1.0 Introduction

Exhibit L addresses potential impacts of the Nolin Hills Wind Power Project (Project) to protected areas, in compliance with Oregon Administrative Rules (OAR) 345-021-0010 (1)(l) and OAR 345-022-0040. OAR 345-022-0040 requires that the Project address impacts to protected areas, as defined in OAR 345-022-0040(1)(a)-(p). While the Project is not located in a protected area (see Figure L-1), the Energy Facility Siting Council (EFSC) must find that, taking into account mitigation, the design, construction, and operation of the Project are not likely to result in significant adverse impacts to protected areas.

2.0 Analysis Area

The Analysis Area for protected areas includes the area within the Site Boundary, as well as 20 miles from the Site Boundary, as defined in OAR 345-001-0010(58)(e). The Site Boundary is described in detail in Exhibits B and C. The Analysis Area is shown on Figure L-1.

3.0 Protected Areas Inventory – OAR 345-021-0010(1)(l)(A)(B)

OAR 345-021-0010(1)(l) Information about the proposed facility’s impact on protected areas, providing evidence to support a finding by the Council as required by OAR 345-022-0040, including:

OAR 345-021-0010(1)(l)(A) A list of the protected areas within the analysis area showing the distance and direction from the proposed facility and the basis for protection by reference to a specific subsection under OAR 345-022-0040(1);

OAR 345-021-0010(1)(l)(B) A map showing the location of the proposed facility in relation to the protected areas listed in OAR 345-022-0040 located within the analysis area;

Table L-1 provides a description of protected areas as defined under OAR 345-022-0040 along with an inventory of the 18 protected areas within the Analysis Area. The table also indicates the proximity and direction of each protected area relative to the Site Boundary. No protected areas are located within the Site Boundary; however, the Umatilla Electric Cooperative (UEC) transmission line corridor is within approximately 0.2 mile of the southeast corner of one protected area, the Echo Meadows site of the Oregon Trail Area of Critical Environmental Concern (ACEC). The inventory of protected areas was based on review of available Geographic Information System (GIS) data, maps, and other available information for the categories of protected areas listed in OAR 345-022-0040(1)(a)-(p). These protected areas are identified by name on Figure L-1.

<td>State Parks &amp; Waysides OAR 345-022-0040(1)(h)</td>
<td>Hat Rock State Park</td>
<td>12.2 (UEC Cottonwood Route) / 16.6 (Turbine Option 2)</td>
<td>N</td>
<td>Yes</td>
<td>Law Impact. Viewshed analysis indicates limited Project visibility ranging from none to good depending on location/elevation, at a background viewing distance of 12+ miles to the UEC Cottonwood route and 16.6 miles to the closest turbines. Because views toward the Project include existing transmission lines, highways and urbanized areas, the turbines and/or transmission line would not be prominent features in the viewshed, if visible at all. The turbines may be visible only from high ground in the park and would not be visible from developed use areas. The direction of the Project from the park indicates that the turbines are unlikely to feature in views of Hat Rock from common vantage points in the park.</td>
</tr>
<tr>
<td>State Natural Heritage Areas OAR 345-022-0040(1)(i)</td>
<td>Battle Mountain Forest State Scenic Corridor</td>
<td>25.6 (UEC Cottonwood or BPA Stanfield Route) / 16.4 (Turbine Option 1 or 2)</td>
<td>SE</td>
<td>Yes</td>
<td>Negligible Impact. Viewshed analysis indicates at most spotty potential Project visibility, with the Project screened by topography along much of the corridor. A far background viewing distance of over 16 miles to the closest turbines, and views toward the Project that include existing transmission lines, highways, and other developed uses, indicates that the turbines would not be an unusual or prominent feature in the viewshed, if visible at all. Distant, intermittent views of the Project will not compromise the scenic nature of this roadway corridor.</td>
</tr>
<tr>

Given the far background viewing distance of nearly 25 miles and views in context with existing urban/industrial development, highway and an existing wind farm, the turbines would not represent an unusual feature in the viewshed and would not be prominent. No management direction applicable to scenic quality; views of the Project will not interfere with wildlife viewing or compromise the purpose of the Wildlife Area.</td>
</tr>
</tbody>
</table>

