I. INTRODUCTION

On December 10, 2025, Portland General Electric Company (certificate holder), filed Request for Amendment 4 of the Site Certificate for the Biglow Canyon Wind Farm (Request or RFA4).

As described below, the Biglow Canyon Wind Farm (facility) is an operational wind energy facility consisting of 217 wind turbines with a combined peak generating capacity of 450 megawatts (MW) and related or supporting facilities located within an approximately 25,000-acre (39 sq. mile) site in Sherman County.

As described in Section I.D. of this Order, in the Request the certificate holder seeks authorization from the Energy Facility Siting Council (Council) to expand the facility to include a 125 MW solar photovoltaic power generation facility, a 125 MW battery energy storage system, and other related or supporting facilities within a 1,924-acre Solar Micrositing Area within the approved site boundary. The certificate holder would own and operate the solar components as a part of the existing facility with the support of a third-party developer, BIGL bn, LLC, which is in turn, a subsidiary of BrightNight, LLC.

Under OAR 345-027-0375, to issue an amended site certificate, the Council must determine that the preponderance of evidence on the record supports the conclusion that the proposed facility, as amended, complies with all applicable laws and Council standards. Section II.A provides additional information regarding the Council's scope of review. An evaluation of compliance with these standards is provided in Section III.

In accordance with OAR 345-027-0371, the Council issues this Final Order approving the Request, subject to the existing, amended and new site certificate conditions set forth in this Order.

I.A. SITE CERTIFICATE PROCEDURAL HISTORY

On June 30, 2006, the Council issued a Site Certificate for the Biglow Canyon Wind Farm authorizing Orion Sherman County Wind Farm LLC to construct and operate a wind energy facility in Sherman County. The site certificate has since been amended three times.

On November 3, 2006, the Council issued its Final Order on Request for Amendment 1 of the Site Certificate (Final Order on RFA1), approving a transfer of the Site Certificate from the original certificate holder to Portland General Electric Company and issuing the First Amended Site Certificate.

On May 10, 2007, the Council issued its Final Order on Request for Amendment 2 of the Site Certificate (Final Order on RFA2), authorizing the construction of new access road and collector line segments, increasing the area of authorized temporary disturbance during construction, modifying one micrositing corridor, and revising several site certificate conditions in the Second Amended Site Certificate.

On October 31, 2008, the Council issued its Final Order on Request for Amendment 3 of the Site Certificate (Final Order on RFA3), authorizing the expansion of the site to accommodate new access roads, collector lines, temporary crane paths, and extended turbine corridors; authorizing expansion of the facility's Operations & Maintenance (O&M) building; and to remove or amend several conditions in the Third Amended Site Certificate.

In addition to amendments of the site certificate, the certificate holder has submitted seven Change Requests and Amendment Determination Requests for modifications of the facility, such as realignment of turbine corridors, access roads, and collector lines, and expansions of the facility's O&M building. The Department reviewed each of the requests and determined that amendment proceedings were not required.[1]

I.B. EXISTING OPERATIONAL FACILITY DESCRIPTION

The Third Amended Site Certificate authorizes the construction and operation of a wind energy facility and related or supporting facilities at a site in Sherman County. A description of the existing facility is provided below.

I.B.1. Energy Facility

The wind facility consists of 217 wind turbines (76 Vestas V82 1.65 MW and 141 Siemens 2.3 MWs) with a combined nominal nameplate generating capacity of up to 450 megawatts (MW). The Vestas V82 turbines are mounted on tubular steel towers with a height of 262 feet at the hub and an overall height of 397 feet including the turbines blades. The Siemens 2.3 MW turbines are mounted on tubular steel towers with a height of 262 feet at the hub and an overall height of 413 feet including the turbine blades. The wind turbines are located on private land that the certificate holder has leased from the participating landowners.

Construction of the facility began on April 1, 2007, and was completed on August 20, 2010. Construction of the final phase was completed on August 20, 2010.[2]

I.B.2. Related or Supporting Facilities

As related or supporting facilities to the wind energy facility, the site certificate authorizes the construction and operation of the facility components described in Table1, below:

[1] Change Request Determination 1, June 4, 2007; Change Request Determination 2, June 27, 2007; Change Request Determination 3, July 21, 2008; Change Request Determination 4, July 21, 2008; Change Request Determination 5, March 12, 2009; Change Request Determination 6, January 12, 2017; Amendment Determination Request 7, March 14, 2019.

I.C. APPROVED SITE DESCRIPTION

As shown in Figure 1, below, the approved site boundary encompasses approximately 25,000 acres of land in Sherman County, Oregon. The site is located approximately 2.5 miles northeast of the City of Wasco in Townships 1 and 2 North, Ranges 17 and 18 East, Willamette Meridian.

Figure 1: Approved Site Boundary and Vicinity

I.D. REQUESTED AMENDMENT

In RFA4, the certificate holder seeks authorization to construct and operate a 125 MW solar photovoltaic power generation facility; a battery energy storage system (BESS) with up to 500 megawatt-hours (MWh) of discharge capacity; and other related or supporting facilities. The dimensions and specifications for the facility components proposed in RFA4 are summarized in Table 2, below.

Table 2: Solar Facility Component Summary

Component and Design Standard	No.	Unit
Site Boundary		
Solar Micrositing Area[1]	1,924	acres
Solar photovoltaic power generation facility		
Solar Photovoltaic Arrays		
Max. Permanent footprint[1]	1,445	acres
Min. setback from turbines	520	feet
Maximum nominal generating capacity	125	MW
Modules (590w module with monocrystalline solar cells, antireflective coating, metal frame, and factory installed wire connectors)		
Approx. number of modules	264,836	modules
Approx. module dimensions (W x L)	45x90	inches
Tracking System		
Mounting height	5	feet AGL
Avg. Height at full tilt	7.5 to 10	feet AGL
Max. Height at full tilt	15	feet AGL
Steel Posts (hollow, screw, or pile-type)		
Approx. total number	32,621	posts
Avg. Installation Depth	7 to 15	Feet BGL
Power Conversion Stations (Inverter with integrated Step-Up Transformer)		
Approx. total number	33	each
Noise level	92	dBA (Broadband)
Transformer oil-containing capacity (each)	700	gallons
Battery Energy Storage System (Lithium-ion)		
Discharge Capacity	125	MW
Total Storage Capacity	500	MWh
BESS Yard Site Size	5	acres
Battery Containers (of Battery Containers on foundations with integrated inverters, HVAC and fire suppression systems, SCADA		
Max. Number Enclosures / Inverters	153	Units
Approx. Dimensions (HxWxL)	10 x 5.5 x 29	Feet
Noise level during discharge	84	dBA (Broadband)
BESS Transformers	39	each

Table 2: Solar Facility Component Summary

Component and Design Standard	No.	Unit
Transformer Height	10	feet
Transformer Noise level	80	dBA (Broadband)
Transformer oil-containing capacity	700	gallons
Related or Supporting Facility Components		
34.5 kV Collection System		
Collector line length, underground	52	miles
Temporary Impact Corridor	50	feet
Collector Substation		
Includes GSU transformers, switches, breakers, surge arrestors, metering equipment, grounding, and associated control wiring. Certain equipment is enclosed in a control building.		
Site size	4.2	acres
Generator Step-Up Transformers	1	each
Transformer oil-containing capacity	10,000-15,000	gallons
Transformer noise level	106	dBA
Control building dimensions	40x15	Feet
Height of structures	8 to 25	feet
230 kV Transmission Line		
Length	600	feet
Corridor Width (contains all disturbance)	150	Feet
Corridor Area	2	acres
Steep Monopole Support Structures	4	each
Height of Support Poles	80	feet
O&M Facility		
Steel building/prefabricated office structure with adjacent storage enclosures and parking areas, well, septic system.		
Building Dimensions	60 X 12	foot
Site size	3	Acres
400 ft2 Storage Containers	3	Each
Internal Access Roads		
Length (graveled)	10.5	miles
Width	16-20	Feet
Vegetation Management Buffer (both sides)	10	feet
Perimeter Fence		
Total Length	92,400	Feet
Height	8	Feet
Access gates	5	each
Vegetation Management Buffer	20	Feet
Temporary Construction Areas

Component and Design Standard	No.	Unit
Site Size	8.7	Acres
1,000-gal aboveground fuel storage tanks	3	Each

Acronyms: dBA = A-weighted decibels; HVAC = heating, ventilation and air conditioning; kV = kilovolt; OH = overhead; O&M = operations and maintenance; SCADA = supervisory, control and data acquisition

Sources: RFA4, Table 1.

Notes:

1. Solar facility components would permanently occupy up to 1,445 acres within the 1,924-acre Solar Micrositing Area. Area within the perimeter fenceline of the solar facility is considered a permanent impact under the Fish and Wildlife Habitat standard; however, impacts within the perimeter fenceline to soils, vegetation and noxious weeds are not considered permanent under the Soil Protection and Land Use standards and must be minimized and mitigated, as discussed in applicable sections in this order.

The certificate holder also proposes to amend existing Site Certificate Conditions as proposed in Attachment 1 to RFA4. New conditions were proposed where needed to demonstrate that the new facility components would comply with Council standards.[3] Changes to specific conditions related to specific standards are discussed in Section III., *Evaluation of Council Standards*.

I.D.1. Proposed Solar Photovoltaic Power Generation Facilities

As described above, in RFA4, the certificate holder proposes to add a solar photovoltaic power generation facility to the existing facility. The proposed solar components would have a nameplate generating capacity of up to 125 MW. The addition of the proposed solar and battery components would increase the peak generating capacity of the facility, as a whole, to 575 MW.[4]

Solar photovoltaic power generation facilities typically consist of rows of photovoltaic modules mounted on a racking system that is either fixed in place or able to track the sun on one or more axes. The racking system is typically supported by steel posts that are either driven directly into the ground or installed into pre-drilled holes. The low voltage DC output of the photovoltaic modules is collected with a cabling system and transmitted to inverter and transformer units which convert the output of several rows of modules to 35-kV AC power that can be collected via the facility's electrical collector system.

The ground below and surrounding the solar arrays would mostly be vegetated, with gravel where needed for maintenance and access roads or where gravel already exists.[5]

[3] BCWAMD4Doc21-01 RFA Div27 2025-12-10, Section 4.0, 6.0.

[4] BCWAMD4Doc21-01 RFA Div27 2025-12-10, Section 4.0.

[5] BCWAMD4Doc21-01 RFA Div27 2025-12-10, Section 4.1.2.

Individual components proposed in RFA4 are discussed in more detail in the sections that follow.

Modules

Solar modules generate electricity by converting sunlight into direct current (DC) electrical energy through the photovoltaic effect. Modules typically consist of mono or poly-crystalline solar cells, antireflective coating, non-specular, galvanized steel racks, and factory installed wire connectors.[6]

The modules would be connected in series to form strings which are then collected via combiners, cables, and switchboards. The type and number of modules required will be determined at final facility design based on the technology available at that time. For the purposes of the analysis in RFA4, the certificate holder assumed use of N-type monocrystalline solar cells.[7]

Tracking System

As proposed, strings of modules would be mounted on single-axis tracker systems to optimize electricity production by rotating the solar modules to follow the path of the sun throughout the day. Each set of modules is expected to be mounted approximately 5 feet off the ground on a single-axis tracker that rotates 60 degrees to the east and west. At maximum tilt, the top edge of the modules is expected to be 7.5 to 10 feet above ground level with a maximum of 15 feet where topography curves under a row. The tracker system and associated posts will be designed to withstand wind, snow, and seismic loads anticipated at the site.[8]

Posts and Foundations

Each tracker row will be supported by multiple steel posts. Hollow steel sections, screw piles, or pile-type posts may be used. Posts will typically be installed 7 to 15 feet below the ground surface and extend approximately 5 feet above grade. Exterior posts at the end of tracker rows are typically installed to greater depth to withstand inclement weather including high wind conditions. In some soil conditions, concrete grouting may be used as backfill, as required. The total number of posts and foundation installation methods required will be determined during detailed design of the tracker system and future geotechnical investigations. For the purposes of the analysis in RFA4, the certificate holder assumed that all the posts may require pre-drilling and/or concrete grouting as backfill.[9]

[6] BCWAMD4Doc21-01 RFA Div27 2025-12-10, Section 4.1.2.1; BCWAMD4Doc21-02 RFA Exhibit G Materials Analysis 2025-12-10, Section 2.0.

[8] BCWAMD4Doc21-01 RFA Div27 2025-12-10, Section 4.1.2.2.

[9] BCWAMD4Doc21-01 RFA Div27 2025-12-10, Section 4.1.2.3.

Cabling

Cables will be used to collect and aggregate the DC output of multiple tracker rows for transmission to the inverter/inverter step-up transformer units described below. Cabling may be installed underground along tracker rows and aggregated using combiner boxes or installed aboveground in aluminum trays or using harnessing if a trunk bus system is used for aggregation. Either system requires a similar amount of cabling. The cabling system will be selected at final facility design, but for the purposes of analysis, the certificate holder assumed that a centralized trunk bus system will be used. [10]

Power Conversion Stations (PCS)

Integrated inverter and step-up transformer systems called Power Conversion Stations (PCS), or similar systems, would be installed throughout the solar arrays to convert the low-voltage DC output of the modules to 34.5kV AC power that can be transmitted via the electrical collector system. Each transformer would contain approximately 700 gallons of mineral oil. Each PCS would be installed on a concrete pad or pile-supported foundation. [11] The inverter specifications would comply with the applicable requirements and standards of the National Electric Code and Institute of Electrical and Electronics Engineers standards.[12]

I.D.2. Proposed Battery Energy Storage Systems

The certificate holder proposes to construct and operate a 125 MW alternating current (AC)-coupled BESS with up to 500 MWh of storage capacity within the proposed Solar Micrositing Area.[13]

The BESS would consist of modular enclosures that hold lithium-ion batteries, battery management systems, integrated inverters, and fire prevention systems. Cooling units would be placed either on top of or along the side of the enclosures may include separate chiller plants. Each enclosure would be placed on a concrete pad or pile-supported foundation.[14] The enclosures would be manufactured, assembled, and inspected off-site prior to installation. Each enclosure would be installed on a concrete pad or pile foundation. [15]

[15] BCWAMD4Doc21-01 RFA Div27 2025-12-10, Section 4.1.3.3; BCWAMD4Doc21-02 RFA Exhibit G Materials Analysis 2025-12-10, Section 2.1, Table G-2; BCWAMD4Doc21-18 RFA Exhibit X Retirement 2025-12-10, Attachment X-1.

As proposed, the BESS will use lithium-ion (Li-ion) batteries. Li-ion batteries are a type of rechargeable battery where lithium ions, suspended in a gel or liquid electrolyte, move from negative to positive electrodes and back when recharging. A variety of chemistries fall under the "Li-ion" term, each with varying performance, cost, and safety characteristics. The certificate holder will select the specific battery chemistry at final facility design.[16]

A Li-ion battery typically consists of a modular unit containing multiple cells, which are hermetically sealed pouches that serve as primary containment for the electrolyte solution. Each module is generally about the size of a desktop computer and serves as leak-proof secondary containment for the electrolyte. Modules are placed in anchored racks and wired into strings, with each enclosure containing multiple battery strings. Each enclosure may contain up to 10,000 cells.

Lithium-ion batteries and electrolyte are typically considered to be hazardous materials due to their flammability and potential for chemical reaction. Electrolyte can only escape (as vapor) in the unlikely case that a battery module fails, and while the enclosure itself provides additional containment in the event of a module failure, venting may be required in the event of a fire or other emergency. Due to the risks, the U.S. Department of Transportation and U.S. Environmental Protection Agency also require special handling when transporting or disposing of lithium-ion batteries.[17] Specific issues related to the fire-risk posed by lithium-ion batteries are discussed in Section III.N, *Wildfire Prevention and Risk Mitigation*. Other issues related to potential hazards associated with transportation, use, and disposal of lithium-ion batteries are discussed in Section III.D., *Soil Protection*; III.M., *Public Services*; and Section III.O, Waste Minimization.

Initially, the BESS would include up to 153 modular enclosures; however, because battery performance degrades over time the certificate holder has stated that additional batteries and associated equipment would be periodically augmented as needed to maintain the design capacity of the system.[18] The certificate holder estimates that approximately 183 enclosures would be installed at the site over the life of the facility. Any augmentation activities would be subject to the requirements of OAR chapter 345, division 27.

BESS Transformers

The BESS will include up to 39 transformers to increase the output voltage from the inverters integrated into the BESS enclosures (typically 660 volts) to the substation feed voltage (34.5-kilovolt [kV] AC). The transformers are anticipated to be approximately 8 to 10 feet in height and would be installed on a concrete pad or pile-supported foundation.[19] Each transformer

[16] BCWAMD4Doc21-01 RFA Div27 2025-12-10, Section 4.1.3.3.

[17] BCWAMD4Doc21-01 RFA Div27 2025-12-10, Section 4.1.3.3; 4.1.4.1; BCWAMD4Doc21-02 RFA Exhibit G Materials Analysis 2025-12-10, Section 2.2.

[19] BCWAMD4Doc21-01 RFA Div27 2025-12-10, Section 4.1.3.3.

would contain approximately 700 gallons of mineral oil for cooling. Oils needed for maintenance will be delivered by a licensed maintenance contractor on an as-needed basis, and no substantial quantities will be stored on-site.[20]

BESS Yard

The BESS facilities would be located in a fenced, graveled yard, adjacent to the proposed collector substation discussed below. The total area expected to be occupied by the BESS yard is approximately 5 acres.[21]

I.D.3. Other Proposed Related or Supporting Facilities

34.5 kV Electrical Collection System

The output of the ISU and BESS transformers will be aggregated and transmitted to the collector substations via underground 34.5-kV collector lines. In the maximum buildout design scenario proposed in RFA4, approximately 52 miles of collector line would be installed within the solar array fence lines. The collector lines would be buried to a minimum of 3 feet at lateral depth, with junction splice boxes positioned intermittently along the lines for maintenance access.[22]

Collector Substation

A new collector substation would be constructed at the proposed solar array areas to aggregate and convert the 34.5 kV power transmitted through the electrical collection system to 230-kV power that can be transmitted to the grid from the existing Biglow Canyon Substation. [23]

The substation would include a generator step-up (GSU) transformer and other electrical equipment including, but not limited to switches, breakers, surge arrests, metering equipment, grounding, and associated control wiring. Certain equipment, including breakers and transformer equipment, would be enclosed in a control building. [24] The GSU transformers are expected to be a ground-mounted unit constructed on a concrete pad. The transformer would contain between 10,000 and 15,000 gallons of mineral or seed oil for cooling and insulation.[25] To minimize the potential for spills, the GSU transformer would be equipped with a secondary

[20] BCWAMD4Doc21-02 RFA Exhibit G Materials Analysis 2025-12-10, Section 2.2.

[25] Consistent with federal regulations, the oils used in transformers do not contain polychlorinated biphenyls or compounds listed as extremely hazardous by the U.S. Environmental Protection Agency.

containment trap sized to contain the amount of oil inside the transformer plus an additional volume for deluge water and required freeboard.[26]

230-kV Overhead Transmission Line

The facility would include an approximately 1,900-foot long 230 kV overhead transmission line connecting the Collector Substation to the existing Biglow Canyon Substation. The transmission line would be supported by up to three 80-foot steel monopole support structures ranging from 80 to 160 feet tall.[27]

O&M Building

A new O&M facility would be constructed in the proposed solar area. The O&M facility would include a steel building or prefabricated office structure with facilities for staff use; enclosures for storing spare parts and maintenance equipment; and space for parking service staging zone. A vegetation-free, noncombustible space, or gravel surface will be maintained around the O&M buildings. The O&M facility would have a septic system, and a septic system permit would be obtained from the Sherman County Public Health Department.[28] Small quantities of lubricants, degreasers, herbicides, or other chemicals may be stored at the O&M facilities.[29] In addition, up to approximately 4,080 spare modules may be stored at the O&M facilities for replacement over the life of the proposed solar components.[30]

Communications and SCADA System

Controls for the facility components proposed in RFA4 would be integrated into the facility's existing Supervisory Control and Data Acquisition (SCADA) System which allows facility operating parameters, power output, and other variables such as meteorological conditions to be constantly monitored from the facility control rooms and remote locations.[31]

Internal Access Roads

Approximately 10.5 miles of new access roads would be constructed within the proposed Solar Micrositing Area to provide access to the facility components proposed in RFA4. In accordance with Oregon Fire Code Section 503, roads needed for emergency access would be approximately 20 feet wide and designed to meet load requirements for all equipment and

[31] BCWAMD4Doc21-01 RFA Div27 2025-12-10, Section 4.1.3.5.

emergency access needs.[32] Other roads would be approximately 16 feet wide. All roads would have a 10-foot buffer maintained with low-growing, fire resistant vegetation on either side.

Perimeter Fencing, and Gates

Each solar array, with any collocated related or supporting facility components, would be enclosed by seven-foot-tall chain-link perimeter fencing with one foot of razor or barbed wire at the top. Alternatively, wire mesh or similar perimeter fencing up to 8 feet in height may be used. Fences would be constructed and grounded in accordance with NESC Rule 110. Vehicle access to the facility would be provided by lockable vehicle gates. Additional gates may be installed for emergency exit or removal of wildlife.[33]

Temporary Construction Areas

An approximately 8.7 acre, temporary construction area would be used to store supplies and equipment and facilitate the delivery and assembly of materials and equipment during construction. Additional temporary construction areas may be utilized within the Solar Micrositing Area. The areas would consist of a crushed gravel surface that will be removed following construction and revegetated, crushed gravel surface that will remain following construction because that was the pre-existing surface condition, or vegetation that is left in place for which the need to revegetate would be evaluated following construction.[34]

As discussed in Section III.D., nonreportable quantities of herbicides, insecticides, paint, cleaners, solvents, or other chemicals may be used and stored in the temporary construction areas. In addition, up to three aboveground 1,000-gallon fuel tanks may be installed in an area within the temporary construction area that provides secondary containment.[35] The certificate holder represents that concrete for construction of foundations would come directly from licensed suppliers and there would not be an on-site batch plant installed at the temporary construction area.[36]

I.D.4. Proposed Solar Micrositing Area

The facility components proposed in RFA4 would be located within a proposed 1,924-acre Solar Micrositing Area.[37] The Solar Micrositing Area is located approximately 4.8 miles northeast of the City of Wasco. The Council permits final siting flexibility within a micrositing corridor when the certificate holder demonstrates that the entire micrositing corridor has been evaluated and

[32] BCWAMD4Doc21-01 RFA Div27 2025-12-10, Section 4.1.3.6, 4.1.4.2.

[35] BCWAMD4Doc21-01 RFA Div27 2025-12-10, Section 4.1.4.1.
[36] BCWAMD4Doc21-02 RFA Exhibit G Materials Analysis 2025-12-10, Section 2.0.
[37] A micrositing corridor is "a continuous area of land within which construction of facility components may occur, subject to site certificate conditions." OAR 345-001-0010(21).

that the requirements of all applicable standards would be satisfied regardless of the location of facility components within the corridor. For RFA4, the certificate holder conducted desktop and field surveys for the proposed Solar Micrositing Area, which are discussed further in the applicable sections of this order. The existing Biglow Canyon Substation, which will be the point of interconnection for the facility components proposed in RFA4 with the regional transmission grid, is located within the proposed Solar Micrositing Area.[38]

II. COUNCIL REVIEW PROCESS FOR AMENDMENTS

With some exceptions, under Oregon Administrative Rule (OAR) 345-027-0350(4), an amendment to a site certificate is required to design, construct, or operate a facility in a manner different from that described in the site certificate, if the proposed change (1) Could result in a significant adverse impact that the Council has not addressed in an earlier order and the impact affects a resource or interest protected by an applicable law or Council standard; (2) Could impair the certificate holder's ability to comply with a site certificate condition; or (3) Could require a new condition or a change to a condition in the site certificate.[39] The proposed addition of new area to the site, and the construction and operation of the facility components proposed in RFA4 could result in a significant adverse impact that the Council has not addressed in an earlier order and could require new conditions or changes to existing conditions in the site certificate.

II.A. SCOPE OF COUNCIL REVIEW: OAR 345-027-0375

(1) In making a decision to grant or deny issuance of an amended site certificate, the Council must apply the applicable laws and Council standards required under section (2) of this rule and in effect on the dates described in section (3) of this rule.

(2) To issue an amended site certificate, the Council must determine that the preponderance of evidence on the record supports the following conclusions:

(a) The facility as amended complies with all applicable laws and Council standards;

*****

(3) In making findings under section (2) of this rule, the Council must apply the applicable laws and Council standards in effect on the following dates, regardless of when the site certificate was previously approved or amended:

[38] BCWAMD4Doc21-01 RFA Div27 2025-12-10, Section 1.2.

[39] See OAR 345-027-0350(1)-(3) for a list of other changes that require an amendment, including a transfer of ownership, application of later adopted laws, or construction deadline extension.

(a) For the applicable substantive criteria under the Council's land use standard, as described in OAR 345-022-0030, the date the request for amendment was submitted; and

(b) For all other applicable laws and Council standards, the date the Council issues its final order on the request for amendment.[40]

As described in more detail below, in RFA4, the certificate holder seeks authorization to construct and operate a new solar photovoltaic power generation facility, battery energy storage system, and other related or supporting facilities within the existing site.

Under OAR 345-027-0375(2)(a), to issue an amended site certificate the Council must determine that the preponderance of evidence on the record supports the conclusion that the facility, as amended, complies with all applicable laws and Council standards. Because the construction and operation of the new solar photovoltaic power generation facility and other related or supporting facilities would potentially impact all resources protected by Council standards, and because the certificate holder proposes to rely on the technical expertise of a third-party to construct and operate the facility components proposed in RFA4, the Council finds that all laws and Council standards applicable to an original site certificate application are applicable to the review of the facility components proposed in RFA4. This includes all the Council's general standards in OAR chapter 345, division 22, and for the proposed 600-foot 230-kV transmission line segment, Siting Standards for Transmission Lines under OAR 345-024-0090. Because there are no proposed changes to the existing Wind Power Generation Facility, the specific siting standards for wind facilities in OAR chapter 345, division 24 are not applicable to this review.

II.B. AMENDMENT PROCESS

The standard amendment review process, set forth in OAR 345-027-0360 through 345-027-0375, is the default review process and applies to the Council's review of a request for amendment proposing a change described in OAR 345-027-0350(2), (3), (4), or (5).[41] These steps are detailed in Section II.C., *Council Review Process for Amendments*, below.

II.B.1. Request for Amendment

On April 17, 2024, the certificate holder met with the Department for a pre-amendment conference. Pursuant to OAR 345-027-0360, following the pre-amendment conference the certificate holder submitted a written request to use the proposed Solar Micrositing Area boundary as the basis for the study area boundaries under OAR 345-001-0010(35) and property

[40] Permanent Administrative Order EFSC 5-2025, amend filed 10/24/2025, effective 10/24/2025.
[41] OAR 345-027-0351(2).

owner lists under OAR 345-027-0360(1)(f) for the proposed amendment. On May 2, 2024, the Department provided written concurrence authorizing the request.[42]

On April 21, 2025, the certificate holder submitted its preliminary Request for Amendment 4. The Department reviewed the pRFA4 to determine whether or not the request contained sufficient information for the Council to make findings.

On April 29, 2025, the Department issued Public Notice that pRFA4 had been received as required by OAR 345-027-0360(2).[43]

On April 30, 2025, the Department requested recommendations for Applicable Substantive Criteria from the Sherman County Court, as the Special Advisory Group for the facility appointed under ORS 469.480.[44]

On the same date, the Department also requested comments from the tribes identified by the Legislative Commission on Indian Services as potentially affected by the construction and operation of the facility components proposed in RFA4, including the Confederated Tribes of Warm Springs, Burns Paiute Tribe, and Confederated Tribes of the Umatilla Indian Reservation.[45]

The Department also requested comments on pRFA4 from the following reviewing agencies:

- Oregon Department of Agriculture
- Oregon Department of Aviation
- Oregon Department of Fish and Wildlife
- Oregon Department of Forestry
- Oregon Department of Geology and Mineral Industries
- Oregon Department of Land Conservation and Development
- Oregon Department of State Lands
- Oregon Public Utility Commission
- Oregon State Historic Preservation Office
- Oregon Department of Environmental Quality
- Oregon Water Resources Department
- City of Wasco
- Gilliam County[46]

[46] BCWAMD4Doc12-00 pRFA Reviewing Agency Notice 2025-04-30

Copies of all written reviewing agency comments on pRFA4 are included in Attachment B of this Order. Table 3, below, includes a summary of the agency comments and where in the order the comment is addressed, if applicable.

Table 3: Summary of Reviewing Agency Comments on pRFA4

Comment Date	Name/Title	Agency	Summary and Location in Order
5/2/2025	Daniel Hubner, Information Analyst	Oregon Department of Forestry (ODF)	Recommended certificate holder be familiar with and fulfill any & all relevant obligations related to fire prevention under ORS chapter 477. These requirements are discussed further in Section III.N., *Wildfire Prevention and Risk Mitigation*.
5/23/2025	Daniel Evans, Wetland Ecology Specialist	Oregon Department of State Lands (DSL)	Provides requirements for Wetland Delineation and Removal-Fill Permits. These requirements are discussed further in Section IV.B., *Removal-Fill.*
5/29/2025	Jason McClaughry, Eastern Oregon Regional Geologist	Oregon Department of Geology and Mineral Industries (DOGAMI)	As discussed in Section III.C., *Structural Standard,* DOGAMI recommended the preliminary geotechnical report included as Exhibit H, Attachment H-2 contains up-to-date references and data. Noted that seismic hazard model used was from 2018 and recommended updated 2023 version of the National Seismic Hazard Model.
5/29/2025	Georgia Macnab, Sherman County Planning Director	Sherman County Court	The County raised concerns about the potential visual impacts of the facility on non-participating landowners and nearby protected areas, potential for increased wildfire risk, potential impacts on soils, and loss of agricultural land. As discussed in Section III.B., *Organizational Expertise,* the County raised concerns about lack of maintenance at the existing wind facility and asked what actions or procedures would be enforced at the solar facility to prevent similar neglect. The County recommended the developer consult with the county Weed Master for this project. In development of a weed plan. As discussed in Section III.D., *Soil Protection,* this has been included as a

			requirement for finalization of the Comprehensive Solar Revegetation and Soil Management Plan included as Attachment D to this Order. The County recommended use of updated Comprehensive Plans for the Cities of Wasco, Rufus and Moro. This comment was addressed during the completeness review, see Section III.J., *Scenic Resources*. Recommended preliminary RFA underestimated demand on local fire protection services based on heightened risk of fire in County. Noted Sherman County process for declaration of Fire Season. See Section III.M., *Public Services* and Section III.N., *Wildfire Protection and Risk Mitigation,* for discussion of wildfire risk. Provided recommendations for Applicable Substantive Criteria. See Section III.E., *Land Use* for evaluation of these criteria.
5/30/2025	Jessica Wilkes, Deschutes Regional Habitat Biologist	Oregon Department of Fish and Wildlife (ODFW)	As discussed in Section III.H., *Fish and Wildlife Habitat,* ODFW*:* • Recommended laws and rules applicable to facility components proposed in RFA4. • Raised concerns Habitat Mitigation Area initially proposed for in-kind mitigation, this proposal has since been revised. • Discouraged the use of vegetation control via domestic livestock to avoid transmission of zoonotic diseases to mapped bighorn sheep populations. • Provided guidance for habitat categorization, encourages certificate holder to avoid in-tact wetlands, sagebrush steppe, and native grasslands due to limited availability in region. • Encouraged certificate holder to avoid Priority Wildlife Connectivity Areas (PWCAs) located on the edge of the micrositing area and provide sufficient setbacks to facilitate wildlife movement.

			• Recommended the certificate holder work with the county weed department to develop a revegetation and weed control plan. Encouraged retention of native vegetation within project boundaries to the maximum extent possible and use of diverse seed mix with consideration given to pollinator-friendly varieties and shrub reestablishment when revegetating. • Recommended seasonal restrictions on activities to minimize impacts on wintering wildlife, ground nesting birds, and nesting raptors.
7/10/2025	Aspen Kemmerlin, Special Projects Archaeologist	State Historic Preservation Office (SHPO)	As discussed in Section III.K., *Historic, Cultural, and Archaeological Resources*, SHPO: • Concurred with recommended determinations that certain resources are not eligible for listing in the National Register of Historic Places (NRHP) • Recommended 20-meter avoidance buffer for all unevaluated and eligible resources. • Recommended Oregon Qualified Archaeologist be present to monitor ground disturbing activities. • Recommended Inadvertent Discovery Plan be implemented during construction.

1

On June 10, 2025, the Department notified the certificate holder that pRFA4 was incomplete and issued requests for additional information (RAIs) needed to recommend findings and condition on applicable standards to the Council. The Department requested the certificate holder submit the additional information on or before July 11, 2025.[47]

On June 27, 2025, the certificate holder informed the Department that it intended to provide RAI responses in batches and expected to be able to respond to all RAIs by September 19, 2025.[48] The RAI responses were provided on July 18, August 22, and September 19, 2025.[49]

On November 7, 2025, the Department informed the certificate holder that it had completed its review of the RAI responses. Following further discussion with the Department, the certificate holder provided a revised version of pRFA4 which, in addition to incorporating responses to the initial RAIs, removed facility components in a "Southern Solar Area" and a proposed 230-kV overhead transmission line from the proposal.[50] The revised pRFA4 was submitted between November 18 and 22, 2025. While new RAIs were not issued, the Department provided informal comments on the revised pRFA4 which resulted in additional changes.[51]

On December 4, 2025, the Department completed its review of the revised pRFA4 and has determined that the revised pRFA4, along with the RAI responses, generally contains adequate information for the Department to recommend findings and conditions to the Energy Facility Siting Council (Council) on all applicable laws, rules, and Council standards. On December 5, 2025, the Department notified the certificate holder that it considered pRFA4, with the RAI responses, to be complete.[52]

On December 10, 2025, the certificate holder filed a complete RFA4 under OAR 345-027-0363(6) that included all revisions to pRFA4 and all additional information requested by the Department.

On December 16, 2025, the Department issued Public Notice of the Proposed Order and Complete Request for Amendment as required by OAR 345-027-0365 and -0367.

[47] BCWAMD4Doc16-00 pRFA4 Completeness Review Letter and RAI1 2025-06-10

[52] BCWAMD4Doc20-00 Revised pRFA Completeness Determination Letter 2025-12-05. A request for amendment is complete when the Department finds that the certificate holder has submitted information adequate for the Council to make findings or impose conditions on all applicable laws and Council standards. OAR 345-027-0363(5). The completeness letter issued by the Department on December 5, 2025 identified that the proposed order would be issued within 21-days (or December 26, 2025). OAR 345-027-0365(1)

II.B.2. Proposed Order

A Public Notice of the complete RFA4, Proposed Order, and Public Hearing was issued concurrently with this Order and sent via mail or email to individuals identified in OAR 345-027-0367(4).[53] The Public Notice of the Proposed Order initiated a public comment period on RFA4 and the Proposed Order. The comment period includes a new public comment process, based on recently amended rules effective October 24, 2025. The new public comment process included the additional steps and deadlines presented in Table 4 below.

Table 4: Proposed Order Public Comment Process and Deadlines

Process Step	Explanation	Deadline
Comment Period	Opportunity to provide comments with sufficient specificity.[1]	Dec. 16, 2025 – Jan. 30, 2026 (45 days)
Certificate holder/Department responses	Opportunity for certificate holder and Department to identify whether comments were raised with sufficient specificity, and to respond with explanation of deficiencies or additional information, evaluation and proposed conditions.	Feb. 13, 2026
Commenter Reply	Opportunity for commenter to supplement their initial comments or determine whether the issue is resolved by the certificate holder or Department's additional information, evaluation or proposed conditions.	Feb. 27, 2026
Certificate holder/Department sur-replies	Final opportunity for certificate holder and Department to resolve issues raised, based on any clarification or supplemental information provided in commenter replies.	March 6, 2026

Notes:
1. OAR 345-027-0367(7) explains that to provide comments with "sufficient specificity," comments should reference recommended findings of fact, conclusions of law or conditions of approval identified in the Proposed Order to which you object; identify the Council standard or other applicable state and local requirements on which your objection is based; and/or present facts or statements supporting your objection.

II.B.3. Draft Final Order

[53] (A) All persons on the Council's general mailing list as defined in OAR 345-011-0020;
(B) All persons on any special mailing list established for the facility;
(C) The reviewing agencies for the facility, as defined in OAR 345-001-0010(52); and
(D) The property owners on the list provided under OAR 345-027-0360.

On March 13, 2026, the Department issued a draft Final Order. Attachment B-3 to this draft Final Order includes the Department's written evaluation of the public comments on the Proposed Order, including all responses, replies, and sur-replies. All recommended changes to the Proposed Order were described in the evaluation and shown in the draft Final Order in track changes.[54] Of note, the Department recommended the following changes based on the evaluation of public comments, responses, replies, and sur-replies:

- Facility Description (Section I.D.3 and Attachment A) and draft Construction Wildfire Mitigation Plan (Attachment G) were revised to grant additional flexibility in road design requested by certificate holder (Issues GS-06, WF-04)
- Recommended Amended Condition 68 (Section III.C and Attachment A) was revised to grant additional flexibility to conduct ground disturbing activities on steep slopes outside of County Natural Hazard Combining Zone (Issue SS-01).
- The draft Comprehensive Revegetation and Soil Management Plan (Attachment D) and the draft Construction Wildfire Mitigation Plan (Attachment G) were revised to specify that vegetation within the Solar Array Areas must be limited to height of 4 to 8 inches during the dry season (Issues SP-04, WF-09 and WF-10).
- The draft Comprehensive Revegetation and Solar Management Plan (Attachment D) and draft Construction Wildfire Mitigation Plan (Attachment G) were revised to align vegetation management standards to Oregon Fire Code (Issue SP-09) and make other minor changes requested by certificate holder (Issue SP-10)
- The draft Community Investment Plan (Attachment E) was revised to add Oregon Wheat Growers League to Selection Committee (Issue LU-11) and remove Agrivoltaics research from list of "pre-screened" projects (Issue LU-13).
- Recommended Historic, Cultural, and Archaeological Condition 2 (GEN-HC-03) (Section III.K and Attachment A) was revised to require a qualified archaeologist or tribal monitor to be on site during ground disturbing activities (Issue HCA-2)
- Facility Description (Section I.D.3 and Attachment A) and recommended Amended Condition 119 (Section III.P and Attachment A) were revised to accommodate new substation location (Issue TL-01).
- Recommended Water Rights Condition 1 (PRE-WR-01) (Section IV.C and Attachment A) revised to clarify timing of requirement for well log submission (Issue WR-01)
- Recommended Amended Condition 75 (OPR-WR-01) (Section IV.C and Attachment A) revised to clarify applicability of cumulative water use limitations (Issues WR-02 and WR-03).

Concurrent with issuing the draft Final Order, the Department issued a Notice of the draft Final Order which was mailed or emailed to all persons, agencies, or organizations who commented during the public comment period.[55] The Department also posted an announcement of the draft Final Order on the Department's webpage for the facility.

[54] OAR 345-027-0371(1).

[55] OAR 345-027-0371(3).

II.B.4. Final Order

At its meeting in Boardman, Oregon, on March 20, 2026, Council reviewed the draft Final Order and all related comments, responses, replies, sur-replies, and the Department's evaluation of issues raised in comments.[56]

After reviewing, the Council, based on the considerations described in OAR 345-027-0375[57] adopted the Department's draft Final Order as the basis for a Final Order and granted issuance of an amended site certificate, which is effective upon execution by the Council Chair and by the certificate holder.[58]

Judicial review of the Council's final order either granting the amended site certificate is as provided in ORS 469.403(3).[59]

III. EVALUATION OF COUNCIL STANDARDS

As described in Section II.A., *Scope of Council Review*, all laws and Council standards applicable to an original site certificate application for a solar photovoltaic power generation facility, including all of the Council's general standards in OAR chapter 345, division 22 are applicable to the review of all new facility components proposed in RFA4. In addition, the Siting Standards for Transmission Lines under OAR 345-024-0090 are applicable to the proposed 230-kV transmission lines. Because there are no proposed changes to the existing Wind Power Generation Facility, the specific siting standards for wind facilities are not applicable to this review.

Consistent with OAR 345-027-0360(3), for all standards that require evaluation of impacts within an analysis area, the analysis areas are based on the proposed Solar Micrositing Area boundary.

III.A. GENERAL STANDARD OF REVIEW: OAR 345-022-0000

> *(1) To issue a site certificate for a proposed facility or to amend a site certificate, the Council shall determine that the preponderance of evidence on the record supports the following conclusions:*
>
> *(a) The facility complies with the requirements of the Oregon Energy Facility Siting statutes, ORS 469.300 to 469.570 and 469.590 to 469.619, and the standards adopted by the Council pursuant to 469.501 or the overall public benefits of the facility outweigh any adverse effects on a resource or interest*

[56] OAR 345-027-0371(6).
[57] See Section II.A., *Scope of Council Review*, in this Order.
[58] OAR 345-027-0371(7).
[59] OAR 345-027-0371(8).

protected by the applicable standards the facility does not meet as described in section (2);

(b) Except as provided in OAR 345-022-0030 for land use compliance and except for those statutes and rules for which the decision on compliance has been delegated by the federal government to a state agency other than the Council, the facility complies with all other Oregon statutes and administrative rules identified in the project order, as amended, as applicable to the issuance of a site certificate for the proposed facility. If the Council finds that applicable Oregon statutes and rules, other than those involving federally delegated programs, would impose conflicting requirements, the Council shall resolve the conflict consistent with the public interest. In resolving the conflict, the Council cannot waive any applicable state statute.

(2) The Council may issue or amend a site certificate for a facility that does not meet one or more of the applicable standards adopted under ORS 469.501 if the Council determines that the overall public benefits of the facility outweigh any adverse effects on a resource or interest protected by the applicable standards the facility does not meet. The Council shall make this balancing determination only when the applicant has shown that the proposed facility cannot meet applicable Council standards or has shown, to the satisfaction of the Council, that there is no reasonable way to meet the applicable Council standards through mitigation or avoidance of any adverse effects on a protected resource or interest. The applicant has the burden to show that the overall public benefits outweigh any adverse effects on a resource or interest, and the burden increases proportionately with the degree of adverse effects on a resource or interest. The Council shall weigh overall public benefits and any adverse effects on a resource or interest as follows:

*****

(3) Notwithstanding section (2) of this rule, the Council shall not apply the balancing determination to the following standards:

*****

(4) In making determinations regarding compliance with statutes, rules and ordinances normally administered by other agencies or compliance with requirements of the Council statutes if other agencies have special expertise, the Department of Energy shall consult with such other agencies during the notice of intent, site certificate application and site certificate amendment processes. Nothing in these rules is intended to interfere with the state's implementation of programs delegated to it by the federal government.

***[60]

III.A.1. Findings of Fact

OAR 345-022-0000 provides the Council's General Standard of Review and requires the Council to find that a preponderance of evidence on the record supports the conclusion that the facility, with the proposed RFA4 changes, complies with the applicable laws or Council standards that protect a resource or interest that could be affected by the proposed change. The findings of fact and conclusions of law presented in this order demonstrate that RFA4 includes sufficient facts and evidence to satisfy a preponderance of evidence under each standard and applicable rule.

Council Standards for Siting Facilities: OAR Chapter 345, Division 22

OAR Chapter 345, Division 22 establishes the Council's General Standards, which apply to all facilities. As described in Sections III.B to III.O, the Council finds that, subject to compliance with existing and new and amended conditions of approval, the preponderance of the evidence on the record supports the conclusion that the facility, with the changes proposed in RFA4, complies with these standards.

Specific Standards for Siting Facilities: OAR Chapter 345, Division 24

OAR Chapter 345, Division 24, establishes standards that are applicable to specific types of facilities including, as relevant to the proposed solar facility, standards for transmission lines under OAR 345-024-0090.

As described in Section III.P., *Siting Standards for Transmission Lines*, the Council finds that, subject to compliance with existing and new and amended conditions of approval, the preponderance of the evidence on the record supports the conclusion that the facility, with the changes proposed in RFA4, complies with this standard.

While not applicable to the proposed solar facility, OAR 345-024-0010 and 345-024-0015 establish specific standards for wind facilities that were evaluated in previous proceedings for this facility. The Council previously imposed Conditions 37 to 52 and 92 to 98 to ensure the existing wind facility complies with the standards. The Council maintains Conditions 38 to 45, 48 to 52, and 92 to 98 with minor alterations to clarify applicability to the existing facility as shown in Attachment A.

Site Certificate Conditions: OAR Chapter 345, Division 25

[60] OAR 345-022-0040, effective April 2, 2025. The information requirements included in the standard are omitted from the language above, but evaluated within the findings of fact below.

Mandatory Conditions OAR 345-025-0006

OAR 345-025-0006 establishes mandatory conditions that must be included in all site certificates.[61] The Council previously imposed Site Certificate Conditions 101 to 116 to meet the requirements of the rule.

The mandatory conditions required under OAR 345-025-0006(1) prohibit the Council from changing the conditions of a site certificate except as provided under the OAR chapter 345, division 27. The Council imposed this requirement under Site Certificate Condition 101. The Council also imposed Site Certificate Condition 14 providing additional interpretation of the requirements then found under OAR 345-027-0050(2); which are now found under OAR 345-027-0353(1). The Council amends these conditions, as shown below, as applicable to the entire facility, including the facility components proposed in RFA4:

Amended Condition 101 (GEN-GS-01)
~~OAR 345-027-0020(1):~~ The Council shall not change the conditions of the site certificate except as provided for in OAR Chapter 345, Division 27.

Amended Condition 14 (GEN-GS-02)
Notwithstanding OAR 345-027-~~0050(2)~~0353(1), an amendment of the site certificate is required if the proposed change would increase the electrical generation capacity of the facility ~~and~~ or would increase the number of wind turbines or the dimensions of existing wind turbines.
[Final Order on AMD4]

The mandatory condition required under OAR 345-025-0006(2) requires the certificate holder to submit a legal description of the site to the Department within 90 days after beginning operation of the existing wind facility. This condition applies to the facility components proposed in RFA4. The Council amends the condition to clarify its applicability to the facility components proposed in RFA4, following the completion of construction, as shown below:

Amended Condition 102 (OPR-GS-01)
~~OAR 345-027-0020(2):~~ The certificate holder shall submit an updated legal description of the site to the Department of Energy within 90 days after beginning operation of the solar facility. The legal description required by this rule means a description of metes and bounds or a description of the site by reference to a map and geographic data that clearly and specifically identifies the outer boundaries that contain all parts of the facility.
[Final Order on AMD4]

[61] At the time the Third Amended Site Certificate was issued, these requirements were located under OAR 345-027-0020. See Administrative Order EFSC 4-2017.

The mandatory condition required under OAR 345-025-0006(3) requires the certificate holder to design, construct, operate and retire the facility substantially as described in the site certificate and in compliance with applicable state and local rules, laws, and permitting requirements. The draft Fourth Amended Site Certificate includes Table 1, Solar Facility Component Summary, and a description intended to establish the parameters for which the facility components must be designed and constructed (see Attachment A of this Order). The Council previously imposed these requirements under Condition 103. The Council amends the condition, as shown below, as applicable to the entire facility, including the facility components proposed in RFA4:

> **Amended Condition 103 (GEN-GS-03)**
> ~~OAR 345-027-0020(3):~~ The certificate holder shall design, construct, operate and retire the facility:
> a. Substantially as described in the site certificate;
> b. In compliance with the requirements of ORS Chapter 469, applicable Council rules, and applicable state and local laws, rules and ordinances in effect at the time the site certificate is issued; and
> c. In compliance with all applicable permit requirements of other state agencies.
> [Final Order on AMD4]

The Council also previously imposed Condition 13 imposing requirements identical to those required under OAR 345-025-0006(3)(a). The Council deletes this duplicative condition.

The mandatory condition required under OAR 345-025-0006(4) requires the certificate holder to begin and complete construction of the facility by the dates specified in the site certificate.[62]

The certificate holder expects construction of the facility components proposed in RFA4 to last approximately 17 to 19 months. Construction is expected to begin in Q2 of 2026 and continue through Q4 of 2027.[63] Despite its projected timelines, the certificate holder requests the Council establish a new construction commencement deadline that is 3 years from the effective date of the Fourth Amended Site Certificate, and a construction completion deadline 6 years from the effective date of the Fourth Amended Site Certificate.[64]

During the 2025 session, the Oregon Legislature passed House Bill (HB) 3681 requiring that the Council provide a new certificate holder with a minimum of 6-years from the date the Council issues the site certificate to start construction. While the measure, which will take effect January 1, 2026, does not apply directly to this amendment proceeding, the to align with the

[62] The Council previously imposed the mandatory condition under OAR 345-025-0006(4) as Site Certificate Condition 104. Deadlines for the beginning and completion of construction of the wind facility were imposed under Site Certificate Conditions 11 and 12. Because these conditions were already satisfied during the construction of the existing wind facility, the Council deletes these conditions.
[63] BCWAMD4Doc21-01 RFA Div27 2025-12-10, Sections 4.1.2, 4.1.5.
[64] BCWAMD4Doc21-01 RFA Div27 2025-12-10, Sections 4.1.5.1.

direction of HB 3681, the Council establishes a 6 year deadline for the commencement of construction. Consistent with recent decisions, the Council sets the construction completion deadline at three years from the date construction begins.

Deleted Condition 104

~~OAR 345-027-0020(4): The certificate holder shall begin and complete construction of the facility by the dates specified in the site certificate.~~

[Final Order on AMD4]

Deleted Condition 11

~~The certificate holder shall begin construction of the facility by June 30, 2009. Under OAR 345-015-0085(9), a site certificate is effective upon execution by the Council Chair and the applicant. The Council may grant an extension of the deadline to begin construction in accordance with OAR 345-027-0030 or any successor rule in effect at the time the request for extension is submitted.~~

~~[Amendment #2]~~

[Final Order on AMD4]

Deleted Condition 12

~~The certificate holder shall complete construction of the facility by June 30, 2011. Construction is complete when: (1) the facility is substantially complete as defined by the certificate holder's construction contract documents; (2) acceptance testing has been satisfactorily completed; and (3) the energy facility is ready to begin continuous operation consistent with the site certificate. The certificate holder shall promptly notify the Department of the date of completion of construction. The Council may grant an extension of the deadline for completing construction in accordance with OAR 345-027-0030 or any successor rule in effect at the time the request for extension is submitted.~~

~~[Amendment #2]~~

[Final Order on AMD4]

General Standard Condition 1 (CON-GS-01)

The certificate holder must begin construction of the solar facility, phase or component on or before March 27, 2032. Within 7 days of construction commencement, the certificate holder must provide the Department with written verification that it has met the deadline by satisfying applicable preconstruction conditions and completing at least $250,000 work in the Solar Micrositing Area.

[Final Order on AMD4]

General Standard Condition 2 (CON-GS-02)

The certificate holder must complete construction of the facility, phase or component within 3 years of the actual applicable construction commencement date under Condition CON-GS-01. Within 7 days after completing construction, the certificate holder shall provide the Department written verification that it has met the deadline.

[Final Order on AMD4]

With certain exceptions for wind facilities and linear facilities, the mandatory condition required under OAR 345-025-0006(5) prohibits the certificate holder from beginning construction of a facility until it has construction rights for all parts of the site. The Council imposed this requirement for the construction of the wind facility under Site Certificate Condition 105. The Council amends the condition, as specific to the construction of the solar facility, as shown below:

Amended Condition 105 (PRE-GS-01)

~~OAR 345-027-0020(5): Except as necessary for the initial survey or as otherwise allowed for wind energy facilities, transmission lines or pipelines under this section~~, the certificate holder shall not begin construction, as defined in OAR 345-001-0010, of the solar facility, or create a clearing on any part of the ~~site~~solar micrositing area, until the certificate holder has construction rights on all parts of the ~~site~~area. For the purpose of this rule, "construction rights" means the legal right to engage in construction activities. ~~For wind energy facilities, transmission lines or pipelines, if the certificate holder does not have construction rights on all parts of the site, the certificate holder may nevertheless begin construction, as defined in OAR 345-001-0010, or create a clearing on a part of the site if the certificate holder has construction rights on that part of the site and:~~

~~(a) The certificate holder would construct and operate part of the facility on that part of the site even if a change in the planned route of a transmission line or pipeline occurs during the certificate holder's negotiations to acquire construction rights on another part of the site; or~~

~~(b) The certificate holder would construct and operate part of a wind energy facility on that part of the site even if other parts of the facility were modified by amendment of the site certificate or were not built.~~

[Final Order on ASC; Condition 105; AMD3, AMD4l Mandatory Condition OAR 345-025-0006(5)]

The mandatory condition required under OAR 345-025-0006(6) requires the certificate holder to report any significant environmental changes or impacts attributable to the facility to the Department. At the time the Third Amended Site Certificate was issued, this mandatory condition was part of a larger rule for monitoring and mitigation programs under OAR 345-027-0028 (now OAR 345-025-0016), which was imposed as Condition 120. The Council also imposed Site Certificate Condition 106 based on a previous version of the mandatory condition rule. The condition requires any mitigation plans required by the site certificate to be developed in consultation with affected agencies and local governments and approved by the Department (then the Office of Energy) prior to construction or operation of the facility. These two conditions implement, in part, the current requirements of OAR 345-025-0016, and in part, the Council's discretion to delegate review and approval of future actions to the Department under ORS 469.402. Because the requirements to finalize monitoring and mitigation plans are established in individual conditions, Condition 106 is not necessary, and the Council deletes it in its entirety. Similarly, the Council amends Condition 120 to only retain the mandatory condition language, as shown below.

Deleted Condition 106

~~OAR 345-027-0020(6): If the Council requires mitigation based on an affirmative finding under any standards of Division 22 or Division 24 of OAR Chapter 345, the certificate holder shall consult with affected state agencies and local governments designated by the Council and shall develop specific mitigation plans consistent with Council findings under the relevant standards. The certificate holder must submit the mitigation plans to the Office and receive Office approval before beginning construction or, as appropriate, operation of the facility.~~

[Final Order on AMD4]

Amended Condition 120 (GEN-GS-04)

~~OAR 345-027-0028: The following general monitoring conditions apply:~~

~~(a) The certificate holder shall consult with affected state agencies, local governments and tribes and shall develop specific monitoring programs for impacts to resources protected by the standards of Divisions 22 and 24 of OAR Chapter 345 and resources addressed by applicable statutes, administrative rules and local ordinances. The certificate holder must submit the monitoring programs to the Department of Energy and receive Department approval before beginning construction or, as appropriate, operation of the facility.~~

~~(b) The certificate holder shall implement the approved monitoring programs described in section (a) and monitoring programs required by permitting agencies and local governments.~~

~~(c) For each monitoring program described in sections (a) and (b), the certificate holder shall have quality assurance measures approved by the Department before beginning construction or, as appropriate, before beginning commercial operation.~~

~~(d)~~ If the certificate holder becomes aware of a significant environmental change or impact attributable to the facility, the certificate holder shall, as soon as possible, submit a written report to the Department describing the impact on the facility and any affected site certificate conditions.

[Final Order on AMD4]

Additional discussion of the Council's discretion to delegate review of monitoring and mitigation plans to the Department is discussed in the evaluation of OAR 345-025-0016, below.

The mandatory conditions required under OAR 345-025-0006(7) to (9) and (16) require the certificate holder to prevent the development of any conditions on the site that would preclude restoration of the site to a useful, non-hazardous condition to the extent that prevention of such site conditions is within the control of the certificate holder. The Council previously imposed these requirements under Condition 107 to 109. The Council maintains this condition, as applicable to the entire facility:

Amended Condition 107 (GEN-GS-05)

~~OAR 345-027-0020(7):~~ The certificate holder shall prevent the development of any conditions on the site that would preclude restoration of the site to a useful, non-hazardous condition to the extent that prevention of such site conditions is within the control of the certificate holder.

[Final Order on AMD4]

The mandatory condition required under OAR 345-025-0006(8), (9), and (16) are related to the retirement of the facility and are discussed in Section III.G., *Retirement and Financial Assurance*.

OAR 345-025-0006(10) requires the Council to impose all representations in the site certificate application and supporting record the Council deems to be binding commitments made by the applicant or certificate holder as site certificate conditions. The Council previously imposed this requirement as Condition 110; however, the rule is a directive to the Council to impose additional conditions and is not, itself, a condition of approval. Because the rule is implemented through other conditions, including conditions imposed in this Order, the Council deletes Condition 110.

Deleted Condition 110

~~OAR 345-027-0020(10): The Council shall include as conditions in the site certificate all representations in the site certificate application and supporting record the Council deems to be binding commitments made by the applicant.~~

[Final Order on AMD4]

As discussed in Section III.D., *Soil Protection,* the Council maintains Condition 111, which imposes the mandatory condition required under OAR 345-025-0006(11). Similarly, the Council maintains Conditions 112 to 114 which, as discussed in Section III.C., *Structural Standard,* impose the mandatory conditions required under OAR 345-025-0006(12) to (14), and Condition 115, which as discussed under Section III.B., *Organizational Expertise,* imposes the mandatory condition required under OAR 345-025-0006(15).

Site Specific Conditions: OAR 345-025-0010

OAR 345-025-0010 establishes "site specific" conditions Council may impose to address issues specific to certain types of facilities or facility components. As described in Section III.P., *Siting Standards for Transmission Lines,* the Council previously imposed Site Certificate Conditions 118 and 119 in accordance with the site specific conditions for transmission lines under OAR 345-025-0010(4) and (5) and the Council amends these conditions as applicable to the proposed 230-kV transmission line segment.

Monitoring and Mitigation Conditions: OAR 345-025-0016

Under ORS 469.402, if the Council elects to impose conditions on a site certificate or an amended site certificate that requires subsequent review and approval of a future action, the Council may delegate the future review and approval to the Department if, in the Council's discretion, the delegation is warranted under the circumstances of the case.

As a matter of practicality, most site certificate conditions include some form of Department review or approval. Some conditions require that an applicant or certificate holder demonstrate that it has received proper permits or documentation or require a demonstration that facility design adheres to established specifications. In these circumstances, the Department's role in finding compliance with the condition is to verify that the future action described in the condition was completed.

The primary circumstance necessitating the application of ORS 469.402 is associated with the uncertainty of financing, developing, engineering, and designing large energy facilities prior to having secured permits. Typically, a proposal in an ASC or RFA to construct and operate an energy facility is based on a facility design that is approximately 30 percent complete. This stage in the facility design includes design features, dimensions, setbacks and resource avoidance areas that are informed by field surveys and desktop analysis conducted in preparation of an ASC or RFA, but may not be informed by final facility design and capacity needs, final engineering studies, and the selection of manufacturer and component specifications.

The timeline for permitting and construction of large energy facilities also necessitates the application of ORS 469.402. Council-approved energy facilities typically have three years to begin construction after Council approval, and then three years to complete construction. In this timespan, circumstances or conditions at the site change, which is why some conditions or mitigation plans include "truing up" information based on the final facility design which must be reviewed and approved prior to construction. Additionally, in the timeframe between EFSC approval and construction, permits, approvals or filings with other agencies or local governments may expire, which would necessitate resubmission.

Under OAR 345-027-0363(5), a Request for Amendment is complete when the Department finds that the certificate holder has submitted information, including any draft mitigation or monitoring plans, adequate for the Council to make findings or impose conditions on all applicable Council standards, and Council must include conditions that address monitoring and mitigation to ensure compliance with the standards contained in OAR Chapter 345, Division 22 and Division 24, including conditions requiring the future review and approval of the plans. Conditions requiring review and approval of such plans in this Order include:

- Organizational Expertise Condition 1 and 2: Draft Operations and Maintenance Framework Plan
- Soil Protection Conditions 1 and 3: Draft Comprehensive Solar Revegetation and Soil Management Plan
- Land Use Condition 6: Draft Community Investment Plan
- Fish and Wildlife Condition 1: Draft Amended Habitat Mitigation Plan

- Wildfire Prevention and Risk Mitigation Conditions 1 and 3: Construction and Operations Wildfire Mitigation Plans; Wildfire Prevention and Risk Mitigation

In accordance with OAR 345-025-0016, certificate holder developed draft plans in consultation with the Department, state agencies and local governments, and importantly, the Department provided additional edits to the mitigation plans that were presented in redline format to the plans that were attached to the Proposed Order. As discussed in the applicable sections of this order, these mitigation plans are in draft form because they include preliminary assessments, impact totals, criteria for avoidance and minimization of impacts to resources, as well as success criteria to determine short and long term success of the mitigation measures defined in the plans. These plans are in preliminary or draft form because, as discussed above, they are based on the design of the facility as presented in RFA4 and will be updated prior to construction and operation of the final designed facility, which could be several years in the future when it is important to capture circumstances at the site at that time.

Lastly, the mitigation plans include specific monitoring and success criteria to determine short and long term success of the mitigation measures defined in the plans. The mitigation plans listed above have an "amendment clause," which under ORS 469.402, allows Council and the Department, in conjunction with the certificate holder, to amend mitigation plans without a site certificate amendment under OAR 345-027-0350 through OAR 345-027-0375. The circumstances that necessitate the subsequent review and approval of a future action (amendment of a finalized mitigation plan) under ORS 469.402 are associated with ongoing compliance with the monitoring and success criteria. Ongoing compliance with monitoring and success criteria may need to be adapted based on site specific changes, environmental conditions, failing criteria, or new or emerging technologies or practices that could be more effective at mitigating an impact or restoring the site. As described in the amendment clause, the Department is required to notify the Council of all Plan amendments, and the Council retains the authority to approve, reject, or modify any amendment of the Plans agreed to by the Department because the delegation is not absolute.

III.A.2. Conclusions of Law

Based on the foregoing analysis, and subject to compliance with the existing and new and amended site certificate conditions described above, the Council finds that the facility components proposed in RFA4 would comply with the requirements of ORS 469.300 to 469.570 and 469.590 to 469.619, the Council's standards in OAR chapter 345, and all other Oregon statutes and administrative rules applicable to the issuance of an amended site certificate.

III.B. ORGANIZATIONAL EXPERTISE: OAR 345-022-0010

(1) To issue a site certificate, the Council must find that the applicant has the organizational expertise to construct, operate and retire the proposed facility in compliance with Council standards and conditions of the site certificate. To conclude that

the applicant has this expertise, the Council must find that the applicant has demonstrated the ability to design, construct and operate the proposed facility in compliance with site certificate conditions and in a manner that protects public health and safety and has demonstrated the ability to restore the site to a useful, non-hazardous condition. The Council may consider the applicant's experience, the applicant's access to technical expertise and the applicant's past performance in constructing, operating and retiring other facilities, including, but not limited to, the number and severity of regulatory citations issued to the applicant.

(2) The Council may base its findings under section (1) on a rebuttable presumption that an applicant has organizational, managerial and technical expertise, if the applicant has an ISO 9000 or ISO 14000 certified program and proposes to design, construct and operate the facility according to that program.

(3) If the applicant does not itself obtain a state or local government permit or approval for which the Council would ordinarily determine compliance but instead relies on a permit or approval issued to a third party, the Council, to issue a site certificate, must find that the third party has, or has a reasonable likelihood of obtaining, the necessary permit or approval, and that the applicant has, or has a reasonable likelihood of entering into, a contractual or other arrangement with the third party for access to the resource or service secured by that permit or approval.

(4) If the applicant relies on a permit or approval issued to a third party and the third party does not have the necessary permit or approval at the time the Council issues the site certificate, the Council may issue the site certificate subject to the condition that the certificate holder shall not commence construction or operation as appropriate until the third party has obtained the necessary permit or approval and the applicant has a contract or other arrangement for access to the resource or service secured by that permit or approval.

** * * * * [65]*

III.B.1. <u>Findings of Fact</u>

Expertise to Construct and Operate the Facility Components Proposed in RFA4

The certificate holder, Portland General Electric Company (PGE), is an Investor-Owned Utility based in Portland, Oregon. PGE has been in operation since the late 1800s; founded as the Willamette Falls Electric Company in approximately 1888, it filed Articles of Incorporation as the Portland General Electric Company in 1930. PGE has over $15.4 million in total utility plant

[65] OAR 345-022-0040, effective April 2, 2025. The information requirements included in the standard are omitted from the language above but evaluated within the findings of fact below.

assets and $2.8 million in annual retail revenues. PGE currently owns or operates six natural gas facilities (2,102 MW), seven hydro-electric facilities (684 MW), four wind facilities, including the existing facility (1,025 MW), and five small solar facilities (9 MW). It also has approximately 97 MW of operational BESSs at three facilities – Coffee Creek, Constable and Port Westward.

As proposed in RFA4, the certificate holder would construct and operate the solar components in partnership with a participating entity, BIGL bn, LLC (BIGL) under a Build Transfer Agreement.[66] BIGL will be responsible for the selection and management of external vendors, including architects, engineers, major component suppliers, and prime contractors for design, construction and operation of the facility components proposed in RFA4.[67] PGE would own, possess and control the facility components proposed in RFA4 and will remain the sole certificate holder.

The mandatory condition required under OAR 345-025-0006(15) requires the certificate holder to inform the Department of any transfer of ownership before it occurs. The Council previously imposed this requirement as Site Certificate Condition 115. The Council maintains this condition as applicable to both the existing facility and proposed facility components:

> **Amended Condition 115 (GEN-OE-01)**
> ~~OAR 345-027-0020(15):~~ Before any transfer of ownership of the facility or ownership of the site certificate holder, the certificate holder shall inform the Department of the proposed new owners. The requirements of OAR 345-027-01~~1~~400 apply to any transfer of ownership that requires a transfer of the site certificate.
> [OAR 345-027-0020(15); Final Order on ASC; Condition 115; AMD3; AMD4]

BIGL is a project-specific LLC and relies upon the organizational expertise and experience of its parent company, BrightNight, LLC. BrightNight, LLC is based in Florida and has designed and constructed over 6 gigawatts (GWs) of solar and storage projects across the United States.[68] The amendment request did not include any other information or evidence regarding BrightNight, LLCs experience or access to technical and financial resources necessary to design, construct and operate facility components proposed in RFA4 or in their technical ability and experience in selecting and managing qualified vendors and contractors. However, both PGE and BrightNight, LLC commit to having stringent contracting standards to ensure that selected contractors and vendors can adequately support the construction and operation of the facility components proposed in RFA4.[69]

[66] The Council's Organizational Expertise standard requires that information be provided for "participating persons" if those persons are being relied upon by the certificate holder for third party permits, approval, agreements or compliance with the standard.
[67] BCWAMD4Doc21-01 RFA Div27 2025-12-10, Section 5.3.2.
[68] *Id.*
[69] BCWAMD4 pRFA RAI Response Att 1 OE-1 Response 2025-09-19.

The Council previously imposed Site Certificate Condition 1 which required that the selection of construction contractors and vendors for the construction of the existing wind facility was based on demonstrated qualifications and experience. Given that the certificate holder proposes BIGL as a participating entity to oversee vendors and contractors during construction, the Council amends Condition 1 as presented below:

Amended Condition 1 (PRE-OE-01)
~~Before beginning~~ Prior to construction of any component or phase ~~-~~of the solar facility, the certificate holder shall notify the Department of the identity and qualifications of primary vendors; the engineering, procurement and construction ~~(EPC)~~ contractor~~(s)~~ for specific portions of the work; and the identity and qualifications of the individuals that will manage and oversee the selected vendors and contractors. The certificate holder shall select ~~EPC~~ vendors, contractors, and personnel dedicated to managing vendors and contractors that have substantial experience in the design and construction of similar facilities. The certificate holder shall report to the Department any change of major construction contractors or management personnel.
[Final Order on ASC, Condition 1; AMD4]

The Council previously imposed Site Certificate Condition 2, which required the certificate holder to contractually require all construction contractors and subcontractors for the construction of the existing facility to comply with all applicable laws and regulations and with the terms and conditions of the site certificate. The Council amends this condition to make it clear that this requirement will also extend to the contractual relationship between PGE and BIGL during operation of the proposed facility components:

Amended Condition 2 (GEN-OE-02)
The certificate holder shall contractually require all ~~construction~~ contractors and subcontractors involved in the construction or operation of the facility to comply with all applicable laws and regulations and with the terms and conditions of the site certificate. Such contractual provisions shall not operate to relieve the certificate holder of responsibility under the site certificate. Any notice of violation, civil penalties, or other enforcement action issued under the site certificate will be issued to the certificate holder.
[Final Order on ASC, Condition 2; AMD4]

The Council previously imposed Site Certificate Condition 15, which required the certificate holder to obtain all necessary state and local permits or approvals required for construction, operation and retirement of the facility or ensure that its contractors obtain necessary state and local permits or approvals. The Council maintains this Condition as applicable to the existing and proposed facility components.

The Council previously imposed Site Certificate Condition 3, which required a qualified manager responsible for site certificate compliance to be on site during construction of the existing facility.

Amended Condition 3 (CON-OE-01)

During construction of any component or phase of the solar facility, the certificate holder shall ~~have~~:

a. Maintain a~~n~~ qualified on-site ~~assistant~~ construction manager ~~who is qualified~~ with demonstrated experience in environmental compliance;

b. Require the construction manager to ensure compliance with all construction-related site certificate conditions. ~~During operation, the certificate holder shall have a project manager who is qualified in environmental compliance to ensure compliance with all ongoing site certificate conditions.~~

c. ~~The certificate holder shall n~~Notify the Department of the name, telephone number, and e-mail address of the~~se~~ manager~~s and shall keep the Department informed of~~ within 72 hours after any change in this information.

[Final Order on ASC, Condition 3; AMD4]

Similar to the approach for construction, certificate holder proposes to rely on the participating entity, BIGL, for operations and maintenance of the facility components proposed in RFA4, for a minimum of the first 5 years. This includes relying on the participating entity for the selection of vendors and contractors, the management of those vendors and contractors, and operations and maintenance.

The certificate holder represents that it will implement a procurement process for O&M vendors and contractors that prioritizes, over low cost, technical qualifications, safety performance, environmental compliance and relevant experience in utility-scale solar and battery storage facilities. The certificate holder affirmed that its contracts with the participating entity, contractors and subcontractors involved in O&M will require adherence to industry best practices including, at a minimum, the following:

- Implementing detailed preventive maintenance schedules,
- Providing trained and certified personnel,
- Utilizing real-time monitoring and fault detection systems,
- Following all OEM maintenance and service guidelines,
- Maintaining transparent documentation and reporting protocols, including ensuring that 100% of preventative maintenance activities scheduled for any given month are logged prior to monthly reporting,
- Using digital maintenance management systems,
- Conducting regular QA/QC inspections,
- Establishing clear escalation procedures for unplanned outages, and
- Participating in site-specific safety trainings and continuous improvement processes.
- Ability to provide additional resources or solutions if inspection and maintenance activities are not completed on time (performance issue will be identified if 5% or more of inspection/maintenance activities are not completed on time).
- Compliance with all applicable terms and conditions of the Site Certificate, including the O&M Plan.

The above representations are included in a draft framework O&M Plan provided by the certificate as Attachment 5 to RFA4. The O&M Framework Plan provides an outline for contractor selection, performance monitoring, inspection and maintenance activities, emergency preparedness and contractor and staff oversight.

During its review, the Council imposed clear requirements in the framework plan to ensure that actions required for plan finalization and plan implementation are clear, as presented below (as presented in red-line changes presented in Attachment C of this Order).

Table 5: Council Imposed Requirements for O&M Plan Finalization

Summary	Requirement
Action Based Plan	This plan shall be finalized based on actions that can be monitored, tracked and recorded. Detailed narrative or explanation that is not a specific action must be removed. Filter for clarity and remove unnecessary high-level narrative.
Qualifications and Contact Information	<u>In the Plan</u>: Include the contact information for: 1. The individuals that will manage and oversee vendors and contractors. 2. The individuals that will perform design-phase safety reviews. <u>Evidence to Support Plan Review</u>: Certificate must provide to the Department the names, contact information and qualifications of the individuals that will manage and oversee vendors and contractors; and of the individuals that will perform design-phase safety reviews. The Department may request additional information or justification for any individuals where the experience or qualifications are inadequate.
Incorporation of requirements/citations from applicable site certificate conditions, protocols and technical plans	<u>In the Plan</u>: Identify all technical and site management plans applicable to operations and compliance for the solar components; incorporate relevant action items into the plan. At a minimum, the plan must reference and incorporate the Emergency Operations Responses Plan, Operational Spill Prevention Control and Countermeasure Plan, Operational Wildlife Mitigation Plan, and Comprehensive Revegetation, Noxious Weed and Soil Reclamation Plan.
Inspection and maintenance	<u>In the Plan</u>: Identify all inspections and maintenance activities, schedule, protocol and inspection documentation format. <u>Evidence to Support Plan Review</u>:

Table 5: Council Imposed Requirements for O&M Plan Finalization

Summary	Requirement
	Provide documentation to be used to track maintenance and inspection activities. If information is tracked via software, explain, demonstrate and provide available data.
Vendor Performance Scoring System	In the Plan: The final plan shall include details about the certificate holder's vendor performance scoring system. The scoring system must, at a minimum, evaluate vendor response time, corrective maintenance scoring rates and inspection completion.
Operations and Maintenance Budget Tracking and Forecasting	In the Plan: The final plan shall include a section for Operations and Maintenance Budget Tracking, including but not limited to, a summary of the basis for the amount estimated in the initial maintenance reserve, and an explanation of the 5-year life cycle cost modeling. The plan shall include information about the estimated and available budget. Future plan updates must include 5-year life cycle cost modeling results.
Third-Party O&M Budget Audit	In the Plan: The final plan shall include information about annual third-party condition assessments, and ensure that the scope of the assessment includes annual review of vendor/contractor performance against warranty and reliability benchmarks.
Build Transfer Agreement	Evidence to Support Plan Review: Provide a copy of the executed Build Transfer Agreement (BTA). Confidential terms and conditions, unrelated to the roles, responsibilities, oversight and control of the certificate holder, third-parties, site certificate and facility, may be redacted from the executed BTA provided to the Department.
Community Outreach	In the Plan: The final plan shall include names and addresses of participating landowners, and shall detail the schedule, agenda and outreach efforts for annual coordination meetings, to be conducted by the certificate holder. The final plan shall require that the certificate holder invite Sherman County emergency responders and ODOE to each annual meeting. The plan shall require minutes from each meeting. Any issues will be tracked and evaluated to determine the appropriate response.
Reporting	In the Plan: Require reporting to the Department of the following: 1. Within 72-hours of a change in contractors, vendors or contract terms, report the change, the reasons for the change, and the

Table 5: Council Imposed Requirements for O&M Plan Finalization

Summary	Requirement
	identification, contact information and qualifications to the Department. 2. Monthly, report to the Department a summary of performance monitoring results (Vendor Performance Scoring System), including identification of any significant performance issues and corrective actions taken by or for the participating entity, contractor(s) and vendor(s). Certificate holder shall identify corrective actions, including stop work or removal from site, required of the vendor(s) for any performance scores less than 95% percent on-time inspection and repair completion rate. 3. Annually, provide the Department a written report from a third-party contractor evaluating whether the established or forecasted operations and maintenance budget is adequate for site operations. 4. Annually, provide the agenda, attendees list and meeting minutes from the community outreach meetings. Certificate holder shall report any issues identified at the meeting and shall provide their response and/or resolution of the identified issue.

The Council imposes the following conditions to ensure that the O&M Plan is finalized and implemented throughout operations:

Organizational Expertise Condition 1 (PRO-OE-01)
Prior to beginning operation of the solar facility, the certificate holder shall submit a final Operation and Maintenance Plan to the Department for review and approval. The plan must be finalized in accordance with Table 1 of the O&M Framework provided in Attachment C to the Final Order on AMD4.
[Final Order on AMD4]

Organizational Expertise Condition 2 (OPR-OE-02)
During operation of the solar facility, the certificate holder shall require onsite contractors and employees to adhere to the O&M Plan approved under Condition PRO-OE-01. The O&M Plan may be amended, subject to Department review and approval
[Final Order on AMD4]

The existing wind facility has experienced substantial equipment and maintenance issues over the past several years (blade detachment, oil and grease releases, transformer failures, and turbine door malfunctions), which demonstrate a deficiency in the adequacy of the existing site certificate conditions in ensuring systematic oversight of vendor performance, preventive maintenance, and safe, reliable construction and operation.

OAR chapter 345, division 26 includes the ongoing compliance obligations, including requirements for compliance plans, inspections, reporting and notification of incidents that will apply to the facility, as amended, if the Council issues an amended site certificate. Note that, if a site certificate is issued, the certificate holder must also comply with additional construction- and operation-related regulations that may apply to the facility components proposed in RFA4 but that may not be covered by the site certificate, as provided in ORS 469.401(4).

Under OAR 345-026-0048, the certificate holder must develop and implement a plan that verifies compliance with all site certificate terms and conditions and applicable statutes and rules. The Council previously imposed these requirements as Site Certificate Condition 121. The Council amends this condition as applicable to the construction of the solar facility:

Amended Condition 121 (PRE-OE-02)

a. ~~OAR 345-026-0048: Following receipt of the site certificate or an amended site certificate,~~ Prior to construction of any component or phase of the solar facility, the certificate holder shall ~~implement~~ submit, to the Department for review and approval, a plan that verifies compliance with all site certificate terms and conditions and applicable statutes and rules. As a part of the compliance plan, to verify compliance with the requirement to begin construction by the date specified in the site certificate, the certificate holder shall report promptly to the Department of Energy when construction begins. Construction is defined in OAR 345-001-0010. In reporting the beginning of construction, the certificate holder shall describe all work on the site performed before beginning construction, ~~including work performed before the Council issued the site certificate,~~ and shall state the cost of that work. For the purpose of this ~~exhibit~~condition, "work on the site" means any work within ~~a site or corridor~~the solar micrositing area, other than surveying, exploration or other activities to define or characterize the site or corridor.
b. The certificate holder shall ~~document~~ implement the compliance plan prior to and during construction and ~~maintain it~~ make documentation of compliance available for inspection by the Department or the Council upon request.

[Final Order on ASC, Condition 121; AMD3, AMD4]

The Council previously imposed Site Certificate Condition 16, which partially duplicated the reporting requirements of Condition 121, with different timing. The Council deletes this condition.

Deleted Condition 16

~~Before beginning construction, the certificate holder shall notify the Department in advance of any work on the site that does not meet the definition of "construction" in OAR 345-001-0010 or ORS 469.300 and shall provide to the Department a description of the work and evidence that its value is less than $250,000.~~

[Final Order on AMD4]

The Council previously imposed Site Certificate Conditions 122, requiring the certificate holder to comply with the reporting requirements of OAR 345-026-0080 during construction and operation of the existing facility. The Council finds that existing conditions and required reporting do not provide sufficient visibility into the effectiveness of corrective actions taken in response to vendor/contractor performance issues at the site, and amends Condition 122 to require enhanced reporting on progress made toward corrective actions that are applicable to the existing facility and the proposed facility components, once operations begin:

Amended Condition 122 (OPR-OE-01)

~~OAR 345-026-0080: The certificate holder shall report according to the following requirements:~~

~~(a) General reporting obligation for energy facilities under construction or operating:~~

~~(i) Within six months after beginning construction, and every six months thereafter during construction of the energy facility and related or supporting facilities, the certificate holder shall submit a semiannual construction progress report to the Department of Energy. In each construction progress report, the certificate holder shall describe any significant changes to major milestones for construction. The certificate holder shall include such information related to construction as specified in the site certificate. When the reporting date coincides, the certificate holder may include the construction progress report within the annual report described in this Condition.~~

a. By April 30 of each year after beginning construction, the certificate holder shall submit an annual report to the Department ~~addressing the subjects listed in this Condition~~. The Council Secretary and the certificate holder may, by mutual agreement, change the reporting date.

~~(ii) To the extent that information required by this rule is contained in reports the certificate holder submits to other state, federal or local agencies, the certificate holder may submit excerpts from such other reports to satisfy this rule. The Council reserves the right to request full copies of such excerpted reports.~~

b. In the annual report, the certificate holder shall include the following information for the calendar year preceding the date of the report:

   i. Facility Status: An overview of site conditions, the status of facilities under construction, and a summary of the operating experience of facilities that are in operation. In this section of the annual report, the certificate holder shall describe any unusual events, such as earthquakes, extraordinary windstorms, major accidents or the like that occurred during the year and that had a significant adverse impact on the facility.

   ii. Reliability and Efficiency of Power Production: For electric power plants, the plant availability and capacity factors for the reporting year. The certificate holder shall describe any equipment failures or plant breakdowns that had a significant impact on those factors and shall describe any actions taken to prevent recurrence of such problems;

   ~~(iii) Fuel Use: For thermal power plants:~~

   ~~(A) The efficiency with which the power plant converts fuel into electric energy. If the fuel chargeable to power heat rate was evaluated when the facility was sited,~~

~~the certificate holder shall calculate efficiency using the same formula and assumptions, but using actual data; and~~

~~(B) The facility's annual hours of operation by fuel type and, every five years afterbeginning operation, a summary of the annual hours of operation by fuel type as described in OAR 345-024-0590(5).~~

iii. Status of Surety Information: Documentation demonstrating that bonds or letters of credit as described in the site certificate are in full force and effect and will remain in full force and effect for the term of the next reporting period;

iv. Monitoring Report: A list and description of all significant monitoring and mitigation activities performed during the previous year in accordance with site certificate terms and conditions, a summary of the results of those activities, and a discussion of any significant changes to any monitoring or mitigation program, including the reason for any such changes.

v. Compliance Report: A description of all instances of noncompliance with a site certificate condition. For ease of review, the certificate holder shall, in this section of the report, use numbered subparagraphs corresponding to the applicable sections of the site certificate.

vi. Facility Modification Report: A summary of changes to the facility that the certificate holder has determined do not require a site certificate amendment in accordance with OAR 345-027-0350.

~~(viii) Nongenerating Facility Carbon Dioxide Emissions: For nongenerating facilities that emit carbon dioxide, a report of the annual fuel use by fuel type and annual hours of operation of the carbon dioxide emitting equipment as described in OAR 345-024-0630(4).~~

c. To the extent that information required by this condition is contained in reports the certificate holder submits to other state, federal or local agencies, the certificate holder may submit excerpts from such other reports to satisfy this condition. The Council reserves the right to request full copies of such excerpted reports. [Final Order on AMD4]

The Council also adopts a new Condition to incorporate Construction progress reporting requirements established in OAR 345-026-0080(1) but increasing the frequency of reporting from semi-annual to every three months to allow the Department to track more closely the ability of the participating entity to adequate manage site certificate compliance during construction, as presented below:

Organizational Expertise Condition 3 (CON-OE-02)

a. Within three months after beginning construction of any phase or component of the solar facility, and every three months thereafter during construction, the certificate holder shall submit a construction progress report to the Department.

b. Each construction progress report shall describe:

i. Any significant changes to major milestones for construction;

ii. Facility Status: An overview of site conditions, the status of facilities under construction, and a summary of the operating experience of facilities that are in

operation. In this section of the annual report, the certificate holder shall describe any unusual events, such as earthquakes, extraordinary windstorms, major accidents or the like that occurred during the year and that had a significant adverse impact on the facility.

iii. Status of Surety Information: Documentation demonstrating that bonds or letters of credit as described in the site certificate are in full force and effect and will remain in full force and effect for the term of the next reporting period;

iv. Monitoring Report: A list and description of all significant monitoring and mitigation activities performed during the reporting period in accordance with site certificate terms and conditions, a summary of the results of those activities, and a discussion of any significant changes to any monitoring or mitigation program, including the reason for any such changes.

v. Compliance Report: A description of all instances of noncompliance with a site certificate condition. For ease of review, the certificate holder shall, in this section of the report, use numbered subparagraphs corresponding to the applicable sections of the site certificate.

vi. Facility Modification Report: A summary of changes to the facility that the certificate holder has determined do not require a site certificate amendment in accordance with OAR 345-027-0050.

c. When the reporting date coincides, the certificate holder may include the construction progress report within the annual report required under Condition OPR-OE-01.

[Final Order on AMD4]

The Council amends Site Certificate Conditions 4, as presented below:

Amended Condition 4 (GEN-OE-04):

The certificate holder shall, as soon as reasonably possible:

a. ~~Within 72 hours after discovery of conditions or circumstances that may violate the terms or conditions of the site certificate, the certificate holder shall report the conditions or circumstances to the Department.~~ Report incidents or circumstances that may violate the terms or conditions of the site certificate, terms or conditions of any order of the Council, to the Department. In the report to the Department, the certificate holder shall provide all pertinent facts including an estimate of how long the conditions or circumstances existed, how long they are expected to continue before they can be corrected, and whether the conditions or circumstances were discovered as a result of a regularly scheduled compliance audit;

b. Initiate and complete appropriate action to correct the conditions or circumstances and to minimize the possibility of recurrence;

c. Submit a written report within 30 days of discovery to the Department. The report must refer to the language in (d) of the condition and contain:

i. A discussion of the cause of the reported conditions or circumstances;

ii. The date of discovery of the conditions or circumstances by the responsible party;

iii. A description of immediate actions taken to correct the reported conditions or

circumstances;

iv. A description of actions taken or planned to minimize the possibility of recurrence; and

v. For conditions or circumstances that may violate the terms or conditions of a site certificate, an assessment of the impact on the resources considered under the standards of OAR Chapter 345 Divisions 22 and 24 as a result of the reported conditions or circumstances.

d. Upon receipt of the written report in sub(c) of this condition, the Department may review the facility record for incidents or circumstances reported or reportable under sub(a) related to public health and safety, the environment, or other resources protected under Council standards. If these incidences are determined by the Department to impact the adequacy of the facility decommissioning cost, the Department or Council may adjust the contingencies identified in Final Order on RFA4 Attachment I and shall request and receive an updated bond or letter of credit from certificate holder in the adjusted amount.
[Final Order on ASC, Condition 4; AMD4]

The Council also previously imposed Conditions 124 and 125 which impose reporting requirements under OAR chapter 345, Division 26. And Condition 37, which required the certificate holder to report accidents or mechanical failures that could result in public health or safety concerns to the Department. The Council maintains these conditions as applicable to the entire facility under Conditions GEN-OE-05 to GEN-OE-07.

Restoration of the Site to a Useful, Non-hazardous Condition

The certificate holder's ability to restore the site of the facility components proposed in RFA4 to a useful, non-hazardous condition is evaluated in Section III.G., *Retirement and Financial Assurance* of this order, in which the Council finds that the certificate holder has demonstrated an ability to comply with the Retirement and Financial Assurance standard.

Third-party Permits

The certificate holder represents that it would rely upon third-party contractors to obtain any required permits from the Oregon Department of Transportation, and any required state and local building and electrical permits, if required for the construction of the facility components proposed in RFA4.

Under OAR 345-022-0010(4), if the certificate holder relies on a permit or approval issued to a third-party contractor, and the third party does not have the permit, the Council may issue an amended site certificate subject to the condition that the certificate holder shall not commence construction or operation as appropriate until the third party has obtained the necessary permits or approvals and the certificate holder has a contract or other arrangement for access to the resource or service secured by that permit or approval. The Council imposes

Organizational Expertise Condition 4, as presented below, to ensure that the certificate holder's contractors obtain all necessary permits and approvals prior to the beginning of construction

Organizational Expertise Condition 4 (PRE-OE-03):
Prior to construction of any component or phase of the solar facility, the certificate holder shall:
a. Provide the Department a list of federal, state and local permits, including any third-party permits; and a schedule for obtaining identified permits.
b. Once obtained, provide copies of all permits, including third-party permits to the Department.
[Final Order on AMD4]

III.B.2. Conclusions of Law

Based on the foregoing analysis, and subject to compliance with existing and new and amended conditions described above, the Council finds that the certificate holder has the organizational expertise to construct, operate and retire the facility components proposed in RFA4 in compliance with Council standards and conditions of the site certificate.

III.C. STRUCTURAL STANDARD: OAR 345-022-0020

(1) Except for facilities described in sections (2) and (3), to issue a site certificate, the Council must find that:

(a) The applicant, through appropriate site-specific study, has adequately characterized the seismic hazard risk of the site; and

(b) The applicant can design, engineer, and construct the facility to avoid dangers to human safety and the environment presented by seismic hazards affecting the site, as identified in subsection (1)(a);

(c) The applicant, through appropriate site-specific study, has adequately characterized the potential geological and soils hazards of the site and its vicinity that could, in the absence of a seismic event, adversely affect, or be aggravated by, the construction and operation of the proposed facility; and

(d) The applicant can design, engineer and construct the facility to avoid dangers to human safety and the environment presented by the hazards identified in subsection (c).

(2) The Council may not impose the Structural Standard in section (1) to approve or deny an application for an energy facility that would produce power from wind, solar or geothermal energy. However, the Council may, to

the extent it determines appropriate, apply the requirements of section (1) to impose conditions on a site certificate issued for such a facility.

(3) The Council may not impose the Structural Standard in section (1) to deny an application for a special criteria facility under OAR 345-015-0310. However, the Council may, to the extent it determines appropriate, apply the requirements of section (1) to impose conditions on a site certificate issued for such a facility.[70]

*****[71]

III.C.1. Findings of Fact

For the purposes of RFA4, the analysis area for the Structural Standard is the area within the proposed Solar Micrositing Area.[72] The analysis area for historical and potentially active faults and earthquakes also includes a 50-mile buffer around the Solar Micrositing Area.

Based on consultation with DOGAMI, the evaluation of seismic hazards at the site is based, in part, on review of 2021 GIS data available through the Oregon Seismic Hazard Database, release 1 (OSHD-1); use of the United States Geologic Survey (USGS)'s 2023 National Seismic Hazard Model; and DOGAMI's 2023 Landslide Inventory and Risk Reduction of the North and Central Portions of Wasco County. The Luna Butte Fault, as presented in Figure 2 below, is based on review of Oregon's HazVu Statewide Geohazards Viewer.[73]

Seismic and non-seismic hazards at the site are also based on previous geotechnical investigations completed in the vicinity of the site, some of which overlap with the Solar Micrositing Area. These include:

- Initial Geotechnical Investigations Phase I Development, Biglow Canyon Wind Farm, Sherman County, Oregon, prepared by Cornforth Consultants for PGE, October 2006 (Cornforth 2006). This investigation was conducted in large portions of the Solar Micrositing Area.

[70] OAR 345-022-0040, effective April 2, 2025.

[71] The information requirements included in the standard are omitted from the language above, but evaluated within the findings of fact below.

[72] On April 17, 2024, the certificate holder met with the Department for a pre-amendment conference. Under OAR 345-027-0360, rules which have since been amended, following the pre-amendment conference the certificate holder submitted request to use the proposed Solar Micrositing Area boundary as the basis for the study area boundaries under OAR 345-001-0010(35) and property owner lists under OAR 345-027-0360(1)(f) for the proposed amendment. On May 2, 2024, the Department provided written concurrence authorizing the study area boundaries. BCWAMD4Doc01-00 ODOE Concurrence on OAR 345-027-0360(3) Request 2024-05-02.

[73] BCWAMD4Doc21-03 RFA Exhibit H Geological Soil Stability 2025-12-10, Attachment H-1. To inform the evaluation of the Structural standard, OAR 345-022-0020(4)(b) requires that a certificate holder consult with DOGAMI on the appropriate methods and scope of seismic, geology and soil related hazards. On November 1, 2024, the certificate holder consulted with DOGAMI where DOGAMI requested that the above sources be relied upon for the evaluation of seismic hazard risk within the proposed site.

- Report of Geotechnical Exploration, Biglow Canyon Wind Farm Phase I, northwest Wasco, Oregon, prepared by GN Northern, Inc., Consulting Geotechnical Engineers for Blattner & Sons, Inc., April 2007 (GN Northern 2007). This investigation was conducted in large portions of the Solar Micrositing Area.
- Report of Geotechnical Exploration, Biglow Canyon Wind Farm Phase II, northwest Wasco, Oregon, prepared by GN Northern, Inc., Consulting Geotechnical Engineers for Blattner & Sons, Inc., July 2008 (GN Northern 2008a). This investigation was conducted in an area northwest of the Solar Micrositing Area.
- Report of Geotechnical Exploration, Biglow Canyon Wind Farm Phase III, northwest Wasco, Oregon, prepared by GN Northern, Inc., Consulting Geotechnical Engineers for Blattner & Sons, Inc., November 21, 2008 (GN Northern 2008b). This investigation was conducted in areas west and south of the Solar Micrositing Area.

For the facility components proposed in RFA4, Terracon Consultants, Inc. conducted a preliminary geotechnical investigation of the Solar Micrositing Area.[74] The geotechnical investigation included completion of 51 borings to depths of 5 to 51.5 feet below ground surface (bgs), laboratory testing, field electrical resistivity testing, pile load testing, and engineering analysis. Fifteen of the borings (B-26 through B-40) were located within the Solar Micrositing Area with depths of 17 to 21.5 feet bgs. The geotechnical report identified earthwork considerations; predrilling considerations for the solar array; footing construction considerations for solar arrays, substation, and transmission line structures; shallow foundation and mat/slab foundation considerations; earthwork considerations; and considerations for access roads and parking areas.[75] As described below, the final geotechnical investigation will further address and/or adhere to these recommendations (see Amended Condition 66).

Topography and Geology of the Site

In general, the terrain within the proposed Solar Micrositing Area is relatively flat or gently sloping with moderate slopes along some drainages. Areas with steeper slopes are located along Biglow Canyon and associated drainages that bound the northeastern portion of the area. Slopes range from 0 to 35 percent, with an average of 4.9 percent. Elevations range from 727 to 1,561 feet above mean sea level.[76]

The proposed Solar Micrositing Area is located in the western portion of the Columbia Plateau, which is dominated by geologically young lava flows known as the Columbia River basalts. The bedrock underlying the Solar Micrositing Area is mapped as part of the Frenchman Springs Member of the Wanapum Basalt formation. In borings conducted as part of the geotechnical investigations, bedrock was encountered from 2.5 to 60 feet bgs. Highly to completely weathered bedrock was encountered as very thin layers above the more competent bedrock

[74] BCWAMD4Doc21-03 RFA Exhibit H Geological Soil Stability 2025-12-10, Attachment H-2. November 2024 Preliminary Geotechnical Engineering Report.

[75] BCWAMD4Doc21-03 RFA Exhibit H Geological Soil Stability 2025-12-10, Section 5.1.

and as thicker units. The Frenchman Springs Member is approximately 300 to 500 feet thick in the area of the Columbia Plateau.[77]

Surficial deposits generally consist of loess soil, consisting of eolian (wind-deposited) silt to fine sand overlying alluvial soil. Some older "caliche" loess units are semi-consolidated through cementation of calcium carbonate components. The alluvium layer generally consists of unconsolidated silt, sand, and gravel derived from local sources.[78] Soils under the majority of the proposed Solar Micrositing Area have thicknesses greater than 7 feet, but about 20 percent are shallower, with thicknesses of 12 to 40 inches to lithic bedrock.[79] A more detailed discussion of the soils in the micrositing area is provided in Section III.D. *Soil Protection.* Groundwater was only encountered in one test boring during the 2024 geotechnical investigation; however, the water was determined to be seepage from localized perched groundwater and not a static groundwater condition.[80]

Seismic Hazards at the site

Seismic hazards at the site were evaluated using available data from DOGAMI, the Oregon Water Resources Department, USGS, and the Natural Resources Conservation Service (NRCS), as well as previous geotechnical investigations in the proposed Solar Micrositing Area. The seismic-hazard analysis was conducted to identify and characterize potential seismic events, evaluate seismic hazards, and recommend mitigation based on the characteristics of the subsurface soils and design earthquakes.[81] Further information about seismic hazards is provided in the 2024 Preliminary Geotechnical Engineering Report prepared by Terracon. The results of the analysis and geotechnical report are summarized below. The Council finds that the information provided adequately characterizes seismic hazards at the site.

The four sources of earthquakes and seismic activity in Northern Oregon are crustal, intraplate, volcanic, and the Cascadia Subduction Zone. The proposed Solar Micrositing Area is not in a volcano hazard zone. The DOGAMI HazVu map shows the proposed Solar Micrositing Area would expect moderate shaking from a Cascadia Subduction Zone event. Figure 2, below, shows crustal faults within 50 miles of the proposed Solar Micrositing Area. The Quaternary-age faults shown in the figure are considered to be Class A, active faults; Class B faults are considered to be potentially active. There are no faults mapped within the proposed Solar Micrositing Area. The preliminary geotechnical engineering report indicates that the nearest Class A faults include the Luna Butte fault (USGS Fault 579), Columbia Hills Structures (USGS Fault 568), and faults near The Dalles (USGS Fault 580). There are several Class B faults located approximately 12 miles south/southeast of the Solar Micrositing Area around the John Day

[77] BCWAMD4Doc21-03 RFA Exhibit H Geological Soil Stability 2025-12-10, Sections 3.2.2., 3.2.2.1., 3.2.2.2.

River.[82] The figure also shows recorded earthquakes within approximately 50 miles of the Solar Micrositing Area. One earthquake greater than magnitude 4.5 was recorded approximately 40 miles southwest of the Solar Micrositing Area. The nearest earthquake is magnitude 2.5 to 3.5 and is located less than 5 miles north of the Solar Micrositing Area. Earthquakes between magnitude 3 and 4 are generally equivalent to a Modified Mercalli Intensity III, indicating shaking that is "noticeable indoors but may not be recognized as an earthquake."[83]

Potential seismic hazards from a design seismic event for the Solar Components include seismic shaking or ground motion, fault displacement, instability from landslides or subsurface movement, and adverse effects from groundwater or surface water.

[82] BCWAMD4Doc21-03 RFA Exhibit H Geological Soil Stability 2025-12-10, Section 7.2.1; Attachment H-1.

[83] BCWAMD4Doc21-03 RFA Exhibit H Geological Soil Stability 2025-12-10, Section 7.2.2

Figure 2: Historical Seismicity and Potentially Active Faults

Seismic Shaking or Ground Motion

The DOGAMI HazVu Geohazards mapping tool indicates that the general earthquake hazard in the proposed Solar Micrositing Area is rated strong in most of the Solar Micrositing Area with an area rated very strong in a portion of the southwestern Solar Micrositing Area. The International Building Code and Oregon Structural Specialty Code require new construction to be designed for the highest strength earthquake that has a 2 percent probability of exceedance in 50 years, or a 2,475-year return period. The tool considers seismicity and soil conditions to identify design parameters for a site. Based on the soil properties observed at the site and as described in the exploration logs and results, the preliminary geotechnical engineering report recommended that Seismic Site Class D**,** reflecting the presence of loess and stiff soils at depths up to 20 feet at the site, was appropriate. The USGS's 2023 National Seismic Hazard Tool was used to identify this design event earthquake.[84] As shown in Table 6, below, the design event for the proposed Solar Micrositing Area would be a 6.47 magnitude earthquake with a peak ground acceleration of 0.2386 acceleration from gravity at the bedrock surface.[85]

Table 6: Seismic Design Parameters – Maximum Considered Earthquake

Location	Site Class	Earthquake Magnitude[1]	Peak Horizontal Ground Acceleration	Return Period
Solar Micrositing Area	D	6.47	0.2386g	2,475 years
Solar Micrositing Area	D	6.57	0.1089g	475 years

Notes:
1. Mean over all sources.
Source: BCWAMD4Doc21-03 RFA Exhibit H Geological Soil Stability 2025-12-10, Table H-2; USGS 2025.

Fault Rupture

There are no active faults within the proposed Solar Micrositing Area. The Luna Butte Fault is located approximately 4.5 miles south/southeast of the proposed Solar Micrositing Area.[86] There is a mapped unnamed fault located about 0.5 to 1 mile north of the Solar Micrositing Area, but the fault is not considered active within recent geologic time.[87] The preliminary geotechnical engineering report recommended that the risk of surface rupture due to ground

[84] BCWAMD4 pRFA Reviewing Agency Comment DOGAMI 2025-05-29. As requested by DOGAMI in their pRFA comments, the certificate holder relied on the 2023 version of the National Seismic Hazard Model to evaluate the probability of earthquakes occurring on previously unmapped or unrecognized faults within or near the site.
[85] BCWAMD4Doc21-03 RFA Exhibit H Geological Soil Stability 2025-12-10, Section 7.2; 7.2.1, 7.2.2. Probabilistic seismic-hazard disaggregation at 475-year and 2,475-year intervals are shown in Attachments H-3 and H-4, respectively.
[86] BCWAMD4Doc21-03 RFA Exhibit H Geological Soil Stability 2025-12-10, Figure H-2 identifies the location of the Luna Butte Fault based on review of DOGAMI's HazVu data, consistent with the request by DOGAMI during the Nov 2024 consultation. BCWAMD4Doc21-03 RFA Exhibit H Geological Soil Stability 2025-12-10 Attachment H-1.
[87] BCWAMD4Doc21-03 RFA Exhibit H Geological Soil Stability 2025-12-10, Section 7.2.5.

faulting is low based on the available fault information, the depth to bedrock, and the site's proximity to the nearest known faults.[88]

Liquefaction

Liquefaction occurs when saturated and cohesionless soils are subjected to dynamic forces like intense or prolonged ground shaking and temporarily lose their strength and liquefy. There is no evidence of historic liquefaction or alluvial fan deposits within the proposed Solar Micrositing Area. While eolian deposits with a high liquefaction potential are present within the proposed Solar Micrositing Area, because the area has a moderate potential for ground shaking and groundwater is indicated to be at least 100 feet bgs, soil liquefaction is unlikely.[89]

Seismically Induced Landslides

DOGAMI's landslide database does not show any historic landslides within the Solar Micrositing Area or within the immediate vicinity. Landslide hazard within the proposed Solar Micrositing Area is generally low or moderate, but areas of high hazard are present along Biglow Canyon and other steep areas in the northeast portion of Solar Micrositing Area. Landslide hazard is discussed more generally below.[90]

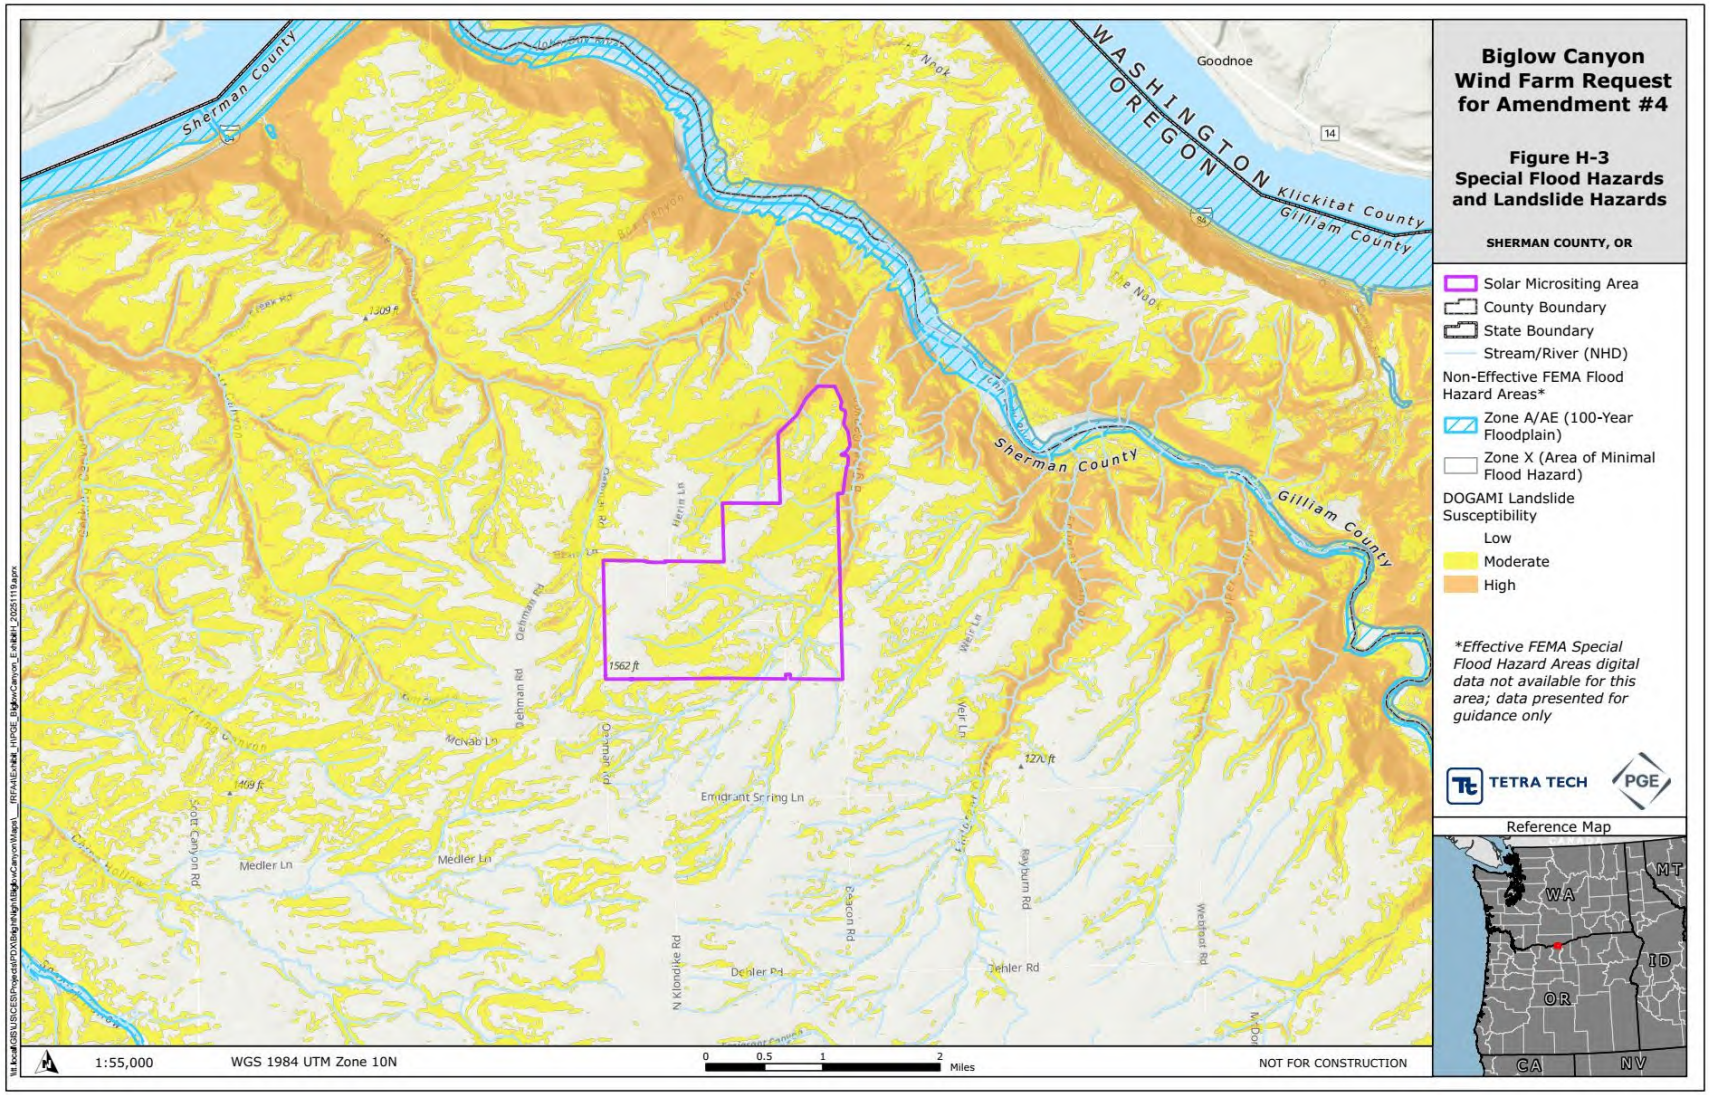
Subsidence

Subsidence is the sudden sinking or gradual downward settling of surface land, often caused by groundwater drawdown, compaction, tectonic movements, mining, or explosive activity. The preliminary geotechnical engineering report indicates that subsidence due to a seismic event is unlikely due to the depth of groundwater at the site and lack of saturated soils. Geologic hazards associated with collapsible soils are discussed more generally below.[91]

<u>Non-seismic Geologic Hazards</u>

Non-seismic geologic hazards that may affect the proposed Solar Micrositing Area include landslides, volcanic eruptions, collapsing soils, and erosion. No soils that are highly susceptible to shrinking and swelling are known to be present in the proposed Solar Micrositing Area.[92]

Landslides



No mapped historic landslides, debris flows, alluvial fans, colluvium or talus are identified in the Oregon Statewide Landslide Database (SLIDO-4.4). As shown in Figure 3, below, most of the

[88] BCWAMD4Doc21-03 RFA Exhibit H Geological Soil Stability 2025-12-10, Attachment H-2.

[90] BCWAMD4Doc21-03 RFA Exhibit H Geological Soil Stability 2025-12-10, Section 7.2.7.
[91] BCWAMD4Doc21-03 RFA Exhibit H Geological Soil Stability 2025-12-10, Section 7.2.8.
[92] BCWAMD4Doc21-03 RFA Exhibit H Geological Soil Stability 2025-12-10, Section 8.5.

proposed Solar Micrositing area is identified as having low or moderate susceptibility for landslides. Areas of high susceptibility for landslides are present along the drainages/canyons along the eastern and northwestern boundaries of the Solar Micrositing Area.[93] As discussed in Section III.E., *Land Use*, some of these areas are also designated as Hazard Areas under Sherman County's Natural Hazard Overlay Zone.

[93] BCWAMD4Doc21-03 RFA Exhibit H Geological Soil Stability 2025-12-10, Section 8.1.

Figure 3: Special Flood Hazards and Landslide Hazards

1

Volcanic Activity

The proposed Solar Micrositing Area is not in a mapped volcano hazard area and no waterways that would be likely to experience pyroclastic flows in the event of an eruption are in the vicinity of the area. The closest volcano to the Solar Micrositing Area is Mount Hood (approximately 50 miles west/southwest). In the event of an eruption, ash fallout could reach the proposed Solar Micrositing Area depending on the size of the eruption and wind conditions. While ash fallout would likely impair facility operations, the presence of the facility components proposed in RFA4 are not expected to aggravate any hazards to public health and safety associated with activity.[94]

Erosion

Erosion can occur when soils are increasingly exposed to wind or water. As discussed in Section III.D. *Soil Protection*, loess soils generally have low resistance to fugitive dust propagation; wind erosion hazard is generally high to very high. The runoff and water erosion hazard is generally moderately low, but some silty soils have higher erosion risk particularly in areas with slopes greater than 15 percent. Erosion potential and available precipitation make site soils especially sensitive to water erosion during winter and spring.[95]

Flooding

As shown in Figure 4, the Federal Emergency Management Agency (FEMA) National Flood Hazard data does not identify flood hazard areas within the proposed Solar Micrositing Area. Seasonal thunderstorms can result in concentrated stormwater runoff and localized flooding in canyons and drainages.[96]

Collapsing Soils

As discussed in Section III.D. *Soil Protection*, soils with low soil compaction resistance, including Lickskillet very stony loam (16D) and Lickskillet-Rock outcrop complex (18E), are present at the site, but are limited to two small soil units along drainages and represent less than one percent of the proposed Solar Micrositing Area.[97]

The preliminary geotechnical engineering report indicates that the semi-stable "honeycomb" structure characteristic of loess soils present throughout the site also makes those soils susceptible to collapse under additional applied load from structures constructed on foundations or saturation due to wetting or ponding. Based on testing, the report estimates that soils could subside by about 1.2 to 3.6 inches if the loess were to remain in place and be

[94] BCWAMD4Doc21-03 RFA Exhibit H Geological Soil Stability 2025-12-10, Section 8.2
[95] BCWAMD4Doc21-03 RFA Exhibit H Geological Soil Stability 2025-12-10, Section 8.3.
[96] BCWAMD4Doc21-03 RFA Exhibit H Geological Soil Stability 2025-12-10, Section 8.4.
[97] BCWAMD4Doc21-04 RFA Exhibit I Soil Conditions 2025-12-10, Section 3.2; Figure I-1.

utilized for support. Collapsible soils were also identified as a geotechnical hazard in the previous Phase I-III geotechnical investigations for the existing wind facility.[98]

Hazard Mitigation

As described above, the site is in a moderate earthquake hazard zone and there is some potential for damaging shaking at the site. The primary risks to human health and safety associated with ground shaking include the failure of electrical equipment and structural failure of O&M buildings or other occupied structures. No other seismic hazards that would require mitigation are likely to occur at the site.

Non-seismic geologic hazards include areas with high potential for landslide, water-erosion, and flooding along Biglow Canyon and other drainages to the north and northeast of the site and the presence throughout the site of loess soils that are susceptible to collapse under loading and saturation. Additional non-structural hazards associated with soil erosion are addressed in Section III.D. *Soil Protection*.

Additional site specific geotechnical work will be completed prior to construction. The scope will be substantially similar to the scope of the 2024 preliminary geotechnical investigation, but will include an increased number of samples and testing locations.[99] To ensure that the additional geotechnical investigation work is completed, consistent with but expanding the scope of the 2024 preliminary geotechnical investigation, the Council amends Condition 66 as follows:

Amended Condition 66 (PRE-SS-01)

a. ~~Before beginning~~ Prior to construction of any component or phase of the solar facility, the certificate holder shall ~~conduct a site-specific~~submit, to the Department for review and comment, a final geotechnical ~~investigation and shall report its findings to the Oregon Department of Geology & Mineral Industries (DOGAMI)~~report that, at a minimum, addresses the recommendations in the in the Preliminary Geotechnical Engineering Report provided as RFA4, Exhibit H, Attachment H-2.

b. The certificate holder shall ~~conduct the geotechnical investigation after consultation with DOGAMI and~~prepare the report in accordance with the Oregon Board of Geologists Examiners ~~guidelines entitled:~~ 2014 Guidelines for Preparing Engineering Geolog~~y~~ic Reports ~~and Site-Specific Seismic Hazard Report~~.

c. The Department may utilize a third-party consultant in the review of the report. The certificate holder shall obtain concurrence from the Department that all comments have been adequately addressed before beginning construction.
[Final Order on ASC, Condition 66; AMD4]

[98] BCWAMD4Doc21-03 RFA Exhibit H Geological Soil Stability 2025-12-10, Section 8.6.

[99] BCWAMD4Doc21-03 RFA Exhibit H Geological Soil Stability 2025-12-10, Section 5.2 includes a description of the scope and schedule of additional geotechnical investigation work that must be done before construction, consistent with OAR 345-022-0020(4)(c).

Existing Conditions 113 and 114 require the certificate holder to notify the Department, the State Building Codes Division, and DOGAMI if the site investigation or other work indicated that geologic conditions at the site were significantly different than those described in the ASC or If specific geologic features are discovered. These conditions correspond to the mandatory conditions currently required under OAR 345-025-0006(13) and (14). The Council readopts these conditions, as applicable to the facility components proposed in RFA4:

Amended Condition 113 (PRE-SS-02):
~~(113) OAR 345-027-0020(13):~~ The certificate holder shall notify the Department, the State Building Codes Division and the Department of Geology and Mineral Industries promptly if ~~site~~ investigations or trenching in the Solar Micrositing Area reveal that conditions in the foundation rocks differ significantly from those described in ~~the application for a site certificate~~ Request for Amendment 4. After the Department receives the notice, the Council may require the certificate holder to consult with the Department of Geology and Mineral Industries and the Building Codes Division and to propose mitigation actions.
[OAR 345-027-0020(13); Final Order on ASC, Condition 113, AMD3, AMD4]

Amended Condition 114 (PRE-SS-03):
~~(114) OAR 345-027-0020(14):~~ The certificate holder shall notify the Department, the State Building Codes Division and the Department of Geology and Mineral Industries promptly if shear zones, artesian aquifers, deformations or clastic dikes are found at or in the vicinity of the ~~site~~ Solar Micrositing Area.
[OAR 345-027-0020(14); Final Order on ASC, Condition 114, AMD3, AMD4]

Existing Site Certificate Condition 67 required the certificate holder to construct all components of the existing facility in compliance with applicable codes and design procedures. In RFA4, the certificate holder represents that the facility components proposed in RFA4 would be designed to withstand the maximum risk-based earthquake in accordance with the latest version of the International Building Code and the Oregon Structural Safety Code in effect at the time of construction. Substation equipment would meet all requirements in the latest version of the Institute of Electrical and Electronics Engineers (IEEE) 693-2018 which establishes standards to ensure equipment installed in substations can withstand expected seismic events. [100] Based on the certificate holder's design and code compliance representations, the Council amends this condition as presented below:

Amended Condition 67 (CON-SS-01):
~~(67)~~ The certificate holder shall design and construct the solar facility in accordance with the applicable requirements ~~set forth by the State of Oregon's~~ of the International Building Code, Oregon Structural Specialty Code, ~~Division~~ and any other applicable codes and design procedures in effect at the time of construction.

[100] BCWAMD4Doc21-03 RFA Exhibit H Geological Soil Stability 2025-12-10, Section 7.2.4, 7.2.9.

[Final Order on ASC, Condition 67, AMD4]

Existing Condition 112 requires the certificate holder to avoid dangers to human safety associated with seismic hazards affecting the site.[101] This condition is applicable to the facility components proposed in RFA4, with additional changes to reflect updates to the mandatory condition:

Amended Condition 112 (CON-SS-02)
~~(112) OAR 345-027-0020(12):~~ The certificate holder must design, engineer and construct the solar facility to avoid dangers to human safety and the environment presented by seismic hazards affecting the site that are expected to result from all maximum probable seismic events. As used in this ~~rule~~ condition "seismic hazard" includes ground shaking, ground failure, landslide, liquefaction triggering and consequences (including flow failure, settlement buoyancy, and lateral spreading), ~~tsunami inundation, fault displacement, and subsidence~~ cyclic softening of clays and silts, fault rupture, directivity effects and soil-structure interaction.
[OAR 345-027-0020(12); Final Order on ASC, Condition 112; AMD4]

The Council finds that subject to the amended conditions above, the certificate holder can design, engineer, and construct the facility components proposed in RFA4 to avoid dangers to human safety and the environment presented by seismic hazards affecting the site.

Significant geologic hazard areas are present along the steep slopes of Biglow Canyon and its tributaries where landslide and erosion hazard are severe and flash flooding can potentially occur. As discussed in Section III.E. *Land Use*, these areas are also identified as being in the County's Natural Hazard Combining Zone, and any development in these areas would need to be addressed through the Conditional Use Review process. The certificate holder represents that areas of steep slope would be avoided or that remedial measures to improve slope stability will be implemented.[102]

The 2024 preliminary geotechnical engineering report concluded that, due to the presence of collapsible soils, soil improvement would likely be required for proposed structures that would be supported by shallow or mat foundations to reduce total and differential settlements from soil subsidence to acceptable levels. Because soils at the site may also be prone to collapse when saturated, site drainage will be designed to prevent ponding or other concentration of surface water flows, especially near structures. Development over existing drainage ways will be avoided wherever possible. If development over existing drainage ways cannot be avoided, rerouting of surface water will also be avoided to not induce potential subsidence.[103]

[101] Mandatory condition OAR 345-025-0006(12).
[102] BCWAMD4Doc21-03 RFA Exhibit H Geological Soil Stability 2025-12-10, Section 7.2.4, 7.2.9, 8.1, 11
[103] BCWAMD4Doc21-03 RFA Exhibit H Geological Soil Stability 2025-12-10, Section 8.6.

Existing Condition 68 requires the certificate holder to design, engineer and construct the facility to avoid dangers to human safety presented by non-seismic hazards. Considering the severe hazard rating, the restrictions in the County Zoning Ordinance, and the potential for harm to waterways and habitat that could result from severe erosion or landslide issues in Biglow Canyon and its tributaries, as well as the certificate holder's representations that these hazard areas can be avoided, the Council amends the condition to prohibit development within Sherman County's Natural Hazard Combining Zone where slopes are greater than 20 percent:

> **Amended Condition 68 (CON-SS-03)**
> ~~(68)~~ The certificate holder shall design, engineer and construct the solar facility to avoid dangers to human safety presented by non-seismic hazards~~. As used in this condition, "non-seismic hazards",~~ including, but not limited to, ~~settlement,~~ landslides, flooding~~, and~~ erosion, and collapsible soils. ~~No g~~Ground disturbing activities are not permitted in areas within Sherman County's Natural Hazard Combining Zone where slopes exceed 20 percent.
> [Final Order on AMD4]

Subject to the amended conditions described above, the Council finds that the certificate holder can design, engineer and construct the facility components proposed in RFA4 to avoid dangers to human safety and the environment presented by the non-seismic geologic hazards identified at the site.

III.C.2. Conclusions of Law

Based on the foregoing analysis, and subject to compliance with the amended site certificate conditions described above, the Council finds the certificate holder has adequately characterized potential seismic and geologic hazards in the Solar Micrositing Area and can design, engineer and construct the facility components proposed in RFA4 to avoid dangers to human safety and the environment presented by those hazards.

III.D. SOIL PROTECTION: OAR 345-022-0022

> *To issue a site certificate, the Council must find that the design, construction and operation of the facility, taking into account mitigation, are not likely to result in a significant adverse impact to soils including, but not limited to, erosion and chemical factors such as salt deposition from cooling towers, land application of liquid effluent, and chemical spills.*
>
> ** * * * * [104]*

[104] OAR 345-022-0040, effective April 2, 2025. The information requirements included in the standard are omitted from the language above, but evaluated within the findings of fact below.

III.D.1. Findings of Fact

The analysis area for the Soil Protection standard is the area within the proposed Solar Micrositing Area. Near-surface soils and their characteristics, within the analysis area, were identified based on data from the NRCS Soil Survey Geographic (SSURGO) Database.[105]

As shown in Figure 4 and Table 7, below, approximately 78.6 percent of the Solar Micrositing Area is comprised of Walla Walla silt loams, which are deep soils made up of loess over fractured basalt. Approximately 20.5 percent of the Solar Micrositing Area is comprised of Anderly silt loams which have a similar formation setting as Walla Walla silt loams but are much shallower soils.[106] These silt loam soils are also productive agricultural soils, and most areas within the proposed Solar Micrositing Area are currently used for dryland wheat cultivation and 25 acres for irrigated row crops.[107] Walla Walla silt loam soils are considered to be especially productive, and where slopes are less than seven percent are considered to be Class II soils under the NRCS's soil capability classification system regardless of whether the soils are irrigated or not. Approximately 40.4 percent of the site is comprised of these high-value farmland (HVF) soils. Other silt loam soils at the site with slopes less than 15 percent are considered Class III soils under the NRCS classification system.[108] Smaller areas where agriculture is not feasible due to the presence of steep slopes, drainages, shallow soils or other factors are not cultivated. Some sections of the analysis area are planted into a grassland mix.

The remaining less than percent of the Solar Micrositing area is comprised of Lickskillet very stony loam, Lickskillet-Rock outcrop complex, and Nansene-Rock outcrop complex. Like other soils at the site, these soils also have moderate to severe erosion potential and the Lickskillet soils also have low resistance to soil compaction.[109] Within the site boundary, these soils are considered Class VII soils under the NRCS classification system and are generally considered to be non-arable.

33D	Walla Walla silt loam, 15 to 35 percent south slopes	Greater than 7 feet	Loess over fractured basalt	81	4.2	0.49	5	Low	Moderate	Severe	Moderate

1. K-factor: Erosion factor K indicates the susceptibility of soil to sheet and rill erosion by water.
2. Wind Erodibility Group: A wind erodibility group (WEG) consists of soils that have similar properties affecting their susceptibility to wind erosion in cultivated areas. The soils assigned to group 1 are the most susceptible to wind erosion, and those assigned to group 8 are the least susceptible.
3. Fugitive Dust Resistance: This rating indicates the vulnerability of soil for eroded soil particles to go into suspension upon disturbance. Rating class terms indicate the extent to which all of the soil features affect the formation of dust. "Low resistance" indicates that the soil has features that are very favorable for the formation of dust. "Moderate resistance" indicates that the soil has features that are favorable for dust formation. "High resistance" indicates that the soil has features that are unfavorable for dust formation.6. Soil Compaction Resistance: This rating indicates the ability of the soil to resist compaction. “High resistance" indicates that the soil has features that are very favorable to resisting compaction. "Moderate resistance" indicates that the soil has features that are favorable to resisting compaction. "Low resistance" indicates that the soil has one or more features that favor the formation of a compacted layer.
4. Hazard for Erosion (Off-road, Off-trail): This rating indicates the hazard of soil loss from off-road and off-trail areas after disturbance activities that expose the soil surface. The ratings are based on slope, soil erosion factor K, and an index of rainfall erosivity (R). A rating of "slight" indicates that erosion is unlikely under ordinary climatic conditions; "moderate" indicates that some erosion is likely and that erosion-control measures may be needed; "severe" indicates that erosion is very likely and that erosion-control measures, including revegetation of bare areas, are advised; and "very severe" indicates that significant erosion is expected, loss of soil productivity and off-site damage are likely, and erosion-control measures are costly and generally impractical.
5. Hazard for Erosion (Road, Trail): The ratings in this interpretation indicate the hazard of soil loss from unsurfaced roads and trails. The ratings are based on soil erosion factor K, slope, and content of rock fragments. A rating of "slight" indicates that little or no erosion is likely; "moderate" indicates that some erosion is likely, that the roads or trails may require occasional maintenance, and that simple erosion-control measures are needed; and "severe" indicates that significant erosion is expected, that the roads or trails require frequent maintenance, and that costly erosion-control measures are needed.

Potential Impacts to Soils

Construction of the facility components proposed in RFA4 has the potential to adversely impact soils within the proposed Solar Micrositing Area. Construction activities including clearing and grubbing vegetation around facility components and conducting earthwork such as grading, excavating, and filling can disturb soils and increase the potential for erosion. The operation of heavy machinery and equipment can compact soils, which can reduce water infiltration and impede plant growth. Vehicle and equipment fueling and maintenance activities, as well as the use and storage of fuels and other chemicals, increase the risk of spills and soil contamination.[110] As described above, sensitive soils are present at the site and may be particularly susceptible to impacts.

The facility components proposed in RFA4 would occupy up to approximately 1,445 acres within the 1,924-acre Solar Micrositing Area. While the entire occupied area is considered to be a permanent disturbance, existing vegetation and/or root systems will be preserved to the extent practicable, however, vegetation will be cleared around solar arrays, temporary construction areas, collector line trenches, the battery energy storage system foundations, collector circuits, substation, construction areas, and new access roads. Significant earthwork will also likely be required for the installation of roads and foundations. The certificate holder expects grading to result in a balanced cut-and-fill quantity of earthwork.[111]

Estimated permanent and temporary disturbance associated with construction and operation of the facility components proposed in RFA4 are presented in Table 8 below.

Table 8: Permanent and Temporary Disturbances in the Solar Micrositing Area

Component	Description	Permanent (Acres)	Temporary (Acres)
Solar Area	Permanent disturbance includes areas and infrastructure inside the perimeter fence for the Solar Arrays. Temporary disturbance is for laydown areas, collector lines, and fence line construction area. Assumes a 6-foot temporary disturbance corridor on the outer side of the fence.	1,445.0	9.6
Gen-Tie Line (230 kV)	Permanent disturbance assumes 2-foot diameter area for poles. Temporary disturbance assumes a 150-foot temporary disturbance corridor (final corridor pending design) plus 20x20-foot pulling/tensioning areas (temporary disturbance).	<0.1	1.8
Road Crossings	Permanent disturbance for road crossings outside the solar area fenceline. Assumes a 16-foot road width, with additional 20-foot width temporary disturbance for construction.	0.3	0.8
Underground Collector Lines	Permanent disturbance includes a total of 52 miles of underground collector lines and a 50-foot-wide impact corridor. These disturbances would be in the solar array fenceline but would be stabilized and revegetated following construction.	315.2	-

[111] BCWAMD4Doc21-04 RFA Exhibit I Soil Conditions 2025-12-10, Section 5.1.1., 6.1.

Table 8: Permanent and Temporary Disturbances in the Solar Micrositing Area

Component	Description	Permanent (Acres)	Temporary (Acres)
BESS	Permanent disturbance includes the area of the BESS yard.	5.0	-
O&M Building	Permanent disturbance for parking area, three 40-foot storage containers for housing spare parts and maintenance equipment, one 40x15-foot control building inside the substation, and one 60x12-foot office structure with electricity, internet, water facilities. Temporary disturbance is for construction of the building and assumes a 25-foot temporary disturbance corridor located around the permanent disturbance footprint.	0.01	0.04
Laydown Area	Temporary disturbance for the laydown area for construction. Additional temporary construction areas may be used within the solar array fencelines.	-	8.7
Substation	Permanent disturbance includes all areas for the proposed collector substation, which is within the solar array fencelines.	4.2	-
	TOTAL	**1,445**	**21**
Source: BCWAMD4Doc21-01 RFA Div27 2025-12-10, Table 2.			

Erosion and Compaction

As described in Table 8 above, the silt loam soils underlying the majority of the site have moderate potential for wind erosion and low fugitive dust resistance, which indicates the need to address potential dust generation by onsite traffic during construction and operation.

The soils also have moderate permeability with slow to rapid runoff potential. The soils are also associated with a moderate to severe hazard for water erosion, depending on slope, particularly when disturbed and unvegetated. At least 55.4 percent of soils within the proposed Solar Micrositing Area have a severe hazard for erosion when used as unsurfaced roads or trails.[112] As shown in Figure 5, these soils are concentrated in the eastern portion of the proposed solar micrositing area around Biglow Canyon and its tributaries. As discussed in Section IV.B. *Removal-Fill Law*, the wetland delineation surveys conducted at the site also identified wetlands and waterways considered to be waters of the state in this portion of the proposed Solar Micrositing Area.

As shown on Figure 5, below, less than one percent of the soils are identified as having low compaction resistance in the NRCS Soils database; however, the preliminary geotechnical engineering report provided in support of Exhibit H notes that the loess soils present are also susceptible to collapse under additional applied load or saturation due to wetting or ponding.[113]

[112] BCWAMD4Doc21-03 RFA Exhibit H Geological Soil Stability 2025-12-10, Section 3.2.2.3; BCWAMD4Doc21-04 RFA Exhibit I Soil Conditions 2025-12-10, Section 3.2, Table I-1.

[113] BCWAMD4Doc21-03 RFA Exhibit H Geological Soil Stability 2025-12-10, Section 3.2.2.3; BCWAMD4Doc21-04 RFA Exhibit I Soil Conditions 2025-12-10, Section 3.2, Table I-1.

Figure 5: Sensitive Soils within the Solar Micrositing Area

Erosion and Compaction Best Management Practices

The Council previously imposed several conditions to address the potential for erosion and other soil impacts at the site during the construction and operation of the wind facility. These conditions required the certificate holder to conduct all construction work in compliance with an Erosion and Sediment Control Plan (ESCP) that satisfies the requirements of the Oregon Department of Environmental Quality's National Pollutant Discharge Elimination System (NPDES) Storm Water Discharge General Permit 1200-C (Condition 26), to minimize open trenches and disturbance areas (Condition 31), and to install and maintain Best Management Practices (BMPs) to conserve topsoil and limit wind- and water-borne erosion and during construction (Conditions 32 to 35).

The certificate holder has incorporated all BMPs related to revegetation, soil management, dust control, stormwater management, and noxious weed control into a draft Comprehensive Solar Revegetation and Soil Management Plan (Exhibit I, Attachment I-2.) A draft plan with additional revisions imposed by the Council is included as Attachment D to this Order.

A draft ESCP was incorporated into Appendix C of the Comprehensive Solar Revegetation and Soil Management Plan, but the ESCP will be updated by the construction contractor according to the final layout and design of the facility components proposed in RFA4 and any additional requirements imposed by DEQ. The final ESCP will include any procedures and BMPs necessary to meet local erosion and sediment control requirements or stormwater management requirements.[114] Specific BMPs identified in the Plan include:

- The installation of stabilized construction entrances and exits where construction vehicles move from newly constructed roads or disturbed areas to paved roads. Stabilized construction entrances and exits will be inspected and maintained during operation of the facility components proposed in RFA4.

- The preservation of existing vegetation and/or root systems, to the extent practicable.

- The installation of silt fencing throughout the construction area as a perimeter control, material stockpile perimeter control, and on the contour downgradient of excavations.

- The use of straw wattles to decrease the velocity of sheet flow stormwater to prevent erosion along the downgradient edge of access roads adjacent to slopes or sensitive areas.

- The use of mulch, stabilization matting, soil binders, and tackifiers to stabilize areas of soil disturbance quickly and during reseeding.

[114] BCWAMD4Doc21-04 RFA Exhibit I Soil Conditions 2025-12-10, Section 5.1.1.

- The establishment of dedicated concrete washout areas near foundation construction locations to keep concrete washout water from concrete chutes and trucks in a localized area.

- Scheduling construction activities in the dry season when soils are less susceptible to compaction, to the extent possible.[115]

The ESCP establishes stormwater management BMPs intended to ensure that engineered access roads and drainages would direct stormwater runoff away from structures and into drainage ditches and culverts. This will also minimize risks associated with flooding and soil subsidence.[116]

The ESCP also establishes measures that would be used to stockpile and protect topsoil removed from areas where grading or excavation is required for use in site reclamation and restoration.[117]

The Comprehensive Solar Revegetation and Soil Management Plan also includes provisions to limit the propagation of fugitive dust during construction, including by limiting construction traffic to designated roads with improved surfaces to the extent possible and applying water or stabilizers to roads and disturbed soils, and implementing trackout control at site exits. Appendix D of the plan contains the dust monitoring and reporting methods that will be used to ensure compliance with the requirements of OAR chapter 340, division 208.[118]

Stormwater management infrastructure and erosion control features installed during construction will be left in place during operation as needed to manage stormwater and prevent discharges.[119]

Site Reclamation and Revegetation

The Council previously imposed Conditions 29, 35, 62, and 111, which required the certificate holder to restore and revegetate disturbed areas following construction. The Council deletes Conditions 35 and 62; and maintains Condition 29 and 111 as applicable to the wind and solar facilities, respectively.

Appendix E of the Comprehensive Solar Revegetation and Soil Management Plan provides soil monitoring methods that would be used to identify whether construction activities resulted in

[115] BCWAMD4Doc21-04 RFA Exhibit I Soil Conditions 2025-12-10, Section 6.1; BCWAMD4Doc21-03 RFA Exhibit H Geological Soil Stability 2025-12-10, Section 8.3.
[116] BCWAMD4Doc21-03 RFA Exhibit H Geological Soil Stability 2025-12-10, Section 8.4.
[117] BCWAMD4Doc21-04 RFA Exhibit I Soil Conditions 2025-12-10, Section 5.2.2, 6.1.
[118] BCWAMD4Doc21-04 RFA Exhibit I Soil Conditions 2025-12-10, Section 5.1.1; 6.1; Attachment I-2; BCWAMD4Doc21-06 RFA Exhibit K Land Use 2025-12-10, Section 5.2.4.3.
[119] BCWAMD4Doc21-04 RFA Exhibit I Soil Conditions 2025-12-10, Section 5.2.2.

significant compaction of soils. Pre- and post-construction field measurements of subsurface soil compaction would be collected for all areas where significant vegetation removal or grading activities occur. The certificate holder would also be required to conduct pre-disturbance surveys of non-agricultural areas that would fall outside of the solar array fenceline to determine baseline vegetation conditions prior to construction.

Appendix F of the Comprehensive Solar Revegetation and Soil Management Plan described above describes the methods that will be used to stabilize disturbed areas following construction activities. This may include the use of straw, hydromulch, or tackifier, or planting areas with winter wheat or sterile triticale.[120] Disturbed areas would then be revegetated using approved seed mix and methods as soon as is practicable following construction. The seed mix would include native grasses and forbs. When required, the seed will be applied with mulch or stabilization matting to protect the growing grass seed.[121]

The criteria for when revegetation would be considered successful depends on whether the disturbed area would be located inside or outside of the solar array fenceline and whether or not the land is currently used for agriculture. Temporary disturbance areas that are currently used for agriculture would be considered to be restored after the land is returned to farm operations and landowners provide written confirmation that they are satisfied that any impacts to soil productivity have been addressed. In non-agricultural areas outside the solar array area, the certificate holder would be required to make reasonable efforts to restore vegetation and soils to their pre-disturbance condition. In the area within and extending 10 feet from the solar array fenceline, the certificate holder will establish and maintain uniform (i.e., evenly distributed, without large bare areas) perennial, non-invasive vegetation that provides 70 percent or more cover.[122]

Vegetation Management and Weed Control

The management of noxious weeds and other undesirable plants is important for maintaining long-term soil health at the site and ensuring the site can be returned to a useful, non-hazardous, condition after the facility components proposed in RFA4 are decommissioned. The treatment methods, monitoring procedures, and management objectives that will be used to control the introduction and spread of weeds have been incorporated into Appendix G of the Comprehensive Solar Revegetation and Soil Management Plan.

Weed Control BMPs required under the plan include flagging and treating areas of noxious weed infestations prior to construction, cleaning vehicles and equipment prior to ground disturbance, strategic use of herbicide, mechanical removal and revegetation of disturbed soils. Additional steps may include monitoring areas of disturbance for noxious weeds after

[120] BCWAMD4Doc21-04 RFA Exhibit I Soil Conditions 2025-12-10, Section 5.1.1, Attachment I-2.
[121] BCWAMD4Doc21-04 RFA Exhibit I Soil Conditions 2025-12-10, Section 6.1.
[122] BCWAMD4Doc21-04 RFA Exhibit I Soil Conditions 2025-12-10, Attachment I-2, Appendix F.

construction, training construction and operations staff and limiting vehicle traffic in noxious weed-infested areas.[123]

The certificate holder currently contracts with the Sherman County Weed Control District to inspect and treat weeds at the wind facility, and there have been no compliance issues associated with weed control at the site..[124] Prior to and during construction and operation of the facility components proposed in RFA4, the certificate holder will be required to hire a Weed Control Contractor responsible for performing weed control in accordance with the Comprehensive Solar Revegetation and Soil Management Plan under Soil Protection Conditions 1 through 3.[125]

In addition to weed management, the certificate holder represents that vegetation under the solar panels will be managed to minimize fire risk and erosion by maintaining low growing vegetation, the certificate holder did not provide specific management standards. The Council added standards to the draft plan based on the applicable provisions of Oregon Fire Code Section 1205. The provisions would require the certificate holder to maintain a clear, brush-free area of 10 feet from both the interior and exterior perimeter fence of all solar array areas (20-feet total). Within the perimeter fenceline, extending from the 10-foot clear, brush free area, vegetation would be maintained at a height of no more than 4 to 8 inches during the dry season (June to October) and no more than 12 inches outside the dry season (November to May) within and adjacent to the solar modules and associated electrical equipment, unless otherwise specified by the local fire official. A minimum 10-foot clear, brush free area would also be required around all BESS components, substations, and other high-voltage, electrical installations, unless otherwise specified by the local fire official or applicable safety code. Activities necessary to maintain the area as clear, brush free shall be based on consultation with local fire code officials, prior to construction, as established in the draft Construction Wildfire Mitigation Plan and the Comprehensive Solar Revegetation and Soil Management Plan under Soil Protection Conditions 1 through 3.

The Council finds that the methods, monitoring protocols, and reporting requirements related to revegetation, soil management, dust control, stormwater management, proposed by the certificate holder and additional requirements imposed by the Council in the draft Comprehensive Solar Revegetation and Soil Management Plan included as Attachment D to this Order, demonstrate that the facility components proposed in RFA4 can be designed, constructed, and operated, in a manner that are not likely to result in a significant adverse

[123] BCWAMD4Doc21-04 RFA Exhibit I Soil Conditions 2025-12-10, Attachment I-2, Appendix G; BCWAMD4Doc21-06 RFA Exhibit K Land Use 2025-12-10, Section 5.2.4.3.

[125] BCWAMD4Doc22-00. Proposed Order on AMD4 2025-12-16. Attachment D, Table A-2, pg. A-3. The draft Comprehensive Solar Revegetation and Soil Management Plan includes additional experience requirements for the Weed Control Contractor.

[125] BCWAMD4Doc22-00. Proposed Order on AMD4 2025-12-16. Attachment D, Table A-2, pg. A-3. The draft Comprehensive Solar Revegetation and Soil Management Plan includes additional experience requirements for the Weed Control Contractor.

impact to soils from erosion, compaction, or topsoil loss. To ensure the certificate holder finalizes and implements the plan, the Council imposes the following conditions:

Soil Protection Condition 1 (PRE-SP-01):
Before beginning construction of any component or phase of the solar facility, the certificate holder shall:

a. Finalize the draft Comprehensive Solar Revegetation and Soil Management Plan included as Attachment D to the Final Order on RFA4 based on final facility design and the approved National Pollutant Discharge Elimination System (NPDES) General Permit 1200-C for the facility. The final Comprehensive Solar Revegetation and Soil Management Plan shall be submitted to the Department for review and approval.
b. Complete all items included in the Pre-construction Compliance Checklist in the final plan, as applicable to the facility components or phase.

[Final Order on AMD4]

Soil Protection Condition 2 (CON-SP-02)
During and following construction of any component or phase of the solar facility, the certificate holder shall conduct all work in compliance with the Comprehensive Solar Revegetation and Soil Management Plan required under Condition PRE-SP-01.
[Final Order on AMD4]

Soil Protection Condition 3 (OPR-SP-06)
During operation of the solar facility, the certificate holder shall monitor and maintain vegetation and any necessary erosion controls in compliance with the Comprehensive Solar Revegetation and Soil Management Plan required under Condition PRE-SP-01, as amended. The certificate holder shall include any reports required by the plan in the annual facility operations reports required under Condition OPR-OE-01.
[Final Order on AMD4]

Because the provisions of the draft Comprehensive Solar Revegetation and Soil Management Plan effectively replace their requirements, the Council deletes existing Conditions 26, 27, and 31 to 35. The Council retains existing Conditions 28 and 30 as they continue to be applicable to the operating facility. Because it applied to the construction of the wind facility, Condition 62 is deleted.

Amended Condition 28 (OPR-SP-03)
~~(28)~~ The certificate holder shall cover turbine pad areas with gravel or other non-erosive material immediately following exposure ~~during construction~~ and shall maintain the pad area covering during operation of the facility.
[Final Order on AMD4]

Amended Condition 29 (OPR-SP-04)

~~(29) During construction of the facility, the certificate holder shall restore areas that are temporarily disturbed in accordance with the methods, monitoring procedures and success criteria described in the Revegetation Plan that is incorporated in this order as Attachment B and as that Revegetation Plan may be amended from time to time.~~ During operation of the wind energy facility, the certificate holder shall restore areas that are temporarily disturbed during facility maintenance or repairs according to the ~~same~~ methods and monitoring procedures in the Revegetation Plan included as Attachment B to the Final Order on the ASC, as amended.
[Final Order on AMD4]

Amended Condition 30 (OPR-SP-05)
~~(30)~~ During operation of the wind energy facility, the certificate holder shall routinely inspect and maintain all roads, pads and trenched areas and, as necessary, maintain or repair erosion control measures.
[Final Order on AMD4]

Deleted Condition 62
~~The certificate holder shall restore areas that are temporarily disturbed during construction in accordance with the methods, monitoring procedures and success criteria set forth in the Revegetation Plan that is incorporated in the Final Order on Amendment #2 as Attachment B and as may be amended from time to time.~~
[Final Order on AMD4]

The Council also retains the mandatory condition established under Site Certificate Condition 111, as applicable to the construction of the proposed solar facility:

Amended Condition 111 (CON-SP-01)
~~OAR 345-027-0020(11):~~ Upon completion of construction of the solar facility, the certificate holder shall restore vegetation to the extent practicable and shall landscape all areas disturbed by construction in a manner compatible with the surroundings and proposed use. Upon completion of construction, the certificate holder shall remove all temporary structures not required for facility operation and dispose of all timber, brush, refuse and flammable or combustible material resulting from clearing of land and construction of the facility.
[OAR 345-027-0020(11); Final Order ASC, Condition 11; AMD3, AMD4]

Once revegetation is complete, typical operation and maintenance activities are not expected to disturb significant areas of soil; however, runoff could be generated if significant volumes of water are used to wash solar modules or other equipment. The certificate holder represents that any water used for module washing is expected to evaporate or infiltrate into the ground. The Council previously imposed Site Certificate Condition 88 requiring the certificate holder to ensure that wind turbine blade washing avoid causing run-off and requiring the use of non-

corrosive, biodegradable and phosphate-free cleaners.[126] To ensure that solar panel washing adheres to the same measures imposed for blade washing activities, the Council amends Condition 88 as follows:

> **Amended Site Certificate Condition 88 (OPR-SP-01)**
> During operation of the facility, the certificate holder may engage in wind turbine blade and solar panel washing activities but shall ensure that these activities do not cause runoff of Washwater from the site or discharges to surface waters, storm sewers or dry wells. The certificate holder shall not use acids, bases or metal brighteners with the wash water. The certificate may use biodegradable, phosphate-free cleaners sparingly. [Final Order on ASC, Condition 88; AMD2, AMD4]

Spills and Soil Contamination

As explained in Section I.D., *Requested Amendment*, above, up to three 1,000 gallon temporary above-ground fuel tanks would be installed in the temporary construction yards during construction. It is anticipated that each diesel tank will be filled once per month or as needed. Each fuel tank would be required to be equipped with secondary containment in accordance with 40 CFR §112.7(c). The certificate holder anticipates that the majority of fuel containers would have self-contained secondary containment (e.g., double-walled containers) that provide capacity for the entire container plus precipitation, but in some cases smaller containers (e.g., drums) would be placed in a constructed secondary containment area that is impervious and is diked or otherwise contained to provide the required fuel and precipitation capacity.[127]

No substantial quantities of lubricating oils, hydraulic fluid for construction equipment, or other hazardous materials would be stored on-site during construction. Lubricating oil or hydraulic fluids for construction equipment will be brought in on an as-needed basis for equipment maintenance by a licensed contractor using a specialized vehicle, and waste oils removed by the same maintenance contractor. As described in more detail below, transformers would be filled with cooling oils during operations, but the certificate holder represents that the oil would arrive on an as-needed basis and transferred into the receiving components, so that none would be stored on-site.[128]

The certificate holder represents that secondary containment and refueling procedures for on-site fuel storage will follow a Spill Prevention, Control, and Countermeasures (SPCC) Plan and proposed a new condition requiring the SPCC to be developed and implemented, and submitted to the Department prior to the *operation* of the facility components proposed in

[126] BCWAMD4Doc21-17 RFA Exhibit W Waste Minimization 2025-12-10, Section 2.2.3
[127] BCWAMD4Doc21-04 RFA4 Exhibit I 2025-12-10, Section 4.1.4.1; BCWAMD4Doc21-02 RFA Exhibit G Materials Analysis 2025-12-10, Section 3.1.
[128] BCWAMD4Doc21-04 RFA4 Exhibit I 2025-12-10, Section 4.1.4.1.

RFA4.[129] The certificate holder does not explain why the SPCC Plan would not be available prior to operations or whether a separate condition is intended to apply to the fuel storage and refueling activities. In accordance with the certificate holder's representation that secondary containment and refueling procedures for on-site fuel storage during construction will follow a SPCC Plan, the Council adopts new conditions requiring the SPCC plan to be provided prior to beginning construction of the solar components and to implement the SPCC plan during construction, as shown below:

Soil Protection Condition 4 (PRE-SP-02)
Prior to beginning construction of any component or phase of the solar facility, the certificate holder shall submit, to the Department, a Construction Spill Prevention, Control and Countermeasure (SPCC) Plan that complies with the requirement of 40 CFR 112.
[Final Order on AMD4]

Soil Protection Condition 5 (CON-SP-03):
During construction of the solar facility, the certificate holder and all onsite contractors and personnel shall adhere to the requirements of the SPCC Plan approved under Condition PRE-SP-02. Updates or revisions to the Plan shall be submitted to the Department prior to implementation.
[Final Order on AMD4]

During operations, the substation GSU transformer and ISU transformers will contain oil for cooling purposes. Transformers typically use mineral oil or seed oil that is considered nontoxic. Federal regulations prohibit transformer coolant from containing significant concentrations of polychlorinated biphenyls or other extremely hazardous compounds.[130]

Each GSU transformer would contain up to 10,000 to 15,000 gallons of oil. The GSU transformers are expected to be a ground-mounted unit constructed on a concrete pad with secondary spill containment traps designed to minimize the possibility of accidental leakage on soil. The concrete catchment system is typically sized to contain the amount of oil inside the transformer plus deluge water and required freeboard. Each of the ISU transformers in the solar arrays and transformers in the BESS would also contain approximately 700 gallons of cooling oil. Due to the smaller capacity, the ISU transformers would not require secondary containment.[131]

[129] BCWAMD4Doc21-04 RFA4 Exhibit I 2025-12-10, Section 4.1.4.1; Attachment 1; Condition 132; BCWAMD4Doc21-02 RFA Exhibit G Materials Analysis 2025-12-10, Section 3.0, 3.2; BCWAMD4Doc21-04 RFA Exhibit I Soil Conditions 2025-12-10, Section 5.1.1;.

[130] BCWAMD4Doc21-04 RFA Exhibit I, Section 4.1.4.1. 2025-12-10.

[131] BCWAMD4Doc21-04 RFA Exhibit I, Section 4.1.4.1. 2025-12-10.; BCWAMD4Doc21-02 RFA Exhibit G Materials Analysis 2025-12-10, Section 3.0, Table G-1;

As discussed in Section III.B, Organizational Expertise, there have been numerous transformer failures at the existing wind facility. In the event of a transformer that results in a release of Oil, the certificate holder would follow response measures outlined in an operations SPCC Plan. As part of this plan, equipment containing oil or hazardous materials will be regularly monitored for leaks, and measures will be put in place if any are found to quickly control and remove spills.[132] Consistent with these representations, the Council imposes conditions requiring the development and implementation of an operational SPCC Plan, as shown below:

> **Soil Protection Condition 6 (PRO-SP-01)**
> Prior to beginning operation of the solar facility, the certificate holder shall submit, to the Department, an Operations Spill Prevention, Control and Countermeasure Plan that complies with the requirement of 40 CFR 112.
> [Final Order on AMD4]
>
> **Soil Protection Condition 7 (OPR-SP-07):**
> During operation of the solar facility, the certificate holder and all onsite contractors and personnel shall adhere to the requirements of the Operations Spill Prevention, Control and Countermeasure Plan approved under Condition PRO-SP-01. Updates or revisions to the Plan shall be submitted to the Department prior to implementation.
> [Final Order on AMD4]

In addition to fuels and oils, small quantities of herbicides, insecticides, paint, cleaners, solvents, and other hazardous materials may also be used on site during construction and stored in a secure location within the temporary construction yard. Potentially hazardous substances will not be permanently present within the construction areas in quantities that exceed Oregon State Fire Marshal Reportable Quantities. Limited amounts of hazardous materials would be stored in the proposed O&M buildings during the operation of the proposed solar facility, including small quantities of lubricants, degreasers, herbicides, or other chemicals. Storage of these chemicals will follow label instructions. No underground storage tanks will be installed at the proposed O&M building. The certificate holder represents that no highly toxic substances or explosive materials will not be necessary to support either the construction or the operations phase of the Solar Components. Lithium-ion batteries and solar modules do not pose a significant hazard for soil contamination under normal operating conditions, but can sometimes be considered hazardous waste by the EPA and will be disposed of according to the most current guidelines at end of life. [133] Requirements for the handling and disposal of these materials is discussed in Section III.O, Waste Minimization.

The Council previously imposed Site Certificate Condition 80, which requires all potentially hazardous substances to be sorted, handled, and disposed of in a manner that is protective of

[132] BCWAMD4Doc21-04 RFA Exhibit I, Section 4.1.4.1. 2025-12-10.

[133] RFA4, Section 4.1.4.1.; BCWAMD4Doc21-02 RFA Exhibit G Materials Analysis 2025-12-10, Section 3.0; 3.1; BCWAMD4Doc21-04 RFA Exhibit I Soil Conditions 2025-12-10, Section 6.1.. BCWAMD4Doc21-17 RFA Exhibit W Waste Minimization 2025-12-10, Section 6.2

human health, safety, and the environment and that complies with all applicable local, state, and federal environmental laws and regulations. The Council maintains this condition as applicable to both the wind and solar facility.

The certificate holder further represents that at the proposed solar facility all potentially hazardous substances, as defined by Oregon Revised Statute 465.200, would be stored, handled, and disposed in accordance with a Hazardous Materials Management and Monitoring Plan.[134] The certificate holder proposed two new conditions requiring the development and implementation of this plan:

> **Certificate Holder Proposed Condition 130:**
> The certificate holder must prepare and implement a Hazardous Materials Management and Monitoring plan approved by the Department. The plan(s) must address the handling of potentially hazardous substances (as defined by ORS 465.200) during construction and operation of the facility, measures to prevent on- and off-site contamination and documentation of plan implementation. Separate plans for the construction and operation phases are acceptable. The certificate holder must use hazardous materials in a manner that protects public health, safety and the environment and must comply with all applicable local, state and federal environmental laws and regulations.
> [Final Order on AMD4]
>
> **Certificate Holder Proposed Condition 131:**
> The Hazardous Materials Management and Monitoring Plan shall contain the same information required for a Spill Prevention, Control and Countermeasure Plan (40 CFR 112). Whereas the SPCC Plan addresses spill prevention for oil products, the materials management and monitoring plan shall address hazardous substances. The Plan shall include operating procedures to prevent hazardous substances releases, control measures to contain hazardous substance releases, countermeasures to contain, cleanup, and mitigate hazardous substance releases, and procedures for required inspections and testing. This Plan must be submitted to the Department for review and approval prior to respective construction or operation phase of the facility.
> [Final Order on AMD4]

Because the certificate holder represents that no reportable quantities of hazardous materials would be used or stored at the site during construction or operation of the facility components proposed in RFA4, the Council finds that the new conditions are unnecessary.

The Council previously imposed Site Certificate Condition 80 under the Waste Minimization Standard, which requires all potentially hazardous substances to be sorted, handled, and disposed of in a manner that is protective of human health, safety, and the environment and that complies with all applicable local, state, and federal environmental laws and regulations.

[134] BCWAMD4Doc21-02 RFA Exhibit G Materials Analysis 2025-12-10, Section 3.0, 3.1, 3.2.

The Council maintains this condition as applicable to both the wind and solar facility as Condition GEN-SP-01.

The Council previously imposed Site Certificate Condition 81, requiring the Certificate holder to notify the Department of any spill or release of hazardous material, including fuels or oils, within 72 hours. In RFA4, the certificate holder proposes that this condition be amended to also apply to the construction and operation of the proposed solar components.[135] The Council agrees with the certificate holder's proposal and amends the condition as applicable to any spills that occur at the site. The Council also adopts a new condition specifying that no reportable quantities of hazardous substances that are not covered by the SPCC Plan may be maintained at the solar facility site.

Amended Condition 81 (OPR-SP-02)

a. If a spill or release of a reportable quantity of fuel, oil, or other hazardous materials occurs during construction or operation of the facility, the certificate holder shall notify the Department within 72 hours.
b. The certificate and shall clean up ~~the~~ any spill or release of hazardous materials and dispose of any contaminated soil or other materials according to applicable regulations.
c. The certificate holder shall ensure that spill kits containing items such as absorbent pads are located on equipment and storage facilities to respond to accidental spills and shall instruct employees handling hazardous materials in the proper handling, storage and cleanup of these materials.

[Final Order on ASC, Condition 81; AMD4]

Soil Protection Condition 8 (GEN-SP-02)

Except for those fuels and oils covered by an SPCC Plan approved under Condition PRE-SP-01 or PRO-SP-02, no reportable quantities of hazardous materials or substances, as defined in OAR chapter 340, division 142, may be stored at the site of any solar facility component.

[Final Order on AMD4]

III.D.2. Conclusions of Law

Based on the foregoing analysis, and subject to compliance with the existing and site certificate conditions described above, the Council finds that the facility components proposed in RFA4 are not likely to result in a significant adverse impact to soils.

III.E. LAND USE: OAR 345-022-0030

[135] BCWAMD4Doc21-01 RFA Div27 2025-12-10, Attachment 1; BCWAMD4Doc21-02 RFA Exhibit G Materials Analysis 2025-12-10, Section 3.0, 3.2.

(1) To issue a site certificate, the Council must find that the proposed facility complies with the statewide planning goals adopted by the Land Conservation and Development Commission.

(2) The Council shall find that a proposed facility complies with section (1) if:

(a) The applicant elects to obtain local land use approvals under ORS 469.504(1)(a) and the Council finds that the facility has received local land use approval under the acknowledged comprehensive plan and land use regulations of the affected local government; or

(b) The applicant elects to obtain a Council determination under ORS 469.504(1)(b) and the Council determines that:

(A) The proposed facility complies with applicable substantive criteria as described in section (3) and the facility complies with any Land Conservation and Development Commission administrative rules and goals and any land use statutes directly applicable to the facility under ORS 197.646(3);

(B) For a proposed facility that does not comply with one or more of the applicable substantive criteria as described in section (3), the facility otherwise complies with the statewide planning goals or an exception to any applicable statewide planning goal is justified under section (4); or

(C) For a proposed facility that the Council decides, under sections (3) or (6), to evaluate against the statewide planning goals, the proposed facility complies with the applicable statewide planning goals or that an exception to any applicable statewide planning goal is justified under section (4).

(3) As used in this rule, the "applicable substantive criteria" are criteria from the affected local government's acknowledged comprehensive plan and land use ordinances that are required by the statewide planning goals and that are in effect on the date the applicant submits the application. If the special advisory group recommends applicable substantive criteria, as described under OAR 345-021-0050, the Council shall apply them. If the special advisory group does not recommend applicable substantive criteria, the Council shall decide either to make its own determination of the applicable substantive criteria and apply them or to evaluate the proposed facility against the statewide planning goals.

(4) The Council may find goal compliance for a proposed facility that does not otherwise comply with one or more statewide planning goals by taking an exception to the applicable goal. Notwithstanding the requirements of ORS 197.732, the statewide planning goal pertaining to the exception process or

any rules of the Land Conservation and Development Commission pertaining to the exception process, the Council may take an exception to a goal if the Council finds:

(a) The land subject to the exception is physically developed to the extent that the land is no longer available for uses allowed by the applicable goal;

(b) The land subject to the exception is irrevocably committed as described by the rules of the Land Conservation and Development Commission to uses not allowed by the applicable goal because existing adjacent uses and other relevant factors make uses allowed by the applicable goal impracticable; or

(c) The following standards are met:

(A) Reasons justify why the state policy embodied in the applicable goal should not apply;

(B) The significant environmental, economic, social and energy consequences anticipated as a result of the proposed facility have been identified and adverse impacts will be mitigated in accordance with rules of the Council applicable to the siting of the proposed facility; and

(C) The proposed facility is compatible with other adjacent uses or will be made compatible through measures designed to reduce adverse impacts.

(5) If the Council finds that applicable substantive local criteria and applicable statutes and state administrative rules would impose conflicting requirements, the Council shall resolve the conflict consistent with the public interest. In resolving the conflict, the Council cannot waive any applicable state statute.

(6) If the special advisory group recommends applicable substantive criteria for an energy facility described in ORS 469.300(11)(a)(C) to (E) or for a related or supporting facility that does not pass through more than one local government jurisdiction or more than three zones in any one jurisdiction, the Council shall apply the criteria recommended by the special advisory group. If the special advisory group recommends applicable substantive criteria for an energy facility described in ORS 469.300(11)(a)(C) to (E) or a related or supporting facility that passes through more than one jurisdiction or more than three zones in any one jurisdiction, the Council shall review the recommended criteria and decide whether to evaluate the proposed facility against the applicable substantive criteria recommended by the special advisory group, against the statewide planning goals or against a combination of the applicable substantive criteria and statewide planning goals. In making

the decision, the Council shall consult with the special advisory group, and shall consider:

(a) The number of jurisdictions and zones in question;

(b) The degree to which the applicable substantive criteria reflect local government consideration of energy facilities in the planning process; and

(c) The level of consistence of the applicable substantive criteria from the various zones and jurisdictions.[136]

***** [137]

III.E.1. Findings of Fact

In accordance with ORS 469.504, the Land Use standard requires the Council to find that a proposed facility or facility, with proposed changes, complies with Oregon's statewide land use planning goals. An applicant or certificate holder may demonstrate compliance with the statewide planning goals either by obtaining local land use approval from the affected local government or by obtaining a Council determination of compliance. In this proceeding, the certificate holder has elected to seek a Council determination of compliance under ORS 469.504(1)(b).[138]

The analysis area for the Land Use standard includes the area within and extending one-half mile from the proposed Solar Micrositing Area. Approximately 5,198 acres are located within the analysis area, including the approximately 1,924 acres within the Solar Micrositing Area itself.

The Council previously imposed Site Certificate Conditions 17 to 25 and 128 to ensure that the existing wind energy facility complied with the Land Use standard. Conditions 17, 19-21, 23-25, and 128 continue to apply to the facility components proposed in RFA4, as Conditions GEN-LU-02 to GEN-LU-09, with minor administrative updates to clarify applicability to the operating wind facility. Changes to the remaining land use conditions are discussed below.

Existing Land Uses

The proposed Solar Micrositing Area includes all or part of two subject tracts. One of the tracts is owned by the certificate holder and contains the facility's existing substation.[139] Turbines and

[136] OAR 345-022-0040, effective April 2, 2025.

[137] The information requirements included in the standard are omitted from the language above, but evaluated within the findings of fact below.

[138] BCWAMD4Doc21-06 RFA Exhibit K Land Use 2025-12-10, Section 1.0.

[139] BCWAMD4Doc21-06 RFA Exhibit K Land Use 2025-12-10, Section 3.2. Under OAR 660-033- 0020(14), "tract" means one or more contiguous lots or parcels under the same ownership.

other facility components are present on the other tract; however, the majority of lands on that tract are currently used for the cultivation of dryland winter wheat and other small grains. As shown in Figure 6, below, some irrigated farmland is also present on the tract.

The cultivation of dryland wheat and other grains is also the dominant use on adjacent lands in the analysis area. There is also a 125.7-acre irrigation pivot used for the cultivation of garlic, carrot seed, mint, wheat and other row crops located approximately 300 feet north of the Solar Micrositing Area.[140] Energy uses are also present on adjacent lands within the analysis area, including the existing wind energy facility and several transmissions lines.[141]

Water Rights

There are two locations appurtenant to a water right within the analysis area.

Oregon Water Right Certificate 57620 authorizes use of up to 3 acre-feet of water per acre for irrigation on up to 325.7 acres of land in the proposed Solar Micrositing Area. The water right has a priority date of February 17, 1976. The point of diversion for the water is also within the proposed Solar Micrositing Area. While the water right certificate authorizes the irrigation of up to 325.7 acres, only 25 acres in a half-pivot are currently irrigated. The irrigated land is currently used for the cultivation of garlic, carrot seed, mint, wheat and other row crops.[142] The certificate holder represents that it is working with the landowner to transfer this water right to industrial use for the life of the solar facility to avoid forfeiture and preserve the ability to transfer the water back to irrigation use following facility decommissioning.[143]

Oregon Water Right Permit G 16704 (McCullough Water Right) authorizes the irrigation of 125.7 acres of land in an irrigation pivot on land adjacent to the proposed Solar Micrositing Area. The irrigated land supports a range of crop types depending on the year that include mint, garlic, and carrot seed.[144]

Soil and Farmland Classifications

As described in Section III.D., *Soil Protection*, approximately 99 percent of the soils in the proposed Solar Micrositing Area are moderately deep, well-drained silt loams formed in loess overlying basalt. The remaining one percent is made up of stoney soils and loess deposits.[145]

[140] BCWAMD4Doc21-06 RFA Exhibit K Land Use 2025-12-10, Section 3.2.1, 3.3.1, Table K-8.

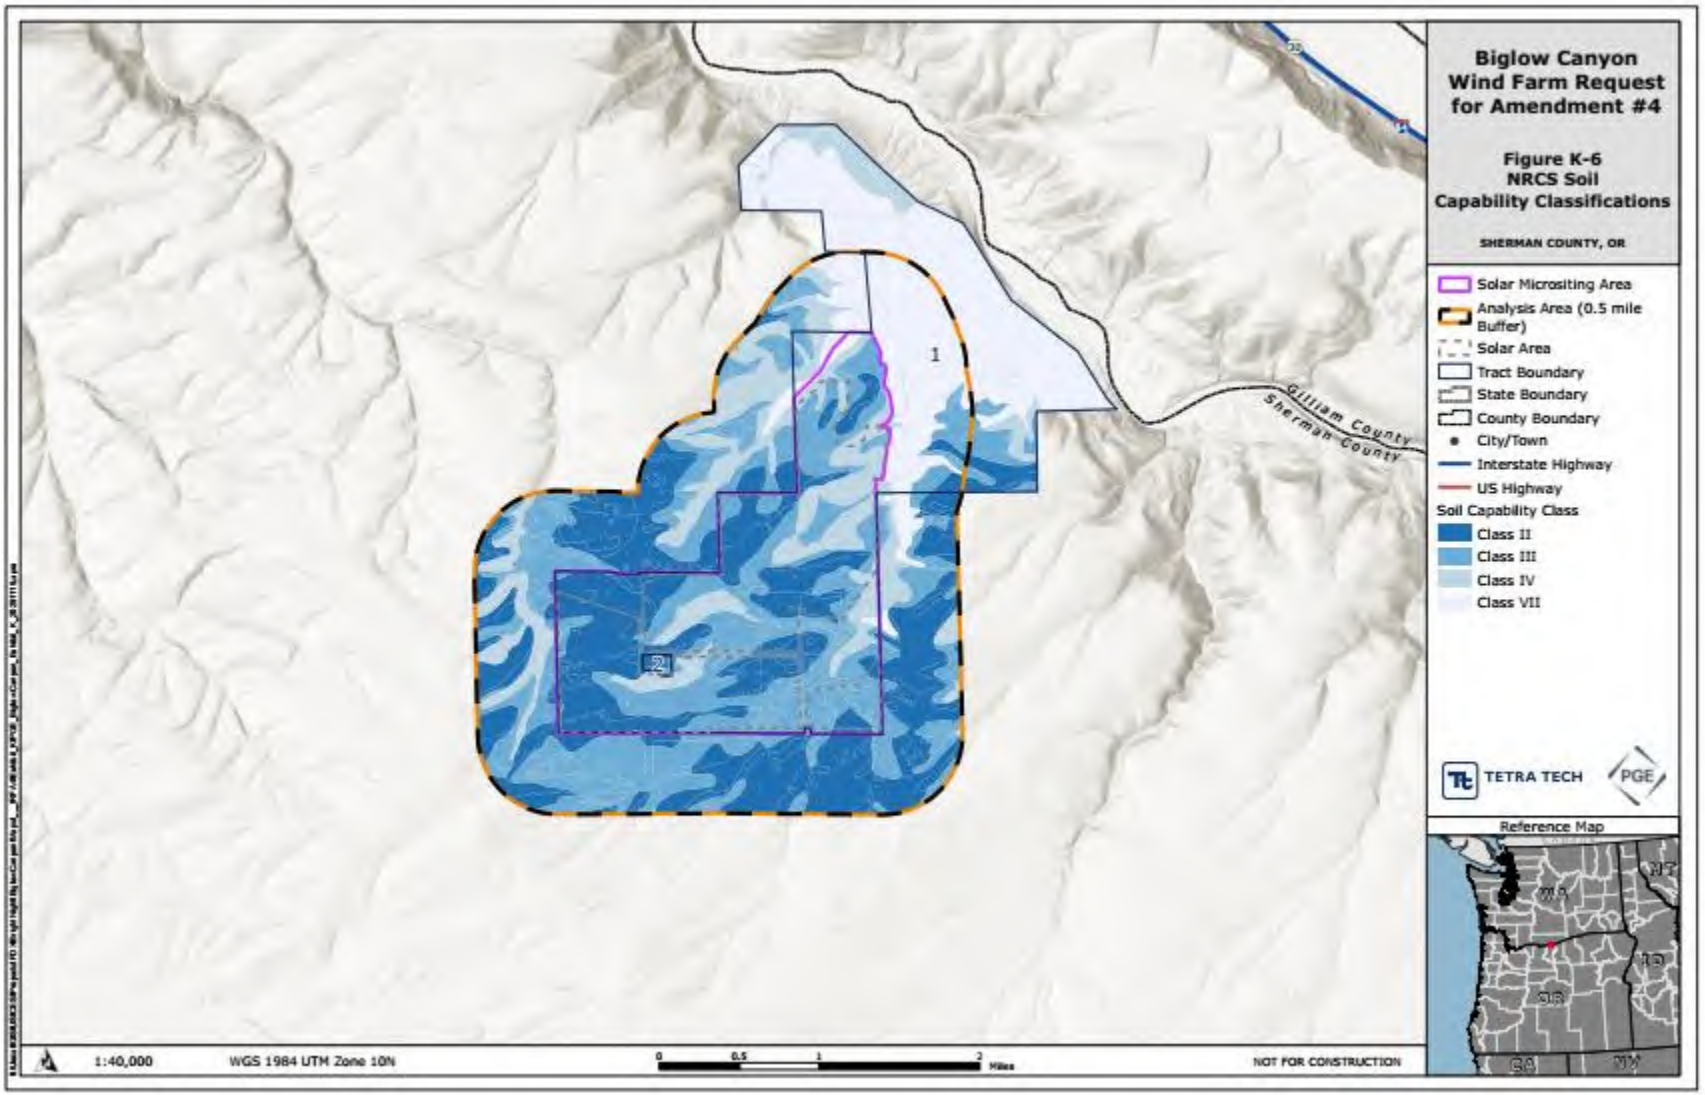
[143] BCWAMD4Doc21-06 RFA Exhibit K Land Use 2025-12-10, Section 3.3.2.
[144] BCWAMD4Doc21-06 RFA Exhibit K Land Use 2025-12-10, Section 3.3.1.
[145] BCWAMD4Doc21-04 RFA Exhibit I Soil Conditions 2025-12-10, Table I-1; BCWAMD4Doc21-06 RFA Exhibit K Land Use 2025-12-10, Section 3.3.2.

The NRCS assigns land capability classifications to each soil unit based on the general suitability of the soils for agriculture. Class I and II soils are the most productive soils. These soils are also considered to be "high-value farmland soils" under ORS 195.300(10). Class III and IV soils are also suitable for agriculture and are considered "arable" soils under OAR 660-033-0130(38). Class V to VII are generally not suitable for agriculture and are considered "not arable" under LCDC's rules. The capability classification is typically dependent on whether or not the land is irrigated, but the non-irrigated and irrigated capability classes for soils in the Solar Micrositing Area are the same. The NRCS also assigns farmland classifications, including "prime" or "unique" designations, based on the suitability of soils for specific crops. Soil units designated by the NRCS as "prime" or "unique" farmland are also considered high-value farmland.

According to the NRCS Web Soil Survey, there are five soil types and ten soil units within the Solar Micrositing Area. The soil capability and farmland classification for each of the soil units in the Solar Micrositing Areas are shown in Table 9 and Figure 6, below. As shown in the table, approximately 40.4 percent of the soils in the Solar Micrositing Area are Class II, high-value farmland soils, and about ninety-nine percent of soils are suitable for agriculture. Additional information about the characteristics of and hazards associated with the soil units is provided in Section III.D., *Soil Protection*.

Table 9: Soil Capability and Farmland Classification within Solar Micrositing Area



Soil Type ID/Soil Unit	NRCS Farmland Classification	Soil Capability Class	Area within Solar Micrositing Area	
			Acres	Percent (%)
1B/Anderly silt loam, 1 to 7 percent slopes	Prime farmland if irrigated	III	79	4.1
1C/Anderly silt loam, 7 to 15 percent slopes	Farmland of statewide importance	III	195	10.2
3D/Anderly silt loam, 15 to 35 percent south slopes	Farmland of statewide importance	IV	119	6.2
16D/Lickskillet very stony loam, 7 to 40 percent south slopes	Not prime farmland	VII	3	0.2
18E/Lickskillet-Rock outcrop complex, 40 to 70 percent south slopes	Not prime farmland	VII	7	0.4
21E/Nansene-Rock outcrop complex, 35 to 70 percent north slopes	Not prime farmland	VII	7	0.4
31B/Walla Walla silt loam, 1 to 7 percent slopes	Prime farmland if irrigated	II	778	40.4
31C/Walla Walla silt loam, 7 to 15 percent slopes	Farmland of statewide importance	III	538	28
32D/Walla Walla silt loam, 15 to 35 percent north slopes	Farmland of statewide importance	IV	116	6.0

Table 9: Soil Capability and Farmland Classification within Solar Micrositing Area

Soil Type ID/Soil Unit	NRCS Farmland Classification	Soil Capability Class	Area within Solar Micrositing Area	
			Acres	Percent (%)
33D/Walla Walla silt loam, 15 to 35 percent south slopes	Farmland of statewide importance	IV	82	4.2
Total High-Value Soils (Class I and II)			**778**	**40.4**
Total Arable Soils (Class III and IV)			**1,129**	**58.6**
Total Non-arable Soils (Class V, VI, VII)			**17**	**1**
Total			**1,945**	**100%**

1

Figure 6: Soil Capability Classes on Subject Tract

1

Under ORS 215.710, when a tract is predominantly composed of high-value farmland soils, the entire tract is considered to be high-value farmland. As shown in Table 10, below, only the smaller tract that underlies the existing substation site is considered to be high-value farmland. The other tract is predominantly composed of arable soils and is therefore considered arable land.

Table 10: High-Value Farmland Soils Predominance Per Tract

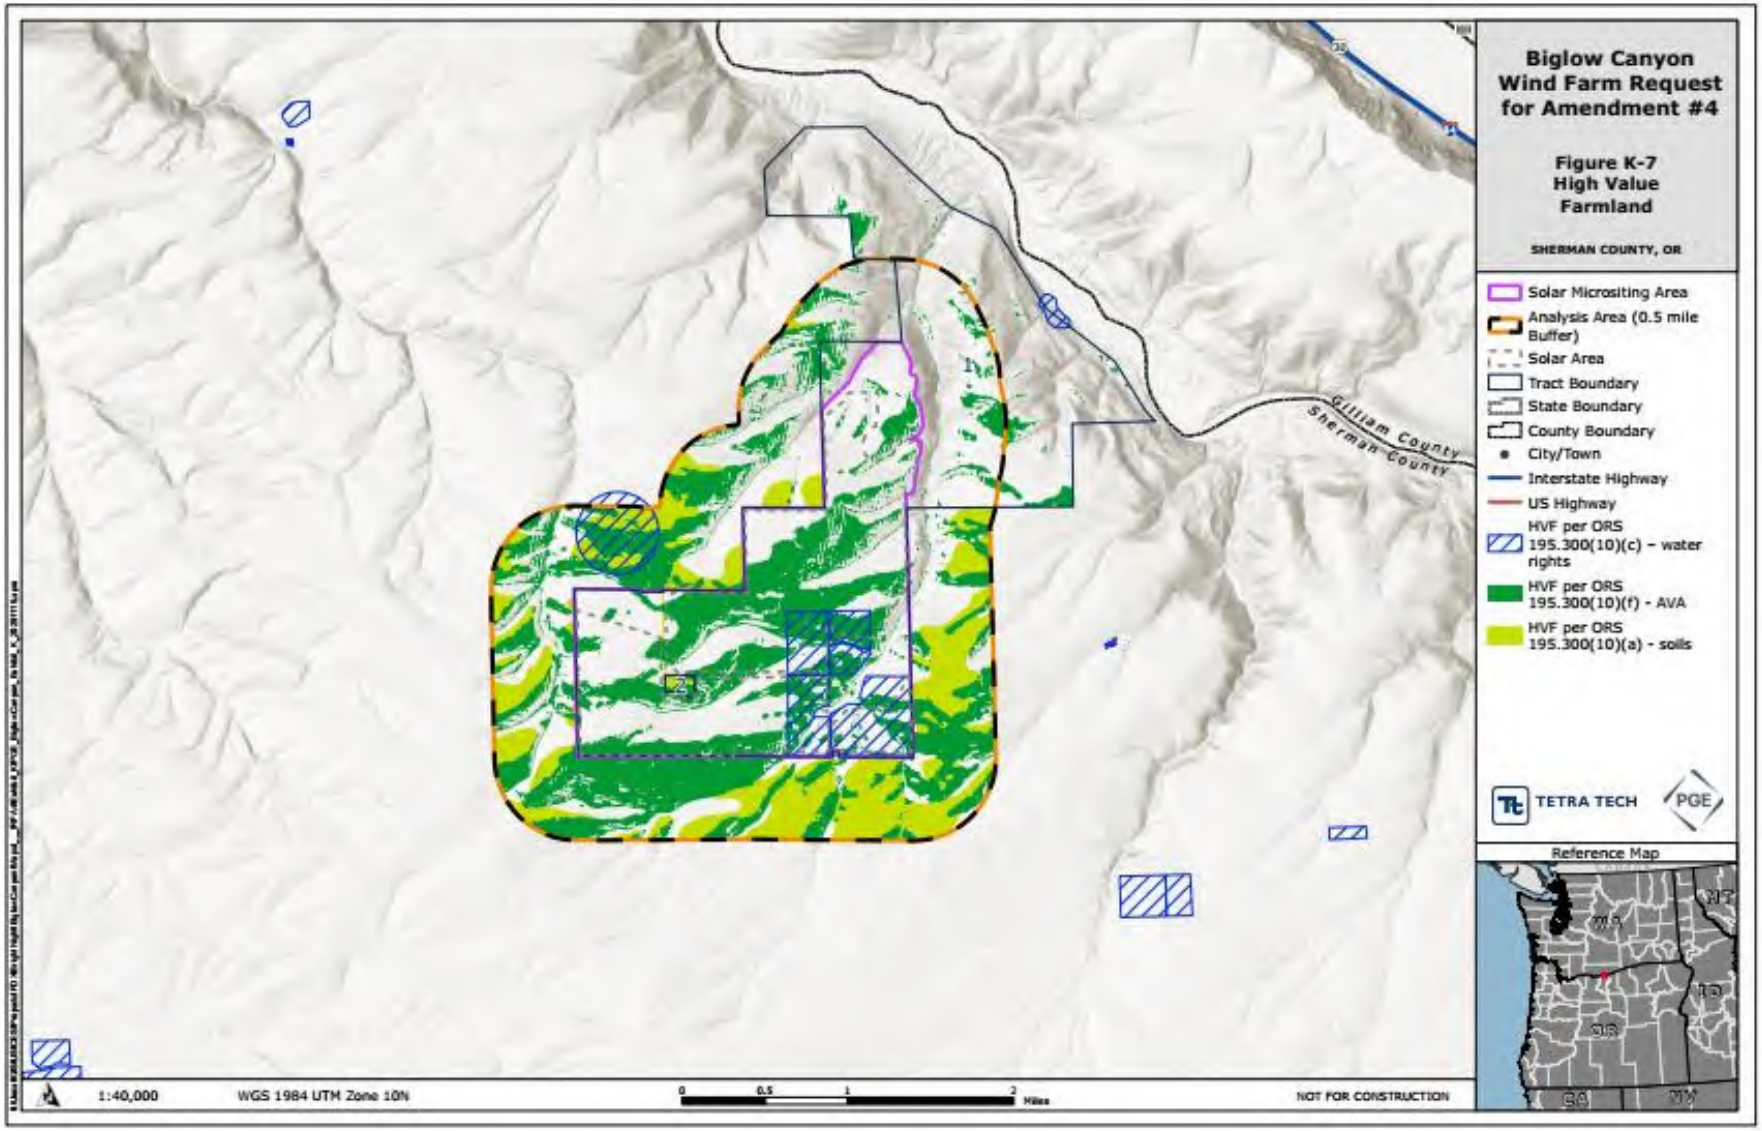
Tract	Owner	Total Tract Area	Total High-Value Farmland Soils		HVF Due to Predominance of HVF Soils
			Acres	Percent	
1	SCHARF, R & A LLC	3,336	890	26.7%	0
2	PORTLAND GENERAL ELECTRIC	13	9	69.2%	13
Total:		**3,349**	**899**	**26.8**	**13**
Source: RFA4 Exhibit K, Table K-2.					

Under ORS 195.300(10)(c), land may also be designated high-value farmland if it is appurtenant to a water right or located within the boundaries of an irrigation district. As discussed above, there are two authorized places of use for existing water rights within the analysis area. As described above, there is one existing place of use water right within the proposed Solar Micrositing Area, which includes approximately 311 acres of high-value farmland.

Finally, under ORS 195.300(10)(f), land located within the Columbia Valley American Viticulture Area (AVA) is considered to be high-value farmland if it meets certain elevation, slope, and aspect criteria, regardless of whether the land has been used for viticulture. An additional 779 acres are considered high-value farmland due to their location within the Columbia Valley AVA.

As shown in Table 11, below, after removing areas of overlap there are approximately 1,305 acres of high-value farmland within the proposed Solar Micrositing Area, which is about 68 percent of the total area.[146] The distribution of high-value farmland within the Solar Micrositing Area is shown in Figure 7.

[146] BCWAMD4Doc21-06 RFA Exhibit K Land Use 2025-12-10, 3.3.2.



1

Table 11: High-Value Farmland in the Solar Micrositing Area

High-Value Farmland Type	Solar Micrositing Area		Tract Area		Est. Perm. Dist. Area	
	Acres	Percent	Acres	Percent	Acres	Percent
Predominance of HVF Soils ORS 195.300(10)(a)	13	1%	13	3%	0	0%
Appurtenant to Water Right ORS 195.300(10)(c)(A)	311*	16%	3,15	9%	227	16%
Located within AVA ORS 195.300(10)(f)	779	40%	880	26%	635	44%
Total High-Value Farmland (merged)	1,305	68%	1463	44%	1,006	70%
Notes: * Acreage is based on GIS data from OWRD, which is less than the 325.7 acres authorized by Water Right Cert: 57620. Approximately 194 of these acres are located on Class II soils.						

2

Figure 7: High-value Farmland within the Proposed Solar Micrositing Area

1

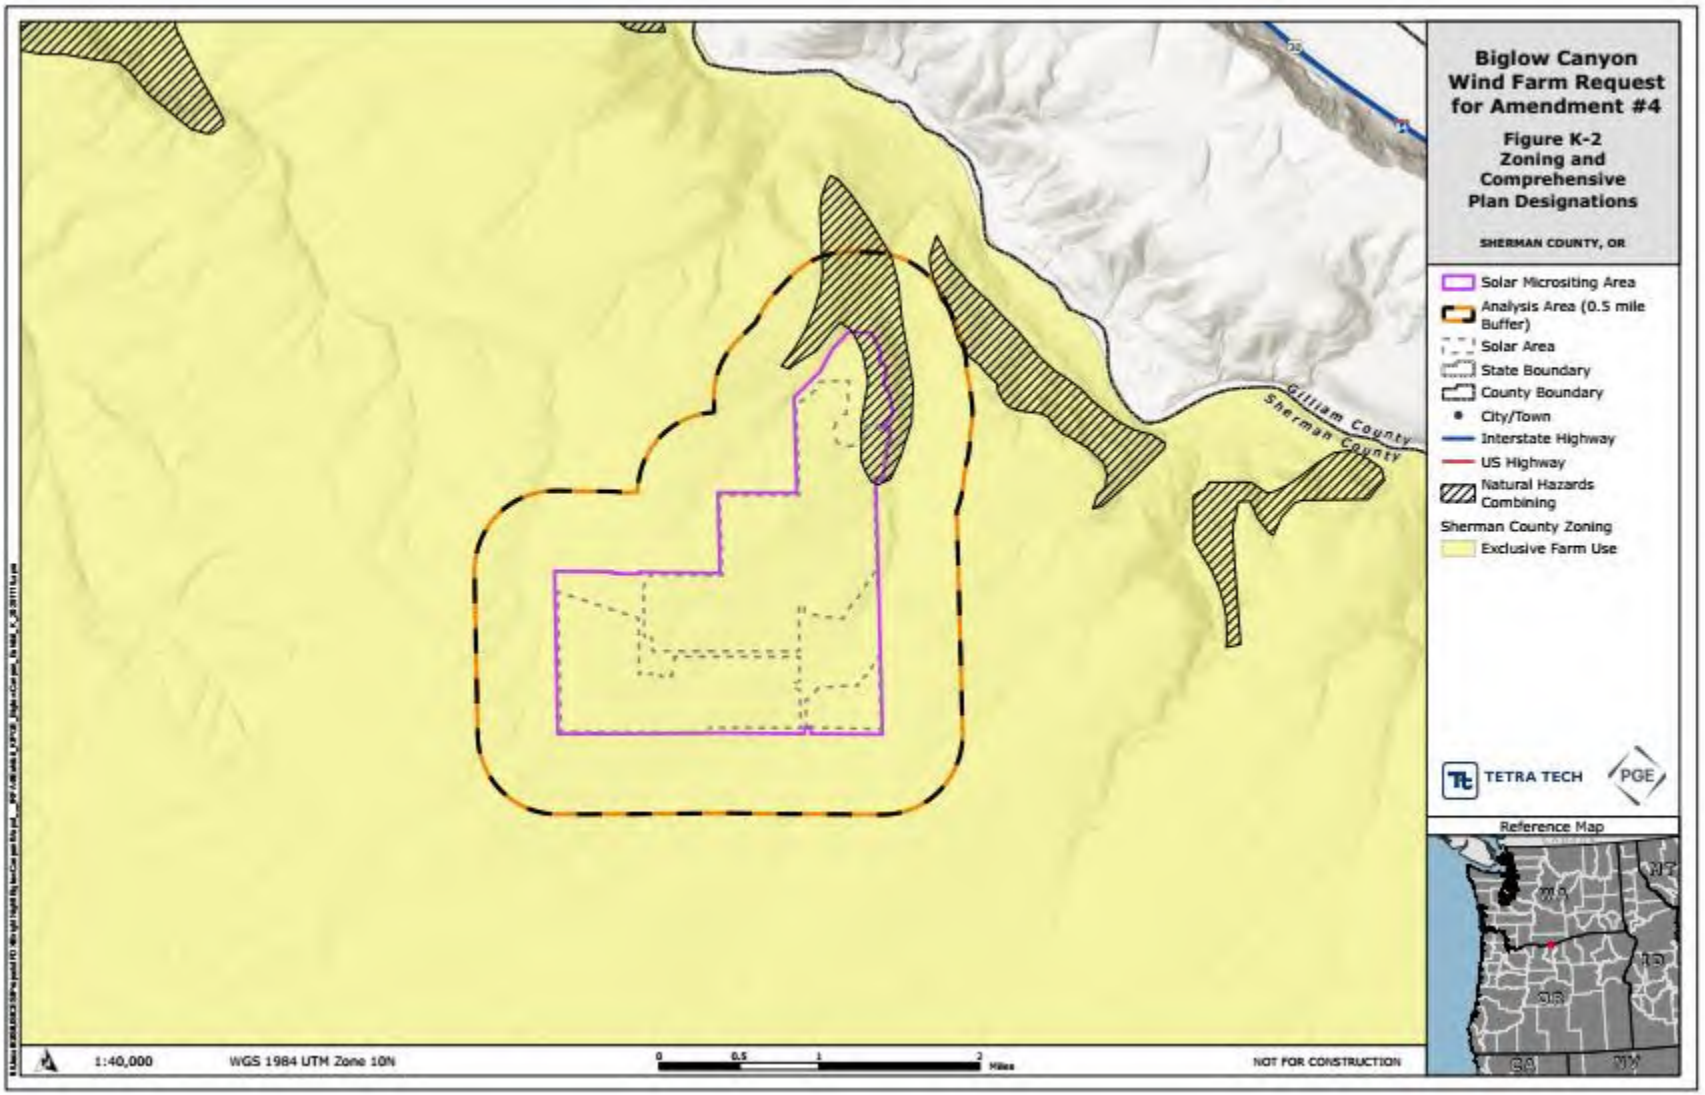
Local Applicable Substantive Criteria

As shown in Figure 8, below, all land within the analysis area is in Sherman County and is located entirely within the County's Exclusive Farm Use (F-1) Zone. Portions of the analysis area and the proposed Solar Micrositing Area are also located within the County's Natural Hazards (NH) combining zone.[147]

On April 30, 2025, the Department requested recommendations for Applicable Substantive Criteria from the Sherman County Court, as the Special Advisory Group for the facility appointed under ORS 469.480.[148] "Applicable substantive criteria" includes criteria from Sherman County's acknowledged comprehensive plan and land use regulations that are required by the statewide planning goals and in effect on the date preliminary RFA4 was submitted, April 21, 2025, and any Land Conservation and Development Commission administrative rules and goals and any land use statutes that apply directly to the facility under ORS 197.646.

Table 12 below provides the applicable substantive criteria from the Sherman County Zoning, Subdivision, Partitioning, and Land Development Ordinance of 1994 (SCZO) as amended by Ordinances 22-05-2003 and 24-06-2003, as recommended by the SAG.[149]

Table 12: Applicable Substantive Criteria from the Sherman County Zoning Ordinance (SCZO)



Section	Title
Section 3.1	Exclusive Farm Use Zone, F-1 Zone
Section 3.6	Significant Resource Combining Zone
Section 3.7	Natural Hazards Combining Zone
Section 5.1	Authorization to Grant or Deny Conditional Uses
Section 5.2	General Criteria
Section 5.3	General Conditions
Section 5.8	Standards Governing Specific Conditional Uses

[147] BCWAMD4Doc21-06 RFA Exhibit K Land Use 2025-12-10, Section 2.0.

Figure 8: Land Use Zones within Analysis Area

SCZO Section 3.1 Exclusive Farm Use Zone, F-1 Zone

> *3. Conditional Uses Permitted - In an F-l Zone, the following uses and their accessory uses are permitted when authorized in accordance with the requirements of Article 5 of this Ordinance and this Section:*
>
> ***
>
> *(q) Commercial utility facilities.*

The facility components proposed in RFA4 would generate power for public use by sale, and is considered to be a commercial utility facility, which under SCZO 3.1.3(q) is a conditionally permitted use in Sherman County's F-1 Zone. For the purposes of the land use evaluation, all proposed related or supporting facilities are considered to be part of, or accessory to, the solar photovoltaic power generation facility. The proposed solar photovoltaic power generation facility's compliance with SCZO Article 5 is evaluated below.

Because the facility components proposed in RFA4 are a permitted conditional use, a Conditional Use Permit must be obtained from the County subject to the provisions of ORS 469.401(3). To ensure the certificate holder obtains the permit prior to beginning construction of the facility components proposed in RFA4, the Council imposes the following condition:

Land Use Condition 3 (PRE-LU-01)

a. Prior to construction of any component or phase of the solar facility, the certificate holder shall submit, to the Department and the Sheman County Planning Commission, an application for Conditional Use Permit meeting the requirements of SCZO Section 5.4(1) and (3).
b. The Site Plan required under SCZO 5.4(1) must demonstrate compliance with all site certificate conditions and the local applicable substantive criteria addressed in the Final Order on AMD4.
[Final Order on AMD4]

> *(z) Construction, reconstruction, or widening of highways, roads, bridges or other transportation projects that are in the Sherman County Transportation system plan.*

The certificate holder identifies SCZO 3.1.3(z) as applicable to the facility components proposed in RFA4, stating: "…If improvements to county roads are required for construction of the solar facility, they would likely be in the form of road widening and/or improving the surface condition. To be conservative, it is assumed that the roads receiving improvements will be roads within the Sherman County Transportation System Plan."[150] The certificate holder has

[150] BCWAMD4Doc21-06 RFA Exhibit K Land Use 2025-12-10, Section 5.2.1.2.

also proposed amendments to Site Certificate 17 that would authorize public road improvements.

While the certificate holder is correct that road widening or other improvements to roads included in the Sherman County Transportation Plan would be a conditionally permitted use under SCZO 3.1.3(z), no road improvements are proposed as part of RFA4, and the certificate holder specifically represents that it does not anticipate that improvements of or alterations to existing public roads will be required for the construction and operation of the proposed solar components.[151]

Because no modifications of existing roads are proposed by the certificate holder, or anticipated to the required for, the construction of the proposed solar components, the Council finds that SCZO 3.1.3(z) is not applicable to the facility components proposed in RFA4. The Council rejects the certificate holders' proposed changes to Condition 17. As described in Section III.A, *General Standard of Review*, the Council finds the condition is no longer effective and deletes it in its entirety. The Council further finds that if the certificate holder determines that improvements or modifications of public roads are necessary for the construction of the facility components proposed in RFA4, that the certificate holder must obtain any required approvals for the modifications directly from the County or seek an amendment to the site certificate.

> *4. Dimensional Standards - In an F-1 (EFU) Zone, the following dimensional standards shall apply:*
>
> *(a) New farm parcels shall be a minimum of 80 acres.*
>
> *(b) MINIMUM LOT SIZE-NON-FARM PARCELS. Non-farm parcels allowed pursuant to the provisions of this Ordinance and more specifically this Section, shall meet the following standards:*
>
> *1) Shall be of adequate size and dimensions to meet applicable setback requirements.*
>
> *2) Shall be of the minimum size necessary to accommodate the intended use and provide for subsurface sewage disposal thereof.*
>
> *3) Each such parcel shall contain a minimum of I Net Buildable Acre as defined in section 1.4 of this Ordinance.*
>
> *(c) SETBACK (YARD) REQUIREMENTS. In an F-l (EFU) Zone, the minimum setback requirements shall be as follows:*

[151] BCWAMD4Doc21-01 RFA Div27 2025-12-10, Section 4.1.3.6, Table 1.

1) The front and rear yard setbacks from the property line shall be 30 feet, except that the front yard setback from the right-of-way line of an arterial or major collector road or street shall be 50 feet unless approved otherwise by the Planning Commission.

2) Each side yard setback from a property line shall be a minimum of 25 feet, and for parcels or lots involving a non-farm residential use with side yard(s) adjacent to farm lands, said adjacent side yards shall be a minimum of 50 feet unless approved otherwise by the Planning Commission.

The certificate holder does not propose to divide any existing lots or create new parcels, as such SCZO 3.1.4(a) and (b) are not applicable to the review of RFA4. The setback requirements of SCZO 3.1.4(c) would apply to the proposed solar components.

As described in SCZO 3.1.4(c)(1), the minimum setback for structures is generally 30 feet from front and rear lot lines and 25 feet from side lot lines, except when a property is fronted by an arterial or major collector road or street, in which case the minimum front setback is 50 feet from the right-of-way line. As defined in SCZO 1.4, a "lot line" is the property line bounding a "lot", and a lot in turn is:

A parcel, tract, or area of land whose boundaries have been established by some, legal instrument, which is recognized as a separate legal entity for purposes of transfer of title, has frontage upon a public or private street, and complies with the dimensional requirements of this code.

In the Final Order on the ASC, the Council imposed Site Certificate Condition 20, requiring the wind power generation facility to comply with the minimum setback requirements of the ordinance. The Council maintained this condition despite a recommendation from the Department that a 50-foot setback requirement be imposed based on representations made by the certificate holder.[152]

In this proceeding, the certificate holder once again represents that all above ground facility components would be set back at least 50 feet from all property lines to maintain compliance

[152] BCWAPPDoc94 BCW Final Order 2006-06-30; pg. 43-44. Site Certificate Condition 20 specifically excludes aboveground power collection lines, transmission lines, and junction boxes from the setback requirements for the wind facility. In granting the exclusion, the Council found that the proposed wind facility would not comply with the requirements of SCZO 3.1.4(c) but found that the proposal to site aboveground electrical collection and transmission components along property lines and public rights-of-way would nevertheless comply with Statewide Planning Goal 3 because it would reduce impacts of the facility on continued agricultural operations at the site. The certificate holder has not requested a similar exclusion for the facility components proposed in RFA4; however, even if it had, the Council finds that such an exclusion is not necessary because all proposed electrical collection system cables would be installed underground, and, as utility facilities necessary for public service, the associated transmission lines are permitted outright under ORS 215.283 and are not subject to additional local restrictions.

with the ordinance, and also to demonstrate compliance with the Council's Wildfire Prevention and Risk Mitigation Standard.[153] As explained in Section III.O., *Wildfire Prevention and Risk Mitigation*, the 50-foot setback from the property line of a non-participating landowner to the perimeter fence of a solar array would be in addition to a20-foot clear, brush free area around the perimeter of the arrays, and would create an additional buffer between the facility components proposed in RFA4 and adjacent uses.

Consistent with these representations, and in accordance with the requirements of SCZO 3.1.4(c)(1), the Council adopts a new condition requiring the outer-perimeter fence of all solar array areas to be setback at least 50 feet from all property lines with nonparticipating landowners and public roads:

> **Land Use Condition 1 (GEN-LU-10)**
> All aboveground components of the solar facility, including perimeter fences, must be setback at least 50 feet from:
> a. The right-of-way line of an arterial or major collector road or street, including, but not limited, to Hilderbrand Lane (Old Wasco-Heppner Highway);
> b. The property line extending along a public road not described in (a); and
> c. Any property line with a tract that is not within the Solar Micrositing Area.
> [Final Order on AMD4]

SCZO Section 3.6 Significant Resources Combining Zone

> *In a (SR) Combining Zone, the following regulations shall apply:*
>
> *1. Purpose - The purpose of this Zone is to protect significant mineral, geothermal, scenic, natural, unique, archaeological and historical resources identified and so designated by the County's Comprehensive Plan, and to permit development which is compatible with such resources and the applicable protection measures.*
>
> *2. Application - This Zone shall be applied to those sites and resources designated as Significant Resource Sites in the County's Comprehensive Plan Goal 5 Significant Resource Inventory and determined by said Plan to be worthy of full protection (i.e. a 3A Site), or a limited protection site (i.e. a 3C Site) against identified conflicting uses. Such resources identified for ongoing inventories as potential resources shall not be subject to this Zone until, as a result of such inventory(s), said resources are officially designated as a significant resource.*
>
> *3. Permitted Uses - If a use or activity permitted Outright in the underlying Zone is listed herein as a Conflicting Use or Activity it shall become a*

[153] BCWAMD4Doc21-06 RFA Exhibit K Land Use 2025-12-10, Section 5.2.1.3.

Conditional Use subject to the provisions of this Zone. If a use or activity permitted as a Conditional Use in the underlying Zone is listed herein as a Conflicting Use or Activity it shall be reviewed for compliance with the provisions of this Zone as an integral part of the overall Conditional Use Permit process as well as the approval requirements of the underlying Zone and Article 6 of this Ordinance.

4. Review Process and Procedures

(a) When a 3A decision (i.e. To fully protect the subject resource) has been made for the significant resource as designated by the County's Plan, any application for a conflicting use or activity listed herein shall be denied unless the applicant can clearly demonstrate that the proposed use or activity will have no significant negative impacts on the resource, or that such impacts can be effectively mitigated, and findings to that effect are established by the designated County Official or the Planning Commission. Findings to this effect shall be based, at a minimum, on consultation with the responsible agency(s) listed within the provisions of this Zone applicable to the subject impacted resource.

(b) When a 3C decision (i.e. Partial Resource Protection) has been made for the significant resource as designated by the County's Plan, any application for a conflicting use or activity shall be reviewed according to the requirements set forth below:

1) The applicant shall submit a map(s) of the location of the resource site affected by the proposed use or activity, and a written description of the resource type and the potential impacts, positive or negative, of the proposed use or activity.

2) The applicant shall submit a written statement stipulating to the proposed mitigation measures to be provided for to minimize or eliminate any potential adverse impacts on the subject resource.

3) The applicant shall consult with the responsible resource agency(s) listed in this Zone for the purpose of identifying any limitations on the sitting, construction, operation or maintenance of the proposed use or activity, which would effectively reduce or eliminate any negative impacts to the subject resource site.

4) In addition to other applicable requirements of this and other County Ordinances, the subject application shall only be approved if it is clearly demonstrated that the proposed use or activity will have no significant

negative impact on the subject resource site, or that the reduced preservation review criteria set forth in Subsection 5 are met.

5. Reduced Preservation Review Criteria - The environmental, social, economic and energy consequences of allowing the proposed use or activity shall be described in sufficient detail to provide a clear demonstration that the applicable criteria below are met:

(a) All Significant Resource Sites.

1) The resource site shall not be altered or impacted to the point where it no longer has any significant resource value.

2) The amount of alteration of or impact to the significant resource shall be the minimum necessary to accomplish the purpose of the proposed use or activity.

3) An alternative site for the proposed use or activity, which would have less impact on the resource value of the site, does not exist on the applicant's lot or parcel or on contiguous lots or parcels that are reasonably available for the proposed use.

** * * * **

(c) Mineral and Aggregate Resource Sites.

1) A conflicting use listed under Subsection (6) of this Section within 1,320 feet from a significant mineral or aggregate resource site (active or potential) may be required to establish setbacks in excess of those required in the underlying primary zone. The required setback shall be determined by the County after consultation with the applicant and the owner/operator of the mineral resource land (or vice versus) to insure visual and sound screening between present and future resource uses and the conflicting use or activity. Such setbacks shall be no less than that set forth by the primary zone.

** * * * **

6. Conflicting Uses and Activities

** * * * **

(g) Mineral and Aggregate Resources.

1) Any permanent use, which reasonably precludes the development and use of such resource for the use designated or intended.

2) Residential, church, schools, medical care facilities and other noise or dust sensitive uses.

3) Public recreation use or development.

4) Wildlife habitat area or scenic waterway.

5) Tourist or travelers accommodations.

6) Dude or guest ranch, or resort facility.

7) Manufactured Home Park or RV campground.

** * * * **

In 2006, the Sherman County Court adopted Ordinance 32-2006 adding an aggregate resource site in Tax lot 02N18E00003900 to the County's Goal 5 inventory. The tax lot containing the site is owned by Robert and Alda Scharf. The adopting ordinance identified the Scharf Site as a "small significant site" worthy of full protection (i.e., a 3A Site). The site was approved by the Oregon Department of Geology and Mineral Industries under Permit No. 28-0032.

While commercial energy facilities or utility facilities are not necessarily considered a conflicting use for aggregate sites, the construction and operation of the facility components could preclude the development and use of the aggregate site if the aggregate site was occupied by facility components or access to the site was blocked by fences or other components. As such, the Council finds the facility is a conflicting use under SCZO Section 3.6(6). Because a 3A decision was made to list the Scharf Aggregate site as a significant resource, the certificate holder must demonstrate that the construction and operation of the facility components proposed in RFA4 will have no significant negative impacts on the aggregate site and the criteria of SCZO 3.6(5) are met.

The preliminary site plan provided by the certificate holder shows that the active portion of the aggregate site would be outside of the proposed solar array fencelines and that access to the site from Herin Lane would be maintained. To ensure that impacts to the aggregate site are minimized, the certificate holder represents that the solar components will be set back at least 30 feet from the boundary of the significant aggregate resource site. The certificate holder provided confirmation from the landowner that the 30 foot setback was sufficient to avoid impacts to the aggregate site, and the certificate holder further represented that it will coordinate with the landowner during construction to ensure minimal disruption to on-going

aggregate mining activities, and that the site may be used as a source of a source of aggregate for the construction of the facility. [154]

While the proposed setback appears to be sufficient to ensure that construction and operation of the facility components proposed in RFA4 would not directly impact aggregate mining operations at the site, the Council finds that it is the certificate holder's responsibility to ensure that the facility components proposed in RFA4 are designed to be compatible with the aggregate mining operations and may not require the mining operation to curtail or alter operations to reduce the impacts of the mining operation (e.g. dust generated by mining activity or road use) on the proposed solar facility.

To ensure that impacts to the aggregate site are avoided, as represented by the certificate holder, the Council imposes Land Use Condition 2, as presented below:

> **Land Use Condition 2 (GEN-LU-11)**
> All components of the solar facility, including perimeter fences, must be setback at least 30 feet from the aggregate site located on Tax lot 02N18E00003900, as identified in Sherman County Ordinance 32-2006. Facility components must be arranged in a manner that allows for continued access to and operation of the aggregate site.
> [Final Order on AMD4]

Subject to compliance with the condition above, the Council finds that the construction and operation of the facility components proposed in RFA4 are not likely to result in significant impacts to the significant aggregate site and therefore comply with the requirements of SCZO Section 3.6.

SCZO Section 3.7 Natural Hazards Combining Zone

> *In any Zone that is combined with the (NH) Combining Zone, the requirements and standards of this Section shall apply in addition to those set forth in the primary zone, provided that if a conflict occurs, the more restrictive provisions shall govern.*
>
> *1. Purpose - The purpose of the (NH) Combining Zone is to promote and protect the public health, safety and general welfare and to minimize potential losses by providing guidelines for development in hazard areas. Development limitations are applicable to developments in areas of surface water accumulations and high groundwater, unstable or fragile soils, geological hazards, and steep slopes, generally those of 30 percent or greater.*

[154] BCWAMD4Doc21-06 RFA Exhibit K Land Use 2025-12-10, Section 5.2.2.

2. Uses Permitted Outright - In a Zone with which the (NH) Zone is combined, the following uses are the only uses permitted outright, and these uses are permitted as such if so permitted by the underlying primary zone.

(a) Agricultural uses conducted without locating a structure, except for boundary fences, and, so restricted as to prevent destruction of vegetation sufficient to cause or increase erosion hazards, and so restricted as to prevent the contamination of surface or ground waters.

(b) Industrial or commercial uses that do not require a structure other than surfacing at ground level such as a loading and/or parking area, or that requires only temporary structures that will not necessitate ground excavation for placement or impede surface water flows.

(c) Recreational uses that require no permanent structures, alteration of natural geology, or vegetation removal without immediate replacement.

(d) Portions of a residential use that do not contain buildings such as a lawn, garden, parking or play area, or a related use thereof that does not require excavation or alteration of the natural geology, or vegetation removal without immediate replacement.

3. Conditional Uses - In any Zone with which the (NH) Zone is combined, all uses permitted by the primary Zone, except those set forth in Subsection (2) above, shall be permitted only as Conditional Uses and subject to the provisions of this Zone and the primary Zone. Said permits shall be processed in accordance with the provisions set forth for a Conditional Use, or as set for by this Ordinance.

4. Permit for Use or Development in a (NH) Zone - No person shall construct, reconstruct, or install a use or development unless a permit therefore has been received, except for those uses permitted as Outright by Subsection (2) of this Section. Except for the improvement of an existing structure which is less than substantial as determined by a Certified Building Official or the County upon appeal, no permit shall be issued unless the use or development will be determined to be reasonably safe from the applicable hazard, and otherwise in compliance with the provisions of this Section, the ~ Zone, this Ordinance and other applicable regulations.

5. Application Requirements for a Use in a (NH) Zone - An application for a use or development in a Zone with which the (NH) Zone is combined, shall be accompanied by the following:

(a) Site Investigation Report: An application for a use or development in a (NH) Zone requires a site investigation report for the subject-affected area. The site investigation report shall provide information on the site of the proposed use or development and surrounding and adjacent lands that are most likely to be affected thereby. Unless the County determines that specific items are not required, the report shall include the information described in this Subsection, together with appropriate identification of information sources and the date of the information. The approved site investigation report may be required to be referenced in the deed and other documents of sale, and may be required to be recorded with the deed of record.

(b) Background Data in Report. At a minimum, the Site Investigation Report shall contain the following background information:

1) A general analysis of the affected site and general area's topography and geology, including faults, folds, geologic and engineering geologic units, and any soils, rock and structural details important to the engineering or geological interpretations and the their relative activity.

2) Location and approximate depths of seasonal surface water accumulations and groundwater tables, and location and direction of all watercourses, including intermittent flows.

3) A history of soil and water related problems on the site and adjacent lands, which may be derived from discussions with local residents and officials and the study of old photographs, reports and newspaper files.

4) The extent of the surface soil formation and its relationship to the vegetation of the site, the activity of the landform, and the locations on the site and surrounding areas.

5) The following ground photographs of the site and surrounding areas with information showing the scale and date of photographs and their relationship to the topographic map and profiles:

A. A view of the general area.

B. The site of the proposed development.

C. Any features which are important to the interpretation of the hazard potential of the site, including all sites of erosion, surface or groundwater accumulations, or accretion.

(c) Topography Map. A topography base map at a scale of not more than 1:100 with a contour interval of 2 feet shall be prepared identifying the following features and accompanied by references to the source(s) and date(s) of information used.

1) Position of lot lines.

2) Boundaries of the property.

3) Each geological feature classification type.

4) Areas of open ground and the boundaries and species identification of major plant communities.

5) Any springs, streams, marshy areas, standing bodies of water, intermittent waterways, drainage ways, and high groundwater areas with highest annual levels.

6) Cut terraces, erosion scarps, and areas exhibiting significant surface erosion due to improper drainage and runoff concentration.

7) Geological information, including lithologic and structural details important to engineering and geologic interpretations.

(d) Subsurface Analysis. If upon initial investigation if it appears there are critical areas where the establishment of geologic conditions at specific depths is required, a subsurface analysis obtained by drilling holes, well logs, and other geophysical techniques shall be conducted, or caused to be conducted by a qualified expert, by the person responsible for the site, and investigation report to include the following data as appropriate:

1) The lithology and compaction of all subsurface horizons to bedrock.

2) The depth, width, slope and bearing of all horizons containing significant amounts of silt and clay and any other subsurface layers which could reduce the infiltration of surface waters.

(e) Development Proposal. The site investigation report shall include the following information on the proposed development as applicable:

1) Plans and profiles showing the position and height of each structure, paved areas, and areas where cut and fill is required for construction.

2) The percent and location of the surface of the site, which will be covered by impermeable surfaces.

3) A stabilization program for the development describing:

A. How much of the site will be exposed during construction and what measures will be taken to reduce erosion and soil movement during construction.

B. A revegetation plan designed to return open soil areas, both preexisting and newly created, to a stable condition as soon as possible following construction and the period of time during which revegetated areas will receive revegetation maintenance.

C. Areas to be protected from vegetation loss or ground water pollution shall be identified and means for protection described.

(f) Conclusions in the Site Investigation:

1) The site investigation report shall contain conclusions stating the following:

A. How the intended use of the land is compatible with the natural conditions; and

B. Any existing or potential hazards noted during the investigation.

2) Mitigating recommendations for specific areas of concern shall be included.

3) Conclusions shall be based on data included in the report, and the sources of information and facts relied upon shall be specifically referenced.

6. Standards for Building Construction in NH Zone

(a) Building construction shall only be approved under conditions that do not adversely affect geological stability, surface or ground waters, or vegetation.

(b) The grading of land and the orientation and design of buildings shall avoid creating conditions that will cause erosion or accretion of soil, or surface and ground water contamination. Where there is some risk of these conditions occurring, a Qualified Geological or Hydrological Expert, whichever is applicable, shall certify that the design and control measures will comply with this standard.

(c) Construction work shall be scheduled and conducted to avoid erosion, and temporary stabilization measures may be needed until permanent installations are accomplished.

7. Standards for an Access Route in a NH Zone - An access route within a (NH) Zone shall comply with the following provisions:

(a) A road or street shall be stabilized by planking, gravel or pavement as deemed necessary; and

(b) Roadways shall be built without installation of excessive fill, diversion of water, or excessive cuts unless the site investigation determines that such conditions will not be detrimental to the area or create unwarranted maintenance problems or additional hazards.

8. Regulations Not a Guarantee - The degree of natural hazard protection afforded by the provisions of this Section or this Ordinance is considered reasonable for regulatory purposes and is based upon engineering and scientific methods of study. Greater hazards than those anticipated by these provisions may occur on occasion, or the natural hazard may be increased by human or natural causes. The identification of areas subject to natural hazards pursuant to the provisions of this Section does not imply that lands outside such areas will be free from such hazards. This Section, nor this Ordinance, shall not create liability on the part of the County or any officer or employee thereof for any damages that result from reliance on the provisions or designations of this Section or this Ordinance, or any administrative decisions lawfully made thereunder.

As shown in Figure 8, above, the area within and immediately adjacent to the northeastern corner of the proposed Solar Micrositing Area is within a Natural Hazards (NH) Combining Zone. The NH Zone is located along areas of steep slopes along Biglow Canyon and its tributaries.

The proposed solar facility is not a use permitted outright in the NH Zone under SCZO 3.7(2) because it is a commercial or industrial use that would require permanent structures to be installed above grade. As such the portions of the facility components proposed in RFA4 in the NH Zone are subject to the provisions of SCZO 3.7(5) to (8). As stated in SCZO 3.7(1), the development limitations in the ordinance apply in hazard areas, including areas with unstable or fragile soils, geological hazards, and steep slopes.

In the area overlapping the NH Zone, the proposed Solar Micrositing Area boundary generally follows the edges of cultivated lands which are on the plateau above the canyons. As discussed in Section III.C., *Structural Standard*, erodible and collapsible soils are present in these areas, but slopes are generally less than 30 percent within the proposed Solar Micrositing Area and

DOGAMI maps show that landslide susceptibility is generally moderate, but some hazard areas are present along the northern fork of Biglow Canyon.

The certificate holder proposes that the Council include a condition of approval requiring the certificate holder to submit an application for a "Permit for Use or Development in an NH Zone to Sherman County" if it determines that the NH zone or hazard areas cannot be avoided.[155] The Council rejects this proposed condition for two reasons. First, the certificate holder has elected to demonstrate compliance with the statewide land use planning goals by obtaining a Council determination that the construction and operation of the facility complies with applicable substantive criteria for the land use decision. As provided under SCZO 3.7(3), a decision to authorize development in the NH Zone must be processed as part of the overall decision to authorize the construction and operation of the facility as a conditional use in both the primary and combining zone. As such, the Council finds that a condition deferring approval for siting facility components in a hazard zone is likely impermissible both under the requirements of SCZO 3.7 and the Council's land use standard. Second, as described above, the development limitations of the NH zone only apply in hazard areas. The certificate holder relies on representations that these areas would be avoided, in part, to demonstrate compliance with the Council's standards, including but not limited to the Structural and Soil Protection Standards. These areas are also avoided in the layout of the facility components proposed in RFA4. [156] As described in Section III.C., *Structural Standard*, Amended Condition 68 would prohibit the certificate holder from siting facility components in hazard areas, including areas with slopes exceeding 20 percent, high landslide susceptibility areas, and other geologic hazards the NH zone is intended to protect against.

For areas that are in the NH zone, but not in hazard areas, the Council finds that existing and conditions of approval are adequate to ensure compliance with the requirements of SCZO 3.7.

As discussed in Section III.C., Structural Standard, the certificate holder will perform site-specific geotechnical work to inform the final design of the proposed solar components. In addition, as discussed in Section III.D, *Soil Protection*, Soil Protection Conditions 1 to 3 would require the certificate holder to finalize the draft Comprehensive Solar Revegetation and Soil Management Plan included as Attachment D to this order based on final facility design and the approved NPDES General Permit 1200-C for the facility, and to conduct all construction work in compliance with the plan. The plan would include an ESCP which prescribes BMPS to reduce the potential for erosion and stormwater discharges into waterways.

Subject to compliance with the conditions described above, the Council finds that the construction and operation of the facility components proposed in RFA4 would comply with the requirements of SCZO Section 3.7.

<u>SCZO Section 5.1 Authorization to Grant or Deny Conditional Uses</u>

[155] BCWAMD4Doc21-03 RFA Exhibit H Geological Soil Stability 2025-12-10, Section 5.2.2.

[156]BCWAMD4Doc21-06 RFA Exhibit K Land Use 2025-12-10, Section 5.2.3.

Uses designated in this Ordinance as Conditional Uses may be permitted, enlarged or otherwise altered when authorized in accordance with the standards and procedures set forth in this Ordinance. In the case of a use existing prior to the effective date of this Ordinance, a change in use, enlargement or alteration of such use shall conform to the provisions of a conditional use if so classified. An application for a Conditional Use may be approved, modified, approved with conditions, or denied by the designated authority.

As described above, the certificate holder has elected to demonstrate compliance with the Statewide Planning Goals under ORS 469.504(1)(b), and as such the Council is responsible for determining whether the facility components proposed in RFA4 comply with the applicable substantive criteria from the affected local government's acknowledged comprehensive plan and land use regulations that are required by the statewide planning goals and in effect on the date the application is submitted, and the provisions of ORS chapters 197 and 215 and OAR chapter 660 that apply directly to the facility under ORS 197.646.

SCZO Section 5.2 General Criteria

In determining whether or not a Conditional Use proposal shall be approved or denied, it shall be determined that the following criteria are either met or can be met through compliance with specific conditions of approval.

1. The proposal is compatible with the County Comprehensive Plan and applicable Policies.

The Sherman County Comprehensive Plan includes goals and policies implementing the Statewide Planning Goals. The County did not recommend any specific policies or goals of the comprehensive plan as applicable substantive criteria for the review of the facility components proposed in RFA4, and as such, the Council finds that compatibility with the substantive policies and goals of the Comprehensive Plan is adequately addressed through the evaluation of the implementing ordinances of the Sherman County Zoning Ordinance, specifically the requirements of SCZO Sections 3.1, 3.6, 3.7, the provisions of ORS chapters 197 and 215 and OAR chapter 660 that apply directly to the facility under ORS 197.646.; and the Council's standards.

In addition, the Council finds that compliance with the procedural requirements of ORS chapter 469 and OAR chapter 345 are adequate to ensure compatibility with the policies and goals implementing Statewide Planning Goal 2 (Citizen Involvement) established in Section VIII of the Comprehensive Plan.

2. The proposal is in compliance with the requirements set forth by the applicable primary Zone, by any applicable combining zone, and other provisions of this Ordinance that are determined applicable to the subject use.

As described above, the facility components proposed in RFA4 are located entirely within Sherman County's F-1 Exclusive Farm Use zone, and a small portion is also located within the NH combining zone. Compliance with the requirements of SCZO 3.1, 3.6, and 3.7 are evaluated above. As described in the evaluation of directly applicable state rules and laws under ORS 197.646, below, the County has not adopted the minimum standards for solar photovoltaic facilities sited on EFU land and as such the provisions of OAR 660-033-0130 are directly applicable to the review of the facility components proposed in RFA4, the facility components proposed in RFA4 would exceed the maximum amounts of arable and high-value farmland allowed under OAR 660-033-0130(38), and for this reason cannot be approved without an exception to Statewide Planning Goal 3.

3. That, for a proposal requiring approvals or permits from other local, state and/or federal agencies, evidence of such approval or permit compliance is established or can be assured prior to final approval.

As described in Section III.B., *Organizational Expertise*, the Council finds the certificate holder has demonstrated that it has the capability to obtain all applicable federal, state, and local permits needed for the construction and operation of the facility components proposed in RFA4; and Organizational Expertise Condition 9 would require that the certificate holder, or its third party contractor has obtained all necessary permits prior to beginning construction of the facility components proposed in RFA4.

4. The proposal is in compliance with specific standards, conditions and limitations set forth for the subject use in this Article and other specific relative standards required by this or other County Ordinance.

Compliance with the Conditional use standards established in SCZO 5.8 is evaluated below.

5. That no approval be granted for any use which is or expected to be found to exceed resource or public facility carrying capacities, or for any use which is found to not be in compliance with air, water, land, and solid waste or noise pollution standards.

As described in Section III.M., *Public Services*, the Council finds that subject to existing and new conditions of approval, the construction and operation of the facility, with the proposed changes in RFA4, will not cause a significant adverse impact on the ability of public service providers to provide services.

As described in Section IV.A., *Noise Control Regulations,* the Council finds that, subject to compliance with existing, amended, and new conditions of approval, the facility, with the

changes proposed in RFA4 will comply with the noise regulations established under OAR 340-035-0035.

As described throughout this Order, the Council finds that the facility components proposed in RFA4 would generally comply with applicable air, water, and solid waste standards; however, as described in the evaluation of directly applicable state rules and laws under ORS 197.646, below, the facility components proposed in RFA4 would exceed the maximum amounts of arable and high-value farmland allowed under OAR 660-033-0130(38), and for this reason cannot be approved without an exception to Statewide Planning Goal 3.

6. That no approval be granted for any use violation of this Ordinance.

The proposed facility is not a use violation, therefore this section of SCZO 4.2 is not applicable.

SCZO Section 5.3 General Conditions

In addition to the standards and conditions set forth in a specific Zone, this Article, this Ordinance, and other applicable local, county, state and/or federal regulations, additional conditions may be imposed which are found to be necessary to avoid a detrimental impact on adjoining properties, the general area, or the County as a whole, and to otherwise protect the general welfare and interests of the surrounding area, the County as a whole and the general public. Such conditions may include, but are not limited to, the following:

1. Limiting the manner in which the use is conducted, including restricting the time an activity may take place, and restrictions to minimize environmental impacts such as noise, vibration, air or water pollution, glare and odor.

2. Establishing a special setback or other open space requirements, and increasing the required lot size or other dimensional standards.

3. Limiting the height, size or location of a building or other structure or use.

4. Increasing street width and/or requiring improvements to public streets and other public facilities serving the proposed use, even including those off-site but necessary to serve the subject proposal.

5. Designating the size, number, improvements, location and nature of vehicle access points and routes, and requiring pedestrian and/or bicycle ways.

6. Limiting or otherwise designating the number, size, location, height, and lighting of signs and outdoor or security lighting, and the intensity and/or direction thereof.

7. Requiring diking, screening, fencing, or other improvements or facilities deemed necessary to protect adjacent or nearby properties, and establishing requirements or standards for the installation and maintenance thereof.

8. Protecting and/or preserving existing trees, other vegetation, and water, scenic, historic, archaeological, unique, landmark, or other natural or manmade significant resources.

Throughout this Order, the Council imposes conditions of approval to ensure that the facility components proposed in RFA4 comply with all applicable local substantive criteria as well as all applicable State laws, rules, and Council Standards. The County has not recommended specific conditions of approval, and as such, no additional conditions of approval need be imposed under SCZO Section 5.3.

SCZO Section 5.8 Standards Governing Specific Conditional Uses

A Conditional Use set forth by this Ordinance shall be subject to review by the Planning Commission in accordance with the public hearing requirements set forth in this Ordinance.

** * * * **

10. Radio or Television Transmitter Tower, Utility Station or Substation - When authorized as a Conditional Use, the following standards and limitations shall apply:

(a) In a residential zone or area, all equipment storage on the site shall be enclosed within a building.

The facility components proposed in RFA4 are not located in a residential zone or area; therefore, the requirements of SCZO 5.8.10(a) do not apply.

(b) The use may be required to be fenced and provided with landscaping.

While this is described as an optional requirement, the National Electric Safety Code generally requires utility substations to be fully enclosed, and as described in Section I.E.3, the certificate holder represents that the proposed collector substations would be fenced or would be entirely within the proposed solar array fenceline. Amended Condition 103 would require the certificate holder to design, construct, and operate the facility, substantially as described in the site certificate.

(c) Coloring of structures, buildings and other permanent installations shall be of neutral colors or as otherwise required by the Commission or reviewing authority.

The Council previously imposed Site Certificate Conditions 50 and 51, requiring the certificate holder to paint wind facility structures with a low-reflectivity neutral-color finish. As described below, the Council imposes a similar condition for the solar facility components to maintain compliance with SCZO 5.8.10(c) and 14(b).

** * * * **

14. Public Facilities and Services

(a) Public facilities including, but not limited to, utility substations, sewage treatment plants, storm water and water lines, water storage tanks, radio and television transmitters, electrical generation and transmission devices, fire stations and other public facilities shall be located so as to best serve the County or area with a minimum impact on neighborhoods, and with consideration for natural or aesthetic values.

The Council finds that, as an electric generation facility, the requirements of SCZO 5.8.14 apply to the proposed solar facility. As described in Sections III.F., *Protected Areas,* III.J., *Scenic Resources,* and III.L., *Recreation,* the proposed solar facility is not expected to create significant visual impacts on any protected area, scenic resources, or recreational opportunities. While the facility components would be visible to nearby residences, the solar components are expected to be visually subordinate to existing wind and transmission facilities that are dominant on the landscape. Based on the Zone of Visual Influence Analysis provided to support the Scenic Resources exhibit, the facility components proposed in RFA4 would not be visible from any incorporated communities in Sherman County. Because the facility components proposed in RFA4 would have minimal impacts on residential areas and scenic and aesthetic values, the Council finds this criterion to be satisfied.

(b) Structures shall be designed to be as unobtrusive as possible. Wherever feasible, all utility components shall be placed underground.

The Council previously imposed Conditions 50 and 51, requiring wind turbines and other structures associated with the wind facility to be painted with low-reflectivity, neutral finishes. The Council also imposed Condition 52 requiring lighting to be minimized to reduce nighttime visual impacts. The Council imposes a similar condition applicable to the facility components proposed in RFA4 to further ensure that the visual impacts of facility components proposed in RFA4 are minimized, as provided below:

Land Use Condition 4 (GEN-LU-12)

a. <u>All structures and equipment associated with the solar facility, including but not limited to, power conversion stations, O&M buildings, and battery enclosures, must be designed or painted with a low-reflectivity, neutral gray, white, off-white or earth tone finish that minimizes contrast with the surrounding landscape.</u>

b. The certificate holder may install a sign identifying the facility near each O&M building or collector substation. No other signs may be installed except as required by law or for facility safety or security

c. All lighting installed at the O&M buildings, substation, or other facility components, shall be limited in intensity, shielded, and directed downward in a manner that prevents the lighting from projecting onto adjacent properties and roadways.

[Final Order on AMD4]

The Council finds that, subject to compliance with the condition of approval, this criterion is satisfied.

(c) Public facilities and services proposed within a wetland or riparian area shall provide findings that: Such a location is required and a public need exists; and Dredge, fill and adverse impacts are avoided or minimized.

As discussed in Section IV.B., *Removal Fill,* the Council finds that, subject to compliance with Removal-Fill Condition 1, no impacts to wetlands or other waters of the state are expected to result from the construction or operation of the facility components proposed in RFA4. Accordingly, the Council finds that this criterion is satisfied.

20. Non-farm Uses in an F-1 Zone - Non-farm uses, excluding farm related, farm accessory uses, or uses conducted in conjunction with a farm use as a secondary use thereof, may be approved upon a finding that each such use:

The proposed solar facility and BESS are non-farm uses that would be located in Sherman County's F-1 Zone. Accordingly, the certificate holder must demonstrate that the facility components proposed in RFA4 comply with the Standards of SCZO 5.8.20.

1. Is compatible with farm uses described in [ORS] 215.203(2);

LCDC has adopted minimum standards for nonfarm uses in an EFU zone under OAR 660-033-0130, including standards for solar facilities under OAR 660-033-0130(38). As described in the evaluation below, the facility components proposed in RFA4 would use more high-value farmland and arable land than allowed under OAR 660-033-00130(38)(g) and (i). Accordingly, the Council finds that the facility components proposed in RFA4 are not compatible with farm use and cannot be approved without taking an exception to Statewide Planning Goal 3.

2. Does not interfere seriously with accepted farming practices on adjacent lands devoted to farm use;

Under ORS 215.296(1), a nonfarm use that is conditionally allowed in an EFU Zone may only be approved if the use will not:

"(a) force a significant change in accepted farm or forest practices on surrounding lands devoted to farm or forest use; or

(b) significantly increase the cost of accepted farm or forest practices on surrounding lands devoted to farm or forest use."

LCDC has adopted standards for evaluating whether or not a facility satisfies these criteria under OAR 660-033-0130(5). As discussed in more detail below, the Council finds that, subject to compliance with new and existing conditions of approval, the facility components proposed in RFA4 would not force a significant change in or significantly increase the costs of accepted farm practices on adjacent lands. Accordingly, the Council finds this criterion is satisfied.

3. Does not materially alter the overall land use pattern of the area;

As described in more detail below, under OAR 660-033-0130(38)(h)(G), the stability of an area's land use pattern would be materially altered if the cumulative effect of existing and potential nonfarm dwellings would make it more difficult for the existing types of farms in the area to continue operation due to diminished opportunities to expand, purchase or lease farmland, acquire water rights or diminish the number of tracts or acreage in farm use in a manner that will destabilize the overall character of the study area. While the test established in LCDC's rule is not directly applicable, the Council finds that it provides important context for evaluating compliance with this criterion.

The Council finds that the conversion of approximately 1,445 acres of cultivated land, including 1,006 acres of high-value farmland, to a nonfarm use does have the potential to materially alter the overall land use pattern of the analysis area by reducing the number of tracts available for farmland and potentially affecting the local agricultural economy, and as such, the Council finds that the criterion under SCZO 5.8.20(3) is not satisfied. Accordingly, the Council may not authorize the construction and operation of the facility components proposed in RFA4 without taking an exception to statewide planning goal 3.

4. Is situated upon generally unsuitable land for the production of farm crops and livestock, considering the terrain, adverse soil or land conditions, drainage and flooding, vegetation, location and size of the tract, and the availability of necessary support resources for agriculture;

Nearly all portions proposed Solar Micrositing Area that are not occupied by previously approved facility components are currently used for the production of farm crops. Accordingly, the Council finds that the criterion under SCZO 5.8.20(4) is not satisfied. Accordingly, the Council may not authorize the construction and operation of the facility components proposed in RFA4 without taking an exception to statewide planning goal 3.

5. Complies with other applicable significant resource provisions; and

The facility's compliance with the provisions of the County's Significant Resource Overlay Zone under SCZO Section 3.6 are evaluated above.

6. Complies with such other conditions as deemed necessary.

Throughout this Order, the Council imposes conditions of approval to ensure that the proposed solar facility complies with all applicable local substantive criteria as well as all applicable State laws, rules, and Council Standards. The County has not recommended specific conditions of approval, and as such, no additional conditions of approval need be imposed.

Directly Applicable State Rules and Statutes

OAR 660-033-0130(5) – Farm Impacts Test

(5) Approval requires review by the governing body or its designate under ORS 215.296. Uses may be approved only where such uses:

(a) Will not force a significant change in accepted farm or forest practices on surrounding lands devoted to farm or forest use; and

(b) Will not significantly increase the cost of accepted farm or forest practices on surrounding lands devoted to farm or forest use.

(c) For purposes of subsection (a) and (b), a determination of forcing a significant change in accepted farm or forest practices on surrounding lands devoted to farm and forest use or a determination of whether the use will significantly increase the cost of accepted farm or forest practices on surrounding lands devoted to farm or forest use requires:

(A) Identification and description of the surrounding lands, the farm and forest operations on those lands, and the accepted farm practices on each farm operation and the accepted forest practices on each forest operation;

As described above, the dominant accepted farming practice on lands adjacent to the proposed Solar Micrositing Area is the cultivation of dryland wheat, which typically includes a two-year cycle where half of the fields are left fallow each year to conserve moisture for the following year's crop. In addition to dryland wheat cultivation, approximately 125 acres in the analysis area are used for the cultivation of irrigated crops with an irrigation pivot.[157] Some non-cultivated lands located in the northeastern portion of the analysis area are also used for livestock grazing. A complete list of landowners within the analysis area and description of the

[157] See Permit: G 16704 * IR located within Analysis Area on Figure K-5; crops have included rotations of mint, garlic, and carrot seed.

accepted farming practices and nonfarm uses occurring on their lands is provided in Exhibit K, Table K-11.

> *(B) An assessment of the individual impacts to each farm and forest practice, and whether the proposed use is likely to have an important influence or effect on any of those practices; and*
>
> *(C) An assessment of whether all identified impacts of the proposed use when considered together could have a significant impact to any farm or forest operation in the surrounding area in a manner that is likely to have an important influence or effect on that operation.*
>
> *(D) For purposes of this subsection, examples of potential impacts for consideration may include but are not limited to traffic, water availability and delivery, introduction of weeds or pests, damage to crops or livestock, litter, trespass, reduction in crop yields, or flooding.*
>
> *(E) For purposes of subsection (a) and (b), potential impacts to farm and forest practices or the cost of farm and forest practices, impacts relating to the construction or installation of the proposed use shall be deemed part of the use itself for the purpose of conducting a review under subsections (a) and (b).*

As discussed in more detail below, the construction of the facility components proposed in RFA4 could potentially affect surrounding farm practices by increasing traffic on roads used by tractors and farm equipment, generating dust and stormwater discharges, and creating opportunities for the introduction and spread of noxious weeds and other nuisance plant species.

The operation of a solar photovoltaic power generation facility at the site is also not expected to interfere with accepted farming practices under normal conditions. The operation of solar photovoltaic facilities is not known to cause any direct impacts on adjacent crops or livestock and there are no emissions or effluents produced in the generation of electricity.

There would be some increased risk of wildfire associated with the presence of energized equipment and battery components at the site. In addition, there could be some minor increases in traffic and traffic-related impacts during the operation of the facility components proposed in RFA4.

Traffic

The expected traffic impacts of the facility components proposed in RFA4, generally, are discussed in Section III.M., Public Services. Potential traffic impacts on accepted farm practices include short-term delays or congestion that could affect tractor or equipment movement during harvest or other critical periods. The certificate holder notes that many of the

participating landowners were also operating during the construction of the existing wind facility and noted that construction related traffic could have some impacts on their operations and emphasized the need for coordinating traffic schedules around farm management road access needs.[158]

The certificate holder assumes county roadway traffic volumes are minimal, with some increase in traffic during the summer and early fall for harvest of various crops in the area. The certificate holder notes that construction-related heavy-vehicle traffic typically occurs in the middle of the day during off-peak hours and that commuter traffic will also generally occur out of phase with the truck traffic, as the workers report earlier and leave later than most of the truck traffic. The certificate holder did not provide evidence on what traffic patterns are associated with agricultural traffic; however, it can be assumed that it would also mostly occur during day-time hours. Peak construction periods are also assumed to coincide with peak harvest and planting seasons in the late summer and fall.

