Idaho Power selected "Portfolio 1-4 Boardman to Hemingway" as its preferred portfolio for the 2010-2019 planning period and "Portfolio 2-4 Wind and Peakers" as its preferred portfolio for the 2020-2029 planning period. The selection of these portfolios as the Preferred Portfolio for the twenty-year study is based on the Company's conclusion that the portfolios present the best combination of expected cost and associated risks.

The Company requests acknowledgement of an Action Plan to implement its Preferred Portfolio. The Action Plan includes the following items:

2010 Irrigation Peak Rewards program increases to 220 MW
FlexPeak Management program increases to 40 MW

[11] Idaho Power uses a 70th percentile water conditions and 70th percentile average load conditions for energy planning purposes. For peak-hour capacity planning, Idaho Power uses 90th percentile water conditions and 95th percentile peak-hour load.

2011 Irrigation Peak Rewards program increases to 250 MW
FlexPeak Management program increases to 45 MW

2012 Wind project on-line 150 MW
Langley Gulch CCCT on-line 300 MW
Geothermal Project on-line 20 MW

2013 Boardman to Hemingway construction begins
Shoshone Falls Upgrade Project construction begins

2015 Shoshone Falls Upgrade Project on-line 49 MW
Boardman to Hemingway completed for market purchases of 250 MW

2016 Geothermal Project on-line 20 MW

2017 Boardman to Hemingway capacity for market purchases of 175 MW

Finally, Idaho Power believes that the flexibility to adjust to changes during the present period of uncertainty regarding carbon regulation is very important.

## II. DISCUSSION

### A. Load Forecast

*1. Parties' Positions*

During a public comment hearing in Ontario, Oregon, on April 20, 2010, many commentators argued that the load forecast in Idaho Power's 2009 IRP is too high. Some of the reasons cited for this conclusion are: (1) the Company should not have included new large load customers; (2) the Company did not consider more recent load information in its forecast; and (3) based on historical housing start data, a more protracted economic recovery will occur than assumed by Idaho Power. Commentators believe that the Company over-projected its short-term load growth, making the Boardman to Hemingway transmission line appear necessary when, in fact, it is not needed in the time period specified by the Company.

In its reply comments, Idaho Power refutes all of the commentators' claims regarding its load forecast. The Company states that its forecast contains the most recent information available at the time the filing was prepared and, compared to the Northwest Power and Conservation Council (NPCC) forecast, Idaho Power's forecast is conservatively low. According to Commission Staff's comments, the NPCC's Sixth Power Plan average load forecast grows at an annual average rate of 1.96 percent, while Idaho Power's forecast grows at 1.4 percent over the twenty-year planning period. For peak-hour load, the NPCC forecast grows at an annual average rate of 2.13 percent, while Idaho Power forecasts its peak-hour load to grow at 2.02 percent.

Regarding the inclusion of large load customers in its forecast, Idaho Power states that large loads are developed through direct input from each of the Company's large load customers. These forecasted customer loads reflect the recession and other operational impacts on future energy use.

In its final comments, Staff agrees with the Company. After reviewing Idaho Power's analyses, Staff believes that the Company has conservatively forecasted its average-energy and peak-hour load, taking into consideration the recent economic downturn. But Staff notes that for the 2019 through 2029 planning period, Idaho Power forecasts average energy to grow at a rate of only 0.1 percent per annum, and peak-hour load growth of only 0.9 percent per annum. Staff is concerned that these growth rates may be too low, especially when the rate of growth in demand-side management (DSM) is projected to slow over this time period.

The inclusion of a customer response to potential price increases due to proposed carbon legislation is a contributing factor to relatively flat growth rates in the second ten-year planning period. Staff finds the customer response to projected price increases associated with carbon regulation to be an interesting change in the Company's forecasting methodology. Staff recommends that the Company provide further description of this analysis in future IRP planning cycles, including the regression coefficients and estimated price responsiveness of each customer class. In its final comments, Idaho Power supports Staff's recommendation.

In its final comments, the Oregon Department of Energy (ODOE) supports Idaho Power's load forecast estimates in its 2009 IRP. ODOE also supports the Staff comments associated with Idaho Power's load forecast and reiterates Staff's concerns about the load growth forecast beyond 2019.

*2. Resolution*

We agree with Staff's conclusion that Idaho Power's first ten-year load forecast is reasonable. We agree with Staff and ODOE that the projected load growth for the second ten-year period seems low. We adopt Staff's recommendation and require Idaho Power to justify its load forecast for the second ten-year period in future IRPs.

We also adopt Staff's recommendation that Idaho Power provide estimates of the price sensitivity for each of its customer classes and document the analyses underpinning those estimates in its next IRP planning cycle.

## B. Preferred Portfolio for the First Ten-Year Planning Period and the Boardman to Hemingway Transmission Project

*1. Parties' Positions*

Idaho Power selected Portfolio 1-4 (Boardman to Hemingway) as its preferred portfolio for the 2010-2019 planning period. In comments on the IRP, Staff and intervening

parties primarily focus on the selection of Portfolio 1-4 as the preferred portfolio versus the other portfolios and, more specifically, the inclusion of the Boardman to Hemingway transmission project. In its analysis, Staff examined the portfolio assumptions associated with the B2H Project, such as capital cost assumptions and third-party subscriptions. Staff evaluated the Company's approach to these variables and their robustness under changing circumstances (for example, higher construction costs or lower third-party subscription rates).

Staff notes that very few interstate transmission projects have been constructed in the region over the last 30 years. It is only recently that utilities in the west have proposed and started to build these large transmission projects, such as Gateway West, the Southwest Intertie, and others. Due to the more recent interest by utilities and consortiums in building these projects, Staff was unable to obtain a reliable set of benchmark data to compare to Idaho Power's cost assumptions and subscription rates. In addition, Staff notes that the cost components of an interstate transmission project can vary widely depending on the type of terrain and right-of-way costs. Thus, rather than attempting to compare these components side-by-side to another project, Staff examined how much these assumptions would have to change in order to make the Portfolio 1-4 no longer the best combination of cost and risk. Idaho Power refers to this analysis as the "tipping point."

Staff discusses at length the Company's analysis of a break-even point, or tipping point, with Portfolio 1-2 (Gas Peaker)—the next best alternative to Portfolio 1-4—to understand the sensitivity of the change in cost within the first ten-year planning period. This analysis demonstrates that Portfolio 1-4 is so robust that capital cost could vary by up to 40 percent and subscription rates could change by 15 percent before the portfolio hits the break-even point with the next best alternative.

In support of its subscription rate assumptions, Idaho Power states that there is significant demand for transmission capacity on its Idaho-Northwest transmission path. Idaho Power states that it is aware of over 4,000 MW of transmission requests on the existing transmission path, with only 133 MW of those requests being granted through 2007 due to limited transmission capacity. The Company claims that it is currently reviewing active transmission requests for the B2H Project. The Company states in its reply comments that it has entered into an agreement with PacifiCorp to negotiate the joint ownership and development of the B2H Project.

Even with a change in cost, Staff states that the Company's analysis also includes additional quantitative and qualitative risk measures that must be taken into consideration. According to Staff, Portfolio 1-4 scored higher than all the alternative portfolios in the Company's risk analyses. The different types of risk modeled in Idaho Power's 2009 IRP are renewable energy credit prices, natural gas prices, carbon emission costs, load growth, and lower conservation. Additionally, Idaho Power performed a qualitative risk analysis that looked at carbon regulation, technology, market risk, and resource siting. Therefore, the Boardman to Hemingway capital costs and subscription estimates would have to vary by more than 40 percent and 15 percent respectively to change

the selection of the Portfolio 1-4 as the preferred portfolio for the 2010 through 2019 planning period.

In conclusion, Staff recommends that the Company continue to evaluate the B2H Project in its 2011 IRP. This on-going analysis of the B2H Project should include updated estimates of construction costs, documentation of progress the Company has made towards securing equity partners, and quantitative estimates of third-party subscription on the Boardman to Hemingway transmission line and future wheeling revenues. Staff additionally recommends that the Commission require that Idaho Power provide third-party documentation in support of the Company's construction cost estimates.

Staff's recommendation for further analysis of third-party subscription and the associated wheeling revenues is based on a concern that the active transmission requests referred to by Idaho Power in its 2009 IRP may not materialize, leaving Idaho Power customers liable for paying for an unused transmission line. Given these concerns, Staff initially recommended that the Commission's acknowledgement of the Boardman to Hemingway action item be conditioned on Idaho Power providing further analysis of these issues in its annual IRP update and next IRP.

In their final comments, ODOE and Idaho Power support Staff's recommendation for further information and analyses on the B2H Project in future IRP planning cycles. Idaho Power also agreed with Staff that if there are significant deviations from the IRP assumptions on issues such as construction costs, equity ownership, and subscription rates, then the Company must explain these deviations in its 2011 IRP. But given that Staff found the Company's estimates to be reasonable at this time, Idaho Power argues that conditional acknowledgment is not necessary. The Company agreed to provide additional analyses of the B2H Project, as prescribed in the eight conditions of Staff's proposed final order.

At the Commission public meeting on September 7, 2010, Staff revised its original recommendation for conditional acknowledgement and agreed with Idaho Power that, with the Company's commitment to continue to analyze and assess the B2H Project as an uncommitted resource, acknowledgement with requirements is a reasonable recommendation that meets the goals of Staff's proposed final order.

Finally, Staff discussed the future ratemaking treatment of the B2H Project. Staff reaffirmed that the Company will be required to compare its actual results with its IRP estimates. If the comparison shows significant deviations from its IRP assumptions, then the Company must provide an adequate explanation for why this project was the right resource as compared to an alternative.

In its opening comments, Renewable Northwest Project (RNP) urges the Commission to acknowledge Portfolio 1-3 (Gas Peaker and B2H) as the preferred portfolio for the first ten-year planning period. RNP states that it believes that the Company's commitment to 150 MW of wind energy and 40 MW of geothermal, coupled with the Boardman to Hemingway transmission line, will foster the growth of new renewable energy

resources in the Northwest. Staff agrees with the latter half of RNP's statement, but points out that Idaho Power's preferred portfolio, Portfolio 1-4, also includes the Company's commitment to 150 MW of wind energy and 40 MW of geothermal. Therefore, Staff believes that Portfolio 1-4 meets RNP's goals.

In reply comments, RNP supported Staff's conclusions associated with Portfolio 1-3, and agreed with Staff that the Company's Portfolio 1-4 will also foster the growth of new renewable resources in the Northwest.

Commentators at the April 20, 2010 public comment hearing focused on the need for the B2H Project. Specifically, commentators believe that building a natural gas plant and additional purchased power are preferable to the Boardman to Hemingway transmission line, and that the line should not be built to accommodate third-party wheeling requests.

Idaho Power refutes each of these claims. First, Idaho Power notes the robustness of Portfolio 1-4 as compared to the other portfolios. Second, Idaho Power refutes the possibility of additional purchased power due to its limited transmission capacity during peaking time on existing transmission paths. Third, Idaho Power states that all wheeling requests on the proposed B2H Project will offset costs associated with building the project, which in turn will reduce its customers' rates. In addition, Idaho Power states that it is bound by federal law to provide wheeling services on a non-discriminatory basis, which requires the Company to construct a transmission system that will ensure reliable and economic service to transmission customers.

*2. Resolution*

As Staff notes, the dearth of recent transmission development and the case-specific nature of any transmission project make it difficult to vet key assumptions that will determine the cost to Idaho Power's retail customers of the B2H Project. But our concern about this uncertainty is tempered by risk analyses showing that the "B2H portfolio" (Portfolio 1-4) is the best portfolio for customers over a range of capital costs and third-party subscription levels. Accordingly, we consider it reasonable to proceed with the B2H Project based on the information available now and acknowledge it as part of the Company's 2009 IRP.

We also adopt Staff's recommendation that Idaho Power be required to update its B2H Project assumptions (for example, construction cost estimates, equity partnership estimates, third-party subscription estimates, and wheeling revenues) in its 2011 IRP. We always expect utilities to update their assessments of previously acknowledged projects that are still in the planning or development stages at the time of an IRP acknowledgement. We make this updating requirement explicit for the B2H Project because of current uncertainty about underlying assumptions. We expect the Company to provide a thorough update of its B2H Project assumptions and its risk analysis in the 2011 IRP, with the understanding that the Commission's acknowledgment of the 2011 IRP will depend on the outcome of that updated analysis.

Finally, we reiterate that at the time of ratemaking any utility is required to show that its investment was a prudent decision. Given the inherent risk associated with a transmission facility and the possibility of escalating costs and delays in permitting, the Company will need to address any significant changes in construction cost, equity partnership, or expected third-party subscription and how these factors influenced the Company's decision to continue with the project.

## C. Preferred Portfolio for the Second Ten-Year Planning Period and the Consolidated Preferred Portfolio

### *1. Parties' Positions*

Idaho Power chose Portfolio 2-4 (Wind and Peakers) for the second ten-year planning period. Portfolio 2-4 consists of five single cycle combustion turbine (SCCT) gas resources with a combined capacity of 1,400 MW, two wind facilities with a combined capacity of 200 MW, and 100 MW of market purchases on PacifiCorp's proposed Gateway West transmission project. Idaho Power states that these resources represent a strategy of adding wind resources sufficient to provide energy and renewable energy credits (REC) along with simple-cycle natural gas plants to provide peaking capacity and operating reserves necessary to integrate wind generation.

In its final comments, Staff noted that the load forecast for the second ten-year planning period is relatively flat. The Company stated that the primary driver for new resources in the second period is the carbon emission reductions, due to coal curtailment, identified in the Waxman-Markey Bill. In its comments, RNP lauded Idaho Power for developing a resource portfolio that allows for considerable curtailment of the Company's coal-fired generation. RNP believes that Idaho Power's IRP strategy appropriately accounts for the costs, risks, and environmental concerns associated with future limits on greenhouse gas emissions.

Staff agrees with RNP and believes that Idaho Power complied with Guideline 8 of the Commission's IRP guidelines by modeling the carbon emission future that it believed was most likely to occur. But Staff cites the need for additional analysis, including the end-effects and costs of the retirement of a coal facility. Staff recommends that the Commission require that Idaho Power examine coal curtailment and the costs associated with coal plant retirement.

In its opening comments, RNP expressed concern that the portfolios rely too heavily on natural gas-fired resources. Staff agrees that Portfolio 2-4 relies too heavily on gas in the second ten-year planning period. Staff's primary concern, however, was not the concentration of gas in the second planning period, but the type of gas resource modeled. Because the primary reason for additional resources in the second ten-year planning period was due to modeled coal curtailment, Staff believes it is unreasonable for the Company to choose multiple SCCTs versus one or two CCCTs.

Staff and RNP believe that the Company needs to consider expanding the number of portfolios it considers in the second ten-year planning period. Staff notes that an IRP is designed to take into consideration a broad array of portfolio options. For the second ten-year planning period and the consolidated Preferred Portfolio, Staff discussed the design of Idaho Power's five alternative portfolios. Staff notes that the Company designed the five portfolios for the second ten-year planning period based on the selection of Portfolio 1-4 for the first ten-year planning period, which limits the resource options considered by Idaho Power.

Staff believes that building portfolios is a learning process examining multiple futures, and this learning process should not be overlooked. Staff believes that more than five portfolios should be developed for the second ten-year planning period. Staff therefore recommends that the Commission require Idaho Power to develop significantly more portfolios for the second ten-year planning period for its next IRP. In addition, Staff recommends that Idaho Power be required to provide a review of the benefits of a CCCT versus a SCCT, looking at variables such as cost effectiveness, operation and maintenance costs, and overall system benefit. In its final comments, Idaho Power supported Staff's recommendation.

In its final comments, ODOE also recognized the need for Idaho Power to develop more portfolios and suggested that the Company should consider uncertainty in its future analyses.

As part of the carbon cost evaluation, Staff recommends that Idaho Power be required to look at the likelihood of Environmental Protection Agency (EPA) regulations on air quality, fly ash, and water for all of its generation facilities. Staff believes the Company needs to include the operational impacts of these possible regulations for future consideration. In its final comments, Idaho Power supported Staff's recommendation.

*2. Resolution*

We support Idaho Power's selection of Portfolio 2-4 for the second ten-year planning period and the overall selection of the Preferred Portfolio. While we recognize the speculative nature of the second half of the planning period, we agree with Staff's conclusion that much can be learned from analyzing more portfolios and resource options. We therefore adopt Staff's recommendation and direct the Company to consider more portfolios, including those needed to evaluate the benefits of a CCCT versus a SCCT, in its next IRP cycle. We also direct the Company to include an analysis of potential EPA or other federal and state environmental policies that may affect Idaho Power's generation portfolio.

**D. Demand-Side Management and Energy Efficiency Programs.**

*1. Parties' Positions*

Several commentators at the April 20, 2010 public comment hearing argued that Idaho Power has been deficient in seeking energy savings. Commentators suggested that Idaho Power's energy efficiency efforts lag behind the regional goals established by the NPCC's Sixth Power Plan. They further asserted that the Company could supplant the need for the Boardman to Hemingway transmission line with increased DSM efforts.

Idaho Power responded to these remarks in its reply comments by explaining how they treat DSM in the planning process and by comparing the Company's efforts to the goals set by the NPCC. Idaho Power explains that prior to evaluating the need for traditional resources, the Company includes all cost-effective energy efficiency from existing and new programs in its load and resource balance. In other words, the Idaho Power gives first priority to obtaining cost-effective conservation. The Company then compares its efforts to the goals set by the NPCC. According to Idaho Power, in 2009 it exceeded the goals in NPCC's Fifth Power Plan by approximately 30 percent. Idaho Power also states that it is working aggressively to meet the goals set in the Sixth Power Plan.