BPA = Bonneville Power Administration; N/A = not applicable; UEC = Umatilla Electric Cooperative

1. Indicates potential visibility of any part of wind turbines or 230-kV transmission lines as determined through viewshed analysis. Applicable to both Option 1 and Option 2 turbine layouts; limited substantive differences found.
2. Information on access and use obtained through a personal communication between Thomas Kruger, Tetra Tech and Jeff Rosier, The Nature Conservancy, on March 9, 2015.
4.0 Potential Impacts – OAR 345-021-0010(1)(l)(C)

OAR 3450-021-0010(1)(l)(C) A description of significant potential impacts of the proposed facility, if any, on the protected areas including, but not limited to, potential impacts such as:

(i) Noise resulting from facility construction or operation;

Exhibit X provides an assessment of the existing acoustical environment and anticipated Project sound levels, and the methodology for noise modeling is discussed in detail in that exhibit. As noted in Exhibit X, sound generated by an operating turbine includes both mechanical sound and aerodynamic sound. The dominant noise component for wind farms is aerodynamic sound, which refers to the sound produced by air flow around the turbine blades and the tower. Some noise will also be generated by construction and operation of the 230-kV transmission line.

Based on the results of acoustic modeling, described in detail in Exhibit X and shown on Figures X-2 and X-3, Project turbine noise would attenuate to a level indistinguishable from the background noise level before reaching any of the protected areas. All protected areas are located more than 5 miles from the primary turbine Site Boundary where noise from Project turbine operations would be effectively inaudible.

One protected area, the Echo Meadows site, part of the Oregon Trail ACEC, would be within 0.2 mile of the UEC Cottonwood route Site Boundary. Potential noise impacts from Project construction on the Echo Meadows site are reviewed below, per the January 2018 EFSC Project Order. However, Echo Meadows is not considered a noise sensitive property in Oregon Department of Environmental Quality noise regulations (OAR 340-035-0035), as the site is not used for sleeping or as a school, church, hospital, or public library; in addition, OAR 340-035-0035(5)(g) specifically exempts construction noise. This site was therefore not addressed specifically in Exhibit X; however, the Exhibit X results are still applicable as a basis for evaluation.

The Echo Meadows site includes 320 acres managed by the U.S. Bureau of Land Management (BLM) for preservation and enjoyment of the remaining evidence of the Oregon Trail. Visitors can hike along a paved trail to see nearly one mile of intact wagon ruts and read interpretive signs about the area and its history. This site receives fairly low levels of public use, up to an estimated maximum of about 850 visitors per year (personal communication between Rachael Katz, Tetra Tech, and Brian Woolf, BLM Vale District, Baker Office, August 6, 2018). Although sound from transmission line construction would be audible within the Echo Meadows ACEC site if the UEC Cottonwood route is selected, the short-term, temporary nature of any noise and relatively low use of the area indicates that it would not be considered a significant noise impact. As described in Exhibit X, the construction engineer normally notifies the community via public notice or alternative method of the expected Project construction commencement and duration to help minimize the effects of
construction noise. Overall, Project construction noise would neither interfere with the enjoyment of nor compromise the integrity of the remaining evidence of the Oregon Trail at this site.

(ii) Increased traffic resulting from facility construction or operation;

Potential traffic impacts are addressed in greater detail in Exhibit U, which provides additional information on anticipated traffic volumes, peak construction traffic times, potential delays and temporary road closures, and mitigation measures.

No significant traffic impacts to protected areas are anticipated from the Project. All but four of the protected areas are located north of Interstate 84 (I-84) and would be generally unaffected by Project traffic, which would be concentrated on a small number of roads south of I-84. If the UEC Cottonwood route alternative is chosen, there may be short-term, temporary disruption to traffic where the route would cross I-84; although I-84 is the most heavily used highway in the region surrounding the Project, temporary impacts on access to protected areas are not expected because alternative access routes are available. As detailed in Exhibit U, implementing best management practices (BMPs) will ensure access restrictions to any highways that may serve protected areas will be timed to avoid peak traffic flow. Construction worker traffic will be dispersed on many roads in the area, rather than concentrated on any one road such that access to any protected area north of the interstate could be adversely affected.