As discussed in Section III.M., *Public Services,* Amended Condition 79 and Amended Condition 77 would require the certificate holder to develop a Construction Traffic Management Plan prior to construction and implement the measures described above to minimize construction-related traffic impacts. The plan would include traffic minimization measures such staggering shift start times to reduce vehicle trips through the westbound I-84 ramp terminal at Biggs Junction and installing temporary traffic controls during peak construction periods. The certificate holder also represents that it will encourage carpooling for construction workers and include traffic safety as part of its safety training program. The certificate holder further represents that it will communicate with adjacent landowners to minimize and mitigate any traffic impacts to their farming practices during the temporary construction period.[159]

Amended Condition 77 and 78 would also require the certificate holder to enter into a Road Use Agreement with the County and ensure that any wear or damage to county roads that results from the construction of the facility components proposed in RFA4 is repaired, and that roads are restored to pre-construction condition or better.

The operation of the facility components proposed in RFA4 is not expected to result in significant volumes of traffic or road use impacts that would affect agricultural operations.

Water Availability and Delivery

As discussed in Section IV.C., *Water Rights*, the certificate holder represents that all water needed from construction and operation of the facility components proposed in RFA4 would be obtained from either the City of Wasco or a private source with an existing water right. Some water would also be obtained from on-site exempt wells constructed to serve the O&M

[158] BCWAMD4Doc21-06 RFA Exhibit K Land Use 2025-12-10, Section 6.2; Attachment K-1.

[159] BCWAMD4Doc21-06 RFA Exhibit K Land Use 2025-12-10, Section 8.3.

buildings, but in accordance with Water Rights Conditions 1 and 2 and the requirements of ORS 537.545 the use of water from all facility wells would not exceed 5,000 gallons per day.

The accepted farm uses in the analysis area, including dryland wheat farming and the use of groundwater for irrigation, do not depend on water deliveries and are not expected to be affected by any increases in demand for municipal water that result from the construction and operation of the facility components proposed in RFA4.

It is possible that water could be obtained from an existing private well if the certificate holder successfully transfers the water right under Oregon Certificate 57620 from agricultural irrigation to industrial use during operation of the facility; however no new water right is proposed and the facility components proposed in RFA4 is not in a critical groundwater area, so any groundwater use is not expected to reduce the amount of water available for irrigation.

Noxious and undesirable weeds

If unabated within the site, noxious weeds or other undesirable plant species could spread to adjacent lands and adversely affect farm operations. As described in Section III.D., *Soil Protection*, Soil Protection Condition 1 to 3, would require the certificate holder to finalize and implement a Comprehensive Solar Revegetation and Soil Management Plan that establishes the actions the certificate holder would be required to take to prevent the introduction of new noxious weed populations and spread of existing noxious weed populations during construction and operation of the solar facility. The Sherman County Weed Control District provides weed control services for the existing facility and the certificate holder represents that it will continue to contract with the district to inspect and treat weeds at the site, if available.

The Council finds that, subject to compliance with the Soil Protection Conditions 1 to 3, the construction and operation of the facility components proposed in RFA4 is not likely to result in the unbated spread or introduction of noxious or undesirable weeds into adjacent properties.

Litter and Solid Waste

As described in Section III.O., *Waste Minimization*, Amended Conditions 84 and 87 and Waste Minimization Condition 1 would require the certificate holder to manage solid waste generated during construction and operation of the facility components proposed in RFA4 in accordance with Construction and Operation Solid Waste Management Plans. The Council finds that, subject to compliance with the conditions, the construction and operation of the facility components proposed in RFA4 is not likely to result in significant amounts of litter or other waste that could affect adjacent properties.

Flooding and Stormwater runoff

The construction of the facility components proposed in RFA4 could create stormwater runoff or other erosion issues that, if unmitigated, could impact farm operations on adjacent properties. As described in Section III.D., *Soil Protection*, Soil Protection Conditions 1 to 3, would require the certificate holder to finalize and implement a Comprehensive Solar Revegetation and Soil Management Plan. The plan would require the certificate holder to construct the facility in compliance with a NPDES 1200-C Construction Stormwater Permit and implement BMPs to prevent the discharge of stormwater from the site.

Any BMPs needed to control stormwater during operation will be maintained for the life of the facility. If the certificate holder conducts solar panel washing during operation of the facility components proposed in RFA4, solar wash water would evaporate or will infiltrate into the ground within the immediate vicinity of its use.

The Council finds that, subject to compliance with the Soil Protection Condition 1 to 4, the construction and operation of the facility components proposed in RFA4 is not likely to result in the discharge of stormwater to adjacent properties.

Dust

As discussed in Section III.D., *Soil Protection*, soils throughout the site have a moderate potential for wind erosion and low fugitive dust resistance, which indicates the need to address potential dust generation by traffic generated during construction and operation of the facilities. Dust can affect photosynthesis, and, if unmitigated, dust generated during construction of the facility components proposed in RFA4 could impact farm operations on adjacent properties. Soil Protection Conditions 1 to 3 would require the certificate holder to finalize and implement a Comprehensive Revegetation and Soil Management Plan that establishes the actions the certificate holder would be required to take to mitigate dust propagation during construction and operation of the facility components proposed in RFA4. In particular, Appendix D of the plan requires the certificate holder to minimize dust during construction through application of water and other dust control measures and to conduct visual monitoring of dust emissions.

The Council finds that, subject to compliance with the Soil Protection Condition 1 to 3, the dust generated by the construction and operation of the facility components proposed in RFA4 is not likely to significantly interfere with farm operations on adjacent properties.

Wildfire

As discussed in Section III.N., *Wildfire Prevention and Risk Mitigation*, the proposed Solar Micrositing Area is in an area associated with high wildfire risk, and in addition to the loss of human life, previous wildfires in the area have resulted in the destruction of significant amounts of crops and damage to agricultural lands. Under Wildfire Prevention and Risk Mitigation Conditions 1 and 2, the certificate holder would be required to finalize and

implement a Construction Wildfire Mitigation Plan establishing the preventative actions and programs the certificate holder will take to minimize the risk of construction activities igniting a wildfire. Wildfire Prevention and Risk Mitigation Conditions 3 and 4 would require a similar plan to be finalized and implemented during operations.

The facility components proposed in RFA4 would also contain numerous features to reduce the risk of a wildfire being ignited by facility components, and to help mitigate the risk of wildfire spreading into or from the proposed solar micrositing area, including fire sensors with remote shutoff capability, vegetation clearances around roads and electrical equipment, and the 50-foot setback from adjacent properties required under Land Use Condition 1. The Council finds these features are adequate to minimize the wildfire risk from the operating facility, and to ensure that adjacent farm operations are not significantly affected.

Liability from Nuisance Claims

In addition to protecting adjacent farm practices from potential impacts that may result from the construction and operation of the facility components proposed in RFA4, ORS 30.930, also known as Oregon's right to farm law, protects farm operators from lawsuits based on noises, smells, dust or other nuisances or trespasses that may result from accepted farm practices. As described in the evaluation Of OAR 660-033-0130(38)(L), below, Land Use Condition 5 would require the certificate holder to sign and record in the deed records of Sherman County a document prohibiting them from pursuing a claim for relief or cause of action alleging injury from farming practices.

Cumulative Assessment

The Council finds that, subject to compliance with compliance with the conditions of approval described above, the construction and operation of the facility components proposed in RFA4 are not expected to significantly interfere with adjacent farm uses. There may be some temporary impacts related to traffic and dust during construction, but these impacts will be minimized in accordance with the Construction Traffic Management Plan required under Amended Condition 77 and the Comprehensive Solar Revegetation and Soil Management Plan required under Soil Protection Conditions 1 to 3. The potential for the introduction or spread of noxious weeds and other undesirable weed species from the site would also be addressed under the latter set of conditions.

The risk of wildfire is a significant concern at the site; however, the facility would be designed with features to reduce wildfire risk and minimize the potential for wildfire to spread out of or into the solar arrays. In addition, the Wildfire Mitigation Plans required under Wildfire Prevention and Risk Mitigation Conditions 1 to 4 would reduce the likelihood of fire ignition at the site, and the vegetation management standards established in the Comprehensive Solar Revegetation and Soil Management Plan required under Soil Protection Conditions 1 to 3 would help reduce the severity of a wildfire if one were to occur.

(F) In the consideration of potentially mitigating conditions of approval under ORS 215.296(2), the governing body may not impose such a condition upon the owner of the affected farm or forest land or on such land itself, nor compel said owner to accept payment to compensate for the significant changes or significant increases in costs described in subsection (a) and (b).

None of the conditions described above apply to adjacent lands or the adjacent landowners.

OAR 660-033-0130(38) – Minimum Standards for Photovoltaic Solar Power Generation Facilities

(38) A proposal to site a photovoltaic solar power generation facility shall be subject to the following definitions and provisions:

(a) "Arable land" means land in a tract that is predominantly cultivated or, if not currently cultivated, predominantly comprised of arable soils.

(b) "Arable soils" means soils that are suitable for cultivation as determined by the governing body or its designate based on substantial evidence in the record of a local land use application, but "arable soils" does not include high-value farmland soils described at ORS 195.300(10) unless otherwise stated.

(c) "Dual-use development" means developing the same area of land for both a photovoltaic solar power generation facility and for farm use.

(d) "Nonarable land" means land in a tract that is predominantly not cultivated and predominantly comprised of nonarable soils.

(e) "Nonarable soils" means soils that are not suitable for cultivation. Soils with an NRCS agricultural capability class V–VIII and no history of irrigation shall be considered nonarable in all cases. The governing body or its designate may determine other soils, including soils with a past history of irrigation, to be nonarable based on substantial evidence in the record of a local land use application.

(f) "Photovoltaic solar power generation facility" includes, but is not limited to, an assembly of equipment that converts sunlight into electricity and then stores, transfers, or both, that electricity. This includes photovoltaic modules, mounting and solar tracking equipment, foundations, inverters, wiring, storage devices and other components. Photovoltaic solar power generation facilities also include electrical cable collection systems connecting the photovoltaic solar generation facility to a transmission line, all necessary grid integration equipment, new or expanded private roads constructed to serve the photovoltaic solar power generation facility, office, operation and

maintenance buildings, staging areas and all other necessary appurtenances. For purposes of applying the acreage standards of this section, a photovoltaic solar power generation facility includes all existing and proposed facilities on a single tract, as well as any existing and proposed facilities determined to be under common ownership on lands with fewer than 1320 feet of separation from the tract on which the new facility is proposed to be sited. Projects connected to the same parent company or individuals shall be considered to be in common ownership, regardless of the operating business structure. A photovoltaic solar power generation facility does not include a net metering project established consistent with ORS 757.300 and OAR chapter 860, division 39 or a Feed-in-Tariff project established consistent with ORS 757.365 and OAR chapter 860, division 84.

The energy facility and all related or supporting facilities, except the proposed 230-KV overhead transmission line, are considered to be a "photovoltaic solar power generation facility" subject to the provisions of OAR 660-033-0130(38). The department is not aware of any existing or proposed solar facilities owned by the certificate holder within 1320 feet of the subject property.

(g) For high-value farmland described at ORS 195.300(10), a photovoltaic solar power generation facility shall not use, occupy, or cover more than 12 acres unless:

(A) The provisions of paragraph (h)(H) are satisfied; or

(B) A county adopts, and an applicant satisfies, land use provisions authorizing projects subject to a dual-use development plan. Land use provisions adopted by a county pursuant to this paragraph may not allow a project in excess of 20 acres. Land use provisions adopted by the county must require sufficient assurances that the farm use element of the dual-use development plan is established and maintained so long as the photovoltaic solar power generation facility is operational or components of the facility remain on site. The provisions of this subsection are repealed on January 1, 2022.

As relevant to the proposed site, ORS 195.300(10) defines high-value farmland as:

- Land in a tract composed predominantly of soils that classified prime, unique, Class I or Class II as determined by irrigation status. ORS 195.300(10)(a).
- Land within the place of use for a permit, certificate or decree for the use of water for irrigation issued by the Water Resources Department; or within the boundaries of an irrigation or diking district. ORS 195.300(10)(c).
- Land that is within the Columbia Valley American Viticultural Area and is no more than 3,000 feet above mean sea level, with an aspect between 67.5 and 292.5 degrees, and a slope between zero and 15 percent. ORS 195.300(10)(f).

As described above, approximately 1,305 acres within the proposed Solar Micrositing Area are considered to be high-value farmland for one or more of these reasons, including approximately 311 acres that are appurtenant to an active irrigation water right. In total, the certificate holder estimates the facility would use, occupy or cover up to 1,006 acres of high-value farmland.

As described below, the facility components proposed in RFA4 do not satisfy the criteria under OAR 660-033-0130(38)(h)(H) and the County did not implement paragraph (g)(B) of the rule. Accordingly, the Council finds that the facility components proposed in RFA4 would use more high-value farmland than permitted under the rule. Because this standard directly implements Statewide Planning Goal 3, the Council finds that the facility components proposed in RFA4 cannot be approved unless the Council takes an exception to the goal under ORS 469.504(2).

> *(h) The following criteria must be satisfied in order to approve a photovoltaic solar power generation facility on high-value farmland described at ORS 195.300(10).*
>
> *(A) The proposed photovoltaic solar power generation facility will not create unnecessary negative impacts on agricultural operations conducted on any portion of the subject property not occupied by project components. Negative impacts could include, but are not limited to, the unnecessary construction of roads dividing a field or multiple fields in such a way that creates small or isolated pieces of property that are more difficult to farm, and placing photovoltaic solar power generation facility project components on lands in a manner that could disrupt common and accepted farming practices;*

To support a finding that the proposed solar components would not create unnecessary negative impacts on agricultural operations, the certificate holder notes that the layout of the facility components proposed in RFA4 Figure 2 shows that areas outside of the proposed solar array fencelines that are suitable for farming are generally contiguous to adjacent farmland and would continue to be available for continued farm operations. Other unused areas include steep slopes or waterways that are generally unsuitable for farming.

The preliminary facility layout also shows that, due to the certificate holder's own requirement that all solar components be set back at least 520 feet from existing turbines, at least 500 acres of cultivated land surrounding existing wind turbines would be included in the proposed fencelines and presumably taken out of agricultural production but wouldn't otherwise be occupied by facility components. While the setbacks may be necessary to ensure the wind components can continue to operate safely and efficiently, the Council finds that the certificate holder did not provide sufficient evidence to demonstrate that the negative impacts on the unused farmland could not be avoided. Accordingly, the Council finds that the criterion under OAR 345-066-0130(38)(h)(A) is not satisfied.

(B) The presence of a photovoltaic solar power generation facility will not result in unnecessary soil erosion or loss that could limit agricultural productivity on the subject property. This provision may be satisfied by the submittal and county approval of a soil and erosion control plan prepared by an adequately qualified individual, showing how unnecessary soil erosion will be avoided or remedied. The approved plan shall be attached to the decision as a condition of approval;

The construction of the facility components proposed in RFA4 could create stormwater runoff or other erosion issues that, if unmitigated, could result in erosion or soil loss on the subject property. As described in Section III.D, Soil Protection, Soil Protection Condition 1 to 4, would require the certificate holder to finalize and implement a Comprehensive Solar Revegetation and Soil Management Plan. The plan would require the certificate holder to construct the facility in compliance with a NPDES 1200-C Construction Stormwater Permit and implement BMPs to prevent the discharge of stormwater from the site.

The Council finds that, subject to compliance with the Soil Protection Conditions 1 to 3, the construction and operation of the facility components proposed in RFA4 is not likely to result in unnecessary soil erosion or soil loss that could limit agricultural productivity on the subject property.

(C) Construction or maintenance activities will not result in unnecessary soil compaction that reduces the productivity of soil for crop production. This provision may be satisfied by the submittal and county approval of a plan prepared by an adequately qualified individual, showing how unnecessary soil compaction will be avoided or remedied in a timely manner through deep soil decompaction or other appropriate practices. The approved plan shall be attached to the decision as a condition of approval;

Construction of the facility components proposed in RFA4 could result in soil compaction, particularly in areas that are cleared of vegetation or graded. As described in Section III.D, Soil Protection, there are also some soils that are highly susceptible to compaction are present at the site.

Soil Protection Conditions 1 to 3, would require the certificate holder to finalize and implement a Comprehensive Revegetation and Soil Management Plan during construction of the facility components proposed in RFA4. The draft Plan, included as Attachment D to this Order includes provisions for soils compaction testing and monitoring and establishes remediation that will be implemented if excessive compaction is detected.

Subject to compliance with these conditions, and the Comprehensive Revegetation and Soil Management Plan, the Council finds the construction and operation of the facility components proposed in RFA4 will not result in unnecessary soil compaction that reduces the productivity of soil for crop production.

(D) Construction or maintenance activities will not result in the unabated introduction or spread of noxious weeds and other undesirable weed species. This provision may be satisfied by the submittal and county approval of a weed control plan prepared by an adequately qualified individual that includes a long-term maintenance agreement. The approved plan shall be attached to the decision as a condition of approval;

If unabated within the site, noxious weeds or other undesirable plant species could spread to adjacent lands and adversely affect farm operations. As described in Section III.D, Soil Protection, Soil Protection Conditions 1 to 3 would require the certificate holder to finalize and implement a Comprehensive Revegetation and Soil Management Plan that establishes the actions the certificate holder would be required to take to prevent the introduction of new noxious weed populations and spread of existing noxious weed populations. The Sherman County Weed Control District provides weed control services for the existing facility and the certificate holder represents that it will continue to contract with the district to inspect and treat weeds at the site, if available.

The Council finds that, subject to compliance with the Soil Protection Conditions 1 to 3, the construction and operation of the facility components proposed in RFA4 is not likely to result in the unbated spread or introduction of noxious or undesirable weeds into adjacent properties.

(E) Except for electrical cable collection systems connecting the photovoltaic solar generation facility to a transmission line, the project is not located on those high-value farmland soils listed in OAR 660-033-0020(8)(a);

OAR 660-033-0020(8)(a) identifies soils that are classified by the NRCS as Class I, Class II, prime, or unique, as high-value farmland soils. As described above and shown in Figure 6, approximately 778 of the 1,945 acres that make up the proposed Solar Micrositing Area are comprised of Class II soils. The certificate holder did not provide an estimate of how much of the high-value farmland soils would be occupied by facility components but based on the layout of the facility components proposed in RFA4, provided in Figure 2, aside from a small unused area in the northeast corner of the Northern Solar Area, nearly all of the high-value soils would be impacted.[160]

Because the facility components proposed in RFA4 would be located on up to approximately 778 acres of high-value soils, the Council finds that the facility components proposed in RFA4 would not satisfy the criterion under OAR 660-033-0130(38)(h)(E). Because this standard directly implements Statewide Planning Goal 3, the Council finds that the facility components

[160] BCWAMD4Doc21-06 RFA Exhibit K Land Use 2025-12-10, Section 6.3. The certificate holder also asserts that it would not be possible to completely avoid the high-value soils due to their prevalence at the site and their patchy and irregular nature, but did not provide evidence that would suggest that the presence of high-value soils was considered in the selection of the site or the development of the proposed layout.

proposed in RFA4 cannot be approved unless the Council takes an exception to the goal under ORS 469.504(2).

> *(F) The project is not located on those high-value farmland soils listed in OAR 660-033-0020(8)(b)-(e) or arable soils unless it can be demonstrated that:*
>
> *(i) Non high-value farmland soils are not available on the subject tract;*
>
> *(ii) Siting the project on non high-value farmland soils present on the subject tract would significantly reduce the project's ability to operate successfully; or*
>
> *(iii) The proposed site is better suited to allow continuation of an existing commercial farm or ranching operation on the subject tract than other possible sites also located on the subject tract, including those comprised of non high-value farmland soils; and*

OAR 660-033-0020(b) identifies soils used for growing specific perennial crops including nursery stock, berries, fruits, nuts, Christmas trees, or vineyards, but not including seed crops, hay, pasture or alfalfa. OAR 660-0033-0020(c) to (e) apply specifically to soils within the Willamette Valley. None of these soils are present within the proposed Solar Micrositing Area, as a result the criteria under OAR 660-033-0130(38)(h)(F) are not applicable to the review of RFA4.

> *(G) A study area consisting of lands zoned for exclusive farm use located within one mile measured from the center of the proposed project shall be established and:*
>
> *(i) If fewer than 48 acres of photovoltaic solar power generation facilities have been constructed or received land use approvals and obtained building permits within the study area, no further action is necessary.*
>
> *(ii) When at least 48 acres of photovoltaic solar power generation facilities have been constructed or received land use approvals and obtained building permits, either as a single project or as multiple facilities within the study area, the local government or its designate must find that the photovoltaic solar power generation facility will not materially alter the stability of the overall land use pattern of the area. The stability of the land use pattern will be materially altered if the overall effect of existing and potential photovoltaic solar power generation facilities will make it more difficult for the existing farms and ranches in the area to continue operation due to diminished opportunities to expand, purchase or lease farmland, acquire water rights, or diminish the number of tracts or acreage in farm use in a manner that will destabilize the overall character of the study area.*

No solar facilities have been constructed or have been approved within the study area identified by rule, so no further analysis is necessary; however, the Council finds that this test provides important context for the evaluation of SCZO 5.8.20(3). In the evaluation of that section, above, the Council finds that the conversion of approximately 1,445 acres of cultivated land, including up to 1,006 acres of high-value farmland, to a nonfarm use does have the potential to materially alter the overall land use pattern of the analysis area by reducing the number of tracts available for farmland and potentially affecting the local agricultural economy.

> *(H) A photovoltaic solar power generation facility may be sited on more than 12 acres of high-value farmland described in ORS 195.300(10)(f)(C) without taking an exception pursuant to ORS 197.732 and OAR chapter 660, division 4, provided the land:*
>
> *(i) Is not located within the boundaries of an irrigation district;*
>
> *(ii) Is not at the time of the facility's establishment, and was not at any time during the 20 years immediately preceding the facility's establishment, the place of use of a water right permit, certificate, decree, transfer order or ground water registration authorizing the use of water for the purpose of irrigation;*
>
> *(iii) Is located within the service area of an electric utility described in ORS 469A.052(2);*
>
> *(iv) Does not exceed the acreage the electric utility reasonably anticipates to be necessary to achieve the applicable renewable portfolio standard described in ORS 469A.052(3); and*
>
> *(v) Does not qualify as high-value farmland under any other provision of law; or*

The certificate holder does not claim to meet the requirements of OAR 660-033-0130(38)(h)(H); therefore, no further analysis of this paragraph is required.

> *(i) For arable lands, a photovoltaic solar power generation facility shall not use, occupy, or cover more than 20 acres. The governing body or its designate must find that the following criteria are satisfied in order to approve a photovoltaic solar power generation facility on arable land:*
>
> *(A) Except for electrical cable collection systems connecting the photovoltaic solar generation facility to a transmission line, the project is not located on those high-value farmland soils listed in OAR 660-033-0020(8)(a);*

(B) The project is not located on those high-value farmland soils listed in OAR 660-033-0020(8)(b)-(e) or arable soils unless it can be demonstrated that:

(i) Nonarable soils are not available on the subject tract;

(ii) Siting the project on nonarable soils present on the subject tract would significantly reduce the project's ability to operate successfully; or

(iii) The proposed site is better suited to allow continuation of an existing commercial farm or ranching operation on the subject tract than other possible sites also located on the subject tract, including those comprised of nonarable soils;

(C) No more than 12 acres of the project will be sited on high-value farmland soils described at ORS 195.300(10);

(D) A study area consisting of lands zoned for exclusive farm use located within one mile measured from the center of the proposed project shall be established and:

(i) If fewer than 80 acres of photovoltaic solar power generation facilities have been constructed or received land use approvals and obtained building permits within the study area, no further action is necessary.

(ii) When at least 80 acres of photovoltaic solar power generation facilities have been constructed or received land use approvals and obtained building permits, either as a single project or as multiple facilities within the study area, the local government or its designate must find that the photovoltaic solar power generation facility will not materially alter the stability of the overall land use pattern of the area. The stability of the land use pattern will be materially altered if the overall effect of existing and potential photovoltaic solar power generation facilities will make it more difficult for the existing farms and ranches in the area to continue operation due to diminished opportunities to expand, purchase or lease farmland, acquire water rights, or diminish the number of tracts or acreage in farm use in a manner that will destabilize the overall character of the study area; and

(E) The requirements of paragraphs (h)(A), (B), (C) and (D) are satisfied.

As described above, all of the land within the proposed Solar Micrositing Area that is not located on high-value farmland, or approximately 619 acres, is considered to be arable land. Because the facility components proposed in RFA4 would use more than 20 acres, the criterion under OAR 660-033-0130(i) is not satisfied. As described in the evaluation of OAR 660-033-0130(h), above the facility components proposed in RFA4 would also not comply with

paragraphs (i)(A), (C), and (E), and paragraph (D) is not appropriate to measure the potential impacts of the facility components proposed in RFA4 on the stability of the overall land use pattern of the area given its potential size.

Accordingly, the Council finds that the facility components proposed in RFA4 would use more arable land and high-value farmland soils than permitted under the rule. Because this standard directly implements Statewide Planning Goal 3, the Council finds that the facility components proposed in RFA4 cannot be approved unless the Council takes an exception to the goal under ORS 469.504(2).

> *(j) For nonarable lands, a photovoltaic solar power generation facility shall not use, occupy, or cover more than 320 acres. The governing body or its designate must find that the following criteria are satisfied in order to approve a photovoltaic solar power generation facility on nonarable land:*
>
> *(A) Except for electrical cable collection systems connecting the photovoltaic solar generation facility to a transmission line, the project is not located on those high-value farmland soils listed in OAR 660-033-0020(8)(a);*
>
> *(B) The project is not located on those high-value farmland soils listed in OAR 660-033-0020(8)(b)-(e) or arable soils unless it can be demonstrated that:*
>
> *(i) Siting the project on nonarable soils present on the subject tract would significantly reduce the project's ability to operate successfully; or*
>
> *(ii) The proposed site is better suited to allow continuation of an existing commercial farm or ranching operation on the subject tract as compared to other possible sites also located on the subject tract, including sites that are comprised of nonarable soils;*
>
> *(C) No more than 12 acres of the project will be sited on high-value farmland soils described at ORS 195.300(10);*
>
> *(D) No more than 20 acres of the project will be sited on arable soils;*
>
> *(E) The requirements of paragraph (h)(D) are satisfied;*
>
> *(F) If a photovoltaic solar power generation facility is proposed to be developed on lands that contain a Goal 5 resource protected under the county's comprehensive plan, and the plan does not address conflicts between energy facility development and the resource, the applicant and the county, together with any state or federal agency responsible for protecting the resource or habitat supporting the resource, will cooperatively develop a specific resource management plan to mitigate potential development*

conflicts. If there is no program present to protect the listed Goal 5 resource(s) present in the local comprehensive plan or implementing ordinances and the applicant and the appropriate resource management agency(ies) cannot successfully agree on a cooperative resource management plan, the county is responsible for determining appropriate mitigation measures; and

(G) If a proposed photovoltaic solar power generation facility is located on lands where, after site specific consultation with an Oregon Department of Fish and Wildlife biologist, it is determined that the potential exists for adverse effects to state or federal special status species (threatened, endangered, candidate, or sensitive) or habitat or to big game winter range or migration corridors, golden eagle or prairie falcon nest sites or pigeon springs, the applicant shall conduct a site-specific assessment of the subject property in consultation with all appropriate state, federal, and tribal wildlife management agencies. A professional biologist shall conduct the site-specific assessment by using methodologies accepted by the appropriate wildlife management agency and shall determine whether adverse effects to special status species or wildlife habitats are anticipated. Based on the results of the biologist's report, the site shall be designed to avoid adverse effects to state or federal special status species or to wildlife habitats as described above. If the applicant's site-specific assessment shows that adverse effects cannot be avoided, the applicant and the appropriate wildlife management agency will cooperatively develop an agreement for project-specific mitigation to offset the potential adverse effects of the facility. Where the applicant and the resource management agency cannot agree on what mitigation will be carried out, the county is responsible for determining appropriate mitigation, if any, required for the facility.

No nonarable land is present within the proposed Solar Micrositing Area, as such, OAR 660-033-0130(38)(j) is not applicable to the review of RFA4.

(k) An exception to the acreage and soil thresholds in subsections (g), (h), (i), and (j) of this section may be taken pursuant to ORS 197.732 and OAR chapter 660, division 4.

As described above, the Council finds that the facility components proposed in RFA4 would use more high-value farmland, arable land, and high-value farmland soils than permitted under OAR 660-033-0130(38)(g) and (i) and the Council finds that the facility components proposed in RFA4 cannot be approved unless the Council takes an exception to the goal under ORS 469.504(2). Whether or not an exception is justified is evaluated below.

(l) The county governing body or its designate shall require as a condition of approval for a photovoltaic solar power generation facility, that the project owner sign and record in the deed records for the county a document binding

the project owner and the project owner's successors in interest, prohibiting them from pursuing a claim for relief or cause of action alleging injury from farming or forest practices as defined in ORS 30.930(2) and (4).

The Council imposes a new condition of approval requiring the certificate holder to sign a binding document described in the rule, as presented below:

Land Use Condition 5 (PRE-LU-02)
Prior to construction of any component or phase of the solar facility, the certificate holder must sign and record in the deed records for the county a document binding the project owner and the project owner's successors in interest, prohibiting them from pursuing a claim for relief or cause of action alleging injury from farming or forest practices as defined in ORS 30.930(2) and (4).
[Final Order on AMD4]

(m) Nothing in this section shall prevent a county from requiring a bond or other security from a developer or otherwise imposing on a developer the responsibility for retiring the photovoltaic solar power generation facility.

As described in Section III.G, Retirement and Financial Assurance, Retirement and Financial Assurance Conditions 1 and 2 and Amended Conditions 10 and 108 would require the certificate holder to submit, and maintain at all times until the facility has been retired, a bond or letter of credit in a form and amount satisfactory to the Council to restore the site to a useful, non-hazardous condition.

(n) If ORS 469.300(11)(a)(D) is amended, the commission may re-evaluate the acreage thresholds identified in subsections (g), (i) and (j) of this section.

This subsection does not provide applicable substantive criteria for the review of the facility components proposed in RFA4.

Goal 3 Exception

As described above, the proposed solar facility would use, occupy, or cover more high-value and arable farmland than allowed under OAR 660-033-0130(38)(h) and (i). Because the facility components proposed in RFA4 would be located on up to approximately 778 acres of Class II high-value farmland soils, the facility components proposed in RFA4 would also not comply with the requirements of OAR 660-033-0130(38)(h)(E). While the SCZO does not provide specific siting standards for solar photovoltaic power generation facilities, the Council also finds that the facility components proposed in RFA4 do not comply with the County's standards for conditional uses under SCZO 5.2 and 5.8.20 based on noncompliance with the minimum standards adopted by LCDC.

Under ORS 469.504(2)(b)(B), if the facility components proposed in RFA4 do not comply with one or more of the applicable substantive criteria recommended by a Special Advisory Group, or with the rules that apply directly to the facility under ORS 197.646, the Council may still find compliance with Land Use standard if it finds the facility components proposed in RFA4 would otherwise comply with the applicable statewide planning goals, or that an exception to any applicable statewide planning goal is justified.

Statewide Planning Goal 3 is "to preserve and maintain agricultural lands for farm use." While certain non-farm uses, including solar facilities, are permitted within farm use zones the guidelines for implementing the goal states that permitted non-farm uses should be "minimized to allow for maximum agricultural productivity."[161] Because the rules in OAR 660-033-0130(38) prescribe the minimum standards for solar photovoltaic power generation facilities to be sited in compliance with Statewide Planning Goal 3, and because the facility components proposed in RFA4 would use more productive farmland, including high-value farmland and high-value farmland soils, than allowed by those standards, the Council finds that the facility components proposed in RFA4 would not otherwise comply with Statewide Planning Goal 3.

The Council may find goal compliance for a facility that does not otherwise comply with one or more statewide planning goals by taking an exception to the applicable goal. Pursuant to ORS 469.504(2)(c): "[t]he council may take an exception to a goal if the council finds" that each of the following standards are met:

- Reasons justify why the state policy embodied in the applicable goal should not apply.
- The significant environmental, economic, social and energy consequences have been identified and adverse impacts will be mitigated in accordance with rules of the Council applicable to the siting of the facility components proposed in RFA4.
- The facility components proposed in RFA4 are compatible with other adjacent uses or will be made compatible through measures designed to reduce adverse impacts.

Each of these standards are evaluated in detail below. It is important to note that the Council has the discretion to determine whether or not given reasons justify an exception to the policy embedded in an applicable goal. In addition, by stating the Council "may take an exception," the statute establishes that the Council is not obligated to grant an exception even if the standards are met. Rather has the discretion whether or not to grant an exception.[162]

[161] OAR 660-015-0000(3)

[162] Oregon courts recognize that the granting of an exception to a statewide land use planning goal is discretionary. See, e.g., Manning v. Land Conservation & Dev. Comm'n, 198 Or. App. 488, 497–98, 109 P.3d 376, 380 (2005) ("*We are aware of no existing authority and see nothing in Goal 2, the rules governing exceptions, or ORS 197.732 that requires a local government to take an exception to a goal. Evidence that an exception may be justified does not require the county to grant an exception. Goal 2 and ORS 197.732 provide that an exception may be granted on showing certain conditions, not that it must*. However, before deciding whether to grant an exception, the county must provide an opportunity for the requesting party to make a complete record and to argue in support of the exception, and the county must consider that record and argument in making its decision" (emphasis added).

Proposed Reasons why the applicable goal should not apply

As described above, the policy embedded in Statewide Planning Goal 3 is "to preserve and maintain agricultural lands for farm use" and to minimize nonfarm uses "to allow for maximum agricultural productivity."[163] In RFA4, the certificate holder proposes that this policy should not apply to the agricultural lands within the Solar Micrositing Area for the following reasons:

1. Locational Dependence: The facility components proposed in RFA4 are locationally dependent on an existing substation with available interconnection capacity, are sited in proximity to major transportation corridors, and are co-located with the existing wind facility and other energy infrastructure.
2. Economic Benefits: The facility components proposed in RFA4 provide local rural economic development benefits through the creation of jobs, the generation of tax revenues, lease payments, and the creation of a Community Investment Plan.
3. Minimal Impacts to Other resources: The facility components proposed in RFA4 avoid and minimize impacts on other resources protected by Council Standards.
4. Consistency with State Climate Goals and Policies: The facility components proposed in RFA4 are consistent with Oregon's Policies and Goals Requiring the State to Address the Climate Crisis.

Each of these reasons is discussed in more detail below. Following the evaluation of individual reasons, the exception request is discussed in its entirety.

Locational Dependence

Locational dependency refers to the proximity of the facility components proposed in RFA4 on existing infrastructure needed to construct and operate the facility, or the presence of uncommon geographical attributes at a site that would create a significant comparative advantage for the facility.

The certificate holder presents three distinct arguments to support its locational dependence reason. Specifically, the certificate holder argues that the facility components proposed in RFA4 are locationally dependent on:

- The regional transmission grid through an existing substation with available interconnection capacity to allow the output of the facility components proposed in RFA4 to be transmitted to the regional grid without the need to construct new regional substations or lengthy high-voltage transmission lines.
- Nearby transportation corridors and local arterial routes which provide access and materials transport to the site, minimizing the need to construct new or improve existing roads.

[163] OAR 660-015-0000(3).

- Other energy facilities, including the existing wind energy facility, because co-location with the wind facility will optimize the energy generated by the wind component by allowing excess wind energy to charge the BESS while keeping infrastructure costs to a minimum.[164]

For the reasons described below, the Council finds that the proposed Solar Micrositing Area's proximity to the regional transmission grid and transportation infrastructure supports a locational dependence reason, and find that the reason supports, but does not by itself justify, an exception to Statewide Planning Goal 3.

Proximity to the regional transmission grid

The proposed solar facility would connect to the regional transmission grid through the Biglow Canyon Substation, which was constructed as part of the existing facility and is located within the proposed Solar Micrositing Area. The Biglow Canyon Substation is connected to the regional grid by an approximately six mile 230-kV transmission line constructed by the Bonneville Power Administration (BPA) to interconnect the existing facility and the nearby Klondike III wind facility to the John Day Substation located outside of Rufus near I-84 and the Columbia River.[165] Several 500 kV transmission lines connect the John Day Substation with generating facilities in Oregon and Washington and load centers in the Portland metro region. In addition to the BPA 230 kV transmission lines connecting the Biglow Canyon Substation to the Klondike III (Klondike Schoolhouse) Substation and John Day Substations, three other medium voltage transmission lines connect the Biglow Canyon Substation with other nearby wind farms.[166]

The certificate holder has an existing interconnection with BPA allowing for power generated by the existing facility to be transmitted to the regional transmission grid via the John Day Substation but is not currently using all of the available transmission capacity under its existing Interconnection Agreement. The certificate holder indicates that it has submitted a new surplus LGIA to BPA that would allow the use of the unused surplus capacity to export additional energy from the proposed solar facility and BESS to the regional grid. The certificate holder has represented that the LGIA is expected to go into effect in January 2026.[167]

The certificate holder argues that the facility components proposed in RFA4 are locationally dependent on the surplus capacity available at the existing Biglow Canyon Substation and the BPA 230-kV Biglow Canyon-John Day transmission line. The certificate holder further argues that utilizing the available surplus capacity eliminates the need for a new regional substation,

[164] BCWAMD4Doc21-06 RFA Exhibit K Land Use 2025-12-10, Section 8.1.1; 8.1.1.3.

[165] Site Certificate, Section III.A.

[166] BCWAMD4Doc21-06 RFA Exhibit K Land Use 2025-12-10, Section 8.1.1.1.

[167] BCWAMD4Doc21-06 RFA Exhibit K Land Use 2025-12-10, Section 8.1.1.1. The BPA Interconnection Queue indicates that a surplus interconnection request for no more than 450 MW of combined capacity was submitted on October 27, 2023. While the Queue indicates a requested in service date of January 2, 2026, the agreed to date is listed June 1, 2028. BPA Interconnection Queue Output for Request G0978. Accessed 10/20/2025 at: https://www.bpa.gov/energy-and-services/transmission/interconnection

and that no new high-voltage transmission lines will be needed to connect the solar components to this hub.

The Council has previously found that a site's proximity to existing transmission infrastructure with the necessary capacity to transmit the output of the facility to the regional grid is an appropriate, but not sufficient, reason to justify an exception to statewide planning goal 3; however, the certificate holder's reliance on proximity to previously approved facility components is somewhat unique and warrants further discussion.[168] In particular, reliance on proximity to previously approved facility components, such as the Biglow Substation, to justify an exception to Statewide Planning Goal 3 for an expansion of that same facility is somewhat problematic and could incentivize future developers to phase facilities in a manner that circumvents the protections provided by the Statewide Planning Goals and other land use regulations. As such, the Council finds that proximity to the existing Biglow Substation is not an appropriate reason to justify an exception to Statewide Planning Goal 3. With the Biglow Substation eliminated from consideration as a potential locational attractor; the Council must consider whether the site's proximity to the BPA 230-kV Biglow Canyon-John Day transmission line and the BPA John Day Substation, which connect the existing facility to the regional transmission grid, supports a locational dependence reason.

As described above, the six-mile BPA 230-kV Biglow Canyon-John Day transmission line was constructed by BPA at least in part to serve the existing facility, but also connects other facilities in the area, including Avangrid's Klondike III facility, to the John Day Substation and the regional transmission grid. Because the Biglow Canyon-John Day transmission line is independently operated and was not constructed solely to serve the existing energy facility, the Council finds that it is an appropriate locational attractor.

The certificate holder argues that locating the facility components proposed in RFA4 in proximity to the Biglow Canyon-John Day transmission line demonstrates locational dependence because it eliminates the need for a new regional substation or lengthy high-voltage transmission line and increases the utilization of existing grid infrastructure in a manner that allows for efficient use of existing transmission infrastructure.[169]

The Council finds that these arguments support a locational dependence reason for the proposed solar facility, and finds that the proposed Solar Micrositing Area's proximity to its point of interconnection with the regional transmission grid and the availability of surplus interconnection capacity supports a locational dependence reason to partially justify an exception to Statewide Planning Goal 3.

[169] BCWAMD4Doc21-06 RFA Exhibit K Land Use 2025-12-10, Section 8.1.1.1.

Proximity to transportation infrastructure

The certificate holder asserts that the facility components proposed in RFA4 are locationally dependent on nearby transportation corridors, including I-84 to the north, and US-97 and OR-206 to the west, which provide access and materials transport to the site. As discussed in Section III.M, *Public Services*, several major and minor collector routes travel provide direct access to the Solar Micrositing Area, including N Klondike Road, Old Wasco-Heppner Highway, Medler Lane, Oehman Road, Herin Lane, and Biglow Canyon Road. These routes have previously been used to support the construction of energy facilities in the vicinity of the site, and no major improvement or expansion of the roads is expected to be needed to support the construction of the facility components proposed in RFA4. The certificate holder notes that locating the facility components proposed in RFA4 adjacent to local roads providing access to these corridors eliminates the need to construct major new access routes to connect with the regional transportation network, and minimizes the need for new access roads within the proposed Solar Micrositing Area.[170]

The Council has previously found that proximity to transportation infrastructure can be relied upon to demonstrate locational dependence, particularly when existing infrastructure precludes the need for new external access roads or significant improvements to existing public roads.[171] Consistent with these previous findings, the Council finds that the proposed Solar Micrositing Area's proximity to existing transportation corridors, which would provide access to the site without the need for the construction of new, or substantial modification, of existing public roads, supports a locational dependence reason to partially justify an exception to Statewide Planning Goal 3.

Proximity to, and colocation with, existing energy infrastructure

The certificate holder asserts that siting the solar facility in proximity to the existing wind facility would allow the certificate holder to utilize existing turbine access roads, allow wind components to charge the newly proposed battery energy storage system, and consolidate land use impacts to agricultural lands that are already within or adjacent to the boundaries of renewable energy projects rather than spreading the impacts across a broader more dispersed portion of the county.[172]

The certificate holder points to several previous Council decisions in which it asserts the Council found that proximity to a facility's own existing energy infrastructure was a reason justifying a Goal 3 exception authorizing the expansion of an existing facility.

[171] SSPAPPDoc56-00 Final Order with Attachments (Secure) 2024-11-20, pg. 113-114; WTSAPPDoc2 Final Order on ASC 2024-09-20, pg. 103; WESAPPDoc 2-2 Final Order on ASC Combined w Attachments Signed 2023-03-24, pg. 84-87.

[172] BCWAMD4Doc21-06 RFA Exhibit K Land Use 2025-12-10, Section 8.1.1.2.

The certificate holder cites the Final Order on the Application for Site Certificate (ASC) for the Nolan Hills Wind Farm; which authorized an exception to Goal 3 for the use of up to 1,896 acres of agricultural land for a solar photovoltaic power generation facility within a larger proposed wind power generation facility. The certificate holder cited the following finding as supporting the colocation reason:

> *"… The Council finds the land on which the solar site would be located, is particularly suited for development of a solar facility given its proximity to the proposed wind facility components and infrastructure because the solar facility would be able to: utilize an existing road during construction and operation of both wind and solar facility components; share energy infrastructure with wind facility components; and avoid any impacts to irrigated agriculture."*[173]

While the certificate holder correctly identifies that the site's suitability for collocation of wind and solar components was found to support locational dependency, this finding was made in the context of reviewing a proposal for new solar and wind components to be sited together and there was no reliance on proximity to *existing* energy infrastructure. On the contrary, the final order contained conditions of approval specifically requiring wind turbines and solar components to be designed and sited in a manner that maximized the energy density of the solar site to support the reason. In addition, in the Final Order on the ASC for Nolin Hills the locational dependence reason was further supported by proximity to the regional transmission grid (with a point of interconnection within one mile of the solar site) and transportation network; proximity to wind infrastructure was not separately evaluated. Even if the Council had explicitly relied on colocation as a reason in that proceeding, the certificate holder has not provided compelling evidence to support the argument that the efficient use of productive farmland was considered in the siting and design of the facility. As proposed in RFA4, turbine strings would be interspersed with solar components throughout the proposed Solar Micrositing Area, but as discussed in the evaluation of OAR 660-033-0130(38)(h)(A) above, the preliminary site plan shows approximately 500 acres of land, including land comprised of high-value farmland soils, that would be included in the proposed solar array fence lines and presumably taken out of agricultural production but wouldn't otherwise be occupied by facility components due to the certificate holder's requirements for spacing from turbine strings.

The certificate holder also points to the Final Order on Request for Amendment 4 of the Site Certificate for the Montague Wind Power Facility, which authorized an exception to Statewide Planning Goal 3 for the addition of a solar photovoltaic power generation facility on up to 1,189 acres of farmland within an, at that time, under construction wind facility. In that Order, the Council found: "It is relevant to the Goal 3 exception reasons to consider that the Phase 2 solar facility components would be located in close proximity to existing infrastructure, "co-located" with the Phase 1 Montague [wind] facility currently under construction."[174] While the Council

[173] Final Order on Nolan Hills ASC, pg. 132.

[174] Final Order on Request for Amendment 4 of the Site Certificate for the Montague Wine Power Facility, pg. 98.

found the colocation to be relevant, this passage notably lacks the conclusion that the argument was a relevant "reason" justifying a Goal 3 exception that was provided for every other supporting reason.

Finally, the certificate holder cites the Final Order on Request for Amendment 4 of the Wheatridge Wind Energy Facility, which authorized an exception to Goal 3 for the addition of a solar photovoltaic power generation facility on up to 1,527 acres of farmland within the site of at that time approved, but not constructed wind facility, as supporting this reason, but no direct quotation or further explanation is provided. In that final order, the Council Found that a locational dependency reason was a relevant reason supporting a Goal 3 exception, "…Based on the proximity to the UEC line [adjacent to the site], and the executed contractual agreement to use the line, which interconnects to BPA's regional system…" Because the Council appeared to base its finding not on proximity to existing wind components, but on access to transmission infrastructure needed to transmit power to the regional grid, this finding is not relevant to this argument.

The Council finds that none of these arguments appear to support the reliance on the presence of existing facility components at a site as a reason to justify an exception to Goal 3 to authorize an expansion of that same facility. As described in the discussion of the facility's proximity to transmission infrastructure, the Council finds that it would be inappropriate to justify an exception based on proximity to an existing energy generation facility that was previously authorized by the Council to be sited on agricultural lands. That could incentivize future developers to segment facilities in a manner that circumvents the protections provided by the Statewide Planning Goals and other land use regulations. Based on this reasoning, the Council finds that colocation with existing facility components does not support a locational dependence reason.

The certificate holder also notes that there are four operational EFSC jurisdictional wind power facilities, two local jurisdictional wind power generation facilities within 10 miles of the proposed Solar Micrositing Area, as shown on Exhibit K, Figure K-3. Citing provisions of the Sherman County Comprehensive plan, the certificate holder notes that development and maintenance of these facilities within Sherman County has created a "significant job market for high-tech maintenance people and thus a significant impaction the small communities, in terms of job creation and housing to serve the new technicians." The certificate holder also notes that local organizations such as the now-dissolved Mid-Columbia Council of Governments and the Columbia Gorge Community College have developed renewable energy facility-specific training programs for the region. The certificate holder argues that the on-going construction of new renewable energy facilities will leverage the existing local workforce skilled in constructing, maintaining and operating these facilities.[175]

The certificate does not explain how the location of the proposed Solar Micrositing Area specifically leverages the regional workforce when compared to any other site in the Mid-

[175] BCWAMD4Doc21-06 RFA Exhibit K Land Use 2025-12-10, Section 8.1.1.2.

Columbia region, or how that workforce benefits from locating the facility components proposed in RFA4 on highly productive agricultural land. For these reasons, the Council finds that the certificate holder has not provided sufficient information to demonstrate that proximity to existing infrastructure supports a locational dependence reason.

Rural Economic Development Benefits

The certificate holder argues that renewable energy generation facilities, including the facility components proposed in RFA4, promote rural economic development in several ways, including:

- By creating jobs as well as direct and indirect local economic benefits during construction and operation;
- By adding to the local tax base which directly benefits the agricultural community;
- Through landowner lease payments; and
- By creating a Community Investment Plan

Each of these economic benefits are discussed in more detail below.

Job creation and direct and indirect local economic benefits

As described in Section III.M, Public Services, the certificate holder estimates that, on average, there would be 165 workers on site each day during the 17- to 19-month construction period. The certificate holder estimates that approximately 30 percent of the construction workforce would be hired from communities within a one-hour commute of the site but provides no additional evidence of a local hiring policy or program. The certificate holder estimates that seven permanent workers will be employed during the operation of the proposed solar and battery facilities, and that additional workers would be contracted for specific tasks such as weed control. In addition to creating these jobs, the certificate holder argues that spending by visiting workers during construction and operation of the facility would indirectly benefit the local economy.[176]

The Council has previously considered the rural economic developments of job creation as supportive of an exception to Statewide Planning Goal 3; however in recent decisions, the Council has found that evidence demonstrating a proposed facility will benefit a local economy in general, including through creation of jobs or generating spending which supports businesses in the service and construction sectors, is not sufficient to serve as an economic benefits reason for granting an exception to Goal 3 because any development will result in some level of job creation. Instead, the Council has found that evidence demonstrating how the local agricultural

[176] BCWAMD4Doc21-06 RFA Exhibit K Land Use 2025-12-10, Section 8.1.3.1.

economy will benefit as a result of the proposed facility is needed to justify an exception to Goal 3.[177]

The Council finds that there is not sufficient evidence on the record to determine that the jobs created during the construction of the facility components proposed in RFA4 would provide any more direct benefit to the agricultural economy than any other development in the County. Accordingly, the Council finds that there is not sufficient evidence to demonstrate that the generation of property tax payments is a reason that justifies an exception to Statewide Planning Goal 3.

Property tax payments

The properties that make up the site are in Sherman County's Tax Code Area 7-2 (Rural Wasco, Rufus). The taxing districts which receive revenues from property taxes in this area include Sherman County, the Sherman County Soil and Water Conservation District (SCSWCD), and North Central Rural Fire Protection District. The certificate holder argues that spending by these districts directly benefits the local agricultural economy. In particular, the certificate holder notes that Sherman County is responsible for road maintenance and improvements, which farmers rely on to move their equipment and crops; and SCSWCD manages the Noxious Weed List and the County Cost Share program providing reimbursement to farmers for implementing conservation practices; and North Central Sherman Rural Fire Protection District provides protection of agricultural lands from wildfire. The certificate holder also notes that tax payments and community service fees provided through the Strategic Investment Program Agreements for existing wind energy facilities have been significant contributors to these districts.[178]

The certificate holder notes that it has not yet entered into any tax arrangements with the County for the facility components proposed in RFA4 but expects to enter into a Payment in Lieu of Property Taxes (PILOT) Agreement with the County. Based on an assumed 40-year operating life of the facility, the certificate holder estimates that minimum payments to Sherman County would be approximately $40.1 million under the Solar PILOT program. Payments under a PILOT agreement would extend over 20 years and be a fixed amount per MW over this period. Payments would be made to the taxing districts that comprise Tax Code Area 7-2 in accordance with their established levies.[179]

[177] For findings in support of this reason see WRWAMD4 Final Order on Request for Amendment 4 2019-11-22, pg. 64; BSPAPPDoc2 Final Order 2020-04-24, pg. 111; MWPAMD5 Final Order on RFA5 2020-09-25, pg. 93; OSCAPPDoc2 Final Order on ASC 2022-02-25, pg. 86-87. More recent orders rejecting this reason include MSEFAPPDoc4-1 Final Order (SIGNED) with Attachments 2021-08-02, pg. 104; WESAPPDoc 2-2 Final Order on ASC Combined w Attachments Signed 2023-03-24, pg. 95-96; WTSAPPDoc2 Final Order on ASC 2024-09-20, pg. 107-109; SSPAPPDoc56-00 Final Order with Attachments (Secure) 2024-11-20, pg. 118-120.

[178] BCWAMD4Doc21-06 RFA Exhibit K Land Use 2025-12-10, Section 8.1.3.2

[179] BCWAMD4Doc21-06 RFA Exhibit K Land Use 2025-12-10, Section 8.1.3.2

The certificate holder argues that due to the importance of agriculture in Sherman County, any local government investments will directly benefit the local agricultural community and economy. It argues that taxes received by Sherman County, the SCSWCD, and North Central Rural Fire Protection District have all resulted in investment back into the local agricultural economy. Sherman County is responsible for road maintenance and improvements, which farmers rely on to move their equipment on throughout the lifecycle of their crops and especially for moving their crops to their end destinations for sale. SCSWCD manages the Noxious Weed List and the County Cost Share program which reimburses farmers for implementing conservation practices and other practices, such as herbaceous weed control and pasture/range planting on their lands. [180]

The Council has previously considered the tax revenues generated by energy development as supportive of an exception to Statewide Planning Goal 3;[181] however in recent decisions, the Council has found that evidence demonstrating a proposed facility will benefit a local economy in general, including through the generation of tax revenue, is not sufficient to serve as an economic benefits reason for granting an exception to Goal 3 because any development will be required to pay some form of taxes. The Council has found that evidence demonstrating how the local agricultural economy will specifically benefit as a result of the proposed facility is needed to justify an exception to Goal 3.[182]

Here, the certificate holder argues that, due to the rural nature of Sherman County and the prevalence of the agricultural sector in its economy, the existing tax scheme guarantees that any increased revenue will directly benefit the agricultural economy.

The certificate holder does not provide a comparison of the estimated revenues that would be generated by the facility components proposed in RFA4 when compared to the existing farm uses, or provide any details about unique investments or improvements that the County or other taxing districts would be able to make if the facility components proposed in RFA4 were constructed. The Council finds that there is not sufficient evidence on the record to determine that the tax benefits from the facility components proposed in RFA4 would provide any more direct benefit to the agricultural economy than any other development in the County. Accordingly, the Council finds that there is not sufficient evidence to demonstrate that the generation of property tax payments is a reason that justifies an exception to Statewide Planning Goal 3.

Creation of a Community Investment Plan

[180] BCWAMD4Doc21-06 RFA Exhibit K Land Use 2025-12-10, Section 8.1.3.2

[182] MSEFAPPDoc4-1 Final Order (SIGNED) with Attachments 2021-08-02, pg. 104; WESAPPDoc 2-2 Final Order on ASC Combined w Attachments Signed 2023-03-24, pg. 95-96; WTSAPPDoc2 Final Order on ASC 2024-09-20, pg. 107-109; SSPAPPDoc56-00 Final Order with Attachments (Secure) 2024-11-20, pg. 118-120.

To ensure the creation of rural economic development, the certificate holder proposes to partner with Sherman County and the MCEDD to establish and manage a mitigation fund that would fund projects that benefit the Sherman County agricultural economy. Before beginning construction of a phase of construction, the certificate holder would contribute $1,600 per acre into the fund for each acre removed from agricultural production for any phase of construction.[183]

To arrive at this number, the certificate holder modeled the economic impacts of removing up to 1,445 acres of farmland within the proposed Solar Micrositing Area from agricultural production based on the productivity of land and average prices of wheat. NRCS assigns an average of 45 to 55 bushels per acre of winter wheat for non-irrigated Walla Walla silt loam and an average of 30 to 40 bushels per acre of winter wheat for non-irrigated Anderly silt loam. Mr. Scharf, the partial owner and farm manager for Tract 2, reported a higher five-year average yield of 62 bushels per acre on the lands he farms in the Tract.[184] Based on the average yields reported by Mr. Scharf, the typical two year crop cycle for dryland winter wheat, and the average price per bushel of winter wheat over the past 10 years, the modelling showed that the construction and operation of the facility components proposed in RFA4 would result in an estimated $281,300 annual reduction in crop output, or about 0.8 percent of the total crop output of Sherman County.[185] Because the direct revenue losses of the reduction would be made up by lease payments, the modelling focused on the indirect impacts on the local agricultural economy that would result from reduced spending on agricultural inputs like fertilizers and herbicides, repair and other services, and crop marketing. The certificate holder notes that it's modeling did not take the spending on services such as weed control and road maintenance into account even though this spending would be expected to reduce the overall indirect impacts.[186] Based on the modelling, the certificate holder estimates that at full build out, the construction and operation of the facility would result in a loss of up to $213,900 per year over the 40-year expected operating life of the facility components proposed in RFA4. Calculated over a period of 40 years of operation, and adjusting to present value, the estimated indirect output would be up to $2,315,128, or $1,600 per acre of farmland taken out of production.[187]

The Community Investment Plan provides details of the establishment and administration of the mitigation fund. As discussed further below, PGE, the Project Developer, Sherman County, and the Mid-Columbia Economic Development District (MCEDD) are negotiating a Memorandum of Understanding to document their working relationships and the procedures that will govern implementation of the Plan and allocation of dollars from the mitigation fund for selected projects.

[184] BCWAMD4Doc21-06 RFA Exhibit K Land Use 2025-12-10, Section 3.3.2.1; Attachment K-1

[185] BCWAMD4Doc21-06 RFA Exhibit K Land Use 2025-12-10, Attachment K-2, Section 4.4.1.

[186] BCWAMD4Doc21-06 RFA Exhibit K Land Use 2025-12-10, See Footnote 29.

[187] BCWAMD4Doc21-06 RFA Exhibit K Land Use 2025-12-10, Attachment K-2.

To help inform the development of the CIP and to identify potential projects that would support the local agricultural economy the certificate holder met with local wheat farmers, the Oregon Watershed Enhancement Board, Oregon State University including its extension service in Sherman County and the College of Agricultural Sciences, the Oregon Wheat Commission, the Sherman County Fire District, Sherman County Emergency Services, the Rural Sherman County Fire Board, and local government officials and staff. The Council approved four "pre-screened" projects that would qualify for funding to be included in the CIP:

1. Investments in minimizing wildland fire risk to agricultural crops, properties, and infrastructure designated in the Sherman County Community Wildfire Protection Plan, and minimizing risk of liability to farmers from farm activities igniting fires and impacting non-farm uses in the agricultural district.
2. Providing additional funds to supplement SCSWCD cost share programs for technical assistance programs such as improving haul routes, weed control, establishing fire breaks, etc.
3. Providing grants to county wheat farmers to invest in precision agricultural technology such as weed management equipment, remote sensing technology to assist with weed mapping or soil mapping, variable rate technology to collect data on soil variability to inform application of fertilizers, and other technologies
4. Establishing a per-bushel support mechanism for Sherman County's wheat growers. An additional $0.05 per bushel would be paid directly to farmers on top of the prevailing market price to help offset the rising costs of inputs such as seed, fertilizer, fuel, machinery, and labor.[188]

For other proposals, a six-person advisory committee (Selection Committee) coordinated by MCEDD would review applications and make recommendations to Sherman County Board of Commissioners on funding. The Selection Committee would include one representative from Sherman County government; one representative from an academic institution engaged in agriculture research in Sherman County or an agricultural-related nonprofit entity located in Sherman County; one dryland farm producer in the County; one representative selected by the Oregon Wheat Grower's League; one community member; and one representative with expertise in wildfire as it relates to agricultural lands. The County would have an opportunity to propose candidates for the Selection Committee, otherwise candidates would be selected by MCEDD.[189]

Each application would be weighed against selection criteria intended to ensure that selected projects will bring economic benefit to the County's agricultural economy. The five selection criteria are as follows:

1. Improving resiliency and efficiency of Sherman County's agricultural economy;
2. Improving agricultural wildfire protection and risk management capacity;

[188] BCWAMD4Doc21-06 RFA Exhibit K Land Use 2025-12-10, Attachment K-4, Section 5.0.

[189] BCWAMD4Doc21-06 RFA Exhibit K Land Use 2025-12-10, Attachment K-4, Section 4.2.1.

3. Investing in research to further agrivoltaics for dryland wheat lands;
4. Investing in agricultural education for next-generation farmers; and
5. Subsidizing the price of wheat produced in Sherman County.[190]

Under the CIP, the Sherman County Board of Commissioners would make the final selection for what projects would be funded and/or what organizations would be awarded mitigation funds. The CIP identifies selection criteria unique to the Sherman County agricultural community and its specific needs that will be applied to proposed mitigation projects. The certificate holder argues that the CIP provides sufficient information to guide Sherman County's selection of mitigation projects to be a) responsive to the community's needs; b) beneficial to the dryland wheat community; and c) more than sufficient to counter any indirect economic impacts from the Solar Components. The Council finds that the proposed CIP was prepared using reasonable methods and the proposed mitigation reasonably addresses the indirect impacts of converting agricultural lands in the proposed Solar Micrositing Area to nonfarm use.

The Council has previously considered the creation of similar investment or mitigation funds to be supportive of a rural economic benefit reason, and that such a reason would partially justify an exception to Statewide Planning Goal 3.[191] While the calculation of mitigation, project selection process and criteria, and pre-screened projects are generally consistent with those included in previous agricultural mitigation plans the inclusion of wildfire prevention and risk mitigation as a benefit to the agricultural economy is a novel proposal and warrants more further discussion.[192]

As discussed in more detail in Section III.N., *Wildfire Prevention and Risk Mitigation*, Sherman County has experienced significant wildfires in recent years which have impacted agricultural lands and farmers are often directly engaged in firefighting activities. As noted by the certificate holder, the Sherman County Community Wildfire Protection Plan notes that the 2018 Substation Fire burned over 78,425 acres, destroyed over 1 million bushels of wheat, and resulted in the death of a farmer-firefighter. The CWPP identified several opportunities to assist the County and local fire protection providers to mitigate and respond to wildfire risk in the county, including upgrading, maintaining, or adding firefighting equipment for Sherman County's Rural Fire Protection Districts; upgrading and developing new facilities at Rufus Fire Hall, North Sherman Rural Fire Protection District Station, and/or South Sherman Rural Fire Protection District Station; training volunteers; funding staff, and funding projects to develop fuel breaks, reduce wildfire hazards, provide firefighting water.[193]

[190] BCWAMD4Doc21-06 RFA Exhibit K Land Use 2025-12-10, Attachment K-4, Section 5.0.
[191] WTSAPPDoc2 Final Order on ASC 2024-09-20, pg. 107-109; SSPAPPDoc56-00 Final Order with Attachments (Secure) 2024-11-20, pg. 121-124
[192] The proposed use of funds to directly subsidize the price of wheat for Sherman County growers is also novel, but the benefit to farmers from that approach seems to be clear.
[193] See the 2024 Sherman County CWPP, Section XII., Wildfire Mitigation Projects; https://storage.googleapis.com/proudcity/shermancountyor/2017/10/Sherman-County-CWPP-2024.pdf

The certificate holder has identified any of the projects identified in the CWPP as "pre-screened" projects for the CIP. The certificate holder emphasizes the interconnectedness of agricultural mitigation and wildfire mitigation in Sherman County and asserts that any project that reduces the risk or extent of wildfire damage to dryland wheat crops and their supporting infrastructure would provide a direct economic benefit to the County's agricultural community.[194] Because the certificate holder has provided strong evidence linking the benefits of wildfire protection to agricultural practices, producers, and the broader community, the Council finds that the inclusion of wildfire mitigation as a potential use of agricultural mitigation funds in the CIP is appropriate and supports a rural economic benefits reason. Based on the other pre-screened projects and selection criteria above, the Council further finds that the agriculture mitigation funds are likely to be used in a manner that benefits the local agricultural economy and responds to community need. Consistent with past proceedings, the Council finds that a non-voting Council representative should be included in the selection committee to ensure statewide and regional interests are represented and that future projects can benefit from any lessons learned from the selection process. This change is reflected in the Community Investment Plan included as Attachment E to this Order.

As discussed in more detail below, the Council finds that the implementation of the CIP may be considered as a reason to support an exception to Statewide Planning Goal 3 but is not sufficient to justify an exception by itself. To ensure the plan is implemented as proposed, and a Council representative is included on the selection committee, the Council imposes the following condition:

> **Land Use Condition 6 (PRE-LU-03)**
> Prior to construction of the solar facility, component or phase, as applicable, the certificate holder shall submit to the Department:
> a. A Memorandum of Understanding or other agreement executed by the certificate holder, Mid-Columbia Community Economic Development District, and Sherman County, establishing a Community Investment Fund in accordance with the Community Investment Plan included as Attachment E to the Final Order on RFA4.
> b. Evidence that that the certificate holder has contributed at least $1,600 per acre of cultivated land that will be occupied by facility components to the Community Investment Fund.
> [Final Order on AMD4]

Landowner Lease Payments

The certificate holder provides testimony from participating landowners that the lease payments that would be made for land taken out of agricultural production would allow the landowners to increase the dollars per acre spent on, and increase the economic viability of, their remaining farm operations.[195]

[194] BCWAMD4Doc21-06 RFA Exhibit K Land Use 2025-12-10, Attachment K-4, Section 5.2.
[195] BCWAMD4Doc21-06 RFA Exhibit K Land Use 2025-12-10, Section 8.1.3.4.

The Council has accepted lease payments made to landowners as an economic benefits reason justifying a Goal 3 exception when the applicant or certificate holder provides evidence of a direct connection between lease payments and specific benefits to significant agricultural operations. In this case, the landowner merely indicated that they will have fewer expenditures and will be farming fewer acres, but will increase general local spending.[196] In addition, the certificate holder notes that the landowner currently leases the land in the Proposed Solar Micrositing to other farmers, and those farmers' agricultural operations are not likely to benefit from the lease payments.

The certificate holder also notes that many of the farmers contacted during the development of the application have benefited from wind farm leases, which helped them diversify their income streams, allowed them to invest in their wheat farming operations and equipment, and strengthened the resilience of their farms in the face of the ongoing global wheat market challenges. These farmers indicated that adding solar leases to their existing farming operations would provide further flexibility to look at new agribusiness models such as agrivoltaics, new crops/markets, and/or agritourism. The farmers also expressed interest around the potential for developing agrivoltaics with dryland crops and stated that lease payments would provide this diversified income stream to allow landowners to take more risks in investing in new technologies, new cropping systems, and agrivoltaics.[197] While income diversification may help farmers strengthen and diversify their farm operations, the Council finds that these arguments are not relevant to the lands in the Proposed Solar Micrositing Area, as the participating landowner or individuals farming the land have not demonstrated, or even indicated, they intend to use the lease payments from the proposed solar facility to make or allow for new farm investment.

Accordingly, the Council finds that the certificate holder has not provided sufficient evidence to demonstrate that lease payments will benefit agricultural operations in a specific or unique manner. Accordingly, the Council finds that there is not sufficient evidence to demonstrate that lease payments made to landowners are a reason to justify an exception to Statewide Planning Goal 3.

Minimal Impacts on other resources protected by Council standards

The certificate holder argues that the facility components proposed in RFA4 are sited to avoid sensitive environmental features, including but not limited to, wetlands, big-game winter range, habitat for state-listed or special status species, in part because it is sited on land currently used for dry-land wheat cultivation. The certificate holder further notes that any additional impacts to resources, including soils, wetlands, protected areas, water resources, scenic and aesthetic

[196] BCWAMD4Doc21-06 RFA Exhibit K Land Use 2025-12-10, Attachment K-1. In Exhibit K, Section 8.1.3.4, the certificate holder claims the landowner testified that they anticipate to spending more per acre on their remaining farm operations, but this is unsupported by the record.

[197] BCWAMD4Doc21-06 RFA Exhibit K Land Use 2025-12-10, Section 8.1.3.4.

resources, and historic, cultural, and archaeological resources will be avoided, minimized, or otherwise mitigated in accordance with new and existing conditions of approval. The certificate holder specifically asserts that "choosing land in farm use allows for the preservation of undeveloped habitats, sensitive lands and waterways in other parts of the county." [198]

As described in Section III.H, as proposed, the facility would result in permanent impacts up to 44 acres of Category 2 to 4 habitat, including approximately 21 acres of Category 2 Sagebrush Shrub-Steppe habitat that is in or adjacent to a Priority Wildlife Connectivity Area.

The council has previously found "minimal impacts to resources protected by Council standards" or "minimal impacts to other environmental resources" as an appropriate, but not in itself sufficient, reason to justify an exception to Statewide Planning Goal 3.[199]

In addition to finding that there are sufficient reasons to justify taking an exception to the applicable goal, when taking an exception, ORS 469.504(2)(a)(B) requires the Council to find that the significant environmental, economic, social and energy consequences anticipated as a result of the facility components proposed in RFA4 have been identified and adverse impacts will be mitigated in accordance with rules of the Council. The Council finds that in order to justify a goal exception, the certificate holder must go beyond demonstrating that this criterion, or the requirements of the applicable Council Standards, has been satisfied and demonstrate that the lack of resources or impacts at a particular site goes beyond the conditions that would be expected on any developed farmland.

The Council finds that the certificate holder has not provided sufficient evidence to demonstrate that the level of impacts to resources that would result from the construction and operation of the facility components identified in RFA4 is exceptionally low, particularly when compared to other locations that are currently in farm use. Accordingly, the Council finds that the certificate holder has not provided sufficient evidence to support a minimal impact to resources reason.

Consistency with State Climate Policies and Goals

The certificate holder argues that authorizing the facility components proposed in RFA4 is consistent with State policies and goals addressing the climate crisis and that relate to the acceleration of Oregon's clean energy transition including the provisions of Statewide Planning Goal 13 and House Bill 2021 (2021).[200]

---

[198] BCWAMD4Doc21-06 RFA Exhibit K Land Use 2025-12-10, Section 8.1.2.

[199] Final Order on the Application for Site Certificate for the Madras Solar Energy Facility (2021), Final Order on the Application for Site Certificate for the West End Solar Project (2023), Final Order on the Application for Site Certificate for the Nolin Hills Wind Power Project (2023), Final Order on the Application for Site Certificate for the Wagon Trail Solar Project (2024), and Final Order on the Application for Site Certificate for the Sunstone Solar Project (2024).

[200] BCWAMD4Doc21-06 RFA Exhibit K Land Use 2025-12-10, Section 8.1.4.

The Council has consistently rejected similar arguments in past proceedings, finding that neither Goal 13 nor House Bill 2021 require renewable energy to be procured from Oregon-based resources, address where renewable energy facilities should be located, or direct agencies to allow facilities to be placed on agricultural lands as an exception to Goal 3.[201]

Here, the certificate holder argues that the Council has the discretion and power to balance the state policies for the preservation of agricultural lands for farm use with its policy directive in ORS 469.010, and encourages the Council to consider recent studies demonstrating the need for additional renewable energy development in the state, including the Department's own Biennial Energy Report which estimates that approximately 63,300 acres in Oregon would need to be utilized for solar development to meet Oregon's renewable energy targets. The certificate holder states that locating the solar facility in the Solar Micrositing Area "helps achieve Oregon's clean energy goals while also taking advantage of the efficiencies of the existing electrical infrastructure in the RFA 4 Site Boundary, minimizing impacts to other state protected resources such as habitat and cultural resources, and while offering economic benefits to the rural community in Sherman County through the tax payments and community benefit program."[202]

The Council finds that the certificate holder has not presented any unique arguments that would require the Council to reconsider its established position regarding the "consistency with State climate goals and policies" reason. While ORS 469.010 does articulate State Polices to encourage the development of "permanently sustainable energy resources" the onus behind this policy is to ensure that "future generations not be left a legacy of vanished or depleted resources, resulting in massive environmental, social and financial impact." In ORS 469.310, the legislature further directed the Council to carry out these policies by ensuring that the siting, construction and operation of both renewable and nonrenewable energy facilities is accomplished "in a manner consistent with protection of the public health and safety and in compliance with the energy policy and air, water, solid waste, land use and other environmental protection policies of this state." In other words, neither the State Energy Policy in ORS 469.010 or ORS 469.310 suggest that the Council should grant an exception to the State's goals to preserve agricultural lands, particularly highly-productive farmlands, for farm use based on the general need for new sources of renewable energy to meet other state goals.

Consistent with the state policies in ORS 469.010, 469.310 and the Council's previous decisions, the Council finds that consistency with State climate goals and policies is not an appropriate reason to justify an exception to Statewide Planning Goal 3.

[201] BSPAPPDoc2 Final Order 2020-04-24, pg. 113; BSPAPPDoc2 Final Order 2020-04-24, pg. 112-113; MWPAMD5 Final Order on RFA5 2020-09-25, 94-95; MSEFAPPDoc4-1 Final Order (SIGNED) with Attachments 2021-08-02, pg. 103-104; MSEFAPPDoc4-1 Final Order (SIGNED) with Attachments 2021-08-02, pg. 104; OSCAPPDoc2 Final Order on ASC 2022-02-25, pg. 88; WESAPPDoc 2-2 Final Order on ASC Combined w Attachments Signed 2023-03-24, pg. 83-84; WTSAPPDoc2 Final Order on ASC 2024-09-20, pg. 100-101, SSPAPPDoc56-00 Final Order with Attachments (Secure) 2024-11-20, pg. 125.

[202] BCWAMD4Doc21-06 RFA Exhibit K Land Use 2025-12-10, Section 8.1.4.

Overall Evaluation of Reasons

As described above, the Council finds that the certificate holder has provided sufficient evidence to demonstrate that the facility components proposed in RFA4 are locationally dependent on nearby major transmission infrastructure and transportation corridors and that the proposed Community Investment Plan is adequate to demonstrate the creation of rural economic development benefits. The Council has previously found that locational dependence and creation of local economic benefits reasons together can justify an exception to Statewide Planning Goal 3; however, as discussed below, these reasons are often coupled with other reasons addressing the productivity of the affected farmland. While not binding upon the Council, the standards for local governments also support such reasons being considered acceptable to justify an exception. Under OAR 660-004-0002(3)(c), a local government may grant a "reasons" exception for a solar facility as a Rural Industrial Development if the government found the facility "would have a significant comparative advantage due to its location…which would benefit the county economy and *cause only minimal loss of productive resource lands*." Emphasis added.

In this case, the Council must determine whether an exception is justified, despite the presence of productive farmland, including irrigated land and high-value farmland soils, at the site. The Council has previously granted exceptions for sites that contain irrigated land and high-value farmland soils, but these decisions have also included reasons establishing why the lands are in-fact not suitable for agriculture, are less productive than other available agricultural lands, or are located on water-challenged lands. For example, in the Council's Final Order on the Application for Site Certificate for the Sunstone Solar Project, the Council granted an exception to Goal 3 for a site that contained both land appurtenant to a water right, and 2,914 acres of soils considered Class II, *when irrigated*. This decision relied on similar locational dependence and economic benefits reasons as presented in RFA4, but the Council also found that there were practical and economic limitations on actually using water due to the site's location in a Critical Groundwater Area.[203]

The NRCS Class II soils at the Biglow site represent some of the most productive soils in the state, and while the underlying tract is not predominantly made up of those soils, up to 777 acres of high-value farmland soils would still be removed from agricultural production during construction and operation of the proposed solar facility. In addition, up to 311 acres of irrigated land are present on the site, although the area that is actually irrigated covers a much smaller area.[204] The Council finds this level of impact represents more than a minimal loss of productive resource lands; however, it is still within the Council's discretion to grant an

[203] SSPAPPDoc56-00 Final Order with Attachments (Secure) 2024-11-20, pg. 114-116. For similar decisions, see WRWAMD4 Final Order on Request for Amendment 4 2019-11-22, pg. 63-64; BSPAPPDoc2 Final Order 2020-04-24, pg. 111; WESAPPDoc 2-2 Final Order on ASC Combined w Attachments Signed 2023-03-24, pg. 87-94; MWPAMD5 Final Order on RFA5 2020-09-25; pg. 93-94.

[204] The site also contains a 13 acre tract which is considered high-value farmland due to the predominance of class II soils; however, because the existing Biglow Canyon Substation is already located on that site and no additional development is proposed, the Council finds it is not necessary to address this impact separately.

exception to Statewide Planning Goal 3 if it finds the accepted reasons provide sufficient justification, and the Council finds that they do. In particular, the Council finds that the availability of surplus capacity for interconnection at a location within the proposed Solar Micrositing Area is a unique reason, and represents a strong locational attractor given the limited availability of new interconnection in the state. While the proposal to provide compensatory mitigation to generate local economic benefits does not present a reason that is unique to the site itself, the Council finds the proposed Community Investment Plan was prepared using reasonable methods and the proposed mitigation reasonably addresses the indirect impacts of converting agricultural lands in the proposed Solar Micrositing Area to nonfarm use. The Council further finds that the screening criteria and pre-screened projected presented in the Community Investment Plan reflect the unique needs and priorities of the local community.

Mitigation of Environmental, economic, social and energy consequences

As discussed in Sections III.F, III.J, and III.L, the Council finds that the construction and operation of the facility components proposed in RFA4 are not likely to have significant adverse impacts on any Protected Areas, significant or important Scenic Resources or Recreation Opportunities. As described in Section III.I, no state listed threatened or endangered species are known to occur at the site and no listed species are expected to be adversely affected by the construction and operation of the facility components proposed in RFA4. As discussed in Section III.D, III.H, and III.K, and IV.B, the construction and operation of the facility components proposed in RFA4 could have significant adverse impacts on soils, fish and wildlife habitat, cultural resources, and waters of the State, but the Council finds that existing and new conditions of approval are adequate to avoid, minimize, or mitigate these impacts.

Wildfire is a significant issue in Sherman County and any significant increase in wildfire risk could have significant environmental, economic, and social consequences. As discussed in Section III.M and III.N, and in this section, the finds that subject to compliance with Wildfire Prevention and Risk Mitigation Conditions 1 to 4, and other existing and new conditions of the site certificate, the construction and operation of the solar facility are not likely to significantly increase wildfire risk in the County.

As discussed in Section III.M., due to the limited number of workers that would be permanently employed by the construction and operation of the facility components proposed in RFA4, the Council finds that no other significant adverse impacts on public services are expected to result from the operation of the facility components proposed in RFA4, and temporary impacts during construction would be minimized in accordance with new and existing conditions of approval. As discussed in Section III.O, the Council finds that existing and new conditions of approval would also minimize any environmental or economic impacts associated with the generation of solid waste at the site.

As discussed in Section III.P and IV.A, the Council finds that the certificate holder has provided sufficient evidence to demonstrate that the construction and operation of the facility

components proposed in RFA4 will comply with the standards for EMF radiation and Noise Control established under OAR 345-024-0090 and 340-035-0035.

Compatibility with adjacent uses

To grant the exception, the Council must find that the facility components proposed in RFA4 are compatible with other adjacent uses or will be made compatible through measures designed to reduce adverse impacts. As discussed in the evaluation of OAR 660-022-0130(5), above, the Council finds that, subject to compliance with existing and new conditions of approval, the construction and operation of the facility components proposed in RFA4 are not expected to result in significant adverse impacts to adjacent farm uses from traffic, dust, noxious weeds, or wildfire.

As discussed in the evaluation of SCZO Section 3.6, the Council finds that the setback required under Land Use Condition 11 is adequate to ensure the facility components proposed in RFA4 are compatible with operations at the significant aggregate resource site located adjacent to the Northern Solar Area.

III.E.2. Conclusions of Law

Based on the foregoing analysis, and subject to compliance with the site certificate conditions described above, the Council finds that the facility components proposed in RFA4 will comply with the statewide planning goals adopted by the Land Conservation and Development Commission.

III.F. PROTECTED AREAS: OAR 345-022-0040

(1) To issue a site certificate, the Council must find:

(a) The proposed facility will not be located within the boundaries of a protected area designated on or before the date the application for site certificate or request for amendment was determined to be complete under OAR 345-015-0190 or 345-027-0363;

(b) The design, construction and operation of the facility, taking into account mitigation, are not likely to result in significant adverse impact to a protected area designated on or before the date the application for site certificate or request for amendment was determined to be complete under OAR 345-015-0190 or 345-027-0363.

(2) Notwithstanding section (1)(a), the Council may issue a site certificate for:
(a) A facility that includes a transmission line, natural gas pipeline, or water pipeline located in a protected area, if the Council determines that other

reasonable alternative routes or sites have been studied and that the proposed route or site is likely to result in fewer adverse impacts to resources or interests protected by Council standards; or

(b) Surface facilities related to an underground gas storage reservoir that have pipelines and injection, withdrawal or monitoring wells and individual wellhead equipment and pumps located in a protected area, if the Council determines that other alternative routes or sites have been studied and are unsuitable.

(3) The provisions of section (1) do not apply to:

(a) A transmission line routed within 500 feet of an existing utility right-of-way containing at least one transmission line with a voltage rating of 115 kilovolts or higher; or

(b) A natural gas pipeline routed within 500 feet of an existing utility right of way containing at least one natural gas pipeline of 8 inches or greater diameter that is operated at a pressure of 125 psig.

(4) The Council shall apply the version of this rule adopted under Administrative Order EFSC 1-2007, filed and effective May 15, 2007, to the review of any Application for Site Certificate or Request for Amendment that was determined to be complete under OAR 345-015-0190 or 345-027-0363 before the effective date of this rule. Nothing in this section waives the obligations of the certificate holder and Council to abide by local ordinances, state law, and other rules of the Council for the construction and operation of energy facilities in effect on the date the site certificate or amended site certificate is executed.[205]

***** [206]

III.F.1. Findings of Fact

The analysis area for the Protected Areas standard is the area within and extending 20 miles from the proposed Solar Micrositing Area Boundary.[207]

[205] OAR 345-022-0040, effective April 2, 2025.

[206] The information requirements included in the standard are omitted from the language above, but evaluated within the findings of fact below.

[207] The Council's procedural requirements for site certificate amendments (OAR 345-027-0360(3) allow the Department to authorize modifications to analysis areas established in a Project Order, if warranted based on the scope of changes in the Request for Amendment. The October 10, 2005 Project Order established the analysis area as the area within and extending 20-miles from the site boundary, including areas outside of the state of Oregon. As authorized under OAR 345-027-0360(3), following a pre-amendment conference on March 5, 2024, the

Protected Areas in the Analysis Area

There are 12 designated protected areas in the analysis area, as presented in Table 13 and Figure 9 below. RFA4 Exhibit L presents potential impacts including noise, traffic, water use, wastewater disposal, and visual impacts during construction and operational. Those impacts are summarized in Table 13 and described further below in this section.

Department approved a modified analysis area for the Protected Areas standard based on the scope and extent of potential impacts associated with the facility components within the proposed Solar Micrositing Area. BCWAMD4Doc01-00 ODOE Concurrence on OAR 345-027-0360(3) Request 2024-05-02.

Ferry Canyon Area of Critical Environmental Concern (ACEC) OAR 345-001-0010(26)(i)	17.5	18.2	Southeast	No	No		Temp Delays		

Notes:
1. Operational noise includes noise from the existing facility with operational noise generating equipment from the proposed changes in RFA4.

Figure 9: Protected Areas Within and Extending 20-miles of the Proposed Solar Micrositing Area

As presented in Table 13 above, the nearest protected areas are John Day Wild and Scenic River and the John Day River State Scenic Waterway, located 3.7 to 3.8 miles, respectively, east of the proposed Solar Micrositing Area. All other protected areas are located at distances of 8 miles or greater from the site.

Potential Impacts on Protected Areas

Noise

Estimated and modeled noise impacts at John Day Wild and Scenic River (approx. 3.7 miles east of the proposed Solar Micrositing Area) are 43 dBA during construction and 26 dBA during operations, respectively. A noise level of 43 dBA represents a similar noise level of light auto traffic at a distance of 100 feet.[208] A noise level of 26 dBA is equivalent to ambient noise levels and considered extremely quiet. These noise levels combined with a more than 3 mile separation distance would not be expected to result in a significant adverse impact at John Day Wild and Scenic River or at any other protected area located at greater distances from the proposed RFA4 site boundary. Therefore, the Council finds that noise impacts are not likely to have a significant adverse impact on users of any protected area within the analysis area.

Traffic

Construction routes will include I-84, US-97, OR-206, Klondike Road and Old Wasco-Heppner Highway. Six of the protected areas are accessed by US-97 or OR-206, including John Day Wild & Scenic River; John Day River State Scenic Waterway; Lower John Day Wilderness Study Area; Ferry Canyon ACEC; Cottonwood Canyon State Park; and Columbia Basin Agricultural Research Center. Visitors travelling to any of these six protected areas could experience short-term delays for the duration of construction. As presented in Section II.M. *Public Services*, there are three existing conditions, Conditions 77-79, that apply to construction-related traffic impacts. These conditions, as amended, will minimize potential traffic volume and road damage impacts, minimizing potential impacts to users of road serving the above-referenced protected areas. Therefore, the Council finds that construction-related traffic is not likely to have a significant adverse impact on roads used to access protected areas within the analysis area.

Only three additional full-time employees are expected to visit the site daily, and other trips for delivery or maintenance would be infrequent. As a result, the Council finds that operational traffic is not likely to have a significant adverse impact on roads used to access protected areas within the analysis area.

Water and Wastewater

No water will be withdrawn from or discharged to any protected area. Wastewater will be managed within the site. There are no water or wastewater related impacts during construction or operation of the changes proposed in RFA4. The Council finds that the facility components proposed in RFA4 would not result in impacts to protected area within the analysis area.

[208] BCWAMD4Doc21-19 RFA Exhibit Y Acoustic Assessment 2025-12-10, Table Y-2. See sound level, in dBA, of light auto traffic at 100 feet.

Visual

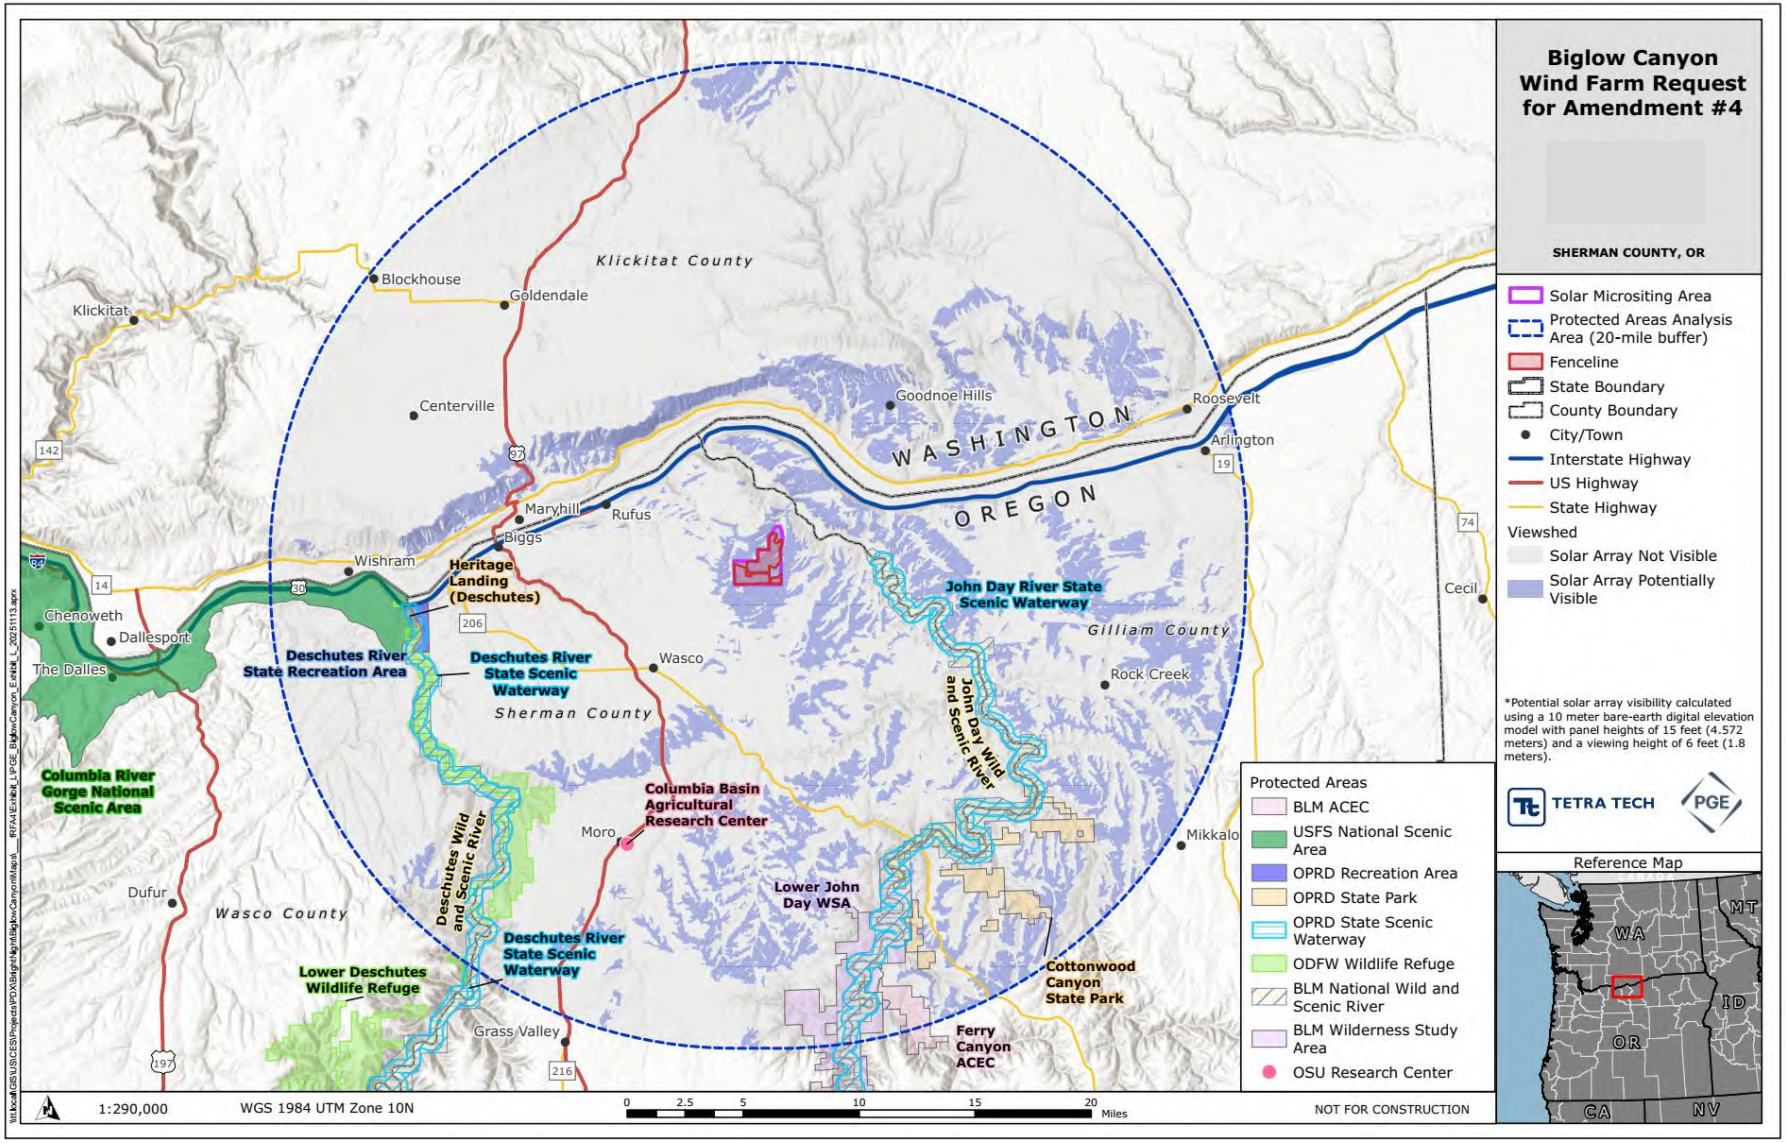
Permanent placement of energy infrastructure proposed in RFA4 could result in potential visual impacts including up to 15 foot tall solar arrays and up to 160 foot-tall transmission line poles. To evaluate potential visual impacts of these structures, RFA4 Exhibit R presents the results of a three-part approach including GIS-based viewshed (or zone of visual influence [ZVI]) modeling; key observation point (KOP) analysis and glare modeling.

First, the ZVI analysis used Esri GIS software and bare-earth 10-meter digital elevation model to determine locations within the analysis area where the changes proposed in RFA4 would be visible. Results of the ZVI analysis are presented in RFA4 Exhibit R Figure R-2 and R-3. Then, based on the results of the ZVI analysis, 21 KOPs were identified, representing locations where a "casual observer" could realistically view the proposed RFA4 structures. The KOP locations are presented in RFA4 Exhibit R Figure R-4. These KOPs are located along accessible viewpoints and near specific scenic resources and used to support the evaluation of the likelihood and magnitude of potential visual impacts (RFA4 Exhibit R Attachment R-3 presents photo locations associated with the KOPs demonstrating actual, existing viewshed conditions). Lastly, a glint and glare analysis was conducted using the Solar Glare Hazard Analysis Tool developed by Sandia National Laboratories to inform potential impacts to drivers on nearby roads.

As presented in Figures 9 and 10 below, visual modeling and viewshed analysis show that portions of six protected areas may have distant or background views of the proposed RFA4 components, while the remaining six protected areas would have no potential visibility. The six protected areas with potential views of the proposed solar components currently have views of other wind farms, transmission lines, industrial development and agricultural irrigation equipment. The glare analysis resulted in no predictions of red, yellow or green glare from the proposed solar arrays at any protected area within the analysis area. Based on these results, the Council finds that visual impacts from solar array glare and structural changes are not likely to result in potentially significant visual impacts to any protected area within the analysis area.

The Council previously imposed Site Certificate Condition 36 to address visual impacts of the wind facility on protected areas by limiting micrositing of turbines and requiring updated visual impact analysis prior to construction. Because the condition applied to the design and construction of the wind energy, the Council deletes the Condition.

Figure 10: **Zone of Visual Influence for Solar Arrays in Protected Areas Analysis Areas**



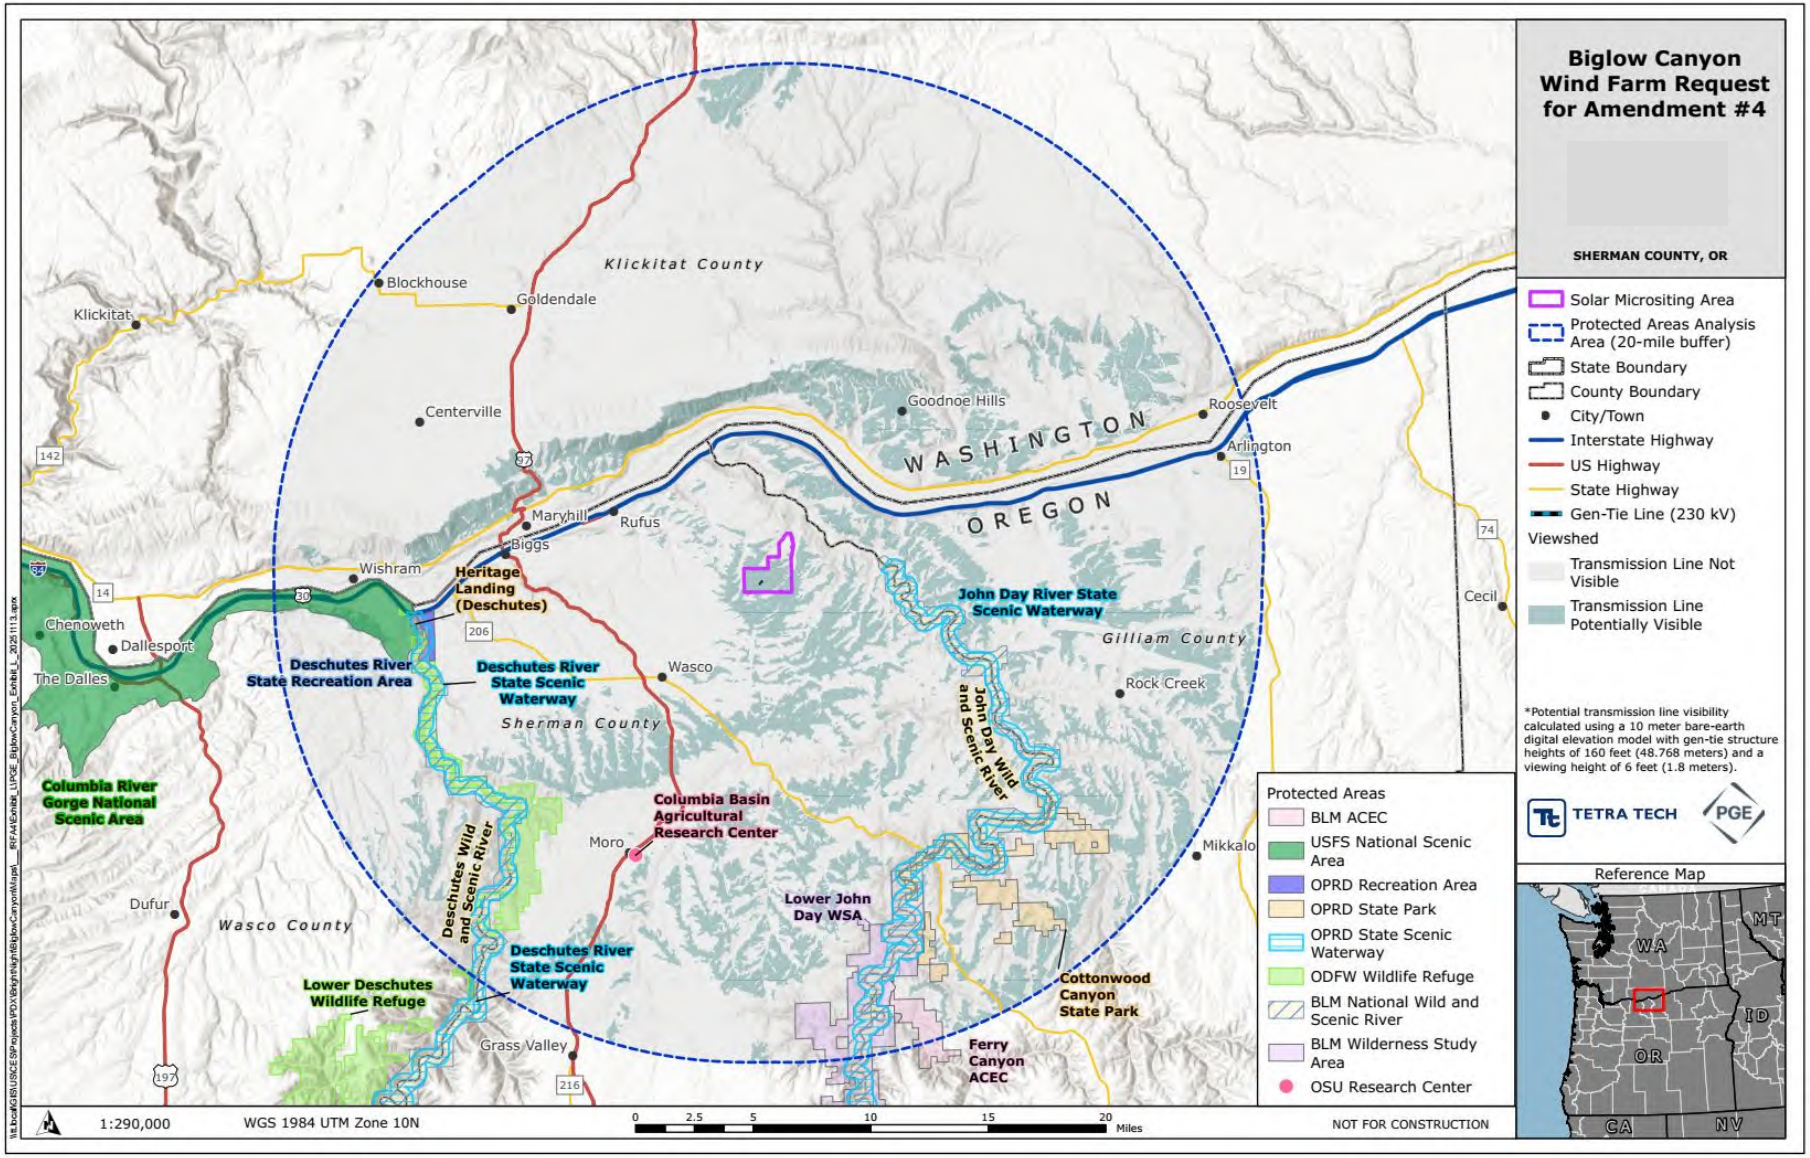


Figure 11: Zone of Visual Influence for Transmission Lines in Protected Areas Analysis Area

III.F.2. Conclusions of Law

Based on the foregoing analysis, and subject to compliance with amended Conditions 77, 78 and 79, the Council finds that the facility components proposed in RFA4 are not located within the boundaries of a protected area and that the design, construction and operation of the facility components proposed in RFA4 are not likely to result in significant adverse impact to any protected areas.

III.G. RETIREMENT AND FINANCIAL ASSURANCE: OAR 345-022-0050

> *To issue a site certificate, the Council must find that:*
>
> *(1) The site, taking into account mitigation, can be restored adequately to a useful, non-hazardous condition following permanent cessation of construction or operation of the facility.*
>
> *(2) The applicant has a reasonable likelihood of obtaining a bond or letter of credit in a form and amount satisfactory to the Council to restore the site to a useful, non-hazardous condition.* [209]
>
> ***** [210]

III.G.1. Findings of Fact

At the end of its useful life, the facility components proposed in RFA4 would be decommissioned and the site would be restored to a useful, non-hazardous condition suitable for agricultural uses. The certificate holder estimates that the facility components proposed in RFA4 will have a useful life of at least 40 years. [211]

The certificate holder also acknowledges that some facility components, including but not limited to individual modules and batteries, may need to be replaced during operation of the facility through routine operations and maintenance activities.[212]

As discussed in Section III.D., *Soil Protection*, the Council finds that the construction and operation of the facility components proposed in RFA4 are not likely to result in significant adverse impacts to soils that would preclude the restoration of the site to a useful, non-hazardous condition; and the Comprehensive Solar Revegetation and Soil management Plan required under Soil Protection Conditions 1 to 3 contain provisions to prevent soil loss, the introduction of weeds, or other impacts that may affect the long-term productivity of soils at

[209] OAR 345-022-0040, effective April 2, 2025.

[210] The information requirements included in the standard are omitted from the language above, but evaluated within the findings of fact below.

[211] BCWAMD4Doc21-18 RFA Exhibit X Retirement 2025-12-10, Section 2.0.

[212] BCWAMD4Doc21-18 RFA Exhibit X Retirement 2025-12-10, Section 2.0.

the site; although as discussed below, additional work may be needed at the time of decommissioning and retirement before lands can be returned to agricultural production.

Facility Decommissioning and Site Restoration

The certificate holder represents that it will conduct the following activities during decommissioning:

- All aboveground facility components would be removed.
  - Solar modules would be separated from the racking and loaded into a truck or roll-off container for off-site disposal or recycling.
  - Posts would be removed from the ground and recycled as scrap metal.
  - Transformers would be decommissioned and disposed of off-site. Transformer oil would be disposed of in accordance with applicable state and federal regulations.
  - Battery containers and associated components would be disassembled and transported off-site via truck for disposal or recycling with applicable regulatory requirements.
  - Refrigerant associated with heating, ventilation, and air conditioning systems would be recovered in accordance with applicable state and federal regulations.
  - Concrete slab-on-grade foundations for transformers, inverters, and battery storage system would be removed in their entirety.
- Underground electrical cables would be removed to lateral depth; lateral runs buried at or exceeding a minimum of 3 feet will be abandoned in place.
- Sub-grade foundations for the O&M buildings and collector substations would be removed to a minimum of at least 3 and 4 feet, respectively. Foundation areas would be backfilled with soil or gravel.
- Access roads constructed within the solar areas would be regraded to natural contours unless landowners request they remain in place. Road gravel would be used for backfill where needed.
- Disturbed areas would be covered with salvaged topsoil where needed and reseeded.[213]

In accordance with the rules for mandatory conditions currently located in OAR 345-025-0006, the Council previously imposed Site Certificate Conditions 107, 109 and 116, requiring the certificate holder to retire the facility according to a final retirement plan approved by the Council following the permanent cessation of construction or operation of the facility and to prevent the development of any conditions on the site that would preclude restoration of the site to a useful, non-hazardous condition during construction and operation of the facility.[214]

[213] BCWAMD4Doc21-18 RFA Exhibit X Retirement 2025-12-10, Section 3.0, 4.2.

[214] At the time the Council issued the Third Amended Site Certificate, the rules for mandatory conditions were found in OAR chapter 345, division 027. In 2017, these rules were moved to OAR chapter 345, division 025.

The conditions were intended to apply to the wind facility and do not contemplate the potential need to decommission separate energy facilities with different expected operating lives independently from one another. The Council amends Condition 109 to provide a clear process to address any partial decommissioning of the facility and ensure any significant portions of the wind energy facility that are decommissioned during the operating life of the solar facility are retired in a timely fashion in accordance with a retirement plan approved by the Council. The Council makes additional administrative edits to Condition 116 to reflect the Council's current rules:

Amended Condition 109 (RET-RF-01)

~~OAR 345-027-0020(9):~~

a. The certificate holder shall retire the facility if the certificate holder permanently ceases construction or operation of the facility. The certificate holder shall retire the facility according to a final retirement plan approved by the Council, as described in OAR 345-027-0110. The certificate holder shall pay the actual cost to restore the site to a useful, non-hazardous condition at the time of retirement, notwithstanding the Council's approval in the site certificate of an estimated amount required to restore the site.

b. If the certificate holder permanently ceases construction or operation of a portion of the facility that is, by itself, an energy facility under ORS 469.300, the certificate holder must retire that portion of the facility within two years following cessation of construction or operation of the facility components in accordance with the provisions of OAR 345-027-0110(10).
[OAR 345-027-0020(9); Final Order on ASC, Condition 109; AMD4]

Amended Condition 116 (RET-RF-02)

~~OAR 345-027-0020(16)~~: If the Council finds that the certificate holder has permanently ceased construction or operation of the facility without retiring the facility according to a final retirement plan approved by the Council, as described in OAR 345-027-0110, the Council shall notify the certificate holder and request that the certificate holder submit a proposed final retirement plan to the Office within a reasonable time not to exceed 90 days. If the certificate holder does not submit a proposed final retirement plan by the specified date, the Council may direct the Department to prepare a proposed a final retirement plan for the Council's approval. Upon the Council's approval of the final retirement plan, the Council may draw on the bond or letter of credit ~~described in OAR 345-027-0020(8)~~ provided under Condition GEN-RF-01 to restore the site to a useful, non-hazardous condition according to the final retirement plan, in addition to any penalties the Council may impose under OAR Chapter 345, Division 29. If the amount of the bond or letter of credit is insufficient to pay the actual cost of retirement, the certificate holder shall pay any additional cost necessary to restore the site to a useful, non-hazardous condition. After completion of site restoration, the Council shall issue an order to terminate the site certificate if the Council finds that the facility has been retired according to the approved final retirement plan.
[OAR 345-027-0020(16); Final Order on ASC, Condition 116; AMD3, AMD4]

Estimated Costs of Site Restoration

The certificate holder estimates that it would cost approximately $14.24 million (Q4 2024 dollars) to retire the facility components proposed in RFA4 and restore the proposed Solar Micrositing Area as described in the section above.[215] As summarized in Table 14, below, the certificate holder identified individual tasks needed for retirement using the professional experience of its engineering staff and contractors. The costs of individual tasks were estimated based on labor requirements, equipment needs, and duration. Facility components were assumed to have no scrap value for the purpose of estimation. Additional methods and assumptions used to produce the estimate include the following:

- Crew, equipment needs, and production rates were established using professional experience and published data from RS Means and other sources.
- Labor costs were developed by reviewing the U.S. Department of Labor wage determinations and rates published by RS Means. Labor cost rates assume a 50 hour workweek and include base wages, overtime, benefits, and payroll tax liability.
- Equipment rates are based on data published by RS Means and historical vendor quotes. Rates include fuel, maintenance, and wear and tear of ground-engaging components. The rates assume the use of rental equipment, not owned equipment.
- Mobilization and demobilization costs reflect the actual costs to mobilize equipment, facilities, and crew to the site and do not include the front loading of cost from other tasks.
- Several other miscellaneous costs have been approximated, including permits, engineering, signage, fencing, traffic control, utility disconnects, etc. In the context of the overall estimate, these are incidental costs that are covered in the estimate's contingency.
- Temporary facilities including one office trailer and one Conex storage unit have been included in the restoration cost. Additional management costs include portable toilets, first aid supplies, and office supplies.
- Field management includes one Superintendent and one Field Engineer to ensure the safe and successful execution of work.
- The cost of transformer oil disposal was estimated at $4 per gallon (2024 dollars).
- Excess gravel from road removal that is not used for backfill was assumed to be accepted by local receivers at no cost.
- Reseeding was assumed to be required for the collector substation site, along with an estimated 35 percent of the areas where solar panels and associated facilities will be removed (217 acres). For cost estimating purposes, it is assumed that final seeding will utilize a mix of native grasses.[216]

[215] BCWAMD4Doc21-18 RFA Exhibit X Retirement 2025-12-10, Section 4.1.

[216] BCWAMD4Doc21-18 RFA Exhibit X Retirement 2025-12-10, Section 3.0, 4.2.

The certificate holder added contractor profit and overhead markups, including 5 percent for Home Office and Project Management and 15 percent for Contractor Overhead and Fee. The certificate holder also applied contingencies for costs that would be incurred by the State if the certificate holder defaulted on its obligations to retire the facility and restore the site, including a 1 percent Performance Bond, 10 percent Administrative and Project Management fee, as well as a 20 percent Future Development contingency for the battery components and a 10 percent contingency.

The Council finds that the certificate holder used reasonable methods and assumptions to estimate the retirement costs of the facility components proposed in RFA4. With markups and contingencies, the cost that would be incurred by the State if the certificate holder failed to retire the facility as required would be approximately $12.09 million (Q4 2024 dollars).[217]

2. See RFA4 Exhibit X Attachment X-1 for detailed breakdown of tasks, actions and unit costs for the sum total costs presented in this table.

Table 14: Decommissioning Tasks and Cost Estimate for Proposed RFA4 Facility Components

Task or Component	Quantity	Unit	Unit Cost ($)	Estimate ($)
3. Tasks associated with a Lump Sum unit cost may be calculated using a fraction (in decimal form) of the actual quantities constructed or by using the more detailed breakdown of unit costs associated with the Lump Sum task identified in the cost estimating worksheet in RFA4 Exhibit X, Attachment X-1.				

Financial Assurance Requirements

The Council previously imposed Site Certificate Condition 108, requiring the certificate holder to provide and maintain a bond or letter of credit in a form and amount satisfactory to the Council to restore the site to a useful, non-hazardous condition in accordance with the mandatory conditions currently found in OAR 345-025-0006. The Council maintains this condition, with changes to make it clear that the conditions apply to all phases of the facility, including the solar facility.

Amended Condition 108 (GEN-RF-01)

a. ~~OAR 345-027-0020(8): Before beginning~~ Prior to construction of the facility, or any component of the facility, the certificate holder shall submit to the State of Oregon, through the Council, a bond or letter of credit in a form and amount satisfactory to the Council to restore the site to a useful, non-hazardous condition. The certificate holder shall maintain a bond or letter of credit in effect at all times until the facility has been retired. The Council may specify different amounts for the bond or letter of credit during construction and during operation of the facility.

b. The certificate holder shall annually adjust all bonds or letters of credit submitted in compliance with this condition to present value using the U.S. Gross Domestic Product Implicit Price Deflator, Chain-Weight, as published in the Oregon Department of Administrative Services' Oregon Economic and Revenue Forecast or by any successor agency (the "Index"). If at any time the Index is no longer published, the Department shall select a comparable calculation to adjust the amount to present value.

[Final Order on ASC, Condition 108; AMD3, AMD4]

The Council also imposed Site Certificate Conditions 8, 9 and 10 specifying the form and amount of assurance needed for the wind energy facility. In the Final Order on RFA3, based on estimates provided by the certificate holder and Department, the Council determined that $14.624 million (2008 dollars) was the amount satisfactory to decommission the wind energy facility and restore the site to a useful, non-hazardous condition.[218]

Based on inflationary adjustments since the time of the preconstruction decommissioning estimate, the amount has increased to $21.3 million. The Department currently has an Irrevocable Standby Letter of Credit issued by Mizuho Bank, Ltd. on file assuring the payment of

[218] BCWAMD3Doc33 BCW AMD3 Final Order 2008-10-31, pg. 10.

up to $21.3 million in the event the certificate holder defaults on its obligation to retire the existing facility and restore the site as required by the site certificate. The Council deletes Condition 8, make administrative edits to Condition 9 to remove outdated information, and amend Condition 10 to make it clear that it applies to all phases of the facility, and adopt a new condition establishing that the amount of assurance that must be provided for the solar facility and related or supporting components must be based on the unit costs, markups and contingencies established in Table 14, above:

Deleted Condition 8

~~If the certificate holder elects to build the facility in more than one phase using any turbines other than the GE 1.5-MW turbines or GE 3.0-MW turbines, before beginning construction of any phase of the facility and after considering all micrositing factors, the certificate holder shall provide to the Department a detailed map of that phase of the facility showing the final locations where facility components are proposed to be built in relation to the features and micrositing corridors shown on Figures 2, 2a, 2b and 2c as identified in the Final Order on Amendment #3, shall identify on this map the facilities that would constitute that phase of construction, and shall provide documentation defining the quantities of each of the following components that would constitute that phase of construction: turbines, pad transformers, meteorological towers, substation, O&M facility, miles of aboveground 34.5 kV collector system, miles of access road, acres of turnarounds and access road intersections, acres of temporary laydown area and miles of temporary crane paths. For each turbine, the certificate shall define the turbine manufacturer, turbine capacity, weight of steel, height of tower, sweep of blade, and size of concrete foundation.~~

[Final Order on AMD4]

Amended Condition 9 (GEN-RF-02)

~~(9) In February 2007, in accordance with the terms and conditions of the First Amended Site Certificate, the certificate holder submitted to the State of Oregon through the Council a letter of credit in the amount of $1.608 million before beginning construction of Phase 1 of the facility. The calculation of the amount of the letter of credit included a deduction from the estimated cost of site restoration for Phase 1 for the estimated value of scrap steel. In the Final Order on Amendment #2, the Council found that there should be no deduction of scrap or salvage value in calculating the amount of financial assurance required for site restoration.~~

~~In June 2007, in accordance with the terms and conditions of the Second Amended Site Certificate, the certificate holder submitted an amended letter of credit for Phase 1 in the amount of $5.001 million (3rd Quarter 2007 dollars). In January 2008, in accordance with the terms and conditions of the Second Amended Site Certificate, the certificate holder submitted an amended letter of credit for Phase 1 in the amount of $5.058 million (1st Quarter 2008 dollars).~~

~~Before beginning construction of any future phase of~~ For the wind energy facility, the ~~certificate holder shall submit a~~ bond or letter of credit ~~for that phase~~ required under

Condition GEN-RF-01 shall be in an amount approved by the Department and based on the costs shown in Table 1 of the Final Order on Amendment #3.

~~a.~~ The certificate holder shall adjust the amounts of all bonds or letters of credit submitted in compliance with this condition to present value as of the date of issuance, using the following calculation and subject to approval by the Department:

a. Adjust the Subtotal (in 2005 dollars) to present value, using the U.S. Gross Domestic Product Implicit Price Deflator, Chain-Weight, as published in the Oregon Department of Administrative Services' Oregon Economic and Revenue Forecast or by any successor agency (the "Index"). If at any time the Index is no longer published, the Council shall select a comparable calculation to adjust 2005 dollars to present value.
b. Add 1 percent of the adjusted Subtotal (i) for the adjusted performance bond amount to determine the adjusted Gross Cost.
c. Add 10 percent of the adjusted Gross Cost (ii) for the adjusted administration and project management costs and 10 percent of the adjusted Gross Cost for the adjusted future developments contingency.
d. Add the adjusted Gross Cost (ii) to the sum of the percentages (iii) and round the resulting total to the nearest $1,000 to determine the adjusted financial assurance amount.

~~(b) The certificate holder shall annually adjust all bonds or letters of credit submitted in compliance with this condition to present value as of the date of issuance as described in (a).~~

~~(c) The certificate holder shall use a form of bond or letter of credit approved by the Council.~~

~~(d) The certificate holder shall use an issuer of the bond or letter of credit approved by the Council.~~

~~(e) The certificate holder shall describe the status of all bonds or letters of credit for the facility in the annual report submitted to the Council under Condition (122).~~

~~(f) The bond or letter of credit shall not be subject to revocation or reduction before retirement of the facility.~~

[Final Order on ASC, Condition 9; AMD2, AMD3, AMD4]

Retirement and Financial Assurance Condition 1 (PRE-RF-01):

Prior to construction of the solar facility, component or phase, as applicable, the certificate holder shall:

a. Submit to the Department Table 14 (Retirement Table with tasks/unit/unit costs) of the Final Order on RFA4, updated based on final design and phased construction, if applicable. Certificate holder may not make changes to the unit cost without review and approval by the Department. Certificate holder must also request that the Department confirm the present-day inflation adjusted decommissioning estimate, rounded to the nearest $1,000, to be reflected in the bond or letter of credit in sub c of this condition.
b. Incorporate any additional decommissioning costs for facility changes which have been determined by the Department not to require a site certificate amendment.

c. Submit to the Department a bond or letter of credit, in the amount affirmed by the Department under (a), based on the Council's current pre-approved financial institution list and form.
[Final Order on RFA4]

Retirement and Financial Assurance Condition 2 (CON-RF-01): If construction extends more than 12 months, the certificate holder shall:

a. Annually adjust the amount of the bond or letter of credit to present dollar value, as determined by the Department.
b. Incorporate any additional decommissioning costs for proposed facility changes which have been determined by the Department not to require a site certificate amendment.
c. The Department and Council reserve the right to adjust the contingencies, as appropriate and necessary to ensure that costs to restore the site are adequate to maintain health and safety of the public and environment.
[Final Order on RFA4]

Retirement and Financial Assurance Condition 3 (OPR-RF-01): During operation of the solar facility, the certificate holder shall:

a. Annually adjust the amount of the bond or letter of credit provided to satisfy Condition GEN-RF-01 to present dollar value, as determined by the Department. The Department shall adjust to present value using the U.S. Gross Domestic Product Implicit Price Deflator, Chain-Weight, as published in the Oregon Department of Administrative Services' Oregon Economic and Revenue Forecast or by any successor agency (the "Index"). If at any time the Index is no longer published, the Department shall select a comparable calculation to adjust the amount to present value.
b. Incorporate any additional decommissioning costs for proposed facility changes which have been determined by the Department not to require a site certificate amendment.
c. The Department and Council reserve the right to adjust the contingencies, as appropriate and necessary to protect public health and safety or the environment and ensure the certificate holder's bond or letter of credit is sufficient to restore the site to a useful, non-hazardous condition.
[Final Order on AMD4]

Amended Condition 10 (GEN-RF-04)

If the certificate holder elects to use a bond to meet the requirements of Condition ~~(9)~~ GEN-RF-01, the certificate holder shall ensure that the surety is obligated to comply with the requirements of applicable statutes, Council rules and this site certificate when the surety exercises any legal or contractual right it may have to assume construction, operation or retirement of the facility. The certificate holder shall also ensure that the surety is obligated to notify the Council that it is exercising such rights and to obtain any Council approvals required by applicable statutes, Council rules and this site certificate

before the surety commences any activity to complete construction, operate or retire the facility.
[Final Order on ASC, Condition 10; AMD4]

The Council finds that, subject to compliance with the conditions described above, the certificate holder has provided sufficient evidence to demonstrate that the site can be restored adequately to a useful, non-hazardous condition following permanent cessation of construction or operation of the facility.

Ability of the Certificate Holder to Obtain a Bond or Letter of Credit

As described above, the Department currently has an Irrevocable Standby Letter of Credit issued by Mizuho Bank, Ltd. on file assuring the payment of up to $21,301,000 in the event the certificate holder defaults on its obligation to retire the existing facility and restore the site as required by the site certificate. Mizuho is also on the Council's 2025 pre-approved financial institution list. The certificate holder provided a letter from Mizuho explaining that, on a preliminary basis, Mizuho would be supportive of furnishing or arranging an additional letter of credit in an amount up to $53.5 million for the facility components proposed in RFA4.[219] While no commitment to issue the letter of credit was made, the amount is significantly more than the $12.09 million decommissioning estimate.

The certificate holder also provided a letter from Angelica Espinosa, PGE's Chief Legal and Compliance Officer, explaining that based upon her best knowledge, that the certificate holder has the legal authority to construct and operate the facility components proposed in RFA4 without violating its bond indenture provisions, Articles of Incorporation, common stock covenants or similar agreements.[220]

Because the certificate holder has provided evidence that it has an existing relationship with an approved financial institution that is willing to issue a letter of credit in an amount sufficient to retire the facility and restore the site in accordance with Council rules and standards, the Council finds that the certificate holder has a reasonable likelihood of obtaining a bond or letter of credit in a form and amount satisfactory to the Council to restore the site to a useful, non-hazardous condition.

III.G.2. Conclusions of Law

Based on the foregoing analysis, and subject to compliance with the existing, new and amended site certificate conditions described above, the Council finds that the site can be restored adequately to a useful, non-hazardous condition following permanent cessation of construction or operation of the facility, and that the certificate holder has a reasonable likelihood of

[219] BCWAMD4Doc21-08 RFA Exhibit M Financial Capability 2025-12-10, Attachment M-2.
[220] BCWAMD4Doc21-08 RFA Exhibit M Financial Capability 2025-12-10, Attachment M-1.

obtaining a bond or letter of credit in a form and amount satisfactory to restore the site to a useful, non-hazardous condition.

III.H. FISH AND WILDLIFE HABITAT: OAR 345-022-0060

> *To issue a site certificate, the Council must find that the design, construction and operation of the facility, taking into account mitigation, are consistent with:*
>
> *(1) The general fish and wildlife habitat mitigation goals and standards of OAR 635-415-0025(1) through (6) in effect as of February 24, 2017, and*
>
> *(2) For energy facilities that impact sage-grouse habitat, the sage-grouse specific habitat mitigation requirements of the Greater Sage-Grouse Conservation Strategy for Oregon at OAR 635-415-0025(7) and OAR 635-140-0000 through -0025 in effect as of February 24, 2017.*
>
> ** * * * * [221]*

III.H.1. Findings of Fact

The analysis area for the Fish and Wildlife Habitat standard is the area within and extending 0.5 mile from the proposed Solar Micrositing Area.[222] The analysis area covers approximately 5,198 acres in northern Sherman County, Oregon, which is located in the Columbia Plateau Ecoregion. As described in more detail below, the majority of the analysis area is comprised of agricultural lands with small areas of remnant grassland and shrub-steppe habitat. Only limited areas of native habitat types occur, and even in those areas, non-native, invasive grasses and forbs, including cheatgrass (Bromus tectorum), bulbous bluegrass (Poa bulbosa), cereal rye (Secale cereale), and prickly lettuce (Lactuca serriola), are abundant.[223]

This general fish and wildlife habitat mitigation goals and standards in OAR 635-415-0025 require the mitigation of impacts to fish and wildlife habitat based on the quantity and quality of the habitat impacted as well as the nature, extent, and duration of the impact. Habitat quality is measured using a habitat classification system based on the function and value the habitat provides to species or groups of species likely to use it. ODFW policy identifies six habitat categories, with Category 1 being the most valuable, and Category 6 the least valuable.

Discovery Measures

[221] OAR 345-022-0040, effective April 2, 2025. The information requirements included in the standard are omitted from the language above, but evaluated within the findings of fact below.
[222] BCWAMD4Doc01-00 ODOE Concurrence on OAR 345-027-0360(3) Request 2024-05-02.
[223] BCWAMD4Doc21-10 RFA Exhibit P Fish and Wildlife 2025-12-10, Section 5.2.

RFA4 includes a 2024 Habitat Categorization and Special Status Wildlife Survey Report prepared by the certificate holder's qualified biologists from Tetra Tech.[224] The biological report was prepared by a combination of desktop analysis/literature review, and field surveys. The desktop survey for habitat categorization of the proposed Solar Micrositing Area delineated potential habitat categories using:

- ODFW information regarding habitat types;
- National Land Cover Database;
- Aerial photography;
- The original application materials for the BCWF and monitoring data from facility operations;[225]
- Oregon Conservation Strategy and ODFW Compass mapping tool;
- Sherman County Comprehensive Plan (Goal 5) for big game habitat

Tetra Tech conducted habitat categorization field surveys within the proposed Solar Micrositing Area in June 2024.[226] Ground-based raptor nest surveys were also conducted in June 2024, covering the area within and extending 0.5 mile from the proposed Solar Micrositing Area. Habitat mapping consistent with ODFW Fish and Wildlife Habitat Mitigation Policy was performed using a minimum of 1-acre mapping unit (except for specialized habitat such as cliffs or rock outcrops) during the growing season to aid in identification of vegetative species. Meandering transects were walked by a biologist to categorize the composition and structure of habitat by noting the dominant vegetation, presence of large trees, existing disturbance, or other habitat features such as shrub and grass composition and density.[227]

Field surveys for wetlands and waters of the state were conducted in July 2024 and used to inform habitat categorization summarized below. Results from the wetland delineations are discussed further in Section IV.B. *Removal-Fill*, of this order.

Fish and Wildlife Habitat within Analysis Area

Approximately 4,301 of 5,198-acres within the analysis area (83 percent) are made up of agricultural or developed lands considered to be Category 6 habitat due to the level of disturbance and limited potential to become essential or important habitat. The remaining 897 acres are made up of grasslands, sagebrush shrub steppe, waterways, wetlands and riparian habitat.[228] As shown in Figure 12 and 13, below, the majority of the habitat areas are

[224] BCWAMD4Doc21-10 RFA Exhibit P Fish and Wildlife 2025-12-10, Attachment P-1.

[225] 2005, 2009-2014 reporting by WEST (Western EcoSystems Technology, Inc.), BCWAMD4Doc21-10 RFA Exhibit P Fish and Wildlife 2025-12-10, Sections 4.1 and 12.0.

[226] The 0.5 mile area outside the proposed Solar Micrositing Area was field surveyed for raptor nests and otherwise evaluated using the desktop methodologies. BCWAMD4Doc21-10 RFA Exhibit P Fish and Wildlife 2025-12-10, Table P-1, and Section 4.2.3.

[227] BCWAMD4Doc21-10 RFA Exhibit P Fish and Wildlife 2025-12-10, Section 4.2.1.

[228] BCWAMD4Doc21-10 RFA Exhibit P Fish and Wildlife 2025-12-10 Table P-4

concentrated to the northeast of the proposed Solar Micrositing Area, with some sagebrush shrub-steppe and grasslands following the lower fork of Biglow Canyon within the proposed Solar Micrositing Area.

Sagebrush shrub-steppe and riparian habitats in the analysis area are considered Category 2, "essential and limited habitat."[229] As presented in RFA4 Exhibit P Figure P-1 and P-3, these habitat subtypes occur within ODFW's designated Priority Wildlife Connectivity Area (PWCA); ODFW has not established habitat categorization for PWCAs but rather recommends that the information be used to inform avoidance areas and site-specific evaluation. Other non-developed habitats in the analysis area are considered 3 and 4 essential or important habitat.

Potential Impacts to Habitat and Mitigation Need

Table 15, below, summarizes estimated temporary and permanent impacts within the proposed Solar Micrositing Area by habitat category. All areas within the solar array fenceline area considered a permanent disturbance from a habitat impact perspective. All temporary disturbance areas are outside the fenced solar array areas.[230] Temporary impacts expected to have a longer restoration timeframe (5+ years) result in temporal loss, requiring mitigation beyond revegetation. Approximately 21 acres of Category 2 habitat, and 3.0 acres of Category 4 essential habitat would be permanently impacted by operation of the solar facility. Approximately 0.3 acres of Category 2 Sagebrush Shrub-Steppe would be temporarily impacted, with a temporal impact. All other anticipated impacts would be to Category 6 agricultural or developed lands.

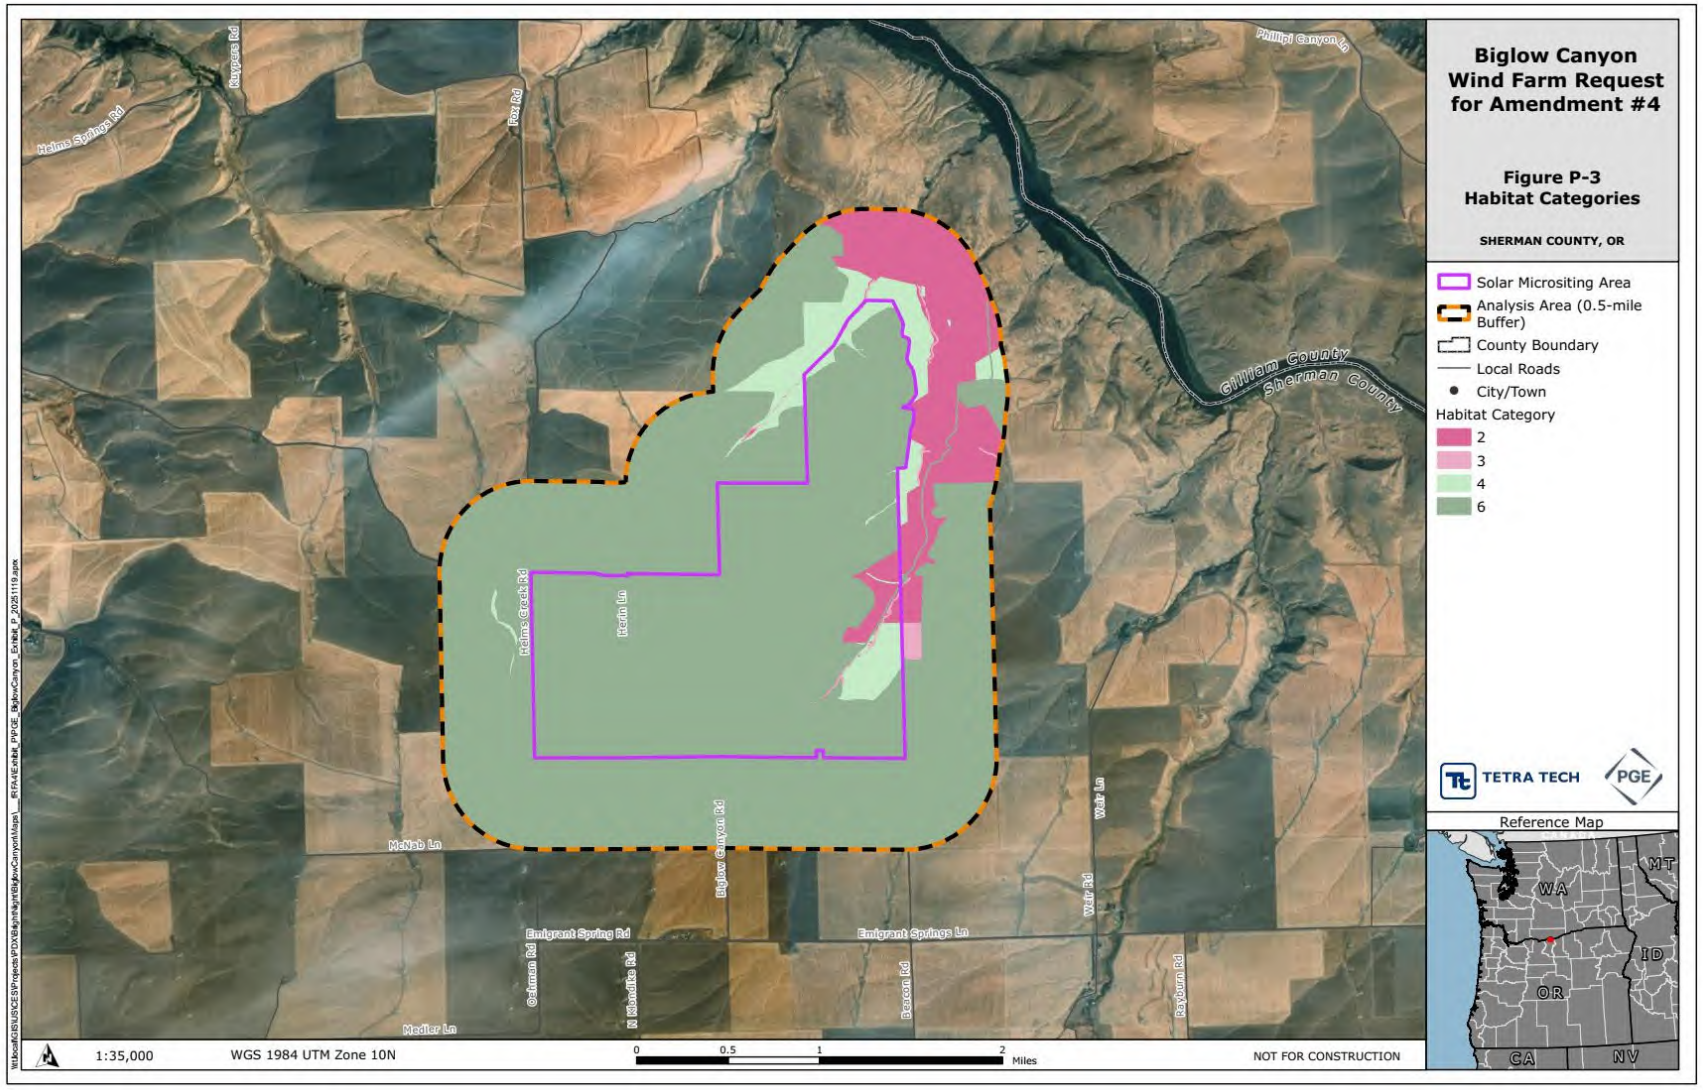
Table 15: Potential Habitat Impacts by Habitat Category

Habitat Category	Habitat Subtype	Impact (acres)	
		Temporary	Permanent
2	Riparian Trees	<0.1	<0.1
	Sagebrush Shrub-Steppe	0.3	20.7
	Category 2 Subtotal	*0.3*	*20.7*
4	Grassland-steppe	0.1	3.0
	Ephemeral Streams	<0.1	<0.1
	Category 4 Subtotal	*0.1*	*3.0*
6	Irrigated Cropland	0.1	52.0
	Non-Irrigated Cropland	9.4	1,365.0
	Developed	1.0	3.9
	Category 6 Subtotal	*10.5*	*1,420.9*
Total Category 2 and 4 Impacts =		**0.4**	**23.7**

[229] BCWAMD4Doc21-10 RFA Exhibit P Fish and Wildlife 2025-12-10, Figure P-1.

[230] BCWAMD4Doc21-10 RFA Exhibit P Fish and Wildlife 2025-12-10, Section 8.0.

Figure 12: Habitat Categories within the Analysis Area



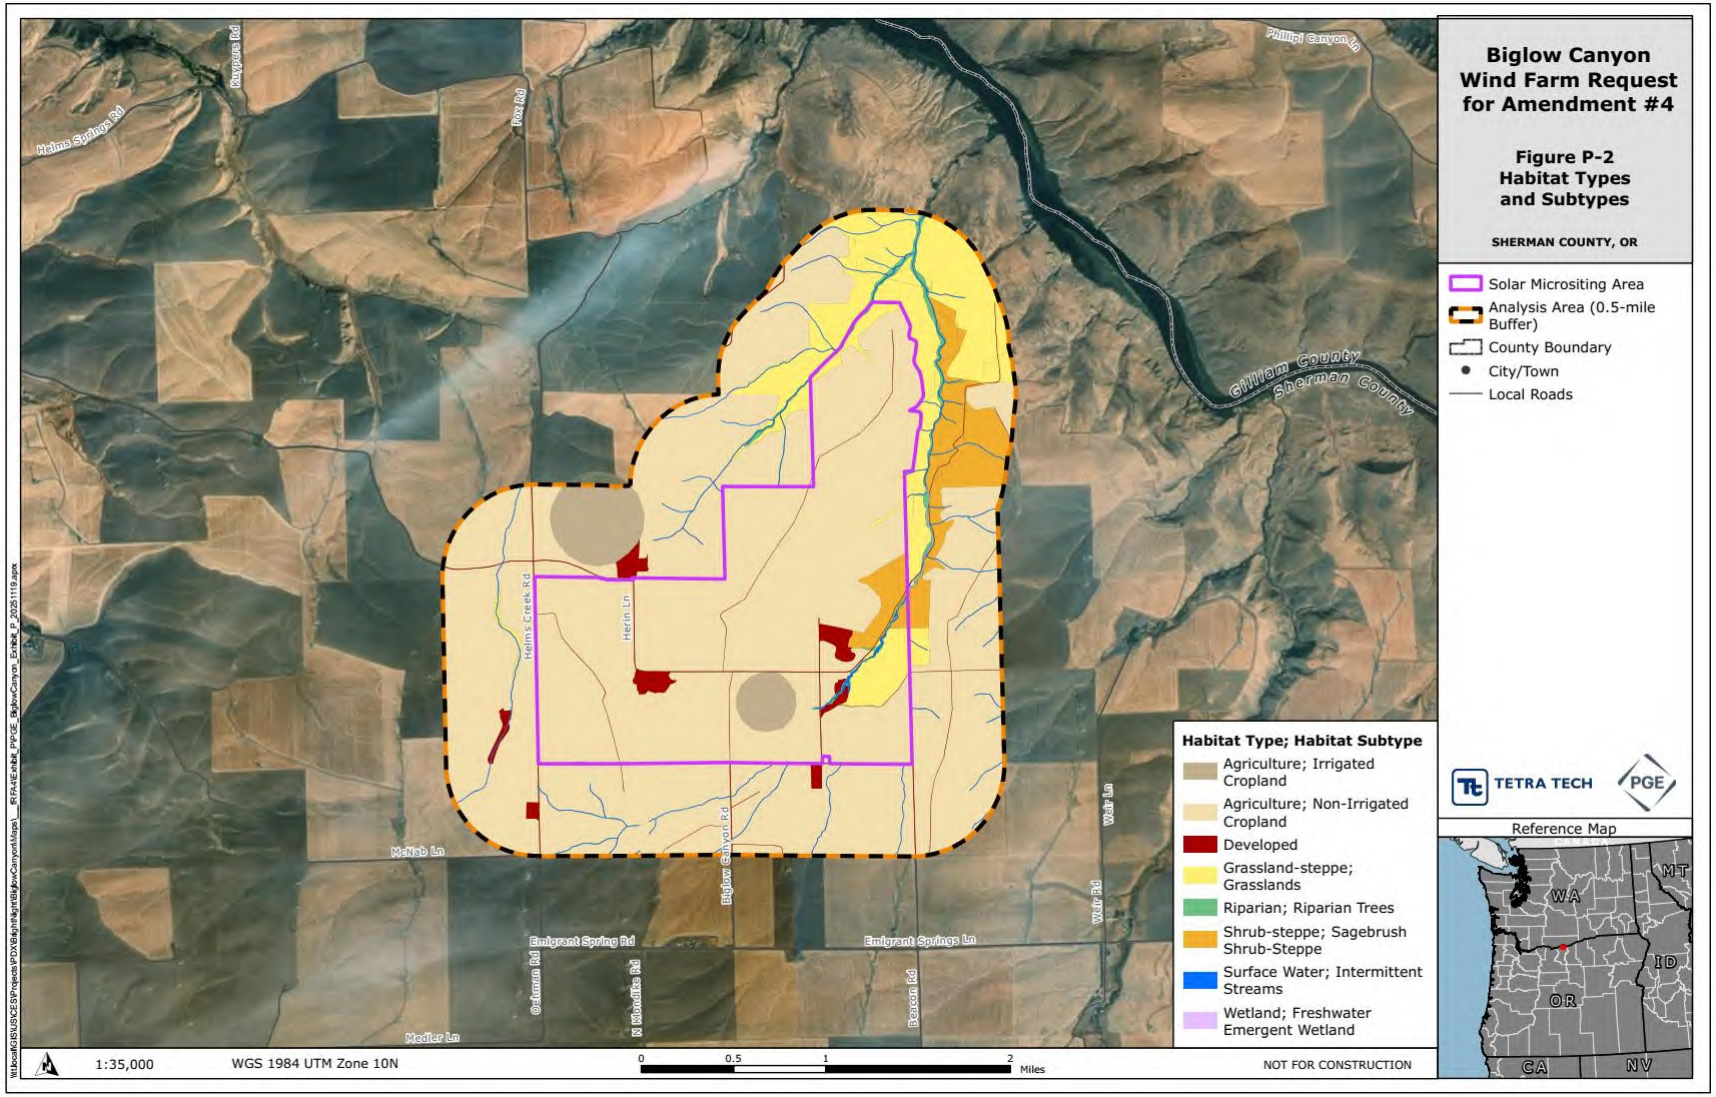


Figure 13: Habitat Subtype within Analysis Are

Mitigation of Potential Habitat Impacts

The Oregon Habitat Mitigation Policy requires mitigation actions to be considered in the following order of priority:

- Avoiding the impact altogether by not taking a certain development action or parts of that action;
- Minimizing impacts by limiting the degree or magnitude of the development action and its implementation;
- Rectifying the impact by repairing, rehabilitating, or restoring the affected environment;
- Reducing or eliminating the impact over time by preservation and maintenance operations during the life of the development action and by monitoring and taking appropriate corrective measures;
- Compensating for the impact by replacing or providing comparable substitute resources or environments.

Habitat Impact Avoidance

The facility components proposed in RFA4 have been designed to avoid many habitat impacts by using available land within existing site boundary for the operating wind facility and predominately located on previously disturbed agricultural lands.[231]

The northwest portion of the proposed Solar Micrositing Area would be adjacent to an ODFW designated PWCA, which includes Biglow Canyon and, at a distance of approximately 3.7 miles, John Day River. To the extent there are drainages or steep slope areas in proximity to the proposed fenceline, Amended Condition 68 would require the certificate holder to avoid placing facility components near areas with steep slopes, further limiting development near the canyon.[232]

Compensatory Mitigation for Habitat Loss

Under the ODFW Policy, compensatory mitigation must be provided for loss of habitat quantity or quality after implementation of avoidance and minimization measures. Mitigation for impacts to Category 2 and 4 habitats must be "in-kind" mitigation actions which create similar structure and function to that being disturbed and must be "in-proximity" to the disturbed area. For Category 2 habitat, the mitigation actions must ensure there is no net loss of either habitat quantity or quality and both habitat quantity and habitat quality must be improved. For Category 4 habitats, the mitigation actions must ensure there is no net loss of either habitat quantity or quality.

[231] BCWAMD4 pRFA Reviewing Agency Comment ODFW 2025-05-30. During review of pRFA4, ODFW acknowledged the value of the proposed site in minimizing potential wildlife impacts because it was co-located in available area within the existing wind facility.

[232] BCWAMD4 pRFA Reviewing Agency Comment ODFW 2025-05-30. Amended Condition 68 is consistent with ODFW's requested setbacks from the facility fenceline to drainages within the PWCA.

The certificate holder proposes to mitigate temporal (i.e. loss of habitat function and values from the time an impact occurs to the time when the restored habitat provides a pre-impact level of habitat function) and permanent habitat impacts in the form of a permanent conservation easement on a habitat mitigation area (HMA) in-proximity to the facility site, which contains similar habitat quality and quantity as the habitat to be impacted. Specifically, for temporal habitat impacts, the certificate holder proposes to include in its HMA 2 acres for every 1 acre of Category 2 habitat temporarily disturbed (a 2:1 ratio). Based on this proposed methodology, the HMA would include 0.6 acres as mitigation for temporal Category 2 habitat loss.

For permanent habitat impacts, the certificate holder proposes to include in its HMA 2 acres for every 1 acre of Category 2 habitat permanently impacted (a 2:1 ratio to provide no net loss and a net benefit of habitat quantity). The certificate holder proposes to mitigate impacts to Category 4 habitat by including 1 acre for every 1 acre permanently impacted within its HMA (a 1:1 ratio to provide no net loss). Based on this proposed methodology, the HMA would include 44.4 acres as mitigation for permanent habitat loss. As summarized in Table 16, below, based on the estimated impacts and proposed mitigation ratios, the habitat mitigation obligation for in-kind, in-proximity mitigation is approximately 45 acres of land.

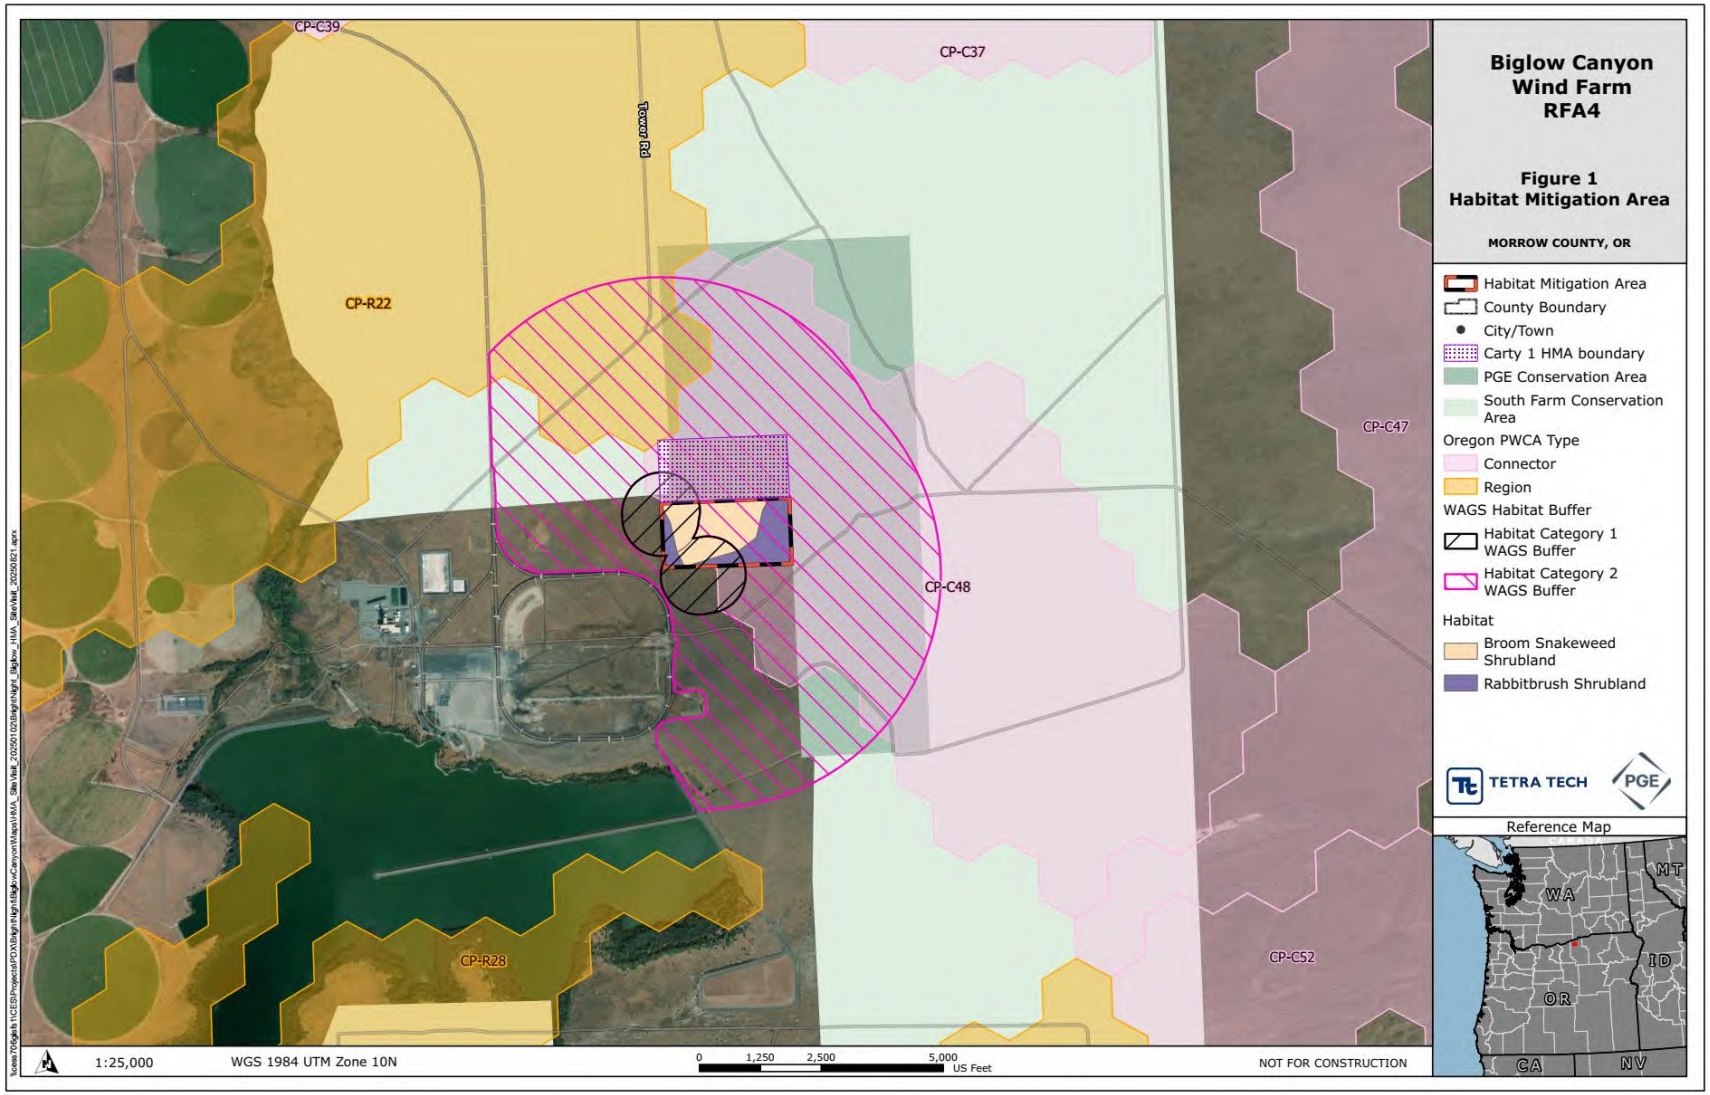
Table 16: Estimated Habitat Impacts and Proposed Mitigation Ratios

Habitat Category	Temporal Impacts			Permanent Impacts			Total Mitigation Need
	Total Impact (Acres)	Mitigation Ratio	Mitigation Need	Total Impact Acres	Mitigation Ratio	Mitigation Need	
Category 2	0.3	2:1	0.6	20.7	2:1	41.4	42
Category 4	0.1	1:1	0.1	3	1:1	3	3
Total	**0.4**		**0.6**	**21.0**		**44.4**	**45**

To meet the mitigation need described above, a draft Habitat Mitigation Plan (HMP) was submitted in RFA4 Exhibit P Attachment P-2. The HMP proposes a 78-acre Habitat Mitigation Area (HMA), adjacent to the Carty Generating Facility in Morrow County. As shown in Figure 14, below, the HMA is adjacent to an existing conservation area operated by the certificate holder and a conservation area maintained by The Nature Conservancy (South Farm Conservation Area). The habitat mapped within the HMA includes rabbitbrush shrubland and broom snakeweed shrubland. The HMA is within a PWCA connector and contains Category 1 and Category 2 habitat associated with Washington ground squirrel (*Urocitellus washingtoni*) colonies that are immediately adjacent to the HMA. Access to the site is currently limited to the Nature Conservancy and Three Mile Canyon Farms occasional use of the two-track access crossing the property to access the other conservation areas and for the certificate holders' general operational needs. No livestock grazing is currently occurring on the site, and grazing would not be allowed in the future. ODFW provided concurrence that the proposed HMA is adequate to meet the Category 2 and 4 mitigation goals applicable to the impacts.

The HMA would be placed in a conservation easement or other legal mechanism which would restrict development, would apply for the life of the solar facility, and would be binding to the landowner upon sale or transfer of the land. The enhancement actions proposed at the HMA include access control; noxious weed control; shrub-planting; and restoration in the event of future wildfire.

The Council modifies the draft plan, as presented in Attachment F of this Order. Generally, the modifications are to specify the scope of finalization, to make clear to the certificate holder the actions that need to be taken to finalize the plan and evaluate the adequacy of the proposed enhancement actions and associated success criteria. To finalize the HMP, the certificate holder must evaluate baseline conditions of the HMA, identify the locations and scope of the proposed enhancement actions; finalize the success criteria; finalize the monitoring and survey methods; finalize the monitoring and implementation schedule; and establish the number and location of monitoring and reference sites to be used to evaluate existing conditions and long-term success of the enhancement actions.



Based on the finalization of the HMP, the Council finds that the proposed HMA and uplift actions will provide appropriate in-kind, in-proximity, mitigation for the expected habitat impacts associated with the construction and operation of the facility components proposed in RFA4. Given the extent of information and actions needed to complete the HMP, the Council imposes the following conditions requiring that the draft HMP be finalized prior to construction, and that the plan be implemented and adhered to during the facility operational lifetime.

Fish and Wildlife Habitat Condition 1 (PRE-FW-01):
Prior to construction of a phase or component of the solar facility, as applicable, the certificate holder shall submit a final Habitat Mitigation Plan substantially similar to Final Order on RFA4 Attachment F, based on the finalization requirements included in Section 2.0 of the plan. The final plan must be submitted for review and approval by the Department, in consultation with ODFW.
[Final Order on AMD4]

Fish and Wildlife Habitat Condition 2 (OPR-FW-05):
During operation of the solar facility, the certificate holder shall implement the Habitat Mitigation Plan finalized under Condition PRE-FW-01. The HMP may be amended from time to time, subject to Department approval.
[Final Order on AMD4]

Temporary impacts to Category 4 grasslands will be restored in accordance with the Comprehensive Solar Revegetation and Soil Restoration Plan (Attachment D of this Order), required under Soil Protection Condition 2.

Figure 14: Proposed Habitat Mitigation Area

1
2

Minimization of Impacts to Sensitive Species

In addition to habitat loss, the construction and operation of the facility components proposed in RFA4 may impact habitat function and the species that depend on it, including sensitive species, by disturbing potential nesting and breeding activities, increasing mortality from collision with solar arrays, fencing, overhead collector lines, vehicles and heavy equipment, and creating disturbances related to artificial lighting. As shown in Table 17, below, while only one state sensitive species was identified during surveys conducted in support of RFA4, several state sensitive species and two protected eagles have been documented or are known to have the potential to occur in the analysis area.

Table 17: State Sensitive Species and Eagles with the Potential to Occur in the Analysis Area

Species	State Status	Probability of Occurrence within Analysis Area	Potential Habitat Within Analysis Area
Reptiles			
Northern sagebrush lizard (Sceloporus graciosus graciosus)	Sensitive	Moderate. Limited suitable habitat. Not detected in surveys.	Shrub-steppe habitats with sandy soils
Western painted turtle (Chrysemys picta bellii)	Sensitive-Critical	Low. Limited suitable habitat. Not detected during surveys.	Riparian, surface water, and wetland habitats
Birds			
Bald eagle (Haliaeetus leucocephalus)	None (Protected by Bald and Golden Eagle Protection Act.)	High. Known to nest along John Day River, but no suitable nesting habitat in analysis area. Regularly detected during avian use surveys for the wind facility.	All terrestrial habitats
Brewer's sparrow (Spizella breweri)	Sensitive	Moderate. Limited suitable habitat within the analysis area. One individual found during fatality monitoring for the wind facility.	Sagebrush and other shrublands
Burrowing owl (Western) (Athene cunicularia hypugaea)	Sensitive-Critical	Moderate. Suitable habitat within the analysis area, detected during pre-construction surveys for the wind facility.	Shrub-steppe, grassland agricultural, and developed habitats
Common nighthawk (Chordeiles minor)	Sensitive	Moderate. Suitable habitat within the analysis area. One individual found during fatality monitoring for the wind facility.	All terrestrial habitats
Ferruginous hawk (Buteo regalis)	Sensitive-Critical	High. Suitable nesting and foraging habitat within the Analysis Area. Low numbers detected during avian use surveys for the wind facility.	Shrub-steppe, grassland, and riparian habitats
Golden eagle (Aquila chrysaetos)	None (Protected by Bald and Golden Eagle Protection Act.)	High. Known historical nest territories along John Day River. Analysis Area lacks nesting habitat but provides foraging habitat. Species regularly detected during avian use surveys for the wind facility.	All mapped habitats within analysis area
Grasshopper Sparrow (Ammodramus savannarum)	Sensitive	Moderate. Suitable habitat within the Analysis Area, regularly detected during avian use surveys for the wind facility.	Grassland habitats

Table 17: State Sensitive Species and Eagles with the Potential to Occur in the Analysis Area

Species	State Status	Probability of Occurrence within Analysis Area	Potential Habitat Within Analysis Area
Lewis's woodpecker (Melanerpes lewis)	Sensitive-Critical	Low. Limited suitable habitat within the analysis area. Not detected during surveys.	Riparian habitats
Loggerhead shrike (Lanius ludovicianus)	Sensitive	High. Suitable nesting and foraging habitat within the analysis area. Detected within proposed Solar Micrositing Area during 2024 special status wildlife surveys and avian use surveys for the wind facility.	All terrestrial habitats
Long-billed curlew (Numenius americanus)	Sensitive-Critical	High. Suitable nesting and foraging habitat within the analysis area. Detected during avian use surveys for the wind facility.	Grassland habitats, agriculture
Swainson's hawk (Buteo swainsoni)	Sensitive	High. Suitable nesting and foraging habitat within the analysis area. Detected during avian use surveys for the wind facility and active nests detected during raptor nest surveys for the wind facility.	All mapped habitats within analysis area
Mammals			
Hoary bat (Lasiurus cinereus)	Sensitive	High, during migration. Frequently found during fatality monitoring at the wind facility.	Riparian and open water habitat
Pallid bat (Antrozous pallidus)	Sensitive	Moderate. Not detected during fatality monitoring at the wind facility.	Shrub-steppe grassland, riparian, and open water habitat
Silver-haired bat (Lasionycteris noctivagans)	Sensitive	High, during migration. Frequently found during fatality monitoring at the wind facility.	Riparian and open water habitat
Spotted bat (Euderma maculatum)	Sensitive	Low. Not detected during fatality monitoring at the wind facility.	Riparian, open water and shrub-steppe habitat
Townsend's big-eared bat (Corynorhinus townsendii)	Sensitive-Critical	Moderate. Not detected during fatality monitoring at the wind facility.	Riparian, open water and shrub-steppe habitat

1

Impacts from Construction

Ground disturbing activities have the potential to directly impact ground nesting birds; however, these impacts will be limited to Category 2 habitat within the proposed Solar Micrositing Area, and the associated subtypes presented in Table 16 above.[233] As presented in Table 17, there are three special status ground nesting birds (Loggerhead shrike, Brewer's sparrow and burrowing owl) that rely on the habitat Category 2 habitat/habitat subtype within the proposed Solar Micrositing Area and could be directly impacted if ground disturbing activities occur during their sensitive nesting/breading season (April 15 – Sept 1). To minimize potential impacts to state-sensitive ground nesting birds, the Council imposes a requirement that mowing, vegetation removal and other ground disturbing site preparation activities within Category 2 habitat be completed during any year in which construction occurs on or before April 15. This requirement is presented in the draft Comprehensive Revegetation and Soil Management Plan (Attachment D of this Order).

Construction activities including noise and disturbances associated with the presence of personnel, vehicles, and equipment has the potential to disrupt some bird species' feeding or breeding activities or cause birds to avoid the area. Construction occurring during the breeding season (as early as February and lasting through August) could also cause active nests to fail due to direct nearby disturbance causing nest abandonment. During the 2024 raptor nest surveys, one nest was presumed active based on observation of a juvenile great horned owl. The nest site is outside of the proposed Solar Micrositing Area, but within 0.5 mile of the site.

Given the potential for previously identified raptor nests or new nest sites to occur within the analysis area during construction, to minimize potential construction related impacts to avian species, the Council requires that active raptor nests be protected with an avoidance buffer. The Council previously imposed such a requirement applicable to the construction of the wind facility, Condition 60. The Council deletes Condition 60 and adopts a new condition with updated language, species list, buffer distances and seasonal timeframes, based on ODFW's March 2024 Solar Siting Guidelines, as presented below:

Deleted Condition 60

~~(60) During construction, the certificate holder shall protect the area within a 1300-foot buffer around any active nests of the following species during the sensitive period, as provided in this condition:~~

~~Species~~	~~Sensitive Period~~	~~Early Release Date~~
~~Swainson's hawk~~	~~April 1 to August 15~~	~~May 31~~
~~Golden eagle~~	~~February 1 to August 31~~	~~May 31~~
~~Ferruginous hawk~~	~~March 15 to August 15~~	~~May 31~~
~~Burrowing owl~~	~~April 1 to August 15~~	~~July 15~~

[233] BCWAMD4Doc21-10 RFA Exhibit P Fish and Wildlife 2025-12-10, Section 8.2.2.

~~The 1300-foot buffer may be reduced, with Department approval, if there is an adequate physical barrier between the nest site and the construction impacts such that a 1300-foot buffer proves to be excessive.~~

~~During the year in which construction of any phase occurs, the certificate holder shall use a protocol approved by the Oregon Department of Fish and Wildlife (ODFW) to determine whether there are any active nests of these species within a half-mile of any areas that would be disturbed during construction. If a nest is occupied by any of these species after the beginning of the sensitive period, the certificate holder shall not engage in high-impact construction activities (activities that involve blasting, grading or other major ground disturbance) or allow high levels of construction traffic within 1300 feet of the nest site, or such lesser distance as may be approved by the Department in the event there is an adequate physical barrier between the nest site and the construction impacts.~~

~~In addition, the certificate holder shall flag the boundaries of the 1300-foot buffer area, or such lesser distance as may be approved by the Department in the event there is an adequate physical barrier between the nest site and the construction impacts, and shall instruct construction personnel to avoid any unnecessary activity within the buffer area. The certificate holder shall direct a qualified biologist, approved by the Department, to observe the active nest sites during the sensitive period for signs of disturbance and to notify the Department of any non-compliance with this condition. The Department has approved the qualifications of the four biologists identified in the Final Order on Amendment #2. The certificate holder may select other qualified biologists to observe the nest sites, subject to Department approval. If the biologist observes nest site abandonment or other adverse impact to nesting activity, the certificate holder shall implement appropriate mitigation, in consultation with ODFW and subject to the approval of the Department, unless the adverse impact is clearly shown to have a cause other than construction activity. The certificate holder may begin or resume high impact construction activities before the ending day of the sensitive period if any known nest site is not occupied by the early release date. If a nest site is occupied, then the certificate holder may begin or resume high-impact construction before the ending day of the sensitive period with the approval of ODFW, after the young are fledged. The certificate holder shall use a protocol approved by ODFW to determine when the young are fledged (the young are independent of the core nest site). [Amendment #2]~~
[Final Order on AMD4]

Fish and Wildlife Condition 3 (CON-FW-01)

a. Prior to the seasonal restriction referred in this condition and during any year in which construction of any component or phase of the solar facility occurs, the certificate holder shall:
    i. Use a protocol approved by ODFW to determine whether there are any active nests of the species listed in the table below within a half-mile of any areas that would be disturbed during construction.
    ii. If a nest is occupied by any of these species after the beginning of the seasonal restriction, the certificate holder shall not engage in high-impact construction

activities (activities that involve blasting, grading or other major ground disturbance) or allow high levels of construction traffic within the spatial buffer of the nest site.

iii. Any work areas within the spatial buffers during the seasonal restriction shall be flagged/marked.

b. The seasonal restrictions are as provided in the table below:

Species	Spatial Buffer	Seasonal Restriction	Early Release Date if Unoccupied
Golden eagle	0.5 – 1 mile	Feb 1 – Aug 15	May 15
Bald eagle	0.5 mile	Jan 1 – Aug 15	May 31
Ferruginous hawk	0.5 mile	Mar 15 – Aug 15	May 31
Northern goshawk**	0.5 mile	May 1 – Aug 15	June 30
Peregrine falcon**	0.25 mile	Jan 1 – Jul 1	May 15
Swainson's hawk**	0.25 mile	Apr 1 – Aug 15	May 31
White-tailed kite	0.25 mile	Jan 1 – Aug 15	
Osprey	0.25 mile	Mar 1 – Sep 15	
Burrowing owl**	0.25 mile	Apr 1 – Aug 15	May 31
Flammulated owl**	0.25 mile	May 1 – Jul 31	June 15
Great gray owl**	0.25 mile	Apr 1 – Jul 31	May 31
Red-tailed hawk	0.10 mile	Mar 1 – Aug 15	May 31
Other hawks and owls	0.25 mile	Mar 1 – Aug 15	May 31
Dates cover territory establishment through fledging. Release dates can be used for unoccupied or failed nests. Some geographic variation exists in seasonal restriction dates, please consult with local ODFW staff. ** Indicates Oregon Conservation Strategy Species.			

c. Upon request by the certificate holder, the Department in consultation with ODFW may provide exceptions to this restriction. The certificate holder's request must include a justification of the request, including any actions the certificate holder will take to avoid, minimize, or mitigate impacts to the raptor and its nest. [Final Order on AMD4]

To ensure the requirements above were implemented, the Council previously imposed Site Certificate Condition 57, requiring the certificate holder to provide environmental training to construction personnel during construction of the wind energy facility. The Comprehensive Soil and Revegetation Plan would require this training to take place before and during construction of the facility components proposed in RFA4 (See Attachment D, Table 5). Because the requirement for environmental training is addressed in the plan, the Council deletes Condition 57.

Deleted Condition 57

~~The certificate holder shall implement measures to mitigate impacts to sensitive wildlife habitat during construction including, but not limited to, the following:~~
~~(a) Preparing maps to show sensitive areas, such as nesting or denning areas for sensitive wildlife species, that are off limits to construction personnel.~~
~~(b) Ensuring that a qualified person instructs construction personnel to be aware of wildlife in the area and to take precautions to avoid injuring or destroying wildlife or significant wildlife habitat.~~
~~(c) Avoiding unnecessary road construction, temporary disturbance and vehicle use.~~
[Final Order on AMD4]

Impacts from Operations

Operating solar photovoltaic facilities are not known to result in the direct fatalities of significant numbers of birds and bat species and human activity at the site would be minimal during operations.

Artificial lighting has been shown to attract nocturnally migrating bird, including the Brewer's and grasshopper sparrows, as well as crepuscular insectivores such as the common nighthawk and bats, resulting in collisions with structures such as communication towers, guy wires, and wind turbines. Research has shown that using lights that are directed downward and shielded, have the lowest allowable intensity, and are on timers or motion sensors can minimize lighting impacts.[234] The Council previously imposed Condition 52, requiring the use of minimal lighting at the existing wind facility. As described in Section III.E, *Land Use*, Land Use Condition 4 would establish similar requirements for the proposed solar facility and would require all outdoor lighting to be sited, limited in intensity, shielded, and hooded in a manner that prevents the lighting from projecting onto adjacent properties and roadways.

Interactions with overhead electrical systems have the potential to negatively affect birds, especially raptors, primarily through electrocutions and collisions. To minimize the potential for electrocutions and collisions, the certificate holder represents that all overhead transmission lines would be constructed following the 2012 Avian Powerline Interaction Committee (APLIC) recommendations for collision avoidance (APLIC 2012).[235]

The Council previously imposed Condition 58 requiring transmission lines constructed as part of the wind facility to comply with the 1995 APLIC design standards. The Council amends Condition 58 to make clear that it applies to the existing facility and facility components proposed in RFA4, specific to aboveground transmission lines:

Amended Condition 58 (GEN-FW-01)
The certificate holder shall design and construct all aboveground transmission line support structures following the current practices suggested by the Avian Powerline

[234] BCWAMD4Doc21-10 RFA Exhibit P Fish and Wildlife 2025-12-10, Section 8.2.2., 9.1.1.
[235] BCWAMD4Doc21-10 RFA Exhibit P Fish and Wildlife 2025-12-10, Section 8.2.2.

Interaction Committee at the time of design. ~~APLIC 1996, referenced in the site certificate application, p. P-33) and shall install anti-perching devices on transmission pole tops and cross arms where the poles are located within one-half-mile of any wind turbines.~~

[Final Order on ASC, Condition 58; AMD4]

While outside of the analysis area, ODFW has identified mapped occupied bighorn sheep habitat within two miles of the proposed Solar Micrositing Area. Bighorn sheep are at high risk for zoonotic diseases such as *Mycoplasma ovipneumoniae* which can be transmitted by domestic sheep and goats. Due to the potential for devastating impacts on important species, the Council finds that domestic sheep or goats may not be used to control vegetation at the site unless adequate biosecurity protocols. A prohibition on the use of domestic sheep and goats at the site has been included in the Comprehensive Solar Revegetation and Soil Management Plan included as Attachment D to this Order (Soil Protection Condition 2)

The construction and operation of the facility may also impact habitat quality through the introduction and spread of noxious weeds and other undesirable plant species. The Comprehensive Solar Revegetation and Soil Management Plan described above would also contain provisions for the control and management of weeds at the solar facility site (see Attachment D, Appendix G.)[236]

The Comprehensive Solar Revegetation and Soil Management Plan also contains requirements for Environmental Training intended to ensure that all personnel are aware of and adhere to the conditions above during construction and operation of the proposed solar facility.

While no specific wildlife monitoring is proposed with respect to the operating solar facility, the Council previously imposed Site Certificate Condition 61, which requires the certificate holder to adhere to the requirements of a Wildlife Monitoring and Mitigation Plan, including ongoing requirements for monitoring and reporting wildlife fatalities under a wildlife incident response and handling system. The Council also imposed Conditions 64 and 65, requiring the certificate holder to provide mitigation and monitoring reports to the Confederated Tribes of the Warm Springs Reservation of Oregon and to meet with Tribal staff on an annual basis to discuss issues that may affect tribal properties near the site. The Council maintains these as applicable to the existing and proposed RFA4 facility components.

III.H.2. Conclusions of Law

Based on the foregoing analysis, and subject to compliance with the existing and new and amended conditions described above, the Council finds that the design, construction and operation of the facility components proposed in RFA4 are consistent with the mitigation goals and requirements of the Oregon Department of Fish and Wildlife's Fish and Wildlife Habitat Mitigation Policy under OAR 635-415-0025.

[236] BCWAMD4Doc21-10 RFA Exhibit P Fish and Wildlife 2025-12-10, Section 9.1.2.

III.I. THREATENED AND ENDANGERED SPECIES: OAR 345-022-0070

To issue a site certificate, the Council, after consultation with appropriate state agencies, must find that:

(1) For plant species that the Oregon Department of Agriculture has listed as threatened or endangered under ORS 564.105(2), the design, construction and operation of the proposed facility, taking into account mitigation:

(a) Are consistent with the protection and conservation program, if any, that the Oregon Department of Agriculture has adopted under ORS 564.105(3); or

(b) If the Oregon Department of Agriculture has not adopted a protection and conservation program, are not likely to cause a significant reduction in the likelihood of survival or recovery of the species; and

(2) For wildlife species that the Oregon Fish and Wildlife Commission has listed as threatened or endangered under ORS 496.172(2), the design, construction and operation of the proposed facility, taking into account mitigation, are not likely to cause a significant reduction in the likelihood of survival or recovery of the species. [237]

***** [238]

III.I.1. Findings of Fact

The analysis area for the Threatened and Endangered (T&E) Species standard is the area within and extending 5 miles from the proposed Solar Micrositing Area.[239]

Methodology – Literature Review and Field Studies

The certificate holder conducted a literature review and field surveys to evaluate the potential for state-listed threatened and endangered plant and wildlife species to occur within the analysis area. The literature review evaluated the following sources:

- Original 2005 application materials for the approved facility [240]
- Oregon Biodiversity Information Center (ORBIC) Threatened, and Endangered Species of Oregon

[237] OAR 345-022-0040, effective April 2, 2025.

[238] The information requirements included in the standard are omitted from the language above, but evaluated within the findings of fact below.

[239] BCWAMD4Doc01-00 ODOE Concurrence on OAR 345-027-0360(3) Request 2024-05-02.

[240] BCWAPPDoc45-2 BCW ASC Supplement Exh K-R, BCWAPPDoc17 BCW Additional 2005 Fall Wildlife Surveys.

- 2024 Oregon Department of Agriculture (ODA) Oregon Listed Plants by County
- 2024 ODA Plant Conservation Program, Complete List of Threatened, Endangered, and Candidate Species
- 2024 OregonFlora data
- ODFW threatened, endangered and candidate fish and wildlife species
- 2024 Streamnet, fish distribution data

No state-listed fish or wildlife species have the potential to occur within the analysis area based on the desktop review.[241] As shown in Table 18, five state-listed or candidate plant species were identified as having the potential to occur within Sherman County.

Table 18: State Listed Species with Potential to Occur in Sherman County

Species	State Status	Occurrence within the Analysis Area	Potential Habitat within with the Solar Micrositing Area
Northern wormwood (*Artemisia campestris var. wormskioldii)*	Endangered	Yes	No
Lawrence's milkvetch (*Astragalus collinus var. laurentii)*	Threatened	No	Limited
Henderson's ricegrass (*Eriocoma (Achnatherum) hendersonii)*	Candidate	No	No
Hepatic monkeyflower (*Erythranthe jungermannioides)*	Candidate	Yes	No
Sessile mousetail (*Myosurus sessilis)*	Candidate	No	No

As shown in the table, there are known occurrences of Northern wormwood and hepatic monkeyflower in the analysis area but no suitable habitat within the proposed Solar Micrositing Area. There is suitable habitat for Lawrence's milkvetch in the proposed Solar Micrositing Area but no records of it being present within the analysis area.[242]

Methods for botanical surveys were submitted to ODA for review on June 10, 2024. ODA provided concurrence with the methods on June 13, 2024, prior to Tetra Tech conducting field surveys.[243]

Botanical field surveys were conducted on July 9 and 10, 2024 to evaluate the potential presence of the state-listed plant species within the proposed Solar Micrositing Area. None of the species with potential to occur, including Lawrence's milkvetch, were observed during the field surveys.[244]

[241] BCWAMD4Doc21-11 RFA Exhibit Q TE Species 2025-12-10, Section 4.1.
[242] BCWAMD4Doc21-11 RFA Exhibit Q TE Species 2025-12-10, Section 4.1.
[243] BCWAMD4Doc21-11 RFA Exhibit Q TE Species 2025-12-10, 3.0.
[244] BCWAMD4Doc21-11 RFA Exhibit Q TE Species 2025-12-10, Section 4.2.

The Council previously imposed Conditions 55 to 57 and 126 to ensure the wind energy facility was constructed in compliance with the Threatened and Endangered Species Standard. Conditions 55, 56, and 126 required T&E plant and wildlife surveys of the existing site prior to construction. Because the certificate holder has already conducted biological surveys of the proposed Solar Micrositing Area, the Council deletes these conditions. The Council also deletes Condition 57 because the requirements (worker environmental training) have been incorporated into the Comprehensive Solar Revegetation and Management Plan required under Soil Protection Conditions 1 to 3.

Deleted Condition 55

~~Before beginning construction of the facility, the certificate holder shall deliver to the Department surveys for threatened and endangered plant and wildlife species in newly affected areas as identified in the ASC Supplement.~~

[Final Order on AMD4]

Deleted Condition 56

~~If construction of the facility begins after 2006, the certificate holder shall review the ONHIC and USFWS databases and consult with an expert designated by ODFW on an annual basis before beginning construction to determine whether nesting bald eagles or peregrine falcons have been documented to occur within two miles of the facility. The certificate holder shall report the results of the database review and consultation to the Department and to ODFW and, if there have been new documentations of nesting bald eagles or peregrine falcons within two miles of the facility, the certificate holder shall implement appropriate measures to protect the species from adverse impact, as approved by the Department and ODFW.~~

[Final Order on AMD4]

Deleted Condition 126

~~(126) Prior to any disturbance in the areas of the site added in the Final Order for Amendment #2, the certificate holder shall deliver to the Department the results of a spring survey of Crossing G, conducted during the appropriate bloom time for Northern wormwood and Henderson's ricegrass. If Northern wormwood or any other protected rare plant species are observed during the spring survey, the certificate holder shall ensure that construction and operation of the facility will have no impact on the rare plant habitat. [Amendment #2]~~

[Final Order on AMD4]

III.I.2. Conclusions of Law

Because there are no state listed wildlife species with the potential to occur in the analysis area, and no state listed plant species with suitable habitat in the analysis area were identified during field surveys of the proposed Solar Micrositing Area, the Council finds that the design, construction and operation of the facility components proposed in RFA4 are not likely to cause

a significant reduction in the likelihood of survival or recovery of species listed as threatened or endangered by the Oregon Department of Agriculture or Oregon Fish and Wildlife Commission.

III.J. SCENIC RESOURCES: OAR 345-022-0080

(1) To issue a site certificate, the Council must find that the design, construction and operation of the facility, taking into account mitigation, are not likely to result in significant adverse visual impacts to significant or important scenic resources.

*****

(3) A scenic resource is considered to be significant or important if it is identified as significant or important in a current land use management plan adopted by one or more local, tribal, state, regional, or federal government or agency.

(4) The Council shall apply the version of this rule adopted under Administrative Order EFSC 1-2007, filed and effective May 15, 2007, to the review of any Application for Site Certificate or Request for Amendment that was determined to be complete under OAR 345-015-0190 or 345-027-0363 before the effective date of this rule. Nothing in this section waives the obligations of the certificate holder and Council to abide by local ordinances, state law, and other rules of the Council for the construction and operation of energy facilities in effect on the date the site certificate or amended site certificate is executed. [245]

***** [246]

III.J.1. Findings of Fact

The analysis area for Scenic Resources is the area within and extending 10-miles from the proposed Solar Micrositing Area, as presented in Figure 15 below. The analysis area includes land governed or managed by two Oregon counties and one Washington county (Sherman, Gilliam and Klickitat); municipalities of Wasco and Rufus; Oregon Department of Transportation (ODOT); National Park Service (NPS); and Bureau of Land Management (BLM).

Land management plans published by the above-referenced cities, counties, state, and federal agencies were evaluated to identify potential scenic resources considered significant or

[245] OAR 345-022-0040, effective April 2, 2025.

[246] The information requirements included in the standard are omitted from the language above, but evaluated within the findings of fact below.

important under this standard.[247] Land management plans identifying significant or important scenic resources within the analysis area are presented in Table 19 below. As presented in the Table, there are 4 significant or important scenic resources within the analysis area, in Oregon (John Day River Canyon; I-84; Journey Through Time Scenic Byway/US-97; OR-206). The closest scenic resource to the proposed Solar Micrositing Area is John Day River Canyon, located 3.7 miles East.

[247] Land management plans and associated resources in Washington are omitted from the analysis because protection of Washington resources is not within Council's jurisdiction.

1

Figure 15: Scenic Resources within RFA4 Analysis Area

Potential Visual Impacts on Significant or Important Scenic Resources

Permanent placement of energy infrastructure proposed in RFA4 could result in potential visual impacts including up to 15 foot tall solar arrays and up to 160 foot-tall transmission line poles. To evaluate potential visual impacts of these structures, RFA4 Exhibit R presents the results of a three-part approach including GIS-based viewshed (or zone of visual influence [ZVI]) modeling; key observation point (KOP) analysis and glare modeling.

First, the ZVI analysis used Esri GIS software and bare-earth 10-meter digital elevation model to determine locations within the analysis area where the changes proposed in RFA4 would be visible. Results of the ZVI analysis are presented in RFA4 Exhibit R Figure R-2 and R-3. Then, based on the results of the ZVI analysis, 21 KOPs were identified, representing locations where a "casual observer" could realistically view the proposed RFA4 structures. The KOP locations are presented in RFA4 Exhibit R Figure R-4. These KOPs are located along accessible viewpoints and near specific scenic resources and used to support the evaluation of the likelihood and magnitude of potential visual impacts (RFA4 Exhibit R Attachment R-3 presents photo locations associated with the KOPs demonstrating actual, existing viewshed conditions). Lastly, a glint and glare analysis was conducted using the Solar Glare Hazard Analysis Tool developed by Sandia National Laboratories to inform potential impacts to drivers on nearby roads.

<u>Facility Structures</u>

John Day River Canyon

The John Day River Canyon is located approximately 3.7 and 5.1 miles East of the proposed solar array and gen-tie line, respectively. The only land management plan with development criteria is the 2007 Sherman County Comprehensive Plan which protects the viewshed of the John Day River Canyon for ¼ mile. The distance between the facility components proposed in RFA4 to John Day River Canyon, at 3.7 miles, far exceeds the ¼-mile viewshed area protected in the Sherman County Comprehensive Plan.

The terrain between the proposed RFA4 site boundary and John Day River Canyon is hilly, limiting viewshed impacts, as presented in RFA4 Exhibit R Figure R2 and R3. The small location from where the proposed solar components are potentially visible is not easily accessed by the public. For these reasons, the Council finds that visual impacts from the facility components proposed in RFA4 are not likely to result in a potentially significant visual impact at John Day River Canyon.

Interstate 84

Interstate 84 is located approximately 4.9 and 5.7 miles North of the proposed solar array and gen-tie line, respectively. At this distance, there will be no visual impacts, as presented in RFA4 Exhibit R Figure R2 and R3. For these reasons, the Council finds that visual impacts from the

facility components proposed in RFA4 are not likely to result in a potentially significant visual impact at Interstate 84.

Journey Through Time Scenic Byway/Interstate 97

Journey Through Time Scenic Byway/Interstate 97 is located approximately 5.9 and 6.6 miles West of the proposed solar array and gen-tie line, respectively. KOPs were taken at two locations along and near US-97 (RFA4 Exhibit R Attachment R-3, Photos 15 and 16). Based on the visibility analysis at KOP 15 and 16, the solar array will introduce dark colors, geometric shapes, horizontal and vertical lines into the landscape setting. Views of the gen-tie line will be similar to the other power lines in the area.

The existing viewshed includes agricultural land with hilly terrain and existing wind turbines. These viewpoints reflect the views of drivers traveling along US-97, likely traveling at a high rate of speed. These impacts will be short term for travelers because the area where the solar array and gen-tie line is potentially visible is very limited and their focus will be on the road ahead.

Due to the distance to the facility components proposed in RFA4 and existing views of other utility infrastructure, the Council finds that visual impacts from the facility components proposed in RFA4 are not likely to result in a potentially significant visual impact along Journey Through Time Scenic Byway/Interstate 97.

Oregon State Highway 206

Oregon State Highway 206 is located approximately 5.5 and 6.3 miles southwest of the proposed solar array and gen-tie line, respectively. At this distance, there will be no visual impacts, as presented in RFA4 Exhibit R Figure R2 and R3. For these reasons, the Council finds that visual impacts from the facility components proposed in RFA4 are not likely to result in a potentially significant visual impact along Oregon State Highway 206.

Glare Impacts

The glare analysis resulted in no predictions of red, yellow or green glare from the proposed solar arrays at any of the significant or important scenic resources within the analysis area.[248] Based on these results, the Council finds that visual impacts from solar array glare are not likely to result in potentially significant visual impacts to any significant or important scenic resource within the analysis area.

Loss of Vegetation

Construction of the facility components proposed in RFA4 will result in up to 336 acres of temporary and 1,445 acres of permanent vegetation loss. Predominate vegetation within the

[248] BCWAMD4Doc21-12 RFA Exhibit R Scenic 2025-12-10, Section 5.3.

proposed Solar Micrositing Area includes dryland wheat; in areas where crop production is not feasible, the terrain includes steep slopes, sides of ditches and drainages. As previously described, John Day River Canyon is the closest scenic resource, located 3.7 miles East of the proposed Solar Micrositing Area. At a distance of nearly 4 miles, vegetation loss is not expected to be visible. Therefore, the Council finds that the facility components proposed in RFA4 are not likely to result in significant adverse visual impacts to John Day River Canyon or any other significant or important scenic resources located at greater distances.

The facility components proposed in RFA4 do not include combustion or thermal heat sources; therefore, the visual impacts from plumes or visible air emissions will not occur.

III.J.2. Conclusions of Law

Based on the foregoing analysis, the Council finds that the design, construction and operation of the facility components proposed in RFA4 are not likely to result in significant adverse visual impacts to significant or important scenic resources.

III.K. HISTORIC, CULTURAL, AND ARCHAEOLOGICAL RESOURCES: OAR 345-022-0090

(1) Except for facilities described in sections (2) and (3), to issue a site certificate, the Council must find that the construction and operation of the facility, taking into account mitigation, are not likely to result in significant adverse impacts to:

(a) Historic, cultural or archaeological resources that have been listed on, or would likely be listed on the National Register of Historic Places;

(b) For a facility on private land, archaeological objects, as defined in ORS 358.905(1)(a), or archaeological sites, as defined in 358.905(1)(c); and

(c) For a facility on public land, archaeological sites, as defined in ORS 358.905(1)(c).

(2) The Council may issue a site certificate for a facility that would produce power from wind, solar or geothermal energy without making the findings described in section (1). However, the Council may apply the requirements of section (1) to impose conditions on a site certificate issued for such a facility.

(3) The Council may issue a site certificate for a special criteria facility under OAR 345-015-0310 without making the findings described in section (1). However, the Council may apply the requirements of section (1) to impose conditions on a site certificate issued for such a facility. [249]

[249] OAR 345-022-0040, effective April 2, 2025.

*** [250]

III.K.1. Findings of Fact

The Historic, Cultural and Archaeological Resources Standard includes direct and indirect analysis areas. The direct analysis area is the area within the proposed Solar Micrositing Area. The indirect analysis area includes the area within and extending 1-mile from the proposed Solar Micrositing Area to account for noise and visual impacts to historic sites (i.e., historic buildings, structures, or objects) and cultural resources, including Historic Properties of Religious or Cultural Significance to Indian Tribes.[251]

The proposed Solar Micrositing Area is in within the boundary of the ceded lands and traditional territories of the Confederated Tribes of the Warm Springs Reservation of Oregon (CTWSRO) and near the ceded lands of the Confederated Tribes of the Umatilla Indian Reservation (CTUIR). Members of the CTWSRO include the Warm Springs, Wasco, and Northern Paiutes. Among the Warm Springs bands, the ancestral territory of the Dock-spus band is the most closely located to the proposed Solar Micrositing Area.[252]

On August 9, 2024, the certificate holder asked the Legislative Commission on Indian Services (LCIS) to identify the Tribes that should be contacted in regard to the requested Amendment. LCIS identified the Confederated Tribes of the Umatilla Indian Reservation, the Confederated Tribes of the Warm Springs Reservation of Oregon, and the Burns Paiute Tribe as potentially affected by RFA4.

On October 10, 2024, and September 4, 2025, the certificate holder sent informal outreach letters via email to representatives of each of these Tribes requesting input regarding the facility components proposed in RFA4 and their potential impacts on resources of concern to the Tribes. The certificate holder represents that it has been in contact with all three Tribes and represented that no substantive issues were identified through informal coordination.[253]

As described in Section II.B., the Department also provided opportunities for the Tribes to review and comment on RFA4 as well as the Department's Proposed Order. As described below, comments were received from the Confederated Tribes of the Warm Springs Reservation of Oregon's Tribal Historic Preservation Officer during the Public Hearing on the Proposed Order.

[250] The information requirements included in the standard are omitted from the language above, but evaluated within the findings of fact below.

[252] BCWAMD4Doc21-13 RFA Exhibit S Cultural 2025-12-10, Attachment S-1, p. 11.

[253] BCWAMD4Doc21-13 RFA Exhibit S Cultural 2025-12-10, Section 3.0, 5.0. BCWAMD4Doc24-08 Proposed Order Public Comment Certificate Holder 2026-01-14.

Survey Methods and Results

The certificate holder contracted with GeoVisions to survey the analysis area in 2024. The survey included a desktop review of records from previous surveys and pedestrian surveys of the proposed solar micrositing area.

During the desktop review, GeoVisions reviewed the Oregon State Historic Preservation Office's (SHPO) Online Archaeological Records Remote Access (OARRA) database; historic maps; and ethnographic, ethnohistoric, and historical background records related to identify previously conducted surveys and recorded cultural resources within the analysis area. The review found several previous cultural resource studies that had been performed within the analysis area. Many of the previous surveys covered small linear portions of the proposed solar micrositing area that were primarily completed for wind energy projects, including the existing facility, Klondike III, and the PaTu Wind Farm. [254]

Between May 8 and November 3, 2024, GeoVisions conducted non-collection, archaeological surveys of the proposed Solar Micrositing Area to determine whether any previously unrecorded archaeological isolates or sites were present.[255] Consistent with SHPO's 2023 Oregon Archaeology Guidelines, GeoVisions archaeologists walked parallel transects separated by no more than 20-meter intervals across the entirety of the Project footprint. Areas determined to be of high probability or with low ground visibility (less than 50%) were surveyed at smaller transect intervals, at the discretion of the Field Director. For areas with previously recorded sites and isolates or known areas of interest that lay within the survey area, archaeologists walked transects spaced under 5 meters apart in North-South and East-West directions until the entirety of the resource was identified and documented, or the entirety of the area was covered. When an archaeological object was observed it was marked with pin flags and a team of archaeologists walked close (two meters or less) transects in a grid pattern radiating out from the object in the cardinal directions. This method was repeated for all artifacts observed within a single site boundary. The boundary for a single site or isolate was determined to be one meter outside the location of the artifact in the direction for which no other artifacts are observed within 30 meters. Once the boundary was determined it was recorded using a Geode, a minimum of two site overview photos from different directions with photo-scale and directional arrow was taken, as well as photographs of any site features and diagnostic artifacts. All site and isolate photographs were recorded in a photograph log and included in the digitized copy of the site form. Site forms were transcribed to the OR SHPO site database through OARRA. [256]

<u>Sites and Isolates in the Proposed Solar Micrositing Area</u>

[254] BCWAMD4Doc21-13 RFA Exhibit S Cultural 2025-12-10, Section 3.0, Attachment S-1.

[255] In accordance with ORS 358.905, isolated finds are defined as a single artifact, archaeological sites are defined as one feature, or two or more artifacts with contextual associations.

[256] BCWAMD4Doc21-13 RFA Exhibit S Cultural 2025-12-10, Section 3.0, Attachment S-1, pg. 26-27.

As summarized in Table 20, below, five archaeological sites and six isolates within the proposed Solar Micrositing Area were identified during the surveys described above. The sites included historic structures in ruin, historic debris scatters, and precontact lithic scatters. The isolates include an obsidian biface fragment and several historic era objects.[257]

One of the archaeological sites (35SH 00188) was recorded in previous surveys. GeoVisions archaeologists were able to identify, revisit, and perform site updates for the site during their surveys. The remaining sites and isolates were previously unrecorded.[258]

The majority of observed sites are historical in nature, appearing to mostly date to the late 19th and early 20th century. However, some of the observed resources at two of the sites originate in the precontact period.[259]

Four of the archaeological sites (35SH00188, BSP-1-S02BSP-1-S10, and BSP-1-S12) and one archaeological isolate (BSP-1-I04) are designated as unevaluated for NRHP eligibility. Unevaluated resources must generally be treated as likely to be eligible for listing until they are demonstrated to be ineligible by further testing or study.

GeoVisions recommended the remaining resources are likely not eligible for listing on the NRHP.[260] On June 10, 2025, Oregon SHPO provided a letter concurring with these recommendations.[261]

Table 20: Cultural Resources in the Solar Micrositing Area

Temporary ID (Trinomial)	Period	General Resource Description	NRHP Recommendation	Distance to Disturbance (meters)	Management Recommendations
Sites					
06/1365-D2 (35SH00188)	Historic	Homestead; historic debris scatter/concentration	Unevaluated	18	Avoidance
BSP-1-S02	Multicomponent	Precontact Lithic; Historic Debris Scatter/Concentration	Unevaluated	28	Avoidance
BSP-1-S03	Historic	Debris Scatter/ Concentration	Not Eligible	0	None
BSP-1-S10	Historic	Homestead in-ruin	Unevaluated	0	Avoidance
BSP-1-S12	Multicomponent	Precontact lithic; historic debris concentration/scatter	Unevaluated	20	Avoidance
Isolates					
BSP-1-I02	Historic	Prince Albert tobacco tin	Not Eligible	50	None
BSP-1-I03	Historic	Liggett & Myers Tobacco Company Velvet pipe and cigarette pocket-tin	Not Eligible	49	None
BSP-1-I04	Precontact	Obsidian biface fragment	Unevaluated	6	Avoidance
BSP-1-I05	Historic	Steel fastener	Not Eligible	0	None
BSP-1-I06	Historic	Aqua bottle glass fragment	Not Eligible	9	None
BSP-1-107	Historic	Soil compactor	Not Eligible	142	None

Proposed Management and Mitigation

The certificate holder represents that the unevaluated archaeological sites (35SH00188, BSP-1-S02BSP-1-S10, and BSP-1-S12) and archaeological isolate (BSP-1-I04) would be avoided by construction and operational activities by a minimum buffer of 20 meters.

The certificate holder notes that the proposed site layout provided in RFA4 Figure 2 (Preliminary Site Plan, Solar Micrositing Area) would result in disturbance within 6 to 28 meters of the protected resources and the resources could be potentially impacted due to their proximity to the facility components proposed in RFA4. The certificate holder represents that additional changes will be made to avoid significant resources during final facility design. If disturbance could not be avoided within this buffer, but would be outside a resource boundary, the certificate holder represents that a Tribal Cultural Resources or archaeological monitor would be present. The certificate holder represents that all impacts to significant cultural resources will be avoided through design of the facility components proposed in RFA4.[262]

In their comments, SHPO concurred with the recommendation for a 20-meter avoidance buffer around all unevaluated and eligible resources, as well as the presence of an Oregon Qualified Archaeologist to monitor ground disturbing activities.[263]

The certificate holder proposed to conduct monitoring if ground disturbing activities occurred within the 20-meter avoidance buffer for NHRP eligible or unevaluated resources. Confederated Tribes of the Warm Springs requested that the certificate holder be required to have a Tribal monitor onsite during all ground-disturbing activities. The Council finds the request to have a Dedicated Tribal Monitor present during all ground disturbing activities goes beyond the recommendations in the GeoVisions Report; but that the Tribes' request to have a qualified archaeologist on site during ground disturbing activities is reasonable given the history of the area and potential for additional unidentified pre-contact sites or isolates to be present at the site documented in the cultural resources survey report. However, the Council finds the condition should allow for an evaluation of lessor frequent monitoring or more specified scope of monitoring if determined appropriate by the Department in consultation with CTWS, as presented below.

Historic, Cultural, and Archaeological Condition 1 (GEN-HC-02)
The certificate holder must design, construct, and operate the solar facility to avoid archaeological sites (35SH00188, BSP-1-S02BSP-1-S10, and BSP-1-S12) and archaeological isolate (BSP-1-I04) with a 20-meter avoidance buffer.

[262] BCWAMD4Doc21-13 RFA Exhibit S Cultural 2025-12-10, Sections 4.1, 4.2., 6.0. Section 5.0 states that if the certificate holder determined that impacts to a significant resource could not be avoided, the certificate holder would consult with ODOE, SHPO, and Tribes to determine appropriate mitigation. Because this statement contradicts other representations in the exhibit that impacts to significant resources could, and would, be avoided during final facility design the Council finds it was likely included in error.
[263] BCWAMD4Doc14-06 pRFA Reviewing Agency Comment SHPO 2025-07-10.

Historic, Cultural, and Archaeological Condition 2 (GEN-HC-03)

a. Prior to construction, the certificate holder must submit to the Department for approval, in consultation with SHPO, a Cultural Resources Monitoring Plan demonstrating that an Oregon Qualified Archaeologist or Tribal Cultural Resource Monitor will be onsite during ground disturbing activities at the site. The plan may provide for exceptions to monitoring scope and frequency, subject to approval by the Department, in consultation with the Confederated Tribes of Warm Springs.
b. During construction, the certificate holder shall adhere to the measures approved in the Cultural Resources Monitoring Plan.

[Final Order on AMD4]

The Council previously imposed Condition 70 through 73, to ensure a qualified archaeologist was present on site during any ground-disturbing activities during construction of the existing wind energy facility, and to cease all activities in the event a previously unrecorded site or object is encountered until a qualified archaeologist could evaluate the significance of the find. The certificate holder represents that all work on site would be conducted in compliance with its corporate Inadvertent Discovery Procedure (IDP), which the certificate holder requested be maintained as confidential. The IDP describes how the facility will maintain compliance with the Native American Graves Protection and Repatriation Act (43 CFR 10) and ORS 97.740-994 and 358.905-961. The IDP also requires all field personnel and contractors to complete Environmental Compliance Training provided by Environmental and Licensing Services that includes cultural awareness training.[264]

The Council adopts new conditions requiring that an IDP be finalized prior to construction to include updated contact information and that all work during the construction of the facility components proposed in RFA4 be conducted in compliance with the IDP.

Historic, Cultural and Archeological Condition 3 (PRE-HC-01)

Prior to construction, the certificate holder shall update the contact information provided in the Final Order on ASC Attachment H, Inadvertent Discovery Plan.

[Final Order on AMD4]

Historic, Cultural and Archeological Condition 4 (CON-HC-01)

During construction, the certificate holder shall require all onsite employees and contractors to implement and adhere to the requirements of the Inadvertent Discovery Plan, as submitted to the Department under Condition PRE-HC-01.

[Final Order on AMD4]

Historic, Cultural and Archeological Condition 5 (OPR-HC-01)

During operations, the certificate holder shall require all onsite employees and contractors to implement and adhere to the requirements of the Inadvertent Discovery

[264] BCWAMD4Doc21-13 RFA Exhibit S Cultural 2025-12-10, Section 5.0.

Plan, as provided in Condition PRE-HC-01. The IDP shall be reviewed and updated annually for current contact information.
[Final Order on AMD4]

Because the IDP and Cultural Resources Monitoring Plan required under the conditions above would establish the requirements previously located in Condition 70 to 73, the Council deletes those conditions.

III.K.2. Conclusions of Law

Based on the foregoing analysis, and subject to compliance with the site certificate conditions described above, the Council finds that the construction and operation of the facility components proposed in RFA4 are not likely to result in significant adverse impacts to historic, cultural or archaeological resources that have been listed on, or would likely be listed on the National Register of Historic Places or other archaeological objects or sites identified under OAR 345-022-0090.

III.L. RECREATION: OAR 345-022-0100

(1) To issue a site certificate, the Council must find that the design, construction and operation of a facility, taking into account mitigation, are not likely to result in a significant adverse impact to important recreational opportunities.

(2) The Council must consider the following factors in judging the importance of a recreational opportunity:

(a) Any special designation or management of the location;

(b) The degree of demand;

(c) Outstanding or unusual qualities;

(d) Availability or rareness;

(e) Irreplaceability or irretrievability of the opportunity.

(3) The Council may issue a site certificate for a special criteria facility under OAR 345-015-0310 without making the findings described in section (1). In issuing such a site certificate, the Council may impose conditions of approval to minimize the potential significant adverse impacts from the design, construction, and operation of the facility on important recreational opportunities.

(4) The Council must apply the version of this rule adopted under Administrative Order EFSC 1-2002, filed and effective April 3, 2002, to the review of any Application for Site Certificate or Request for Amendment that was determined to be complete under OAR 345-015-0190 or 345-027-0363 before the effective date of this rule. Nothing in this section waives the obligations of the certificate holder and Council to abide by local ordinances, state law, and other rules of the Council for the construction and operation of energy facilities in effect on the date the site certificate or amended site certificate is executed. [265]

*** [266]

III.L.1. Findings of Fact

The Recreation standard requires the Council to find that the design, construction, and operation of a facility or facility, with proposed changes, would not likely result in significant adverse impacts to "important" recreational opportunities. Therefore, the Council's Recreation standard applies only to those recreation areas that the Council finds to be "important," utilizing the factors listed in the sub-paragraphs of section (1) of the standard. The importance of recreational opportunities is assessed based on five factors outlined in the standard: special designation or management, degree of demand, outstanding or unusual qualities, availability or rareness, and irreplaceability or irretrievability of the recreational opportunity.

Recreational Opportunities within the Analysis Area

The analysis area for recreational opportunities is the area within and extending 5 miles from the proposed Solar Micrositing Area Boundary.

Recreational opportunities within the analysis area were identified through review of existing published and unpublished information available from desktop research sources commonly used for recreation inventory efforts. Resources reviewed for the inventory include:

- Geographic Information System files documenting recreational resources obtained from key recreation provider agencies, *e.g.*, the Bureau of Land Management (BLM 2024), Oregon Department of Fish and Wildlife (ODFW 2022), United States Forest Service (USFS 2024), United States Geological Survey (USGS 2024), and Oregon Parks and Recreation Department (OPRD 2020);
- Land management agency planning documents;
- Comprehensive plans, park and recreation plans, and individual park master plans prepared by OPRD and by counties and municipal governments within the analysis area;

[265] OAR 345-022-0040, effective April 2, 2025.

[266] The information requirements included in the standard are omitted from the language above, but evaluated within the findings of fact below.

- Internet sites maintained by recreation provider agencies, including OPRD, ODFW, and county and city park departments (Sherman County 2024; ODFW 2024; ODOT 2024; OPRD 2024); and
- Internet sites maintained by various commercial entities, including sites providing general recreation and tourism information and sites applicable to specific private-sector recreation opportunities (Google Earth 2024; ORBIC 2024).

Based on the above review, three recreational opportunities were identified within the analysis area – a portion of the Oregon National Historic Trail (ONHT); John Day River and associated parks (Albert Philippi Park and LePage Park); and Giles L. French Park. These resources are evaluated below to determine whether they are "important" as defined by the standard.

Recreational Opportunity Importance Assessment

ONHT High Potential Segment/Sites

As presented in RFA4 Exhibit T, there is a historically mapped segment of ONHT extending 15 miles within the analysis area, approximately 0.4 miles from the proposed Solar Micrositing Area Boundary. For this historically mapped segment, there is no visible or physical evidence of intact segments, nor are any portions of the segment publicly available (i.e., all located on private land). ONHT trail segments have a special designation as a National Historic Trail, however, given that there is no remaining physical evidence of the trail within the analysis area, there are no outstanding or rare qualities. For these reasons, the Council agrees with the certificate holder's conclusions and finds this recreational opportunity not to be "important" under the standard.

John Day River, Albert Philippi Park and LePage Park

As presented in RFA4 Exhibit T, John Day River is approximately 3.7 miles from the proposed Solar Micrositing Area Boundary. John Day River is designated as a federal Wild and Scenic River and State Scenic Water Way. There are two parks associated with the John Day River, Albert Philippi Park and Lepage Park, which both offer river access and camping opportunities. The river and associated parks are popular for recreational opportunities, and access to, rafting, kayaking, and fishing. The river is irreplaceable and rare. For all of these reasons, the Council agrees with the certificate holder's conclusions and finds this recreational opportunity is "important" under the standard.

Giles L. French Park

As presented in RFA4 Exhibit T, Giles L. French Park is approximately 4.8 miles from the proposed Solar Micrositing Area Boundary. The park is located along the Columbia River and has free primitive camping, bathrooms, boat dock and trails. The park is one of several USACE parks in the analysis area, all of which offer similar amenities. The park is therefore not rare and

is replaceable. For all of these reasons, the Council agrees with the certificate holder's conclusions and finds this recreational opportunity not to be "important" under the standard.

Potential Impacts to Important Recreation Opportunities

Potential impacts to John Day River and associated parks are evaluated below.

Direct and Indirect Loss of Recreational Opportunity

Direct Loss

A direct loss to an important recreational opportunity would occur when construction or operation would impact a recreational opportunity by directly altering the resource so that it no longer exists in its current state. Based on the location of the facility components proposed in RFA4 in relation to the one identified important recreational opportunity, at 3.7 miles, physical disturbance, or ground disturbance, would not occur at John Day River. The facility components proposed in RFA4 would also not require any temporary or permanent closure or removal of John Day River to public use. Therefore, based upon review of the location and proximity of John Day River to the RFA4 site boundary, the Council finds that the facility components proposed in RFA4 would not be expected to result in indirect impacts to John Day River.

Indirect Loss

Similar to the assessment of direct loss, indirect loss would result if construction or operation of the facility components proposed in RFA4 would impact a recreational opportunity by indirectly altering the resource or some component of it. To evaluate indirect loss associated resulting from the construction and operation, the Council considers potential noise, traffic and visual impacts to the above mentioned important recreational opportunities, as presented below.

Potential Traffic-Related Impacts

Construction routes will include I-84, US-97, OR-206, Klondike Road and Old Wasco-Heppner Highway. John Day River is accessed by US-97 or OR-206. Visitors could experience short-term delays for the duration of construction. As presented in Section II.M. *Public Services*, there are three existing conditions, Conditions 77-79, that apply to construction-related traffic impacts. These conditions, as amended, will minimize potential traffic volume and road damage impacts, minimizing potential impacts to users of road serving the above-referenced protected areas. Based on compliance with the amended conditions, the Council finds that construction-related traffic is not likely to have a significant adverse impact on roads used to access John Day River.

Only three additional full-time employees are expected to visit the site daily, and other trips for delivery or maintenance would be infrequent. As a result, the Council finds that operational traffic is not likely to have a significant adverse impact on roads used to access John Day River.

Potential Noise Impacts

Estimated and modeled noise impacts at John Day River (approx. 3.7 miles east of the RFA4 site boundary) are 43 dBA during construction and 26 dBA during operations, respectively. A noise level of 43 dBA represents a similar noise level of light auto traffic at a distance of 100 feet.[267] A noise level of 26 dBA is equivalent to ambient noise levels and considered extremely quiet. These noise levels combined with a more than 3 mile separation distance would not be expected to result in a significant adverse impact at John Day River. Therefore, the Council finds that potential noise impacts are not likely to have a significant adverse impact on users of John Day River.

Potential Visual Impacts

Permanent placement of energy infrastructure proposed in RFA4 could result in potential visual impacts including up to 15-foot tall solar arrays and up to 160-foot-tall transmission line poles. To evaluate potential visual impacts of these structures, RFA4 Exhibit R presents the results of a three-part approach including GIS-based viewshed (or zone of visual influence [ZVI]) modeling; key observation point (KOP) analysis and glare modeling.

First, the ZVI analysis used Esri GIS software and bare-earth 10-meter digital elevation model to determine locations within the analysis area where the changes proposed in RFA4 would be visible. Results of the ZVI analysis are presented in RFA4 Exhibit R Figure R-2 and R-3. Then, based on the results of the ZVI analysis, 21 KOPs were identified, representing locations where a "casual observer" could realistically view the proposed RFA4 structures. The KOP locations are presented in RFA4 Exhibit R Figure R-4. These KOPs are located along accessible viewpoints and near John Day River and used to support the evaluation of the likelihood and magnitude of potential visual impacts (RFA4 Exhibit R Attachment R-3 presents photo locations associated with the KOPs demonstrating actual, existing viewshed conditions). Lastly, a glint and glare analysis was conducted using the Solar Glare Hazard Analysis Tool developed by Sandia National Laboratories to inform potential impacts to drivers on nearby roads.

Visual modeling and viewshed analysis show that portions of John Day River may have distant or background views of the proposed RFA4 components, but the existing viewshed includes existing wind farms, transmission lines, industrial development and agricultural irrigation equipment. The glare analysis resulted in no predictions of red, yellow or green glare from the proposed solar arrays at John Day River. Therefore, the proposed solar components will not introduce new or unusual features in the viewshed. For these reasons, the Council finds that potential visual impacts from the facility components proposed in RFA4 are not likely to have a significant adverse impact on users of John Day River.

III.L.2. Conclusions of Law

[267] BCWAMD4Doc21-19 RFA Exhibit Y Acoustic Assessment 2025-12-10, Table Y-2. See sound level, in dBA, of light auto traffic at 100 feet.

Based on the foregoing analysis, the Council finds that the design, construction and operation of the facility components proposed in RFA4 are not likely to result in a significant adverse impact to important recreational opportunities.

III.M. PUBLIC SERVICES: OAR 345-022-0110

(1) Except for facilities described in sections (2) and (3), to issue a site certificate, the Council must find that the construction and operation of the facility, taking into account mitigation, are not likely to result in significant adverse impact to the ability of public and private providers within the analysis area described in the project order to provide: sewers and sewage treatment, water, storm water drainage, solid waste management, housing, traffic safety, police and fire protection, health care and schools.

(2) The Council may issue a site certificate for a facility that would produce power from wind, solar or geothermal energy without making the findings described in section (1). However, the Council may apply the requirements of section (1) to impose conditions on a site certificate issued for such a facility.

(3) The Council may issue a site certificate for a special criteria facility under OAR 345-015-0310 without making the findings described in section (1). However, the Council may apply the requirements of section (1) to impose conditions on a site certificate issued for such a facility. [268]

***** [269]

III.M.1. Findings of Fact

The analysis area for the Public Services standard is the area within and extending 10 miles from the proposed Solar Micrositing Area.[270] The analysis area includes Rufus, Wasco and portions of unincorporated Sherman and Gilliam counties; the analysis area also extends into Washington (portions of Klickitat County).

Impact Assessment Assumptions

[268] OAR 345-022-0040, effective April 2, 2025.

[269] The information requirements included in the standard are omitted from the language above, but evaluated within the findings of fact below.

[270] BCWAMD4 ODOE Concurrence on OAR 345-027-0360(3) Request. The Council's procedural requirements for site certificate amendments (OAR 345-027-0360(3)) allow the Department to authorize modifications to analysis areas established in a Project Order, if warranted based on the scope of changes in a Request for Amendment. As authorized under OAR 345-027-0360(3), following a pre-amendment conference on May 2, 2024, the Department approved a modified analysis area for RFA4 based on the scope and extent of potential impacts associated with RFA4 changes.

The following assumptions were relied upon to estimate potential impacts on public and private service providers:

Construction

- Construction would last approximately 17 to 19 months
- There would be an average of 165 workers on-site each day during construction, with up to 350 workers on site during peak construction periods.
- Approximately 30 percent of the construction workforce would be residents within a 1-hr commuting distance to the site. The remaining 70 percent would temporarily relocate to communities within a 1-hour commuting distance from the site.

Operation

- Up to three new employees would be needed for operations and maintenance activities.
- A household size of three is assumed for each permanent worker; a total of nine new permanent residents could be added to the local population. [271]

Sewer and Sewage Treatment

The certificate holder does not propose to connect to or modify any existing public or private sewer or sewage treatment system. During construction, sanitary waste would be collected on-site in portable toilets provided and serviced by a private sanitation service provider. The Council previously imposed Condition 82 requiring that, during construction, portable toilets be pumped and cleaned regularly by a licensed contractor. Condition 82 would continue to apply to construction of the facility components proposed in RFA4.

During operations, sanitary waste would be discharged through the existing septic system at the O&M building, or if the proposed new O&M building is constructed, it would be designed with a new, licensed septic system. The Council previously imposed Condition 83 requiring any onsite septic system be properly designed and licensed with the county, through the North Central Public Health District. Condition 83 would continue to apply if a new O&M building is constructed.

Because the facility components proposed in RFA4 would not connect to a public sewer or sewage disposal system, the Council finds that construction and operation are not likely to result in significant adverse impact to the ability of any public or private sewer/sewage treatment providers to provide sewer and sewage treatment services.

Stormwater and Wastewater Drainage

The certificate holder does not propose to connect to or modify any existing developed stormwater or wastewater drainage system. As described in Section III.D., *Soil Protection*, under

[271] BCWAMD4Doc21-15 RFA Exhibit U Public Services 2025-12-10, Section 4.2.2.

Soil Protection Conditions 1 to 3, the certificate holder would be required to construct the facility components proposed in RFA4 in accordance with the Department of Environmental Quality's National Pollutant Discharge Elimination System Construction Stormwater Discharge General Permit 1200-C and associated Erosion and Sediment Control Plan; and a Comprehensive Solar Revegetation and Soil Management Plan.

Because the facility components proposed in RFA4 will not connect to a developed stormwater or drainage system, the Council finds that construction and operation are not likely to result in significant adverse impact to the ability of any public or private service providers to provide stormwater and wastewater services.

Water Use

Under average conditions, up to 26 million gallons of water will be needed for construction for dust suppression, road compaction, concrete mixing, and equipment washing. Construction water will likely be obtained from a municipal source, such as City of Wasco, which affirmed capacity to meet the forecasted construction water demand.[272] Potable water will also be required for sanitation and drinking water, which will be obtained from the existing, exempt well or from bottled water.

The Council previously imposed Condition 74 which required that, during construction, the certificate holder and its contractors obtain water from previously permitted sources. This condition applies to the water usage associated with AMD4. However, the Council amends Condition 74 to add clarity on the documentation to be submitted to afford the Department the ability to verify that the water source has the legal ability to provide the type and quantity of water needed for construction, as presented below.

> **Amended Condition 74 (CON-PS-01)**
> Prior to and during construction of any component or phase of the solar facility, as applicable, the certificate holder and its contractors shall: ~~obtain all water required for construction activities from off-site sources previously permitted for such uses.~~
> a. Identify all water-related needs and estimate daily and annual water demand for facility construction.
> b. Provide evidence such as a contract or purchase agreement demonstrating that adequate water supply to meet facility construction demand has been secured and that water for all construction activities will be legally obtained by service providers or third-party permits.
> [Final Order on AMD4]

During operations, up to 330,000 gallons per year may be needed for potable water and panel washing. Potable water may be obtained from the facility's existing, exempt well or a newly constructed exempt well. As addressed in Section IV.C., *Water Rights*, the Council adopts Water

[272] BCWAMD4Doc21-15 RFA Exhibit U Public Services 2025-12-10, Attachment U-1.

Rights Condition 1 and amends Condition 75 requiring that, for any newly constructed well, the certificate holder comply with OWRD water record requirements as well as limit the well system's (i.e., well system including the existing and proposed well) combined withdrawal to 5,000 gallons per day or less, unless a permit is obtained from OWRD for either or both wells.

The Council previously imposed Condition 76 requiring that, during operation, the certificate holder and its contractors obtain water from previously permitted sources. The Council amends Condition 76 to add clarity on the documentation to be submitted to afford the Department the ability to evaluate whether the water source has the legal ability to provide the type and quantity of water needed for operation, as presented below.

Amended Condition 76 (OPR-PS-01)
During operation of the facility, for any water needed from offsite sources, the certificate holder and its contractors shall: ~~obtain all water required for blade-washing activities from off-site sources previously permitted for such uses or from the on-site well, provided such use of well water would not cause the rate of extraction to exceed 5,000 gallons in any one-day period.~~

a. Identify all water-related needs and estimate daily and annual water demand for facility operations.
b. Provide evidence such as a contract or purchase agreement demonstrating that adequate water supply to meet facility operational demand has been secured and that water for all operational activities will be legally obtained by service providers or third-party permits.

[Final Order on ASC, Condition 76; AMD4]

Because the certificate holder has demonstrated that it can obtain adequate water supply for the construction and operation of the facility components proposed in RFA4, and subject to the Amended Conditions 74 and 76, and new Water Rights Condition 1 described in this order, the Council finds that the construction and operation of the facility components proposed in RFA4 are not likely to result in significant adverse impact to the ability of any public or private water providers to provide services.

Solid Waste Management

Construction would generate approximately 12,000 cubic yards total of solid waste over a twelve-month period, including discarded construction materials, packaging materials, wood forms from foundations, and spent erosion control materials.[273]

During operations, approximately two cubic yards of waste per month will be generated, including damaged or defective equipment and associated packing materials, and typical office waste. Any materials that cannot be recycled would be disposed of at Columbia Ridge Landfill

[273] BCWAMD4Doc21-17 RFA Exhibit W Waste Minimization 2025-12-10, Section 2.1.1.

(20 miles east of the proposed Solar Micrositing Area) and the Wasco County Landfill (25 miles west of the proposed Solar Micrositing Area).

As described in Section III.O., *Waste Minimization*, under Amended Conditions 84 and 87, the certificate holder would be required to implement Waste Management Plans that contain provisions for minimizing the generation of wastes and recycling materials to the extent reasonably practicable during construction and operation of the proposed solar facility. The plans would provide for hazardous wastes and electronic wastes from solar modules and the BESS to be handled in accordance with applicable regulations and sent to proper facilities for disposal or recycling.

WM Senior Industrial Account Executive, Mark Krening, affirmed that Columbia Ridge Landfill can accept construction and demolition waste, with capacity to operate for 100 more years. Oregon Landfills Business Development Manager, Jocelyn Jones, affirmed that Wasco County Landfill has 26 years of capacity, with a potential for an additional 20 years if future expansion occurs.[274]

Because the certificate holder will minimize solid waste generated by its waste management plan and has identified appropriate providers with adequate capacity to accept solid waste and recyclable materials from the site, the Council finds that the construction and operation of the facility components proposed in RFA4 are not likely to result in significant adverse impact to the ability of any public or private solid waste providers to provide waste management services.

Housing

Temporary housing could be required for up to 245 workers during the peak construction period and about 116 workers on average during the construction period. Workers who temporarily re-locate to the area during construction are expected to utilize short-term rental housing, hotels, motels, RV parks or campgrounds in communities within a 1-hour commute of the site, including Morrow, Gilliam, Sherman, Wasco, and Klickitat counties. There are 33 hotels and motels in this area, with establishments concentrated in The Dalles (11 hotels) and Boardman (5 hotels/motels). Collectively, the hotels have 1,318 rooms. In 2023, hotels and motels in the region had an average occupancy rate of 63.8 percent, with a peak occupancy rate of 82.8 percent during August. Peak construction periods would likely occur during the peak occupancy periods; however, even at peak occupancy, 227 hotel or motel rooms were available.[275]

There are 17 RV parks or campgrounds with a combined 755 RV sites within a 1-hour commuting distance. This includes 188 RV sites in Sherman County. Occupancy rates were not provided for RV campgrounds, but assuming similar rates as hotels and motels would result in

[274] BCWAMD4Doc21-15 RFA Exhibit U Public Services 2025-12-10, Attachment U-1.

[275] BCWAMD4Doc21-15 RFA Exhibit U Public Services 2025-12-10, Section 4.3.7, 4.4.5

approximately 138 sites being available within a 1-hour commutable distance.[276] If temporary construction workers rely on RV sites within Sherman County, there could be a significant, temporary impact on local RV capacity. To minimize and mitigate potential impacts to local RV park capacity, the Council imposes the following conditions requiring that the certificate holder develop a construction worker housing plan to provide strategies to minimize impacts to the local housing supply based on an ongoing evaluation of patterns of uses and potential shortages or changes in housing demand, as presented below:

Public Services Condition 1 (PRE-PS-01)
At least 90-days prior to construction of a phase or component of the solar facility, the certificate holder shall provide to the Department and Sherman County a Construction Workforce Housing Plan. The Construction Workforce Housing Plan must include:

a. An evaluation of ongoing patterns of housing uses and potential shortages or changes in housing demand;
b. Consideration of concerns and suggestions from Sherman County; and
c. Provide strategies to minimize impacts to the local housing supply.

[Final Order on AMD4]

Public Services Condition 2 (CON-PS-02)
During construction of a phase or component of the solar facility, the certificate holder shall report on the implementation of the Construction Workforce Housing Plan required under PRE-PS-01, including any outstanding issues associated with workforce housing and potential solutions.
[Final Order on AMD4]

Based on compliance with the conditions above, the Council finds that construction of the facility components proposed in RFA4 are not likely to result in significant adverse impact to the ability of any public or private housing providers to provide housing services.

Permanent housing for up to three new households, including workers and their families, may be required during operations. Based on an analysis of data from the U.S. Census Bureau's American Community Survey, on average, there were approximately 596 unoccupied rental units in Sherman and Wasco Counties in 2022. Housing data for rural areas have high margins of error and that occupancy rates may have changed since 2022; however, the Council finds the data demonstrate that there is likely sufficient permanent housing available for the relatively small number of workers expected to be employed during operation of the proposed solar facility.[277]

Based on the limited increase in permanent households from operations, the Council finds that operation of the facility components proposed in RFA4 are not likely to result in significant

[276] BCWAMD4Doc21-15 RFA Exhibit U Public Services 2025-12-10, Section 4.3.7.
[277] BCWAMD4Doc21-15 RFA Exhibit U Public Services 2025-12-10, Section 4.3.7, 4.4.5.

adverse impact to the ability of any public or private housing providers to provide housing services.

Health Care

Health Care services with Level III Trauma center is Adventist Health Columbia Gorge Hospital in the Dalles. If more advanced treatment was needed, the nearest Level I Trauma centers are in Portland. Ground ambulance service at the site is provided by Sherman County Ambulance. Air ambulance service is available for more serious injuries.[278]

The Council previously imposed Site Certificate Conditions 46 and 47, which require the development and implementation of health and safety plans during construction and operation of the existing facility, accordingly. The Council amends Condition 46 to require a new health and safety plan to be developed for the construction of the facility components proposed in RFA4. The Council maintains Condition 47 to require the existing health and safety plan to be implemented for both the existing and proposed facility components.

> **Amended Condition 46 (CON-PS-03)**
> During construction of the solar facility, the certificate holder shall require that all on-site construction contractors develop and implement a site health and safety plan that informs on-site workers and others what to do in case of an emergency and that includes the locations of fire extinguishers and nearby hospitals, important telephone numbers, and first aid techniques.
> [Final Order on ASC, Condition 46; AMD4]

The relatively small increase in population expected to result from up to three workers permanently relocating to the area during operation of the facility components proposed in RFA4 is not expected to result in significant increase in demand for primary health care services in the analysis area.

Accordingly, the Council finds that the construction and operation of the facility components proposed in RFA4 are not likely to result in significant adverse impact to the ability of public and private health care providers to provide health care services in the analysis area.

Schools

Workers temporarily relocating to the area during construction of the facility components proposed in RFA4 are not likely to be joined by family members or enrolled in local education programs in significant numbers. The relatively small increase in population expected to result from up to three workers permanently relocating to the area during operation of the facility components proposed in RFA4 is also not expected to result in significant increase in demand for education services in the analysis area. Accordingly, the Council finds that the construction

[278] BCWAMD4Doc21-15 RFA Exhibit U Public Services 2025-12-10, Section 4.3.10; 4.4.8.

and operation of the facility are not likely to result in a significant adverse impact to the ability of public and private education providers to provide education services in the analysis area.

Traffic Safety

Construction

Peak construction activities are expected to generate up to 350 worker-vehicle round trips per day. There would also be up to 54 round trips by small and large trucks making deliveries of equipment and materials. This equates to approximately 808 one-way trips each day during peak construction periods.[279]

The primary transportation route for construction-related, heavy-duty, and light-duty delivery vehicles, as well as some workforce traffic will start from either the west or east on I-84 to south on US-97 (from Biggs, Oregon) to Wasco, then southeast on Oregon Route 206 (OR-206), east on either Klondike Road or the Old Wasco Heppner Highway, and then onto various County roads providing local access to the site. A secondary route starting at the I-84/Rufus junction, continuing to Herin Lane via Scott Canyon Road would be used for some commuter vehicle traffic.[280] Existing roads for these routes are generally in fair to good condition and are not anticipated to require improvement or alterations to accommodate facility-related traffic.[281]

Based on 2024 Average Annual Daily Traffic (AADT) Volumes published by ODOT, peak construction related traffic could increase AADT volumes on I-84 by about 4.5 percent, along US-97 by up to 23 percent, and along OR-206 by up to 57 percent. The increase in traffic on I-84 was considered to be minimal. The increase in traffic on US-97 was shown to result in a level of service (LOS) B, which indicates the increased traffic volume could potentially cause some minor traffic delay, particularly during the AM and PM peak hours, but it is unlikely to cause significant disruption. While the percentage increase along OR-206 was the greatest, the evaluation showed that the roadway would maintain LOS A (minimal delays) even during peak construction period given the relatively low AADT compared to the capacity of the roadway.[282]

County and local roadways are expected to be able to safely accommodate construction-related traffic without significant improvement or modification.[283]

The Council previously imposed Conditions 77, 78 and 79 to mitigate the traffic related impacts from the construction of the existing wind facility. Condition 77 and 78 required the certificate holder to monitor impacts on roads during construction and to restore the roads to at least

[279] BCWAMD4Doc21-15 RFA Exhibit U Public Services 2025-12-10, Section 4.4.6

[280] BCWAMD4Doc21-15 RFA Exhibit U Public Services 2025-12-10, Section 4.3.8.1., 4.3.8.2.

[281] BCWAMD4Doc21-01 RFA Div27 2025-12-10, Section 4.1.3.6; BCWAMD4Doc21-15 RFA Exhibit U Public Services 2025-12-10, Section 4.3.8.4.

[282] BCWAMD4Doc21-15 RFA Exhibit U Public Services 2025-12-10, Section 4.4.6.

[283] BCWAMD4Doc21-15 RFA Exhibit U Public Services 2025-12-10, Section 4.4.6.1.

their pre-construction condition following the completion of construction. Condition 79 required the certificate holder to implement specific measures to reduce traffic delays on county roads serving as transportation routes for delivery of equipment to the site during construction of the wind facility. The Council amends Conditions 77 and 78 to apply to construction of the facility components proposed in RFA4 because construction related traffic can result in damage to road surfaces. Consistent with the certificate holder's representations that it would comply with Condition 79 by developing a Construction Traffic Management Plan prior to construction describing how it will implement the traffic minimization measures in the condition,[284] the Council amends Conditions 77 to incorporate the requirements of Condition 79; and amends Condition 78 as presented below:

Amended Condition 77 (PRE-PS-02)

~~Before beginning~~ Prior to construction of any phase or component of the solar facility, the certificate holder shall ~~develop~~:

a. Provide an executed Road Use Agreement between the certificate holder and Sherman County Public Works Department, which includes, at a minimum:
   i. ~~a~~ A system for ~~monitoring~~ documenting the pre-construction condition of ~~state highways and~~ local roads that would serve as transport~~er~~ation routes for delivering equipment to the facility site ~~for degradation, e.g., major potholes, so that safe travel paths may be maintained. The monitoring system shall include site inspection and photographic cataloguing of existing road conditions~~ so that pre-construction conditions can be compared with conditions after construction has been completed to assess needed repairs and payment for repairs.
   ii. Protocols for monitoring road conditions for degradation during construction so that safe travel paths may be maintained.
   iii. An agreement to fund repairs of construction related damage to the satisfaction of Sherman County Public Works. ~~The certificate holder shall coordinate monitoring methods and preferred mitigation efforts with Sherman County Public Works and the Oregon Department of Transportation.~~
b. Submit a Construction Traffic Management Plan for Department review and approval. Unless the following are included in the executed Road Use Agreement, the plan shall, at a minimum, require that the certificate holder:
   i. Provide notice to adjacent landowners when construction takes place to help minimize access disruptions;
   ii. Provide proper road signage and warnings of "Equipment on Road," "Truck Access," or "Road Crossings;"
   iii. Implement traffic diversion equipment, such as advance signage and pilot cars, whenever possible when slow or oversized loads are being hauled;

[284] BCWAMD4Doc21-15 RFA Exhibit U Public Services 2025-12-10, Section 4.4.6. The certificate holder also cites Condition 17, 27 and 60. As discussed in Section III.E, Land Use, Condition 17 is not applicable to the construction and operation of the facility components proposed in RFA4. Condition 27 and 60 are intended to protect soils and wildlife within the site, and are discussed in Section III.D (Soil Protection) and III.H (Fish and Wildlife Habitat), respectively.

iv. Encourage carpooling for the construction workforce to reduce traffic volume;
v. Employ flaggers, as necessary, to direct traffic when large equipment is entering or exiting public roads to minimize risk of accidents; and
vi. Maintain at least one travel lane at all times so that roadways will not be closed to traffic as a result of construction vehicles entering or exiting public roads.

[Final Order on ASC, Condition 77; AMD1, AMD4]

Amended Condition 78 (CON-PS-04)

~~(78) After completing~~ During and following construction of a phase or component of the solar facility, the certificate holder shall ~~restore state highways and county roads affected by facility construction activities to at least their pre-construction conditions, to the satisfaction of Sherman County Public Works and the Oregon Department of Transportation~~ adhere to the requirements of the Road Use Agreement and Construction Traffic Management Plan required under Condition PRE-PS-02.

[Final Order on ASC, Condition 78; AMD4]

Deleted Condition 79

~~(79) During construction of a component or phase of the facility, the certificate holder shall implement the following measures to reduce traffic delays on county roads serving as transporter routes for delivery of equipment to the facility site:~~

~~a. Provide notice to adjacent landowners when construction takes place to help minimize access disruptions;~~
~~b. Provide proper road signage and warnings of "Equipment on Road," "Truck Access," or "Road Crossings;"~~
~~c. Implement traffic diversion equipment, such as advance signage and pilot cars, whenever possible when slow or oversized loads are being hauled;~~
~~d. Encourage carpooling for the construction workforce to reduce traffic volume;~~
~~e. Employ flaggers, as necessary, to direct traffic when large equipment is entering or exiting public roads to minimize risk of accidents; and~~
~~f. Maintain at least one travel lane at all times so that roadways will not be closed to traffic as a result of construction vehicles entering or exiting public roads.~~

[Final Order on AMD4]

Vehicle weight and dimension limits applicable to state highways are established under ORS chapter 818 and OAR chapter 734. Any vehicle that exceeds legal vehicle dimensions and weight must obtain an over-dimension permit from the Oregon Department of Transportation (ODOT) to utilize state highways. Overweight, or over-dimension, loads may be required for delivering the substation transformer or heavy construction equipment during construction. As described in Section III.B., *Organizational Expertise,* under Organizational Expertise Condition 9 (PRE-OE-03), the certificate holder would be required to submit copies of the required permits to the Department prior to any deliveries requiring over-dimensional loads.

Operation

As described above, only three additional full-time employees are expected to visit the site daily, and other trips for delivery or maintenance would be infrequent. As a result, the Council finds that operational traffic is not likely to have a significant adverse impact on traffic safety.

RFA4 includes an analysis of glare that could potentially be produced by solar arrays from specific viewpoints within the analysis area, including roadways. The analysis was produced using the ForgeSolar GlareGuage application, which relies on the Solar Glare Hazard Analysis Tool (SGHAT) developed by Sandia National Laboratories. SGHAT categorizes glare hazards based on the potential impacts on viewers based on predicted intensity of glare and the size and distance of a glare source to a potential receptor. Ocular hazards are categories as follows:

- Red glare: glare predicted with a potential for permanent eye damage (retinal burn);
- Yellow glare: glare predicted with a potential for temporary after-image; and
- Green glare: glare predicted with a low potential for temporary after-image.[285]

SGHAT was used to evaluate the potential for glint and glare when driving along 1) segments of Emigrant Springs Lane, Herin Lane, OR-206, I-97, Klondike Road, Medler Lane, N Klondike Road, Oehman Road, Old Wasco-Heppner Highway, and Webfoot Road. The analysis simulated modules equipped with an antireflective coating mounted on a single-axis tracking system with a 60-degree tilt and mounted 8 feet above ground surface. Importantly, the model does not account for varying ambient conditions (i.e., cloudy days, precipitation), atmospheric attenuation, screening due to existing vegetation or structures unless specified through obstruction modeling, screening due to existing topography not located within the defined array layouts, or the potential effects of grading within the array area.[286]

No red glare is expected to be produced by the proposed solar arrays. As shown in Figure 16, below, the yellow glare may be experienced by drivers travelling South along a short segment of Herin Lane and would occur mostly between 10:00 am and 5:00 pm, from November through February.[287]

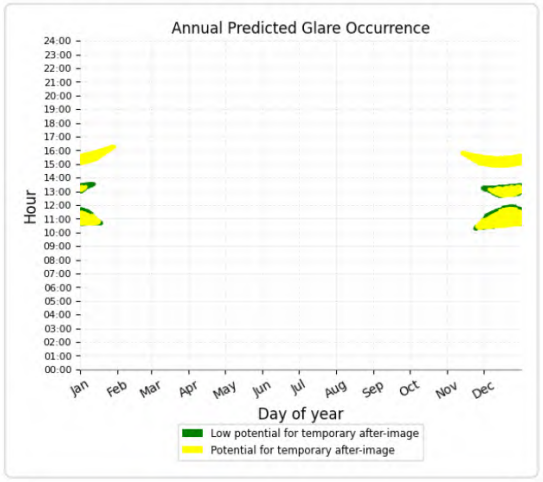
[285] As a point of comparison, direct viewing of the sun without a filter is considered to be on the border between yellow glare and red glare, while typical camera flashes are considered to be lower tier yellow glare (approximately three orders of magnitude less than direct viewing of the sun). Upon exposure to yellow glare, the observer may experience a temporary spot in their vision temporarily lasting after the exposure. Upon exposure to green glare, the observer may experience a bright reflection but typically no spot lasting after exposure. https://efsec.wa.gov/sites/default/files/2025-05/20241009_Wautoma_FinalASC_AttachmentH_SolarGlareAnalysis.pdf Wautoma Solar Energy Project Solar Glare Analysis April 2022.

[286] BCWAMD4Doc21-15 RFA Exhibit U Public Services 2025-12-10, Section 4.4.6.3.

[287] BCWAMD4Doc21-12 RFA Exhibit R Scenic 2025-12-10, BCWAMD4Doc21-15 RFA Exhibit U Public Services 2025-12-10, Section 4.4.6.3.

According to the 2015 Sherman County Transportation System Plan (TSP), this segment of Herin Lane has average daily traffic of 90 vehicles, where the peak time when its traveled is between 6:00-7:00 a.m., and a seasonally adjusted peak hour vehicle count of 16 vehicles.[288] This peak travel time on the roadway is outside the daily timeframe when glare may occur.

