Re: Additional record materials for Metro UGB Amendment 001-24

Dear Periodic Review Specialist:

With this letter, Metro is submitting additional materials for the DLCD record that were not included as part of our original UGB record submittal on December 19, 2024. These materials are being provided under OAR 660-025-0130(4) as documents that are relevant to one or more of the filed objections. As required by that rule, all ten objectors are being notified of this submittal by copy of this letter – the materials are too voluminous to send to the objectors via email, but may be obtained from DLCD by request. There is also a hard copy available for review at the Metro Regional Center, located at 600 NE Grand Avenue in Portland.

Thank you for your assistance.

Sincerely,

Roger A. Alfred
Office of Metro Attorney

About this Report

The report responds to specific legislative direction dating back to House Bill 2003 (2019). This bill charted a new direction to more fully and equitably meet housing needs as required by Goal 10: Housing, of Oregon's statewide land use planning program. House Bill 2003 led to multiple reforms, including a requirement for local adoption of Housing Production Strategies (HPSs) and the development of a new pilot methodology for estimating statewide housing need. In House Bill 2003 and the pilot methodology the model to estimate statewide housing need was called the Regional Housing Needs Analysis (RHNA), but it is now called the Oregon Housing Needs Analysis (OHNA).

In a budget note in House Bill 5006 (2021), the Legislature then directed Oregon Housing and Community Services (OHCS) and the Department of Land Conservation and Development (DLCD) to deliver recommendations on how to implement the OHNA in advance of the 2023 Legislative Session. The Legislature followed up with additional direction in House Bill 5202 (2022) to address issues related to land capacity and the implementation of the OHNA.

This report documents the core components of the agencies' recommendations. While it may be possible to consider some of these recommendations in isolation from others, our core finding is that Oregon's ongoing housing crisis requires comprehensive and structural changes to Goal 10 implementation and housing production. Many precedent documents and processes inform these recommendations:

1. OHCS and DLCD each published reports in 2021 (OHCS summary report, OHCS technical report, and DLCD report) describing technical elements of the new statewide methodology for calculating housing need and recommending legislative action to implement it.
2. In early 2022, OHCS and DLCD developed an initial framework document, titled *Meeting Oregon's Housing Needs: Next Steps for Equitable Housing Production,* to describe how the new methodology might be incorporated into the state's Goal 10 processes. The recommendations herein build from this framework.
3. DLCD and Communitas Consulting facilitated a working group, which met six times to inform recommendations. To review meeting materials and summaries, visit the OHNA Project Webpage.
4. Kearns & West led six stakeholder focus groups and three follow-up sessions with partners from nonprofit, development, local government, and fair housing organizations to solicit input. A summary of all stakeholder engagement is included in Appendix E.
5. DLCD held 14 regional forums with local government planners, developers, elected officials, and advocacy groups around the state to inform recommendations. A summary of all stakeholder engagement is included in Appendix E.
6. In response to a 2022 legislative budget note and direction, DLCD led a parallel Housing Capacity Working Group, charged with considering specific reforms to the Housing Capacity Analysis and the process described in statewide planning Goal 14-Urbanization. This group met a total of seven times to inform recommendations, which are included in Recommendation 1.4 and Appendix A of this report.
7. ECONorthwest conducted best practices research into what is working in other states and reviewed an audit of California's housing planning system to inform these recommendations.
8. ECONorthwest completed a series of technical revisions to the initial pilot methodology and prepared a report summarizing these refinements, which is included in Appendix D of this report.

9. The University of Oregon conducted a literature review and a survey of planners, developers, and local governments regarding barriers to development and published a report summarizing their results, which is included in Appendix F of this report.

Executive Summary

Oregon's housing undersupply threatens the very core of our common purpose as Oregonians. We cannot grow sustainably, move toward a more equitable economy, or address the full complexity of the homelessness crisis unless we substantially increase our supply of homes.

Making meaningful progress will require comprehensive system reforms. While Oregon has already made great strides, including through recent legislative initiatives such as House Bill 2001 and House Bill 2003 (2019), we are still falling behind. To continue, the state and its communities must now tackle the harder reforms needed to prioritize housing production.

Our current system plans for and invests in too little housing. The outcome is undersupply, rising home prices, segregation and displacement in some communities, and deepening inequities across all communities. Together, we must plan for and build the housing we need, where we need it.

The recommendations in this document describe the comprehensive, system-wide reforms needed to reverse decades of underinvestment in housing production and development readiness, organize our land use planning systems toward the common goal of building housing, and begin to redress disparities in housing outcomes. These recommendations can only make a difference if the Oregon Legislature commits to serious reform of the land use planning system, helps local governments pay for public infrastructure and affordable housing, and creates a cohesive state approach to housing production. Those comprehensive reforms will require significant investments, as well as changes to state statute, rule, and guidance to implement. In summary, they are:

Housing Under-Production is a National Problem

Oregon is not alone. While nearly every state is experiencing underproduction, Oregon's outcomes are among the worst.

Measured as a share of housing stock, **Oregon ranks 4th in under-producing housing in the country** behind California, Colorado, Utah, and ahead of Washington State.

Recommendation 1) Plan for what's needed.

Oregon's land use system needs to balance housing production with growth management, economic, and environmental goals. For this to work, the system requires a reorientation that starts with an updated and consistent statewide methodology to more clearly determine housing need and equitably distribute it among jurisdictions. Planning for what's needed requires that:

1.1 **Adopt OHNA Methodology.** Formalize the OHNA methodology as the standardized, statewide source for setting common goals for housing planning. OHCS and DLCD have extensively reviewed and refined the 2019 pilot methodology (see Appendix D for refinements) Maintaining and deploying it will require administrative and technical capacity, a regular cycle of review and update to incorporate new data, and annual database management to track statewide progress toward housing production targets.

What is the Oregon Housing Needs Analysis?

The OHNA is the cornerstone of a reformed housing planning system. It provides a comprehensive, city-by-city estimate of housing need by income, along with data and information about how local housing outcomes vary by race and ethnicity, age, disability status, and other identity markers. When implemented, it will be a regularly updated data suite that can be used to set state and local **housing production targets**. It provides a **more accurate representation** of full housing need and a **more equitable distribution of affordable housing** throughout regions.

In the methodology alone, the **ONHA takes a big step toward equitable outcomes** compared to the current Housing Capacity Analysis methods, by incorporating historic housing underproduction and housing needed for people experiencing homelessness into future production targets, and by **using regional incomes to project housing need** by income level. In addition, the OHNA would be the source of annual housing production dashboards that provide clear metrics that can be used to track and monitor real production outcomes and metrics related to housing equity.

1.2 **Establish Production Targets and Equity Indicators.** Establish housing production targets and equity indicators, produced by the state, for cities with a population above 10,000 people to help solve our crisis. The state would measure progress toward targets in an outcome-driven system that adjusts policies over time.

1.3 **Emphasize Housing Production Strategies.** With their OHNA-derived housing production targets and strengthened policy requirements, cities would craft community-led and implementable Housing Production Strategies (HPSs) that promote equitable housing production and overcome locally specific development barriers.

1.4 **Streamline UGB Amendments.** Improve and streamline land capacity and urbanization processes to expedite well-planned expansions that support needed housing where capacity is limiting production.

Recommendation 2) Build what's needed, where it's needed.

It's one thing to plan to accommodate housing and another for that housing to be built. Where housing is built and for whom dramatically impacts who prospers and how our neighborhoods function. Building what's needed where it's needed will require us to:

2.1. **Commit Sustained, Coordinated Investment.** Commit resources for housing production, affordable housing production, and development readiness, including infrastructure funding. This is not a one-time, small-scale investment. The state must sustain this effort over time and focus investments in the construction of housing that the market is least likely to produce without aid: housing for low- and middle-income households and housing in rural and coastal markets. Creative financing and funding sources that leverage private investment should be considered. Additionally, the state has the opportunity to better coordinate existing resources and focus funding toward the goal of housing production (see Recommendation 3.1).

2.2. **Reinforce Housing Choice for All.** Use the implementation of Housing Production Strategies to advance fair and equitable housing outcomes, including addressing segregation and displacement.[1] We must build more housing in the places where it is needed, with intentional strategies that aim for fair housing and enable housing choice for all.

Recommendation 3) Commit to working together with urgency.

Housing underproduction is a systemic problem that no one actor can resolve. Public, private, local, and statewide entities all have a role to play and can become obstacles when not coordinated. **There is no one entity or person responsible for the public sector role in housing production at the state level.** For our state to have an effective system to accelerate housing production, we must have coordinated administrative systems that can deliver. Working together with urgency requires us to:

3.1. **Establish a Coordinated Governance Structure.** Develop a mechanism for state agency administration, collaboration, and accountability, to make rapid progress toward housing production goals. The solution should encompass a housing production team composed of experts in development, affordable housing development, fair housing, planning and development code, permitting processes, etc. to diagnose and overcome development barriers to quickly identify and implement policy or funding interventions where needed.

3.2. **Continue State and Regional Policy Action.** Develop strategies in which the State and Metro Regional Government (Metro) clearly articulate the tools, actions, and policies the state and regional governments will employ to meet housing production targets. These strategies should describe what they will contribute to partnerships with local jurisdictions, consistent with their statutory and charter limitations. Metro will continue to manage its region's land use planning processes and will use housing projection methodologies consistent with the OHNA. The state will allocate housing production goals to local jurisdictions within the Portland Metropolitan Area.

Implementation Considerations

Few policy imperatives are more important to Oregon's future than increasing the pace of building new homes. Housing production is on the critical path to building Oregon's economic competitiveness, helping families prosper, and improving community resilience. Simply producing the units needed to meet current demand could generate up to $40 billion in additional economic growth, a boost that would benefit us all.[2]

---

[1] Those who most often face housing discrimination, segregation, and displacement include, but are not limited to, low-income households, households of color, people with disabilities, large families, other federally protected classes, and households with other specific housing needs.

[2] This estimate is based on Oregon's share of the national economic benefits that come from producing 3.8 million housing units across the country over a 20-year time period (as described in Up for Growth's *Housing Underproduction in the U.S. 2022 Report*), scaled to match the OHNA estimates of current underproduction and units needed for people experiencing homelessness. Economic growth is measured as increase in gross domestic product.

Implementing these recommendations will likely need to be sequenced over more than one legislative cycle. To make near-term progress on their implementation, we recommend that the Legislature consider bills in the 2023 session that advance the goal of building more homes. DLCD and OHCS look forward to continuing conversations about solutions and refining these recommendations in advance of and during the 2023 legislative session.

A. Redefine Oregon's Planning Process for Housing

The Legislature should establish the OHNA as the foundation for Goal 10 planning processes in state statute, including directing cities to replace local projections of need in Housing Capacity Analyses (HCAs) with OHNA-generated 20-year need. It should strengthen HPSs by requiring actions that address housing barriers and advance fair housing outcomes, and by incorporating production targets based on the data provided in the OHNA. Additionally, the Legislature should make statutory changes necessary to make needed urban growth boundary (UGB) expansions[3] more efficient and certain and support housing production within the UGB.

B. Coordinate State Response

The Legislature should establish a Housing Production Team and administrative leadership position. This team should be deployed as quickly as possible to achieve early housing production wins by helping cities build on challenging development sites, removing barriers, and focusing state resources. Additionally, this team should be charged with developing the first ever statewide Housing Production Strategy, which can shift the state's energy and efforts to this urgent challenge. The Legislature should direct staff at a broad cross-section of agencies, including DLCD, Oregon Housing and Community Services, Business Oregon, the Oregon Health Authority, the Bureau of Labor and Industries, and the Oregon Department of Transportation, to coordinate their activities and (as appropriate) available funding toward the goal of housing production in coordination with the new Housing Production Team.

C. Create Innovative Funding and Finance Solutions

In addition to funding affordable housing production through OHCS, the Legislature should establish new housing production funding mechanisms aimed at housing the market cannot produce on its own, including middle-income housing. Along with better coordination of existing funding sources, new sources for infrastructure funding, systems development charges, and pre-development activities are needed. Several formal and informal groups of stakeholders are considering innovative funding and financing mechanisms that are resonant with the recommended fund types in this report.

[3] Each Oregon city is surrounded by an urban growth boundary (UGB); a line that designates where a city expects to grow over a 20-year period. Generally speaking, it's where the city ends, and the farms and forests begin.

I. Introduction: Our Housing Crisis

Oregon's lack of housing threatens the very core of our common purpose. Decades of underbuilding have driven up home prices and rents and left too many without adequate housing choices. Too often, people can't afford housing at all. We won't be able to grow sustainably, move toward a more equitable economy, or address the full complexity of the homelessness crisis unless we substantially increase our pace of building new homes. Over the next 20 years, Oregon's communities need to add more than 550,000 units, over 30 percent of which will house Oregon's lowest-income residents and will most likely require public funding or subsidy. We must organize our systems to plan for and build these homes.

We cannot equitably distribute what is being underproduced. The people who are suffering most acutely from our housing shortage are disproportionately lower income households and communities of color. The lack of housing options perpetuates segregation through economic exclusion. By restricting people's housing choices, we make Oregon less fair, deprive people of basic human dignity, and limit our collective growth and prosperity. Where housing is built and for whom dramatically impacts who prospers and how our neighborhoods function. We need a range of housing types for all income levels, distributed equitably around and within each region of the state, providing access to employment and critical services and reducing the overall cost-burden to families and individuals.

This applies to both renting and homeownership. For most Americans, homeownership is the primary path to building personal and generational wealth. However, housing scarcity inverts the American dream. The market caters mostly to wealthier buyers, while rising housing costs make it nearly impossible for many to buy their first homes. At the same time, the lack of housing increases the need for publicly financed units and ultimately forces the most vulnerable people to become unhoused. This is devastating for people experiencing homelessness and has negative social and economic impacts on communities.

Oregon's system of comprehensive land use planning describes a decades-old intention to do better. It embodies the state's core values and has long represented a consensus on the preservation of farm and forest land, the importance of community engagement, and the need to plan for a healthy economic future. It also includes a requirement that jurisdictions plan for the "availability of adequate numbers of needed housing units at price ranges and rent levels which are commensurate with the financial capabilities of Oregon households."[4] However, Oregon has not fully realized this vision and many thousands of Oregonians lack an affordable, accessible, or safe place to live.

A recent survey conducted by the University of Oregon sheds light on what is not working. The survey found broad agreement that we face significant challenges in the cost, availability, and readiness of land to support development as well as the prohibitive cost of infrastructure, materials, and labor. There are sharper divides among those surveyed, however, when

[4] Goal 10 of Oregon's Land Use Planning: https://www.oregon.gov/lcd/OP/Documents/goal10.pdf

determining who is responsible for causing and addressing the current crisis. The survey finds that local governments tend to implicate the lack of funding and inflexibility on the part of developers to deliver a broader range of housing types, while private and non-profit developers view over-regulation and onerous processes as the culprit. Meanwhile, for the most part, local governments interested in advancing affordable housing solutions have been left on their own, without meaningful coordination or investment from the state to help find and implement solutions.

By statute, DLCD regulates the land use planning and policy that is implemented at the local level. OHCS funds affordable housing production and preservation. However, *no state agency is directly responsible for overall housing production*. This has left some jurisdictions without workable solutions to incentivize market or affordable housing production and allowed others to avoid their housing obligations. We should not be surprised that, despite the best efforts of the agencies and local governments, the outcome of this disconnected system has been decades of housing underproduction and the perpetuation of housing inequities.

The recommendations offered in this report focus on streamlining statutory requirements and bureaucracy so that Oregon can deliver real outcomes -- more housing in all parts of the state, a diversity of housing types, and more affordable units where they are needed. We offer these recommendations with a great sense of urgency. While there are many efforts underway to address the immediate symptoms caused by our lack of housing, we will not be able to meaningfully address the hardships faced by Oregonians until we focus on the long-term solution: providing more housing options for everyone, everywhere.

A Shift in Focus That Benefits Us All: Leading with Production

While the originators of Goal 10 intended for careful planning that would result in balanced, diverse, and affordable outcomes, implementation has fallen far short of that intent. The historic implementation of Goal 10 has overemphasized "accommodation" of housing need by completing an accounting exercise of the theoretical capacity of land, while doing little to ensure that housing is built or address where it should be located and whether households are realistically able to access it. This has negative consequences for all Oregonians – with dramatic underproduction, rising rates of cost burdening and homelessness, and continued patterns of segregation and involuntary displacement. The state needs to make comprehensive updates to our planning systems to better produce needed housing.

The recommendations in this report shift the current system's focus on accommodating potential housing growth to building the housing Oregonians need. We do this by:

- Accurately identifying what housing is needed by income and holding ourselves accountable to action
- Equitably allocating housing need within and between communities
- Requiring jurisdictions to consider context-specific actions to address displacement and segregation

- Providing strategic, flexible funding for housing the market cannot build on its own
- Connecting existing Fair Housing[5] obligations to our land use system and Housing Production Strategies to support diverse, quality, physically accessible, affordable housing choices with access to economic opportunities, services, and amenities
- Measuring and evaluating progress towards improved housing outcomes, especially for those who have been historically underserved

Taken together, these recommendations can transform our system from one that plans for and invests in too little housing to one that plans for and builds the housing we need, where we need it.

Our Shared Housing Obligation

We all share a responsibility to find the solutions that let us build what's needed where it's needed. The lack of sufficient units affects every community, but the people who are suffering most acutely from our housing shortage are disproportionately lower income, communities of color, or people with disabilities. They cannot be asked to wait another decade or more for Oregon to reverse the discriminatory policies and practices that have limited their housing options.

Solutions include: policies that enable production, public and private investment in a range of housing types, and clear policy goals so we can hold ourselves and each other accountable to outcomes.

To make meaningful change, Oregon needs a comprehensive system reform that brings state and local governments and affordable and market-rate developers together with common goals for building more homes, building more publicly supported homes, and investing in inclusive communities. To achieve this aim, we need a clear shift in approach to lead with production.

Reforming the Goal 10 Planning System for Housing

Oregon does not have a clear roadmap to follow for state oversight of housing production. Few other states have attempted a production-focused strategy, and none of them share Oregon's statewide land use planning system. While our review of national best practices provides lessons learned from other states, applying them in Oregon requires a thoughtful, carefully implemented approach, at least in part because the Oregon Legislature has already taken some of the suggested steps. In House Bill 2001 (2019), it eliminated zoning exclusive to detached single-unit homes, allowing a greater diversity of housing to be built throughout the state, and required cities of over 10,000 to develop Housing Production Strategies (HPSs). While these are necessary steps that will yield long-term benefits, expedited housing production will also require an alignment of a full suite of policy tools, agency coordination, and public investment.

[5] All recipients of federal funds from the Department of Housing and Urban Development are required to affirmatively further the policies and purposes of the Fair Housing Act, also known as "affirmatively further fair housing" or "AFFH."

In many states that are newer to comprehensive planning initiatives, zoned capacity limits housing production. Oregon's problems are different. The state has already increased zoned capacity to enable production, including through recent legislative initiatives such as House Bill 2001 (2019). Now, we must tackle the harder reforms needed to lead with production. We need to make sure that enough zoned capacity is available in the right places so that community members, especially those who have experienced historic marginalization, have meaningful choices in where they live and what kind of housing choices are available to them. At present, our system generates lower housing production in whiter, more affluent communities and expands capacity mostly in lower-income and more diverse communities. We need to improve the often onerous and contentious system for allowing jurisdictions to add land needed to meet growth and current housing deficits. And, most importantly, we need to turn our attention and investments to making land ready for development, advance state and local policies that are supportive of increased production and housing options and accelerate affordable low- and middle-income housing construction.

The recommendations in this report are far-reaching and will fundamentally change the way Oregon plans for and produces housing. If adopted, these changes could modernize Goal 10 into a national model for housing production. Goal 10 systems reform can deliver:

- **Increased focus on local actions that enable land readiness and production**, including removal of zoning and regulatory barriers and access to infrastructure investment
- **A smoother and less litigious UGB expansion process**, supported by the land use efficiencies in housing production strategies, a more accurate representation of housing need and capacity, and increased flexibility to unlock land where it's needed
- **Advancing fair housing goals**, by expanding production and housing options in historically exclusionary areas and integrating diverse, affordable, quality, and accessible housing across regions
- **Better and clearer guidance on local actions**, clarifying the purpose of each planning function and reducing and streamlining current requirements

These improvements are anchored by the objectivity of the OHNA methodology, data, and unit allocation to local jurisdictions. It is critical that these goals be seen as achievable and not an unfunded mandate. Discussions with local governments, market rate and affordable housing developers, and various advocacy organizations throughout the state have clarified that the state needs to implement changes that foster **partnership** between state and local governments, **accountability** to working towards housing need, and **investment** to support affordable housing production that the private housing market cannot produce on its own.

II. Core Recommendations

Recommendation 1) Plan for what's needed

Overview: Lead with Production

Leading with production requires a fundamental shift from a more passive planning approach to accommodate growth to outcomes-based strategies that focus on production.

As directed by statute, our current system addresses housing need by using past development trends to calculate the land supply and zoning capacity needed to meet future demand. However, past trends may not reflect the actual regional housing need and demand for housing options in any particular location. In this current system, most jurisdictions systematically underestimate their future housing demand, and especially underestimate their demand for housing for lower income households, because the demand was not appropriately accounted for originally and was reinforced through low production performance. This creates a negative feedback loop where underproducing housing, especially affordable housing, causes future projections to further underestimate need. A consequence of this dynamic over several decades is that the Housing Capacity Analysis (or Housing Needs Analysis), the historic implementing document of Goal 10, has become a land supply calculation and growth management tool that has little to do with actual housing production needed for a healthy society and economy. Instead, Goal 10 implementation has enabled and reinforced housing inequities between and within communities.

Overcoming this challenge requires implementing a new methodology that better estimates total need and does not rely on past development trends to determine where growth will occur (recommendation 1.1), setting production targets and measuring progress toward those targets and equitable outcomes (recommendation 1.2), strengthening Housing Production Strategies so that they are better organized to remove barriers to development (recommendation 1.3), and streamlining the process for expanding urban growth boundaries when they are needed in a coordinated housing planning system (recommendation 1.4).

1.1 Formalize the OHNA as the foundation for housing planning in Oregon.

Part of 2019's House Bill 2003 directed OHCS to develop a pilot methodology to estimate Oregon's statewide housing need. In its inception, this methodology was called the Regional Housing Needs Analysis or RHNA, borrowing the term from California. In this implementation work, it is renamed the Oregon Housing Needs Analysis, or OHNA, to better reflect its evolution to a unique, Oregon-specific model. The pilot analysis was completed and extensively reviewed in 2020, including a full results report, technical methodology, and assessment report that documents how this methodology improves upon current processes.

The OHNA methodology is the cornerstone of a different approach to Goal 10 implementation. The recommendations in this report assume access to the data and information that would come from implementing the OHNA methodology. The OHNA methodology will provide a data-informed measurement of housing need in each area of the state that, (i) estimates units needed

to meet current and future housing need, (ii) catches up with past underproduction and the resulting pent-up demand, (iii) accounts for people experiencing homelessness, and (iv) ensures a more equitable distribution of affordable units within a region. Using this methodology, the state will calculate and allocate housing need with a standardized approach, replacing housing needs projections that are currently developed by local jurisdictions at great expense of time and resources.

As part of this implementation effort, DLCD and OHCS recommend changes to the pilot methodology to fully account for the impacts on housing markets from second and vacation homes, improve and broaden indicators of housing outcomes, and better align income brackets with funding sources available to support affordable housing production. These recommended changes are documented in the technical report included in Appendix D. The revised methodology suggests that **Oregon needs 554,691 new housing units** to accommodate 20 years of population growth and to account for current underproduction and the lack of units for people experiencing homelessness.[6] About 176,300 of these units, or 32 percent, will need to be affordable for households earning less than 60 percent of statewide area median income (AMI).

With these revisions, the OHNA contains the following parts:

1. **Needed Housing (20-year housing need).** For each city and county and for the state as a whole, the OHNA will provide estimates of housing need for 20 years, by income range. These estimates will replace the 20-year projection of housing need currently completed locally by cities in housing capacity analyses. Local jurisdictions will continue to make critical decisions about the types, characteristics, and location of housing based on the state methodology, community priorities, and context-sensitive local information, such as cost burden, accessibility, and household demographics.

2. **Housing Production Index (housing production targets).** The OHNA will also establish local housing production targets for cities over 10,000 (see recommendation 1.2). These targets set a baseline by which the state regularly tracks and evaluates progress on housing production.

3. **Housing Production Dashboard (measures progress toward meeting need).** Annually, for each city that has a six or eight-year production target, for Metro, and for the State, the state will compile and publish data showing progress toward production targets (see recommendation 1.2 for details) in a housing production dashboard.

4. **Housing Equity Indicators (measures housing outcomes).** For each city, the OHNA model will provide annual reports on housing outcomes. These include data and information about rates of rent burdening and homeownership by race and ethnicity, age,

[6] The pilot methodology estimated a total statewide need of about 554,000 units, of which 110,000 units were due to underproduction. The revised methodology shifts the income bins used and better accounts for the effects of second and vacation homes on total housing stock, which decreases the overall estimate for underproduction while increasing housing need in areas of the state with concentrations of second homes.

and disability status (as data allow for smaller jurisdictions). It can also be updated to include information about segregation and risk of gentrification, or other measures of housing outcomes, such as climate resilience within communities. The information provided will vary from geography to geography; for some smaller geographies, data are insufficient to provide reliable disaggregation. While DLCD and OHCS will lead further engagement and discussion following legislative adoption of these recommendations to confirm the specific measures that are most useful and appropriate, recommendation 1.2 provides initial concepts.

The OHNA will need to be reviewed and updated on a regular cycle as new data become available. This update process should include a process in which the implementing agency consults with a range of experts for peer review and publishes notice and review of the proposed methodology. The most appropriate schedule for significant revisions is likely to be every ten years, timed as new census data and geographic boundaries become available. Smaller mid-cycle adjustments and updates are possible if warranted and resources are available. To maintain and run the model on a regular basis, the OHNA will need to be housed in an agency with data capabilities including housing economics, modeling capacity, database management, and data visualization skills, and with the ability to gather information from local governments about actual rates of production to track progress toward targets.

OHCS oversaw the process of developing the methodology and could continue regularly running and updating the methodology on a regular basis. This work requires staff capacity commensurate with the analytical, procedural, and communications requirements as directed by the Legislature. We estimate that implementation would require a qualified staff person (1 FTE equivalent) to regularly complete and update the methodology, with additional staff capacity to continue work ancillary to the analysis itself, including external communications, public engagement, policy analysis, and data publication, mapping, and visualization. However, the exact number of staff necessary depend on the extent of analysis and engagement directed by the Legislature.

The Oregon Office of Economic Analysis is another possible lead agency for this work in the long run, as they are involved in neither the funding nor regulation of housing and may be seen as impartial. However, it is important to emphasize that this agency has much less programmatic infrastructure in place to conduct this analysis. Therefore, it would very likely take more staff capacity and funding appropriation to implement initially. Overall, regardless of which agency or office manages it, state government needs to closely coordinate the technical work of running and maintaining the OHNA model with implementation of the system (see recommendation 3.1 for more details about system administration).

Broadening "Needed Housing"

Under the current Goal 10 framework, Oregon cities are required to plan for "needed housing", which refers to housing types determined to meet locally identified need at a variety of price or rent ranges. Currently, this means that cities needed to plan for different housing types, such as single-family, multi-family, and manufactured housing types, based on locally-driven analyses. These analyses are conducted by individual cities and consider anticipated population growth, household demographics, local market trends, and various context-sensitive factors.

However, the implementation of this requirement has often overlooked a number of factors that affect need, especially for historically marginalized communities such as people experiencing homelessness, people with disabilities, and communities of color. Additionally, many of the housing types projected in local analyses are based primarily on past development trends, even if that housing is unlikely to meet need or be affordable to current and future residents.

To implement an OHNA, the Legislature would need to establish a statute that requires a state agency to regularly develops and conduct a methodology estimating and allocating housing need to local jurisdictions, including the number of units and the affordability ranges needed over the next twenty years. Additionally, existing statutes would need to be adjusted to better plan for a variety of housing needs, types, and characteristics, including factors that are currently omitted:

- Broadening the types of needed housing to include middle housing and accessible housing,
- Clarifying that household demographics include considerations of race and ethnicity, disability status, and student population (if applicable), and
- Including the effect of second and vacation homes on need, as estimated by the OHNA.

Note: specific changes to the needed housing statute are outlined in greater detail in Appendix C

This would establish a system in which the state estimates the **total amount of housing and affordability ranges** needed, while local jurisdictions make critical decisions about the **types, characteristics, and location of housing** based on the state methodology and context-sensitive local information, such as cost burden and disability status, as well as community priorities.

1.2 Create production targets and indicators and measure progress towards outcomes in local Housing Production Strategies.

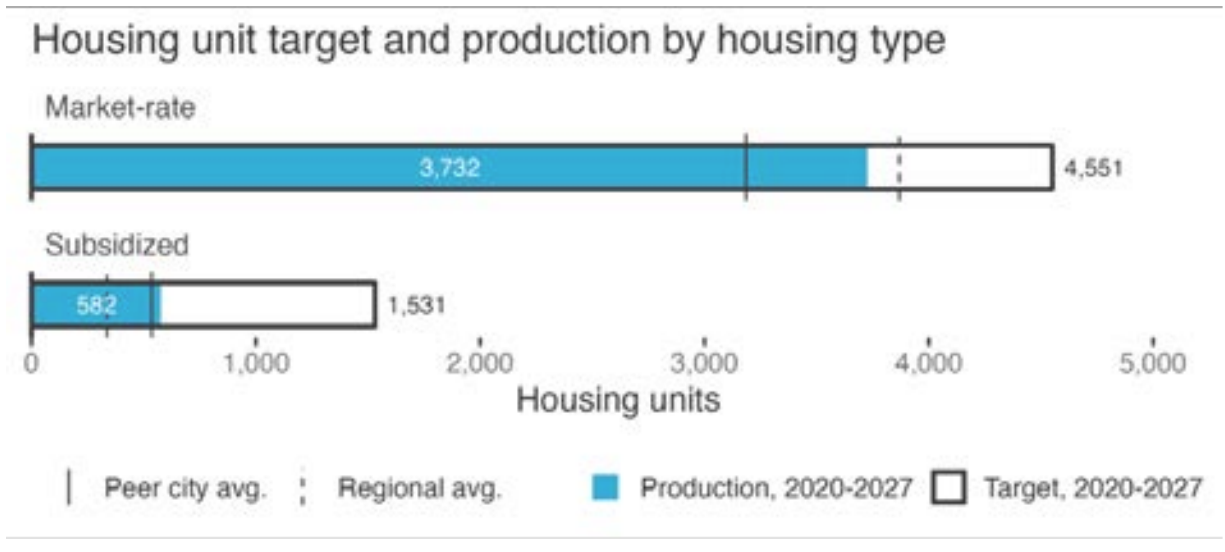
The proposed framework draws from the OHNA's Housing Production Index to set production targets that orient all partners toward common goals for market-rate and publicly supported housing production. Using the OHNA allows the state to benchmark housing production on an annual basis and informs local policy decisions, providing transparent, regular information about progress toward outcomes.

The OHNA methodology addresses inequities in the current system by allocating a share of regional demand to each community based on income, access to jobs, and population. In this way, the state and local governments can collectively begin to address chronic underproduction and geographic inequity at a regional scale. This will allow implementing jurisdictions to make informed decisions about how to plan for an increase in housing production and allow state agencies to partner with local jurisdictions to help fund and implement those plans. It also means

jurisdictions will not have to wait until the end of a six- or eight-year planning cycle to consider housing production.

The state will not expect jurisdictions to hit their targets exactly in each cycle. However, if it is clear that a jurisdiction's production is much lower than in regional or market-based peers,[7] there are likely locally specific development barriers that the jurisdiction must address. A production-focused system will use measurement of progress toward targets to identify these problem areas, and work proactively to address them, bringing state funding and expertise to support. Below is an example of what such a dashboard might look like, with commentary on the data options, for a fictional city.

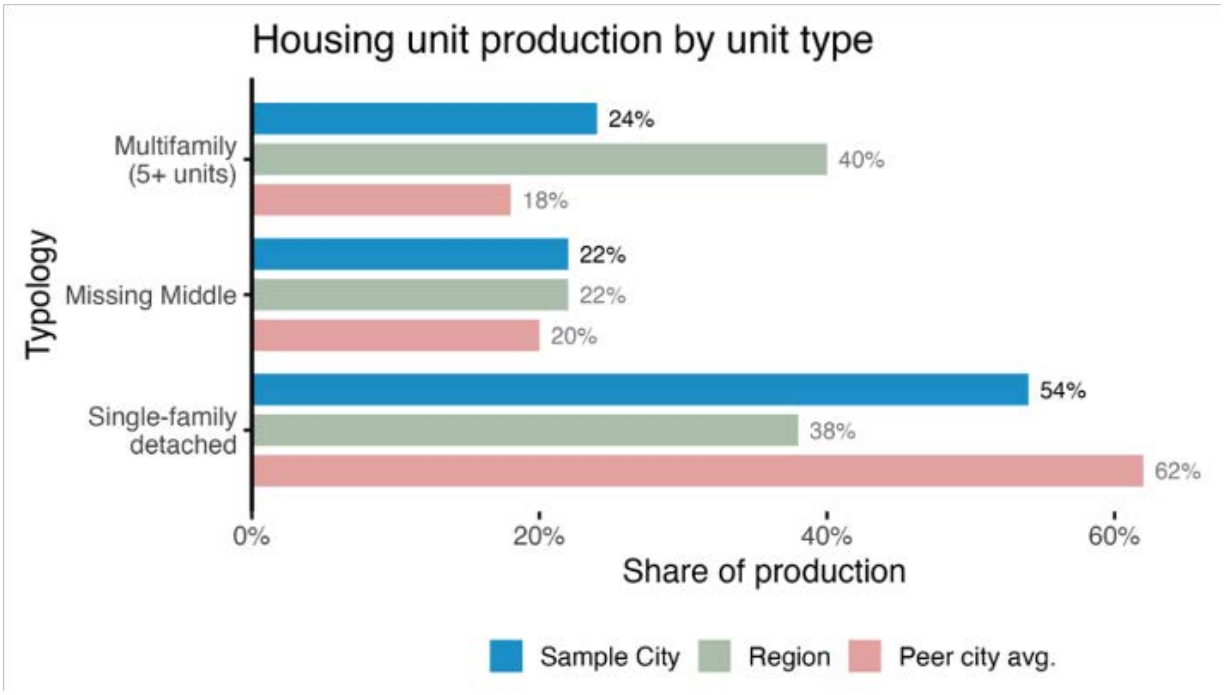
Figure 1. Sample Housing Production Dashboard



Production by housing type

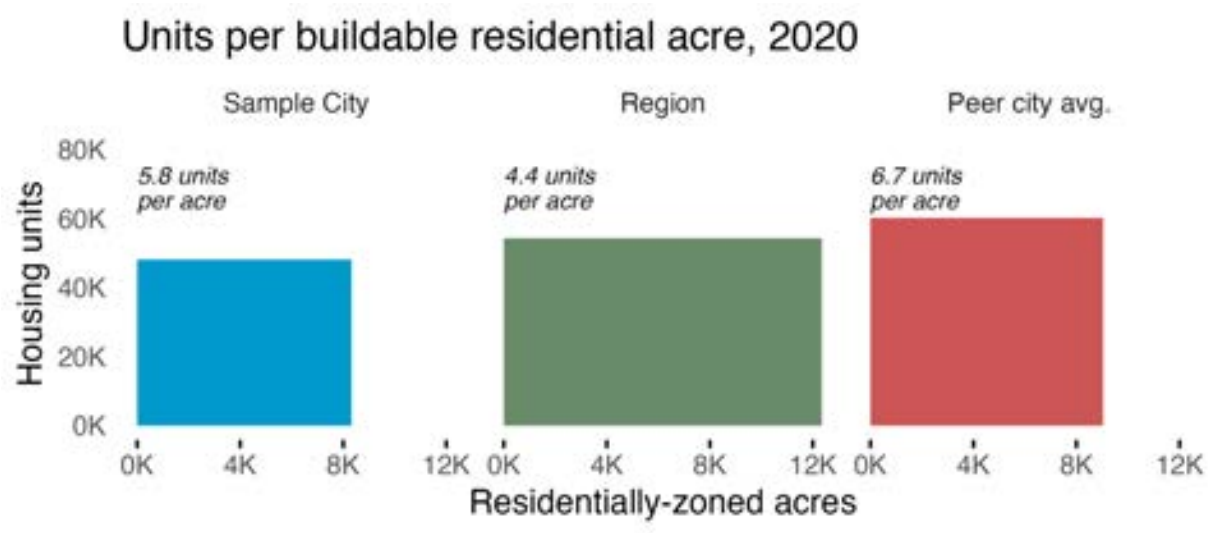
- Track permitting and production data that is already collected by DLCD.
- Compare to region and peer cities to highlight overall housing market.
- Could also provide trend-line.

[7] The technical report included in Appendix D describes how market-based peer cities could be determined.



Production by unit type

- Use DLCD data about the unit typology to track production (or permits) by basic housing typology (single-unit, middle housing, multi-unit).
- No "targets," just relative data and information.
- "Efficiency measures" in the HPS will consistently work towards greater housing diversity and choice.



Land use efficiency

- Could be based on calculations of buildable residential land from local Buildable Land Inventories.
- If a jurisdiction is "built up," the image should expand upwards.
- If a jurisdiction is sprawled, the image would expand to the right.
- No "targets," just relative data and information.

Twenty-year need (the basis for targets articulated in the Housing Production Index) can be produced on an annual basis, so that cities that are on different planning cycles can have access to the most current data inputs as they begin their analyses. For an individual city, production targets will be set for the entire six- or eight-year time period, as either 30 percent of 20-year need (for cities on a six-year cycle) or 40 percent of 20-year need (for cities on an eight-year cycle) and will be based on Needed Housing data available the year they begin their planning process. Progress toward the six- or eight-year target will be measured annually in the dashboard. New targets will be assigned in the next six- or eight-year cycle, based on updated data that reflect progress toward targets in previous cycles.

Targets should be set for both the **total number of units** and the **total number of affordable units** that should be constructed in six or eight years. By tracking progress toward total unit production, the system recognizes and encourages the production of units affordable to all residents and of all types. Achieving total production targets will help cities overcome past underproduction, which is necessary to allow the private market to better meet the needs of middle-income residents. By tracking progress toward publicly-supported units for lower-income Oregonians, the system recognizes that the private market, on its own, cannot meet all housing need. Even in a well-supplied market, these units will need public support, as market-rate units are unlikely to filter to these levels of affordability in a timeframe that will provide real relief to Oregonians in need.

A few considerations about determining thresholds for measuring publicly supported affordable units:

- To establish a target for affordable units, we recommend using one income category, all units affordable to households earning less than 60 percent of Area Median Income, (AMI). While there is substantial need for housing for the lowest income Oregonians (with incomes below 30 percent of AMI) it is not practical to track the production of units at these lower levels of affordability, because these units layer subsidies that are impracticable to measure. It is common to add rent subsidies to help very low-income residents access units that may technically be rent-restricted to those below 60 percent of AMI, rather than to build units that are rent-restricted below 30 percent of AMI.
- While the target is focused on one income category, the Housing Production Dashboard should track and report publicly-supported units at all income categories, including housing affordable to middle-income households earning between 60 and 120 percent AMI. In some instances, these are also publicly supported, with the goal of supporting middle-income or home ownership access. While these data will not fully represent the total amount of housing production affordable to these households, it will measure the impact of state and local subsidies aimed at this segment of the market.

Additionally, the OHNA model will track specific indicators of housing outcomes that can enable jurisdictions to better understand and support strategies designed to overcome inequities in the housing market. The pilot methodology included extensive data analysis and documentation for

cities across the state on indicators of housing outcomes that should be maintained as part of the OHNA dashboard going forward. These included cost burden, tenure, and other factors, by race, ethnicity, age, and disability status.

Additional indicators can and should be added to the dashboard, such as segregation, displacement, a deeper look at housing for people with disabilities, greenhouse gas emission reduction, or climate resilience, based on the priorities established by the Legislature and through rulemaking for implementation. The technical report (Appendix D) describes in more detail the data available to evaluate housing outcome disparities by race, ethnicity, age, and disability status, and offers a few example statistics and graphics. The report also summarizes the data limitations and ways to show as much detail as possible for smaller geographies.

Overall, the dashboard is envisioned as an accessible, publicly available web-based data interface that will provide relevant housing production and outcome data for each relevant geography. The dashboard reporting is a critical evaluative tool that will inform needed refinements to a local jurisdiction's Housing Production Strategies. Over time, the dashboard will also help jurisdictions across the state learn from one another about the types of policy and regulatory approaches that are working well and will provide a simple and transparent way for community members to track progress.

Implementing the OHNA in the Metro Region

Adopting the OHNA methodology will need to operate somewhat differently within the boundaries of the Portland Metro region. Metro Regional Government holds statutory responsibility for coordinating forecasts within its urban growth boundary. This entails Metro completing a regional forecast and distributing expected growth to its constituent cities and counties. This system has proven largely effective for integrating land use and transportation planning, resulting in livable communities and reduced greenhouse gas emissions. Metro and the region's cities have also developed a distinct system for identifying and planning for UGB expansions that includes urban and rural reserves, as well as concept planning for new urban areas. The region's approach recognizes that Metro is responsible for forecasts and managing the UGB while cities and counties are responsible for zoning and service provision. These differing responsibilities require coordination and a focus, not just on land need, but city readiness to urbanize land.

A core purpose of implementing an OHNA is to distribute housing more equitably between cities in a region. Under the current system, localized needs projections reinforce disparate responsibilities between cities in planning for a diversity of housing types and affordability. While the methodology addresses this dynamic statewide, in the Portland Metro, it will be critical that the resultant allocation of housing results in a more equitable distribution of housing in the region while maintaining Metro Regional Government's statutory responsibilities. More importantly, this allocation must be paired with systematic changes to the implementation of Goal 10 to ensure local governments are taking meaningful actions to increase production, diversity, and affordability within their communities. To do this, we recommend a partnership approach among the state, Metro Regional Government, and local jurisdictions, including the following core components:

1. **Metro should maintain its regional forecast coordination and growth management responsibilities** with its ongoing focus on readiness and requiring concept planning for urban reserves before expanding the UGB. Its 20-year regional forecast should include the same considerations that the OHNA considers, including the effect of underproduction, homelessness, and second/vacation homes.
2. **The state should allocate six-year production targets** for local governments above 10,000 population within the region, based on the 20-year regional forecast. These targets should be applied to local Housing Production Strategies and reflect an equitable distribution of housing between cities within the region. For neighboring communities outside of the Portland Metro region and within the tri-county region, the OHNA will estimate and allocate needed housing similar to other cities in the state.
3. **Local jurisdictions should continue conducting Housing Capacity Analyses** to ensure they adopt efficiency measures and strategize preparing buildable lands for development in subsequent cycles of their Housing Production Strategy.
4. **Accountability should be state-driven for local jurisdictions above 10,000 population** to implement meaningful actions that support production. See Recommendation 1.3 for more detail.
5. **Goal 10 should be applicable to urban, unincorporated areas in the Metro.** While cities above 10,000 population in the Metro must regularly plan for housing under Goal 10, there are substantial urban, unincorporated areas in the Metro UGB that are currently omitted from this requirement. Addressing this will require cities and counties in the Metro to amend or establish agreements to ensure urban, unincorporated areas are planned for under Goal 10. While the counties may in many cases have current zoning authority over these areas, it is important to stress that planning for these areas should not become the sole responsibility of counties, given that cities typically provide urban services to annexed areas. Further, in those areas not anticipated to be annexed by cities, the state must be prepared to provide on-going funding and investment to Metro counties to ensure they have sufficient resources to complete any needed interim Goal 10 requirements for urban, unincorporated areas.
6. **Metro Regional Government should complete a "Housing Coordination Strategy"** similar to local Housing Production Strategies but with an emphasis on regional coordination rather than local policies. See Recommendation 3.2 for detail.

1.3 Strengthen the Housing Production Strategy to promote production and overcome barriers.

The existing rules and laws governing HPS implementation provide a starting place to ensure state and local governments are doing everything they can to promote housing production.[8] According to House Bill 2003 (2019), the Legislature gave DLCD statutory authority to review, amend, and remand Housing Production Strategies. The current accountability system is designed to emphasize general *action towards addressing a need,* rather than achieving specific numerical targets or implementing any one particular action.

The implementation of the OHNA can build on this existing accountability framework and ensure that state agencies and local governments are taking meaningful and effective actions towards housing production. DLCD should incorporate a review of performance and progress

[8] Oregon Administrative Rules 660-008-0065 and 0070.

towards housing production outcomes and OHNA targets as part of its current review process that occurs at development of a new HPS, midway through the HPS implementation cycle, and then again at the six- or eight-year update of the HPS. With this addition, the system would then be organized to define clear goals, transparently show progress toward those goals, learn together about which actions are helping to make progress over time, and adjust strategies accordingly.

The proposed reforms focus community attention on building the housing we need where we need it (the desired outcome), rather than meeting administrative planning requirements that may or may not result in needed housing production. This makes HPSs – the set of identified local planning and policy changes to support housing production – the centerpiece of Goal 10 implementation.

Building Local Capacity

The vast majority of housing is built by the private sector. At the same time, local plans and development policies play a significant role in creating the conditions for housing production. Given the scope of the state's housing crisis, we recommend measuring the effectiveness of an HPS by the outcomes it produces. The goal is not to penalize jurisdictions for missing their targets – it will take time to dig ourselves out of our housing shortage – but to evaluate what is working and to course-correct when strategies are not leading to more housing for communities who need it most.

It is important to emphasize that the implementation of locally-focused policy and funding action on housing will require substantial investments in local capacity. DLCD's 2023-25 Agency Request Budget includes additional staff and a regular biennial investment of $2.5 million intended to provide jurisdictions technical and financial support for Goal 10 implementation. Additionally, the housing capacity recommendations discussed in Appendix A call for additional investment in urbanization planning and technical support. These investments are critical to support housing and urbanization planning, but they are insufficient on their own to fulfill the gap jurisdictions face. For example, the Oregon Office of Economic Analysis estimates that meeting housing production needs identified in the OHNA requires approximately 400-500 more public sector workers per year simply to approve, permit, and inspect the additional units at the local level.[9]

To address this gap, the state should partner with local jurisdictions and provide funding support (described in recommendation 2.1) tied to HPS implementation. Under the current and revised Goal 10 framework, cities above 10,000 in population are required to regularly complete housing planning requirements.

Small, Rural, and Coastal Communities

It is important to emphasize that small, rural, and coastal communities very often face significant and unique challenges with housing production. Many of these communities face significant

[9] Oregon Office of Economic Analysis. "Addressing Oregon's Housing Shortage". Accessed via: https://olis.oregonlegislature.gov/liz/2021I1/Downloads/CommitteeMeetingDocument/256863

economic challenges that significantly inhibit production and have limited resources and staff capacity to support housing planning and production.

While it is reasonable to require larger cities to periodically update plans and policies to support housing production, establishing the same requirements to smaller cities is impractical because they lack the financial and staffing resources needed to complete that work. Therefore, these recommendations seek to lift these communities up and provide them the support they need via the following actions and investments:

- Continue to enable, but do not require, communities below 10,000 to adopt HPSs and access the same funding resources that support production as larger jurisdictions.
- Enable county and regional entities to adopt county- or region-wide Housing Coordination Strategies in coordination with cities below 10,000 to access the same funding resources. See Recommendation 3.2 for more detail.
- Direct state investment to support housing production where the market is unable, with an emphasis on housing affordable to low- and middle-income households in rural and coastal markets.
- Establish a program that enables DLCD to provide funding and capacity to smaller communities without requiring submittal of competitive grant applications.
- Provide direct DLCD analytical support for smaller communities pursuing Goal 10 housing-related initiatives.
- Establish more streamlined analytical requirements and policy responses to housing need for smaller communities.

Housing Production Strategies

While cities are currently required to adopt strategies that comprehensively address identified needs, the current accountability framework does not require implementation of a particular strategy or to meet a specific production threshold. Currently, state administration of the HPS program progresses from collaboration, assisting jurisdictions in need of support, to increasingly more stringent measures should inaction continue. At the highest level of enforcement, if a jurisdiction is recalcitrant towards adopting meaningful strategies that address housing needs, DLCD has the authority to petition the Land Conservation and Development Commission (LCDC) to issue an enforcement order, requiring the jurisdiction to address the deficiency. These recommendations propose an important change to this system: integrating regular data-informed evaluation of progress toward targets and needed housing outcomes as part of the OHNA. This will help focus strategies and provide clear indicators of successful implementation. This additional data and information will help to focus collaborative conversations about the resources and strategies needed to overcome production barriers.

By establishing housing production as the primary indicator of progress, cities can orient their strategies toward the necessary policy changes, housing types, and measures of land readiness to

enable housing outcomes and break the negative feedback loop that leads to underproduction in the current system. Each HPS will be unique to local circumstances, and local expertise is essential to figuring out which strategies make sense in a specific context. At the same time, we can organize local actions into categories that are consistent with statewide goals and best practices for building the housing we need in the places we need it. Tighter definitions of HPS categories will also allow for more consistent evaluation by local jurisdictions and DLCD of their effectiveness and comparisons between peer cities.

The current administrative rule for HPSs requires jurisdictions to provide an interim, mid-cycle implementation report and a full report at the end/start of each cycle.[10] We recommend maintaining these existing reporting functions and will seek to help jurisdictions fulfill the requirements.

Through the OHNA, the state will provide baseline housing needs data that is currently the obligation of cities to generate, as described in recommendation 1.2 above. In addition, the table below provides an overview of the HPS elements that are currently required, and how we propose amending them with clarifications in existing rules and guidance. These changes will ensure that the actions are sufficiently and comprehensively focused on making land ready for development and for equitable housing production.

Figure 2. Suggested Revisions to Existing Housing Production Strategy Elements

Current elements of the HPS	Recommended revisions
Contextualized housing need	The state will provide OHNA-generated baseline data that is currently an obligation of local jurisdictions. Cities may add data necessary to help inform strategies.
Production strategies	When the HPS is adopted and approved, funding for implementing these strategies is unlocked. Strategies must address the following categories of actions: ▪ Zoning and code changes ▪ Reduce regulatory impediments ▪ Financial incentives and resources ▪ Land use efficiency measures ▪ Development readiness ▪ Fair housing (more details in recommendation 2.2) To support development of these strategies, new guidance will be needed regarding fair housing, housing mix and land use efficiency measures, and DLCD's defined HPS program outcomes.
Engagement	Local governments will continue to engage consumers and producers of needed housing, as required by current administrative rules. Future state level guidance will be needed to support this work and Goal 1.
Fair housing narratives	New data will be available to support cities' fair housing strategies and reporting through the OHNA, measured as annual indicators of housing outcomes. DLCD will provide additional guidance about how cities can use production-related policies and actions to advance fair housing.

[10] Oregon Administrative Rule 660-008-0060.

Accountability

Throughout this process, accountability at all levels of government was raised as a substantial condition for success needed to facilitate the development of needed housing. While DLCD has an existing accountability framework predicated on timely, good-faith implementation of tools, actions, and policies that promote production, participants raised a need to better clarify this framework. Specifically, it is not clear under the current framework how underperformance in market rate or affordable housing production will result in meaningful funding or policy interventions to increase production, nor is it sufficiently clear that failure to take meaningful action will be met with appropriate enforcement actions.

It is important to emphasize that under any accountability framework, it will take substantial investment at the state level to support the kinds of policy and funding interventions that are needed to increase production. This report calls for that investment in partnership with local governments to increase local capacity and funding needed to build housing, especially housing that the market would not otherwise produce on its own (see Recommendation 2.1). Additionally, while many participants have called for increased local accountability, many participants have also correctly asserted that local governments only control a portion of the policy levers that affect housing production and affordability. Underproduction of housing is a consequence of a myriad of policy and economic factors, and any accountability framework should acknowledge and reflect this dynamic.

Recognizing that accountability requires substantial Legislative decision-making, this report provides several considerations to inform future discussion that provides policy pathways that balance perspectives heard throughout the process. First and foremost, the project team recognizes that **unmet housing need should be addressed with meaningful action from all levels of government**. Achieving that goal requires three major components:

1. Clearly define "unmet housing need" through the OHNA
2. Respond to identified unmet housing need through local and state policy and funding interventions, in partnership.
3. Establish clear enforcement parameters to ensure timely action.

1. Define "unmet housing need"

Recommendation 1.2 establishes housing production targets and provides baseline data by which the state regularly tracks and reports housing outcomes, including annual market-rate and affordable housing production, for cities above 10,000 population. Additionally, it includes relative peer and regional assessments of local jurisdictions to assess the relative performance of jurisdictions by geography and market typology. While this information is not sufficient on its own to definitively assess underperformance, it provides a critical barometer to direct policy and funding interventions.

If a local jurisdiction consistently produces less housing in comparison to the region and other similar housing markets, it suggests that policy and funding interventions may be necessary to

facilitate the production of housing[11]. Thus, Recommendation 1.2 enables DLCD, with appropriate direction and parameters assigned by the Legislature, to define a threshold in which a response is warranted.

2. Respond to unmet housing need

Currently, jurisdictions regularly complete Housing Production Strategies to identify tools, actions, and policies that promote production of needed housing, and DLCD reviews and approves, amends, or remands submitted HPSs to ensure they substantially comply with administrative rule. By necessity, this framework requires substantial discretion, because the actions cities take to promote housing production will vary substantially based on local economic, political, and implementation dynamics. As a consequence, there is a lack of clarity on "how much is enough" with regard to identified strategies.

It is possible to provide more clarity through enhanced review and partnership by DLCD. If a jurisdiction is identified as consistently producing less housing than regional or market peers, this could trigger a requirement for DLCD to conduct an audit and review of city policies in advance of their next HPS, focused on identifying the following:

- Financial and regulatory impediments to production
- Financial and regulatory incentives, including available state resources
- Actions that advance fair and equitable outcomes

This audit should include a series of recommendations by which a city could address identified barriers to housing production, either through changes to local policies/actions, coordination of state resources, or other measures. After conducting the audit, DLCD could then be required to develop a performance plan in consultation with cities to establish a series of actions that address the barriers identified in the audit, timelines for the implementation of those actions, and coordination of state and local resources needed for implementation, such as financial or technical support.

This review and performance plan could be extended to a broader range of state agencies with the establishment of a coordinated statewide entity described in Recommendation 3.1, which could provide a much more comprehensive review of the full suite of tools a city could access than DLCD can alone. Additionally, the Legislature could also establish parameters that increase the likelihood of timely and coordinated action, including:

- Establishment of a timeframe by which implementation of actions must be implemented;

  Please note: The timeline must balance the need for urgent action with practicable local implementation, with flexibility to modify timelines to accommodate local circumstances. As a

[11] Interventions cannot be "one size fits all" and should respond to a variety of local contexts and conditions, especially in consideration of fair and equitable housing outcomes. See Recommendation 2.2 and the Technical Report (Appendix D) for more information.

starting place for discussion, one option could be adoption of actions within two years of the adoption of an HPS with flexibility for the state to amend deadlines to accommodate extenuating circumstances.

- Requiring DLCD (and potentially other agencies that distribute financial resources to local jurisdictions) to prioritize funding and technical support for jurisdictions with unmet housing need; and
- Establishing clear and scaling enforcement actions connected to the timely implementation of actions, discussed below.

3. Establish clear enforcement parameters

Communities throughout the state generally support the provision of adequate, affordable housing options within their community, and it is important to recognize that to increase the production of needed housing, most of the time this requires providing resources and tools to communities to support the implementation of that vision. However, it is equally important to recognize that appropriately-scaled enforcement provisions are an important tool in ensuring meaningful and timely action.

It is important to emphasize that **enforcement should only occur upon failure to act timely or act at all, not as a consequence of housing underproduction on its own**. Enforcement should begin collaboratively and take progressive steps in response to inaction, while providing opportunities for jurisdictions to readily come back into compliance. An enforcement policy must recognize that many factors operating at the national, state, and local levels can inhibit production and local capacity to address barriers. It is also critical to emphasize that **without substantial state investment in both local capacity and housing production writ large, it will not be possible to implement an accountability framework that delivers meaningful results**.

Additionally, it's important to recognize that there may be cases where, despite consistent good-faith implementation of strategies to facilitate production, housing production remains stymied due to factors outside of a jurisdiction's control. In these instances, there should be a list of policy options where a jurisdiction can demonstrate they are doing all they reasonably can to promote production, without risking the application of potential enforcement provisions.

Under the current framework, enforcement actions begin collaboratively and become progressively more substantial if delinquency continues, with the most substantial measure being an enforcement order issued by LCDC. A challenge with this approach is it 1) costs significant time and resources to compel action and 2) creates uncertainty as to whether failure to act will result in enforcement. Establishing **clear timelines** and **automatically applicable provisions** when a deadline passes addresses these shortcomings and enables city staff to clearly signal to local decisionmakers what needs to occur by when and what happens in lieu of local action.

Enforceable provisions must be established through legislative deliberation, but generally, the more impactful an enforcement provision is, the more contentious and challenging it will be to adopt, implement, and enforce. Additionally, it is important to consider how enforcement might differ between overall housing production and affordable housing production. Affordable

housing production faces a variety of barriers, and while overall production requires long-term policy solutions to create healthy market environments, there is a compelling argument to expedite and reduce barriers for subsidized affordable housing substantially to proportionally respond to the affordability crisis.

Below are a few examples of provisions the Legislature could consider, organized from less to more impactful:

1. Application of streamlined permitting processes for units that meet zoning requirements and specific criteria – e.g. California Assembly Bill No. 2011 (2022)
2. Application of a "development override" for subsidized affordable housing meeting specific criteria – e.g. Senate Bill 8 (2021) or Massachusetts Chapter 40 B (1969)
3. Application of a "model code" enabling a greater diversity of housing types in a defined area – e.g. House Bill 2001 (2019)
4. Application of tax incentives, such as property tax exemptions, for qualifying subsidized affordable housing meeting specific criteria – e.g. California Senate Bill 196 (2019)
5. Withholding certain state funding sources, such as state transportation funding – e.g. Utah House Bill 462 (2022)

All of the example provisions represent substantial enforcement actions that should not be applied lightly, and any inclusion of such provisions should not be applied until there has been substantial opportunity to address barriers, including state partnership and investment to overcome barriers to housing production.

Other Major Statewide Policy Initiatives

A critical dynamic in the implementation of the Oregon Housing Needs Analysis is how systemic changes to the housing planning system interface with other statewide policy initiatives. In particular, there is significant ongoing policy work related to climate change, wildfire, and housing preservation that stakeholders raised as intersecting with legislative recommendations.

Climate Change

The Land Conservation and Development Commission adopted rules for Climate-Friendly and Equitable Communities in July 2022. The rules require fifteen communities to designate "climate-friendly areas" – walkable, mixed-use neighborhoods where residents, workers, and visitors can meet most of their daily needs without having to drive. These areas are required to accommodate 30% or more of a community's projected 20-year housing need. This raises a critical question: how do we ensure that we are able to provide significantly more housing while planning for neighborhoods that mitigate greenhouse gas emissions?

This was a substantial consideration during rulemaking. Stakeholders and DLCD staff wanted to ensure that ambitious policy facilitating climate-friendly areas did not inhibit a community's ability to plan for an adequate supply of housing by creating "phantom capacity" – capacity on paper that is unlikely to be realized in practice. To achieve this, the rule requires cities to designate this capacity *in addition to* their 20-year land supply, but this capacity does not "count" until development occurs.

This is a key strategy in planning for significantly more housing. Climate policy and housing policy are inextricably linked, and addressing both requires building a substantial amount of housing in walkable, mixed-use neighborhoods that mitigate greenhouse gas emissions. In all Oregon communities, we need to plan for this abundance while also conservatively estimating land capacity to ensure that these policies do not artificially inhibit an adequate supply of land. In total, the OHNA recommendations ensure that communities are planning for this abundance, ensuring there is an adequate supply of developable land and preparing land to support housing production.

While adopted rules enable the possibility of "climate-friendly areas" through changes to land use, by itself, it does not guarantee that the housing will actually be built. To ensure climate-friendly areas result in actual production on the ground, implementation will need to ensure the designation of these areas is consistent with funding and policy actions identified in the local Housing Production Strategy. This will include a variety of strategies, ranging from reducing regulatory impediments to providing financial incentives, to support the production of housing in these communities and pair them with the needed investments in infrastructure, transit, and amenities to ensure these communities foster affordability, choice, and resilience in the future.

Wildfire Adapted Communities

As directed by Senate Bill 762, DLCD has published a Wildfire Adapted Communities Recommendations Report for consideration by the Oregon Legislature during the 2023 legislative session. The recommendations focus on potential ways the statewide land use planning program and local comprehensive plans and zoning codes can minimize risk, even as the frequency, intensity, and duration of wildfires continue to increase.

The wildfire report is complementary to this report, providing six recommendations and multiple implementation alternatives intended to increase the resiliency of communities. The emphasis of the report is *not* to prohibit the production of needed housing, but rather, to facilitate development in a manner that reduces wildfire risk and minimizes loss of life and property. Protecting existing homes from wildfires is necessary to prevent housing shortages in fire prone communities. DLCD's recommendations build on the protections recently adopted by the Legislature in SB 762 to minimize the spread of wildfires at the community and neighborhood level, thus further reducing the risks to individual homes and development.

Housing Preservation

This recommendations report makes clear that in order to address the housing affordability crisis Oregon faces today, state and local governments need to plan for substantially more housing and focus policy and funding interventions on increasing housing production. However, an important strategy to support affordability and promote housing stability is the preservation of existing housing supply, especially "naturally-occurring affordable housing" – housing that is relatively affordable without subsidy.

While the recommendations emphasize the need to focus on housing production at all levels of government, the framework should also facilitate the preservation of naturally occurring and subsidized affordable housing that would otherwise be lost to age or demolition. To do this, state and local policies should incentivize and encourage the rehabilitation or adaptive reuse of aging properties while focusing redevelopment on areas with lower risk of displacement, such as in underutilized parking lots or vacant large-scale retail/office sites. The housing capacity recommendations included in Appendix A include several recommendations that incorporate these principles in the local implementation of housing production strategies.

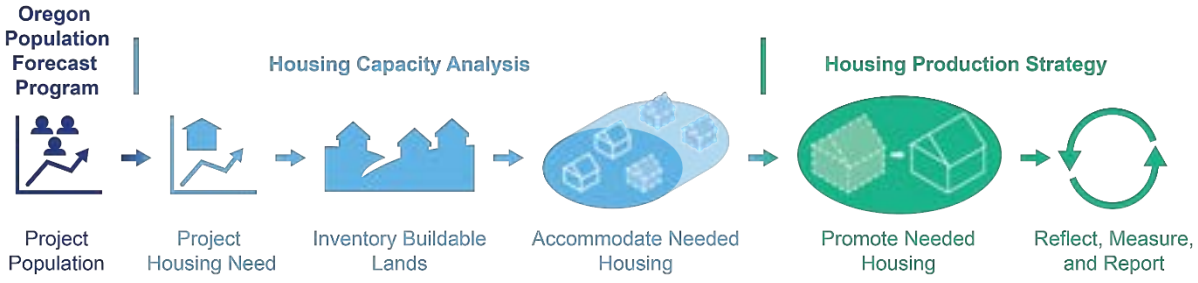
1.4 Streamline land capacity and urbanization processes to expedite well-planned expansions.

A renewed commitment to implementing Goal 10 for housing requires careful consideration of the relationship to Urban Growth Boundary (UGB) expansions. It is important to note that the adoption of OHNA-generated production targets and Housing Production Strategies are required for cities over 10,000, regardless of their existing built conditions and expansion context. In other words, jurisdictions that have achieved some level of infill or are "land-locked", i.e., physically unable to expand their UGB, will still be responsible for a share of the overall need.

UGB amendments are an existing tool to increase the supply of development ready land. Between 2016 and 2021, there have been a total of 35 successful UGB amendments (out of 37), 13 of which were to accommodate residential land needs.[12] Increasing housing supply and providing affordable options will require a combination of planning and policy actions at all levels, and when warranted, this should continue to include UGB amendments. To facilitate a smoother UGB amendment process, this report includes nine recommendations (see page 28) that increase the capacity and flexibility for local jurisdictions to pursue UGB amendments, reduce the likelihood of appeal or challenge of UGB decisions, and better prepare land within the UGB to support housing production.

Under the current system, jurisdictions conduct a Housing Capacity Analysis (HCA), which consists of two major components: a 20-year housing needs projection and a Buildable Lands Inventory. These two analyses answer a critical question: "Is there enough land within the UGB, zoned to sufficient capacity, to accommodate twenty years of projected growth?" If there is a deficiency of land, a jurisdiction must adopt measures to accommodate needed housing. First, the jurisdiction must adopt "efficiency measures," which are policies that increase development within a UGB. If a jurisdiction cannot reasonably accommodate needed housing within a UGB, the jurisdiction must expand its UGB, conducting a locational analysis under Goal 14 to determine which area would best suit the identified need.

Figure 3. The Current Goal 10 Process



The current process requires a local jurisdiction adopt a housing capacity analysis that projects past conditions into the future to determine whether increasing zoned capacity is necessary.

[12] Department of Land Conservation and Development. *Urban Growth Boundary Adjustments 2016-2021.* Accessed via: https://www.oregon.gov/lcd/UP/Documents/UGB_Amendments_2016-2021.pdf

Housing capacity analyses have emphasized characterizing density and counting the hypothetical capacity of lands for housing at the expense of supporting the actual production of housing. The consequence of this dynamic is that, while jurisdictions have substantial land and zoned capacity on paper, this land is not readily developable and housing production slows as available land supply becomes increasingly more costly to serve and prepare for development.

To put the emphasis on housing production, we recommend shifting the focus of land use efficiency measures from a Housing Capacity Analysis limited to analyzing the potential of lands for providing housing to the Housing Production Strategy (HPS) for cities over 10,000, which includes measures to support housing production, prepare land for development, and increase housing efficiency and diversity. Making this change in the HPS can serve a dual function, providing a policy and planning roadmap for housing production while also making the Goal 14: Urbanization process for land supply simpler and more efficient.

With the HPS at the center of housing implementation, communities can consider plans and policies specifically in terms of meeting their housing production goals. Cities can consider where it makes sense to upzone or rezone, where they should make capital investments in community amenities, where they should focus investments in low-cost market rental preservation efforts and affordable housing production, whether they can streamline their regulatory process to reduce costly delays in permitting, and what kinds of housing types match the OHNA-derived need, to name a few examples. Cities can then adopt these updates into local planning documents, ordinances, and/or comprehensive plans.

Leading with production requires some adjustments to the sequencing of Goal 10 compliance within Oregon's land use program. The current system begins with a local, city-based analysis to determine how many new households might demand housing in the future, translates that demand into unit types and income categories based on past development and demographic trends, and then determines whether there is sufficient land supply to meet the estimated future demand. Further, the method of analysis often varies by jurisdiction, meaning that local projections are not consistent and standardized across the state. When there is a gap, this is addressed either through land use efficiency measures such as rezoning and/or by expanding the urban growth boundary. Local governments often make this determination without consideration of the broader regional housing market, where economic growth is anticipated in the future, the current level of housing choice afforded in the region and other regional demographic distributions, desired equitable outcomes, fiscal impacts, or other systemic effects.

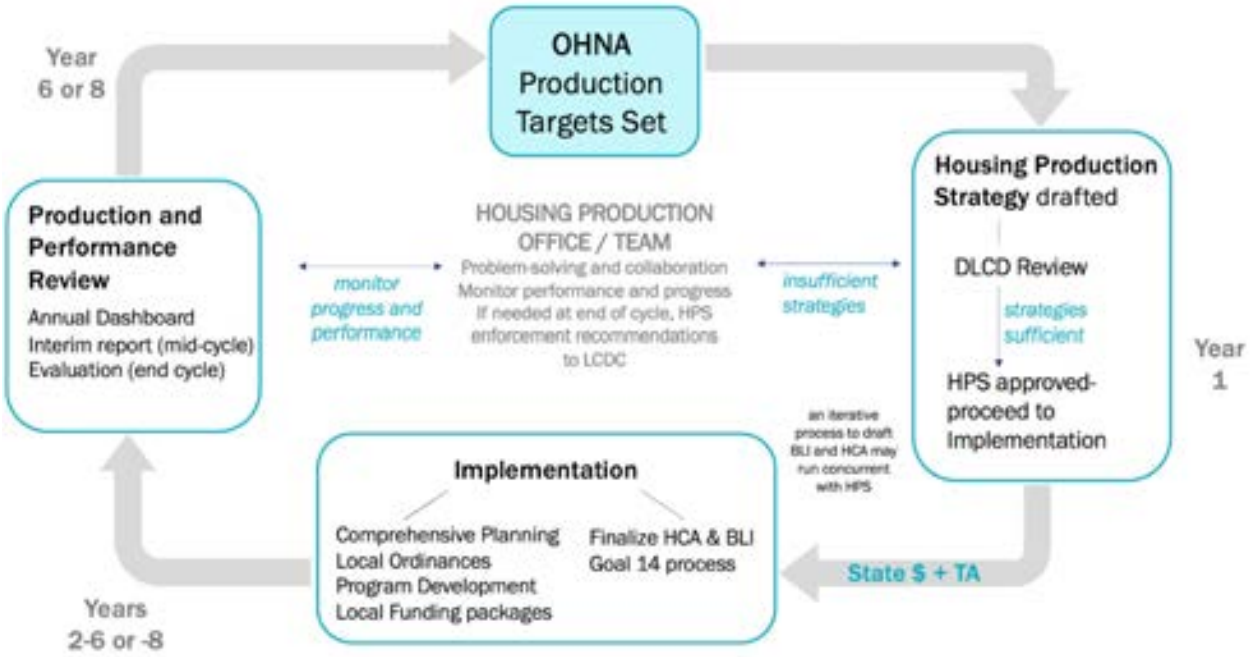
This means that production strategies are only factored in after the jurisdictions have forecast and planned for housing types and determined the need for additional land supply. The process does not take into account the impact that Housing Production Strategies – such as easing regulatory restrictions, minimizing procedural delay, preparing land for development, or increasing housing choices allowed in communities – may have on future development patterns.

This recommendation merges these two processes so OHNA targets inform HPSs, and implementation of those strategies can shape HCAs. In this way, HPS outcomes will inform

future Buildable Lands Inventories (BLIs) and HCAs. While in practice the two processes may inform one another, conceptually, it is helpful to consider this improved Goal 10 implementation process as a cycle in which we transform a negative feedback loop to positive by centering housing production targets. This outcome-focused and comprehensive housing production system will be implemented on a rolling basis, with new targets provided in each planning cycle. If a city is meeting the need and its rates of housing underproduction and cost burdening are declining, its future targets will reflect that progress.

Overall, these process revisions serve to streamline work for local governments by increasing certainty in land supply decisions, providing common datasets that are produced at the state level rather than locally, and creating a space for productive policy discussions in the HPS that are tied to a clear, measurable set of outcomes and targets.

Figure 4. Revised Housing Production Strategy Review Process



House Bill 5202 - Housing Capacity

This recommendation includes a series of refinements to Goal 10 and Goal 14 developed in consultation with a Housing Capacity Work Group, convened by DLCD in response to Legislative direction under House Bill 5202 (2022). Through this process, DLCD has identified a total of nine recommendations to streamline the HCA and UGB amendment process. The net effect of these recommendations would increase local capacity, reduce administrative burden, increase legal certainty, and build on existing tools to facilitate the timely expansion of UGBs and prepare land for development and redevelopment. These recommendations are summarized below. Specific housing capacity recommendations are included in Appendix A. Housing Capacity Recommendations included in this document and are also integrated with the policy outline included in Appendix C.

A. Better Utilize Land within the UGB

1. Enable the adoption of "efficiency measures" in the Housing Production Strategy, enabling a jurisdiction to adopt efficiency measures in advance of a UGB amendment.
2. Direct LCDC to adopt administrative rules and guidance on the local implementation of efficiency measures that support housing production and affordability, prioritizing the following outcomes:
   - Credit recent local implementation of statewide policy initiatives related to housing
   - Increase housing diversity, efficiency, and affordability
   - Enhance flexibility in housing choice and location
   - Reduce cost or delay and increase procedural certainty for housing production
   - Incentivize preservation and stability of naturally-occurring affordable housing
   - Prepare land for development and redevelopment, including underutilized commercial or employment lands

B. Streamline Establishing Need for a UGB Amendment

3. Amend the "needed housing" statute (ORS 197.303) to replace local housing needs projections with the OHNA and provide greater local discretion to plan housing types and characteristics in response to need and market feasibility, rather than primarily on past development trends.
4. Amend the "buildable lands" statute (ORS 197.296) to reflect a more realistic estimation of 20-year residential land supply and provide more options to discount land that is unlikely to develop.
5. Direct LCDC to refine administrative rules related to buildable lands inventories to provide more methodological options for local jurisdictions to estimate land capacity.

C. Streamline Regulatory Review of UGB Amendment

6. Adjust the "urban reserve" statute (ORS 197.145 and 197A.320) and related administrative rules to increase flexibility and ease of local implementation.
7. Facilitate the existing UGB land exchange process to remove lands within the UGB unlikely to develop within twenty years, while adding land that is more likely to develop.

D. Increase Local Capacity & Support

8. Appropriate funding to support local urbanization planning, including UGB amendments, UGB land exchanges, public facilities planning, urban reserve, and concept planning, prioritizing supporting smaller and more rural communities.
9. Focus new housing staff requested in DLCD's Agency Request Budget to focus on urbanization and public facilities planning to support local governments with analysis and technical assistance, prioritizing supporting smaller and more rural communities.

Additional Policy Considerations - Small-Scale UGB Amendment

The nine recommendations listed above reflect a substantial set of reforms developed in a very short timeframe prescribed by the Legislature. Critically, these recommendations reflect a series of refinements that have pretty broad support among stakeholders, even among those who often substantially disagree on urbanization-related policy. However, it is important to acknowledge that discussions surrounding urbanization are often significantly contentious, and given the short duration of the legislatively-prescribed deadline, DLCD staff recognized that consensus building for every policy option would be challenging.

DLCD staff believe that a core intent of the Legislative direction provided under HB 5202 required bona fide discussion on potential policy options that could reduce local analytical burden in pursuing a UGB amendment in exchange for delivery of statewide housing goals. The Legislative direction driving this work under HB 5202 is a direct response to a bill considered in the 2022 Session, House Bill 4118, which proposed requiring approval of UGB amendments in response to housing proposals affordable to households earning at or below area median income.

This proposal reflects a broader legislative discussion surrounding this kind of policy. Previously, House Bill 4079 (2016) was initially adopted to evaluate the barriers to affordable housing production arising from the UGB amendment process, and whether a removal of that process (with limitations) would stimulate provision of affordable housing. This legislation enabled two cities (later three) to pursue a UGB amendment without completing a Goal 10 and Goal 14 analysis for a qualifying proposal. To date, two of the three cities (Bend and Redmond) are in progress, but have not yet completed, projects, and the third (Pendleton) has not begun its process.

These policies, and similar policies modeled after these bills, were substantially contentious among work group members. In particular, many members raised significant concern about a potential bypass to the urbanization system that undermines the land use planning program at large, while other members maintain that a pathway could leverage the urbanization process to support statewide housing affordability goals.

While the short timeframe associated with the process was insufficient to establish a fully-developed and viable policy option with substantial buy-in from stakeholders, DLCD staff learned many important takeaways that warrant inclusion in this report. First, it is important to emphasize that **whether to advance a policy option that provides a streamlined UGB amendment in exchange for delivery of affordable housing is a legislative decision**. Should the Legislature decide to pursue this option, there are several considerations to improve its implementation, effectiveness, and political viability. This includes:

1. **A requirement for deed restriction guaranteeing delivery of affordable and diverse housing options in exchange for regulatory flexibility**. The Legislature would need to determine the types of housing outcomes that the pathway should require. Examples include:

- Regulated affordable housing for low-, moderate-, and mixed-income housing, including affordable rental, homeownership, and cooperative ownership housing.
- Diverse housing options the market is unlikely to produce, including manufactured, middle, and multi-family housing.

2. **Regulatory streamlining that reduces the analytical burden for small and capacity-constrained local jurisdictions** utilizing the pathway. Example approaches include:

   - A "shifted burden" approach, in which submittal of a qualifying project triggers a requirement for DLCD to conduct a limited Goal 10 and 14 analyses within a specified timeframe.
   - A "limited analysis" approach, in which a subset of jurisdictions identified as facing significant growth and affordability challenges under the OHNA qualify for a limited site alternative analysis, weighing priority and locational factors for several potential development areas.
   - An "analysis waiver" approach, in which small jurisdictions with constrained planning capacity submitting qualifying proposals would not be required to prepare Goal 10 or Goal 14-related analysis for limited UGB amendments, subject to a cap on the number of UGB amendments within a 5-year period.

3. **Limitations on the scope, scale, and applicability of the pathway.** Examples include:

   - Jurisdiction applicability, considering:
     - Population – The policy should emphasize providing an additional option to small jurisdictions with limited staff capacity and resources, not to larger jurisdictions with more capacity and resources to pursue a standard UGB amendment.
     - Population growth and cost burden – With the implementation of an OHNA, it is possible to measure and identify fast growing communities facing significant cost burden, enabling the option in communities where it is most needed.
     - Geographic or regional limitations – The policy should consider the exclusion of areas with significant concerns about the loss of resource lands, such as the Willamette Valley.
     - Frequency of use – The policy should have a limit on the frequency of use to ensure it does not overwhelm staff capacity or bypass the standard urbanization process.
   - Site applicability, considering:
     - Site size – There should be some upper acreage threshold for qualifying projects included in the policy. Examples of commonly suggested acreage thresholds include up to 50 or up to 100 acres.
     - Resource land exclusion – The policy should prohibit the inclusion of high-value farmland lands from the pathway and consider requiring a streamlined Goal 14 priority analysis. As discussed previously, the policy should consider excluding geographic areas where preservation of resource lands are a higher priority.

Recommendation 2) Build what's needed, where it's needed

Overview: Addressing housing need at all levels

On its own, the market will not meet the housing needs of all Oregonians. Housing for the lowest income Oregonians will always require public support, and the funding gap for meeting that need is daunting. Additionally, in most parts of the state, denser development, infill development, smaller product types, development in rural communities, and redevelopment of underutilized or contaminated parcels are harder for developers to get permitted, successfully finance, and feasibly build. These units are very important to meeting overall housing need, as they provide important workforce housing and homeownership opportunities, and help build climate-resilient communities and add needed units to an undersupplied market. Overall, approximately 49% of Oregon's needed housing over the next 20 years will require some public subsidy.

In many areas, denser development, infill development, smaller product types, and the redevelopment of underutilized or contaminated parcels are harder to build and require public subsidy.

While housing generally becomes more affordable as it ages, we cannot count on this process for several reasons: (a) it can take generations to reach lower affordability levels, (b) it almost never produces safe, adequate housing for the lowest income levels, and (c) it can halt or even reverse (for example, through gentrification) when a market is undersupplied.

Digging out of our housing deficit will require ongoing funding support from the Legislature that includes and extends beyond the traditional categories of affordable housing. Investments should be targeted to the development types that the market would not otherwise produce on its own, such as those listed above. **Without strong public investment in housing development, implementation of the OHNA will simply help us do a better job counting what we do not build**.

2.1 Commit sustained, coordinated investment

While simplifying and rationalizing our planning system is an important piece of the puzzle, there are many other significant barriers to housing production that communities face. Private market housing providers are not able to provide housing affordable to lower income households without subsidy, and local governments will need new tools to take on an expanded role in housing production. Success requires a new and expanded partnership between the state and local jurisdictions. Without significant state investment, OHNA implementation will likely be understood as an unfunded mandate that fails to provide the necessary conditions for local governments to comprehensively address housing need.

Oregon needs to produce about 27,000 housing units annually to meet the 20-year statewide production targets. In recent years the state has only produced 15,000-20,000 units per year.[13] To

[13] Source: U.S. Department of Housing and Urban Development's State of the Cities Data Systems (SCODS) database on Oregon housing permits. Between 2014 and 2021 annual permits have ranged from about 15,300 to 19,100 statewide.

close this gap, we need to look at which investments are best suited to overcome market barriers at all income levels with particular attention to the needs of historically underserved Oregonians.

Publicly Supported Affordable Housing

The most challenging unmet need to address is at the lower end of the income spectrum of households earning less than 60 percent of area median income (AMI). While public support is needed for many types of development, it is most acute to produce about 9,000 units per year that are affordable to low-income households. Lower-income Oregonians are affected most severely by the housing shortage and live with the greatest housing instability. This intervention point has the most urgent need for additional direct subsidies and support.

As the state's affordable housing financing agency, OHCS's funding mechanisms and allocation methodologies rely on complex and layered data and evaluation criteria designed to target resources toward strategic policy objectives. OHCS already prioritizes housing need in its allocation methodologies and can use the OHNA data to ensure that affordable housing production is equitably distributed across the state.

Affordable Housing Financing in Oregon is Changing

Affordable housing finance relies on layering local, state, federal, and philanthropic resources along with private equity and debt to fund development. These layered resources are necessary because the rents that are affordable to the intended tenants are below what it costs to develop and operate the property, leaving a "funding gap." This gap requires public subsidy or low-cost financing to pay for construction and ongoing operations along with large levels of mortgage or debt service payments.

To bring the impact of state resources to scale, OHCS has worked to maximize the use of federal Low Income Housing Tax Credits (LIHTCs) that are generated when the project includes financing with federally allocated Private Activity Bonds (PABs). Long an underutilized program, recent state and local investments in affordable housing were deliberately structured to leverage this 4% LIHTC and have successfully delivered new development. This increases utilization of the 4% LIHTC program has exhausted all built up capacity for the Private Activity Bond resource.

While the 4% LIHTC program will continue to operate and be a source of leverage for state Local Innovation and Fast Track (LIFT) investments, it is not a program that can continue to expand beyond that allowed by the annual federal Private Activity Bond authority allocated to Oregon. This means that the 4% LIHTC program cannot be used to increase the current rate of affordable housing development and future gap funding from the state or local jurisdictions is going to require either much higher per unit subsidy rates or some other source of fund leverage.

OHCS has managed unprecedented levels of investment in affordable housing

Despite federal constraints, OHCS hopes to continue recent momentum in affordable housing development. A major component of this is through a 2023-2025 funding request to the Oregon Legislature that includes $160 million for LIFT rental housing production and another $65 million for affordable homeownership. This would help create an estimated 1,200 rental units and 280 homeownership units, which, combined with the leveraging of available federal funds, would develop an estimated 4,000 new affordable homes for rent or purchase over the biennium. Additionally, OHCS is requesting more than $260 million to support affordable housing development and preservation of affordable homes. Even with this significant investment request, these resources are primarily required to continue funding at the level of recent years and will unfortunately fund less than a quarter of the documented need.

In summary, the landscape for affordable housing funding in Oregon has changed, and action at all levels of government is necessary to meet the moment and provide the funding required to continue developing the level of affordable housing needed by low-income Oregonians.

Additional funding for affordable housing development is critical to meet the needs of Oregon's lowest-income households. The Legislature should consider the investments included in OHCS' 2023-25 Agency Request Budget as an absolute minimum to maintain current production levels, which fall far short of actual needs as outlined in the OHNA. More resources from the state will be necessary to make more progress towards meeting these needs, the funding is only a part of the solution.

Federal caps on LIHTC and PABs currently limit the ability to utilize state and local funds most effectively. The Oregon Legislature must look to Congress as vital partners in housing solutions and pursue changes that will maximize the benefit of state and local investment. Legislation such as the Affordable Housing Tax Credit Improvement Act would, among other things, make technical adjustments to the PAB and 4% LIHTC program that would foster equity investment from the private sector into affordable housing developments and effectively stretch state investments further to allow for greater production. Combining federal action with more state resources for LIFT or other OHCS funding programs would have a substantial positive impact, augmenting unit production in the state beyond even the unprecedented growth in recent years.

Other types of support

Chronic underproduction has made it much harder for more people to afford the cost of housing. This now extends well beyond the traditional categories of publicly supported housing and affects higher income households as well. We need to pursue innovative tools that more effectively work with the market to support development types that might not be feasible. This can be especially true in smaller cities and more rural markets where infrastructure and land readiness costs are prohibitive for local budgets.

At a minimum, we recommend that the state coordinate existing funding sources that are currently distributed across many agencies and ensure that they are leveraged toward the goal of housing production. For example, Business Oregon already distributes some funds for the

purpose of infrastructure development, and recently produced an economic recovery plan that highlights workforce housing as a major impediment to achieving resilience in the business community. The Oregon Department of Transportation acquires land as it invests in transportation infrastructure, some of which might be used for housing development. The Department of Environmental Quality administers a Clean Water State Revolving Fund that has recently been significantly expanded with federal infrastructure funding and could be leveraged to support housing production. There are many other examples. While coordinating these investments and activities would require administrative structures that do not exist, this strategy is the most straightforward near-term option to make progress toward production goals, in part because it does not require new revenue sources.

At the same time, we know that additional, sustained resources will be needed. We cannot meaningfully move toward meeting housing need without aggressive investment in desired housing outcomes. The following types of funding would be particularly helpful to consider. Further inquiry with developers, lenders, and other partners in the development process can help to clarify how incentive programs might best be structured, funded, and targeted to needed types.

- **Infrastructure and development readiness**. Local governments will require infrastructure investments to jump-start housing production strategies both within existing UGBs and in expansion areas. This could take the form of a revolving loan fund or grant program such as those that currently exist within Business Oregon and would offer significant incentives for jurisdictions to play a more active role in housing production. Additional funds could be made available on a competitive basis to jurisdictions successfully meeting housing production metrics, such as the number of units permitted.

  Infrastructure funds would be used to support land acquisition, parcel consolidation, and infrastructure in expansion areas. It would also be available for retrofitting infrastructure for infill development, and master planning for larger sites. This could be structured like a block grant, such as those currently available for economic development. Ideally, these funds would be distributed with limited administrative requirements required from local entities, proportionate to the need identified in the OHNA.

- **Systems development charges** (SDCs) are fees charged to new development to help cover the incremental impact of new units and households on local infrastructure. While there is no question that these fees are necessary to the viability of public infrastructure, they also increase the cost of development and can be a barrier to production. A state-level fund to buy down the cost of SDCs for both affordable and market-rate workforce housing could support development that would not otherwise occur. Such a fund would create an incentive for needed housing types without affecting the revenues that local governments depend on for basic services in their communities. By backfilling these costs, the state could help make more units viable and affordable. Additionally, this could be set up as a local matching fund to maximize available resources for the greatest impact. As a very

rough starting-place estimate, an investment of $100 million could incentivize the creation of 5,000 - 10,000 units depending on program structure, that would not otherwise be built.

- **Gap funding.** Most local governments have extremely limited capacity and few resources to take an active role in housing development. The state could help jurisdictions achieve specific outcomes in their HPSs by providing access to capital for gap funding and assistance for workforce and missing middle housing (e.g., duplexes, triplexes, cottage clusters, etc.). We recommend that the state consider a revolving loan fund, capitalized by state dollars, to help overcome local barriers to production such as site acquisition, preparation, or rehabilitation, or gap funding directly to a project that helps a jurisdiction meet its production targets.
- **Funding for implementing fair housing strategies.** Housing production is one of several tools available to help cities advance fair housing outcomes. With expanded guidance, cities may be including additional strategies that better connect people to units, facilitate homeownership, increase unit accessibility, and reduce discriminatory practices. To support policy development and implementation, some grant or technical assistance funding for local governments will be helpful. Additional incentives should be made available by the state to support affordable housing development in areas of concentrated affluence, where higher land costs are often a barrier to development. By more equitably distributing affordable housing across communities, we can work toward equitable and fair housing goals such as dismantling segregation, preventing displacement, improving homeownership opportunities, or increasing the accessibility of existing or new housing, among others.
- **Technical assistance and capacity building.** Current staffing levels in local governments would be stretched beyond capacity by realizing the shared objective of catalyzing a rapid increase in statewide housing production. This requires a significant legislative investment to support implementation of Goal 10, which would include technical assistance for locally needed plans and permit capacity to speed up the building process.

  The Oregon Office of Economic Analysis estimates that 400-500 new local planners and inspectors would be needed statewide for a 10,000 increase in annual housing starts. Currently, many cities fund their permitting staff at least in part through permit fees charged on development. This means that cities must staff up quickly when the development market picks up and may have to lay off staff when development cools. This is highly inefficient and can lead to permitting delays. Additional funding for permitting staff, perhaps conditioned on decreased permitting fees to development, could help overcome this challenge.

  Additionally, the transition to an implementation-focused system suggests the addition of other types of local government staff, including planning staff who can create actionable Housing Production Strategies and coordinate policies and investments to support production. In the previous biennium alone, a historic investment from the Legislature in housing planning totaling $4.5 million supported 92 housing-related

projects in 75 jurisdictions. This translates to $1 million of investment supporting roughly 20 new housing projects in about 15-20 communities. DLCD has submitted an Agency Request Budget to establish a continuous biennial budget of $2.5 million for direct planning assistance to local jurisdictions in order to implement legislative housing direction. More funding support will directly result in increased local capacity to work on housing production, especially in small communities, and is an essential signal that the state is a true partner in housing production.

2.2 HPS implementation should advance fair housing outcomes

While housing abundance is a necessary precondition to housing equity, it is insufficient on its own. The people who are suffering most acutely from our housing shortage are disproportionately lower income and communities of color. They cannot be asked to wait another decade or more for Oregon to reverse the discriminatory policies and practices that have limited housing options for generations. Meaningful implementation of Goal 10 must provide a range of housing types for all income levels, distributed equitably around and within each region of the state, and for people of all ages and abilities. This provides access to employment and critical services and reduces the overall cost-burden to families and individuals. Centering the HPS in our Goal 10 system creates a new space for communities to address these issues directly.

Housing Production Strategies can serve as an important tool available to cities to help advance fair housing outcomes. Improved guidance to cities can help them consider how policies that influence housing production and the built environment intersect with fair housing outcomes. DLCD can begin by connecting existing, but currently separate, guidance regarding gentrification and anti-displacement into the HPS process, and cross-walking other existing guidance to more clearly demonstrate how the recommended tools can support land use efficiency.

Fair Housing Considerations

The Fair Housing Act prohibits discrimination in housing because of race, color, national origin, religion, sex (including gender identity and sexual orientation), familial status, or disability status.[14] Oregon's laws also protect people from discrimination based on source of income, domestic violence survivorship, and marital status.[15]

Furthermore, the Fair Housing Act requires the U.S. Department of Housing and Urban Development (HUD) and its recipients of federal financial assistance to Affirmatively Further Fair Housing, which means they must "do more than simply not discriminate… take meaningful actions to overcome patterns of segregation and foster inclusive communities."[16]

OHCS, Business Oregon and the Oregon Health Authority receive federal funds from HUD and as such have an obligation to affirmatively further fair housing. These agencies work together to comply with this mandate by engaging in fair housing planning through a process called the Analysis of Impediments to Fair Housing Choice every five years.

The OHNA housing equity indicators are intended to help provide standardized data across Oregon communities to monitor housing outcomes on a range of equity and fair housing concerns. The goal is that this data will help jurisdictions in their fair housing and equity reporting requirements and help communities track progress and hold jurisdictions and the state accountable with easy-to-read annual reports on progress.

In addition, these recommendations align local actions in a Housing Production Strategy with the Fair Housing obligations of combating housing discrimination, overcoming patterns of segregation, and fostering inclusive communities free from barriers that restrict access to opportunity.

In developing HPSs, local jurisdictions and state partners will need to consider which actions to deploy in which places to generate the desired outcomes, such as assessing where upzoning can help to undo patterns of exclusion and underproduction, or where is it necessary to consider stabilization and anti-displacement measures. These issues can be addressed using a decision-making framework similar to the example below. In the near term, jurisdictions can estimate current levels of production and patterns of growth using their permit data, recent HCAs, or other easily available sources. Over time, the OHNA will provide data to help jurisdictions understand what actions are most effective in individual census tracts and within jurisdiction as a whole.

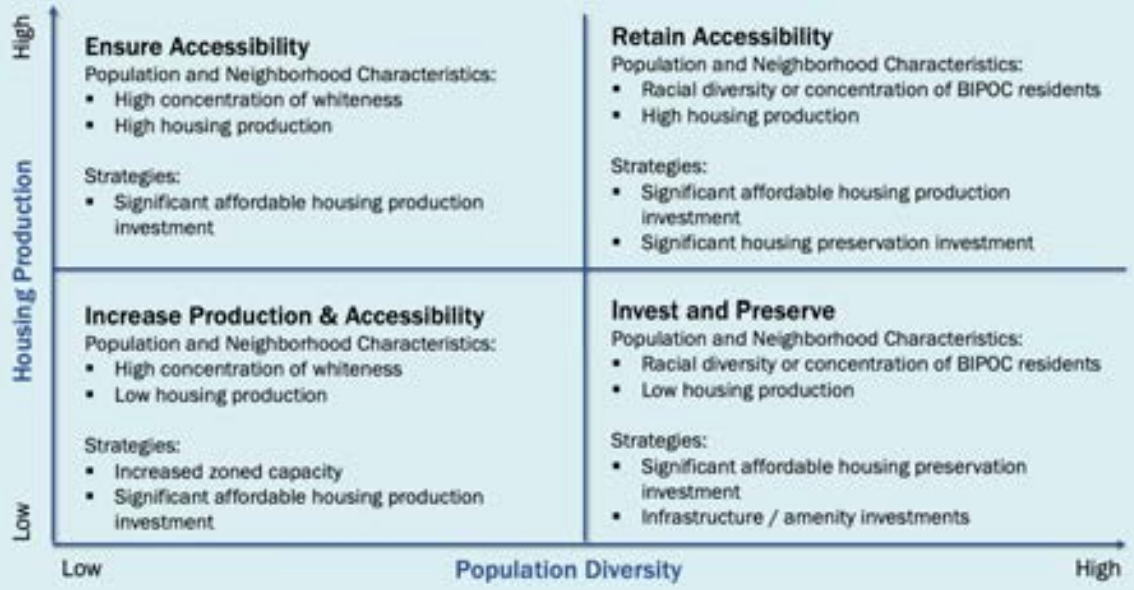
Example Fair Housing Framework

Figure 5. Example Framework to Determine Strategies Needed for Fair Housing Production



The framework in Figure 4 is one way to think about organizing that guidance. On the vertical axis, the framework conceptually shows a range of housing production outcomes, from low production in slower growing or constrained environments to high production. On the horizontal axis, it conceptually shows community diversity, from low diversity, where there is a relative concentration of whiteness, to high. The fair housing challenges and solutions vary in each quadrant and so must the strategies. For example, areas with a high concentration of white households and corresponding concentration of affluence that have low housing production (in the bottom left-hand corner), restrictive zoning is likely reducing development capacity and should be increased. In the opposite corner, relatively high diversity combined with high housing production suggests a strong need for anti-displacement strategies and investment in preservation.

It is possible to place communities – either entire cities or census tracts – in these quadrants to provide a key input to cities as they complete their HPSs. The technical report included in Appendix D outlines recommended changes to the OHNA Pilot Methodology will provide more details and examples. Many of the tools that might be applied to fair housing outcomes are already listed in HPS guidance but are not clearly cross-walked to desired policy outcomes nor to the market characteristics that are likely to drive neighborhood change.

As described in the funding recommendations above, local governments will need new tools and technical assistance to plan and implement specific programmatic improvements aimed at fair housing outcomes and anti-displacement and gentrification. This could take the form of a specific housing equity fund.

Recommendation 3) Commit to working together with urgency

Overview: Dedicate state level staff to oversee and support housing production across the entire market spectrum

Currently, there is no specific agency of state government responsible for overall housing production, and many of the available regulatory tools are better suited to preventing unwanted developments than to encouraging those that are needed. As a result, the policy response to the current housing shortage has been disjointed, with siloed policy discussion and action occurring at several agencies without meaningful, systemic coordination between them or with local and regional partners.

A comprehensive, production-focused system needs leadership and coordination across the many entities engaged in some aspect of housing production. Simply put: someone needs to be in charge, to: (1) ensure coordination of available funding sources and regulatory authorities (currently spread across many agencies) toward meeting production targets, and (2) implement the OHNA model, including ongoing management of the data that measure progress toward targets.

Figure 6. State agency roles in housing production.

Agency	Roles in Housing Production
Oregon Housing and Community Services	Affordable Housing Finance, Fair Housing
Department of Land Conservation and Development	Planning & Zoning Rules, Public Facilities Planning, Land Use Regulation
Department of Administrative Services	Economic Analysis
Oregon Department of Transportation	Integrated Transportation and Land Use, Transportation Infrastructure and Planning
Department of Environmental Quality	Water and Wastewater Infrastructure, Environmental Regulation
Business Oregon	Infrastructure & Capital Improvements Funding, Economic Development, Community Development Block Grants, Brownfields Redevelopment
Bureau of Labor and Industries	Occupational Licensing, Fair Housing
Department of Consumer and Business Services	Building Codes, Lending & Financial Regulation

3.1 Develop a coordinated statewide administrative structure

Coordinated statewide action would require sufficient authority to (a) convene agency leadership, (b) develop and refine policies to achieve desired housing production outcomes, (c) administer programs with accountability in housing production as well as fiscal and budget, contracting, HR, and IT services, (d) provide specialized housing production expertise to local partners, (e) direct funding for housing and public infrastructure, and (f) provide regular reporting to the Legislature and Governor's office.

Recognizing an urgent need to begin addressing housing production barriers, we recommend establishing an interagency Housing Production Team and administrative leadership position. The leadership of this team should be housed at the coordinated statewide administrative entity, and staff assigned to the team should be drawn from multiple agencies, leveraging the expertise and programmatic knowledge of each agency. This team should respond to a legislative mandate that directs agencies to coordinate their existing and potential new funding sources and regulatory authorities toward the goal of housing production. This provides a clear focal point for communicating and partnering with local governments.

The Housing Production Team should have (or be able to contract for) expertise in affordable housing finance, market rate development, permitting and building code, land readiness, fair housing law, community engagement, and development policy analysis. The team would deliver a commitment to federal and state requirements for fair housing, including anti-displacement tools and other housing equity strategies. This would also facilitate better coordination of housing production with broader policy initiatives, including transportation, equity, infrastructure, environmental quality, and climate. This team would function in two ways:

A. As technical experts that can be called on to address specific site development challenges or policy questions in partnership with local governments. Local jurisdictions face numerous constraints that inhibit the development of sites that would otherwise support housing production and receive minimal support from the state in technical or financial assistance to address such constraints. This team would provide varied and specialized housing production expertise that can diagnose and overcome development barriers through policy and investment interventions. It should also be able to deploy technical assistance and consultant support to ensure that it can help unstick complex development sites or evaluate thorny policy questions.

B. As an accountability and review team, to oversee progress toward goals in HPSs. The team would recommend actions that may be missing in local strategies or need more attention on a regular review cycle. In its accountability function, we recommend that the inter-agency Housing Production Team incorporate the existing staff review of HPS documents. This will enable the team to partner with local jurisdictions on specific actions identified in the HPS to ensure they have the resources and state coordination needed for implementation. If necessary, they would also be able to recommend enforcement orders for cities that are not meeting targets and are not taking sufficient action to address those deficits.

Implementing the OHNA will require a high degree of trust, communication, and transparency, as jurisdictions become accustomed to the new methodology. The establishment of a coordinated statewide administrative structure and Housing Production Team may necessitate phasing, recognizing the substantial challenge of reorganizing power and responsibility among state government agencies. We recommend further discussion around the best models for building confidence, such as community and stakeholder engagement, contracting of experts in the field, and regular reporting to the Legislature.

3.2 State and Regional Continuing Policy Action

The goal in centering housing production and outcomes in Goal 10 implementation is to remove barriers to housing development and to align capacity for better outcomes. This is true at both the local level and across state and regional government. To ensure that we are bringing all resources to bear in addressing the housing crisis, we recommend that the state and Metro Regional Government adopt action plans similar to HPSs that would:

- Define new regional and state actions to meeting need, such as the LIFT affordable housing development program or Metro's voter-approved measures for affordable housing and permanent supportive housing
- Identify existing resources that could be invested or leveraged for better outcomes
- Coordinate with local implementation
- Report to legislature on regional and state progress
- Identify new opportunities for action

In contrast to locally-adopted HPSs, the action plan that Metro adopts must recognize the coordinating role that regional governments play in housing planning. Rather than adopting specific policies, such as local zoning codes and regulations, regional housing coordination strategies should emphasize the collaborative actions among local governments that can be facilitated regionally. For example, regional housing coordination strategies could include identifying shared funding sources, sharing staff capacity, or entering intergovernmental agreements to promote housing production.

While we recommend that Metro be required to periodically complete such a strategy, counties and other regional entities should be able to opt-in and collaborate with cities, especially those with populations under 10,000, making them eligible for funding, capacity, and resources to address shared housing priorities. This would be especially helpful in smaller, more rural communities.

At the state level, the administrative entity described in Recommendation 3.1 should periodically complete a coordinated state HPS. Such a requirement would help address significant data gaps and follow up policy work. At present, we do not have an accurate picture of how much housing exists or is being produced statewide. An Oregon HPS would create a baseline understanding and data standards to track new production and the equitable distribution of housing options. This would allow for comprehensive tracking of the state's progress towards closing the gap in underproduction.

Additionally, many of the policy issues DLCD and OHCS heard through engagement require follow-up and collaboration with other state agencies. See Appendix B for a detailed list of DLCD's follow-up policy work. These and other areas of follow-up work highlight the need for a statewide HPS in which the state is consistently working to promote housing production and evaluate progress towards equitable outcomes.

III. Conclusions and Next Steps

Housing underproduction is a systemic, nationwide challenge that has been decades in the making. Nearly every state has failed to produce enough homes to meet the need. In this respect, even with its comprehensive land use program, Oregon is not unique. Along with the other coastal and intermountain west states that have seen rapid population growth, Oregon's situation is dire. We rank fourth worst in states in terms of underproduction as a share of total housing units, better only than California, Colorado, and Utah.[17]

This crisis is felt throughout Oregon, whether in large urban areas with skyrocketing rent and home values, in more rural communities struggling to find construction workers and developers, or on the coast where the local workforce competes for housing with short-term rentals. While some important details remain to be resolved in the coming months, we believe that these recommendations will position Oregon to make the systemic changes necessary to confront this challenge.

Few policy imperatives are more important to Oregon's future than increasing the pace of building new homes. Housing production is essential for Oregon's economic competitiveness, helping families prosper, and improving community resilience. Simply producing the units needed to meet current demand could generate up to $40 billion in additional economic growth, a boost that would benefit us all.[18] Achieving this will take hard work, coordinated action and investment from many partners in the public and private sectors, and at the state, regional, and local levels.

The recommendations described in the pages above are complex and comprehensive. Implementing them will require significant investments, changes to state statute, rules, and guidance, and will likely need to be sequenced over more than one legislative cycle. To make near-term progress on their implementation, we recommend that the Legislature consider bills that advance the bipartisan goal of building more homes, as follows:

A. **Redefine Oregon's Planning Process for Housing.** The state should establish the OHNA as the foundation for Goal 10 planning processes in state statute. This should, at a minimum:

   - Adopt core components of the OHNA methodology into statute, including that the OHNA must account for underproduction and an estimate of housing needed to serve people experiencing homelessness, must be allocated based on regional incomes and job distributions, and must be reviewed and updated with appropriate new data on a regular cycle. (Recommendation 1.1)

[17] Up for Growth, 2022, Housing Underproduction in the U.S. 2022, https://www.upforgrowth.org/underproduction

[18] See footnote 2 on page 3.

- Create administrative capacity to run the OHNA and track progress toward targets on an annual basis. This could be in OHCS, or in the Office of Economic Analysis. (Recommendation 1.1)
- Direct cities to replace local projections of need in Housing Capacity Analyses with OHNA-generated 20-year need numbers, by income, produced by the state. (Recommendation 1.1 and 1.4)
- Direct cities to strengthen Housing Production Strategies by requiring actions that address housing barriers and advance fair housing outcomes (Recommendation 1.3 and 2.2) and by incorporating production targets based on the data provided in the OHNA (Recommendation 1.2).
- The state should make statutory changes necessary to make needed UGB amendments more efficient and better prepare land for development. This should include direction and funding/resources for DLCD and LCDC to continue work related to Goal 10 and facilitating timely expansion of Urban Growth Boundaries when a need is identified. (Recommendation 1.4 and Appendix A).

B. **Coordinate the state response.** The state should establish a coordinated statewide administrative structure with a Housing Production Team. If it is necessary to phase this in, a temporary Housing Production Team could be established as part of DLCD or OHCS while broader discussion occurs. The housing production issues facing many communities demand an immediate state response. This team should be deployed as quickly as possible to achieve early housing production wins by helping cities unstick challenging development sites, removing barriers and focusing state resources. Additionally, this team should be charged with developing the first ever statewide Housing Production Strategy, which will serve to shift the state's energy and efforts to this urgent challenge. Over time, as rules are developed and take effect, this team can begin to function in its review process to assist with HPS implementation and accountability. (Recommendations 3.1 and 3.2).

- Provide position authority and Legislative direction for staff at other agencies to work with the newly established Housing Production Team toward the goal of housing production. Meeting production goals will require coordinating existing funding sources to meet housing need, working across agencies to overcome site permitting challenges, and providing support to local staff to overcome affordable housing funding challenges. (Recommendation 3.1)

C. **Create innovative funding and finance solutions.** The state should establish new housing production funding mechanisms aimed at middle housing or workforce housing development. Several stakeholder forums are considering innovative funding and financing mechanisms that are resonant with the recommended fund types in this report. (Recommendation 2.1)

The process of developing a Statewide Housing Production Strategy will inevitably uncover additional changes that are needed, and iterative improvements should be expected. More work will undoubtedly be required in future Legislative sessions. The Housing Production Team may need to evolve as we learn from its initial successes. Additional funding sources are required to make meaningful progress. Further accountability mechanisms may be needed. However, the comprehensive legislative package described above would be a substantial movement in the right direction, putting Oregon on the trajectory to lead the nation with a new approach to housing production focused on meeting the needs of all Oregonians. These recommendations, and the associated increase in housing production, will only succeed with sustained Legislative leadership and action in the 2023 Session and beyond.

BEFORE THE METRO COUNCIL

FOR THE PURPOSE OF ADOPTING THE DISTRIBUTION OF THE POPULATION AND EMPLOYMENT GROWTH TO YEAR 2045 TO LOCAL GOVERNMENTS IN THE REGION CONSISTENT WITH THE FORECAST ADOPTED BY ORDINANCE NO. 18-1427 IN FULFILLMENT OF METRO'S POPULATION COORDINATION RESPONSIBILITY UNDER ORS 195.036	)	ORDINANCE NO. 21-1457 Introduced by Chief Operating Officer Marissa Madrigal in concurrence with Council President Lynn Peterson

WHEREAS, ORS 195.025 designates Metro as the local government responsible for coordination of planning activities within the Metro district; and

WHEREAS, ORS 195.036 requires Metro, in coordination with other local governments within its boundary, to issue a population forecast for the entire area within its boundary to be applied by Metro and local governments within the boundary of Metro as a basis for changes to comprehensive plans and land use regulations; and

WHEREAS, on December 13, 2018 the Metro Council adopted a population and employment forecast for the region by Ordinance No. 18-1427 (“For the Purpose of Expanding the Urban Growth Boundary to Provide Capacity for Housing to the Year 2038 and Amending the Metro Code to Conform"); and

WHEREAS, Metro planning staff have begun work on a required update to the Regional Transportation Plan, which is scheduled for adoption in 2023 and will need to rely on the most current data regarding the distribution of the forecasted population and employment growth for the region; and

WHEREAS, Metro began the process of distribution of the forecasted population and employment in November 2019 by coordinating with the 24 cities and three counties within the Metro district regarding the proposed distribution, including a series of meetings and a review and comment period designed to improve the accuracy of the distributions; and

WHEREAS, Metro staff made presentations to its advisory committees (MTAC and TPAC) regarding the distribution and coordination with local governments; and

WHEREAS, Metro incorporated comments and suggestions from the cities and counties to refine the distribution; and

WHEREAS, the forecast distributions shown on the attached Exhibit A are expressed in terms of population, households, and employment; now, therefore,

THE METRO COUNCIL ORDAINS AS FOLLOWS:

1. The distribution made to local governments, described in Exhibit A to this Ordinance and in the Staff Report dated January 29, 2021, of the regional population and employment forecast adopted by the Council in Ordinance No. 18-1427, is accepted and adopted as fulfillment of Metro's responsibilities regarding coordination of population forecasts under ORS 195.025 and 195.036 and is endorsed for use by the 24 cities and three counties as their own population and employment forecasts for their planning activities.

2. The Metro Chief Operating Officer shall make the distribution of population and employment available to each city and county in the district.

ADOPTED by the Metro Council this 25th day of February 2021.

Lynn Peterson, Council President

Attest:

Jaye Cromwell, Recording Secretary

Approved as to Form:

Carrie MacLaren, Metro Attorney

DocuSign Envelope ID: 5E925632-F777-452C-A2A5-CCC2FA1C4BD7

STAFF REPORT

IN CONSIDERATION OF ORDINANCE NO. 21-1457, FOR THE PURPOSE OF ADOPTING THE DISTRIBUTION OF THE POPULATION AND EMPLOYMENT GROWTH TO YEAR 2045 TO LOCAL GOVERNMENTS IN THE REGION CONSISTENT WITH THE FORECAST ADOPTED BY ORDINANCE NO. 18-1427 IN FULFILLMENT OF METRO'S POPULATION COORDINATION RESPONSIBILITY UNDER ORS 195.036.

Date: February 1, 2021
Department: Planning & Development

Prepared by: Chris Johnson, Ted Reid
Presenters: Chris Johnson, Roger Alfred
Ted Reid

BACKGROUND

Federal and state laws (23 U.S. Code 134 and ORS 197.040, respectively) require Metro to prepare and update a transportation plan for its metropolitan planning area every 5 years. In accordance with these laws, an update of the Regional Transportation Plan (RTP) is scheduled to begin in late 2021 with an intended adoption date of December 2023. This 2023 RTP will need to rely on a Transportation Analysis Zone[1] (TAZ) Distributed Forecast of future population and employment.

The 2045 Distributed Forecast under consideration is intended to replace and extend the 2040 Distributed Forecast, which was adopted by Metro in fall 2016. The 2045 Distributed Forecast is aligned with the Regional Forecast (seven-county area) developed to inform Metro's most recent urban growth management decision, which the Metro Council adopted in December 2018. This ensures that the 2023 RTP will be based on the best available information and that the region's land use and transportation plans are consistent.

Oregon land use laws (195.025; ORS 195.036) require Metro to coordinate its regional population and employment forecasts with local governments inside the urban growth boundary for use in updating their comprehensive plans, land use regulations and other related policies. In accordance with this law, Metro coordinated with the local jurisdictions to conduct this Distributed Forecast update for use in the 2023 RTP.

<u>The Growth Forecast Distribution Update Process</u>

This update was able to build on the lengthy review process conducted in support of preparing the 2018 Urban Growth Report. During that process, Metro conducted extensive technical engagement with its regional partners to establish the methodology used to identify the region's buildable land inventory (BLI). With the 2018 Urban Growth Report already in place, Metro was able to focus regional

[1] The TAZ is the geographic unit that serves as the building block of Metro's primary forecasting tools (the travel demand model and MetroScope). The region is divided into 2,162 TAZs. These small subdivisions improve the accuracy of the travel demand model as well as all other aspects of transportation planning. The TAZ-level data also assists land use planners in updating comprehensive plans and zoning, and conducting other types of land use analysis, including neighborhood level analysis.

DocuSign Envelope ID: 5E925632-F777-452C-A2A5-CCC2FA1C4BD7

coordination efforts on revisions to smaller-geography population and employment forecasts based on local knowledge.

Regional coordination of the updated forecast distribution included two main stages of local review.

The first stage involved Metro and local government staff working together to confirm the core inputs to the MetroScope land use allocation model. These inputs include the base year numbers for population and employment as well as the BLI that was completed as part of the 2018 urban growth boundary decision. Local government staff reviewed these inputs and made revisions based on recent zoning changes, new developments or investments within their respective jurisdictions. This review period extended from May 2017 to May 2018.

Metro staff completed modeling using the results from the first stage of local review and prepared a draft distribution of households and jobs into the region's 2,162 TAZs. To view a TAZ map, refer to Exhibit A. The local jurisdictions were then given approximately five months (February 2020 thru June 2020) to examine the TAZ-level results. Jurisdictions wishing to adjust the growth by TAZ (increase or decrease) assigned by the model worked with Metro to re-allocate that growth in a manner consistent with accepted regional figures previously adopted by the Metro Council.

Metro worked closely with a designated county lead from each county throughout a second stage of review to ensure that all participating cities understood their roles and were able to complete their reviews by the deadline. Additional meetings were held with individual county leads to review results. With assistance from the county leads, Metro was able to either accommodate each jurisdiction's proposed changes or negotiate a satisfactory revision where the full change could not be implemented. The timeline for local reviewer engagement and ground rules are described in Attachment 1.

In accordance with state law (ORD 195.036), Metro summarized the TAZ distribution (which is used in transportation modeling) into a jurisdiction-level distribution that is more understandable for local planning activities. The resulting product is the 2045 Distributed Forecast of population, households and employment to cities and counties in the Portland region and is included as Exhibit B.

Regional Planning Directors Involvement

Metro coordinated with regional planning directors throughout the Distributed Forecast update through the local review process. The names of the regional planning directors, designated county leads, and other local reviewer who participated in this process are listed in Attachment 2.

The process began with a series of kickoff meetings held in January 2020, convening the planning directors (or designated planning leads) from Clackamas, Multnomah, and Washington Counties. Each kickoff meeting reviewed the purpose, timeline, and instructions for the local review process. The county leads served as liaisons between Metro and the cities within their respective jurisdictions, providing technical guidance to local staff throughout the process and helped to coordinate the timely return of feedback. County leads also conducted reviews on behalf of several smaller cities with limited planning staff capacity.