South of I-84, the Echo Meadows ACEC site is accessed via a gravel road extending north from Oregon Trail Road (OR-320) that connects the town of Echo and OR-207. If the UEC Cottonwood route alternative is chosen, there may be short-term disruption to traffic on this road and therefore access to the Echo Meadows site while the line is constructed. Any disruption or delay from construction traffic will be temporary and have a minor effect on access to the site. As noted above, use of the Echo Meadows site is relatively low and few users are likely to be affected by construction delays. Construction worker traffic may occur on roads providing access to the other areas south of I-84 as well; however, construction worker traffic will be dispersed on many roads in the area, and the level of worker traffic anticipated will not adversely affect Level of Service on those roads (see Exhibit U).

Project operations will not generate amounts of traffic that could adversely impact protected areas. Operation of the Project is expected to employ from 10 to 15 individuals (see Exhibit U). Therefore, there will be no significant impacts to protected areas due to Project operations traffic.

(iii) Water use during facility construction or operation;

No significant water-related impacts to protected areas are anticipated from the Project. Water used in construction processes will be obtained from nearby locations with adequate water rights, such as the City of Hermiston, or from local landowners with existing, upgraded existing or newly constructed wells permitted under a limited water use license. Therefore, construction of the
Project will not have any adverse effect on the availability of water in any protected areas. Water acquired from such sources near the Project will be transported to construction areas, which represents a component of the traffic impact analysis discussed above and in Exhibit U. No ground or surface water withdrawals will take place for construction of the Project beyond those already permitted for existing water suppliers. During operation, the Project will have minimal water needs that would be fulfilled through the use of an exempt well at the Operations and Maintenance (O&M) Building. Water used during Project construction and operation will not impact water availability or use at protected areas.

(iv) **Wastewater disposal resulting from facility construction or operation;**

Wastewater, in this context, refers to stormwater runoff and to sanitation wastewater; no industrial wastewater would be produced during construction or operation of the Project. Stormwater runoff will be managed on-site according to the BMPs as described in the National Pollutant Discharge Elimination System 1200-C Erosion and Sediment Control Plan (Exhibit I), such that no stormwater will leave the Site Boundary. Therefore, no protected area will be affected by stormwater runoff from the Project.

Sanitation wastewater during construction will be contained in portable toilets, to be provided and maintained by a licensed contractor. Wastewater generated at the O&M Building during Project operation will be handled by an on-site septic system, to be permitted prior to construction. No protected area would be impacted by sanitation wastewater related to the Project. Exhibit O provides additional information on water use, and Exhibit V provides information on wastewater.

(v) **Visual impacts of facility structures or plumes.**

Visual impacts of the Project are primarily related to views of the turbines, and to a lesser degree, other facilities such as the up to 24.9-mile UEC Cottonwood or Bonneville Power Administration Stanfield 230-kV transmission line, internal transmission line, site access roads, O&M Building, and substations. The Project will not generate emissions plumes; therefore, no visual impacts from plumes are expected.

In evaluating the visual impacts, Nolin Hills Wind, LLC (the Applicant) first determined whether the Project would be visible from each protected area using digital bare earth modeling. The analysis began with a zone of visual influence (ZVI) analysis (also known as a viewshed or visibility analysis), using Environmental Systems Research Institute ArcGIS software to identify the areas from which the proposed Project turbines might be visible. To assess the potential visibility of the structures, the ZVI analysis was performed for the Option 1 (Figure L-2) and Option 2 (Figure L-3) turbine layouts assuming 100 percent maximum blade tip height (MBTH). This resulted in an assumed turbine MBTH of 656 feet for the Option 1 (Siemens-Gamesa 6.0 MW) turbines and 496 feet for the Option 2 (General Electric 3.03 MW) turbines.