In its final comments, Staff echoed the sentiments of Idaho Power and believes that the Company has explored and included all cost-effective DSM and energy efficiency programs in its 2009 IRP. In addition, Staff states that the Company has made great strides with its energy efficiency and DSM measures as compared to the Company's 2006 IRP.

*2. Resolution*

Idaho Power's existing and new energy efficiency programs are forecasted to reduce average annual system loads by 189 MWa by the year 2019 and 383 MWa by 2029. We agree with Staff that Idaho Power is running a reasonable set of programs to capture all cost-effective conservation. We also support the Company in its efforts to refine and improve upon its programs.

We find that Idaho Power cannot rely on additional cost-effective conservation in lieu of a supply-side resource to meet its summer capacity needs and maintain a reliable system. On a monthly basis, after counting energy efficiency savings, the Company forecasts a resource deficit of 155 MWa during July 2019. On a peak hour basis, after counting savings from existing and new energy efficiency programs and new demand response programs, the Company forecasts summertime capacity deficits as large as 471 MW during 2019. We concur with Staff and Idaho Power that a supply-side resource is required to meet these forecasted capacity deficits.

## E. Policy Issues

### *1. Parties' Positions*

In its opening comments, RNP did not agree with Idaho Power's recommendation to sell its RECs from its renewable energy projects until the Company is required to use the RECs to comply with a federal Renewable Energy Standard (RES). RNP believes Idaho Power should be retaining RECs in preparation for compliance with a future federal RES.

In its final comments, Staff notes that the Idaho Public Utilities Commission accepted Idaho Power's REC management plan filing on June 11, 2010.[12] This REC management plan is consistent with Idaho Power's IRP. In its reply comments, Idaho Power explained that its REC management strategy will benefit customers of Idaho Power in two ways. First, customers' rates will be reduced due to REC sales revenue. Second, the Company plans to continue to acquire and hold long-term contract rights to own RECs to meet future federal RES.

In addition, RNP supported the development of a solar pilot project in Idaho Power's service territory. RNP stated that it would like to participate in a stakeholder workshop with Idaho Power to explore options for a solar pilot project. In response to Staff final comments, RNP generally supported Staff's conclusions.

### *2. Resolution*

We agree with Idaho Power's conclusion that its REC management strategy is in the best interest of customers, will reduce rates, and will provide the ability to meet future RES standards.

More recently, Idaho Power has participated in the pilot project for a solar feed-in tariff in Oregon. We believe Idaho Power's participation and introduction of the solar feed-in tariff fulfills RNP's request to develop a solar pilot project in Idaho Power's service territory.[13]

## F. General Issues

### *1. Parties' Positions*

In final comments, Staff noted several deficiencies in Idaho Power's narrative description of its 2009 IRP. Staff believes that Idaho Power should provide a more thorough explanation of the Company's selection of the Preferred Portfolio. Staff believes that Idaho Power failed to provide an adequate narrative of how the Preferred Portfolio performed in the risk analysis individually and comparatively to the other portfolios. Staff therefore recommended that the Commission require Idaho Power to devote specific chapters in its next IRP explaining the selection of its Preferred Portfolio in greater detail and as compared

[12] *See* Idaho Public Utilities Commission Case No. IPC-E-08-24, Order No. 32002.
[13] *See* Docket No. UM 1452.

to an alternative portfolio. Staff believes this narrative should include an explanation of the relative performance of each portfolio within each of the modeled risk measures, including charts and matrices showing the relative ranking of each portfolio using cost and risk metrics. Finally, Staff recommended that Idaho Power should be required to provide an explanation of how each portfolio performed with regard to the qualitative measures the Company considered in its selection process.

Staff also pointed out that Idaho Power's risk analysis consisted of modeling risk variables, such as load growth, in only one direction—high. In its Technical Appendix the Company did not model low load growth scenarios, low subscription rates, or low natural gas prices. Staff recommends the Company model the full range of possible futures for its risk variables, including both the high and low side, in the next IRP. In response to Staff's final comments, Idaho Power agrees with Staff's recommendations.

*2. Resolution*

We support Staff's recommendation regarding Idaho Power's next IRP cycle. As stated in Order No. 07-002, the Commission guidelines incorporate what we minimally expect from an IRP.[14] We always urge the utility to provide more, rather than less, information, especially given the increasing complexity of the planning process.

## III. CONCLUSION

Idaho Power Company's 2009 Integrated Resource Plan, as highlighted in this order, reasonably adheres to the principles of resource planning established in Order No. 07-002 and is acknowledged with the following requirements:

1. Idaho Power Company will file its next integrated resource plan no later than June 30, 2011.

2. In its 2011 Integrated Resource Plan, Idaho Power Company will treat the Boardman to Hemingway transmission project as an uncommitted resource and will update its project analysis, including progress the Company has made towards securing equity partners, updated estimates of construction costs, and quantitative estimates of third-party subscription on the Boardman to Hemingway transmission line and future wheeling revenues. In addition, Idaho Power Company will provide third-party documentation in support of its construction cost estimates.

3. In its next planning cycle, Idaho Power Company will analyze coal curtailment and the costs associated with coal plant retirement.

[14] *See* Order 07-002 at 12.

4. In its next planning cycle, Idaho Power Company will develop significantly more portfolios for the second ten-year planning period, including portfolios designed to evaluate the benefits of a combined cycle combustion turbine gas resource versus multiple single cycle combustion turbine gas resources.

5. In its next planning cycle, Idaho Power Company, will analyze any potential Environmental Protection Agency, state, and other federal agency regulations associated with air quality, fly ash, and water that may affect the Company's generation facilities. These results will be included in the Company's 2011 Integrated Resource Plan.

6. In its 2011 Integrated Resource Plan, Idaho Power Company will provide a more robust justification for its load forecast for the second ten-year planning period. In addition, Idaho Power will provide additional analysis and a description of its estimated price response related to future carbon regulation for each customer class in its next IRP planning cycle.

7. In its 2011 Integrated Resource Plan, Idaho Power Company will devote specific chapters in the Plan to explaining the selection of the Preferred Portfolio in greater detail and as compared to an alternative portfolio. This narrative will include an explanation of the relative performance of each portfolio within each of the modeled risk measures, including charts and matrices showing the relative ranking of each portfolio using cost and risk metrics. Idaho Power Company will provide an explanation of how each portfolio performed using the qualitative measures the Company considered in its selection process.

8. In the 2011 Integrated Resource Plan, Idaho Power Company will model the full range of possible futures for its updated risk variables. Idaho Power Company will model both a high and low future for each variable.

At the Commission's September 7, 2010 public meeting, Idaho Power Company agreed to perform all of the above analyses in its 2011 Integrated Resource Plan and understood that the Commission's acknowledgement of Idaho Power's 2011 Integrated Resource Plan will be based upon the results of the updated analyses.[15]

[15] For further details regarding Idaho Power's adherence to the Commission's Guidelines in Order No. 07-002, *see* Staff Final Comments, Appendix A: Adherence of the Plan to Integrated Resource Planning Guidelines (July 9, 2010).

## IV. ORDER

IT IS ORDERED that:

1. The 2009 Integrated Resource Plan filed by Idaho Power Company on December 30, 2009, is acknowledged with the requirements set forth in this order.

2. Idaho Power Company will file its next Integrated Resource Plan no later than June 30, 2011.

Made, entered, and effective OCT 11 2010.

**Ray Baum**
Chairman

**John Savage**
Commissioner

**Susan K. Ackerman**
Commissioner

| | |
|---|---|
| In the Matter of<br><br>IDAHO POWER COMPANY<br><br>2011 Integrated Resource Plan. | ORDER |

DISPOSITION: INTEGRATED RESOURCE PLAN ACKNOWLEDGED WITH CONDITIONS AND EXCEPTIONS

## I. INTRODUCTION

Idaho Power Company (Idaho Power) seeks acknowledgment of its 2011 Integrated Resource Plan (IRP). The Company submitted the IRP to meet the requirement that all regulated energy utilities operating in Oregon engage in integrated resource planning.[1] We acknowledge the company's 2011 IRP with conditions and exceptions.

## II. BACKGROUND

We require each regulated energy utility to prepare and file an IRP within two years after acknowledgment of a utility's last IRP. Substantively, we require that energy utilities: (1) evaluate resources on a consistent and comparable basis; (2) consider risk and uncertainty; (3) make the primary goal of the process selecting a portfolio of resources with the best combination of expected costs and associated risks and uncertainties for the utility and its customers; and (4) create an action plan that is consistent with the long-run public interest as expressed in Oregon and federal energy policies.[2]

We acknowledge a utility's IRP to the extent the plan satisfies our procedural and substantive requirements, and the plan is deemed reasonable at the time of acknowledgement. Acknowledgment does not constitute a determination of the prudency of any resource acquisitions or other expenditures made by the utility pursuant to the plan. As a legal matter, we must reserve judgment on all rate-making issues.[3] Nonetheless, we consider the integrated resource planning process to complement the rate-making process. In rate-making proceedings in which the reasonableness of resource acquisitions is considered, the Commission will give considerable weight to utility actions which are consistent with acknowledged IRP action plans. Utilities will also be

[1] *See* Order Nos. 89-507, 07-002, and 07-047.
[2] *See* Order No. 07-002.
[3] *See* Order No. 07-002 at 24.

expected to explain actions they take which may be inconsistent with Commission-acknowledged plans.

## III. PROCEDURAL HISTORY

Idaho Power filed its 2011 IRP on June 30, 2011. A prehearing conference was held July 29, 2011, and the schedule adopted. Petitions to intervene were granted on behalf of Renewable Northwest Project (RNP), Portland General Electric Company (PGE), the Oregon Department of Energy (ODOE), Move Idaho Power, and Stop Idaho Power. The Citizens' Utility Board of Oregon (CUB) intervened by right.

On September 20, 2011, Idaho Power presented its IRP to the Commission at a public meeting. A technical workshop was held for parties on September 20, 2011. Staff and intervenor initial comments were filed October 18, 2011. Company reply comments were filed November 8, 2011. Staff's final comments and a proposed order were filed December 6, 2011. Company and intervenor comments in reply to Staff's final comments were filed January 3, 2012. Staff's report and its final proposed order were filed on January 24, 2012. This matter was taken up for Commission action at a public meeting on February 14, 2012.

## IV. DISCUSSION

### A. 2011 IRP Overview

Its 2011 IRP is Idaho Power's tenth resource plan filed to meet the requirements and guidelines established by this Commission and the Idaho Public Utilities Commission. In its filing Idaho Power assumed that, during the planning period (2011 through 2030), it will continue to be responsible for acquiring resources sufficient to serve all of its retail customers in its Oregon and Idaho service areas as a vertically integrated company. In developing its plan, Idaho Power worked with its IRP Advisory Council, which is comprised of major stakeholders representing the environmental community, major industrial customers, irrigation customers, state legislators, public utility commission representatives, and others. Following the filing of its final plan, Idaho Power presented the IRP at public meetings in various cities within its service area.

Idaho Power expects the number of customers in its service area to increase from about 492,000 in 2010 to over 650,000 by 2030. The IRP expected-case load forecast projects peak-hour load will grow 69 megawatts (MW) annually (1.8 percent), and average-system load will increase annually 29 average megawatts (aMW) (1.4 percent) over the 20-year term. In 2011, Idaho Power's demand response programs are expected to reduce peak-hour load by 330 MW. Two resources identified in the 2009 IRP are considered committed resources in the 2011 IRP: (1) the 300 MW Langley Gulch combined cycle combustion turbine that is expected to be available in the summer of 2012; and (2) a 49 MW upgrade of the Shoshone Falls Hydroelectric Project in 2015.

Idaho Power divided its 20-year planning period into two 10-year segments. In the first 10-year period, the company examined nine resource portfolios. Each portfolio was designed to substantially meet the energy and capacity deficits identified in the resource balance. For the second 10-year period, Idaho Power analyzed the preferred resource portfolio from the initial 10-year period coupled with each of the 10 portfolios considered for the second period.

In addition to those committed resources (Langley Gulch and the Shoshone Falls upgrade), the preferred resource portfolio includes 450 MW of market purchases beginning in 2016, with the completion of the Boardman to Hemingway transmission line. The total west-to-east transfer capacity reserved on Boardman to Hemingway by Idaho Power is expected to be 450 MW. For the second 10-year period the preferred portfolio adds a mixture of renewable resources along with natural gas-fired baseload and peaking resources.

## B. Objections to Idaho Power's 2011 IRP

Staff and other parties raised numerous issues and provided considerable commentary on certain aspects and elements of the original action items in Idaho Power's IRP Action Plan. We also expressed concerns with aspects of the plan at the public meeting held on February 14, 2011. Those issues, and our resolution of them, are as follows:

### *1. Evaluation of Environmental Compliance Costs for Existing Coal-Fired Plants (Action Item 11)*

Idaho Power does not wholly own or operate any coal plants, but does have a significant ownership interest in three large plants (Boardman, North Valmy, and Jim Bridger). As reported by CUB, these plants provide 41 percent of Idaho Power's total generation. CUB points out that the owners of these three plants likely will face increasing costs to comply with clean air regulations in the coming years.

CUB and RNP are not satisfied with Idaho Power's analysis of the possible environmental compliance costs associated with ownership and operation of these plants. CUB suggests that Idaho Power be required to conduct a unit-by-unit evaluation of its clean air investment costs (similar to that conducted by PGE for its Boardman plant) before the IRP provisions relating to coal plant investment are considered for acknowledgement. CUB recommends that the Commission withhold acknowledgment of the IRP until Idaho Power completes a study of its coal investment compliance costs and the parties have had the opportunity to review and comment on the study. RNP also recommends that the Commission require Idaho Power to analyze the costs and risks of maintaining its coal plants (including carbon costs and environmental regulations) before the company commits to significant investments.

Idaho Power responds that because the amount of any environmental compliance costs is "highly speculative" at this time, any analysis of the costs would be highly speculative as

well. The company argues that the Commission should acknowledge its 2011 IRP, and require that Idaho Power conduct the environmental costs analysis in future IRP filings.

Staff shares CUB's and RNP's concerns about future environmental compliance costs, but agrees with Idaho Power that the company should provide the requested analysis in its 2011 IRP Update. Staff proposes an additional Action Item 11 to address this future requirement.

*Resolution*

As discussed at the public meeting, we share the concerns raised by CUB and RNP regarding Idaho Power's failure to perform a comprehensive study of the possible costs and consequences of environmental regulations associated with the company's partial ownership of three coal plants. Accordingly, we acknowledge Staff's proposed Action Item 11, but not any other IRP provision relating to new investments in coal plants until Idaho Power completes a study of its coal investment compliance costs and other parties have had the opportunity to comment on the study.

### *2. Boardman to Hemingway Transmission (Action Item 7)*

RNP supports acknowledgment of the Boardman to Hemingway (B2H) transmission project as the primary resource in Idaho Power's near-term portfolio. Staff recommends we acknowledge Action Item 7 requiring Idaho Power to continue to make progress on the B2H transmission project between now and the completion of the company's 2013 IRP. CUB notes, however, that closure of one or more coal plants would open up capacity on existing transmission lines and could cause changes to the design and location of new lines.

*Resolution*

We share CUB's concern that coal cost study results will have implications for Idaho Power's transmission line use and plans, but acknowledge Action Item 7 requiring the company to continue to make progress on the B2H transmission project as an uncommitted resource.

### *3. Conservation Voltage Reduction (Action Item 4)*

Staff notes the "promising beginnings" for conservation voltage reduction (CVR) measures reported by Idaho Power. Staff points out, however, that the Company shows no further CVR measures in either its IRP or its Appendix B on Demand-Side Management.

*Resolution*

We are convinced that there is an untapped CVR resource and that this resource is cost effective. We direct the addition of a CVR action item as follows:

> Action Item 4 – Conservation Voltage Reduction – The next IRP filed by Idaho Power will include an assessment of the available cost-effective conservation voltage reduction (CVR) resource potential in its service area. The company will propose an action plan in its 2013 IRP related to this resource. The planned energy savings and reduced peak demand will be incorporated into Idaho Power's load-resource balance forecasts.

### *4. Demand Response (Action Item 3)*

In this IRP cycle Idaho Power switched from an "all cost-effective DSM" approach to "need-based" approach. Based on its analysis comparing the costs of energy saved from demand response to the cost of owning and operating a simple cycle combustion turbine (SCCT), Idaho Power derived an optimal amount of demand response for its system. Staff believes that the Company should pursue all cost-effective demand response through existing programs and consider new programs as applicable. Staff believes Idaho Power should pursue the maximum amount of demand response that (1) is less costly on a kW basis than a supply-side resource, and (2) up to the company's system capacity deficit amount.

*Resolution*

Staff proposed no change to this IRP action item. We accept Staff's proposal that during the preparation of its 2013 IRP, Idaho Power will convene a meeting of its IRP Advisory Council to address demand response, where Staff intends to work with the parties to develop a demand response approach in the best interest of ratepayers.

### *5. Energy Efficiency (Action Items 1 and 2)*

Staff recommends acknowledgment of Idaho Power's Action Items 1 and 2, and recommends the Company continue to pursue all cost-effective demand side management as the lowest cost resource for customers.

*Resolution*

We agree with Staff that Idaho Power should continue to pursue all cost-effective demand side management. No revision to these action items is required.

### *6. Alternative Portfolio (Action Items 8 and 9)*

RNP urges the Commission to consider alternatives to acknowledging Idaho Power's alternative resource portfolio (which is comprised solely of SCCT plants). RNP recommends the Commission give demand side management and solar photovoltaic resources time to ripen. Staff recommends the Commission not acknowledge the alternative portfolio, because there are existing mechanisms in the IRP process to deal with unforeseen circumstances.