Metro staff communicated with county leads and jurisdiction staff primarily via e-mail throughout the local review process. Metro also met with county leads and cities as needed to coordinate reviews and provide guidance during the review period.

DocuSign Envelope ID: 5E925632-F777-452C-A2A5-CCC2FA1C4BD7

Metro Advisory Committee Involvement

The Metro Technical Advisory Committee (MTAC) served as the primary advisory committee for the 2045 Distributed Forecast. A project kickoff presentation was given before MTAC in November 2019 to review the purpose, timeline, and ground rules for the local review process. Subsequent project status reports were provided to both MTAC and the Transportation Policy Alternatives Committee (TPAC) to keep both committee informed as to project progress. The final project status presentation was given to MTAC in November 2020.

ANALYSIS/INFORMATION

1. Known Opposition

There is no known opposition to the 2045 Distributed Forecast. Metro staff was able to either incorporate local jurisdictions' suggested revisions in the baseline assumptions and distributions or come to agreement on modifications to those assumptions and distributions.

2. Legal Antecedents

Consultation conducted to prepare the 2045 Distributed Forecast satisfies Metro's coordination obligations under ORS 195.025 and 195.036. As requested by DLCD, staff proposes that the Metro Council adopt the 2045 Distributed Forecast by an ordinance that will be acknowledged by DLCD as part of Metro's planning documents in order to support future planning decisions by local governments that rely upon the population forecasts. State law requires cities and counties to adopt coordinated forecasts as part of their comprehensive plans.

3. Anticipated Effects

Adoption of the updated distribution of population and employment forecast will inform the 2023 RTP and ensure that the plan is based on the most recent data available. This localized data will also encourage local governments to use the distribution information to conform their land use and transportation plans to regional policies adopted by the Metro Council. Delay of the adoption could also delay the development of the 2023 RTP and may delay some local government activities that would be accomplished with the updated 2045 Distributed Forecast information. Also note that a new Regional Forecast and subsequent Distributed Forecast will be prepared for the Metro Council's consideration as part of its anticipated urban growth management decision in 2024.

4. Budget Impacts

The FY 2019-2020 and FY 2020-2021 budgets included resources for staff in the Research Center and the Planning and Development Department to work on this project.

RECOMMENDED ACTION

Staff recommends that the Metro Council accept and adopt the updated 2045 Distributed Forecast of population, households and employment which was completed in accordance with Metro's responsibilities on population coordination with local governments in the region to inform the 2023 RTP.

Attachment 1
Distributed Forecast Engagement Plan and Ground Rules

Action	Timeframe
Notify MTAC, TPAC of 2019 distr. forecast schedule & stakeholder engagement plan	November 2019
Complete TAZ allocations – Metro staff	September – December 2019
Contact county leads – coordinate TAZ review with each	December 2019
Obtain stakeholder signatures for es-202 employment data	December 2019
Send out TAZ forecast and es-202 task reminders – finalize by end of month	January 2020
Kick-off meetings (by county) – provide forecast materials for review 1. Review UGM regional forecast drivers 2. Review 2019 distr. forecast specifications and assumptions 3. Execute es202 releases for all stakeholders with the State 4. Send out data to qualified stakeholders (excel)	January 2020
Provide any material assistance as requested by local stakeholders – stakeholders review TAZ forecast figures (jobs and households) 1. Review 2020 base year figures by jurisdiction 2. Review 2030 "mid-year" figures 3. Review 2045/50 forecast figures 4. Go over TAZ adjustment ground rules 5. Send in TAZ reviews to county leads	February – June 2020
Adjust TAZ's as needed	July – August 2020
Lock-down final TAZ forecast figures	September 2020
Forecast documentation, citation, and archive	September 2020

Although careful attention to inputs and forecasts (and MetroScope model statistics) have been exercised in preparing the distributed forecast, current conditions and future expectations may change in which we might not have been aware of during the development of the TAZ forecast. Thus we are asking stakeholders to help us refine the initial TAZ-level forecast with additional manual (if any) adjustments based on your local knowledge. In order to maintain the integrity of the forecast, we ask participants to follow these basic guidelines on making adjustments to the TAZ forecast.

Ground rules:

- Each jurisdiction has been assigned a set of TAZ's that approximate the current city limits and county jurisdiction (note: there may be rounding and estimation error / differences between city limits and TAZ boundaries that can't be avoided).
- Cities and counties are given TAZ allocations that add up to "control totals" for each jurisdiction.
    - The ultimate control total or cap is determined by Metro's regional forecast. (This is the total forecast amount for the region as a whole and adopted in the 2018 UGM decision)
    - Within the control totals for each jurisdiction, we advise jurisdictions to limit their manual adjustment (plus or minus) to each TAZ subject to recovering your control total.

DocuSign Envelope ID: 5E925632-F777-452C-A2A5-CCC2FA1C4BD7

    - If your TAZ review identifies an excess (or shortfall) in your city control total, please contact your county lead to see if there is another city in your county that has a shortfall (or excess). Your county lead can assist in manually rebalancing the TAZ totals in the county.
    - If the county adjustments exceed (or has a shortfall) the given county control total, Metro in coordination with the effected cities and counties will affect a compromise to settle the manual TAZ adjustments.
- Cities and counties have latitude to make adjustments, but Metro asks that the manual adjustments are paired with explanations as to why the adjustments are necessary.

Your assistance in this review process is important and helps make this a better forecast product. Thank you for your involvement in this process.

BEFORE THE METRO COUNCIL

FOR THE PURPOSE OF ADOPTING THE DISTRIBUTION OF THE POPULATION AND EMPLOYMENT GROWTH TO YEAR 2045 TO LOCAL GOVERNMENTS IN THE REGION CONSISTENT WITH THE FORECAST ADOPTED BY ORDINANCE NO. 18-1427 IN FULFILLMENT OF METRO'S POPULATION COORDINATION RESPONSIBILITY UNDER ORS 195.036	)	ORDINANCE NO. 21-1457 Introduced by Chief Operating Officer Marissa Madrigal in concurrence with Council President Lynn Peterson

WHEREAS, ORS 195.025 designates Metro as the local government responsible for coordination of planning activities within the Metro district; and

WHEREAS, ORS 195.036 requires Metro, in coordination with other local governments within its boundary, to issue a population forecast for the entire area within its boundary to be applied by Metro and local governments within the boundary of Metro as a basis for changes to comprehensive plans and land use regulations; and

WHEREAS, on December 13, 2018 the Metro Council adopted a population and employment forecast for the region by Ordinance No. 18-1427 (“For the Purpose of Expanding the Urban Growth Boundary to Provide Capacity for Housing to the Year 2038 and Amending the Metro Code to Conform"); and

WHEREAS, Metro planning staff have begun work on a required update to the Regional Transportation Plan, which is scheduled for adoption in 2023 and will need to rely on the most current data regarding the distribution of the forecasted population and employment growth for the region; and

WHEREAS, Metro began the process of distribution of the forecasted population and employment in November 2019 by coordinating with the 24 cities and three counties within the Metro district regarding the proposed distribution, including a series of meetings and a review and comment period designed to improve the accuracy of the distributions; and

WHEREAS, Metro staff made presentations to its advisory committees (MTAC and TPAC) regarding the distribution and coordination with local governments; and

WHEREAS, Metro incorporated comments and suggestions from the cities and counties to refine the distribution; and

WHEREAS, the forecast distributions shown on the attached Exhibit A are expressed in terms of population, households, and employment; now, therefore,

DocuSign Envelope ID: 5E925632-F777-452C-A2A5-CCC2FA1C4BD7

THE METRO COUNCIL ORDAINS AS FOLLOWS:

1. The distribution made to local governments, described in Exhibit A to this Ordinance and in the Staff Report dated January 29, 2021, of the regional population and employment forecast adopted by the Council in Ordinance No. 18-1427, is accepted and adopted as fulfillment of Metro's responsibilities regarding coordination of population forecasts under ORS 195.025 and 195.036 and is endorsed for use by the 24 cities and three counties as their own population and employment forecasts for their planning activities.

2. The Metro Chief Operating Officer shall make the distribution of population and employment available to each city and county in the district.

ADOPTED by the Metro Council this 25th day of February 2021.

Lynn Peterson, Council President

Attest:

Jaye Cromwell, Recording Secretary

Approved as to Form:

Carrie MacLaren, Metro Attorney

STAFF REPORT

IN CONSIDERATION OF ORDINANCE NO. 21-1457, FOR THE PURPOSE OF ADOPTING THE DISTRIBUTION OF THE POPULATION AND EMPLOYMENT GROWTH TO YEAR 2045 TO LOCAL GOVERNMENTS IN THE REGION CONSISTENT WITH THE FORECAST ADOPTED BY ORDINANCE NO. 18-1427 IN FULFILLMENT OF METRO'S POPULATION COORDINATION RESPONSIBILITY UNDER ORS 195.036.

Date: February 1, 2021
Department: Planning & Development

Prepared by: Chris Johnson, Ted Reid
Presenters: Chris Johnson, Roger Alfred
Ted Reid

BACKGROUND

Federal and state laws (23 U.S. Code 134 and ORS 197.040, respectively) require Metro to prepare and update a transportation plan for its metropolitan planning area every 5 years. In accordance with these laws, an update of the Regional Transportation Plan (RTP) is scheduled to begin in late 2021 with an intended adoption date of December 2023. This 2023 RTP will need to rely on a Transportation Analysis Zone[1] (TAZ) Distributed Forecast of future population and employment.

The 2045 Distributed Forecast under consideration is intended to replace and extend the 2040 Distributed Forecast, which was adopted by Metro in fall 2016. The 2045 Distributed Forecast is aligned with the Regional Forecast (seven-county area) developed to inform Metro's most recent urban growth management decision, which the Metro Council adopted in December 2018. This ensures that the 2023 RTP will be based on the best available information and that the region's land use and transportation plans are consistent.

Oregon land use laws (195.025; ORS 195.036) require Metro to coordinate its regional population and employment forecasts with local governments inside the urban growth boundary for use in updating their comprehensive plans, land use regulations and other related policies. In accordance with this law, Metro coordinated with the local jurisdictions to conduct this Distributed Forecast update for use in the 2023 RTP.

<u>The Growth Forecast Distribution Update Process</u>

This update was able to build on the lengthy review process conducted in support of preparing the 2018 Urban Growth Report. During that process, Metro conducted extensive technical engagement with its regional partners to establish the methodology used to identify the region's buildable land inventory (BLI). With the 2018 Urban Growth Report already in place, Metro was able to focus regional

[1] The TAZ is the geographic unit that serves as the building block of Metro's primary forecasting tools (the travel demand model and MetroScope). The region is divided into 2,162 TAZs. These small subdivisions improve the accuracy of the travel demand model as well as all other aspects of transportation planning. The TAZ-level data also assists land use planners in updating comprehensive plans and zoning, and conducting other types of land use analysis, including neighborhood level analysis.

DocuSign Envelope ID: 5E925632-F777-452C-A2A5-CCC2FA1C4BD7

coordination efforts on revisions to smaller-geography population and employment forecasts based on local knowledge.

Regional coordination of the updated forecast distribution included two main stages of local review.

The first stage involved Metro and local government staff working together to confirm the core inputs to the MetroScope land use allocation model. These inputs include the base year numbers for population and employment as well as the BLI that was completed as part of the 2018 urban growth boundary decision. Local government staff reviewed these inputs and made revisions based on recent zoning changes, new developments or investments within their respective jurisdictions. This review period extended from May 2017 to May 2018.

Metro staff completed modeling using the results from the first stage of local review and prepared a draft distribution of households and jobs into the region's 2,162 TAZs. To view a TAZ map, refer to Exhibit A. The local jurisdictions were then given approximately five months (February 2020 thru June 2020) to examine the TAZ-level results. Jurisdictions wishing to adjust the growth by TAZ (increase or decrease) assigned by the model worked with Metro to re-allocate that growth in a manner consistent with accepted regional figures previously adopted by the Metro Council.

Metro worked closely with a designated county lead from each county throughout a second stage of review to ensure that all participating cities understood their roles and were able to complete their reviews by the deadline. Additional meetings were held with individual county leads to review results. With assistance from the county leads, Metro was able to either accommodate each jurisdiction's proposed changes or negotiate a satisfactory revision where the full change could not be implemented. The timeline for local reviewer engagement and ground rules are described in Attachment 1.

In accordance with state law (ORD 195.036), Metro summarized the TAZ distribution (which is used in transportation modeling) into a jurisdiction-level distribution that is more understandable for local planning activities. The resulting product is the 2045 Distributed Forecast of population, households and employment to cities and counties in the Portland region and is included as Exhibit B.

Regional Planning Directors Involvement

Metro coordinated with regional planning directors throughout the Distributed Forecast update through the local review process. The names of the regional planning directors, designated county leads, and other local reviewer who participated in this process are listed in Attachment 2.

The process began with a series of kickoff meetings held in January 2020, convening the planning directors (or designated planning leads) from Clackamas, Multnomah, and Washington Counties. Each kickoff meeting reviewed the purpose, timeline, and instructions for the local review process. The county leads served as liaisons between Metro and the cities within their respective jurisdictions, providing technical guidance to local staff throughout the process and helped to coordinate the timely return of feedback. County leads also conducted reviews on behalf of several smaller cities with limited planning staff capacity.

Metro staff communicated with county leads and jurisdiction staff primarily via e-mail throughout the local review process. Metro also met with county leads and cities as needed to coordinate reviews and provide guidance during the review period.

DocuSign Envelope ID: 5E925632-F777-452C-A2A5-CCC2FA1C4BD7

Metro Advisory Committee Involvement

The Metro Technical Advisory Committee (MTAC) served as the primary advisory committee for the 2045 Distributed Forecast. A project kickoff presentation was given before MTAC in November 2019 to review the purpose, timeline, and ground rules for the local review process. Subsequent project status reports were provided to both MTAC and the Transportation Policy Alternatives Committee (TPAC) to keep both committee informed as to project progress. The final project status presentation was given to MTAC in November 2020.

ANALYSIS/INFORMATION

1. Known Opposition

There is no known opposition to the 2045 Distributed Forecast. Metro staff was able to either incorporate local jurisdictions' suggested revisions in the baseline assumptions and distributions or come to agreement on modifications to those assumptions and distributions.

2. Legal Antecedents

Consultation conducted to prepare the 2045 Distributed Forecast satisfies Metro's coordination obligations under ORS 195.025 and 195.036. As requested by DLCD, staff proposes that the Metro Council adopt the 2045 Distributed Forecast by an ordinance that will be acknowledged by DLCD as part of Metro's planning documents in order to support future planning decisions by local governments that rely upon the population forecasts. State law requires cities and counties to adopt coordinated forecasts as part of their comprehensive plans.

3. Anticipated Effects

Adoption of the updated distribution of population and employment forecast will inform the 2023 RTP and ensure that the plan is based on the most recent data available. This localized data will also encourage local governments to use the distribution information to conform their land use and transportation plans to regional policies adopted by the Metro Council. Delay of the adoption could also delay the development of the 2023 RTP and may delay some local government activities that would be accomplished with the updated 2045 Distributed Forecast information. Also note that a new Regional Forecast and subsequent Distributed Forecast will be prepared for the Metro Council's consideration as part of its anticipated urban growth management decision in 2024.

4. Budget Impacts

The FY 2019-2020 and FY 2020-2021 budgets included resources for staff in the Research Center and the Planning and Development Department to work on this project.

RECOMMENDED ACTION

Staff recommends that the Metro Council accept and adopt the updated 2045 Distributed Forecast of population, households and employment which was completed in accordance with Metro's responsibilities on population coordination with local governments in the region to inform the 2023 RTP.

Attachment 1
Distributed Forecast Engagement Plan and Ground Rules

Action	Timeframe
Notify MTAC, TPAC of 2019 distr. forecast schedule & stakeholder engagement plan	November 2019
Complete TAZ allocations – Metro staff	September – December 2019
Contact county leads – coordinate TAZ review with each	December 2019
Obtain stakeholder signatures for es-202 employment data	December 2019
Send out TAZ forecast and es-202 task reminders – finalize by end of month	January 2020
Kick-off meetings (by county) – provide forecast materials for review 1. Review UGM regional forecast drivers 2. Review 2019 distr. forecast specifications and assumptions 3. Execute es202 releases for all stakeholders with the State 4. Send out data to qualified stakeholders (excel)	January 2020
Provide any material assistance as requested by local stakeholders – stakeholders review TAZ forecast figures (jobs and households) 1. Review 2020 base year figures by jurisdiction 2. Review 2030 "mid-year" figures 3. Review 2045/50 forecast figures 4. Go over TAZ adjustment ground rules 5. Send in TAZ reviews to county leads	February – June 2020
Adjust TAZ's as needed	July – August 2020
Lock-down final TAZ forecast figures	September 2020
Forecast documentation, citation, and archive	September 2020

Although careful attention to inputs and forecasts (and MetroScope model statistics) have been exercised in preparing the distributed forecast, current conditions and future expectations may change in which we might not have been aware of during the development of the TAZ forecast. Thus we are asking stakeholders to help us refine the initial TAZ-level forecast with additional manual (if any) adjustments based on your local knowledge. In order to maintain the integrity of the forecast, we ask participants to follow these basic guidelines on making adjustments to the TAZ forecast.

Ground rules:

- Each jurisdiction has been assigned a set of TAZ's that approximate the current city limits and county jurisdiction (note: there may be rounding and estimation error / differences between city limits and TAZ boundaries that can't be avoided).
- Cities and counties are given TAZ allocations that add up to "control totals" for each jurisdiction.
    - The ultimate control total or cap is determined by Metro's regional forecast. (This is the total forecast amount for the region as a whole and adopted in the 2018 UGM decision)
    - Within the control totals for each jurisdiction, we advise jurisdictions to limit their manual adjustment (plus or minus) to each TAZ subject to recovering your control total.

DocuSign Envelope ID: 5E925632-F777-452C-A2A5-CCC2FA1C4BD7

    - If your TAZ review identifies an excess (or shortfall) in your city control total, please contact your county lead to see if there is another city in your county that has a shortfall (or excess). Your county lead can assist in manually rebalancing the TAZ totals in the county.
    - If the county adjustments exceed (or has a shortfall) the given county control total, Metro in coordination with the effected cities and counties will affect a compromise to settle the manual TAZ adjustments.
- Cities and counties have latitude to make adjustments, but Metro asks that the manual adjustments are paired with explanations as to why the adjustments are necessary.

Your assistance in this review process is important and helps make this a better forecast product. Thank you for your involvement in this process.

Sherwood Vacant Lands Capacity Analysis

September 2024

SHERWOOD WEST CONCEPT PLAN

1,291 acres added to UGB 41% expansion of city's land area.

3,117 to 5,582 new expensive low-density homes & rentals

4,524 new jobs

$334 million for new infrastructure.

$58- $70 million funding shortfall for infrastructure

$45,000 - $51,000 system development charge/new home

Sherwood Planning Area* Vacant Lands Capacity

0 additional acres added to the Urban Growth Boundary

4,572 new homes with a closer fit with housing needs

5,526 new jobs

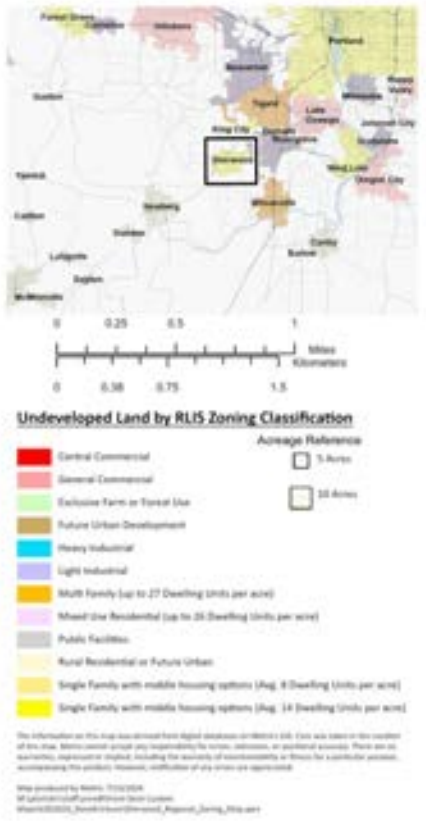
$58-$70 million taxpayer and ratepayer savings because no funding shortfall; $ millions saved on unneeded infrastructure.

Conserves instead of develops **precious farmland, forests, streams and wildlife.**

* The Sherwood Planning Area is the land inside the city limits of Sherwood, plus the Brookman Addition area and Tonquin Employment Area previously added to the UGB.

Methodology for Capacity Analysis of Sherwood Planning Area Vacant Lands

Metro Resource Center Map of Vacant Land in Sherwood Planning Area Prepared August 2024



The Sherwood Planning Area is the land inside Sherwood city limits, the Brookman UGB expansion concept area and Tonquin Employment Area

Vacant Lands in the Sherwood Planning Area

Metro RLIS General Zoning Class	Vacant Acres
Single Family Residential	146.76
Mixed Use Residential	22.53
Multi Family Residential	36.07
Commercial	22.99
Industrial (Light & Heavy)	229.78
Future Urban Development	111.43
Rural (residential, farm, forest use)	18.16
Public Facilities	5.03

Housing Needs & Vacant Land Capacity

Vacant Land Available for Housing In Sherwood Planning Area

Metro Generalized RLIS Zoning	**Acres**
Mixed Use Residential	22.53
Multi Family Residential	36.07
Single Family Residential	146.76
Total Residential	**205.35**
Future Urban Development	111.43
Rural	18.16
Total Vacant Land Available for Housing	**334.94**

Single-Family Detached Homes

Single-Family Detached Homes on 5,000 sq ft lots

Example: Sherwood, 4 bedroom, 3 bath, 4,791 square foot lot.

Single-Family Detached Homes on small lots

Example: Sherwood, 3 bedroom, 3 bath, 3,049 square foot lot.

Single-Family Attached Row Homes

Example: Stonewater Row Homes at Orenco 1,200 square feet homes (23 homes/acre)

Middle Housing

Accessory Dwelling Units, Duplexes, Triplexes, Fourplexes, Cottage Clusters

Middle Housing is allowed by state law on the 146.76 acres of vacant land zoned for single-family residential in the Sherwood planning area.

Middle Housing: Accessory Dwellings

Internal ADU
With separate entrance

ADU over garage

Detached backyard cottage

Middle Housing: Duplex Homes

Example: New construction on 5,300 sf lot in SE Portland (about 16 homes/net and about 13 homes/gross acre)

Middle Housing: Triplex & Fourplex Homes

Examples: NW Portland; 3-plex on 5,000 square foot lot (left homes/acre) and 4-plex on 5,000 square foot lot (right, = homes/acre)

Cottage Clusters

Example: Hastings Green in Portland 23 cottages on 2/3rds of an acre (about 35 homes/net acre and 28 homes/gross acre)

Middle Housing Vacant Land Capacity

Home type	acres	homes
100 ADUs with 2% of existing 5000 sf homes; 50 (4%) with 1,234 new SF homes	0	150
Cottage clusters at 24 homes/acre gross density	10	240
Duplexes on 6,000 sf lots homes/acre gross density	15	174
Three-plexes on 7,200sf lots at gross density	15	272
Four-plexes on 7,200 sf lots at gross density	10	116
Total Middle Housing	***50***	***953***

Multi-Family Homes

Multifamily Homes in Mixed Use

Example: Alta Arlo in Seattle 241 apartments on 7.8 acres. (31 homes net acre and about 28 homes/gross acre plus commercial spaces)

Multifamily Homes in Mixed Use

Example: The Windward in Lake Oswego:200 residential, 43,000 sq ft of commercial space, parking garage for 430 cars,135 spaces of public parking on 3 acres (67 homes/acre net or about 60 homes/acre gross).

Multi-Family Homes: Market Rate Condos

1310 Condominiums in SE Portland: 5 units on 5,000 square foot lot (about 43 homes/net acre net and 35 homes/gross acre)

Multi-Family Homes: Market Rate

Example: The Vector Apartments at Orenco station; 230 apartments on 2.25 acres (102 homes/net acre [and about 90 homes/ gross acre.)

Multi-Family Housing for Seniors of Modest Means
who live or want to live in Sherwood.

"Seniors face a serious affordability crisis in our region. Folks on fixed income need to be able to live with safety and stability," said Metro Councilor Gerritt Rosenthal. "Tigard is an important and bold partner in delivering on our promise to Metro voters to provide accessible housing."

Example: Alongside Senior Apartments next to the senior center in Tigard:
57 units on 2 acres (28 homes/net acre and about 25 homes/gross acre)

Affordable Multi-family Homes for Teachers and Other Employees of the Sherwood School District.

SVA Architects

705 Serramonte features 122 apartment homes, with 59 one-, 56 two-, and seven three-bedroom units, with rental rates set at 50% of market rate at the time of occupancy.

Example: 705 Serramonte Drive Daly City, CA. 122 units on 3.3 acres
(about 40 homes/net acre and 36 homes/gross acres

Affordable Multi-family Homes for People Working in the Vineyards and Farms near Sherwood

At the dedication Metro Councilor Juan Carlos Gonzalez “highlighted how Nueva Esperanza addresses the plight of local farmworkers, “who work tirelessly to feed our communities [and] struggle to secure safe and affordable housing for themselves and [their] families.”

Example: Nueva Esperanza, Hillsboro 150 units on 6.12 acres (24 homes/net acre and about 22 homes/gross acre

Affordable Multi-family Homes for People Working in Stores, Restaurants and Motels in or Near Sherwood

Example: Cedar Rising Aloha, 81 units on 1.2 acres

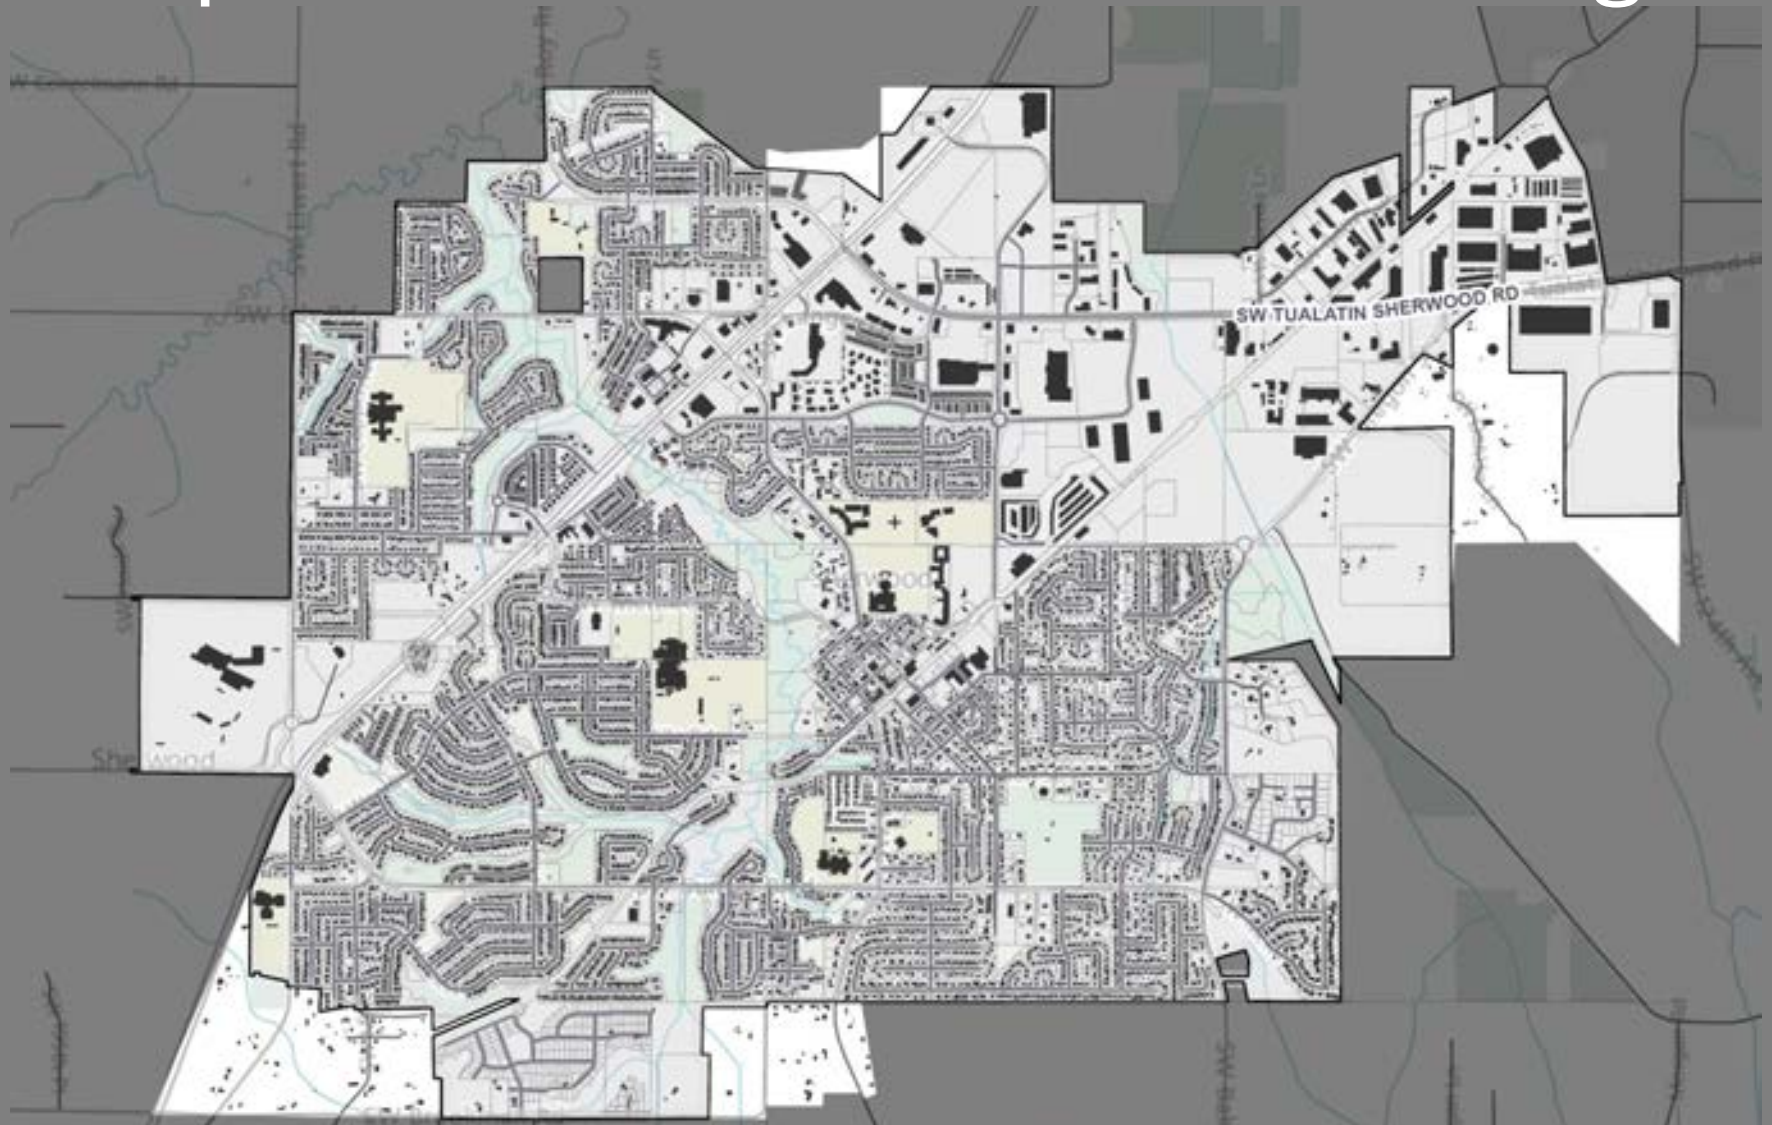
Sherwood Vacant Land Capacity for Housing

Home type	Acres	Homes	Share
Single-family detached	200	1,859	41%
Single-family attached	20	460	10%
Middle housing homes	50	953	21%
Market Rate Multi-family homes	50	1,300	28%
Affordable MF homes for farmworkers, teachers, clerks	9	410	9%
Totals	***329***	***4,572***	***100%***

This use of land would cover 81% of the regional deficit of 2,100multi-famiy units in Scenario 2 and more than cover the regional deficit for single-family detached and middle housing in scenario 3. It also allows for market an affordable multifamily housing representing substantial progress toward Oregon and Sherwood's housing needs analyses.

In addition to development of housing on vacant lands there is significant potential for infill on partially developed lots and through redevelopment.

Building footprints in the Sherwood Planning Area



Sherwood Planning Area is Sherwood city limits, Brookman annexation area and portion of Tonquin Employment Area

Many parcels have room for additional development.

Sherwood Vacant Land Capacity for Housing

CONCLUSION

Sherwood and the Brookman area have more than enough vacant land to meet all of its housing needs for 20 years plus thousands of additional homes to meet regional needs, without expanding the UGB.

Sherwood Vacant Lands Capacity for Employment

RLIS Vacant Land Class Sherwood Planning Area	**Acres**		**Sherwood West Concept Plan Employment Land Designation**	**Sherwood West Concept Plan Jobs/Acre** Table 5 page 48 of Concept Plan	**Jobs**
Heavy Industrial	40.82		Mixed Employment	18	735
Light Industrial	188.95		Mixed Employment	18	3,401

General Commercial	18.33		Commercial	36	660
Mixed Use	22.53		Mixed Use	25	563
Total	**275.29**				**5,527**
Note: Does not include hospitality and schools jobs included in Table 5.					

Natural Resources & the Environment

Using vacant lands inside the UGB in Sherwood Planning Area conserves world-class farmland & forestlands.

These lands can grow and have grown high value crops like Pinot Noir grapes, hazelnuts and Christmas Trees.

Natural Resource & Environmental Protection

Saves Chicken Creek and adjoining riparian areas and forests from development and retains their carbon sequestration values; helps maintain water quality in Tualatin River National Wildlife Refuge.

CONCLUSION

Using vacant land already inside the Sherwood Planning Area means:

- *Less Sprawl*
- *Less Taxes & Fees*
- *More Housing Choices*
- *Plenty of Jobs*
- *Protects farmland and forests*
- *Conserves water and wildlife*

Savings for Taxpayers and Ratepayers by using vacant lands in the Sherwood Planning Area

$?? millions saved by not spending money on new infrastructure serving development west of city limits.

No need to find additional taxes and fees to cover $58 to $70 infrastructure shortfall.

SECTION IV: HEARINGS OFFICER'S SUMMARY AND RECOMMENDATION… 74

SECTION I: APPLICATION SUMMARY

FILE NAME:	UGB Case 17-02: Sherwood School District Urban Growth Boundary Major Amendment
APPLICANT:	Sherwood School District 23295 SW Main Street Sherwood, OR 97140
PROPOSAL:	82-acre expansion of the urban growth boundary (UGB) for a high school campus with sports fields. Realign SW Elwert Road and SW Kruger Road in Sherwood.
LOCATION:	Tax Lots 2S236-200, -201, -206, and -207
SITE ADDRESSES:	18880 SW Haide Road, 22895 SW Elwert Road and 18985 SW Kruger Road, Sherwood, Oregon 97140
URBAN RESERVE AREA:	Area 5B.
CURRENT ZONING:	AF-20
METRO CODE:	Metro Code Sections 3.07.1425 (B, C, D, E & F) and 3.07.1440 (A & B). Code Section 3.07.1425(C)(1-9)

SECTION II: BACKGROUND INFORMATION

Proposal Description: The applicant requests an expansion of the City of Sherwood UGB to include approximately 82 acres for a high school campus with sports fields. This proposal also seeks to realign the intersection of SW Elwert Road and SW Kruger Road for improved and safer traffic flow.

Site Information: The site consists of four tax lots located within unincorporated Washington County on the west side of SW Elwert Road, between SW Haide Rd and SW Kruger Rd as shown in Attachment 1. The property has frontage on SW Elwert, SW Haide and SW Kruger Roads. The entire property is zoned AF-20 (Agricultural and Forest District) by Washington County with a minimum lot size of 80 acres. The entirety of the property is located within the Sherwood West Preliminary Concept Plan area (Metro Urban Reserve Area 5B). The site slopes

gently down to the east towards SW Elwert Road with approximately 40 foot grade change across the site. There is a shallow valley and ridge within this slope.

The properties have been used for various agricultural activities including a Christmas tree farm, tree plantation and row crops. The tax lot in the southeast corner of the site, adjacent to the intersection of SW Elwert and SW Kruger Roads is owned by the City of Sherwood, a portion of which will be used for the road realignment. A 40-foot wide permanent Northwest Natural gas easement zigzags along the western edge of the site, separating the northwest corner of the site from the remainder of the property.

Case History: The Sherwood School District (District) is centered on the city of Sherwood and extends into the surrounding rural area in all directions, including a small area east of I-5, between Wilsonville and Tualatin. The District includes an area of 4.31 square miles and an estimated population of 18,884. The District has seven schools that provide educational services to just over 5,000 students, the majority of which live in the city of Sherwood. The District experienced substantial growth in the late 1990's and early 2000's leading to a community effort in 2005 to determine facility needs. This resulted in the successful 2006 bond measure which included funding for an addition to the current high school to increase capacity to 1,550 students, consistent with phase 1 of the 2006 high school master plan. Current enrollment at the high school is over 1,700 students and projections show over 2,250 students by the 2025-26 school year. In early 2014 the District's Long Range Planning Committee made recommendations to the School Board regarding enrollment and growth challenges, facilities analysis and needs and financing options. In 2015 the District documented the condition and educational adequacy of its facilities, leading to bond visioning and steering committees in 2016. This resulted in the District's voters approving a bond measure in 2016 providing funding for school improvements including construction of a new high school. The District continues to engage the community through a design committee and community input sessions.

Local Government Statement: This UGB major amendment is being considered at the request of the Sherwood School District. The City of Sherwood completed the Sherwood West Preliminary Concept Plan for urban reserve area 5B and submitted a service provider form supporting the school district's application. The school district participated in the concept planning process and the subject site is one of the school locations identified in the preliminary concept plan. Washington County submitted a written statement supporting the application with proposed conditions for Metro to consider. Tualatin Valley Fire and Rescue submitted a written statement supporting the application and Clean Water Services is neutral on the application.

SECTION III: APPLICABLE REVIEW CRITERIA

The criteria for a Major Amendment to the UGB are contained in Metro Code Section 3.07.1425(B, C, D, E, & F) and 3.07.1440 (A & B). The approval criteria appear ***bold 12-pt Aerial Narrow font),*** and the hearings officer's analysis follows.

> ***Metro Code Section 3.07.1440(A) The purpose of the major amendment process is to provide a mechanism to address needs for land that cannot wait until the next analysis of buildable land supply under ORS 197.299. Land may be added to the***

UGB under this section only for the following purposes: public facilities and services, public schools, natural areas, land trades and other non-housing needs;

This code section requires that the applicant show, by substantial evidence in the whole record, that it is an eligible entity allowed to use the interim ORS 197.299 Major Amendment UGB process rather than wait until the next regular Metro UGB amendment cycle (in December, 2018).

Hearings Officer's Analysis: Title 14 of the Metro Code (*i.e.* Metro's Urban Growth Management Functional Plan) includes the Major Amendment process to amend the UGB for a number of specific non-housing needs, including schools and public parks. This process, which is designed to implement ORS 197.299(4), is intended to provide an opportunity to meet these specific land needs outside of the legislative housing needs process the Metro Council conducts on a six-year cycle as required by ORS 197.299(1) and ORS 197.296.

As part of the six-year legislative housing needs process, Metro conducts an inventory of the current residential and employment capacity within the UGB, forecasts population and employment growth over a 20-year timeframe, determines the capacity of the current UGB to accommodate that growth and documents the results of these analyses in an urban growth report. ORS 197.296(6)(a), which is one of the state's needed housing statutes, envisions that local governments with populations over 25,000 will factor in land for schools at the same time as they determine the amount of land needed to be brought in to the UGB for housing. In this regard, the need for land for schools under ORS 197.296(6)(a) is a "derivative need" which is linked to, and dependent upon, a finding that there is a need for land to be brought into the UGB to accommodate an identified housing need. As noted in more detail below, this process has proven to be long, drawn out affair, which is not sensitive to short-term needs. Furthermore, because it is done on a large-scale regional basis, is not always sensitive to more localized school and park needs.

In fact, Metro's most recent urban growth report, adopted in 2015, did not address school and park land needs at the regional level at all. Some school districts anticipate growth, others see declining enrollment and none look out over the 20-year timeframe that the urban growth report considers. Depending on the particular physical, financial and expected growth characteristics of each school district, plans for accommodating projected increases in enrollment vary. Similarly, park districts acquire property and develop park facilities based on numerous operational and funding parameters that can't be considered at the regional level. In addition, it is quite common for school districts and cities to collaborate on opportunities to meet the city's recreation needs as well as the school district's team needs. For these reasons, the Major Amendment process is the appropriate means of addressing specific school district and park needs that can be accommodated through UGB expansions.

Metro has adopted specific criteria to implement ORS 197.299(4). There are two criteria contained in Metro Code section 3.07.1440(A) that are analyzed separately below:

1) The proposal must be for a non-housing need, and

> 2) The proposal must be intended to meet needs that cannot wait until the next analysis of land supply (December 2018).

There does not appear to any disagreement that the first criterion is met: the applicant proposes to add land to the boundary for a public school and a public facility need, both of which are non-housing needs. The Sherwood School District's Sherwood High School is a "public school" within the meaning of Metro Code Section 3.07.1440(A).

However, whether the applicant has met the second criterion has proven to be more controversial. The applicant addresses its need as follows:

> As of 2015, the Sherwood School District encompasses 4.31 square miles serving a population of approximately 18,884 residents and 5,000 students. The Sherwood School District includes:
> - The City of Sherwood city limits;
> - Portion of the western area of the City of Tualatin (mostly industrial land);
> - Rural Clackamas County (primarily between Sherwood and Wilsonville); and
> - Rural Washington County north and west of Sherwood, as well as a small area east of I-5 between Wilsonville and Tualatin.
>
> To facilitate future planning and to comply with State requirements for a fast-growing school district, the District adopted a long-term facilities plan in January of 2008, which assumed that additional school capacity would therefore likely be needed within ten years of the plan's adoption. As predicted school facilities have recently become overtaxed. In 2015, to assess current resources, the Sherwood School District completed a Facilities Planning and Assessment Report to determine both condition and available capacity. Enrollment based on the most current demographic data and capacity shows that school capacity is near or over capacity at all school levels as shown in Staff Report Attachment 2 (Table 1 in petition).
>
> The School District commissioned Davis Demographics & Planning Inc. to complete an updated 10-year demographic study in May of 2016. The study reviewed the following factors that determine student enrollment: (1) the current and planned residential development over the next ten years; (2) student yield factors that apply to new residential development; (3) birth factors for the District area; and (4) mobility factors, which examine the in/out migration of students within existing housing units. The forecast projects a deficiency in capacity in all levels, with the

high school level having the largest deficiency. Staff Report Attachment 3 (Table 2 in petition) shows 10-year enrollment projections compared with existing school building capacity. The table demonstrates that if no capacity is added (no-build) the school facilities will be far over capacity in 10 years with the Sherwood High School having the largest capacity issue operating at 141% of capacity.

From the updated capacity assessment and demographic data, it became apparent that facilities must be expanded to keep pace with continued student enrollment growth. A Long Range Planning Committee, Bond Steering Committee, Bond Visioning Committee and Sherwood High School Programming Committee were formed to study facility needs. Led by the Bond Management Team, these committees met from 2014 to 2016, making recommendations to the Sherwood School District Board. The process included input from a number of participants from the community including City Council and staff representation, School District staff, architects, civil engineers, financial advisors, business leaders, citizens, parents and students. Throughout this process, the Sherwood City Council was provided with updates and community input was sought via various public outreach methods.

As evidenced by capacity study and demographic growth data, the high school level is where there is the biggest need for additional capacity both now and to a greater extent within 7 to 10 years. Therefore, the Bond Management Team first looked to the existing high school campus for opportunities for expansion to accommodate this growth. With the conclusion that the existing high school cannot be upsized to meet demand, the District's Bond Management Team began looking for a long-term solution and the School Board, with voter approval, ultimately decided to build a new high school. The new high school is planned to be sized to initially accommodate 2,000 students, but allow for easy expansion to 2,400 students. This size will allow for projected growth over the next 10 years and foreseeable future.

Once a new high school is online, the existing high school building can be repurposed as a consolidated middle school with both existing middle schools (Laurel Ridge and Sherwood Middle) being relocated to the existing high school campus. Once this occurs, the two existing middle schools can be converted to elementary school use to expand needed elementary school capacity. Finally, the proposal allows for Hopkins Elementary School, a building nearing its useful lifespan, to be taken out of

> school service and converted to administrative functions. The existing administrative offices consist of portable buildings in varying locations and with the conversion of Hopkins, office space can be centralized for increased efficiencies.

The primary opponent argues that the applicant has not justified the use of the Major Amendment process instead of waiting until the normally scheduled Metro 2018 UGB expansion. Their attorney states: "Metro's scheduled UGB expansion in 2018 is the appropriate time to analyze the expansion for the proposed high school because more data will be available and the full set of impacts can be analyzed. The delay will also resolve the issues with inadequate notice in the current application." *See* Letter from Jennifer Bragar dated June 6, 2017, at p. 8.

What the opponents appear to be arguing is that this application is premature, and the applicant should wait until 2018 when the 20-year buildable lands analysis will be available. Furthermore, the opponents do believe that the Major Amendment process authorized by ORS 197.299(4)(a)(A) requires the same type and level of analysis required when Metro conducts its periodic legislative housing need analysis required by ORS 197.299(1) and ORS 197.296. The opponent's unstated assumption is that school needs must be evaluated as a derivative need of housing using the ORS 197.296(6) process.

Metro staff weighed in on the debate via a Memorandum dated June 9, 2017, which states, in relevant part:

> Metro's legislative process for reviewing the UGB is guided partially by ORS 197.296. Subsection 197.296(2) directs Metro to demonstrate that there is sufficient buildable land within the UGB to accommodate estimated housing needs for 20 years. A housing need is the only need identified in the statute. ORS 197.296(6) says if the housing need is greater than the capacity of the UGB Metro shall take one or more actions that could include amending the UGB to include sufficient buildable lands to accommodate housing needs for 20 years. Subsection (6)(a) goes on to say that if the UGB was amended to accommodate housing needs for the next 20 years, then the amendment shall include sufficient land reasonably necessary to accommodate the siting of new public school facilities.
>
> The statutory directive to Metro is to include sufficient land for school facilities as part of any UGB expansion that is required to meet a 20-year need for housing. In Metro's most recent analysis of the 20-year housing supply (the 2015 UGR), Metro determined there was sufficient capacity inside the existing UGB to accommodate housing needs; therefore, no corresponding analysis for public school facilities was required.

> Even if the Metro Council had determined there was a need to expand the UGB in 2015 to accommodate a 20-year housing need, there is no certainty that the location where the land would be added to meet the housing need is also a location where a local school district needs additional land to meet its facility needs. Likewise there is no certainty that the specific land needs of a school district are coordinated with the local jurisdictions desire for additional housing. For instance, a UGB expansion adjacent to Hillsboro to meet a regional housing need would not support the Sherwood School District's need for a new high school.
>
> These difficulties arise, in part, from the size of the Metro region and the fact that it consists of 24 individual cities and 17 different school districts. It is important to recognize that the provisions of ORS 197.296(6)(a) regarding planning for accommodation of new school facilities is included in the statutory section that describes the analysis required for all cities in the State of Oregon. While it would not be as difficult for a smaller jurisdiction to coordinate future public school needs with future housing needs in making UGB expansions, that task is much more complicated in the Metro region.
>
> The disconnect in the Metro region between the location of UGB expansions to meet a 20-year housing need and the needs of existing school districts is addressed, in part, by ORS 197.299(4)(a), which is the statute that directs Metro to establish the process being utilized by the Sherwood School District in this proceeding. ORS 197.299(4)(a) requires Metro to allow "off-cycle" UGB expansions as necessary to accommodate a need for land for a public school that cannot reasonably wait.

Given that the opponents have a very different interpretation of the purpose and meaning of ORS 197.299(4) when compared to Metro staff and the applicant, a discussion of statutory interpretation is in order.

A statute is considered "ambiguous" if it is capable of at least two reasonable interpretations. *State v. Tarrence*, 161 Or App 583, 985 P2d 225 (1999); *Kenton Neighborhood Ass'n v. City of Portland and Oregon Waste Systems, Inc.*, 17 Or LUBA 784, 797 (1990) (when code is internally inconsistent, it is ambiguous).[1] If the legislation is unambiguous, local governments and courts are bound to apply the statute in that manner, regardless of how inartful the enactment seems. *Sanchez v. Clatsop County*, 146 Or App 159, 164 n 4, 932 P2d 557 (1997). Stated another way, an unambiguous statute should not be "interpreted." *City of Hillsboro v. Housing Dev'l Corp of Washington County*, 61 Or App 484, 488, 657 P2d 726 (1983). *See GTE*

[1] *See also Fisher v. City of Gresham*, 69 Or App 411, 416, 685 P2d 486 (1984); *McCoy v. Linn County*, 90 Or App 271, 276 nl, 752 P2d 323 (1988).

Northwest, Inc., v. Oregon Public Utility Comm'n, 179 Or App 46, 39 P3d 201 (2002). Rather, unambiguous words should be given their plain, natural, and ordinary meaning. *PGE v. BOLI*, 317 Or at 611.[2]

In this case, the hearings officer believes that the relationship between ORS 197.296 and ORS 197.299 creates sufficient ambiguity to warrant an exercise of statutory interpretation.

Text and Context.

When construing a statute, the court will often first look directly at the text of the statute itself. *See Whipple v. Howser*, 291 Or 475, 635 P2d 782 (1981) (citing *Greyhound Corp. v. Mount Hood Stages, Inc.*, 437 US 322, 330, 98 S Ct 2370, 2375 (1978)). Emphasizing the need to look first to the language of the statute, the *Whipple* court stated:

> "The cardinal rule for the construction of a statute is to ascertain from the language thereof the intent of the law makers as to what the purpose was to be served, or what the objective was designed to be attained."

Whipple, 291 Or at 479 (citing *Swift & Co. and Armour & Cove, Co. v. Peterson*, 192 Or 97, 233 P2d 216 (1951). *See also State of Oregon v. Buck*, 200 Or 87, 92, 262 P2d 495 (1953). The *Whipple* court also cited to *State ex rel. Cox v. Wilson*, 277 Or 747, 562 P2d 172 (1977), in which the court stated:

> "There is, of course, no more persuasive evidence of the purpose of a statute then the words by which the legislature undertook to give impression to its wishes."

Courts do not view the text in a vacuum; they consider the context of the language at issue as well. In fact, the context of the statute is as important to the interpretation as the text. *State v. Webb*, 324 Or 380, 927 P2d 79 (1996); *Friends of Neaback Hill v. City of Philomath*, 139 Or App 39, 48, 911 P2d 350 (1996). *See e.g., Shadrin v. Clackamas County*, 34 Or LUBA 154 (1998). In some cases, the court may consider the context before examining the text, in situations where the context "provided perspective on the text." *See Plotkin v. Washington County*, 165 Or App 246, 250, 997 P2d 226 (2000). In this case, consider the two statutes in tandem.

ORS 197.299 provides as follows:

---

[2] *See also OSHU v. Hass*, 325 Or 492, 501, 942 P2d 261 (1997); *Zidell Marine Corp. v. West Painting, Inc.*, 322 Or 347, 906 P2d 809 (1995); *State v. Langley*, 314 Or 247, 256, 839 P2d 692 (1992); *Curly's Dairy, Inc. v. State Dept of Agriculture*, 244 Or 15, 415 P2d 740 (1966) (If statute is clear and unambiguous, the court may not resort to rules of statutory construction in ascertaining and declaring the legislative intent.); *Sullivan v. City of Ashland*, 130 Or App 480, 882 P2d 633, *rev den*, 320 Or 453, 887 P2d 792 (1994) (An unambiguous code provision cannot be interpreted, even if that provision is contrary to the express purposes of the provision.); *City of Portland v. White*, 61 Or App 120, 655 P2d 629 (1982).

197.299 Metropolitan service district analysis of buildable land supply; schedule for accommodating needed housing; need for land for school; extension of schedule.

(1) A metropolitan service district organized under ORS chapter 268 shall complete the inventory, determination and analysis required under ORS 197.296(3) not later than six years after completion of the previous inventory, determination and analysis.

(2)(a) The metropolitan service district shall take such action as necessary under ORS 197.296(6)(a) to accommodate one-half of a 20-year buildable land supply determined under ORS 197.296 (3) within one year of completing the analysis.

(b) The metropolitan service district shall take all final action under ORS 197.296(6)(a) necessary to accommodate a 20-year buildable land supply determined under ORS 197.296 (3) within two years of completing the analysis.

(c) The metropolitan service district shall take action under ORS 197.296(6)(b), within one year after the analysis required under ORS 197.296(3)(b) is completed, to provide sufficient buildable land within the urban growth boundary to accommodate the estimated housing needs for 20 years from the time the actions are completed. The metropolitan service district shall consider and adopt new measures that the governing body deems appropriate under ORS 197.296 (6)(b).

(3) The Land Conservation and Development Commission may grant an extension to the time limits of subsection (2) of this section if the Director of the Department of Land Conservation and Development determines that the metropolitan service district has provided good cause for failing to meet the time limits.

(4)(a) The metropolitan service district shall establish a process to expand the urban growth boundary to accommodate a need for land for a public school that cannot reasonably be accommodated within the existing urban growth boundary. The metropolitan service district shall design the process to:

(A) Accommodate a need that must be accommodated between periodic analyses of urban growth boundary capacity required by subsection (1) of this section; and

(B) Provide for a final decision on a proposal to expand the urban growth boundary within four months after submission of a complete application by a large school district as defined in ORS 195.110.

(b) At the request of a large school district, the metropolitan service district shall assist the large school district to identify school sites required by the school facility planning process described in ORS 195.110. A need for a public school is a specific type of identified land need under ORS 197.298 (3). [1997 c.763 §2; 2001 c.908 §2; 2005 c.590 §1; 2007 c.579 §2; 2014 c.92 §5]

As quoted above, ORS 197.299(1) cross-references ORS 197.296(3), which, in term, cross-references to ORS 197.296(2). These two statutes together set forth a process for evaluating and accommodating housing needs:

> *(2) At periodic review pursuant to ORS 197.628 to 197.651 or at any other legislative review of the comprehensive plan or regional framework plan that concerns the urban growth boundary and requires the application of a statewide planning goal relating to buildable lands for residential use, a local government shall demonstrate that its comprehensive plan or regional framework plan provides sufficient buildable lands within the urban growth boundary established pursuant to statewide planning goals to accommodate estimated housing needs for 20 years. The 20-year period shall commence on the date initially scheduled for completion of the periodic or legislative review.*
>
> *(3) In performing the duties under subsection (2) of this section, a local government shall:*
>
> *(a) Inventory the supply of buildable lands within the urban growth boundary and determine the housing capacity of the buildable lands; and*
>
> *(b) Conduct an analysis of housing need by type and density range, in accordance with ORS 197.303 and statewide planning goals and rules relating to housing, to determine the number of units and amount of land needed for each needed housing type for the next 20 years.* (Underlined emphasis added).

As the underlined language indicates, ORS 197.296 is a statute narrowly-tailored towards the process used to establish and fulfill an identified *housing* need. It is an expansion of the basic concepts set forth in Statewide Planning Goal 10, but it goes beyond Goal 10 in scope.

As part of that process, the effect of ORS 197.296(6) should also be considered as context:

> *(6) If the housing need determined pursuant to subsection (3)(b) of this section is greater than the housing capacity determined pursuant to subsection (3)(a) of this section, the local government shall take one or more of the following actions to accommodate the additional housing need:*
>
> *(a) Amend its urban growth boundary to include sufficient buildable lands to accommodate housing needs for the next 20 years. As part of this process, the local government shall consider the effects of measures taken pursuant to paragraph (b) of this subsection. The amendment shall include sufficient land reasonably necessary to accommodate the siting of new public school facilities. The need and inclusion of lands for new public school facilities shall be a coordinated process between the affected public school*

districts and the local government that has the authority to approve the urban growth boundary;

(b) Amend its comprehensive plan, regional framework plan, functional plan or land use regulations to include new measures that demonstrably increase the likelihood that residential development will occur at densities sufficient to accommodate housing needs for the next 20 years without expansion of the urban growth boundary. A local government or metropolitan service district that takes this action shall monitor and record the level of development activity and development density by housing type following the date of the adoption of the new measures; or

(c) Adopt a combination of the actions described in paragraphs (a) and (b) of this subsection.

A few key points can be quickly gleaned from ORS 197.296. First, by its terms, ORS 197.296(2) only applies to periodic review or another "*legislative* review of the [.. .] regional framework plan that concerns the urban growth boundary and requires the application of a statewide planning goal relating to buildable lands for residential use. " This Major Amendment application is not periodic review and is also not a legislative review of Metro's regional framework plan, *i.e.*, the every six-year UGB amendment cycle. The Major Amendment application is subject to a quasi-judicial process and will result in a quasi-judicial decision by the Metro Council.

Strawberry Hill 4 Wheelers v. Board of Comm'rs sets out a list of factors to be weighed to determine whether a land use decision is legislative or quasi-judicial. 287 Or 591, 602-603, 601 P2d 769 (1979). Under *Strawberry Hills*, the Major Amendment is quasi-judicial because (a) the application process is bound to result in a decision, (b) the decision must apply pre-existing criteria to concrete facts, and (c) the action is directed at a closely circumscribed factual situation.

With regard to the first question, the *Strawberry Hills 4-Wheelers* Court asks practitioners to consider the following question: "Does the statute require the [local government] to reach a decision after the hearing, as in an adjudication, or may it indefinitely postpone or abandon the issue, like a legislative proposal?" 287 Or at 605. At first glance, one might assume that any land use decision that originates from an application being submitted (as opposed to be initiated by the local government itself) would be "bound to result in a decision." Indeed, that seems to have been the original intent of the *Strawberry Hill* Court. However, over the years LUBA and the Court of Appeals have increasingly read this factor more and more narrowly and will only find that that a decision is "bound to result in a decision" if the code either expressly requires a decision to be made, or if that requirement can be fairly read into the language of the code based on the context. *Estate of Gold v. City of Portland*, 87 Or App 45, 48, 740 P2d 812 (1987) ("the statute simply says that the governing body *may* approve the proposal, not that it *must* do anything."); *Johnson v. City of La Grande*, 37 Or LUBA at 388; *Valerio v. Union County*, 33 Or LUBA 604 (1997); *Miner v. Clatsop County*, 46 Or LUBA 467 (2004). In some cases, LUBA has not been as exacting in its analysis, holding that although the code did not:

> "expressly state that once a person requests an interpretation of a provision of the city's zoning ordinance that the person is entitled to a decision. We believe, however, that any reasonable person reading this ordinance would conclude that if a person requested an interpretation from the planning director, received that interpretation and then appealed the interpretation to the planning commission and to the city council, the person filing the appeal would be entitled to a decision from the city council."

Hoffman Ind. Inc. v. City of Beaverton, 2 Or LUBA 411 (1981); *Dean v. City of Oakland*, 33 Or LUBA 806, 809 (1997)("While the cited policy does not require a decision within a specified time, the most natural reading of its terms requires a decision.") The fact that any given ordinance in question states that the decision-maker "may" make a decision should not be a fact which is determined to be indicative of a legislative decision, but unfortunately, in practice it is just that. In this regard, the statute at issue in *Strawberry Hill* did not expressly require that a decision be made. However, the Supreme Court found no difficulty in concluding that "although affirmative action is optional, the statute appears to contemplate that the County Court will *eventually* reach and pronounce some decision whether to act or not. *Id*. at 606. (Emphasis added).

In this case, the MC 3.07.1440(g) requires the Metro Council to make a final decision on the petition. Therefore, this factor suggests that the decision is quasi-judicial.

The second of the *Strawberry Hill* questions has, in practice, become somewhat of a non-factor. Both LUBA and the Court of Appeals have recognized that all land use decisions in Oregon are subject to "preexisting criteria" and apply to concrete facts. LUBA has addressed this issue as follows:

> Turning to the "apply existing criteria to concrete facts" factor, that factor is present to some extent in all land use decisions. *Valerio*, 33 Or LUBA at 607. This factor is therefore less important than the other two factors, particularly where, as is the case here, the decisions are adopting new land use laws rather than applying existing land use laws to grant land use approval for a single property or a small number of properties. *Churchill v. Tillamook County*, 29 Or LUBA 68, 71 (1995); *McInnis v. City of Portland*, 27 Or LUBA 1, 5-7 (1994).

Carver v. Deschutes County, 58 Or LUBA 323 (2009). *See also Casey Jones Well Drilling, Inc. v. City of Lowell*, 34 Or LUBA 263, 271 (1998); *Johnson v. Jefferson Country*, 56 Or LUBA 72 (2008). In this case, the MC 3.07.1440 sets forth criteria for a Major Amendment to a UGB. Therefore, this factor suggests that the decision at issue is quasi-judicial.

Under the third factor, LUBA and the Courts are supposed to assess whether the decision either (1) affects either a small number of owners and properties or (2) the "action directed at a closely circumscribed factual situation," or whether the decision has more broad

applicability. According to early decisions by the Court of Appeals, "the number of people affected and the size of the area covered are less important considerations," and the focus should instead be on "the importance of assuring that the decision is factually correct and that the decision-maker gives fair attention to affected individuals." *1000 Friends of Oregon v. Wasco Co. Court*, 80 Or App 532, 536, 723 P2d 1034 (1986), *rev'd on other grounds*, 304 Or 76, 742 P2d 39 (1987). In practice, this third bean-counting "factor" has become the most critical issue to LUBA, and, despite suggestions to the contrary, in most cases it is more-or-less the dispositive factor. In fact, LUBA has found decisions to be legislative even when the other two factors favored a determination that a decision was quasi-judicial. *Davenport v. City of Tigard*, 22 Or LUBA 577 (1992).

In this case, the proposal involves 82 acres consisting of four tax lots in unknown ownerships. This is well within the size and ownership limits that would allow the conclusion that the decision is quasi-judicial.

The primary opponent argues that this Major Amendment is a "legislative decision," The primary opponent states that "[t]he decision amends the Metro Boundary map that is incorporated into the Metro Urban Growth Functional Plan, and as such the change is legislative." *See* Letter from Jennifer Brager dated June 23, 2017 at p. 1. However, map amendments are not necessarily or inherently legislative or quasi-judicial in nature. *Compare Thomas v. City of Veneta*, 44 Or LUBA 5 (2003) (TSP and zoning map amendment affecting two tax lots comprising 6.4 acres); *Dan Giles & Assoc., Inc. v. McIver*, 113 Or App 1, 3, 831 P2d 1024 (1992)(zone change for single 29-acre parcel in unified ownership is quasi-judicial); *Neuberger v. City of Portland*, 288 Or 155, 603 P2d 771 (1979) (re-zoning involving 601 acres of land owned by three landowners is quasi-judicial).[3] *Contrast Valerio v. Union County*, 33 Or LUBA 604 (1997) (comprehensive plan amendment and zone change pertaining to 185 acres in a "number of different ownerships" is legislative); *Friends of Cedar Mill v. Washington County*, 28 Or LUBA 477 (1995) (PAPA relocating arterial and changing it from 5 lanes to 3 lanes is legislative, where it affects 40 properties and will carry 17,000 – 18,000 trips per day.); *McInnis v. City of Portland*, 27 Or LUBA 1 (1994) (Proposal which rezones 5000 acres in 110 different ownerships is legislative.); *Davenport v. City of Tigard*, 22 Or LUBA 577 (1992) (Transportation plan map amendment that directly involves nine property owners, but has "indirect effects" on a broader population is legislative). Nor is a UGB amendment inherently legislative in nature. *BenjFran Development, Inc. v. Metro*, 17 Or LUBA 30 (1988) (denial of request for UGB amendment comprising almost 500 acres in three ownerships is quasi-judical).

Cases such as *Davenport* and *Friends of Cedar Mill* suggest that large transportation projects will be considered legislative due to the broad secondary effects that transportation facilities can have on commuters. The hearings officer does not believe that this line of cases can be extended to a school, however, based simply on the fact that many kids will attend the school. If that were the case, then any land use decision involving a Wal-Mart or Home Depot store would be legislative, because those uses have higher usage / trip generation rates than a typical school.

[3] *See Neuberger v. City of Portland*, 37 Or App 13 (1978), *rev'd in part, aff'd in part*, 288 Or 155, 603 P2d 771 (1979).

Opponent's counsel cites *Colwell v. Washington County*, 79 Or App 82, 87-8 (1986) for the proposition that this Major Amendment is a legislative (and not a quasi-judicial) decision (*see* Bragar letter dated 23 June 2017, pp 1-2). *Colwell* does not support that conclusion, and is easily distinguished. In *Colwell*, the Washington County Planning Commission made a land use decision which opponents wished to appeal to the Board of Commissioners, but their appeal was dismissed for failure to timely pay for the quasi-judicial Planning Commission hearing transcript. *Colwell*, 79 Or App at 85. Opponents appealed to the LUBA, which dismissed the appeal for failure to exhaust remedies at the local (County) level. The Oregon Court of Appeals reversed and remanded, finding that the Washington County governing body (*i.e.* the elected Board of County Commissioners) - and not the unelected County Planning Commission - must make Comprehensive Plan amendments, pursuant to ORS 215.050(1) and ORS 215.060.

Opponent's argument might have some merit if this unelected hearings officer was the one to make the final decision on this Major Amendment land use application. Only the elected Metro Council has that authority, however. This hearings officer's findings and determination are merely a recommendation to the Metro Council, and the Council is free to accept or reject this Hearings officer's decision, as the Council sees fit. Since the Metro Council will be the governmental body to make the final land use decision in this case, the Court of Appeals' holding in *Colwell* shall be followed for this application.

Despite the lengthy analysis set forth above, the hearings officer does not really believe that the quasi-judicial vs. legislative debate is dispositive, in any event. Rather, it is a red herring. Stated another way, the hearings officer does not believe that ORS 196.296 would apply to this UGB Amendment even it was a legislative decision. By its terms, ORS 197.296 only applies to UGB amendments that "require the application of a statewide planning goal relating to buildable lands for residential use." As discussed elsewhere in this recommendation, an amendment to a UGB which adds AF-20 zoned land for use as a school does not implicate Goal 10 in any meaningful way .

Second, ORS 197.296 sets forth a mandatory periodic process that is focused on only one type of land need: a need for housing. We can credit the Home Builder Association for being active in the legislature over the past 30+ years and influencing the adoption of specific statutory language, such as ORS 197.296, which relates specifically to their industry. But we should also not lose sight of the fact that there are other types of land need under Goal 14 that don't implicate ORS 197.296.

Taking a step back, recall that Goal 14 states that a UGB amendment must be based on consideration of six factors set forth in the Goal. The first two factors are commonly referred to as the "need" factors. The need factors require either a demonstrated need to accommodate long range urban population, consistent with a 20-year population forecast coordinated with affected local governments, <u>*or*</u> a demonstrated need for housing, employment opportunities, livability or uses such as public facilities, streets and roads, schools, parks or open space, or any combination of the need categories. While the need for housing is governed by ORS 197.296, other land needs are governed by Statewide Planning Goal 14, and in some cases, by OAR Ch. 660, Div 24. Note, as an example, that OAR Ch. 660, Div. 24 does not address now a livability need is established; Goal 14 seems to be the sole administrative pronouncement of its use. What is important to understand for purposes of this case is that ORS 197.296 is not the sole way to

establish land need, and a school need is not limited to being established as a derivative need of housing under ORS 197.296(6).

Among the more common types of land need mentioned in Goal 14 include a need for employment land, a need for public facilities, a need for schools, a need for parks, and the amorphous catch-all known as a "livability need."[4] With one exception related to public schools, ORS 197.296 does not govern substantively how these other types of land needs are established. Nor does it establish a *process* by which those other needs are established. Rather, ORS 197.296(2) & (3) are narrowly focused on accommodating a housing need, and as shown below, accommodating land for public schools as a derivative need stemming from housing need.

Consider ORS 197.296(6) as context: this statute applies when a local government is undertaking periodic review or a legislative review of a UGB that implicates Goal 10. If during such a process, the local government determines that a need exists for additional residential land and that accommodating that land need must necessarily involves a UGB amendment, then ORS 197.296(6)(a) requires that local government to "include sufficient land reasonably necessary to accommodate the siting of new public school facilities." Thus, under that process, a public school facility is considered a derivative need that arises by operation of a demonstrated need for housing. However, there is nothing in ORS 197.296(6) that makes ORS 197.296 the exclusive process by which a need for schools can be established. As demonstrated by the applicant a need for new school facilities can exist independent of housing needs. And while the primary opponent chalks up the applicant's current need to poor planning on the District's part (a sentiment that may have some basis in fact), ORS 197.299(4) appears to written as a safety value that can be used by school districts regardless of the causes that led to the need.

ORS 197.299(4)(a)(A) provides additional key textual clues which helps understand the nature of the process currently being undertaken. This provision authorizes Metro to "establish" and "design" a "process" that will fulfill a need that must be accommodated "*between*" periodic analyses of urban growth boundary capacity required by subsection (1) of this section." By giving Metro the authority to "establish" and "design" a unique UGB amendment process for schools, the statute makes clear that the school need specific "4(a)" process is not the *same* process as the legislative six-year process required by ORS 197.299(1) and 197.296(3). The ORS 197.296 process is already "established" and "designed" by statute, and really only puts a regional government much as Metro in an implementation role. On the other hand, ORS 197.299 delegates to Metro a role that is greater than mere implementation of a pre-existing process. Furthermore, ORS 197.299(4)(a)(4) further emphasizes that the school-specific process is only supposed to be used "between" the 6-year legislatively-mandated processes for accommodating housing needs, and it can only be invoked if the identified school need cannot wait until the next scheduled six-year legislative process.

[4] LUBA cases confirm that a need to improve livability can provide a basis for adding land to a UGB. Such an analysis requires, in addition to identifying a significant livability problem, an evaluation of probable and negative impacts on livability that may occur if the UGB is amended, and an explanation of why the livability benefits outweigh negative impacts on livability. *1000 Friend of Oregon v. City of North Plains*, 27 Or LUBA 372, 383, *aff'd.*, 130 Or App 406 (1994); *1000 Friends of Oregon v. Metro Service Dist.*, 18 Or LUBA 311, 320 (1989).

The gravamen of opponents' complaints with respect to ORS 197.299(4) stem from a misunderstanding of the relationship between the ORS 197.299(1) six-year UGB amendment process with the ORS 197.299(4) public school amendment process. Much of opponent counsel's testimony at the June 13, 2017, hearing and again in her June 23, 2017 letter, was directed generally at a dissatisfaction with how Metro plans for regional housing and employment needs and opponents' opinion that allowing out-of-cycle UGB expansions for public schools exacerbates Metro's alleged poor planning. In its June 23, 2017 letter, opponents argued that this Major Amendment application does not meet the requirements of ORS 197.296(2).

At its core, the opponent's argument hinges on the assumption that the school-specific process must be substantively the same as the periodic six-year legislative process. Stated another way, the opponents argue that the substantive standards and criteria that govern the school specific process are the same as the housing-specific legislative process under which school need can be established as a derivative need. However, if that were truly the case, however, there would be no need for Metro to "establish" and "design" a new process. Rather, if the legislative intent was to mandate the same rigorous process that is used to establish housing need and to otherwise limit school need as a derivative need, the legislature would have simply stated that a school-related need can form the basis for accelerating the time frame under which the legislative housing need process is conducted. And that in itself does not make any sense because nothing in ORS 197.299(1) or ORS 197.296 prohibits Metro from conducting the legislative housing-needs process sooner than on a 6-year increment. In fact, ORS 197.299(1) merely states that Metro must undertake the ORS 197.296 process "*not later than six years after completion of the previous inventory, determination and analysis.*" In theory, Metro could voluntarily conduct that inventory and analysis on a bi-annual or other timeline. In light of this observation, ORS 197.299(4) would be a redundancy if interpreted in the manner that the primary opponent advocates.

Courts strive to give effect to all parts of a statute, in order to produce a harmonious whole. ORS 174.010.[5] As a corollary, courts will avoid interpretations that render a portion of the statute redundant or meaningless surplusage.[6] *See State v. Stamper,* 197 Or.App. 413, 418, 106 P.3d 172, *rev. den.*, 339 Or. 230, 119 P.3d 790 (2005) ("we assume that the legislature did not intend any portion of its enactments to be meaningless surplusage"). If the school-specific process were not a separate process governed by different substantive criteria than ORS 197.296, it would not accomplish anything that Metro did not already have the right to do.

Rather than being drafted as an authorization to conduct the existing six-year legislative housing needs process at any time increment earlier than six years if a need exists that cannot wait six years, ORS 197.299(4)(a)(A) contemplates a *new* process *designed* by Metro to cater to

[5] *Lane County v. LCDC*, 325 Or 569, 578, 942 P2d 278 (1997); *Bolt v. Influence, Inc.*, 333 Or. 572, 581, 43 P.3d 425 (2002) ("we are to construe multiple provisions, if possible, in a manner that will give effect to all"). *See also Davis v. Wasco IED*, 286 Or 261, 267, 593 P2d 1152 (1979); *Tatum v. Clackamas County*, 19 Or App 770, 775, 529 P2d 393 (1974); *Plotkin v. Washington County*, 36 Or LUBA 378 (1996); *Walz v. Polk County*, 31 Or LUBA 363 (1996); *Fechtig v. City of Albany*, 31 Or LUBA 410 (1996) (Ordinance).

[6] *Certain Underwriters at Lloyd's London and Excess Ins. Co., Ltd. v. Massachusetts Bonding and Ins. Co.*, 235 Or.App. 99, 230 P.3d 103 (2010); *State v. Stamper*, 197 Or.App. 413, 417, 106 P.3d 172, *rev. den.*, 339 Or. 230, 119 P.3d 790 (2005); *EQC v. City of Coos Bay*, 171 Or.App. 106, 110, 14 P.3d 649 (2000).

school needs as a primary independent need, not as a secondary derivative need resulting from a housing need. Because it is a different process that is intended to evaluate a needs other than a housing needs, the process and requirements (*i.e.* inventory, determination, and analysis) of ORS 197.296 do not apply to this separate process. And discussed below, the legislative history confirms this analysis.

Legislative History

Prior to 2001, the case of *Portland Gen. Elec. Co. v. Bureau of Labor & Indus.*, 317 Or 606, 611–612, 859 P2d 1143 (1993) (hereinafter *PGE*) made clear that legislative history could not be used to determine legislative intent if the text and context of the law made the meaning of that law unambiguous. The case of *State v. Gaines*, 346 Or 160, 171–172, 206 P3d 1042 (2009) essentially acknowledges that the *PGE v. BOLI* approach was legislatively modified in 2001 via amendments to ORS 174.020, and that the statute now permits the consideration of legislative history even when the text and context seem to make the meaning unambiguous. For this reason, a careful treatment of *Gaines* is warranted here.

The OSB publication entitled "Interpreting Oregon Statutes" Steve Johansen, Hon. Jack Landau, and Anne Villella ed. OSB CLE (2009) contains a lengthy but highly relevant discussion of *Gaines*, as follows:

> In *Gaines*, the defendant was convicted of obstructing governmental administration when she refused to cooperate in being photographed after her arrest. On appeal, she argued that her behavior did not constitute a "'means of . . . physical . . . interference or obstacle' "within the meaning of the relevant statute. *Gaines*, 346 Or at 162 (quoting ORS 162.235(1)). She argued further that the 2001 amendments to ORS 174.020 required the court to consider the legislative history of ORS 162.235(1) along with the text and context of the statute, even if the court found that its analysis of the text and context did not render the legislative intent ambiguous. *Gaines*, 346 Or at 165. Interestingly, in assessing the meaning of the 2001 amendments to ORS 174.020, the court found that a text-and-context analysis suggested that the amendments did not significantly change the *PGE* standard. *Gaines*, 346 Or at 166. However, the court did not stop its analysis at the text-and-context level. As the plaintiff argued that ORS 174.020 required, the court went on to examine the legislative history. The legislative history revealed a clear legislative intent to eliminate the requirement that a court only look to legislative history "if but only if" the text and context left the meaning ambiguous. *Gaines*, 346 Or at 169.
>
> * * * * *.

> The court will now consider proffered legislative history even when the text and context of a statute appear to render it unambiguous. In effect, *Gaines* brings legislative history into the step-one analysis along with the text and context of a statute. That said, legislative history remains a second step of statutory analysis—the court will consider it only after analyzing the text and context of a statute. The weight the court gives that legislative history also remains within the discretion of the court. A party attempting to overcome seemingly plain and unambiguous text through reference to legislative history has "a difficult task before it." *Gaines,* 346 Or at 172.

Although *Gaines* modifies the *PGE* methodology, the full extent of that modification remains to be seen. However, a recent appellate court decision suggests the extent may be relatively slight. *State v. Kelly,* 229 Or App 461, 211 P3d 932 (2009). *Kelly* raised the issue of the meaning of ORS 811.335(1)(b), which requires drivers to signal a turn "during not less than the last 100 feet traveled by the vehicle before turning." The defendant, who signaled a turn after he had stopped at an intersection, argued that the legislative history showed that the intent of the statute was to require a signal for at least as long as it took to travel the last 100 feet, but not to signal for the specified distance. The court agreed that under *Gaines* it needed to consider the legislative history. The court also made several points as to what weight it would give that legislative history.

The court first made clear that legislative history alone cannot overcome statutory text that is truly capable of only one interpretation. *Kelly,* 229 Or App at 466. Beyond that caution, the court explained the traditional limits of legislative history: legislative history is most helpful when it uncovers the general legislative intent of a statute (*Kelly,* 299 Or App at 466); statements of single legislators or non-legislators are generally, though not always, less helpful (*Kelly,* 299 Or App at 466–467), and the existence of a particular problem that precipitated a bill does not necessarily mean the statute was intended to address only that problem (*Kelly,* 299 Or App at 468). What *Kelly* does not suggest is that *Gaines* changes in any significant way *how* courts use legislative history. Rather, it only changes *when* the court will consider legislative history. Thus, even under *Gaines,* legislative history will be most helpful when an analysis of the text and context does not resolve an ambiguity of the statute. Legislative history may also be useful to reinforce an apparently unambiguous interpretation of a statute. (Emphasis added).

Courts are not likely to be persuaded by legislative history when that history does not give any indication that the precise legal question at issue was considered during the legislative enactment.[7]

The subsection in question, subsection 4, was added to ORS 197.299 in 2005 as part of Senate Bill 1032. Testimony at legislative committee hearings from bill authors and proponents indicates SB 1032 was intended to grant Metro new expedited authority to expand the UGB for the purpose of allowing construction of new schools, and such a process would be separate from the "normal" UGB expansion process typically required by state statutes.

Testimony of several speakers during the May 17, 2005 public hearing provide insight regarding the policy goals behind SB 1032. The main speaker, Gary Conkling, represented the Beaverton School District and was one of the authors of the bill. Mr. Conkling began his testimony in favor of the bill by outlining the pressing problems that face the city of Beaverton. He stated that "in the last decade or so the Beaverton School District has added more than ten thousand students" and that those students alone would make up the fifteenth largest school district in the state.[8]

Mr. Conkling explained that overabundance problems are common in the metropolitan areas of Portland, and most suitable plots of land for schools have been used for other projects intended to spur economic development. Mr. Conkling "anticipate[d] [Beaverton] will have to look outside the UGB for one or more additional school sites" to meet the growing demand. He ended his testimony by stating two main objectives of SB 1032. First, the bill is designed to gain "guidance from Metro, cities, and urban service providers as to where we should look outside the UGB" for suitable plots of land for schools. Second, the bill has language that "will encourage Metro to provide an accelerated process to add those lands once . . . the need has been established . . . so that lands can be added on an accelerated basis to the UGB."[9]

Metro Legislative Affairs Director Randy Tucker, a second advocate of SB 1032, added some additional points regarding the purpose and scope of the bill. Mr. Tucker explained that developing lands for schools requires additional planning considerations than developing lands for other purposes because schools must be located in particular locations. These additional considerations include that ideally, schools should be located near city centers, and schools must fall within existing school district boundaries. This makes it even more difficult to find suitable land for new school construction without expanding the UGB.

---

[7] For example, the court often dispense with legislative history in one sentence by stating simply that the legislative history is silent on the particular issue facing the court. *Ritcherson v. State*, 131 Or App 183, 186, 884 P2d 554 (1994) (seeking to determine if ORS 138.510(2) included retroactive application of its two-year statute of limitations period); *see also Windsor Ins. Co. v. Judd*, 321 Or 379, 387, 898 P2d 761 (1995) ("[W]hat little [discussion of the amendment] there was reveals nothing that sheds light directly on the question posed in this case."); *State v. Holloway*, 138 Or App 260, 267, 908 P2d 324 (1995) ("Unfortunately, our examination of the legislative history sheds no light on the matter."); *In Def. of Animals v. Or. Health Scis. Univ.*, 199 Or App 160, 173 n 9, 112 P3d 336 (2005) ("We note that the legislative history . . . provides no assistance in determining the provision's meaning.").

[8] Hearing on S.B. 1032 Before the S. Comm. on Environment & Land Use, 2005 Leg., 73rd Assemb., Reg. Sess. (Or. 2005) (statement of Gary Conkling, Representative of Beaverton School District).

[9] *Id.*

Finally, Mr. Tucker added that Metro intended to implement SB 1032 by amending its own code to make it easier to expand the UGB for schools "when [new schools] cannot be reasonably accommodated in the UGB, and when they must be accommodated before we would normally do an UGB expansion." Here, Mr. Tucker indicated that Metro should be authorized to quickly initiate UGB expansion for schools outside of the "typical" or "normal" legislative process of reevaluating the buildable land supply inside the UGB every [six] years.

Later, in a May 31, 2005 work session on SB 1032, Messrs. Conkling and Tucker again provided testimony in support of the bill and explained its purpose and scope. Mr. Conkling stated the bill's main purpose is to provide Metro "[with a] process that can work in between its periodic review, and provide for an accelerated process to bring these school sites inside the UGB."

After the testimony of Mr. Tucker, Senator Charlie Ringo, Chair of the Committee, asked if the bill will "facilitate Metro addressing the problem with high growth districts not finding land for schools."[10] Mr. Tucker stated his answer was yes, and that the bill would provide the basis for immediate negotiation as to what land should be included in the UGB as part of an amendment. Mr. Tucker explained that the bill would be beneficial to districts like Beaverton because "it facilitates the process for expanding the UGB for a school district that has need." Mr. Tucker stated that ideally, after revising the Metro code to implement the statute, the process to expand the UGB to include land for a school would take only four months.

The legislative history of HB 1032 indicates that one main purpose of the bill was to streamline the process for amending the UGB for the purpose of building new schools. The testimony of both Conkling and Tucker describe a pressing need for land in metropolitan areas for new school construction that cannot always be met within the typical five-year UGB cycle. Proponents of the bill clearly express intent to grant Metro authority to amend the UGB through a process that would be separate from the regular review cycle and corresponding 20-year need analysis.

Proponents of the bill used words such as "streamline" and "accelerated" in the context of a new expansion process that could occur outside and separate from the "normal" time intensive 20-year need analysis, and described a process that would be based exclusively on a demonstrated need for additional school facilities. Testimony regarding the purpose of SB 1032 indicates that the purpose of the legislation was to allow a separate and expedited process exclusively for school siting, which would not be tied to the 20-year buildable land supply analysis that is required under ORS 197.296.

As described above, it is clear from legislative history that the 2005 Oregon legislature was acutely aware of the problem of holding school districts to a six year Metro planning cycle during the enactment of SB 1032. Metro's Randy Tucker specifically stated that SB1032

[10] Work Session on S.B. 1032 Before the S. Comm. on Environment & Land Use, 2005 Leg., 73rd Assemb., Reg. Sess. (Or. 2005) (statement of Sen. Charlie Ringo, Chair, S. Comm. on Environment & Land Use).

"facilitated" school districts obtaining a UGB amendment for school facilities.[11] According to the Merriam-Webster dictionary, the word "facilitate" means "to make (an action or process) easy or easier." It makes little sense to believe that the legislature would desire to make obtaining a Metro UGB amendment *just as, or even more difficult* for schools while simultaneously creating an "accelerated" process specifically for schools. Indeed, Metro's own Legislative Affairs Director – no stranger to tightly-crafted statutory language - was quite clear in stating that the purpose of SB 1032 was to "facilitate" (that is, make easier) the process for Metro-area schools.

In addition, the hearings officer finds that the ORS 197.299's school-specific UGB amendment process is no less thorough or exacting than an application that could have been filed in due course of the next six-year Metro planning cycle. It is true, as opponents claim, that the next Metro 20-year buildable lands analysis is not yet available, and thus cannot be taken into account during this application. The law does not require that, however, and requiring school applicants to wait until the next six-year Metro planning cycle would render the passage of ORS 197.299 pointless. The entire point of ORS 197.299 was to provide schools with an interim, accelerated, easier ("facilitated") application process, rather than waiting for the next 6 year Metro planning cycle. Statutes should not be construed such that they make other statutes completely meaningless.

As noted above, the Metro Council is required to complete a 20-year forecast and analysis of land need to maintain a 20-year supply of residential and employment land inside the UGB on a six-year cycle. However the Metro Council has directed staff to complete an urban growth report in 2018, three years after the urban growth report was adopted in 2015, with a possible growth management decision occurring in December 2018 that may or may not result in an expansion of the UGB. Delaying the proposed amendment for these specific school and park needs until that time, when these types of specific needs are not addressed in the regional analysis, is not an appropriate or an efficient way to provide these needed services and would result in the District experiencing ever-increasing overcrowding of their facilities.

Thus, in summary, review of the text and context of ORS 197.299 and ORS 197.296 in combination with the legislative history of the 2005 Amendments which created ORS 197.299(4) bring the legislative intent into clear focus. ORS 197.299(4) explicitly provides a "safety valve" of sorts for public school needs. The statute de-couples the need for schools from the derivative secondary needs analysis set forth in ORS 197.296(6). The legislature apparently understood the critical nature of schools to serve the community and felt strongly enough about that to provide a mechanism to ensure that needed schools can be built. Opponents' attempt to saddle Major Amendments with all of the trappings of a six-year legislative review of the region's UGB is contrary to both the plain text of ORS 197.299(4) and its legislative history.

Having resolved the statutory interpretation question, we turn back to the evidence of need. The District originally adopted a long-term facilities plan in January 2008 that assumed additional school capacity would be needed in ten years. This proved true, as of 2017 the high

[11] Testimony before the Senate Environment and land Use Committee, May 31, 2005, beginning at minute 1.13, available at http://records.sos.state.or.us/webdrawer/webdrawer.dll/webdrawer/rec/4193397/ Mr. Tucker's statement is found at minute 1.18, in response to a question from Senator Ginnie Burdick.

school is at 109% of capacity and the four elementary schools are at 99% capacity. A ten-year demographic study by Davis Demographics & Planning Inc., completed in May 2016, forecasted a deficit in capacity at all levels with the high school operating at 141% of capacity. In order to meet the growing need, the District determined, with the assistance of numerous committees, that a new high school would be needed. Voters approved a bond measure in 2016 to construct a new high school and make other facility improvements. The applicant adequately addressed the urgent need for the new high school by substantial evidence in the whole record in its application submittal and its subsequent submittals. (*See* application narrative ("Narrative") at 14-15, 33, Appendices G, H, and I; June 8, 2017, District letter at 1-3, Attachment i; June 13, 2017, District letter at 5.)

The applicant has met its burden of showing compliance of the two criteria found in Metro Code section 3.07.1440(A) by substantial evidence in the whole record.

Metro Code Section 3.07.1440(B)

> **3.07.1440 Major Amendments - Criteria**
> **(b) The applicant shall demonstrate that the proposed amendment to the UGB will provide for an orderly and efficient transition from rural to urban land use and complies with the criteria and factors in subsections (b), (c), (d), (e), and (f) of section 3.07.1425. The applicant shall also demonstrate that: (1) The proposed uses of the subject land would be compatible, or through measures can be made compatible, with uses of adjacent land; (2) If the amendment would add land for public school facilities, the coordination required by subsection (c)(5) of section 3.07.1120 of this chapter has been completed; and (3) If the amendment would add land for industrial use pursuant to section 3.07.1435, a large site or sites cannot reasonably be created by land assembly or reclamation of a brownfield site.**

[Note: This Provision Incorporates by Reference: 3.07.1425(B), (C), (D), (E), & (F), which are Discussed Below].

***MC** 3.07.1425(B)(1): Demonstrated need to accommodate future urban population, consistent with a 20-year population range forecast coordinated with affected local governments;*

Hearing Officer's Analysis: MC 3.07.1425(b)(1) requires that the Major Amendment application show a [d]emonstrated need to accommodate future urban population, consistent with a 20-year population forecast coordinated with affected local governments. " This criterion is taken word for word from the first need factor set forth in Statewide Planning Goal 14. In the context of periodic review, Factor 1 pertains to a determination of overall land need in order to accommodate population growth. In this case, the need is for additional school capacity to alleviate an overcrowding situation at the Sherwood high School. For this reason, the first need factor set forth at MCC 3.07.1425(B)(1) is to be considered, but it is not determinative by itself.

In *Residents of Rosemont v. Metro*, 173 Or App 321, 328, 21 P3d 1108 (2001), the Court of Appeals explained that "[w]e held in *Baker [v. Marion County,* 120 Or App 50, 852 P2d 254, *rev den*, 317 Or 485, 858 P2d 875 (1993),] that factors 1 and 2 of Goal 14 are interdependent and

that, if one of the factors is not fully satisfied, or is less determinative, that factor must still be considered and discussed in deciding if a need for expansion of a UGB has been shown under factors 1 and 2 of Goal 14."

This factor requires the applicant to show, by substantial evidence in the whole record, that there is a demonstrable need for the new Sherwood High School based on a forecast that is consistent with the adopted 20-year population range forecast which has been coordinated with affected local governments.

The District and Metro staff address this provision at: Application Narrative at pp. 15, 34, App'x H; May 4, 2017, staff report ("Staff Report") at 5; June 9, 2017, Metro memo; June 13, 2017, District letter at 1-2. In particular, the applicant attempts to meet its burden of proof with the following analysis:

> *As described herein, the need for additional school capacity including the need for a new high school is well documented as described in Section III of the petition. The existing high school is operating overcapacity and the constraints of the existing high school site and building do not allow for feasible expansion to 2,400 students to serve long-term needs. Building a new high school will also allow the existing high school building to be converted to middle school use by consolidating the two existing middle schools to one location. This will further allow for the conversion of the two existing middle schools to elementary school use. The capacity analysis and 10-year demographic projections indicate that there will be capacity issues at all school levels if nothing is done. The proposed project will provide the long-term capacity needed.*
>
> *The School District commissioned Davis Demographics & Planning Inc. to complete an updated 10-year demographic study in May of 2016. The study reviewed the following factors that determine student enrollment: (1) the current and planned residential development over the next ten years; (2) student yield factors that apply to new residential development; (3) birth factors for the District area; and (4) mobility factors, which examine the in/out migration of students within existing housing units. The forecast projects a deficiency in capacity in all levels, with the high school level having the largest deficiency. Staff Report Attachment 3 (Table 2 in petition) shows 10-year enrollment projections compared with existing school building capacity. The table demonstrates that if no capacity is added (no-build) the school facilities will be far over capacity in 10 years with the Sherwood High School having the largest capacity issue operating at 141% of capacity.*

Metro's 20-year population range forecast is part of the 2015 urban growth report ("UGR"). Therein, the Metro Council determined that the region could meet the expected 20-year residential and employment forecast need within the UGB and no expansion of the UGB was needed to meet housing or employment needs. The UGR did not address specific school and park land needs. As a result, the District prepared a ten-year demographic study that supports a need for additional land for a new high school in order to accommodate future urban population. The District completed this demographic study using population and demographic projections for the cities of Sherwood and Tualatin.

The parties do not focus much, if any, of their debate on whether the population and demographic projections in the District's 10-year study are "consistent" with the assumptions in the 2015 UGR. Such as comparison is complicated by the fact that the UGR takes a high-level regional look at residential and employment needs, whereas the District's 10-year demographic study is much more narrowly focused on Sherwood's population. Nonetheless, the hearings officer reviewed both the 10-year study and the UGR and finds that there is no glaring inconsistency between them. The 2105 UGR anticipates continued high levels of growth in our region. The UGR further recognizes that there is still a considerable amount of vacant and redevelopable land located in and near the City of Sherwood. This would indicate that the District needs to be prepared to accommodate a large amount of additional school children. Given that the regional 20-year forecast did not address school and park land needs, the District's ten-year demographic study, which supplements the long-term facility plan completed in 2008, demonstrates a need to accommodate future urban population by substantial evidence in the whole record. The applicant has provided information regarding a ten-year demographic study showing a need for providing specific school facilities to meet present and future populations based on established methodologies for the proposed use. The applicant also provided written and verbal testimony from experts such as architect Karina Ruiz of Dull Olson Weekes IBI Group Architects, Inc, planner Keith Jones AICP of Harper Houf Peterson Righellis Inc, and traffic engineers Scott Mansur, P.E. and Carl Springer, P.E. of DKS Associates. Having reviewed these materials and observed their testimony, the hearings officer finds them more credible and assigns great weight to their views.

Staff is also correct when it states that even if Metro had expanded the UGB in 2015 for a 20-year housing need, there is no guarantee that the location of the added land would have accommodated the specific need for a new high school in Sherwood. ORS 197.299(4) provides a safety valve for such a situation.

The primary opponent argues that the District could only demonstrate consistency with the 2015 UGR by submitting a new 20-year demographic study. *See* letter from Jennifer Bragar dated June 23, 2017, at p. 20. The opponent points to no specific law which expressly states such a requirement, and the hearings officer does not believe that such a requirement exists. As far as the hearings officer can determine, "consistency" in this context simply means using the same or similar growth rates contemplated in the 2015 UGR, and that appears to be the case here. *See* the updated 10-year demographic study conducted by Davis Demographics & Planning Inc. dated May, 2016. This is consistent with Goal 2, which requires the factual inventories and assumptions included in the comprehensive planning documents to form the "basis for all decisions and actions related to land use." *Rivergate Residents Ass'n v. LCDC*, 38 Or App 149,

5990 P2d 1233, *rev den*. 286 Or 521 (1979); *Hildenbrand v. City of Adair Village*, 217 Or App 623, 177 P3d 401 (2008) ("Plan policies or inventories can serve to justify subsequent and related plan amendments because comprehensive plans must be internally consistent under Goal 2.)" *See also 1000 Friends of Oregon v. Metro (Ryland Homes)*, 174 Or App 406, 26 P3d 151 (2001). *Compare GMK Developments v. City of Madras*, 225 Or App 1, 199 P3d 882 (2008) (Nothing in Goal 2 itself requires the sort of continuous data correction that the opponents urge us to impose in this case).

MC 3.07.1425(B)(1) requires the District to demonstrate a need to accommodate future urban population; consistent with the demographic study contained in the 2015 UGR. The District has done that, and that is all that is required. The applicant has met its burden of showing compliance with this factor by substantial evidence in the whole record.

MC 3.07.1425(B)(2): Demonstrated need for land suitable to accommodate housing, employment opportunities, livability or uses such as public facilities and services, schools, parks, open space, or any combination of the foregoing in this paragraph;

This factor requires the applicant to show, by substantial evidence in the whole record, that there is a demonstrable "need for land suitable to accommodate * * * uses such as * * * schools * * *." The applicant presents its case as follows:

> As described herein, the need for additional school capacity including the need for a new high school is well documented as described in Section III of the petition. The existing high school is operating overcapacity and the constraints of the existing high school site and building do not allow for feasible expansion to 2,400 students to serve long-term needs. Building a new high school will also allow the existing high school building to be converted to middle school use by consolidating the two existing middle schools to one location. This will further allow for the conversion of the two existing middle schools to elementary school use. The capacity analysis and 10-year demographic projections indicate that there will be capacity issues at all school levels if nothing is done. The proposed project will provide the long-term capacity needed.
>
> The School District commissioned Davis Demographics & Planning Inc. to complete an updated 10-year demographic study in May of 2016. The study reviewed the following factors that determine student enrollment: (1) the current and planned residential development over the next ten years; (2) student yield factors that apply to new residential development; (3) birth factors for the District area; and (4) mobility factors, which examine the in/out migration of students within existing housing units. The forecast projects a deficiency in capacity in all levels, with the high school level having the largest deficiency. Staff Report Attachment

3 (Table 2 in petition) shows 10-year enrollment projections compared with existing school building capacity. The table demonstrates that if no capacity is added (no-build) the school facilities will be far over capacity in 10 years with the Sherwood High School having the largest capacity issue operating at 141% of capacity.

The City of Sherwood and the Sherwood School District have an intergovernmental agreement to share ballfields. The City of Sherwood owns an extensive system of parks and trails. However, the City's ballfield resources are very limited with only one soccer field located at the City's Snyder Park. In the early 1990s, prior to rapid growth in the preceding 20 years, the City took measures to protect natural resources. This included the protection of floodplains and wetland areas surrounding the Cedar Creek stream corridor that flows south to north through the center of the City limits to the Tualatin National Wildlife Refuge. The City acquired much of this land and maintains these areas as natural open space, wetlands and walking paths. Since most of the areas are sensitive and passive recreation areas, they are off limits to ballfield construction. Because Sherwood has a very active sports community, the City and School District decided to share sports fields with most of these facilities being on school grounds.

In the case of the new High School site, the City owns the approximately 20-acre parcel in the southeast corner of the property. Some of this land, approximately 4 acres, will be used for the Elwert and Kruger Road realignment and roundabout, but the remaining balance will become part of the new high school campus and allow for construction of additional ballfields to be shared with both school and City sports functions.

As documented in Section III of the petition, viable high school sites are not available within the current UGB. The only viable sites, including the proposed site, have been identified within the Sherwood West Concept Planning Area (Urban Reserve Area 5B).

The subject site ("Site C") is the best alternative site considering that it has:

- No mapped sensitive areas (habitats, wetlands or waterways),
- Gently sloping topography to allow for construction of ballfields,
- Close proximity to SW Elwert Road and Highway 99W for ease of access,
- Availability of public utilities (water and sewer),

- Available downstream discharge point for stormwater, and
- Sufficient area to provide high school campus for 2,400 students and needed City/School District shared ballfields.

As shown above, the applicant has shown a compelling need for providing specific school facilities to meet present and future populations.

The City of Sherwood and the District have an intergovernmental agreement to share sports fields with most of the facilities on school grounds. The City has an extensive system of parks and trails but sport field resources are very limited with one soccer field located in a city park. Thus, the applicant has shown there is a demonstrated land need to accommodate both school and park services by substantial evidence in the whole record. That evidence may be found in the following: Applicant's Narrative at p. 12-32, 34, Appendices C, G, H, and I; June 8, 2017, District letter pp 1-3. Additionally, the applicant demonstrated that district bond financing rules require moving ahead with the application now, rather than wait until the end of 2018. *See* letter from applicant's counsel Kelly Hossaini dated June 8, 2017, page 3 (discussing the district's finances).

The applicant has met its burden of showing compliance with this factor by substantial evidence in the whole record.

MC 3.07.1425 (B)(3): A demonstration that any need shown under paragraphs (1) and (2) of this subsection cannot be accommodated on land already inside the UGB.

MC 3.07.1425(B)(3) requires an alternatives sites analysis showing that the needed new school cannot be accommodated within the existing UGB. This requirement stems from state law. Among other laws, Statewide Planning Goal 14 requires the applicant to consider, as part of the needs analysis, all suitable lands inside the UGB as positive alternatives, and even requires the City to consider whether zone changes could make land suitable for the project. *See Brandt v. Marion County*, 22 Or LUBA 473, 481 (1991); *Turner v. Washington County*, 8 Or LUBA 234, 258 (1982), *aff'd*, 70 Or App 575,689 P2d 1318 (1984).

The applicant's narrative discusses MC 3.07.1425(B)(3) at p. 19-21, 34-35. For example, on pages 16-17 of the narrative, the applicant states as follows:

> As evidenced by capacity study and demographic growth data, the high school level is where there is the biggest need for additional capacity both now and to a greater extent within 7 to 10 years. Therefore, the Bond Management Team first looked to the existing high school campus for opportunities for expansion to accommodate this growth.
>
> **Expansion of Existing High School**
>
> The existing Sherwood High School is located on approximately 37.8 acres of land at 16956 SW Meinecke Road. The existing high

school has capacity for 1,550 students and, as of the writing of this report, is well over capacity with an enrollment of 1,689. This growth is expected to continue with a needed student capacity of approximately 2,200 by the year 2025 and peaking at approximately 2,400 students. Therefore, the School District will need a long-term high school capacity for 2,400 students.

Expanding the existing high school campus to meet this need is problematic on many fronts due to existing size limitation and irregular configuration of the site boundaries. Further, the campus cannot expand beyond its current boundaries as the campus is completely surrounded by existing residential development to the north, south and west and Stella Olsen Park and the sensitive wetland areas along Cedar Creek to the east as shown in Staff Report Attachment 4(Figure 5 in petition).

With respect to the buildings themselves, the School District has made additions over the years to accommodate growth, but the buildings are now completely overtaxed. Based on capacity analysis performed by the School District's contract architect, DOWA, the existing high school campus could be renovated to accommodate only another 450 students. This would increase capacity from 1,550 to approximately 2,000 students. However, at 2,000 students, the school would only have capacity for 7 years requiring the School District to add capacity again down the road. In review of the School District's bonding capacity, the School District will not be in a financial position to make any changes in 7 years and would be saddled with overcapacity schools for the foreseeable future. Therefore expanding the existing campus would provide for a short-term fix but would not provide the long-term solution the District is looking for.

New High School Siting Criteria

With the determination that a new high school is needed, the Bond Management Team identified the following criteria for aid in locating sites for further consideration:

1. Minimum Size: 50 acres
2. Zoning: Site must be zoned or planned for residential or institutional use that allow schools
3. Location: Site must be in Sherwood or contiguous to Sherwood (The City of Sherwood and mostly western Sherwood is where 90% of the student population resides)
4. Topography: Flat to mostly flat to accommodate ballfields

5. Wetlands and Waterways: No wetlands or minimal wetlands/waterways
6. Water and Sanitary Sewer: Adequate public utilities must be available or can feasibly be extended to serve the site
7. Stormwater Drainage: Downstream drainage capacity must exist to accommodate new impervious areas
8. Transportation: Site must be located near major streets to allow ease of access for students and limited routing of school traffic and buses through existing or planned residential areas

Inside the Current UGB

Using Metro's Regional Land Information System, City's Residential Buildable Lands Map and concept planning documents, potential sites were searched within the Sherwood School District Boundary that is inside the Existing Sherwood Urban Growth Boundary and within the Wilsonville or Tualatin existing Urban Grown Boundary.

Northeast Sherwood (Commercial and Industrial Land)

Sherwood City Limits

The northwest area of the City of Sherwood is zoned commercial and industrial, zoning that does not allow for school uses. In addition, much of the commercial and industrial land is built-out or contains wetlands and sensitive areas that cannot be developed. The largest vacant developable site in this area is located at the southeast corner of SW Langer Farms Parkway and SW Century Drive and is only 22 acres, too small for a high school.

Tonquin Employment Area

In 2004, 300 acres of industrial land was added to the Sherwood urban growth boundary in east Sherwood, known as the Tonquin Employment Area. A concept planning document was completed for this area in October of 2010. None of the area has of yet been annexed into the City of Sherwood to allow for urban development. There is an 88 acre parcel that fronts SW Tualatin-Sherwood Road that has potential to accommodate a new high school (12900 SW Tualatin Sherwood Road – 2S128D000100). However, this parcel was added to the UGB for the purpose of providing industrial uses and not for school uses. In addition, this site is located at the far east end of the existing Sherwood city limits and is not close to the student population that predominately resides on the west side of Sherwood. Therefore, locating the

school here would result in an inconvenient and isolated high school campus in the midst of industrial uses. Thus, the site was rejected from further consideration.

South and West Sherwood (Residential Land)

The southern and western areas of Sherwood are mostly residential. Residential zoning allows for school uses. This is also where most of the School District's student population resides (more than 90% of the student population lives in southern and western Sherwood). South of the existing city limits and within the urban growth boundary is the 250-acre Brookman Road Addition Concept Planning Area (Brookman Planning Area). The primarily-residential Brookman Planning Area has a completed concept plan from May of 2009. However, the area has not yet been annexed into the City of Sherwood and therefore has not been developed for urban uses.

The City of Sherwood recently completed a draft Housing Needs Analysis dated June 2015 for the existing urban growth boundary. The housing needs analysis contained a 2014 residential buildable lands inventory map that identified vacant buildable residential land within the City's UGB including the Brookman Planning Area. The residential buildable lands inventory map identified some available residential land. However, the available land is fragmented and/or constrained with no large developable sites that would accommodate a high school campus of 50 acres. Further there is no opportunity to consolidate this fragmented land in a way that would meet the District's criteria for a high school site. The Sherwood Buildable lands map is shown in Staff Report Attachment 5(Figure 6 in petition).

Within the Wilsonville or Tualatin Urban Growth Boundary

There are some limited areas of the Sherwood School District that are within Wilsonville and Tualatin's urban growth boundary, including the following:

Southwest Tualatin Concept Planning Area

Adjacent and east of the Sherwood Tonquin Employment Area is the Southwest Tualatin Concept Planning Area. Similar to Tonquin, this 614-acre area was added to the urban growth boundary in 2004. The area is planned for industrial use, and is even further away from west Sherwood students than Tonquin Road. Therefore, the area was rejected from further consideration.

Basalt Creek and Coffee Creek Planning Areas

Both of these planning areas are too far from the west Sherwood student population to be seriously considered. In addition, discussions with the City of Tualatin, who is leading the planning for Basalt Creek, indicates that there are no sites large enough with the correct zoning within Basalt Creek that would accommodate a new high school. The Coffee Creek planning area is designated by Metro as Regionally Significant Industrial land. This designation does not allow for school uses under any circumstances.

In summary as noted in Section III of the petition there are no suitable sites for a new high school within the current UGB to serve the Districts target population.

As noted in the findings set forth above, the District first examined the ability to expand the current high school to meet future capacity needs. However expanding the existing high school building is problematic due to existing size limitation and the configuration of the existing school campus. The current high school building includes a series of additions designed and constructed in an attempt to incrementally accommodate growth in the student population, resulting in a crowded non-operational and functional facility. Thus additional expansions to meet long term needs are not possible. In addition, the current high school campus is surrounded by residential development on three sides with the fourth side bordering a city park and natural resource area, thereby not allowing expansion of the campus itself.

The District identified eight site location criteria to help guide their search for appropriate site locations within the Sherwood city limits as well as limited areas within Tualatin and Wilsonville that are within the District boundary. The analysis of land within the city limits offered no usable sites. The city's industrial and commercial zones don't allow school uses and the vacant and developable land within the residentially zoned portions of the city is fragmented and constrained with no large enough sites available. The industrial designated land within the UGB but not in the city (Tonquin Employment Area) does contain one site large enough to meet the need; however it was included in the UGB for industrial purposes, is adjacent to existing industrial uses including an active quarry site and is located away from the main student population base. The limited land area within Tualatin and Wilsonville also include either industrially zoned land or very limited parcel sizes that does not provide an opportunity to site a high school. In addition, these areas are even a longer distance from the main student population base in the central and western portions of the city.

No opponents take issue with the applicant's analysis.

The hearings officer believes that it is relatively obvious that there are no sites within the City limits that could meet the need, even considering rezoning as an option. While there is vacant land in the existing UGB, the applicant has shown there are no suitable sites within the

UGB to meet the identified land need. The applicant has met its burden of showing compliance with this factor by substantial evidence in the whole record.

MC 3.07.1425 (C)(1): If the Council determines that there is a need to amend the UGB, the Council shall evaluate areas designated urban reserve for possible addition to the UGB and shall determine which areas better meet the need considering the following factors:

(1) efficient accommodation of identified land needs;

Hearing Officer's Analysis: Once a local government establishes a "demonstrated need" to expand the urban growth boundary, it then must apply the Goal 14's four "locational factors." When Goal 14 was amended in 2005, the locational factors were amended to make clear that the analysis is to be comparative in nature, as opposed to establishing minimum thresholds. The rule now states:

> The location of the urban growth boundary and changes to the boundary shall be determined *by evaluating alternative boundary locations* consistent with ORS 197.298 and with consideration of the following factors:
>
> (1) efficient accommodation of identified land needs
> (2) orderly and economic provision of public facilities and services;
> (3) *comparative* environmental energy, economic and social consequences; and
> (4) compatibility of the proposed urban uses with nearly agricultural and forest activities accruing on farm and forest land outside the UGB. (Underline emphasis added).

Metro has taken the four state-mandated locational factors set forth in Goal 14 and expended them to nine factors. Regardless of this, the goal of the locational analysis remains the same as state law, which is to determine the "best" land to include within the UGB to meet the land need**,** based on appropriate *consideration and balancing* of each factor. *1000 Friends of Oregon v. Metro (Ryland Homes)*, 38 Or LUBA 565, 584 (2000), *rev'd in part on other grounds* 174 Or App 406, 26 P3d 151 (2001). In *Barkers Five, LLC v. LCDC*, 261 Or App 259, 289 (2014), the court stated that consideration of factors means that the local government must:

> "(a) apply and evaluate each factor, (b) weigh and balance the factors which are not independent approval criteria-as a whole, and (c) meaningfully explain why a designation as urban or rural reserves is appropriate. "

Barkers Five, 261 Or App at 300.

OAR 660-024-0060(3) also provides guidance for how one "considers" the location factors and states:

> The boundary location factors of Goal 14 are not independent criteria. When the factors are applied to compare alternative boundary locations and to determine the Metro UGB location, Metro must show that all of the factors were considered and balanced.

In conducting this analysis, one point that cannot be over-emphasized is that no one locational factor can be considered to be a determinative reason to include or exclude any one particular site. Thus, a decision to include or exclude land from a UGB must be based on a *balancing* of all these factors, rather than reliance on any one factor. OAR 660-024-0060(3). *See also Branscomb v. LCDC*, 64 Or App 738, 745, 669 P2d 1192 (1983)(Court held that land could not be excluded from consideration *solely* because it was agricultural land and, as such, fared badly under factor 6). *D.S. Parklane*, 165 Or App at 25; *1000 Friends of Oregon v. Metro (Ryland Homes)*, 174 Or App 406, 409-10 (2001).

A related issue is that local governments often incorrectly treat the locational factors as threshold criteria. In fact, this misunderstanding was so pervasive that at one point LUBA even wrongly suggested that each of the locational factors had a "minimum objective threshold" that had to be identified and met by each site included in a UAR/UGB. *See D.S. Parklane Development, Inc., v. Metro*, 35 Or LUBA 516, 572-3 (1999), *aff'd as modified*, 165 Or App 1, 24, 994 P2d 1205 (2000). However, on appeal, the Court of Appeals clarified that the locational factors were not intended to be applied as threshold ("go - no go") criteria. *Id.* In other words, the intent is *not* to confirm that the preferred site was "good enough" to urbanize based on minimum threshold standards. Rather, the locational factors were intended to be "applied equally" to include lands into a UGB only "where all of the factors justify that inclusion." *Id.* In other words, the intent in establishing these factors was to assist in evaluating and ranking which site(s) amongst *all* potential candidate sites were, relative to one another, the *best* sites to urbanize in order to meet the demonstrated land need.

With that introduction in mind, we turn to a discussion of the first factor. The applicant discusses the first locational factor as follows:

> Urban reserves are lands outside the existing urban growth boundary that are considered suitable for accommodating urban development and expanding the growth boundary when additional urban land is determined to be needed over a 50-year period. The following urban reserve areas are within the Sherwood School District Boundary and are identified in Staff Report Attachment 6 (Figure 7 in petition):
>
> Sherwood North – North of Sherwood UGB
> Sherwood South – South of Sherwood UGB
> Sherwood West – West of Sherwood UGB
> Tonquin – South and West of Sherwood UGB
> Grahams Ferry – Northwest of Wilsonville

I-5 East – East of I-5 and north of Wilsonville
Elligsen Road - East of I-5 and north of Wilsonville

I-5 East, Elligsen Road and Grahams Ferry Urban Reserve Areas
These urban reserve areas were immediately rejected from further consideration due to the distance from west and south Sherwood where the majority of the student enrollment resides. These areas are 2 to 5 miles away in a straight line and even further when traveling on the road network.

Tonquin Urban Reserve Area
This area is directly south of the Sherwood Tonquin Employment UGB area and west of the Southwest Tualatin UGB area. The Tonquin Urban Reserve area encompasses approximately 571 acres. The area has parcels large enough to accommodate the high school site. However, much of the property is mapped as containing Upland Habitat Class A (Metro Title 13) and Riparian Areas Class I, II and III (Metro Title 3). This urban reserve area and it is likely to be designated industrial and/or employment due to its close proximity to other industrial areas. This urban reserve area is on the east side of the City and not centrally located for use by the majority of the School District students. The area is further isolated by a rock bluff that forms the eastern boundary of the current urban growth boundary and Sherwood City limits. This bluff is perched above the Rock Creek stream corridor that effectively isolates this area from the existing residential neighborhoods of Sherwood. Finally, the area does not have adopted concept plan or plan for how utilities will be extended to serve the area.

Sherwood North Urban Reserve Area
This area represents slivers of land along the existing urban growth boundary at the north end of the City of Sherwood. The area was designated urban reserve because it is not within the floodplain of the Tualatin River. However, this land is not large enough to accommodate a high school site and therefore was rejected from further consideration.