It should be noted that this “bare-earth” modeling approach, based only on the effects of terrain on visibility, results in a conservative assessment of potential visibility for several reasons. First, in
some areas where the analysis indicates Project structures would be visible, the only visible
components might be the tips of the turbine blades at MBTH, which would likely be noticeable only
at relatively close viewing distances. In addition, the model does not account for the effects of
distance, lighting, weather, and atmospheric attenuation factors that diminish visibility under
actual field conditions. A bare-earth analysis also does not account for the effects of vegetation or
buildings, which can in practice block or screen views in some places. Figures L-2 and L-3 show the
areas from which the turbines will likely be visible, for the turbine Option 1 and turbine Option 2
layouts, respectively; potential visibility (yes/no) is indicated by color-coding on those figures.

Based on the results of the ZVI analysis, there will be potential visibility of some portions of the
Project from 15 of the 18 protected areas in the Analysis Area (see Table L-1). In some of these
protected areas, visibility is characterized as limited, meaning that there will be no views of the
Project from a substantial portion of the protected area.

Potential visibility is but one of several factors that comprise an assessment of visual impact to a
protected area. Other factors to consider include the viewing distance; other natural and manmade
features visible within the view; the likely number and nature of visitors to a protected area; and
whether there is any management direction related to preservation of scenic quality, either within
the protected area or outside of it. Table L-1 provides a summary of the visual impact assessment
for each of the 18 protected areas, for turbine Option 1 and Option 2. There were limited
differences in potential visibility between the two layouts at this level of analysis; see Exhibit R for
additional details regarding differences in the number of turbines visible for scenic areas.

The visual impact is negligible for most protected areas, primarily due to their distance of 6 to 20
miles from the Site Boundary (and over 20 miles for some protected areas to the portion of the Site
Boundary encompassing the wind turbines). Views of the Project turbines for most protected areas
would therefore be at a background viewing distance where the apparent size of the turbines is
greatly diminished, and the turbines would occupy a limited portion of the total viewshed. Many of
the protected areas currently have views of other wind farms, transmission lines, and urban and
industrial development so the Project will not introduce a new or unusual feature to the view. In
addition, potential Project views from some of the protected areas will be partially to fully screened
by vegetation.

Only two of the protected areas will have foreground to middleground views of Project facilities
(from a distance of up to 0.5 mile for foreground, and 0.5 to 5 miles for middleground). These are
the Echo Meadows site of the Oregon Trail ACEC and the Hermiston Agricultural Research Center.
In both cases, the foreground to middleground viewing distance is to the UEC Cottonwood route;
views of Project turbines will be at a background distance of over 6 miles. The following paragraphs
provide a more in-depth visual impact assessment for these protected areas.

4.4.1 Echo Meadows Site, Oregon Trail ACEC

The Echo Meadows site of the Oregon Trail ACEC is located just north of the Site Boundary along
the UEC Cottonwood route that follows Oregon Trail Road (OR-320). It is a 320-acre parcel
managed by the BLM for preservation and enjoyment of the remaining evidence of the Oregon Trail. Visitors can hike along a quarter-mile paved trail to see nearly one mile of intact wagon ruts and read interpretive signs about the area and its history.

The visibility analysis indicates good Project visibility at a foreground viewing distance for the UEC Cottonwood route (0.2 mile), and variable visibility at a background viewing distance (6.4 miles or more) for the turbines. Views from the site will include existing wind turbines, power lines, agricultural structures and multiple center-pivot agricultural irrigation systems. This site receives fairly low levels of public use, estimated at 850 visitors per year (personal communication between Rachael Katz, Tetra Tech, and Brian Woolf, BLM Vale District, Baker Office, August 6, 2018). Visual conditions at the site are managed under the BLM Visual Resource Management (VRM) system; however, it is not classified by the BLM as an important scenic resource (i.e., VRM Class I or II). While the VRM system applies only to actions that occur within the boundaries of the site, the current Resource Management Plan for the area includes management direction that “new uses incompatible with maintaining visual qualities or providing public interpretation will be excluded in a ½ mile corridor,” from the ACEC (BLM 1989). For this reason, it was included for purposes of EFSC analysis as an important scenic resource in Exhibit R. The evaluation in Exhibit R indicates that views of the transmission line, and Project wind turbines at a distance, will not represent a significant change from existing conditions. Therefore, the Project will not interfere with the enjoyment of nor compromise the integrity of the remaining evidence of the Oregon Trail at this site.