Because the certificate holders glare analysis did not predict any red glare, the yellow glare predicted is based on modeling that doesn't take into account cloud cover and the predicted glare would occur during winter months, and that the time of day where glare may occur would occur outside the most traveled times on Herin Lane, a County road that already experiences low traffic volumes, the Council finds that potential glare from the facility would be less than significant and would not impact vehicular traffic and public service providers responding to traffic incidents.



[288] Serman Cunty TSP, Volume 1, October 2015; Table 4-3, page 31. https://stkai01.blob.core.windows.net/kaiwebdata/04jlic8pz8xpv9juw4cnihjqe935?sp=r&sv=2018-11-09&se=2025-12-10T21%3A16%3A16Z&rscd=inline%3B+filename%3D%2218054_Final_vol1_with_appendices.pdf%22%3B+filename*%3DUTF-8%27%2718054_Final_vol1_with_appendices.pdf&rsct=application%2Fpdf&sr=b&sig=l1nNALed9ZF%2FUOFpVUKX7Y4%2Fxd9jaKHL6WhF4z7ppwc%3D

Green glare: 1,239 min.

1

Air Traffic Safety

Facility components proposed in RFA4 include solar arrays with a maximum height at full tilt of 15 feet; 230 kV transmission line poles with a maximum height of 80 feet; and substation, battery storage and O&M building with maximum height of 25 feet. Solar arrays may also produce glare that could potentially interfere with air travel, particularly if severe glare affects pilots operating in an approach pathway or low-altitude flight path.

Wasco State Airport is located approximately 4.4 miles southwest of the proposed Solar Micrositing Area. The glare analysis presented in RFA4 Exhibit U indicated that no glare was expected within the two 2-mile final approach paths for Wasco State Airport.[289]

The proposed Solar Micrositing Area is approximately 4 miles laterally away from military utilized airspace; based on this distance, Department of Defense confirmed no concerns with the facility components proposed in RFA4.[290]

Under 14 CFR 77, any person proposing to construct structures over 200 feet above ground level (AGL) or structures that exceed certain lower height restrictions within 20,000 feet of a public-use airport to submit a Notice of Construction or Alteration (Form 7460-1) to the Federal Aviation Administration (FAA). The same criteria and form are used to evaluate state standards for obstructions to navigable airspace under OAR chapter 738. Based on review of the FAA's Notice Criteria Tool and Oregon Department of Aviation review, the Council finds that the facility components proposed in RFA4 would not require future 7460 review.[291]

Because the facility components proposed in RFA4 are not expected to obstruct air navigation, or result in glare that could affect flight paths, the Council finds that the construction and operation of facility components proposed in RFA4 are not likely to result in significant adverse impacts on the ability of air navigation providers and facilities in the analysis area to operate safely.

Fire Protection and Emergency Response

Potential adverse impacts on North Sherman County Rural Fire Protection District could result if construction or operation or the increased population associated with either causes an increase in fires or other needs for fire protection services beyond the ability of local fire departments to provide those services. During construction, there could be some risk of accidental grass fires on the site due to metal cutting, welding, smoking, refueling vehicles and equipment, and operating or parking vehicles and other equipment off roadways in areas of tall dry grass. Once

[289] BCWAMD4Doc21-12 RFA Exhibit R Scenic 2025-12-10, Attachment R-2, BCWAMD4Doc21-15 RFA Exhibit U Public Services 2025-12-10, Section 4.4.6.3.
[290] Reviewing Agency Comment DOD 2025-06-05.
[291] Reviewing Agency Comment ODAv. 2025-12-10.

constructed, the battery storage system would introduce an element that could pose a fire hazard.

The certificate holder provided a record of correspondence documenting coordination with the North Sherman Rural Fire Protection District Fire Board and Chief Jacob Burbank.[292] The correspondence indicates that NSRFPD raised several concerns about the access considerations, training, and equipment needed to address fire risk associated with the facility components proposed in RFA4.

As discussed in Section III.E., *Land Use,* and III.N., *Wildfire Prevention and Risk Mitigation,* the certificate holder represented that it would maintain a 20-foot setback from the perimeter fence to facility structures, and a 50-foot setback from the fence to the property line with a non-participating landowner to serve as fire-breaks and emergency access. These setbacks have been incorporated into the facility description and will be required under Amended Condition 103 and Land Use Condition 1. Training and on-site equipment requirements would be established under the Wildfire Mitigation Plans required under Wildfire Prevention and Risk Mitigation Conditions 1 to 4. The Fire Board made specific requests for additional wildfire equipment to increase capacity. While the certificate holder did not commit to providing the equipment, it did include the option to provide capacity building funds to local fire service providers as part of the Community Investment Plan proposed to support the certificate holder's Goal 3 Exception Request.

Under the Council's Wildfire Prevention and Risk Mitigation standard, as presented in Section IV.N. of this order, the certificate holder is required to characterize wildfire risk within the analysis area and demonstrate how the facility components proposed in RFA4 will be designed, constructed, and operated in a manner than minimizes wildfire risk and proposes an adequate response plan in the event of a wildfire. As presented in Section IV.N. of this order, the certificate holder will be required to finalize, implement and adhere to the requirements of a Department-approved Wildfire Mitigation Plan (WMP) during both construction and operation. The findings of fact, conditions and analysis from Section IV.N. are incorporated herein by reference.

Because the WMPs required under Wildfire Prevention and Risk Mitigation Conditions 1 to 4 would address fire hazards associated with the facility components proposed in RFA4, and would require coordination with local fire and emergency service providers, the Council finds that the construction and operation of the facility components proposed in RFA4 are not likely to result in significant adverse impacts to fire protection or emergency response services in the analysis area.

Police

[292] BCWAMD4Doc21-15 RFA Exhibit U Public Services 2025-12-10, Attachment U-1.

Construction activities could result in increased demand of police protection services due to the increase in onsite temporary workers and new activity at the site. Generally, public safety concerns associated with solar photovoltaic power generation facilities include unauthorized access to facility components, traffic-related concerns, and general increases in demand on police services associated with increases in population.

The Sherman County Sheriff's Office provides law enforcement and police services in unincorporated Sherman County. Additional law enforcement service is available through the Oregon State Police. Sherman County Sheriff confirmed that they had no public safety concerns regarding RFA4.[293]

The small number of permanent-resident employees is not anticipated to place significant new demands on law enforcement agencies in the area.[294]

III.M.2. Conclusions of Law

Based on the foregoing analysis, and subject to compliance with existing, proposed and amended site certificate conditions described above, the Council finds that construction and operation of the facility components proposed in RFA4 are not likely to result in significant adverse impacts to the ability of public and private providers to provide the services listed in OAR 345-022-0110.

III.N. WILDFIRE PREVENTION AND RISK MITIGATION: OAR 345-022-0115

(1) To issue a site certificate, the Council must find that:

(a) The applicant has adequately characterized wildfire risk within the analysis area using current data from reputable sources, by identifying:

(A) Baseline wildfire risk, based on factors that are expected to remain fixed for multiple years, including but not limited to topography, vegetation, existing infrastructure, and climate;

(B) Seasonal wildfire risk, based on factors that are expected to remain fixed for multiple months but may be dynamic throughout the year, including but not limited to, cumulative precipitation and fuel moisture content;

(C) Areas subject to a heightened risk of wildfire, based on the information provided under paragraphs (A) and (B) of this subsection;

[293] BCWAMD4Doc21-15 RFA Exhibit U Public Services 2025-12-10, Attachment U-1.

[294] BCWAMD4Doc21-15 RFA Exhibit U Public Services 2025-12-10, Section 4.3.9.

(D) High-fire consequence areas, including but not limited to areas containing residences, critical infrastructure, recreation opportunities, timber and agricultural resources, and fire-sensitive wildlife habitat; and

(E) All data sources and methods used to model and identify risks and areas under paragraphs (A) through (D) of this subsection.

(b) That the proposed facility will be designed, constructed, and operated in compliance with a Wildfire Mitigation Plan approved by the Council. The Wildfire Mitigation Plan must, at a minimum:

(A) Identify areas within the site boundary that are subject to a heightened risk of wildfire, using current data from reputable sources, and discuss data and methods used in the analysis;

(B) Describe the procedures, standards, and time frames that the applicant will use to inspect facility components and manage vegetation in the areas identified under subsection (a) of this section;

(C) Identify preventative actions and programs that the applicant will carry out to minimize the risk of facility components causing wildfire, including procedures that will be used to adjust operations during periods of heightened wildfire risk;

(D) Identify procedures to minimize risks to public health and safety, the health and safety of responders, and damages to resources protected by Council standards in the event that a wildfire occurs at the facility site, regardless of ignition source; and

(E) Describe methods the applicant will use to ensure that updates of the plan incorporate best practices and emerging technologies to minimize and mitigate wildfire risk.

(2) The Council may issue a site certificate without making the findings under section (1) if it finds that the facility is subject to a Wildfire Protection Plan that has been approved in compliance with OAR chapter 860, division 300.

(3) This Standard does not apply to the review of any Application for Site Certificate or Request for Amendment that was determined to be complete under OAR 345-015-0190 or 345-027-0363 on or before the effective date of this rule. [295]

[295] OAR 345-022-0040, effective April 2, 2025.

*** [296]

III.N.1. Findings of Fact

The analysis area for potential wildfire risks is the area within and extending one-half mile from the proposed Solar Micrositing Area, which includes approximately 5,198 acres.[297] The wildfire analysis area is generally bounded by Interstate 84 to the north, the John Day River to the east, Highway 206 to the south, and Highway 97 to the west.

Based on the certificate holder's and Council's assessment of wildfire risk at the site and within the analysis area, as described in RFA4 and this order, the Council finds that wildfire fire within the proposed Solar Micrositing Area and within the analysis area is high, particularly in the summer months.

Wildfire Risk Analysis

Under OAR 345-022-0115(1)(a), an applicant or certificate holder must adequately characterize the wildfire risk within the analysis area using reputable sources to describe Baseline Wildfire Risk, Seasonal Wildfire Risk, Areas Subject to Heightened Risk of Wildfire, and High-fire Consequence Areas.

Each of these are discussed in detail in this section with a description of the data source, as necessary to support the findings and conclusions. The data sources used to evaluate wildfire risk are listed in ASC Exhibit V and include but are not limited to:

- Community Wildfire Protection Plan Planning (CWPP), 2018 Tool Oregon Explorer;
- 2023 USFS, Pacific Northwest Quantitative Wildfire Risk Assessment: Methods and Results;
- Conservation Biology Institute 2020 data;
- Sherman County September 2024 Community Wildfire Protection Plan;[298]
- 2024 National Oceanic and Atmospheric Administration climate data;

Baseline and Seasonal Wildfire Risk

As described in the Sherman County Community Wildfire Protection Plan, which was last updated in September 2024, conditions throughout the county are conducive to large and fast-moving wildfires. Conditions and concerns in the analysis area which are identified in the CWPP as contributing to the wildfire threat and potential for catastrophic losses include:

[296] The information requirements included in the standard are omitted from the language above, but evaluated within the findings of fact below.
[297] BCWAMD4Doc01-00 ODOE Concurrence on OAR 345-027-0360(3) Request 2024-05-02.
[298] https://storage.googleapis.com/proudcity/shermancountyor/2017/10/Sherman-County-CWPP-2024.pdf

- The John Day River and numerous side canyons, all with very steep slopes, and other areas of moderate to steep slopes which add to the rate of wildfire spread and suppression difficulty.
- Climatic and topographic conditions including hot and dry conditions with frequent high winds which can contribute to fast moving fires that are difficult to control.
- Large agricultural areas that have the potential for fast moving fires which can destroy valuable crops in short periods of time.
- Lightning, power lines, debris burning, and equipment use add to the risk.
- All volunteer fire districts with limited resources.

For these reasons, and other reasons described below, the baseline wildfire risk within the analysis area is high, with additional seasonal risk during the summer months.

Topography

As discussed in detail in Section III.C, *Structural Standard*, the proposed Solar Micrositing Area is relatively flat or gently sloping with moderate slopes (up to 36 percent/25 degrees) along some drainages. Steeper slopes are located in the analysis area along Biglow Canyon and associated drainages that bound the northeastern portion of the site.[299]

Vegetation

Vegetation is a significant predictor of fire behavior and the US Forest Service has developed standardized set of fuel models representing wide range of vegetation conditions.[300] The certificate holder identified fuel models for the site based on the fuel models mapped in the CWPP Planning Tool, based on conditions observed during surveys conducted to support the habitat categorization discussed in Section III.H., *Fish and Wildlife Habitat*, and based on the understanding of landowner practices discussed in Section III.E., *Land Use*.

According to CWPP, approximately 90 percent of the analysis area (4,678 acres) and 93 percent of the solar micrositing area (1,790 acres) consists of vegetation in Fuel Models 102 and 242. These models reflect low load, dry climate grasses and wheat fields.[301] Small amounts of non-burnable areas, including irrigated farmland and paved surfaces, and small amounts of shrubland and other fuel types are also present.

Existing infrastructure

[299] BCWAMD4Doc21-03 RFA Exhibit H Geological Soil Stability 2025-12-10, Sections 3.2.1., 3.2.2; BCWAMD4Doc21-16 RFA Exhibit V Wildfire 2025-12-10, Section 2.1.1.

[300] BCWAMD4Doc21-16 RFA Exhibit V Wildfire 2025-12-10, Section 2.2.2.

[301] BCWAMD4Doc21-16 RFA Exhibit V Wildfire 2025-12-10, Section 2.1.2 and Table V-2.

In addition to the existing wind energy facility, infrastructure in the analysis area includes public roads and BPA transmission lines, as well as residential and agricultural buildings in the southeastern portion of the site.[302]

Climate

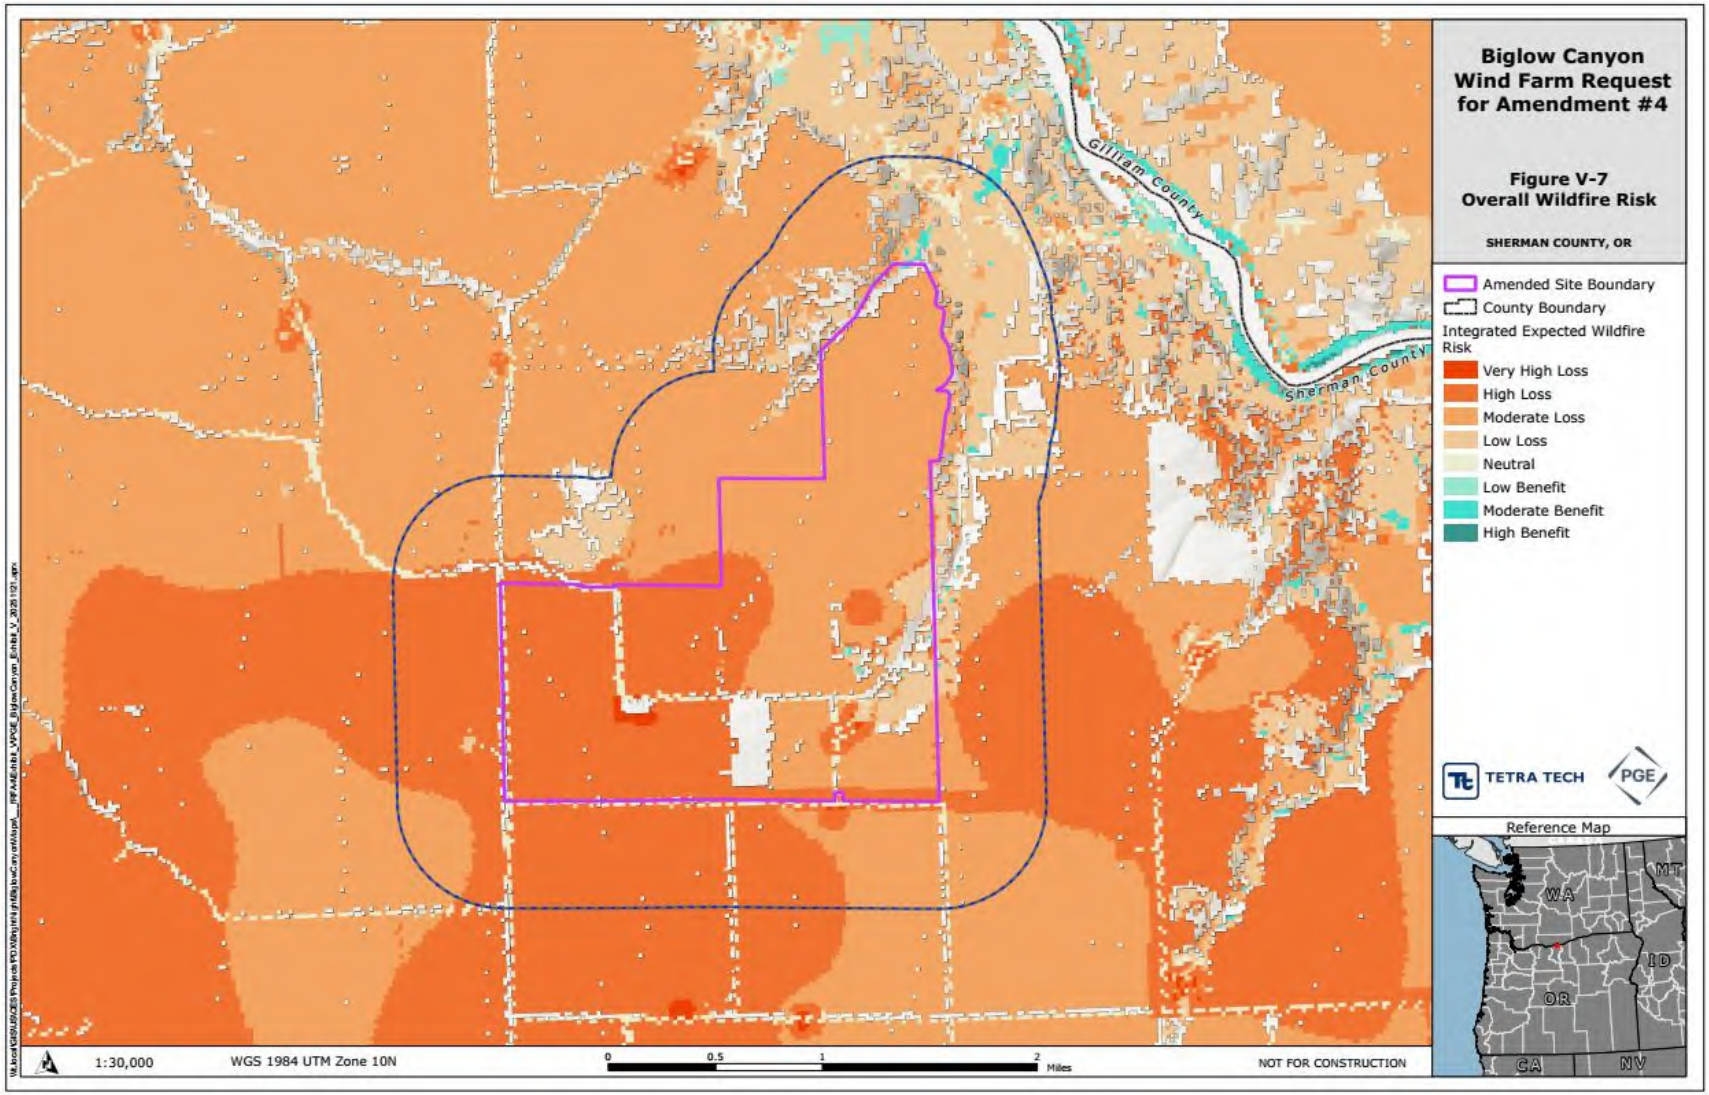
Based on NOAA climate normals, which average climate data collected between 1991 to 2020 for Arlington, Oregon, located approximately 18 miles east of the Solar Micrositing Area, the driest months on average are July, August, and September, typical for this region. These months have average monthly precipitation rates of 0.48 inch (June), 0.10 inch (July), and 0.15 inch (August). July, August, and September are the hottest months of the year with average maximum temperatures of 89.5° F, 88.9° F, and 80.0° F respectively. As an average, climate normals do not reflect the absolute maximum temperatures in the vicinity of the site, which regularly exceed 100° F in summer months.

The total average annual precipitation for Arlington is 9.3 inches per year, which is indicative of an arid climate. Fuel moisture content during the hot dry months is expected to be low, increasing risk of ignition and spread of fires.

Overall Wildfire Risk

The fuels, topography and climate in the analysis area contribute to a high-probability of wildfire in all burnable areas within the analysis area and micrositing area.[303] Average flame lengths are expected to be 4 to 6 feet, typical of dryland grasses and burnable wheat fields.[304] Fires in these fuels can spread quickly in dry, hot conditions especially when fueled by wind.

<u>High-Fire Consequence Areas</u>



The CWPP data identifies Integrated Expected Wildfire Risk, which is a representation of cumulative risk at any location based on which highly valued resources and assets (HVRAs) are present, fire intensity, and the likelihood of a fire occurring (burn probability). The integrated risk maps synthesize risk across all resources and assets present at a specific location and the result is either net beneficial or net adverse impacts. As shown in Figure 17, below, most of the analysis area is identified as having a moderate- (43 percent) or high- (36 percent) loss rating. The area surrounding the existing Biglow Canyon substation and residences are shown as having a very-high loss rating.

[302] BCWAMD4Doc21-16 RFA Exhibit V Wildfire 2025-12-10, Section 2.1.3

[303] BCWAMD4Doc21-16 RFA Exhibit V Wildfire 2025-12-10, Section 2.1.5, Table V-4. A “high” burn probability corresponds to a 1 in 500 to 1 in 100 chance of fire in a given year based on the physical landscape, historical fire occurrence, and historical weather observations.

[304] BCWAMD4Doc21-16 RFA Exhibit V Wildfire 2025-12-10, Section 2.3.3. Flame length is commonly used as a direct visual indication of fire intensity and is a primary factor to consider for firefighter safety and for gauging potential impacts to resources and assets.

Figure 17: Integrated Wildfire Risk within the Analysis Area

Wildfire Mitigation Plans

Under OAR 345-022-0115(1)(b), Council must find that the facility will be designed, constructed, and operated in compliance with a Wildfire Mitigation Plan (WMP) approved by Council; and under OAR 345-022-0115(2), the Council may issue a site certificate if it finds that a WMP has been approved for the facility by the Oregon Public Utility Commission (OPUC). The certificate holder provided a Construction Wildfire Mitigation Plan as Exhibit V, Attachment V-1. The certificate holder also provides its system wide 2024 Wildfire Mitigation Plan under OAR 345-022-0115(2.

Facility Design

As described in ASC Exhibit B, C, V and in Section I.E., *Requested Amendment* the below-listed facility fire-mitigation design features that are added to the amended site certificate. Under Amended Condition 108, the certificate holder would be required to design, construct and operate the facility substantially as described in the site certificate, which includes the facility design feature descriptions.

The certificate holder-presented design features and maintenance standards that would avoid and reduce the wildfire risk at the facility site include:

- The solar arrays will generally be oriented adjacent and parallel to existing roads. The BESS and substation would be enclosed within the solar fenceline located immediately adjacent to Herin Lane which is a paved two-lane road located north of the components. These paved roads act as a fire break as well as provide emergency responders local access to the facility site and electrical components;
- Roads used for emergency access within the facility will be 20 feet wide and designed to meet load requirements for all equipment and emergency access needs. Other roads would be approximately 16 feet wide. All roads would have a 10-foot, clear, brush free area maintained with low-growing, fire-resistant vegetation on either side.[305]
- All perimeter fences will be set back at least 50 feet from all property lines of non-participating landowners. Facility components will be set back at least 20 feet from fences.[306]
- A minimum 20-foot clear, brush free area will be maintained around the outside of all perimeter fences.[307]

[305] BCWAMD4Doc21-15 RFA Exhibit U Public Services 2025-12-10, Attachment U-1; BCWAMD4Doc21-16 RFA Exhibit V Wildfire 2025-12-10, Section 4.6.
[306] See Section III.E., *Land Use*; *SCZO Section 3.1 Exclusive Farm Use Zone, F-1 Zone*, of this order and BCWAMD4Doc21-06 RFA Exhibit K Land Use 2025-12-10, Section 5.2.1.3; BCWAMD4Doc21-15 RFA Exhibit U Public Services 2025-12-10, Attachment U01.
[307] BCWAMD4Doc21-16 RFA Exhibit V Wildfire 2025-12-10, Section 4.6.

- A minimum 20-foot gravel or compacted-soil buffer will be maintained around the O&M building, collector substation, and BESS. Fenced areas surrounding these related or supporting facilities will be fully graveled and vegetation-free.
- The solar array includes shielded electrical cabling, as required by applicable code, to prevent electrical fires;
- The BESS will be contained within self-contained enclosures in accordance with applicable UL Solutions, National Electric Code, and National Fire Protection Association standards, and will be placed on concrete foundations;
- BESS will have fire sensors, smoke and hydrogen and/or carbon monoxide detectors, alarms, emergency ventilation systems, cooling systems within each battery enclosure; and
- The SCADA system provides remote operation, including shut off, and monitoring of the facility's solar array, BESS, and substation components.

Construction WMP Finalization, Wildfire Risk Minimization Preventative Actions, Programs, and Procedures

The certificate holder provided a draft Construction WMP is included as Exhibit V, Attachment V- Attachment V-1. A Construction WMP would be finalized prior to beginning construction of the proposed solar facility.[308] Finalization of the WMP includes updating wildfire risk at the site, submitting site maps that identify access details and the location of fire protection equipment, and updated emergency contact information to the local fire department. The Construction WMP includes pre-construction onsite trainings with contractors, the Department, emergency service professionals, and the certificate holder. Additionally, prior to construction, the certificate holder must mail a letter to residences within the 0.5-mile wildfire analysis area which would provide the facility contact information and encourage individuals to sign up for the county's emergency notification system.

Section 4.5 of the Construction WMP has definitions for fire precaution levels and associated restrictions during fire season. The fire precaution levels include non-fire season, fire season, fire weather watch, and red flag weather warning, where the red flag weather warning would be the most restrictive for activities that may increase the risk of wildfire. Examples of fire season restrictions include maintaining a fire watch, driving and parking only on gravel surfaces, and limitations on hot work. The certificate holder will maintain a log of when construction and operational activities are impacted by the fire season restrictions.

Section 4.2 of the Construction WMP outlines the specifications for fire protection equipment that is maintained on site, which include fire extinguishers, hand tools, and pails. During fire season, on site water source(s), such as water trucks mist be on site and equipment with a

[308] Although both the construction and operational WMPs must be finalized prior to construction and operation, the Wildfire Prevention and Risk Mitigation Conditions do not label the WMPs as "Final". This is because, as designated in the WMP's, the WMP's may be updated and amended to address changes in wildfire risk at the site over time, therefore, there may be several iterations of the WMPs during construction and the life of the facility.

pump, hose and nozzle. All internal combustion engines must be equipped with exhaust systems, mufflers and screens, or include an appropriate spark arrestor.

Preventive Actions, Programs, and Procedures

The preventative actions, programs and procedures that manage vegetation and minimize wildfire risk during construction activities in the draft WMP include:

- During construction clearing, grubbing, and grading, the contractor will establish a clear, brush free area extending a minimum of 10 feet inside the fence line and another minimum 10-foot limits of disturbance buffer outside the fence line for a total of a minimum of 20 feet of clear, brush free area around the perimeter of the site.[309]
- Fire season, Red Flag Warnings and weather conditions that produce an increased risk of fire danger will be monitored and communicated to staff.
- Best management practices (BMPs) that minimize fire risk from vehicle travel, equipment use, and fueling activities will be implemented such as vegetation wetting, no idling vehicles and limited off-road travel.
- Vegetation height will be limited to 4-8 inches during the dry season (June to October). Vegetation will be mowed in advance of fire season or in accordance to any fire restrictions. Outside of the dry season (November to May), vegetation will be limited to a height of 10-12 inches.
- Vegetation buildup in the fence line(s), shall be removed.
- Personnel will be trained on the RACE (Remove, Alarm, Confine and Extinguish or Evacuate) and the use of fire protection equipment.

During facility construction, in the semi-annual construction progress report, the certificate holder will provide updates of the performance of the WMP including any changes of wildfire risk at the site, facility contact information, and training logs. The log of any changes in construction activities due to Fire Season Restrictions, as designated in Section 4.5, will be provided to the Department in the semi-annual construction report.

The certificate holder's draft Construction WMP, with revisions imposed by Council, is included as Attachment G to this Order. The Council imposes the two conditions below to require the Draft WMP be finalized prior to facility construction and be implemented during construction activities.

Wildfire Prevention and Risk Mitigation Condition 1 (PRE-WF-01)
Prior to construction of any component or phase of the solar facility, the certificate holder shall finalize and submit to the Department, for review and approval, a Construction Wildfire Mitigation Plan (WMP), consistent with Attachment G to the Final Order on AMD4.

[309] BCWAMD4Doc21-16 RFA Exhibit V Wildfire 2025-12-10, Attachment V-1, Section 4.1.

[Final Order on AMD4]

Wildfire Prevention and Risk Mitigation Condition 2 (CON-WF-01)
During construction of the solar facility, the certificate holder shall require onsite contractors and employees to adhere to the Construction Wildfire Mitigation Plan (WMP) approved under Condition PRE-WF-01.
[Final Order on AMD4]

Operational WMP, Wildfire Risk Minimization Preventative Actions, Programs, and Procedures

The certificate holder is a public utility that is required to operate in compliance with a risk-based wildfire protection plan that is approved by the Oregon Public Utility Commission under ORS 757.963 and the requirements of OAR chapter 860, division 300. While the certificate holder relies on a facility specific WMP for construction of the proposed solar facility, the certificate holder requests that Council rely on its Corporate Wildfire Protection Plan during Operation under OAR 345-022-0115(2).

Under OAR 345-022-0115(2), the Council may, in its discretion, rely upon a PUC approved Wildfire Protection Plan that governs the construction and operation of a facility.[310] The certificate holder provided its 2024 Wildfire Protection Plan in support of its request under Exhibit V Attachment V-3. The plan is primarily concerned with managing fire-related risks associated with PGE's distribution and transmission system and contains minimal provisions for mitigation fire risks for generating facilities located outside of the utilities service territory. Section 3.1 of the WPP includes an overview of PGEs Annual Wildfire Risk Assessment and states that the certificate holder evaluates wildfire risk across PGE transmission and generation assets outside its service area, but no additional detail is provided. Section 8.0 of the WPP states that PGE conducts annual Ignition Prevention Inspections within High Fire Risk Zones (HFRZ) in its service territory, but states that, outside the service area, inspections primarily address conditions in the ROW for 230 kV or 500 kV transmission facilities. Appendix 5 does appear to indicate that ignition modelling does cover generating assets outside of the service territory in the certificate holder's Wildfire Risk Assessment Process. The certificate holder acknowledges that the current Wildfire Protection Plan does not include site-specific mitigation activities for individual facilities, but represents that its forthcoming Wildfire Protection Plan, scheduled for filing with the Oregon PUC on December 31, 2025, will expand upon the 2024 framework to include wildfire-risk analysis and mitigation measures for all generation sites, including the BCWF and proposed Solar Components. The certificate holder has stated that the corporate WMP is under active internal development and legal review and therefore cannot be shared in draft form.[311]

[310] OAR 860-300-0001(1), Scope and Applicability of OPUC Rules for Wildfire Mitigation Plans, states "The rules in this division prescribe the filing requirements for risk-based Wildfire Mitigation Plans filed by a Public Utility that provides electric service in Oregon pursuant to ORS 757.005." The certificate holder is a Public Utility that provides electric service in Oregon, and therefore must comply with the Wildfire Mitigation Plan (WMP) rules.
[311] BCWAMD4Doc21-16 RFA Exhibit V Wildfire 2025-12-10, Section 2.6.

The Council finds that there is not sufficient evidence on the record to demonstrate that all of the requirements of OAR 345-022-0115 would be adequately addressed by the certificate holder's system-wide Wildfire Protection Plan; however, some of the information required by the standard would be incorporated into other plans required under this Order. In particular, as discussed in Section III.B., *Organizational Expertise,* and III.D., *Soir Protection* the procedures, standards, and time frames for solar facility component inspections and vegetation management in the Solar Micrositing Area, as required under OAR 345-022-00115(1)(b)(B), would be established in the Operations and Maintenance Framework Plan included as Attachment C to this Order and the Comprehensive Solar Revegetation and Soil Management Plan included as Attachment D.

As described in Section III.B., *Organizational Expertise*, Organizational Expertise Conditions 5 and 6 require the finalization and implementation of an Operation and Maintenance Plan and Operating Framework (O&M Plan). The O&M Plan would establish the inspections required for the proposed solar facility components as well as their frequency. The O&M Plan would also include the types of maintenance that would be required for each type of facility component with a tracking log that would be submitted during operations. The O&M Plan also outlines a framework for how BIGL and the certificate holder will coordinate and share responsibilities during the first five years of operation. As designated in the O&M Plan and conditions, it would be finalized prior to operations based on the final technology selected and manufacture recommendations.

As discussed in Section III.D., *Soil Protection*, Soil Protection Conditions 1 to 3 would require the certificate holder to finalize and implement the draft Comprehensive Solar Revegetation and Soil Management Plan included as Attachment D to this order. The Comprehensive Solar Revegetation and Soil Management Plan includes success criteria and management standards for soil reclamation, revegetation, and long term weed management. Based on representations from the certificate holder in the technical specifications document provided as Attachment V-4, the following vegetation management standards and practices have been added to the Comprehensive Solar Revegetation and Soil Management Plan:

- Vegetation will be limited to a height of 10-12 inches during the rainy season (November to May) and 4-8 inches during the dry season (June-October) in:
    - All areas within the Solar Array Fencelines
    - A 10-foot clear, brush free area on either side of service roads outside of the solar array fenceline
    - A 20-foot clear, brush free area around the perimeter of the site
- Vegetation near, at, or taller than the maximum height shall be removed or mowed.
- A minimum vegetation clearance of 12 inches from electrical equipment will be maintained
- Mowing will be done in advance of fire season or in accordance to any fire restrictions.

- Any vegetation removed from the site will be disposed of and not stored onsite. Certificate holder and contractors will prevent the accumulation of combustible "burn piles" on site.
- Fenced areas around the collector substation, operations and maintenance structure, and meteorological stations will be graveled, with no vegetation present.

The Sherman County CWPP discusses the County's struggle with the invasive annual Cheatgrass, stating that Cheatgrass grows quickly, reaching heights of 4-32 inches annually and research has shown it can increase fire frequency, horizontal continuity of fuels and rate of wildfire spread. Cheatgrass does this by adding abundant fuels to an ecosystem. It grows quickly and recovers quickly from fires, providing hazardous fuel materials more quickly than native bunch grasses, potentially shortening fire return intervals.[312] Requirements for consultation for measures to eliminate, reduce and mitigate the growth of cheatgrass on the site have been added to the Comprehensive Solar Revegetation and Soil Management Plan, which is discussed in more detail below.

The Council finds that the added measures to the Comprehensive Solar Revegetation and Soil Management Plan and O&M Plan, imposed under Soil Protection Conditions 1 to 4, and Organizational Expertise Conditions 5 and 6, describe the procedures, standards, and time frames that the certificate holder will use to inspect facility components and manage vegetation. The Council imposes new conditions, as shown below, requiring the certificate holder to submit a plan that addresses the remaining criteria in the standard prior to Operation, whether that is the OPUC-approved Wildfire Protection Plan or a separate facility-specific WMP, and to adhere to the plan during Operation.

Wildfire Prevention and Risk Mitigation Condition 3 (PRO-WF-01)

a. Prior to operation of the solar facility, phase or component, as applicable, the certificate holder shall submit to the Department for review and approval, an Operational Wildfire Mitigation Plan that complies with the requirements of OAR 345-022-0115(1)(b).
b. The certificate holder may rely on a Wildfire Protection Plan approved by the Oregon Public Utility Commission under OAR chapter 860, division 300, or another plan approved by the Department in accordance with this Site Certificate to satisfy some or all of the requirements of this condition.

[Final Order on AMD4]

Wildfire Prevention and Risk Mitigation Condition 4 (OPR-WF-01)

During operation of the solar facility, the certificate holder must adhere to the requirements of the Operational Wildfire Mitigation Plan approved by the Department under Condition PRO-WF-01, as updated in accordance with the requirements of the plan.

[312] https://storage.googleapis.com/proudcity/shermancountyor/2017/10/Sherman-County-CWPP-2024.pdf, page 28.

[Final Order on AMD4]

III.N.2. Conclusions of Law

Based on the foregoing analysis, and subject to compliance with the proposed site certificate conditions described above and in this order, the Council finds that the certificate holder has adequately characterized wildfire risk within the analysis area using current data from reputable sources, and that, subject to Council approval, the facility components proposed in RFA4 will be designed, constructed, and operated in compliance with Wildfire Mitigation Plans.

III.O. WASTE MINIMIZATION: OAR 345-022-0120

(1) Except for facilities described in sections (2) and (3), to issue a site certificate, the Council must find that, to the extent reasonably practicable:

(a) The applicant's solid waste and wastewater plans are likely to minimize generation of solid waste and wastewater in the construction and operation of the facility, and when solid waste or wastewater is generated, to result in recycling and reuse of such wastes;

(b) The applicant's plans to manage the accumulation, storage, disposal and transportation of waste generated by the construction and operation of the facility are likely to result in minimal adverse impact on surrounding and adjacent areas.

(2) The Council may issue a site certificate for a facility that would produce power from wind, solar or geothermal energy without making the findings described in section (1). However, the Council may apply the requirements of section (1) to impose conditions on a site certificate issued for such a facility.
(3) The Council may issue a site certificate for a special criteria facility under OAR 345-015-0310 without making the findings described in section (1). However, the Council may apply the requirements of section (1) to impose conditions on a site certificate issued for such a facility.
**** 313, 314*

III.O.1. Findings of Fact

Construction

Solid Waste, Spoils and Concrete Waste

[313] OAR 345-022-0040, effective April 2, 2025.

[314] The information requirements included in the standard are omitted from the language above, but evaluated within the findings of fact below.

Construction would generate approximately 12,000 cubic yards of non-hazardous solid waste. Most of the waste would consist of packaging materials, but would also include scrap metal (e.g., wire and rebar scraps); wood; excavated soil[315]; and concrete waste/washwater.[316]

To minimize construction-related waste, the certificate holder and its contractors are required to implement a plan or actions designed to properly store and minimize waste, maximizing recycling and reuse. The Council previously imposed Site Certificate Condition 84 requiring that, prior to construction of the existing wind facility, the certificate holder develop a Construction Waste Management Plan that, at a minimum, included measures for employee training; waste generation minimization measures; requirements for recycling of steep, scrap metal, wood waste and packaging; properly collecting waste for transport to a landfill by a licensed waste hauler; and a requirement to segregate hazardous waste for proper disposal.

The Council amends Condition 84 to be specific to the facility components proposed in RFA4. In addition, based on experience working with the certificate holder on implementation and evaluating compliance with Waste Management Plans, Council is clarifies several condition subparts with additional specificity on the action and information expected to be included in the plan, as well as additional requirements to address new waste streams associated with solar and battery related electrical equipment, as explained below:

- Sub(a) of the condition previously required that the Construction Waste Management Plan include employee training. The Council amends the condition to clarify that the plan not only require employee training but that the plan must specify the format (in-person or computer based), content (training materials) and frequency of worker trainings.
- Sub(b) and (c) of the condition previously required the Construction Waste Management Plan to identify minimization measures based on detailed estimating and recycling of specific material types. The Council amends the condition language to more explicitly require that the plan identify waste stream and quantities; and then, subsequently, identify the specific measures/practices designed to minimize the estimated waste streams and types.
- Sub(g) of the condition previously required that the Construction Waste Management Plan include details about the segregation of hazardous waste. The Council amends the condition to require that, in addition to hazardous waste, the plan include segregation procedures for recyclable materials and non-hazardous waste (presented as Sub(e)).
- The Council adds a provision, Sub(d), requiring that the Construction Waste Management Plan include a procedure or policy for evaluating whether any damaged or defective solar panels and other electrical equipment delivered to the site should be

[315] Construction and grading of the proposed access roads and foundation excavations may generate dirt and rock spoils. Cut and fill activities are expected to balance the need for and use of soils, so the amount of spoils requiring disposal would be minimal.

[316] BCWAMD4Doc21-02 RFA Exhibit G Materials Analysis 2025-12-10, Section 4.1; BCWAMD4Doc21-17 RFA Exhibit W Waste Minimization 2025-12-10, Section 2.1.1. DATE.

treated as hazardous waste prior to storing and preparing the material for disposal or recycle.

- The Council adds a provision, Sub(g), requiring that Construction Waste Management Plan identify inspection and recordkeeping procedures to allow both certificate holder and the Department the ability to evaluate implementation and compliance with the Plan, once finalized.
- Consistent with ORS 469.402, the Council includes a provision, Sub(h), allowing the certificate holder to amend the plan, after finalization, subject to Department review and approval, in the event that changes are needed to adapt to the circumstances at the time.

Amended Condition 84 is presented below.

Amended Condition 84 (PRE-WM-01)

~~During~~ Prior to construction of any component or phase of the solar facility, the certificate holder shall ~~implement~~submit a Construction ~~w~~Waste ~~m~~Management ~~p~~Plan, for review and approval by the Department. The plan must include, at a minimum, ~~that includes but is not limited to~~ the following ~~measures~~:

a. The format, content and frequence of ~~Training~~ employee~~s~~ trainings to minimize and recycle solid waste;
b. Practices and measures that will be implemented to ~~M~~minimiz~~ing~~e the generation of wastes from construction ~~through detailed estimating of materials needs and through efficient construction practices~~;
c. Identify a procedure or process for evaluating whether photovoltaic modules, batteries, or other facility components are considered hazardous waste under state or federal regulations;
d. Identify procedures for the segregation of recyclable materials, non-hazardous waste, and hazardous waste for transport and disposal by a licensed hauler specializing in the proper recycling or disposal of the wastes.
e. Identify names and locations of licensed haulers and facilities that will be used for the following, including associated collection and hauling protocols and requirements:
    i. Recycling steel and other metal scrap;
    ii. Recycling wood waste;
    iii. Recycling packaging wastes, such as paper and cardboard;
    iv. Collecting non-recyclable waste for transport to a landfill by a licensed waste hauler; and

~~f. Segregating all hazardous wastes, such as used oil, oily rags and oil-absorbent materials, mercury-containing lights and lead-acid and nickel-cadmium batteries for disposal by a licensed firm specializing in the proper recycling or disposal of hazardous wastes.~~

~~g.~~ f. Identify inspection and recordkeeping procedures for waste handling, disposal and recycling.

~~h.~~ g. Include a provision allowing for updates of the plan, subject to Department review and approval.

[Final Order on ASC, Condition 84; AMD4]

The amended condition provides clear, enforceable requirements that ensure waste streams are identified, minimized, recycled or otherwise properly disposed, in accordance with the standard. The Council adopts Waste Minimization Condition 1, requiring that, during construction, the certificate and its contractors implement and adhere to the requirements of the final, Department approved Construction Waste Management.

Waste Minimization Condition 1 (CON-WM-01):
During construction of a component or phase of the solar facility, the certificate holder and all onsite contractors must implement the Construction Waste Management Plan required under Condition PRE-WM-01.
[Final Order on AMD4]

The Council previously imposed Site Certificate Conditions 85 authorizing the certificate holder to dispose of waste concrete in an excavated pit on site and Condition 86 requiring concrete washout to occur at a batch plant site or at a tower foundation location. Due to the high-alkalinity of washout water, current Best Management Practices under 1200-C NPDES General Permit require concrete washout water to be collected in an infiltration pit or tank in a dedicated area. To avoid any confusion, and to ensure that waste concrete and concrete washout water is handled and disposed of in accordance with current DEQ regulations, the Council deletes Conditions 85 and 86:

Deleted Condition 85
~~(85) The certificate holder may dispose of waste concrete on site with the permission of the landowner and in accordance with OAR 340-093-0080 and other applicable regulations. The certificate holder shall dispose of waste concrete on site by placing the material in an excavated hole, covering the concrete with at least 3 feet of topsoil, and grading the area to match existing contours. If the waste concrete is not disposed of on site, the certificate holder shall arrange for proper disposal in a licensed landfill.~~
[Final Order on AMD4]

Deleted Condition 86
~~(86) During construction of the facility, the certificate holder shall ensure that the wash down of concrete trucks occurs only at a contractor-owned batch plant or at tower foundation locations. If such wash down occurs at tower foundation locations, then the certificate holder shall ensure that wash down wastewater does not run off the construction site into otherwise undisturbed areas and that the wastewater is disposed of on backfill piles and buried underground with the backfill over the tower foundation.~~
[Final Order on AMD4]

Operations

Solid Waste

Operation of facility components proposed in RFA4 would generate up to 2 cubic yards per month, of both non-hazardous and potentially hazardous wastes. Non-Hazardous solid waste would include packing materials for replacement components, and waste typical of a small office, and would be disposed of at either the Wasco County Landfill or Columbia Ridge landfill.[317]

Repair or replacement of the solar modules and associated electrical equipment could generate incidental waste. However, a solar module typically lasts at least 25 years without significant degradation in function; modules will be replaced infrequently but requiring storage space for approximately 0.5% of replacement modules on site.[318] As described above, solar modules can potentially be considered hazardous waste depending on their composition.

Lithium-ion batteries may also contain hazardous materials, and the operation of the BESS may generate battery waste if batteries are damaged or decommissioned during the operating life of the facility. The Council previously imposed Site Certificate Condition 87, requiring the certificate holder to implement a waste management plan during operation of the wind facility that contains provisions for the minimization and recycling of solid wastes, as well as the segregation and safe handling of hazardous wastes. The Council maintains this condition as applicable to the entire facility, with the same changes described above for Amended Condition 84, to address the potential for hazardous battery and solar module waste generated during facility operation.

Amended Condition 87 (OPR-WM-02)
During operation of the facility, the certificate holder shall implement a waste management plan that includes but is not limited to the following ~~measures~~:

a. The format, content, and frequency of ~~Training~~ employee~~s~~ trainings to minimize ~~and recycle~~ the generation of solid waste, recycle materials, and properly handle and dispose of electronic wastes and hazardous materials;
b. Identify names and locations of licensed haulers and facilities that will be used for the following, including associated collection and hauling protocols and requirements:
   ~~(b)~~i. Recycling paper products, metals, glass and plastics, and other recyclable materials;
   ~~(c)~~ii. ~~Collecting~~ Disposing non-recyclable, nonhazardous waste for transport to a landfill ~~by a licensed waste hauler~~; ~~and~~
c. Identify a procedure or process for evaluating whether photovoltaic modules, batteries, or other facility components are considered hazardous waste under state or federal regulations;

[317] BCWAMD4Doc21-17 RFA Exhibit W Waste Minimization 2025-12-10, Section 2.1.2, 3.2.
[318] BCWAMD4Doc21-02 RFA Exhibit G Materials Analysis 2025-12-10, Section 3.2, Table G-2.

d. Identify procedures for the segregation of recyclable materials, nonhazardous waste, and hazardous waste sources ~~Segregating all hazardous wastes, such as used oil, oily rags and oil-absorbent materials, mercury-containing lights and lead-acid and nickel-cadmium batteries~~ for transport and disposal by a licensed ~~firm~~ hauler specializing in the proper recycling or disposal of ~~hazardous~~the wastes~~.~~;

e. Identify inspection and recordkeeping procedures for waste handling, disposal and recycling; and

f. Include a provision allowing for updates of the plan, subject to the Department review and approval.

[Final Order on AMD4]

The amended condition provides clear, enforceable requirements that ensure waste streams are identified, minimized, recycled or otherwise properly disposed, in accordance with the standard.

Wastewater

Operation of the facility components proposed in RFA4 will not generate wastewater. Operation will result in sanitary wastewater and solar panel wash water, if panel washing occurs. These sources are addressed in Section III.M. *Public Services* of this order.

III.O.2. Conclusions of Law

Based on the foregoing analysis, and subject to compliance with the amended and new conditions described above, the Council finds that the certificate holder's solid waste and wastewater plans are likely to minimize generation of solid waste and wastewater during the construction and operation of the facility components proposed in RFA4, result in recycling and reuse of such wastes, and that the certificate holder will manage the accumulation, storage, disposal and transportation of wastes in a manner that will result in minimal adverse impacts to surrounding and adjacent areas.

III.P. SITING STANDARDS FOR TRANSMISSION LINES – OAR 345-024-0090

To issue a site certificate for a facility that includes any transmission line under Council jurisdiction, the Council must find that the applicant:

(1) Can design, construct and operate the proposed transmission line so that alternating current electric fields do not exceed 9 kV per meter at one meter above the ground surface in areas accessible to the public;

(2) Can design, construct and operate the proposed transmission line so that induced currents resulting from the transmission line and related or supporting facilities will be as low as reasonably achievable.

*** [319]

III.P.1. Findings of Fact

The facility components proposed in RFA4 would include approximately 600 feet of a new 230-kV overhead transmission line. There are no occupied buildings, residences, or other sensitive receptors within 200 feet of the center line of the proposed transmission line.[320] The right-of-way for the proposed transmission line would be within the fenced solar array area and would not be accessible to the public.

Electric and magnetic fields

Electric and magnetic fields that could be generated by the proposed transmission line were modeled using Bonneville Power Administration's Corona and Fields Effect Program, Version 3. The modeling results and assumptions are presented in Table 21, below:

Table 21: Transmission Line Modelling Specifications

Item	Specification
Overhead pole height	80 feet
Site Elevation	1,500 feet above sea level
Amperage	314 amps
Voltage	230-kV phase/phase or 132.79-kV phase/ground
Ground wire configuration	One overhead ground wire, 0.68 inch in diameter Two overhead shield wires, 0.5 inch in diameter
Ground Wire Minimum Height	68 feet
Ground Wire Location	Centerline
Conductor type	Single 954 Cardinal Aluminum Conductor Steel Reinforced per phase, 1.196 inches in diameter
A-Phase Minimum Height	28 feet
A-Phase Location	Lower arm, 19 feet left of centerline
B-Phase Minimum Height	28 feet
B-Phase Location	Lower arm, 19 feet right of centerline
C-Phase Minimum Height	41 feet
C-Phase Location	Upper arm, 19 feet right of centerline

Table 22, below, shows the calculated strength of electric and magnetic fields within the right-of-way for the proposed transmission line. As shown in the table, electric fields generated by the transmission line would not exceed the 9 kV/m limit established by the Standard at any location within the right-of-way.

[319] OAR 345-024-0090, effective April 2, 2025.

[320] BCWAMD4Doc21-20 RFA Exhibit AA EMF 2025-12-10, Section 2.1.

Table 22: Calculated Electric and Magnetic Field Strength

Description	200 feet left of centerline	Peak Value	200 feet right of centerline
Electric Field (kV/m)	0.039	3.42 (24 feet left of centerline)	0.055
Magnetic Field (mG)	1.97	7.58 (4 feet left of centerline)	2.03

Because the right-of-way for the proposed transmission line would be in an area that is not accessible to the public, and based on modeling results demonstrating that electric fields generated by the proposed transmission line would not exceed 9 kV/m at ground level anywhere within the proposed right-of-way, the Council finds the certificate holder can design, construct and operate the proposed transmission in accordance with OAR 345-024-0090(1).

The Council previously imposed Condition 53, requiring the certificate holder to design transmission lines constructed as part of the existing facility in compliance with OAR 345-024-0090(1). This condition continues to apply to the proposed new transmission line segment. The Council amends the condition, modifying reference to a single transmission line to multiple transmission lines, to clarify applicability, as presented below.

> **Amended Condition 53 (GEN-TL-01)**
> The certificate holder shall design ~~the~~ all overhead transmission lines so that alternating current electric fields ~~shall~~ do not exceed 9 kV per meter at one meter above the ground surface in areas accessible to the public.
> [Final Order on ASC, Condition 53; AMD4]

The Council also adopted Condition 99, requiring the certificate holder to take reasonable steps to reduce or manage public exposure to EMF and provide information to the public about EMF levels associated with the wind facility and its associated transmission lines. The Council finds no such condition is needed for the proposed transmission line because the right-of-way for the proposed transmission line would not be accessible to the public.

Under OAR 345-025-0010(5), the Council must specify an approved corridor for a transmission line approved in a site certificate. Under OAR 345-001-0010(7), a transmission line corridor is defined as a continuous area of land not more than one-half mile in width, extending the length of the proposed alignment.

For the 1,900-foot segment of 230 kV transmission line, the proposed corridor width is equivalent to the right of way width at 150 feet, as presented in Amended Site Certificate, Figure 2. The location extends from the existing Biglow Canyon Substation to the proposed new

substation. The Council amends Condition 119 to establish the approved transmission line corridor, as presented below:[321]

> **Amended Condition 119 (GEN-TL-05):**
> ~~(119) OAR 345-027-0023(5): If the proposed energy facility is a pipeline or a transmission line or has, as a related or supporting facility, a pipeline or transmission line, the Council shall specify an approved corridor in the site certificate and shall allow t~~The certificate holder ~~to~~shall construct the ~~pipeline or~~ 230-kV transmission line connecting the Biglow Canyon Substation to the Solar Substation ~~anywhere~~ within a 150 foot corridor, as presented in Figure 3 of the Amended Site Certificate ~~the corridor, subject to the conditions of the site certificate. If the applicant has analyzed more than one corridor in its application for a site certificate, the Council may, subject to the Council's standards, approve more than one corridor~~.
> [Final Order on ASC, Condition 119, AMD4]

Induced-Currents and Grounding

The voltages and currents associated with the transmission line have the potential to induce voltage and current in nearby conductors (e.g., metal fences and irrigation systems). This effect is more likely where ungrounded fences or irrigation systems run parallel to a transmission line for longer distances (e.g. one mile or more). These induced voltages could result in a "nuisance" shock to anyone who touches such a fence or irrigation system.[322] The proposed transmission line would be within the fenced solar array and substation areas, and so the conductors most likely to be affected are the facility perimeter fences, which the proposed transmission line would cross perpendicularly.

The Council previously imposed Condition 54 requiring the certificate holder to design the transmission line to minimize induced voltages. The Council amends this condition to be applicable to the entire facility:

> **Amended Condition 54 (GEN-TL-02):**
> ~~(54)~~ The certificate holder shall design ~~the~~all overhead transmission lines so that induced voltages resulting from the transmission lines are as low as reasonably achievable.
> [Final Order on ASC, Condition 54; AMD4]

In accordance with site specific conditions now found in OAR 345-025-0010(4), the Council also imposed Condition 118, requiring the certificate holder to design and construct transmission lines constructed as part of the existing wind facility in accordance with the 1997 version of the National Electric Safety Code and to adopt a program to assure that all objects or structures of a

[321] The Council previously imposed Condition 119 with regards to transmission lines approved as part of the wind facility but removed from consideration in the Final Order on AMD2.
[322] BCWAMD4Doc21-20 RFA Exhibit AA EMF 2025-12-10, Section 5.1.3.

permanent nature that could become inadvertently charged with electricity are grounded or bonded throughout the life of the lines. The Council maintains this condition as applicable to the wind energy facility only and adopts a new condition to address the transmission line proposed to be constructed with the solar facility. The certificate holder represents that it will construct the proposed transmission lines in accordance with" all pertinent electrical codes to be protective of health and safety."[323] Based on this representation, the new condition requires the certificate holder to design, construct and operate the transmission line in accordance with the current (2023) version of the NESC. Because NESC Rule 110 also requires security fences for electric installations to be grounded, and no private fences or metal objects would be located within the right-of-way for the proposed transmission line, the Council finds the requirements of OAR 345-025-0010(4)(b), related to programs for grounding or bonding, are not necessary.

Amended Condition 118 (GEN-TL-04)

~~(118) OAR 345-027-0023(4): If the facility includes any transmission line under Council jurisdiction:~~

a. The certificate holder shall design, construct and operate ~~the~~ transmission lines associated with the wind energy facility in accordance with the requirements of the National Electrical Safety Code (American National Standards Institute, Section C2, 1997 Edition); and
b. The certificate holder shall develop and implement a program that provides reasonable assurance that all fences, gates, cattle guards, trailers, or other objects or structures of a permanent nature that could become inadvertently charged with electricity by the transmission lines are grounded or bonded throughout the life of the line.

[Final Order on ASC, Condition 118; AMD3; AMD4]

New Transmission Line Condition 1 (GEN-TL-06):

The certificate holder must design, construct, and operate transmission lines associated with the solar facility in accordance with the requirements of the 2023 Edition of the National Electrical Safety Code.

[Final Order on AMD4]

III.P.2. Conclusions of Law

Based on the foregoing analysis, and subject to compliance with the existing and new site certificate conditions described above, the Council finds that the certificate holder can design, construct, and operate the facility components proposed in RFA4 so that alternating current electric fields do not exceed 9-kV per meter at one meter above the ground surface in areas accessible to the public and that induced currents resulting from the transmission line and related or supporting facilities will be as low as reasonably achievable.

[323] *Id.*

IV. EVALUATION OF OTHER APPLICABLE REGULATORY REQUIREMENTS

IV.A. Noise Control Regulations: OAR 340-035-0035

1) Standards and Regulations:

(a) Existing Noise Sources. No person owning or controlling an existing industrial or commercial noise source shall cause or permit the operation of that noise source if the statistical noise levels generated by that source and measured at an appropriate measurement point, specified in subsection (3)(b) of this rule, exceed the levels specified in Table 7, except as otherwise provided in these rules.

(b) New Noise Sources:

(A) New Sources Located on Previously Used Sites. No person owning or controlling a new industrial or commercial noise source located on a previously used industrial or commercial site shall cause or permit the operation of that noise source if the statistical noise levels generated by that new source and measured at an appropriate measurement point, specified in subsection (3)(b) of this rule, exceed the levels specified in Table 8, except as otherwise provided in these rules. For noise levels generated by a wind or solar energy facility of any size and any associated equipment or machinery, subparagraph (1)(b)(B)(iii) applies.

(B) New Sources Located on Previously Unused Site:

(i) No person owning or controlling a new industrial or commercial noise source located on a previously unused industrial or commercial site shall cause or permit the operation of that noise source if the noise levels generated or indirectly caused by that noise source increase the ambient statistical noise levels, L10 or L50, by more than 10 dBA in any one hour, or exceed the levels specified in Table 8, as measured at an appropriate measurement point, as specified in subsection (3)(b) of this rule, except as specified in subparagraph (1)(b)(B)(iii).

(ii) The ambient statistical noise level of a new industrial or commercial noise source on a previously unused industrial or commercial site shall include all noises generated or indirectly caused by or attributable to that source including all of its related activities. Sources exempted from the requirements of section (1) of this rule, which are identified in subsections (5)(b)–(f), (j), and (k) of this rule, shall not be excluded from this ambient measurement.

(iii) For noise levels generated or caused by a wind or solar energy facility:

(I) The increase in ambient statistical noise levels is based on an assumed background L50 ambient noise level of 26 dBA or the actual ambient background level. The person owning the wind or solar energy facility may conduct measurements to determine the actual ambient L10 and L50 background level.

(II) The "actual ambient background level" is the measured noise level at the appropriate measurement point as specified in subsection (3)(b) of this rule using generally accepted noise engineering measurement practices. Background noise measurements shall be obtained at the appropriate measurement point, and for wind energy facilities synchronized with wind speed measurements of hub height conditions at the nearest wind turbine location. "Actual ambient background level" does not include noise generated or caused by the proposed wind or solar energy facility.

(III) The noise levels from a wind or solar energy facility may increase the ambient statistical noise levels L10 and L50 by more than 10 dBA (but not above the limits specified in Table 8), if the person who owns the noise sensitive property executes a legally effective easement or real covenant that benefits the property on which the wind or solar energy facility is located. The easement or covenant must authorize the wind or solar energy facility to increase the ambient statistical noise levels, L10 or L50 on the sensitive property by more than 10 dBA at the appropriate measurement point.

*****

(c) Quiet Areas. No person owning or controlling an industrial or commercial noise source located either within the boundaries of a quiet area or outside its boundaries shall cause or permit the operation of that noise source if the statistical noise levels generated by that source exceed the levels specified in Table 9 as measured within the quiet area and not less than 400 feet (122 meters) from the noise source.

(d) Impulse Sound. Notwithstanding the noise rules in Tables 7 through 9, no person owning or controlling an industrial or commercial noise source shall cause or permit the operation of that noise source if an impulsive sound is emitted in air by that source which exceeds the sound pressure levels specified below, as measured at an appropriate measurement point, as specified in subsection (3)(b) of this rule:

(A) Blasting. 98 dBC, slow response, between the hours of 7 a.m. and 10 p.m. and 93 dBC, slow response, between the hours of 10 p.m. and 7 a.m.

(B) All Other Impulse Sounds. 100 dB, peak response, between the hours of 7 a.m. and 10 p.m. and 80 dB, peak response, between the hours of 10 p.m. and 7 a.m.

(e) Octave Bands and Audible Discrete Tones. When the Director has reasonable cause to believe that the requirements of subsection (1)(a), (b), or (c) of this rule do not adequately protect the health, safety, or welfare of the public as provided for in ORS Chapter 467, the Department may require the noise source to meet the following rules:

(A) Octave Bands. No person owning or controlling an industrial or commercial noise source shall cause or permit the operation of that noise source if such operation generates a median octave band sound pressure level which, as measured at an appropriate measurement point, specified in subsection (3)(b) of this rule, exceeds applicable levels specified in Table 10.

(B) One-third Octave Band. No person owning or controlling an industrial or commercial noise source shall cause or permit the operation of that noise source if such operation generates a median one-third octave band sound pressure level which, as measured at an appropriate measurement point, specified in subsection (3)(b) of this rule, and in a one-third octave band at a preferred frequency, exceeds the arithmetic average of the median sound pressure levels of the two adjacent one-third octave bands by:

(i) 5 dB for such one-third octave band with a center frequency from 500 Hertz to 10,000 Hertz, inclusive. Provided: Such one-third octave band sound pressure level exceeds the sound pressure level of each adjacent one-third octave band; or

(ii) 8 dB for such one-third octave band with a center frequency from 160 Hertz to 400 Hertz, inclusive. Provided: Such one-third octave band sound pressure level exceeds the sound pressure level of each adjacent one-third octave band; or

(iii) 15 dB for such one-third octave band with a center frequency from 25 Hertz to 125 Hertz, inclusive. Provided: Such one-third octave band sound pressure level exceeds the sound pressure level of each adjacent one-third octave band;

(iv) This rule shall not apply to audible discrete tones having a one-third octave band sound pressure level 10 dB or more below the allowable sound pressure levels specified in Table 10 for the octave band which contains such one-third octave band.

(2) Compliance. Upon written notification from the Director, the owner or controller of an industrial or commercial noise source operating in violation of the adopted rules shall submit a compliance schedule acceptable to the Department. The schedule will set forth the dates, terms, and conditions by which the person responsible for the noise source shall comply with the adopted rules.

(3) Measurement:

(a) Sound measurements procedures shall conform to those procedures which are adopted by the Commission and set forth in Sound Measurement Procedures Manual (NPCS-1), or to such other procedures as are approved in writing by the Department;

(b) Unless otherwise specified, the appropriate measurement point shall be that point on the noise sensitive property, described below, which is further from the noise source:

(A) 25 feet (7.6 meters) toward the noise source from that point on the noise sensitive building nearest the noise source;

(B) That point on the noise sensitive property line nearest the noise source.[324]

IV.A.1. <u>Findings of Fact</u>

The analysis area for the Noise Control Regulation includes the area within and extending 1-mile from the proposed Solar Micrositing Area.[325]

The Council previously imposed Site Certificate Conditions 90 and 91 requiring wind turbines to be sited in compliance with the noise control regulations. Because these conditions have no ongoing requirements, the Council deletes them from the site certificate.

Exempt Construction Noise

Under OAR 340-035-0035(5), noise generated during construction is exempt from the requirement to meet DEQ's noise standards. However, construction-related noise impacts are evaluated under the Council's Protected Area, Scenic Resources, and Recreation standards, as provided in Sections III.F., III.J., and III.L of this order. To support the evaluation required under those standards, the predicted construction-noise is summarized in this section.

[324] OAR 345-035-0035, effective October 17, 2024.

[325] BCWAMD4Doc01-00 ODOE Concurrence on OAR 345-027-0360(3) Request 2024-05-02.

Construction activities include site preparation and grading; installation of foundations for solar arrays, conductors, and O&M building; assembly of solar panels and electrical connection components; construction of inverter and battery pads, substation and transmission lines; and commissioning. RFA4 Table Y-3 identifies typical construction equipment and the anticipated sound level from 50 to 5,000 feet from the noise source. However, as described in RFA4, construction equipment operates simultaneously with delivery trucks and other construction noise. Table 23, below, outlines examples of compiled construction noise based on potential construction phases.

Table 23: Estimated Construction Noise Levels Based on Roadway Construction Noise Model

Phase	Existing Noise Levels in dBA		Assumed Construction Operation	Equipment Assumed to Be Operating	Assumed Distance (in feet) from Equipment to Site	Estimated Noise from Construction Activity in dBA	
	L_{eq}	L_{max}				L_{eq}	L_{max}
1	62.7	76.8	Demolition	Backhoe	175	62.7	66.7
				Compressor	175	62.8	66.8
				Dump Truck	175	61.6	65.6
				Front End Loader	175	64.2	68.2
				Mounted Impact Hammer (hoe ram)	175	72.4	79.4
				All Equipment		**74.0**	**79.4**

Source: Table 8.1 from Federal Highway Administration HIGHWAY CONSTRUCTION NOISE HANDBOOK August 2006 U.S. Department of Transportation. https://rosap.ntl.bts.gov/view/dot/8837

Depending on the type of equipment operating at the same time during the phases of construction (excavation and installation), construction noise at approximately 100-200 feet

away would be between 79 and 89 dBA, which is considered loud. However, noise attenuates with distance, topography and intervening vegetation, therefore at 400 feet from the noise source, construction noise would be approximately 73-83 dBA, and at approximately 0.5 miles away the noise levels would be 61-71 dBA, which is the sound level of a passenger car or air condition unit.[326] Construction noise would occur during daytime hours would be temporary, and attenuates (lessens) with distance from the facility.

The certificate holder represents that it will comply with Condition 89, which requires the noisiest operation of heavy construction equipment to be limited to daylight hours; construction equipment be equipped with exhaust mufflers; and, that a noise complaint response system be established. The Council amends the condition, as shown below.

Amended Condition 89 (CON-NC-01)

~~(89) To reduce noise impacts at nearby residential areas~~ During construction of the solar facility, the certificate holder shall:

a. Confine the noisiest operation of heavy construction equipment to the daylight hours;
b. Require contractors to install and maintain exhaust mufflers on all combustion engine-powered equipment; and
c. Establish a complaint response system at the construction manager's office to address noise complaints.

[Final Order on ASC, Condition 89; AMD4]

Operational Noise

Noise generated by a new industrial or commercial source located on a previously unused site must comply with two standards: the "ambient noise degradation standard" and the "maximum allowable noise standard." Under the ambient noise degradation standard, facility-generated noise must not increase the ambient hourly L10 or L50 noise levels at any noise sensitive property by more than 10 dBA. Under the maximum allowable noise standard at OAR 340-035-0035(1)(b)(B)(i), new industrial or commercial noise sources may not exceed the noise levels specified in the noise rules, as represented in Table 24 below (50 dBA representing the lowest standard).

Table 24: Statistical Noise Limits for Industrial and Commercial Noise Sources

Statistical Descriptor	Maximum Permissible Hourly Statistical Noise Levels (dBA)	
	Daytime (7:00 AM – 10:00 PM)	Nighttime (10:00 PM to 7:00 AM)
L50	55	50

[326] Average noise attenuation is approximately 6 dB per doubling of distance for a point source. This means if you double your distance from a sound source, the sound level drops by about 6 decibels. And RFA4, BCWAMD4Doc21-19 RFA Exhibit Y Acoustic Assessment 2025-12-10, Table Y-2.

Table 24: Statistical Noise Limits for Industrial and Commercial Noise Sources

Statistical Descriptor	Maximum Permissible Hourly Statistical Noise Levels (dBA)	
	Daytime (7:00 AM – 10:00 PM)	Nighttime (10:00 PM to 7:00 AM)
L10	60	55
L1	75	60
Note: The hourly L50, L10, and L1 noise levels are defined as the noise levels equaled or exceeded 50 percent, 10 percent, and 1 percent of the hour, respectively. Source: OAR 345-035-0035, Table 8.		

The noise limits apply at an appropriate measurement point on noise sensitive properties or Noise Sensitive Receptors (NSRs), such as dwellings, schools, churches, hospitals, or public libraries.[327] There are six NSRs within the analysis area, including one (NSR-7) located inside the proposed Solar Micrositing Area.[328]

Noise Analysis and Potential Noise Impacts

DEQ's noise regulations apply to all noise sources attributable to a facility; therefore, for this analysis, the evaluation is based on operational noise from the existing facility and the facility components proposed in RFA4.[329] Sound power levels of the facility components proposed in RFA4 are presented in Table 25 below.

Table 25: Modeled Sound Power Level of Components

Equipment	Broadband (dBA)
Photovoltaic Inverter	92
BESS Unit and Inverter	84
BESS Transformer	80
Generator Step-up Transformer (135 MVA)	106
BESS = battery energy storage system; dBA = A-weighted decibel; MVA = megavolt ampere Source: Exhibit Y, Tables Y-4 and Y-5.	

The sound power levels of facility components proposed in RFA4 were used to model operational noise, using the 2025 version of DataKustik GmbH's Computer-Aided Noise Abatement Model (CadnaA). Then, sound levels of the existing wind turbines were combined

[327] "Noise sensitive property" is defined in OAR 340-035-0015(38) as "real property normally used for sleeping, or normally used as schools, churches, hospitals or public libraries. Property used in industrial or agricultural activities is not Noise Sensitive Property unless it meets the above criteria in more than an incidental manner."

[328] The certificate holder notes that, based on field observations, NSR ID 6 appears to be an abandoned structure.

[329] OAR 340-035-0035(1)(b)(ii), "the ambient statistical noise level of a new industrial or commercial noise source on a previously unused industrial or commercial site shall include all noises generated or indirectly caused by or attributable to that source including all of its related activities."

with the modelled sound levels of facility components proposed in RFA4 using energetic addition.[330]

As presented in Table 26, expected sound levels at 1 NSR would reach, but not exceed, the 50 dBA L50 nighttime maximum permissible noise level prescribed by OAR 340-035-0035(1)(b)(B)(i). Received noise levels at all other NSRs would be under the maximum permitted level.

Table 26: Modeled Operational Noise of the Facility, as Amended

NSR ID	Existing Facility Noise (dBA)	Noise from Proposed Solar Facility Components (dBA)	Combined Noise (Background + Solar) (dBA)	Combined Noise (Background + Wind/Solar) (dBA)	Change from Assumed 26 dBA Sound Level (dBA)
4	49	21	27	49	23
5	49	23	28	49	23
6	48	30	31	48	22
7	48	32	33	48	22
8	50	29	31	50	24
13	47	21	27	47	21
14	50	24	28	50	24
Source: RFA4 Exhibit Y, Table Y-6 and Table Y-7.					

The second column in Table 26 above shows the noise levels of the existing operational wind facility. Table 26 shows the combination of the combined noise with the ambient noise and noise from the wind and solar facility showing that, the additional of the solar facility does not change the noise levels of the operational facility. In other words, the addition of the noise generating equipment from the solar facility would not increase the overall noise from the facility as a whole, therefore, the additional of the solar facility components would not alter the previously approved noise levels and the certificate holder's compliance with the DEQ Noise Regulations.

Noise levels produced by equipment may vary based on the manufacturer and final configuration. To ensure the facility, as amended, complies with the 50 dBA L50 nighttime

[330] BCWAMD4Doc21-19 RFA Exhibit Y Acoustic Assessment 2025-12-10, Section 5.1. The predicted received sound levels at NSRs from the sound contributions of the solar and wind components were calculated using the following equation:

$$L_{Cumulative} = 10 \cdot log_{10}\left(10^{\left(\frac{L_{Solar}}{10}\right)} + 10^{\left(\frac{L_{BCWF}}{10}\right)}\right)$$

Where:
$L_{Cumulative}$ = Cumulative sound level from the Solar Components and BCWF (dBA)
L_{Solar} = Sound level from the Solar Components (dBA)
L_{BCWF} = Sound level from the BCWF (dBA)

maximum permissible noise level, which cannot be complied with through a noise waiver described below, the Council imposes a new condition requiring that, prior to construction of noise generating equipment, the certificate holder conduct an updated noise assessment demonstrating compliance based on final facility design and the manufacture specifications for the equipment selected. As shown below, the condition would require the cumulative analysis of noise as evaluated in this section.

> **Noise Control Condition 1 (PRE-NC-01):**
> Prior to beginning construction of noise generating equipment, the certificate holder shall provide an updated acoustic modeling analysis based on final facility design and equipment specifications demonstrating that the cumulative operational noise levels of the wind and solar facility, taking into account any necessary acoustic mitigation, will comply with the maximum permissible noise level, 50 dBA L50.
> [Final Order on AMD4]

The 10 dBA anti-ambient noise degradation standard is modeled to be exceeded at seven NSRs. Under OAR 340-035-0035(1)(b)(B)(iii), the noise levels from a solar or wind facility may increase the ambient statistical noise levels L10 and L50 by more than 10 dBA (but not above the limits specified in Table 8), if the person who owns the NSR executes a legally effective easement or real covenant that benefits the property on which the facility is located (benefits the certificate holder/operation of the facility).[331] The certificate holder relies on easements or "noise waivers" previously obtained for the operational wind facility to maintain compliance with the standard, however, copies of the easements were not provided in RFA4.[332] Because the certificate holder relies on the noise waivers from the wind facility and the addition of the solar facility components would not change the noise levels from the facility as a whole, the Council finds that if the results from the updated noise assessment under Noise Control Condition 1 shows exceedances of the ambient degradation standard at any NSR impacted by the RFA4 solar facility, the Council imposes the following condition which requires the submission of executed noise easements for the RFA4 NSRs:

> **Noise Control Condition 2 (PRE-NC-02):** Prior to construction of the solar facility, the certificate holder must submit to the Department copies of executed legally effective easement(s) or real covenant(s) for all Noise Sensitive Properties identified in RFA4 that are impacted by the facility with noise exceedance.
> [OAR 340-035-0035(1)(b)(B)(iii); Final Order on AMD4]

Based on the results of the noise modeling for operations, and subject to compliance with the new site certificate conditions, the Council finds that the facility, with the changes proposed in RFA4, would remain in compliance with OAR 340-035-0035.

[331] The easement or covenant must authorize the energy facility to increase the ambient statistical noise levels, L10 or L50 on the sensitive property by more than 10 dBA at the appropriate measurement point.
[332] BCWOPSDoc108 BCW Noise Easements, 2008-10-16. (Pre-construction compliance).

IV.A.2. Conclusions of Law

Based on the foregoing analysis, and subject to compliance with the existing and new site certificate conditions described above, the Council finds that the facility, with proposed changes, will comply with the applicable Noise Control Regulations in OAR 340-035-0035.

IV.B. Removal-Fill

The Oregon Removal-Fill Law (ORS 196.795 through 196.990) and Department of State Lands (DSL) regulations (OAR 141-085-0500 through 141-085-0785) require a removal-fill permit if 50 cubic yards or more of material is removed, filled, or altered within any "waters of the state."[333] The Council, in consultation with DSL, must determine whether a removal-fill permit is needed and if so, whether a removal-fill permit should be issued. The analysis area for wetlands and other waters of the state is the area within the site boundary.

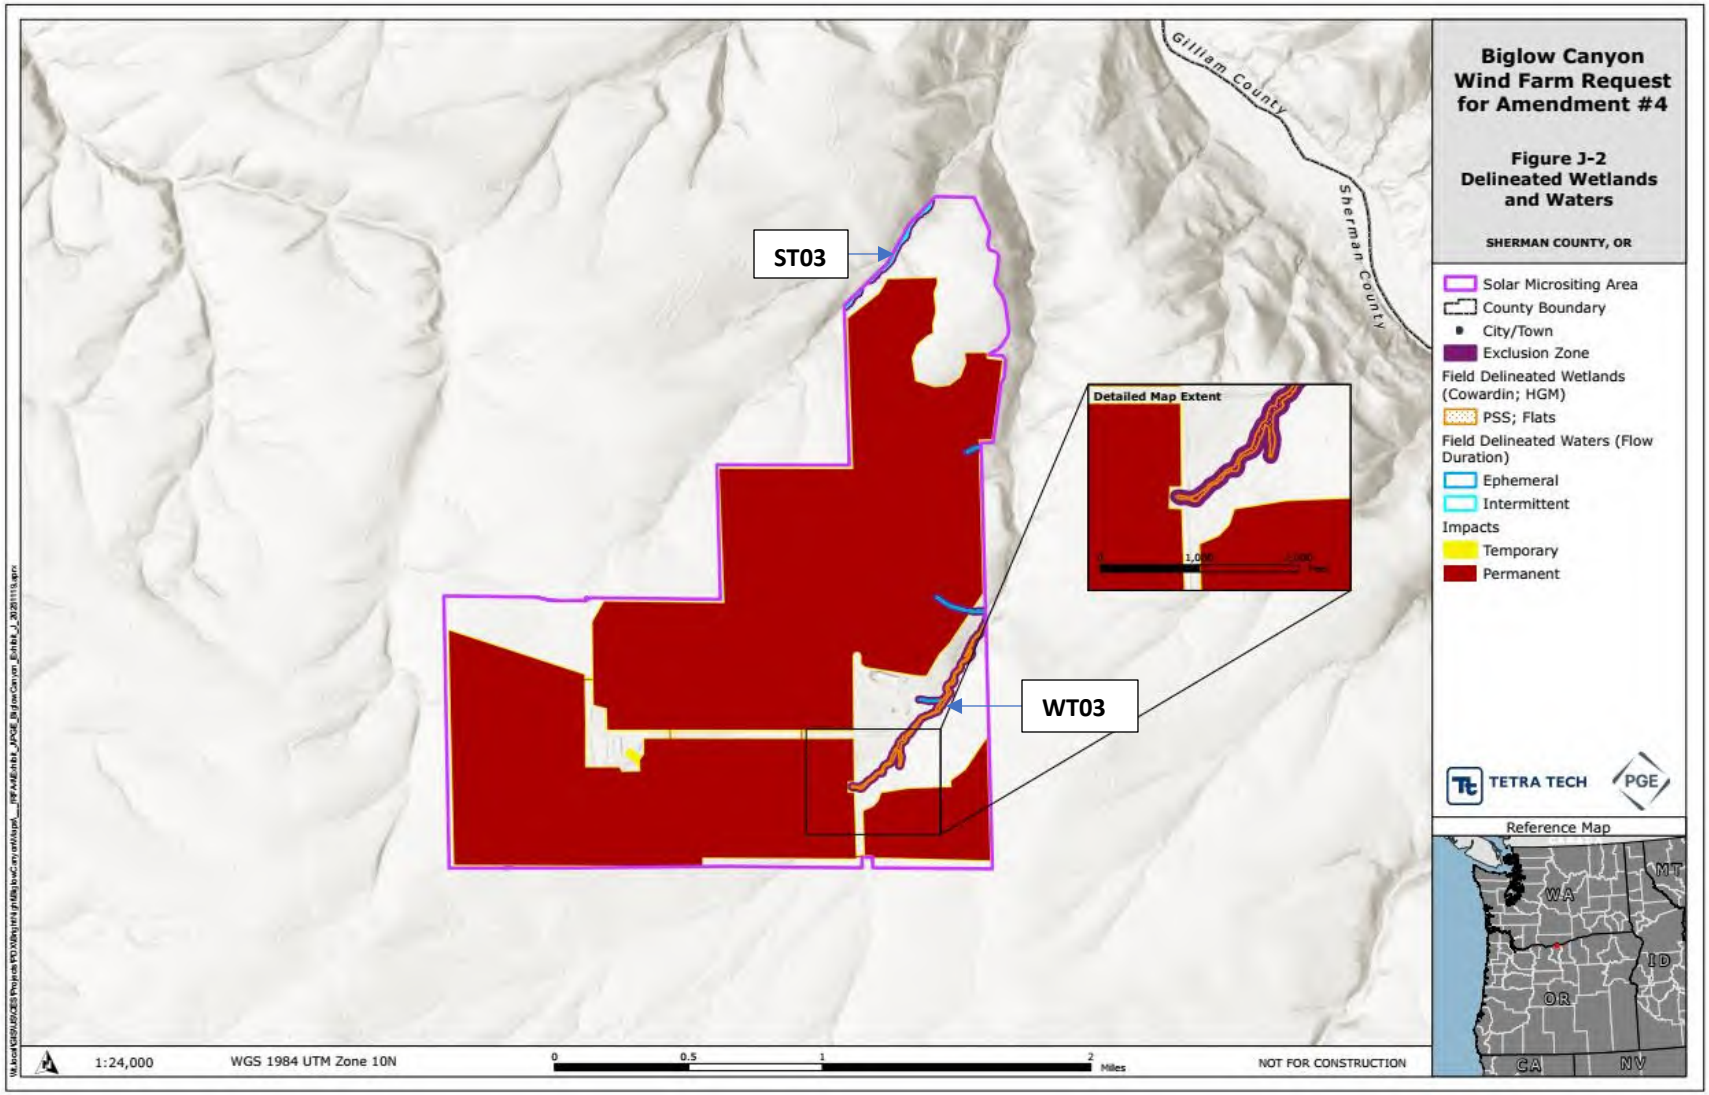
IV.B.1. Findings of Fact

There is one riverine wetland (WT03) and one intermittent stream (ST04) delineated, and concurred on August 12, 2025 by DSL, to be regulated waters of the state within the proposed Solar Micrositing Area.[334, 335] The location of WT03 and ST04 are presented in Figure 18 below. These two waters of the state are located outside of the perimeter fenceline; there is also an existing road that parallels WT03, providing additional buffer and separation from the perimeter fenceline for the majority of the length of the stream.[336] Based on the preliminary facility layout, impacts to WT03 and ST04 are not anticipated. The certificate holder represents that it would maintain a minimum 50-foot avoidance buffer from any disturbance activities to the boundary of the delineated waters of the state.[337]

Changes in land use, hydrology or in DSL's regulations could occur over time; therefore, DSL's concurrence is only valid for a 5-year timeframe, or until August 12, 2030.[338] As presented in Section III.A. *General Standard of Review* of this Order, the Council imposes a construction commencement deadline 6-years from the date of approval, if approval is granted. Because the amended commencement deadline allows for construction to occur after the DSL concurrence expiration, and because it is necessary to ensure waters of the state are properly delineated and either avoided, mitigated if impacted and/or that a removal fill permit is obtained if impacts are 50 cubic yards or greater, the Council imposes a requirement that the certificate

[333] ORS 196.800(15) defines "Waters of this state." The term includes wetlands and certain other waterbodies.
[334] BCWAMD4Doc21-05 RFA Exhibit J Wetlands 2025-12-10, Attachment J-1.
[335] BCWAMD4Doc21-05 RFA Exhibit J Wetlands 2025-12-10, Attachment J-1 Wetland Delineation Concurrence 2025-0012.
[336] BCWAMD4Doc21-05 RFA Exhibit J Wetlands 2025-12-10, Figures 5.12 – 5.18.
[337] BCWAMD4Doc21-05 RFA Exhibit J Wetlands 2025-12-10, Section 4.0.
[338] BCWAMD4Doc21-05 RFA Exhibit J Wetlands 2025-12-10, Attachment J-1 Wetland Delineation Concurrence 2025-0012.

holder submit and obtain a renewed concurrence of its WD 2025-0012, if construction activities do not commence by August 12, 2030.[339]



Removal-Fill Condition 1 (PRE-WL-01):

a. Certificate holder shall flag and avoid, or develop constraints mapping, identifying a 50-foot avoidance buffer from the delineated boundary of wetland WT03 and intermittent waterway ST04 (Wetland Delineation Report WD #2025-0012) to ground disturbing activities.

b. Prior to August 12, 2030, if construction of the solar facility has not yet commenced, the certificate holder must submit a renewal request to DSL for Wetland Delineation Report WD #2025-0012. Certificate holder must provide a copy of DSL reissuance to the Department, once obtained.
[Final Order on AMD4]

[339] Renewal requests is an allowable process under OAR 141-090-0045.

Figure 18: Delineated Wetlands and Waters

IV.B.2. Conclusions of Law

Based on the foregoing analysis, and subject to compliance with the proposed conditions described above, the Council finds that the facility components proposed in RFA4 will comply with the Council's Soil Protection standard.

IV.C. Water Rights

Under ORS Chapters 537 and 540 and OAR Chapter 690, the Oregon Water Resources Department (OWRD) administers water rights for appropriation and use of the water resources of the state. Under OAR 345-022-0000(1)(b), the Council must determine whether the facility, with proposed changes, would comply with the statutes and administrative rules identified in the project order. The project order identifies OAR 690, Divisions 310 and 380 (Water Resources Department permitting requirements) as the administrative rules governing use of water resources and water rights as applicable to the facility.

IV.C.1. Findings of Fact

Construction related water use is anticipated to utilize up to 28,390 gallons per day, or approximately 26 million gallons total, for dust suppression, road compaction, concrete mixing, and equipment washing. Construction water will likely be obtained from a municipal source, such as the City of Wasco, which affirmed capacity to meet the forecasted construction water demand.[340] Potable water will also be required for sanitation and drinking water, which will be obtained from the existing, exempt well or from bottled water.

As presented in Section IV.M.1 *Public Services, Water Use* of this order, the Council previously imposed Condition 74 which required that, during construction, the certificate holder and its contractors obtain water from previously permitted sources. This condition applies to the water usage associated with AMD4. However, the Council amends Condition 74 to add clarity on the documentation to be submitted to afford the Department the ability to verify that the water source has the legal ability to provide the type and quantity of water needed for construction.

During operations, up to 330,000 gallons per year may be needed for potable water and panel washing. Operational water would be obtained from the facility's existing, exempt well or a newly constructed exempt well. The existing well at the O&M building is limited to 5,000 gallons per day in order to maintain permit-exempt status from OWRD.[341] If a new well is constructed to support a new O&M building, the same 5,000 gallons per day limit applies, but applies to combined well water usage (i.e., 5,000 gallon per day limit applies to one or many wells located on any lands under common ownership).

[340] BCWAMD4Doc21-15 RFA Exhibit U Public Services 2025-12-10, Attachment U-1.

[341] Under ORS 537.545(1)(f), an exempt use of ground water includes any single industrial or commercial purpose in an amount not exceeding 5,000 gallons a day.

Under OWRD rules, a well system that uses less than 5,000 gallons of water per day for a single industrial or commercial purpose are exempt from registration, permits, or ground water right certificates. The provisions of ORS 537.545 require the owner of the land on which an exempt well is drilled to provide to the OWRD a certified map showing the exact location of the well, as well as pay a recording fee to OWRD. ORS 537.765 requires a well log containing specific information described in ORS 537.765 to be filed with the Water Resources Commission within 30-days after the completion of construction of a new exempt well is drilled, or an existing well is altered, converted, or abandoned.

If a new exempt, well is constructed, the Council imposes the following conditions:

Water Rights Condition 1 (CON-WR-01)
No later than 30 days after completing construction of any new well, the certificate holder shall provide the Department a copy of the map, well log and all other information it provided to OWRD pursuant to ORS 537.545 and ORS 537.765 to qualify for an exempt ground water use for any onsite exempt wells.
[Final Order on AMD4]

The Council previously imposed Condition 75 restricting the water use and quantity of the onsite well. This condition continues to apply; however, the Council amends the condition to require usage monitoring and recording to ensure that the 5,000 gallons per day limit for the system is not exceeded without a permit.

Amended Condition 75 (OPR-WR-01)
a. For any onsite exempt wells, ~~Before beginning operation of the facility, the certificate holder shall have in operation a well suitable for delivering water,~~ combined water usage shall not exceed~~ing~~ 5,000 gallons per day~~,~~ for domestic use at the facility's O&M buildings and~~, provided the rate of extraction would not exceed 5,000 gallons per day,~~ solar panel and blade-washing activities.
b. If new exempt wells are constructed for the solar facility, certificate holder shall install flow meters on the existing and new wells; monitor the volume of groundwater used from all onsite wells on a daily basis; maintain a record of such use; and, make the monitoring records available to the Department upon request. ~~The certificate holder shall not change the source of water for the facility's domestic use without prior Council approval.~~
[Final Order on AMD4]

The Council also amends Condition 75 to remove a requirement that the certificate holder obtain Council approval for any offsite water sources because of the changes to Condition 76.

As presented in Section IV.M.1 *Public Services, Water Use* of this order, Amended Condition 76 requires that, prior to and during operations, the certificate holder estimate its annual operational water demand and provide evidence that any offsite source has the legal ability to provide the quantity and serve the use needed by the facility.

IV.C.2. Conclusions of Law

Based on the foregoing findings of facts and new conditions, the Council concludes that the facility components proposed in RFA4 do not need a groundwater permit, surface water permit, or water right transfer.

V. FINAL CONCLUSIONS AND ORDER

Based on the findings of fact and conclusions of law included in this order, under OAR 345-027-0375, the Council finds that the preponderance of evidence on the record, including the record of RFA4 and of the *Final Order on ASC*, supports the following conclusions:

1. The facility as amended complies with the applicable substantive criteria under the Council's Land Use standard, as described in OAR 345-022-0030, from the date RFA4 was submitted.

2. The facility as amended complies with the requirements of the Energy Facility Siting Statutes ORS 469.300 to 469.520.

3. The facility as amended complies with all applicable standards adopted by Council pursuant to ORS 469.501, in effect on the date Council issues its Final Order.

4. The facility as amended complies with all other Oregon statutes and administrative rules identified in effect on the date Council issues its Final Order.

Accordingly, the Council finds that the facility as amended complies with the General Standard of Review, OAR 345-022-0000, and OAR 345-027-0375. The Council finds, based on a preponderance of the evidence on the record, that the site certificate may be amended as requested.

The Council therefore approves Request for Amendment 4 of the Biglow Canyon Wind Farm Site Certificate, and issue the 4th Amended Site Certificate included as Attachment A to this Order.

Issued March 27, 2026

OREGON ENERGY FACILITY SITING COUNCIL

Cynthia R. Condon

Cynthia R. Condon (Mar 30, 2026 10:54:44 PDT)

Cindy Condon, Chair

VI. NOTICE OF RIGHT TO APPEAL

Judicial review of this Order is as provided under ORS 469.403 and 469.405(1). Notwithstanding ORS 183.482 and 183.484, judicial review of the Council's approval of a request for an amendment to a site certificate is conferred solely on the Supreme Court. Only the certificate holder or persons who submitted comments on the Request for Amendment in compliance with council rules may seek judicial review. A person who seeks judicial review is limited to the issues the person raised in their comments.

1.0 Introduction

This site certificate for the Biglow Canyon Wind Farm ("Biglow" or the "facility") is issued and executed in the manner provided by ORS Chapter 469, by and between the State of Oregon ("State"), acting by and through its Energy Facility Siting Council (the "Council"), and Portland General Electric Company ("certificate holder"). This site certificate is a binding agreement between the State, acting by and through the Council, and the certificate holder. [Amendment #1]

The findings of fact, reasoning and conclusions of law underlying the terms and conditions of this site certificate are set forth in the following documents related to the facility, which are incorporated herein by this reference: (a) the Council's Final Order in the Matter of the Application for a Site Certificate for the Biglow Canyon Wind Farm (the "Final Order on the Application"); (b) the Council's Final Order on Amendment #1; (c) the Council's Final Order on Amendment #2; (d) the Council's Final Order on Amendment #3; and (e) the Council's Final Order on Amendment #4. [Amendments #1, #2, #3 and #4]

In interpreting this site certificate, any ambiguity shall be clarified by reference to the following, in order of priority: (1) this Fourth Amended Site Certificate; (2) the Final Order on Amendment #4; (3) the Final Order on Amendment #3; (4) the Final Order on Amendment #2; (5) the Final Order on Amendment #1; (6) the Final Order on the Application; and (6) the record of the proceedings that led to the Final Orders on the Application, Amendment #1, Amendment #2, Amendment #3, and Amendment #4. [Amendments #1, #2, #3 and #4]

The terms used in this site certificate shall have the same meaning as set forth in ORS 469.300 and OAR 345-001-0010, except where otherwise stated or where the context clearly indicates otherwise.

2.0 Site Certification

A. To the extent authorized by state law and subject to the conditions set forth herein, the State authorizes the certificate holder to construct, operate and retire a wind and solar power generation facility, together with certain related or supporting facilities, at the site in Sherman County, Oregon, as described in Section 4.0 of this site certificate. ORS 469.401(1)

B. This site certificate is effective until it is terminated under OAR 345-027-0110 or the rules in effect on the date that termination is sought or until the site certificate is revoked under ORS 469.440 and OAR 345-029-0100 or the statutes and rules in effect on the date that revocation is ordered. ORS 469.401(1)

C. This site certificate does not address, and is not binding with respect to, matters that were not addressed in the Council's Final Orders on the Application, Amendment #1, Amendment #2, Amendment #3, or Amendment #4. These matters include, but are not limited to: building code compliance, wage, hour and other labor regulations, local government fees and charges, and other design or operational issues that do not relate to siting the facility (ORS 469.401(4)) and permits issued under statutes and rules for which the decision on compliance has been delegated by the federal government to a state agency other than the Council. ORS 469.503(3). [Amendments #1, #2, #3, #4]

D. Both the State and the certificate holder shall abide by local ordinances, state law, and the rules of the Council in effect on the date this site certificate is issued. In addition, upon a clear showing of a significant threat to public health, safety or the environment that requires application of later-adopted laws or rules, the Council may require compliance with such later-adopted laws or rules. ORS 469.401(2)

E. For a permit, license or other approval addressed in and governed by this site certificate, the certificate holder shall comply with applicable state and federal laws adopted in the future to the extent that such compliance is required under the respective state agency statutes and rules. ORS 469.401(2)

F. Subject to the conditions herein, this site certificate binds the State and all counties, cities and political subdivisions in Oregon as to the approval of the site and the construction, operation and retirement of the facility as to matters that are addressed in and governed by this site certificate. ORS 469.401(3)

G. Each affected state agency, county, city and political subdivision in Oregon with authority to issue a permit, license or other approval addressed in or governed by this site certificate shall, upon submission of the proper application and payment of the proper fees, but without hearings or other proceedings, issue such permit, license or other approval subject only to conditions set forth in this site certificate. ORS 469.401(3)

H. After issuance of this site certificate, each state agency or local government agency that issues a permit, license or other approval for the facility shall continue to exercise enforcement authority over such permit, license or other approval. ORS 469.401(3)

I. After issuance of this site certificate, the Council shall have continuing authority over the site and may inspect, or direct the Department to inspect, or request another state agency or local government to inspect, the site at any time in order to ensure that the facility is being operated consistently with the terms and conditions of this site certificate. ORS 469.430

3.0 Descriptions

3.1 The Wind Facility

Major Structures

The Biglow Canyon Wind Farm consists of 217 wind turbines (76 Vestas V82 1.65 MW and 141 Siemens 2.3 MWs) with an aggregate nominal nameplate generating capacity of up to 450 megawatts (MW) of electricity and an average electric generating capacity of up to 150 MW. The Vestas V82 turbines are mounted on tubular steel towers with a height of 262 feet at the hub and an overall height of 397 feet including the turbine blades. The Siemens 2.3 MW turbines are mounted on tubular steel towers with a height of 262 feet at the hub and an overall height of 413 feet including the turbine blades. The wind turbines are located on private land that the certificate holder has leased from the affected landowners.
[Final Order on ASC, AMD1, AMD2, AMD4]

Related or Supporting Facilities

The facility includes the following related or supporting facilities:

Power Collection System

Each wind turbine generates power at about 600 volts. The transformer sitting at the base of each wind turbine unit increases the voltage to 34.5 kilovolts (kV). From the transformer, power is transmitted to a central substation by means of electric cables. Most of the cables are buried three feet or more below the surface in trenches about 3 feet wide. In areas where collector cables from several turbine strings follow the same alignment, e.g., on approach to the substation, multiple sets of cables have been installed within a single trench. The facility contains approximately 75 miles of 3-wire collector cables are underground. Generally, these cables are above, below or adjacent to the fiber optic cables comprising the supervisory control and data acquisition system.

Approximately 5 miles of 34.5 kV collector cables are above ground on pole or tower structures. Poles or towers supporting aboveground segments of the power collection system are about 23 to 28 feet tall. [Final Order on ASC, AMD1, AMD2, AMD4]

Substations and Interconnection System

The substation site is a graveled, fenced area of up to 6 acres with transformers, switching equipment and a parking area. Transformers are non-polychlorinated biphenyl (PCB) oil-filled types. The facility interconnects with a new Bonneville Power Administration (BPA) system transmission line adjacent to the facility substation. [Final Order on ASC, AMD2, AMD4].

Meteorological Towers

There are 4 meteorological towers throughout the facility site to collect wind resource data. The towers are 279 feet tall. [Final Order on ASC, AMD4]

Operations and Maintenance Buildings

The site of the operations and maintenance buildings is 5 acres adjacent to the substation on Herin Lane. The O&M buildings occupy about 19,500 square feet and include office and workshop areas, control room, kitchen, bathroom, shower, utility sink, and other typical facilities. Water for the bathroom, shower and kitchen is obtained from an onsite well constructed by a licensed contractor in accordance with local and state requirements. Water use from all onsite wells may not cumulatively exceed 5,000 gallons per day, unless a permit is obtained from OWRD. Domestic wastewater generated at the O&M facility drains into an onsite septic system. A graveled parking area for employees, visitors and equipment is located adjacent to the O&M facility. [Final Order on ASC, AMD2, AMD3, AMD4]

Control System

The facility includes a supervisory control and data acquisition (SCADA) system to assist with the remote operation of the wind turbines, to collect data from each wind turbine, and to archive wind and performance data from various sources. The SCADA system is linked by means of fiber optic cables or other means of communication to a central computer in the O&M facility. [Final Order on ASC]

Access Roads

The facility includes about 41.7 miles of roads to provide access to the wind turbine strings, together with turnaround areas at the end of each wind turbine string. The roads are about 16 feet wide (possibly up to 28 feet wide in some locations) and are composed of crushed gravel with shoulders (without gravel) about 3 feet wide. [Final Order on ASC, AMD2, AMD3, AMD4]

3.2 The Solar Facility

The solar facility includes up to 125 MW solar photovoltaic power generation components; a battery energy storage system (BESS) with up to 500 megawatt-hours (MWh) of discharge capacity; and other related or supporting facilities.

The approximate dimensions and specifications approved to be constructed and operated are presented in Table 1 below. The final design of the solar facility must substantially comply with these dimensions and specifications.

Table 1: Solar Facility Component Summary

Component and Design Standard	No.	Unit
Site Boundary		
Solar Micrositing Area[1]	1,924	acres
Max. Permanent footprint[1]	1,445	acres
Min. setback from turbines	520	feet
Maximum nominal generating capacity	125	MW
Modules (590w module with monocrystalline solar cells, antireflective coating, metal frame, and factory installed wire connectors)		
Approx. number of modules	264,836	modules
Approx. module dimensions (W x L)	45x90	inches
Tracking System		
Mounting height	5	feet AGL
Avg. Height at full tilt	7.5 to 10	feet AGL
Max. Height at full tilt	15	feet AGL
Steel Posts (hollow, screw, or pile-type)		
Approx. Total Number	32,621	posts
Avg. Installation Depth	7 to 15	Feet BGL
Power Conversion Stations (Inverter with integrated Step-Up Transformer)		
Approx. Total Number	33	each
Noise Level	92	dBA (Broadband)
Transformer Oil-Containing Capacity (each)	700	gallons
Battery Energy Storage System (Lithium-ion)		
BESS Yard Site Size	5	acres
Battery Containers (of Battery Containers on foundations with integrated inverters, HVAC and fire suppression systems, SCADA		
Max. Number Enclosures / Inverters	153	Units
Approx. Dimensions (HxWxL)	10 x 5.5 x 29	Feet

BESS Inverters	153	each
BESS Transformers	39	each
Transformer Height	10	feet
BESS Transformer Noise Level	80	dBA (Broadband)
Transformer Oil-Containing Capacity	700	Gallons/each
Related or Supporting Facility Components		
34.5 kV Collection System		
Collector line length, underground	52	miles
Temporary Impact Corridor (limit)	50	feet
Collector Substation		
Includes GSU transformers, switches, breakers, surge arrestors, metering equipment, grounding, and associated control wiring. Certain equipment is enclosed in a control building.		

Table 1: Solar Facility Component Summary

Component and Design Standard	No.	Unit
Site size	4.2	acres
Generator Step-Up Transformers	1	each
Transformer Oil-Containing Capacity	10,000-15,000	gallons
Transformer Noise Level	106	dBA
Control building dimensions	40x15	Feet
Height of structures	8 to 25	feet
230 kV Transmission Line		
Length	1900	feet
Corridor Width (contains all disturbance)	150	Feet
Corridor Area	2	acres
Steep Monopole Support Structures	3	each
Height of Support Poles	80	feet
O&M Facility		
Steel building/prefabricated office structure with adjacent storage enclosures and parking areas, well, septic system.		
Building Dimensions	60 X 12	foot
Site size	3	Acres
400 ft^2 Storage Containers	3	Each
Internal Access Roads		
Length (graveled)	10.5	miles
Width	16-20	feet
Vegetation Management Buffer (both sides)	10	feet
Perimeter Fence		
Total Length	92,400	Feet
Height	8	Feet
Access gates	5	each
Clear, brush free Area (10-feet from both exterior and interior)	20	Feet
Temporary Construction Areas		
Site Size	8.7	Acres
1,000-gal aboveground fuel storage tanks	3	Each

Acronyms: dBA = A-weighted decibels; HVAC = heating, ventilation and air conditioning; kV = kilovolt; OH = overhead; O&M = operations and maintenance; SCADA = supervisory, control and data acquisition
Sources: RFA4, Table 1.
Notes:

1. Solar facility components would permanently occupy up to 1,445 acres within the 1,924-acre Solar Micrositing Area . Area within the perimeter fenceline of the solar facility is considered a permanent impact under the Fish and Wildlife Habitat standard; however, impacts within the perimeter fenceline to soils, vegetation and noxious weeds are not considered permanent under the Soil Protection and Land Use standards and must be minimized and mitigated, as discussed in applicable sections in this order.

[AMD4]

Solar Photovoltaic Power Generation Facilities

The solar components have a nameplate generating capacity of up to 125 MW. The addition of the solar and battery components increases the peak generating capacity of the facility, as a whole, to 575 MW.

Solar photovoltaic power generation facilities typically consist of rows of photovoltaic modules mounted on a racking system that is either fixed in place or able to track the sun on one or more axes. The racking system is typically supported by steel posts that are either driven directly into the ground or installed into pre-drilled holes. The low voltage DC output of the photovoltaic modules is collected with a cabling system and transmitted to inverter and transformer units which convert the output of several rows of modules to 35-kV AC power that can be collected via the facility's electrical collector system. The ground below and surrounding the solar arrays would mostly be vegetated, with gravel where needed for maintenance and access roads or where gravel already exists. [Final Order on AMD4]

Modules

Modules typically consist of mono or poly-crystalline solar cells, antireflective coating, non-specular, galvanized steel racks, and factory installed wire connectors. The modules will be connected in series to form strings which are then collected via combiners, cables, and switchboards. The type and number of modules required will be determined at final facility design based on the technology available at that time. The certificate holder assumes use of N-type monocrystalline solar cells. [Final Order on AMD4]

Tracking System

Strings of modules will be mounted on single-axis tracker systems to optimize electricity production by rotating the solar modules to follow the path of the sun throughout the day. Each set of modules is expected to be mounted approximately 5 feet off the ground on a single-axis tracker that rotates 60 degrees to the east and west. At maximum tilt, the top edge of the modules is expected to be 7.5 to 10 feet above ground level with a maximum of 15 feet where topography curves under a row. The tracker system and associated posts will be designed to withstand wind, snow, and seismic loads anticipated at the site. [Final Order on AMD4]

Posts and Foundations

Each tracker row will be supported by multiple steel posts. Hollow steel sections, screw piles, or pile-type posts may be used. Posts will typically be installed 7 to 15 feet below the ground surface and extend approximately 5 feet above grade. Exterior posts at the end of tracker rows are typically installed to greater depth to withstand inclement weather including high wind conditions. In some soil conditions, concrete grouting may be used as backfill, as required. The total number of posts and foundation installation methods required will be determined during

detailed design of the tracker system and future geotechnical investigations. [Final Order on AMD4]

Cabling

Cables will be used to collect and aggregate the DC output of multiple tracker rows for transmission to the inverter/inverter step-up transformer units described below. Cabling may be installed underground along tracker rows and aggregated using combiner boxes or installed aboveground in aluminum trays or using harnessing if a trunk bus system is used for aggregation. Either system requires a similar amount of cabling. [Final Order on AMD4]

Power Conversion Stations (PCS)

Integrated inverter and step-up transformer systems called Power Conversion Stations (PCS), or similar systems, will be installed throughout the solar arrays to convert the low-voltage DC output of the modules to 34.5 kV AC power that can be transmitted via the electrical collector system. Each transformer will contain approximately 700 gallons of mineral oil. Each PCS will be installed on a concrete pad or pile-supported foundation. The inverter specifications will comply with the applicable requirements and standards of the National Electric Code and Institute of Electrical and Electronics Engineers standards. [Final Order on AMD4]

Battery Energy Storage Systems

The BESS will be AC-coupled and located adjacent to the collector substation on a fenced 5-acre site.

The BESS will consist of modular enclosures that hold lithium-ion batteries, battery management systems, integrated inverters, and fire prevention systems. Cooling units will be placed either on top of or along the side of the enclosures may include separate chiller plants. Each enclosure will be placed on a concrete pad or pile-supported foundation. The enclosures will be manufactured, assembled, and inspected off-site prior to installation. Each enclosure will be installed on a concrete pad or pile foundation.

The BESS will use lithium-ion (Li-ion) batteries. Li-ion batteries are a type of rechargeable battery where lithium ions, suspended in a gel or liquid electrolyte, move from negative to positive electrodes and back when recharging. A Li-ion battery typically consists of a modular unit containing multiple cells, which are hermetically sealed pouches that serve as primary containment for the electrolyte solution. Modules are placed in anchored racks and wired into strings, with each enclosure containing multiple battery strings. Each enclosure may contain up to 10,000 cells.

Lithium-ion batteries and electrolyte are typically considered to be hazardous materials due to their flammability and potential for chemical reaction. Electrolyte can only escape (as vapor) in

the unlikely case that a battery module fails, and while the enclosure itself provides additional containment in the event of a module failure, venting may be required in the event of a fire or other emergency. Due to the risks, the U.S. Department of Transportation and U.S. Environmental Protection Agency also require special handling when transporting or disposing of lithium-ion batteries.

Initially, the BESS will include up to 153 modular enclosures; however, because battery performance degrades over time additional batteries and associated equipment will be periodically augmented as needed to maintain the design capacity of the system. Approximately 183 enclosures will be installed at the site over the life of the facility. [Final Order on AMD4]

BESS Transformers

The BESS includes up to 39 transformers to increase the output voltage from the inverters integrated into the BESS enclosures (typically 660 volts) to the substation feed voltage (34.5-kilovolt [kV] AC). The transformers are anticipated to be approximately 8 to 10 feet in height and will be installed on a concrete pad or pile-supported foundation. Each transformer will contain approximately 700 gallons of mineral oil for cooling. Oils needed for maintenance will be delivered by a licensed maintenance contractor on an as-needed basis, and no substantial quantities will be stored on-site. [Final Order on AMD4]

BESS Yard

The BESS facilities will be located in a fenced, graveled yard, adjacent to the collector substation discussed below. The total area expected to be occupied by the BESS yard is approximately 5 acres. [Final Order on AMD4]

<u>Other Related or Supporting Facilities</u>

34.5 kV Electrical Collection System

The output of the ISU and BESS transformers will be aggregated and transmitted to the collector substations via underground 34.5-kV collector lines. Up to 52 miles of collector line will be installed within the solar array fence lines. The collector lines will be buried to a minimum of 3 feet at lateral depth, with junction splice boxes positioned intermittently along the lines for maintenance access. [Final Order on AMD4]

Collector Substation

A new collector substation will be constructed to aggregate and convert the 34.5 kV power transmitted through the electrical collection system to 230-kV power that can be transmitted to the grid from the existing Biglow Canyon Substation.

The substation will include a generator step-up (GSU) transformer and other electrical equipment including, but not limited to switches, breakers, surge arrests, metering equipment, grounding, and associated control wiring. Certain equipment, including breakers and transformer equipment, will be enclosed in a control building. The GSU transformer is expected to be a ground-mounted unit constructed on a concrete pad. The transformer will contain between 10,000 and 15,000 gallons of mineral or seed oil for cooling and insulation.[1] To minimize the potential for spills, the GSU transformer will be equipped with a secondary containment trap sized to contain the amount of oil inside the transformer plus an additional volume for deluge water and required freeboard. [Final Order on AMD4]

230-kV Overhead Transmission Line

The solar facility will include an approximately 1900-foot long 230 kV overhead transmission line connecting the Collector Substation to the existing Biglow Canyon Substation. The transmission line will be supported by three 80-foot steel monopole support structures. [Final Order on AMD4]

O&M Building

A new O&M facility will be constructed in the solar area. The O&M facility will include a steel building or prefabricated office structure with facilities for staff use; enclosures for storing spare parts and maintenance equipment; and space for parking service staging zone and clearance areas. The O&M facility will have a septic system, and a septic system permit will be obtained from the Sherman County Public Health Department. Small quantities of lubricants, degreasers, herbicides, or other chemicals may be stored at the O&M facilities. In addition, up to approximately 4,080 spare modules may be stored at the O&M facilities for replacement over the life of the solar components. [Final Order on AMD4]

Communications and SCADA System

The SCADA for the solar facility will be integrated with the SCADA for the wind facility, allowing facility operating parameters, power output, and other variables such as meteorological conditions to be constantly monitored from the facility control rooms and remote locations. [Final Order on AMD4]

Internal Access Roads

Approximately 10.5 miles of new access roads will be constructed within the solar array areas to provide access to the facility components. In accordance with Oregon Fire Code Section 503, roads needed for emergency access will be approximately 20 feet wide and designed to meet load requirements for all equipment and emergency access needs. Other roads would be

[1] Consistent with federal regulations, the oils used in transformers do not contain polychlorinated biphenyls or compounds listed as extremely hazardous by the U.S. Environmental Protection Agency.

approximately 16 feet wide. All roads would have a 10-foot buffer maintained with low-growing, fire resistant vegetation on either side. [Final Order on AMD4]

Perimeter Fencing, and Gates

Each solar array, with any collocated related or supporting facility components, will be enclosed by seven-foot-tall chain-link perimeter fencing with one foot of razor or barbed wire at the top. Alternatively, wire mesh or similar perimeter fencing up to 8 feet in height may be used. Fences will be constructed and grounded in accordance with NESC Rule 110. Vehicle access to the facility will be provided by lockable vehicle gates. Additional gates may be installed for emergency exit or removal of wildlife. [Final Order on AMD4]

Temporary *Construction Areas*

Up to 8.7 acres will be used as a temporary construction area to store supplies and equipment and facilitate the delivery and assembly of materials and equipment during construction. Additional temporary construction areas may be utilized within the Solar Micrositing Area . The area will consist of a crushed gravel surface that will be removed following construction, crushed gravel surface that will remain following construction because that was the pre-existing surface condition, or vegetation that is left in place for which the need to revegetate will be evaluated following construction. Nonreportable quantities of herbicides, insecticides, paint, cleaners, solvents, or other chemicals may be used and stored in the temporary construction areas. Up to three aboveground 1,000-gallon fuel tanks may be installed in an area within the temporary construction area that provides secondary containment. Concrete for construction of foundations will come directly from licensed suppliers and there would not be an on-site batch plant installed at the temporary construction area. [Final Order on AMD4]

Solar Micrositing Area

The solar facility components are approved to be located within a 1,924-acre Solar Micrositing Area, as presented in Figure 1.

The existing Biglow Canyon Substation, which will be the point of interconnection for the solar facility components to the regional transmission grid, is located within the Solar Micrositing Area. [Final Order on AMD4]

3.3 Location of The Facility

The facility is located about 2.5 miles northeast of the City of Wasco in Townships 1 and 2 North, Ranges 17 and 18 East, Willamette Meridian, Sherman County, Oregon. The Solar Micrositing Area is located approximately 4.8 miles northeast of the Town of Wasco. [Final Order on ASC, AMD4]

The conditions of this Site Certificate are organized and coded to indicate the phase of implementation, the standard the condition is required to satisfy, and an identification number (1, 2, 3, etc.).[2] The table below presents a "key" for phase of implementation:

Key	Type of Conditions/Phase of Implementation
GEN	General Conditions: Design, Construction and Operation
PRE	Pre-Construction Conditions
CON	Construction Conditions
PRO	Pre-Operational Conditions
OPR	Operational Conditions
RET	Retirement Conditions

The facility is approved to be constructed in phases. Therefore, preconstruction and construction conditions include language allowing for the condition to be satisfied based on the applicability of the requirements to the location or component to be constructed, rather than the entirety of the facility, components or site not yet constructed or impacted.

4.0 Conditions Applicable to the Entire Facility

The conditions listed in this section are based on representations in the site certificate application and supporting record. The Council deems these representations to be binding commitments made by the certificate holder. These conditions are required under OAR 345-025-0006(10).

This section includes other specific facility conditions the Council finds necessary to ensure compliance with the siting standards of OAR Chapter 345, Divisions 22 and 24, and to protect the public health and safety.

[2] The identification number is not representative of an order that conditions must be implemented; it is intended only to represent a numerical value for identifying the condition.

4.1 General (GEN) Conditions: Design, Construction and Operations

Condition Number	General (GEN) Conditions
STANDARD: GENERAL STANDARD OF REVIEW (GS) [OAR 345-022-0000]	
GEN-GS-01	The Council shall not change the conditions of the site certificate except as provided for in OAR Chapter 345, Division 27. [OAR 345-027-0020(1); Final Order on ASC, Condition 101; AMD4]
GEN-GS-02	Notwithstanding OAR 345-027-0353(1), an amendment of the site certificate is required if the proposed change would increase the electrical generation capacity of the facility or would increase the number of wind turbines or the dimensions of existing wind turbines. [Final Order on ASC, Condition 14; AMD4]
GEN-GS-03	The certificate holder shall design, construct, operate and retire the facility: a. Substantially as described in the site certificate; b. In compliance with the requirements of ORS Chapter 469, applicable Council rules, and applicable state and local laws, rules and ordinances in effect at the time the site certificate is issued; and c. In compliance with all applicable permit requirements of other state agencies. [OAR 345-027-0020(3); Final Order on ASC, Conditions 13, 103; AMD4]
GEN-GS-04	If the certificate holder becomes aware of a significant environmental change or impact attributable to the facility, the certificate holder shall, as soon as possible, submit a written report to the Department describing the impact on the facility and any affected site certificate conditions. [OAR 345-027-0028; Final Order on ASC, Condition 120; AMD3; AMD4]
GEN-GS-05	The certificate holder shall prevent the development of any conditions on the site that would preclude restoration of the site to a useful, non-hazardous condition to the extent that prevention of such site conditions is within the control of the certificate holder. [OAR 345-027-0020(7); Final Order on ASC, Condition 107; AMD4]
STANDARD: Organizational Expertise (OE) [OAR 345-022-0010]	
GEN-OE-01	Before any transfer of ownership of the facility or ownership of the site certificate holder, the certificate holder shall inform the Department of the proposed new owners. The requirements of OAR 345-027-0400 apply to any transfer of ownership that requires a transfer of the site certificate. [OAR 345-027-0020(15); Final Order on ASC; Condition 115; AMD3; AMD4]
GEN-OE-02	The certificate holder shall contractually require all contractors and subcontractors involved in the construction or operation of the facility to comply with all applicable laws and regulations and with the terms and conditions of the site certificate. Such contractual provisions shall not operate to relieve the certificate holder of responsibility under the site certificate. Any notice of violation, civil penalties, or other enforcement action issued under the site certificate will be issued to the certificate holder.

Condition Number	General (GEN) Conditions
	[Final Order on ASC, Condition 2; AMD4]
GEN-OE-03	The certificate holder shall obtain all necessary state and local permits or approvals required for construction, operation and retirement of the facility or ensure that its contractors obtain necessary state and local permits or approvals. [Final Order on ASC, Condition 15; AMD4]
GEN-OE-04	The certificate holder shall, as soon as reasonably possible: a. Report incidents or circumstances that may violate the terms or conditions of the site certificate, terms or conditions of any order of the Council, to the Department. In the report to the Department, the certificate holder shall provide all pertinent facts including an estimate of how long the conditions or circumstances existed, how long they are expected to continue before they can be corrected, and whether the conditions or circumstances were discovered as a result of a regularly scheduled compliance audit; b. Initiate and complete appropriate action to correct the conditions or circumstances and to minimize the possibility of recurrence; c. Submit a written report within 30 days of discovery to the Department. The report must contain: i. A discussion of the cause of the reported conditions or circumstances; ii. The date of discovery of the conditions or circumstances by the responsible party; iii. A description of immediate actions taken to correct the reported conditions or circumstances; iv. A description of actions taken or planned to minimize the possibility of recurrence; and v. For conditions or circumstances that may violate the terms or conditions of a site certificate, an assessment of the impact on the resources considered under the standards of OAR Chapter 345 Divisions 22 and 24 as a result of the reported conditions or circumstances. d. Upon receipt of a written report submitted under this condition, the Department may review the facility record for incidents or circumstances related to public health and safety, the environment, or other resources protected under Council standards. If these incidences are determined by the Department to impact the adequacy of the facility decommissioning cost, the Department or Council may adjust the contingencies identified in Final Order on RFA4, Attachment I and shall request and receive an updated bond or letter of credit from certificate holder in the adjusted amount. [Final Order on ASC, Condition 4; AMD4]
GEN-OE-05	The certificate holder shall notify the Department of Energy within 72 hours of any occurrence involving the facility if: a. There is an attempt by anyone to interfere with its safe operation;

Condition Number	General (GEN) Conditions
	b. A natural event such as an earthquake, flood, tsunami or tornado, or a human-caused event such as a fire or explosion affects or threatens to affect the public health and safety or the environment; or c. There is any fatal injury at the facility. [OAR 345-026-0170; Final Order on ASC, Condition 125; AMD3, AMD4]
GEN-OE-06	The certificate holder and the Department of Energy shall exchange copies of all correspondence or summaries of correspondence related to compliance with statutes, rules and local ordinances on which the Council determined compliance, except for material withheld from public disclosure under state or federal law or under Council rules. The certificate holder may submit abstracts of reports in place of full reports; however, the certificate holder shall provide full copies of abstracted reports and any summarized correspondence at the request of the Department. [OAR 345-026-0105; Final Order on ASC, Condition 124, AMD3, AMD4]
GEN-OE-07	During construction, operation or retirement of the facility, the certificate holder shall notify the Department within 72 hours of any accidents that may result in public health and safety concerns, including mechanical failures on the site associated with construction or operation of the facility. [Final Order on ASC, Condition 37; AMD4]
STANDARD: Soil Protection (SP) [OAR 345-022-0022]	
GEN-SP-01	The certificate holder shall use hazardous materials in a manner that protects public health, safety and the environment and shall comply with applicable local, state and federal environmental laws and regulations. [Final Order on ASC, Condition 80; AMD4]
STANDARD: Land Use (LU) [OAR 345-022-0030]	
GEN-LU-01	The certificate holder shall ensure that no equipment or machinery is parked or stored on any county road except while in use. [Final Order on ASC, Condition 18; AMD4]
STANDARD: Retirement and Financial Assurance (RF) [OAR 345-022-0050]	
GEN-RF-01	a. Prior to construction of the facility, or any component of the facility, the certificate holder shall submit to the State of Oregon, through the Council, a bond or letter of credit in a form and amount satisfactory to the Council to restore the site to a useful, non-hazardous condition. The certificate holder shall maintain a bond or letter of credit in effect at all times until the facility has been retired. The Council may specify different amounts for the bond or letter of credit during construction and during operation of the facility. b. The certificate holder shall annually adjust all bonds or letters of credit submitted in compliance with this condition to present value using the U.S. Gross Domestic Product Implicit Price Deflator, Chain-Weight, as published in the Oregon Department of Administrative Services' Oregon Economic and Revenue Forecast or by any successor agency (the "Index"). If at any time the Index is no

Condition Number	General (GEN) Conditions
	longer published, the Department shall select a comparable calculation to adjust the amount to present value. [Final Order on ASC, Condition 108; AMD3; AMD4]
GEN-RF-02	For the wind energy facility, the bond or letter of credit required under Condition GEN-RF-01 shall be in an amount approved by the Department and based on the costs shown in Table 1 of the Final Order on Amendment #3. The certificate holder shall adjust the amounts of all bonds or letters of credit submitted in compliance with this condition to present value as of the date of issuance, using the following calculation and subject to approval by the Department: a. Adjust the Subtotal (in 2005 dollars) to present value, using the U.S. Gross Domestic Product Implicit Price Deflator, Chain-Weight, as published in the Oregon Department of Administrative Services' Oregon Economic and Revenue Forecast or by any successor agency (the "Index"). If at any time the Index is no longer published, the Council shall select a comparable calculation to adjust 2005 dollars to present value. b. Add 1 percent of the adjusted Subtotal (i) for the adjusted performance bond amount to determine the adjusted Gross Cost. c. Add 10 percent of the adjusted Gross Cost (ii) for the adjusted administration and project management costs and 10 percent of the adjusted Gross Cost for the adjusted future developments contingency. d. Add the adjusted Gross Cost (ii) to the sum of the percentages (iii) and round the resulting total to the nearest $1,000 to determine the adjusted financial assurance amount. [Final Order on ASC, Condition 9, AMD2, AMD3, AMD4]
GEN-RF-03	For the solar facility, the bond or letter of credit required under Condition GEN-RF-01 shall be in an amount approved by the Department and based on the unit costs, markups, and contingencies shown in Attachment J of the Final Order on RFA4, as updated under Condition PRE-RF-01. [Final Order on AMD4, Retirement and Financial Assurance Condition 1]
GEN-RF-04	If the certificate holder elects to use a bond to meet the requirements of Condition GEN-RF-01, the certificate holder shall ensure that the surety is obligated to comply with the requirements of applicable statutes, Council rules and this site certificate when the surety exercises any legal or contractual right it may have to assume construction, operation or retirement of the facility. The certificate holder shall also ensure that the surety is obligated to notify the Council that it is exercising such rights and to obtain any Council approvals required by applicable statutes, Council rules and this site certificate before the surety commences any activity to complete construction, operate or retire the facility. [Final Order on ASC, Condition 10, AMD4]
STANDARD: Fish and Wildlife Habitat (FW) [OAR 345-022-0060]	

Condition Number	General (GEN) Conditions
GEN-FW-01	The certificate holder shall design and construct all aboveground transmission line support structures following the current practices suggested by the Avian Powerline Interaction Committee at the time of design. [Final Order on ASC, Condition 58; AMD4]
STANDARD: Siting Standards for Transmission Lines (TL) [OAR 345-024-0090]	
GEN-TL-01	The certificate holder shall design all overhead transmission lines so that alternating current electric fields shall not exceed 9 kV per meter at one meter above the ground surface in areas accessible to the public. [Final Order on ASC, Condition 53; AMD4]
GEN-TL-02	The certificate holder shall design all overhead transmission lines so that induced voltages resulting from the transmission lines are as low as reasonably achievable. [Final Order on ASC, Condition 54; AMD4]
STANDARD: Other – Removal-Fill (WL)	
GEN-WL-01	The certificate holder shall avoid any disturbance, including the placement of poles for the collector line, within 25 feet of the stream channel in the area identified as Crossing G in the Request for Amendment #2 and within a wetland area identified as "POWHX" on Figure J-1 of the site certificate application. [Final Order on AMD2, Condition 127; AMD4]
GEN-WL-02	The certificate holder shall avoid any disturbance within 25 feet of the stream channel in the area identified as "Stream Crossing H" in the Request for Amendment #3 and shall install any collector line through the area by tunneling or drilling beneath the stream channel. [Final Order on AMD3, Condition 129; AMD4]

4.2 Operational (OPR) Conditions

Condition Number	Operational (OPR) Conditions
STANDARD: Organizational Expertise (OE) [OAR 345-022-0010]	
OPR-OE-01	a. By April 30 of each year after beginning construction, the certificate holder shall submit an annual report to the Department. The Council Secretary and the certificate holder may, by mutual agreement, change the reporting date. b. In the annual report, the certificate holder shall include the following information for the calendar year preceding the date of the report: i. Facility Status: An overview of site conditions, the status of facilities under construction, and a summary of the operating experience of facilities that are in operation. In this section of the annual report, the certificate holder shall describe any unusual events, such as earthquakes, extraordinary windstorms, major accidents or the like that occurred during the year and that had a significant adverse impact on the facility. ii. Reliability and Efficiency of Power Production: For electric power plants, the plant availability and capacity factors for the reporting year. The certificate holder shall describe any equipment failures or plant breakdowns that had a significant impact on those factors and shall describe any actions taken to prevent recurrence of such problems; iii. Status of Surety Information: Documentation demonstrating that bonds or letters of credit as described in the site certificate are in full force and effect and will remain in full force and effect for the term of the next reporting period; iv. Monitoring Report: A list and description of all significant monitoring and mitigation activities performed during the previous year in accordance with site certificate terms and conditions, a summary of the results of those activities, and a discussion of any significant changes to any monitoring or mitigation program, including the reason for any such changes. v. Compliance Report: A description of all instances of noncompliance with a site certificate condition. For ease of review, the certificate holder shall, in this section of the report, use numbered subparagraphs corresponding to the applicable sections of the site certificate. vi. Facility Modification Report: A summary of changes to the facility that the certificate holder has determined do not require a site certificate amendment in accordance with OAR 345-027-0350. c. To the extent that information required by this condition is contained in reports the certificate holder submits to other state, federal or local agencies, the certificate holder may submit excerpts from such other reports to satisfy this condition. The Council reserves the right to request full copies of such excerpted reports.

Condition Number	Operational (OPR) Conditions
	[OAR 345-026-0080; Final Order on ASC, Condition 122; AMD3; AMD4]
STANDARD: Soil Protection (SP) [OAR 345-022-0020]	
OPR-SP-01	During operation of the facility, the certificate holder may engage in wind turbine blade and solar panel washing activities but shall ensure that these activities do not cause runoff of washwater from the site or discharges to surface waters, storm sewers or dry wells. The certificate holder shall not use acids, bases or metal brighteners with the wash water. The certificate may use biodegradable, phosphate-free cleaners sparingly. [Final Order on ASC, Condition 88; AMD2; AMD4]
OPR-SP-02	a. If a spill or release of a reportable quantity of fuel, oil, or other hazardous materials occurs during construction or operation of the facility, the certificate holder shall notify the Department within 72 hours. b. The certificate holder shall clean up any spill or release of hazardous materials and dispose of any contaminated soil or other materials according to applicable regulations. c. The certificate holder shall ensure that spill kits containing items such as absorbent pads are located on equipment and storage facilities to respond to accidental spills and shall instruct employees handling hazardous materials in the proper handling, storage and cleanup of these materials. [Final Order on ASC, Condition 81; AMD4]
STANDARD: Land Use (LU) [OAR 345-022-0030]	
OPR-LU-01	During operation of the facility, the certificate holder, in cooperation with landowners, shall avoid impact on cultivated land to the extent reasonably possible when performing facility repair and maintenance activities. [Final Order on ASC, Condition 22; AMD4]
STANDARD: Retirement and Financial Assurance (RF) [OAR 345-022-0050]	
OPR-RF-01	During operation of the facility, the certificate holder shall: a. Annually adjust the amount of bonds or letters of credit provided to satisfy Condition GEN-RF-01 to present dollar value, as determined by the Department. The Department shall adjust to present value using the U.S. Gross Domestic Product Implicit Price Deflator, Chain-Weight, as published in the Oregon Department of Administrative Services' Oregon Economic and Revenue Forecast or by any successor agency (the "Index"). If at any time the Index is no longer published, the Department shall select a comparable calculation to adjust the amount to present value. b. Incorporate any additional decommissioning costs for proposed facility changes which have been determined by the Department not to require a site certificate amendment. c. The Department and Council reserve the right to adjust the contingencies, as appropriate and necessary to protect public health and safety or the environment

Condition Number	Operational (OPR) Conditions
	and ensure the certificate holder's bond or letter of credit is sufficient to restore the site to a useful, non-hazardous condition. [Final Order on AMD4, Retirement and Financial Assurance Condition 3]
STANDARD: Fish and Wildlife Habitat (FW) [OAR 345-022-0060]	
OPR-FW-01	The certificate holder shall conduct wildlife monitoring and mitigation in accordance with the Wildlife Monitoring and Mitigation Plan that is incorporated in the Final Order on Amendment #2 as Attachment A and as may be amended from time to time. [Final Order on ASC, Condition 61; AMD2; AMD4]
OPR-FW-02	For the life of the project, the certificate holder shall provide to the appropriate staff of the Confederated Tribes of the Warm Springs Reservation of Oregon the same annual mitigation and monitoring reports it submits to the Department. [Final Order on ASC, Condition 64; AMD4]
OPR-FW-03	For the life of the project, the certificate holder shall consult annually with the appropriate staff of the Confederated Tribes of the Warm Springs Reservation of Oregon to discuss noxious weed or other issues that may arise from the close proximity of the facility site and tribal lands. The certificate holder shall provide a summary of that consultation in the annual report it provides to the Department. [Final Order on ASC, Condition 65; AMD4]
STANDARD: Public Services (PS) [OAR 345-022-0110]	
OPR-PS-01	During operation of the facility, for any water needed from offsite sources, the certificate holder and its contractors shall: a. Identify all water-related needs and estimate daily and annual water demand for facility operations. b. Provide evidence such as a contract or purchase agreement demonstrating that adequate water supply to meet facility operational demand has been secured and that water for all operational activities will be legally obtained by service providers or third-party permits. [Final Order on ASC, Condition 76; AMD4]
OPR-PS-02	During operation of the facility, the certificate holder shall develop and implement a site health and safety plan that informs on-site employees and others what to do in case of an emergency and that includes the locations of fire extinguishers and nearby hospitals, important telephone numbers, and first aid techniques. [Final Order on ASC, Condition 47]
STANDARD: Waste Minimization (WM) [OAR 345-022-0120]	
OPR-WM-01	During operation of the facility, the certificate holder shall discharge sanitary wastewater generated at the O&M buildings to licensed on-site septic systems in compliance with county permit requirements. The certificate holder shall design the septic systems with a capacity that is less than 2,500 gallons per day. [Final Order on ASC, Condition 83; AMD3; AMD4]
OPR-WM-02	During operation of the facility, the certificate holder shall implement a waste management plan that includes but is not limited to the following :

Condition Number	Operational (OPR) Conditions
	a. The format, content and frequency of employee trainings to minimize the generation of solid waste, recycle materials, and properly handle and dispose of electronic wastes and hazardous materials; b. Identify names and locations of licensed haulers and facilities that will be used for the following, including associated collection and hauling protocols and requirements: i. Recycling paper products, metals, glass and plastics, and other recyclable materials; ii. Disposing non-recyclable, nonhazardous waste for transport to a landfill; c. Identify a procedure or process for evaluating whether photovoltaic modules, batteries, or other facility components are considered hazardous waste under state or federal regulations; d. Identify procedures for the segregation of recyclable materials, nonhazardous waste, and hazardous waste sources for transport and disposal by a licensed hauler specializing in the proper recycling or disposal of the wastes; e. Identify inspection and recordkeeping procedures for waste handling, disposal and recycling; and f. Include a provision allowing for updates of the plan, subject to the Department review and approval. [Final Order on ASC, Condition 87; AMD4]
STANDARD: Other – Water Rights (WR)	
OPR-WR-01	a. For any onsite exempt wells, combined water usage shall not exceed 5,000 gallons per day for domestic use at the facility's O&M buildings and solar panel and blade-washing activities. b. If new exempt wells are constructed for the solar facility, the certificate holder shall install flow meters on the existing and new wells; monitor the volume of groundwater used from all onsite wells on a daily basis, maintain a record of such use and make the monitoring records available to the Department upon request. [Final Order on ASC, Condition 75; AMD3, AMD4]

4.3 Retirement (RET) Conditions

Condition Number	Retirement (RET) Conditions
STANDARD: Retirement and Financial Assurance (RF) [OAR 345-022-0050]	
RET-RF-01	a. The certificate holder shall retire the facility if the certificate holder permanently ceases construction or operation of the facility. The certificate holder shall retire the facility according to a final retirement plan approved by the Council, as described in OAR 345-027-0110. The certificate holder shall pay the actual cost to restore the site to a useful, non-hazardous condition at the time of

Condition Number	Retirement (RET) Conditions
STANDARD: Retirement and Financial Assurance (RF) [OAR 345-022-0050]	
	retirement, notwithstanding the Council's approval in the site certificate of an estimated amount required to restore the site. b. If the certificate holder permanently ceases construction or operation of a portion of the facility that is, by itself, an energy facility under ORS 469.300, the certificate holder must retire that portion of the facility within two years following cessation of construction or operation of the facility components in accordance with the provisions of OAR 345-027-0110(10). [OAR 345-027-0020(9); Final Order on ASC, Condition 109; AMD4]
RET-RF-02	If the Council finds that the certificate holder has permanently ceased construction or operation of the facility without retiring the facility according to a final retirement plan approved by the Council, as described in OAR 345-027-0110, the Council shall notify the certificate holder and request that the certificate holder submit a proposed final retirement plan to the Office within a reasonable time not to exceed 90 days. If the certificate holder does not submit a proposed final retirement plan by the specified date, the Council may direct the Department to prepare a proposed a final retirement plan for the Council's approval. Upon the Council's approval of the final retirement plan, the Council may draw on the bond or letter of credit provided under Condition GEN-RF-01 to restore the site to a useful, non-hazardous condition according to the final retirement plan, in addition to any penalties the Council may impose under OAR Chapter 345, Division 29. If the amount of the bond or letter of credit is insufficient to pay the actual cost of retirement, the certificate holder shall pay any additional cost necessary to restore the site to a useful, non-hazardous condition. After completion of site restoration, the Council shall issue an order to terminate the site certificate if the Council finds that the facility has been retired according to the approved final retirement plan. [OAR 345-027-0020(160); Final Order on ASC, Condition 116; AMD3, AMD4]

5.0 Conditions Applicable to the Wind Energy Facility

5.1 General (GEN) Conditions: Design, Construction and Operations

Condition Number	General (GEN) Conditions
STANDARD: Land Use (LU) [OAR 345-022-0030]	
GEN-LU-02	The certificate holder shall construct the public road improvements described in the site certificate application to meet or exceed road standards for the road classifications in the County's Transportation System Plan and Zoning Ordinance because roads will require a more substantial section to bear the weight of the vehicles and turbine components than would usually be constructed by the County. [Final Order on ASC, Condition 17; AMD4]
GEN-LU-03	The site certificate holder shall design and construct private access roads associated with the wind energy facility to minimize the division of existing farm units. [Final Order on ASC, Condition 19; AMD4]
GEN-LU-04	The certificate holder shall not locate any aboveground facility structure associated with the wind energy facility (including wind turbines, O&M buildings, substations, and meteorological towers, but not including aboveground transmission and collector lines and junction boxes) within 30 feet from any property line or within 50 feet from the right-of-way of any arterial or major collector road or street and shall not allow any architectural feature, as described in Sherman County Zoning Ordinance Section 4.2, to project into these required setbacks by more than 2 feet. [Final Order on ASC, Condition 19; AMD3, AMD4]
GEN-LU-05	The certificate holder shall locate access roads associated with the wind energy facility to minimize disturbance with farming practices and, wherever feasible, shall place turbines and transmission interconnection lines along the margins of cultivated areas to reduce the potential for conflict with farm operations. The certificate holder shall place aboveground collector lines and junction boxes along property lines and public road rights-of-way to the extent practicable. [Final Order on ASC, Condition 19; AMD2, AMD4]
GEN-LU-06	Where necessary and feasible, the certificate holder shall provide access to fields within the wind energy facility site and otherwise provide adequate and timely access to properties during critical periods in the farming cycle, such as harvest. [Final Order on ASC, Condition 19; AMD4]
GEN-LU-07	Before beginning construction of the wind energy facility, the certificate holder shall record a Farm Management Easement covering the properties on which the certificate holder locates wind power generation facilities. The certificate holder shall record the easements in the real property records of Sherman County and shall file a copy of the recorded easement with the Sherman County Planning Director.

Condition Number	General (GEN) Conditions
	[Final Order on ASC, Condition 19; AMD4]
GEN-LU-08	The certificate holder shall remove from Special Farm Assessment the portions of parcels on which facilities are located and shall pay all property taxes due and payable after the Special Farm Assessment is removed from such properties. [Final Order on ASC, Condition 19; AMD4]
GEN-LU-09	With respect to any turbine constructed within a micrositing corridor approved by the Council after November 21, 2007, the certificate holder shall not locate such turbine within the setback prescribed by Section 4 of the Sherman County Wind Power Set Back Ordinance (Ordinance No. 39-2007) unless the Council has approved a variance to such setback for the turbine or the certificate holder has negotiated a setback agreement with the affected adjacent property owner and wind project developer. [Final Order on AMD3, Condition 128; AMD4]
STANDARD: Fish and Wildlife Habitat (FW) [OAR 345-022-0060]	
GEN-FW-02	The certificate holder may construct turbines and other facility components within the 500-foot turbine corridors shown on Figures P-1 through P-10 of the site certificate application and March 2006 supplement and within the "Permitted Areas" and "Amendment III Areas" as shown on Figures 2, 2a, 2b and 2c of the Request for Amendment #3, subject to the following requirements addressing potential habitat impact: a. The certificate holder shall not construct any facility components within areas of Category 1 or Category 2 habitat and shall avoid temporary disturbance of Category 1 or Category 2 habitat. b. The certificate holder shall design and construct facility components that are the minimum size needed for safe operation of the energy facility. c. Prior to constructing any turbines or permanent related or supporting facilities within the northward extension of Corridor 3 shown on Figure 2a of the Request for Amendment #3, the certificate holder shall provide the Department with maps and calculations documenting the additional permanent impacts, if any, to Category 3 and Category 4 habitat predicted to result from construction. If the construction would result in additional permanent impacts, the certificate holder shall increase the area of mitigation for permanent loss of Category 3 and Category 4 habitat as described in the Habitat Mitigation Plan incorporated herein by GEN-FW-03. [Final Order on ASC, Condition 59; AMD3; AMD4]
GEN-FW-03	Before beginning construction of the facility, the certificate holder shall acquire the legal right to create, maintain and protect a habitat mitigation area for the life of the facility by means of an outright purchase, conservation easement or similar conveyance and shall provide a copy of the documentation to the Department. Within the habitat mitigation area, the certificate holder shall improve the habitat quality in accordance with the Habitat Mitigation Plan that is incorporated in the

Condition Number	General (GEN) Conditions
	Final Order on Amendment #3 as Attachment C and as may be amended from time to time. [Final Order on ASC, Condition 63; AMD2; AMD3; AMD4]
STANDARD: Historic, Cultural and Archaeological Resources (HC) [OAR 345-022-0090]	
GEN-HC-01	Before beginning construction of any phase of the facility, the certificate holder shall provide to the Department a map showing the final design locations of all components of that phase of the facility and areas that would be temporarily disturbed during construction and also showing the areas surveyed by CH2M Hill and Archaeological Investigations Northwest, Inc. (AINW) in preparing the Cultural Resources Surveys for Biglow Canyon Wind Farm included in the site certificate application as Attachment S-1 and in Request for Amendment #2 as Attachment 15. The certificate holder shall hire qualified personnel to conduct field investigation of all areas of permanent or temporary disturbance that CH2M Hill and AINW did not previously survey and shall provide to the Department a written report of the field investigation. If any significant historic, cultural or archaeological resources are found during the field investigation, the certificate holder shall ensure that construction and operation of the facility will have no impact on the resources. The certificate holder shall instruct all construction personnel to avoid areas where the resources were found and shall implement other appropriate measures to protect the resources. [Amendment #2]
STANDARD: Public Health and Safety for Wind Energy Facilities (PHSW) [OAR 345-024-0010]	
GEN-PHSW-01	Before beginning construction or alteration of any phase of the wind energy facility, the certificate holder shall submit a Notice of Proposed Construction or Alteration to the Federal Aviation Administration (FAA) identifying the proposed final locations of the turbines and related or supporting facilities for that phase of the facility. The certificate holder shall notify the Department of the FAA's response as soon as it has been received. [Final Order on ASC, Condition 38; AMD4]
GEN-PHSW-02	The certificate holder shall enclose the facility substation with appropriate fencing and locked gates to protect the public from electrical hazards. [Final Order on ASC, Condition 39; AMD4]
GEN-PHSW-03	The certificate holder shall not locate turbine towers within 450 feet of any residence. The certificate holder shall not locate turbine towers within 450 feet of any public road, unless the certificate holder demonstrates to the Department's satisfaction that a lesser setback is consistent with the protection of public health and safety. [Final Order on ASC, Condition 40; AMD4]
GEN-PHSW-04	The certificate holder shall construct turbine towers that are smooth steel structures with no exterior ladders or access to the turbine blades and shall install locked access doors accessible only to authorized personnel. [Final Order on ASC, Condition 41; AMD4]

Condition Number	General (GEN) Conditions
GEN-PHSW-08	During construction of the wind energy facility, the certificate holder shall install generator step-up transformers at the base of each turbine tower in locked cabinets designed to protect the public from electrical hazards and to avoid creation of artificial habitat for raptor prey. [Final Order on ASC, Condition 45; AMD4]
Siting Standards for Wind Energy Facilities (WF) [OAR 345-024-0015]	
GEN-WF-01	The certificate holder shall construct turbines on concrete foundations and shall cover the ground within a minimum 10-foot radius with non-flammable material. The certificate holder shall maintain the non-flammable pad area covering throughout operation of the facility. [Final Order on ASC, Condition 48; AMD4]
GEN-WF-03	During construction of the wind energy facility, to reduce the visual impact of the facility, the certificate holder shall: a. Paint turbine towers, nacelles, rotors, meteorological towers, and cabinets containing pad-mounted equipment with a low-reflectivity, neutral gray, white, off-white or earth tone finish to reduce contrast with the surrounding background. b. Apply a low-reflectivity finish to the exterior of the O&M buildings and substation equipment to control their visual integration into the surrounding background. c. With the exception of the turbine manufacturer's logo that may appear on turbine nacelles, not allow any advertising to be used on any part of the facility or on any signs posted at the facility. In addition, the certificate holder may place its logo on the nacelles of not more than 20 percent of the wind turbines. d. Use only those signs required by law or for facility safety or security, except that the certificate holder may erect a sign near the O&M facility or substation to identify the wind energy facility. [Final Order on ASC, Condition 50; AMD2;AMD3; AMD4]
GEN-WF-04	The certificate holder shall design and construct the O&M buildings for the wind energy facility to be generally consistent with the character of similar buildings used by commercial farmers or ranchers in the area and shall paint the building in a neutral color to blend with the surrounding background. [Final Order on ASC, Condition 51; AMD3; AMD4]
GEN-WF-05	The certificate holder shall not use exterior nighttime lighting at the wind energy facility except: a. The minimum turbine tower lighting required by the Federal Aviation Administration. b. Security lighting at the O&M buildings and substation, provided that such lighting is shielded or directed downward to reduce glare. c. Minimum lighting necessary for repairs or emergencies.

Condition Number	General (GEN) Conditions
	d. Minimum lighting necessary for nighttime construction. The certificate holder may use lighting only at the work location and only directed downward to illuminate the work area at the turbine base or upward from the base to illuminate the turbine tower; construction lighting shall not be directed outward. The certificate holder shall use nighttime lighting only with the approval of the owner of the property on which the work is conducted and shall provide notice of nighttime construction to occupants of all residences within one-half mile of the construction site. [Final Order on ASC, Condition 52; AMD3]
STANDARD: Siting Standards for Transmission Lines (TL) [OAR 345-024-0090]	
GEN-TL-03	The certificate holder shall take reasonable steps to reduce or manage exposure to electromagnetic fields (EMF), consistent with Council findings presented in the "Report of EMF Committee to the Energy Facility Siting Council," March 30, 1993, and subsequent findings. Effective on the date of this site certificate, the certificate holder shall provide information to the public, upon request, about EMF levels associated with the wind energy facility and its related transmission lines. [Final Order on ASC, Condition 38; AMD4]
GEN-TL-04	a. The certificate holder shall design, construct and operate transmission lines associated with the wind energy facility in accordance with the requirements of the National Electrical Safety Code (American National Standards Institute, Section C2, 1997 Edition); and b. The certificate holder shall develop and implement a program that provides reasonable assurance that all fences, gates, cattle guards, trailers, or other objects or structures of a permanent nature that could become inadvertently charged with electricity by the transmission lines are grounded or bonded throughout the life of the line. [Final Order on ASC, Condition 118; AMD3; AMD4]
STANDARD: Other – Removal-Fill (WL)	
GEN-WL-01	The certificate holder shall avoid any disturbance, including the placement of poles for the collector line, within 25 feet of the stream channel in the area identified as Crossing G in the Request for Amendment #2 and within a wetland area identified as "POWHX" on Figure J-1 of the site certificate application. [Final Order on AMD2, Condition 127; AMD4]
GEN-WL-02	The certificate holder shall avoid any disturbance within 25 feet of the stream channel in the area identified as "Stream Crossing H" in the Request for Amendment #3 and shall install any collector line through the area by tunneling or drilling beneath the stream channel. [Final Order on AMD3, Condition 129; AMD4]

5.2 Operational (OPR) Conditions

Condition Number	Operational (OPR) Conditions
STANDARD: Soil Protection (SP) [OAR 345-022-0020]	
OPR-SP-03	The certificate holder shall cover turbine pad areas with gravel or other non-erosive material immediately following exposure and shall maintain the pad area covering during operation of the facility. [Final Order on ASC, Condition 28; AMD4]
OPR-SP-04	During operation of the wind energy facility, the certificate holder shall restore areas that are temporarily disturbed during facility maintenance or repairs according to the methods and monitoring procedures in the Revegetation Plan included as Attachment B to the Final Order on the ASC, as amended. [Final Order on ASC, Condition 29; AMD4]
OPR-SP-05	During operation of the wind energy facility, the certificate holder shall routinely inspect and maintain all roads, pads and trenched areas and, as necessary, maintain or repair erosion control measures. [Final Order on ASC, Condition 30; AMD4]
STANDARD: Fish and Wildlife Habitat (FW) [OAR 345-022-0060]	
OPR-FW-04	During operation of the wind energy facility, the certificate holder shall implement a plan to control the introduction and spread of noxious weeds. The certificate holder shall develop the weed control plan in consultation with the Sherman County Weed Control District and the Department. [Final Order on ASC, Condition 49; AMD4]
STANDARD: Public Health and Safety for Wind Energy Facilities (PHSW) [OAR 345-024-0010]	
OPR-PHSW-01	During operation of the wind energy facility, the certificate holder shall follow manufacturers' recommended handling instructions and procedures to prevent damage to towers or blades that could lead to failure. [Final Order on ASC, Condition 42; AMD4]
OPR-PHSW-02	During operation of the wind energy facility, the certificate holder shall have an operational safety-monitoring program and shall inspect turbine blades on a regular basis for signs of wear. The certificate holder shall repair turbine blades as necessary to protect public safety. [Final Order on ASC, Condition 43; AMD4]
OPR-PHSW-03	During operation of the wind energy facility, the certificate holder shall install and maintain self-monitoring devices on each turbine, connected to a fault annunciation panel or supervisory control and data acquisition (SCADA) system at the O&M facility, to alert operators to potential dangerous conditions, and the certificate holder shall remedy any dangerous conditions immediately. [Final Order on ASC, Condition 44; AMD4]
OPR-PHSW-04	During operation of the wind energy facility, the certificate holder shall maintain built-in fire prevention measures in each turbine that would shut down the turbine automatically before mechanical problems create excess heat or sparks.

Condition Number	Operational (OPR) Conditions
	[Final Order on ASC, Condition 92; AMD4]
OPR-PHSW-05	During construction and operation of the wind energy facility, the certificate holder shall develop and implement fire management plans in consultation with local fire control authorities to minimize the risk of fire and to respond appropriately to any fires that occur on the facility site. In developing the fire management plans, the certificate holder should take into account the dry nature of the region and should address risks on a seasonal basis. [Final Order on ASC, Condition 93; AMD4]
OPR-PHSW-06	During construction and operation of the wind energy facility, the certificate holder shall ensure that each on-site company vehicle contains a fire extinguisher, water spray can, shovel, emergency response procedures book, and two-way radio for immediate communication with the O&M facility. [Final Order on ASC, Condition 94; AMD4]
OPR-PHSW-07	Upon beginning operation of the wind energy facility, the certificate holder shall provide to all local fire departments maps of the facility site. During operation of the facility, the certificate holder shall provide to all local fire departments the names and telephone numbers of facility personnel available to respond on a 24-hour basis in case of an emergency on the facility site. [Final Order on ASC, Condition 96; AMD4]
OPR-PHSW-08	During operation of the wind energy facility, the certificate holder shall ensure that all on-site employees receive annual fire prevention and response training by qualified instructors or members of the local fire department and that all employees are instructed to keep vehicles on roads and off dry grassland, except when off-road operation is required for emergency purposes. [Final Order on ASC, Condition 97; AMD4]
OPR-PHSW-09	During operation of the wind energy facility, the certificate holder shall comply with the written fire protection recommendations of the Fire Chief of the applicable Rural Fire Protection District and shall promptly provide to the Department any correspondence from the Fire Chief regarding those recommendations. [Final Order on ASC, Condition 98; AMD3, AMD4]

6.0 Conditions Applicable to the Solar Facility

6.1 General (GEN) Conditions: Design, Construction and Operations

Condition Number	General (GEN) Conditions
STANDARD: Soil Protection (SP) [OAR 345-022-0022]	
GEN-SP-02	Except for those fuels and oils covered by an SPCC Plan approved under Condition PRE-SP-01 or PRO-SP-02, no reportable quantities of hazardous materials or

Condition Number	General (GEN) Conditions
	substances, as defined in OAR chapter 340, division 142, may be stored at the site of any solar facility component. [Final Order on AMD4, Soil Protection Condition 8]
STANDARD: Land Use (LU) [OAR 345-022-0030]	
GEN-LU-10	All aboveground components of the solar facility, including perimeter fences, must be setback at least 50 feet from: a. The right-of-way line of an arterial or major collector road or street, including, but not limited, to Hilderbrand Lane (Old Wasco-Heppner Highway); b. The property line extending along a public road not described in (a); and c. Any property line with a tract that is not within the Solar Micrositing Area. [Final Order on AMD4, Land Use Condition 1]
GEN-LU-11	All components of the solar facility, including perimeter fences, must be setback at least 30 feet from the aggregate site located on Tax lot 02N18E00003900, as identified in Sherman County Ordinance 32-2006. Facility components must be arranged in a manner that allows for continued access to and operation of the aggregate site. [Final Order on AMD4, Land Use Condition 2]
GEN-LU-12	a. All structures and equipment associated with the solar facility, including but not limited to, power conversion stations, O&M buildings, and battery enclosures, must be designed or painted with a low-reflectivity, neutral gray, white, off-white or earth tone finish that minimizes contrast with the surrounding landscape. b. The certificate holder may install a sign identifying the facility near each O&M building or collector substation. No other signs may be installed except as required by law or for facility safety or security c. All lighting installed at the O&M buildings, substation, or other facility components, shall be limited in intensity, shielded, and directed downward in a manner that prevents the lighting from projecting onto adjacent properties and roadways. Final Order on AMD4, Land Use Condition 4]
STANDARD: Historic, Cultural and Archaeological Resources (HC) [OAR 345-022-0090]	
GEN-HC-02	The certificate holder must design, construct, and operate the solar facility to avoid archaeological sites (35SH00188, BSP-1-S02BSP-1-S10, and BSP-1-S12) and archaeological isolate (BSP-1-I04) with a 20-meter avoidance buffer. [Final Order on RFA4, Historic, Cultural, and Archaeological Condition 1]
GEN-HC-03	a. Prior to construction, the certificate holder must submit to the Department for approval, in consultation with SHPO, a Cultural Resources Monitoring Plan demonstrating that an Oregon Qualified Archaeologist or Tribal Cultural Resource Monitor will be onsite during ground disturbing activities at the site. The plan may provide for exceptions to monitoring scope and frequency, subject to

Condition Number	General (GEN) Conditions
	approval by the Department, in consultation with the Confederated Tribes of Warm Springs. b. During construction, the certificate holder shall adhere to the measures approved in the Cultural Resources Monitoring Plan. [Final Order on AMD4, Historic, Cultural, and Archaeological Condition 2]
STANDARD: Siting Standards for Transmission Lines (TL) [OAR 345-024-0090]	
GEN-TL-05	The certificate holder shall construct the 230-kV transmission line connecting the Biglow Canyon Substation to the Solar Substation within a 150-foot corridor, as presented in Figure 2 of the Amended Site Certificate. . [Final Order on ASC, Condition 119; AMD4]
GEN-TL-06	The certificate holder must design, construct, and operate transmission line associated with the solar facility in accordance with the requirements of the 2023 Edition of the National Electrical Safety Code. [Final Order on AMD4. Transmission Line Condition 1]

6.2 Pre-Construction (PRE) Conditions

Condition Number	Preconstruction (PRE) Conditions
STANDARD: General Standard of Review (GS) [OAR 345-022-0000]	
PRE-GS-01	Except as necessary for the initial survey, the certificate holder shall not begin construction, as defined in OAR 345-001-0010, of the solar facility, or create a clearing on any part of the solar micrositing area until the certificate holder has construction rights on all parts of the area. For the purpose of this rule, "construction rights" means the legal right to engage in construction activities. [Final Order on ASC; Condition 105; AMD3; AMD4; Mandatory Condition OAR 345-025-0006(5)]
STANDARD: Organizational Expertise (OE) [OAR 345-022-0010]	
PRE-OE-01	Prior to construction of any phase or component of the solar facility, the certificate holder shall notify the Department of the identity and qualifications of primary vendors; the engineering, procurement and construction contractors for specific portions of the work; and the identity and qualifications of the individuals that will manage and oversee the selected vendors and contractors. The certificate holder shall select vendors, contractors, and personnel dedicated to managing vendors and contractors that have substantial experience in the design and construction of similar facilities. The certificate holder shall report to the Department any change of major construction contractors or management personnel. [Final Order on ASC, Condition 1; AMD4]
PRE-OE-02	a. Prior to construction of any component or phase of the solar facility, the certificate holder shall submit, to the Department for review and approval, a plan that verifies compliance with all site certificate terms and conditions and applicable statutes and rules. As a part of the compliance plan, to verify compliance with the requirement to begin construction by the date specified in the site certificate, the certificate holder shall report promptly to the Department of Energy when construction begins. Construction is defined in OAR 345-001-0010. In reporting the beginning of construction, the certificate holder shall describe all work on the site performed before beginning construction, and shall state the cost of that work. For the purpose of this condition, "work on the site" means any work within the Solar Micrositing Area, other than surveying, exploration or other activities to define or characterize the site or corridor. b. The certificate holder shall implement the compliance plan prior to and during construction and make documentation of compliance available for inspection by the Department or the Council upon request. [Final Order on ASC, Condition 121 AMD3; AMD4]
PRE-OE-03	Prior to construction of any component or phase of the solar facility, the certificate holder shall: a. Provide the Department a list of federal, state and local permits, including any third-party permits; and a schedule for obtaining identified permits.

Condition Number	Preconstruction (PRE) Conditions
	b. Once obtained, provide copies of all permits, including third-party permits to the Department. [Final Order on AMD4; Organizational Expertise Condition 4]
STANDARD: Structural (SS) [OAR 345-022-0020]	
PRE-SS-01	a. Prior to construction of any component or phase of the solar facility, the certificate holder shall submit, to the Department for review and comment, a final geotechnical report that, at a minimum, addresses the recommendations in the Preliminary Geotechnical Engineering Report provided as RFA4, Exhibit H, Attachment H-2. b. The certificate holder shall prepare the report in accordance with the Oregon Board of Geologists Examiners 2014 Guidelines for Preparing Engineering Geologic Reports. c. The Department may utilize a third-party consultant in the review of the report. The certificate holder shall obtain concurrence from the Department that all comments have been adequately addressed before beginning construction. [Final Order on ASC, Condition 66; AMD4]
PRE-SS-02	The certificate holder shall notify the Department, the State Building Codes Division and the Department of Geology and Mineral Industries promptly if investigations or trenching in the Solar Micrositing Area reveal that conditions in the foundation rocks differ significantly from those described in Request for Amendment 4. After the Department receives the notice, the Council may require the certificate holder to consult with the Department of Geology and Mineral Industries and the Building Codes Division and to propose mitigation actions. [OAR 345-027-0020(13); Final Order on ASC, Condition 113; AMD3; AMD4]
PRE-SS-03	The certificate holder shall notify the Department, the State Building Codes Division and the Department of Geology and Mineral Industries promptly if shear zones, artesian aquifers, deformations or clastic dikes are found at or in the vicinity of the Solar Micrositing Area. [OAR 345-027-0020(14); Final Order on ASC, Condition 114; AMD3; AMD4]
STANDARD: Soil Protection (SP) [OAR 345-022-0020]	
PRE-SP-01	Prior to beginning construction of any component or phase of the solar facility, the certificate holder shall: a. Finalize the draft Comprehensive Solar Revegetation and Soil Management Plan included as Attachment D to the Final Order on RFA4 based on final facility design and the approved National Pollutant Discharge Elimination System (NPDES) General Permit 1200-C for the facility. The final Comprehensive Solar Revegetation and Soil Management Plan shall be submitted to the Department for review and approval. b. Complete all items included in the Pre-construction Compliance Checklist in the final plan, as applicable to the facility components or phase. [Final Order on AMD4, Soil Protection Condition 1]

Condition Number	Preconstruction (PRE) Conditions
PRE-SP-02	Prior to beginning construction of any component or phase of the solar facility, the certificate holder shall submit, to the Department, a Construction Spill Prevention, Control and Countermeasure (SPCC) Plan that complies with the requirement of 40 CFR 112. [Final Order on AMD4, Soil Protection Condition 4]
STANDARD: Land Use (LU) [OAR 345-022-0030]	
PRE-LU-01	a. Prior to construction of any component or phase of the solar facility, the certificate holder shall submit, to the Department and the Sheman County Planning Commission, an application for Conditional Use Permit Meeting the requirements of SCZO Section 5.4(1) and (3). b. The Site Plan required under SCZO 5.4(1) must demonstrate compliance with all site certificate conditions and the local applicable substantive criteria addressed in the Final Order on AMD4. [Final Order on AMD4, Land Use Condition 3]
PRE-LU-02	Prior to construction of any component or phase of the solar facility, the certificate holder must sign and record in the deed records for the county a document binding the project owner and the project owner's successors in interest, prohibiting them from pursuing a claim for relief or cause of action alleging injury from farming or forest practices as defined in ORS 30.930(2) and (4). [Final Order on AMD4, Land Use Condition 5]
PRE-LU-03	Prior to construction of the solar facility, component or phase, as applicable, the certificate holder shall submit to the Department: a. A Memorandum of Understanding or other agreement executed by the certificate holder, Mid-Columbia Community Economic Development District, and Sherman County, establishing a Community Investment Fund in accordance with the Community Investment Plan included as Attachment E to the Final Order on RFA4. b. Evidence that that the certificate holder has contributed at least $1,600 per acre of cultivated land that will be occupied by facility components to the Community Investment Fund. [Final Order on AMD4, Land Use Condition 6]
STANDARD: Retirement and Financial Assurance (RF) [OAR 345-022-0050]	
PRE-RF-01	Prior to construction of the solar facility, component or phase, as applicable, the certificate holder shall: a. Submit to the Department Table 14 (Retirement Table with tasks/unit/unit costs) of the Final Order on RFA4, updated based on final design and phased construction, if applicable. Certificate holder may not make changes to the unit cost without review and approval by the Department. Certificate holder must also request that the Department confirm the present-day inflation adjusted

Condition Number	Preconstruction (PRE) Conditions
	decommissioning estimate, rounded to the nearest $1,000, to be reflected in the bond or letter of credit in sub c of this condition. b. Incorporate any additional decommissioning costs for facility changes which have been determined by the Department not to require a site certificate amendment. c. Submit to the Department a bond or letter of credit, in the amount affirmed by the Department under (a), based on the Council's current pre-approved financial institution list and form. [Final Order on AMD4, Retirement and Financial Assurance Condition 1]
STANDARD: Fish and Wildlife Habitat (FW) [OAR 345-022-0060]	
PRE-FW-01	Prior to construction of a phase or component of the solar facility, as applicable, the certificate holder shall submit the final Habitat Mitigation Plan substantially similar to Final Order on RFA4 Attachment F, based on the finalization requirements included in Section 2.0 of the plan. The final plan must be submitted for review and approval by the Department in consultation with ODFW. [Final Order on AMD4, Fish and Wildlife Habitat Condition 1]
STANDARD: Historic, Cultural and Archeological (HC) [OAR 345-022-0090]	
PRE-HC-01	Prior to construction, the certificate holder shall update the contact information provided in the Final Order on ASC Attachment H, Inadvertent Discovery Plan. [Final Order on AMD4; Historic, Cultural and Archeological Condition 3]
STANDARD: Public Services (PS) [OAR 345-022-0100]	
PRE-PS-01	At least 90-days prior to construction of a phase or component of the solar facility, the certificate holder shall provide to the Department and Sherman County a Construction Workforce Housing Plan. The Construction Workforce Housing Plan must include: a. An evaluation of ongoing patterns of housing uses and potential shortages or changes in housing demand; b. Consideration of concerns and suggestions from Sherman County; and c. Provide strategies to minimize impacts to the local housing supply. [Final Order on AMD4, Public Services Condition 1]
PRE-PS-02	Prior to construction of any phase or component of the solar facility, the certificate holder shall: a. Provide an executed Road Use Agreement between the certificate holder and Sherman County Public Works Department, which includes, at a minimum: i. A system for documenting the pre-construction condition of local roads that would serve as transportation routes for delivering equipment to the facility site so that pre-construction conditions can be compared with conditions after construction has been completed to assess needed repairs and payment for repairs. ii. Protocols for monitoring road conditions for degradation during construction so that safe travel paths may be maintained.

Condition Number	Preconstruction (PRE) Conditions
	iii. An agreement to fund repairs of construction related damage to the satisfaction of Sherman County Public Works. b. Submit a Construction Traffic Management Plan for Department review and approval. Unless the following are included in the executed Road Use Agreement, the plan shall, at a minimum, require that the certificate holder: i. Provide notice to adjacent landowners when construction takes place to help minimize access disruptions; ii. Provide proper road signage and warnings of "Equipment on Road," "Truck Access," or "Road Crossings;" iii. Implement traffic diversion equipment, such as advance signage and pilot cars, whenever possible when slow or oversized loads are being hauled; iv. Encourage carpooling for the construction workforce to reduce traffic volume; v. Employ flaggers, as necessary, to direct traffic when large equipment is entering or exiting public roads to minimize risk of accidents; and vi. Maintain at least one travel lane at all times so that roadways will not be closed to traffic as a result of construction vehicles entering or exiting public roads. [Final Order on ASC, Condition 77; AMD1; AMD4]
STANDARD: Wildfire Prevention and Risk Mitigation (WF) [OAR 345-022-0115]	
PRE-WF-01	Prior to construction of any component or phase of the solar facility, the certificate holder shall finalize and submit to the Department, for review and approval, a Construction Wildfire Mitigation Plan (WMP) consistent with Attachment G to the Final Order on AMD4. [Final Order on AMD4, Wildfire Prevention and Risk Mitigation Condition 1]
STANDARD: Waste Minimization (WM) [OAR 345-022-0120]	
PRE-WM-01	Prior to construction of any component or phase of the solar facility, the certificate holder shall submit a Construction Waste Management Plan, for review and approval by the Department. The plan must include, at a minimum, the following : a. The format, content and frequency of employee trainings to minimize and recycle solid waste; b. Practices and measures that will be implemented to minimize the generation of wastes from construction; c. Identify a procedure or process for evaluating whether photovoltaic modules, batteries, or other facility components are considered hazardous waste under state or federal regulations; d. Identify procedures for the segregation of recyclable materials, non-hazardous waste, and hazardous waste for transport and disposal by a licensed hauler specializing in the proper recycling or disposal of the wastes. e. Identify names and locations of licensed haulers and facilities that will be used for the following, including associated collection and hauling protocols and requirements:

Condition Number	Preconstruction (PRE) Conditions
	i. Recycling steel and other metal scrap; ii. Recycling wood waste; iii. Recycling packaging wastes, such as paper and cardboard; iv. Collecting non-recyclable waste for transport to a landfill by a licensed waste hauler; and f. Identify inspection and recordkeeping procedures for waste handling, disposal and recycling. g. Include a provision allowing for updates of the plan, subject to Department review and approval. [Final Order on ASC, Condition 84; AMD4]
STANDARD: Noise Control Regulations (NC) [OAR 340-035-0035]	
PRE-NC-01	Prior to beginning construction of any noise generating equipment, the certificate holder shall provide an updated acoustic modeling analysis based on final facility design and equipment specifications demonstrating that the cumulative operational noise levels of the wind and solar facility, taking into account any necessary acoustic mitigation, will comply with the maximum permissible noise level, 50 dBA L50 [Final Order on AMD4, Noise Control Condition 1]
PRE-NC-02	Prior to construction of the solar facility, the certificate holder must submit to the Department copies of executed legally effective easement(s) or real covenant(s) for all Noise Sensitive Properties impacted by the facility with noise exceedance. [OAR 340-035-0035(1)(b)(B)(iii)(; Final Order on AMD4; Noise Control Condition 1]
STANDARD: Other – Removal-Fill (WL)	
PRE-WL-01	a. Certificate holder shall flag and avoid, or develop constraints mapping, identifying a 50-foot avoidance buffer from the delineated boundary of wetland WT03 and intermittent waterway ST04 (Wetland Delineation Report WD #2025-0012) to ground disturbing activities. b. Prior to August 12, 2030, if construction of the solar facility has not yet commenced, the certificate holder must submit a renewal request to DSL for Wetland Delineation Report WD #2025-0012. Certificate holder must provide a copy of DSL reissuance to the Department, once obtained. [Final Order on AMD4, Removal-Fill Condition 1]
STANDARD: Other – Water Rights (WR)	

6.3 Construction (CON) Conditions

Condition Number	Construction (CON) Conditions
STANDARD: GENERAL STANDARD (GS) [OAR 345-022-0000]	
CON-GS-01	The certificate holder must begin construction of the solar facility, phase or component on or before March 27, 2032. Within 7 days of construction commencement, the certificate holder must provide the Department with written

Condition Number	Construction (CON) Conditions
	verification that it has met the deadline by satisfying applicable preconstruction conditions and completing at least $250,000 work in the Solar Micrositing Area. [OAR 345-025-0006(4), Final Order on AMD4, General Standard Condition 1]
CON-GS-02	The certificate holder must complete construction of the facility, phase or component within 3 years of the actual applicable construction commencement date for the facility or applicable phase reported under Condition CON-GS-01. Within 7 days after completing construction, the certificate holder shall provide the Department written verification that it has met the deadline. [OAR 345-025-0006(4), Final Order on AMD4, General Standard Condition 2]
STANDARD: Organizational Expertise (OE) [OAR 345-022-0010]	
CON-OE-01	During construction of any component or phase of the solar facility, the certificate holder shall: a. Maintain a qualified on-site construction manager with demonstrated experience in environmental compliance; b. Require the construction manager to ensure compliance with all construction-related site certificate conditions. c. Notify the Department of the name, telephone number, and e-mail address of the manager within 72 hours after any change in this information. [Final Order on ASC, Condition 3; AMD4]
CON-OE-02	a. Within three months after beginning construction of any phase or component of the solar facility, and every three months thereafter during construction, the certificate holder shall submit a construction progress report to the Department. b. Each construction progress report shall describe: i. Any significant changes to major milestones for construction; ii. Facility Status: An overview of site conditions, the status of facilities under construction, and a summary of the operating experience of facilities that are in operation. In this section of the annual report, the certificate holder shall describe any unusual events, such as earthquakes, extraordinary windstorms, major accidents or the like that occurred during the year and that had a significant adverse impact on the facility. iii. Status of Surety Information: Documentation demonstrating that bonds or letters of credit as described in the site certificate are in full force and effect and will remain in full force and effect for the term of the next reporting period; iv. Monitoring Report: A list and description of all significant monitoring and mitigation activities performed during the reporting period in accordance with site certificate terms and conditions, a summary of the results of those activities, and a discussion of any significant changes to any monitoring or mitigation program, including the reason for any such changes. v. Compliance Report: A description of all instances of noncompliance with a site certificate condition. For ease of review, the certificate holder shall, in this

Condition Number	Construction (CON) Conditions
	section of the report, use numbered subparagraphs corresponding to the applicable sections of the site certificate. vi. Facility Modification Report: A summary of changes to the facility that the certificate holder has determined do not require a site certificate amendment in accordance with OAR 345-027-0050. c. When the reporting date coincides, the certificate holder may include the construction progress report within the annual report required under Condition OPR-OE-01. [Final Order on AMD4, Organizational Expertise Condition 3]
STANDARD: Structural Standard (SS) [OAR 345-022-0020]	
CON-SS-01	The certificate holder shall design and construct the solar facility in accordance with the applicable requirements of the International Building Code, Oregon Structural Specialty Code, and any other applicable codes and design procedures in effect at the time of construction. [Final Order on ASC, Condition 67; AMD4]
CON-SS-02	The certificate holder shall design, engineer and construct the solar facility to avoid dangers to human safety and the environment presented by seismic hazards affecting the site that are expected to result from all maximum probable seismic events. As used in this condition "seismic hazard" includes ground shaking, ground failure, landslide, liquefaction triggering and consequences (including flow failure, settlement buoyancy, and lateral spreading), cyclic softening of clays and silts, fault rupture, directivity effects and soil-structure interaction. [OAR 345-027-0020(12); Final Order on ASC, Condition 112; AMD4]
CON-SS-03	The certificate holder shall design, engineer and construct the solar facility to avoid dangers to human safety presented by non-seismic hazards, including, but not limited to, landslides, flooding, erosion, and collapsible soils. Ground disturbing activities are not permitted in areas within Sherman County's Natural Hazard Combining Zone where slopes exceed 20 percent. [Final Order on ASC, Condition 68; AMD4]
STANDARD: Soil Protection (SP) [OAR 345-022-0022]	
CON-SP-01	Upon completion of construction of the solar facility, the certificate holder shall restore vegetation to the extent practicable and shall landscape all areas disturbed by construction in a manner compatible with the surroundings and proposed use. Upon completion of construction, the certificate holder shall remove all temporary structures not required for facility operation and dispose of all timber, brush, refuse and flammable or combustible material resulting from clearing of land and construction of the facility. [OAR 345-027-0020(11); Final Order on ASC, Condition 111; AMD3; AMD4]

</table>

Condition Number	Construction (CON) Conditions
CON-PS-03	During construction of the solar facility, the certificate holder shall require that all on-site construction contractors develop and implement a site health and safety plan that informs on-site workers and others what to do in case of an emergency and that includes the locations of fire extinguishers and nearby hospitals, important telephone numbers, and first aid techniques. [Final Order on ASC, Condition 46; AMD4]
CON-PS-04	During and following construction of a phase or component of the solar facility, the certificate holder shall adhere to the requirements of the Road Use Agreement and Construction Traffic Management Plan required under Condition PRE-PS-02. [Final Order on ASC, Condition 78; AMD4]
STANDARD: Wildfire Prevention and Risk Mitigation (WF) [OAR 345-022-0115]	
CON-WF-01	During construction of the solar facility, the certificate holder shall require onsite contractors and employees to adhere to the Construction Wildfire Mitigation Plan (WMP) approved under Condition PRE-WF-01. [Final Order on AMD4, Wildfire Prevention and Risk Mitigation Condition 2]
STANDARD: Waste Minimization (WM) [OAR 345-022-0120]	
CON-WM-01	During construction of a component or phase of the solar facility, the certificate holder and all onsite contractors must implement the Construction Waste Management Plan required under Condition PRE-WM-01. [Final Order on AMD4, Waste Minimization Condition 1]
CON-WM-02	During construction of the facility, the certificate holder shall provide portable toilets for on-site sewage handling and shall ensure that the portable toilets are pumped and cleaned regularly by a qualified licensed contractor. [Final Order on ASC, Condition 82, AMD4]
Standard: Noise Control, OAR 340-035-0035	
CON-NC-01	During construction of the solar facility, the certificate holder shall: a. Confine the noisiest operation of heavy construction equipment to the daylight hours; b. Require contractors to install and maintain exhaust mufflers on all combustion engine-powered equipment; and c. Establish a complaint response system at the construction manager's office to address noise complaints. [Final Order on ASC, Condition 89; AMD4]
STANDARD: Other – Water Rights (WR)	
CON-WR-01	No later than 30 days after completing construction of any new well, the certificate holder shall provide the Department a copy of the map, well log and all other information it provided to OWRD pursuant to ORS 537.545 and ORS 537.765 to qualify for an exempt ground water use for any onsite exempt wells. [Final Order on AMD4, Water Rights Condition 1]

6.4 Pre-Operational (PRO) Conditions

Condition Number	Pre-Operational (PRO) Conditions
STANDARD: Organizational Expertise (OE) [OAR 345-022-0010]	
PRO-OE-01	Prior to beginning operation of the solar facility, the certificate holder shall submit a final Operation and Maintenance Plan to the Department for review and approval. The plan must be finalized in accordance with Table 1 of the O&M Framework provided in Attachment C to the Final Order on AMD4. [Final Order on AMD4, Organizational Expertise Condition 1]
STANDARD: Soil Protection (SP) [OAR 345-022-0020]	
PRO-SP-01	Prior to beginning operation of the solar facility, the certificate holder shall submit, to the Department, an Operations Spill Prevention, Control and Countermeasure Plan that complies with the requirement of 40 CFR 112. [Final Order on AMD4, Soil Protection Condition 6]
STANDARD: Wildfire Prevention and Risk Mitigation (WF) [OAR 345-022-0115]	
PRO-WF-01	a. Prior to operation of the solar facility, phase or component, as applicable, the certificate holder shall submit, to the Department for review and approval, an Operational Wildfire Mitigation Plan that complies with the requirements of OAR 345-022-0115(1)(b). b. The certificate holder may rely on a Wildfire Protection Plan approved by the Oregon Public Utility Commission under OAR chapter 860, division 300, or another plan approved by the Department in accordance with this Site Certificate to satisfy some or all of the requirements of this condition. [Final Order on AMD4, Wildfire Prevention and Risk Mitigation Condition 3]

6.5 Operational (OPR) Conditions

Condition Number	Operational (OPR) Conditions
STANDARD: General Standard of Review (GS) [OAR 345-022-0000]	
OPR-GS-01	The certificate holder shall submit an updated legal description of the site to the Department of Energy within 90 days after beginning operation of the solar facility. The legal description required by this rule means a description of metes and bounds or a description of the site by reference to a map and geographic data that clearly and specifically identifies the outer boundaries that contain all parts of the facility. [OAR 345-027-0020(2); Final Order on ASC, Condition 102; AMD3; AMD4]
STANDARD: Organizational Expertise (OE) [OAR 345-022-0010]	
OPR-OE-02	During operation of the solar facility, the certificate holder shall require onsite contractors and employees to adhere to the O&M Plan approved under Condition PRO-OE-01. The O&M Plan may be amended, subject to Department review and approval.

Condition Number	Operational (OPR) Conditions
	[Final Order on AMD4, Operational Expertise Condition 2]
STANDARD: Soil Protection (SP) [OAR 345-022-0020]	
OPR-SP-06	During operation of the solar facility, the certificate holder shall monitor and maintain vegetation and any necessary erosion controls in compliance with the Comprehensive Solar Revegetation and Soil Management Plan required under Condition PRE-SP-01, as amended. The certificate holder shall include any reports required by the plan in the annual facility operations reports required under Condition OPR-OE-01. [Final Order on AMD4, Soil Protection Condition 3]
OPR-SP-07	During operation of the solar facility, the certificate holder and all onsite contractors and personnel shall adhere to the requirements of the Operations Spill Prevention, Control and Countermeasure Plan approved under Condition PRO-SP-01. Updates or revisions to the Plan shall be submitted to the Department prior to implementation. [Final Order on AMD4, Soil Protection Condition 7]
STANDARD: Fish and Wildlife Habitat (FW) [OAR 345-022-0060]	
OPR-FW-05	During operation of the solar facility, the certificate holder shall implement the Habitat Mitigation Plan finalized under Condition PRE-FW-01. The HMP may be amended from time to time, subject to Department approval. [Final Order on AMD4, Fish and Wildlife Habitat Condition 2]
STANDARD: Historic, Cultural and Archeological (HC) [OAR 345-022-0090]	
OPR-HC-01	During operations, the certificate holder shall require all onsite employees and contractors to implement and adhere to the requirements of the Inadvertent Discovery Plan, as provided in Condition PRE-HC-01. The IDP shall be reviewed and updated annually for current contact information. [Final Order on AMD4; Historic, Cultural and Archeological Condition 5]
STANDARD: Wildfire Prevention and Risk Mitigation (WF) [OAR 345-022-0115]	
OPR-WF-01	During operation of the solar facility, the certificate holder must adhere to the requirements of the Operational Wildfire Mitigation Plan approved by the Department under Condition PRO-WF-01, as updated in accordance with the requirements of the plan. [Final Order on AMD4, Wildfire Prevention and Risk Mitigation Condition 4]

7.0 Successors and Assigns

To transfer this site certificate, or any portion thereof, or to assign or dispose of it in any other manner, directly or indirectly, the certificate holder shall comply with OAR 345-027-0100.

8.0 Severability and Construction

If any provision of this agreement and certificate is declared by a court to be illegal or in conflict with any law, the validity of the remaining terms and conditions shall not be affected, and the rights and obligations of the parties shall be construed and enforced as if the agreement and certificate did not contain the particular provision held to be invalid. In the event of a conflict between the conditions contained in this site certificate and the Council's final order, the conditions contained in this site certificate shall control.

9.0 Governing Law and Forum

This site certificate shall be governed by the laws of the State of Oregon. Any litigation or arbitration arising out of this agreement shall be conducted in an appropriate forum in Oregon.

10.0 Execution

This site certificate may be executed in counterparts and will become effective upon signature by the Chair of the Energy Facility Siting Council and the authorized representative of the certificate holder.

IN WITNESS THEREOF, this site certificate has been executed by the State of Oregon, acting by and through the Energy Facility Siting Council, and by Portland General Electric Company.

Subject: RE: Email Summary of Public Notice of Receipt of Preliminary Request for Amendment 4 of the Site Certificate for the Biglow Canyon Wind Farm

---

Hi Christopher,

Based on review of the facility map (which indicates an absence of forested land in the project area), ODF does not have any specific comments on this preliminary amendment request – except to note as usual that the applicant is expected to be familiar with and fulfill any & all relevant obligations related to fire prevention (ORS Chapter 477).

Thanks for the opportunity to comment. Happy to provide a more formal no-comment letter if needed for your records – but if email suffices, we're all good from ODF's end.

Best,
Dan

Subject: FW: Email Summary of Public Notice of Receipt of Preliminary Request for Amendment 4 of the Site Certificate for the Biglow Canyon Wind Farm

Hello,

The Oregon Department of Energy requests agency comments on preliminary Request for Amendment 4 of the Site Certificate for the Biglow Canyon Wind Farm by **May 30, 2025.** In the preliminary Request, the certificate holder, Portland General Electric Company, seeks authorization from the Energy Facility Siting Council to construct and operate a 385-MW solar photovoltaic power generation facility, battery energy storage systems with up to 375 MW of discharge capacity, and other related or supporting facilities at the site of the operating Biglow Canyon Wind Farm in Sherman County. Please see the notice below for additional information.

You are receiving this request because the Department has identified your organization as a "reviewing agency" for this application. As defined in OAR 345-001-0010, this includes state agencies, local governments and tribal governments with subject matter or geographic jurisdiction over the construction and operation of the facility. If you represent a city and the proposed facility is not located within your jurisdiction, you are a reviewing agency because your jurisdiction is within 10 miles of the facility and construction or operation of the facility may impact your jurisdiction. I will follow up with specific requests for individual agency partners; but in general, the Department is seeking your agencies determination on whether the preliminary request contains sufficient information for the Energy Facility Siting Council to determine whether or not the proposed facility components would comply with all applicable standards, laws, and rules that are subject to the Council's review under ORS chapter 469.

The preliminary Request for Amendment and other information is available at: https://www.oregon.gov/energy/facilities-safety/facilities/Pages/BCW.aspx. If you need additional time or information, or require print copies materials to prepare your comments, please let me know as soon as possible. If you do not respond to this request by May 30, 2025, the Department will assume your agency does not have any comments at this time.

Thank you,

Christopher M. Clark
Senior Siting Analyst

OREGON DEPARTMENT OF ENERGY ENERGY FACILITY SITING COUNCIL

Email Summary of Public Notice of Receipt of Preliminary Request for Amendment 4 of the Site Certificate for the Biglow Canyon Wind Farm

On April 21, 2025, the Oregon Department of Energy received preliminary Request for Amendment 4 of the Site Certificate for the Biglow Canyon Wind Farm (pRFA4).

In pRFA4, Portland General Electric Company, the certificate holder, requests the Energy Facility Siting Council's approval to construct and operate a 385-MW solar photovoltaic power generation facility, battery energy storage systems with up to 375 MW of discharge capacity, and other related or supporting facilities within a 3,980-acre (6.2 sq. mile) solar micrositing area. The proposed solar micrositing area includes 2,571 acres within the approved wind energy facility site boundary and 1,409 acres which would be added to the site.

The pRFA4 and Public Notice of Receipt of the pRFA4 are available on the Department's website.

The Biglow Canyon Wind Farm is an is an operating wind energy facility located within a site boundary comprised of approximately 25,000 acres (39 square miles). The facility consists of 217 wind turbines, with a maximum blade tip height of 445 feet, and a peak generating capacity of 450 megawatts.

Please note, this notice is to provide early notification of this amendment request. There is no comment period associated with this phase of review. A comment period and public hearing will be held later in the process.

For more information about pRFA4, please contact Christopher Clark, Senior Siting Analyst, via phone, fax, email, or mail:
Christopher Clark, Senior Siting Analyst
550 Capitol Street NE
Salem, OR 97301
Phone: (503) 871-7254
Fax: (503) 373-7806
Email: christopher.clark@energy.oregon.gov

You received this notice either because you previously signed up for email updates through GovDelivery or ClickDimensions related to specific siting projects or all Energy Facility Siting Council activities (the "General List"). You will automatically receive all future notices per your request or GovDelivery/ClickDimensions choices, unless you unsubscribe via ClickDimensions or by contacting the Department.

If you have any questions or comments about ClickDimensions please feel free to contact the Department's Administrative Assistant, Nancy Hatch at 503-428-7905, toll-free in Oregon at 800-221-8035, or email to nancy.hatch@energy.oregon.gov.

Oregon Department of Energy
Leading Oregon to a safe, equitable, clean, and sustainable energy future.

Subject: RE: Email Summary of Public Notice of Receipt of Preliminary Request for Amendment 4 of the Site Certificate for the Biglow Canyon Wind Farm

---

Hi Christopher,

For the Amendment 4 for Biglow Canyon Wind Farm

1. **The name, address and telephone number of the contact person assigned to review the application for your agency**.

Trevor Griffiths 971-375-8886 is assigned review of a wetland delineation, WD2025-0012. It is currently in review.

2) **Comments on aspects of the proposed facility that are within the particular responsibility or expertise of your agency.**
DSL will review a wetland delineation report for determining Waters of the State. At this time it is not know if a Wetland Removal-Fill application governing the issuance and enforcement of removal-fill authorizations within Waters of Oregon, including wetlands, is required.

3) **A list of statutes, administrative rules and local government ordinances administered by your agency that might apply to construction or operation of the proposed facility and a description of any information needed for determining compliance.**

Wetland delineations will be reviewed per OAR 141-090
Wetland Removal-Fill applications, if required, will be reviewed per OAR 141-085

4) **A list of any permits administered by your agency that might apply to construction or operation of the proposed facility and a description of any information needed for reviewing a permit application.**

Wetland Removal-Fill Permit

5) **Recommendations regarding the size and location of analysis areas (see below for more information).**

Based on the proposed project area, it appears many potential resources, as mapped on the Statewide Wetland Inventories are present. A wetland delineation will determine the on-the-grounds extent. Once approved by DSL, awetland delineation will provide project designers the footprint of wetlands and waters and allow for avoidance and minimization of impacts to Waters of the State to the extent practicable.

6) **A list of studies that should be conducted to identify potential impacts of the proposed facility and mitigation measures.**

Wetland Delineation, which may include additional supporting studies, depending on the site. These may include but are not limited to Stream Duration Assessment Method, identification of Aquatic Resources of Special Concern (e.g.: vernal pools)

Wetland Removal-Fill Permit, which may include additional supporting studies, depending on the site. These may include but are not limited to the Oregon Rapid Wetland Assessment Protocol

and Stream Function Assessment Method.

Thank you,

Daniel Evans, PWS

Subject: RE: Email Summary of Public Notice of Receipt of Preliminary Request for Amendment 4 of the Site Certificate for the Biglow Canyon Wind Farm

---

Hello Christopher:

Greetings. Thank you for the opportunity to review the preliminary request for Amendment 4 of the site certificate for the Biglow Canyon wind farm project, as required by the Oregon Department of Energy. Overall, the report contains up-to-date references and includes the latest data sets from the 2021 Oregon seismic hazard database, as well as other sources from the USGS. One minor issue to note is that the seismic hazard model used is from 2018. DOGAMI recommends that practitioners use the 2023 version of the National Seismic Hazard Model, as it includes the probability of an earthquake occurring on a previously unmapped or unrecognized fault. If you have any additional questions about this review, please contact our geology hazards specialist Lalo Guerrero who is ccd on this email. Thank you.

Best Regards,
Jason

CC: Lalo Guerrero, Ph.D., G.I.T.

Subject: FW: Email Summary of Public Notice of Receipt of Preliminary Request for Amendment 4 of the Site Certificate for the Biglow Canyon Wind Farm

Hello,

The Oregon Department of Energy requests agency comments on preliminary Request for Amendment 4 of the Site Certificate for the Biglow Canyon Wind Farm by **May 30, 2025.** In the preliminary Request, the certificate holder, Portland General Electric Company, seeks authorization from the Energy Facility Siting Council to construct and operate a 385-MW solar photovoltaic power generation facility, battery energy storage systems with up to 375 MW of discharge capacity, and other related or supporting facilities at the site of the operating Biglow Canyon Wind Farm in Sherman County. Please see the notice below for additional information.

You are receiving this request because the Department has identified your organization as a "reviewing agency" for this application. As defined in OAR 345-001-0010, this includes state agencies, local governments and tribal governments with subject matter or geographic jurisdiction over the construction and operation of the facility. If you represent a city and the proposed facility is not located within your jurisdiction, you are a reviewing agency because your jurisdiction is within 10 miles of the facility and construction or operation of the facility may impact your jurisdiction. I will follow up with specific requests for individual agency partners; but in general, the Department is seeking your agencies determination on whether the preliminary request contains sufficient information for the Energy Facility Siting Council to determine whether or not the proposed facility components would comply with all applicable standards, laws, and rules that are subject to the Council's review under ORS chapter 469.

The preliminary Request for Amendment and other information is available at: https://www.oregon.gov/energy/facilities-safety/facilities/Pages/BCW.aspx. If you need additional time or information, or require print copies materials to prepare your comments, please let me know as soon as possible. If you do not respond to this request by May 30, 2025, the Department will assume your agency does not have any comments at this time.

Thank you,

OREGON DEPARTMENT OF ENERGY 50 YEARS of SERVICE ENERGY FACILITY SITING COUNCIL

Email Summary of Public Notice of Receipt of Preliminary Request for Amendment 4 of the Site Certificate for the Biglow Canyon Wind Farm

On April 21, 2025, the Oregon Department of Energy received preliminary Request for Amendment 4 of the Site Certificate for the Biglow Canyon Wind Farm (pRFA4).

In pRFA4, Portland General Electric Company, the certificate holder, requests the Energy Facility Siting Council's approval to construct and operate a 385-MW solar photovoltaic power generation facility, battery energy storage systems with up to 375 MW of discharge capacity, and other related or supporting facilities within a 3,980-acre (6.2 sq. mile) solar micrositing area. The proposed solar micrositing area includes 2,571 acres within the approved wind energy facility site boundary and 1,409 acres which would be added to the site.

The pRFA4 and Public Notice of Receipt of the pRFA4 are available on the Department's website.

The Biglow Canyon Wind Farm is an is an operating wind energy facility located within a site boundary comprised of approximately 25,000 acres (39 square miles). The facility consists of 217 wind turbines, with a maximum blade tip height of 445 feet, and a peak generating capacity of 450 megawatts.

Please note, this notice is to provide early notification of this amendment request. There is no comment period associated with this phase of review. A comment period and public hearing will be held later in the process.

For more information about pRFA4, please contact Christopher Clark, Senior Siting Analyst, via phone, fax, email, or mail:
Christopher Clark, Senior Siting Analyst

RE: Biglow Canyon Solar Farm
Dear Mr. Clark,
Thank you for the opportunity to comment on the Biglow Canyon Solar project. The following comments are conveyed on behalf of the Sherman County Court.

1) The name, address and telephone number of the contact person assigned to review the application for your agency:
Georgia Macnab
Sherman County Planning Director
PO Box 381
Moro, OR 97039

2) Comments on aspects of the proposed facility that are within the particular responsibility or expertise of your agency.
The document has been well prepared along with studies and research regarding fire and fire protection, scenic resources, noise, police protection, ect. Based on these studies and exhibits it appears that the project has been well thought out and researched. However the project and impacts on the ground can be much different than what is on paper. The other concern is the time frame for review and comments on the amendment. There are a lot of Exhibits and information to review and a months' time is not a sufficient amount of time to submit this back to the Department.

The Sherman County Court is concerned about the future impacts that the solar farm will create. These include the visual impact to adjacent land owners or residents, who are not under contract, wildfire, long term damage to the ground and loss of farm ground and grazing pasture.

Since this is an amendment to an existing permit for the Biglow Wind Farm concerns have been raised about the lack of maintenance to the wind towers associated with that farm. Will the same be true of the solar farm. What actions or procedures will be enforced to remedy this kind of neglect?

Other comments:
Weed Control: Has the company talked to the Weed Master for this project. The document states that they have a current weed plan but have they contacted the Weed Master for this project.
Ex L 4.4.2.2 Scenic John Day River, Pg 27-28: Cumulative Scenic Impacts of Wind Farms and Solar Farms cannot be ignored.

Ex R, Municipalities, Pg 9; Applicant did not use the most recent Comprehensive Plans for the Cities of Wasco, Rufus and Moro. The plans sited are from 1978 and those plans were updated in 2007. Moro is in the process of updating their 2007 Comprehensive Plan and is in the process of being adopted.
Exhibit U, 4.4.7, pg. 25: states that "fire and police concerns are not expected to be a significant demand on services". Fire concerns are of high significance to the county. Wildfires can and do start and spread quickly. All fire districts are manned by volunteers and work at day jobs. There is a history of wildfires in this area plus wildfire can spread from Wasco County to Sherman County. The county feels that this statement is highly underestimated and should be taken more seriously.
Ex U Pg. 27: Health care provider is no longer Mid Columbia Medical Center, it is now Adventist Health Columbia Gorge Hospital.
Ex V, 4.5.1 Page 10; States that the fire chief declares the fire season. However the county court declares the fire season after consultation with all county fire chiefs.

Also not clear is whether adjacent property owners to the proposed solar farm were contacted regarding the solar facility.

3) A list of statutes, administrative rules and local government ordinances administered by your agency that might apply to construction or operation of the proposed facility and a description of any information needed for determining compliance.
Article 3, 3.1, Exclusive Farm Use Zone 1.Conditional Uses Permitted
(q)Commercial Utility Facilities
(x) Transmission Lines over 200 Feet in Height.
Section 3.7 Natural Hazards Combining Zone
There appears to be areas within the proposed site that is bordering a Natural Hazards Combining Zone. The applicant has addressed this sufficiently in the submittal.

The regulations regarding Conditional Use Permits are found in the SCZO:
Article 5 Sections 5.1 Authorization to Grant or Deny conditional Uses

5.2 General Criteria

5.3 General Conditions

Section 5.8 Standards Governing Specific Conditional Uses
10. Radio or Television Transmitter Tower, Utility or Substation
14. Public Facilities and Services
20. Non Farm Uses in an F-1 Zone

Sherman County Goal 5 Inventory
Sherman County also has a Goal 5 Inventory that includes Historical, Cultural and Mineral sites. Mineral Sites must be protected. There is a possibility of 2 sites in the area and there is no reference to these in the application.

Sherman County Transportation Plan (TSP)
Sherman County TSP has an access management policy for the County's arterial and collector road system. Access spacing standards for all driveways and private roads are provided within this plan.

4) A list of any permits administered by your agency that might apply to construction or operation of the proposed facility and a description of any information needed for reviewing a permit application.

-Sanitation- North Central Public Health District provides sanitation permits for Sherman County. They are located in The Dalles, OR.
-Road Approach Permit- Sherman County Road Department
-Road Use Agreement- Sherman County Road Department
-Building permits- Oregon State building codes, Pendleton Regional Office.
-Conditional Use Permit- Sherman County Planning.

5. Recommendations regarding the size and location of analysis areas (see below for more information).

-Sherman County has a history of wildfires in the county. The analysis area should be expanded beyond the .5 mile radius.
-Land use should be expanded beyond the .5 mile radius.

6) A list of studies that should be conducted to identify potential impacts of the proposed facility and mitigation measures.

-Contact Sherman County Emergency Services for impacts of ambulance services for a final plan.
-Meet with North Sherman Rural Fire Protection District or the North Sherman Fire District Board for wildfire concerns or wildfire plan.
- Meet with the Sherman County Weed Department for weed control on the site.
-Soils Impact Analysis/Study--Watersheds-Sherman County SWCD
contact Sherman County NRCS and SWCD
- ODOT may require a Traffic Analysis Impact Study

If you have any questions please contact me at 541-565-3601.
Sincerely,

Georgia L. Macnab

RE: Request for comments on the Preliminary Request for Amendment 4 (pRFA4) of the Site Certificate for the Biglow Canyon Wind Farm submitted by Portland General Electric Company for the authorization to construct and operate a 385-MW solar photovoltaic power generation facility, battery energy storage systems with up to 375 MW of discharge capacity, and other related or supporting facilities at the site of the operating Biglow Canyon Wind Farm in Sherman County.

Dear Mr. Clark:

Oregon Department of Energy (ODOE) has requested comments from the Oregon Department of Fish and Wildlife (ODFW) on the pRFA4 for the Biglow Canyon Wind Farm. The Solar Micrositing Area identified as part of pRFA4 is approximately 3,980 acres and provides an estimate of the maximum area needed for development, micrositing, and temporary disturbances from the Solar Components during construction. This Letter contains: (1) ODFW contact information for the project; and (2) ODFW's comments on the Preliminary Request for Amendment 4.

A. Contacts

I will be the main contact person for ODFW for the Energy Facility Siting Council (EFSC) permitting process and my contact information is: Jessica Wilkes, 61374 Parrell Road, Bend, OR 97702. My phone number is (541) 388-6099, Jessica.S.Wilkes@odfw.oregon.gov. In addition, please copy Jeremy Thompson, Energy Program Coordinator, 4034 Fairview Industrial Drive SE, Salem OR 97302. Phone number (541) 980-8524, Jeremy.L.Thompson@odfw.oregon.gov. ODFW requests that as applicable, all correspondence for this project be conveyed electronically.

B. Comments on the Preliminary Application for Site Certificate

General Comments

Please find below a listing of the most applicable statutes, administrative rules and policies administered by ODFW that would pertain to the siting of this proposed facility. ODFW will review and make recommendations for the proposed project based on the following applicable statutes and rules.

Oregon Revised Statutes (ORS)

- ORS 496.012 Wildlife Policy

- ORS 506.036 Protection and Propagation of Fish

- ORS 496.171 through 496.192 Threatened and Endangered Wildlife and Fish Species. A listing of State and Federal threatened, endangered and candidate species can be found on ODFW's website at: http://www.dfw.state.or.us/wildlife/diversity/species/threatened_endangered_candidate_list.asp

- ORS 498.301 through 498.346 Screening and By-pass devices for Water Diversions or Obstructions

- ORS 506.109 Food Fish Management Policy

- ORS 509-140 Placing Explosives in Water

- ORS 509.580 through 509.910 Fish Passage; Fishways: Screening Devices- a listing of requirements under ODFW's Fish Passage Program can be found on ODFW's website at http://www.dfw.state.or.us/fish/passage/

Oregon Administrative Rules (OAR)

- OAR Chapter 635, Division 100 provides authority for adoption of the State sensitive species list and the Wildlife Diversity Plan, and contains the State list of threatened and endangered wildlife and fish species. A current list of State sensitive species can be found on ODFW's website at: http://www.dfw.state.or.us/wildlife/diversity/species/docs/SSL_by_category.pdf

- OAR Chapter 635, Division 415 (ODFW's Fish and Wildlife Mitigation Policy found on ODFW's website at: http://www.dfw.state.or.us/lands/mitigation_policy.asp describes six habitat categories and establishes mitigation goals and standards for each wildlife habitat ranging from Category 1 (irreplaceable, essential, limited) to Category 6 (non-habitat)

- The Policy goal for Category 1 habitat is no loss of either habitat quantity or quality via avoidance of impacts through development alternatives, or an ODFW recommendation of denial of the proposed development action if impacts cannot be avoided. Categories 2-4 are essential or important but not irreplaceable habitats. Category 5 habitat is not essential or important habitat but has a high restoration potential. The application for a site certificate must identify the appropriate habitat category for all affected areas of the proposed project on mapping; provide basis for each habitat category selection; and provide an appropriate mitigation plan; all subject to ODOE and ODFW review and comment. ODOE has adopted this rule into OAR 345-022-0060 as an energy facility siting standard for Applicants to meet in order to obtain a site certificate.

- ODFW also provides technical review and recommendations on compliance with Oregon EFSC rules, particularly OAR 345-02100010(1) (p) and (q) and 345-22-040, 060 and 070.

- ODFW also advocates for project proponents to site solar facilities in a manner consistent with the Oregon Columbia Plateau Ecoregion (CPE) Wind Energy Siting and Permitting Guidelines that were established in conjunction with multiple state, federal and industry partners. The intent of these guidelines were to create a balance between the development of renewable energy and environmental protection. While these guidelines were developed for wind facilities, they are also applicable to solar projects within the CPE.

Specific Comments

- ODFW applauds co-location efforts by utilizing available area beneath wind farms for new solar facilities. The Department appreciates the applicant's communication and efforts to address fish and wildlife concerns related to the application.
- Specific to the HMA:
    - As discussed with the applicant, ODFW has concerns whether the BCWF HMA can successfully meet mitigation criteria.
    - ODFW requests more information about the alternative mitigation site location and uplift actions to meet the quality and quantity of impacted habitat to achieve "no net loss" and "net benefit."
    - ODFW requests a more detailed explanation of success criteria and uplift actions for the HMA, especially for weed control and seeding/shrub planting.
        - Methodology for uplift actions and success criteria should be written with enough detail such that someone who is new to the project would be able to reproduce the same actions and success criteria evaluation with no further explanation or instruction needed.
        - Uplift actions, success criteria and sampling methodology needs to be determined prior to construction and selection of an HMA.
- This project is within approximately 2 miles of mapped occupied bighorn sheep habitat. ODFW requests ODOE condition the facility to not allow utilization of domestic sheep or goats within the facility. We discourage the use of vegetation control via domestic livestock to avoid transmission of zoonotic diseases such as *M. ovi* ensure the integrity of the bighorn sheep population.
- ODFW considers all habitats within winter range, with the exception of areas designated as Category 6 in the CPE, to be Category 2 as per the Oregon Habitat Mitigation Policy. For Category 2 habitats, ODFW's policy is to have "no net loss of habitat quantity or quality," and asks for "in-kind, in-proximity mitigation" (OAR Chapter 635, Division 415). The CPE contains several habitats that are rare and declining including wetlands, sagebrush steppe, and native grasslands. ODFW encourages the applicant avoid these rare intact habitats when it comes to micro siting and favor siting in previously disturbed areas.
- ODFW continues to advocate for avoidance of Priority Wildlife Connectivity Areas (PWCAs) located on the edge of the facility. To avoid losing the function of this habitat, utilization of setbacks sufficient to facilitate wildlife movement along the edges of major drainages adjacent to the facility will be key.
- ODFW recommends that the applicant work with the county weed department or Oregon State Extension to develop a revegetation and weed control plan that will be successful within the project area, given the challenges realized within this ecoregion with revegetation projects. ODFW encourages retention of native vegetation within project boundaries to the maximum extent possible. When revegetating, ODFW encourages

utilizing a diverse seed mix with consideration given to pollinator-friendly varieties and shrub reestablishment.

- ODFW requests that any ground disturbance or vegetation removal within the project boundary be conducted prior to or after the critical period for ground nesting birds, April 15- September 1. Should ground disturbance occur during this period, ODFW requests that vegetative removal occurs prior to the critical nesting period.
- ODFW requests that the applicant limit construction activities outside of the project footprint during the winter period, December 1- April 1, to reduce disturbance to wintering wildlife. In addition, ODFW requests that the placement of project infrastructure, including buildings and roads be sited within the project boundary in a manner to reduce the potential for disturbing wildlife outside of the project boundaries both during construction and in the operational phase.
- Impacts to all nests located should be avoided, and all activities prohibited during the timeframes and within the distances listed below for the species that may occur within the project boundary.

Species	**Spatial Buffer**	**Seasonal Restriction**	**Release Date if Unoccupied**
Western burrowing owl	0.25 mile	April 1 to August 15	31-May
Golden eagle	0.5 mile	Feb 1- Aug 15	15-May
Red-tailed hawk	300-500 ft	Mar 1- Aug 15	31-May
Ferruginous hawk	0.25 mile	Mar 15- Aug 15	31-May
Swainson's hawk	0.25 mile	April 1- Aug 15	31-May
Prairie Falcon	0.25 mile	Mar 15- Jul 1	15-May
Peregrine falcon	0.25 mile	Jan 1- Jul 1	15-May
American kestrel	0.25 mile	Mar 1- Jul 31	15-May

Table 1. Recommended seasonal and spatial activity restrictions for raptor species.

ODFW appreciates the opportunity to comment on this pRFA4 and the actions taken to consider fish and wildlife impacts. ODFW looks forward to working with ODOE and the Applicant on this proposed project.

Respectfully,

Jessica Wilkes, Deschutes Regional Habitat Biologist

---

Good morning Chris,

Thank you for reaching out and providing the project overview.

We did our analysis and the project is approx. 4 miles away laterally from any of our military utilized airspace. Given there are no new wind turbines, the NORAD portion within the GAC is not a concern either.

Thanks again.

V/R,

Subject: [Non-DoD Source] FW: Email Summary of Public Notice of Receipt of Preliminary Request for Amendment 4 of the Site Certificate for the Biglow Canyon Wind Farm

Hello Kim,

Sarah let me know that you did not receive our initial notice on Receipt of Preliminary Request for Amendment 4 of the Site Certificate for the Biglow Canyon Wind Farm, my apologies for that. For context, this project proposes to add up to 385 MW of (~3,200 acres) of solar arrays; up to 1,500 MWh of Battery Energy Storage; and other related and supporting facilities including 2.7 miles of overhead 230-kV transmission lines, to the existing wind facility in Sherman County. No changes to existing wind infrastructure is proposed at this time. The project is within the Boardman Geographic Area of Concern.

More information is included below, and I have attached a shapefile of the micrositing boundary for the proposed components for your reference (please rename extension to .zip before use). Please let me

know if you have any comments or concerns regarding the project at your earliest convenience. I would be happy to schedule a call or send any other information along if that would be helpful.

I've also copied project contacts from PGE, Brightnight, and Tetra Tech on this message. They may be better able to answer any specific questions you may have about the proposal than I.

Thank you,

Christopher M. Clark

OREGON DEPARTMENT OF ENERGY — ENERGY FACILITY SITING COUNCIL

Email Summary of Public Notice of Receipt of Preliminary Request for Amendment 4 of the Site Certificate for the Biglow Canyon Wind Farm

On April 21, 2025, the Oregon Department of Energy received preliminary Request for Amendment 4 of the Site Certificate for the Biglow Canyon Wind Farm (pRFA4).

In pRFA4, Portland General Electric Company, the certificate holder, requests the Energy Facility Siting Council's approval to construct and operate a 385-MW solar photovoltaic power generation facility, battery energy storage systems with up to 375 MW of discharge capacity, and other

related or supporting facilities within a 3,980-acre (6.2 sq. mile) solar micrositing area. The proposed solar micrositing area includes 2,571 acres within the approved wind energy facility site boundary and 1,409 acres which would be added to the site.

The pRFA4 and Public Notice of Receipt of the pRFA4 are available on the Department's website.

The Biglow Canyon Wind Farm is an is an operating wind energy facility located within a site boundary comprised of approximately 25,000 acres (39 square miles). The facility consists of 217 wind turbines, with a maximum blade tip height of 445 feet, and a peak generating capacity of 450 megawatts.

Please note, this notice is to provide early notification of this amendment request. There is no comment period associated with this phase of review. A comment period and public hearing will be held later in the process.

For more information about pRFA4, please contact Christopher Clark, Senior Siting Analyst, via phone, fax, email, or mail:

RE: SHPO Case No. 25-0589
ODOE, 24-22, Biglow Solar
PGE has submitted an RFA for the Biglow Canyon Wind Farm to add photovoltaic solar energy generation and battery storage to the operating wind facility.
multiple, Sherman County

Dear Christopher Clark:

Thank you for submitting information for the project referenced above. According to our records and the provided archaeological report, there are previously identified archaeological objects or sites (Oregon Revised Statute [ORS] 358.905), or Native American cairn, burial, human remains, sacred objects and objects of cultural patrimony (ORS 97.740-760) in or adjacent to the project area. We concur with the determination that 11 of the archaeological resources identified are not eligible for listing in the National Register of Historic Places (NRHP); however, 8 archaeological resources remain unevaluated within the project area.

Our office concurs with the recommendation for a 20-meter avoidance buffer around all unevaluated and eligible resources, as well as the presence of an Oregon Qualified Archaeologist to monitor ground disturbing activities as proposed in the provided cover letter. Our office also concurs with the recommendation to have an Inadvertent Discovery Plan in place for all construction activities.

This recommendation is meant to assist with compliance of state law. Under ORS 358.920 and ORS 97.745, archaeological sites, objects and human remains are protected on both state public and private lands in Oregon.

A list of contractors can be found on the Association of Oregon Archaeologists website (www.oregonarchaeologists.com). This list includes qualified archaeologists in the state of Oregon. Some of these contractors have professional staff to address built-environment resources. For assistance in hiring a contractor, our office has published advice in Archaeology Bulletin 4 (https://www.oregon.gov/oprd/OH/Documents/Bulletin4.pdf).

If the project has a federal nexus (lands, funding, permitting, or oversight) coordinate with the lead federal agency to ensure compliance with Section 106 of the National Historic Preservation Act. If you have not already done so, be sure to consult with all appropriate Native American tribes regarding the proposed project. Additional consultation regarding this case must be sent through Go Digital. In order to help us track the project accurately, reference the SHPO case number above in all correspondence.

Our office has assigned the report SHPO biblio number 36068. Details will be available in the bibliographic database.

Please contact our office if you have any questions, comments or need additional assistance.

Sincerely,

Aspen Kemmerlin
Special Projects Archaeologist

Hi Sarah,

Thanks again for your coordination on this. Based on what you've provided, I agree with PGE's consultant that it does not appear notice of construction to ODAV/FAA will be required. Let me know if any future revisions are made to the project—namely, if it gets closer to an airport or increases to pole/transmission line height are proposed.

Subject: Biglow Canyon Wind Farm Request for Amendment 4 - Request for ODAv Concurrence on Applicability of 7460 Review

This message was sent from outside the organization. Treat attachments, links and requests with caution. Be conscious of the information you share if you respond.

Hi Brandon,

Thanks for the phone call this morning. As we discussed, PGE's Request for Amendment 4 of the Biglow Canyon Wind Farm Site Certificate has changed since Feb 2025 (when we originally received the request). We wanted to notify you of

the change, which includes removing the southern portion of the proposed solar area and the associated 230 kV transmission, reducing the changes under review to a 1,924 acre area encompassing up to 125 MW of solar photovoltaic power generation equipment, a substation, O&M building, two battery storage systems and approx. 600 feet of 230 kV transmission line. The solar arrays would be up to 15 feet in height; the transmission poles would be up to 80 feet in height; and the other components up to 25 feet in height. Figures with current layout and regional location are attached.

PGE (and their consultant, Tetra Tech) indicated that they ran the FAA Notice Criteria Tool to evaluate whether future notice and review under the 7460 process would be required. They confirmed that the tool indicated 7460 review would not be required. Could you confirm whether ODAv agrees that future 7460 review would not be needed for the facility components proposed in RFA4?

Please let us know if you need any additional information to evaluate the proposal/question. If you have everything you need, we would love a response this week if possible.

Thanks,
Sarah

Subject:	Biglow Canyon Wind Farm Facility
Attachments:	Wind Towers Down-compressed.pdf

Christopher,

Here is Exhibit One. Why in the world would we trust PGE to run a solar project in a high-risk wildfire area when the wind towers look like this? Yes, they still look like this. Supposedly, 17 of the 40+ broken Vestas towers will be fixed in 2026, **over four years after the "blade throw".**

We are over 100 miles from Portland. It is hard to find good help, especially when PGE pays less than the surrounding wind facilities like Avangrid. On weekends, the plant is not staffed, although there are some technicians working. On nights, no one is working. **Is this a power plant? Or a tax write-off?**

Yes, they have a new pitch system coming from Germany, and it looks great. But this project was built from the ground up in 9 months. That tells me this is a **financial** issue.

Will the solar facility be 24/7, especially during fire season? Will the weeds be kept down? Will the facility be protected by hundreds of feet of gravel on the west side or just 50, like they are proposing?

Will the BESS units be maintained better than the transformers? (pictures included below) I put this PDF together three years ago. The towers still look like this, and most of the Vestas are unsafe to run.

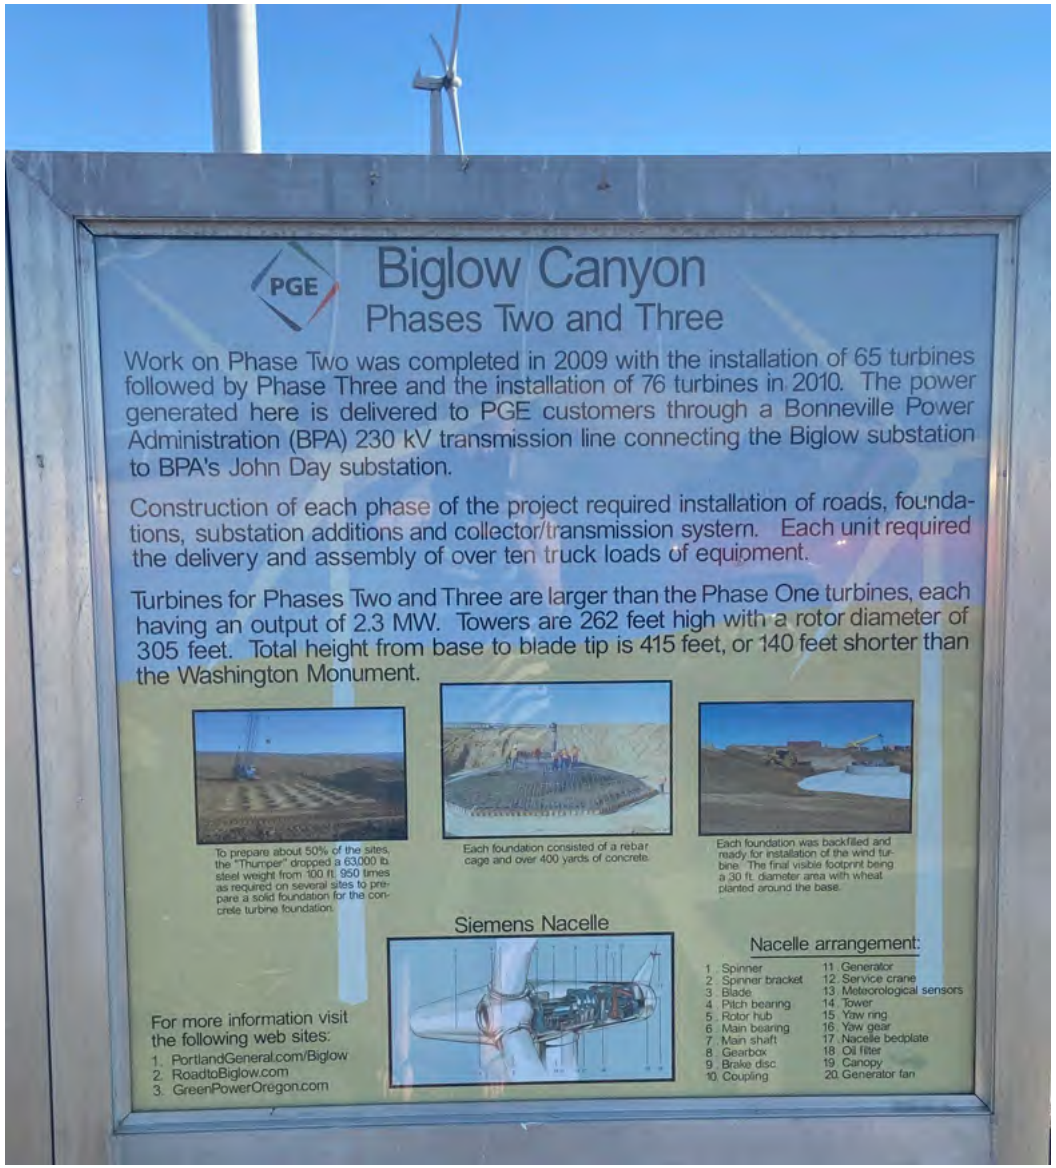
These are questions that need answers. We do not believe PGE is operating Biglow in good faith. They should not be allowed to build solar until the Vestas towers are fixed.

Sincerely,

Keven and Kathy McCullough

When Wind Towers Fall Apart

Portland General Electric's (PGE) Biglow Canyon



Without maintenance or good management, everything fails.

John DeMoss died in 2008 and his oversight went with him.

We were so proud of this wind farm. Thrilled. Excited.
We stayed outside at night in the cold watching them erect the towers.

Then, in 2010 the towers started leaking oil. Kevin and I complained, but nothing changed. The leaks got worse.

PGE says they have vegetable oil in all their transformers, and that it is safe. That's a bait and switch. The transformers are at the bottom of the towers. This is a blade pitch motor leak and it is definitely hydraulic oil.

There are 76 Vestas in this project, and over half of them are leaky, oily messes.

Disgusting.

No more great photos for me.

When things break, the towers sit idle for months before parts arrive or a crane is brought in.

Oil at the bases leaking onto the ground….

We fix our farm equipment when we see leaks.

Oily rags show just how dirty it is up there.

Oil all over the ground.

PGE puts oil pads around some of the bases to soak up the excess oil.

These bases are relatively clean…
it’s the transformers that look bad. A little paint?

This is one of the "vegetable oil" transformers. Vegetable oil still has a flashpoint…!

Then the biosolid spreaders and PGE technicians started finding bolts on the ground.

Sheared off.

Siemens Europe has had two deaths from bolts hitting people on the ground. And one man is permanently brain-injured, according to a safety presentation technicians here in Sherman County received.

Oregon Department of Energy (ODOE) says anything that falls from 265 feet can be deadly, especially since it can reach a velocity up to 130 feet per second.

Some of the bolts are almost two feet long.

There were bolts on the ground so the biosolid spreaders used them as paperweights!

It's not like taking them over to the PGE building makes a difference... when you have pieces lying on the ground for a year you get the impression that no one cares about this project.

Bolts aren't the only things that falls to the ground.

This one is missing a door. In fact, a lot of these towers are missing hatch doors, and the guys find them in our fields "all the time."

(Zoom in, it's hard to see with all the oil).

When a tower is this greasy, how can you see a problem?

This is a hatch door. We pick them up out of the fields and lean them against the towers - or take them over to the PGE building.

Zoom in.

(Two doors between each blade, 6 total.)

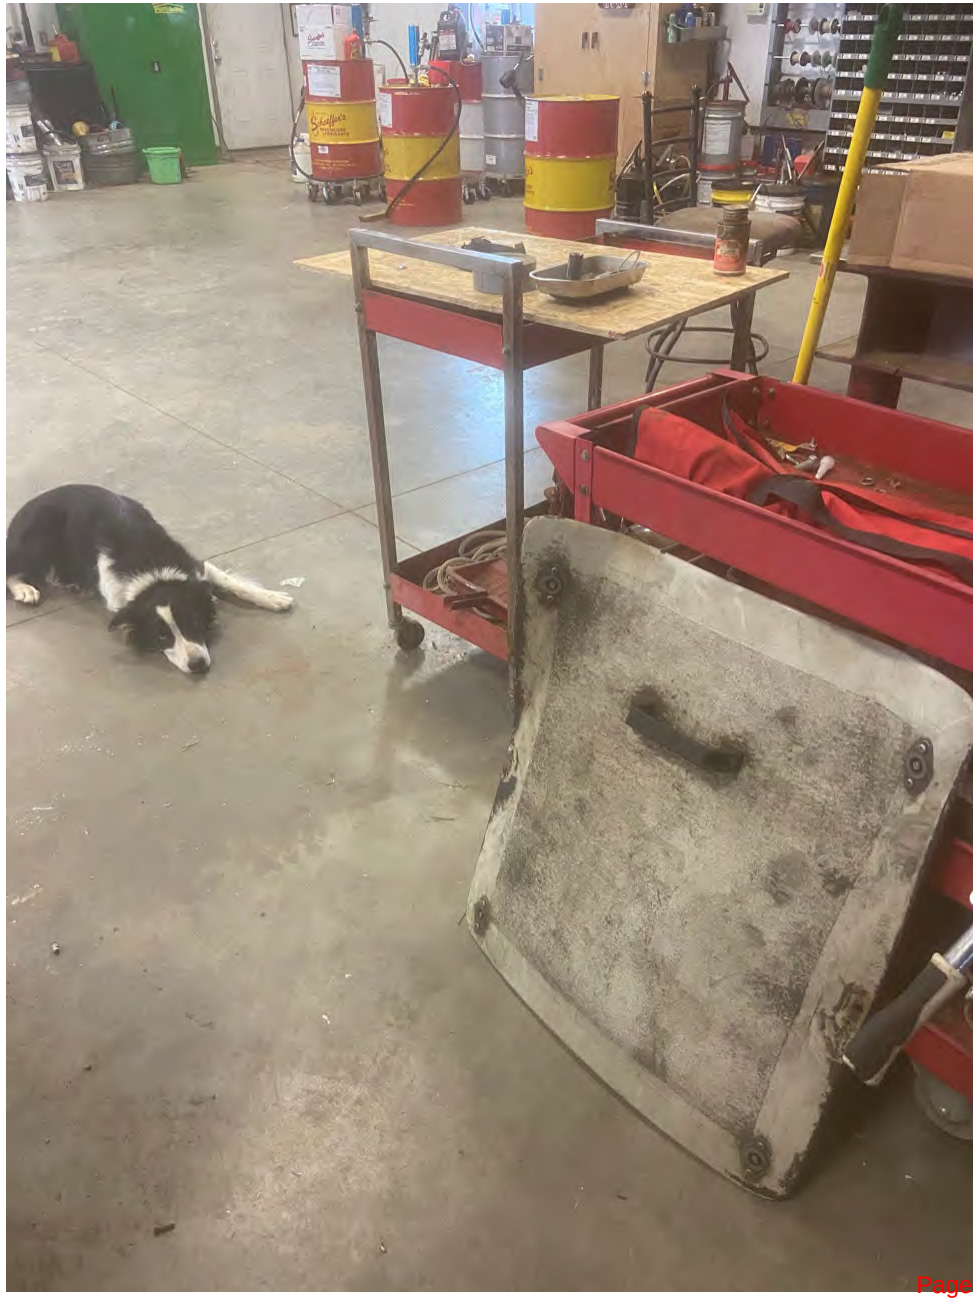
I leaned the door under the stairs for them to find and fix.

(Yes, I'm a dreamer...)

Another missing door.

I found three missing yesterday where we were harvesting. 22, 23, and 25.

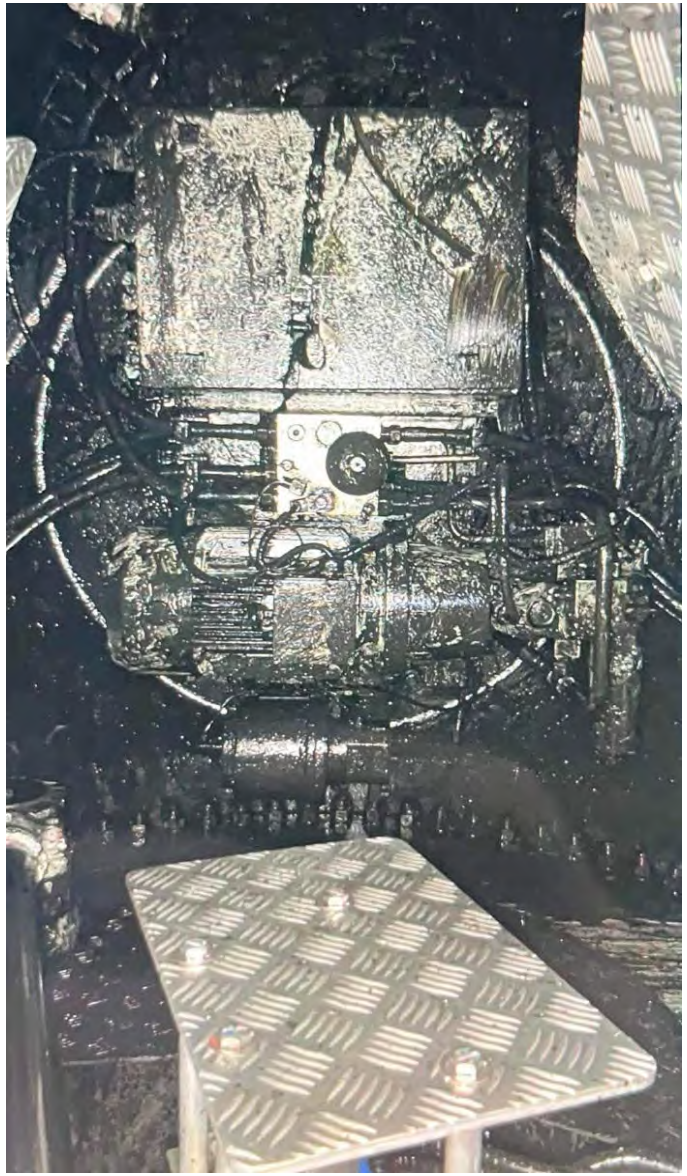
See the hole? You can see where it broke away.



The backside of the door.

Really greasy on the inside, of course.

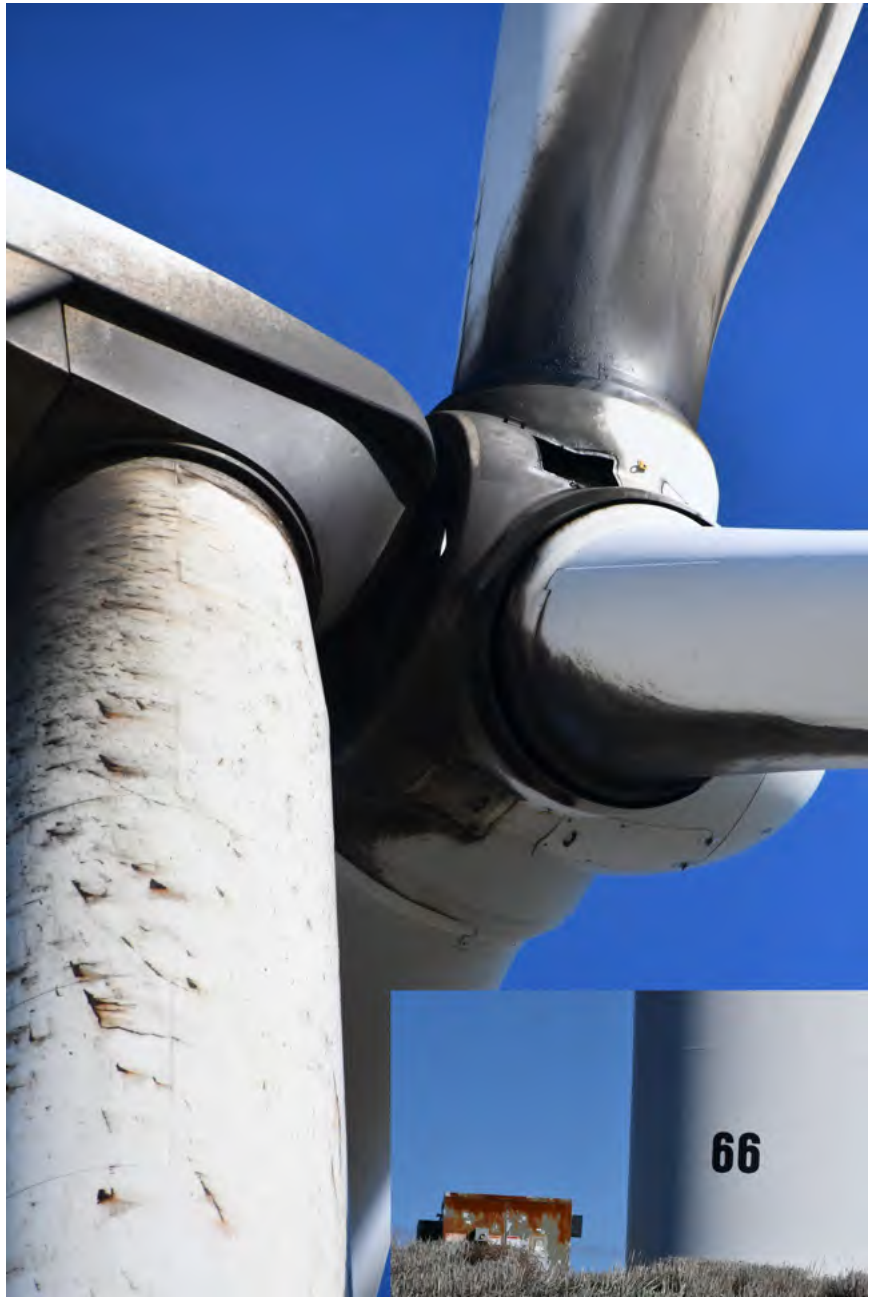
Even Turbo is discouraged.



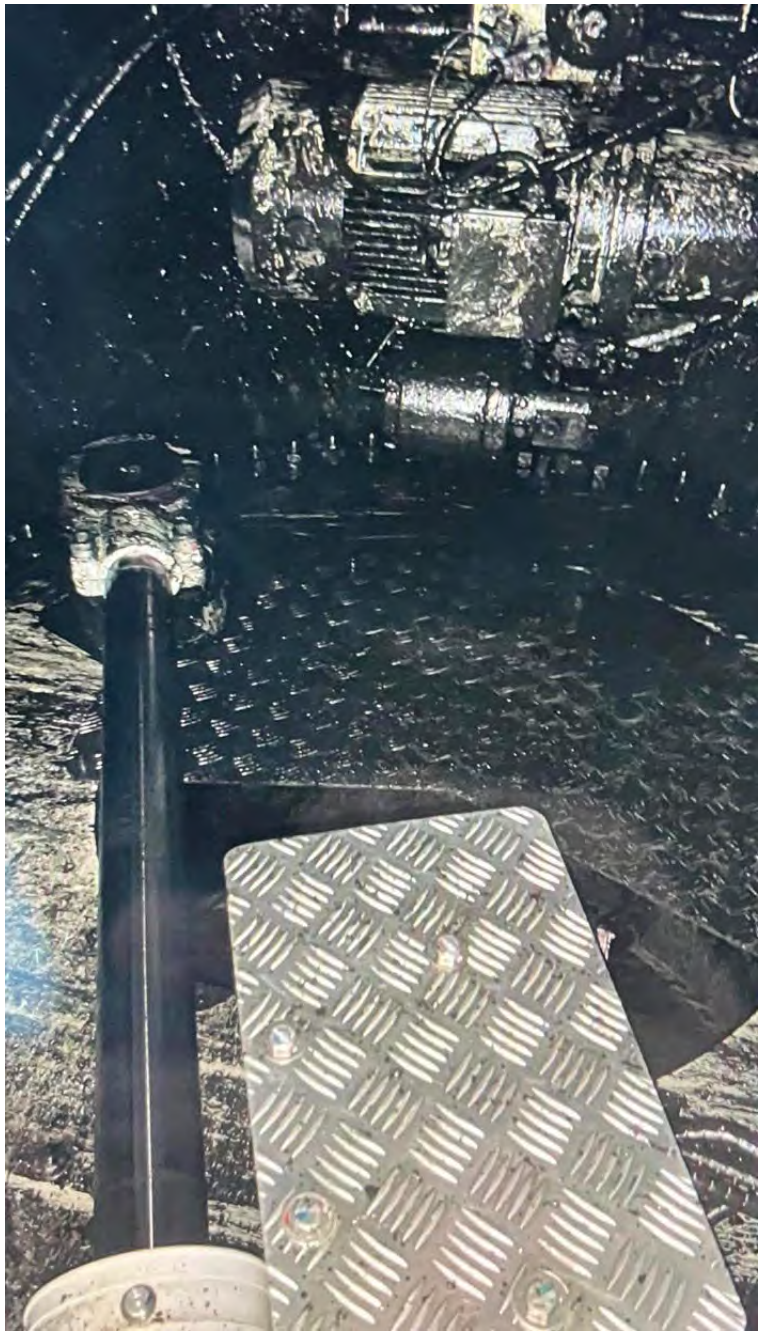
My other worry is fire. These things are oily and greasy inside.

PGE says they can't confirm this is a Biglow tower.

Well, I can.



41



With our high summer temperatures
(111 degrees +), and their over-heating components, it's a fire waiting to happen.

We've told PGE this.
So it is on them.

This is what they actually look like in the ones that haven't been cleaned lately.

The trouble is, without fixing the problem, they keep leaking and within a couple weeks they are disgusting again.

PGE says they are clean, and even sent techs up to take a photo to confirm it. Yes.
This is a cleaned-up one, and what they should all look like inside.

But that's not all that falls off. Oh no. That's not all.

(I feel like I'm living in a Dr. Seuss book.)

This disk is a big flying saucer that weighs ten pounds.

About 100 yards away in a gully the guys found a disk from a Siemens tower.

So it isn't just the Vestas that have maintenance issues.

Don’t believe me?

It even has a part number on it.

(ZOOM IN)

It is metal, and it is thick. It belongs up in the hub… vibrations loosen them and they fly like a saucer through the air!