Sherwood South Urban Reserve Area
This area is directly south of the Brookman Road UGB area. This area consists of rolling hills with much of the area identified by Metromap online mapping system having slopes greater than 10%. There is also two stream corridors that travel through the area with many areas mapped by Metromap as being riparian or upland habitat. One potential site is located between Oberst Road and Labrousse Road that is not mapped as having upland habitat or

riparian areas. However, this land is mapped by Metro as having slopes of greater than 10% making development of a high school campus and ballfields difficult. The biggest challenge of developing in this area is that the Brookman Road UGB area would need to be annexed and developed first before this area can be made available for development. Therefore, development in this urban reserve area is likely years away and the only promising site is at the south end of and not next to the existing Brookman Road UGB area. This area also does not have a concept plan. For these reasons, this area was rejected from further consideration.

Sherwood West Urban Reserve Area

In February 2016, Sherwood completed a Preliminary Concept Plan for the Sherwood West Planning area (aka Metro Urban Reserve Area 5B). Sherwood West encompasses 1,291 acres along the west border of Sherwood's existing urban growth boundary. The Sherwood West Planning Area is shown in Staff Report Attachment 7 (Figure 8 in petition).

Six alternative high school sites (A-F) were identified within the Sherwood West Urban Reserve Area that are large enough to accommodate a new high school. The six alternative sites (A-F) within the Sherwood West Concept Plan Area were evaluated based on site selection criteria. The site locations and evaluation criteria are indicated in Staff Report Attachment 8 (Figures 9 to 14 in petition). The School District's site alternative analysis is summarized in the table below.

(Table 1 – Alternative Sites Summary in petition)

Alternative Selection Criteria	***Alternative Sites****					
	A	***B***	***C***	***D***	***E***	***F***
Flat Topography	*N*	***U***	***Y***	*U*	*U*	*U*
Wetlands	*N*	***Y***	***Y***	*U*	*Y*	*N*
Water Service	*N*	***Y***	***Y***	*Y*	*N*	*N*
Sanitary Sewer Service	*N*	***Y***	***Y***	*N*	*N*	*Y*
Storm Drainage	*Y*	***Y***	***U***	*N*	*N*	*Y*
** Y-Meets Criteria - N-Does Not Meet Criteria – U-Undetermined*						

From the site alternatives analysis, it became clear that Sites B and C were the most promising with other sites lacking utilities, having significant wetlands, drainage issues and/or significant topography that would make construction challenging. Alternative Sites B and C are located near each other both west of SW Elwert Road at SW Haide Road, just north of Highway 99W. Site C was selected due

to having more of a gentle slope and less grade changes. Most of Site C has a consistent slope change of approximately 40 feet over the length of the site with only a small valley and ridge. Site B has a more drastic slope change of 50 to 60 feet with a more defined ridge running through the middle of the site. Site B would be far more challenging to grade and develop for a high school than Site C. The Sherwood West Concept Plan contained a phasing and funding strategy. The phasing plan identified six phases (A-F). The subject site (Site C) is located within Phase A of the concept plan.

The subject site represents an efficient location because:

- The location is next to existing western Sherwood and close to the vast majority of the District's student population (90%).
- City utilities are available to serve this site or can be extend as the site is adjacent to the city limits.
- Direct and efficient access will be available via major streets that are intended to accommodate significant motor vehicle, pedestrian and bicycle needs.
- The site will be developed on the north, south and west along existing right-of-ways and will be developed to the existing City limits and UGB. This location is a logical location to develop first within the Sherwood West Concept Plan, as it is really the first site north of 99W. Other sites in Sherwood West would result in undesirable leapfrog development.
- Utilizing the approximate 76-acre site to ultimately accommodate the large 2,400-student high school and the School District/City shared ballfields will provide greater efficiency than developing play fields independently. The district and City have a long history of partnering to maximize use of shared ball field resources.

As set forth in the District's narrative and response to MC 3.07.1440(a), there is an identified need for a major amendment of the UGB to provide for a new high school site and this need cannot wait until the next analysis of the building land supply under ORS 197.299. As allowed by MC 3.07.1425(b), the District specified characteristics necessary for land to be suitable for the identified need, *i.e.*, the new high school. *See* Applicant's Narrative at 18-19, 33-35. These characteristics included a minimum site size of 50 acres; zoning that would allow for an institutional use; within or contiguous to Sherwood, where 90% of the children served by the District reside; flat to mostly flat topography; no or minimal constraints such as streams, wetlands, intact upland habitat; adequate/feasible access to public utilities, including water, sanitary sewer, and storm sewer; and near to major (collector or arterial) streets to accommodate high school-level transportation impacts. As also required by MC 3.07.1425(b), the District has demonstrated that the need for the new high school cannot be accommodated on land already inside the UGB.

As shown above, the District undertook an analysis of seven urban reserve areas that are within the district boundary, three of which are not adjacent to the city of Sherwood. The Metro Code does not allow for the creation of an island of urban land so the analysis must be limited to those properties that are directly adjacent to the current UGB. MC 3.07.1425(f).

The Seven Urban Reserve Areas

Within the District's boundary, there are seven areas that contain urban reserves (*see* Application Narrative p. 22 of 39, showing map of all seven areas). They are:

- Sherwood North
- Sherwood South
- I-5 East
- Elligsen Road
- Tonquin
- Graham's Ferry
- Sherwood West

Each will be discussed in turn.

The Sherwood North Urban Reserve Area

The Sherwood North urban reserve area is comprised of slivers of land without flood plain constraints north of the existing city limits and south of Tualatin River. This area does not contain one or more contiguous parcels that would be large enough to meet any of the District's siting criteria for a high school site. Therefore, the hearings officer finds that the Sherwood North urban reserve area cannot accommodate the need for a new high school.

The Sherwood South Urban Reserve Area

The Sherwood South urban reserve area is adjacent to the Brookman Road UGB area. Some of the Brookman Road UGB area was recently annexed to the city, but much of it still has not been annexed. The Sherwood South area consists of rolling hills with much of the area identified by Metro Map as having slopes greater than ten percent, which would not meet the District's siting criterion of a flat to relatively flat site. (See Attachment 3.) There are also two stream corridors that traverse the area with many areas mapped by Metro as being riparian or upland habitat. (See Attachment 4.) There is a potential site located between Oberst Road and Labrousse Road that is not mapped as being constrained by upland habitat or riparian areas, but is mapped as having slopes greater than ten percent, which would not meet the District's siting criterion for a flat to relatively flat site. A challenge in the overall development of this area is that the Brookman Road area within the UGB must be annexed and developed first before the Sherwood South area will have the public services it needs to be able to develop. Further, Sherwood South is not even concept planned yet. As far as the hearings officer is aware, no such planning has been scheduled. As noted earlier, MC 3.07.1110 requires that urban reserve areas be concept planned before they be considered for inclusion in the UGB. As set forth in response

to MC 3.07.1440(a) there is a pressing need for the new high school. To wait at least one or more years for the City to concept plan the Sherwood South urban reserve area under MC 3.07.1110 is not consistent with the pressing need for the new high school that precipitated this major amendment application. Therefore, the hearings officer concludes Sherwood South cannot accommodate the need for a new high school.

The I-5 East Urban Reserve Area

The I-5 East urban reserve area is at the extreme eastern end of the District's boundary, east of I-5, next to Tualatin. This urban reserve area does not meet the District's siting criterion that the new high school site be within or contiguous to Sherwood, where 90% of the children served by the District reside. Further, as set forth in the staff report, these urban reserves are constrained by natural resources issues and steeper slopes yielding no buildable areas big enough to accommodate a new high school. For all of these reasons, the hearings officer finds and concludes that this urban reserve cannot accommodate the new high school.

The Elligsen Road Urban Reserve Area

Similarly, the Elligsen Road urban reserve area is at the extreme eastern end of the District's boundary, east of I-5, next to Tualatin, and immediately south of the I-5 East urban reserve area. This urban reserve area does not meet the District's siting criterion that the new high school site be within or contiguous to Sherwood, where 90% of the children served by the District reside. Travel to western Sherwood would be at least five miles for the vast majority of students along the already-congested Tualatin-Sherwood Road (*see* Application Narrative p. 22 of 39, showing map). Further, as set forth in the staff report, these urban reserves are constrained by natural resources issues and steeper slopes yielding no buildable areas big enough to accommodate a new high school. For all of these reasons, the hearings officer finds and concludes that this urban reserve cannot accommodate the new high school.

The Tonquin Urban Reserve Area

The fifth urban reserve is the Tonquin urban reserve area. This area lies on the east side of Sherwood and is contiguous to Sherwood's city boundary. As set forth in the Narrative, this urban reserve area is directly south of the Sherwood Tonquin Employment UGB area and, according to Julia Hajduk, the City's Community Development Director, will be used to accommodate the City's future industrial and employment needs given its proximity to other industrial uses and Sherwood's employment/industrial core. Therefore it is not likely to allow for zoning for an institutional use. As noted in the staff report, another issue with building a new high school in this area is that the majority of adjacent land within the UGB is not yet developed to urban standards. Any out-of-sequence development in this area, then, would require a costly and inefficient extension of public services. Further, much of the property in this urban area is mapped as containing Upland Habitat Class A (Metro Title 13) and Riparian Areas Class I, II, and III (Metro Title 13). (See Attachment 1.) This area is further isolated by a rock bluff that forms the eastern boundary of the current UGB and city limits. This bluff is perched above the Rock Creek stream corridor that effectively isolates the area from the existing residential neighborhoods of Sherwood, thereby making it less efficient to serve the student population

given that the bulk of that population is in the southern and western areas of the city. Significant areas of the urban reserve also have substantial slopes of ten percent and greater, along with floodplain constraints, which would not meet the District's siting criterion of a flat to relatively flat site. (See Attachment 2.) Further, this urban reserve area does not have a concept plan in place or a plan for how utilities might be extended to serve the area. Concept planning has not been completed for this area. MC 3.07.1110 requires that urban reserve areas be concept planned before these areas can be considered for inclusion in the UGB. As set forth in response to MC 3.07.1440(a) there is a pressing need for the new high school. To wait at least one or more years for the City to concept plan the Tonquin urban reserve area under MC 3.07.1110 is not consistent with the pressing need for the new high school that precipitated this major amendment application.[12] Therefore, the hearings officer concludes the Tonquin urban reserve area cannot accommodate the need for a new high school.

The Grahams Ferry Urban Reserve Area

The Grahams Ferry urban reserve area is at the District's extreme southeast boundary next to Wilsonville. This urban reserve areas meet the District's siting criterion that the new high school site be within or contiguous to Sherwood, where 90% of the children served by the District reside. Travel to from Graham's Ferry to western Sherwood would be at least seven miles for the vast majority of students along the already-congested Tualatin-Sherwood Road (*see* Application Narrative p. 22 of 39, showing map). Further, as set forth in the staff report, this urban reserve area is constrained by natural resources and steeper slopes yielding no buildable areas big enough to accommodate a new high school. For all of these reasons, the hearings officer finds and concludes that these urban reserves cannot accommodate the new high school.

The Sherwood West Urban Reserve Area

The seventh and final urban reserve area studied was Sherwood West. The hearings officer finds this is the only urban reserve area that can efficiently accommodate a new high school consistent with the citing criteria, for these reasons: Sherwood West has been MC 3.07.1110 concept planned and so may be considered for inclusion within the UGB. Sherwood West is adjacent to the city's existing UGB and in close proximity to the bulk of the District's student population. The area is planned for predominantly residential uses, including schools, and so as Sherwood West develops even more of the student population will reside in the vicinity of the proposed high school site. The District studied the 1,291-acre Sherwood West urban reserve for places within it that could accommodate a new high school site. The applicant District did this by utilizing an engineer and architect to evaluate all sites in the urban reserve that were flat to relatively flat; had a minimum buildable site size of approximately 50 acres or more; no or minimal constraints from streams, wetlands, and intact upland habitat; adequate/feasible access to public utilities; and proximity to a major (collector or arterial) street network. Findings addressing MC 3.07.1425(c) can be found in the Narrative and in the staff report. The applicant District included an analysis of the six areas within Sherwood West. Therefore, the hearings officer finds that, given the framework of MC 3.07.1425(b) and (c), no urban reserve except for

[12] Urban Reserve Areas are intended to provide a 50-year supply of land. Given that the City has no plans to complete a concept plan for the area, and because contiguous areas within the UGB would need to develop first to extend the needed infrastructure, it is safe to conclude that development of this area is at least several years away.

Sherwood West should advance to MC 3.07.1425(c) to determine which urban reserve can best meet the identified need, because no other urban reserve can meet that need.

The Six Sites Studied within the Sherwood West Urban Reserve Area

The District identified six sites (designates Sites A through F) within the Sherwood West urban reserve area that were large enough to accommodate a new high school campus. Each of the six is discussed in turn:

Site A – The hearings officer finds this site cannot efficiently accommodate the new high school due to slope, natural area constraints, public infrastructure issues or a combination of these factors. There is a small wetland in the center of this site. The western portion is mostly occupied by Chicken Creek. There is no water service available from SW Elwert Road, and water extensions would be required along Elwert frontage and east from SW Edy Road. The site is low-lying and sanitary sewer connection is not available from SW Edy Road, so a major pumping station would have to be built.

Site B - The hearings officer finds this site *could* possibly accommodate the new high school. However, it has a significant ridge running through the middle of the site, which would require extensive grading, with slopes running both east and west with a 50-60 foot grade change. Both public water and a 15" sanitary sewer pipe are available off SW Elwert Road.

Site C - This site is quite flat, with no more than a 40 foot grade change required. It has water and sewer connections off SW Elwert Road. There are no wetlands. The hearings officer finds that Sites B and C are the two areas that can most efficiently accommodate a new high school, but Site C is clearly superior because Site B has a significant topographic ridge running north-south through the middle of the site with an approximately 50-60 foot grade change. Site C has less topography to manage, which is important when one considers that ballfields, tracks, and other sports facilities needed as part of the new high school cannot be developed on slopes. Therefore, the hearings officer concludes and finds Site C can most efficiently meet the identified need of a new high school.

Site D - The hearings officer finds this site cannot efficiently accommodate the new high school due to slope, natural area constraints, and public infrastructure issues. The entire site slopes down to the east towards private property, with a grade change in excess of 50 feet. There is no sanitary sewer service available. A very costly sewer line extension and public system improvements would be necessary. There are no established public storm drains in the vicinity. Street improvements on Kruger Road and offsite improvements would likely be required. Sites D also suffers from not being adjacent to the existing Sherwood UGB, which means more land would be required to be brought into the UGB than is necessary for the school site in order to ensure contiguity and public infrastructure would have to be extended further to serve the new high school, which is inefficient and expensive.

Site E - The hearings officer finds this site cannot efficiently accommodate the new high school due to slope, natural area constraints, and public infrastructure issues. The entire site slopes down to the east towards Highway 99, with a grade change around 75 feet. There is no

sanitary sewer service available. A very costly sewer line extension and public system improvements would be necessary. There are no established public storm drains in the vicinity.

Site F - The hearings officer finds this site cannot efficiently accommodate the new high school due to wetlands, drainage, powerlines, and lack of public water supplu. While quite flat, this site has wetlands, drainage, and a BPA power line easement running through it. While there is a nearby sewer line, there is no water line, and costly improvements would have be made to supply the school with drinking and irrigation water as well as meeting firefighting needs. Site F is further constrained by a BPA easement that cuts diagonally through what would otherwise be the flattest, least constrained part of that area and this flat area is segregated from the existing UGB by Chicken Creek and protects a riparian corridor. Site F also suffers from not being adjacent to the existing Sherwood UGB, which means more land would be required to be brought into the UGB than is necessary for the school site in order to ensure contiguity and public infrastructure would have to be extended further to serve the new high school, which is inefficient and expensive.

Conclusion of the Alternative Sites Analysis for the Six Sites in Sherwood West

The District evaluated the alternative sites related to five selection criteria noted above and determined that four of the six sites (A, D, E & F) lacked utilities, had significant wetlands, drainage issues or topography that restricted the ability to efficiently accommodate the identified land need. In addition, site D is not adjacent to the current UGB and therefore would create an island of urban land which is not allowed under Metro Code. Areas B & C better met the selection criteria with site C being the best site due to less grading and site work to accommodate the identified land need. Based on the urban reserve areas analyzed site C in the Sherwood West urban reserve best meets the need considering efficient accommodation of the identified land need. For these reasons, the hearings officer concludes and finds that proposed Site C (on the northwest corner of SW Elwert and Kruger Roads) can most efficiently meet the identified need of a new high school.

MC 3.07.1425(c)(2): If the Council determines there is a need to amend the UGB, the Council shall evaluate areas designated urban reserve for possible addition to the UGB and shall determine which areas better meet the need considering:

(2) the orderly and economic provision of public facilities and services.

Hearings Officer's Analysis: This suitability factor focuses on the orderly and economic provision of public facilities and services. Because Sherwood West has been concept planned pursuant to MC 3.07.1110, the provision of public facilities and services within the Sherwood West Concept Plan area has been studied to a larger degree than other URAs. The Sherwood West Concept Plan was prepared with analyses of existing sanitary sewer, water, storm water, and transportation conditions and analyses of how those systems need to be upgraded, extended, and phased to meet the future development of Sherwood West. (See Sherwood West Concept Plan, pages 15-21, 40-44, Appendix 3 (Existing Conditions Report), and Appendix 8 (Transportation Options Alternative Analysis Report and Cost Estimates). The concept plan was prepared in coordination with all of the future service providers, including those services that

will be provided by the City and those that will be provided by others, including Clean Water Services, ODOT, Tualatin Valley Fire & Rescue, and Washington County. (*See* Sherwood West Concept, acknowledgements page and Appendix 6 (Service Provider Interviews). The District was also part of the Technical Advisory Committee that informed the concept planning effort. Because all of this extensive analysis and coordination work had already been done for Sherwood West, the District used that work as the jumping off point for its analysis of the area for orderly and efficient accommodation of public services.

As demonstrated in the Narrative, pages 24-31, four of the six sites (A, D, E, and F) have significant barriers to provision of public infrastructure. Sites B and C have the fewest barriers and are most feasible for public infrastructure service. This is consistent with the findings of the Sherwood West Concept Plan, which anticipates phasing public infrastructure to serve the area encompassed by Sites B and C first, i.e., Area A. (*See* Sherwood West Concept Plan, pages 40-44.) Service provider interviews conducted as part of the concept planning effort also identified Area A as the "first stage development area." (*See* Sherwood West Concept Plan, Appendix 6, page 5.) It is also worth noting that, according to the concept plan, Area A of the concept plan has most infrastructure in place, "presents the best near-term opportunity for development in Sherwood West," and the cost to serve is on the lower end of the cost scale. (Sherwood West Concept Plan, pages 42-43.) The District also engaged a licensed traffic engineer to prepare the March 15, 2017, Sherwood High School UGB Expansion Transportation Study (the "Transportation Study") to address effects of a new high school on Site C on the surrounding transportation system. The Transportation Study found that, with appropriate mitigation, Site C can accommodate the new high school while maintaining an adequate transportation system. See also District's findings in response to Goals 11 and 12 with respect to the provision of public facilities and services to Site C.

As part of this UGB amendment application effort, the District obtained service provider comments from the City of Sherwood, Washington County, Tualatin Valley Fire and Rescue, and Clean Water Services, all of whom supported the siting of the new school on Site C from an infrastructure provision standpoint, consistent with the Sherwood West Concept Plan.

In sum, Sites B and C best meet the need for a new high school considering the orderly and economic provision of public services per the Sherwood West Concept Plan and the District's own analysis.

The primary opponent makes only a desultory effort to challenge the applicant's proposed findings. *See* letter from Jennifer Brager dated June 23, 2017, at p. 7. Ms. Bragar concludes, without much in the way of analysis, that "Site C is unworkable." The only evidence that the opponent cites as support for this theory is the DKS Traffic Study dated March 15, 2017, which shows that currently there are several failing intersections in the vicinity. However, failing intersections is not in any way determinative when considering the locational factors.

The proposed site has positive attributes from the transportation and traffic perspective. The site is close to the area's major north-south highway (Highway 99) and east-west arterial (the Tualatin-Sherwood Road). It has a relatively flat topography, reducing hazards in wet or snowy conditions. With the planning modifications, the site will have adequate access and

capacity for peak school commuting times (7.15 to 8 am and 2.50 to 3:45 pm). Road widths and sightlines will be sufficient for safety purposes, an important consideration for less-experienced drivers, such as high school juniors and seniors.

The traffic issue has been addressed by unrebutted evidence from the applicant's civil and traffic engineers - the *only* expert testimony in the record - and is belied by the fact that all of the public service providers for the Sherwood West area, including Washington County, the City of Sherwood, and Clean Water Services, submitted service provider letters that support the new high school on Site C, and state that such services can be provided. (*see* Appendix to the Application Narrative for copies of these letters).

At the public hearing, local residents Carolyn McBee and Karen Labahn raised issues of traffic safety at the proposed site, specifically on Kruger and Elwert Roads. They testified, convincingly, that the roads abutting the preferred alternative site are rural in nature and not capable of handling the traffic generated by the school. As the hearings officer emphasized at the hearing, the analysis is comparative in nature. A site does not have to be good; it just has to be better than the alternatives. This is true even if all of the alternatives are objectively bad. In fact, it will undoubtedly be the case that the roads in all seven of the candidate urban reserve areas are rural in nature and incapable of handling urban levels of traffic. At this stage, the analysis is high level and really only focused on identifying issues that made any one site particularly good or horrendously bad in relation to the others.

In this case, the applicant's traffic engineers Scott Mansur, P.E. and Carl Springer, P.E. of DKS Associates wrote the following in a June 28, 2017 memorandum:

> DKS prepared the March 15, 2017, Sherwood High School UGB Expansion Transportation Study ("March Transportation Study"). The March Transportation Study assesses the proposed UGB amendment impacts and identifies a roster of system improvements for the short-term and long-term. This study acknowledges that several local intersections are heavily congested during peak hours, and that the rural street infrastructure nearby the proposed UGB amendment site does not meet either the City's or the County's facility design standards today. What this study also tells us, however, is that with proper mitigation the proposed school site can be adequately served with transportation infrastructure. The next step in the planning process is the post-UGB amendment Title 11 planning, as required by Metro, and it is during that process that the next transportation planning steps will be taken. These planning steps include designating urban zoning and land use types within the newly added UGB area. During this stage, we will engage in additional technical studies, including a second transportation impact study, to (1) refine the specific project needs, (2) ensure that the Transportation Planning Rule is met, (3) ensure that performance standards can be maintained over time, and (4) ensure that a safe transportation network is provided for the new

> high school. Based on our transportation analyses so far, we are confident that the Sherwood School District can provide adequate state and local transportation facilities to support the proposed Site C high school.

While the residents' traffic safety concerns are well meant, and taken seriously by the hearings officer, the engineers are undoubtedly correct that the applicant's preferred alternative site can be improved with reasonable cost expenditure. The improvements discussed at the hearing were typical of what one would expect when land urbanizes, and do not involve any highly extravagant technical solutions such as bridges over wetlands / streams, or expensive highway overpasses. The hearings officer had the opportunity to evaluate these engineering experts and considers their representations highly credible. No evidence was presented pertaining to other sites that would suggest that any other site would be significantly better from a transportation standpoint, and several of the sites required more expensive improvements.

The opponents argue that the applicant gamed the system by counting traffic in the middle of winter. *See* letter from Jennifer Brager dated June 23, 2017, at p. 8. Again, this argument seems to lose focus of the intended exercise. That argument might have merit if the applicant's traffic engineers had performed their traffic counts at some locations in winter, but at other locations in summer (when traffic is lighter because school is out of session and many workers are not commuting, due to vacations). That did not happen. The applicant's traffic study clearly states:

> To perform the intersection analysis, traffic counts were collected during the AM peak (7:00 – 9:00 am) on Feb 1, 2017 and the PM peak (4:00-6:00 pm) on Jan 31, 2017. Study intersections on ODOT facilities (i.e. OR 99W) were analyzed using estimated 30th highest hour traffic volume (30 HV) conditions. The 30 HV development process for existing conditions *includes the determination of seasonal adjustments.* (DKS "Sherwood High School UGB Expansion Transportation Study" dated March 15, 2017, p. 9, italic emphasis added).

Site C is located in close proximity to existing urban arterials, which in and of itself makes it a better site as compared to alternatives such as Sites D and F, which are more isolated and remote. Sites A, E, and F will be more expensive to develop than Sites B and C. Sites D and F suffer from not being contiguous with the existing UGB and so public infrastructure would have to be extended further, out of sequence, to reach those sites. This creates a significant unnecessary expense. Further, sites with steeper topography and natural resource constraints, like Sites A, D, E, and F will also be more costly to develop. Sites B and C will cost less than the other sites to develop, but Site C will cost even less than Site B due to its flatter topography.

The hearings officer wishes to emphasize that the public will have many additional opportunities to comment on and influence the types of transportation improvements that will be built.

MC 3.07.1425(c)(3): If the Council determines there is a need to amend the UGB, the Council shall evaluate areas designated urban reserve for possible addition to the UGB and shall determine which areas better meet the need considering:

(3) comparative environmental, energy, economic, and social consequences.

A comparison of the six sites with respect to environmental, energy, economic, and social consequences of development is set forth below:

Environmental Consequences: There are areas within Sherwood West that have significant natural resources within them. The maps at Figure 6 of the Sherwood West Concept Plan and Appendix B of Appendix 3 of the Sherwood West Concept plan are instructive in this regard. From those maps one can see that Sites A, D, and F have significant areas of floodplains, wetlands, protected stream corridors, and inventoried wildlife habitat. In contrast, Sites B and C have little to no environmental resources on them. Further, Sites B and C are closest to the city's existing urban core, which give them the most direct transportation connections, thus limiting air quality degradation. Therefore, development of these sites with a high school would have the least negative environmental consequences of all of the alternative sites.

Energy Consequences: From an energy standpoint, all of the sites are reasonably close to the bulk of the student population to be served, but Sites E and F are more remote. This will be exacerbated as Sherwood West develops with mostly residential uses. Sites A, B, C, and D are most centrally located, which will allow more students to walk and bike to school and reduces the number of students being bused and driven to school, and allows for the least vehicle miles traveled for those who use cars and buses. Site D would require an out-of-sequence extension of public infrastructure to the more interior of the urban reserve, however, which ticks its adverse energy consequences somewhat higher than Sites A, B and C.

Economic Consequences: Public bond dollars are finite and must not be wasted. Taxpayers expect that school districts will be good stewards of the public money and building new school facilities is no exception. Being more remote from the existing urban area and public infrastructure, Sites A, E, and F will be more expensive to develop than Sites B and C. Sites D and F suffer from not being contiguous with the existing UGB and so public infrastructure would have to be extended further, out of sequence, to reach those sites. This creates a significant unnecessary expense. Further, sites with steeper topography and natural resource constraints, like Sites A, D, E, and F will also be more costly to develop. Sites B and C will cost less than the other sites to develop, but Site C will cost even less than Site B due to its flatter topography. The effect of topography on the cost of building a high school site with its need for ball fields and other sports facilities should not be under estimated. Even small amounts of slope will have significant, expensive consequences on a school site due to the cost of grading.

Site C has another factor that weighs in its favor over Site B, which is that Site B contains a number of single-family residences that would have to be purchased and demolished to build the new high school. Purchasing houses to tear them down is not a good use of bond dollars if it can be avoided. Therefore, Site C clearly comes out ahead in this consideration.

Social Consequences: Siting the new high school in the most centrally located area possible is important to fostering a sense of civic and school pride. Although high schools can have fairly significant impacts on an area, they should be sited where the bulk of the population resides and be a use that brings people together in a place that the citizens identify as an integral part of their community. One of the alternatives that the District considered in its facilities planning to alleviate the capacity issue at the existing Sherwood High School was building a second high school. The community, however, was very much opposed to that idea. A small, cohesive community like Sherwood wants to remain bound together not divided by different allegiances to different high schools. All of the sites analyzed in Sherwood West would be superior to any sites in any other urban reserve for these reasons alone; however, within Sherwood West Sites B and C are most centrally located - both now and in the future as the city continues to grow to the south and west. Even so, development of Site B has a more immediate social consequence that Site C does not have. There are a number of residences in Site B that would have to be purchased and demolished in order to develop the new high school. Displacing residents from their homes needlessly is a very adverse social consequence and should not occur if it can be avoided, which in this case it can. Therefore, Site C comes out ahead here, too.

Conclusion: Sites B and C are the two sites that come out the most favorably when one factors in the environmental, energy, economic, and social consequences. However, Site C edges ahead of Site B due to Site B's increased adverse economic and social consequences.

MC 3.07.1425(c)(4): If the Council determines there is a need to amend the UGB, the Council shall evaluate areas designated urban reserve for possible addition to the UGB and shall determine which areas better meet the need considering

(4) compatibility of proposed urban uses with nearby agricultural and forest activities occurring on land outside the UGB designated for agriculture or forestry pursuant to a statewide planning goal.

Hearings Officer's Analysis: The District identified a number of site characteristics that a new site would need to meet in order to accommodate a new high school. As discussed above, is one urban reserve area that can efficiently accommodate a new high school - Sherwood West. Sherwood West has been MC 3.07.1110 concept planned and so may be considered for inclusion within the UGB. Sherwood West is adjacent to the city's existing UGB and in close proximity to the bulk of the District's student population. The area is planned for predominantly residential uses, including schools, and so as Sherwood West develops even more of the student population will reside in the vicinity of the proposed high school site. The District studied the 1,291-acre urban reserve for areas within it that could accommodate a new high school site. The District did this by utilizing an engineer and architect to evaluate all sites in the urban reserve that were flat to relatively flat; had a minimum buildable site size of approximately 50 acres or more; no or minimal constraints from streams, wetlands, and intact upland habitat; adequate/feasible access to public utilities; and proximity to a major street network. This analysis yielded six sites, which were then ranked according to the site criteria.

With respect to how the six sites meet the need for a new high school considering the compatibility of proposed urban uses with nearby agricultural and forest activities, it is important to note that the entire Sherwood West area is slated for eventual urban development, regardless of the current uses and zoning of land within it. It was designated as an urban reserve instead of a rural reserve partly due to its small-scale, intermittent farming and forestry activity, parcelization, and rural residential development. That said, urbanizing land that is adjacent to existing urban development is more consistent with this boundary location factor than urbanizing land further into the undeveloped portions of an area, which will likely remain in rural use much longer whether the new high school is built in the area or not. Sites A, B, and C are closest to existing urban development. Sites D, E, and F are more remote from existing urban development. Therefore, in this respect, A, B, and C will have fewer impacts on any nearby agricultural and forest activities. Site A does not appear to have any adjacent agricultural or forest activities occurring adjacent to it. The other sites have very minor to small amounts of agricultural activities occurring on adjacent land. Therefore, none of the sites would appear to have much impact on agricultural or forest activities. Given the sites' rough equivalency in this regard, Sites B and C are the least costly to serve and most readily developable according to the Sherwood West Concept Plan, so developing in those areas "now" will have fewer impacts on nearby agricultural and forest activities than jumping ahead to an area that might have otherwise remained rural for the next 20 years. This gives Sites B and C the edge in considering this factor.

MC 3.07.1425(c)(5): If the Council determines there is a need to amend the UGB, the Council shall evaluate areas designated urban reserve for possible addition to the UGB and shall determine which areas better meet the need considering

(5) equitable and efficient distribution of housing and employment opportunities throughout the region.

Hearings Officer's Analysis: This factor is not directly relevant to the siting of a new high school and therefore is not determinative in any way.

MC 3.07.1425(c)(6): If the Council determines there is a need to amend the UGB, the Council shall evaluate areas designated urban reserve for possible addition to the UGB and shall determine which areas better meet the need considering

(6) contribution to the purposes of Centers and Corridors.

Hearings Officer's Analysis: This factor is not found within Statewide Planning Goal 14 but is instead a consideration created internally at Metro. According to Metro's 2040 Growth Concept Map, the proposed site is not in a Regional or Town center, nor is it directly on a Corridor. Site A is closest to a Corridor, but as staff pointed out in the staff report, it is mostly undeveloped or in single-family residential use. None of the other sites are close enough to any Centers or Corridors to contribute to them at this point in time. Therefore, none of the alternatives support the purposes of Centers and Corridors in any significant way.

MC 3.07.1425(c)(7): If the Council determines there is a need to amend the UGB, the Council shall evaluate areas designated urban reserve for possible addition to the UGB and shall determine which areas better meet the need considering:

(7) protection of farmland that is most important for the continuation of commercial agriculture in the region.

Hearings Officer's Analysis: This factor is not found within Statewide Planning Goal 14 but is instead a consideration created internally at Metro.

As noted by staff in the staff report, Metro and Washington County completed an urban and rural reserve process that designated the most important land for commercial agriculture in the county as rural reserve and the land most suitable for urban development as urban reserve. This means that development within any urban reserve will, at least presumptively, protect farmland that is most important for the continuation of commercial agriculture in the region.

However, this factor seems to reach beyond that concern and require further differentiation of urban reserve areas, at least to the extent that any of these urban reserves are still in commercial agricultural production. Of the six sites studied in Sherwood West urban reserve area, none appear to have any significant commercial agriculture. As such, it seems their agricultural output does not form a significant component of the Sherwood area's economy.

The applicant points out that development of sites within an urban reserve that are closest to the existing UGB and to areas within the UGB that actually contain urban-level development, helps to keep agricultural and forest land further from the UGB and urban areas in unaffected operation until such time as urban development grows further in that direction.

MC 3.07.1425(c)(8): If the Council determines there is a need to amend the UGB, the Council shall evaluate areas designated urban reserve for possible addition to the UGB and shall determine which areas better meet the need considering

(8) avoidance of conflict with regionally significant fish and wildlife habitat.

Hearings Officer's Analysis: This factor is not found within Statewide Planning Goal 14 but is instead a consideration created internally at Metro.

The Sherwood West urban reserve has some significant fish and wildlife habitat within in it, much of which is associated with Chicken Creek. According to the Sherwood West Concept Plan, Steelhead *(Oncorhynchus mykill),* a federally listed species, are known to exist within Chicken Creek. Sites located closer to Chicken Creek would therefore tend to be less suitable for this project.

All of the sites *except* for Sites B and C are constrained by a significant or moderate level of natural resources:

Site A has a wetland right in the middle, and the entire western portion of this site is mostly creek, and its drainage discharge is right into Chicken Creek (see Narrative, p. 25).

Site D has creek drainage running through the southern portion of the site. Since there is no established public storm drainage anywhere in the vicinity, so a costly system to route storm discharge would have to be built with input from the City of Sherwood and Clean water Services to avoid negatively impacting significant fish and wildlife habitat.

Site E is steeply sloped down to the east towards Highway 99, with a grade change around 75 feet. There are no established public storm drains in the vicinity. so a costly system to route storm discharge would have to be built with input from the City of Sherwood and Clean water Services to avoid negatively impacting significant fish and wildlife habitat.

Site F has creek drainage and potential wetlands running through the entire site (see Narrative, p. 30), so extensive mitigation measures could be required to avoid negatively effecting significant fish and wildlife habitat.

As shown on Figure 6 of the Sherwood West Concept Plan, the western edge of Site B abuts a tributary of Chicken Creek and includes some associated wildlife habitat. Site C has no such identified resources, and, therefore, the hearings officer concludes and finds that Site C best avoids conflicts with regionally significant fish and wildlife habitat.

MC 3.07.1425(c)(9): If the Council determines there is a need to amend the UGB, the Council shall evaluate areas designated urban reserve for possible addition to the UGB and shall determine which areas better meet the need considering

(9) *a clear transition between urban and rural lands, using natural and built features to mark the transition***.**

Hearings Officer's Analysis: This factor is not found within Statewide Planning Goal 14 but is instead a consideration created internally at Metro.

The boundaries of Sherwood West do not appear to have been designated according to providing a clear transition between urban and rural reserves using natural or built features. It is bisected in large part at its northern end by Chicken Creek. But Chicken Creek will not form a natural barrier between urban and rural uses, as the Sherwood West Concept Plan contemplates development on either side of the creek. So, Chicken Creek will end up being a natural area within an urban area - not a boundary between urban and rural uses. Because the boundaries of Sherwood West were not created according to natural or built features, and because all of the six sites studied within Sherwood West for a new high school are internal to Sherwood West and will eventually be in the midst of other urban area, this factor is not particularly relevant to this application. Even so, as staff notes in the staff report, there are no built or natural features that would mark even an internal transition from urban to rural lands for Sites C and E. Site B is flanked by Chicken Creek, which could form such a barrier, but, again, there will be urban development on the other side of that "barrier" one day. Site A is also flanked by Chicken Creek, but the creek and natural resources associated with that site also limit the development

potential of that site for a new high school. Further, there will be urban development on the other side of those natural barriers one day, so they will not really mark the transition that this factor contemplates. Site D has some natural resources on it that could provide a barrier of sorts, but which also reduce the buildable area, and, again, the concept plan does not contemplate these natural areas being any sort of permanent barrier between urban and rural uses. Site F has a large amount of wildlife habitat, but that habitat, too, cuts into the buildable area and will provide no such barrier as contemplated by this factor.

Hearings Officer's Analysis and Summary of the Nine MC 3.07.1425(c) Locational Factors

In summary, little weighing and balancing is needed in this case, because the applicant's preferred alternative, Site C, nearly always came out as the site that best met the intent of each individual factor. With respect to two factors, Sites B and C equally met the intent of the factor, and with respect to another factor Site B came in a fairly close second to Site C. All in all, however, Site C best met all of the factors. In sum, all of the factors were applied and evaluated, and on-balance, Site C came out ahead. Thus, whatever weighing and balancing of all of the nine locational factors with respect to the six sites that could potentially accommodate a new high school is required, the Hearings officer finds that the applicant's analysis clearly demonstrates that the proposed site, Site C, better meets the applicable locational factors than the other sites.

No discussion presented by any opponent to the contrary is convincing. In disputing the District's location factor analysis, the primary opponent pointed to individual aspects of different sites and argued why it believed those aspects made one site better than another with respect to a given, discrete aspect. The opponent's sniping is ineffective, however, because unlike the applicant, the opponent did not evaluate the sites *holistically* based on the nine enumerated factors. Stated it another, it may be the case, that some of the alternative sites fair better than the applicant's preferred alternative in some particular or another. No site is perfect, after all, and each site has its positives and its negatives. However, when viewed as a whole, on balance, the applicant's preferred alternative fairs the best over the broadest consideration of the nine factors. Therefore, the opponent failed to demonstrate that the MC 3. 07.1425(C) factors findings are deficient.

The opponent also argues that Sherwood South cannot be ruled out as a possible area for the Major Amendment even though it has not been concept planned under MC 3.07.1110, because MC 3.07.1110(6) provides that such an area can be added even if it has not yet been concept planned. *See* Brager letter dated June 23, 2017 at p.7. MC 3.07.1110(6) states:

> *"If the local governments responsible for completion of a concept plan under this section are unable to reach agreement on a concept plan by the date set under subsection (a), then the Metro Council may nonetheless add the area to the UGB if necessary to fulfill its responsibility under ORS 197.299 to ensure the UGB has sufficient capacity to forecasted growth."*

First, the MC 3.07.1110(6) exception is restricted to situations where "the local governments responsible for completion of a concept plan under this section are unable to reach agreement on a concept plan." There is no evidence that any local governments responsible for a concept plan for Sherwood South are unable to reach agreement on that concept plan. In fact, there seems to be no question that the City of Sherwood will be planning for Sherwood South-it just hasn't done it yet, and has no current plans to do so. Second, the fact that no pre-UGB expansion concept planning has been done for Sherwood South is just one of many reasons the District gave for why Sherwood South ceased to be considered as a viable area for the new high school. The opponent has not pointed to an area within Sherwood South that would meet the District's siting criteria. In fact, in the opponent's June 23, 2017, letter, the opponent points to "a large block of property" south of the recent Brookman Road annexation area, but then appears to agree that it is too sloped to work as a high school site. See Letter from Jennifer Brager dated June 23, 2017, at p.6.

Metro Code section 3.07.1425(D) The Council may consider land not designated urban or rural reserve for possible addition to the UGB only if it determines that:

1. *Land designated urban reserve cannot reasonably accommodate the need established pursuant to subsection B of this section; or*
2. *The land is subject to a concept plan approved pursuant to section 3.07.1110 of this chapter, involves no more than 50 acres not designated urban or rural reserve and will help the concept plan area urbanize more efficiently and effectively.*

Hearing Officer's Analysis: The proposed expansion is within an urban reserve. This criterion is not relevant because the site and surrounding properties to the north, east and south are within an Urban Reserve area (no property within or next to the subject site is outside of urban reserve areas).

This criterion is not applicable.

Metro Code section 3.07.1425(E): The Council may not add land designated rural reserve to the UGB.

Hearing Officer's Analysis: The proposed expansion is not within a rural reserve. This criterion is not relevant because the subject site and surrounding properties to the north, east and south are within an Urban Reserve area.

This criterion is either not applicable or has been met.

Metro Code section 3.07.1425(F): The Council may not amend the UGB in such a way that would create an island of urban land outside the UGB or an island of rural land inside the UGB.

Hearing Officer's Analysis: The subject site and the remaining portion of the Sherwood West urban reserve are adjacent to the City of Sherwood. The transformation of this area from rural to urban represents a logical and methodical way to enlarge an urban area, which will not create an island of urban development outside of the UGB.

The proposed expansion will not create an island of urban land outside the UGB or an island of rural land inside the UGB. The applicant has met its burden of showing compliance with this factor by substantial evidence in the whole record.

Metro Code section 3.07.1440 (B)(1) The applicant shall also demonstrate that:

(1) The proposed uses of the subject land would be compatible, or through measures can be made compatible, with uses of adjacent land.

Hearing Officer's Analysis: The applicant addresses this criterion as follows:

> The proposed major amendment site is surrounded by land that is either within the City of Sherwood or the Sherwood Urban Reserve Area 5B (aka Sherwood West Preliminary Concept Plan Area) (see Attachment 6). The land in the City located north and east of SW Elwert Road is fully urbanized with single-family subdivisions and constructed houses. City land located south and east of SW Elwert Road is the location of the Sherwood Elks Lodge. The Elks Lodge site contains a large area of vacant land around the existing building and parking lot. The Elks Lodge and undeveloped surrounding land is zoned Low Density Residential (LDR).
>
> Land to the north, south and west is currently rural and within the urban reserve area (Sherwood West Concept Plan). This County land is zoned Agricultural Forest (AF) and is a patchwork of sites zoned AF-5, AF-10 and AF-20 with the subject site zoned AF-20. AF-5 has a minimum lot size of 5 acres, AF-10 of 10 acres and AF-20 has a minimum lot size of generally 80 acres. The surrounding property has been highly parcelized and consists of a patchwork of small forests/farms and rural residential properties with none more than 80 acres and many under five acres in size.
>
> The site is compatible with surrounding residential properties as the property has separation provided by existing streets on the north (Haide Road), south (Kruger Road) and west (Elwert Road) boundaries. The eastern boundary consists of mostly forestland with only one house near the site boundary near the northwest corner of the site. All school traffic will be able to access the site

> from Elwert Road and will not be routed through existing or proposed residential areas or streets.
>
> While the development of a school site will be the first urban development in the Sherwood West Concept Plan Area, the regional and local plans anticipate redevelopment of this entire area for primarily residential land. Schools typically locate within residential areas and are considered to be compatible with residential land uses when the impacts of the school on residential uses are considered within the design.
>
> The first urban development projects to occur within rural areas typically can cause some tension between existing residents who welcome the change, and those who are content with its current rural character. So well-designed solutions to deal with compatibility issues may still feel like "encroachment" to rural residents. The development of the site will include public involvement during the design development and permit approval process, allowing ample opportunity for the neighbors to help address specific compatibility issues. In the long term, establishing the school will provide the opportunity for subsequent urban developments to be oriented and designed to optimize their physical relationship with the school. This will allow the development of future Sherwood West properties to "grow up together" compared to infilling a large public facility into an established residential neighborhood.

The subject site borders the UGB on the east along SW Elwert Road. Adjacent land uses include single family homes and the Sherwood Robin Hood Elk Lodge that also includes some vacant land that is zoned for residential use, which is expected to develop over time. Directly to the southeast across Highway 99W is the Sherwood Regional Family YMCA. To the north across SW Haide Road is mostly open land with some out-buildings and one dwelling that appears to be vacant. To the west are forested parcels with one dwelling adjacent to the NW corner of the subject parcel. To the south across SW Kruger Road is the Countryside Community Church, limited agricultural activities and four dwellings. The typical weekend use of the church complements the weekday uses of a school. The land to the south also borders Highway 99W.

The District has developed a preliminary site plan that shows the school buildings located in the center of the property with sports fields generally to the south and west and parking located to the north. The southeast corner of the site will contain the realignment of SW Elwert and SW Kruger Roads. The three adjacent roads provide some buffering for the very few adjacent homes and the NW Natural Gas Easement also buffers the southwest corner of the site. The district currently has a High School Design Committee charged with working with the design team to provide advice on a number of design elements and a couple of community input meetings will be scheduled in 2017. In addition there will be public input opportunities during the City's development review and permit approval process.

Finally the subject site is within a very large urban reserve area that has the potential to urbanize over time. As noted previously this portion of the Sherwood West urban reserve was identified as phase A in the preliminary concept plan the City completed. This allows the adjacent land to be designed and developed in a manner that enhances and embraces this important community facility. Therefore the proposed use of the site can be made compatible, through measures, with the uses of the adjacent land.

The applicant has met its burden of showing compliance with this factor by substantial evidence in the whole record.

Metro Code section 3.01.1440 (B)(2) The applicant shall also demonstrate that:

If the amendment would add land for public school facilities, the coordination required by subsection C(5) of section 3.07.1120 of this chapter has been completed.

Hearing Officer's Analysis: MC 3.07.1120(C)(5) states:

> *"Provision for the amount of land and improvements needed, if any, for public school facilities sufficient to serve the area added to the UGB in coordination with affected school districts. This requirement includes consideration of any school facility plan prepared in accordance with ORS 195.110."*

The applicant addresses this requirement as follows:

> This requirement is satisfied as described in Section III of the application. In summary, the Sherwood School District adopted a long-term facilities plan in January of 2008. The long-term plan assumed that additional school capacity would likely be needed within 10 years of the plan's adoption. (The 2008 Long Term Facilities Plan is provided in Appendix C).
>
> In 2014 to 2016, the School District did significant planning prior to placing a bond on the November 2016 ballot that was ultimately approved by voters. This included inventorying existing school facilities, completing updated demographic information, as well as significant planning and public outreach to identify a plan for school facilities that includes the proposed new high school.

As the District points out, it experienced substantial growth in the late 1990's and early 2000's leading to a community effort in 2005 to determine facility needs. This resulted in the successful 2006 bond measure which included funding for an addition to the current high school to increase capacity to 1,550 students, consistent with phase 1 of the 2006 high school master plan. The District completed a long term facilities plan in 2008. Current enrollment at the high school is over 1,700 students and projections show over 2,250 students by the 2025-26 school

year. In early 2014 the District's Long Range Planning Committee made recommendations to the School Board regarding enrollment and growth challenges, facilities analysis and needs and financing options. In 2015 the District documented the condition and educational adequacy of its facilities, leading to bond visioning and steering committees in 2016. This resulted in the District's voters approving a bond measure in 2016 providing funding for school improvements including construction of a new high school. The District and the city of Sherwood have an intergovernmental agreement to share sport fields with most of the facilities occurring on school grounds. Thus the coordination required by subsection C(5) of Metro Code Section 3.07.1120 has been completed.

The applicant has met its burden of showing compliance with this factor by substantial evidence in the whole record.

Metro Code section 3.01.1440(B)(3) The applicant shall also demonstrate that:

If the amendment would add land for industrial use pursuant to section 3.07.1435, a large site or sites cannot be reasonably be created by land assembly or reclamation of a brownfield site.

Hearing Officer's Analysis: The proposed expansion is not for industrial use. This criterion is not applicable.

Findings Addressing OAR 660- Division 24 and the Applicable Statewide Planning Goals.

OAR 660-024-0020 requires that all UGB amendments apply the Statewide Planning Goals to the amendment process. This directive applies to the whole gamut of UGB amendments, from the every-six-year Metro legislative review of its UGB to a quasi-judicial major amendment under the Metro code to provide land for a specific public need, such as a school or other public facilities. However, this does not mean that the Goals will apply equally and in the same way in each situation. It may even be that one or more of the Goals may not apply at all to a given situation.

The primary opponent asserts that the applicant failed to adequately address the Statewide Planning Goals. *See* Letter from Jennifer Bragar dated June 6, 2017. While that was correct at the time Ms. Brager wrote her letter, the applicant followed up two days later with proposed findings. The Hearings officer finds that the applicant did adequately demonstrate compliance with the applicable Statewide Planning Goals by substantial evidence in the whole record, and adopts the applicant's suggested findings, with slight modification, as set forth below. The opponent's specific objections are also addressed below.

OAR 660-024 -0020

OAR 660-024-0020 sets out which of the Statewide Planning Goals are applicable to UGB amendments. The Goals will have a somewhat limited applicability to a UGB amendment for a specific need, but the relevant Goals are addressed below.

Goal 1 - Citizen Involvement

"To develop a citizen involvement program that insures the opportunity for citizens to be involved in all phases of the planning process."

Hearings Officer Analysis: This Major Amendment application does not alter Metro's citizen involvement program. Consequently, compliance with Goal 1 is established through compliance with the public involvement requirements of Metro's code. Those requirements have been followed.

Goal 2 - Land Use Planning
"To establish a land use planning process and policy framework as a basis for all decisions and actions related to use of land and to assure an adequate factual base for such decisions and actions."

Hearings Officer Analysis: OAR 660-024-0020(1)(a) states that the exceptions process in Goal 2 and OAR 660, Division 4 are not applicable unless a goal exception is part of the application. A goal exception is not part of the Major Amendment application and so those provisions will not be addressed. Other than goal exceptions, Goal 2 requires the establishment of a comprehensive plan, a need for coordination of government entities in planning, and the need for public hearings and an opportunity for comment and review.

1) Coordination: This Major Amendment application has required coordination with and between Metro, Washington County, the City of Sherwood, and public service providers including ODOT, Tualatin Valley Fire & Rescue, and Clean Water Services. This includes coordination at the Major Amendment level and at the Sherwood West Concept Plan level. Therefore, the required coordination has occurred.

2) Public Hearings/Opportunities for Comment and Review: Metro staff sent the required notice for the hearing before the hearings officer, and there has been opportunity for comment and review of the application materials. The hearing was continued, which provides additional opportunity for comment and review, and the hearings officer has stated he is likely to leave the record open after the second hearing concludes. There will also be at least one hearing before Metro Council. Further, the proposed high school will have additional approvals to obtain after the Major Amendment application has been approved, such as annexation, a zone change and a conditional use permit, all of which include a public involvement component. Therefore, there has been and will continue to be public hearings and an opportunity for comment and review.

Goal 3- Agricultural Lands

Hearings Officer Analysis: Not applicable under OAR 660-024-0020(3)(b).

Goal 4 - Forest Lands

Hearings Officer Analysis: Not applicable under OAR 660-024-0020(3)(b).

Goal 5 - Natural Resources, Scenic and Historic Areas, and Open Spaces

"To protect natural resources and conserve scenic and historic areas and open spaces."

Hearings Officer Analysis: OAR 660-024-0020(1)(c) requires states that Goal 5 and its related rules apply only in areas added to the UGB. The area to be added to the UGB is the site identified in this application. There are no Goal 5 resources on the site identified by Metro, Washington County or the City of Sherwood in the Sherwood West Concept Plan. Therefore, this goal is not applicable.

Goal 6 - Air, Water and Land Resources Quality
"To maintain and improve the quality of the air, water and land resources of the state."

Hearings Officer Analysis: As LUBA recently stated:

> "[t]he relevant Goal 6 inquiry for a decision that amends comprehensive plan and zoning map designations, without approving any particular new development, is whether there is a reasonable expectation that applicable state and federal environmental quality standards can be met at the time the property is developed in the future. *See Friends of the Applegate Watershed v. Josephine County*, 44 Or LUBA 786, 802 (2003), (at the post-acknowledgment plan amendment stage, a local government need only show it is reasonable to expect that applicable state and federal environmental quality standards can be met); *see also Salem Golf Club v. City of Salem*, 28 Or LUBA 561, 583 (1995) (same).

See Nicita v. City of Oregon City, ___ Or LUBA ___ (LUBA No. 2016-045, Jan 25, 2017, slip op. at 27.

The hearings officer does not see how there could not be any "reasonable expectation that applicable state and federal environmental quality standards can be met at the time the property is developed [as a school]." The proposed school campus poses no significant adverse air, land or water quality impacts. There are no expected significant "waste or process discharges" from the new high school campus. The high school does not "process" anything and so there are no process discharges associated with the high school. Any waste that will be produced by high school activities will be handled through the normal course of business. For example, any solid waste generated by the school will be subject to recycling and solid waste collection by the franchised garbage hauler for the area. Any waste associated with sanitary sewers or storm events will be handled as part of the public sanitary and storm water facilities. As the property develops, the District will be required to coordinate with the state Department of Environmental Quality and with Clean Water Services to ensure that air, land and water resources are not degraded. As noted in response to Goal 5, no significant Goal 5 resources have been mapped on this property by Metro, Washington County or the City. Further, the proposed new high school site is adjacent to the existing UGB and will allow for efficient multi-modal transportation of the

bulk of the student population - especially as Sherwood West builds out with primarily residential uses in the decades to come.

The primary opponents make a half-hearted attempt to challenge the applicant's Goal 6 compliance, but its argument is too vague and too unfocused to provide a basis for denial. First, the opponent state that "air quality issues should be examined for a new school to be built near Highway 99." *See* letter from opponent's counsel Jennifer Brager, at p. 2, 6. This argument appears to assume that highway 99 causes sufficient level of pollution that a school should not be located in close proximity thereof. The opponents suggest that a "buffer" and "distancing is needed. The opponent never suggests what a proper buffer would be. The Hearings officer finds this concern to be speculative, unsupported by substantial evidence in the record, and beyond the scope of Goal 6's reach. Even if the hearings officer believed this was a valid concern, the hearings officer finds the air quality benefits of locating a school away from a major arterial would be offset by the additional VMT needed to transport school children a further distance.

Goal 7- Natural Hazards

"To protect life and property from natural disasters and hazards."

Hearings Officer Analysis: Goal 7 (Areas Subject to Natural Hazards). Goal 7 requires local governments to evaluate risks to people "upon receiving notice" of new hazard information from DLCD, and based on evaluation of that risk to prohibit development in areas "where the risk to public safety cannot be mitigated." Natural hazards for purposes of this goal are: floods (coastal and riverine), landslides, earthquakes and related hazards, tsunamis, coastal erosion, and wildfires.

No natural hazards have been mapped on the properties that comprise the proposed school site. (*See*, *e.g.*, Sherwood West Concept Plan, figures 6 and 7.) The applicant's proposed site appears to be devoid of any natural hazards: It is not in a flood plain or a coastal zone. It does not have steep slopes that would be vulnerable to landslides. It does not contain soils that are exceptionally vulnerable to being an earth quake hazard (at least any more so in comparison to the rest of the Portland Metro region generally). Therefore, this goal is inapplicable.

Goal 8- Recreational Needs

"To satisfy the recreational needs of the citizens of the state and visitors and, where appropriate, to provide for the siting of necessary recreational facilities including destination resorts."

Hearings Officer Analysis: As set forth in the Narrative, the District provides most of the athletic fields for the City of Sherwood. The City and the District have had a long history of partnering in the provision, use, and maintenance of these fields so that recreational opportunities are provided as efficiently as possible. The new high school campus will include a number of new fields and sports facilities on which the City and the District will continue to partner. The new fields and sports facilities will be in addition to the existing fields and sports facilities already in use as part of the existing school facilities. See page 32 of the Narrative for additional

detail. The new high school campus, then is supportive of this goal, as it will help satisfy the need for recreational facilities in the city and in the District.

Goal 9 - Economic Development

> *"To provide adequate opportunities throughout the state for a variety of economic activities vital to the health, welfare, and prosperity of Oregon's citizens."*

Hearings Officer Analysis: Goal 9 applies to areas within an urban growth boundary. OAR 660-09-0010(1). *Port of St. Helens v. Land Conservation & Development Committee*, 164 Or App 487, 495, 996 P 2d 1014 (2000). Goal 9 requires that jurisdictions provide adequate opportunities for a variety of economic activities. Goal 9 planning is limited to areas within UGBs, and local land use plans are required to comply with Goal 9 at periodic review and whenever a jurisdiction undergoes a post-acknowledgment plan amendment that changes the plan designation of more than two acres of land from industrial/employment use to a nonindustrial/non-employment use. OAR 660-009-0010(1), 0010(2), and 0010(4).)

Pursuant to OAR 660-024-0020, certain Goals, including Goal 9, are also applicable when the UGB is amended. The Major Amendment application expands the UGB to allow an existing high school to move several miles away from one site within the City of Sherwood to another site that will be annexed into the City of Sherwood for that purpose. This appears to be fairly neural from the standpoint of economic opportunities.

The opponent cites *Barkers Five, LLC v. LCDC*, 261 Or App 259, 289 (2014), and states that Goal 9 "requires a determination of the potential future land need for employment and is supposed to occur at the time the UGB is expanded, " and that "the school itself has to be analyzed as an 'other employment use' as defined under OAR 660-009-0005 because it will involve a governmental employment activity. " *See* letter from Jennifer Bragar dated June 6, 2017, at p. 2. That might be true for a UGB amendment that proposes to add employment land, but it not explain the relevance of Goal 9 to this particular UGB application, which is specific to a need for land for a new high school. In this case, the UGB amendment is targeting a specific need, *i.e.*, the relocation of an existing high school several miles away within the same city. Goal 9 is not applicable as the UGB expansion is for a specific need for a high school.

The cited passage from *Barkers Five* should be read in context. LCDC was referring to OAR 660-027-0050(2) and Metro's analysis for employment land needs occurring as part of its urban growth report. There is nothing in that passage that would make such an analysis a requirement for a major amendment application submitted under ORS 197.299(4). As stated in the findings for Goal 9, this goal is not applicable to a UGB amendment for a specific high school need. To the extent that the high school will have any Goal 9 impacts, the Hearings officer finds those impacts will be positive in terms of temporary construction jobs during development and provision of part-and-full time employment year-round.

Furthermore, if the opponent is implying that Metro must engage in a full-blown economic opportunities analysis in the context of a major amendment application for a high school, that conclusion does not follow from the opponent's stated premises or from Goal 9. The

opponent's argument is not developed well enough to allow the hearings officer to evaluate it on the merits: the opponent has not explained how this application actually impacts the requirements or scope of Goal 9.

Goal 10 - Housing

"To provide for the housing needs of citizens of the state."

Hearings Officer Analysis: The applicant states that Goal 10 is not applicable as the UGB expansion is for a specific need for a high school. The opponent states that "Goal 10 is implicated because housing opportunities will be lost as a result of this large land grab by the school district." *See* letter from Jennifer Bragar dated June 6, 2017, at p. 2. While it is true that any use of land for non-residential purposes results in that land not being available for housing, that truism does not create a Goal 10 violation. As best as the hearings officer can determine, the opponent is arguing that the Preliminary Sherwood West Concept Plan shows a small school site surrounded by housing, and the applicant's current plan shows the entire site being used for a school and no housing. The opponent concludes that this change in plans 'will limit the planned housing in the Sherwood West Concept Plan Area," which, according to the opponent, "has Goal 10 implications." *See* letter from Jennifer Bragar dated June 6, 2017, at p. 2-3. It appears that the opponent is arguing that the Concept Plan locks in the density and mix of housing, and any change to the Concept Plan requires an analysis of Goal 10 compliance.

The hearings officer finds that the concept plan does not have the regulatory effect that the opponent assigns to it. The opponent cites to nothing in any local zoning code or Comprehensive Plan that gives this sort of regulatory effect to this (or any other) concept planning effort. Goal 10 would not have that type of regulatory effect until the property subject to the Concept Plan is brought into the UGB and assigned urban zoning designations. As currently situated, the land at issue is not within the UGB and so is not considered "buildable lands" under Goal 10 and Goal 14, and is not included in any buildable land inventory. Therefore, there is no buildable lands inventory to measure the Major Amendment application against and Goal 10 does not anticipate that there would be in this situation. By its terms, Goal 14 requires that jurisdictions "provide for the housing needs of citizens of the state" by inventorying "buildable lands for residential use. " Goal 10 defines buildable lands as lands in "urban and urbanizable areas that are suitable, available and necessary for residential use. " Under the definitions section of the Statewide Planning Goals, "urban land" is defined as "land inside an urban growth boundary, " and "urbanizable land" is defined as urban land, i.e., land inside a UGB, that is presently unavailable for any number of reasons. Therefore, the opponent' argument that, in the context of a Major Amendment, Goal 10 requires Metro to "demonstrate that its actions do not leave it with less than adequate residential land supplies" is wrong..

Moreover, as the applicant points out, the City's urban reserves include a 50-year land supply for the City. There is no evidence that siting a new high school in Sherwood West, in the location that the Concept plan contemplated a new school, will in any way negatively impact the ability of the City to provide for its housing needs, especially when Sherwood West is combined with Sherwood North and Sherwood South.

.

The opponent also complains that the applicant is seeking to bring in 82 acres when it defined its current need as requiring only a 50-acre site. *See* letter from Jennifer Bragar dated June 6, 2017, at p. 2. The hearings officer is at a loss to understand the relevance of this argument to a Goal 10 challenge. The opponent's argument is simply not developed sufficiently to allow the hearings officer to understand the nature of the complaint.

The opponent also argues that an 82-acre school site "contradicts the two school sites considered in the Preliminary Sherwood West Concept Plan. *See* letter from Jennifer Bragar dated June 6, 2017, at p. 2. However, Concept Plans are not regulatory documents in the sense that they do not limit the size of planned facilities. The Concept Plan took the provision of additional school sites into account when it was developed. Although the concept plan includes two identified school sites, it is important to remember that the Concept Plan is a general plan that addresses how the area will develop generally. The Concept Plan does not specify the types of schools that the conceptual school sites reflect, e.g., elementary, middle or high school. Therefore, one should not view the blue squares denoting school sites in the Concept Plan in the literal sense of trying to determine how big the Concept Plan believed the sites will ultimately be. Such information comes from future refinement of the Concept Plan after areas are brought into the UGB.

Moreover, as the applicant points out, Goal 10 concerns itself with land already within a UGB, which the subject property is not. Therefore, Goal 10 has very limited applicability to a Major Amendment application for a new public school site. That said, the justification for the proposed expansion area of 82 acres is included in the Narrative. (Narrative at 31-32.) As set forth in the Narrative, approximately seven of the 82 acres will be needed for transportation improvements that will support the new high school. There is also a 40-foot wide gas pipeline easement that runs across the site, occupying approximately 2.2 acres but requiring protection of additional, adjacent property of approximately 20 feet on either side. This pipeline easement essentially gives the site an irregular shape, which reduces the efficiency with which it can be developed. The Narrative also discusses the shared sports fields arrangement between the City of Sherwood and the District that provides for additional ballfields. The District would also note that Figure 3 of the Narrative depicts a conceptual layout of the high school site and related transportation improvements over the entire 82-acre area. (Narrative at 7.) As one can see on that conceptual layout, the entire site will be fully utilized.

In the Appendix 6 Service Provider Interviews, the District warns that the current high school was at-capacity at the time of the interview (the appendix is dated June 15, 2015), and with the growth expected in Sherwood the high school could be expected to become over-capacity. (See Appendix 6, pages 3-4.) The District stated that expanding the existing high school and adding a new high school to the District would both be explored. The relevant information to be gleaned from the Concept Plan is that the majority of Sherwood West is intended to be developed with varying densities of housing and that the Concept Plan integrated the need for at least two additional school sites, with an understanding that the existing Sherwood High School would soon be over-capacity.

In its June 23, 2017 letter, the opponent argues that Metro "must demonstrate that its actions do not leave it with less than adequate residential land supplies in the types, locations,

and affordability ranges affected." *See* letter from Jennifer Bragar dated June 23, 2017, at p.2. As support for this requirement, the opponent relies on *Burk v. Umatilla County*, 20 Or LUBA 54 (1990). In *Burk*, the Port of Umatilla filed an application with the City of Umatilla to amend the city's comprehensive plan map for a 42-acre area within the city's urban growth boundary, but outside the city limits, from single-family residential to industrial. The city's buildable land inventory for housing included the 42 acres, because that acreage was within its UGB. Even with the 42 acres included in the buildable lands inventory, the city was deficient in land available for single-family housing. The city approved the map amendment even though it increased that deficiency, which earned the city a remand by LUBA.

The facts of *Burk* are different than those presented by this Major Amendment application. The land in question in *Burk* was inside a UGB and was already planned for zoned and residential uses. That is a key factual difference from the present case, because the land in this case is planned for agriculture and forestry. The land proposed to be added to the UGB is not "buildable land," and is not in any current inventory. For this reason, the Goal 10 analysis required in *Burk* is not applicable here.

Goal 11 - Public Facilities and Services

> *"To Plan and develop a timely, orderly and efficient arrangement of public facilities and services to serve as a framework for urban and rural development."*

Hearings Officer Analysis: As set forth in response to MC 3.07.1425(c)(2), the Sherwood West Concept Plan extensively studied the provision of public facilities and services with respect to that urban reserve. The concept plan was prepared with analyses of existing sanitary sewer, water, and storm water conditions and analyses of how those systems need to be upgraded, extended, and phased to meet the future development of Sherwood West. The concept plan was prepared in coordination with all of the future service providers, including those services that will be provided by the City and those that will be provided by others, including Clean Water Services. The concept plan discusses the provision of public facilities and services to the area at pages 16-18 and 40-44, as well as in Appendix 3 (Existing Conditions Report) and Appendix 6 (Service Provider Interviews). According to the Concept Plan, the area in which the school site is proposed "presents the best near-term opportunity for development in Sherwood West," and the cost to serve the area is on the lower end of the cost scale. (Sherwood West Concept Plan, pages 42-43.) The District used this work as a jumping off point to study the proposed site for inclusion in the UGB (as well as other sites within Sherwood West). See Narrative, pages 24-31 and Application Appendix A (New High School Preliminary Site and Utility Exhibit) and Appendix B (Service Provider Letters). All of the foregoing information addresses the orderly and efficient arrangement of sanitary sewer, water, and storm drainage facilities to serve the new school property, as well as the larger Sherwood West area and all of the evidence consistently points to the chosen property as a property that can served in a timely, orderly, and efficient manner.

The opponents argue that Goal 11 is not met, because the local sewer and water agency (Clean Water Services) has a concern about the installation of a temporary pump station. *See* letter from Jennifer Brager dated June 23, 2017, at p. 5. The opponents offer no testimony, expert

opinion, or evidence that would call into question the conclusions reached by the applicant's engineers, KPFF. Goal 11 does not require that every technical engineering solution be worked out at the time of UGB amendment. The KPFF engineers seem to believe that an engineering solution is not only possible, but likely, which is all that is required at this stage. See KPFF memo dated June 13, 2017. This Hearings officer has evaluated the opinion of the KPFF engineers, and finds them more credible.

The opponents further argue that "fire flow tests have not been completed." *See* Letter from Jennifer Brager dated June 23, 2017, at p. 5. The opponents do not explain why fire flow tests are mandated by Goal 11 in the context of a UGB amendment, nor is it obvious why they would be. The KPFF engineers seem to be satisfied that the fire flow issue can be adequately handled, and this hearings officer finds them more credible.

Goal 12 - Transportation

> *"To provide and encourage a safe, convenient and economic transportation system."*

Hearings Officer Analysis: Early LUBA cases suggested that a local government could not "pass the buck" by deferring compliance with Goal 12 and the TPR until the time of site plan review.[13] However, more recent case law clarifies that conditions of approval can be used to limit new development until such time as the TPR is addressed. For example, in *Citizens for Protection of Neighborhoods v. City of Salem*, 47 Or LUBA 111 (2004) (*Citizens*), the City of Salem approved a zone change to allow mixed residential and commercial use of a 275-acre property. That approval included a condition that prohibited development of the property until later adoption of a master plan for the property. The City of Salem's code criteria applicable during the master plan process included requirements that were substantially identical to the requirements of the TPR. Based on the condition requiring master plan approval, the city found that the zone change did not significantly affect the transportation facility because no development could occur until the subsequent master plan phase. *Id*. at 115, 116. LUBA held that the city could properly conclude that the rezoning of the property did not significantly affect any transportation facility because the condition essentially prohibited development on the property without first showing that any allowed development is consistent with the function, capacity and performance standards of affected transportation facilities. *Id*. at 120.

In *ODOT v. City of Klamath Falls (Southview Dev'l, LLC)*, 39 Or LUBA 641, 660, *aff'd* 177 Or App 1, 34 P2d 667 (2001), LUBA affirmed that portion of a county decision which approved a zone change with a condition that prevented additional development from impacting a transportation facility until such a time in the future when the TPR is addressed. LUBA found that this condition was sufficient to ensure compliance with the TPR in the interim.

Finally, in *Willamette Oaks, LLC v. City of Eugene,* 59 Or. LUBA 60 (2009), the city approved a zone change, and imposed a condition of approval prohibiting development of the property without approval of a planned unit development (PUD) application and a showing of

[13] *1000 Friends of Oregon v. City of North Plains*, 27 Or LUBA 372 (1994), *aff'd*, 130 Or App 406 882 P2d 1130 (1994); *Concerned Citizens of the Upper Rogue v. Jackson County*, 33 Or LUBA 70 (1997).

consistency with the TPR as part of the PUD application and review. LUBA approved this approach, stating as follows:

> In sum, with one caveat discussed below,[14] we think it is permissible for the city to defer consideration of compliance with the TPR to a subsequent review process at the time actual development is proposed, provided that the zone change or plan amendment is effectively conditioned to prohibit traffic or other impacts inconsistent with the TPR's requirements unless and until those requirements are fully addressed. Applicant offers no reason in the present case why deferring the application of the provisions of the TPR to a later PUD application process is insufficient to ensure that allowed uses of the subject property are consistent with

---

[14] LUBA stated in a footnote that the PAPA procedural requirements would still need to be satisfied as part of the deferred process:

> The caveat mentioned above is that unless the local government takes steps to ensure otherwise, the subsequent review process may not require a comprehensive plan or land use regulation amendment and therefore will not trigger [**12] the notice obligations of a post-acknowledgement action under ORS 197.610 *et seq*. Under those statutes, a local government that amends its comprehensive plan or land use regulations, including zone changes, must provide to the Department of Land Conservation and Development (DLCD) timely notice of the hearing on the proposed amendments as well the decision adopting the amendments. DLCD, in turn, provides notice of the proposed amendments and any subsequent adoption to persons or agencies who request such notice. OAR 660-018-0025. The requirement to provide notice of post-acknowledgment plan amendments to DLCD and other parties is a critical component of a statutory and rule-based scheme that is designed to ensure that post-acknowledgment plan and land use amendments comply with the applicable statewide planning goals and rules, including the TPR. *See Oregon City Leasing, Inc. v. Columbia County, 121 Or App 173, 177, 854 P2d 495 (1993)* (failure to provide DLCD the notice required under ORS 197.610 *et seq*. is a substantive, not procedural error). The efficacy of that scheme is undermined if a local government defers consideration [**13] of compliance with the TPR to a subsequent review process that does not provide equivalent notice to that required by ORS 197.610 *et seq*. Without such notice, it is possible that DLCD and parties who may rely on DLCD's re-notice, potentially including ODOT, may not learn of the review proceeding or have an opportunity to participate in that proceeding.

> the function, capacity and performance standards of the affected transportation facilities. *ODOT v. City of Klamath Falls,* 39 Or LUBA at 660.

Under OAR 660-024-0020(1)(d), the Transportation Planning Rule ("TPR") need not be applied to a UGB amendment if the land will remain zoned as urbanizable. That will be the case with the properties subject to the proposed UGB amendment. The current AF-20 zoning will remain until the is annexed into the City of Sherwood. During the forthcoming Metro Title 11 concept planning process for the properties, the City will determine the appropriate zone and this will include a TPR analysis. The zoning will not actually be changed, however, until after annexation.

With respect to Goal 12 generally, as set forth in response to MC 3.07.1425(c)(2), the Sherwood West Concept Plan extensively studied the provision of public facilities and services, including transportation, with respect to that urban reserve. The concept plan analyzed the existing transportation system and how that system will need to be upgraded, extended, and phased to meet the future development of Sherwood West. The concept plan was prepared in coordination with all of the future transportation service providers, including Washington County and ODOT. The concept plan discusses the transportation system within the plan area at 18-21, 40-44, as well as in Appendix 3 (Existing Conditions Report), Appendix 6 (Service Provider Interviews), and Appendix 8 (Transportation Options Alternative Analysis Report). The District used this work as the jumping off point to study the proposed site for inclusion in the UGB (as well as other sites within Sherwood West). See Narrative at pages 10-11, and Appendix B (Service Provider Letters). The District also engaged a licensed traffic engineer to prepare the March 15, 2017, Sherwood High School UGB Expansion Transportation Study (the "Transportation Study") to address the provision of a safe, convenient, and economic transportation system for the new high school site. (The Transportation Study has been submitted to the record.) The Sherwood West Concept Plan takes a higher-level look at the transportation needs of the Sherwood West area in general, including the need for new streets and intersection improvements. The Narrative provides general information about how the school site will be served and the Transportation Study provides more detail than is commonly found at the UGB expansion stage, but finds that, with some mitigation improvements, a new high school on the proposed site can be served by the appropriate transportation system. The Transportation Study will become more relevant at the Title 11 concept planning and annexation stages of the high school site development. Because the new high school is very near to an existing, urban-level street system, and because Washington County and the City will be constructing a new intersection improvement adjacent to the new high school, the provision of transportation services to the new school will be more economical. According to the concept plan, the area in which the school site is proposed "presents the best near-term opportunity for development in Sherwood West," and the cost to serve the area is on the lower end of the cost scale. (Sherwood West Concept Plan, pages 42-43.) In sum, all of the cited evidence supports a finding that it is possible to safely, conveniently, and economically provide for the transportation needs of the new high school.

For this reason, the applicant proposes a condition of approval to the UGB amendment that prohibits any new development on the subject property until a Comprehensive Plan Map and Zoning Map Amendment are completed, and that the TPR will be addressed at that time.

Several opponents expressed concerns about the adequacy of the surrounding transportation system to support the proposed high school. It is tempting to jump ahead to the specific traffic impacts of a proposed use even at this early stage of the land use process. It is important to keep in mind, however, that the Major Amendment application is just the first application in a series of land use proceedings that must occur prior to the high school actually being approved on the property. With respect to the Major Amendment application, Goal 12, OAR 660-024-0060(8), and MC 3. 07. l425(c)(2) are applicable and implicate transportation facilities. The District has submitted findings with supporting substantial evidence to address all of those provisions. The District also submitted additional evidence from its traffic engineer to address particular issues raised with respect to the March 15, 2017, Sherwood High School UGB Expansion Transportation Study. (See June 28, 2017, DKS memorandum.)

No one besides the District provided any evidence or testimony from a traffic engineer regarding any aspect of the Major Amendment application. Opponents correctly point out that there are existing transportation deficiencies in the area that surrounds the proposed high school site. Those opponents also correctly point out that if those deficiencies are not addressed then the new high school will exacerbate them. All of that is true, but it would be expected to be true regardless of where the new high school is sited, *i.e.*, nearly every area in and around Sherwood has existing transportation deficiencies and siting a new high school in any of those areas would impact the transportation system. Where the opponent's logic fails is in the apparent assumption that the transportation impacts of the new high school will not be addressed as part of the planning and permitting processes that are required prior to the new school opening its doors in 2020. That assumption is incorrect.

The laws and regulations that govern the permitting of the new high school simply do not allow the new school to be plopped down anywhere without transportation impacts being analyzed and mitigated in accordance with the law. The specifics of that analysis and mitigation for the chosen site are largely irrelevant at the UGB amendment stage. Instead, those specific transportation impacts will be addressed through subsequent Title ll planning for the UGB amendment area, and through annexation, zone change, and conditional use permit processes. Through these processes, the Transportation Planning Rule will be addressed, appropriate off-site mitigation within an appropriate timeframe will be required, and appropriate frontage improvements for all of the abutting streets will be conditioned. Public involvement is included in each of those steps as part of each of the planning and permitting processes. (See June 28, 2017, DKS & Associates memorandum.)

Goal 13 - Energy Conservation

"To conserve energy."

Hearings Officer Analysis: LUBA and the Courts have never given any regulatory affect to this Goal. The Hearings officer views this goal as being essentially meaningless. The general practice has been for applicants and staff to write some flowery prose that extorts the energy

saving virtues of the project. In this vein, the applicant states:

> As explained under the District's response to MC 3.07.1425(c)(3), which is the analog of Goal 14, Location Factor 3 (ESEE energy consequences), the proposed school site's adjacency to the existing UGB, served by major streets, facilitates multi-modal access for students, teachers, families, and administrative staff to and from the school campus. This will multi-modal facilitation will only increase as Sherwood West builds out into a predominantly residential area with nodes of neighborhood commercial.

Without some baseline standard to measure against, it is difficult to evaluate whether any given proposal will "conserve energy" or not. But at least it sounds good.

For its part, the opponent's arguments do not shed much light on the issue. They merely state that an "energy analysis" must be provided. *See* Letter from Jennifer Brager dated June 6, 2017, at p. 3. The opponents do not explain exactly what an "energy analysis" entails, nor it is particularly apparent on its face. Given that no focused argument concerning Goal 13 was raised by any party, the hearings officer finds that the applicant's proposed findings comply with Goal 13 – whatever it means.

Goal 14 - Urbanization

> *"To provide for an orderly and efficient transition from rural to urban land use, to accommodate urban population and urban employment inside urban growth boundaries, to ensure efficient use of land, and to provide for livable communities."*

Hearings Officer Analysis: Goal 14 is addressed throughout this submittal.

Goals 15 through 19

Hearings Officer Analysis: These goals are not applicable, as the proposed UGB expansion does not include Willamette River Greenway, Estuarine Resources, Coastal Shorelands, Beaches and Dunes or Ocean Resources.

OAR 660-024-0040 - 0050

OAR 660-024-0050 directs local governments to inventory land inside the UGB to determine whether there is adequate development capacity to accommodate 20-year needs determined in OAR 660-024-0040. The District's Major Amendment application does not directly implicate these rule provisions, because the need for the new high school site did not arise out of an OAR 660-024-0040 overall land needs analysis and subsequent OAR 660-024-0050 buildable lands analysis. A specific need for a new high school site arose out of long-term facilities planning engaged in by the District. However, once the need for the new high school was identified, the District analyzed land that was within both the District boundaries and the Sherwood, Wilsonville, and Tualatin UGBs for land that could accommodate the need for the

new high school based on its suitability criteria. (See Narrative at pages 8-21.) There was no suitable land within those areas. The analysis required by OAR 660-024-0050 tracks closely in some respects with the analysis required by MC 3.07.1425(a), which was addressed by the District in its application. The caveat, however, is that identified specific land need, such as land for a new school, is not the same as a generalized need for more residential land or employment land. Given the specific need for a new school site, MC 3.07.1440(a) allows a UGB expansion tailored to just that need under certain circumstances.

OAR 660-024-0060 - Metro Boundary Local Alternatives Analysis

OAR 660-024-0060 sets forth the provisions that apply when a need within the Metro UGB has been specified and there is no land within the UGB that can accommodate that need. The provisions in OAR 660-024-0060 track closely with the provisions contained in MC 3.07.1425(c), which have been addressed in the District's application submittal, the Metro staff report, and the additional findings submitted by the District in response to the hearings officer's request.

OAR 660-024-0060:

(1) When considering a Metro UGB amendment, Metro must determine which land to add by evaluating alternative urban growth boundary locations. For Metro, this determination must be consistent with the priority of land specified in ORS 197.298 and the boundary location factors of Goal 14, as follows:

(a) Beginning with the highest priority of land available, Metro must determine which land in that priority is suitable to accommodate the need deficiency determined under OAR 660-024-0050.

Hearings Officer Analysis: The highest priority of land available is land designated urban reserve. (ORS 197.298(1)(a).) The District's application included an analysis of urban reserve land.

(b) If the amount of suitable land in the first priority category exceeds the amount necessary to satisfy the need deficiency, Metro must apply the location factors of Goal 14 to choose which land in that priority to include in the Metro UGB.

Hearings Officer Analysis: As set forth in the District's Major Amendment application, there is suitable land within an existing urban reserve to satisfy the need deficiency, i.e., the new high school. Accordingly, the location factors of Goal 14 were applied to that land. Those location factors are the first four location factors found in MC 3.07.1425(c)(1)-(9) and have been addressed in the District's application submittal, the Metro staff report, and the additional findings submitted by the District in response to the hearings officer's request.

(c) If the amount of suitable land in the first priority category is not adequate to satisfy the identified need deficiency, Metro must determine which land in the next priority is suitable to

accommodate the remaining need, and proceed using the same method specified in subsections (a) and (b) of this section until the land need is accommodated.

Hearings Officer Analysis: This is not applicable as there is urban reserve land that can accommodate the need.

(d) Notwithstanding subsection (a) to (c) of this section, Metro may consider land of lower priority as specified in ORS 197.298(3).

Hearings Officer Analysis: This is not applicable as there is urban reserve land that can accommodate the need.

(e) For purposes of this section, the determination of suitable land to accommodate land needs must include consideration of any suitability characteristics specified under section (5) of this rule, as well as other provisions of law applicable in determining whether land is buildable or suitable.

Hearings Officer Analysis: This provision is similar to MC 3.07.1425(b), in which site characteristics may be specified for land to be suitable for an identified need. The District specified such characteristics in the Narrative at page 19.

(2) Notwithstanding OAR 660-024-0050(4) and subsection (1)(c) of this rule, except during a legislative review of the Metro UGB, Metro may approve an application under ORS 197.610 to 197.625 for a Metro UGB amendment proposing to add an amount of land less than necessary to satisfy the land need deficiency determined under OAR 660-024-0050(4), provided the amendment complies with all other applicable requirements.

Hearings Officer Analysis: This provision is not applicable.

(3) The boundary location factors of Goal 14 are not independent criteria. When the factors are applied to compare alternative boundary locations and to determine the Metro UGB location, Metro must show that all the factors were considered and balanced.

Hearings Officer Analysis: This provision is consistent with how Metro interprets its analogous boundary location factors in MC 3.07.1425(c), which were applied to the District's Major Amendment application.

(4) In determining alternative land for evaluation under ORS 197.298, "land adjacent to the UGB" is not limited to those lots or parcels that abut the UGB, but also includes land in the vicinity of the UGB that has a reasonable potential to satisfy the identified need deficiency.

Hearings Officer Analysis: The District's analysis took into account all of the land in the urban reserves that otherwise met the District's siting criteria. Some of the land analyzed did not abut the UGB, but was rejected for other reasons.

(5) If Metro has specified characteristics such as parcel size, topography, or proximity that are necessary for land to be suitable for an identified need, Metro may limit its consideration to land that has the specified characteristics when it conducts the boundary location alternatives analysis and applies ORS 197.298.

Hearings Officer Analysis: This provision is similar to MC 3.07.1425(b), in which site characteristics may be specified for land to be suitable for an identified need. The District specified such characteristics in the Narrative at page 19.

(6) The adopted findings for a Metro UGB adoption or amendment must describe or map all of the alternative areas evaluated in the boundary location alternatives analysis. If the analysis involves more than one parcel or area within a particular priority category in ORS 197.298 for which circumstances are the same, these parcels or areas may be considered and evaluated as a single group.

Hearings Officer Analysis: The District mapped all of the alternative areas evaluated in the boundary location alternatives analysis and evaluated them separately.

(7) For purposes of Goal 14 Boundary Location Factor 2, "public facilities and services" means water, sanitary sewer, storm water management, and transportation facilities.

Hearings Officer Analysis: The District took into account the public facilities and services enumerated in this provision when it evaluated MC 3.07.1425(c)(2), which is the analog to Goal 14 Boundary Location Factor 2.

(8) The Goal 14 boundary location determination requires evaluation and comparison of the relative costs, advantages and disadvantages of alternative Metro UGB expansion areas with respect to the provision of public facilities and services needed to urbanize alternative boundary locations. This evaluation and comparison must be conducted in coordination with service providers, including the Oregon Department of Transportation (ODOT) with regard to impacts on the state transportation system. "Coordination" includes timely notice to service providers and the consideration of evaluation methodologies recommended by service providers. The evaluation and comparison must include:

(a) The impacts to existing water, sanitary sewer, storm water and transportation facilities that serve nearby areas already inside the Metro UGB;

(b) The capacity of existing public facilities and services to serve areas already inside the UGB as well as areas proposed for addition to the Metro UGB; and

(c) The need for new transportation facilities, such as highways and other roadways, interchanges, arterials and collectors, additional travel lanes, other major improvements on existing roadways and, for urban areas of 25,000 or more, the provision of public transit service.

Hearings Officer Analysis: As set forth in the responses to Goals 11 and 12, Sherwood West has been concept planned pursuant to MC 3.07.1110, and so the provision of public

facilities and services within the Sherwood West concept plan area and as those services relate to the rest of the city have been studied extensively, as required by MC 3.07.1110. The Sherwood West Concept Plan was prepared with analyses of existing sanitary sewer, water, stormwater, and transportation conditions and analyses of how those systems need to be upgraded, extended, and phased to meet the future development of Sherwood West without adversely impacting the existing city development. The concept plan was prepared in coordination with all of the future service providers, including those services that will be provided by the City and those that will be provided by others, including Clean Water Services, ODOT, and Washington County.[15]

Additional Issues Raised by Opponents

1. **Metro Staff Provided Proper Notice to DLCD.**

Opponents allege that Metro failed to provide notice to DLCD of a proposed plan map amendment under ORS 197.610. *See* Letter from Jennifer Bragar dated June 23, 2017, at p. 8. This is not correct. Metro submitted the requisite notice to DLCD on April 20, 2017, as evidenced on the weekly DLCD notice summary dated April 21, 2017, which is attached to the June 30, 2017 letter from Metro counsel Roger Alfred.

2. **The Fair Housing Act Is Inapplicable.**

The opponent argues that Metro must apply the Fair Housing Act ("FHA") to the Major Amendment application, because "Metro has a duty to affirmatively further fair housing." *See* Letter from Jennifer Bragar dated June 23, 2017, at p. 3-5.

The opponent does not point to any approval criterion that requires Metro to apply the FHA directly to this application, and did not include any convincing argument as to why a UGB expansion to accommodate a new public high school would require the FHA to be addressed. As best as the hearings officer can ascertain, the opponent's core argument is that the FHA is a *de-facto* approval standard for every Comprehensive Plan Amendment and zone change decision. In this regard, Ms. Brager states that "Metro has a duty to affirmatively further fair housing" and that "Metro needs to address fair housing implications in this Major Amendment application through analysis under Goal 10 and under Metro's locational factors, Metro Code 3.07.1425(c)(5) regarding equitable and efficient distribution of housing." The argument is not well-developed; the opponent seems to be arguing that the FHA must be complied with, but that compliance with Goal 10 and the Metro Code establishes compliance with the FHA.

Beyond that, the opponent complains that Sherwood does not have enough subsidized housing, which "does not properly address the housing issues in Washington County for low-income households, especially protected classes." That statement is followed up with the conclusion that the "failure to analyze the school siting in context of the regional need for fair housing only exacerbates the inequitable distribution of affordable housing in the Metro region."

[15] This coordination effort included service provider interviews included as Appendix 6 of the Sherwood West Concept Plan. Appendix 8 provides more detail regarding the provision of transportation infrastructure to the Sherwood West Concept Plan area.

Letter from Jennifer Bragar dated June 23, 2017, at p. 5. Again, the hearings officer is at a loss to understand the opponent's argument, especially since the opponent does not tie their ultimate policy concern back to any specific language in the FHA or any other law for that matter. This argument is simply not developed sufficiently to allow for its review and evaluation. If the argument is that every school siting project has an inclusionary zoning requirement for additional low-income / subsidized housing, that argument is rejected.

SECTION IV: HEARINGS OFFICER'S SUMMARY, RECOMMENDATION, AND PROPOSED CONDITIONS OF APPROVAL.

The applicant seeks to amend the UGB to include approximately 82 acres for a high school with sports fields and the realignment of SW Elwert and SW Kruger Roads. The Applicant has provided sufficient evidence to demonstrate that the criteria are satisfied and the locational factors have been addressed. As detailed herein, the applicant has demonstrated that the high school is currently over capacity and by 2025 will be severely over capacity. Delaying the decision to await a legislative amendment of the UGB by the Metro Council which may or may not occur in the 2018 timeframe only exacerbates the capacity issues which impacts the District's ability to meet the goals of its strategic plan. The applicant provided adequate comparison of the proposed UGB expansion area with other possible expansion areas in seven different urban reserve areas and a determination that the need cannot be met on land currently within the urban growth boundary. In addition the applicant has shown the proposed use can be made compatible with adjacent uses through site design and the city's development design review process provides for public involvement. Additionally the adjacent land is within an urban reserve and is expected to urbanize over time, allowing for the development of a cohesive neighborhood and school/park facility.

Therefore, the hearings officer forwards a recommendation to the Metro Council for ***approval*** of this petition, with the following two conditions of approval:

1. The property must be used for a public high school, associated accessory uses, and public transportation improvements consistent with the application are required for this Major Amendment.

2. The applicant must comply with the Transportation Planning Rule (TPR) at the time the zoning is established on the subject property.

Respectfully submitted this 21st day of July, 2017.

ANDREW H. STAMP, P.C.

SECTION IV: HEARINGS OFFICER'S SUMMARY AND RECOMMENDATION… 74

SECTION I: APPLICATION SUMMARY

FILE NAME:	UGB Case 17-02: Sherwood School District Urban Growth Boundary Major Amendment
APPLICANT:	Sherwood School District 23295 SW Main Street Sherwood, OR 97140
PROPOSAL:	82-acre expansion of the urban growth boundary (UGB) for a high school campus with sports fields. Realign SW Elwert Road and SW Kruger Road in Sherwood.
LOCATION:	Tax Lots 2S236-200, -201, -206, and -207
SITE ADDRESSES:	18880 SW Haide Road, 22895 SW Elwert Road and 18985 SW Kruger Road, Sherwood, Oregon 97140
URBAN RESERVE AREA:	Area 5B.
CURRENT ZONING:	AF-20
METRO CODE:	Metro Code Sections 3.07.1425 (B, C, D, E & F) and 3.07.1440 (A & B). Code Section 3.07.1425(C)(1-9)

SECTION II: BACKGROUND INFORMATION

Proposal Description: The applicant requests an expansion of the City of Sherwood UGB to include approximately 82 acres for a high school campus with sports fields. This proposal also seeks to realign the intersection of SW Elwert Road and SW Kruger Road for improved and safer traffic flow.

Site Information: The site consists of four tax lots located within unincorporated Washington County on the west side of SW Elwert Road, between SW Haide Rd and SW Kruger Rd as shown in Attachment 1. The property has frontage on SW Elwert, SW Haide and SW Kruger Roads. The entire property is zoned AF-20 (Agricultural and Forest District) by Washington County with a minimum lot size of 80 acres. The entirety of the property is located within the Sherwood West Preliminary Concept Plan area (Metro Urban Reserve Area 5B). The site slopes

gently down to the east towards SW Elwert Road with approximately 40 foot grade change across the site. There is a shallow valley and ridge within this slope.

The properties have been used for various agricultural activities including a Christmas tree farm, tree plantation and row crops. The tax lot in the southeast corner of the site, adjacent to the intersection of SW Elwert and SW Kruger Roads is owned by the City of Sherwood, a portion of which will be used for the road realignment. A 40-foot wide permanent Northwest Natural gas easement zigzags along the western edge of the site, separating the northwest corner of the site from the remainder of the property.

Case History: The Sherwood School District (District) is centered on the city of Sherwood and extends into the surrounding rural area in all directions, including a small area east of I-5, between Wilsonville and Tualatin. The District includes an area of 4.31 square miles and an estimated population of 18,884. The District has seven schools that provide educational services to just over 5,000 students, the majority of which live in the city of Sherwood. The District experienced substantial growth in the late 1990's and early 2000's leading to a community effort in 2005 to determine facility needs. This resulted in the successful 2006 bond measure which included funding for an addition to the current high school to increase capacity to 1,550 students, consistent with phase 1 of the 2006 high school master plan. Current enrollment at the high school is over 1,700 students and projections show over 2,250 students by the 2025-26 school year. In early 2014 the District's Long Range Planning Committee made recommendations to the School Board regarding enrollment and growth challenges, facilities analysis and needs and financing options. In 2015 the District documented the condition and educational adequacy of its facilities, leading to bond visioning and steering committees in 2016. This resulted in the District's voters approving a bond measure in 2016 providing funding for school improvements including construction of a new high school. The District continues to engage the community through a design committee and community input sessions.

Local Government Statement: This UGB major amendment is being considered at the request of the Sherwood School District. The City of Sherwood completed the Sherwood West Preliminary Concept Plan for urban reserve area 5B and submitted a service provider form supporting the school district's application. The school district participated in the concept planning process and the subject site is one of the school locations identified in the preliminary concept plan. Washington County submitted a written statement supporting the application with proposed conditions for Metro to consider. Tualatin Valley Fire and Rescue submitted a written statement supporting the application and Clean Water Services is neutral on the application.

SECTION III: APPLICABLE REVIEW CRITERIA

The criteria for a Major Amendment to the UGB are contained in Metro Code Section 3.07.1425(B, C, D, E, & F) and 3.07.1440 (A & B). The approval criteria appear ***bold 12-pt Aerial Narrow font),*** and the hearings officer's analysis follows.

> ***Metro Code Section 3.07.1440(A) The purpose of the major amendment process is to provide a mechanism to address needs for land that cannot wait until the next analysis of buildable land supply under ORS 197.299. Land may be added to the***

UGB under this section only for the following purposes: public facilities and services, public schools, natural areas, land trades and other non-housing needs;

This code section requires that the applicant show, by substantial evidence in the whole record, that it is an eligible entity allowed to use the interim ORS 197.299 Major Amendment UGB process rather than wait until the next regular Metro UGB amendment cycle (in December, 2018).

Hearings Officer's Analysis: Title 14 of the Metro Code (*i.e.* Metro's Urban Growth Management Functional Plan) includes the Major Amendment process to amend the UGB for a number of specific non-housing needs, including schools and public parks. This process, which is designed to implement ORS 197.299(4), is intended to provide an opportunity to meet these specific land needs outside of the legislative housing needs process the Metro Council conducts on a six-year cycle as required by ORS 197.299(1) and ORS 197.296.

As part of the six-year legislative housing needs process, Metro conducts an inventory of the current residential and employment capacity within the UGB, forecasts population and employment growth over a 20-year timeframe, determines the capacity of the current UGB to accommodate that growth and documents the results of these analyses in an urban growth report. ORS 197.296(6)(a), which is one of the state's needed housing statutes, envisions that local governments with populations over 25,000 will factor in land for schools at the same time as they determine the amount of land needed to be brought in to the UGB for housing. In this regard, the need for land for schools under ORS 197.296(6)(a) is a "derivative need" which is linked to, and dependent upon, a finding that there is a need for land to be brought into the UGB to accommodate an identified housing need. As noted in more detail below, this process has proven to be long, drawn out affair, which is not sensitive to short-term needs. Furthermore, because it is done on a large-scale regional basis, is not always sensitive to more localized school and park needs.

In fact, Metro's most recent urban growth report, adopted in 2015, did not address school and park land needs at the regional level at all. Some school districts anticipate growth, others see declining enrollment and none look out over the 20-year timeframe that the urban growth report considers. Depending on the particular physical, financial and expected growth characteristics of each school district, plans for accommodating projected increases in enrollment vary. Similarly, park districts acquire property and develop park facilities based on numerous operational and funding parameters that can't be considered at the regional level. In addition, it is quite common for school districts and cities to collaborate on opportunities to meet the city's recreation needs as well as the school district's team needs. For these reasons, the Major Amendment process is the appropriate means of addressing specific school district and park needs that can be accommodated through UGB expansions.

Metro has adopted specific criteria to implement ORS 197.299(4). There are two criteria contained in Metro Code section 3.07.1440(A) that are analyzed separately below:

1) The proposal must be for a non-housing need, and

> 2) The proposal must be intended to meet needs that cannot wait until the next analysis of land supply (December 2018).

There does not appear to any disagreement that the first criterion is met: the applicant proposes to add land to the boundary for a public school and a public facility need, both of which are non-housing needs. The Sherwood School District's Sherwood High School is a "public school" within the meaning of Metro Code Section 3.07.1440(A).

However, whether the applicant has met the second criterion has proven to be more controversial. The applicant addresses its need as follows:

> As of 2015, the Sherwood School District encompasses 4.31 square miles serving a population of approximately 18,884 residents and 5,000 students. The Sherwood School District includes:
> - The City of Sherwood city limits;
> - Portion of the western area of the City of Tualatin (mostly industrial land);
> - Rural Clackamas County (primarily between Sherwood and Wilsonville); and
> - Rural Washington County north and west of Sherwood, as well as a small area east of I-5 between Wilsonville and Tualatin.
>
> To facilitate future planning and to comply with State requirements for a fast-growing school district, the District adopted a long-term facilities plan in January of 2008, which assumed that additional school capacity would therefore likely be needed within ten years of the plan's adoption. As predicted school facilities have recently become overtaxed. In 2015, to assess current resources, the Sherwood School District completed a Facilities Planning and Assessment Report to determine both condition and available capacity. Enrollment based on the most current demographic data and capacity shows that school capacity is near or over capacity at all school levels as shown in Staff Report Attachment 2 (Table 1 in petition).
>
> The School District commissioned Davis Demographics & Planning Inc. to complete an updated 10-year demographic study in May of 2016. The study reviewed the following factors that determine student enrollment: (1) the current and planned residential development over the next ten years; (2) student yield factors that apply to new residential development; (3) birth factors for the District area; and (4) mobility factors, which examine the in/out migration of students within existing housing units. The forecast projects a deficiency in capacity in all levels, with the

high school level having the largest deficiency. Staff Report Attachment 3 (Table 2 in petition) shows 10-year enrollment projections compared with existing school building capacity. The table demonstrates that if no capacity is added (no-build) the school facilities will be far over capacity in 10 years with the Sherwood High School having the largest capacity issue operating at 141% of capacity.

From the updated capacity assessment and demographic data, it became apparent that facilities must be expanded to keep pace with continued student enrollment growth. A Long Range Planning Committee, Bond Steering Committee, Bond Visioning Committee and Sherwood High School Programming Committee were formed to study facility needs. Led by the Bond Management Team, these committees met from 2014 to 2016, making recommendations to the Sherwood School District Board. The process included input from a number of participants from the community including City Council and staff representation, School District staff, architects, civil engineers, financial advisors, business leaders, citizens, parents and students. Throughout this process, the Sherwood City Council was provided with updates and community input was sought via various public outreach methods.

As evidenced by capacity study and demographic growth data, the high school level is where there is the biggest need for additional capacity both now and to a greater extent within 7 to 10 years. Therefore, the Bond Management Team first looked to the existing high school campus for opportunities for expansion to accommodate this growth. With the conclusion that the existing high school cannot be upsized to meet demand, the District's Bond Management Team began looking for a long-term solution and the School Board, with voter approval, ultimately decided to build a new high school. The new high school is planned to be sized to initially accommodate 2,000 students, but allow for easy expansion to 2,400 students. This size will allow for projected growth over the next 10 years and foreseeable future.

Once a new high school is online, the existing high school building can be repurposed as a consolidated middle school with both existing middle schools (Laurel Ridge and Sherwood Middle) being relocated to the existing high school campus. Once this occurs, the two existing middle schools can be converted to elementary school use to expand needed elementary school capacity. Finally, the proposal allows for Hopkins Elementary School, a building nearing its useful lifespan, to be taken out of

> school service and converted to administrative functions. The existing administrative offices consist of portable buildings in varying locations and with the conversion of Hopkins, office space can be centralized for increased efficiencies.

The primary opponent argues that the applicant has not justified the use of the Major Amendment process instead of waiting until the normally scheduled Metro 2018 UGB expansion. Their attorney states: "Metro's scheduled UGB expansion in 2018 is the appropriate time to analyze the expansion for the proposed high school because more data will be available and the full set of impacts can be analyzed. The delay will also resolve the issues with inadequate notice in the current application." *See* Letter from Jennifer Bragar dated June 6, 2017, at p. 8.

What the opponents appear to be arguing is that this application is premature, and the applicant should wait until 2018 when the 20-year buildable lands analysis will be available. Furthermore, the opponents do believe that the Major Amendment process authorized by ORS 197.299(4)(a)(A) requires the same type and level of analysis required when Metro conducts its periodic legislative housing need analysis required by ORS 197.299(1) and ORS 197.296. The opponent's unstated assumption is that school needs must be evaluated as a derivative need of housing using the ORS 197.296(6) process.

Metro staff weighed in on the debate via a Memorandum dated June 9, 2017, which states, in relevant part:

> Metro's legislative process for reviewing the UGB is guided partially by ORS 197.296. Subsection 197.296(2) directs Metro to demonstrate that there is sufficient buildable land within the UGB to accommodate estimated housing needs for 20 years. A housing need is the only need identified in the statute. ORS 197.296(6) says if the housing need is greater than the capacity of the UGB Metro shall take one or more actions that could include amending the UGB to include sufficient buildable lands to accommodate housing needs for 20 years. Subsection (6)(a) goes on to say that if the UGB was amended to accommodate housing needs for the next 20 years, then the amendment shall include sufficient land reasonably necessary to accommodate the siting of new public school facilities.
>
> The statutory directive to Metro is to include sufficient land for school facilities as part of any UGB expansion that is required to meet a 20-year need for housing. In Metro's most recent analysis of the 20-year housing supply (the 2015 UGR), Metro determined there was sufficient capacity inside the existing UGB to accommodate housing needs; therefore, no corresponding analysis for public school facilities was required.

> Even if the Metro Council had determined there was a need to expand the UGB in 2015 to accommodate a 20-year housing need, there is no certainty that the location where the land would be added to meet the housing need is also a location where a local school district needs additional land to meet its facility needs. Likewise there is no certainty that the specific land needs of a school district are coordinated with the local jurisdictions desire for additional housing. For instance, a UGB expansion adjacent to Hillsboro to meet a regional housing need would not support the Sherwood School District's need for a new high school.
>
> These difficulties arise, in part, from the size of the Metro region and the fact that it consists of 24 individual cities and 17 different school districts. It is important to recognize that the provisions of ORS 197.296(6)(a) regarding planning for accommodation of new school facilities is included in the statutory section that describes the analysis required for all cities in the State of Oregon. While it would not be as difficult for a smaller jurisdiction to coordinate future public school needs with future housing needs in making UGB expansions, that task is much more complicated in the Metro region.
>
> The disconnect in the Metro region between the location of UGB expansions to meet a 20-year housing need and the needs of existing school districts is addressed, in part, by ORS 197.299(4)(a), which is the statute that directs Metro to establish the process being utilized by the Sherwood School District in this proceeding. ORS 197.299(4)(a) requires Metro to allow "off-cycle" UGB expansions as necessary to accommodate a need for land for a public school that cannot reasonably wait.

Given that the opponents have a very different interpretation of the purpose and meaning of ORS 197.299(4) when compared to Metro staff and the applicant, a discussion of statutory interpretation is in order.

A statute is considered "ambiguous" if it is capable of at least two reasonable interpretations. *State v. Tarrence*, 161 Or App 583, 985 P2d 225 (1999); *Kenton Neighborhood Ass'n v. City of Portland and Oregon Waste Systems, Inc.*, 17 Or LUBA 784, 797 (1990) (when code is internally inconsistent, it is ambiguous).[1] If the legislation is unambiguous, local governments and courts are bound to apply the statute in that manner, regardless of how inartful the enactment seems. *Sanchez v. Clatsop County*, 146 Or App 159, 164 n 4, 932 P2d 557 (1997). Stated another way, an unambiguous statute should not be "interpreted." *City of Hillsboro v. Housing Dev'l Corp of Washington County*, 61 Or App 484, 488, 657 P2d 726 (1983). *See GTE*

[1] *See also Fisher v. City of Gresham*, 69 Or App 411, 416, 685 P2d 486 (1984); *McCoy v. Linn County*, 90 Or App 271, 276 nl, 752 P2d 323 (1988).

Northwest, Inc., v. Oregon Public Utility Comm'n, 179 Or App 46, 39 P3d 201 (2002). Rather, unambiguous words should be given their plain, natural, and ordinary meaning. *PGE v. BOLI*, 317 Or at 611.[2]

In this case, the hearings officer believes that the relationship between ORS 197.296 and ORS 197.299 creates sufficient ambiguity to warrant an exercise of statutory interpretation.

Text and Context.

When construing a statute, the court will often first look directly at the text of the statute itself. *See Whipple v. Howser*, 291 Or 475, 635 P2d 782 (1981) (citing *Greyhound Corp. v. Mount Hood Stages, Inc.*, 437 US 322, 330, 98 S Ct 2370, 2375 (1978)). Emphasizing the need to look first to the language of the statute, the *Whipple* court stated:

> "The cardinal rule for the construction of a statute is to ascertain from the language thereof the intent of the law makers as to what the purpose was to be served, or what the objective was designed to be attained."

Whipple, 291 Or at 479 (citing *Swift & Co. and Armour & Cove, Co. v. Peterson*, 192 Or 97, 233 P2d 216 (1951). *See also State of Oregon v. Buck*, 200 Or 87, 92, 262 P2d 495 (1953). The *Whipple* court also cited to *State ex rel. Cox v. Wilson*, 277 Or 747, 562 P2d 172 (1977), in which the court stated:

> "There is, of course, no more persuasive evidence of the purpose of a statute then the words by which the legislature undertook to give impression to its wishes."

Courts do not view the text in a vacuum; they consider the context of the language at issue as well. In fact, the context of the statute is as important to the interpretation as the text. *State v. Webb*, 324 Or 380, 927 P2d 79 (1996); *Friends of Neaback Hill v. City of Philomath*, 139 Or App 39, 48, 911 P2d 350 (1996). *See e.g., Shadrin v. Clackamas County*, 34 Or LUBA 154 (1998). In some cases, the court may consider the context before examining the text, in situations where the context "provided perspective on the text." *See Plotkin v. Washington County*, 165 Or App 246, 250, 997 P2d 226 (2000). In this case, consider the two statutes in tandem.

ORS 197.299 provides as follows:

---

[2] *See also OSHU v. Hass*, 325 Or 492, 501, 942 P2d 261 (1997); *Zidell Marine Corp. v. West Painting, Inc.*, 322 Or 347, 906 P2d 809 (1995); *State v. Langley*, 314 Or 247, 256, 839 P2d 692 (1992); *Curly's Dairy, Inc. v. State Dept of Agriculture*, 244 Or 15, 415 P2d 740 (1966) (If statute is clear and unambiguous, the court may not resort to rules of statutory construction in ascertaining and declaring the legislative intent.); *Sullivan v. City of Ashland*, 130 Or App 480, 882 P2d 633, *rev den*, 320 Or 453, 887 P2d 792 (1994) (An unambiguous code provision cannot be interpreted, even if that provision is contrary to the express purposes of the provision.); *City of Portland v. White*, 61 Or App 120, 655 P2d 629 (1982).

197.299 Metropolitan service district analysis of buildable land supply; schedule for accommodating needed housing; need for land for school; extension of schedule.

(1) A metropolitan service district organized under ORS chapter 268 shall complete the inventory, determination and analysis required under ORS 197.296(3) not later than six years after completion of the previous inventory, determination and analysis.

(2)(a) The metropolitan service district shall take such action as necessary under ORS 197.296(6)(a) to accommodate one-half of a 20-year buildable land supply determined under ORS 197.296 (3) within one year of completing the analysis.

(b) The metropolitan service district shall take all final action under ORS 197.296(6)(a) necessary to accommodate a 20-year buildable land supply determined under ORS 197.296 (3) within two years of completing the analysis.

(c) The metropolitan service district shall take action under ORS 197.296(6)(b), within one year after the analysis required under ORS 197.296(3)(b) is completed, to provide sufficient buildable land within the urban growth boundary to accommodate the estimated housing needs for 20 years from the time the actions are completed. The metropolitan service district shall consider and adopt new measures that the governing body deems appropriate under ORS 197.296 (6)(b).

(3) The Land Conservation and Development Commission may grant an extension to the time limits of subsection (2) of this section if the Director of the Department of Land Conservation and Development determines that the metropolitan service district has provided good cause for failing to meet the time limits.

(4)(a) The metropolitan service district shall establish a process to expand the urban growth boundary to accommodate a need for land for a public school that cannot reasonably be accommodated within the existing urban growth boundary. The metropolitan service district shall design the process to:

(A) Accommodate a need that must be accommodated between periodic analyses of urban growth boundary capacity required by subsection (1) of this section; and

(B) Provide for a final decision on a proposal to expand the urban growth boundary within four months after submission of a complete application by a large school district as defined in ORS 195.110.

(b) At the request of a large school district, the metropolitan service district shall assist the large school district to identify school sites required by the school facility planning process described in ORS 195.110. A need for a public school is a specific type of identified land need under ORS 197.298 (3). [1997 c.763 §2; 2001 c.908 §2; 2005 c.590 §1; 2007 c.579 §2; 2014 c.92 §5]

As quoted above, ORS 197.299(1) cross-references ORS 197.296(3), which, in term, cross-references to ORS 197.296(2). These two statutes together set forth a process for evaluating and accommodating housing needs:

> *(2) At periodic review pursuant to ORS 197.628 to 197.651 or at any other legislative review of the comprehensive plan or regional framework plan that concerns the urban growth boundary and requires the application of a statewide planning goal relating to buildable lands for residential use, a local government shall demonstrate that its comprehensive plan or regional framework plan provides sufficient buildable lands within the urban growth boundary established pursuant to statewide planning goals to accommodate estimated housing needs for 20 years. The 20-year period shall commence on the date initially scheduled for completion of the periodic or legislative review.*
>
> *(3) In performing the duties under subsection (2) of this section, a local government shall:*
>
> *(a) Inventory the supply of buildable lands within the urban growth boundary and determine the housing capacity of the buildable lands; and*
>
> *(b) Conduct an analysis of housing need by type and density range, in accordance with ORS 197.303 and statewide planning goals and rules relating to housing, to determine the number of units and amount of land needed for each needed housing type for the next 20 years.* (Underlined emphasis added).

As the underlined language indicates, ORS 197.296 is a statute narrowly-tailored towards the process used to establish and fulfill an identified *housing* need. It is an expansion of the basic concepts set forth in Statewide Planning Goal 10, but it goes beyond Goal 10 in scope.

As part of that process, the effect of ORS 197.296(6) should also be considered as context:

> *(6) If the housing need determined pursuant to subsection (3)(b) of this section is greater than the housing capacity determined pursuant to subsection (3)(a) of this section, the local government shall take one or more of the following actions to accommodate the additional housing need:*
>
> *(a) Amend its urban growth boundary to include sufficient buildable lands to accommodate housing needs for the next 20 years. As part of this process, the local government shall consider the effects of measures taken pursuant to paragraph (b) of this subsection. The amendment shall include sufficient land reasonably necessary to accommodate the siting of new public school facilities. The need and inclusion of lands for new public school facilities shall be a coordinated process between the affected public school*

districts and the local government that has the authority to approve the urban growth boundary;

(b) Amend its comprehensive plan, regional framework plan, functional plan or land use regulations to include new measures that demonstrably increase the likelihood that residential development will occur at densities sufficient to accommodate housing needs for the next 20 years without expansion of the urban growth boundary. A local government or metropolitan service district that takes this action shall monitor and record the level of development activity and development density by housing type following the date of the adoption of the new measures; or

(c) Adopt a combination of the actions described in paragraphs (a) and (b) of this subsection.

A few key points can be quickly gleaned from ORS 197.296. First, by its terms, ORS 197.296(2) only applies to periodic review or another "*legislative* review of the [.. .] regional framework plan that concerns the urban growth boundary and requires the application of a statewide planning goal relating to buildable lands for residential use. " This Major Amendment application is not periodic review and is also not a legislative review of Metro's regional framework plan, *i.e.*, the every six-year UGB amendment cycle. The Major Amendment application is subject to a quasi-judicial process and will result in a quasi-judicial decision by the Metro Council.

Strawberry Hill 4 Wheelers v. Board of Comm'rs sets out a list of factors to be weighed to determine whether a land use decision is legislative or quasi-judicial. 287 Or 591, 602-603, 601 P2d 769 (1979). Under *Strawberry Hills*, the Major Amendment is quasi-judicial because (a) the application process is bound to result in a decision, (b) the decision must apply pre-existing criteria to concrete facts, and (c) the action is directed at a closely circumscribed factual situation.

With regard to the first question, the *Strawberry Hills 4-Wheelers* Court asks practitioners to consider the following question: "Does the statute require the [local government] to reach a decision after the hearing, as in an adjudication, or may it indefinitely postpone or abandon the issue, like a legislative proposal?" 287 Or at 605. At first glance, one might assume that any land use decision that originates from an application being submitted (as opposed to be initiated by the local government itself) would be "bound to result in a decision." Indeed, that seems to have been the original intent of the *Strawberry Hill* Court. However, over the years LUBA and the Court of Appeals have increasingly read this factor more and more narrowly and will only find that that a decision is "bound to result in a decision" if the code either expressly requires a decision to be made, or if that requirement can be fairly read into the language of the code based on the context. *Estate of Gold v. City of Portland*, 87 Or App 45, 48, 740 P2d 812 (1987) ("the statute simply says that the governing body *may* approve the proposal, not that it *must* do anything."); *Johnson v. City of La Grande*, 37 Or LUBA at 388; *Valerio v. Union County*, 33 Or LUBA 604 (1997); *Miner v. Clatsop County*, 46 Or LUBA 467 (2004). In some cases, LUBA has not been as exacting in its analysis, holding that although the code did not:

> "expressly state that once a person requests an interpretation of a provision of the city's zoning ordinance that the person is entitled to a decision. We believe, however, that any reasonable person reading this ordinance would conclude that if a person requested an interpretation from the planning director, received that interpretation and then appealed the interpretation to the planning commission and to the city council, the person filing the appeal would be entitled to a decision from the city council."