*Resolution*

We agree with Staff that there are existing mechanisms in the IRP process to address unforeseen circumstances and do not find a need to acknowledge an alternative resource portfolio. We clarify, however, that the non-acknowledgment of the Alternative Portfolio Action Items 8 and 9 is not due to a flaw or failure in the IRP.

### *7. Long Term Action Items (Action Item 12)*

In its Action Plan, Idaho Power included action items for the 2021 through 2030 time period. Because the IRP Guidelines focus on actions over the next two to four years, Staff recommends that these long-term action items not be acknowledged as part of this IRP.

*Resolution*

We agree with Staff that the desired focus in the IRP is on actions over the next two to four years. We decline to acknowledge the long-term action items contained in Action Item 12.

### *8. Load Forecast*

Staff is concerned that Idaho Power's assumptions of average energy growth and peak-hour load growth are too high. Staff's concerns are based on the lingering economic conditions, plus shifts occurring in the demand/supply balance, conservation, and environmental regulation.

*Resolution*

We agree with Staff that the 2011 IRP Update and the 2013 IRP need to be based on an updated load forecast that reflects current conditions. We concur that it is appropriate to include an allowance for new large loads in the load forecast only if there is a signed energy service agreement, and the load forecast is based on specific supporting documentation.

### *9 Risk Analysis*

Staff is troubled by aspects of Idaho Power's stochastic risk analyses, as contrasted with the more conventional approaches used by other Oregon utilities. With the approach used by Idaho Power, an adverse combination of two or more unfavorable risk factors will never be "sampled," because only one risk factor is allowed to depart from its base value for any one "draw." Staff also recommends the company include hydro generation variability as a risk factor for its next IRP cycle, in light of Idaho Power's significant reliance on hydroelectric generation.

*Resolution*

We adopt Staff's recommendation that the 2013 IRP risk analysis should include hydroelectric generation variability. We agree with Staff's goal of working toward collaborative improvement of Idaho Power's stochastic risk analysis. At least one of the 2013 IRP meetings of the IRP Advisory Committee should focus on this subject.

### *10. Wind Integration Study*

RNP noted that Idaho Power is conducting a wind integration study internally. It encouraged the company to look for ways to lower its costs of wind integration, to seek independent technical review of its study, and to provide stakeholders the chance to provide meaningful feedback.

*Resolution*

We agree that Idaho Power should seek independent technical review of its wind integration study and allow stakeholders the opportunity to provide feedback before the study results are incorporated into the company's next IRP. Accordingly, we direct Idaho Power to form a wind integration study technical review committee that is fully engaged in the process. We also direct Idaho Power to establish a schedule for workshops, providing full opportunity for stakeholder involvement.

### *11. Solar Photovoltaic Analysis*

RNP encourages Idaho Power to evaluate the performance of solar photovoltaic projects as a class, not simply as single projects. The geographic distribution of the projects could have a significant effect of smoothing the short-term variability of single projects.

*Resolution*

We agree with RNP that Idaho Power should evaluate the performance of the solar photovoltaic projects as a class, as consistent with the goals of the pilot program.

### *12. Adherence of Plan to Integrated Resource Planning Guidelines*

Intervenors and Staff agree that Idaho Power's 2011 IRP filing did not comply with IRP Guidelines 1(c) and 4(g),[4] because the company failed to provide a comprehensive evaluation of the compliance of its existing coal fired generation resources with new, draft, and anticipated environmental regulations. Without that evaluation, it was not possible to determine whether any of the candidate resource portfolios met the specified standard.

In response to that deficiency, in its September 20, 2011 IRP presentation to the Commission, Idaho Power presented a "very high-level" evaluation of a range of costs that could potentially result if certain environmental regulations were implemented. According to the company, the existing coal-fired resources would still be less expensive than replacement natural gas generation resources, even if the company were required to spend the estimated amounts to comply with the potential federal environmental regulations.

Staff also noted that Idaho Power did not comply with IRP Guidelines 4(a) and 4(n), because the company did not explain how the utility met each substantive and procedural requirement, nor provide a concise listing of action items for all resources and resource related activities.

*Resolution*

We note Idaho Power's high-level presentation about environmental compliance costs, and expect more detailed information to be provided in the company's coal study. We agree with Staff that future Idaho Power IRPs should include: (1) an explanation of how the utility met each substantive and procedural requirement, and (2) a concise listing of action items for all resources and resource related activities, with each action item numbered.

[4] IRP Guideline 1(c) prescribes the primary goal of the IRP to be the selection of a portfolio of resources with the best combination of cost and risk for the utility and its customers. IRP Guideline 4(g) requires the utility to identify key assumptions about the future, including future enviromnental compliance costs.

## IV. ORDER

IT IS ORDERED that the 2011 Integrated Resource Plan filed by Idaho Power Company is acknowledged with conditions and exceptions contained in this order, with the action items and recommendations summarized in Appendix A .

This order memorializes the decision of the Public Utility Commission of Oregon made and effective at a public meeting held on February 14, 2012.

Dated this 21 day of May, 2012, at Salem, Oregon.

**John Savage**
Commissioner

**Susan K. Ackerman**
Commissioner

**Stephen M. Bloom**
Commissioner

# Appendix A
# Adopted Action Items and Recommendations for Future IRPs

Idaho Power 2011 Integrated Resource Plan (IRP)

Action Items:

Near-Term Action Plan (2011-2020)

Demand-Side Resource Action Items

Action Item 1 - Current Portfolio Energy Efficiency - In 2015, the forecast reduction for 2011–2015 programs will be 69 aMW; by the year 2020, the reduction across all customer classes increases to 133 aMW. By the end of the IRP planning horizon in 2030, 191 aMW of reduction is forecast to come from the current energy efficiency portfolio, with 80 percent of that reduction coming from programs serving commercial and industrial customers.

Action Item 2 - New Portfolio Energy Efficiency - In 2015, the new and expanded energy efficiency programs will reduce average loads by 13 aMW; in 2020, average loads will be reduced by 25 aMW. The full 20-year capacity of the program additions and changes is 42 aMW of average demand reduction.

Action Item 3 - Demand Response - The levels of demand response determined for the 2011 IRP analysis is 330 MW for summer 2011, 310 MW in 2012 when the Langley Gulch plant comes on line, and 315 MW in 2013 and 2014. In 2015, the demand response level used in the IRP analysis is 321 MW and then 351 MW from 2016 through the end of the planning period.

Action Item 4 – Conservation Voltage Reduction - The next IRP filed by Idaho Power will include an assessment of the available cost-effective conservation voltage reduction (CVR) resource potential in its service area. The Company will propose an action item in its 2013 IRP related to this resource. The planned energy savings and reduced peak demand will be incorporated into Idaho Power's load-resource balance forecasts.

Supply-Side Resource Action Items (Preferred Portfolio)

Action Item 5 - Solar - Issue a request for proposal (RFP) before the end of 2011 to design and construct a 500-kW–1-MW solar PV resource to be located in Idaho Power's service area. Evaluate proposals by mid-2012, and if a successful bidder is identified, file a request with the IPUC for a CPCN. If approved, have the facility on line as early as the end of 2012.

This solar resource will satisfy the State of Oregon's Solar PV Pilot Program requirement to build a 500-kilovolt (kV) solar PV project. Continue working with the OPUC to determine if this facility would have to be built in Oregon, which may impact the structure of the RFP.

Action Item 6 - Power Purchase Agreements - Complete 83 MW in market purchase from the east side of Idaho Power's system. The purchase is necessary to cover a summer peak-hour deficit in 2015 that exists before the Boardman to Hemingway line becomes available in 2016.

Action Item 7 - Transmission – Continue to make progress on the Boardman to Hemingway transmission project between now and the completion of the 2013 IRP, and plan to begin work on permitting and initial designs shortly after the completion of the 2013 IRP.

As the Company proceeds with the B2H project, its project assumptions (for example, construction cost estimates, equity partnership estimates, third-party subscription estimates, and wheeling revenues) will be updated and analyzed in the 2013 IRP.

~~Supply-Side Resource Action Items (Alternative Portfolio)~~

~~Action Item 8 - Solar – as described for preferred portfolio Action Item 5.~~

~~Action Item 9 - Simple Cycle Combustion Turbine – 170 MW in 2015, 170 MW in 2017, and 94 MW in 2019. If the Boardman to Hemingway transmission project is delayed, begin the acquisition process for the 2015 SCCT as early as 2012.~~

Other Action Items

Action Item 10 - Renewable Energy Certificate Management - As detailed in the REC Management Plan, continue selling RECs in the near term until they are needed to meet a federal RES.

Action Item 11 - Evaluation of Environmental Compliance Costs for Existing Coal-fired Plants

In its next IRP Update, Idaho Power will include an Evaluation of Environmental Compliance Costs for Existing Coal-fired Plants. The Evaluation will investigate whether there is flexibility in the emerging environmental regulations that would allow the Company to avoid early compliance costs by offering to shut down individual units prior to the end of their useful lives. The Company will also conduct further plant specific analysis to determine whether this tradeoff would be in the ratepayers' interest.

~~Long-Term Action Plan (2021-2030)~~

~~Action Item 12 – Long-Term Action Items – as outlined in IRP Table 10.2~~

Recommendations for future Idaho Power IRPs:

1. During preparation of the 2013 IRP, there be an Integrated Resource Plan Advisory Council (IRPAC) meeting specifically focused on demand response. Staff will participate in that meeting, and work with the Company and parties to develop a demand response approach that is in the best interest of ratepayers.

2. Base the 2011 IRP Update and the 2013 IRP on an updated load forecast that, as accurately as possible, reflects current conditions.

3. Related to the new large load issue, include an allowance for new large loads in the load forecast only if there is a signed energy service agreement. Further, include an allowance for new large loads in the load and resource balance, but the new large load must be based on specific supporting documentation.

4. Toward the goal of working collaboratively to improve of the stochastic risk analysis, at least one 2013 IRP IRPAC meeting should be set aside to focus on this subject. Further, the 2013 IRP risk analysis should include hydroelectric generation variability. In the risk analysis focused IRPAC meeting, the Company should vet its approach to including hydroelectric generation variability in the 2013 IRP risk analysis.

5. Form a wind integration study technical review committee as soon as possible. The committee is recommended to be fully engaged to review and offer suggestions for improvement of the Company's proposals for analytical methods and data used in the study. In addition, establish as soon as possible, a schedule for workshops providing full opportunity for stakeholder involvement and progress reviews. Finally, in the Company's next wind integration study look for ways in which diversity and flexible balancing resources could lower its cost of integrating intermittent resources.

6. Include in future IRPs an explanation of how the utility met each substantive and procedural requirement, as required by Guideline 4(a).

7. Include in future IRPs an action plan with resource activities the utility intends to undertake over the next two to four years to acquire the identified resources, as required by IRP Guideline 4(n).

8. Include in future IRPs a concise listing of action items for all resources and resource related activities, with each action item numbered.

ORDER NO. 14 253

ENTERED JUL 08 2014

# BEFORE THE PUBLIC UTILITY COMMISSION

# OF OREGON

LC 58

| | |
|---|---|
| In the Matter of<br>IDAHO POWER COMPANY,<br>2013 Integrated Resource Plan | ORDER |

DISPOSITION: PLAN ACKNOWLEDGED IN PART AND AS REVISED

## I. INTRODUCTION

Idaho Power Company is a public utility operating in Oregon and is subject to the Commission's jurisdiction and requirements regarding integrated resource planning. Idaho Power's 2011 Integrated Resource Plan (IRP) was acknowledged with exceptions and guidance for its next IRP in Order No. 12-177. Idaho Power now seeks acknowledgment of its 2013 IRP.

We require each regulated energy utility to prepare and file an IRP within two years of acknowledgment of the utility's last plan. In the IRP, an energy utility must: (1) evaluate resources on a consistent and comparable basis; (2) consider risk and uncertainty; (3) aim to select a portfolio of resources with the best combination of expected costs and associated risks and uncertainties for the utility and its customers; and (4) create a plan that is consistent with the long-run public interest as expressed in Oregon and federal energy policies.[1]

Once a utility completes a plan, we review for adherence to the procedural and substantive requirements outlined in Order No. 89-507. We generally acknowledge the plan—that is, find it reasonable based on the information available at that time—or return it to the utility with comments.[2] We may also decline to acknowledge specific action items if we question whether the utility's proposed resource decision presents the least cost and risk option for its customers.

We reaffirm our long-standing view that decisions made in IRP proceedings do not constitute ratemaking. Decisions whether to allow a utility to recover from its customers the costs associated with new resources may only be made in a rate proceeding. Acknowledgment of an IRP, however, is relevant to subsequent examination of whether a

[1] Order No. 07-002.
[2] *Id.* at 2.

utility's resource investment is prudent and should be recovered from ratepayers. As we have previously stated:

> Consistency of resource investments with least-cost planning principles will be an additional factor that the Commission will consider in judging prudence. When a plan is acknowledged by the Commission, it will become a working document for use by the utility, the Commission, and any other interested party in a rate case or other proceeding before the Commission[.] Consistency with the plan may be evidence in support of favorable rate-making treatment of the action, although it is not a guarantee of favorable treatment.[3]

Just as acknowledgment does not guarantee favorable ratemaking, a decision to not acknowledge an action item does not constitute a preliminary determination of imprudence. The purpose of the IRP process is to provide the utility with the information and opinion of stakeholders and the Commission based on information presented by the utility. The question of whether a specific investment made by a utility in its planning process was prudent will be fairly examined in a subsequent rate case proceeding.

## II. DISCUSSION

We conclude Idaho Power satisfies all the procedural guidelines and all but one of the substantive guidelines for IRP planning. Idaho Power did not comply with the IRP Guideline regarding flexible capacity adopted in Order No 12-013.

We acknowledge the short-term action items in Idaho Power's Action Plan, except for the investment in selective catalytic reduction emissions technology at Jim Bridger Units 3 and 4.[4] In addition, we acknowledge two additional action items recommended by Staff that relate to energy efficiency. We do not acknowledge the remaining action items, which are for the most part outside the two-to-four year action plan period.[5]

## III. IDAHO POWER'S IRP

During the 20-year planning period, Idaho Power expects that the number of its customers will increase by about 8,400 each year, from approximately 500,000 in 2012 to 670,000 in 2032. Idaho Power's expected-case load forecast predicts that summer-peaking hour load requirements will grow at about 55 MW per year, and that the average-energy requirements will grow at 21 aMW per year. Idaho Power's load and resource balance analysis, which accounts for forecast load growth and generation from all of the company's existing resources and planned purchases, shows no energy deficits through the planning period. Idaho Power's analysis shows a capacity deficit starting in 2016 and monthly peak-hour deficit positions growing steadily in magnitude and the number of months affected. By July 2032, the capacity deficits are approximately 870 MW.

---

[3] *Id.* at 24, *quoting* Order No. 89-507 at 7.
[4] *See* Appendix A.
[5] *See* Guideline 4(n).

Idaho Power identifies as its major resource addition the Boardman to Hemingway transmission line (B2H) with market purchases. The company's preferred portfolio also includes demand response, continued operations at the Jim Bridger and North Valmy coal facilities after investment in emission-control technology, and the continued operation of Idaho Power's other existing supply-side resources.

Guideline 4(n) requires the utility to include an action plan with resource activities the utility intends to undertake over the next two to four years. Idaho Power includes the following activities in its Action Plan:

| Year | Resource – Action |
|---|---|
| 2013-2018 | Boardman to Hemingway – Ongoing permitting, planning studies, and regulatory filings |
| 2013 | Gateway West – Ongoing permitting, planning studies, and regulatory filings |
| 2013 | North Valmy Unit 1 – Commit to the installation of dry sorbent injection emission-control technology |
| 2013 | Jim Bridger Units 3&4 – Commit to the installation of selective catalytic reduction emission-control technology |
| 2016-2017 | Demand response – Have demand response capacity available to satisfy deficiencies up to approximately 150 MW |
| 2018 | Boardman to Hemingway – Transmission line complete and in service |
| 2019 | Shoshone Falls – Upgrade complete and in service |
| 2019 | Jim Bridger Unit 2 – Commit to the installation of selective catalytic reduction emission-control technology |
| 2020 | Jim Bridger Unit 1 – Commit to the installation of selective catalytic reduction emission-control technology |
| 2020 | Boardman – Coal-fired operations at the Boardman plant are scheduled to end by year-end 2020 |
| 2024-2032 | Demand response – Have demand response capacity available to satisfy deficiencies in 50 MW increments up to approximately 370 MW |

## IV. DISCUSSION

In this order, we first address Idaho Power's Action Plan, discussing the comments filed by participants[6] and specific IRP Guidelines as appropriate. We then address issues raised by the participants or that we identify related to Idaho Power's compliance with the IRP Guidelines and our order regarding Idaho Power's 2011 IRP that are not discussed in connection with our review of the Action Plan.

[6] Renewable Northwest (RNW), the Citizens' Utility Board of Oregon (CUB), the Oregon Department of Energy (ODOE), and Staff of the Public Utility Commission (Staff) filed opening and reply comments regarding Idaho Power's IRP, and Idaho Power filed two rounds of comments in response. In addition, a resident of Idaho, John Weber, forwarded comments to Staff, which Staff forwarded to the Administrative Hearings Division for inclusion in the record.

## A. Transmission

### *1. Boardman to Hemingway*

Currently, the Boardman to Hemingway transmission project (B2H) is envisioned as a single-circuit 500 kV transmission line approximately 300 miles long between northeast Oregon and southwest Idaho. Idaho Power states that it has entered into a joint funding agreement with PacifiCorp and the Bonneville Power Administration to pursue permitting the project, under which Idaho Power is the permitting project manager.