They basically plug a hole, a wind technician friend of mine says. But if you don’t get it screwed in properly…

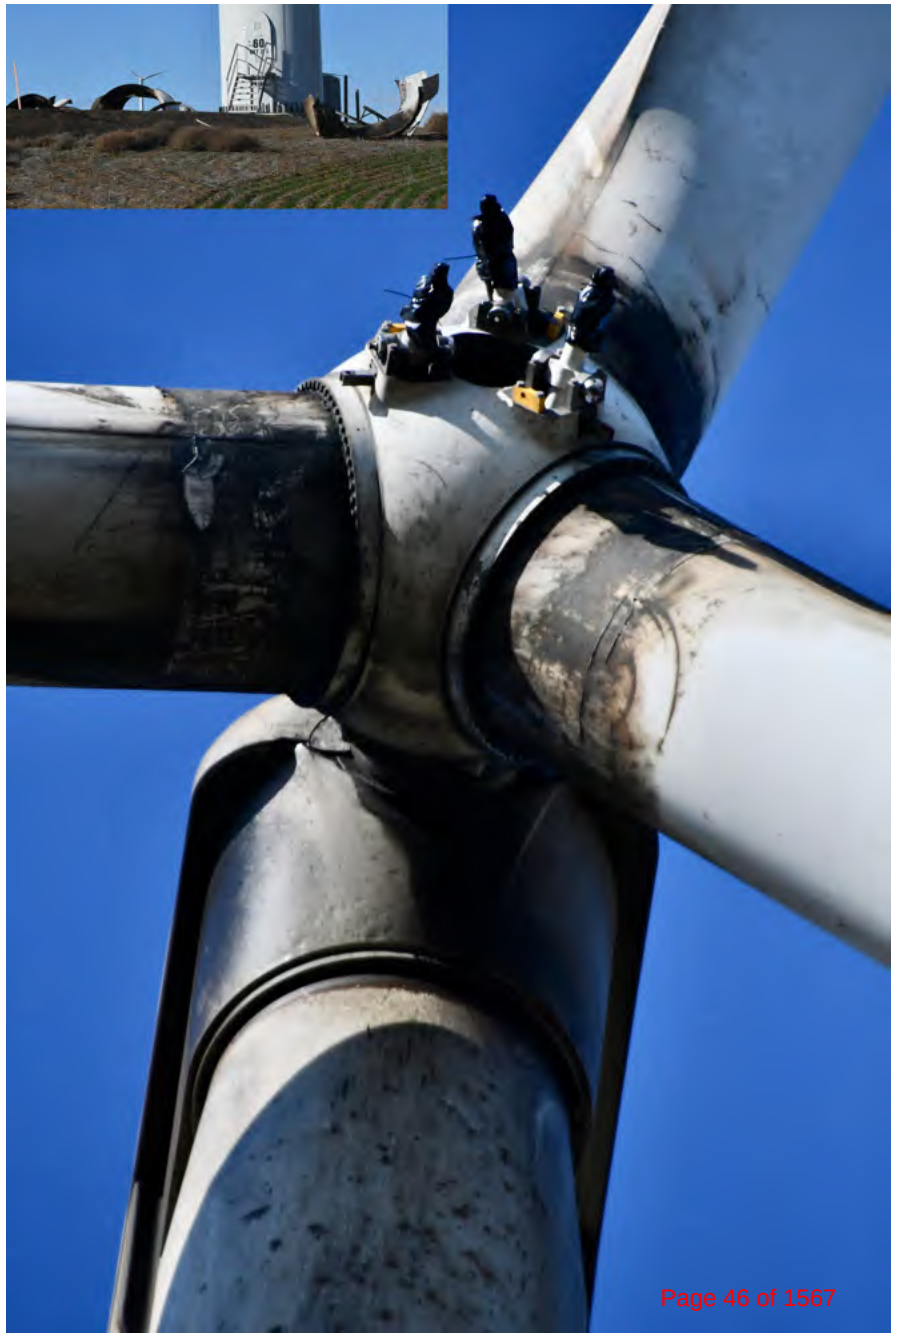
I can't see where it should be from the ground, but apparently a good tech can see that it is missing.

It flew a long ways - about seventy-five yards… ouch.

A year ago, April 2021, part of a nose cone fell off. PGE took the rest of the nose cone down and left it.
We were seeding October 7 and it was still there.

We picked up the 3+ pieces that had dropped in the field and placed them under the tower.

When the blade fell off February 1, 2022, all the pieces were still there! (You can’t see the nose cone in the gully)



I mentioned the nose cone was still down in the gully on a Zoom call this July. They said that was because the farmer told them not to pick it up! *Well, kind of true.* We didn't want them driving through our growing wheat, but they had 6 months before we seeded!

Besides, it's not like that's the only thing that falls that they don't pick up…

You can't make this stuff up. But you can lie about it. When asked why the nose cone wasn’t reported to ODOE (a year later), PGE "self reported" within 72 hours and ODOE basically said, that's okay. You guys are good partners. Just don't let it happen again.

Anything that falls is reportable.

I feel like ODOE, PUC, PGE, and BPA are all in a secret club that doesn't include the ratepayers or the taxpayers or the landowners. Remember, they used federal and state money to build this project.

So what happens when you don't maintain a wind project?

A blade falls off.

That is our house in the background.

The blade fell off at 2:13 AM, and the thump woke Kevin and our dog, Turbo. It landed 300 feet away from the tower.

There was a load of biosolids delivered in this field by this tower at 10:30PM. It could have fallen then. And killed someone.

Crews flooded the fields after the blade fell. I have never seen that many workers checking and tightening bolts.

I believe it is only a matter of time until another blade falls.

Lies and broken promises.
(The landowner told us not to pick up the nose cone. You're our partners. We'll get a newsletter out to the landowners each quarter. And on and on.)

The worst part is that we have been talking to PGE about these issues for 12 years. We first noticed the leaks in 2010 when the pitch motors were still under warranty!

They must think we are dumb farmers who don't understand how difficult it is to run a wind project.

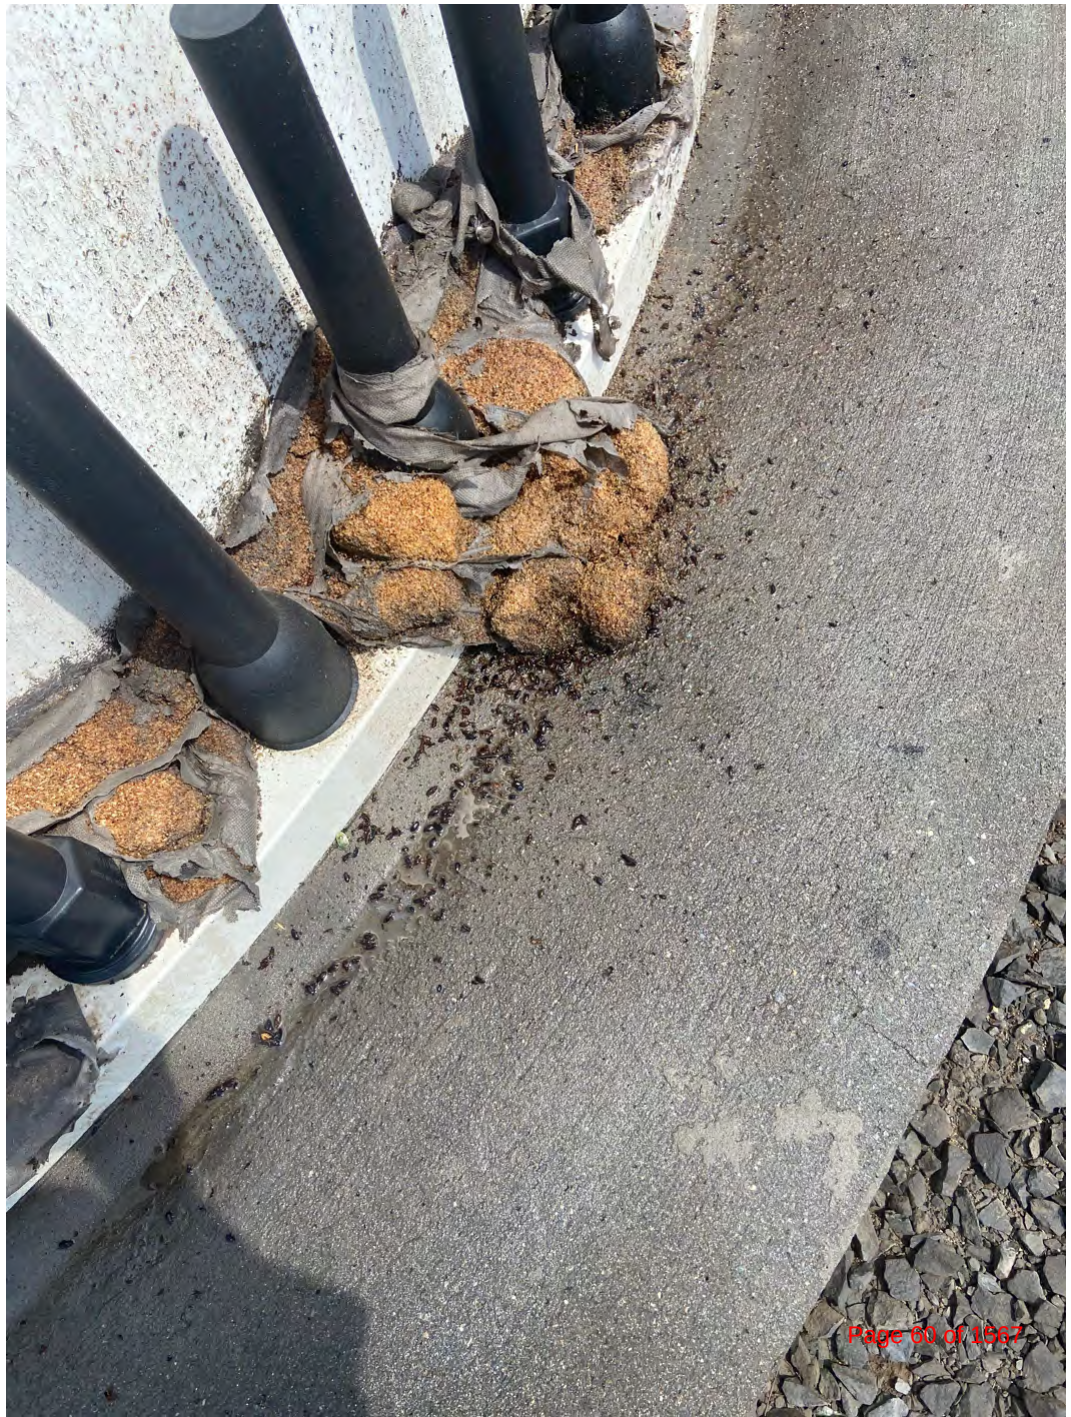
But all things mechanical have to be maintained,
and if you look at our farm equipment,
you will see we practice what we preach.
Besides, who doesn’t fix things under warranty?

Two weekends ago there were 40 towers down out of 217. No one is here to notice except us. Don’t we need electricity 24/7?

This isn’t a hobby farm and I’m pretty sure Biglow isn’t either.

I'm mad, but mostly I'm sad. We noticed that they were shutting down the towers on windy days. Eventually we learned PGE was getting paid to shut them down. BPA paid them “wheeling charges” when there was too much wind and the dams were running water through.

PGE told us we only got paid when the towers generated electricity. It had never occurred to us that PGE would get money for *not* producing electricity from towers on our land.



This could have been a great partnership. Like marriages that end in divorce after an affair, the relationship probably isn't salvageable. We don't trust PGE anymore.

Grease & oil, bolts, doors, disks, nose cone pieces, and blades.

Our payments are over 50% down.
But that’s the least of our worries.

What's next?
A tower falling over?

I don't want anyone else hurt or killed.

We already lost one life in this county when a wind tower fell over.

2007

WHERE DO WE GO FROM HERE?

WILL PGE FIX THE TOWERS AND MAKE US “WHOLE”?

OR WILL THEY CONTINUE TO RUN THIS PROJECT AS CHEAPLY AS POSSIBLE WITH NO INTEGRITY?

IT’S UP TO THEM, BECAUSE WE FEEL DISCOURAGED, USED, AND LIED TO.

2022

PGE has not maintained the Biglow Wind Project. We have observed Biglow's deterioration since 2010. We have no reason to expect that solar will be any different.

PGE has lied to us so many times over the years that I have lost count. It started when we noticed the towers were turned off on windy days or at night. The plant manager told us they were not turning them off at night. Besides, how could we tell if they were when it was dark out? After that ridiculous statement, I informed him of the large, lighted moon, as well as the red lights on the turbines flashing as I see the blades going around.

We found large pieces, including doors, discs, and a nose cone that had fallen off. Of course, we reported them to PGE, often taking them to the operations building. When the blade was "liberated" in February 2022, they could no longer deny our claims. PGE told ODOE they didn't know what size falling pieces had to be reported. ODOE said any size. DUH.

I asked ODOE why they hadn't noticed the oil leaks. The man on the phone said he had never looked up. The bases were in the site certificate, so he measured and inspected the gravel around the tower. Additionally, they had numerous projects to monitor in Oregon — the annual inspections on Biglow were being done by phone, since PGE was a trusted operator.

Now, almost four years later, despite promises to repair the turbines, including a new pitch system, 41 turbines are either too unsafe to operate or broken beyond repair for the foreseeable future. PGE claims they will fix 18 of them in 2026. We're waiting, but not holding our breath.

Now they want to install solar. We have no reason to believe that a solar project will be maintained any better than the wind, especially after the first five years. We are worried because we live and farm around the Biglow project. We have asked PGE for a hold harmless clause if we accidentally start a fire. Their answer is a firm no. No explanation, no discussion—just that their lawyers said NO.

"Matters of civil liability are generally outside of the Council's jurisdiction, and it is my understanding that EFSC cannot require a developer to indemnify surrounding farm operators from liability beyond the requirements of the existing right-to-farm law under ORS 30.930 to 30.947 or other state or local laws and ordinances, and as you have brought up in the past, the existing right to farm law does not cover damages from fire." Christopher Clark, ODOE

As stated above, Oregon's Right to Farm Law does not include fire. This may be outside the Council's jurisdiction, but it should be considered. Either the law needs to be amended, or solar projects should not be located in high-fire-risk areas.

Oregon adopted legislation in 1993 and updated it in 1995 and 2001 to protect farm and forest practices from adjacent conflicting issues. The program is called Oregon's Right to Farm laws. It protects farmers from claims over smell, dust, noise, and other trespass or nuisances associated with farming.

Oregon Department of Agriculture Literature
https://www.oregon.gov/oda/shared/Documents/Publications/NaturalResources/RightToFarm.pdf

ORS 30.930 to 30.947, Farming and Forest Practices
ORS 30.936 and 30.937, Immunity from private action based on farming practices

We need a hold harmless agreement from PGE before this project is approved or assurances in writing that they will not sue us or go through our insurance.

Every year, fires start in Sherman County from hot equipment or sparks. We keep our equipment in good condition, just like other operators around us do. Each year we help as volunteer firefighters to extinguish fires near us. It's not a matter of if we will have a fire, but when. PGE has already had two, but I don't believe they have reported all of their fires. Usually, we help extinguish between 6 and 10 fires a year.

Over half of the PGE Vestas towers are dripping oil. The transformer cases were allowed to rust. PGE Biglow transformers have blown and started a fire: at least two. Who knows if they have reported all of them.

The new Tesla battery cases look immaculate in the BESS photo from BrightNight. But the transformer cases around the existing wind turbines looked good when they were new, too. Lithium-ion batteries have a history of catching on fire when not properly maintained. In addition, there were five solar panel fires last year in the Avangrid project in the next county, and two this year in our county.

While we have not started any fires ourselves, that remains a possibility. So far, we have been lucky.

Our farm has $5 million in liability insurance, but that would be insignificant if we start a fire. Covering the cost of 700 or 800 acres of solar panels and/or BESS (battery storage) could bankrupt us. That's a blow to the right to farm. Placing a solar project in the heart of a county that has the highest percentage of agricultural land in Oregon interferes with our livelihood. With high temperatures and wind in the summer, this could lead to serious issues. We shouldn't be held responsible for normal farming practices.

PGE has verbally stated that they will not target us personally and will "only" use our insurance money if a fire results from typical farming activities. They miss the point. After such a large claim, we will never be insured again. No insurer will want to cover us. Insurance is already very

costly where we live, and our agent said that even a microwave fire in the PGE office building south of us could increase our rates.

Besides, we don't trust PGE or BrightNight. We have been lied to by both of them so many times that we have lost count.

PGE told us they were maintaining the towers, but they weren't. The budget allocated annually decreased instead of increasing. Everyone with equipment knows that costs rise, not fall, with age. PGE explained its approach to wind farm maintenance:

"…state regulators have not issued any violations for failing to report safety incidents; only two of the incidents it did report were actually related to public health and safety; leaking oil posed only a low environmental or fire risk; and lost service time is likely the result of grid constraints beyond its control. The issues at Biglow Canyon, it said, are consistent with those experienced by other utilities with similarly aged equipment."

BrightNight told us we would have a setback from our property, then sent us photos of them right up to our property line. Fortunately, the property owner raised concerns and got it pushed back ½ mile.

Here are a few of the highlights from the Wind Bust article (Linked below) in the Oregonian:

Although the Vestas machines were just halfway through their 30-year estimated useful lifespan by 2022, *The Oregonian* reported PGE was already thinking about retiring them.

Despite all this, a PGE spokeswoman gave a prickly reply about the tone of *The Oregonian*'s questions. https://capitalresearch.org/article/wind-turbines-produce-drama-cash-and-some-electricity-part-1/

"PGE entered into a long-term maintenance contract with the maker of the turbines, a wind sector leader, Vestas," PGE spokesperson Melissa Havel said in response to written questions. "This was a prudent and industry standard action on the part of PGE. "We challenge your categorization of the volume of troubles," she wrote. "Since coming online, Biglow Canyon wind farm has generated more than 13,000,000 MWh of clean electricity, which translates to powering 120,000 homes per year."

Problems began more than a decade ago. The McCulloughs said they expressed concern to PGE that the Vestas turbines, then only three years old, were leaking oil and lubricants from the nacelles, the box atop the turbine tower that houses its gearbox and other major components.

"PGE is updating our office regularly with the inspection status, as well as committing to provide our office with a longer-term inspection and maintenance plan," Hank Stern, a spokesperson, said in an email. "Sen. Wyden will keep watchdogging this issue to ensure PGE follows through on its commitment to him and the community."

Financially, PGE appears to have two routes to address issues.

Jenkins, the utility's vice president of operations, insists that PGE is managing the project – and the Vestas turbines – for longevity, focusing on preventive maintenance to keep small problems from turning into big ones. "I don't know that with the age of these assets, the case can be made that they're not performing," he said.

Biglow Canyon has never experienced a turbine fire. But they do happen in the industry, with a 2,000-acre blaze in Gilliam County four years ago linked to a turbine operated by a different company, according to compliance reports submitted to the state.

"Just because an asset is dirty doesn't mean it's not running well," Jenkins said. "We're more concerned with what's on the inside."

But keeping the turbines performing at a high level may require significant investments, and PGE's filings with regulators don't reflect that reality.

In fact, PGE's operations and maintenance expenses at Biglow Canyon have steadily declined, despite the aging equipment and acknowledged need for major repairs. PGE spent $13 million last year, down 40% from 2013, according to figures filed with the Federal Energy Regulatory Commission. That's the lowest total since 2010.

And in documents submitted to Oregon regulators, the company said it would spend even less this year: $10 million.

Jenks, the ratepayer advocate, said the review would also include an analysis of whether the current equipment has been properly maintained, and if not, what went wrong.

"If we're going to make a transition to clean energy," he said, "we need to hold the utilities responsible for managing these projects properly."

The landowners would like that same level of accountability.

"When we entered into the agreement, the objective of the company and the landowners leasing the land was to have the project work, and make money," said Cheryl Woods, a Biglow Canyon property owner and the accountant for the wind prospecting company that originally arranged the lease.

"But it doesn't seem to be exactly going that way. It just hasn't been managed well."

- PGE has failed to report public safety incidents at Biglow Canyon, in potential violation of its operating agreement with the state. The utility hasn't disclosed incidents where hatches, metal disks and blade bolts have fallen off turbines from a height of about 265 feet. PGE has questioned whether such incidents meet the reporting threshold, but regulators insist even small objects may be a hazard to anyone near a turbine because they can reach almost 90 mph when falling.
- PGE knowingly operated at least four turbines at Biglow Canyon with broken blade bolts, in one case for nearly a year, maintenance records show. Those bolts clamp blades to the rotor and bear the stress of wind and motion. Research indicates that broken bolts,

while not uncommon, can become a serious problem leading to catastrophic blade failures like the one in February.

- Oil leaks from Biglow Canyon's wind turbines and transformers are environmental and fire hazards. The turbines have been plagued by leaks of oil and lubricants that coat towers and blades and spit on to their gravel pads and surrounding fields. Transformers have ruptured regularly, causing two fires and spilling about 3,000 gallons of mineral oil into surrounding soil that prompted expensive cleanups.
- The number of problems PGE has disclosed to regulators is out of line with other wind farms. Since 2010, PGE has reported more than a dozen oil spills and other incidents at Biglow Canyon with the potential to affect public safety – about three times more than any other wind farm regulated by the state. But state officials only recently began pressing PGE to explain those troubles.
- Biglow Canyon has generated far less power than PGE originally projected. The availability of its Vestas wind turbines to produce energy has abruptly declined in recent years, and the project's rate of energy production is less than neighboring wind farms of comparable age.
- Ratepayers may end up footing the bill for assets that are no longer useful. The project's 76 turbines manufactured by Vestas are halfway through their projected life but PGE is already considering replacing them. If that happens by the end of 2023, ratepayers would be stuck covering $156 million in remaining costs.

Kathy McCullough:

I showed the Oregonian a real photo of the inside of a Biglow tower after Jenkins provided a clear photo. They say Biglow has not had a turbine fire, but they have experienced other fires, including transformer fires.

PGE spokesperson Havel did not admit that the maintenance contract was changed and that the pitch seal warranty claim was never finalized. I'm so tired of lying by omission.

All things considered, the energy they generated isn't something Havel should brag about. PGE produced much less energy than expected, with the project just south of us in a less windy area, generating only 37%. So, this isn't a wind issue. It's a maintenance problem. It's also because BPA is paying PGE wheeling charges.

"We will investigate if it's reported to us," said Todd Cornett, assistant director of the Department of Energy siting division.

PGE did not report violations to the Oregon Department of Energy, and ODOE did not investigate. Additionally, there aren't any reports from other utilities with similarly aged equipment.

Senator Wyden has not continued to watch over the situation; in my opinion, he has not taken any action.

_____

"…rules require issues in comments to be raised with "sufficient specificity" to afford the Council, the Department, and the certificate holder an opportunity to respond. Under OAR 345-027-0367(7)(a), that means the comments must identify the recommended findings of fact, conclusions of law or conditions of approval identified in the proposed order to which you object; specify the Council standard or other applicable state and local requirements on which the objection is based; and present facts or statements supporting that objection." ODOE

_____

Sufficient specificity: I object to this project piggybacking on the wind without proper fire mitigation. Oregon has a "Right To Farm" law that should be respected. This project infringes on our Right To Farm. It's a high-risk fire area. There is a lot that PGE has not done in good faith in the past. Given PGE's track record, we need proof that things will be different with solar.

Story by **Ted Sickinger**
Photography by **Dave Killen**
The Oregonian/OregonLive
Aug. 27, 2022

In the waning days of January, a worker delivering fertilizer to a wheat farm in the rolling hills of Sherman County found some broken, industrial-size bolts on the ground near one of Portland General Electric's towering wind turbines.

A broken blade bolt found under a wind turbine at Biglow Canyon wind farm by a worker delivering fertilizer in late January. A day or two later, the turbine threw an eight-ton blade into a nearby field. (Courtesy Kevin Massie)

He was puzzled because it stood to reason the bolts fell from the machine. But he didn't know if there was a problem or, if so, who to tell. So he picked up one, sent a snapshot to his co-worker, Kevin Massie, and used it as a paperweight while he documented the delivery.

Massie arrived a day or two afterward to tow a delivery driver whose vehicle got stuck in the mud near the same turbine at Biglow Canyon. It was dark and windy. Nothing seemed out of the ordinary.

Hours later, at 2:11 a.m. Feb. 1, one of the turbine's three spinning blades launched into the night.

No one saw it. No one heard it. But it was evidently a violent affair.

The skinny blade, as tall as an 11-story building and weighing more than four Toyota Camrys, soared the full length of a football field. It plowed a furrow 4-feet deep in the wheat stubble where it eventually landed.

Heavy-duty bolts that once kept the blade fastened to the tower scattered around the turbine base like shrapnel, some spiked deep into the soil.

Broken blade bolts were scattered around turbine 71 at Portland General Electric's Biglow Canyon wind farm after the turbine threw a blade in the early hours of Feb. 1. Hours before the blade throw, a driver delivering fertilizer became stuck in close proximity to the turbine and had to be towed out. (Courtesy Kevin Massie)

"Someone could have been killed or badly injured," said Kathryn McCullough, whose husband, Kevin, farms under about half of Biglow Canyon's turbines – including the one that lost its blade.

The broken bolts preceding the incident weren't the only warning signs of problems at PGE's flagship wind facility, which opened 15 years ago amid a push to expand green energy technology in Oregon and nationally. But it took the so-called "blade liberation" for PGE to take urgent action at Biglow Canyon, one of Oregon's largest wind farms, shutting down all 217 turbines for testing and keeping some out of service for at least four months.

The dramatic episode in the rural landscape of the Columbia River Gorge represents a revealing, if concerning, inflection point in Oregon's two-decade history with the ubiquitous turbines that help fuel clean energy.

On Feb 1, turbine 71 at Portland General Electric's Biglow Canyon wind farm threw an eight-ton blade 100 yards into a nearby field, plowing a deep furrow in the ground where it landed. (Left, Dave Killen, right courtesy Kathryn McCullough)

Industry groups insist that wind farms are very safe and major malfunctions, such as blades flying off the turbines, are exceedingly rare. But as wind farms grow older and the underlying components age, regular and proactive maintenance become far more important.

More: Why accident, safety data is hard to come by for wind industry

Yet landowners have been raising concerns to PGE for the last decade about maintenance issues at Biglow Canyon and their impact on energy production at the facility. And an investigation by The Oregonian/OregonLive has found that the seemingly isolated blade incident is part of a wider set of maintenance problems and equipment failures that are now undercutting electricity generation at Biglow Canyon, shortchanging ratepayers and landowners, and putting those who cultivate crops under the turbines – and potentially their farmland itself – at risk.

Among the findings:

- PGE has failed to report public safety incidents at Biglow Canyon, in potential violation of its operating agreement with the state. The utility hasn't disclosed incidents where hatches, metal disks and blade bolts have fallen off turbines from a height of about 265 feet. PGE has questioned whether such incidents meet the reporting threshold, but regulators insist even small objects may be a hazard to anyone near a turbine because they can reach almost 90 mph when falling.
- PGE knowingly operated at least four turbines at Biglow Canyon with broken blade bolts, in one case for nearly a year, maintenance records show. Those bolts clamp blades to the rotor and bear the stress of wind and motion. Research indicates that broken bolts, while not uncommon, can become a serious problem leading to catastrophic blade failures like the one in February.
- Oil leaks from Biglow Canyon's wind turbines and transformers are environmental and fire hazards. The turbines have been plagued by leaks of oil and lubricants that coat towers and blades and spit on to their gravel pads and surrounding fields. Transformers have ruptured regularly, causing two fires and spilling about 3,000 gallons of mineral oil into surrounding soil that prompted expensive cleanups.

- The number of problems PGE has disclosed to regulators is out of line with other wind farms. Since 2010, PGE has reported more than a dozen oil spills and other incidents at Biglow Canyon with the potential to affect public safety — about three times more than any other wind farm regulated by the state. But state officials only recently began pressing PGE to explain those troubles.
- Biglow Canyon has generated far less power than PGE originally projected. The availability of its Vestas wind turbines to produce energy has abruptly declined in recent years, and the project's rate of energy production is less than neighboring wind farms of comparable age.
- Ratepayers may end up footing the bill for assets that are no longer useful. The project's 76 turbines manufactured by Vestas are halfway through their projected life but PGE is already considering replacing them. If that happens by the end of 2023, ratepayers would be stuck covering $156 million in remaining costs.

Kathryn McCullough, a Sherman County landowner, examines a bolt off the blade that was thrown from a turbine at PGE's Biglow Canyon wind farm on Feb. 1. "Someone could have been killed or badly injured," she said.

The Biglow Canyon turbine that launched its blade is one of about 72,000 machines nationwide, including some 2,300 turbines in Oregon, which has more production capacity than all but nine other states. Yet there is no effective national, state or county reporting requirement or database tracking safety or operational incidents at wind farms, and only 13 of the largest of Oregon's 48 wind farms are regulated by the state, numbers that include multiple phases of some projects.

PGE launched an investigation into this winter's blade throw and is filing written updates to regulators. But it has asked the Oregon Department of Energy to keep those confidential until the end of the year because of the possibility of litigation.

Seven months into that review, PGE told The Oregonian/OregonLive that preliminary results suggest the connection between the turbine blade and its hub was “not well clamped,” a problem likely caused by “bolts becoming loose and experiencing fatigue damage over time.”

PGE said it took the blade failure “very seriously as a safety incident” and is working to fully understand the cause, rectify it and make any other necessary adjustments to improve operations.

But PGE defended its overarching maintenance efforts. It said that state regulators have not issued any violations for failing to report safety incidents; only two of the incidents it did report were actually related to public health and safety; leaking oil posed only a low environmental or fire risk; and lost service time is likely the result of grid constraints beyond its control. The issues at Biglow Canyon, it said, are consistent with those experienced by other utilities with similarly aged equipment.

“PGE entered into a long-term maintenance contract with the maker of the turbines, a wind sector leader, Vestas,” PGE spokesperson Melissa Havel said in response to written questions. “This was a prudent and industry standard action on the part of PGE. We challenge your categorization of the volume of troubles. Since coming online, Biglow Canyon wind farm has generated more than 13,000,000 MWh of clean electricity, which translates to powering 120,000 homes per year.”

Even so, PGE said it has now taken a more active role monitoring the turbines at Biglow Canyon, analyzing incoming data for anomalies or patterns that may indicate performance or safety issues. PGE officials said the utility could also end up suing Vestas, which maintains all the turbines there and manufactured the one that launched the blade. PGE said it has streamlined Vestas’ scope of work so the company can focus more on preventative maintenance.

Vestas said it completed its own investigation into the blade failure but could not share results because they contain proprietary information. Vestas, which has its North American headquarters in Portland, said there was no evidence to suggest that inadequate maintenance has shortened the lifespan of turbines at Biglow Canyon, and that the project continues to operate at or above industry standards.

Most of the turbines at Biglow Canyon have now returned to service.

“We wouldn’t run it if it wasn’t safe,” said Jesus Carrera, PGE’s manager of wind operations.

Maintenance issues at Biglow Canyon matter broadly because PGE – Oregon’s largest electricity provider, serving some 900,000 homes and businesses in Oregon – plans to transition to 100% carbon-free energy by 2045. And its customers will be paying the bill.

To eliminate all its greenhouse emissions, PGE would need to supersize its fleet of renewable energy resources and manage them for longevity, maximizing production for decades to come. Yet the economics of wind power are heavily dependent on federal subsidies, and some experts suggest those subsidies are structured in a way that incentivizes operators to skimp on maintenance for older equipment that is no longer eligible.

PGE's operations and maintenance expenses at Biglow Canyon have declined precipitously, federal records show. In 2021, PGE spent 40% less than it did eight years earlier, and it told economic regulators that spending would be even lower this year.

PGE said it has consistently invested in Biglow Canyon's operations while also striving to maintain competitive rates and balancing customer cost implications. "We expect to remain consistent with our investments this year until we determine the best future course of investment," Havel added.

The blade thrown from a turbine at PGE's Biglow Canyon wind farm on Feb 1. An outbuilding next to the McCullough's residence is shown in the background.

Meanwhile, Biglow Canyon landowners who believe in the promise of green energy have been left frustrated, not only by a perceived lack of transparency from PGE, but also because they feel financially shortchanged by excessive turbine downtime, as payments to them are based on energy production.

Don Godier, a retired air force colonel who lives in Florida, said it's always been a team effort to scratch a modest living out of the farm his great grandparents established. The family was fired up by the prospect of "harvesting the wind" by placing turbines on their land. But the resulting payments from PGE, which he said he uses to support his mother's long-term care, haven't met expectations.

"We were a little naïve and trusting," he said, "but those days are over."

Landowners recently hired a Portland lawyer to investigate potential remedies.

The McCulloughs, whose house and farm are surrounded by turbines, have been particularly vocal. They've regularly complained to PGE and recently provided documentation about maintenance concerns to the office of U.S. Sen. Ron Wyden, Oregon's senior senator and a member of the Senate Energy and Natural Resources Committee.

"If you think about it, any of those things could come down at any time," said Kathryn McCullough, a retired 747 airline captain. "If we maintained our equipment like that, we wouldn't be farming for long."

Kathryn McCullough, a Sherman County landowner, examines the blade that was thrown from a turbine at PGE's Biglow Canyon wind farm on Feb. 1. Her husband, Kevin McCullough, farms wheat under about half the wind farm's 217 turbines, including the one that threw the blade. Thirteen of the wind farm's turbines are on their land.

'What's not to like?'

When a wind prospecting outfit first approached Sherman County residents in 2001 about leasing out portions of their cropland to a wind farm operator, the McCulloughs were immediately intrigued.

The nation's wind energy boom was just getting off the ground. California was adopting rules requiring utilities to invest in green power, soon to be followed by Oregon and Washington. And

the Columbia River Gorge, with solid winds and existing transmission lines established to carry hydropower around the west, would soon become a hotbed of wind farm development and eventually become one of the top ten wind energy producers in the nation.

The big-talking wind prospector was spinning tales of the Learjets landowners would soon own, the McCulloughs remember.

It seemed like a no-brainer.

And while state and county regulations limit public access to the land under wind farms, there are virtually no off-limit areas for farming. That meant farmers could continue to cultivate nearly right up to the base of the turbines, harvesting crops from the ground and a regular stream of lease payments from overhead machines.

The McCulloughs and their neighbors soon became big backers, expressing support for the Biglow Canyon project at various forums as other groups raised concerns about its visual and noise impacts, bird mortality and operations of a nearby airport. Kevin McCullough even appeared in a promotional video for the project.

It took several years, but the project gained momentum, first steered by Orion Energy, then PGE.

The first 76 Vestas turbines under construction at Biglow Canyon wind farm in 2007. Kevin McCullough, right, looked on enthusiastically at the time. He farms under about half of the wind farm's 217 turbines today and earns lease payments based on electricity production from the 13 turbines on land he and his wife own there. (File photos by Ross William Hamilton)

By 2007, the first 76 turbines manufactured by Vestas were up and spinning on the McCulloughs' and neighboring farms. They were followed by 141 Siemens machines by 2010, in what was then the largest wind farm on the Columbia Plateau. PGE said costs from the $1 billion project would raise ratepayers' monthly bills by a total of 4.5% while producing the equivalent amount of energy used by 125,000 homes in a year.

PGE's Biglow Canyon wind farm was a reality. The electricity – and the dollars – began to flow.

“We were ecstatic,” Kathryn McCullough said of the 13 turbines on their land. “What’s not to like? When these things are turning, we’re making $100,000 a year. How do you shake a stick at that?”

‘Just pure carelessness’

Long before the blade flew into the night at Biglow Canyon, landowners say they had concerns about substances spewing from PGE’s turbines.

Problems began more than a decade ago. The McCulloughs said they expressed concern to PGE that the Vestas turbines, then only three years old, were leaking oil and lubricants from the nacelles, the box atop the turbine tower that houses its gearbox and other major components.

It’s a condition that persists today. Many of the once-pristine white Vestas turbines are visibly soiled by oil, blackening the towers, the blades, the gravel pads and spitting into the fields below. The McCulloughs snapped photos of the problem as recently as early August showing their truck spattered in oil after just 30 minutes parked near a turbine, and the ground darkened with oil spots.

The leaks likely fall below the threshold for reporting oil spills to the Department of Environmental Quality, which requires disclosure only for discharges to the ground over 42 gallons in any 24-hour period. And officials at the Department of Energy said the problem had not been brought to their attention by a member of the public, during annual inspections or by PGE, so they haven’t looked into it.

Kevin McCullough parked his truck near one of Biglow Canyon’s Vestas wind turbines for about 30 minutes during wheat harvest in early August. When he returned, he said it was spattered in oil leaking from the top of the turbine. At right, oil spots on the ground nearby the same turbine. Landowners worry that regular leaks of oil and lubricants from Vestas turbines, which PGE says is a fixable problem if it chooses to make the investment, could be contaminating their cropland. (Courtesy Kathryn McCullough)

Godier, the property owner paying for his mother’s care, said he’s driven cross country twice in the past few years and made it a point to check conditions at other wind farms.

“I didn’t see a single one with the amount of oil and grease we have on ours,” he said, while speculating that it could be seeping into the water table. “It’s on the ground. Someone needs to hold these folks liable for what we’re going to find in 50 years.”

Residents who own land under PGE’s Biglow Canyon wind farm worry that regular leaks of oil and lubricants from turbines pose fire and environmental hazards.

Brett Gray, who farms under PGE’s turbines, said the Vestas turbines seem the worst, but the Siemens machines at Biglow Canyon leak, too. He also farms under turbines at another wind farm to the south, Klondike, and regularly passes by others.

“It’s not the norm for the projects I’ve been around,” he said of the oil, adding that PGE told landowners there’s “no way to fix” the Vestas turbines. “But that’s hard to believe.”

PGE’s spokesperson said Vestas has identified a solution and could install retrofit kits to equipment that is prone to leaking. But PGE hasn’t decided whether to make those fixes, saying it must first choose between enhanced maintenance of existing turbines or replacing them.

A metal frame and pieces of fiberglass fell from the spinner cone of this Vestas turbine into a field below at Biglow Canyon wind farm in April 2021. PGE didn't report the incident to regulators until this summer. Wind technicians later lowered the turbine's nose cone and spinner frame onto the turbine pad, where the pieces remained for a year. The nose cone blew into a nearby gully, and remained there earlier this month.

Mark Haller, a wind industry consultant who spent 40 years managing and developing wind farms across the globe until retiring last year, said that if the turbines continue to leak oil, "it's because someone isn't spending the money to fix them."

"Those machines should not be puking oil all over the place, other than just pure carelessness," he said.

The same model of Vestas turbines used at Biglow Canyon, officially known as the V82 1.65mw, are in operation at the Echo wind farm about 50 miles to the east. They were commissioned in 2009, two years after those at Biglow Canyon, and are partially owned by a group of farmers.

Kent Madison, one of the farmers there, said he's seen an occasional leak from the gears in several turbines, but they've been promptly fixed, cleaned and look nothing like the machines at Biglow.

"Ours have run like a fine watch," he said. "We have not had any issues over the years."

Brad Jenkins, PGE's vice president of utility operations, this summer led a reporter on a guided tour of Biglow Canyon that didn't include any of the soiled turbines. Jenkins downplayed the potential environmental issues, saying the oil leaks were confined to the machines, and said PGE would never run a turbine with a fire risk.

Biglow Canyon has never experienced a turbine fire. But they do happen in the industry, with a 2,000-acre blaze in Gilliam County four years ago linked to a turbine operated by a different company, according to compliance reports submitted to the state.

“Just because an asset is dirty doesn’t mean it’s not running well,” Jenkins said. “We’re more concerned with what’s on the inside.”

Portland General Electric provided a look inside the spotless nacelle of a Vestas turbines (left) at Biglow Canyon wind farm during a tour in late June. Kathryn McCullough sent the pictures at right to U.S. Sen. Ron Wyden, which she said shows the oil-coated nacelle of a Vestas turbine this spring at Biglow Canyon. (Photos courtesy PGE, left, and Courtesy Kathryn McCullough, right)

The guided tour included showing off the inside of a spotless turbine. But Kathryn McCullough recently emailed Oregon’s senior senator photos she said she obtained from a contractor showing the inside of a turbine at Biglow Canyon this spring.

The machinery appeared filthy, heavily coated in oil, the photos show.

PGE declined to comment, saying the photos had no metadata attached so it couldn’t confirm where or when they were taken.

Oil has also leaked from Biglow Canyon’s on-site transformers, which sit at the base of each turbine and are used to regulate electrical current.

Ten transformers have failed at Biglow since 2010, three times more than reported by any other facility regulated by the state, according to Department of Energy records. Nine transformers under both Vestas and Siemens turbines and one in a substation spilled some 3,400 gallons of mineral oil — 90% of it to the ground around the turbines, prompting excavation and soil replacement.

“Ten transformer failures?” said Haller, the industry consultant. “That’s bad.”

PGE’s Jenkins said oil used in transformers is essentially vegetable oil, and poses minimal environmental or fire hazard. But the mineral oil used in transformers is flammable, and transformers have caught fire at Biglow Canyon in 2011 and 2013.

After nine transformer ruptures and related oil spills since 2010, state regulators this year pressed PGE for answers about the problems. But after hearing from a utility official in January, they took no further action.

PGE has experienced 10 transformer failures at Biglow Canyon that have collectively leaked 3,000 gallons of mineral oil to the ground surrounding turbines and caused two fires. Pictured above, pad-mount transformers sit in cabinets below each turbine at Biglow Canyon.

Screen shots of a ruptured transformer and the required cleanup of a transformer oil spill from a presentation that PGE made to state regulators in January about transformer problems at the wind farm.

Lenna Cope, a project specialist at PGE, told regulators during a public meeting transformer failures are an industry-wide problem and PGE was replacing them with transformers with different specifications when they failed. She said the demand on turbine transformers is unique because it rises and falls with rapid changes in the wind, and resulting temperature changes can degrade transformer oil and insulators, leading to the buildup of combustible gasses. The gas accumulation can over pressurize a tank, cause a rupture or, if there's an electrical arc, flash off and cause an explosion.

"PGE has a program to sample each transformer for dissolved gasses, but there are no industry standards to compare the results for decision making and accurately predict pending failures," Cope said. "PGE does our best to make prudent choices."

After watching PGE's presentation online at The Oregonian/OregonLive's request, Tony Sleva, the president of Prescient Transmission Systems, said it appeared to be tailored for an audience with limited knowledge of electrical equipment, and a panel of electrical engineers would have been more skeptical. Sleva, whose expertise includes forensic analysis of aging and failed electrical equipment, told the newsroom that testing gas in oil is an effective method to predict remaining transformer life, the methodology is well understood, and the science simple.

“PGE needs to obtain the service of a forensics lab,” he said in a statement, adding that without intervention the number of failures would likely climb.

Two weeks after Cope’s comments to regulators, another transformer failed at Biglow Canyon, leaking 166 gallons of mineral oil to the surrounding ground.

‘They’d hurt you’

Pieces of turbine equipment are now falling into landowners’ fields with some regularity.

PGE has not reported those incidents to the state promptly, or in some cases at all. That’s a potential violation of state administrative rules governing wind farms, as well as the conditions in Biglow Canyon’s operating permit with the state.

Take the metal frame and pieces of fiberglass that fell off the damaged nose cone of a Vestas turbine in April 2021. PGE didn’t report it until June of this year, and only after a reporter asked why it hadn’t been disclosed to regulators.

State rules require wind farm owners to operate the facility in a way that prevents structural failures of the tower or blades that could endanger public safety, and PGE’s operating permit requires a report within 72 hours of any incident with the potential to impact public safety.

Pieces from a damaged Vestas V82 wind turbine at Biglow Canyon. PGE told regulators a metal frame and pieces of fiberglass fell off the turbine in April 2021. Wind technicians later lowered the turbine’s nose cone and spinner frame to the ground, where they were left for a year.

After PGE questioned whether such an incident was reportable, the Department of Energy made it clear to PGE that it was, noting that even a small item falling from about 265 feet could reach 130 feet per second, the equivalent of almost 90 miles per hour.

At “those speeds, even a small object may present a hazard and raises questions with both the adequacy of and compliance with the requirements of PGE’s Operational Safety-Monitoring Program,” Wally Adams, an analyst at the department, wrote to the utility.

Using that standard, it appears PGE should have been reporting a lot more public safety incidents, based on what landowners say happens.

Kevin McCullough said that over the years, he has found 10 to 12 hatch doors, most of them beaten up and coated in oil, that have broken off the top of the Vestas turbines and fallen into the fields he farms. Each measures 25 inches by 29 inches and weighs about 10 pounds. He picks them up so his combine doesn’t, and either sits them against the base of the turbines or delivers them to PGE’s office.

Gray, one of the neighboring farmers, confirmed the same. “The Vestas turbines, they lose doors all the time and you’ll see them laying in the field. They’d hurt you. My neighbors won’t park by them.”

Likewise, the McCulloughs’ son, Colton, said he’s found several metal disks with a Siemens label attached, of about the same size and weight as the Vestas hatches, that have fallen off the Siemens turbines.

Landowners say they find hatch doors (left) from the Vestas turbines at Biglow Canyon and metal disks (center) from the Siemens turbines that break off and fall into their fields from a height of about 265 feet. State regulators say even small objects falling from that height can reach speeds of nearly 90 mph and could endanger anyone below. (Courtesy Kathryn McCullough)

PGE has also discovered at least one instance of broken blade bolts falling from the turbines. Last year, the company discovered broken bolts on four of its Siemens turbines, maintenance

reports obtained by The Oregonian/OregonLive show. In three cases, those were identified during annual inspections or during repairs, while broken blade bolts were found under one of the turbines in the fourth instance.

It's not clear how many blade bolts were broken or missing on each turbine. But PGE did not report the bolts, or the fallen hatches or disks, to the state.

Havel said PGE has reported "consistent with our understanding" of state rules and "in alignment with other wind operators' reporting patterns" but will "continue to evaluate our practice to ensure we are meeting" the state's expectations. PGE told regulators in July that it would hold meetings with staff and contractors to review the types of events that trigger reporting requirements.

The Department of Energy told the newsroom it would require reporting of a broken blade bolt found below a turbine but wouldn't say if the obligation would apply to other items, without having more details from the wind farm operator or a member of the public.

"We will investigate if it's reported to us," said Todd Cornett, assistant director of the Department of Energy siting division.

What is clear is that PGE kept its four Siemens turbines with broken blade bolts running for months while awaiting spare parts. In one case, according to the maintenance reports, PGE left a turbine in service with broken bolts for nearly a year.

Jenkins, the PGE manager, defended the decision. He said both Siemens and Vestas specify how many bolts attaching a blade to the rotor hub can be loose or broken and have the turbine remain operational. He declined to say what those specifications are, saying PGE is under a non-disclosure agreement.

Flags marking debris in a wheat field after a Vestas V82 wind turbine at Biglow Canyon threw one of its eight-ton blades the length of a football field on Feb. 1.

Andrew Luther, a spokesperson for Siemens Gamesa, said in a statement that it provides focused recommendations for Siemens turbines with broken blade bolts, but that "as every wind farm has a unique combination of location, wind conditions, equipment, age, and maintenance schedules, we do not have the necessary information to comment on this situation." He also declined to comment on falling equipment or oil leaks because the company is not responsible for maintaining turbines at Biglow Canyon.

Vestas said most oil leaks are contained within the turbine structure, don't affect performance and have a low risk of migrating to surrounding areas.

In the "rare instance" that objects fall to the ground, it is the responsibility of the wind turbine owner to make any required report to regulators, it said.

"Vestas investigates and repairs issues provided the failure falls within Vestas's agreed upon scope with the wind turbine owner."

The company said that when broken blade bolts are found, engineers make the determination on a case-by-case basis.

"Under certain circumstances and with the necessary engineering assessment, Vestas' guidelines may allow for temporary wind turbine operation with additional guidelines," it said in response to written questions. Those might include extra inspections and replacing additional bolts around the broken bolt during repair.

PGE said it had not identified broken bolts on Vestas turbine No. 71 or any of the other Vestas machines before this winter's blade throw. But it found broken bolts and other problems on other machines afterward — including a cracked blade bearing, a steel ring that connects the blade to the rotor hub and controls the blade angle to the wind. PGE had to replace both the bearing and the attached blade as a result.

"A cracked blade bearing is a biggee," said Haller, the retired industry consultant.

PGE told regulators its inspections this year included hiring a contractor to check the torque on "a representative sample" of more than 10,000 blade bolts at Biglow Canyon, and it submitted 50 of the failed blade bolts from the thrown blade for specialized metal testing.

Project maintenance reports obtained by The Oregonian/OregonLive show broken blade bolts were found on four more Siemens turbines and two more Vestas machines. The reports show those machines were taken offline by PGE.

Jenkins told the newsroom that if a certain percentage of blade bolts on a given turbine were not within specifications, it planned to replace all bolts on that blade. Havel later said that it replaced all the bolts on four Vestas turbines but, after testing the metal, concluded full bolt replacement was unnecessary on additional turbines.

The failure of blade bolts due to stress and metal fatigue is cited as a frequent cause of turbine failure, according to a recent study published in the academic journal Engineering Failure Analysis, which presented a methodology to predict the remaining life of in-service wind turbine bolts.

Metal blade bolts do have some ability to stretch and deform without breaking. But over time, they begin to lose that elasticity, and corrosion or cracking can cause them to snap under severe loads.

Workers replacing the blades on a Vestas V82 wind turbine at Portland General Electric's Biglow Canyon wind farm in late June. The turbine threw one of its blades into a wheat field on Feb. 1. PGE blamed "a loss of clamping force."

When a fatigue failure occurs, the paper said, it's difficult to pinpoint the origin after the fact, which complicates the decision on whether to replace bolts on every turbine or just the one with failed bolts. "It is of paramount importance to know whether the fatigue-damaged bolts are in general throughout the whole farm/park, only of one turbine or only those of one connection."

One of the paper's authors, Daniel Garcia Vallejo, a professor of mechanical engineering at the University of Seville in Spain, said in an email that catastrophic failures typically result from a cascading set of events.

"Usually, the first bolt will break due to fatigue, and after a number of other bolt breakages the rest will break due to overload," he wrote.

Asked if it was considered safe, under any circumstance, to run a turbine with broken blade bolts, he replied, "I don't think so. When one bolt breakage is detected it should be analyzed and repaired."

'It could produce so much more'

Amid the problems, landowners say Biglow Canyon's turbines often resemble giant lawn ornaments, sometimes sitting idle for months at a time.

And that is what they find most exasperating, and something they contend should also concern utility ratepayers and regulators, who aren't getting the carbon-free energy production they are paying for and expect.

“It’s a good rent, but I’m complaining because it could produce so much more electricity,” said John Scharf, who has 26 of the project’s turbines on his land.

Where the turbines are

Biglow Canyon has been a disappointment from the start.

In 2008, when PGE first asked the Oregon Public Utility Commission to approve a rate increase to cover the cost of the first phase of Biglow Canyon, it told commissioners it expected the Vestas turbines would generate, on average, about 37% of their rated capacity of 125.4 megawatts.

That number is known as a turbine's "capacity factor," which accounts for the fact that wind doesn't blow all the time. It's an important contributor to wind farm economics, as it tells you not only how much power they'll generate but how many federal subsidy dollars are likely to flow to the project.

The project's capacity factor has never hit 37%. In their first five years of operation, compliance reports filed with the state show the Vestas turbines had an average capacity factor of 31%, meaning the project widely missed its initial projections.

A Vestas V82 turbine, missing a hatch door, at PGE's Biglow Canyon wind farm this summer. Farmers say the hatches fall into their fields from a height of 265 feet. (Courtesy Kathryn McCullough)

"Phase one was clearly not very good," said Bob Jenks, a ratepayer advocate for the Citizens' Utility Board of Oregon. "They'd probably argue that it was new technology and they were learning how to operate it. But they asked us to pay for output, not a learning experience."

By the time the last turbines were finished in 2010, PGE said publicly that the entire project's capacity factor was expected to be about 33%. Instead, it's averaged 27.6% – again, well below projections.

PGE said its estimates were based on assumptions and history of wind at the location, and that as the industry matures and it collects more weather pattern data, it can now more accurately assess wind farms capacity factors.

Nearby facilities are performing better.

The Patu wind farm, a six-turbine operation owned by a neighboring landowner that opened in 2010 and sits directly adjacent to some of Biglow's turbines, has had an average capacity factor of 36%. Klondike III, a large, neighboring wind farm of comparable age, has maintained consistently higher capacity factors than Biglow, averaging 29.2%, which over the years adds up to a lot of extra generated electricity.

Gray said he has four Biglow Canyon turbines on his land to the north and west of the Patu wind farm. He said he seldom sees any of the neighboring turbines down.

"He's not on any exceptional ridge," Gray said of the Patu operator. "When they built Biglow, they built on the best wind resource available."

PGE said different environmental factors and plant features affect the capacity factors of each, and that "these wind farms are not directly comparable."

State regulators separately require wind farm operators under their jurisdiction to report how often equipment is available to generate power, regardless of whether the wind is blowing.

On-shore wind turbines tend to be very reliable, typically available more than 95% of the time, according to James Manwell, a professor in the Department of Mechanical and Industrial Engineering at the University of Massachusetts who studies wind energy.

Farmers cultivate wheat right up to the base of wind turbines at Portland General Electric's Biglow Canyon wind farm (left). An aerial shot (right) of a Vestas turbine on Feb. 22, after it threw a blade 100 yards into a field below.

Among wind farms under state jurisdiction that have been operational for at least 10 years, all have hit that mark, on average, including Biglow Canyon. But the Vestas machines at Biglow have failed to achieve that target in half the years they've operated, plummeting to 88.5% in 2020 and 86.5% in 2021.

This year's performance could be worse, as many of the Vestas turbines were down three or four months after the blade separation.

Doug Medler, a Portland resident who sold his land to the McCulloughs three years ago but retained the wind rights, said his payment for the second quarter of this year was about $5,250, compared to about $17,850 in the same quarter last year, a 71% reduction.

"It's a significant hit," he said. "It's a big source of income, but not one that affects my ability to put food on the table or pay the utility bill."

During the past five years, PGE has offered landowners various reasons for the turbine downtime: low wind; plant curtailments by the Bonneville Power Administration when the region's hydroelectric dams are producing too much energy; and more recently, aging equipment and a lack of parts due to disruptions in the global supply chain. PGE has also said it's sometimes advantageous to ratepayers to run its other wind plants that are still within the 10-year eligibility window for federal production tax credits, and shut down Biglow Canyon, which is no longer eligible for the subsidies.

PGE told the newsroom substation and transmission outages initiated by the Bonneville Power Administration likely affected Biglow Canyon in 2020 and 2021. "There were no equipment failures or breakdowns that significantly impacted availability or capacity," PGE previously told regulators about those years.

Yet in emails to Kathryn McCullough about frustrations over downtime, a PGE official last year acknowledged the role of failing equipment.

Nick Loos, the director of dam safety and renewable energy, blamed increased downtime on wear and tear, "end of life issues" that were "rearing its ugly head" and the need for PGE to stay ahead of the "failure curve."

"The past maintenance strategy of replace as main components fail has worked in the past," he told her, "but with the increase in failures we need to mature our maintenance strategy. Work we are doing in the background is focused on preventative maintenance."

'Need to hold the utilities responsible'

The path forward for Biglow Canyon is uncertain.

Company officials have pledged to improve safety and performance, and Wyden, the senator, has vowed to keep watch.

“PGE is updating our office regularly with the inspection status, as well as committing to provide our office with a longer-term inspection and maintenance plan,” Hank Stern, a spokesperson, said in an email. “Sen. Wyden will keep watchdogging this issue to ensure PGE follows through on its commitment to him and the community.”

Financially, PGE appears to have two routes to address issues.

Jenkins, the utility’s vice president of operations, insists that PGE is managing the project – and the Vestas turbines – for longevity, focusing on preventive maintenance to keep small problems from turning into big ones. “I don’t know that with the age of these assets, the case can be made that they’re not performing,” he said.

But keeping the turbines performing at a high level may require significant investments, and PGE’s filings with regulators don’t reflect that reality.

In fact, PGE’s operations and maintenance expenses at Biglow Canyon have steadily declined, despite the aging equipment and acknowledged need for major repairs. PGE spent $13 million last year, down 40% from 2013, according to figures filed with the Federal Energy Regulatory Commission. That’s the lowest total since 2010.

And in documents submitted to Oregon regulators, the company said it would spend even less this year: $10 million.

If that seems strange, perhaps it shouldn’t.

A 2020 study by researchers at Lawrence Berkeley National Lab found that wind plant performance in the United States declines suddenly after 10 years – far more abruptly than output dropped in Europe or Asia. One theory the authors offered: As plants aged out of the 10-year window for federal production subsidies, they don't warrant more intensive operations and maintenance activities to maximize production.

A wind technician enters a Vestas turbine at PGE's Biglow Canyon wind farm. The project's 76 Vestas turbines are now 15 years old, about halfway through their depreciable life. PGE is already considering replacing them.

A related hypothesis cited by the research: regular maintenance that was deferred to maximize production while the wind farms were still eligible for the tax credits eventually comes home to roost in the form of increased breakdowns.

PGE's alternative to spending more on maintenance would be to repower the Vestas turbines, replacing most of their components, increasing their efficiency and output. It's not uncommon. And PGE is considering it.

If that happens, ratepayers could end up eating the remaining value tied to the existing machines. The Public Utility Commission said that was $178 million at the end of last year and would decline to about $156 million by the end of 2023.

The likelihood of repowering may have just gotten higher, as the Inflation Reduction Act passed by Congress this month renewed the federal production tax credit subsidy for another 10 years for wind and solar farms that begin construction prior to Jan. 1, 2025, including those repowering turbines.

Any decision to repower turbines at Biglow Canyon would be subject to a so-called “prudency review” by the Oregon Public Utility Commission to determine whether the investment is in the public interest. That decision would include all the costs involved, including the remaining costs of the turbines being repowered, the cost of the new equipment, and the available tax credits.

Jenks, the ratepayer advocate, said the review would also include an analysis of whether the current equipment has been properly maintained, and if not, what went wrong.

“If we’re going to make a transition to clean energy,” he said, “we need to hold the utilities responsible for managing these projects properly.”

The landowners would like that same level of accountability.

“When we entered into the agreement, the objective of the company and the landowners leasing the land was to have the project work, and make money,” said Cheryl Woods, a Biglow Canyon property owner and the accountant for the wind prospecting company that originally arranged the lease.

“But it doesn’t seem to be exactly going that way. It just hasn’t been managed well.”

A Vestas wind turbine at PGE’s Biglow Canyon wind farm.

Danish Wind Turbines Produce Drama, Climate-Left Cash . . . and Some Electricity (full series)
Big Trouble at Biglow Canyon | "Unexpected"
"Extraordinarily Rare" | Support for Anti-Nuclear Nonprofits

At 2:11 a.m. on February 1, 2022, according to a report in *The Oregonian*, a wind turbine at the Biglow Canyon Wind Farm in Oregon hurled one of its giant blades the "full length of a football

field" away from its tower. Described as heavier than "four Toyota Camrys" and "as tall as an 11-story building," the detached blade sliced a four-foot-deep crater in a nearby farm field. In an eerie newspaper photo, the crash site looked like the wreckage of an alien spacecraft.

A few days earlier a driver delivering fertilizer had recovered and photographed "industrial-size bolts" on the ground near the troubled tower. His coworker returned to the same location during the evening of January 31, just hours before the blade flung loose, to tow out the vehicle of another delivery worker who had gotten stuck in the mud.

"Someone could have been killed or badly injured," observed Kathryn McCullough, whose husband farmed the same fields.

Owned by Portland General Electric, the turbine was built by Vestas, a Danish firm that has been one of the world's largest producers of wind-energy machines. *The Oregonian* investigative feature in August 2022 was headlined "Wind Bust: How an Airborne Blade Exposed Broader Problems at PGE's Flagship Wind Farm." The report revealed concerns about both Vestas turbines and PGE's maintenance of them.

The recently enacted Inflation Reduction Act is expected pay out *$400 billion* in carbon and climate policy pork, and much of it is crashing down on weather-restricted energy systems such as wind turbines. The wind welfare industry is already off to a flying start. Using 2022 data, energy journalist Robert Bryce compared the subsidies for all major American forms of energy, "calculated on an energy-produced basis," and found that wind power received nearly *70 times* more taxpayer loot than carbon-free nuclear power.

As a major wind industry supplier, Vestas stands to indirectly profit from the taxpayer largesse.

In 2012, facing the threat of Congress ending the wind production tax credit (PTC), a Vestas official warned that 75 to 95 percent of the American wind power industry could disappear without the corporate welfare. In 2014, according to the *Washington Free Beacon*, the two U.S. senators from Colorado specifically cited Vestas as the reason they were supporting renewal of the PTC.

Not surprisingly, Vestas has also been a big donor to major left-wing nonprofits that promote its problematic weather-dependent wind power.

Big Trouble at Biglow Canyon

PGE responded to the February 2022 blade detachment by shutting down and inspecting all 217 turbines at Biglow Canyon, 76 of which were made by Vestas and 141 by Siemens Gamesa, a Spanish-German firm. Some of the turbines were still out of action four months later.

The Oregonian investigation found that "hatches, metal disks and blade bolts" had repeatedly fallen off PGE's 265-foot-tall turbine towers and the utility had "knowingly operated at least four turbines at Biglow Canyon with broken blade bolts, in one case for nearly a year."

The newspaper cited concerns with all of PGE's turbines, but also revealed that the Oregon power company was considering suing Vestas. Although the McCullough family were initially supporters of the wind project, the newspaper said they began noticing problems just three years after the Vestas turbines were installed in 2007.

The turbines started leaking lubricants:

It's a condition that persists today. Many of the once-pristine white Vestas turbines are visibly soiled by oil, blackening the towers, the blades, the gravel pads and spitting into the fields below. The McCulloughs snapped photos of the problem as recently as early August showing their truck spattered in oil after just 30 minutes parked near a turbine, and the ground darkened with oil spots.

The Oregonian showed photos of the badly soiled turbines and the truck hood, plus large parts that had been falling from the Vestas machines:

Kevin McCullough said that over the years, he has found 10 to 12 hatch doors, most of them beaten up and coated in oil, that have broken off the top of the Vestas turbines and fallen into the fields he farms. Each measures 25 inches by 29 inches and weighs about 10 pounds.

"The Vestas turbines, they lose doors all the time and you'll see them laying in the field," confirmed another farmer quoted in the report. "They'd hurt you. My neighbors won't park by them."

The report also cited an official from the Oregon Department of Energy who estimated that the items falling from 265 feet up could smash into the ground (or anything and anyone else) at nearly 90 miles per hour.

In 2008, according to *The Oregonian*, PGE told state regulators its Vestas turbines would average 37 percent of their rated capacity. But the newspaper found the turbines never even achieved 37 percent of rated capacity, let alone made an average of that production level.

"They'd probably argue that it was new technology and they were learning how to operate it," chirped a ratepayer advocate quoted by *The Oregonian*. "But they asked us to pay for output, not a learning experience."

Because the weather is fickle, the capacity factor of wind turbines is very low. According to the U.S. Department of Energy, the average capacity factor of all American wind energy is just 34.6 percent. At 92.7 percent, carbon-free nuclear energy has the highest capacity factor of all major American sources of electricity.

Although the Vestas machines were just halfway through their 30-year estimated useful lifespan by 2022, *The Oregonian* reported PGE was already thinking about retiring them.

Despite all this, a PGE spokeswoman gave a prickly reply about the tone of *The Oregonian*'s questions.

“We challenge your categorization of the volume of troubles,” she wrote. “Since coming online, Biglow Canyon wind farm has generated more than 13,000,000 MWh of clean electricity, which translates to powering 120,000 homes per year.”

All things considered, that’s nothing to brag about.

Biglow Canyon came online in 2007 and covers 25,000 acres (39 square miles), almost the size of the city of Eugene, Oregon, home to 177,000 people. By comparison, California’s Diablo Canyon nuclear plant covers just 1,000 acres (1.5 square miles).

Yet every year Diablo Canyon produces at least 16.5 million MWh of carbon-free electricity (and sometimes more than 18.5 million MWh). That works out to a cumulative total of more than 281 million MWh during the era when Biglow Canyon generated just 13 million MWh.

Leave aside the years of oil leaks and smaller debris falling onto Oregon. If throwing just one 11-story, multi-ton piece of equipment since 2007 can be excused away as the acceptable price to pay for Biglow Canyon’s relatively pitiful zero-carbon energy output since then, then the hyper efficient Diablo Canyon needs to drop 22 giant blades on its local community just to catch up to the same level of incompetence.

Biglow Canyon’s turbine troubles should be considered a serious problem in any context, but even more so relative to the tiny power output and immense chunks of Oregon’s land and skies that it consumes.

https://capitalresearch.org/article/wind-turbines-produce-drama-cash-and-some-electricity-part-1/

In the next installment, Vestas wind turbines experience “unexpected and increasing wind turbine failure rates.”

Wind Turbines Produce Drama, Cash, and Some Electricity: “Unexpected”

by Ken Braun
February 27, 2024

Danish Wind Turbines Produce Drama, Climate-Left Cash . . . and Some Electricity (full series)
Big Trouble at Biglow Canyon | "Unexpected"
"Extraordinarily Rare" | Support for Anti-Nuclear Nonprofits

"Unexpected . . . Failure Rates"

But Biglow Canyon is far from the only place where Vestas turbines have been behaving badly according to the media. There were at least a half dozen additional incidents in the 20 months after the flying blade failure in Oregon.

In June 2022, an entire tower with a Vestas turbine fell over at an Australian facility run by the Iberdrola energy firm. "The failure of turbine 43 at Alinta Wind Farm is a serious event," said the Iberdrola's Australia CEO. "We are currently working closely with regulatory bodies and the operations and maintenance contractor, Vestas, to understand the factors that have contributed to the failure of the turbine."

A fire broke out at a Vestas turbine in Germany in December 2022, according to ReNews.Biz.

And in October 2022, a turbine owned by Warren Buffett's MidAmerican Energy caught on fire in Iowa. According to ReNews.Biz, the Vestas turbines at the facility had "began operating in 2020."

"An incident such as this is an extremely rare occurrence—throughout our fleet we have experienced only one other fire of this magnitude in the nearly 20 years since we began operating our first wind farm," said a MidAmerican official.

He soon learned the wind turbine gods can be as capricious as the wind itself. Almost precisely a year later, in October 2023, another Vestas turbine at a different MidAmerican facility in Iowa reportedly caught fire.

"Local fire brigades from Adair and surrounding towns responded but could do little as they lacked equipment to reach the nacelle," reported ReCharge. "The fire eventually consumed the nacelle and one of the blades, with burning debris falling into surrounding cornfields that sent up plumes of smoke that could be seen for miles."

Local TV news caught a dramatic video of a flaming blade crashing to the ground. "An incident such as this is an extremely rare occurrence," the MidAmerican official reportedly said once again.

According to other media accounts, 2023 had already been a thrilling year for Vestas turbines.

In February 2023, ReNews.Biz reported a fire at a Vestas machine in Denmark, its home nation. The report did not quote anyone claiming the fire was a "rare occurrence."

Good thing, because in August 2023, EnergyVoice reported an offshore Vestas turbine had caught fire just off the coast of Norfolk in the United Kingdom. A BBC account featured several dramatic photos of the destroyed machine billowing black smoke that could be easily seen from the coastline.

By July 2023 ReNew Economy was reporting maintenance troubles for Vestas:

Vestas has added €210 million in warranty provisions for repairs in the December quarter, as rising call outs and higher upgrade costs bite at the Danish company, too. Vestas also said its lost production factor is rising towards 4 per cent due to the number of "extraordinary" repairs and upgrades.

By then all of the big turbine makers were having troubles, according to ReNew Economy:

Unexpected and increasing wind turbine failure rates, largely in newer and bigger models, are savaging the profits of some of the world's biggest manufacturers, as Siemens Gamesa, GE and Vestas report heavy repair and maintenance losses.

In its Biglow Canyon investigation, *The Oregonian* correctly observed that "there is no effective national, state or county reporting requirement or database tracking safety or operational

incidents at wind farms." The newspaper also reported that Portland General Electric had claimed the "issues at Biglow Canyon" were "consistent with those experienced by other utilities with similarly aged equipment."

It is difficult and perhaps impossible for an outside party to objectively evaluate whether the problems for Vestas have been typically awful for the industry, or extraordinarily awful. In the absence of any substantive recordkeeping or obligation on the part of the turbine makers to publicly report their major malfunctions, we must rely on the accuracy of media accounts.

Even if accurately reported, such accounts often fail to mention critical details such as who manufactured the equipment. And there are likely major malfunctions that have gone unreported, particularly in lower-income nations with comparatively less robust media coverage.

Even with these caveats, Vestas wind turbines have been appearing in unpleasant media accounts for more than a decade.

https://capitalresearch.org/article/wind-turbines-produce-drama-cash-and-some-electricity-part-2/

In the next installment, Vestas characterizes the wind turbine failures as "extraordinarily rare."

Wind Turbines Produce Drama, Cash, and Some Electricity: "Extraordinarily Rare"

February 27, 2024

Danish Wind Turbines Produce Drama, Climate-Left Cash . . . and Some Electricity (full series)
Big Trouble at Biglow Canyon | "Unexpected"
"Extraordinarily Rare" | Support for Anti-Nuclear Nonprofits

An "Extraordinarily Rare Event"

"In December 2011, a wind turbine in the coastal town of Ardrossan in the UK spectacularly exploded during a storm," reported *New Scientist*. "Pictures of the flaming debris shower flashed across global media, triggering claims that turbines cannot cope in extreme weather." According to *New Scientist,* a Vestas wind turbine had been the star of that show.

A few months later in April 2012, according to the *Crescent News*, two blades broke off of a Vestas turbine in Ohio. The facility was owned by EDF Renewables. the *Crescent News* quoted an EDF spokesman who claimed the problem was an "extraordinarily rare event."

But within weeks of each other in the early summer of 2012, according to *Renewable Energy Magazine*, fires occurred at Vestas machines in Germany and Spain.

"Given the information available, the Casa del Aire incident is an isolated case with no connection to the fire involving the V112 in Germany or any other incident concerning a Vestas wind turbine," claimed a Vestas official.

And then *Lincoln Star Journal* reported another Vestas wind turbine fire in Nebraska in October 2012.

According to the *Bangor Daily News*, a Vestas wind turbine in Maine, near the Canadian border, caught fire in January 2013.

"Companies that operate wind farms in Maine are not currently required to report turbine fires to any state agency," reported the newspaper in late April, explaining why it was just getting around to covering a fire that had occurred on January 16. The newspaper began the report claiming the incident had "generated concern about the safety and reliability of turbines, and the process by which these fires are reported to government officials and the public."

In March 2013 a Vestas turbine tower collapse in Ireland, leaving wreckage that "had been strewn over a wide area," according to one local newspaper, and "just yards from a popular cycling route" according to the *Irish Independent*.

An Irish radio station interviewed Vestas officials who "said such incidents are very rare" but "refused to answer questions about how many times such collapses have happened in the past." In a statement, Vestas declined to speculate on the cause of the collapse, but ironically noted it had occurred in "very high winds."

In April 2013, *North American Windpower* reported that a Vestas turbine in Ontario had caught on fire. According to the *Stratford Beacon-Herald*, the fire "fueled the fierce debate between those who add fire hazard to their list of reasons to hate wind turbines and those who say an isolated incident doesn't detract from wind energy's exceptional safety record."

Two young Dutch workers trapped atop a turbine inferno died in October 2013. Multiple online images and videos show a "Vestas" logo on the machine, including those showing the doomed workers sharing a final hug. Two ReNews.Biz stories archived at the Wayback Machine from October 2013 and November 2013 identify the turbine as a "Vestas V66," with the first report stating "Vestas said it was saddened by the incident and extended its sympathies to the families involved."[1]

The German news site Soester Anzeiger posted a February 2014 account of another fire with photos of a Vestas turbine ablaze in Echtrop, Germany.

In late December 2015, according to ReNews.Biz, a Vestas turbine tower collapsed in Sweden. The report paraphrased a Vestas official who claimed that "incidents involving structural integrity are very rare."

Eight weeks later in February 2016 the *Huron Daily Tribune* in Michigan reported the collapse of a "400-foot, 485,000-pound" Vestas wind turbine and tower. According to the newspaper, investigators concluded it had "shook itself apart" in a "pretty violent act" during an "overspeed event." The reporter wrote there was a "dose of irony" involved in high winds wrecking a wind turbine.

"In Operation Less Than One Year"

In October 2016 blades broke off two different Vestas wind turbines at another wind facility in Michigan. According to the *Huron Daily Tribune*, the wind machines had just been turned on during the "startup phase" at the then-new Deerfield Wind Energy project. Also in October 2016, according to North American Windpower, a Vestas wind machine caught fire in Brazil.

In early January 2017, CBC News reported that a Vestas wind turbine tower "snapped in half" during a "severe wind warning" in Nova Scotia. One observer told CBC he could "see the debris was flying down towards the ocean."

"If it's too windy, then maybe it's not the right place for it," said another local Nova Scotian. "Because it is close to houses and I imagine the people up the hill . . . they must have been scared because it was right near to their house."

The Clarendon Enterprise reported in June 2017 that a Vestas turbine had caught fire near Jericho, Texas; Offshore Energy reported in August 2017 that a Vestas turbine had burned up atop a 140-meter tower at a Denmark test facility; and in October 2017, according to Balkan Green Energy News, a Vestas turbine tower collapsed in Croatia.

A Vestas wind turbine in Iowa owned by MidAmerican Energy caught fire in May 2018, according to Perry News. It had "been in operation less than one year," according to the newspaper.

ReNews.Biz reported that a turbine and blades simply fell off a tower in Thailand in October 2018. "Vestas said a nacelle detached from the tower and fell to the ground together with the blades," reported ReNews.Biz. "TV pictures have shown a wrecked turbine at the foot of a relatively unscathed tower." It was another incident involving a wind project that had "only very recently been completed and commissioned."

A Vestas turbine in Denmark caught fire in January 2019. A TV station reported the fire spread to buildings at a nearby farm where dozens of bull calves were kept, but that none of the livestock were injured. The website featured a photo of the turbine ablaze, with the Vestas logo still visible.

A blade from a Vestas turbine in Ohio snapped off in September 2020, according to the account in Windpower Monthly. The following month in October 2020, according to ReNews.Biz, a blade fell off a "recently-commissioned" Vestas turbine in Australia. And Windpower Monthly reported the November 2020 collapse of a "newly installed" Vestas turbine tower in Sweden.

And in October 2021, Mercury Energy reported a fire had destroyed one of its Vestas turbines at the Tararua Wind Farm New Zealand. According to the *New Zealand Herald*, Mercury had just purchased Tararua and the Vestas turbine from another energy firm in August 2021.

Notes

[1] Curiously, as of January 2024, the pair of ReNews.Biz page addresses, each referencing the original headlines from the dramatic story, redirected to benign and unrelated ReNews.Biz reports from May and June of 2019. A request for clarification sent to ReNews.Biz in early January was acknowledged but not answered before CRC posted this analysis. Beyond the two, now oddly discarded, ReNews.Biz reports, any other original reporting naming Vestas as the maker of the turbine in the Dutch fire is (at a minimum) difficult to locate.

As noted, a Vestas logo is clearly visible in multiple online videos and photos purporting to be from the incident. There are still some secondary media accounts online that mention the original ReNews.Biz reports. National Wind Watch, a watchdog group that is skeptical of wind energy, reproduced the entire text of the November 2013 ReNews.Biz report: "Dutch Investigate Deadly Turbine Fire."

https://capitalresearch.org/article/wind-turbines-produce-drama-cash-and-some-electricity-part-3/

In the next installment, wind turbines compare unfavourability with carbon-free nuclear power.

Wind Turbines Produce Drama, Cash, and Some Electricity: Support for Anti-Nuclear Nonprofits

by Ken Braun
February 27, 2024

Danish Wind Turbines Produce Drama, Climate-Left Cash . . . and Some Electricity (full series)
Big Trouble at Biglow Canyon | "Unexpected"
"Extraordinarily Rare" | Support for Anti-Nuclear Nonprofits

Relative Unreliability

As noted earlier, all the major turbine makers have recently reported financial challenges linked to unanticipated reliability issues. The assertion that these dozens of comprehensive and frequently dangerous failures represent "very rare" incidents for Vestas should be weighed against what each those calamitous turbines can produce.

In a comparison of needless drama produced per kilowatt hour, how do wind turbines stack up?

Not well. According to a January 2024 estimate from the Massachusetts Institute of Technology Climate Portal, nearly 800 average-sized wind turbines are needed to match the electricity output of just one average output (900MW capacity) carbon-free nuclear reactor.

The report also calculates how much environment gets torn up by all those turbines:

When it comes to land use, nuclear plants take up as little as 10 hectares per terawatt-hour of electricity produced per year, while wind uses about 100 hectares, measuring just the area taken up by turbines. (This rises to an astounding 10,000 hectares if you include all the land covered by a wind farm, but most of this space is open land and can be used for ranching or farming.)

For environmentalists who wish to reduce carbon emissions while preserving the environment, the choice between nuclear and wind energy (or solar, also a large land hog) should be a no-brainer.

Support for Anti-Nuclear Nonprofits

But as these supposedly "very rare" disasters have hit Vestas turbines over the past two decades, the wind machine maker has been supporting and partnering with nonprofits that oppose nuclear energy.

In 2011, the World Wildlife Fund (WWF) announced it was partnering with the Vestas "WindMade" campaign.

"The new label in the WindMade family will recognize a wide variety of renewable energy sources, including wind, solar, and geothermal, as well as hydro power and biomass from approved certification schemes," crowed WWF in a news release.

Missing from this formula is nuclear energy. According to Our World in Data, nuclear reactors provided more of the planet's carbon-free power in 2022 than any other source except hydroelectric dams. And nuclear was the overwhelming carbon-free power champion in the United States in 2022, kicking out *three times* more electricity than American hydro dams and more than the *combined total* for wind, solar, geothermal, and biomass.

WWF is anything but a champion of nuclear power. Throughout 2020 and 2021 the climate alarmist nonprofit repeatedly opposed attempts by the European Parliament to include nuclear power as part of the EU's sustainable energy taxonomy.

Whether its agreement with Vestas translated into direct support isn't clear, but WWF isn't starving either. In its recent IRS filings the U.S. affiliate of WWF reported revenue of $381.6 million for 2022 and $408.3 million for 2021.

Like all 501(c)(3) educational nonprofits, WWF should be entitled to donor privacy and is not legally required to disclose the names of donors. But some occasionally do so voluntarily.

The 2015 and 2016 annual reports from the Rocky Mountain Institute (RMI) both thank Vestas for donations in the "$100,000–499,000" giving range. RMI has quietly become one of America's largest climate policy nonprofits, with annual reported revenue since 2021 exceeding $115 million. RMI founder Amory Lovins has been a strident opponent of nuclear power for almost half a century.

It is not clear when or if Vestas continued this support for RMI, though RMI's 2022 annual report credited 13 "anonymous" donors giving at least $100,000 each, with four of those giving more than $1 million each.[2]

A May 2016 Rocky Mountain Institute report on its Renewable Energy Buyer's Alliance noted a collaboration between RMI and Vestas:

Finally, looking beyond the value chain, we engaged manufacturers, including turbine producer Vestas, and transmission-line developers such as Clean Line Energy, that are helping to improve the grid so that more wind and solar can be transmitted easily and reliably from where the wind blows and the sun shines to where customers need it.

A 2017 annual report from the Australian affiliate of Friends of the Earth credits Vestas Australia in its list of "donors and supporters," but does not disclose a giving level. IRS filings by the U.S. affiliate showed revenue exceeding $17.6 million for both 2021 and 2022.

For at least 40 years Friends of the Earth (FoE) has been one of the Earth's most adamant enemies of nuclear power. In 2023, FoE's American affiliate filed lawsuits in an effort to close California's Diablo Canyon nuclear plant. This put FoE far to the kooky left of even California's stridently lefty Gov. Gavin Newsom (D), who wisely and successfully intervened to keep the carbon-free energy facility open.

Diablo Canyon has a generating capacity of 2,240 megawatts. Using the aforementioned estimate from the Massachusetts Institute of Technology (nearly 800 wind turbines needed for every 900 MW of nuclear capacity), this would make Diablo Canyon the equal of *more than 1,900 wind turbines*. In 2022, according to the U.S. Department of Energy, Diablo Canyon all by itself produced 17.6 terawatt hours of electricity, 20 percent more than the combined output of every wind turbine in the state of California.

Using the MIT estimate of a 10,000 hectare field needed for each terawatt hour of annual wind energy production, a wind turbine facility producing 17.6 terawatt hours would scatter turbines across a 176,000 hectare field.

That would mean using 679 square miles to accomplish what Diablo Canyon does with 1.5 square miles. To put 679 square miles in perspective, imagine covering an area twice the size of the very windy Rocky Mountain National Park with wind turbines.

Why is there all this evidence that Vestas reliably and repeatedly works with and supports so many powerful, stridently anti-nuclear, climate nonprofits?

There may be nuanced and complex answers to this question.

But the simple answer is probably the correct one.

https://capitalresearch.org/article/wind-turbines-produce-drama-cash-and-some-electricity-part-4/

Notes

[2] This detail regarding anonymous donors was also referenced in "Climate Alarmists Hoover Up Corporate Welfare," an October 4, 2023, CRC analysis that looked more closely at Rocky Mountain Institute donors: "In the 2022 annual report alone, 13 "anonymous" donors are also credited with giving $100,000 or more—four gave more than $1 million. Given what is known of the named donors, it is reasonable to conclude that some of the 13 have also benefited directly from the IRA corporate welfare for weather-dependent power and storage."

In a development that may be merely correlation, but could also be causation, the Rocky Mountain Institute's 2023 annual report appeared after the online posting of the passage quoted above. But this latest RMI annual report did not itemize the number of anonymous donors at each giving level. RMI had publicly disclosed this statistic regarding anonymous giving in every previous annual report since at least 2007.

Exhibit 3

Exhibit P: Fish and Wildlife Habitats and Species

Mammalian species affected by solar panels. The February 2025 study reports 11 bird species and 5 bat species in the Biglow project.

Where are the turkeys, quail, and pheasant? Where are the antelope, deer, cougar, elk, coyotes, foxes, badgers, rabbits, gophers, squirrels, voles, and other creatures we have in the area? I have included photos I have taken of some of the animals in or near the project boundaries.

This report is incomplete and appears to apply only to some birds and bats. **This report is for wind towers, not solar. 217 pages of bats and birds, as well as a lizard species and a turtle species.**

Especially with the increased fire risk, all of these animals need to be included.

Even Fish and Wildlife agrees:

Kathy,

Completely agree that we should be taking fire into greater account in our mitigation policy, and that topic is on the list for consideration when the policy gets reviewed in the future. The agency hasn't reviewed the mitigation policy for quite some time, with all the proposed development we are just trying to keep up with the requests for project review.

Exhibit 3

Exhibit P: Fish and Wildlife Habitats and Species
Attachment 5: Wildlife species occurring in the Solar Components vicinity

Mammalian species affected by solar panels. The February 2025 study reports 11 bird species and 5 bat species in the Biglow project.

Where are the turkeys? Where are the cougar, elk, coyotes, foxes, badgers, jack rabbits, gophers, voles, raccoons, and other mammals we have in the area?

The photos below were taken in or near the project boundary.

This report is incomplete and appears to apply only to birds and bats. Attachment 5 has some of the animals listed, but not specifics. **This report is for wind towers, not solar. 217 pages of bats and birds, as well as a lizard species and a turtle species. Mammals need the same level of study and notation as birds do, as we have quite a diversity here.**

Hundreds of acres of solar panels will change the habitat considerably. I am asking for a more comprehensive evaluation of how solar will impact all of our mammals.

Especially with the increased fire risk, this is an important amendment.

Fish and Wildlife:

Kathy,

Completely agree that we should be taking fire into greater account in our mitigation policy, and that topic is on the list for consideration when the policy gets reviewed in the future. The agency hasn't reviewed the mitigation policy for quite some time, with all the proposed development we are just trying to keep up with the requests for project review.

PGE doesn't even let its personnel go to a fire near Biglow to help us fight it.

The Wildfire Mitigation and Risk document produced for PGE by Tetra Tech is a joke. It is a ridiculous cut-and-paste, ultimately proving or saying nothing. Why didn't they use actual temperature data from Biglow? Or NOAA?

Our temperatures are much higher than the climate normal data indicates. Winds are powerfully strong. My intention is to demonstrate how fire-prone we are and to secure real mitigation and written assurances if we cannot obtain a hold-harmless clause for:

Fire started accidentally by BrightNight/PGE
or
Fire accidentally started by us, either at our house or while farming west of PGE's solar.

Will PGE/BrightNight be paying for our insurance if they start a fire and push us into a higher, unaffordable insurance bracket? This is a terrible place for a solar farm.

I have highlighted my primary concerns in their 225 page report. I will summarize them here:

I think what is missing is the definition of fallow. We do chemical fallow, ie, we spray to kill the weeds, but we do not turn over the dirt. That is why the Substation Fire of 2018 could not be stopped. High winds, high temperatures, and low humidity as well as a fuel source (crop and chemical fallow) kept it going. The only time there is bare dirt is right after the ground is seeded in the fall, not a high fire risk time.

The Substation Fire of July 2018: Impact of Weather on Fire Behavior
The combination of high temperatures, low humidity, and strong winds created a volatile environment. This led to:

- Rapid fire growth, with the fire spreading over 18 miles in just a few days.
- Increased difficulty for firefighters in controlling the blaze.

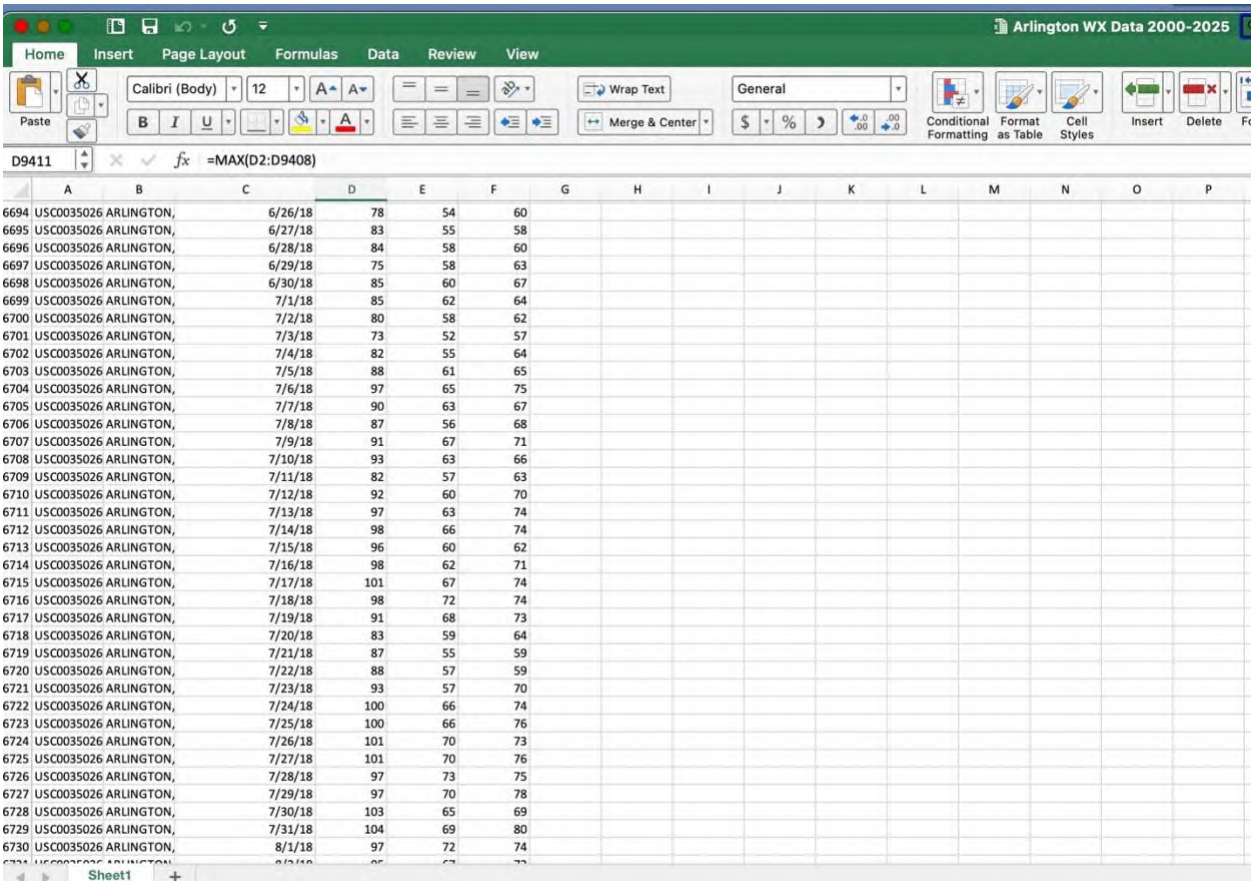
The weather conditions during the Substation Fire exemplified how environmental factors can exacerbate wildfire risks, particularly in regions experiencing drought and high temperatures.

The high burn probability is much higher than 66%, but 66% is very high, especially in an area that already has 6-10 fires in a normal year! And no paid fire department - volunteer only.

Note: Moderate to high for months!!!! What is PGE going to do to preserve our "Right to Farm"? They have verbally assured us that they will just go after our insurance, not us, but

once they go through our $5 million of insurance, no one will ever insure us again. MODERATE TO HIGH! WE NEED ASSURANCES.

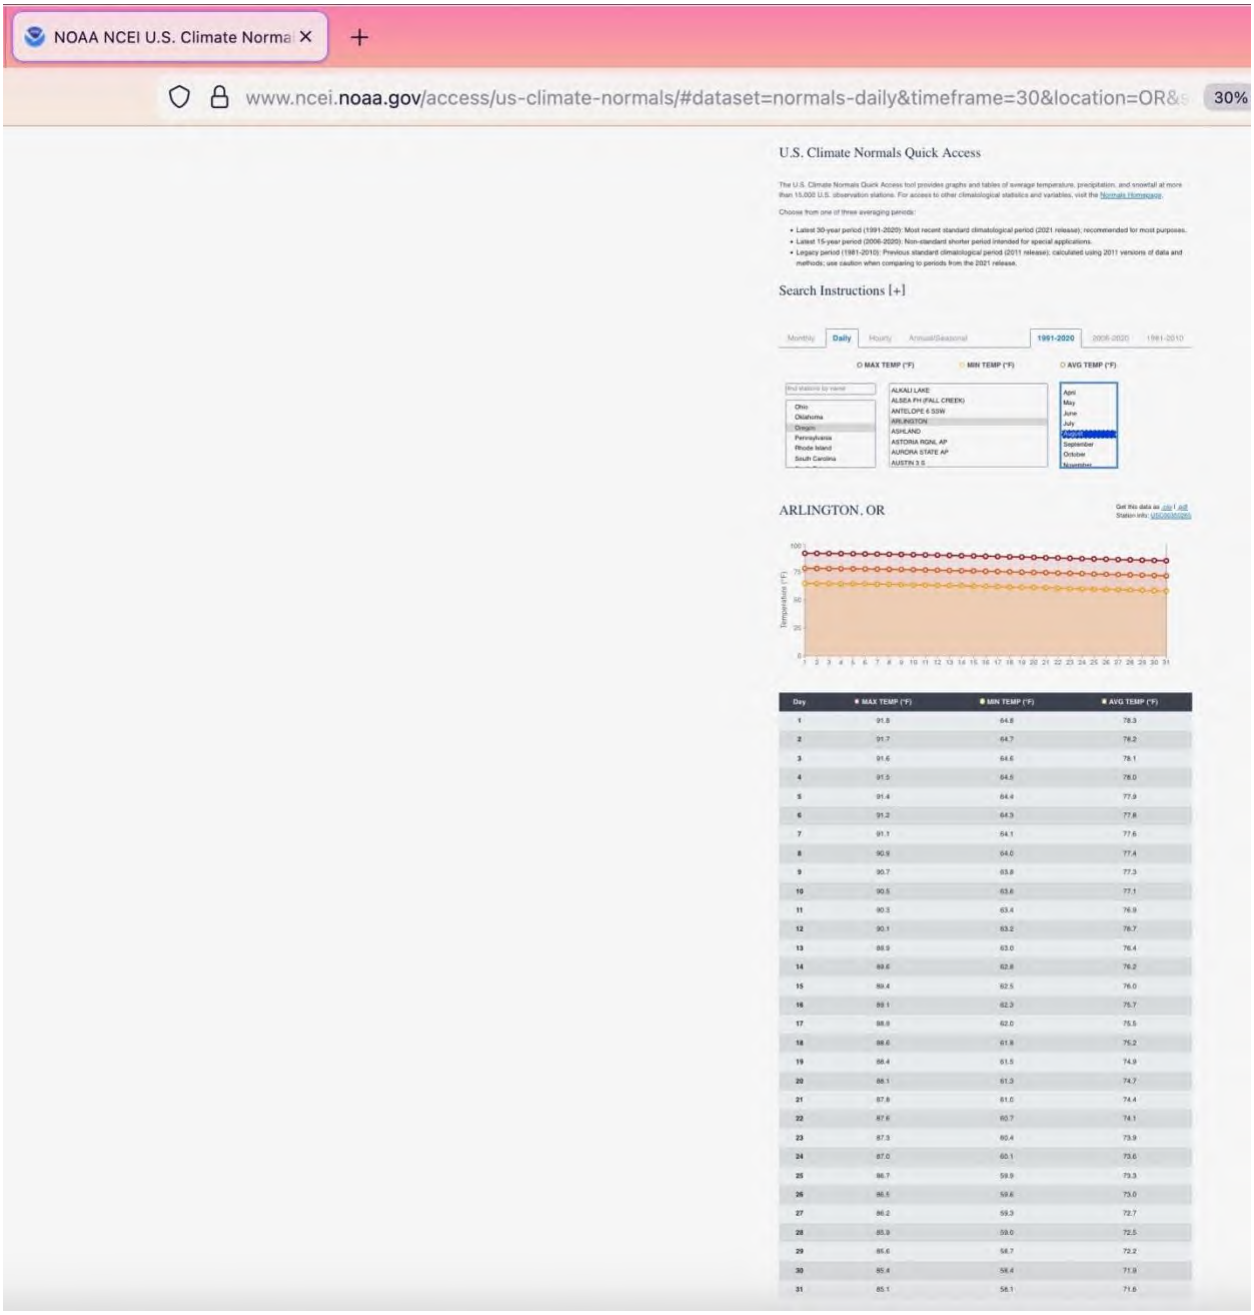
Page 10: Highlighted high fire risk is TRUE: After further analysis, most of the area within the Solar
Micrositing Area that is categorized with an average flame length of 0 feet above can be more
accurately categorized to represent wildfire risk with average flame lengths of either 4 to 8 feet or 0
to 4 feet, with only a small portion remaining with an average flame length of 0 feet.
Maybe… hopefully… eight feet is high!



We need to see this re-evaluation of risks. Lithium-ion batteries continue to pose a significant fire risk in areas with high temperatures.

Climate normals are statistical models that effectively lower the high temperatures that we experience over 100 degrees Fahrenheit into the 70s or 80s. This is a poor model for our purposes of fire mitigation and risk. See the attachment of actual temperatures. Even though Arlington (on the river, 18 miles away) is not the best choice for a temperature chart in Sherman County, the 117 degree high noted does provide some authenticity.

Biglow Canyon Wind Farm RFA 4



Page 4 wide risk assessment of wildfire as "high" probability and identifies many areas in the county as "conducive for large and fast-moving wildfires" due to high winds typical for regional dry conditions and terrain. The plan identifies risk factors for starting wildfires in the county as highways, railroads, lighting, power lines, debris burning, and equipment.

3.0 Conclusion
Per the data reviewed and presented here, wildfire risk and consequences of fire in the Solar Micrositing Area are typical for the vegetation type and fire regime encountered in Sherman County. Within the Solar Micrositing Area and wildfire analysis area, assets that could currently be impacted include BCWF infrastructure, residential structures, agricultural areas and farming operations, and roads. If a wildfire did ignite near those assets, they could be at risk. It is anticipated that, due to the moderate to very high hazard to potential structures, high burn probability, moderate expected intensity as measured by average flame length, fuels, weather, and topography, post-construction overall fire risk would be moderate to high.

Exhibit V

Wildfire Prevention and Risk Mitigation

Biglow Canyon Wind Farm
February 2025

Prepared for

Portland General Electric Company

Prepared by

TETRA TECH

2.1.1 Topography

The wildfire analysis area is generally bounded by Interstate 84 to the north, the John Day River to the east, Highway 206 to the south, and Highway 97 to the west.

Elevations within the wildfire analysis area are between -12 and 600 meters. The majority (99 percent) of the wildfire analysis area has slopes that range from 0 to 25 degrees (Table V-1; Figure V-1). As shown on Figure V-1, slopes in the northern portion of the Solar Micrositing Area and wildfire analysis area increase to 25 to 50 degrees. This portion of the wildfire analysis area borders the John Day River.

Table V-1. Slope

Slope (degrees)	Percent of Wildfire Analysis Area	Acres of Wildfire Analysis Area	Percent of Solar Micrositing Area	Acres in Solar Micrositing Area
0-25	99	11,185	100	3,977
25-50	1	72	0	3
50-75	0	0	0	0
Total	**100**	**11,256**	**100**	**3,980**
Note: All quantities may not result in 100 percent due to rounding adjustments.				

2.1.2 Vegetation

As discuss ation and special status wildlife surveys were performed in June by ositing Area (Exhibit P, Attachment P-1). The Survey Area cover ire Solar Micrositing Area and additional lands that have since been ing Area. Most of the analysis area is Category 6, which includes A t types that are dominated by Non-irrigated Cropland subtypes b d and Developed subtypes. Additionally, Category 4, 3, and 2 habi nt in the analysis area.

I think what is missing is the definition of fallow. We do chemical fallow, ie. we spray to kill the weeds but we do not turn over the dirt. That is why the Substation Fire of 2018 could not be stopped. High winds, high temperatures, and low humidity as well as a fuel source (crop and chemical fallow) kept it going. The only time there is bare dirt is

The broad vegetation type) are derived from data from the Communit P) Planning Tool (Oregon Explorer 2018). Fuel model groups wit nsist of agriculture, grass with small amounts of fine, dead fuel, shrubs, urban, and barren. As shown on Figure V-2 and described below in Table V-2, the majority of the vegetation within the Solar Micrositing Area is Fuel Model (FM) 102 – Low Load, dry climate grass (55 percent) and FM 93 – agricultural (29 percent). Within the wildfire analysis area, the most prominent FMs are also FM 102 (53 percent) and FM 93 (36 percent). A further discussion of FMs is provided in Section 2.2.2.

122	6	719	12	494
161	0	3	0	1
182	0	3	0	0
183	0	1	0	0
Total	**99**	**11,256**	**98**	**3,979**
Note: All quantities may not result in 100 percent due to rounding adjustments.				

FM 102 and FM 104 more accurately represent wildfire risk of the agricultural areas within the Solar Micrositing Area that include dryland wheat. FM 102 (low load, dry climate grass) is an FM in which grass is the primary carrier of fire and that uses a dynamic transfer of herb fuel load from live to dead (NWCG 2024). This represents approximately 55 percent of the Solar Micrositing Area within FM 93 from Table V-3 above. FM 104 also uses dynamic transfer of herb fuel load from live to dead. The primary carrier of fire is continuous, dry-climate grass (NWCG 2024). This FM represents approximately 13 percent of the Solar Micrositing Area.

The areas that are fallowed and only contain stubble more accurately r
the Solar Micrositing Area as FM 1. FM 1 (short grass) includes annual
cured fine herbaceous fuels, and stubble with very little shrub or timbe
1 represents 13 percent of the Solar Micrositing Area within FM 93 fro
left as fallowed.

The small portion of areas that are tilled (and not simply fallowed) ren
are considered NB (NWCG 2021) and are associated with one landown
their land every summer.

The increased wildfire risk also likely applies to the areas in the wildfi
appear to be irrigated. Therefore, it is possible the wildfire risk is slightly higher in the wildfire analysis area than is represented in Table V-2 and Figure V-2 because the NB agricultural fields (FM 93) could be fallowed or dryland wheat agriculture, which are burnable.

The Substation Fire of July 2018: Impact of Weather on Fire Behavior
The combination of high temperatures, low humidity, and strong winds created a volatile environment. This led to:
- Rapid fire growth, with the fire spreading over 18 miles in just a few days.
- Increased difficulty for firefighters in controlling the

2.1.3 Existing Infrastructure

The BCWF is an operational wind power facility that includes 217 wind turbines, three meteorological towers, collector lines, a Facility substation, transmission lines, O&M buildings, and access roads. Paved roads within the wildfire analysis area generally include Herin Lane, Emigrant Springs Lane, N Klondike Road, Medler Lane, Old Wasco Heppner Highway, and Klondike Road. There are many unnamed gravel turbine string roads within the wildfire analysis area that are currently in use for the BCWF. There are no hazardous liquid pipelines or gas transmission pipelines within 10 miles of the wildfire analysis area (NPMS 2024).

2.1.3 Existing Infrastructure

The BCWF is an operational wind power facility that includes 217 wind turbines, three meteorological towers, collector lines, a Facility substation, transmission lines, O&M buildings, and access roads. Paved roads within the wildfire analysis area generally include Herin Lane, Emigrant Springs Lane, N Klondike Road, Medler Lane, Old Wasco Heppner Highway, and Klondike Road. There are many unnamed gravel turbine string roads within the wildfire analysis area that are currently in use for the BCWF. There are no hazardous liquid pipelines or gas transmission pipelines within 10 miles of the wildfire analysis area (NPMS 2024).

As shown on RFA 4 Division 27 Figure 4, RFA 4 is within 10 miles of multiple renewable energy projects, including Klondike III Wind Project, Golden Hills Wind Project, Leaning Juniper IIA Wind Power Facility, and Summit Ridge Renewable Energy Facility.

2.1.4 Climate

The area has a warmer, arid climate. Climate data were used for Arlington, Oregon, which is located approximately 18 miles east of the Solar Micrositing Area. Based on available monthly normals of climate data between 1991 and 2020 for Arlington, the driest months on average are June, July, and August (NOAA 2024a). These months have average monthly precipitation rates of 0.48 inch (June), 0.10 inch (July), and 0.15 inch (August). July, August, and September are the hottest months of the year with average temperatures of 76.3 degrees Fahrenheit (°F) (July), 75.5 °F (August), and 66.5 °F (September). The total averag annual precipitation for Arlington is 9.3 inches per year (NOAA 2024a), which is indicative of ditionally, Arlington receives approximately 5.3 inches of s the coldest month (January) having approximately 2.0 inches of s um temperature of 40.8 °F, and an average daily minimum temp AA 2024a).

This is from 25 years ago! NOAA 2024a explains climate normal... and 18 miles away.

Table V-4. Summary of M nd Precipitation at Arlington, OR

Month	Maximu	erature (°F)	Precipitation (inch)
January			1.47
February	46.9	38.7	0.98
March	55.6	45.6	0.83
April	63.7	52.8	0.61
May	73.2	61.7	0.75
June	79.7	68.2	0.48
July	89.5	76.3	0.10
August	88.9	75.5	0.15
September	80.0	66.5	0.33
October	65.5	53.7	0.81
November	50.4	42.4	1.13
December	41.1	35.5	1.66

2.1.5 Burn Probability

Burn probability is the likelihood of a wildfire greater than 250 acres burning a given location based on wildfire simulation modeling. This is an annual burn probability, adjusted to be consistent with the historical annual area burned. The burn probability classes range from non-burnable (a

risk as moderate burn probability, either as Moderate (1-in-5,000 to 1-in-1,000) or Moderate to High (1-in1,000 to 1-in-500), with only a small portion remaining as burn probability of 0. Table V-6 shows the refined analysis for consideration that more accurately reflects the burn probability within the Solar Micrositing Area that takes into account the landowner's agricultural practices.

Table V-6. Refined Burn Probability Within Solar Micrositing Area for Consideration

Burn Probability	Percent of Wildfire Analysis Area	Acres of Wildfire Analysis Area	Percent of Solar Micrositing Area	Acres in Solar Micrositing Area
0	4	456	3	112
0 - 0.0001 Low (<= 1-in-10,000)	0	0	0	0
0.0001 - 0.0002 Low - Moderate (1-in-10,000 to 1-in-5,000)	0	4		
0.0002 - 0.001 Moderate (1-in-5,000 to 1-in-1,000)	21	235		
0.001 - 0.002 Moderate - High (1-in-1,000 to 1-in-500)	19	218		
0.002 - 0.01 High (1-in-500 to 1-in-100)	0	0		
0.01 - 0.02 High – Very High (1-in-100 to 1-in-50)	56	625		
0.02 - 0.04 Very High (1-in-50 to 1-in-25)	0	0		
Total	**100**	**11,255**	**101**	**3,981**
Note: All quantities may not result in 100 percent due to rounding adjustments.				

The high burn probability is much higher than 66%, but 66% is very high, especially in an area that already has 6-10 fires in a normal year! And no paid fire department - volunteer only.

Based on the refined analysis, the area categorized with a burn probability of 0 was reduced from 32 percent to 3 percent of the Solar Micrositing Area. Although typically areas of cultivated crops are given a burn probability of 0, there is a portion of the area in dryland wheat that is left fallow in alternating years. Therefore, it is more accurately represented by Moderate burn probability (1-in-1,000 to 1-in-500) and Moderate-High burn probability (1-in-1,000 to 1-in-500). Overall, 66 percent of the Solar Micrositing Area still primarily has a High to Very High (1-in-100 to 1-in-50) burn probability.

2.2 Seasonal Fire Risk – OAR 345-022-0115(1)(a)(B)

OAR 345-022-0115(1)(a)(B) Seasonal wildfire risk, based on factors that are expected to remain fixed for multiple months but may be dynamic throughout the year, including but not limited to, cumulative precipitation and fuel moisture content;

Response: Seasonal wildfire risk was assessed based on factors that are anticipated to remain consistent for several months but may vary throughout the year and over time. These factors include annual and monthly cumulative precipitation levels, weather advisories (including fuel moisture content data), and average flame length (average length of flames expected during a fire given local fuel and weather conditions). The seasonal wildfire risk within the Solar Micrositing Area and wildfire analysis area is low for most of the year, but moderate to high in the summer months based on the warmer arid climate, moderate average flame lengths, and low average rainfall during the summer months.

2.2.1 Precipitation

See Section 2.1.4 and Table V-4 for a discussion of precipitation within the wildfire analysis area.

2.2.2 Fuel Moisture Content

Fuel moisture content is a primary variable when observing wildfire behavior. Fuel moisture content "is a measure (vegetation) available to a fire and is expressed as a percen ic fuel" (NOAA 2024b). Fuel moisture content varies with weather, periods. The higher the fuel moisture content, the greater d opagate. Living plants and dead fuels respond differently to weather g processes of dead fuels is such that the moisture content of th weather changes. These moisture contents are influenced by pre urface temperatures, wind, cloudiness, as well as by fuel factors compactness, and arrangement. Fuel moisture content with l Solar Micrositing Area is dependent on current weather cond easonal weather patterns.

Note: Moderate to high for months!!!! What is PGE going to do to preserve our "Right to Farm"? They have verbally assured us that they will just go after our insurance, not us, but once they go through our $5 million of insurance, no one will ever insure us again. MODERATE TO HIGH! WE NEED ASSURANCES.

Fuel moisture varies with vegetation type. For instance, annual grasses are highly flammable whereas broadleaf vegetation is less flammable (USFS 1970). Additionally, live evergreen trees and shrubs can burn despite having a moisture content of over 100 percent.

Fuel model groups within the wildfire analysis area consist of grass, grass/shrub, agricultural, urban/developed, bare ground, broadleaf litter, and conifer litter. As shown on Figure V-2 and described above in Table V-2, the majority of the vegetation within the Solar Micrositing Area is FM 102 – Low Load, dry climate grass (55 percent) and FM 93 – agricultural (29 percent). Within the wildfire analysis area, the most prominent fuel models are also FM 102 (53 percent) and FM 93 (36 percent). The primary carrier of fire in FM 102 is grass and small amounts of dead fuel. If there are shrubs present, they typically do not affect fire behavior. Additionally, the primary carrier of fire in FM 93 is grass (Scott and Burgan 2005). However, as noted in Section 2.1.2 and Table V-3, FM 102 and FM 104 more accurately represent wildfire risk of the agricultural areas within the Solar Micrositing Area that include dryland wheat, and FM 1 more accurately represents wildfire risk for areas that are fallowed and only contain stubble.

of an Independent Evaluator's Report, review of stakeholder comments, and ongoing participation in WMP public workshops and stakeholder engagement. The Oregon PUC Order 24-232 (Attachment V-3) includes direction for actions for future WMPs, including 24 recommended actions for PGE to take for the 2025 and 2026 WMP updates, as detailed in Attachment A of Order No. 24-232 (Attachment V-3).

If construction of the Solar Components in RFA 4 proceeds, the following annual update for the WMP will include a re-evaluation of risks considering the new solar and battery energy storage system components. However, the Certificate Holder has created a construction WMP (Attachment V-1) to satisfy OAR 345-022-0115(1)(b).

3.0 Conclusion

Per the data reviewed and presented here, wildfire risk and consequences of fire in the Solar Micrositing Area are typical for the vegetation type and fire regime encountered in Sherman County. Within the Solar Micrositing Area and wildfire analysis area, assets that could currently be impacted include BCWF infrastructure, residential structures, agricultural areas and farming operations, and roads. If a wildfire did ignite near those assets, they could be at risk. It is anticipated that, due to the moderate to very high hazard to potential structures, high burn probability, moderate expected intensity as measured by average flame length, fuels, weather, and topography, post-construction overall fire risk would be moderate to high.

We need to see this re-evaluation of risks. Lithium-ion batteries continue to pose a significant fire risk in areas with high temperatures.

Attachments: The Wildfire Mitigation and Risk document produced for PGE by Tetra Tech is a joke.pdf

---

Categories: Tracked To Dynamics 365

Thanks, Chris.

IS the PDF clear enough? I noticed the screenshots I sent you are blurry when I look at them now…

Kathy

PGE doesn't even let its personnel go to a fire near Biglow to help us fight it.

The Wildfire Mitigation and Risk document produced for PGE by Tetra Tech is a joke. It is a
ridiculous cut-and-paste, ultimately proving or saying nothing. Why didn't they use actual
temperature data from Biglow? Or NOAA?

Our temperatures are much higher than the climate normal data indicates. Winds are
powerfully strong. My intention is to demonstrate how fire-prone we are and to secure real
mitigation and written assurances if we cannot obtain a hold-harmless clause for:

Fire started accidentally by BrightNight/PGE
or
Fire accidentally started by us, either at our house or while farming west of PGE's solar.

Will PGE/BrightNight be paying for our insurance if they start a fire and push us into a higher,
Unaffordable insurance bracket?

WE ARE ALL VOLUNTEERS. This is a terrible place for a solar farm.

I have highlighted my primary concerns in their 225 page report. I will summarize them here.

I flew 747s (820,000 pounds on takeoff, 650,000 pounds max landing) with passengers and freight across Asia, Europe, and the US for over 17 years. Passenger planes were not allowed to carry lithium-ion batteries as cargo because they are too dangerous, and thermal runaways are real. We were trained annually to fight fires in our fire training room with PPE protection. However, even our Class D extinguishers could not put out battery fires. UPS 6 out of Dubai is our poster child. The flight crashed 26 minutes after the fire warning. The plane experienced a catastrophic fire that severely damaged its control systems.

I can guarantee that neither I, my husband, nor my son will be fighting fires inside a solar facility. Even with training, it's too risky. I will also encourage other farmers not to get involved.

That leaves PGE responsible for providing fire training to its employees. Biglow was built in 2007, and PGE has never helped us fight fires around the facility.

So, how do we recruit trained volunteers, assuming other farmers and residents feel the same way? Do PGE or Sherman County guarantee their livelihoods if they get injured or killed? Do PGE or Sherman County give them huge bonuses for their willingness to step up and fight a solar fire?

Our fire departments are all volunteer. BLM and others distribute some funds after major fires. The county has built new firehalls and added firetrucks, so the equipment and trucks are ready to go. But who operates them?

I am not concerned about BrightNight's initial five-year period. My concern is if they sell, run out of tax credits (2032), or PGE takes over as planned at year six.

PGE's safety record is weak at Biglow. They've been fortunate, with so many parts falling, including a "blade" liberation in February 2022, not to have killed someone. At 90 MPH dropping from 265 feet, even a small piece of fiberglass or a bolt can cause serious harm or death, according to the Oregon Department of Energy.

When we turned over doors, discs, and pieces we found in the fields over the years, we assumed they had to report to someone. They didn't. So over 25 incidents were never reported. This is negligent or willful on their part.

So how can we trust them with solar? The blade fell four years ago, and the towers are in worse shape now. Finally, they've bought the parts to fix the original Phase 1 towers and hired 34 more technicians. It will take years to get them operational again. Now the Siemens towers are facing issues after years of neglect and cost-cutting.

PGE should not be allowed to pivot to solar until the wind towers are repaired. This is too risky a project for PGE to take on.

However, if they do somehow get approval from ODOE/EFSC, here are problems that need to be addressed, at a minimum:

Mitigations:

- **Reinforced Containers**: BrightNight should use metal containers or fiberglass with steel reinforcements to resist turbine debris impacts.
- **Wind Barriers**: Install windbreaks (e.g., berms, fences) around BESS to reduce debris and ember spread.
- **Backup Power**: Ensure multiple generators/solar-powered cooling for PSPS, preventing overheating in 40°C heat.
- **Fire Training**: Train local firefighters for BESS fires, addressing rural response gaps.

Conclusion: Modular containers are designed to withstand fires and high winds, but Sherman County's unique risks—ferocious winds, turbine debris, and limited fire response—require enhanced protections to ensure safety.

BESS: **BESS** stands for **Battery Energy Storage System**. It refers to a system that stores electrical energy, typically from renewable sources like solar or wind, in batteries for later use. In the context of BrightNight's project in Sherman County, Oregon, the BESS is the **100-acre lithium-ion phosphate (LFP) battery storage** facility designed to store energy generated by the 1900 acre solar farm, integrated with the Biglow Canyon Wind Farm's infrastructure. These systems use modular containers (often fiberglass or metal, like NEMA 4X enclosures) to house batteries, along with cooling systems, Battery Management Systems (BMS), and fire suppression to manage energy and mitigate risks like overheating or fires.

The unique hazards of lithium-ion battery fires—toxic fumes (e.g., hydrogen fluoride), thermal runaway, and the ineffectiveness of water-based firefighting—combined with Sherman County's ferocious winds and rural setting, make this a high-risk task for volunteers. Recruiting trained volunteers, ensuring their safety, and addressing financial protections for injury or death are critical, especially in light of the Biglow Canyon Wind Farm's maintenance failures and the state's lax oversight.

1. Challenges of Recruiting Volunteers for Solar Facility Fires
Hazards of Lithium-Ion BESS Fires:

- **Toxic Fumes**: Lithium-ion (LFP) battery fires release hydrogen fluoride, carbon monoxide, and other gases, requiring specialized personal protective equipment (PPE) like self-contained breathing apparatus (SCBA).

- **Thermal Runaway**: Fires can reach 500–1,000°C, with re-ignition risks, making containment difficult. Water can exacerbate fires by spreading lithium or causing explosions, necessitating foam, dry chemical, or controlled burnouts.
- **Sherman County Conditions**: Winds (20–30 mph, gusts to 60–80 mph) can spread flames and embers, complicating firefighting. Dry vegetation (tumbleweeds, grass) increases wildfire risks.
- **Rural Limitations**: Sherman County's volunteer fire departments (e.g., North Sherman County RFPD) have limited personnel (typically 10–20 volunteers per station), equipment, and training for specialized fires, unlike urban departments.

Community Reluctance:

- **Personal Risk**: Farmers and residents may refuse to fight BESS fires due to health risks (inhalation, burns) and potential fatality, even with training.
- **Economic Concerns**: Volunteers, often farmers or small business owners, rely on their livelihoods. Injury or death could devastate families in a county with a median household income of ~$60,000 (2021 data).
- **Trust Issues**: Biglow's maintenance failures (12 turbine pieces dropped in the last year, 40 Vestas turbines offline) and Oregon's weak oversight (no penalties for PGE's non-reporting) erode confidence in renewable projects, make residents wary of risking their lives for BrightNight's BESS.

Recruitment Barriers:

- **Limited Pool**: Sherman County's population (~1,800) restricts volunteer numbers. Many are already committed to regular firefighting, farming, or other jobs.
- **Training Demands**: Lithium-ion fire training requires specialized courses (e.g., NFPA 855-compliant, hazmat certification), costing $500–$2,000 per person, plus time away from work.
- **Retention**: Without financial protections or incentives, volunteers may drop out, especially after witnessing Biglow's safety lapses or learning of incidents like the Moss Landing fire (2025).

2. Strategies to Recruit Trained Volunteers

To recruit and retain volunteers for BESS fire response in Sherman County, despite community reluctance, a multi-faceted approach is needed, balancing training, safety, and incentives. Here are actionable strategies:

1. Establish a Specialized BESS Fire Response Team:

- **Model**: Create a dedicated **Sherman County BESS Response Unit** within existing fire districts (e.g., North Sherman or Moro RFPD), trained specifically for lithium-ion fires.
- **Training Program**:
    - Partner with organizations like the **National Fire Protection Association (NFPA)** or **International Association of Fire Fighters (IAFF)** to provide NFPA 855-compliant training, covering:
        - Lithium-ion fire behavior (thermal runaway, toxic gases).
        - Use of foam, dry chemical, or CO2 suppressants.
        - SCBA and hazmat PPE operation.
        - Controlled burnout strategies to avoid water use.
    - Contract trainers from urban departments (e.g., Portland Fire & Rescue) or private firms (e.g., Fire & Risk Alliance), with costs (~$20,000–$50,000 for 10–15 volunteers) funded by BrightNight or PGE.
    - Conduct annual drills at BrightNight's BESS site, simulating windy conditions, to build confidence.
- **Recruitment**:
    - Target younger residents (18–40) with firefighting interest, offering flexible training schedules to accommodate farming.
    - Engage community groups (e.g., Sherman County Farm Bureau) to identify candidates, emphasizing BESS safety as a community benefit.
    - Use social media and town halls (e.g., Wasco or Rufus) to promote the unit, highlighting protections and incentives (below).

2. Partner with Regional Fire Departments:

- **Mutual Aid Agreements**: Coordinate with neighboring counties (Gilliam, Wasco) or urban centers (The Dalles, ~30 miles away) to provide backup for BESS fires. Their departments may have hazmat-trained personnel.
- **State Support**: Request Oregon State Fire Marshal (OSFM) deploy its **Hazardous Materials Response Teams** (13 statewide) for major BESS incidents, supplementing local volunteers.
- **Funding**: Secure grants from OSFM's **Community Risk Reduction Program** or FEMA's **Assistance to Firefighters Grant** (~$50,000–$100,000) to train regional teams, reducing Sherman County's burden.

3. Engage BrightNight and PGE:

- **Corporate Responsibility**: Require BrightNight to fund and organize training as a condition of EFSC approval, citing their community commitment (jobs, tax revenue).

PGE, as Biglow's operator, should co-fund due to their maintenance failures increasing local distrust.

- **On-Site Support**: Mandate BrightNight maintain a small, trained BESS response team (2–3 staff) on-site, equipped with foam suppressants and SCBA, to initiate response before volunteers arrive.
- **Community Liaison**: BrightNight should appoint a fire safety coordinator (contact Maribeth Sawchuk, maribeth@brightnightpower.com) to work with residents, ensuring transparency about BESS risks and training plans.

4. Address Community Fears:

- **Education**: Host workshops explaining LFP battery safety (lower fire risk than Moss Landing's NMC) and NFPA 855 protections (gas venting, modular spacing), reducing perceptions of danger.
- **Transparency**: Share BrightNight's BESS specs (e.g., LFP, cooling systems) and fire response plans at public hearings, addressing concerns.
- **Opt-Out Respect**: Acknowledge residents like your family who refuse to fight BESS fires, focusing recruitment on willing volunteers to avoid community tension.

3. Financial Protections and Incentives for Volunteers

To ensure volunteers' livelihoods are protected and incentivize participation, Sherman County must address the risks of injury or death in BESS firefighting. Here are proposed solutions:

1. Insurance and Compensation Guarantees:

- **Disability and Life Insurance**:
  - **Policy**: Provide comprehensive insurance for BESS response volunteers, covering:
    - **Disability**: Full income replacement (e.g., $60,000/year, based on county median) for permanent injuries preventing work.
    - **Death**: $500,000–$1M payout to families, ensuring financial security.
    - **Medical Costs**: All BESS-related injuries (e.g., burns, inhalation) covered, including long-term care for toxic exposure.
  - **Funding**: BrightNight and PGE fund policies (~$5,000–$10,000/year per volunteer for 10–15 volunteers), leveraging ITC savings or Biglow's tax revenue ($12.8M in 2020).
  - **Model**: Oregon's **Volunteer Firefighters' Insurance Program** (ORS 243.950) offers a framework, but BESS-specific policies need higher coverage due to risks.

- **Workers' Compensation**:
  - Extend Oregon's **SAIF Corporation** coverage to volunteers, ensuring medical and wage benefits for BESS injuries. BrightNight/PGE should cover premiums (~$2,000/year per volunteer).
  - Include long-term monitoring for hydrogen fluoride exposure, as seen in Moss Landing's aftermath.

2. Bonuses and Incentives:

- **Hazard Pay**:
  - Offer **$500–$1,000 per BESS fire call**, reflecting the high risk and specialized skills, funded by BrightNight/PGE.
  - Compare to urban hazmat firefighters' pay (~$100/hour for incidents), adjusted for rural volunteers.
- **Annual Stipends**:
  - Provide **$2,000–$5,000/year** for active BESS unit members, covering training time and readiness, encouraging retention.
  - Fund via Sherman County's tax revenue from BrightNight or PGE's Biglow operations.
- **Tax Benefits**:
  - Advocate for state tax credits (e.g., $1,000/year) for BESS volunteers, modeled on Oregon's **Volunteer Firefighter Tax Credit** (up to $250, ORS 315.622).
  - BrightNight could sponsor additional local tax relief for volunteers' families.
- **Equipment Support**:
  - Supply volunteers with personal SCBA, foam kits, and hazmat suits (~$10,000 per volunteer), maintained by BrightNight to reduce financial burden.

3. Livelihood Protections:

- **Job Security**: Partner with local employers (e.g., farms, Northwest Grain Growers, MCGG) to guarantee volunteers' jobs during training or recovery from injuries, using BrightNight's community ties.
- **Family Support**: Offer counseling and financial planning for volunteers' families, funded by BrightNight, to address fears of loss, as your family feels.
- **Legal Protections**: Ensure volunteers are not liable for BESS fire outcomes (e.g., environmental damage), with BrightNight/PGE indemnifying them.

4. Community Fund:

- **BESS Safety Fund**: Create a $1M–$2M fund, seeded by BrightNight/PGE and replenished by BESS revenue, to cover:
  - Emergency payouts for injured/killed volunteers' families.
  - Training and equipment upgrades.
  - Community wildfire prevention (e.g., vegetation control).
- **Administration**: Managed by Sherman County commissioners with resident oversight (e.g., a board including farmers like Kevin and Colt McCullough), ensuring fairness.

Feasibility:

- **BrightNight's Role**: As a community-focused developer, BrightNight can fund training and protections via ITC savings ($10M–$20M for a 200–400 MWh BESS) or operational revenue.
- **PGE's Responsibility**: PGE's Biglow failures (40% maintenance cut, 3,400 gallons of oil leaked) justify their contribution, using overhaul funds ($156M planned) or tax revenue.
- **State Support**: Oregon's RPS budget and OSFM grants can subsidize costs, reducing local burden.
- **Precedent**: California's **PG&E Wildfire Mitigation Fund** ($300M) supports rural fire training; Oregon could adopt a similar model for BESS risks.

4. Addressing Community Reluctance

Given reluctance and similar feelings among farmers and residents, recruitment must respect opt-outs while appealing to willing volunteers:

- **Survey Residents**: Conduct a countywide survey (through the Sherman County Extension Service) to gauge interest in BESS firefighting and identify 10–15 candidates.
- **Target Diverse Groups**: Recruit from non-farming residents (e.g., teachers, retirees) and younger volunteers seeking community roles to reduce reliance on farmers.
- **Highlight Protections**: Emphasize insurance, bonuses, and BrightNight's safety measures (LFP, NFPA 855) in recruitment drives to build trust.
- **Alternative Roles**: Offer non-firefighting roles (e.g., logistics, evacuation coordination) for residents like your family to support the response without direct risk.

Moss Battery, Kilwinning, and Warwick have recently had horrific fires, so toxic that mainstream news is not publishing the aftereffects in the community. PG&E and Vistra Corp. are being sued over the Moss Battery fire. Again,this is too risky a project for PGE to take on.

https://www.silive.com/news/2025/12/second-fire-at-upstate-bess-site-shows-these-unsafe-toxic-facilities-must-be-stopped-opinion.html

Subject:	NOI #5 Plan for Trained Firefighters in Sherman County
Attachments:	NOI #5 Plan for Trained Firefighters in Sherman County.pdf

Categories: Tracked To Dynamics 365

The unique hazards of lithium-ion battery fires—toxic fumes (e.g., hydrogen fluoride), thermal runaway, and the ineffectiveness of water-based firefighting—combined with Sherman County's ferocious winds and rural setting, make this a high-risk task for volunteers. Recruiting trained volunteers, ensuring their safety, and addressing financial protections for injury or death are critical, especially in light of the Biglow Canyon Wind Farm's maintenance failures and the state's lax oversight.PGE should not be allowed to pivot to solar until the wind towers are repaired. This is too
risky a project for PGE to take on.

Chris,

Were my comments specific enough in the 5 NOIs I submitted? Do I need to present more facts, statements, or specify more?

I don't think one public hearing is enough, considering the scope of this amendment. It is not even apples and oranges… and there have been so many problems with their wind project. Now they get a green light for solar?

Just the fact that so many pages have been amended in the site certificate makes it difficult for the lay reader.

It looks like there will be fire mitigation during construction, but then PGE comes up with their own mitigation for the solar afterwards? And the weeds can be a foot high? Noxious weeds, not all weeds?

There is so much wrong with this process that I am having trouble voicing all my concerns.

Kathy

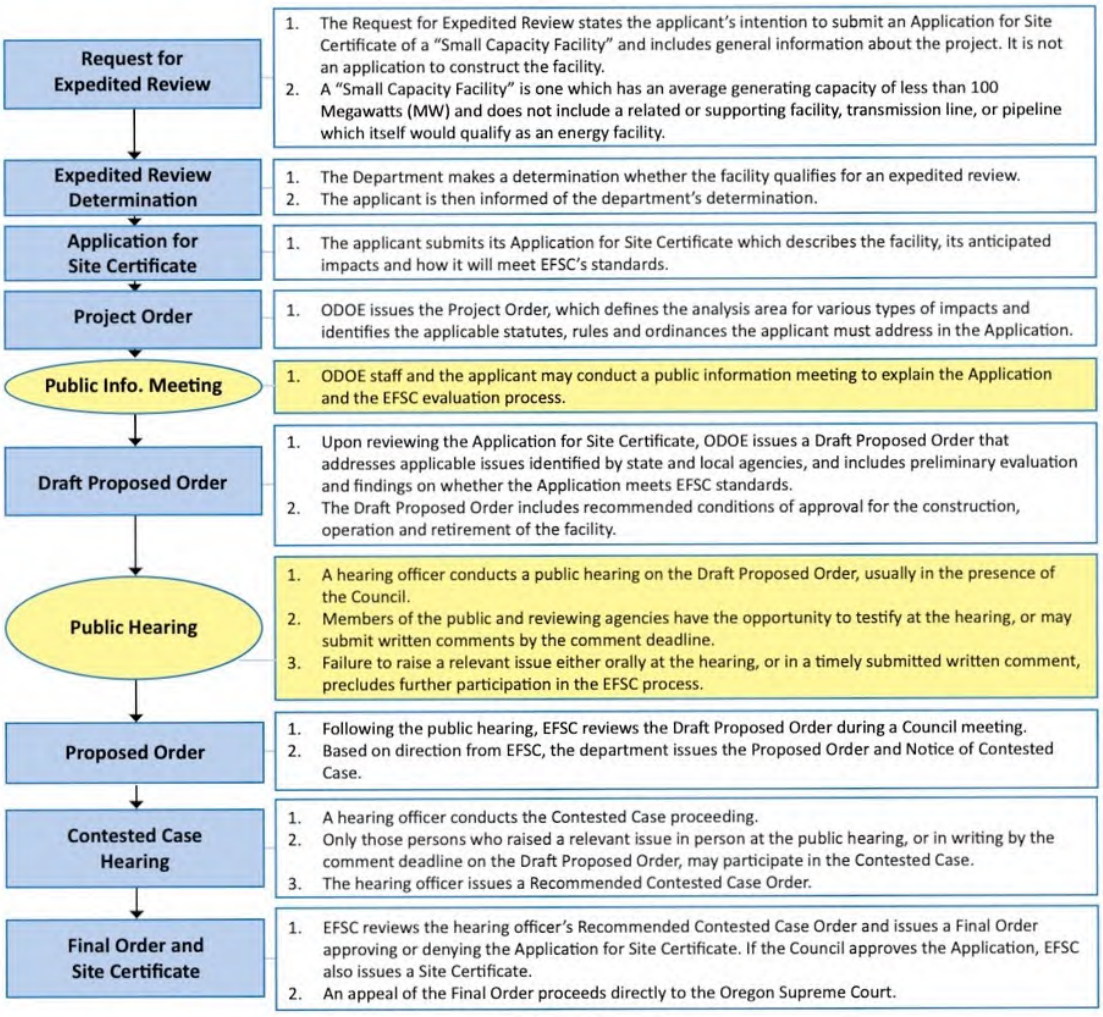
Subject: Question on the Timeline

Chris,

This is our timeline, correct? (Because it is shortened there are only two public meetings?) The first meeting in yellow is the one on January 15, 2026, in Grass Valley?



When is the next one scheduled?

If PGE does not address the fire concerns to our satisfaction, is that when it is considered contested?

Kathy

SITING OF ENERGY FACILITIES IN OREGON
EFSC Expedited Review Process Flowchart

The Oregon Department of Energy administers the Energy Facility Siting Council facility siting process, which consolidates state agency and local government regulations into a single review process. State agencies and local governments participate throughout the process. The two yellow stages indicate where public participation is encouraged.

RE: Biglow Canyon Wind Farm Site Certificate Amendment 4 | Public Comment

Dear Mr. Clark,

Sherman County operates within the Mid-Columbia Economic Development District's boundaries, and the district maintains an ongoing working relationship with the Sherman County Court. Our interest in the proposed project relates to our partnership with the Sherman County Court to assist with the implementation of the Community Investment Plan and Fund.

We understand that PGE is required to develop a mitigation plan for the Goal 3 exception to exclusive farm use land on which the facility is sited.

PGE, Sherman County Court, and Mid-Columbia Economic Development District are collaborating through a memorandum of understanding to execute the Community Investment Plan. Mid-Columbia Economic Development District has been asked and has agreed to administer the Community Investment Fund that will be created as a component of the Community Investment Plan with and for Sherman County Court.

The pending memorandum of understanding between Sherman County, Mid-Columbia Economic Development District, and PGE represents constructive collaboration. Mid-Columbia Economic Development District is pleased to assist Sherman County in this capacity.

Sincerely,

Jessica Metta

Re: Biglow Canyon Wind Farm Request for Amendment 4 – Proposed Order

Dear Mr. Clark,

Portland General Electric (PGE; Certificate Holder) submits the following comments in response to the Oregon Department of Energy's (ODOE) Proposed Order (PO) on the Request for Amendment 4 (RFA 4) of the Biglow Canyon Wind Farm (BCWF or Facility) Site Certificate.

The Certificate Holder generally agrees with the findings in the PO and the draft Amended Site Certificate for the RFA 4 and acknowledges the substantial effort undertaken by ODOE staff and participating state agencies reviewing and evaluating the proposed amendment. The Certificate Holder appreciates the collaborative coordination throughout the review process and provides the following comments and requests for consideration. This comment letter addresses requested edits related to corrections or clarifications of the record ahead of the public hearing. PGE anticipates submitting a second comment letter after the hearing that offers additional comments on the PO (and plans) for ODOE's and Council's consideration in the Final Order.

Requested changes to the Proposed Order:

- **Facility Site Location:** The Proposed Order Cover Letter identifies the Facility Site Location being 4.8 miles northeast of the Town of Wasco. The Solar Micrositing Area is 4.8 miles northeast of the Town of Wasco, but the Facility Site Location is 2.5 miles northeast of the Town of Wasco.

- **I.B.1 Energy Facility:** The Certificate Holder requests that the existing operational facility description be updated and provide the following revisions and additions to reflect the facility as built:

  ~~*The wind turbines are located on private land that the certificate holder has leased from the affected landowners.*~~ *The Siemens 2.3 MW turbines are mounted on tubular steel towers with a* ~~*hub*~~ *height of* ~~*280*~~ *262 feet at the hub and* ~~*maximum blade tip*~~ *an overall height of* ~~*445*~~ *413 feet including the turbine blades. The wind turbines are located on private land that the certificate holder has leased from the participating landowners.*

- **I.B.2. Related or Supporting Facilities, Table 1:** The Certificate Holder requests the following revisions to Table 1 be made to accurately reflect the existing facility components as built:

    - *Collector line length, underground: ~~106~~ 75 miles*
    - *Collector line length, overhead: ~~3.9~~ 5 miles*
    - *O&M Building Quantity: ~~2~~3 each*

- **I.D.3 Internal Access Roads:** The Certificate Holder would like to clarify that all new facility access roads will be 16 feet in width.

- **III.B.1 Recommended Amended Condition 3 (CON-OE-01):** The Certificate Holder requests that fax number be removed as a requirement.

- **III.B.1 Table 5:**
    - **Build Transfer Agreement:** The Certificate Holder requests that Table 5 be updated to reflect that a redacted version of the Build Transfer Agreement with confidential terms withheld will be submitted as part of fin.

- **III.D.1 Table 7: General Description of Mapped Soil Units in the Analysis Area -** The Certificate Holder requests revisions to the Area within Solar Micrositing Area to reflect a presence of 0.1% for soil unit: Lickskillet very stony loam, 7 to 40 percent north slopes (ID 16D), to reflect values represented in Exhibit I, Table I-1 of the fRFA4.

- **III.D.1 Vegetation Management and Weed Control:**
    - The Certificate Holder clarifies that, while there is intent to contract the Sherman County Weed Control District to implement measures of the Weed Control Plan, the District may not have sufficient capacity to manage implementation, in which case the Certificate Holder requests that other qualified vendors may be contracted to implement the measures of the Weed Control Plan.

- **III.K.1 Findings of Fact:** The Certificate Holder has conducted outreach to the Confederated Tribes of the Warm Springs Reservation of Oregon (CTWSRO), the Confederated Tribes of the Umatilla Indian Reservation (CTUIR) and the Burns Paiute Tribe. The Certificate Holder requests that the following summary of the correspondence with these Tribes be included in this section.
    - The certificate holder represents that no responses *to the October 2024 outreach letters were received*.[255] *On September 4, 2025, the certificate holder again sent informal outreach letters via email to the respective Tribes. On September 5, 2025, the certificate holder received an email response from the CTUIR deferring the project to the CTWSRO. On September 5, 2025, the certificate holder received an email response from the Burns Paiute Tribe acknowledging receipt of the outreach letter and agreeing to further engagement to discuss the project. On September 22, 2025, the certificate holder provided their availability for a meeting with the Burns Paiute Tribe; however, no responses were received to the meeting invitation. On September 11, 2025, the certificate holder received a response from CTWSRO agreeing to further engagement to discuss the project. On November 20, 2025, the certificate holder met with the CTWSRO in person to provide an overview of the*

project and to address any questions or concerns related to natural and cultural resources. The CTWSRO did not express any immediate concerns about the project.

- **IV. A.1 Table 26: Modeled Operational Noise of the Facility, as Amended**
  - The Certificate Holder would like to note that Table 26 *Modeled Operational Noise of the Facility, as Amended* omits NSR 13. This NSR should be included. Acoustic modeling shows that noise would be below the threshold.
  - The Certificate Holder would like to clarify that the source in Table 26 should be RFA4 Exhibit Y, Table Y-6 *and Table Y-7*.

Certificate Holder Requested Changes to the Draft Site Certificate:

- **Section 3.0 (Descriptions), Subsection 3.1 (The Wind Facility), part d. (Operations and Maintenance Building)**
  The Certificate Holder requests that the total square footage of the as built O&M buildings total be changed from 17,500 square feet to 19,500 square feet due to the building added by the Sixth Change Request.

- **GEN-TL-05**
  The Certificate Holder requests that the Department change this recommended amended condition to read:

  > ~~*(119) OAR 345-027-0023(5): If the proposed energy facility is a pipeline or a transmission line or has, as a related or supporting facility, a pipeline or transmission line, the Council shall specify an approved corridor in the site certificate and shall allow t*~~*The certificate holder* ~~*to*~~*shall construct the* ~~*pipeline or*~~ *230-kV transmission line connecting the Biglow Canyon Substation* ~~*anywhere*~~ *within a 150-foot corridor, as* ~~*presented in Figure 2 of the Amended Site Certificate*~~ *identified in the final site design* ~~*the corridor, subject to the conditions of the site certificate. If the applicant has analyzed more than one corridor in its application for a site certificate, the Council may, subject to the Council's standards, approve more than one corridor*~~.

  This edit will allow for flexibility of the location of the transmission line corridor, rather than requiring that the transmission line be located as shown in Figure 2.

- **PRE-WR-01**
  The Certificate Holder requests that the Department change this condition to read: ~~Prior to construction of any new well,~~ *No later than 30 days after completing construction of any new well*, the certificate holder shall provide the Department a copy of the map, well log and all other information it provided to OWRD pursuant to ORS 537.545 and ORS 537.765 to qualify for an exempt ground water use for any onsite exempt wells.

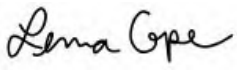
  The Certificate Holder requests this change because ORS 537.545 and 537.765 require the submission of this information following construction of a new well. A well log cannot be provided prior to construction because it is created during construction.

- **OPR-WR-01**
  The Certificate Holder cannot comply with this requirement to monitor the volume of groundwater used on a daily basis as of the effective date of the site certificate because

the existing well does not have a flow meter and one cannot be installed prior to when the Site Certificate is countersigned. The Certificate Holder requests that this requirement be revised to require monitoring as of the start of construction for the Solar Components.

- **GEN-FW-02** references Condition 63 (should now be GEN-FW-03)

Certificate Holder Requested Changes to Attachment D Comprehensive Solar Revegetation and Soil Management Plan:



- The Certificate Holder has identified that the suggested revisions provided by ODOE in Attachment D to the Proposed Order would restrict all vegetation removal in Cat 2 habitat from Apr 15 to Sept 1 and would preclude almost all work in those areas, incentivizing grading instead of mowing or drive and crush. Mowing is essential prior to work during the dry season to reduce fire risk. The Certificate Holder requests that the Department make the following changes to Section 5.0 Table 4. Construction Compliance Checklist, During Ground-Disturbing Activities:

    - *Action: To the extent practical, mowing or other vegetation removal activities in Category 2 habitat will be scheduled to occur outside the critical period for ground-nesting birds (April 15 – September 1), to avoid disturbing active nests. If mowing or other vegetation removal activities in Category 2 habitat are necessary between April 15 to September 1, the Certificate Holder shall hire a qualified biologist to conduct a clearance survey for nesting birds prior to vegetation removal. The Certificate Holder shall ensure that active nest sites identified during the clearance survey are flagged and marked as sensitive areas for avoidance on construction maps. ~~On or before April 15 of any year in which construction occurs within Category 2 habitat, all mowing, vegetation removal and/or ground disturbance associated with site preparation must be completed. No mowing, vegetation removal and/or ground disturbance associated with site preparation may occur within Category 2 habitat between April 15 through September 1.~~*

    - *Responsible Party: EPC, Certificate Holder*

PGE respectfully submits these comments for consideration by ODOE and the Energy Facility Siting Council in advance of Council action on the Proposed Order for Request for Amendment 4.

Sincerely,

Lenna Cope

WATER USE AGREEMENT

This Water Use Agreement ("Agreement") is entered into as of December 3, 2025 by and between R & A Scharf, LLC, an Oregon limited liability company ("Grantor") and BIGL bn, LLC, a Delaware limited liability company ("Grantee"). Grantor and Grantee are referred to collectively as "Parties" and individually as a "Party."

RECITALS

A. Grantor and Grantee entered into a certain Option and Land Lease dated August 2, 2024 and amended by a First Amendment to Option and Land Lease dated July 2, 2025 and a First Amendment to Memorandum of Option and Land Lease dated July 2, 2025 (together, the "Lease") providing for Grantee's lease of and easement rights over certain real property owned by Grantor and located in Sherman County in the State of Oregon, more particularly described in the attached Exhibit A ("Grantor Property").

B. A well (the "Well") and other appurtenant facilities including, but are not limited to, pipes, valves, turnouts, meter, electrical and/or other power source(s) (the "Water Facilities") are located on the Grantor Property. Water Right Certificate 57620 is appurtenant to the Grantor Property and allows for irrigation of certain areas of the Grantor Property, using the Well as the point of diversion ("Certificate 57620").

C. Grantor and Grantee wish to enter into an agreement governing Grantee's use of the Well, Water Facilities, and water from the Well for industrial purposes, including but not limited to the construction, operation, and maintenance of a commercial solar energy facility, including an energy storage system and other related or supporting facilities (the "Project") on the Grantor Property.

NOW THEREFORE, in consideration of the mutual covenants set forth below, and for valuable consideration, the receipt of which each of the Parties acknowledge, the Parties agree as follows:

1. Effective Date, Term, and Termination. This Agreement shall become effective upon execution by the Parties ("Effective Date") and shall remain effective for a term of thirty (30) years ("Term"). Grantee shall have the right to extend the Term for two (2) additional periods of five (5) years each by providing written notice of such extension to Grantor at least sixty (60) days prior to the expiration of the previous term. The Parties

may terminate this Agreement by mutual agreement or as otherwise provided under Section 10(b).

2. Grant of Water Use. Grantor hereby grants Grantee an exclusive license to use the Well, the Water Facilities and water from the Well for the construction, operation, and maintenance of the Project, including fire protection water and solar panel washing, as well as domestic use ("Project Water Use"), as follows:

    a. As of the Effective Date, Grantee may use up to five thousand (5,000) gallons per day of exempt groundwater as authorized under ORS 537.545 ("Exempt Use Water") for Project Water Use.

    b. Grantee may use water under Certificate 57620, subject to Section 3 Regulatory Approvals below, for Project Water Use.

    c. For the avoidance of doubt, Grantor and its successors, assigns, agents, lessees, tenants, contractors and subcontractors will not have any use of the Well, Water Facilities, and water from the Well, including water under Certificate 57620 for the Term of this Agreement. Grantor warrants that it has full and clear legal authority to grant the license hereunder and that no other person or entity has a claim to water from the Well, including water under Certificate 57620, for the Term of this Agreement.

3. Regulatory Approvals. The Parties acknowledge that using Certificate 57620 for industrial purposes for the Project will require applying to the Oregon Water Resources Department ("OWRD") for a transfer (the "Transfer Application"). The Transfer Application may include a request to change the character of use of Certificate 57620 from irrigation to industrial use, the authorized place of use to the area covered by the Project, the season of use to year-round use, and the volume of water authorized. Grantee agrees it will not use water from Certificate 57620 for Project Water Use until OWRD issues a final order approving the Transfer Application and issuing a revised water right (the "Transfer Right"). As soon as reasonably practicable following the execution of this Agreement, Grantor shall submit the Transfer Application to OWRD using GSI Water Solutions as its agent. Grantee agrees to pay for all reasonable costs associated with the Transfer Application, including but not limited to OWRD processing fees and the costs associated with GSI Water Solutions' support. Grantor and Grantee agree to cooperate in good faith to gather all of the information required and sign all forms necessary to submit the Transfer Application on behalf of R&A Sharf LLC for the benefit of Grantee. Grantee agrees to comply with all conditions included in a final order approving the Transfer Application or Transfer Right.

4. Regulatory Reporting. Grantor is responsible for submitting a timely claim of beneficial use of the Transfer Right to OWRD, as appropriate, along with a request for a water right certificate, and any on-going reporting required by OWRD in association with the Water Facilities and water usage required during the Term. Grantee will cooperate in good faith to provide Grantor with information required to file a claim of beneficial use for the

Transfer Right or reports to OWRD to the extent that information is in Grantee's possession.

5. Water Quantity. Certificate 57620 allows for the irrigation of three hundred twenty-five and seven-tenths (325.7) acres at a rate of up to sixty-six hundredths (0.66) cubic feet per second ("cfs"). However, based on historical practices on the Grantor Property, only approximately twenty (20) acres have been irrigated in compliance with Certificate 57620. Accordingly, the Parties acknowledge that the Transfer Application may result in a new permit or certificate for the Transfer Right allowing for a reduced quantity of water use corresponding to the use of water on approximately twenty (20) acres at a corresponding rate of approximately for hundredths (0.04) cfs, which equates to about twenty-four thousand (24,000) gallons per day ("Transfer Use Water"). **Grantor bears all risk for any reduction in allowed water use under Certificate 57620 or subsequent transfer orders or certificates as a result of the Transfer Application and hereby releases and waives any claims against Grantee and its successors and assigns associated therewith or other proceedings related to the Project**.

6. Compensation for Water Use. Grantee agrees to compensate Grantor on a yearly basis for the Project Water Use at a flat rate of [redacted] per one thousand (1,000) gallons for all Project Water Use, including Exempt Use Water and Transfer Use Water. The flat rate includes all of Grantor's administrative and operating costs, including electricity, for the Term of this Agreement, except Grantee will install a meter on the Well prior to drawing water from the Well, at its sole cost, to measure water use under this Agreement. Grantor agrees to read the meter once a year and invoice Grantee once a year for the water use of the preceding year using water use data from the meter within sixty (60) days of the anniversary of the Effective Date. Grantee agrees to pay Grantor within sixty (60) days of receiving the annual invoice. The Parties acknowledge that if there is no Project Water Use in any year, Grantee has no obligation to compensate Grantor under this Section 6, except as otherwise provided in Section 7.

7. Forfeiture for Non-Use. Upon issuance of a final order approving the Transfer Application and Transfer Right, Grantee shall be responsible, during the term of this Agreement, for using water consistent with the Transfer Right to prevent forfeiture of the Transfer Right for non-use, including using the maximum rate authorized under the Transfer Right (or the amount of the Transfer Use Water) at least every five (5) years ("Nonforfeiture Action") and/or maintaining the Well and Water Facilities so that they are "ready, willing, and able" to use the maximum rate authorized under the final order. In the unlikely event a Nonforfeiture Action is required, Grantee's payment obligation under Section 6 is estimated at about [redacted] ([24,000 gallons x [redacted]).

8. Decommissioning. Upon decommissioning of the Project, Grantor and Grantee agree to cooperate in good faith to transfer the Water Right back to irrigation use. Grantor will be responsible for all costs and filings associated with this transfer, except that Grantee agrees to pay Grantor the sum of [redacted] within sixty (60) days of execution of this Agreement to account for those future costs.

9. Access Easement. In addition to and in connection with the exclusive license granted in accordance with Section 2, Grantor hereby grants and conveys to Grantee and its successors and assigns an exclusive easement for ingress to and egress from the Water Facilities (located on the Grantor Property), or to extend the Water Facilities as necessary for the Project Water Use, by means of existing roads and lanes, or otherwise by such route or routes as Grantee may construct.

10. Construction, Operation, and Maintenance of the Water Facilities.

    a. During the Term of this Agreement, Grantee agrees to be solely responsible for, the use, improvement, operation, maintenance, and the reasonable repair of the Water Facilities for the Project Water Use, except that Grantee shall have no obligation under this Section if (a) the Project is not constructed, or (b) if this Agreement terminates; or (c) the Water Facilities are (i) damaged by Grantor or a Grantor successor, agent, lessee, tenant, contractor or subcontractor, or (ii) used by Grantor or a Grantor successor, agent, lessee, tenant, contractor or subcontractor in breach of this Agreement, in which case Grantor is responsible for repair and maintenance costs.

    b. If the Well dries up or otherwise stops functioning, as determined by a licensed and bonded well constructor, during the Term, Grantee may notice Grantor of its intent to terminate the Agreement. Within sixty (60) days of such notice, Grantee shall pay Grantor any amount owed under Section 6, at which point this Agreement shall terminate and the Parties shall be relieved of their obligations under the Agreement.

11. Indemnification. Each Party ("Indemnifying Party") agrees to defend, indemnify and hold harmless the other Party and the other Party's officers, directors, employees, representatives, tenants, lessees, agents, contractors mortgagees and agents (collectively, "Indemnified Party") against any and all losses, damages, claims, expenses and liabilities for physical damage to real and personal property and for physical injury to any person, including, without limitation, reasonable attorneys' fees and all other legal expenses, to the extent resulting from or arising out of a breach of this Agreement by an Indemnifying Party. Grantor agrees to indemnify, defend and hold the Grantee harmless from and against any claim, suit, loss, damage, cost, expense, penalty or liability brought by any third party due to or arising out of this Agreement. This indemnification shall not apply to losses, damages, claims, expenses and liabilities to the extent caused by any negligent or intentional act or omission on the part of the Indemnified Party. This indemnification shall survive the expiration or termination of this Agreement. IN NO EVENT WILL EITHER PARTY BE LIABLE UNDER ANY CIRCUMSTANCES TO THE OTHER PARTY FOR SPECIAL, INDIRECT, PUNITIVE, INCIDENTAL, EXEMPLARY OR CONSEQUENTIAL DAMAGES OR LOSSES, INCLUDING LOST PROFITS, LOSS OF BUSINESS OPPORTUNITY OR OTHER SIMILAR DAMAGES RESULTING FROM OR ARISING OUT OF THIS AGREEMENT, BY STATUTE, IN TORT OR CONTRACT, UNDER ANY INDEMNITY PROVISION OR OTHERWISE.

12. Successors and Assigns. Grantee may freely assign its right to use water under this Agreement, its interest in Certificate 57620 (or subsequent certificates), and/or the easement granted under Section 9 of this Agreement to a third party. The terms, covenants, conditions and restrictions contained in this Agreement shall be enforceable and binding on each Party's assigns, successors, lessees, and purchasers.

13. General Terms.

a. Amendment

This Agreement may be amended only by written agreement by the Parties.

b. Governing Law; Waiver to Jury Trial

This Agreement and the rights of the parties hereunder shall be governed by and construed in accordance with the laws of the State of Oregon, exclusive of conflict or choice of law rules. Each of the Parties knowingly, voluntarily, and intentionally waives the right to a trial by jury in respect of any litigation based on this Agreement, or arising out of, under or in connection with this Agreement. Each of the Parties waives any right to consolidate any action in which a jury trial has been waiver with any other action in which a jury cannot or has not been waived.

c. Waiver.

Neither Party shall be deemed to have waived any provision of this Agreement or any remedy available to it unless such waiver is in writing and signed by the Party against whom the waiver would operate. Any waiver at any time by either Party of its rights with respect to any rights arising in connection with this Agreement shall not be deemed a waiver with respect to any other provision of the Agreement or any subsequent or other matter.

d. Relationship of the Parties.

This Agreement shall not be interpreted or construed to create an association, joint venture, fiduciary relationship or partnership between Grantor and Grantee or to impose any partnership obligation or liability or any trust or agency obligation or relationship upon either Party. Grantor and Grantee shall not have any right, power, or authority to enter into any agreement or undertaking for, or act on behalf of, or to act or be an agent or representative of, or to otherwise bind, the other Party.

e. Corporate Authority

Each Party hereby represents and warrants to the other that each individual executing this Agreement on its behalf is duly authorized to execute and deliver this Agreement on its behalf in accordance with its respective organizational governance documents, and that this Agreement is a legal, valid and binding obligation of such Party, enforceable against it in accordance with its terms.

f. Headings

The captions and paragraph headings used in this Agreement are inserted for convenience of reference only and are not intended to define, limit, or affect the interpretation or construction of any term or provision of this Agreement

g. Entire Agreement

This Agreement constitutes the entire understanding and agreement of the Parties to this Agreement with respect to its subject matter. All prior agreements, understandings, or representations, if any, with respect to this Agreement's subject matter are canceled in their entirety and are of no further force or effect.

[*signatures follow*]

IN WITNESS WHEREOF, the parties have caused this instrument to be executed the day and year first written above.

GRANTOR

R & A Scharf, LLC
an Oregon limited liability company

By: John Scharf
Name: John Scharf
Title: Manager

STATE OF Oregon)
)SS:
COUNTY OF Lincoln)

This instrument was acknowledged before me on November 20th, 2025 by John Scharf as Manager of R & A Scharf, LLC, an Oregon limited liability company.

OFFICIAL STAMP

EXHIBIT A

GRANTOR PROPERTY

Sherman County, Oregon

Parcel 1:

Tax ID Nos: 02N18E0000300, 02N18E0000500, 02N18E0000800 and 02N18E00001800

All of the above listed Tax ID Numbers share in one and the same legal description being described as follows:

The North Half of the Northeast Quarter (N2 NE4), Section 9, Township 2 North, Range 18 East

Lots 2, 3 and 4 and the Southwest Quarter of the Northeast Quarter (SW4 NE4); the South Half of the Northwest Quarter (S2 NW4) and the South Half (S2) of Section 4, all lying within Section 4, Township 2 North, Range 18 East of the Willamette Meridian, Sherman County, Oregon.

EXCEPT those tracts or parcels of land conveyed by James Fox and Emma Fox, husband and wife, Grantors to the United States of America by Deed dated June 8, 1962, recorded June 8, 1962 in book 36 at page 364, Deed Records, Sherman County, Oregon; FURTHER EXCEPTING those tracts or parcels of land conveyed by George L. Fox and Lucille H. Fox, husband and wife, by Deed dated June 27, 1962, recorded June 27, 1962 in Book 36, Page 405, Deed Records, Sherman County, Oregon, FURTHER EXCEPTING those tracts or parcels condemned and taken by the United States of America in that Judgment on the Declaration of Taking and Order for immediate Possession no. 63-380, said Judgment being recorded August 29, 1963 in Book 36 at Page 913, Deed Records, Sherman County, Oregon.

Parcel contains 18.00 acres, more or less (Tax ID No: 02N18E0000300), 11.10 acres, more or less (Tax ID No: 02N18E0000500), 432.29 acres, more or less (Tax ID No: 02N18E0000800) and 4.00 acres, more or less Tax ID No: 02N18E00001800), an aggregate of 465.39 acres, more or less

Leased portion of parcel contains 465.39 acres, more or less

Parcel 2:

Tax ID No: 02N18E00001600

The East Half (E2), Section 8, Township 2 North, Range 18 East

Parcel contains 320.00 acres, more or less

Leased portion of parcel contains 320.00 acres, more or less

Parcel 3:

Tax ID No: 02N18E00001700

The South Half of the Northeast Quarter (S2 NE4), the West Half (W2) and the Southeast Quarter (SE4), Section 9, Township 2 North, Range 18 East

All that part of the Northwest Quarter (NW4) which lies Southwesterly of a traverse line described as follows: beginning at a point North 53 00' 32" East 322.34 feet from the Northwest corner of said Section 10, thence South 51° 32' 31" East 1903.86 feet; thence South 41° 31' 20" East 600 feet to a point lying Easterly of the North-South center line of said section, which point lies North 51° 57' 49" East 3861.38 feet from the Southwest corner of said section, said point being the terminus of the herein described traverse line, Section 10, Township 2 North, Range 18 East

Parcel contains 658.40 acres, more or less

Leased portion of parcel contains 658.40 acres, more or less

Parcel 4:

Tax ID No: 02N18E00003800

The Northeast Quarter (NE4), Section 17, Township 2 North, Range 18 East

Parcel contains 160.00 acres, more or less

Leased portion of parcel contains 160.00 acres, more or less

Parcel 5:

Tax ID No: 02N18E00003900

The West Half (W2) and the Southeast Quarter (SE4) of Section, Section 17, Township 2 North, Range 18 East

EXCEPTING therefrom a strip 40 feet in width, being 20 feet on each side of the center line as described and set forth in that deed to Sherman County, Oregon recorded In Book U, Page 444, Deed records of Sherman County, Oregon.

Parcel contains 473.54 acres, more or less

Leased portion of parcel contains 473.54 acres, more or less

Parcel 6:

Tax ID No: 02N18E00004000

The South Half (S2), Section 18, Township 2 North, Range 18 East and the Northwest Quarter (NW4), Section 19, Township 2 North, Range 18 East

Parcel contains 494.80 acres, more or less

Less and except the approximately 226.45-acre portion of the above-described property as generally depicted below

Leased portion of parcel contains 268.35 acres, more or less

Parcel 7:

Tax ID No: 02N18E00002300

The South Half of the Southeast Quarter (S2 SE4), Section 10, Township 2 North, Range 18 East

ALSO, the South Half of the South Half (S2 S2), Section 11, Township 2 North, Range 18 East,

SAVING AND EXCEPTING THEREFROM the following:

That portion thereof described as Tract 1613 of the John Day Lock and Dam, heretofore conveyed to the United States of America, and particularly described as follows:

Tract 1613, All that portion of the Southeast Quarter (SE4) of Section 11, Township 2 North, Range 18 East, of the Willamette Meridian, Sherman County, State of Oregon, which lies Northeasterly of a traverse line described as follows: Beginning at a point lying Northerly of the North line of the said Southeast Quarter of the Southeast Quarter (SE4 SE4) of Section 11, which point lies North 32°50'51" West, a distance of 1800.21 feet from the Southeast corner of said Section 11; thence South 50°44'39" East a distance of 300.0 feet; thence South 70°53' 10" East a distance of 1100.0 feet to a point lying Easterly of the East line of said Section 11, which point lies North 17°03' 15" East, a distance of 1006.63 feet from the Southeast corner of said Section 11, and said point of being the point of terminus of the above described traverse line. The tract of land above described contains 2.25, acres more or less.

Parcel contains 237.75 acres, more or less

Leased portion of parcel contains 237.75 acres, more or less

Parcel 8:

Tax ID No: 02N18E00003300

The Southwest Quarter of the Southwest Quarter (SW4 SW4), Section 14, Township 2 North, Range 18 East

Parcel contains 40.00 acres, more or less

Leased portion of parcel contains 40.00 acres, more or less

Parcel 9:

Tax ID No: 02N18E00003100

The East Half of the Southeast Quarter (E2 SE4), Section 14, Township 2 North, Range 18 East

Parcel contains 80.00 acres, more or less

Leased portion of parcel contains 80.00 acres, more or less

Parcel 10:

Tax ID No: 02N18E0000900

Lots 1, 2 and 3 and the Southeast Quarter of the Northeast Quarter (SE4 NE4), Section 5, Township 2 North, Range 18 East

Parcel contains 176.85 acres, more or less

Leased portion of parcel contains 176.85 acres, more or less

Parcel 11:

Tax ID No: 02N18E0002900

The East Half of the East Half (E2 E2) of Section 24, Township 2 North, Range 18 East 18 East of the Willamette Meridian in Sherman County, Oregon.

ALSO, all those parts of Government Lots 2 and 8 on the westerly side of the John Day River and the Government Lots 3, 6, 7, 9, 10, 15 and 16 of Section 13, in Township 2 North, Range 18 East of the Willamette Meridian, in Sherman County, Oregon, SAVING AND EXCEPTING therefrom the following:

That portion thereof described as Tract No. 1614-1 of-the John Day Dam and Lock heretofore conveyed to the United States of America, and particularly described as follows:
Tract 1614-1, All that portion of Government Lots 1, 2, 7, 8, and 9 of Section 13, Township 2 North, Range 18 East of the Willamette Meridian, Sherman County, State of Oregon, which lies southwesterly of the center of the main channel of the John Day River and northeasterly of a traverse line described as follows: Beginning at a point lying northerly of the north line of said Section 13, which point lies North 81° 37' 15" East, a distance of 2179.13 feet from the Northwest corner of said Section 13; thence South 56° 52' 26" East, a distance of 704.50 feet; thence South 38° 16' 39" East, a distance of 4045.13 feet to a point lying easterly of the east line of said Section 13, which point lies South 58° 18' 16" East, a distance of 6172.29 feet from the Northwest corner of said Section 13, and said point being the point of terminus of the above described traverse line. The tract of land above described contains 28.46 acres, more or less, of which 2.96 acres lie below the ordinary high water line and within the John Day River.

Parcel contains 469.15 acres, more or less

Leased portion of parcel contains 469.15 acres, more or less

Parcel 12:

Tax ID No: 02N18E00004300

The Northeast Quarter (NE4), Section 19, Township 2 North, Range 18 East of the Willamette Meridian in Sherman County, Oregon.

LESS AND EXCEPT Parcel 1, Partition Plat No. 2007-01, recorded April 16, 2007 as Document No. 070145, Sherman County Plat Records. Situated in the Northeast Quarter (NE4) of Section 19, Township 2 North and Range 18 East of the Willamette Meridian, Sherman County, Oregon, being more particularly described as follows:

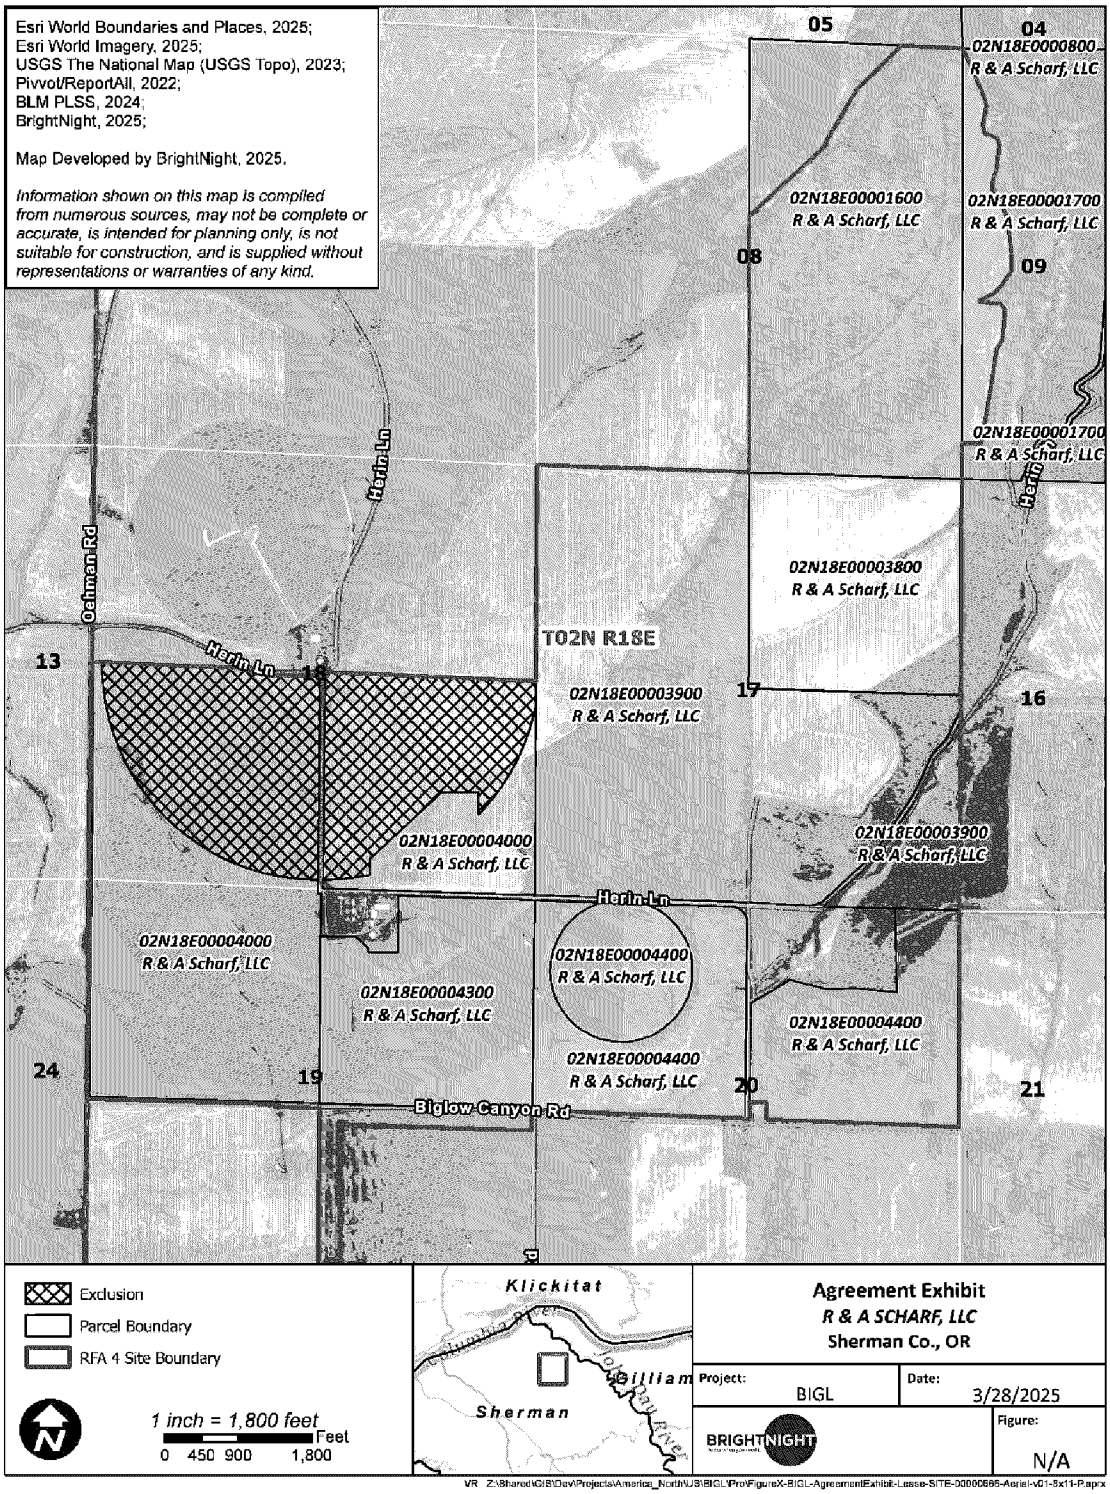
Beginning at a 5/8" iron rod with yellow plastic cap stamped "DEA INC" at a point of intersection of the west line of said Northeast Quarter (NE4) of Section 19 and the south right-of-way line of Herin Lane (County Road recorded in Bock "A", Pages 52-55, 90 Sherman County), said point of beginning being North 15° 46' 49" East 10875.00 feet from a ½" iron rod at the southeast corner of Section 25, Township 2 North and Range 17 East, Willamette Meridian: and running thence South 88° 34' 22" East tracing said south right of way line a distance of 942.39 feet; thence South 0° 00' 00" West leaving said south right of way line a distance of 687.45 feet; thence South 90° 00' 00" West 360.00 feet; thence North 00° 00' 00" East 37.56 feet; thence North 45° 00' 00" West 212.13 feet; thence South 90° 00' 00" West 277. 13 feet; thence North 00° 00' 00" East 246.82 feet; thence South 90° 00' 00" West 156.40 feet to said west line of the Northeast Quarter (NE4) of Section 19; thence North 0° 17' 48" East tracing said west line a distance of 276.54 feet to the point of beginning.

Bearings are based on the State Plane Coordinate system of 1983, Oregon North Zone.
Containing 12.000 acres, more or less.

Parcel contains 142.77 acres, more or less

Leased portion of parcel contains 142.77 acres, more or less

Parcel 13:



Tax ID No: 02N18E00004400

The North Half (N2), Section 20, Township 2 North, Range 18 East of the Willamette Meridian in Sherman County, Oregon; SAVE AND EXCEPT that certain tract conveyed to School District No. 1, Sherman County, Oregon by deed recorded in Book D, Page 173, Deed Records of Sherman County.

Parcel contains 309.90 acres, more or less

Leased portion of parcel contains 309.90 acres, more or less

The Premises contains 3,802.10 acres, more or less

Hey Chris,

On behalf of the PGE and BrightNight please see the attached comment letter on the Proposed Order for the record ahead of the hearing tomorrow. I've also attached an executed copy of the Scharf water use agreement for the record.

Best,

-

THE CONFEDERATED TRIBES OF THE WARM SPRINGS RESERVATION OF OREGON

BRANCH OF NATURAL RESOURCES
P.O. Box C, Warm Springs, Oregon 97761
Phone (541) 553-2001

January 15, 2026

Christopher Clark
Senior Siting Analyst
Oregon Department of Energy

Dear Mr. Clark,
I am writing on behalf of the Confederated Tribes of the Warm Springs Reservation of Oregon (CTWSRO) in my capacity as Tribal Historic Preservation Officer (THPO) regarding Request for Amendment 4 (RFA4) of the Site Certificate for the Biglow Canyon Wind Farm, and the Department's Proposed Order currently before the Energy Facility Siting Council.

CTWSRO acknowledges receipt of the Proposed Order and appreciates the opportunity to provide comments as part of the public hearing and comment process. The Project area is within the Tribes' ceded lands and an area of ongoing cultural, historical, and archaeological importance to the Confederated Tribes.

CTWSRO has participated in consultation related to the Biglow Solar components proposed under RFA4 and has reviewed the completed cultural resources survey prepared for the applicant. That survey identifies multiple archaeological sites and isolates within the Project footprint and includes clear recommendations intended to ensure compliance with applicable laws, Site Certificate conditions, and Tribal expectations for cultural resource protection.

At this time, CTWSRO wishes to formally flag a concern that recent communications from the applicant and its consultants suggest a narrowing of cultural resource compliance measures that does not appear to align with the recommendations documented in the survey or with the substance of consultation discussions. Specifically, the applicant has characterized archaeological monitoring as limited in scope and duration, focused on a single location, rather than implementing monitoring for all ground-disturbing activities occurring within proximity to recorded cultural resources, as recommended.

The survey also concludes that the current construction plan would result in an adverse effect to archaeological resources. CTWSRO is concerned that this determination, and the associated recommendations for monitoring, inadvertent discovery response, and Tribal involvement, are not being fully reflected in how the applicant is proposing to implement cultural resource protection measures as the Project moves toward construction.

CTWSRO respectfully requests that ODOE and the Energy Facility Siting Council ensure that the final order and conditions of approval clearly require implementation of the full suite of cultural

resource protection measures identified through survey and consultation, and that these measures not be reduced through subsequent project-level interpretation or contractor scoping decisions. Continued consultation with CTWSRO will be essential as construction planning advances. The Confederated Tribes of Warm Springs submit these comments to ensure the consultation record is accurately reflected and that cultural resource compliance for RFA4 remains consistent with Tribal recommendations, Site Certificate obligations, and applicable state and federal requirements.

Thank you for the opportunity to provide comments. Please do not hesitate to contact me if additional clarification or discussion would be helpful.

If you have any questions, please contact Lawrence Squiemphen III at (541) 553-2026 or email at lawrence.squiemphen@ctwsbnr.org.

Sincerely,

Lawrence Squiemphen III
Confederated Tribes of Warm Springs
Tribal Historic Preservation Officer

January 16, 2025
EFSC Chair Condon,

I woke up thinking about your question about the lease. I was thinking farm lease, equipment lease, etc. You meant our lease with PGE? Our lease was actually with Orion Energy, back in 2006. It's not a good lease for the landowner, but wind energy was new back then.

When everything started going wrong with the towers, we learned that PGE had not performed the warranty work on the pitch systems. Stymied and hitting dead ends with every PGE representative I spoke with, I contacted their CEO, Maria Pope. I thought she must not know about the Biglow towers leaking and being turned off at night and on windy days (the plant manager denied it, but we live under them).

She wrote me back and said: "Thank you for your recent emails. Please be assured that Brad Jenkins and the rest of our Biglow Canyon wind operations team have kept me fully informed about your concerns and related issues, and their responses to your prior communications reflect my understanding of our mutual responsibilities and rights – yours and PGE's – in our long-term relationship at the wind farm." She went on to say their arrangement with BPA was their business, and that multiple factors govern whether each turbine within a wind farm is the right resource at any given moment.

I have the whole letter, but I'm trying to get to your point about the lease. We finally engaged a lawyer in 2022, after the blade detached. We decided not to proceed because PGE is a very large company with many lawyers, and our only claim would be clean-up and trespass. (below)

Again, thank you for being on the EFSC council, engaging with us, and listening.

Sincerely,
Kathy and Kevin McCullough

I. PGE Easement – Default
PGE Easement section 7.5(a) includes the following language: "Should any Hazardous Materials (as defined in Applicable Environmental Laws) be discharged on the Property as a result of Grantee's operations and/or activities thereon in violation of such Applicable Environmental Laws, Grantee agrees to clean-up and remove the same, if required by Applicable Environmental Laws and in accordance therewith, at Grantee's sole cost and expense." A failure to clean-up and remove, and a failure to provide the landowner with satisfactory evidence of such clean-up is a default of the PGE Easement Agreement.

J. Private Nuisance
A private nuisance is an invasion of an individual's interest in the use and enjoyment of land. Liability may arise from intentional, negligent, or reckless act or from the operation of an abnormally dangerous activity.[17] The landowners may argue that falling sheet metal and leaking oil adversely affect the use of their land. Because turbine oil is detrimental to crop production and falling sheet metal is detrimental to human health, a nuisance claim seems likely to prevail. Trespass and nuisance claims can be asserted in the same legal action to better ensure at least one theory of recovery will apply to the facts. If the court finds a nuisance or trespass has occurred, the court can issue a permanent injunction requiring the party committing the nuisance to abate it or to prevent a future trespass, which in this case will be through requiring PGE to repair and maintain the turbines.[18]

I am writing you concerning the NOI for the Speedway Energy facility proposed for Sherman County Oregon.

I am a 4th-generation farmer/rancher in Sherman and Wasco Counties, working with my son, who is the 5th generation. Our ranch is in direct proximity to or borders portions of the Bakeoven approved solar (1,270 ac), Daybreak approved solar (1817ac), Sunset approved solar (1817ac), and Yellow Rosebush under review solar (8075ac). We also border the Buckley under-review solar project (7852ac) and the Speedway NOI solar project (14000ac solar with wind, totaling 25000ac).

In addition to these solar projects, Avangrid is leasing property extending east from the Speedway project to the John Day River to develop another solar project, which could easily match the Speedway project in size. Keep in mind the acreage listed above is only the acres to be covered with actual solar panels. The total acres included in these projects and removed from agricultural production are estimated to be greater than 100,000 acres of F-1, exclusive farm use acres, and do not include proposed solar projects in the north end of Sherman County, such as the Biglow solar project. Please keep in mind the total effect of all of these projects combined will have on wildlife, wildfire, the agriculture community, and supporting Ag industries. The precedent set on these individual projects will have far-reaching and permanent consequences.

If all of these projects are allowed to continue to move forward unchecked, I fear a collapse of the ag sector in Sherman County and possibly beyond. Sherman County has always been referred to as “the land of wheat,” grown from river to river. Some on your EFSC council and our CREA group (Community Renewable Energy Association) have been quoted as saying that we “produce low-quality wheat that is undesirable.” As a past president of the Oregon Wheat Growers League (OWGL), I can testify that is completely false and would enjoy a public debate with those members. World wheat consumption has exceeded production five out of the last 6 years.

The United States loses 4.3 acres of farmland every minute (USDA DATA), of which much of this is highly productive land. We also continue to lose irrigated acres to loss of water availability through water rights litigation. These Sherman County acres are “dryland” acres, non-irrigated, and don’t use river or groundwater or electricity to produce.

The U.S. is experiencing an extreme shortage of beef production, much of which is caused by state and Federal regulations removing cattle from public as well as private lands. Many of the acres in these projects are range land used for cattle ranching.

As a 5th-generation farm and ranching operation, we are extremely concerned about the viability of our operation should these projects be approved. The loss of this many acres to solar will make it very difficult for local agricultural businesses to survive. We will lose these businesses and their labor force while increasing the cost to those of us remaining in agricultural production.

We have continued to see a decline in mule deer in this region, and fencing off tens of thousands of acres will only accelerate this decline. It will also divert the remaining population of deer, elk, and antelope to the remaining farm and range land, thus damaging crops and range.

According to the U.S. Forest Service (USFS), Sherman County’s risk of wildfires is higher than 98% of counties in the entire United States (wildfirerisk.org). Brookfield claims it can control wildfires on its projects. As a 66-year-old Sherman County native and volunteer firefighter, I will tell you that it is absolutely false.

First of all, once these wildfires are started, typically by dry lightning, they are extinguished by the local farming community and volunteer fire districts using millions of dollars of large-scale farm tillage and industrial equipment, all donated by farmers. Where terrain allows, these fires are stopped by creating fire breaks with tillage equipment or bulldozers and starting backfires. Where terrain prohibits these practices, volunteer foot crews descend into the canyons to extinguish the flames, often at night when winds are light and humidity is up.

Once these solar sites are fenced off, both of these mechanical options will be off the table. The toxic fumes emitted from a burning solar site will prohibit entry and may well prohibit ground crews from engaging the fires downwind. The potential for these fires to grow exponentially is real. The historic Oregon Substation fire that burned from The Dalles, Oregon, across Wasco and Sherman Counties, burning thousands of acres in a matter of hours and taking human life along the way, will not be the last. This entire area is composed of large, deep canyons, and only foot crews and aerial support can combat the fires. I recently served, at Governor Kotek’s pleasure, on the Oregon Wildfire Funding Committee to help come up with new funding mechanisms to fund a shortfall in an ever-increasing firefighting budget. These solar sites will only increase the need for state resources to fight fires once controlled by local funds and

volunteers.

This area is 100% exclusive farm use, and we have historically been able to extinguish fires relatively fast, thus preventing large losses. I carry liability insurance to cover the risk that our farm machinery might accidentally start a fire and spread to neighboring property. If these solar sites are permitted, the potential for catastrophic losses is very probable and real. I cannot afford a policy to cover such exposure. Brookfield has publicly stated that we can't be sued for accidental fires. From past experience, I know this to be absolutely false. They have refused to agree to a hold harmless agreement for historic and ordinary agricultural operations. This refusal tells me that they and/or their insurance companies fully intend to recoup losses any way they can.

These energy companies are being allowed by the Oregon State administration to intrude into an exclusive agricultural-use community, ignore all land-use policies, and extensively change the long-held practices of that area. The Agricultural community needs protection at the state level to safeguard our right to farm and prevent undue hardship from extreme liability exposure. These solar sites will be worth billions of dollars.

Because of the current wildfire risk, our fire insurance has increased substantially to the point that some companies won't even quote a policy for this area anymore. If these solar projects are eventually built, this will only increase the risk level, insurance rates, and insurability.

I find it extremely frustrating that Green Energy companies are being subsidized and given state and federal tax breaks, through enterprise zones, and state and county property tax relief through SIP agreements. These same SIP agreements prohibit reductions in local tax rates. So while we subsidize the energy companies, which are mostly foreign-owned, with our tax dollars, long-standing residents and businesses keep paying more. Everyone involved in these green energy projects is getting extremely rich. Currently, solar companies are paying 10 to 20 times the current rental rates for these farm and ranch acres. They are driving long-standing renters out of their leases and out of business.

I recently flew over Hawaii and noticed that most residential and commercial rooftops and parking lots were covered with solar panels, while very few areas were covered with solar farms. Oregon has plenty of public and private options that don't pose such a high risk and destroy farmland.

I urge you to deny the construction of any proposed solar facility based on its adverse effects on the area's cultural, historic, and scenic values. I further urge you to deny based on the extreme wildfire risk, risk to wildlife, and the devastating economic effects this will have on the current and long-standing "Ag Use" community. If you allow this to continue, it will destroy Sherman County, "The Land of Wheat," forever.

Alan von Borstel

Sent from my iPad

Sherman County Court,

We had two meetings this week, one for Speedway (Brookfield) and one for Biglow (PGE/BrightNight). I believe Joan and Justin were at both, and I appreciated Joan's comments after the Biglow meeting. Thank you for listening! Joe is no longe answering me, so I don't know how he feels about these projects.

The Biglow Project was the first and final meeting, as PGE is piggybacking on its 2006 wind site certificate. They should not be allowed to do this, since wind is an entirely different animal from Solar. No wildlife studies were done (except for birds and bats), and honestly, Tetra Tech provided **2200 pages of information** to read, which PGE and Brookfield are both using to supply us with cut-and-paste information that's too lengthy to plow through. I read as much as I could, and was disheartened by the references to "climate normal" temperature algorithms that claim our temperatures are in the 80s.

I want to address the lies we were told by developers and some speakers.

First of all, Alan von Borstel made very convincing points in Grass Valley at the Speedway meeting. Regarding the 81,000 acres signed up for solar, Brookfield Energy admitted it was using 14,000 of the 25,000 acres. That is a lot of grazing land and fire to fight, especially with the mitigation stating a 12" height for grass under and around solar panels and batteries. They still seem to think we have paid fire departments and just need a few more fire trucks. They will be providing in-person and online training for us! ***What? We will not be fighting their solar fires. They need staff on site during fire season, 24/7, like they have had to do in Gilliam County.***

Oh, and they won't sue us. *Alan said no, but your insurance company will. We can't handle that kind of liability.* And no one will give us a hold harmless clause for farming. Here is the public comment Alan submitted. You can go to the ODOE site and read the rest.

Siting Docket · Customer Self-ServiceSiting Docket · Customer Self-Service

They also claimed that BPA had given them access to the powerlines and that they would be done by 2029. ***What?*** **Another lie?**

Then, at the Biglow EFSC meeting, Ormand Hilderbrand even claimed, "The developer has engaged seriously with the permitting process and has demonstrated a willingness to address environmental considerations." He knows them because he is in CREA. Well, BrightNight has not been great to work with. Contact us, and we will provide a list of promises made and broken. Mr. Hilderbrand also said the land will be better when it comes out of solar in 50 or 60 years. ***How does he know?*** I have data to the contrary, but actually, no one knows. So, more lies.

Meanwhile, we live under Biglow and have seen the horrible job they have done. Four years after the blade dropped, 40-50 towers are still broken every day out of 217. Actually, they are too dangerous to run, so I'm glad they are shut down. It took them 9 months to build Phase 1 in 2007, and it is going to take 4 years to fix it? On top of the four years we have already waited since the blade dropped. Why will solar be any different? They need to get the Phase One Vestas towers running and show 96% power produced before they can build solar.

We really could have used some support from the courts and some truth from our taxpayer lobbying dollars that go to CREA. Balance. Both sides, please.

Finally, we are tired of watching our taxes go up year after year. Either renegotiate the SIPs or stop granting them.

2:31:51 & 3:36:44 for McCullough's part. 2:47:34 for Ormand's. 3:11:18 for Amanda Whitman. (BTW, she has not been contacted in the Conservation Office.) I also highlighted them in the EFSC meeting transcript below.

Chad Higgins also had to weigh in and tell us how great agrivoltaics were in The Valley! Oh, and at 2:18:44, there was a discussion about grasses and how some will stay green year-round (!) and provide a fire break!

These people are delusional. Colt supports (as we do)the ODOE recommendation of 1- 3" maximum during fire season. That we can live with, if it is written into the Site Certificate. But the mechanical failures were in the 2008 Amended Site Certificate, and PGE was never held accountable. In fact, PGE repeatedly stated that they had never had any violations or citations on Biglow! **Because you never reported anything!!!! Their feet were not held to the fire.**

Honestly, the EFSC counsel listened and even called us back up. The EFSC counsel members on ZOOM even questioned whether they had the power to stop Biglow Solar! We are hopeful. However, we could have used some support from the County Court, rather than grandstanding by a CREA representative who is a developer who wants solar on his property.

Sincerely,

Kathy & Kevin McCullough

I am writing you concerning the NOI for the Speedway Energy facility proposed for Sherman County Oregon.

I am a 4th-generation farmer/rancher in Sherman and Wasco Counties, working with my son, who is the 5th generation. Our ranch is in direct proximity to or borders portions of the Bakeoven approved solar (1,270 ac), Daybreak approved solar (1817ac), Sunset approved solar (1817ac), and Yellow Rosebush under review solar (8075ac). We also border the Buckley under-review solar project (7852ac) and the Speedway NOI solar project (14000ac solar with wind, totaling 25000ac).

In addition to these solar projects, Avangrid is leasing property extending east from the Speedway project to the John Day River to develop another solar project, which could easily match the Speedway project in size. Keep in mind the acreage listed above is only the acres to be covered with actual solar panels. The total acres included in these projects and removed from agricultural production are estimated to be greater than 100,000 acres of F-1, exclusive farm use acres, and do not include proposed solar projects in the north end of Sherman County, such as the Biglow solar project. Please keep in mind the total effect of all of these projects combined will have on wildlife, wildfire, the agriculture community, and supporting Ag industries. The precedent set on these individual projects will have far-reaching and permanent consequences.

If all of these projects are allowed to continue to move forward unchecked, I fear a collapse of the ag sector in Sherman County and possibly beyond. Sherman County has always been referred to as “the land of wheat,” grown from river to river. Some on your EFSC council and our CREA group (Community Renewable Energy Association) have been quoted as saying that we “produce low-quality wheat that is undesirable.” As a past president of the Oregon Wheat Growers League (OWGL), I can testify that is completely false and would enjoy a public debate with those members. World wheat consumption has exceeded production five out of the last 6 years.

The United States loses 4.3 acres of farmland every minute (USDA DATA), of which much of this is highly productive land. We also continue to lose irrigated acres to loss of water availability through water rights litigation. These Sherman County acres are “dryland” acres, non-irrigated, and don’t use river or groundwater or electricity to produce.

The U.S. is experiencing an extreme shortage of beef production, much of which is caused by state and Federal regulations removing cattle from public as well as private lands. Many of the acres in these projects are range land used for cattle ranching.

As a 5th-generation farm and ranching operation, we are extremely concerned about the viability of our operation should these projects be approved. The loss of this many acres to solar will make it very difficult for local agricultural businesses to survive. We will lose these businesses and their labor force while increasing the cost to those of us remaining in agricultural production.

We have continued to see a decline in mule deer in this region, and fencing off tens of thousands of acres will only accelerate this decline. It will also divert the remaining population of deer, elk, and antelope to the remaining farm and range land, thus damaging crops and range.

According to the U.S. Forest Service (USFS), Sherman County’s risk of wildfires is higher than 98% of counties in the entire United States (wildfirerisk.org). Brookfield claims it can control wildfires on its projects. As a 66-year-old Sherman County native and volunteer firefighter, I will tell you that it is absolutely false.

First of all, once these wildfires are started, typically by dry lightning, they are extinguished by the local farming community and volunteer fire districts using millions of dollars of large-scale farm tillage and industrial equipment, all donated by farmers. Where terrain allows, these fires are stopped by creating fire breaks with tillage equipment or bulldozers and starting backfires. Where terrain prohibits these practices, volunteer foot crews descend into the canyons to extinguish the flames, often at night when winds are light and humidity is up.

Once these solar sites are fenced off, both of these mechanical options will be off the table. The toxic fumes emitted from a burning solar site will prohibit entry and may well prohibit ground crews from engaging the fires downwind. The potential for these fires to grow exponentially is real. The historic Oregon Substation fire that burned from The Dalles, Oregon, across Wasco and Sherman Counties, burning thousands of acres in a matter of hours and taking human life along the way, will not be the last. This entire area is composed of large, deep canyons, and only foot crews and aerial support can combat the fires. I recently served, at Governor Kotek’s pleasure, on the Oregon Wildfire Funding Committee to help come up with new funding mechanisms to fund a shortfall in an ever-increasing firefighting budget. These solar sites will only increase the need for state resources to fight fires once controlled by local funds and

volunteers.

This area is 100% exclusive farm use, and we have historically been able to extinguish fires relatively fast, thus preventing large losses. I carry liability insurance to cover the risk that our farm machinery might accidentally start a fire and spread to neighboring property. If these solar sites are permitted, the potential for catastrophic losses is very probable and real. I cannot afford a policy to cover such exposure. Brookfield has publicly stated that we can't be sued for accidental fires. From past experience, I know this to be absolutely false. They have refused to agree to a hold harmless agreement for historic and ordinary agricultural operations. This refusal tells me that they and/or their insurance companies fully intend to recoup losses any way they can.

These energy companies are being allowed by the Oregon State administration to intrude into an exclusive agricultural-use community, ignore all land-use policies, and extensively change the long-held practices of that area. The Agricultural community needs protection at the state level to safeguard our right to farm and prevent undue hardship from extreme liability exposure. These solar sites will be worth billions of dollars.

Because of the current wildfire risk, our fire insurance has increased substantially to the point that some companies won't even quote a policy for this area anymore. If these solar projects are eventually built, this will only increase the risk level, insurance rates, and insurability.

I find it extremely frustrating that Green Energy companies are being subsidized and given state and federal tax breaks, through enterprise zones, and state and county property tax relief through SIP agreements. These same SIP agreements prohibit reductions in local tax rates. So while we subsidize the energy companies, which are mostly foreign-owned, with our tax dollars, long-standing residents and businesses keep paying more. Everyone involved in these green energy projects is getting extremely rich. Currently, solar companies are paying 10 to 20 times the current rental rates for these farm and ranch acres. They are driving long-standing renters out of their leases and out of business.

I recently flew over Hawaii and noticed that most residential and commercial rooftops and parking lots were covered with solar panels, while very few areas were covered with solar farms. Oregon has plenty of public and private options that don't pose such a high risk and destroy farmland.

I urge you to deny the construction of any proposed solar facility based on its adverse effects on the area's cultural, historic, and scenic values. I further urge you to deny based on the extreme wildfire risk, risk to wildlife, and the devastating economic effects this will have on the current and long-standing "Ag Use" community. If you allow this to continue, it will destroy Sherman County, "The Land of Wheat," forever.

0:00
Ready to go.
0:17
Good evening and welcome. I'm Cindy Condan. The time is now 3:32. I would
0:23
like to call the January 15, 2026 meeting of the Energy Facility Sighting Council to order. Mr. Secretary, please
0:31
call the role. Cindy Condan here. Marcy Grail
0:36
here. Kent How here. Richard Develin.
0:49
Richard Delin. Do we know if council member Develin is
0:54
on?
1:00
Hello. Okay. Anyone hear me? Yep. Yeah. Yes, we can hear you. Thank you. Council
1:05
member Delin and Patty Perry here if you can hear me.
1:12
We can. Thank you. Uh Chair Condan, you have a quorum. Thank you, Mr. Secretary. Are there any
1:17
agenda modifications? Chair condan, there are no agenda modifications at this time.
1:23
So, we'll just get a little bit a little bit closer. A little bit closer. How's this? Yep.
1:28
Good. I have the following announcements for council members and anyone addressing the council. Please remember
1:35
to state your name clearly and please do not use the speaker phone feature as it
1:40
will create feedback. Please mute your phones and if you are joining us by phone and receive a phone call, please
1:47
hang out from this call and dial back if after finishing uh in after finishing
1:53
your other call. For those signed in onto the webinar, please do not broadcast your webcam. For agenda item
2:00
C, public comment period, and agenda item F, the Big Low Canyon Amendment for
2:05
public hearing, there are three ways to let us know you are interested in providing comments to the council.
2:12

One, for those in person, please fill out a registration card and submit to Nancy Hatch, who is our administrator.
2:20
Um, two, for those using the WebEx, you will need to use the raise your hand
2:25
feature. Three, for those on the phone only, you will need to press star three,
2:31
which will alert us that you want to speak, and Nancy Patch will unmute you
2:37
as necessary. We will go over these options again during that agenda item.
2:42
If you want to receive future email notifications of council meetings, project milestones or rulemakings
2:49
through our click dimensions program, you can do so by clicking on the link in the agenda or on the council web page.
2:56
Look for the green box on the right hand side of the page that says sign up for emails updates. You are also welcome to
3:04
access the online project mapping tool and any documents by visiting our website. Please note that the audio and
3:11
video of this meeting is being recorded and may be posted to the council's website following the meeting. Energy
3:18
facility sighting council meetings shall be conducted in a respectful and courteous manner where everyone is
3:24
allowed to state their positions at the appropriate times consistent with council rules and procedures. Willful,
3:31
accusatory, offensive, insulting, threatening, insolent, or slanderous comments which disrupt the council
3:38
meeting are not acceptable. Pursuant to Oregon Administrative Rule 345-011-0080,
3:46
any person who engages in unacceptable conduct which disrupts the meeting may
3:51
be expelled. So, first on our agenda is um the
3:57
consent calendar and this is an action item approval of the November 21st, 2025
4:03
meeting minutes. Chair Condan. Yes. Councelor How?
4:09
I move that the council approve the minutes of the November 21, 2025 meeting

4:15
as presented and recommended by staff. Do we have a second online?
4:22
Chair Con and this is Marcy. I second that motion. Thank you, Councelor Gra.
4:29
Madame Chair. Yes. I was not present for this meeting, so I'll be abstaining.
4:36
Thank you, Councelor Develin. Mr. Secretary, you please call the role
4:41
or further vote. Ken Hal, yes.
4:46
Patty Perry, yes. Cindy Condan, yes.
4:52
Marcy Grail, yes.
5:00
Motion carries, Chair Condan. Thank you, counselors. And now for the council secretary report.
5:05
Thank you, Chair Con. Give me one second.
5:16
Uh I'm going to first start with project updates. Um so the first project update
5:21
is the Wellsprings project. So we received the notice of intent for that
5:27
project on January 2nd. Uh the project would be a 750 megawatt solar PV project
5:35
with 500 megawatts of battery storage on approximately 7,365
5:42
acres or 11 square miles. The project location is in Mororrow County, approximately 5 miles northwest
5:49
of the town of Ion. The parent company is Emanate and that's capital M, capital
5:56
N, and then the number eight uh energy development company LLC. Um
6:04
the department's project web page will be live tomorrow. This is a fairly new project. So um project page will be up
6:10
tomorrow. Uh and we anticipate sending the public notice uh of the receipt of
6:16
the notice of intent uh and a comment period by next week as well. That is also a reminder for uh at least state
6:24
employees that Monday is the Martin Luther King Jr. holiday. So we won't be working on Monday, but um we will try to
6:30
get to it after that. This is K. Did you say that was Mororrow

6:35
County? Yeah, that's in Mororrow County. So I mean generally I mean if you can kind of picture where the Borman bombing range
6:41
is. Yeah. And so if you go kind of south of the Borman bombing range kind of south and to the west of it. Um so it's you I
6:48
described it as sort of 5 miles northwest of Ion and that's correct but it's also kind of southwest of the
6:54
Borbin bombing range bill. Thank you. The uh next update is the Sunstone solar
7:03
project. So at the November council meeting, there was a discussion regarding the parent company of the
7:08
Stonestone Solar Project going into bankruptcy. So they were planning on submitting an amendment to split the
7:14
site certificate. They withdrew that. Uh and there was some conversation um that we had kind of uh they explaining kind
7:20
of all of that. Um so as a reminder what that project is, it was approved by council in November of 2024.
7:28
uh includes 1,200 megawws of solar, 1,200 megawatts of battery storage and
7:33
it would be on approximately 9,442 acres or 14.75 square miles. Um that's
7:41
also in Mororrow County. Um on Tuesday, I sent council members an article that
7:48
Amazon won the bid to purchase the facility, although I just found out that I think you need a a login to be able to
7:54
access that. So, my apology. We we'll follow up with that with the the uh the
8:00
information from the article and we'll just copy and paste that and put it into a email so you can see that. But I mean
8:06
again uh Amazon won the bid for that and they are now um I well I don't know if
8:11
now they're the owner but they are essentially going to become the owner. Um but as we discussed at November the
8:17
November meeting just as a reminder um the Sunstone can sell it to them and
8:23
Amazon can buy it but until Amazon comes in and requests and receives approval

8:29
for a site certificate transfer amendment they can't do anything with the project. So again a site certificate
8:36
is functionally a business contract between the state of Oregon FSAC on behalf of the state of Oregon and the
8:42
developer. We currently do not have any business relationship with Amazon for this project. That will have to be
8:48
established first before they can move forward on doing anything related to the site certificate.
8:56
Um, next project is the saddle but energy facility. So, at the December council meeting, I let you know that we
9:02
have received the notice of intent for that project. This would be a 488 megawatt uh wind energy project
9:09
consisting of up to 70 wind turbines uh each up to 698 ft tall. I'll say that
9:16
again. 698 ft tall. Uh there would also be 4 488 megawatts of battery storage.
9:25
The project location is in Gillum County approximately 6 milesi southwest of the city of Arlington. Uh the parent company
9:32
is Brookfield Renewables. they own the Shepherd's Flats facilities.
9:37
Uh so it's kind of in in range geographic range of th of those facilities. Um since the December
9:44
meeting, we have set up a project page. It's available. Uh we've provided public notice and then um we held a public
9:51
information meeting in Condan on Tuesday. Uh and the public comment period on the notice of intent concludes
9:57
on January 30th. Next is the Speedway Energy Facility. So
10:05
like the Saddlebut Energy Facility, at the December council meeting, I let you know that we received the notice of intent for that project. That would be a
10:13
1,400 megawatt solar, PB, and wind project and including 500 megawatts of
10:18
battery storage. The project is located generally southeast and northeast of exactly where
10:25
we're at right now. So, if you look, you know, kind of in these directions of this building, it would be all around

10:31
this building. Maybe not on that side, but but all around where we're exactly at right now. Um, the parent company
10:39
also is Brookfield Renewable, same as the Saddlebut Energy Facility.
10:45
And, uh, we had a public uh, so yeah, we had a public information meeting in this
10:51
room last night. Uh and the notice of intent concludes on January 23rd. So
10:58
this has been a bit of a busy week in terms of meetings and hearings and getting on the road.
11:05
Uh next is the Yellow Rose Bush uh facility. So the Yellow Rosebush energy
11:11
facility. So this would be 800 megawatts of solar PV, 800 megawatts of battery
11:16
storage on approximately 8,000 acres, about 12 square miles. The project
11:22
location is in Wasco and Sherman counties east of the city of Mppen. The developer of Savon LLC, which is a
11:29
division of the Royal Dutch Shell Company. At the November meeting, the council reviewed the draft proposed
11:34
order and all comments that were made uh or that were received and provided direction to staff to make changes in
11:40
the proposed order uh which we did. And uh we issued the proposed order uh and
11:46
included also a notice of opportunity to request to participate in the contested case. That's a mouthful, but I think it
11:52
bears clarifying. Frequently, people say they've asked for a contested case.
11:58
There is a contested case with every application. It is an automatic step in the process. The distinction is if
12:04
anybody requests to participate in it. Um, and we did have two requests to
12:09
participate in the contested case. So, at this point, um, that has gone to the,
12:16
uh, you know, we contract with the office of administrative hearings. they provide a uh a contested case uh or a
12:24
hearing officer uh for us for that and that hearing officer uh will be the one
12:30

that's evaluating those requests for contested case to make sure that they uh justify participation. And so we if
12:38
there wasn't any requests for participation in the contested case, we would have had the council's review of the final decision tonight. Um but that
12:46
will take some time. So, we'll keep you up to date on that and that will certainly be updated in my secretary
12:52
report as well as in the monthly sighting report. Uh, next is the leaning juniper 2A uh
13:00
amendment determination. So on December 21st, the department issued its
13:05
determination. Uh we received a request uh for an amendment determination uh and
13:10
that was that um
13:17
yeah their their request was that they wouldn't have to go through the amendment process. So the changes that they were proposing wouldn't trigger an
13:23
amendment. No. Um and the changes proposed uh included uh a tax equity sale lease
13:31
back transaction with certificate holder and a national financial institution
13:36
under which um that institution would acquire the legal title to certain
13:41
facility equipment as personal property and simultaneously lease that equipment back to the certificate holder under a
13:47
long-term lease. So the department's determination uh was based on an evaluation of Oregon administrative rule
13:54
345 division 27 0350
14:00
and those are the factors where uh an amendment is required and none of those
14:05
factors triggered. We've had this kind of request previously I believe one time and and made the same determination. Um,
14:12
however, because this is a determination, you know, that an amendment is not required, council has
14:18
the opportunity to request that that be brought forth to council as an agenda
14:24
item where you would review it and you could then come to your own conclusion whether you agree or disagree uh with

14:30
that determination.
14:36
Just raised my hand myself. Um, thank you, Secretary Cornet. question about
14:41
that and I am not sure um
14:47
about the review necessary but this is the second time we've had
14:54
something similar come up and I'd like to make sure uh we understand what it as
15:00
these get more complicated in terms of the structure um that we understand kind of the full
15:08
um responsibility associated with it and how it plays out
15:14
over time. I mean, I understand the words that you're using, but I'm not
15:19
sure what it means to us versus what it means to the company itself. So I'm wondering if there's an opportunity to
15:25
do it, not necessarily to review the decision of uh the department, but to
15:31
really understand why the decision was made or how the decision was made uh based on your
15:39
understanding of the risks associated or long-term long-term process for it.
15:44
I hope that makes sense. Yeah, I mean this is something either again this particular one it's totally
15:50
within council's authority to say we want to take a look at this ourselves. Um we want to take a you know review it
15:56
and we would then put it on a future council meeting and then we would provide you know our analysis well their request their analysis our request or
16:04
our determination our analysis to you and you could come up to your own conclusions and and certainly ask us
16:10
more more questions and then the certificate holder more questions about it as well. That's an opportunity. You
16:16
know, you know, we've looked at it. We don't believe that it triggers an amendment as those um rules kind of
16:23
require right now. This is also the second time I believe I'm going to look at Sarah. Yeah, second time that we've
16:28

seen this. We don't know if there's going to be a pattern or not. So, this could also be, you know, outside of this
16:34
specific action. Um this could be determination. I won't say action, I'll
16:40
say determination. Um, we could do this in the future as an information item
16:45
where we explore this sort of outside the context of a request. Um, it's hard to do head nods in the
16:51
room, you know, about whether we we want to do it or not. I know I would like at least anformational
16:57
uh session on it, especially as we're looking at organizational expertise
17:02
uh standard and financial assurance standard. Uh to me that all fits together.
17:09
Councelor How any Secretary Kernet you said you bring it
17:15
to us once you've made your determination. That's what I'm doing now. So the the way the amendment determination process
17:20
works is you know and and a a site certificate holder is not obligated to use this process. It's to their benefit.
17:28
They could make some choice, put it in their annual report and include that as a sort of a facility modification. We
17:35
would then review that and then the risk is that if we determine, oh, that should have been an amendment, well, they've
17:41
already made these changes, they then are forced to come back in. So, it's to their benefit that they, you know,
17:47
frequently choose this method, which is to get some, you know, validation, you
17:53
know, kind of officially that, you know, an amendment is not required. And so, you know, what they do is they they make
17:59
their case. They say, here's the requirements of when an amendment is required. this is what we're proposing.
18:05
You know, presumably they're going to say, "We don't believe this triggers these things." We then review that
18:10

ourselves. And then the requirement is at the next council meeting after we make our determination, I provide this
18:18
update to you. And then again, your ability is to either say, "Yeah, that
18:23
that sounds great." Or if you're like, "We really want to take a look at this ourselves and we want to do the
18:29
evaluation of all of that information." That's absolutely within your authority.
18:36
I myself am fine with the staff evaluation as
18:41
this is Marcy um and I agree with uh council member how I'm fine with the
18:48
staff evaluation as well. And just uh to clarify I'm fine with the
18:56
decision. It's the information that I'm anformational item that I'm asking about
19:04
um not necessarily related to that this project, but how these these structures
19:10
they're different um and how they how they work in a project for both the
19:17
developer and uh the state. So yeah, I mean we could absolutely put
19:24
it on the list for a future council meeting if you want to do it as a as an information item. Yeah, as an information item that
19:31
doesn't hold this uh then that sounds fine to me. Sure. Sorry. Nancy, we turn the heat
19:36
down a little bit. It's starting to get warm right here in here. Councelor Develin or Perry, any any
19:44
thoughts? Yes. Thank you, Chair Condan. I I would be interested
19:53
as you are with the information making it anformational item
20:00
on one of our agendas to just understand a little bit more about that process. I
20:07
totally agree with um you know allowing the
20:13
staff to be able to make those um or the re reviewing body
20:22
uh review uh those requests as appropriate and um I I would just like
20:30
to know how they do that. Councelor Develin,
20:37

I would actually concur with those statements. I would be fine with having a presentation about the process, but I
20:43
mean ultimately uh the process I think should stay at the staff level to make that determination.
20:51
So, so sorry for for the record, Todd Cornet, just for clarification. My understanding was not the amendment determination process and how that
20:57
works, but it was more specifically this specific type of request. Yes.
21:03
The sale lease back. Yes. Yes. Okay. Good.
21:08
Which was the previous one as well with the sale on lease back. So yeah,
21:13
I think we're all in agreement. We'll make a note of that. Nancy, can you put in note of that for a future agenda item? Thank you.
21:22
Okay. Moving on to compliance updates. So um you know as I've indicated before
21:29
the way that the annual reports work is the um so for in this case the 2024
21:35
annual reports every certificate holder has to submit a report annually. The ones that they did for the calendar year
21:41
2024 were have to be submitted most of them by the end of April 2025. So then
21:47
that gives us the you know the time to start working and reviewing those. We're getting to the end of those reviews.
21:53
Didn't quite finish. We've done all of the initial reviews. Uh we've requested
21:58
some additional information from some of the certificate holders um to provide additional information to clarify that
22:04
they meet conditions. We're still waiting to hear some from some back, but we're getting close to concluding those
22:09
which which is great. Having more staff resources is hugely beneficial. Um but I
22:15
do have two quick updates uh on uh two of the Shepherd's Flats facilities.
22:21
So, the Shepherd's Flat Central u again we kind of talked about that Brookfield uh in Gillum County just to the south of
22:31
Arlington. That's a 265 megawatt facility. Uh it's been in operation
22:36

since 2012. And uh with regards to their meeting
22:42
their conditions, I provided an update on uh Shephardd's Plat Central last
22:48
council meeting. It's really these are the same things. There have been sort of persistent issues with weed control and
22:54
reveation management uh since construction or reconstruction of the
22:59
well initial construction of the process or the project and then also following
23:04
the 2019 repower. So they know that we know that they're working on it. We're
23:09
you know being clear with them. So we're looking for more information. Um yes, thank you. I meant to say turn it on
23:17
there. Um, and yeah, that won't be concluded until 2026. Um, it's just, you
23:23
know, we're I know we're in 2026 now, but it'll take a while because there's some pretty significant, you know, sort
23:28
of detailed information has to be evaluated and provided. So, but as I said, they're diligently working on it.
23:34
We're diligently working on it, and we do believe that we can kind of come up to speed on those in 2026.
23:40
um Shepherd's Flat South kind of similar that's a 290 megawatt facility located
23:47
in Gilam and Mororrow counties also operational since 2012. Um the majority of the site is under
23:55
cultivation for wheat production. Um but the site also has had persistent weed control and reveation uh kind of
24:01
management issues. So really the same thing as the the other one. um they are diligently working on it and we do
24:08
expect to have that all concluded um in 2026.
24:15
Okay. Next on my list is um executive order 2529.
24:21
So I brought this up at the I was the last council meeting or the one previous to that. So Governor Cotch issued this
24:28
executive order in November. This order requires the Department of Energy to

24:34
take several d undertake several directives in coordination with other state agencies. Uh and it includes two
24:41
required studies to be submitted to the governor by September 1st of 2026. U and
24:47
these studies are being um led by our PNI division policy and innovation um
24:53
and also us to some degree um and I'll indicate what that means in a second. So for one of the studies um ODOT is
25:00
directed to inventory, assess and analyze barriers to permitting,
25:06
construction and interconnection of clean energy projects and associated infrastructure.
25:12
For the other study, ODO is directed to evaluate and recommend actions to update sighting and permitting processes to
25:17
facilitate deployment of renewable energy, energy storage and grid infrastructure. Those are the mandates
25:24
in the executive order. So, we will be looking we'll be working on this, you know, in the coming months
25:31
and we'll be giving you updates as to uh what we're doing. We will likely be doing some outreach on that as well, but
25:37
again, we will ultimately have to provide a report to the governor by September.
25:44
And then great, next slide. You got it. So, uh we are soon to be entering into
25:50
the short legislative session. So, I've included um on this slide the schedule.
25:56
Again, it's the short session. So, it really isn't very long. That doesn't mean it won't be significant. It just
26:01
means it's short. Um and we do already anticipate there being some legislation
26:07
related to energy facility sighting and maybe energy facility sighting council uh your statutes specifically. Uh but
26:15
you can see you know the session starts on February 2nd and then there are
26:21
always uh deadlines uh or bills basically start to die. So bills have to
26:26

be posted for a work session then they actually have to have a work session and if they don't meet those thresholds then
26:32
they basically just move out. So there always ends up being like some huge volume of bills and it starts narrowing
26:39
down pretty significantly. So you can see the deadlines for the first chamber and then the deadline for the second
26:44
chamber and then March 8th is the constitutional end of session. So it has to be done by then. So like the long
26:51
session um I'll be providing updates in the monthly sighting report and the secretary report the difference is in
26:57
the long session there's a lot more time to sort of understand what's going on
27:03
and see this. And with a short session it's um February and by the time we have
27:08
March it's done anyway. So there won't be much time. So I might be submitting uh information to council outside of the
27:15
monthly sighting report and outside of council secretary report at a council meeting just so you're updated as to
27:21
what kind of legislation relates to you. Um another update
27:29
and you're probably not tracking this but there are now new federal visibil
27:35
visual accessibility requirements. Um and these are applicable to all
27:40
government agencies, state agencies, I believe local governments as well. The purpose of those is to ensure that all
27:47
people including any with any kind of visual limitations can access all websites and digital information. So you
27:54
know you go onto you know a website and if you have sort of visual impairments you may not be able to see that
27:59
information. So now you have pretty sophisticated screen readers and other types of devices that actually can
28:05
provide you know the content to somebody who has you know sort of visual limitations. Um and so we're by by end
28:13

of April we have to be compliant with those federal requirements. Agency is moving forward. We're moving forward. BB
28:19
and Nancy have already been working on templates. Um really this is just a way to kind of make sure that as you're
28:26
going to start to see some variations and some differences uh in the PowerPoint presentations.
28:31
Um you know if we have a a map or a chart or a graph or a screenshot there
28:37
has to be alternative text associated with that because somebody can't necessarily see that the screen reader
28:42
would have to be able to read what that image or what that graph is. So we're
28:47
we're just coming up to speed. um you know but we have until April to figure that out. So again we're already working
28:53
on it but you know just as a you'll start to see those changes and we also
28:58
will need to provide a handout to anybody who submits um slides for the
29:04
council meeting or anybody you know all of our our applicants they will have to submit information digital information
29:10
that meets those requirements as well. Just a question on that. I presume that
29:17
the agency gets support from from a
29:23
resource. You're not doing all of the all of the work
29:29
to get it done. You're not you are doing I mean it's a it's an enterprisewide
29:34
thing. Everybody within the state of Oregon um I'm not sure how much sort of direction and detail is coming out of
29:39
the Department of Administrative Services. My understanding is a lot of state agencies are really sort of having to chart this course by themselves for
29:46
now. I'm sure as anything changes, you know, that sort of change is difficult.
29:51
Likely we'll see probably more consistency in the future, but my understanding is right now it is largely
29:56
um at the individual agency level. Thank you.
30:03

on my list is uh next council meeting that will be February 13th, Friday the
30:09
13th will be in Salem and uh we only need that Friday meeting and um we
30:16
anticipate right now that that would end around 1 p.m. So it won't be a very long meeting
30:23
and I will not be at that meeting. Correct. I'm just going to say I'm not going to I was going to try and make it but I I
30:29
will be absent. I think being out of the country is is a realistic absence.
30:37
Um, and that concludes my secretary report unless any council members have any questions. Madam Chair, any Yes, councelor Delin.
30:45
Madam Chair, just a quick question to the secretary. Um, I was looking in
30:50
previous evenings uh on the website and sometimes you can find things on the
30:57
websites and sometimes you can't. Sometimes they exist, sometimes they don't. But I was trying to look to see
31:04
if there were any cumulative reports from on the compliance side or any
31:10
cumulative reports on I think what we refer to as incident side. What I mean is some way to query like if you had a
31:18
particular applicant before you uh who perhaps had an amendment, not necessarily speaking just about the one
31:25
of the ones we have this today, but where you could actually do a query
31:31
where you could find out what previous compliance reports have shown and
31:36
cumulatively what incidents there have been at that site.
31:42
And if it's not available, that's fine because I I I at this point cannot
31:48
estimate what it would take to actually make it available other than a member just simply making a specific inquiry.
31:57
Yep. Thank Thank you, Council Member Develin. Um uh timing is uh is
32:03
interesting that you ask for this because we just had a compliance meeting today. compliance team is working on
32:08

their presentation for next council meeting. And this is exactly one of the things that we discussed. What are the
32:15
types of things that the council is interested in either being, you know, presented at a council meeting um in the
32:22
the during uh like the monthly sighting report or or in other avenues. I mean,
32:29
so that information is sort of theoretically available. We'd have to conduct the research and then pull it
32:34
all together. So, we don't have it sort of nice and packaged up right now, but it is a good question and this is one of the things I want council to think about
32:41
as the compliance team comes next month. What are you interested in the compliance side? What do you think the
32:47
public is interested in from the compliance side? We have the resources now to be able to spend a lot more time
32:53
and pull that kind of data together. So, your question is, yeah, can we do that? Absolutely. Can we do that, you know,
32:59
could we do that today? No. um you know but this is the kind of stuff will be very helpful to hear about at the next
33:06
council meeting so we can start changing that program to have you know more information available to the council and
33:13
members of the public you know and then also thinking about you know as we've initiated the rule making for compliance
33:19
you know what kind of rule changes you know may or may not relate to some of these questions you know we don't have
33:25
to create rules to do those types of things but um there can be overlap so I
33:30
think it will be helpful to be thinking about that and so I I appreciate the timing of your your question. It was
33:35
literally like three hours ago we we had a similar type of conversation so it was very good timing.
33:41
Thank you. Thank you councelor Develin and just a comment about that. I I think that is
33:47
the next stage in a process that we started I think two years ago to have a

33:53
compliance report every meeting. And so I think all of us are probably getting
33:58
uh more comfortable with okay here are the issues here are the uh projects
34:04
involved and so the logical next step is I think exactly what councelor Develin
34:10
uh is asking about. Yeah, and as I said, now that we have the actual resource, the staffing resources to do that, now
34:16
we have three people, it makes it much easier to do those kinds of projects like with one person, you know,
34:22
scrambling just to try to keep up with everything, the huge volume of work that had to be done on an annual basis was
34:28
was over it's still overwhelming even with three people. But we can start to do these things and as I always say, you
34:35
know, we do three things, you know, within the sighting division. you know, we do the review of applications and
34:40
amendments, we do rulemaking, and we do compliance. And you see the first two, you know, almost every meeting. You
34:47
don't see compliance as much, but it is just as important as the other two. And so, we want to kind of amplify
34:54
that program and provide the information that you want in the way you want it. So, please be thinking about that. And
35:02
the other thing I'll say is I I also think that as we get these compliance
35:07
reports at least it makes me think about well what could could we do at the beginning of the process as we see the
35:13
project start to make sure we have that in place. So no and that's that's tying the compliance team with you know reviews of
35:20
the applications and amendments to ensure that those conditions that are being created are as clear and
35:25
implementable as possible. Yeah, there there's a lot of overlap between, you know, these sort of subprograms within
35:31
the division. That's great. Thank you, counselor Delin.