Hoffman Ind. Inc. v. City of Beaverton, 2 Or LUBA 411 (1981); *Dean v. City of Oakland*, 33 Or LUBA 806, 809 (1997)("While the cited policy does not require a decision within a specified time, the most natural reading of its terms requires a decision.") The fact that any given ordinance in question states that the decision-maker "may" make a decision should not be a fact which is determined to be indicative of a legislative decision, but unfortunately, in practice it is just that. In this regard, the statute at issue in *Strawberry Hill* did not expressly require that a decision be made. However, the Supreme Court found no difficulty in concluding that "although affirmative action is optional, the statute appears to contemplate that the County Court will *eventually* reach and pronounce some decision whether to act or not. *Id*. at 606. (Emphasis added).

In this case, the MC 3.07.1440(g) requires the Metro Council to make a final decision on the petition. Therefore, this factor suggests that the decision is quasi-judicial.

The second of the *Strawberry Hill* questions has, in practice, become somewhat of a non-factor. Both LUBA and the Court of Appeals have recognized that all land use decisions in Oregon are subject to "preexisting criteria" and apply to concrete facts. LUBA has addressed this issue as follows:

> Turning to the "apply existing criteria to concrete facts" factor, that factor is present to some extent in all land use decisions. *Valerio*, 33 Or LUBA at 607. This factor is therefore less important than the other two factors, particularly where, as is the case here, the decisions are adopting new land use laws rather than applying existing land use laws to grant land use approval for a single property or a small number of properties. *Churchill v. Tillamook County*, 29 Or LUBA 68, 71 (1995); *McInnis v. City of Portland*, 27 Or LUBA 1, 5-7 (1994).

Carver v. Deschutes County, 58 Or LUBA 323 (2009). *See also Casey Jones Well Drilling, Inc. v. City of Lowell*, 34 Or LUBA 263, 271 (1998); *Johnson v. Jefferson Country*, 56 Or LUBA 72 (2008). In this case, the MC 3.07.1440 sets forth criteria for a Major Amendment to a UGB. Therefore, this factor suggests that the decision at issue is quasi-judicial.

Under the third factor, LUBA and the Courts are supposed to assess whether the decision either (1) affects either a small number of owners and properties or (2) the "action directed at a closely circumscribed factual situation," or whether the decision has more broad

applicability. According to early decisions by the Court of Appeals, "the number of people affected and the size of the area covered are less important considerations," and the focus should instead be on "the importance of assuring that the decision is factually correct and that the decision-maker gives fair attention to affected individuals." *1000 Friends of Oregon v. Wasco Co. Court*, 80 Or App 532, 536, 723 P2d 1034 (1986), *rev'd on other grounds*, 304 Or 76, 742 P2d 39 (1987). In practice, this third bean-counting "factor" has become the most critical issue to LUBA, and, despite suggestions to the contrary, in most cases it is more-or-less the dispositive factor. In fact, LUBA has found decisions to be legislative even when the other two factors favored a determination that a decision was quasi-judicial. *Davenport v. City of Tigard*, 22 Or LUBA 577 (1992).

In this case, the proposal involves 82 acres consisting of four tax lots in unknown ownerships. This is well within the size and ownership limits that would allow the conclusion that the decision is quasi-judicial.

The primary opponent argues that this Major Amendment is a "legislative decision," The primary opponent states that "[t]he decision amends the Metro Boundary map that is incorporated into the Metro Urban Growth Functional Plan, and as such the change is legislative." *See* Letter from Jennifer Brager dated June 23, 2017 at p. 1. However, map amendments are not necessarily or inherently legislative or quasi-judicial in nature. *Compare Thomas v. City of Veneta*, 44 Or LUBA 5 (2003) (TSP and zoning map amendment affecting two tax lots comprising 6.4 acres); *Dan Giles & Assoc., Inc. v. McIver*, 113 Or App 1, 3, 831 P2d 1024 (1992)(zone change for single 29-acre parcel in unified ownership is quasi-judicial); *Neuberger v. City of Portland*, 288 Or 155, 603 P2d 771 (1979) (re-zoning involving 601 acres of land owned by three landowners is quasi-judicial).[3] *Contrast Valerio v. Union County*, 33 Or LUBA 604 (1997) (comprehensive plan amendment and zone change pertaining to 185 acres in a "number of different ownerships" is legislative); *Friends of Cedar Mill v. Washington County*, 28 Or LUBA 477 (1995) (PAPA relocating arterial and changing it from 5 lanes to 3 lanes is legislative, where it affects 40 properties and will carry 17,000 – 18,000 trips per day.); *McInnis v. City of Portland*, 27 Or LUBA 1 (1994) (Proposal which rezones 5000 acres in 110 different ownerships is legislative.); *Davenport v. City of Tigard*, 22 Or LUBA 577 (1992) (Transportation plan map amendment that directly involves nine property owners, but has "indirect effects" on a broader population is legislative). Nor is a UGB amendment inherently legislative in nature. *BenjFran Development, Inc. v. Metro*, 17 Or LUBA 30 (1988) (denial of request for UGB amendment comprising almost 500 acres in three ownerships is quasi-judical).

Cases such as *Davenport* and *Friends of Cedar Mill* suggest that large transportation projects will be considered legislative due to the broad secondary effects that transportation facilities can have on commuters. The hearings officer does not believe that this line of cases can be extended to a school, however, based simply on the fact that many kids will attend the school. If that were the case, then any land use decision involving a Wal-Mart or Home Depot store would be legislative, because those uses have higher usage / trip generation rates than a typical school.

[3] *See Neuberger v. City of Portland*, 37 Or App 13 (1978), *rev'd in part, aff'd in part*, 288 Or 155, 603 P2d 771 (1979).

Opponent's counsel cites *Colwell v. Washington County*, 79 Or App 82, 87-8 (1986) for the proposition that this Major Amendment is a legislative (and not a quasi-judicial) decision (*see* Bragar letter dated 23 June 2017, pp 1-2). *Colwell* does not support that conclusion, and is easily distinguished. In *Colwell*, the Washington County Planning Commission made a land use decision which opponents wished to appeal to the Board of Commissioners, but their appeal was dismissed for failure to timely pay for the quasi-judicial Planning Commission hearing transcript. *Colwell*, 79 Or App at 85. Opponents appealed to the LUBA, which dismissed the appeal for failure to exhaust remedies at the local (County) level. The Oregon Court of Appeals reversed and remanded, finding that the Washington County governing body (*i.e.* the elected Board of County Commissioners) - and not the unelected County Planning Commission - must make Comprehensive Plan amendments, pursuant to ORS 215.050(1) and ORS 215.060.

Opponent's argument might have some merit if this unelected hearings officer was the one to make the final decision on this Major Amendment land use application. Only the elected Metro Council has that authority, however. This hearings officer's findings and determination are merely a recommendation to the Metro Council, and the Council is free to accept or reject this Hearings officer's decision, as the Council sees fit. Since the Metro Council will be the governmental body to make the final land use decision in this case, the Court of Appeals' holding in *Colwell* shall be followed for this application.

Despite the lengthy analysis set forth above, the hearings officer does not really believe that the quasi-judicial vs. legislative debate is dispositive, in any event. Rather, it is a red herring. Stated another way, the hearings officer does not believe that ORS 196.296 would apply to this UGB Amendment even it was a legislative decision. By its terms, ORS 197.296 only applies to UGB amendments that "require the application of a statewide planning goal relating to buildable lands for residential use." As discussed elsewhere in this recommendation, an amendment to a UGB which adds AF-20 zoned land for use as a school does not implicate Goal 10 in any meaningful way .

Second, ORS 197.296 sets forth a mandatory periodic process that is focused on only one type of land need: a need for housing. We can credit the Home Builder Association for being active in the legislature over the past 30+ years and influencing the adoption of specific statutory language, such as ORS 197.296, which relates specifically to their industry. But we should also not lose sight of the fact that there are other types of land need under Goal 14 that don't implicate ORS 197.296.

Taking a step back, recall that Goal 14 states that a UGB amendment must be based on consideration of six factors set forth in the Goal. The first two factors are commonly referred to as the "need" factors. The need factors require either a demonstrated need to accommodate long range urban population, consistent with a 20-year population forecast coordinated with affected local governments, <u>*or*</u> a demonstrated need for housing, employment opportunities, livability or uses such as public facilities, streets and roads, schools, parks or open space, or any combination of the need categories. While the need for housing is governed by ORS 197.296, other land needs are governed by Statewide Planning Goal 14, and in some cases, by OAR Ch. 660, Div 24. Note, as an example, that OAR Ch. 660, Div. 24 does not address now a livability need is established; Goal 14 seems to be the sole administrative pronouncement of its use. What is important to understand for purposes of this case is that ORS 197.296 is not the sole way to

establish land need, and a school need is not limited to being established as a derivative need of housing under ORS 197.296(6).

Among the more common types of land need mentioned in Goal 14 include a need for employment land, a need for public facilities, a need for schools, a need for parks, and the amorphous catch-all known as a "livability need."[4] With one exception related to public schools, ORS 197.296 does not govern substantively how these other types of land needs are established. Nor does it establish a *process* by which those other needs are established. Rather, ORS 197.296(2) & (3) are narrowly focused on accommodating a housing need, and as shown below, accommodating land for public schools as a derivative need stemming from housing need.

Consider ORS 197.296(6) as context: this statute applies when a local government is undertaking periodic review or a legislative review of a UGB that implicates Goal 10. If during such a process, the local government determines that a need exists for additional residential land and that accommodating that land need must necessarily involves a UGB amendment, then ORS 197.296(6)(a) requires that local government to "include sufficient land reasonably necessary to accommodate the siting of new public school facilities." Thus, under that process, a public school facility is considered a derivative need that arises by operation of a demonstrated need for housing. However, there is nothing in ORS 197.296(6) that makes ORS 197.296 the exclusive process by which a need for schools can be established. As demonstrated by the applicant a need for new school facilities can exist independent of housing needs. And while the primary opponent chalks up the applicant's current need to poor planning on the District's part (a sentiment that may have some basis in fact), ORS 197.299(4) appears to written as a safety value that can be used by school districts regardless of the causes that led to the need.

ORS 197.299(4)(a)(A) provides additional key textual clues which helps understand the nature of the process currently being undertaken. This provision authorizes Metro to "establish" and "design" a "process" that will fulfill a need that must be accommodated "*between*" periodic analyses of urban growth boundary capacity required by subsection (1) of this section." By giving Metro the authority to "establish" and "design" a unique UGB amendment process for schools, the statute makes clear that the school need specific "4(a)" process is not the *same* process as the legislative six-year process required by ORS 197.299(1) and 197.296(3). The ORS 197.296 process is already "established" and "designed" by statute, and really only puts a regional government much as Metro in an implementation role. On the other hand, ORS 197.299 delegates to Metro a role that is greater than mere implementation of a pre-existing process. Furthermore, ORS 197.299(4)(a)(4) further emphasizes that the school-specific process is only supposed to be used "between" the 6-year legislatively-mandated processes for accommodating housing needs, and it can only be invoked if the identified school need cannot wait until the next scheduled six-year legislative process.

[4] LUBA cases confirm that a need to improve livability can provide a basis for adding land to a UGB. Such an analysis requires, in addition to identifying a significant livability problem, an evaluation of probable and negative impacts on livability that may occur if the UGB is amended, and an explanation of why the livability benefits outweigh negative impacts on livability. *1000 Friend of Oregon v. City of North Plains*, 27 Or LUBA 372, 383, *aff'd.*, 130 Or App 406 (1994); *1000 Friends of Oregon v. Metro Service Dist.*, 18 Or LUBA 311, 320 (1989).

The gravamen of opponents' complaints with respect to ORS 197.299(4) stem from a misunderstanding of the relationship between the ORS 197.299(1) six-year UGB amendment process with the ORS 197.299(4) public school amendment process. Much of opponent counsel's testimony at the June 13, 2017, hearing and again in her June 23, 2017 letter, was directed generally at a dissatisfaction with how Metro plans for regional housing and employment needs and opponents' opinion that allowing out-of-cycle UGB expansions for public schools exacerbates Metro's alleged poor planning. In its June 23, 2017 letter, opponents argued that this Major Amendment application does not meet the requirements of ORS 197.296(2).

At its core, the opponent's argument hinges on the assumption that the school-specific process must be substantively the same as the periodic six-year legislative process. Stated another way, the opponents argue that the substantive standards and criteria that govern the school specific process are the same as the housing-specific legislative process under which school need can be established as a derivative need. However, if that were truly the case, however, there would be no need for Metro to "establish" and "design" a new process. Rather, if the legislative intent was to mandate the same rigorous process that is used to establish housing need and to otherwise limit school need as a derivative need, the legislature would have simply stated that a school-related need can form the basis for accelerating the time frame under which the legislative housing need process is conducted. And that in itself does not make any sense because nothing in ORS 197.299(1) or ORS 197.296 prohibits Metro from conducting the legislative housing-needs process sooner than on a 6-year increment. In fact, ORS 197.299(1) merely states that Metro must undertake the ORS 197.296 process "*not later than six years after completion of the previous inventory, determination and analysis.*" In theory, Metro could voluntarily conduct that inventory and analysis on a bi-annual or other timeline. In light of this observation, ORS 197.299(4) would be a redundancy if interpreted in the manner that the primary opponent advocates.

Courts strive to give effect to all parts of a statute, in order to produce a harmonious whole. ORS 174.010.[5] As a corollary, courts will avoid interpretations that render a portion of the statute redundant or meaningless surplusage.[6] *See State v. Stamper,* 197 Or.App. 413, 418, 106 P.3d 172, *rev. den.*, 339 Or. 230, 119 P.3d 790 (2005) ("we assume that the legislature did not intend any portion of its enactments to be meaningless surplusage"). If the school-specific process were not a separate process governed by different substantive criteria than ORS 197.296, it would not accomplish anything that Metro did not already have the right to do.

Rather than being drafted as an authorization to conduct the existing six-year legislative housing needs process at any time increment earlier than six years if a need exists that cannot wait six years, ORS 197.299(4)(a)(A) contemplates a *new* process *designed* by Metro to cater to

[5] *Lane County v. LCDC*, 325 Or 569, 578, 942 P2d 278 (1997); *Bolt v. Influence, Inc.*, 333 Or. 572, 581, 43 P.3d 425 (2002) ("we are to construe multiple provisions, if possible, in a manner that will give effect to all"). *See also Davis v. Wasco IED*, 286 Or 261, 267, 593 P2d 1152 (1979); *Tatum v. Clackamas County*, 19 Or App 770, 775, 529 P2d 393 (1974); *Plotkin v. Washington County*, 36 Or LUBA 378 (1996); *Walz v. Polk County*, 31 Or LUBA 363 (1996); *Fechtig v. City of Albany*, 31 Or LUBA 410 (1996) (Ordinance).

[6] *Certain Underwriters at Lloyd's London and Excess Ins. Co., Ltd. v. Massachusetts Bonding and Ins. Co.*, 235 Or.App. 99, 230 P.3d 103 (2010); *State v. Stamper*, 197 Or.App. 413, 417, 106 P.3d 172, *rev. den.*, 339 Or. 230, 119 P.3d 790 (2005); *EQC v. City of Coos Bay*, 171 Or.App. 106, 110, 14 P.3d 649 (2000).

school needs as a primary independent need, not as a secondary derivative need resulting from a housing need. Because it is a different process that is intended to evaluate a needs other than a housing needs, the process and requirements (*i.e.* inventory, determination, and analysis) of ORS 197.296 do not apply to this separate process. And discussed below, the legislative history confirms this analysis.

Legislative History

Prior to 2001, the case of *Portland Gen. Elec. Co. v. Bureau of Labor & Indus.*, 317 Or 606, 611–612, 859 P2d 1143 (1993) (hereinafter *PGE*) made clear that legislative history could not be used to determine legislative intent if the text and context of the law made the meaning of that law unambiguous. The case of *State v. Gaines*, 346 Or 160, 171–172, 206 P3d 1042 (2009) essentially acknowledges that the *PGE v. BOLI* approach was legislatively modified in 2001 via amendments to ORS 174.020, and that the statute now permits the consideration of legislative history even when the text and context seem to make the meaning unambiguous. For this reason, a careful treatment of *Gaines* is warranted here.

The OSB publication entitled "Interpreting Oregon Statutes" Steve Johansen, Hon. Jack Landau, and Anne Villella ed. OSB CLE (2009) contains a lengthy but highly relevant discussion of *Gaines*, as follows:

> In *Gaines*, the defendant was convicted of obstructing governmental administration when she refused to cooperate in being photographed after her arrest. On appeal, she argued that her behavior did not constitute a "'means of . . . physical . . . interference or obstacle' "within the meaning of the relevant statute. *Gaines*, 346 Or at 162 (quoting ORS 162.235(1)). She argued further that the 2001 amendments to ORS 174.020 required the court to consider the legislative history of ORS 162.235(1) along with the text and context of the statute, even if the court found that its analysis of the text and context did not render the legislative intent ambiguous. *Gaines*, 346 Or at 165. Interestingly, in assessing the meaning of the 2001 amendments to ORS 174.020, the court found that a text-and-context analysis suggested that the amendments did not significantly change the *PGE* standard. *Gaines*, 346 Or at 166. However, the court did not stop its analysis at the text-and-context level. As the plaintiff argued that ORS 174.020 required, the court went on to examine the legislative history. The legislative history revealed a clear legislative intent to eliminate the requirement that a court only look to legislative history "if but only if" the text and context left the meaning ambiguous. *Gaines*, 346 Or at 169.
>
> * * * * *.

> The court will now consider proffered legislative history even when the text and context of a statute appear to render it unambiguous. In effect, *Gaines* brings legislative history into the step-one analysis along with the text and context of a statute. That said, legislative history remains a second step of statutory analysis—the court will consider it only after analyzing the text and context of a statute. The weight the court gives that legislative history also remains within the discretion of the court. A party attempting to overcome seemingly plain and unambiguous text through reference to legislative history has "a difficult task before it." *Gaines,* 346 Or at 172.

Although *Gaines* modifies the *PGE* methodology, the full extent of that modification remains to be seen. However, a recent appellate court decision suggests the extent may be relatively slight. *State v. Kelly,* 229 Or App 461, 211 P3d 932 (2009). *Kelly* raised the issue of the meaning of ORS 811.335(1)(b), which requires drivers to signal a turn "during not less than the last 100 feet traveled by the vehicle before turning." The defendant, who signaled a turn after he had stopped at an intersection, argued that the legislative history showed that the intent of the statute was to require a signal for at least as long as it took to travel the last 100 feet, but not to signal for the specified distance. The court agreed that under *Gaines* it needed to consider the legislative history. The court also made several points as to what weight it would give that legislative history.

The court first made clear that legislative history alone cannot overcome statutory text that is truly capable of only one interpretation. *Kelly,* 229 Or App at 466. Beyond that caution, the court explained the traditional limits of legislative history: legislative history is most helpful when it uncovers the general legislative intent of a statute (*Kelly,* 299 Or App at 466); statements of single legislators or non-legislators are generally, though not always, less helpful (*Kelly,* 299 Or App at 466–467), and the existence of a particular problem that precipitated a bill does not necessarily mean the statute was intended to address only that problem (*Kelly,* 299 Or App at 468). What *Kelly* does not suggest is that *Gaines* changes in any significant way *how* courts use legislative history. Rather, it only changes *when* the court will consider legislative history. Thus, even under *Gaines,* legislative history will be most helpful when an analysis of the text and context does not resolve an ambiguity of the statute. Legislative history may also be useful to reinforce an apparently unambiguous interpretation of a statute. (Emphasis added).

Courts are not likely to be persuaded by legislative history when that history does not give any indication that the precise legal question at issue was considered during the legislative enactment.[7]

The subsection in question, subsection 4, was added to ORS 197.299 in 2005 as part of Senate Bill 1032. Testimony at legislative committee hearings from bill authors and proponents indicates SB 1032 was intended to grant Metro new expedited authority to expand the UGB for the purpose of allowing construction of new schools, and such a process would be separate from the "normal" UGB expansion process typically required by state statutes.

Testimony of several speakers during the May 17, 2005 public hearing provide insight regarding the policy goals behind SB 1032. The main speaker, Gary Conkling, represented the Beaverton School District and was one of the authors of the bill. Mr. Conkling began his testimony in favor of the bill by outlining the pressing problems that face the city of Beaverton. He stated that "in the last decade or so the Beaverton School District has added more than ten thousand students" and that those students alone would make up the fifteenth largest school district in the state.[8]

Mr. Conkling explained that overabundance problems are common in the metropolitan areas of Portland, and most suitable plots of land for schools have been used for other projects intended to spur economic development. Mr. Conkling "anticipate[d] [Beaverton] will have to look outside the UGB for one or more additional school sites" to meet the growing demand. He ended his testimony by stating two main objectives of SB 1032. First, the bill is designed to gain "guidance from Metro, cities, and urban service providers as to where we should look outside the UGB" for suitable plots of land for schools. Second, the bill has language that "will encourage Metro to provide an accelerated process to add those lands once . . . the need has been established . . . so that lands can be added on an accelerated basis to the UGB."[9]

Metro Legislative Affairs Director Randy Tucker, a second advocate of SB 1032, added some additional points regarding the purpose and scope of the bill. Mr. Tucker explained that developing lands for schools requires additional planning considerations than developing lands for other purposes because schools must be located in particular locations. These additional considerations include that ideally, schools should be located near city centers, and schools must fall within existing school district boundaries. This makes it even more difficult to find suitable land for new school construction without expanding the UGB.

---

[7] For example, the court often dispense with legislative history in one sentence by stating simply that the legislative history is silent on the particular issue facing the court. *Ritcherson v. State*, 131 Or App 183, 186, 884 P2d 554 (1994) (seeking to determine if ORS 138.510(2) included retroactive application of its two-year statute of limitations period); *see also Windsor Ins. Co. v. Judd*, 321 Or 379, 387, 898 P2d 761 (1995) ("[W]hat little [discussion of the amendment] there was reveals nothing that sheds light directly on the question posed in this case."); *State v. Holloway*, 138 Or App 260, 267, 908 P2d 324 (1995) ("Unfortunately, our examination of the legislative history sheds no light on the matter."); *In Def. of Animals v. Or. Health Scis. Univ.*, 199 Or App 160, 173 n 9, 112 P3d 336 (2005) ("We note that the legislative history . . . provides no assistance in determining the provision's meaning.").

[8] Hearing on S.B. 1032 Before the S. Comm. on Environment & Land Use, 2005 Leg., 73rd Assemb., Reg. Sess. (Or. 2005) (statement of Gary Conkling, Representative of Beaverton School District).

[9] *Id.*

Finally, Mr. Tucker added that Metro intended to implement SB 1032 by amending its own code to make it easier to expand the UGB for schools "when [new schools] cannot be reasonably accommodated in the UGB, and when they must be accommodated before we would normally do an UGB expansion." Here, Mr. Tucker indicated that Metro should be authorized to quickly initiate UGB expansion for schools outside of the "typical" or "normal" legislative process of reevaluating the buildable land supply inside the UGB every [six] years.

Later, in a May 31, 2005 work session on SB 1032, Messrs. Conkling and Tucker again provided testimony in support of the bill and explained its purpose and scope. Mr. Conkling stated the bill's main purpose is to provide Metro "[with a] process that can work in between its periodic review, and provide for an accelerated process to bring these school sites inside the UGB."

After the testimony of Mr. Tucker, Senator Charlie Ringo, Chair of the Committee, asked if the bill will "facilitate Metro addressing the problem with high growth districts not finding land for schools."[10] Mr. Tucker stated his answer was yes, and that the bill would provide the basis for immediate negotiation as to what land should be included in the UGB as part of an amendment. Mr. Tucker explained that the bill would be beneficial to districts like Beaverton because "it facilitates the process for expanding the UGB for a school district that has need." Mr. Tucker stated that ideally, after revising the Metro code to implement the statute, the process to expand the UGB to include land for a school would take only four months.

The legislative history of HB 1032 indicates that one main purpose of the bill was to streamline the process for amending the UGB for the purpose of building new schools. The testimony of both Conkling and Tucker describe a pressing need for land in metropolitan areas for new school construction that cannot always be met within the typical five-year UGB cycle. Proponents of the bill clearly express intent to grant Metro authority to amend the UGB through a process that would be separate from the regular review cycle and corresponding 20-year need analysis.

Proponents of the bill used words such as "streamline" and "accelerated" in the context of a new expansion process that could occur outside and separate from the "normal" time intensive 20-year need analysis, and described a process that would be based exclusively on a demonstrated need for additional school facilities. Testimony regarding the purpose of SB 1032 indicates that the purpose of the legislation was to allow a separate and expedited process exclusively for school siting, which would not be tied to the 20-year buildable land supply analysis that is required under ORS 197.296.

As described above, it is clear from legislative history that the 2005 Oregon legislature was acutely aware of the problem of holding school districts to a six year Metro planning cycle during the enactment of SB 1032. Metro's Randy Tucker specifically stated that SB1032

[10] Work Session on S.B. 1032 Before the S. Comm. on Environment & Land Use, 2005 Leg., 73rd Assemb., Reg. Sess. (Or. 2005) (statement of Sen. Charlie Ringo, Chair, S. Comm. on Environment & Land Use).

"facilitated" school districts obtaining a UGB amendment for school facilities.[11] According to the Merriam-Webster dictionary, the word "facilitate" means "to make (an action or process) easy or easier." It makes little sense to believe that the legislature would desire to make obtaining a Metro UGB amendment *just as, or even more difficult* for schools while simultaneously creating an "accelerated" process specifically for schools. Indeed, Metro's own Legislative Affairs Director – no stranger to tightly-crafted statutory language - was quite clear in stating that the purpose of SB 1032 was to "facilitate" (that is, make easier) the process for Metro-area schools.

In addition, the hearings officer finds that the ORS 197.299's school-specific UGB amendment process is no less thorough or exacting than an application that could have been filed in due course of the next six-year Metro planning cycle. It is true, as opponents claim, that the next Metro 20-year buildable lands analysis is not yet available, and thus cannot be taken into account during this application. The law does not require that, however, and requiring school applicants to wait until the next six-year Metro planning cycle would render the passage of ORS 197.299 pointless. The entire point of ORS 197.299 was to provide schools with an interim, accelerated, easier ("facilitated") application process, rather than waiting for the next 6 year Metro planning cycle. Statutes should not be construed such that they make other statutes completely meaningless.

As noted above, the Metro Council is required to complete a 20-year forecast and analysis of land need to maintain a 20-year supply of residential and employment land inside the UGB on a six-year cycle. However the Metro Council has directed staff to complete an urban growth report in 2018, three years after the urban growth report was adopted in 2015, with a possible growth management decision occurring in December 2018 that may or may not result in an expansion of the UGB. Delaying the proposed amendment for these specific school and park needs until that time, when these types of specific needs are not addressed in the regional analysis, is not an appropriate or an efficient way to provide these needed services and would result in the District experiencing ever-increasing overcrowding of their facilities.

Thus, in summary, review of the text and context of ORS 197.299 and ORS 197.296 in combination with the legislative history of the 2005 Amendments which created ORS 197.299(4) bring the legislative intent into clear focus. ORS 197.299(4) explicitly provides a "safety valve" of sorts for public school needs. The statute de-couples the need for schools from the derivative secondary needs analysis set forth in ORS 197.296(6). The legislature apparently understood the critical nature of schools to serve the community and felt strongly enough about that to provide a mechanism to ensure that needed schools can be built. Opponents' attempt to saddle Major Amendments with all of the trappings of a six-year legislative review of the region's UGB is contrary to both the plain text of ORS 197.299(4) and its legislative history.

Having resolved the statutory interpretation question, we turn back to the evidence of need. The District originally adopted a long-term facilities plan in January 2008 that assumed additional school capacity would be needed in ten years. This proved true, as of 2017 the high

[11] Testimony before the Senate Environment and land Use Committee, May 31, 2005, beginning at minute 1.13, available at http://records.sos.state.or.us/webdrawer/webdrawer.dll/webdrawer/rec/4193397/ Mr. Tucker's statement is found at minute 1.18, in response to a question from Senator Ginnie Burdick.

school is at 109% of capacity and the four elementary schools are at 99% capacity. A ten-year demographic study by Davis Demographics & Planning Inc., completed in May 2016, forecasted a deficit in capacity at all levels with the high school operating at 141% of capacity. In order to meet the growing need, the District determined, with the assistance of numerous committees, that a new high school would be needed. Voters approved a bond measure in 2016 to construct a new high school and make other facility improvements. The applicant adequately addressed the urgent need for the new high school by substantial evidence in the whole record in its application submittal and its subsequent submittals. (*See* application narrative ("Narrative") at 14-15, 33, Appendices G, H, and I; June 8, 2017, District letter at 1-3, Attachment i; June 13, 2017, District letter at 5.)

The applicant has met its burden of showing compliance of the two criteria found in Metro Code section 3.07.1440(A) by substantial evidence in the whole record.

Metro Code Section 3.07.1440(B)

> **3.07.1440 Major Amendments - Criteria**
> **(b) The applicant shall demonstrate that the proposed amendment to the UGB will provide for an orderly and efficient transition from rural to urban land use and complies with the criteria and factors in subsections (b), (c), (d), (e), and (f) of section 3.07.1425. The applicant shall also demonstrate that: (1) The proposed uses of the subject land would be compatible, or through measures can be made compatible, with uses of adjacent land; (2) If the amendment would add land for public school facilities, the coordination required by subsection (c)(5) of section 3.07.1120 of this chapter has been completed; and (3) If the amendment would add land for industrial use pursuant to section 3.07.1435, a large site or sites cannot reasonably be created by land assembly or reclamation of a brownfield site.**

[Note: This Provision Incorporates by Reference: 3.07.1425(B), (C), (D), (E), & (F), which are Discussed Below].

***MC** 3.07.1425(B)(1): Demonstrated need to accommodate future urban population, consistent with a 20-year population range forecast coordinated with affected local governments;*

Hearing Officer's Analysis: MC 3.07.1425(b)(1) requires that the Major Amendment application show a [d]emonstrated need to accommodate future urban population, consistent with a 20-year population forecast coordinated with affected local governments. " This criterion is taken word for word from the first need factor set forth in Statewide Planning Goal 14. In the context of periodic review, Factor 1 pertains to a determination of overall land need in order to accommodate population growth. In this case, the need is for additional school capacity to alleviate an overcrowding situation at the Sherwood high School. For this reason, the first need factor set forth at MCC 3.07.1425(B)(1) is to be considered, but it is not determinative by itself.

In *Residents of Rosemont v. Metro*, 173 Or App 321, 328, 21 P3d 1108 (2001), the Court of Appeals explained that "[w]e held in *Baker [v. Marion County,* 120 Or App 50, 852 P2d 254, *rev den*, 317 Or 485, 858 P2d 875 (1993),] that factors 1 and 2 of Goal 14 are interdependent and

that, if one of the factors is not fully satisfied, or is less determinative, that factor must still be considered and discussed in deciding if a need for expansion of a UGB has been shown under factors 1 and 2 of Goal 14."

This factor requires the applicant to show, by substantial evidence in the whole record, that there is a demonstrable need for the new Sherwood High School based on a forecast that is consistent with the adopted 20-year population range forecast which has been coordinated with affected local governments.

The District and Metro staff address this provision at: Application Narrative at pp. 15, 34, App'x H; May 4, 2017, staff report ("Staff Report") at 5; June 9, 2017, Metro memo; June 13, 2017, District letter at 1-2. In particular, the applicant attempts to meet its burden of proof with the following analysis:

> *As described herein, the need for additional school capacity including the need for a new high school is well documented as described in Section III of the petition. The existing high school is operating overcapacity and the constraints of the existing high school site and building do not allow for feasible expansion to 2,400 students to serve long-term needs. Building a new high school will also allow the existing high school building to be converted to middle school use by consolidating the two existing middle schools to one location. This will further allow for the conversion of the two existing middle schools to elementary school use. The capacity analysis and 10-year demographic projections indicate that there will be capacity issues at all school levels if nothing is done. The proposed project will provide the long-term capacity needed.*
>
> *The School District commissioned Davis Demographics & Planning Inc. to complete an updated 10-year demographic study in May of 2016. The study reviewed the following factors that determine student enrollment: (1) the current and planned residential development over the next ten years; (2) student yield factors that apply to new residential development; (3) birth factors for the District area; and (4) mobility factors, which examine the in/out migration of students within existing housing units. The forecast projects a deficiency in capacity in all levels, with the high school level having the largest deficiency. Staff Report Attachment 3 (Table 2 in petition) shows 10-year enrollment projections compared with existing school building capacity. The table demonstrates that if no capacity is added (no-build) the school facilities will be far over capacity in 10 years with the Sherwood High School having the largest capacity issue operating at 141% of capacity.*

Metro's 20-year population range forecast is part of the 2015 urban growth report ("UGR"). Therein, the Metro Council determined that the region could meet the expected 20-year residential and employment forecast need within the UGB and no expansion of the UGB was needed to meet housing or employment needs. The UGR did not address specific school and park land needs. As a result, the District prepared a ten-year demographic study that supports a need for additional land for a new high school in order to accommodate future urban population. The District completed this demographic study using population and demographic projections for the cities of Sherwood and Tualatin.

The parties do not focus much, if any, of their debate on whether the population and demographic projections in the District's 10-year study are "consistent" with the assumptions in the 2015 UGR. Such as comparison is complicated by the fact that the UGR takes a high-level regional look at residential and employment needs, whereas the District's 10-year demographic study is much more narrowly focused on Sherwood's population. Nonetheless, the hearings officer reviewed both the 10-year study and the UGR and finds that there is no glaring inconsistency between them. The 2105 UGR anticipates continued high levels of growth in our region. The UGR further recognizes that there is still a considerable amount of vacant and redevelopable land located in and near the City of Sherwood. This would indicate that the District needs to be prepared to accommodate a large amount of additional school children. Given that the regional 20-year forecast did not address school and park land needs, the District's ten-year demographic study, which supplements the long-term facility plan completed in 2008, demonstrates a need to accommodate future urban population by substantial evidence in the whole record. The applicant has provided information regarding a ten-year demographic study showing a need for providing specific school facilities to meet present and future populations based on established methodologies for the proposed use. The applicant also provided written and verbal testimony from experts such as architect Karina Ruiz of Dull Olson Weekes IBI Group Architects, Inc, planner Keith Jones AICP of Harper Houf Peterson Righellis Inc, and traffic engineers Scott Mansur, P.E. and Carl Springer, P.E. of DKS Associates. Having reviewed these materials and observed their testimony, the hearings officer finds them more credible and assigns great weight to their views.

Staff is also correct when it states that even if Metro had expanded the UGB in 2015 for a 20-year housing need, there is no guarantee that the location of the added land would have accommodated the specific need for a new high school in Sherwood. ORS 197.299(4) provides a safety valve for such a situation.

The primary opponent argues that the District could only demonstrate consistency with the 2015 UGR by submitting a new 20-year demographic study. *See* letter from Jennifer Bragar dated June 23, 2017, at p. 20. The opponent points to no specific law which expressly states such a requirement, and the hearings officer does not believe that such a requirement exists. As far as the hearings officer can determine, "consistency" in this context simply means using the same or similar growth rates contemplated in the 2015 UGR, and that appears to be the case here. *See* the updated 10-year demographic study conducted by Davis Demographics & Planning Inc. dated May, 2016. This is consistent with Goal 2, which requires the factual inventories and assumptions included in the comprehensive planning documents to form the "basis for all decisions and actions related to land use." *Rivergate Residents Ass'n v. LCDC*, 38 Or App 149,

5990 P2d 1233, *rev den*. 286 Or 521 (1979); *Hildenbrand v. City of Adair Village*, 217 Or App 623, 177 P3d 401 (2008) ("Plan policies or inventories can serve to justify subsequent and related plan amendments because comprehensive plans must be internally consistent under Goal 2.)" *See also 1000 Friends of Oregon v. Metro (Ryland Homes)*, 174 Or App 406, 26 P3d 151 (2001). *Compare GMK Developments v. City of Madras*, 225 Or App 1, 199 P3d 882 (2008) (Nothing in Goal 2 itself requires the sort of continuous data correction that the opponents urge us to impose in this case).

MC 3.07.1425(B)(1) requires the District to demonstrate a need to accommodate future urban population; consistent with the demographic study contained in the 2015 UGR. The District has done that, and that is all that is required. The applicant has met its burden of showing compliance with this factor by substantial evidence in the whole record.

MC 3.07.1425(B)(2): Demonstrated need for land suitable to accommodate housing, employment opportunities, livability or uses such as public facilities and services, schools, parks, open space, or any combination of the foregoing in this paragraph;

This factor requires the applicant to show, by substantial evidence in the whole record, that there is a demonstrable "need for land suitable to accommodate * * * uses such as * * * schools * * *." The applicant presents its case as follows:

> As described herein, the need for additional school capacity including the need for a new high school is well documented as described in Section III of the petition. The existing high school is operating overcapacity and the constraints of the existing high school site and building do not allow for feasible expansion to 2,400 students to serve long-term needs. Building a new high school will also allow the existing high school building to be converted to middle school use by consolidating the two existing middle schools to one location. This will further allow for the conversion of the two existing middle schools to elementary school use. The capacity analysis and 10-year demographic projections indicate that there will be capacity issues at all school levels if nothing is done. The proposed project will provide the long-term capacity needed.
>
> The School District commissioned Davis Demographics & Planning Inc. to complete an updated 10-year demographic study in May of 2016. The study reviewed the following factors that determine student enrollment: (1) the current and planned residential development over the next ten years; (2) student yield factors that apply to new residential development; (3) birth factors for the District area; and (4) mobility factors, which examine the in/out migration of students within existing housing units. The forecast projects a deficiency in capacity in all levels, with the high school level having the largest deficiency. Staff Report Attachment

3 (Table 2 in petition) shows 10-year enrollment projections compared with existing school building capacity. The table demonstrates that if no capacity is added (no-build) the school facilities will be far over capacity in 10 years with the Sherwood High School having the largest capacity issue operating at 141% of capacity.

The City of Sherwood and the Sherwood School District have an intergovernmental agreement to share ballfields. The City of Sherwood owns an extensive system of parks and trails. However, the City's ballfield resources are very limited with only one soccer field located at the City's Snyder Park. In the early 1990s, prior to rapid growth in the preceding 20 years, the City took measures to protect natural resources. This included the protection of floodplains and wetland areas surrounding the Cedar Creek stream corridor that flows south to north through the center of the City limits to the Tualatin National Wildlife Refuge. The City acquired much of this land and maintains these areas as natural open space, wetlands and walking paths. Since most of the areas are sensitive and passive recreation areas, they are off limits to ballfield construction. Because Sherwood has a very active sports community, the City and School District decided to share sports fields with most of these facilities being on school grounds.

In the case of the new High School site, the City owns the approximately 20-acre parcel in the southeast corner of the property. Some of this land, approximately 4 acres, will be used for the Elwert and Kruger Road realignment and roundabout, but the remaining balance will become part of the new high school campus and allow for construction of additional ballfields to be shared with both school and City sports functions.

As documented in Section III of the petition, viable high school sites are not available within the current UGB. The only viable sites, including the proposed site, have been identified within the Sherwood West Concept Planning Area (Urban Reserve Area 5B).

The subject site ("Site C") is the best alternative site considering that it has:

- No mapped sensitive areas (habitats, wetlands or waterways),
- Gently sloping topography to allow for construction of ballfields,
- Close proximity to SW Elwert Road and Highway 99W for ease of access,
- Availability of public utilities (water and sewer),

- Available downstream discharge point for stormwater, and
- Sufficient area to provide high school campus for 2,400 students and needed City/School District shared ballfields.

As shown above, the applicant has shown a compelling need for providing specific school facilities to meet present and future populations.

The City of Sherwood and the District have an intergovernmental agreement to share sports fields with most of the facilities on school grounds. The City has an extensive system of parks and trails but sport field resources are very limited with one soccer field located in a city park. Thus, the applicant has shown there is a demonstrated land need to accommodate both school and park services by substantial evidence in the whole record. That evidence may be found in the following: Applicant's Narrative at p. 12-32, 34, Appendices C, G, H, and I; June 8, 2017, District letter pp 1-3. Additionally, the applicant demonstrated that district bond financing rules require moving ahead with the application now, rather than wait until the end of 2018. *See* letter from applicant's counsel Kelly Hossaini dated June 8, 2017, page 3 (discussing the district's finances).

The applicant has met its burden of showing compliance with this factor by substantial evidence in the whole record.

MC 3.07.1425 (B)(3): A demonstration that any need shown under paragraphs (1) and (2) of this subsection cannot be accommodated on land already inside the UGB.

MC 3.07.1425(B)(3) requires an alternatives sites analysis showing that the needed new school cannot be accommodated within the existing UGB. This requirement stems from state law. Among other laws, Statewide Planning Goal 14 requires the applicant to consider, as part of the needs analysis, all suitable lands inside the UGB as positive alternatives, and even requires the City to consider whether zone changes could make land suitable for the project. *See Brandt v. Marion County*, 22 Or LUBA 473, 481 (1991); *Turner v. Washington County*, 8 Or LUBA 234, 258 (1982), *aff'd*, 70 Or App 575,689 P2d 1318 (1984).

The applicant's narrative discusses MC 3.07.1425(B)(3) at p. 19-21, 34-35. For example, on pages 16-17 of the narrative, the applicant states as follows:

> As evidenced by capacity study and demographic growth data, the high school level is where there is the biggest need for additional capacity both now and to a greater extent within 7 to 10 years. Therefore, the Bond Management Team first looked to the existing high school campus for opportunities for expansion to accommodate this growth.
>
> **Expansion of Existing High School**
>
> The existing Sherwood High School is located on approximately 37.8 acres of land at 16956 SW Meinecke Road. The existing high

school has capacity for 1,550 students and, as of the writing of this report, is well over capacity with an enrollment of 1,689. This growth is expected to continue with a needed student capacity of approximately 2,200 by the year 2025 and peaking at approximately 2,400 students. Therefore, the School District will need a long-term high school capacity for 2,400 students.

Expanding the existing high school campus to meet this need is problematic on many fronts due to existing size limitation and irregular configuration of the site boundaries. Further, the campus cannot expand beyond its current boundaries as the campus is completely surrounded by existing residential development to the north, south and west and Stella Olsen Park and the sensitive wetland areas along Cedar Creek to the east as shown in Staff Report Attachment 4(Figure 5 in petition).

With respect to the buildings themselves, the School District has made additions over the years to accommodate growth, but the buildings are now completely overtaxed. Based on capacity analysis performed by the School District's contract architect, DOWA, the existing high school campus could be renovated to accommodate only another 450 students. This would increase capacity from 1,550 to approximately 2,000 students. However, at 2,000 students, the school would only have capacity for 7 years requiring the School District to add capacity again down the road. In review of the School District's bonding capacity, the School District will not be in a financial position to make any changes in 7 years and would be saddled with overcapacity schools for the foreseeable future. Therefore expanding the existing campus would provide for a short-term fix but would not provide the long-term solution the District is looking for.

New High School Siting Criteria

With the determination that a new high school is needed, the Bond Management Team identified the following criteria for aid in locating sites for further consideration:

1. Minimum Size: 50 acres
2. Zoning: Site must be zoned or planned for residential or institutional use that allow schools
3. Location: Site must be in Sherwood or contiguous to Sherwood (The City of Sherwood and mostly western Sherwood is where 90% of the student population resides)
4. Topography: Flat to mostly flat to accommodate ballfields

5. Wetlands and Waterways: No wetlands or minimal wetlands/waterways
6. Water and Sanitary Sewer: Adequate public utilities must be available or can feasibly be extended to serve the site
7. Stormwater Drainage: Downstream drainage capacity must exist to accommodate new impervious areas
8. Transportation: Site must be located near major streets to allow ease of access for students and limited routing of school traffic and buses through existing or planned residential areas

Inside the Current UGB

Using Metro's Regional Land Information System, City's Residential Buildable Lands Map and concept planning documents, potential sites were searched within the Sherwood School District Boundary that is inside the Existing Sherwood Urban Growth Boundary and within the Wilsonville or Tualatin existing Urban Grown Boundary.

Northeast Sherwood (Commercial and Industrial Land)

Sherwood City Limits

The northwest area of the City of Sherwood is zoned commercial and industrial, zoning that does not allow for school uses. In addition, much of the commercial and industrial land is built-out or contains wetlands and sensitive areas that cannot be developed. The largest vacant developable site in this area is located at the southeast corner of SW Langer Farms Parkway and SW Century Drive and is only 22 acres, too small for a high school.

Tonquin Employment Area

In 2004, 300 acres of industrial land was added to the Sherwood urban growth boundary in east Sherwood, known as the Tonquin Employment Area. A concept planning document was completed for this area in October of 2010. None of the area has of yet been annexed into the City of Sherwood to allow for urban development. There is an 88 acre parcel that fronts SW Tualatin-Sherwood Road that has potential to accommodate a new high school (12900 SW Tualatin Sherwood Road – 2S128D000100). However, this parcel was added to the UGB for the purpose of providing industrial uses and not for school uses. In addition, this site is located at the far east end of the existing Sherwood city limits and is not close to the student population that predominately resides on the west side of Sherwood. Therefore, locating the

school here would result in an inconvenient and isolated high school campus in the midst of industrial uses. Thus, the site was rejected from further consideration.

South and West Sherwood (Residential Land)

The southern and western areas of Sherwood are mostly residential. Residential zoning allows for school uses. This is also where most of the School District's student population resides (more than 90% of the student population lives in southern and western Sherwood). South of the existing city limits and within the urban growth boundary is the 250-acre Brookman Road Addition Concept Planning Area (Brookman Planning Area). The primarily-residential Brookman Planning Area has a completed concept plan from May of 2009. However, the area has not yet been annexed into the City of Sherwood and therefore has not been developed for urban uses.

The City of Sherwood recently completed a draft Housing Needs Analysis dated June 2015 for the existing urban growth boundary. The housing needs analysis contained a 2014 residential buildable lands inventory map that identified vacant buildable residential land within the City's UGB including the Brookman Planning Area. The residential buildable lands inventory map identified some available residential land. However, the available land is fragmented and/or constrained with no large developable sites that would accommodate a high school campus of 50 acres. Further there is no opportunity to consolidate this fragmented land in a way that would meet the District's criteria for a high school site. The Sherwood Buildable lands map is shown in Staff Report Attachment 5(Figure 6 in petition).

Within the Wilsonville or Tualatin Urban Growth Boundary

There are some limited areas of the Sherwood School District that are within Wilsonville and Tualatin's urban growth boundary, including the following:

Southwest Tualatin Concept Planning Area

Adjacent and east of the Sherwood Tonquin Employment Area is the Southwest Tualatin Concept Planning Area. Similar to Tonquin, this 614-acre area was added to the urban growth boundary in 2004. The area is planned for industrial use, and is even further away from west Sherwood students than Tonquin Road. Therefore, the area was rejected from further consideration.

Basalt Creek and Coffee Creek Planning Areas

Both of these planning areas are too far from the west Sherwood student population to be seriously considered. In addition, discussions with the City of Tualatin, who is leading the planning for Basalt Creek, indicates that there are no sites large enough with the correct zoning within Basalt Creek that would accommodate a new high school. The Coffee Creek planning area is designated by Metro as Regionally Significant Industrial land. This designation does not allow for school uses under any circumstances.

In summary as noted in Section III of the petition there are no suitable sites for a new high school within the current UGB to serve the Districts target population.

As noted in the findings set forth above, the District first examined the ability to expand the current high school to meet future capacity needs. However expanding the existing high school building is problematic due to existing size limitation and the configuration of the existing school campus. The current high school building includes a series of additions designed and constructed in an attempt to incrementally accommodate growth in the student population, resulting in a crowded non-operational and functional facility. Thus additional expansions to meet long term needs are not possible. In addition, the current high school campus is surrounded by residential development on three sides with the fourth side bordering a city park and natural resource area, thereby not allowing expansion of the campus itself.

The District identified eight site location criteria to help guide their search for appropriate site locations within the Sherwood city limits as well as limited areas within Tualatin and Wilsonville that are within the District boundary. The analysis of land within the city limits offered no usable sites. The city's industrial and commercial zones don't allow school uses and the vacant and developable land within the residentially zoned portions of the city is fragmented and constrained with no large enough sites available. The industrial designated land within the UGB but not in the city (Tonquin Employment Area) does contain one site large enough to meet the need; however it was included in the UGB for industrial purposes, is adjacent to existing industrial uses including an active quarry site and is located away from the main student population base. The limited land area within Tualatin and Wilsonville also include either industrially zoned land or very limited parcel sizes that does not provide an opportunity to site a high school. In addition, these areas are even a longer distance from the main student population base in the central and western portions of the city.

No opponents take issue with the applicant's analysis.

The hearings officer believes that it is relatively obvious that there are no sites within the City limits that could meet the need, even considering rezoning as an option. While there is vacant land in the existing UGB, the applicant has shown there are no suitable sites within the

UGB to meet the identified land need. The applicant has met its burden of showing compliance with this factor by substantial evidence in the whole record.

MC 3.07.1425 (C)(1): If the Council determines that there is a need to amend the UGB, the Council shall evaluate areas designated urban reserve for possible addition to the UGB and shall determine which areas better meet the need considering the following factors:

(1) efficient accommodation of identified land needs;

Hearing Officer's Analysis: Once a local government establishes a "demonstrated need" to expand the urban growth boundary, it then must apply the Goal 14's four "locational factors." When Goal 14 was amended in 2005, the locational factors were amended to make clear that the analysis is to be comparative in nature, as opposed to establishing minimum thresholds. The rule now states:

> The location of the urban growth boundary and changes to the boundary shall be determined *by evaluating alternative boundary locations* consistent with ORS 197.298 and with consideration of the following factors:
>
> (1) efficient accommodation of identified land needs
> (2) orderly and economic provision of public facilities and services;
> (3) *comparative* environmental energy, economic and social consequences; and
> (4) compatibility of the proposed urban uses with nearly agricultural and forest activities accruing on farm and forest land outside the UGB. (Underline emphasis added).

Metro has taken the four state-mandated locational factors set forth in Goal 14 and expended them to nine factors. Regardless of this, the goal of the locational analysis remains the same as state law, which is to determine the "best" land to include within the UGB to meet the land need**,** based on appropriate *consideration and balancing* of each factor. *1000 Friends of Oregon v. Metro (Ryland Homes)*, 38 Or LUBA 565, 584 (2000), *rev'd in part on other grounds* 174 Or App 406, 26 P3d 151 (2001). In *Barkers Five, LLC v. LCDC*, 261 Or App 259, 289 (2014), the court stated that consideration of factors means that the local government must:

> "(a) apply and evaluate each factor, (b) weigh and balance the factors which are not independent approval criteria-as a whole, and (c) meaningfully explain why a designation as urban or rural reserves is appropriate. "

Barkers Five, 261 Or App at 300.

OAR 660-024-0060(3) also provides guidance for how one "considers" the location factors and states:

> The boundary location factors of Goal 14 are not independent criteria. When the factors are applied to compare alternative boundary locations and to determine the Metro UGB location, Metro must show that all of the factors were considered and balanced.

In conducting this analysis, one point that cannot be over-emphasized is that no one locational factor can be considered to be a determinative reason to include or exclude any one particular site. Thus, a decision to include or exclude land from a UGB must be based on a *balancing* of all these factors, rather than reliance on any one factor. OAR 660-024-0060(3). *See also Branscomb v. LCDC*, 64 Or App 738, 745, 669 P2d 1192 (1983)(Court held that land could not be excluded from consideration *solely* because it was agricultural land and, as such, fared badly under factor 6). *D.S. Parklane*, 165 Or App at 25; *1000 Friends of Oregon v. Metro (Ryland Homes)*, 174 Or App 406, 409-10 (2001).

A related issue is that local governments often incorrectly treat the locational factors as threshold criteria. In fact, this misunderstanding was so pervasive that at one point LUBA even wrongly suggested that each of the locational factors had a "minimum objective threshold" that had to be identified and met by each site included in a UAR/UGB. *See D.S. Parklane Development, Inc., v. Metro*, 35 Or LUBA 516, 572-3 (1999), *aff'd as modified*, 165 Or App 1, 24, 994 P2d 1205 (2000). However, on appeal, the Court of Appeals clarified that the locational factors were not intended to be applied as threshold ("go - no go") criteria. *Id.* In other words, the intent is *not* to confirm that the preferred site was "good enough" to urbanize based on minimum threshold standards. Rather, the locational factors were intended to be "applied equally" to include lands into a UGB only "where all of the factors justify that inclusion." *Id.* In other words, the intent in establishing these factors was to assist in evaluating and ranking which site(s) amongst *all* potential candidate sites were, relative to one another, the *best* sites to urbanize in order to meet the demonstrated land need.

With that introduction in mind, we turn to a discussion of the first factor. The applicant discusses the first locational factor as follows:

> Urban reserves are lands outside the existing urban growth boundary that are considered suitable for accommodating urban development and expanding the growth boundary when additional urban land is determined to be needed over a 50-year period. The following urban reserve areas are within the Sherwood School District Boundary and are identified in Staff Report Attachment 6 (Figure 7 in petition):
>
> Sherwood North – North of Sherwood UGB
> Sherwood South – South of Sherwood UGB
> Sherwood West – West of Sherwood UGB
> Tonquin – South and West of Sherwood UGB
> Grahams Ferry – Northwest of Wilsonville

I-5 East – East of I-5 and north of Wilsonville
Elligsen Road - East of I-5 and north of Wilsonville

I-5 East, Elligsen Road and Grahams Ferry Urban Reserve Areas
These urban reserve areas were immediately rejected from further consideration due to the distance from west and south Sherwood where the majority of the student enrollment resides. These areas are 2 to 5 miles away in a straight line and even further when traveling on the road network.

Tonquin Urban Reserve Area
This area is directly south of the Sherwood Tonquin Employment UGB area and west of the Southwest Tualatin UGB area. The Tonquin Urban Reserve area encompasses approximately 571 acres. The area has parcels large enough to accommodate the high school site. However, much of the property is mapped as containing Upland Habitat Class A (Metro Title 13) and Riparian Areas Class I, II and III (Metro Title 3). This urban reserve area and it is likely to be designated industrial and/or employment due to its close proximity to other industrial areas. This urban reserve area is on the east side of the City and not centrally located for use by the majority of the School District students. The area is further isolated by a rock bluff that forms the eastern boundary of the current urban growth boundary and Sherwood City limits. This bluff is perched above the Rock Creek stream corridor that effectively isolates this area from the existing residential neighborhoods of Sherwood. Finally, the area does not have adopted concept plan or plan for how utilities will be extended to serve the area.

Sherwood North Urban Reserve Area
This area represents slivers of land along the existing urban growth boundary at the north end of the City of Sherwood. The area was designated urban reserve because it is not within the floodplain of the Tualatin River. However, this land is not large enough to accommodate a high school site and therefore was rejected from further consideration.

Sherwood South Urban Reserve Area
This area is directly south of the Brookman Road UGB area. This area consists of rolling hills with much of the area identified by Metromap online mapping system having slopes greater than 10%. There is also two stream corridors that travel through the area with many areas mapped by Metromap as being riparian or upland habitat. One potential site is located between Oberst Road and Labrousse Road that is not mapped as having upland habitat or

riparian areas. However, this land is mapped by Metro as having slopes of greater than 10% making development of a high school campus and ballfields difficult. The biggest challenge of developing in this area is that the Brookman Road UGB area would need to be annexed and developed first before this area can be made available for development. Therefore, development in this urban reserve area is likely years away and the only promising site is at the south end of and not next to the existing Brookman Road UGB area. This area also does not have a concept plan. For these reasons, this area was rejected from further consideration.

Sherwood West Urban Reserve Area

In February 2016, Sherwood completed a Preliminary Concept Plan for the Sherwood West Planning area (aka Metro Urban Reserve Area 5B). Sherwood West encompasses 1,291 acres along the west border of Sherwood's existing urban growth boundary. The Sherwood West Planning Area is shown in Staff Report Attachment 7 (Figure 8 in petition).

Six alternative high school sites (A-F) were identified within the Sherwood West Urban Reserve Area that are large enough to accommodate a new high school. The six alternative sites (A-F) within the Sherwood West Concept Plan Area were evaluated based on site selection criteria. The site locations and evaluation criteria are indicated in Staff Report Attachment 8 (Figures 9 to 14 in petition). The School District's site alternative analysis is summarized in the table below.

(Table 1 – Alternative Sites Summary in petition)

Alternative Selection Criteria	***Alternative Sites****					
	A	***B***	***C***	***D***	***E***	***F***
Flat Topography	*N*	***U***	***Y***	*U*	*U*	*U*
Wetlands	*N*	***Y***	***Y***	*U*	*Y*	*N*
Water Service	*N*	***Y***	***Y***	*Y*	*N*	*N*
Sanitary Sewer Service	*N*	***Y***	***Y***	*N*	*N*	*Y*
Storm Drainage	*Y*	***Y***	***U***	*N*	*N*	*Y*
** Y-Meets Criteria - N-Does Not Meet Criteria – U-Undetermined*						

From the site alternatives analysis, it became clear that Sites B and C were the most promising with other sites lacking utilities, having significant wetlands, drainage issues and/or significant topography that would make construction challenging. Alternative Sites B and C are located near each other both west of SW Elwert Road at SW Haide Road, just north of Highway 99W. Site C was selected due

to having more of a gentle slope and less grade changes. Most of Site C has a consistent slope change of approximately 40 feet over the length of the site with only a small valley and ridge. Site B has a more drastic slope change of 50 to 60 feet with a more defined ridge running through the middle of the site. Site B would be far more challenging to grade and develop for a high school than Site C. The Sherwood West Concept Plan contained a phasing and funding strategy. The phasing plan identified six phases (A-F). The subject site (Site C) is located within Phase A of the concept plan.

The subject site represents an efficient location because:

- The location is next to existing western Sherwood and close to the vast majority of the District's student population (90%).
- City utilities are available to serve this site or can be extend as the site is adjacent to the city limits.
- Direct and efficient access will be available via major streets that are intended to accommodate significant motor vehicle, pedestrian and bicycle needs.
- The site will be developed on the north, south and west along existing right-of-ways and will be developed to the existing City limits and UGB. This location is a logical location to develop first within the Sherwood West Concept Plan, as it is really the first site north of 99W. Other sites in Sherwood West would result in undesirable leapfrog development.
- Utilizing the approximate 76-acre site to ultimately accommodate the large 2,400-student high school and the School District/City shared ballfields will provide greater efficiency than developing play fields independently. The district and City have a long history of partnering to maximize use of shared ball field resources.

As set forth in the District's narrative and response to MC 3.07.1440(a), there is an identified need for a major amendment of the UGB to provide for a new high school site and this need cannot wait until the next analysis of the building land supply under ORS 197.299. As allowed by MC 3.07.1425(b), the District specified characteristics necessary for land to be suitable for the identified need, *i.e.*, the new high school. *See* Applicant's Narrative at 18-19, 33-35. These characteristics included a minimum site size of 50 acres; zoning that would allow for an institutional use; within or contiguous to Sherwood, where 90% of the children served by the District reside; flat to mostly flat topography; no or minimal constraints such as streams, wetlands, intact upland habitat; adequate/feasible access to public utilities, including water, sanitary sewer, and storm sewer; and near to major (collector or arterial) streets to accommodate high school-level transportation impacts. As also required by MC 3.07.1425(b), the District has demonstrated that the need for the new high school cannot be accommodated on land already inside the UGB.

As shown above, the District undertook an analysis of seven urban reserve areas that are within the district boundary, three of which are not adjacent to the city of Sherwood. The Metro Code does not allow for the creation of an island of urban land so the analysis must be limited to those properties that are directly adjacent to the current UGB. MC 3.07.1425(f).

The Seven Urban Reserve Areas

Within the District's boundary, there are seven areas that contain urban reserves (*see* Application Narrative p. 22 of 39, showing map of all seven areas). They are:

- Sherwood North
- Sherwood South
- I-5 East
- Elligsen Road
- Tonquin
- Graham's Ferry
- Sherwood West

Each will be discussed in turn.

The Sherwood North Urban Reserve Area

The Sherwood North urban reserve area is comprised of slivers of land without flood plain constraints north of the existing city limits and south of Tualatin River. This area does not contain one or more contiguous parcels that would be large enough to meet any of the District's siting criteria for a high school site. Therefore, the hearings officer finds that the Sherwood North urban reserve area cannot accommodate the need for a new high school.

The Sherwood South Urban Reserve Area

The Sherwood South urban reserve area is adjacent to the Brookman Road UGB area. Some of the Brookman Road UGB area was recently annexed to the city, but much of it still has not been annexed. The Sherwood South area consists of rolling hills with much of the area identified by Metro Map as having slopes greater than ten percent, which would not meet the District's siting criterion of a flat to relatively flat site. (See Attachment 3.) There are also two stream corridors that traverse the area with many areas mapped by Metro as being riparian or upland habitat. (See Attachment 4.) There is a potential site located between Oberst Road and Labrousse Road that is not mapped as being constrained by upland habitat or riparian areas, but is mapped as having slopes greater than ten percent, which would not meet the District's siting criterion for a flat to relatively flat site. A challenge in the overall development of this area is that the Brookman Road area within the UGB must be annexed and developed first before the Sherwood South area will have the public services it needs to be able to develop. Further, Sherwood South is not even concept planned yet. As far as the hearings officer is aware, no such planning has been scheduled. As noted earlier, MC 3.07.1110 requires that urban reserve areas be concept planned before they be considered for inclusion in the UGB. As set forth in response

to MC 3.07.1440(a) there is a pressing need for the new high school. To wait at least one or more years for the City to concept plan the Sherwood South urban reserve area under MC 3.07.1110 is not consistent with the pressing need for the new high school that precipitated this major amendment application. Therefore, the hearings officer concludes Sherwood South cannot accommodate the need for a new high school.

The I-5 East Urban Reserve Area

The I-5 East urban reserve area is at the extreme eastern end of the District's boundary, east of I-5, next to Tualatin. This urban reserve area does not meet the District's siting criterion that the new high school site be within or contiguous to Sherwood, where 90% of the children served by the District reside. Further, as set forth in the staff report, these urban reserves are constrained by natural resources issues and steeper slopes yielding no buildable areas big enough to accommodate a new high school. For all of these reasons, the hearings officer finds and concludes that this urban reserve cannot accommodate the new high school.

The Elligsen Road Urban Reserve Area

Similarly, the Elligsen Road urban reserve area is at the extreme eastern end of the District's boundary, east of I-5, next to Tualatin, and immediately south of the I-5 East urban reserve area. This urban reserve area does not meet the District's siting criterion that the new high school site be within or contiguous to Sherwood, where 90% of the children served by the District reside. Travel to western Sherwood would be at least five miles for the vast majority of students along the already-congested Tualatin-Sherwood Road (*see* Application Narrative p. 22 of 39, showing map). Further, as set forth in the staff report, these urban reserves are constrained by natural resources issues and steeper slopes yielding no buildable areas big enough to accommodate a new high school. For all of these reasons, the hearings officer finds and concludes that this urban reserve cannot accommodate the new high school.

The Tonquin Urban Reserve Area

The fifth urban reserve is the Tonquin urban reserve area. This area lies on the east side of Sherwood and is contiguous to Sherwood's city boundary. As set forth in the Narrative, this urban reserve area is directly south of the Sherwood Tonquin Employment UGB area and, according to Julia Hajduk, the City's Community Development Director, will be used to accommodate the City's future industrial and employment needs given its proximity to other industrial uses and Sherwood's employment/industrial core. Therefore it is not likely to allow for zoning for an institutional use. As noted in the staff report, another issue with building a new high school in this area is that the majority of adjacent land within the UGB is not yet developed to urban standards. Any out-of-sequence development in this area, then, would require a costly and inefficient extension of public services. Further, much of the property in this urban area is mapped as containing Upland Habitat Class A (Metro Title 13) and Riparian Areas Class I, II, and III (Metro Title 13). (See Attachment 1.) This area is further isolated by a rock bluff that forms the eastern boundary of the current UGB and city limits. This bluff is perched above the Rock Creek stream corridor that effectively isolates the area from the existing residential neighborhoods of Sherwood, thereby making it less efficient to serve the student population

given that the bulk of that population is in the southern and western areas of the city. Significant areas of the urban reserve also have substantial slopes of ten percent and greater, along with floodplain constraints, which would not meet the District's siting criterion of a flat to relatively flat site. (See Attachment 2.) Further, this urban reserve area does not have a concept plan in place or a plan for how utilities might be extended to serve the area. Concept planning has not been completed for this area. MC 3.07.1110 requires that urban reserve areas be concept planned before these areas can be considered for inclusion in the UGB. As set forth in response to MC 3.07.1440(a) there is a pressing need for the new high school. To wait at least one or more years for the City to concept plan the Tonquin urban reserve area under MC 3.07.1110 is not consistent with the pressing need for the new high school that precipitated this major amendment application.[12] Therefore, the hearings officer concludes the Tonquin urban reserve area cannot accommodate the need for a new high school.

The Grahams Ferry Urban Reserve Area

The Grahams Ferry urban reserve area is at the District's extreme southeast boundary next to Wilsonville. This urban reserve areas meet the District's siting criterion that the new high school site be within or contiguous to Sherwood, where 90% of the children served by the District reside. Travel to from Graham's Ferry to western Sherwood would be at least seven miles for the vast majority of students along the already-congested Tualatin-Sherwood Road (*see* Application Narrative p. 22 of 39, showing map). Further, as set forth in the staff report, this urban reserve area is constrained by natural resources and steeper slopes yielding no buildable areas big enough to accommodate a new high school. For all of these reasons, the hearings officer finds and concludes that these urban reserves cannot accommodate the new high school.

The Sherwood West Urban Reserve Area

The seventh and final urban reserve area studied was Sherwood West. The hearings officer finds this is the only urban reserve area that can efficiently accommodate a new high school consistent with the citing criteria, for these reasons: Sherwood West has been MC 3.07.1110 concept planned and so may be considered for inclusion within the UGB. Sherwood West is adjacent to the city's existing UGB and in close proximity to the bulk of the District's student population. The area is planned for predominantly residential uses, including schools, and so as Sherwood West develops even more of the student population will reside in the vicinity of the proposed high school site. The District studied the 1,291-acre Sherwood West urban reserve for places within it that could accommodate a new high school site. The applicant District did this by utilizing an engineer and architect to evaluate all sites in the urban reserve that were flat to relatively flat; had a minimum buildable site size of approximately 50 acres or more; no or minimal constraints from streams, wetlands, and intact upland habitat; adequate/feasible access to public utilities; and proximity to a major (collector or arterial) street network. Findings addressing MC 3.07.1425(c) can be found in the Narrative and in the staff report. The applicant District included an analysis of the six areas within Sherwood West. Therefore, the hearings officer finds that, given the framework of MC 3.07.1425(b) and (c), no urban reserve except for

[12] Urban Reserve Areas are intended to provide a 50-year supply of land. Given that the City has no plans to complete a concept plan for the area, and because contiguous areas within the UGB would need to develop first to extend the needed infrastructure, it is safe to conclude that development of this area is at least several years away.

Sherwood West should advance to MC 3.07.1425(c) to determine which urban reserve can best meet the identified need, because no other urban reserve can meet that need.

The Six Sites Studied within the Sherwood West Urban Reserve Area

The District identified six sites (designates Sites A through F) within the Sherwood West urban reserve area that were large enough to accommodate a new high school campus. Each of the six is discussed in turn:

Site A – The hearings officer finds this site cannot efficiently accommodate the new high school due to slope, natural area constraints, public infrastructure issues or a combination of these factors. There is a small wetland in the center of this site. The western portion is mostly occupied by Chicken Creek. There is no water service available from SW Elwert Road, and water extensions would be required along Elwert frontage and east from SW Edy Road. The site is low-lying and sanitary sewer connection is not available from SW Edy Road, so a major pumping station would have to be built.

Site B - The hearings officer finds this site *could* possibly accommodate the new high school. However, it has a significant ridge running through the middle of the site, which would require extensive grading, with slopes running both east and west with a 50-60 foot grade change. Both public water and a 15" sanitary sewer pipe are available off SW Elwert Road.

Site C - This site is quite flat, with no more than a 40 foot grade change required. It has water and sewer connections off SW Elwert Road. There are no wetlands. The hearings officer finds that Sites B and C are the two areas that can most efficiently accommodate a new high school, but Site C is clearly superior because Site B has a significant topographic ridge running north-south through the middle of the site with an approximately 50-60 foot grade change. Site C has less topography to manage, which is important when one considers that ballfields, tracks, and other sports facilities needed as part of the new high school cannot be developed on slopes. Therefore, the hearings officer concludes and finds Site C can most efficiently meet the identified need of a new high school.

Site D - The hearings officer finds this site cannot efficiently accommodate the new high school due to slope, natural area constraints, and public infrastructure issues. The entire site slopes down to the east towards private property, with a grade change in excess of 50 feet. There is no sanitary sewer service available. A very costly sewer line extension and public system improvements would be necessary. There are no established public storm drains in the vicinity. Street improvements on Kruger Road and offsite improvements would likely be required. Sites D also suffers from not being adjacent to the existing Sherwood UGB, which means more land would be required to be brought into the UGB than is necessary for the school site in order to ensure contiguity and public infrastructure would have to be extended further to serve the new high school, which is inefficient and expensive.

Site E - The hearings officer finds this site cannot efficiently accommodate the new high school due to slope, natural area constraints, and public infrastructure issues. The entire site slopes down to the east towards Highway 99, with a grade change around 75 feet. There is no

sanitary sewer service available. A very costly sewer line extension and public system improvements would be necessary. There are no established public storm drains in the vicinity.

Site F - The hearings officer finds this site cannot efficiently accommodate the new high school due to wetlands, drainage, powerlines, and lack of public water supplu. While quite flat, this site has wetlands, drainage, and a BPA power line easement running through it. While there is a nearby sewer line, there is no water line, and costly improvements would have be made to supply the school with drinking and irrigation water as well as meeting firefighting needs. Site F is further constrained by a BPA easement that cuts diagonally through what would otherwise be the flattest, least constrained part of that area and this flat area is segregated from the existing UGB by Chicken Creek and protects a riparian corridor. Site F also suffers from not being adjacent to the existing Sherwood UGB, which means more land would be required to be brought into the UGB than is necessary for the school site in order to ensure contiguity and public infrastructure would have to be extended further to serve the new high school, which is inefficient and expensive.

Conclusion of the Alternative Sites Analysis for the Six Sites in Sherwood West

The District evaluated the alternative sites related to five selection criteria noted above and determined that four of the six sites (A, D, E & F) lacked utilities, had significant wetlands, drainage issues or topography that restricted the ability to efficiently accommodate the identified land need. In addition, site D is not adjacent to the current UGB and therefore would create an island of urban land which is not allowed under Metro Code. Areas B & C better met the selection criteria with site C being the best site due to less grading and site work to accommodate the identified land need. Based on the urban reserve areas analyzed site C in the Sherwood West urban reserve best meets the need considering efficient accommodation of the identified land need. For these reasons, the hearings officer concludes and finds that proposed Site C (on the northwest corner of SW Elwert and Kruger Roads) can most efficiently meet the identified need of a new high school.

MC 3.07.1425(c)(2): If the Council determines there is a need to amend the UGB, the Council shall evaluate areas designated urban reserve for possible addition to the UGB and shall determine which areas better meet the need considering:

(2) the orderly and economic provision of public facilities and services.

Hearings Officer's Analysis: This suitability factor focuses on the orderly and economic provision of public facilities and services. Because Sherwood West has been concept planned pursuant to MC 3.07.1110, the provision of public facilities and services within the Sherwood West Concept Plan area has been studied to a larger degree than other URAs. The Sherwood West Concept Plan was prepared with analyses of existing sanitary sewer, water, storm water, and transportation conditions and analyses of how those systems need to be upgraded, extended, and phased to meet the future development of Sherwood West. (See Sherwood West Concept Plan, pages 15-21, 40-44, Appendix 3 (Existing Conditions Report), and Appendix 8 (Transportation Options Alternative Analysis Report and Cost Estimates). The concept plan was prepared in coordination with all of the future service providers, including those services that

will be provided by the City and those that will be provided by others, including Clean Water Services, ODOT, Tualatin Valley Fire & Rescue, and Washington County. (*See* Sherwood West Concept, acknowledgements page and Appendix 6 (Service Provider Interviews). The District was also part of the Technical Advisory Committee that informed the concept planning effort. Because all of this extensive analysis and coordination work had already been done for Sherwood West, the District used that work as the jumping off point for its analysis of the area for orderly and efficient accommodation of public services.

As demonstrated in the Narrative, pages 24-31, four of the six sites (A, D, E, and F) have significant barriers to provision of public infrastructure. Sites B and C have the fewest barriers and are most feasible for public infrastructure service. This is consistent with the findings of the Sherwood West Concept Plan, which anticipates phasing public infrastructure to serve the area encompassed by Sites B and C first, i.e., Area A. (*See* Sherwood West Concept Plan, pages 40-44.) Service provider interviews conducted as part of the concept planning effort also identified Area A as the "first stage development area." (*See* Sherwood West Concept Plan, Appendix 6, page 5.) It is also worth noting that, according to the concept plan, Area A of the concept plan has most infrastructure in place, "presents the best near-term opportunity for development in Sherwood West," and the cost to serve is on the lower end of the cost scale. (Sherwood West Concept Plan, pages 42-43.) The District also engaged a licensed traffic engineer to prepare the March 15, 2017, Sherwood High School UGB Expansion Transportation Study (the "Transportation Study") to address effects of a new high school on Site C on the surrounding transportation system. The Transportation Study found that, with appropriate mitigation, Site C can accommodate the new high school while maintaining an adequate transportation system. See also District's findings in response to Goals 11 and 12 with respect to the provision of public facilities and services to Site C.

As part of this UGB amendment application effort, the District obtained service provider comments from the City of Sherwood, Washington County, Tualatin Valley Fire and Rescue, and Clean Water Services, all of whom supported the siting of the new school on Site C from an infrastructure provision standpoint, consistent with the Sherwood West Concept Plan.

In sum, Sites B and C best meet the need for a new high school considering the orderly and economic provision of public services per the Sherwood West Concept Plan and the District's own analysis.

The primary opponent makes only a desultory effort to challenge the applicant's proposed findings. *See* letter from Jennifer Brager dated June 23, 2017, at p. 7. Ms. Bragar concludes, without much in the way of analysis, that "Site C is unworkable." The only evidence that the opponent cites as support for this theory is the DKS Traffic Study dated March 15, 2017, which shows that currently there are several failing intersections in the vicinity. However, failing intersections is not in any way determinative when considering the locational factors.

The proposed site has positive attributes from the transportation and traffic perspective. The site is close to the area's major north-south highway (Highway 99) and east-west arterial (the Tualatin-Sherwood Road). It has a relatively flat topography, reducing hazards in wet or snowy conditions. With the planning modifications, the site will have adequate access and

capacity for peak school commuting times (7.15 to 8 am and 2.50 to 3:45 pm). Road widths and sightlines will be sufficient for safety purposes, an important consideration for less-experienced drivers, such as high school juniors and seniors.

The traffic issue has been addressed by unrebutted evidence from the applicant's civil and traffic engineers - the *only* expert testimony in the record - and is belied by the fact that all of the public service providers for the Sherwood West area, including Washington County, the City of Sherwood, and Clean Water Services, submitted service provider letters that support the new high school on Site C, and state that such services can be provided. (*see* Appendix to the Application Narrative for copies of these letters).

At the public hearing, local residents Carolyn McBee and Karen Labahn raised issues of traffic safety at the proposed site, specifically on Kruger and Elwert Roads. They testified, convincingly, that the roads abutting the preferred alternative site are rural in nature and not capable of handling the traffic generated by the school. As the hearings officer emphasized at the hearing, the analysis is comparative in nature. A site does not have to be good; it just has to be better than the alternatives. This is true even if all of the alternatives are objectively bad. In fact, it will undoubtedly be the case that the roads in all seven of the candidate urban reserve areas are rural in nature and incapable of handling urban levels of traffic. At this stage, the analysis is high level and really only focused on identifying issues that made any one site particularly good or horrendously bad in relation to the others.

In this case, the applicant's traffic engineers Scott Mansur, P.E. and Carl Springer, P.E. of DKS Associates wrote the following in a June 28, 2017 memorandum:

> DKS prepared the March 15, 2017, Sherwood High School UGB Expansion Transportation Study ("March Transportation Study"). The March Transportation Study assesses the proposed UGB amendment impacts and identifies a roster of system improvements for the short-term and long-term. This study acknowledges that several local intersections are heavily congested during peak hours, and that the rural street infrastructure nearby the proposed UGB amendment site does not meet either the City's or the County's facility design standards today. What this study also tells us, however, is that with proper mitigation the proposed school site can be adequately served with transportation infrastructure. The next step in the planning process is the post-UGB amendment Title 11 planning, as required by Metro, and it is during that process that the next transportation planning steps will be taken. These planning steps include designating urban zoning and land use types within the newly added UGB area. During this stage, we will engage in additional technical studies, including a second transportation impact study, to (1) refine the specific project needs, (2) ensure that the Transportation Planning Rule is met, (3) ensure that performance standards can be maintained over time, and (4) ensure that a safe transportation network is provided for the new

> high school. Based on our transportation analyses so far, we are confident that the Sherwood School District can provide adequate state and local transportation facilities to support the proposed Site C high school.

While the residents' traffic safety concerns are well meant, and taken seriously by the hearings officer, the engineers are undoubtedly correct that the applicant's preferred alternative site can be improved with reasonable cost expenditure. The improvements discussed at the hearing were typical of what one would expect when land urbanizes, and do not involve any highly extravagant technical solutions such as bridges over wetlands / streams, or expensive highway overpasses. The hearings officer had the opportunity to evaluate these engineering experts and considers their representations highly credible. No evidence was presented pertaining to other sites that would suggest that any other site would be significantly better from a transportation standpoint, and several of the sites required more expensive improvements.

The opponents argue that the applicant gamed the system by counting traffic in the middle of winter. *See* letter from Jennifer Brager dated June 23, 2017, at p. 8. Again, this argument seems to lose focus of the intended exercise. That argument might have merit if the applicant's traffic engineers had performed their traffic counts at some locations in winter, but at other locations in summer (when traffic is lighter because school is out of session and many workers are not commuting, due to vacations). That did not happen. The applicant's traffic study clearly states:

> To perform the intersection analysis, traffic counts were collected during the AM peak (7:00 – 9:00 am) on Feb 1, 2017 and the PM peak (4:00-6:00 pm) on Jan 31, 2017. Study intersections on ODOT facilities (i.e. OR 99W) were analyzed using estimated 30th highest hour traffic volume (30 HV) conditions. The 30 HV development process for existing conditions *includes the determination of seasonal adjustments.* (DKS "Sherwood High School UGB Expansion Transportation Study" dated March 15, 2017, p. 9, italic emphasis added).

Site C is located in close proximity to existing urban arterials, which in and of itself makes it a better site as compared to alternatives such as Sites D and F, which are more isolated and remote. Sites A, E, and F will be more expensive to develop than Sites B and C. Sites D and F suffer from not being contiguous with the existing UGB and so public infrastructure would have to be extended further, out of sequence, to reach those sites. This creates a significant unnecessary expense. Further, sites with steeper topography and natural resource constraints, like Sites A, D, E, and F will also be more costly to develop. Sites B and C will cost less than the other sites to develop, but Site C will cost even less than Site B due to its flatter topography.

The hearings officer wishes to emphasize that the public will have many additional opportunities to comment on and influence the types of transportation improvements that will be built.

MC 3.07.1425(c)(3): If the Council determines there is a need to amend the UGB, the Council shall evaluate areas designated urban reserve for possible addition to the UGB and shall determine which areas better meet the need considering:

(3) comparative environmental, energy, economic, and social consequences.

A comparison of the six sites with respect to environmental, energy, economic, and social consequences of development is set forth below:

Environmental Consequences: There are areas within Sherwood West that have significant natural resources within them. The maps at Figure 6 of the Sherwood West Concept Plan and Appendix B of Appendix 3 of the Sherwood West Concept plan are instructive in this regard. From those maps one can see that Sites A, D, and F have significant areas of floodplains, wetlands, protected stream corridors, and inventoried wildlife habitat. In contrast, Sites B and C have little to no environmental resources on them. Further, Sites B and C are closest to the city's existing urban core, which give them the most direct transportation connections, thus limiting air quality degradation. Therefore, development of these sites with a high school would have the least negative environmental consequences of all of the alternative sites.

Energy Consequences: From an energy standpoint, all of the sites are reasonably close to the bulk of the student population to be served, but Sites E and F are more remote. This will be exacerbated as Sherwood West develops with mostly residential uses. Sites A, B, C, and D are most centrally located, which will allow more students to walk and bike to school and reduces the number of students being bused and driven to school, and allows for the least vehicle miles traveled for those who use cars and buses. Site D would require an out-of-sequence extension of public infrastructure to the more interior of the urban reserve, however, which ticks its adverse energy consequences somewhat higher than Sites A, B and C.

Economic Consequences: Public bond dollars are finite and must not be wasted. Taxpayers expect that school districts will be good stewards of the public money and building new school facilities is no exception. Being more remote from the existing urban area and public infrastructure, Sites A, E, and F will be more expensive to develop than Sites B and C. Sites D and F suffer from not being contiguous with the existing UGB and so public infrastructure would have to be extended further, out of sequence, to reach those sites. This creates a significant unnecessary expense. Further, sites with steeper topography and natural resource constraints, like Sites A, D, E, and F will also be more costly to develop. Sites B and C will cost less than the other sites to develop, but Site C will cost even less than Site B due to its flatter topography. The effect of topography on the cost of building a high school site with its need for ball fields and other sports facilities should not be under estimated. Even small amounts of slope will have significant, expensive consequences on a school site due to the cost of grading.

Site C has another factor that weighs in its favor over Site B, which is that Site B contains a number of single-family residences that would have to be purchased and demolished to build the new high school. Purchasing houses to tear them down is not a good use of bond dollars if it can be avoided. Therefore, Site C clearly comes out ahead in this consideration.

Social Consequences: Siting the new high school in the most centrally located area possible is important to fostering a sense of civic and school pride. Although high schools can have fairly significant impacts on an area, they should be sited where the bulk of the population resides and be a use that brings people together in a place that the citizens identify as an integral part of their community. One of the alternatives that the District considered in its facilities planning to alleviate the capacity issue at the existing Sherwood High School was building a second high school. The community, however, was very much opposed to that idea. A small, cohesive community like Sherwood wants to remain bound together not divided by different allegiances to different high schools. All of the sites analyzed in Sherwood West would be superior to any sites in any other urban reserve for these reasons alone; however, within Sherwood West Sites B and C are most centrally located - both now and in the future as the city continues to grow to the south and west. Even so, development of Site B has a more immediate social consequence that Site C does not have. There are a number of residences in Site B that would have to be purchased and demolished in order to develop the new high school. Displacing residents from their homes needlessly is a very adverse social consequence and should not occur if it can be avoided, which in this case it can. Therefore, Site C comes out ahead here, too.

Conclusion: Sites B and C are the two sites that come out the most favorably when one factors in the environmental, energy, economic, and social consequences. However, Site C edges ahead of Site B due to Site B's increased adverse economic and social consequences.

MC 3.07.1425(c)(4): If the Council determines there is a need to amend the UGB, the Council shall evaluate areas designated urban reserve for possible addition to the UGB and shall determine which areas better meet the need considering

(4) compatibility of proposed urban uses with nearby agricultural and forest activities occurring on land outside the UGB designated for agriculture or forestry pursuant to a statewide planning goal.

Hearings Officer's Analysis: The District identified a number of site characteristics that a new site would need to meet in order to accommodate a new high school. As discussed above, is one urban reserve area that can efficiently accommodate a new high school - Sherwood West. Sherwood West has been MC 3.07.1110 concept planned and so may be considered for inclusion within the UGB. Sherwood West is adjacent to the city's existing UGB and in close proximity to the bulk of the District's student population. The area is planned for predominantly residential uses, including schools, and so as Sherwood West develops even more of the student population will reside in the vicinity of the proposed high school site. The District studied the 1,291-acre urban reserve for areas within it that could accommodate a new high school site. The District did this by utilizing an engineer and architect to evaluate all sites in the urban reserve that were flat to relatively flat; had a minimum buildable site size of approximately 50 acres or more; no or minimal constraints from streams, wetlands, and intact upland habitat; adequate/feasible access to public utilities; and proximity to a major street network. This analysis yielded six sites, which were then ranked according to the site criteria.

With respect to how the six sites meet the need for a new high school considering the compatibility of proposed urban uses with nearby agricultural and forest activities, it is important to note that the entire Sherwood West area is slated for eventual urban development, regardless of the current uses and zoning of land within it. It was designated as an urban reserve instead of a rural reserve partly due to its small-scale, intermittent farming and forestry activity, parcelization, and rural residential development. That said, urbanizing land that is adjacent to existing urban development is more consistent with this boundary location factor than urbanizing land further into the undeveloped portions of an area, which will likely remain in rural use much longer whether the new high school is built in the area or not. Sites A, B, and C are closest to existing urban development. Sites D, E, and F are more remote from existing urban development. Therefore, in this respect, A, B, and C will have fewer impacts on any nearby agricultural and forest activities. Site A does not appear to have any adjacent agricultural or forest activities occurring adjacent to it. The other sites have very minor to small amounts of agricultural activities occurring on adjacent land. Therefore, none of the sites would appear to have much impact on agricultural or forest activities. Given the sites' rough equivalency in this regard, Sites B and C are the least costly to serve and most readily developable according to the Sherwood West Concept Plan, so developing in those areas "now" will have fewer impacts on nearby agricultural and forest activities than jumping ahead to an area that might have otherwise remained rural for the next 20 years. This gives Sites B and C the edge in considering this factor.

MC 3.07.1425(c)(5): If the Council determines there is a need to amend the UGB, the Council shall evaluate areas designated urban reserve for possible addition to the UGB and shall determine which areas better meet the need considering

(5) equitable and efficient distribution of housing and employment opportunities throughout the region.

Hearings Officer's Analysis: This factor is not directly relevant to the siting of a new high school and therefore is not determinative in any way.

MC 3.07.1425(c)(6): If the Council determines there is a need to amend the UGB, the Council shall evaluate areas designated urban reserve for possible addition to the UGB and shall determine which areas better meet the need considering

(6) contribution to the purposes of Centers and Corridors.

Hearings Officer's Analysis: This factor is not found within Statewide Planning Goal 14 but is instead a consideration created internally at Metro. According to Metro's 2040 Growth Concept Map, the proposed site is not in a Regional or Town center, nor is it directly on a Corridor. Site A is closest to a Corridor, but as staff pointed out in the staff report, it is mostly undeveloped or in single-family residential use. None of the other sites are close enough to any Centers or Corridors to contribute to them at this point in time. Therefore, none of the alternatives support the purposes of Centers and Corridors in any significant way.

MC 3.07.1425(c)(7): If the Council determines there is a need to amend the UGB, the Council shall evaluate areas designated urban reserve for possible addition to the UGB and shall determine which areas better meet the need considering:

(7) protection of farmland that is most important for the continuation of commercial agriculture in the region.

Hearings Officer's Analysis: This factor is not found within Statewide Planning Goal 14 but is instead a consideration created internally at Metro.

As noted by staff in the staff report, Metro and Washington County completed an urban and rural reserve process that designated the most important land for commercial agriculture in the county as rural reserve and the land most suitable for urban development as urban reserve. This means that development within any urban reserve will, at least presumptively, protect farmland that is most important for the continuation of commercial agriculture in the region.

However, this factor seems to reach beyond that concern and require further differentiation of urban reserve areas, at least to the extent that any of these urban reserves are still in commercial agricultural production. Of the six sites studied in Sherwood West urban reserve area, none appear to have any significant commercial agriculture. As such, it seems their agricultural output does not form a significant component of the Sherwood area's economy.

The applicant points out that development of sites within an urban reserve that are closest to the existing UGB and to areas within the UGB that actually contain urban-level development, helps to keep agricultural and forest land further from the UGB and urban areas in unaffected operation until such time as urban development grows further in that direction.

MC 3.07.1425(c)(8): If the Council determines there is a need to amend the UGB, the Council shall evaluate areas designated urban reserve for possible addition to the UGB and shall determine which areas better meet the need considering

(8) avoidance of conflict with regionally significant fish and wildlife habitat.

Hearings Officer's Analysis: This factor is not found within Statewide Planning Goal 14 but is instead a consideration created internally at Metro.

The Sherwood West urban reserve has some significant fish and wildlife habitat within in it, much of which is associated with Chicken Creek. According to the Sherwood West Concept Plan, Steelhead *(Oncorhynchus mykill),* a federally listed species, are known to exist within Chicken Creek. Sites located closer to Chicken Creek would therefore tend to be less suitable for this project.

All of the sites *except* for Sites B and C are constrained by a significant or moderate level of natural resources:

Site A has a wetland right in the middle, and the entire western portion of this site is mostly creek, and its drainage discharge is right into Chicken Creek (see Narrative, p. 25).

Site D has creek drainage running through the southern portion of the site. Since there is no established public storm drainage anywhere in the vicinity, so a costly system to route storm discharge would have to be built with input from the City of Sherwood and Clean water Services to avoid negatively impacting significant fish and wildlife habitat.

Site E is steeply sloped down to the east towards Highway 99, with a grade change around 75 feet. There are no established public storm drains in the vicinity. so a costly system to route storm discharge would have to be built with input from the City of Sherwood and Clean water Services to avoid negatively impacting significant fish and wildlife habitat.

Site F has creek drainage and potential wetlands running through the entire site (see Narrative, p. 30), so extensive mitigation measures could be required to avoid negatively effecting significant fish and wildlife habitat.

As shown on Figure 6 of the Sherwood West Concept Plan, the western edge of Site B abuts a tributary of Chicken Creek and includes some associated wildlife habitat. Site C has no such identified resources, and, therefore, the hearings officer concludes and finds that Site C best avoids conflicts with regionally significant fish and wildlife habitat.

MC 3.07.1425(c)(9): If the Council determines there is a need to amend the UGB, the Council shall evaluate areas designated urban reserve for possible addition to the UGB and shall determine which areas better meet the need considering

(9) *a clear transition between urban and rural lands, using natural and built features to mark the transition***.**

Hearings Officer's Analysis: This factor is not found within Statewide Planning Goal 14 but is instead a consideration created internally at Metro.

The boundaries of Sherwood West do not appear to have been designated according to providing a clear transition between urban and rural reserves using natural or built features. It is bisected in large part at its northern end by Chicken Creek. But Chicken Creek will not form a natural barrier between urban and rural uses, as the Sherwood West Concept Plan contemplates development on either side of the creek. So, Chicken Creek will end up being a natural area within an urban area - not a boundary between urban and rural uses. Because the boundaries of Sherwood West were not created according to natural or built features, and because all of the six sites studied within Sherwood West for a new high school are internal to Sherwood West and will eventually be in the midst of other urban area, this factor is not particularly relevant to this application. Even so, as staff notes in the staff report, there are no built or natural features that would mark even an internal transition from urban to rural lands for Sites C and E. Site B is flanked by Chicken Creek, which could form such a barrier, but, again, there will be urban development on the other side of that "barrier" one day. Site A is also flanked by Chicken Creek, but the creek and natural resources associated with that site also limit the development

potential of that site for a new high school. Further, there will be urban development on the other side of those natural barriers one day, so they will not really mark the transition that this factor contemplates. Site D has some natural resources on it that could provide a barrier of sorts, but which also reduce the buildable area, and, again, the concept plan does not contemplate these natural areas being any sort of permanent barrier between urban and rural uses. Site F has a large amount of wildlife habitat, but that habitat, too, cuts into the buildable area and will provide no such barrier as contemplated by this factor.

Hearings Officer's Analysis and Summary of the Nine MC 3.07.1425(c) Locational Factors

In summary, little weighing and balancing is needed in this case, because the applicant's preferred alternative, Site C, nearly always came out as the site that best met the intent of each individual factor. With respect to two factors, Sites B and C equally met the intent of the factor, and with respect to another factor Site B came in a fairly close second to Site C. All in all, however, Site C best met all of the factors. In sum, all of the factors were applied and evaluated, and on-balance, Site C came out ahead. Thus, whatever weighing and balancing of all of the nine locational factors with respect to the six sites that could potentially accommodate a new high school is required, the Hearings officer finds that the applicant's analysis clearly demonstrates that the proposed site, Site C, better meets the applicable locational factors than the other sites.

No discussion presented by any opponent to the contrary is convincing. In disputing the District's location factor analysis, the primary opponent pointed to individual aspects of different sites and argued why it believed those aspects made one site better than another with respect to a given, discrete aspect. The opponent's sniping is ineffective, however, because unlike the applicant, the opponent did not evaluate the sites *holistically* based on the nine enumerated factors. Stated it another, it may be the case, that some of the alternative sites fair better than the applicant's preferred alternative in some particular or another. No site is perfect, after all, and each site has its positives and its negatives. However, when viewed as a whole, on balance, the applicant's preferred alternative fairs the best over the broadest consideration of the nine factors. Therefore, the opponent failed to demonstrate that the MC 3. 07.1425(C) factors findings are deficient.

The opponent also argues that Sherwood South cannot be ruled out as a possible area for the Major Amendment even though it has not been concept planned under MC 3.07.1110, because MC 3.07.1110(6) provides that such an area can be added even if it has not yet been concept planned. *See* Brager letter dated June 23, 2017 at p.7. MC 3.07.1110(6) states:

> *"If the local governments responsible for completion of a concept plan under this section are unable to reach agreement on a concept plan by the date set under subsection (a), then the Metro Council may nonetheless add the area to the UGB if necessary to fulfill its responsibility under ORS 197.299 to ensure the UGB has sufficient capacity to forecasted growth."*

First, the MC 3.07.1110(6) exception is restricted to situations where "the local governments responsible for completion of a concept plan under this section are unable to reach agreement on a concept plan." There is no evidence that any local governments responsible for a concept plan for Sherwood South are unable to reach agreement on that concept plan. In fact, there seems to be no question that the City of Sherwood will be planning for Sherwood South-it just hasn't done it yet, and has no current plans to do so. Second, the fact that no pre-UGB expansion concept planning has been done for Sherwood South is just one of many reasons the District gave for why Sherwood South ceased to be considered as a viable area for the new high school. The opponent has not pointed to an area within Sherwood South that would meet the District's siting criteria. In fact, in the opponent's June 23, 2017, letter, the opponent points to "a large block of property" south of the recent Brookman Road annexation area, but then appears to agree that it is too sloped to work as a high school site. See Letter from Jennifer Brager dated June 23, 2017, at p.6.

Metro Code section 3.07.1425(D) The Council may consider land not designated urban or rural reserve for possible addition to the UGB only if it determines that:

1. *Land designated urban reserve cannot reasonably accommodate the need established pursuant to subsection B of this section; or*
2. *The land is subject to a concept plan approved pursuant to section 3.07.1110 of this chapter, involves no more than 50 acres not designated urban or rural reserve and will help the concept plan area urbanize more efficiently and effectively.*

Hearing Officer's Analysis: The proposed expansion is within an urban reserve. This criterion is not relevant because the site and surrounding properties to the north, east and south are within an Urban Reserve area (no property within or next to the subject site is outside of urban reserve areas).

This criterion is not applicable.

Metro Code section 3.07.1425(E): The Council may not add land designated rural reserve to the UGB.

Hearing Officer's Analysis: The proposed expansion is not within a rural reserve. This criterion is not relevant because the subject site and surrounding properties to the north, east and south are within an Urban Reserve area.

This criterion is either not applicable or has been met.

Metro Code section 3.07.1425(F): The Council may not amend the UGB in such a way that would create an island of urban land outside the UGB or an island of rural land inside the UGB.

Hearing Officer's Analysis: The subject site and the remaining portion of the Sherwood West urban reserve are adjacent to the City of Sherwood. The transformation of this area from rural to urban represents a logical and methodical way to enlarge an urban area, which will not create an island of urban development outside of the UGB.

The proposed expansion will not create an island of urban land outside the UGB or an island of rural land inside the UGB. The applicant has met its burden of showing compliance with this factor by substantial evidence in the whole record.

Metro Code section 3.07.1440 (B)(1) The applicant shall also demonstrate that:

(1) The proposed uses of the subject land would be compatible, or through measures can be made compatible, with uses of adjacent land.

Hearing Officer's Analysis: The applicant addresses this criterion as follows:

> The proposed major amendment site is surrounded by land that is either within the City of Sherwood or the Sherwood Urban Reserve Area 5B (aka Sherwood West Preliminary Concept Plan Area) (see Attachment 6). The land in the City located north and east of SW Elwert Road is fully urbanized with single-family subdivisions and constructed houses. City land located south and east of SW Elwert Road is the location of the Sherwood Elks Lodge. The Elks Lodge site contains a large area of vacant land around the existing building and parking lot. The Elks Lodge and undeveloped surrounding land is zoned Low Density Residential (LDR).
>
> Land to the north, south and west is currently rural and within the urban reserve area (Sherwood West Concept Plan). This County land is zoned Agricultural Forest (AF) and is a patchwork of sites zoned AF-5, AF-10 and AF-20 with the subject site zoned AF-20. AF-5 has a minimum lot size of 5 acres, AF-10 of 10 acres and AF-20 has a minimum lot size of generally 80 acres. The surrounding property has been highly parcelized and consists of a patchwork of small forests/farms and rural residential properties with none more than 80 acres and many under five acres in size.
>
> The site is compatible with surrounding residential properties as the property has separation provided by existing streets on the north (Haide Road), south (Kruger Road) and west (Elwert Road) boundaries. The eastern boundary consists of mostly forestland with only one house near the site boundary near the northwest corner of the site. All school traffic will be able to access the site

> from Elwert Road and will not be routed through existing or proposed residential areas or streets.
>
> While the development of a school site will be the first urban development in the Sherwood West Concept Plan Area, the regional and local plans anticipate redevelopment of this entire area for primarily residential land. Schools typically locate within residential areas and are considered to be compatible with residential land uses when the impacts of the school on residential uses are considered within the design.
>
> The first urban development projects to occur within rural areas typically can cause some tension between existing residents who welcome the change, and those who are content with its current rural character. So well-designed solutions to deal with compatibility issues may still feel like "encroachment" to rural residents. The development of the site will include public involvement during the design development and permit approval process, allowing ample opportunity for the neighbors to help address specific compatibility issues. In the long term, establishing the school will provide the opportunity for subsequent urban developments to be oriented and designed to optimize their physical relationship with the school. This will allow the development of future Sherwood West properties to "grow up together" compared to infilling a large public facility into an established residential neighborhood.

The subject site borders the UGB on the east along SW Elwert Road. Adjacent land uses include single family homes and the Sherwood Robin Hood Elk Lodge that also includes some vacant land that is zoned for residential use, which is expected to develop over time. Directly to the southeast across Highway 99W is the Sherwood Regional Family YMCA. To the north across SW Haide Road is mostly open land with some out-buildings and one dwelling that appears to be vacant. To the west are forested parcels with one dwelling adjacent to the NW corner of the subject parcel. To the south across SW Kruger Road is the Countryside Community Church, limited agricultural activities and four dwellings. The typical weekend use of the church complements the weekday uses of a school. The land to the south also borders Highway 99W.

The District has developed a preliminary site plan that shows the school buildings located in the center of the property with sports fields generally to the south and west and parking located to the north. The southeast corner of the site will contain the realignment of SW Elwert and SW Kruger Roads. The three adjacent roads provide some buffering for the very few adjacent homes and the NW Natural Gas Easement also buffers the southwest corner of the site. The district currently has a High School Design Committee charged with working with the design team to provide advice on a number of design elements and a couple of community input meetings will be scheduled in 2017. In addition there will be public input opportunities during the City's development review and permit approval process.

Finally the subject site is within a very large urban reserve area that has the potential to urbanize over time. As noted previously this portion of the Sherwood West urban reserve was identified as phase A in the preliminary concept plan the City completed. This allows the adjacent land to be designed and developed in a manner that enhances and embraces this important community facility. Therefore the proposed use of the site can be made compatible, through measures, with the uses of the adjacent land.

The applicant has met its burden of showing compliance with this factor by substantial evidence in the whole record.

Metro Code section 3.01.1440 (B)(2) The applicant shall also demonstrate that:

If the amendment would add land for public school facilities, the coordination required by subsection C(5) of section 3.07.1120 of this chapter has been completed.

Hearing Officer's Analysis: MC 3.07.1120(C)(5) states:

> *"Provision for the amount of land and improvements needed, if any, for public school facilities sufficient to serve the area added to the UGB in coordination with affected school districts. This requirement includes consideration of any school facility plan prepared in accordance with ORS 195.110."*

The applicant addresses this requirement as follows:

> This requirement is satisfied as described in Section III of the application. In summary, the Sherwood School District adopted a long-term facilities plan in January of 2008. The long-term plan assumed that additional school capacity would likely be needed within 10 years of the plan's adoption. (The 2008 Long Term Facilities Plan is provided in Appendix C).
>
> In 2014 to 2016, the School District did significant planning prior to placing a bond on the November 2016 ballot that was ultimately approved by voters. This included inventorying existing school facilities, completing updated demographic information, as well as significant planning and public outreach to identify a plan for school facilities that includes the proposed new high school.

As the District points out, it experienced substantial growth in the late 1990's and early 2000's leading to a community effort in 2005 to determine facility needs. This resulted in the successful 2006 bond measure which included funding for an addition to the current high school to increase capacity to 1,550 students, consistent with phase 1 of the 2006 high school master plan. The District completed a long term facilities plan in 2008. Current enrollment at the high school is over 1,700 students and projections show over 2,250 students by the 2025-26 school

year. In early 2014 the District's Long Range Planning Committee made recommendations to the School Board regarding enrollment and growth challenges, facilities analysis and needs and financing options. In 2015 the District documented the condition and educational adequacy of its facilities, leading to bond visioning and steering committees in 2016. This resulted in the District's voters approving a bond measure in 2016 providing funding for school improvements including construction of a new high school. The District and the city of Sherwood have an intergovernmental agreement to share sport fields with most of the facilities occurring on school grounds. Thus the coordination required by subsection C(5) of Metro Code Section 3.07.1120 has been completed.

The applicant has met its burden of showing compliance with this factor by substantial evidence in the whole record.

Metro Code section 3.01.1440(B)(3) The applicant shall also demonstrate that:

If the amendment would add land for industrial use pursuant to section 3.07.1435, a large site or sites cannot be reasonably be created by land assembly or reclamation of a brownfield site.

Hearing Officer's Analysis: The proposed expansion is not for industrial use. This criterion is not applicable.

Findings Addressing OAR 660- Division 24 and the Applicable Statewide Planning Goals.

OAR 660-024-0020 requires that all UGB amendments apply the Statewide Planning Goals to the amendment process. This directive applies to the whole gamut of UGB amendments, from the every-six-year Metro legislative review of its UGB to a quasi-judicial major amendment under the Metro code to provide land for a specific public need, such as a school or other public facilities. However, this does not mean that the Goals will apply equally and in the same way in each situation. It may even be that one or more of the Goals may not apply at all to a given situation.

The primary opponent asserts that the applicant failed to adequately address the Statewide Planning Goals. *See* Letter from Jennifer Bragar dated June 6, 2017. While that was correct at the time Ms. Brager wrote her letter, the applicant followed up two days later with proposed findings. The Hearings officer finds that the applicant did adequately demonstrate compliance with the applicable Statewide Planning Goals by substantial evidence in the whole record, and adopts the applicant's suggested findings, with slight modification, as set forth below. The opponent's specific objections are also addressed below.

OAR 660-024 -0020

OAR 660-024-0020 sets out which of the Statewide Planning Goals are applicable to UGB amendments. The Goals will have a somewhat limited applicability to a UGB amendment for a specific need, but the relevant Goals are addressed below.

Goal 1 - Citizen Involvement

"To develop a citizen involvement program that insures the opportunity for citizens to be involved in all phases of the planning process."

Hearings Officer Analysis: This Major Amendment application does not alter Metro's citizen involvement program. Consequently, compliance with Goal 1 is established through compliance with the public involvement requirements of Metro's code. Those requirements have been followed.

Goal 2 - Land Use Planning
"To establish a land use planning process and policy framework as a basis for all decisions and actions related to use of land and to assure an adequate factual base for such decisions and actions."

Hearings Officer Analysis: OAR 660-024-0020(1)(a) states that the exceptions process in Goal 2 and OAR 660, Division 4 are not applicable unless a goal exception is part of the application. A goal exception is not part of the Major Amendment application and so those provisions will not be addressed. Other than goal exceptions, Goal 2 requires the establishment of a comprehensive plan, a need for coordination of government entities in planning, and the need for public hearings and an opportunity for comment and review.

1) Coordination: This Major Amendment application has required coordination with and between Metro, Washington County, the City of Sherwood, and public service providers including ODOT, Tualatin Valley Fire & Rescue, and Clean Water Services. This includes coordination at the Major Amendment level and at the Sherwood West Concept Plan level. Therefore, the required coordination has occurred.

2) Public Hearings/Opportunities for Comment and Review: Metro staff sent the required notice for the hearing before the hearings officer, and there has been opportunity for comment and review of the application materials. The hearing was continued, which provides additional opportunity for comment and review, and the hearings officer has stated he is likely to leave the record open after the second hearing concludes. There will also be at least one hearing before Metro Council. Further, the proposed high school will have additional approvals to obtain after the Major Amendment application has been approved, such as annexation, a zone change and a conditional use permit, all of which include a public involvement component. Therefore, there has been and will continue to be public hearings and an opportunity for comment and review.

Goal 3- Agricultural Lands

Hearings Officer Analysis: Not applicable under OAR 660-024-0020(3)(b).

Goal 4 - Forest Lands

Hearings Officer Analysis: Not applicable under OAR 660-024-0020(3)(b).

Goal 5 - Natural Resources, Scenic and Historic Areas, and Open Spaces

"To protect natural resources and conserve scenic and historic areas and open spaces."

Hearings Officer Analysis: OAR 660-024-0020(1)(c) requires states that Goal 5 and its related rules apply only in areas added to the UGB. The area to be added to the UGB is the site identified in this application. There are no Goal 5 resources on the site identified by Metro, Washington County or the City of Sherwood in the Sherwood West Concept Plan. Therefore, this goal is not applicable.

Goal 6 - Air, Water and Land Resources Quality
"To maintain and improve the quality of the air, water and land resources of the state."

Hearings Officer Analysis: As LUBA recently stated:

> "[t]he relevant Goal 6 inquiry for a decision that amends comprehensive plan and zoning map designations, without approving any particular new development, is whether there is a reasonable expectation that applicable state and federal environmental quality standards can be met at the time the property is developed in the future. *See Friends of the Applegate Watershed v. Josephine County*, 44 Or LUBA 786, 802 (2003), (at the post-acknowledgment plan amendment stage, a local government need only show it is reasonable to expect that applicable state and federal environmental quality standards can be met); *see also Salem Golf Club v. City of Salem*, 28 Or LUBA 561, 583 (1995) (same).

See Nicita v. City of Oregon City, ___ Or LUBA ___ (LUBA No. 2016-045, Jan 25, 2017, slip op. at 27.

The hearings officer does not see how there could not be any "reasonable expectation that applicable state and federal environmental quality standards can be met at the time the property is developed [as a school]." The proposed school campus poses no significant adverse air, land or water quality impacts. There are no expected significant "waste or process discharges" from the new high school campus. The high school does not "process" anything and so there are no process discharges associated with the high school. Any waste that will be produced by high school activities will be handled through the normal course of business. For example, any solid waste generated by the school will be subject to recycling and solid waste collection by the franchised garbage hauler for the area. Any waste associated with sanitary sewers or storm events will be handled as part of the public sanitary and storm water facilities. As the property develops, the District will be required to coordinate with the state Department of Environmental Quality and with Clean Water Services to ensure that air, land and water resources are not degraded. As noted in response to Goal 5, no significant Goal 5 resources have been mapped on this property by Metro, Washington County or the City. Further, the proposed new high school site is adjacent to the existing UGB and will allow for efficient multi-modal transportation of the

bulk of the student population - especially as Sherwood West builds out with primarily residential uses in the decades to come.

The primary opponents make a half-hearted attempt to challenge the applicant's Goal 6 compliance, but its argument is too vague and too unfocused to provide a basis for denial. First, the opponent state that "air quality issues should be examined for a new school to be built near Highway 99." *See* letter from opponent's counsel Jennifer Brager, at p. 2, 6. This argument appears to assume that highway 99 causes sufficient level of pollution that a school should not be located in close proximity thereof. The opponents suggest that a "buffer" and "distancing is needed. The opponent never suggests what a proper buffer would be. The Hearings officer finds this concern to be speculative, unsupported by substantial evidence in the record, and beyond the scope of Goal 6's reach. Even if the hearings officer believed this was a valid concern, the hearings officer finds the air quality benefits of locating a school away from a major arterial would be offset by the additional VMT needed to transport school children a further distance.

Goal 7- Natural Hazards

"To protect life and property from natural disasters and hazards."

Hearings Officer Analysis: Goal 7 (Areas Subject to Natural Hazards). Goal 7 requires local governments to evaluate risks to people "upon receiving notice" of new hazard information from DLCD, and based on evaluation of that risk to prohibit development in areas "where the risk to public safety cannot be mitigated." Natural hazards for purposes of this goal are: floods (coastal and riverine), landslides, earthquakes and related hazards, tsunamis, coastal erosion, and wildfires.

No natural hazards have been mapped on the properties that comprise the proposed school site. (*See*, *e.g.*, Sherwood West Concept Plan, figures 6 and 7.) The applicant's proposed site appears to be devoid of any natural hazards: It is not in a flood plain or a coastal zone. It does not have steep slopes that would be vulnerable to landslides. It does not contain soils that are exceptionally vulnerable to being an earth quake hazard (at least any more so in comparison to the rest of the Portland Metro region generally). Therefore, this goal is inapplicable.

Goal 8- Recreational Needs

"To satisfy the recreational needs of the citizens of the state and visitors and, where appropriate, to provide for the siting of necessary recreational facilities including destination resorts."

Hearings Officer Analysis: As set forth in the Narrative, the District provides most of the athletic fields for the City of Sherwood. The City and the District have had a long history of partnering in the provision, use, and maintenance of these fields so that recreational opportunities are provided as efficiently as possible. The new high school campus will include a number of new fields and sports facilities on which the City and the District will continue to partner. The new fields and sports facilities will be in addition to the existing fields and sports facilities already in use as part of the existing school facilities. See page 32 of the Narrative for additional

detail. The new high school campus, then is supportive of this goal, as it will help satisfy the need for recreational facilities in the city and in the District.

Goal 9 - Economic Development

> *"To provide adequate opportunities throughout the state for a variety of economic activities vital to the health, welfare, and prosperity of Oregon's citizens."*

Hearings Officer Analysis: Goal 9 applies to areas within an urban growth boundary. OAR 660-09-0010(1). *Port of St. Helens v. Land Conservation & Development Committee*, 164 Or App 487, 495, 996 P 2d 1014 (2000). Goal 9 requires that jurisdictions provide adequate opportunities for a variety of economic activities. Goal 9 planning is limited to areas within UGBs, and local land use plans are required to comply with Goal 9 at periodic review and whenever a jurisdiction undergoes a post-acknowledgment plan amendment that changes the plan designation of more than two acres of land from industrial/employment use to a nonindustrial/non-employment use. OAR 660-009-0010(1), 0010(2), and 0010(4).)

Pursuant to OAR 660-024-0020, certain Goals, including Goal 9, are also applicable when the UGB is amended. The Major Amendment application expands the UGB to allow an existing high school to move several miles away from one site within the City of Sherwood to another site that will be annexed into the City of Sherwood for that purpose. This appears to be fairly neural from the standpoint of economic opportunities.

The opponent cites *Barkers Five, LLC v. LCDC*, 261 Or App 259, 289 (2014), and states that Goal 9 "requires a determination of the potential future land need for employment and is supposed to occur at the time the UGB is expanded, " and that "the school itself has to be analyzed as an 'other employment use' as defined under OAR 660-009-0005 because it will involve a governmental employment activity. " *See* letter from Jennifer Bragar dated June 6, 2017, at p. 2. That might be true for a UGB amendment that proposes to add employment land, but it not explain the relevance of Goal 9 to this particular UGB application, which is specific to a need for land for a new high school. In this case, the UGB amendment is targeting a specific need, *i.e.*, the relocation of an existing high school several miles away within the same city. Goal 9 is not applicable as the UGB expansion is for a specific need for a high school.

The cited passage from *Barkers Five* should be read in context. LCDC was referring to OAR 660-027-0050(2) and Metro's analysis for employment land needs occurring as part of its urban growth report. There is nothing in that passage that would make such an analysis a requirement for a major amendment application submitted under ORS 197.299(4). As stated in the findings for Goal 9, this goal is not applicable to a UGB amendment for a specific high school need. To the extent that the high school will have any Goal 9 impacts, the Hearings officer finds those impacts will be positive in terms of temporary construction jobs during development and provision of part-and-full time employment year-round.

Furthermore, if the opponent is implying that Metro must engage in a full-blown economic opportunities analysis in the context of a major amendment application for a high school, that conclusion does not follow from the opponent's stated premises or from Goal 9. The

opponent's argument is not developed well enough to allow the hearings officer to evaluate it on the merits: the opponent has not explained how this application actually impacts the requirements or scope of Goal 9.

Goal 10 - Housing

"To provide for the housing needs of citizens of the state."

Hearings Officer Analysis: The applicant states that Goal 10 is not applicable as the UGB expansion is for a specific need for a high school. The opponent states that "Goal 10 is implicated because housing opportunities will be lost as a result of this large land grab by the school district." *See* letter from Jennifer Bragar dated June 6, 2017, at p. 2. While it is true that any use of land for non-residential purposes results in that land not being available for housing, that truism does not create a Goal 10 violation. As best as the hearings officer can determine, the opponent is arguing that the Preliminary Sherwood West Concept Plan shows a small school site surrounded by housing, and the applicant's current plan shows the entire site being used for a school and no housing. The opponent concludes that this change in plans 'will limit the planned housing in the Sherwood West Concept Plan Area," which, according to the opponent, "has Goal 10 implications." *See* letter from Jennifer Bragar dated June 6, 2017, at p. 2-3. It appears that the opponent is arguing that the Concept Plan locks in the density and mix of housing, and any change to the Concept Plan requires an analysis of Goal 10 compliance.