Idaho Power proposes the following actions for the Boardman to Hemingway transmission project:

| | |
|---|---|
| *2013-2018* | *Boardman to Hemingway – Ongoing permitting, planning studies, and regulatory filings* |
| *2018* | *Boardman to Hemingway – Transmission line complete and in service* |

#### *a. Participants' Comments*

RNW supports investment in B2H because it would provide Idaho Power not only with transmission to a liquid market, enabling the company to access low-cost resources to meet capacity and energy needs, but to also generate revenue by selling energy to other regional utilities. RNW also contends B2H will provide environmental benefits by enabling Idaho Power to reach renewable energy resource zones, thereby facilitating renewable energy resources.

Staff recommends acknowledgement of ongoing permitting, planning studies, and regulatory filings for B2H. Staff notes that B2H is included in five of the nine portfolios modeled in the 2013 IRP. The preferred portfolio and the next lowest "total costs portfolios" include B2H. Staff finds that the IRP analysis regarding B2H supports acknowledgment of ongoing permitting, planning studies, and regulatory filings.

Staff recommends, however, that we decline to acknowledge B2H "Transmission line complete and in-service" in 2018. Staff reports that the estimated in-service date for B2H has moved from 2018 (the year noted in Idaho Power's IRP) to 2020 (the year reported in the company's reply comments). Staff concludes this action item is now well beyond the two-to-four year period prescribed in the IRP Guidelines.

With respect to Idaho Power's activities that occur between the our order in this docket and Idaho Power's 2015 IRP, Staff asks to be apprised of any (1) updated project plan incorporating changes related to Bureau of Land Management delays and Energy Facilities Siting Council developments; (2) final agreement regarding allocation of construction costs between project participants; and (3) significant regulatory decisions that impact the project schedule or costs. Staff also asks that the company to further explore whether B2H would significantly impact wind generation curtailment during

periods of low demand as well as the impact of B2H on resource integration costs in general.

In its first round of comments, Idaho Power asserts that Staff's recommendation to acknowledge only the permitting activities of B2H and not the construction phase of the project is inconsistent with the our past acknowledgment of B2H and is unnecessary to ensure continued analysis of this project. In its final comments, Idaho Power states that it is only requesting acknowledgment of specific action items scheduled to occur within the next four years (which excludes the construction of B2H), but does ask that we acknowledge the 2013 IRP in its entirety, which includes B2H in its preferred portfolio.

*b. Commission Resolution*

We acknowledge ongoing permitting, planning studies, and regulatory filings for B2H. As Staff notes, the analysis in the IRP supports these planned near-term activities. We anticipate additional analysis regarding B2H in Idaho Power's 2015 IRP before acknowledging other actions related to B2H.

We decline to acknowledge completion of B2H because it is well beyond the two-to-four year period for action items specified by the IRP Guidelines. Further, we disagree with any suggestion that declining to acknowledge the construction of B2H is inconsistent with our previous acknowledgment of certain activities (*e.g.*, permitting) related to this resource or inconsistent with previous orders acknowledging IRPs based on a preferred portfolio that includes B2H. Our acknowledgment of an IRP is based on our conclusion that it complies with our guidelines and that the plan seems reasonable based on information known at the time.

*2. Gateway West*

Gateway West is a multi-segment, multi-year, joint transmission project of Idaho Power and PacifiCorp/Rocky Mountain Power to build and operate approximately 1000 miles of new transmission lines from Wyoming to the Hemingway Substation near Melba, Idaho. The project timeline indicates line segments in service between 2019 and 2023. Idaho Power has a one-third interest in some, but not all, of the segments to be located in Idaho and sole interest in one segment.

Idaho Power asks for acknowledgment of the following action item related to Gateway West:

*2013* *Gateway West – Ongoing permitting, planning studies, and regulatory filings*

Idaho Power reports that the Gateway West and B2H projects are complementary and will provide an upgraded transmission path from the Pacific Northwest across Idaho and into eastern Wyoming with an additional transmission connection to a population center in Utah. Idaho Power states that Gateway West will benefit customers by (1) relieving transmission constraints on certain transmission paths allowing Idaho Power to move additional energy between the east and west sides of the system; (2) providing the option

to locate future generation resources east of the Treasure Valley load center; and (3) providing future load service to the Magic Valley from the Cedar Hill Substation. Idaho Power does not request acknowledgment of Gateway West as a supply side resource. Instead, the company asserts that Gateway West is reasonable to address transmission system constraints and provide for future least cost resource development.

*a. Participants' Comments*

RNW supports investment in Gateway West because it will provide the same benefits that B2H will provide—that is, access to low-cost resources, access to regions where renewable resources could be sited, and reliability.

CUB recommends that we not acknowledge Gateway West as presented. CUB notes that Gateway West is a large project composed of a number of segments that can be analyzed individually. CUB asserts that Idaho Power should narrow its request and seek acknowledgment only of the segments of Gateway West that it can demonstrate are cost effective for Idaho Power's customers.

Staff concludes that, although there is insufficient information to support acknowledgment of the construction of Gateway West, we should acknowledge the permitting-related activities that must occur prior to construction. For purposes of Idaho Power's next IRP, however, Staff recommends that the company include an analysis of the historical and projected power flows for the portions of the Gateway West project in which Idaho Power has an interest in order to demonstrate the need and specific constraint-related benefits.

*b. Commission Resolution*

We acknowledge ongoing permitting, planning studies, and regulatory filings for Gateway West. However, as CUB notes, the project is composed of multiple segments that can and should be analyzed individually. Moreover, Idaho Power has an ownership interest in relatively few of the segments and must demonstrate the need and specific constraint-related benefits for each segment in which it holds an interest before we will consider acknowledgment of the project's construction.

## B. Pollution Control Investments in Coal Resources

### *1. Idaho Power's Analysis*

IRP Guideline 8, as modified by Order No. 08-339, contains four requirements related to environmental costs. Under this guideline, the utility must model a base case scenario to reflect what it considers to be the most likely regulatory compliance future for carbon dioxide ($CO_2$), nitrogen oxides, sulfur oxides, and mercury emissions. The utility must also develop several compliance scenarios ranging from the present $CO_2$ level to the upper reaches of credible proposals by governing entities. Then, the utility must estimate, under each of the compliance scenarios, the present value of revenue requirement (PVRR) cost and risk measures in its preferred portfolio and alternate portfolios. Guideline 8 directs the utility to identify the $CO_2$ emission cost adder level

that triggers the selection of a portfolio that is substantially different from the preferred portfolio. In addition, Guideline 8 requires utilities develop a portfolio to achieve voluntary carbon emission reduction targets set forth in Oregon law.

*a. Participants' Comments*

RNW asserts that Idaho Power's analysis of its coal resources failed to meet IRP Guideline 8 because the company did not (1) model natural gas conversions of the Jim Bridger Units 3 and 4 boilers; (2) model a range of pollution control costs; and (3) account for recent direction from President Obama's Administration that may reduce the cost competitiveness of existing coal resources. RNW asserts that investing in coal units is generally not reasonable under scenarios with low natural gas costs or stringent $CO_2$ regulation or both.

CUB also criticizes Idaho Power's analysis, and contends the company failed to consider all possible scenarios. CUB proposes a four-part, Boardman-style analysis that (1) allows potential pollution controls under different scenarios; (2) compares the broader range of pollution control scenarios to alternative investments, such as repowering with natural gas, building a CCCT, or relying on front office transactions; (3) investigates whether there is a plausible scenario for a phase-out that is at a lower cost than either of the two options; and (4) analyzes whether committing to close a plant at the end of its depreciable life would reduce pollution control costs.

Staff voices a concern similar to CUB's regarding Idaho Power's failure to consider a range of early shutdown scenarios. Staff notes that Idaho Power compared the cost of early shutdown and no controls against other alternatives, but did not model a range of early shut-down scenarios, *e.g.*, smaller pollution control investment in exchange for shutdowns at different points in time, which Staff expected would be done. Like CUB, Staff recommends that future coal analysis consider alternative dates for pollution control equipment, shut down, or other alternatives such as gas conversion.

Staff concludes that Idaho Power's analysis is sufficient to comply with the IRP Guidelines, as well as our direction, provided in 2012, to evaluate whether there is flexibility in the emerging environmental regulations that would allow the company to avoid early compliance costs by offering to shut down individual units prior to the end of their useful lives.

Idaho Power responds that its modeling complies with Guideline 8. Idaho Power notes that it modeled three levels of carbon adders to evaluate the potential impact of carbon emissions regulations in its coal study and in the IRP. In addition, Idaho Power explains it created an alternate portfolio in which the North Valmy units are converted to a gas-fired plant and Jim Bridger Units 3 and 4 are replaced with combined cycle combustion turbines (CCCTs). Idaho Power points out that President Obama's announcement regarding $CO_2$ regulation was issued the same month Idaho Power filed its IRP and that Idaho Power could not account for the announcement without delaying the filing of the 2013 IRP. And, Idaho Power asserts the June 2013 Presidential Memorandum concerned regulations for new power plants and none are included in the company's IRP.

*b. Commission Resolution*

We conclude that Idaho Power's IRP complies with IRP Guideline 8, but as discussed below, is not sufficient to provide a basis to support acknowledgment of selective catalytic reduction emission-control technology (SCR) at Jim Bridger Units 3 and 4. Guideline 8 does not require Idaho Power to model every feasible alternative scenario, but requires the company to determine the PVRR costs and risk measures of a "set of reasonable alternative portfolios" assuming a range of different compliance scenarios. Although Idaho Power did not model a scenario in which both North Valmy units and Bridger Units 3 and 4 were converted to natural gas facilities, as RNW believes should have been done, Idaho Power did model a scenario in which North Valmy is converted to natural gas and Bridger Units 3 and 4 are replaced with CCCTs (portfolio 6). In addition, although Idaho Power did not build a compliance scenario that specifically accounts for the June 2013 Presidential Memorandum, Idaho Power did test its portfolios against a range of carbon compliance futures including a carbon adder in the planning case of $14.64 per ton beginning in 2018 and escalating three percent annually, and a carbon adder in the high case of $35 per ton beginning in 2018 and escalating nine percent annually.

The carbon adder was modeled at three levels: low ($0), planning, and high. Idaho Power did not model a distribution of values, as was done with gas prices, load, and hydro in the stochastic analysis. Instead, one-third of the simulations were drawn from each carbon adder level. The company's analysis showed the preferred portfolio 2 and the non-coal portfolio 6 would switch places at a carbon adder of $45 in 2018. We find the alternative portfolios selected by Idaho Power and the range of compliance futures sufficient to satisfy the requirements of Guideline 8.

We share CUB's and Staff's concern regarding the limited nature of Idaho Power's early retirement scenarios analysis. Even though Idaho Power may have technically complied with the action item from Order No. 12-177, we expected that Idaho Power would model a broader range of early shutdown scenarios. We expect Idaho Power to engage fully with Staff and stakeholders in a timely manner to design coal investment analyses for future IRPs to ensure more robust consideration of early shutdown as a compliance option.

Also, we direct Idaho Power to work with stakeholders to explore options for how it plans to model and perform analysis in the 2015 IRP in order to comply with the applicable emissions requirements of §111(d) of the Clean Air Act.

***2. North Valmy Unit 1***

North Valmy is a coal-fired plant consisting of two generating units located in Nevada. Idaho Power is a 50 percent owner of North Valmy. After adjusting for routine scheduled maintenance and estimated forced outages, the annual energy generating capability of Idaho Power's share of the plant is approximately 220 aMW. Idaho Power plans on the continued operation of North Valmy Unit 1 throughout the 20-year planning period of the 2013 IRP and both units of North Valmy are included in Idaho Power's preferred portfolio.

Idaho Power proposes the following action for North Valmy Unit 1 to comply with federal Mercury Air Toxics Standards (MATS):

*2013* *North Valmy Unit 1 – Commit to the installation of dry sorbent injection emission-control technology*

*a. Participants' Comments*

CUB is concerned because Idaho Power's preferred portfolio includes North Valmy with an end-of-life date that CUB fears is too far in the future. CUB notes that the end-of-life date for North Valmy is at or beyond the end of the 20-year planning period in Idaho Power's preferred portfolio but that the co-owner of North Valmy, Nevada Energy, has announced plans to close the plant in 2025.

Idaho Power responds that it modeled North Valmy consistently with its current expectation of the end-of-life date. Idaho Power asserts that Nevada Energy cannot close the plant early without Idaho Power's consent, which it has not given. Also, Idaho Power modeled two portfolios that included a shortened end-of-life date for North Valmy and replacement of lost energy with other resources. These portfolios were higher cost than the preferred portfolio.

Staff recommends acknowledgment of DSI installation. Staff finds that because the cost of the investment is so small, there is no tipping point in the modeled scenarios at which it is more cost-effective to shut down North Valmy rather than invest in DSI.

*b. Commission Resolution*

We acknowledge installation of DSI at North Valmy Unit 1. We find as Staff did that the relatively low cost of the investment leads to the conclusion that the DSI investment and continued operation of North Valmy is the least cost/least risk alternative given the information that is currently available.

We do not share CUB's concern regarding how Idaho Power included North Valmy in its preferred portfolio. First, shortening the life of North Valmy would not change the result of Idaho Power's analysis; installing DSI would still be the least cost/least risk alternative. Second, future events may lead to a shortened operating life for North Valmy, but whether they will is not certain. Idaho Power reasonably relied on the results of modeling based on the assumption North Valmy will operate as Idaho Power currently expects, rather than an assumption based on events that may, or may not, transpire.

***3. Jim Bridger Units 3 and 4***

Jim Bridger is a coal-fired plant consisting of four generating units located in Wyoming. Idaho Power owns one-third of the plant, or 771 MW. The Environmental Protection Agency (EPA) submitted a final rule on January 10, 2014, requiring the installation of selective catalytic reduction emission-control technology (SCR) at Bridger Units 3 and 4 by December 31, 2015 and December 31, 2016, respectively. Idaho Power's application to the Idaho Public Utilities Commission (IPUC) for a Certificate of Public Convenience

and Necessity states that Idaho Power's cost before AFUDC is estimated to be approximately $118 million.

Idaho Power proposes the following action for Jim Bridger Units 3 and 4:

*2013* — *Jim Bridger Units 3 and 4 – Commit to the installation of selective catalytic reduction emission-control technology*

*a. Participants' Comments*

CUB and RNW recommend that we not acknowledge pollution control investments at Jim Bridger Units 3 and 4, contending additional analysis is needed. Specifically, CUB asserts that Idaho Power should analyze the effect that different early retirement dates would have on the need for pollution controls at Bridger Units 3 and 4 to inform whether the currently planned investment is cost-effective. CUB notes that a shorter life may reduce the controls needed (and therefore costs), making early retirement of coal plants more cost-effective than other options. RNW adds that Idaho Power did not adequately analyze conversion to natural gas or a sufficient range of future $CO_2$ compliance costs. Also, RNW believes that investing in coal units is generally not reasonable under scenarios with low natural gas costs or stringent $CO_2$ regulation or both.

Idaho Power disagrees with RNW's and CUB's conclusions regarding its analysis for Bridger Units 3 and 4, noting that it examined a range of options including early shutdown and conversion to natural gas, and that its analysis shows that installation of SCR at Bridger Units 3 and 4 is the least cost option for the majority of the alternate carbon and natural gas scenarios it modeled.

Staff recommends we acknowledge installation of SCR at Bridger Units 3 and 4. Staff concludes that Idaho Power's coal study demonstrates that the SCR investments are the lowest cost compared to the alternatives analyzed under planning case assumptions and in the majority of the carbon and gas sensitivities. In addition to reviewing the coal study, Staff constructed an independent spreadsheet analysis of the impact of a range of gas and carbon prices on the economics of the SCR investments, which confirmed the coal study results.

*b. Commission Resolution*

Based on the information we have at this time, we decline to acknowledge Idaho Power's action item related to Bridger Units 3 and 4. Our decision regarding these investments is inextricably tied to our decision regarding the same investments in the docket opened to address PacifiCorp's IRP, docket LC 57. In that docket, we did not acknowledge the investments for Bridger Units 3 and 4 for four interrelated reasons.

First, some of the alternatives modeled by PacifiCorp suggest that the installation of SCR at Bridger Units 3 and 4 is not the lowest cost resource option. Second, there were gaps in the analyses conducted by PacifiCorp. Third, some of the questions raised by Staff and other participants on the merit of retaining or retiring the units were not fully fleshed out, while others are more appropriately addressed in a rate proceeding. Finally, PacifiCorp,

the managing utility, is proceeding with the investments, which calls into question the appropriateness of addressing the investments in a planning docket.

We recognize that Idaho Power conducted its own analysis of whether installing SCR at Bridger Units 3 and 4 is the least cost and least risk option. However, Idaho Power's analysis does not persuade us to reach a resolution in this docket that differs from that in docket LC 57, at least in part because of deficiencies in Idaho Power's analysis. More specifically, Idaho Power did not (1) analyze a full range of reasonable scenarios; (2) consider a wider range of resource replacement options as PacifiCorp; or (3) evaluate an adequate range of natural gas price sensitivities.

Idaho Power is proceeding with the investments. We will undertake a fair and thorough investigation of the prudence of the SCR investments when Idaho Power seeks rate recovery. Our decision to not acknowledge them in this docket does not prejudge the prudence of the investments for purposes of rate recovery.

## C. Demand Response

Idaho Power proposes the following near-term action related to demand response:

*2016-2017* *Have demand response capacity available to satisfy deficiencies up to approximately 150 MW*

### *a. Participants' Comments*

Staff notes that both the Oregon and Idaho commissions recently issued orders approving stipulations regarding the redesign of Idaho Power's demand response programs for 2014 and beyond. Those stipulations provide that the annual value of demand response is equal to the levelized annual cost of the minimum size deferred resource, or 170 MW. Therefore, Staff recommends changing this action item to read: "Have demand response capacity available to satisfy deficiencies up to approximately ~~150 MW~~ 170 MW beginning in 2014, and increasing as needed through 2017."