35:37
Any other questions? Again, I can't see um on the screen, so
35:43
feel free to just speak up. Okay.
35:48
Thank you, C. Thank you. Thank you, Mr. Secretary. And
35:54
now we'll move on in the agenda. We'll have Summit Ridge renewable energy facility notice of intent extension
36:00
request. Sarah Esterson, senior policy advisor. Um and we will review the
36:07
request with the beginning with the presentation from Miss Esterson.
36:14
Good afternoon, Chair Condan, Vice Chair Byer, and members of the council. Um if
36:20
we could go to the next slide, please Nancy. So, let's start with a little background. Summit Ridge Wind LLC, the
36:28
certificate holder, has requested to extend the notice, the expiration date of their notice of intent for the Summit
36:35
Ridge renewable energy facility from January 25th, 2026 to January 25th,
36:41
2027. Um, the Summit Ridge renewable energy facility is a 261 megawatt wind and
36:48
solar facility proposed in Wasco County. for your reference.
36:55
So, um you have rules that apply to an a notice of intent extension request and
37:01
those rules establish your scope of review. Um that scope includes review of two criteria. Um one is a a timely
37:10
criteria and the other is good cause. The timely criteria establishes that a
37:15
request for extension of a notice of intent expiration date must be submitted at least 45 days prior to the expiration
37:23
date. And as I mentioned, they also have to provide or describe um a good cause
37:29
for the extension request. Okay. So let's review the criteria.
37:36
Uh the first criteria of timely. So the NOI expiration date was January 25th,
37:42
2026. The request to extend the expiration date was received on November 24th,
37:48

2025, which was 62 days prior to that deadline. So we are recommending that
37:54
the timely submission criteria is met. And then for good cause um and I said
38:02
certificate holder earlier, I meant applicant. The applicant provided two reasons to justify the extension request
38:09
which are somewhat interrelated. Um, but they've requested more time to allow landowner negotiations primarily due to
38:16
uncertainty and changes in Bonavville Power Administration's uh planning for a
38:22
substation that they the applicant had been planning to interconnect to. So they said they need more time to
38:29
negotiate sighting given changes. And then the the additional reason was that
38:35
um BPA has sort of changed their mind on the funding of the substation but they
38:40
still want an agreement in place so that they can tie in. Uh applicant has
38:46
indicated that they would come to an agreement execute an agreement in late January or February.
38:52
Um and we did ask for some sort of additional description and details so
38:57
that we could evaluate the merits of this representation of landowner negotiation and we feel like they
39:03
provided that upon request. So um now I think next slide please
39:10
Nancy. Um, we are recommending that council um find that criteria have been
39:17
met and that the um NOI expiration date may be extended by one year. And we'll
39:23
now turn it over to you for deliberation and possible decision.
39:28
Council members, any comment, questions?
39:33
Mrs. Marcy, I have none.
39:39
Councelor H. I have none. Um I have um one.
39:46
Um can you go back to the previous slide? Um it's just are do you have a
39:53
feel for the order of um the sufficient time? Does the planning with

40:00
BPA and the negotiation with land owners occur at the same time or do land owners
40:06
want to understand that there is a BPA an agreement with BPA first or vice
40:12
versa? BPA wants to understand that no you have the you have the agreements
40:18
with land owners and you're ready for the interconnect. Do do you haven't I I don't think I know the answer to
40:25
that. Um but in their discussion it they described that there's been like years
40:32
of waiting for BPA to move forward and a decision on this substation and then
40:37
there was significant staff turnover um earlier in the year and then there were
40:43
changes with the substation that necessitated new negotiation with landowner in terms of sighting. Okay.
40:50
So, I can't speak to what the land owners knew to be true before the uncertainty came about.
40:59
An additional question. How many extensions are allowed for the notice of intent? One. Is it just one? Okay. Uh, thank you. If
41:08
there are no other questions or comments, Chair Condan, I move that the council
41:14
find the petition by the applicant to extend the expiration date of the notice of intent for the proposed Summit Ridge
41:21
renewable energy facility was timely submitted and demonstrates good cause for the extension for the reasons
41:28
described in the staff report. I further move that the council approve the extension of the expiration date of the
41:34
notice of intent for the proposed Summit Ridge renewable energy facility by one year for a new expiration date of
41:41
January 25, 2027. We have a second.
41:47
Patty Perry here. I will second that. Thank you, Councelor Perry. Any more
41:53
discussion with that? Secretary Cornette, can you
41:59
call for the vote? Cindy Condan, yes. Richard Delin,
42:09

yes. Yes. Marcy Gra. Yes.
42:14
Ken Hal, yes. Patty Perry, yes.
42:20
Motion carries. Check on them. Thank you. And now to the next item. We have a public comment period. Sorry,
42:27
we're a little bit uh late in that according to the the timeline. Um
42:34
uh this time is reserved for the public to address the council regarding any item within council jurisdiction that is
42:40
not otherwise closed for comment. In the agenda, we have set the amount of time for individual commenters to 7 minutes.
42:48
Nancy, how many comment cards and raised hands on the webinar and phone do we have? At this point, we have one
42:56
commenter in the room, and there are no hands raised yet.
43:02
So, we can go ahead and call Jennifer Miller to go ahead and come on up and make your comments.
43:23
And if you could start with name name and address and spell your name, that'd be great. My name is Jennifer Miller. Uh, boring.
43:30
J E N I F E R M I L L E R. Um, and I live in Hermiston, Oregon.
43:37
And my comments are just really general. I have a letter that I'm reading from and I will hand that over when I'm
43:44
finished so it can be submitted to the records or I'll read you that. Thank you.
43:50
So my name is Jennifer Miller and I'm here representing both myself and Octa Oregon and California Trails
43:55
Association. My comments at this moment, excuse me, are general ones. I would like to ask
44:01
the council to look at projects projects from say a helicopter view. This area of
44:06
eastern Oregon is being covered rapidly by wind, solar and transmission activities. Valuable farmland, farmland,
44:14
and native flora and fauna is being crowded out almost daily. Exclusive farming/sweet fields are being bought or
44:21

signed over for projects with little guard to how our food will be reproduced in the future. Wheat fields, grazing,
44:28
and rural means of making a living are being drastically affected. It seems as
44:33
if the locals have to operate under one set of rules while energy projects get others and there is not much consistency
44:40
in this particular area and I mean this grass valley area of course there are historic trails that need to be
44:46
considered the Barllo road cutoff runs through this area and I do know that this council was addressed last night by
44:51
Wendell Baskins so I'm we're part of the same group and I'm just continuing some of those comments
44:57
um very quickly. Sure. I think only uh Chair Condan was online last night. The other council
45:03
members um didn't didn't hear Mr. Baskin. So, and if that makes you want to change your public comment today, you
45:10
can. But just to make sure you know that the rest of them didn't hear that. That's fine. I was just saying Yeah.
45:17
just so um I'm just saying that um some of the projects that are happening in this area are not I think some of them
45:24
are not knowledgeable that there is the Barlo road cut off and that projects do need to know about that going into you
45:30
know just from the very beginning knowing that this historic trail cut off does exist and it would be really
45:37
helpful if that cutout route could be added to layers on the FPSC project maps so like when we go in and look at things
45:43
we can see where the main historic Oregon Trail is but we also feel that the Barllo Road cutoff needs to be added
45:49
as well because it is also a very historic trail within the site within the boundary of Oregon plus the other 15
45:57
16 major historic trails. Um so we're just I'm asking if that map
46:03

could be added and I know OSU has something to do with the mapping so some kind of coordination perhaps could be
46:11
done to make sure that that cutoff map can be included. Um, I do have two maps
46:16
that were also here last night, but I will submit mine as well so that people today can look at them. Um, and hope
46:24
that that this blue line that's on these maps could be added. So, in conclusion,
46:29
my request is just that a bigger picture is viewed instead of the projects or piece, you know, looking at peace meal.
46:35
Um, the overall overall impact to this whole area is huge. It's just not a series of parcels, but a unique and
46:42
amazing landscape that has its own beauty and and importance.
46:47
Any questions? Thank you for your comments, Miss Miller. Any questions?
46:55
I don't hear anybody, but I do have one. Um, so I'm curious, and I did certainly hear
47:01
the comments last. I am curious if the association
47:06
that you're a part of if you have um commissionation
47:14
or um scheduled meetings with land owners who are all part of a part of
47:20
this process. We often don't know which land owners are impacted until we can look at the
47:26
project on the map. So sometimes we're uh sometimes we don't even know about it
47:31
until it's almost too late that it's even happening. Um, as people are learning more about Octa, the Oregon and
47:39
California Trails Association, some projects are reaching out to us so that we can start working on things ahead of
47:44
time and and trying to create that space where, you know, preservation can be
47:50
worked into the project if at all possible. And so, um, does that answer
47:56
your question? So, so yes and no. Like, we don't always know who owns what. And of course, most projects have
48:03

non-disclosure agreements signed. And so it's hard to know who knows what and who's willing to talk about what. And we
48:11
understand that projects are going to happen. We understand that we need energy. We're just trying to do what we
48:17
can do to save as much as we can while it is possible.
48:23
Thank you. Yeah, I I appreciate that. It's just it kind of um was opaque to me
48:30
about what happens beforehand, what you know, what communication could be done. It would be great if we could get in on
48:37
projects way sooner so that we could look up and then say, "Oh, that's not any threat of the trail." Um that's
48:44
that's that's fine. Like that's not a problem. Or this is going to be a huge visual impact.
48:50
Let's see what we can do about that. or please don't put that transmission line directly along the length of this
48:56
section of the trail. Perhaps cross it instead and parallel it but you know a further distance away so that it's not
49:02
such a big impact. So I mean there's lots of things that we try to do to to
49:08
keep the story alive. Okay, Secretary Cornette. Uh yeah, thank you Chair Con for the
49:13
record. Todd Cornet, um are you signed up to receive our monthly sighting report? Yes. Okay, good. because frankly we usually
49:20
don't even know the details of a project until they submit their notice of intent. So you know whatever has occurred before then we're not even in
49:27
the loop on. So when we get that notice of intent and then we start to put it in the monthly sighting report or we
49:33
provide the notice that's really the first time that we have any indication. But it is important to know that that's the pre-application stage. So
49:40
identifying anything any resources obviously your your your interest is in you know primarily with the with the
49:46
trails but that's the time to do it is during those notice of intent right comment periods right and I'm sure that I mean know it's
49:52

not just the trails I mean like there was a huge native presence in this area for hundreds of years and so that is
49:58
also an important thing right thank you welcome thanks for being here
50:08
Nancy See, sorry. All right. Uh, so at this point there is one person with their hand raised, but
50:14
let me just go ahead and remind everyone how to raise their hand and you see it on the screen in front of you. Um, if
50:21
you are on the webinar, you're going to click on the participant window at the bottom of the screen. You're going to
50:27
push the hand icon and that will raise your hand. When you're finished commenting, you're going to click it again to lower it. If you are on the
50:34
phone, push star three on your keypad to raise your hand and star three again to lower your hand. So, at this moment, I
50:41
will unmute. I have Miss Irene Gilbert. I'm going to go ahead and unmute your mic.
50:47
And you are ready to leave your comment. Okay. Thank you. Thank you for allowing me to speak. Can you hear me?
50:54
Yes. Okay, great. Um, I wanted to comment on a couple of things. One is um as I've
51:00
followed the council over several years, I've noted that the opportunity for the
51:06
public to actually access the council members has become less and less easy
51:11
and available. And um one one thing I sent a a couple of notices a couple of
51:19
information items to specifically to the council regarding the um wildlife
51:25
mitigation plan for because of the exceedences. Basically, I said that I felt that with an error rate, um, doing
51:33
mitigation that was projected to only bring the bat deaths down to 1/100ths of
51:39
a percentage below the threshold of concern, uh, should be of concern to the to the council. and also that um there's
51:48
nothing that I can see in terms of a follow-up uh evaluation or surveys to
51:54
determine whether or not they actually stayed below the 2.5
51:59

standard. So I am concerned about that kind of thing. I also wanted to comment on the decision regarding an amendment
52:05
to the whether or not an amendment was needed due to the sale of the B2
52:10
interest in the um transmission line to a private enterprise. Um issues include
52:19
uh this is a non-energy uh organization which was has never done
52:25
this before. They were created just to uh have this sale.
52:30
um they they don't fall they are not going to fall under the authority of the
52:35
PUC uh because they're not an energy uh company and so there's going to be no
52:41
control over how much they're charging for energy or any of those kinds of things that are controlled that way. um
52:49
the fact that there is no longer going to be um the stated customers and or
52:56
owners that were in the original certificate for public convenience and necessity has resulted in at least three
53:03
appeals of the uh the uh PUC determination that they were not going
53:09
to resend that uh certificate of public convenience and necessity. I'm also
53:14
concerned because Pacific Core is basically wanting to sell this because
53:20
their um financing rating has fallen so much and I'm concerned about the ability
53:27
to access even access any funds from this Shell company if it is needed to
53:33
restore the site. So, lots and lots of concerns that should be of concern to
53:39
the council. Um and the PUC has not approved this sale. Uh they're going to
53:45
have to have full contested cases because of the the substantial impacts
53:51
and the unusual nature of this sale. So to think that the um energy facility
53:58
sighting council does not believe that you should have a full amendment process
54:04
uh really is a real surprise to me and
54:09
frankly I'll be really surprised if there isn't you know some kind of legal

54:14
um response to it just given the fact that it's no longer the same owner. It's
54:21
no longer to the same customers. Um the there's a question about whether or not
54:27
they should even be condemning property to build this. And part of that question
54:33
is related to the fact that these this new company has no experience and and
54:40
nobody's going to control what they do to the customers. So, um I encourage you
54:46
to uh have some more discussion about this and perhaps decide that a decision
54:52
to not provide an amendment isn't the wisest choice given I mean this is a big
55:00
deal, a big deal legally, a big deal um publicly and it's not going to go away.
55:07
So that's my comment about B2. Be careful what you do. Um, and I wanted
55:13
to say I'm sorry to see Katie gone. She was asking questions that needed to be asked, especially since the public has
55:21
such a hard time getting to the council with information. I was really surprised
55:27
to see the email that I sent to the council members returned saying, "We
55:33
aren't taking comments on this." And I'm assuming you never saw my email, but uh to have that kind of a blockade between
55:40
the public and and FSAC, it seems to um
55:46
defeat your entire reason for existing. So, thank you.
55:53
Any questions? Thank you, Miss Gilbert. Any questions
55:58
from the council or comments?
56:07
Thank you very much. Um Nancy, any any more hands raised?
56:18
There are no more hands raised at this time. We'll do a last call. If you'd like to make a comment, please raise
56:23
your hand.
56:40
I think that'll do it for us. So, we will move on. Thank you, Miss Miller. Thank you, Miss Gilbert, for your

56:47
comments. And we'll move on to our next item, which is the state line wind
56:52
project wildlife monitoring and mitigation plan amendment. And this is
56:58
an action item for the council. Christopher Clark, senior sighting analysis, will be guiding us through the
57:04
review. Thank you. Thank you, Chair Condan. Council members, for the record, my name is
57:10
Christopher Clark. I'm a senior sighting analyst with the department. Uh, and I've been assigned to monitor compliance
57:16
for the state line wind project. Um, so Nancy, if I could get the next slide,
57:21
please. Uh so the state line wind project is an operational wind power facility uh
57:29
located in Umatillaa County, Oregon and Walawala County, Washington. Um the council has jurisdiction over the
57:36
components cited in Oregon. Um as shown on the slide, the facility consists of
57:42
three phases um that are separated into two distinct geographic and operational
57:48
units. um those are state line one and two which are the black dots and um the
57:54
vansickle 2 portion of the facility which are the red dots. I'm going to be talking mostly about vansickle 2 today
58:00
um as that's what this mitigation proposal is for. And I also just wanted
58:06
to point out that there's different certificate holders for each of the
58:11
geographic units. Um but both certificate holder LLC's are um
58:16
subsidiaries of Nextera Energy Resources LLC. Um so moving specifically into the
58:24
discussion of Vancicle 2, that portion of the facility includes 43 Seammen's
58:30
2.3 megawatt turbines. Um the council approved the final order on request for
58:37
seven uh in 2022 and that authorized that um the uh turbines which had been
58:44
commissioned in 2009 can be repowered with larger diameter rotors. If I could get the next slide please.
58:52

Um so that repowering was completed uh in 2023, sorry. And then a
58:59
postreppowering fatality monitoring study that was required by the um
59:05
wildlife monitoring and mitigation plan that was included as part of that final order on request for amendment 7 uh
59:11
required one year of postrepowering fatality monitoring uh which was completed between 2023 and 2024.
59:19
Um after the monitoring was complete in April of last year, the certificate holder notified us that there was an
59:25
exceedence of the threshold of concern for bat fatalities. Um and based on the estimation methods
59:33
uh required by the WMP, the report estimated that there were approximately 5.86 bat fatalities per megawatt
59:41
attributable to the facility in the monitor year compared with the threshold of 2.5 fatalities per megawatt. Uh, no
59:48
other thresholds of concern were exceeded. And I did want to note um that all reported bat fatalities were from
59:54
two migratory bat species. That's the Hory bat and silveredhaired bat.
1:00:00
Um, after an opportunity for public comment uh on the monitoring results and
1:00:06
consultation with the Oregon Department of Fish and Wildlife or ODFW, the department notified the certificate
1:00:12
holder that based on the magnitude of the exceedence and the species effective that mitigation was necessary.
1:00:18
We received the mitigation proposal um that is included as attachment one to
1:00:24
your staff report in October. Um, I'll go into the details and that in the next slide, but I did want to remind the
1:00:30
council that the approved wildlife monitoring and mitigation plan authorizes the department to agree to
1:00:35
mitigation actions and changes to the WMP, but it requires us to notify the
1:00:41

council of any agreements. Uh, and the council retains the authority to approve, reject, or modify the actions
1:00:46
or or agreements. Okay. So, uh, any questions so far?
1:00:53
Sorry, going a little fast. Okay. So in the mitigation proposal
1:00:59
itself um the certificate holder proposes to contail curtail operations
1:01:04
of all vanicle 2 turbines for the life of the facility. Cretelment would would occur when wind speeds are below the
1:01:10
manufacturer's recommended cutin speed of 3 meters/s year round and then the
1:01:16
cutin speed would increase to 5 meters/s in July and October and 6 meters per
1:01:21
second in August and September. Um, curtailment essentially means feathering
1:01:26
or breaking turbine blades so that the rotation of the blade slows. Um, I can
1:01:32
go into exactly the definition of curtailment that we've worked out or received from the certificate holder in
1:01:39
a couple slides, but I I just wanted to make sure that was clear. Um and then I wanted to kind of illustrate what this
1:01:45
graph is showing is that um we have studies showing that curtailment is an
1:01:52
effective strategy to reduce bat mortality associated with wind um wind
1:01:58
facility operations and that mortality rates are um or reductions in mortality
1:02:04
rates are positively associated with increased curtailment wind speed. So the more you curtail, the less likely it is
1:02:10
that there will be fatalities. Um I don't uh want to presume myself as
1:02:16
an expert on all the science on this, but um the general idea is that bats are
1:02:21
more active at lower wind speeds um since very windy conditions uh make it harder for them to fly and hunt. So
1:02:28
stopping or slowing blades to um less than dangerous speeds at these low wind
1:02:34
speeds is is a really good strategy to reduce mortality without impacting um
1:02:40

the power production of the wind farm as much as other things might.
1:02:45
Um and then I wanted to point out that the yellow line on this graph is showing
1:02:50
the proposed cutin speed for wind. Um so
1:02:55
if winds are below 3 meters per second year you round it shows the flat part of the line. Um that's when the the wind
1:03:04
turbines would not rotate as quickly. Um that wind speed increases during the months when the most fatalities were
1:03:11
reported. Um those months also coincide with the migration periods for the two
1:03:16
bat species um that are affected.
1:03:25
So this uh proposal was based on the threshold of concern and based on the
1:03:31
statistical analysis provided in a metaanalysis of a number of different
1:03:36
curtailment studies. There's a link to that meta analysis in your staff report. The proposal would be expected to reduce
1:03:43
fatalities to 2.49 fatalities per megawatt per year uh which is just below
1:03:49
the threshold. Um we did consult with our colleagues at ODFW on the review of
1:03:54
the proposal um and whether it would be effective in addressing the concern and
1:03:59
they provided support for curtailment as a strategy to minimize and mitigate bat mortality risks. Uh and they noted that
1:04:06
if this proposal was accepted it would be the first time that curtailment was implemented at an Oregon facility.
1:04:12
Um as I did want to note uh one thing is that there are no uh follow-up
1:04:19
requirements for monitoring of the effectness effectiveness of this proposal but ODFW um outside of the
1:04:25
regulatory process is working to connect an independent researcher with the facility um to conduct a study of
1:04:33
fatalities after curtailment is implemented. Um so based on the comments we received
1:04:41

from ODFW and review of the evidence provided uh the department notified the certificate holder that we agreed with
1:04:46
the proposal in December. Um and if I could get the next slide.
1:04:52
We are still in the process of working with the certificate holder to document the specifics and details of the
1:04:59
agreement as an amendment to the WMP. um specific items that we've discussed
1:05:05
or have resolved so far as the standard for containment, which is that they would um reduce the speeds of turbines
1:05:14
turbine blade rotation to less than one rotation per minute when the 10-minute average of wind speed is below the
1:05:20
applicable cutting speed. Um, we are still working to solidify the reporting
1:05:26
and validation requirements, although they've informed us that their SCAT system can um give a report of whether
1:05:34
or not the contailment was implemented to the minute and that they're working on a way to include that into the annual
1:05:40
compliance report that would be submitted to us um each April. They're also um looking at a way to notify us if
1:05:48
there was a significant failure of the system and curtailment didn't happen when it was supposed to for a prolonged
1:05:53
amount of time. Um the certificate holder also notified us that they
1:05:59
intended for this mitigation proposal to only be implemented from dust to dawn
1:06:04
because it is a proposal uh related to that mitigation. Um, we let them know
1:06:10
that we thought that was a material change since it wasn't specified in the original thing. Although we don't necessarily object to it, we wanted to
1:06:16
talk to our colleagues at ODFW again and make sure there weren't any additional concerns. Um, they're also working on
1:06:24
getting the specifics of what dust to dawn means and how that will be determined. So, um, all that to say on
1:06:31
this slide is that we don't have a red line for you at this time. We thought it

1:06:36
would still be valuable to get additional feedback. Um, if the council's comfortable with uh moving
1:06:42
forward with this information, I think it would still make sense to make a vote. I'll leave that up to you. Um, but
1:06:49
if you have any questions, I'm happy to answer them. Council members, any questions or
1:06:56
comments about the presentation? Councelor H. Yeah, this is Kent. I um great staff
1:07:03
report, good explanation. When I was going through it, it w it's kind of a
1:07:10
what's the word for when it's um not
1:07:16
straightforward in in the way you're thinking in the way I'm thinking anyway.
1:07:21
And so it was like when I was reading the in November to June when the blade
1:07:27
rotation would be limited when the wind speed is below 3 m/s.
1:07:33
I looked that up. That's about 7 miles an hour then the manufacturer is going
1:07:39
to cut the speed of the blade I think is what that means.
1:07:45
Um thank you council member. Ow. Uh, so when the the manufacturer's cutting
1:07:51
speed is the speed at which the um wind has to be blowing for the turbine to
1:07:58
begin producing electricity. Okay. Um so if the wind is not that fast, they
1:08:04
will feather it out of the wind so that the blades don't spin as fast. Okay. Yeah. Okay. So on that graph where when
1:08:12
the winds are higher uh in those months it seemed like it was
1:08:23
it the way it was showing with Nancy. Can you go back to that slide? Yeah. Thank you.
1:08:29
It looks like it allows them to go faster because the line goes up as
1:08:34
opposed to dipping down. Uh, and that just confused me. And it's not you. It's
1:08:41
not the It's just my brain was looking at it um and thinking, okay, I think
1:08:50
what I wanted to do is have it show a reduction in the speed of the blade, but that's showing how much it's going to

1:08:57
reduce the speed of the blade. Council member How, I'd say what the line on the graph represents is how fast
1:09:05
the wind has to be blowing before the turbine starts spinning. Um, it's not
1:09:10
related to the speed of the turbine itself. It's related to the speed of the wind. And once the wind starts blowing,
1:09:19
if it starts for most of the year outside of the migration period, if the
1:09:24
winds at 2.9 m/s based on their meteor meteorological towers,
1:09:30
yeah, the turbines will be stopped from spinning as quickly. Okay. Once it hits 3 m/s or more, they will
1:09:38
feather the the blades back into the wind and it'll start spinning normally.
1:09:43
Okay. And I I do not know how fast those turbine blades go, but it is it is fast
1:09:50
when they are into the wind. So yeah,
1:09:56
Secretary Cornet, so just just for clarification because so to me this graph represents the fatalities.
1:10:03
Is that right? It's a two axis graph. So the axis on the left, the y- axis on the left is the
1:10:09
number of fatalities and that'd be the bar graph and then the wine graph is the cut in speed.
1:10:14
Right. Right. Yeah. And so the you know obviously August, September, October, that's where
1:10:20
the majority or much higher levels of bad fatalities are occurring, right?
1:10:25
And so trying to adjust the cut in speed during those months to a different level
1:10:31
to reduce those fatalities. Is that the the basic concept? That's correct. Yeah. And in the meta
1:10:38
analysis, it it kind of indicates that for each additional meter per second of wind
1:10:44
speed that you allow per certain to continue basically um you get a greater
1:10:50
number of uh le you get fewer and fewer reductions. So bats are still active
1:10:57
above 3.0 meters per second. Um so if you increase it to five or six uh more
1:11:03
bats or less bats will be negatively impacted by the lines. So so the yellow line is the

1:11:09
proposed cut in speed and so theoretically a year from now if you showed this graph
1:11:15
the yellow line would be the same because that's their established cut in speed. Yeah. But if it works as it's
1:11:21
supposed to work, those numbers probably in July, August, September, October.
1:11:27
Yeah. Those should be reduced um below that because those cutting speeds
1:11:32
changed according to that yellow line. Right. Yeah. I knew that's what it all was saying,
1:11:39
but intuitively it it seemed like the
1:11:45
to reduce the wind speed, the graph shouldn't go up. It ought to be reducing
1:11:51
the wind speed, you know, the speed of the blade. But I get it and I think you
1:11:56
did a great job. Okay. Thanks. That's my I'll take full credit for this graph and it made sense in my
1:12:02
brain, but I understand why it's not intuitive. But just can you go back to the graph? I
1:12:07
just want to make sure. And so from November,
1:12:13
well, as it says from November to June, the turbons are basically still
1:12:19
right. All right. Council member Conan, between November and June June, curtailment
1:12:27
would only occur when wind speeds are below 3 meters per second. So that's actually the most they would be
1:12:34
operating. They would be operating most of the time between November and June.
1:12:39
So that's don't that's in higher wind at higher wind speeds.
1:12:44
Yeah. And I don't know exactly where that ceiling is for them. But um they are more active at low wind speeds.
1:12:51
That's correct. Yes. Okay. That helps too. I didn't understand that.
1:12:56
Okay. I think I was kind of thinking about this backwards. too.
1:13:02
So, and I have a question related to curtailment and um is has curtailment
1:13:08

been used in I mean I'm presuming that the Oregon Department of Fish and Wildlife has lots of information about
1:13:15
this issue. Is curtailment used in other states effectively and therefore
1:13:22
this should be meaningful cura curtailment here should be meaningful to
1:13:28
decrease fatalities chair condan yes the I don't know how
1:13:35
often it has been used as a regulatory instrument but the um metaanalysis
1:13:41
provided is actually based on real studies that happened across the United States including including studies I
1:13:47
think in the Northwest but definitely studies that uh included the two species that um are present here were present in
1:13:56
those studies um and they look at both a pre-cretailment study and a
1:14:01
postcretailment study um to a certain extent and then um see how the reductions played out. So I think there
1:14:08
are um I couldn't tell you the exact number of studies but it being a a um
1:14:14
meta analysis it does include several that were conducted over a decade so
1:14:19
empirically supported to be an effective strategy. Yes. Okay. Thank you. And um a final question
1:14:26
for me um on it is given the higher than
1:14:31
anticipated uh fatalities before is there any um mitigation you know post
1:14:36
mitigation you know we've seen contributions to wildlife centers or
1:14:42
whatever to to speak to the over fatalities. Um
1:14:48
when we uh had our initial consultation with ODFW um we kind of asked about that. Uh they
1:14:55
there's two reasons why that sort of compensatory mitigation
1:15:00
um was not preferred and and this sort of operational curtailment that's
1:15:06
actually designed to reduce future fatalities was um the option that we push for and in in what was um proposed.
1:15:15

So there's not a lot of data available about migratory bats. Um there's not a
1:15:21
lot of science on them. So not a lot of studies. Um and biologists don't even know a ton about their migration
1:15:28
patterns. Um so we see them when they show up uh in a fatality study, but it's
1:15:34
hard to kind of estimate what would really help them um as far as um that
1:15:40
sort of mitig compensatory mitigation. And the other thing is where raptors might be able to go to a rehabilitation
1:15:48
study. Um bats are both very small and and I think any interaction they have
1:15:54
with a wind turbine that results in an injury or fatalities is almost always a fatality. So there's not a lot of like
1:16:02
opportunities for rehabilitation of injured bats just because of the nature of how they are affected by the
1:16:09
turbines. Yes. And to be clear, I wasn't suggesting that um I think the
1:16:15
mitigation approach as it is here going forward is much better than a compensatory approach, but it was the
1:16:21
compensatory compensation for the higher than expected that
1:16:27
I I was questioning but just a question. Thank you, Chair Con. One comment on the
1:16:33
thresholds of concern is they are a signpost. So it's, you know, we have
1:16:39
requirements for post construction fatality monitoring often and then if a threshold's exceed is exceeded, it's not
1:16:45
necessarily like they need to meet the threshold like that triggers a
1:16:51
conversation with us and then we see if this is a impact that wasn't considered in the permitting that needs to be
1:16:57
addressed. Um, and that's what we found was the case in this case. A lot of times there will just be another year
1:17:03
monitoring and it'll be found to be an anomaly. So, um, it is, uh, you know, a
1:17:09
little more nuanced than we just need them to get down to 2.5. Okay. Thank you. Any other comments or

1:17:16
questions? Seeing we're hearing none,
1:17:22
Chair Condan, I move that the council approve the proposed amendments to the state line
1:17:28
wind project wildlife monitoring and mitigation plan to curtail turbine operations at the Benickle
1:17:35
2 unit below specified wind speeds to address an exceedence of the threshold
1:17:40
of concern for bat fatalities as presented in the staff report. Thank you, councelor. House
1:17:47
second. Um, we have a second from councelor
1:17:54
de secretary.
1:18:00
Yes, there's Perry seconds the motion.
1:18:05
Oh, we had a second from councelor Dellet. Okay. Thank Thank you, Councelor Perry
1:18:11
and Secretary Cornette that can you please call Patty Perry?
1:18:18
Yes. Richard Delin. Yes.
1:18:24
Kent How? Yes. Cindy Condan. Yes.
1:18:30
Marcy Grill. Yes. Yes. Motion carries. Chair Condan.
1:18:35
Thank you, Secretary Cornette and counselors. Chair Condan. Thank you. Yes,
1:18:40
this is Marcy and Christopher, I just got to tell you, thank you for what you're doing, but I tell you everybody
1:18:47
every year, this is the hardest thing for me to do on FSE. I can the whole bat
1:18:54
thing just wigs me out. So, good on you for getting in there and and pulling it
1:18:59
together for us, Christopher, because if I had to read very much, I don't I don't think I'd be pulling my weight. So,
1:19:04
thanks as always for a great presentation. Yeah. Yes. Thank you.
1:19:11
Is it the picture that wigs you out? The uh when I see you again, I will amuse
1:19:18
you with all my nuance fears and paranoia and all the things bat related.
1:19:23

Bats and rats, all the things just I can't even tell you. I can't look at them on TV without getting the
1:19:30
heebiejibbies. Yes, technical term heebie-jebies. Uh I turn into a 5-year-old child. I just I'm sitting
1:19:36
here with my eyes kind of open like squinting trying to not be a child about it, but Oh, that's a rough one.
1:19:45
Well, thanks for sticking with us. Okay, next item on the agenda is the
1:19:50
Oregon Trail Solar Facility Reveitation and Noxious Weed Plan amendments. It's
1:19:55
an action item and Sarah is with us once again, policy advisor and you'll for a
1:20:02
presentation. Thank you. Thank you. Good evening, Chair Condan, Vice Chair Byer, and members of the
1:20:08
council. Um, so the site certificate for the Oregon Trail Solar Facility
1:20:13
authorizes up to 41 You can go back just one second. It authorizes up to 41
1:20:19
megawatts of a combination of wind and solar power generation components within an approved site located in Gillum
1:20:26
County. The certificate holder is Oregon Trail Solar LLC, which is a wholly owned
1:20:31
subsidiary of Avengrid Power LLC. So for this facility, the
1:20:38
preconstruction and construction is being phased and it's currently in both
1:20:43
phases um with plans to move forward with construction 41 megawatt solar facility
1:20:50
and 20 megawatt battery energy storage system um on Monday.
1:20:56
So as you know as we talk about um compliance that preconstruction compliance is a phase where the
1:21:02
certificate holders required to comply with preconstruction conditions that are established in the site certificate that
1:21:09
you've issued prior to moving forward with construction. And this is a process where the certificate holder is
1:21:15
submitting information to the department for review and approval orurrence.
1:21:20

Mitigation plans are almost always pre-construction requirements that have to be finalized and approved prior to
1:21:27
construction. So in this instance for this facility, we're here to discuss changes related to two mitigation plans,
1:21:34
the reveation and noxious weed plans. So as part of pre-construction compliance
1:21:40
of for this facility for these two plans, the s the certificate holder requested changes that are beyond the
1:21:46
scope of changes contemplated in the draft plan. So, while we're we've reviewed for approval for finalization,
1:21:53
they've requested substantive changes that we want to bring back to um the council for transparency to make sure
1:22:00
that you would agree with these types of changes. And as we've discussed in a couple of meetings over the last year,
1:22:05
if if not a lot, that mitigation plans do have an amendment clause that allows
1:22:11
for changes to be reviewed outside of the amendment process, but maintains an obligation that we bring it forward to
1:22:18
council for concurrence, modification, or rejection.
1:22:23
Okay. So, let's move into the substantive changes that they that the certificate has proposed. So first um
1:22:31
the reveation plan the reveation plan applies to temporary temporary impacts
1:22:38
to habitat predominantly and then it has general requirements for restoration of
1:22:43
temporary impacts to crop land. So the proposal is to remove all requirements
1:22:49
that apply to temporarily impacted habitat because based on the solar
1:22:54
facility, there really isn't temporary impacts outside the fence line that are
1:22:59
considered habitat. What they have is a little sliver of a collector line that is it has grass land dispersed
1:23:07
throughout other a land in between the patchway facility and active a. So when
1:23:14

if if you look at it on its own, it's grassland that's considered habitat. But when you look at it overall and you
1:23:22
consider habitat function and value based on consultation with ODFW, we
1:23:27
agree to categorize it as category six, which relieves the obligation to do a
1:23:33
habitat restoration level plan that is within the reveation plan.
1:23:39
Um so just to note general reveitation requirements still apply. You have a
1:23:44
mandatory condition that applies to all temporary impacts and it says you have to restore temporarily impacted land
1:23:50
commensurate with adjacent lands and then they have an obligation under the
1:23:56
1200 C permit that DEEQ issues. All FSE facilities have to get this permit that
1:24:01
also has a vegetation uh stabilization requirement before they can close that permit out. So while the proposal is to
1:24:09
basically remove this habitat restoration level requirement because there's no real habitat, know that
1:24:15
reveation is still a requirement. Okay. So and then we we are going to
1:24:22
lift the general restoration of crop land temporarily impacted crop land over
1:24:28
into the noxious weed plan. So now we can go over into the noxious weed plan. That noxious weed plan also has um a a
1:24:36
seeding and weed treatment obligation. So you're going to get reveation through the noxious weed plan as well. But the
1:24:44
substantive change here that was beyond finalization requires amendment is that they again want to use sheep grazing as
1:24:51
a vegetation management strategy at this site. Um, you have evaluated this
1:24:56
request for several solar to date, including the Montag Solar, also known as Patchway, as well as Bake Oven and
1:25:03
Daybreak. And as you know, with ODFW coming forward, you received a
1:25:08
presentation a few months ago, their biggest concern with sheep grazing is the potential for disease transmission

1:25:14
to big game or to um big horn sheep. Um, and so we did consult with the regional
1:25:20
biologist Lindseay Summers at ODFW to confirm whether that disease transmission risk concern existed for
1:25:27
this site and they confirmed that it did not. But they do have a set of best management practices they've recommend
1:25:34
be included in the plan. So that is included in red line and the attachment to for your consideration. but it
1:25:40
includes um doing fence checks to make sure that the the the fence is intact
1:25:46
and that sheep can't escape. Um and that they would be monitoring and reporting to evaluate if there are um big horn
1:25:53
sheep identified or if any of sheep escape from the site should they choose to use it. Um and then we've recommended
1:26:01
that the noxious weed plan make clear that use of sheep grazing and the success thereof is reported annually to
1:26:08
the department as we do want to understand if this is working or what type of problems are occurring and that
1:26:13
they are following through with those ODFW notification elements
1:26:20
and yeah I summarized that on the slide too. Okay. So, those are the substantive
1:26:26
changes proposed that would necessitate an amendment of both the reveation plan and the noxious weed plan. And we are
1:26:32
recommending that council concur with staff and agree that these changes can be incorporated. So, I'll hand it over
1:26:39
to you for deliberation and decision.
1:26:44
Council members, any comments or questions? No questions. This is Marcy.
1:26:54
Thank you. Thank you, Miss Esther, for um the presentation. And I think we
1:27:00
might be ready for a motion. Chair Condan, I move that the council approve the proposed amendments to the
1:27:06

Oregon Trail Solar Project Revitation Plan and the Noxious Weed Plan as presented in the staff report.
1:27:13
Thank you, Councelor. How? Do we have a second?
1:27:19
This is council member Gra. I second the motion. Thank you, councelor Grail. Any
1:27:25
discussion? Secretary Cornett, I think we're ready for a vote.
1:27:32
Richard Delin. Hi. Kent Hal, yes.
1:27:39
RC Gra, yes. Patty Perry,
1:27:44
yes. Cindy Condan. Yes. Motion carries. Chair condan.
1:27:51
Again, thank you Miss Esterson for the presentation. And now we have on the schedule a break.
1:28:00
Um so we'll take a break at this point. And our next agenda item
1:28:06
um is at six o'clock. And so this will be a longer break than our our normal
1:28:13
break. Sorry about that. We don't have a circus animals or anything. So with us,
1:28:19
we do have some refreshments and um some people to talk to. So thank you very
1:28:25
much. We'll break until 6:00.
1:28:40
Good evening. My name is Cindy Condan. It is now 6 5:59 almost 6:00 and I would
1:28:46
like to call the meeting back from recess and continue on with our next agenda item which is Big Low Canyon
1:28:54
Amendment 4 the public hearing and with us tonight is Chris Clark senior
1:28:59
sighting analyst will provide an overview of the sighting process and the proposed amendment as the hearing
1:29:05
progress and the hearing will progress. Thank you, Chris. You have
1:29:12
Thank you, Chair Condan. Council members, for the record, my name is Chris Clark. I'm a senior sighting analyst with the department, and we are
1:29:19
uh here tonight for the public hearing on propo on the proposed order for request for amendment four of the site
1:29:25
certificate of the Biglo Canyon wind farm. Um I am going to start the

1:29:31
presentation uh tonight with a overview of the um proposed amendment and the
1:29:37
proposed order. I'll then turn it over to our senior sighting analyst Sarah Esther who will be serving as the
1:29:43
presiding officer for tonight's hearing. Um Sarah will give an overview of the hearing process itself and then um open
1:29:50
the floor to public hearing and oral testimony. Um the order of testimony will be the
1:29:57
certificate will be given an opportunity to speak followed by members of the public and then um the council will have an opportunity to ask clarifying
1:30:03
questions. Um uh to get into the overview of the
1:30:11
proposed order. Uh this project the Biglo Canyon wind farm is an operating
1:30:16
wind power generation facility in Sherman County. Uh the facility includes 217 Vestus and Seaman's turbines and
1:30:24
related and supporting facilities including a collector substation and an O andM facility. Uh the facility is
1:30:31
located within an approximately 39 square mile site located about 2 milesi from the city of Wasco at its closest
1:30:38
point. Um, in request for amendment four, the
1:30:44
certificate holder proposes to construct and operate a 125 megawatt solar
1:30:49
photovoltaic power generation facility, 500 megawatt hour battery energy storage system or bests and new related or
1:30:56
supporting facilities uh at the existing site. The proposed facility components
1:31:01
would be located within a proposed solar micro sighting area which is represented by the pink hash outline on this map. Um
1:31:10
the proposed solar micro sighting area includes approximately 1,924
1:31:15
acres uh which is uh that is located entirely within the
1:31:21
approved site boundary. Um that proposed microighting area is located approximately 4.8 miles northeast of the
1:31:28

city of Wasco.
1:31:33
This request for amendment is being processed under the amendment rules that were adopted by the council last
1:31:39
October. Um the department received the preliminary application or preliminary
1:31:45
request for amendment, excuse me, on April 21st, 2025. Uh we com conducted a
1:31:50
completeness review in coordination with reviewing agencies and after receiving responses to requests for additional
1:31:57
information between July and September of last year and then in a revised amendment request in November, we issued
1:32:03
a determination that the request was complete on December 5th, 2025.
1:32:08
On December 16th, we issued the proposed order as well as a public notice establishing the common period on the
1:32:15
proposed order and tonight's hearing. After the close of the public comment period, the certificate holder will be
1:32:21
required to respond in writing to comments and the department will have the option to respond as well and then
1:32:26
there will be an opportunity for com commenters to reply to those responses and certificate holder to provide s
1:32:32
replies to those replies. Uh Sarah Esterson will go over this process in more detail during her presentation.
1:32:41
Um, no later than 21 days after the deadline for sir replies, the department must issue a draft of the final order
1:32:47
with written analysis of any comments on the proposed order, including analysis of responses and replies and s replies
1:32:53
and whether we recommend any changes to the proposed order. Um, and then if we recommend any changes, we will include
1:33:00
them in a draft final order which we'll present to the council. The council can review and then um modify, reject or
1:33:07
approve as their final order. Um, if the council grants issuance of an amendment site certificate, uh, the

1:33:14
council will then issue an amended site certificate effective upon execution by the council chair and by the site
1:33:19
certificate holder.
1:33:27
So this uh request would add new energy facilities to the existing site in the
1:33:33
existing site certificate. Um and for that reason there were a lot of existing conditions in the um approved site
1:33:40
certificate which were applicable to pre-construction and construction phases of the existing facility which while no
1:33:46
longer applicable to the existing facility could be updated and amended to apply to the proposed facility
1:33:52
components. Um some of those conditions particularly mandatory conditions would also apply to both the operation um of
1:33:59
existing and proposed components. Uh to make applicability of the existing and proposed conditions more clear,
1:34:06
departments recommended that the site certificate be reorganized and that all conditions be renumbered with an
1:34:12
identifier that includes phase and standards similar to more recent site certificates. Um but many of those
1:34:17
conditions aren't changing. Uh and some of the conditions that are new or proposed to be amended are very similar
1:34:23
to conditions that um have been imposed or adopted by the council in recent proceedings. So, I'm not going to go
1:34:30
into um the standards which only have those kinds of conditions in them in a
1:34:35
lot of detail during this presentation. Um they are shown on this slide. These standards that I won't cover more here,
1:34:42
but I did want to give the opportunity um to the council to ask questions. Now, if you want um just so you know that
1:34:49
there are findings and conditions associated with all these, I just don't have more in my presentation about them
1:34:55

at this time. Yeah. Is that better?
1:35:04
Okay. Um, I'll hear questions. I'm going to go over some select issues and
1:35:10
conditions in the proposed order. I do know we have a lot of interest tonight, so I will try to keep it brief.
1:35:15
Um for the general standard of review, um the department is recommending that
1:35:21
the council find that this facility or the request for amendment would comply with the applicable standards and that
1:35:28
the council approve this. It's part of the general standard review. As far as conditions, um we do have two fairly
1:35:33
standard conditions for construction deadlines that I did just want to highlight. Um these are similar to what
1:35:39
the council has done recently, but um given some legislative changes recently, I thought it would be worth um just
1:35:45
pointing out that our recommended general standards one and two would recommend um that the council uh impose
1:35:54
construction deadlines that for the beginning of construction, uh construction would be required to start
1:35:59
within six years after the date the amended site certificate is issued. And then um construction would be required
1:36:06
to complete be completed within three years after the date that construction actually begins. Um this is uh again
1:36:13
consistent with the mandatory condition language that requires the council to set deadlines and with the requirements
1:36:19
of HB 3681 uh which requires the council to give at least six years to the start of
1:36:25
construction. Um but I did want to point out that in the request for amendment the certificate holders indicated that they intend to begin construction in the
1:36:31
second quarter of this year. uh and that construction would take 17 to 19 months.
1:36:39
Okay, moving to organizational expertise. Uh we wanted to highlight that this um project is somewhat unique
1:36:46

in that the certificate holder which is Portland General Electric Company would construct and operate the solar
1:36:52
components in partnership with a another entity um Big LNLC.
1:36:57
Big L which is a subsidiary of Bright Knight LLC under a build transfer agreement. Um so given this partnership
1:37:07
um we are both looking at the expertise of Coral and General Electric and Brightite. Um Bright Knight as it says
1:37:13
on the slide is based in Florida and has designed and constructed over 6 gawatts of solar and storage projects in the
1:37:19
United States. and that um in the request for amendment, Bright Knight and PG have committed to having stringent
1:37:26
contracting standards to ensure the selected contractors and vendors can adequately support the construction and
1:37:31
operation of facility components proposed in the request for amendment. Um
1:37:38
to ensure that this happens, uh the department has recommended the council
1:37:43
adopt and amend several conditions. Recommended amen amended condition one
1:37:48
would require the certificate holder to provide notice of the identity identity and qualifications of all primary
1:37:55
contractors and vendors involved in the construction of the solar facility which is a fairly standard condition and
1:38:01
similar to what is in current condition one. Um the change is that the condition would also require uh PGE to identify
1:38:08
the individuals at big L that will manage and oversee the selected vendors and contractors. So there's an
1:38:14
additional layer of oversight included. Um similarly
1:38:20
recommended amended condition two which currently only applies to construction would require the certificate holder and
1:38:26
big L to contractually require all contractors and subcontractors for the construction uh and operation it should
1:38:33

say on the slide of the solar facility to comply with all applicable laws and regulations uh and the terms and
1:38:39
conditions of the site certificate.
1:38:47
Um, next we just wanted to highlight, and I think this is one of the things you will hear about during the hearing
1:38:53
tonight, is that the existing wind facility has experienced substantial appointment and maintenance issues over
1:38:58
the past few years. Um, and that we have uh been documenting incidents since
1:39:04
2022, including a blade detachment, uh, oil and grease releases, multiple
1:39:09
transformer failures, u multiple turbine door and hatch malfunctions. Um, those
1:39:15
are things that have been reported to the council and your regular compliance reports. Um, they are also things that are being addressed through corrective
1:39:21
action plans and other compliance actions at the site. Um but we have um
1:39:27
given those um issues and the lessons learned identified by the certificate
1:39:32
holder in the request recommended a few additional conditions um new conditions
1:39:38
be imposed uh to enhance the oversight of operations and maintenance activities
1:39:44
at the site. Recommended organizational expertise condition ones and two would
1:39:50
require finalization and implementation of a draft framework operations
1:39:55
maintenance plan prior to and during operations. Um that plan outlines the
1:40:01
operational responsibilities, long-term maintenance protocols, quality assurance processes, environmental compliance
1:40:07
measures, and emergency response and monitoring systems that would be relied upon to safely operate and maintain the
1:40:12
solar components. A version of that draft framework plan that includes
1:40:18
information the department believes will be required to be included prior to operation is included as a C to the
1:40:24
proposed order. Um the additional inquir information requirements included by the

1:40:30
department include things like budgeting, community outreach and reporting protocols.
1:40:37
Recommended organizational expertise condition three would incorporate construction progress reporting
1:40:44
requirements which are established in OAR chapter 345 division 26. Um but
1:40:50
where those reports are typically provided semianually the recommended condition would um increase the
1:40:56
frequency of reporting to every 3 months to allow the department to track uh progress and compliance more closely.
1:41:03
And then recommended and the last bullet should read recommended amended condition for would impose enhanced
1:41:10
incident reporting requirements similar to the requirements provided in OAR chapter 345 division 29.
1:41:22
Moving to land use, we just wanted to highlight um that there are numerous land use conditions uh intended to um
1:41:31
ensure compliance with the uh Sherman County zoning ordinance and other local land use uh criteria. Um but we wanted
1:41:38
to focus on the goal exception and recommended land use condition six, which would be uh implementing part of
1:41:45
that exception request. Um so in the um goal exception request, the
1:41:53
certificate holder provides several reasons uh why the re policy underlying
1:42:00
statewide planning goal three should not apply. And the department recommends that the council grant a goal exception
1:42:05
based on two of those reasons which are locationational dependence uh to uh both
1:42:11
existing in energy infrastructure including transmission and transportation infrastructure a as well
1:42:17
as a rural economic development reason. Um and the council or the department has recommended the council reject proposed
1:42:23
minimal impacts to other resources in consistency with state climate goals and policy reasons.
1:42:29

Um, as part of the local rural economic development benefit reasons, the
1:42:35
certificate holder has represented that it will finalize and implement a draft
1:42:40
community investment plan um, and contribute $1,600
1:42:46
per acre of cultivated land that would be occupied by the solar components to a community investment plan that would be
1:42:52
administered by the Mid Columbia Economic Development District. um recommended land use condition six would
1:42:58
require the um certificate holder to implement those representations
1:43:12
for fish and wildlife habitat. the um
1:43:18
and my apologies for not having the exact number, but um the uh facility would occupy mostly
1:43:27
cultivated farmland, but there would be I think around 24 acres. Um my apologies
1:43:33
again for that not being the exact number of category two um sage brush uh
1:43:40
sage brush shrubland habitat uh and other habitat areas. Um to mitigate for
1:43:47
those impacts, thei recommended fish and wildlife habitat conditions one and two
1:43:52
would require the certificate holder to finalize and implement a draft habitat mitigation plan and provide inkind in
1:44:00
proximity mitigation for habitat impacts. Um this is a pretty standard
1:44:05
approach for mitigation to habitat impacts. And one thing we wanted to flag here is that the habitat mitigation area
1:44:12
that was identified in consultation with the Oregon Department of Fish and Wildlife is a habitat mitigation area
1:44:18
adjacent to the Cardi generation facility in Morrow County. Um, we understand that that site is preferred
1:44:25
because it provides high-quality grassland habitat of a similar kind to the habitat that would be impacted and
1:44:31
is adjacent to other um habitat mitigation areas which would enhance the conservation of value of the habitat
1:44:38

mitigation area. Um
1:44:44
we also have a condition which is fairly similar to um standard conditions uh
1:44:50
requiring seasonal restrictions on construction work near active net sites. Uh and those were uh recommended in
1:44:58
accordance with recommendations from ODFW.
1:45:19
Um, we have several uh public services conditions
1:45:25
that are amended from uh conditions that would be in the existing site
1:45:30
certificate as well as new conditions for public services. Um I want to
1:45:35
highlight in particular recommended amended conditions 74 and 76 and then recommended new public services
1:45:41
conditions 1 and two. Um recommended amended conditions 74 and 76 would
1:45:47
require the certificate holder to demonstrate that an adequate water supply for construction operation has
1:45:52
been secured. Then that all water for construction will be legally obtained. that's similar to the conditions the
1:45:58
council has adopted um in other water constrained areas in the state. Um for
1:46:05
recommended public services conditions one and two, they would require the certificate holder to develop and
1:46:10
implement a construction worker housing plan um to provide strategies to minimize impacts to the local housing
1:46:16
supply. Um that is in part due to the limited nature of RV parking here in Sherman County um and the potential for
1:46:23
um adverse impacts uh if there's not a coordinated effort to to make sure construction workers get to appropriate
1:46:30
housing options.
1:46:35
Um, in addition to organizational expertise, as I mentioned earlier, I think one of the the things the council
1:46:41

will hear a lot about tonight and the thing the council has heard about in uh comments already submitted on the record
1:46:47
is wildfire prevention and risk mitigation. Um, we just wanted to uh
1:46:52
summarize some of the findings in the proposed order. Uh so conditions in in Sherman County are conducive to large
1:46:59
and fastmoving fires um grass fires and the probability of a fire in the
1:47:05
proposed solar microighting area is high particularly in this summer months according to data from the community uh
1:47:11
wildlife the community wildfire protection planning tool um as well as
1:47:16
the Oregon wildfire explorer map data. um areas of elevated fire risk in the
1:47:23
proposed solar microitarian area which are um shown by the darker red areas on
1:47:29
the map on the slide are concentrated around addition add existing residential structures and infrastructure. We also
1:47:37
want to point out that um damage to agricultural lands and um other areas is
1:47:43
is possible. Um you can see in this map too that there are some areas within canyons that um are mapped as having you
1:47:50
know white benefits from fire. Um those are really ecosystem benefits and don't reflect the the hazard of fire spread.
1:48:02
um design features and maintenance standards to reduce wildfire risk that
1:48:08
are discussed both in the um request for amendment as well as the draft
1:48:15
construction wildfire management wildfire mitigation plan that's attached to the proposed order and the proposed
1:48:20
order itself in um orienting arrays adjacent and parallel to existing RS
1:48:26
existing roads for access and fire brakes setting perimeter fences back at least 50 ft f feet from property lines
1:48:33
and facility components 20 ft back from those fences. Installing 20ft service
1:48:38
roads with 10ft vegetation clearance zones on either side. Maintaining 20 foot vegetation clearance areas around

1:48:45
the outside of all perimeter fences. Uh and maintaining 20 foot gravel or compacted soil buffers around the ODM
1:48:52
building uh collector substation and a proposed battery energy storage system.
1:48:59
Um and to show in a little bit more detail inside those areas called uh
1:49:04
vegetation clearance zones and areas within the solar array fence vegetation would be limited to height of 10 to 12
1:49:10
in during the rainy season uh when fires are less likely and then 1 to 3 in during the dry season. Um a minimum
1:49:18
vegetation clearance of 12 in would also be maintained from electrical equipment at all times.
1:49:27
Uh, as far as the conditions, um, wildfire prevention and risk mitigation
1:49:32
conditions one and two would require the certificate holder to develop and implement a construction wildfire
1:49:37
mitigation plan, whereas wildfire prevention risk mitigations conditions three and four um would apply to the
1:49:44
operation of the facility. Um, the certificate holder would be required to develop and implement a operational
1:49:51
wildfire mitigation plan. Um but the condition as recommended would allow the certificate holder to rely on the um
1:49:59
public utility commission reviewed wildfire protection plan or other plans included in the um final order or
1:50:06
approved by the department to satisfy the requirement. Um and I'm highlighting this. I do want to point out that there
1:50:11
is a draft construction wildfire mitigation plan attached to the proposed order. Um but there is not an
1:50:17
operational wildfire mitigation plan at this time. Although some of the um
1:50:23
requirements and vegetation standards have been incorporated into other plans.
1:50:33
Um in particular um vegetation management uh conditions
1:50:40

would be incorporated into a draft comprehensive revitation and soil management plan which is required under
1:50:47
recommended soil protection conditions 1 to four. Um and then I wanted to just
1:50:52
highlight that the setbacks from the property lines um are uh being
1:50:57
recommended under a land use condition recommended land use condition one.
1:51:05
Okay. Um that concludes my review of uh the things that we thought would be most
1:51:11
important for the council to be aware of and things that the public might be interested in before this. Um, I do want
1:51:16
to go quickly over a review of the comments that we've received to date and then I'll turn things over to Sarah. But
1:51:22
I'll just pause for a second in case there's any questions.
1:51:31
Okay. Um, so I my site is a little out of date. I I put this together at about
1:51:38
noon today, but um, since that time we received one additional comment. So, as of today, the department has received
1:51:44
nine written comments. Six of those comments are from Kathern Mcola. Um, one
1:51:49
of the comments was from the Mid Columbia Economic Development District. Uh, the certificate holder provided
1:51:54
comments and then we also received comments from the Confederated Tribes of the Warm Springs Reservation of Oregon.
1:52:00
Um, I believe uh most of the folks who provided comments are here tonight, so
1:52:06
I'm going to go over what's in there very very briefly. Um I did I do not have a a slide for the Mid Columbia
1:52:12
Economic Development District's comments and I'll just summarize that they explain their um relationship with the
1:52:18
community investment plan and their um their uh partnership in implementing it.
1:52:23
So good comments to review. Um issues raised in comments by Miss
1:52:30
McCulla include concerns about the certificate holders ability to safely operate and maintain the proposed

1:52:35
facility components. Uh and those comments provide documentation of ongoing maintenance issue at the
1:52:41
existing wind facility. Um the comments provide concerns about the certificate holder's ability to maintain vegetation
1:52:47
equipment on site uh in a manner that provides protection from wildfire. Concerns about potential liability for
1:52:54
damages uh to the solar facility from a wildfire arising from farm practices. Um
1:53:02
uh concern over the lack of the operational wildfire mitigation plan. uh a comment that exhibit P which is the
1:53:10
wildlife uh habitat exhibit and the biological assessment in the request do not adequately address impacts to
1:53:16
mammals and other species that could be present at the site such as pong horn and mu deer uh concern and agg and and
1:53:23
concern about the accuracy of a single hearing again I'm summarizing this very quickly there's obviously more detail in
1:53:29
those comments and the commenter herself I believe will be touching on a lot of these topics tonight uh but I just
1:53:35
wanted to give a overview of what was in there. Um the certificate holder um also
1:53:42
provided fairly extensive comments requesting corrections to the facility description, minor corrections to
1:53:48
certain findings and conditions in the site certificate. Um I'm sure you will hear in more detail from them about
1:53:53
those tonight. Um they've requested additional flexibility in transmission corridor sighting under the proposed
1:53:59
recommended condition Gen T05. um request for changes on timing of
1:54:05
compliance with water rights conditions preWR1 and operations WR1 relating to the
1:54:13
timing of providing a well log for new wells and flow meter readings for existing wells um based on when it's
1:54:19
possible to get that information u and request for uh release of the

1:54:25
prohibition on vegetation removal for during critical periods for ground nesting birds um if clearance surveys
1:54:32
are conducted prior to removal. Um, and then I will I don't have a slide
1:54:40
for the comments from the Confederated Tribes of Warm Springs, but um I do think it's important just to raise those that they uh requested
1:54:47
uh specific uh review of a condition related to the scope of when um cultural
1:54:54
resource monitoring would be required. Um they've asked that it be required during all ground uh disturbing
1:55:00
activities, not just in ground disturbing activities within a avoidance buffer.
1:55:06
Um yeah, and so that concludes my presentation. Um and unless there's
1:55:11
questions for me, I will turn it over to the presiding officer to give an overview of the hearing process.
1:55:32
Okay, good evening and welcome. This is the public hearing on the proposed order
1:55:37
on request for site certificate amendment 4 for Biglo Canyon Wind Farm.
1:55:43
I Sarah Esther, senior policy adviser for the Oregon Department of Energy Sighting Division, am serving as the
1:55:49
presiding officer for this hearing. Today is January 15, 2026. The time is
1:55:56
6:27. This public hearing is being held at an
1:56:02
energy facility sighting council meeting in person here at the Grass Valley Pavilion in Grass Valley, Oregon. This
1:56:09
hearing is also being held via WebEx webinar with a call-in option for those who cannot participate in person or via
1:56:17
webinar. Please note that this hearing is being recorded and the presentations,
1:56:23
written comments, and all verbal testimony are part of the decision record for this amendment request.
1:56:35
Okay. So hopefully you're aware the comment period on the department's proposed order on request for amendment
1:56:42

4 extends through January 30th at 5:00 p.m.
1:56:47
It is important that you know the following information.
1:56:53
A person who contends that the council should reject the request to amend this site certificate or that council and its
1:57:00
final order should reject or revise certain aspects of the department's proposed order must meet the following.
1:57:08
You must comment in person or in write writing prior to the close of the comment period. Again, that January
1:57:14
30th, 2026 5:00 p.m. deadline. You must raise your issue with sufficient
1:57:20
specificity to afford the council, the department, and the certificate holder an adequate opportunity to respond.
1:57:27
To raise an issue with sufficient specificity, you must in your comments identify the recommended findings of
1:57:34
fact, conclusion of law, or conditions of approval that are included in the proposed order to which you object. You
1:57:41
need to specify the council standard or other applicable state or local requirement on which your objection is
1:57:47
based and present facts or statements that support your objection.
1:57:53
If your comment is not made with sufficient specificity, the council will not be able to make changes in its final
1:57:59
order based on your comments.
1:58:07
Okay. So um if if you comment during this comment period which started
1:58:13
December 5th again extends through January 30th you will automatically be part of a subsequent process um which is
1:58:22
designed to further evaluate the issues that you raise. This is a new process for us so it's
1:58:29
going to be interesting. So uh the certificate holder which is Portland General Electric is required to respond
1:58:37
to all comments. The department may respond but the holder is required to
1:58:42

respond to all comments and the so certificate holder and the department
1:58:47
have a deadline of February 13 to respond to your comments. These responses are going to be provided to
1:58:54
you in the same method that you commented. So, if you email your comments and we have your email address,
1:59:00
that's how you're going to receive responses. If you submit your comments in hard copy with a physical address, we
1:59:06
and we don't have an email, we will respond. Certificate holder will respond in writing to your physical address.
1:59:14
If you don't provide an address, no email, no physical address, you will not be able to participate in this
1:59:20
subsequent process. We will have no way to communicate with you and respond.
1:59:25
So, what to expect? Um, so first and foremost, certificate holder and the
1:59:32
department are going to be trying to determine if your comments have been raised with sufficient specificity. So,
1:59:38
I just read through that. Did you identify recommended findings of fact that you have an issue with? Have you
1:59:44
identified a council standard or applicable requirement that you believe is not being met? And have you provided
1:59:50
facts or supporting information to support your objection? If you haven't met any of those, the response is going
1:59:57
to identify that one one or all of those things. If you have provided comments
2:00:02
that meet the sufficient specificity criteria, certificate holder in the department are are going to say that and
2:00:10
we are going to either identify where your issue is believed to be addressed and potentially already resolved within
2:00:17
the proposed order or it's going to provide a resolution to your issue if it's not yet addressed. Um, so it's kind
2:00:25
of a big step. Again, February 13th, you will be getting this response that has all of these words or may not be

2:00:33
familiar with, but that's coming. In the department's response, we plan to provide, you know, helpful information
2:00:40
to help you understand how to navigate through this process. Um, and this, you know, this is intended
2:00:46
to help further evaluate your comments and make sure that we understand and
2:00:52
that we get it right. Um,
2:00:57
okay. So then that's not the end of it. So February 13th, certificate holder and
2:01:03
the department are responding. Then you as a commenter will have an opportunity to reply to those responses and you have
2:01:11
a deadline that's already been established in the department's notice. That deadline is February 27th. So you
2:01:18
don't have to, but you can choose if if the department and or the certificate holder has said your comments were not
2:01:25
raised with sufficient specificity. We don't know what standard your comments are related to. You didn't provide any
2:01:30
facts. You can then take that and identify the council standard and provide facts. Um you can disagree. It's
2:01:39
it's a process designed to sort of continue evaluating those comments.
2:01:45
And then after you respond, if you choose to respond, both certificate holder and department have a final
2:01:51
opportunity to provide sir reply. Um again, ideally it's a resolution. Um we
2:01:58
will see how that works out. I believe our deadline for sir reply is March 6th.
2:02:04
So that's kind of the whole extent of the comment process.
2:02:09
And feel free to ask any of us questions after the meeting. Chris Clark's information will be on a slide later.
2:02:16
You're free to reach out to him at any time and and ask how this is going to work or how it's working once it gets
2:02:22
once that February 13th date uh comes forward.

2:02:28
Okay. So, there are several acceptable means for submitting comments on the record. You can submit comments
2:02:35
electronically through our comment portal. This is a link to our comment portal. Um, if you submit through our
2:02:41
comment portal, you will get an email confirmation that you have submitted comments. So, please make sure you get
2:02:47
that. It is important that you include your contact information and comments you submit on the comment portal so that
2:02:53
you have an opportunity to get a response and further the evaluation.
2:02:58
You can also submit comments in hard copy by mailing to the department's Salem office, 550 Capitol Street
2:03:05
Northeast, Salem, Oregon. Attention, Chris Clark. And of course, you can provide comments verbally tonight. As I
2:03:13
said, this meeting, this hearing is being recorded. We will have the recording transcribed and that
2:03:18
information will be available on our website.
2:03:24
Okay. So, we're almost getting started with your turn. The order tonight will start with an opportunity for the
2:03:31
certificate holder. Then, we'll open it up to members of the council. After
2:03:36
that, I'm sorry. Then we'll open it up to members of the public. And after that, we'll open it up to members of the
2:03:42
council. And then we'll return to the certificate holder. We may establish a time limit on members of the public
2:03:48
depending on how many individuals are interested in commenting tonight.
2:03:53
So, let's go ahead and start with the certificate holder. Is the certificate
2:03:59
holder interested in providing comments?
2:04:21
testing. That sounded good. Okay, great. Uh, good evening everyone. Um, uh, Chair
2:04:28
Condan, members of the council. For the record, my name is Kristen Sharon. I'm vice president for public policy and

2:04:33
resource planning for Portland General Electric. Uh PG is a fully integrated um electric utility that's has a service
2:04:40
population of um nearly two million Oregonians and twothirds of the state's
2:04:45
economic activity occurs within our service area. Can you hear me all now? That's better. Okay, great. Um as owner
2:04:52
and operator of the Biglo Canyon wind farm, PG has a long-standing history and connection to Sherman County. Uh in
2:04:58
2024, PG Yeah, I can. There we go.
2:05:07
All right, let's try that again. In 2024, PG contributed $7.3 million in
2:05:14
property taxes, about a third of the county's property tax base, helping to support schools, parks, infrastructure.
2:05:20
Sherman County is a very special place, and the opportunity to represent PGE in the community here tonight is not lost
2:05:26
on me. But I'm here today to discuss the the importance of the Biglo Canyon Wind Farm RFA4 site certificate amendment to
2:05:34
PGE's resource portfolio to our customers and to Oregon's clean energy and economic development goals. We
2:05:40
appreciate the Oregon Department of Energy staff recommendation to FSE to approve this amendment. The Big Low
2:05:47
Canyon Wind Farm has supplied clean affordable energy to Oregonians since 2007.
2:05:52
Being one of the first major wind operations in the state, there were learning lessons along the way,
2:05:57
including around maintenance and performance. And since that time that we began Biglo Canyon, we have added
2:06:03
thousands of megawatts of clean energy to our system PG and our partners, including wind farm in southeast
2:06:09
Washington, um a wind farm in Montana, uh a combined wind, solar, and battery
2:06:16
uh here in Oregon. Uh the largest of its scale to uh open in the United States.
2:06:22

Um, but we are committed to continuously improving and upgrading equipment to increase efficiency and reduce costs for
2:06:29
our customers. An ongoing maintenance and overhaul project at Biglo Canyon Wind Farm to continue safe and reliable
2:06:35
plant operations for years to come is well underway as we pursue now adding solar and battery storage to the site.
2:06:42
Through this amendment that we're proposing, the addition of solar and battery storage at the site will help to
2:06:47
optimize clean energy generation and delivery in support of our customers growing electricity,
2:06:55
clean energy, and emissions reductions requirements. As we plan our system, affordability for
2:07:00
customers remains top of mind. And PGE has aggressively pursued federal production and investment tax credits
2:07:06
that have reduced the cost of clean energy projects on our system by at least 20 to 40%. To date, PG and its
2:07:13
partners have secured over a billion dollars in federal tax credits for our clean energy portfolio to the benefit of
2:07:19
our customers. However, recent changes in federal policy will rapidly sunset clean energy tax credits, escalating the
2:07:27
long-term cost of renewable energy and storage and threatening customer affordability and the pace of achieving
2:07:32
the state's clean energy and economic development objectives. An amended site
2:07:37
certificate allows this project to move forward on a timeline that can capture the value of those existing federal tax
2:07:43
credits while they're still available for our customers before they're phased out, aligning with PGE and the state's
2:07:49
focus on delivering affordable, reliable, and increasingly clean power while acknowledging while achieving the
2:07:55
directives outlined in Governor Cotek's recent executive order to accelerate renewable energy sighting.
2:08:01

Colllocating solar and wind power generation equipment allows us to take advantage of the existing infrastructure
2:08:06
on the site like transmission lines and substations and to reduce the overall impact to the land and to the
2:08:12
environment. Adding solar capacity complements the existing wind capacity since wind and solar typically produce
2:08:18
peak power production at different times of the day. This allows both renewable energy resources to work together to
2:08:24
meet a broader range of our customers energy needs, increasing PGE's overall system reliability and the value of the
2:08:31
site overall to our customers. The addition of battery storage will also provide flexibility to the grid,
2:08:37
allowing energy storage when demand is low and its use when demand is high. The right mix of energy resources in the
2:08:43
right locations can help reduce reliance on fossil fuels and drive a cleaner, more affordable and reliable energy
2:08:49
resource mix. Fiji has already made strong progress toward achieving the state's emissions targets with an
2:08:56
overall resource portfolio that is 45% non-emitting as of the close of 2024.
2:09:02
And this includes um uh projects like the Big Low Canyon wind farm. The site
2:09:08
certificate we're seeking today to add solar and storage will further PG's progress toward meeting our 2030 state
2:09:14
emission targets to identify the least cost least risk portfolio of resources that are needed
2:09:21
to meet our customers current and future energy needs as well as state clean energy requirements as overseen by the
2:09:26
Oregon Public Utility Commission. PG engages in long-term integrated resource planning. In our most recent integrated
2:09:33
resource plan updated in July of 2025, PG identified a need to procure an
2:09:39
additional 4,500 megawatts of clean energy resources. This represents about a 16% increase
2:09:46

since PGE's prior that had been filed only in 2023.
2:09:51
Projects like the proposed addition of 125 megawatts of solar and 125 megawatts
2:09:56
of storage at Biglo are critical contributors to this growing clean energy need.
2:10:02
PG's all source request for proposals is a transparent, regulated, competitive process by which interested developers
2:10:09
submit detailed project proposals for consideration as we plan to meet our customers energy needs. the 1600
2:10:16
megawatts of resources that PG identified on the final short list of projects that resulted from our 2023 all
2:10:22
source request for proposals competitive bidding process included the big low solar project was acknowledged by the
2:10:29
Oregon public utility commission and the projects were selected for their potential to deliver affordable reliable
2:10:35
and cleaner energy by selecting projects through this competitive process verified by an independent evaluator PG
2:10:42
can add high value responsible projects that capture significant federal incentives and reduce costs while
2:10:48
meeting the state's growing energy needs. Given the shortened timeline that now exists to capture tax credits, the
2:10:55
importance of maintaining a project schedule is paramount. We have partnered with Bright Knight to ensure responsible
2:11:01
and timely delivery of this project that recognizes that this is a critical opportunity in time for Portland
2:11:07
Generals, the state, and Sherman County. The certificate amendment will allow critical energy need and capacity to
2:11:14
meet Oregon's economic development needs and the state's emission targets. So, we urge the energy facility sighting
2:11:21
council to approve the site certificate amendment recommended by staff, thereby maintaining the development schedule
2:11:26
with a final decision in March 2026. And with that, I want to thank you for

2:11:31
your time and I want to hand this over to our project partners at Bright Knight to provide more details on the project
2:11:36
itself as proposed. Thank you, Kristen. And thank you, Chair Condan and members of the council. My
2:11:42
name is Jess Molen. I'm executive vice president of development at Brightnite. I've spent nearly 20 years developing
2:11:49
renewable power projects across the United States. Earlier in my career, I served as a US Air Force pilot, an
2:11:56
experience that continues to shape how I approach complex infrastructure development, balancing creativity and
2:12:02
innovation with discipline, precision, and an unwavering focus on safety and
2:12:07
reliability. Those same principles guide Bright Knight as a company. Bright Knight is developing over 30 gawatts of
2:12:14
clean energy projects nationw nationwide with 11 gawatts located in the Pacific
2:12:19
Northwest. Across our portfolio, we are committed to safety, responsible cost
2:12:25
management, and building durable partnerships with the communities where we operate.
2:12:30
Our team consists of some of the most accomplished energy project development and operation professionals within the
2:12:35
entire industry. The team at Brightonite is like-minded. We want to be part of a company that is a reliable partner and
2:12:43
committed to the communities we invest and operate in and one that has a strong financial backing with leading edge
2:12:49
system design. Our ability to deliver projects responsibly and on schedule is
2:12:54
validated by our backing by investment partners at Goldman Sachs, global infrastructure partners now owned by
2:13:00
Black Rockck and Cordelio Power, providing the financial strength and stability our utility partners and their
2:13:07
customers expect. Optimizing project to projects to
2:13:12

deliver maximum value to customers and communities while minimizing impacts is central to how it operates. We have
2:13:20
taken those lessons learned and built on that track record here with the Biglo solar and energy storage project. You
2:13:26
will hear this evening in detail the innovative planning and design that has gone into this project, the increased
2:13:31
efficiencies and output BigLow will add to the grid and the best-in-class features to improve operational safety
2:13:37
and resilience. Bright Knight is pleased to be here this evening in partnership with PGE to speak with council about the
2:13:44
Biglo solar and storage project and the steps that our teams have taken to develop a thoughtful responsibly cited
2:13:50
project. Thank you. And now we'll bring up the actual experts.
2:14:10
Thank you, Chair Condan and members of the council. We also want to thank the Oregon Department of Energy staff for
2:14:16
their thorough review and the work reflected in the proposed order. For the record, my name is Kathleen Campanella
2:14:22
and I'm senior director of development for Bright Knight and I'm responsible for the development of the Biglo Solar
2:14:28
and Storage Project. I'd like to begin this evening with a simple question. What does it mean to
2:14:34
site a project responsibly? For this project, responsible sighting
2:14:40
wasn't a single decision or a single mitigation measure.
2:14:48
It's a it's a principle, excuse me for that. It's a principle that affected nearly every aspect of the project's development and engineering. It shaped
2:14:55
where the project is located, how the site boundary was drawn, how impacts
2:15:00
were avoided and minimized, and how remaining impacts are addressed.
2:15:06
I want to briefly summarize that approach and how it is reflected in the department's analysis.
2:15:17
I'll start by discussing collocation. This is a renewable energy project and
2:15:22

by definition it delivers an environmental benefit. But like any infrastructure project, it also has
2:15:29
impacts. Responsible sighting means acknowledging that reality and finding the option with
2:15:36
the least impacts. Collocation is just that. For this
2:15:41
project, it integrates solar and battery storage with the existing Biglo Canyon wind farm, therefore reducing the need
2:15:48
for new transmission lines, new access roads, and disturbing additional land.
2:15:58
Is that good? Another core element of our approach to responsible sighting is community engagement and listening. This allowed
2:16:06
us to better understand and address local concerns, resulting in a design that is responsive
2:16:11
to the community's voice. We participated in dozens of one-on-one conversations with local leaders,
2:16:19
neighboring land owners, agricultural producers, and community members.
2:16:29
Finally, I want to highlight our outreach and coordination with local organizations and public service
2:16:34
providers, including county departments, agricultural and conservation groups,
2:16:40
economic development entities, and emergency service providers.
2:16:45
These discussions are reflected in project plans and in the conditions of the proposed order that ensure ongoing
2:16:52
coordination with public service providers. Taken together, these efforts reflect
2:16:57
the same responsible sighting approach I referenced at the outset, anticipating
2:17:02
impacts, engaging early, and responding in a way that aligns with local priorities.
2:17:09
With that, I'll pass it on to Todd to discuss vegetation and wildfire management and project safety
2:17:14
considerations. Thank you, Kathleen. Chair condan, counselors, my name is
2:17:20
Todd Elwood. I'm the senior permitting director for Bright Knight. Bright night and PGE have heard from the
2:17:26

very beginning how important vegetation management and wildfire risk are for this project. We appreciate the input
2:17:32
received from ODO staff, the reviewing agencies, and the community that have all informed the design of the project
2:17:39
and the draft plans before you today. Rather than relying on any single
2:17:44
measure, the project uses an integrated approach. Project design, construction planning, long-term operations, and
2:17:51
community coordination investment all work together to support long-term landscape resilience. The goal is to
2:17:58
reduce ignition risk, limit fuel buildup, support early detection and response, and strengthen regional
2:18:04
wildfire preparedness. The project is designed to reduce risk from the outset. The layout, materials, access roads are
2:18:12
all planned to minimize ignition sources, break up fuel continuity, and create defensible space around solar
2:18:18
panels, the best, the substation, and related infrastructure. The project has
2:18:24
been designed to exceed fire code requirement by maintaining no less than a 20 foot non-combustible buffer around
2:18:30
the perimeter of the site. This cons conservative approach reflects our commitment to fire safety and directly
2:18:36
responds to input received through outreach with local fire agencies and local and neighboring land owners.
2:18:44
Wildfire mitigation is addressed during every phase of the project. There will be dedicated wildfire mitigation plans
2:18:50
for both construction and operations, including equipment standards, weather-based work restrictions, active
2:18:56
monitoring, and coordination with fire agencies and local responders. There will also be e emergency response plans
2:19:02
for each phase of the project and training for all contractors as well as local responders. The project will use
2:19:08

low fuel vegetation. Restoration seed mixes are comprised of native native
2:19:14
grasses and forbes that produce less biomass, cure more slowly, and do not create continuous fine fuels. Our
2:19:21
proposed seed mix will reduce the need for repeated mowing or treatment, which in turn lowers ignition risk from
2:19:28
maintenance activities. We also take a proactive approach to noxious weed prevention. Rapid reveation, clean
2:19:35
equipment practices, and ongoing monitoring help prevent invasive weeds that increase fire risk and reduce land
2:19:41
productivity. Over the long term, vegetation management continues through the operation and ma maintenance plan.
2:19:47
This includes regular inspections, adaptive management, and ongoing fuel load control for the life of the
2:19:53
project. Soil stability and erosion control are also key parts of this strategy. Proper soil handling,
2:20:00
restoration. Proper soil handling and restoration will reduce weed invasion and help
2:20:05
prevent conditions that can worsen wildfire behavior. Reveitation and weed
2:20:10
control contractors will be held to stringent qualification standards. All of these measures help protect adjacent
2:20:16
agricultural and rain uses by reducing the potential for wildfire spread beyond
2:20:21
the project site. Did advance? Um, taken as a whole, our
2:20:29
commitment to a comprehensive management program demonstrates the project will coexist with and not undermine ongoing
2:20:35
agricultural use in the area. As previously mentioned, the use of setbacks and micro sighting also help
2:20:41
ensure the project will be compatible with neighboring farming operations. Brightite has implemented setbacks
2:20:47
buffers and will have three 2,000galon firewater tanks outside the perimeter fence that can be used by by our
2:20:55

neighbors. The proposed order contains numerous conditions to require accountability and long-term
2:21:00
enforcement, and we support staff's recommendations. Thank you for your time, and I'll hand it off to Lena to
2:21:08
discuss goal three.
2:21:30
Chair, are you guys always going to forget the microphone? Chair condan, council members, my name is Lennena Cop.
2:21:36
I am a environmental specialist with Portland General Electric and we wanted to cover a couple things regarding the
2:21:44
um goal three exception and a little bit more information about the community investment plan.
2:21:50
As you heard from Chris's presentation, the staff is recommending that the goal three exception uh be approved based on
2:21:56
the location dependency and the creation of rural economic benefits. As Kathleen
2:22:02
spoke to earlier, colllocating the solar uh facilities with this particular location is very important to take
2:22:09
advantage of the existing transmission lines, surplus capacity on those transmission lines and existing BPA um
2:22:17
substations. The real economic benefits will be realized through the implementation of a
2:22:24
community investment plan um which was developed from extensive community engagement and listening. The plan
2:22:30
includes pre-screening projects identified through outreach such as dryland wheat agrovotayics agricultural
2:22:38
wildfire risk minimization and capacity building funding fund matching for soil
2:22:43
and water conservation district programs for wheat farmers next generation farming innovation and technology
2:22:50
training program and capacity building for wheat growers. So those are the
2:22:55
pre-screen projects included in the community investment plan. The plan also includes provisions for additional
2:23:00

projects to request funding and a local governance structure through the Midcolia Economic Development District.
2:23:08
The analysis of indirect economic impacts uh performed during our amendment preparation indicate that 1600
2:23:15
acres per acre of farmland taken out of production prior to starting construction will be applied to the
2:23:21
fund. This is in addition to the projected $40 million in property tax revenue.
2:23:27
And we also estimate that on average there will be 165 union workers on site each day during the approximately 18
2:23:33
months construction period generating additional spending in the local community.
2:23:39
In addition to staff's acceptance of RFA's location dependency and rural economic benefit
2:23:46
reasons, PG will be advocating for the council to recognize the project's consistency with state climate goals and
2:23:52
policies. As Kristen discussed in her comments, the site amendment to add
2:23:58
solar and storage will further PG's progress towards meeting our 2030 mission targets mandated by the state.
2:24:04
And for that reason, we will be requesting the council recognize an additional reason to support the goal three exception. And we will provide
2:24:10
additional evidence in the written record to support that request.
2:24:22
Okay. I also wanted to touch on operations and maintenance. Uh we know that there are community concerns with
2:24:28
the past maintenance and performance of the Biglo phase 1 wind assets. PG's ongoing maintenance and overall project
2:24:34
has been addressing those concerns and route issues and Dan will be speaking to those in just a moment. But regarding
2:24:40
the solar battery, um, as has been mentioned by previous speakers and the staff's presentation, the proposed order
2:24:47
requires a standalone onm plan to be approved by the department with review and updates if needed on an annual
2:24:54

basis. The onm plan covers ongoing inspection, monitoring, reporting, and
2:24:59
enforcement by the department at a level not previously specified in the existing big site certificate or any site
2:25:05
certificate issued by the council previously. The plan will also integrate commitments
2:25:11
from the other major operational plans such as the comprehensive reveation and
2:25:17
soil management plan and the operational wildfire mitigation plan. The content of all the plans is informed by the
2:25:23
department's involvement in other recent solar and battery projects and addresses the challenges faced at those sites with
2:25:29
the goal to reduce those challenges at future sites. The development and approval of the
2:25:34
plans are mandated by the site certificate and will be reported on for the life of the project at varying
2:25:39
frequencies. In addition to all those improved details and specific requirements, the
2:25:45
department itself has put significant efforts into their compliance program, has additional compliance staff and
2:25:50
retains the authority to inspect the facility and require corrective action if anything is found to not meet the
2:25:56
requirements. And now I will hand it over to Dan.
2:26:01
Thank you, Lena. For the record, my name is Dan Wilson and I'm the director of renewable operations for Portland
2:26:07
General Electric. In addressing the age and the material condition of the Bigalow wind farm at its 18-year age and
2:26:14
after a long period of stable operation, the Bigalow wind farm has shown an
2:26:20
increase in equipment failures over the past four years. And this has signaled a
2:26:25
condition of age related degradation, a trend that we confirmed by benchmarking
2:26:30
against other industry leaders. In direct response, we have implemented a comprehensive and proactive enhancement
2:26:37
plan to secure the asset's future reliability. The key strategic actions include first

2:26:44
to operate and maintain we have hired a new service provider that is an industry
2:26:49
leader for all wind generation. The performance of the service is reviewed by PGE's leadership to ensure top-notch
2:26:56
compliance to the maintenance standards. Second, we have increased inspection frequencies for key components. Third,
2:27:04
we are executing a critical redesign and replacement program for the obsolete and
2:27:09
failureprone V82 pitch systems which have been a primary source of downtime.
2:27:16
Fourth, after completing of the pitch system replacements, we are cleaning the towers, hubs, and blades. In summary,
2:27:24
the wind farm's current condition reflects its age, but we are actively mitigating those risks through a
2:27:31
targeted capital enhancement and maintenance strategy. The centerpiece of this effort, the pitch system overhaul
2:27:38
directly addresses most of the significant historical failure mode positioning an asset of improved
2:27:44
reliability and extended operational life. Thank you very much and we look
2:27:49
forward to hearing from public comments and will return after our closing. Thank you.
2:28:01
Thanks.
2:28:09
Is there a separate presentation that goes on now? Why is it the last slide?
2:28:21
Okay. Okay. Thank you, certificate holder representatives. We'll now move
2:28:27
to members of the public. Nancy, could you confirm how many comment cards we
2:28:32
have? While she's doing that, is there anyone in the room that would like to provide
2:28:38
verbal testimony tonight that has not filled out a comment card? If you could
2:28:43
raise your hand, seeing none. Okay. Five.
2:28:51
And if you are on the webinar or on the phone, could you raise your hand if you're interested in providing uh verbal
2:28:58
testimony

2:29:06
or she can call you do a time limit on five?
2:29:11
Do you want to do a time limit?
2:29:19
Let's
2:29:26
let's do seven. Okay. So, we have eight individuals that are interested in
2:29:31
providing uh testimony and the council an opportunity to provide comments and
2:29:37
questions and the certificate holder can come back. So, we're going to put a 7 minute time limit on your comments. Note
2:29:43
this is you can provide comments all the way through January 30th. Um, can you put a timer on the screen?
2:29:52
Okay. So, will you stand up and wave your hands when your timer goes off?
2:30:00
Okay. So, I'm going to let you call the commenter since you have the cards. Okay. So again, just as a reminder for
2:30:06
any individuals that wish to provide testimony tonight, please state your name, identify if you're representing
2:30:13
anyone other than yourself, and confirm your physical mail or email address or make sure that it's written on the
2:30:19
comment card. Okay, now we'll turn it over to you.
2:30:26
Okay, our first commenter is Kathy McCulla. Come on up, Kathy.
2:30:32
Okay. Okay. And just so you know, go ahead and come on up. I'll start the timer when
2:30:38
you start to present. Um, and then I'll just raise my hand
2:30:44
when you're at one minute left to go.
2:30:51
And then just a note, if you're going to use the pictures as part of your comments, we'll just take photos of
2:30:57
them. So, but we need to do that before you take them away because once you enter them into the record, they're part of the record.
2:31:09
Should I sit down or stand up? I mean, probably sit down standing up
2:31:14

that's going to pick up on Okay, I can talk.
2:31:20
There you go. Um, you closer.
2:31:32
Stand just like this.
2:31:37
Okay. It's a whole lot. Okay. Thanks.
2:31:43
So, pick up the whole thing. You're gonna stand. You need to hook up here. I think I can sit.
2:31:51
Kathy McCulla and I live right under the project about a half mile from the PG building
2:32:00
and I'm a retired 747 captain for Delta
2:32:07
and I'm also a microbiology environmental health graduate from
2:32:12
Colorado State. When this project was first started, you wouldn't have found
2:32:19
anybody more excited about it than I was because to me, these looked like giant
2:32:26
propellers. I loved it. I I wanted clean energy and
2:32:31
wind and we could farm around them. That was the best. It in fact, it helped us.
2:32:37
We got new roads. We got in and out of fields we could never get into before. It was amazing.
2:32:45
We were probably the biggest proponents of this project
2:32:50
until it construction was great. The first
2:32:56
five years, great manager, uh, new equipment, everything was perfect. The
2:33:03
next 10 years, horrible. I mean, horrible. We were picking up
2:33:09
pieces in our field. There were nose cones dropping. They all started leaking, all of them in
2:33:17
phase one. And the culmination was when a blade dropped
2:33:24
February 2022, waking up my husband and my dog. I wasn't home at the time.
2:33:31
This is the blade down here on the ground there. This is our house across
2:33:39
the road. Was really close. It was really loud. We had been complaining for a while because there had been so many
2:33:45
pieces. PGE wouldn't listen to us. They really would not listen and we didn't

2:33:52
know what else to do. I mean, even after the blade fell and PGE got Allight to
2:33:59
come in and start inspecting all the bolts in all 76 of the first Vestus
2:34:04
towers. Nothing changed. All tight came. All tight went uh one
2:34:13
company before them said it was the greasiest mess that they had ever seen and it was unsafe and they quit. They
2:34:19
had to throw their coveralls away after one day. It was it was one of those things that
2:34:26
we knew would happen. We we'd been watching. This is what they still all
2:34:31
look like that they haven't they haven't gotten better. They aren't cleaner. None
2:34:37
of them have. There's one that has the new prototype on it, but four years after the blade drop, nothing has been
2:34:45
fixed. They have all the parts ordered, but nothing is different to us. And in fact, the old
2:34:55
um Brad Jenkins, who was in charge of the project before, lied to the
2:35:01
newspaper and said, "Just because they're dirty outside doesn't mean they're dirty inside."
2:35:07
Well, I have a picture of the inside. It's horrible. The wiring's cracked. It
2:35:15
It's really bad. And And they flat out lied to us.
2:35:21
So, my problem is, how do I trust this company for solar in a county that is so
2:35:30
fireprone, you would not believe it? Our fires, this is under big loaf. This is
2:35:35
one of the fires we've had. We have six to 10 fires a year during harvest and
2:35:40
around the dry season. And they're scary. I mean, they are they they move
2:35:45
fast. My neighbor barely got in the car and out of her house as a wall of flames was coming towards her. We all run to
2:35:53
fight them. We all have water um on the back of our pickups. We have shovels. We
2:35:58
have hose. We have everything like that. But they still move fast. And I mean
2:36:04
fast. There were probably 50 pickups and farmers fighting this fire. And this was
2:36:10

this was a couple years ago. It's just one of the many. And if I trusted PGE
2:36:17
with their with their wind,
2:36:23
I I can't trust them with their solar. I can't trust that I'm safe in my house if
2:36:28
they're not going to be honest.
2:36:35
And if they're going to tell people that we lie, there's a whole new regime at PGE now. I
2:36:43
I admit that because I like Dan. I like the people who are there now.
2:36:49
And I think we're on a different tap. I think we're going a different direction.
2:36:55
But unless it's in the site certificate, they're not going to do anything. And
2:37:01
most of this most of this amendment is construction. Very little of it concerns
2:37:09
actual operation once the construction phase is over. We really need a strong
2:37:15
site certificate. Even with PGE knowing all that, they never reported anything
2:37:22
until I went to the paper and got the Orgonian to write four months after. No,
2:37:28
wait. February is when the blade dropped and I think the paper maybe September
2:37:36
came out and there was no change, nothing. They knew pieces were dropping
2:37:43
and I just I I'm glad they have new maintenance. I really am. Or new, you
2:37:49
know, new people. But we've got to have a strong sight certificate. We could not
2:37:54
get them to give us a holdless clause for farming. So if we accidentally start a fire and it burns into their facility,
2:38:01
that's like a that that's a two billion dollar facility we don't have money for.
2:38:08
The only other thing I was going to say is bright night's got great ideas. I mean for fire and and as 747 captain
2:38:17
lithium ion batteries are scary. They are just plain scary. My my vinyl sighting on my house melted in 2021 to
2:38:26
the west side. That's how hot it gets there. So if you don't have good,
2:38:32

you know, good protection, you're in tr you're in trouble. So this is how they look. They say, "Oh no, they look great.
2:38:38
They're They're white. They're clean. Yes, they are. This is how the transform
2:38:44
boxes look that PGE has under the towers. How am I supposed to think that
2:38:49
the batteries are going to look okay? I I just So, I hope I understand we have
2:38:55
to have this green energy mandated, etc.
2:39:01
Can we get some real teeth in this site certificate? Can we get some real
2:39:08
help out where we are? And if there's a fire,
2:39:14
please don't let them sue us so that we can't farm anymore because we only have
2:39:19
5 million liability. We can't pay for that facility.
2:39:24
We've never started a fire during harvest, but we fight four to six a year. Well, no, six to 10. So, they
2:39:31
happen all the time. One of these days it's going to be our turn. Okay. Thank you so much for your
2:39:38
comments. Appreciate it.
2:39:46
Let's see if I can take it all away. Ask questions whenever you want. You will get a designated time, but you
2:39:53
can ask whenever you want.
2:40:03
All right. So, our next commenter is Kevin McCulla.
2:40:17
Obviously, I'm Kathy's wife or hus Oh, excuse me. Kathy Kathy's husband. Uh,
2:40:25
I farm I farm underneath the the project. PGE has not done what they said
2:40:31
they were going to do and now that we have new management, this is a good thing. But they need to they need to
2:40:38
prove that they can operate this. I don't know why you would give them a certificate to put in a solar farm when
2:40:44
they have not proven that they they can operate what they have. They keep saying
2:40:49

they need more green power. You know how many towers we have sitting every day out of those 217?
2:40:56
40 to 50. Every day. Makes no sense to me why you would be willing to give them
2:41:02
a certificate to build a solar thing until they fix this problem over here.
2:41:07
It's it's bizarre to me. And the other thing is the fires. Like
2:41:12
she just said, it's not if we start a fire, it's when we start a fire. and
2:41:19
your setbacks aren't even close to deep enough to keep us from having to pay,
2:41:25
they're going to sue us and we will no longer be in business.
2:41:30
So, thank you for your time and hopefully you take some of this into
2:41:35
account.
2:41:46
Okay, my next commenter is Colt McCola.
2:41:58
Good evening everyone. Um, should be the last McCulla commenting I think must some that I don't know about. U, my name
2:42:04
is Colton McCulla and I am the current farmer on the land that the proposed project would be built on. As some of
2:42:10
you know from experience and have learned recently, Sherman County is extremely wildfire prone from late May
2:42:16
through October. My main concern with the proposed project is both fire starting within the project and fire
2:42:21
starting outside the project and burning into the project. I farm on nearly every side of the project and potentially in
2:42:27
the middle if approved. Sherman County is agricultural community with the primary crop going being wheat. Wheat is
2:42:33
typically harvested wheat typically wheat harvest typically happens in July and August. This is when the crop dries
2:42:40
out and can be harvested, but it is also when it is most likely to burn. We do a lot to prevent and stop fire from always
2:42:46

having a fire fighting pickup and tractor with a disc in the field to preventive maintenance on our combines
2:42:51
and other equipment to putting fire brakes around houses and other infrastructure to shutting down on days of extreme heat and high wind.
2:42:59
Even taking these precautions, there is no way to eliminate the chance that we will start a fire. As they've said, it's
2:43:05
not if, it's winds. I do my best to prevent fire and will continue to do so, but I am very worried about starting a
2:43:12
fire and having it burn into the solar facility. I carry a large liability policy, but not even close to large
2:43:18
enough if I burn up a solar facility. There is no economical way to carry a large enough policy. I don't want to
2:43:24
lose the farm or have my son lose the farm because we burn solar facility cited in
2:43:31
the middle of wheat fields where seasonal fire risk is extremely high. I have been told that the panels will not
2:43:38
burn and that may or may not be true, but that doesn't mean that they won't be damaged or melted by the heat of the
2:43:44
vegetation burning below them. The best way to reduce the fire risk in the solar project is to reduce the amount of
2:43:50
vegetation available to burn. Under the request for amendment for currently
2:43:56
submitted, it is suggested that the maximum height of the vegetation be 12 in year round. This is far too tall and
2:44:03
would be a significant wildfire risk during fire season. Under the proposed order submitted by ODOE, it is suggested
2:44:10
the vegetation be kept to a maximum height of 12 in during the rainy se November to May and 1 to 3 in during the
2:44:16
dry season June to October for all areas within the solar fence line along with
2:44:22
several other stipulations on page 233 of the proposed order. I strongly support Odoe's suggestions
2:44:29

and feel that it would make the project a safer and far less likely to have a wildfire. The small change in management
2:44:35
practice would drastically reduce the wildfire potential within the solar facility.
2:44:42
From what I can tell, ODOE changes would go under the comprehensive
2:44:47
solar reveation and soil management plan. although redlinined in by ODOE.
2:44:56
If this is the case, I would like to see some other language addressed in that section as it currently states this is
2:45:01
only the plan in the interimm until an operational wildfire management plan is
2:45:07
put in place. It concerns me that there is no operational wild wildfire plan to
2:45:12
be reviewed yet and PGE system wild systemwide wildfire mitigation plan may
2:45:19
be used. PG systemwide wildfire with WMP primarily focuses on power transmission
2:45:25
and some limited information on the generating generating facilities. It is not a sightsp specific plan that
2:45:32
considers specific wildfire risks for a project like this in a location like
2:45:38
here. I would like to see language saying ODOE's vegetation height and
2:45:43
clearances suggestion would be implemented into the operation wildfire mitigation plan and remain a basic
2:45:49
requirement for the life of the operation of the facility if not included into the operational wildfire
2:45:56
mitigation plan. Basically, I want to see the vegetation height suggested by ODOE be a permanent, not easily amended
2:46:03
part of the facility requirement throughout the operation of the project and not be ignored because the operation
2:46:10
wildfire mitigation plan says something different or doesn't specify vegetation height.
2:46:16
My intent of publicly coming is not to show support for or against the project but to ensure the critical wire file
2:46:22
fire preventive strategies are used during building and operation of the project. I would like to see the project

2:46:28
be an asset to fire prevention in the county not a risk. I would like to see see it be a fire break where people know
2:46:34
when the fire gets to the actual project that it is going to be stopped. But there has to be stuff in the site certificate that puts teeth that make
2:46:41
them maintain it to this standard. But if vegetation isn't managed properly, it's not fair to ask the
2:46:48
farmers and community members around the project to take the risk associated with the solar facility. I want the council
2:46:53
to realize that this is this proposed project is being cited in the middle of wheat country that is associated with
2:47:00
very high seasonal fire risk. Setting a standard of vegetation management and making sure that standard is upheld
2:47:06
throughout the operations of the facility would address a large part of the fire concern with the solar budget.
2:47:15
Thank you.
2:47:23
Okay, our next commenter is Mr. Hildebrand.
2:47:34
Greetings. Uh, Orund Hildred is my name and I am not a makulla.
2:47:40
Um, I manage my family's farm which is near
2:47:48
the proposed Bigalow renewable power project and have been involved with
2:47:54
Oregon's environmental and land use issues for years. I am submitting this
2:48:00
pro this statement for the record regarding the Bigalow renewable power project. Um I approach projects like
2:48:08
this with a clear understanding that development has impacts. The question is
2:48:14
not whether impacts exist because they do but whether they are acknowledged,
2:48:20
responsibly mitigated and managed through a rigorous public process.
2:48:27
Even farming has impacts on on our land. You know, some may argue that our land
2:48:34
shouldn't have been put to the plow back in the 1880s, but it was done. Impacts
2:48:39

happen. Um, but
2:48:45
based on my experience, I am confident that the impacts associated with this
2:48:51
project can be addressed appropriately. And I'm confident that after 50 to 70
2:48:57
years of the project being a major solar producer, if we get to that point and we
2:49:02
need to have the land back for agriculture production, it can come back to agriculture production with an
2:49:10
improved soil health. That is critical. I'm a strong believer in clean energy.
2:49:16
I've been a director of the community renewable energy association, Korea, for
2:49:22
many years. Korea is a strong advocate advocate for shaping policy to benefit
2:49:29
rural Oregon and I'm personally have been involved in a development my own renewable energy project wind farm which
2:49:37
is a 9 megawatt 6G 1.5 SLE turbines that
2:49:42
are adjacent to Portland General Electric's Big Low Canyon. I supply
2:49:48
power to over 3,000 homes in the Portland area.
2:49:55
That experience has given me a practical understanding of what responsible project planning looks like, including
2:50:02
the importance of environmental review, mitigation commitments, and ongoing
2:50:07
accountability. You we must hold companies accountable for what they say
2:50:13
they're going to do. The Bigalow project reflects this level of responsibility.
2:50:19
The developer has engaged seriously with the permitting process and has demonstrated a willingness to address
2:50:25
environmental considerations. I have attended several of the discussions myself, including a presentation of the
2:50:32
North Sherman County Fire District that discussed these fire mitigation procedures.
2:50:38
Used to be that we on the east side felt that we had the fire risk to ourselves. Now that you on your west with the
2:50:45

climate change, you had the fire risk too. So I think everybody can appreciate, especially in a rural county
2:50:52
where the land and agriculture, natural resources are deeply inter interconnected, the importance of this
2:50:59
fire mitigation. I also believe it's important to consider projects like this in a broader long-term context. Sherman
2:51:07
Countyy's economy has changed significantly over time and the pressures facing agriculture and rural
2:51:13
communities continue to evolve. We had in 1920s we had over 4,000 people living
2:51:20
in the county. That's more than twice what we have right now. We had hotels in
2:51:26
the towns and restaurants and theaters and I've read even roofers had a golf course. That's all most of that is gone
2:51:34
now. um and primarily due to consolidation of
2:51:40
farms enabling our producers to reduce their production costs and they've done
2:51:45
a damn good job of it. They've really driven down their cost to to compete in
2:51:51
a tight environment and I appreciate people young farmers like Colton coming on because we need them to continue this
2:51:59
into the future but it's going to become tougher. uh our farmers have to
2:52:06
consolidate and they have to become larger and those that don't are not going to be with us anymore. Um and can
2:52:14
anybody doubt that the drive for more that we will see
2:52:20
more capital intensive equipment uh powered by artificial intelligence
2:52:27
that's will continue and further fuel consolidation amongst the farms in
2:52:32
Sherman County. Thoughtfully planned energy projects represent one step in a
2:52:38
more diversified and resilient future. uh one that balances environmental stewardship with an econ economic
2:52:45
stability. In this case, it is true that solar saves farms.
2:52:51

Last month, Governor Cotch issued an executive order to state agencies to move faster on clean energy projects.
2:52:58
And recently, even Representative Bence acknowledged that Oregon will have a
2:53:04
critical short shortfall in energy unless drastic steps are taken,
2:53:10
including expansion of our transmission facilities. The Bigalow The Bigalow
2:53:15
renewable energy project is lowhanging fruit with the existing underutilized
2:53:20
PGE transmission. While recognizing the project is not without impact, I view
2:53:25
the Bigalow renewable project as a positive contribution when evaluated through the established FSE process and
2:53:33
supported by enforcable mitigation measures. Thank you for the opportunity
2:53:39
to provide the statement and for your careful consideration, positive consideration of this these issues as
2:53:46
part of the record. Thank you.
2:53:57
Okay, our next commenter in the room is Chad Higgins.
2:54:11
Audio check. Honorable committee, uh, my name is, uh,
2:54:17
thank you for the opportunity for me to present testimony and comments. My name is Chad Higgins. I'm an associate
2:54:24
professor at Oregon State UN University, and a farmer in Lynn County. My area of
2:54:29
expertise is in integrated farming and energy systems, agricultural sustainability, and egg tech. I spent
2:54:36
more than the past decade working on ways to integrate solar energy production and agricultural practice and
2:54:43
uh mitigate the conflict between the renewable energy and agricultural production so-called agic systems. I'll
2:54:50
keep my testimony um to the agricultural aspects that pertain to goal three. Uh
2:54:56
broadly speaking, I care deeply about agricultural land protection and agree
2:55:01

with the principle that protection of agricultural land is of critical importance. Indeed, my entire research
2:55:07
portfolio and a good part of my life's work has been devoted to serving farmers in local rural communities. There would
2:55:15
be no farms without the land to support them. But farming is an in incredibly
2:55:21
challenging and requires brilliant folks to do it under the current conditions.
2:55:27
It isn't sufficient to simply protect land um as it's only one piece of the puzzle
2:55:33
that makes farming possible. an economically v vigorous agricultural system depends on the land and soil of
2:55:39
course but it also depends on the skilled farmers access to the needed agricultural inputs access to
2:55:46
sufficiently developed agricultural markets and enough regulatory freedom to allow land managers uh to adapt to new
2:55:53
economic uh and resource availability conditions. I'm an advocate for balancing
2:55:59
agricultural land use trade-offs with energy trade-offs wherever possible and I applaud your efforts in doing that in
2:56:06
a uh respectful and sensitive manner. My research on agriboltaic systems has
2:56:12
shown that the benefits of shade to cropping systems most critically depend on the dry soil's fertility. That is
2:56:20
crops generally benefit more in water limiting conditions and with uh the benefit of good soil. This means that
2:56:27
agrialttics are appropriate in some locations and not appropriate in others. Uh note that the proposed project is not
2:56:34
an aggravate project. I will say that the three most common criticisms of my
2:56:39
research are one that I haven't tested any particular crop in a particular region. Uh ported to this uh particular
2:56:47
region it would be you haven't tried say wheat in central Oregon which is true. It's fair criticism. Um, the second
2:56:55

major criticism of my work is that my experimental trials are small compared to proposed commercial projects. That's
2:57:00
also fair. I don't have the money to build a multi-billion dollar large project for my research. They tend to be
2:57:07
uh of the multiple acres size as opposed to multiple thousands of acres. And third is uh I just don't believe you
2:57:14
Chad that this is possible. Um and uh if you are a critical thinker, you first
2:57:19
have to be critical and I take that uh challenge on. Uh these are fair critiques. Even though I endeavor to
2:57:26
perform transferable re transferable research for maximum social benefits, my research team and I have done most of
2:57:32
our work in the Wamut Valley, a location with drastically different hydrarology and soil to here. I will note that we
2:57:39
have done a trial in Madress on irrigated carrot seed production that showed consistent results with all of
2:57:45
our other studies and the carrot seed benefited um from the energy system. But that
2:57:50
trial was limited in scope and it was a not a dryland crop as the situation is
2:57:56
on the point of scaling. Um, I'll I'll take issue and say if I can make it work
2:58:02
profitably at a small scale, economies of scale dictate that it should work at the larger scale because you just turn
2:58:08
the tractor around less. Um, the main point is that more research is
2:58:14
targeted to the local region, specific crops and unique conditions like the
2:58:19
fire risk condition that's unique to this area and so critical here. um more
2:58:24
research would help inform future development in a sustainable way and I uh really support the inclusion of the
2:58:31
competitive research funding to be managed by the economic development district. Um in full disclosure, I will
2:58:38
uh absolutely com enter that competition. Um and my approach would be to work with the community to address

2:58:44
their most precient concerns and questions. But should I not win, I'll applaud anyer because I believe that
2:58:52
that work would strongly uh help the community. Um because it's no secret
2:58:57
that there's many projects proposed for this area. Uh solar sighting tends to be
2:59:04
local in scope as as you know, but when you find a good spot, there tends to be a concentration in that spot as you
2:59:11
know. and um uh Gillum County here, sorry, Sherman County here, I misspoke,
2:59:17
is uh one of those Goldilock zones. Um may the best researcher win. I welcome
2:59:23
the competition. Uh secondly, I do want to say that these projects are longived but ultimately temporary installations.
2:59:30
A natural question that a farmer may ask is what's the agricultural potential of so of the soil at the end of the
2:59:36
project's life? To answer that, my research team in collaboration with soil scientists at OSU are in a third year of
2:59:42
a multi-deadal study where we rest the soil under solar uh panels to see the
2:59:48
change in soil condition. As part of that project, we're monitoring the soil's health annually. And thus far at
2:59:54
this early stage, we've we've observed increased soil carbon and fertility relative to the non-solarized control
3:00:01
under the same management practice. Of course, there are many years of observation ahead of us here, but the preliminary observations are promising.
3:00:08
Finally, I understand if anyone is skeptical of my science, you don't believe that this is possible or that
3:00:15
the benefits are there. Um, but I tr I ask you to believe the evidence of your own eyes and I invite you to come to my
3:00:22
research facilities and tour it for yourself. Anyone here on the committee, anyone in the community, I welcome uh
3:00:28
please come out. I know it's a bit of a drive from here. Um, but I I would hope to make it worth worth your while. I I'm

3:00:35
open to the public the second Tuesday of every month at 1 1 p.m. The location is
3:00:41
the North Wamut Research and Extension Center in Aurora, Oregon. Um,
3:00:46
please come out. Um, you're you're most welcome. Um, and I will answer I'll make myself available to answer any questions
3:00:52
that the committee has or the community has based on my research in these systems. And um, yeah, thank you very
3:00:59
much.
3:01:08
Okay. Anybody in the room that would like to make a comment that has not turned a foreman in? Okay. Go ahead and
3:01:15
step up to the mic. Just be sure to give us your name and your address, please. Thank you. My name is uh Chair Condan,
3:01:22
Secretary Cornett. We uh my name is John Langden and I filled out a form and
3:01:30
mishandled the uh application process. I apologize Sarah. So I do believe Chad
3:01:36
and I do believe Orman that solar saves farms. And so I am a fourth generation
3:01:42
farmer. My address is 30574 Diamond Hill Drive in Harrisburg. I have
3:01:49
some property that has a particular uh interest for solar. So, I've been
3:01:55
approached many many times over the years and that's led me to have solar companies come to us with proposals.
3:02:03
And there's always been a level of understanding and education there. But I got to go to a
3:02:10
uh meeting like the one last night, a letter of intent meeting where I got to see Todd in action. It was pretty
3:02:16
impressive. And in that meeting, I decided that I needed to educate myself on the A and solar world. And so, for
3:02:24
the last 30 months, there's rarely been a day where I me and my partners haven't taken that path. We were at Chad's
3:02:32
facility on Tuesday, and I think that was our 30th tour in 30th month. And and
3:02:37

every time we learn something new. We bring a lot of solar developers, a lot of VIPs. We actually had some
3:02:44
shepherdesses out there last time and our mission is to
3:02:49
learn all we can about a and solar working together, communities, agricultural
3:02:55
systems, agricultural uh neighbors, all of those things together and try to educate myself to be
3:03:02
um qualified to speak to it and help other people whether it's this council
3:03:08
or farmers or developers. So we also
3:03:14
one of my partners likes to travel so we went to Europe. We heard that they do it better over there or they're ahead of
3:03:20
us. So we went to Europe. We've been to a multitude of cu uh countries and saw a lot of different projects. A lot of
3:03:26
those were farm projects. And quite frankly after dozens and dozens of conversations with developers in
3:03:33
multitude of countries, Bright Night is great. They've done a
3:03:39
great job. I've been in multiple conversations with them about vegetation management. One of the things that we've
3:03:44
done in our learning is we've had the opportunity to become vegetation managers. So, we are vegetation managers
3:03:50
in Oregon. The best way to learn something is to go do it. So, we've done that. And we've looked at every system
3:03:57
we can find where agriculture and solar works together in a communities and with farmers and with those systems. And I
3:04:04
can tell you that the conversations with Bright Knight have been as outstanding and as advanced as anyone I've had in
3:04:11
the world. I would trust them with my land. So, what I'm telling you is
3:04:17
these guys seem to be listening to the farmer. Todd and Kathleen have been
3:04:23
I think they're genuinely interested in the community, the farmer, making it work, making it great, and making it a
3:04:29

win-winwin for everybody. And so I would encourage the council to look upon them favorably.
3:04:35
So thank you.
3:04:43
Okay. Anybody else in the room that would like to make a comment?
3:04:49
Okay. Seeing none, we're going to go ahead and move on to the people on the webinar.
3:04:55
Uh just as a reminder, if you are in the webinar um and you would like to raise your hand, at the bottom of the ic or
3:05:01
the main window, excuse me, is a set of icon, click on that participant and you'll see a hand icon. You're going to
3:05:08
click on that to raise your hand and you will click it again to lower your hand after you have commented. If you're on
3:05:14
the phone, press star three on your keypad to raise your hand and then again press star three to lower your hand.
3:05:26
Okay, so our first commenter is Dan Hilderbrand.
3:05:34
Oh no, he lowered his hand. Okay, if you need to, you can raise your hand
3:05:39
again, Dan, if you if that was a mistake. So, we're going to move on to Miss Irene Gilbert.
3:05:49
Okay. All right, let's see.
3:06:00
Okay, Irene, don't touch your button. I'm unmuting you. We're playing a game back and forth right now.
3:06:23
Okay, she's working. All right. Can't get Irene on. So, Dan,
3:06:28
I see your mic is open. You go ahead with your comment. Okay. Thank you. Uh, can you hear me?
3:06:34
Okay. Hello. Can you hear me? Okay.
3:06:41
Yes, we can hear you just fine. Oh, I'm sorry. Okay. Um, I'm representing uh my brother and I, Randy.
3:06:48
Uh, he's the since we inherited the ranch from my father. He's now the general manager of our operation. Uh, we
3:06:56
represent the fourth generation of Hilderbrands farming our ranch. And uh,
3:07:02

it's been a struggle as it always has been since Orman and I grew up on the ranch as kids. our family every year
3:07:09
worrying that we were going to have enough uh yield with with the price of wheat combined together and uh it's
3:07:15
always been a struggle um to to be efficient farmer. Now with the exponential increase in not only
3:07:21
equipment but the inputs of the trimming practices um it's been that much more of
3:07:27
a struggle. Um, the nice thing about this project is going to give us some more flexibility and and continuity as
3:07:33
far as the dependability of uh our e economical strength to keep the farm
3:07:39
going and make a sustainable career rather than a constant financial gamble. Um, approving the Bigalow renewable
3:07:46
project is a decision to keep the farmland in production and diversify the economic base of Eastern Oregon. And uh
3:07:53
we want to be responsible stewards of the of the of the ranch and the and the
3:07:59
farming in general. And this will provide a more predictable revenue stream that we can depend on. And uh
3:08:07
this is not going to replace farming. It's just going to help uh support and diversify it. Um in the past uh
3:08:15
had very very few opportunities to improve. The wind turbines were one of the first ones. A lot of people were
3:08:22
skeptical of the wind turbines and we still do to this day. Um, and one of my
3:08:27
first concerns when I've heard about this is I I was very positive on it. I thought it was a very good uh thing for
3:08:33
us and I went to one of the public uh comment meetings at the Wasco um
3:08:39
activity center there in uh in Wasco and was pretty confident in what I heard
3:08:45
coming from Bright Night and the and where they were going with it and they want to be good in this project and I
3:08:50

really feel um with the input as far as the wildfires go. Yes, we do have them from time to time. It's only in the
3:08:59
summer and it's something that farmers we grew up as kids that's something that you always had to concern yourself with
3:09:05
and it's just something we've grown up with along along with the wind and everything else. Uh the project itself
3:09:12
the 1400 acres represents about according to Randy about 1 half% of the total acreage and uh so it's not going
3:09:20
to replace farming in any of the imagination. Uh originally when Randy
3:09:26
and I were talking about it, he was actually quite skeptical about it. And I said, "Randy, look at it like this. We're not farming wheat farming photons
3:09:33
or electrons coming from the sun. We're just farming something else." Um our dad was behind the wind turbines. My dad and
3:09:40
uh our uncle John Orman's dad uh were very uh strong advocates of it. and I
3:09:45
see what it's done for the county and the uh the income that has helped the entire county, the businesses in Wasco
3:09:52
and Mororrow and surrounding areas. It's been a very beneficial opportunity. And
3:09:57
I had to remind Randy once, I said, Randy, the solar panels are going to look really good outside the windshield or as you're looking at them through the
3:10:04
windshield of your new combine. So, um I think we can look at this as very valuable partnership for everybody and
3:10:11
uh and I think with the wildfire, yes, that is a huge concern. It is a very huge concern. I understand that. Um but
3:10:18
that's something the farmers have always had to fight that about every summer. Um
3:10:25
it's just something that we've always had to learn to live with. If there's any questions, uh, any correspondence
3:10:30
can be directed my and care of my brother Randy at Post Office Box 326, West Oregon.
3:10:40
I'm sorry, Dan. Could you repeat your address for the record? Uh, you can uh almost said email. You
3:10:47

can send any correspondence in care of Randy Hilderbrand, Post Office Box 326, WAS, Oregon 97065.
3:10:55
Thank you. I also one last comment. I do share council member um Royal's uh ick factor
3:11:04
towards the bats and the rat. They're nothing large flying rats. So I stand in solidarity with her and her.
3:11:10
Thank you, sir.
3:11:18
All right. Thank you very much, Miss Philbrand. Uh looks like our next commenter is going to be Amanda Whitman.
3:11:25
Amanda, I'm gonna go ahead and unmute your mic. You are ready to comment.
3:11:30
Can you hear me? Yes, we can hear you. Okay. Hi, I'm Amanda Whitman and I am
3:11:37
the district manager for Sherman County Soil and Water Conservation District. Um, I have lived in Sherman County for
3:11:43
about 16 years now. And one of my concerns is that um no one from this
3:11:49
project has contacted the district as far as conservation issues that would
3:11:55
arise with the construction of this project or um the outcome of the
3:12:02
construction of this project. Um, in the past we have been very involved with the
3:12:07
original wind farm projects in Sherman County and I have noticed um with the
3:12:14
solar that that is not the case. Uh they like to meet with me once and listen to what
3:12:23
I have to say but they're not listening to what I have to say. So that is a concern. Um
3:12:30
we had significant erosion issues with the one solar project that has been um
3:12:36
implemented in this county and there was damage to neighboring uh land from that
3:12:42
project. Um all a lot of this land is prime farmland and it is also highly
3:12:50
erodable land. So no matter how much rainfall we get in the county, we still have major eros erosion issues that go
3:12:58
along with that rain. Um I have asked multiple solar companies
3:13:05
about the long-term effects of solar on our soil and water tributaries

3:13:11
um long-term effects and no one has given me any answers on that. Um, so
3:13:20
there there's a lot of concerns that the district has with these projects, especially these large larger scale
3:13:26
projects that could really affect our wersheds in the county. Um the other
3:13:32
thing as far as fire goes, um we have been working for over a year now with
3:13:39
Natural Resource Conservation Services, NRCS to incorporate a uh fire break um
3:13:47
project in the county to help with these fires that come through our county every year. And I you mentioned that you were
3:13:56
going to put in 20 foot buffers. Um the minimum for NRCS is 30 foot.
3:14:02
Um and that is the absolute minimum that they're suggesting. So it's imperative that I think they
3:14:10
talk to the our part the partners in this about what they are suggesting. Um,
3:14:17
USDA has been active in this county for many years and we know the land. We know
3:14:23
the vegetation. We know how fire moves and I think that's very important.
3:14:30
Another issue is the weeds and annual grasses. We've seen that with other
3:14:35
solar projects and wind farms. There's no um immediate control over weeds. The
3:14:43
Russian thistles in this county, for instance, grow rapidly. Um, they don't
3:14:48
need water. They catch on fire very quickly. So, if we don't have weed and
3:14:55
annual grass control around these projects, it's going to be detrimental.
3:15:00
Um, trying to think what else. I I think um
3:15:07
those are the ma my main concerns. I I did not plan on talking tonight, but I felt like those were a few things that I
3:15:13
needed to bring up. The conservation district has been in this county for 75 years now. We've had um over $2 million
3:15:22
worth of conservation work implemented in this county and a lot of these projects take out those conservation
3:15:29

practices. And then what do we do to fix that? We're going back in time on all of
3:15:36
the work that we've put in to fix our riparian areas. And I know you think it's upland, but upland affects riparian
3:15:44
and the streams and the rivers. So, um, those are my main concerns tonight. And
3:15:50
I will submit a letter before the comment period is over. Thank you.
3:16:00
All right. Thank you, Miss Whitman. All right. Well, I'm going to circle back to Miss Gilbert. I do not see your hand
3:16:07
raised, Miss Gilbert, but if you are interested in commenting, please just raise your hand and that will bring me
3:16:14
Oh, she's got her hand up and she's unmuted. Go ahead, Miss Gilbert. Hello. Are we talking now?
3:16:21
We are talking. Okay. Um, Irene Gilbert, 2310 Adams Avenue, Lrand, Oregon. Um, I'm co-chair
3:16:30
of the STBH group and I've spent quite a bit of time representing the public interest before FSAC. So, I do have a
3:16:37
few I haven't done a thorough review of this, but um I will say that the people who did the presentation did a very
3:16:44
professional uh job and I appreciate that. Um, my concerns rely along the
3:16:50
lines of the fact that this this group has a really poor track record in terms
3:16:56
of compliance or um holding their people accountable for following the uh site
3:17:04
certificate conditions. And specifically, the ones that that really jump out to me are the fire plan and the
3:17:10
noxious weed plan. Um now the statutes require monitoring and mitigation plans
3:17:16
and um what has been happening with these site certificates is that they're
3:17:22
approved with a lack of details regarding what is to be included in the monitoring and mitigation plan and site
3:17:30
certificates are issued but those plans are not finalized until after the public
3:17:35
process has ended. So I based on that I believe there's a really an important
3:17:42

issue in that the the draft plans need to be very detailed very specific and
3:17:49
include the requests that are being made for specific um mitigation methods and I
3:17:57
don't I have not found that to be this the case so far. Um, it becomes even
3:18:02
more important since the Oregon Department of Energy has been making changes to monitoring and mitigation
3:18:09
plans without amendments to site certificates. So, it's making it difficult for uh land owners and the
3:18:16
public to trust that the site certificates are actually going to be complied with. Um, one thing that I'm
3:18:24
really very concerned about is the fact that this site certificate references the use of the public utilities
3:18:31
commission fire uh wildfire plan once the operation of the development begins.
3:18:37
So, you're working on this for the construction period and getting a lot of feedback. But if you're using the PUC um
3:18:46
fire mitigation plan without adding specific local criteria, what ends up
3:18:52
happening is for example, developers rate fire hazard differently oftentimes
3:18:59
than local areas. So, for example, with the B2 transmission line, Idaho Power
3:19:05
found no high-risk areas for fire across any of the five counties that that
3:19:11
transmission line crosses. So, I think it's important that it be more or less
3:19:17
cast in stone that this area will be treated as a high-risisk area in terms of fire. Um the other thing um the the
3:19:26
issue of landowner liability for damages um to their facilities as a result of
3:19:32
fires. Um and I I was glad to hear the last person comment on this 20 ft is not
3:19:38
providing the protection or the mitigation for that risk to the the property owners that are facing the risk
3:19:46
of being sued for damages to the develop to the area. I personally think 30 feet
3:19:52

is not enough. I I would say that in order to issue a site certificate that mitigates for that risk. Um there needs
3:20:00
to be some research into how far do these fires jump when they are in uh
3:20:05
wheat area and assure that the uh the no fire zone is wide enough to actually
3:20:12
provide that. uh the FSAC makes a determination about significance of
3:20:18
impacts and it's not going to be a significant impact but um I just wanted to remind you that that does not exclude
3:20:26
the fact that the developer is supposed to mitigate for all of the all the impacts they are to leave these
3:20:32
agricultural um land owners basically at the same
3:20:38
point as they are going into this by addressing the increased risks that are
3:20:43
created by this development. Certainly, one of those increased risks is that
3:20:48
they could be sued for a fire um that happens on their area jumping into a um
3:20:55
into this new development. I um at any rate, I'm going to spend
3:21:00
some more time looking through these and we'll make some specific comments uh and reference the mitigation and and u plan
3:21:09
statutes which I understand is required for this. But I do think that while it's a good start, this draft, the drafts of
3:21:17
the fire and also the noxious weed plans are not developed to the extent that the
3:21:22
public can have any kind of assurance that you're actually going to be uh
3:21:28
number one implementing mitigation that leaves the the public free of risk of or
3:21:35
addresses the increased risk or that the monitoring is going to be adequate to
3:21:40
asssure long-term protection. action. Um the plans don't address, for instance,
3:21:46
state requirements for weed management. And there's been a lot of concern from
3:21:52
the tribes, from individuals about the level of weeds that are being uh spread
3:21:57
by these renewable energy projects. And I I would really encourage you to

3:22:03
require the developer to comply with the state requirements and to leave the land
3:22:09
owners uh financially free of the consequences of having to go to the
3:22:15
county and and file against a developer because they're failing to manage the weeds according to the state statutes.
3:22:23
Um I guess that's enough for once. I didn't use my seven minutes. I don't believe. Anyway, thank you for your
3:22:29
time. Any questions?
3:22:36
No, there are no questions. Thank you for your comments. All right. So, at this point, I see no
3:22:42
other hands raised. Is there anyone else in the room that would like to provide a comment?
3:22:50
Last call.
3:22:57
Okay. So now we're going to provide an opportunity to members of the council to
3:23:03
ask questions or make any recommendations to staff.
3:23:09
Chair Condan, this is Marcy. Thank you, Marcy.
3:23:16
Uh, first of all, I would like to say uh I wish I had been there in person, but
3:23:21
nonetheless, thank you to everyone who took the time to so clearly state your
3:23:28
concerns. One of the things that I've most appreciated about serving on this council is it has been absolutely
3:23:35
educational for me, not just as an Oregonian, but professionally. Um Sarah
3:23:42
to directly um respond to your your request about you know comments to
3:23:48
staff. I'm well aware of the separation between the Department of Energy and the Oregon
3:23:55
Public Utility Commission, but I strongly um encourage and ask whether
3:24:01
it's just to and I'm happy to do some of my own research, but I'm I'm really
3:24:06
concerned about our limits that I'm aware of that may or may
3:24:13
not align with what can be done elsewhere. So for example like I know we
3:24:19

can't say oh you must have blank number of people or we can't say you must
3:24:24
double whatever the the average you know standards are or exceed minimum
3:24:31
standards but I just I really like to know that there's a way to provide some more assurance to the public. Um it's no
3:24:39
secret I've said it probably every meeting since we've started talking about wildfire. Um, someone mentioned
3:24:45
that PGE's plan um tends to lean towards
3:24:50
trans or I don't know if they said transmission or distribution, but um anyway, I really just am curious if
3:24:56
there are things that we can glean from other areas that can align and help the
3:25:02
public get some of the reassurance they need. And um I would just encourage the
3:25:08
developer to really think about how they can invest to the public to to meet some
3:25:15
of these things because while you as a you know as a developer have a lot of risk, this is their livelihood. This is
3:25:23
their their legacy, their communities as well. So, I believe, you know, I I have
3:25:31
to believe people are operating in good intent, but I really hope that the comments around the noxious weeds and
3:25:38
the wildfires are really, really taken to heart. And lastly, I'll just say that
3:25:43
anyone who's participated over the last couple years has heard this council talk a lot about operational
3:25:51
uh or excuse me, organizational expertise. And I think we heard a lot of comments
3:25:57
directed at that today. So I hope the developer plans to address those things to presside provide reassurance to the
3:26:05
public and to our council. Thank you.
3:26:11
Thank you. Uh councelor Gra. Uh any other comments or questions from
3:26:18
council members? I have a question. Madam Chair,
3:26:24
um I'll be second. Yes. Uh, no. Go ahead, Councelor Delin.

3:26:31
Okay, Madam Chair, um, I don't know if I have a statement or a question. Um, it
3:26:39
seems to me that, you know, some of the things that people are talking about in terms of uh, past performance, there's
3:26:46
actually some agreement on. I mean uh within the statements from staff there was some statements about uh the fact
3:26:55
that the actual performance particularly on the first phase over time has not been what was expected. Obviously some
3:27:03
of the people that are critical of the proposal um are saying that very clearly and even
3:27:11
the applicant is now admitting that some of that performance has been less than desirable.
3:27:18
Now, the problem I have is I don't have an answer for this. I'm not an attorney.
3:27:23
I am not our obviously our um our representative from the attorney
3:27:29
general's office, but we have specific criteria that we view every project in.
3:27:35
And I'm not sure that we can actually apply or create a new criteria that in a sense
3:27:44
tries to enforce perhaps some shortcoming from a past approval or the
3:27:50
performance in a past area. I'm just not sure of that how you would do that or if it if if it even could be done in a
3:27:58
matter that would be um let's say uh where litigation would be limited.
3:28:05
The second thing is I clearly doubt that this body has any authority and I'm not
3:28:12
even sure the legislature would have authority um to limit the liability of various
3:28:18
parties that might be involved in something that would cause damages to another. I mean that's clearly u outside
3:28:26
the purview of of this council. Um, and I not even sure about all the
3:28:32
ramifications of that, if that would even be uh within the legislaturator's
3:28:37
perview on a statutory basis. I just want to put those comments on the record. I I do think the concerns are
3:28:44
real. Um, I do think that uh turbons wear out. Uh

I do believe there have been quite a number of issues with them particularly that sort of uh first phase and I don't know if which generation of turbines that was. I know turbines are actually under an enormous amount of stress over time. It's interesting that one of the speakers is a former 747 pilot and she's
obviously probably aware of the uh metal fatigue in aircraft over time and the
fatigue in the blades of that those turbons. There are significant issues there also and I just wanted to put all that on the record. Uh, I'll be probably thinking about what our actual authorities are, but I clearly
believe people have made some clear and to a large degree some compelling arguments.
3:29:42
Thank you, Councelor Develin. Councelor Perry, do you do you have your hand
3:29:49
raised? I can't see it, but yes, I did. Thank you. Yes, feel free. Yes.
3:29:56
Thank you. I I did have a couple of points and along the same lines as
3:30:02
councelor Deon um was mentioning first of all about the
3:30:09
fire concerns. **It seems like when there's a concern with property owners and developers as a as a planner, you know, there's there's been situations where, you know, a covenant not to sue would be in order, but that's not something that this council has any um purview over.** That's more like uh
3:30:36
like councelor Delin was saying a legal matter between the owners and the
3:30:41
developer to uh work that out on who's responsible for what on the property. But uh on the
3:30:50
other the other uh point I wanted to make was about you know and as a planner I've you
3:30:59
know had situations before where we have a property that you know may have a
3:31:06
violation on it of some sort and then then they want to come in and apply for a land use application to do something
3:31:13
else. And if if there's a violation on the
3:31:18
property, then you wouldn't necessarily want to approve or be able to approve
3:31:25
based on the regulations of that local jurisdiction to to approve
3:31:33
um an a new thing on our property if there is some kind of a compliance
3:31:39
issue. And I'm new to this. I'm not as familiar with the um administrative
3:31:47
rules and the and the sighting standards as our experts are in the staff and and

3:31:54
secretary and our legal office. But I was just uh I guess a question now to
3:32:00
um this the staff uh Chris would **would**
there be some kind of regulation that I may not be aware of that
would prohibit the approval of an amendment to an existing site
certificate when the existing site certificates requirements may or may not
be satisfactory. But in looking through the staff report, it looks like you have addressed
those and with the addition of some additional amendments to the conditions that were
placed on there that would remedy some of that. And I was just wondering if
there was anything that um uh the sighting council needs to
consider on that situation where we have um if if we
look at if if the existing facility is in compliance with everything then there
isn't an issue with um moving forward with looking at specifically this in
relationship to that with the addition of the solar to this sighting
certificate. Um, I just wanted to make sure that that
we're covering all those bases. Thank you.
3:33:32
Thank you, Councelor Perry. And we have Christopher now at the mic.
3:33:38
Thank you, Council Member Perry. For the record, this is Christopher Clark, senior sighting analyst. Um, just since
3:33:44
you called out me specifically, I will respond um with two things. uh one I
3:33:50
think the relevant standard is the organizational expertise standard and so I'll just read that at least in part um
so the standard provides that to issue a site certificate the council must find that the applicant or in this case certificate holder has the organizational expertise to construct operate and retire the proposed facility in compliance with council standards and conditions of the site certificate. I am not aware of a separate rule that would um prohibit the council from
approving a facility if there were a violation in place or or something like
that or a requirement secure. Um I do want to point out though and I think this is important for the record. Uh at this point in time the certificate holder has not been issued any notice of violation or um I maybe can be corrected but even a notice of non-compliance for these issues. um they have been responsive to the department's um requests for corrective action plans and and and things like that. So there there have been a number of compliance issues at the facility and and that is well documented but not violations themselves.
Thank you, Christopher.
3:35:07
Councelor Perry, sorry. Was that a thank you or did you have something further? No, I think we just kind of talked
3:35:14
over each other. I was just thanking Chris for that response. Okay. Thank you very much. Um, and I do
3:35:22

have a question, but I'm wondering if the makullas can come up to the microphones.
3:35:29
Oh, okay. Thank you. Yeah, you can go first. Um, this is Kent and um, tonight we
3:35:36
heard a lot about organizational expertise. Hold on just one second.
3:35:41
Did you Oh, sorry. I thought I had a question of that. No, no, no. Sorry. Um, organizational expertise while or the
noxious weeds and vegetation management, but um, we did hear regarding wildfire a
3:35:59
recommendation from the S SWCD to I think **it was 35 ft and that probably has some science behind it uh, that um, could withstand a challenge or whatever.**
3:36:09
So I think we ought to kind of look into that. That's all. Thank you, councelor. How and now a
3:36:17
question for you. And um I think uh one of the things this meeting has
3:36:22
really brought into focus is our work on compliance. Uh the wildfire um rules are
3:36:30
pretty new to us. I think we're now in our third year of wildfire rules and
3:36:35
working through projects and what's appropriate, what are compliance issues. Um, and every step we go, we we
3:36:44
learn more. But one of the things that is has been very opaque to me and it sounds like you're big supporters of renewable energy and certainly went into this project with um uh great um uh uh enthusiasm enthusiasm. Yes, passion and enthusiasm and um and you it worked well and then then it didn't. And so I am wondering one some of the uh uh issues you have as underlying property owners of the project. You I guess I have operated on the on the um thought that all the underlying property owners have an agreement with the with the developer and in those agreements there are some provisions that we guess asked about here there. simply not not necessarily open to us to we we don't have the authority to do much with it. So could you enlighten just I know some of it is proprietary information but um speak a little bit about the leases and do your lease agreements speak anything speak to anything that you spoke to us about today? What do you think?
3:38:04
If you're looking at me blank, you probably know more. You're talking about the Are you talking about the leases or the soul?
3:38:11
Well, um Okay. Well, right right now it sounds to me I guess the premise for my question is it
3:38:18
sounds like um it's just um a matter of understanding and coming to some
3:38:24
agreement. Sounds like uh the developer has is really now concerned with
3:38:29

compliance. You've certainly suggested that they've been more pro proactive, but in the your agreements with them, right, um does it call for action um of compliance that or are you dependent depending on on us?

We're depending on you because after 10 years of reporting pieces and and our concerns and having them ignore us and lie to us, we don't trust them anymore. And since the blade fell four years ago, there the now more towers are down than ever. And we're just stymied. We don't know. We're not signed up for solar because we would not sign up for them period after what we've seen with the wind. Okay? And it's not really addressed in the lease, but it's in the site certificate.
And no, there are no violations on PGE because they never told you guys.

Hello. Well, and as I see at this meeting, we've talked a lot about it and the last, I don't know, five meetings. Some of these issues have come up and are now being addressed and there seems to be a plan going forward. And I'm wondering if you are aware of that, you know, part of your are you included in those conversations with the developer and Okay. All right. I um you can answer that. Yeah. Well, I Yeah. Yes, we we are. and and the PGE crew that is there now have been very open and coming and talking to us and wanting our opinions on how things are. But it's just we have lack of faith in PG right now. They haven't proven anything to me. They are a disappointment, unfortunately. they need to keep moving forward and figure out how to fix this and then prove to me that this is going to work because they haven't done anything yet other than shut the towers off because they're dangerous. Well, you presented your message well, right? Or at least in in my opinion and I thank you for um for being here um and and sharing one your experience. But I also uh just given the wildfire mitigation risk, if you have um some ideas that um you don't see in the mitigation, the draft mitigation plans uh for construction or that should be there on the solar project um that is now proposed. um um you know the the more detail you can give to us and staff the better it informs us for our decision- making. Okay. And since Colt is actually farming now he's my biggest issue my biggest issue there now. Yeah. My biggest issue is there's no operational wildfire mitigation plan to even look at right now. So, how am I even supposed to comment on something that doesn't even ex I Yeah, I don't have privy to it. So, all I'm going off is what the OdoE is saying that they're they're going to put in in the interimm, but then I'm not going to have any say when it actually comes out. Okay. Um Okay. Thank you.

And it's, you know, I know it's coming. We've heard that and just keep your ear. Okay.
Yes. And just as an aside, even Bright Night hasn't been forthcoming with us. This is like the fourth or fifth representatives that have come through that, you know, that are now the experts. And we were told that the panels weren't going to be within view of our house. And then they were right across the road. So, we just panicked. And the our landlord is the one that got them to move them back.

Everything we've been promised, somebody reneigs on. And it's getting really frustrating because we feel like we're just in a wave that we can't stop. We keep hearing the right things. We just haven't seen them. It's not in writing. Until I see it in writing from now on, I will not believe it. It needs to be put in writing and signed by whoever the proper authority is. And that's what needs to happen. I used to do business on a handshake. Not going to happen ever again. I had really good intentions with PGE and there's their wind project and they kept telling us they're going to do it, but they kept cutting their maintenance budget on the project. How do you how do you I don't know how you run anybody's farm or you do anything. We spend money on our equipment to keep it up and make it work. So, we're not going to be out there intentionally starting fires. Their solution was not to do anything with this new management team. I have great hopes. Well, thank you. Thank you for being here and coming up twice.
3:43:41
Thanks. And having such strong representation. And I'm wondering if um PGE wants to
3:43:48
come come and respond or
3:43:54
you don't have to. It's just our final comment. Okay. Yeah. Okay.
3:44:00
Thank you. Um Yeah. Thanks for listening.
3:44:05
Okay. Yeah. Listen. And and I will say and you've heard from all
3:44:11
of the C Yeah. Every all of the council members spoke today and these are of
3:44:16
real concern to us. The issues that came up today are of concerns with this project, but overall they have been a
3:44:23
real area of focus for us. So, um, thank you for being here for the hearing. And
3:44:29
if there are no more comments from the council, I'll turn this over.
3:44:35
Yes. Thank you very much. Okay. So to close us out, would the certificate holder like to respond to any comments you've received to date or evening,
3:44:53
Chair Condan, um uh members of the council, and folks in the room this evening, thank you very much for your time and energy and for the for the input. Um uh I'll just say two things, then I'll hand it over to Lenna to to to wrap us up here. um in response to what we've heard tonight. So, one um you know, I think to reiterate um we recognize that some of the concerns raised about the operation of the Biglow Canyon Wind Farm do not meet the uh standards for excellence that PGE expects of all of its sites. Um and we are taking appropriate actions. Um we also operate thousands of megawatts of clean energy across this region with an excellent track record of safety and reliability. Uh, with regards to wildfire, let me reiterate the safety and well-being of the communities we serve is paramount and we recognize the existential risk of operating a utility today in the West amidst growing wildfire risk from climate change. We maintain and implement robust wildfire mitigation plans as required by the state um and

submitted to the Oregon Public Utility Commission on a regular basis. Those plans are evaluated by an independent evaluator by the safety staff at the Oregon Public Utility Commission and it is through a very public process with robust stakeholder input. We just submitted our mo most recent wildfire mitigation plan um in December and it is
currently under review. Uh right now we're forecasting about $120 million
annually in wildfire mitigation um investments uh to protect the safety uh
and well-being of the communities we serve. And that includes things that have been discussed tonight such as grid hardening and vegetation management. Uh
situational awareness so think risk modeling as well as the use of like AI panoramic cameras. It includes operational procedures across our system distribution, transmission and generation um and and it includes um the
work that we do with our communities around education and outreach. So wildfire safety is important and we continue to evolve our wildfire mitigation plans um in response to changing technology, improving technology as well as evolving industry best practice and unfortunately the growing risk of wildfire in this region.
3:47:10
Thank you. Thank you. Uh we just want to again uh
3:47:16
say that we appreciate all the comments and people taking the time to review these documents. Come here in person to
3:47:21
provide your testimony. Um we will review all the comments and provide written responses. Um but we do want to
3:47:29
reiterate that the level of detail in the plans and the monitoring, the inspection, the reporting and the
3:47:35
enforcement by the department in these plans is at a much greater level than any previous plan. Um the department
3:47:43
staff and the staff that we have supporting the development of these plans have identified these improvements
3:47:48
to the site certificate and associated plans and they have teeth. We heard
you know we we want teeth and we believe these plans do have that. Um
3:48:00
additionally in the written comment we will be submitting um our communications log with stakeholders into the record to
3:48:06
show our outreach to stakeholders. Okay, with that, thank you again for
3:48:12
your time and get home safe tonight.
3:48:19
Any final comments or questions from council to the certificate holder?
3:48:27
Thank you again, certificate holder. Um, I need to amend one statement that I

3:48:32
previously made about the comment deadline. So, all comments must be
3:48:37
received by January 30th at 5:00 PM. Not submitted by, but received. So, if
3:48:43
you're paper mailing your comments to the department, make sure you've mailed them in a manner that they can be
3:48:48
received by our office on January 30th at 5:00 p.m.
3:48:54
Okay. So, it is now 8:20 p.m. on January 15, 2026, and the public hearing portion
3:49:01
of the comment period on the proposed order for request for amendment four of Biglo Canyon wind farm site certificate
3:49:08
has concluded. I'm going to hand it over to Chair Condan to close the meeting. Chair Condan, if I may.
3:49:15
Secretary Cordet. Yeah, I just want to take the opportunity to thank everybody for coming out tonight. Really appreciate it. Our process is designed to include
3:49:22
public participation, local participation. That's why we're here. It works better if there is good robust
3:49:29
participation. So, I encourage you if you have comments, please do submit those comments. As you've heard from the
3:49:35
council, we take them very seriously. So, please do comment. Thank you.
3:49:40
I want to add my thanks again uh for everyone who came to the hearing tonight and especially those who sat through the
3:49:47
whole the whole meeting tonight. So, thank you. Um, the time is now 8:21 and
3:49:54
the January 15, 2026 meeting of the Energy Facility Siting Council is now
3:49:59
adjourned. Thank you. Thank you. Nice job, Cindy.
3:50:08
Yeah.

Kathy McCullough and I live right under the project, about a half mile from the PG building, and I'm a retired 747 captain for Delta, and I'm also a microbiology and environmental health graduate from Colorado State. When this project was first started, you wouldn't have found anybody more excited about it than I was, because to me, these looked like giant propellers. I loved it. I wanted clean energy and wind … we could farm around them. That was the best. In fact, it helped us. We got new roads. We got in and out of fields we could never get into before. It was amazing. We were probably the biggest proponents of this project until…

Construction was great. The first five years, great manager, new equipment, everything was perfect. The next 10 years, horrible. I mean, horrible. We were picking up pieces in our field. There were nose cones dropping. They all started leaking, all of them in phase one. And the culmination was when a blade dropped February 2022, waking up my husband and my dog. I wasn't home at the time.

This is the blade down here on the ground there. This is our house across the road. Was really close. It was really loud.

We had been complaining for a while because there had been so many pieces. PGE wouldn't listen to us. They really would not listen, and we didn't know what else to do. I mean, even after the blade fell and PGE got Alltite to come in and start inspecting all the bolts in all 76 of the first Vestas towers. Nothing changed. Alltite came. Alltite went. One company before them said it was the greasiest mess that they had ever seen, and it was unsafe and they quit. They had to throw their coveralls away after one day. It was one of those things that we knew would happen. We had been watching.

This is what they still all look like… they haven't they haven't gotten better. They aren't cleaner. None of them have. There's one that has the new prototype on it, but four years after the blade drop, nothing has been fixed. They have all the parts ordered, but nothing is different to us. And in fact, the old (project manager) Brad Jenkins, who was in charge of the project before, lied to the newspaper and said, "Just because they're dirty outside doesn't mean they're dirty inside."

Well, I have a picture of the inside. It's horrible. The wiring's cracked. It It's really bad. And they flat-out lied to us.

So, my problem is, how do I trust this company for solar in a county that is so Fire-prone, you would not believe it? Our fires, this is under BIGLOW.

This is one of the fires we've had. We have six to 10 fires a year during harvest and around the dry season. And they're scary. I mean, they are… they move fast. My neighbor barely got in the car and out of her house as a wall of flames was coming towards her.

We all run to fight them. We all have water on the back of our pickups. We have shovels. We have hoes. We have everything like that. But they still move fast. And I

mean fast. There were probably 50 pickups and farmers fighting this fire. And this was this was a couple years ago. It's just one of the many. And if I trusted PGE with their with their wind, I can't trust them with their solar. I can't trust that I'm safe in my house if they're not going to be honest.

And if they're going to tell people that we lie?

There's a whole new regime at PGE now. I admit that because I like Dan. I like the people who are there now. And I think we're on a different tack. I think we're going a different direction.

But unless it's in the site certificate, they're not going to do anything. And most of this most of this amendment is construction. Very little of it concerns actual operation once the construction phase is over.

We really need a strong site certificate. Even with PGE knowing all that, they never reported anything until I went to the paper and got the Oregonian to write… four months after. No, wait. February is when the blade dropped, and I think the paper may have been September, and there was no change, nothing.

They knew pieces were dropping and I just I I'm glad they have new maintenance. I really am. Or new, you know, new people. But we've got to have a strong site certificate.

We could not get them to give us a holdless clause for farming. So if we accidentally start a fire and it burns into their facility, that's like a that that's a two billion dollar facility we don't have money for.

The only other thing I was going to say is BrightNight's got great ideas. I mean for fire. As 747 captain, lithium ion batteries are scary. They are just plain scary. My vinyl sighting on my house melted in 2021 to the west side. That's how hot it gets there. So if you don't have good, you know, good protection, you're in trouble.

So this is how they look. They say, "Oh no, they look great. They're white. They're clean. Yes, they are. This is how the transformer boxes look that PGE has under the towers. How am I supposed to think that the batteries are going to look okay?

So I hope… I understand we have to have this green energy mandated, etc.
Can we get some real teeth in this site certificate? Can we get some real help out where we are? And if there's a fire, please don't let them sue us so that we can't farm anymore, because we only have $5 million liability. We can't pay for that facility.

We've never started a fire during harvest, but we fight four to six a year. Well, no, six to 10. So, they happen all the time. One of these days it's going to be our turn.

Okay. Thank you so much for your

comments. Appreciate it.

All right. So, our next commenter is Kevin McCullough.

Obviously, I'm Kathy's wife. Oh, excuse me. Kathy's husband.
I farm underneath the the project. PGE has not done what they said
They were going to do, and now that we have new management, this is a good thing.
But they need to prove that they can operate this. I don't know why you would give them a certificate to put in a solar farm when they have not proven that they can operate what they have. They keep saying they need more green power.

You know how many towers we have sitting every day out of those 217?
40 to 50. Every day. Makes no sense to me why you would be willing to give them a certificate to build a solar thing until they fix this problem over here.
It's it's bizarre to me. And the other thing is the fires. Like she just said, it's not if we start a fire, it's when we start a fire, and your setbacks aren't even close to deep enough to keep us from having to pay, they're going to sue us and we will no longer be in business.

So, thank you for your time and hopefully you take some of this into account.

2:41:46
Good evening, everyone. Um, should be the last McCullough commenting.
My name is Colton McCullough and I am the current farmer on the land that the proposed project would be built on.

I'll put Colt's comments on later, but they are on this You Tube:
https://www.youtube.com/watch?v=XEXStXCgWTQ

2:47:34
Greetings. Uh, Ormand Hilderbrand is my name, and I am not a McCullough.
2:47:40
Um, I manage my family's farm which is near
2:47:48
the proposed Bigalow renewable power project and have been involved with
2:47:54
Oregon's environmental and land use issues for years. I am submitting this
2:48:00
pro this statement for the record regarding the Bigalow renewable power project. Um I approach projects like
2:48:08
this with a clear understanding that development has impacts. The question is
2:48:14
not whether impacts exist because they do but whether they are acknowledged,
2:48:20
responsibly mitigated and managed through a rigorous public process.
2:48:27
Even farming has impacts on on our land. You know, some may argue that our land
2:48:34
shouldn't have been put to the plow back in the 1880s, but it was done. Impacts
2:48:39
happen. Um, but
2:48:45
based on my experience, I am confident that the impacts associated with this project can be addressed appropriately. And I'm confident that after 50 to 70 years of the project being a major solar producer, if we get to that point and we need to have the land back for agriculture production, it can come back to agriculture production with an improved soil health. That is critical. I'm a strong believer in clean energy. I've been a director of the community renewable energy association, CREA, for many years. CREA is a strong advocate advocate for shaping policy to benefit
rural Oregon and I'm personally have been involved in a development my own renewable energy project wind farm which
2:49:37
is a 9 megawatt 6G 1.5 SLE turbines that
2:49:42
are adjacent to Portland General Electric's Big Low Canyon. I supply
2:49:48
power to over 3,000 homes in the Portland area.
2:49:55
That experience has given me a practical understanding of what responsible project planning looks like, including
2:50:02
the importance of environmental review, mitigation commitments, and ongoing
2:50:07
accountability. You we must hold companies accountable for what they say

2:50:13
they're going to do. The Biglow project reflects this level of responsibility.
The developer has engaged seriously with the permitting process and has demonstrated a willingness to address environmental considerations. I have attended several of the discussions myself, including a presentation of the North Sherman County Fire District that discussed these fire mitigation procedures. Used to be that we on the east side felt that we had the fire risk to ourselves. Now that you on your west with the climate change, you had the fire risk too. So I think everybody can appreciate, especially in a rural county where the land and agriculture, natural resources are deeply inter interconnected, the importance of this fire mitigation. I also believe it's important to consider projects like this in a broader long-term context. Sherman County's economy has changed significantly over time and the pressures facing agriculture and rural
communities continue to evolve. We had in 1920s we had over 4,000 people living
2:51:20
in the county. That's more than twice what we have right now. We had hotels in
2:51:26
the towns and restaurants and theaters and I've read even roofers had a golf course. That's all most of that is gone
2:51:34
now. um and primarily due to consolidation of
2:51:40
farms enabling our producers to reduce their production costs and they've done
2:51:45
a damn good job of it. They've really driven down their cost to to compete in
2:51:51
a tight environment and I appreciate people young farmers like Colton coming on because we need them to continue this
2:51:59
into the future but it's going to become tougher. uh our farmers have to
2:52:06
consolidate and they have to become larger and those that don't are not going to be with us anymore. Um and can
2:52:14
anybody doubt that the drive for more that we will see
2:52:20
more capital intensive equipment uh powered by artificial intelligence
2:52:27
that's will continue and further fuel consolidation amongst the farms in
2:52:32
Sherman County. Thoughtfully planned energy projects represent one step in a
2:52:38
more diversified and resilient future. uh one that balances environmental stewardship with an econ economic
2:52:45
stability. In this case, it is true that solar saves farms.
2:52:51

Last month, Governor Cotch issued an executive order to state agencies to move faster on clean energy projects.
2:52:58
And recently, even Representative Bence acknowledged that Oregon will have a
2:53:04
critical short shortfall in energy unless drastic steps are taken,
2:53:10
including expansion of our transmission facilities. The Bigalow The Bigalow
2:53:15
renewable energy project is lowhanging fruit with the existing underutilized
2:53:20
PGE transmission. While recognizing the project is not without impact, I view
2:53:25
the Bigalow renewable project as a positive contribution when evaluated through the established FSE process and
2:53:33
supported by enforcable mitigation measures. Thank you for the opportunity
2:53:39
to provide the statement and for your careful consideration, positive consideration of this these issues as
2:53:46
part of the record. Thank you.
2:53:57
Okay, our next commenter in the room is Chad Higgins.

2026-420- Public Comment Detail

Comment Title: I am enclosing a 3 minutes presentation on our fires and how fast they move, created by my neighbor. Exhibit V is fire one the Biglow Site certificate, not Waste.

Comment Details:

As I told and showed the EFSC committee in Grass Valley on January 15, 2026, our wildfire risk is high, and our fires travel fast. Perhaps this will show how real it is out here! This is the Substation Fire, put together by Whitney Weedman.

Re: Support for the Biglow Renewable Power Project

Dear Christopher,

I am writing in support of the Biglow Renewable Power Project. This project represents a sound business opportunity for our community. I am the fourth generation of my family to farm here in Sherman County. Our farm that was homesteaded in 1896 continues to see financial ups and downs, and in recent years making a profit has become harder. At times it seems unlikely I will be able to pass the operation on to my grandsons.

Wheat prices continue to swing with the market, averaging just over $5.90 per bushel today, not much higher than a decade ago. While the cost of operating farms and maintaining our crops has climbed exponentially. For example a two year old combine to replace my 10-year-old machine would cost me over $500,000.

I've personally witnessed the decline in small family farms in my area. Many blame our changing climate, the cost of farming, and even renewable power projects that use local farmland. But the reality is that the cost of doing business is the culprit. As farmers, we are used to adapting to new challenges. Projects like Biglow provide the stability area farmers need. Lease payments and community mitigation funds will give farmers a reliable source of income that isn't tied to volatile commodity markets. That stability means families can keep farming, and even invest in newer equipment, and support the local economy through jobs and spending. It also means younger generations may see farming as a sustainable career, rather than a constant financial gamble.

Approving the Biglow Renewable Power Project is a decision to keep farmland in production and to diversify the economic base of eastern Oregon. For those of us who depend on farming, it's an opportunity to strengthen our businesses and protect the future of agriculture in this region.

Your consideration would be greatly appreciated.

Respectfully,

Randy Hilderbrand

Subject: Proposed Order for Biglow Solar

You don't often get email from nickw@shermancountyor.gov. Learn why this is important

Mr. Clark,

As the Sherman County Weed District Supervisor, I have reviewed the Revegetation and Soil Management Plan and have not identified any elements with which I disagree. The only concern I have identified is within the Proposed Order, Section III.N.1, Findings of Fact, on page 233, regarding the specified grass height during the dry season.

The proposed grass height of 1–3 inches does not appear feasible if erosion control is a priority. Additionally, several of the bunchgrass species proposed for planting could be negatively impacted by maintaining vegetation at such a short height. In my professional opinion, allowing a grass height of 4–8 inches during the dry season would better support continued establishment, promote a stronger root system, and result in healthier long-term growth.

Re: Biglow Canyon Wind Farm
Public Comment for Site Certification Amendment and Proposed Order
Notice Date: December 16, 2025

Dear Mr. Clark:

This office represents Donald Hilderbrand. Mr. Hilderbrand wishes to provide comment on the proposed Order with changes proposed in Request For Amendment 4 dated December 16, 2025, in which Portland General Electric (certificate holder), seeks approval from the Energy Facility Council to construct and operate (1) 124 MW solar photovoltaic power generation facility occupying up to 1,445 acres; (2) a 500 megawatt-hour Battery Energy Storage System (BESS), and (3) related or supporting facilities, including a 34.5 kilovolt (kV) electrical collection system, collator substation, 600-foot 230-kV transmission line, operations and maintenance building, 10.5 miles of access roads, and perimeter fencing, gates, etc. located on a operational facility located within a 25,000-acre site boundary on private owned land zoned for Exclusive Farm Use, approximatively 2 miles northwest of the Town of Wasco.

Mr. Hilderbrand has an interest in the real property and does not consent to the plan as currently proposed. As he does not wish to have his property as part of this project.

If you have any questions, comments, or concerns, please feel free to contact me.

Much Appreciated,

Jered Reid

2026-454 - Public Comment Detail

Comment Title

From: Kathy McCullough

Comment Date: 1/29/2026

ASC Exhibit: Exhibit B - Proposed Facility Description

Comment:

Page 32-34 in the Request for Amendment 4 for Biglow Canyon Wind Farm: compliance (as well as page 4). Operator has not been forthcoming and compliant. Inspectors were taken to certain clean towers, and falling pieces were never reported until landowners caught them lying and obfuscating.

Suggest Operator (PGE) repair all 76 of the Vestas towers in 2026 before they are allowed to bring in solar.

I know it sounds harsh to say I don't trust PGE and BrightNight, and that they lie, but I do have evidence—the closest to proof I can get.

PGE has been telling us since our meeting in 2017 that they would fix the pitch systems in the 76 Phase 1 Vestas towers. The blade fell in February 2022, four years ago, and the towers are still broken. Now PGE says 17 will be fixed this year, 26 in 2027, and the rest in 2028. Eleven years to fix them, maybe… I'll believe it when I see it. It took less than a year to build them: transmission lines, substation, and all 76 of them!

BrightNight told us they would keep the panels out of view of our yard, at least half a mile away. Then their plan was released. Does this look like it's out of view? Half a mile?

Side yard

BrightNight also said they would use the less-productive ground of Scharf's first. (Scharf's have 4000 acres) Instead, they are putting the 800 acres of panels and batteries on the best farm ground of Scharfs because it is closest to the substation, on flat ground, and cheaper to build. We threw a fit, and Scharfs told BrightNight to move the panels back ½ mile.

These are the two biggest lies we've been told. There are plenty more. These companies act like used car salespeople—they'll sell you a car, tell you how great it is, and then, as soon as you drive off the lot, it falls apart. Actually, they are worse than used car salesmen. $$$ **Companies like BrightNight and Brookfield are here today and gone tomorrow. Won't they and PGE build safer projects if they know there is a hold harmless clause for farmers?**

Front yard

Oh the ground will be better when it comes out of solar 50 years down the road. **How do you know???** "After having ground in CRP for 40 years with no roads or traffic compacting, controlling weeds, and deep-rooted perennial grasses, our soil tests show no significant improvement over our wheat fields. In fact, some of our wheat fields have higher organic matter now that we have gone 100% no till." Alan von Borstel

The agronomic and geographic conditions of the Pacific Northwest have evolved into the only place in the world where soft white wheat is successfully and consistently grown. There is no other place in the WORLD that can grow this class of wheat, making this area very unique. There are no truer words than Oregon's motto, "Oregon wheat feeds the world". Darren Padget

Sincerely, *Kathy McCullough*

2026-455 - **Public Comment Detail**

Organization: Kathy & Kevin McCullough

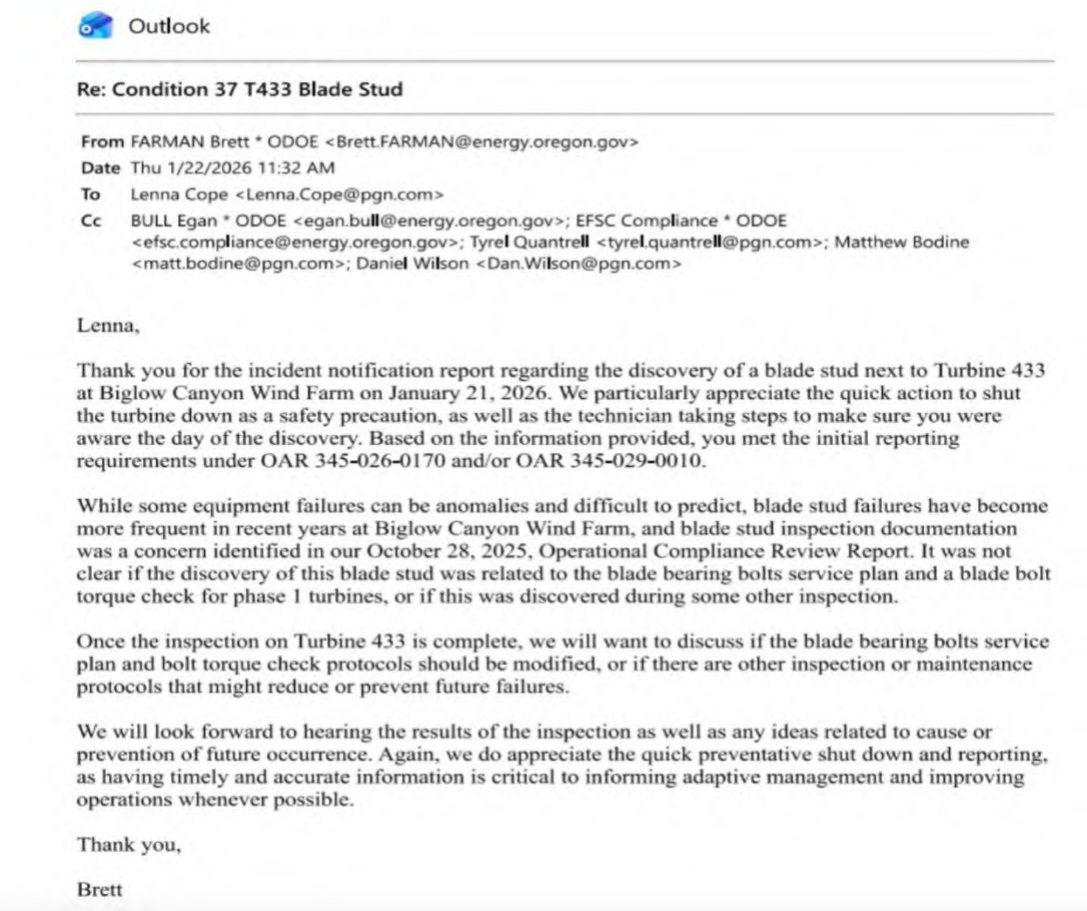
Zip Code: 97065

Comment Summary:

Falling pieces



Request for Amendment 4 for Biglow Canyon Wind Farm
Page 23 Long Term Facility Maintenance Plan

4.2.1 Long-term Facility Maintenance Plan
Over the course of more than 15 years of operation at the Existing Facility, the Certificate Holder has encountered technical challenges that have offered valuable insights into both technical and procedural vulnerabilities and informed continuous improvement efforts. The Certificate Holder has implemented targeted improvements specific to the Existing Facility, including changes to internal management structure and personnel, a change in the turbine O&M provider with a newly negotiated contract to mitigate future technical challenges and better align with site-specific performance goals, and improved monitoring of contractor performance. Improved preventative maintenance, robust monitoring, and corrective action planning will be the result of these ongoing changes.

The specific types of technical challenges with the Existing Facility would be unlikely to occur with the Solar Components due to the difference in technology. Lessons learned from more than a decade of wind facility operations at BCWF are being directly integrated into the planning and management of the proposed Solar Components. Past challenges have informed the adoption of more robust preventative maintenance and corrective action protocols, improvements to vendor contracts to ensure the contracts use asset management and equipment health as the measure for vendor performance, stronger consequences for poor performance, and improved quality control and assurance oversight of vendors.

This is my final letter before the end of the comment period.

My husband and I used to walk under the Vestas towers during our evening walks. We can't anymore because they're dangerous to walk under. Now, the Siemens towers are dropping blade stud bolts, with the most recent incident a week ago. Five more are listed below.

Outlook

Re: Condition 37 T433 Blade Stud

From FARMAN Brett * ODOE <Brett.FARMAN@energy.oregon.gov>
Date Thu 1/22/2026 11:32 AM
To Lenna Cope <Lenna.Cope@pgn.com>
Cc BULL Egan * ODOE <egan.bull@energy.oregon.gov>; EFSC Compliance * ODOE <efsc.compliance@energy.oregon.gov>; Tyrel Quantrell <tyrel.quantrell@pgn.com>; Matthew Bodine <matt.bodine@pgn.com>; Daniel Wilson <Dan.Wilson@pgn.com>

Lenna,

Thank you for the incident notification report regarding the discovery of a blade stud next to Turbine 433 at Biglow Canyon Wind Farm on January 21, 2026. We particularly appreciate the quick action to shut the turbine down as a safety precaution, as well as the technician taking steps to make sure you were aware the day of the discovery. Based on the information provided, you met the initial reporting requirements under OAR 345-026-0170 and/or OAR 345-029-0010.

While some equipment failures can be anomalies and difficult to predict, blade stud failures have become more frequent in recent years at Biglow Canyon Wind Farm, and blade stud inspection documentation was a concern identified in our October 28, 2025, Operational Compliance Review Report. It was not clear if the discovery of this blade stud was related to the blade bearing bolts service plan and a blade bolt torque check for phase 1 turbines, or if this was discovered during some other inspection.

Once the inspection on Turbine 433 is complete, we will want to discuss if the blade bearing bolts service plan and bolt torque check protocols should be modified, or if there are other inspection or maintenance protocols that might reduce or prevent future failures.

We will look forward to hearing the results of the inspection as well as any ideas related to cause or prevention of future occurrence. Again, we do appreciate the quick preventative shut down and reporting, as having timely and accurate information is critical to informing adaptive management and improving operations whenever possible.

Thank you,

Brett

I tried to obtain the incidents from the six months prior, but ODOE couldn't find any. I know of at least one large disc that fell from a Siemens into a gully where the guys were farming in October 2025. It isn't mentioned. I can't let my two-year-old grandson play near the wind towers, and he wants to! But it isn't safe. What happened to "peaceful enjoyment"?

The **blade bolts** are obviously a serious problem. **A 20-inch bolt could seriously injure someone near the tower. Still, there have been six bolt-related incidents (including spinner bolts) in the past two years!** *Only six? I suspect more.* PGE must demonstrate it can operate this project safely and effectively. They didn't report **anything** until ODOE instructed them in October 2022, long after the "blade liberation." Allowing them to install solar on the project before all Phase 1 towers are fixed and before the Siemens towers stop dropping bolts is unacceptable.

Kathy & Kevin McCullough

Subject: Biglow Condition 37 - Blade Stud T335 and T356

Duane,

Pursuant to the incident reporting guidance issued by the Oregon Department of Energy on October 27, 2022, and potential applicability of Condition 37 of the Biglow Canyon Wind Farm site certificate, PGE is notifying the Department that on September 5, 2024, while performing monthly inspections, a PGE technician found a blade stud on the ground at Turbine 335 (T335) and a blade stud on the ground at T356; both turbines are Phase 2 Siemens turbines. Blade studs hold the blade to the blade bearing; there are 54 blade studs for each blade. The portions of the blade studs found were approximately 20 inches in length. The blade stud for T335 was found approximately 20 feet from the turbine and an associated washer was also found; the blade stud for T356 was found approximately 13 feet from the turbine. T335 was inspected on September 5 to check for any damage to other components in the hub, any additional broken blade studs, and for any other items at risk of falling from the turbine; there was no additional damage or findings for T335. The same inspection was performed on T356 on September 6; one additional blade stud was found loose, that stud was removed. The turbines will remain out of service until they are engineering evaluated and deemed operationally safe. PGE will be tensioning 100% of the blade studs in Phase 2 and 3, and replacing any blade stud that is damaged or moves more than ½ a turn The effort will be completed by the end of the year. See below for pictures.

Please advise if you have any questions or need additional information.

Thank you.

Duane,

Pursuant to the incident reporting guidance issued by the Oregon Department of Energy on October 27, 2022, and potential applicability of Condition 37 of the Biglow Canyon Wind Farm site certificate, PGE is notifying the Department that on February 14, 2024 at 12:08 p.m. PGE's maintenance contractor, Vestas, found a broken blade bearing bolt on the ground at Turbine 28 (T28), a Phase 1 Vestas turbine. It was found in the gravel approximately 3 feet from the base of T28. The turbine was inspected and all other bolts were ping tested to confirm there were no other loose or broken bolts. The last annual inspection of T28 was conducted on 11/19/2023. The turbine was last visited on 12/13/2023 and there was not a bolt present on the ground.

Please advise if you have any questions or need additional information.

Subject: Biglow Condition 37 - T72 Spinner Shell Bolts

Duane,

Pursuant to the incident reporting guidance issued by the Oregon Department of Energy on October 27, 2022, and potential applicability of Condition 37 of the Biglow Canyon Wind Farm site certificate, PGE is notifying the Department that on October 7, 2024 at 10:30 a.m., PGE's road maintenance contractor found four spinner shell bolts at the base of turbine 72 (T72); a Phase 1 Vestas turbine. Spinner bolts hold the shell at the base of the blades that protects the hub. There are three pieces to the spinner shell which are attached to each other, and each section is attached to the nacelle by two bolts for a total of six bolts. The spinner bolts are about six inches long and were found approximately six feet from the turbine. The road maintenance contractor picked up the bolts and placed them at the base of the turbine and notified PGE staff. The turbine was immediately taken out of

service and inspected on 10/7/2024 and all six bolts were found to be missing (the other two bolts have not been located), although the bolts were missing the spinner shell remained in place because the three pieces being attached to each other continued to hold it in place. The bolts were replaced on 10/7/2024 and the turbine was placed back in service.

Please advise if you have any questions or need additional information.

An Oregon kind of energy.

response and monitoring systems (see Attachment 5). Prior to the start of operation, the Certificate Holder will develop an O&M Plan based on this framework to further detail the specific actions required to operate and maintain the Solar Components. Actions described in the O&M Plan Framework include:

- The integration of existing and new technical and site management plans into the solar facility O&M plan;
- Facility roles and responsibilities;
- Preventative maintenance and asset monitoring;
- Compliance, controls, and reporting;
- Emergency preparedness in n;
- Contractor and staff oversight;
- Design and equipment selection; and
- Long-term maintenance and operational continuity, including:
    - Personnel and quality assurance oversight,
    - Budget planning, and
    - Lifecycle management.

The final O&M Plan will be a living document that will be updated throughout the life of the Solar Components to ensure proactive and effective management of the site.

4.3 Applicable Laws and Council Rules – OAR 345-027-0360(1)(b)(B)

OAR 345-027-0360 Preliminary Request for Amendment

- Per Conditions 37 and 81 of the BCWF site certificate, PGE continues to report incidents that occur at our facilities in accordance with guidance issued by ODOE on October 27, 2022. None of these incident reports have resulted in a violation or citation being issued to PGE; however, several of them have required PGE to implement corrective action plans to reduce the likelihood of recurrence. The incidents reported since the beginning of 2022 include a blade detachment, various broken fasteners, failed hatches, an open turbine door, and transformer failures. Corrective actions plans have been implemented to address these issues. PGE meets regularly with ODOE to ensure issues are adequately being addressed.

Despite the issues identified in the section above, the Existing Facility is currently operated in compliance with its respective Site Certificate Conditions and in a manner that protects public health and safety. Given the Certificate Holder's successful expansion of their renewable energy generation portfolio and ability to address issues if they arise, and their demonstrated ability to restore the BCWF to a useful, non-hazardous condition (see Conditions 107 through 109),[14] the Council may conclude that the BCWF, as amended by RFA 4, will continue to comply with OAR 345-022-0010.

5.3.2 BIGL bn, LLC

The BIGL team through its parent company, BrightNight, LLC, has more than 6 gigawatts of experience developing, designing, and constructing solar and storage projects across the United States. Currently, BIGL's global 30+ gigawatt development pipeline has converted to projects under or nearing construction in Arizona and Washington, and under current operations in India.

	On October 10, 2024 PGE notified ODOE via email that four spinner shell bolts were found on the ground from T72. On October 17, 2024 PGE notified ODOE via email that a hub Casing Tube Bolt from T39 was found. On October 18, 2024 PGE notified ODOE via email that there was an oil spill at T434 that resulted from a failed transformer. The transformer dissolved gas analysis was within acceptable range in 2023. The spill cleanup report submitted to DEQ was provided to ODOE on 11/20/2024. There were no unusual events such as earthquakes, extraordinary windstorms, major accidents that had a significant adverse impact on the facility during 2024.
(ii) Reliability and Efficiency of Power Production: For electric power plants, the plant availability and capacity factors for the reporting year. The certificate holder shall describe any equipment failures or plant breakdowns that had a significant impact on those factors and shall describe any actions taken to prevent the recurrence of such problems.	Plant availability for each facility phase was: • 79.7% for phase one • 93.5% for phase two • 89.7% for phase three • 87.4% facility average Total capacity factor for the facility was: • 26.0% facility average See Exhibit 5 supporting documentation for additional information contained in Attachments 1 and 10.

See the availability for Phase 1 in 2024? That was before the towers were shut down for safety. **I.E. Dropping Pieces!** Now, less than one-third of them are running. PGE finally bought all the parts necessary to fix them in December 2025. But they aren't going to fix them until September, and only 17 then. One has been returned to service with the new Pitch System. And the capacity factor? 26%? The project south with less wind was running at 37%! (That's my recollection – you can doublecheck – it Patu Wind) We have good wind. **Biglow should be producing at a 96% facility average. How do I trust them with solar in our fire-prone area?**

Stakeholder Statement for the Record

Oregon Energy Facility Siting Council (EFSC)
Oregon Department of Energy
Biglow Renewable Power Project

My name is Justin Scharf. I am a Fourth generation farmer and landowner in Sherman County, Oregon, and I am submitting this statement for the record regarding the Biglow Renewable Power Project on behalf of myself and R&A Scharf LLC.

I want to be clear at the outset that we are a participating landowner in this project. We are also landowners in the Biglow Canyon Wind Farm, a project that our family was early supporters of. I believe it is important for the Council to understand why we chose to participate, and how that decision relates directly to the long-term future of our family farm.

Like many farmers in this community, our primary goal is to keep this land in our family and in agricultural use for future generations. Farming margins are tight, and the financial pressures facing family farms continue to increase. Without new and reliable sources of income, it becomes harder every year to plan for succession, invest in the operation, and ensure that the next generation has the option to continue farming. Diversification is key, and in this area there are limited options for diversifying crops.

Utilizing a portion of our farmland to also produce and sell energy provides that stability. It allows us to diversify the farm's income while the surrounding ground can continue to be farmed. This type of diversification helps us manage risk, maintain the operation, and avoid having to sell or fragment the property in the future.

From our perspective, the project has been planned in a way that respects the land and recognizes that this is working farmland surrounded by additional farms and working farmland. Agriculture remains central to how this land is used, and renewable energy development is being incorporated in a way that supports, not replaces, that use. While a critic might say that any acre of farmland used for solar is an acre not farmed, I'd ask them to consider this: farming yields and efficiency have improved. Due to this, the need for new energy sources is far outpacing the need for additional crop land. Capitalizing on these farming advances means we can allocate some of that land for alternative income generation.

We are aware of pushback on the project, in part, because of past problems on the operation and maintenance of the Biglow Wind Farm. As land owners in that project as well, the concerns are valid when looking back at how problems were handled in the past. We believe that the new management and plan has drastically improved and addressed these shortcomings. It would be a shame to miss out on this opportunity based on past management that is no longer involved.

With the direction the Biglow Wind Farm is now headed, we are confident in the proposal for solar to work in conjunction with the wind farm. With much of the infrastructure and transmission lines already in place it is and ideal place to add solar. Already having energy production will have far less impact than adding solar in an area with no current infrastructure.

There is also concern from neighbors on fire risk surrounding the project. As a volunteer firefighter for nearly thirty years I also understand this concern. High wind, low humidity, and high fuels are nearly unstoppable conditions for a fire. We believe that the plan has done a good job of addressing this danger. Fire lines

around the project, and much lower fuel loads within the project, should make fires in, or approaching, the project controllable.

Our participation in this project is not about changing the character of the land or the community. It is about preserving both. Projects like Biglow give farmers practical tools to remain on the land, pass it on, and continue contributing to Oregon's agricultural economy.

Thank you for the opportunity to submit this statement and for your consideration of these perspectives as part of the record.

Salem, OR 97301

Re: Biglow Energy Facility

Dear Christopher,

The Oregon Wheat Growers League is a nonprofit trade association supporting the wheat industry throughout the state. We appreciate the opportunity to comment on the proposed order for the Biglow Canyon Energy Facility in Sherman County. Given the scale of the project and potential impacts to the industry, we offer comments for your consideration, with the intent to minimize negative impacts that would reduce viability of the wheat industry overall.

The League supports protection of private property rights and the ability to enhance agricultural land, to the extent it remains compatible with neighboring uses and the ability for the wheat industry to remain viable. In regard to the Biglow Canyon project, we request consideration of the following items:

Overall Impacts: We agree with the statement that "Taking the affected area out of agricultural production would not only have direct impacts [...], but it will also have indirect and induced impacts to the local agricultural economy [...]. Whereas wind projects provide capacity for coexistence of agricultural operations, the proposed industrial solar development would fully remove the capability for wheat production on over 1,000 acres.

Direct Impacts: We disagree with the statement "For direct impacts, the landowner/farmer will experience the loss of direct agricultural production revenue, but this lost revenue will be replaced by revenue received from the Solar Components lease payments." That statement presumes that the landowner and farmer are the same entity. However, land ownership often differs from land management and operations. Those who lease land for agricultural production (wheat producers farming that ground) will experience the loss of agricultural production without support in lost revenue near or long term, nor an alternative space to continue farm operations.

> *We would seek clarification as to the statements attributed to farmers if they are operators or landowners or landowner/operators to best identify the extent of impacts and benefits to each.*

Indirect Impacts: The indirect impact analysis is missing the full extent of indirect impacts. In addition to the areas commonly considered in reviews, one that is unique to agricultural production is assessments. Each bushel of wheat produced is assessed and those funds are collectively used to primarily fund research and market development, as well as grower services through the League. The scale of the acres proposed to be taken out of wheat production, unless mitigated, would have an adverse impact on the ability of the industry to invest in itself and its

long-term sustainability. It would also remove grower-driven decision making around those investments.

As discussed below, we seek to have mitigation plans incorporate wheat grower engagement as the plan shifts investment decision-making from those impacted. We would also seek to ensure the impact model is updated to account for lost assessment revenues.

Ag Mitigation and Community Investment Plan (8.1.3.3): Given the real and substantial impacts to wheat producers and communities, we seek modifications to the proposed ag mitigations to connect resources to those most impacted. Currently, the CIP does not deliver on the statement that it references indicating that the plan will "ensure any negative economic impacts that could result from the decrease in total acres of wheat production in the county will be offset by investments in the local agricultural community." Nor do we think the changes below will be able to ever fully offset given the loss of agricultural land into an industrial use. However, modifications within the ag mitigation plan will better alleviate the challenging impacts with a partial mitigation.

- Administration: The plan should include farmer representative(s) built into the decision-making process. Under the CIP, the Sherman County Court will select what projects would be funded and/or what organizations would be awarded mitigation funds, with Mid-Columbia Economic Development District (MCEDD) as the administrator. While both the County Court and MCEDD are supportive structures, there is no guarantee a wheat producer would be involved under this current structure. The model needs to incorporate *active* dryland wheat farmers. *Proposed: Update the structure to include a representative from the Oregon Wheat Growers League.*
- Farm production: Further consultation with those engaged in market development to understand the long-term markets in domestic and international capacities is needed to clarify statements listed in the market statements. *Proposed: Further outreach to the Oregon Wheat Commission, U.S. Wheat Associates, National Association of Wheat Growers and Northwest Grain Growers.*
- Agrivoltaics: This area is significantly overstated and while research in higher rainfall zones by OSU may have investment purpose, we are concerned that the focus of this effort in dryland systems would not produce meaningful results. *Proposed instead: Similar to how the wheat industry currently conducts research reviews, a producer-led analysis of research proposals would allow research investments to match the growing area most effectively.*
- Weed control: Maintaining weed control should not be a separate ag mitigation effort, but a requirement of the project. The project adds burden to neighboring properties in weed control. Soil disturbed in construction becomes a favorable environment for noxious and invasive species. Farms must actively manage weeds and are heavily adversely impacted by weed banks from neighboring properties. The project should ensure that a weed management plan that can be reasonably enforced is completed outside of ag mitigation efforts. *Proposed: Incorporate weed management to the project requirements, not diminishing ag mitigation funds.*

- Fire: As the state struggles heavily with impacts from wildfire, fire management and response is critical. Similar to weed management, the efforts on addressing fire liability should occur as part of the project plan, not as an ag mitigation. Investments in fire support outside of the project obligations is appropriate, however.

Thank you for the opportunity to provide comment.

Sincerely,
Thad Eakin
Oregon Wheat Growers League President

RE: Proposed Order on Request of Amendment 4 of the Biglow Canyon Wind Farm Site Certificate

To Whom it May Concern,

The Sherman County Soil and Water Conservation District (SWCD) would like to express concerns regarding the proposed amendment to the Biglow Canyon Wind Farm, near Wasco, Oregon, which would expand the facility to include a 125 MW solar photovoltaic power generation facility, particularly as those concerns relate to the surrounding natural resources and environment.

After the construction of a solar project in 2018 that resulted in the catastrophic loss of irreplaceable topsoil, the County saw fit to add Sherman County SWCD to the list of organizations for the renewable energy companies to consult with before proceeding with the construction of their projects. Sherman County SWCD has 75 years of experience in working with the state of Oregon, federal agencies, public interest groups and landowners/operators to implement soil and water conservation practices for the better protection of our natural resources. It was the County's hope that the District's vast experience with the management of local natural resources could also work with renewable energy companies to help them implement practices in their construction and continued management process to help prevent such an environmental failure from happening again in the future.

Since then, the District has enjoyed the privilege of working with these companies as they move forward with their projects. Although we recognize that these companies are now required by the County to meet with us, the District appreciates any cooperative work done to best alleviate our concerns when it comes to the damage to our local environment and natural resources. When it comes to protecting our natural resources, the District believes that being proactive is much better than being reactive.

The District has shared general concerns with the overall volume of current renewable energy projects being proposed in Sherman County in such a short timeline. To our best estimate there are approximately 35,000 acres of green energy projects entering their first phases to be approved to start construction in coming years, with reports of this eventually growing to a total of 81,000 acres. Should the latter acreage be met, this would mean that over 15% of the County would be converted to green energy production not including the large amount of acreage already in production.

Large scale solar facilities installed on agricultural land can pose several risks to soil health and watershed function if not properly sited, designed, and managed. Such risks include disturbance of soil structure, increase compaction, and reduced organic matter. Altered surface conditions associated with solar arrays—including panel rows, access roads, gravel pads, and stormwater infrastructure—can change natural drainage patterns. Concentrated runoff from panel surfaces may increase the velocity and volume of stormwater, leading to rill and gully erosion and increased sediment delivery to nearby streams, ditches, and waterways. Sedimentation can degrade water quality, reduce channel capacity, and negatively affect aquatic habitat downstream.

The conversion of agricultural land to solar facilities may also reduce vegetative cover that normally protects soil and filters runoff. Without adequate ground cover or conservation practices, nutrients, pesticides, and sediments can be transported more readily into surface waters, impacting watershed health.

In addition, long-term maintenance practices such as repeated vehicle traffic and vegetation control can further exacerbate soil compaction and erosion if not carefully managed.

For these reasons, large-scale solar development on agricultural land requires careful planning, site-specific soil and watershed assessments, and the implementation of conservation practices to minimize erosion, protect water quality, and preserve soil function. It is our opinion that this level of increase in such a concentrated area should not be taken lightly. Sherman County's geographical location being bordered by three major rivers and many smaller tributaries raises risk of disaster.

Although our concerns mostly focus on the main natural resource issues that also pertain to other landowners such as soil erosion, weed management, and fire mitigation, to name a few, it should also be noted that there are many unknowns to the public associated with newer solar technology. For example, it is to our knowledge that in the event of a fire, there is increased need for caution for the safety of fire crews due to toxins present in the panels and batteries. One of our concerns is the consequences of panels or batteries being damaged, either by fire or other means, and releasing toxins into the soil and into the waterways. Once toxins enter the waterways, it is too late to stop the damage. Sherman County records a risk of wildfire 98% higher than the counties in the entire United States according to the U.S. Forest Service raising the likelihood of damage occurring.

Even if no damage were to occur, Sherman County SWCD has been repetitively told by the renewable energy companies that their projects will have no measurable effects on the environment and natural resources without any extra steps taken. Sherman County SWCD finds that even with the proper steps taken, it is impossible to construct projects of this size and not have some measurable effect on wildlife, natural plant species, soil, and local watersheds. It is the District's goal to work with these companies to reduce this effect as much as possible knowing that there will be some level of interference in our natural ecosystems.

The District would also like to express that over its 75 years of existence it has had the pleasure of working with a population of involved and dedicated landowners and managers towards natural resource conservation. This population will very clearly be reduced with these projects, as a large area of land and many owners/managers transfers to the management of just a few large renewable energy companies. It is with this knowledge; the District expresses concerns that there are few laws in place and the ones that exist are not readily enforced to hold these companies accountable to managing the land in a way that

protects the environment and natural resources for all in the coming years. It is Sherman County SWCD's wish that as long as these projects exist, the state holds the companies accountable for any mismanagements in controlling weeds, preventing soil erosion, promoting fire prevention, and any other practices that ensure the health of the surrounding community and watersheds.

It is Sherman County SWCD's hope that the state does not rush the addition of solar to the Biglow Wind Farm's amendment and construction before proper natural resource protection management plans can be put in place, in order to prevent the wrecks of the past from happening again. Our hope is to develop a strong working relationship with Portland General Electric and BrightNight Power in order to help them in the effort to maintain our natural resources at a healthy level for the good of all of the community. Thank you for your attention to this matter.

Sincerely,

Amanda Whitman
District Manager
Sherman County Soil and Water Conservation District

Re: Biglow Canyon Wind Farm Request for Amendment 4 – Proposed Order

Dear Mr. Clark,

Portland General Electric (PGE; Certificate Holder) submits the following comments in response to the Oregon Department of Energy's (ODOE's) Proposed Order on the Request for Amendment 4 (RFA 4) of the Biglow Canyon Wind Farm (BCWF or Facility) Site Certificate.

The Certificate Holder generally agrees with the findings in the Proposed Order and the draft Amended Site Certificate for the RFA 4 and acknowledges the substantial effort undertaken by ODOE staff and participating state agencies reviewing and evaluating the proposed amendment. The Certificate Holder appreciates the collaborative coordination throughout the review process and provides the following comments to clarify the record and support consistent implementation. The Certificate Holder also submits a separate letter specific to the requested Goal 3 exception.

The Certificate Holder provided a letter to ODOE on January 14, 2026, addressing requested edits related to corrections or clarifications of the record for the Proposed Order and associated plans (included as attachments on the Proposed Order) for ODOE's and Council's consideration in the Final Order. This comment letter provides additional clarifications and requested revisions on the Proposed Order and associated plans for consideration in the Final Order.

Certificate Holder's Comments on the Proposed Order:

- **I.D.3 Temporary Construction Areas**
  The Certificate Holder requests clarification and correction of the description of Temporary Construction Areas in the Proposed Order. The Proposed Order states that temporary construction areas would be established "within the perimeter fenceline," which could be interpreted to inaccurately constrain their location. Temporary construction areas may be located anywhere within the approved Solar Micrositing Area, including areas both inside and outside the perimeter fence line, provided they remain within the Solar Micrositing Area. This clarification is consistent with the RFA and ensures construction logistics are not inadvertently limited.

- **I.D.3: Other Proposed Related or Supporting Facilities**
  The Certificate Holder would like to request that the following language in red font be inserted into the paragraph below regarding Perimeter Fencing and Gates:

  > *Each solar array, with any collocated related or supporting facility components, would be enclosed by seven-foot-tall chain-link perimeter fencing with one foot of razor or barbed wire at the top. Alternatively, wire mesh or similar perimeter fencing up to 8 feet in height may be used. Fences would be constructed and grounded in accordance with NESC Rule 110. Vehicle access to the facility would be provided by lockable vehicle gates. Additional gates may be installed for emergency exit or removal of wildlife.*

  This language allows final fencing materials and heights to be determined during the final design process, while remaining consistent with safety and code requirements. This change is also requested for Attachment G Draft Construction Wildfire Mitigation Plan Section 4.1.5.

- **I.D: Table 2 – Solar Facility Component Summary**
  The Certificate Holder submits this comment to clarify an inaccuracy in Table 2 regarding the description of the Solar Micrositing Area. The note in Table 2 currently states:

  > *"The Solar Micrositing Area would occupy approximately 1,445 acres within fenced areas and transmission line corridor. The entire solar facility footprint is considered a permanent disturbance area for the purposes of evaluating and mitigating impacts to resources such as Fish and Wildlife Habitat; however, soil reclamation and weed management is applicable to the solar facility footprint as discussed in applicable section in this order."*

  This description inaccurately depicts the Solar Micrositing Area and conflates the Solar Micrositing Area with the anticipated permanent disturbance footprint. The correct description is as follows:

  > *The approved BCWF site boundary encompasses approximately 25,000 acres and includes all existing and approved BCWF components. The Certificate Holder proposes to modify the use of approximately 1,924 acres within the approved BCWF site boundary (Figure 3) to accommodate the Solar Components. These 1,924 acres comprise the Solar Micrositing Area (also referred to as the RFA 4 Site Boundary), within which construction of the Solar Components may occur.*

  The Solar Micrositing Area represents a conservative estimate of the maximum area required to accommodate development, micrositing flexibility, and temporary construction disturbances, and does not represent the anticipated permanent disturbance footprint. The clarification is provided to ensure the record accurately reflects the scope and purpose of the Solar Micrositing Area and avoids confusion regarding impact evaluation and mitigation.

- **III.B.1 Table 5**
  Reporting: The Certificate Holder supports ODOE's recommendation that regular reporting summarizing performance monitoring results be implemented; however, the Certificate Holder requests that the Department consider changing the identified monthly requirement to a quarterly cadence. Monthly reporting may over-emphasize short-term variability that does not reflect underlying performance trends, while quarterly reporting allows for more meaningful evaluation of system performance and provides sufficient time

for the Certificate Holder and O&M contractors to address identified issues.

- **III.C.1 Amended Condition 68**
  The Certificate Holder supports the intent of amended Condition 68 to avoid dangers to human safety presented by non-seismic hazards, including settlement, landslides, flooding, erosion, and collapsible soils. The Certificate Holder also acknowledges the severe hazard ratings present in portions of the BCWF site boundary.

  The Certificate Holder seeks to clarify that the proposed prohibition on all ground-disturbing activity in areas with slopes exceeding 20 percent, as written, may unnecessarily limit construction flexibility in areas where site-specific conditions can be demonstrated to be stable through engineering analysis.

  Existing slopes exceeding 20 percent are limited in extent and will generally be graded to slopes under 20 percent. Transitions between existing and final grades will be evaluated by the Geotechnical Engineer of Record. A job hazard analysis (JHA) will be implemented during construction.

  The Certificate Holder agrees that development should not occur on slopes exceeding 20 percent unless such development is demonstrated to be safe and appropriate based on site-specific geotechnical evaluation. Accordingly, the Certificate Holder requests clarification to allow ground-disturbing activities on slopes exceeding 20 percent only where reviewed, approved, and designed by the Geotechnical Engineer of Record to address non-seismic hazard risks.

  The Certificate Holder submits the following clarification for the record to maintain the intent of Condition 68 while allowing limited engineering-based flexibility:

  > **Proposed Clarified Condition 68 (CON-SS-03):**
  >
  > *The Certificate Holder shall design, engineer, and construct the solar facility to avoid dangers to human safety presented by non-seismic hazards, including but not limited to settlement, landslides, flooding, erosion, and collapsible soils. Ground-disturbing activities shall be avoided in areas with slopes exceeding 20 percent unless such activities are reviewed and approved by the Geotechnical Engineer of Record and designed to adequately address non-seismic hazard risks.*

- **III.D.1 Vegetation Management and Weed Control**
  The Certificate Holder provides the following clarification to ensure consistent interpretation of buffer area requirements along roads and perimeter fencelines within the Solar Micrositing Area, consistent with typical solar facility vegetation management practices and wildfire risk reduction measures.

  The terms "clear, brush-free area" and "vegetation-clearance area/zone" are used in multiple locations in the Proposed Order and Attachments D and G without consistent definition. To improve the clarity and avoid misinterpretation, the Certificate Holder requests that these terms be replaced with "low-growing, fire-resistant vegetation," or that the documents otherwise clarify that these buffer areas are intended to be maintained with low-growing, fire-resistant vegetation rather than fully devoid of vegetation.

  In addition, the Certificate Holder notes an inconsistency regarding whether the required buffer along the perimeter fenceline is intended to be 10 feet on each side or 20 feet measured along the exterior or interior and requests clarification from ODOE to ensure consistent understanding and implementation of the buffer requirement.

- **Section III.E. Land Use: OAR-345-022-0030**
  The Certificate Holder generally agrees with most of the findings in this section of the Proposed Order but disagrees with some of ODOE's findings under the applicable substantive criteria. Those are discussed in more detail below.

  SCZO Article 5. Conditional Uses; Section 5.2 General Criteria:

  In determining whether or not a Conditional Use proposal shall be approved or denied, it shall be determined that the following criteria are either met or can be met through compliance with specific conditions of approval.

  * * * * *

  - ***SCZO 5.2(5)****. That no approval be granted for any use which is or expected to be found to exceed resource or public facility carrying capacities, or for any use which is found to not be in compliance with air, water, land, and solid waste or noise pollution standards.*

    Certificate Holder Comment: In the Proposed Order, ODOE recommends the Council find that the facility would not exceed resource or public facility carrying capacities and would generally comply with applicable air, water, solid waste, and noise standards. However, ODOE continues that because the facility would trigger a Goal 3 exception under the DLCD acreage thresholds, the facility cannot meet this applicable substantive criterion as it does not meet an applicable "land standard." The Certificate Holder understands ODOE to be concluding that the DLCD Goal 3 acreage threshold in OAR 660-033-0130(38)(k) is a "land standard" within the meaning of the SCZO.

    The applicable substantive criterion in question is a general conditional use criterion, and the "land standards" referenced in it mean substantive standards that impose requirements on a use. The DCLD Goal 3 exception acreage threshold in OAR 660-033-0130(38)(k) is not a "land standard" within the meaning of the applicable substantive criteria – it is a threshold that, if triggered, requires the application of more stringent review criteria under the exceptions test. If ODOE is to interpret the DCLD rules as providing "land standards" within the meaning of this applicable substantive criterion, it should be the high-value and arable land siting standards in OAR 660-033-0130(38)(h) and (i), with which the Certificate Holder demonstrates compliance. The Certificate Holder requests that ODOE reconsider its finding and conclude that the facility, as amended, meets this applicable substantive criterion.

  - ***SZCZO 5.2(6).*** *That no approval be granted for any use violation of this Ordinance.*

    Certificate Holder Comment: In its findings, ODOE notes the facility would trigger a Goal 3 exception under DLCD acreage thresholds and therefore would not meet this applicable substantive criterion.

    This applicable substantive criterion prevents approval of a proposal that results in a "use violation" of the SCZO. The facility, as amended, is a "commercial utility facility" under the SCZO, which is a use allowed subject to conditional use review

and a Goal 3 exception. The fact that the use requires review and approval as a conditional use, and a use triggering a goal exception, does not mean that the proposed project results in a "use violation" of the SCZO. The DLCD solar siting standards are not adopted as part of the SCZO and are not a basis for evaluating compliance with the SCZO under this applicable substantive criterion. For these reasons, the Certificate Holder requests that ODOE reconsider their findings and find the facility, as amended, meets this applicable substantive criterion.

SCZO Section 5.8 Standards Governing Specific Conditional Uses:

A Conditional Use set forth by this Ordinance shall be subject to review by the Planning Commission in accordance with the public hearing requirements set forth in this Ordinance.

* * * * *

- ***SCZO 5.8(20).*** *Non-farm Uses in an F-1 Zone - Non-farm uses, excluding farm related, farm accessory uses, or uses conducted in conjunction with a farm use as a secondary use thereof, may be approved upon a finding that each such use:*

- ***SCZO 5.8(1).*** *Is compatible with farm uses described in [ORS] 215.203(2);*

  Certificate Holder Comment: In its findings, ODOE recommends the Council find that the facility components proposed in RFA4 are not compatible with farm use due to the facility exceeding the Goal 3 exception thresholds in maximum amounts of arable and high-value farmland allowed under OAR 660-033-0130(38)(k), and for this reason cannot be approved without an exception to Statewide Planning Goal 3.

  The Certificate Holder notes that this section of the SCZO allows for non-farm uses in an F-1 zone as long as they are compatible with farm uses described in ORS 215.203(2) (i.e., the employment of land for raising, harvesting, and selling crops for profit.…). The Certificate Holder provided evidence of the facility's compatibility with farm uses in Exhibit K Section 5.2.5.3. Furthermore, as part of the Goal 3 analysis, ODOE found that, subject to compliance with existing and recommended conditions of approval, the construction and operation of the facility components proposed in RFA4 are not expected to result in significant adverse impacts to adjacent farm uses from traffic, dust, noxious weeds, or wildfire, and as such, the facility meets the fourth prong of the Goal 3 exception test requiring that the facility, as amended, be compatible with adjacent uses, which are predominately farm uses (see Proposed Order page 149 Rows 17-25).

  Exceeding the Goal 3 exception acreage thresholds does not in and of itself preclude a facility from being compatible with farm uses. The Certificate Holder demonstrates throughout the record how the facility, as amended, avoids, minimizes, and mitigates for potential adverse impacts to surrounding farm uses and in doing so, complies with the applicable SCZO criteria and the siting standards in OAR 660-033-0130(38)(h) and (i). Therefore, the Certificate Holder maintains that the facility meets this provision in the SCZO. For these reasons, the Certificate Holder requests that ODOE reconsider their findings and conclude that the facility, as amended, meets this applicable substantive criterion.

- ***SCZO 5.8(3)**. Does not materially alter the overall land use pattern of the area;*

  Certificate Holder Comment: ODOE recommends the Council find the facility's conversion of approximately 1,445 acres of cultivated land, including 1,006 acres of high-value farmland, to a non-farm use does have the potential to materially alter the overall land use pattern of the analysis area by reducing the number of tracts available for farmland and potentially affecting the local agricultural economy.

  For purposes of analyzing this applicable substantive criterion, there are four steps: (1) define the area, (2) identify the land use pattern within that area, (3) identify potential impacts from the proposed use, and (4) determine if such potential impacts result in material changes to existing land use patterns. In the Land Use Exhibit K (Section 5.2.5.3) analysis of compliance with this criterion, the Certificate Holder defined the "area" as the portion of Sherman County east of US-97 and north of Grass Valley Canyon. The area is approximately 130 square miles. The overall land use pattern within the area is predominately large tracts of dryland crop production. The Solar Components would occupy two tracts within a 3-square-mile area. This would amount to approximately 2.3 percent of land being removed from production within the overall land use area for the life of the project.

  The facility would not diminish opportunities for farms on surrounding lands and lands in north Sherman County to expand, purchase, or lease farmland. The facility would not diminish the number of tracts or acreage in farm use in a manner that will destabilize the overall character of the study area. The underlying land will remain legally configured, meaning no parcels or tracts will be reduced. The Biglow Agricultural and Fiscal Impact Analysis (Attachment K-2) states that the 2022 agricultural census identified 402,516 acres in farms in Sherman County, occupying approximately 76 percent of the land in the county (USDA 2022, U.S. Census Bureau 2024). The removal of 1,445 acres of cultivated land into nonfarm use represents only 0.36 percent of the total farm acres in the county.

  Further, unlike other non-farm uses like non-farm dwellings that ODOE references, the facility will be decommissioned, retired, and the land will be restored at the end of operations. The participating landowners have the right to choose how to use their land – it is not the responsibility of these landowners to ensure that other farmers have continued opportunity to expand, purchase or lease farmland. Regardless, the Certificate Holder has demonstrated on the record that the facility, as amended, taking into consideration avoidance, minimization, and mitigation, (1) will not result in adverse environmental, economic, social, and energy consequences; (2) will not result in significant adverse impacts to accepted farming practices; and (3) will result in rural local economic benefits through the implementation of a Community Investment Plan. There is substantial evidence in the record to find that the facility, as amended and as conditioned, will not materially alter the overall land use patterns of the area. For these reasons, the Certificate Holder requests the ODOE reconsider its findings.

- **Directly Applicable State Rules and Statues: OAR 660-033-0130(38)(G)**

  Certificate Holder Comment: The entire paragraph of findings under this subsection should be struck. This subsection of the DLCD solar siting rule requires a stability analysis if there are at least 48 acres of solar facilities within a one-mile study area. First, there are no acres of solar facilities within the study area; therefore, subpart (G) is not triggered per the plain language in subpart (G)(i). Second, ODOE states that this rule was intended to apply to a facility less than 12 acres and "does not accurately capture the proposed facilities potential impacts on the stability of the overall land use pattern." ODOE needs to apply the rule as drafted. Moreover, the SCZO already requires the analysis ODOE is attempting to address under subpart (G)(ii), which the Certificate Holder addresses above.

- **III.N.1 Facility Design**
  The Certificate Holder requests the following change to the language in the third bulleted item, as shown in red below:

  - *All perimeter fences will be set back at least 50 feet from all property lines of non-participating landowners. Facility components will be set back at least 20 feet from fences.*

  Perimeter fencelines may abut the property line of the participating landowner, as identified in Land Use Condition 1 (GEN-LU-10). This clarification is requested to ensure alignment in all other references to the 50-foot setback in the Proposed Order and Attachment G Draft Construction Wildfire Mitigation Plan Section 4.1.3 and support final design considerations.

- **III.N.1 Operational WMP, Wildfire Risk Minimization Preventative Actions, Programs, and Procedures**
  The Certificate Holder acknowledges the Department's recommendation to maintain vegetation at a reduced height of 1 to 3 inches during the dry season (June–October) and requests that the vegetation height requirements be set to limit a height of 10 to 12 inches year-round. Based on practical vegetation management considerations, this approach better supports wildfire risk reduction for the following reasons:

  1. Repeated low mowing to such reduced heights would be detrimental to perennial grasses included in the approved seed mix, as repeated damage to bunchgrass crowns would likely result in plant mortality within a few growing seasons.

  2. Extremely low mowing would favor the establishment of annual grasses, thereby increasing fine fuels rather than reducing fire risk.

  3. Low mowing would significantly reduce or eliminate wildlife habitat, particularly for ground-nesting birds and beneficial insects.

  4. Mowing at such low heights at the beginning of the dry season increases the risk of fire ignition due to sparks generated when mowing equipment contacts rocks or hard surfaces.

  5. Maintaining vegetation at a 1- to 3-inch height would substantially increase vegetation management costs without providing commensurate fire-risk reduction benefits.

Certificate Holder's Comments on the Draft Site Certificate:

- **Recommended Land Use Condition 3 (PRE-LU-01)**
  The Certificate Holder has elected to seek a Council determination of compliance with statewide land use planning goals under ORS 469.504(1)(b). Given this election, Sherman County would not have discretionary approval of a CUP or Site Plan, and compliance with applicable sections of the Sherman County Zoning Code (SCZO) is determined by Council and memorialized in the Final Order and Site Certificate. Sherman County, in issuing a CUP or Site Plan under ORS 469.401(3), may adopt conditions from the Site Certificate to have concurrent enforcement authority.

  The Certificate Holder requests that the language in PRE-LU-01 conform to ORS 469.401(3) with the revisions identified in redline below:

  a. *Prior to construction of any component or phase of the solar facility, the certificate holder shall submit, to the Department and the Sheman County Planning Commission, an application for Conditional Use Permit pursuant to ORS 469.401(3) ~~meeting the requirements of SCZO Section 5.4(1) and (3).~~*

  b. ~~*The Site Plan required under SCZO 5.4(1) must demonstrate compliance with all applicable local ordinances and site certificate conditions*~~.
  [Final Order on AMD4]

- **PRE-NC-02**
  The Certificate Holder requests that the Department revise this condition to reference the Facility as a whole, rather than the solar facility alone, to align with the Department's requirement that noise compliance be demonstrated through cumulative modeling of the entire Facility. Additionally, the executed easements and/or real covenants apply broadly to the Facility, including any additions, without distinguishing among infrastructure components.

- **OPR-WR-01**
  The Certificate Holder understands that for any onsite wells, the combined water usage shall not exceed 5,000 gallons per day, for domestic use at the Facility's O&M buildings and solar panel and blade-washing activities. The Certificate Holder would like to clarify that this limit applies to all onsite exempt wells.

Certificate Holder's Comments on Attachment C Draft Operations and Maintenance Plan Framework:

- The Certificate Holder requests the following changes to the first bulleted item in Section 3.4.2 PV System:

  - *Routine module inspections and annual infrared/aerial thermal imaging with anomalies detected ~~via SCADA~~ generating corrective work orders ~~within 48 hours~~ according to the final Operations and Maintenance Plan.*

  This change is requested because it is unlikely that SCADA will detect module-level anomalies for work order creation. The Certificate Holder will include protocols for module inspections and corrective actions in the final Operations and Maintenance Plan submitted to ODOE prior to commencing operations of the Biglow Solar facility.

- The Certificate Holder notes that the text in Section 5.0 references the OIM Plan; this

should be changed to O&M Plan.

Certificate Holder's Comments on Attachment G Draft Construction Wildfire Mitigation Plan:

- **Section 4.1.3 Fire Prevention:**

  The Certificate Holder provides the following clarification regarding roadway design within the Solar Micrositing Area to ensure consistency with applicable Oregon Fire Code (OFC) provisions and typical utility-scale solar facility layouts.

  Roads designated for emergency access will be designed and constructed in accordance with the 2022 OFC, including Section 503 and Appendix D (Fire Apparatus Access Roads), which generally require a minimum width of approximately 20 feet. These requirements will apply to all exterior roads and designated emergency access routes intended for firefighting access.

  Within the solar facility fenceline, narrower interior service roads are proposed between panel rows to provide routine operations and maintenance (O&M) access to photovoltaic (PV) arrays. This configuration is typical of utility-scale solar facility design. These interior service roads are not intended or designated for use by fire apparatus or for fire suppression activities and are distinct from OFC fire apparatus access roads. Interior service roads within the solar facility fenceline will be at least 16 feet wide.

  The North Sherman County Fire Department has reviewed the site plans and has not provided comments regarding the widths of roads located within the site fenceline. Areas immediately surrounding O&M buildings, the proposed substation, and the BESS will be graveled and maintained free of vegetation. All exterior and designated emergency access roads will continue to comply with applicable Oregon Fire Code requirements.

- **Section 4.2 Specifications for Fire Protection Equipment:**

  The Certificate Holder requests to remove *Drip Can: 5 gallon capacity* from the list of fire suppression equipment required to be carried in maintenance vehicles and stored on-site at the O&M building. O&M staff are not expected to have experience using this type of equipment and will not be conducting activities requiring the use of drip cans.

Certificate Holder's Comments on Proposed Order Attachments: The Certificate Holder has reviewed the Proposed Order and confirms acceptance of all redline revisions provided on the attachments referenced therein, except where explicitly noted in comment on the record.

The Certificate Holder submits redline with corresponding comments provided to explain the basis for the requested changes to facilitate agency review. The following documents are submitted in redline versions with comments for the following:

- **Attachment D – Draft Comprehensive Revegetation and Solar Management Plan**
- **Attachment F – Draft Habitat Mitigation Plan**

PGE respectfully submits these comments for consideration by ODOE and the Energy Facility Siting Council in advance of Council action on the Proposed Order for Request for Amendment 4.

Sincerely,

Lenna Cope

NPDES	National Pollutant Discharge Elimination System
ODOE	Oregon Department of Energy
PGE or Certificate Holder	Portland General Electric Company
RC	Revegetation Contractor
RFA	Request for Amendment
WC	Weed Control Contractor

1.0 Introduction

This Comprehensive Solar Revegetation and Soil Management Plan (Comprehensive Plan) has been prepared by Portland General Electric Company (PGE or Certificate Holder) to serve as a primary source of commitments related to revegetation, soil management, dust control, stormwater management, and noxious weed control through the pre-construction, construction, and operations phases for the photovoltaic solar energy generation and battery storage (Solar Components) associated with Request for Amendment (RFA) 4 of the Site Certificate for the Biglow Canyon Wind Farm (BCWF or Facility). PGE will own and operate the Solar Components as a part of the BCWF (together, Amended Facility or Facility), which, to date, have been developed by BIGL bn, LLC (BIGL or Project Developer). BIGL, in its capacity as the project developer, supports PGE in this RFA 4 and may construct and temporarily operate the Solar Components on behalf of PGE under a Build-Transfer Agreement.

For ease of implementation and compliance tracking, this document is structured to identify actionable items by phase and typical sequencing within each phase, with additional details provided as appendices and/or incorporated by reference.

This Comprehensive Plan will be updated, as necessary, in coordination with the Oregon Department of Energy (ODOE) and applicable agencies as specified below prior to construction to reflect the final layout of the Solar Components and additional details only available once an Engineering, Procurement, and Construction Contractor (EPC) has been identified.

1.1 ~~Comprehensive~~ Plan Finalization

Table 1 identifies information that must be incorporated into the Comprehensive Plan before beginning any phase of construction.

Table 1. Action Items for ~~Comprehensive~~ Plan Finalization

Action	Timeframe	Implemented By	Review/ Verification
Notify Department of identity of EMC, EPC, RC, and WC. Provide evidence that each contractor meets the minimum qualifications described in Appendix A.	Plan Finalization	Certificate Holder	ODOE
Update Appendix A, Table A-1 with name and contact information for each contractor.	Plan Finalization	Certificate Holder	ODOE
Update Section 6.0, Table 5 with operations long-term vegetation management details from Public Utility Commission (PUC)-approved vegetation management plan including monitoring for Wildfire Management Plan vegetation criteria.	Prior to Operations	EMC	ODOE
Update Appendix B, Table B-1 with temporary and permanent disturbance acres by habitat subtype.	Plan Finalization	EMC	ODOE

Action	Timeframe	Implemented By	Review/ Verification
Update Appendix B with a Construction Plan and maps based on final design, expected disturbance levels, and sequencing of construction.	Plan Finalization	EMC	ODOE, ODA, ODFW, County
Update Appendix C with approved National Pollutant Discharge Elimination System (NPDES) 1200-C permit and Erosion and Sediment Control Plan (ESCP). Incorporate all stormwater control and treatment best management practices (BMPs) required by the 1200-C permit, and any supplemental BMPs required by this Comprehensive Plan, into ESCP.	Plan Finalization	EPC	ODOE
Update Appendix D with construction dust control measures. Include contact information and procedures for Dust Control Hotline.	Plan Finalization	EPC	ODOE
Update Appendix E with proposed baseline soil compaction sample locations.	Plan Finalization	Certificate Holder	ODOE
Update Appendix F with Final Revegetation methods, as needed, for both temporary and permanent disturbance areas in consultation with ODOE	Plan Finalization	EMC	ODOE
Update Appendix G with timing and treatment methods for each identified weed species of concern after consulting with the Sherman County Weed District.	Plan Finalization	WC & EMC	ODOE and County
Update Appendix G with final noxious weed and vegetation monitoring methods.	Plan Finalization	EMC	ODOE
Notes: EMC = Environmental Monitoring Contractor; EPC = Engineering, Procurement, and Construction Contractor; ODOE = Oregon Department of Energy; WC = Weed Control Contractor; County = Sherman County			

Commented [A1]: ODOE – Is there something specific that needs to be updated? Nothing in Appendix F is flagged for updates. We would prefer to consider this complete unless there is something specific that requires further discussion.

This might be related to the line above that states "Update Section 6.0, Table 5 with operations long-term vegetation management details from PUC-approved vegetation management plan."

Commented [A2]: ODOE - Weed monitoring methods were added and submitted to ODOE with RFA 4. Request that ODOE review and approve, then remove this line.

2.0 Definitions

Definitions applicable to this Comprehensive Plan are provided in Table 2, below.

Table 2. Definitions for the Biglow Canyon Wind Farm

Term	Definition
BCWF; Facility	Biglow Canyon Wind Farm
Habitat Areas	Any undeveloped, non-agricultural areas, including but not limited to areas mapped as grassland, sagebrush shrub-steppe, or riparian habitat, prior to construction of the Solar Components.
Permanent Disturbance Area	Any area permanently occupied by the Solar Components, including all areas within the fence line of a solar array or substation.
Sensitive Soils	Soils that are highly susceptible to erosion from water, fugitive dust propagation, compaction, or other impacts as described in Appendix E.

Term	Definition
Solar Components	Photovoltaic solar energy generation, battery storage, and other components authorized in RFA 4.
Solar Micrositing Area/ RFA 4 Site Boundary	Maximum area where Solar Components may be built or cause temporary disturbance.
Temporary Disturbance Area	Any area that is disturbed during construction of the Solar Components but will not be permanently occupied during operations.
Weed Management Area	Disturbance area associated with the Solar Components and a 10-foot buffer.

3.0 Plan Goals and Management Objectives

This Comprehensive Plan was developed to demonstrate compliance with the terms and conditions of the Site Certificate and other applicable state and local laws and regulations. Specifically, the actions described in this Comprehensive Plan are intended to increase the probability of revegetation success, reduce erosion and dust pollution, protect topsoil for future agricultural use on agricultural land, prevent and address the establishment and spread of noxious weeds, minimize fire risk, and maintain beneficial vegetation at the site.

The BCWF is located on privately owned agricultural land used primarily for dryland wheat production and, to a lesser extent, cattle grazing. The grazed land is grassland, shrub-steppe rangeland, and/or fallow wheat stubble fields. The Solar Micrositing Area also contains important wildlife habitat and movement corridors, particularly along the John Day River and its tributaries. Sensitive soils are present throughout the Solar Micrositing Area, and erosion hazards from wind and water are severe in areas with steep slopes, including canyons and drainages in the northeast portion. To ensure that the area can be restored adequately to a useful, non-hazardous condition following permanent cessation of construction or operation of the Solar Components, Permanent Disturbance Areas in wildlife habitat will be revegetated for the purposes of soil stabilization to reduce erosion, dust pollution, topsoil depletion, and the potential for invasion by noxious weeds and other invasive plants. Cropland in the Solar Micrositing Area will be returned to landowner control and will not be revegetated by the Certificate Holder.

To minimize impacts to agricultural uses and habitat in Temporary Disturbance Areas, soil disturbance and vegetation removal will be minimized and reasonable efforts will be made to restore vegetation and soils in agricultural and habitat areas to their pre-disturbance condition. Best Management Practices (BMPs) will be implemented to minimize erosion and prevent the introduction or spread of noxious weeds and other invasive plants in both habitat areas and temporarily disturbed developed areas (i.e., existing roads, rock quarries).

4.0 Pre-construction Compliance

Table 3 outlines actions related to revegetation, soil management, dust control, stormwater management, and noxious weed control that must be completed before beginning construction.

Table 3. Pre-construction Compliance Checklist

Action	Timeframe	Implemented By	Review/ Verification
Provide Final Comprehensive Plan to all participating parties.	At least 30 days prior to construction	Certificate Holder	ODOE
Hold a kick-off meeting with the EMC, EPC, County, and ODOE.	At least 14 days prior to construction.	Certificate Holder	ODOE
Collect baseline soil compaction measurements within all anticipated Level 3 and 4 Disturbance Areas (described in Appendix B) ~~Temporary Disturbance Areas~~ using the protocol described in Appendix E. Submit baseline soil compaction measurement results to ODOE.	Prior to construction	EMC	ODOE
Complete installation of stormwater, erosion, and sediment controls as required by the 1200-C permit. See Appendix C.	Prior to construction	EPC	ODOE
Coordinate the construction schedule and sequence with landowners to maintain land in current production and weed control until the last growing season prior to construction~~just prior to construction~~.	Prior to construction	Certificate Holder	ODOE
Conduct on-site Environmental Training with contractors ~~and,~~ construction personnel, and environmental inspector(s), inviting specialty contractors, Oregon Department of Agriculture (ODA), Oregon Department of Fish and Wildlife (ODFW), the County, and ODOE. The training must cover all aspects of this Comprehensive Plan and other requirements applicable to construction, including but not limited to: • Roles and ~~R~~responsibilities • Implementation of avoidance buffers for sensitive resources (e.g., flagging) • Methods for identifying and preventing the spread of noxious and invasive weeds • BMPs for soil protection and erosion control under the 1200-C ~~P~~permit. • Fire prevention practices during construction	Prior to construction	Certificate Holder	ODOE
Provide records demonstrating that all contractor personnel have attended on-site Environmental Training described above.	Prior to construction	Certificate Holder	ODOE
Conduct additional pre-construction noxious weed surveys to identify noxious weeds present within the Solar Components at the time of construction to inform management.	Prior to construction	EMC	ODOE
Provide the Appendix G Weed Control Plan to the Sherman County Weed District for review and concurrence with treatment guidelines.	Prior to construction	Certificate Holder	ODOE

Action	Timeframe	Implemented By	Review/ Verification
Treat noxious weeds within the Weed Management Area in accordance with methods in Appendix G.	Prior to construction	WC	ODOE
Provide evidence that existing noxious weeds have been identified and treated in accordance with methods in Appendix G.	Prior to construction	Certificate Holder	ODOE
Notes: County = Sherman County; EMC = Environmental Monitoring Contractor; EPC = Engineering, Procurement, and Construction Contractor; ODOE = Oregon Department of Energy; RC = Revegetation Contractor; WC = Weed Control Contractor			

5.0 Construction Compliance

Table 4 outlines actions needed for compliance during construction related to revegetation, soil management, dust control, stormwater management, and noxious weed control.

This list includes actions applicable throughout construction as well as actions required as construction nears completion and revegetation commences in preparation for entering the operations phase.

Table 4. Construction Compliance Checklist

Action	Timeframe	Responsible Party	Review/ Verification
During Construction Mobilization			
Provide information about target noxious weed species at the operations and maintenance buildings.	During construction	EPC	EMC & ODOE
Ensure a copy of this Comprehensive Plan and a description of any additional fugitive dust control requirements are available on site.	During construction	EPC	EMC & ODOE
Prominently display Dust Control Hotline signs, providing direct access to the Certificate Holder Site Manager.	During construction	EPC	EMC & ODOE
Flag sensitive environmental resources (e.g., historic, cultural, and archaeological resources; active raptor nests; delineated wetlands and waterways) and noxious weed infestations to alert construction personnel to of avoidance areas or management requirements.	During construction	EMC	ODOE
During Ground-Disturbing Activities			
To the extent practical, mowing or other vegetation removal activities in Category 2 habitat will be scheduled to occur outside the critical period for ground-nesting birds (April 15 – September 1), to avoid disturbing active nests. If mowing or other vegetation removal activities in Category 2 habitat are necessary between April 15 and September 1, the Certificate Holder shall hire a qualified biologist to conduct a clearance survey for nesting birds prior to vegetation removal. The Certificate Holder shall ensure that active nest sites identified during the clearance survey are flagged and marked as sensitive areas for avoidance on construction maps. ~~On or before April 15 of any year in which construction occurs within Category 2 habitat, all mowing, vegetation removal and/or ground disturbance associated with site preparation must be completed. No mowing, vegetation removal and/or ground disturbance associated with site preparation may occur within Category 2 habitat between April 15 through September 1.~~	During construction within Category 2 habitat	EPC, Certificate Holder	EMC & ODOE
In Disturbance Level 3, 4, and 5 areas (described in Appendix B), stockpile excavated soils by soil horizon to replace in the same order and prevent mixing of topsoil and subsoils. Put conserved topsoil back in place prior to revegetation activities.	During construction	EPC	EMC & ODOE
Do not move topsoil and other soils from areas with noxious weeds to areas without noxious weeds; instead, return these soils to their previous location during reclamation activities to reduce the transport of weed seeds, roots, or rhizomes.	During construction	EPC	EMC & ODOE

Commented [A3]: ODOE – Revised to require nesting bird clearance surveys prior to vegetation removal during the specified window. Restricting all vegetation removal in Cat 2 habitat from Apr 15 to Sept 1 would preclude almost all work in those areas and incentivize grading instead of mowing or drive and crush. Mowing is essential prior to work during the dry season to reduce fire risk.

Action	Timeframe	Responsible Party	Review/ Verification
Use appropriate erosion and sediment control practices, as required by the ~~National Pollutant Discharge Elimination System (NPDES)~~ 1200-C permit (Appendix C).	During construction	EPC	EMC & ODOE
Limit vehicle access to designated routes, whether existing roads or newly constructed roads, and the outer limits of construction disturbances per the final design for the Solar Components; limit vehicle traffic in areas with noxious weeds.	During construction	EPC	EMC & ODOE
Require construction vehicles to pass through a wheel wash station at vehicle ingress/egress points each time they enter or exit the Solar Components.	During construction	EPC	EMC & ODOE
Clean vehicles and equipment associated with ground disturbance and movement of topsoil utilizing a mobile wash station after performing work in areas with noxious weeds and prior to performing work in areas without noxious weeds.	During construction	EPC	EMC & ODOE
Implement appropriate BMPs to control any dust generated by construction activities, such as applying water or stabilizers to roads and disturbed soil areas.	During construction	EPC	EMC & ODOE
Maintain records of U.S. Environmental Protection Agency (EPA) Method 22 (ODEQ 2019) monitoring.	During construction	EPC	EMC & ODOE
After grading is complete but prior to installation of Solar Components, apply temporary or permanent soil stabilization, as described in Appendix F.	During construction	RC	EMC & ODOE
Monitor the Weed Management Area for noxious weeds during and after construction and implement control measures as described in Appendix G.	During and following construction	EMC & Certificate Holder	ODOE
Conduct compliance monitoring to ensure that contractors are complying with noxious weed prevention measures in this Comprehensive Plan. Facilitate coordination meetings with ODOE and Sherman County Weed District, train all personnel to maintain tracking sheets, conduct routine check-in calls with the construction team, and document communication with landowners prior to chemical application. Maintain records and provide ODOE with copies of these records annually during construction. If the Certificate Holder contracts with the Sherman County Weed District to perform weed control at the Solar Components, then monitoring records will include a statement that the county agency performed the work.	During construction	EMC	ODOE
If construction extends into the growing season prior to the commercial date of operations and formal post-construction weed monitoring, conduct informal but comprehensive weed surveys to	During construction	EMC	ODOE

Action	Timeframe	Responsible Party	Review/ Verification
inform adaptive management. Weed monitoring may be conducted as part of routine environmental monitoring to be completed at least monthly from April to October.			
Soil Stabilization and Reclamation			
Coordinate with the landowner or farm operator to identify the preferred approach for soil stabilization on agricultural land until routine seeding and tillage resumes. Soil stabilization may include applying unseeded hydromulch or crimping in weed-free straw until seeding can occur. Landowner may choose to assume responsibility for soil stabilization. Agricultural lands will be restored to landowner satisfaction.	During and following construction	Certificate Holder	EMC & ODOE
Meet with ODOE in coordination with ODFW and Sherman County Weed District to review the actual extent and conditions of disturbed areas and confirm the revegetation methods to be implemented.	After each phase of construction is complete and before revegetation	Certificate Holder	ODOE
In areas with noxious weeds where soil was removed, return soils to their previous location during reclamation activities to reduce transport of weed seeds, roots, or rhizomes.	During reclamation	EPC	EMC & ODOE
Treat noxious weeds in the Weed Management Area using methods described in Appendix G and in consultation with the Sherman County Weed District as necessary. No weed treatment will occur in agricultural lands without landowner permission.	Before reclamation and revegetation	WC	EMC & ODOE
Decompact soil by mechanical scarification (tilling or ripping the soil) to an appropriate depth as described in Appendix F. Soil amendment, such as addition of organic matter (compost), may also be necessary to alleviate compaction.	Prior to revegetation	EPC	EMC & ODOE
Complete post-construction soil compaction testing in spring or late fall in accordance with Appendix E. Submit results to ODOE for review and approval.	After reclamation and before revegetation	EMC & Certificate Holder	ODOE
Perform soil preparation prior to seeding using methods described in Appendix F.	Before revegetation	EPC	EMC & ODOE
Prevent conditions favorable for noxious weed germination by revegetating as soon as practicable.	After reclamation	RC	ODOE
Revegetation of Permanent Disturbance Areas			
Following completion of construction phases, seed undeveloped permanent disturbance areas in accordance with methods described in Appendix F.	During revegetation	RC	EMC & ODOE

Action	Timeframe	Responsible Party	Review/ Verification
Revegetation of Agricultural Temporary Disturbance Areas			
~~De-compact agricultural soil by mechanical scarification (tilling or ripping the soil) to an appropriate depth. Soil amendment, such as addition of organic matter (compost), may also be necessary to alleviate compaction.~~	~~During reclamation~~	~~EPC~~	~~EMC & ODOE~~
Coordinate with the landowner or farm operator to identify the preferred approach for revegetating agricultural land. Landowner may choose to assume responsibility for revegetation. Agricultural lands will be restored to landowner satisfaction.	During revegetation, following each construction phase	Certificate Holder, EPC	EMC & ODOE
Report to ODOE on the success of agricultural land restoration efforts; provide evidence that landowner or farm operator is satisfied with restoration.	During & following construction	Certificate Holder	EMC & ODOE
Revegetation of Non-Agricultural Temporary Disturbance Areas			
Reseed areas of temporary disturbance outside of agricultural lands, as described in Appendix F.	During revegetation, following each construction phase	RC	EMC & ODOE
If straw is needed and certified weed-free straw is unavailable, identify a local source of straw and obtain approval for its use by ODOE in consultation with the Sherman County Weed District.	Before revegetation	RC or EPC	ODOE
Consult with ODOE, ODFW, ODA, Sherman County Weed District, and/or the seed supplier to determine the optimal timing for seed application based on climatic conditions of the particular year when construction and revegetation efforts are implemented. Seeding from September to March is typically recommended.	Before revegetation	RC & EMC	ODOE
Stabilize seeded areas to facilitate establishment by applying seedless, certified weed-free hydromulch containing a tackifier or crimped weed-free straw.	During revegetation	RC or EPC	EMC & ODOE
Maintain records of revegetation efforts in all temporary and permanent disturbance areas and update ODOE monthly as revegetation work occurs.	Monthly during revegetation	EMC	ODOE
Notes: EMC = Environmental Monitoring Contractor; EPC = Engineering, Procurement, and Construction Contractor; ODOE = Oregon Department of Energy; RC = Revegetation Contractor; WC = Weed Control Contractor			

Commented [A4]: ODOE - Moved to reclamation header above and made general to encompass agricultural and non-ag lands.

Commented [A5]: ODOE - Added line for seeding agricultural land in coordination with the landowner.

Commented [A6]: ODOE - There are no temporary disturbances to wildlife habitat in the current layout. These will only be implemented if applicable based on final design.

6.0 Operations Compliance

Table 5 summarizes actions needed for compliance during operations related to revegetation, stormwater management, and noxious weed control. This list includes actions applicable throughout operations as well as actions required only initially following construction, for example through the Notice of Termination (NOT) for Coverage under a ~~National Pollutant Discharge Elimination System (~~NPDES~~)~~ Permit. Soil management and dust control measures are not included in Table 5 because they are addressed during prior phases.

Table 5. Operations Compliance Checklist

Action	Timeframe	Responsible Party	Review/ Verification
YEAR 1			
Conduct seasonal monitoring of Permanent Disturbance Areas to visually assess the following: a. Establishment of seeded species; b. Inspection of areas of bare soil for erosion; and c. Presence of noxious weeds.	Initiate within 60 days of the completion of revegetation and conduct once per season in the first year following construction	EMC	ODOE
Inspect and maintain stormwater measures as required in the 1200-C permit.	During operations, prior to achieving NOT for the NPDES	Certificate Holder & EMC	ODOE
Inspect and maintain any permanent stormwater management infrastructure. Inspect project facilities (e.g., roads) for erosion issues.	During operations, after achieving NOT for the NPDES	Certificate Holder	ODOE
YEARS 2 to 6			
Conduct annual ~~quantitative~~ monitoring of Permanent Disturbance Areas to assess whether vegetation meets success criteria (Appendices B and D).	Annually for 5 years in May or June, beginning the first year after revegetation	EMC	ODOE
Monitor revegetated Temporarily Disturbance Areas, unless the landowner converted the area to land uses that preclude meeting revegetation success criteria. To determine if revegetated temporarily disturbed areas are meeting success criteria, compare vegetation for monitoring and reference transects in each of the non-agricultural habitat subtypes that had more than 0.2 acre of temporary disturbance (Appendix B).	Annually for 5 years in May or June, beginning the first year after revegetation	EMC	ODOE
Determine and report on whether success criteria have been met or are trending towards being met (see Appendix F for report content and success criteria) for Temporary and Permanent Disturbance Areas. Final determination of whether the Certificate Holder is in compliance with revegetation obligations will be made by ODOE. Remedial actions and/or additional monitoring for areas may be required in areas that have been determined by ODOE not to have met the success criteria.	Annually for 5 years in May or June, beginning the first year after revegetation and for the life of the Solar Components on a schedule to be determined in consultation with ODOE.	EMC	ODOE
If a revegetated area is damaged by wildfire, develop a plan, subject to ODOE approval, to address the damaged area. Continue to monitor and report on revegetation progress during the remainder of the 5-year period. Report to ODOE within 72 hours of discovery.	During the first ~~five~~ 5 years following revegetation if wildfire occurs.	EMC	ODOE

Commented [A7]: ODOE - Deleted to match Appendix E.

Action	Timeframe	Responsible Party	Review/ Verification
Summarize noxious weed monitoring results in annual reports that describe noxious weeds identified, treatments implemented, treatment efficacy, and recommendations for additional treatments. Submit reports to ODOE, ODA, ODFW, and the County annually. If the Certificate Holder contracts with the Sherman County Weed District to perform weed control at the Solar Components, then no monitoring report needs to be provided except for a statement that the County agency performed the work.	During first 5 years of operations	Certificate Holder & EMC	ODOE
Implement the measures outlined in Appendix F to address vegetation management to reduce wildfire risk.	During ~~o~~operations	EMC	ODOE
Consult with ODOE, ODA, and the Sherman County Weed District to design a long-term weed control plan as needed based on the success of control efforts.	After 5th year of annual monitoring	Certificate Holder	ODOE, ODA, County
Provide records demonstrating that all Facility personnel have been trained on noxious weed control.	Annually during operations	Certificate Holder	ODOE
Monitor as outlined in Appendix G within the Weed Management Area for the life of the Solar Components to assess weed growth and inform noxious weed control measures. Assess the success of noxious weed treatments and document any new noxious weed infestations observed.	During operations	Certificate Holder & EMC	ODOE
Control noxious weeds as described in the long-term weed control plan. Maintain ongoing communication with landowners and the Sherman County Weed District regarding noxious weeds at the Solar Components. Control noxious weeds reported by landowners on a case-by-case basis and prepare a summary of measures taken for that landowner.	During operations	Certificate Holder	ODOE
Consult with the Sherman County Weed District on timing, method, and application rates for each identified weed species of concern, to allow for adaptive weed management given changes in weed control effectiveness from noxious weed species tolerance to herbicide treatment over time. Report the results of the consultation to ODOE within 30 days. Any alternative control methods can be proposed by the Certificate Holder or its contractors, subject to approval by the Sherman County Weed District.	Every fall season during operations	Certificate Holder	ODOE
Notes: EMC = Environmental Monitoring Contractor; NOT = Notice of Termination; NPDES = National Pollutant Discharge Elimination System; ODOE = Oregon Department of Energy; ODFW = Oregon Department of Fish and Wildlife			

Commented [A8]: ODOE - Language for long-term monitoring plan is still in Appendix E. Confirm whether a long-term vegetation management plan is still needed.

7.0 ~~Comprehensive~~ Plan Amendment

This Comprehensive Plan may be amended from time to time by agreement of the Certificate Holder and the Oregon Energy Facility Siting Council (EFSC). Such amendments may be made without amendment of the site certificate. EFSC authorizes ODOE to agree to amendments to this Comprehensive Plan. ODOE shall notify EFSC of all Comprehensive Plan amendments, and EFSC retains the authority to approve, reject, or modify any amendment agreed to by ODOE.

ODEQ (Oregon Department of Environmental Quality). 2019. OAR 340-208-0210 EPA Method 22. https://secure.sos.state.or.us/oard/viewAttachment.action?ruleVrsnRsn=256141

Appendix A. Roles and Qualifications

Roles and Responsibilities

The Certificate Holder is the overall responsible party for construction and operation of the Solar Components and implementation of this Comprehensive Plan. However, the Certificate Holder may use contractors to complete tasks associated with this Comprehensive Plan. Responsible parties and their roles are described in Table A-1. Minimum qualifications for contractors are provided in Table A-2.

Table A-1. Roles and Responsibilities

Responsible Party	Name and Contact Information	Role
Certificate Holder	Portland General Electric Company	Responsible for compliance with all site condition requirements, hiring contractors that meet the minimum qualifications described in Appendix A, and ensuring that all contractors perform work in accordance with the requirements of this Comprehensive Plan.
Engineering, Procurement, and Construction Contractor (EPC)	Name: Contact Person: Address: Phone Email	Responsible for implementing best management practices (BMPs) and other measures specified in the National Pollutant Discharge Elimination System (NPDES) 1200-C permit and this Comprehensive Plan to minimize impacts during construction, as well as for performing restoration and revegetation actions, as identified in this Comprehensive Plan.
Revegetation Contractor (RC)	Name: Contact Person: Address: Phone Email	Responsible for performing revegetation actions during and immediately after construction, as described in this Comprehensive Plan.
Weed Control Contractor (WC)	Name: Contact Person: Address: Phone Email	Responsible for performing weed control actions in the Weed Management Area, as described in this Comprehensive Plan.
Environmental Monitoring Contractor (EMC)	Name: Contact Person: Address: Phone Email	Responsible for conducting environmental monitoring and documenting compliance with aspects of this Comprehensive Plan during and following construction, including conducting revegetation, dust, soil, stormwater, and noxious weed monitoring.

Responsible Party	Name and Contact Information	Role
Oregon Department of Energy (ODOE)	Oregon Department of Energy Compliance Specialist 550 Capitol St. NE Salem, OR 97301 Phone Email	Responsible for providing technical input on proposed BMPs and other measures to minimize impacts and for validating all compliance deliverables described in this Comprehensive Plan. ODOE may utilize contractors to meet its responsibilities under this Comprehensive Plan during some or all phases.
Sherman County (County)	Sherman County Weed Department Nick Weis, Weed District Supervisor 66143 Lone Rock Road Moro, OR 97039 (541) 565-3655 nickw@shermancountyor.gov	Responsible for providing input on weed control and other actions described in this Comprehensive Plan and its implementation as needed. The County will also attend calls with ODOE and other agencies as needed.

Contractor Minimum Qualifications

Table A-2. Contractor Minimum Qualifications

Contractor	Role	Minimum Qualification
Engineering, Procurement, and Construction Contractor (EPC)	Responsible for implementing ~~B~~best ~~M~~management ~~P~~practices (BMPs) and other measures specified in the National Pollutant Discharge Elimination System (NPDES) 1200-C permit and this Comprehensive Plan to minimize impacts during construction, as well as for performing restoration and revegetation actions.	Minimum qualifications for the EPC include: • Experience implementing measures in the NPDES 1200-C permit; • Demonstration of sufficient resources and staffing for anticipated BMP installations and maintenance; and • Experience in coordination with agencies and private landowners.
Revegetation Contractor (RC)	Responsible for performing revegetation actions during and immediately after construction.	The Certificate Holder will ensure that the RC has the following minimum qualifications: • Demonstrated experience in the Columbia Plateau; • Experience in native plant, non-native and invasive plants, and noxious weed identification and management; • Experience in revegetating natural areas; • Experience with site preparation and applicable seeding methods; • Experience in documenting revegetation actions and providing progress reports; • Experience in coordination with agencies and private landowners; and • No recent (within one year) violations on the contractor's record.
Weed Control Contractor (WC)	Responsible for performing weed control prior to, during, and after construction within the disturbance area and a 10-foot buffer (Weed Management Area).	The Certificate Holder will ensure that noxious weed management actions will be conducted by specialists with the following qualifications: • Experience in native plant, non-native and invasive plants, and noxious weed identification in the Columbia Plateau Ecoregion; • Experience in noxious weed mapping; • If chemical control is used, specialists must possess a Commercial or Public Pesticide Applicator License from the Oregon Department of Agriculture or possess an Immediately Supervised Pesticide Trainee License and be supervised by a licensed applicator;

Contractor	Role	Minimum Qualification
		• Training in noxious weed management or Integrated Pest Management with an emphasis in noxious weeds; • Experience in coordination with agencies and private landowners; and • No recent (within one year) violations on the contractor's record.
Environmental Monitoring Contractor (EMC)	Responsible for conducting environmental monitoring and documenting compliance with aspects of this Comprehensive Plan during and following construction, including conducting revegetation, dust, soil, stormwater, and noxious weed monitoring as described below.	Minimum qualifications for the EMC include: • Have an active certification recognized in the 1200-C permit (e.g., Certified Erosion and Sediment Control); • Experience implementing and monitoring measures in the ~~NPDES~~ 1200-C permit; • Experience and knowledge of U.S. Environmental Protection Agency Method 22 (ODEQ 2019) with respect to the general procedures for determining the presence of visible emissions; • Experience in native plant, non-native and invasive plants, and noxious weed identification and management; • Experience in noxious weed mapping; • Training in noxious weed management or Integrated Pest Management with an emphasis in noxious weeds; and • Experience in coordination with agency and private landowners. The EMC will include a qualified botanist or revegetation specialist who will be responsible for monitoring and reporting on revegetation success.

Appendix B. Construction Plan

Disturbance Acreage

Acres of temporary and permanent disturbance to habitat subtypes associated with Solar Component construction and operation are provided in Table B-1.

Table B-1. Acres of Temporary and Permanent Disturbance

ODFW Habitat Category	Habitat Type	Habitat Subt-Type	Temporary Disturbance (acres)	Permanent Disturbance (acres)
1	N/A	N/A	-	-
2	Riparian	Riparian Trees	0.0	0.0
	Shrub-steppe	Sagebrush Shrub-Steppe	0.3	20.7
	Category 2 Subtotal		**0.3**	**20.7**
3	N/A	N/A	-	-
4	Grassland-steppe	Grasslands	0.1	3.0
	Surface Water	Ephemeral Streams	0.0	0.0
	Category 4 Subtotal		**0.1**	**3.0**
5	N/A	N/A	-	-
6	Agriculture	Irrigated Cropland	0.1	52.0
	Agriculture	Non-Irrigated Cropland	9.4	1,365.0
	Developed	Developed	1.0	3.9
	Category 6 Subtotal		**10.5**	**1,420.9**
		Total	**10.9**	**1,444.6**

1. There are no disturbances in surface water habitat types. Refer to Exhibit J of RFA 4 for detailed analysis of disturbances to wetlands and waters.

N/A = not applicable; ODFW = Oregon Department of Fish and Wildlife

Disturbance Levels

Revegetation and soil stabilization needs will be determined by a combination of topography, soil type, disturbance level, and existing vegetative cover.

Disturbance levels will primarily be determined by conditions such as slope, gradient, and existing vegetation. As much as is feasible, use of heavy machinery and soil disturbance should be conducted on dry soil. Disturbance of saturated soil has a much greater risk of compaction and requires more effort to revegetate and control weedy species. Disturbance levels are defined as follows and depicted in Figure B-1:

- *Level 1 – Mowing:* Mowing is used to conserve vegetative resources within a facility. Vegetation will be limited to a height of 12 inches and mowed to no less than 6 inches during construction. Mowing to no less than 6 inches protects perennial grass crowns and allows grasses to regenerate. Depending on facility objectives, vegetation can be allowed to

reach a normal height or kept trimmed to a height between 6 inches and the plant's full height potential. Crushing of vegetation will be minimal and this disturbance level is designed to have a minimal impact on existing vegetation. This method is least likely to result in invasions of undesirable plant species.

- *Level 2 – Overland Drive and Crush:* Disturbance caused by accessing a facility without significantly modifying the landscape. Vegetation is crushed to the ground, but no surface soil is removed so root structures are left intact. Even though vegetation may be damaged or destroyed, the surface soil and seed bank remain in place. Some crushed vegetation will likely sprout after disturbance ceases. These activities would result in minimal to moderate disturbance. This type of disturbance will result in a faster recovery time for vegetation compared to Levels 3 and 4. Soil seed banks remain largely in place, perennial vegetation can grow back, and minimal external efforts are necessary. This method is less likely to result in invasions of undesirable plant species compared to Levels 3 and 4.
- *Level 3 – Clear and Cut:* Disturbance caused by accessing the facility including having to remove all vegetation to improve or provide suitable access for equipment. All vegetation is removed, soils are compacted, and the root zone or soil A-horizon may be disturbed, but no subsurface soil is removed. Clear and cut activities would result in moderate disturbance. This type of disturbance will result in moderate recovery times for vegetation. This method has a moderate risk for invasion of undesirable plant species. An example is imprinting to crush vegetation down into the soil or incidental grading and smoothing of surface soils.
- *Level 4 – Clear and Cut with Soil Removal*: Disturbance is caused by removing all vegetation in the impact zone, soils are compacted, and surface soil- and subsoil are displaced. These activities result in heavy disturbance. This type of disturbance results in an extensive recovery time for vegetation, and is most likely to lead to invasions of undesirable plant species, which can result in lengthy and expensive control efforts. Includes disc-and-roll construction and other traditional construction methods where soils are disturbed and no vegetation is left intact. This category includes all work requiring the segregation and replacement of topsoil.
- *Level 5 – Development Footprint*: Disturbance is caused by removing all vegetation and covering the area surface with gravel, concrete, or other vegetation-free surfaces, or where the intended function of a specific area necessitates it remain unvegetated. This disturbance level includes roads, graveled lots, fire breaks, utility pole pads, and the areas underlying any component installed on a foundation. This level does not include vegetated areas under solar arrays. This type of disturbance will result in a complete loss of vegetation and will be required to be monitored and kept free of noxious weeds and other vegetation for the life of the facility.

Maps showing the expected disturbance levels in Temporary and Permanent Disturbance Areas in relation to existing vegetation type, habitat type, and areas with sensitive soils are provided in Figure B-1 below.

<<INSERT DISTURBANCE LEVEL MAPS HERE>>

Figure B-1. Disturbance Levels in Temporary and Permanent Disturbance Areas in Relation to Existing Vegetation Type, Habitat Type, and Areas with Sensitive Soils

Appendix C. 1200-C Permit and Erosion and Sediment Control Plan

Appendix D. Fugitive Dust Control Plan

To manage fugitive dust from construction, the Certificate Holder and its contractors will generally follow the Dust Control Plan Flow Chart (Figure D-1).

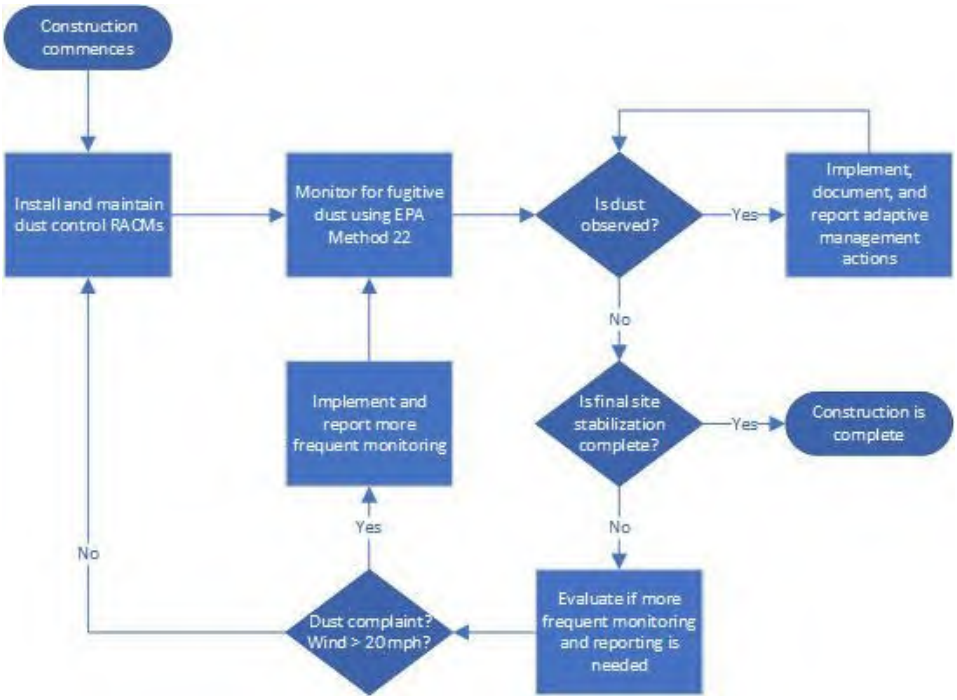

Figure D-1. Dust Control Plan Flow Chart

Fugitive Dust Monitoring and Reasonable Available Control Measures (RACMs)

The visual monitoring required by the 1200-C permit must occur at least once every 14 calendar days. However, because Oregon Administrative Rule (OAR) 340-208-0210 restricts visible fugitive emissions on a continuous standard to a maximum of **18 seconds in any 6-minute period**, and because fugitive dust emissions may provide an immediate public safety concern, this Comprehensive ~~p~~Plan requires that fugitive dust be monitored and controlled on an ongoing basis (Table D-1).

Monitoring for fugitive dust emissions shall include:

- Use of U.S. Environmental Protection Agency (EPA) Method 22 (ODEQ 2019), as specified in OAR 340-208-0210, **at least once per day during the dry season, during peak construction activities.**

- The observation shall be performed during times of peak construction activity at the downwind facility boundary.
- Recording of observations in a fugitive dust inspection log that is kept on site and shall be kept digitally, described below.

Triggers for additional, more frequent monitoring will include:

- Observation of visible fugitive dust emissions by the Environmental Inspector, contractor(s), agency, or Certificate Holder staff,
- Wind speeds or gusts greater than 20 miles per hour, or
- Receipt of complaints or concerns through the Project Dust Control Hotline or other means.

Table D-1. Fugitive Dust Sources and Reasonable Available Control Measures (RACMs)

Construction Phase	RACM(s)	Supplemental RACM(s)
All Phases of Construction	Daily fugitive dust monitoring and record keeping.	Increase frequency of monitoring.
	Prominent display of Dust Control Hotline signs, providing direct access to the Environmental Inspector.	If established, proactive engagement with Community Action Council.
	Worker Environmental Awareness Program training for all construction employees.	Additional trainings and refreshers for employees.
	Maintain stockpile of best management practices (BMPs) on site, including sufficient palliatives for a single treatment of all access roads and sufficient palliatives, mulch, and/or hydromulch for a minimum of 25 percent of the total disturbed area, and machinery for application.	Increase stockpile of palliatives, mulch, and/or hydromulch and add additional BMPs.
	Documentation and reporting of adaptive management actions.	Development and submittal of revised Fugitive Dust Control Plan.
Facility Access	Install and maintain stabilized construction entrances at ingress/egress locations and restrict traffic to these locations.	Add additional construction entrance BMPs (e.g., wheel wash).
	Daily sweeping up of sediment from paved surfaces utilizing vacuum sweeper with high efficiency particulate air (HEPA) filtration.	Increase sweeper frequency.
	Access roads shall be graveled.	Road maintenance and reapplication of gravel.
	Access roads will be stabilized with water or palliative sufficient to eliminate visible and sustained dust from vehicular travel and wind erosion. Reapply stabilization as necessary to maintain dust-free condition.	If water is unavailable or ineffective, or if water use is limited by any agency or regulation, access roads will be stabilized with longer-lasting palliatives.
	Restrict construction traffic to established and stabilized access routes.	Install fencing or barricades to prevent traffic outside of established routes.

Construction Phase	RACM(s)	Supplemental RACM(s)
	Limit traffic speeds to 15 miles per hour on stabilized unpaved roads within the facility as long as such speeds do not create significant visible dust emissions. Traffic speed signs shall be displayed prominently at all entrances and exits.	Limit traffic speeds within the facility to 5 or 10 miles per hour.
	Minimize disturbance areas and soil exposure to the maximum extent feasible.	Limit work to a portion of the disturbed area until all disturbed areas receive temporary or final stabilization.
	When wind speeds or gusts exceed 15 miles per hour, minimize new disturbances to the extent possible and/or mobilize additional water trucks or palliatives to minimize fugitive dust from exposed surfaces.	Stop all ground disturbing activities and apply additional dust control measures until measures are effective or wind speeds slow and fugitive emissions stop.
	Separate and cover or otherwise stabilize topsoil to preserve it until it is replaced during revegetation.	Increase maintenance frequency for topsoil cover/stabilization. Combine methods, such as mulch plus tackifier.
	Stabilize exposed soils within the timeframes established in the 1200-C permit. Stabilize exposed soils in stages based on soil conditions and weather.	Stabilize exposed soils more frequently, even if additional work is anticipated within the timeframe established in the 1200-C permit. Reapply stabilization measures following any additional disturbances.
	Temporarily stabilize exposed surfaces to prohibit significant and sustained visible fugitive dust from wind erosion. Utilize BMPs such as mulch, hydromulch with or without seeds, tackifier, spreading stone or gravel, and trackwalking.	Combine stabilization methods, such as mulch plus tackifier, or trackwalking plus hydromulch. Increase frequency of maintenance of stabilization.
	Seed exposed surfaces during the appropriate season with approved temporary or permanent seed mixes.	Reapply seed to newly disturbed areas or areas with poor germination. Use temporary seeding even if additional work is anticipated before final stabilization. Use irrigation to enhance seeding success.
Removing and Hauling Sand, Soil, or Other Loose Materials	Gate seals should be tight on dump trucks. Soil load shall be kept below 6 inches of the freeboard of the truck. Drop heights shall be minimized when loaders dump soil into trucks. Gate seals will be checked and tight on dump trucks. All trucks on highways must be fully covered and secured.	Cover haul trucks with a tarp or other suitable cover.

Fugitive Dust Reporting

A dust inspection log shall be completed after each dust inspection. Log records shall be kept digitally and included in construction monitoring reports as described in Appendix E of this Comprehensive Plan. This log shall include all information required in EPA Method 22. Photos and/or video taken during the observation period to document conditions shall be available

digitally to the Oregon Department of Energy upon request. Any documented exceedance events shall include a detailed explanation of RACMs implemented for corrective action and the results of subsequent monitoring demonstrating fugitive dust has returned to below exceedance thresholds.

Appendix E. ~~Construction~~ Environmental Monitoring Methods

The Environmental Monitoring Contractor (EMC) will be present during construction activities that involve ground disturbance, grading, weed treatments, vegetation removal, and high traffic volumes and is responsible for monitoring and recording construction activity to ensure compliance with this Comprehensive Plan.

In addition, the EMC will:

- Assist contractor(s) for the direction of water trucks, civil activities, and road maintenance to reduce fugitive dust and erosion issues.
- Identify when reasonably available and best available control measures are not adequate, as designated in Appendix D.
- Maintain dust inspection and noxious weed logs and reporting designated in this Comprehensive Plan.

Specific protocols and requirements for testing and monitoring to be performed prior to and during construction and revegetation efforts are described in the sections that follow.

Soil Compaction Testing

~~*Sampling*~~ *Monitoring Protocol*

The EMC will conduct pre- and post-construction ~~field measurements of subsurface~~ soil compaction testing in all anticipated Level 3 and 4 Disturbance Areas, and any areas consisting of soils with low ~~S~~soil ~~C~~compaction ~~R~~resistance (e.g., Lickskillet very stony loam (16D) and Lickskillet-Rock outcrop complex [18E] soils). If disturbance level maps are not available at the time of pre-construction sampling, ~~Portland General Electric Company (~~the Certificate Holder~~)~~ may choose to base sample~~ing~~ locations on the overall anticipated disturbance area (i.e., regardless of level of disturbance). Soil compaction sample locations will be evenly distributed across the disturbance area at a rate of 1 sample per 50 acres. ~~Proposed s~~Soil ~~s~~ample locations were stratified by soil type to ensure a minimum of three sample locations in each soil type and a representative density of sample locations in major soil types. Additionally, sample locations were selected to avoid infrastructure such as inverters and roads where revegetation will not occur. Sample~~ing~~ locations are identified in Figure E-1, below.

Soil compaction measurements will be collected at all sample~~ing~~ locations prior to ground disturbing activities and again at the same locations post reclamation but prior to revegetation.

[to be inserted at plan finalization]

Figure E-1. Soil Compaction Sample Locations

Test Methods

Soil Compaction Testing will be conducted using the following standard methods (NRCS 2020; Duiker 2025):

- The surveyor will measure soil resistance using a penetrometer.
- Resistance will be measured at 3-inch intervals to 12 inches or until the meter goes above 300 pounds per square inch (3, 6, 9, and 12 inches if soils allow).
- Measurements will be conducted in conditions favorable to soil testing (e.g., non-saturated or frozen soils).

Results

Testing results will be provided to the Oregon Department of Energy (ODOE) prior to construction and after reclamation but before revegetation.

Baseline Vegetation Conditions

Prior to construction of the Solar Components, the EMC will conduct pre-construction habitat surveys for all temporary disturbance areas. Data collected will include:

- Vascular plant species present;
- Native/non-native species present;
- Percent cover of dominant species; and
- Percent cover of state and county listed noxious weeds.

Revegetation Monitoring

The Certificate Holder will monitor revegetated areas as described below, unless the landowner converted an area to a use that precludes meeting revegetation success criteria such as cropland. The Certificate Holder should coordinate grazing timing and intensity with the landowner so that it does not preclude revegetation success. Revegetated areas will be monitored by a qualified investigator in May or June- annually for 5 years, beginning the first year after seeding.

Temporary Disturbance Areas

Reference and Revegetation Transects

Establish 50-meter reference and revegetation transects for each temporarily disturbed wildlife habitat subtype and category with more than 0.5 acres of temporary disturbance as described below. Establish one reference transect for every temporarily disturbed wildlife habitat subtype and category. Reference transects are intended to be representative of baseline conditions for the revegetation effort.

Establish revegetation transects randomly in every wildlife habitat subtype and category that will be temporarily disturbed by construction using existing habitat mapping. Transect locations and/or lengths may need to be adjusted to account for linear features whose disturbance footprint may be too narrow or too short to meaningfully place a transect. Determine the number of transects as follows:

- Less than 0.5 acres of temporary disturbance = 0 transects
- 0.3 to 5 acres of temporary disturbance = 1 transect
- 6 to 10 acres of temporary disturbance = 2 transects
- For each additional 10 acres of disturbance, one additional transect will be added (e.g., 11-20 acres of disturbance = 3 transects, 21-30 acres = 4 transects, etc.)