The hearings officer finds that the concept plan does not have the regulatory effect that the opponent assigns to it. The opponent cites to nothing in any local zoning code or Comprehensive Plan that gives this sort of regulatory effect to this (or any other) concept planning effort. Goal 10 would not have that type of regulatory effect until the property subject to the Concept Plan is brought into the UGB and assigned urban zoning designations. As currently situated, the land at issue is not within the UGB and so is not considered "buildable lands" under Goal 10 and Goal 14, and is not included in any buildable land inventory. Therefore, there is no buildable lands inventory to measure the Major Amendment application against and Goal 10 does not anticipate that there would be in this situation. By its terms, Goal 14 requires that jurisdictions "provide for the housing needs of citizens of the state" by inventorying "buildable lands for residential use. " Goal 10 defines buildable lands as lands in "urban and urbanizable areas that are suitable, available and necessary for residential use. " Under the definitions section of the Statewide Planning Goals, "urban land" is defined as "land inside an urban growth boundary, " and "urbanizable land" is defined as urban land, i.e., land inside a UGB, that is presently unavailable for any number of reasons. Therefore, the opponent' argument that, in the context of a Major Amendment, Goal 10 requires Metro to "demonstrate that its actions do not leave it with less than adequate residential land supplies" is wrong..

Moreover, as the applicant points out, the City's urban reserves include a 50-year land supply for the City. There is no evidence that siting a new high school in Sherwood West, in the location that the Concept plan contemplated a new school, will in any way negatively impact the ability of the City to provide for its housing needs, especially when Sherwood West is combined with Sherwood North and Sherwood South.

.

The opponent also complains that the applicant is seeking to bring in 82 acres when it defined its current need as requiring only a 50-acre site. *See* letter from Jennifer Bragar dated June 6, 2017, at p. 2. The hearings officer is at a loss to understand the relevance of this argument to a Goal 10 challenge. The opponent's argument is simply not developed sufficiently to allow the hearings officer to understand the nature of the complaint.

The opponent also argues that an 82-acre school site "contradicts the two school sites considered in the Preliminary Sherwood West Concept Plan. *See* letter from Jennifer Bragar dated June 6, 2017, at p. 2. However, Concept Plans are not regulatory documents in the sense that they do not limit the size of planned facilities. The Concept Plan took the provision of additional school sites into account when it was developed. Although the concept plan includes two identified school sites, it is important to remember that the Concept Plan is a general plan that addresses how the area will develop generally. The Concept Plan does not specify the types of schools that the conceptual school sites reflect, e.g., elementary, middle or high school. Therefore, one should not view the blue squares denoting school sites in the Concept Plan in the literal sense of trying to determine how big the Concept Plan believed the sites will ultimately be. Such information comes from future refinement of the Concept Plan after areas are brought into the UGB.

Moreover, as the applicant points out, Goal 10 concerns itself with land already within a UGB, which the subject property is not. Therefore, Goal 10 has very limited applicability to a Major Amendment application for a new public school site. That said, the justification for the proposed expansion area of 82 acres is included in the Narrative. (Narrative at 31-32.) As set forth in the Narrative, approximately seven of the 82 acres will be needed for transportation improvements that will support the new high school. There is also a 40-foot wide gas pipeline easement that runs across the site, occupying approximately 2.2 acres but requiring protection of additional, adjacent property of approximately 20 feet on either side. This pipeline easement essentially gives the site an irregular shape, which reduces the efficiency with which it can be developed. The Narrative also discusses the shared sports fields arrangement between the City of Sherwood and the District that provides for additional ballfields. The District would also note that Figure 3 of the Narrative depicts a conceptual layout of the high school site and related transportation improvements over the entire 82-acre area. (Narrative at 7.) As one can see on that conceptual layout, the entire site will be fully utilized.

In the Appendix 6 Service Provider Interviews, the District warns that the current high school was at-capacity at the time of the interview (the appendix is dated June 15, 2015), and with the growth expected in Sherwood the high school could be expected to become over-capacity. (See Appendix 6, pages 3-4.) The District stated that expanding the existing high school and adding a new high school to the District would both be explored. The relevant information to be gleaned from the Concept Plan is that the majority of Sherwood West is intended to be developed with varying densities of housing and that the Concept Plan integrated the need for at least two additional school sites, with an understanding that the existing Sherwood High School would soon be over-capacity.

In its June 23, 2017 letter, the opponent argues that Metro "must demonstrate that its actions do not leave it with less than adequate residential land supplies in the types, locations,

and affordability ranges affected." *See* letter from Jennifer Bragar dated June 23, 2017, at p.2. As support for this requirement, the opponent relies on *Burk v. Umatilla County*, 20 Or LUBA 54 (1990). In *Burk*, the Port of Umatilla filed an application with the City of Umatilla to amend the city's comprehensive plan map for a 42-acre area within the city's urban growth boundary, but outside the city limits, from single-family residential to industrial. The city's buildable land inventory for housing included the 42 acres, because that acreage was within its UGB. Even with the 42 acres included in the buildable lands inventory, the city was deficient in land available for single-family housing. The city approved the map amendment even though it increased that deficiency, which earned the city a remand by LUBA.

The facts of *Burk* are different than those presented by this Major Amendment application. The land in question in *Burk* was inside a UGB and was already planned for zoned and residential uses. That is a key factual difference from the present case, because the land in this case is planned for agriculture and forestry. The land proposed to be added to the UGB is not "buildable land," and is not in any current inventory. For this reason, the Goal 10 analysis required in *Burk* is not applicable here.

Goal 11 - Public Facilities and Services

> *"To Plan and develop a timely, orderly and efficient arrangement of public facilities and services to serve as a framework for urban and rural development."*

Hearings Officer Analysis: As set forth in response to MC 3.07.1425(c)(2), the Sherwood West Concept Plan extensively studied the provision of public facilities and services with respect to that urban reserve. The concept plan was prepared with analyses of existing sanitary sewer, water, and storm water conditions and analyses of how those systems need to be upgraded, extended, and phased to meet the future development of Sherwood West. The concept plan was prepared in coordination with all of the future service providers, including those services that will be provided by the City and those that will be provided by others, including Clean Water Services. The concept plan discusses the provision of public facilities and services to the area at pages 16-18 and 40-44, as well as in Appendix 3 (Existing Conditions Report) and Appendix 6 (Service Provider Interviews). According to the Concept Plan, the area in which the school site is proposed "presents the best near-term opportunity for development in Sherwood West," and the cost to serve the area is on the lower end of the cost scale. (Sherwood West Concept Plan, pages 42-43.) The District used this work as a jumping off point to study the proposed site for inclusion in the UGB (as well as other sites within Sherwood West). See Narrative, pages 24-31 and Application Appendix A (New High School Preliminary Site and Utility Exhibit) and Appendix B (Service Provider Letters). All of the foregoing information addresses the orderly and efficient arrangement of sanitary sewer, water, and storm drainage facilities to serve the new school property, as well as the larger Sherwood West area and all of the evidence consistently points to the chosen property as a property that can served in a timely, orderly, and efficient manner.

The opponents argue that Goal 11 is not met, because the local sewer and water agency (Clean Water Services) has a concern about the installation of a temporary pump station. *See* letter from Jennifer Brager dated June 23, 2017, at p. 5. The opponents offer no testimony, expert

opinion, or evidence that would call into question the conclusions reached by the applicant's engineers, KPFF. Goal 11 does not require that every technical engineering solution be worked out at the time of UGB amendment. The KPFF engineers seem to believe that an engineering solution is not only possible, but likely, which is all that is required at this stage. See KPFF memo dated June 13, 2017. This Hearings officer has evaluated the opinion of the KPFF engineers, and finds them more credible.

The opponents further argue that "fire flow tests have not been completed." *See* Letter from Jennifer Brager dated June 23, 2017, at p. 5. The opponents do not explain why fire flow tests are mandated by Goal 11 in the context of a UGB amendment, nor is it obvious why they would be. The KPFF engineers seem to be satisfied that the fire flow issue can be adequately handled, and this hearings officer finds them more credible.

Goal 12 - Transportation

> *"To provide and encourage a safe, convenient and economic transportation system."*

Hearings Officer Analysis: Early LUBA cases suggested that a local government could not "pass the buck" by deferring compliance with Goal 12 and the TPR until the time of site plan review.[13] However, more recent case law clarifies that conditions of approval can be used to limit new development until such time as the TPR is addressed. For example, in *Citizens for Protection of Neighborhoods v. City of Salem*, 47 Or LUBA 111 (2004) (*Citizens*), the City of Salem approved a zone change to allow mixed residential and commercial use of a 275-acre property. That approval included a condition that prohibited development of the property until later adoption of a master plan for the property. The City of Salem's code criteria applicable during the master plan process included requirements that were substantially identical to the requirements of the TPR. Based on the condition requiring master plan approval, the city found that the zone change did not significantly affect the transportation facility because no development could occur until the subsequent master plan phase. *Id*. at 115, 116. LUBA held that the city could properly conclude that the rezoning of the property did not significantly affect any transportation facility because the condition essentially prohibited development on the property without first showing that any allowed development is consistent with the function, capacity and performance standards of affected transportation facilities. *Id*. at 120.

In *ODOT v. City of Klamath Falls (Southview Dev'l, LLC)*, 39 Or LUBA 641, 660, *aff'd* 177 Or App 1, 34 P2d 667 (2001), LUBA affirmed that portion of a county decision which approved a zone change with a condition that prevented additional development from impacting a transportation facility until such a time in the future when the TPR is addressed. LUBA found that this condition was sufficient to ensure compliance with the TPR in the interim.

Finally, in *Willamette Oaks, LLC v. City of Eugene,* 59 Or. LUBA 60 (2009), the city approved a zone change, and imposed a condition of approval prohibiting development of the property without approval of a planned unit development (PUD) application and a showing of

[13] *1000 Friends of Oregon v. City of North Plains*, 27 Or LUBA 372 (1994), *aff'd*, 130 Or App 406 882 P2d 1130 (1994); *Concerned Citizens of the Upper Rogue v. Jackson County*, 33 Or LUBA 70 (1997).

consistency with the TPR as part of the PUD application and review. LUBA approved this approach, stating as follows:

> In sum, with one caveat discussed below,[14] we think it is permissible for the city to defer consideration of compliance with the TPR to a subsequent review process at the time actual development is proposed, provided that the zone change or plan amendment is effectively conditioned to prohibit traffic or other impacts inconsistent with the TPR's requirements unless and until those requirements are fully addressed. Applicant offers no reason in the present case why deferring the application of the provisions of the TPR to a later PUD application process is insufficient to ensure that allowed uses of the subject property are consistent with

---

[14] LUBA stated in a footnote that the PAPA procedural requirements would still need to be satisfied as part of the deferred process:

> The caveat mentioned above is that unless the local government takes steps to ensure otherwise, the subsequent review process may not require a comprehensive plan or land use regulation amendment and therefore will not trigger [**12] the notice obligations of a post-acknowledgement action under ORS 197.610 *et seq*. Under those statutes, a local government that amends its comprehensive plan or land use regulations, including zone changes, must provide to the Department of Land Conservation and Development (DLCD) timely notice of the hearing on the proposed amendments as well the decision adopting the amendments. DLCD, in turn, provides notice of the proposed amendments and any subsequent adoption to persons or agencies who request such notice. OAR 660-018-0025. The requirement to provide notice of post-acknowledgment plan amendments to DLCD and other parties is a critical component of a statutory and rule-based scheme that is designed to ensure that post-acknowledgment plan and land use amendments comply with the applicable statewide planning goals and rules, including the TPR. *See Oregon City Leasing, Inc. v. Columbia County, 121 Or App 173, 177, 854 P2d 495 (1993)* (failure to provide DLCD the notice required under ORS 197.610 *et seq*. is a substantive, not procedural error). The efficacy of that scheme is undermined if a local government defers consideration [**13] of compliance with the TPR to a subsequent review process that does not provide equivalent notice to that required by ORS 197.610 *et seq*. Without such notice, it is possible that DLCD and parties who may rely on DLCD's re-notice, potentially including ODOT, may not learn of the review proceeding or have an opportunity to participate in that proceeding.

> the function, capacity and performance standards of the affected transportation facilities. *ODOT v. City of Klamath Falls,* 39 Or LUBA at 660.

Under OAR 660-024-0020(1)(d), the Transportation Planning Rule ("TPR") need not be applied to a UGB amendment if the land will remain zoned as urbanizable. That will be the case with the properties subject to the proposed UGB amendment. The current AF-20 zoning will remain until the is annexed into the City of Sherwood. During the forthcoming Metro Title 11 concept planning process for the properties, the City will determine the appropriate zone and this will include a TPR analysis. The zoning will not actually be changed, however, until after annexation.

With respect to Goal 12 generally, as set forth in response to MC 3.07.1425(c)(2), the Sherwood West Concept Plan extensively studied the provision of public facilities and services, including transportation, with respect to that urban reserve. The concept plan analyzed the existing transportation system and how that system will need to be upgraded, extended, and phased to meet the future development of Sherwood West. The concept plan was prepared in coordination with all of the future transportation service providers, including Washington County and ODOT. The concept plan discusses the transportation system within the plan area at 18-21, 40-44, as well as in Appendix 3 (Existing Conditions Report), Appendix 6 (Service Provider Interviews), and Appendix 8 (Transportation Options Alternative Analysis Report). The District used this work as the jumping off point to study the proposed site for inclusion in the UGB (as well as other sites within Sherwood West). See Narrative at pages 10-11, and Appendix B (Service Provider Letters). The District also engaged a licensed traffic engineer to prepare the March 15, 2017, Sherwood High School UGB Expansion Transportation Study (the "Transportation Study") to address the provision of a safe, convenient, and economic transportation system for the new high school site. (The Transportation Study has been submitted to the record.) The Sherwood West Concept Plan takes a higher-level look at the transportation needs of the Sherwood West area in general, including the need for new streets and intersection improvements. The Narrative provides general information about how the school site will be served and the Transportation Study provides more detail than is commonly found at the UGB expansion stage, but finds that, with some mitigation improvements, a new high school on the proposed site can be served by the appropriate transportation system. The Transportation Study will become more relevant at the Title 11 concept planning and annexation stages of the high school site development. Because the new high school is very near to an existing, urban-level street system, and because Washington County and the City will be constructing a new intersection improvement adjacent to the new high school, the provision of transportation services to the new school will be more economical. According to the concept plan, the area in which the school site is proposed "presents the best near-term opportunity for development in Sherwood West," and the cost to serve the area is on the lower end of the cost scale. (Sherwood West Concept Plan, pages 42-43.) In sum, all of the cited evidence supports a finding that it is possible to safely, conveniently, and economically provide for the transportation needs of the new high school.

For this reason, the applicant proposes a condition of approval to the UGB amendment that prohibits any new development on the subject property until a Comprehensive Plan Map and Zoning Map Amendment are completed, and that the TPR will be addressed at that time.

Several opponents expressed concerns about the adequacy of the surrounding transportation system to support the proposed high school. It is tempting to jump ahead to the specific traffic impacts of a proposed use even at this early stage of the land use process. It is important to keep in mind, however, that the Major Amendment application is just the first application in a series of land use proceedings that must occur prior to the high school actually being approved on the property. With respect to the Major Amendment application, Goal 12, OAR 660-024-0060(8), and MC 3. 07. l425(c)(2) are applicable and implicate transportation facilities. The District has submitted findings with supporting substantial evidence to address all of those provisions. The District also submitted additional evidence from its traffic engineer to address particular issues raised with respect to the March 15, 2017, Sherwood High School UGB Expansion Transportation Study. (See June 28, 2017, DKS memorandum.)

No one besides the District provided any evidence or testimony from a traffic engineer regarding any aspect of the Major Amendment application. Opponents correctly point out that there are existing transportation deficiencies in the area that surrounds the proposed high school site. Those opponents also correctly point out that if those deficiencies are not addressed then the new high school will exacerbate them. All of that is true, but it would be expected to be true regardless of where the new high school is sited, *i.e.*, nearly every area in and around Sherwood has existing transportation deficiencies and siting a new high school in any of those areas would impact the transportation system. Where the opponent's logic fails is in the apparent assumption that the transportation impacts of the new high school will not be addressed as part of the planning and permitting processes that are required prior to the new school opening its doors in 2020. That assumption is incorrect.

The laws and regulations that govern the permitting of the new high school simply do not allow the new school to be plopped down anywhere without transportation impacts being analyzed and mitigated in accordance with the law. The specifics of that analysis and mitigation for the chosen site are largely irrelevant at the UGB amendment stage. Instead, those specific transportation impacts will be addressed through subsequent Title ll planning for the UGB amendment area, and through annexation, zone change, and conditional use permit processes. Through these processes, the Transportation Planning Rule will be addressed, appropriate off-site mitigation within an appropriate timeframe will be required, and appropriate frontage improvements for all of the abutting streets will be conditioned. Public involvement is included in each of those steps as part of each of the planning and permitting processes. (See June 28, 2017, DKS & Associates memorandum.)

Goal 13 - Energy Conservation

"To conserve energy."

Hearings Officer Analysis: LUBA and the Courts have never given any regulatory affect to this Goal. The Hearings officer views this goal as being essentially meaningless. The general practice has been for applicants and staff to write some flowery prose that extorts the energy

saving virtues of the project. In this vein, the applicant states:

> As explained under the District's response to MC 3.07.1425(c)(3), which is the analog of Goal 14, Location Factor 3 (ESEE energy consequences), the proposed school site's adjacency to the existing UGB, served by major streets, facilitates multi-modal access for students, teachers, families, and administrative staff to and from the school campus. This will multi-modal facilitation will only increase as Sherwood West builds out into a predominantly residential area with nodes of neighborhood commercial.

Without some baseline standard to measure against, it is difficult to evaluate whether any given proposal will "conserve energy" or not. But at least it sounds good.

For its part, the opponent's arguments do not shed much light on the issue. They merely state that an "energy analysis" must be provided. *See* Letter from Jennifer Brager dated June 6, 2017, at p. 3. The opponents do not explain exactly what an "energy analysis" entails, nor it is particularly apparent on its face. Given that no focused argument concerning Goal 13 was raised by any party, the hearings officer finds that the applicant's proposed findings comply with Goal 13 – whatever it means.

Goal 14 - Urbanization

> *"To provide for an orderly and efficient transition from rural to urban land use, to accommodate urban population and urban employment inside urban growth boundaries, to ensure efficient use of land, and to provide for livable communities."*

Hearings Officer Analysis: Goal 14 is addressed throughout this submittal.

Goals 15 through 19

Hearings Officer Analysis: These goals are not applicable, as the proposed UGB expansion does not include Willamette River Greenway, Estuarine Resources, Coastal Shorelands, Beaches and Dunes or Ocean Resources.

OAR 660-024-0040 - 0050

OAR 660-024-0050 directs local governments to inventory land inside the UGB to determine whether there is adequate development capacity to accommodate 20-year needs determined in OAR 660-024-0040. The District's Major Amendment application does not directly implicate these rule provisions, because the need for the new high school site did not arise out of an OAR 660-024-0040 overall land needs analysis and subsequent OAR 660-024-0050 buildable lands analysis. A specific need for a new high school site arose out of long-term facilities planning engaged in by the District. However, once the need for the new high school was identified, the District analyzed land that was within both the District boundaries and the Sherwood, Wilsonville, and Tualatin UGBs for land that could accommodate the need for the

new high school based on its suitability criteria. (See Narrative at pages 8-21.) There was no suitable land within those areas. The analysis required by OAR 660-024-0050 tracks closely in some respects with the analysis required by MC 3.07.1425(a), which was addressed by the District in its application. The caveat, however, is that identified specific land need, such as land for a new school, is not the same as a generalized need for more residential land or employment land. Given the specific need for a new school site, MC 3.07.1440(a) allows a UGB expansion tailored to just that need under certain circumstances.

OAR 660-024-0060 - Metro Boundary Local Alternatives Analysis

OAR 660-024-0060 sets forth the provisions that apply when a need within the Metro UGB has been specified and there is no land within the UGB that can accommodate that need. The provisions in OAR 660-024-0060 track closely with the provisions contained in MC 3.07.1425(c), which have been addressed in the District's application submittal, the Metro staff report, and the additional findings submitted by the District in response to the hearings officer's request.

OAR 660-024-0060:

(1) When considering a Metro UGB amendment, Metro must determine which land to add by evaluating alternative urban growth boundary locations. For Metro, this determination must be consistent with the priority of land specified in ORS 197.298 and the boundary location factors of Goal 14, as follows:

(a) Beginning with the highest priority of land available, Metro must determine which land in that priority is suitable to accommodate the need deficiency determined under OAR 660-024-0050.

Hearings Officer Analysis: The highest priority of land available is land designated urban reserve. (ORS 197.298(1)(a).) The District's application included an analysis of urban reserve land.

(b) If the amount of suitable land in the first priority category exceeds the amount necessary to satisfy the need deficiency, Metro must apply the location factors of Goal 14 to choose which land in that priority to include in the Metro UGB.

Hearings Officer Analysis: As set forth in the District's Major Amendment application, there is suitable land within an existing urban reserve to satisfy the need deficiency, i.e., the new high school. Accordingly, the location factors of Goal 14 were applied to that land. Those location factors are the first four location factors found in MC 3.07.1425(c)(1)-(9) and have been addressed in the District's application submittal, the Metro staff report, and the additional findings submitted by the District in response to the hearings officer's request.

(c) If the amount of suitable land in the first priority category is not adequate to satisfy the identified need deficiency, Metro must determine which land in the next priority is suitable to

accommodate the remaining need, and proceed using the same method specified in subsections (a) and (b) of this section until the land need is accommodated.

Hearings Officer Analysis: This is not applicable as there is urban reserve land that can accommodate the need.

(d) Notwithstanding subsection (a) to (c) of this section, Metro may consider land of lower priority as specified in ORS 197.298(3).

Hearings Officer Analysis: This is not applicable as there is urban reserve land that can accommodate the need.

(e) For purposes of this section, the determination of suitable land to accommodate land needs must include consideration of any suitability characteristics specified under section (5) of this rule, as well as other provisions of law applicable in determining whether land is buildable or suitable.

Hearings Officer Analysis: This provision is similar to MC 3.07.1425(b), in which site characteristics may be specified for land to be suitable for an identified need. The District specified such characteristics in the Narrative at page 19.

(2) Notwithstanding OAR 660-024-0050(4) and subsection (1)(c) of this rule, except during a legislative review of the Metro UGB, Metro may approve an application under ORS 197.610 to 197.625 for a Metro UGB amendment proposing to add an amount of land less than necessary to satisfy the land need deficiency determined under OAR 660-024-0050(4), provided the amendment complies with all other applicable requirements.

Hearings Officer Analysis: This provision is not applicable.

(3) The boundary location factors of Goal 14 are not independent criteria. When the factors are applied to compare alternative boundary locations and to determine the Metro UGB location, Metro must show that all the factors were considered and balanced.

Hearings Officer Analysis: This provision is consistent with how Metro interprets its analogous boundary location factors in MC 3.07.1425(c), which were applied to the District's Major Amendment application.

(4) In determining alternative land for evaluation under ORS 197.298, "land adjacent to the UGB" is not limited to those lots or parcels that abut the UGB, but also includes land in the vicinity of the UGB that has a reasonable potential to satisfy the identified need deficiency.

Hearings Officer Analysis: The District's analysis took into account all of the land in the urban reserves that otherwise met the District's siting criteria. Some of the land analyzed did not abut the UGB, but was rejected for other reasons.

(5) If Metro has specified characteristics such as parcel size, topography, or proximity that are necessary for land to be suitable for an identified need, Metro may limit its consideration to land that has the specified characteristics when it conducts the boundary location alternatives analysis and applies ORS 197.298.

Hearings Officer Analysis: This provision is similar to MC 3.07.1425(b), in which site characteristics may be specified for land to be suitable for an identified need. The District specified such characteristics in the Narrative at page 19.

(6) The adopted findings for a Metro UGB adoption or amendment must describe or map all of the alternative areas evaluated in the boundary location alternatives analysis. If the analysis involves more than one parcel or area within a particular priority category in ORS 197.298 for which circumstances are the same, these parcels or areas may be considered and evaluated as a single group.

Hearings Officer Analysis: The District mapped all of the alternative areas evaluated in the boundary location alternatives analysis and evaluated them separately.

(7) For purposes of Goal 14 Boundary Location Factor 2, "public facilities and services" means water, sanitary sewer, storm water management, and transportation facilities.

Hearings Officer Analysis: The District took into account the public facilities and services enumerated in this provision when it evaluated MC 3.07.1425(c)(2), which is the analog to Goal 14 Boundary Location Factor 2.

(8) The Goal 14 boundary location determination requires evaluation and comparison of the relative costs, advantages and disadvantages of alternative Metro UGB expansion areas with respect to the provision of public facilities and services needed to urbanize alternative boundary locations. This evaluation and comparison must be conducted in coordination with service providers, including the Oregon Department of Transportation (ODOT) with regard to impacts on the state transportation system. "Coordination" includes timely notice to service providers and the consideration of evaluation methodologies recommended by service providers. The evaluation and comparison must include:

(a) The impacts to existing water, sanitary sewer, storm water and transportation facilities that serve nearby areas already inside the Metro UGB;

(b) The capacity of existing public facilities and services to serve areas already inside the UGB as well as areas proposed for addition to the Metro UGB; and

(c) The need for new transportation facilities, such as highways and other roadways, interchanges, arterials and collectors, additional travel lanes, other major improvements on existing roadways and, for urban areas of 25,000 or more, the provision of public transit service.

Hearings Officer Analysis: As set forth in the responses to Goals 11 and 12, Sherwood West has been concept planned pursuant to MC 3.07.1110, and so the provision of public

facilities and services within the Sherwood West concept plan area and as those services relate to the rest of the city have been studied extensively, as required by MC 3.07.1110. The Sherwood West Concept Plan was prepared with analyses of existing sanitary sewer, water, stormwater, and transportation conditions and analyses of how those systems need to be upgraded, extended, and phased to meet the future development of Sherwood West without adversely impacting the existing city development. The concept plan was prepared in coordination with all of the future service providers, including those services that will be provided by the City and those that will be provided by others, including Clean Water Services, ODOT, and Washington County.[15]

Additional Issues Raised by Opponents

1. **Metro Staff Provided Proper Notice to DLCD.**

Opponents allege that Metro failed to provide notice to DLCD of a proposed plan map amendment under ORS 197.610. *See* Letter from Jennifer Bragar dated June 23, 2017, at p. 8. This is not correct. Metro submitted the requisite notice to DLCD on April 20, 2017, as evidenced on the weekly DLCD notice summary dated April 21, 2017, which is attached to the June 30, 2017 letter from Metro counsel Roger Alfred.

2. **The Fair Housing Act Is Inapplicable.**

The opponent argues that Metro must apply the Fair Housing Act ("FHA") to the Major Amendment application, because "Metro has a duty to affirmatively further fair housing." *See* Letter from Jennifer Bragar dated June 23, 2017, at p. 3-5.

The opponent does not point to any approval criterion that requires Metro to apply the FHA directly to this application, and did not include any convincing argument as to why a UGB expansion to accommodate a new public high school would require the FHA to be addressed. As best as the hearings officer can ascertain, the opponent's core argument is that the FHA is a *de-facto* approval standard for every Comprehensive Plan Amendment and zone change decision. In this regard, Ms. Brager states that "Metro has a duty to affirmatively further fair housing" and that "Metro needs to address fair housing implications in this Major Amendment application through analysis under Goal 10 and under Metro's locational factors, Metro Code 3.07.1425(c)(5) regarding equitable and efficient distribution of housing." The argument is not well-developed; the opponent seems to be arguing that the FHA must be complied with, but that compliance with Goal 10 and the Metro Code establishes compliance with the FHA.

Beyond that, the opponent complains that Sherwood does not have enough subsidized housing, which "does not properly address the housing issues in Washington County for low-income households, especially protected classes." That statement is followed up with the conclusion that the "failure to analyze the school siting in context of the regional need for fair housing only exacerbates the inequitable distribution of affordable housing in the Metro region."

[15] This coordination effort included service provider interviews included as Appendix 6 of the Sherwood West Concept Plan. Appendix 8 provides more detail regarding the provision of transportation infrastructure to the Sherwood West Concept Plan area.

Letter from Jennifer Bragar dated June 23, 2017, at p. 5. Again, the hearings officer is at a loss to understand the opponent's argument, especially since the opponent does not tie their ultimate policy concern back to any specific language in the FHA or any other law for that matter. This argument is simply not developed sufficiently to allow for its review and evaluation. If the argument is that every school siting project has an inclusionary zoning requirement for additional low-income / subsidized housing, that argument is rejected.

SECTION IV: HEARINGS OFFICER'S SUMMARY, RECOMMENDATION, AND PROPOSED CONDITIONS OF APPROVAL.

The applicant seeks to amend the UGB to include approximately 82 acres for a high school with sports fields and the realignment of SW Elwert and SW Kruger Roads. The Applicant has provided sufficient evidence to demonstrate that the criteria are satisfied and the locational factors have been addressed. As detailed herein, the applicant has demonstrated that the high school is currently over capacity and by 2025 will be severely over capacity. Delaying the decision to await a legislative amendment of the UGB by the Metro Council which may or may not occur in the 2018 timeframe only exacerbates the capacity issues which impacts the District's ability to meet the goals of its strategic plan. The applicant provided adequate comparison of the proposed UGB expansion area with other possible expansion areas in seven different urban reserve areas and a determination that the need cannot be met on land currently within the urban growth boundary. In addition the applicant has shown the proposed use can be made compatible with adjacent uses through site design and the city's development design review process provides for public involvement. Additionally the adjacent land is within an urban reserve and is expected to urbanize over time, allowing for the development of a cohesive neighborhood and school/park facility.

Therefore, the hearings officer forwards a recommendation to the Metro Council for ***approval*** of this petition, with the following two conditions of approval:

1. The property must be used for a public high school, associated accessory uses, and public transportation improvements consistent with the application are required for this Major Amendment.

2. The applicant must comply with the Transportation Planning Rule (TPR) at the time the zoning is established on the subject property.

Respectfully submitted this 21st day of July, 2017.

ANDREW H. STAMP, P.C.

The high tech employment Sherwood is targeting for its employment lands in the norther district, is disproportionately white and male; 83% of Executive positions are held by whites and 80% by males. By contrast, employment in agriculture and forestry, which will be displaced and compromised by the Sherwood UGB expansion, is 32.3% Hispanic.

U.S. Equal Employment Opportunity Commission

DIVERSITY IN HIGH TECH

Excerpt from Executive Summary

- Compared to overall private industry, the high tech sector employed a larger share of whites (63.5 percent to 68.5 percent), Asian Americans (5.8 percent to 14 percent) and men (52 percent to 64 percent), and a smaller share of African Americans (14.4 percent to 7.4 percent), Hispanics (13.9 percent to 8 percent), and women (48 percent to 36 percent).
- In the tech sector nationwide, whites are represented at a higher rate in the Executives category (83.3 percent), which typically encompasses the highest level jobs in the organization. This is roughly over 15 percentage points higher than their representation in the Professionals category (68 percent), which includes jobs such as computer programming. However, other groups are represented at significantly lower rates in the Executives category than in the Professionals category; African Americans (2 percent to 5.3 percent), Hispanics (3.1 percent to 5.3 percent), and Asian Americans (10.6 percent to 19.5 percent).
- Of those in the Executives category in high tech, about 80 percent are men and 20 percent are women. Within the overall private sector, 71 percent of Executive positions are men and about 29 percent are women.

Information on Average Rents in Cities in the Portland Metro Area

Submitted by West of Sherwood Farm Alliance

Website data from November 15, 2024

Apartments.com™

Rental Market Trends in Sherwood, OR

What is the average rent in Sherwood, OR?

$1,797/month	728 Sq Ft	+8.8%
Average Rent	Average apartment size	Increase in the Last Year

As of November 2024, the average rent in Sherwood, OR is $1,797 per month. This is 15% higher than the national average rent price of $1,559/month, making Sherwood one of the most expensive cities in the US. When you rent an apartment in Sherwood, you can expect to pay about $1,545 per month for a studio, $1,797 for a one-bedroom apartment, and around $1,887 for a two-bedroom apartment. If you opt for a three-bedroom rental, you could pay $2,265 or more.

Rental Market Trends in Beaverton, OR

What is the average rent in Beaverton, OR?

$1,519/month	683 Sq Ft	+1%
Average Rent	Average apartment size	Increase in the Last Year

As of November 2024, the average rent in Beaverton, OR is $1,519 per month. For comparison, the national average rent price in the US is currently $1,559/month, which means Beaverton rent prices are 3% lower than the national average. When you rent an apartment in Beaverton, you can expect to pay about $1,452 per month for a studio, $1,519 for a one-bedroom apartment, and around $1,746 for a two-bedroom apartment. If you opt for a three-bedroom rental, you could pay $2,034 or more.

Rental Market Trends in Gresham, OR

What is the average rent in Gresham, OR?

$1,362/month	670 Sq Ft	+1.8%
Average Rent	Average apartment size	Increase in the Last Year

As of November 2024, the average rent in Gresham, OR is $1,362 per month. For comparison, the national average rent price in the US is currently $1,559/month, which means Gresham rent prices are 13% lower than the national average. When you rent an apartment in Gresham, you can expect to pay about $1,266 per month for a studio, $1,362 for a one-bedroom apartment, and around $1,584 for a two-bedroom apartment. If you opt for a three-bedroom rental, you could pay $2,053 or more.

Rental Market Trends in Hillsboro, OR

What is the average rent in Hillsboro, OR?

$1,681/month	725 Sq Ft	-0.1%
Average Rent	Average apartment size	Decrease in the Last Year

As of November 2024, the average rent in Hillsboro, OR is $1,681 per month. For comparison, the national average rent price in the US is currently $1,559/month, which means Hillsboro rent prices are 8% higher than the national average. When you rent an apartment in Hillsboro, you can expect to pay about $1,525 per month for a studio, $1,681 for a one-bedroom apartment, and around $1,923 for a two-bedroom apartment. If you opt for a three-bedroom rental, you could pay $2,379 or more.

Rental Market Trends in Milwaukie, OR

What is the average rent in Milwaukie, OR?

$1,461/month	661 Sq Ft	+1.7%
Average Rent	Average apartment size	Increase in the Last Year

As of November 2024, the average rent in Milwaukie, OR is $1,461 per month. For comparison, the national average rent price in the US is currently $1,559/month, which means Milwaukie rent prices are 6% lower than the national average. When you rent an apartment in Milwaukie, you can expect to pay about $1,323 per month for a studio, $1,461 for a one-bedroom apartment, and around $1,637 for a two-bedroom apartment. If you opt for a three-bedroom rental, you could pay $2,023 or more.

Rental Market Trends in Oregon City, OR

What is the average rent in Oregon City, OR?

$1,513/month	672 Sq Ft	+1.3%
Average Rent	Average apartment size	Increase in the Last Year

As of November 2024, the average rent in Oregon City, OR is $1,513 per month. For comparison, the national average rent price in the US is currently $1,559/month, which means Oregon City rent prices are 3% lower than the national average. When you rent an apartment in Oregon City, you can expect to pay about $1,315 per month for a studio, $1,513 for a one-bedroom apartment, and around $1,718 for a two-bedroom apartment. If you opt for a three-bedroom rental, you could pay $2,386 or more.

Rental Market Trends in Portland, OR

What is the average rent in Portland, OR?

$1,508/month	647 Sq Ft	+0.8%
Average Rent	Average apartment size	Increase in the Last Year

As of November 2024, the average rent in Portland, OR is $1,508 per month. For comparison, the national average rent price in the US is currently $1,559/month, which means Portland rent prices are 3% lower than the national average. When you rent an apartment in Portland, you can expect to pay about $1,249 per month for a studio, $1,508 for a one-bedroom apartment, and around $1,787 for a two-bedroom apartment. If you opt for a three-bedroom rental, you could pay $2,089 or more.

Rental Market Trends in Tigard, OR

What is the average rent in Tigard, OR?

$1,569/month	683 Sq Ft	+4.6%
Average Rent	Average apartment size	Increase in the Last Year

As of November 2024, the average rent in Tigard, OR is $1,569 per month. For comparison, the national average rent price in the US is currently $1,559/month, which means Tigard rent prices are 1% higher than the national average. When you rent an apartment in Tigard, you can expect to pay about $1,578 per month for a studio, $1,569 for a one-bedroom apartment, and around $1,753 for a two-bedroom apartment. If you opt for a three-bedroom rental, you could pay $2,159 or more.

Rental Market Trends in Tualatin, OR

What is the average rent in Tualatin, OR?

$1,586/month	652 Sq Ft	+2.4%
Average Rent	Average apartment size	Increase in the Last Year

As of November 2024, the average rent in Tualatin, OR is $1,586 per month. For comparison, the national average rent price in the US is currently $1,559/month, which means Tualatin rent prices are 2% higher than the national average. When you rent an apartment in Tualatin, you can expect to pay about $1,480 per month for a studio, $1,586 for a one-bedroom apartment, and around $1,780 for a two-bedroom apartment. If you opt for a three-bedroom rental, you could pay $2,154 or more.

Rental Market Trends in Wilsonville, OR

What is the average rent in Wilsonville, OR?

$1,582/month	711 Sq Ft	+1.3%
Average Rent	Average apartment size	Increase in the Last Year

As of November 2024, the average rent in Wilsonville, OR is $1,582 per month. For comparison, the national average rent price in the US is currently $1,559/month, which means Wilsonville rent prices are 1% higher than the national average. When you rent an apartment in Wilsonville, you can expect to pay about $1,407 per month for a studio, $1,582 for a one-bedroom apartment, and around $1,767 for a two-bedroom apartment. If you opt for a three-bedroom rental, you could pay $2,256 or more.

About this Report

The report responds to specific legislative direction dating back to House Bill 2003 (2019). This bill charted a new direction to more fully and equitably meet housing needs as required by Goal 10: Housing, of Oregon's statewide land use planning program. House Bill 2003 led to multiple reforms, including a requirement for local adoption of Housing Production Strategies (HPSs) and the development of a new pilot methodology for estimating statewide housing need. In House Bill 2003 and the pilot methodology the model to estimate statewide housing need was called the Regional Housing Needs Analysis (RHNA), but it is now called the Oregon Housing Needs Analysis (OHNA).

In a budget note in House Bill 5006 (2021), the Legislature then directed Oregon Housing and Community Services (OHCS) and the Department of Land Conservation and Development (DLCD) to deliver recommendations on how to implement the OHNA in advance of the 2023 Legislative Session. The Legislature followed up with additional direction in House Bill 5202 (2022) to address issues related to land capacity and the implementation of the OHNA.

This report documents the core components of the agencies' recommendations. While it may be possible to consider some of these recommendations in isolation from others, our core finding is that Oregon's ongoing housing crisis requires comprehensive and structural changes to Goal 10 implementation and housing production. Many precedent documents and processes inform these recommendations:

1. OHCS and DLCD each published reports in 2021 (OHCS summary report, OHCS technical report, and DLCD report) describing technical elements of the new statewide methodology for calculating housing need and recommending legislative action to implement it.
2. In early 2022, OHCS and DLCD developed an initial framework document, titled *Meeting Oregon's Housing Needs: Next Steps for Equitable Housing Production,* to describe how the new methodology might be incorporated into the state's Goal 10 processes. The recommendations herein build from this framework.
3. DLCD and Communitas Consulting facilitated a working group, which met six times to inform recommendations. To review meeting materials and summaries, visit the OHNA Project Webpage.
4. Kearns & West led six stakeholder focus groups and three follow-up sessions with partners from nonprofit, development, local government, and fair housing organizations to solicit input. A summary of all stakeholder engagement is included in Appendix E.
5. DLCD held 14 regional forums with local government planners, developers, elected officials, and advocacy groups around the state to inform recommendations. A summary of all stakeholder engagement is included in Appendix E.
6. In response to a 2022 legislative budget note and direction, DLCD led a parallel Housing Capacity Working Group, charged with considering specific reforms to the Housing Capacity Analysis and the process described in statewide planning Goal 14-Urbanization. This group met a total of seven times to inform recommendations, which are included in Recommendation 1.4 and Appendix A of this report.
7. ECONorthwest conducted best practices research into what is working in other states and reviewed an audit of California's housing planning system to inform these recommendations.
8. ECONorthwest completed a series of technical revisions to the initial pilot methodology and prepared a report summarizing these refinements, which is included in Appendix D of this report.

9. The University of Oregon conducted a literature review and a survey of planners, developers, and local governments regarding barriers to development and published a report summarizing their results, which is included in Appendix F of this report.

Executive Summary

Oregon's housing undersupply threatens the very core of our common purpose as Oregonians. We cannot grow sustainably, move toward a more equitable economy, or address the full complexity of the homelessness crisis unless we substantially increase our supply of homes.

Making meaningful progress will require comprehensive system reforms. While Oregon has already made great strides, including through recent legislative initiatives such as House Bill 2001 and House Bill 2003 (2019), we are still falling behind. To continue, the state and its communities must now tackle the harder reforms needed to prioritize housing production.

Our current system plans for and invests in too little housing. The outcome is undersupply, rising home prices, segregation and displacement in some communities, and deepening inequities across all communities. Together, we must plan for and build the housing we need, where we need it.

The recommendations in this document describe the comprehensive, system-wide reforms needed to reverse decades of underinvestment in housing production and development readiness, organize our land use planning systems toward the common goal of building housing, and begin to redress disparities in housing outcomes. These recommendations can only make a difference if the Oregon Legislature commits to serious reform of the land use planning system, helps local governments pay for public infrastructure and affordable housing, and creates a cohesive state approach to housing production. Those comprehensive reforms will require significant investments, as well as changes to state statute, rule, and guidance to implement. In summary, they are:

Housing Under-Production is a National Problem

Oregon is not alone. While nearly every state is experiencing underproduction, Oregon's outcomes are among the worst.

Measured as a share of housing stock, **Oregon ranks 4th in under-producing housing in the country** behind California, Colorado, Utah, and ahead of Washington State.

Recommendation 1) Plan for what's needed.

Oregon's land use system needs to balance housing production with growth management, economic, and environmental goals. For this to work, the system requires a reorientation that starts with an updated and consistent statewide methodology to more clearly determine housing need and equitably distribute it among jurisdictions. Planning for what's needed requires that:

1.1 **Adopt OHNA Methodology.** Formalize the OHNA methodology as the standardized, statewide source for setting common goals for housing planning. OHCS and DLCD have extensively reviewed and refined the 2019 pilot methodology (see Appendix D for refinements) Maintaining and deploying it will require administrative and technical capacity, a regular cycle of review and update to incorporate new data, and annual database management to track statewide progress toward housing production targets.

What is the Oregon Housing Needs Analysis?

The OHNA is the cornerstone of a reformed housing planning system. It provides a comprehensive, city-by-city estimate of housing need by income, along with data and information about how local housing outcomes vary by race and ethnicity, age, disability status, and other identity markers. When implemented, it will be a regularly updated data suite that can be used to set state and local **housing production targets**. It provides a **more accurate representation** of full housing need and a **more equitable distribution of affordable housing** throughout regions.

In the methodology alone, the **ONHA takes a big step toward equitable outcomes** compared to the current Housing Capacity Analysis methods, by incorporating historic housing underproduction and housing needed for people experiencing homelessness into future production targets, and by **using regional incomes to project housing need** by income level. In addition, the OHNA would be the source of annual housing production dashboards that provide clear metrics that can be used to track and monitor real production outcomes and metrics related to housing equity.

1.2 **Establish Production Targets and Equity Indicators.** Establish housing production targets and equity indicators, produced by the state, for cities with a population above 10,000 people to help solve our crisis. The state would measure progress toward targets in an outcome-driven system that adjusts policies over time.

1.3 **Emphasize Housing Production Strategies.** With their OHNA-derived housing production targets and strengthened policy requirements, cities would craft community-led and implementable Housing Production Strategies (HPSs) that promote equitable housing production and overcome locally specific development barriers.

1.4 **Streamline UGB Amendments.** Improve and streamline land capacity and urbanization processes to expedite well-planned expansions that support needed housing where capacity is limiting production.

Recommendation 2) Build what's needed, where it's needed.

It's one thing to plan to accommodate housing and another for that housing to be built. Where housing is built and for whom dramatically impacts who prospers and how our neighborhoods function. Building what's needed where it's needed will require us to:

2.1. **Commit Sustained, Coordinated Investment.** Commit resources for housing production, affordable housing production, and development readiness, including infrastructure funding. This is not a one-time, small-scale investment. The state must sustain this effort over time and focus investments in the construction of housing that the market is least likely to produce without aid: housing for low- and middle-income households and housing in rural and coastal markets. Creative financing and funding sources that leverage private investment should be considered. Additionally, the state has the opportunity to better coordinate existing resources and focus funding toward the goal of housing production (see Recommendation 3.1).

2.2. **Reinforce Housing Choice for All.** Use the implementation of Housing Production Strategies to advance fair and equitable housing outcomes, including addressing segregation and displacement.[1] We must build more housing in the places where it is needed, with intentional strategies that aim for fair housing and enable housing choice for all.

Recommendation 3) Commit to working together with urgency.

Housing underproduction is a systemic problem that no one actor can resolve. Public, private, local, and statewide entities all have a role to play and can become obstacles when not coordinated. **There is no one entity or person responsible for the public sector role in housing production at the state level.** For our state to have an effective system to accelerate housing production, we must have coordinated administrative systems that can deliver. Working together with urgency requires us to:

3.1. **Establish a Coordinated Governance Structure.** Develop a mechanism for state agency administration, collaboration, and accountability, to make rapid progress toward housing production goals. The solution should encompass a housing production team composed of experts in development, affordable housing development, fair housing, planning and development code, permitting processes, etc. to diagnose and overcome development barriers to quickly identify and implement policy or funding interventions where needed.

3.2. **Continue State and Regional Policy Action.** Develop strategies in which the State and Metro Regional Government (Metro) clearly articulate the tools, actions, and policies the state and regional governments will employ to meet housing production targets. These strategies should describe what they will contribute to partnerships with local jurisdictions, consistent with their statutory and charter limitations. Metro will continue to manage its region's land use planning processes and will use housing projection methodologies consistent with the OHNA. The state will allocate housing production goals to local jurisdictions within the Portland Metropolitan Area.

Implementation Considerations

Few policy imperatives are more important to Oregon's future than increasing the pace of building new homes. Housing production is on the critical path to building Oregon's economic competitiveness, helping families prosper, and improving community resilience. Simply producing the units needed to meet current demand could generate up to $40 billion in additional economic growth, a boost that would benefit us all.[2]

---

[1] Those who most often face housing discrimination, segregation, and displacement include, but are not limited to, low-income households, households of color, people with disabilities, large families, other federally protected classes, and households with other specific housing needs.

[2] This estimate is based on Oregon's share of the national economic benefits that come from producing 3.8 million housing units across the country over a 20-year time period (as described in Up for Growth's *Housing Underproduction in the U.S. 2022 Report*), scaled to match the OHNA estimates of current underproduction and units needed for people experiencing homelessness. Economic growth is measured as increase in gross domestic product.

Implementing these recommendations will likely need to be sequenced over more than one legislative cycle. To make near-term progress on their implementation, we recommend that the Legislature consider bills in the 2023 session that advance the goal of building more homes. DLCD and OHCS look forward to continuing conversations about solutions and refining these recommendations in advance of and during the 2023 legislative session.

A. Redefine Oregon's Planning Process for Housing

The Legislature should establish the OHNA as the foundation for Goal 10 planning processes in state statute, including directing cities to replace local projections of need in Housing Capacity Analyses (HCAs) with OHNA-generated 20-year need. It should strengthen HPSs by requiring actions that address housing barriers and advance fair housing outcomes, and by incorporating production targets based on the data provided in the OHNA. Additionally, the Legislature should make statutory changes necessary to make needed urban growth boundary (UGB) expansions[3] more efficient and certain and support housing production within the UGB.

B. Coordinate State Response

The Legislature should establish a Housing Production Team and administrative leadership position. This team should be deployed as quickly as possible to achieve early housing production wins by helping cities build on challenging development sites, removing barriers, and focusing state resources. Additionally, this team should be charged with developing the first ever statewide Housing Production Strategy, which can shift the state's energy and efforts to this urgent challenge. The Legislature should direct staff at a broad cross-section of agencies, including DLCD, Oregon Housing and Community Services, Business Oregon, the Oregon Health Authority, the Bureau of Labor and Industries, and the Oregon Department of Transportation, to coordinate their activities and (as appropriate) available funding toward the goal of housing production in coordination with the new Housing Production Team.

C. Create Innovative Funding and Finance Solutions

In addition to funding affordable housing production through OHCS, the Legislature should establish new housing production funding mechanisms aimed at housing the market cannot produce on its own, including middle-income housing. Along with better coordination of existing funding sources, new sources for infrastructure funding, systems development charges, and pre-development activities are needed. Several formal and informal groups of stakeholders are considering innovative funding and financing mechanisms that are resonant with the recommended fund types in this report.

[3] Each Oregon city is surrounded by an urban growth boundary (UGB); a line that designates where a city expects to grow over a 20-year period. Generally speaking, it's where the city ends, and the farms and forests begin.

I. Introduction: Our Housing Crisis

Oregon's lack of housing threatens the very core of our common purpose. Decades of underbuilding have driven up home prices and rents and left too many without adequate housing choices. Too often, people can't afford housing at all. We won't be able to grow sustainably, move toward a more equitable economy, or address the full complexity of the homelessness crisis unless we substantially increase our pace of building new homes. Over the next 20 years, Oregon's communities need to add more than 550,000 units, over 30 percent of which will house Oregon's lowest-income residents and will most likely require public funding or subsidy. We must organize our systems to plan for and build these homes.

We cannot equitably distribute what is being underproduced. The people who are suffering most acutely from our housing shortage are disproportionately lower income households and communities of color. The lack of housing options perpetuates segregation through economic exclusion. By restricting people's housing choices, we make Oregon less fair, deprive people of basic human dignity, and limit our collective growth and prosperity. Where housing is built and for whom dramatically impacts who prospers and how our neighborhoods function. We need a range of housing types for all income levels, distributed equitably around and within each region of the state, providing access to employment and critical services and reducing the overall cost-burden to families and individuals.

This applies to both renting and homeownership. For most Americans, homeownership is the primary path to building personal and generational wealth. However, housing scarcity inverts the American dream. The market caters mostly to wealthier buyers, while rising housing costs make it nearly impossible for many to buy their first homes. At the same time, the lack of housing increases the need for publicly financed units and ultimately forces the most vulnerable people to become unhoused. This is devastating for people experiencing homelessness and has negative social and economic impacts on communities.

Oregon's system of comprehensive land use planning describes a decades-old intention to do better. It embodies the state's core values and has long represented a consensus on the preservation of farm and forest land, the importance of community engagement, and the need to plan for a healthy economic future. It also includes a requirement that jurisdictions plan for the "availability of adequate numbers of needed housing units at price ranges and rent levels which are commensurate with the financial capabilities of Oregon households."[4] However, Oregon has not fully realized this vision and many thousands of Oregonians lack an affordable, accessible, or safe place to live.

A recent survey conducted by the University of Oregon sheds light on what is not working. The survey found broad agreement that we face significant challenges in the cost, availability, and readiness of land to support development as well as the prohibitive cost of infrastructure, materials, and labor. There are sharper divides among those surveyed, however, when

[4] Goal 10 of Oregon's Land Use Planning: https://www.oregon.gov/lcd/OP/Documents/goal10.pdf

determining who is responsible for causing and addressing the current crisis. The survey finds that local governments tend to implicate the lack of funding and inflexibility on the part of developers to deliver a broader range of housing types, while private and non-profit developers view over-regulation and onerous processes as the culprit. Meanwhile, for the most part, local governments interested in advancing affordable housing solutions have been left on their own, without meaningful coordination or investment from the state to help find and implement solutions.

By statute, DLCD regulates the land use planning and policy that is implemented at the local level. OHCS funds affordable housing production and preservation. However, *no state agency is directly responsible for overall housing production*. This has left some jurisdictions without workable solutions to incentivize market or affordable housing production and allowed others to avoid their housing obligations. We should not be surprised that, despite the best efforts of the agencies and local governments, the outcome of this disconnected system has been decades of housing underproduction and the perpetuation of housing inequities.

The recommendations offered in this report focus on streamlining statutory requirements and bureaucracy so that Oregon can deliver real outcomes -- more housing in all parts of the state, a diversity of housing types, and more affordable units where they are needed. We offer these recommendations with a great sense of urgency. While there are many efforts underway to address the immediate symptoms caused by our lack of housing, we will not be able to meaningfully address the hardships faced by Oregonians until we focus on the long-term solution: providing more housing options for everyone, everywhere.

A Shift in Focus That Benefits Us All: Leading with Production

While the originators of Goal 10 intended for careful planning that would result in balanced, diverse, and affordable outcomes, implementation has fallen far short of that intent. The historic implementation of Goal 10 has overemphasized "accommodation" of housing need by completing an accounting exercise of the theoretical capacity of land, while doing little to ensure that housing is built or address where it should be located and whether households are realistically able to access it. This has negative consequences for all Oregonians – with dramatic underproduction, rising rates of cost burdening and homelessness, and continued patterns of segregation and involuntary displacement. The state needs to make comprehensive updates to our planning systems to better produce needed housing.

The recommendations in this report shift the current system's focus on accommodating potential housing growth to building the housing Oregonians need. We do this by:

- Accurately identifying what housing is needed by income and holding ourselves accountable to action
- Equitably allocating housing need within and between communities
- Requiring jurisdictions to consider context-specific actions to address displacement and segregation

- Providing strategic, flexible funding for housing the market cannot build on its own
- Connecting existing Fair Housing[5] obligations to our land use system and Housing Production Strategies to support diverse, quality, physically accessible, affordable housing choices with access to economic opportunities, services, and amenities
- Measuring and evaluating progress towards improved housing outcomes, especially for those who have been historically underserved

Taken together, these recommendations can transform our system from one that plans for and invests in too little housing to one that plans for and builds the housing we need, where we need it.

Our Shared Housing Obligation

We all share a responsibility to find the solutions that let us build what's needed where it's needed. The lack of sufficient units affects every community, but the people who are suffering most acutely from our housing shortage are disproportionately lower income, communities of color, or people with disabilities. They cannot be asked to wait another decade or more for Oregon to reverse the discriminatory policies and practices that have limited their housing options.

Solutions include: policies that enable production, public and private investment in a range of housing types, and clear policy goals so we can hold ourselves and each other accountable to outcomes.

To make meaningful change, Oregon needs a comprehensive system reform that brings state and local governments and affordable and market-rate developers together with common goals for building more homes, building more publicly supported homes, and investing in inclusive communities. To achieve this aim, we need a clear shift in approach to lead with production.

Reforming the Goal 10 Planning System for Housing

Oregon does not have a clear roadmap to follow for state oversight of housing production. Few other states have attempted a production-focused strategy, and none of them share Oregon's statewide land use planning system. While our review of national best practices provides lessons learned from other states, applying them in Oregon requires a thoughtful, carefully implemented approach, at least in part because the Oregon Legislature has already taken some of the suggested steps. In House Bill 2001 (2019), it eliminated zoning exclusive to detached single-unit homes, allowing a greater diversity of housing to be built throughout the state, and required cities of over 10,000 to develop Housing Production Strategies (HPSs). While these are necessary steps that will yield long-term benefits, expedited housing production will also require an alignment of a full suite of policy tools, agency coordination, and public investment.

[5] All recipients of federal funds from the Department of Housing and Urban Development are required to affirmatively further the policies and purposes of the Fair Housing Act, also known as "affirmatively further fair housing" or "AFFH."

In many states that are newer to comprehensive planning initiatives, zoned capacity limits housing production. Oregon's problems are different. The state has already increased zoned capacity to enable production, including through recent legislative initiatives such as House Bill 2001 (2019). Now, we must tackle the harder reforms needed to lead with production. We need to make sure that enough zoned capacity is available in the right places so that community members, especially those who have experienced historic marginalization, have meaningful choices in where they live and what kind of housing choices are available to them. At present, our system generates lower housing production in whiter, more affluent communities and expands capacity mostly in lower-income and more diverse communities. We need to improve the often onerous and contentious system for allowing jurisdictions to add land needed to meet growth and current housing deficits. And, most importantly, we need to turn our attention and investments to making land ready for development, advance state and local policies that are supportive of increased production and housing options and accelerate affordable low- and middle-income housing construction.

The recommendations in this report are far-reaching and will fundamentally change the way Oregon plans for and produces housing. If adopted, these changes could modernize Goal 10 into a national model for housing production. Goal 10 systems reform can deliver:

- **Increased focus on local actions that enable land readiness and production**, including removal of zoning and regulatory barriers and access to infrastructure investment
- **A smoother and less litigious UGB expansion process**, supported by the land use efficiencies in housing production strategies, a more accurate representation of housing need and capacity, and increased flexibility to unlock land where it's needed
- **Advancing fair housing goals**, by expanding production and housing options in historically exclusionary areas and integrating diverse, affordable, quality, and accessible housing across regions
- **Better and clearer guidance on local actions**, clarifying the purpose of each planning function and reducing and streamlining current requirements

These improvements are anchored by the objectivity of the OHNA methodology, data, and unit allocation to local jurisdictions. It is critical that these goals be seen as achievable and not an unfunded mandate. Discussions with local governments, market rate and affordable housing developers, and various advocacy organizations throughout the state have clarified that the state needs to implement changes that foster **partnership** between state and local governments, **accountability** to working towards housing need, and **investment** to support affordable housing production that the private housing market cannot produce on its own.

II. Core Recommendations

Recommendation 1) Plan for what's needed

Overview: Lead with Production

Leading with production requires a fundamental shift from a more passive planning approach to accommodate growth to outcomes-based strategies that focus on production.

As directed by statute, our current system addresses housing need by using past development trends to calculate the land supply and zoning capacity needed to meet future demand. However, past trends may not reflect the actual regional housing need and demand for housing options in any particular location. In this current system, most jurisdictions systematically underestimate their future housing demand, and especially underestimate their demand for housing for lower income households, because the demand was not appropriately accounted for originally and was reinforced through low production performance. This creates a negative feedback loop where underproducing housing, especially affordable housing, causes future projections to further underestimate need. A consequence of this dynamic over several decades is that the Housing Capacity Analysis (or Housing Needs Analysis), the historic implementing document of Goal 10, has become a land supply calculation and growth management tool that has little to do with actual housing production needed for a healthy society and economy. Instead, Goal 10 implementation has enabled and reinforced housing inequities between and within communities.

Overcoming this challenge requires implementing a new methodology that better estimates total need and does not rely on past development trends to determine where growth will occur (recommendation 1.1), setting production targets and measuring progress toward those targets and equitable outcomes (recommendation 1.2), strengthening Housing Production Strategies so that they are better organized to remove barriers to development (recommendation 1.3), and streamlining the process for expanding urban growth boundaries when they are needed in a coordinated housing planning system (recommendation 1.4).

1.1 Formalize the OHNA as the foundation for housing planning in Oregon.

Part of 2019's House Bill 2003 directed OHCS to develop a pilot methodology to estimate Oregon's statewide housing need. In its inception, this methodology was called the Regional Housing Needs Analysis or RHNA, borrowing the term from California. In this implementation work, it is renamed the Oregon Housing Needs Analysis, or OHNA, to better reflect its evolution to a unique, Oregon-specific model. The pilot analysis was completed and extensively reviewed in 2020, including a full results report, technical methodology, and assessment report that documents how this methodology improves upon current processes.

The OHNA methodology is the cornerstone of a different approach to Goal 10 implementation. The recommendations in this report assume access to the data and information that would come from implementing the OHNA methodology. The OHNA methodology will provide a data-informed measurement of housing need in each area of the state that, (i) estimates units needed

to meet current and future housing need, (ii) catches up with past underproduction and the resulting pent-up demand, (iii) accounts for people experiencing homelessness, and (iv) ensures a more equitable distribution of affordable units within a region. Using this methodology, the state will calculate and allocate housing need with a standardized approach, replacing housing needs projections that are currently developed by local jurisdictions at great expense of time and resources.

As part of this implementation effort, DLCD and OHCS recommend changes to the pilot methodology to fully account for the impacts on housing markets from second and vacation homes, improve and broaden indicators of housing outcomes, and better align income brackets with funding sources available to support affordable housing production. These recommended changes are documented in the technical report included in Appendix D. The revised methodology suggests that **Oregon needs 554,691 new housing units** to accommodate 20 years of population growth and to account for current underproduction and the lack of units for people experiencing homelessness.[6] About 176,300 of these units, or 32 percent, will need to be affordable for households earning less than 60 percent of statewide area median income (AMI).

With these revisions, the OHNA contains the following parts:

1. **Needed Housing (20-year housing need).** For each city and county and for the state as a whole, the OHNA will provide estimates of housing need for 20 years, by income range. These estimates will replace the 20-year projection of housing need currently completed locally by cities in housing capacity analyses. Local jurisdictions will continue to make critical decisions about the types, characteristics, and location of housing based on the state methodology, community priorities, and context-sensitive local information, such as cost burden, accessibility, and household demographics.

2. **Housing Production Index (housing production targets).** The OHNA will also establish local housing production targets for cities over 10,000 (see recommendation 1.2). These targets set a baseline by which the state regularly tracks and evaluates progress on housing production.

3. **Housing Production Dashboard (measures progress toward meeting need).** Annually, for each city that has a six or eight-year production target, for Metro, and for the State, the state will compile and publish data showing progress toward production targets (see recommendation 1.2 for details) in a housing production dashboard.

4. **Housing Equity Indicators (measures housing outcomes).** For each city, the OHNA model will provide annual reports on housing outcomes. These include data and information about rates of rent burdening and homeownership by race and ethnicity, age,

[6] The pilot methodology estimated a total statewide need of about 554,000 units, of which 110,000 units were due to underproduction. The revised methodology shifts the income bins used and better accounts for the effects of second and vacation homes on total housing stock, which decreases the overall estimate for underproduction while increasing housing need in areas of the state with concentrations of second homes.

and disability status (as data allow for smaller jurisdictions). It can also be updated to include information about segregation and risk of gentrification, or other measures of housing outcomes, such as climate resilience within communities. The information provided will vary from geography to geography; for some smaller geographies, data are insufficient to provide reliable disaggregation. While DLCD and OHCS will lead further engagement and discussion following legislative adoption of these recommendations to confirm the specific measures that are most useful and appropriate, recommendation 1.2 provides initial concepts.

The OHNA will need to be reviewed and updated on a regular cycle as new data become available. This update process should include a process in which the implementing agency consults with a range of experts for peer review and publishes notice and review of the proposed methodology. The most appropriate schedule for significant revisions is likely to be every ten years, timed as new census data and geographic boundaries become available. Smaller mid-cycle adjustments and updates are possible if warranted and resources are available. To maintain and run the model on a regular basis, the OHNA will need to be housed in an agency with data capabilities including housing economics, modeling capacity, database management, and data visualization skills, and with the ability to gather information from local governments about actual rates of production to track progress toward targets.

OHCS oversaw the process of developing the methodology and could continue regularly running and updating the methodology on a regular basis. This work requires staff capacity commensurate with the analytical, procedural, and communications requirements as directed by the Legislature. We estimate that implementation would require a qualified staff person (1 FTE equivalent) to regularly complete and update the methodology, with additional staff capacity to continue work ancillary to the analysis itself, including external communications, public engagement, policy analysis, and data publication, mapping, and visualization. However, the exact number of staff necessary depend on the extent of analysis and engagement directed by the Legislature.

The Oregon Office of Economic Analysis is another possible lead agency for this work in the long run, as they are involved in neither the funding nor regulation of housing and may be seen as impartial. However, it is important to emphasize that this agency has much less programmatic infrastructure in place to conduct this analysis. Therefore, it would very likely take more staff capacity and funding appropriation to implement initially. Overall, regardless of which agency or office manages it, state government needs to closely coordinate the technical work of running and maintaining the OHNA model with implementation of the system (see recommendation 3.1 for more details about system administration).

Broadening "Needed Housing"

Under the current Goal 10 framework, Oregon cities are required to plan for "needed housing", which refers to housing types determined to meet locally identified need at a variety of price or rent ranges. Currently, this means that cities needed to plan for different housing types, such as single-family, multi-family, and manufactured housing types, based on locally-driven analyses. These analyses are conducted by individual cities and consider anticipated population growth, household demographics, local market trends, and various context-sensitive factors.

However, the implementation of this requirement has often overlooked a number of factors that affect need, especially for historically marginalized communities such as people experiencing homelessness, people with disabilities, and communities of color. Additionally, many of the housing types projected in local analyses are based primarily on past development trends, even if that housing is unlikely to meet need or be affordable to current and future residents.

To implement an OHNA, the Legislature would need to establish a statute that requires a state agency to regularly develops and conduct a methodology estimating and allocating housing need to local jurisdictions, including the number of units and the affordability ranges needed over the next twenty years. Additionally, existing statutes would need to be adjusted to better plan for a variety of housing needs, types, and characteristics, including factors that are currently omitted:

- Broadening the types of needed housing to include middle housing and accessible housing,
- Clarifying that household demographics include considerations of race and ethnicity, disability status, and student population (if applicable), and
- Including the effect of second and vacation homes on need, as estimated by the OHNA.

Note: specific changes to the needed housing statute are outlined in greater detail in Appendix C

This would establish a system in which the state estimates the **total amount of housing and affordability ranges** needed, while local jurisdictions make critical decisions about the **types, characteristics, and location of housing** based on the state methodology and context-sensitive local information, such as cost burden and disability status, as well as community priorities.

1.2 Create production targets and indicators and measure progress towards outcomes in local Housing Production Strategies.

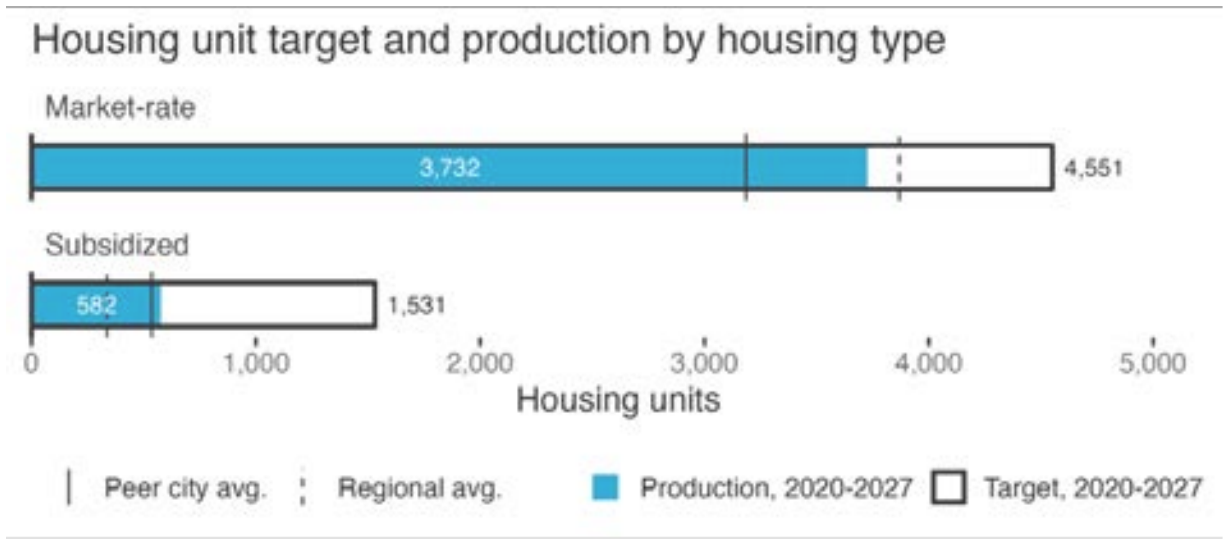
The proposed framework draws from the OHNA's Housing Production Index to set production targets that orient all partners toward common goals for market-rate and publicly supported housing production. Using the OHNA allows the state to benchmark housing production on an annual basis and informs local policy decisions, providing transparent, regular information about progress toward outcomes.

The OHNA methodology addresses inequities in the current system by allocating a share of regional demand to each community based on income, access to jobs, and population. In this way, the state and local governments can collectively begin to address chronic underproduction and geographic inequity at a regional scale. This will allow implementing jurisdictions to make informed decisions about how to plan for an increase in housing production and allow state agencies to partner with local jurisdictions to help fund and implement those plans. It also means

jurisdictions will not have to wait until the end of a six- or eight-year planning cycle to consider housing production.

The state will not expect jurisdictions to hit their targets exactly in each cycle. However, if it is clear that a jurisdiction's production is much lower than in regional or market-based peers,[7] there are likely locally specific development barriers that the jurisdiction must address. A production-focused system will use measurement of progress toward targets to identify these problem areas, and work proactively to address them, bringing state funding and expertise to support. Below is an example of what such a dashboard might look like, with commentary on the data options, for a fictional city.

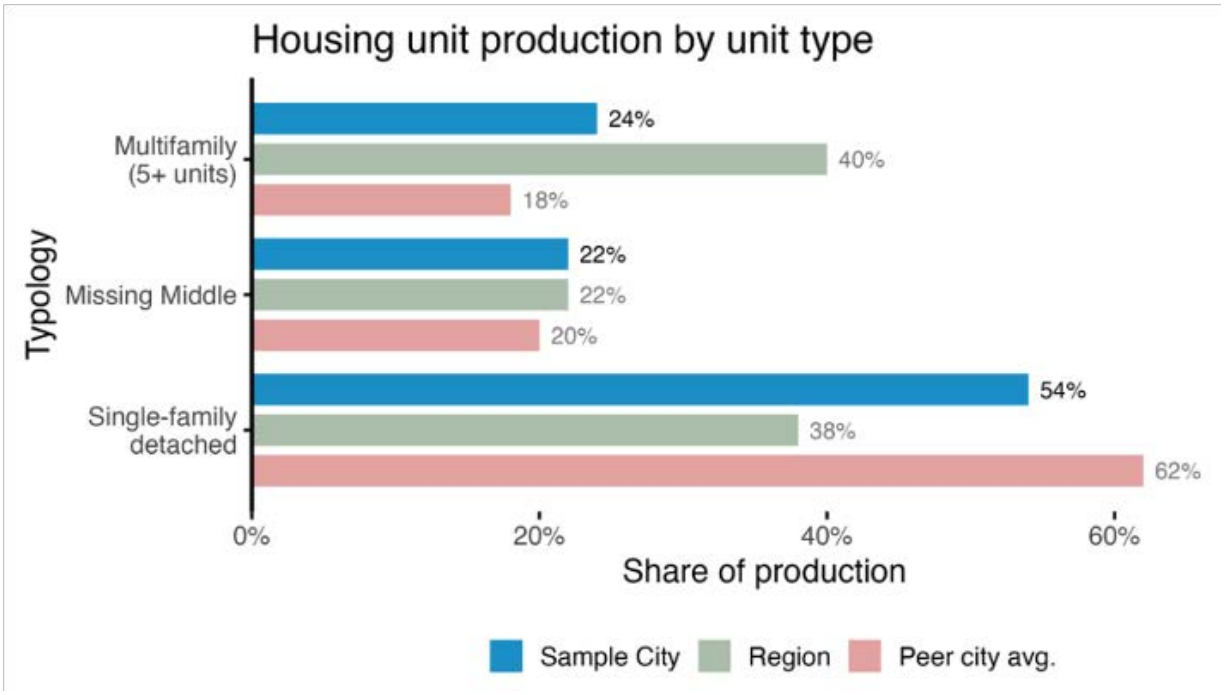
Figure 1. Sample Housing Production Dashboard



Production by housing type

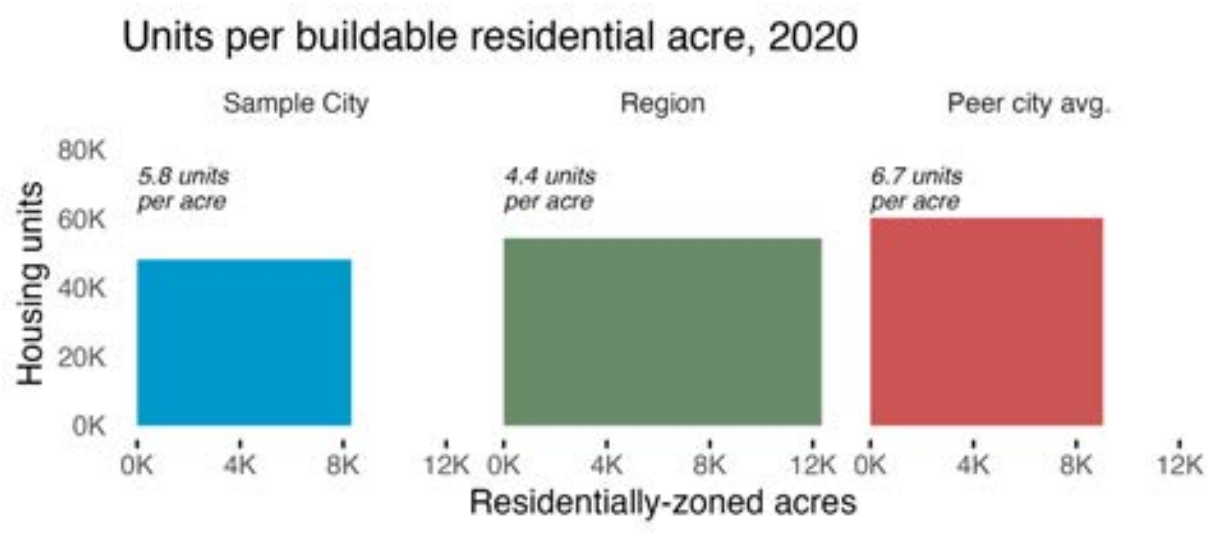
- Track permitting and production data that is already collected by DLCD.
- Compare to region and peer cities to highlight overall housing market.
- Could also provide trend-line.

[7] The technical report included in Appendix D describes how market-based peer cities could be determined.



Production by unit type

- Use DLCD data about the unit typology to track production (or permits) by basic housing typology (single-unit, middle housing, multi-unit).
- No "targets," just relative data and information.
- "Efficiency measures" in the HPS will consistently work towards greater housing diversity and choice.



Land use efficiency

- Could be based on calculations of buildable residential land from local Buildable Land Inventories.
- If a jurisdiction is "built up," the image should expand upwards.
- If a jurisdiction is sprawled, the image would expand to the right.
- No "targets," just relative data and information.

Twenty-year need (the basis for targets articulated in the Housing Production Index) can be produced on an annual basis, so that cities that are on different planning cycles can have access to the most current data inputs as they begin their analyses. For an individual city, production targets will be set for the entire six- or eight-year time period, as either 30 percent of 20-year need (for cities on a six-year cycle) or 40 percent of 20-year need (for cities on an eight-year cycle) and will be based on Needed Housing data available the year they begin their planning process. Progress toward the six- or eight-year target will be measured annually in the dashboard. New targets will be assigned in the next six- or eight-year cycle, based on updated data that reflect progress toward targets in previous cycles.

Targets should be set for both the **total number of units** and the **total number of affordable units** that should be constructed in six or eight years. By tracking progress toward total unit production, the system recognizes and encourages the production of units affordable to all residents and of all types. Achieving total production targets will help cities overcome past underproduction, which is necessary to allow the private market to better meet the needs of middle-income residents. By tracking progress toward publicly-supported units for lower-income Oregonians, the system recognizes that the private market, on its own, cannot meet all housing need. Even in a well-supplied market, these units will need public support, as market-rate units are unlikely to filter to these levels of affordability in a timeframe that will provide real relief to Oregonians in need.

A few considerations about determining thresholds for measuring publicly supported affordable units:

- To establish a target for affordable units, we recommend using one income category, all units affordable to households earning less than 60 percent of Area Median Income, (AMI). While there is substantial need for housing for the lowest income Oregonians (with incomes below 30 percent of AMI) it is not practical to track the production of units at these lower levels of affordability, because these units layer subsidies that are impracticable to measure. It is common to add rent subsidies to help very low-income residents access units that may technically be rent-restricted to those below 60 percent of AMI, rather than to build units that are rent-restricted below 30 percent of AMI.
- While the target is focused on one income category, the Housing Production Dashboard should track and report publicly-supported units at all income categories, including housing affordable to middle-income households earning between 60 and 120 percent AMI. In some instances, these are also publicly supported, with the goal of supporting middle-income or home ownership access. While these data will not fully represent the total amount of housing production affordable to these households, it will measure the impact of state and local subsidies aimed at this segment of the market.

Additionally, the OHNA model will track specific indicators of housing outcomes that can enable jurisdictions to better understand and support strategies designed to overcome inequities in the housing market. The pilot methodology included extensive data analysis and documentation for

cities across the state on indicators of housing outcomes that should be maintained as part of the OHNA dashboard going forward. These included cost burden, tenure, and other factors, by race, ethnicity, age, and disability status.

Additional indicators can and should be added to the dashboard, such as segregation, displacement, a deeper look at housing for people with disabilities, greenhouse gas emission reduction, or climate resilience, based on the priorities established by the Legislature and through rulemaking for implementation. The technical report (Appendix D) describes in more detail the data available to evaluate housing outcome disparities by race, ethnicity, age, and disability status, and offers a few example statistics and graphics. The report also summarizes the data limitations and ways to show as much detail as possible for smaller geographies.

Overall, the dashboard is envisioned as an accessible, publicly available web-based data interface that will provide relevant housing production and outcome data for each relevant geography. The dashboard reporting is a critical evaluative tool that will inform needed refinements to a local jurisdiction's Housing Production Strategies. Over time, the dashboard will also help jurisdictions across the state learn from one another about the types of policy and regulatory approaches that are working well and will provide a simple and transparent way for community members to track progress.

Implementing the OHNA in the Metro Region

Adopting the OHNA methodology will need to operate somewhat differently within the boundaries of the Portland Metro region. Metro Regional Government holds statutory responsibility for coordinating forecasts within its urban growth boundary. This entails Metro completing a regional forecast and distributing expected growth to its constituent cities and counties. This system has proven largely effective for integrating land use and transportation planning, resulting in livable communities and reduced greenhouse gas emissions. Metro and the region's cities have also developed a distinct system for identifying and planning for UGB expansions that includes urban and rural reserves, as well as concept planning for new urban areas. The region's approach recognizes that Metro is responsible for forecasts and managing the UGB while cities and counties are responsible for zoning and service provision. These differing responsibilities require coordination and a focus, not just on land need, but city readiness to urbanize land.

A core purpose of implementing an OHNA is to distribute housing more equitably between cities in a region. Under the current system, localized needs projections reinforce disparate responsibilities between cities in planning for a diversity of housing types and affordability. While the methodology addresses this dynamic statewide, in the Portland Metro, it will be critical that the resultant allocation of housing results in a more equitable distribution of housing in the region while maintaining Metro Regional Government's statutory responsibilities. More importantly, this allocation must be paired with systematic changes to the implementation of Goal 10 to ensure local governments are taking meaningful actions to increase production, diversity, and affordability within their communities. To do this, we recommend a partnership approach among the state, Metro Regional Government, and local jurisdictions, including the following core components:

1. **Metro should maintain its regional forecast coordination and growth management responsibilities** with its ongoing focus on readiness and requiring concept planning for urban reserves before expanding the UGB. Its 20-year regional forecast should include the same considerations that the OHNA considers, including the effect of underproduction, homelessness, and second/vacation homes.
2. **The state should allocate six-year production targets** for local governments above 10,000 population within the region, based on the 20-year regional forecast. These targets should be applied to local Housing Production Strategies and reflect an equitable distribution of housing between cities within the region. For neighboring communities outside of the Portland Metro region and within the tri-county region, the OHNA will estimate and allocate needed housing similar to other cities in the state.
3. **Local jurisdictions should continue conducting Housing Capacity Analyses** to ensure they adopt efficiency measures and strategize preparing buildable lands for development in subsequent cycles of their Housing Production Strategy.
4. **Accountability should be state-driven for local jurisdictions above 10,000 population** to implement meaningful actions that support production. See Recommendation 1.3 for more detail.
5. **Goal 10 should be applicable to urban, unincorporated areas in the Metro.** While cities above 10,000 population in the Metro must regularly plan for housing under Goal 10, there are substantial urban, unincorporated areas in the Metro UGB that are currently omitted from this requirement. Addressing this will require cities and counties in the Metro to amend or establish agreements to ensure urban, unincorporated areas are planned for under Goal 10. While the counties may in many cases have current zoning authority over these areas, it is important to stress that planning for these areas should not become the sole responsibility of counties, given that cities typically provide urban services to annexed areas. Further, in those areas not anticipated to be annexed by cities, the state must be prepared to provide on-going funding and investment to Metro counties to ensure they have sufficient resources to complete any needed interim Goal 10 requirements for urban, unincorporated areas.
6. **Metro Regional Government should complete a "Housing Coordination Strategy"** similar to local Housing Production Strategies but with an emphasis on regional coordination rather than local policies. See Recommendation 3.2 for detail.

1.3 Strengthen the Housing Production Strategy to promote production and overcome barriers.

The existing rules and laws governing HPS implementation provide a starting place to ensure state and local governments are doing everything they can to promote housing production.[8] According to House Bill 2003 (2019), the Legislature gave DLCD statutory authority to review, amend, and remand Housing Production Strategies. The current accountability system is designed to emphasize general *action towards addressing a need,* rather than achieving specific numerical targets or implementing any one particular action.

The implementation of the OHNA can build on this existing accountability framework and ensure that state agencies and local governments are taking meaningful and effective actions towards housing production. DLCD should incorporate a review of performance and progress

[8] Oregon Administrative Rules 660-008-0065 and 0070.

towards housing production outcomes and OHNA targets as part of its current review process that occurs at development of a new HPS, midway through the HPS implementation cycle, and then again at the six- or eight-year update of the HPS. With this addition, the system would then be organized to define clear goals, transparently show progress toward those goals, learn together about which actions are helping to make progress over time, and adjust strategies accordingly.

The proposed reforms focus community attention on building the housing we need where we need it (the desired outcome), rather than meeting administrative planning requirements that may or may not result in needed housing production. This makes HPSs – the set of identified local planning and policy changes to support housing production – the centerpiece of Goal 10 implementation.

Building Local Capacity

The vast majority of housing is built by the private sector. At the same time, local plans and development policies play a significant role in creating the conditions for housing production. Given the scope of the state's housing crisis, we recommend measuring the effectiveness of an HPS by the outcomes it produces. The goal is not to penalize jurisdictions for missing their targets – it will take time to dig ourselves out of our housing shortage – but to evaluate what is working and to course-correct when strategies are not leading to more housing for communities who need it most.

It is important to emphasize that the implementation of locally-focused policy and funding action on housing will require substantial investments in local capacity. DLCD's 2023-25 Agency Request Budget includes additional staff and a regular biennial investment of $2.5 million intended to provide jurisdictions technical and financial support for Goal 10 implementation. Additionally, the housing capacity recommendations discussed in Appendix A call for additional investment in urbanization planning and technical support. These investments are critical to support housing and urbanization planning, but they are insufficient on their own to fulfill the gap jurisdictions face. For example, the Oregon Office of Economic Analysis estimates that meeting housing production needs identified in the OHNA requires approximately 400-500 more public sector workers per year simply to approve, permit, and inspect the additional units at the local level.[9]

To address this gap, the state should partner with local jurisdictions and provide funding support (described in recommendation 2.1) tied to HPS implementation. Under the current and revised Goal 10 framework, cities above 10,000 in population are required to regularly complete housing planning requirements.

Small, Rural, and Coastal Communities

It is important to emphasize that small, rural, and coastal communities very often face significant and unique challenges with housing production. Many of these communities face significant

[9] Oregon Office of Economic Analysis. "Addressing Oregon's Housing Shortage". Accessed via: https://olis.oregonlegislature.gov/liz/2021I1/Downloads/CommitteeMeetingDocument/256863

economic challenges that significantly inhibit production and have limited resources and staff capacity to support housing planning and production.

While it is reasonable to require larger cities to periodically update plans and policies to support housing production, establishing the same requirements to smaller cities is impractical because they lack the financial and staffing resources needed to complete that work. Therefore, these recommendations seek to lift these communities up and provide them the support they need via the following actions and investments:

- Continue to enable, but do not require, communities below 10,000 to adopt HPSs and access the same funding resources that support production as larger jurisdictions.
- Enable county and regional entities to adopt county- or region-wide Housing Coordination Strategies in coordination with cities below 10,000 to access the same funding resources. See Recommendation 3.2 for more detail.
- Direct state investment to support housing production where the market is unable, with an emphasis on housing affordable to low- and middle-income households in rural and coastal markets.
- Establish a program that enables DLCD to provide funding and capacity to smaller communities without requiring submittal of competitive grant applications.
- Provide direct DLCD analytical support for smaller communities pursuing Goal 10 housing-related initiatives.
- Establish more streamlined analytical requirements and policy responses to housing need for smaller communities.

Housing Production Strategies

While cities are currently required to adopt strategies that comprehensively address identified needs, the current accountability framework does not require implementation of a particular strategy or to meet a specific production threshold. Currently, state administration of the HPS program progresses from collaboration, assisting jurisdictions in need of support, to increasingly more stringent measures should inaction continue. At the highest level of enforcement, if a jurisdiction is recalcitrant towards adopting meaningful strategies that address housing needs, DLCD has the authority to petition the Land Conservation and Development Commission (LCDC) to issue an enforcement order, requiring the jurisdiction to address the deficiency. These recommendations propose an important change to this system: integrating regular data-informed evaluation of progress toward targets and needed housing outcomes as part of the OHNA. This will help focus strategies and provide clear indicators of successful implementation. This additional data and information will help to focus collaborative conversations about the resources and strategies needed to overcome production barriers.

By establishing housing production as the primary indicator of progress, cities can orient their strategies toward the necessary policy changes, housing types, and measures of land readiness to

enable housing outcomes and break the negative feedback loop that leads to underproduction in the current system. Each HPS will be unique to local circumstances, and local expertise is essential to figuring out which strategies make sense in a specific context. At the same time, we can organize local actions into categories that are consistent with statewide goals and best practices for building the housing we need in the places we need it. Tighter definitions of HPS categories will also allow for more consistent evaluation by local jurisdictions and DLCD of their effectiveness and comparisons between peer cities.

The current administrative rule for HPSs requires jurisdictions to provide an interim, mid-cycle implementation report and a full report at the end/start of each cycle.[10] We recommend maintaining these existing reporting functions and will seek to help jurisdictions fulfill the requirements.

Through the OHNA, the state will provide baseline housing needs data that is currently the obligation of cities to generate, as described in recommendation 1.2 above. In addition, the table below provides an overview of the HPS elements that are currently required, and how we propose amending them with clarifications in existing rules and guidance. These changes will ensure that the actions are sufficiently and comprehensively focused on making land ready for development and for equitable housing production.

Figure 2. Suggested Revisions to Existing Housing Production Strategy Elements

Current elements of the HPS	Recommended revisions
Contextualized housing need	The state will provide OHNA-generated baseline data that is currently an obligation of local jurisdictions. Cities may add data necessary to help inform strategies.
Production strategies	When the HPS is adopted and approved, funding for implementing these strategies is unlocked. Strategies must address the following categories of actions: ▪ Zoning and code changes ▪ Reduce regulatory impediments ▪ Financial incentives and resources ▪ Land use efficiency measures ▪ Development readiness ▪ Fair housing (more details in recommendation 2.2) To support development of these strategies, new guidance will be needed regarding fair housing, housing mix and land use efficiency measures, and DLCD's defined HPS program outcomes.
Engagement	Local governments will continue to engage consumers and producers of needed housing, as required by current administrative rules. Future state level guidance will be needed to support this work and Goal 1.
Fair housing narratives	New data will be available to support cities' fair housing strategies and reporting through the OHNA, measured as annual indicators of housing outcomes. DLCD will provide additional guidance about how cities can use production-related policies and actions to advance fair housing.

[10] Oregon Administrative Rule 660-008-0060.

Accountability

Throughout this process, accountability at all levels of government was raised as a substantial condition for success needed to facilitate the development of needed housing. While DLCD has an existing accountability framework predicated on timely, good-faith implementation of tools, actions, and policies that promote production, participants raised a need to better clarify this framework. Specifically, it is not clear under the current framework how underperformance in market rate or affordable housing production will result in meaningful funding or policy interventions to increase production, nor is it sufficiently clear that failure to take meaningful action will be met with appropriate enforcement actions.

It is important to emphasize that under any accountability framework, it will take substantial investment at the state level to support the kinds of policy and funding interventions that are needed to increase production. This report calls for that investment in partnership with local governments to increase local capacity and funding needed to build housing, especially housing that the market would not otherwise produce on its own (see Recommendation 2.1). Additionally, while many participants have called for increased local accountability, many participants have also correctly asserted that local governments only control a portion of the policy levers that affect housing production and affordability. Underproduction of housing is a consequence of a myriad of policy and economic factors, and any accountability framework should acknowledge and reflect this dynamic.

Recognizing that accountability requires substantial Legislative decision-making, this report provides several considerations to inform future discussion that provides policy pathways that balance perspectives heard throughout the process. First and foremost, the project team recognizes that **unmet housing need should be addressed with meaningful action from all levels of government**. Achieving that goal requires three major components:

1. Clearly define "unmet housing need" through the OHNA
2. Respond to identified unmet housing need through local and state policy and funding interventions, in partnership.
3. Establish clear enforcement parameters to ensure timely action.

1. Define "unmet housing need"

Recommendation 1.2 establishes housing production targets and provides baseline data by which the state regularly tracks and reports housing outcomes, including annual market-rate and affordable housing production, for cities above 10,000 population. Additionally, it includes relative peer and regional assessments of local jurisdictions to assess the relative performance of jurisdictions by geography and market typology. While this information is not sufficient on its own to definitively assess underperformance, it provides a critical barometer to direct policy and funding interventions.

If a local jurisdiction consistently produces less housing in comparison to the region and other similar housing markets, it suggests that policy and funding interventions may be necessary to

facilitate the production of housing[11]. Thus, Recommendation 1.2 enables DLCD, with appropriate direction and parameters assigned by the Legislature, to define a threshold in which a response is warranted.

2. Respond to unmet housing need

Currently, jurisdictions regularly complete Housing Production Strategies to identify tools, actions, and policies that promote production of needed housing, and DLCD reviews and approves, amends, or remands submitted HPSs to ensure they substantially comply with administrative rule. By necessity, this framework requires substantial discretion, because the actions cities take to promote housing production will vary substantially based on local economic, political, and implementation dynamics. As a consequence, there is a lack of clarity on "how much is enough" with regard to identified strategies.

It is possible to provide more clarity through enhanced review and partnership by DLCD. If a jurisdiction is identified as consistently producing less housing than regional or market peers, this could trigger a requirement for DLCD to conduct an audit and review of city policies in advance of their next HPS, focused on identifying the following:

- Financial and regulatory impediments to production
- Financial and regulatory incentives, including available state resources
- Actions that advance fair and equitable outcomes

This audit should include a series of recommendations by which a city could address identified barriers to housing production, either through changes to local policies/actions, coordination of state resources, or other measures. After conducting the audit, DLCD could then be required to develop a performance plan in consultation with cities to establish a series of actions that address the barriers identified in the audit, timelines for the implementation of those actions, and coordination of state and local resources needed for implementation, such as financial or technical support.

This review and performance plan could be extended to a broader range of state agencies with the establishment of a coordinated statewide entity described in Recommendation 3.1, which could provide a much more comprehensive review of the full suite of tools a city could access than DLCD can alone. Additionally, the Legislature could also establish parameters that increase the likelihood of timely and coordinated action, including:

- Establishment of a timeframe by which implementation of actions must be implemented;

  Please note: The timeline must balance the need for urgent action with practicable local implementation, with flexibility to modify timelines to accommodate local circumstances. As a

[11] Interventions cannot be "one size fits all" and should respond to a variety of local contexts and conditions, especially in consideration of fair and equitable housing outcomes. See Recommendation 2.2 and the Technical Report (Appendix D) for more information.

starting place for discussion, one option could be adoption of actions within two years of the adoption of an HPS with flexibility for the state to amend deadlines to accommodate extenuating circumstances.

- Requiring DLCD (and potentially other agencies that distribute financial resources to local jurisdictions) to prioritize funding and technical support for jurisdictions with unmet housing need; and
- Establishing clear and scaling enforcement actions connected to the timely implementation of actions, discussed below.

3. Establish clear enforcement parameters

Communities throughout the state generally support the provision of adequate, affordable housing options within their community, and it is important to recognize that to increase the production of needed housing, most of the time this requires providing resources and tools to communities to support the implementation of that vision. However, it is equally important to recognize that appropriately-scaled enforcement provisions are an important tool in ensuring meaningful and timely action.

It is important to emphasize that **enforcement should only occur upon failure to act timely or act at all, not as a consequence of housing underproduction on its own**. Enforcement should begin collaboratively and take progressive steps in response to inaction, while providing opportunities for jurisdictions to readily come back into compliance. An enforcement policy must recognize that many factors operating at the national, state, and local levels can inhibit production and local capacity to address barriers. It is also critical to emphasize that **without substantial state investment in both local capacity and housing production writ large, it will not be possible to implement an accountability framework that delivers meaningful results**.

Additionally, it's important to recognize that there may be cases where, despite consistent good-faith implementation of strategies to facilitate production, housing production remains stymied due to factors outside of a jurisdiction's control. In these instances, there should be a list of policy options where a jurisdiction can demonstrate they are doing all they reasonably can to promote production, without risking the application of potential enforcement provisions.

Under the current framework, enforcement actions begin collaboratively and become progressively more substantial if delinquency continues, with the most substantial measure being an enforcement order issued by LCDC. A challenge with this approach is it 1) costs significant time and resources to compel action and 2) creates uncertainty as to whether failure to act will result in enforcement. Establishing **clear timelines** and **automatically applicable provisions** when a deadline passes addresses these shortcomings and enables city staff to clearly signal to local decisionmakers what needs to occur by when and what happens in lieu of local action.

Enforceable provisions must be established through legislative deliberation, but generally, the more impactful an enforcement provision is, the more contentious and challenging it will be to adopt, implement, and enforce. Additionally, it is important to consider how enforcement might differ between overall housing production and affordable housing production. Affordable

housing production faces a variety of barriers, and while overall production requires long-term policy solutions to create healthy market environments, there is a compelling argument to expedite and reduce barriers for subsidized affordable housing substantially to proportionally respond to the affordability crisis.

Below are a few examples of provisions the Legislature could consider, organized from less to more impactful:

1. Application of streamlined permitting processes for units that meet zoning requirements and specific criteria – e.g. California Assembly Bill No. 2011 (2022)
2. Application of a "development override" for subsidized affordable housing meeting specific criteria – e.g. Senate Bill 8 (2021) or Massachusetts Chapter 40 B (1969)
3. Application of a "model code" enabling a greater diversity of housing types in a defined area – e.g. House Bill 2001 (2019)
4. Application of tax incentives, such as property tax exemptions, for qualifying subsidized affordable housing meeting specific criteria – e.g. California Senate Bill 196 (2019)
5. Withholding certain state funding sources, such as state transportation funding – e.g. Utah House Bill 462 (2022)

All of the example provisions represent substantial enforcement actions that should not be applied lightly, and any inclusion of such provisions should not be applied until there has been substantial opportunity to address barriers, including state partnership and investment to overcome barriers to housing production.

Other Major Statewide Policy Initiatives

A critical dynamic in the implementation of the Oregon Housing Needs Analysis is how systemic changes to the housing planning system interface with other statewide policy initiatives. In particular, there is significant ongoing policy work related to climate change, wildfire, and housing preservation that stakeholders raised as intersecting with legislative recommendations.

Climate Change

The Land Conservation and Development Commission adopted rules for Climate-Friendly and Equitable Communities in July 2022. The rules require fifteen communities to designate "climate-friendly areas" – walkable, mixed-use neighborhoods where residents, workers, and visitors can meet most of their daily needs without having to drive. These areas are required to accommodate 30% or more of a community's projected 20-year housing need. This raises a critical question: how do we ensure that we are able to provide significantly more housing while planning for neighborhoods that mitigate greenhouse gas emissions?

This was a substantial consideration during rulemaking. Stakeholders and DLCD staff wanted to ensure that ambitious policy facilitating climate-friendly areas did not inhibit a community's ability to plan for an adequate supply of housing by creating "phantom capacity" – capacity on paper that is unlikely to be realized in practice. To achieve this, the rule requires cities to designate this capacity *in addition to* their 20-year land supply, but this capacity does not "count" until development occurs.

This is a key strategy in planning for significantly more housing. Climate policy and housing policy are inextricably linked, and addressing both requires building a substantial amount of housing in walkable, mixed-use neighborhoods that mitigate greenhouse gas emissions. In all Oregon communities, we need to plan for this abundance while also conservatively estimating land capacity to ensure that these policies do not artificially inhibit an adequate supply of land. In total, the OHNA recommendations ensure that communities are planning for this abundance, ensuring there is an adequate supply of developable land and preparing land to support housing production.

While adopted rules enable the possibility of "climate-friendly areas" through changes to land use, by itself, it does not guarantee that the housing will actually be built. To ensure climate-friendly areas result in actual production on the ground, implementation will need to ensure the designation of these areas is consistent with funding and policy actions identified in the local Housing Production Strategy. This will include a variety of strategies, ranging from reducing regulatory impediments to providing financial incentives, to support the production of housing in these communities and pair them with the needed investments in infrastructure, transit, and amenities to ensure these communities foster affordability, choice, and resilience in the future.

Wildfire Adapted Communities

As directed by Senate Bill 762, DLCD has published a Wildfire Adapted Communities Recommendations Report for consideration by the Oregon Legislature during the 2023 legislative session. The recommendations focus on potential ways the statewide land use planning program and local comprehensive plans and zoning codes can minimize risk, even as the frequency, intensity, and duration of wildfires continue to increase.

The wildfire report is complementary to this report, providing six recommendations and multiple implementation alternatives intended to increase the resiliency of communities. The emphasis of the report is *not* to prohibit the production of needed housing, but rather, to facilitate development in a manner that reduces wildfire risk and minimizes loss of life and property. Protecting existing homes from wildfires is necessary to prevent housing shortages in fire prone communities. DLCD's recommendations build on the protections recently adopted by the Legislature in SB 762 to minimize the spread of wildfires at the community and neighborhood level, thus further reducing the risks to individual homes and development.

Housing Preservation

This recommendations report makes clear that in order to address the housing affordability crisis Oregon faces today, state and local governments need to plan for substantially more housing and focus policy and funding interventions on increasing housing production. However, an important strategy to support affordability and promote housing stability is the preservation of existing housing supply, especially "naturally-occurring affordable housing" – housing that is relatively affordable without subsidy.

While the recommendations emphasize the need to focus on housing production at all levels of government, the framework should also facilitate the preservation of naturally occurring and subsidized affordable housing that would otherwise be lost to age or demolition. To do this, state and local policies should incentivize and encourage the rehabilitation or adaptive reuse of aging properties while focusing redevelopment on areas with lower risk of displacement, such as in underutilized parking lots or vacant large-scale retail/office sites. The housing capacity recommendations included in Appendix A include several recommendations that incorporate these principles in the local implementation of housing production strategies.

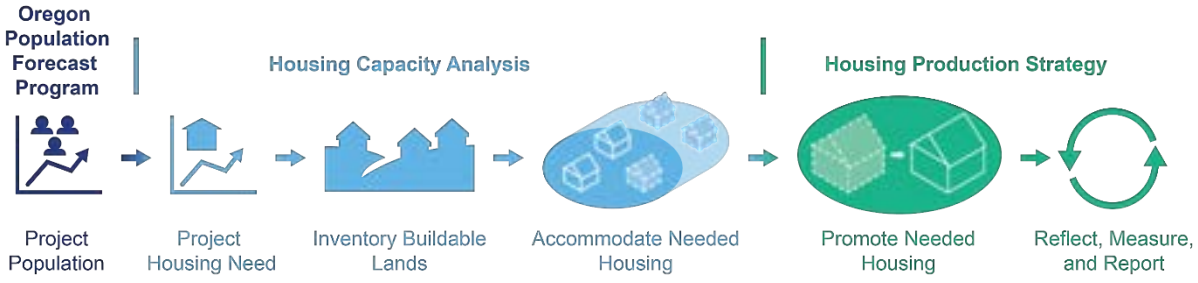
1.4 Streamline land capacity and urbanization processes to expedite well-planned expansions.

A renewed commitment to implementing Goal 10 for housing requires careful consideration of the relationship to Urban Growth Boundary (UGB) expansions. It is important to note that the adoption of OHNA-generated production targets and Housing Production Strategies are required for cities over 10,000, regardless of their existing built conditions and expansion context. In other words, jurisdictions that have achieved some level of infill or are "land-locked", i.e., physically unable to expand their UGB, will still be responsible for a share of the overall need.

UGB amendments are an existing tool to increase the supply of development ready land. Between 2016 and 2021, there have been a total of 35 successful UGB amendments (out of 37), 13 of which were to accommodate residential land needs.[12] Increasing housing supply and providing affordable options will require a combination of planning and policy actions at all levels, and when warranted, this should continue to include UGB amendments. To facilitate a smoother UGB amendment process, this report includes nine recommendations (see page 28) that increase the capacity and flexibility for local jurisdictions to pursue UGB amendments, reduce the likelihood of appeal or challenge of UGB decisions, and better prepare land within the UGB to support housing production.

Under the current system, jurisdictions conduct a Housing Capacity Analysis (HCA), which consists of two major components: a 20-year housing needs projection and a Buildable Lands Inventory. These two analyses answer a critical question: "Is there enough land within the UGB, zoned to sufficient capacity, to accommodate twenty years of projected growth?" If there is a deficiency of land, a jurisdiction must adopt measures to accommodate needed housing. First, the jurisdiction must adopt "efficiency measures," which are policies that increase development within a UGB. If a jurisdiction cannot reasonably accommodate needed housing within a UGB, the jurisdiction must expand its UGB, conducting a locational analysis under Goal 14 to determine which area would best suit the identified need.

Figure 3. The Current Goal 10 Process



The current process requires a local jurisdiction adopt a housing capacity analysis that projects past conditions into the future to determine whether increasing zoned capacity is necessary.

[12] Department of Land Conservation and Development. *Urban Growth Boundary Adjustments 2016-2021.* Accessed via: https://www.oregon.gov/lcd/UP/Documents/UGB_Amendments_2016-2021.pdf

Housing capacity analyses have emphasized characterizing density and counting the hypothetical capacity of lands for housing at the expense of supporting the actual production of housing. The consequence of this dynamic is that, while jurisdictions have substantial land and zoned capacity on paper, this land is not readily developable and housing production slows as available land supply becomes increasingly more costly to serve and prepare for development.

To put the emphasis on housing production, we recommend shifting the focus of land use efficiency measures from a Housing Capacity Analysis limited to analyzing the potential of lands for providing housing to the Housing Production Strategy (HPS) for cities over 10,000, which includes measures to support housing production, prepare land for development, and increase housing efficiency and diversity. Making this change in the HPS can serve a dual function, providing a policy and planning roadmap for housing production while also making the Goal 14: Urbanization process for land supply simpler and more efficient.

With the HPS at the center of housing implementation, communities can consider plans and policies specifically in terms of meeting their housing production goals. Cities can consider where it makes sense to upzone or rezone, where they should make capital investments in community amenities, where they should focus investments in low-cost market rental preservation efforts and affordable housing production, whether they can streamline their regulatory process to reduce costly delays in permitting, and what kinds of housing types match the OHNA-derived need, to name a few examples. Cities can then adopt these updates into local planning documents, ordinances, and/or comprehensive plans.

Leading with production requires some adjustments to the sequencing of Goal 10 compliance within Oregon's land use program. The current system begins with a local, city-based analysis to determine how many new households might demand housing in the future, translates that demand into unit types and income categories based on past development and demographic trends, and then determines whether there is sufficient land supply to meet the estimated future demand. Further, the method of analysis often varies by jurisdiction, meaning that local projections are not consistent and standardized across the state. When there is a gap, this is addressed either through land use efficiency measures such as rezoning and/or by expanding the urban growth boundary. Local governments often make this determination without consideration of the broader regional housing market, where economic growth is anticipated in the future, the current level of housing choice afforded in the region and other regional demographic distributions, desired equitable outcomes, fiscal impacts, or other systemic effects.

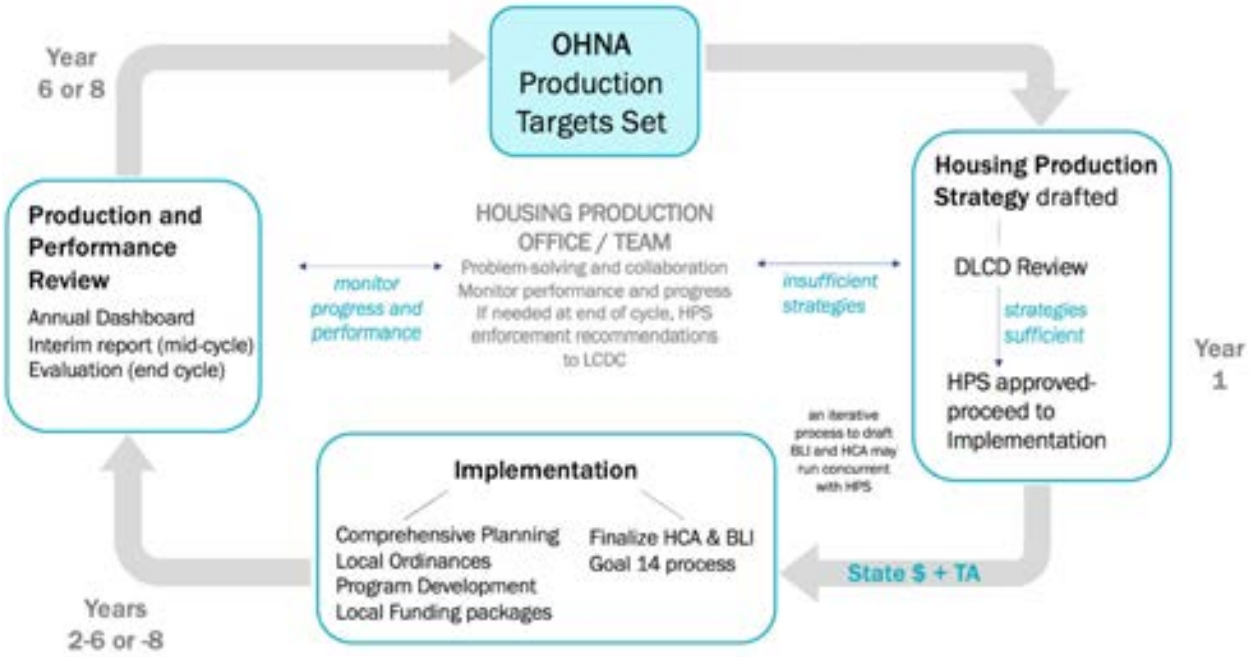
This means that production strategies are only factored in after the jurisdictions have forecast and planned for housing types and determined the need for additional land supply. The process does not take into account the impact that Housing Production Strategies – such as easing regulatory restrictions, minimizing procedural delay, preparing land for development, or increasing housing choices allowed in communities – may have on future development patterns.

This recommendation merges these two processes so OHNA targets inform HPSs, and implementation of those strategies can shape HCAs. In this way, HPS outcomes will inform

future Buildable Lands Inventories (BLIs) and HCAs. While in practice the two processes may inform one another, conceptually, it is helpful to consider this improved Goal 10 implementation process as a cycle in which we transform a negative feedback loop to positive by centering housing production targets. This outcome-focused and comprehensive housing production system will be implemented on a rolling basis, with new targets provided in each planning cycle. If a city is meeting the need and its rates of housing underproduction and cost burdening are declining, its future targets will reflect that progress.

Overall, these process revisions serve to streamline work for local governments by increasing certainty in land supply decisions, providing common datasets that are produced at the state level rather than locally, and creating a space for productive policy discussions in the HPS that are tied to a clear, measurable set of outcomes and targets.

Figure 4. Revised Housing Production Strategy Review Process



House Bill 5202 - Housing Capacity

This recommendation includes a series of refinements to Goal 10 and Goal 14 developed in consultation with a Housing Capacity Work Group, convened by DLCD in response to Legislative direction under House Bill 5202 (2022). Through this process, DLCD has identified a total of nine recommendations to streamline the HCA and UGB amendment process. The net effect of these recommendations would increase local capacity, reduce administrative burden, increase legal certainty, and build on existing tools to facilitate the timely expansion of UGBs and prepare land for development and redevelopment. These recommendations are summarized below. Specific housing capacity recommendations are included in Appendix A. Housing Capacity Recommendations included in this document and are also integrated with the policy outline included in Appendix C.

A. Better Utilize Land within the UGB

1. Enable the adoption of "efficiency measures" in the Housing Production Strategy, enabling a jurisdiction to adopt efficiency measures in advance of a UGB amendment.
2. Direct LCDC to adopt administrative rules and guidance on the local implementation of efficiency measures that support housing production and affordability, prioritizing the following outcomes:
   - Credit recent local implementation of statewide policy initiatives related to housing
   - Increase housing diversity, efficiency, and affordability
   - Enhance flexibility in housing choice and location
   - Reduce cost or delay and increase procedural certainty for housing production
   - Incentivize preservation and stability of naturally-occurring affordable housing
   - Prepare land for development and redevelopment, including underutilized commercial or employment lands

B. Streamline Establishing Need for a UGB Amendment

3. Amend the "needed housing" statute (ORS 197.303) to replace local housing needs projections with the OHNA and provide greater local discretion to plan housing types and characteristics in response to need and market feasibility, rather than primarily on past development trends.
4. Amend the "buildable lands" statute (ORS 197.296) to reflect a more realistic estimation of 20-year residential land supply and provide more options to discount land that is unlikely to develop.
5. Direct LCDC to refine administrative rules related to buildable lands inventories to provide more methodological options for local jurisdictions to estimate land capacity.

C. Streamline Regulatory Review of UGB Amendment

6. Adjust the "urban reserve" statute (ORS 197.145 and 197A.320) and related administrative rules to increase flexibility and ease of local implementation.
7. Facilitate the existing UGB land exchange process to remove lands within the UGB unlikely to develop within twenty years, while adding land that is more likely to develop.

D. Increase Local Capacity & Support

8. Appropriate funding to support local urbanization planning, including UGB amendments, UGB land exchanges, public facilities planning, urban reserve, and concept planning, prioritizing supporting smaller and more rural communities.
9. Focus new housing staff requested in DLCD's Agency Request Budget to focus on urbanization and public facilities planning to support local governments with analysis and technical assistance, prioritizing supporting smaller and more rural communities.

Additional Policy Considerations - Small-Scale UGB Amendment

The nine recommendations listed above reflect a substantial set of reforms developed in a very short timeframe prescribed by the Legislature. Critically, these recommendations reflect a series of refinements that have pretty broad support among stakeholders, even among those who often substantially disagree on urbanization-related policy. However, it is important to acknowledge that discussions surrounding urbanization are often significantly contentious, and given the short duration of the legislatively-prescribed deadline, DLCD staff recognized that consensus building for every policy option would be challenging.

DLCD staff believe that a core intent of the Legislative direction provided under HB 5202 required bona fide discussion on potential policy options that could reduce local analytical burden in pursuing a UGB amendment in exchange for delivery of statewide housing goals. The Legislative direction driving this work under HB 5202 is a direct response to a bill considered in the 2022 Session, House Bill 4118, which proposed requiring approval of UGB amendments in response to housing proposals affordable to households earning at or below area median income.

This proposal reflects a broader legislative discussion surrounding this kind of policy. Previously, House Bill 4079 (2016) was initially adopted to evaluate the barriers to affordable housing production arising from the UGB amendment process, and whether a removal of that process (with limitations) would stimulate provision of affordable housing. This legislation enabled two cities (later three) to pursue a UGB amendment without completing a Goal 10 and Goal 14 analysis for a qualifying proposal. To date, two of the three cities (Bend and Redmond) are in progress, but have not yet completed, projects, and the third (Pendleton) has not begun its process.

These policies, and similar policies modeled after these bills, were substantially contentious among work group members. In particular, many members raised significant concern about a potential bypass to the urbanization system that undermines the land use planning program at large, while other members maintain that a pathway could leverage the urbanization process to support statewide housing affordability goals.

While the short timeframe associated with the process was insufficient to establish a fully-developed and viable policy option with substantial buy-in from stakeholders, DLCD staff learned many important takeaways that warrant inclusion in this report. First, it is important to emphasize that **whether to advance a policy option that provides a streamlined UGB amendment in exchange for delivery of affordable housing is a legislative decision**. Should the Legislature decide to pursue this option, there are several considerations to improve its implementation, effectiveness, and political viability. This includes:

1. **A requirement for deed restriction guaranteeing delivery of affordable and diverse housing options in exchange for regulatory flexibility**. The Legislature would need to determine the types of housing outcomes that the pathway should require. Examples include:

- Regulated affordable housing for low-, moderate-, and mixed-income housing, including affordable rental, homeownership, and cooperative ownership housing.
- Diverse housing options the market is unlikely to produce, including manufactured, middle, and multi-family housing.

2. **Regulatory streamlining that reduces the analytical burden for small and capacity-constrained local jurisdictions** utilizing the pathway. Example approaches include:

   - A "shifted burden" approach, in which submittal of a qualifying project triggers a requirement for DLCD to conduct a limited Goal 10 and 14 analyses within a specified timeframe.
   - A "limited analysis" approach, in which a subset of jurisdictions identified as facing significant growth and affordability challenges under the OHNA qualify for a limited site alternative analysis, weighing priority and locational factors for several potential development areas.
   - An "analysis waiver" approach, in which small jurisdictions with constrained planning capacity submitting qualifying proposals would not be required to prepare Goal 10 or Goal 14-related analysis for limited UGB amendments, subject to a cap on the number of UGB amendments within a 5-year period.