Staff also recommends that the company update its assessment of demand response availability based on summer 2014 program participation and other relevant factors by the end of 2014. In addition, Staff recommends that the Energy Efficiency Advisory Group review any revisions to the resource assessment, along with other relevant factors.

RNW supports Idaho Power's continuation of its demand response program to meet the company's capacity needs.

### *b. Commission Resolution*

We agree that revising the near-term demand response action item as recommended by Staff is appropriate in light of recently concluded dockets in Oregon and Idaho regarding demand response. We acknowledge the action item as revised by Staff. We also expect that Idaho Power will follow Staff's recommendation regarding updating its assessment of demand response availability in 2014.

## D. Long-term Action Items

Idaho Power's Action Plan includes the following long-term activities:

| | |
|---|---|
| *2019* | *Shoshone Falls – Upgrade complete and in service* |
| *2019* | *Jim Bridger Unit 2 – Commit to the installation of selective catalytic reduction emission-control technology* |
| *2020* | *Jim Bridger Unit 1 – Commit to the installation of selective catalytic reduction emission-control technology* |
| *2020* | *Boardman – Coal-fired operations at the Boardman plant are scheduled to end by year-end* |
| *2024-2032* | *Demand Response – Have demand response capacity available to satisfy deficiencies in 50 MW increments up to approximately 370 MW* |

### *a. Participants' Comments*

Both Staff and CUB note, and Idaho Power acknowledges, that Idaho Power's Action Plan includes long-term action items in addition to the short-term action items typically presented in an IRP action plan. Staff and CUB recommend that we not acknowledge action items occurring beyond a two-to-four year period. In response, Idaho Power states that it does not seek acknowledgment of the long-term items.

### *b. Commission Resolution*

Although Idaho Power states it does not seek acknowledgment of these long-term action items, they remain part of the company's IRP. For this reason, we believe it is necessary to address them. We do not acknowledge these action items because, as Staff and CUB note, the purpose of an action plan is to identify specific near-term actions that the company plans to take to meet its resource needs.[7] We generally do not acknowledge action items planned to occur more than four years in the future.[8]

## D. Analysis of IRP

### *1. Wind Resources*

#### *a. Participants' Comments*

Several participants raise concerns related to wind resources. RNW asserts that Idaho Power's IRP underestimates the capacity factor of modern wind turbines and includes an unsupported and unreasonably high wind integration rate.

Staff and RNW raise concerns about Idaho Power's wind integration study (WIS), and the company's use of the technical review committee (TRC) we recommended the

[7] *See* Order No. 12-177.
[8] *Id.*

company form to improve such studies.[9] Staff notes that it anticipated more involvement of the TRC and recommends that Idaho Power engage with the TRC for future IRPs. RNW adds that Idaho Power's WIS based the size of the required balancing reserve on the difference between the day-ahead forecast and actual generation, which increased the assumed balancing reserves and costs. RNW notes that the TRC we required in Order No. 12-177 flagged this methodological assumption as a significant concern. Staff shares RNW's concern, and has reservations about using the study results in future filings.

In response to RNW's concern regarding overstated costs, Idaho Power notes the cost difference between the National Renewable Energy Laboratory (NREL) report and its costs comes from the conversion of 2009 dollars to 2013 dollars, the common base for the IRP's comparison of resource costs. In response to RNW's concern regarding the size of the balancing reserves, Idaho Power states that it chose to base the assumption on the day-ahead forecast because balancing reserves based on the hour-ahead forecast "would too often translate to a risky reliance on the wholesale energy market."

In response to RNW's concern regarding the average capacity factor, Idaho Power asserts that the NREL reports that Class 3 resources have an average capacity factor of 33 percent—a percentage Idaho Power adjusted downward to account for lower capacity factors of Class 2 resources. Idaho Power also asserts that its actual observations support the 26 percent average capacity factor used in the WIS and IRP.

In response to Staff's and RNW's concern regarding the role of the TRC, Idaho Power notes that we directed the company to form the committee in February 2012, nearly a year after the company had begun work on the WIS. Idaho Power announced the formation of the committee at an April 2012 workshop, but by this time the study was complete and the company was presenting preliminary study results.

*b. Commission Resolution*

We appreciate that Idaho Power responded quickly to our recommendation but are disappointed the TRC did not prove to be an effective mechanism for stakeholders to engage with Idaho Power regarding the analytical methodology of the WIS. Using the TRC to review and provide comments on the analytical methodology and results is not what we envisioned when making our 2012 recommendation. But, we recognize that our recommendation came late in Idaho Power's process, limiting the opportunity for TRC input.

We continue to recommend use of a TRC in connection with wind integration studies. The TRC could be an effective mechanism for stakeholders to engage with the company regarding the analytical methodology underlying the study and expect Idaho Power to engage with the TRC at the outset of any future study.

Regarding RNW's specific complaints regarding the WIS, we note that RNW does not urge us to disregard the WIS for the purpose of judging the reasonableness of Idaho Power's IRP, but cautions against using the WIS to determine avoided cost prices in a

[9] *Id.* at Appendix A at 3.

future proceeding. Our acknowledgment of Idaho Power's IRP has no effect on the validity of the WIS during any proceeding to establish avoided cost prices for variable wind resources. We do note, however, that effective engagement between stakeholders and utilities regarding the study methodology and inputs would likely lessen disagreements in any proceeding in which the accuracy of the study is at issue.

### 2. *Capacity Contribution of Solar and Other Resources*

#### a. *Participants' Comments*

ODOE recommends certain changes to how Idaho Power examines capacity credits for solar, wind, and hydro resources, and how the company models orientation of flat-plate solar PV systems.

Idaho Power disagrees with ODOE's specific recommendation regarding the capacity contribution, but recognizes that solar resources are unique and that its analysis must address numerous considerations such as tracking systems, resource orientation, and materials. Idaho Power states it seeks to attribute the proper capacity credit to distributed solar PV and has initiated an IRP Advisory Council distributed solar PV workgroup to address the cost and capacity credit of distributed solar PV in the 2015 IRP. Idaho Power states that it anticipates the workgroup will address topics such as panel orientation and tracking systems. Idaho Power also states that it is analyzing integration of large-scale solar PV projects and working on this topic with members of its Solar Integration Study Technical Review Committee.

#### b. *Commission Resolution*

We appreciate Idaho Power's willingness to work on the issues identified by ODOE for its next IRP. We hope Idaho Power will work directly with ODOE. In any event, we expect to see results of Idaho Power's work in its 2015 IRP.

### 3. *Gas Price Forecasts*

#### a. *Participants' Comments*

Staff comments on three aspects of Idaho Power's natural gas price forecasts used in the IRP. Staff expresses concerns regarding the symmetric adjustments to the base case forecast, the escalation of the Energy Information Administration (EIA) reference case gas price forecast, and the high correlation between natural gas prices and wholesale electricity prices in the company's modeling. Staff identifies gas price forecasts as an issue to be analyzed during the development of the 2015 IRP. The company responds that its stochastic inputs are reasonable and that it will consider alternatives to deriving high and low gas price scenarios for future IRPs.

#### b. *Commission Resolution*

We anticipate that these analytical issues will be raised by Staff and addressed during the planning process for the 2015 IRP.

### 4. *Flexibility Guideline*

In our investigation of matters related to electric vehicle charging, we adopted our Staff's recommendation to add an IRP guideline to require utilities to incorporate planning for flexible capacity in IRPs.[10] Utilities must forecast the balancing reserves needed at different time intervals to respond to variation in load and intermittent renewable generation over the 20-year planning period and to forecast the availability of balancing reserves at different time intervals. In planning to fill any gap between the demand and supply of flexible capacity, utilities must also evaluate all resource options on a consistent and comparable basis.

#### *a. Participants' Comments*

RNP asserts that Idaho Power's IRP does not comply with the IRP Guidelines because it does not forecast the demand for and supply of flexible capacity, or evaluate flexible resources on a consistent and comparable basis. RNW suggests that future IRPs should quantify the existing supply of flexible resources across multiple time scales, quantify the amount of reserves associated with each supply-side resource, and expand types of demand for flexible resources, *e.g.*, need to meet hourly ramps of load and other variable resources.

Idaho Power responds that its 2013 IRP did, in fact, include much of the flexibility analysis that RNW asserts is lacking. Idaho Power notes that a pumped storage hydro project was modeled as a resource alternative and as a tool to assist in the integration of wind resources. Idaho Power asserts that this modeling captured the flexibility and peaking capacity of the pumped storage hydro project and helped to integrate the variable wind generation into the system, and captured market arbitrage opportunities.

Staff recognizes that the company provided qualitative analysis that shows it is unlikely Idaho Power will need additional flexible capacity over the 20-year planning horizon, but agrees with RNW that the guideline asks for quantitative analysis of the size and timing of the flexible capacity resource balance. Staff recommends that Idaho Power substantially expand its analysis in the 2015 IRP. Staff is willing to work with Idaho Power and other stakeholders to help develop the quantitative analysis.

#### *b. Commission Resolution*

We find that Idaho Power's IRP does not comply with the Flexible Resources Guideline. Idaho Power did not submit the required analysis of demand and supply of balancing reserves disaggregated across multiple timescales. We expect the company to use the recommendations of both RNW and Staff to provide a compliant and more robust analysis regarding flexible resources in its 2015 IRP.

[10] Order No. 12-013 at16-18.

### 5. *Conservation Voltage Reduction*

Staff states that Idaho Power failed to include the required assessment of the available cost effective conservation voltage reduction (CVR) in its service area. Staff explains that we directed the assessment in our review of Idaho Power's 2012 IRP:

> The next IRP filed by Idaho Power will include an assessment of the available cost-effective conservation voltage reduction (CVR) resource potential in its service area. The company will propose an action item in its 2013 IRP related to this resource. The planned energy savings and reduced peak demand will be incorporated into Idaho Power's load-resource balance forecasts.[11]

We agree that Idaho Power's 2013 IRP failed to include this assessment, and direct the company to provide this assessment in its 2015 IRP.

In the interim, we direct our Staff to conduct the independent CVR and Volt/Var Ampere Reactive control programs we ordered in Idaho Power's 2013 Annual Smart Grid Report.[12] Staff should conduct the analysis within the next six months and report the results of the analysis to us at a public meeting.

### 6. *Energy Efficiency*

Although Idaho Power's IRP contains specific energy efficiency targets as part of its plan, the company does not include those amounts in the Action Plan. Staff proposes two action items to address energy efficiency:

| | | |
|---|---|---|
| *2013-2017* | *Energy Efficiency* | *The forecast reduction for 2013 to 2017 programs will be 69 aMW* |
| *2013-2017* | *Energy Efficiency* | *The incremental energy efficiency savings for 2013 to 2017 will reduce energy loads by 38 aMW* |

We adopt Staff's proposed additions to the Action Plan.

### 7. *NEEA*

Idaho Power plans to curtail funding to the Northwest Energy Efficiency Alliance (NEEA) in the next five-year funding cycle. Idaho Power explains that it has asked NEEA to operate under an alternative funding model that would allow Idaho Power's funds to be directed toward the costs of activities that Idaho Power believes are most valuable to its customers. Idaho Power supports the concept of optional programs in NEEA's 2015-2019 Business Plan in which funders could choose to participate and fund certain programs or opt out of them altogether.

---

[11] Order No. 12-177 at 5.
[12] Order No. 13-481 at 1-2.

*a. Participants' Comments*

CUB and Staff are concerned with Idaho Power's proposal to curtail funding to NEAA. Staff believes that NEAA is one of Idaho Power's most cost effective energy investments. Staff notes that NEEA is a compact between over 100 Northwest utilities and efficiency organizations that creates value for its supporters by broad market intervention and energy efficiency market development. NEEA's activities have resulted in the development of an energy efficiency products and practices pipeline to the region that benefits Idaho Power's and the region's ratepayers.

*b. Commission Resolution:*

We do not know Idaho Power's final decision about continued participation in NEEA. However, we are dismayed by the possibility that Idaho Power's approach could undermine support for regional market transformation. We agree with Staff's observations of the importance of NEEA. We believe that market transformation is an integral part of an effective energy efficiency strategy to lower cost and risk to ratepayers. Based on our analysis and our continued oversight of funding to NEEA from Oregon ratepayers, we believe that NEEA is capturing cost-effective energy efficiency over the long run and expanding opportunities for cost-effective energy efficiency in the future. For those programs Idaho Power opts out of, we expect Idaho Power will acquire commensurate savings from equivalent services at a cost equal to or less than what NEEA could provide.

## D. Recommendations For Idaho Power's 2015 IRP

In Order No. 12-177, we reminded Idaho Power that IRP Guideline 4(n) requires utilities to include in an IRP action plan the resource activities the utility plans to undertake over the next two to four years to acquire the identified resources. We also recommended that Idaho Power's future IRPs include a "concise listing of action items for all resources and resource related activities, with each action item numbered."[13]

Idaho Power did include an action plan with resource activities it plans to take in the next two to four years, but the plan also includes longer-term actions. We clarify that, in future IRPs, Idaho Power should limit its Action Plan to activities it plans to undertake in the next two to four years. Idaho Power may compile other lists of activities planned for an extended period, as it has done in this IRP, but we recommend the company create and identify the action plan activities for which it requests specific acknowledgment. Again, we recommend that the company number each of these action items to facilitate our review.

## E. IRP Update

Staff sought delays in these proceedings to facilitate our review of resource action items presented for acknowledgment in both PacifiCorp's IRP and Idaho Power's IRP.

[13] Order No. 12-177 at 8.

As a result of this delay, Idaho Power's annual update to its 2013 IRP, which is due no later than 12 months after acknowledgment. However, Idaho Power must file its 2015 IRP with the Idaho Public Utilities Commission no later than June 2015. Idaho Power intends to file an IRP in Oregon at the same time it files in Idaho.

Given that Idaho Power will file its next IRP with the Idaho commission by June 2015, we waive the requirement that Idaho Power file an annual update to this IRP. This waiver addresses only a routine IRP update, and we expect Idaho Power to file an IRP update if it anticipates a significant deviation from its acknowledged 2013 IRP in the manner required by IRP Guideline 3(f).

## V. ORDER

IT IS ORDERED that the 2013 Integrated Resource Plan filed by Idaho Power Company is acknowledged in part consistent with the terms of this order.

Made, entered, and effective JUL 08 2014.

# Appendix A

**Acknowledged Action Plan Items**

| Year | Resource - Action |
|---|---|
| 2013- 2018 | Boardman to Hemingway – Ongoing permitting, planning studies, and regulatory filings |
| 2013 | Gateway West – Ongoing permitting, planning studies, and regulatory filings |
| 2013 | North Valmy Unit 1 – Commit to the installation of dry sorbent injection emission-control technology |
| 2016-2017 | Have demand response capacity available to satisfy deficiencies up to approximately 170 MW beginning in 2014, and increasing as needed through 2017 |
| 2013-2017 | Energy efficiency – The forecast reduction for 2013 to 2017 programs will be 69 aMW |
| 2013-2017 | The incremental energy efficiency savings for 2013-2017 will reduce energy loads by 38 aMW |
| 2013-2015 | CVR – Include an assessment of the available cost-effective conservation voltage reduction (CVR) resource potential in service area and an action item related to this resource in the next IRP. Incorporate the planned energy savings and reduced peak demand into load-resource balance forecasts. |

# ATTACHMENT N-9
# ORDER NO. 16-160 IN DOCKET LC 63

ORDER NO. 16 160

ENTERED: APR 28 2016

# BEFORE THE PUBLIC UTILITY COMMISSION

# OF OREGON

LC 63

| | |
|---|---|
| In the Matter of<br><br>IDAHO POWER COMPANY,<br><br>2015 Integrated Resource Plan. | ORDER |

DISPOSITION: STAFF'S RECOMMENDATION ADOPTED AS REVISED

This order memorializes our decision made at the March 24, 2016 Special Public Meeting regarding Idaho Power Company's 2015 Integrated Resource Plan (IRP). At the meeting, we adopted Commission Staff's recommendation to acknowledge Idaho Power's 2015 IRP, as revised by Staff's presentation during the meeting. As we stated at the close of the meeting, our decision to not acknowledge certain action items was based on procedural reasons rather than the merits of the action items.

The Staff Report with its initial recommendation is attached as Appendix A. During the public meeting, Staff made the following revisions to this initial recommendation:

*Action Items 5, 7, 10, and 12* – Staff recommends that we not acknowledge these items. Staff explains that these actions are better suited for evaluation in a general rate case as they relate to a facility upgrade that no longer is forecast to meet any resource need.

*Action Items 6 and 8* – Staff recommends that we not acknowledge these items. Staff recommends that we wait and review these actions in a general rate case as they relate to installation of emission-control technology that is already completed or is significantly underway.

*Action Item 11* – Staff recommends that we not acknowledge this item. Staff reasons that the act of evaluating installing emission-control technology is outside the usual scope of IRP acknowledgement and suggests we wait and address the outcome of the evaluation (rather than the decision itself to evaluate).

For the convenience of the parties, we attach, as Appendix B, a list summarizing all of the action items and our decision as to each item.

## ORDER

IT IS ORDERED that the 2015 Integrated Resource Plan, filed by Idaho Power Company, is acknowledged consistent with the terms of this order and the attached Appendices A & B.

Dated this 28 day of April, 2016, at Salem, Oregon.

**Susan K. Ackerman**
Chair

**John Savage**
Commissioner

**Stephen M. Bloom**
Commissioner

ORDER NO. 16 160

**ITEM NO.1**

**PUBLIC UTILITY COMMISSION OF OREGON**
**STAFF REPORT**
**PUBLIC MEETING DATE: March 24, 2016**

**REGULAR** X **CONSENT** ____ **EFFECTIVE DATE** **Upon Commission's Approval**

**DATE:** March 8, 2016

**TO:** Public Utility Commission

**FROM:** Michael Breish MB

**THROUGH:** Jason Eisdorfer and Aster Adams

**SUBJECT:** IDAHO POWER COMPANY: (Docket No. LC 63) Acknowledgement of the 2015 Integrated Resource Plan.

**STAFF RECOMMENDATION:**

Staff recommends the Commission acknowledge Idaho Power Company's (Idaho Power or Company) 2015 Integrated Resource Plan (IRP) with certain recommendations.