Temporary Disturbance Area Monitoring Methods

Vegetation will be measured quantitatively using the line-point intercept (LPI) method combined with a belt transect to document species richness and sagebrush density, where necessary (Elzinga et al. 1998; MacKinnon et al. 2011). The LPI method is described in detail in the *Monitoring Manual for Grassland, Shrubland, and Savanna Ecosystems, Volume I* (Herrick et al. 2021). The surveyor will drop a narrow pin perpendicular to the ground at 1-meter intervals along a 50-meter transect and record up to four plant species that intercept the pin in order of interception as well as the soil surface type (bare ground, litter, rock, moss, or biotic crust) where the pin touches the ground. Once all 50 points have been collected, the surveyor will walk back along the transect and record any species within 1 meter on either side of the transect that were not documented at a point. The surveyor will take a photo from the transect start point, looking down the length of the transect. For transects in sagebrush shrub-steppe habitat, the surveyor will record the number of sagebrush individuals by size class (i.e., less than 1 foot tall, between 1 and 2 feet tall, greater than 2 feet tall) occurring within 1 meter on either side of the 50-meter transect.

Following field surveys, foliar cover will be determined by multiplying the number of top hits for each species by two. Cover of bare ground will be determined by counting every point in which bare ground was recorded as a surface type and no plants were intercepted and multiply this number by two. Species richness will be determined by counting all the unique species that were recorded at a point or along the belt transect.

~~*Revegetated*~~ *Permanent Disturbance Areas*

Following implementation of revegetation efforts, the Certificate Holder will monitor revegetated permanent disturbance areas as described below. Revegetated areas will be monitored by a qualified investigator annually for 5 years, beginning the first year after seeding. If success criteria are met in the first 5 years, then long-term vegetation monitoring will be determined in consultation with ODOE~~. Long-term monitoring of vegetation will be conducted~~ to document and manage vegetation to reduce wildfire risk.

The Certificate Holder will monitor Permanent Disturbance Areas to assess the following:

- Dominant species composition;
- Relative cover of desirable and undesirable forbs and grasses;
- Percent cover of bare soil;
- Degree of erosion;

- Presence of noxious weeds; and
- Qualitative assessment of overall vigor of vegetation within revegetated areas.

The ~~Environmental Monitoring Contractor (~~EMC~~)~~ will monitor revegetated Permanent Disturbance Areas with a meander survey beginning within 60 days of the completion of initial revegetation. During the meander survey, the EMC will walk in revegetated Permanent Disturbance Areas and document the assessment items listed above using photos and spatial data collection. Areas of erosion and significant patches of bare soil will be mapped and photographed. The EMC will record dominant species, overall percent cover of forbs and grasses, and general notes about plant vigor.

Monitoring will be conducted at least once per season during the first year following construction. After the first complete year of monitoring, the Certificate Holder will consult with ODOE to determine if the monitoring cycle can be reduced based on revegetation progress. After ~~five~~ 5 years of monitoring, the Certificate Holder will design a long-term monitoring plan in consultation with ODOE.

Commented [A9]: ODOE - Developing a long term vegetation monitoring plan was removed from the compliance table. Confirm that a long-term veg plan is still needed.

Revegetation Monitoring Reports

Revegetation monitoring reports will be prepared and submitted to ODOE annually for ~~five~~ 5 years following revegetation. The first monitoring report will include a detailed description and timeline of revegetation methods that were implemented including species, amounts, and locations of seed applications and dates revegetation work was performed. Annual monitoring reports will include:

a. Geographic information system (GIS) maps of revegetated areas and disturbance levels;
b. Monitoring methods;
c. Local climatic data (i.e., precipitation, temperature) for the monitoring month and year and percent deviation from the historical average;
d. Results of monitoring efforts;
e. Photos of transects and representative overview photos of revegetated areas;
f. Assessment of whether revegetated areas are trending toward meeting success criteria;
g. Assessment of factors impacting the ability of revegetated areas to trend towards meeting the success criteria; and
h. Recommendations for remedial actions, if any. If applicable, provide recommendations for reseeding, weed control, or other remedial measures for areas (either permanently or temporarily disturbed) that are not showing progress toward meeting success criteria. Include adaptive management measures taken in the next monitoring report.

~~Long term monitoring of vegetation will be conducted to document and manage vegetation to reduce wildfire risk.~~

Commented [A10]: ODOE - Moved sentence to Permanent Disturbance Area monitoring section.

Appendix F. Revegetation and Soil Stabilization Methods

Soil Stabilization

- The Engineering, Procurement, and Construction Contractor (EPC) will use appropriate erosion and sediment control practices (i.e., seeded or unseeded hydromulch, tackifier, weed-free erosion control blankets, weed-free or locally sourced straw mulch) to maintain topsoil during construction in Temporary and Permanent Disturbance Areas.
- After grading is complete but prior to installation of Solar Components, apply temporary or permanent soil stabilization.
- If seeding is used for temporary soil stabilization, seed areas with less than 70 percent vegetative cover with a non-invasive, non-persistent cover crop such as winter wheat or sterile triticale.
- Select cover crop based on the time of year; for example, winter wheat or sterile triticale can be seeded from fall to early spring while peas should be seeded in spring. Tillage radish and sunflowers can be seeded in spring to reduce compaction but are not suitable options for soil stability.

Soil Reclamation

In areas where soil is removed during construction, the following measures will be taken where appropriate:

- During construction, excavated topsoil will be stockpiled separately from subsoil and replaced in proper order with topsoil on the surface to maintain soil productivity. Stockpiled soil will be put back in place prior to revegetation activities.
- Topsoil and other soils from noxious weed infested areas will not be moved outside infested areas and will be returned to their previous location during reclamation activities to eliminate the transport of weed seeds, roots, or rhizomes. Noxious weed occurrences will be flagged and monitored for compliance.

Site Preparation

- Ensure that soils from weed infested areas are treated with a post- or pre-emergent herbicide as needed prior to initiation of revegetation efforts, depending on site-specific conditions.
- Prior to final regrade and revegetation efforts, any weeds that have grown during periods of construction dormancy should be treated as described in Appendix G.
- Perform site preparation using methods described below. Consider site-specific factors including slope, soil type, size of area, and erosion potential when determining methods.
  - Soil Roughening: Also known as imprinting, tracking, or track walking, soil roughening is a temporary erosion control practice and seedbed preparation technique implemented when grading a slope (EPA 2021). This technique involves creating grooved soil surface with depressions running parallel to the hill contour to promote

seed germination and provide moderate erosion control while vegetation is established. Tracking with heavy equipment may compact the soil and inhibit root penetration; this can be mitigated by using lighter-weight equipment and not tracking saturated soil. Soil roughening should be done prior to applying hydromulch, straw mulch, or installing erosion BMPs. Seed and mulch roughened areas as soon as possible to obtain optimum seed germination and growth (ODOT 2023).

- Deep Tilling: Reduce soil compaction by fracturing restrictive soil layers in areas where compaction levels inhibit plant growth (NRCS 2022). Deep tillage is only suitable in areas outside of solar arrays and where solar infrastructure is not present (i.e., temporary roads) and should be conducted after construction and prior to revegetation when soil moisture is at 30-50 percent of field capacity.
- Decompaction: Where soil compaction testing in areas with Level 3 and 4 disturbance demonstrates that soils are compacted greater than 300 pounds per square inch (psi), then remediation activities may be completed in those areas prior to the construction contractor moving to a new location or offsite as described in Table F-1. Areas with intact vegetation (typically in areas with Level 1 or 2 disturbance) will not be decompacted to avoid additional soil disturbance and erosion risk. Locations where baseline monitoring indicated that soils were compacted more than 300 psi prior to construction will only be decompacted as needed based on field assessment of likely vegetation success (see Table F-1).~~or as necessary to create a uniform seedbed,~~
    - Remediation activities may include mechanical scarification (e.g., tilling or ripping the soil) to an appropriate depth to reduce the potential effects of compaction, to maintain soil productivity, and reduce the potential for erosion on compacted soils. Dry soils should be decompacted using an agricultural disc, soil ripper, or similar equipment~~mechanically scarify soils when dry using an agricultural disc, soil ripper, or similar equipment to an appropriate depth to maintain soil productivity, reduce the potential for erosion~~.

- Prepare salvaged topsoil into a firm, fine-textured seedbed before seeding or planting (ODOT 2023). Loosen the top 1 to 2 inches of the soil surface by shallow tilling with a disc, followed by harrow or drag if necessary and where feasible with construction equipment. If soil is assessed as too soft by the Revegetation Contractor or the Environmental Monitoring Contractor (EMC), firm with a roller or cultipacker.

Table F-1. Decompaction Actions by Disturbance Level

Disturbance Level	Baseline Soil Compaction Level	
	Under 300 psi	Over 300 psi
1 – Mowing	If intact, living vegetation present, then no action; confirm vegetation success in next growing season. If bare soil, revegetate as described in the following section.	If intact, living vegetation present, then no action; confirm vegetation success in next growing season. If bare soil, decompact prior to revegetation.
2 – Overland Drive and Crush	If intact, living vegetation present, then no action; confirm vegetation success in next growing season. If bare soil, revegetate as described in the following section	If intact, living vegetation present, then no action; confirm vegetation success in next growing season. If bare soil, decompact prior to revegetation.
3 – Clear and Cut	Revegetate as described in the following section.	Decompact prior to revegetation.
4 – Clear and Cut with Soil Removal	Revegetate as described in the following section.	Decompact prior to revegetation.

Revegetation Methods

- The Certificate Holder will restore temporarily disturbed areas by re-establishing slope, surface stability, and drainage features, as needed, followed by soil preparation and seeding as described below.
- Revegetation will begin as soon as feasible after completion of each construction phase. Seeding and planting will be done in a timely manner and in the appropriate season to facilitate germination and establishment of seeded species.
- Following seeding, stabilize seeded areas to facilitate establishment by applying seedless, certified weed-free hydromulch containing a tackifier or crimped weed-free straw.
- Cropland outside the Solar Components fenceline will be returned to landowner control and will not be revegetated by the Certificate Holder.
- Revegetation methods for each disturbance level were developed to tailor revegetation to specific conditions (Table F-2).

Table F-2. Revegetation Methods by Disturbance Level

Disturbance Level	Soil Reclamation	Site Preparation	Seeding
1 – Mowing	No soil disturbance. Retain existing vegetation to prevent erosion.	Weed control.	Seed if necessary to achieve success criteria.
2 – Overland Drive and Crush	No soil disturbance. Retain existing vegetation and implement erosion control practices.	Weed control.	Seed if necessary to achieve success criteria.
3 – Clear and Cut	Track or decompact soil as necessary. Implement erosion control practices.	Weed control. Seed cover crop if necessary to stabilize soil. Prepare firm, fine-textured seedbed prior to seeding.	Required
4 – Clear and Cut with Soil Removal	Stockpile topsoil separately from subsoil and stabilize during construction. Regrade and replace subsoil then topsoil prior to seeding. Track or decompact soil as necessary. Implement erosion control practices.	Weed control. Regrade and add soil amendments if necessary. Seed cover crop if necessary to stabilize soil. Prepare firm, fine-textured seedbed prior to seeding.	Required

Seed Mix and Shrub Planting

A low-growing seed mix was developed for revegetation of Temporary Disturbance Areas and Permanent Disturbance Areas within the Solar Micrositing Area (Table F-~~1~~3).

Table F-~~1~~3. Seed Mix for Revegetation of Disturbed Areas

Growth Habit	Common Name	Scientific Name	Pounds of pure live seed/acre[1]
Grasses			
	Squirreltail	*Elymus elymoides*	~~2.3~~3.5
	Thurber's needlegrass	*Eriocoma thurberiana*	~~6.8~~4.4
	Idaho fescue	*Festuca idahoensis*	~~1.5~~2.1
	Sandberg bluegrass	*Poa secunda* ssp. *secunda*	~~0.9~~2.1
Forbs (choose 3 or 4 depending on seed availability)			
	Common yarrow	*Achillea millefolium*	0.1
	Oregon sunshine	*Eriophyllum lanatum*	0.1
	Fleabane	*Erigeron filifolius* or *E. pumilus*	0.1
	Wooly plantain	*Plantago patagonica*	0.2
	Clover	*Trifolium macrocephalum ~~or T. repens~~*	0.1
Total			**12**

Note: The species and seeding rates included in this table are a recommendation. Substitutions can be made through consultation with ODOE.

1. Pounds of pure live seed per acre listed for drill seeding and imprint seeding. Double drill seeding rate for broadcast seeding and multiply by 2.5 for hydroseeding.

Commented [A11]: ODOE - Reduced to 10% of mix due to height and increased other grasses. Thurber's needlegrass has large seed, so by weight it looks like more of the mix than it is.

Commented [A12]: ODOE - Removed because this species prefers wetter and cooler habitats unless irrigated.

Seeding Methods

Four common seed application methods that may be used for revegetation include broadcast seeding, drill seeding, imprint seeding, and hydroseeding; each of these are discussed further below. Other seeding methods may be proposed for review and approval prior to revegetation efforts.

Broadcast Seeding

Broadcast seeding is the application of seed directly to the ground surface. This method may be chosen for areas with shallow and rocky soils, and the type of broadcast spreader would depend on the size of the area to be seeded and the terrain.

In this method, the seed mix would be broadcast at 24 pounds of pure live seed per acre, or twice the recommended rate for drill seeding. When feasible, due to the seasonality of when planting can occur, the entire area will be seeded after grading is complete but before placement of solar components, providing more flexibility in seed application. In those instances where seeding occurs prior to installation of components, follow-up seeding will occur in areas temporarily disturbed by installation and any areas that are deficient in vegetation from the first round of seeding. Immediately following seed application, hydromulch or certified weed-free straw would be applied. Broadcast seeding will not be employed if winds exceed 5 miles per hour. If certified weed-free straw is unavailable, the Certificate Holder or EPC will identify a local source of straw. The local

source of the straw will be approved by the Sherman County Weed District and the Oregon Department of Fish and Wildlife (ODFW) prior to purchase. This straw will either be crimped into the ground or applied with a tackifier.

Drill Seeding

Drill seeding can be used for large areas with deep soils and moderate to gentle terrain to accommodate mechanical equipment. This method provides the advantage of planting the seed at a uniform depth and may provide better soil to seed contact. Using a range seed drill, seeds will be sown at 12 pounds pure live seed per acre or according to application rates recommended by the seed supplier. Drill seeding will be difficult after solar components have been installed, so it will primarily be used if seeding occurs after grading is complete but before components are installed, or in areas that were temporarily disturbed during construction that do not have any permanent infrastructure (e.g., temporary access roads, laydown areas).

Imprint Seeding

Imprint seeding is a no-till drill seeding method used to restore grasslands in areas with low annual precipitation. Seeds will be sown at 12 pounds pure live seed per acre or according to application rates recommended by the seed supplier. The seeder consists of a heavy metal drum roller with V-shaped, angled teeth and a seed agitator box. The teeth create V-shaped troughs with a depth of 4-7 inches to collect rainwater. The rolling drum presses the seed into the soil, insuring good seed-to-soil contact. The troughs collect rainwater for seed germination and seedling growth. Imprint seeders can be used on steep slopes and do not require seed bed preparation before seeding. Seeding can occur on soils with light to moderate vegetative cover, with the vegetation acting as a mulch, preventing soil erosion until seedlings are established. Imprint seeders do not work well in areas with shrubs or heavy vegetation cover. Heavily compacted soils may need to be ripped or de-compacted before seeding. The seeding rate for this method should be the same as for broadcast seeding.

Hydroseeding

Hydroseeding is most applicable for areas where drill or broadcast seeding machinery cannot access; this usually includes steep slopes or narrow terrain but can be used in all terrains. Soil bed preparation is also crucial for growth success and frequently includes tracking perpendicular to the slope to create micro conditions for seed. Flat grading and compaction are not recommended. Seeding rates increase by 30 to 50 percent of broadcast seeding rates (i.e., 30 pounds pure live seed per acre) per consultation with the seed supplier and ODFW. Prior to hydroseeding, the tackifier will be reviewed and approved in consultation with the Oregon Department of Energy (ODOE). Fertilizer should not be used when hydroseeding wildlife habitat.

Revegetation Records

The EMC will maintain records of revegetation efforts in all temporary and permanent disturbance areas and update ODOE monthly as revegetation work occurs. Revegetation records will include:

a. Date construction phase was completed;

b. Acreage of each disturbance level;

c. Description and photos of the affected area;

d. Date revegetation was initiated;

e. Description of the revegetation effort, including methods and timing;

f. Supporting figures representing the location, acres affected, and pre-disturbance condition of the revegetation area; and

g. Confirmation from the landowner that temporary disturbances in cropland have been satisfactorily restored.

Success Criteria for Temporary Disturbance Areas

Commented [A13]: ODOE – There are no temporary disturbances to wildlife habitat in the current layout. These will only be utilized if applicable based on final design.

Reclamation of Temporary Disturbance Areas on agricultural lands will be considered complete after the land is returned to farm operations and landowners provide written confirmation that they are satisfied that any impacts to soil productivity have been addressed. The Certificate Holder will provide evidence that landowners are satisfied after one crop cycle.

In non-agricultural areas, the Certificate Holder will make reasonable efforts to restore vegetation and soils ~~in agricultural and~~ wildlife habitat areas to their pre-disturbance condition.

a. **Native Shrubs**: Average density of sagebrush on revegetation transects in areas planted with sagebrush should be at least 50 percent of the reference transect within 5 years.

b. **Native and Desirable Forbs**: Cover of native and desirable (i.e., non-native species included in the seed mix) forbs, averaged across revegetation transects by habitat subtype and category, will be at least 75 percent of reference transects for the corresponding habitat subtype within 5 years.

c. **Native and Desirable Grasses**: Cover and richness of native and desirable (i.e., non-native species included in the seed mix) grass species, averaged across revegetation transects by habitat subtype and category, will be at least 85 percent of reference transects for the corresponding habitat subtype within 5 years.

d. **Noxious Weeds**: Presence and cover of noxious weeds on revegetation transects is 75 percent or less than that of the reference transect for the corresponding habitat subtype.

~~Prohibition on Use of Domestic Sheep and Goats for Vegetation Management~~

Commented [A14]: ODOE - Moved this new section under Vegetation Management for Permanent Disturbance header

~~The certificate holder may not keep or use domestic sheep, goats, or other livestock at the solar facility for vegetation control or other purposes without written approval from the Department.~~

~~Any request to use domestic sheep, goats, or other livestock at the solar facility must be accompanied by a description of practices and controls that will be implemented to prevent zoonotic disease transmission to wild sheep populations. The Department may impose additional requirements to prevent zoonotic disease transmission based on consultation with ODFW.~~

Vegetation Management ~~Objectives~~ for Permanent Disturbance Areas

During operation of the Solar Components, vegetation under the solar panels will be managed to minimize fire risk and erosion by maintaining low growing vegetation.

Prohibition on Use of Domestic Sheep and Goats for Vegetation Management

The Certificate Holder may not keep or use domestic sheep, goats, or other livestock at the Facility for vegetation control or other purposes without written approval from ODOE. Any request to use domestic sheep, goats, or other livestock at the Facility must be accompanied by a description of practices and controls that will be implemented to prevent zoonotic disease transmission to wild sheep populations. ODOE may impose additional requirements to prevent zoonotic disease transmission based on consultation with ODFW. This prohibition does not apply to landowners grazing livestock outside the Solar Components in accordance with their leases.

Commented [A15]: ODOE - Added clarification for landowner grazing not affiliated with the Facility.

Success Criteria for Permanent Disturbance Areas

The Certificate Holder will establish uniform (i.e., evenly distributed, without large bare areas) perennial, non-invasive vegetation that provides 70 percent or more cover on all exposed areas within the Solar Components in compliance with the soil protection standard (Oregon Administrative Rule [OAR] 345-022-0022); National Pollutant Discharge Elimination System 1200-C permit requirements; and Sherman County requirements.

Integrated Vegetation Management ~~Measures~~

To support reclamation success and reduce wildfire risk throughout all phases (i.e., both construction and operations) of the Solar Components, vegetation management will be implemented consistent with the draft Construction Wildfire Mitigation Plan and anticipated Operations Wildfire Management Plan. In the interim, while those plans are being finalized, this section establishes the minimum vegetation management and fire prevention requirements that will apply during construction and operation of the Solar Components. Vegetation will be managed in accordance with the applicable provisions of the 2025 Oregon Fire Code, Section 1205.5.1 (Oregon State Fire Marshall 2025):

> *"A clear brush free area of 10 feet shall be required around the perimeter of the ground-mounted photovoltaic arrays or as determined by the fire code official. A maintained vegetative surface or noncombustible base, approved by the fire code official, shall be installed and maintained under the photovoltaic arrays and associated electrical equipment installations."*

These measures are intended to minimize ignition potential, maintain defensible space, support consistent vegetation control, and outline inspection practices that will contribute to long-term fire resiliency. At a minimum, the following criteria will be met:

a. **Vegetation Height and Clearance**
   - Vegetation within and adjacent to the Solar Components will be maintained at a height of less than 12 inches, with a minimum vertical clearance of 12 inches from all electrical and mechanical equipment.

- Vegetation exceeding this height will be mowed or removed prior to local Oregon Department of Forestry(ODF)- or County-issued fire restrictions.
- At no time shall vegetation come into contact with electrical infrastructure, inverters, or cable runs.
- Vegetation height will be maintained by mowing or other vegetation management techniques. Grazing by sheep or goats is prohibited without written approval from ODOE.
- A minimum 20-foot non-combustible buffer will be maintained around the interior or exterior perimeter of fenced areas, and gravel or compacted soil surfaces will be maintained beneath and around all inverter skids, the collector substation, O&M building, and meteorological towers.

Commented [A16]: ODOE - Deleted because this is repeated in the "Designated Noncombustible Areas" section.

b. **Fuel and Debris Management**

- Vegetation and debris removed from the Facility will be disposed of off-site and will not be stored or burned on-site.
- The Certificate Holder and contractors will prevent accumulation of combustible materials or "burn piles."
- Inspections will ensure that fence lines, service roads, and work areas remain clear of dry vegetation, woody debris, or stored materials that could create fuel continuity during fire season.
- All newly constructed or maintained service roads within the Solar Micrositing Area will maintain a minimum 16-foot width of graveled, all-weather surface to facilitate emergency response access.

c. **Designated Noncombustible Areas**

- All-weather service roads will be compacted soil or gravel and maintained in good condition.
- A 20-foot non-vegetated perimeter buffer will be maintained around the Solar Components and around substations and control operations and maintenance buildings.
- Parking and laydown areas will consist of compacted soil, gravel, or other non-combustible material to reduce ignition potential from vehicles and equipment.
- Areas immediately surrounding electrical equipment, transformers, and battery energy storage system (BESS) enclosures will remain vegetation-free and will be maintained as graveled or earthen surfaces.

d. **Standards and Continuous Improvement:** Vegetation management and fire prevention measures will be reviewed annually to ensure continued compliance with applicable codes and evolving best practices, including:

- North American Electric Reliability Corporation (NERC) FAC-003-0 – Vegetation Management Standard for Transmission Lines
- Oregon Fire Code and National Fire Protection Association (NFPA) Standards relevant to energy facilities
- OAR Chapter 477 and 629-043 – ODF Fire Prevention Standards
- OAR 860-024 – Public Utility Commission (PUC) Electrical Safety Standards

- American Clean Power (ACP) and Avian Power Line Interaction Committee (APLIC) industry best practices

The Certificate Holder will evaluate new technologies, standards, and operational lessons learned each year to incorporate applicable improvements into this Comprehensive Plan or the future Operations Wildfire Management Plan.

Appendix G. Weed Control Plan

Regulatory Framework

The Oregon Department of Agriculture (ODA) and Sherman County Weed District maintain lists and classifications of noxious weeds. Although not all listed noxious weeds occur in the vicinity of the Solar Micrositing Area, the Certificate Holder and its contractors should be aware of the entire list while monitoring and controlling weeds.

State of Oregon

In Oregon, a noxious weed is defined under Oregon Revised Statutes (ORS) 569.175 as "a terrestrial, aquatic, or marine plant designated by the State Weed Board under ORS 569.615 as among those representing the greatest public menace and as a top priority for action by weed control programs." Noxious weeds have been declared by ORS 569.350 as a menace to public welfare, and control of these plants is the responsibility of private landowners and operators, as well as county, state, and federal governments.

The Oregon State Weed Board (OSWB) was created by ODA under ORS 569.600. OSWB provides recommendations for noxious weed control at the state level and is responsible for updating the State Noxious Weed List. The OSWB and the ODA classify noxious weeds in Oregon in accordance with the ODA Noxious Weed Classification System; there are three designations under the State's system:

- **A-Listed Weed:** A weed of known economic importance which occurs in the state in small enough infestations to make eradication or containment possible; or is not known to occur, but its presence in neighboring states makes future occurrence in Oregon seem imminent.
  - **Recommended Action:** Focus on prevention of new infestations through vector control, certification programs, education, outreach and surveys. New and existing infestations are prioritized for eradication or intensive control when and where found. Regionally focused, species-specific Statewide Management Strategies for A-listed weeds may be developed as necessary.
- **B-Listed Weed:** A weed of economic importance that is regionally abundant but may have limited distribution in some counties.
  - **Recommended Action:** Limited to intensive control at the state, county, or regional level as determined on a site-specific, case-by-case basis. Where implementation of a fully integrated statewide management plan is not feasible, biological control (when available) shall be the primary control method.
- **T-Designated Weed:** A designated group of weed species selected from the B list as a focus for prevention and control by the Noxious Weed Control Program. T-designated noxious weeds are determined by the Oregon State Weed Board and management actions are prioritized and informed by species-specific T-List Statewide Management Strategies created and maintained by the ODA. Action against these weeds will receive priority in accordance with the recommendations of the Statewide Management Strategy.

Sherman County

The Sherman County noxious weed list and protocol were developed by the Sherman County Weed District. Sherman County defines weeds of significance with six classes:

- **A Class:** High priority. Any noxious weed which greatly endangers the overall economic well-being of the County and has a small enough distribution where eradication is possible.
- **B Class:** Moderate priority. A noxious weed which is well established in the County and has known negative impacts, but due to its distribution, eradication is not feasible.
- **C Class:** Low priority. A noxious weed which is widespread throughout the County and has known economic impacts.
- **Q Class**: Questionable list. A newly detected weed which may have some importance, but more information is needed to determine its impact on agriculture. There is only one Q Class weed currently: hairy willow herb (*Epilobium hirsutum*).
- **T Class:** Targeted list. A noxious weed from any Class that the Sherman County Weed Control Board wishes to focus efforts and resources on. This list is reviewed annually.
- **W Class:** Watch list. Any noxious weed that may occur in neighboring counties, the State or similar environments as the County, and could potentially endanger the overall economic well-being of the County. Once detected, these weeds shall be moved to the appropriate list.

Noxious Weeds Identified at the Solar Components

Noxious weeds identified within the Solar Micrositing Area on July 9 and 10, 2024, are listed in Table G-1. Twelve listed noxious weeds were documented, including 8 ODA-listed noxious weeds and 12 Sherman County listed noxious weeds. Eight of the noxious weeds observed were state and/or County "B" listed weeds. One species, rush skeletonweed (*Chondrilla juncea*), is an "A" Class Weed in Sherman County and a state "T"-designated weed, meaning that ODA targeted this species for prevention and control.

In addition to noxious weeds, cheatgrass (*Bromus tectorum*), an invasive annual grass, was identified in grassland habitats within the Solar Micrositing Area. While cheatgrass is not a listed noxious weed, it and other invasive annual grasses can adversely impact habitat and increase fire risk.

Table G-1. Noxious Weeds Observed During Surveys in 2024

Scientific Name	Common Name	ODA Status[1]	Sherman County Status[1]	Frequency[2]
Aegilops cylindrica	jointed goatgrass	B	C	Infrequently observed.
Centaurea diffusa	diffuse knapweed	B*	B	Several small to medium-sized populations observed.
Chondrilla juncea	rush skeletonweed	B (T)*	A (T)	Frequently observed in non-cultivated areas.

Scientific Name	Common Name	ODA Status[1]	Sherman County Status[1]	Frequency[2]
Cirsium arvense	Canada thistle	B*	B (T)	One observation made.
Cirsium vulgare	bull thistle	B*	C	Observed in two locations.
Convolvulus arvensis	field bindweed	B	B	Many small to large populations observed.
Conyza canadensis	horseweed	Not listed	C	Commonly observed.
Lactuca serriola	prickly lettuce	Not listed	C	Frequently observed.
Onopordum acanthium	Scotch thistle	B	B (T)	Several observations made.
Rhaponticum (Acroptilon) repens	Russian knapweed	B*	B	One observation made.
Salsola tragus	Russian thistle	Not listed	C	Frequently observed.
Secale cereale	cereal rye	Not listed	C	Frequently observed.

1. Species marked with a (*) are targeted for biocontrol.
2. Patch/observation sizes are as follows: small = less than 0.1 acre, medium = 0.1 to 1.0 acre, large = greater than 1 acre.

Management Objectives

Management objectives shall be based on the classification status of a species and frequency of observations (Tables G-1 and G-2). Classification status will be determined based on the ~~higher~~ highest status identified by the State or County Weed List unless recommended otherwise by the County. Management objectives for unlisted species will be determined on a case-by-case basis based on need for control (e.g., fire control, etc.)

Table G-2. Management Objectives

Weed Classifications	Years		
	~~1-5~~0	~~1-6-20~~	~~20~~6+
A, A(T) or B(T)	~~Eradication~~ Begin control ~~P~~prior to ~~C~~construction and continue throughout construction.	Intensive ~~C~~control with the goal to~~,~~ ~~E~~eradicate~~ion~~ within first 5 years of operations. Prevent new infestations.	Intensive ~~C~~control and eradication for life of ~~F~~Facility. Prevent new infestations.
B	Begin control prior to construction on a case-by-case basis and continue throughout construction.~~Eradication Prior to Construction~~	Intensive control on a case-by-case basis with the goal to eradicate within first 5 years of operations. Prevent new infestations.~~Monitoring and Management to prevent new populations/spread of existing populations.~~	Monitor ~~ing~~ and ~~M~~management to prevent new populations or ~~/~~spread of existing populations.
C	Monitor~~ing~~ and ~~Management~~ manage to prevent new populations or ~~/~~spread of existing populations.	Monitor~~ing~~ and ~~Management~~ manage to prevent new populations~~/~~ or spread of existing populations.	Monitor~~ing~~ and ~~Management~~ manage to prevent new populations~~/~~ or spread of existing populations.

Commented [A17]: ODOE – Revised table to make pre-construction treatment objectives more obvious.

Weed Classifications	Years		
	1-50	1-6-20	206+
Invasive Annual Grasses	Monitoring and Mmanagement to minimize wildfire risk.	Monitoring and Mmanagement to minimize wildfire risk.	Monitoring and Mmanagement to minimize wildfire risk.

Commented [A17]: ODOE – Revised table to make pre-construction treatment objectives more obvious.

Weed Control Methods

Noxious weed control methods for the Weed Management Area (i.e., the disturbance area associated with the Solar Components plus a 10-foot buffer) described in this Comprehensive Plan were developed utilizing information from the ODA Noxious Weed Control Program and the Sherman County Weed District. Management of noxious weeds will be considered throughout all stages of construction and operation of the Solar Components and will include:

- **Prevention:** Implementing measures to prevent the spread of noxious weeds during construction, operation, and maintenance activities.
- **Treatment:** Treating noxious weed populations with their appropriate control methods, at appropriate time intervals.
- **Monitoring:** Assessing noxious weed changes within the Weed Management Area over time and ensuring that legacy as well as new weed populations are not increasing their distribution.

Portland General Electric Company's (the Certificate Holder) objective is to prevent the introduction of new noxious weed populations and spread of existing noxious weed populations. The methods described above in this Comprehensive Plan and supplemented below will be implemented to minimize the spread of noxious weeds during construction activities. New noxious weeds detected within the Weed Management Area during post-construction revegetation will be considered a result of construction activities and will be controlled accordingly.

Biological Control

Biological control involves the use of prescribed insects, fungi, and livestock to control noxious weeds to achieve management objectives. Biological control methods are typically targeted to a specific species or plant to control its persistence. They are also used for maintenance in targeted areas for vegetation management control in height and density that includes mitigating fire risk and erosion. Biological control is environmentally friendly and should be the first consideration when applicable.

Mechanical Treatment

Mechanical treatment will be the preferred method of treatment for existing noxious weed populations where appropriate within the Weed Management Area. Mechanical control methods rely on removal of plants, seed heads, and/or cutting roots with a shovel or other hand tools or equipment that can be used to remove, mow, or disc noxious weed populations. Hand removal of plants is also included under this treatment method. Mechanical methods are useful for smaller,

isolated populations of noxious weeds in areas of sensitive habitats. Additionally, hand removal of small infestations can minimize soil disturbance, allowing desirable species to remain and limiting conditions favorable for noxious weeds.

Some rhizomatous plants can spread by discing or tillage. For example, rush skeletonweed, which has been identified within the Solar Micrositing Area (Appendix E), can reproduce vegetatively from small segments of root, and discing or tilling can facilitate the spread of this species. As such, implementation of discing will be species-specific and avoided in areas where it will be counter-productive.

If discing is employed in areas that will be revegetated following construction, subsequent seeding will be conducted to re-establish desirable vegetative cover that will stabilize the soils and slow the potential re-invasion of noxious weeds. Discing, tilling, or other mechanical treatments that disturb the soil surface within native habitats will also be avoided in favor of herbicide application, which is an effective means of reducing the size of noxious weed populations as well as preventing the establishment of new infestations.

Chemical Treatment

Chemical control can effectively remove noxious weeds through use of selective herbicides. The specific herbicide used, and the timing of application will be chosen based on the specific noxious weed being treated, as appropriate herbicides differ between species and types of plants (i.e., dicots such as rush skeletonweed versus monocots such as jointed goatgrass).

Herbicides will be applied to identified, treatable, noxious weed infestations. The Certificate Holder or their contractors will coordinate with the Sherman County Weed District to determine which populations are treatable and will notify landowners of proposed herbicide use on their lands prior to application. If a noxious weed population is deemed to be untreatable (e.g., too widespread and established in an area to successfully control), the Certificate Holder will implement the applicable prevention measures discussed in this Comprehensive Plan, subject to approval by the Oregon Department of Energy (ODOE) and the Sherman County Weed District.

Apply only herbicides approved by the U.S. Environmental Protection Agency (EPA) and ODA; annually check the status of herbicide approval (e.g., confirming herbicides are approved for use by the EPA and ODA).

Herbicide application will be performed within the appropriate season to achieve desired results, as approved by ODOE and the Sherman County Weed District. No weed treatment will occur in agricultural lands without landowner permission.

Herbicide Application and Handling

Hand application methods (e.g., backpack spraying) may be used in roadless areas or in rough terrain. Vehicle-mounted sprayers (e.g., handgun, boom, and injector) will be used mainly in open areas that are readily accessible by vehicle. Calibration checks of equipment will be conducted prior to spraying activities, as well as periodically throughout use, to ensure that appropriate application rates are achieved.

Herbicides will be transported with the following stipulations:

- Only the quantity needed for that day's work will be transported.
- Concentrate will be transported in approved containers only, and in a manner that will prevent spilling, stored separately from food, clothing, and safety equipment.
- Mixing will be done at a distance greater than 200 feet from open or flowing water, wetlands, or other sensitive species' habitat. No herbicides will be applied at these areas unless authorized by the appropriate regulatory agencies.
- All herbicide equipment and containers will be inspected daily for leaks.
- Herbicide use will be in accordance with all manufacturer's label recommendations and warnings.
- Apply herbicide under appropriate conditions (i.e., not when wind velocity exceeds 15 miles per hour for granular application, or exceeds 10 miles per hour for liquid applications; snow or ice covers the foliage of target species; or adverse weather conditions are forecasted within the next few days).

Herbicide Spills and Cleanups

All appropriate precautions will be taken to avoid herbicide spills. In the event of a spill, cleanup will be immediate. Contractors will keep spill kits in their vehicles to allow for quick and effective response to spills. Items included in the spill kit will be:

- Protective clothing and gloves;
- Adsorptive clay, "kitty litter," or other commercial adsorbent;
- Plastic bags and a bucket;
- A shovel;
- A fiber brush and screw-in handle;
- A dustpan;
- Caution tape;
- Highway flares (use on existing hard-top roads only); and
- Detergent.

Response to an herbicide spill will vary with the size and location of the spill, but general procedures include:

- Stopping the leak;
- Containing the spilled material;
- Traffic control;
- Dressing the clean-up team in protective clothing;

- Cleaning up and removing the spilled herbicide, as well as the contaminated adsorptive material and soil; and
- Transporting spilled herbicide and contaminated material to an authorized disposal site.

Herbicide Spill Reporting

All herbicide contractors will have readily available copies of the appropriate material safety data sheets for the herbicides used at their disposal and will keep copies of the safety data sheets in the application vehicle. If an herbicide spill of any size occurs, the appropriate agency and spill coordinators will be notified promptly. In case of a spill into wetlands and waterbodies, the appropriate federal, state, and county agencies will be notified immediately. All herbicide spills equal to or greater than 200 pounds or 25 gallons of pesticide residue will be reported to the Oregon Emergency Response System in accordance with applicable laws and requirements (Oregon Administrative Rules 340-142-0050). The Certificate Holder, BIGL bn, LLC (BIGL or Project Developer), or the Environmental Monitoring Contractor (EMC) will report all herbicide spills to ODOE by phone or email within 72 hours with follow-up reporting as appropriate.

Special Considerations

Special consideration will be provided to perennial, intermittent, and ephemeral streams/draws during treatment activities. No herbicide will be sprayed where the drift can enter standing water or saturated soil. It will be the herbicide applicators' responsibility to ensure that no herbicide or drift enters standing water, regardless of the season when the herbicide is applied. Similar considerations will be made when in proximity to agricultural fields.

Weed Monitoring and Reporting

Weed inspections will occur within the Weed Management Area through visual inspection of the site while driving or walking. During the construction phase, ~~construction staff~~the EMC will conduct periodic monitoring of noxious weeds. Noxious weeds observed during construction will be treated with mechanical or chemical treatments or other best management practices, as applicable. If construction extends into the growing season prior to the commercial date of operations and formal post-construction weed monitoring, the EMC will conduct informal but comprehensive weed surveys to inform adaptive management. In addition, weed monitoring may be conducted by the EMC as part of routine construction environmental monitoring monthly from April to October.

The EMC will conduct annual post-construction noxious weed monitoring within the Weed Management Area starting the first growing season after construction to map the extent of all noxious weed occurrences and identify areas for treatment. Results will be summarized in annual monitoring reports that describe treatments performed, treatment efficacy, recommendations to improve efficacy (if necessary), and any new noxious weed occurrences. Reports will be submitted to ODOE, ODFW, and the County annually. The Certificate Holder will be responsible for treating all noxious weeds observed within the Weed Management Area.

Based on the success of control efforts after the second year of monitoring, the Certificate Holder will consult with ODOE and the Sherman County Weed District to determine if the monitoring cycle

can be reduced for Year 3 through Year 5. After 5 years of monitoring, the Certificate Holder will design a long-term weed control plan in consultation with ODOE and the Sherman County Weed District . The Certificate Holder will maintain ongoing communication with individual landowners, the Sherman County Weed District, and ODOE regarding noxious weeds within the Weed Management Area. Landowners may also contact the Certificate Holder directly to report the presence of noxious weeds related to Solar Component activity. The Certificate Holder will control reported noxious weeds on a case-by-case basis and prepare a summary of measures taken for that landowner. During the operational period of the Solar Components, the Certificate Holder will control noxious weeds as described in the long-term weed control plan. The Certificate Holder will report the investigator's findings and recommendations regarding weed control in the Solar Component's annual report required by Oregon Administrative Rule 345-026-0080.

Treatment Plan

Table G-3, below, provides a treatment plan for noxious and invasive weeds (listed by ODA and Sherman County) in the Weed Management Area, including management objectives and treatment guidelines. This table will be updated in each year's annual monitoring report. Specific herbicide application rates will be determined in consultation with the Sherman County Weed District and the Weed Control Contractor.

Table G-3. Treatment Plan for Noxious and Invasive Weeds

Scientific Name	Common Name	State/County Status	Frequency	Management Objective	Treatment Guidelines[1]
Aegilops cylindrica	jointed goatgrass	B/C	Infrequently observed.	Monitor~~ing~~ and ~~Management~~ manage to prevent new populations~~/~~ or spread of existing populations	Mechanical: Timing is critical, mow after flowering but before seeds reach soft boot stage. Early mowing will result in new tiller growth. Requires multiple mowings throughout the growing season over several years. **Chemical:** Apply to actively growing plants in late winter or spring before flowering or pre-emergent herbicide in fall. Biocontrol: None
Centaurea diffusa	diffuse knapweed	B/B	Several small to medium-sized populations observed.	Monitor and manage to prevent new populations or ~~Monitoring and Management to prevent new populations/~~spread of existing populations	Mechanical: Manually remove entire plant, including taproot, prior to flowering. Chemical: Apply to actively growing plants in fall or spring from rosette to bolting stage. **Biocontrol:** Agents include several seed feeding flies and weevils and a root-boring beetle.
Chondrilla juncea	rush skeletonweed	B (T)/A(T)	Frequently observed in non-cultivated areas.	Intensive ~~C~~control, ~~E~~eradication within first 5 years of ~~Operation~~operations. Prevent new populations.	Mechanical: Regenerates from root fragments. Manually remove entire plant, including taproot, prior to flowering. Will require multiple efforts during the growing season for more than one year. **Chemical:** Apply to rosettes in the spring immediately before or during bolting. Biocontrol: Agents include a gall midge, gall mite, rust fungus, and root-mining moth
Cirsium arvense	Canada thistle	B/B(T)	One observation made.	Begin control prior to construction and continue throughout construction. Intensive control with the goal to eradicate within first 5 years of operations. ~~Eradication Prior to~~	Mechanical: Not recommended, rhizomatous. **Chemical:** Apply from rosette to bud stage to actively growing thistle in spring or in fall with select chemicals only. Biocontrol: Four approved agents; stem weevil, seed head weevil, crown weevil, and stem gall fly.

Scientific Name	Common Name	State/County Status	Frequency	Management Objective	Treatment Guidelines[1]
				~~Construction.~~ Prevent new populations.	
Cirsium vulgare	bull thistle	B/C	Observed in two locations.	Begin control prior to construction and continue throughout construction. Intensive control with the goal to eradicate within first 5 years of operations.~~Eradication Prior to Construction~~. Prevent new populations.	**Mechanical:** Till or pull prior to flowering. Cut off root below soil surface. Chemical: Treat rosettes in fall or spring. Biocontrol: Seed head gall fly, not effective for individuals but can reduce overall population.
Convolvulus arvensis	field bindweed	B/B	Many small to large populations observed.	Monitor and manage to prevent new populations or ~~Monitoring and Management to prevent new populations/~~spread of existing populations.	Mechanical: Not recommended, bindweed has extensive root systems and can spread by seed and root fragments. **Chemical**: Apply to rapidly growing plants in spring or summer, prior to flowering. Plants should not be under drought stress at time of application. Biocontrol: Two approved agents; a moth and mite.
Conyza canadensis	horseweed	Not listed/C	Commonly observed.	Monitor and manage to prevent new populations or ~~Monitoring and Management to prevent new populations/~~spread of existing populations.	**Mechanical**: Mow or pull prior to flowering. Chemical: Apply to rapidly growing plants prior to flowering. Biocontrol: Unknown
Lactuca serriola	prickly lettuce	Not listed/C	Frequently observed.	Monitor and manage to prevent new populations or ~~Monitoring and Management to prevent new populations/~~spread of existing populations.	Mechanical: Graze, till, or pull prior to flowering. Mowing not considered effective due to robust regrowth. **Chemical:** Apply to rapidly growing plants in spring prior to flowering. Biocontrol: None
Onopordum acanthium	Scotch thistle	B/B(T)	Several observations made.	Intensive ~~C~~control, ~~E~~eradication within first 5 years of ~~O~~operations.	**Mechanical:** Pull prior to flowering, cut off root below soil surface. Tilling will control emerged plants but stimulate germination. Follow up tilling

Scientific Name	Common Name	State/County Status	Frequency	Management Objective	Treatment Guidelines[1]
					with herbicide application to treat seedlings. Sheep and goats will eat young plants and flower heads. Chemical: Treat from rosette to bolting stage in fall or spring. Most effective on small rosettes. Biocontrol: None
Rhaponticum (Acroptilon) repens	Russian knapweed	B/B	One observation made.	Begin control prior to construction and continue throughout construction. Intensive control with the goal to eradicate within first 5 years of operations~~Eradication Prior to Construction~~. Prevent new populations.	**Mechanical:** Manually remove entire plant, including taproot, prior to flowering. Chemical: Apply to actively growing plants in fall or in spring from rosette to bolting stage. Biocontrol: Gall nematode available.
Salsola tragus	Russian thistle	Not listed/C	Frequently observed.	Monitor and manage to prevent new populations or ~~Monitoring and Management to prevent new populations/~~spread of existing populations.	Mechanical: Hand pulling effective for small populations. Mow just before flower maturation or repeatedly mow younger plants. **Chemical:** Treat young, rapidly growing plants from seedling to mid-rosette stage in spring or fall. Most effective on smaller plants. Preemergence also effective. Many populations are herbicide resistant in the inland northwest, consult with local herbicide applicator or county weed manager. Biocontrol: Leaf mining and stem boring moths have provided poor control.
Secale cereale	cereal rye	Not listed/C	Frequently observed.	Monitor and manage to prevent new populations or ~~Monitoring and Management to prevent new populations/~~spread of existing populations.	**Mechanical**: Repeated mowing in spring prior to seed set or tillage combined with herbicide application in fallow fields. Hand pull prior to seed set. Chemical: Treat prior to seed set. Herbicide more effective if applied one year after mowing to reduce thatch buildup. Biocontrol: None

Scientific Name	Common Name	State/County Status	Frequency	Management Objective	Treatment Guidelines[1]
Invasive annual grasses such as cheatgrass (*Bromus tectorum*)		Not listed	Common in grassland habitat.	Monitor and manage to minimize wildfire risk.	Mechanical: Repeated mowing (every 3 weeks) to 2 inches in spring can eliminate seed production in areas where herbicide application is unacceptable. **Chemical:** Apply pre-emergent herbicide prior to germination. Post emergent in fall or early spring/ summer to rapidly growing plants prior to seed set. Biocontrol: None
Sources: Becerra-Alvarez 2025, DiTomaso et al. 2013, ODA 2025. 1. Preferred treatment method in bold.					

Commented [A18]: ODOE - Added invasive annual grass treatment to treatment plan in response to addition of management objectives in Table G-2.

1.0 Introduction

This draft Habitat Mitigation Plan (HMP) was submitted by the Portland General Electric Company (PGE or Certificate Holder) for the photovoltaic solar energy generation and battery storage (Solar Components) at the Biglow Canyon Wind Farm (BCWF or Existing Facility). Located approximately 4.5 miles northeast of Wasco in Sherman County, Oregon, BCWF currently consists of 217 wind turbines, with a peak generating capacity of 450 megawatts (MW).

The Solar Micrositing Area identified as part of Request for Amendment (RFA) 4 is approximately 1,924 acres and provides an estimate of the maximum area needed for development, micrositing, and temporary disturbances from the Solar Components during construction, rather than the anticipated disturbance footprint. The permanent disturbance area impacted by the Solar Components is approximately 1,445 acres.

PGE will own and operate the Solar Components as a part of the BCWF (together, Facility), which, to date, have been developed by BIGL bn, LLC (BIGL). BIGL, in its capacity as the project developer, supports PGE in this RFA 4 and may construct and temporarily operate the Solar Components on behalf of PGE under a Build-Transfer Agreement.

The Certificate Holder's goal is to preserve and maintain in-kind habitat in the Columbia Plateau Ecoregion to achieve a net benefit to Category 2 habitat, and no net loss of Category 4 habitat through the measures described in this ~~draft Habitat Mitigation Plan (~~HMP~~)~~.

2.0 Finalization of the HMP (PRE-FW-01)

Fish and Wildlife Habitat Condition 1 requires finalization of the draft HMP, stating the following:

> *Prior to construction of a phase or component of the solar facility, as applicable, the certificate holder shall submit a final Habitat Mitigation Plan substantially similar to Final Order on RFA4 Attachment F, base-d on the finalization requirements included in Section 2.0 of the plan. The final plan must be submitted for review and approval by the Department, in consultation with ODFW.*

The HMP must be finalized prior to construction, based on the estimated permanent habitat impacts associated with the facility, component or phase, as applicable. Final review and approval of the ~~plan~~HMP has been delegated by the Council under ORS 469.402 to the Department. The Department, in consultation with the Oregon Department of Fish and Wildlife (ODFW), will review the final HMP based on the following scope:

1. **Final habitat and impact assessment.** Based on final design/layout, update tabular summaries of temporary and permanent disturbance estimates (acres).
    a. Table 2. Temporary and Permanent Impacts by Habitat Category and Habitat Subtype,
    b. Table 3. Calculating Mitigation for Permanent Impacts, and

c. Table 4. Calculating Mitigation for Temporary Impacts

2. **Execute legal instrument.** Obtain and submit to ~~the Department~~ODOE a copy of the conservation easement or legal instrument securing the Habitat Mitigation Area (HMA) ~~site~~ for conservation purposes as outlined in this HMP:
   a. The term of the conservation easement or legal instrument will be for the life of the ~~s~~Solar ~~facility~~Components;
   b. The terms of the conservation easement or legal instrument will be binding upon the landowner, heirs, or successors and would run with the land if property is sold;
3. The conservation easement or legal instrument will identify restricted uses that have the potential to diminish wildlife habitat functions and value, including but not limited to grazing; grading, mowing, blading or expansion of impervious surfaces or access road networks; division of the Property. **Identify/map baseline condition/~~reference~~monitoring sites and enhancement action areas.** Map baseline habitat conditions of the HMA. Propose number and location of monitoring ~~and references~~ sites for noxious weeds and shrub-planting. Submit habitat mapping and monitoring ~~reference~~ site locations to ODOE and ODFW for review and approval.
   a. Provide baseline habitat maps, photographs and maps/GIS data for proposed monitoring ~~reference~~ sites at the HMA with a description of the weed and vegetative cover.
      i. Baseline monitoring plot photo points within the HMA, include 1) a minimum of five permanent photo points distributed to show general vegetation status throughout the HMA, and 2) additional photo points as needed to monitor success of noxious weed control and shrub-planting;
4. **Finalize enhancement actions and success criteria in Section 6.2.1, 6.2.2 and 6.2.3.** Based on the baseline assessment completed under Sub(3) above:
   a. Provide maps/GIS data of weed treatment and shrub-planting areas.
   ~~a.~~b. Determine sagebrush planting density.
   ~~b.~~c. Finalize the success criteria for weed treatment and shrub planting.
      i. Success criteria for weed treatment must represent a ~~%~~percent increase in native vegetation cover and ~~%~~percent decrease in invasive cover ~~of~~at monitoring sites compared to ~~reference site~~baseline.
      ii. Shrub planting will be considered successful when sagebrush density in enhancement areas is 50 percent of planting density (i.e., 50 percent survival of sagebrush planted at 300 plants per acre) ~~Success criteria for shrubs shall be based on a minimum 50% density of monitoring to reference sites~~ at 5 years.
   ~~c.~~d. Propose restoration methods in the event of fire which at a minimum include post-burn seeding and noxious weed control.
   ~~d.~~e. ~~The Department~~ODOE and ODFW must evaluate whether the combined enhancement actions satisfy the Category 2 mitigation goal of a net benefit in habitat quality. If the HMA has minimal need or opportunity for the enhancement actions as currently proposed, additional actions may be identified/required.

Commented [A1]: ODOE – Removed reference sites because they are not appropriate to measure enhancement actions within the HMA. Success should be measured compared to baseline for mitigation to show uplift has been provided over baseline rather than compared to adjacent property conditions.

Reference sites within the HMA would not make sense because weeds should be treated wherever found and there is no existing sagebrush habitat with the HMA to use as a target density.

Commented [A2]: ODOE – Revised shrub success criteria to tier to planting density. There is no sagebrush habitat within the HMA to compare with monitoring sites.

5. **Finalize Implementation Schedule.** Provide an implementation schedule for habitat enhancement actions and monitoring.
6. **Finalize Monitoring Protocols and Survey Methods.** Submit final proposed monitoring protocol and survey methods to monitor~~ing~~ and evaluat~~e~~ing the success of enhancement actions.

Approval of the final HMP will be based on review by ODOE~~the Department~~, in consultation with ODFW, based on the adequacy of ~~the~~ information provided to address the steps/requirements listed above.

3.0 Habitat Categories and Habitat Types

A habitat survey was conducted as part of RFA4 to verify habitat subtypes and habitat categories of all areas to be affected by the Facility. The ODFW Fish and Wildlife Habitat Mitigation Policy (OAR 635-415-0025) provides a framework to categorize habitats based on type, quality, availability, and usefulness/importance to wildlife, and establishes mitigation goals and implementation standards for each. Table 1 defines each of the six habitat category types as presented in the ODFW Habitat Mitigation Policy.

Table 1. Habitat Categorization Types

Category Type	Definition[1]	Mitigation Goal
1	Irreplaceable, essential habitat for a fish or wildlife species, population, or a unique assemblage of species and is limited on either a physiographic province or site-specific basis, depending on the individual species, population or unique assemblage.	The mitigation goal for Category 1 habitat is no loss of either habitat quantity or quality.
2	Essential habitat for a fish or wildlife species, population, or unique assemblage of species and is limited either on a physiographic province or site-specific basis depending on the individual species, population or unique assemblage.	The mitigation goal if impacts are unavoidable is no net loss of either habitat quantity or quality and to provide a net benefit of habitat quantity or quality.
3	Essential habitat for fish and wildlife, or important habitat for fish and wildlife that is limited either on a physiographic province or site-specific basis, depending on the individual species or population.	The mitigation goal is no net loss of either habitat quantity or quality.
4	Important habitat for fish and wildlife species.	The mitigation goal is no net loss of either habitat quantity or quality.
5	Habitat for fish and wildlife having high potential to become either essential or important habitat.	The mitigation goal, if impacts are unavoidable, is to provide a net benefit in habitat quantity or quality.
6	Habitat that has low potential to become essential or important habitat for fish and wildlife.	The mitigation goal is to minimize impacts.

1. Source: OAR 635-415-0025.

4.0 Temporary and Permanent Impacts

Impacts may be permanent or temporary. Permanent impacts are defined as those impacts that will exist for the life of the Solar Components. Temporary impacts are those impacts that will last for a time less than the life of the Solar Components. The duration of temporary impacts to habitat will vary by habitat subtype. For example, the recovery period for agricultural areas that were temporarily disturbed could be as short as 1 to 3 years, grasslands generally recover within 3 to 7 years, and shrublands may require 10 to 50 years to recover (with the longer recovery periods associated with disturbances in mature sagebrush [*Artemisia* sp.] habitats). The Certificate Holder will restore temporary impacts consistent with the Comprehensive Solar Revegetation and Soil Management Plan (Final Order on RFA4, Attachment D).

As described in Exhibit P, there are no impacts to Category 1 habitat within the Solar Micrositing Area. Category 2 habitat occurs in the Solar Micrositing Area and will be impacted by the Solar Components (Table 2). Category 2 habitat within the Solar Micrositing Area is associated with Shrub-steppe~~;~~: Sagebrush Shrub-steppe habitat along Biglow Canyon and Riparian: Riparian Tree habitat to a lesser extent. Category 4 and 6 habitat will also be impacted by the Solar Components, while Category 3 and 5 habitat ~~were not identified in the Solar Micrositing Area~~will not be impacted.

Table 2 shows the acres of permanent and temporary impacts in each habitat category by habitat subtype for the Solar Components.

Table 2. Temporary and Permanent Impacts by Habitat Category and Habitat Subtype

Habitat Category	Habitat Subtype	Impact (acres)	
		Temporary	Permanent
2	Riparian Trees	<0.1	<0.1
	Sagebrush Shrub-Steppe	0.3	20.7
Category 2 Subtotal		**0.3**	**20.7**
4	Grassland-steppe	0.1	3.0
	Ephemeral Streams	<0.1	<0.1
Category 4 Subtotal		**0.1**	**3.0**
6	Irrigated Cropland	0.1	52.0
	Non-Irrigated Cropland	9.4	1,365.0
	Developed	1.0	3.9
Category 6 Subtotal		**10.5**	**1,420.9**
Grand Total		**10.9**	**1,444.6**

Note: Totals in this table may not sum correctly due to rounding; "--" = no impact; <0.1 = greater than zero but less than 0.05 acre.

5.0 Methods for Calculating Mitigation

Solar Component impacts, as determined based on the Solar Micrositing Area, would result in a mitigation need of 45 acres, including 44.4 acres of mitigation for permanent impacts (41.4 acres of Category- 2 and 3.0 acres of Category 4 habitat (Table 3) and 0.6 acres of mitigation for temporary ~~temporal~~ impacts (0.6 acres of Category 2 and <0.1 acres of Category 4~~; Table 3 and Table 4~~(Table 4).[1] The actual acres of temporary and permanent impacts and the associated mitigation requirements will be confirmed following construction. The Certificate Holder is not proposing compensatory mitigation under the ODFW Fish and Wildlife Habitat Mitigation Policy for impacts to Category 6 habitat.

Table 3. Calculating Mitigation for Permanent Impacts

Habitat Category	Impact Acres	Mitigation Ratio[1]	Mitigation Need	Mitigation Description
Category 2	20.7	2:1	41.4	The mitigation goal for Category 2 habitat is "no net loss" and "net benefit." Accordingly, mitigation for permanent impacts on Category 2 habitat needs to demonstrate a net benefit in quality or quantity.
Category 4	3.0	1:1	3.0	The mitigation goal for Category 4 habitat is "no net loss" in quantity or quality. During a site visit on January 10, 2025, ODFW recommended that impacts on Upland Tree habitat types should be mitigated within grassland or shrubland habitat types.
Category 6	1,420.9	0:1	--	The mitigation goal for impacts on Category 6 habitat is minimization; no compensatory mitigation proposed.
Grand Total	**1,444.6**	**--**	**44.4**	--

1. Acres mitigation per acres impacted.
Note: Totals in this table may not sum correctly due to rounding.

Table 4. Calculating Mitigation for Temporaryal Impacts

Habitat Category	Habitat Subtype	Impact Acres	Mitigation Ratio[1]	Mitigation Need	Mitigation Description
Category 2	~~PWCA:~~ Riparian Trees	<0.1	2:1	<0.1	The mitigation goal for Category 2 habitat is "no net loss" and "net benefit." Accordingly, mitigation for permanent

[1] Temporary impacts to some habitat subtypes results in ~~T~~temporal loss ~~refers to loss~~ of habitat function and values from the time an impact occurs to the time when the restored habitat provides a pre-impact level of habitat function. Sagebrush steppe and riparian tree habitat subtypes ~~is~~are reasonably expected to require a longer restoration timeframe (5+ years) and therefore would be expected to result in temporal loss requiring compensatory mitigation beyond the Certificate Holder's revegetation obligation.

Habitat Category	Habitat Subtype	Impact Acres	Mitigation Ratio[1]	Mitigation Need	Mitigation Description
	~~PWCA:~~ Sagebrush Shrub-steppe	0.3	2:1	0.6	impacts on Category 2 habitat needs to demonstrate a net benefit in quality or quantity.
Category 4	Grassland-steppe	0.1	0:1	--	The mitigation goal for Category 4 habitat is "no net loss" in quantity or quality. The proposed mitigation ratio would result in a lesser amount of acreage of mitigation than what is impacted by the Solar Components. Combined with restoration of temporary disturbances, the proposed mitigation ratio is intended to account for the temporary loss of habitat functionality and meet the "no net loss" goal. Temporary disturbances to Category 4 Grassland-steppe are not mitigated beyond restoration.
	Ephemeral Streams	<0.1	1:1	<0.1	
Category 6	Agriculture, Developed	10.5	0:1	--	The mitigation goal for impacts on Category 6 habitat is minimization; no compensatory mitigation proposed.
Grand Total		**10.9**	**--**	**0.6**	--
1. Acres mitigation per acres impacted.					
Note: Totals in this table may not sum correctly due to rounding. "--" = no impact; <0.1 = greater than zero but less than 0.05 acres.					

6.0 Biglow Canyon Wind Farm Habitat Mitigation Area

The ~~Habitat Mitigation Area (~~HMA~~)~~ is the area where the Certificate Holder is proposing to perform enhancement and preservation actions that are in addition to the revegetation of areas of temporary disturbance associated with the Biglow Solar Project. The HMA must be large enough and have the characteristics to meet the standards set in the ODFW Fish and Wildlife Habitat Mitigation Policy~~OAR 635-415-0025~~.

According to ODFW standards, areas appropriate for mitigation of Category 2 habitat impacts must provide "in-kind" mitigation that creates similar structure and function to that being disturbed, be "in-proximity" to the Solar Components, and have potential for habitat enhancement. The Certificate Holder identified 78 acres for the HMA located within 880 acres of land owned by the Certificate Holder adjacent to the Carty Generating Facility in Morrow County (Figure 1). The Certificate Holder identified an area larger than its mitigation need ~~(need is 45 acres)~~ to allow for flexibility in management of the HMA. The Certificate Holder discussed the location of the HMA with ODFW and received assurance that the mitigation goals of "in-kind" and "in-proximity" can be met.

6.1 Habitat Assessment and Mitigation Accounting

The Certificate Holder identified 78 acres of suitable in-kind and in-proximity habitat within an 880-acre parcel. The HMA is adjacent to the existing PGE-owned Conservation Area and a conservation area maintained by The Nature Conservancy (South Farm Conservation Area; Figure 1). The habitat mapped within the HMA includes rabbitbrush shrubland and broom snakeweed shrubland (Figure 1). The HMA is dominated by Sandberg's bluegrass (*Poa secunda*), bluebunch wheatgrass (*Pseudoroegneria spicata*), and intermittent areas of needle-and-thread grass (*Hesperostipa comata*), as well as cheatgrass (*Bromus tectorum*). There are also occasional occurrences of green rabbitbrush (*Chrysothamnus viscidiflorus*), gray rabbitbrush (*Ericameria nauseosa*), big sagebrush (*Artemisia tridentata*), fiddleneck (*Amsinckia menziesii*), and yarrow (*Achillea millefolium*).

The HMA is within a PWCA connector (ODFW 2023).[2] The HMA also contains Category 1 and Category 2 habitat associated with Washington ground squirrel (*Urocitellus washingtoni*) colonies that are immediately adjacent to the HMA.

The Certificate Holder plans to mitigate for the habitats impacted by placing a conservation easement on the appropriate acreage and by providing habitat uplift through the habitat enhancement and monitoring activities described below.

6.2 Habitat Enhancement Actions

Based on the acres of impact and mitigation need identified in Tables 2, 3, and 4, the Certificate Holder identified 78 acres available to fulfill the mitigation need for Solar Component impacts, subject to confirmation of impacts following construction. The objectives of habitat enhancement and restoration are to protect habitat within the mitigation area from degradation and improve the habitat quality of the mitigation area. The Certificate Holder shall initiate the habitat enhancement actions for the Facility before beginning operation of the Solar Components. The Certificate Holder shall restrict uses of the mitigation area that are inconsistent with the goal of no net loss and net benefit of Category 2 habitat and no net loss of Category 4 habitat as designated in the conservation easement. The Certificate Holder shall implement habitat enhancement actions as described in this ~~Plan~~ HMP and as specified in the Site Certificate. Enhancement actions and monitoring procedures are detailed below and will be finalized in this HMP prior to construction. Besides legal protection

[2] The Oregon Conservation Strategy (ODFW 2025) defines PWCA "regions" as the combined top one percent of connectivity priorities across all 54 Oregon Connectivity Assessment and Mapping Project (OCAMP) species' connectivity models. Regions are large, contiguous areas and represent the highest-value habitat for facilitating species movement throughout the state. PWCA "connectors" are then described as pathways that provide the best available habitat for facilitating movement between regions. Connectors may pass through high-quality habitat in intact, relatively undisturbed parts of the landscape, as well as the best remaining marginal habitat in developed or degraded areas. The Solar Components impact a PWCA region along Biglow Canyon.

to ensure no development, enhancement actions for the HMA include those detailed in the following subsections.

6.2.1 Restoration and Enhancement Actions in the Event of Fire

The final HMP must include a description of enhancement actions to be implemented at the HMA if the site is damaged from fire or fire suppression efforts (e.g., vehicular disturbance or chemical application). At a minimum, the enhancement actions must include a plan for seeding and noxious weed treatment, and coordination of the final measures to be implemented after the fire or fire suppression activities.

6.2.2 Noxious Weed Prevention, Inventory, and Control

Weeds will be controlled as needed to maintain and enhance habitat quality within the mitigation area, with the goal of working toward eradication of targeted noxious weeds or, if eradication is not practical, decreasing their abundance to minimize impacts on native plant communities. Weeds known to occur within the HMA include rush skeletonweed (*Chondrilla juncea*), knapweed (*Centaurea* spp.), and yellow starthistle (*Centaurea solstitialis*).

The final HMP will identify the weed management practices including schedule and treatment, consistent with an integrated weed management approach, using an appropriate combination of inventory, prevention (such as best management practices to prevent weed establishment), and control methods (such as hand pulling, mowing, biological control, and/or herbicides). The Certificate Holder shall obtain ODFW's approval prior to the use of pesticides. Controlling weeds in the HMA should promote growth of native vegetation.

6.2.3 Access Control

The Certificate Holder will monitor and control access to the HMA and will post informative signs depicting the area(s) as "protected" and including natural resources information as appropriate for the life of the Facility. Primary access to the PGE property is controlled by a gate off Tower Road north of the Carty Generating Station (currently used by PGE and The Nature Conservancy), the gated entrance to the Boardman Plant, and a gated road from Ione to the south. The Nature Conservancy and Three Mile Canyon Farms may occasionally use the two-track access crossing PGE's property to access the Farm's conservation area. Approved access to the site is currently limited to such occasional approved use of access roads and PGE's general operational needs. No livestock grazing is currently occurring on the site, and grazing would be a restricted use identified in the conservation easement, as established in Section 2.0 of this ~~Plan~~HMP. Periodic monitoring will be conducted to evaluate the effectiveness of access control measures and signage maintenance needs.

6.2.4 Sagebrush Plantings

To mitigate for temporal and permanent impacts to Category 2 sagebrush habitat, the Certificate Holder will plant sagebrush seedlings in the HMA, focusing on enhancing and expanding remnant stands of shrubs that were impacted by past wildfires. Planting density will be determined in this HMP prior to construction.

The success of sagebrush planting will be based on an evaluation of the monitoring to reference sites, where the monitoring sites demonstrate an average density of 50 percent of the density of the reference site within 5 years of planting. Density (plant counts) will be measured within macroplots, quadrats, and/or belt transects randomly located within the enhancement area.

Commented [A3]: ODOE – Deleted as this is redundant with Section 6.3.

6.3 HMA Enhancement Monitoring

The Certificate Holder will use a qualified investigator (botanist, wildlife biologist, or revegetation specialist) to conduct monitoring at the HMA. The purpose of this monitoring is to evaluate on an ongoing basis the protection of habitat quality and the results of enhancement actions.

The investigator will visit the HMA after each growing season for the first five years post planting/weed treatment. If success is achieved at year five, monitoring may be reduced to every fifth year thereafter (in years divisible by five, unless otherwise specified for specific measures) for the life of the Facility.

Monitoring methods and frequency will be established in the final HMP, as established in Section 2.0 of this Plan. Monitoring activity shall include an assessment of the following:

1. General quality of vegetation cover (dominant species, structural age, etc.), as determined by ocular estimates, measurements, and photo points;
2. Success of weed control efforts:
    a. Weed control efforts at the HMA will be considered successful when native plant cover within monitoring sites is greater than the reference sitebaseline, and invasive cover within monitoring sites is less than baselinethe reference site. The final success criteria should be a %percent increase and % decrease value, following evaluation of baseline conditions at the referencemonitoring sites.
    b. Annual inventories will be conducted on the HMA to identify new weed infestations, the status of existing infestations, and the progress of weed control efforts in eradicating or reducing infestations.
    c. Weed inventories will be conducted on foot. Detailed information on weed infestations will be collected, including, but not limited to, data on species, location, growth form, infestation size, and weed cover class (an ocular estimate of the percentage of the ground covered or concealed by weeds in a specific infestation area). In addition, the surveyor will identify potential weed control strategies for

each infestation, as well as constraints that could limit the effectiveness of weed control efforts.

d. Results from the surveys will be incorporated into a ~~geographic information system~~GIS database and provided to the Department with the Monitoring Report. Weed infestations will also be photographed over time to document progress of weed control efforts.

3. Sagebrush planting will be considered successful when sagebrush density in enhancement areas is 50 percent of planting density (i.e., 50 percent survival of sagebrush planted at 300 plants per acre) ~~Success of sagebrush plantings will be based on an evaluation of the monitoring to reference sites, where the monitoring sites demonstrate an average density of 50 percent of the density of the reference site~~ within 5 years of planting. Density (plant counts) will be measured within macroplots, quadrats, and/or belt transects randomly located within the enhancement area.
4. Success of remedial actions to restore habitat quality in damaged areas (such as managed weed infestations, fire damage, and any necessary seeding/planting areas), as determined by vegetation cover (ocular estimate) and photo points (see below);
5. Photos taken from established monitoring positions (photo points) within the HMA, including 1) a minimum of five permanent photo points distributed to show general vegetation status throughout the HMA, and 2) additional photo points as needed to monitor success of significant enhancement activities, such as managed weed infestations and/or any necessary seeding/planting areas;
6. Incidental wildlife occurring within the HMA (counts concurrent with all other monitoring work);
7. Environmental factors found on site during monitoring activities and annual summary records (such as precipitation); and
8. Surveys of resident special status wildlife species (Washington ground squirrel) that have been documented during previous monitoring or survey efforts within the HMA, using existing protocols approved by ODFW.

7.0 Data Reporting

The Certificate Holder will submit a report including wildlife and habitat monitoring data and analysis to the ~~Oregon Department of Energy (~~ODOE~~)~~ and ODFW during each monitoring year according to the schedule in Table 5. The Certificate Holder will notify the U.S. Fish and Wildlife Service and ODFW within one business day if any federal or state endangered or threatened species are killed or injured on the facility site or within the HMA. The Certificate Holder may include the reporting of wildlife monitoring data and analysis in the report required under OAR 345-026-0080 or submit this information as a separate document concurrently with the submittal of the report. In addition, the Certificate Holder will provide ODOE with any data or

record generated by the investigators in carrying out this Plan upon request by ODOE.

Table 5. Schedule of Monitoring

Task	Schedule
General HMA Monitoring	During the first, third, and fifth years after Solar Component construction, and otherwise every fifth year thereafter for the life of the Facility.
Washington Ground Squirrel Monitoring	
General Weed Inventory, Control and Monitoring Activity for HMA	Every year for the first 5 years following implementation of initial enhancement; long-term monitoring frequency to be determined after year 5.
HMA Sagebrush Habitat Monitoring	Every year for the first 5 years following implementation of initial enhancement; long-term monitoring frequency to be determined after year 5.

8.0 Amendment of the HMP

This HMP may be amended from time to time by agreement of the Certificate Holder and the Energy Facility Siting Council (EFSC), or ODOE, acting within its delegated authority of EFSC under ORS 469.402. Such amendments may be made without amendment of the site certificate. EFSC authorizes ODOE to agree to amendments to this HMP. ODOE shall notify EFSC of all amendments, and EFSC retains the authority to approve, reject, or modify any amendment of this plan agreed to by ODOE.

Mr. Clark,

Please find attached PGE's comments in response to the Proposed Order on the Request for Amendment 4 of the Biglow Canyon Wind Farm Site Certificate. Two attachments associated with our Goal 3 Comment Letter will be uploaded to a SharePoint site for you to download. That link will be shared shortly. The attachments will be PGE's 2023 Clean Energy Plan/Integrated Resource Plan Update and PGE's 2024 ESG Report.

Thank you.

Re: Biglow Canyon Request for Amendment 4 – Proposed Order Goal 3 Exception

Dear Mr. Clark,

Portland General Electric (PGE; Certificate Holder) submits the following comments in response to the Oregon Department of Energy's (ODOE) Proposed Order on the Request for Amendment 4 (RFA 4) of the Biglow Canyon Wind Farm (BCWF or Facility) Site Certificate. This letter is specific to the findings related to the requested Goal 3 exception.

In the Proposed Order, ODOE disregarded two of the reasons the Certificate Holder presented to justify the requested Goal 3 exception. The Certificate Holder respectfully requests that ODOE reconsider its recommended findings. This letter provides revised proposed findings and evidence for ODOE's consideration.

- **Proposed Reason: Minimal Impacts to Other Resources Protected by Council Standards**

  Certificate Holder Comment:
  The Certificate Holder maintains that the Solar Micrositing Area is sited to avoid sensitive environmental features, including Washington ground squirrel (*Urocitellus washingtoni*) occupied habitat, FEMA 100-year floodplains, U.S. Fish and Wildlife Service-designated critical habitat, ODFW-designated big game winter ranges, and wetlands and waters.

  The Solar Components avoid almost all impacts to ODFW wildlife habitats (Category 1-Category 5), with only 1.6 percent (23.7 acres) of the approximately 1,445 acres of permanent impact area impacting ODFW classified wildlife habitats. The remaining 98.4 percent, or 1,420.9 acres, are considered ODFW Category 6 habitat, which is either developed or agricultural land that has little habitat value (see Exhibit P, Table P-6).

The Certificate Holder maintains that this is an exceptionally low amount of habitat impacts, particularly when compared to other solar developments approved for a Goal 3 Exception by EFSC. In fact, the proposed Solar Micrositing Area has less Category 2-5 habitat than any other solar facility that has been granted a Goal 3 exception, in part due to the "minimal impacts on other resources protected by Council standards" reason.

See the table below listing the permanent impacts (in acres) approved for West End Solar, Madras Solar, and Sunstone Solar compared to the proposed Solar Micrositing Area.

Permanent Disturbance Acreage Comparison

Project	Cat 1	Cat 2	Cat 3	Cat 4	Cat 5	Subtotal Cat 2-5
Biglow RFA 4	0	20.7	0	3	0	23.7
West End Solar Project	0	0	20	139	161	320
Madras Solar Energy Facility	0	0	0	270.18	0	270.18
Sunstone Solar Project	0	<0.1	0	17.9	18.5	36.5

Compared to previous Goal 3 exceptions approved by Council, as noted in the table above, the anticipated impacts to 23.7 acres of Category 2 through 4 habitats described in RFA 4 represent an exceptionally low amount of habitat impact.

Furthermore, for the approximately 23.7 acres of land within the Solar Micrositing Area classified as ODFW wildlife habitat categories 2 through 4, permanent habitat loss will be mitigated according to ODFW Habitat Mitigation Policy goals and standards, as described in the Solar Micrositing Area HMP (see Attachment P-2 to Exhibit P). For these reasons, the Certificate Holder requests that ODOE reconsider its findings and conclude that this reason supports the Goal 3 exception request.

With respect to cultural resources, disturbance will not occur within 20 meters of any NRHP-eligible, -listed, or unevaluated cultural resources. If disturbance is planned within an avoidance buffer, the Certificate holder will consult with the Council and Tribes, and an archaeological or Tribal monitor must be present. All impacts to significant cultural resources will be avoided through Solar Components design.

- **Proposed Reason: Directly Furthers Oregon's Clean Energy Directives and Goals**

Certificate Holder Comment:

The Certificate Holder presents a revised analysis to demonstrate why a Goal 3 exception is justified because the facility, as amended, directly furthers Oregon's clean energy directives and goals.

Before presenting the reason, the Certificate Holder reiterates its earlier argument that the Council has broad discretion and authority to determine "reasons" warranting a goal exception under ORS 469.504. ODOE argues that consistency with State climate goals and policies is not an appropriate reason to justify an exception to Statewide Planning Goal 3 because "neither the State Energy Policy in ORS 469.010 or ORS 469.310 suggest that the Council should grant an exception to the State's goals to preserve agricultural

lands, particularly highly productive farmlands, for farm use based on the general need for new sources of renewable energy to meet other state "goals." The Certificate Holder maintains that the State Energy Policies in ORS 469.010 or ORS 469.310 also do not suggest the Council should not grant an exception to Goal 3 based on the need for new sources of renewable energy. Furthermore, as noted in RFA4 Exhibit K, the Certificate Holder respectfully submits that previous Land Use Board of Appeals (LUBA) decisions do not prohibit Council from considering Oregon's goals and policies that relate to the acceleration of Oregon's clean energy transition in a justification as to why the state policy embodied in Goal 3 should not apply.

The Certificate Holder maintains that the Council has the discretion and authority to balance the policies that are embedded in the goal for which an exception is sought, with its policy directive in ORS 469.010, other statewide planning goal policies and objectives, and other policy reasons that the Council determines warrant the requested exception. The legislature granted the Council such discretion when it adopted a different goal exception test in ORS 469.504 than the ORS 197 test[1]. The Certificate Holder encourages the Council to exercise its discretion to further Oregon's clean energy directive and goals.

The Certificate Holder requests that Council acknowledge, for purposes of this analysis, that Oregon's clean energy directives and goals include the following:

House Bill 2021 (ORS 469A.400-469A.475)

This bill requires retail electricity providers including PGE to reduce greenhouse gas emissions associated with electricity sold to Oregon customers by at least 80% below a baseline by 2030; 90% below the baseline by 2035; and 100% below the baseline by 2040. PGE is required to demonstrate continued progress towards these emissions targets and submit a plan for compliance with these emissions targets in its Clean Energy Plan and Integrated Resource Plan, filed with the Oregon Public Utility Commission.

Senate Bill 1547 (ORS 469A.005-469A.210)

Among other provisions, this bill mandates that large investor-owned utilities, including PGE, eliminate coal-fired electricity from their Oregon portfolios by 2030 and doubles the Renewable Portfolio Standard (RPS) to 50% by 2040, with interim targets of 35% clean by 2030 and 45% by 2035. The RPS targets must be met with qualifying resources, which include utility-scale solar facilities. PGE must describe its plan for meeting the RPS requirements as part of its Integrated Resource Plan filed with the Oregon Public Utility Commission.

Executive Order 20-04

Consistent with the minimum GHG reduction goals set forth in ORS 468A.205(1)(c), the Executive Order establishes science-based GHG emissions reduction goals and calls for the State of Oregon to reduce its GHG emissions (1) at least 45 percent below

[1] The Oregon Supreme Court recognized that the legislature intentionally omitted the more stringent alternative analysis test from the EFSC test. *Save Our Rural Oregon v. Energy Facility Siting Council*, 339 Or 353, 372 (2005).

1990 emissions levels by 2035; and (2) at least 80 percent below 1990 emissions levels by 2050. The order mandated state agencies, including the Oregon Department of Energy (ODOE), to exercise any and all authority and discretion vested in them by law to help facilitate Oregon's achievement of the GHG emissions reduction goals; prioritize and expedite any processes and procedures that could accelerate reductions in GHG emissions; and consider and integrate climate change, climate change impacts and the state's GHG emissions reductions goals into their planning, budget, investments, and policy making decisions.

Recognizing the urgency of, and the hurdles to, furthering Oregon's clean energy directives and goals, including the legally required mandates of HB 2021 and SB 1547, Governor Tina Kotek issued two executive orders: Executive Order 25-25 *Accelerating Wind and Solar Energy Development in Advance of Elimination of Federal Clean Energy Tax Credits* (EO 25-25), and Executive Order 25-29 *Reducing Greenhouse Gas Emissions and Advancing Oregon's Clean Energy Future* (EO 25-29). These executive orders make clear the priority of the State to support investment in clean energy infrastructure to support utilities' transition from fossil fuels to meet HB 2021 and SB 1547 requirements.

These executive orders make clear that ODOE and the Council need to take aggressive steps to recognize and give weight to Oregon's clean energy directives and goals.

The facility, as amended, directly furthers Oregon's clean energy directives and goals and there is concrete evidence the Council may rely on when making its decision, including the following:

- To identify the least-cost, least-risk portfolio of resources needed to meet our customers' current and future energy needs and state clean energy requirements as overseen by the Oregon Public Utility Commission, PGE engages in long-term integrated resource planning and public engagement, as required by the Oregon Public Utility Commission. PGE's Integrated Resource Plan (IRP) and Clean Energy Plan (CEP) model the utility's energy needs, customer demand, and path to compliance with all state energy and emissions requirements, including HB 2021 and SB 1547.
- In PGE's 2023 CEP/IRP[2]and 2025 updates to the CEP/IRP[3], PGE models and describes its strategy for making continuous progress toward emissions targets and meeting RPS requirements, by adding significant quantities of non-emitting resources like wind, solar, and batteries to meet growing customer electricity demand and replace fossil fuels in the electricity mix.
- In PGE's most recent Integrated Resource Plan update in July 2025, PGE identified a need to procure an additional 4,629 MW of clean energy resources. This represented an increase of 16% since PGE's prior IRP filed in 2023. For reference, PGE currently has 3,600 MW of generation on its system. These identified needs in PGE's 2023 IRP, which were acknowledged by the OPUC, require PGE to add

[2] Portland General Electric 2023 Clean Energy Plan and Integrated Resource Plan, June 30, 2023

[3] Portland General Electric 2023 Clean Energy Plan and Integrated Resource Plan Update, August 15, 2025

renewable energy resources at an unprecedented pace, while maintaining reliability and affordability for customers.

- Projects like the proposed addition of 125 MW solar and 125 MW storage at Biglow are critical contributions to this growing clean energy need.
- The ability to integrate renewable energy resources to serve Oregon retail customers is limited by the current transmission infrastructure. Projects must be sited where transmission is available to serve PGE loads in Oregon.
- Multiple studies and analyses have identified transmission constraints and permitting and siting as significant contributors to regional challenges in meeting growing energy demands, particularly with clean resources. Recent studies include preliminary results of the upcoming Ninth Northwest Regional Power Plan[4] by the Northwest Power and Conservation Council and Phase 1 of the Resource Adequacy and the Energy Transition in the Pacific Northwest Study by Energy and Environmental Economics, Inc. (E3)[5].
- Co-locating solar and wind power generation equipment at the BCWF site allows PGE to take advantage of the existing infrastructure on the site, like transmission lines and substations, and to reduce the overall impact to the land and to the environment. The addition of solar and battery at the BCWF site will help to optimize clean energy generation and delivery in support of PGE's growing electricity, clean energy and emissions reductions requirements.
- Adding solar capacity complements the existing wind capacity since wind and solar typically produce peak power production at different times of the day. This allows both renewable energy resources to work together to meet a broader range of our customers' energy needs, increasing PGE's overall system reliability and the value of the site overall to our customers.
- The addition of battery storage will also provide flexibility to the grid, allowing energy storage when demand is low and its use when demand is high. The right mix of energy resources in the right locations can help reduce reliance on fossil fuels and drive a cleaner, more affordable, and reliable energy resource mix.
- PGE has already made strong progress towards achieving the state's emissions targets, with an overall resource portfolio that is 45 percent non-emitting as of the close of 2024; this includes projects like the Biglow Canyon Wind Farm. The BCWF RFA4 will further PGE's progress toward meeting its 2030 state emission targets.
- The upcoming expiration of the federal clean energy tax credits will escalate the long-term cost of renewable energy and storage, threatening customer affordability and the pace of achieving the state's clean energy and economic development objectives. Therefore, the RFA4 is a timely request, and approval to amend the site certificate will allow the facility to move forward on a timeline that can capture the value of those existing federal tax credits while still available for PGE's customers, aligning with PGE's

[4] Northwest Power and Conservation Council Power Plan Update, January 6, 2026

[5] Summary of the 2025 Long-term Resource Adequacy Meeting, Washington Utilities and Transportation Commission and the Washington State Department of Commerce, November 19, 2025

and the state's focus on delivering affordable, reliable, and increasingly clean power while achieving the directives in EO 25-25 and EO 25-29.

- Consistent with PGE's 2023 IRP Action Plan, as acknowledged by the OPUC, PGE issued an all-source request for proposals (2023 RFP) to identify the least-cost, least-risk portfolio of resources that are needed to meet our customers' current and future energy needs, as well as state clean energy requirements. PGE's all-source request for proposals is a transparent, regulated, competitive process by which interested developers submit detailed project proposals for consideration as we plan to meet our customers' energy needs.
- The 1,600 megawatts of resources that PGE identified on the final short list of projects that resulted from our 2023 all-source request for proposals competitive bidding process, including the Biglow Solar Project, was acknowledged by the OPUC, and the projects were selected for their potential to deliver affordable, reliable, and cleaner energy.
- By selecting projects through this competitive process verified by an independent evaluator, PGE can add high-value, responsible projects that capture significant federal incentives and reduce costs while meeting the state's growing energy needs.
- Given the shortened timeline that now exists to capture tax credits, the importance of maintaining a project schedule is paramount. PGE has partnered with BrightNight to ensure responsible and timely delivery of this project that recognizes that this is a critical opportunity in time for Portland General customers, the state, and Sherman County. The certificate amendment will allow critical energy need and capacity to meet Oregon's economic development goals and the state's emission targets.

The Certificate Holder requests that Council acknowledge, for purposes of this Goal 3 exception analysis, that Oregon's clean energy directives and goals are furthered by this site certificate amendment.

Sincerely,

Lenna Cope
Senior Environmental Specialist

2023 Clean Energy Plan and Integrated Resource Plan Update

This document was updated on August 15, 2025 pursuant to an errata filing.

This document contains forward-looking statements, including those regarding implementation of our business plans, technology transitions, our business, strategies and financial performance, our offerings of new services, and other statements that are not historical fact, and actual results could differ materially from these forward-looking statements. Risk factors that could cause actual results to differ are set forth in the "Risk Factors" section, as well as other sections of our Annual Report on Form 10-K, available on our website at investors.portlandgeneral.com/financial information/sec-filings, as well as, or in addition to, other filings with the SEC. All forward-looking statements are based on management's estimates, projections, and assumptions as of the date of filing, and we undertake no obligation to update any such statements.

Introduction

Portland General Electric Company (PGE or Company) submits this 2023 Clean Energy Plan and Integrated Resource Plan Update to inform the Oregon Public Utility Commission (OPUC or Commission) of the Company's actions since acknowledgment of the 2023 Integrated Resource Plan (IRP). The OPUC's Order 24-096 acknowledged, with conditions, PGE's 2023 IRP on April 18, 2024. Additionally, the Commission directed PGE to update PGE's Clean Energy Plan (CEP) in PGE's subsequent CEP/IRP Update.

An IRP Update addresses specific inputs that may have changed since the most recent IRP was acknowledged, without attempting to fully revise the IRP. This IRP Update refreshes the analysis filed with the 2023 IRP and provides status reports on actions and requirements associated with the Commission Order.

PGE does not propose modification to the acknowledged 2023 IRP Action Plan and PGE is not requesting acknowledgement of the 2023 CEP/IRP Update. We continue to find that the recommended Action Plan is in the long-term interest of our customers, providing the best path forward to ensure system reliability and continued progress toward delivering a clean, affordable energy future for Oregon.

The 2023 IRP Action Plan proposed conducting one or more RFPs to meet the Company's carbon-free energy and capacity needs through 2028. Negotiations from PGE's 2023 RFP Final Shortlist are ongoing, and PGE has requested approval of the proposed 2025 RFP. Procuring resources through these solicitations will aid PGE's ongoing efforts to demonstrate continual progress for HB 2021 and will enable PGE to address the portfolio's forecasted reliability needs.

Reliability and affordability remain the foundation of PGE's role in supporting customers and Oregon's economy. The Company's CEP/IRP demonstrates how PGE can achieve our responsibilities to deliver affordable services for our customers while maintaining progress to meet HB 2021 emissions targets.

PGE recognizes the importance of stakeholder engagement and dialogue regarding the Company's resource plans. This Update has benefited from monthly participation in PGE's IRP roundtables since the acknowledgment of the 2023 IRP. PGE looks forward to continued engagement with the Commission and stakeholders in upcoming meetings and in response to the 2023 CEP/IRP Update as filed.

Chapter 1. CEP Update

1.1 Overview

House Bill (HB) 2021 is a transformative public policy that has set Portland General Electric (PGE) on a path toward decarbonizing the power supply for Oregon retail customers.[1] PGE has engaged in robust planning, analysis, stakeholder and community engagement to inform its approach to decarbonization and to demonstrate progress toward the specific greenhouse gas (GHG) emissions targets detailed in HB 2021. Throughout the planning process, PGE remains committed to balancing affordability for customers, the reliability of the grid, and emissions reduction.

The inaugural Clean Energy Plan (CEP), filed in 2023 with the Integrated Resource Plan (IRP) was an important first step in charting a course toward emissions targets in 2030, 2035 and 2040 that balances affordability and reliability for customers. PGE has furthered this work through the continued stakeholder and community engagement and monthly roundtables that have informed this Update. PGE will continue to learn and adapt strategies as customers' needs, the market, and technologies evolve.

This chapter summarizes the results of updated modeling and portfolio analysis which form the basis of this CEP Update and details the Company's progress toward HB 2021 emissions targets.

CEP Update: Key Highlights

- PGE is not requesting Oregon Public Utility Commission acknowledgement of this Update and maintains its Commission-acknowledged Action Plan.
- PGE continues to identify a significant need to procure non-emitting resources and capacity to keep pace with new customer demands, system reliability, and to make progress toward emissions targets.
- PGE is working to continue to reduce emissions and maintaining reliable service by replacing emitting generation and market purchases with non-emitting energy and capacity resources.
- Uncertainties regarding the ability to meet emissions targets at prices that are affordable for customers on the timelines specified by HB 2021 have grown, due to factors outside PGE and its customers' control. These factors include lengthy permitting and siting processes and likely changes to federal policies including tax incentives which are anticipated to significantly increase the costs of new clean resources and tariffs that impact supply-chain availability and costs.
- Transmission is a significant factor impacting the economics and timing of resource additions. Transmission solutions are integral to maintaining reliability and providing long-term pathways for decarbonized power supply. The constraints limiting transmission expansion will drive a greater role for customer-sited

[1] House Bill (HB) 2021 codified as ORS 469A.400 to 469A.475, effective 09/25/2021.

resources such as demand response (DR), energy efficiency (EE), distributed solar/storage and community-based renewable energy (CBRE) resources, highlighting the importance of PGE's efforts to improve utilization of these resources through a virtual power plant (VPP).

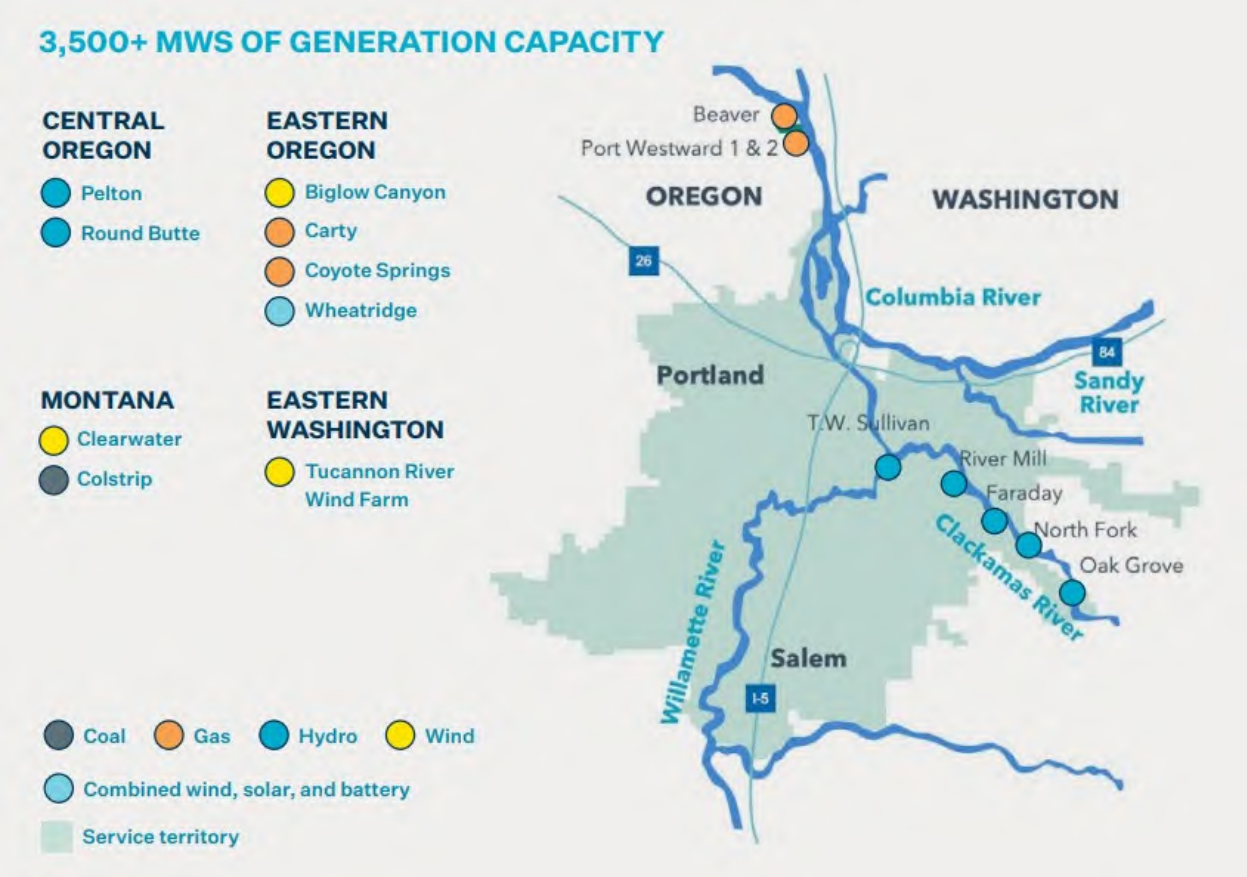
- Updated analysis, based on what is currently known, finds 2030 emissions targets can be met by technologies and resources that are currently known and commercially available, though costs have increased and the timing of resource additions may be constrained based on what is commercially available in the market. While the costs presented as part of this modeling exercise do not represent actual changes to customer prices, the analysis is suggestive that, on a planning basis, system costs are likely to increase significantly in order to comply with HB 2021.
- Decarbonization pathways to 2040 will require further technological advancement of non-emitting resources and transmission to meet the region's energy and capacity needs.

PGE must continue to operate its existing portfolio efficiently and seek to procure the best combination of resources that balances costs, risks and maintains safe and reliable service for customers. As detailed in the inaugural Clean Energy Plan, decarbonizing PGE customer's power supply will require resource acquisition and integration at a significant pace and scale. The planning environment has evolved significantly since the original filing. Some of the planning changes, including changes to federal policy, resource cost increases, significant industrial load growth, and long-lead time for transmission expansion, all present challenges to the pace and affordability of PGE's path to emissions targets. Other changes to the planning environment, including progress on regional energy market development, regional resource adequacy sharing frameworks, and active state policy regarding large industrial customers and fair cost allocation provide important tools for PGE to most efficiently meet PGE customers resource needs at the lowest cost possible. External factors that affect critical dependencies are further described in **Section 1.5**.

Electricity is a critical service for local communities and the economy. Customers already rely on the utility for their essential electricity needs. Looking to the future, customer reliance on electricity will increase as they electrify their vehicles, homes and businesses. Our local industrial customers, who are advancing national interest through pursuit of advanced semi-conductor manufacturing, information technologies and artificial intelligence capabilities, need abundant and reliable service. Working to serve this industrial growth with fair cost allocation supports our local economy and has the opportunity to lower the average cost of service. Providing electrical service for all of PGE's customers with increasingly fewer emissions will require significant new investment in energy resources and distribution and transmission infrastructure to prepare for the smart, clean energy grid of the future. While PGE faces some significant changes in the planning environment, PGE's commitment to energy access, affordability, and an increasingly non-emitting electricity supply is steadfast.

PGE will continue to actively manage costs for customers throughout the transition to an energy mix while working to reduce emissions. This includes careful and inclusive planning through

PGE's Clean Energy Plan, Integrated Resource Plan, and Distribution System Plan processes, competitive procurement through Requests for Proposals (RFPs) for resources, joining the California Independent System Operator's (CAISO) Extended Day-Ahead Market (EDAM), as well as continuous efforts to improve operational efficiency, safety, and system and equipment reliability. PGE has actively pursued federal and state grant funding and tax credit opportunities to offset investment costs and support key decarbonization initiatives on behalf of customers, including infrastructure upgrades, though the future of many of those programs and grants is now in jeopardy due to the change in federal policy. PGE also supports efforts to connect customers with the unprecedented federal tax incentives and rebates available, ranging from electric vehicles to heat pumps to rooftop solar. PGE will continue to leverage available tools to prioritize affordability. Some recent examples are further described in **Section 1.4.1 Annual goals**.



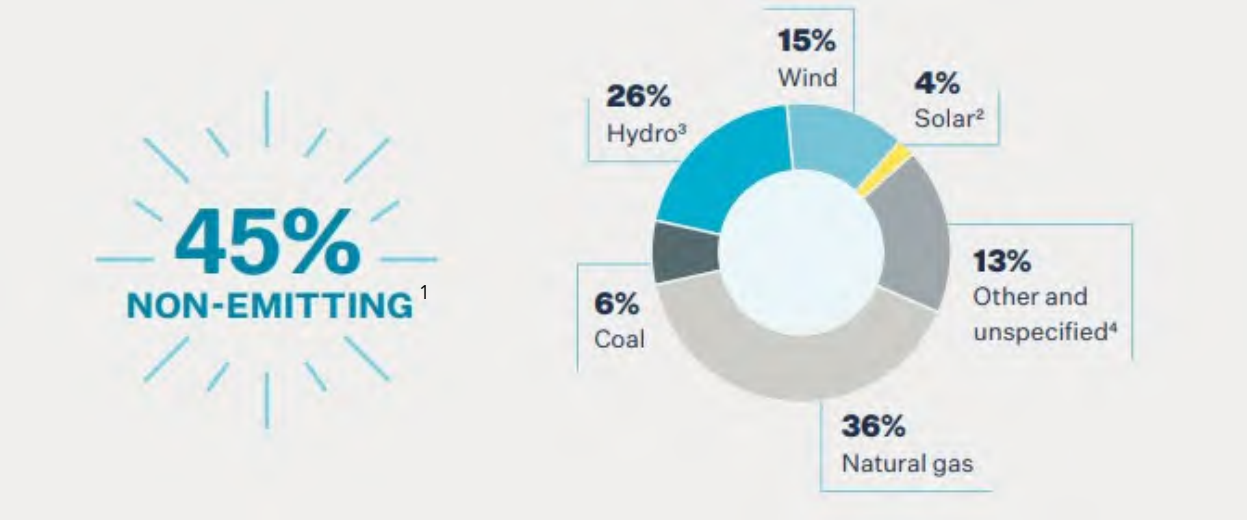
1.2 Historical emissions trends and resource mix

PGE customers include some of the world's most sophisticated corporate renewable energy buyers and local municipalities with ambitious climate action goals. Portland, Beaverton, Multnomah County, Hillsboro, Salem and many other municipalities have developed climate action plans that encourage finding new and innovative ways to reduce the carbon intensity of electricity service, while also supporting electrification efforts, fostering economic development and modernizing the grid to enhance resilience to extreme weather. Many companies in PGE's service territory have publicly adopted ambitious clean energy or emissions goals, including Oregon Health and Science University, Nike, Intel, STACK Infrastructure, Daimler and others. As large electricity buyers, they look to PGE to support their decarbonization efforts.

PGE supports customers' climate and sustainability goals by decarbonizing the electricity supply and offering innovative voluntary programs that enable customers to go further and faster. PGE offers programs for large businesses, cities and counties that match their electricity needs with new renewable energy facilities in the region. Convenient options are also available for small business and residential customers to support clean energy development by purchasing renewable energy certificates from energy generation throughout the U.S. In 2021, PGE became the first utility in North America to sign The Climate Pledge to achieve net zero emissions across company operations (Scope 1, 2 and 3 emissions) by 2040, ten years ahead of the United Nations' Paris Agreement. PGE then collaborated with state lawmakers and stakeholders to pass Oregon's 100 percent Clean Electricity Law (HB 2021) to establish emissions targets for electric utilities in Oregon.

PGE meets the growing clean energy demands of customers with a diverse mix of generation facilities shown in **Figure 1**, owned in whole or in part, or through contract. Today, PGE's generation portfolio consists of seven hydroelectric facilities, five natural gas facilities, three wind facilities, one combined wind/solar/ battery facility and a partial ownership stake in an out-of-state coal facility. PGE previously announced the acquisition of 475 MW of new battery storage projects, of which 275 MW achieved commercial operations in December 2024 with the remaining 200 MW scheduled for service in mid-2025.

Figure 1. PGE generation portfolio



Customer-sited resources, including rooftop solar, batteries and standby generation play an increasingly critical role in the resource portfolio. For example, customer-sited rooftop solar generation contributed an additional 264,826 MWh of non-emitting energy in PGE service territory in 2024. PGE manages the output of owned power plants in conjunction with available power supplies on the wholesale market to deliver power to customers at the lowest possible price. PGE actively coordinates with transmission providers like the Bonneville Power Administration and other utilities and energy suppliers across the region, to secure transmission access and additional power on contract for customers. PGE also owns major transmission rights to the Pacific Intertie and participates in the CAISO Energy Imbalance Market (EIM) and the soon-to-be established EDAM. These options provide additional flexibility to buy and sell power and to access a more diverse and increasingly clean mix of generating resources.

In 2024, PGE made strong progress toward advancing a resource mix for total system load that is increasingly clean. The percentage of total load comprised by non-emitting resources grew from 35 percent in 2023 to 45 percent in 2024. As a result, the carbon intensity of the total power supply declined to 0.27 MMTCO2e per MWh in 2024, despite load growth. While natural gas remains the largest component of the generating mix and provides much-needed capacity to meet resource adequacy and reliability requirements – hydropower, wind and utility-scale solar continue to grow on the system, in addition to customer sited renewable energy resources like rooftop solar. Wind output alone grew by 56 percent, reaching record breaking levels of wind

generation on the system in 2024 primarily due to the addition of the Clearwater Wind facility in Montana. Not only does this facility have a high energy output rate, but it also generates power when other wind resources closer to home in Oregon and Washington are less productive. This exemplifies the importance of resource diversity in the portfolio – and is a critical decarbonization strategy.

Unspecified emissions are reported as part of annual GHG reporting to the Oregon Department of Environmental Quality (ODEQ) when the underlying source of generation for energy purchased from the market, including from CAISO's Energy Imbalance Market, is unknown or not otherwise specified in a contract. Following best practice and ODEQ rules, an emissions rate is assigned to unspecified purchases in recognition that the power pool in Western states still includes fossil fuel generation. Throughout 2024, PGE reduced emissions from unspecified sources, from 16 percent of the resource mix in 2023 to 14 percent in 2024. As Western states decarbonize and energy markets such as CAISO adopt more precise mechanisms for tracking and reporting the carbon content of resources dispatched and allocated through energy markets, emissions associated with unspecified purchases should continue to decline. **Figure 2** summarizes PGE's total system resource mix for 2024.

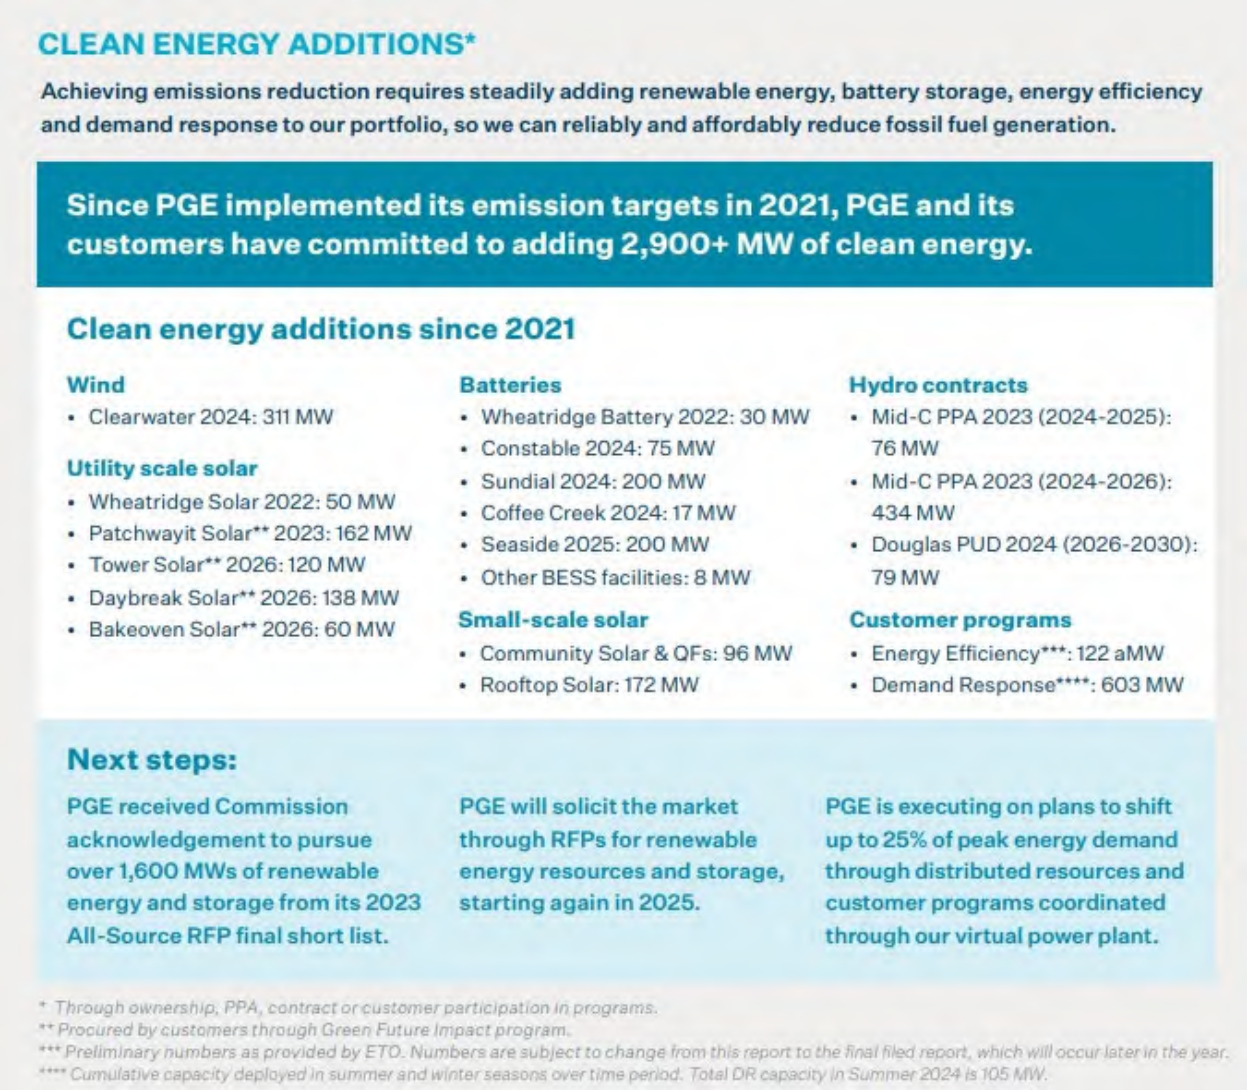


Figure 2. PGE total system resource mix

1. Percentages above represent 2024 resource mix from PGE's total load, inclusive of wholesale volumes.
2. Represents owned and contracted solar resources, does not include the 264,826 MWh of customer owned rooftop resources.
3. Hydro amounts include purchases from Bonneville Power Administration, which may have an immaterial amount of emissions associated with them, per ODEQ rules.
4. Unspecified is purchased power for which a specific generating resource is not defined and could be any of the generation types (e.g., wind, hydro, gas)

PGE recently concluded the largest open-application request for proposal (RFP) for clean energy resources to augment the portfolio to date and has applied to return to the market with another RFP in 2025. This and subsequent RFPs will be necessary to meet customers' energy needs and work towards PGE's emissions targets. PGE's steady progress in procuring clean energy and investing in grid-edge technologies and customer programs will reduce reliance on fossil fuels and drive a cleaner resource mix in the coming years. Additions since 2021 are shown in in **Figure 3**.

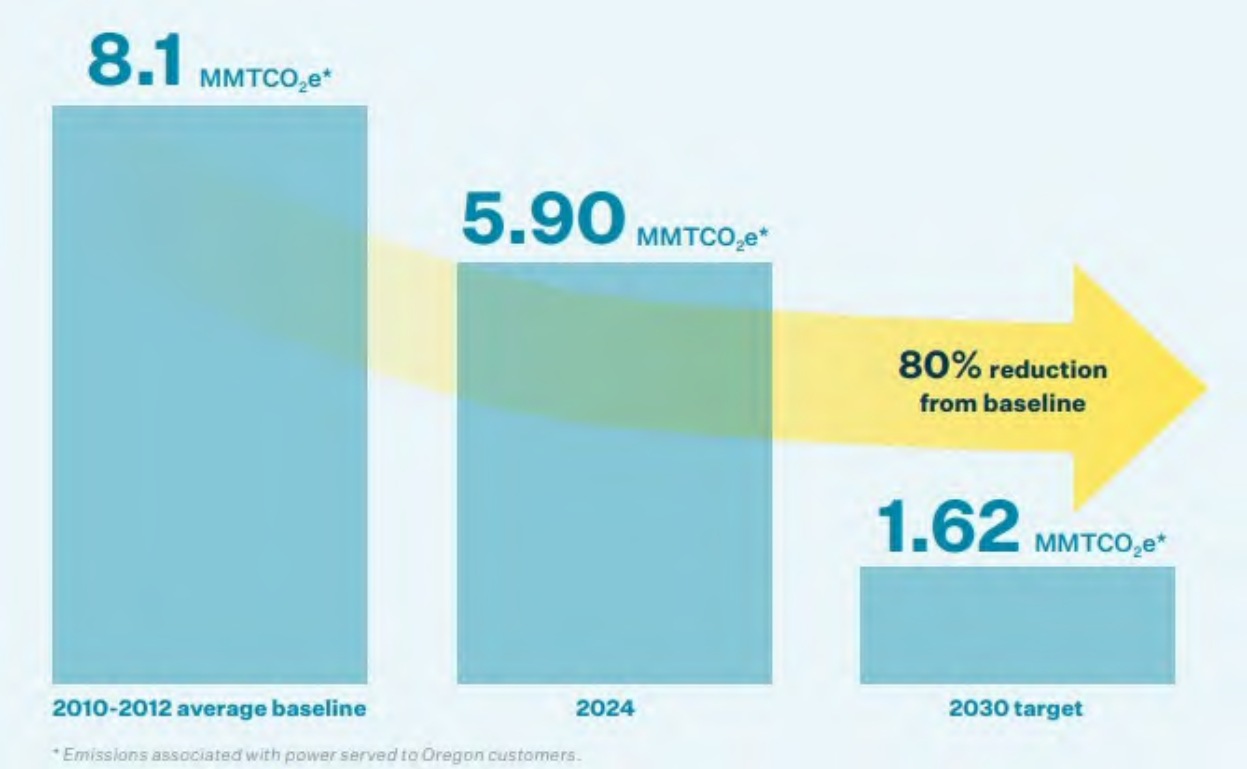

Figure 3. Clean Energy Additions

As shown in **Figure 4**, preliminary estimates subject to ODEQ final approval of emissions associated with power served to Oregon customers in 2024 equated to approximately 5.90 million metric tons of CO_2e.[2] This is a 10 percent decrease in retail emissions reported in 2023, largely driven by additional hydropower and the addition of the Clearwater Wind facility. It also represents a 27 percent reduction in baseline emissions established for HB 2021 compliance.

[2] The 2024 emissions estimate is preliminary pending reporting and third-party verification, as required by the Oregon Department of Environmental Quality (ODEQ).

Figure 4. 2024 GHG emissions in context

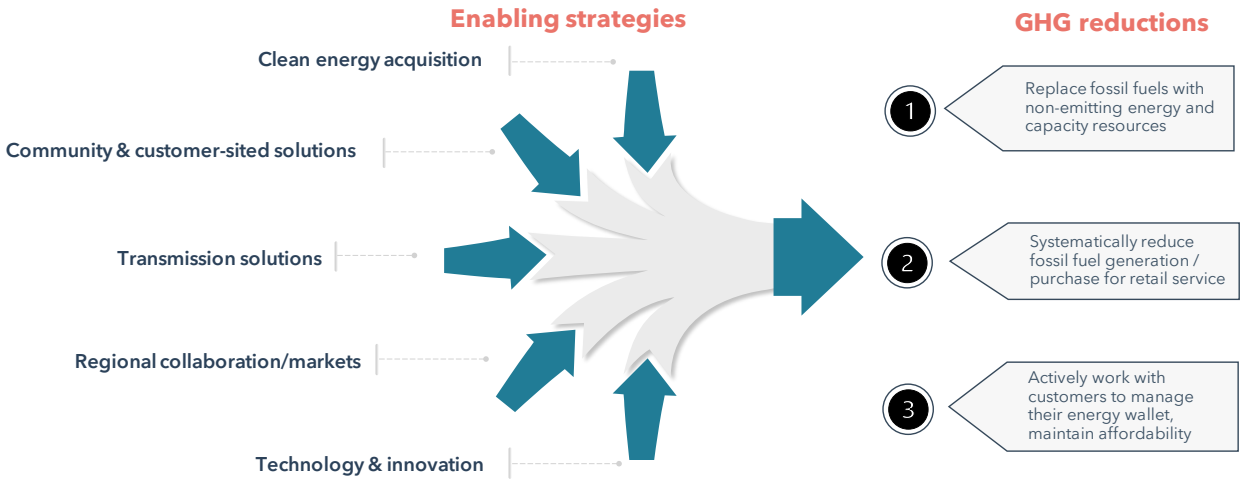
Like most utilities, PGE's emissions are driven by the fossil fuels combusted to generate electricity. PGE is actively planning and executing strategies for a balanced transition from thermal generation to increasingly cleaner generation sources while providing reliable energy service that can affordably meet customers' energy needs. Year-to-year variations in reported emissions may be driven by changes in economic factors that affect load or changes in weather that affect hydro conditions, renewable capacity and peak energy needs, that are increasingly hard to forecast. This is discussed further in **Section 1.4.2 GHG emissions**.

Achieving emissions reduction requires steadily adding, to the extent available, renewable energy, battery storage, energy efficiency and demand response to the portfolio to reliably and affordably reduce fossil fuel generation. Customer-sited resources, including rooftop solar, batteries and standby generation play an increasingly critical role in the overall resource portfolio as PGE decarbonizes.

In 2023, PGE published its combined Clean Energy Plan and Integrated Resource Plan, a twenty-year roadmap for meeting customer energy needs at the lowest possible costs while transitioning from fossil fuel generation. PGE demonstrated a potential path toward the 80 percent emissions reduction target in 2030 that involves resources and technologies that are economically and technically feasible in the region today. No single technology right now can replace the role of natural gas generation in the electric power system. Clean energy of all types – including customer rooftop solar generation, community-scale microgrids that combine batteries and solar, utility-scale wind, batteries – energy efficiency and demand response

programs and customer dispatchable standby generation will all be needed to replace the energy and backstop capacity that natural gas currently provides. Looking ahead to deeper decarbonization targets in 2035 and beyond, PGE anticipates the need for access to a broader geographic diversity of resources and technologies to replace fossil fuels on the grid. This will require solutions to current regional transmission constraints and adopting future non-emitting technologies as they become cost-effective. This could include green hydrogen, offshore wind, nuclear, long-duration storage and carbon capture and storage.

When the Legislature passed HB 2021 in 2021, PGE was anticipating flat to minimal load growth, consistent with trends for the electric sector across the country. Since the passage of HB 2021, PGE and the region are forecasting significant industrial load growth, led primarily by the expansion of data centers, AI technologies, and advanced manufacturing. HB 2021 targets are absolute emissions targets, not carbon intensity targets, and are unforgiving of the load growth forecasted for the region and PGE's service territory.



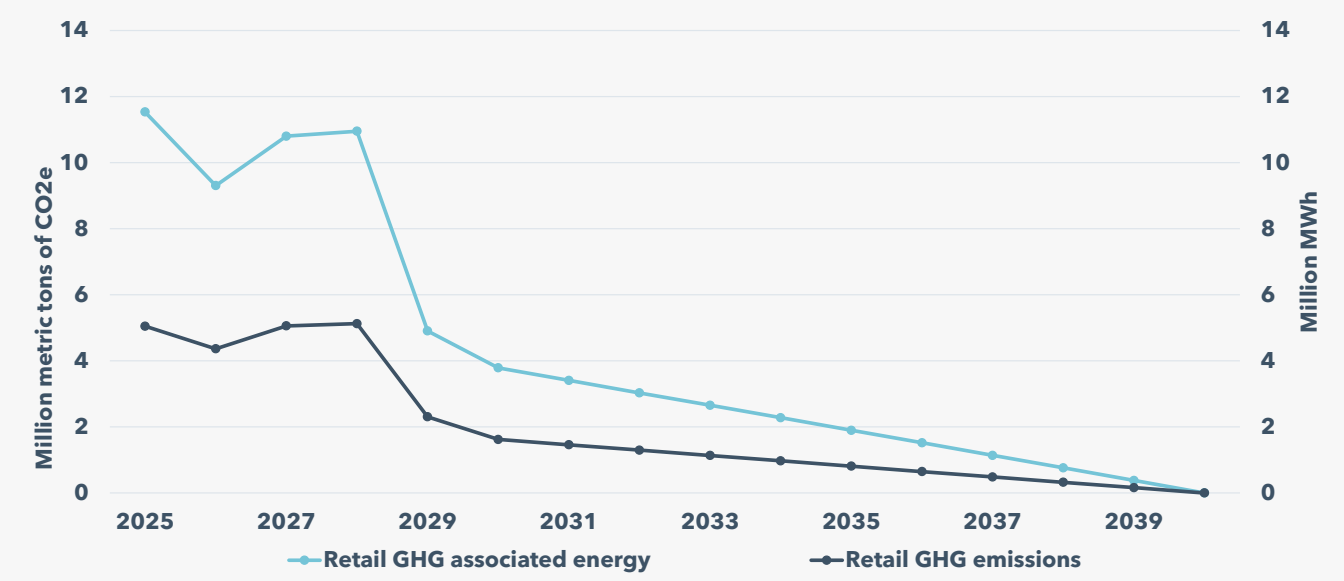
This CEP/IRP Update reflects a significant increase in need for procurement of new generation and storage capacity to keep pace with new customer demand as well as to make progress toward emissions targets. The utility is also considering ways to allocate relevant costs fairly to customers that have a high demand for electricity, such as new data centers. Mitigating residential and small commercial customer price impacts and maintaining reliability are core priorities as PGE decarbonizes its power supply while keeping all customer prices as low as possible.

PGE's decarbonization planning centers on customers' needs and investments in new non-emitting resources and the grid that make progress toward the HB 2021 emissions targets for 2030, 2035 and 2040. At the highest level, the approach to reducing emissions involves:

- Increasing purchase and integration of non-emitting energy and capacity resources.
- Systematically reducing the generation and purchase of fossil fuels for Oregon retail customer load.
- Actively working with customers to help them manage their energy use and total energy expenditures.

This approach is bolstered with key, enabling strategies to be able to deliver a reliable, affordable, clean energy supply, displayed in **Figure 5**.

Figure 5. Decarbonization strategies



This high-level approach to decarbonization involves gradually reducing fossil fuel generation and purchases for Oregon retail customers and replacing it with non-emitting energy resources and capacity, as well as key enabling strategies to facilitate a reliable and affordable transition. The IRP estimates PGE's energy and capacity needs subject to HB 2021 emissions constraints. It creates a Preferred Portfolio of resources to meet those needs and details an Action Plan to guide the company's procurement and related resource actions over the next 2-4 years.

1.3 Pathways to emissions targets

One of the CEP's primary objectives is to detail a path to compliance with the HB 2021 targets. It shows that the Preferred Portfolio and Action Plan that PGE has developed in its IRP are consistent with steps the company could take in the near-term to make progress toward the emissions targets in 2030, 2035 and 2040, according to the best methods available at the time of analysis. Moreover, the CEP describes how the company will demonstrate continual progress toward those targets. This section summarizes how strategies to decarbonize, resource needs and the Action Plan inform a path to the emissions targets that balance affordability and reliability for customers.

Updated data and analysis described in **Section 3.5.1 HB 2021** result in an updated emission reduction glidepath also presented here in **Figure 6**.

Figure 6. GHG emissions and energy associated with serving Oregon retail load (Reference Case)

PGE's glidepath identifies expected thermal generation and market purchases with associated emissions retained for retail load. Since the 2023 CEP/IRP, PGE has updated the earliest available resource addition year to 2029. This means that while PGE continues to add customer sited non-emitting resources like distributed solar in every year, large utility scale projects are assumed unavailable for addition until the beginning of 2029 due to the considerable time required to procure and construct such resources. One important exception is the assumed addition of solar and storage resources that PGE is working to acquire through the 2023 RFP. While 2023 RFP procurement is not yet finalized, PGE forecasts for this CEP proxy resources shown in **Table 1**, added to the portfolio on January 1, 2028. This is further described in **Chapter 5 Resource options** and **Chapter 6 Resource plan**.

PGE is planning for accelerated procurement through RFPs between now and 2030. PGE has initiated the regulatory process in 2025 to conduct an RFP, which is expected to continue to seek non-emitting resources to meet needs that remain after the 2023 RFP process has concluded. PGE aims to issue this 2025 RFP to market over the summer, with negotiations likely in winter 2026 and possible resource online dates from 2029 to 2032. However, actual procurement from this 2025 RFP is yet unknown and therefore not included in this analysis.

Additional programs are offered by PGE to acquire clean energy outside the RFP processes. For example, the Green Future Impact program enables interested businesses and cities to drive procurement of new renewable energy facilities to directly support their load needs.

Progress toward the HB 2021 emissions targets will require investment and be driven by integrating additional non-emitting resources into PGE's system. The Preferred Portfolio represents the best set of incremental resource additions that balance cost and risk for customers while making progress toward HB 2021 emissions targets. External factors will challenge the pace and scale of PGE's transformation, but ultimately, resource acquisition can

enable the replacement fossil fuel generation and purchases with non-emitting alternatives to support emissions reductions toward HB 2021 targets. Beyond achieving emissions reductions, new large loads, reliability needs, and broader economic trends also impact costs.

PGE seeks to acquire and integrate non-emitting resources, resulting in declining reported emissions associated with serving retail load, under average weather and other conditions. The realities of market procurement, transmission and system integration may lead to step-changes in resources becoming available to PGE customers, resulting in non-linear emissions reductions into the future toward the HB 2021 targets. Work to further develop the virtual power plant (VPP) to enhance utilization of distributed energy resources (DERs) and community-based renewable energy (CBRE) resources will also continue in parallel over this time frame.

Figure 7 details the incremental resource actions by year between now and 2035. The figure also includes PGE's existing portfolio of resources, including proxy assumptions for the 2023 RFP (actual procurement not yet known), and declining GHG-emitting energy retained to serve retail load.

Figure 7. Preferred Portfolio resource pathway through 2035

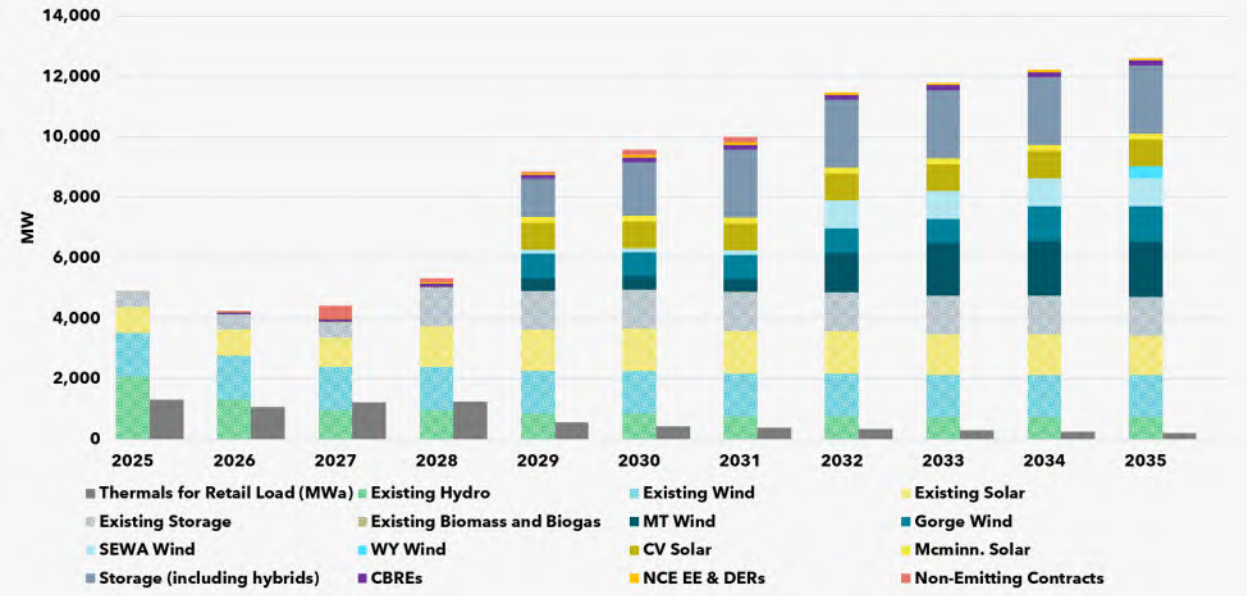


Figure 8 shows the Preferred Portfolio incremental resource additions through 2030 along with changes to PGE's existing portfolio of resources for a view of total generating capacity. The capacity of existing thermals shown in **Figure 8** does not reflect emissions target-driven reductions in emitting energy retained for retail load. After accounting for changes (reductions) to the existing mix, total capacity in the portfolio grows by roughly 1.5x in these five years to add sufficient capacity to maintain resource adequacy in light of forecasted load growth with a focus on clean energy to also meet the 2030 HB 2021 emissions target. Most of these resources are added in the model in 2029, as shown in **Figure 7** and **Table 1**, though external factors such as transmission access and RFP procurement processes and associated timelines continue to be significant factors impacting the economics and timing of actual changes to PGE's system.

Figure 8. Total resource changes from 2025 to 2030

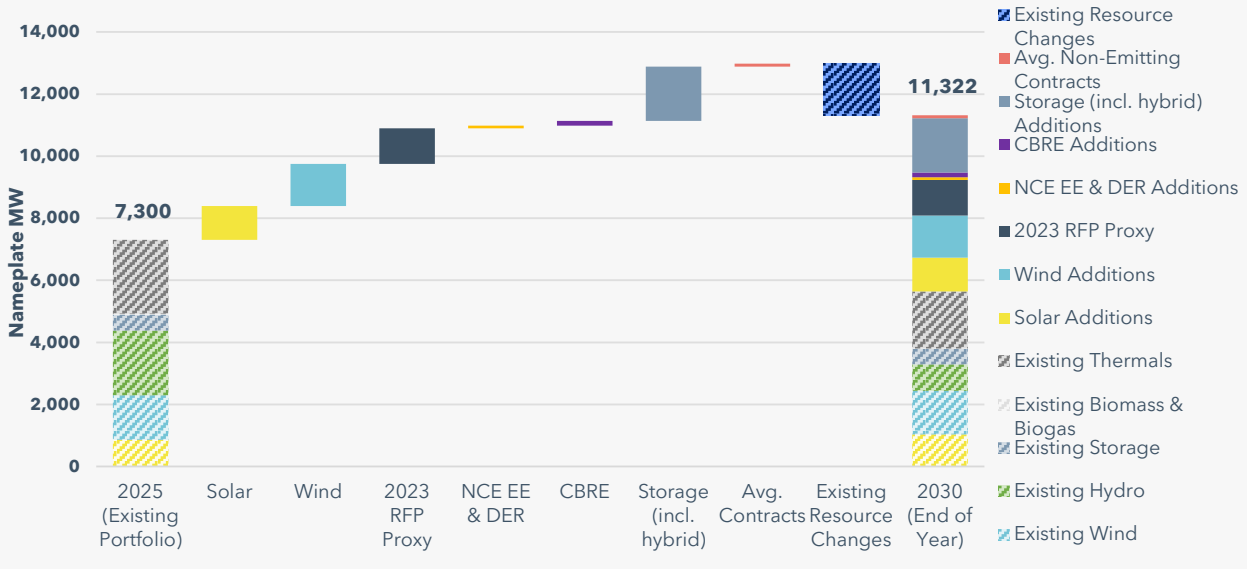

Table 1 provides a summary of total resource actions from 2025 through 2030 as cumulative buildout within this timeframe. The analysis demonstrates the ability to meet the 2030 target using resources that are currently known and have been commercially available. Between now and 2030, PGE's thermal fleet is assumed to dispatch economically, as it does presently, to meet resource adequacy and cost-minimization for PGE's customers and the region.

Table 1. Cumulative resource buildout of the Preferred Portfolio 2026-2030 (MW)

Resource	2026	2027	2028	2029	2030
Wind	0	0	0	1362	1362
Solar (including hybrids)	0	0	0	1089	1089
Storage (including hybrids)	0	0	0	1250	1750
CBREs	66	85	110	133	155
NCE EE (MWa)	0	21	38	58	68
NCE DERs	3	8	12	13	15
Transmission	0	0	0	0	0
Non-Emitting Contracts	16	422	120	33	190
Cost-effective EE (MWa)	104	138	173	208	245
Cost-effective DR	142	172	199	225	248
2023 RFP Proxy Solar (incl. hybrids)	0	0	375	375	375
2023 RFP Proxy Storage (incl. hybrids)	0	0	775	775	775

As PGE adds non-emitting energy and capacity resources, it anticipates systematically reducing the amount of thermal output from natural gas and coal for Oregon retail load to meet emissions targets (see **Figure 27**).

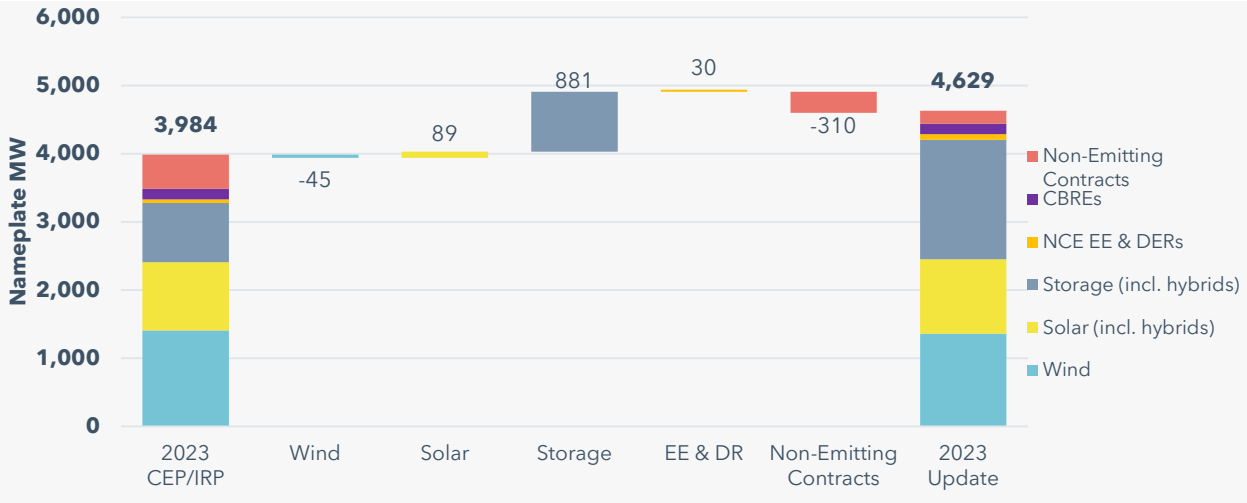
The market for thermal generation is increasingly constrained across the West, with clean energy or GHG requirements in place in almost every state in the Western Interconnect. Thermal generation sold into the Western Interconnect may be subject to the GHG or clean energy requirements of other states. For example, fossil fuel energy exported to California and Washington incurs direct carbon pricing obligations. Public policies such as these, and the massive buildout of non-emitting resources anticipated across the region, lowers economically dispatched thermal output in forward modeling post-2030.

Two key planning needs become apparent when looking beyond 2030 to the 90 percent emissions reduction requirement in 2035 and the zero-emission requirement by 2040. First, there is a need for additional dispatchable non-emitting resources to be developed and available to us in the region to meet resource adequacy needs. In this analysis, the model leverages transmission to access proxy non-emitting resources from around the West to meet reliability needs that increase after 2030 (see **Table 30**). Second, part of the capacity needs leading into 2040 could potentially be offset by existing thermal plants if they were to transition to non-emitting fuels or carbon capture by 2040. It is possible that if supplies become commercially available sooner, PGE's thermal fleet could combust hydrogen or an alternative low-carbon fuel sooner. Almost all of PGE's existing thermal fleet is capable of combusting a blend of hydrogen or renewable natural gas. Informed by least-cost and least-risk planning, the current Preferred Portfolio relies on new non-emitting resources rather than changes at existing thermal plants to reduce emissions.

As described in **Chapter 6 Resource plan**, IRP portfolio analysis determines the best combinations of resource technologies and quantities to meet energy and capacity needs under different scenarios. This informs the creation of the Preferred Portfolio, the company's Action Plan, and a path to HB 2021 emissions targets. The insights gleaned from the construction and comparison of different portfolios informed the creation of PGE's Preferred Portfolio and a balanced path to HB 2021 emissions targets, specifically finding that:

- On a planning basis, system costs are likely to increase in order to reliably meet load growth as well as to comply with HB 2021.
- External factors such as federal policy changes, transmission access, and RFP procurement processes and associated timelines continue to be significant factors impacting the economics and timing of non-emitting resource additions to PGE's system.
- Regional coordination is important for managing costs, as indicated by the portfolio sensitivity analyses focused on resource adequacy and non-emitting market purchases.

PGE's 2023 CEP/IRP Action Plan remains robust, and therefore, PGE is not requesting modifications or seeking acknowledgment of this Update. Updated analysis described throughout this report suggests resource need has increased, driven mainly by growing demand and the need to maintain resource adequacy. The Action Plan referenced in **Chapter 7** remains the best set of near-term resource options for the company to consider in reliably building towards HB 2021's emissions targets while minimizing costs. With uncertainties in the planning



environment, rapidly changing policy landscape, and results of current and future procurement processes, the Action Plan will be reviewed and refined in the 2026 IRP.

1.4 Progress in the CEP Update

This Update includes a range of model assumption refinements aimed at refreshing PGE's planning analytics and incorporating feedback and staff direction from LC 80 Order 24-096. Some key refinements to analysis include changes to supply-side resource costs and options, electricity price forecast, capacity contribution values, and significant developments in transmission planning.

These changes lead to important implications for resource planning further described in this report. For example, updated resource economic assumptions show significantly higher prices in some years, affecting the evaluation and selection of resources in portfolio analysis. The reduced capacity contribution of storage resources (particularly in winter) highlights a critical planning challenge regarding the interaction between storage and energy resources in a system with growing demand and thus energy deficits. Refinements to transmission options included in modeling now reflect more realistic estimates of project timelines, achievable capacity, and market access benefits. These changes highlight the growing urgency of PGE's transmission needs as the company works toward decarbonization goals while facing anticipated increasing load growth and system constraints. **Figure 9** compares the resource additions in the updated Preferred Portfolio to data presented in the 2023 CEP/IRP for model year 2030. Growing demand and updates to supply-side resource costs are main drivers in the differences of model additions, which is broken out by resource type.

Figure 9. Cumulative resource additions through 2030 in the updated Preferred Portfolio compared to 2023 CEP/IRP

As the forward-looking planning environment evolves, PGE is still able to demonstrate measurable impacts and progress across the same metrics that were presented in the 2023

CEP.[3] PGE will measure progress toward HB 2021 emissions targets in a variety of ways, such as in megawatts of non-emitting resources added to the system, in addition to tons of emissions reductions. Measuring progress with multiple metrics is important for two key reasons. First, emissions reductions are predicated on adding non-emitting resources and capacity to reduce thermal generation and purchases for meeting load and resource adequacy requirements. Second, emissions associated with retail sales reported to ODEQ between now and 2030 will exhibit year-to year variation, due to factors like weather that impacts hydro conditions, renewable capacity and peak loads or other events that the utility could not reasonably forecast or control.

1.4.1 Annual goals

HB 2021 does not explicitly set GHG limits for years prior to 2030. ORS 469A.415 (4)(e) states that electric utilities, like PGE, must demonstrate continual progress towards meeting clean energy targets in a Clean Energy Plan (CEP). HB 2021 did not define progress as actual annual emissions reductions. PGE interprets this progress as planned actions to gradually replace fossil fuel resources with non-emitting ones, aiming to meet the 2030, 2035, and 2040 emissions targets. Concurrently with the IRP Action Plan, PGE's decarbonization strategy is multi-faceted to support reliable and affordable power through clean energy procurement, customer-sited solutions, technology and innovation, and regional solutions to resource adequacy.

Since the 2023 CEP/IRP, PGE has continued to make progress in acquiring clean energy resources and investing in advanced grid technologies and customer programs to reduce reliance on fossil fuels and meet future emissions targets.

On customer programs, 122 MWa have been saved from energy efficiency measures since 2021. Demand response capacity totaled 105 MW in 2024. Customer actions reduced record load by more than 90 MW at the hottest time of the day during an August 2023 heat wave, avoiding outages and increasingly volatile power market purchases during extreme weather events. PGE is executing on plans to shift up to 25 percent of peak energy demand through resources including distributed resources and customer programs coordinated through the virtual power plant. Additionally, customer-sited rooftop solar additions increased in 2023 and 2024.

Importantly, PGE is conducting a request for offers (RFO) for CBRE resources, informed by engagement with and input from community representatives, PGE's CBIAG, potential bidders, and Oregon Public Utility Commission (OPUC) Staff. Since CBRE is a new type of resource acquisition, PGE has been providing information and exploring appropriate regulatory treatment through regular updates to OPUC Staff. The RFO is open through November, with three rounds of evaluation. More details and results anticipated in 2026.

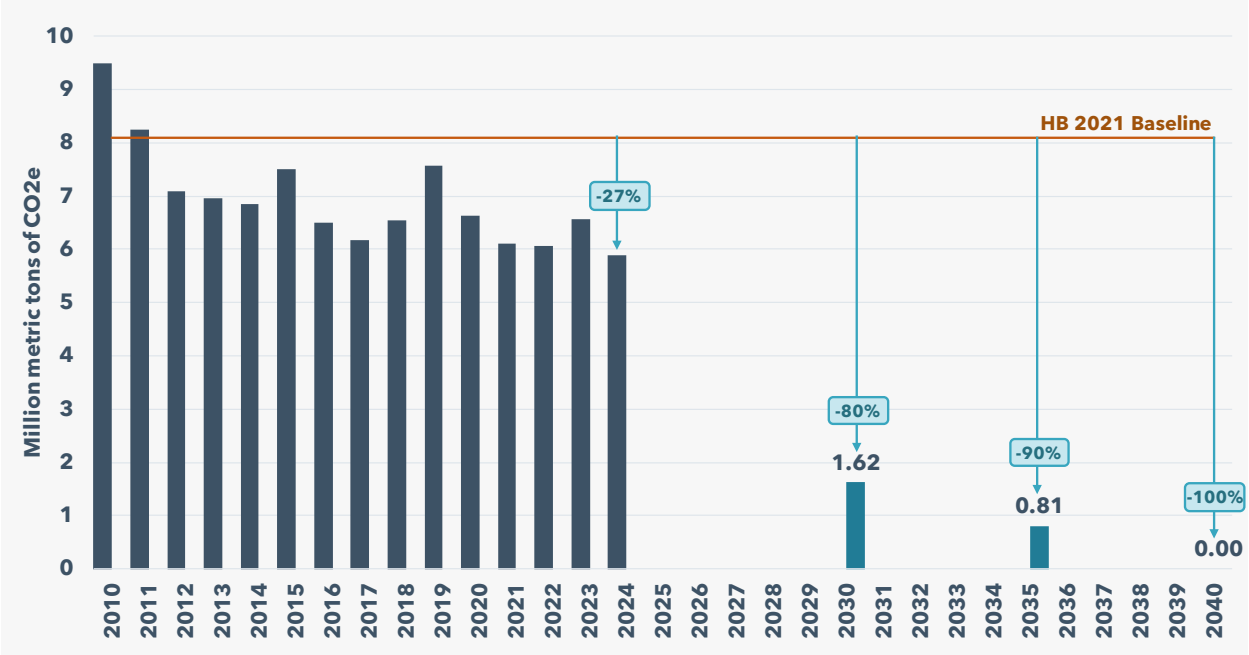
PGE has also expanded utility-scale clean energy and capacity resources. In part due to the 2021 RFP, PGE expanded the resource and geographic diversity of the non-emitting resource portfolio

[3] In the Matter of Public Utility Commission of Oregon, House Bill 2021 Investigation into Clean Energy Plans, Docket No. UM 2225, Order No. 22-390 (Oct 25, 2022), Attachment #1 at Topic #8, available at https://apps.puc.state.or.us/orders/2022ords/22-390.pdf.

when the 311 MW Clearwater Wind facility in Montana began generating test energy in 2023, coming fully online in early 2024. PGE procured 492 MW of new battery storage in 2024, the largest acquisition by a utility outside of California, including the 75 MW Constable Battery Energy Storage System. PGE also executed, renewed and extended three cooperative agreements for hydropower from regional public utility districts, included here as part of the baseline portfolio. In November 2024, the OPUC acknowledged the shortlist of projects from a 2023 RFP that was filed shortly after the 2023 CEP.[4] PGE ranked the final shortlist of up to 1,600 MWs of renewable energy into two groups, prioritized based on performance in the scoring evaluation, representing the optimal intersection of value to customers at least-cost and least-risk. A follow-on RFP has been initiated in 2025 to continue to address needs.

PGE continues to investigate transmission actions, a critical need to meet growing demand, maintain system reliability, and further support decarbonization while balancing costs and risks. In late 2023, PGE and the Confederated Tribes of Warm Springs (CTWS) received a $250 million grant from the U.S. Department of Energy (DOE) to enhance the Bethel-Round Butte line and support imported power. PGE broadly continues to leverage federal, state, and local funds to support clean energy and efficiency initiatives. For example, PGE is currently working with the City of Portland and $40,000 in grant funding for installing electric vehicle chargers. Other avenues to help lower costs and increase system reliability are also moving forward. In 2024, PGE announced its intent to join the California Independent System Operator's (CAISO) Extended Day-Ahead Market (EDAM), expected to begin operations in 2026. Participation will provide access to more clean energy resources from across the West.

PGE's 2024 Environmental, Social and Governance Report shares further information about the company's commitment to sustainability along with information about strategic projects that illustrate progress in advancing a sustainable future and commitment to the community. To read the full 2024 Report, "Advancing Toward a Clean Energy Future," visit www.portlandgeneral.com/sustainability.



To examine the optimal progress toward the 2030 emissions target in portfolio analysis, PGE analyzed various GHG glidepaths in the 2023 CEP/IRP. Ultimately, the Preferred Portfolio that informed the Action Plan was constructed in a way that minimized the costs and risk of new resource acquisitions and maximized the provision of community benefits by thoroughly investigating key decision points with the potential to impact costs. This included selecting a linear GHG-emissions reduction pathway that met HB 2021 requirements while mitigating costs relative to more aggressive pathways and reducing risks compared to less-aggressive pathways. Choices that minimize cost or risk were also made regarding additional DERs, the inclusion of CBRE resources and opportunities to expand transmission availability. For more information, see Chapter 11 Portfolio analysis in the 2023 CEP/IRP.

[4] In the Matter of Public Utility Commission of Oregon, PGE Request for Waiver of 2023 RFP Process, Docket No. UM 2274, Order No. 24-425 (Nov 25, 2024), available at https://apps.puc.state.or.us/orders/2024ords/24-425.pdf.

1.4.2 GHG emissions

GHG emissions from generation and power purchases fluctuate year to year, often due to variations in economic conditions, temperature, wind/solar conditions, water conditions and other external factors. For example, higher-than-expected temperatures can increase the need for mechanical cooling (air conditioning), which increases demand and the emissions associated with serving that retail electrical load.[5] Water conditions can change hydroelectric power availability, with low water years, such as 2023, increasing reliance on GHG emitting generation. An increase or decrease in macroeconomic activity can alter energy demand and the emissions associated with serving retail load. **Figure 10** demonstrates the variability of year-to-year reported emissions, with a declining trend from 2010 through 2024.

Figure 10. Historical emissions for Oregon retail load service and HB 2021 targets

Due to these annual GHG variations, the OPUC has stated that utilities should "achieve the 2030 and 2035 clean energy targets under typical or expected weather and hydro conditions…".[6] This implies that emissions may be higher or lower than the targets due to variability, but under average conditions meet the targets.

The IRP assumes future load growth after cost-effective energy efficiency and distributed energy resources (DERs) are acquired and incorporated into PGE's system. Therefore, emissions reductions occur due to non-emitting resource procurement displacing coal or gas generation

[5] Since non-emitting resources dispatch first, an increase in load above the expected basis would likely be met by gas, coal or market purchases.

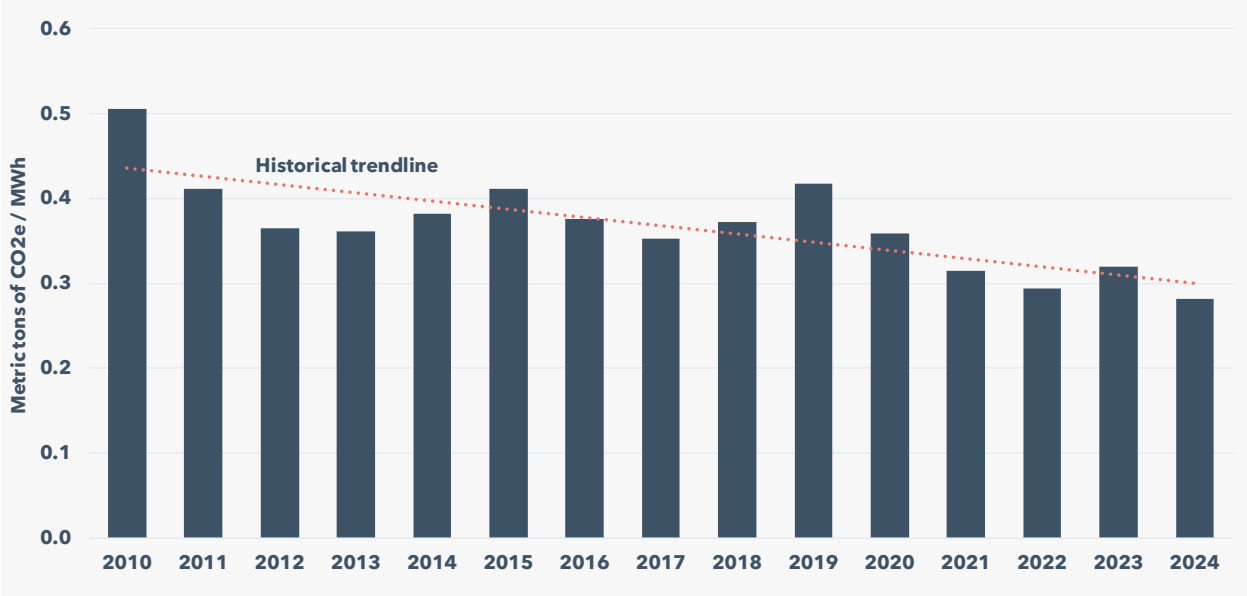
[6] In the Matter of Public Utility Commission of Oregon, House Bill 2021 Investigation into Clean Energy Plans, Docket No. UM 2225, Order No. 22-446 (Nov 14, 2022), Appendix A at 31, available at https://apps.puc.state.or.us/orders/2022ords/22-446.pdf.

(as opposed to reductions from net demand reduction). In actual reporting, the non-linear historical GHG decline seen in **Figure 10** is due to various factors, including but not limited to:

- Weather variations: for example, the same power system will produce different emission levels in a mild temperature year vs. an extreme temperature year, such as 2023.
- Procurement timelines: GHG emissions decline when PGE acquires additional non-emitting energy. These acquisitions will occur in blocks and may lead to staircase-like GHG reductions over time. However, while each portion of resource procurement may lead to a 'blocky' reduction of GHG emissions, from a portfolio perspective, balancing regulatory, operational, financial and resource procurement risks points to the advantages of continual acquisition of non-emitting resources over time. Achieving continual emissions reductions will necessitate procurement of non-emitting resources throughout the decade, which is likely to provide the best opportunity to add resources that offer an optimal combination of geographic location, resource characteristics, technological advancements and access to needed transmission rights.
- Unexpected economic conditions impacting loads: higher or lower than expected load may impact GHG emissions. Higher loads could arrive from faster-than-expected industrial growth (potentially from large data centers) and/or faster-than-expected electrification.

ORS 469A.420(4)(a) requires PGE to provide the OPUC with its two most recent annual emissions reports that have been filed with the Oregon Department of Environmental Quality (ODEQ) reflecting emissions associated with retail sales. Information from these reports for years 2022 and 2023 as well as reports going back to 2010 is available on ODEQ's website[7] and is shown in **Figure 10**. At the close of 2022, PGE disclosed emissions of 6.0 million metric tons of CO_2e, a 25 percent reduction in baseline emissions from power served to Oregon retail customers. Emissions associated with power served to Oregon retail customers in 2023 equated to approximately 6.6 million metric tons of CO_2e. This is an increase from the amount reported in 2022, largely driven by the low hydropower and wind output seen throughout the region and in PGE's service territory. Throughout 2023, PGE reduced emissions from unspecified sources, which represented roughly 17 percent of the retail resource mix in 2023, compared to 21 percent in 2022. Data for 2024 show further emissions decreases to 5.9 million metric tons of CO_2e.

For the CEP Update, PGE is required to compare any GHG emissions reports filed with ODEQ since the CEP with the emissions forecast in the CEP.[8] Reported emissions for 2023 and 2024 are roughly 11 percent higher than those forecasted for retail sales for those same years in the 2023 CEP/IRP. The retail sales emissions forecast for planning assumes average conditions. As described above, actual weather and temperature conditions for these years were considered to



[7] ODEQ, Greenhouse Gas Emissions Reported to DEQ, available at: https://www.oregon.gov/deq/ghgp/Pages/GHG-Emissions.aspx.
[8] In the Matter of Public Utility Commission of Oregon, House Bill 2021 Investigation into Clean Energy Plans, Docket No. UM 2225, Order No. 22-390 (Oct 25, 2022), Attachment #1 at Topic #8, available at https://apps.puc.state.or.us/orders/2022ords/22-390.pdf.

be above average, resulting in greater reliance on emitting resources than was forecast. Relatedly, HB 2021 does not explicitly set GHG limits for years other than the target years of 2030, 2035 and 2040. ORS 469A.415 (4)(e) states that electric utilities, like PGE, must demonstrate continual progress towards meeting clean energy targets in a CEP. HB 2021 did not define progress as actual annual emissions reductions. However, PGE has been making progress toward decarbonization and 2024 emissions are 27 percent below HB 2021's 2010-2012 average baseline level of emissions.

1.4.3 GHG emissions intensity

Because of the correlation between retail load and emissions, GHG emissions intensity, defined as metric tons of CO_2e per megawatt hour (MWh), is a useful decarbonization metric as it normalizes changes in load to better account for the resource mix that is serving that load. **Figure 11** shows PGE's Oregon retail GHG intensity from year 2010 through 2024. In 2024, PGE made strong progress toward advancing a resource mix that is increasingly clean, resulting in a decline in the carbon intensity of the retail power supply despite anticipated load growth. While GHG intensity provides useful information, HB 2021 requires an absolute reduction in utility GHG emissions, not a decrease in GHG intensity.

Figure 11. Historical GHG intensity for Oregon retail load service

1.4.4 Average electric rates for Oregon customers

HB 2021 does not set requirements relating to electricity rates nor does PGE present information on rates in the CEP or IRP due to the disconnect from this forward-looking planning document from actual rates, which are based on real investment decisions. Some $/MWh prices aligning with total costs represented in the IRP are included in **Section 6.2.1 Yearly cost estimates**. These yearly price impacts do not represent actual customer rates as they only focus on planned

generation and transmission expansion cost changes and do not incorporate any other cost changes across PGE. The metric can still be indicative for evaluating options to decarbonize.

1.4.5 Community impacts and benefits

PGE has supported Oregon communities with reliable, affordable and safe power for over 130 years. While many things have changed over that time, PGE's core responsibility to power Oregon homes and businesses has not. It has become increasingly apparent that climate change poses significant risks to the electric sector across all regions of the country. Extreme weather and natural disasters threaten utility infrastructure, contribute to energy market volatility and render the balancing of energy supply and demand more challenging. Climate change has been witnessed first-hand at PGE in the form of record-breaking winter and summer energy peaks, damaging and disruptive storms, and increasing wildfire risk.

PGE's commitment to equity is important across all areas of the business, but especially when it comes to the disproportionate impacts of climate change on vulnerable communities. PGE aims to decarbonize the system in ways that can benefit communities disproportionately impacted by climate change, as required by HB 2021. In the 2023 CEP/IRP, Chapter 7 (Community benefits indicators (CBIs) and community-based renewable energy) described efforts to apply an equity lens to resource and decarbonization planning. Chapter 14 Community equity lens described efforts throughout PGE's planning process to create an inclusive process in which all communities served can participate and be heard.

For the 2023 CEP/IRP, PGE conducted a CBRE potential study and incorporated the results into portfolio analysis to assess the contributions of these resources toward meeting the system requirements and providing community benefits.[9] CBRE resource potential and associated CBIs are included in portfolio analysis to understand the implications that their relative costs, system benefits and CBIs have on various metrics considered within the planning framework and across various portfolio options. In 2024, PGE engaged Resource Innovations (formerly Cadeo) to conduct research into CBIs. Based on this research and stakeholder feedback, PGE refined its approach to how CBIs are considered in analysis as well as expanded the list of CBIs which is further discussed in **Section 5.5 Community benefits indicators (CBIs)**.

Integration of CBIs provides an opportunity for PGE to extend resource planning to include the values and priorities of the communities PGE serves. CBIs have evolved into an analytical framework for addressing resilience, equity, environmental impact, public health, and economic development, ensuring that resource planning considers benefits that are tangible, measurable, and equitable.

By analyzing CBIs within the IRP, PGE can account for community benefits in quantifiable ways to inform resource portfolio decisions. Proxy metrics are used for CBIs that are difficult to quantify, monetize, or lack sufficient data. Outside the IRP analysis, informational CBIs provide a critical

[9] Incorporating CBIs and CBREs into PGE's overall portfolio planning process was described in the 2023 CEP/IRP Chapter 11, Portfolio analysis. The approach to CBI development, including informational CBIs not included in IRP portfolio analysis, was described in Section 7.1, Community benefits indicators.

mechanism for establishing baselines and tracking progress toward achievement of other CBIs based on program delivery and performance.

The challenges identified—including data gaps, proxy metric limitations, and diverse stakeholder priorities—highlight the need for continued research, collaboration, and refinement. Through expanded and continued stakeholder engagement, localized data development, and the adoption of advanced methodologies, PGE is well-positioned to continue to address these challenges and further enhance the impact of CBIs.

1.5 High-level opportunities, potential barriers, critical dependencies

PGE's critical barriers to long-term decarbonization efforts are the same as those faced throughout the industry and global economy. Major barriers include the pace of development for commercially available non-emitting generation technologies, the availability of transmission to access renewable resources, affordability constraints, supply chain disruptions, and permitting and regional interconnection limitations. Solutions will depend on regional cooperation between utilities and jurisdictions, federal policy and financial support.

Current uncertainties in the future of federal policies, tariffs, and supportive tax incentives for renewable energy will meaningfully impact the affordability of PGE's clean energy transition. Further, tariffs on imported goods can impact materials supply chains, slowing timelines and increasing costs of new clean resource buildout. There is much uncertainty about the anticipated cost impacts of final tariffs on solar and energy storage components imported into the United States, but it is likely that the cost of power and energy storage will rise. Procurement delays, supply chain constraints, increased uncertainties in available transmission inventory, siting challenges and operational risks associated with adding large quantities of resources in a short period of time can also delay PGE's timeline.

PGE faces additional procurement challenges related to unresolved exposure to wildfire risk. To achieve the resource procurement targets related to HB 2021, and our customer's reliability needs, PGE must procure multiple gigawatts of new clean resources. The capital investments necessary to construct and commission such resources are significant. Wildfire risk is growing in Oregon, threatening the safety of the communities we serve, as well as utility assets and the overall financial health of the utility. This risk is reflected in higher capital costs, which drive up the costs of clean energy projects. While PGE anticipates working with Independent Power Producers under multiple commercial structures (e.g., Power Purchase Agreements), PGE will likely face barriers to secure low-cost contracts given the perceived risk of utility financial losses related to wildfire. This challenge is not easily resolved; despite successfully accomplishing robust wildfire mitigation that protects human safety, business partners are forced to increase prices to recognize the unresolved financial exposure that PGE presents as counterparty.

Any significant change in statutes, rules or guidelines that would require PGE to alter its strategy or restrict optionality in the pursuit of non-emitting resources could delay emissions reductions or threaten reliability and affordability for customers. Relatedly, load growth forecasts continue to increase, further impacting PGE's ability to swiftly decarbonize given existing technologies, costs, and the imperative to maintain a reliably system.

PGE will be ready to continue to adapt strategies accordingly and will continue to engage regulators, stakeholders, and communities in the next full CEP/IRP. This engagement will be in part informed by forthcoming Commission direction in UM 2273 on the planning requirements relating to HB 2021's cost cap provisions. Moreover, in light of many changes to the federal policy landscape, the broader macroeconomic environment, Oregon's economy, and unanticipated load growth that is outpacing the integration of renewables and storage technologies, it is likely that policy makers and stakeholder will initiate discussions soon on the appropriateness of Oregon's clean energy policies and whether changes or additional supports are necessary. There will be critical junctures on the way to 2030, 2035 and 2040 emissions targets that may require material changes in decarbonization pathways analyses. Resource needs for reliability and the pace of acquisition of non-emitting energy and capacity will be tracked closely and if PGE has concerns around maintaining reliable operations or if there are delays beyond the utility's control, adjustments to the implementation approach will be needed to overcome timeline, affordability, reliability, or other constraints. At the same time, if new technologies or transmission options on- and off-system do not materialize, PGE will likely not be able to access the diverse resources the system needs to decarbonize and maintain reliability. Successful solutions depend on regional coordination and cooperation, as well as on federal, state, or local tax credits and other support for siting and permitting resources and evolving grid strategies.

To execute on a long-term plan, the quantities of non-emitting resources estimated to be available on the market need to be actualized as well as cost-effective. New transmission is needed to gain access to off-system resources or reliability of the system is at risk. Nearer the 2040 target and an absolute zero emissions requirement, new technologies that can replicate thermal generation dispatchable capacity, such as advanced nuclear, hydrogen or carbon capture and storage will be needed across the region to support decarbonization and resource adequacy.

1.6 Acknowledged Actions, Order requirements and other updates

Along with the CEP updates provided in **Section 1.4**, the Update addresses Actions and Requirements that were stipulated in the OPUC's Acknowledgement Order, Order 24-096.[10] This section provides a summary of how the Actions and Requirements were addressed and where that information can be found in this Update. The information and analysis that has been updated from the 2023 CEP/IRP is also summarized as well as those which remain unchanged in this filing.

Table 2 provides a summary of the Actions and Requirements and the location where additional details can be found.

[10] In the Matter of Public Utility Commission of Oregon, PGE 2023 CEP and IRP, Docket No. LC 80, Order No. 24-096 (Apr 18, 2024), pp.18-22 and Appendix A, Attachment 1, pp.26-27, available at https://apps.puc.state.or.us/orders/2024ords/24-096.pdf.

Table 2. Actions and Requirements crosswalk

Action/Requirement	Applicable Section(s)
A. Conditions and Direction Related to PGE's Action Plan	
Staff Recommendation 1: CBRE Actions	Acquisition of CBREs is discussed in **Section 7.1.2.** Additional information regarding PGE's CBRE activities is available on PGE's website at: https://portlandgeneral.com/about/who-we-are/resource-planning/cbre-procuring-clean-energy
Staff Recommendation 2: Energy/Capacity Actions – Long lead-time resource RFI …before issuing its next utility-scale RFP, PGE file a proposal to develop a long lead-time resource RFI… facilitate a workshop on the RFI findings, and allow sufficient time for stakeholder review of its RFI before proposing its next steps.	PGE's RFI results are discussed in **Section 5.6**; findings from the RFI were presented at a Roundtable: https://assets.ctfassets.net/416ywc1laqmd/2GF5BwVt9cR1MXtEpn6fli/e719ec6879183abd984928db360fe410/RFI_slides_jdg_web_1197.pdf
Staff Recommendation 3: • PGE shall conduct hourly production cost simulation of its preferred portfolio under the Reference Case in a manner that separately tracks hourly purchases and hourly sales. PGE will use this analysis to revise its GHG emissions forecast and to revise its submission to DEQ. • PGE shall update the Preferred Portfolio accordingly and provide a brief narrative explanation of the key planning insights derived from this exercise.	**Appendix D** outlines the steps that PGE has taken to update its GHG emissions forecasting to incorporate hourly analysis of its energy and emissions accounting. **Section 6.2.2** discusses hourly energy and emissions accounting results. PGE resubmitted the forecast for DEQ review in June 2025 prior to the filing date for this Update.
Transmission Analysis and Alternatives …we require a more complete analysis of the need and evaluation of the full range of available transmission solutions than was provided here, including non-wires alternatives when appropriate. PGE will need to present a risk-informed, cost-benefit analysis of all available transmission solutions for the 2030 time frame, including factors such as the associated timeline and cost risks, anticipated rate impacts, and the presence of longer-term or broader regional benefits.	**Sections 4.5 and 4.6** discusses transmission options for Portfolio Analysis.
B. Direction for Future Planning	

Action/Requirement	Applicable Section(s)
Staff Recommendation 4: Customer Actions and Guidance for Avoided Cost Update …direct PGE to work with Staff to propose a new method for calculating avoided costs in docket UM 1893… we direct PGE to collaborate with Staff and ETO to modernize the approach to long-term energy efficiency planning to use the best currently available information on energy efficiency and technical potential in future IRP and CEP updates.	PGE actively participated in the UM 1893 docket. PGE delivered this presentation on Redeveloping Avoided Costs for Energy Efficiency https://edocs.puc.state.or.us/efdocs/HAH/um1893hah329014025.pdf The Order adopting energy efficiency avoided cost data for use by Energy Trust is available here https://apps.puc.state.or.us/orders/2025ords/25-017.pdf Discussion of updates to the IRP price forecast as it relates to the UM 1893 docket is included in **Section 5.1.4**.
Staff Recommendation 5: Direct PGE in the next CEP/IRP Update to include an SSR compliance assessment. The SSR analysis should state the projected SSR compliance position broken out by relevant resource types and outline the actions the Company plans to take to fill any identified SSR shortfalls.	PGE's Small Scale Renewables Plan is discussed in **Section 6.4**.
Staff Recommendation 6 - Improved Engagement: …direct PGE to collaborate with Staff, stakeholders, peer utilities, and the CBIAGs in a dedicated collaborative to develop clear, actionable improvements to community and stakeholder engagement in subsequent CEP/IRPs.	PGE provided an update on improvements to community and stakeholder engagement in subsequent IRPs and CEPs here https://edocs.puc.state.or.us/efdocs/HAD/lc80had335791056.pdf
Staff Recommendation 7 – CBI by Next Update: …PGE must demonstrate development of CBIs … we expect that some set of informational-only metrics be developed in time to be included with PGE's next RFP. If PGE cannot develop such metrics by its next CEP/IRP update, PGE must provide a detailed explanation of the barriers and constraints, along with a proposal for how and when PGE and its community stakeholders will be able to address them.	PGE has advanced the integration of CBIs into resource planning processes. Development, refinement, and application of CBIs is discussed in **Section 5.5**.
Staff Recommendation 8 – Report on Federal Incentives with Next Update: PGE should provide as much visibility into future opportunities as possible.	**Appendix A** provides an update on PGE's federal grant funding.

Action/Requirement	Applicable Section(s)
Staff Recommendation 9 - QF Renewals and Success Rates: …direct PGE to recalculate its IRP inputs using an assumption of 75 percent for QF renewals and the QF success rate for Schedule 202 projects. However, we read this narrowly and clarify that the avoided cost pricing inputs are not material to the IRP itself, but to the avoided cost price filing. We stress that the pricing inputs must be corrected due to their impact on the avoided cost price filing and decline to adopt PGE's recommendation to instead incorporate this change through an update.	**Appendix C** provides updated analysis for QFs.

Table 3 identifies the components of the 2023 CEP/IRP that were updated in this Update.

Table 3. Updated components of the 2023 CEP/IRP

Updated Component	Applicable Section(s)
Market development	**Section 2.2**

Non-emitting energy market (Brattle)	**Appendix F**

PGE's 2023 IRP Update does not revisit or update all analyses contained in the 2023 CEP/IRP. Instead, the 2023 CEP/IRP Update focuses on components that have the most impact on PGE's resource plan. The decision to forego updates in these following areas is driven by prioritization of critical elements that have a more direct impact on PGE's IRP outcomes. **Table 4** lists components that PGE will not be updating along with their corresponding location in the 2023 CEP/IRP.

Table 4. Components of the 2023 CEP/IRP not changed in this Update

2023 CEP/IRP Component	2023 CEP/IRP Location
Flexibility analysis	Section 6.8
Resiliency Chapter	Chapter 13
Tuned ELCCs	Appendix K
Market capacity study	Appendix G
Economics of CBREs	Section 8.3
CBRE Potential	Section 7.2
Utility vs PPA analysis	Section 8.6

Chapter 2. Planning environment

PGE's long-term planning adapts to evolving laws, policies, technological advancements, economic conditions, and climate change impacts. These factors influence resource economics, customer prices, community benefits, and ultimately shape PGE's resource decisions to serve its customers effectively. This chapter explores the broader planning context influencing the overall resource strategy to meet customers' energy needs reliably while keeping prices as low as possible and achieving emissions reduction requirements.

Key Highlights

- Under the new Federal Administration, the EPA is reconsidering the powerplant emission limit final rules established on April 25, 2024, under Section 111 of the Clean Air Act. The details of this and other policy changes at the federal level remain uncertain, though Congress is actively evaluating proposals that would remove federal tax incentives for new non-emitting generation and storage resources. The analysis in this Update mainly contemplates current known final rules, with the exception of sensitivity analyses that exclude tax credits, further described in **Section 6.6 Federal tax credit availability scenarios**.
- PGE has signed an implementation agreement for CAISO's Extended Day-Ahead Market (EDAM) go-live in October 2026.
- PGE is currently developing regional alignment on Resource Adequacy planning standards as a precursor for a regional reliability program.
- The Western Transmission Expansion Coalition's (WestTEC) West-Wide Transmission Study Project represents a new regional effort to address transmission constraints.
- Large industrial customer growth is expected to increase regional electric demand across the Western Interconnection.

Developments Since 2023 IRP

The planning environment has evolved significantly since the 2023 CEP/IRP filing, with changes to federal regulations and policies, progress on market design implementation, and increased focus on regional transmission planning. Additionally, this Update addresses the challenge and opportunity of unprecedented industrial load growth, highlighting PGE's regulatory efforts to ensure appropriate cost allocation for large customer connections.

Strategic Implications

Load growth for industrial customers is expected to significantly increase the quantity of generation, storage and transmission resources required to maintain system reliability and reduce emissions. Change in Oregon ratemaking policy also creates an opportunity to equitably serve large industrial customers while building infrastructure that supports reliability for all customers. Other opportunities to maximize the efficiency of PGE's resource portfolio are advancing through participation in EDAM and regional resource adequacy frameworks. The change in federal administration creates considerable near-term uncertainty regarding tax credit support for clean energy resources.

Staff Recommendations Incorporated

This section addresses Staff Recommendation 8 referenced in LC 80 Order No. 24-096, which directs PGE to include a report on federal incentive implementation and its key impact on the company's Action Plan.[11]

2.1 EPA powerplant rules

When planning for PGE's customer needs, PGE must monitor trends that impact the Western Interconnect of the North American power system. One important trend relates to federal policy and regulations imposing compliance requirements on thermal generation resources. For example, on April 8, 2025, President Trump granted a two-year compliance exemption for various affected facilities subject to the Mercury and Air Toxics Standards, including the Colstrip facility in Montana for which PGE has partial ownership. Pursuant to section 112 of the Clean Air Act, these rules set emissions limits for filterable particulate matter for coal-based generating units.

The implementation of these and other rules is undergoing significant challenges under the current Administration and is being targeted for reconsideration by the United States Environmental Protection Agency (EPA). Additionally, several states and industry groups have filed lawsuits against them in federal court. These challenges and agency reconsideration actions will take time, and the outcomes remain uncertain. PGE will continue to evaluate EPA rules to assess the impact they may have on PGE resource plans.

2.2 Market development

Regional market integration offers PGE and other western utilities opportunities to lower costs, enhance reliability, and integrate diverse resources through the efficient use of existing resources. To maximize the use of existing transmission infrastructure and benefit from least cost resources available in a regional energy market, PGE has elected to participate in CAISO's EDAM. As a separate effort to address regional resource adequacy challenges, PGE has

[11] OPUC. Acknowledgement of 2023 Integrated Resource Plan and Clean Energy Plan. Docket No. LC 80, December 14, 2023. Retrieved from https://edocs.puc.state.or.us/efdocs/HAU/lc80hau325590032.pdf.

engaged in the Western Resource Adequacy Program (WRAP), led by the Western Power Pool (WPP). The WRAP has established a region-wide approach for assessing and addressing resource adequacy with future opportunities for providing operating efficiencies, diversity, and sharing of pooled resources.

The combination of a regional resource adequacy program such as WRAP, which will facilitate capacity adequacy for each participant, and EDAM, which will enable the most efficient economic dispatch of all resources to meet load, is expected to support delivery of reliable power at the lowest possible cost for customers.

2.2.1 CAISO's Extended Day Ahead Market

PGE currently participates in the Western Energy Imbalance Market (WEIM) for dispatch optimization inside the hour, which is operated by the CAISO and supports over 80 percent of the load in the Western Interconnection. The WEIM lowers energy costs for customers, enhances reliability through wide area visibility and integrated generation dispatch, and supports renewable resource integration. The WEIM has proven to be a critical tool for maintaining reliability during extreme weather events, brining energy from areas of surplus to those experiencing peak events. Since joining the WEIM in 2017, PGE has supported the development of regional solutions that enhance reliability, promote clean energy, and incrementally advance western markets to lower costs for customers.[12]

Based on PGE's day-ahead market comparative analysis, PGE selected EDAM as the preferred market choice to maximize the benefits of a day-ahead market for PGE's customers. The benefits of participation are outlined in an informational filing titled Comparative Analysis of CAISO's EDAM and SPP's Markets.[13] In addition, PGE has identified a review of markets access assumptions to determine the impact of EDAM on the expansion in market capacity as an item for review in the 2026 CEP/IRP. On July 2, 2024, PGE signed an implementation agreement with CAISO for participation in EDAM with market go-live in October 2026. This day-ahead market complements PGE's participation in the current bi-lateral market, in which PGE already operates. PGE considers dual participation to be necessary until there is greater market participation in EDAM across Western Electricity Coordinating Council (WECC) market participants. Additionally, on April 3, 2025, PGE filed revisions to its Open Access Transmission Tariff (OATT) for EDAM participation with the Federal Energy Regulatory Commission (FERC).[14]

EDAM leverages CAISO's existing day-ahead market, cost efficiently building on the successful WEIM platform. EDAM offers a cost-effective, incremental option that builds upon the successes

[12] For example, PGE has chaired the WEIM Regional Issues Forum, and is co-chair of the West-wide Governance Pathways Initiative.
[13] Portland General Electric. (2024, March 21). Comparative analysis of the CAISO's EDAM and the SPP's markets: PGE informational filing on commitment to the California Independent System Operator's extended day-ahead market (OPUC Docket No. LC 80). Oregon Public Utility Commission. https://edocs.puc.state.or.us/efdocs/HAH/lc80hah327479040.pdf
[14]Federal Energy Regulatory Commission. (2025, April 3). Portland General Electric Company submits tariff filing per 35.13(a)(2)(iii): Revisions to Portland General Elec. OATT to implement EDAM to be effective 6/2/2025 (ER25-1868) [Filing Type: 10; Document Accession No. 20250403-5095]. https://elibrary.ferc.gov/eLibrary/filelist?accession_number=20250403-5095

and proven economic benefits of WEIM, while maximizing the value of PGE's existing investments in market software and communication systems to join the only currently operating day-ahead market in the West. With over 50 percent of the load in the western interconnection current committed to or leaning towards EDAM, the market offers a contiguous transmission footprint with significant resource diversity and transfer capacity. This contiguous footprint allows the EDAM to better optimize the diverse resources, including wind, solar, hydro, and thermal resources. The EDAM offers a robust platform for continued market evolution for PGE.

EDAM optimizes all supply and demand across the market footprint while respecting transmission limitations to produce optimized day-ahead schedules. All generation and load within a participating EDAM Balancing Authority Area (BAA) must either economically bid or self-schedule in the market. These transactions are then re-optimized in the existing WEIM sub-hourly 15- and 5-minute markets. EDAM requires participants to demonstrate sufficient energy, capacity, flexibility, and transmission on a day-ahead basis, consistent with forecasted demand.

The EDAM transmission framework is designed to maximize transmission availability while respecting the OATT rights and legacy contracts of participants. The transmission availability within the EDAM design seeks to maximize the amount of transmission capability made available to the market across a variety of transmission service arrangements. Prior to the day-ahead market run, each EDAM Entity will identify the firm and conditional firm transmission capacity that can be made available to support reliable transfers. Any additional unsold firm available transfer capability (ATC) will be made available to support transfers between EDAM BAA's. The transmission service provider maintains the responsibility to plan and operate the transmission system within the BAA and administer cost allocation in accordance with the OATT.

EDAM accounts for the costs arising from state GHG accounting and reduction policies that price GHG. CAISO has convened a regional stakeholder process to modify the GHG framework to account for a non-priced GHG-capped state policy. PGE is actively participating in this process with Oregon regulatory agencies to develop an emissions report which may enable GHG attribution for EDAM and WEIM market purchases under HB 2021 reporting requirements.

The benefits of EDAM are expected to grow following the expansion of the market footprint. With an eye to the potential for future expansion, the market is revisiting its governance model. EDAM has adopted a joint authority governance model informed by the regional West-wide Governance Pathways Initiative that includes oversight roles for state commissions through the Body of State Regulators and for stakeholders though the Regional Issues Forum. Notably, the West-wide Governance Pathways Initiative aims to develop and establish a new and independent entity with an independent governance structure capable of overseeing an expansive suite of West-wide wholesale electricity markets and related functions. Senate Bill 540 was recently introduced in the California legislature to enable California investor-owned utility participation in this new regional organization. For more information on the West-wide Governance Pathways Initiative, please visit the Western Interstate Energy Board website.[15]

[15] Western Interstate Energy Board. https://www.westernenergyboard.org/wwgpi/

As PGE moves towards participation in EDAM, several regulatory and procedural milestones are required prior to go-live. The first major step is a tariff filing that is currently pending with FERC[16] PGE will also need to file with FERC for Market-Based Rates (MBR) to ensure that no single market participant has market power. Finally, PGE must demonstrate to FERC that it meets the Readiness Criteria established in the CAISO tariff. Details on these filings and other EDAM implementation milestones can be found on the WEIM website[17]. It is also likely that a tariff update with the OPUC will be required to enable some programs to be adequately represented in EDAM.

For more information on CAISO's EDAM, please visit the CAISO website.[18]

2.2.2 Western Resource Adequacy Program (WRAP)

WRAP is an industry-initiated and led resource adequacy planning standard and compliance framework designed to meet the growing resource adequacy challenge and enhance reliability in the region. On April 16, 2024, in docket AR 660, the OPUC adopted new resource adequacy (RA) rules which mirror the WRAP program requirements in many ways. Participation in the state RA program is mandatory for IOUs and ESSs that do not voluntarily participate in WRAP.

The WRAP is a planning standard and compliance framework that seeks to take advantage of and maximize regional diversity in resources and load to enhance reliability for all customers across the WRAP footprint. The program experienced numerous delays since FERC initially approved the tariff in early 2023. First scheduled to become binding Summer 2025, participants expressed concern in their ability to meet capacity requirements due to supply chain issues and increases in peak-load driven by electrification and data centers. [19,20] In September 2024, a revised transition plan was accepted by the Western Power Pool Board of Directors and the program is now scheduled to be binding beginning Winter 2027-2028. Although the regional RA planning standard established by WRAP will not become binding until Winter 2027-2028 at the earliest, it is a first step towards a common reliability planning standard. As the region moves to align with the WRAP planning standard, PGE continues to explore options to operationalize this planning standard to achieve enhanced reliability through diversity sharing.

In addition to WRAP, in UM 2143, the OPUC adopted Staff recommendation to open a formal rulemaking on resource adequacy. The OPUC then adopted new rules in Docket AR 660 requiring electric companies and electric service suppliers to provide a Binding Forward

[16] Federal Energy Regulatory Commission. (2025). Portland General Electric Company submits tariff filing per 35.13(a)(2)(iii): Revisions to Portland General Elec. OATT to implement EDAM to be effective 6/2/2025 (FERC Docket No. ER25-1868) [Filing Type: 10]. https://elibrary.ferc.gov
[17] California Independent System Operator. (n.d.). Extended Day-Ahead Market Implementation and Onboarding. Western Energy Imbalance Market. Retrieved June 3, 2025, from https://www.westerneim.com/Pages/ExtendedDayAheadMarketImplementation.aspx
[18] California Independent System Operator. Western Energy Markets: Extended Day-Ahead Market (EDAM). CAISO, 2024, https://www.westerneim.com/Pages/ExtendedDayAheadMarket.aspx.
[19] FERC Order Accepting Proposed Tariff re Northwest Power Pool under ER22-2762. Feb. 10, 2023
[20] WRAP Participant Letter, April 24, 2024

Showing consistent with state program requirements.[21] The company believes that the reliability challenges facing PGE and the greater Western region warrant the continued development of State RA rules, especially considering recent delays in the WRAP. The efficiencies presented by the pooling of resources will be an important tool to address PGE's future capacity needs at lowest costs.

As a result of UM 2143 and AR 600, PGE has modified its resource adequacy modeling under the 'State RA Requirements' scenario. This method uses WRAP standards instead of using the PGE resource adequacy method in portfolio analysis. Results of this analysis are presented in **Section 6.3.5 State RA requirements**.

2.2.3 Hydroelectric Contract Availability and Competition

PGE is facing increased competition for existing resources such as Mid-Columbia hydroelectric power and BPA marketed Federal hydroelectric power, driven by rising demand from data centers and growing Public Utility Districts (PUDs) loads. This heightened competition is raising market prices, and as a result, PGE must pay higher contract rates to secure access to carbon-free, dispatchable, and highly flexible resources – ultimately impacting the cost of delivering reliable, clean energy to our customers.

2.3 Transmission coordination

This section describes the Western Transmission Expansion Coalition (WestTEC) effort and how this effort will help PGE pursue cost-effective transmission projects. As of March 2025, the WestTEC effort is in the study phase. Therefore, the information discussed here is the most up-to-date as of finalization of this 2023 CEP/IRP Update.

2.3.1 Western Transmission Expansion Coalition (WestTEC)

The objective of the Western Transmission Expansion Coalition (WestTEC) West-Wide Transmission Study Project (Project) is to produce an actionable 10-year and 20-year transmission study based on transmission portfolios that enhance Western reliability while also considering economic efficiencies and state policy goals.[22]

WestTEC includes collaboration between diverse sectors of the energy industry, states, and tribes. The project will address interregional and interstate transmission needs spanning the Western Interconnection, including the collective footprint of the existing three regional planning organizations for the West (NorthernGrid, the California Independent System Operator, and WestConnect) as well as interties with Canadian Provinces.

The goal of the 10-year and 20-year transmission study is to provide a high quality, high confidence foundation for future transmission build decisions and actions that can be

[21] Oregon Public Utility Commission. (2023, September 22). Order No. 23-340: UM 2143/AR 660 – Staff's recommendation adopted [Docket No. UM 2143; signed by Commissioners Megan Decker, Letha Tawney, and Mark Thompson]. https://apps.puc.state.or.us/orders/2023ords/23-340.pdf

[22] Western Transmission Expansion Coalition. (2024, July 19). Study plan (Draft V4). Western Power Pool. https://www.westernpowerpool.org/private-media/documents/WestTEC_Study_Plan_Draft_V4.pdf

undertaken by the industry. WestTEC uses an independent consultant to focus on identifying interregional and interstate transmission expansion solutions that are based on an assessment of the consolidated and coordinated needs of western utilities, not just a single utility or regional planning organization. Consistent with methodologies identified in FERC Order No. 1920 (**Appendix H.2 FERC Order 1920 process**), WestTEC measures important regional transmission benefits including production cost savings, reduced congestion, and mitigation of extreme weather events.[23] Following the completion of the WestTEC studies, specific transmission solutions will be available for study in the IRP.

The WestTEC 10-year horizon transmission study will be complete in August 2025 and the 20-year horizon transmission study will be complete in September 2026. Given that the first study will not be completed until August 2025, nearer term transmission projects will not go through the Project.

For additional details on scheduled transmission projects, see **Section 4.2 PGE transmission projects.** The transmission options modeled in the 2023 CEP/IRP Update are described in **Section 4.6 Transmission options for portfolio analysis**. The cumulative transmission buildout selected in the Preferred Portfolio is presented in **Section 6.2 Preferred Portfolio**.

2.4 Industrial load growth

This section outlines the general trends in electricity demand, with a particular focus on the Pacific Northwest and the role of large industrial customers, such as data centers and semiconductor producers, in driving this demand as well as the regulatory and policy responses in Oregon.

2.4.1 General trends in electricity demand across the Western Interconnection

While the western interconnection has historically seen modest growth in electricity demand, recent developments signal a period of rapid expansion, particularly in industrial sectors such as technology and manufacturing. Several key factors are contributing to this shift including the transportation electrification, manufacturing, and building electrification. A significant driver of industrial load growth is the expansion of data centers. These facilities provide cloud storage, computing power, and digital infrastructure and require significant electricity to power servers, cool buildings, and maintain continuous operations.

2.4.2 Industrial load growth in the Pacific Northwest

The Pacific Northwest is particularly attractive to large industrial customers due to its cooler climate, which reduces cooling costs, proximity to the Trans-Pacific Submarine Cables that terminate in Hillsboro, and access to abundant renewable energy from hydropower, wind, and solar sources—leading to relatively lower electricity costs. Due to these factors, the region has seen significant recent investment. The Oregon CHIPS Act (SB 4) provides state funding and regulatory support to strengthen Oregon's semiconductor industry by aligning with the federal

[23] FERC Order No. 1920, issued on May 13, 2024 and FERC Order No. 1920-A, issued on November 21, 2024.

CHIPS and Science Act. It streamlines permitting and invests in site development to help Oregon compete for federal semiconductor manufacturing incentives.[24]

Industrial load growth presents substantial opportunity and benefit for PGE's customers. PGE's service of industrial load growth includes infrastructure that supports reliability for all customers. Additional benefits may accrue to all customers should large industrial backup generation or other resources tied to these customers be made available for grid reliability and flexibility. As noted below, PGE is also actively involved on several fronts to ensure that costs to serve the rapid industrial load growth is appropriately allocated to the customers driving the expense.

2.4.3 Regulatory and policy responses to large customer demand growth

The 2025 Legislature enacted House Bill 3546, requiring the creation of a separate rate class for large energy use facilities and allocating the costs of serving these large energy use facilities in a manner that is equal or proportional to the cost of serving the class.[25] The bill also requires utilities to enter contracts to serve certain large energy use facilities.

PGE has revised its tariff to provide for appropriate cost allocation to the growing large industrial customers including through the addition of new study fees, minimum demand charges, and deposits, aiming to prevent stranded assets and incentivize large customers to invest in grid resiliency. PGE's revised tariff also includes provisions to mitigate cost-shifting risks, particularly for distribution and transmission investments, while providing that costs are appropriately allocated, and large customers pay for the cost to connect and serve their energy needs.[26] Whether these changes remain in place or are revised as well as implementation of HB 3546 are issues under consideration by OPUC in a pending docket, UM 2377, creating uncertainty regarding industrial load cost allocation, particularly with data centers.[27] This leads to uncertainty in the cost forecasts in the IRP.

In UM 2024, OPUC is reviewing Oregon's Direct Access Program, which allows large customers to contract directly with third-party electricity service suppliers. In UM 2024, OPUC is conducting a holistic review of the Direct Access Program. The review includes but is not limited to transition adjustment charges, election windows for customers to opt into the DA program, default pricing for Direct Access customers, and all load serving entities (including energy service suppliers and utilities) resource adequacy.

The impacts of large customer industrial load growth are evaluated within the Update as a scenario within portfolio analysis. A detailed description of the results of this scenario can be found in **Section 6.3.3 Large industrial customer growth**.

2.5 Federal administration changes

There has been a change in the Federal Administration since the 2023 CEP/IRP. During its first 100 days in 2025, the Trump Administration has taken a range of actions aimed at energy independence and deregulation, the full impacts of which are uncertain but likely to delay and increase the cost of renewable energy development and roll back environmental regulations. Due to uncertainties or lack of new final rules, most anticipated changes are not incorporated into this analysis.

2.5.1 Tax credit policy

The Inflation Reduction Act (IRA) of 2022 authorized approximately $270 billion in energy security and climate resilience investments, with a central focus on enhancing and expanding tax-based incentives for clean energy deployment.[28] A cornerstone of the IRA was the long-term extension and modernization of the Investment Tax Credit (ITC) and the Production Tax Credit (PTC), which had historically faced repeated expirations and short-term renewals that constrained planning and investment.[29] The IRA extended these credits for projects that begin construction before January 1, 2033, and transitions to a technology-neutral credit regime beginning in 2025. On a forward going basis, the IRA awards tax incentives based on the emissions profile of the generation source rather than technology type.[30] The IRA introduced tax credit transferability allowing eligible taxpayers to transfer all or part of certain tax credits to unrelated parties in exchange for cash, creating a new market for credit buyers and sellers.[31] This provision aimed to simplify financing, reduce dependence on complex tax equity structures, and make clean energy investment more accessible to a broader set of developers, utilities, and nonprofit entities.

While the Inflation Reduction Act (IRA) of 2022 provides funding and tax credits (including the ITC and PTC) through at least 2032, the current administration has introduced significant uncertainty regarding the future of the IRA and its provisions. In the executive order issued on January 20, 2025, the administration placed an immediate pause on the disbursements of funds appropriated through the IRA.[32] Federal Judges have issued orders requiring the administration to resume IRA funding, but the effect on the overall policy environment has been chilling to clean energy development, with potential modifications to key provisions affecting the stability and predictability of clean energy investments.[33] Congress is also working to phase out and condition many IRA tax credits, including the 45Y and 48E tax credits that provide significant value for PGE customers as PGE invests in clean energy. The outcome if this legislative effort is not yet known.

In response to this shifting policy landscape, PGE's IRP Update includes portfolio sensitivity analysis assessing the impacts of reverting to a pre-IRA planning environment. The details regarding the design of this scenario are introduced in **Section 5.1.3 Tax credit sensitivities** and results of the scenario analysis are provided in **Section 6.6 Federal tax credit availability scenarios**.

2.5.2 Grant funding

PGE and joint applicants were awarded USDOE grant funding in 2024 through the Grid Resilience and Innovation Partnerships (GRIP) Program to support some transmission projects. There is uncertainty whether these federal dollars will be fully awarded or not as payments were paused by the time of this Update publication. The analysis assumes this funding is awarded to support the selected projects described in **Section 4.6 Transmission options for portfolio analysis**. Further, **Appendix A Federal grant funding** details grants awarded to PGE. The delivery of these grants remains uncertain due to developing policy priorities at the Federal Administration.

2.5.3 BPA

Federal Administration changes have impacted BPA processes and workforce. The Transmission Service Request Study and Expansion Process (TSEP) to evaluate and address transmission service requests has been paused. Significant workforce reductions and current rehiring processes may impact operations, load service, and resource procurement.

On September 30, 2028, the existing settlement of the Residential Exchange Program (REP) is set to expire. PGE is still in active conversation and negotiation with BPA to make sure PGE customers receive an equitable share of the benefits of the Federal system. There is significant uncertainty associated with the impact of the expiration of the existing REP settlement and the level of REP benefits that BPA will make available to PGE's residential and eligible small farm customers. However, the OPUC has estimated that removal of the existing REP benefits that customers currently receive through the BPA REP program would create a cost impact to customers equivalent to around a 3.6 percent rate increase.

The ultimate implications of changes at BPA are uncertain but have the potential to impact day to day grid operations and slow regional transmission investment and development necessary for reliability and growth. This Update does not contemplate these complications.

Chapter 3. System needs

This chapter quantifies the drivers of energy and capacity needs in the 2023 CEP/IRP Update. The analyses described below provide the foundational metrics for addressing resource adequacy, decarbonization objectives and other policy requirements while minimizing long-term costs and risks. Previous modeling approaches for evaluating PGE's demand, supply, and policy requirements were described in the 2023 CEP/IRP's Chapter 6 – Resource needs and in the 2023 CEP/IRP Addendum, Chapter 2 – Need changes.[34,35] Additionally, this chapter discusses the 2023 Request for Proposal (RFP) results and the competitive bidding process initiated following the 2023 CEP/IRP.

Key Highlights

- Twenty-year average annual growth rates are estimated at 2.8 percent annually, a 1.2 percentage point increase from the 2023 CEP/IRP Addendum forecast. Growth is driven primarily by unprecedented industrial sector expansion, especially in semiconductor manufacturing and data centers.
- Resources assumed to be added following the conclusion of the 2023 RFP reduce long term capacity needs and make important contributions to addressing near-term capacity deficits.
- PGE continues to procure resources as part of the 2025 RFP. Such resource additions are likely to enter the system approximately 2029, limiting near-term emissions reductions.
- Monthly assessment of PGE's long-term energy need increases resource need relative to annual energy accounting.

Developments Since 2023 IRP

Since the 2023 IRP, PGE updated its load forecast methodology, shifting from a dual-horizon econometric analysis to an econometric model which spans the entire planning horizon and incorporates recent hourly demand data. This adjustment better captures current trends, including rapid industrial growth and changing residential energy use patterns post-COVID-19. Monthly energy need analysis was introduced to reflect the variability in renewable energy generation more accurately. Additionally, forecasts for distributed energy resources (DER) have been refined, further impacting projected energy and capacity needs.

Strategic Implications

The updated forecasting methods and revised growth projections underscore the urgency and scale of PGE's resource planning efforts. The significant industrial sector

[34] 2023 CEP/IRP
[35] 2023 CEP/IRP Addendum: System Needs and Portfolio Analysis Refresh

expansion necessitates timely resource procurement and infrastructure development to manage unprecedented demand increases.

Staff Recommendations Incorporated

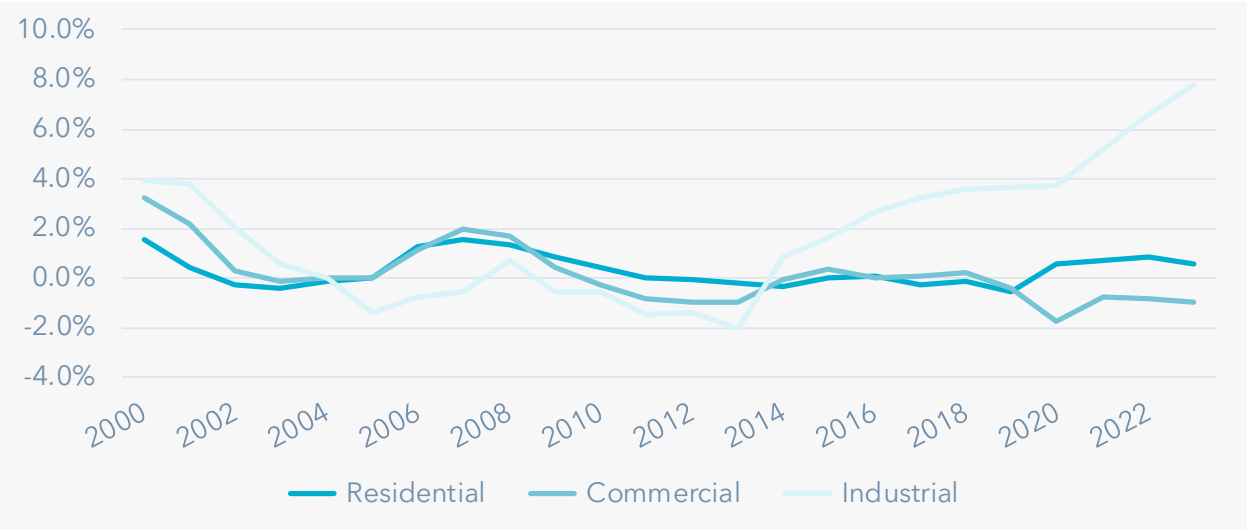
This section discusses IRP Updates which incorporate Staff Recommendations #3, #5, and #9 from Order No. 24-096. Recommendation #3 is advanced by representing non-emitting resource needs in a more granular accounting of PGE's forecasted emission through the quantification and incorporation of monthly energy needs in portfolio modeling. Recommendation #5 is addressed by explicitly accounting for Small-Scale Resource need in the IRP modeling. Lastly, Recommendation #9 is incorporated by assuming 75 percent renewal rate of QF resources in IRP inputs for capacity and energy.

3.1 Econometric load forecast

PGE customer's load forecasts have grown since the 2023 CEP/IRP filing which is demonstrated in this section's discussion of the PGE's May 2024 load forecast. The Addendum to PGE's 2023 CEP/IRP increased the load forecast from the initial filing and, unless noted, comparisons to the 2023 CEP/IRP refer to the Addendum.[36] PGE's load forecast includes two methodological changes to the Energy and Peak Forecasts which account for current trends and differences compared to the previous filing.[37] Additionally, PGE presents a high and low load forecast which include wider bounds in the near term to reflect increased uncertainty in industrial segment growth. Load forecasts exclude direct-access customers, consistent with 2023 CEP/IRP – Section 6.1.1 and in response to Order No. 07-022, IRP Guideline 9.[38]

The industrial segment is expected to be the focus of growth in PGE's service area due to the semiconductor industry and data centers. As **Section 2.4.2 Industrial load growth in the Pacific Northwest** describes, PGE's service area has experienced a dramatic increase in semiconductor and data center investment, a segment that is positioned to grow dramatically as cloud computing and AI demands increase. As this growth is unprecedented, the pace and scale of the electricity demand required to serve these needs introduces increased uncertainty in the outlook.

Forecasts of distributed energy resources (DERs), including rooftop solar, transportation and building electrification, are additional to the underlying econometric load forecast (base forecast). The energy and peak load impact of DERs, further referred to as electrification, are



[37] May 2024 Forecasts are the vintage used in the 2023 CEP/IRP Update. More recent vintages are not used as load forecasts are one of the furthest upstream inputs in the modeling process. The Sept. 2024 forecast estimates suggest a nominal change in average energy deliveries and seasonal peak loads across the planning horizon, and more recent forecasts are not expected to materially change the 2023 CEP/IRP Update's final recommendations.
[38] In the Matter of Public Utility Commission of Oregon, Investigation Into Integrated Resource Planning, Docket No. UM 1056, Order No. 07-002 (Jan 8, 2007) at 19, available at: https://apps.puc.state.or.us/orders/2007ords/07-002.pdf

estimated in PGE's AdopDER model, as discussed in **Section 5.2.2 Cost-effective demand response**. In the sections below, electrification forecasts from AdopDER are combined with results from the base forecast to provide a more complete forecast of energy and peak load estimates across the planning horizon. Resource need representations presented in **Sections 3.3 Energy need** and **Section 3.4 Capacity need** also consider the cumulative load forecasted for both PGE's base service area demand and the incremental impact of electrification.

3.1.1 Energy forecast

Recent years have marked a period of meaningful change in how PGE's customers use energy. **Figure 12** shows energy deliveries growth by customer class presented using a five-year rolling average growth rate. Across the past decade the industrial segment has offset relatively flat energy usage in the residential and commercial segments due to growth in high-tech and data center sectors. Growth from these sectors is estimated to account for approximately 75 percent of load growth between 2025-2030 (**Figure 17**), 50 percent of 2030 seasonal capacity need, and 30 percent of portfolio resources in 2030 (**Section 6.3.3 Large industrial customer growth**). Increased growth in industrial energy deliveries is expected to continue as Oregon's semiconductor industry grows and data center demand from cloud and AI uses expands. This rapid load growth presents economic opportunities for the region and is driving new policy and planning considerations to ensure PGE's system remains reliable and affordable in the face of unprecedented change. As part of these new considerations, the 2023 CEP/IRP Update includes a new model structure for PGE's energy deliveries forecast that allows for direct incorporation of individual large customer load growth projections.

Figure 12. Five-year average growth rates by class

3.1.1.1 Energy Forecast Methodological Changes

PGE's updated energy deliveries forecast includes two primary components: econometric forecast models by rate schedule and customer specific forecasts for a selection of large

customers. As part of the 2023 CEP/IRP Update, the Company revised the econometric forecast model.

The econometric portion of PGE's model ties energy deliveries to macro-economic drivers, primarily residential building permits and employment. PGE's residential models segment customers by dwelling type and estimates both usage per customer and customer count. The commercial models are segmented by rate schedule and energy deliveries are estimated directly.

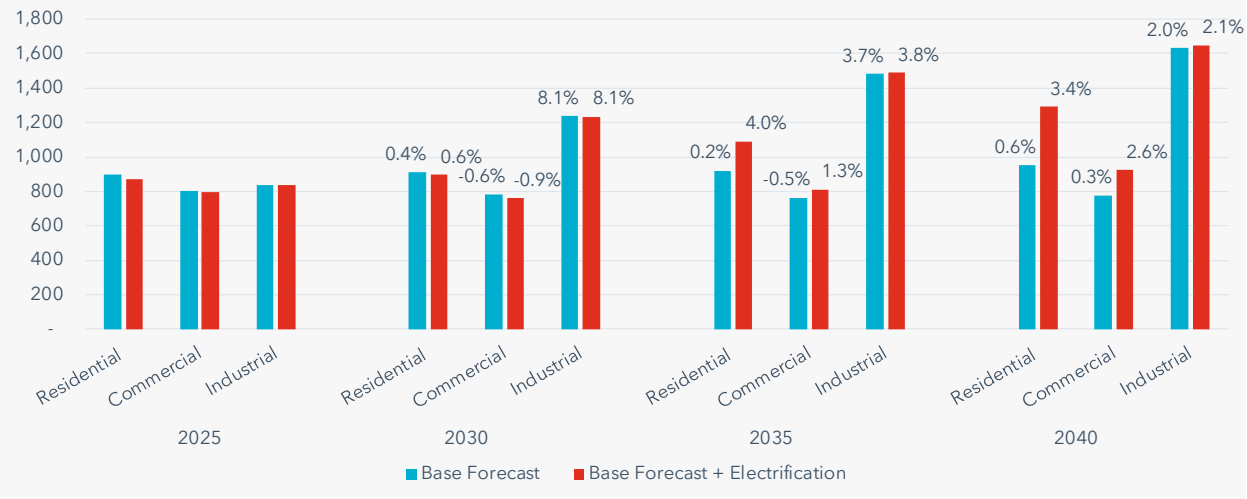
A key update to the econometric model is that PGE no longer splits its forecast into two horizons as it has in the past (1–5-year vs long term). A single set of regression models now span the full horizon of the 20-year CEP/IRP planning horizon. **Table 5** summarizes the groupings used for the econometric regression models.

Table 5. Structure of regression models

Dependent Variable	Model Groups
Usage Per Customer	Residential Single Family, Multi Family and Manufactured Home
New Connect	Single Family, Multi Family and Manufactured Home
Monthly Energy Deliveries	Non-residential Rate Schedules: 32, 38, 83, 85, 89 Other Residential Misc. Schedules: Irrigation, Area Lighting, Street Lighting and Traffic Signals

3.1.1.2 Large customer forecast

Consistent with the 2023 CEP/IRP, the large customer forecast is an individual forecast for a subset of large customers with high energy intensity, such as large non-residential customers on Rate 89, and 90.[39] These customers can experience stepwise changes in operations which are often communicated by the customer to PGE but are not easily predicted by reliance on regional macroeconomic drivers. Information used to develop these forecasts includes customer requests, segment industry reports, historic load-ramps, and comparisons to like customers. The state legislature and OPUC are actively discussing policy regarding industrial customer cost allocation as part of HB 3546 and UM 2377.[40,41] These efforts will further refine methods for differentiating large customer load in future planning cycles.



3.1.1.3 Resulting Energy Forecast

PGE's average growth rate for energy over the next 20 years is forecasted to be 1.9 percent, not including the impacts of electrification. This growth rate increases to 2.8 percent after including

[39] https://portlandgeneral.com/about/info/rates-and-regulatory/tariff
[40] Oregon HB 3546
[41] UM 2377

electrification estimates from PGE's AdopDER model.[42] Both the residential and commercial sectors are expected to remain relatively flat through 2030, with energy efficiency mostly offsetting customer growth in the near-term. After 2030, demand from non-industrial customers grows with increased electrification. The industrial sector is forecast to grow rapidly, driven primarily by semiconductor and data center sector growth. **Figure 13** shows the magnitude of customer class load at five-year increments and growth rates associated with the preceding five-year period. Industrial total usage is forecasted to surpass the residential and commercial sectors by 2030.

Figure 13. Energy forecast at five-year increments, with annual average growth rates

3.1.1.4 Energy High and Low Forecasts

PGE creates high and low load forecasts to account for different economic futures. The health of Oregon's economy impacts PGE's load growth, with residential driven by population and commercial driven by employment. In addition to the population and employment scenarios, PGE accounted for different large customer growth futures. The industrial sector has the widest bounds, accounting for the increased uncertainty in this sector. **Table 6** presents a growth rate summary comparing PGE's reference, high and low load forecasts for the base forecast and including the effects of electrification as estimated in AdopDER.

PGE notes that strong demand for industrial load service contributes to the uncertainty of the load forecast. PGE has received service requests from many large industrial customers whose requested load service is not included in the Reference case load forecast. PGE's choice to exclude many of these industrial requests is supported by PGE's judgement on the maturity of these requests and the absence of commitments from such customers. Ongoing policy discussions regarding the fair allocation of system costs to such customers discussed in **Section 2.4.3** contributes to the uncertainty of PGE's industrial load forecast. PGE's High load forecast

[42] AdopDER provides electrification estimates for residential and non-residential segments. Non-residential electrification estimates are weighted 90/10 (commercial/industrial) as most programs are targeted to commercial customers.

partially captures the potential of still stronger industrial service demand to be further assessed following these policy determinations.

Table 6. High, reference, and low forecasts

	High		Reference		Low	
	Base	Base + Electrification	Base	Base + Electrification	Base	Base + Electrification
Total Energy	3.31%	4.11%	1.94%	2.87%	0.58%	1.12%
Residential	1.02%	2.65%	0.44%	2.25%	-0.15%	0.71%
Commercial	0.50%	1.78%	-0.05%	1.13%	-0.75%	-0.06%
Industrial	7.48%	7.55%	5.14%	5.22%	2.87%	2.94%

3.1.1.5 IRP Update Comparison to 2023 CEP/IRP

Table 7 shows twenty-year average annual growth rates by customer segment for the 2030 CEP/IRP Update compared against the previous 2023 CEP/IRP and Addendum: System Need and Portfolio Analysis Refresh filings. The May 2024 update resulted in an increase in forecasted annual growth rates, from 1.6 percent in the filed addendum to 1.9 percent. The residential and commercial sectors both saw moderate decreases in forecasted growth prior to the inclusion of electrification. After including electrification, estimates for residential and commercial sectors grew by an additional 1.8 and 1.1 percentage points, respectively. The industrial sector increased from the Addendum estimate of 3.9 percent to 5.1 percent in the May 2024 Forecast, prior to electrification. Overall, the five-year forecast remained consistent with the prior update while the long-term growth rate saw an increase. This increase is primarily driven by the methodology update presented in **Section 3.1.1.1 Energy Forecast Methodological Changes**.

Figure 14 presents a graphical comparison of the forecast vintages including a segment build of the most recent, May 2024 load forecast.

Figure 14. Comparison across load forecast vintages

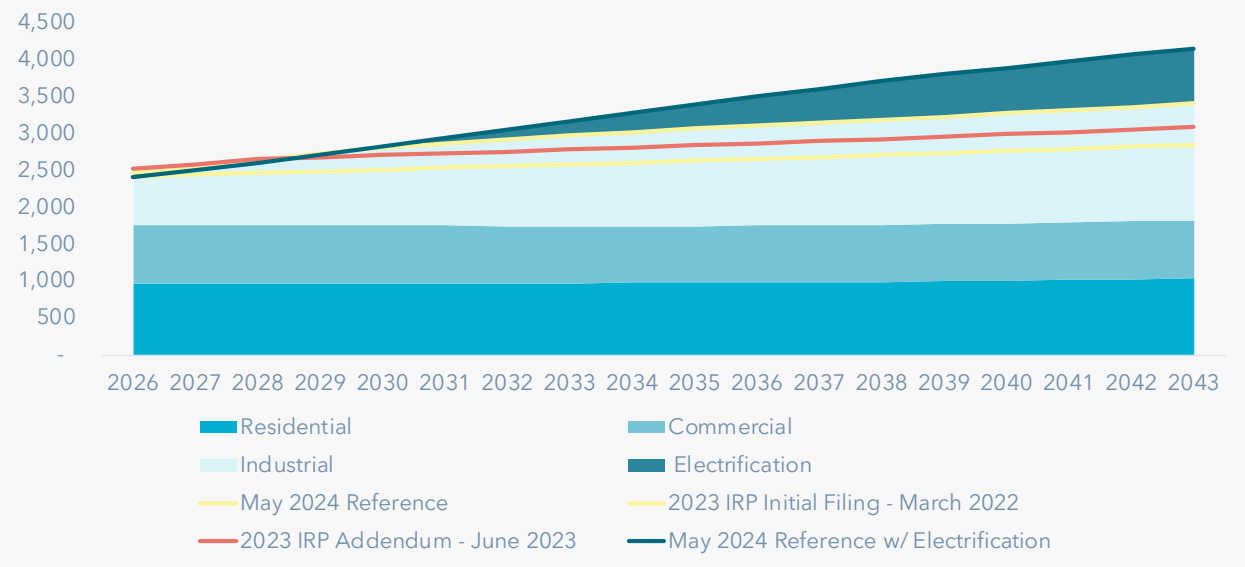


Table 7 presents a tabular growth rate summary comparison of the forecast vintages.

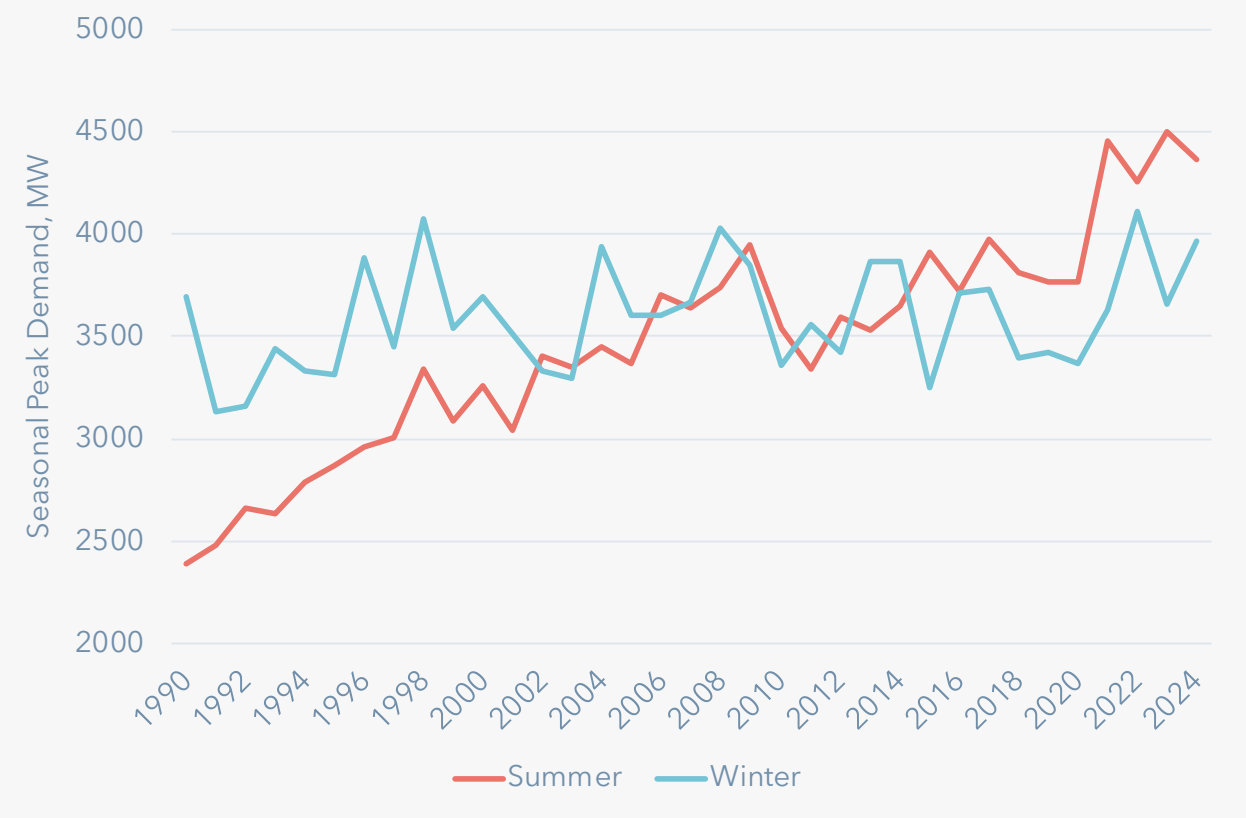

Table 7. Twenty-year average annual growth rates

	2023 CEP/IRP (March 2022)	2023 CEP/IRP Addendum (June 2023)	May 2024 Reference	May 2024 Reference + Electrification
Total Energy	1.2%	1.6%	1.9%	2.8%
Residential	0.5%	0.6%	0.4%	2.2%
Commercial	0.0%	0.0%	-0.1%	1.1%
Industrial	3.5%	3.9%	5.1%	5.2%

3.1.2 Seasonal peak demand forecast

In addition to increased industrial deliveries, PGE has also experienced persistent increases in its summer system peak demand. **Figure 15** presents the historical net system peak demand for the PGE service area from 1990-2024 for both the winter and summer seasons.

Figure 15. Actual seasonal net system peak demand, in MW

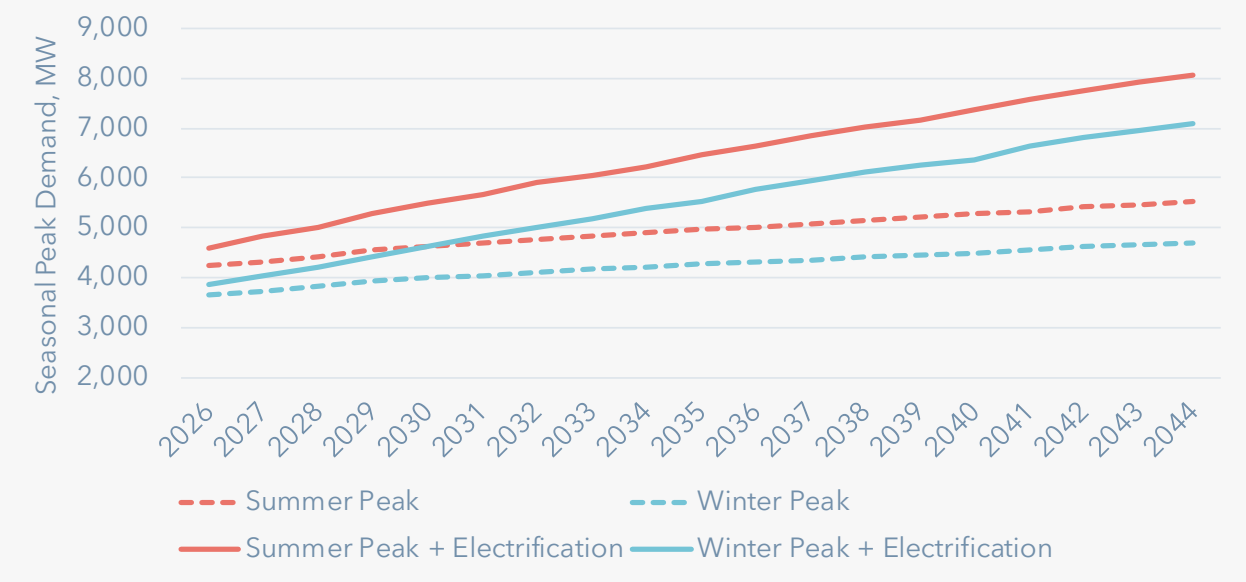
Recent events, such as wildfire smoke in 2020, the heat dome of 2021, increased AC saturations, and the rise in work-from-home have led to shifts in the utilization of home cooling systems.

To address these trends, PGE updated the peak demand forecast methodology. In addition to capturing recent trends, this methodology also allows for changes in load shape as the industrial class grows at an accelerated rate.

3.1.2.1 Peak Forecast Methodological Changes

In the 2023 CEP/IRP, PGE utilized a monthly regression model that related the single-hour peak demand to average monthly demand. This model trained with one observation per month, using historical data back to 2000. This resulted in few observations for training a summer peak event given the short nature of Oregon's summers. Further, these training observations reflected periods in time where the saturation and utilization of air conditioning in the home was less prevalent. Using this method, the temperature inputs used to forecast seasonal peak demand were based on a simple average of 15 years of peak day events.

For the May 2024 forecast, PGE updated its peak demand model with a focus on better capturing recent response to warm summer temperatures. The updated peak demand model uses hourly data by customer class – residential, commercial, and industrial – for 2019-2023 to better capture current usage trends during peak events. By using hourly data, the training set includes more cooling and heating events and can better capture the impact of weather on usage. The fixed effect model includes various weather variables, rooftop solar capacity, and



indicator variables to control for monthly, day of the week, extreme weather and COVID-19 impacts as explanatory variables.[43]

To develop the peak demand forecast, weather year simulations are created using historical hourly weather data for the period 2008-2023 with shifted day of week start to reflect 105 total simulations. These simulations are scaled by class to the average monthly energy forecast to capture growth. The expected seasonal peaks reflect the average system peak across the simulations in the given season. Probabilistic outputs were also created based on the standard deviation of simulated peak. This approach allows for data to feed directly into the Sequoia model, as described in **Section 3.4.2 Changes to modeling capacity need**.

3.1.2.2 Resulting Peak Forecast

PGE's base forecast average growth rate over the next 20 years is forecasted to be 1.5 percent for the summer peak and 1.4 percent for the winter peak, as shown in **Table 8**. After including the peak load impacts of electrification, average growth rates increase to 3.3 percent and 3.4 percent for summer and winter, respectively. **Figure 16** shows the trajectory of PGE's forecasted seasonal peak demand forecasts for the summer and winter seasons with and without electrification.

Figure 16. Forecasted seasonal peak demand, in MW

3.1.2.3 Peak High and Low Forecasts

PGE creates a high and low peak forecasts that correspond with the high and low load forecasts. In each scenario, the growth is front weighted to the five-year horizon, corresponding with the higher forecasted growth rate in the short-term. **Table 8** shows a comparison of the growth rate

[43] Weather variables include heating degree hours (HDH), cooling degree hours (CDH), and lagged HDH and CDH. HDH and CDH were calculated based using the observed temperature at each hour compared to a set base temperature (such as 65°F) with HDH being total degrees below set point and CDH being total degrees above.

of seasonal peak demand across the reference, high and low load forecasts both with and without the effects of electrification.

Table 8. Forecast twenty-year average growth rates

	High		Reference		Low	
	Base	Base + Electrification	Base	Base + Electrification	Base	Base + Electrification
Summer Peak	2.6%	4.2%	1.5%	3.3%	0.4%	1.8%
Winter Peak	2.5%	4.4%	1.4%	3.4%	0.3%	2.0%

3.1.2.4 IRP Update Comparison to Previous Filings

The May 2024 update reflected an increase in the peak forecast for both the summer and winter peak.[44] This increase is driven by the increased forecasted load growth as well as the updated methodology described in **Section 3.1.2.1 Peak Forecast Methodological Changes**. Though the peak forecasted growth rate has increased, it remains lower than the forecasted energy annual growth rate. **Table 9** shows a comparison of the growth rate of seasonal peak demand across the forecast vintages, including effects from electrification as estimated in AdopDER.

Table 9. Forecast peak 19 year (2026-2044) average annual growth rates

	2023 CEP/IRP (March 2022)	2023 CEP/IRP Addendum (June 2023)	May 2024 Reference	May 2024 Reference + Electrification
Summer Peak	0.7%	0.9%	1.5%	3.2%
Winter Peak	0.7%	0.8%	1.4%	3.5%

3.1.3 Load forecasts – excluding large customer load

To provide transparency into the drivers of PGE's resource need, additional analysis was performed to disaggregate large industrial load from PGE's forecast. As described in **Section 3.1.1.2 Large customer forecast**, semiconductor and data center loads are responsible for significant increases in PGE's forecast.[45]

3.1.3.1 Methodology: Excluding load from large customers

PGE's econometric load forecast methodology includes three core modeling elements: a monthly forecast of energy deliveries by rate schedule, a monthly forecast of large customer

[44] May 2024 Load Forecast Update discussed in Jul. 11, 2024 CEP/IRP Roundtable 24-3

[45] Similar segmentation was not performed in PGE's AdopDER model for electrification forecasts. It is assumed that all electrification in the industrial segment is associated to non-large customer projects.

usage, and an hourly simulation which creates the peak demand output. To isolate the impact of growth from large industrial load, PGE focuses on the large customer forecast, holding all customers who are projected to add at least 30 MW of load in coming years at levels consistent with PGE's forecasted values for 2025. This categorization by size is consistent with Category 3 large non-residential customers in PGE's proposed modification to its tariff filed in Advice No. 24-38/UE 430.

This approach does not attempt to capture the nuance associated with timing of individual customer load growth but instead selects a point in time and illustrates the magnitude of forecasted growth associated with large customer projects thereafter based on PGE's May 2024 Reference case Load Forecast.[46]

3.1.3.2 Resulting forecast – excluding large customer load

Removing growth associated with large customer load after 2025 results in lower energy deliveries and seasonal peak demand forecasts. The twenty-year average annual growth rate for the May 2024 Reference total energy forecast is estimated to reduce from 1.9 percent to 0.1 percent, prior to electrification. After including electrification, forecasts that exclude large customer load estimate a 1.3 percentage point reduction in the total energy twenty-year average annual growth rate, as shown in **Table 10**.

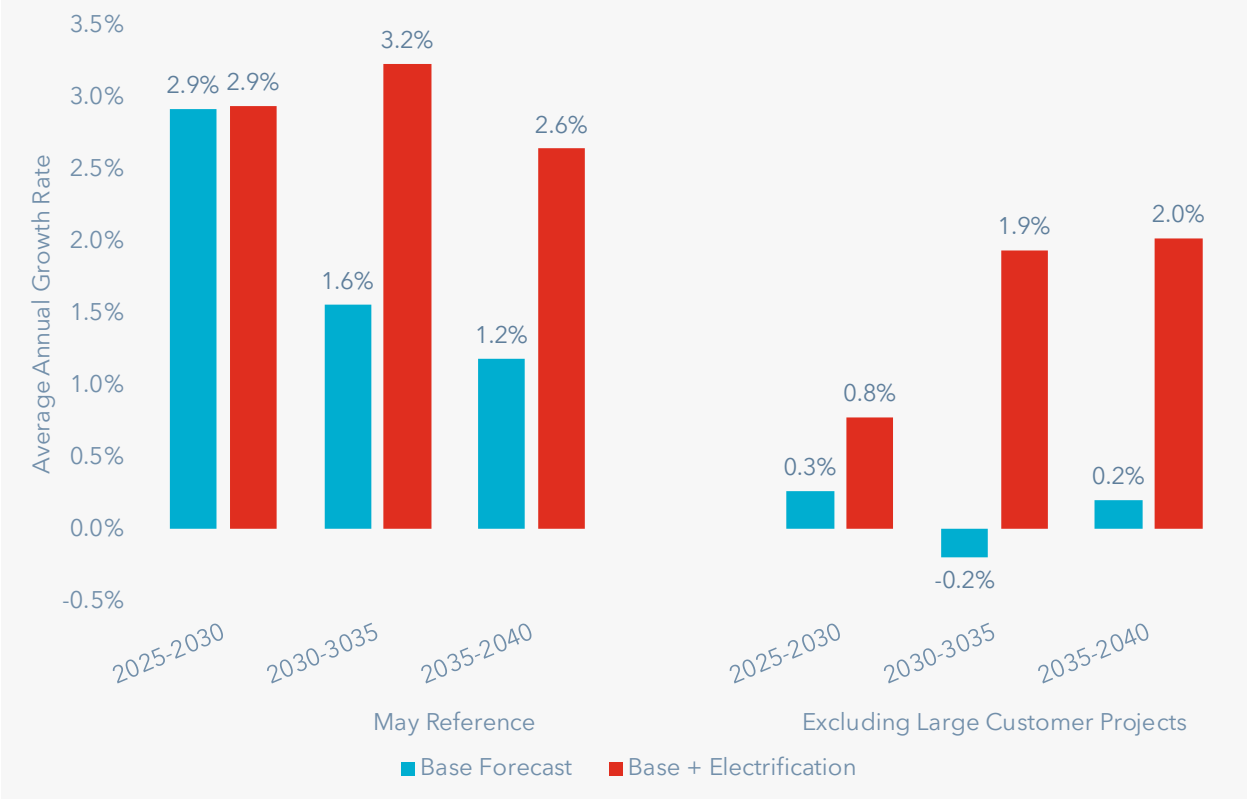


Table 10. Twenty-year average annual growth rate comparison, Excluding Large Customer Projects

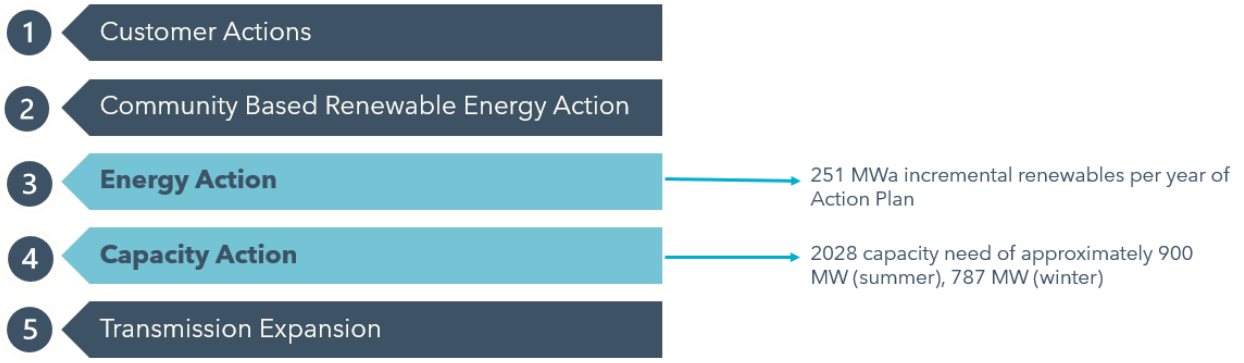
	May 2024 Reference	May 2024 Reference + Electrification	May 2024 Reference, Excluding Large Customer Projects	May 2024 Reference + Electrification, Excluding Large Customer Projects
Total Energy	1.9%	2.8%	0.1%	1.5%
Summer Peak	1.5%	3.2%	0.3%	2.3%
Winter Peak	1.4%	3.5%	0.2%	2.5%

The reductions in load estimates from forecasts that exclude large customer load is greatest in the near term where line of sight to large customer load is most certain and growth is expected to be greater. **Figure 17** compares the five-year average annual growth rates consistent with the May 2024 Reference load forecast and the forecast which excludes large customer load, with and without electrification. These estimates suggest large customer load comprises the majority of PGE growth prior to 2030, after which electrification in the residential and commercial segments begins to account for an increasing share of forecasted growth.

[46] This methodology is forward looking and does not differentiate existing large loads.

Figure 17. Comparison of annual average growth rates for energy forecast at 5-year increments



3.2 2023 RFP results

3.2.1 Target and need

In the 2023 RFP, PGE pursued non-emitting resources to facilitate a reliable energy supply for the service area while reducing the greenhouse gas emissions associated with energy generated to serve customers. PGE's 2023 CEP/IRP found that the company has a need for additional capacity resources beginning in 2026, with an additional capacity need in 2028. Further, the 2023 CEP/IRP Action Plan identified that procuring additional energy resources is needed to support the reduction of greenhouse gas emissions within PGE's portfolio. The 2023 RFP was designed and approved, subject to conditions, to seek resources to address these needs within a 2025-2027 commercial online date (COD) window, consistent with PGE's 2023 CEP/IRP Action Plan.[47] PGE's 2023 CEP/IRP Action Plan items are shown in **Figure 18**, with the targets for energy and capacity actions targeted by the 2023 RFP shown in light blue.

[47] See Order No. 24-011, as modified by Order Nos. 24-024 and 24-085.

Figure 18. PGE's 2023 CEP/IRP Action Plan, and associated targets for 2023 RFP[48]

As shown above, the 2023 CEP/IRP Action Plan included both a capacity and energy action: the capacity action identified a need in 2028 of 905 MW in summer and 787 MW in winter.[49] The response from the market to the 2023 CEP/RFP was robust, and PGE's final shortlist included 361 MW of capacity contribution from renewable resources, plus an additional 695 MW of capacity contribution from dispatchable capacity options in the form of lithium-ion battery storage. In the RFP, PGE sought the identified capacity needs entirely from non-emitting resources and has identified resources which, after contemplating the latest IRP capacity modeling updates, reduce PGE's 2028 capacity need to 0 MW and 195 MW for summer and winter, respectively. Because negotiations are ongoing, there is still uncertainty in which resources will become part of PGE's portfolio.

PGE evaluated the costs, risks, and benefits of renewable procurement volumes to make progress toward the identified energy action outlined in PGE's 2023 CEP/IRP Action Plan. While PGE saw a robust response to the 2023 RFP, the total number of renewable energy resources recommended for procurement based on customer value was not sufficient to fully address PGE's 2025-2027 energy action as described in the Action Plan in the 2023 CEP/IRP. Where the 2023 CEP/IRP recommended 753 MWa of renewable energy acquisition, the total generation available from of renewable options on PGE's initial shortlist for this RFP was approximately 350 MWa. PGE's final shortlist Group A, which identified 96 MWa of renewable energy resources and 775 MW of lithium-ion batteries, and Group B, which identified 885 MW of lithium-ion batteries, included projects that are likely to represent least-cost, least-risk for customers.[50] PGE continues to negotiate with the remaining Group A projects and aims to finalize contracts over the course of 2025.

PGE did not include four unique renewable projects on the final shortlist, which together represented an additional 1,000 MW of resources. The primary reason these projects were not included in the final shortlist was their anticipated impact to customer affordability. PGE is continuing to actively seek additional clean energy resources from the market that offer reliability

[48] See PGE's Request for Acknowledgment of the Final Shortlist of Bidders, p. 5
[49] See PGE Response to Staff's Round 2 Comments and Recommendations, p.42
[50] On December 12, 2024, one of the projects in Group A notified PGE that it was withdrawing from commercial negotiations.

and efficiency at the lowest costs to customers. PGE is currently advancing the 2025 All-Source RFP to seek additional non-emitting energy and capacity resources. PGE plans to issue the RFP to the market in the third quarter 2025 and compile a final shortlist in early 2026.[51]

3.2.2 2023 RFP proxy

On November 25, 2024, the OPUC acknowledged, subject to conditions, PGE's 2023 RFP final shortlist of bids.[52] PGE commenced commercial negotiations to acquire resources from the final shortlist Group A.[53] The final shortlist Group A consists of four projects with the following general characteristics:

1. Hybrid 250 MW solar & 250 MW battery
2. Hybrid 125 MW solar & 125 MW battery
3. Standalone 400 MW battery
4. Standalone 41 MW solar

Because negotiations for project acquisition are ongoing, there is still uncertainty in which resources will become part of PGE's portfolio. To account for the expected addition of resources to the portfolio, PGE's models include a proxy set of resources that represents an informed estimate of the quantity of resource acquisitions from the 2023 RFP. The RFP proxy serves as a placeholder for the resources in PGE's modeled portfolio.

The RFP proxy represents the energy and capacity benefits contributed to PGE's portfolio by the expected resources from the final shortlist so they can be accounted for in calculation of energy need, capacity need, and proxy resource ELCCs. The RFP proxy used in IRP Update modeling consists of 375 MW of solar/battery hybrid resources and 400 MW of standalone 4-hr battery storage, representing Group A resources.[54] Since identifying the resources in the final shortlist Group A, the 41 MW standalone solar project withdrew from commercial negotiations and energy and capacity are not included in the RFP proxy.[55] Subsequent to the final definition of modeling assumptions in the Update, the 250 MW solar & 250 MW battery hybrid project also withdrew from commercial negotiations. Because modeling was already underway, the energy and capacity of the 250 MW solar & 250 MW battery hybrid is included in the RFP proxy. The updated needs in 2028 with the inclusion of the RFP Proxy are 0 MW and 195 MW for summer and winter, respectively.

[51] Docket No: UM 2371
[52] OPUC Docket No. UM 2274 Final Order available here: https://apps.puc.state.or.us/orders/2024ords/24-425.pdf
[53] The shortlist is bifurcated into an A group and a B group of resources. The RFP proxy is based on the resources in group A only and references to the final shortlist in this section refer to group A resources only. PGE's decision on whether to pursue group B bids will depend upon the outcomes of commercial negotiations for group A bids.
[54] Final shortlist Group B resources are not included in the RFP proxy.
[55] On December 12, 2024, the 41 MW standalone solar project notified PGE that it was withdrawing from commercial negotiations.

3.3 Energy need

Energy need is the difference between PGE's forecasted load (demand) and the supply of energy available to serve load from existing owned and contracted resources in the baseline portfolio, defined in terms of average Megawatts (MWa). Energy need is an important input to portfolio analysis as one of the main drivers of the need for new resource additions. This section describes the energy need forecast used for portfolio analysis, calculated with the most up to date information available at the time of analysis.

PGE presented an annual energy position forecast in the 2023 CEP/IRP and subsequently updated it in the 2023 CEP/IRP Addendum.[56] The Addendum incorporated an updated load forecast and changes to the baseline portfolio that occurred after the writing of the 2023 CEP/IRP. The net effect of updates made to the annual energy position from the 2023 CEP/IRP to the Addendum were to increase PGE's energy need.

PGE has incorporated additional updates into modeling since the Addendum, which has led to another update to PGE's forecasted energy need. Modeling updates incorporated into IRP Update that impact annual energy need include an updated load forecast (**Section 3.1 Econometric load forecast**), updated forecasts of cost-effective DERs (**Section 5.2.1 Passive DERs**) and EE (**Section 5.3 Energy efficiency**), and updates to PGE's baseline resource portfolio. The load forecast used in the Update includes higher energy demand compared to the forecast from the IRP Addendum. Updated forecasts of cost-effective DERs and EE have increased since the IRP Addendum. These resources offset energy usage and reduce the quantity of load to be served, decreasing annual energy load resource balance.

Updates to the baseline portfolio since the Addendum include the RFP proxy, the addition of new contracts and an updated Qualifying Facilities (QF) forecast. The three new hydro contracts in the base portfolio include one with Grant PUD from 2024-2026 and two with Douglas PUD, one spanning 2024-2025 and one from 2026-2030.[57] Additionally, included in this update is a new contract with Calpine for a 250 MW share of the Hermiston combined-cycle natural gas plant in Hermiston, OR from 2025 through 2029.[58] Baseline portfolio updates have increased the quantity of energy in PGE's portfolio, decreasing annual energy need.

The incremental impact of each of the updates and resulting 2030 Reference Case needs are shown in **Figure 19**. In 2030, the increase in annual energy in PGE's baseline portfolio and increased EE and DERs outweigh the increased need associated with the new load forecast and other modeling updates, resulting in a decrease in PGE's annual energy load-resource balance from 1307 MWa to 1204 MWa. PGE's annual energy load-resource balance, including Reference, Low, and High need futures, is shown for the 20-year planning horizon in **Figure 20**.