3. **Limitations on the scope, scale, and applicability of the pathway.** Examples include:

   - Jurisdiction applicability, considering:
     - Population – The policy should emphasize providing an additional option to small jurisdictions with limited staff capacity and resources, not to larger jurisdictions with more capacity and resources to pursue a standard UGB amendment.
     - Population growth and cost burden – With the implementation of an OHNA, it is possible to measure and identify fast growing communities facing significant cost burden, enabling the option in communities where it is most needed.
     - Geographic or regional limitations – The policy should consider the exclusion of areas with significant concerns about the loss of resource lands, such as the Willamette Valley.
     - Frequency of use – The policy should have a limit on the frequency of use to ensure it does not overwhelm staff capacity or bypass the standard urbanization process.
   - Site applicability, considering:
     - Site size – There should be some upper acreage threshold for qualifying projects included in the policy. Examples of commonly suggested acreage thresholds include up to 50 or up to 100 acres.
     - Resource land exclusion – The policy should prohibit the inclusion of high-value farmland lands from the pathway and consider requiring a streamlined Goal 14 priority analysis. As discussed previously, the policy should consider excluding geographic areas where preservation of resource lands are a higher priority.

Recommendation 2) Build what's needed, where it's needed

Overview: Addressing housing need at all levels

On its own, the market will not meet the housing needs of all Oregonians. Housing for the lowest income Oregonians will always require public support, and the funding gap for meeting that need is daunting. Additionally, in most parts of the state, denser development, infill development, smaller product types, development in rural communities, and redevelopment of underutilized or contaminated parcels are harder for developers to get permitted, successfully finance, and feasibly build. These units are very important to meeting overall housing need, as they provide important workforce housing and homeownership opportunities, and help build climate-resilient communities and add needed units to an undersupplied market. Overall, approximately 49% of Oregon's needed housing over the next 20 years will require some public subsidy.

In many areas, denser development, infill development, smaller product types, and the redevelopment of underutilized or contaminated parcels are harder to build and require public subsidy.

While housing generally becomes more affordable as it ages, we cannot count on this process for several reasons: (a) it can take generations to reach lower affordability levels, (b) it almost never produces safe, adequate housing for the lowest income levels, and (c) it can halt or even reverse (for example, through gentrification) when a market is undersupplied.

Digging out of our housing deficit will require ongoing funding support from the Legislature that includes and extends beyond the traditional categories of affordable housing. Investments should be targeted to the development types that the market would not otherwise produce on its own, such as those listed above. **Without strong public investment in housing development, implementation of the OHNA will simply help us do a better job counting what we do not build**.

2.1 Commit sustained, coordinated investment

While simplifying and rationalizing our planning system is an important piece of the puzzle, there are many other significant barriers to housing production that communities face. Private market housing providers are not able to provide housing affordable to lower income households without subsidy, and local governments will need new tools to take on an expanded role in housing production. Success requires a new and expanded partnership between the state and local jurisdictions. Without significant state investment, OHNA implementation will likely be understood as an unfunded mandate that fails to provide the necessary conditions for local governments to comprehensively address housing need.

Oregon needs to produce about 27,000 housing units annually to meet the 20-year statewide production targets. In recent years the state has only produced 15,000-20,000 units per year.[13] To

[13] Source: U.S. Department of Housing and Urban Development's State of the Cities Data Systems (SCODS) database on Oregon housing permits. Between 2014 and 2021 annual permits have ranged from about 15,300 to 19,100 statewide.

close this gap, we need to look at which investments are best suited to overcome market barriers at all income levels with particular attention to the needs of historically underserved Oregonians.

Publicly Supported Affordable Housing

The most challenging unmet need to address is at the lower end of the income spectrum of households earning less than 60 percent of area median income (AMI). While public support is needed for many types of development, it is most acute to produce about 9,000 units per year that are affordable to low-income households. Lower-income Oregonians are affected most severely by the housing shortage and live with the greatest housing instability. This intervention point has the most urgent need for additional direct subsidies and support.

As the state's affordable housing financing agency, OHCS's funding mechanisms and allocation methodologies rely on complex and layered data and evaluation criteria designed to target resources toward strategic policy objectives. OHCS already prioritizes housing need in its allocation methodologies and can use the OHNA data to ensure that affordable housing production is equitably distributed across the state.

Affordable Housing Financing in Oregon is Changing

Affordable housing finance relies on layering local, state, federal, and philanthropic resources along with private equity and debt to fund development. These layered resources are necessary because the rents that are affordable to the intended tenants are below what it costs to develop and operate the property, leaving a "funding gap." This gap requires public subsidy or low-cost financing to pay for construction and ongoing operations along with large levels of mortgage or debt service payments.

To bring the impact of state resources to scale, OHCS has worked to maximize the use of federal Low Income Housing Tax Credits (LIHTCs) that are generated when the project includes financing with federally allocated Private Activity Bonds (PABs). Long an underutilized program, recent state and local investments in affordable housing were deliberately structured to leverage this 4% LIHTC and have successfully delivered new development. This increases utilization of the 4% LIHTC program has exhausted all built up capacity for the Private Activity Bond resource.

While the 4% LIHTC program will continue to operate and be a source of leverage for state Local Innovation and Fast Track (LIFT) investments, it is not a program that can continue to expand beyond that allowed by the annual federal Private Activity Bond authority allocated to Oregon. This means that the 4% LIHTC program cannot be used to increase the current rate of affordable housing development and future gap funding from the state or local jurisdictions is going to require either much higher per unit subsidy rates or some other source of fund leverage.

OHCS has managed unprecedented levels of investment in affordable housing

Despite federal constraints, OHCS hopes to continue recent momentum in affordable housing development. A major component of this is through a 2023-2025 funding request to the Oregon Legislature that includes $160 million for LIFT rental housing production and another $65 million for affordable homeownership. This would help create an estimated 1,200 rental units and 280 homeownership units, which, combined with the leveraging of available federal funds, would develop an estimated 4,000 new affordable homes for rent or purchase over the biennium. Additionally, OHCS is requesting more than $260 million to support affordable housing development and preservation of affordable homes. Even with this significant investment request, these resources are primarily required to continue funding at the level of recent years and will unfortunately fund less than a quarter of the documented need.

In summary, the landscape for affordable housing funding in Oregon has changed, and action at all levels of government is necessary to meet the moment and provide the funding required to continue developing the level of affordable housing needed by low-income Oregonians.

Additional funding for affordable housing development is critical to meet the needs of Oregon's lowest-income households. The Legislature should consider the investments included in OHCS' 2023-25 Agency Request Budget as an absolute minimum to maintain current production levels, which fall far short of actual needs as outlined in the OHNA. More resources from the state will be necessary to make more progress towards meeting these needs, the funding is only a part of the solution.

Federal caps on LIHTC and PABs currently limit the ability to utilize state and local funds most effectively. The Oregon Legislature must look to Congress as vital partners in housing solutions and pursue changes that will maximize the benefit of state and local investment. Legislation such as the Affordable Housing Tax Credit Improvement Act would, among other things, make technical adjustments to the PAB and 4% LIHTC program that would foster equity investment from the private sector into affordable housing developments and effectively stretch state investments further to allow for greater production. Combining federal action with more state resources for LIFT or other OHCS funding programs would have a substantial positive impact, augmenting unit production in the state beyond even the unprecedented growth in recent years.

Other types of support

Chronic underproduction has made it much harder for more people to afford the cost of housing. This now extends well beyond the traditional categories of publicly supported housing and affects higher income households as well. We need to pursue innovative tools that more effectively work with the market to support development types that might not be feasible. This can be especially true in smaller cities and more rural markets where infrastructure and land readiness costs are prohibitive for local budgets.

At a minimum, we recommend that the state coordinate existing funding sources that are currently distributed across many agencies and ensure that they are leveraged toward the goal of housing production. For example, Business Oregon already distributes some funds for the

purpose of infrastructure development, and recently produced an economic recovery plan that highlights workforce housing as a major impediment to achieving resilience in the business community. The Oregon Department of Transportation acquires land as it invests in transportation infrastructure, some of which might be used for housing development. The Department of Environmental Quality administers a Clean Water State Revolving Fund that has recently been significantly expanded with federal infrastructure funding and could be leveraged to support housing production. There are many other examples. While coordinating these investments and activities would require administrative structures that do not exist, this strategy is the most straightforward near-term option to make progress toward production goals, in part because it does not require new revenue sources.

At the same time, we know that additional, sustained resources will be needed. We cannot meaningfully move toward meeting housing need without aggressive investment in desired housing outcomes. The following types of funding would be particularly helpful to consider. Further inquiry with developers, lenders, and other partners in the development process can help to clarify how incentive programs might best be structured, funded, and targeted to needed types.

- **Infrastructure and development readiness**. Local governments will require infrastructure investments to jump-start housing production strategies both within existing UGBs and in expansion areas. This could take the form of a revolving loan fund or grant program such as those that currently exist within Business Oregon and would offer significant incentives for jurisdictions to play a more active role in housing production. Additional funds could be made available on a competitive basis to jurisdictions successfully meeting housing production metrics, such as the number of units permitted.

  Infrastructure funds would be used to support land acquisition, parcel consolidation, and infrastructure in expansion areas. It would also be available for retrofitting infrastructure for infill development, and master planning for larger sites. This could be structured like a block grant, such as those currently available for economic development. Ideally, these funds would be distributed with limited administrative requirements required from local entities, proportionate to the need identified in the OHNA.

- **Systems development charges** (SDCs) are fees charged to new development to help cover the incremental impact of new units and households on local infrastructure. While there is no question that these fees are necessary to the viability of public infrastructure, they also increase the cost of development and can be a barrier to production. A state-level fund to buy down the cost of SDCs for both affordable and market-rate workforce housing could support development that would not otherwise occur. Such a fund would create an incentive for needed housing types without affecting the revenues that local governments depend on for basic services in their communities. By backfilling these costs, the state could help make more units viable and affordable. Additionally, this could be set up as a local matching fund to maximize available resources for the greatest impact. As a very

rough starting-place estimate, an investment of $100 million could incentivize the creation of 5,000 - 10,000 units depending on program structure, that would not otherwise be built.

- **Gap funding.** Most local governments have extremely limited capacity and few resources to take an active role in housing development. The state could help jurisdictions achieve specific outcomes in their HPSs by providing access to capital for gap funding and assistance for workforce and missing middle housing (e.g., duplexes, triplexes, cottage clusters, etc.). We recommend that the state consider a revolving loan fund, capitalized by state dollars, to help overcome local barriers to production such as site acquisition, preparation, or rehabilitation, or gap funding directly to a project that helps a jurisdiction meet its production targets.
- **Funding for implementing fair housing strategies.** Housing production is one of several tools available to help cities advance fair housing outcomes. With expanded guidance, cities may be including additional strategies that better connect people to units, facilitate homeownership, increase unit accessibility, and reduce discriminatory practices. To support policy development and implementation, some grant or technical assistance funding for local governments will be helpful. Additional incentives should be made available by the state to support affordable housing development in areas of concentrated affluence, where higher land costs are often a barrier to development. By more equitably distributing affordable housing across communities, we can work toward equitable and fair housing goals such as dismantling segregation, preventing displacement, improving homeownership opportunities, or increasing the accessibility of existing or new housing, among others.
- **Technical assistance and capacity building.** Current staffing levels in local governments would be stretched beyond capacity by realizing the shared objective of catalyzing a rapid increase in statewide housing production. This requires a significant legislative investment to support implementation of Goal 10, which would include technical assistance for locally needed plans and permit capacity to speed up the building process.

  The Oregon Office of Economic Analysis estimates that 400-500 new local planners and inspectors would be needed statewide for a 10,000 increase in annual housing starts. Currently, many cities fund their permitting staff at least in part through permit fees charged on development. This means that cities must staff up quickly when the development market picks up and may have to lay off staff when development cools. This is highly inefficient and can lead to permitting delays. Additional funding for permitting staff, perhaps conditioned on decreased permitting fees to development, could help overcome this challenge.

  Additionally, the transition to an implementation-focused system suggests the addition of other types of local government staff, including planning staff who can create actionable Housing Production Strategies and coordinate policies and investments to support production. In the previous biennium alone, a historic investment from the Legislature in housing planning totaling $4.5 million supported 92 housing-related

projects in 75 jurisdictions. This translates to $1 million of investment supporting roughly 20 new housing projects in about 15-20 communities. DLCD has submitted an Agency Request Budget to establish a continuous biennial budget of $2.5 million for direct planning assistance to local jurisdictions in order to implement legislative housing direction. More funding support will directly result in increased local capacity to work on housing production, especially in small communities, and is an essential signal that the state is a true partner in housing production.

2.2 HPS implementation should advance fair housing outcomes

While housing abundance is a necessary precondition to housing equity, it is insufficient on its own. The people who are suffering most acutely from our housing shortage are disproportionately lower income and communities of color. They cannot be asked to wait another decade or more for Oregon to reverse the discriminatory policies and practices that have limited housing options for generations. Meaningful implementation of Goal 10 must provide a range of housing types for all income levels, distributed equitably around and within each region of the state, and for people of all ages and abilities. This provides access to employment and critical services and reduces the overall cost-burden to families and individuals. Centering the HPS in our Goal 10 system creates a new space for communities to address these issues directly.

Housing Production Strategies can serve as an important tool available to cities to help advance fair housing outcomes. Improved guidance to cities can help them consider how policies that influence housing production and the built environment intersect with fair housing outcomes. DLCD can begin by connecting existing, but currently separate, guidance regarding gentrification and anti-displacement into the HPS process, and cross-walking other existing guidance to more clearly demonstrate how the recommended tools can support land use efficiency.

Fair Housing Considerations

The Fair Housing Act prohibits discrimination in housing because of race, color, national origin, religion, sex (including gender identity and sexual orientation), familial status, or disability status.[14] Oregon's laws also protect people from discrimination based on source of income, domestic violence survivorship, and marital status.[15]

Furthermore, the Fair Housing Act requires the U.S. Department of Housing and Urban Development (HUD) and its recipients of federal financial assistance to Affirmatively Further Fair Housing, which means they must "do more than simply not discriminate… take meaningful actions to overcome patterns of segregation and foster inclusive communities."[16]

OHCS, Business Oregon and the Oregon Health Authority receive federal funds from HUD and as such have an obligation to affirmatively further fair housing. These agencies work together to comply with this mandate by engaging in fair housing planning through a process called the Analysis of Impediments to Fair Housing Choice every five years.

The OHNA housing equity indicators are intended to help provide standardized data across Oregon communities to monitor housing outcomes on a range of equity and fair housing concerns. The goal is that this data will help jurisdictions in their fair housing and equity reporting requirements and help communities track progress and hold jurisdictions and the state accountable with easy-to-read annual reports on progress.

In addition, these recommendations align local actions in a Housing Production Strategy with the Fair Housing obligations of combating housing discrimination, overcoming patterns of segregation, and fostering inclusive communities free from barriers that restrict access to opportunity.

In developing HPSs, local jurisdictions and state partners will need to consider which actions to deploy in which places to generate the desired outcomes, such as assessing where upzoning can help to undo patterns of exclusion and underproduction, or where is it necessary to consider stabilization and anti-displacement measures. These issues can be addressed using a decision-making framework similar to the example below. In the near term, jurisdictions can estimate current levels of production and patterns of growth using their permit data, recent HCAs, or other easily available sources. Over time, the OHNA will provide data to help jurisdictions understand what actions are most effective in individual census tracts and within jurisdiction as a whole.

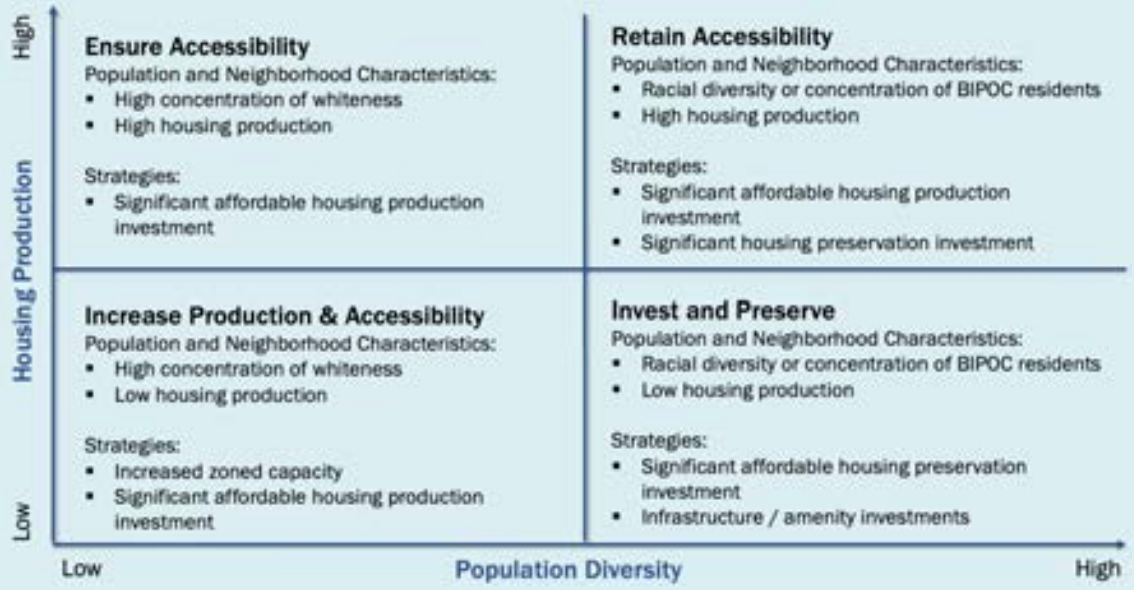
Example Fair Housing Framework

Figure 5. Example Framework to Determine Strategies Needed for Fair Housing Production



The framework in Figure 4 is one way to think about organizing that guidance. On the vertical axis, the framework conceptually shows a range of housing production outcomes, from low production in slower growing or constrained environments to high production. On the horizontal axis, it conceptually shows community diversity, from low diversity, where there is a relative concentration of whiteness, to high. The fair housing challenges and solutions vary in each quadrant and so must the strategies. For example, areas with a high concentration of white households and corresponding concentration of affluence that have low housing production (in the bottom left-hand corner), restrictive zoning is likely reducing development capacity and should be increased. In the opposite corner, relatively high diversity combined with high housing production suggests a strong need for anti-displacement strategies and investment in preservation.

It is possible to place communities – either entire cities or census tracts – in these quadrants to provide a key input to cities as they complete their HPSs. The technical report included in Appendix D outlines recommended changes to the OHNA Pilot Methodology will provide more details and examples. Many of the tools that might be applied to fair housing outcomes are already listed in HPS guidance but are not clearly cross-walked to desired policy outcomes nor to the market characteristics that are likely to drive neighborhood change.

As described in the funding recommendations above, local governments will need new tools and technical assistance to plan and implement specific programmatic improvements aimed at fair housing outcomes and anti-displacement and gentrification. This could take the form of a specific housing equity fund.

Recommendation 3) Commit to working together with urgency

Overview: Dedicate state level staff to oversee and support housing production across the entire market spectrum

Currently, there is no specific agency of state government responsible for overall housing production, and many of the available regulatory tools are better suited to preventing unwanted developments than to encouraging those that are needed. As a result, the policy response to the current housing shortage has been disjointed, with siloed policy discussion and action occurring at several agencies without meaningful, systemic coordination between them or with local and regional partners.

A comprehensive, production-focused system needs leadership and coordination across the many entities engaged in some aspect of housing production. Simply put: someone needs to be in charge, to: (1) ensure coordination of available funding sources and regulatory authorities (currently spread across many agencies) toward meeting production targets, and (2) implement the OHNA model, including ongoing management of the data that measure progress toward targets.

Figure 6. State agency roles in housing production.

Agency	Roles in Housing Production
Oregon Housing and Community Services	Affordable Housing Finance, Fair Housing
Department of Land Conservation and Development	Planning & Zoning Rules, Public Facilities Planning, Land Use Regulation
Department of Administrative Services	Economic Analysis
Oregon Department of Transportation	Integrated Transportation and Land Use, Transportation Infrastructure and Planning
Department of Environmental Quality	Water and Wastewater Infrastructure, Environmental Regulation
Business Oregon	Infrastructure & Capital Improvements Funding, Economic Development, Community Development Block Grants, Brownfields Redevelopment
Bureau of Labor and Industries	Occupational Licensing, Fair Housing
Department of Consumer and Business Services	Building Codes, Lending & Financial Regulation

3.1 Develop a coordinated statewide administrative structure

Coordinated statewide action would require sufficient authority to (a) convene agency leadership, (b) develop and refine policies to achieve desired housing production outcomes, (c) administer programs with accountability in housing production as well as fiscal and budget, contracting, HR, and IT services, (d) provide specialized housing production expertise to local partners, (e) direct funding for housing and public infrastructure, and (f) provide regular reporting to the Legislature and Governor's office.

Recognizing an urgent need to begin addressing housing production barriers, we recommend establishing an interagency Housing Production Team and administrative leadership position. The leadership of this team should be housed at the coordinated statewide administrative entity, and staff assigned to the team should be drawn from multiple agencies, leveraging the expertise and programmatic knowledge of each agency. This team should respond to a legislative mandate that directs agencies to coordinate their existing and potential new funding sources and regulatory authorities toward the goal of housing production. This provides a clear focal point for communicating and partnering with local governments.

The Housing Production Team should have (or be able to contract for) expertise in affordable housing finance, market rate development, permitting and building code, land readiness, fair housing law, community engagement, and development policy analysis. The team would deliver a commitment to federal and state requirements for fair housing, including anti-displacement tools and other housing equity strategies. This would also facilitate better coordination of housing production with broader policy initiatives, including transportation, equity, infrastructure, environmental quality, and climate. This team would function in two ways:

A. As technical experts that can be called on to address specific site development challenges or policy questions in partnership with local governments. Local jurisdictions face numerous constraints that inhibit the development of sites that would otherwise support housing production and receive minimal support from the state in technical or financial assistance to address such constraints. This team would provide varied and specialized housing production expertise that can diagnose and overcome development barriers through policy and investment interventions. It should also be able to deploy technical assistance and consultant support to ensure that it can help unstick complex development sites or evaluate thorny policy questions.

B. As an accountability and review team, to oversee progress toward goals in HPSs. The team would recommend actions that may be missing in local strategies or need more attention on a regular review cycle. In its accountability function, we recommend that the inter-agency Housing Production Team incorporate the existing staff review of HPS documents. This will enable the team to partner with local jurisdictions on specific actions identified in the HPS to ensure they have the resources and state coordination needed for implementation. If necessary, they would also be able to recommend enforcement orders for cities that are not meeting targets and are not taking sufficient action to address those deficits.

Implementing the OHNA will require a high degree of trust, communication, and transparency, as jurisdictions become accustomed to the new methodology. The establishment of a coordinated statewide administrative structure and Housing Production Team may necessitate phasing, recognizing the substantial challenge of reorganizing power and responsibility among state government agencies. We recommend further discussion around the best models for building confidence, such as community and stakeholder engagement, contracting of experts in the field, and regular reporting to the Legislature.

3.2 State and Regional Continuing Policy Action

The goal in centering housing production and outcomes in Goal 10 implementation is to remove barriers to housing development and to align capacity for better outcomes. This is true at both the local level and across state and regional government. To ensure that we are bringing all resources to bear in addressing the housing crisis, we recommend that the state and Metro Regional Government adopt action plans similar to HPSs that would:

- Define new regional and state actions to meeting need, such as the LIFT affordable housing development program or Metro's voter-approved measures for affordable housing and permanent supportive housing
- Identify existing resources that could be invested or leveraged for better outcomes
- Coordinate with local implementation
- Report to legislature on regional and state progress
- Identify new opportunities for action

In contrast to locally-adopted HPSs, the action plan that Metro adopts must recognize the coordinating role that regional governments play in housing planning. Rather than adopting specific policies, such as local zoning codes and regulations, regional housing coordination strategies should emphasize the collaborative actions among local governments that can be facilitated regionally. For example, regional housing coordination strategies could include identifying shared funding sources, sharing staff capacity, or entering intergovernmental agreements to promote housing production.

While we recommend that Metro be required to periodically complete such a strategy, counties and other regional entities should be able to opt-in and collaborate with cities, especially those with populations under 10,000, making them eligible for funding, capacity, and resources to address shared housing priorities. This would be especially helpful in smaller, more rural communities.

At the state level, the administrative entity described in Recommendation 3.1 should periodically complete a coordinated state HPS. Such a requirement would help address significant data gaps and follow up policy work. At present, we do not have an accurate picture of how much housing exists or is being produced statewide. An Oregon HPS would create a baseline understanding and data standards to track new production and the equitable distribution of housing options. This would allow for comprehensive tracking of the state's progress towards closing the gap in underproduction.

Additionally, many of the policy issues DLCD and OHCS heard through engagement require follow-up and collaboration with other state agencies. See Appendix B for a detailed list of DLCD's follow-up policy work. These and other areas of follow-up work highlight the need for a statewide HPS in which the state is consistently working to promote housing production and evaluate progress towards equitable outcomes.

III. Conclusions and Next Steps

Housing underproduction is a systemic, nationwide challenge that has been decades in the making. Nearly every state has failed to produce enough homes to meet the need. In this respect, even with its comprehensive land use program, Oregon is not unique. Along with the other coastal and intermountain west states that have seen rapid population growth, Oregon's situation is dire. We rank fourth worst in states in terms of underproduction as a share of total housing units, better only than California, Colorado, and Utah.[17]

This crisis is felt throughout Oregon, whether in large urban areas with skyrocketing rent and home values, in more rural communities struggling to find construction workers and developers, or on the coast where the local workforce competes for housing with short-term rentals. While some important details remain to be resolved in the coming months, we believe that these recommendations will position Oregon to make the systemic changes necessary to confront this challenge.

Few policy imperatives are more important to Oregon's future than increasing the pace of building new homes. Housing production is essential for Oregon's economic competitiveness, helping families prosper, and improving community resilience. Simply producing the units needed to meet current demand could generate up to $40 billion in additional economic growth, a boost that would benefit us all.[18] Achieving this will take hard work, coordinated action and investment from many partners in the public and private sectors, and at the state, regional, and local levels.

The recommendations described in the pages above are complex and comprehensive. Implementing them will require significant investments, changes to state statute, rules, and guidance, and will likely need to be sequenced over more than one legislative cycle. To make near-term progress on their implementation, we recommend that the Legislature consider bills that advance the bipartisan goal of building more homes, as follows:

A. **Redefine Oregon's Planning Process for Housing.** The state should establish the OHNA as the foundation for Goal 10 planning processes in state statute. This should, at a minimum:

   - Adopt core components of the OHNA methodology into statute, including that the OHNA must account for underproduction and an estimate of housing needed to serve people experiencing homelessness, must be allocated based on regional incomes and job distributions, and must be reviewed and updated with appropriate new data on a regular cycle. (Recommendation 1.1)

[17] Up for Growth, 2022, Housing Underproduction in the U.S. 2022, https://www.upforgrowth.org/underproduction

[18] See footnote 2 on page 3.

- Create administrative capacity to run the OHNA and track progress toward targets on an annual basis. This could be in OHCS, or in the Office of Economic Analysis. (Recommendation 1.1)
- Direct cities to replace local projections of need in Housing Capacity Analyses with OHNA-generated 20-year need numbers, by income, produced by the state. (Recommendation 1.1 and 1.4)
- Direct cities to strengthen Housing Production Strategies by requiring actions that address housing barriers and advance fair housing outcomes (Recommendation 1.3 and 2.2) and by incorporating production targets based on the data provided in the OHNA (Recommendation 1.2).
- The state should make statutory changes necessary to make needed UGB amendments more efficient and better prepare land for development. This should include direction and funding/resources for DLCD and LCDC to continue work related to Goal 10 and facilitating timely expansion of Urban Growth Boundaries when a need is identified. (Recommendation 1.4 and Appendix A).

B. **Coordinate the state response.** The state should establish a coordinated statewide administrative structure with a Housing Production Team. If it is necessary to phase this in, a temporary Housing Production Team could be established as part of DLCD or OHCS while broader discussion occurs. The housing production issues facing many communities demand an immediate state response. This team should be deployed as quickly as possible to achieve early housing production wins by helping cities unstick challenging development sites, removing barriers and focusing state resources. Additionally, this team should be charged with developing the first ever statewide Housing Production Strategy, which will serve to shift the state's energy and efforts to this urgent challenge. Over time, as rules are developed and take effect, this team can begin to function in its review process to assist with HPS implementation and accountability. (Recommendations 3.1 and 3.2).

- Provide position authority and Legislative direction for staff at other agencies to work with the newly established Housing Production Team toward the goal of housing production. Meeting production goals will require coordinating existing funding sources to meet housing need, working across agencies to overcome site permitting challenges, and providing support to local staff to overcome affordable housing funding challenges. (Recommendation 3.1)

C. **Create innovative funding and finance solutions.** The state should establish new housing production funding mechanisms aimed at middle housing or workforce housing development. Several stakeholder forums are considering innovative funding and financing mechanisms that are resonant with the recommended fund types in this report. (Recommendation 2.1)

The process of developing a Statewide Housing Production Strategy will inevitably uncover additional changes that are needed, and iterative improvements should be expected. More work will undoubtedly be required in future Legislative sessions. The Housing Production Team may need to evolve as we learn from its initial successes. Additional funding sources are required to make meaningful progress. Further accountability mechanisms may be needed. However, the comprehensive legislative package described above would be a substantial movement in the right direction, putting Oregon on the trajectory to lead the nation with a new approach to housing production focused on meeting the needs of all Oregonians. These recommendations, and the associated increase in housing production, will only succeed with sustained Legislative leadership and action in the 2023 Session and beyond.

RESIDENTIAL INFILL PROJECT

Year-One Report

JUNE 26, 2023

CASCADIA PARTNERS

Project Context

- The Residential Infill Project (RIP) Year-One Report was produced for the City of Portland's Bureau of Planning and Sustainability (BPS).
- It is an analysis of residential sales activity in the R2.5, R5, and R7 zones in the three years leading up to RIP adoption and permit activity during the first 12 months following its implementation (August 2021 – July 2022).
- Understanding RIP's longer-term impact on housing production will likely take continued monitoring. This period is also during the COVID-19 pandemic, which is not indicative of normal market trends.

How is the study organized?

➔ **Pre-RIP Context Analysis**: Analysis of residential sales in the three years prior to adoption of RIP:

- Sales Volumes
- Home Prices / Sizes
- Housing Unit Characteristics

➔ **RIP Permit Reporting:** Permit data was analyzed to identify common traits of Middle Housing development:

- Development Characteristics
- Locational Context

What is the Residential Infill Project (RIP)?

- The City of Portland adopted rules that govern the types of housing permitted in its neighborhoods to **allow more housing options** in Portland and also regulate the size and scale of new housing.
- Portland City Council adopted RIP 1 on August 12, 2020, and most changes went into effect on August 1, 2021. This report analyzed the first year of adoption **August 1, 2021-July 31, 2022**.
- RIP 1 allows **duplexes, triplexes and fourplexes, sixplexes, as well as additional/expanded ADU allowances**.
- **RIP** affects **R2.5, R5, and R7 zones** in the city.

Critical Takeaways

- ➔ Excluding ADUs, the **majority of housing units** permitted in the R2.5, R5, and R7 zones in the first year since adoption of RIP were in Middle Housing projects.
- ➔ **Fourplexes** accounted for more than ¾ of middle housing units in these zones.
- ➔ Middle housing uses land nearly **three times more efficiently** than single houses.
- ➔ **ADUs are still an important part of the housing mix**, producing an equal number of units as middle housing.
- ➔ But unlike ADU's, **over 99% of middle housing units had 2 or more bedrooms**, enabling growing or multigenerational households.
- ➔ Building size limits imposed by RIP have **prevented very large, and more expensive single dwelling homes** from being built.

Image Source: Zillow

Permit Activity Overview

Key Finding

Three quarters of permitted middle housing units were in fourplexes

Permit Activity by Housing Type (R2.5, R5, and R7 Zones)

Glossary

Residential Infill Project (RIP): recent changes to zoning regulations for single-family lots, allowing for the construction of smaller, more varied housing types such as duplexes, triplexes, and fourplexes. For the purposes of this study, RIP implies the first phase of RIP implementation, often referred to as RIP 1.

Accessory Dwelling Unit (ADU): a self-contained living unit that is secondary to the main dwelling on a residential property.

Single Dwelling (SD): detached single-family dwelling on its own lot without an ADU

Middle Housing (MH): For the purposes of this study, middle housing refers to duplexes including corner lot duplexes, triplexes, fourplexes and sixplexes.

ADU Allowance: additional ADUs allowed as part of RIP. These could include 2nd ADUs with a house, an ADU with a duplex, and internal basement conversion ADUs of a larger size than were permitted before RIP.

Floor-to-Area Ratio (FAR): a measure of the total amount of floor area that can be developed on a particular piece of land, expressed as a ratio of the total area of the lot.

Table of Contents

The RIP Year-One Report includes findings from three years of home sales prior to adoption of RIP, data analysis of the first 12 months of permit activity in zones where RIP took effect, and case studies of RIP development projects.

Pre-RIP Context Analysis 9

RIP Permit Data Analysis 15

- Development Characteristics 19
- Locational Context 24

Case Studies 40

PRE-RIP CONTEXT ANALYSIS

Analysis of residential sales in the three years prior to adoption of RIP:

- ➔ Sales Volumes
- ➔ Home Prices / Sizes
- ➔ Housing Unit Characteristics

New Floor Area Ratio (FAR) Restrictions Imposed by RIP

In addition to allowing more units per parcel, RIP placed limits on the maximum floor area allowed for single unit dwellings. To understand the potential impact of these limits, residential sales were analyzed for the three years preceding RIP adoption.

The Pre-RIP Context Analysis focuses on detached single-family homes built between 2018 and 2022 that are above and below RIP floor-to-area (FAR) limits for single unit dwellings. Under RIP, there is a sliding scale for maximum FAR that varies by zone and number of units per lot.

Under RIP1, the FAR for four units was the same as for three units. This was changed with RIP2.

FAR by Zone and Units per Lot

Units	R7	R5	R2.5
1	0.4 to 1	0.5 to 1	0.7 to 1
2	0.5 to 1	0.6 to 1	0.8 to 1
3+	0.6 to 1	0.7 to 1	0.9 to 1

Source:
https://www.portland.gov/bds/zoning-land-use/residential-infill-project/residential-floor-area-ratio

Data Sources

The Pre-RIP Context Analysis relied on Regional Multiple Listing Service (RMLS) data which captures open market sales transactions.

RMLS data from Q1 2018 – Q2 2022 was studied to understand trends in housing production in the R2.5-R7 zones prior to RIP adoption. In order to focus only on new housing production, this data excluded sales of homes built prior to 2018. Home sales prices were inflation-adjusted to 2022 dollars.

Given the length of time housing development takes to move through the pipeline, the data includes homes sold during when RIP in effect.

Critical Questions:

- ➔ What proportion of houses built prior to RIP could not be built today?
- ➔ How much more expensive were these houses than those below current FAR limits?

Above RIP FAR (Zone R5 | .8 FAR)

Above RIP FAR (Zone R2.5 | 1.3 FAR)

Image Source: Zillow

Summary of Findings

Sales trends for new detached single-family homes in the years leading up to RIP adoption suggest that **RIP's impact is not just in what it allows, but also in what it does not**.

Key Finding #1

Nearly half of the new detached single-family homes built and sold from Q1 2018 to Q2 2022 are not possible to build under RIP. This means that RIP not only altered the nature of housing production, it also **truncated the most expensive segment of the detached single-family housing market.**

Pre-RIP Context Analysis Snapshot

1,178 Total new (built since 2018) detached single dwelling homes sold 2018 - 2022

44% Percent of new detached single dwelling homes sold over FAR threshold

$117k Average sale price difference between homes above and below FAR limits set by RIP

Source: RMLS data (Q1 2018 - Q2 2022)

Detached Single-Family Sales Trends

A large proportion of new detached single-family homes sold between 2018 and 2022 in the R2.5-R7 zones could not be built today under new FAR limits imposed by RIP.

Roughly one-third to one-half of new detached single-family homes built and sold between 2018 and 2022 are larger than the threshold set by RIP for single dwellings.

New Detached Single-Family Home Sales above and below RIP FAR Limits

FAR Limits and Impacts to Home Sales Prices

Key Finding #2

Detached single-family homes with high FARs tend to sell for higher prices due to their size. By limiting the largest of these detached single-family homes, RIP prevents more expensive homes from being built and makes Middle Housing more competitive.

Detached single-family homes over the current FAR limit sold for substantially more than those below the limit. On average, the difference in sales price was over $117,000.

RIP PERMIT DATA ANALYSIS

Permit data was analyzed to identify common traits of Middle Housing development:

- ➔ Development Characteristics
- ➔ Locational Context

RIP PERMIT DATA ANALYSIS

Overview

The RIP permit data analysis compares the housing production pipeline for all dwelling units in the R2.5, R5, and R7 zones for the 12 months following when RIP took effect.

It is organized in two data analysis categories. The first, *Development Characteristics,* includes detailed summaries of Middle Housing development projects. The second, *Locational Context* focuses on the location of new Middle Housing units relative to other forms of housing built over the same time period.

DATA ANALYSIS CATEGORIES

- DEVELOPMENT CHARACTERISTICS
  Parking, size, demolitions
- LOCATIONAL CONTEXT
  Parks, transit, centers & corridors, zones

Data and Methods

The RIP permit data analysis relies on information from the City of Portland's permitting system, *AMANDA*, demolition permits, and detailed information from 85 permit applications submitted for Middle Housing projects during the first 12 months after RIP took effect.

The City also conducted geospatial analysis that evaluated permit activity across multiple categories to add more context to the permit activity pulled from the first year of RIP.

Permit Classification

The following sections will refer to various housing types permitted in the R2.5–R7 zones. These housing types are listed below. Refer to the glossary for more information on each permit class.

01 – Single Dwelling 02 – ADU 03 – Single Dwelling + ADU 04 – Corner Duplex	Allowed Prior to RIP
05 – ADU Allowance 06 – Duplex 07 – Triplex 08 – Fourplex 09 – Sixplex	Allowed by RIP

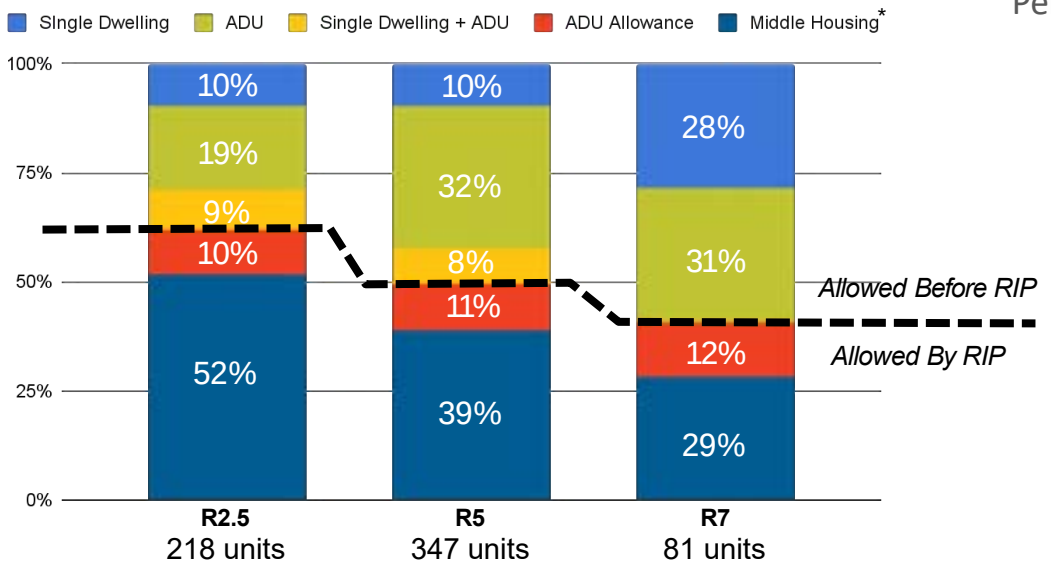
**When comparing the performance of single dwelling development against middle housing, this report includes corner duplexes as middle housing.*

RIP Permits at a Glance

Key Finding #3

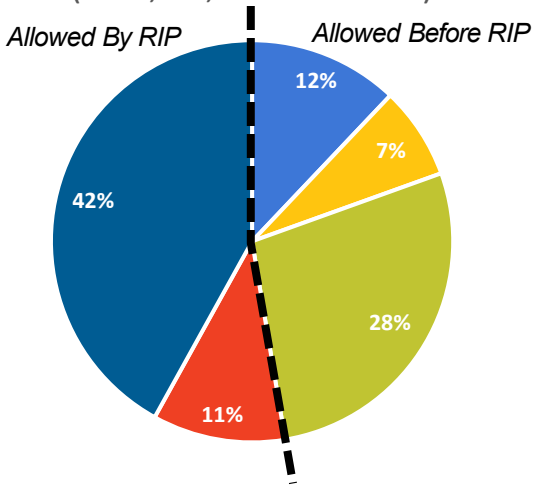
Units allowed by RIP represent the majority of permitted units

Percent of Units Permitted by Housing Type in RIP Zones



*Middle Housing category includes corner duplexes

Percent of Units Permitted by Housing Type (R2.5, R5, R7 combined)

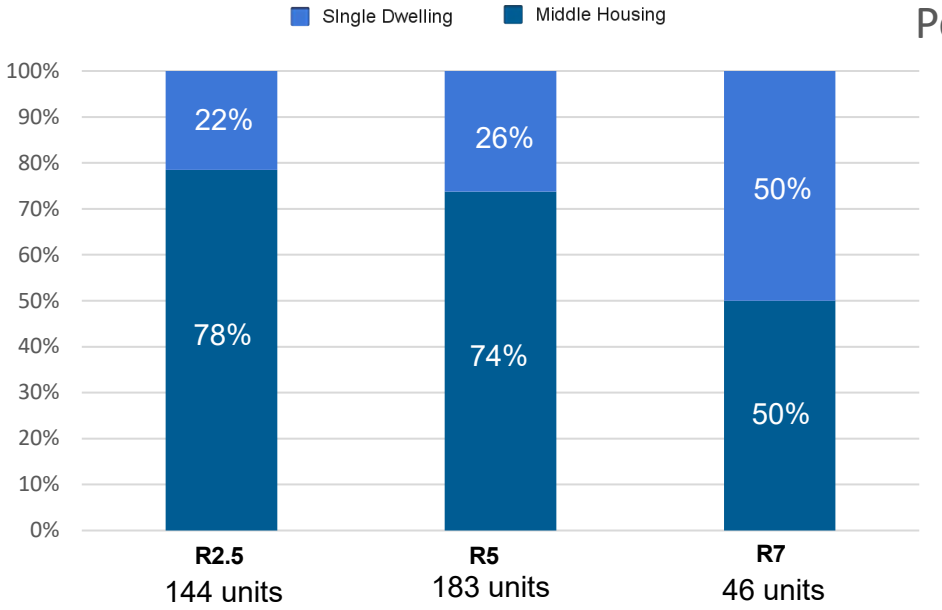


RIP Permits at a Glance

Key Finding

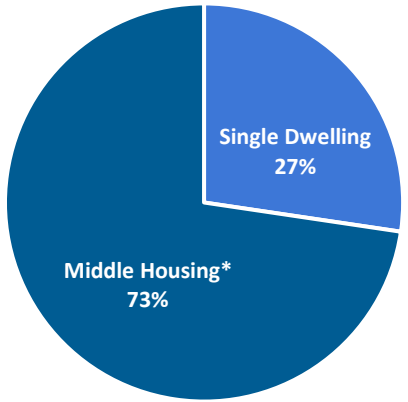
Excluding ADU's, middle housing units accounted for 73% of all units

Percent of Units Permitted by Housing Type in RIP Zones (excluding ADUs)



**Middle Housing category includes corner duplexes*

Percent of Units Permitted by Housing Type (R2.5, R5, R7 combined, excl ADUs)

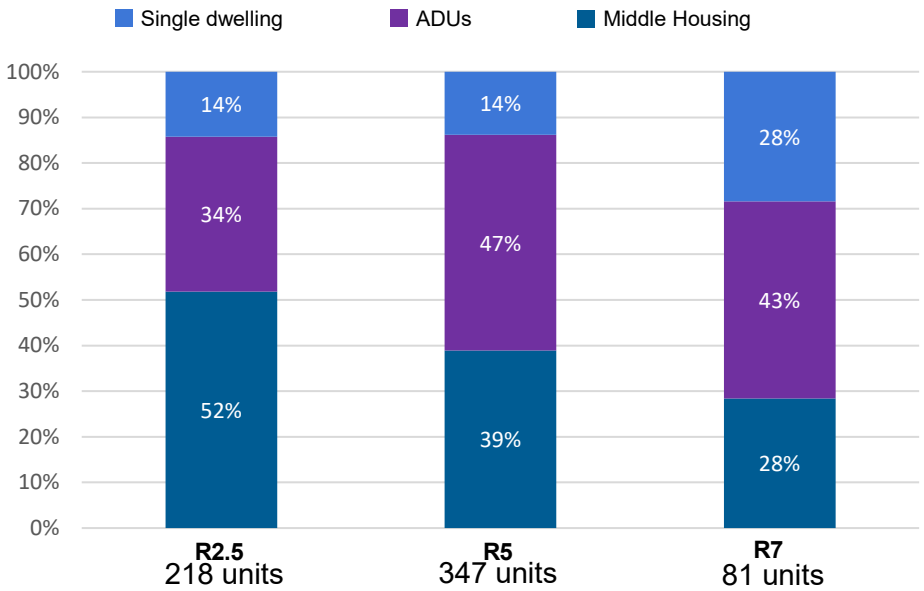


RIP Permits at a Glance

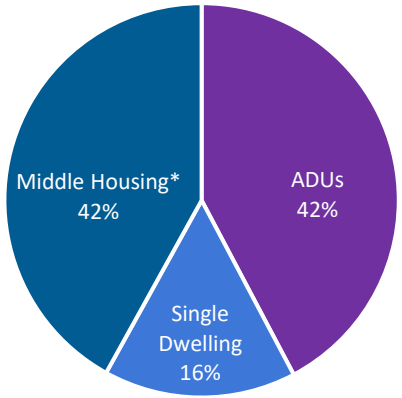
Key Finding

ADUs equaled middle housing units permitted overall

Percent of Units Permitted by Housing Type in RIP Zones (House, ADU, Middle Housing)



Percent of Units Permitted (SD, ADU, MH)
R2.5, R5, R7



*Middle Housing category includes corner duplexes. ADUs includes ADU, ADU w/house and ADU allowances

DEVELOPMENT CHARACTERISTICS

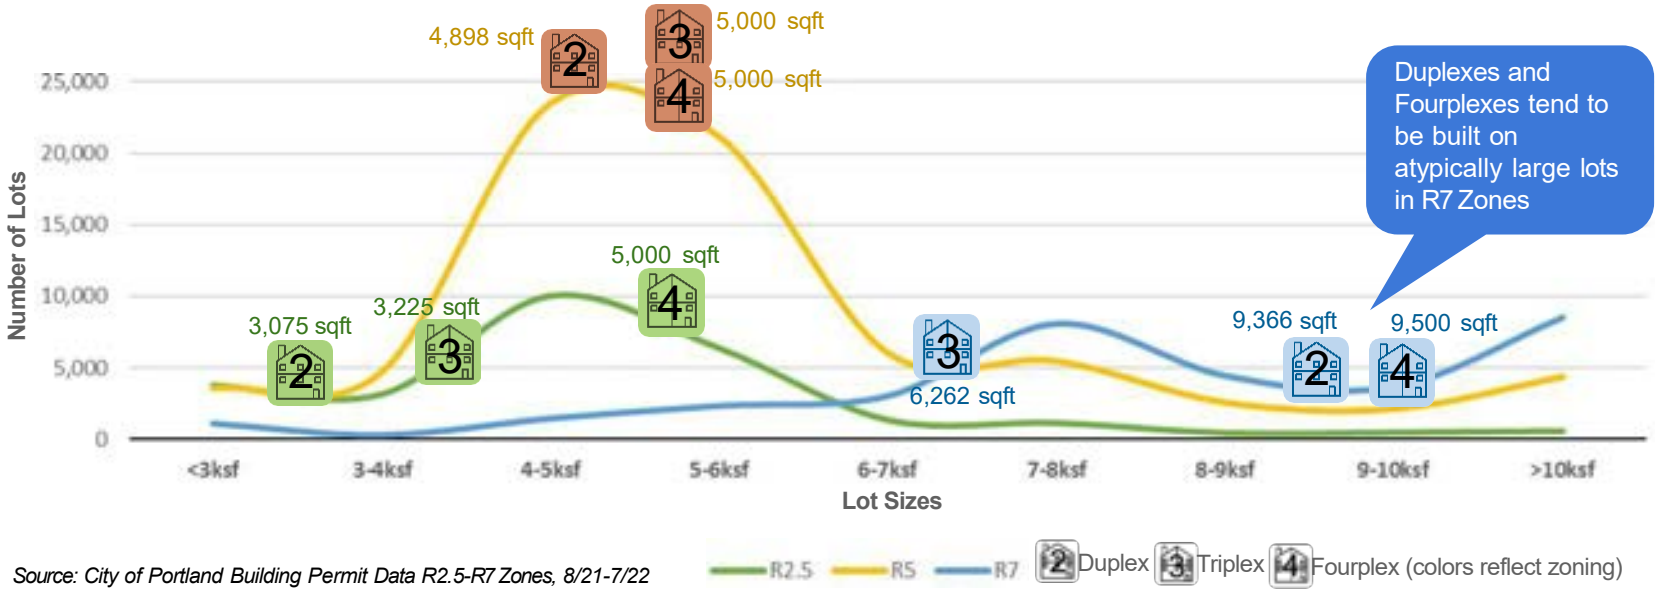
Development characteristics of RIP permits were analyzed to identify trends in lot sizes, development projects, and parking configurations.

Lot Size

Key Finding #5

Developers of fourplexes appear to prefer larger than average lots in the R2.5 and R7 zones.

Distribution of Lot Sizes Citywide by Zone vs Median Lot Sizes for Middle Housing Projects



Source: City of Portland Building Permit Data R2.5-R7 Zones, 8/21-7/22

Unit Size By Housing Type in Each Zone

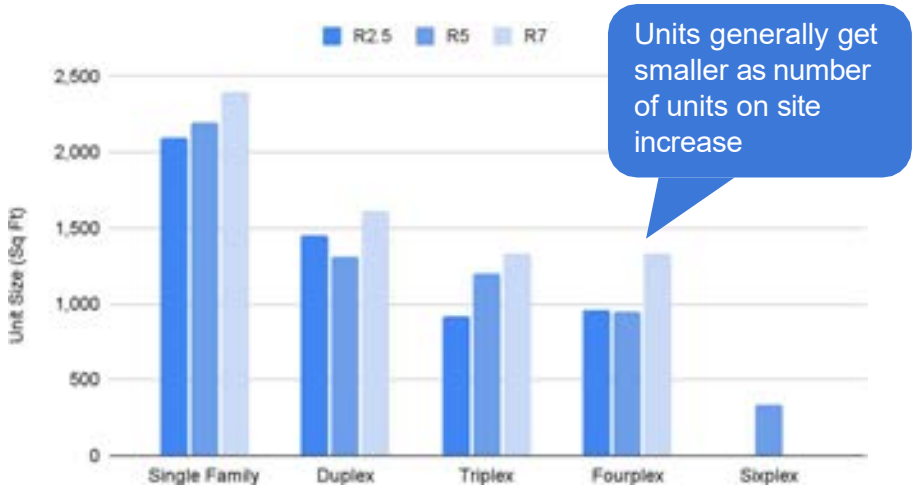
Key Finding #6

Even with new FAR limits for all building types, Middle Housing units tend to be much smaller than detached single dwellings.

This trend is also visible within Middle Housing types. For example, fourplexes tend to include smaller units than triplexes and duplexes.

The Planning Commission revised FAR limits for fourplexes as part of RIP2 to better enable larger sized units.

Average Unit Size (Sqft) by Housing Type and Zone



Source: City of Portland Building Permit Data R2.5-R7 Zones, 8/21-7/22

Number of Bedrooms by Housing Type

More units per building tends to produce less bedrooms per unit.

Developers tend to build smaller units with fewer bedrooms in fourplexes than they do in duplexes and triplexes.

Units Permitted by Housing Type and Bedroom Count*

Housing Type	1 Bedroom	2 Bedroom	3 Bedroom	4+ Bedroom
Duplex	1	13	20	2
Triplex	0	13	11	3
Fourplex	0	**176**	21	7

Key Finding #7

2 bedroom appears to be the "sweet spot" for fourplexes

**Does not include 2 unit conversion into sixplex*

Source: City of Portland Building Permit Data R2.5-R7 Zones, 8/21-7/22

Parking Spaces by Housing Type

Parking competes with site area for dwelling units.

Key Finding #8

For Middle Housing types with 3+ units, developers tend to provide less parking. This is likely a result of needing more site area to achieve desired FAR.

Number of Parking Spaces per Unit by Permit*

Housing Type	No Parking	< 1 Space per Unit	1 Space per Unit	> 1 Space per Unit
Duplex	5	1	11	2
Triplex	6	1	2	0
Fourplex	**46**	1	4	0

Fourplexes leverage flexible parking requirements

**Does not include 2 unit conversion into sixplex*

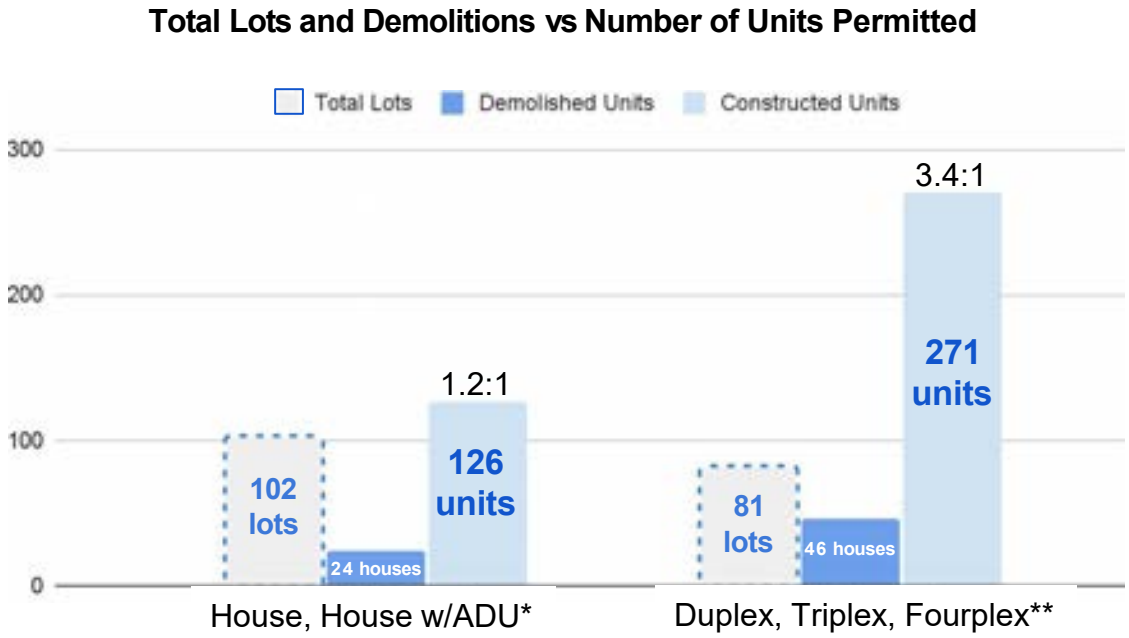
Source: City of Portland Building Permit Data R2.5-R7 Zones, 8/21-7/22

Demolitions and Replacements

The housing unit replacement rate is the ratio of new units built to units demolished.

Key Finding #9

The net number of units added for Middle Housing has been substantially higher than for single dwellings.



Source: City of Portland Building Permit Data R2.5-R7 Zones, 8/21-7/22

** Count of primary single dwellings and ADUs on lots where single dwellings or single dwellings + ADU were permitted. Excludes sites where only ADUs were constructed.*

*** Excludes ADU allowances, includes corner duplexes*

LOCATIONAL CONTEXT

Permit locations for all housing types were analyzed to examine location preferences relative to centers, corridors, zones, and pattern areas.

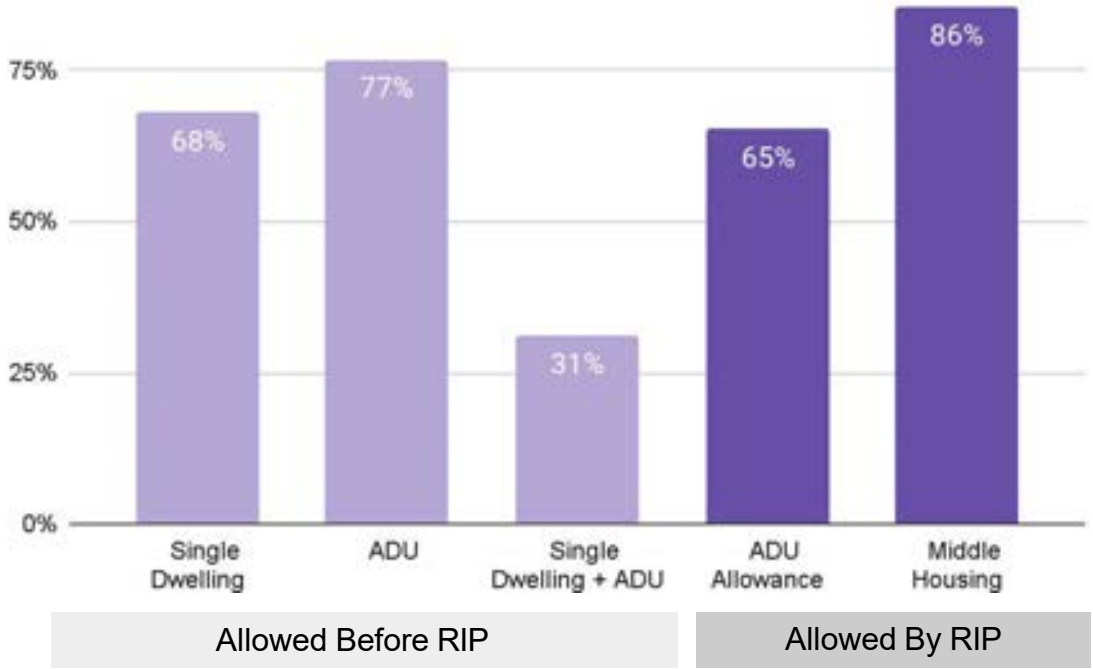
Proximity to Centers and Corridors

Key Finding #10

A greater share of permitted units newly allowed by RIP are near designated Centers and Corridors.

It is possible that developers of these units perceive benefits from proximity to amenities, such as public transportation and walkable retail.

Percent of Units Built Within ¼ Mile of a Center or Corridor



Source: City of Portland Building Permit Data R2.5-R7 Zones, 8/21-7/22

Proximity to Centers and Corridors

Proximity to Transit Stops

A greater share of permitted units newly allowed by RIP exist near a transit stop.

Key Finding #11

Just over half of Single Dwelling homes are within 1/4 of transit compared to over three-quarters of Middle Housing.

Percent of Units Built Within ¼ Mile of a Transit Stop

RECOMMENDATIONS

The following recommendations are intended to improve the City of Portland's workflow in future years of reporting on RIP.

Recommendations for Ongoing Reporting

1

Because trends in housing production take time to identify, conduct recurring annual or bi-annual reporting on the residential development pipeline in zones where RIP took effect.

2

Develop a definitive list of permit classifications and definitions to differentiate Middle Housing from other housing types.

3

Cross reference Middle Housing permits with sales data to gain better understanding of the pricing of for-sale units as more come online.

4

Cross reference Middle Housing permits with "schedule R" rental property registration data to gain a better sense of tenure.

5

Conduct further interviews with Middle Housing developers to understand perceived barriers to development as well as location, site, and development project preferences.

6

For Middle Housing permits, develop a streamlined workflow for extracting development projects from plansets. For all other permits, track lot and building size at a minimum. Track unit sizes for ADUs.

BEFORE THE METRO COUNCIL

FOR THE PURPOSE OF AMENDING THE URBAN GROWTH BOUNDARY IN THE VICINITY OF THE CITY OF SHERWOOD UPON APPLICATION BY THE SHERWOOD SCHOOL DISTRICT	)	Ordinance No. 17-1406
	)	
	)	Introduced by Chief Operating Officer
	)	Martha Bennett with the Concurrence of
	)	Council President Tom Hughes

WHEREAS, the Metro Urban Growth Management Functional Plan Title 14: Urban Growth Boundary provides a mechanism to amend the urban growth boundary (UGB) through a major amendment process for public facilities and other non-housing purposes; and

WHEREAS, the Sherwood School District filed an application for a major amendment pursuant to Metro Code Section 3.07.1430 to add approximately 82 acres to the UGB for the purpose of constructing a new high school to serve the Sherwood area; and

WHEREAS, the application was considered by a hearings officer appointed by Metro at public hearings in the City of Sherwood on May 24, 2017 and June 6, 2017; and

WHEREAS, on July 21, 2017 the hearings officer submitted to Metro a proposed order recommending approval of the application, together with findings of fact and conclusions of law in support of a decision by the Metro Council that the application satisfies the requirements of the Metro Code and applicable state law; and

WHEREAS, the Council considered the proposed order and testimony at a public hearing on August 10, 2017 under the procedural requirements of Metro Code Section 3.07.1430(u); now, therefore,

THE METRO COUNCIL ORDAINS AS FOLLOWS:

1. The UGB is hereby amended, as indicated in Exhibit A, attached and incorporated into this ordinance, to add 82.3 acres to the UGB for development of a high school with sports fields and a roadway improvement, subject to the following three conditions of approval:

    a. The property must be used for a public high school, associated accessory uses, and public transportation improvements consistent with the application for this UGB amendment.

    b. The applicant must comply with the state Transportation Planning Rule (TPR) at the time the zoning is established on the subject property.

    c. The City of Sherwood shall complete the requirements of Urban Growth Management Functional Plan Title 11, section 3.07.1120: Planning for Areas Added to the UGB, prior to development occurring.

2. The Findings of Fact and Conclusions of Law contained in the hearings officer's recommendation attached as Exhibit B and hereby incorporated into this ordinance, explain how this amendment to the UGB complies with applicable provisions of the Regional Framework Plan, Metro Code, and applicable statewide planning laws.

3. The Metro Council adopts as supplemental findings in support of its decision the legal memorandum dated August 15, 2017 attached as Exhibit C and hereby incorporated into this ordinance, which includes responses to issues raised at the public hearing by opponents of the application.

ADOPTED by the Metro Council this 17 day of August 2017.

Tom Hughes, Council President

SECTION IV: HEARINGS OFFICER'S SUMMARY AND RECOMMENDATION… 74

SECTION I: APPLICATION SUMMARY

FILE NAME:	UGB Case 17-02: Sherwood School District Urban Growth Boundary Major Amendment
APPLICANT:	Sherwood School District 23295 SW Main Street Sherwood, OR 97140
PROPOSAL:	82-acre expansion of the urban growth boundary (UGB) for a high school campus with sports fields. Realign SW Elwert Road and SW Kruger Road in Sherwood.
LOCATION:	Tax Lots 2S236-200, -201, -206, and -207
SITE ADDRESSES:	18880 SW Haide Road, 22895 SW Elwert Road and 18985 SW Kruger Road, Sherwood, Oregon 97140
URBAN RESERVE AREA:	Area 5B.
CURRENT ZONING:	AF-20
METRO CODE:	Metro Code Sections 3.07.1425 (B, C, D, E & F) and 3.07.1440 (A & B). Code Section 3.07.1425(C)(1-9)

SECTION II: BACKGROUND INFORMATION

Proposal Description: The applicant requests an expansion of the City of Sherwood UGB to include approximately 82 acres for a high school campus with sports fields. This proposal also seeks to realign the intersection of SW Elwert Road and SW Kruger Road for improved and safer traffic flow.

Site Information: The site consists of four tax lots located within unincorporated Washington County on the west side of SW Elwert Road, between SW Haide Rd and SW Kruger Rd as shown in Attachment 1. The property has frontage on SW Elwert, SW Haide and SW Kruger Roads. The entire property is zoned AF-20 (Agricultural and Forest District) by Washington County with a minimum lot size of 80 acres. The entirety of the property is located within the Sherwood West Preliminary Concept Plan area (Metro Urban Reserve Area 5B). The site slopes

gently down to the east towards SW Elwert Road with approximately 40 foot grade change across the site. There is a shallow valley and ridge within this slope.

The properties have been used for various agricultural activities including a Christmas tree farm, tree plantation and row crops. The tax lot in the southeast corner of the site, adjacent to the intersection of SW Elwert and SW Kruger Roads is owned by the City of Sherwood, a portion of which will be used for the road realignment. A 40-foot wide permanent Northwest Natural gas easement zigzags along the western edge of the site, separating the northwest corner of the site from the remainder of the property.

Case History: The Sherwood School District (District) is centered on the city of Sherwood and extends into the surrounding rural area in all directions, including a small area east of I-5, between Wilsonville and Tualatin. The District includes an area of 4.31 square miles and an estimated population of 18,884. The District has seven schools that provide educational services to just over 5,000 students, the majority of which live in the city of Sherwood. The District experienced substantial growth in the late 1990's and early 2000's leading to a community effort in 2005 to determine facility needs. This resulted in the successful 2006 bond measure which included funding for an addition to the current high school to increase capacity to 1,550 students, consistent with phase 1 of the 2006 high school master plan. Current enrollment at the high school is over 1,700 students and projections show over 2,250 students by the 2025-26 school year. In early 2014 the District's Long Range Planning Committee made recommendations to the School Board regarding enrollment and growth challenges, facilities analysis and needs and financing options. In 2015 the District documented the condition and educational adequacy of its facilities, leading to bond visioning and steering committees in 2016. This resulted in the District's voters approving a bond measure in 2016 providing funding for school improvements including construction of a new high school. The District continues to engage the community through a design committee and community input sessions.

Local Government Statement: This UGB major amendment is being considered at the request of the Sherwood School District. The City of Sherwood completed the Sherwood West Preliminary Concept Plan for urban reserve area 5B and submitted a service provider form supporting the school district's application. The school district participated in the concept planning process and the subject site is one of the school locations identified in the preliminary concept plan. Washington County submitted a written statement supporting the application with proposed conditions for Metro to consider. Tualatin Valley Fire and Rescue submitted a written statement supporting the application and Clean Water Services is neutral on the application.

SECTION III: APPLICABLE REVIEW CRITERIA

The criteria for a Major Amendment to the UGB are contained in Metro Code Section 3.07.1425(B, C, D, E, & F) and 3.07.1440 (A & B). The approval criteria appear ***bold 12-pt Aerial Narrow font)***, and the hearings officer's analysis follows.

> ***Metro Code Section 3.07.1440(A) The purpose of the major amendment process is to provide a mechanism to address needs for land that cannot wait until the next analysis of buildable land supply under ORS 197.299. Land may be added to the***

UGB under this section only for the following purposes: public facilities and services, public schools, natural areas, land trades and other non-housing needs;

This code section requires that the applicant show, by substantial evidence in the whole record, that it is an eligible entity allowed to use the interim ORS 197.299 Major Amendment UGB process rather than wait until the next regular Metro UGB amendment cycle (in December, 2018).

Hearings Officer's Analysis: Title 14 of the Metro Code (*i.e.* Metro's Urban Growth Management Functional Plan) includes the Major Amendment process to amend the UGB for a number of specific non-housing needs, including schools and public parks. This process, which is designed to implement ORS 197.299(4), is intended to provide an opportunity to meet these specific land needs outside of the legislative housing needs process the Metro Council conducts on a six-year cycle as required by ORS 197.299(1) and ORS 197.296.

As part of the six-year legislative housing needs process, Metro conducts an inventory of the current residential and employment capacity within the UGB, forecasts population and employment growth over a 20-year timeframe, determines the capacity of the current UGB to accommodate that growth and documents the results of these analyses in an urban growth report. ORS 197.296(6)(a), which is one of the state's needed housing statutes, envisions that local governments with populations over 25,000 will factor in land for schools at the same time as they determine the amount of land needed to be brought in to the UGB for housing. In this regard, the need for land for schools under ORS 197.296(6)(a) is a "derivative need" which is linked to, and dependent upon, a finding that there is a need for land to be brought into the UGB to accommodate an identified housing need. As noted in more detail below, this process has proven to be long, drawn out affair, which is not sensitive to short-term needs. Furthermore, because it is done on a large-scale regional basis, is not always sensitive to more localized school and park needs.

In fact, Metro's most recent urban growth report, adopted in 2015, did not address school and park land needs at the regional level at all. Some school districts anticipate growth, others see declining enrollment and none look out over the 20-year timeframe that the urban growth report considers. Depending on the particular physical, financial and expected growth characteristics of each school district, plans for accommodating projected increases in enrollment vary. Similarly, park districts acquire property and develop park facilities based on numerous operational and funding parameters that can't be considered at the regional level. In addition, it is quite common for school districts and cities to collaborate on opportunities to meet the city's recreation needs as well as the school district's team needs. For these reasons, the Major Amendment process is the appropriate means of addressing specific school district and park needs that can be accommodated through UGB expansions.

Metro has adopted specific criteria to implement ORS 197.299(4). There are two criteria contained in Metro Code section 3.07.1440(A) that are analyzed separately below:

1) The proposal must be for a non-housing need, and

2) The proposal must be intended to meet needs that cannot wait until the next analysis of land supply (December 2018).

There does not appear to any disagreement that the first criterion is met: the applicant proposes to add land to the boundary for a public school and a public facility need, both of which are non-housing needs. The Sherwood School District's Sherwood High School is a "public school" within the meaning of Metro Code Section 3.07.1440(A).

However, whether the applicant has met the second criterion has proven to be more controversial. The applicant addresses its need as follows:

> As of 2015, the Sherwood School District encompasses 4.31 square miles serving a population of approximately 18,884 residents and 5,000 students. The Sherwood School District includes:
> - The City of Sherwood city limits;
> - Portion of the western area of the City of Tualatin (mostly industrial land);
> - Rural Clackamas County (primarily between Sherwood and Wilsonville); and
> - Rural Washington County north and west of Sherwood, as well as a small area east of I-5 between Wilsonville and Tualatin.
>
> To facilitate future planning and to comply with State requirements for a fast-growing school district, the District adopted a long-term facilities plan in January of 2008, which assumed that additional school capacity would therefore likely be needed within ten years of the plan's adoption. As predicted school facilities have recently become overtaxed. In 2015, to assess current resources, the Sherwood School District completed a Facilities Planning and Assessment Report to determine both condition and available capacity. Enrollment based on the most current demographic data and capacity shows that school capacity is near or over capacity at all school levels as shown in Staff Report Attachment 2 (Table 1 in petition).
>
> The School District commissioned Davis Demographics & Planning Inc. to complete an updated 10-year demographic study in May of 2016. The study reviewed the following factors that determine student enrollment: (1) the current and planned residential development over the next ten years; (2) student yield factors that apply to new residential development; (3) birth factors for the District area; and (4) mobility factors, which examine the in/out migration of students within existing housing units. The forecast projects a deficiency in capacity in all levels, with the

high school level having the largest deficiency. Staff Report Attachment 3 (Table 2 in petition) shows 10-year enrollment projections compared with existing school building capacity. The table demonstrates that if no capacity is added (no-build) the school facilities will be far over capacity in 10 years with the Sherwood High School having the largest capacity issue operating at 141% of capacity.

From the updated capacity assessment and demographic data, it became apparent that facilities must be expanded to keep pace with continued student enrollment growth. A Long Range Planning Committee, Bond Steering Committee, Bond Visioning Committee and Sherwood High School Programming Committee were formed to study facility needs. Led by the Bond Management Team, these committees met from 2014 to 2016, making recommendations to the Sherwood School District Board. The process included input from a number of participants from the community including City Council and staff representation, School District staff, architects, civil engineers, financial advisors, business leaders, citizens, parents and students. Throughout this process, the Sherwood City Council was provided with updates and community input was sought via various public outreach methods.

As evidenced by capacity study and demographic growth data, the high school level is where there is the biggest need for additional capacity both now and to a greater extent within 7 to 10 years. Therefore, the Bond Management Team first looked to the existing high school campus for opportunities for expansion to accommodate this growth. With the conclusion that the existing high school cannot be upsized to meet demand, the District's Bond Management Team began looking for a long-term solution and the School Board, with voter approval, ultimately decided to build a new high school. The new high school is planned to be sized to initially accommodate 2,000 students, but allow for easy expansion to 2,400 students. This size will allow for projected growth over the next 10 years and foreseeable future.

Once a new high school is online, the existing high school building can be repurposed as a consolidated middle school with both existing middle schools (Laurel Ridge and Sherwood Middle) being relocated to the existing high school campus. Once this occurs, the two existing middle schools can be converted to elementary school use to expand needed elementary school capacity. Finally, the proposal allows for Hopkins Elementary School, a building nearing its useful lifespan, to be taken out of

> school service and converted to administrative functions. The existing administrative offices consist of portable buildings in varying locations and with the conversion of Hopkins, office space can be centralized for increased efficiencies.

The primary opponent argues that the applicant has not justified the use of the Major Amendment process instead of waiting until the normally scheduled Metro 2018 UGB expansion. Their attorney states: "Metro's scheduled UGB expansion in 2018 is the appropriate time to analyze the expansion for the proposed high school because more data will be available and the full set of impacts can be analyzed. The delay will also resolve the issues with inadequate notice in the current application." *See* Letter from Jennifer Bragar dated June 6, 2017, at p. 8.

What the opponents appear to be arguing is that this application is premature, and the applicant should wait until 2018 when the 20-year buildable lands analysis will be available. Furthermore, the opponents do believe that the Major Amendment process authorized by ORS 197.299(4)(a)(A) requires the same type and level of analysis required when Metro conducts its periodic legislative housing need analysis required by ORS 197.299(1) and ORS 197.296. The opponent's unstated assumption is that school needs must be evaluated as a derivative need of housing using the ORS 197.296(6) process.

Metro staff weighed in on the debate via a Memorandum dated June 9, 2017, which states, in relevant part:

> Metro's legislative process for reviewing the UGB is guided partially by ORS 197.296. Subsection 197.296(2) directs Metro to demonstrate that there is sufficient buildable land within the UGB to accommodate estimated housing needs for 20 years. A housing need is the only need identified in the statute. ORS 197.296(6) says if the housing need is greater than the capacity of the UGB Metro shall take one or more actions that could include amending the UGB to include sufficient buildable lands to accommodate housing needs for 20 years. Subsection (6)(a) goes on to say that if the UGB was amended to accommodate housing needs for the next 20 years, then the amendment shall include sufficient land reasonably necessary to accommodate the siting of new public school facilities.
>
> The statutory directive to Metro is to include sufficient land for school facilities as part of any UGB expansion that is required to meet a 20-year need for housing. In Metro's most recent analysis of the 20-year housing supply (the 2015 UGR), Metro determined there was sufficient capacity inside the existing UGB to accommodate housing needs; therefore, no corresponding analysis for public school facilities was required.

> Even if the Metro Council had determined there was a need to expand the UGB in 2015 to accommodate a 20-year housing need, there is no certainty that the location where the land would be added to meet the housing need is also a location where a local school district needs additional land to meet its facility needs. Likewise there is no certainty that the specific land needs of a school district are coordinated with the local jurisdictions desire for additional housing. For instance, a UGB expansion adjacent to Hillsboro to meet a regional housing need would not support the Sherwood School District's need for a new high school.
>
> These difficulties arise, in part, from the size of the Metro region and the fact that it consists of 24 individual cities and 17 different school districts. It is important to recognize that the provisions of ORS 197.296(6)(a) regarding planning for accommodation of new school facilities is included in the statutory section that describes the analysis required for all cities in the State of Oregon. While it would not be as difficult for a smaller jurisdiction to coordinate future public school needs with future housing needs in making UGB expansions, that task is much more complicated in the Metro region.
>
> The disconnect in the Metro region between the location of UGB expansions to meet a 20-year housing need and the needs of existing school districts is addressed, in part, by ORS 197.299(4)(a), which is the statute that directs Metro to establish the process being utilized by the Sherwood School District in this proceeding. ORS 197.299(4)(a) requires Metro to allow "off-cycle" UGB expansions as necessary to accommodate a need for land for a public school that cannot reasonably wait.

Given that the opponents have a very different interpretation of the purpose and meaning of ORS 197.299(4) when compared to Metro staff and the applicant, a discussion of statutory interpretation is in order.

A statute is considered "ambiguous" if it is capable of at least two reasonable interpretations. *State v. Tarrence*, 161 Or App 583, 985 P2d 225 (1999); *Kenton Neighborhood Ass'n v. City of Portland and Oregon Waste Systems, Inc.,* 17 Or LUBA 784, 797 (1990) (when code is internally inconsistent, it is ambiguous).[1] If the legislation is unambiguous, local governments and courts are bound to apply the statute in that manner, regardless of how inartful the enactment seems. *Sanchez v. Clatsop County*, 146 Or App 159, 164 n 4, 932 P2d 557 (1997). Stated another way, an unambiguous statute should not be "interpreted." *City of Hillsboro v. Housing Dev'l Corp of Washington County*, 61 Or App 484, 488, 657 P2d 726 (1983). *See GTE*

[1] *See also Fisher v. City of Gresham,* 69 Or App 411, 416, 685 P2d 486 (1984); *McCoy v. Linn County,* 90 Or App 271, 276 nl, 752 P2d 323 (1988).

Northwest, Inc., v. Oregon Public Utility Comm'n, 179 Or App 46, 39 P3d 201 (2002). Rather, unambiguous words should be given their plain, natural, and ordinary meaning. *PGE v. BOLI*, 317 Or at 611.[2]

In this case, the hearings officer believes that the relationship between ORS 197.296 and ORS 197.299 creates sufficient ambiguity to warrant an exercise of statutory interpretation.

Text and Context.

When construing a statute, the court will often first look directly at the text of the statute itself. *See Whipple v. Howser*, 291 Or 475, 635 P2d 782 (1981) (citing *Greyhound Corp. v. Mount Hood Stages, Inc.*, 437 US 322, 330, 98 S Ct 2370, 2375 (1978)). Emphasizing the need to look first to the language of the statute, the *Whipple* court stated:

> "The cardinal rule for the construction of a statute is to ascertain from the language thereof the intent of the law makers as to what the purpose was to be served, or what the objective was designed to be attained."

Whipple, 291 Or at 479 (citing *Swift & Co. and Armour & Cove, Co. v. Peterson,* 192 Or 97, 233 P2d 216 (1951). *See also State of Oregon v. Buck,* 200 Or 87, 92, 262 P2d 495 (1953). The *Whipple* court also cited to *State ex rel. Cox v. Wilson*, 277 Or 747, 562 P2d 172 (1977), in which the court stated:

> "There is, of course, no more persuasive evidence of the purpose of a statute then the words by which the legislature undertook to give impression to its wishes."

Courts do not view the text in a vacuum; they consider the context of the language at issue as well. In fact, the context of the statute is as important to the interpretation as the text. *State v. Webb*, 324 Or 380, 927 P2d 79 (1996); *Friends of Neaback Hill v. City of Philomath*, 139 Or App 39, 48, 911 P2d 350 (1996). *See e.g*., *Shadrin v. Clackamas County*, 34 Or LUBA 154 (1998). In some cases, the court may consider the context before examining the text, in situations where the context "provided perspective on the text." *See Plotkin v. Washington County*, 165 Or App 246, 250, 997 P2d 226 (2000). In this case, consider the two statutes in tandem.

ORS 197.299 provides as follows:

---

[2] *See also OSHU v. Hass*, 325 Or 492, 501, 942 P2d 261 (1997); *Zidell Marine Corp. v. West Painting, Inc.*, 322 Or 347, 906 P2d 809 (1995); *State v. Langley*, 314 Or 247, 256, 839 P2d 692 (1992); *Curly's Dairy, Inc. v. State Dept of Agriculture*, 244 Or 15, 415 P2d 740 (1966) (If statute is clear and unambiguous, the court may not resort to rules of statutory construction in ascertaining and declaring the legislative intent.); *Sullivan v. City of Ashland*, 130 Or App 480, 882 P2d 633, *rev den*, 320 Or 453, 887 P2d 792 (1994) (An unambiguous code provision cannot be interpreted, even if that provision is contrary to the express purposes of the provision.); *City of Portland v. White*, 61 Or App 120, 655 P2d 629 (1982).

197.299 Metropolitan service district analysis of buildable land supply; schedule for accommodating needed housing; need for land for school; extension of schedule.

(1) A metropolitan service district organized under ORS chapter 268 shall complete the inventory, determination and analysis required under ORS 197.296(3) not later than six years after completion of the previous inventory, determination and analysis.

(2)(a) The metropolitan service district shall take such action as necessary under ORS 197.296(6)(a) to accommodate one-half of a 20-year buildable land supply determined under ORS 197.296 (3) within one year of completing the analysis.

(b) The metropolitan service district shall take all final action under ORS 197.296(6)(a) necessary to accommodate a 20-year buildable land supply determined under ORS 197.296 (3) within two years of completing the analysis.

(c) The metropolitan service district shall take action under ORS 197.296(6)(b), within one year after the analysis required under ORS 197.296(3)(b) is completed, to provide sufficient buildable land within the urban growth boundary to accommodate the estimated housing needs for 20 years from the time the actions are completed. The metropolitan service district shall consider and adopt new measures that the governing body deems appropriate under ORS 197.296 (6)(b).

(3) The Land Conservation and Development Commission may grant an extension to the time limits of subsection (2) of this section if the Director of the Department of Land Conservation and Development determines that the metropolitan service district has provided good cause for failing to meet the time limits.

(4)(a) The metropolitan service district shall establish a process to expand the urban growth boundary to accommodate a need for land for a public school that cannot reasonably be accommodated within the existing urban growth boundary. The metropolitan service district shall design the process to:

(A) Accommodate a need that must be accommodated between periodic analyses of urban growth boundary capacity required by subsection (1) of this section; and

(B) Provide for a final decision on a proposal to expand the urban growth boundary within four months after submission of a complete application by a large school district as defined in ORS 195.110.

(b) At the request of a large school district, the metropolitan service district shall assist the large school district to identify school sites required by the school facility planning process described in ORS 195.110. A need for a public school is a specific type of identified land need under ORS 197.298 (3). [1997 c.763 §2; 2001 c.908 §2; 2005 c.590 §1; 2007 c.579 §2; 2014 c.92 §5]

As quoted above, ORS 197.299(1) cross-references ORS 197.296(3), which, in term, cross-references to ORS 197.296(2). These two statutes together set forth a process for evaluating and accommodating housing needs:

> ***(2) At periodic review pursuant to ORS 197.628 to 197.651 or at any other legislative review of the comprehensive plan or regional framework plan that concerns the urban growth boundary and requires the application of a statewide planning goal relating to buildable lands for residential use, a local government shall demonstrate that its comprehensive plan or regional framework plan provides sufficient buildable lands within the urban growth boundary established pursuant to statewide planning goals to accommodate estimated housing needs for 20 years. The 20-year period shall commence on the date initially scheduled for completion of the periodic or legislative review.***
>
> ***(3) In performing the duties under subsection (2) of this section, a local government shall:***
>
> ***(a) Inventory the supply of buildable lands within the urban growth boundary and determine the housing capacity of the buildable lands; and***
>
> ***(b) Conduct an analysis of housing need by type and density range, in accordance with ORS 197.303 and statewide planning goals and rules relating to housing, to determine the number of units and amount of land needed for each needed housing type for the next 20 years.*** (Underlined emphasis added).

As the underlined language indicates, ORS 197.296 is a statute narrowly-tailored towards the process used to establish and fulfill an identified *housing* need. It is an expansion of the basic concepts set forth in Statewide Planning Goal 10, but it goes beyond Goal 10 in scope.

As part of that process, the effect of ORS 197.296(6) should also be considered as context:

> ***(6) If the housing need determined pursuant to subsection (3)(b) of this section is greater than the housing capacity determined pursuant to subsection (3)(a) of this section, the local government shall take one or more of the following actions to accommodate the additional housing need:***
>
> ***(a) Amend its urban growth boundary to include sufficient buildable lands to accommodate housing needs for the next 20 years. As part of this process, the local government shall consider the effects of measures taken pursuant to paragraph (b) of this subsection. The amendment shall include sufficient land reasonably necessary to accommodate the siting of new public school facilities. The need and inclusion of lands for new public school facilities shall be a coordinated process between the affected public school***

districts and the local government that has the authority to approve the urban growth boundary;

(b) Amend its comprehensive plan, regional framework plan, functional plan or land use regulations to include new measures that demonstrably increase the likelihood that residential development will occur at densities sufficient to accommodate housing needs for the next 20 years without expansion of the urban growth boundary. A local government or metropolitan service district that takes this action shall monitor and record the level of development activity and development density by housing type following the date of the adoption of the new measures; or

(c) Adopt a combination of the actions described in paragraphs (a) and (b) of this subsection.

A few key points can be quickly gleaned from ORS 197.296. First, by its terms, ORS 197.296(2) only applies to periodic review or another "*legislative* review of the [.. .] regional framework plan that concerns the urban growth boundary and requires the application of a statewide planning goal relating to buildable lands for residential use. " This Major Amendment application is not periodic review and is also not a legislative review of Metro's regional framework plan, *i.e.*, the every six-year UGB amendment cycle. The Major Amendment application is subject to a quasi-judicial process and will result in a quasi-judicial decision by the Metro Council.

Strawberry Hill 4 Wheelers v. Board of Comm'rs sets out a list of factors to be weighed to determine whether a land use decision is legislative or quasi-judicial. 287 Or 591, 602-603, 601 P2d 769 (1979). Under *Strawberry Hills,* the Major Amendment is quasi-judicial because (a) the application process is bound to result in a decision, (b) the decision must apply pre-existing criteria to concrete facts, and (c) the action is directed at a closely circumscribed factual situation.

With regard to the first question, the *Strawberry Hills 4-Wheelers* Court asks practitioners to consider the following question: "Does the statute require the [local government] to reach a decision after the hearing, as in an adjudication, or may it indefinitely postpone or abandon the issue, like a legislative proposal?" 287 Or at 605. At first glance, one might assume that any land use decision that originates from an application being submitted (as opposed to be initiated by the local government itself) would be "bound to result in a decision." Indeed, that seems to have been the original intent of the *Strawberry Hill* Court. However, over the years LUBA and the Court of Appeals have increasingly read this factor more and more narrowly and will only find that that a decision is "bound to result in a decision" if the code either expressly requires a decision to be made, or if that requirement can be fairly read into the language of the code based on the context. *Estate of Gold v. City of Portland*, 87 Or App 45, 48, 740 P2d 812 (1987) ("the statute simply says that the governing body *may* approve the proposal, not that it *must* do anything."); *Johnson v. City of La Grande*, 37 Or LUBA at 388; *Valerio v. Union County*, 33 Or LUBA 604 (1997); *Miner v. Clatsop County*, 46 Or LUBA 467 (2004). In some cases, LUBA has not been as exacting in its analysis, holding that although the code did not:

> "expressly state that once a person requests an interpretation of a provision of the city's zoning ordinance that the person is entitled to a decision. We believe, however, that any reasonable person reading this ordinance would conclude that if a person requested an interpretation from the planning director, received that interpretation and then appealed the interpretation to the planning commission and to the city council, the person filing the appeal would be entitled to a decision from the city council."

Hoffman Ind. Inc. v. City of Beaverton, 2 Or LUBA 411 (1981); *Dean v. City of Oakland*, 33 Or LUBA 806, 809 (1997)("While the cited policy does not require a decision within a specified time, the most natural reading of its terms requires a decision.") The fact that any given ordinance in question states that the decision-maker "may" make a decision should not be a fact which is determined to be indicative of a legislative decision, but unfortunately, in practice it is just that. In this regard, the statute at issue in *Strawberry Hill* did not expressly require that a decision be made. However, the Supreme Court found no difficulty in concluding that "although affirmative action is optional, the statute appears to contemplate that the County Court will *eventually* reach and pronounce some decision whether to act or not. *Id*. at 606. (Emphasis added).

In this case, the MC 3.07.1440(g) requires the Metro Council to make a final decision on the petition. Therefore, this factor suggests that the decision is quasi-judicial.

The second of the *Strawberry Hill* questions has, in practice, become somewhat of a non-factor. Both LUBA and the Court of Appeals have recognized that all land use decisions in Oregon are subject to "preexisting criteria" and apply to concrete facts. LUBA has addressed this issue as follows:

> Turning to the "apply existing criteria to concrete facts" factor, that factor is present to some extent in all land use decisions. *Valerio*, 33 Or LUBA at 607. This factor is therefore less important than the other two factors, particularly where, as is the case here, the decisions are adopting new land use laws rather than applying existing land use laws to grant land use approval for a single property or a small number of properties. *Churchill v. Tillamook County*, 29 Or LUBA 68, 71 (1995); *McInnis v. City of Portland*, 27 Or LUBA 1, 5-7 (1994).

Carver v. Deschutes County, 58 Or LUBA 323 (2009). *See also Casey Jones Well Drilling, Inc. v. City of Lowell*, 34 Or LUBA 263, 271 (1998); *Johnson v. Jefferson Country*, 56 Or LUBA 72 (2008). In this case, the MC 3.07.1440 sets forth criteria for a Major Amendment to a UGB. Therefore, this factor suggests that the decision at issue is quasi-judicial.

Under the third factor, LUBA and the Courts are supposed to assess whether the decision either (1) affects either a small number of owners and properties or (2) the "action directed at a closely circumscribed factual situation," or whether the decision has more broad

applicability. According to early decisions by the Court of Appeals, "the number of people affected and the size of the area covered are less important considerations," and the focus should instead be on "the importance of assuring that the decision is factually correct and that the decision-maker gives fair attention to affected individuals." *1000 Friends of Oregon v. Wasco Co. Court*, 80 Or App 532, 536, 723 P2d 1034 (1986), *rev'd on other grounds*, 304 Or 76, 742 P2d 39 (1987). In practice, this third bean-counting "factor" has become the most critical issue to LUBA, and, despite suggestions to the contrary, in most cases it is more-or-less the dispositive factor. In fact, LUBA has found decisions to be legislative even when the other two factors favored a determination that a decision was quasi-judicial. *Davenport v. City of Tigard*, 22 Or LUBA 577 (1992).

In this case, the proposal involves 82 acres consisting of four tax lots in unknown ownerships. This is well within the size and ownership limits that would allow the conclusion that the decision is quasi-judicial.

The primary opponent argues that this Major Amendment is a "legislative decision," The primary opponent states that "[t]he decision amends the Metro Boundary map that is incorporated into the Metro Urban Growth Functional Plan, and as such the change is legislative." *See* Letter from Jennifer Brager dated June 23, 2017 at p. 1. However, map amendments are not necessarily or inherently legislative or quasi-judicial in nature. *Compare Thomas v. City of Veneta*, 44 Or LUBA 5 (2003) (TSP and zoning map amendment affecting two tax lots comprising 6.4 acres); *Dan Giles & Assoc., Inc. v. McIver*, 113 Or App 1, 3, 831 P2d 1024 (1992)(zone change for single 29-acre parcel in unified ownership is quasi-judicial); *Neuberger v. City of Portland*, 288 Or 155, 603 P2d 771 (1979) (re-zoning involving 601 acres of land owned by three landowners is quasi-judicial).[3] *Contrast Valerio v. Union County*, 33 Or LUBA 604 (1997) (comprehensive plan amendment and zone change pertaining to 185 acres in a "number of different ownerships" is legislative); *Friends of Cedar Mill v. Washington County*, 28 Or LUBA 477 (1995) (PAPA relocating arterial and changing it from 5 lanes to 3 lanes is legislative, where it affects 40 properties and will carry 17,000 – 18,000 trips per day.); *McInnis v. City of Portland*, 27 Or LUBA 1 (1994) (Proposal which rezones 5000 acres in 110 different ownerships is legislative.); *Davenport v. City of Tigard*, 22 Or LUBA 577 (1992) (Transportation plan map amendment that directly involves nine property owners, but has "indirect effects" on a broader population is legislative). Nor is a UGB amendment inherently legislative in nature. *BenjFran Development, Inc. v. Metro*, 17 Or LUBA 30 (1988) (denial of request for UGB amendment comprising almost 500 acres in three ownerships is quasi-judical).

Cases such as *Davenport* and *Friends of Cedar Mill* suggest that large transportation projects will be considered legislative due to the broad secondary effects that transportation facilities can have on commuters. The hearings officer does not believe that this line of cases can be extended to a school, however, based simply on the fact that many kids will attend the school. If that were the case, then any land use decision involving a Wal-Mart or Home Depot store would be legislative, because those uses have higher usage / trip generation rates than a typical school.

[3] *See Neuberger v. City of Portland*, 37 Or App 13 (1978), *rev'd in part, aff'd in part*, 288 Or 155, 603 P2d 771 (1979).

Opponent's counsel cites *Colwell v. Washington County*, 79 Or App 82, 87-8 (1986) for the proposition that this Major Amendment is a legislative (and not a quasi-judicial) decision (*see* Bragar letter dated 23 June 2017, pp 1-2). *Colwell* does not support that conclusion, and is easily distinguished. In *Colwell,* the Washington County Planning Commission made a land use decision which opponents wished to appeal to the Board of Commissioners, but their appeal was dismissed for failure to timely pay for the quasi-judicial Planning Commission hearing transcript. *Colwell*, 79 Or App at 85. Opponents appealed to the LUBA, which dismissed the appeal for failure to exhaust remedies at the local (County) level. The Oregon Court of Appeals reversed and remanded, finding that the Washington County governing body (*i.e.* the elected Board of County Commissioners) - and not the unelected County Planning Commission - must make Comprehensive Plan amendments, pursuant to ORS 215.050(1) and ORS 215.060.

Opponent's argument might have some merit if this unelected hearings officer was the one to make the final decision on this Major Amendment land use application. Only the elected Metro Council has that authority, however. This hearings officer's findings and determination are merely a recommendation to the Metro Council, and the Council is free to accept or reject this Hearings officer's decision, as the Council sees fit. Since the Metro Council will be the governmental body to make the final land use decision in this case, the Court of Appeals' holding in *Colwell* shall be followed for this application.

Despite the lengthy analysis set forth above, the hearings officer does not really believe that the quasi-judicial vs. legislative debate is dispositive, in any event. Rather, it is a red herring. Stated another way, the hearings officer does not believe that ORS 196.296 would apply to this UGB Amendment even it was a legislative decision. By its terms, ORS 197.296 only applies to UGB amendments that "require the application of a statewide planning goal relating to buildable lands for residential use." As discussed elsewhere in this recommendation, an amendment to a UGB which adds AF-20 zoned land for use as a school does not implicate Goal 10 in any meaningful way .

Second, ORS 197.296 sets forth a mandatory periodic process that is focused on only one type of land need: a need for housing. We can credit the Home Builder Association for being active in the legislature over the past 30+ years and influencing the adoption of specific statutory language, such as ORS 197.296, which relates specifically to their industry. But we should also not lose sight of the fact that there are other types of land need under Goal 14 that don't implicate ORS 197.296.

Taking a step back, recall that Goal 14 states that a UGB amendment must be based on consideration of six factors set forth in the Goal. The first two factors are commonly referred to as the "need" factors. The need factors require either a demonstrated need to accommodate long range urban population, consistent with a 20-year population forecast coordinated with affected local governments, <u>or</u> a demonstrated need for housing, employment opportunities, livability or uses such as public facilities, streets and roads, schools, parks or open space, or any combination of the need categories. While the need for housing is governed by ORS 197.296, other land needs are governed by Statewide Planning Goal 14, and in some cases, by OAR Ch. 660, Div 24. Note, as an example, that OAR Ch. 660, Div. 24 does not address now a livability need is established; Goal 14 seems to be the sole administrative pronouncement of its use. What is important to understand for purposes of this case is that ORS 197.296 is not the sole way to

establish land need, and a school need is not limited to being established as a derivative need of housing under ORS 197.296(6).

Among the more common types of land need mentioned in Goal 14 include a need for employment land, a need for public facilities, a need for schools, a need for parks, and the amorphous catch-all known as a "livability need."[4] With one exception related to public schools, ORS 197.296 does not govern substantively how these other types of land needs are established. Nor does it establish a *process* by which those other needs are established. Rather, ORS 197.296(2) & (3) are narrowly focused on accommodating a housing need, and as shown below, accommodating land for public schools as a derivative need stemming from housing need.

Consider ORS 197.296(6) as context: this statute applies when a local government is undertaking periodic review or a legislative review of a UGB that implicates Goal 10. If during such a process, the local government determines that a need exists for additional residential land and that accommodating that land need must necessarily involves a UGB amendment, then ORS 197.296(6)(a) requires that local government to "include sufficient land reasonably necessary to accommodate the siting of new public school facilities." Thus, under that process, a public school facility is considered a derivative need that arises by operation of a demonstrated need for housing. However, there is nothing in ORS 197.296(6) that makes ORS 197.296 the exclusive process by which a need for schools can be established. As demonstrated by the applicant a need for new school facilities can exist independent of housing needs. And while the primary opponent chalks up the applicant's current need to poor planning on the District's part (a sentiment that may have some basis in fact), ORS 197.299(4) appears to written as a safety value that can be used by school districts regardless of the causes that led to the need.

ORS 197.299(4)(a)(A) provides additional key textual clues which helps understand the nature of the process currently being undertaken. This provision authorizes Metro to "establish" and "design" a "process" that will fulfill a need that must be accommodated "*between*" periodic analyses of urban growth boundary capacity required by subsection (1) of this section." By giving Metro the authority to "establish" and "design" a unique UGB amendment process for schools, the statute makes clear that the school need specific "4(a)" process is not the *same* process as the legislative six-year process required by ORS 197.299(1) and 197.296(3). The ORS 197.296 process is already "established" and "designed" by statute, and really only puts a regional government much as Metro in an implementation role. On the other hand, ORS 197.299 delegates to Metro a role that is greater than mere implementation of a pre-existing process. Furthermore, ORS 197.299(4)(a)(4) further emphasizes that the school-specific process is only supposed to be used "between" the 6-year legislatively-mandated processes for accommodating housing needs, and it can only be invoked if the identified school need cannot wait until the next scheduled six-year legislative process.

[4] LUBA cases confirm that a need to improve livability can provide a basis for adding land to a UGB. Such an analysis requires, in addition to identifying a significant livability problem, an evaluation of probable and negative impacts on livability that may occur if the UGB is amended, and an explanation of why the livability benefits outweigh negative impacts on livability. *1000 Friend of Oregon v. City of North Plains,* 27 Or LUBA 372, 383, *aff'd.,* 130 Or App 406 (1994); *1000 Friends of Oregon v. Metro Service Dist*., 18 Or LUBA 311, 320 (1989).

The gravamen of opponents' complaints with respect to ORS 197.299(4) stem from a misunderstanding of the relationship between the ORS 197.299(1) six-year UGB amendment process with the ORS 197.299(4) public school amendment process. Much of opponent counsel's testimony at the June 13, 2017, hearing and again in her June 23, 2017 letter, was directed generally at a dissatisfaction with how Metro plans for regional housing and employment needs and opponents' opinion that allowing out-of-cycle UGB expansions for public schools exacerbates Metro's alleged poor planning. In its June 23, 2017 letter, opponents argued that this Major Amendment application does not meet the requirements of ORS 197.296(2).

At its core, the opponent's argument hinges on the assumption that the school-specific process must be substantively the same as the periodic six-year legislative process. Stated another way, the opponents argue that the substantive standards and criteria that govern the school specific process are the same as the housing-specific legislative process under which school need can be established as a derivative need. However, if that were truly the case, however, there would be no need for Metro to "establish" and "design" a new process. Rather, if the legislative intent was to mandate the same rigorous process that is used to establish housing need and to otherwise limit school need as a derivative need, the legislature would have simply stated that a school-related need can form the basis for accelerating the time frame under which the legislative housing need process is conducted. And that in itself does not make any sense because nothing in ORS 197.299(1) or ORS 197.296 prohibits Metro from conducting the legislative housing-needs process sooner than on a 6-year increment. In fact, ORS 197.299(1) merely states that Metro must undertake the ORS 197.296 process "*not later than six years after completion of the previous inventory, determination and analysis."* In theory, Metro could voluntarily conduct that inventory and analysis on a bi-annual or other timeline. In light of this observation, ORS 197.299(4) would be a redundancy if interpreted in the manner that the primary opponent advocates.

Courts strive to give effect to all parts of a statute, in order to produce a harmonious whole. ORS 174.010.[5] As a corollary, courts will avoid interpretations that render a portion of the statute redundant or meaningless surplusage.[6] *See State v. Stamper,* 197 Or.App. 413, 418, 106 P.3d 172, *rev. den.,* 339 Or. 230, 119 P.3d 790 (2005) ("we assume that the legislature did not intend any portion of its enactments to be meaningless surplusage"). If the school-specific process were not a separate process governed by different substantive criteria than ORS 197.296, it would not accomplish anything that Metro did not already have the right to do.

Rather than being drafted as an authorization to conduct the existing six-year legislative housing needs process at any time increment earlier than six years if a need exists that cannot wait six years, ORS 197.299(4)(a)(A) contemplates a *new* process *designed* by Metro to cater to

---

school needs as a primary independent need, not as a secondary derivative need resulting from a housing need. Because it is a different process that is intended to evaluate a needs other than a housing needs, the process and requirements (*i.e.* inventory, determination, and analysis) of ORS 197.296 do not apply to this separate process. And discussed below, the legislative history confirms this analysis.

Legislative History

Prior to 2001, the case of *Portland Gen. Elec. Co. v. Bureau of Labor & Indus.,* 317 Or 606, 611–612, 859 P2d 1143 (1993) (hereinafter *PGE*) made clear that legislative history could not be used to determine legislative intent if the text and context of the law made the meaning of that law unambiguous. The case of *State v. Gaines,* 346 Or 160, 171–172, 206 P3d 1042 (2009) essentially acknowledges that the *PGE v. BOLI* approach was legislatively modified in 2001 via amendments to ORS 174.020, and that the statute now permits the consideration of legislative history even when the text and context seem to make the meaning unambiguous. For this reason, a careful treatment of *Gaines* is warranted here.

The OSB publication entitled "Interpreting Oregon Statutes" Steve Johansen, Hon. Jack Landau, and Anne Villella ed. OSB CLE (2009) contains a lengthy but highly relevant discussion of *Gaines,* as follows:

> In *Gaines,* the defendant was convicted of obstructing governmental administration when she refused to cooperate in being photographed after her arrest. On appeal, she argued that her behavior did not constitute a "'means of . . . physical . . . interference or obstacle' "within the meaning of the relevant statute. *Gaines,* 346 Or at 162 (quoting ORS 162.235(1)). She argued further that the 2001 amendments to ORS 174.020 required the court to consider the legislative history of ORS 162.235(1) along with the text and context of the statute, even if the court found that its analysis of the text and context did not render the legislative intent ambiguous. *Gaines,* 346 Or at 165. Interestingly, in assessing the meaning of the 2001 amendments to ORS 174.020, the court found that a text-and-context analysis suggested that the amendments did not significantly change the *PGE* standard. *Gaines,* 346 Or at 166. However, the court did not stop its analysis at the text-and-context level. As the plaintiff argued that ORS 174.020 required, the court went on to examine the legislative history. The legislative history revealed a clear legislative intent to eliminate the requirement that a court only look to legislative history "if but only if" the text and context left the meaning ambiguous. *Gaines,* 346 Or at 169.
>
> * * * * *.

> The court will now consider proffered legislative history even when the text and context of a statute appear to render it unambiguous. In effect, *Gaines* brings legislative history into the step-one analysis along with the text and context of a statute. That said, legislative history remains a second step of statutory analysis—the court will consider it only after analyzing the text and context of a statute. The weight the court gives that legislative history also remains within the discretion of the court. A party attempting to overcome seemingly plain and unambiguous text through reference to legislative history has "a difficult task before it." *Gaines,* 346 Or at 172.

Although *Gaines* modifies the *PGE* methodology, the full extent of that modification remains to be seen. However, a recent appellate court decision suggests the extent may be relatively slight. *State v. Kelly,* 229 Or App 461, 211 P3d 932 (2009). *Kelly* raised the issue of the meaning of ORS 811.335(1)(b), which requires drivers to signal a turn "during not less than the last 100 feet traveled by the vehicle before turning." The defendant, who signaled a turn after he had stopped at an intersection, argued that the legislative history showed that the intent of the statute was to require a signal for at least as long as it took to travel the last 100 feet, but not to signal for the specified distance. The court agreed that under *Gaines* it needed to consider the legislative history. The court also made several points as to what weight it would give that legislative history.

The court first made clear that legislative history alone cannot overcome statutory text that is truly capable of only one interpretation. *Kelly,* 229 Or App at 466. Beyond that caution, the court explained the traditional limits of legislative history: legislative history is most helpful when it uncovers the general legislative intent of a statute (*Kelly,* 299 Or App at 466); statements of single legislators or non-legislators are generally, though not always, less helpful (*Kelly,* 299 Or App at 466–467), and the existence of a particular problem that precipitated a bill does not necessarily mean the statute was intended to address only that problem (*Kelly,* 299 Or App at 468). What *Kelly* does not suggest is that *Gaines* changes in any significant way *how* courts use legislative history. Rather, it only changes *when* the court will consider legislative history. Thus, even under *Gaines,* legislative history will be most helpful when an analysis of the text and context does not resolve an ambiguity of the statute. Legislative history may also be useful to reinforce an apparently unambiguous interpretation of a statute. (Emphasis added).

Courts are not likely to be persuaded by legislative history when that history does not give any indication that the precise legal question at issue was considered during the legislative enactment.[7]

The subsection in question, subsection 4, was added to ORS 197.299 in 2005 as part of Senate Bill 1032. Testimony at legislative committee hearings from bill authors and proponents indicates SB 1032 was intended to grant Metro new expedited authority to expand the UGB for the purpose of allowing construction of new schools, and such a process would be separate from the "normal" UGB expansion process typically required by state statutes.

Testimony of several speakers during the May 17, 2005 public hearing provide insight regarding the policy goals behind SB 1032. The main speaker, Gary Conkling, represented the Beaverton School District and was one of the authors of the bill. Mr. Conkling began his testimony in favor of the bill by outlining the pressing problems that face the city of Beaverton. He stated that "in the last decade or so the Beaverton School District has added more than ten thousand students" and that those students alone would make up the fifteenth largest school district in the state.[8]

Mr. Conkling explained that overabundance problems are common in the metropolitan areas of Portland, and most suitable plots of land for schools have been used for other projects intended to spur economic development. Mr. Conkling "anticipate[d] [Beaverton] will have to look outside the UGB for one or more additional school sites" to meet the growing demand. He ended his testimony by stating two main objectives of SB 1032. First, the bill is designed to gain "guidance from Metro, cities, and urban service providers as to where we should look outside the UGB" for suitable plots of land for schools. Second, the bill has language that "will encourage Metro to provide an accelerated process to add those lands once . . . the need has been established . . . so that lands can be added on an accelerated basis to the UGB."[9]

Metro Legislative Affairs Director Randy Tucker, a second advocate of SB 1032, added some additional points regarding the purpose and scope of the bill. Mr. Tucker explained that developing lands for schools requires additional planning considerations than developing lands for other purposes because schools must be located in particular locations. These additional considerations include that ideally, schools should be located near city centers, and schools must fall within existing school district boundaries. This makes it even more difficult to find suitable land for new school construction without expanding the UGB.

---

[7] For example, the court often dispense with legislative history in one sentence by stating simply that the legislative history is silent on the particular issue facing the court. *Ritcherson v. State,* 131 Or App 183, 186, 884 P2d 554 (1994) (seeking to determine if ORS 138.510(2) included retroactive application of its two-year statute of limitations period); *see also Windsor Ins. Co. v. Judd,* 321 Or 379, 387, 898 P2d 761 (1995) ("[W]hat little [discussion of the amendment] there was reveals nothing that sheds light directly on the question posed in this case."); *State v. Holloway,* 138 Or App 260, 267, 908 P2d 324 (1995) ("Unfortunately, our examination of the legislative history sheds no light on the matter."); *In Def. of Animals v. Or. Health Scis. Univ.,* 199 Or App 160, 173 n 9, 112 P3d 336 (2005) ("We note that the legislative history . . . provides no assistance in determining the provision's meaning.").

[8] Hearing on S.B. 1032 Before the S. Comm. on Environment & Land Use, 2005 Leg., 73rd Assemb., Reg. Sess. (Or. 2005) (statement of Gary Conkling, Representative of Beaverton School District).

[9] *Id.*

Finally, Mr. Tucker added that Metro intended to implement SB 1032 by amending its own code to make it easier to expand the UGB for schools "when [new schools] cannot be reasonably accommodated in the UGB, and when they must be accommodated before we would normally do an UGB expansion." Here, Mr. Tucker indicated that Metro should be authorized to quickly initiate UGB expansion for schools outside of the "typical" or "normal" legislative process of reevaluating the buildable land supply inside the UGB every [six] years.

Later, in a May 31, 2005 work session on SB 1032, Messrs. Conkling and Tucker again provided testimony in support of the bill and explained its purpose and scope. Mr. Conkling stated the bill's main purpose is to provide Metro "[with a] process that can work in between its periodic review, and provide for an accelerated process to bring these school sites inside the UGB."

After the testimony of Mr. Tucker, Senator Charlie Ringo, Chair of the Committee, asked if the bill will "facilitate Metro addressing the problem with high growth districts not finding land for schools."[10] Mr. Tucker stated his answer was yes, and that the bill would provide the basis for immediate negotiation as to what land should be included in the UGB as part of an amendment. Mr. Tucker explained that the bill would be beneficial to districts like Beaverton because "it facilitates the process for expanding the UGB for a school district that has need." Mr. Tucker stated that ideally, after revising the Metro code to implement the statute, the process to expand the UGB to include land for a school would take only four months.

The legislative history of HB 1032 indicates that one main purpose of the bill was to streamline the process for amending the UGB for the purpose of building new schools. The testimony of both Conkling and Tucker describe a pressing need for land in metropolitan areas for new school construction that cannot always be met within the typical five-year UGB cycle. Proponents of the bill clearly express intent to grant Metro authority to amend the UGB through a process that would be separate from the regular review cycle and corresponding 20-year need analysis.

Proponents of the bill used words such as "streamline" and "accelerated" in the context of a new expansion process that could occur outside and separate from the "normal" time intensive 20-year need analysis, and described a process that would be based exclusively on a demonstrated need for additional school facilities. Testimony regarding the purpose of SB 1032 indicates that the purpose of the legislation was to allow a separate and expedited process exclusively for school siting, which would not be tied to the 20-year buildable land supply analysis that is required under ORS 197.296.

As described above, it is clear from legislative history that the 2005 Oregon legislature was acutely aware of the problem of holding school districts to a six year Metro planning cycle during the enactment of SB 1032. Metro's Randy Tucker specifically stated that SB1032

[10] Work Session on S.B. 1032 Before the S. Comm. on Environment & Land Use, 2005 Leg., 73rd Assemb., Reg. Sess. (Or. 2005) (statement of Sen. Charlie Ringo, Chair, S. Comm. on Environment & Land Use).

"facilitated" school districts obtaining a UGB amendment for school facilities.[11] According to the Merriam-Webster dictionary, the word "facilitate" means "to make (an action or process) easy or easier." It makes little sense to believe that the legislature would desire to make obtaining a Metro UGB amendment *just as, or even more difficult* for schools while simultaneously creating an "accelerated" process specifically for schools. Indeed, Metro's own Legislative Affairs Director – no stranger to tightly-crafted statutory language - was quite clear in stating that the purpose of SB 1032 was to "facilitate" (that is, make easier) the process for Metro-area schools.

In addition, the hearings officer finds that the ORS 197.299's school-specific UGB amendment process is no less thorough or exacting than an application that could have been filed in due course of the next six-year Metro planning cycle. It is true, as opponents claim, that the next Metro 20-year buildable lands analysis is not yet available, and thus cannot be taken into account during this application. The law does not require that, however, and requiring school applicants to wait until the next six-year Metro planning cycle would render the passage of ORS 197.299 pointless. The entire point of ORS 197.299 was to provide schools with an interim, accelerated, easier ("facilitated") application process, rather than waiting for the next 6 year Metro planning cycle. Statutes should not be construed such that they make other statutes completely meaningless.

As noted above, the Metro Council is required to complete a 20-year forecast and analysis of land need to maintain a 20-year supply of residential and employment land inside the UGB on a six-year cycle. However the Metro Council has directed staff to complete an urban growth report in 2018, three years after the urban growth report was adopted in 2015, with a possible growth management decision occurring in December 2018 that may or may not result in an expansion of the UGB. Delaying the proposed amendment for these specific school and park needs until that time, when these types of specific needs are not addressed in the regional analysis, is not an appropriate or an efficient way to provide these needed services and would result in the District experiencing ever-increasing overcrowding of their facilities.

Thus, in summary, review of the text and context of ORS 197.299 and ORS 197.296 in combination with the legislative history of the 2005 Amendments which created ORS 197.299(4) bring the legislative intent into clear focus. ORS 197.299(4) explicitly provides a "safety valve" of sorts for public school needs. The statute de-couples the need for schools from the derivative secondary needs analysis set forth in ORS 197.296(6). The legislature apparently understood the critical nature of schools to serve the community and felt strongly enough about that to provide a mechanism to ensure that needed schools can be built. Opponents' attempt to saddle Major Amendments with all of the trappings of a six-year legislative review of the region's UGB is contrary to both the plain text of ORS 197.299(4) and its legislative history.

Having resolved the statutory interpretation question, we turn back to the evidence of need. The District originally adopted a long-term facilities plan in January 2008 that assumed additional school capacity would be needed in ten years. This proved true, as of 2017 the high

[11] Testimony before the Senate Environment and land Use Committee, May 31, 2005, beginning at minute 1.13, available at http://records.sos.state.or.us/webdrawer/webdrawer.dll/webdrawer/rec/4193397/ Mr. Tucker's statement is found at minute 1.18, in response to a question from Senator Ginnie Burdick.

school is at 109% of capacity and the four elementary schools are at 99% capacity. A ten-year demographic study by Davis Demographics & Planning Inc., completed in May 2016, forecasted a deficit in capacity at all levels with the high school operating at 141% of capacity. In order to meet the growing need, the District determined, with the assistance of numerous committees, that a new high school would be needed. Voters approved a bond measure in 2016 to construct a new high school and make other facility improvements. The applicant adequately addressed the urgent need for the new high school by substantial evidence in the whole record in its application submittal and its subsequent submittals. (*See* application narrative ("Narrative") at 14-15, 33, Appendices G, H, and I; June 8, 2017, District letter at 1-3, Attachment i; June 13, 2017, District letter at 5.)