**DISCUSSION:**

**Procedural History**

Idaho Power filed its 2015 IRP on June 30, 2015. The Company's filing included the IRP and three appendices.[1] Gail Carbiener, a member of the public, filed initial comments on October 22, 2015. Commission Staff (Staff) and the Citizen's Utility Board (CUB) filed initial comments on November 25, 2015. Idaho Power filed reply comments on December 30, 2015. Mr. Carbiener filed his final comments on January 8, 2016, and CUB and Staff filed final comments on January 22, 2016. Idaho Power filed final reply comments on February 19, 2016.

Idaho Power held 12 IRP Advisory Council (IRPAC) meetings leading up to the submission of the 2015 IRP. IRPAC members represent various public agencies, public and private enterprises, and advocacy groups. The IRPAC covers aspects of the IRP development, particularly on the resource stack, resource portfolio considerations and

[1] The appendices are the "Sales and Load Forecast," the "DSM Annual Report," and the "Technical Report."

risk analyses. The IRPAC played an integral role this year in discussing matters related to the Environmental Protection Agency Clean Power Plan (CPP), promulgated pursuant to the Clean Air Act, Section 111(d) (Section 111(d)), as well as distributed energy resource integration. Staff appreciated the open and involved stakeholder process that Idaho Power dedicates time and energy into in order to fulfill the public input component of the Company's IRP process.

Staff discusses the comments by the parties and the Company, referencing the near-term action plan, long-term planning aspects of the preferred portfolio, and other IRP issues. The original IRP action plan is set forth in Attachment A to this memo.

**General Description of the IRP**

Idaho Power's IRP presents an analysis that considers costs, risks, and uncertainties of various resource portfolios designed to sufficiently satisfy system load, reliability, and flexibility needs over the next 20 years. Idaho Power analyzed 23 resource portfolios under seven different CPP scenarios as well as three variables in a stochastic analysis.[2] Not only was this a significant increase in the number of portfolios provided with previous IRPs, but the diversity of resource considerations within those portfolios increased as well.

Of critical importance in the 2015 IRP are the fates of Idaho Power's two remaining coal-fired generating plants, North Valmy located in Nevada and Jim Bridger located in Wyoming. Because Idaho Power's 2015 IRP was published at the time of only the draft Section 111(d) rules, Idaho Power's analysis reflects the Company's best assumption of what the final Section 111(d) rule may be. Staff addresses final Section 111(d) considerations later in this report.

With a peak-hour capacity deficit first occurring in 2025 under the Company's preferred portfolio, the 2015 IRP action plan features no additional planned generation. Beyond the ongoing processes related to the Boardman-to-Hemingway (B2H) and Gateway West transmission lines, the only significant actions in the 2015 IRP Action Plan relate to completion and consideration of emissions technology on Jim Bridger units and an upgrade of the Shoshone Falls generation station.

**Compliance with Commission IRP Guidelines**

In its Final Comments, Staff asserted that Idaho Power was not compliant with IRP Guidelines 1 and 12 due to aspects of the Company's residential and commercial solar photovoltaic (PV) resource consideration and calculation. Staff believed that Idaho

[2] These three variables were natural gas prices, customer load, and hydroelectric variability.

Power's inclusion of the fixed costs of a customer-owned and financed resource in the Company's supply-side resource stack was inconsistent with Guideline 1. Guideline 1, part 1, states that "all resources must be evaluated on a consistent and comparable basis." Staff found that since the fixed costs of a residential or commercial solar PV system are not directly borne by the Company unlike other supply-side resources, the results "are inherently inconsistent and incomparable and do not reflect the realities of customer-owned resources."[3] Because of this inconsistency in fixed costs burden, Staff concluded that Idaho Power did not comply with Guideline 12, which states that "electric utilities should evaluate distributed generation technologies on par with other supply-side resources...." Staff further concluded in its Final Comments that it "does not want to punish but rather create an opportunity to determine a more realistic analysis of this new class of supply-side resource."[4]

In its Final Comments, the Company disagreed with Staff's assertions, building on its response made in its Reply Comments. There, Idaho Power argued that "the inclusion of capital costs associated with resource construction is consistent with the treatment for other resources considered in the IRP, thus allowing meaningful cost comparisons between resources."[5] Additionally, Idaho Power stated that excluding a supply-side resource's fixed costs would "lead to uneconomic resource procurement and inefficient deployment of capital on the part of Idaho Power and its customers."[6]

Idaho Power expanded on these points in its Final Comments. There the Company explained that its methodology is predicated on the flow of both costs and benefits to all customers. Idaho Power believes this approach to be reasonable, in part because, though the Company does not directly incur the fixed costs, the customer who owns the PV system will eventually recover its fixed cost investment. Furthermore, the analysis of distributed solar PV's total resource cost, which the Company utilizes for all resources including energy efficiency, enables reasonable comparisons of resources' respective values. Therefore, the Company's approach is consistent with the treatment of other resources.

Staff appreciates Idaho Power's effort in addressing its concerns regarding the consideration of distributed solar PV systems. Idaho Power indicates it is open to exploring the possibility of modeling refinements in its 2017 IRP.[7] Staff appreciates this because additional opportunities for incorporating distributed PV solar system benefits exist. Staff believes that once the resource value of solar is established in

[3] Staff's Final Comments, at page 1, Docket No. LC 63, January 22, 2016.
[4] Ibid., at page 2.
[5] Idaho Power's Reply Comments, at page 19, Docket No. LC 63, December 30, 2015.
[6] Ibid.
[7] Idaho Power's Final Comments, at page 7, Docket No. LC 63, February 19, 2016.

Docket No. UM 1716, the conversation regarding different approaches to modeling distributed solar PV resources at the IRPAC will be appropriate.

Staff also asserted in its Final Comments that Idaho Power was noncompliant with Guideline 4, part I, which states that a utility's IRP must select "a portfolio that represents the best combination of cost and risk for the utility and its customers."[8] Idaho Power's selection of preferred portfolio P6(b) is neither least-cost nor least-risk. However, the Company states that consideration of qualitative risks results in the Company selecting P6(b) as the preferred portfolio.

As Staff discusses later in this memo, without a comprehensive and balanced assessment of every portfolio's qualitative risks, Staff cannot make an informed determination on whether a particular portfolio is least-cost, least-risk when qualitative risks are a deciding factor. Though Idaho Power is correct in pointing out that the Commission only acknowledges a utility's Action Plan, Staff notes that a short-term Action Plan is ultimately derived from a resource plan that achieves long-run cost-risk optimality.[9] Therefore, concerns regarding mid-term and long-term action items should not be dismissed.

| Staff is satisfied that the Company has adequately met the IRP guidelines. |
|---|

**Compliance with Previous IRP Order No. 14-253**

In issuing Order No. 14-253, the Commission accepted Idaho Power's 2013 IRP with several directives and recommendations. These are listed below along with Staff's conclusions about Idaho Power's respective compliance.

Pollution Control Investments in Coal Resources

The Commission directed Idaho Power "to work with stakeholders to explore options for how it plans to model and perform analysis in the 2015 IRP in order to comply with the applicable emissions requirements §111(d) of the Clean Air Act."[10] Staff finds that Idaho Power satisfied the first component of this directive by holding an inclusive and engaging stakeholder process (i.e. the IRP Advisory Council). Idaho Power presented the considerations and analyses of the Company's Coal Study Working Group at the

[8] Commission Order No. 07-002, Appendix A, at page 5, Docket No. UM 10, January 8, 2007.
[9] Commission Order No. 14-253, at page 12, Docket No. LC 58, July 8, 2014.
[10] Ibid., at page 8.

September 2014 IRPAC meeting. Additionally, Idaho Power welcomed and incorporated coal plant retirement date suggestions from IRPAC members.

Staff also finds that Idaho Power satisfied the second component of this directive. To address uncertainty surrounding Section 111(d) and the joint ownership of Idaho Power's coal plants, Idaho Power analyzed 23 portfolios that contain various retirement dates for those facilities. Additionally, Idaho Power conducted a Section 111(d) sensitivity on the 23 resource portfolios that consisted of seven different scenarios split into mass-based or rate-based. However, these analyses were conducted prior to the finalization of Section 111(d) rules. Due to this temporal issue, Staff will recommend additional analyses in Idaho Power's 2015 IRP update.

Gas Price Forecasts

Though not an explicit directive, Staff mentions the Commission's expectation that Idaho Power would address stakeholders' concerns regarding three aspects of the Company's natural gas price forecast.[11] Staff finds that Idaho Power sufficiently addressed the concerns by utilizing Energy Information Administration data for high and low cases as well as the nominal forecast prices. The Company also verified that the implied heat rate, which verifies the relationship between natural gas prices and wholesale electricity prices, aligns with the historical correlation.[12]

Conservation Voltage Reduction (CVR)

Idaho Power was directed to include a CVR assessment in the 2015 IRP after failing to do so in the 2013 IRP. CVR efforts currently progressing at Idaho Power under the "CVR Enhancements Project" should be completed by 2016. Through its *2014 and 2015 Smart Grid Reports*, the Company has kept Staff and the Commission abreast of the renewed evaluation and possible integration of CVR into distribution system operations.

Idaho Power did not include a CVR assessment due to the ongoing nature of the project, but did include a description of the current project on page 48 of the IRP. Staff recommends the Commission delay action on CVR until Staff has been able to review the Company's analysis in the CVR Enhancements Project report to be filed September 1, 2016.

[11] The three issues were " the symmetric adjustments to the base case forecast, the escalation of the Energy Information Administration's reference case gas price forecast, and the high correlation between natural gas prices and wholesale electricity prices in the company's modeling. "*See* Commission Order No. 14-253, at page 14, Docket No. LC 58, July 8, 2014.
[12] Idaho Power's 2015 IRP, Appendix C, at page 215, Docket No. LC 63, June 30, 2015.

Action Plan Limits

The Commission stated that Idaho Power should limit its Action Plan to activities it plans to undertake in the next two to four years as well as enumerate them for ease of analysis. Idaho Power has done so.

| |
|---|
| Staff is satisfied that the Company has adequately addressed all of the Commission's directives set forth in Order 14-253. |

**Action Item Discussion**

The Company offered the following Action Items for the time period 2015-2019.

Action Item #1 – B2H Transmission Line

*Idaho Power will continue the ongoing permitting, planning studies and regulatory filings.*

Mr. Carbiener expressed concerns about the increasing costs of the B2H line as well as the Company's presentation of the viability of portfolios that do not contain B2H. Additionally, Mr. Carbiener discussed how a tipping point analysis of the costs of B2H would be helpful in considering alternative resources.

Staff notes that the Commission acknowledged the same actions for B2H in Order No. 14-253.[13]

The only major development to occur since the 2014 IRP is the Bureau of Land Management's (BLM) issuance of the draft Environmental Impact Statement (EIS), which includes the agency's initial analysis on the proposed and alternate routes of the B2H line.[14] Idaho Power expects the BLM to issue a final EIS in 2016.

| |
|---|
| Staff recommends acknowledgment of Action Item #1. |

[13] Ibid., at page 5.
[14] BLM's *Draft Environmental Impact Statement and Land Use Plan Amendments for the Boardman to Hemingway Transmission Line Project, DOI-BLM-OR-V000-2012-016-EIS,* December 19, 2014.

Action Item #2 – Gateway West Transmission Line

*Idaho Power will continue the ongoing permitting, planning studies and regulatory filings.*

No parties commented on this Action Item.

Staff notes that the Commission acknowledged the same actions for B2H in Order No. 14-253.[15]

Staff recommends acknowledgment of Action Item #2.

Action Item #3 – Energy Efficiency

*Idaho Power will continue the pursuit of cost-effective energy efficiency – the forecast reduction for the 2015-2019 programs is 84 average megawatts (MW) for energy demand and 126 MW for peak demand*

CUB expressed concern that Idaho Power is underestimating the forecasted achievable energy efficiency potential that the Company can acquire. At the core of CUB's concern was Idaho Power's pursuit of achievable, cost-effective energy efficiency, which the Company historically has exceeded annually. CUB believes opportunities exist for Idaho Power to meet more of its projected load growth through energy efficiency, including offering more programs, increasing the Company's energy efficiency marketing, and implementing a "more aggressive (energy efficiency) policy."[16] Staff highlights the fact that Idaho Power's energy efficiency target for the five year period from 2015 to 2019 is 22 percent higher than the five-year window in the 2013 IRP.

Staff recommends acknowledgment of Action Item #3.

Action Item #4 – Section 111(d)

*Idaho Power will coordinate with government agencies on implementation planning for Section 111(d).*

[15] Ibid., at page 6.
[16] CUB's Initial Comments, at page 7, Docket No. LC 63, November 25' 2015.

Staff analyzed and discussed the results of Idaho Power's Section 111(d) sensitivity analyses in its Initial and Reply Comments. Because the 2015 IRP was published prior to the release of the final Section 111(d) rules, Staff expects Idaho Power will continue to work with the co-owners of the North Valmy and Jim Bridger Coal-fired generation stations as states develop Section 111(d) compliance plans.

Staff recommends acknowledgment of Action Item #4, and proposes the following additional recommendations:

- Analyze alternative Section 111(d) compliance paths' impacts on Idaho Power's respective liabilities in North Valmy and Jim Bridger generation stations with stochastic analysis for each compliance path.
- Calculate the cost of compliance with these paths for Idaho Power, and the impact of these costs upon Idaho Power's ratepayers.

Action Item #5 – Shoshone Falls License Amendment

*Idaho Power will file to amend the FERC license regarding the 50-MW expansion.*

No parties commented on this action item.

Staff recommends acknowledgment of Action Item #5.

Action Item #6 – Jim Bridger Unit 3

*Idaho Power will complete the installation of selective catalytic reduction (SCR) emission-control technology.*

No parties commented on this action item.

Staff recommends acknowledgment of Action Item #6.

Action Item #7 – Shoshone Falls Upgrades Study

*Idaho Power will study options for smaller upgrades ranging in size up to approximately 4 MW.*

No parties commented on this action item.

Staff recommends acknowledgment of Action Item #7.

Action Item #8 – Jim Bridger Unit 4

*Idaho Power will complete installation of SCR emission-control technology.*

No parties commented on this action item.

Staff recommends acknowledgment of Action Item #8.

Action Item #9 – North Valmy Units 1 and 2

*Idaho Power will continue to work with NV Energy to synchronize depreciation dates and determine if a date can be established to cease coal-fired operations.*

Mr. Carbiener suggested Idaho Power include additional portfolios that mirror Nevada Power's 2013 IRP 2021 modeled shut down date for North Valmy.

Staff raised concerns regarding the forecasted shut down dates of the North Valmy plant in the Company's preferred portfolio compared to other portfolios that have lower cost and risk. However, all shut down dates considered in Idaho Power's resource portfolios occur beyond the four-year window of the 2015 IRP, so Staff discusses this matter further below.

Staff recommends acknowledgment of Action Item #9.

Action Item #10 – Shoshone Falls 2017 Upgrade

*Idaho Power will commence construction of a smaller upgrade.*

Idaho Power in its Final Comments provided clarifying and additional information regarding the planned upgrades and maintenance of the Shoshone Falls facility that

enables Staff to retract its initial recommendation of non-acknowledgement. The upgrade of the Shoshone Falls facility is necessary for continued reliable operations.[17]

| Staff recommends acknowledgment of Action Item #10. |
|---|

Action Item #11 – Jim Bridger Units 1 and 2

*Idaho Power will evaluate the installation of SCR technology for units 1 and 2 at Jim Bridger in the 2017 IRP.*

Staff noted in its Final Comments that when Idaho Power models Section 111(d) compliance paths, it should fully consider Jim Bridger scenarios that are informed by considerations and possible decisions of the co-owner PacifiCorp. Staff addresses matters related to Jim Bridger in recommendations made under Action Item #4.

| Staff recommends acknowledgment of Action Item #11. |
|---|

Action Item # 12 – Shoshone Falls 2019 On-Line Date

*Idaho Power will place the smaller upgrade on-line.*

Similar to Action Item #10, Staff initially recommended non-acknowledgement of this Action Item in its Final Comments. However, Idaho Power provided clarifying information that led Staff to retract that recommendation.

| Staff recommends acknowledgment of Action Item #12. |
|---|

**Other Issues**

Selection of Preferred Portfolio

Staff and CUB challenged Idaho Power's selection of portfolio P6(b) as the Company's preferred portfolio due to the its higher cost, higher risk, and higher Section 111(d) compliance cost compared to alternative resource portfolios. The Company responded

[17] Idaho Power's Final Comments, at page 7, Docket No. LC 63, February 19, 2016.

that in addition to the relatively small differences in cost for the portfolios that Staff and CUB contended were quantitatively supported, portfolio P6(b) minimized qualitative risks.

Idaho Power also correctly identified that the Commission in its review of a utility's IRP will only consider items set forth in the utility's short-term Action Plan.[18] The portfolios that Staff and CUB argued were more appropriate choices share the same four-year Action Plan as the Company's preferred portfolio. From this, the Company argues the Commission should acknowledge the Company's IRP.

Staff reiterates its observation made in its Final Comments: an Action Plan is only justified by the long-term resource plan. Despite similar or even identical Action Plans, they are otherwise irrelevant if not considered in the broader context of a cost-risk optimal long-term resource plan.

Staff agrees with Idaho Power's position that the Commission should acknowledge Idaho Power's 2015 IRP Action Plan.