4.4.2 Hermiston Agricultural Research Center

The Hermiston Agricultural Research Center is an extension of Oregon State University, providing expertise to serve users of nearly 500,000 acres of irrigated agriculture in Oregon and Washington’s Columbia Basin. Occupying approximately 15 acres just outside the incorporated City of Hermiston, the center conducts research on identification of new crops and production practices, plant breeding and varietal evaluation, as well as stream ecology topics related to salmon (OSU Extension Service 2018).

The visibility analysis indicates potential visibility of the UEC Cottonwood route, at a distance of 4.4 miles, and unlikely visibility of Project turbines. If visible, the turbines will be at a background distance of over 12 miles. As the research center is just outside of a more urbanized area and among industrial agriculture, views of the Project will be in context with existing urban/industrial development, nearby highways, transmission lines, and existing wind turbines. The Project transmission line and wind turbines will not be prominent features in the viewshed. In addition, there is no management or other research direction applicable to scenic quality. Users of the center are engaged in focused activities that do not typically involve viewing scenery, and any views of the Project will not compromise the purpose of the facility. Therefore, the Project will not have a significant visual impact on the Hermiston Agricultural Research Center.

Based on this analysis, the Applicant concludes that there will be no significant visual impacts to protected areas within the Analysis Area. While most of the protected areas will have some level of Project visibility, the Project will be in the distant background except for the two sites assessed.
above, which will not be significantly impacted. Additionally, views from most of the protected areas already include wind turbines, transmission lines, and other industrial infrastructure or urbanized areas, indicating that the Project will not represent a new or unusual feature in the landscape.

(vi) Visual impacts from air emissions resulting from facility construction or operation, including, but not limited to, impacts on Class I Areas as described in OAR 340-204-0050.

Class I areas, as defined in OAR 340-204-0050, consist of the 12 federally-designated Wilderness Areas in Oregon. None of these wilderness areas are located within the Analysis Area. The Project will not generate any emissions plumes, so will not cause any visual impacts from air emissions. Potential visual impacts due to dust created during construction of the Project will be minimized by following BMPs for dust control as detailed in Exhibit O.

4.5 Other Impacts

No other impacts to protected areas are anticipated.

5.0 Conclusions

The Project Analysis Area contains all or part of 18 protected areas. The Applicant analyzed potential impacts to these areas and concluded as follows:

- **Noise.** Based on the results of the noise modeling presented in Exhibit X, operational noise was determined to attenuate to background ambient noise levels at all 18 protected areas within the Analysis Area. Construction noise for the transmission line may be audible in one protected area, nearest the Project; however, construction noise will be short-term and intermittent, and will not be considered a significant impact to any protected area.

- **Traffic.** Project-related traffic will not be sufficiently high, nor located so as to significantly impact any protected areas. Some short-term, intermittent and temporary delays may be experienced by visitors attempting to reach some of the protected areas during Project construction; however, these will be temporary and traffic conditions will return to typical low levels following construction. Therefore, there will be no significant impact to traffic resulting from the operation of the Project.

- **Water.** The Project will not use water in sufficient quantities or from sources that would significantly impact any protected areas. Therefore, there will be no significant impacts to protected areas by water use at the Project.

- **Wastewater.** The Project will manage its very limited quantities of wastewater on-site. Therefore, there will be no significant impacts to protected areas due to wastewater generated at the Project.

- **Visual.** The Project will potentially be visible from 15 of the 18 protected areas in the Analysis Area, for both the Option 1 and Option 2 turbine layouts. However, due to distance
from the Project, existing industrial, urban and agricultural features within view, relatively low user numbers at the nearest sites, and general lack of management direction applicable to scenic quality beyond the boundaries of each protected area, the Project will not have a significant visual impact on any protected area. The visual impact assessment results are not substantively different for the two turbine layout scenarios.

For these reasons, the Council may conclude that the design, construction, and operation of the Project will not result in significant adverse impacts to protected areas and therefore complies with the protected areas standard under OAR 345-022-0040.