The applicant has met its burden of showing compliance of the two criteria found in Metro Code section 3.07.1440(A) by substantial evidence in the whole record.

Metro Code Section 3.07.1440(B)

> **3.07.1440 Major Amendments - Criteria**
> **(b) The applicant shall demonstrate that the proposed amendment to the UGB will provide for an orderly and efficient transition from rural to urban land use and complies with the criteria and factors in subsections (b), (c), (d), (e), and (f) of section 3.07.1425. The applicant shall also demonstrate that: (1) The proposed uses of the subject land would be compatible, or through measures can be made compatible, with uses of adjacent land; (2) If the amendment would add land for public school facilities, the coordination required by subsection (c)(5) of section 3.07.1120 of this chapter has been completed; and (3) If the amendment would add land for industrial use pursuant to section 3.07.1435, a large site or sites cannot reasonably be created by land assembly or reclamation of a brownfield site.**

[Note: This Provision Incorporates by Reference: 3.07.1425(B), (C), (D), (E), & (F), which are Discussed Below].

MC 3.07.1425(B)(1): Demonstrated need to accommodate future urban population, consistent with a 20-year population range forecast coordinated with affected local governments;

Hearing Officer's Analysis: MC 3.07.1425(b)(1) requires that the Major Amendment application show a [d]emonstrated need to accommodate future urban population, consistent with a 20-year population forecast coordinated with affected local governments. " This criterion is taken word for word from the first need factor set forth in Statewide Planning Goal 14. In the context of periodic review, Factor 1 pertains to a determination of overall land need in order to accommodate population growth. In this case, the need is for additional school capacity to alleviate an overcrowding situation at the Sherwood high School. For this reason, the first need factor set forth at MCC 3.07.1425(B)(1) is to be considered, but it is not determinative by itself.

In *Residents of Rosemont v. Metro,* 173 Or App 321, 328, 21 P3d 1108 (2001), the Court of Appeals explained that "[w]e held in *Baker [v. Marion County,* 120 Or App 50, 852 P2d 254, *rev den*, 317 Or 485, 858 P2d 875 (1993),] that factors 1 and 2 of Goal 14 are interdependent and

that, if one of the factors is not fully satisfied, or is less determinative, that factor must still be considered and discussed in deciding if a need for expansion of a UGB has been shown under factors 1 and 2 of Goal 14."

This factor requires the applicant to show, by substantial evidence in the whole record, that there is a demonstrable need for the new Sherwood High School based on a forecast that is consistent with the adopted 20-year population range forecast which has been coordinated with affected local governments.

The District and Metro staff address this provision at: Application Narrative at pp. 15, 34, App'x H; May 4, 2017, staff report ("Staff Report") at 5; June 9, 2017, Metro memo; June 13, 2017, District letter at 1-2. In particular, the applicant attempts to meet its burden of proof with the following analysis:

> *As described herein, the need for additional school capacity including the need for a new high school is well documented as described in Section III of the petition. The existing high school is operating overcapacity and the constraints of the existing high school site and building do not allow for feasible expansion to 2,400 students to serve long-term needs. Building a new high school will also allow the existing high school building to be converted to middle school use by consolidating the two existing middle schools to one location. This will further allow for the conversion of the two existing middle schools to elementary school use. The capacity analysis and 10-year demographic projections indicate that there will be capacity issues at all school levels if nothing is done. The proposed project will provide the long-term capacity needed.*
>
> *The School District commissioned Davis Demographics & Planning Inc. to complete an updated 10-year demographic study in May of 2016. The study reviewed the following factors that determine student enrollment: (1) the current and planned residential development over the next ten years; (2) student yield factors that apply to new residential development; (3) birth factors for the District area; and (4) mobility factors, which examine the in/out migration of students within existing housing units. The forecast projects a deficiency in capacity in all levels, with the high school level having the largest deficiency. Staff Report Attachment 3 (Table 2 in petition) shows 10-year enrollment projections compared with existing school building capacity. The table demonstrates that if no capacity is added (no-build) the school facilities will be far over capacity in 10 years with the Sherwood High School having the largest capacity issue operating at 141% of capacity.*

Metro's 20-year population range forecast is part of the 2015 urban growth report ("UGR"). Therein, the Metro Council determined that the region could meet the expected 20-year residential and employment forecast need within the UGB and no expansion of the UGB was needed to meet housing or employment needs. The UGR did not address specific school and park land needs. As a result, the District prepared a ten-year demographic study that supports a need for additional land for a new high school in order to accommodate future urban population. The District completed this demographic study using population and demographic projections for the cities of Sherwood and Tualatin.

The parties do not focus much, if any, of their debate on whether the population and demographic projections in the District's 10-year study are "consistent" with the assumptions in the 2015 UGR. Such as comparison is complicated by the fact that the UGR takes a high-level regional look at residential and employment needs, whereas the District's 10-year demographic study is much more narrowly focused on Sherwood's population. Nonetheless, the hearings officer reviewed both the 10-year study and the UGR and finds that there is no glaring inconsistency between them. The 2105 UGR anticipates continued high levels of growth in our region. The UGR further recognizes that there is still a considerable amount of vacant and redevelopable land located in and near the City of Sherwood. This would indicate that the District needs to be prepared to accommodate a large amount of additional school children. Given that the regional 20-year forecast did not address school and park land needs, the District's ten-year demographic study, which supplements the long-term facility plan completed in 2008, demonstrates a need to accommodate future urban population by substantial evidence in the whole record. The applicant has provided information regarding a ten-year demographic study showing a need for providing specific school facilities to meet present and future populations based on established methodologies for the proposed use. The applicant also provided written and verbal testimony from experts such as architect Karina Ruiz of Dull Olson Weekes IBI Group Architects, Inc, planner Keith Jones AICP of Harper Houf Peterson Righellis Inc, and traffic engineers Scott Mansur, P.E. and Carl Springer, P.E. of DKS Associates. Having reviewed these materials and observed their testimony, the hearings officer finds them more credible and assigns great weight to their views.

Staff is also correct when it states that even if Metro had expanded the UGB in 2015 for a 20-year housing need, there is no guarantee that the location of the added land would have accommodated the specific need for a new high school in Sherwood. ORS 197.299(4) provides a safety valve for such a situation.

The primary opponent argues that the District could only demonstrate consistency with the 2015 UGR by submitting a new 20-year demographic study. *See* letter from Jennifer Bragar dated June 23, 2017, at p. 20. The opponent points to no specific law which expressly states such a requirement, and the hearings officer does not believe that such a requirement exists. As far as the hearings officer can determine, "consistency" in this context simply means using the same or similar growth rates contemplated in the 2015 UGR, and that appears to be the case here. *See* the updated 10-year demographic study conducted by Davis Demographics & Planning Inc. dated May, 2016. This is consistent with Goal 2, which requires the factual inventories and assumptions included in the comprehensive planning documents to form the "basis for all decisions and actions related to land use." *Rivergate Residents Ass'n v. LCDC*, 38 Or App 149,

5990 P2d 1233, *rev den*. 286 Or 521 (1979); *Hildenbrand v. City of Adair Village*, 217 Or App 623, 177 P3d 401 (2008) ("Plan policies or inventories can serve to justify subsequent and related plan amendments because comprehensive plans must be internally consistent under Goal 2.)" *See also 1000 Friends of Oregon v. Metro (Ryland Homes)*, 174 Or App 406, 26 P3d 151 (2001). *Compare GMK Developments v. City of Madras,* 225 Or App 1, 199 P3d 882 (2008) (Nothing in Goal 2 itself requires the sort of continuous data correction that the opponents urge us to impose in this case).

MC 3.07.1425(B)(1) requires the District to demonstrate a need to accommodate future urban population; consistent with the demographic study contained in the 2015 UGR. The District has done that, and that is all that is required. The applicant has met its burden of showing compliance with this factor by substantial evidence in the whole record.

MC 3.07.1425(B)(2): Demonstrated need for land suitable to accommodate housing, employment opportunities, livability or uses such as public facilities and services, schools, parks, open space, or any combination of the foregoing in this paragraph;

This factor requires the applicant to show, by substantial evidence in the whole record, that there is a demonstrable "need for land suitable to accommodate * * * uses such as * * * schools * * *." The applicant presents its case as follows:

> As described herein, the need for additional school capacity including the need for a new high school is well documented as described in Section III of the petition. The existing high school is operating overcapacity and the constraints of the existing high school site and building do not allow for feasible expansion to 2,400 students to serve long-term needs. Building a new high school will also allow the existing high school building to be converted to middle school use by consolidating the two existing middle schools to one location. This will further allow for the conversion of the two existing middle schools to elementary school use. The capacity analysis and 10-year demographic projections indicate that there will be capacity issues at all school levels if nothing is done. The proposed project will provide the long-term capacity needed.
>
> The School District commissioned Davis Demographics & Planning Inc. to complete an updated 10-year demographic study in May of 2016. The study reviewed the following factors that determine student enrollment: (1) the current and planned residential development over the next ten years; (2) student yield factors that apply to new residential development; (3) birth factors for the District area; and (4) mobility factors, which examine the in/out migration of students within existing housing units. The forecast projects a deficiency in capacity in all levels, with the high school level having the largest deficiency. Staff Report Attachment

3 (Table 2 in petition) shows 10-year enrollment projections compared with existing school building capacity. The table demonstrates that if no capacity is added (no-build) the school facilities will be far over capacity in 10 years with the Sherwood High School having the largest capacity issue operating at 141% of capacity.

The City of Sherwood and the Sherwood School District have an intergovernmental agreement to share ballfields. The City of Sherwood owns an extensive system of parks and trails. However, the City's ballfield resources are very limited with only one soccer field located at the City's Snyder Park. In the early 1990s, prior to rapid growth in the preceding 20 years, the City took measures to protect natural resources. This included the protection of floodplains and wetland areas surrounding the Cedar Creek stream corridor that flows south to north through the center of the City limits to the Tualatin National Wildlife Refuge. The City acquired much of this land and maintains these areas as natural open space, wetlands and walking paths. Since most of the areas are sensitive and passive recreation areas, they are off limits to ballfield construction. Because Sherwood has a very active sports community, the City and School District decided to share sports fields with most of these facilities being on school grounds.

In the case of the new High School site, the City owns the approximately 20-acre parcel in the southeast corner of the property. Some of this land, approximately 4 acres, will be used for the Elwert and Kruger Road realignment and roundabout, but the remaining balance will become part of the new high school campus and allow for construction of additional ballfields to be shared with both school and City sports functions.

As documented in Section III of the petition, viable high school sites are not available within the current UGB. The only viable sites, including the proposed site, have been identified within the Sherwood West Concept Planning Area (Urban Reserve Area 5B).

The subject site ("Site C") is the best alternative site considering that it has:

- No mapped sensitive areas (habitats, wetlands or waterways),
- Gently sloping topography to allow for construction of ballfields,
- Close proximity to SW Elwert Road and Highway 99W for ease of access,
- Availability of public utilities (water and sewer),

- Available downstream discharge point for stormwater, and
- Sufficient area to provide high school campus for 2,400 students and needed City/School District shared ballfields.

As shown above, the applicant has shown a compelling need for providing specific school facilities to meet present and future populations.

The City of Sherwood and the District have an intergovernmental agreement to share sports fields with most of the facilities on school grounds. The City has an extensive system of parks and trails but sport field resources are very limited with one soccer field located in a city park. Thus, the applicant has shown there is a demonstrated land need to accommodate both school and park services by substantial evidence in the whole record. That evidence may be found in the following: Applicant's Narrative at p. 12-32, 34, Appendices C, G, H, and I; June 8, 2017, District letter pp 1-3. Additionally, the applicant demonstrated that district bond financing rules require moving ahead with the application now, rather than wait until the end of 2018. *See* letter from applicant's counsel Kelly Hossaini dated June 8, 2017, page 3 (discussing the district's finances).

The applicant has met its burden of showing compliance with this factor by substantial evidence in the whole record.

MC 3.07.1425 (B)(3): A demonstration that any need shown under paragraphs (1) and (2) of this subsection cannot be accommodated on land already inside the UGB.

MC 3.07.1425(B)(3) requires an alternatives sites analysis showing that the needed new school cannot be accommodated within the existing UGB. This requirement stems from state law. Among other laws, Statewide Planning Goal 14 requires the applicant to consider, as part of the needs analysis, all suitable lands inside the UGB as positive alternatives, and even requires the City to consider whether zone changes could make land suitable for the project. *See Brandt v. Marion County*, 22 Or LUBA 473, 481 (1991); *Turner v. Washington County*, 8 Or LUBA 234, 258 (1982), *aff'd*, 70 Or App 575,689 P2d 1318 (1984).

The applicant's narrative discusses MC 3.07.1425(B)(3) at p. 19-21, 34-35. For example, on pages 16-17 of the narrative, the applicant states as follows:

> As evidenced by capacity study and demographic growth data, the high school level is where there is the biggest need for additional capacity both now and to a greater extent within 7 to 10 years. Therefore, the Bond Management Team first looked to the existing high school campus for opportunities for expansion to accommodate this growth.
>
> **Expansion of Existing High School**
>
> The existing Sherwood High School is located on approximately 37.8 acres of land at 16956 SW Meinecke Road. The existing high

school has capacity for 1,550 students and, as of the writing of this report, is well over capacity with an enrollment of 1,689. This growth is expected to continue with a needed student capacity of approximately 2,200 by the year 2025 and peaking at approximately 2,400 students. Therefore, the School District will need a long-term high school capacity for 2,400 students.

Expanding the existing high school campus to meet this need is problematic on many fronts due to existing size limitation and irregular configuration of the site boundaries. Further, the campus cannot expand beyond its current boundaries as the campus is completely surrounded by existing residential development to the north, south and west and Stella Olsen Park and the sensitive wetland areas along Cedar Creek to the east as shown in Staff Report Attachment 4(Figure 5 in petition).

With respect to the buildings themselves, the School District has made additions over the years to accommodate growth, but the buildings are now completely overtaxed. Based on capacity analysis performed by the School District's contract architect, DOWA, the existing high school campus could be renovated to accommodate only another 450 students. This would increase capacity from 1,550 to approximately 2,000 students. However, at 2,000 students, the school would only have capacity for 7 years requiring the School District to add capacity again down the road. In review of the School District's bonding capacity, the School District will not be in a financial position to make any changes in 7 years and would be saddled with overcapacity schools for the foreseeable future. Therefore expanding the existing campus would provide for a short-term fix but would not provide the long-term solution the District is looking for.

New High School Siting Criteria

With the determination that a new high school is needed, the Bond Management Team identified the following criteria for aid in locating sites for further consideration:

1. Minimum Size: 50 acres
2. Zoning: Site must be zoned or planned for residential or institutional use that allow schools
3. Location: Site must be in Sherwood or contiguous to Sherwood (The City of Sherwood and mostly western Sherwood is where 90% of the student population resides)
4. Topography: Flat to mostly flat to accommodate ballfields

5. Wetlands and Waterways: No wetlands or minimal wetlands/waterways
6. Water and Sanitary Sewer: Adequate public utilities must be available or can feasibly be extended to serve the site
7. Stormwater Drainage: Downstream drainage capacity must exist to accommodate new impervious areas
8. Transportation: Site must be located near major streets to allow ease of access for students and limited routing of school traffic and buses through existing or planned residential areas

Inside the Current UGB

Using Metro's Regional Land Information System, City's Residential Buildable Lands Map and concept planning documents, potential sites were searched within the Sherwood School District Boundary that is inside the Existing Sherwood Urban Growth Boundary and within the Wilsonville or Tualatin existing Urban Grown Boundary.

Northeast Sherwood (Commercial and Industrial Land)

Sherwood City Limits

The northwest area of the City of Sherwood is zoned commercial and industrial, zoning that does not allow for school uses. In addition, much of the commercial and industrial land is built-out or contains wetlands and sensitive areas that cannot be developed. The largest vacant developable site in this area is located at the southeast corner of SW Langer Farms Parkway and SW Century Drive and is only 22 acres, too small for a high school.

Tonquin Employment Area

In 2004, 300 acres of industrial land was added to the Sherwood urban growth boundary in east Sherwood, known as the Tonquin Employment Area. A concept planning document was completed for this area in October of 2010. None of the area has of yet been annexed into the City of Sherwood to allow for urban development. There is an 88 acre parcel that fronts SW Tualatin-Sherwood Road that has potential to accommodate a new high school (12900 SW Tualatin Sherwood Road – 2S128D000100). However, this parcel was added to the UGB for the purpose of providing industrial uses and not for school uses. In addition, this site is located at the far east end of the existing Sherwood city limits and is not close to the student population that predominately resides on the west side of Sherwood. Therefore, locating the

school here would result in an inconvenient and isolated high school campus in the midst of industrial uses. Thus, the site was rejected from further consideration.

South and West Sherwood (Residential Land)

The southern and western areas of Sherwood are mostly residential. Residential zoning allows for school uses. This is also where most of the School District's student population resides (more than 90% of the student population lives in southern and western Sherwood). South of the existing city limits and within the urban growth boundary is the 250-acre Brookman Road Addition Concept Planning Area (Brookman Planning Area). The primarily-residential Brookman Planning Area has a completed concept plan from May of 2009. However, the area has not yet been annexed into the City of Sherwood and therefore has not been developed for urban uses.

The City of Sherwood recently completed a draft Housing Needs Analysis dated June 2015 for the existing urban growth boundary. The housing needs analysis contained a 2014 residential buildable lands inventory map that identified vacant buildable residential land within the City's UGB including the Brookman Planning Area. The residential buildable lands inventory map identified some available residential land. However, the available land is fragmented and/or constrained with no large developable sites that would accommodate a high school campus of 50 acres. Further there is no opportunity to consolidate this fragmented land in a way that would meet the District's criteria for a high school site. The Sherwood Buildable lands map is shown in Staff Report Attachment 5(Figure 6 in petition).

Within the Wilsonville or Tualatin Urban Growth Boundary

There are some limited areas of the Sherwood School District that are within Wilsonville and Tualatin's urban growth boundary, including the following:

Southwest Tualatin Concept Planning Area

Adjacent and east of the Sherwood Tonquin Employment Area is the Southwest Tualatin Concept Planning Area. Similar to Tonquin, this 614-acre area was added to the urban growth boundary in 2004. The area is planned for industrial use, and is even further away from west Sherwood students than Tonquin Road. Therefore, the area was rejected from further consideration.

Basalt Creek and Coffee Creek Planning Areas

Both of these planning areas are too far from the west Sherwood student population to be seriously considered. In addition, discussions with the City of Tualatin, who is leading the planning for Basalt Creek, indicates that there are no sites large enough with the correct zoning within Basalt Creek that would accommodate a new high school. The Coffee Creek planning area is designated by Metro as Regionally Significant Industrial land. This designation does not allow for school uses under any circumstances.

In summary as noted in Section III of the petition there are no suitable sites for a new high school within the current UGB to serve the Districts target population.

As noted in the findings set forth above, the District first examined the ability to expand the current high school to meet future capacity needs. However expanding the existing high school building is problematic due to existing size limitation and the configuration of the existing school campus. The current high school building includes a series of additions designed and constructed in an attempt to incrementally accommodate growth in the student population, resulting in a crowded non-operational and functional facility. Thus additional expansions to meet long term needs are not possible. In addition, the current high school campus is surrounded by residential development on three sides with the fourth side bordering a city park and natural resource area, thereby not allowing expansion of the campus itself.

The District identified eight site location criteria to help guide their search for appropriate site locations within the Sherwood city limits as well as limited areas within Tualatin and Wilsonville that are within the District boundary. The analysis of land within the city limits offered no usable sites. The city's industrial and commercial zones don't allow school uses and the vacant and developable land within the residentially zoned portions of the city is fragmented and constrained with no large enough sites available. The industrial designated land within the UGB but not in the city (Tonquin Employment Area) does contain one site large enough to meet the need; however it was included in the UGB for industrial purposes, is adjacent to existing industrial uses including an active quarry site and is located away from the main student population base. The limited land area within Tualatin and Wilsonville also include either industrially zoned land or very limited parcel sizes that does not provide an opportunity to site a high school. In addition, these areas are even a longer distance from the main student population base in the central and western portions of the city.

No opponents take issue with the applicant's analysis.

The hearings officer believes that it is relatively obvious that there are no sites within the City limits that could meet the need, even considering rezoning as an option. While there is vacant land in the existing UGB, the applicant has shown there are no suitable sites within the

UGB to meet the identified land need. The applicant has met its burden of showing compliance with this factor by substantial evidence in the whole record.

MC 3.07.1425 (C)(1): If the Council determines that there is a need to amend the UGB, the Council shall evaluate areas designated urban reserve for possible addition to the UGB and shall determine which areas better meet the need considering the following factors:

(1) efficient accommodation of identified land needs;

Hearing Officer's Analysis: Once a local government establishes a "demonstrated need" to expand the urban growth boundary, it then must apply the Goal 14's four "locational factors." When Goal 14 was amended in 2005, the locational factors were amended to make clear that the analysis is to be comparative in nature, as opposed to establishing minimum thresholds. The rule now states:

> The location of the urban growth boundary and changes to the boundary shall be determined *by evaluating alternative boundary locations* consistent with ORS 197.298 and with consideration of the following factors:
>
> (1) efficient accommodation of identified land needs
> (2) orderly and economic provision of public facilities and services;
> (3) *comparative* environmental energy, economic and social consequences; and
> (4) compatibility of the proposed urban uses with nearly agricultural and forest activities accruing on farm and forest land outside the UGB. (Underline emphasis added).

Metro has taken the four state-mandated locational factors set forth in Goal 14 and expended them to nine factors. Regardless of this, the goal of the locational analysis remains the same as state law, which is to determine the "best" land to include within the UGB to meet the land need**,** based on appropriate *consideration and balancing* of each factor. *1000 Friends of Oregon v. Metro (Ryland Homes)*, 38 Or LUBA 565, 584 (2000), *rev'd in part on other grounds* 174 Or App 406, 26 P3d 151 (2001). In *Barkers Five, LLC v. LCDC*, 261 Or App 259, 289 (2014), the court stated that consideration of factors means that the local government must:

> "(a) apply and evaluate each factor, (b) weigh and balance the factors which are not independent approval criteria-as a whole, and (c) meaningfully explain why a designation as urban or rural reserves is appropriate. "

Barkers Five, 261 Or App at 300.

OAR 660-024-0060(3) also provides guidance for how one "considers" the location factors and states:

> The boundary location factors of Goal 14 are not independent criteria. When the factors are applied to compare alternative boundary locations and to determine the Metro UGB location, Metro must show that all of the factors were considered and balanced.

In conducting this analysis, one point that cannot be over-emphasized is that no one locational factor can be considered to be a determinative reason to include or exclude any one particular site. Thus, a decision to include or exclude land from a UGB must be based on a *balancing* of all these factors, rather than reliance on any one factor. OAR 660-024-0060(3). *See also Branscomb v. LCDC*, 64 Or App 738, 745, 669 P2d 1192 (1983)(Court held that land could not be excluded from consideration *solely* because it was agricultural land and, as such, fared badly under factor 6). *D.S. Parklane*, 165 Or App at 25; *1000 Friends of Oregon v. Metro (Ryland Homes)*, 174 Or App 406, 409-10 (2001).

A related issue is that local governments often incorrectly treat the locational factors as threshold criteria. In fact, this misunderstanding was so pervasive that at one point LUBA even wrongly suggested that each of the locational factors had a "minimum objective threshold" that had to be identified and met by each site included in a UAR/UGB. *See D.S. Parklane Development, Inc., v. Metro*, 35 Or LUBA 516, 572-3 (1999), *aff'd as modified*, 165 Or App 1, 24, 994 P2d 1205 (2000). However, on appeal, the Court of Appeals clarified that the locational factors were not intended to be applied as threshold ("go - no go") criteria. *Id.* In other words, the intent is *not* to confirm that the preferred site was "good enough" to urbanize based on minimum threshold standards. Rather, the locational factors were intended to be "applied equally" to include lands into a UGB only "where all of the factors justify that inclusion." *Id.* In other words, the intent in establishing these factors was to assist in evaluating and ranking which site(s) amongst *all* potential candidate sites were, relative to one another, the *best* sites to urbanize in order to meet the demonstrated land need.

With that introduction in mind, we turn to a discussion of the first factor. The applicant discusses the first locational factor as follows:

> Urban reserves are lands outside the existing urban growth boundary that are considered suitable for accommodating urban development and expanding the growth boundary when additional urban land is determined to be needed over a 50-year period. The following urban reserve areas are within the Sherwood School District Boundary and are identified in Staff Report Attachment 6 (Figure 7 in petition):
>
> Sherwood North – North of Sherwood UGB
> Sherwood South – South of Sherwood UGB
> Sherwood West – West of Sherwood UGB
> Tonquin – South and West of Sherwood UGB
> Grahams Ferry – Northwest of Wilsonville

I-5 East – East of I-5 and north of Wilsonville
Elligsen Road - East of I-5 and north of Wilsonville

I-5 East, Elligsen Road and Grahams Ferry Urban Reserve Areas
These urban reserve areas were immediately rejected from further consideration due to the distance from west and south Sherwood where the majority of the student enrollment resides. These areas are 2 to 5 miles away in a straight line and even further when traveling on the road network.

Tonquin Urban Reserve Area
This area is directly south of the Sherwood Tonquin Employment UGB area and west of the Southwest Tualatin UGB area. The Tonquin Urban Reserve area encompasses approximately 571 acres. The area has parcels large enough to accommodate the high school site. However, much of the property is mapped as containing Upland Habitat Class A (Metro Title 13) and Riparian Areas Class I, II and III (Metro Title 3). This urban reserve area and it is likely to be designated industrial and/or employment due to its close proximity to other industrial areas. This urban reserve area is on the east side of the City and not centrally located for use by the majority of the School District students. The area is further isolated by a rock bluff that forms the eastern boundary of the current urban growth boundary and Sherwood City limits. This bluff is perched above the Rock Creek stream corridor that effectively isolates this area from the existing residential neighborhoods of Sherwood. Finally, the area does not have adopted concept plan or plan for how utilities will be extended to serve the area.

Sherwood North Urban Reserve Area
This area represents slivers of land along the existing urban growth boundary at the north end of the City of Sherwood. The area was designated urban reserve because it is not within the floodplain of the Tualatin River. However, this land is not large enough to accommodate a high school site and therefore was rejected from further consideration.

Sherwood South Urban Reserve Area
This area is directly south of the Brookman Road UGB area. This area consists of rolling hills with much of the area identified by Metromap online mapping system having slopes greater than 10%. There is also two stream corridors that travel through the area with many areas mapped by Metromap as being riparian or upland habitat. One potential site is located between Oberst Road and Labrousse Road that is not mapped as having upland habitat or

riparian areas. However, this land is mapped by Metro as having slopes of greater than 10% making development of a high school campus and ballfields difficult. The biggest challenge of developing in this area is that the Brookman Road UGB area would need to be annexed and developed first before this area can be made available for development. Therefore, development in this urban reserve area is likely years away and the only promising site is at the south end of and not next to the existing Brookman Road UGB area. This area also does not have a concept plan. For these reasons, this area was rejected from further consideration.

Sherwood West Urban Reserve Area

In February 2016, Sherwood completed a Preliminary Concept Plan for the Sherwood West Planning area (aka Metro Urban Reserve Area 5B). Sherwood West encompasses 1,291 acres along the west border of Sherwood's existing urban growth boundary. The Sherwood West Planning Area is shown in Staff Report Attachment 7 (Figure 8 in petition).

Six alternative high school sites (A-F) were identified within the Sherwood West Urban Reserve Area that are large enough to accommodate a new high school. The six alternative sites (A-F) within the Sherwood West Concept Plan Area were evaluated based on site selection criteria. The site locations and evaluation criteria are indicated in Staff Report Attachment 8 (Figures 9 to 14 in petition). The School District's site alternative analysis is summarized in the table below.

(Table 1 – Alternative Sites Summary in petition)

Alternative Selection Criteria	***Alternative Sites****					
	A	***B***	***C***	***D***	***E***	***F***
Flat Topography	*N*	***U***	***Y***	*U*	*U*	*U*
Wetlands	*N*	***Y***	***Y***	*U*	*Y*	*N*
Water Service	*N*	***Y***	***Y***	*Y*	*N*	*N*
Sanitary Sewer Service	*N*	***Y***	***Y***	*N*	*N*	*Y*
Storm Drainage	*Y*	***Y***	***U***	*N*	*N*	*Y*
** Y-Meets Criteria - N-Does Not Meet Criteria – U-Undetermined*						

From the site alternatives analysis, it became clear that Sites B and C were the most promising with other sites lacking utilities, having significant wetlands, drainage issues and/or significant topography that would make construction challenging. Alternative Sites B and C are located near each other both west of SW Elwert Road at SW Haide Road, just north of Highway 99W. Site C was selected due

to having more of a gentle slope and less grade changes. Most of Site C has a consistent slope change of approximately 40 feet over the length of the site with only a small valley and ridge. Site B has a more drastic slope change of 50 to 60 feet with a more defined ridge running through the middle of the site. Site B would be far more challenging to grade and develop for a high school than Site C. The Sherwood West Concept Plan contained a phasing and funding strategy. The phasing plan identified six phases (A-F). The subject site (Site C) is located within Phase A of the concept plan.

The subject site represents an efficient location because:

- The location is next to existing western Sherwood and close to the vast majority of the District's student population (90%).
- City utilities are available to serve this site or can be extend as the site is adjacent to the city limits.
- Direct and efficient access will be available via major streets that are intended to accommodate significant motor vehicle, pedestrian and bicycle needs.
- The site will be developed on the north, south and west along existing right-of-ways and will be developed to the existing City limits and UGB. This location is a logical location to develop first within the Sherwood West Concept Plan, as it is really the first site north of 99W. Other sites in Sherwood West would result in undesirable leapfrog development.
- Utilizing the approximate 76-acre site to ultimately accommodate the large 2,400-student high school and the School District/City shared ballfields will provide greater efficiency than developing play fields independently. The district and City have a long history of partnering to maximize use of shared ball field resources.

As set forth in the District's narrative and response to MC 3.07.1440(a), there is an identified need for a major amendment of the UGB to provide for a new high school site and this need cannot wait until the next analysis of the building land supply under ORS 197.299. As allowed by MC 3.07.1425(b), the District specified characteristics necessary for land to be suitable for the identified need, *i.e.*, the new high school. *See* Applicant's Narrative at 18-19, 33-35. These characteristics included a minimum site size of 50 acres; zoning that would allow for an institutional use; within or contiguous to Sherwood, where 90% of the children served by the District reside; flat to mostly flat topography; no or minimal constraints such as streams, wetlands, intact upland habitat; adequate/feasible access to public utilities, including water, sanitary sewer, and storm sewer; and near to major (collector or arterial) streets to accommodate high school-level transportation impacts. As also required by MC 3.07.1425(b), the District has demonstrated that the need for the new high school cannot be accommodated on land already inside the UGB.

As shown above, the District undertook an analysis of seven urban reserve areas that are within the district boundary, three of which are not adjacent to the city of Sherwood. The Metro Code does not allow for the creation of an island of urban land so the analysis must be limited to those properties that are directly adjacent to the current UGB. MC 3.07.1425(f).

The Seven Urban Reserve Areas

Within the District's boundary, there are seven areas that contain urban reserves (*see* Application Narrative p. 22 of 39, showing map of all seven areas). They are:

- Sherwood North
- Sherwood South
- I-5 East
- Elligsen Road
- Tonquin
- Graham's Ferry
- Sherwood West

Each will be discussed in turn.

The Sherwood North Urban Reserve Area

The Sherwood North urban reserve area is comprised of slivers of land without flood plain constraints north of the existing city limits and south of Tualatin River. This area does not contain one or more contiguous parcels that would be large enough to meet any of the District's siting criteria for a high school site. Therefore, the hearings officer finds that the Sherwood North urban reserve area cannot accommodate the need for a new high school.

The Sherwood South Urban Reserve Area

The Sherwood South urban reserve area is adjacent to the Brookman Road UGB area. Some of the Brookman Road UGB area was recently annexed to the city, but much of it still has not been annexed. The Sherwood South area consists of rolling hills with much of the area identified by Metro Map as having slopes greater than ten percent, which would not meet the District's siting criterion of a flat to relatively flat site. (See Attachment 3.) There are also two stream corridors that traverse the area with many areas mapped by Metro as being riparian or upland habitat. (See Attachment 4.) There is a potential site located between Oberst Road and Labrousse Road that is not mapped as being constrained by upland habitat or riparian areas, but is mapped as having slopes greater than ten percent, which would not meet the District's siting criterion for a flat to relatively flat site. A challenge in the overall development of this area is that the Brookman Road area within the UGB must be annexed and developed first before the Sherwood South area will have the public services it needs to be able to develop. Further, Sherwood South is not even concept planned yet. As far as the hearings officer is aware, no such planning has been scheduled. As noted earlier, MC 3.07.1110 requires that urban reserve areas be concept planned before they be considered for inclusion in the UGB. As set forth in response

to MC 3.07.1440(a) there is a pressing need for the new high school. To wait at least one or more years for the City to concept plan the Sherwood South urban reserve area under MC 3.07.1110 is not consistent with the pressing need for the new high school that precipitated this major amendment application. Therefore, the hearings officer concludes Sherwood South cannot accommodate the need for a new high school.

The I-5 East Urban Reserve Area

The I-5 East urban reserve area is at the extreme eastern end of the District's boundary, east of I-5, next to Tualatin. This urban reserve area does not meet the District's siting criterion that the new high school site be within or contiguous to Sherwood, where 90% of the children served by the District reside. Further, as set forth in the staff report, these urban reserves are constrained by natural resources issues and steeper slopes yielding no buildable areas big enough to accommodate a new high school. For all of these reasons, the hearings officer finds and concludes that this urban reserve cannot accommodate the new high school.

The Elligsen Road Urban Reserve Area

Similarly, the Elligsen Road urban reserve area is at the extreme eastern end of the District's boundary, east of I-5, next to Tualatin, and immediately south of the I-5 East urban reserve area. This urban reserve area does not meet the District's siting criterion that the new high school site be within or contiguous to Sherwood, where 90% of the children served by the District reside. Travel to western Sherwood would be at least five miles for the vast majority of students along the already-congested Tualatin-Sherwood Road (*see* Application Narrative p. 22 of 39, showing map). Further, as set forth in the staff report, these urban reserves are constrained by natural resources issues and steeper slopes yielding no buildable areas big enough to accommodate a new high school. For all of these reasons, the hearings officer finds and concludes that this urban reserve cannot accommodate the new high school.

The Tonquin Urban Reserve Area

The fifth urban reserve is the Tonquin urban reserve area. This area lies on the east side of Sherwood and is contiguous to Sherwood's city boundary. As set forth in the Narrative, this urban reserve area is directly south of the Sherwood Tonquin Employment UGB area and, according to Julia Hajduk, the City's Community Development Director, will be used to accommodate the City's future industrial and employment needs given its proximity to other industrial uses and Sherwood's employment/industrial core. Therefore it is not likely to allow for zoning for an institutional use. As noted in the staff report, another issue with building a new high school in this area is that the majority of adjacent land within the UGB is not yet developed to urban standards. Any out-of-sequence development in this area, then, would require a costly and inefficient extension of public services. Further, much of the property in this urban area is mapped as containing Upland Habitat Class A (Metro Title 13) and Riparian Areas Class I, II, and III (Metro Title 13). (See Attachment 1.) This area is further isolated by a rock bluff that forms the eastern boundary of the current UGB and city limits. This bluff is perched above the Rock Creek stream corridor that effectively isolates the area from the existing residential neighborhoods of Sherwood, thereby making it less efficient to serve the student population

given that the bulk of that population is in the southern and western areas of the city. Significant areas of the urban reserve also have substantial slopes of ten percent and greater, along with floodplain constraints, which would not meet the District's siting criterion of a flat to relatively flat site. (See Attachment 2.) Further, this urban reserve area does not have a concept plan in place or a plan for how utilities might be extended to serve the area. Concept planning has not been completed for this area. MC 3.07.1110 requires that urban reserve areas be concept planned before these areas can be considered for inclusion in the UGB. As set forth in response to MC 3.07.1440(a) there is a pressing need for the new high school. To wait at least one or more years for the City to concept plan the Tonquin urban reserve area under MC 3.07.1110 is not consistent with the pressing need for the new high school that precipitated this major amendment application.[12] Therefore, the hearings officer concludes the Tonquin urban reserve area cannot accommodate the need for a new high school.

The Grahams Ferry Urban Reserve Area

The Grahams Ferry urban reserve area is at the District's extreme southeast boundary next to Wilsonville. This urban reserve areas meet the District's siting criterion that the new high school site be within or contiguous to Sherwood, where 90% of the children served by the District reside. Travel to from Graham's Ferry to western Sherwood would be at least seven miles for the vast majority of students along the already-congested Tualatin-Sherwood Road (*see* Application Narrative p. 22 of 39, showing map). Further, as set forth in the staff report, this urban reserve area is constrained by natural resources and steeper slopes yielding no buildable areas big enough to accommodate a new high school. For all of these reasons, the hearings officer finds and concludes that these urban reserves cannot accommodate the new high school.

The Sherwood West Urban Reserve Area

The seventh and final urban reserve area studied was Sherwood West. The hearings officer finds this is the only urban reserve area that can efficiently accommodate a new high school consistent with the citing criteria, for these reasons: Sherwood West has been MC 3.07.1110 concept planned and so may be considered for inclusion within the UGB. Sherwood West is adjacent to the city's existing UGB and in close proximity to the bulk of the District's student population. The area is planned for predominantly residential uses, including schools, and so as Sherwood West develops even more of the student population will reside in the vicinity of the proposed high school site. The District studied the 1,291-acre Sherwood West urban reserve for places within it that could accommodate a new high school site. The applicant District did this by utilizing an engineer and architect to evaluate all sites in the urban reserve that were flat to relatively flat; had a minimum buildable site size of approximately 50 acres or more; no or minimal constraints from streams, wetlands, and intact upland habitat; adequate/feasible access to public utilities; and proximity to a major (collector or arterial) street network. Findings addressing MC 3.07.1425(c) can be found in the Narrative and in the staff report. The applicant District included an analysis of the six areas within Sherwood West. Therefore, the hearings officer finds that, given the framework of MC 3.07.1425(b) and (c), no urban reserve except for

[12] Urban Reserve Areas are intended to provide a 50-year supply of land. Given that the City has no plans to complete a concept plan for the area, and because contiguous areas within the UGB would need to develop first to extend the needed infrastructure, it is safe to conclude that development of this area is at least several years away.

Sherwood West should advance to MC 3.07.1425(c) to determine which urban reserve can best meet the identified need, because no other urban reserve can meet that need.

The Six Sites Studied within the Sherwood West Urban Reserve Area

The District identified six sites (designates Sites A through F) within the Sherwood West urban reserve area that were large enough to accommodate a new high school campus. Each of the six is discussed in turn:

Site A – The hearings officer finds this site cannot efficiently accommodate the new high school due to slope, natural area constraints, public infrastructure issues or a combination of these factors. There is a small wetland in the center of this site. The western portion is mostly occupied by Chicken Creek. There is no water service available from SW Elwert Road, and water extensions would be required along Elwert frontage and east from SW Edy Road. The site is low-lying and sanitary sewer connection is not available from SW Edy Road, so a major pumping station would have to be built.

Site B - The hearings officer finds this site *could* possibly accommodate the new high school. However, it has a significant ridge running through the middle of the site, which would require extensive grading, with slopes running both east and west with a 50-60 foot grade change. Both public water and a 15" sanitary sewer pipe are available off SW Elwert Road.

Site C - This site is quite flat, with no more than a 40 foot grade change required. It has water and sewer connections off SW Elwert Road. There are no wetlands. The hearings officer finds that Sites B and C are the two areas that can most efficiently accommodate a new high school, but Site C is clearly superior because Site B has a significant topographic ridge running north-south through the middle of the site with an approximately 50-60 foot grade change. Site C has less topography to manage, which is important when one considers that ballfields, tracks, and other sports facilities needed as part of the new high school cannot be developed on slopes. Therefore, the hearings officer concludes and finds Site C can most efficiently meet the identified need of a new high school.

Site D - The hearings officer finds this site cannot efficiently accommodate the new high school due to slope, natural area constraints, and public infrastructure issues. The entire site slopes down to the east towards private property, with a grade change in excess of 50 feet. There is no sanitary sewer service available. A very costly sewer line extension and public system improvements would be necessary. There are no established public storm drains in the vicinity. Street improvements on Kruger Road and offsite improvements would likely be required. Sites D also suffers from not being adjacent to the existing Sherwood UGB, which means more land would be required to be brought into the UGB than is necessary for the school site in order to ensure contiguity and public infrastructure would have to be extended further to serve the new high school, which is inefficient and expensive.

Site E - The hearings officer finds this site cannot efficiently accommodate the new high school due to slope, natural area constraints, and public infrastructure issues. The entire site slopes down to the east towards Highway 99, with a grade change around 75 feet. There is no

sanitary sewer service available. A very costly sewer line extension and public system improvements would be necessary. There are no established public storm drains in the vicinity.

Site F - The hearings officer finds this site cannot efficiently accommodate the new high school due to wetlands, drainage, powerlines, and lack of public water supplu. While quite flat, this site has wetlands, drainage, and a BPA power line easement running through it. While there is a nearby sewer line, there is no water line, and costly improvements would have be made to supply the school with drinking and irrigation water as well as meeting firefighting needs. Site F is further constrained by a BPA easement that cuts diagonally through what would otherwise be the flattest, least constrained part of that area and this flat area is segregated from the existing UGB by Chicken Creek and protects a riparian corridor. Site F also suffers from not being adjacent to the existing Sherwood UGB, which means more land would be required to be brought into the UGB than is necessary for the school site in order to ensure contiguity and public infrastructure would have to be extended further to serve the new high school, which is inefficient and expensive.

Conclusion of the Alternative Sites Analysis for the Six Sites in Sherwood West

The District evaluated the alternative sites related to five selection criteria noted above and determined that four of the six sites (A, D, E & F) lacked utilities, had significant wetlands, drainage issues or topography that restricted the ability to efficiently accommodate the identified land need. In addition, site D is not adjacent to the current UGB and therefore would create an island of urban land which is not allowed under Metro Code. Areas B & C better met the selection criteria with site C being the best site due to less grading and site work to accommodate the identified land need. Based on the urban reserve areas analyzed site C in the Sherwood West urban reserve best meets the need considering efficient accommodation of the identified land need. For these reasons, the hearings officer concludes and finds that proposed Site C (on the northwest corner of SW Elwert and Kruger Roads) can most efficiently meet the identified need of a new high school.

MC 3.07.1425(c)(2): If the Council determines there is a need to amend the UGB, the Council shall evaluate areas designated urban reserve for possible addition to the UGB and shall determine which areas better meet the need considering:

(2) the orderly and economic provision of public facilities and services.

Hearings Officer's Analysis: This suitability factor focuses on the orderly and economic provision of public facilities and services. Because Sherwood West has been concept planned pursuant to MC 3.07.1110, the provision of public facilities and services within the Sherwood West Concept Plan area has been studied to a larger degree than other URAs. The Sherwood West Concept Plan was prepared with analyses of existing sanitary sewer, water, storm water, and transportation conditions and analyses of how those systems need to be upgraded, extended, and phased to meet the future development of Sherwood West. (See Sherwood West Concept Plan, pages 15-21, 40-44, Appendix 3 (Existing Conditions Report), and Appendix 8 (Transportation Options Alternative Analysis Report and Cost Estimates). The concept plan was prepared in coordination with all of the future service providers, including those services that

will be provided by the City and those that will be provided by others, including Clean Water Services, ODOT, Tualatin Valley Fire & Rescue, and Washington County. (*See* Sherwood West Concept, acknowledgements page and Appendix 6 (Service Provider Interviews). The District was also part of the Technical Advisory Committee that informed the concept planning effort. Because all of this extensive analysis and coordination work had already been done for Sherwood West, the District used that work as the jumping off point for its analysis of the area for orderly and efficient accommodation of public services.

As demonstrated in the Narrative, pages 24-31, four of the six sites (A, D, E, and F) have significant barriers to provision of public infrastructure. Sites B and C have the fewest barriers and are most feasible for public infrastructure service. This is consistent with the findings of the Sherwood West Concept Plan, which anticipates phasing public infrastructure to serve the area encompassed by Sites B and C first, i.e., Area A. (*See* Sherwood West Concept Plan, pages 40-44.) Service provider interviews conducted as part of the concept planning effort also identified Area A as the "first stage development area." (*See* Sherwood West Concept Plan, Appendix 6, page 5.) It is also worth noting that, according to the concept plan, Area A of the concept plan has most infrastructure in place, "presents the best near-term opportunity for development in Sherwood West," and the cost to serve is on the lower end of the cost scale. (Sherwood West Concept Plan, pages 42-43.) The District also engaged a licensed traffic engineer to prepare the March 15, 2017, Sherwood High School UGB Expansion Transportation Study (the "Transportation Study") to address effects of a new high school on Site C on the surrounding transportation system. The Transportation Study found that, with appropriate mitigation, Site C can accommodate the new high school while maintaining an adequate transportation system. See also District's findings in response to Goals 11 and 12 with respect to the provision of public facilities and services to Site C.

As part of this UGB amendment application effort, the District obtained service provider comments from the City of Sherwood, Washington County, Tualatin Valley Fire and Rescue, and Clean Water Services, all of whom supported the siting of the new school on Site C from an infrastructure provision standpoint, consistent with the Sherwood West Concept Plan.

In sum, Sites B and C best meet the need for a new high school considering the orderly and economic provision of public services per the Sherwood West Concept Plan and the District's own analysis.

The primary opponent makes only a desultory effort to challenge the applicant's proposed findings. *See* letter from Jennifer Brager dated June 23, 2017, at p. 7. Ms. Bragar concludes, without much in the way of analysis, that "Site C is unworkable." The only evidence that the opponent cites as support for this theory is the DKS Traffic Study dated March 15, 2017, which shows that currently there are several failing intersections in the vicinity. However, failing intersections is not in any way determinative when considering the locational factors.

The proposed site has positive attributes from the transportation and traffic perspective. The site is close to the area's major north-south highway (Highway 99) and east-west arterial (the Tualatin-Sherwood Road). It has a relatively flat topography, reducing hazards in wet or snowy conditions. With the planning modifications, the site will have adequate access and

capacity for peak school commuting times (7.15 to 8 am and 2.50 to 3:45 pm). Road widths and sightlines will be sufficient for safety purposes, an important consideration for less-experienced drivers, such as high school juniors and seniors.

The traffic issue has been addressed by unrebutted evidence from the applicant's civil and traffic engineers - the *only* expert testimony in the record - and is belied by the fact that all of the public service providers for the Sherwood West area, including Washington County, the City of Sherwood, and Clean Water Services, submitted service provider letters that support the new high school on Site C, and state that such services can be provided. (*see* Appendix to the Application Narrative for copies of these letters).

At the public hearing, local residents Carolyn McBee and Karen Labahn raised issues of traffic safety at the proposed site, specifically on Kruger and Elwert Roads. They testified, convincingly, that the roads abutting the preferred alternative site are rural in nature and not capable of handling the traffic generated by the school. As the hearings officer emphasized at the hearing, the analysis is comparative in nature. A site does not have to be good; it just has to be better than the alternatives. This is true even if all of the alternatives are objectively bad. In fact, it will undoubtedly be the case that the roads in all seven of the candidate urban reserve areas are rural in nature and incapable of handling urban levels of traffic. At this stage, the analysis is high level and really only focused on identifying issues that made any one site particularly good or horrendously bad in relation to the others.

In this case, the applicant's traffic engineers Scott Mansur, P.E. and Carl Springer, P.E. of DKS Associates wrote the following in a June 28, 2017 memorandum:

> DKS prepared the March 15, 2017, Sherwood High School UGB Expansion Transportation Study ("March Transportation Study"). The March Transportation Study assesses the proposed UGB amendment impacts and identifies a roster of system improvements for the short-term and long-term. This study acknowledges that several local intersections are heavily congested during peak hours, and that the rural street infrastructure nearby the proposed UGB amendment site does not meet either the City's or the County's facility design standards today. What this study also tells us, however, is that with proper mitigation the proposed school site can be adequately served with transportation infrastructure. The next step in the planning process is the post-UGB amendment Title 11 planning, as required by Metro, and it is during that process that the next transportation planning steps will be taken. These planning steps include designating urban zoning and land use types within the newly added UGB area. During this stage, we will engage in additional technical studies, including a second transportation impact study, to (1) refine the specific project needs, (2) ensure that the Transportation Planning Rule is met, (3) ensure that performance standards can be maintained over time, and (4) ensure that a safe transportation network is provided for the new

> high school. Based on our transportation analyses so far, we are confident that the Sherwood School District can provide adequate state and local transportation facilities to support the proposed Site C high school.

While the residents' traffic safety concerns are well meant, and taken seriously by the hearings officer, the engineers are undoubtedly correct that the applicant's preferred alternative site can be improved with reasonable cost expenditure. The improvements discussed at the hearing were typical of what one would expect when land urbanizes, and do not involve any highly extravagant technical solutions such as bridges over wetlands / streams, or expensive highway overpasses. The hearings officer had the opportunity to evaluate these engineering experts and considers their representations highly credible. No evidence was presented pertaining to other sites that would suggest that any other site would be significantly better from a transportation standpoint, and several of the sites required more expensive improvements.

The opponents argue that the applicant gamed the system by counting traffic in the middle of winter. *See* letter from Jennifer Brager dated June 23, 2017, at p. 8. Again, this argument seems to lose focus of the intended exercise. That argument might have merit if the applicant's traffic engineers had performed their traffic counts at some locations in winter, but at other locations in summer (when traffic is lighter because school is out of session and many workers are not commuting, due to vacations). That did not happen. The applicant's traffic study clearly states:

> To perform the intersection analysis, traffic counts were collected during the AM peak (7:00 – 9:00 am) on Feb 1, 2017 and the PM peak (4:00-6:00 pm) on Jan 31, 2017. Study intersections on ODOT facilities (i.e. OR 99W) were analyzed using estimated 30th highest hour traffic volume (30 HV) conditions. The 30 HV development process for existing conditions *includes the determination of seasonal adjustments*. (DKS "Sherwood High School UGB Expansion Transportation Study" dated March 15, 2017, p. 9, italic emphasis added).

Site C is located in close proximity to existing urban arterials, which in and of itself makes it a better site as compared to alternatives such as Sites D and F, which are more isolated and remote. Sites A, E, and F will be more expensive to develop than Sites B and C. Sites D and F suffer from not being contiguous with the existing UGB and so public infrastructure would have to be extended further, out of sequence, to reach those sites. This creates a significant unnecessary expense. Further, sites with steeper topography and natural resource constraints, like Sites A, D, E, and F will also be more costly to develop. Sites B and C will cost less than the other sites to develop, but Site C will cost even less than Site B due to its flatter topography.

The hearings officer wishes to emphasize that the public will have many additional opportunities to comment on and influence the types of transportation improvements that will be built.

MC 3.07.1425(c)(3): If the Council determines there is a need to amend the UGB, the Council shall evaluate areas designated urban reserve for possible addition to the UGB and shall determine which areas better meet the need considering:

(3) ***comparative environmental, energy, economic, and social consequences.***

A comparison of the six sites with respect to environmental, energy, economic, and social consequences of development is set forth below:

Environmental Consequences: There are areas within Sherwood West that have significant natural resources within them. The maps at Figure 6 of the Sherwood West Concept Plan and Appendix B of Appendix 3 of the Sherwood West Concept plan are instructive in this regard. From those maps one can see that Sites A, D, and F have significant areas of floodplains, wetlands, protected stream corridors, and inventoried wildlife habitat. In contrast, Sites B and C have little to no environmental resources on them. Further, Sites B and C are closest to the city's existing urban core, which give them the most direct transportation connections, thus limiting air quality degradation. Therefore, development of these sites with a high school would have the least negative environmental consequences of all of the alternative sites.

Energy Consequences: From an energy standpoint, all of the sites are reasonably close to the bulk of the student population to be served, but Sites E and F are more remote. This will be exacerbated as Sherwood West develops with mostly residential uses. Sites A, B, C, and D are most centrally located, which will allow more students to walk and bike to school and reduces the number of students being bused and driven to school, and allows for the least vehicle miles traveled for those who use cars and buses. Site D would require an out-of-sequence extension of public infrastructure to the more interior of the urban reserve, however, which ticks its adverse energy consequences somewhat higher than Sites A, B and C.

Economic Consequences: Public bond dollars are finite and must not be wasted. Taxpayers expect that school districts will be good stewards of the public money and building new school facilities is no exception. Being more remote from the existing urban area and public infrastructure, Sites A, E, and F will be more expensive to develop than Sites B and C. Sites D and F suffer from not being contiguous with the existing UGB and so public infrastructure would have to be extended further, out of sequence, to reach those sites. This creates a significant unnecessary expense. Further, sites with steeper topography and natural resource constraints, like Sites A, D, E, and F will also be more costly to develop. Sites B and C will cost less than the other sites to develop, but Site C will cost even less than Site B due to its flatter topography. The effect of topography on the cost of building a high school site with its need for ball fields and other sports facilities should not be under estimated. Even small amounts of slope will have significant, expensive consequences on a school site due to the cost of grading.

Site C has another factor that weighs in its favor over Site B, which is that Site B contains a number of single-family residences that would have to be purchased and demolished to build the new high school. Purchasing houses to tear them down is not a good use of bond dollars if it can be avoided. Therefore, Site C clearly comes out ahead in this consideration.

Social Consequences: Siting the new high school in the most centrally located area possible is important to fostering a sense of civic and school pride. Although high schools can have fairly significant impacts on an area, they should be sited where the bulk of the population resides and be a use that brings people together in a place that the citizens identify as an integral part of their community. One of the alternatives that the District considered in its facilities planning to alleviate the capacity issue at the existing Sherwood High School was building a second high school. The community, however, was very much opposed to that idea. A small, cohesive community like Sherwood wants to remain bound together not divided by different allegiances to different high schools. All of the sites analyzed in Sherwood West would be superior to any sites in any other urban reserve for these reasons alone; however, within Sherwood West Sites B and C are most centrally located - both now and in the future as the city continues to grow to the south and west. Even so, development of Site B has a more immediate social consequence that Site C does not have. There are a number of residences in Site B that would have to be purchased and demolished in order to develop the new high school. Displacing residents from their homes needlessly is a very adverse social consequence and should not occur if it can be avoided, which in this case it can. Therefore, Site C comes out ahead here, too.

Conclusion: Sites B and C are the two sites that come out the most favorably when one factors in the environmental, energy, economic, and social consequences. However, Site C edges ahead of Site B due to Site B's increased adverse economic and social consequences.

MC 3.07.1425(c)(4): If the Council determines there is a need to amend the UGB, the Council shall evaluate areas designated urban reserve for possible addition to the UGB and shall determine which areas better meet the need considering

(4) compatibility of proposed urban uses with nearby agricultural and forest activities occurring on land outside the UGB designated for agriculture or forestry pursuant to a statewide planning goal.

Hearings Officer's Analysis: The District identified a number of site characteristics that a new site would need to meet in order to accommodate a new high school. As discussed above, is one urban reserve area that can efficiently accommodate a new high school - Sherwood West. Sherwood West has been MC 3.07.1110 concept planned and so may be considered for inclusion within the UGB. Sherwood West is adjacent to the city's existing UGB and in close proximity to the bulk of the District's student population. The area is planned for predominantly residential uses, including schools, and so as Sherwood West develops even more of the student population will reside in the vicinity of the proposed high school site. The District studied the 1,291-acre urban reserve for areas within it that could accommodate a new high school site. The District did this by utilizing an engineer and architect to evaluate all sites in the urban reserve that were flat to relatively flat; had a minimum buildable site size of approximately 50 acres or more; no or minimal constraints from streams, wetlands, and intact upland habitat; adequate/feasible access to public utilities; and proximity to a major street network. This analysis yielded six sites, which were then ranked according to the site criteria.

With respect to how the six sites meet the need for a new high school considering the compatibility of proposed urban uses with nearby agricultural and forest activities, it is important to note that the entire Sherwood West area is slated for eventual urban development, regardless of the current uses and zoning of land within it. It was designated as an urban reserve instead of a rural reserve partly due to its small-scale, intermittent farming and forestry activity, parcelization, and rural residential development. That said, urbanizing land that is adjacent to existing urban development is more consistent with this boundary location factor than urbanizing land further into the undeveloped portions of an area, which will likely remain in rural use much longer whether the new high school is built in the area or not. Sites A, B, and C are closest to existing urban development. Sites D, E, and F are more remote from existing urban development. Therefore, in this respect, A, B, and C will have fewer impacts on any nearby agricultural and forest activities. Site A does not appear to have any adjacent agricultural or forest activities occurring adjacent to it. The other sites have very minor to small amounts of agricultural activities occurring on adjacent land. Therefore, none of the sites would appear to have much impact on agricultural or forest activities. Given the sites' rough equivalency in this regard, Sites B and C are the least costly to serve and most readily developable according to the Sherwood West Concept Plan, so developing in those areas "now" will have fewer impacts on nearby agricultural and forest activities than jumping ahead to an area that might have otherwise remained rural for the next 20 years. This gives Sites B and C the edge in considering this factor.

MC 3.07.1425(c)(5): If the Council determines there is a need to amend the UGB, the Council shall evaluate areas designated urban reserve for possible addition to the UGB and shall determine which areas better meet the need considering

(5) equitable and efficient distribution of housing and employment opportunities throughout the region.

Hearings Officer's Analysis: This factor is not directly relevant to the siting of a new high school and therefore is not determinative in any way.

MC 3.07.1425(c)(6): If the Council determines there is a need to amend the UGB, the Council shall evaluate areas designated urban reserve for possible addition to the UGB and shall determine which areas better meet the need considering

(6) contribution to the purposes of Centers and Corridors.

Hearings Officer's Analysis: This factor is not found within Statewide Planning Goal 14 but is instead a consideration created internally at Metro. According to Metro's 2040 Growth Concept Map, the proposed site is not in a Regional or Town center, nor is it directly on a Corridor. Site A is closest to a Corridor, but as staff pointed out in the staff report, it is mostly undeveloped or in single-family residential use. None of the other sites are close enough to any Centers or Corridors to contribute to them at this point in time. Therefore, none of the alternatives support the purposes of Centers and Corridors in any significant way.

MC 3.07.1425(c)(7): If the Council determines there is a need to amend the UGB, the Council shall evaluate areas designated urban reserve for possible addition to the UGB and shall determine which areas better meet the need considering:

(7) protection of farmland that is most important for the continuation of commercial agriculture in the region.

Hearings Officer's Analysis: This factor is not found within Statewide Planning Goal 14 but is instead a consideration created internally at Metro.

As noted by staff in the staff report, Metro and Washington County completed an urban and rural reserve process that designated the most important land for commercial agriculture in the county as rural reserve and the land most suitable for urban development as urban reserve. This means that development within any urban reserve will, at least presumptively, protect farmland that is most important for the continuation of commercial agriculture in the region.

However, this factor seems to reach beyond that concern and require further differentiation of urban reserve areas, at least to the extent that any of these urban reserves are still in commercial agricultural production. Of the six sites studied in Sherwood West urban reserve area, none appear to have any significant commercial agriculture. As such, it seems their agricultural output does not form a significant component of the Sherwood area's economy.

The applicant points out that development of sites within an urban reserve that are closest to the existing UGB and to areas within the UGB that actually contain urban-level development, helps to keep agricultural and forest land further from the UGB and urban areas in unaffected operation until such time as urban development grows further in that direction.

MC 3.07.1425(c)(8): If the Council determines there is a need to amend the UGB, the Council shall evaluate areas designated urban reserve for possible addition to the UGB and shall determine which areas better meet the need considering

(8) avoidance of conflict with regionally significant fish and wildlife habitat.

Hearings Officer's Analysis: This factor is not found within Statewide Planning Goal 14 but is instead a consideration created internally at Metro.

The Sherwood West urban reserve has some significant fish and wildlife habitat within in it, much of which is associated with Chicken Creek. According to the Sherwood West Concept Plan, Steelhead *(Oncorhynchus mykill),* a federally listed species, are known to exist within Chicken Creek. Sites located closer to Chicken Creek would therefore tend to be less suitable for this project.

All of the sites *except* for Sites B and C are constrained by a significant or moderate level of natural resources:

Site A has a wetland right in the middle, and the entire western portion of this site is mostly creek, and its drainage discharge is right into Chicken Creek (see Narrative, p. 25).

Site D has creek drainage running through the southern portion of the site. Since there is no established public storm drainage anywhere in the vicinity, so a costly system to route storm discharge would have to be built with input from the City of Sherwood and Clean water Services to avoid negatively impacting significant fish and wildlife habitat.

Site E is steeply sloped down to the east towards Highway 99, with a grade change around 75 feet. There are no established public storm drains in the vicinity. so a costly system to route storm discharge would have to be built with input from the City of Sherwood and Clean water Services to avoid negatively impacting significant fish and wildlife habitat.

Site F has creek drainage and potential wetlands running through the entire site (see Narrative, p. 30), so extensive mitigation measures could be required to avoid negatively effecting significant fish and wildlife habitat.

As shown on Figure 6 of the Sherwood West Concept Plan, the western edge of Site B abuts a tributary of Chicken Creek and includes some associated wildlife habitat. Site C has no such identified resources, and, therefore, the hearings officer concludes and finds that Site C best avoids conflicts with regionally significant fish and wildlife habitat.

MC 3.07.1425(c)(9): If the Council determines there is a need to amend the UGB, the Council shall evaluate areas designated urban reserve for possible addition to the UGB and shall determine which areas better meet the need considering

(9) ***a clear transition between urban and rural lands, using natural and built features to mark the transition.***

Hearings Officer's Analysis: This factor is not found within Statewide Planning Goal 14 but is instead a consideration created internally at Metro.

The boundaries of Sherwood West do not appear to have been designated according to providing a clear transition between urban and rural reserves using natural or built features. It is bisected in large part at its northern end by Chicken Creek. But Chicken Creek will not form a natural barrier between urban and rural uses, as the Sherwood West Concept Plan contemplates development on either side of the creek. So, Chicken Creek will end up being a natural area within an urban area - not a boundary between urban and rural uses. Because the boundaries of Sherwood West were not created according to natural or built features, and because all of the six sites studied within Sherwood West for a new high school are internal to Sherwood West and will eventually be in the midst of other urban area, this factor is not particularly relevant to this application. Even so, as staff notes in the staff report, there are no built or natural features that would mark even an internal transition from urban to rural lands for Sites C and E. Site B is flanked by Chicken Creek, which could form such a barrier, but, again, there will be urban development on the other side of that "barrier" one day. Site A is also flanked by Chicken Creek, but the creek and natural resources associated with that site also limit the development

potential of that site for a new high school. Further, there will be urban development on the other side of those natural barriers one day, so they will not really mark the transition that this factor contemplates. Site D has some natural resources on it that could provide a barrier of sorts, but which also reduce the buildable area, and, again, the concept plan does not contemplate these natural areas being any sort of permanent barrier between urban and rural uses. Site F has a large amount of wildlife habitat, but that habitat, too, cuts into the buildable area and will provide no such barrier as contemplated by this factor.

Hearings Officer's Analysis and Summary of the Nine MC 3.07.1425(c) Locational Factors

In summary, little weighing and balancing is needed in this case, because the applicant's preferred alternative, Site C, nearly always came out as the site that best met the intent of each individual factor. With respect to two factors, Sites B and C equally met the intent of the factor, and with respect to another factor Site B came in a fairly close second to Site C. All in all, however, Site C best met all of the factors. In sum, all of the factors were applied and evaluated, and on-balance, Site C came out ahead. Thus, whatever weighing and balancing of all of the nine locational factors with respect to the six sites that could potentially accommodate a new high school is required, the Hearings officer finds that the applicant's analysis clearly demonstrates that the proposed site, Site C, better meets the applicable locational factors than the other sites.

No discussion presented by any opponent to the contrary is convincing. In disputing the District's location factor analysis, the primary opponent pointed to individual aspects of different sites and argued why it believed those aspects made one site better than another with respect to a given, discrete aspect. The opponent's sniping is ineffective, however, because unlike the applicant, the opponent did not evaluate the sites *holistically* based on the nine enumerated factors. Stated it another, it may be the case, that some of the alternative sites fair better than the applicant's preferred alternative in some particular or another. No site is perfect, after all, and each site has its positives and its negatives. However, when viewed as a whole, on balance, the applicant's preferred alternative fairs the best over the broadest consideration of the nine factors. Therefore, the opponent failed to demonstrate that the MC 3. 07.1425(C) factors findings are deficient.

The opponent also argues that Sherwood South cannot be ruled out as a possible area for the Major Amendment even though it has not been concept planned under MC 3.07.1110, because MC 3.07.1110(6) provides that such an area can be added even if it has not yet been concept planned. *See* Brager letter dated June 23, 2017 at p.7. MC 3.07.1110(6) states:

> ***"If the local governments responsible for completion of a concept plan under this section are unable to reach agreement on a concept plan by the date set under subsection (a), then the Metro Council may nonetheless add the area to the UGB if necessary to fulfill its responsibility under ORS 197.299 to ensure the UGB has sufficient capacity to forecasted growth."***

First, the MC 3.07.1110(6) exception is restricted to situations where "the local governments responsible for completion of a concept plan under this section are unable to reach agreement on a concept plan." There is no evidence that any local governments responsible for a concept plan for Sherwood South are unable to reach agreement on that concept plan. In fact, there seems to be no question that the City of Sherwood will be planning for Sherwood South-it just hasn't done it yet, and has no current plans to do so. Second, the fact that no pre-UGB expansion concept planning has been done for Sherwood South is just one of many reasons the District gave for why Sherwood South ceased to be considered as a viable area for the new high school. The opponent has not pointed to an area within Sherwood South that would meet the District's siting criteria. In fact, in the opponent's June 23, 2017, letter, the opponent points to "a large block of property" south of the recent Brookman Road annexation area, but then appears to agree that it is too sloped to work as a high school site. See Letter from Jennifer Brager dated June 23, 2017, at p.6.

Metro Code section 3.07.1425(D) The Council may consider land not designated urban or rural reserve for possible addition to the UGB only if it determines that:

1. ***Land designated urban reserve cannot reasonably accommodate the need established pursuant to subsection B of this section; or***
2. ***The land is subject to a concept plan approved pursuant to section 3.07.1110 of this chapter, involves no more than 50 acres not designated urban or rural reserve and will help the concept plan area urbanize more efficiently and effectively.***

Hearing Officer's Analysis: The proposed expansion is within an urban reserve. This criterion is not relevant because the site and surrounding properties to the north, east and south are within an Urban Reserve area (no property within or next to the subject site is outside of urban reserve areas).

This criterion is not applicable.

Metro Code section 3.07.1425(E): The Council may not add land designated rural reserve to the UGB.

Hearing Officer's Analysis: The proposed expansion is not within a rural reserve. This criterion is not relevant because the subject site and surrounding properties to the north, east and south are within an Urban Reserve area.

This criterion is either not applicable or has been met.

Metro Code section 3.07.1425(F): The Council may not amend the UGB in such a way that would create an island of urban land outside the UGB or an island of rural land inside the UGB.

Hearing Officer's Analysis: The subject site and the remaining portion of the Sherwood West urban reserve are adjacent to the City of Sherwood. The transformation of this area from rural to urban represents a logical and methodical way to enlarge an urban area, which will not create an island of urban development outside of the UGB.

The proposed expansion will not create an island of urban land outside the UGB or an island of rural land inside the UGB. The applicant has met its burden of showing compliance with this factor by substantial evidence in the whole record.

Metro Code section 3.07.1440 (B)(1) The applicant shall also demonstrate that:

(1) The proposed uses of the subject land would be compatible, or through measures can be made compatible, with uses of adjacent land.

Hearing Officer's Analysis: The applicant addresses this criterion as follows:

> The proposed major amendment site is surrounded by land that is either within the City of Sherwood or the Sherwood Urban Reserve Area 5B (aka Sherwood West Preliminary Concept Plan Area) (see Attachment 6). The land in the City located north and east of SW Elwert Road is fully urbanized with single-family subdivisions and constructed houses. City land located south and east of SW Elwert Road is the location of the Sherwood Elks Lodge. The Elks Lodge site contains a large area of vacant land around the existing building and parking lot. The Elks Lodge and undeveloped surrounding land is zoned Low Density Residential (LDR).
>
> Land to the north, south and west is currently rural and within the urban reserve area (Sherwood West Concept Plan). This County land is zoned Agricultural Forest (AF) and is a patchwork of sites zoned AF-5, AF-10 and AF-20 with the subject site zoned AF-20. AF-5 has a minimum lot size of 5 acres, AF-10 of 10 acres and AF-20 has a minimum lot size of generally 80 acres. The surrounding property has been highly parcelized and consists of a patchwork of small forests/farms and rural residential properties with none more than 80 acres and many under five acres in size.
>
> The site is compatible with surrounding residential properties as the property has separation provided by existing streets on the north (Haide Road), south (Kruger Road) and west (Elwert Road) boundaries. The eastern boundary consists of mostly forestland with only one house near the site boundary near the northwest corner of the site. All school traffic will be able to access the site

from Elwert Road and will not be routed through existing or proposed residential areas or streets.

While the development of a school site will be the first urban development in the Sherwood West Concept Plan Area, the regional and local plans anticipate redevelopment of this entire area for primarily residential land. Schools typically locate within residential areas and are considered to be compatible with residential land uses when the impacts of the school on residential uses are considered within the design.

The first urban development projects to occur within rural areas typically can cause some tension between existing residents who welcome the change, and those who are content with its current rural character. So well-designed solutions to deal with compatibility issues may still feel like "encroachment" to rural residents. The development of the site will include public involvement during the design development and permit approval process, allowing ample opportunity for the neighbors to help address specific compatibility issues. In the long term, establishing the school will provide the opportunity for subsequent urban developments to be oriented and designed to optimize their physical relationship with the school. This will allow the development of future Sherwood West properties to "grow up together" compared to infilling a large public facility into an established residential neighborhood.

The subject site borders the UGB on the east along SW Elwert Road. Adjacent land uses include single family homes and the Sherwood Robin Hood Elk Lodge that also includes some vacant land that is zoned for residential use, which is expected to develop over time. Directly to the southeast across Highway 99W is the Sherwood Regional Family YMCA. To the north across SW Haide Road is mostly open land with some out-buildings and one dwelling that appears to be vacant. To the west are forested parcels with one dwelling adjacent to the NW corner of the subject parcel. To the south across SW Kruger Road is the Countryside Community Church, limited agricultural activities and four dwellings. The typical weekend use of the church complements the weekday uses of a school. The land to the south also borders Highway 99W.

The District has developed a preliminary site plan that shows the school buildings located in the center of the property with sports fields generally to the south and west and parking located to the north. The southeast corner of the site will contain the realignment of SW Elwert and SW Kruger Roads. The three adjacent roads provide some buffering for the very few adjacent homes and the NW Natural Gas Easement also buffers the southwest corner of the site. The district currently has a High School Design Committee charged with working with the design team to provide advice on a number of design elements and a couple of community input meetings will be scheduled in 2017. In addition there will be public input opportunities during the City's development review and permit approval process.

Finally the subject site is within a very large urban reserve area that has the potential to urbanize over time. As noted previously this portion of the Sherwood West urban reserve was identified as phase A in the preliminary concept plan the City completed. This allows the adjacent land to be designed and developed in a manner that enhances and embraces this important community facility. Therefore the proposed use of the site can be made compatible, through measures, with the uses of the adjacent land.

The applicant has met its burden of showing compliance with this factor by substantial evidence in the whole record.

Metro Code section 3.01.1440 (B)(2) The applicant shall also demonstrate that:

If the amendment would add land for public school facilities, the coordination required by subsection C(5) of section 3.07.1120 of this chapter has been completed.

Hearing Officer's Analysis: MC 3.07.1120(C)(5) states:

> ***"Provision for the amount of land and improvements needed, if any, for public school facilities sufficient to serve the area added to the UGB in coordination with affected school districts. This requirement includes consideration of any school facility plan prepared in accordance with ORS 195.110."***

The applicant addresses this requirement as follows:

> This requirement is satisfied as described in Section III of the application. In summary, the Sherwood School District adopted a long-term facilities plan in January of 2008. The long-term plan assumed that additional school capacity would likely be needed within 10 years of the plan's adoption. (The 2008 Long Term Facilities Plan is provided in Appendix C).
>
> In 2014 to 2016, the School District did significant planning prior to placing a bond on the November 2016 ballot that was ultimately approved by voters. This included inventorying existing school facilities, completing updated demographic information, as well as significant planning and public outreach to identify a plan for school facilities that includes the proposed new high school.

As the District points out, it experienced substantial growth in the late 1990's and early 2000's leading to a community effort in 2005 to determine facility needs. This resulted in the successful 2006 bond measure which included funding for an addition to the current high school to increase capacity to 1,550 students, consistent with phase 1 of the 2006 high school master plan. The District completed a long term facilities plan in 2008. Current enrollment at the high school is over 1,700 students and projections show over 2,250 students by the 2025-26 school

year. In early 2014 the District's Long Range Planning Committee made recommendations to the School Board regarding enrollment and growth challenges, facilities analysis and needs and financing options. In 2015 the District documented the condition and educational adequacy of its facilities, leading to bond visioning and steering committees in 2016. This resulted in the District's voters approving a bond measure in 2016 providing funding for school improvements including construction of a new high school. The District and the city of Sherwood have an intergovernmental agreement to share sport fields with most of the facilities occurring on school grounds. Thus the coordination required by subsection C(5) of Metro Code Section 3.07.1120 has been completed.

The applicant has met its burden of showing compliance with this factor by substantial evidence in the whole record.

Metro Code section 3.01.1440(B)(3) The applicant shall also demonstrate that:

If the amendment would add land for industrial use pursuant to section 3.07.1435, a large site or sites cannot be reasonably be created by land assembly or reclamation of a brownfield site.

Hearing Officer's Analysis: The proposed expansion is not for industrial use. This criterion is not applicable.

Findings Addressing OAR 660- Division 24 and the Applicable Statewide Planning Goals.

OAR 660-024-0020 requires that all UGB amendments apply the Statewide Planning Goals to the amendment process. This directive applies to the whole gamut of UGB amendments, from the every-six-year Metro legislative review of its UGB to a quasi-judicial major amendment under the Metro code to provide land for a specific public need, such as a school or other public facilities. However, this does not mean that the Goals will apply equally and in the same way in each situation. It may even be that one or more of the Goals may not apply at all to a given situation.

The primary opponent asserts that the applicant failed to adequately address the Statewide Planning Goals. *See* Letter from Jennifer Bragar dated June 6, 2017. While that was correct at the time Ms. Brager wrote her letter, the applicant followed up two days later with proposed findings. The Hearings officer finds that the applicant did adequately demonstrate compliance with the applicable Statewide Planning Goals by substantial evidence in the whole record, and adopts the applicant's suggested findings, with slight modification, as set forth below. The opponent's specific objections are also addressed below.

OAR 660-024 -0020

OAR 660-024-0020 sets out which of the Statewide Planning Goals are applicable to UGB amendments. The Goals will have a somewhat limited applicability to a UGB amendment for a specific need, but the relevant Goals are addressed below.

Goal 1 - Citizen Involvement

"To develop a citizen involvement program that insures the opportunity for citizens to be involved in all phases of the planning process."

Hearings Officer Analysis: This Major Amendment application does not alter Metro's citizen involvement program. Consequently, compliance with Goal 1 is established through compliance with the public involvement requirements of Metro's code. Those requirements have been followed.

Goal 2 - Land Use Planning
"To establish a land use planning process and policy framework as a basis for all decisions and actions related to use of land and to assure an adequate factual base for such decisions and actions."

Hearings Officer Analysis: OAR 660-024-0020(1)(a) states that the exceptions process in Goal 2 and OAR 660, Division 4 are not applicable unless a goal exception is part of the application. A goal exception is not part of the Major Amendment application and so those provisions will not be addressed. Other than goal exceptions, Goal 2 requires the establishment of a comprehensive plan, a need for coordination of government entities in planning, and the need for public hearings and an opportunity for comment and review.

1) Coordination: This Major Amendment application has required coordination with and between Metro, Washington County, the City of Sherwood, and public service providers including ODOT, Tualatin Valley Fire & Rescue, and Clean Water Services. This includes coordination at the Major Amendment level and at the Sherwood West Concept Plan level. Therefore, the required coordination has occurred.

2) Public Hearings/Opportunities for Comment and Review: Metro staff sent the required notice for the hearing before the hearings officer, and there has been opportunity for comment and review of the application materials. The hearing was continued, which provides additional opportunity for comment and review, and the hearings officer has stated he is likely to leave the record open after the second hearing concludes. There will also be at least one hearing before Metro Council. Further, the proposed high school will have additional approvals to obtain after the Major Amendment application has been approved, such as annexation, a zone change and a conditional use permit, all of which include a public involvement component. Therefore, there has been and will continue to be public hearings and an opportunity for comment and review.

Goal 3- Agricultural Lands

Hearings Officer Analysis: Not applicable under OAR 660-024-0020(3)(b).

Goal 4 - Forest Lands

Hearings Officer Analysis: Not applicable under OAR 660-024-0020(3)(b).

Goal 5 - Natural Resources, Scenic and Historic Areas, and Open Spaces

"To protect natural resources and conserve scenic and historic areas and open spaces."

Hearings Officer Analysis: OAR 660-024-0020(1)(c) requires states that Goal 5 and its related rules apply only in areas added to the UGB. The area to be added to the UGB is the site identified in this application. There are no Goal 5 resources on the site identified by Metro, Washington County or the City of Sherwood in the Sherwood West Concept Plan. Therefore, this goal is not applicable.

Goal 6 - Air, Water and Land Resources Quality
"To maintain and improve the quality of the air, water and land resources of the state."

Hearings Officer Analysis: As LUBA recently stated:

> "[t]he relevant Goal 6 inquiry for a decision that amends comprehensive plan and zoning map designations, without approving any particular new development, is whether there is a reasonable expectation that applicable state and federal environmental quality standards can be met at the time the property is developed in the future. *See Friends of the Applegate Watershed v. Josephine County*, 44 Or LUBA 786, 802 (2003), (at the post-acknowledgment plan amendment stage, a local government need only show it is reasonable to expect that applicable state and federal environmental quality standards can be met); *see also Salem Golf Club v. City of Salem*, 28 Or LUBA 561, 583 (1995) (same).

See Nicita v. City of Oregon City, ___ Or LUBA ___ (LUBA No. 2016-045, Jan 25, 2017, slip op. at 27.

The hearings officer does not see how there could not be any "reasonable expectation that applicable state and federal environmental quality standards can be met at the time the property is developed [as a school]." The proposed school campus poses no significant adverse air, land or water quality impacts. There are no expected significant "waste or process discharges" from the new high school campus. The high school does not "process" anything and so there are no process discharges associated with the high school. Any waste that will be produced by high school activities will be handled through the normal course of business. For example, any solid waste generated by the school will be subject to recycling and solid waste collection by the franchised garbage hauler for the area. Any waste associated with sanitary sewers or storm events will be handled as part of the public sanitary and storm water facilities. As the property develops, the District will be required to coordinate with the state Department of Environmental Quality and with Clean Water Services to ensure that air, land and water resources are not degraded. As noted in response to Goal 5, no significant Goal 5 resources have been mapped on this property by Metro, Washington County or the City. Further, the proposed new high school site is adjacent to the existing UGB and will allow for efficient multi-modal transportation of the

bulk of the student population - especially as Sherwood West builds out with primarily residential uses in the decades to come.

The primary opponents make a half-hearted attempt to challenge the applicant's Goal 6 compliance, but its argument is too vague and too unfocused to provide a basis for denial. First, the opponent state that "air quality issues should be examined for a new school to be built near Highway 99." *See* letter from opponent's counsel Jennifer Brager, at p. 2, 6. This argument appears to assume that highway 99 causes sufficient level of pollution that a school should not be located in close proximity thereof. The opponents suggest that a "buffer" and "distancing is needed. The opponent never suggests what a proper buffer would be. The Hearings officer finds this concern to be speculative, unsupported by substantial evidence in the record, and beyond the scope of Goal 6's reach. Even if the hearings officer believed this was a valid concern, the hearings officer finds the air quality benefits of locating a school away from a major arterial would be offset by the additional VMT needed to transport school children a further distance.

Goal 7- Natural Hazards

"To protect life and property from natural disasters and hazards."

Hearings Officer Analysis: Goal 7 (Areas Subject to Natural Hazards). Goal 7 requires local governments to evaluate risks to people "upon receiving notice" of new hazard information from DLCD, and based on evaluation of that risk to prohibit development in areas "where the risk to public safety cannot be mitigated." Natural hazards for purposes of this goal are: floods (coastal and riverine), landslides, earthquakes and related hazards, tsunamis, coastal erosion, and wildfires.

No natural hazards have been mapped on the properties that comprise the proposed school site. (*See, e.g.,* Sherwood West Concept Plan, figures 6 and 7.) The applicant's proposed site appears to be devoid of any natural hazards: It is not in a flood plain or a coastal zone. It does not have steep slopes that would be vulnerable to landslides. It does not contain soils that are exceptionally vulnerable to being an earth quake hazard (at least any more so in comparison to the rest of the Portland Metro region generally). Therefore, this goal is inapplicable.

Goal 8- Recreational Needs

"To satisfy the recreational needs of the citizens of the state and visitors and, where appropriate, to provide for the siting of necessary recreational facilities including destination resorts."

Hearings Officer Analysis: As set forth in the Narrative, the District provides most of the athletic fields for the City of Sherwood. The City and the District have had a long history of partnering in the provision, use, and maintenance of these fields so that recreational opportunities are provided as efficiently as possible. The new high school campus will include a number of new fields and sports facilities on which the City and the District will continue to partner. The new fields and sports facilities will be in addition to the existing fields and sports facilities already in use as part of the existing school facilities. See page 32 of the Narrative for additional

detail. The new high school campus, then is supportive of this goal, as it will help satisfy the need for recreational facilities in the city and in the District.

Goal 9 - Economic Development

> ***"To provide adequate opportunities throughout the state for a variety of economic activities vital to the health, welfare, and prosperity of Oregon's citizens."***

Hearings Officer Analysis: Goal 9 applies to areas within an urban growth boundary. OAR 660-09-0010(1). *Port of St. Helens v. Land Conservation & Development Committee*, 164 Or App 487, 495, 996 P 2d 1014 (2000). Goal 9 requires that jurisdictions provide adequate opportunities for a variety of economic activities. Goal 9 planning is limited to areas within UGBs, and local land use plans are required to comply with Goal 9 at periodic review and whenever a jurisdiction undergoes a post-acknowledgment plan amendment that changes the plan designation of more than two acres of land from industrial/employment use to a nonindustrial/non-employment use. OAR 660-009-0010(1), 0010(2), and 0010(4).)

Pursuant to OAR 660-024-0020, certain Goals, including Goal 9, are also applicable when the UGB is amended. The Major Amendment application expands the UGB to allow an existing high school to move several miles away from one site within the City of Sherwood to another site that will be annexed into the City of Sherwood for that purpose. This appears to be fairly neural from the standpoint of economic opportunities.

The opponent cites *Barkers Five, LLC v. LCDC*, 261 Or App 259, 289 (2014), and states that Goal 9 "requires a determination of the potential future land need for employment and is supposed to occur at the time the UGB is expanded, " and that "the school itself has to be analyzed as an 'other employment use' as defined under OAR 660-009-0005 because it will involve a governmental employment activity. " *See* letter from Jennifer Bragar dated June 6, 2017, at p. 2. That might be true for a UGB amendment that proposes to add employment land, but it not explain the relevance of Goal 9 to this particular UGB application, which is specific to a need for land for a new high school. In this case, the UGB amendment is targeting a specific need, *i.e.,* the relocation of an existing high school several miles away within the same city. Goal 9 is not applicable as the UGB expansion is for a specific need for a high school.

The cited passage from *Barkers Five* should be read in context. LCDC was referring to OAR 660-027-0050(2) and Metro's analysis for employment land needs occurring as part of its urban growth report. There is nothing in that passage that would make such an analysis a requirement for a major amendment application submitted under ORS 197.299(4). As stated in the findings for Goal 9, this goal is not applicable to a UGB amendment for a specific high school need. To the extent that the high school will have any Goal 9 impacts, the Hearings officer finds those impacts will be positive in terms of temporary construction jobs during development and provision of part-and-full time employment year-round.

Furthermore, if the opponent is implying that Metro must engage in a full-blown economic opportunities analysis in the context of a major amendment application for a high school, that conclusion does not follow from the opponent's stated premises or from Goal 9. The

opponent's argument is not developed well enough to allow the hearings officer to evaluate it on the merits: the opponent has not explained how this application actually impacts the requirements or scope of Goal 9.

Goal 10 - Housing

"To provide for the housing needs of citizens of the state."

Hearings Officer Analysis: The applicant states that Goal 10 is not applicable as the UGB expansion is for a specific need for a high school. The opponent states that "Goal 10 is implicated because housing opportunities will be lost as a result of this large land grab by the school district." *See* letter from Jennifer Bragar dated June 6, 2017, at p. 2. While it is true that any use of land for non-residential purposes results in that land not being available for housing, that truism does not create a Goal 10 violation. As best as the hearings officer can determine, the opponent is arguing that the Preliminary Sherwood West Concept Plan shows a small school site surrounded by housing, and the applicant's current plan shows the entire site being used for a school and no housing. The opponent concludes that this change in plans 'will limit the planned housing in the Sherwood West Concept Plan Area," which, according to the opponent, "has Goal 10 implications." *See* letter from Jennifer Bragar dated June 6, 2017, at p. 2-3. It appears that the opponent is arguing that the Concept Plan locks in the density and mix of housing, and any change to the Concept Plan requires an analysis of Goal 10 compliance.

The hearings officer finds that the concept plan does not have the regulatory effect that the opponent assigns to it. The opponent cites to nothing in any local zoning code or Comprehensive Plan that gives this sort of regulatory effect to this (or any other) concept planning effort. Goal 10 would not have that type of regulatory effect until the property subject to the Concept Plan is brought into the UGB and assigned urban zoning designations. As currently situated, the land at issue is not within the UGB and so is not considered "buildable lands" under Goal 10 and Goal 14, and is not included in any buildable land inventory. Therefore, there is no buildable lands inventory to measure the Major Amendment application against and Goal 10 does not anticipate that there would be in this situation. By its terms, Goal 14 requires that jurisdictions "provide for the housing needs of citizens of the state" by inventorying "buildable lands for residential use. " Goal 10 defines buildable lands as lands in "urban and urbanizable areas that are suitable, available and necessary for residential use. " Under the definitions section of the Statewide Planning Goals, "urban land" is defined as "land inside an urban growth boundary, " and "urbanizable land" is defined as urban land, i.e., land inside a UGB, that is presently unavailable for any number of reasons. Therefore, the opponent' argument that, in the context of a Major Amendment, Goal 10 requires Metro to "demonstrate that its actions do not leave it with less than adequate residential land supplies" is wrong..

Moreover, as the applicant points out, the City's urban reserves include a 50-year land supply for the City. There is no evidence that siting a new high school in Sherwood West, in the location that the Concept plan contemplated a new school, will in any way negatively impact the ability of the City to provide for its housing needs, especially when Sherwood West is combined with Sherwood North and Sherwood South.

.

The opponent also complains that the applicant is seeking to bring in 82 acres when it defined its current need as requiring only a 50-acre site. *See* letter from Jennifer Bragar dated June 6, 2017, at p. 2. The hearings officer is at a loss to understand the relevance of this argument to a Goal 10 challenge. The opponent's argument is simply not developed sufficiently to allow the hearings officer to understand the nature of the complaint.

The opponent also argues that an 82-acre school site "contradicts the two school sites considered in the Preliminary Sherwood West Concept Plan. *See* letter from Jennifer Bragar dated June 6, 2017, at p. 2. However, Concept Plans are not regulatory documents in the sense that they do not limit the size of planned facilities. The Concept Plan took the provision of additional school sites into account when it was developed. Although the concept plan includes two identified school sites, it is important to remember that the Concept Plan is a general plan that addresses how the area will develop generally. The Concept Plan does not specify the types of schools that the conceptual school sites reflect, e.g., elementary, middle or high school. Therefore, one should not view the blue squares denoting school sites in the Concept Plan in the literal sense of trying to determine how big the Concept Plan believed the sites will ultimately be. Such information comes from future refinement of the Concept Plan after areas are brought into the UGB.

Moreover, as the applicant points out, Goal 10 concerns itself with land already within a UGB, which the subject property is not. Therefore, Goal 10 has very limited applicability to a Major Amendment application for a new public school site. That said, the justification for the proposed expansion area of 82 acres is included in the Narrative. (Narrative at 31-32.) As set forth in the Narrative, approximately seven of the 82 acres will be needed for transportation improvements that will support the new high school. There is also a 40-foot wide gas pipeline easement that runs across the site, occupying approximately 2.2 acres but requiring protection of additional, adjacent property of approximately 20 feet on either side. This pipeline easement essentially gives the site an irregular shape, which reduces the efficiency with which it can be developed. The Narrative also discusses the shared sports fields arrangement between the City of Sherwood and the District that provides for additional ballfields. The District would also note that Figure 3 of the Narrative depicts a conceptual layout of the high school site and related transportation improvements over the entire 82-acre area. (Narrative at 7.) As one can see on that conceptual layout, the entire site will be fully utilized.

In the Appendix 6 Service Provider Interviews, the District warns that the current high school was at-capacity at the time of the interview (the appendix is dated June 15, 2015), and with the growth expected in Sherwood the high school could be expected to become over-capacity. (See Appendix 6, pages 3-4.) The District stated that expanding the existing high school and adding a new high school to the District would both be explored. The relevant information to be gleaned from the Concept Plan is that the majority of Sherwood West is intended to be developed with varying densities of housing and that the Concept Plan integrated the need for at least two additional school sites, with an understanding that the existing Sherwood High School would soon be over-capacity.

In its June 23, 2017 letter, the opponent argues that Metro "must demonstrate that its actions do not leave it with less than adequate residential land supplies in the types, locations,

and affordability ranges affected." *See* letter from Jennifer Bragar dated June 23, 2017, at p.2. As support for this requirement, the opponent relies on *Burk v. Umatilla County*, 20 Or LUBA 54 (1990). In *Burk*, the Port of Umatilla filed an application with the City of Umatilla to amend the city's comprehensive plan map for a 42-acre area within the city's urban growth boundary, but outside the city limits, from single-family residential to industrial. The city's buildable land inventory for housing included the 42 acres, because that acreage was within its UGB. Even with the 42 acres included in the buildable lands inventory, the city was deficient in land available for single-family housing. The city approved the map amendment even though it increased that deficiency, which earned the city a remand by LUBA.

The facts of *Burk* are different than those presented by this Major Amendment application. The land in question in *Burk* was inside a UGB and was already planned for zoned and residential uses. That is a key factual difference from the present case, because the land in this case is planned for agriculture and forestry. The land proposed to be added to the UGB is not "buildable land," and is not in any current inventory. For this reason, the Goal 10 analysis required in *Burk* is not applicable here.

Goal 11 - Public Facilities and Services

> ***"To Plan and develop a timely, orderly and efficient arrangement of public facilities and services to serve as a framework for urban and rural development."***

Hearings Officer Analysis: As set forth in response to MC 3.07.1425(c)(2), the Sherwood West Concept Plan extensively studied the provision of public facilities and services with respect to that urban reserve. The concept plan was prepared with analyses of existing sanitary sewer, water, and storm water conditions and analyses of how those systems need to be upgraded, extended, and phased to meet the future development of Sherwood West. The concept plan was prepared in coordination with all of the future service providers, including those services that will be provided by the City and those that will be provided by others, including Clean Water Services. The concept plan discusses the provision of public facilities and services to the area at pages 16-18 and 40-44, as well as in Appendix 3 (Existing Conditions Report) and Appendix 6 (Service Provider Interviews). According to the Concept Plan, the area in which the school site is proposed "presents the best near-term opportunity for development in Sherwood West," and the cost to serve the area is on the lower end of the cost scale. (Sherwood West Concept Plan, pages 42-43.) The District used this work as a jumping off point to study the proposed site for inclusion in the UGB (as well as other sites within Sherwood West). See Narrative, pages 24-31 and Application Appendix A (New High School Preliminary Site and Utility Exhibit) and Appendix B (Service Provider Letters). All of the foregoing information addresses the orderly and efficient arrangement of sanitary sewer, water, and storm drainage facilities to serve the new school property, as well as the larger Sherwood West area and all of the evidence consistently points to the chosen property as a property that can served in a timely, orderly, and efficient manner.

The opponents argue that Goal 11 is not met, because the local sewer and water agency (Clean Water Services) has a concern about the installation of a temporary pump station. *See* letter from Jennifer Brager dated June 23, 2017, at p. 5. The opponents offer no testimony, expert

opinion, or evidence that would call into question the conclusions reached by the applicant's engineers, KPFF. Goal 11 does not require that every technical engineering solution be worked out at the time of UGB amendment. The KPFF engineers seem to believe that an engineering solution is not only possible, but likely, which is all that is required at this stage. See KPFF memo dated June 13, 2017. This Hearings officer has evaluated the opinion of the KPFF engineers, and finds them more credible.

The opponents further argue that "fire flow tests have not been completed." *See* Letter from Jennifer Brager dated June 23, 2017, at p. 5. The opponents do not explain why fire flow tests are mandated by Goal 11 in the context of a UGB amendment, nor is it obvious why they would be. The KPFF engineers seem to be satisfied that the fire flow issue can be adequately handled, and this hearings officer finds them more credible.

Goal 12 - Transportation

"To provide and encourage a safe, convenient and economic transportation system."

Hearings Officer Analysis: Early LUBA cases suggested that a local government could not "pass the buck" by deferring compliance with Goal 12 and the TPR until the time of site plan review.[13] However, more recent case law clarifies that conditions of approval can be used to limit new development until such time as the TPR is addressed. For example, in *Citizens for Protection of Neighborhoods v. City of Salem*, 47 Or LUBA 111 (2004) (*Citizens*), the City of Salem approved a zone change to allow mixed residential and commercial use of a 275-acre property. That approval included a condition that prohibited development of the property until later adoption of a master plan for the property. The City of Salem's code criteria applicable during the master plan process included requirements that were substantially identical to the requirements of the TPR. Based on the condition requiring master plan approval, the city found that the zone change did not significantly affect the transportation facility because no development could occur until the subsequent master plan phase. *Id*. at 115, 116. LUBA held that the city could properly conclude that the rezoning of the property did not significantly affect any transportation facility because the condition essentially prohibited development on the property without first showing that any allowed development is consistent with the function, capacity and performance standards of affected transportation facilities. *Id*. at 120.

In *ODOT v. City of Klamath Falls (Southview Dev'l, LLC)*, 39 Or LUBA 641, 660, *aff'd* 177 Or App 1, 34 P2d 667 (2001), LUBA affirmed that portion of a county decision which approved a zone change with a condition that prevented additional development from impacting a transportation facility until such a time in the future when the TPR is addressed. LUBA found that this condition was sufficient to ensure compliance with the TPR in the interim.

Finally, in *Willamette Oaks, LLC v. City of Eugene,* 59 Or. LUBA 60 (2009), the city approved a zone change, and imposed a condition of approval prohibiting development of the property without approval of a planned unit development (PUD) application and a showing of

[13] *1000 Friends of Oregon v. City of North Plains*, 27 Or LUBA 372 (1994), *aff'd*, 130 Or App 406 882 P2d 1130 (1994); *Concerned Citizens of the Upper Rogue v. Jackson County*, 33 Or LUBA 70 (1997).

consistency with the TPR as part of the PUD application and review. LUBA approved this approach, stating as follows:

> In sum, with one caveat discussed below,[14] we think it is permissible for the city to defer consideration of compliance with the TPR to a subsequent review process at the time actual development is proposed, provided that the zone change or plan amendment is effectively conditioned to prohibit traffic or other impacts inconsistent with the TPR's requirements unless and until those requirements are fully addressed. Applicant offers no reason in the present case why deferring the application of the provisions of the TPR to a later PUD application process is insufficient to ensure that allowed uses of the subject property are consistent with

---

[14] LUBA stated in a footnote that the PAPA procedural requirements would still need to be satisfied as part of the deferred process:

> The caveat mentioned above is that unless the local government takes steps to ensure otherwise, the subsequent review process may not require a comprehensive plan or land use regulation amendment and therefore will not trigger [**12] the notice obligations of a post-acknowledgement action under ORS 197.610 *et seq*. Under those statutes, a local government that amends its comprehensive plan or land use regulations, including zone changes, must provide to the Department of Land Conservation and Development (DLCD) timely notice of the hearing on the proposed amendments as well the decision adopting the amendments. DLCD, in turn, provides notice of the proposed amendments and any subsequent adoption to persons or agencies who request such notice. OAR 660-018-0025. The requirement to provide notice of post-acknowledgment plan amendments to DLCD and other parties is a critical component of a statutory and rule-based scheme that is designed to ensure that post-acknowledgment plan and land use amendments comply with the applicable statewide planning goals and rules, including the TPR. *See Oregon City Leasing, Inc. v. Columbia County, 121 Or App 173, 177, 854 P2d 495 (1993)* (failure to provide DLCD the notice required under ORS 197.610 *et seq*. is a substantive, not procedural error). The efficacy of that scheme is undermined if a local government defers consideration [**13] of compliance with the TPR to a subsequent review process that does not provide equivalent notice to that required by ORS 197.610 *et seq*. Without such notice, it is possible that DLCD and parties who may rely on DLCD's re-notice, potentially including ODOT, may not learn of the review proceeding or have an opportunity to participate in that proceeding.

> the function, capacity and performance standards of the affected transportation facilities. *ODOT v. City of Klamath Falls,* 39 Or LUBA at 660.

Under OAR 660-024-0020(1)(d), the Transportation Planning Rule ("TPR") need not be applied to a UGB amendment if the land will remain zoned as urbanizable. That will be the case with the properties subject to the proposed UGB amendment. The current AF-20 zoning will remain until the is annexed into the City of Sherwood. During the forthcoming Metro Title 11 concept planning process for the properties, the City will determine the appropriate zone and this will include a TPR analysis. The zoning will not actually be changed, however, until after annexation.

With respect to Goal 12 generally, as set forth in response to MC 3.07.1425(c)(2), the Sherwood West Concept Plan extensively studied the provision of public facilities and services, including transportation, with respect to that urban reserve. The concept plan analyzed the existing transportation system and how that system will need to be upgraded, extended, and phased to meet the future development of Sherwood West. The concept plan was prepared in coordination with all of the future transportation service providers, including Washington County and ODOT. The concept plan discusses the transportation system within the plan area at 18-21, 40-44, as well as in Appendix 3 (Existing Conditions Report), Appendix 6 (Service Provider Interviews), and Appendix 8 (Transportation Options Alternative Analysis Report). The District used this work as the jumping off point to study the proposed site for inclusion in the UGB (as well as other sites within Sherwood West). See Narrative at pages 10-11, and Appendix B (Service Provider Letters). The District also engaged a licensed traffic engineer to prepare the March 15, 2017, Sherwood High School UGB Expansion Transportation Study (the "Transportation Study") to address the provision of a safe, convenient, and economic transportation system for the new high school site. (The Transportation Study has been submitted to the record.) The Sherwood West Concept Plan takes a higher-level look at the transportation needs of the Sherwood West area in general, including the need for new streets and intersection improvements. The Narrative provides general information about how the school site will be served and the Transportation Study provides more detail than is commonly found at the UGB expansion stage, but finds that, with some mitigation improvements, a new high school on the proposed site can be served by the appropriate transportation system. The Transportation Study will become more relevant at the Title 11 concept planning and annexation stages of the high school site development. Because the new high school is very near to an existing, urban-level street system, and because Washington County and the City will be constructing a new intersection improvement adjacent to the new high school, the provision of transportation services to the new school will be more economical. According to the concept plan, the area in which the school site is proposed "presents the best near-term opportunity for development in Sherwood West," and the cost to serve the area is on the lower end of the cost scale. (Sherwood West Concept Plan, pages 42-43.) In sum, all of the cited evidence supports a finding that it is possible to safely, conveniently, and economically provide for the transportation needs of the new high school.

For this reason, the applicant proposes a condition of approval to the UGB amendment that prohibits any new development on the subject property until a Comprehensive Plan Map and Zoning Map Amendment are completed, and that the TPR will be addressed at that time.

Several opponents expressed concerns about the adequacy of the surrounding transportation system to support the proposed high school. It is tempting to jump ahead to the specific traffic impacts of a proposed use even at this early stage of the land use process. It is important to keep in mind, however, that the Major Amendment application is just the first application in a series of land use proceedings that must occur prior to the high school actually being approved on the property. With respect to the Major Amendment application, Goal 12, OAR 660-024-0060(8), and MC 3. 07. l425(c)(2) are applicable and implicate transportation facilities. The District has submitted findings with supporting substantial evidence to address all of those provisions. The District also submitted additional evidence from its traffic engineer to address particular issues raised with respect to the March 15, 2017, Sherwood High School UGB Expansion Transportation Study. (See June 28, 2017, DKS memorandum.)

No one besides the District provided any evidence or testimony from a traffic engineer regarding any aspect of the Major Amendment application. Opponents correctly point out that there are existing transportation deficiencies in the area that surrounds the proposed high school site. Those opponents also correctly point out that if those deficiencies are not addressed then the new high school will exacerbate them. All of that is true, but it would be expected to be true regardless of where the new high school is sited, *i.e.,* nearly every area in and around Sherwood has existing transportation deficiencies and siting a new high school in any of those areas would impact the transportation system. Where the opponent's logic fails is in the apparent assumption that the transportation impacts of the new high school will not be addressed as part of the planning and permitting processes that are required prior to the new school opening its doors in 2020. That assumption is incorrect.

The laws and regulations that govern the permitting of the new high school simply do not allow the new school to be plopped down anywhere without transportation impacts being analyzed and mitigated in accordance with the law. The specifics of that analysis and mitigation for the chosen site are largely irrelevant at the UGB amendment stage. Instead, those specific transportation impacts will be addressed through subsequent Title ll planning for the UGB amendment area, and through annexation, zone change, and conditional use permit processes. Through these processes, the Transportation Planning Rule will be addressed, appropriate off-site mitigation within an appropriate timeframe will be required, and appropriate frontage improvements for all of the abutting streets will be conditioned. Public involvement is included in each of those steps as part of each of the planning and permitting processes. (See June 28, 2017, DKS & Associates memorandum.)

Goal 13 - Energy Conservation
"To conserve energy."

Hearings Officer Analysis: LUBA and the Courts have never given any regulatory affect to this Goal. The Hearings officer views this goal as being essentially meaningless. The general practice has been for applicants and staff to write some flowery prose that extorts the energy

saving virtues of the project. In this vein, the applicant states:

> As explained under the District's response to MC 3.07.1425(c)(3), which is the analog of Goal 14, Location Factor 3 (ESEE energy consequences), the proposed school site's adjacency to the existing UGB, served by major streets, facilitates multi-modal access for students, teachers, families, and administrative staff to and from the school campus. This will multi-modal facilitation will only increase as Sherwood West builds out into a predominantly residential area with nodes of neighborhood commercial.

Without some baseline standard to measure against, it is difficult to evaluate whether any given proposal will "conserve energy" or not. But at least it sounds good.

For its part, the opponent's arguments do not shed much light on the issue. They merely state that an "energy analysis" must be provided. *See* Letter from Jennifer Brager dated June 6, 2017, at p. 3. The opponents do not explain exactly what an "energy analysis" entails, nor it is particularly apparent on its face. Given that no focused argument concerning Goal 13 was raised by any party, the hearings officer finds that the applicant's proposed findings comply with Goal 13 – whatever it means.

Goal 14 - Urbanization

> ***"To provide for an orderly and efficient transition from rural to urban land use, to accommodate urban population and urban employment inside urban growth boundaries, to ensure efficient use of land, and to provide for livable communities."***

Hearings Officer Analysis: Goal 14 is addressed throughout this submittal.

Goals 15 through 19

Hearings Officer Analysis: These goals are not applicable, as the proposed UGB expansion does not include Willamette River Greenway, Estuarine Resources, Coastal Shorelands, Beaches and Dunes or Ocean Resources.

OAR 660-024-0040 - 0050

OAR 660-024-0050 directs local governments to inventory land inside the UGB to determine whether there is adequate development capacity to accommodate 20-year needs determined in OAR 660-024-0040. The District's Major Amendment application does not directly implicate these rule provisions, because the need for the new high school site did not arise out of an OAR 660-024-0040 overall land needs analysis and subsequent OAR 660-024-0050 buildable lands analysis. A specific need for a new high school site arose out of long-term facilities planning engaged in by the District. However, once the need for the new high school was identified, the District analyzed land that was within both the District boundaries and the Sherwood, Wilsonville, and Tualatin UGBs for land that could accommodate the need for the

new high school based on its suitability criteria. (See Narrative at pages 8-21.) There was no suitable land within those areas. The analysis required by OAR 660-024-0050 tracks closely in some respects with the analysis required by MC 3.07.1425(a), which was addressed by the District in its application. The caveat, however, is that identified specific land need, such as land for a new school, is not the same as a generalized need for more residential land or employment land. Given the specific need for a new school site, MC 3.07.1440(a) allows a UGB expansion tailored to just that need under certain circumstances.

OAR 660-024-0060 - Metro Boundary Local Alternatives Analysis

OAR 660-024-0060 sets forth the provisions that apply when a need within the Metro UGB has been specified and there is no land within the UGB that can accommodate that need. The provisions in OAR 660-024-0060 track closely with the provisions contained in MC 3.07.1425(c), which have been addressed in the District's application submittal, the Metro staff report, and the additional findings submitted by the District in response to the hearings officer's request.

OAR 660-024-0060:

(1) When considering a Metro UGB amendment, Metro must determine which land to add by evaluating alternative urban growth boundary locations. For Metro, this determination must be consistent with the priority of land specified in ORS 197.298 and the boundary location factors of Goal 14, as follows:

(a) Beginning with the highest priority of land available, Metro must determine which land in that priority is suitable to accommodate the need deficiency determined under OAR 660-024-0050.

Hearings Officer Analysis: The highest priority of land available is land designated urban reserve. (ORS 197.298(1)(a).) The District's application included an analysis of urban reserve land.

(b) If the amount of suitable land in the first priority category exceeds the amount necessary to satisfy the need deficiency, Metro must apply the location factors of Goal 14 to choose which land in that priority to include in the Metro UGB.

Hearings Officer Analysis: As set forth in the District's Major Amendment application, there is suitable land within an existing urban reserve to satisfy the need deficiency, i.e., the new high school. Accordingly, the location factors of Goal 14 were applied to that land. Those location factors are the first four location factors found in MC 3.07.1425(c)(1)-(9) and have been addressed in the District's application submittal, the Metro staff report, and the additional findings submitted by the District in response to the hearings officer's request.

(c) If the amount of suitable land in the first priority category is not adequate to satisfy the identified need deficiency, Metro must determine which land in the next priority is suitable to

accommodate the remaining need, and proceed using the same method specified in subsections (a) and (b) of this section until the land need is accommodated.

Hearings Officer Analysis: This is not applicable as there is urban reserve land that can accommodate the need.

(d) Notwithstanding subsection (a) to (c) of this section, Metro may consider land of lower priority as specified in ORS 197.298(3).

Hearings Officer Analysis: This is not applicable as there is urban reserve land that can accommodate the need.

(e) For purposes of this section, the determination of suitable land to accommodate land needs must include consideration of any suitability characteristics specified under section (5) of this rule, as well as other provisions of law applicable in determining whether land is buildable or suitable.

Hearings Officer Analysis: This provision is similar to MC 3.07.1425(b), in which site characteristics may be specified for land to be suitable for an identified need. The District specified such characteristics in the Narrative at page 19.

(2) Notwithstanding OAR 660-024-0050(4) and subsection (1)(c) of this rule, except during a legislative review of the Metro UGB, Metro may approve an application under ORS 197.610 to 197.625 for a Metro UGB amendment proposing to add an amount of land less than necessary to satisfy the land need deficiency determined under OAR 660-024-0050(4), provided the amendment complies with all other applicable requirements.

Hearings Officer Analysis: This provision is not applicable.

(3) The boundary location factors of Goal 14 are not independent criteria. When the factors are applied to compare alternative boundary locations and to determine the Metro UGB location, Metro must show that all the factors were considered and balanced.

Hearings Officer Analysis: This provision is consistent with how Metro interprets its analogous boundary location factors in MC 3.07.1425(c), which were applied to the District's Major Amendment application.

(4) In determining alternative land for evaluation under ORS 197.298, "land adjacent to the UGB" is not limited to those lots or parcels that abut the UGB, but also includes land in the vicinity of the UGB that has a reasonable potential to satisfy the identified need deficiency.

Hearings Officer Analysis: The District's analysis took into account all of the land in the urban reserves that otherwise met the District's siting criteria. Some of the land analyzed did not abut the UGB, but was rejected for other reasons.

(5) If Metro has specified characteristics such as parcel size, topography, or proximity that are necessary for land to be suitable for an identified need, Metro may limit its consideration to land that has the specified characteristics when it conducts the boundary location alternatives analysis and applies ORS 197.298.

Hearings Officer Analysis: This provision is similar to MC 3.07.1425(b), in which site characteristics may be specified for land to be suitable for an identified need. The District specified such characteristics in the Narrative at page 19.

(6) The adopted findings for a Metro UGB adoption or amendment must describe or map all of the alternative areas evaluated in the boundary location alternatives analysis. If the analysis involves more than one parcel or area within a particular priority category in ORS 197.298 for which circumstances are the same, these parcels or areas may be considered and evaluated as a single group.

Hearings Officer Analysis: The District mapped all of the alternative areas evaluated in the boundary location alternatives analysis and evaluated them separately.

(7) For purposes of Goal 14 Boundary Location Factor 2, "public facilities and services" means water, sanitary sewer, storm water management, and transportation facilities.

Hearings Officer Analysis: The District took into account the public facilities and services enumerated in this provision when it evaluated MC 3.07.1425(c)(2), which is the analog to Goal 14 Boundary Location Factor 2.

(8) The Goal 14 boundary location determination requires evaluation and comparison of the relative costs, advantages and disadvantages of alternative Metro UGB expansion areas with respect to the provision of public facilities and services needed to urbanize alternative boundary locations. This evaluation and comparison must be conducted in coordination with service providers, including the Oregon Department of Transportation (ODOT) with regard to impacts on the state transportation system. "Coordination" includes timely notice to service providers and the consideration of evaluation methodologies recommended by service providers. The evaluation and comparison must include:

(a) The impacts to existing water, sanitary sewer, storm water and transportation facilities that serve nearby areas already inside the Metro UGB;

(b) The capacity of existing public facilities and services to serve areas already inside the UGB as well as areas proposed for addition to the Metro UGB; and

(c) The need for new transportation facilities, such as highways and other roadways, interchanges, arterials and collectors, additional travel lanes, other major improvements on existing roadways and, for urban areas of 25,000 or more, the provision of public transit service.

Hearings Officer Analysis: As set forth in the responses to Goals 11 and 12, Sherwood West has been concept planned pursuant to MC 3.07.1110, and so the provision of public

facilities and services within the Sherwood West concept plan area and as those services relate to the rest of the city have been studied extensively, as required by MC 3.07.1110. The Sherwood West Concept Plan was prepared with analyses of existing sanitary sewer, water, stormwater, and transportation conditions and analyses of how those systems need to be upgraded, extended, and phased to meet the future development of Sherwood West without adversely impacting the existing city development. The concept plan was prepared in coordination with all of the future service providers, including those services that will be provided by the City and those that will be provided by others, including Clean Water Services, ODOT, and Washington County.[15]

Additional Issues Raised by Opponents

1. **Metro Staff Provided Proper Notice to DLCD.**

Opponents allege that Metro failed to provide notice to DLCD of a proposed plan map amendment under ORS 197.610. *See* Letter from Jennifer Bragar dated June 23, 2017, at p. 8. This is not correct. Metro submitted the requisite notice to DLCD on April 20, 2017, as evidenced on the weekly DLCD notice summary dated April 21, 2017, which is attached to the June 30, 2017 letter from Metro counsel Roger Alfred.

2. **The Fair Housing Act Is Inapplicable.**

The opponent argues that Metro must apply the Fair Housing Act ("FHA") to the Major Amendment application, because "Metro has a duty to affirmatively further fair housing." *See* Letter from Jennifer Bragar dated June 23, 2017, at p. 3-5.

The opponent does not point to any approval criterion that requires Metro to apply the FHA directly to this application, and did not include any convincing argument as to why a UGB expansion to accommodate a new public high school would require the FHA to be addressed. As best as the hearings officer can ascertain, the opponent's core argument is that the FHA is a *de-facto* approval standard for every Comprehensive Plan Amendment and zone change decision. In this regard, Ms. Brager states that "Metro has a duty to affirmatively further fair housing" and that "Metro needs to address fair housing implications in this Major Amendment application through analysis under Goal 10 and under Metro's locational factors, Metro Code 3.07.1425(c)(5) regarding equitable and efficient distribution of housing." The argument is not well-developed; the opponent seems to be arguing that the FHA must be complied with, but that compliance with Goal 10 and the Metro Code establishes compliance with the FHA.

Beyond that, the opponent complains that Sherwood does not have enough subsidized housing, which "does not properly address the housing issues in Washington County for low-income households, especially protected classes." That statement is followed up with the conclusion that the "failure to analyze the school siting in context of the regional need for fair housing only exacerbates the inequitable distribution of affordable housing in the Metro region."