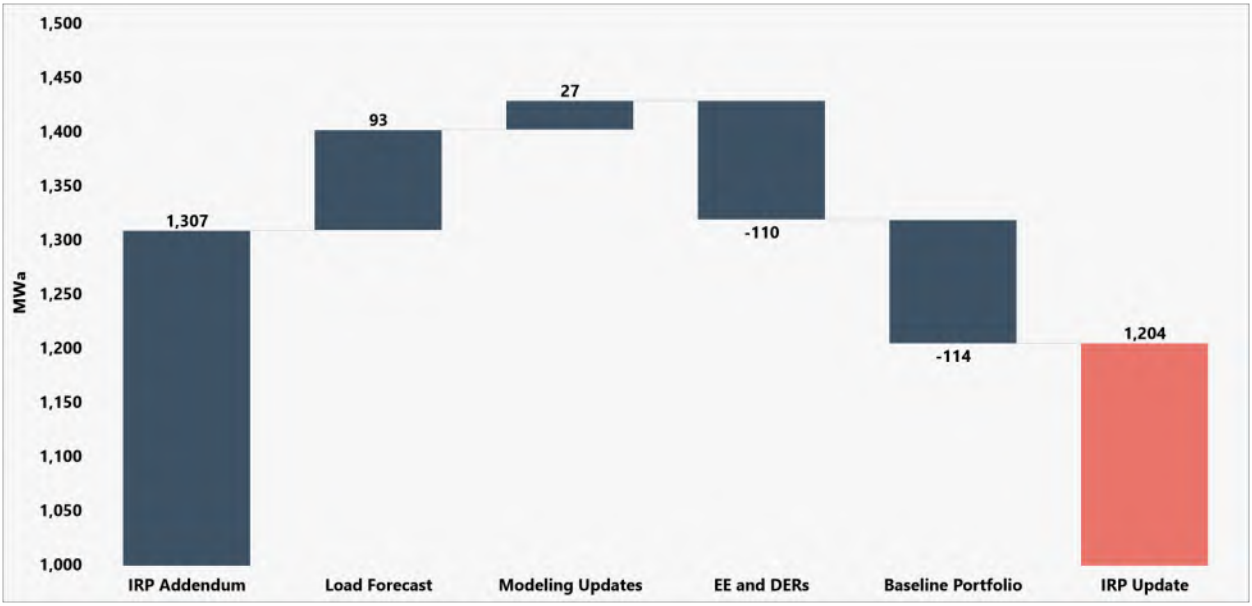
---

[56] 2023 CEP/IRP and Addendum to the 2023 CEP/IRP

[57] Hydro contract details available in PGE 2024 10k filing, page 15.

[58] Consistent with the methodology used in the 2023 CEP/IRP, the quantity of emitting energy retained to serve PGE's load is limited to quantities that are compliant with HB 2021 GHG emissions targets based on the linear GHG reduction glidepath. The quantity of energy retained from the Calpine project is determined by the IGHG model. The impact of Calpine on PGE's retained quantity of emitting energy is described in **Section 3.5.1 HB 2021**.

Figure 19. Incremental impacts of updates on 2030 Reference Case energy need



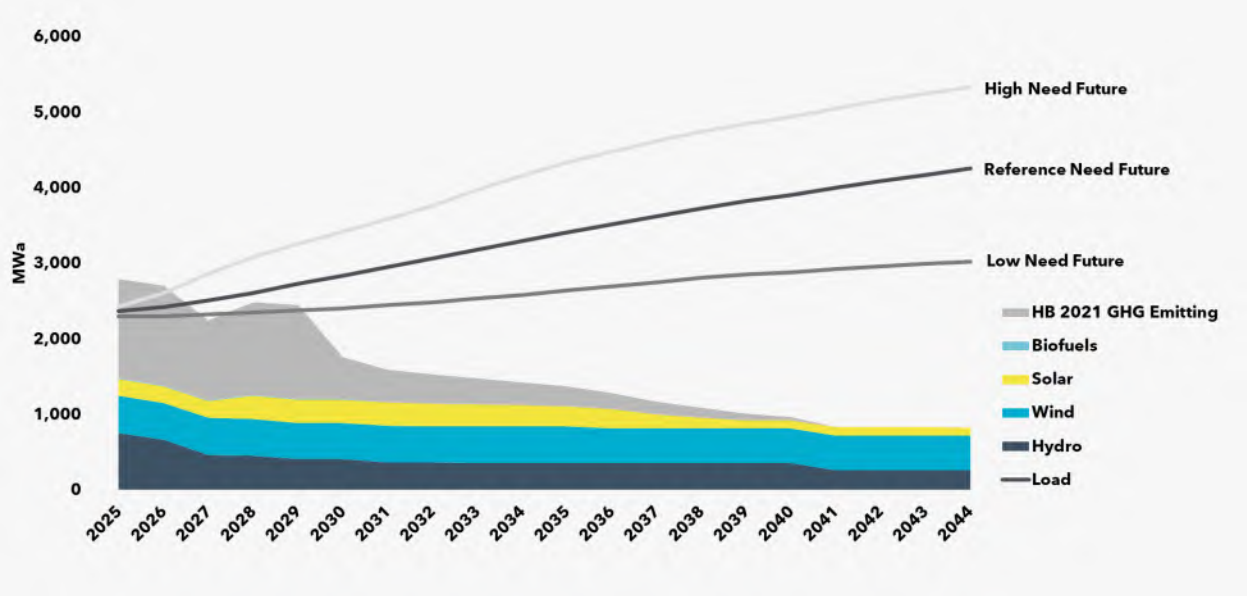


Figure 20. Annual energy-load resource balance from 2025 through 2044

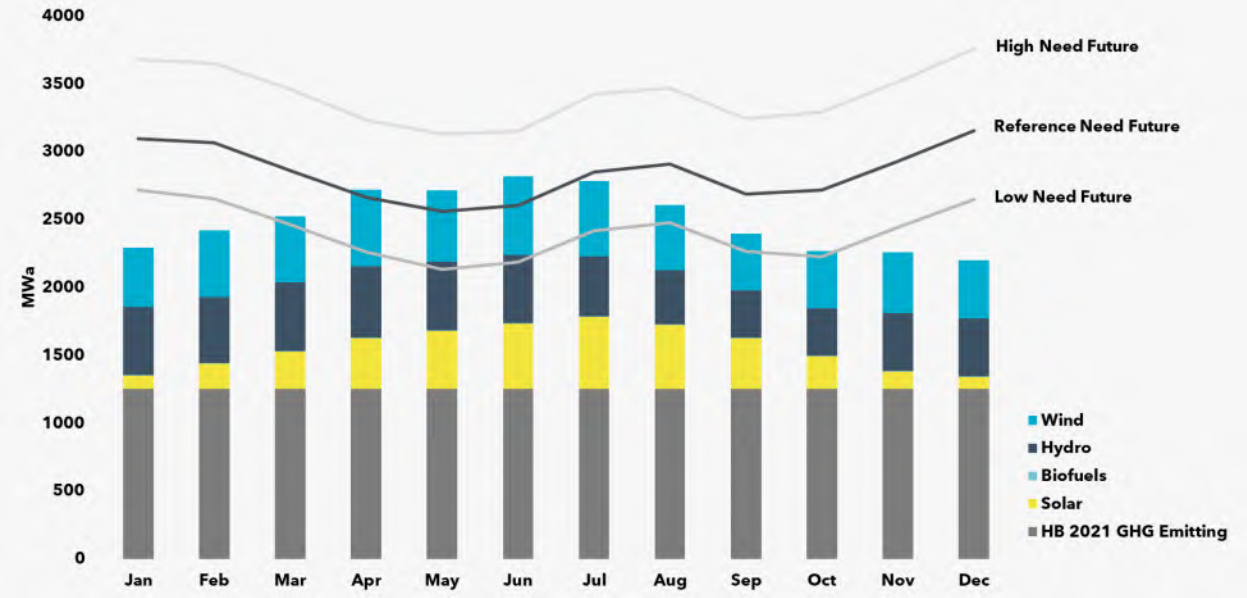
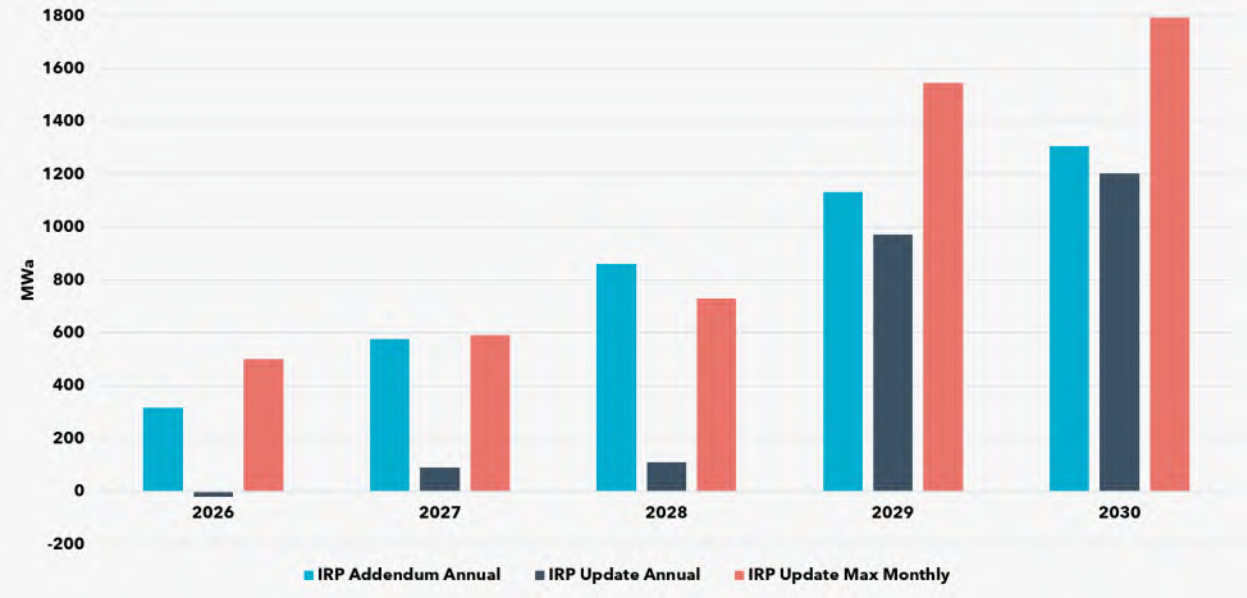


The gap between load and the stacked area of annual energy from PGE's baseline portfolio retained to serve retail load under HB 2021-compliant assumptions in **Figure 20** represents the minimum energy need remaining to be filled by incremental resource additions in portfolio analysis. For this Update PGE has calculated a monthly energy-load resource balance to further inform the magnitude of PGE's energy need. Because load and energy generation from renewable resources are both influenced by weather and the presence or absence of sunshine and wind, there are distinct seasonal patterns to energy supply and demand. PGE's load tends to

peak in the summer and winter when temperatures are very hot or cold and is lower during the mild temperatures of the spring and fall. Solar facilities produce the most energy in the summer and the least in the winter. Patterns of wind production are less predictable than solar but still display seasonality that varies by location. On average, the wind in PGE's baseline portfolio tends to produce the most in the spring and early summer. Hydro generation is also seasonal, with peak generation coinciding with spring runoff.

These dynamics in load and expected resource generation are shown for 2028 in **Figure 21**. The quantity of energy from renewable resources is calculated using monthly average capacity factors, which represents the percent of the time that a facility is expected to be generating throughout any given month. Energy from dispatchable sources cannot be allocated using static average capacity factors like non-dispatchable resources because the timing of their generation is determined by economic and operational decision making, so in **Figure 21** they are depicted as flat across each month of the year.[59]

Figure 21. 2028 monthly load-resource balance



Seasonal dynamics can have important implications for resource planning and influence the optimal quantity and mix of resources in the portfolio. The magnitude of energy need in a given month may exceed the energy need on average across the year, increasing the quantity of resources needed. The timing of energy need throughout the year may be more correlated with some resource options than others, impacting which resources most optimally meet energy needs. Monthly energy-load resource balance accounting enables PGE to capture and consider seasonal variations in resource planning.

[59] The monthly allocation of energy from dispatchable sources is accounted for in portfolio analysis and is discussed in **Section 6.1.2 Energy need**.

The Update relies upon monthly energy needs to inform portfolio analysis. Resources are added to portfolios to ensure that each portfolio is forecasted to achieve monthly energy load resource balance. **Figure 22** compares PGE's annual energy load resource balance to the monthly energy load resource balance that is incorporated into PGE's portfolio analysis. Consistent with the above figure, this comparison assumes that energy from dispatchable sources is evenly distributed throughout the year, while PGE's portfolio analysis methodology allows dispatchable energy to be allocated throughout the year to minimize maximum monthly energy needs consistent with comprehensive portfolio economics. PGE's choice of incorporating monthly energy needs into portfolio analysis is responsive to Staff's condition, adopted by the OPUC in the 2023 CEP/IRP which expressed concern the previous filings reliance on annual energy metrics to demonstrate continual progress toward PGE's HB 2021 emissions targets.[60] By incorporating monthly energy needs into portfolio analysis, PGE's IRP Update better represents the seasonal aspects of PGE's decarbonized energy needs. Additional analysis which directly assesses the ability of the Preferred Portfolio to meet emissions targets on at an hourly granularity is discussed in **Section 6.2.2 Hourly energy and emissions accounting results**.

Figure 22. Comparison of Annual to Monthly Energy Need

3.4 Capacity need

Capacity need estimates the effective capacity, expressed in MW, required to achieve a resource-adequate portfolio. These estimates come from PGE's resource adequacy model, Sequoia. Sequoia estimates capacity need under a "1 day in 10 years" reliability metric, interpreted as 2.4 loss of load hours (LOLH) annually. PGE first developed Sequoia during the

[60] Staff Recommendation #3 from IRP Acknowledgement Order 24-096. Available here: https://apps.puc.state.or.us/orders/2024ords/24-096.pdf

2019 IRP Update.[61] The following section discusses the 2023 CEP/IRP Update need across the planning horizon, describes the effect of model updates made since PGE's CEP/IRP Addendum: System Need & Portfolio Refresh, and compares capacity need across different need futures that capture supply and demand uncertainty.

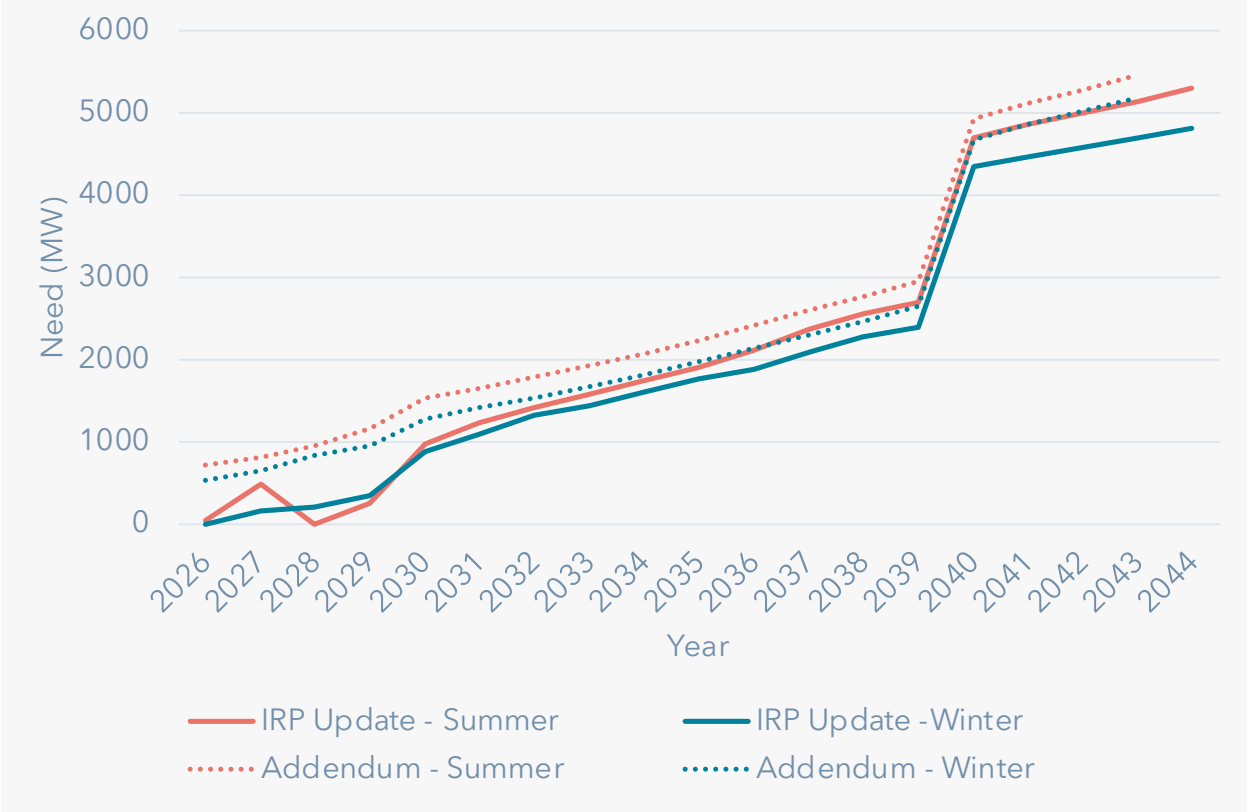
3.4.1 Seasonal need – reference case

The 2023 CEP/IRP Update estimates capacity need in summer (April-September) and winter (October-March). **Figure 23** shows PGE's seasonal capacity need across the 20-year planning horizon compared to capacity need previously estimated in Addendum filing.[62] PGE's near-term capacity need decreased since the addendum because of supply side additions, namely bilateral contracts, and resource additions modeled by the RFP Proxy. The updated summer capacity need is estimated at 47 MW in 2026. This capacity need grows to 485 MW in 2027 with the expiration of Grant PUD hydro contracts, then drops to 0 MW in 2028 as RFP Proxy Resources enter the modeled supply stack. In 2027, a winter capacity need of 159 MW is estimated and is expected to continuously grow.

PGE notes sources of uncertainty in short-term capacity need estimates. PGE's Econometric Load Forecast represent average expected outcomes and include a range of possible values. The 2023 CEP/IRP Update represents uncertainty in load forecasts by modeling different need futures, which could decrease or increase short-term need significantly (**Figure 23**). Another source of uncertainty relates to PGE's supply portfolio. Absent executed agreements, the 2023 CEP/IRP Update includes RFP Proxy resources assuming a January 1, 2028 commercial operations date. Resources may reach commercial operations before or after the assumed date. PGE can address remaining short-term need through commercial agreements to access existing resources. Structured or bilateral contracts can be agreed upon to provide capacity from existing resources. Additionally, regional sharing mechanisms from state resource adequacy requirements may provide additional capacity.[63]

Looking beyond the short-term, capacity needs in both seasons increase significantly in 2030 due to the exit of Colstrip and expiration of the Calpine contract. Capacity need grows steadily until 2040 where it is assumed all gas plants exit the portfolio, resulting in an approximately 2 GW increase in need.[64]

---



[61] The following resources provide descriptions of Sequoia from past roundtables and filings: 2019 IRP Update Sequoia overview - Appendix K; 2023 CEP/IRP Sequoia overview – Appendix H.3; May 2021 CEP/IRP Roundtable; March 2022 CEP/IRP Roundtable; January 2023 CEP/IRP Roundtable; August 2024 CEP/IRP Roundtable

[62] PGE's 2023 CEP/IRP Addendum: System Need & Portfolio Refresh

[63] OPUC Docket AR 660 – Resource Adequacy Rules

[64] Due to infeasibility of model solutions in Sequoia for years with a very high need and little dispatchable resources, out of model adjustments were made to extrapolate latter years in the planning horizon. Infeasible years for the reference and high need futures are 2041-2044, and 2044 for the low need future. The average annual growth rate of need for 3 years prior to the greatest feasible year for each season and need future are used to extrapolate need. The average annual growth rate used to extrapolate need is approximately 8%, 6% and 4% for reference, high and low need futures, respectively.

Figure 23. 2023 CEP/IRP Update Capacity Need – Reference Case

3.4.2 Changes to modeling capacity need

The 2023 CEP/IRP Update includes multiple changes to Sequoia as part of refreshing PGE's capacity need estimates. The updates include methodological and other input related changes that aim to improve the representation of Sequoia's assessment of demand and supply in PGE's system. **Figure 24** and **Figure 25** display the incremental effect of major updates affecting PGE's capacity need estimates for both summer and winter, respectively. The incremental changes in capacity need depicted depend on the order in which updates are sequenced, while the final capacity need does not.[65] Updates were ordered to show methodological effects first, followed by changes in input assumptions. Updated capacity need in 2028 shows a net decrease for both summer and winter.

3.4.2.1 Updated analysis period

As part of the 2023 CEP/IRP Update, Sequoia was updated to allow modeling of the most recent 30 years of historical load and generation data, shifting the analysis period from 1992-2021 to 1994-2023. This shift in analysis period allows Sequoia to model more recent weather effects on

[65] For example, the 155 MW increase and 57 MW decrease of summer and winter capacity need resulting from Load Updates, respectively, are relative to the changes which resulted from the "Updated Analysis Period" vintage of Sequoia modeled prior. Reordering these changes would not alter the 0 MW summer and 195 MW winter capacity needs for 2028.

load and variable energy resources. This change in methodology results in a 46 MW increase in summer need and 14 MW increase in winter need.[66]

3.4.2.2 Load forecast updates

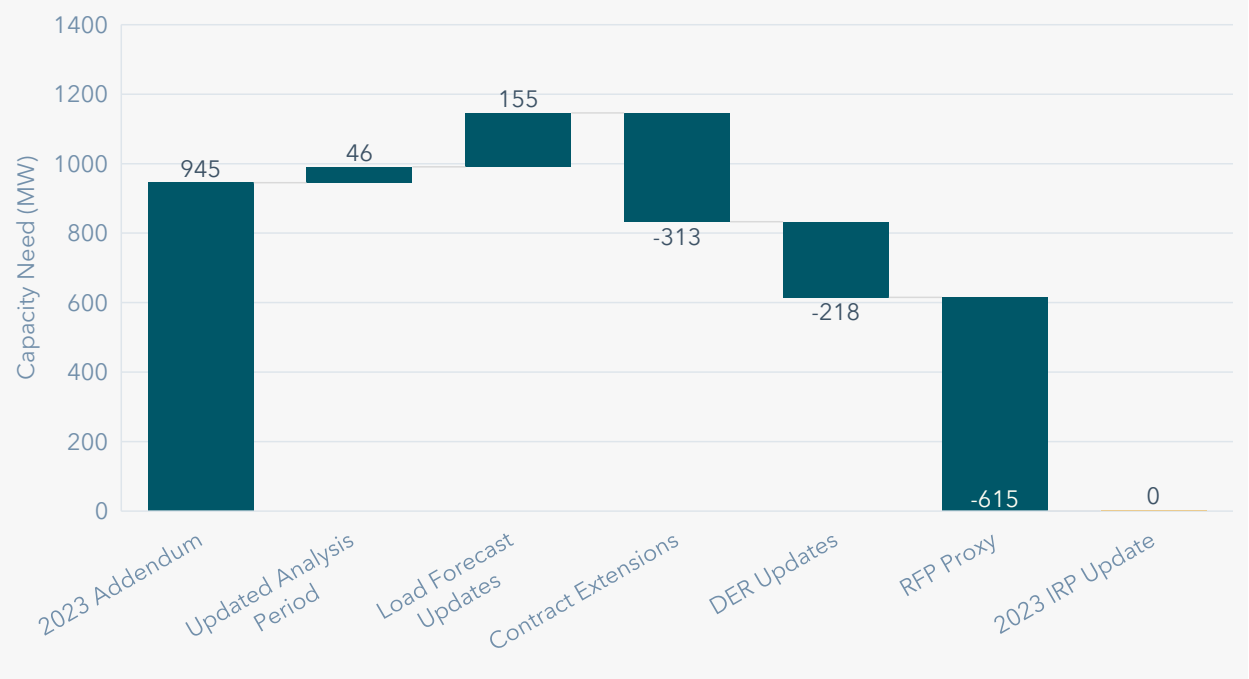
Two updates to load forecasts used in Sequoia are included in the 2023 CEP/IRP Update. First, PGE's Corporate Load Forecasts (CLF) hourly historical simulation is used in place of the previous historical simulation. Second, the load forecast version is updated from May 2023 to May 2024. As part of the 2023 CEP/IRP Update, PGE's CLF developed a historical simulation of hourly load (**Section 3.1 Econometric load forecast**). This simulation replaced the previous approach which scaled historical weather-dependent load to approximate forecasted monthly peak and average energy for future years. Scaling the weather-dependent load shape required a linear estimation which aimed to represent future load shapes, a process which was less precise and irreproducible iteration-to-iteration. The new CLF approach produces the hourly historical simulation necessary for Sequoia, resulting in a more efficient and reproducible method. Lastly, forecasts used to estimate load were updated from May 2023 to May 2024. In total, these load forecast updates result in a 57 MW decrease in winter capacity need and a 155 MW increase in summer capacity need for 2028.

3.4.2.3 Supply-side updates

The various supply-side updates that are part of the 2023 CEP/IRP Update (**Section 3.3 Energy need**), resulted in a 313 MW, 218 MW and 615 MW reduction in summer need for new contracts in the base portfolio, revised DER estimates, and RFP Proxy Resources, respectively. In winter, the supply-side updates resulted in a 335 MW, 91MW and 162 MW reduction in capacity need from new contracts in the base portfolio, revised DER estimates, and RFP Proxy Resources, respectively.

[66] Reference **Appendix B Sequoia methodological update** for additional detail.

Figure 24. Incremental Changes to Capacity Need - Summer 2028 Reference Case



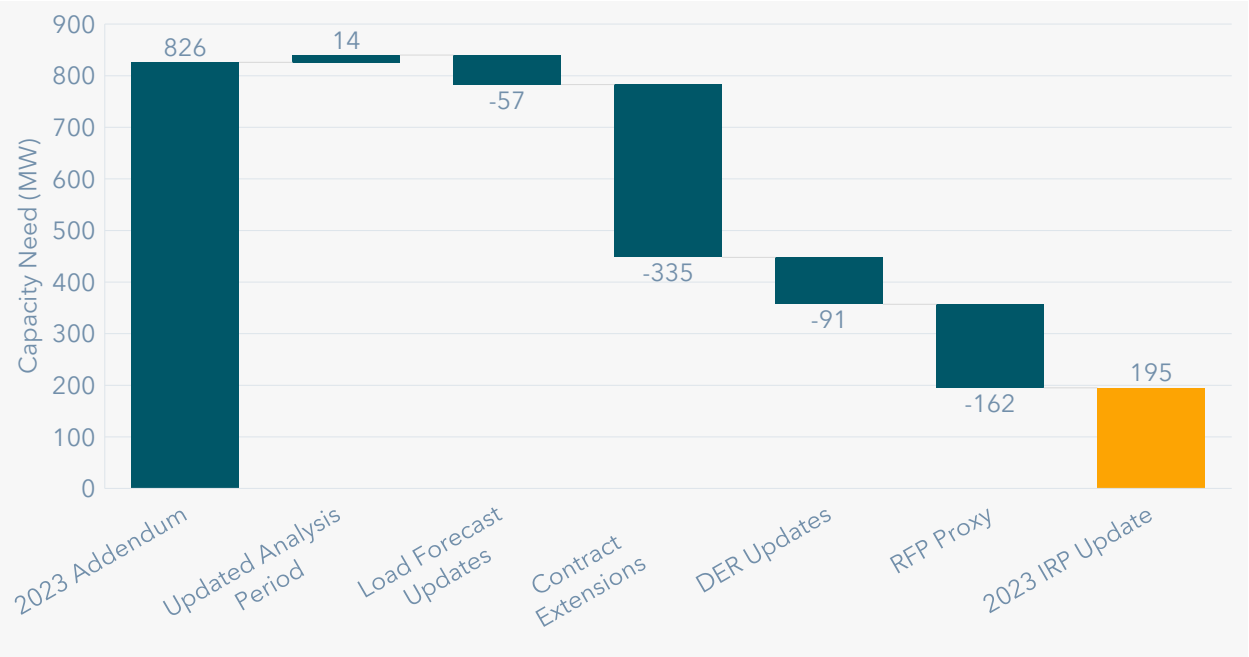


Figure 25. Incremental Changes to Capacity Need - Winter 2028 Reference Case

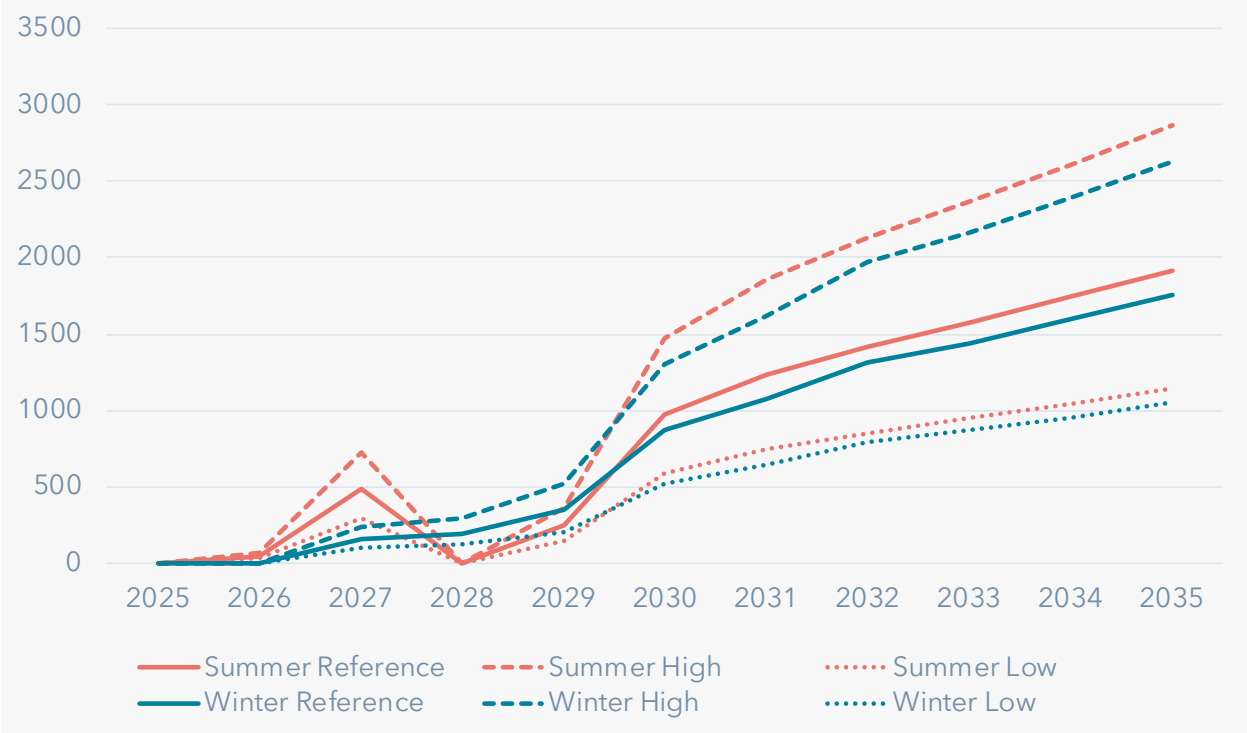


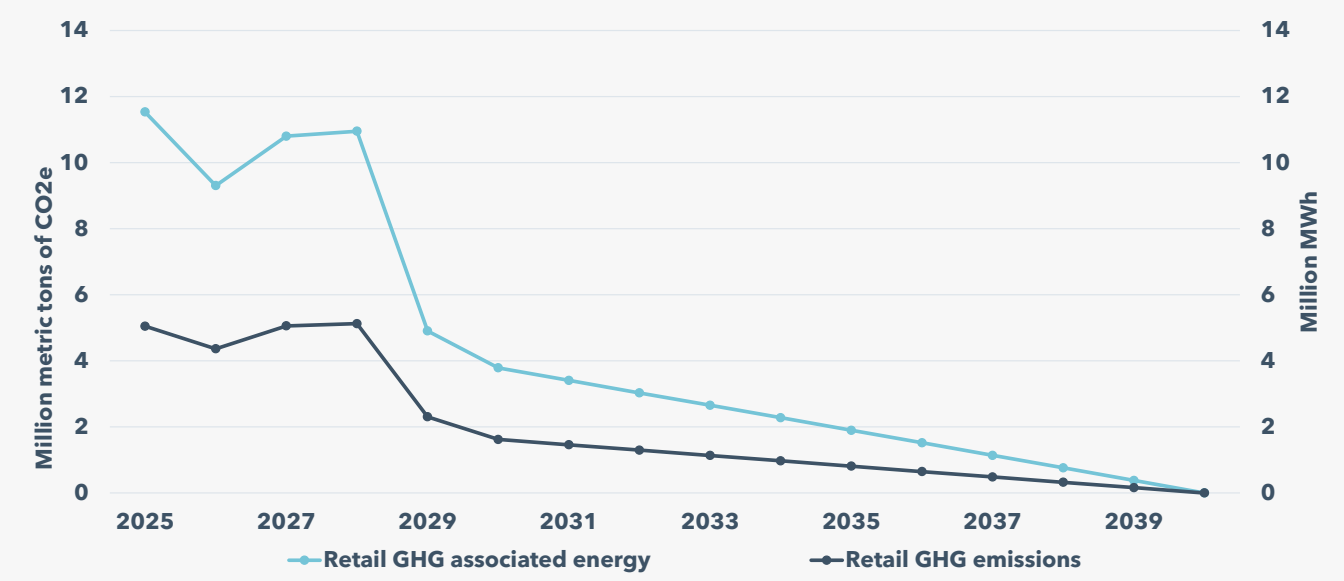
3.4.3 Capacity need under different futures

The 2023 CEP/IRP Update models capacity need across low and high need futures to capture uncertainty in both supply and demand side variables. **Figure 26** shows the capacity needs of the low and high need futures and the Reference Case. The figure suggests the different futures

approximate a uniform shift of reference case needs, resulting in 0 MW of need prior to 2030 in both seasons, except summer 2027. The high need future results in approximately 700 MW more need on average in each season for years 2030-2035.

Figure 26. Capacity need under different need futures: 2026-2035

3.5 State policy requirements



This section describes how State policy requirements are imposed through the utility regulatory framework and updates PGE made to reflect these constraints as part of the 2023 CEP/IRP Update.

3.5.1 HB 2021

The 2023 CEP/IRP was the first resource plan published by PGE that addressed the requirements of HB 2021. The emissions targets of HB 2021 remain unchanged from the 2023 CEP/IRP Update; compliance with these requirements is incorporated as the default assumption in modeling, including the creation of the Preferred Portfolio and the Action Plan. More details on modeling specifics can be found in those chapters of this document.

PGE continues to rely on a linear GHG reduction glidepath to inform the modeling as it was found to provide the best combination of cost, risk, and rate of emissions reduction amongst a variety of glidepaths tested in the Appendix I C-level analysis of the 2023 CEP/IRP. The impact of this glidepath is a limit of the thermal generation and market purchases with associated emissions retained for retail load. Updated data and analysis described in Chapter 3 inform an updated emission reduction glidepath presented in **Figure 27**.

Figure 27. GHG emissions & energy associated with serving Oregon retail load (Reference Case)

The 2023 RFP procurement results are not yet final but could add resources by the beginning of 2028. While further resource procurement will allow for more portfolio additions, these are unlikely to come online before the beginning of 2029 due to the time needed for procurement processes and construction timelines. Consequently, all current resources are necessary to meet demand and maintain reliability until 2029. Modeling does not include any additional non-emitting resources until the beginning of 2029 at the earliest. This situation limits the near-term emissions reductions achievable by PGE over the next three years. As a result, the updated emissions glidepath in the near-term reflects emissions levels more consistent with recent history given inability to alter the current generating mix prior to 2029.

PGE is accelerating procurement through RFPs between now and 2030. PGE has requested approval of its 2025 RFP in Docket UM 2371 to continue to seek resources to meet needs that remain after the conclusion of the 2023 RFP. Possible resource procurements from the 2025 RFP are presently unknown and therefore not included in this analysis.

Figure 28. Total (retail + wholesale) GHG emissions under the adjusted linear reduction glidepath (Reference Case)

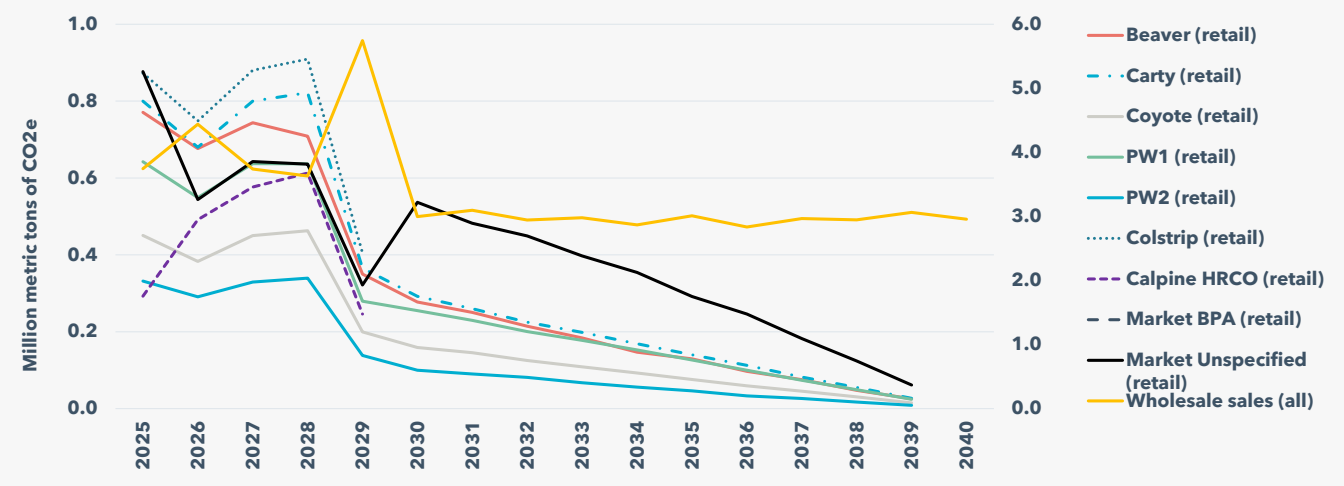


Figure 28 reflects GHG emissions projections from thermal generation and market purchases under the updated decarbonization glidepath. The lines specific to individual resources show retail GHG emissions. The specified wholesale sales category captures GHG emissions from sales from all sources not accounted for in retail sales that in the Update forecast support customer affordability through reduced net-variable power costs and reflect ongoing participation in the wholesale market to support reliability of the regional power system.

To achieve the HB 2021 emissions target in 2030, integration of non-emitting resources onto PGE's system will enable a systematic reduction in fossil fuels serving Oregon retail load and subsequent GHG reductions. As non-emitting energy and capacity resources are added, the amount of thermal output from natural gas and coal for Oregon retail load is reduced to meet the emissions targets. The market for thermal generation is increasingly constrained across the West, with clean energy or GHG requirements in place in almost every state in the Western Interconnection. Thermal generation sold into the Western Interconnection is therefore increasingly subject to the GHG or clean energy requirements of other states. For example, fossil fuel energy exported to California and Washington incurs direct carbon pricing obligations. These policies, and dramatic addition of non-emitting resources anticipated across the region, contribute to reducing the quantity of economically dispatched thermal output in PGE's forecasts.

3.5.2 RPS obligation

RPS requirements were included in the 2023 CEP/IRP and will continue to be accounted for in portfolio analysis in the 2023 CEP/IRP Update. PGE's RPS obligation, which is a function of the forecasted load, has been updated to reflect the updated load forecast used in the Update. Updated RPS requirements are shown in **Table 11**. The Preferred Portfolio's compliance with RPS requirements is demonstrated in **Section 6.2 Preferred Portfolio**.

Table 11. Updated RPS obligations Reference need future

Year	RPS requirement (% of retail sales)	RPS requirement (MWa)
2025	27%	482
2030	35%	748
2035	45%	1155
2040	50%	1470

This filing has not made any updates to assumptions regarding the Company's REC bank since the 2023 CEP/IRP. In Order No. 24-096, the OPUC directed PGE to provide a more detailed RPS analysis in the next CEP/IRP, and PGE intends to include this analysis and broader REC strategy in the 2026 plan.[67]

3.5.3 Small scale renewables standard

Following Commission direction, this Update will explicitly account for Oregon's small-scale renewable (SSR) requirement in its modeling.[68] The SSR requirement that, starting in 2030, 10 percent of aggregate electric capacity in PGE's portfolio be composed of renewable facilities 20 MW or smaller in size is incorporated into portfolio analysis. In this update, PGE has added a new constraint and a new SSR proxy resource option in ROSE-E to ensure that the Preferred Portfolio is compliant with SSR requirements. The SSR proxy resource option is described in **Section 5.4 SSR resource**. The quantity of resources forecasted to be required to meet the 10 percent requirement, which is dependent on the quantity of resources added in the Preferred Portfolio, is presented and discussed in **Section 6.4 Small scale renewables plan**.

[67] Direction for future planning on RECs can be found on page 22 of the final order, available at: https://apps.puc.state.or.us/orders/2024ords/24-096.pdf.
[68] The SSR requirement is included based on Commission direction in the LC 80 final order. See page 11 at: https://apps.puc.state.or.us/orders/2024ords/24-096.pdf.

Chapter 4. Transmission landscape

PGE owns transmission assets and holds transmission contract rights for reliable delivery of electricity from generation resources to load. Additional transmission rights will be required for PGE to access more diverse resources, decarbonize, and maintain adequacy. However, there is a limited amount of existing transmission available for future resources to use. This chapter provides an update on relevant evolving topics discussed more fully in the 2023 CEP/IRP and provides an overview of PGE's current transmission environment, projects in PGE's system planning, and options in IRP modeling.

Key Highlights

- The transmission system serving PGE customers is highly constrained, with limited existing transmission available for future resources, particularly on BPA's system which supports limited resource additions prior to further transmission upgrades.
- The North of Pearl (NOPE) flowgate has emerged as a significant constraint since August 2023, creating operational challenges that could be exacerbated by ongoing regional trends that are causing increasing south to north flows near Portland. Multiple projects are required to address reliability risks related to this flowgate.
- Transmission plays an essential role to access diverse generation resources that are unavailable within PGE's service territory. Several transmission projects in various stages of development have been identified to help PGE access new renewable resources from diverse geographic areas.

Developments Since 2023 IRP

This Update reflects significant developments in PGE's transmission planning since the 2023 CEP/IRP. The North of Pearl flowgate, which BPA established in August 2023, has created operational constraints during periods of renewable resource imports from California and the desert southwest across PGE's service territory. For the Bethel-Round Butte (also known as Warm Springs Power Pathway) project, PGE and the Confederated Tribes of Warm Springs have successfully secured a $250 million Grid Resilience and Innovation Partnerships (GRIP) Program grant, enabling survey work to begin. PGE has further refined additional transmission options in the modeling based on third-party analyses from Energy Strategies and Energy GPS, reflecting more realistic estimates of project timelines, achievable capacity, and market access benefits.

Strategic Implications

These changes highlight the growing urgency of PGE's transmission needs as the company works toward decarbonization goals while facing increasing load growth and system constraints. The emergence of the North of Pearl flowgate creates new operational challenges that will require collaborative solutions with BPA. The GRIP funding for the Bethel-Round Butte project improves its economics and solidifies its role as a valuable upgrade. Overall, the refined analysis of transmission options, further described in **Section 4.6 Transmission options for portfolio analysis,** provides a clearer picture of the timing and benefits of various projects, which will inform PGE's strategy for planning sufficient transmission capacity to access diverse resource zones and potentially lower cost markets.

Staff Recommendations Incorporated

The Update addresses several conditions from LC 80 Order 24-096. Broadly, the Update refined and expanded analysis of transmission and local resources as alternatives to large-scale transmission expansion. PGE has conducted a more comprehensive analysis of transmission constraints and potential solutions as supported by third party analysis. The company has expanded its evaluation of transmission options beyond BPA's system to include potential projects that would access more diverse climate zones, responding to stakeholder concerns about transmission development matching the urgency of PGE's needs. The update also reflects PGE's continued assessment of the Bethel-Round Butte 500 kV upgrade, which was identified by the OPUC as a project to study for increasing PGE's import capability.

4.1 Transmission and regulatory environment

PGE-owned and contracted-for generating resources to serve load are both directly connected to PGE's transmission system and remote to PGE's system. PGE's transmission portfolio – comprised of PGE-owned assets and held transmission rights – is designed to ensure reliable delivery of electricity from this broad array of generation resources to load. Variable energy resources that generate non-emitting electricity will need to be added to meet growing load and decarbonize towards the targets of HB 2021. Increasingly these resources are expected to be developed in new geographic areas, with their delivery to PGE's system requiring expanded transmission infrastructure and growing interconnectedness in the West.

4.1.1 Regulatory environment

As a vertically integrated investor-owned utility that is regulated by the Federal Energy Regulatory Commission (FERC), PGE is obligated by FERC to functionally separate its Transmission Function (PGET) from its Merchant function (PGEM). PGET is required to plan and operate PGE's transmission system in a non-discriminatory manner that provides open access to all transmission customers, including PGEM. This means PGET cannot unduly preference PGEM and, by extension, the retail customers that PGEM serves. PGET's transmission customers include

PGEM, Oregon-defined Electricity Service Supplier (ESS) customers, BPA, and transmission customers who utilize PGE's transmission system to transmit power across the region.

PGEM is responsible for purchasing transmission rights – on PGET's transmission facilities and other regional providers – to deliver power to PGE's service area to meet PGE's load obligations. PGEM holds extensive rights on PGET's transmission system, as well as the BPA transmission system, the largest transmission provider in the Pacific Northwest.

Consistent with Federal requirements, PGE must plan and build its transmission system to meet the needs of all PGET transmission customers, including PGEM, ESS customers, and all other transmission customers.[69] Transmission customers typically utilize PGE's transmission system to serve load contained within PGET's system footprint or to transfer power through PGET's system to other transmission systems.

Transmission customers who serve load located within PGE's Balancing Authority Area (BAA) generally use a transmission service called Network Integration Transmission Service (NITS). Transmission customers who move power through PGET's transmission system for delivery to a point on another transmission system typically use Point-to-Point (PTP) transmission service. For PGET to develop its transmission plans for most NITS customers, with the State of Oregon-defined Electric Service Supplier (ESS) customers being the exception, PGE uses the ten-year load-and-resource (L&R) forecasts supplied by NITS customers along with PTP transmission service commitments and requests. ESS customers are not currently obligated to designate generation resources to serve their loads because they are allowed to take a secondary form of NITS service under Oregon law.

PGET uses the NITS customers' L&R forecasts and the best available information, including transmission service requests, generation interconnection requests, and information from neighboring transmission providers' transmission planning and construction activities, to determine the need and timing for investments in the transmission system. The bulk of PGET's NITS customer-driven needs comes from PGEM, which supplies energy and capacity for PGE's retail customers. Oregon's HB 2021 is central to PGE's strategy and the resource decisions of PGET's transmission customers, including PGEM, resulting in the need to develop new transmission system investment and deployment plans. The 2025 L&R letter from PGEM to PGET documents the expectation that PGEM's future resource needs will change, given the need to meet growing load and comply with HB 2021. PGET works with its customers, including PGEM, to plan the PGET transmission system to maintain reliable service as its customers' resource mixes change over the next several years.

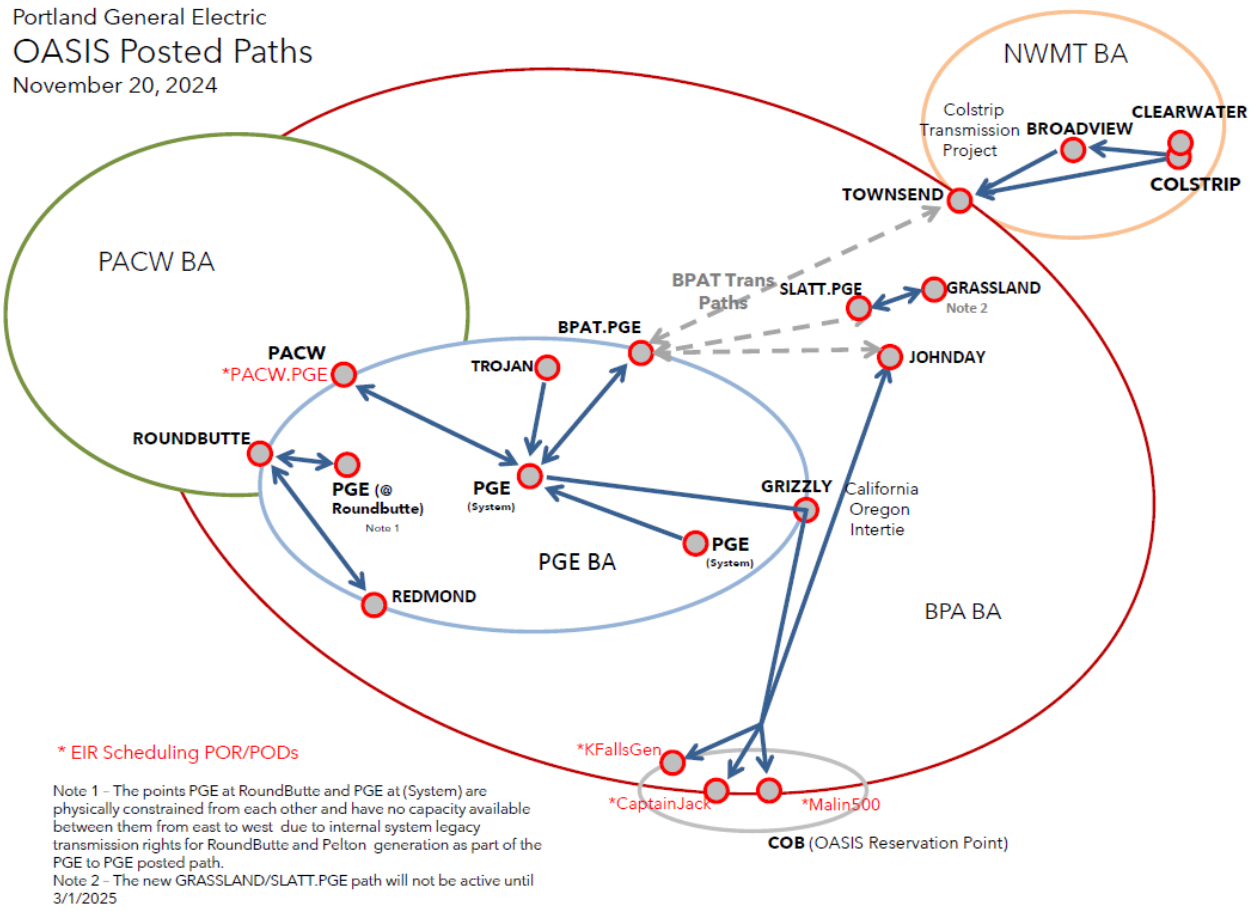
While PGE's transmission customers, except ESSs, are required to provide annual L&R forecasts looking ten years into the future, transmission development in the West requires lengthy planning, rights-of-way (ROW) acquisition, permitting, and construction timelines that often take years. As such, PGET cannot rely solely on the L&R forecasts to plan future transmission investments and must plan its transmission system on a longer time horizon.

[69] Such as the principles of FERC Order Nos. 890 and 1000 and requirements of PGE's FERC-approved open access transmission tariff (OATT).

4.1.2 PGE's transmission system

PGE's transmission system serves roughly half of Oregon's population and powers approximately two-thirds of Oregon's commercial and industrial activity. It is highly integrated with other transmission systems in the west due to the highly networked nature of the regional transmission system.

The PGE service area is a compact area located primarily in Oregon's Willamette Valley. PGE owns and operates its transmission system and BAA to deliver energy to retail customers while also providing transmission service to other wholesale transmission customers as required by FERC and in accordance with PGET's OATT. Most of PGE's existing, owned transmission assets are within the PGE service area. PGE also owns transmission assets in central and southern Oregon and Montana. PGE is obligated to plan, build, and operate the transmission system in a manner that reliably delivers power to serve customer load and the needs of PGET's OATT transmission customers.



The PGE transmission system has 268 miles of 500 kV, 334 miles of 230 kV, and 559 miles of 115 kV lines, 454 circuit miles of 57 kV lines, and includes 176 substations and switching stations.[70]

4.1.3 Transmission system topology

PGE's transmission system (**Figure 29**) is highly interconnected with and exists almost entirely within the footprint of BPA. PGE is also interconnected to the western part of PacifiCorp's system, albeit with a much smaller transfer capability than PGE's interface with BPA. PGE's interface with PacifiCorp is primarily used to meet obligations within the Energy Imbalance Market (EIM). PGE is a co-owner of the Colstrip Transmission System, two 500 kV transmission circuits in Montana that runs between Colstrip and BPA's system in western Montana. Additionally, PGE owns one of the three 500 kV circuits in central Oregon that comprise the Northwest AC Intertie (NWACI), which is part of the California-Oregon Intertie, that connects Oregon to California. PGE jointly owns NWACI with BPA and PacifiCorp, and it is operated by BPA.

[70] An asset reclassification of PGE's 57 kV assets as transmission has been approved by the OPUC and is currently under review with FERC.

Figure 29. Oasis posted paths

4.1.3.1 BPA and Pacific Northwest transmission system

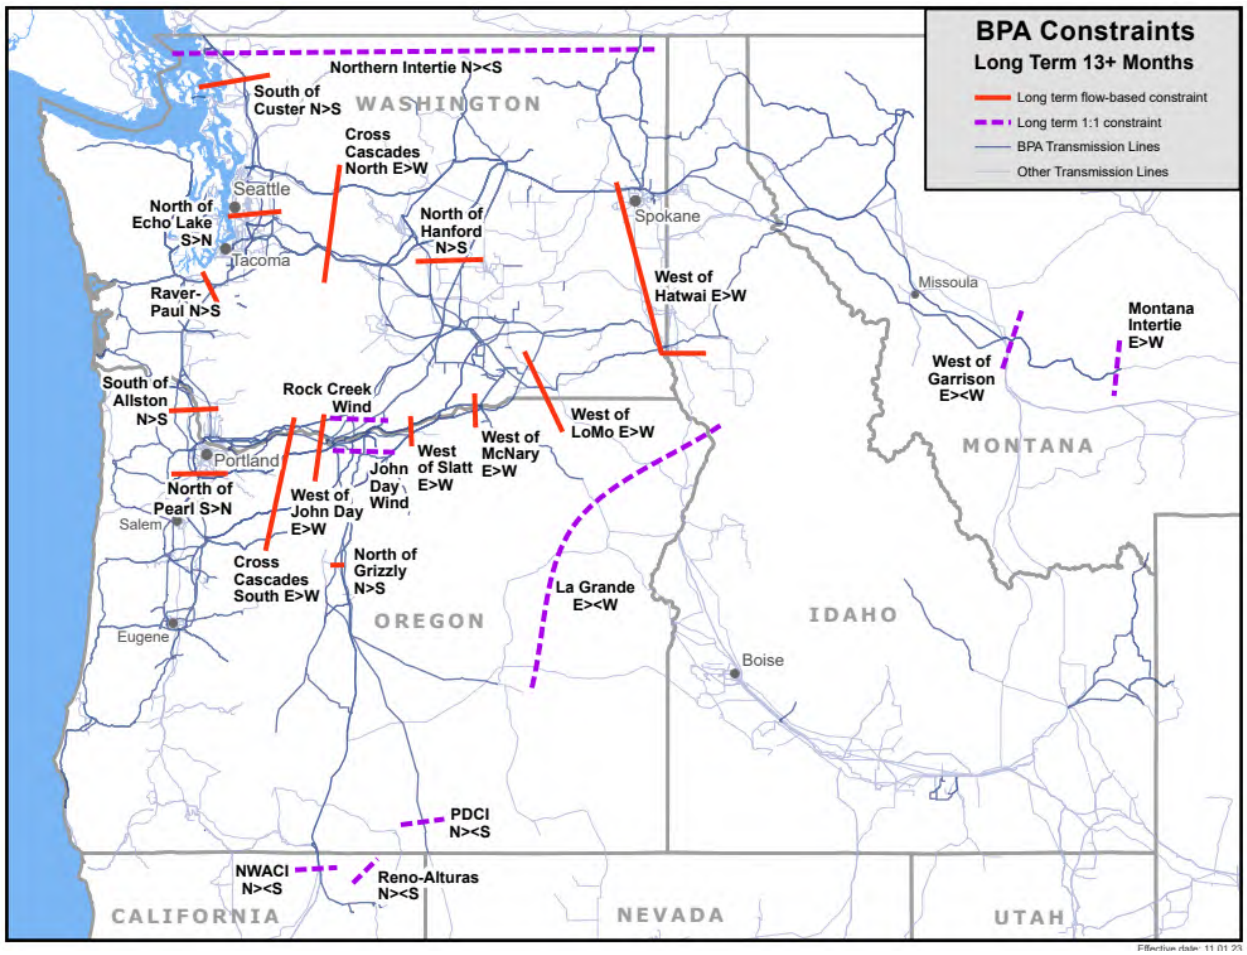
BPA is a federal power marketing administration (PMA) that operates approximately 75 percent of the transmission in the Pacific Northwest, consisting of more than 15,000 miles of high-voltage transmission lines. BPA operates transmission in Idaho, Oregon, Washington, western Montana and small parts of eastern Montana, California, Nevada, Utah and Wyoming.[71]

4.1.3.2 PGE and BPA

PGE's system is largely surrounded by BPA's transmission system. PGE has long relied on BPA transmission to deliver energy from throughout the west to serve PGE load. PGE currently holds over 4000 MW of long-term firm transmission under contract with BPA. The rights held on BPA's system deliver energy from discrete points, either on BPA's system or from the edge of BPA's system to PGE. These rights are known as point-to-point transmission rights and the points of receipt and delivery are set in perpetuity. This means that if a resource that would normally utilize

[71] BPA transmission system: https://www.bpa.gov/-/media/Aep/about/publications/maps/bpa-transmissionlines-and-facilities.pdf.

certain rights is unavailable, the unused transmission rights cannot be used to access different points on BPA's system. As discussed by BPA and stakeholders throughout BPA's recent Transmission Study and Expansion Processes (TSEP), BPA's system is effectively fully subscribed, and incremental transmission requests are unlikely to be granted until the early to mid-2030s, pending significant upgrades. Additionally, BPA has recently announced a pause to their TSEP process entirely while they attempt to develop reforms to their transmission service request process. As such, future transmission planning and procurement activity recommended throughout this chapter is a way to expand and diversify transmission options as the energy associated with serving load is decarbonized. It is important to recognize that the identification and development of transmission solutions are long-lead-time activities that often take longer than the Action Plan window time horizon of the IRP. Given this dynamic, it is necessary to engage in transmission planning and development on a forward-looking basis beyond the Action Plan window. See the description of the West-Wide Transmission Study Project (**Section 2.3.1 Western Transmission Expansion Coalition (WestTEC)**), a 10-year and 20-year transmission study addressing interregional and interstate transmission needs spanning the Western Interconnection.



4.1.3.3 Paths and flowgates

To get to PGE's system, power generated or purchased from remote locations must travel through different paths and flowgates on the region's transmission system. A flowgate is a collection of transmission lines and facilities that collectively start in a geographically similar area and terminate in a different geographically similar area. These flowgates are typically operated by BPA and are shown in **Figure 30**. The flowgates that currently have the most significant impact on PGEM's transmission rights portfolio are North of Pearl, South of Allston, Raver Paul, West of John Day, and Cross Cascades South, all of which are constrained, with little or no ATC.

Flowgates are used by BPA as a way to monitor flow through areas of constraint on their system. Conceptually, when managed appropriately, the establishment of flowgates allows for a transmission provider to monitor system flows and take action to mitigate system constraints in the real-time operations horizon. Congestion at flowgates can be caused by different reasons including:

- Localized high loads at the receiving end of a flowgate in excess of flowgate capacity,
- Localized concentration of generation resources at the sending end of a flowgate trying in excess of flowgate capacity, and
- Flow-though, also known as loop flow, where far-flung regional load and generation dispatch scenarios create flows in excess of transmission capacity.

Figure 30. BPA Constraints[72]

The following summarizes the most significant flowgates and paths affecting energy delivery from remote resources to PGE's service area.

- The North of Pearl flowgate was instituted in August 2023 and has presented PGE with challenging operational scenarios since. The flowgate generally exists between the Wilsonville and Sherwood areas, SW of Portland. It is most constrained during periods of high renewable resource production in California and the desert southwest when it is also cool in the Pacific Northwest. Much less frequently, high Portland area loads can also contribute to high flows on North of Pearl. Further explanation of the North of Pearl flowgate will be described below.
- Some amount of energy from the majority of PGE's generating resources flows across the constrained South of Allston flowgate. This flowgate is most constrained during heavy summer and heavy winter loading periods. The South of Allston flowgate is a collection of several electrically parallel transmission lines that route from north to south just north of the

[72] Source: https://www.bpa.gov/-/media/Aep/transmission/atc-methodology/atc-long-term-constraints-11-1-23.pdf.

Portland metro area. Historically, the South of Allston flowgate was most constrained in the summer months.

- A large portion of the energy flowing from PGE's remote resources flows across the West of Cross Cascades South (WOCS) flowgate. Additionally, depending on the resource location, energy will flow across the West of John Day flowgate and the Raver-Paul flowgate. The WOCS flowgate is typically most constrained during heavy winter loading, while the West of John Day and Raver-Paul flowgates are typically most constrained during heavy spring and summer loading. PGE's Bethel-Round Butte 230 kV transmission line is part of the WOCS path.

Energy from PGE's resources in Montana first flow over the West of Garrison flowgate before reaching several other flowgates on the way to PGE's load in the Willamette Valley.

4.1.3.4 North of Pearl

The North of Pearl (NOPE) flowgate consists of a combination of BPA and PGE lines that run between BPA's Pearl substation in Wilsonville, OR to PGE's Sherwood substation in Sherwood, OR. The flowgate is comprised of BPA's Pearl-Keeler 500kV line, the Pearl BPA-Sherwood #1 & #2 230kV lines, and the McLoughlin-Pearl BPA-Sherwood 230kV line. The flowgate was instituted on August 11, 2023, a few days prior to a heatwave that blanketed much of the PNW. The NOPE flowgate was originally intended to be enabled in November 2023, prior to the winter operating season, but was expedited by BPA with the extreme heat that occurred in August 2023.

The NOPE flowgate was originally enabled for the purposes of monitoring south-to-north (S-N) flows through the Portland area. Previously, S-N flows were monitored as part of the South of Allston flowgate, but in a S-N flow pattern. BPA eventually shifted the focal point for monitoring S-N flows from the South of Allston flowgate to the more appropriate NOPE location. The South of Allston S-N flowgate was retired in early 2024.

During spring of 2024 and 2025, there have been several occasions where the North of Pearl flowgate reached S-N transmission flow levels near the upper limits of the flowgate limit high renewable resource imports from California and the desert southwest and low hydro generation output from British Columbia. Additionally, unscheduled energy flows have been observed coming into the Pacific Northwest and through PGE's service territory. These unscheduled flows, and the load and resource dispatch patterns several hundreds of miles away from PGE's system in either direction, have caused BPA to take real-time mitigation actions that included: sending congestion signals to the EIM marketplace that dispatched PGE Port Westward gas resources unexpectedly, halting short-term firm transmission sales, stopping all hourly redirects on BPA's system, and curtailing approximately 4000 MWs of transmission schedules across the region. If these scenarios had happened at higher local Portland area load levels, BPA curtailment of firm transmission schedules could have resulted in reliability concerns for PGE.

As PGE anticipates significant load growth into the future from the semiconductor and data center industrial sectors, much of the forecasted growth will locate in the Beaverton/Hillsboro area on the west side of PGE's service territory. Existing constraints north of the NOPE flowgate will limit industrial growth here. Additionally, it is expected that solar deployments will continue

in California and the desert southwest, further exacerbating the NOPE flowgate constraint. PGE and BPA are collaboratively planning how to address the NOPE constraint. Constraint mitigation will require a combination of new and upgraded transmission facilities as well as new operational scenarios that are currently being evaluated.

4.2 PGE transmission projects

Various FERC and NERC compliance and regulatory obligations require that PGE develop, engineer, procure, and construct PGET-owned transmission projects. Transmission projects can develop as a result of NERC reliability obligations, be driven by transmission or interconnection customer actions, result in response to state policy actions, load growth, and resource forecasts and requests by PGET's network transmission service customers.

Key transmission projects placed in service in 2024 include:

- A new 1.7 mile 230 kV transmission line between BPA's Keeler substation and PGE's Horizon substation, both located in Hillsboro, Oregon.
- The Evergreen Substation, a new bulk substation located in Hillsboro, Oregon that facilitates the interconnection of PGE's Constable Battery Energy Storage Facility, as well as the ability to serve new load in Washington County.

PGE revisits transmission plans and projects on a specific time cadence, with those in **Table 12** representing current plans. Future needs will continue to be evaluated over time. For the Near-Term and Long-Term Planning Horizon, PGE has identified transmission projects which will be needed to maintain compliance with the NERC TPL-001-5 standard. Each project has identified a completion date and any long lead time items that are required as a part of the work. Any construction phases which need to be scheduled are also identified and assessed to ensure that the reliability to the Bulk Electric System is not compromised during each phase of a project.

Table 12. Transmission Projects

Project Name	Anticipated In Service Date
Bethel-Round Butte 230kV Fixed Series Capacitor Project	2027 March
Bethel-Round Butte 500kV Project	2032 November
Blue Lake (Sundial) 230kV Battery Project	2025 June
Grassland 500kV Breaker Addition	2026 July

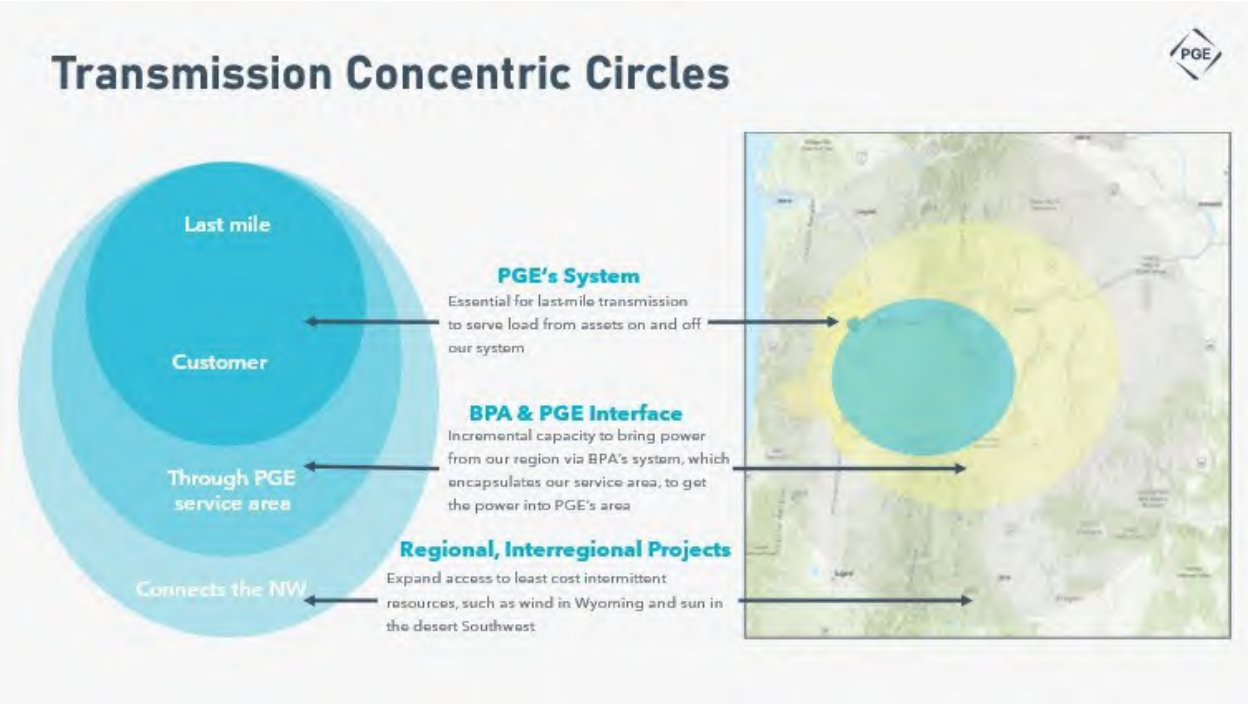
Hillsboro 500kV Expansion (Arden/Harrington)	2030 May



4.3 Transmission strategy/outlook

PGE will deploy a portfolio of strategies to meet future transmission needs and intends to explore expanding transmission access through the acquisition of rights on third-party systems, equity investment in regional projects as they are constructed, and PGE-developed projects, including upgrades of existing assets. PGE is also exploring Grid Enhancing Technologies (GETs), including actively putting in dynamic line ratings, with some of these projects utilizing advanced conductor and capacity enhancements. These different avenues of transmission expansion will allow PGE to optimize for the least cost and least risk plan to meet future needs and will continue to be discussed in the next full IRP.

4.3.1 Concentric circles of transmission

As PGE assesses strategies to meet load growth obligations and decarbonization goals and HB 2021 requirements, PGE must ensure transmission capacity is available from geographically diverse resources. Often, delivering energy to PGE's system requires multiple segments of transmission lines. Because PGE's network load is centralized in a compact service area, instead of dispersed out in multiple areas of load, PGE utilizes a concentric circle model to contemplate available transmission options, displayed below in **Figure 31**.

Figure 31. PGE Transmission Concentric Circles

4.3.1.1 PGE's system

The inner most circle in the model, 'Circle One', is predominantly used to move power through PGE's system for the purposes of safely and reliably serving PGE network load. It is important to remember that PGE network load includes PGE retail customer loads and also the loads of ESS customers and other transmission customers. PGE performs a series of annual transmission planning and reliability assessments. As Circle One on the system is planned, not only must PGE network load be accounted for, but also the potential for energy to flow through PGE's system enroute to other utilities in the western interconnection. These routine transmission planning efforts identify the projects necessary to reliably and safely serve PGE load, accounting for transmission service requested through PGE's service territory, and accounting for the impact regional resource dispatch patterns can have on PGE's transmission system.

4.3.1.2 Connecting PNW to PGE's transmission system

'Circle Two' in the model connects PGE's service territory to BPA's system and the rest of the PNW transmission system. Because PGE's service area is so concentrated in the northern Willamette Valley and new non-emitting generation resources will be generally located in remote geographic locations, PGE must determine how to best enable resources to reach the system. An example of Circle Two transmission would be transmission that enables energy to cross the Cascades enroute to PGE or adds additional capacity to the South of Allston flow gate flowing from north of the Portland Metro area.

4.3.1.3 Connecting the PNW to other regions

'Circle Three', the outer most circle, connects the PNW to other resource rich regions like the Dakotas and eastern interconnection, Rocky Mountains, and the Desert Southwest. Projects that connect multiple regions are often proposed and developed by large independent transmission companies who can more easily absorb the additional risk these large ambitious projects carry.

4.3.1.4 Grid Enhancing Technologies (GETs)

GETs are solutions that aid in the optimization of existing grid infrastructure. These technologies help PGE more effectively manage power flow for the aim of increasing capacity, efficiency and reliability on the system and to reduce the need for more costly grid expansion. The categories below detail GETs in use and planned for PGE's service area.

Dynamic Line Ratings (DLRs)

PGE is integrating DLRs beginning 2025 through partnership with the Electric Power Research Institute (EPRI) and BPA. DLRs are a method for determining available transfer capability of transmission lines utilizing real-time data to account for weather. DLRs can increase real-time capacities under favorable weather conditions (lower ambient temperature, higher wind speeds, and cloud shadowing) and derate capacities when weather is unfavorable. This additional operational flexibility is intended to help with reducing overloads due to unplanned outages or allow for better certainty of planned outages and system impacts. An impact analysis will be studied in 2025 and refined as the DLR system goes in-service and real time performance data becomes available over the second half of 2025.

Conductor Coating Technologies

PGE is integrating heat-dissipating overhead conductor coating technologies that reduce power loss and increase power carrying capacity. PGE's first use of the coating is for the 1.5 mile Horizon-Keeler #1 230 kV reconductor project is expected begin construction in 2026.

Topology Optimization

PGE utilizes switching of circuit breakers on the existing system to optimize power flow. PGE operations teams have long used this tool to more effectively change system flows as an alternative to costly options such as generation redispatch. PGE is upgrading a 230kV circuit breaker at the McLoughlin substation in 2025 to support this topology optimization practice.

Advanced Conductors

PGE is working with EPRI and other utilities on the Grid Enhancing Technologies for a Smart Energy Transition (GET SET) initiative to design and construct high temperature Aluminum Conductor Steel Supported (ACSS) lines in the territory. PGE has utilized ACSS conductors since 2006 to help ensure efficient power transmission and mechanical reliability across long-distance transmission lines and these new high temperature low sag conductors are already integrated in PGE's transmission planning studies.

4.3.2 Existing PGE projects/local transmission plan

*Refers to the inner circle in **Figure 31.***

To address the needs identified during PGE's transmission planning assessments, a local transmission plan is developed that identifies the portfolio of projects to meet the needs of PGE's customers and to maintain and operate a safe, resilient, and reliable system. Historically, PGE has focused on planning within the inner circle for reliable and load service-driven transmission given PGE's unique geographic footprint within BPA's system. This was primarily because BPA traditionally had ample ATC on their transmission system that PGE has been able to leverage to transfer new remote generation resources to PGE's system. With the recognition that ATC inventories on BPA's system have been fully allocated, and that changes in resource dispatch patterns have created a paradigm shift in regional flow patterns on the west-wide transmission system, PGE's transmission planning and strategy have necessarily evolved from an approach based primarily on reliability and load service to a more proactive approach that aligns with future load service needs (described in **Chapter 3 System needs**) as PGE decarbonizes. It is important to recognize the significant transmission planning and project development efforts already underway that are necessary for reliable load service and proper cost allocation within PGE's load service area. PGE's local transmission plan has identified more than 20 projects, discussed in **Section 4.2 PGE transmission projects**.

4.3.3 BPA projects important to PGE

*Refers to all circles in **Figure 31.***

PGE's and BPA's transmission systems are highly interconnected, both in PGE's service area and around Oregon and the PNW. Because of the highly networked nature of PGE's transmission systems, PGE has been collaboratively working with BPA to ensure BPA has sufficient system reinforcements planned that, in concert with PGE's planned transmission projects, will enable PGE to reliably serve load. As a result of this collaborative system planning, PGE and BPA have identified a suite of projects, both joint PGE-BPA projects and BPA-only projects as shown in **Table 13**, necessary for the safe and reliable operation of the region's transmissions system. Several joint projects are inflight that will help address the NOPE flowgate constraint. In addition to joint projects, BPA has identified several projects that only involve work to their infrastructure that will have significant impact for PGE and its customers. Several of them are currently in-flight or in the scoping phase.

Table 13. PGE-BPA and BPA-only Transmission Projects

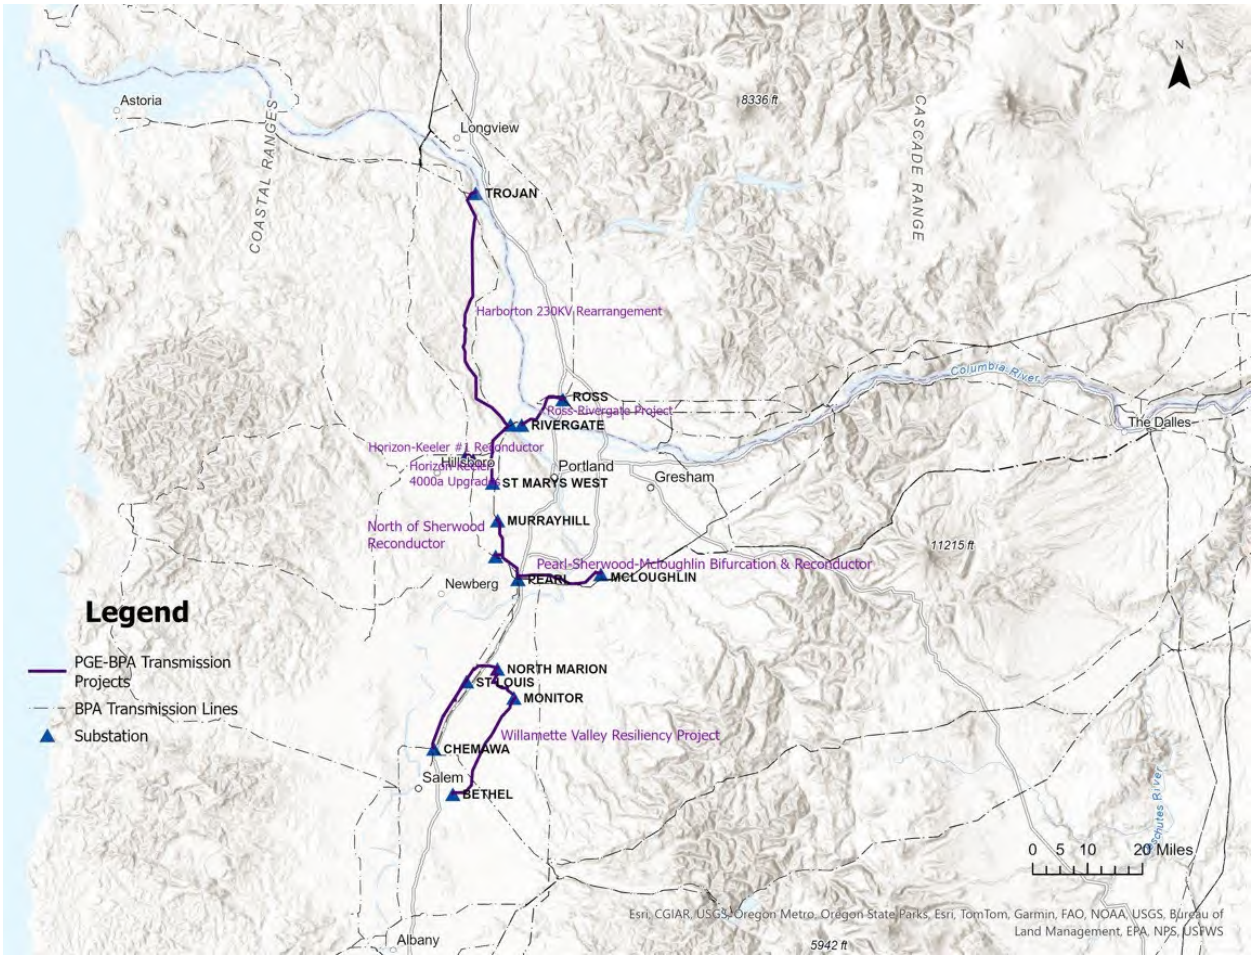

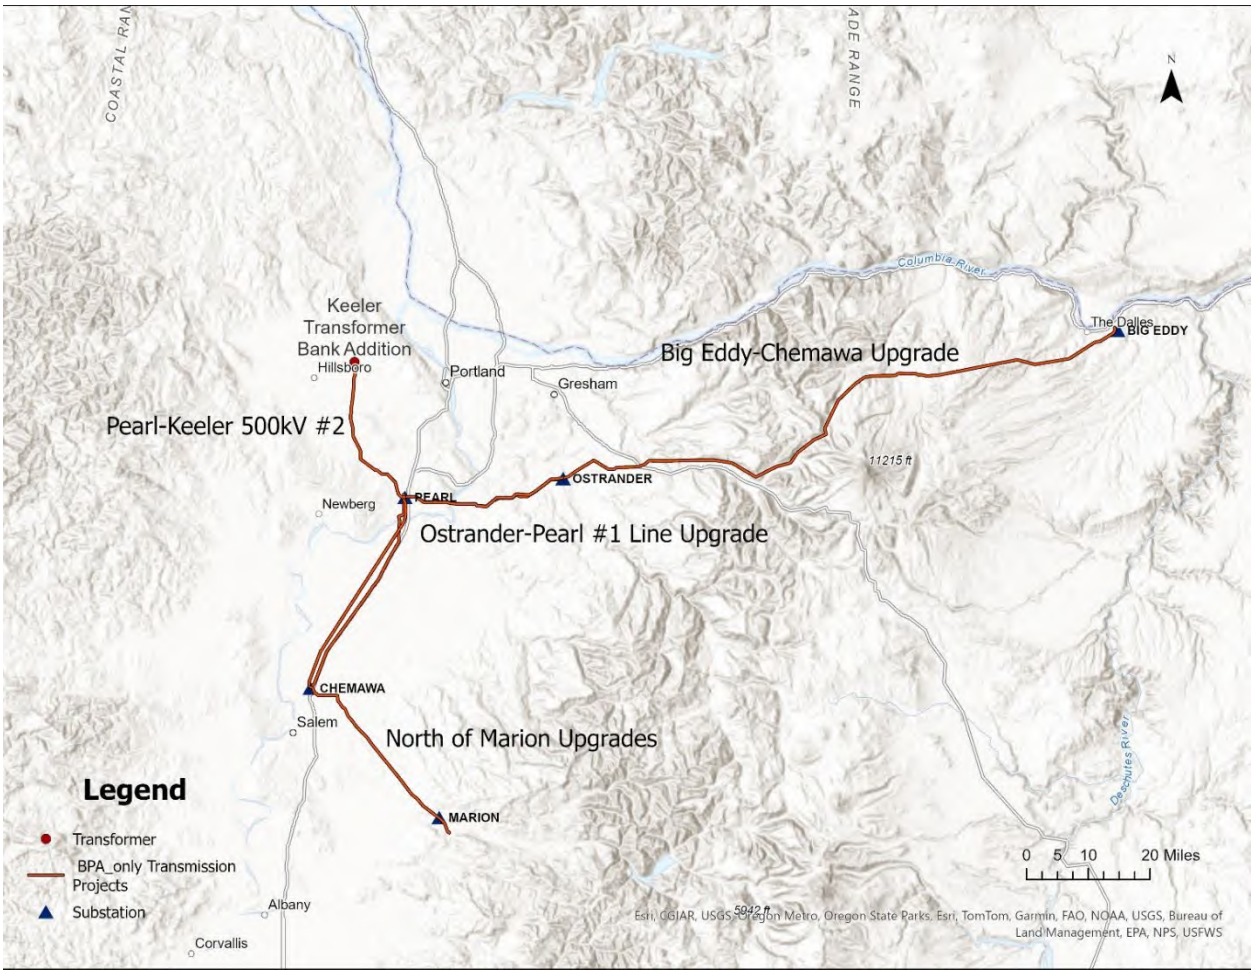

Figure 33. BPA-only transmission projects

4.4 Assessment of available BPA point-to-point transmission

Limitations on the region's transmission system constrain PGE's ability to access Pacific Northwest (PNW) renewable resources. For the 2023 CEP/IRP, PGE conducted a study of transmission service requests directed toward PGE in BPA's Transmission Study Request (TSR) Study and Expansion Process (TSEP) reports in order to estimate the quantity of transmission currently available. As part of the transmission-related assumptions and modeling in the 2023 CEP/IRP, PGE included these estimates of available capacity on BPA's transmission system as a resource build constraint in portfolio analysis. The total ATC available in the 2023 CEP/IRP was 1818 MW.[73]

PGE has refreshed these estimates for the Update with the most up-to-date data available. The updated values, shown in **Table 14**, are included as constraints on resource additions in portfolio analysis.[74] The total ATC has increased by 688 MW compared to the 2023 CEP/IRP to

[73] See Appendix H.7 of the filed 2023 CEP/IRP.
[74] The updated numbers and methodology were described by PGE in the October 2024 Roundtable Meeting. Available here:

2506 MW. Total ATC determines the quantity of resources that can be added to PGE's portfolio without incurring the costs associated with transmission upgrades or expansion (as described in **Section 4.6 Transmission options for portfolio analysis**).

Regional transmission constraints in the 2023 CEP/IRP required that each MW of new renewable resource had 1 MW of associated transmission capacity. In the Update, this assumption has been updated, with each MW of transmission capacity now allowing access to 1.33 MW of renewable resources (requiring that 75 percent of new resources have associated transmission rights).[75] This increases the quantity of accessible resources from 2506 MW to 3341 MW. Excluding offshore wind, which has additional constraints that push earliest COD in portfolio analysis out to 2036, this results in access to 2451 MW of off-system renewables prior to the first available transmission upgrade option in 2032. Transmission availability is identified by transmission zones, with the transmission zone associated with each proxy resource identified in **Table 15**.

Table 14. Transmission ATC by resource zone

Transmission Zone	Long-Term Firm	Conditional Firm	Total ATC
Christmas Valley	201	466	667
Gorge	179	418	667
McMinnville	45	105	150
Montana	96	224	320
Offshore	201	467	668

4.5 Third-party assessment of PGE regional transmission options

In response to Staff comments on the transmission action item and modeling from LC 80 Order 24-096, PGE contracted with two third-party consultants to more thoroughly evaluate viable transmission options and their modeled benefits.

First, PGE contracted with Energy Strategies to assess transmission options identified by PGE, their general viability and any alternative, related CODs, and firm MW access assumptions.[76] Three key categories of changes resulted from Energy Strategies' analysis, which were incorporated as seven transmission options into PGE's modeling as discussed in **Section 4.6 Transmission options for portfolio analysis**:

1. Two alternative projects were identified to replace PGE's options of TransWest Express for accessing Wyoming Wind Proxy Resources and Western Bounty for access to Nevada Solar Proxy Resources. Energy Strategies proposed these alternatives due to policy, price, and timeline risks with WesternBounty and TransWest Express.
2. CODs were adjusted outward into the future based on Energy Strategies' understanding of project statuses and best estimates of completion timelines.
3. MW access assumptions were adjusted downward to account for Energy Strategies' assessment of ATC and rights on the identified transmission paths.

Second, PGE contracted with Energy GPS to conduct a market liquidity analysis for energy markets adjacent to the Pacific Northwest.[77] This analysis developed an understanding of the added benefit that a given transmission project may provide through its connection to a broader but nearby market. To estimate the additional market access benefits of a transmission project, Energy GPS analyzed correlations in PGE's hours of greatest load with high load hours in CAISO, Desert Southwest (DSW), Midcontinent ISO (MISO) North, and Southwest Power Pool (SPP) North

[76] PGE's January 2025 Roundtable - Transmission Options. See also **Appendix J Transmission options study**.
[77] PGE's November 2024 Roundtable - Transmission - Step 3 - Market Access.

markets. The analysis resulted in two key conclusions, which PGE incorporated into each modeled transmission option's market access benefits:

1. It is reasonable to assume transmission to SPP North or MISO North can provide access to energy and capacity during critical hours for both summer and winter.
2. It is reasonable to assume transmission to DSW or CAISO markets can provide access to energy and capacity during critical hours during winter.

4.6 Transmission options for portfolio analysis

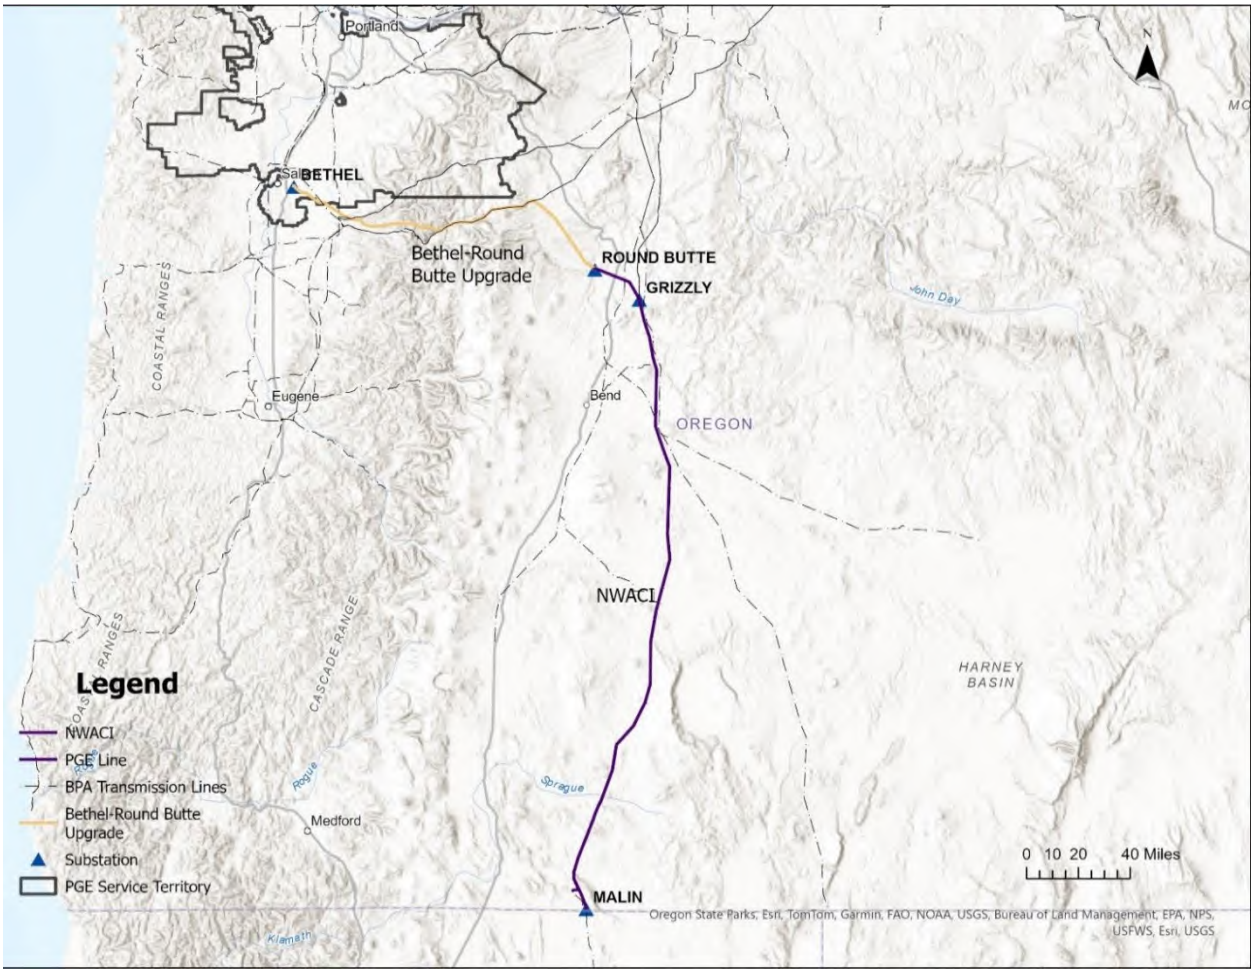
The transmission necessary to reach resource rich geographical locations can often rely on multiple segments of transmission infrastructure to reach from generation site to where demand is located. PGE continues to analyze and explore all publicly known transmission project opportunities in the west that could be useful in serving PGE loads but generally do not directly connect to PGE. PGE identified a list of potential transmission projects within the BPA-PGE interface (Concentric Circle 2, as described in **Section 4.3.1 Concentric circles of transmission**) and greater region (Concentric Circle 3). These projects would provide access to proxy BPA resources such as Gorge Wind and Christmas Valley Solar, and proxy interregional resources such as North Dakota Wind and Nevada Solar. The resulting list provides known possibilities that may allow PGE to expand access to off-system renewable resources and markets. PGE continues to conduct analysis of these projects and will update this assessment in the 2026 CEP/IRP.

The remainder of this section describes project specific details of options modeled in the 2023 CEP/IRP Update based on Energy Strategies' analysis and the assumptions used in modeling transmission options.

Figure 34 illustrates the transmission options recommended for study by Energy Strategies.

Figure 34. Overview of PGE Transmission Options

4.6.1 Bethel-Round Butte upgrade



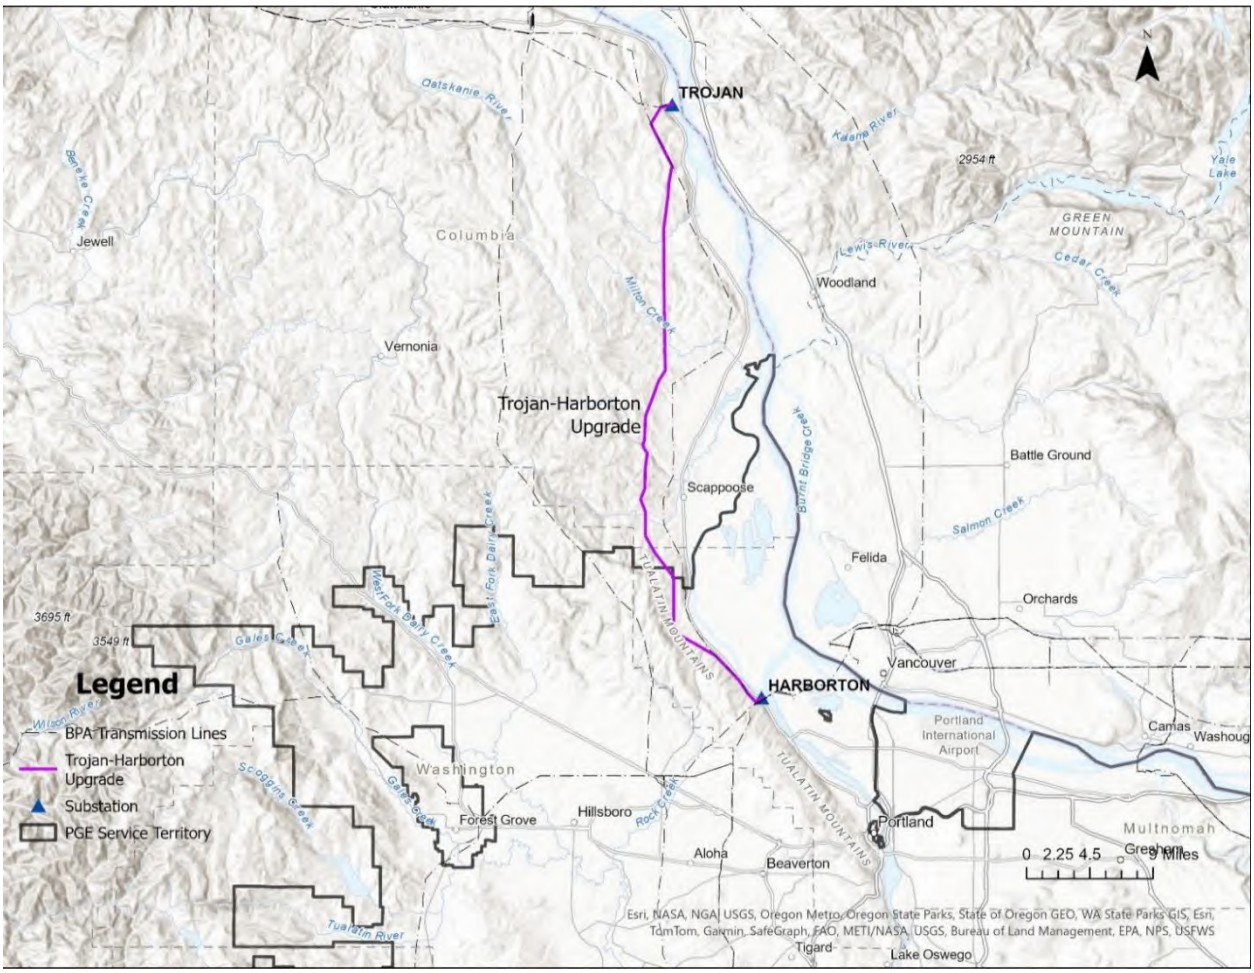
Bethel-Round Butte transmission project is a 98-mile 230 kV line upgrade running between PGE's Bethel and Round-Butte substations at the south-east edge of PGE's service territory. The project plans to rebuild the existing transmission line from 230 kV to 500 kV and build a second 500 kV line, enabling up to 3000 MW of additional resources from the BPA-PGE interface, or Concentric Circle 2 (**Section 4.3.1 Concentric circles of transmission**), to reach PGE's service territory. Resources within the BPA-PGE interface include: Wind Gorge, Wind SE WA, Solar CV, Solar MCMN, Solar Wasco, CV hybrids, and MCMN hybrids, and are resources that are assumed accessible by way of one wheel across BPA transmission infrastructure. Additionally, the project would increase access through the California Oregon Border (COB) to the CAISO market of 600 MW in winter.[78] The estimated commercial operation date (COD) for the upgraded line is 2032.

[78] PGE's November Roundtable - Transmission - Step 3 - Market Access.

The 2023 CEP/IRP characterized the Bethel-Round Butte transmission option as a valuable upgrade to the PGE system, necessary to integrate the scale of non-emitting resources required to offset fossil fuels.

In partnership with The Confederated Tribes of Warm Springs (CTWS), an application was submitted to the USDOE for a Grid Resilience and Innovation Partnerships (GRIP) Program grant for the Bethel-Round Butte upgrade. The GRIP application was successful, and a $250 million award was made to PGE's partners, the CTWS. The CTWS and PGE are currently in the process of developing the project.

Figure 35. Bethel-Round Butte Upgrade

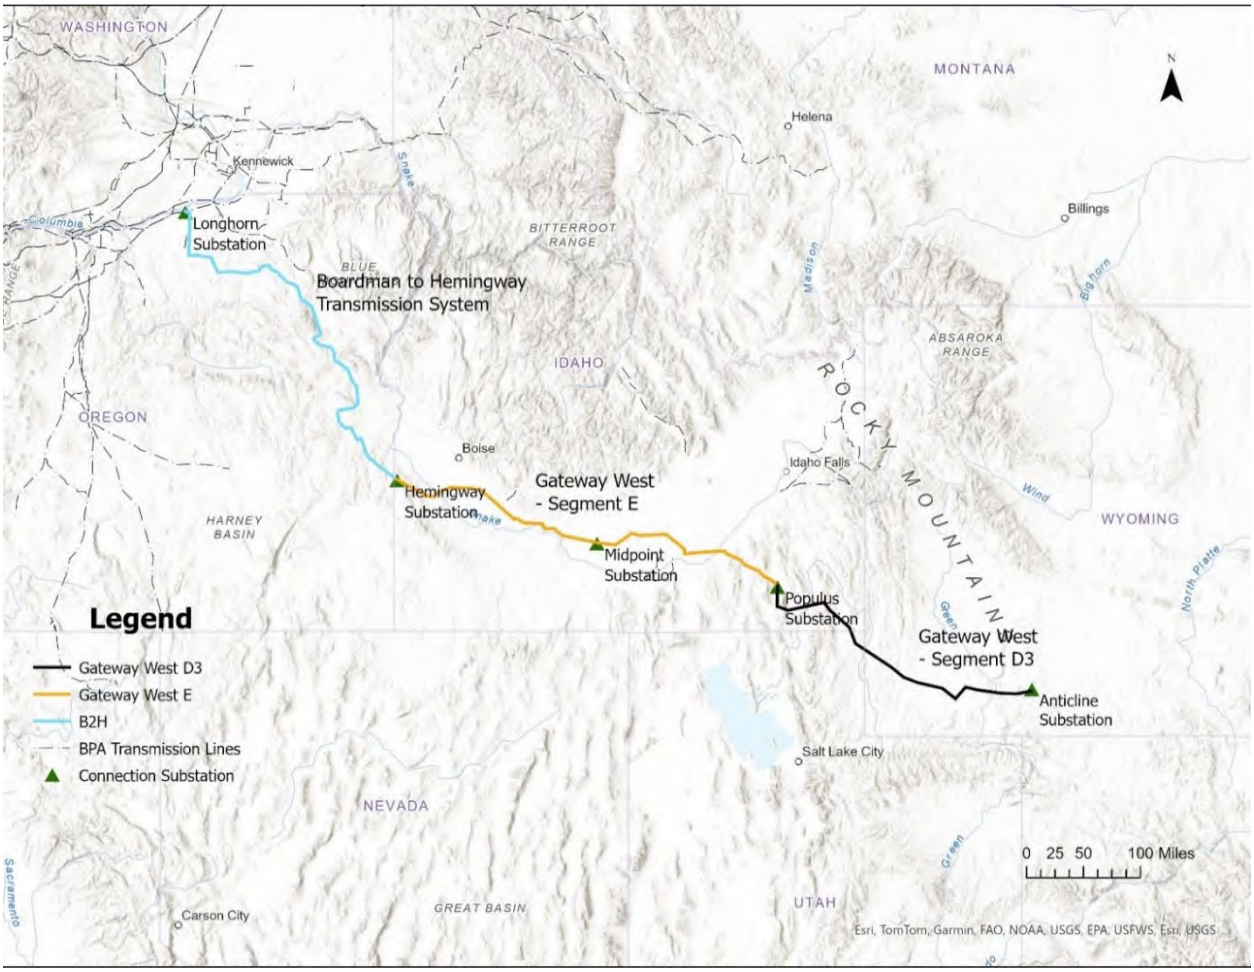


4.6.2 Harborton-Trojan upgrade

Harborton-Trojan Upgrade is a 34-mile 230 kV transmission option between these two PGE substations at the north-west edge of PGE's service territory. The project would run parallel to two existing PGE transmission lines, in service since the 1970s. PGE currently owns the right-of-way (ROW) necessary to complete this upgrade. The project is estimated to enable up to 800 MW from resources within the BPA-PGE interface to reach PGE customers, subject to cooperative

study and agreement with other South of Allston path owners, BPA and PacifiCorp. The anticipated COD of the project is 2035. It is assumed that the Harborton-Trojan option will provide no additional market-access benefits.[79]

Figure 36. Harborton-Trojan Upgrade



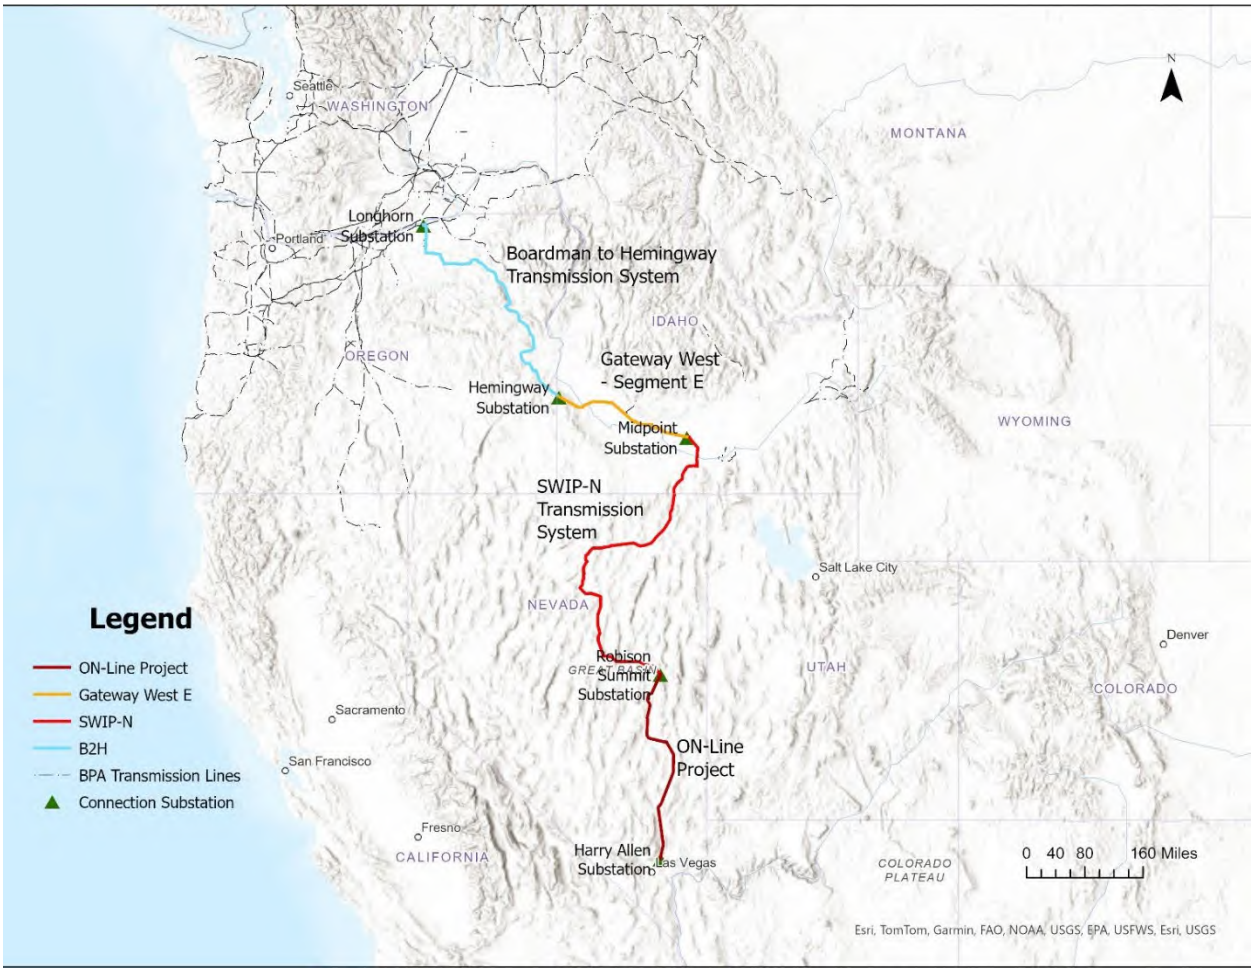
4.6.3 Gateway + B2H + Longhorn (Gateway)

The Gateway transmission option is modeled as the preferred path to access Wyoming Wind proxy resources. The Gateway option begins in western Wyoming, traversing 200 miles from Anticline to Populus substation along the Gateway West D-3 leg. The second segment covers 500 miles on Gateway West E segment where it terminates in Hemingway and then traverses 270 miles along the Boardman to Hemingway (B2H) leg. Finally, Longhorn to PGE is identified as a viable wheel to bring the energy to PGE service territory. The Gateway transmission option is estimated to provide up to 400 MW of capacity for Wyoming Wind by 2035. The 2035 COD reflects the expected timeline for new BPA Transmission Service Requests (TSRs) on the Longhorn to PGE leg. Additionally, Gateway is assumed to provide an additional 400 MW of

[79] PGE's November Roundtable - Transmission - Step 3 - Market Access.

market access during winter.[80] Securing firm transmission access for the Gateway option in the 2030's is uncertain due to competition with Pacific Power and Idaho Power Company and the required timely granting of transmission service requests.

Figure 37. Gateway Transmission Option



4.6.4 NVE + SWIP-N + Gateway + B2H + Longhorn (SWIP-N)

The SWIP-N transmission option includes approximately 673 miles of AC segments along the Southwest Intertie Project – North, Gateway West 8, and Boardman to Hemingway transmission projects. The option is composed of five segments, two of which are modeled as wheels. The first segment is represented as one wheel that captures PGE's need to move energy across the existing or committed NVE projects (Desert Link, ON-Line, Greenlink West, Greenlink North). Next, the option traverses the 275-mile Southwest Intertie Project – North project, then passes 128 miles along Gateway West 8 leg. The SWIP-N option utilizes the Boardman to Hemingway segment and a Longhorn to PGE wheel to bring energy to the PGE service territory. SWIP-N is estimated to provide capacity up to 400 MW of Nevada Solar by 2035 and an additional 400 MW

[80] PGE's November Roundtable - Transmission - Step 3 - Market Access.

of market access in winter.[81] The 2035 COD reflects the expected timeline for new BPA TSRs on Longhorn to PGE leg.

Figure 38. SWIP-N Transmission Option

4.6.5 North Plains Connector

The North Plains Connector (NPC) option includes a 412-mile 500kV HVDC incremental line segment and two additional wheels to reach PGE.[82] PGE has signed a non-binding memorandum of understanding with the developers of this line for a 20 percent stake (600 MW) in the 3000 MW line. Following PGE's MOU, on August 6, 2024, the US Department of Energy (USDOE) selected the NPC, in partnership with the State of Montana, for a $700 million GRIP grant. Pending the outcome of development and execution of definitive agreements, this significant GRIP grant is modeled to buy down the development costs for participation in the NPC project. Additionally, this grant apportioned $70 million for the upgrade of the Colstrip Transmission System (CTS).

[81] PGE's November Roundtable - Transmission - Step 3 - Market Access
[82] The tariff charges incurred to transit both CTS and the Montana Intertie (Townsend-Garrison) are assumed equivalent to the rate of a BPA PTP+SCD wheel.

The NPC would allow PGE to utilize 270 MW of existing firm transmission to replace generation from Colstrip Units 3 & 4 with energy from some of the highest capacity factor renewable resources estimated as part of the 2023 CEP/IRP Update (Table 20). Further, the NPC connects to the Southwest Power Pool (SPP), and the Mid-Continent Independent System Operator (MISO) Zone 1 Market, where historical data suggests a surplus of supply during approximately 80 percent of PGE's highest demand hours.[83] As such, the NPC is a valuable transmission option for addressing PGE's winter reliability challenges as discussed in **Section 6.2.3 Preferred Portfolio resource adequacy testing**.

The NPC option is modeled to provide capacity up to 600 MW of North Dakota Wind proxy resource by 2038. This COD reflects expected timing to receive requested BPA and Northwestern (NWMT) TSRs. Six hundred MW represents what is assumed commercially available and aligns with PGE's existing transmission rights of 270 MW on CTS plus approximately 300 MW of firm and short-term rights on Northwestern path associated to PGE's Clearwater project. In addition, PGE has submitted TSRs for an additional 720 MW across BPA's and NWMT's system. Access to the benefits associated with the assumed 600 MW of potential capacity on this line requires that at least some of the additional submitted TSRs be approved. If submitted TSRs do not come to fruition, PGE's access to the capacity of the line would be only the current 270 MW of PGE's rights along the CTS. The 270 MW of firm transmission access across the CTS are available with the exit of Colstrip Units 3 & 4, assumed after 2029.[84] However, modeled access to these resources is not captured from 2030 to 2037. The NPC is modeled to provide access to an additional 600 MW of both summer and winter market access through its connection to the Eastern Interconnection, the SPP and MISO Zone 1.

[83] PGE's November Roundtable - Transmission - Step 3 - Market Access
[84] PGE's November Roundtable - Transmission - Step 3 - Market Access

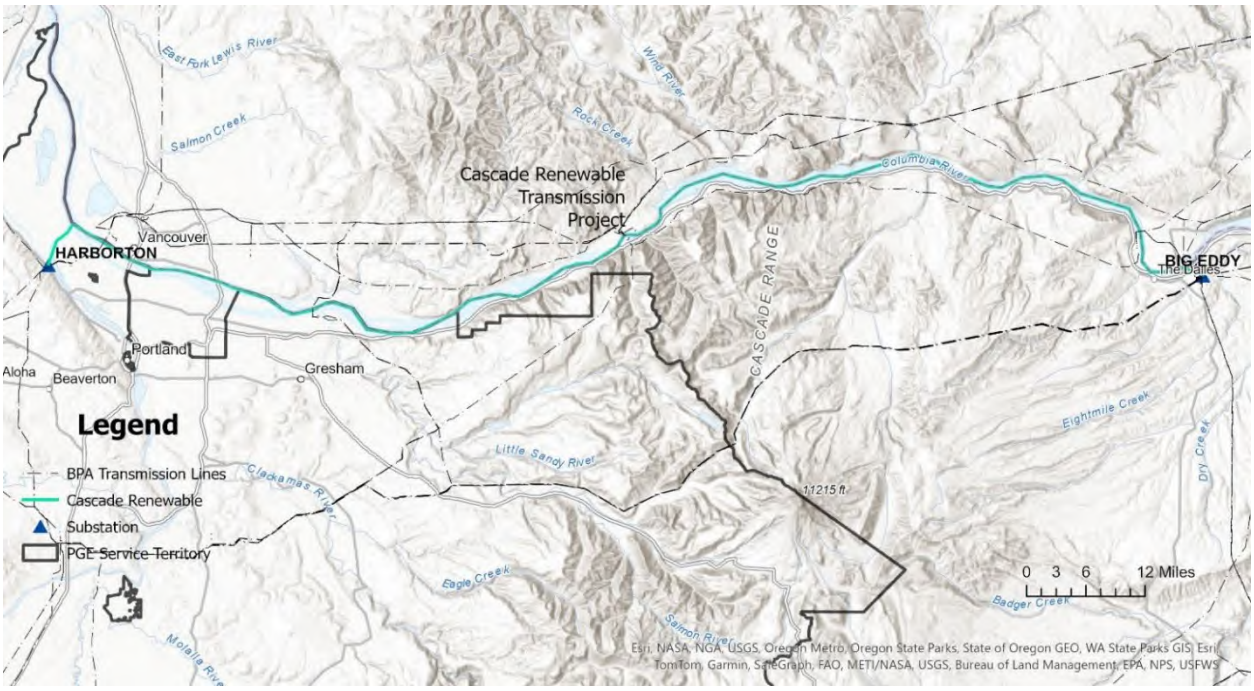
Figure 39. North Plains Connector

4.6.6 NVE + Greenlink 3 + Cpt. Jack to Grizzly + BRB upgrade (Greenlink)

The Greenlink transmission option includes 300 miles of additional AC circuits, and one wheel along Nevada Energy (NVE) infrastructure. The Greenlink option is modeled with four line segments from generation site to PGE's service territory. The first segment is comprised of one wheel that captures PGE's need to move energy across the existing or committed NVE projects (Desert Link, ON-Line, Greenlink West, Greenlink North). Second, the path incurs 300 miles of incremental costs from Ft. Churchill substation in eastern Nevada to the Captain Jack substation near Path 66 at COB. Energy is then moved from Captain Jack to the Grizzly Substation, a point along the Northwest AC Intertie (NWACI) and adjacent to PGE's transmission footprint, using existing PGE rights. Finally, the path assumes the Bethel-Round Butte Upgrade is in place to bring the energy to PGE's service territory. The Greenlink option is estimated to provide PGE up to 627 MW of proxy solar resources from Nevada with an expected availability date of 2035. The COD reflects estimated timing of the Greenlink 3 segment from Fort Churchill to Captain Jack. Further, an additional 627 MW of market access in the winter is assumed.[85]

[85] PGE's November Roundtable - Transmission - Step 3 - Market Access.

Figure 40. Greenlink Transmission Option



4.6.7 Cascade Renewable Transmission project

The Cascade Renewable Transmission Project (CRT) is an underwater HVDC transmission option of 100 miles that would route from BPA's Big Eddy substation near The Dalles, OR to PGE's Harborton Substation in NW Portland. The project is modeled as one incremental line of additional transmission. The project would allow up to 1100 MW of new east-west transmission capacity for PGE to access off-system proxy resources in the Pacific Northwest, such as Christmas Valley Solar and Southeast Washington Wind. The project will require additional BPA and PGE transmission expansion for PGE to access these benefits and is estimated available by 2038. Additionally, The CRT is assumed to provide no additional market access benefits.[86] PGE is not currently participating in CRT.

[86] PGE's November Roundtable - Transmission - Step 3 - Market Access.

Figure 41. Cascade Renewable Transmission Project

4.6.8 Transmission options summary

Table 16 provides a summary of the seven transmission options discussed above and their assumptions used for portfolio analysis.[87] PGE will continue to review and refine these options as part of the 2026 CEP/IRP.

Table 16. Transmission options

Project	COD[88]	Generation Resource	MW Available to PGE	Summer Market Access (% of MW Avail.)	Winter Market Access (% of MW Avail.)	Real-Levelized Cost ($/kW-mo)
Bethel-Round Butte	2032	BPA Resources	3000	0%	20%[89]	$ 5.52
Harborton-Trojan	2035	BPA Resources	800	0%	0%	$ 5.61
Gateway	2035	Wyoming Wind	400	0%	100%	$ 8.17

[87] BPA Generation resources refer to all Proxy Resources located within Concentric Circle 2 (**Section 4.3.1 Concentric circles of transmission**), including: Wind Gorge, Wind SE WA, Solar CV, Solar MCMN, Solar Wasco, CV hybrids, and MCMN hybrids.
[88] Project Commercial Operation Dates (CODs) represent the greatest COD for the underlying transmission segments.
[89] Assumed equivalent to PGE's existing rights at the California Oregon Border (COB).

Project	COD[88]	Generation Resource	MW Available to PGE	Summer Market Access (% of MW Avail.)	Winter Market Access (% of MW Avail.)	Real-Levelized Cost ($/kW-mo)
SWIP-N	2035	Nevada Solar	400	0%	100%	$ 9.56
North Plains Connector	2038	Montana & North Dakota Wind	600	100%	100%	$ 9.83
Greenlink	2035	Nevada Solar	627	0%	100%	$ 9.98
Cascade Renewable Tx Project	2038	BPA Resources	1100	0%	0%	$ 12.13

4.6.9 Transmission cost assumptions

The U.S. Department of Energy (DOE) "National Transmission Planning Study" and data from the GRIP are the primary sources used to calculate cost estimates for both AC and DC transmission options. All AC options are modeled as 500 kV single-circuit lines estimated at $2,048,670/mi and all DC options are modeled as 500kV HVDC circuits estimated at $4,600,000/mi.[90,91] Additionally, the DOE study provides terrain multipliers for AC options that are used to scale per mile estimates.[92] Federal cost share of GRIP awards was then subtracted from the estimated cost of a transmission option, where applicable.[93] These assumptions along with a project's estimated transfer capacity are used to derive costs for incremental transmission lines, those uncommitted projects that would require PGE ownership. Costs estimated are based on publicly available data and should be interpreted as a general estimate of the direct cost of line construction and do not account for additional development costs such as profit, balance of plant, permitting, procurement, and overheads.

Some transmission options required existing energized or committed projects to bring (wheel) energy home to PGE's service territory. Additional costs to wheel energy for such segments are included in the total cost for an option. The assumed rate for a wheel is $1.96 /kW-mo, based on BPA Point-to-Point Scheduling, System Control and Dispatch (PTP + SCD) costs for 2024. Lastly,

[90] U.S. Department of Energy. *The National Transmission Planning Study*. Ch 3. p.127.
[91] U.S. Department of Energy. The National Transmission Planning Study. Ch 3. p.70.
[92] Terrain multipliers are not identified for HVDC projects. Public information on project specific costs for HVDC options was used to calculate terrain multipliers for those HVDC projects.
[93] https://www.energy.gov/gdo/grid-resilience-and-innovation-partnerships-grip-program-projects.

all projects are assumed to carry a $4.81 /kW-mo real-levelized cost for operations and maintenance in 2024 dollars.

Chapter 5. Resource options

There are many resource options to be considered as PGE makes the energy transition to a decarbonized system. For analysis, PGE identifies all technologically and commercially feasible generation resource options. The economics of resources represent a crucial element of dynamics within IRP analyses for evaluating the characteristics of resources that could plausibly be deployed in the region. This chapter describes relevant costs and benefits associated with each resource assessed in this analysis update. These dynamics drive the decisions in portfolio analysis for evaluating resource options, optimizing for costs and benefits. Resource comparisons that can occur outside portfolio analysis are also visualized on a net cost basis.

Key Highlights

- Resource costs have increased, primarily driven by fixed costs in the current planning environment, with different resources providing disparate benefits in either energy generation, capacity, or storage capabilities. The potential effect of a reduction in tax credits is investigated.
- The inclusion of non-cost-effective Distributed Energy Resources (DERs) provides insight into how these resources can play an enhanced role in a decarbonized future.
- Community Benefits Indicator (CBIs) assumptions have been expanded and refined to better incorporate stakeholder feedback and provide measurable metrics across resilience, health, environmental impacts, energy equity, and economic impacts.

Developments Since 2023 IRP

This Update includes several key changes to resource economic assumptions including updated financial parameters; an adjusted electricity price forecast methodology incorporating forward price curves through 2028; updated supply-side resource costs; and refined capacity contribution values evaluated for 2030 using the Sequoia model. Further, portfolio sensitivity analysis considers current uncertainties regarding federal-level policies, including analysis without clean energy tax credits.

Additionally, the Update incorporates a new North Dakota wind resource option enabled by potential participation in the North Plains Connector transmission project and pushes back the earliest assumed availability for Oregon offshore wind to 2036 due to delays in the BOEM lease auction process.

Strategic Implications

These changes lead to several important implications for resource planning. The updated electricity price forecast shows significantly higher prices between 2025-2029, affecting the economic evaluation of resources. The reduced capacity contribution of

storage resources (particularly in winter) highlights a critical planning challenge regarding the interaction between storage and energy resources in a system with significant energy deficits. Importantly, the availability of federal clean energy tax credits has meaningful impacts on resource costs discussed in this chapter as well as total portfolio costs discussed in **Chapter 6**.

The North Dakota wind resource provides a new geographic diversity option, which is potentially valuable for addressing seasonal needs. Further, the updated CBIs framework provides a more comprehensive method for evaluating community benefits in resource decisions.

Staff Recommendations Incorporated

The Update addresses multiple Staff recommendations from LC 80 Order 24-096. For CBRE actions (Staff recommendation #1), PGE added a Small-Scale Renewable (SSR) proxy resource to model compliance with the 10 percent requirement. Regarding energy efficiency, PGE collaborated with Energy Trust of Oregon to develop guiding principles for complementary funding and establish funding targets with reporting requirements (Staff recommendation #4). On energy/capacity actions, PGE conducted a Request for Information (RFI) for long lead-time resources (Staff recommendation #2) and presented findings in 2024.[94] PGE also advanced CBI integration into resource planning and expanded RECs discussion through stakeholder engagement (Staff recommendations #6 and #7).

5.1 Resource economics

PGE's resource planning conclusions regarding best available generation technology and forecasted costs are driven by resource cost and performance assumptions. The candidate supply-side resources considered for portfolio construction in this Update are the same as those evaluated in PGE's 2023 CEP/IRP except for two changes that are discussed below. This section provides revisions to several key components of resource economics. Some of these updates result from updates to inputs, financial assumptions, and resource costs. These values flow into the portfolio analysis presented in **Chapter 6 Resource plan**.

5.1.1 PGE financial parameters

This Update uses revised financial parameters as of June 2024, which are summarized in **Table 17**.[95]

[94] PGE RFI Key Insights presentation, December 2024, https://assets.ctfassets.net/416ywc1laqmd/2GF5BwVt9cR1MXtEpn6fli/e719ec6879183abd984928db360fe410/RFI_slides_jdg_web_1197.pdf.

[95] Given the lead time for analysis, June 2024 represents the most recent financial parameter snapshot practicably possible for inclusion.

Table 17. 2025 IRP Update Financial Parameters

Component	Value
Composite Income Tax Rate	27.50%
Incremental Cost of Long-term Debt	5.79%
Long-term Debt Share of Capital Structure	50.00%
Common Equity Return	9.50%
Common Equity Share of Capital Structure	50.00%
Weighted Cost of Capital	7.65%
Weighted After-Tax Cost of Capital	6.85%
Long-Term General Inflation	2.04%

5.1.2 Supply-side resource costs

As mentioned above, the incremental supply-side resources considered in this Update are generally consistent with those evaluated in PGE's 2023 CEP/IRP. National Renewable Energy Laboratory (NREL) and Energy Information Administration (EIA) research still serves as the source for resource cost and performance parameter information. In this Update, PGE is generally using supply-side resource information from two sources:

- The NREL 2024 Annual Technology Baseline (ATB) updated in July 2024.[96]
- The EIA-commissioned Sargent & Lundy report, "Capital Cost and Performance Characteristics for Utility-Scale Electric Power Generating Technologies" released January 2024.[97]

These two reports represent the most recent updates from NREL and EIA, respectively, at the time of PGE's analysis in this Update. **Table 18** provides a summary of these assumptions by resource. Additional resources that PGE views as potentially available post-2030 are discussed below in **Section 5.6 Long lead-time resources**.

Table 18. Supply-side resource assumptions for portfolio construction - 2028 COD (2025$)

Resource	CF / RTE (%)	O/N Capital[98] ($/kW)		Fixed Costs[99] ($/kW-yr)	LCOE[100] ($/MWh)	
		IRP	Update		IRP	Update
Wind Gorge	44%	1,609	1,643	118	28	31

[96] NREL (National Renewable Energy Laboratory). 2024. 2024 Annual Technology Baseline. Golden, CO: National Renewable Energy Laboratory, https://atb.nrel.gov/.
[97] https://www.eia.gov/analysis/studies/powerplants/capitalcost/pdf/capital_cost_AEO2025.pdf.
[98] Overnight capital – is the upfront cost to construct the resources without consideration for the cost of funds during construction, includes interconnection costs but does not include the cost of incremental transmission unless otherwise noted.
[99] Real levelized fixed cost – is the annualized fixed cost (capital and operating) of the resource across the assumed economic life, in constant year dollars.
[100] Levelized cost of energy – is the annualized cost of the resource on a per MWh generated basis.

Resource	CF / RTE (%)	O/N Capital[98] ($/kW) IRP	O/N Capital[98] ($/kW) Update	Fixed Costs[99] ($/kW-yr)	LCOE[100] ($/MWh) IRP	LCOE[100] ($/MWh) Update
Wind MT	42%	1,560	1,531	136	32	36
Wind SE WA	42%	1,597	1,604	118	30	33
Wind WY[101]	44%	-	1,531	103	125	338
Wind ND[102]	41%	-	1,560	143	-	371
Solar Christmas Valley (CV)	27%	1,269	1,453	145	42	62
Solar McMinnville (MCMN)	21%	1,324	1,491	146	60	78
Solar Wasco	25%	1,269	1,453	145	45	65
Solar Mead[103]	32%	1,269	1,503	155	184	389
CV hybrid 1	-	2,278	2,912	280	212	112
CV hybrid 2	-	1,772	2,182	215	131	84
MCMN hybrid 1	-	2,329	2,982	285	303	146
MCMN hybrid 2	-	1,824	2,236	219	192	109
2-hour battery	86%	800	990	94		
4-hour battery	86%	1,212	1,617	153		

A pattern of increased costs for resources is observable in **Table 18**. Overnight capital costs have increased for nearly all resource technologies. Forecasted capital costs for storage resource have increased by over 30 percent which contributes to higher portfolio costs as analyzed in the Preferred Portfolio described in **Section 6.2**. Resource costs for solar resources have also increased significantly while increases in costs for wind resources is more modest.

Cost increases across generation and storage technologies may be driven by many factors including macro-economic concerns related to inflation, disrupted supply chains, and strong demand. The resource cost assumptions do not directly consider emerging issues such as federal policy uncertainties, variations in the macroeconomic environment (e.g., inflation, recessions), or the status of international trade agreements (e.g., duties or tariffs). Instead, a range of potential resource cost outcomes, including low-, reference-, and high-cost cases, are considered in portfolio construction.

5.1.2.1 Resource-specific updates

1. Onshore wind

A North Dakota-sited wind resource is added to the set of resources considered in portfolio construction for this Update. PGE's potential participation in the North Plains Connector (NPC)

[101] LCOE includes the cost of incremental transmission.
[102] LCOE includes the cost of incremental transmission.
[103] LCOE includes the cost of incremental transmission.

transmission project enables access to this resource. See the discussion of the NPC in **Section 4.6.5 North Plains Connector**. This resource is located near the eastern terminus of the NPC. Overnight capital cost estimates are based on EIA research. PGE's analysis assumes an earliest availability date of 2032. Other onshore wind resources in this Update are consistent with those considered in PGE's 2023 CEP/IRP.

2. Offshore wind

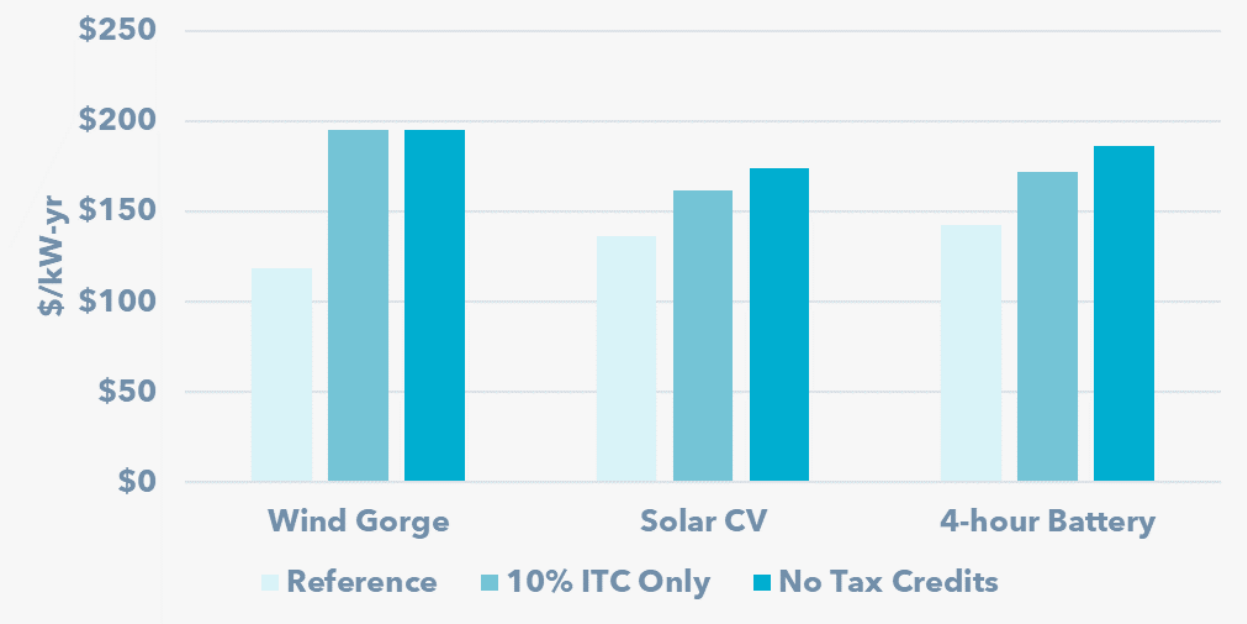
On September 27, 2024, the Bureau of Ocean Energy Management (BOEM) announced a delay in the auction for potential lease areas offshore Oregon due to "insufficient bidder interest at this time."[104] Just one of the five qualified companies indicated bidding interest in the planned auction. The auction for two lease areas was planned for October 15, 2024. As a result of these delays in the lease auction process, the earliest assumed availability for Oregon offshore wind is moved to 2036 (from 2032 in PGE's 2023 CEP/IRP) due to this delay in development opportunity.

5.1.3 Tax credit sensitivities

The Reference Case in this 2023 CEP/IRP Update assumes the same tax credit environment for generation and energy storage resources as described in PGE's 2023 CEP/IRP.[105] This environment was shaped by the federal governments passage of the Inflation Reduction Act (IRA) in 2022. Key assumptions for modeling include:

- Tax credits continue across the analysis period for modeling purposes. This assumption removes the possibility of tax credit expiration influencing the portfolio construction process.
- Non-emitting generating resources qualify for 100 percent of the production- or investment-based tax credits (PTC and ITC, respectively).
- Standalone storage resources qualify for 100 percent of the investment-based tax credit without the need for normalization.
- Tax credits are assumed to be fully monetized in the year they are generated.

To help understand the potential impact on resource economics of changes to this set of assumptions, two sensitivities are considered:



1. Federal tax credit policy reverts to a roughly "pre-IRA" state:
    a. The PTC is not available for new non-emitting generating resources, and
    b. The ITC is available at a rate of ten percent for solar and energy storage resources.
2. Federal policy removes tax credits entirely for new non-emitting generating and energy storage resources that are placed in service after December 31, 2028.

Resource costs relative to the Reference Case in both scenarios as summarized below in **Figure 42**. The sensitivities assume that credits continue to be fully monetized when generated for

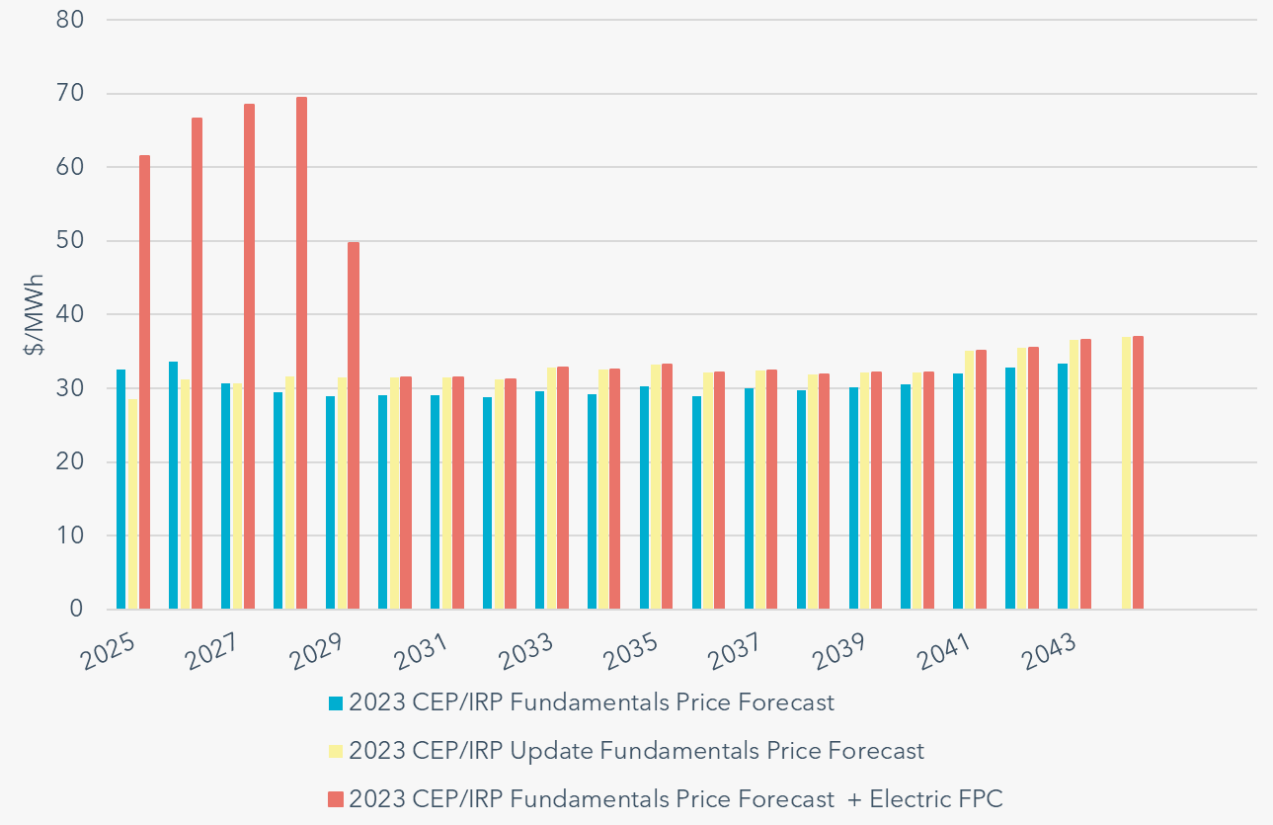
[104] https://www.boem.gov/newsroom/press-releases/boem-postpones-oregon-offshore-wind-energy-auction.
[105] Tax credits are discussed in Section 2.1 and 8.1.6 of the 2023 CEP/IRP (see pages 42 and 173).

purposes of determining resource costs. Removing the PTC as modeled from a generic wind resource results in an approximately 64 percent increase in the cost of that resource on a real-levelized basis. Reducing the ITC to ten percent increases solar and battery storage resource costs by approximately 19-20 percent; removing the ITC entirely results in a further ten percent increase in costs for these resources. This analysis assumes wind resources are not eligible for the ITC and, thus, the resource cost is unchanged in the "10 percent ITC Only" and "No Tax Credit" sensitivities.

Figure 42. Tax credit scenario real-levelized costs 2030 COD (2025$/kW-year)

As is observed in **Figure 42**, the availability of federal tax credits has a significant impact on the assumed cost of generation and storage resources. Specifically, without the availability of federal tax credits through 2035 generation costs are expected to increase by as much as 64 percent and storage resources by 30 percent. The customer cost increases associated with changing these assumptions are significant and analyzed further in **Section 6.6 Federal tax credit availability scenarios**.

5.1.4 Electricity price forecast



OPUC Staff provided feedback on the 2023 CEP/IRP regarding the PGE electricity price forecast, which is used in the calculation of energy efficiency avoided cost data.[106] Between 2025 and 2029, the PGE electricity forward price curve (FPC) was significantly higher than PGE's fundamental price forecast. The fundamental price forecast is produced by PGE's IRP team in Aurora using forecasted supply and demand conditions across the WECC. The FPC used by IRP

[106] Public Utility Commission of Oregon. (2024, April 30). Staff report: Request for approval of energy efficiency avoided cost data to be used by Energy Trust (Docket No. UM 1893). https://edocs.puc.state.or.us/efdocs/HAU/um1893hau328091055.pdf

is the same as produced for the 2025 AUT. Staff recommended that the Energy Trust of Oregon use a blended price when calculating the avoided costs of energy efficiency.

In response, PGE adjusted the methodology used in the electricity price forecast for this Update to align with Staff's recommendation in UM 1893. For the years 2025 through 2028, the PGE electricity FPC replaces the long-term fundamentals price forecast. After 2029, the IRP electricity price forecast is based on the fundamentals forecast. In 2029, the price forecast is calculated as the hourly average blend of the two forecasts for each of the 39 price futures. **Figure 43** shows the results of incorporating the FPC into the IRP price forecast compared to the fundamentals price forecast in the 2023 CEP/IRP and the 2023 CEP/IRP Update.

Figure 43. Reference IRP Price Forecasts from 2025 – 2044

5.1.5 Supply-side resource energy value

PGE uses Aurora to estimate the energy value of dispatching existing generating resources, contracts, and candidate new resources using electricity prices and associated risk variable inputs from each price future.

The Reference case energy value and range of outcomes across the simulated price futures for each resource are summarized in **Table 19**. These values are levelized across each resource's economic life, for resources with 2028 commercial operation dates.

Table 19. New resource option energy values (2028 COD)[107]

Resource	Levelized energy value (2025$/MWh) Reference case	Range
Solar CV	$23.51	$15.36 - $34.54
Solar MCMN	$22.52	$14.77 - $33.12
Solar Wasco	$22.03	$14.45 - $32.41
Wind Gorge	$27.70	$17.91 - $41.19
Wind MT	$32.53	$20.81 - $47.98
Wind SE WA	$30.03	$19.28 - $44.41
Wind ND	$31.05	$19.98 - $45.86
CV hybrid 1	$28.72	$18.96 - $40.70
CV hybrid 2	$26.00	$18.02 - $37.87
MCMN hybrid 1	$29.33	$19.47 - $41.34
MCMN hybrid 2	$25.81	$17.97 - $37.47

Energy values presented here for a 2028 COD are higher on average than those in the 2023 CEP/IRP by roughly 10 percent to 35 percent, depending on the resource. This is driven in part by the upward change in the electricity price forecast for early model years, as described in **Section 5.1.4 Electricity price forecast**.

5.1.6 Resource capacity contribution

Resource capacity contribution values were discussed in Section 10.5 of PGE's 2023 CEP/IRP. Please also see the related discussion in **Section 3.4 Capacity need** of this Update. The effective load-carrying capability (ELCC) identifies the percentage of a resource's nameplate capacity that can be depended upon when planning for resource adequacy. For example, the 100 MW nameplate capacity of a 4-hour battery may have an ELCC of 22 percent in the winter. This means that the 100 MW nameplate capacity of a 4-hour battery contributes 22 MW (100 * 0.22) towards reducing system capacity needs. If the starting system has a winter capacity need of 200 MW, after adding a 100 MW 4-hour battery, the new capacity need will be 178 MW (200 MW of need, less 22 MW of capacity).

For this Update, the capacity contributions of resources summarized in **Table 20** are evaluated in the year 2030 using Sequoia. The analysis uses the same snapshot of loads and resources as used for the updated capacity need assessment discussed in **Section 3.4 Capacity need**. Since the publication of the 2023 CEP/IRP, model updates were made to Sequoia including load forecasts, QF assumptions, and RFP proxy additions (**Section 3.4.2 Changes to modeling capacity need**). These updates reduced the 2026 capacity need, the year ELCCs were evaluated

[107] Ranges reflect upward and downward semi-deviations around the Reference Case across the market price futures.

in the 2023 CEP/IRP, to 47 MW in summer and 0 MW in winter. 2030 was elected as a representative year with sufficient need to test the capacity contributions of proxy resources for the 2023 CEP/IRP Update. Additionally, as part of the 2023 CEP/IRP Update it is assumed that proxy resources will acquire firm transmission equal to 75 percent of the nameplate capacity. This change reflects an attempt to align transmission modeling assumptions with state resource adequacy requirement (e.g. WRAP) and future modeling.[108]

A major finding of the Update is the reduction in ELCCs of storage resources. The cause of this reduction is due in part to an additional 775 MW of storage resources in the system with the RFP Proxy.[109] Second, the ELCC of storage resources is dependent on the amount of energy in the system, for which the 2030 base energy system has a significant energy deficit and is pronounced in winter as discussed in **Section 3.3 Energy need**. PGE considers the unique planning challenge presented by the interactions between storage and energy to be a priority item for review in future integrated resource plans. **Section 6.2.3 Preferred Portfolio resource adequacy testing** expands on the current planning framework, the concern it presents in Preferred Portfolio results, and approaches to address these concerns as part of the 2023 CEP/IRP Update and future planning efforts. Additionally, long-duration storage (LDS) was not assumed available for portfolio expansion due to the lack of commercially proven projects, as such the ELCCs for this resource are not included below. However, **Section 6.2.3 Preferred Portfolio resource adequacy testing** provides a preliminary view of the benefit LDS could provide to PGE's system and motivates further analysis of this and other emergent technology as part of the 2026 CEP/IRP.

Table 20. ELCC values for portfolio construction in year 2030, incremental 100 MW nameplate

	Summer		Winter	
Resource	Firm	Conditional Firm	Firm	Conditional Firm
Wind Gorge	40%	34%	28%	28%
Wind MT	24%	17%	58%	55%
Wind SE WA	17%	13%	43%	39%
Wind WY	32%	20%	59%	51%
Wind ND	30%	19%	54%	51%
Solar CV	23%	10%	21%	21%
Solar MCMN	26%	13%	21%	11%
Solar Wasco	27%	13%	18%	18%
Solar Mead	14%	10%	30%	30%
CV hybrid 1	76%	50%	36%	36%
CV hybrid 2	56%	34%	25%	26%

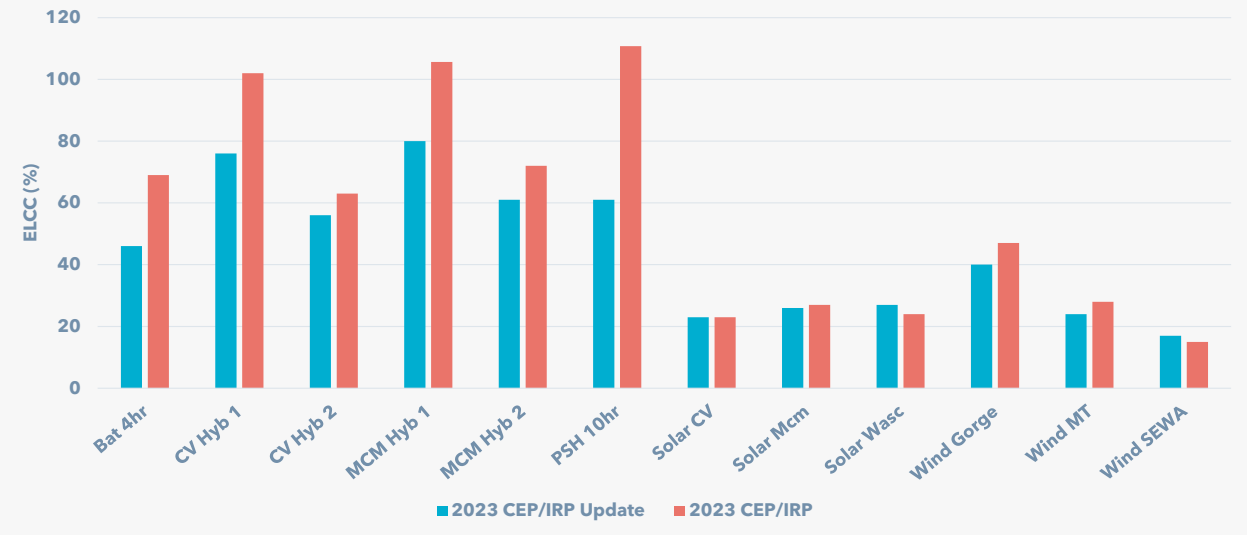
MCMN hybrid 1	80%	57%	32%	32%
MCMN hybrid 2	61%	34%	28%	28%
2-hour battery	31%		14%	
4-hour battery	46%		22%	



5.1.7 Comparison of resource capacity contribution to 2023 CEP/IRP

As discussed in the section above, the updates that PGE made to resource adequacy modeling, including changes to the underlying portfolio, have resulted in updated proxy resource capacity contributions. These changes can have important impacts on portfolio analysis. To understand the potential key drivers of changes in portfolio outcomes from the 2023 CEP/IRP, this section provides a comparison between the updated ELCCs and those from the 2023 CEP/IRP. Comparisons between ELCCs from the 2023 CEP/IRP and this Update for Summer and Winter are shown in **Figure 44** and **Figure 45**.

Figure 44 shows that generally Summer ELCCs for Proxy resources have decreased since the 2023 CEP/IRP. This decrease is attributed to the assumed 75 percent transmission availability assumption, discussed in the section above, and due to the additional storage and solar resources modeled in the system as part of the 2023 RFP Proxy resource discussed in **Section 3.2.2 2023 RFP proxy**.

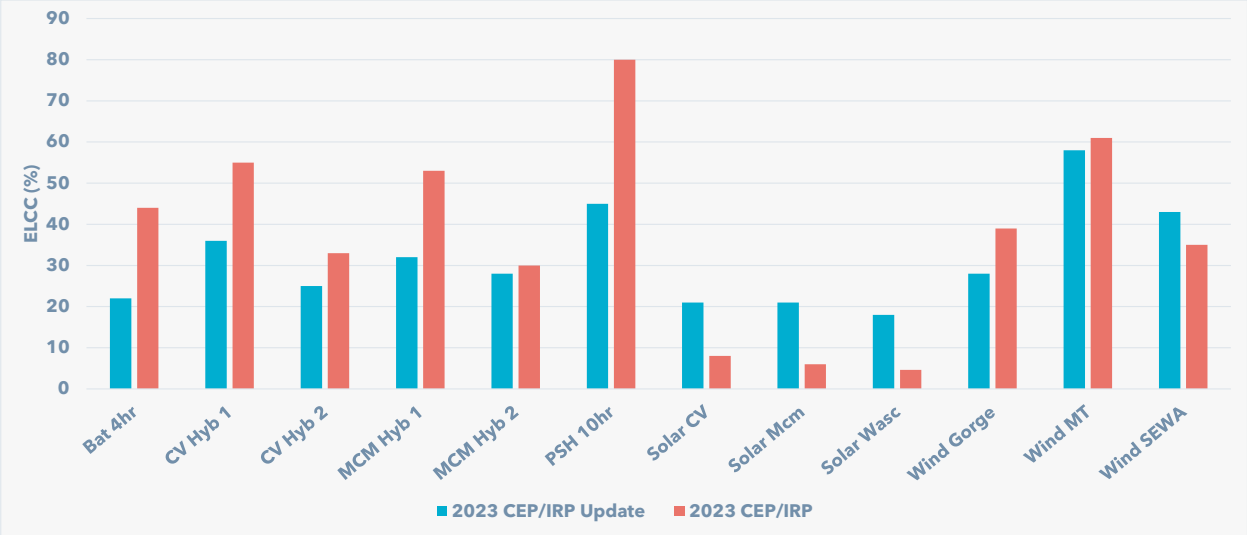


Figure 45 shows the same general trend of lower ELCCs exists in Winter. However, there is a modest increase in the value of solar proxy resources, attributed to the added benefit that midday energy plays in decreasing the likelihood that winter reliability events span across the AM and PM peaks.[110]

Figure 44. Select ELCC Comparison – Summer, Firm Transmission

[110] See **Section 6.2.3.1 Energy sensitivity adequacy assessment of Preferred Portfolio** for more discussion on the value of energy in meeting winter reliability challenges.

Figure 45. Select ELCC Comparison – Winter, Firm Transmission

5.1.8 Resource capacity value

The capacity value is a theoretical construct that uses the net cost of capacity and a resource's capacity contribution to derive a dollar value.

Using the $237/kw-yr described in **Section 6.7 Net cost of capacity resources** as the cost of capacity, with the same approach as in PGE's 2023 CEP/IRP, the capacity value of a resource at (nameplate) is:

$$Capacity\ value\ of\ resource\ A\ =\ Capacity\ contribution\ of\ resource\ A\ (ELCC\ \%)\ *\ \$237/kW-yr$$

While not used directly for portfolio analysis in this Update, the resulting capacity value is useful for the purpose of comparing resources or for calculating the administratively determined avoided cost payments for resources procured outside of competitive or negotiated processes. This value has increased meaningfully compared to the 2023 CEP/IRP driven mainly by updated assumptions regarding higher fixed costs as well as increased capacity which reduced ELCCs. This net cost of capacity value is an illustrative metric and is not directly included in portfolio analysis.

Table 21 and **Table 22** summarize the capacity values of resources considered in this Update. For capacity resources in **Table 21**, the ELCC and corresponding capacity value ($/kW-yr.) indicate the amount of capacity required of each resource to provide an incremental 100 MW of capacity contribution to the portfolio. Emergent technologies, such as LDS, geothermal, hydrogen storage, nuclear, etc. are not detailed below due to a current lack of commercially proven projects. As noted above, **Section 6.2.3 Preferred Portfolio resource adequacy testing** suggests these resources may be valuable additions in PGE's portfolio due to winter reliability challenges and motivates the need for a more thorough analysis of such emergent technologies in the 2026 CEP/IRP.

Table 21. Capacity Resource ELCCs and Capacity Values

Resource	Annual ELCC 100 MW capacity contribution	Capacity value (2025$/kW-yr.)
4-hour battery	32%	76
6-hour battery	43%	101
Wind SE WA	12%	29
Solar CV	16%	37
CV hybrid 1	55%	129
MCMN hybrid 1	55%	131

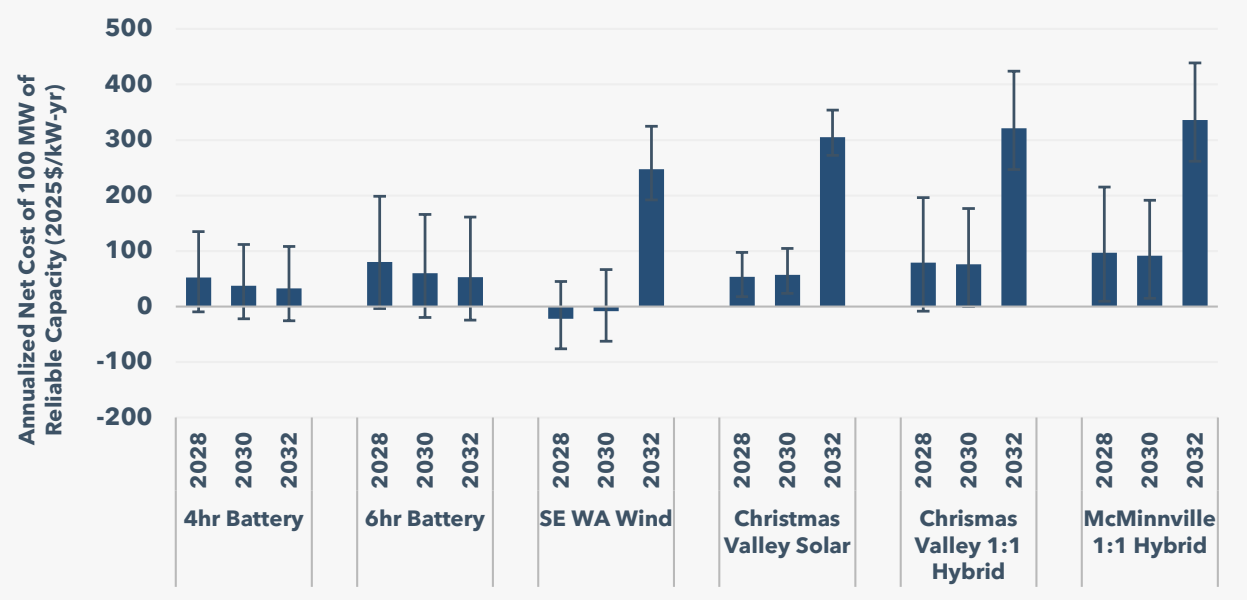
For energy resources in **Table 22**, the ELCC and corresponding capacity value ($/MWh) are shown corresponding to 100-megawatt average (MWa) addition sizes after accounting for the corresponding levelized capacity factors. The ELCC values reflect the effects of the declining marginal ELCC curves.[111]

Table 22. Energy Resource ELCCs and Capacity Values

Resource	Annual ELCC 100 MWa energy addition	Capacity value (2025$/MWh)
Wind MT	35%	23
Wind Gorge	33%	20
Wind SE WA	18%	11
Solar CV	19%	19
Solar Wasco	17%	18
Solar MCMN	17%	22

5.1.9 Resource net cost

This section provides an overview of updates to Section 10.8 of PGE's 2023 CEP/IRP on resource net cost; combining a resource's cost, energy value, flexibility value, and capacity value results in the "net cost". As discussed in Section 10.8.1 and 10.8.2 of PGE's 2023 CEP/IRP, the net cost of capacity and energy resources can be a useful tool for comparing resources on similar terms, though these results are not used directly in portfolio analysis. The net costs displayed in this section are based on the formula in **Section 5.1.9 Resource net cost** above. Based on these illustrative results, the portfolio analysis in **Chapter 6 Resource plan** meets capacity needs more economically with energy resources in select years.



5.1.9.1 Net cost – capacity resources

Figure 46 illustrates the net cost in $/kW-yr of providing 100 MW capacity contribution to the portfolio from various select resources. From this snapshot, standalone batteries appear to be

[111] The annual ELCCs shown in this table are calculated with the average of the seasonal ELCC and are for informational purposes and meant to be directional indicators of capacity value. The actual value of capacity is estimated within portfolio analysis and is dependent on seasonal ELCCs.

the least-cost means to provide capacity to the portfolio in the near-term. These net cost of capacity values represent the total cost less energy, flexibility, and capacity contribution values. Negative net costs imply the given resource for that COD is less expensive than the portfolio-blended cost of capacity described in **Section 6.7 Net cost of capacity resources**. However, in reality, the resource may not yet be available given transmission constraints. Broadly, the relative net costs highlight the order of selection. For example, with transmission constraints beginning in 2032 for some resources, based on the information in **Figure 46**, a model adding capacity while minimizing cost would select battery resources before any of the transmission expansion options.

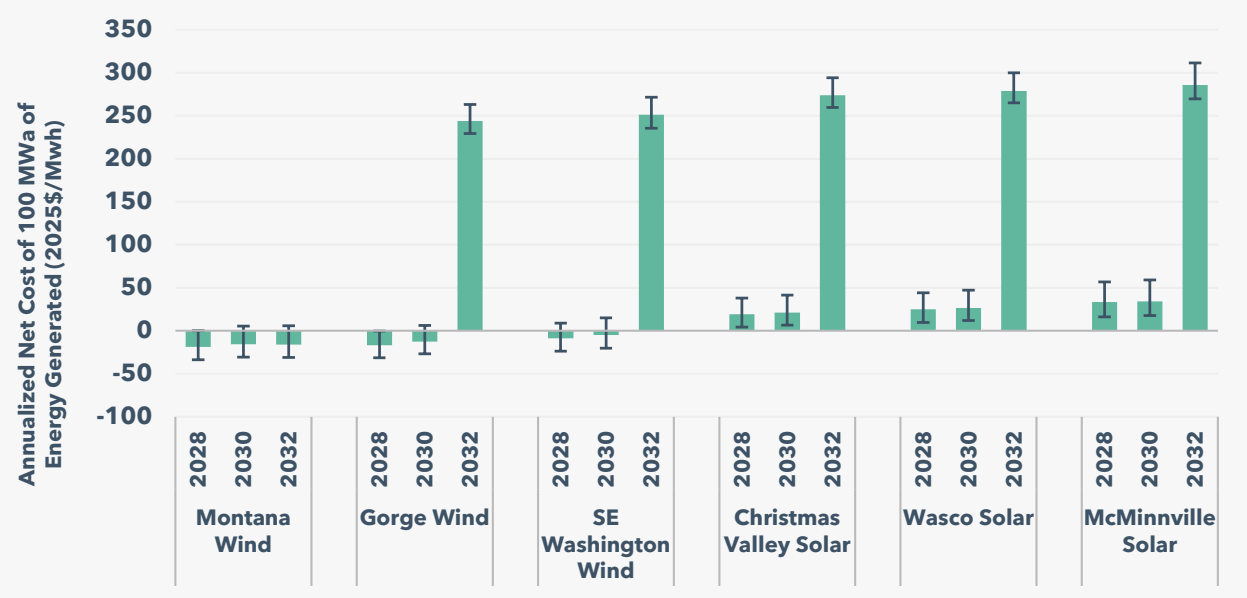


Figure 46. Net cost of 100 MW of capacity contribution by COD

5.1.9.2 Net cost – energy resources

Similarly, **Figure 47** summarizes the net cost in $/MWh of 100 MWa incremental energy contribution to the portfolio from a selection of variable energy resources. These net cost of energy values represent the levelized cost of energy less energy, flexibility, and capacity contribution values. Given the CODs shown, these net costs do not begin to include transmission access and associated costs until 2032 for select resources. This meaningfully increases costs in later years once transmission access is deemed available and this premium highlights why distribution-connected resources may become increasingly cost-competitive in a model, despite having higher fixed costs than their supply-side counterparts.

Figure 47. Net cost of 100 MWa generation by COD

While net costs of new resources provide helpful insights for understanding the economic tradeoffs between specific resource actions, this simplistic view of resource economics neglects risks associated with future uncertainties and potential interactions between resources and constraints. These are more thoroughly investigated through portfolio analyses described in **Chapter 6 Resource plan**.

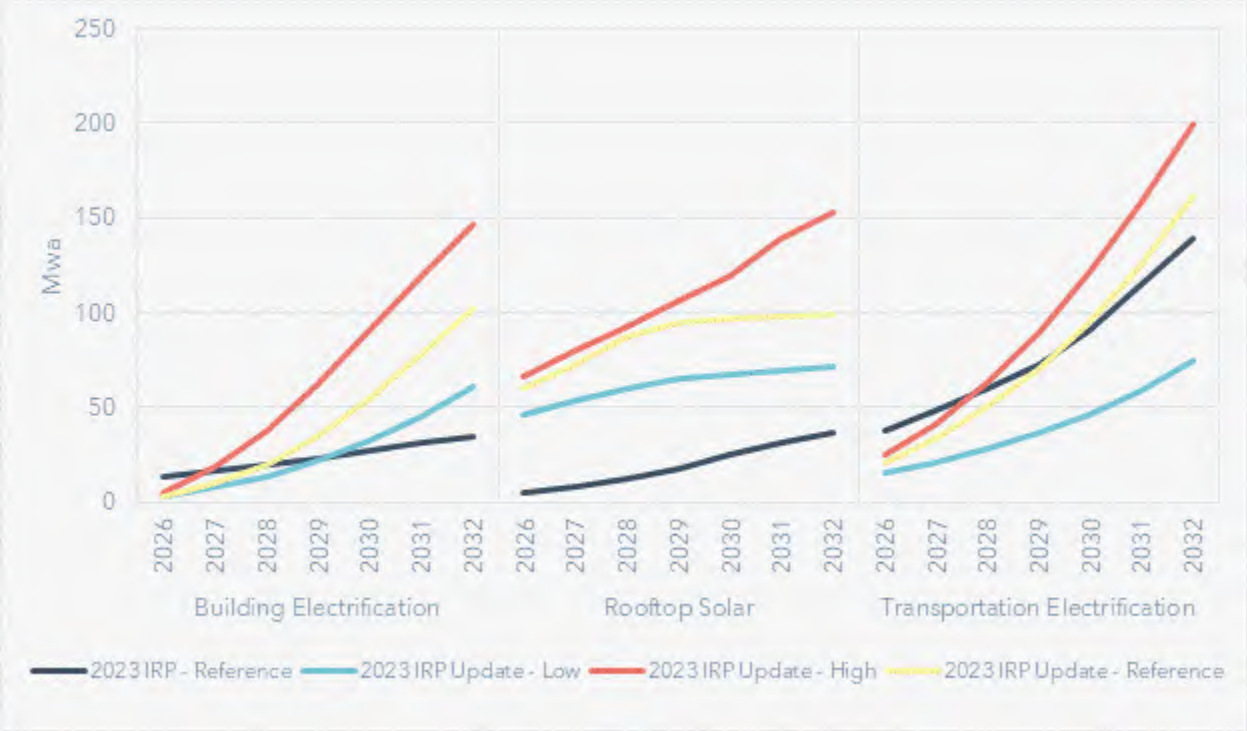
5.2 Distributed energy resources (DERs)

PGE develops a forecast of DER adoption and hourly load impact on a regular basis. This DER forecast provides insights on how much market-based DER adoption will impact both PGE's bulk and distribution systems. It also informs how much cost-effective demand response can be made available to shape and shift load on the bulk system. As such, the DER forecast informs PGE's planning processes, including its Distribution System Plan (DSP) and the IRP. This section provides a brief description of the approach used and results from the DER forecast.

The DER forecast uses PGE's AdopDER software to model the adoption of over 60 DER technologies and technology combinations. The software uses a current, point-in-time snapshot of data from PGE systems that describes the characteristics of each PGE service point: building type and vintage, heating and cooling system, vehicle weight class(es) and fuel(s), and interconnected solar PV and storage. AdopDER also accounts for customer growth across PGE's service territory to simulate the eligibility, adoption, and load impacts for each DER over a 20-year forecast horizon through calendar year 2044.

From this starting point, AdopDER simulates both the market adoption of passive DERs and expected customer participation in current and future demand response programs—representing achievable potential within a potential study framework. For this update to PGE's 2023 CEP/IRP, three adoption scenarios (reference, high, and low) were modeled using varying inputs such as

cost assumptions, adoption trends, and policy signals. The outputs reflect how DER deployment is shaped by evolving market, regulatory, and customer dynamics.



AdopDER calculates cost-effectiveness metrics for each demand response resource and modeling of these resources in the IRP is handled in distinct ways depending on whether a resource is deemed to be cost-effective, or non-cost-effective, in AdopDER. Cost-effective measures are assumed to be adopted, with their capacity benefits reducing PGE's forecasted capacity need. Measures deemed to be non-cost-effective in AdopDER are made available in portfolio analysis, competing on an economic basis for selection against supply-side resource options. To consider the potential of the entire demand response supply curve, the IRP Action Plan sets a demand response target that includes all of the cost-effective measure and any additional non-cost-effective resources identified through portfolio analysis.

This Update reflects the best available DER forecasts at the time of analysis, including results from the August 2024 AdopDER run. AdopDER is a dynamic tool, and its outputs are sensitive to underlying assumptions—such as changes in federal and state policy, economic conditions, and regional adoption patterns. These inputs are continually refined as new data becomes available. All DER forecasts are currently being updated as of May 2025 and will be incorporated into the forthcoming Transportation Electrification Plan, Distributed Systems Plan, and Flexible Load Multi-Year Plan.

5.2.1 Passive DERs

Passive DERs are represented in IRP modeling using three categories: distributed solar (PV), transportation electrification (TE) and building electrification (BE). These cost-effective DER shapes are not incorporated into the PGE load forecast regression as outlined in **Section 3.1 Econometric load forecast**. **Figure 48** shows the reference case values from the 2023 CEP/IRP are included shows the passive DER shapes by category by year (2026-2032) for the low, base and high case scenarios used in the 2023 CEP/IRP Update.

Figure 48. Passive DER shapes by category by year

5.2.1.1 Distributed solar (PV)

The annual adoption of distributed solar PV is projected to experience significant growth through the late 2020s before leveling off in the early 2030s. Multiple factors drive this growth trajectory: decreasing technology costs, rapid technological advancements, supportive state policies, and increasing customer environmental awareness. However, this trend is anticipated to begin to flatten for two primary reasons. First, key financial incentives like the Residential Clean Energy Credit and Investment Tax Credit—currently stimulating adoption—will gradually phase down after 2032, with credit percentages decreasing to 26 percent in 2033 and 22 percent in 2034, before potentially being eliminated. Second, as residential customers continue to drive the majority of distributed solar PV adoption, the diminishing availability of suitable rooftops will create a natural constraint on future growth as the most optimal installation sites become saturated. The results from the AdopDER forecast for Distribute PV do not consider risks associated with the more rapid phasing out of tax credits as discussed in **Section 2.5 Federal administration changes**.

5.2.1.2 Transportation electrification (TE)

The transportation electrification policy assumptions include the impact of the 2022 Advanced Clean Cars II rule for light-duty vehicles, which requires that auto manufacturers meet 100 percent of the market share of new vehicles with zero-emission battery electric and plug-in

hybrid electric models by 2035.[112] Similarly, medium- and heavy-duty vehicles follow the 2021 Advanced Clean Truck rules, which set aggressive electrification targets for this vehicle segment.[113] The DER forecast also accounts for PGE customers and their known fleet electrification plans (i.e., a customer has plans to electrify 100 percent of its fleet by year 2028).

In the 2023 CEP/IRP Update forecast, PGE expects a total of 270,000 light-duty battery electric vehicles by 2030, predominantly in the residential sector, and approximately 80,000 medium and heavy-duty battery electric vehicles. From these vehicle estimates, PGE expects the annual transportation electrification load to achieve 95 MWa by 2030.

Gross transportation electrification load does not account for the potential impact of associated demand response programs such as time-of-use or managed charging programs. These impacts are instead captured under Demand Response or Flexible Load resources (e.g., direct load control programs).

5.2.1.3 Building electrification (BE)

Building electrification has significant potential to both decarbonize the economy and increase the amount of electric load that PGE needs to serve its customers' needs. In the DER forecast, fuel switching from fossil fuels to electric space heating, water heating, and/or cooking technologies in existing buildings and the new construction sector drives the building electrification forecast. The rate at which these customers electrify their end-use systems includes the expected impact of the 2022 Inflation Reduction Act legislation.

Like transportation electrification, gross building electrification load across varying adoption scenarios, not accounting for the potential impact of associated demand response and direct load control programs.

5.2.2 Cost-effective demand response

Cost-Effective (CE) DER resources are included in PGE's assessment of system need. **Section 3.4 Capacity need** details PGE's approach to estimating system need for the 2023 CEP/IRP Update using PGE's resource adequacy assessment model, Sequoia. As part of estimating system need, Sequoia utilizes estimates from PGE's AdopDER model. AdopDER simulates market adoption of passive DERs and the expected participation of customers in current and potential demand response programs.[114] AdopDER accounts for key site-level factors such as access to garage parking, breaker space and equipment turnover to determine the technical, achievable, and economic potential. Twenty CE DER resources are modeled as part of the 2023 CEP/IRP Update, the same number as used in the 2023 CEP/IRP. Two inputs from AdopDER are used to estimate

[112] Final rule amendments to OAR Chapter 340, Division 257 adopted by the Oregon Environmental Quality Commission in Order DEQ 23-2022 (December 19, 2022), https://www.oregon.gov/deq/rulemaking/Documents/DEQ232022.pdf.
[113] Final rule amendments to OAR Chapter 340, Division 257 adopted by the Oregon Environmental Quality Commission in Order DEQ 17-2021 (November 17, 2021), https://records.sos.state.or.us/ORSOSWebDrawer/Recordhtml/8581405.
[114] For more information on AdopDER reference 2023 CEP/IRP Chapter 6.2 - Distributed Energy Resource (DER) impact on load

the hourly effect of each CE DER in Sequoia: hourly shape and program size by month. Hourly shapes are scaled across the planning horizon based on program size, resulting in estimated hourly contributions of each CE DER resource which grow with forecasted increases in program participation. Further, CE DER contributions are estimated for the three need futures (Low/Reference/High) used in the 2023 CEP/IRP Update. **Table 23** provides a summary of program size of CE DER resources in the 2030 Reference need future. In total, there are 1269 MW of capacity from CE DER resources on average in 2030, a 181 MW net increase in capacity from the 2023 CEP/IRP Addendum: System Need and Portfolio Analysis Refresh. The largest change in program participation is in the Rooftop Solar program, which is estimated at 668 MW of capacity on average in 2030, a 165 MW increase from the estimates used in the 2023 CEP/IRP Addendum.

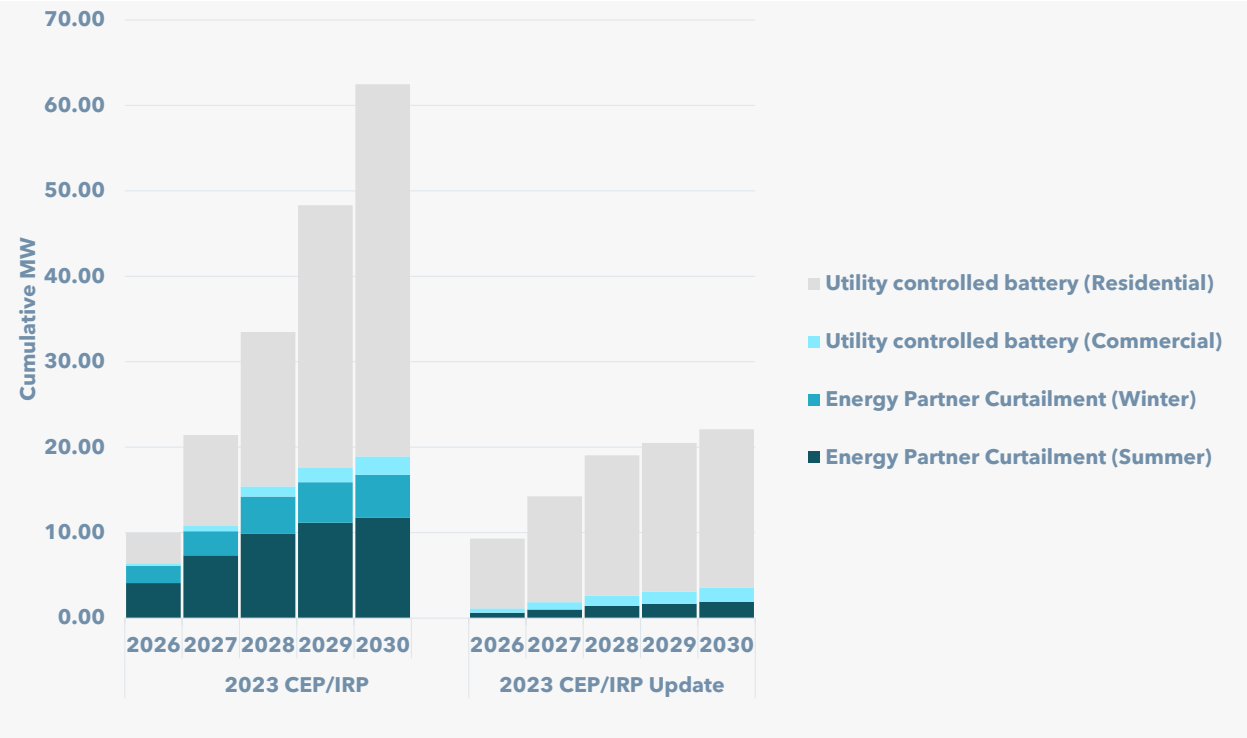
Table 23. Monthly Average Program Size of CE DER Resources – 2030 Reference Case (MW)

Program	2023 CEP/IRP Update	2023 CEP/IRP Addendum	2023 CEP/IRP
Rooftop Solar	668	503	206
Building Electrification	96	51	33
Light Duty EV	95	149	101
Energy Partner Curtailment (Summer)	92	52	52
Smart Thermostat (Summer)	76	65	65
Energy Partner Curtailment (Winter)	68	46	46
Time-of-Use (Summer)	41	30	30
Smart Thermostat (Winter)	39	35	35
Time-of-Use (Winter)	23	15	15
Peak-time Rebates (Summer)	22	43	43
Peak-time Rebates (Winter)	18	28	28
Multi-Family Water Heater (Winter)	18	41	41
Multi-Family Water Heater (Summer)	10	26	26
Utility Controlled Storage (Commercial)	3	3	3
Utility Controlled Storage (Residential)	0	0	0
Customer Controlled Storage	0	0	0
EV Load Control (Winter)	0	0	0
EV Load Control (Summer)	0	0	0
Customer Controlled Storage	0	0	0
Utility Controlled Storage w/ PV	0	0	0
Total	**1269**	**1087**	**724**

Lastly, PGE adjusted AdopDER estimates of program size for years 2025-2026 to align values with PGE's Multi-Year Plan (MYP) forecasts for mature CE DER programs: Smart Thermostat, Peak-time Rebates, Time-of-Use, Energy Partner Curtailment, and Multi-family Water Heater.[115] The MYP provides more accurate short-term forecasts of eligible program adoption compared to AdopDER's bottom-up, locational approach. PGE aligned the AdopDER near-term forecasts with MW impacts from MYP to ensure consistency across all planning deliverables.

5.2.2.1 Dispatchable Stand-by Generation (DSG)

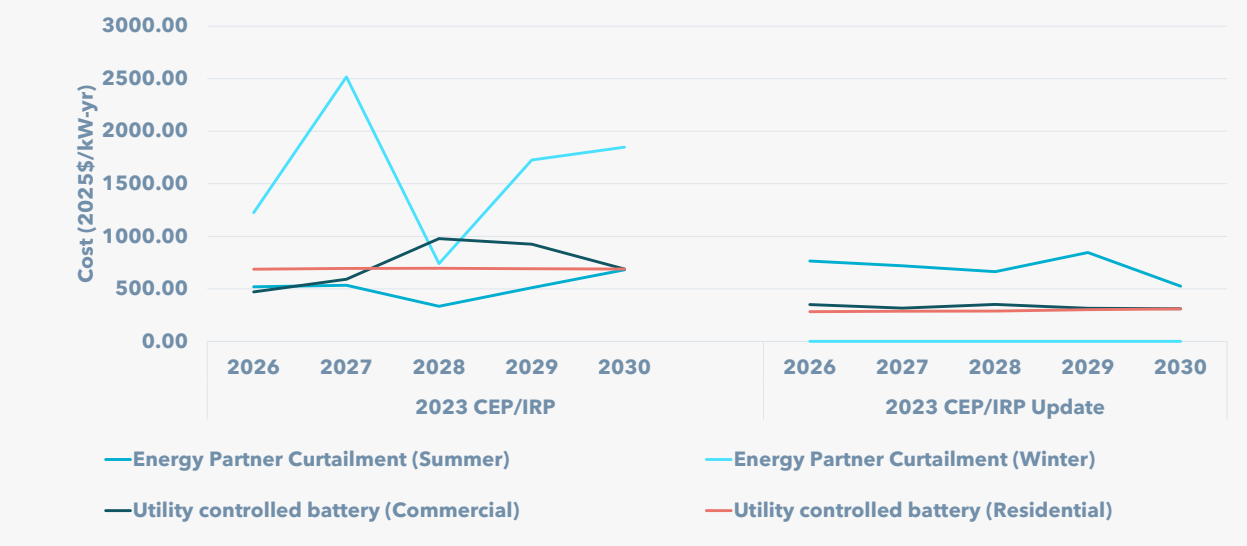
PGE's DSG program provides a valuable reliability benefit. The contingency reserves these customer-sited resources supply in the form of operating reserves free-up PGE's generating resources to serve load. Additionally, DSG resources can provide ancillary services in the form of frequency and demand response. This program was estimated to have little to no growth in the 2023 CEP/IRP and 2023 CEP/IRP Update, growing from approximately 109 MW in 2025 to 113 MW by 2030. However, more recent analysis of load growth from the industrial segment and data centers is expected to increase program participation by 120 MW.[116] Including growth from data centers as well as other C&I customers, the DSG program is expected to have 300 MW of nameplate enrollment by 2030. In anticipation of growth in the DSG PGE's rate Schedule 200 was updated to ensure customers are at least cost-neutral to participate, increasing the likelihood of enrollments and the ability of this program to avert situations that could lead to power quality problems for the power supply in the local region.[117]



5.2.3 Non-cost-effective demand response

The 2023 CEP/IRP Update includes updated quantity and cost assumptions for four bundles of non-cost-effective (NCE) DER resources. Updated values result from the August 2024 run of PGE's AdopDER model, used to forecast metrics for NCE DERs.[118,119] The four bundles are groupings of the same site-level measures as used in the 2023 CEP/IRP described in Section 8.2 - Additional distributed energy resources and Section 8.2.2 – Additional demand response. Each bundle represents similar DER programs based on dispatch characteristics and costs. **Figure 49** compares the available quantities of NCE DER resources in the 2023 CEP/IRP Update to those used in the 2023 CEP/IRP. The cumulative total quantity of NCE DER resources decreased by 40.39 MW in 2030, due largely to a 57 percent reduction in forecasted adoption of utility-controlled battery in the residential segment. The large reduction in residential utility-controlled battery is due to a slower adoption trend for these resource as estimated in the August 2024

[115] Flexible Load Multi-Year Plan 2025-2026
[116] OPUC Staff Report Docket No. Adv 1705 - Updates Schedule 200 Dispatchable Standby Generation to increase the Aid in Construction Allowance. These more recent estimates of DSG program size were not incorporated in the 2023 CEP/IRP Update due to timing in the analysis process. Estimates will be reviewed as part of the 2026 CEP/IRP planning cycle.
[117] PGE Rate Schedule 200
[118] For a more detailed discussion of AdopDER reference: 2023 CEP/IRP's Section 6.2 – Distributed Energy (DER) impact on Load
[119] These updates do not take into account UM 2141 updates approved after August 2024 (i.e., Feb. 2025 approvals)



AdopDER run. Further, capacity from winter NCE Energy Partner Curtailment resources is non-existent in the 2024 AdopDER run, as the smart thermostat and cold storage curtailment programs previously bundled within are now considered cost-effective.

Figure 49. NCE DER Quantities Available in 2023 CEP/IRP and 2023 CEP/IRP Update

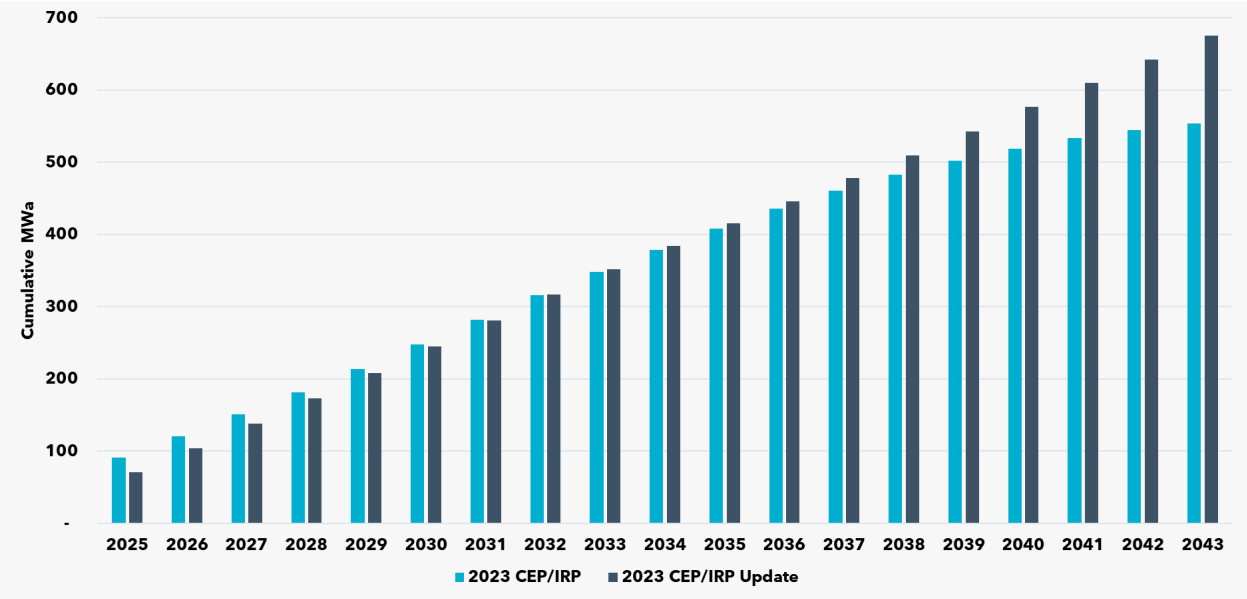
Cost assumptions were updated as part of the revised AdopDER results. Fixed costs for these NCE DER resources reflect weighted average site-level costs, including customer acquisition costs, upfront incentives, and upfront participation costs. Ongoing costs were also revised and included as variable costs for customers, incentives, and participants. **Figure 50** displays a comparison of costs from the 2023 CEP/IRP to values used in the 2023 CEP/IRP Update. Average costs across 2026-2030 for utility-controlled batteries in both commercial and residential segments decreased by approximately $380 /kW-yr, while average costs across the same period increased by $180 /kW-yr for summer Energy Partner Curtailment resources. Winter Energy Partner Curtailment costs are no longer reported as the estimated quantity available in the 2023 CEP/IRP Update is 0 MW, as described above.

Figure 50. Comparison of Updated NCE DER Costs (2025$/kW-yr)

5.3 Energy efficiency

PGE relies on the Energy Trust of Oregon (ETO) to identify energy efficiency measures available in the IRP using its resource assessment modeling tool. This modeling tool uses a cost-effectiveness screen on energy efficiency potential to forecast two metrics: (1) Cost-Effective (CE) energy efficiency measures and (2) Non-Cost-Effective (NCE) energy efficiency measures. The CE energy efficiency measures are incorporated into PGE's IRP load forecast and assumed to be acquired in IRP portfolio analysis. The NCE energy efficiency measures are incorporated into IRP's portfolio analysis and are considered as incremental resource additions based upon the aggregation of energy efficiency measures into discrete bins.

5.3.1 Cost-effective energy efficiency



PGE receives a list of Cost-Effective (CE) Energy Efficiency measures that the ETO has found to pass its cost-effectiveness screening. The screening involves using a benefit-cost ratio to determine if the present value of benefits is equal to or exceeds the present value of the costs of the measure being evaluated. The CE Energy Efficiency forecasts are incorporated into the IRP load forecast as independent, or explanatory, variables in PGE's load forecast regression models.[120] For details on the CE achievable potential by end use and sector and final savings projections for CE energy efficiency measures, see the 2025 Resource Assessment Model provided by the Energy Trust of Oregon in **Appendix E**.

For this Update PGE incorporated an updated forecast of CE EE from the ETO. As shown in **Figure 51**, cumulative quantities of CE EE are forecast to be slightly lower through 2031 than in the 2023 CEP/IRP. Beyond 2031, CE EE quantities are increased relative to the 2023 CEP/IRP forecast, although the differences are relatively small until the late 2030's. By 2043, the updated

[120] The Energy Efficiency Savings forecast shared by the Energy Trust in November of 2023 was used as an input to the May 2024 load forecast.

forecast identifies 122 MWa more CE EE than was incorporated in modeling in the 2023 CEP/IRP. The main drivers of this increased potential CE EE savings are described in the 2025 Resource Assessment Model provided by the Energy Trust of Oregon in **Appendix E.**

Figure 51. Cost-effective energy efficiency in the 2023 CEP/IRP and IRP Update

5.3.2 Non-cost-effective energy efficiency

For PGE's 2023 CEP/IRP update, the ETO provides PGE with savings and levelized cost data for energy efficiency measures that do not pass the cost-effectiveness screening in the Resource Assessment Model. A summary of the ETO energy efficiency measures in the 2025 Resource Assessment Model provided by the Energy Trust of Oregon can be found in **Appendix E**. These Non-Cost Effective (NCE) measures are incorporated into IRP modeling via the PGE bundling methodology as candidate resources in Portfolio Analysis.

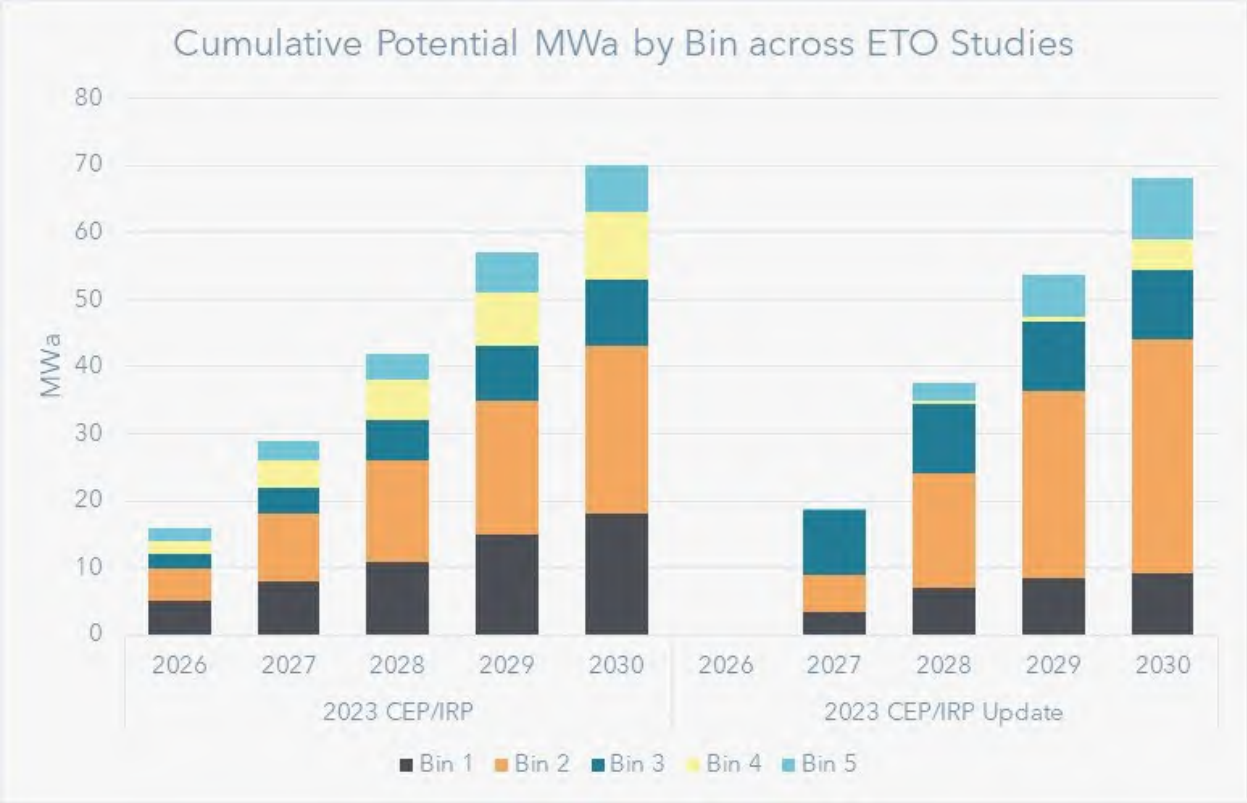
5.3.3 Bundling of NCE energy efficiency measures

PGE adopted a similar process as the Northwest Power and Conservation Council and aggregated measures into discrete bundles (or 'bins') based on the measures' levelized costs. Within these five bins the NCE energy efficiency measures are organized based on the rank of the measure's levelized cost. The bin ranges are generated by creating megawatt-average thresholds across the cumulative megawatt-average of total NCE potential. In the 2023 CEP/IRP, the bin ranges were established by prioritizing bins that contained at least 10 megawatt-average per bin. In the 2023 CEP/IRP update, the bin shapes prioritize aggregation according to average fixed cost. In portfolio analysis, the analysis of any given bin will assess the next set of potential energy efficiency measures that share similar cost structures rather than assessing the next 10 megawatt-average of the cumulative NCE potential.

From these bin shapes, PGE is able to calculate the maximum potential NCE energy efficiency savings by year. Updated bin shapes are summarized in **Table 24**. PGE then calculates costs,

capacity factors, ELCCs and energy values for each bin shape with which to characterize the NCE energy efficiency as resources available for selection in portfolio analysis.

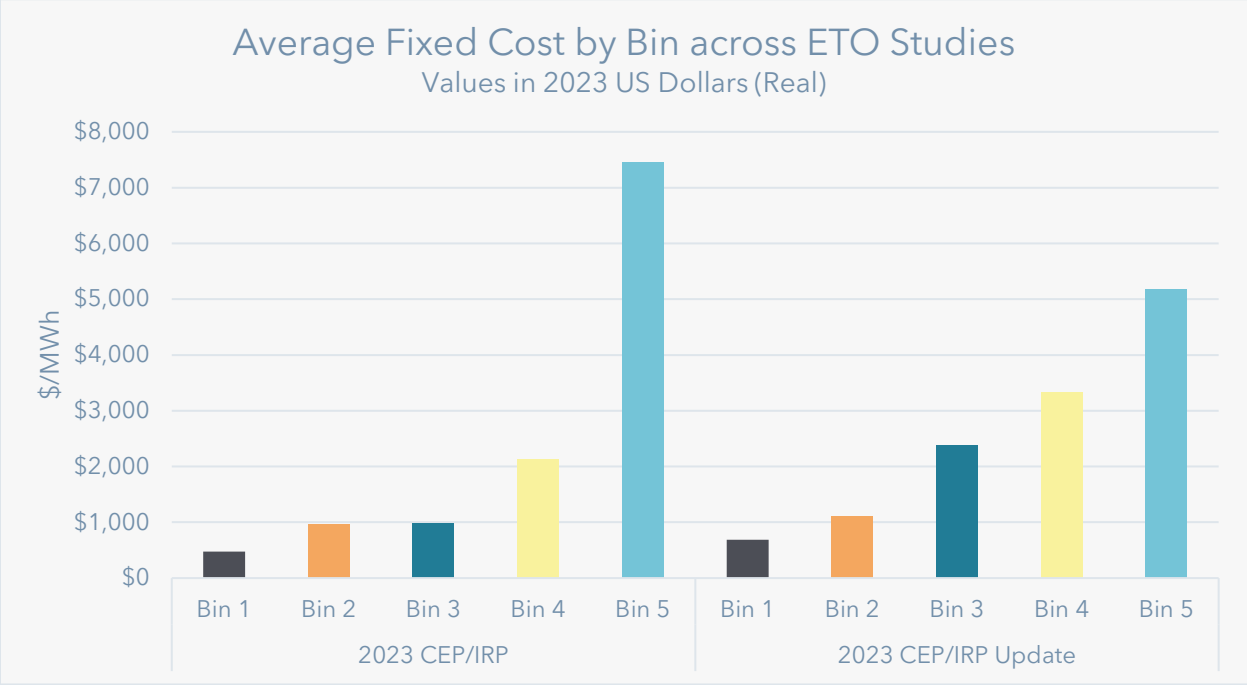
Table 24. Cumulative NCE EE potential by Bin (MWa) through 2030



Year	Bin 1	Bin 2	Bin 3	Bin 4	Bin 5
2026	0.0	0.0	0.0	0.0	0.0
2027	3.5	5.5	9.5	0.1	0.2
2028	7.0	17.0	10.4	0.6	2.7
2029	8.6	27.8	10.4	0.7	6.2
2030	9.1	34.9	10.4	4.6	9.1

5.3.4 Comparing NCE energy efficiency in 2023 CEP/IRP to the 2023 CEP/IRP Update

The total cumulative megawatt-average of NCE energy efficiency expected by 2030 changes little between the 2023 CEP/IRP and the 2023 CEP/IRP Update, falling from 70 megawatt-average to 68.1 megawatt-average across all five bins, as summarized in **Figure 52**. The bin sizes differ between filings as the changes in the fixed costs for each NCE energy efficiency measure led to resorting across the five bins.[121]



[121] In the 2023 CEP/IRP PGE was able to create roughly 10 MWa bins by aggregating programs with similar levelized costs. In the CEP/IRP Update PGE prioritized keeping bins of similar costs, which resulted in differences in MWa bin size.

Figure 52. Comparison of the Potential MWa by Bin between the 2023 CEP/IRP and the 2023 CEP/IRP Update

There is an increase in the average fixed costs for all bins, except Bin 5, as average levelized costs increased 37.2 percent over all measures, as depicted in **Figure 53**. The increases in average fixed costs are due to rising costs of EE equipment driven by inflation, changes in supply chain, post-COVID effects, and increased avoided costs, making measures that were on the margin now cost-effective. This removes lower cost measures from the list of NCE measures.

Figure 53. Comparison of the Average Fixed Cost by Bin between the 2023 CEP/IRP and the 2023 CEP/IRP Update expressed in real $ (2023)

5.3.5 Energy efficiency program and policy

This section provides an update on near-term commitments to address costs and implementation challenges present in the accelerated procurement of the Energy Efficiency identified in the 2023 CEP/IRP.[122] Those commitments include:

- Supporting Energy Trust of Oregon's development of guiding principles to actively consider utility rate impacts,
- Supporting Energy Trust of Oregon's creation of a mechanism to set targets for outside funding and requirements for regular reporting,
- Supporting Energy Trust of Oregon's formalization of the divisions of labor and funding allocations established between Energy Trust of Oregon and other entities,
- Exploring the co-deployment of flexible load and EE programs with near-term focus on how these programs can help customers participating in PGE's Income Qualified Bill Discount, and
- Continued collaboration on program demonstration in the PGE testbed and measure development that includes complementary funding.

This Update represents an articulation of PGE's understanding of the feasibility of new cost recovery mechanisms, pathways for co-deployment informed by stakeholder feedback and the

[122] OPUC. Acknowledgement of 2023 Integrated Resource Plan and Clean Energy Plan. Docket No. LC 80, December 14, 2023, Page 9. Retrieved from https://edocs.puc.state.or.us/efdocs/HAU/lc80hau325590032.pdf.

stage of readiness achieved by Energy Trust of Oregon. Some dependencies that may impact the progress on commitments made, and perhaps the Need Futures presented, include the revision to the Energy Trust of Oregon Grant Agreement, the timing and magnitude of public sector funding, changes made to avoided cost methodology on UM 1893, and Energy Trust's ability to engage and formalize roles with other public sector entities.

5.3.5.1 Utility rate impacts

Energy Trust has recently increased its focus on leveraging customer funding paid through rates with other, complementary funding sources to enable deeper retrofits, increase savings, reach more customers, and deliver overall greater value. PGE worked with Energy Trust in 2024 to refine and articulate principles for complementary funding.

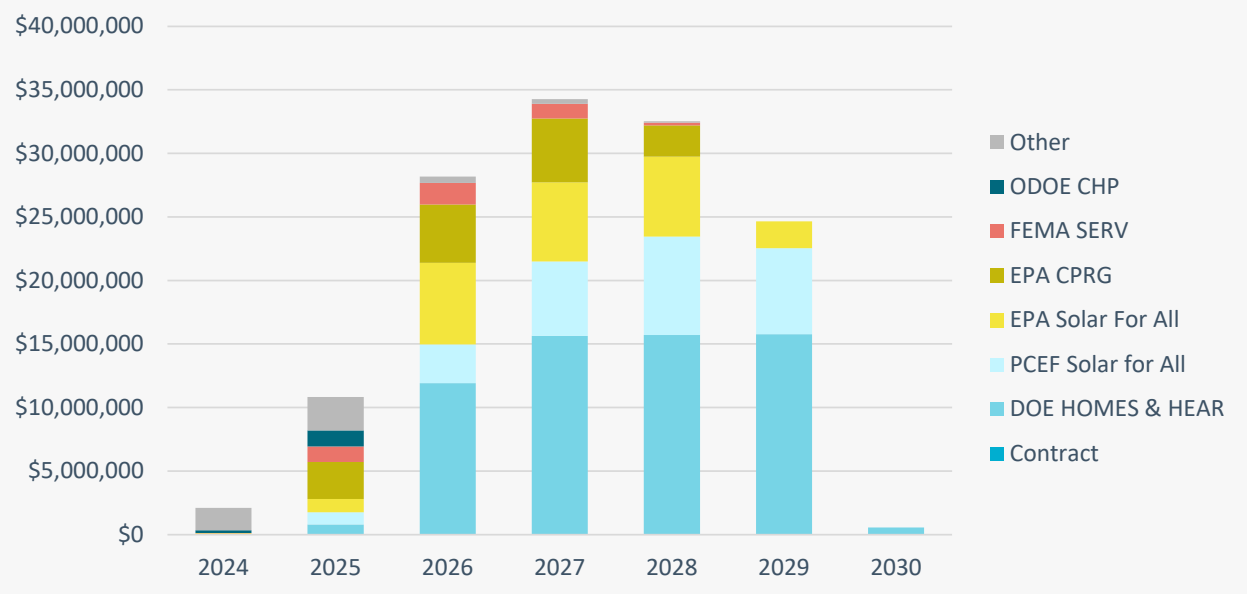
Energy Trust will align its investments with Oregon's decarbonization policies by following guidance from the OPUC and supporting customer fuel choices with high-efficiency equipment incentives. They will address fuel-switch constraints and ensure efficient use of resources to advance state policy objectives. Additionally, Energy Trust may administer programs promoting clean air and decarbonization with separate funding if it aligns with their vision and purpose.

Defining leveraging, braiding and co-funding

The term "leveraging" is used loosely to cover a broad range of complementary funding strategies that bring additional, public-sector funds to support Energy Trust projects, programs, and activities. "Braiding," "co-funding," "layering" or "stacking" funding streams is a process for using multiple sources of funding to support a common program or project that results in energy savings or generation.

This complementary funding is expected to contribute through the following efforts:

- Enable: Braiding dollars for deferred maintenance overcomes a barrier to participation.
- Amplify: Energy Trust delivery infrastructure and multi-utility funding model produces economies of scale by an order of magnitude ($1 ratepayer: $10 taxpayer).
- Offset: Braiding dollars improves cost-effectiveness by reducing the incremental measure cost.



Guiding principles for leveraging funds

Energy Trust has stated that it will prioritize leveraged funding to increase energy savings and generation, improve equitable access to services, stretch customer dollars, and fill unmet customer needs. They also committed to minimizing program confusion, strengthening stakeholder relationships, ensuring continuous customer support, and enhancing contractor effectiveness. Leveraged funding examples include co-funding heat pump installations, provided it results in greater benefits for customers.

5.3.5.2 ETO funding allocation

In 2025, Energy Trust will be developing a complementary funding strategy as a component of the 2026-2030 multiyear plan. This component of the multi-year plan will outline strategies to leverage other funding in support of multiyear program strategies to achieve energy targets. Current estimates provided by ETO, across all utility funders not just PGE, are shown in **Figure 54**, though exact timing and amounts may be subject to change.

Figure 54. Estimated Energy Trust Complementary Funding Revenue by Year, Contract

PGE customers benefit from the leveraging of taxpayer dollars. Given that public sector grants and rebates fund the same end-use improvements it is important to establish an understanding of the roles and responsibilities across funding administrators and implementers so as not to duplicate efforts. This sorting and defining of roles is currently happening at the funding opportunity or contract level for Energy Trust. For example, for EPA Solar For All, this is described in the role of partners within that agreement.

5.3.5.3 Co-Deployment of Flexible Load and EE programs

Action Planning with Energy Trust of Oregon

As a result of legislative direction in HB 3141 (2021), codified as ORS 757.746(e), Energy Trust of Oregon was required to, "with public utilities, jointly develop public utility specific budgets, action plans and agreements that detail the entity's public utility-specific action plan (USAP), resources, including coordinated activities that require joint investment and deployment." Also, per the legislation, "Each action plan must reflect stakeholder feedback gathered through a public process managed by the entity and the relevant public utility as overseen by the commission." This statutory direction required modification to Energy Trust's current budget development process, with more utility-specific coordination.

In June of 2022, following a series of work sessions with OPUC, Energy Trust, utility funders and customer advocates, a Budget Process Coordination and Action Plan Memorandum (the "HB 3141 Budget Coordination Memo") was formed. This memorandum represented a joint planning framework that articulated stepwise activities to support annual budget and utility-specific action planning.

Building on this plan development process the Energy Trust and PGE propose evolving from a two-year cycle to a multi-year (2026-2030) time horizon and from an activity-based plan to an outcomes-based co-deployment framework. Doing so affords the two organizations the opportunity to better maximize value for shared customers, accelerate procurement as determined in the PGE Integrated Resource Plan in compliance with HB 2021, as well as align based on organizational and program readiness.

Co-Deployment

Co-deployment with the Energy Trust encompasses a shared strategy, with common marketing, outreach, and messaging, to efficiently deliver complementary energy services to shared customers. Through co-deployment of complementary services, customers benefit from behind-the-scenes coordination with streamlined participation and total delivery cost reduction for all customers. To start, co-deployment will include targeting priority high energy burdened customers with services that lead to meaningful bill reduction and advance the shared objective of reducing energy burden. The timing of this effort is aligned with implementation of HB 2475 through the OPUC docket UM 2211, with the goal of reducing energy burden and the anticipated availability of public sector funding. Co-deployed services will initially consist of existing, feasible offerings provided by each organization today. Over time, additional services and deployment forms or pathways will be added to the framework as each organization is ready to bring in more services to market. The framework will evolve to focus on different configurations of candidate screening and more targeted delivery.

Co-deployment may take a variety of forms and pathways:

- Community outreach: Shared program marketing collateral and tabling events together
- Co-funding: A methodological approach in which PGE provides complementary funding for flex value (e.g., residential thermostats)
- Bill reduction: Referral of IQBD customers to increase EE program participation (also provides flex potential for future co-funding opportunities)
- Solar+ storage: Aligning PGE smart battery roadmap with the U.S. Environmental Protection Agency Greenhouse Gas Reduction Fund Solar for All grant funding timing
- Pilot to program: Ensuring that tested collaboration yields a hand-off to product and measure development.

5.4 SSR resource

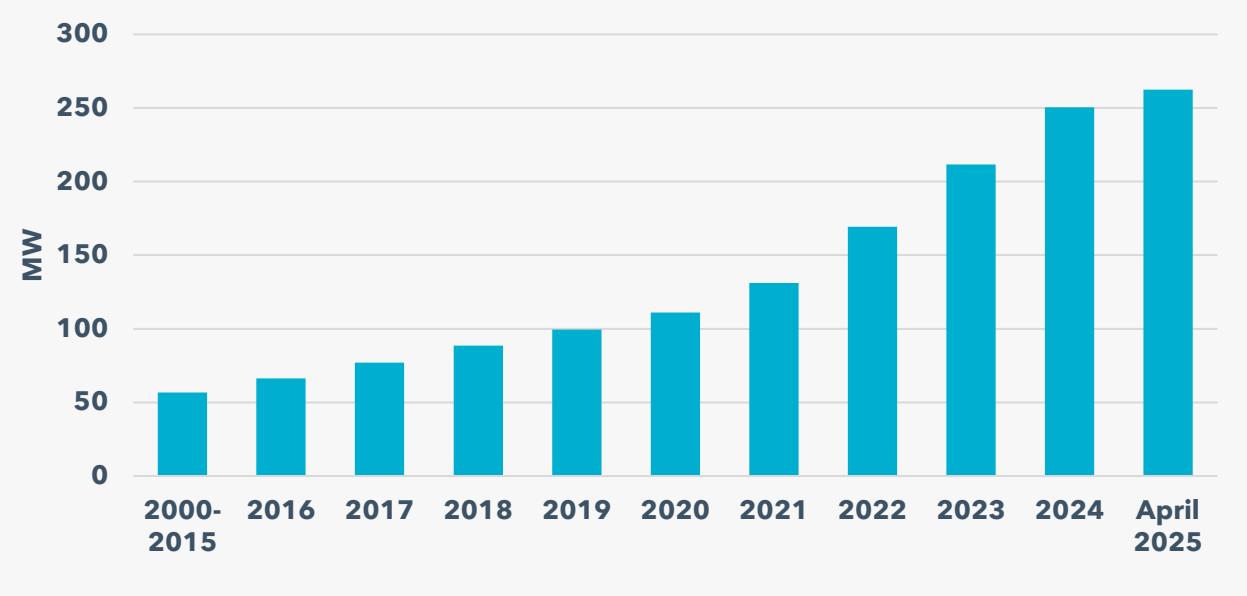
A new proxy supply-side resource was added to represent the range of small-scale renewable (SSR) resources that may be available to help PGE meet Oregon's ten percent small-scale

renewable requirement. The inclusion of a SSR resource allows the requirement that starts in 2030 to be accounted for in portfolio analysis.

The ten percent requirement uses only one metric (i.e., 20 MW or less in size) and does not incorporate community benefits.[123] The purpose of the SSR proxy resource is strictly to analyze compliance with the ten percent requirement; consequently PGE chose to design the resource to represent projects on the upper end of the 20 MW size limit, which are less costly than smaller community-scale projects. Smaller-scale projects are already considered in portfolio analysis through the lens of CBREs.

Due to limited suitable locations within PGE's service territory to site a 20 MW renewable energy facility, the resource is assumed to be off-system. The resource cost and performance parameters of the SSR resource are based on the Christmas Valley solar proxy resource. The performance characteristics match those of the Christmas Valley solar resource. This means having the same generation profile and resulting capacity factors and energy value. The cost characteristics are scaled to account for the fact that smaller projects benefit less from economies of scale than larger projects and therefore can be expected to be more costly on a per-unit basis. In order to account for this size-cost dynamic, the $/kW fixed costs of the SSR resource are inflated by eight percent above the fixed costs of the Christmas Valley solar resource, the fixed costs of which are based on an assumed 100 MW DC project size. Analysis in Berkeley Lab's "2024 Utility-Scale Solar, 2024 Edition" report is used to estimate a cost premium associated with smaller-scale resources. In the report, projects between 5-20 MW DC were found to have a weighted mean capex cost of $1.28/W, while projects between 50-100 MW DC had eight percent lower capex costs, with a weighted mean of $1.18/W.[124]

5.5 Community benefits indicators (CBIs)



PGE has taken steps to advance the integration of community benefits indicators (CBIs) into resource planning processes, consistent with regulatory directives and community stakeholder priorities. This chapter provides an update on the development, refinement, and application of CBIs since the 2023 CEP/IRP. As guided by OPUC Order 22-390 and stakeholder input,[125] PGE has expanded its CBI framework to encompass measurable and impactful metrics across resilience, health and community well-being, environmental impacts, energy equity, and economic impacts. This update aims to share key developments, preliminary findings, and the roadmap for future efforts.

For example, PGE has long supported customer-sited resources connecting to the power grid. **Figure 55** shows rooftop solar installations have grown roughly four-fold in the past decade.

[123] While SSR resources can be CBRE's, they are not required to provide the community benefits that distinguish CBRE's from other small-scale resources. The SSR proxy resource therefore does not include any assumption of provision of community benefits beyond what would be provided by larger utility-scale resources.
[124] Berkeley Lab's "2024 Utility-Scale Solar, 2024 Edition" report can be found at http://utilityscalesolar.lbl.gov.
[125] This order, along with valuable stakeholder input, has guided PGE's approach to Community benefits indicators Oregon Public Utility Commission. (2022). Order No. 22-390 in Docket No. LC 73. Retrieved from https://apps.puc.state.or.us/orders/2022ords/22-390.pdf.

Community-based renewable energy is just a part of what PGE will quantify and track toward CBIs.

Figure 55. Cumulative Installed Rooftop Solar PV Capacity (MW)

5.5.1 Background and regulatory framework

OPUC Order 22-390 provided guidance on CBIs and their application to CEP/IRP analysis and established five CBI topic areas that must be included: health and community well-being; resilience; environmental impacts; energy equity; and economic impacts.[126] The Order also required that these topics should include at least one metric of each of three CBI categories. In 2023, PGE filed its first CEP as part of the IRP, including a set of CBIs responsive to these three CBI categories:

1. **Portfolio CBIs (pCBI)**: the CEP included a proxy value for all CBRE, set at 1 MW of CBRE equal to 1 unit of community benefit, reflecting an unspecified set of benefits associated with a hypothetical CBRE
2. **Resource CBIs (rCBI)**: PGE utilized a ten percent adder to reduce the levelized cost of CBRE projects, reflecting an approximation of the associated community benefit value of CBREs within the resource portfolio comparison process
3. **Informational CBIs (iCBI):** PGE identified a set of six iCBI and associated metrics, based on community engagement efforts and stakeholder feedback

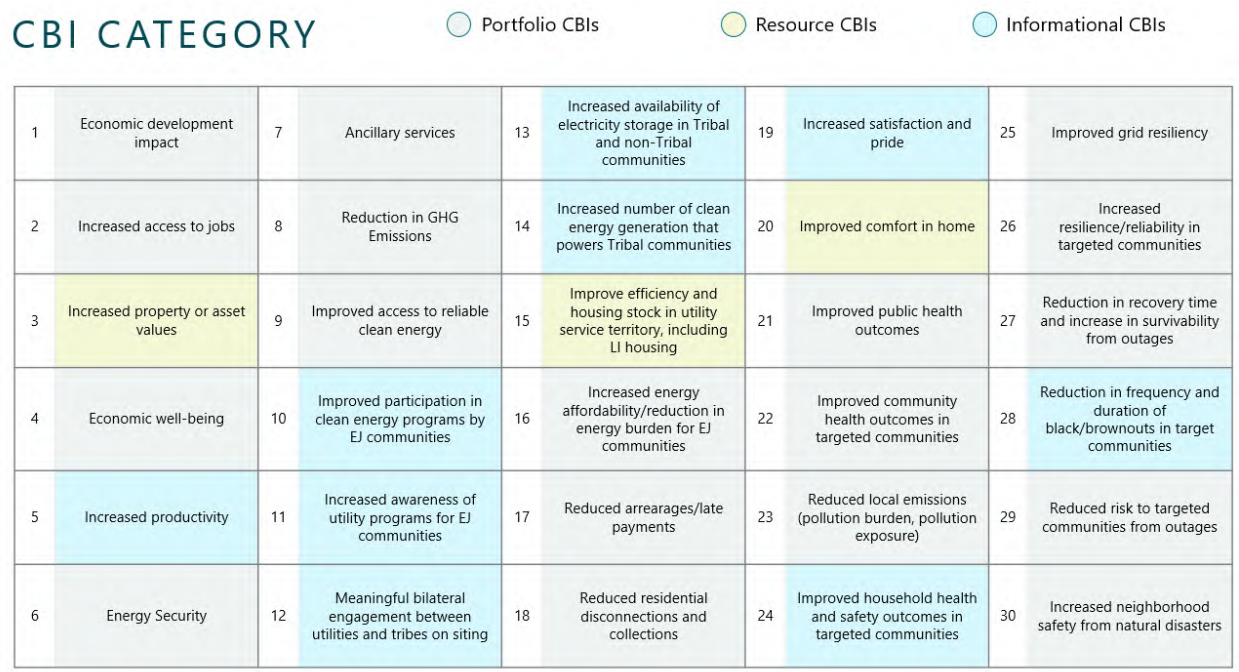
In April 2024, OPUC issued Order 24-096, which identified the following required actions:

[126] Oregon Public Utility Commission. (2022). In the Matter of PORTLAND GENERAL ELECTRIC COMPANY, 2019 Integrated Resource Plan (Order No. 22-390). Retrieved from https://apps.puc.state.or.us/orders/2022ords/22-390.pdf

"PGE must demonstrate development of CBIs to assist in our understanding tradeoffs between cost, risk, and community benefit, and when evaluating procurement decisions.

"PGE must develop a set of informational-only metrics by its next CEP/IRP or provide a detailed explanation of barriers, constraints, and a proposal for resolution." [127]

5.5.2 Advancing CBI methodologies and integrating to the IRP



5.5.2.1 Updated CBI approach

In 2024, PGE engaged Cadeo (now Resource Innovations) to conduct research into CBIs. Based on this research and stakeholder feedback, PGE refined its approach to CBI as follows:

1. Expanded CBI List: PGE incorporated a list of 30 CBIs that was developed by Cadeo, characterized by their applicability to specific resources, monetizable value, and alignment with OPUC categories (see **Figure 56**). For more detail on how Cadeo developed this list, please see **Appendix G**.
2. Valuation Methods: Cadeo's research into monetizable CBIs has developed a method to include five pCBI categories to align and comply with OPUC requirements. For rCBIs, Cadeo reviewed several studies which they then used to quantify percentage adjustments which would reduce the levelized cost of capacity for several specific resource bundles.
3. Stakeholder Collaboration: PGE Engagement with the IRP Roundtable, OPUC Staff, and the Community Benefits and Impacts Advisory Group (CBIAG) has informed revisions to CBI metrics and methodologies. The CBIAG provided valuable feedback on the CBI framework, suggesting improvements and identifying areas for future exploration. Affordability emerged as a key concern, particularly regarding the impact of investment costs on customer rates, especially for those with higher energy burdens.
4. Integration Strategies: PGE research proposed four distinct approaches to incorporate CBIs into IRP modeling, ranging from proxy indicators to direct cost adjustments.

[127] Oregon Public Utility Commission. (2023). Docket No. LC 80, Order 240-096: PORTLAND GENERAL ELECTRIC COMPANY 2023 Integrated Resource Plan. Retrieved from https://apps.puc.state.or.us/edockets/DocketNoLayout.asp?DocketID=23636

Figure 56. List of CBIs by Category

1	Economic development impact	7	Ancillary services	13	Increased availability of electricity storage in Tribal and non-Tribal communities	19	Increased satisfaction and pride	25	Improved grid resiliency
2	Increased access to jobs	8	Reduction in GHG Emissions	14	Increased number of clean energy generation that powers Tribal communities	20	Improved comfort in home	26	Increased resilience/reliability in targeted communities
3	Increased property or asset values	9	Improved access to reliable clean energy	15	Improve efficiency and housing stock in utility service territory, including LI housing	21	Improved public health outcomes	27	Reduction in recovery time and increase in survivability from outages
4	Economic well-being	10	Improved participation in clean energy programs by EJ communities	16	Increased energy affordability/reduction in energy burden for EJ communities	22	Improved community health outcomes in targeted communities	28	Reduction in frequency and duration of black/brownouts in target communities
5	Increased productivity	11	Increased awareness of utility programs for EJ communities	17	Reduced arrearages/late payments	23	Reduced local emissions (pollution burden, pollution exposure)	29	Reduced risk to targeted communities from outages
6	Energy Security	12	Meaningful bilateral engagement between utilities and tribes on siting	18	Reduced residential disconnections and collections	24	Improved household health and safety outcomes in targeted communities	30	Increased neighborhood safety from natural disasters

5.5.2.2 Integrating CBIs into IRP modeling

Following CBI discussions and direction from UM 2225 and LC 80, PGE has utilized the same structured pathways to integrate CBIs into IRP processes:

Resource CBIs highlight the localized benefits of individual projects:

- rCBIs can be used to adjust levelized costs of specific resources. For instance, the economic and health benefits of solar panels and energy efficiency measures are quantified and incorporated into resource cost comparisons.
- These adjustments could be used to influence the cost-minimization portfolio analysis towards the selection of resources that maximize community benefits.

Portfolio CBIs reflect the cumulative benefits of resource portfolios, with emphasis on economic, environmental, and equity impacts.

- pCBIs are determined by the quantities of resources selected in portfolio analysis.
- Portfolios with higher pCBI values could be identified as higher performing in portfolio analysis (based on their broader community benefits).

Informational CBIs

- iCBIs may be used as tracking tools to monitor long-term impacts, such as the percentage of low-income households benefiting from clean energy programs, quality job creation, and increased resiliency within Tribal and energy-burdened communities.

In the initial use of Resource CBIs, a direct adjustment was applied to the levelized cost of specific energy resources to account for measurable participant benefits. While research identified a set of eight core benefit categories with the potential for monetization, only those substantiated by secondary data sources were included: property value increases and comfort improvements. Due to limited primary research on benefit valuation for specific resource types within PGE jurisdiction, this analysis relied on secondary sources and adapted benefit metrics for IRP application. PGE caveats that these benefits accrue to the participant not directly to the community (and therefore supports further refinement of this framework through planning and acquisition efforts). The assumption underlying the application of these benefits is that these participant benefits, when aggregated in a local setting, result in a community benefit. This initial assessment and application of these first rCBIs were integrated into IRP evaluations as percentage reductions to resource costs.

Examples of **rCBI Application** include the reduction of resources costs to account for:

- **Community-based renewable energy** (**CBRE) Solar** if qualified by providing tangible and resilience benefits to community is based on a 6.8 percent increase in property values, reflecting benefits tied to behind-the-meter installations for residential customers.
- **Energy efficiency (EE)**, to reflect monetization of comfort benefits at $62 per project annually for low-income households and $42 for non-low-income households.
- **Curtailment programs (Battery Storage)** based on a 2.3 percent increase in property values for residential batteries enrolled in curtailable Summer/Winter programs.

Table 25 summarizes selected rCBI applications.

Table 25. Assumed rCBI Applications

CBI	Resource Category	% Reduction to Levelized Cost	CBI Benefit Metric	Source	IRP Application Assumptions
Property Value	CBRE Solar	**269%**	6.8% increase in property value	Zillow 2024	Assumes 5 kW residential solar install; applicable to behind the meter projects; dependent on ownership structure (i.e., assumes value occurring at time of sale for home/property owner)
Property Value	Demand Response	**64%**	2.3% increase in property value	Zillow 2024	Assumes applicability for 5kW residential battery, assumes behind the meter installation
Property Value	EE	**45%**	0.5% increase in property	LBNL 2022	Applicable for home performance projects (e.g., HPwES, whole-house weatherization); reflecting Residential study.
Comfort (Shell)	EE	**10.6% LI; 7.2% non-LI**	$62/project (LI); $42/project (non-LI)	EmPOWER Maryland (2023)	Applicable for projects with shell measures (insulation, air sealing); benefit accrue annually over measure lifetime

CBI	Resource Category	% Reduction to Levelized Cost	CBI Benefit Metric	Source	IRP Application Assumptions
Comfort (HVAC)	EE	**5%**	Average of $30/project (3%) and $100/project (7%)	MA Residential NEI Study (2023); EmPOWER Maryland (2023)	Applicable for HVAC replacements using heat pumps; benefits accrue annually over measure lifetime; assuming 2000 kWh annually, 18-year EUL, and project cost of $15,000.

The rCBI benefits PGE was able to identify and quantify required two key conditions: (1) access to existing research with adaptable, quantified benefits; and (2) available data across all applicable resources for a given benefit. This consistency requirement is key for maintaining balanced resource comparisons, as including monetized benefits with the levelized costs for only some eligible resources would create an uneven evaluation framework. The approach prioritized consistency, meaning CBIs through the rCBI pathway were only applied when complete data existed across all applicable resources. Otherwise, associated benefits are considered within the pCBI approach.

Portfolio CBIs: Proxy-based Benefits

Portfolio CBIs represent those benefits which are more challenging to quantify or monetize, or that may have insufficient available data for all eligible resources (and thus present an imbalance if included for some but not all resources). For this update PGE attempted to assign these benefits to resource bundles in line with the economic, equity, health, resilience, and environmental categories laid out in OPUC guidance. PGE applied pCBIs as proxy values at the backend of the IRP modeling sequence after resource bundles were established, to characterize and identify bundles that likely accrue specific CBI benefits. PGE then considers these CBIs as part of the scorecard approach for portfolio selection.

Examples of **pCBI Application**:

- **Economic Impacts**: Included economic development, increased access to jobs, economic well-being, increased property value, and increased productivity. Economic impact benefits are identified for a wider range of resources, not limited to demand response and CBREs. This includes supply-side resources as potential economic development and job creation opportunities exist across various resource categories.
- **Energy Equity**: Benefits such as improved affordability and reduced arrearages were assigned to CBRE, energy efficiency (EE), and demand response (DR) (specifically time-of-use rates), applicable to resources targeting disadvantaged communities and those with highest likelihood of yielding bill impacts.
- **Health and Well-being**: Proxy values for improved indoor air quality and household safety were applied to weatherization and HVAC measures.
- **Environmental Impacts**: Emissions reductions were reflected across CBRE and demand-side

resources to account for their role in mitigating climate change. In the development of the IRP, the availability of pCBIs remains limited for many resource options under consideration. While pCBIs have been identified for certain distributed energy resources, such as community-based renewables and energy efficiency programs—where benefits like energy equity, local economic development, and resilience can be reasonably quantified—many supply-side resources lack studies or assessments that would inform the application of pCBI benefit.

This is primarily due to the complexity of attributing broad community benefits to large-scale generation and transmission assets, as well as the absence of standardized methodologies for quantifying their indirect social and environmental impacts.[128] **Table 26** highlights how the five topic areas for pCBIs were mapped to resource bundles, this table excludes resources such as out-of-state wind and others that do not have associated pCBIs.

Table 26. pCBI Mapping

Resource Bundle	Economic Impacts	Energy Equity	Health/ Well-being	Resilience	Environmental Impacts
CBRE Solar	✓	✓		✓	✓
Energy Efficiency	✓	✓	✓	✓	✓
Demand Response	✓	✓		✓	✓
CBRE Microgrids	✓	✓	✓	✓	✓
Battery	✓	✓			
CBRE Hydro	✓	✓		✓	✓
Gas Turbine	✓				
CV Hybrid	✓				
Wind - PGE territory	✓				
Solar - PGE territory	✓				

There are detailed applicability requirements for all CBIs, therefore resource-specific applicability must be carefully considered. These requirements relate to factors including measure characteristics, program design, geographic targeting, and baseline conditions. For

[128] These results are consistent with PGE's statements in UM 2225 about the inability to create useful and rigorous estimates of community benefits indicators to be applied in IRP analysis.

example, CBIs unlocked through energy efficiency often relate to specific measures, such as weatherization or HVAC improvements. When IRP resource bundles include various end-uses and technologies, these CBIs may only apply to a subset of the energy savings. Additionally, some CBIs focused on equity outcomes require geographic considerations, such as savings occurring within locations designated as environmental justice or tribal communities. Other CBIs aimed at achieving customer-level economic impacts related to energy affordability will be contingent upon resources that can achieve higher levels of bill savings.

5.5.3 Challenges and next steps

PGE faces several challenges integrating CBIs into its IRP process. One significant issue is the limited availability of jurisdiction-specific studies to substantiate the valuation for certain CBIs. Local conditions such as weather, the characteristics of the residence, customer awareness, power generation mix and location, distribution grid infrastructure status, and more can influence the valuation of different types of benefits. PGE has identified a need for further primary research to reflect these local conditions and policy goals and looks forward to engaging with stakeholders on the method, scope, and objectives of this research. The company is conducting a CBRE Request for Offer (RFO) through November 2025, which serves as a valuable tool for market research on project costs and CBIs. The insights gained from this process, including evaluations by CBIAG and engagement with OPUC Staff, should be incorporated into future resource planning updates to demonstrate PGE's commitment to understanding and valuing community benefits.

Another challenge lies in the limitations of proxy metrics, which require a balance between precision and usability. These metrics must be refined to ensure they provide meaningful insights while remaining practical for use in resource planning.

PGE has identified the need for further research to fully capture the benefits of Distributed Energy Resources (DERs), particularly for those DR resources not associated with EE. This may include considering the development of a cost-test model that could potentially incorporate identified community benefits. The process may involve examining recent research methodologies for quantifying benefits. New York State Energy Research and Development Authority's (NYSERDA) Community Adder program was reviewed for concept insights, finding additional incentives for community solar projects benefiting disadvantaged communities.[129] In consideration of the principles outlined in HB 2021, PGE aims to evaluate potential strategies for improving clean energy accessibility, assess projects that may provide benefits to disadvantaged communities, and pursue clean energy and equity objectives, while maintaining a focus on meeting load requirements and striving for cost-effective solutions for customers.[130]

[129] NYSERDA. *Community Adder* webpage. Retrieved from https://www.nyserda.ny.gov/All-Programs/NY-Sun/Contractors/Dashboards-and-incentives/Community-Adder.
[130] Oregon House Bill 2021, Section 1(3)(a), 2021 Regular Session. https://olis.oregonlegislature.gov/liz/2021R1/Downloads/MeasureDocument/HB2021/Enrolled.

5.5.4 Conclusion

Integration of CBIs provides an opportunity for PGE to extend resource planning to include the values and priorities of the communities PGE serves. CBIs offer a means by which to quantify benefits such as resilience, equity, environmental impact, public health, and economic development.

The challenges identified—including data gaps, proxy metric limitations, and diverse stakeholder priorities—highlight the need for continued research, collaboration, and refinement. As detailed earlier in the section, PGE believes continued stakeholder engagement, localized data development, and the adoption of advanced methodologies are necessary to overcome these challenges and enhance the impact of CBIs.

5.6 Long lead-time resources

This section provides an updated summary of Chapter 8.5 of the 2023 CEP/IRP regarding potential future resource options that PGE considered, including new generation and transmission expansion to other regions.

5.6.1 Post-2030 resource options

In 2024, in response to docket LC 80, PGE enacted a "Request for Information" (RFI), reaching out to WECC market participants to better understand post-2030 regional resource availability.[131] Using a comprehensive questionnaire distributed amongst a variety of developer communities and trade organizations, PGE gathered information on producers across key production regions in the WECC market and included a public/stakeholder workshop on these findings in late 2024.[132] That work has granted some insights that are relevant to post-2030 resourcing and is referenced in this section of the Update.

5.6.2 Hydrogen and ammonia

Included in the Inflation Reduction Act is a new 45V Clean Hydrogen Production Tax Credit (10-year duration). The tax credit provides up to $3.00/kg of hydrogen produced based on the emission intensity of the energy used to produce hydrogen. The law lays out a series of qualifying conditions in order to receive the credit, including a calculation of the lifecycle GHG emissions of the electricity, the age of the producing asset, and other considerations. Section 45V may yet serve as an additional incentive to the implementation of green hydrogen applications.

The federal government established a multi-billion-dollar grant for green hydrogen hub development nationally, with Oregon's Pacific Northwester Hydrogen Association receiving up

[131] Staff Report, recommendation #2, filed December 14, 2023, https://edocs.puc.state.or.us/efdocs/HAU/lc80hau325590032.pdf.
[132] PGE RFI Key Insights presentation, December 2024, https://assets.ctfassets.net/416ywc1laqmd/2GF5BwVt9cR1MXtEpn6fli/e719ec6879183abd984928db360fe410/RFI_slides_jdg_web_1197.pdf.

to $1 billion for four DOE-defined development phases spanning nine years. PGE has participated in this consortium to identify an opportunity to make this additional incentive available for customers, though there is currently some uncertainty of funding under the new Trump Administration.

5.6.3 Nuclear

In Oregon, Measure 7 prohibits the construction of a new nuclear power plant in the state without a federal long-term nuclear waste repository and a statewide popular vote. However, there is growing national interest in nuclear power as a non-emitting resource with active projects appearing in neighboring states.

In their 2021 IRP, PacifiCorp identified a sodium cooled fast reactor nuclear power plant with molten salt storage as a demonstration of the commercialization of this new, potentially safer, nuclear technology. Construction on the plant began in 2024, in conjunction with TerraPower, and incorporates a storage unit that will allow the production of 500 MW for short durations, with an anticipated online date in 2030. In PacifiCorp's 2023 CEP/IRP, the company announced two other nuclear power plants to be built in Utah, on the sites of soon-to-be-retired coal plants, both to be natrium plants producing 500 MW each. However, PacifiCorp communicated its intention to pull back on these two new plants in an IRP revision in mid-2024.

In Washington, small modular reactor (SMR) projects have also moved forward as Energy Northwest has partnered with X-energy to design a program of 12 small plants, each producing 80 MW. As of Q4 2024, Amazon Web Services agreed to partner on four advanced SMRs, generating 320 MW on the Columbia River, with the plants expected to enter service in the early 2030s. Once partnerships and funding are found for the other eight SMRs, 640 MW of nuclear power may come online in Washington.

It remains to be seen if next generation nuclear technology can lower the cost, safety, and political hurdles faced by traditional nuclear power.

5.6.4 Geothermal

PGE's 2024 RFI gained information on few geothermal projects developing inside Oregon. The projects utilize experimental technology and are expected to enter service in 2030-onward. The projects together will generate approximately 75 MW of continuous non-carbon-emitting power, a sizeable addition to Oregon's current geothermal operations, but a very small fraction of the total potential geothermal energy available in the State.

Future improvements in drilling technologies will result in reduced development time and costs. Developments in EGS stimulation technology and higher success rates will also reduce costs and development timelines.

5.6.5 Post-2030 wind/solar generation

PGE's 2024 RFI reflected a potential 6 GW of wind and solar projects at various stages of development, to come online between 2030-2034. Of these 6 GW, ~2,7 GW are being produced

in Oregon, primarily in the form of wind projects with varying degrees of feasibility. With another 3.1 GW in neighboring states, also mostly in the form of wind projects (although some 300 MW of Nevada stand-alone solar are also coming online).

5.6.6 Long-term hybrid resources

The 2024 PGE RFI produced information about future hybrid projects coming online in 2030 and after. According to the RFI, some 4 GW of hybrid projects are to come online between 2032-2034: 2.5 GW in Oregon, incorporating both wind and solar resources; and the other 1.5 GW in neighboring markets. In particular, 1 GW of solar + storage units coming online in Nevada, access to which could be improved through transmission expansions options discussed in **Chapter 4**.

5.6.7 Long-duration storage

Long Duration Energy Storage (LDES) is defined as any electricity storage with greater than six hours of duration. In early 2025, the U.S. Department of Energy's (DOE) Office of Electricity announced a Notice of Funding Opportunity for up to $8 million seeking to accelerate energy storage manufacturing through pre-production design innovations to ultimately scale this technology faster to meet the nation's growing energy storage needs.

Currently lithium-ion batteries are the most common storage options on the market, but other chemical storage options include flow batteries. Longer duration batteries may soon be more widely available.

Another potential technology for longer-duration storage relies on pumped air/iron-air storage, wherein energy expended in oxidation and de-oxidation constitutes a storage technology. Organized in large battery packs, this technology permits 100+ hours of storage in testing environments and is demonstrably cost-effective when compared to lithium-ion battery storage technology. Form Energy, a company founded in 2017, is pioneering this technology across the United States.[133] For example, Great River Energy, a Minnesota Utility, is working to develop a multiday iron air battery.

As more variable energy resources are expected to arrive on both the PGE system and the greater Western Interconnection, there may be increased opportunities to use storage to shift energy from oversupply hours to hours of greater need and value.

Chapter 6. Resource plan

This report updates PGE's comprehensive and robust 2023 CEP/IRP portfolio analysis. The analysis presented in this chapter incorporates updates to key inputs and advancements to PGE's modeling capabilities. The portfolio analysis in the 2023 CEP/IRP identified a Preferred Portfolio based on the insights gained from the evaluation of transmission need, GHG glidepaths, the role for additional EE and DERs, CBRE's, emerging technologies, and optimization assumptions. Portfolio analysis in this Update carries forward those insights where applicable, while updating key inputs and incorporating modeling advancements to determine a new Preferred Portfolio.

This portfolio analysis incorporates PGE's most recently available forecasts of energy and capacity needs and updated resource cost information. This analysis incorporates updated characterization of the state of the existing transmission system and a comprehensive set of options to increase transmission access through upgrades or expansion. PGE also incorporated modeling advancements to GHG emissions accounting, granularity of energy accounting, and CBI reporting.

The updated modeling inputs and methods were used to inform the creation of a new Preferred Portfolio, which is described in detail in **Section 6.2 Preferred Portfolio**. The Preferred Portfolio is analyzed from multiple angles to consider annual cost impacts, resource adequacy, hourly emissions reporting, and SSR compliance. Multiple sensitivities are conducted on the Preferred Portfolio, exploring key topics of interest regarding large industrial customer growth, resource adequacy planning assumptions, the availability of federal tax credits, and the availability of non-emitting market purchases for hourly emission accounting.

Key Highlights

- The updated Preferred Portfolio demonstrates a least-cost, least-risk approach to meeting resource adequacy needs while decarbonizing in accordance with HB 2021, including 1362 MW of wind, 1089 MW of solar, 1750 MW of storage, 83 MW of NCE EE and DERs, and 155 MW of community-based renewable energy (CBRE) resources by 2030.
- Hourly emissions analysis confirms the Preferred Portfolio can comply with HB 2021 emissions limits in 2030, with thermal generation concentrated in winter months when non-emitting energy is scarce.
- Resource adequacy testing reveals winter adequacy challenges requiring substantial storage resources, suggesting the need to identify different capacity resources better suited to meet ongoing winter capacity needs.

Developments Since 2023 IRP

The 2023 IRP Update incorporates significant methodology improvements including: monthly energy accounting (versus annual in 2023 IRP), updated resource cost information, comprehensive transmission upgrade options, enhanced GHG emissions

accounting, and greater CBI reporting granularity. An expansive set of portfolio sensitivities were developed to explore key planning questions that have increased in prominence since the filing of the 2023 CEP/IRP.

Strategic Implications

The analysis reveals the critical importance of transmission options for meeting system needs, with all seven transmission options being added between 2032-2038, unlocking 6927 MW of off-system renewables. Winter adequacy challenges are more precisely identified, showing short-duration storage has limited effectiveness in winter capacity needs (seven percent ELCC) compared to summer (53 percent ELCC), highlighting the need for alternative capacity resources with greater energy storage capability or on-demand production.

Staff Recommendations Incorporated

The Update directly addresses Order 24-096 directives through updates to portfolio analysis. PGE addresses Staff Recommendation #3 by conducting hourly production cost simulation of the Preferred Portfolio to separately track hourly purchases and sales. Resulting GHG emissions impacts better demonstrates HB 2021 compliance and reveals key planning insights while allowing PGE to revise GHG emissions forecasts accordingly and provide narrative explanations of key planning insights from this exercise. Additionally, Staff Recommendation #5 is addressed through the inclusion of an SSR compliance analysis, in which PGE's compliance position is identified and potential cost impacts of compliance are considered using a SSR proxy resource in portfolio analysis.