Qualitative Risk Analysis

Both CUB and Staff raised concerns over the Company's reliance on qualitative risks to support the selection of portfolio P6(b) as the preferred portfolio despite four lower-cost, lower-risk alternatives. In particular, Staff raised concerns regarding the Section 111(d), "regulatory" resource commitment, PURPA, and DSM implementation qualitative risks. Though Idaho Power further clarified some of Staff's concerns in its Reply Comments, Staff believes that some of these lower-cost, lower-risk portfolios also afford the same qualitative risk benefits the Company attributes to preferred portfolio P6(b). Because of the lack of comprehensive evaluation of qualitative risks of all other portfolios besides the preferred portfolio, Staff recommends Idaho Power pursue a systematic evaluation of all portfolios' qualitative risks. This evaluation must be balanced and consistent in its comparisons in order to support future preferred portfolios. Despite this concern, Staff appreciates Idaho Power's broader assessment in assessing qualitative risks.

| Staff recommends Idaho Power include a more systematic evaluation of the qualitative benefits of the resource portfolios in the 2017 IRP. |
|---|

[18] Commission Order No. 14-253, at page 12, Docket No. LC 58, July 8, 2014.

2015 IRP Update Waiver

In its final comments, Staff recommended that Idaho Power provide updated Section 111(d) and existing coal unit considerations in the 2015 IRP Update. Idaho Power replied in its Final Comments that, though it plans to comply with Staff's recommendations regarding additional analyses, doing so in the 2015 IRP Update would be inefficient. The Company notes that the 2017 IRP is due only three months after the planned 2015 IRP Update filing. Because the analyses requested by Staff are substantial and therefore more suited for a complete IRP cycle rather than an IRP Update, Idaho Power recommends the Commission waive its obligation to file a 2015 IRP Update.

| |
|---|
| Staff agrees and recommends the Commission waive Idaho Power's obligation to file a 2015 IRP Update. |

**PROPOSED COMMISSION MOTION:**

Idaho Power's 2015 IRP be acknowledged with the following recommendations by Staff as contained in this report and summarized in Attachment A to this report.

## ATTACHMENT A

| Action Item | Description | Staff Recommendation |
|---|---|---|
| 1 | B2H – ongoing permitting, planning studies, and regulatory filings | Acknowledge |
| 2 | Gateway West – ongoing permitting, planning studies, and regulatory filings | Acknowledge |
| 3 | Pursuit of cost-effective energy efficiency | Acknowledge |
| 4 | Implementation planning for Section 111(d) | Acknowledge with Recommendations |
| 5 | Shoshone Falls license amendment | Acknowledge |
| 6 | Jim Bridger 3 – Complete SCR installation | Acknowledge |
| 7 | Shoshone Falls upgrade study | Acknowledge |
| 8 | Jim Bridger 4 – Complete SCR installation | Acknowledge |
| 9 | North Valmy – NV Energy collaboration | Acknowledge |
| 10 | Shoshone Falls 2017 upgrade | Acknowledge |
| 11 | Jim Bridger 1 & 2 – SCR evaluation | Acknowledge |
| 12 | Shoshone Falls 2019 on-line date | Acknowledge |

**Recommendations**

In addition to acknowledgement of the Action Plan items, Staff recommends that the Commission direct the Company to:

- Analyze alternative Section 111(d) compliance paths' impacts on Idaho Power's respective liabilities in North Valmy and Jim Bridger generation stations with stochastic analysis for each compliance path in the 2017 IRP.
- Calculate the cost of compliance with these paths for Idaho Power, and the impact of these costs upon Idaho Power's ratepayers.
- Include a more systematic evaluation of the qualitative benefits of the resource portfolios that Idaho Power analyzes in the 2017 IRP.

APPENDIX B

## 1. Action Items

| Action Item | Resource | Description | Disposition |
|---|---|---|---|
| 1 | B2H Transmission | Ongoing permitting, planning studies, and regulatory filings | ***Acknowledged*** |
| 2 | Gateway West Transmission | Ongoing permitting, planning studies, and regulatory filings | ***Acknowledged*** |
| 3 | Energy Efficiency | Continue the pursuit of cost-effective energy efficiency | ***Acknowledged*** |
| 4 | N/A | Coordinate with government agencies on implementation planning for Clean Air Act Section 111(d) | ***Acknowledged*** |
| 5 | Shoshone Falls Hydro | File to amend FERC license regarding 50-MW expansion | Not Acknowledged |
| 6 | Jim Bridger Unit 3 | Complete installation of selective catalytic reduction (SCR) emission-control technology | Not Acknowledged |
| 7 | Shoshone Falls Hydro | Study options for a smaller upgrade ranging in size up to approximately 4 MW | Not Acknowledged |
| 8 | Jim Bridger Unit 4 | Complete installation of SCR emission-control technology | Not Acknowledged |
| 9 | North Valmy Units 1 & 2 | Continue to work with NV Energy to synchronize depreciation dates and determine if a date can be established to cease coal-fired operations | ***Acknowledged*** |
| 10 | Shoshone Falls Hydro | Commence construction of smaller upgrade | Not Acknowledged |
| 11 | Jim Bridger Units 1 & 2 | Evaluate the installation of SCR technology in the 2017 IRP | Not Acknowledged |
| 12 | Shoshone Falls Hydro | On-line date for smaller upgrade during first quarter of 2019 | Not Acknowledged |

## 2. Recommendations

a. Analyze alternative Section 111(d) compliance paths' impacts on Idaho Power's respective liabilities in North Valmy and Jim Bridger generation stations with stochastic analysis for each compliance path in the 2017 IRP.
b. Calculate the cost of compliance with these paths for Idaho Power, and the impact of these costs upon Idaho Power's ratepayers.
c. Include a more systematic evaluation of the qualitative benefits of the resource portfolios that Idaho Power analyzes in the company's 2017 IRP.

# ATTACHMENT N-10
# ORDER NO. 18-176 IN DOCKET LC 68

ORDER NO. 18 176

ENTERED MAY 23 2018

# BEFORE THE PUBLIC UTILITY COMMISSION

# OF OREGON

LC 68

| | |
|---|---|
| In the Matter of<br>IDAHO POWER COMPANY,<br>2017 Integrated Resource Plan. | ORDER |

DISPOSITION: 2017 IRP ACKNOWLEDGED WITH MODIFICATIONS AND EXCEPTIONS

This order memorializes our decision, made and effective at the April 10, 2018 Regular Public Meeting, concerning Idaho Power Company's 2017 Integrated Resource Plan (IRP). We acknowledge all but two of the action items proposed in Idaho Power's revised action plan. Although our acknowledgement includes Idaho Power's Boardman to Hemingway (B2H) related action items, we note that our acknowledgement is limited to our interpretation of IRP standards specific to the Public Utility Commission, and does not interpret or apply the standard of any other state or federal agency.

## I. INTRODUCTION

The central feature of Idaho Power's 2017 IRP is the B2H project. The B2H project has been identified as part of the preferred resource portfolio in Idaho Power's 2009, 2011, 2013, and 2015 IRPs. Several groups formed to oppose this project and, along with many individual interested citizens, participated actively and constructively in this IRP process. Many groups and individuals are concerned about the land use and environmental impacts of B2H and share a preference for demand-side and distributed, clean energy alternatives to B2H. It is our view that the robust participation of citizen groups and individuals has supported a better and fuller understanding of the issues associated with the B2H project and other IRP issues. Although we acknowledge Idaho Power's selection of the B2H project as a least cost, least risk resource to meet the needs of its customers, we remain grateful for the hard work, dedication, knowledge, and passion of all stakeholders in this process.

## II. IRP PROCESS

### A. Purpose

The objective of the IRP is to ensure an adequate and reliable supply of energy at the least cost to the utility and customers in a manner consistent with the long-run public interest.[1] The IRP provides extensive opportunity for the provision of broad input from a range of stakeholders, and public participation and input is a central goal of the IRP. This input, along with IRP guideline requirements that ensure a detailed and wide-ranging review of resource options, technology advancements, pricing scenarios and risk profiles are intended to test the conclusions of the utility. The IRP process is intended to be iterative. Where weakness or issues are identified, stakeholder participation can help identify alternatives and improvements to the plan. Utilities should respond proactively to the concerns of stakeholders, and consider alternatives.

Ultimately, an acknowledged plan will become a working document for use by the utility, the Commission, and other interested parties in Commission proceedings.[2] We have noted in recent IRP decisions that during a time of considerable electric utility industry flux IRPs should serve to allow for course corrections as industry evolution comes into greater focus.[3]

### B. Timing and Content

We require regulated energy utilities to prepare and file IRPs within two years of acknowledgement of the utility's last plan.[4] The IRP process uses a 20-year planning period. Oregon's IRP guidelines include thirteen elements. Summarized, the elements include the following key components:

- Identification of capacity and energy needs to bridge the gap between expected loads and resources
- Identification and estimated costs of all supply-side and demand-side resource options
- Construction of a representative set of resource portfolios
- Evaluation of the performance of the candidate portfolios over the range of identified risks and uncertainties

---

[1] *In the Matter of the Investigation into Least-Cost Planning for Resource Acquisitions by Energy Utilities in Oregon*, Docket No. UM 180, Order No. 89-507 at 2 (Apr 20, 1989).
[2] *Id.* at 7.
[3] *In the Matter of Portland General Electric Company, 2016 Integrated Resource Plan, Docket No. LC 66,* Order No. 17-386 at 2 (Oct 9, 2017).
[4] OAR 860-027-0400(3).

- Selection of a portfolio that represents the best combination of cost and risk and risk for the utility and its customers
- Creation of an Action Plan that is consistent with the long-run public interest as expressed in Oregon and federal energy policies

The primary outcome of the IRP process is the selection of a portfolio of resources with the best combination of expected costs and associated risks and uncertainties for the utility and the customers, that the Commission deems reasonable after the presentation of the plan and review by Staff and stakeholders.

## C. Action Plan

An important product of the IRP process is an action plan. Where new resources are needed to meet system needs, the action plan will include these resource acquisitions. The action plan identifies the preferred portfolio of supply-side and demand-side resources to meet this need and identifies the steps the company will take within the next four years to deliver needed resources. Different resources require different steps to move forward with procurement. Transmission in particular requires more development lead time than other supply-side resources.

## D. Acknowledgement

Our acknowledgement of an IRP means that the Commission finds that the utility's preferred portfolio is reasonable at the time of acknowledgement.[5] We may decline to acknowledge specific action items if we are not satisfied that the proposed resource decision presents the least cost and risk option for customers. We may provide the utility an opportunity to revise the IRP before issuing an acknowledgement order.[6]

Acknowledgment is not a guarantee of cost recovery, nor is consistency with an acknowledged plan a requirement for recovery of resource costs in rates. Acknowledgment provides guidance for later ratemaking proceedings, which are the forum for the Commission to make its ultimate decision to approve or disapprove a resource procurement as prudent and recoverable in customer rates. Consistency with an acknowledged plan may be used as evidence in support of favorable ratemaking treatment, but the utility still must demonstrate that its actions remained reasonable, particularly in light of any material changes in the facts, circumstances and assumptions that supported IRP acknowledgment.

---

[6] OAR 860-027-0400(6).

## III. IDAHO POWER'S 2017 IRP

### A. Previous Idaho Power IRPs

As noted, Idaho Power's IRP process has consistently identified the B2H project as part of its preferred portfolio since 2009, and we have previously recognized action items related to the planning of B2H as reasonable and have encouraged the company to continue its efforts to move forward with the project. We declined to acknowledge construction of B2H once in the past, but did so solely because Idaho Power requested acknowledgement of planned construction activity outside of the four year action plan period.[7]

### B. Projected Resource Needs and Portfolio Modeling

Idaho Power identifies summer peak capacity needs in the 2026 timeframe. The company has access to adequate capacity supply prior to this period. Load is expected to grow by an average of 0.09 percent annually, while peak capacity needs are expected to grow by 1.4 percent annually, according to the company.

For its 2017 IRP, Idaho Power utilized a "factorial design approach." This design was intended to inform the IRP's Action Plan with regard to Selective Catalytic Reduction equipment (SCR) investments for Jim Bridger units one and two, and review the B2H transmission line. The result of this approach was the development of twelve portfolio options, using four SCR investment scenarios for Jim Bridger and three resource portfolio constructions. The non-B2H alternatives included a natural gas generation portfolio and a natural gas and solar generation portfolio. Previous Idaho Power IRPs reviewed more portfolio options. In 2015, Idaho Power compared 23 resource portfolios.

### C. Preferred Portfolio

Of the twelve portfolio options, Idaho Power concludes that portfolio seven provides the best combination of costs and risks for customers. This portfolio includes the following resources: B2H with an in service date in 2026, reciprocating engines in 2031 and 2032, a 300 MW CCCT in 2033, and reciprocating engines in 2035 and 2036. Due to the long lead-times associated with transmission line development, Idaho Power requests acknowledgement of B2H construction activity in its 2017 IRP to meet its 2026 capacity need.

---

[7] *In the Matter of Idaho Power Company, 2013 Integrated Resource* Plan, Docket No. LC 58, Order No. 14-253 at 5 (Jul 8, 2014).

### *1. Transmission*

The B2H Transmission project involves permitting, constructing, operating, and maintaining a new single-circuit 500-kV transmission line approximately 300 miles long between the proposed Longhorn Station near Boardman, Oregon, and the existing Hemingway Substation in southwest Idaho. Idaho Power states that this project will provide the lowest cost, lowest risk capacity resource to meet identified needs commencing in 2026. Idaho Power plans to meet capacity needs through market purchases facilitated by the development of the line.

Idaho Power also plans to conduct ongoing permitting, planning studies and regulatory filings for the Gateway West transmission project. Gateway West is a joint project between Idaho Power and PacifiCorp to build and operate new transmission lines running from the planned Windstar substation in Wyoming to the Hemingway substation in Idaho. The line is in the permitting stage, and Idaho Power characterizes Gateway West as complementary to the B2H project.

### *2. Coal*

Idaho Power owns 50 percent, or 284 MW, of the North Valmy coal-fired power plant in Nevada. NV Energy is the operator of the facility and owns the other 50 percent. The plant has two units. Idaho Power plans to exit its share of North Valmy Unit 1 at year-end 2019. Idaho Power identified likely economic benefits associated with a 2019 shutdown of Unit 1 as opposed to the 2025 shutdown date planned in the 2015 IRP. North Valmy units are assumed to be replaced with market purchases imported across the Idaho-Nevada path. Idaho Power plans to exit its share of North Valmy Unit 2 at year-end 2025.

Idaho Power owns one-third (771 MW) of the Jim Bridger coal-fired power plant. PacifiCorp owns two-thirds of the facility and is its operator. The company proposes Jim Bridger unit 1 and 2 retirements at year-end 2028 and year-end 2032, respectively, provided it obtains regulatory approvals allowing it to continue operation without installing SCRs. Previous IRPs had called for the evaluation of SCRs at the units. Idaho Power proposes to work with a variety of regulators and the co-owners of the facility to achieve these retirement dates without SCR installation.

Idaho Power owns 10 percent, of 64.2 MW of the Boardman coal-fired power plant. Portland General Electric (PGE) owns 90 percent of the facility and is its operator. Idaho Power plans to coordinate with PGE to achieve cessation of coal-fired operations at the Boardman coal plant by year-end 2020 and subsequent decommissioning and demolition of the unit. PGE has reached an agreement with Oregon Department of Environmental

Quality and the Environmental Protection Agency to cease coal-fired operations at the facility.

### *3. Demand Side Management*

Idaho Power will continue the pursuit of what it has identified as cost-effective energy efficiency and demand response resources. By 2036, Idaho Power plans to acquire 390 MW of committed peak summer capacity through demand response and expects a reduction in annual loads from energy efficiency of 273 MWa. Energy efficiency is expected to reduce peak load by 483 MW by 2036. The company states that demand-side resources are the first selected resource in each IRP, and the no supply-side generation resource is considered until all future cost-effective, achievable potential energy efficiency and forecasted demand response is accounted for and credited against future loads. Long-term savings estimates declined between the 2015 and 2017 IRPs, due to an anticipated drop in residential savings.

### *4. Natural Gas*

The preferred portfolio includes several natural gas resource additions later in the planning period. Portfolio seven includes the acquisition of 36 MW reciprocating engines in 2031 and 2032, one 300 MW Combined-Cycle Combustion Turbine (CCCT) addition in 2033, and 36 MW reciprocating engines in 2035 and 2036.

## IV. DISCUSSION

We focus our discussion on Idaho Power's proposed action items and one other issue, a waiver request from Idaho Power. For each issue, we describe the action item, briefly summarize some intervenors' comments, and explain our resolution. Idaho Power's proposed action plan identifies steps to be taken within the next four years.

Idaho Power's action plan includes pursuit of cost-effective energy efficiency in conjunction with stakeholder and regional groups, preparation for participation in the western Energy Imbalance Market (EIM) beginning in April 2018, involvement as a stakeholder in CAA Section 111(d) proceedings or alternative regulations constraining carbon emissions, early retirement of Valmy units 1 and 2, early retirement for Jim Bridger units 1 and 2, and investigation of solar PV contribution to peak using loss of load probability (LOLP) analysis for use in the 2019 IRP. The B2H short-term action plan is 2017 to 2026. All other action plan items are in the 2017 to 2021 timeframe.

Idaho Power has also requested a waiver of IRP guideline 3(f), which would relieve the company of the obligation to file an IRP update within one year of IRP acknowledgement.

## A. B2H Transmission Project

The B2H project incorporates action items five and six, in which Idaho Power plans to conduct ongoing permitting, planning studies, and regulatory filings for the B2H transmission line and conduct preliminary construction activities, acquire long-lead materials (action item five), and construct the B2H project (action item six).