6.1 Portfolio analysis design and scoring

PGE evaluated portfolios using the capacity expansion model, ROSE-E, over a 20-year time horizon from 2025 through 2044. Portfolios must satisfy all the constraints described in the sections that follow throughout the analysis timeline using the addition of available resources at the minimum possible cost. Portfolios are analyzed across 351 future scenarios representing combinations of conditions for need, price, and technology costs.[134] Where not otherwise stated, inputs, assumptions and methods are consistent with those described in the 2023 CEP/IRP.[135]

6.1.1 GHG emissions

PGE enforces compliance with HB 2021 GHG emissions targets in ROSE-E for the Preferred Portfolio and all scenarios except the 'Reliability Needs Only' analysis. Emissions decline according to the linear GHG glidepath described in **Section 3.5.1 HB 2021**.

[134] [39 Price] x [3 Need] x [3 Technology Cost] = 351 Future Scenarios
[135] See Chapter 11 Portfolio Analysis of the 2023 CEP/IRP, available here: https://edocs.puc.state.or.us/efdocs/HTB/lc80htb8430.pdf

6.1.2 Energy need

In the 2023 CEP/IRP, PGE required portfolios to meet energy needs on an annual basis, ensuring portfolios had sufficient energy on average throughout each year. For the first time in this Update, portfolio analysis uses a more-detailed monthly energy accounting to establish energy need, ensuring that portfolio add sufficient resources to meet projected energy needs in every month of the planning horizon. PGE's annual and monthly energy-load resource balances are presented in **Section 3.3 Energy need**.

Monthly energy accounting allows the interactions between seasonal variation in PGE's load and existing portfolio, and the generation profiles of proxy resources to be accounted for in resource selection. These seasonal dynamics can influence the optimal quantity and mix of resources in the portfolio. By increasing the granularity of accounting of energy-load resource balance from annual to monthly, ROSE-E is able to make more-optimal resource selections.

To incorporate monthly variation in energy from dispatchable sources, the monthly allocation of GHG-emitting energy is determined within ROSE-E by co-optimizing it with the selection of new resource additions. ROSE-E receives the maximum annual generation by each emitting source as an input from PGE's Intermediary GHG model (IGHG) and allocates that energy across the months of each year in a manner that minimizes the costs of new resource additions.

6.1.3 Capacity need

PGE updated forecasted summer and winter capacity needs for this analysis and they are described in **Section 3.4 Capacity need**. Portfolios are constrained to meet PGE's resource adequacy requirements in summer and winter every year. Capacity needs must be met through the addition of new proxy resources, as determined by their estimated ELCC. Proxy resource ELCCs are described in **Section 5.1.6 Resource capacity contribution**.[136] As a backstop source of capacity when the capacity from available resources is not sufficient to meet need, the model has access to a perfect capacity-fill resource (100 percent ELCC in summer and winter) to meet needs on a year-to-year basis.

6.1.4 Resource availability

ROSE-E has access to a variety of resource types to meet energy and capacity needs. These resources include renewables, storage, CBREs, distributed energy resources (DERs), and energy efficiency (EE). The variety of proxy resource types available for selection in portfolio analysis are described in **Chapter 5 Resource options**. To account for the time required for procurement through a request for proposals (RFP) process, the earliest that traditional supply-side resources can be added to the portfolio is 2029. The timing and available quantity of off-system resources is also a function of transmission availability, as described in **Section 6.1.5.1 Transmission constraints**. There is also a 500 MW annual limit on the addition of batteries to smooth the

[136] The State RA Requirements scenario relies on different capacity needs and proxy resource capacity contributions.

cadence of resource additions and prevent the model from relying on very large additions of storage in certain years.

CBREs and non-cost-effective (NCE) DERs and EE are available for selection beginning in 2026. Quantities available for selection of NCE demand response and energy efficiency have been updated for the Update and are described in **Section 5.2.3 Non-cost-effective demand response** and **Section 5.3.2 Non-cost-effective energy efficiency**. The quantity of CBRE's available for selection is unchanged from the 2023 CEP/IRP.[137] Prior to 2029, energy and capacity-fill resources are also available on an annual basis to allow the model to meet PGE's energy and capacity needs until sufficient quantities of supply-side resources become available for addition to the portfolio.

6.1.5 Transmission constraints and options

Assumptions about transmission represent one of the most impactful determinants of resource availability in portfolio analysis. These elements were incorporated into PGE's portfolio analysis for the first time in the 2023 CEP/IRP. This Update includes updated assumptions regarding constraints on the existing transmission system and the options to increase transmission capacity through upgrades and expansion. Off-system renewable resources must have associated transmission to be added to PGE's portfolio in ROSE-E. Transmission capacity can come from either estimated available regional transmission capacity (described in **Section 6.1.5.1 Transmission constraints**), or investment in additional transmission options (described in **Section 6.1.5.2 Transmission options**).

6.1.5.1 Transmission constraints

PGE's estimates of existing regional transmission availability are described in **Section 4.4 Assessment of available BPA point-to-point transmission**. Prior to 2032, when the first transmission option becomes available, the total quantity of off-system renewables available to be added to PGE's portfolio is limited to 2451 MW based on the quantity of available regional transmission capacity.

6.1.5.2 Transmission options

As part of a holistic transmission study for the Update, PGE has developed an updated set of options for transmission upgrades and expansion. The updated and expanded set of options includes three transmission upgrade options and four transmission expansion options. The quantity, timing, cost, and type of resource accessed are described in detail in **Section 4.6 Transmission options for portfolio analysis**. Both transmission upgrades and expansion increase the quantity of resources available for selection in ROSE-E. In portfolio analysis the two types of transmission actions allow access to additional resources in different ways. Transmission upgrades increase the capacity of PNW renewable resources that PGE can access across the

[137] See Chapter 7 of the 2023 CEP/IRP. Available here: https://edocs.puc.state.or.us/efdocs/HTB/lc80htb8430.pdf. PGE plans to update information about the cost and availability of CBRE resources for the 2026 CEP/IRP, leveraging information gained through the CBRE RFO described in **Section 7.1.2 CBRE action**.

regional transmission system. Transmission expansion options allow access to renewable resources and capacity markets outside of the PNW. Resources accessed through either transmission upgrades or expansion incur the cost of both the resource itself and the transmission required to deliver the energy to PGE's system.

6.1.6 Portfolio scoring

Portfolios are evaluated based on the traditional scoring metrics described in **Table 27** and the portfolio community benefits indicator (pCBI) metrics described in **Table 28**. The traditional scoring metrics for cost, variability and severity are the same that were used in the 2023 CEP/IRP and continue to provide valuable insights that ensure the Preferred Portfolio and Action Plan represent the best combination of cost and risks.

Table 27. Traditional portfolio scoring metrics

Metric	Description	Units
Cost	Net present value of revenue requirement (NPVRR), calculated for each of the 351 future scenarios for the analysis timeline (2025-2044). IRP costs consist of only those associated with existing and incremental generating resources (including associated transmission costs) and do not include other PGE costs (e.g. administrative costs, wildfire costs, etc.).	Million 2025$
Variability	Semi-deviation of NPVRR across all futures, relative to the Reference Case. This metric captures the potential variation in cost outcomes across futures, considering only futures in which NPVRR exceeds the Reference Case. Portfolios with low variability scores tend to provide more cost certainty and lessen the customer's impacts of higher-than-expected cost conditions.	Million 2025$
Severity	The tail value at risk (TailVAR) at the 90th percentile of the NPVRR across futures. This metric measures the potential magnitude of very high-cost outcomes across all futures. Portfolios with low severity scores tend to have less costly worst-case scenarios for customer cost impacts.	Million 2025$

The pCBI scoring metrics represent a substantially more thorough and detailed approach to measuring the level of community benefits provided by each portfolio than has been used in the past. pCBIs are unitless indicators that accrue for each MW of eligible resource that is added in a portfolio. A detailed description of the pCBI development, including a mapping of which proxy resources generate each of the pCBIs, is provided in **Section 5.5 Community benefits indicators (CBIs)**. Scoring outcomes for pCBIs of each portfolio analyzed are described in **Section 6.5 Portfolio CBIs.**

Table 28. Portfolio Community benefits indicator (pCBI) metrics

Metric	Description
pCBI 1 Economic Impacts	Economic development, increased access to jobs, economic well-being, increased productivity
pCBI 2 Energy Equity	Improved awareness and access to clean energy programs by environmental justice and tribal communities; increased affordability; increased efficiency of housing stock; reduced arrearages and disconnections
pCBI 3 Health and Community Wellbeing	Increased comfort; improved public health outcomes, particularly for environmental justice communities; reduced local emissions; improved home health and safety (including indoor air quality)
pCBI 4 Resilience / Reliability	Improved grid resiliency; increased resilience/reliability in environmental justice communities, including reduced recovery time and frequency of outages
pCBI 5 Environmental Impacts	Reduced air emissions, including CO_2 and criteria pollutants

6.2 Preferred Portfolio

PGE's updated Preferred Portfolio demonstrates the least-cost, least-risk, set of resources needed to meet resource adequacy needs while decarbonizing in accordance with HB 2021 through the year 2044. **Table 29** shows the optimized resource additions made in ROSE-E as well as cost-effective quantities of EE and DERs and the 2023 RFP proxy, through the year 2030. The supply-side energy and capacity resources added in ROSE-E represent generalizations of resources that may become available for acquisition through an RFP process in which actual projects will be compared on the basis of project-specific costs and benefits. Near-term non-emitting and capacity contracts represent opportunities that PGE could pursue through bilateral contract negotiations.

Optimized resource additions through 2030 include 1362 MW of wind, 1089 MW of solar, 1750 MW of storage, 83 MW of NCE EE and DERs, and 155 MW of CBREs. The 2030 resource mix also includes 190 MW of non-emitting contracts. This 4629 MW of incremental resource additions made through 2030 represents a 16 percent increase compared to the 3984 MW of resource additions in the final 2023 IRP Preferred Portfolio.[138] The bulk of the increase in 2030 resource additions is comprised of storage, which has roughly doubled compared to the 869 MW (including hybrid storage) in the 2023 CEP/IRP final Preferred Portfolio. The increase in storage additions is largely driven by a decrease in PGE's calculated capacity contribution of those resources. As described in **Section 5.1.7 Comparison of resource capacity contribution to**

[138] The final Preferred Portfolio from the 2023 CEP/IRP was published in PGE's response to Staff Round 2 Comments. Updated resource need reporting conventions introduce some complexities when comparing current projections of resource need to past disclosures. The comparison made here uses the updated convention of identifying hybrid storage separately for the calculation of total resource need for both portfolios. PGE's response to Staff Round 2 Comments is available here: https://edocs.puc.state.or.us/efdocs/HAC/lc80hac154444.pdf

2023 CEP/IRP, the ELCC of the 4-hr battery proxy resource has decreased by 33 percent in summer and 50 percent in winter compared to the 2023 CEP/IRP.

The selection of 68 MWa of NCE EE in optimized portfolio construction highlights the potential for accelerated procurement of EE to lower portfolio costs in a transmission-constrained planning environment over the long-term. However, as discussed in Section 11.4 of the 2023 CEP/IRP, including additional quantities of EE in the portfolio has the potential to create near-term customer cost impacts because of unique policy factors associated with these resources. Unlike other assets, additional EE is not financed or securitized, which can increase near-term cost impacts relative to other resource options. As discussed in **Section 5.3.5 Energy efficiency program and policy**, PGE is committed to working with Energy Trust of Oregon on multiple potential avenues to address the cost and implementation challenges associated with accelerated procurement of EE.

Notably, this first year of transmission availability in 2032 is five years later than the 2027 date of first-available transmission option in the 2023 CEP/IRP. The reliance on some non-emitting contracts through 2031 highlights the impact of transmission constraints on off-system resource additions prior to the first opportunity for transmission upgrades in 2032.

Table 29. Cumulative resource buildout of the Preferred Portfolio 2026-2030 (MW)

Resource	2026	2027	2028	2029	2030
Wind	0	0	0	1362	1362
Solar (including hybrids)	0	0	0	1089	1089
Storage (including hybrids)	0	0	0	1250	1750
CBREs	66	85	110	133	155
NCE EE (MWa)	0	21	38	58	68
NCE DERs	3	8	12	13	15
Transmission	0	0	0	0	0

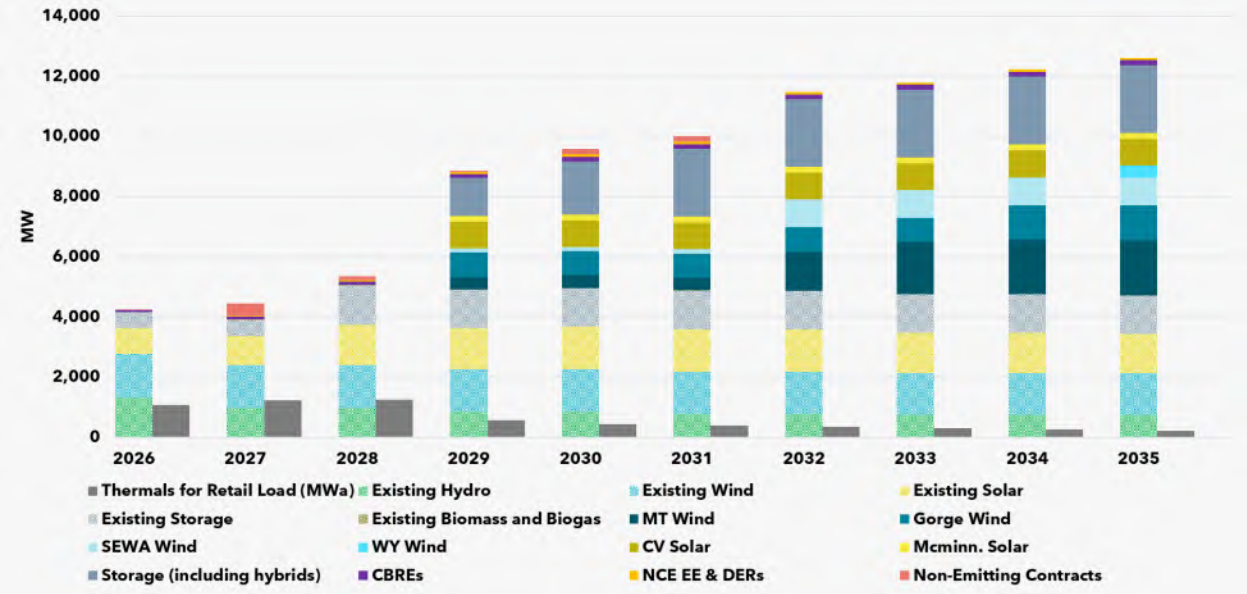
Cost-effective EE (MWa)	104	138	173	208	245
Cost-effective DR	142	172	199	225	248
2023 RFP Proxy Solar (including hybrids)	0	0	375	375	375
2023 RFP Proxy Storage (including hybrids)	0	0	775	775	775

*** Values for contracts are annual, not cumulative.**

Post-2030 results show that all seven transmission options are added to the portfolio between 2032 and 2038, unlocking access to the energy and capacity of 6927 MW of off-system

renewables (**Table 30**).[139] The addition of all 6927 MW of transmission options illustrates the importance of evaluating and consider taking action on transmission opportunities, both through upgrades and partnering-on or investing-in proposed transmission expansion projects, in order to access off-system renewables and energy markets. This aspect of the Preferred Portfolio differs substantially from the content of the 2023 CEP/IRP Preferred Portfolio, which included only 1200 MW of available transmission options (all of which were added in the Preferred Portfolio) and instead relied heavily on generic capacity and renewable resources post-2030. The comprehensive and detailed list of most-appropriate transmission options potentially available to PGE, modeled in this Update provides a substantially more well-defined look at the mix of resources that may become available to meet energy and capacity needs in the 2030's and beyond. In contrast to the generic transmission options used in the 2023 CEP/IRP, the transmission options added to this Preferred Portfolio represent specific opportunities (modeled with somewhat generalized resource cost characteristics). The transmission options, identified with the help of consultant Energy Strategies, are described in detail in **Section 4.6 Transmission options for portfolio analysis**.

Table 30. Cumulative resource buildout of the Preferred Portfolio 2031-2038 (MW)



Resource	2031	2032	2033	2034	2035	2036	2037	2038
Wind	1362	3029	3460	3897	4319	4821	5467	5996
Solar (including hybrids)	1089	1089	1089	1089	1089	1089	1089	1089
Storage (including hybrids)	2250	2250	2250	2250	2250	2750	3250	3750
CBREs	155	155	155	155	155	155	155	155
NCE EE (MWa)	68	68	68	68	68	68	68	68

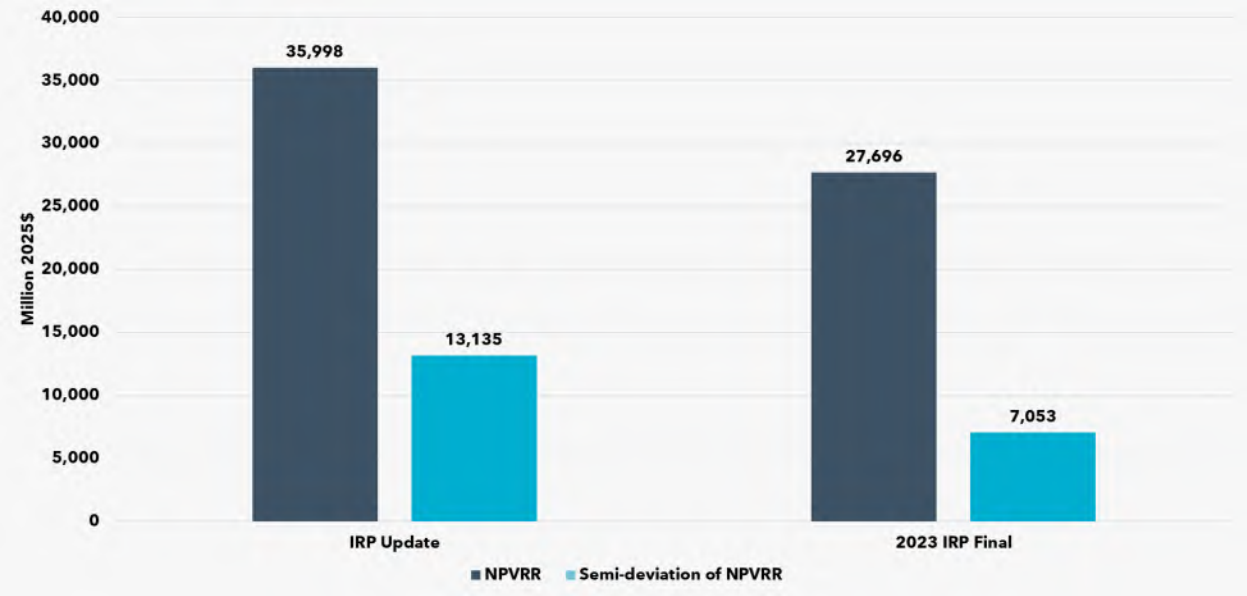
Transmission	0	3000	3000	3000	5227	5227	5227	6927
Non-Emitting Contracts*	187	0	0	0	0	0	0	0
Cost-effective EE (MWa)	281	317	352	384	415	446	478	510
Cost-effective DR	266	284	299	312	325	336	348	356
2023 RFP Proxy Solar (including hybrids)	375	375	375	375	375	375	375	375
2023 RFP Proxy Storage (including hybrids)	775	775	775	775	775	775	775	775

*** Values for contracts are annual, not cumulative.**

[139] Some of the transmission options also provide additional capacity through access to diverse energy markets. In the 2023 CEP/IRP final Preferred Portfolio, transmission options did not provide additional capacity associated with diverse market access.

The cumulative addition of the Preferred Portfolio's incremental resources to PGE's existing resource portfolio are shown in **Figure 57**. The quantity of energy retained from existing emitting sources, in average Megawatts (MWa), can be seen to decline through time in accordance with the GHG glidepath that leads to compliance with HB 2021 emissions targets in 2030 and beyond. Incremental resource additions experience a large jump in 2029 when the first supply-side resources become available and another smaller jump in 2032, when the Bethel-Round Butte transmission upgrade unlocks access to 3000 MW of additional off-system renewable resources. The quantity of resources in PGE's existing portfolio varies through time, increasing in 2028 with the addition of 2023 RFP Proxy resources, and declining at various points in time as certain contracts expire. By 2030, the 4629 MW of incremental resource additions in the Preferred Portfolio are nearly equal to the nearly 5 GW of non-emitting resources already expected in PGE's existing portfolio at that time.

Figure 57. Preferred Portfolio Resource Additions (MW)[140]



Costs of the updated Preferred Portfolio are larger than those of the final Preferred Portfolio from the 2023 CEP/IRP.[141] Across the full 20-year planning horizon the updated Preferred Portfolio has an NPVRR of $35,998 million, which is a $8,302 million increase from the $27,696 million NPVRR of the final 2023 CEP/IRP Preferred Portfolio (**Figure 58**).[142] The increase in portfolio cost is driven by a combination of increased quantity of resource additions and increased $/kW-yr resource costs projections for some types of supply-side resources, as described in **Section 5.1.2 Supply-side resource costs**. These drivers of increased cost outweigh the cost-reducing impacts of having a more well-defined set of transmission options that have reduced reliance on the expensive generic capacity and VER resources that were relied on heavily in the post-2030

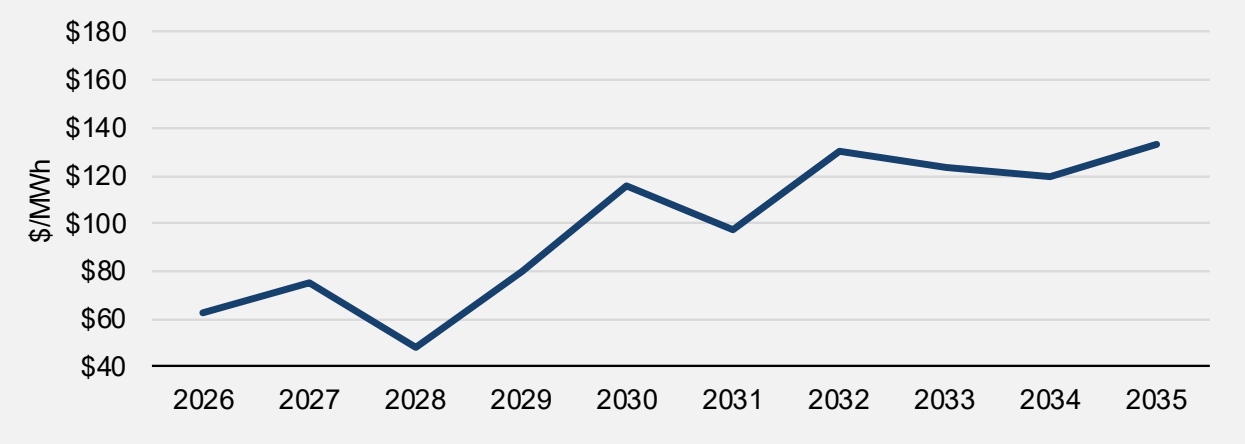
[140] Existing resource quantities include 2023 RFP Proxy.
[141] The final Preferred Portfolio from the 2023 CEP/IRP was published in PGE's response to Staff Round 2 Comments. Available here: https://edocs.puc.state.or.us/efdocs/HAC/lc80hac154444.pdf
[142] Portfolio costs in the 2023 CEP/IRP were reported in 2023 $'s and have been adjusted to 2025 $'s for this comparison.

resource buildout of the 2023 CEP/IRP Preferred Portfolio. Additional detail on the annual costs of the Preferred Portfolio is provided in **Section 6.2.1 Yearly cost estimates**.

Figure 58. Cost and Risk Metrics of the Preferred Portfolio (MW)

6.2.1 Yearly cost estimates

The purpose of this section is to show yearly cost estimates of proxy new resource additions in the Preferred Portfolio under a set of utility ownership and tax credit assumptions. This section provides updated results compared to those presented in Section 11.3 of the 2023 CEP/IRP. The Preferred Portfolio was run through a version of the Annual Revenue-requirement Tool (ART) that contains updated input data. The ART uses reference load presented in **Chapter 3 System needs** and existing and incremental proxy resource costs described in **Chapter 5 Resource options**.



The model incorporates the impact of market sales on an annual basis and can evaluate different combinations of ownership structures and tax incentives for each portfolio.[143] Market purchases and thermal sales are calculated on an annual basis within the Intermediary GHG (IGHG) model and imported to ART. Further, ART only focuses on existing and new generating resources, including associated estimated transmission expansion costs. Estimates do not include costs from the rest of PGE, such as those associated with administrative costs, grid modernization, other transmission and distribution maintenance and upgrades, wildfire mitigation or actual generation costs. Caution is warranted in interpreting these estimates, as these values reflect a change in forecasted annual costs of real and proxy generating assets that only represent a subset of PGE's total annual cost. Accordingly, these yearly price impacts do not represent actual customer price impacts (expressed either as total or a percent) as they only focus on planned generation and transmission expansion cost changes and do not incorporate any other cost

[143] Modeling assumption of the ownership structures do not impact or reflect future procurement approaches nor prejudge outcomes of future procurement processes.

changes across PGE. Additionally, the cost impact uncertainty due to ongoing policy discussions regarding cost allocation to large industrial customers and the resulting unequal and evolving distribution of costs between customers classes is another factor making the results presented here not reflective of actual customer rate impacts. This topic is explored in more detail in through the sensitivity analysis presented in **Section 6.3.3 Large industrial customer growth**.

The price impacts can still be indicative for evaluating options to decarbonize reliably. Through an extensive analysis of resource additions amongst a variety of portfolios, PGE finds that while the incremental resource additions included in these estimates represent the least cost and risk manner to meet the emissions targets established in HB 2021, they are anticipated to raise the costs associated with generation resources relative to today. These Reference Case price changes are shown in **Figure 59** and include a 50 percent ownership assumption and full ITC/PTC tax credits available for relevant resources. This $/MWh annual price represents the modeled cost estimates divided by total PGE load described in **Section 3.1.1 Energy forecast**. Incremental resource additions, including the expansion of the existing transmission system, continue to increase the costs of generation resources through 2035 and beyond. While this analysis does not represent actual changes to customer prices, it is suggestive that, on a planning basis, system costs are likely to increase to comply with HB 2021.

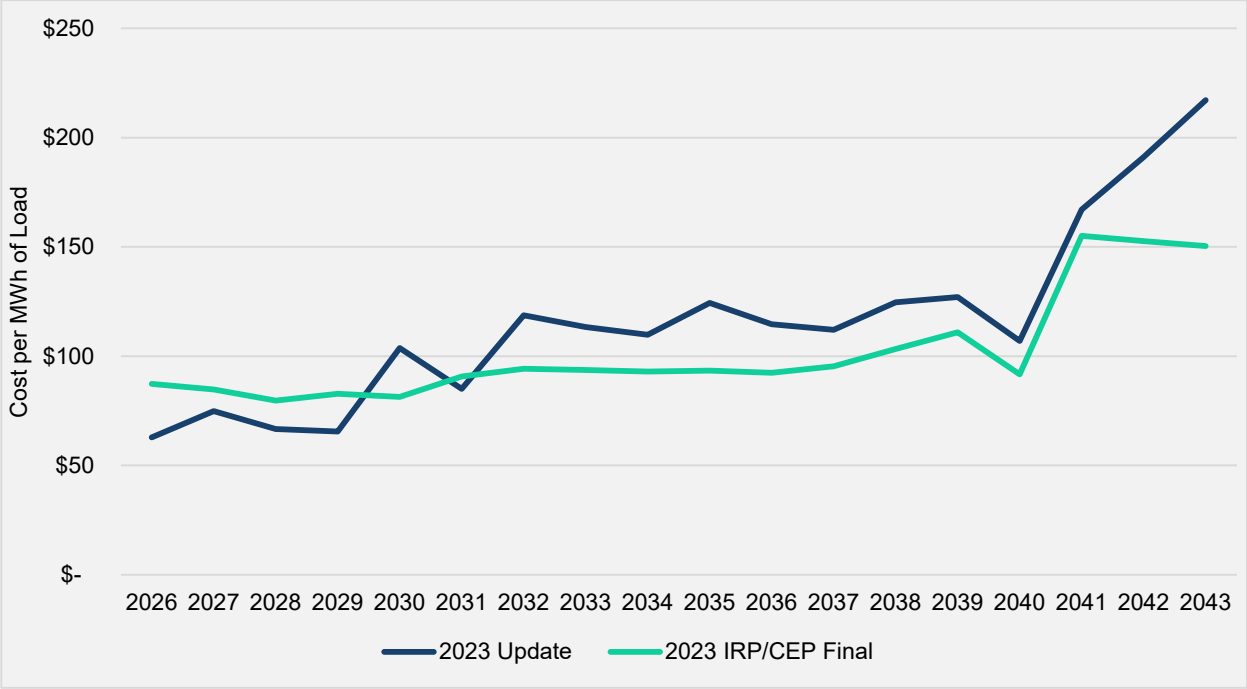


Figure 59. Reference Yearly Price Impacts ($/MWh) of the Preferred Portfolio

As discussed in previous chapters, the 2023 RFP procurement results are not yet final, but based on ongoing negotiations, no new non-emitting resources identified through this RFP can be contracted prior to a January 1, 2028 COD. Incremental resource additions (and associated costs) prior to 2029 are for CBREs and DERs. After this time, the models add much more non-emitting resources to reduce thermal generation serving retail load in order to meet HB 2021 compliance as well as maintain resource adequacy. The yearly cost forecast supports the finding described above and previously in the 2023 CEP/IRP that GHG emission reductions lead to cost increases. **Figure 60** compares the updated yearly price estimates to those presented for the Preferred Portfolio in the 2023 CEP/IRP updated for the final Preferred Portfolio. Total costs are a bit higher in the Update after 2035 and the updated retail load forecast is higher, allowing costs to be spread across more MWhs. In the updated analysis, PGE has replaced generic capacity and energy resources with actual modeled resources which are more cost effective than the generic

capacity and energy resources. These were unavailable in the 2023 IRP due to transmission limitations. While these transmission expansion options have costs associated with them, they are significantly cheaper than the generic capacity and energy resources. The overall increase in costs is due to increased resource additions and increased costs with some resource types.

Figure 60. Comparison of Reference Yearly Price Impacts ($/MWh)

Given the constraints in the planning environment associated with HB 2021 decarbonization goals, load growth, and transmission availability, the need for resource procurement identified in this Update continues to be large and is estimated to result in substantial cost impacts. Included in load growth expectations are significant increases in large new loads which account for between 30 percent to 80 percent of load growth forecast in any given year, averaging 47 percent over the 20-year period. These new large loads significantly increase PGE's need to acquire new resources, increasing total load by about 20 percent by 2044. PGE constructed a Preferred Portfolio that minimizes the costs and risk of new resource acquisitions and maximizes the provision of community benefits by thoroughly investigating key decision points with the potential to impact costs. This includes the selected GHG emissions-reduction pathway described in **Section 3.5.1 HB 2021** that complies with HB 2021 requirements while mitigating costs relative to more aggressive pathways and reducing risks compared to less aggressive pathways. Mitigating the impact of cost increases is critical and PGE will continue to study options that can help minimize costs for customers, including maximizing acquisition of cost-effective energy efficiency, continuing to explore the potential of emerging technologies as they develop and studying options to expand transmission access to cost-effective non-emitting resources.

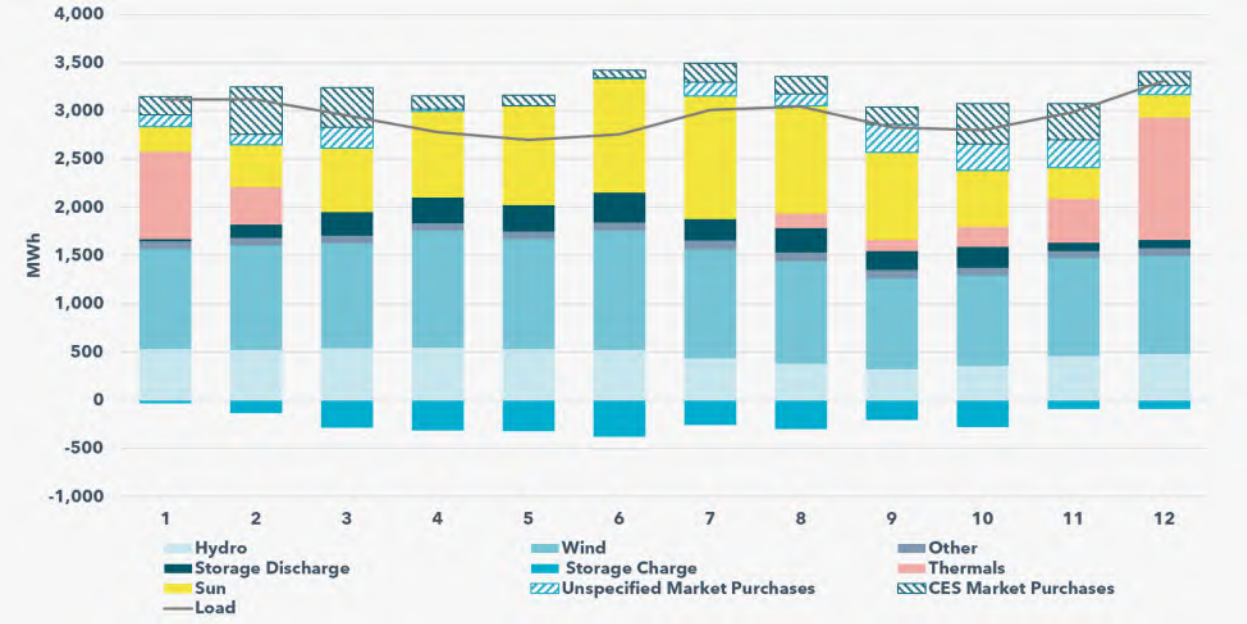
6.2.2 Hourly energy and emissions accounting results

This section expands upon Chapter 5 of the 2023 CEP/IRP to reflect the hourly energy accounting and resulting GHG emissions impacts of the Preferred Portfolio. In the 2023 CEP/IRP, PGE demonstrated compliance with HB 2021 using annualized estimates of emissions of thermal generation and unspecified market purchases under a variety of GHG reduction glidepaths. In the December 14, 2023, Public Utility Commission of Oregon Staff report on docket LC 80, Staff identified that PGE's annual GHG emissions approximations neglected important aspects of system operations that may impact the Company's annual GHG emissions accounting. Staff highlighted the need for an hourly dispatch analysis to confirm PGE's GHG emissions projections and demonstrate its ability to comply with HB 2021. In Order 24-096, the OPUC directed PGE to resubmit a revised plan with its CEP/IRP Update in 2025 consistent with Staff Recommendation 3, stating that:

- PGE shall conduct hourly production cost simulation of its Preferred Portfolio under the reference case in a manner that separately tracks hourly purchases and hourly sales.
- PGE will use this analysis to revise its GHG emissions forecast to revise its submission to the DEQ.
- PGE shall update the Preferred Portfolio accordingly and provide a narrative explanation of the key planning insights derived from this exercise.[144]

In this Update, PGE addresses the requirements outlined above using a modified version of its PGE-Zone Model (PZM) to simulate hourly energy and emissions positions. This model is referred to as the Modified PGE-Zone Model (mPZM). The mPZM performs hourly production simulations under Reference case conditions in a manner that tracks hourly resource operation, market purchases, and market sales based upon supply and demand conditions.

The mPZM uses outputs from the PZM, the Brattle Clean Energy Surplus Model (CESM), Intermediate GHG Model (IGHG), and the Preferred Portfolio from ROSE-E portfolio development as inputs. Hourly and annual constraints are added to prevent emitting generation and unspecified market purchases from exceeding quantities specified by HB 2021 emissions limits. Additional details of how PGE applies the hourly energy and emissions accounting methodology are set forth in **Appendix D Hourly emissions methodology**. The results of this simulation indicate that, based upon forecasted market conditions, PGE's Preferred Portfolio can comply with HB 2021 emissions limits in 2030.



The following sections provide the results of this hourly mPZM analysis. First, a summary of monthly results demonstrates how emissions compliance is achieved; next, assumptions regarding market availability are detailed; generation from thermal resources are summarized; finally, example weeks in June and December provide greater detail on model results.

[144] https://apps.puc.state.or.us/orders/2024ords/24-096.pdf

6.2.2.1 Summary of results

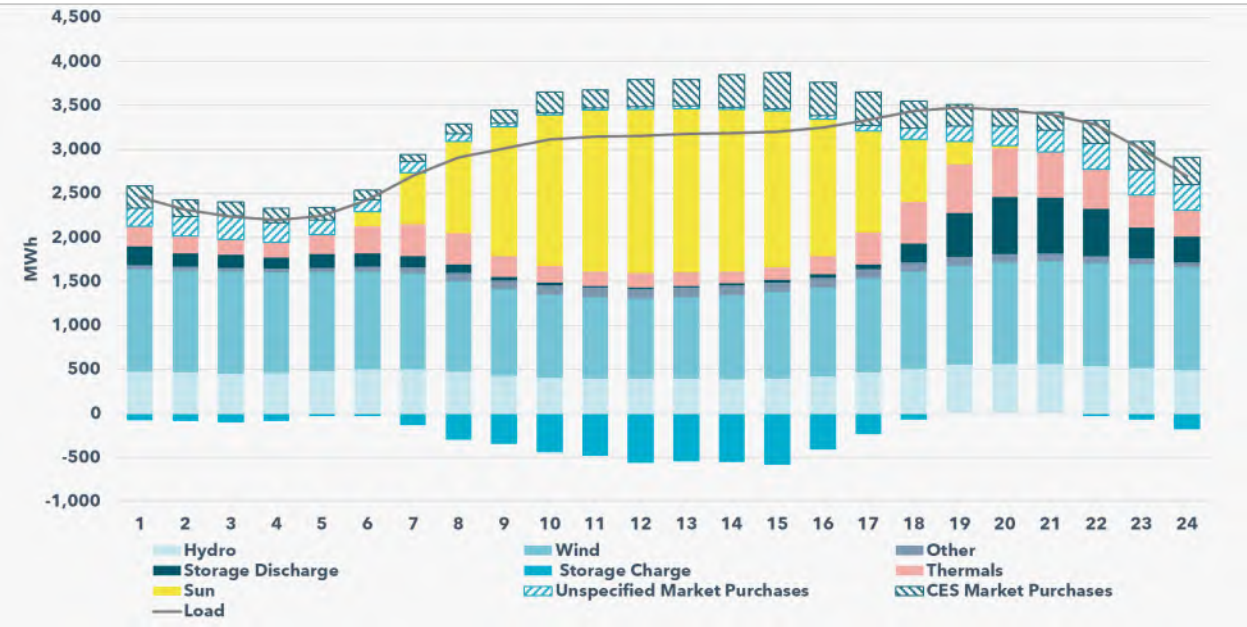


Figure 61 demonstrates the composition of supply used to meet demand for each month in 2030. Thermal generation is concentrated in the winter when non-emitting energy is scarce. Storage charging and discharging occurs in the spring, when storage opportunities to levelize net demand across the day is most present. Market purchases from non-emitting sources (clean energy surplus or "CES") are concentrated in the shoulder months across hours when the premium for such energy relative to the unspecified market (premium for clean energy or "PFC") is low. Unspecified market purchases are largley allocated outside of the spring months.

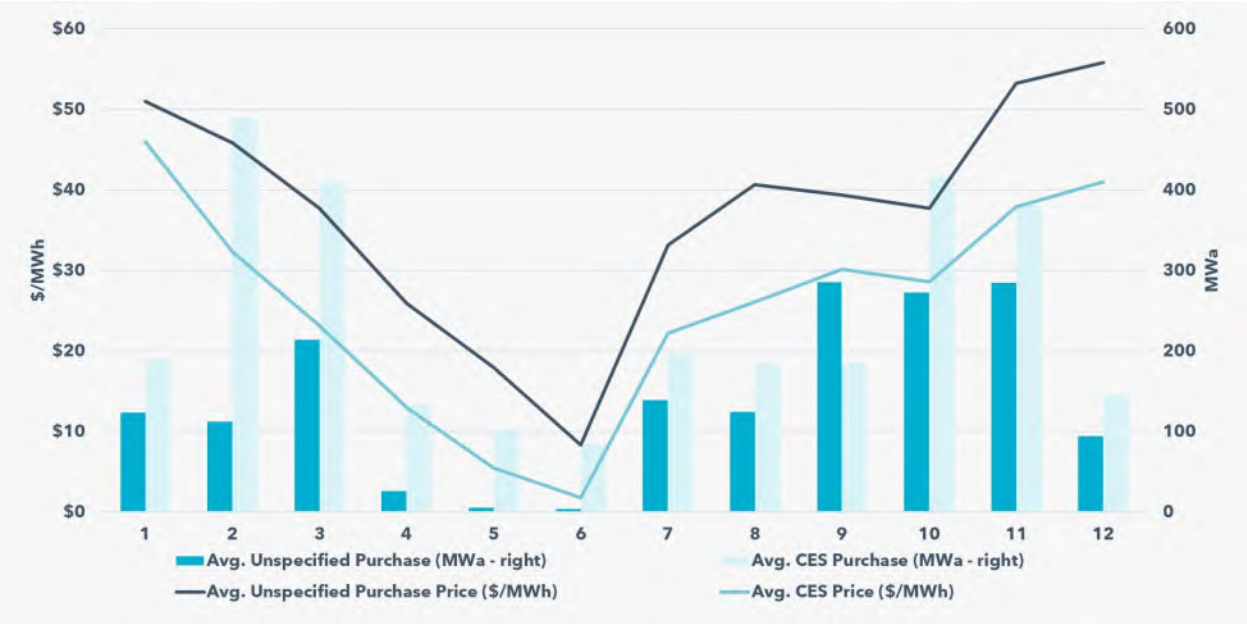
Figure 61. Monthly Modified PZM results show the simulated generation (MWh) by resource type across 2030

The composition of supply used to meet demand for the average day in 2030 is demonstrated in **Figure 62**. Thermal generation and storage discharge are concentrated over the peaks of the day. Storage charging occurs primarily during midday solar hours. Clean energy surplus market purchases are more frequent midday, during solar hours, as well, and unspecifed market purchases occur most frequently over the evening and early morning periods.

Figure 62. Hourly Modified PZM results show the simulated MWh by resource type across an average day in 2030

6.2.2.1 Assumptions of market availability



These simulations assume that when PGE's hourly position is long generation (supply exceeds retail demand), the excess generation contributes towards market sales. The thermal output dispatched by the Modified PZM optimization demonstrates the portion of thermal generation dedicated to serve retail load. Any additional wholesale sales of thermal generation will not be represented in the Modified PZM output. Any additional wholesale sales in the Modified PZM are a function of excess non-thermal resources such as periods of ample wind and solar generation and/or the presence of hydro must-run conditions. The periods in which the simulation results in PGE selling into the market are generally April–July. The timing of these long positions tends to align with periods of clean energy surplus across the WECC as the premium for clean energy is near zero during hours of most sales. This is demonstrated in **Figure 63** where the columns depict the average market sales volume (MWa) by month. The average realized price (the market price plus the premium for clean energy) is represented by the dark blue line, and the average premium for clean energy is shown as the red line. Given that non-emitting generation is greatest in the spring, as shown above, PGE market sales also tend to occur predominantly in the spring.

Figure 63. Average Hourly Revenue on Market Sales by Month

Figure 64 shows the timing of both unspecified and clean energy surplus market purchases in the mPZM simulation; the price of clean energy surplus market purchases includes the additional premium for clean energy. The methodology first assigns unspecified market purchases to hours with the highest premium, up to the portion of PGE's 2030 emission budget allocated to unspecified market purchases by the IGHG model. Clean energy surplus market purchases then fill remaining hours of need based on the quantity and timing of availability detailed in the Brattle report provided in **Appendix F Market for non-emitting energy**. Total market purchases average 382 MWa for the year, with 141 MWa allocated to unspecified purchases and 241 MWa allocated to CES purchases. Please see PGE's discussion of market developments in **Section 2.2.1 CAISO's Extended Day Ahead Market**.

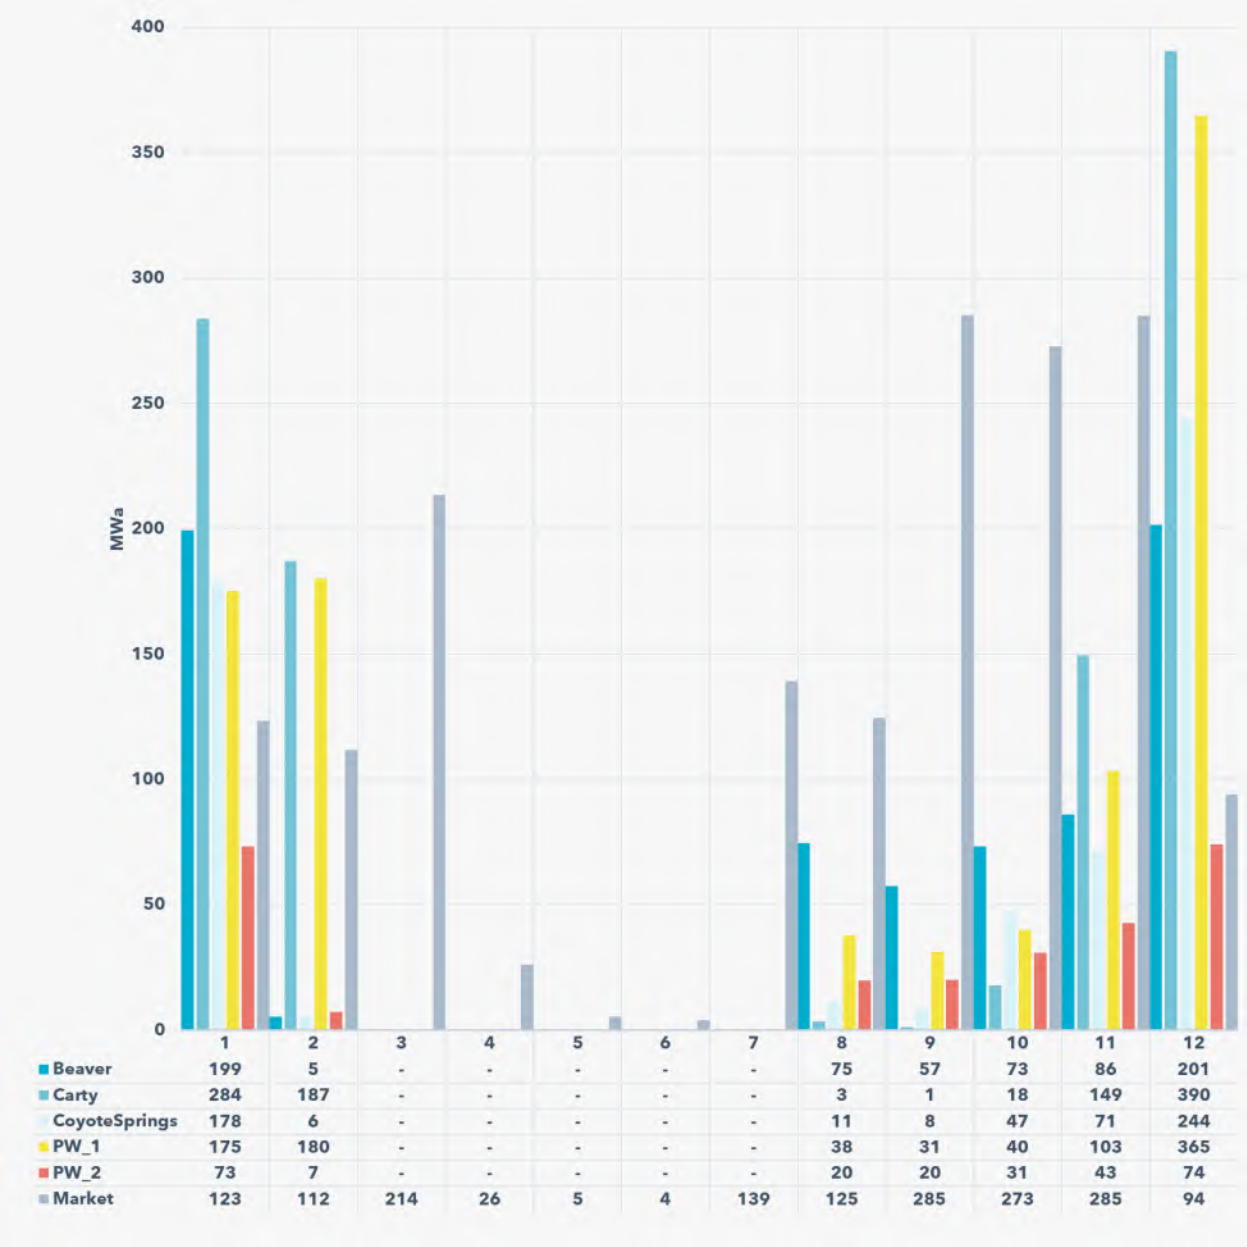


Figure 64. Timing of both unspecified and CES market purchases in the mPZM simulation

6.2.2.1 Thermal generation

Thermal generation allocated to serve PGE retail load is capped at the annual generation levels determined in the IGHG model. The mPZM optimizes emitting resource generation allocated to the retail portfolio across 2030 up to the IGHG limits. **Figure 65** shows the timing of emitting generation by month for the 2030 simulation.

Figure 65. Monthly generation (MWa) by emission source across 2030 forecast

	1	2	3	4	5	6	7	8	9	10	11	12
Beaver	199	5	-	-	-	-	-	75	57	73	86	201
Carty	284	187	-	-	-	-	-	3	1	18	149	390
CoyoteSprings	178	6	-	-	-	-	-	11	8	47	71	244
PW_1	175	180	-	-	-	-	-	38	31	40	103	365
PW_2	73	7	-	-	-	-	-	20	20	31	43	74
Market	123	112	214	26	5	4	139	125	285	273	285	94

Since thermal generation and unspecified market purchases are capped, the emissions associated with serving retail load are designed to meet the HB 2021 emission limit of 1.62 million metric tons of CO_2 ($mmtCO_2e$). The timing of emissions is concentrated most heavily in the winter months as shown **Figure 66**. Approximately 60 percent of all simulated emissions occur in January, November, and December. This summary shows how PGE could use its emitting resources in a planning context, given the Preferred Portfolio and market assumptions detailed above, to meet portfolio needs within the 2030 emission targets. While the Update's simulation thermal operations in 2030 identifies how thermal output can be forecasted, PGE recognizes that many operational considerations and market complexities are challenging to

fully incorporate into planning. These differences prevent precise estimates of future operating conditions.

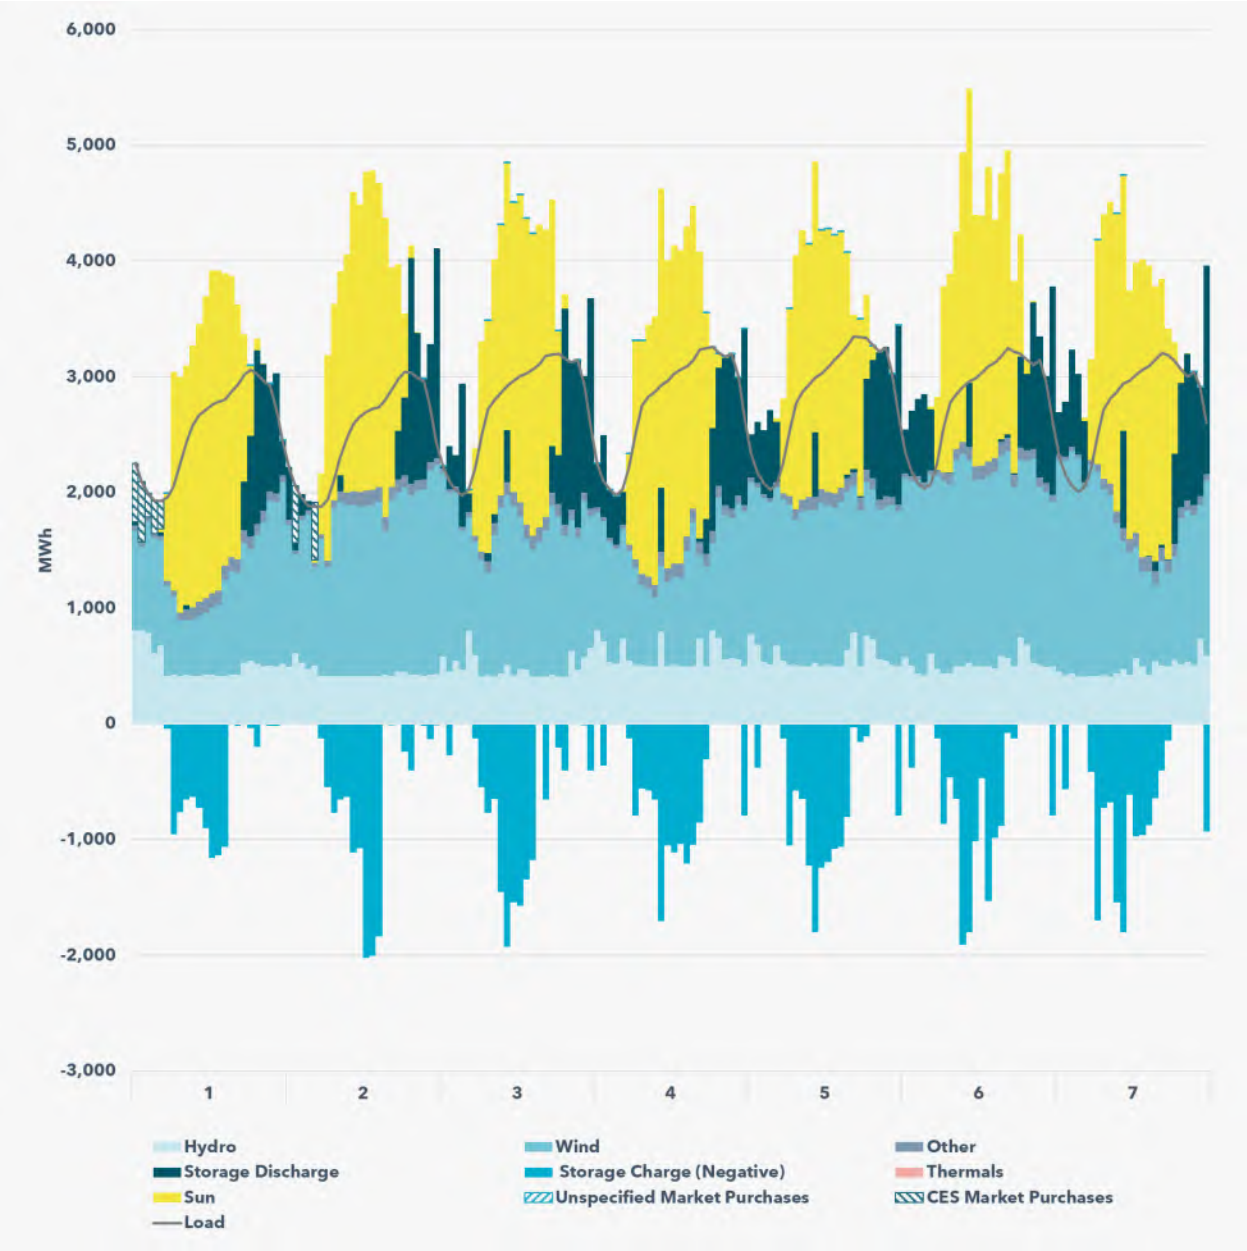

Figure 66. mPZM simulated 2030 monthly cumulative emissions (mmtCO2e) by source

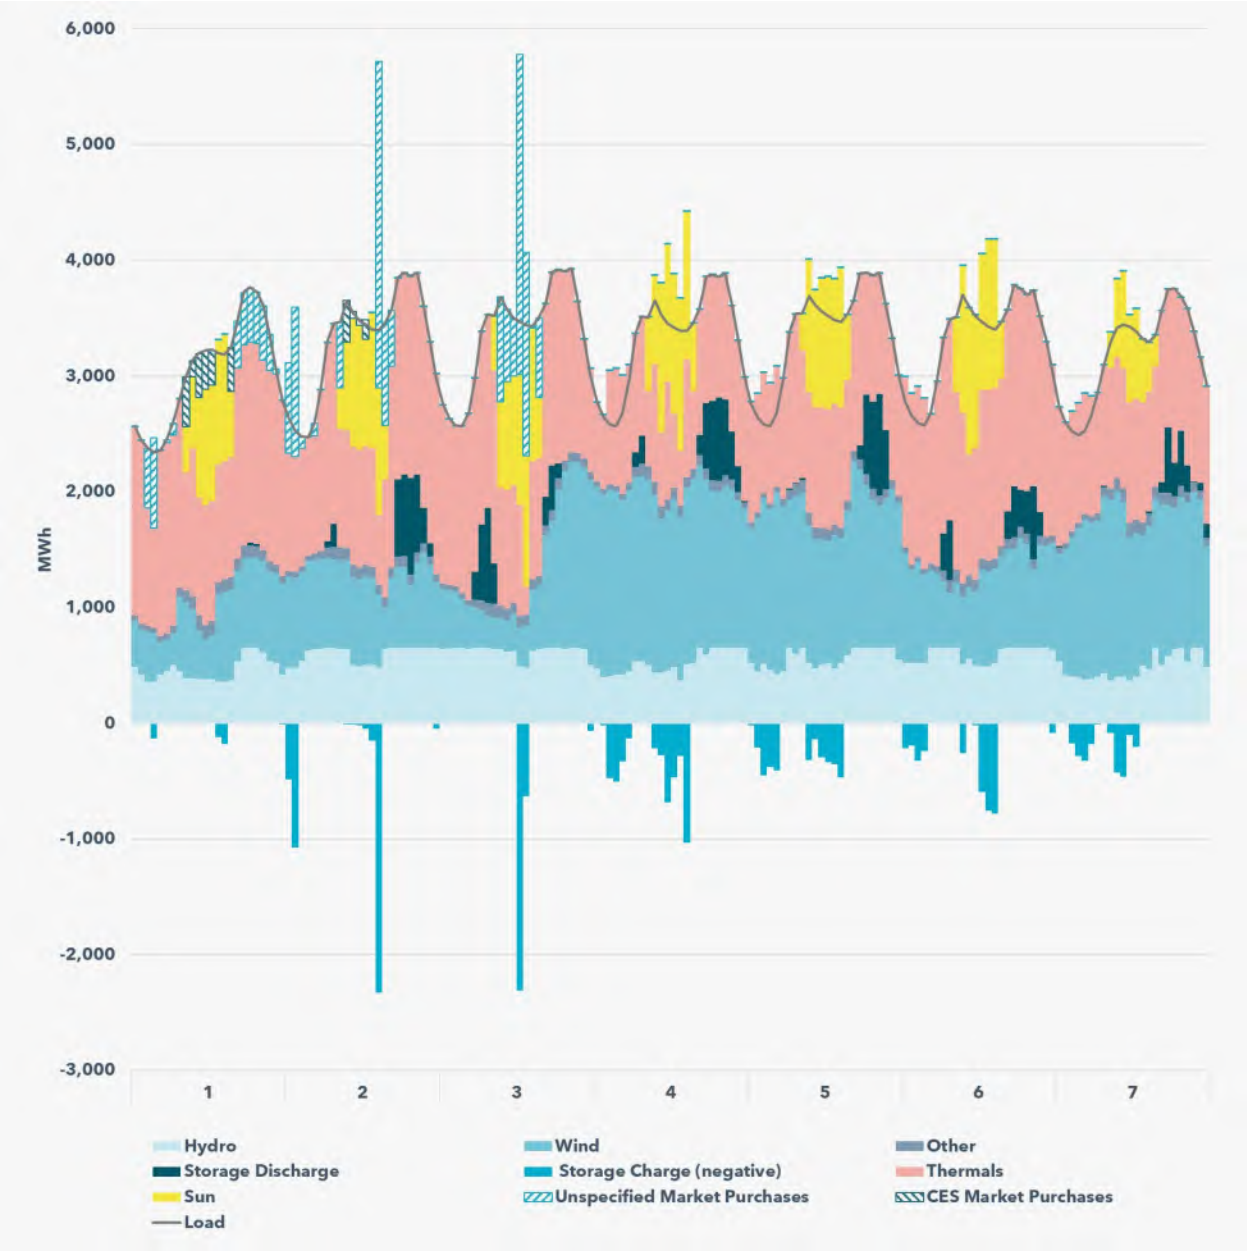
6.2.2.1 Hourly generation snapshots



To demonstrate more granular representations of the mPZM results, sample weeks with hourly values by resource type are provided (**Figure 67**). The results include the first seven days of the month for June and December 2030 to demonstrate seasonal variation. June is punctuated by solar and wind generation with storage resources utilized to smooth the daily load-resource balance.

Figure 67. Hourly mPZM snapshots show simulated supply and demand positions by resource type in June 2030

In December 2030, thermal generation is deployed as PGE non-emitting generation is volatile and scarce while market premiums for clean energy are high (**Figure 68**). Unspecified market purchases are leveraged to charge batteries midday so they can be dispatched across evenings and early mornings.

Figure 68. Hourly mPZM snapshots show simulated supply and demand positions by resource type in December 2030

6.2.3 Preferred Portfolio resource adequacy testing

To ensure that the Preferred Portfolio can meet PGE's reliability needs, the Update analyzes the portfolio's specific resource configuration in the Sequoia adequacy model. This test evaluates how adequate the system is after including the Preferred Portfolio and assesses whether the ELCCs used in capacity expansion modeling remain valid when considering the dynamic system interactions present in a portfolio of resources.

The Company's capacity expansion model ROSE-E is constrained to meet system need (**Section 6.1.3 Capacity need**) utilizing an estimate of proxy resource capacity contributions or ELCCs

(**Section 5.1.6 Resource capacity contribution**). The estimation incudes two simplifications that PGE validates when assessing adequacy of the Preferred Portfolio. First, ELCCs are estimated in 2030 only, as estimating ELCCs in Sequoia is a computationally intensive and prolonged process. Second, ROSE-E interprets ELCCs as additive, where the addition of one resource does not affect the ELCCs of another. However, the capacity contribution of a resource is dynamic relative to system demand and supply across time. Including the Preferred Portfolio in Sequoia provides a more granular assessment of its effect on system reliability and appropriateness of the simplifications above. If abstractions used in capacity expansion modeling are representative of the dynamic system, the adequacy effect of the Preferred Portfolio would result in zero capacity need and a 2.4 loss-of-load hours (LOLH) adequacy metric.

Table 31 details the seasonal capacity need of PGE's system after including the Preferred Portfolio. These estimates show the portfolio is estimated as adequate in summer and winter seasons for 2026 through 2030, except a remaining capacity need in winter 2028 of 68 MW. As discussed in **Section 3.4 Capacity need**, structured or bilateral contracts that may be facilitated by State RA participation are tools PGE may use to procure capacity in the short-term.

Table 31. Reference Seasonal Capacity Need with Preferred Portfolio Resources

Year	Summer Need (MW)	Winter Need (MW)
2026	0	0
2027	0	0
2028	0	68
2029	0	0
2030	0	0

Analyzing the frequency of unserved energy events provides insight into how adequate the system is in future years. **Table 32** displays the LOLH metrics that correspond to the capacity need estimates above. Estimates greater than 2.4 LOLH indicate positive capacity needs. For example, the capacity need of 68 MW in winter 2028 represents a system with 2.01 hours of unserved energy per year greater than the threshold. Conversely, estimates less than 2.4 LOLH provide a measure of the degree of system adequacy. In 2030, the Preferred Portfolio additions result in an adequate system in both summer and winter. However, the higher LOLH metric in winter suggests that meeting reliability in the winter is the active constraint in PGE's capacity expansion.

Table 32. Seasonal LOLH of PGE system with Preferred Portfolio Resources

Year	Summer LOLH	Winter LOLH
2026	2.27	0.03
2027	1.45	0.20
2028	0.41	4.41
2029	0.00	0.06

Year	Summer LOLH	Winter LOLH
2030	0.06	2.25

The results above indicate that the ELCC simplifications used by ROSE-E are reasonably accurate for identifying an adequate portfolio, as shown by the approximately exact capacity built for winter 2030. Additionally, and as discussed further below, winter adequacy challenges appear to be the cause of significant resource additions in the Preferred Portfolio.

6.2.3.1 Energy sensitivity adequacy assessment of Preferred Portfolio

The Update includes an energy sensitivity analysis of the Preferred Portfolio to further PGE's understanding of cost and reliability implications driven by winter adequacy challenges. This analysis aims to identify the nature of PGE's capacity needs decomposed from PGE's energy needs.

To conduct the energy sensitivity assessment, all 4679 MW of nameplate resources in the Preferred Portfolio were partitioned into 2879 MW of resources required to meet ROSE-E's energy need including solar and wind (Energy Only Preferred Portfolio) and 1800 MW of storage resources.[145] The Energy Only Preferred Portfolio was added to the PGE system as modeled in Sequoia. Short duration storage resources were then incrementally added to examine their effect on capacity need.[146] **Figure 69** shows the changes to 2030 capacity need for winter and summer using this method.

The results indicate that short duration storage resources are effective at addressing PGE's summer capacity needs and inefficient at meeting PGE's winter capacity needs. The results clearly demonstrate the challenge of addressing winter adequacy with short duration storage resources under current system assumptions.[147] A 2030 winter capacity need of 123 MW persists after adding the Energy Only Preferred Portfolio and no additional storage resources.[148] This suggests that the 1800 MW of four-hour batteries in the Preferred Portfolio is required to resolve 123 MW of winter capacity need, a 6.8 percent ELCC. For comparison, the summer need

[145] Total value includes sum of nameplate for storage and energy resources associated with hybrids. Energy resources from hybrids were segmented and included in the base system with equivalent generation profiles. Additionally, the Energy Only Portfolio includes energy equivalent to the 123 MWa Non-Emitting Contract modeled as a hydro resource using parameters from recent hydro contracts.

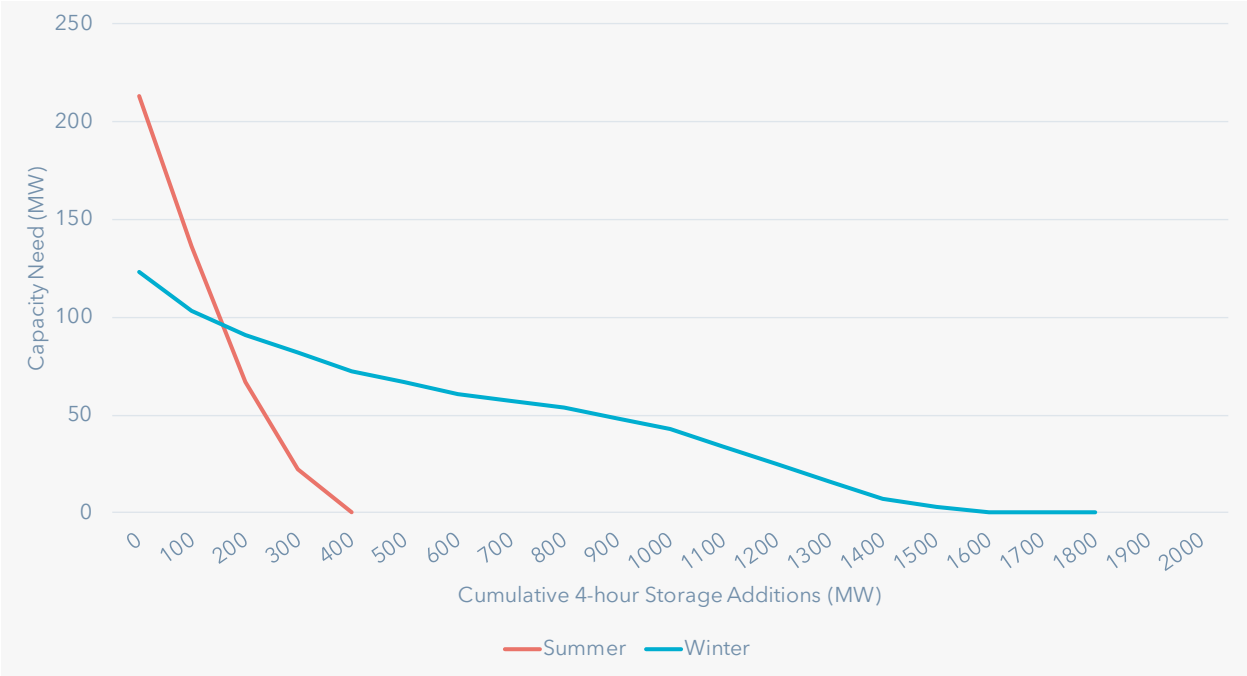
[146] All incremental additions are modeled as 4-hour stand-alone energy resources with standard Sequoia assumptions, starting each simulated week fully charged. This assumption is consistent with how storage and hybrid resources are modeled in the above adequacy assessment. Additions were made in 100, 200, 400, 600, 800, 1000, 1400, 1800, and 2000 MW tranches then smoothed and interpolated using the same methodology as in the 2033 CEP/IRP and 2023 CEP/IRP Update.

[147] The Energy Only Preferred Portfolio plus 1800 MW of storage resources results in a winter capacity need of 0 MW and 2.21 LOLH, compared against the Preferred Portfolio's winter capacity need of 0 MW and 2.25 LOLH as shown in **Table 32.** The modest difference in modeling results relates to small differences in assumed charging behavior between hybrid and standalone storage resources and other portfolio modeling simplifications. Interpolation between the 1400 MW tranche an 1800 MW tranche of storage additions results in a curve suggesting approximately 1600 MW are required to achieve adequacy.

[148] As compared to the 978 MW and 886 MW capacity needs for summer and winter, respectively, prior to any additions from the Preferred Portfolio, **Section 3.4 Capacity need**.

remaining after energy additions is 213 MW. This need is resolved with an estimated 400 MW of storage additions, a 53 percent ELCC.

Figure 69. Capacity Need of Energy Only Portfolio and Cumulative 4-hour Storage Additions – 2030 Reference



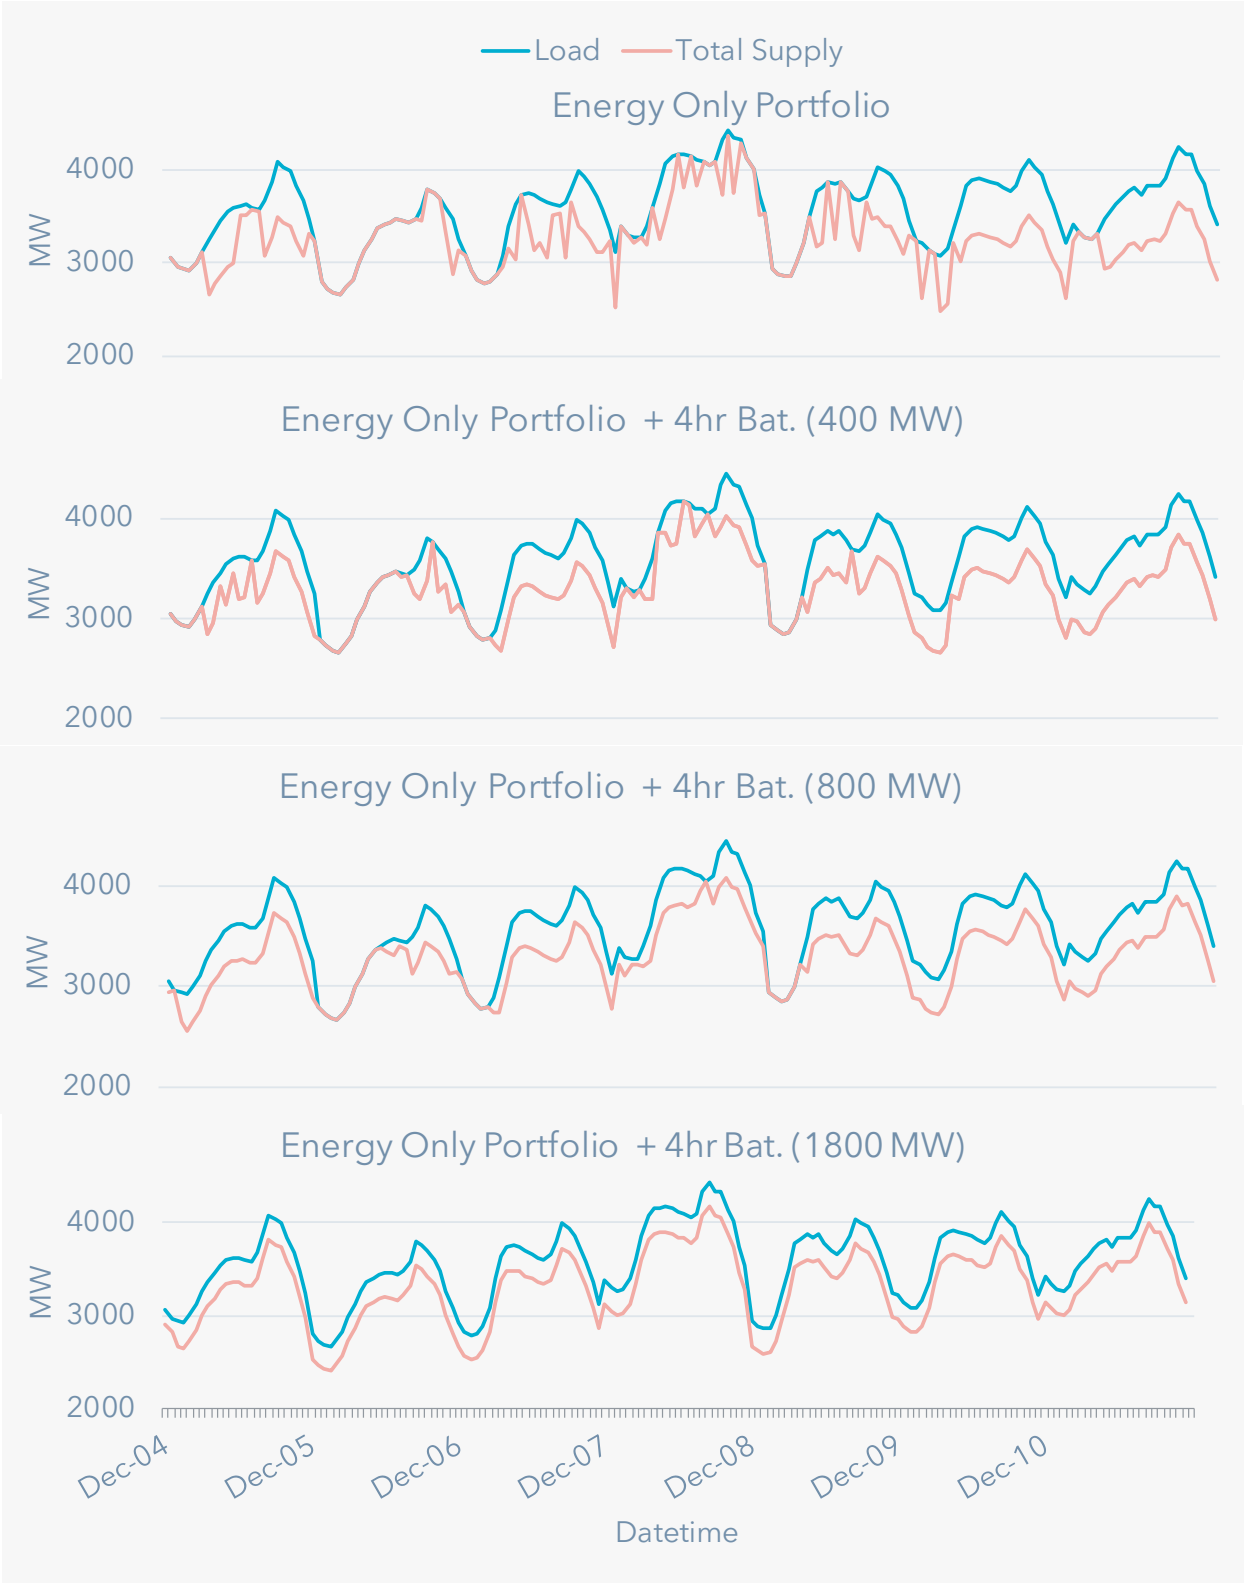


Figure 70 shows a Sequoia simulation of load and supply during a week in December 2030. This image highlights the challenge of trying to meet load in winter with short-duration storage resources. The first panel shows load and total supply in the base system with the Energy Only Portfolio, where gaps between total supply and load are unserved energy. As the quantity of storage increases the supply curve is shaped to reduce the largest hours of unserved energy. Due to insufficient energy, the optimal solution is to charge during periods of adequacy and lessen the size of unserved energy events in other hours, as is clear in Panel 4.[149] Panel 4 represents a tail event in the system, a week of energy shortfall where all 168 hours are short. Such a week has a 1 in 100,000 chance of occurring in an adequate system which includes the Preferred Portfolio. This inability of storage resources to resolve shortages when energy is short is representative of the declining marginal winter capacity curve shown in **Figure 69**.

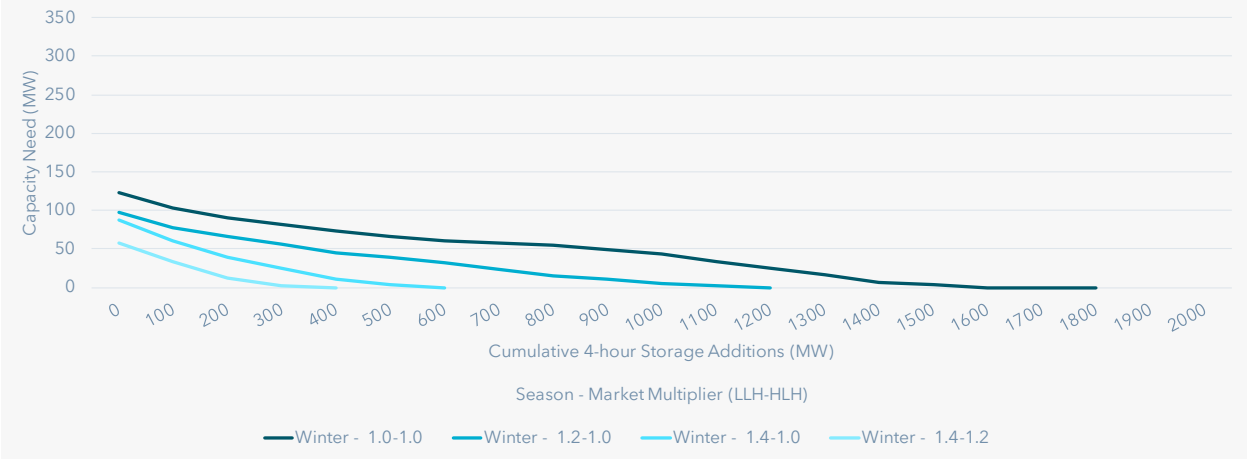
[149] The objective function of Sequoia is to minimize the sum of the greatest hour of unserved energy of the week plus the average shortfall across the week.

Figure 70. December 2030 Weekly Adequacy Simulation



Previous regional resource adequacy studies have also reported on the challenges of meeting adequacy needs in the Pacific Northwest with short-duration storage. Energy and Environmental

Economics (E3) highlighted the steeply declining ELCC value of storage resources as a pattern that is particularly acute in the Pacific Northwest due to the quantity of hydro resources in the region.[150] This report concluded that firm capacity is an important component of a deeply decarbonized grid, and achieving decarbonization using only wind, solar, hydro and energy storage is impractical and prohibitively expensive. To compare the capacity value of dispatchable hydro resources against energy storage, the Company modeled the 2030 ELCC of the Non-Emitting Contract from the Preferred Portfolio based on parameters detailed in recent bilateral hydro agreements. The capacity value of this contract was estimated at 189 MW and when added to the system with the Energy Only Portfolio in 2030 resulted in ELCCs of 122 percent in summer and 115 percent ELCC in winter, as compared to 46 percent in summer and 22 percent in winter for 200 MW of 4-hour battery storage.

To test whether availability of energy is constraining the value of storage resources in winter, the same Energy Only Preferred Portfolio and incremental storage sensitivity analysis was conducted under various market availability assumptions. Adjustments were made by scaling Sequoia's market access assumptions for low-load hours (LLH) and heavy-load hours (HLH).[151] **Figure 71** shows the effect of this market sensitivity test on seasonal capacity need, where the market access multiplier represents the scalar for LLH and HLH, respectively. For example, in the 1.2-1.0 market access multiplier scenario an additional 20 percent (approximately 200 MW) is available during LLH and no change is assumed during HLH. In the 1.4-1.0 scenario, an additional 400 MW to the maximum availability in LLH results in winter adequacy at approximately 600 MW of incremental storage. This quantity of storage is equivalent to that included in the State RA Requirements Portfolio, 1200 MW less than the Preferred Portfolio.

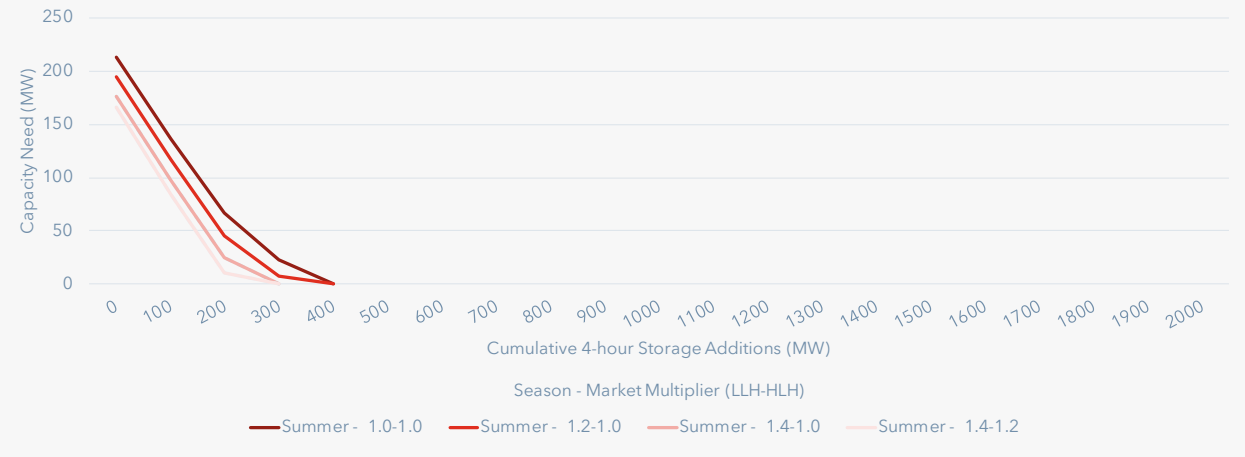


Figure 71. Capacity Need of Energy Only Portfolio with Incremental 4-hour Storage Additions and Variable Market Availability Assumptions – 2030 Reference

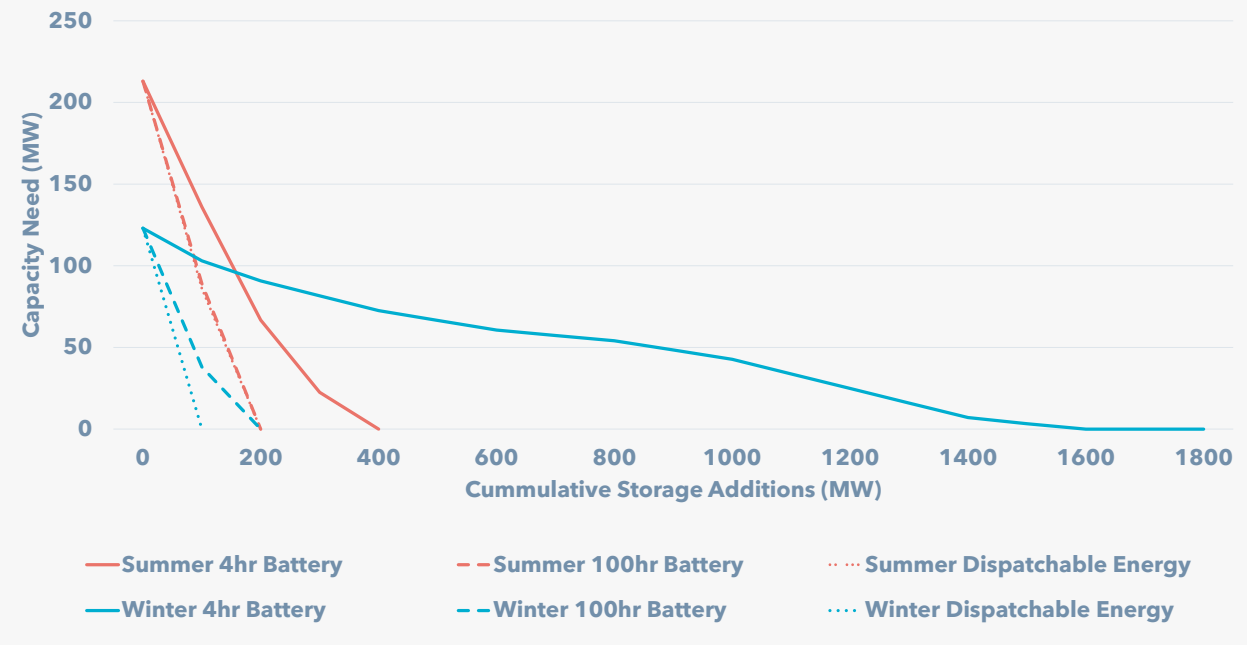
Panel A – Winter Capacity Need

[150] Energy and Environmental Economics. 2019. Resource Adequacy in the Pacific Northwest. San Francisco, CA.
[151] Sequoia's standard market assumptions vary by month, weekend/weekday, and hour (LLH/HLH) and are negatively correlated to load (i.e., greater load assumes less availability). In December, weekday values are limited to 999 MW and 150 MW for LLH and HLH, respectively. In August, values are limited to 999 MW and 0 MW for LLH and HLH, respectively.

Panel B – Summer Capacity Need



The above results highlight the sensitivity of the Preferred Portfolio to PGE's assumptions of access to regional markets. An estimated 66 percent of the 1800 MW of storage in the Preferred Portfolio is offset with approximately 400 MW of additional energy in LLH. Changing market access assumptions to arrive at a portfolio roughly equivalent to the State RA Requirement Portfolio reduces the NPVRR of resources by roughly $7 billion dollars across the planning horizon.[152] However, an Energy Only Portfolio with storage resources equivalent to the State RA Requirements portfolio is inadequate in winter 2030 as estimated in Sequoia. 60 MW of winter capacity need remain to achieve the 24-hours in 10 years metric. This capacity need equates to 3.73 LOLH, or 37 hours of unserved energy in 10 years for winter.

Finally, PGE estimated capacity contributions from emergent technologies as part of this analysis. These estimates are considered preliminary, and the Company intends to further refine them and EDAM market capacity contributions (see **Section 2.2.1 CAISO's Extended Day Ahead Market**) as part of the 2026 CEP/IRP. **Figure 72** compares capacity contributions of long-duration storage (LDS) and dispatchable energy technologies against those from 4-hour storage, as displayed in **Figure 69**.[153] This analysis suggests that approximately 200 MW of 100-hour storage and 100 MW of dispatchable energy provides effective capacity equivalent to 1800 MW of 4-hour batteries when added to the Energy Only Portfolio. Unlike 4-hour storage, the characteristics of these emergent technologies appear better suited to resolve the multi-hour reliability events characteristic to the winter season because of their ability to hold greater quantities of energy or generate energy on demand.

[152] Energy resources in the State RA Requirements Portfolio are roughly equivalent to those in the Preferred Portfolio. Value represents the difference between the NVPRR of the Preferred Portfolio and the State RA Requirements Portfolio presented in **Section 6.2 Preferred Portfolio** and **Section 6.3.5 State RA requirements**.

[153] LDS is modeled as a 100-hour battery with 35% round-trip efficiency, while dispatchable energy is modeled as perfect capacity. Long-duration storage is assumed to start each dispatch period fully charged, just as short-duration storage. Improved representation of the operational availability of LDS is suggested for the 2026 CEP/IRP.

Figure 72. Capacity Need of Energy Only Portfolio and Emergent Technology Additions – 2030 Reference

The results from this energy sensitivity analysis show that ELCCs for winter storage do not improve with additional energy availability and short-duration storage remains an inefficient marginal resource for meeting winter adequacy needs. Short-duration resources are inefficient primarily due to the length of constraining reliability events. This conclusion motivates **Section 6.7 Net cost of capacity resources**, where the Company represents the cost of marginal resource with a value that captures the capacity and energy costs required to ensure adequacy.

Further, this analysis provides insight into four considerations PGE intends to investigate in the 2026 CEP/IRP with respect to future capacity needs: (1) continue to rely on short-duration storage as the marginal resource, (2) evaluate the role of additional energy from expanded market access, (3) evaluate the role of an expanded regional sharing mechanism as part of the State Resource Adequacy requirements, and (4) review the viability of emergent technologies as the marginal resource. PGE expects it necessary to identify different long-term marginal capacity resources better suited to provide the energy and capacity necessary to meet ongoing winter adequacy challenges, such as long-duration storage, hydrogen storage resources, advanced geothermal, nuclear generation, carbon capture utilization and storage, and long-distance transmission access to geographically diverse trading hubs, such as the North Plains Connector.

6.3 Portfolio sensitivities

This section describes, and presents results for, the multiple sensitivities that are conducted on the Preferred Portfolio. Topics explored through these sensitivities include the quantity of emitting energy retained by PGE to serve retail load, large industrial customer growth, resource adequacy planning assumptions and the availability of non-emitting market purchases for hourly emissions accounting. Except where otherwise specified, PGE held the assumptions for each

sensitivity constant with those of the Preferred Portfolio in order to isolate the impacts to the topic of interest. Select results are presented for each scenario to highlight the findings of interest.

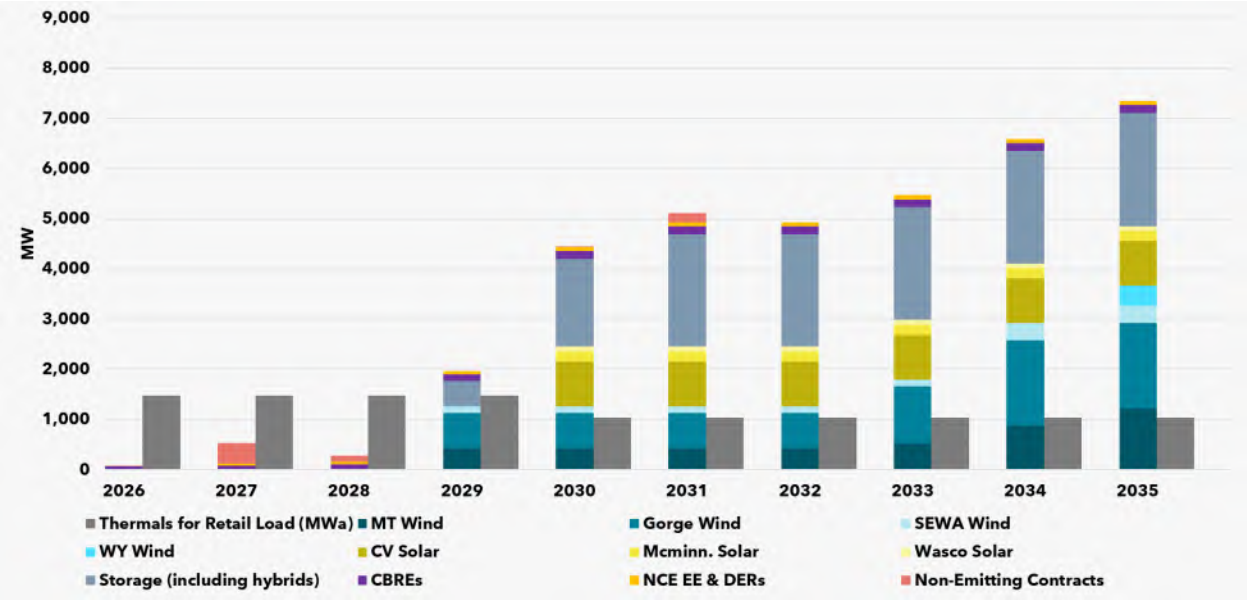
6.3.1 Reliability needs only

The 'Reliability Needs Only' scenario demonstrates how capacity and energy needs driven by load growth and portfolio composition changes. In this scenario, HB 2021 GHG emissions targets are not enforced. The quantity of thermal energy retained from PGE's existing fleet of resources to serve retail load is determined by recent historical plant operations. Additionally, thermal resources continue to provide capacity beyond 2039, unlike the Preferred Portfolio, in which the capacity from thermals must be replaced with non-emitting sources in 2040. Although not constrained to HB 2021 emissions reductions, the 'Reliability Needs Only' scenario is compliant with RPS requirements. As in all other portfolios analyzed in the Update, this portfolio does not contemplate the addition of new natural gas resources to PGE's portfolio.

Resource additions for the 'Reliability Needs Only' scenario are shown in **Figure 73**. Optimized resource additions through 2030 include 1262 MW of wind, 1189 MW of solar, 1745 MW of storage, 83 MW of non-cost-effective EE and DERs, 155 MW of CBREs, and 9 MW of non-emitting contracts. Total resource additions in 2030 are 95 percent of those in the Preferred Portfolio. The substantial incremental resource additions by 2030 without reducing thermals suggests resource adequacy, including the need to serve growing load in a reliable manner, is a main driver of PGE's resource needs.

Results differ more substantially from the Preferred Portfolio later in the analysis time-horizon when the ability to retain thermals for capacity impacts resource additions. By 2040, the resource additions of the "Reliability Needs Only' scenario are only 53 percent of those in the Preferred Portfolio. Driven largely by these later-year differences, the cost and risk of the 'Reliability Needs Only' scenario, shown in **Figure 74**, are substantially lower than the Preferred Portfolio. 20-year portfolio NPVRR for the 'Reliability Needs Only' scenario are $4,970 million lower than the Preferred Portfolio.

Figure 73. Resource Additions for Reliability Needs Only Scenario (MW)



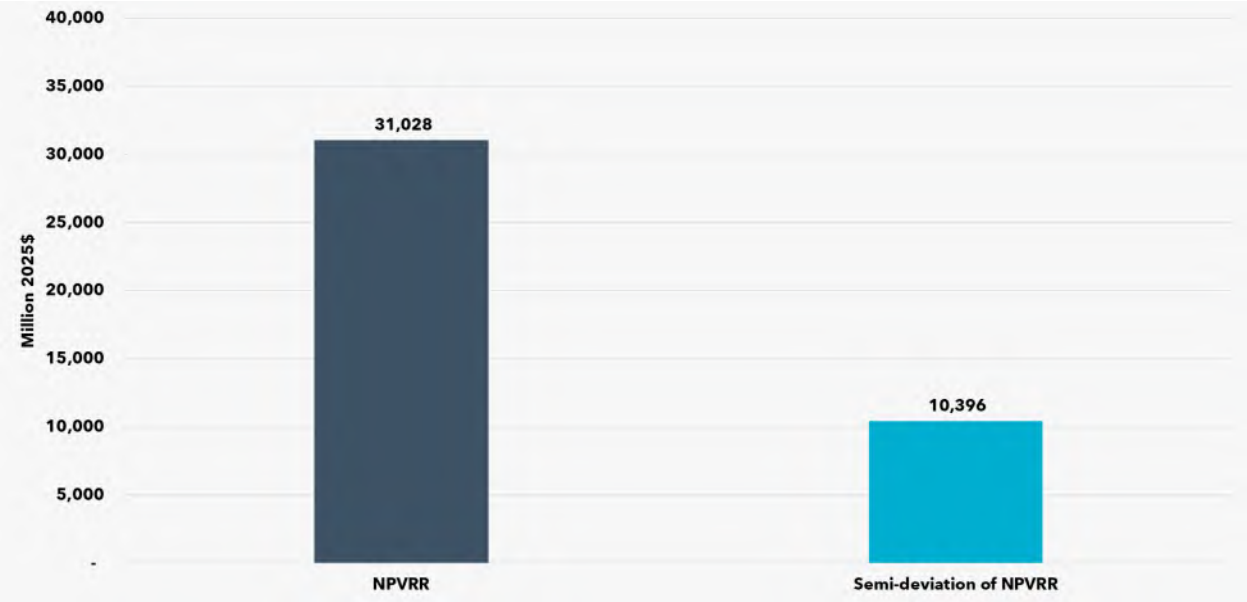


Figure 74. Cost and Risk of Reliability Needs Only Scenario

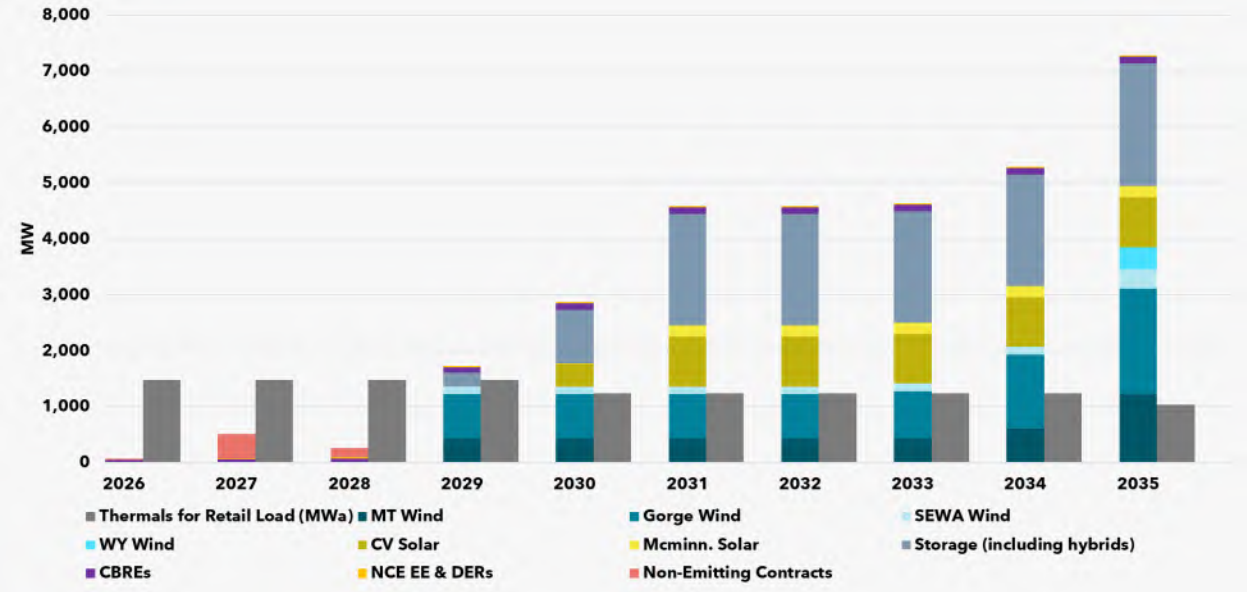


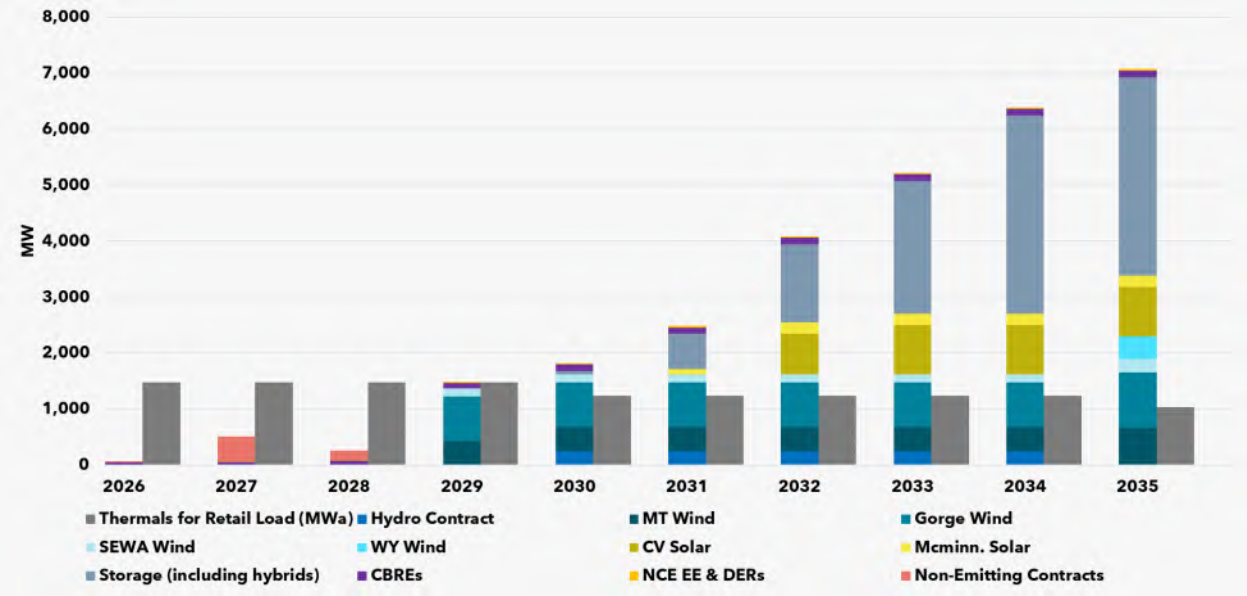
6.3.2 Further Reliability need sensitivities

The scenarios presented in this section expand upon the 'Reliability Needs Only' scenario by considering how needs are reduced assuming 1) that PGE extends a 250 MW contract for dispatchable emitting energy and 2) PGE extends a 250 MW contract for dispatchable emitting energy in addition to a 250 MW non-emitting hydro contract. These scenarios are named the 'Dispatchable Emitting Contract Scenario' and the 'Dispatchable Emitting and Hydro Contracts Scenario'. Both contract extensions are assumed to provide both energy and capacity from 2030 through 2034. Aside from the contract extension assumptions, these scenarios rely on identical

assumptions to the 'Reliability Needs Only' scenario. In contrast to the small impact on needs found when comparing the 'Reliability Needs Only' scenario, with its' reduced energy needs, to the Preferred Portfolio, the addition of capacity and energy from contract extensions in these scenarios produces substantial reductions in 2030 resource needs, as illustrated in the results below.

Portfolio resource additions for the 'Dispatchable Emitting Contract Scenario' shown in **Figure 75**. Additional quantities of emitting energy can be seen as taller gray bars in 2030 – 2034. Through 2030, the portfolio adds 1362 MW of wind, 415 MW of solar, 952 MW of storage, 24 MW of NCE EE and DERs, and 119 MW of CBREs. Total resource additions are 2872 MW through 2030, which is 1571 MW, or 35 percent, lower than in the 'Reliability Needs Only' Scenario. The decrease in resources is driven largely by decreases in the quantity of solar and storage, with CBRE's, NCE EE, and NCE DERs are also reduced.

Figure 75. Resource Additions for Dispatchable Emitting Contract Scenario

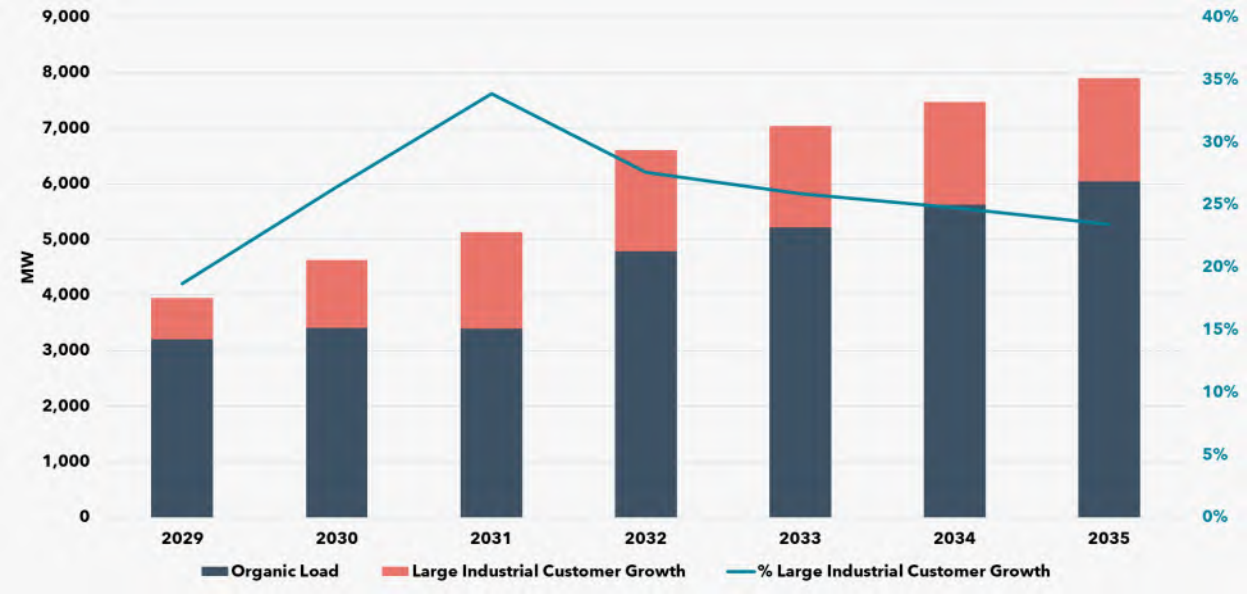


Portfolio resource additions for the 'Dispatchable Emitting and Hydro Contracts Scenario' shown in **Figure 76**. Through 2030, the portfolio adds 1362 MW of wind, 64 MW of storage, 24 MW of NCE EE and DERs, and 119 MW of CBREs. Total resource additions are 1569 MW through 2030, which is 2874 MW, or 65 percent, lower than in the 'Reliability Needs Only' Scenario. Consistent with the results of the previous scenario, the decrease in resources is driven largely by decreases in the quantity of solar and storage.

Notably, in the 'Dispatchable Emitting and Hydro Contracts Scenario' the need for transmission options is reduced, with the needs reduced enough during the 2030 – 2034 period of contract extensions that the 3000 MW Bethel-Round Butte transmission upgrade (BRB) is foregone when it becomes available in 2032. The impact of this outcome produces an initially unintuitive result when comparing the resource additions of the two contract extension scenarios in 2033 - 2034

reveals. Comparison of **Figure 75** and **Figure 76** reveal larger 2033 and 2034 resource additions in the 'Dispatchable Emitting and Hydro Contracts Scenario', which has 500 MW of contract extensions than the 'Dispatchable Emitting Contract Scenario', which has 250 MW of contract extension. Instead of investing in BRB, the 'Dispatchable Emitting and Hydro Contracts Scenario' lowers costs by relying on additional quantities of storage to meet needs in these years and delaying the addition of any transmission options until 2035.

Figure 76. Resource Additions for Dispatchable Emitting and Hydro Contracts Scenario



6.3.3 Large industrial customer growth

As described in **Section 2.4 Industrial load growth**, substantial electricity demand from large industrial customers is projected in the PNW in coming decades and will have implications for utility planning. PGE is taking steps to mitigate the risk of inequitable customer cost impacts associated with large industrial load growth, including through its filings in UE 430 and UM 2377, in which PGE has proposed a change to its tariff regarding cost allocation amongst customer classes. In addition, the Oregon legislature is considering law that would place data centers into a specific customer class. The Update analysis is illustrative of how new resource costs are driven by all large and growing industrial customers. There remain important differences in methodology and purpose between the IRP Update analysis and methodology that may result from UM 2377 which may limit the applicability of these results which should be considered illustrative only.

As an initial exploration of the impacts of this projected growth on PGE's planning, an analysis was conducted to identify what the quantity of resource additions in PGE's Preferred Portfolio are associated with meeting the needs created by the growth of large industrial customers. To do so, PGE created a load forecast sensitivity that excludes large industrial customer growth. This forecast and the methodology used to develop it are described in detail in **Section 3.1.3 Load forecasts – excluding large customer** . The load that remains to be served after removing the

impact of large industrial customer growth is referred to here as 'organic load'. Using this load forecast, a scenario was created that produced a portfolio of resource additions that provides sufficient energy and capacity needs to meet organic load growth and is compliant with HB 2021. The resulting capacity need for the 2030 reference case is estimated at 497 MW and 473 MW for summer and winter, respectively, roughly 50 percent of the estimated capacity need for the Preferred Portfolio. The quantity of resources associated with serving large industrial customer growth can be estimated by taking the difference in the resource buildout of the Preferred Portfolio and the 'No Large Industrial Customer Growth' scenario, which adds resources to meet organic load only. **Figure 77** shows the total cumulative resource additions in each year for the Preferred Portfolio and the 'No Large Industrial Customer Growth' scenario and shows that by 2030, about 26 percent resource additions can be attributed to growth in large industrial customer load. Resource additions associated with large industrial customer growth reach as high as nearly 34 percent in 2031.

Figure 77. Cumulative Resource Additions for Large Industrial Customer Growth

6.3.4 Market scenarios

PGE developed three market scenarios to analyze uncertainties in the potential availability of low- and non-emitting power for purchase. These scenarios vary assumptions in PGE's IGHG model which impact the quantity of emitting energy that PGE is ultimately able to retain to serve retail load. Compliance with HB 2021 is assumed for each alternative market scenario. The three market scenarios are described in **Table 33**.

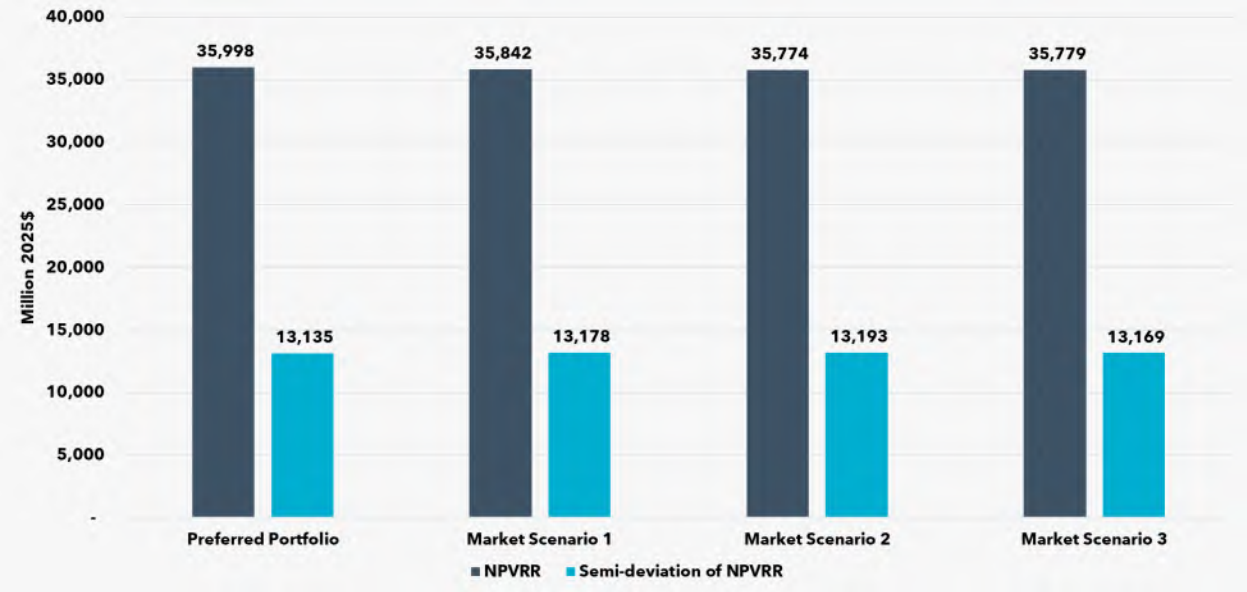


Table 33. Market Scenarios

Scenario	Description
Market Scenario 1: Specify More Power Purchases	Specify 50% of the assumed unspecified market purchases (informed by historical data) serving retail load in the IGHG

Scenario	Description
	model as non-emitting with the remaining 50% assigned the market unspecified emissions rate.
Market Scenario 2: Extend Low-Emitting Existing Purchases	Extend known low-emitting short-term specified purchases that would otherwise expire in the IGHG model.
Market Scenario 3: Lower Emission Rate	Reduce the emissions rate of unspecified market purchases in the IGHG model by 30%.

Because the assumptions in the market scenarios allow PGE to retain more emitting energy and thus reduce the energy need, resource additions are lower than in the Preferred Portfolio. However, because capacity need is unchanged, the impacts on resource buildouts and portfolio cost and risk are modest. Portfolio cost and risk metrics for the market scenarios are shown in **Figure 78**. Relative to the Preferred Portfolio, Market Scenario 1 lowers portfolio cost by $156 million, while Market Scenarios 2 and 3 produce costs $224 million and $219 million lower than the Preferred Portfolio, over the 20-year analysis time-horizon.

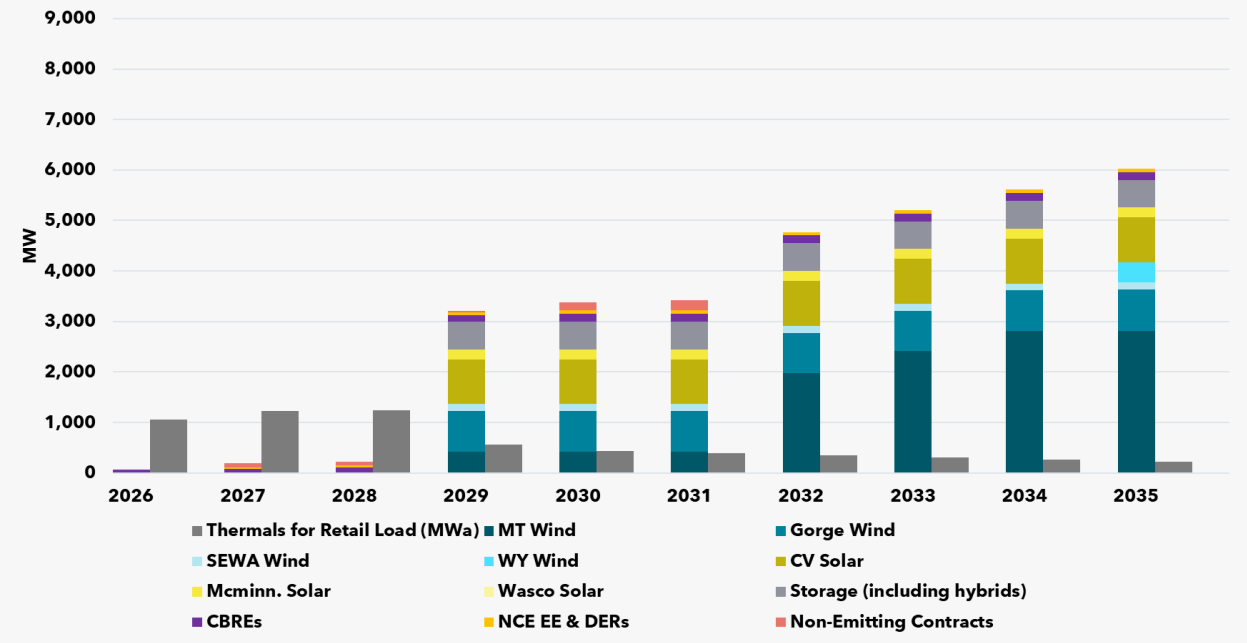
Figure 78. Cost and Risk of Market Scenarios

6.3.5 State RA requirements

The 'State RA Requirements' scenario models PGE's resource adequacy needs using methods from the WRAP instead of using the PGE resource adequacy methods that are standard in the Preferred Portfolio and all other scenarios. The alternative methodology used for this scenario impacts capacity need and proxy resource ELCCs, as described in **Appendix I Inputs for state RA requirements portfolio**. Because of the assumed sharing of resources by regional entities, the WRAP methodology generally produces a lower estimated capacity need than PGE's standard IRP methods. As a result, the resource additions in the 'State RA Requirements' scenario are substantially lower than in the Preferred Portfolio and portfolio cost is $6,546 million lower

over the planning horizon. Resource additions for the 'State RA Requirements' scenario are shown in **Figure 79**, and cost and risk metrics are shown in **Figure 80**.

Figure 79. Resource Additions in State RA Requirements Scenario (MW)



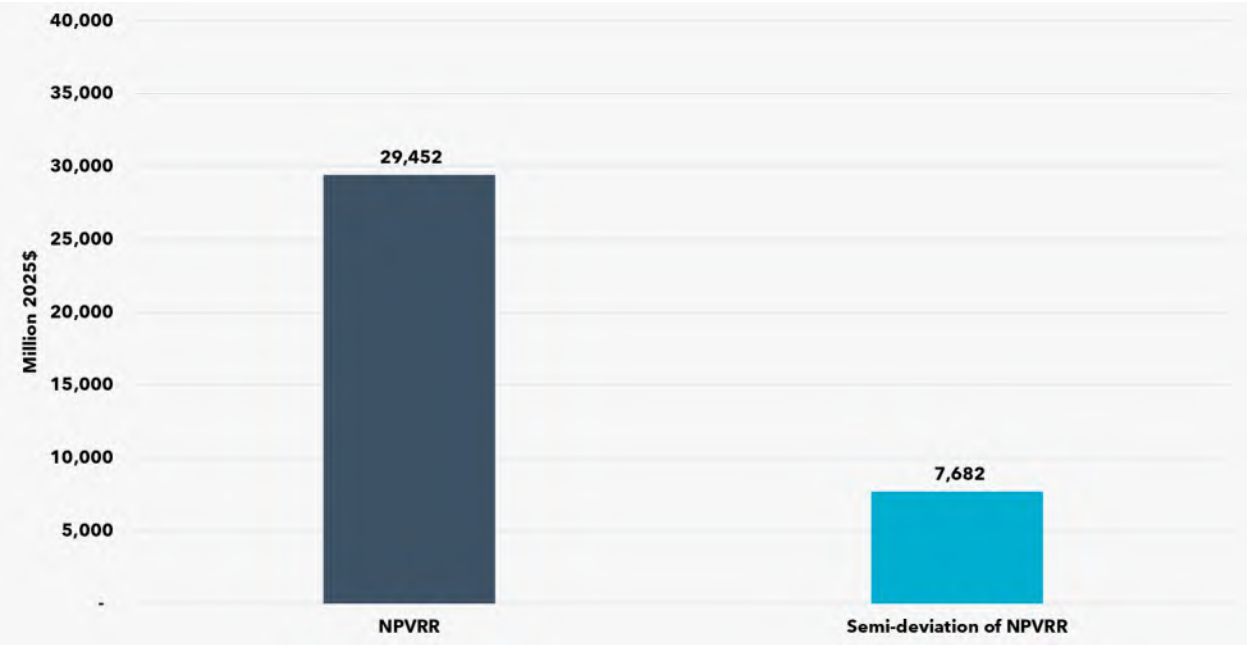


Figure 80. Cost and Risk of State RA Requirements Scenario

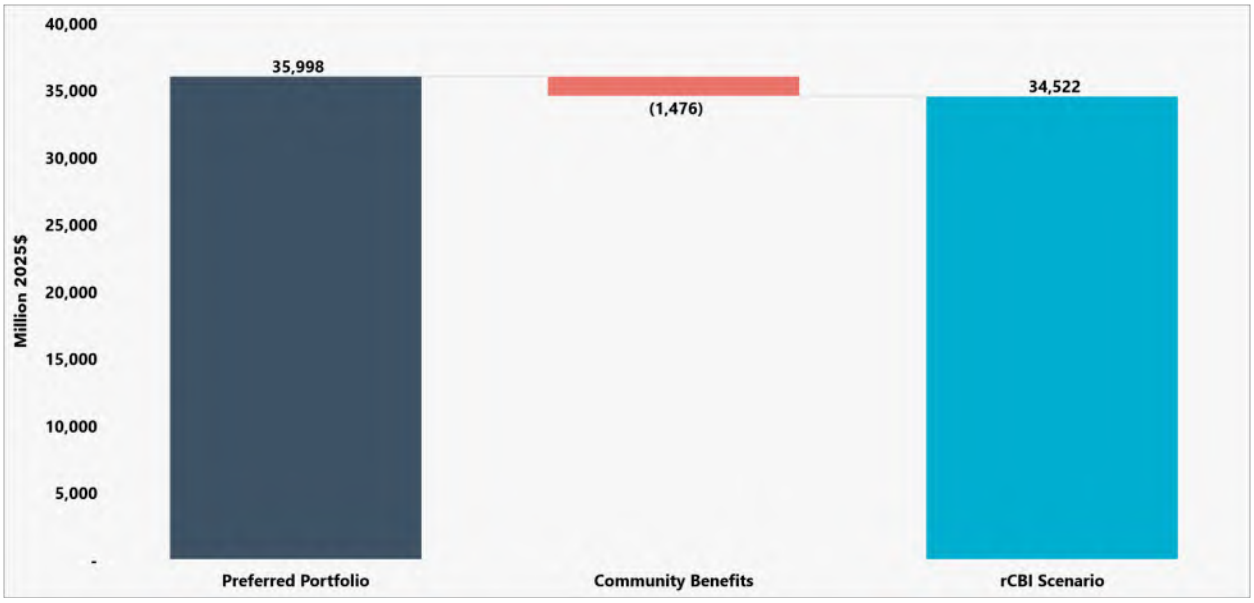


6.3.6 Resource Community Benefits Indicator (rCBI)

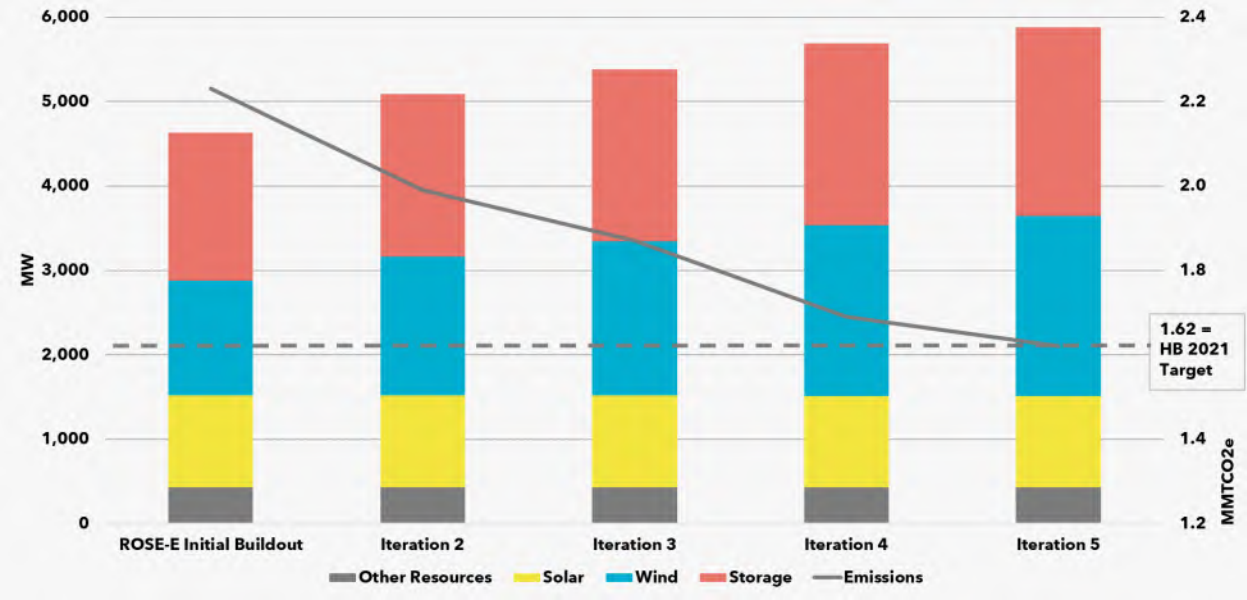
The 'rCBI' scenario applies reductions in fixed costs to certain CBRE, NCE DR, and NCE EE resources to reflect the societal value of community benefits associated with these resources, as described in **Section 5.5 Community benefits indicators (CBIs)**. Because the majority of NCE EE and DR, and the entirety of CBRE resources available, are added in the Preferred Portfolio, differences in resource buildout between the 'rCBI' scenario and the Preferred Portfolio are minimal. The reduced fixed costs did result in the selection of an additional 2 MW of NCE DR resources.

The lower costs associated with these resources lowered portfolio NPVRR by $1,476 million compared to the Preferred Portfolio (**Figure 81**). This reduction in NPVRR represents the value of localized community benefits provided by the resources in the portfolio. The $1,476 million in community benefits reflects the societal benefits provided by the resources in the portfolio and does not represent a decrease in the monetary cost of the portfolio or suggest that the 'rCBI' portfolio would result in lower customer bills than the Preferred Portfolio.

Figure 81. NPVRR of Preferred Portfolio and rCBI Scenario

6.3.7 Absence of non-emitting market

The 'Absence of Non-Emitting Market' scenario contemplates the quantity of resource additions that would be necessary to meet HB 2021 emissions targets using hourly energy accounting if PGE didn't have access to the non-emitting market energy that is available in the analysis reported in **Section 6.2.2 Hourly energy and emissions accounting results**. A detailed description of the iteration method is provided in **Appendix D Hourly emissions methodology**. In brief, the question is answered using the following approach:



1. ROSE-E determines the resources required to meet resource needs based on monthly energy sufficiency.

2. The modified PZM estimates what hours in the year would PGE be short (and by how much) under average conditions.
3. An outboard workbook creates a new energy constraint to be met and resource options are assigned a weighted capacity factor that encourages the addition of resources that are most useful in meeting that need. The new constraint is fed back into step 1 until a portfolio that meets all hourly needs is produced.

Because transmission constraints would make it impossible to add sufficient resources to meet the hourly emissions requirements in 2030, the resource additions in iterations subsequent to the initial ROSE-E buildout are not subject to transmission constraints.

Over the course of five iterations between ROSE-E and the modified PZM, incremental additions of renewable and storage resources are added until the portfolio achieves emissions of 1.62 MMTCO2e when evaluated at an hourly time-step (**Figure 82**). When the portfolio achieves emissions targets, the quantity of resource additions has increased by 1249 MW, from 4629 MW in the initial ROSE-E buildout to 5881 MW in the fifth iteration. This 21 percent increase in the quantity of resources in the portfolio illustrates that for PGE to decarbonize in isolation, substantial additional resources would be required that may exacerbate procurement challenges and cost pressure. The findings underscore the importance of access to market opportunities to purchase non-emitting energy from entities within the region.

Figure 82. Resource Addition Iterations in Absence of Non-Emitting Market Scenario

6.4 Small scale renewables plan

As required by ORS 469A.210, PGE has a 10 percent small-scale renewable requirement, requiring that 10 percent of electrical generating capacity come from renewable resources smaller than 20 MW or qualifying biomass generators starting in 2030.[154] Per Staff

[154] Oregon ORS 469A.210 can be found at https://www.oregonlegislature.gov/bills_laws/ors/ors469a.html.

Recommendation #5, approved via LC 80 Order 24-096, PGE has included a SSR compliance analysis as part of this Update. This compliance analysis provided in this section assesses the forecast SSR need, resource contributions, costs, and acquisition/compliance actions. This will include results from portfolio analysis using a SSR proxy resource. It will also include a discussion of how PGE plans to acquire the needed resources to achieve compliance and a discussion on the current status and potential future status of customer sited resources for SSR compliance.

6.4.1 SSR needs assessment

The SSR need is a function of the nameplate capacity of resource in PGE's baseline portfolio and new resources added through capacity expansion modeling. In the Preferred Portfolio, PGE forecasts an aggregate SSR need of 769 MW in 2030, growing to 1292 MW by 2040 (**Table 34**).

Table 34. Total SSR Compliance Requirement by Year

Year	Preferred Portfolio
<2030	No min. requirement
2030	738 MW
2035	991 MW
2040	1314 MW

6.4.2 Contributions from baseline resource acquisition

Several ongoing resource acquisition pathways contribute to SSR development, including the Oregon Community Solar Program projects, QF development, and CBRE acquisition:

- CSP capacity in 2030: 93 MW
- QF capacity <20 MW under contract to PGE in 2030: 260 MW
- CBRE acquisition forecast for 2030: 155 MW
- Other PGE owned or contracted SSR-eligible projects modeled in 2030 portfolio: up to 51 MW

Per OPUC Order 21-464, net metered (NEM) renewables do not contribute to SSR compliance (or to PGE's aggregate electrical capacity). However, the role of net metered solar in PGE's planning has continued to evolve since 2021 as interconnected NEM solar more than doubled in three years. Improvements in inverter capabilities, increasingly common storage pairing, and advancement of grid planning and management as discussed in Distribution System Plans and PGE's Virtual Power Plant activities all have contributed to the value of solar to PGE's system. PGE's SSR compliance assessment considers NEM solar as a sensitivity. Customer solar deployment by 2030 is forecast to be 675 MW (see **Section 5.2.1.1 Distributed solar (PV)**).

6.4.3 Remaining SSR need

Table 35 summarizes PGE's 2030 SSR compliance position, with and without contributions of NEM. With NEM ineligible to contribute to compliance, PGE's forecasted incremental

compliance requirement in 2030 is 179 MW of SSR resources. With all NEM solar considered as an eligible resource there is no incremental compliance need in 2030 (in this case, the first year in which an incremental need arises is 2036).

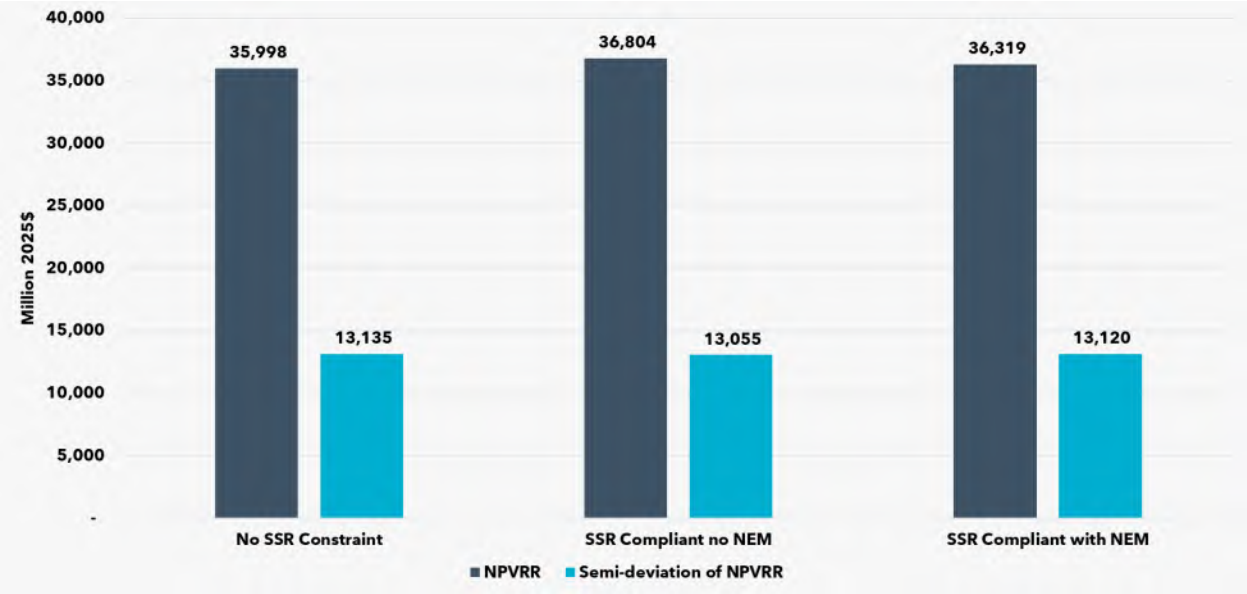


Table 35. SSR Compliance Position, 2030

Compliance Position	All NEM Remains Ineligible	All Customer Sited Eligible
2030 Compliance Need	738 MW	806 MW
Baseline Resource Contribution	560 MW	560 MW
Customer-Sited Contribution	0 MW	675 MW
Incremental Compliance Requirement	179 MW	0 MW

6.4.4 SSR compliance cost assessment

As discussed in **Section 5.4 SSR resource**, PGE used a modeling assumption that SSR resources cost eight percent more and have identical resource characteristics to utility-scale renewables. In order to assess the cost impacts of complying with SSR requirements in every year of the portfolio analysis time-horizon beginning in 2030, two portfolios were constructed. The first portfolio assumes that NEM is not eligible to contribute to compliance ('SSR Compliance No NEM'), and the second assumes that NEM is eligible ('SSR Compliance NEM'). Pairing of NEM solar with storage can increase the value of NEM resources and could plausibly be a consideration in future assessment of SSR eligibility; however, the 'SSR Compliance NEM' scenario does not incorporate any assumptions regarding storage addition. The costs of these portfolios, along with a portfolio that does not enforce SSR compliance, are shown in **Figure 83.** The cost of compliance in each of the two SSR scenarios can be illustrated by comparing the cost of these portfolios against that of the 'No SSR Constraint' portfolio. Results show that over the full analysis time-horizon, procurement of sufficient volumes of SSR resources increases net present portfolio costs by $806 million when NEM is not eligible and $321 million when NEM is eligible (due to costs incurred for compliance after 2036).

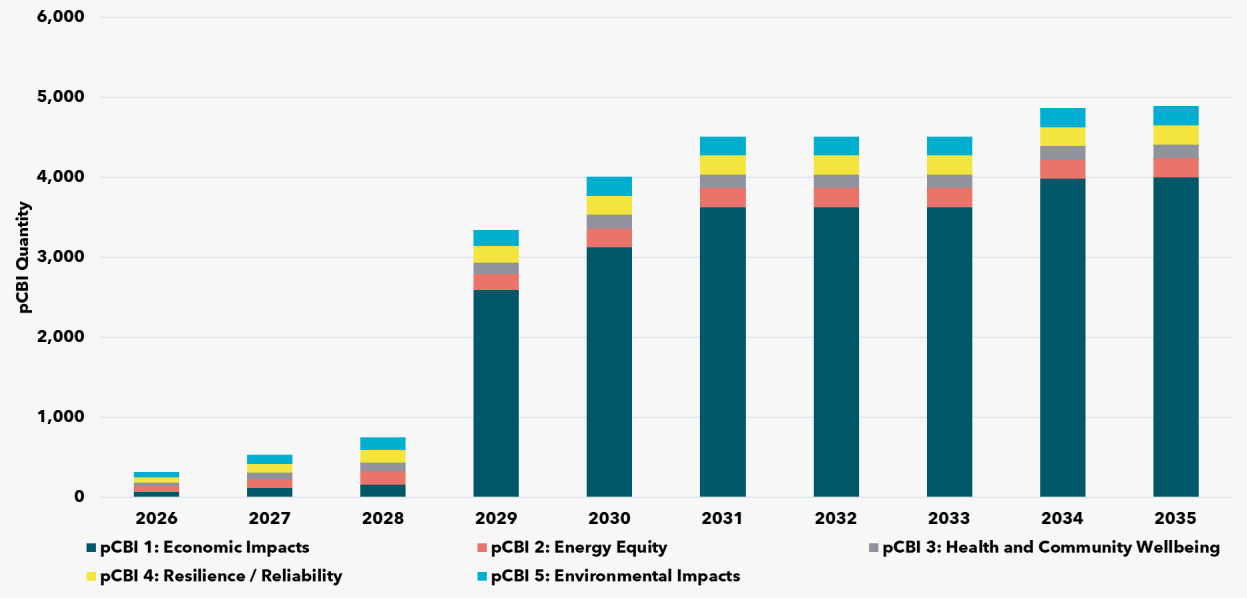
Figure 83. Cost Impacts of SSR Compliance

6.4.5 SSR acquisition strategy

As shown in **Figure 83**, significant customer benefit can be realized by reassessing the SSR eligibility of NEM capacity. This change would be fully consistent with Oregon statute as most recently revisited in HB 2021 and require only a Commission order, with no changes to administrative rules. As described in PGE's recent 2024 Distribution System Plan, PGE also is prioritizing deployment of a virtual power plant in which customer resources are harnessed for system benefit, akin to traditional supply-side resources. PGE looks forward to further progress on this topic as a key component of the SSR acquisition strategy.

In addition, PGE is pursuing the following resource acquisition actions, as discussed in the Action Plan:

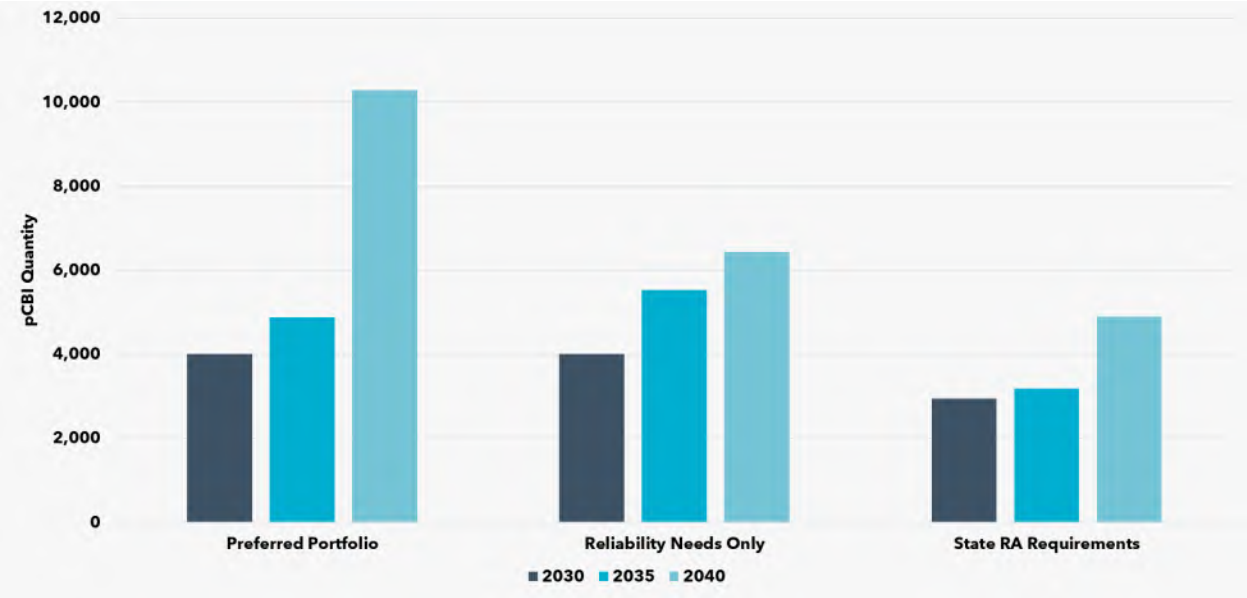
- CBRE Acquisition
- All-Source Energy and Capacity procurement, in which PGE encourages offers from SSRs



PGE believes incremental SSR procurement should only be pursued to the extent SSRs provide unique community benefits aligned with the CBRE acquisition pathway.

6.5 Portfolio CBIs

The cumulative quantity of each of the five pCBI scoring metrics through 2035 for the Preferred Portfolio are shown in **Figure 84**. A large increase in pCBIs generated can be seen in 2029, driven by the addition of substantial quantities of renewable resources, which generate economic community benefits (pCBI 1) when sited in OR. pCBIs 2-5 are generated by NCE EE and DERs and CBREs only and their quantities can be seen to increase through 2030 as additions of these resources are made to the portfolio. Because NCE EE and DERs and CBREs resources are not available for addition beyond 2030, the quantity of pCBIs 2-5 generated by the portfolio

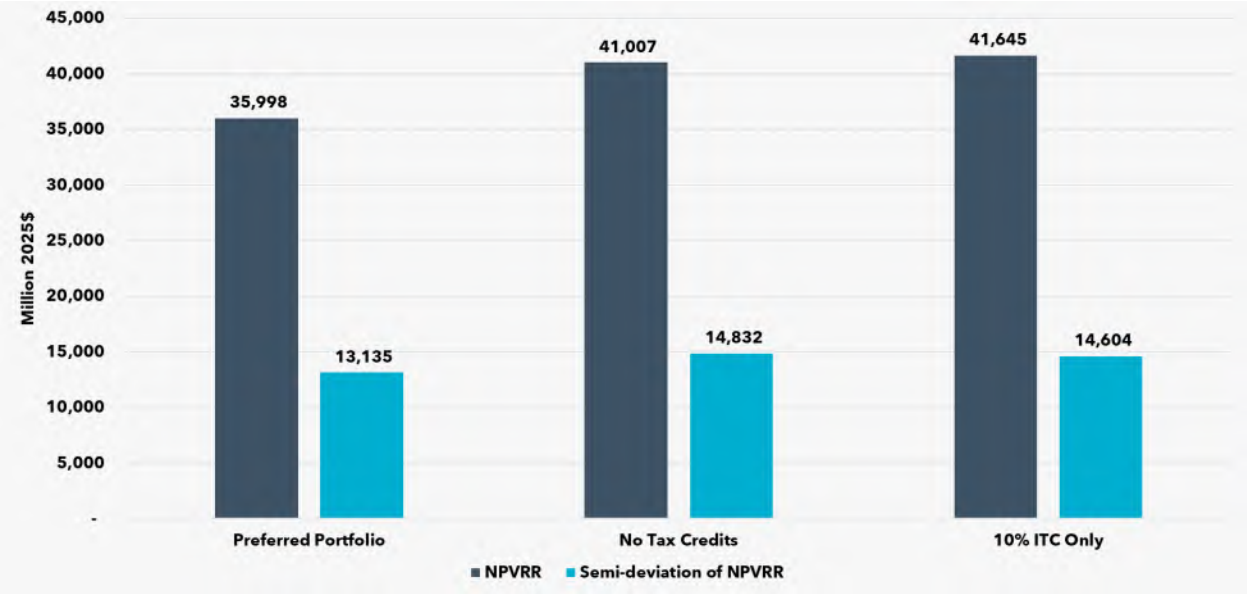


do not increase after 2030. Because of their very similar resource buildouts, the pCBIs generated by the 'rCBI' and three 'Market' scenarios are nearly identical to that of the Preferred Portfolio.

Figure 84. pCBIs of the Preferred Portfolio

Because pCBIs are unitless measures of community benefit, they are most useful in comparing the provision of benefits across alternative scenarios than as an absolute measure of community benefits. The total pCBI quantities of the Preferred Portfolio, and 'Reliability Needs Only' and 'State RA Requirements' scenarios are shown for 2030, 2035, and 2040 in **Figure 85**. Because the Preferred Portfolio has larger quantities of renewable resource additions, it generates more pCBIs than the 'Reliability Needs Only' and 'State RA Requirements' scenarios throughout the study period. In 2030 however, the 'Reliability Needs Only' portfolio generates more pCBIs than the Preferred Portfolio because it has a larger quantity OR renewables, which provide economic impact benefits (pCBI 1) than the Preferred Portfolio which relies more heavily on MT wind (which does not provide economic impact benefits due to it's out of state location). Intuitively, because larger quantities of resource additions generate more pCBIs, more expensive scenarios tend to generate more pCBIs.

Figure 85. Total pCBI Comparison



6.6 Federal tax credit availability scenarios

As noted in **Section 5.1.3 Tax credit sensitivities**, PGE's baseline resource cost assumptions assume the same tax credit environment for generation and energy storage resources as described in PGE's 2023 CEP/IRP. To help understand the potential impact on portfolio outcomes of changes to this set of assumptions, two sensitivities are considered: '10 percent ITC Only' and 'No Tax Credits'. In both scenarios, the costs of certain resources are increased relative to baseline assumptions. The impacts on resource costs of the change in assumptions in each of these scenarios are described **Section 5.1.3 Tax credit sensitivities.** The impact on portfolio composition and cost are explored through portfolio sensitivities in this section.

Both tax credit availability scenarios are modeled with identical assumptions to the Preferred Portfolio in every respect except for the changes to resource costs. The impact on portfolio costs and risk over the 20-year planning horizon in these two scenarios is shown in **Figure 86**. Intuitively, because resources are more expensive, portfolio NPVRR of each tax credit scenario is larger than the Preferred Portfolio. Relative to the Preferred Portfolio, NPVRR is $5,647 million larger in the '10 percent ITC Only' scenario and $5,009 million larger in the 'No Tax Credits' scenario. Reduction or removal of federal tax credits also increases the risk of costly outcomes outside of the Reference Case future, with increased semi-deviation of NPVRR across the 351 futures analyzed relative to the Preferred Portfolio.

Figure 86. Cost and risk of tax availability scenarios

Resource additions of the '10 percent ITC Only' and 'No Tax Credits' scenarios are shown in **Figure 87** and **Figure 88**, respectively. Portfolio resource buildouts of the scenarios are nearly identical to the Preferred Portfolio prior to 2032, with resource additions being driven by transmission constraints and the quantity of transmission available to the individual transmission zones. After 2031, the most notable changes associated with the re-optimized resource selection in both scenarios is a substitution of additional MT wind for some of the SE Washington wind in the portfolio. This effect is driven by the fact that a similar absolute increase in costs for both proxy resources produces a smaller relative increase in the cost of MT wind because it is more expensive, making MT wind relatively more cost-effective. In the '10 percent ITC Only' scenario MT wind increases by 570 MW, and in the 'No Tax Credits' scenario MT wind increases by 430 MW. The increases in resource costs did not create a meaningful shift in the relative cost-effectiveness between wind, solar, and storage resources.

Figure 87. Resource additions in 10 percent ITC scenario (MW)

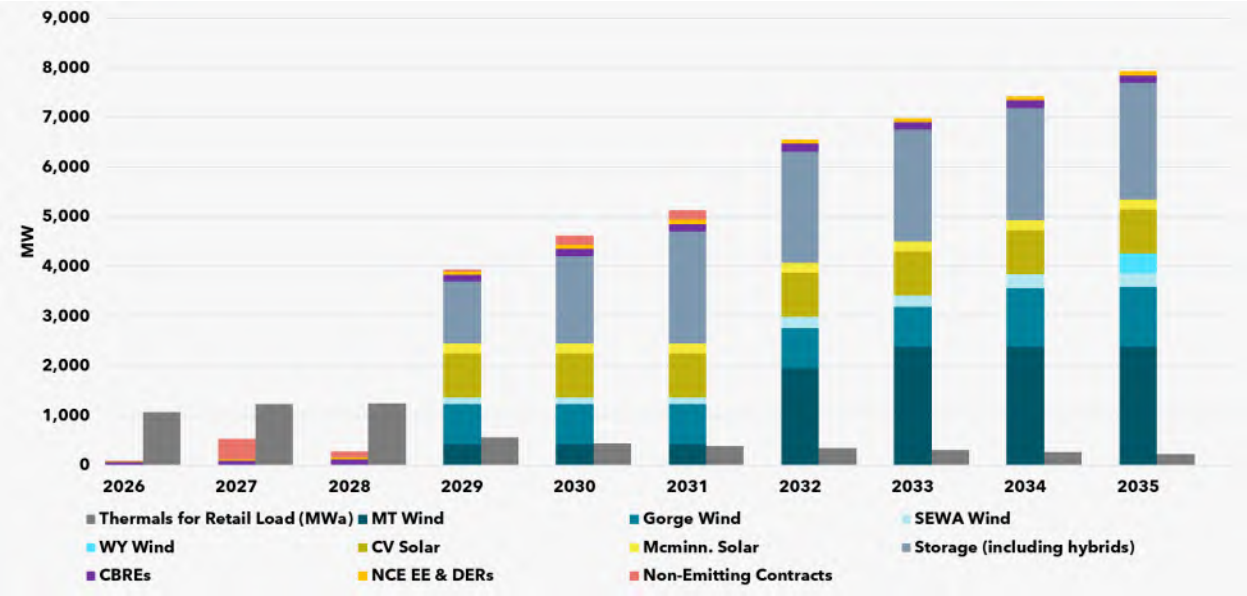


Figure 88. Resource additions in no tax credits scenario (MW)

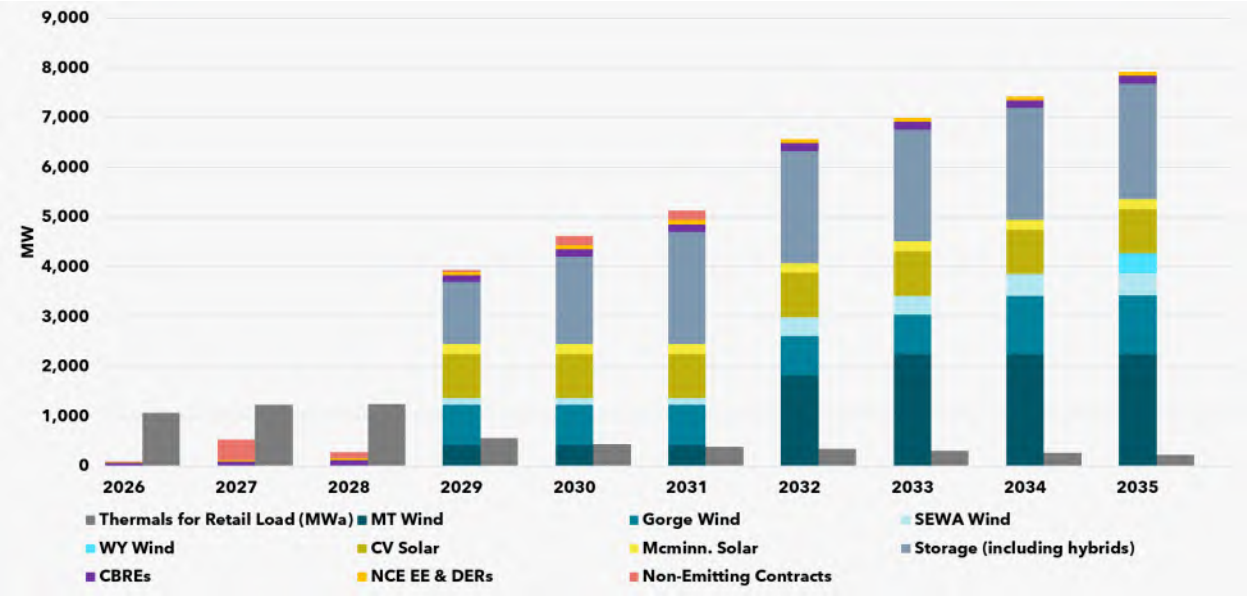

Figure 89 below reflects the annual change in the revenue requirement under all three tax scenarios. This is the incremental cost excluding the baseline existing resource costs. Those costs in addition to the existing portfolio costs results in the portfolio generation cost per MWh shown in **Figure 90**. The most notable changes occur in 2029 and 2040, where the Preferred Portfolio selects a large quantity of resources with large tax credits associated with them. Those cost savings are reduced or removed in the other scenarios.

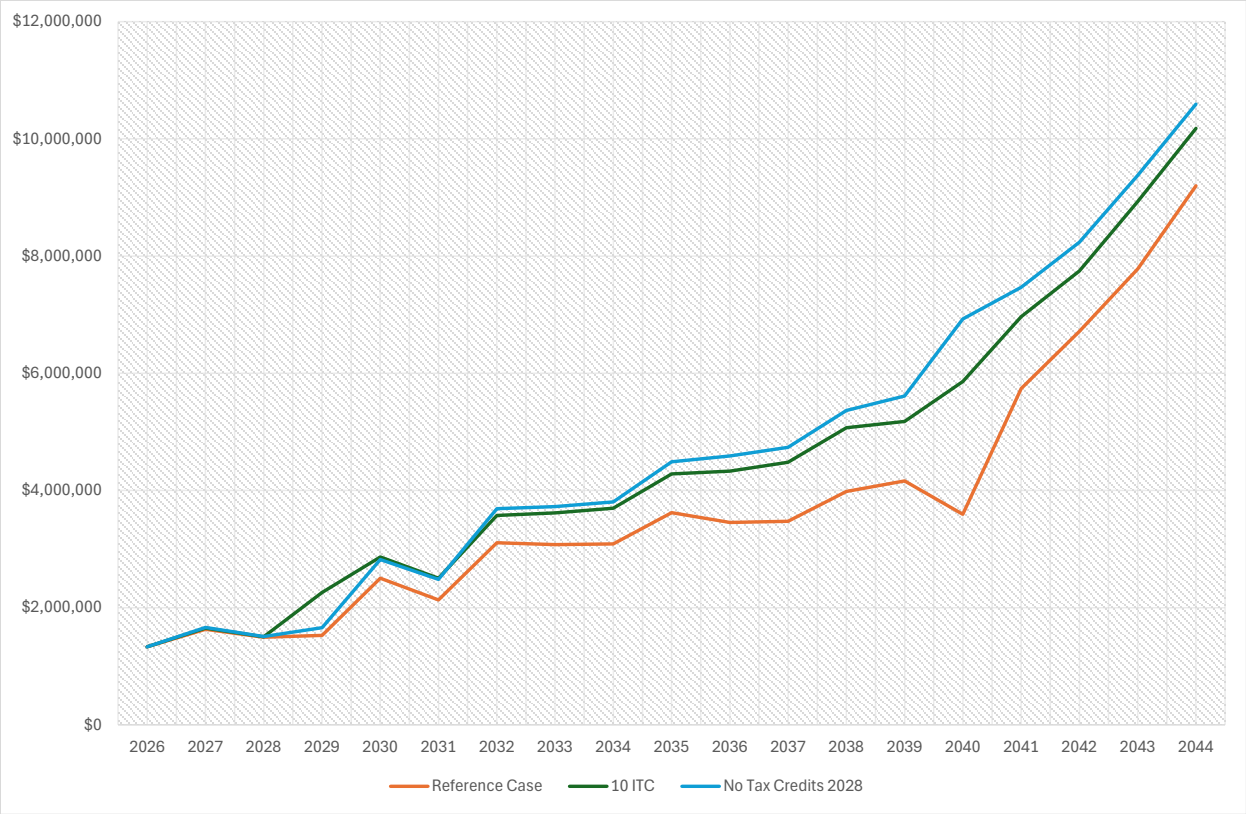
Figure 89. Annual incremental revenue requirement by tax scenario ($k)



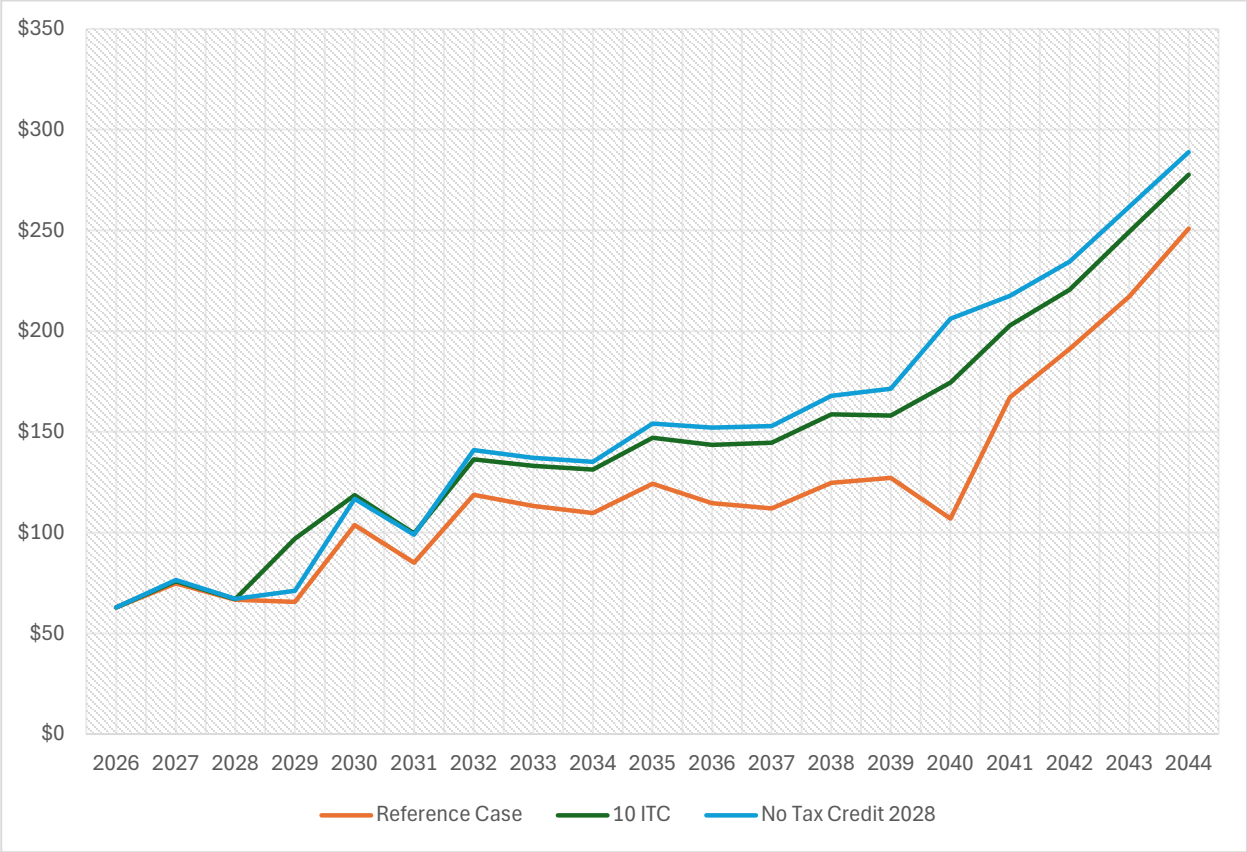


Figure 90. Annual portfolio generation cost by tax scenario ($/MWh)

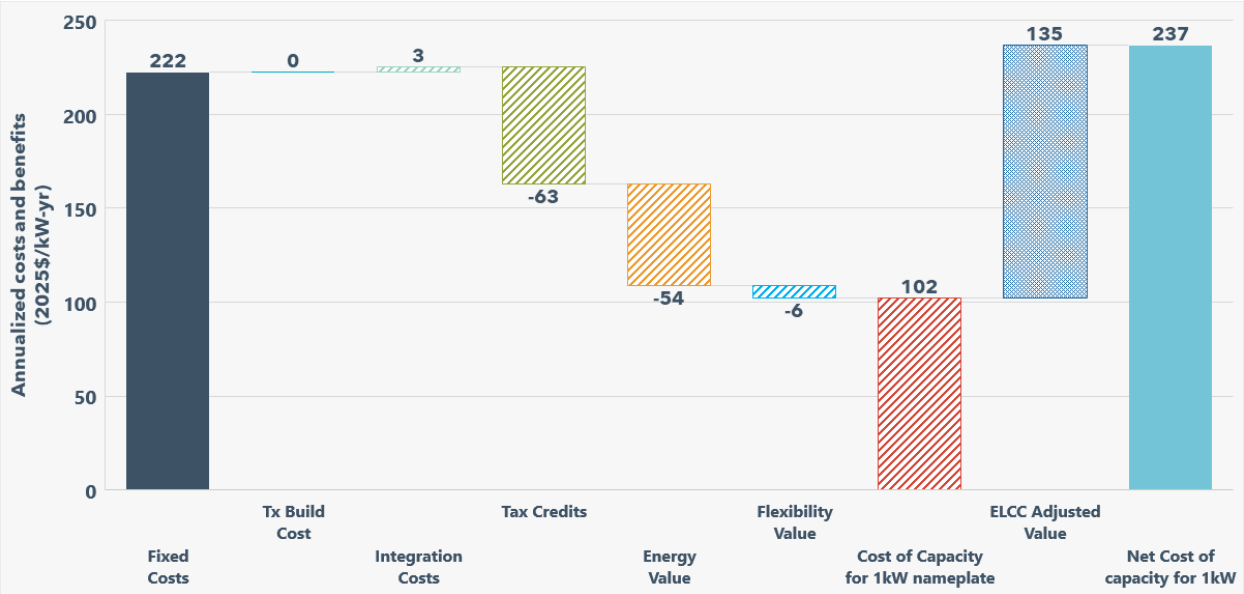


6.7 Net cost of capacity resources

Candidate resources described in **Section 5.1 Resource economics** flow into the portfolio analysis as well as provide inputs to determine resource capacity values and net costs. Additional specific cost or value assumptions to inform net costs are described below. The resource net costs are not used directly in portfolio analysis, though the resulting capacity value is useful for the purpose of comparing resources or for calculating the administratively determined avoided cost payments for resources procured outside of competitive or negotiated processes. This section provides an overview of updates to Section 10.6 of PGE's 2023 CEP/IRP on the net cost of capacity.

The components previously used to derive the net cost of capacity aligned with a 4-hour battery. However, given PGE's growing capacity needs driven by demand growth, reliability, and decarbonization targets, a battery may not be the most representative new resource due to reliable capacity performance limitations, especially in winter months. PGE continues to investigate alternative resource assumptions to inform net cost results. Presented in **Figure 91** is a bridge approach that looks across costs and benefits for each supply-side resource and weights their contribution to a portfolio-blended value based on each resource's nameplate capacity additions by 2030 in the Preferred Portfolio. Dollar amounts are presented on a levelized basis in 2025 dollars.

- The blended net cost of 1 kW nameplate is $102/kW-yr.
    - This amount is calculated as the sum of all the applicable costs net of any benefits (including tax credits) and represents the cost of capacity to procure 1 kW nameplate of the portfolio-blended proxy resource.
- The blended ELCC of the Preferred Portfolio new resource additions in 2030 is 43 percent.[155]
- The net cost of capacity is calculated by dividing $102/kW-yr by the ELCC of 43 percent, resulting in $237/kW-yr.
    - This represents the Net Cost of Capacity.
- The "ELCC adjusted value" noted in **Figure 91** represents the difference between the net cost of 1 kW nameplate and the net cost of 1 kW of capacity contribution.

Figure 91. Deriving the blended cost of 1 kW of capacity contribution

As discussed in **Section 6.2.3.1 Energy sensitivity adequacy assessment of Preferred Portfolio**, long-duration energy storage appears to possess valuable attributes for meeting PGE's future reliability needs. Preliminary analysis indicates that the net cost of capacity for a 100-hour energy storage resource could fall below the $237/kW-yr threshold detailed above. The assumptions of this initial analysis are summarized in **Table 36**.[156]

[155] This ELCC of each individual resource is based on an average of summer and winter firm capacity additions. The portfolio-blended average ELCC weights each resource's ELCC by its nameplate capacity added in the Preferred Portfolio by 2030.
[156] Cost assumptions from: https://formenergy.com/wp-content/uploads/2025/01/Navigating-the-Pacific-Northwests-Energy-Challenges.pdf

Table 36. Proxy 100-Hour Battery Storage Parameters (2030 COD)

Item	Unit	Amount
All-in Overnight Capital	2025$/kW	2,808
Fixed O&M	2025$/kW	24
Real Levelized Fixed Cost	2025$/kW-yr	218
Round-trip Efficiency	%	35
Useful Life	Years	20

Given the framework and assumptions presented above, the Cost of Capacity for 1 kW nameplate of the Proxy 100-Hour Battery Storage resource is detailed in **Table 37**.

Table 37. Proxy 100-Hour Battery Storage Net Cost of 1 kW Capacity (2030 COD)[157]

Net Cost Component	Unit	Amount
Fixed Costs	2025$/kW-yr	218
Energy Value	2025$/kW-yr	0
Flexibility Value	2025$/kW-yr	0
Cost for 1 kW nameplate	2025$/kW-yr	218
Annual ELCC (100 MW)	%	106
Net Cost of 1 kW Capacity	2025$/kW-yr	206

PGE's preliminary analysis estimates the annual ELCC for the first 100 MW addition of 100-hour energy storage at 106 percent.[158] The resulting Net Cost of Capacity for 1 kW of this resource, given the assumptions, would be $206/kW-yr. As noted above, the net cost of capacity is calculated by dividing the cost for 1 kW nameplate by the ELCC ($218 / 106 percent = $206). The Net Cost of Capacity is less than the $237/kW-yr threshold for ELCC values greater than approximately 92 percent.

[157] Energy and Flexibility values are assumed to be zero for the purposes of this exercise.
[158] Annual ELCC is the average of summer and winter ELCCs as estimated in Sequoia for the 2030 Reference case.

Chapter 7. Action Plan

PGE developed the Action Plan for the 2023 CEP/IRP based on the key findings of the Preferred Portfolio in the 2023 CEP/IRP. Though the Preferred Portfolio has been updated several times since (including this Update), PGE is not making changes to the Action Plan from the 2023 CEP/IRP, as the actions included continue to represent the best combination of cost, risk, community benefit, and emission reductions.

Chapter highlights

- PGE is not requesting Oregon Public Utility Commission acknowledgement of this Update and is therefore maintaining the Action Plan that was acknowledged as part of the 2023 CEP/IRP.
- PGE continues to identify the need for more RFPs to procure additional resources for resource adequacy, reliability, and compliance with HB 2021 GHG emissions targets.
- Updated analysis described in this Update suggests resource need has increased.

7.1 Action Plan

The five actions, as acknowledged by the Oregon Public Utility Commission in the 2023 CEP/IRP, are described in the following sections, as are the potential directional changes suggested by the updated portfolio analysis presented in **Chapter 6 Resource plan**.[159] PGE is not requesting acknowledgement of this Update, and this Action Plan is consistent with that acknowledged as part of the 2023 CEP/IRP.

7.1.1 Customer resource action

- *Action 1A. Acquire all cost-effective EE plus additional quantities identified in the CEP/IRP analysis*

PGE planned to acquire all cost-effective energy efficiency, which was forecast to be a cumulative 182 MWa for 2024 through 2028.

PGE identified 53 MWa of additional EE by 2030 as beneficial for customers over the planning horizon. Within this Action Plan window, by 2028, PGE aims to acquire 32 MWa at lowest cost.

Updated ETO forecasts described in **Section 5.3 Energy efficiency** project cost-effective EE to be 173 MWa for 2025 through 2028. PGE will continue to explore opportunities to deploy

[159] In the Matter of Public Utility Commission of Oregon, PGE 2023 IRP and CEP, Docket No. LC 80, Order No. 24-096 (Apr 18, 2024), Appendix A, p.5, available at https://apps.puc.state.or.us/orders/2024ords/24-096.pdf.

sensible EE measures. PGE will also continue to engage with ETO as guiding principles and potential securitization mechanisms regarding utility rate impacts due to cost-effective EE measures that are developed.

- *Action 1B. Incorporate customer demand response*

  PGE planned to enroll distributed flexibility resources that customers choose to provide. By 2028, this is currently forecast to be a total enrollment of:[160]

- *211 MW of summer demand response (Low: 173 MW, High: 343 MW)*
- *158 MW of winter demand response (Low: 127 MW, High: 234 MW)*

Updated forecasts using PGE's AdopDER described in **Section 5.2 Distributed energy resources (DERs)** project increased program participation for a total of 1,269 MW on average from cost-effective DERs in 2030 (a 182 MW net increase from the 2023 CEP/IRP).

7.1.2 CBRE action

- *Action 2: Initiate a CBRE-focused RFP*

  PGE planned to conduct an RFP targeting 66 MW of CBRE resources to come online by 2026.

PGE is conducting a request for offers (RFO) for CBRE resources to support a trajectory towards achieving the target from the 2023 CEP/IRP of 155 MW of CBREs by 2030. PGE's approach to the CBRE RFO has been informed by engagement with and input from community representatives, PGE's CBIAG, potential bidders, and OPUC Staff. Since CBRE is a new type of resource acquisition, PGE has been providing information and exploring appropriate regulatory treatment through regular updates to OPUC Staff. The RFO is open through November 2025, with three rounds of evaluation. PGE anticipates more details and results to be available for the next full CEP/IRP (2026).

7.1.3 Energy action

- *Action 3: Conduct one or more energy RFPs*

  PGE planned to conduct one or more RFPs to add non-emitting resources to support progress toward meeting the 2030 emission targets established in HB 2021. The Reference Case need projected in 2030 was 905 MWa. Through 2028, PGE targeted acquiring 1,254 MWa, or one fifth of that need (251 MWa) per year in the Action Plan (2024-2028).

PGE's baseline portfolio, inclusive of proxy assumptions for procurement from the 2023 RFP, as well as increased EE and DERs, outweigh increased need associated with the new load forecast and other modeling updates. PGE's resulting energy need for 2030 described in **Section 3.3 Energy need** is estimated to be 1204 MWa. This could be thought of as 301 MWa of energy

[160] Demand response values include existing programs.

acquisition necessary in each of the next four calendar years to 2030. At the time of publication of this Update, PGE has two RFPs in progress.

7.1.4 Capacity action

- *Action 4a: Pursue capacity opportunities in the bilateral market*
- *Action 4b: Conduct one or more capacity RFPs*

PGE forecasted significant capacity needs in 2028: 905 MW and 787 MW in the summer and winter, respectively.

Updated analysis described in **Section 3.4 Capacity need** finds PGE's near-term capacity need through 2028 decreased due to supply side additions, namely bilateral contracts, and resource additions modeled as the 2023 RFP Proxy. The updated summer need is estimated at 47 MW in 2026, growing to 485 MW in 2027 with the expiration of hydro contracts with Grant PUD, then drops to 0 MW in 2028 as RFP Proxy Resources enter the modeled supply. In winter, there is 159 MW of need in 2027 that grows through the early years of the analysis period. Actual procurement from the 2023 and 2025 RFPs will seek to fill capacity needs, however, the forecasted near-term need cannot be met by RFP timelines and will therefore need to be addressed by commercial activity in bilateral market purchases.

7.1.5 Transmission expansion action

- *Action 5A: Develop a comprehensive transmission study regarding options to alleviate congestion on the South of Allston (SoA) flowgate*
- *Action 5B: Develop a comprehensive transmission study to explore options to upgrade the Bethel-Round Butte line (from 230 to 500 kV)*

Section 4.6 Transmission options for portfolio analysis describes modeled transmission expansion options through an approach that is consistent with the 2023 CEP/IRP and as informed by new third-party analysis described in **Section 4.5 Third-party assessment of PGE regional transmission options**. Continued study of transmission options will be critical to evaluating access to additional cost-effective clean energy resources ad capacity markets outside of the PNW.

7.2 Conclusion

The 2023 IRP Action Plan, as well as the 2023 and 2025 RFPs are designed to reflect PGE's values and commitment to serving customers with low-cost and clean technologies while mitigating future risks. The Action Plan was developed by estimating system resource needs using forecasts of long-term demand and projections of generation from existing and contracted assets. The difference between that estimated demand and existing supply forms the basis of forecasted system need. To fill that need, all available options and their potential costs and benefits in PGE's system were evaluated. The portfolio analysis was then tailored to answer the most critical questions PGE faces in long-term planning, comparing the relative performance of portfolios

with various combinations of supply-side options. A Preferred Portfolio was created with the best set of incremental resource additions that met system needs while minimizing cost and risk, while maximizing community benefits and considering emissions targets. Finally, an Action Plan was created to act on the key near-term drivers of the Preferred Portfolio. Concurrently with these actions, PGE will continue to work to specify sources of market purchases and accompanying emission rates, utilize funding opportunities to mitigate customer price pressure and implement transmission upgrades within PGE's Balancing Authority and connecting to BPA's system. These actions provide clarity on PGE’s priorities and become a tool for future conversation with customers, communities, stakeholders and the OPUC.

Appendices

Appendix A Federal grant funding

The Oregon Public Utility Commission directed PGE to include a report on federal incentive implementation relevant to resource procurement and transmission development.[161] This section outlines the federal grant programs PGE has engaged with, including awarded grants, denied grants, grants still in application phase and instances where PGE withdrew from the application process. As noted in **Section 2.5.2 Grant funding**, changes at the Federal Administration increase uncertainty to the delivery of funding from grants detailed below.

A.1Grants awarded

Grid Services Demonstration Project – USDOE (GID01)

- Project partners: PGE (Lead), Bonneville Power Administration (BPA), Pacific Northwest National Laboratories (PNNL), Portland State University (PSU), University of Texas, Austin (UTA), GE Vernova
- Description: The proposed project will use technologies at the Wheatridge Renewable Energy Facility to create a demonstration concept to show how different types of active and reactive power controls can transform a renewable resource from a simple intermittent energy source to a resource capable of providing a wide range of grid services, such as inertia, voltage and frequency support. Thermal resources currently provide these services and the need to replace such grid stabilizing services will increase with thermal retirement.
- Areas of focus: Grid resiliency, grid modernization
- Project budget: $9-12 million **($4.5 million grant**; $4.5+ million match)
- Grant Phase: Execution

Park and Charge: Leveraging Utility Pole-Mounted Chargers to Increase Access to Overnight EV Charging in Portland, Oregon (GID13)

- Project partners: Portland Bureau of Transportation (PBOT) (Lead), PGE, Pacific Power, Forth, PSU, National Renewable Energy Laboratory (NREL), Columbia-Willamette Clean Cities Coalition
- Description: This project leverages PBOT's jurisdiction over parking policies and permitting of the public right-of-way (ROW) as well as PGE and Pacific Power's existing utility poles to offer an innovative charging solution that is low-cost, scalable, equitable, and accessible. This project will site and deploy 50 Level 2 EV chargers (40 by PGE) on utility-owned poles in the public ROW in existing on-street parking spaces with a focus on underserved communities who lack access to at-home charging.

[161] ORDER NO. 24-096 Staff Recommendation 8 available here: https://apps.puc.state.or.us/orders/2024ords/24-097.pdf

- Areas of focus: EV Adoption
- Project budget (PGE): $**40,000** PGE grant share
- Grant Phase: Execution

Quality Green Jobs Regional Challenge – Jobs for the Future (1st, 2nd , and 3rd phases) (GID14)

- Project partners: Oregon Clean Energy Coalition members (PGE applied on behalf of the Oregon Clean Energy Coalition)
- Description: The Quality Green Jobs Regional Challenge is an initiative that will invest nearly $5 million in communities across the country to develop and implement regional quality green job strategies reaching 25,000 individuals. The OCEWC was one of six regions chosen to participate in all three phases of the challenge. The first phase focused on engagement with key partners including labor, CBOs, employers, governments, and employers. The second phase of the grant focused on building a Quality Green Jobs Agenda included strategies for training and placing Oregonians into jobs within the clean energy sector as well as a statewide market assessment. Phase three will develop and implement an outreach and education model that will work with partners across the state to train and place 5,000 Oregonians in the clean energy sector.
- Areas of focus: Workforce development
- Project budget (PGE): $**10,000 (first phase); $75,000 (second phase); $750,000 (third phase). Pure grant,** no cost share requirement.
- Grant Phase: Execution

Bethel-Round Butte Transmission Line Upgrade (PGE a sub-applicant) - USDOE GRIP (GID05)

- Project partners: Confederated Tribes of the Warm Springs (CTWS) Lead, PGE
- Description: This project, a partnership between the CTWS and PGE, will upgrade the existing 230 kV Bethel-Round Butte Transmission line to 500 kV. The project will accelerate the much-needed development of transmission capacity, enabling new carbon-free generation in Central and Eastern Oregon to reach customer demand loads in Western Oregon, including PGE service territory. Grant funds will directly off-set PGE capital investment costs. The added capacity and associated upgrades will also increase resiliency of the transmission system as well as resiliency of the CTWS Tribal communities by increasing resources available to the Tribes to support adaptation and response strategies. Engineering studies are underway which may impact final project design. Project discussed in **Section 4.6.1 Bethel-Round Butte upgrade**.
- Area of focus: Grid modernization, reliability, decarbonization

- Project budget: ~$860 million ($**250 million grant,** $363 million match over 8 years)
- Grant Phase: Execution

Accelerating and Deploying Grid Edge Computing – US DOE GRIP Grant (GID02): DE-GD0000901

- Project partners: PGE (Lead), Oregon State University, Saturday Academy
- Description: The U.S. DOE selected Portland General Electric (PGE) for a $50 million matching funds grant to deploy Grid Edge Computing (GEC) at approximately 90,000 locations by 2029, across approximately 10 percent of its customer base. GEC is a combination of advanced computing power and software applications deployed on devices at the grid edge, accelerating PGE's grid transformation. The project will use near real-time information from edge computing devices to improve visibility of the electrical system, provide operational insights and improve outage response, and ultimately help to anticipate and mitigate the impacts of extreme weather on grid resiliency. Anticipated benefits include:
    - Local decision-making: Grid adjustments, like demand response, can potentially be made autonomously at the edge
    - Better integration of DERs: Seek to manage and optimize DERs such as EVs and storage at the grid edge
    - Near-Real-time monitoring and control: Detect and respond to grid issues, such as dynamic DER capacity constraints or issues with power quality
    - Improved reliability and resilience: Edge systems ensure critical functions are maintained even during network disruptions or cyberattacks. Customers benefit from fewer outages and more consistent energy delivery.

  Through edge computing and advanced algorithms that collect and analyze grid-edge data, this project will demonstrate how GEC can help accelerate the transformation of PGE's distribution system and help it meet clean energy targets. Advancements from this project that will accelerate grid transformation will be demonstrated through five technical use cases: 1. Real-time grid visibility, 2. Dynamic (near-real-time) DER local capacity insights, 3. DER integration and optimization, 4. Validating DER performance, and 5. Enhanced Grid Resiliency.
- Area of focus: Grid reliability, grid resiliency, grid modernization
- Project budget: Approximately $115 million ($50 million grant; $65 million match)
- Grant Phase: Post award execution

Renewable Hydrogen Production and Generation – USDOE (GID04)

- Note: June 4, 2025, PGE is withdrawing from this grant given the exit of an essential project partner, challenging project economics for utility customers, and potential federal policy changes. PGE does not see a viable path forward for the Boardman Hydrogen Project at a manageable cost.

  Note: PGE is withdrawing from this grant effective June 4th given the exit of an essential project partner, challenging project economics for utility customers, and potential federal policy changes. As a result, PGE does not see a viable path forward for this project at a manageable cost.

- Description: The project will install electrolyzers at PGE's Boardman site in Morrow County to produce hydrogen from renewable electricity, along with on-site storage and hydrogen-only peaker turbines to supply PGE customers with dispatchable non-emitting electricity. The project will also install a pipeline to the Port of Morrow to supply industrial hydrogen uses. Toward the end of the decade the project may add a hydrogen-only pipeline further east to the Port of Umatilla and Pendleton to supply additional uses of clean hydrogen. Project discussed in **Section 5.6.2 Hydrogen and ammonia**.
- Area of focus: Production of hydrogen from renewable electricity; energy storage; use of renewable hydrogen for industrial uses and power generation
- Project budget: $600K Phase 1 to PGE.
- Grant Phase: Execution

Critical Sector Job Quality – USDOL (GID03)

- Project partners: Oregon Clean Energy Workforce Coalition (PGE applied on behalf of the coalition), Clackamas Workforce Partnership, East Cascades Works, Oregon Building Trades and Construction Council, Bricklayers Local 1, Ironworkers Local 29, Cement Masons Local 555, Oregon Department of Corrections, CTWS, Oregon Higher Education Coordinating Commission
- Description: The Coalition's demonstration projects will support building the much-needed clean energy workforce in two distinct areas of the state – Clackamas County and Central Oregon. The first demonstration project will provide a 12-week pre-apprenticeship construction program to adults in custody that are getting ready to transition out of the correctional system. The second demonstration project will provide career learning and career exposure opportunities to opportunity youth (those not connected to work or school).
- Area of focus: Workforce development
- Project budget: Approximately **$3 million** from US Department of Labor; no cost share requirement
- Grant Phase: Execution

Proactive Human-Machine Teaming Enabled Cybersecure Technologies – USDOE Cybersecurity, Energy Security, and Emergency Response (CESER) (GID25)

- Project Partners: Pacific Northwest National Laboratory (PNNL) (Lead), University of Central Florida (UCF), New Jersey Institute of Technology (NJIT), Siemens Technology, PGE, and Florida Power & Light
- Description: The project will develop, validate, and field demonstrate (via red-team testing) human-machine teaming enabled AI/ML tools and algorithms (acronym: 'PROTECT') for operators to perform real-time detection, precise localization, and appropriate mitigation for a wide range of cyber-attacks on DER operations data. The proposed solutions primarily target the cybersecurity enhancement in a DER Operations Center (e.g., DMS/ADMS, DERMS, and DER Aggregators).
- Area of focus: Cyber security
- Project budget: $3.5 million over 3 years; $**200K** PGE no cost share
- Grant Phase: Execution

Forecasting Load and Demand Response during Heat Waves through Large-Scale Sensing and Data Fusion – USDOE (GID35)

- Project Partners: Lawrence Berkeley National Laboratory (LBNL) (Prime), PGE, NREL, AutoGrid
- Description: This project aims at developing novel methods and applications – based on large-scale sensing and data fusion techniques – to estimate the system load during heat waves, provide better forecasts for DR resources, unlock building demand flexibility, and provide information to utilities and ISOs on the process of planning emergency rotating power outages.
- Area of focus: Grid Resilience, Grid Modernization
- Project budget: $1.6 million, PGE In-kind only and no cost share
- Grant Phase: Close Out

Western-based Analysis of Distributed Battery Storage System Emission Benefits and Tradeoffs – USDOE (BENEFIT) (GID34)

- Project Partners: Johns Hopkins University (Prime), PGE, NREL, Columbia University, Arizona Public Service, Rocky Mountain Power, Mandalay Homes, SolarEdge, Sonnen
- Description: This team will evaluate the dispatch and emissions impacts of over 3,000 BESSs associated with residential utility programs in operation across three western-based utilities: APS, RMP, and PGE. The project team will also rely on product manufacturing partners (i.e., Sonnen, Mandalay Homes, and SolarEdge) to gather complementary data on the dispatch,

lifecycle emissions, and related impacts of over 20,000 BESSs nationwide. This information can be used to validate the existing emission benefits/opportunities for BESS, while modeling pathways to co-optimize emission reductions with benefits to the homeowner and utility grids.

- Area of focus: Grid Resilience, Grid Modernization
- Project budget: $1.6 million, PGE In-kind only and no cost share
- Grant Phase: Execution

Sensor Placement, Monitoring, and Data Analytics Platform (Sensor-MAP) – USDOE SETO (GID42)

- Project Partners: NREL (Prime), PGE, Duquesne Light Company (DLC), Open Systems International (OSI), Virginia Tech, Oakridge National Labs (ORNL)
- Description: National Renewable Energy Laboratory (NREL), in collaboration with Portland General Electric (PGE), DLC, OSI, ORNL, and Virginia Tech, proposes to develop and demonstrate Sensor Placement, Monitoring, and Data Analytics Platform (Sensor-MAP), and develop an extensible open-source software suite to perform multistage probabilistic optimal sensor selection and placement that includes observability quantification at both the system and individual state levels; steady-state and dynamic state estimation applications for distribution grids (D-SSSE and D-DSSE) with high levels of distributed energy resources (DERs), including solar photovoltaics (PV); and dashboards for enhancing situational awareness.
- Area of focus: Grid Resilience, Grid Modernization
- Project budget: $3 million, PGE In-kind only and no cost share
- Grant Phase: Negotiation

North Plains Connector – USDOE GRIP (GID20)

- Project Partners: Montana Department of Commerce (Prime), North Plains Connector LLC, Allete Inc, Standing Rock, Northern Cheyenne, Crow Agency, NorthWestern Energy, Basin Electric Power Cooperative, Montana-Dakota Utilities, Minnkota Power Cooperative, PGE, Puget Sound, Avista Utilities, Otter Tail Power Company, Berkshire Hathaway
- Description: NPC is a transformative transmission project that will establish a new 3,000 MW connection between Montana and North Dakota and the eastern and western electrical grids. Project discussed in **Section 4.6.5 North Plains Connector**.
- Area of focus: Grid modernization
- Project budget: Approximately $3.7 billion ($700 million grant (10 percent apportioned for Colstrip Transmission System upgrade); $140 million grant benefit to PGE)

- Grant Phase: Negotiation

Hydropower Incentives – USDOE (GID07, GID37, GID38, GID40)

- Project partners: PGE (Lead), Confederated Tribes of the Warm Springs
- Description: Hydropower facility resiliency, dam safety, and environmental projects at multiple facilities that meet the requirements of the FOA for improvements. Projects proposed at Pelton-Rd Butte, Blue Heron and TG Sullivan plants, and Faraday. Each FERC licensed area is eligible for up to $5 million in grants (70 percent cost share required). Administrative costs incurred by existing PGE staff.
- Area of focus: Hydropower operations
- Project Budget: **$11.3 million** from US Department of Energy for 4 sites
- Project Phase: Negotiation

A.2 Full applications submitted

Oregon Dept of Energy (ODOE) IIJA Resilience Grants - USDOE and ODOE (GID55)

- Project partners: PGE (Lead)
- Description: State formula grants from USDOE to ODOE to enhance electrical grid resiliency and mitigate impacts of wildfires. PGE proposes to expand the microgrid at the Salem Smart Power Center to enhance reliability to several City and State facilities.
- Areas of focus: Grid modernization, Grid resiliency, wildfire mitigation
- Project Budget: Up to $5.54 million ($5.54 million match)

Geothermal with Confederated Tribes of Warm Springs (CTWS) – USDOE (GID63)

- Project Partners: CTWS (Lead), PGE
- Description: Geothermal Resources' Value in Implementing Decarbonization
- Area of focus: Grid Resiliency, Grid Modernization
- Project budget: Grant $1.5M, No cost share requirement

A.3 Application interviews

Distribution System Operator with Virtual Power Plants, Dynamic Operating Envelope, and Competitive Market-Choice (DSO+3) – USDOE STRIVES Topic 1 (GID59)

- Project partners: PNNL (Lead), PGE, Oregon State University (OSU), University of Nevada, Reno (UNR)
- Description: Demonstration of a distribution system operator (DSO) model using (1) virtual power plants (VPP) operating in different modes with different parameters by different entities, (2) a topology- and physics-based dynamic operating envelope (DOE) function managed by the DSO, and (3) competitive market choice (CMC) for consumers through VPP selection and VPP diversity.
- Area of focus: Grid Modernization
- Project Budget: $3 million max grant

A.4 Grants not awarded

Bethel-Round Butte Middle Mile Fiber Project – NTIA (GID33)

- Project partners: PGE (Lead), Peak Internet, Link Oregon
- Description: The project will install a new fiber optic communications cable on the Bethel-Round Butte 230kV transmission path. Peak internet is partnering with PGE to provide broadband services to underserved communities along the transmission path and other partners will benefit from increased communications capabilities for university networks. PGE and BPA will partner to swap fibers for the benefit of both organizations in protecting critical generation and transmission infrastructure.
- Areas of focus: Broadband communications, grid resiliency
- Project budget: $65 million ($30 million grant; $35 million match)

Cybersecurity for Distributed Energy Resources – USDOE (CESER) (GID29)

- Project partners: NREL (Lead), PGE, Iowa State University, Portland State University, OpenEGrid, Avangrid, Xcel Energy
- Description: Develop a cyberattack-resilient DER infrastructure and communications architecture to comprehensively address confidentiality, integrity, and availability requirements in DER communications.
- Area of focus: Grid modernization

Carbon Optimization Framework for Energy Emissions (COFFEE) Grant (Non-IIJA) - USDOE

- Project partners: PGE (Lead), NREL, PSU

- Description: The COFFEE project aims to create a usable and repeatable guide for how to operate and optimize Battery Energy Storage Systems (BESS) and Electric Vehicle (EV) programs for decarbonization.
- Area of focus: Decarbonization
- Project budget: ~$1.5 million ($1.2 million grant, $300,000 match)

Distribution Grid Modernization for Reliability and Wildfire Risk Reduction – USDOE GRIP (GID08)

- Project partners: PGE (Lead), EPRI, PNNL
- Description: The Distribution Grid Modernization project will accelerate the modernization of the distribution grid with the implementation of a variety of technologies like distribution automation and early fault detection along with hardening techniques such as undergrounding of high voltage lines and the installation of covered conductors where appropriate within PGE's High Fire Risk Zones.
- Areas of focus: Wildfire mitigation, grid reliability, grid modernization
- Project budget: Approximately $213 million ($100 million grant; $113 million match)

Enhanced Wildfire Awareness Technologies and Visualization Platforms to Support Public Safety and Community Awareness Initiatives (PGE a sub-applicant) - USDOE GRIP (GID031)

- Project partners: EPRI (Lead), PGE, other confidential partners
- Description: The proposed project will enhance and unify situational awareness capability for wildfire incidents by deploying transformational technology solutions including AI enhanced imaging technologies and multi-purpose micro weather stations that would be integrated into a geospatially referenced data visualization system.
- Area of focus: Wildfire mitigation, grid modernization
- Project budget: Approximately $5 million ($2.5 grant; $2.5 million match)

Operation and Planning Tools for Inverter-Based Resource Management and Availability for Future Power Systems (OPTIMA) – USDOE (GID11)

- Project partners: WSU (Lead), PGE, Utilidata, SW Power Pool, Texas A&M, San Diego State University, Grid Protection Alliance
- Description: In this project, we propose the use of synchronized measurements, both synchrophasors and synchronized point-on-wave measurements, for deriving intelligence on the operational impact of IBRs on power grids.
- Area of focus: Grid modernization, Grid resiliency

Mt. Hood Corridor Resiliency Project (2022-2025) – FEMA (BRIC Grant) (GID16)

- Project partners: Clackamas County (Lead), City of Portland, PGE
- Description: The Mt. Hood Corridor Resiliency Project is a multi-phased critical infrastructure project supporting the resiliency of community lifelines in the northern region of the state. Stage 1 would underground the transmission and distribution lines that power the Bull Run Watershed, which is the primary drinking water supply for nearly one million people in the cities of Gresham, Portland, Fairview, Sandy, and Tualatin. This is the third attempt at this grant.
- Areas of focus: Wildfire mitigation, grid resiliency, grid modernization
- Project budget: Approximately $88 million ($50 million grant; $38 million match)

Undergrounding Powerlines to Reduce Wildfire Risk in National Forests 2024 – IFNF (GID46)

- Project Partners: PGE (Prime), USFS
- Description: Portland General Electric proposes partnering with the U.S. Forest Service to underground powerlines to reduce potential fire starts in a high wildfire risk zone of the Mt. Hood National Forest.
- Area of focus: Wildfire Mitigation
- Project budget: $500,000 (No Match)

Powering Climate and Infrastructure Careers Challenge - Families and Workers Fund – Private (GID28)

- Project Partners: Confederated Tribes of the Warm Springs (lead), PGE, Oregon Clean Energy Workforce Coalition
- Description: The project will support training the workforce needed to enable the state's clean energy transition with a particular focus on providing opportunities for tribal members in pursuit of the tribe's renewable energy development goals on the reservation.
- Area of focus: Workforce development
- Project budget: $1.5 million

Western Bounty Transmission - USDOE GRIP (GID19)

- Project Partners: Nevada Governor's Office of Energy (Prime), ENGIE North America, PGE, Los Angeles Department of Water and Power

- Description: A transformational project that will substantially increase transmission capacity throughout the Western Interconnection on an inter-regional basis while unlocking and enabling between 15-29GW (or more) of otherwise inaccessible high-quality remote renewable resources. Western Bounty is a multi-terminal and bi-directional voltage source converter (VSC) high voltage direct current (HVDC) system in a "hub and spoke" arrangement.
- Area of focus: Grid modernization
- Project budget: Approximately $12 billion ($1 billion grant, $11 billion match) PGE support only, no matching funds

Scale Smart Managed Charging and Enhance Grid Resilience through Enriched Grid Edge DERMS (DSO+3) – USDOE Connected Communities Topic 1A

- Project partners: PGE (Lead), OSU
- Description: Enrich PGE's Grid Edge Distributed Energy Resource Management System (DERMS) integrations to scale Smart Charge Management to more EVs in PGE's territory and to inform investigation of scalable, utility-side load optimization strategies and grid resiliency support.
- Area of focus: Grid Modernization
- Project Budget: ~$3 million

An Energy Resilience Planning Tool for PGE – USDOE CESER

- Project Partners: PGE (Prime), PNNL
- Description: PGE and PNNL have assembled an integrated team driven by common goals, led by experts in the key research areas, and supported by PNNL's institutional capabilities related to data hosting, live data feeds, high-performance computing, cybersecurity, all aspects of grid operations, T&D modeling, and energy assurance planning. PGE's EGRASS platform will leapfrog current solutions by integrating varied multi-hazard impacts into a high-resolution T&D system. The statistical analyses and microclimate forecasts will lead to more accurate outage forecast in advance of actual outages, minimizing customer impacts.
- Area of focus: Grid Resilience
- Project budget: Approximately $3.5 million ($1.2 million grant, $1.3 million match)

Wildfire and All Hazards Modeling and Mitigation Consortium – USDOE GRIP (GID09)

- Project partners: Avista Utilities (Prime), PGE, Chelan County Public Utility District, City of Drain, City of Monmouth, Consumers Power, Forest Grove Light & Power, Blachly-Lane Electric Cooperative, Clark Public Utilities, Northern Lights, Inc., Douglas Electric

Cooperative, Puget Sound Energy, Inland Power & Light Company, Kootenai Electric Cooperative, Northwestern Energy, Lawrence Berkeley National Lab, Pacific Northwest National Lab

- Description: Avista Utilities is partnering with utility experts from across the Pacific Northwest, National Laboratories, universities, and private innovators to combat increased wildfire and all hazard threats to the electrical distribution system. The consortium will develop a granular wildfire risk model and methodology, and high-definition weather model, enhancing all consortium members' ability to assess wildfire risk and inform all hazards mitigation decisions. The weather model will enable consortium utilities to better assess impacts and minimize operating risks to the electrical system from extreme weather events, including fire weather, in both real-time and for the planning horizon.
- Areas of focus: Wildfire mitigation, grid resiliency, grid modernization
- Project budget: Approximately $507 million ($250 million grant; $257 million match)

Mobile Batteries for Adaptive Resilience – USDOE GRIP (GID17)

- Project Partners: Avista Utilities (Prime), PGE
- Description: DOE funding would allow the project partners to develop and deploy an innovative battery solution to provide a more adaptive and resilient grid. Each microgrid will include one or more interfaces for fast connection of mobile energy storage systems, plus allow for expansion to include solar, EV charging, and additional storage.
- Area of focus: Grid resilience
- Project budget: Approximately $40 million ($20 million grant; $20 million match)

West Coast Real-Time Inertia Measurement Project – USDOE GRIP (GID21)

- Project Partners: RT Technologies USA INC. (Prime), CAISO/RC West, Southern California Edison, PacifiCorp, PGE, and EPRI
- Description: RT has developed an innovative, first of a kind technology which provides operators with access to unique highly accurate, continuous and direct, real-time inertia measurement and analytics data for the grid. GridMetrix® uses this patented, world-first, breakthrough method to maximize the safe and reliable integration of renewable energy. Grid operators can now make informed decisions about inertia level and renewable grid frequency stability. With a stable grid and rapidly scaling up renewables and scaling down fossil fuels, a net zero carbon grid can be achieved safely, reliably, and faster.
- Area of focus: Grid modernization
- Project budget: Approximately $30 million ($15 million grant, $15 million match)

Grid Copilot for an Electrified, Decarbonized & Empowering Grid – USDOE (GID61)

- Project Partners: GE Vernova (Prime), Florida Power & Light, Duke Energy, Commonwealth Edison, Portland General Electric, Avista Utilities, Alfred University, University of Central Florida, University of California Riverside, Amazon Web Services
- Description: Grid Copilot is powered by a physics-informed artificial intelligence (AI)-based digital twin of the grid, overcoming limitations with traditional engineering techniques, in providing real-time and predictive monitoring and situational awareness analytics, robust recommendations and automated solutions for digital grid control, big data validation and cleaning, online simulation coach to train utility workforce, and an agent to engage developers and communities suggesting a diverse mix of energy resources for accelerated interconnection.
- Area of focus: Grid Resilience/Modernization
- Project budget: Approximately $200 million ($100 million grant, $100 million match)

Weavegrid – USDOE GRIP (GID62)

- Project Partners: Weavegrid (Prime), PGE, Avista, PSE, PG&E, SCE, BGE, Xcel, Alabama Pwr, Georgia Pwr, TEP, PEPCO, Orange & Rockland, Eversource, Luma
- Description: Managed EV charging to enhance grid resilience.
- Area of focus: Grid Resiliency, Grid Modernization

Vegetation-based ignition risk characterization and comprehensive near-term wildfire risk mitigation – USDOE CESER

- Project Partners: GE Vernova (Prime), WSU, PGE
- Description: GEVAR team is proposing to create a comprehensive framework and tools to mitigate wildfire risk with optimized vegetation management and Public Safety Power Shutdown (PSPS) events as well as minimize the impact of PSPS on the communities.
- Area of focus: Grid Resilience
- Project budget: Advisory Committee Only

Hydropower Incentives – USDOE (GID39, GID41)

- Project partners: PGE (Lead), Confederated Tribes of the Warm Springs
- Description: Hydropower facility resiliency, dam safety, and environmental projects at multiple facilities that meet the requirements of the FOA for improvements. Projects proposed at Pelton-Rd Butte, Blue Heron and TG Sullivan plants, and Faraday. Each FERC licensed area is eligible for up to $5 million in grants (70 percent cost share required).

- Area of focus: Hydropower operations
- Project Budget: $11.3 million across multiple sites

A.5 Pending grant opportunities awaiting federal guidance

Distribution Grid Technology and Modernization Partnership – USDOE GRIP (GID06)

- Project partners: PGE (Prime), Umatilla Electric Coop, Eugene Water & Electric Board, Clark Public Utilities, Pacific Northwest National Labs
- Description: This project concept aims to remove barriers to participation by leveraging the ADMS and DERMS system already in service at PGE's state of the art Integrated Operations Center (IOC). A new, replicated system will be stood up for consortium utilities to manage and operate their distribution networks, in a secure geofenced segment of the system.
- Areas of focus: Grid modernization, DER integration
- Project budget: Approximately $100 million ($50 million grant; $50 million match)

Data Center Flexibility as a Grid Enhancing Technology - USDOE GRIP (GID18)

- Project Partners: Virginia Department of Energy (Prime), Maryland Clean Energy Center, Oregon Department of Energy, North Carolina Department of Environmental Quality, Amazon, Rappahannock Electric Cooperative, PGE, Georgia Power, PacifiCorp, North Carolina Electric Cooperatives, (Exelon), Intel, LevelTen Energy, Grid Forward
- Description: Utilities will invest in a range of grid-enhancing technologies to expand transmission capacity and support the more flexible interconnection of large data center loads. DC operators will leverage on-site generation, storage and load control capabilities to support regional grid operations. The utilities, operators and state energy officials will collaborate on potential new tariff designs, utility programs and cost-benefit assessments to replicate the concepts and capabilities demonstrated.
- Area of focus: Grid modernization
- Project budget: Approximately $700,000,000 ($250 million grant; $450 million match)

Agentic AI for Automated Interconnections – ConnectWerx, USDOE (GID67)

- Project Partners: ThinkLabs AI (Lead), PGE, ISO New England, NYISO, National Grid, TVA, UC Riverside
- Description: This project is expected to provide guidance on existing interconnection process and bottlenecks, data needed for building the AI models, evaluate results of AI-assisted analysis and compare against existing approach, and potential deployment in appropriate Cloud environment for end-to-end testing.

- Area of focus: Grid Modernization
- Project budget: Grant $12M+, No cost share requirement

Connected Communities – TechWerx (USDOE) (GID68)

- Project Partners: Resource Innovations (Lead), PGE
- Description: Resource Innovations will develop a platform to take in AMI and program participation data and produce per-participant, hourly grid impacts for demand response and flexible load measures that account for load diversity.
- solutions to support decarbonization and grid modernization efforts.
- Area of focus: Grid Modernization
- Project budget: Grant $1M, No cost share requirement

Appendix B Sequoia methodological update

PGE made one methodological update in Sequoia as part of the 2023 CEP/IRP Update. The result of this methodological change allows Sequoia to model the most recent 30 years of historical load and generation data, shifting the analysis period from 1992-2021 to 1994-2023. This shift in analysis period allows Sequoia to model more recent weather effects on load and variable energy resources.

Updating the analysis period in Sequoia required redefining the day-type characterization, or load bins, of historical days.[162] Consistent with past versions of Sequoia, load-bins are five equally sized percentile ranges (i.e. 0th-20th, …, 80th-100th) of weather-dependent load used to match demand with variable energy resources (VERs). Load-bins allow Sequoia to simulate various plausible load and VER generation scenarios under the assumption that temperature, load and generation from VERs are correlated. The effects from the updated analysis period are reported in two steps: 1) changes to the method used to estimate the 1992-2021 weather-dependent load from which load-bins are calculated; and 2) redefinition of load-bins using 1994-2023 weather-dependent load as estimated from the updated methodology.

For PGE's resource adequacy modeling purposes, weather-dependent load for years 1980-2019 was estimated at hourly intervals one time using a neural network model produced by external consultant, E3. IRP analysts incrementally added hourly load shapes for years beyond 2019, backward adjusting the incremental load to remove the influence of population growth, economic changes, and other influences on load that are not weather-dependent. The manual approach used to detrend load motivated the development of a more rigorous and reproducible methodology.

For the Update PGE developed a regression model to estimate weather-dependent load using fixed effects and daily weather measurements as specified in **Equation 1**.[163] Where $\widehat{MW_t}$ is the estimated load in MW for hour t, given the daily temperature in degrees Celsius for midpoint, heating degrees, cooling degrees, maximum and minimum. X_{it} represents various fixed effects as indicator variables for: year, month, hour, day of week, holiday, and weekend.

Equation 1. Weather-dependent load using fixed effects and daily weather measurements

$$\widehat{MW_t} = \beta_0 + \beta_1 MidpointTemp_d + \beta_2 HeatingDegrees_d + \beta_3 CoolingDegrees_d + \beta_4 MaxTemp_d + \beta_5 MinTemp_d + \beta_i X_{it}$$

[162] For more information on day-type characterization see 2019 IRP Appendix K.1.1.

[163] The IRP elected to use a random-forest algorithm due to improved out-of-sample accuracy compared to ordinary least-squares (OLS) regression. Random-forest estimation explained 98 percent of load variability with a mean absolute error (MAE) of 57 MW, while OLS estimation explained 93 percent of variability with MAE of 124 MW. **Equation 1** is specified as an OLS regression for interpretation purposes only, covariate weights for random-forest algorithms are not calculated as coefficients as in ordinary least squares.

The model was trained on a sample of 361,849 observations and tested on an out-of-sample set of 178,225 observations. Accuracy metrics on the out-of-sample set showed 98 percent of the variability in load was captured, with an average absolute error of 57 MW. After training the model, weather-dependent load was estimated by simulating historical hourly demand from 1960-2023 in MW from year 2023. Estimated capacity need for the 2028 reference case using the updated weather-dependent load profile is 11 MW and 13 MW greater for winter and summer, respectively. Finally, shifting the analysis period forward 2 years (1994-2023) and re-calculating load-bins using the updated weather-dependent load shape results in an additional 3 MW of winter and 33 MW of summer capacity need for the 2028 reference case.

Appendix C QF capacity update

As part of this Update, Qualified Facility (QF) capacity estimates were updated in Sequoia to align with contracted and online resources. Sequoia uses monthly estimates of QF MW capacity as proxied by six distinct resources: Biogas, Geothermal, Hydro, PV East, PV West, and Wind. Individual QF resources are grouped into the above categories to simplify modeling assumptions. Two assumptions are included in the estimation of QF capacity based on Order 24-96. The first is that for those QF projects that are contracted but not yet operating, it is assumed that 75 percent of the MW will reach operation. Second, a 75 percent renewal rate of QF capacity is assumed after contract termination. Estimated MW for the 2028 Reference Case are listed in **Table 38**, in addition to a comparison to pre-update modeling assumptions.

Table 38. Modeled QF Resources

Modeled QF Resource	2023 IRP (MW)	2023 IRP Update (MW)	Change (MW)
PV West	139.65	134.66	-4.99
PV East	263.25	234.25	-29
Biogas	5.2	8.92	3.72
Geothermal	0	0	0
Hydro	4.04	7.19	3.15
Wind	29.15	29.15	0

There is a net 27.12 MW reduction in QF capacity for the 2028 Reference Case. The 35 MW decrease in modeled resources is due to a 29 MW and 4.99 MW reduction in capacity for PV East and PV West, respectively. An increase of 3.72 MW and 3.15 MW of Hydro and Biogas resources, respectively, account for the remaining differences in estimated QF capacity.

Appendix D Hourly emissions methodology

This section outlines the steps that PGE has taken to update its GHG emissions forecasting to incorporate hourly analysis of its energy and emissions accounting.

These steps make assumptions about thermal generation and market purchases specified in the IGHG model to produce an hourly system position and resulting emissions impacts using the following:

- An alternative approach to production cost modeling that balances the hourly system position in Aurora to produce an hourly allocation of IGHG-constrained thermal generation, hydro and storage dispatch optimized around serving PGE retail load and provide the final validation of the Preferred Portfolio by generating a resource dispatch output that results in a system position consistent with HB 2021 compliance.
- An allocation of IGHG-allocated market purchases across hours of remaining need.
- An hourly accounting of the availability and price premium associated with a WECC-wide clean energy surplus estimate. These estimates were estimated by The Brattle Group and are used to reflect the contribution that the non-emitting market can provide in supporting PGE's hourly energy position.

D.1Challenges with existing IRP emissions reporting

In the 2023 CEP/IRP, the PZM was used to simulate PGE existing dispatchable generation resources, contracts and new resources using economic dispatch based upon electricity prices[164]. The electricity prices contained risk variable inputs that vary across each of the 39 forecasts of electricity prices. When a resource is economically dispatched, market price exceeds the variable cost of operation.

The PZM simulation forecasts total resources generation but does not distinguish between generation associated with retail load and wholesale sales. This gap was addressed using the IGHG model. This step used the GHG emissions reduction glidepath and historical estimates of wholesale market transactions to estimate the amount of energy dedicated to wholesale sales and the amount of energy dedicated to PGE retail load service for each GHG-emitting source. The estimated amount of emitting energy used for PGE retail load service is incorporated into the capacity expansion model (ROSE-E).

By economically dispatching PGE resources to the price forecasts simulated by the WECC model, PGE is assuming the presence of a regional market in which PGE is a pure price taker. Relative to the size of the entire Western Interconnect, PGE comprises less than 3 percent of the total load as measured by peak loads. No quantity of PGE market purchases or market sales will change the WECC price forecasts. Adapting this methodology to demonstrate that PGE is compliant with HB 2021 emissions requirements is difficult given that partitioning emitting

[164] Outlined in Appendix H.1.2 of PGE's 2023 CEP/IRP.

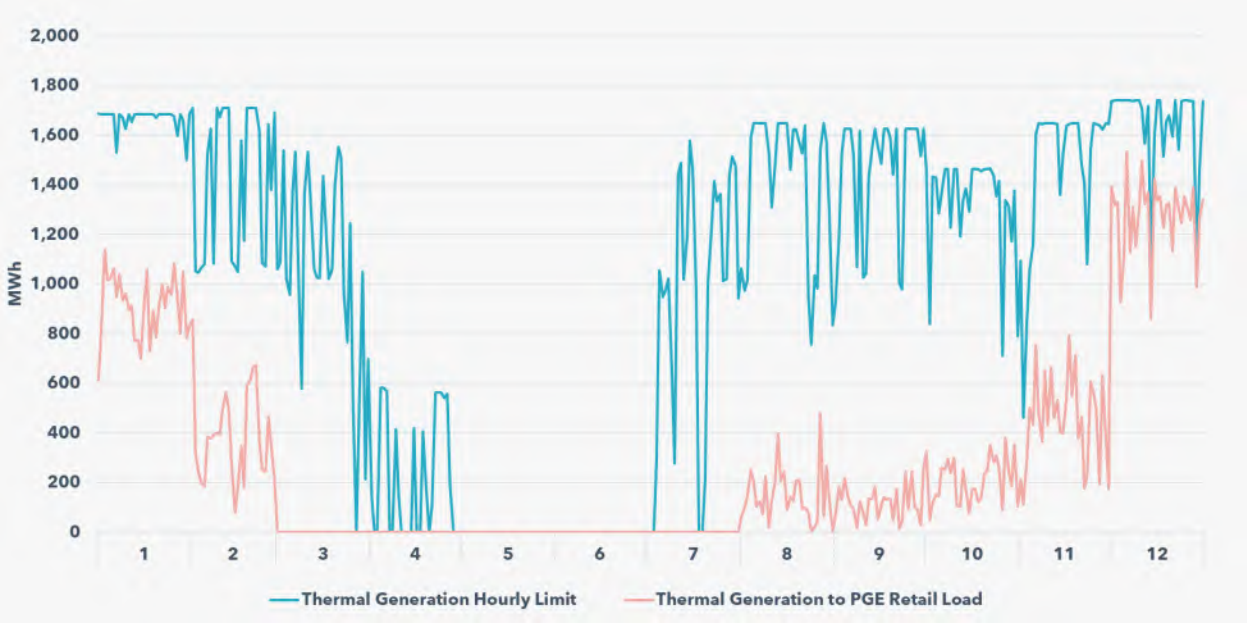
energy to wholesale sales from retail load service is a complex modeling challenge. This is the original reason for using the intermediate IGHG Model as a bridge between production cost and capacity expansion models.

PGE can allocate thermal generation to serve retail load (up to the emissions target for HB2021 compliance) or sell it to the wholesale market. In prior analysis, PGE experimented with post-model adjustments to thermal dispatch that removed thermal dispatch directed to serve wholesale sales by prioritizing thermal generation for when retail load hours are shortest (deficit-sorting) and during hours when prices are highest (price-sorting).[165] Neither method allowed the model to co-optimize thermal generation with other dispatchable resources such as storage or hydro. The result presented an improvement in the hourly representation of PGE system, but the methodology leaned on out-of-model adjustments.

At this point there is no simple way to develop market logic in Aurora that would allow thermal units to choose between unconstrained wholesale sales and constrained retail load service within the PZM in time for the 2023 CEP-IRP update. The current methodology in the PZM uses WECC input price forecasts to dispatch resources. The methodology in which resources are dispatched to forecasted market prices is limited in its ability to represent the disaggregation of thermal generation into an unconstrained wholesale market and retail load service with an annual emissions cap.

The remainder of this appendix shows the methodology used to adapt PGE's production cost model to better represent PGE's hourly energy and emissions position in 2030. Section D.2 provides the change in model dispatch logic that addresses the challenges described in the previous section while discussing how thermal generation is allocated to retail load subject to the HB 2021 emissions constraint. Section D.3 discusses modifications to the dispatch of storage generation that result from the change in modeling logic. Section D.4 shows how non-emitting market availability is incorporated in the new hourly energy and emissions modeling.

D.2 Modifications to model dispatch logic and thermal dispatch



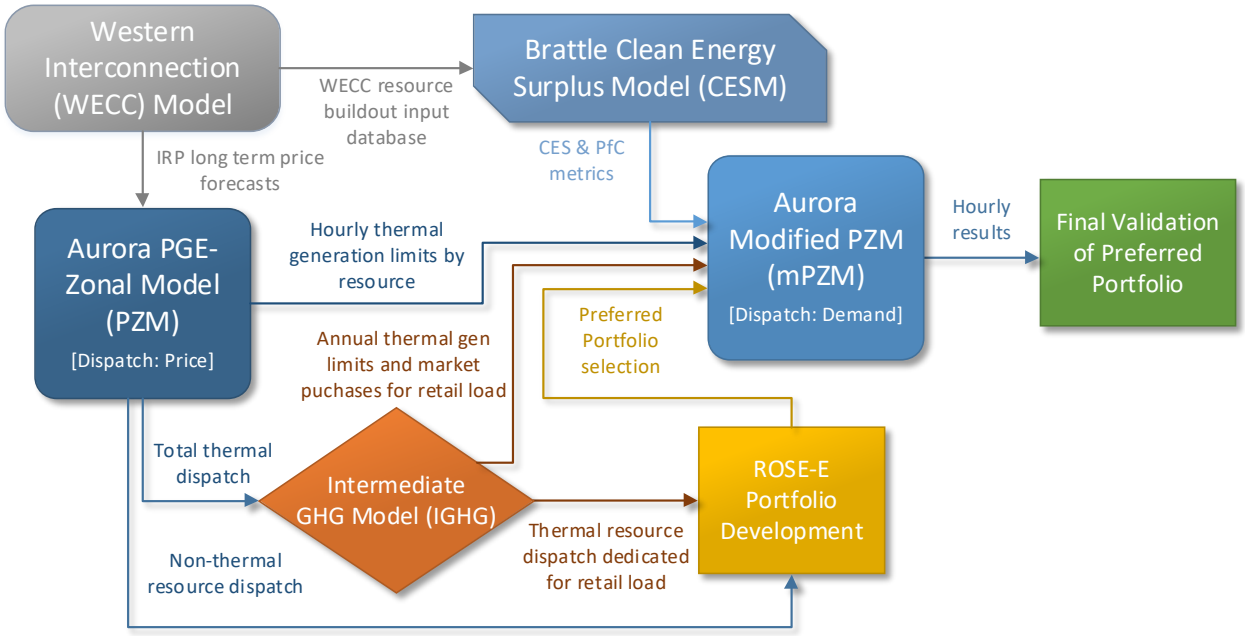
To solve the problem identified in **Section D.1**, PGE has modified the PZM to dispatch PGE resources at minimum cost subject to the constraint that retail load obligations are met with the HB 2021 annual emissions cap in place. This model is called the Modified PZM. The effect of changing the dispatch logic from dispatching resources to price to dispatching resources to meet retail load allows PGE to model how PGE's Preferred Portfolio can meet its hourly retail load requirements and comply with the annual GHG emissions limit. The model can choose the timing of the thermal dispatch from the total economic dispatch (both retail load service and wholesale sales) that is previously determined in the PZM. The Modified PZM will dispatch the portion of that thermal generation allocated to serve retail load service from the IGHG model. This is represented in the Modified PZM by an hourly cap on emissions (by thermal resource) determined by the total economic dispatch level set by the PZM. This allows the Aurora

[165] Portland General Electric Company. (2023, November 21). LC 80 – Portland General Electric Company's 2023 Clean Energy Plan and Integrated Resource Plan: Reply to Staff Round 2 Comments and Recommendations.

optimization to select the hourly profile of the total annual thermal energy dedicated to serve retail load as calculated in the IGHG Model.

Hourly thermal limits are also placed on thermal generation to prevent using thermals during hours deemed uneconomic in the PZM (where resources are dispatched against WECC-wide market prices). This is depicted as the blue line in **Figure 92**. The red line provides the timing of thermal output used to serve PGE retail load in the mPZM.

Figure 92. Thermal Generation Hourly Limits & Thermal Generation to PGE Retail Load by Month



The results of the Modified PZM system dispatch are sent to the excel-based Hourly Energy and Emissions Accounting Workbook (Hourly Workbook). The Hourly Workbook is designed to apply the IGHG-allocated unspecified market purchases using the price-sorting methodology. Any remaining short energy position is applied the unspecified emission rate of 0.428 mmtCO2e in accordance with the Oregon DEQ reporting methodology in OAR Chapter 340, Division 215. From this, the emissions impact is calculated and the determination of compliance with HB 2021 is made based upon the modeled selected portfolio.

In addition, the Modified PZM incorporates hourly information about the availability of clean energy from the market and the corresponding price premium attached to this clean energy. **Section D.4 Incorporating non-emitting market generation** discusses how the market for non-emitting energy is incorporated into the Modified PZM.

Figure 93 below outlines the flow of data and connectivity between the models as it pertains to hourly energy accounting.

Figure 93. IRP modeling diagram Hourly Energy Accounting

The purpose of the Modified PZM Aurora model and hourly workbook is to (1) provide ROSE-E with information on the remaining short positions after applying the IGHG-allocated thermal generation and market purchases such that ROSE-E can weight its portfolio selection as outlined in Portfolio Analysis and (2) determine whether the portfolio of resources selected by ROSE-E provides sufficient resources to meet hourly retail load requirements and GHG-compliance needs. The Modified PZM model is focused on calculating the 2030 energy position to meet hourly retail load obligation and emissions compliance constraints and does not calculate energy values for purposes of minimizing net cost in portfolio optimization. That function remains the purpose of the PZM.

D.3 Change in storage dispatch logic

In the PZM, storage dispatch only considers the value of price arbitrage, or the ability to reshape energy across the day by charging when prices are low and discharging when prices are high. If the dispatch of thermal resources is not constrained by emissions, then this dispatch outcome is the lowest cost solution subject to the parameters chosen.

However, given the constraints imposed by HB 2021, the dispatch of storage resources should include the opportunity cost of emissions. Within any given emissions budget, an additional ton emitted from one generation resource requires a reduction of one ton from somewhere else. The opportunity cost of an additional emission is the cost of this offsetting reduction in generation. Since the cost of the offsetting reduction in generation is not included in the storage dispatch logic, the PZM results will be sub-optimal under the following outcomes:

- Storage discharged to provide energy in excess of retail load due to high prices. This energy could have been saved for another hour in which PGE is short and the market price is lower (displacing emitting resources or market purchases in future hours). The

price difference between the high-priced hour and the low-priced hour must be less than the opportunity cost of emissions.

- Storage is charged to consume energy in deficit of retail load due to low prices. This energy could have been consumed during another hour in which PGE is long and market price is higher (displacing emitting resources or market purchases in current hour). The price difference between the high-priced hour and the low-priced hour must be less than the opportunity cost of emissions.

This problem is solved by changing the model dispatch logic such that storage resources are dispatched economically to internally generated hourly prices that are solved by using model supply and demand conditions instead of by using externally-provided forecasted input prices as is used in the PZM. This change in logic prioritizes storage dispatch to move energy across the day from hours in which PGE has excess energy to hours in which PGE has excess demand instead of prioritizing storage dispatch logic to arbitrage market prices. This is useful in maximizing the displacement of emitting thermal generation using storage to meet system needs and provides a better representation at how well the Preferred Portfolio can meet PGE system needs when PGE's system is emissions constrained.

D.4 Incorporating non-emitting market generation

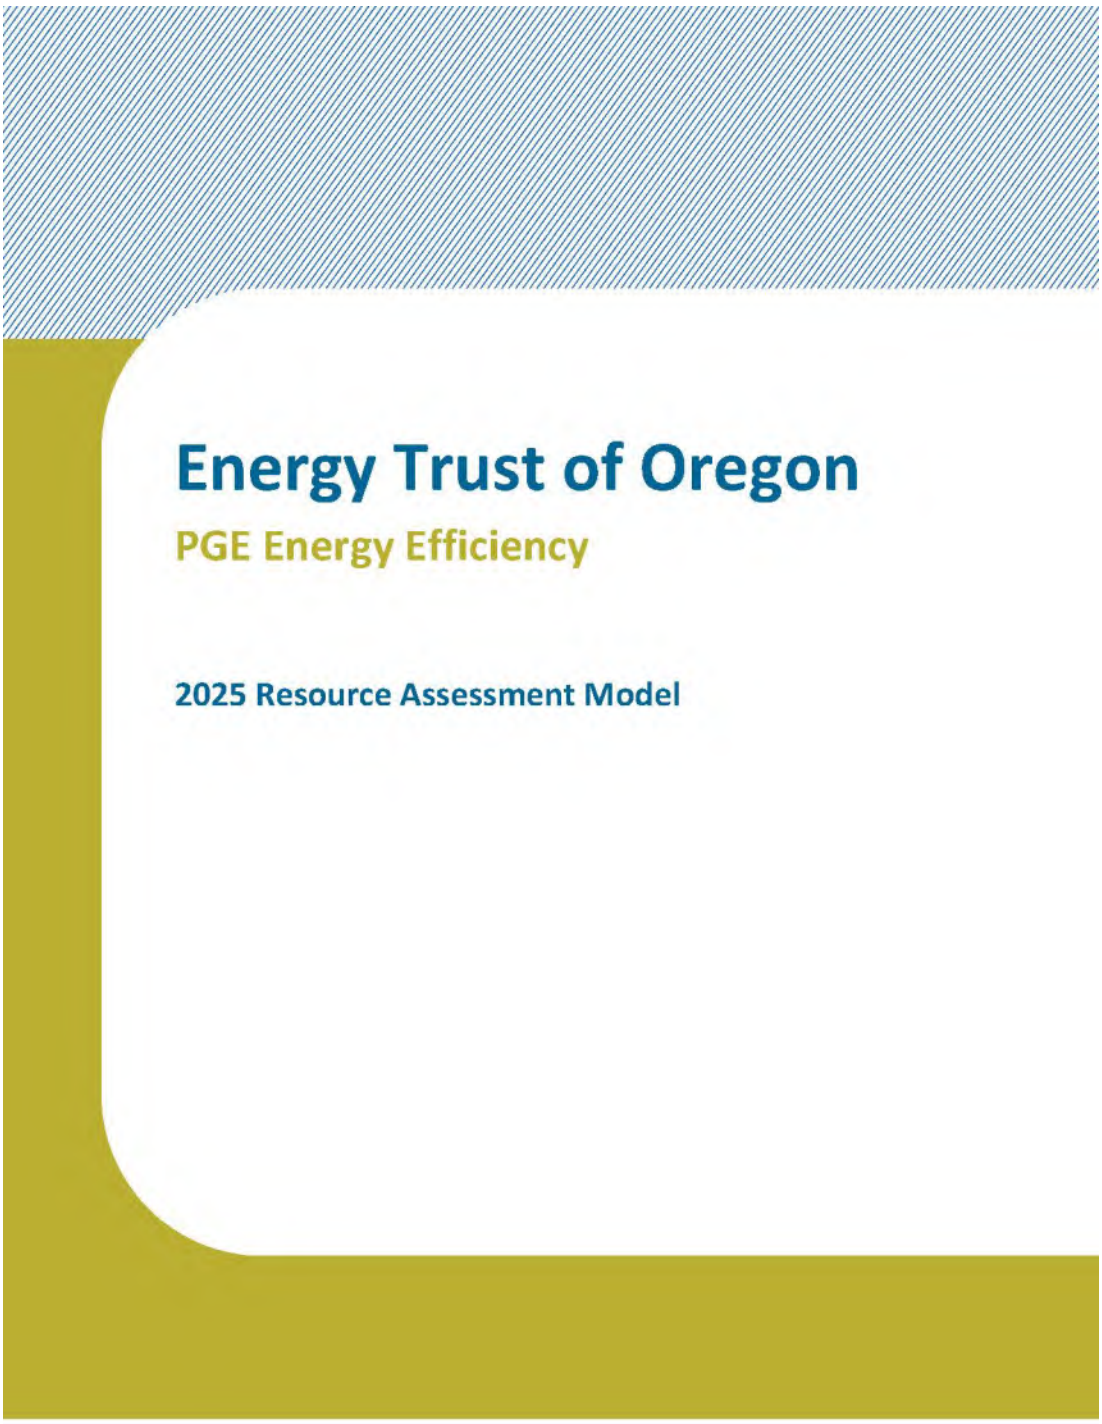
The yearly IGHG model in the 2023 PFC/IRP utilized an assumption that PGE was able to rely upon market purchases above the allocated market purchases in the IGHG model at times in which it was short. With this assumption, the average hourly position was 9 MWa long in 2030.[166] This conclusion relied on the assumption that PGE will be able to sell emitting generation at no price discount for market sales above those allocated by the IGHG model. Inversely, this conclusion also relied on the assumption that PGE will be able to access non-emitting generation at no price premium for market purchases above those allocated by the IGHG model.

- If this assumption was true, then this analysis indicated that meeting emissions targets with the Preferred Portfolio's set of incremental resource additions is possible under expected conditions.
- If this assumption was false, then both PGE and Staff's draft analyses were in alignment. Both pointed to a need for an increased quantity of non-emitting generation to be acquired between now and 2030 to ensure compliance with HB 2021 under expected average conditions.

PGE recognized that if there is no market to buy non-emitting energy in the hours that PGE is short, forecasted need required allocating additional emissions to those market purchases to balance. In the analysis provided in LC 80: PGE's Reply to Round 2 Comments, PGE

[166] Portland General Electric Company. (2023, September 6). *LC 80 – 2023 Clean Energy Plan and Integrated Resource Plan: Reply to Round 1 comments* (p. 53). Oregon Public Utility Commission. [https://edocs.puc.state.or.us/efdocs/HAC/lc80hac131341.pdf]

demonstrated that under the condition of no market for non-emitting generation, additional resource procurement would be needed to comply with annual cap on GHG emissions.



In response to these concerns, PGE contracted The Brattle Group to develop a high-level framework for estimating WECC-wide and regional analysis of the market for non-emitting energy to serve as an input into the hourly energy and emissions accounting modeling. The Brattle Group performed an analysis of the regional WECC market and provided PGE with forecasts of the availability and price premium of non-emitting or clean energy available to PGE in 2030. The Clean Energy Surplus (CES) is the clean energy available beyond that which is needed to meet annual state-level clean energy targets and the Premium for Clean (PFC) is the additional cost beyond the energy price associated with the purchase of surplus clean energy.

Brattle used PGE's IRP Aurora results from the Regional WECC model that is used to generate PGE's IRP Price Forecasts and other input parameters capturing regional data on state clean energy requirements to calculate the CES. After allocating the annual CES across hours of the year, Brattle applied deliverability constraints to determine how much CES is available to PGE in Oregon West for each hour of 2030. In addition, Brattle used the CES to calculate the PFC by hour in the analysis. For a detailed description of the Brattle Analysis, read **Appendix F Market for non-emitting energy**.

The Modified PZM incorporates the CES and PFC by including the CES as a market resource available up to the hourly deliverable energy to Oregon West Zone. This market energy is priced at the sum of the forecasted Oregon West hourly price plus the hourly PFC. The Modified PZM optimizes dispatchable generation and available non-emitting market purchases to leverage PGE's generation, contracts, and the regional diversity in clean energy to meet its HB 2021 compliance goals.

When the results of the Modified PZM analysis contains a summation of short hours less than the quantity of unspecified market purchases, the hourly workbook reallocates non-emitting market purchases to replace non-emitting market purchases to that extent that the full IGHG allocation is exhausted. This is accomplished by replacing the hours with the largest Premium for Clean first as ranked from highest to lowest. Given a budget of unspecified market purchases, total cost will be minimized by purchasing unspecified energy instead of clean energy from the market when the Premium for Clean is highest. This method is also indicative of the likelihood of finding energy in the clean energy market—it will be more difficult to procure clean energy when the Premium for Clean is non-zero.

Appendix E Energy Trust of Oregon (ETO)

Energy Trust of Oregon Background

Energy Trust of Oregon, Inc. (Energy Trust) is an independent nonprofit organization dedicated to helping utility customers in Oregon and Southwest Washington benefit from energy efficiency and renewable power. Energy Trust operates under a grant agreement with the Oregon Public Utility Commission (OPUC).

As a result of state legislation, tariffs and other requirements, Energy Trust is funded by customers of Portland General Electric, Pacific Power, NW Natural, Cascade Natural Gas and Avista. Energy Trust's model of delivering energy efficiency programs unilaterally across the service territories of the five gas and electric utilities they serve has experienced a great deal of success. Since the inception of the organization in 2002, Energy Trust has achieved total annual savings of 1,025 aMW of electricity. Additionally, Energy Trust has saved 103 million therms since gas efficiency programs began in 2003. Combined, this equates to more than 40 million metric tons of CO2 emissions avoided, and Energy Trust has played a significant factor with relatively flat energy loads observed by both gas and electric utilities from 2014 to 2023, as shown in OPUC utility statistic books.[1]

Energy Trust, with support from PGE, serves residential, commercial and industrial customers in Oregon. In 2024, Energy Trust's service to PGE customers through energy efficiency programs achieved 37.8 aMW of electric savings achieving 132% of goal. Energy Trust achieved electric savings at a utility levelized cost of 0.035$/kWh, meeting OPUC performance measures to achieve electric savings at a levelized cost below 0.046 $/kWh.

PGE actively promotes Energy Trust offerings to its customers and supports their participation in Energy Trust efficiency programs. Also, when shared technologies and programs are mutually beneficial, PGE coordinates its demand response program activities with Energy Trust's energy efficiency programs. For example, smart thermostats are used by PGE for demand response, but also provide energy efficiency savings, which the Energy Trust counts towards its energy saving goals.

In addition to administering energy efficiency programs with support from PGE, Energy Trust also provides a 20-year demand-side management (DSM) resource forecast to identify cost-effective energy efficiency savings potential. This forecast examines how much of that potential is estimated to be achieved by Energy Trust over the 20-year period. The results are used by PGE and other utilities in Integrated Resource Plans (IRP) to inform the energy efficiency resource potential Energy Trust expects to acquire in their territory, helping to offset the need for new generating resources to meet projected load growth.

Energy Trust Forecast Overview and High-Level Results

Energy Trust developed a 20-year DSM energy efficiency resource forecast for PGE using Energy Trust's resource assessment modeling tool (hereinafter 'RA Model') to identify the total 20-year cost effective modeled energy efficiency savings potential. Energy Trust then deploys this cost-effective potential exogenously to the RA model into an annual energy efficiency savings projection based on past program

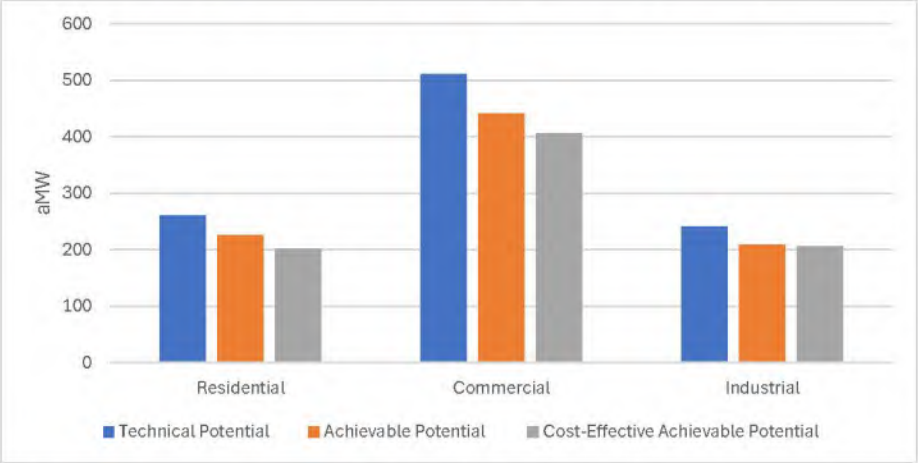
[1] OPUC 2023 Stat book – 10 Year Summary Tables: https://www.oregon.gov/puc/forms/Forms%20and%20Reports/2023-Oregon-Utility-Statistics-Book.pdf

experience, knowledge of current and developing markets, and future codes and standards. This final 20-year savings projection is provided to PGE for inclusion in their Integrate Resource Planning (IRP) forecasts. The 2025 IRP results show that PGE can save 171.7 average megawatts[2] (aMW) in the next five years from 2025 to 2029 and over 675 by 2043.[3] These results represent an 11% and 22% increase respectively in deployed cost-effective DSM potential over the prior IRP in 2023. The main drivers of this increased potential are:

1. Growth in the PGE load forecast, most notably in the commercial sector.
2. Growth in avoided costs.
3. Updated measure assumptions, new measures and updated market characterizations.
4. Lighting market transformation and HB 2531. While Energy Trust will not claim the bulk of these savings, they are still expected to come off PGE's system and thus savings are included in this forecast.
5. Residential electrification.

Figure 1 depicts the full suite of savings potential identified in the model by potential type (Technical, Achievable, Cost-effective achievable).

Figure 1 – 20-year Savings Potential by Sector and Potential Type



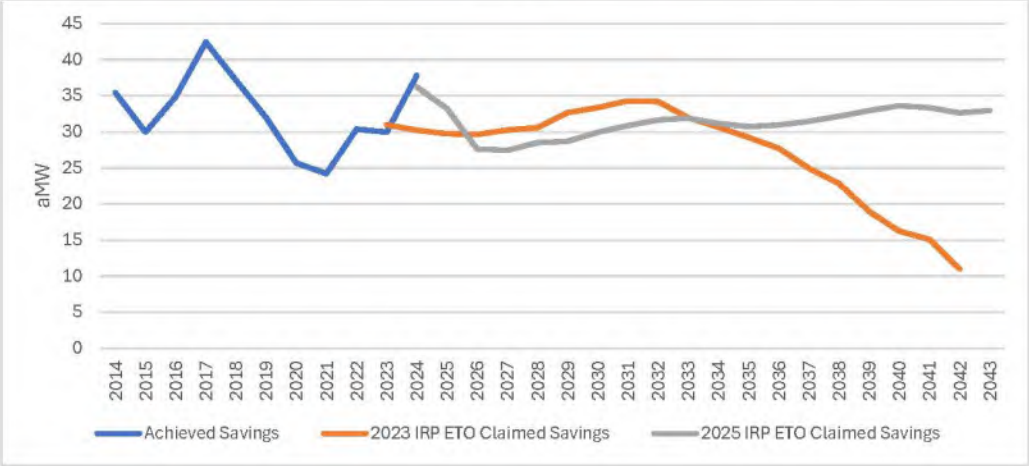


Figure 2 links actual historic savings going back to 2014 to the Energy Trust claimed savings projection for the 2025 IRP. It also compares the 2025 IRP forecast to the 2023 IRP forecast.

[2] All energy described in this report is measured at the generator.
[3] Includes 47.5 aMW of market transformation savings that Energy Trust will not claim resulting from residential and commercial lighting standards going into effect.

Energy Trust 20-Year Forecast Methodology

20-Year Forecast Overview

Energy Trust developed a 20-year DSM resource forecast for PGE using Energy Trust's RA Model to identify the total 20-year cost-effective modeled energy efficiency savings potential, which is 'deployed' exogenously of the model to provide an estimate of the final savings forecast. There are four types of potential that are calculated to develop the final savings potential estimate, which are shown in Figure 3 and discussed in greater detail in the sections below.

Figure 3 – Types of Potential Calculated in 20-year Forecast Determination