### *1. Comments*

According to Staff, B2H has been demonstrated to show important regional benefits and is part of the lowest cost, lowest risk portfolio of resources. Staff considers that in several prior IRPs, Commission Staff performed analysis of the need and justification for the transmission line. Staff notes that the Commission has found the project reasonable in numerous past IRP decisions.

Initially, Staff considered B2H to be inadequately supported by the filed IRP. In response, Idaho Power assembled and submitted Appendix D which focused largely on the B2H project. Staff found that Appendix D delivered a thorough account of the history of the B2H project, the associated reliability and capacity benefits, a detailed account of public participation, and other important material. Staff considered Appendix D to be a responsive and persuasive submission by the company that helped Staff ultimately support acknowledgement of B2H.

The Stop B2H Coalition (Stop B2H) argues that Idaho Power already has sufficient transmission capacity and that the line is not needed for transmission purposes. Stop B2H asserts that transmission should not be treated as a generation resource, and that transmission is less reliable and flexible than other resources because it relies on market purchases. Idaho Power and Staff contend the opposite; that B2H will provide the flexibility to purchase power in many different time frames (years, months, a day, an hour, or within the hour). Idaho Power states that B2H will allow more flexibility to access various generation, including newer renewable resources. Staff and Idaho Power agree that our IRP guidelines as written do encourage the consideration of transmission as a supply resource.

Stop B2H presents a series of arguments asserting that the cost of B2H is likely to be much higher than outlined by the company and the benefits far less extensive. Stop B2H argues that market purchases are a poor strategy for meeting capacity needs. Staff and the

company identify this reliance on market as a strength. Staff believes that one of the central merits of the B2H proposal is that is connects a major power hub (the Mid-C market), which Staff contends is highly liquid, to loads in the Intermountain West.

All stakeholders recognize that Idaho Power has been open and welcoming of public comment and participation throughout this IRP process, and in the many public forums in which B2H was discussed and considered. In its Appendix D to the IRP, Idaho Power highlights that it has participated in over 250 public and stakeholder meetings on the project, with an estimated attendance of over 3,000 people.

Commission Staff states that it has participated in forums and events on B2H with interested members of the public. Commission Staff notes that it was involved in the Commission open houses that occurred in Malheur and Baker Counties, dating back to 2009, and at which the B2H project was discussed with citizens.

Staff points out that the B2H project has been included in numerous regional studies by the Northern Tier Transmission Group, the Western Electricity Coordinating Council (WECC), Columbia Grid, and others. Staff highlights that B2H has been listed as a "Foundational Transmission Project" by WECC's Subregional Planning Group, a committee formed to create interconnection-wide transmission plans for western interconnection. Idaho Power contends that B2H is required for both its west-to-east and east-to-west capacity to meet regional needs.

Stakeholders have repeatedly referenced risks related to Idaho Power's minority share of the capacity of the line and the need for significant participation from other utilities to construct the project. Idaho Power responds that it has an active permitting agreement with its current co-participants. Idaho Power also stated that, should a co-participant drop out, Idaho Power would evaluate other potential partnerships and, if necessary, reevaluate its own participation in the project. ODOE notes that the Energy Facility Siting Council (EFSC) siting process includes risk safeguards for construction and non-performance of partners. Before Idaho Power can begin construction of B2H, it must obtain a Site Certificate from EFSC.

The Lewis and Clark Trail Heritage Foundation asserts that B2H does not adequately protect natural, cultural, and historic resources. Gail Carbiener also argues that the B2H project will disrupt and harm the Oregon Trail. Idaho Power states that trail impacts will be appropriately considered as part of the EFSC siting process, and that B2H will work to minimize trail impacts. Staff believes that Idaho Power has reasonably sought to address landowner concerns and worked with the BLM towards a feasible route minimizing impacts to communities, the Oregon Trail, and public and private land.

Citizens Advocating for Common Sense state that ODOE's processes are too industry friendly and strongly opposes acknowledgement. In addition to formal filed comments, many informal comments were submitted to Staff and the Commission. These comments almost uniformly expressed strong opposition to the construction of the B2H project. Many argue that reliance on traditional resources like large-scale transmission is counter to significant changes in the utility industry, and that distributed resources and other solutions should be prioritized over larger, more centralized resources. Along these lines, some comments urge delay of acknowledgement to the 2019 IRP. Idaho Power states that acknowledgement cannot be delayed, if the project is to move forward with permitting expeditiously and be constructed in time to help the company meet the anticipated 2026 capacity shortfall.

Several parties, including Staff, present objections to Idaho Power's chosen factorial modeling. Like these other parties, CUB objects to Idaho Power's failure to use a capacity expansion model, but does not object to Idaho Power's selection of portfolios including B2H.

Staff asserts that B2H presents a unique case because Idaho Power's analysis of B2H as a least cost, least risk resource to meet customer needs identified in this IRP is also supported by the extensive vetting of the project in prior years and the regional benefits that are associated with it. Rather than locking in costs, Staff sees the resource as flexible, allowing market power purchases without committing to a single technology and remaining flexible to accommodate future changes in technology. Staff argues that while not ideal, the portfolio analysis presented by Idaho Power is sufficient to determine that portfolio seven represents the best combination of costs and risk of the twelve analyzed.

### *2. Resolution*

We acknowledge B2H Action Item 5 to conduct ongoing permitting, planning studies, and regulatory filings for the B2H transmission line, as well as Action Item 6 to conduct preliminary construction activities, acquire long-lead materials, and construct the B2H project. We clarify that this determination is limited to our IRP standards and that, in acknowledging these action items, we do not interpret or apply the standards of any other state or federal agency. Through our acknowledgement we find that these action items are reasonable components of Idaho Power's resource plan based on the information available at this time.

Our acknowledgement of Action Item 6 is based on our finding of its reasonableness, according to the information we possess today, in the context of Idaho Power's entire IRP. Our decision does not mean that Action Item 6 is the only possible option for meeting Idaho Power's resource needs, simply means that we are satisfied that it is the

least cost, least risk resource for meeting the demonstrated resource needs of Idaho Power's customers. We recognize that there may be other ways of meeting the capacity needs identified in this IRP that may not have the same impacts to eastern Oregon as B2H. In this proceeding, however, we do not find that any such alternatives have been demonstrated to be lower cost and lower risk, based on the information presented.

Our acknowledgement of Action Item 6 is not a final determination of prudence and does not guarantee favorable ratemaking treatment. The IRP process is designed to provide the utility with guidance from Staff, stakeholders, and the Commission based on the utility's submitted plan. We have long held that consistency with an acknowledged plan may be evidence in support of favorable ratemaking treatment, but the utility still must demonstrate that its actions remained reasonable, particularly in light of any material changes in the facts, circumstances and assumptions that supported IRP acknowledgment.

We are encouraged by the extensive participation of citizens in this case, many of which are motivated by sincere concerns over impacts to the land which will be created by this project. We are bound by state laws and legal precedent that directs us to exclude from our inquiry many of these concerns, however, and we note that energy facility siting impact issues are appropriately reviewed in other state or federal proceedings.

Our decision is supported by the fact that B2H has been prioritized over multiple portfolios in different IRPs using numerous different modeling concepts and reflecting many different assumptions. While presence in numerous IRPs is not determinative for our acknowledgement judgement, it is indicative to us of sustained value that has remained robust across industry and market changes to date. In each of these portfolios, B2H has proven to be a low-cost resource that provides considerable value to the system. While we are sensitive to the arguments that the utility industry is in flux, and that technological changes are impacting the system in unanticipated ways, we have not seen information presented as part of this IRP process indicating that large-scale transmission resources will not be an important part of future utility systems. We recognize that B2H has the potential to create significant regional benefits and could represent a tool for allocating and moving a diverse set of new low-carbon resources across the west.

Transmission must be developed with very long lead times. Because circumstances may change in the future, and new information may be presented at a later date, the ultimate development of the B2H project is not a foregone conclusion. We agree with Staff that a host of changed circumstances could require Idaho Power to reevaluate its course, including but not limited to significant changes in co-participant shares and commitments, project costs, load needs, power market liquidity and depth, and capabilities and costs of alternative technologies. Idaho Power should be prepared for

such reevaluation and to change course should such information or circumstances emerge.

Based on what we know today, however, we find that the plan to construct the B2H project is reasonable and should be acknowledged subject to the conditions outlined in Staff's memo.

**B. Gateway West**

Action Item 8 concerns Gateway West. Idaho Power plans to conduct ongoing permitting, planning studies, and regulatory filings.

Staff recommends acknowledgement of this action item, but notes that it is important for the Commission to understand how the Gateway West series of projects relate to the B2H project. Staff recommends that the company update the Commission on the status of Gateway West beyond what has been presented in the 2017 IRP.

We acknowledge Action Item 8, and adopt Staff's recommendation.

**C. North Valmy Unit 1**

With Action Item 3, Idaho Power includes a commitment to plan and coordinate with NV Energy an exit from coal-fired operations of North Valmy Unit 1 by year-end 2019. Idaho Power also plans to assess import dependability from Northern Nevada.

Staff and Sierra Club recommend acknowledging this action item. Throughout the comment period, Staff had several requests for clarification on the analysis and rationale behind the decision to exit North Valmy Unit 1 in 2019. Idaho Power responded to these requests, explaining the status of its exit negotiations.

We acknowledge this action item.

**D. North Valmy Unit 2**

In Action Item 11, Idaho Power communicates its plans to coordinate with NV Energy the company's exit from coal-fired operations of North Valmy Unit 2 by year-end 2025. This retirement date is consistent with Idaho Power's 2015 IRP. In November of 2016, Idaho Power requested, and we approved, the accelerated depreciation of both Valmy units with a corresponding increase in rates.

We adopt Staff's recommendation to acknowledge this action item.

## E. Jim Bridger

With Action Item 4, Idaho Power will plan and negotiate with PacifiCorp and regulators to achieve early retirement dates of year-end 2028 for Jim Bridger Unit 2 and year-end 2032 for Jim Bridger Unit 1.

### *1. Comments*

Staff recommends against acknowledgement of this action item. Staff notes that the company considered a 2023 Jim Bridger retirement date in its 2015 IRP, and that this retirement date was not part of any 2017 IRP analysis. Staff also argues that the company has not demonstrated that its plan to not install SCRs at the facilities in 2021 and 2022 is feasible.

Sierra Club also opposes acknowledgement, and argues that there is a lack of discussion and analysis of the economic status of the Jim Bridger plants, and that operation until 2028 and 2032 without SCR represents an illegal plan under current regulatory requirements. Sierra Club recommends that Idaho Power economically model alternative retirement dates.

ODOE recommends the company take a deeper look at carbon price increases as part of the 2019 IRP. Sierra Club also argues that the company must install SCRs by 2021-2022 or shut the facilities down.

CUB is not certain Idaho Power's chosen Bridger retirement date is the least-cost option, because the differences in the cost of portfolios with earlier retirement dates are not statistically significant.

Idaho Power responds that the chosen retirement dates are consistent with those adopted by the majority owner, PacifiCorp. Idaho Power sees its decision not to install SCRs as consistent with its stated objective to transition away from coal-fired resources. Idaho Power asserts that it will not agree to any operational plan for the facility that is illegal, and that it will work with the appropriate regulators to pursue the action item as outlined in the IRP.

### *2. Discussion*

We decline to acknowledge this action item. We agree with Staff and other stakeholders that Idaho Power has not demonstrated that the retirement dates outlined in the action plan are supported by sufficiently robust or compelling economic analysis. In addition,

although we do not expect Idaho Power to provide information at the level necessary to secure environmental regulatory approvals, we do expect a better demonstration that the company has a viable path forward under currently applicable emission control regulations. The paucity of information on the alternative paths forward is particularly concerning because, under current regulations, installation of SCR is required within the four-year action plan window for this IRP.

**F. Boardman**

Action Item 7 commits Idaho Power to continue to coordinate with Portland General Electric (PGE) to achieve cessation of coal-fired operations at the Boardman coal plant by year-end 2020 and the subsequent decommissioning and demolition of the unit. Staff recommends acknowledgement of this action item, noting that it is consistent with previous Commission orders that allow early closure of the Boardman coal plant.

We acknowledge this action item.

**G. Demand Side Management**

With Action Item 9, Idaho Power proposes to continue the pursuit of cost-effective energy efficiency.

Staff recommends acknowledgement of this action item with conditions that Idaho Power undertake greater studies of residential savings opportunities and update its transmission and distribution system deferral calculations. Stop B2H argues that Idaho Power has achieved less energy efficiency than other utilities, and argues that the company could do significantly more to achieve demand reduction through more investment in energy efficiency. Stop B2H argues that reductions in peak demand brought on through increased energy efficiency could obviate the near-term need for new transmission facilities. Stop B2H contends that Idaho Power should act to deploy advanced metering infrastructure. Sierra Club argues that Idaho Power's energy efficiency potential is understated, because it's planning uses achievable potential, and Idaho Power has historically out-performed those achievable potential estimates.

We acknowledge Action Item 9, and adopt Staff's recommended conditions.

**H. EIM**

Idaho Power has begun participating in the EIM effective April 2018, and the company requests acknowledgement of this activity through Action Item 1.

Staff does not recommend acknowledgement of this action item. Staff states that it is not appropriately included as an action item, and add that the company did not provide an adequate discussion of costs, risks and value of EIM participation. Idaho states that it included EIM participation in its action plan for informational purposes only.

We view this action item as informational only and therefore decline to acknowledge it.

## I. Solar Investigation

Idaho Power's calculated contribution to peak of solar energy has been derived from a settlement in docket UM 1719. That docket required the company to conduct a loss-of-load study, which the company expects to complete in the near term.

Staff recommends acknowledgement of this action item.

We acknowledge this action item.

## J. Stakeholder Engagement in CAA 111(d) Proceedings

With Action Item 10, Idaho Power seeks to develop other ways in which carbon policy risk can be addressed in its IRP process, and plans to stay engaged as an active stakeholder in CAA 111(d) proceedings.

Staff recommends acknowledgement of this action item. Staff recommends that the company develop a report for the next IRP to assess the risks that climate change presents to the company and its customers.

We acknowledge this action item, and request that Idaho Power include as part of its 2019 IRP a report describing the risks to the company and its customers associated with climate change.

## K. Request for Waiver

As part of its final comments, Idaho Power requests a waiver from IRP guideline 3(f). IRP guideline 3(f) requires an annual update on a utility's most recently acknowledged plan on or before the acknowledgement order anniversary date. Idaho Power requests a waiver of this filing requirement because the update will likely be due concurrent with or a month prior to the filing of the 2019 IRP. Staff recommends against granting this waiver in its report, but at the April 10 Regular Public Meeting agreed with Idaho Power on the waiver request with the expectation that Idaho Power would file a report on key information prior to the filing of the 2019 IRP.

We grant Idaho Power's request for a waiver of IRP guideline 3(f), but require that five months prior to the filing of the 2019 IRP, Idaho Power file a report in this docket providing the following information:

- A comprehensive update of the B2H project.
- Information about the planned gas price forecast for the 2019 IRP, and any appropriate updates on the natural gas price forecast.
- A discussion of portfolio modeling options and preferences for the 2019 IRP.
- An update on Jim Bridger environmental control developments and options.
- Updates as requested by Staff.

Several stakeholders commented on Idaho Power's gas price forecast, arguing that it ultimately led to an estimate of forward gas prices that are unreasonably low. We have ordered that Idaho Power provide updated, detailed information on its gas price forecast as part of the 2019 IRP. Idaho Power sufficiently demonstrated that sensitivities associated with its gas price forecast did not affect its portfolio selection, and we do not in this order make a determination as to whether or not the IRP gas price forecast is reasonable.

## V. ORDER

IT IS ORDERED that:

The Integrated Resource Plan filed by Idaho Power is acknowledged as described with the terms of this order and the attached Appendix A.

Made, entered, and effective MAY 23 2018.

**Lisa D. Hardie**
Chair

**Stephen M. Bloom**
Commissioner

**Megan W. Decker**
Commissioner

## Appendix A

Acknowledged Action Items with Modifications

**Action Items 5 and 6** (Boardman to Hemingway)

- 5 – Conduct ongoing permitting, planning studies, and regulatory filings.
- 6 – Conduct preliminary construction activities, acquire long-lead materials, and construct the B2H project.

**Action Item 8** (Gateway West)

- 8 – Conduct ongoing permitting, planning studies, and regulatory filings.

Modifications:

  - Idaho Power should provide additional information to the Commission on an ongoing basis on Energy Gateway's progress, Idaho Power's inclusion of it as a least-cost/least risk portfolio, the status of co-participants and Energy Gateway's role in the IRP.

**Action Items 3 and 11** (North Valmy Units 1 and 2, respectively)

- 3 – Plan and coordinate with NV Energy Idaho Power's exit from coal-fired operations by year-end 2019. Assess import dependability from northern Nevada.
- 11 – Plan and coordinate with NV Energy Idaho Power's exit from coal-fired operations by year-end 2025.

**Action Item 7** (Boardman)

- Continue to coordinate with PGE to achieve cessation of coal-fired operations by year-end 2020 and the subsequent decommission and demolition of the unit.

**Action Item 9** (Energy efficiency)

- Continue the pursuit of cost-effective energy efficiency.

Modifications:

  - In its 2019 IRP Idaho Power will report on future expanded energy efficiency opportunities and improvements to its avoided cost methodology.

**Action Item 2** (Loss-of-load and solar contribution to peak)

- Investigate solar PV contribution to peak and loss-of-load probability analysis.

**Action Item 10** (Carbon emission regulations)

- Continue stakeholder involvement in CAA Section 111(d) proceedings, or alternative regulations affecting carbon emissions.

Modifications:

  - Idaho Power will provide a report as part of its 2019 IRP filing describing the risks to the company and its customers associated with climate change.