[15] This coordination effort included service provider interviews included as Appendix 6 of the Sherwood West Concept Plan. Appendix 8 provides more detail regarding the provision of transportation infrastructure to the Sherwood West Concept Plan area.

Letter from Jennifer Bragar dated June 23, 2017, at p. 5. Again, the hearings officer is at a loss to understand the opponent's argument, especially since the opponent does not tie their ultimate policy concern back to any specific language in the FHA or any other law for that matter. This argument is simply not developed sufficiently to allow for its review and evaluation. If the argument is that every school siting project has an inclusionary zoning requirement for additional low-income / subsidized housing, that argument is rejected.

SECTION IV: HEARINGS OFFICER'S SUMMARY, RECOMMENDATION, AND PROPOSED CONDITIONS OF APPROVAL.

The applicant seeks to amend the UGB to include approximately 82 acres for a high school with sports fields and the realignment of SW Elwert and SW Kruger Roads. The Applicant has provided sufficient evidence to demonstrate that the criteria are satisfied and the locational factors have been addressed. As detailed herein, the applicant has demonstrated that the high school is currently over capacity and by 2025 will be severely over capacity. Delaying the decision to await a legislative amendment of the UGB by the Metro Council which may or may not occur in the 2018 timeframe only exacerbates the capacity issues which impacts the District's ability to meet the goals of its strategic plan. The applicant provided adequate comparison of the proposed UGB expansion area with other possible expansion areas in seven different urban reserve areas and a determination that the need cannot be met on land currently within the urban growth boundary. In addition the applicant has shown the proposed use can be made compatible with adjacent uses through site design and the city's development design review process provides for public involvement. Additionally the adjacent land is within an urban reserve and is expected to urbanize over time, allowing for the development of a cohesive neighborhood and school/park facility.

Therefore, the hearings officer forwards a recommendation to the Metro Council for ***approval*** of this petition, with the following two conditions of approval:

1. The property must be used for a public high school, associated accessory uses, and public transportation improvements consistent with the application are required for this Major Amendment.

2. The applicant must comply with the Transportation Planning Rule (TPR) at the time the zoning is established on the subject property.

Respectfully submitted this 21st day of July, 2017.

ANDREW H. STAMP, P.C.

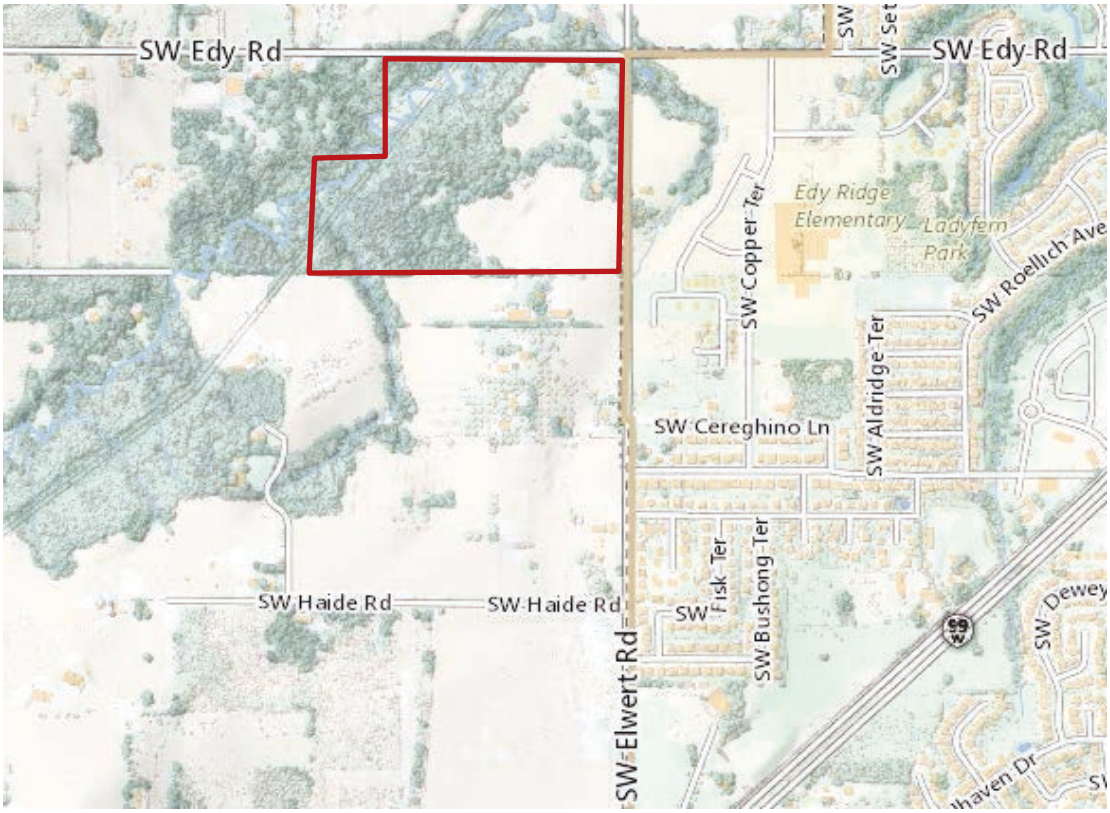
Attachment 8

Alternative High School Site A
(SW Corner of Edy & Elwert Road)



Topography (USGS GIS Lidar Mapping)	Wetlands (National Wetlands Inventory)	Water Utility (City of Sherwood)	Sanitary Utility (Clean Water Services)
✗ Low-lying, relatively flat. Approximately 25 feet grade across site. Very low lying for sanitary sewer. Significant portion of site below elevation 200. Western portion mostly creek.	✗ Small wetland in center of site. Western portion of site mostly drainage area.	✗ No water available adjacent in Elwert. Would require water extensions along Elwert frontage and east on Edy.	✗ Low lying site - sanitary sewer not available in Elwert. Would require significant extension in Edy or pump station.

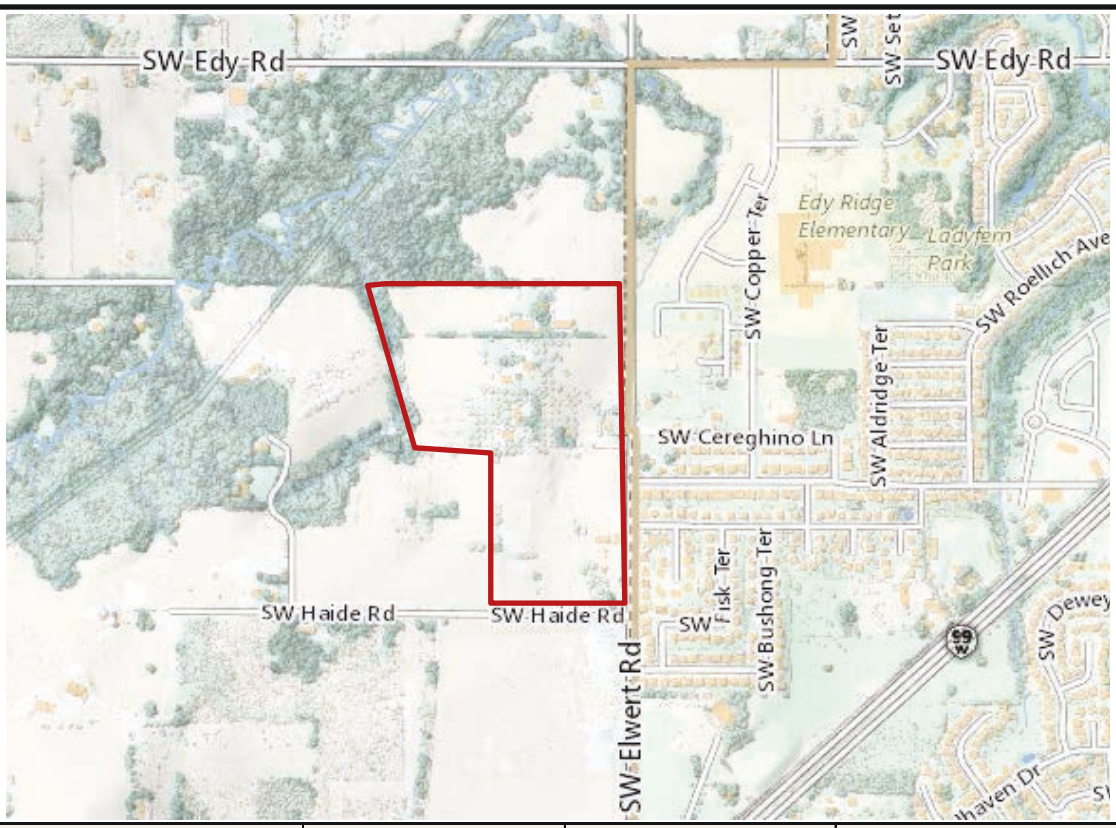
Storm Drainage	Public ROW Improvements
✓ Drainage discharge available onsite into Chicken Creek.	1. Water extension along Elwert frontage. 2. Sanitary upgrades in Edy and Elwert. 3. Storm drainage improvements along Elwert. 4. Street improvements on Elwert and Edy frontages.

LEGEND

✓ = Advantage ○ = Still to be Determined ✗ = Disadvantage

Attachment 8 continued

Alternate High School Site B
(NW corner of Haide & Elwert)



Topography (USGS GIS Lidar Mapping)	Wetlands (National Wetlands Inventory)	Water Utility (City of Sherwood)	Sanitary Utility (Clean Water Services)
O Significant topographic ridge running N-S through middle of site. Site slopes both east and west. Approximately 50-60 feet grade change. Significant grading for fields.	✓ No wetlands shown.	✓ 12" City of Sherwood public water main available in Elwert.	✓ 15" sanitary sewer and manhole available in Elwert at Daybreak subdivision. (Confirmed with City of Sherwood). City would likely still require public sanitary improvement in Elwert.

Storm Drainage	Public ROW Improvements
✓ North-south ridge running through site. West portion could drain directly to Chicken Creek. East portion drains to public improvements and across road to Chicken Creek.	1. Although not needed for site development, sanitary and storm sewer improvements likely needed in Elwert frontage as part of public frontage improvements. 2. Street improvements on Elwert & Haide frontages.

LEGEND

✓ = Advantage O = Still to be Determined ✗ = Disadvantage

Attachment 8 continued

Alternate High School Site C (Preferred Site)
(NW Corner Krugger & Elwert)

Topography (USGS GIS Lidar Mapping)	Wetlands (National Wetlands Inventory)	Water Utility (City of Sherwood)	Sanitary Utility (Clean Water Services)
✓ Entire site slopes down to the east toward Elwert. Relatively gentle topography. Approx. 40 feet grade change across entire site. Note: shallow valley and ridge complicates storm drainage.	✓ No wetlands shown.	✓ 12" City of Sherwood public water main in Elwert; also 18" public water main in Kruger.	✓ Feasible to extend 15" sanitary sewer main south on Elwert. Would require approximate 2,000 linear foot public extension. (Confirmed with City of Sherwood).

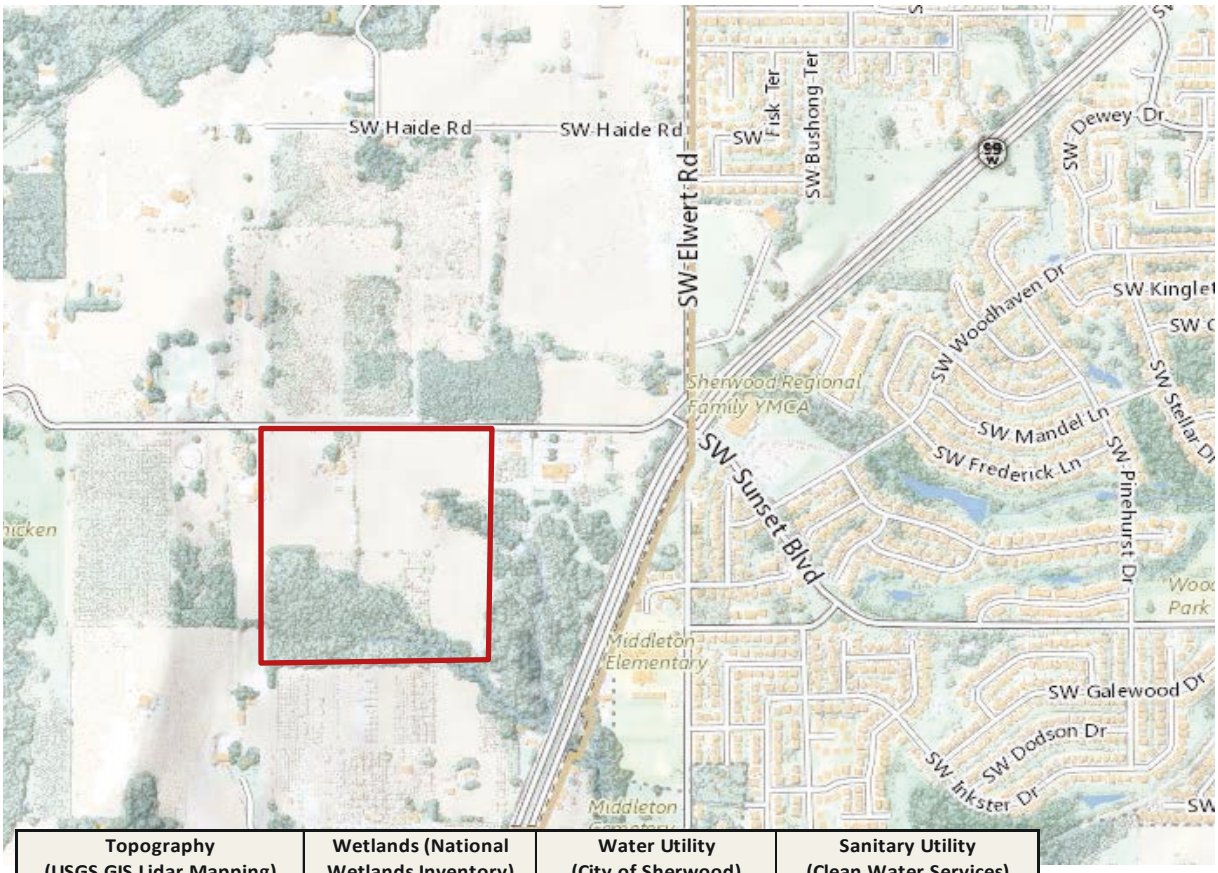
Storm Drainage	Public ROW Improvements
○ East-west ridge running through site. North portion could require long public storm extension to Chicken Creek. South portion would need to drain to new City intersection improvements at Elwert & Kruger intersection.	1. Sanitary extension in Elwert. 2. Storm drainage improvements along Elwert north to Chicken Creek. 3. Street improvements on Elwert frontage. 4. Need to consult with CWS to work out storm discharge.

LEGEND

✓ = Advantage ○ = Still to be Determined ✗ = Disadvantage

Attachment 8 continued

Alternative High School Site D
(South Side of Kruger Road)



Topography (USGS GIS Lidar Mapping)	Wetlands (National Wetlands Inventory)	Water Utility (City of Sherwood)	Sanitary Utility (Clean Water Services)
O Entire site slopes down to the east toward private property. Moderate topography. Approximately 50-60 feet grade change.	O No wetlands shown, but creek drainage runs through south portion of site.	✓ 18" public water main in Kruger.	✗ No sanitary sewer services available. Significant sewer extension and public system improvements necessary.

Storm Drainage	Public ROW Improvements
✗ No established public storm drainage systems in vicinity. Storm discharge would need to be worked out with the City and CWS along 99W. Storm extension likely required.	1. Sanitary sewer extension (exact route to be determined). 2. Storm drainage extension (exact route to be determined). 3. Street improvements on Kruger. 4. Offsite street improvements likely required.

Attachment 8 continued

Alternative High School Site E
(NW Corner Chapman & Pacific Highway)

Topography (USGS GIS Lidar Mapping)	Wetlands (National Wetlands Inventory)	Water Utility (City of Sherwood)	Sanitary Utility (Clean Water Services)
O Entire site slopes down to the east toward Pacific Highway. Slightly steeper topography. Approximately 75 feet grade change. Would need to evaluate for fields.	✓ No wetlands shown.	✗ No public water service in immediate vicinity of site. Need to extend water south from Kruger or under Pacific Highway.	✗ No sanitary sewer services available. Significant sewer extension and public system improvements necessary.

Storm Drainage	Public ROW Improvements
✗ No established public storm drainage systems in vicinity. Storm discharge would need to be worked out with the City and CWS along 99W. Storm extension likely required.	1. Sanitary sewer extension (exact route to be determined). 2. Storm drainage extension (exact route to be determined). 3. Street improvements on Chapman.

EXHIBIT C to Ordinance No. 17-1406

Memo

Metro
600 NE Grand Ave.
Portland, OR 97232-2736

Date: August 15, 2017
To: Metro Council
From: Roger Alfred, Senior Assistant Attorney
Subject: Sherwood School District UGB Amendment; Metro Ordinance No. 17-1406
Responses to Issues Raised at Public Hearing

This memorandum provides responses to issues raised in the letter submitted by attorney Jennifer Bragar on behalf of Byers Properties LLC ("Byers") at the public hearing before the Metro Council on August 10, 2017. For the reasons set forth below, the Office of Metro Attorney concludes that the arguments are without merit, and the Metro Council may adopt the hearings officer's recommendation of approval.

Most of the issues raised in the Byers letter have been considered and addressed in the hearings officer's decision. Where that is the case, this memo refers to the appropriate pages of that decision.

1. This UGB amendment process is quasi-judicial, not legislative

Byers first contends that Metro is making a legislative decision, rather than a quasi-judicial decision. This issue is thoroughly analyzed at pages 13-16 of the hearings officer's decision, where he correctly reaches the fairly obvious conclusion that this is a quasi-judicial process. The hallmark of a quasi-judicial land use process is that it is initiated by an application, which the local government is then obligated to either approve or deny. Here, the "major amendment" process is initiated when an applicant files a request for a UGB amendment with Metro. Metro then appoints a hearings officer, who holds a public hearing that is governed by the quasi-judicial procedures set forth in Oregon statute (ORS 197.763). It is worth noting that, during the hearing before the hearings officer, Byers invoked the quasi-judicial procedures in that statute by requesting that the record be held open for additional evidence, a request that was granted by the hearings officer. Metro's final decision on the application is based on applying preexisting criteria to the facts of the application, and it impacts a discrete parcel of property, rather than a broad population. The process is clearly quasi-judicial under the relevant case law.

2. This UGB amendment does not involve or implicate housing

The reason Byers contends this process is legislative is in order to implicate ORS 197.296(2), which is the statute that directs Metro to ensure there is a 20-year supply of housing inside the UGB when it conducts the 6-year "regular cycle" urban growth management process (which is a legislative process, not quasi-judicial). As correctly concluded by the hearings officer, the arguments raised by Byers regarding the decision being legislative are a "red herring," because even if this UGB major amendment process was legislative, ORS 197.296(2) would still not apply because the express purpose of the major amendment process is to provide land for non-housing uses. There is no legal,

or rational, reason why Metro would undertake a regionwide housing need analysis as part of a decision to expand the UGB for a non-housing use. The fact that this UGB amendment process is governed by a different statutory section, and does not implicate housing need under ORS 197.296, is analyzed in detail by the hearings officer at pages 16-24 of his decision, and is also addressed in my memorandum to the hearings officer dated June 9, 2017.

Byers also argues, for the first time, that the ESEE analysis is inadequate because it fails to address social consequences arising out of "the loss of housing land" resulting from approving this UGB expansion. Byers is correct that this issue is not addressed in the hearings officer's analysis, but that is because Byers failed to raise this issue below. Under Metro Code, this proceeding before the Metro Council is "on the record" of what was before the hearings officer. Specifically, section 3.07.1430(u) of the Metro Code provides: "Argument must be based upon the record of those [hearings officer] proceedings." Accordingly, participants before the Metro Council may not introduce new evidence or issues beyond what was presented to the hearings officer. *See DLCD v. Tillamook County*, 34 Or LUBA 586, 591 (1998) (noting that where a hearing is held on the record, "petitioner could not have raised a new issue at that stage of the proceeding.") Allowing parties to raise new issues before the Metro Council could trigger a need to respond with new evidence, which is not permitted in an "on the record" process.

Adoption of this memorandum by the Metro Council in support of approving the application is an express interpretation by the Council of 3.07.1430(u) to mean that any issues not raised before the hearings officer are waived. This interpretation is consistent with the meaning of "on the record" expressed in the statutes governing LUBA's scope of review (ORS 197.835(2)(a) and (3)), which prohibit new issues from being raised on appeal.

Even if this issue had not been waived by Byers, the hearings officer expressly rejected Byers' argument below that approval of this UGB amendment results in a "loss of housing land." The land being added to the UGB is currently zoned for agricultural use, not housing. Accordingly there are no social impacts arising out of a loss of land for housing.

3. The application is based on a demonstrated need for a high school, not for parks

Byers contends that the application includes a request for a park use, and is deficient because it did not consider "alternatives to the park use separate from collocation with the high school." Like the ESEE argument addressed above, Byers did not raise this issue in the proceedings before the hearings officer, and has therefore waived the ability to raise it before the Metro Council.

In the event this issue was not waived, on the merits Byers mischaracterizes the nature of the UGB amendment application. The application is for a high school use, a use that necessarily and customarily includes active play space, including a number of ball fields, and other sports facilities, such as a track and tennis courts. This is depicted on the concept plan for the high school, which is included in the application, and explained in the application narrative and in the applicant's

testimony before the hearings officer. The UGB amendment application is not for park land, and the references to the future shared use of the new high school's active ball fields should not be construed to that effect. The nature and purpose of the application is not changed by the facts that (1) the city does not generally provide ball fields or other active sports facilities, and (2) the city and the school district have an IGA that generally allows the community to use the District's ball fields and other active sports facilities when those fields and facilities are not in use by the school district. As set forth in the record, the property proposed for the relocated high school will be fully utilized by the needs of the high school, and the larger campus of the new high school (when compared to the existing high school) will allow for the full range of facilities normally provided at a comprehensive high school. The availability of more sports fields that can be shared with the community is merely an additional benefit arising out of the agreement between the school district and the city.

On this point, one aspect of the hearings officer's findings should be clarified. At page 29 the hearings officer includes a finding that the applicant has shown there is a "demonstrated land need to accommodate both school and park services." This is a mis-statement by the hearings officer, as the school district's application is based on the need for a new school, and not on a need to provide park services.

4. The application is "consistent with" Metro's 20-year population range forecast

One criterion for a UGB expansion under the Metro Code is that the application must show a need to accommodate future urban population "consistent with a 20-year population range forecast." Byers argued below, and argues again to the Council, that this requires Metro to undertake a new regionwide 20-year population forecast, and the school district's 10-year school population forecast is therefore deficient. The hearings officer addressed this argument at page 26, concluding that the code requires the applicant to show a need that is "consistent with" a 20-year forecast, which "in this context simply means using the same or similar growth rates contemplated in the 2015 UGR, and that appears to be the case here."

In support of this argument Byers references materials attached to their August 10, 2017 letter to the Metro Council regarding a 2016 study of race and ethnicity impacts. This is a new document that was not part of the evidentiary record before the hearings officer and therefore cannot be considered by the Metro Council in this proceeding.

5. Public facilities and services are available to serve the proposed site, and the applicant must comply with the TPR upon rezoning

As part of the consideration of alternative urban reserves areas for potential expansion of the UGB, one location-related factor that must be considered is the "orderly and economic provision of public facilities and services." This issue is analyzed and addressed at pages 43-45 of the hearings officer's decision. The hearings officer also correctly notes, at page 35, that these are locational "factors" that

must be *considered* by Metro, and are not criteria that must be satisfied: "one point that cannot be over-emphasized is that no one locational factor can be considered to be a determinative reason to include or exclude any one particular site. Thus, a decision to include or exclude land from a UGB must be based on a balancing of all these factors, rather than a reliance on any one factor."

Nonetheless, Byers contends that this factor is a criterion that must be satisfied, arguing that the applicant must show whether the proposal will impact availability of public facilities. Byers then contends that the applicant's traffic impact analysis does not demonstrate that nearby intersections will meet applicable level of service standards.

The issue raised by Byers is not relevant to the applicable inquiry for purposes of a UGB expansion, which is a much more general question of whether public facilities are available to serve the site. Questions related to traffic impacts from a new school on existing and planned transportation facilities in the area will need to be addressed as part of the comprehensive plan and zoning map amendments that will be necessary to develop a school, which will trigger application of the state Transportation Planning Rule (TPR). The ordinance proposed for adoption by the Metro Council includes the hearings officer's recommended condition of approval requiring application of the TPR at the time zoning for the school is being adopted.

6. Metro has satisfied the coordination requirement

Byers contends that Metro failed to coordinate with affected local governments as required by ORS 195.025. This issue was not raised before the hearings officer and is therefore waived. In the event the issue is not waived, the hearings officer adopted the following findings regarding the coordination requirement at page 58 of his decision:

"This Major Amendment application has required coordination with and between Metro, Washington County, the City of Sherwood, and public service providers including ODOT, Tualatin Valley Fire & Rescue, and Clean Water Services. This includes coordination at the Major Amendment level and at the Sherwood West Concept Plan level. Therefore, the required coordination has occurred."

The record includes evidence that Metro fulfilled its coordination obligation by providing written notice to all cities and counties inside the UGB regarding the proposed UGB amendment, as well as to ODOT and relevant service providers. The City of Sherwood supports approval of the application and included the following comments in its service provider letter dated March 11, 2017:

"The Sherwood West preliminary concept plan was developed through community input and had community and Council support. The voters within the Sherwood School District approved a bond for the new high school. While there will be challenges to building a new school within the Sherwood West area, and coordination between the District, City, County and ODOT will be

required, the District is committed to ensuring that is serves as a great cornerstone to the future growth in the area."

In response to questions at the public hearing from members of the Metro Council regarding coordination with the City of Sherwood, the school district representatives verbally stated that the district is currently working with the city on Title 11 concept planning and that district representatives attended a city planning commission meeting earlier in the week where they were told that the planning effort is on the right track. These are evidentiary statements that were not included in the record before the hearings officer and therefore will not be considered or relied upon by the Metro Council in its final decision.

Finally, Byers suggests that the school district has not satisfied a coordination obligation, but cites no authority regarding why or how the school district is obligated to coordinate as part of its application. The coordination requirement applies to Metro through the major amendment process and ORS 195.025, and not to the school district. Byers also states that comments received from Washington County "suggest that coordination is incomplete as the management of transportation systems has not been finalized." It is not entirely clear what this means; however, there is no requirement, coordination-related or otherwise, that management of transportation systems must be "finalized" at the point of a UGB amendment. The Metro Ordinance includes a condition of approval requiring the city to finalize its concept plan for the area prior to development occurring on the site, which will include coordination with the county regarding transportation planning. Additional transportation planning will occur at the time of annexation by the city and rezoning of the property, at which point the TPR must be applied to ensure that transportation facilities serving the new school will be adequate.

All coordination obligations have been satisified.

STAFF REPORT

IN CONSIDERATION OF ORDINANCE NO. 17-1406, FOR THE PURPOSE OF AMENDING THE URBAN GROWTH BOUNDARY IN THE VICINITY OF THE CITY OF SHERWOOD UPON APPLICATION BY THE SHERWOOD SCHOOL DISTRICT

Date: July 27, 2017

Prepared by: Tim O'Brien
Principal Regional Planner

PROPOSED ACTION

Adoption of Ordinance 17-1406, approving *UGB Case 17-02: Sherwood School District,* a major amendment to the urban growth boundary (UGB). The proposed amendment area is shown on Attachment 1. Staff recommends approval of the ordinance as described below, which would add approximately 82 acres to the UGB west of Sherwood for a high school campus and sports fields. In addition a portion of the land will be used for the construction of a roundabout at SW Elwert and SW Kruger Roads.

SUMMARY OF PROCESS

The proposed amendment is a "major amendment" to the UGB under the Metro Code, which is a special process reserved for requests to include land for public facilities and other non-housing needs that cannot wait until the next UGB cycle. An application for a major amendment is first considered at a public hearing before a hearings officer appointed by Metro. After receiving testimony from interested parties, the hearings officer prepares a proposed order, with findings of fact and conclusions of law recommending approval or denial of the application, and forwards the recommendation to the Metro Council along with the record of the hearing. The Metro Council must consider the hearings officer's report and recommendation at an "on the record" public hearing where individuals who participated in the proceeding before the hearings officer are allowed to submit oral and written argument. The argument must be based on the evidence that was provided to the hearings officer, and no new evidence may be submitted to the Metro Council. If the Council decides to approve the application and expand the UGB, the Council must adopt an ordinance within 15 days after holding a public hearing.

BACKGROUND AND ANALYSIS

Proposal Description:
The Sherwood School District filed an application for an 80-acre amendment to the UGB for a high school campus and sports fields. The site consists of four tax lots located within unincorporated Washington County on the west side of SW Elwert Road, between SW Haide Road and SW Kruger Road, immediately west of the City of Sherwood. The site has frontage on all three roads, is zoned Agriculture and Forest (AF-20) and is located within Sherwood West Urban Reserve 5B. The adjacent properties to the north, south and west are also within Urban Reserve 5B and contain rural residences with limited agriculture and a church to the south, wooded lots and rural residences to the west and open fields and rural residences to the north. The subject properties have been used for various agricultural activities including a Christmas tree farm, tree plantation and row crops. The tax lot in the southeast corner of the site, adjacent to the intersection of SW Elwert and SW Kruger Roads is owned by the City of Sherwood, a portion of which will be used for the SW Elwert and SW Kruger Road roundabout improvement. A 40-foot wide permanent Northwest Natural gas easement zigzags along the western edge of the site, separating the northwest corner of the site from the remainder of the property.

The Sherwood School District is centered on the city of Sherwood and extends into the surrounding rural area in all directions, including a small area east of I-5, between Wilsonville and Tualatin. The District includes an area of 4.31 square miles and an estimated population of 18,884. The District has seven schools that provide educational services to just over 5,000 students, the majority of which live in the city of Sherwood. The District experienced substantial growth in the late 1990s and early 2000s leading to a community effort in 2005 to determine facility needs. This resulted in the successful 2006 bond measure which included funding for an addition to the current high school to increase capacity to 1,550 students, consistent with phase 1 of the 2006 high school master plan. Current enrollment at the high school is over 1,700 students and projections show over 2,250 students by the 2025-26 school year. In early 2014 the District's Long Range Planning Committee made recommendations to the School Board regarding enrollment and growth challenges, facilities analysis and needs and financing options. In 2015 the District documented the condition and educational adequacy of its facilities, leading to bond visioning and steering committees in 2016. This resulted in the District's voters approving a bond measure in 2016 providing funding for school improvements including construction of a new high school. The District continues to engage the community through a design committee and community input sessions.

Public Hearing before the Hearings Officer

The hearings officer, Andrew H. Stamp, conducted a public hearing at the Sherwood Police Department Community Room on May 24, 2017. Metro staff recommended approval of the application. Six people testified at the hearing, five in favor of the application and one against the application. The hearings officer continued the hearing to June 13, 2017 in response to a procedural question. Three people testified at the June 13th hearing, all in opposition to the application, including one who had also testified at the May 24th hearing. The hearings officer granted a request to keep the record open for ten days, followed by additional time for rebuttal by participants and final argument by the applicant; the record closed on July 7, 2017.

The primary opponent of the application is Byers Properties, LLC, which is the entity that owns one of the parcels of property to be included in the proposed expansion. Byers is currently involved in condemnation proceedings with the Sherwood School District regarding acquisition of the property for public use. Byers raised numerous legal issues in the proceedings before the hearings officer, all of which were ultimately rejected in the final order and recommendation to the Metro Council.

Hearings Officer Recommendation and Proposed Findings

On July 21, 2017 the hearings officer submitted a proposed order recommending approval of Case 17-02, based upon the findings and conclusions in his report. The hearings officer included two conditions of approval in his recommendation:

1. The property must be used for a public high school, associated accessory uses, and public transportation improvements consistent with the application for this Major Amendment.
2. The applicant must comply with the state Transportation Planning Rule (TPR) at the time the zoning is established on the subject property.

A hearing on the recommendation before the Metro Council is set for August 10, 2017. All parties to the case were notified in writing of the Council hearing date and the notice was also posted on Metro's website. In addition, the hearings officer's proposed order was made available for review by all parties.

Letter from attorney Kelly Hossaini on behalf of Sherwood School District, dated July 7, 2017

SUMMARY/OPTIONS

According to Metro Code 2.05.045(b), the Council may either:

- Adopt Ordinance 17-1406 to approve *Case 17-02: Sherwood School District* based on the findings of fact and conclusions of law in the hearings officer's order. Staff recommends this option.
- Vote in favor of adopting Ordinance 17-1406 to approve *Case 17-02: Sherwood School District* based on revised findings of fact and conclusions of law to be prepared by Metro staff.
- Remand the proceeding to the Hearings Officer for further consideration.
- Vote to adopt a Resolution entering an order to deny *Case 17-02: Sherwood School District* based on revised findings of fact and conclusions of law to be prepared by Metro staff.

In addition, pursuant to Code Section 3.07.1455, the Council may establish conditions of approval it deems necessary to ensure the addition of land complies with state planning laws and the Regional Framework Plan. Metro staff recommends the Council include the following three conditions of approval, the first two of which were recommended by the hearings officer:

1. The property must be used for a public high school, associated accessory uses, and public transportation improvements consistent with the application for this Major Amendment.
2. The applicant must comply with the state Transportation Planning Rule (TPR) at the time the zoning is established on the subject property.
3. The City of Sherwood shall complete the requirements of Urban Growth Management Functional Plan Title 11, section 3.07.1120: Planning for Areas Added to the UGB, prior to development occurring.

INFORMATION

Known Opposition: Attorney Jennifer Bragar, representing one of the subject property owners, testified verbally and in writing in opposition to the application before the hearings officer and by providing additional written information during the open record period. Two persons who live in the vicinity of the proposed UGB expansion area testified verbally and in writing in opposition to the application before the

hearings officer and by providing additional written information during the open record period. One person who lives in the vicinity of the proposed UGB expansion area testified in writing in opposition to the application during the continued public hearing timeframe.

Legal Antecedents: The Metro Regional Framework Plan and Urban Growth Management Functional Plan Title 14: Urban Growth Boundary authorizes amending the Urban Growth Boundary through the major amendment process.

Anticipated Effects: The adoption of Ordinance 17-1406 will add 82.3 acres of land to the urban growth boundary in the vicinity of Sherwood for a high school campus with sports fields and road improvements.

Budget Impacts: There is no budget impact from adopting this ordinance.

BEFORE THE METRO COUNCIL

FOR THE PURPOSE OF AMENDING THE URBAN GROWTH BOUNDARY IN THE VICINITY OF THE CITY OF SHERWOOD UPON APPLICATION BY THE SHERWOOD SCHOOL DISTRICT	)	Ordinance No. 17-1406
	)	
	)	Introduced by Chief Operating Officer
	)	Martha Bennett with the Concurrence of
	)	Council President Tom Hughes

WHEREAS, the Metro Urban Growth Management Functional Plan Title 14: Urban Growth Boundary provides a mechanism to amend the urban growth boundary (UGB) through a major amendment process for public facilities and other non-housing purposes; and

WHEREAS, the Sherwood School District filed an application for a major amendment pursuant to Metro Code Section 3.07.1430 to add approximately 82 acres to the UGB for the purpose of constructing a new high school to serve the Sherwood area; and

WHEREAS, the application was considered by a hearings officer appointed by Metro at public hearings in the City of Sherwood on May 24, 2017 and June 6, 2017; and

WHEREAS, on July 21, 2017 the hearings officer submitted to Metro a proposed order recommending approval of the application, together with findings of fact and conclusions of law in support of a decision by the Metro Council that the application satisfies the requirements of the Metro Code and applicable state law; and

WHEREAS, the Council considered the proposed order and testimony at a public hearing on August 10, 2017 under the procedural requirements of Metro Code Section 3.07.1430(u); now, therefore,

THE METRO COUNCIL ORDAINS AS FOLLOWS:

1. The UGB is hereby amended, as indicated in Exhibit A, attached and incorporated into this ordinance, to add 82.3 acres to the UGB for development of a high school with sports fields and a roadway improvement, subject to the following three conditions of approval:

    a. The property must be used for a public high school, associated accessory uses, and public transportation improvements consistent with the application for this UGB amendment.

    b. The applicant must comply with the state Transportation Planning Rule (TPR) at the time the zoning is established on the subject property.

    c. The City of Sherwood shall complete the requirements of Urban Growth Management Functional Plan Title 11, section 3.07.1120: Planning for Areas Added to the UGB, prior to development occurring.

2. The Findings of Fact and Conclusions of Law contained in the hearings officer's recommendation attached as Exhibit B and hereby incorporated into this ordinance, explain how this amendment to the UGB complies with applicable provisions of the Regional Framework Plan, Metro Code, and applicable statewide planning laws.

3. The Metro Council adopts as supplemental findings in support of its decision the legal memorandum dated August 15, 2017 attached as Exhibit C and hereby incorporated into this ordinance, which includes responses to issues raised at the public hearing by opponents of the application.

ADOPTED by the Metro Council this 17 day of August 2017.

Tom Hughes, Council President

SECTION I: APPLICATION SUMMARY

FILE NAME:	UGB Case 17-02: Sherwood School District Urban Growth Boundary Major Amendment
APPLICANT:	Sherwood School District 23295 SW Main Street Sherwood, OR 97140
PROPOSAL:	82-acre expansion of the urban growth boundary (UGB) for a high school campus with sports fields. Realign SW Elwert Road and SW Kruger Road in Sherwood.
LOCATION:	Tax Lots 2S236-200, -201, -206, and -207
SITE ADDRESSES:	18880 SW Haide Road, 22895 SW Elwert Road and 18985 SW Kruger Road, Sherwood, Oregon 97140
URBAN RESERVE AREA:	Area 5B.
CURRENT ZONING:	AF-20
METRO CODE:	Metro Code Sections 3.07.1425 (B, C, D, E & F) and 3.07.1440 (A & B). Code Section 3.07.1425(C)(1-9)

SECTION II: BACKGROUND INFORMATION

Proposal Description: The applicant requests an expansion of the City of Sherwood UGB to include approximately 82 acres for a high school campus with sports fields. This proposal also seeks to realign the intersection of SW Elwert Road and SW Kruger Road for improved and safer traffic flow.

Site Information: The site consists of four tax lots located within unincorporated Washington County on the west side of SW Elwert Road, between SW Haide Rd and SW Kruger Rd as shown in Attachment 1. The property has frontage on SW Elwert, SW Haide and SW Kruger Roads. The entire property is zoned AF-20 (Agricultural and Forest District) by Washington County with a minimum lot size of 80 acres. The entirety of the property is located within the Sherwood West Preliminary Concept Plan area (Metro Urban Reserve Area 5B). The site slopes

gently down to the east towards SW Elwert Road with approximately 40 foot grade change across the site. There is a shallow valley and ridge within this slope.

The properties have been used for various agricultural activities including a Christmas tree farm, tree plantation and row crops. The tax lot in the southeast corner of the site, adjacent to the intersection of SW Elwert and SW Kruger Roads is owned by the City of Sherwood, a portion of which will be used for the road realignment. A 40-foot wide permanent Northwest Natural gas easement zigzags along the western edge of the site, separating the northwest corner of the site from the remainder of the property.

Case History: The Sherwood School District (District) is centered on the city of Sherwood and extends into the surrounding rural area in all directions, including a small area east of I-5, between Wilsonville and Tualatin. The District includes an area of 4.31 square miles and an estimated population of 18,884. The District has seven schools that provide educational services to just over 5,000 students, the majority of which live in the city of Sherwood. The District experienced substantial growth in the late 1990's and early 2000's leading to a community effort in 2005 to determine facility needs. This resulted in the successful 2006 bond measure which included funding for an addition to the current high school to increase capacity to 1,550 students, consistent with phase 1 of the 2006 high school master plan. Current enrollment at the high school is over 1,700 students and projections show over 2,250 students by the 2025-26 school year. In early 2014 the District's Long Range Planning Committee made recommendations to the School Board regarding enrollment and growth challenges, facilities analysis and needs and financing options. In 2015 the District documented the condition and educational adequacy of its facilities, leading to bond visioning and steering committees in 2016. This resulted in the District's voters approving a bond measure in 2016 providing funding for school improvements including construction of a new high school. The District continues to engage the community through a design committee and community input sessions.

Local Government Statement: This UGB major amendment is being considered at the request of the Sherwood School District. The City of Sherwood completed the Sherwood West Preliminary Concept Plan for urban reserve area 5B and submitted a service provider form supporting the school district's application. The school district participated in the concept planning process and the subject site is one of the school locations identified in the preliminary concept plan. Washington County submitted a written statement supporting the application with proposed conditions for Metro to consider. Tualatin Valley Fire and Rescue submitted a written statement supporting the application and Clean Water Services is neutral on the application.

SECTION III: APPLICABLE REVIEW CRITERIA

The criteria for a Major Amendment to the UGB are contained in Metro Code Section 3.07.1425(B, C, D, E, & F) and 3.07.1440 (A & B). The approval criteria appear ***bold 12-pt Aerial Narrow font)***, and the hearings officer's analysis follows.

> ***Metro Code Section 3.07.1440(A) The purpose of the major amendment process is to provide a mechanism to address needs for land that cannot wait until the next analysis of buildable land supply under ORS 197.299. Land may be added to the***

UGB under this section only for the following purposes: public facilities and services, public schools, natural areas, land trades and other non-housing needs;

This code section requires that the applicant show, by substantial evidence in the whole record, that it is an eligible entity allowed to use the interim ORS 197.299 Major Amendment UGB process rather than wait until the next regular Metro UGB amendment cycle (in December, 2018).

Hearings Officer's Analysis: Title 14 of the Metro Code (*i.e.* Metro's Urban Growth Management Functional Plan) includes the Major Amendment process to amend the UGB for a number of specific non-housing needs, including schools and public parks. This process, which is designed to implement ORS 197.299(4), is intended to provide an opportunity to meet these specific land needs outside of the legislative housing needs process the Metro Council conducts on a six-year cycle as required by ORS 197.299(1) and ORS 197.296.

As part of the six-year legislative housing needs process, Metro conducts an inventory of the current residential and employment capacity within the UGB, forecasts population and employment growth over a 20-year timeframe, determines the capacity of the current UGB to accommodate that growth and documents the results of these analyses in an urban growth report. ORS 197.296(6)(a), which is one of the state's needed housing statutes, envisions that local governments with populations over 25,000 will factor in land for schools at the same time as they determine the amount of land needed to be brought in to the UGB for housing. In this regard, the need for land for schools under ORS 197.296(6)(a) is a "derivative need" which is linked to, and dependent upon, a finding that there is a need for land to be brought into the UGB to accommodate an identified housing need. As noted in more detail below, this process has proven to be long, drawn out affair, which is not sensitive to short-term needs. Furthermore, because it is done on a large-scale regional basis, is not always sensitive to more localized school and park needs.

In fact, Metro's most recent urban growth report, adopted in 2015, did not address school and park land needs at the regional level at all. Some school districts anticipate growth, others see declining enrollment and none look out over the 20-year timeframe that the urban growth report considers. Depending on the particular physical, financial and expected growth characteristics of each school district, plans for accommodating projected increases in enrollment vary. Similarly, park districts acquire property and develop park facilities based on numerous operational and funding parameters that can't be considered at the regional level. In addition, it is quite common for school districts and cities to collaborate on opportunities to meet the city's recreation needs as well as the school district's team needs. For these reasons, the Major Amendment process is the appropriate means of addressing specific school district and park needs that can be accommodated through UGB expansions.

Metro has adopted specific criteria to implement ORS 197.299(4). There are two criteria contained in Metro Code section 3.07.1440(A) that are analyzed separately below:

1) The proposal must be for a non-housing need, and

2) The proposal must be intended to meet needs that cannot wait until the next analysis of land supply (December 2018).

There does not appear to any disagreement that the first criterion is met: the applicant proposes to add land to the boundary for a public school and a public facility need, both of which are non-housing needs. The Sherwood School District's Sherwood High School is a "public school" within the meaning of Metro Code Section 3.07.1440(A).

However, whether the applicant has met the second criterion has proven to be more controversial. The applicant addresses its need as follows:

> As of 2015, the Sherwood School District encompasses 4.31 square miles serving a population of approximately 18,884 residents and 5,000 students. The Sherwood School District includes:
> - The City of Sherwood city limits;
> - Portion of the western area of the City of Tualatin (mostly industrial land);
> - Rural Clackamas County (primarily between Sherwood and Wilsonville); and
> - Rural Washington County north and west of Sherwood, as well as a small area east of I-5 between Wilsonville and Tualatin.
>
> To facilitate future planning and to comply with State requirements for a fast-growing school district, the District adopted a long-term facilities plan in January of 2008, which assumed that additional school capacity would therefore likely be needed within ten years of the plan's adoption. As predicted school facilities have recently become overtaxed. In 2015, to assess current resources, the Sherwood School District completed a Facilities Planning and Assessment Report to determine both condition and available capacity. Enrollment based on the most current demographic data and capacity shows that school capacity is near or over capacity at all school levels as shown in Staff Report Attachment 2 (Table 1 in petition).
>
> The School District commissioned Davis Demographics & Planning Inc. to complete an updated 10-year demographic study in May of 2016. The study reviewed the following factors that determine student enrollment: (1) the current and planned residential development over the next ten years; (2) student yield factors that apply to new residential development; (3) birth factors for the District area; and (4) mobility factors, which examine the in/out migration of students within existing housing units. The forecast projects a deficiency in capacity in all levels, with the

high school level having the largest deficiency. Staff Report Attachment 3 (Table 2 in petition) shows 10-year enrollment projections compared with existing school building capacity. The table demonstrates that if no capacity is added (no-build) the school facilities will be far over capacity in 10 years with the Sherwood High School having the largest capacity issue operating at 141% of capacity.

From the updated capacity assessment and demographic data, it became apparent that facilities must be expanded to keep pace with continued student enrollment growth. A Long Range Planning Committee, Bond Steering Committee, Bond Visioning Committee and Sherwood High School Programming Committee were formed to study facility needs. Led by the Bond Management Team, these committees met from 2014 to 2016, making recommendations to the Sherwood School District Board. The process included input from a number of participants from the community including City Council and staff representation, School District staff, architects, civil engineers, financial advisors, business leaders, citizens, parents and students. Throughout this process, the Sherwood City Council was provided with updates and community input was sought via various public outreach methods.

As evidenced by capacity study and demographic growth data, the high school level is where there is the biggest need for additional capacity both now and to a greater extent within 7 to 10 years. Therefore, the Bond Management Team first looked to the existing high school campus for opportunities for expansion to accommodate this growth. With the conclusion that the existing high school cannot be upsized to meet demand, the District's Bond Management Team began looking for a long-term solution and the School Board, with voter approval, ultimately decided to build a new high school. The new high school is planned to be sized to initially accommodate 2,000 students, but allow for easy expansion to 2,400 students. This size will allow for projected growth over the next 10 years and foreseeable future.

Once a new high school is online, the existing high school building can be repurposed as a consolidated middle school with both existing middle schools (Laurel Ridge and Sherwood Middle) being relocated to the existing high school campus. Once this occurs, the two existing middle schools can be converted to elementary school use to expand needed elementary school capacity. Finally, the proposal allows for Hopkins Elementary School, a building nearing its useful lifespan, to be taken out of

> school service and converted to administrative functions. The existing administrative offices consist of portable buildings in varying locations and with the conversion of Hopkins, office space can be centralized for increased efficiencies.

The primary opponent argues that the applicant has not justified the use of the Major Amendment process instead of waiting until the normally scheduled Metro 2018 UGB expansion. Their attorney states: "Metro's scheduled UGB expansion in 2018 is the appropriate time to analyze the expansion for the proposed high school because more data will be available and the full set of impacts can be analyzed. The delay will also resolve the issues with inadequate notice in the current application." *See* Letter from Jennifer Bragar dated June 6, 2017, at p. 8.

What the opponents appear to be arguing is that this application is premature, and the applicant should wait until 2018 when the 20-year buildable lands analysis will be available. Furthermore, the opponents do believe that the Major Amendment process authorized by ORS 197.299(4)(a)(A) requires the same type and level of analysis required when Metro conducts its periodic legislative housing need analysis required by ORS 197.299(1) and ORS 197.296. The opponent's unstated assumption is that school needs must be evaluated as a derivative need of housing using the ORS 197.296(6) process.

Metro staff weighed in on the debate via a Memorandum dated June 9, 2017, which states, in relevant part:

> Metro's legislative process for reviewing the UGB is guided partially by ORS 197.296. Subsection 197.296(2) directs Metro to demonstrate that there is sufficient buildable land within the UGB to accommodate estimated housing needs for 20 years. A housing need is the only need identified in the statute. ORS 197.296(6) says if the housing need is greater than the capacity of the UGB Metro shall take one or more actions that could include amending the UGB to include sufficient buildable lands to accommodate housing needs for 20 years. Subsection (6)(a) goes on to say that if the UGB was amended to accommodate housing needs for the next 20 years, then the amendment shall include sufficient land reasonably necessary to accommodate the siting of new public school facilities.
>
> The statutory directive to Metro is to include sufficient land for school facilities as part of any UGB expansion that is required to meet a 20-year need for housing. In Metro's most recent analysis of the 20-year housing supply (the 2015 UGR), Metro determined there was sufficient capacity inside the existing UGB to accommodate housing needs; therefore, no corresponding analysis for public school facilities was required.

> Even if the Metro Council had determined there was a need to expand the UGB in 2015 to accommodate a 20-year housing need, there is no certainty that the location where the land would be added to meet the housing need is also a location where a local school district needs additional land to meet its facility needs. Likewise there is no certainty that the specific land needs of a school district are coordinated with the local jurisdictions desire for additional housing. For instance, a UGB expansion adjacent to Hillsboro to meet a regional housing need would not support the Sherwood School District's need for a new high school.
>
> These difficulties arise, in part, from the size of the Metro region and the fact that it consists of 24 individual cities and 17 different school districts. It is important to recognize that the provisions of ORS 197.296(6)(a) regarding planning for accommodation of new school facilities is included in the statutory section that describes the analysis required for all cities in the State of Oregon. While it would not be as difficult for a smaller jurisdiction to coordinate future public school needs with future housing needs in making UGB expansions, that task is much more complicated in the Metro region.
>
> The disconnect in the Metro region between the location of UGB expansions to meet a 20-year housing need and the needs of existing school districts is addressed, in part, by ORS 197.299(4)(a), which is the statute that directs Metro to establish the process being utilized by the Sherwood School District in this proceeding. ORS 197.299(4)(a) requires Metro to allow "off-cycle" UGB expansions as necessary to accommodate a need for land for a public school that cannot reasonably wait.

Given that the opponents have a very different interpretation of the purpose and meaning of ORS 197.299(4) when compared to Metro staff and the applicant, a discussion of statutory interpretation is in order.

A statute is considered "ambiguous" if it is capable of at least two reasonable interpretations. *State v. Tarrence*, 161 Or App 583, 985 P2d 225 (1999); *Kenton Neighborhood Ass'n v. City of Portland and Oregon Waste Systems, Inc.,* 17 Or LUBA 784, 797 (1990) (when code is internally inconsistent, it is ambiguous).[1] If the legislation is unambiguous, local governments and courts are bound to apply the statute in that manner, regardless of how inartful the enactment seems. *Sanchez v. Clatsop County*, 146 Or App 159, 164 n 4, 932 P2d 557 (1997). Stated another way, an unambiguous statute should not be "interpreted." *City of Hillsboro v. Housing Dev'l Corp of Washington County*, 61 Or App 484, 488, 657 P2d 726 (1983). *See GTE*

[1] *See also Fisher v. City of Gresham,* 69 Or App 411, 416, 685 P2d 486 (1984); *McCoy v. Linn County,* 90 Or App 271, 276 nl, 752 P2d 323 (1988).

Northwest, Inc., v. Oregon Public Utility Comm'n, 179 Or App 46, 39 P3d 201 (2002). Rather, unambiguous words should be given their plain, natural, and ordinary meaning. *PGE v. BOLI*, 317 Or at 611.[2]

In this case, the hearings officer believes that the relationship between ORS 197.296 and ORS 197.299 creates sufficient ambiguity to warrant an exercise of statutory interpretation.

Text and Context.

When construing a statute, the court will often first look directly at the text of the statute itself. *See Whipple v. Howser*, 291 Or 475, 635 P2d 782 (1981) (citing *Greyhound Corp. v. Mount Hood Stages, Inc.*, 437 US 322, 330, 98 S Ct 2370, 2375 (1978)). Emphasizing the need to look first to the language of the statute, the *Whipple* court stated:

> "The cardinal rule for the construction of a statute is to ascertain from the language thereof the intent of the law makers as to what the purpose was to be served, or what the objective was designed to be attained."

Whipple, 291 Or at 479 (citing *Swift & Co. and Armour & Cove, Co. v. Peterson,* 192 Or 97, 233 P2d 216 (1951). *See also State of Oregon v. Buck,* 200 Or 87, 92, 262 P2d 495 (1953). The *Whipple* court also cited to *State ex rel. Cox v. Wilson*, 277 Or 747, 562 P2d 172 (1977), in which the court stated:

> "There is, of course, no more persuasive evidence of the purpose of a statute then the words by which the legislature undertook to give impression to its wishes."

Courts do not view the text in a vacuum; they consider the context of the language at issue as well. In fact, the context of the statute is as important to the interpretation as the text. *State v. Webb*, 324 Or 380, 927 P2d 79 (1996); *Friends of Neaback Hill v. City of Philomath*, 139 Or App 39, 48, 911 P2d 350 (1996). *See e.g*., *Shadrin v. Clackamas County*, 34 Or LUBA 154 (1998). In some cases, the court may consider the context before examining the text, in situations where the context "provided perspective on the text." *See Plotkin v. Washington County*, 165 Or App 246, 250, 997 P2d 226 (2000). In this case, consider the two statutes in tandem.

ORS 197.299 provides as follows:

---

[2] *See also OSHU v. Hass*, 325 Or 492, 501, 942 P2d 261 (1997); *Zidell Marine Corp. v. West Painting, Inc.*, 322 Or 347, 906 P2d 809 (1995); *State v. Langley*, 314 Or 247, 256, 839 P2d 692 (1992); *Curly's Dairy, Inc. v. State Dept of Agriculture*, 244 Or 15, 415 P2d 740 (1966) (If statute is clear and unambiguous, the court may not resort to rules of statutory construction in ascertaining and declaring the legislative intent.); *Sullivan v. City of Ashland*, 130 Or App 480, 882 P2d 633, *rev den*, 320 Or 453, 887 P2d 792 (1994) (An unambiguous code provision cannot be interpreted, even if that provision is contrary to the express purposes of the provision.); *City of Portland v. White*, 61 Or App 120, 655 P2d 629 (1982).

197.299 Metropolitan service district analysis of buildable land supply; schedule for accommodating needed housing; need for land for school; extension of schedule.

(1) A metropolitan service district organized under ORS chapter 268 shall complete the inventory, determination and analysis required under ORS 197.296(3) not later than six years after completion of the previous inventory, determination and analysis.

(2)(a) The metropolitan service district shall take such action as necessary under ORS 197.296(6)(a) to accommodate one-half of a 20-year buildable land supply determined under ORS 197.296 (3) within one year of completing the analysis.

(b) The metropolitan service district shall take all final action under ORS 197.296(6)(a) necessary to accommodate a 20-year buildable land supply determined under ORS 197.296 (3) within two years of completing the analysis.

(c) The metropolitan service district shall take action under ORS 197.296(6)(b), within one year after the analysis required under ORS 197.296(3)(b) is completed, to provide sufficient buildable land within the urban growth boundary to accommodate the estimated housing needs for 20 years from the time the actions are completed. The metropolitan service district shall consider and adopt new measures that the governing body deems appropriate under ORS 197.296 (6)(b).

(3) The Land Conservation and Development Commission may grant an extension to the time limits of subsection (2) of this section if the Director of the Department of Land Conservation and Development determines that the metropolitan service district has provided good cause for failing to meet the time limits.

(4)(a) The metropolitan service district shall establish a process to expand the urban growth boundary to accommodate a need for land for a public school that cannot reasonably be accommodated within the existing urban growth boundary. The metropolitan service district shall design the process to:

(A) Accommodate a need that must be accommodated between periodic analyses of urban growth boundary capacity required by subsection (1) of this section; and

(B) Provide for a final decision on a proposal to expand the urban growth boundary within four months after submission of a complete application by a large school district as defined in ORS 195.110.

(b) At the request of a large school district, the metropolitan service district shall assist the large school district to identify school sites required by the school facility planning process described in ORS 195.110. A need for a public school is a specific type of identified land need under ORS 197.298 (3). [1997 c.763 §2; 2001 c.908 §2; 2005 c.590 §1; 2007 c.579 §2; 2014 c.92 §5]

As quoted above, ORS 197.299(1) cross-references ORS 197.296(3), which, in term, cross-references to ORS 197.296(2). These two statutes together set forth a process for evaluating and accommodating housing needs:

> ***(2) At periodic review pursuant to ORS 197.628 to 197.651 or at any other legislative review of the comprehensive plan or regional framework plan that concerns the urban growth boundary and requires the application of a statewide planning goal relating to buildable lands for residential use, a local government shall demonstrate that its comprehensive plan or regional framework plan provides sufficient buildable lands within the urban growth boundary established pursuant to statewide planning goals to accommodate estimated housing needs for 20 years. The 20-year period shall commence on the date initially scheduled for completion of the periodic or legislative review.***
>
> ***(3) In performing the duties under subsection (2) of this section, a local government shall:***
>
> ***(a) Inventory the supply of buildable lands within the urban growth boundary and determine the housing capacity of the buildable lands; and***
>
> ***(b) Conduct an analysis of housing need by type and density range, in accordance with ORS 197.303 and statewide planning goals and rules relating to housing, to determine the number of units and amount of land needed for each needed housing type for the next 20 years.*** (Underlined emphasis added).

As the underlined language indicates, ORS 197.296 is a statute narrowly-tailored towards the process used to establish and fulfill an identified *housing* need. It is an expansion of the basic concepts set forth in Statewide Planning Goal 10, but it goes beyond Goal 10 in scope.

As part of that process, the effect of ORS 197.296(6) should also be considered as context:

> ***(6) If the housing need determined pursuant to subsection (3)(b) of this section is greater than the housing capacity determined pursuant to subsection (3)(a) of this section, the local government shall take one or more of the following actions to accommodate the additional housing need:***
>
> ***(a) Amend its urban growth boundary to include sufficient buildable lands to accommodate housing needs for the next 20 years. As part of this process, the local government shall consider the effects of measures taken pursuant to paragraph (b) of this subsection. The amendment shall include sufficient land reasonably necessary to accommodate the siting of new public school facilities. The need and inclusion of lands for new public school facilities shall be a coordinated process between the affected public school***

districts and the local government that has the authority to approve the urban growth boundary;

(b) Amend its comprehensive plan, regional framework plan, functional plan or land use regulations to include new measures that demonstrably increase the likelihood that residential development will occur at densities sufficient to accommodate housing needs for the next 20 years without expansion of the urban growth boundary. A local government or metropolitan service district that takes this action shall monitor and record the level of development activity and development density by housing type following the date of the adoption of the new measures; or

(c) Adopt a combination of the actions described in paragraphs (a) and (b) of this subsection.

A few key points can be quickly gleaned from ORS 197.296. First, by its terms, ORS 197.296(2) only applies to periodic review or another "*legislative* review of the [.. .] regional framework plan that concerns the urban growth boundary and requires the application of a statewide planning goal relating to buildable lands for residential use. " This Major Amendment application is not periodic review and is also not a legislative review of Metro's regional framework plan, *i.e.*, the every six-year UGB amendment cycle. The Major Amendment application is subject to a quasi-judicial process and will result in a quasi-judicial decision by the Metro Council.

Strawberry Hill 4 Wheelers v. Board of Comm'rs sets out a list of factors to be weighed to determine whether a land use decision is legislative or quasi-judicial. 287 Or 591, 602-603, 601 P2d 769 (1979). Under *Strawberry Hills,* the Major Amendment is quasi-judicial because (a) the application process is bound to result in a decision, (b) the decision must apply pre-existing criteria to concrete facts, and (c) the action is directed at a closely circumscribed factual situation.

With regard to the first question, the *Strawberry Hills 4-Wheelers* Court asks practitioners to consider the following question: "Does the statute require the [local government] to reach a decision after the hearing, as in an adjudication, or may it indefinitely postpone or abandon the issue, like a legislative proposal?" 287 Or at 605. At first glance, one might assume that any land use decision that originates from an application being submitted (as opposed to be initiated by the local government itself) would be "bound to result in a decision." Indeed, that seems to have been the original intent of the *Strawberry Hill* Court. However, over the years LUBA and the Court of Appeals have increasingly read this factor more and more narrowly and will only find that that a decision is "bound to result in a decision" if the code either expressly requires a decision to be made, or if that requirement can be fairly read into the language of the code based on the context. *Estate of Gold v. City of Portland*, 87 Or App 45, 48, 740 P2d 812 (1987) ("the statute simply says that the governing body *may* approve the proposal, not that it *must* do anything."); *Johnson v. City of La Grande*, 37 Or LUBA at 388; *Valerio v. Union County*, 33 Or LUBA 604 (1997); *Miner v. Clatsop County*, 46 Or LUBA 467 (2004). In some cases, LUBA has not been as exacting in its analysis, holding that although the code did not:

> "expressly state that once a person requests an interpretation of a provision of the city's zoning ordinance that the person is entitled to a decision. We believe, however, that any reasonable person reading this ordinance would conclude that if a person requested an interpretation from the planning director, received that interpretation and then appealed the interpretation to the planning commission and to the city council, the person filing the appeal would be entitled to a decision from the city council."

Hoffman Ind. Inc. v. City of Beaverton, 2 Or LUBA 411 (1981); *Dean v. City of Oakland*, 33 Or LUBA 806, 809 (1997)("While the cited policy does not require a decision within a specified time, the most natural reading of its terms requires a decision.") The fact that any given ordinance in question states that the decision-maker "may" make a decision should not be a fact which is determined to be indicative of a legislative decision, but unfortunately, in practice it is just that. In this regard, the statute at issue in *Strawberry Hill* did not expressly require that a decision be made. However, the Supreme Court found no difficulty in concluding that "although affirmative action is optional, the statute appears to contemplate that the County Court will *eventually* reach and pronounce some decision whether to act or not. *Id*. at 606. (Emphasis added).

In this case, the MC 3.07.1440(g) requires the Metro Council to make a final decision on the petition. Therefore, this factor suggests that the decision is quasi-judicial.

The second of the *Strawberry Hill* questions has, in practice, become somewhat of a non-factor. Both LUBA and the Court of Appeals have recognized that all land use decisions in Oregon are subject to "preexisting criteria" and apply to concrete facts. LUBA has addressed this issue as follows:

> Turning to the "apply existing criteria to concrete facts" factor, that factor is present to some extent in all land use decisions. *Valerio*, 33 Or LUBA at 607. This factor is therefore less important than the other two factors, particularly where, as is the case here, the decisions are adopting new land use laws rather than applying existing land use laws to grant land use approval for a single property or a small number of properties. *Churchill v. Tillamook County*, 29 Or LUBA 68, 71 (1995); *McInnis v. City of Portland*, 27 Or LUBA 1, 5-7 (1994).

Carver v. Deschutes County, 58 Or LUBA 323 (2009). *See also Casey Jones Well Drilling, Inc. v. City of Lowell*, 34 Or LUBA 263, 271 (1998); *Johnson v. Jefferson Country*, 56 Or LUBA 72 (2008). In this case, the MC 3.07.1440 sets forth criteria for a Major Amendment to a UGB. Therefore, this factor suggests that the decision at issue is quasi-judicial.

Under the third factor, LUBA and the Courts are supposed to assess whether the decision either (1) affects either a small number of owners and properties or (2) the "action directed at a closely circumscribed factual situation," or whether the decision has more broad

applicability. According to early decisions by the Court of Appeals, "the number of people affected and the size of the area covered are less important considerations," and the focus should instead be on "the importance of assuring that the decision is factually correct and that the decision-maker gives fair attention to affected individuals." *1000 Friends of Oregon v. Wasco Co. Court*, 80 Or App 532, 536, 723 P2d 1034 (1986), *rev'd on other grounds*, 304 Or 76, 742 P2d 39 (1987). In practice, this third bean-counting "factor" has become the most critical issue to LUBA, and, despite suggestions to the contrary, in most cases it is more-or-less the dispositive factor. In fact, LUBA has found decisions to be legislative even when the other two factors favored a determination that a decision was quasi-judicial. *Davenport v. City of Tigard*, 22 Or LUBA 577 (1992).

In this case, the proposal involves 82 acres consisting of four tax lots in unknown ownerships. This is well within the size and ownership limits that would allow the conclusion that the decision is quasi-judicial.

The primary opponent argues that this Major Amendment is a "legislative decision," The primary opponent states that "[t]he decision amends the Metro Boundary map that is incorporated into the Metro Urban Growth Functional Plan, and as such the change is legislative." *See* Letter from Jennifer Brager dated June 23, 2017 at p. 1. However, map amendments are not necessarily or inherently legislative or quasi-judicial in nature. *Compare Thomas v. City of Veneta*, 44 Or LUBA 5 (2003) (TSP and zoning map amendment affecting two tax lots comprising 6.4 acres); *Dan Giles & Assoc., Inc. v. McIver*, 113 Or App 1, 3, 831 P2d 1024 (1992)(zone change for single 29-acre parcel in unified ownership is quasi-judicial); *Neuberger v. City of Portland*, 288 Or 155, 603 P2d 771 (1979) (re-zoning involving 601 acres of land owned by three landowners is quasi-judicial).[3] *Contrast Valerio v. Union County*, 33 Or LUBA 604 (1997) (comprehensive plan amendment and zone change pertaining to 185 acres in a "number of different ownerships" is legislative); *Friends of Cedar Mill v. Washington County*, 28 Or LUBA 477 (1995) (PAPA relocating arterial and changing it from 5 lanes to 3 lanes is legislative, where it affects 40 properties and will carry 17,000 – 18,000 trips per day.); *McInnis v. City of Portland*, 27 Or LUBA 1 (1994) (Proposal which rezones 5000 acres in 110 different ownerships is legislative.); *Davenport v. City of Tigard*, 22 Or LUBA 577 (1992) (Transportation plan map amendment that directly involves nine property owners, but has "indirect effects" on a broader population is legislative). Nor is a UGB amendment inherently legislative in nature. *BenjFran Development, Inc. v. Metro*, 17 Or LUBA 30 (1988) (denial of request for UGB amendment comprising almost 500 acres in three ownerships is quasi-judical).

Cases such as *Davenport* and *Friends of Cedar Mill* suggest that large transportation projects will be considered legislative due to the broad secondary effects that transportation facilities can have on commuters. The hearings officer does not believe that this line of cases can be extended to a school, however, based simply on the fact that many kids will attend the school. If that were the case, then any land use decision involving a Wal-Mart or Home Depot store would be legislative, because those uses have higher usage / trip generation rates than a typical school.

[3] *See Neuberger v. City of Portland*, 37 Or App 13 (1978), *rev'd in part, aff'd in part*, 288 Or 155, 603 P2d 771 (1979).

Opponent's counsel cites *Colwell v. Washington County*, 79 Or App 82, 87-8 (1986) for the proposition that this Major Amendment is a legislative (and not a quasi-judicial) decision (*see* Bragar letter dated 23 June 2017, pp 1-2). *Colwell* does not support that conclusion, and is easily distinguished. In *Colwell,* the Washington County Planning Commission made a land use decision which opponents wished to appeal to the Board of Commissioners, but their appeal was dismissed for failure to timely pay for the quasi-judicial Planning Commission hearing transcript. *Colwell*, 79 Or App at 85. Opponents appealed to the LUBA, which dismissed the appeal for failure to exhaust remedies at the local (County) level. The Oregon Court of Appeals reversed and remanded, finding that the Washington County governing body (*i.e.* the elected Board of County Commissioners) - and not the unelected County Planning Commission - must make Comprehensive Plan amendments, pursuant to ORS 215.050(1) and ORS 215.060.

Opponent's argument might have some merit if this unelected hearings officer was the one to make the final decision on this Major Amendment land use application. Only the elected Metro Council has that authority, however. This hearings officer's findings and determination are merely a recommendation to the Metro Council, and the Council is free to accept or reject this Hearings officer's decision, as the Council sees fit. Since the Metro Council will be the governmental body to make the final land use decision in this case, the Court of Appeals' holding in *Colwell* shall be followed for this application.

Despite the lengthy analysis set forth above, the hearings officer does not really believe that the quasi-judicial vs. legislative debate is dispositive, in any event. Rather, it is a red herring. Stated another way, the hearings officer does not believe that ORS 196.296 would apply to this UGB Amendment even it was a legislative decision. By its terms, ORS 197.296 only applies to UGB amendments that "require the application of a statewide planning goal relating to buildable lands for residential use." As discussed elsewhere in this recommendation, an amendment to a UGB which adds AF-20 zoned land for use as a school does not implicate Goal 10 in any meaningful way .

Second, ORS 197.296 sets forth a mandatory periodic process that is focused on only one type of land need: a need for housing. We can credit the Home Builder Association for being active in the legislature over the past 30+ years and influencing the adoption of specific statutory language, such as ORS 197.296, which relates specifically to their industry. But we should also not lose sight of the fact that there are other types of land need under Goal 14 that don't implicate ORS 197.296.

Taking a step back, recall that Goal 14 states that a UGB amendment must be based on consideration of six factors set forth in the Goal. The first two factors are commonly referred to as the "need" factors. The need factors require either a demonstrated need to accommodate long range urban population, consistent with a 20-year population forecast coordinated with affected local governments, <u>or</u> a demonstrated need for housing, employment opportunities, livability or uses such as public facilities, streets and roads, schools, parks or open space, or any combination of the need categories. While the need for housing is governed by ORS 197.296, other land needs are governed by Statewide Planning Goal 14, and in some cases, by OAR Ch. 660, Div 24. Note, as an example, that OAR Ch. 660, Div. 24 does not address now a livability need is established; Goal 14 seems to be the sole administrative pronouncement of its use. What is important to understand for purposes of this case is that ORS 197.296 is not the sole way to

establish land need, and a school need is not limited to being established as a derivative need of housing under ORS 197.296(6).

Among the more common types of land need mentioned in Goal 14 include a need for employment land, a need for public facilities, a need for schools, a need for parks, and the amorphous catch-all known as a "livability need."[4] With one exception related to public schools, ORS 197.296 does not govern substantively how these other types of land needs are established. Nor does it establish a *process* by which those other needs are established. Rather, ORS 197.296(2) & (3) are narrowly focused on accommodating a housing need, and as shown below, accommodating land for public schools as a derivative need stemming from housing need.

Consider ORS 197.296(6) as context: this statute applies when a local government is undertaking periodic review or a legislative review of a UGB that implicates Goal 10. If during such a process, the local government determines that a need exists for additional residential land and that accommodating that land need must necessarily involves a UGB amendment, then ORS 197.296(6)(a) requires that local government to "include sufficient land reasonably necessary to accommodate the siting of new public school facilities." Thus, under that process, a public school facility is considered a derivative need that arises by operation of a demonstrated need for housing. However, there is nothing in ORS 197.296(6) that makes ORS 197.296 the exclusive process by which a need for schools can be established. As demonstrated by the applicant a need for new school facilities can exist independent of housing needs. And while the primary opponent chalks up the applicant's current need to poor planning on the District's part (a sentiment that may have some basis in fact), ORS 197.299(4) appears to written as a safety value that can be used by school districts regardless of the causes that led to the need.

ORS 197.299(4)(a)(A) provides additional key textual clues which helps understand the nature of the process currently being undertaken. This provision authorizes Metro to "establish" and "design" a "process" that will fulfill a need that must be accommodated "*between*" periodic analyses of urban growth boundary capacity required by subsection (1) of this section." By giving Metro the authority to "establish" and "design" a unique UGB amendment process for schools, the statute makes clear that the school need specific "4(a)" process is not the *same* process as the legislative six-year process required by ORS 197.299(1) and 197.296(3). The ORS 197.296 process is already "established" and "designed" by statute, and really only puts a regional government much as Metro in an implementation role. On the other hand, ORS 197.299 delegates to Metro a role that is greater than mere implementation of a pre-existing process. Furthermore, ORS 197.299(4)(a)(4) further emphasizes that the school-specific process is only supposed to be used "between" the 6-year legislatively-mandated processes for accommodating housing needs, and it can only be invoked if the identified school need cannot wait until the next scheduled six-year legislative process.

[4] LUBA cases confirm that a need to improve livability can provide a basis for adding land to a UGB. Such an analysis requires, in addition to identifying a significant livability problem, an evaluation of probable and negative impacts on livability that may occur if the UGB is amended, and an explanation of why the livability benefits outweigh negative impacts on livability. *1000 Friend of Oregon v. City of North Plains,* 27 Or LUBA 372, 383, *aff'd.,* 130 Or App 406 (1994); *1000 Friends of Oregon v. Metro Service Dist*., 18 Or LUBA 311, 320 (1989).

The gravamen of opponents' complaints with respect to ORS 197.299(4) stem from a misunderstanding of the relationship between the ORS 197.299(1) six-year UGB amendment process with the ORS 197.299(4) public school amendment process. Much of opponent counsel's testimony at the June 13, 2017, hearing and again in her June 23, 2017 letter, was directed generally at a dissatisfaction with how Metro plans for regional housing and employment needs and opponents' opinion that allowing out-of-cycle UGB expansions for public schools exacerbates Metro's alleged poor planning. In its June 23, 2017 letter, opponents argued that this Major Amendment application does not meet the requirements of ORS 197.296(2).

At its core, the opponent's argument hinges on the assumption that the school-specific process must be substantively the same as the periodic six-year legislative process. Stated another way, the opponents argue that the substantive standards and criteria that govern the school specific process are the same as the housing-specific legislative process under which school need can be established as a derivative need. However, if that were truly the case, however, there would be no need for Metro to "establish" and "design" a new process. Rather, if the legislative intent was to mandate the same rigorous process that is used to establish housing need and to otherwise limit school need as a derivative need, the legislature would have simply stated that a school-related need can form the basis for accelerating the time frame under which the legislative housing need process is conducted. And that in itself does not make any sense because nothing in ORS 197.299(1) or ORS 197.296 prohibits Metro from conducting the legislative housing-needs process sooner than on a 6-year increment. In fact, ORS 197.299(1) merely states that Metro must undertake the ORS 197.296 process "*not later than six years after completion of the previous inventory, determination and analysis."* In theory, Metro could voluntarily conduct that inventory and analysis on a bi-annual or other timeline. In light of this observation, ORS 197.299(4) would be a redundancy if interpreted in the manner that the primary opponent advocates.

Courts strive to give effect to all parts of a statute, in order to produce a harmonious whole. ORS 174.010.[5] As a corollary, courts will avoid interpretations that render a portion of the statute redundant or meaningless surplusage.[6] *See State v. Stamper,* 197 Or.App. 413, 418, 106 P.3d 172, *rev. den.,* 339 Or. 230, 119 P.3d 790 (2005) ("we assume that the legislature did not intend any portion of its enactments to be meaningless surplusage"). If the school-specific process were not a separate process governed by different substantive criteria than ORS 197.296, it would not accomplish anything that Metro did not already have the right to do.

Rather than being drafted as an authorization to conduct the existing six-year legislative housing needs process at any time increment earlier than six years if a need exists that cannot wait six years, ORS 197.299(4)(a)(A) contemplates a *new* process *designed* by Metro to cater to

---

[5] *Lane County v. LCDC*, 325 Or 569, 578, 942 P2d 278 (1997); *Bolt v. Influence, Inc.,* 333 Or. 572, 581, 43 P.3d 425 (2002) ("we are to construe multiple provisions, if possible, in a manner that will give effect to all"). *See also Davis v. Wasco IED*, 286 Or 261, 267, 593 P2d 1152 (1979); *Tatum v. Clackamas County*, 19 Or App 770, 775, 529 P2d 393 (1974); *Plotkin v. Washington County*, 36 Or LUBA 378 (1996); *Walz v. Polk County*, 31 Or LUBA 363 (1996); *Fechtig v. City of Albany*, 31 Or LUBA 410 (1996) (Ordinance).

[6] *Certain Underwriters at Lloyd's London and Excess Ins. Co., Ltd. v. Massachusetts Bonding and Ins. Co*., 235 Or.App. 99, 230 P.3d 103 (2010); *State v. Stamper,* 197 Or.App. 413, 417, 106 P.3d 172, *rev. den.,* 339 Or. 230, 119 P.3d 790 (2005); *EQC v. City of Coos Bay,* 171 Or.App. 106, 110, 14 P.3d 649 (2000).

school needs as a primary independent need, not as a secondary derivative need resulting from a housing need. Because it is a different process that is intended to evaluate a needs other than a housing needs, the process and requirements (*i.e.* inventory, determination, and analysis) of ORS 197.296 do not apply to this separate process. And discussed below, the legislative history confirms this analysis.

Legislative History

Prior to 2001, the case of *Portland Gen. Elec. Co. v. Bureau of Labor & Indus.,* 317 Or 606, 611–612, 859 P2d 1143 (1993) (hereinafter *PGE*) made clear that legislative history could not be used to determine legislative intent if the text and context of the law made the meaning of that law unambiguous. The case of *State v. Gaines,* 346 Or 160, 171–172, 206 P3d 1042 (2009) essentially acknowledges that the *PGE v. BOLI* approach was legislatively modified in 2001 via amendments to ORS 174.020, and that the statute now permits the consideration of legislative history even when the text and context seem to make the meaning unambiguous. For this reason, a careful treatment of *Gaines* is warranted here.

The OSB publication entitled "Interpreting Oregon Statutes" Steve Johansen, Hon. Jack Landau, and Anne Villella ed. OSB CLE (2009) contains a lengthy but highly relevant discussion of *Gaines,* as follows:

> In *Gaines,* the defendant was convicted of obstructing governmental administration when she refused to cooperate in being photographed after her arrest. On appeal, she argued that her behavior did not constitute a "'means of . . . physical . . . interference or obstacle' "within the meaning of the relevant statute. *Gaines,* 346 Or at 162 (quoting ORS 162.235(1)). She argued further that the 2001 amendments to ORS 174.020 required the court to consider the legislative history of ORS 162.235(1) along with the text and context of the statute, even if the court found that its analysis of the text and context did not render the legislative intent ambiguous. *Gaines,* 346 Or at 165. Interestingly, in assessing the meaning of the 2001 amendments to ORS 174.020, the court found that a text-and-context analysis suggested that the amendments did not significantly change the *PGE* standard. *Gaines,* 346 Or at 166. However, the court did not stop its analysis at the text-and-context level. As the plaintiff argued that ORS 174.020 required, the court went on to examine the legislative history. The legislative history revealed a clear legislative intent to eliminate the requirement that a court only look to legislative history "if but only if" the text and context left the meaning ambiguous. *Gaines,* 346 Or at 169.
>
> * * * * *.

> The court will now consider proffered legislative history even when the text and context of a statute appear to render it unambiguous. In effect, *Gaines* brings legislative history into the step-one analysis along with the text and context of a statute. That said, legislative history remains a second step of statutory analysis—the court will consider it only after analyzing the text and context of a statute. The weight the court gives that legislative history also remains within the discretion of the court. A party attempting to overcome seemingly plain and unambiguous text through reference to legislative history has "a difficult task before it." *Gaines,* 346 Or at 172.

Although *Gaines* modifies the *PGE* methodology, the full extent of that modification remains to be seen. However, a recent appellate court decision suggests the extent may be relatively slight. *State v. Kelly,* 229 Or App 461, 211 P3d 932 (2009). *Kelly* raised the issue of the meaning of ORS 811.335(1)(b), which requires drivers to signal a turn "during not less than the last 100 feet traveled by the vehicle before turning." The defendant, who signaled a turn after he had stopped at an intersection, argued that the legislative history showed that the intent of the statute was to require a signal for at least as long as it took to travel the last 100 feet, but not to signal for the specified distance. The court agreed that under *Gaines* it needed to consider the legislative history. The court also made several points as to what weight it would give that legislative history.

The court first made clear that legislative history alone cannot overcome statutory text that is truly capable of only one interpretation. *Kelly,* 229 Or App at 466. Beyond that caution, the court explained the traditional limits of legislative history: legislative history is most helpful when it uncovers the general legislative intent of a statute (*Kelly,* 299 Or App at 466); statements of single legislators or non-legislators are generally, though not always, less helpful (*Kelly,* 299 Or App at 466–467), and the existence of a particular problem that precipitated a bill does not necessarily mean the statute was intended to address only that problem (*Kelly,* 299 Or App at 468). What *Kelly* does not suggest is that *Gaines* changes in any significant way *how* courts use legislative history. Rather, it only changes *when* the court will consider legislative history. Thus, even under *Gaines,* legislative history will be most helpful when an analysis of the text and context does not resolve an ambiguity of the statute. Legislative history may also be useful to reinforce an apparently unambiguous interpretation of a statute. (Emphasis added).

Courts are not likely to be persuaded by legislative history when that history does not give any indication that the precise legal question at issue was considered during the legislative enactment.[7]

The subsection in question, subsection 4, was added to ORS 197.299 in 2005 as part of Senate Bill 1032. Testimony at legislative committee hearings from bill authors and proponents indicates SB 1032 was intended to grant Metro new expedited authority to expand the UGB for the purpose of allowing construction of new schools, and such a process would be separate from the "normal" UGB expansion process typically required by state statutes.

Testimony of several speakers during the May 17, 2005 public hearing provide insight regarding the policy goals behind SB 1032. The main speaker, Gary Conkling, represented the Beaverton School District and was one of the authors of the bill. Mr. Conkling began his testimony in favor of the bill by outlining the pressing problems that face the city of Beaverton. He stated that "in the last decade or so the Beaverton School District has added more than ten thousand students" and that those students alone would make up the fifteenth largest school district in the state.[8]

Mr. Conkling explained that overabundance problems are common in the metropolitan areas of Portland, and most suitable plots of land for schools have been used for other projects intended to spur economic development. Mr. Conkling "anticipate[d] [Beaverton] will have to look outside the UGB for one or more additional school sites" to meet the growing demand. He ended his testimony by stating two main objectives of SB 1032. First, the bill is designed to gain "guidance from Metro, cities, and urban service providers as to where we should look outside the UGB" for suitable plots of land for schools. Second, the bill has language that "will encourage Metro to provide an accelerated process to add those lands once . . . the need has been established . . . so that lands can be added on an accelerated basis to the UGB."[9]

Metro Legislative Affairs Director Randy Tucker, a second advocate of SB 1032, added some additional points regarding the purpose and scope of the bill. Mr. Tucker explained that developing lands for schools requires additional planning considerations than developing lands for other purposes because schools must be located in particular locations. These additional considerations include that ideally, schools should be located near city centers, and schools must fall within existing school district boundaries. This makes it even more difficult to find suitable land for new school construction without expanding the UGB.

---

[7] For example, the court often dispense with legislative history in one sentence by stating simply that the legislative history is silent on the particular issue facing the court. *Ritcherson v. State,* 131 Or App 183, 186, 884 P2d 554 (1994) (seeking to determine if ORS 138.510(2) included retroactive application of its two-year statute of limitations period); *see also Windsor Ins. Co. v. Judd,* 321 Or 379, 387, 898 P2d 761 (1995) ("[W]hat little [discussion of the amendment] there was reveals nothing that sheds light directly on the question posed in this case."); *State v. Holloway,* 138 Or App 260, 267, 908 P2d 324 (1995) ("Unfortunately, our examination of the legislative history sheds no light on the matter."); *In Def. of Animals v. Or. Health Scis. Univ.,* 199 Or App 160, 173 n 9, 112 P3d 336 (2005) ("We note that the legislative history . . . provides no assistance in determining the provision's meaning.").

[8] Hearing on S.B. 1032 Before the S. Comm. on Environment & Land Use, 2005 Leg., 73rd Assemb., Reg. Sess. (Or. 2005) (statement of Gary Conkling, Representative of Beaverton School District).

[9] *Id.*

Finally, Mr. Tucker added that Metro intended to implement SB 1032 by amending its own code to make it easier to expand the UGB for schools "when [new schools] cannot be reasonably accommodated in the UGB, and when they must be accommodated before we would normally do an UGB expansion." Here, Mr. Tucker indicated that Metro should be authorized to quickly initiate UGB expansion for schools outside of the "typical" or "normal" legislative process of reevaluating the buildable land supply inside the UGB every [six] years.

Later, in a May 31, 2005 work session on SB 1032, Messrs. Conkling and Tucker again provided testimony in support of the bill and explained its purpose and scope. Mr. Conkling stated the bill's main purpose is to provide Metro "[with a] process that can work in between its periodic review, and provide for an accelerated process to bring these school sites inside the UGB."

After the testimony of Mr. Tucker, Senator Charlie Ringo, Chair of the Committee, asked if the bill will "facilitate Metro addressing the problem with high growth districts not finding land for schools."[10] Mr. Tucker stated his answer was yes, and that the bill would provide the basis for immediate negotiation as to what land should be included in the UGB as part of an amendment. Mr. Tucker explained that the bill would be beneficial to districts like Beaverton because "it facilitates the process for expanding the UGB for a school district that has need." Mr. Tucker stated that ideally, after revising the Metro code to implement the statute, the process to expand the UGB to include land for a school would take only four months.

The legislative history of HB 1032 indicates that one main purpose of the bill was to streamline the process for amending the UGB for the purpose of building new schools. The testimony of both Conkling and Tucker describe a pressing need for land in metropolitan areas for new school construction that cannot always be met within the typical five-year UGB cycle. Proponents of the bill clearly express intent to grant Metro authority to amend the UGB through a process that would be separate from the regular review cycle and corresponding 20-year need analysis.

Proponents of the bill used words such as "streamline" and "accelerated" in the context of a new expansion process that could occur outside and separate from the "normal" time intensive 20-year need analysis, and described a process that would be based exclusively on a demonstrated need for additional school facilities. Testimony regarding the purpose of SB 1032 indicates that the purpose of the legislation was to allow a separate and expedited process exclusively for school siting, which would not be tied to the 20-year buildable land supply analysis that is required under ORS 197.296.

As described above, it is clear from legislative history that the 2005 Oregon legislature was acutely aware of the problem of holding school districts to a six year Metro planning cycle during the enactment of SB 1032. Metro's Randy Tucker specifically stated that SB1032

[10] Work Session on S.B. 1032 Before the S. Comm. on Environment & Land Use, 2005 Leg., 73rd Assemb., Reg. Sess. (Or. 2005) (statement of Sen. Charlie Ringo, Chair, S. Comm. on Environment & Land Use).

"facilitated" school districts obtaining a UGB amendment for school facilities.[11] According to the Merriam-Webster dictionary, the word "facilitate" means "to make (an action or process) easy or easier." It makes little sense to believe that the legislature would desire to make obtaining a Metro UGB amendment *just as, or even more difficult* for schools while simultaneously creating an "accelerated" process specifically for schools. Indeed, Metro's own Legislative Affairs Director – no stranger to tightly-crafted statutory language - was quite clear in stating that the purpose of SB 1032 was to "facilitate" (that is, make easier) the process for Metro-area schools.

In addition, the hearings officer finds that the ORS 197.299's school-specific UGB amendment process is no less thorough or exacting than an application that could have been filed in due course of the next six-year Metro planning cycle. It is true, as opponents claim, that the next Metro 20-year buildable lands analysis is not yet available, and thus cannot be taken into account during this application. The law does not require that, however, and requiring school applicants to wait until the next six-year Metro planning cycle would render the passage of ORS 197.299 pointless. The entire point of ORS 197.299 was to provide schools with an interim, accelerated, easier ("facilitated") application process, rather than waiting for the next 6 year Metro planning cycle. Statutes should not be construed such that they make other statutes completely meaningless.

As noted above, the Metro Council is required to complete a 20-year forecast and analysis of land need to maintain a 20-year supply of residential and employment land inside the UGB on a six-year cycle. However the Metro Council has directed staff to complete an urban growth report in 2018, three years after the urban growth report was adopted in 2015, with a possible growth management decision occurring in December 2018 that may or may not result in an expansion of the UGB. Delaying the proposed amendment for these specific school and park needs until that time, when these types of specific needs are not addressed in the regional analysis, is not an appropriate or an efficient way to provide these needed services and would result in the District experiencing ever-increasing overcrowding of their facilities.

Thus, in summary, review of the text and context of ORS 197.299 and ORS 197.296 in combination with the legislative history of the 2005 Amendments which created ORS 197.299(4) bring the legislative intent into clear focus. ORS 197.299(4) explicitly provides a "safety valve" of sorts for public school needs. The statute de-couples the need for schools from the derivative secondary needs analysis set forth in ORS 197.296(6). The legislature apparently understood the critical nature of schools to serve the community and felt strongly enough about that to provide a mechanism to ensure that needed schools can be built. Opponents' attempt to saddle Major Amendments with all of the trappings of a six-year legislative review of the region's UGB is contrary to both the plain text of ORS 197.299(4) and its legislative history.

Having resolved the statutory interpretation question, we turn back to the evidence of need. The District originally adopted a long-term facilities plan in January 2008 that assumed additional school capacity would be needed in ten years. This proved true, as of 2017 the high

[11] Testimony before the Senate Environment and land Use Committee, May 31, 2005, beginning at minute 1.13, available at http://records.sos.state.or.us/webdrawer/webdrawer.dll/webdrawer/rec/4193397/ Mr. Tucker's statement is found at minute 1.18, in response to a question from Senator Ginnie Burdick.

school is at 109% of capacity and the four elementary schools are at 99% capacity. A ten-year demographic study by Davis Demographics & Planning Inc., completed in May 2016, forecasted a deficit in capacity at all levels with the high school operating at 141% of capacity. In order to meet the growing need, the District determined, with the assistance of numerous committees, that a new high school would be needed. Voters approved a bond measure in 2016 to construct a new high school and make other facility improvements. The applicant adequately addressed the urgent need for the new high school by substantial evidence in the whole record in its application submittal and its subsequent submittals. (*See* application narrative ("Narrative") at 14-15, 33, Appendices G, H, and I; June 8, 2017, District letter at 1-3, Attachment i; June 13, 2017, District letter at 5.)

The applicant has met its burden of showing compliance of the two criteria found in Metro Code section 3.07.1440(A) by substantial evidence in the whole record.

Metro Code Section 3.07.1440(B)

> **3.07.1440 Major Amendments - Criteria**
> **(b) The applicant shall demonstrate that the proposed amendment to the UGB will provide for an orderly and efficient transition from rural to urban land use and complies with the criteria and factors in subsections (b), (c), (d), (e), and (f) of section 3.07.1425. The applicant shall also demonstrate that: (1) The proposed uses of the subject land would be compatible, or through measures can be made compatible, with uses of adjacent land; (2) If the amendment would add land for public school facilities, the coordination required by subsection (c)(5) of section 3.07.1120 of this chapter has been completed; and (3) If the amendment would add land for industrial use pursuant to section 3.07.1435, a large site or sites cannot reasonably be created by land assembly or reclamation of a brownfield site.**

[Note: This Provision Incorporates by Reference: 3.07.1425(B), (C), (D), (E), & (F), which are Discussed Below].

MC 3.07.1425(B)(1): Demonstrated need to accommodate future urban population, consistent with a 20-year population range forecast coordinated with affected local governments;

Hearing Officer's Analysis: MC 3.07.1425(b)(1) requires that the Major Amendment application show a [d]emonstrated need to accommodate future urban population, consistent with a 20-year population forecast coordinated with affected local governments. " This criterion is taken word for word from the first need factor set forth in Statewide Planning Goal 14. In the context of periodic review, Factor 1 pertains to a determination of overall land need in order to accommodate population growth. In this case, the need is for additional school capacity to alleviate an overcrowding situation at the Sherwood high School. For this reason, the first need factor set forth at MCC 3.07.1425(B)(1) is to be considered, but it is not determinative by itself.

In *Residents of Rosemont v. Metro,* 173 Or App 321, 328, 21 P3d 1108 (2001), the Court of Appeals explained that "[w]e held in *Baker [v. Marion County,* 120 Or App 50, 852 P2d 254, *rev den*, 317 Or 485, 858 P2d 875 (1993),] that factors 1 and 2 of Goal 14 are interdependent and

that, if one of the factors is not fully satisfied, or is less determinative, that factor must still be considered and discussed in deciding if a need for expansion of a UGB has been shown under factors 1 and 2 of Goal 14."

This factor requires the applicant to show, by substantial evidence in the whole record, that there is a demonstrable need for the new Sherwood High School based on a forecast that is consistent with the adopted 20-year population range forecast which has been coordinated with affected local governments.

The District and Metro staff address this provision at: Application Narrative at pp. 15, 34, App'x H; May 4, 2017, staff report ("Staff Report") at 5; June 9, 2017, Metro memo; June 13, 2017, District letter at 1-2. In particular, the applicant attempts to meet its burden of proof with the following analysis:

> *As described herein, the need for additional school capacity including the need for a new high school is well documented as described in Section III of the petition. The existing high school is operating overcapacity and the constraints of the existing high school site and building do not allow for feasible expansion to 2,400 students to serve long-term needs. Building a new high school will also allow the existing high school building to be converted to middle school use by consolidating the two existing middle schools to one location. This will further allow for the conversion of the two existing middle schools to elementary school use. The capacity analysis and 10-year demographic projections indicate that there will be capacity issues at all school levels if nothing is done. The proposed project will provide the long-term capacity needed.*
>
> *The School District commissioned Davis Demographics & Planning Inc. to complete an updated 10-year demographic study in May of 2016. The study reviewed the following factors that determine student enrollment: (1) the current and planned residential development over the next ten years; (2) student yield factors that apply to new residential development; (3) birth factors for the District area; and (4) mobility factors, which examine the in/out migration of students within existing housing units. The forecast projects a deficiency in capacity in all levels, with the high school level having the largest deficiency. Staff Report Attachment 3 (Table 2 in petition) shows 10-year enrollment projections compared with existing school building capacity. The table demonstrates that if no capacity is added (no-build) the school facilities will be far over capacity in 10 years with the Sherwood High School having the largest capacity issue operating at 141% of capacity.*

Metro's 20-year population range forecast is part of the 2015 urban growth report ("UGR"). Therein, the Metro Council determined that the region could meet the expected 20-year residential and employment forecast need within the UGB and no expansion of the UGB was needed to meet housing or employment needs. The UGR did not address specific school and park land needs. As a result, the District prepared a ten-year demographic study that supports a need for additional land for a new high school in order to accommodate future urban population. The District completed this demographic study using population and demographic projections for the cities of Sherwood and Tualatin.

The parties do not focus much, if any, of their debate on whether the population and demographic projections in the District's 10-year study are "consistent" with the assumptions in the 2015 UGR. Such as comparison is complicated by the fact that the UGR takes a high-level regional look at residential and employment needs, whereas the District's 10-year demographic study is much more narrowly focused on Sherwood's population. Nonetheless, the hearings officer reviewed both the 10-year study and the UGR and finds that there is no glaring inconsistency between them. The 2105 UGR anticipates continued high levels of growth in our region. The UGR further recognizes that there is still a considerable amount of vacant and redevelopable land located in and near the City of Sherwood. This would indicate that the District needs to be prepared to accommodate a large amount of additional school children. Given that the regional 20-year forecast did not address school and park land needs, the District's ten-year demographic study, which supplements the long-term facility plan completed in 2008, demonstrates a need to accommodate future urban population by substantial evidence in the whole record. The applicant has provided information regarding a ten-year demographic study showing a need for providing specific school facilities to meet present and future populations based on established methodologies for the proposed use. The applicant also provided written and verbal testimony from experts such as architect Karina Ruiz of Dull Olson Weekes IBI Group Architects, Inc, planner Keith Jones AICP of Harper Houf Peterson Righellis Inc, and traffic engineers Scott Mansur, P.E. and Carl Springer, P.E. of DKS Associates. Having reviewed these materials and observed their testimony, the hearings officer finds them more credible and assigns great weight to their views.

Staff is also correct when it states that even if Metro had expanded the UGB in 2015 for a 20-year housing need, there is no guarantee that the location of the added land would have accommodated the specific need for a new high school in Sherwood. ORS 197.299(4) provides a safety valve for such a situation.

The primary opponent argues that the District could only demonstrate consistency with the 2015 UGR by submitting a new 20-year demographic study. *See* letter from Jennifer Bragar dated June 23, 2017, at p. 20. The opponent points to no specific law which expressly states such a requirement, and the hearings officer does not believe that such a requirement exists. As far as the hearings officer can determine, "consistency" in this context simply means using the same or similar growth rates contemplated in the 2015 UGR, and that appears to be the case here. *See* the updated 10-year demographic study conducted by Davis Demographics & Planning Inc. dated May, 2016. This is consistent with Goal 2, which requires the factual inventories and assumptions included in the comprehensive planning documents to form the "basis for all decisions and actions related to land use." *Rivergate Residents Ass'n v. LCDC*, 38 Or App 149,

5990 P2d 1233, *rev den*. 286 Or 521 (1979); *Hildenbrand v. City of Adair Village*, 217 Or App 623, 177 P3d 401 (2008) ("Plan policies or inventories can serve to justify subsequent and related plan amendments because comprehensive plans must be internally consistent under Goal 2.)" *See also 1000 Friends of Oregon v. Metro (Ryland Homes)*, 174 Or App 406, 26 P3d 151 (2001). *Compare GMK Developments v. City of Madras,* 225 Or App 1, 199 P3d 882 (2008) (Nothing in Goal 2 itself requires the sort of continuous data correction that the opponents urge us to impose in this case).

MC 3.07.1425(B)(1) requires the District to demonstrate a need to accommodate future urban population; consistent with the demographic study contained in the 2015 UGR. The District has done that, and that is all that is required. The applicant has met its burden of showing compliance with this factor by substantial evidence in the whole record.

MC 3.07.1425(B)(2): Demonstrated need for land suitable to accommodate housing, employment opportunities, livability or uses such as public facilities and services, schools, parks, open space, or any combination of the foregoing in this paragraph;

This factor requires the applicant to show, by substantial evidence in the whole record, that there is a demonstrable "need for land suitable to accommodate * * * uses such as * * * schools * * *." The applicant presents its case as follows:

> As described herein, the need for additional school capacity including the need for a new high school is well documented as described in Section III of the petition. The existing high school is operating overcapacity and the constraints of the existing high school site and building do not allow for feasible expansion to 2,400 students to serve long-term needs. Building a new high school will also allow the existing high school building to be converted to middle school use by consolidating the two existing middle schools to one location. This will further allow for the conversion of the two existing middle schools to elementary school use. The capacity analysis and 10-year demographic projections indicate that there will be capacity issues at all school levels if nothing is done. The proposed project will provide the long-term capacity needed.
>
> The School District commissioned Davis Demographics & Planning Inc. to complete an updated 10-year demographic study in May of 2016. The study reviewed the following factors that determine student enrollment: (1) the current and planned residential development over the next ten years; (2) student yield factors that apply to new residential development; (3) birth factors for the District area; and (4) mobility factors, which examine the in/out migration of students within existing housing units. The forecast projects a deficiency in capacity in all levels, with the high school level having the largest deficiency. Staff Report Attachment

3 (Table 2 in petition) shows 10-year enrollment projections compared with existing school building capacity. The table demonstrates that if no capacity is added (no-build) the school facilities will be far over capacity in 10 years with the Sherwood High School having the largest capacity issue operating at 141% of capacity.

The City of Sherwood and the Sherwood School District have an intergovernmental agreement to share ballfields. The City of Sherwood owns an extensive system of parks and trails. However, the City's ballfield resources are very limited with only one soccer field located at the City's Snyder Park. In the early 1990s, prior to rapid growth in the preceding 20 years, the City took measures to protect natural resources. This included the protection of floodplains and wetland areas surrounding the Cedar Creek stream corridor that flows south to north through the center of the City limits to the Tualatin National Wildlife Refuge. The City acquired much of this land and maintains these areas as natural open space, wetlands and walking paths. Since most of the areas are sensitive and passive recreation areas, they are off limits to ballfield construction. Because Sherwood has a very active sports community, the City and School District decided to share sports fields with most of these facilities being on school grounds.

In the case of the new High School site, the City owns the approximately 20-acre parcel in the southeast corner of the property. Some of this land, approximately 4 acres, will be used for the Elwert and Kruger Road realignment and roundabout, but the remaining balance will become part of the new high school campus and allow for construction of additional ballfields to be shared with both school and City sports functions.

As documented in Section III of the petition, viable high school sites are not available within the current UGB. The only viable sites, including the proposed site, have been identified within the Sherwood West Concept Planning Area (Urban Reserve Area 5B).

The subject site ("Site C") is the best alternative site considering that it has:

- No mapped sensitive areas (habitats, wetlands or waterways),
- Gently sloping topography to allow for construction of ballfields,
- Close proximity to SW Elwert Road and Highway 99W for ease of access,
- Availability of public utilities (water and sewer),

- Available downstream discharge point for stormwater, and
- Sufficient area to provide high school campus for 2,400 students and needed City/School District shared ballfields.

As shown above, the applicant has shown a compelling need for providing specific school facilities to meet present and future populations.

The City of Sherwood and the District have an intergovernmental agreement to share sports fields with most of the facilities on school grounds. The City has an extensive system of parks and trails but sport field resources are very limited with one soccer field located in a city park. Thus, the applicant has shown there is a demonstrated land need to accommodate both school and park services by substantial evidence in the whole record. That evidence may be found in the following: Applicant's Narrative at p. 12-32, 34, Appendices C, G, H, and I; June 8, 2017, District letter pp 1-3. Additionally, the applicant demonstrated that district bond financing rules require moving ahead with the application now, rather than wait until the end of 2018. *See* letter from applicant's counsel Kelly Hossaini dated June 8, 2017, page 3 (discussing the district's finances).

The applicant has met its burden of showing compliance with this factor by substantial evidence in the whole record.

MC 3.07.1425 (B)(3): A demonstration that any need shown under paragraphs (1) and (2) of this subsection cannot be accommodated on land already inside the UGB.

MC 3.07.1425(B)(3) requires an alternatives sites analysis showing that the needed new school cannot be accommodated within the existing UGB. This requirement stems from state law. Among other laws, Statewide Planning Goal 14 requires the applicant to consider, as part of the needs analysis, all suitable lands inside the UGB as positive alternatives, and even requires the City to consider whether zone changes could make land suitable for the project. *See Brandt v. Marion County*, 22 Or LUBA 473, 481 (1991); *Turner v. Washington County*, 8 Or LUBA 234, 258 (1982), *aff'd*, 70 Or App 575,689 P2d 1318 (1984).

The applicant's narrative discusses MC 3.07.1425(B)(3) at p. 19-21, 34-35. For example, on pages 16-17 of the narrative, the applicant states as follows:

> As evidenced by capacity study and demographic growth data, the high school level is where there is the biggest need for additional capacity both now and to a greater extent within 7 to 10 years. Therefore, the Bond Management Team first looked to the existing high school campus for opportunities for expansion to accommodate this growth.
>
> **Expansion of Existing High School**
>
> The existing Sherwood High School is located on approximately 37.8 acres of land at 16956 SW Meinecke Road. The existing high

school has capacity for 1,550 students and, as of the writing of this report, is well over capacity with an enrollment of 1,689. This growth is expected to continue with a needed student capacity of approximately 2,200 by the year 2025 and peaking at approximately 2,400 students. Therefore, the School District will need a long-term high school capacity for 2,400 students.

Expanding the existing high school campus to meet this need is problematic on many fronts due to existing size limitation and irregular configuration of the site boundaries. Further, the campus cannot expand beyond its current boundaries as the campus is completely surrounded by existing residential development to the north, south and west and Stella Olsen Park and the sensitive wetland areas along Cedar Creek to the east as shown in Staff Report Attachment 4(Figure 5 in petition).

With respect to the buildings themselves, the School District has made additions over the years to accommodate growth, but the buildings are now completely overtaxed. Based on capacity analysis performed by the School District's contract architect, DOWA, the existing high school campus could be renovated to accommodate only another 450 students. This would increase capacity from 1,550 to approximately 2,000 students. However, at 2,000 students, the school would only have capacity for 7 years requiring the School District to add capacity again down the road. In review of the School District's bonding capacity, the School District will not be in a financial position to make any changes in 7 years and would be saddled with overcapacity schools for the foreseeable future. Therefore expanding the existing campus would provide for a short-term fix but would not provide the long-term solution the District is looking for.

New High School Siting Criteria

With the determination that a new high school is needed, the Bond Management Team identified the following criteria for aid in locating sites for further consideration:

1. Minimum Size: 50 acres
2. Zoning: Site must be zoned or planned for residential or institutional use that allow schools
3. Location: Site must be in Sherwood or contiguous to Sherwood (The City of Sherwood and mostly western Sherwood is where 90% of the student population resides)
4. Topography: Flat to mostly flat to accommodate ballfields

5. Wetlands and Waterways: No wetlands or minimal wetlands/waterways
6. Water and Sanitary Sewer: Adequate public utilities must be available or can feasibly be extended to serve the site
7. Stormwater Drainage: Downstream drainage capacity must exist to accommodate new impervious areas
8. Transportation: Site must be located near major streets to allow ease of access for students and limited routing of school traffic and buses through existing or planned residential areas

Inside the Current UGB

Using Metro's Regional Land Information System, City's Residential Buildable Lands Map and concept planning documents, potential sites were searched within the Sherwood School District Boundary that is inside the Existing Sherwood Urban Growth Boundary and within the Wilsonville or Tualatin existing Urban Grown Boundary.

Northeast Sherwood (Commercial and Industrial Land)

Sherwood City Limits

The northwest area of the City of Sherwood is zoned commercial and industrial, zoning that does not allow for school uses. In addition, much of the commercial and industrial land is built-out or contains wetlands and sensitive areas that cannot be developed. The largest vacant developable site in this area is located at the southeast corner of SW Langer Farms Parkway and SW Century Drive and is only 22 acres, too small for a high school.

Tonquin Employment Area

In 2004, 300 acres of industrial land was added to the Sherwood urban growth boundary in east Sherwood, known as the Tonquin Employment Area. A concept planning document was completed for this area in October of 2010. None of the area has of yet been annexed into the City of Sherwood to allow for urban development. There is an 88 acre parcel that fronts SW Tualatin-Sherwood Road that has potential to accommodate a new high school (12900 SW Tualatin Sherwood Road – 2S128D000100). However, this parcel was added to the UGB for the purpose of providing industrial uses and not for school uses. In addition, this site is located at the far east end of the existing Sherwood city limits and is not close to the student population that predominately resides on the west side of Sherwood. Therefore, locating the

school here would result in an inconvenient and isolated high school campus in the midst of industrial uses. Thus, the site was rejected from further consideration.

South and West Sherwood (Residential Land)

The southern and western areas of Sherwood are mostly residential. Residential zoning allows for school uses. This is also where most of the School District's student population resides (more than 90% of the student population lives in southern and western Sherwood). South of the existing city limits and within the urban growth boundary is the 250-acre Brookman Road Addition Concept Planning Area (Brookman Planning Area). The primarily-residential Brookman Planning Area has a completed concept plan from May of 2009. However, the area has not yet been annexed into the City of Sherwood and therefore has not been developed for urban uses.

The City of Sherwood recently completed a draft Housing Needs Analysis dated June 2015 for the existing urban growth boundary. The housing needs analysis contained a 2014 residential buildable lands inventory map that identified vacant buildable residential land within the City's UGB including the Brookman Planning Area. The residential buildable lands inventory map identified some available residential land. However, the available land is fragmented and/or constrained with no large developable sites that would accommodate a high school campus of 50 acres. Further there is no opportunity to consolidate this fragmented land in a way that would meet the District's criteria for a high school site. The Sherwood Buildable lands map is shown in Staff Report Attachment 5(Figure 6 in petition).

Within the Wilsonville or Tualatin Urban Growth Boundary

There are some limited areas of the Sherwood School District that are within Wilsonville and Tualatin's urban growth boundary, including the following:

Southwest Tualatin Concept Planning Area

Adjacent and east of the Sherwood Tonquin Employment Area is the Southwest Tualatin Concept Planning Area. Similar to Tonquin, this 614-acre area was added to the urban growth boundary in 2004. The area is planned for industrial use, and is even further away from west Sherwood students than Tonquin Road. Therefore, the area was rejected from further consideration.

Basalt Creek and Coffee Creek Planning Areas

Both of these planning areas are too far from the west Sherwood student population to be seriously considered. In addition, discussions with the City of Tualatin, who is leading the planning for Basalt Creek, indicates that there are no sites large enough with the correct zoning within Basalt Creek that would accommodate a new high school. The Coffee Creek planning area is designated by Metro as Regionally Significant Industrial land. This designation does not allow for school uses under any circumstances.

In summary as noted in Section III of the petition there are no suitable sites for a new high school within the current UGB to serve the Districts target population.

As noted in the findings set forth above, the District first examined the ability to expand the current high school to meet future capacity needs. However expanding the existing high school building is problematic due to existing size limitation and the configuration of the existing school campus. The current high school building includes a series of additions designed and constructed in an attempt to incrementally accommodate growth in the student population, resulting in a crowded non-operational and functional facility. Thus additional expansions to meet long term needs are not possible. In addition, the current high school campus is surrounded by residential development on three sides with the fourth side bordering a city park and natural resource area, thereby not allowing expansion of the campus itself.

The District identified eight site location criteria to help guide their search for appropriate site locations within the Sherwood city limits as well as limited areas within Tualatin and Wilsonville that are within the District boundary. The analysis of land within the city limits offered no usable sites. The city's industrial and commercial zones don't allow school uses and the vacant and developable land within the residentially zoned portions of the city is fragmented and constrained with no large enough sites available. The industrial designated land within the UGB but not in the city (Tonquin Employment Area) does contain one site large enough to meet the need; however it was included in the UGB for industrial purposes, is adjacent to existing industrial uses including an active quarry site and is located away from the main student population base. The limited land area within Tualatin and Wilsonville also include either industrially zoned land or very limited parcel sizes that does not provide an opportunity to site a high school. In addition, these areas are even a longer distance from the main student population base in the central and western portions of the city.

No opponents take issue with the applicant's analysis.

The hearings officer believes that it is relatively obvious that there are no sites within the City limits that could meet the need, even considering rezoning as an option. While there is vacant land in the existing UGB, the applicant has shown there are no suitable sites within the

UGB to meet the identified land need. The applicant has met its burden of showing compliance with this factor by substantial evidence in the whole record.

MC 3.07.1425 (C)(1): If the Council determines that there is a need to amend the UGB, the Council shall evaluate areas designated urban reserve for possible addition to the UGB and shall determine which areas better meet the need considering the following factors:

(1) efficient accommodation of identified land needs;

Hearing Officer's Analysis: Once a local government establishes a "demonstrated need" to expand the urban growth boundary, it then must apply the Goal 14's four "locational factors." When Goal 14 was amended in 2005, the locational factors were amended to make clear that the analysis is to be comparative in nature, as opposed to establishing minimum thresholds. The rule now states:

> The location of the urban growth boundary and changes to the boundary shall be determined *by evaluating alternative boundary locations* consistent with ORS 197.298 and with consideration of the following factors:
>
> (1) efficient accommodation of identified land needs
> (2) orderly and economic provision of public facilities and services;
> (3) *comparative* environmental energy, economic and social consequences; and
> (4) compatibility of the proposed urban uses with nearly agricultural and forest activities accruing on farm and forest land outside the UGB. (Underline emphasis added).

Metro has taken the four state-mandated locational factors set forth in Goal 14 and expended them to nine factors. Regardless of this, the goal of the locational analysis remains the same as state law, which is to determine the "best" land to include within the UGB to meet the land need**,** based on appropriate *consideration and balancing* of each factor. *1000 Friends of Oregon v. Metro (Ryland Homes)*, 38 Or LUBA 565, 584 (2000), *rev'd in part on other grounds* 174 Or App 406, 26 P3d 151 (2001). In *Barkers Five, LLC v. LCDC*, 261 Or App 259, 289 (2014), the court stated that consideration of factors means that the local government must:

> "(a) apply and evaluate each factor, (b) weigh and balance the factors which are not independent approval criteria-as a whole, and (c) meaningfully explain why a designation as urban or rural reserves is appropriate. "

Barkers Five, 261 Or App at 300.

OAR 660-024-0060(3) also provides guidance for how one "considers" the location factors and states:

> The boundary location factors of Goal 14 are not independent criteria. When the factors are applied to compare alternative boundary locations and to determine the Metro UGB location, Metro must show that all of the factors were considered and balanced.

In conducting this analysis, one point that cannot be over-emphasized is that no one locational factor can be considered to be a determinative reason to include or exclude any one particular site. Thus, a decision to include or exclude land from a UGB must be based on a *balancing* of all these factors, rather than reliance on any one factor. OAR 660-024-0060(3). *See also Branscomb v. LCDC*, 64 Or App 738, 745, 669 P2d 1192 (1983)(Court held that land could not be excluded from consideration *solely* because it was agricultural land and, as such, fared badly under factor 6). *D.S. Parklane*, 165 Or App at 25; *1000 Friends of Oregon v. Metro (Ryland Homes)*, 174 Or App 406, 409-10 (2001).

A related issue is that local governments often incorrectly treat the locational factors as threshold criteria. In fact, this misunderstanding was so pervasive that at one point LUBA even wrongly suggested that each of the locational factors had a "minimum objective threshold" that had to be identified and met by each site included in a UAR/UGB. *See D.S. Parklane Development, Inc., v. Metro*, 35 Or LUBA 516, 572-3 (1999), *aff'd as modified*, 165 Or App 1, 24, 994 P2d 1205 (2000). However, on appeal, the Court of Appeals clarified that the locational factors were not intended to be applied as threshold ("go - no go") criteria. *Id.* In other words, the intent is *not* to confirm that the preferred site was "good enough" to urbanize based on minimum threshold standards. Rather, the locational factors were intended to be "applied equally" to include lands into a UGB only "where all of the factors justify that inclusion." *Id.* In other words, the intent in establishing these factors was to assist in evaluating and ranking which site(s) amongst *all* potential candidate sites were, relative to one another, the *best* sites to urbanize in order to meet the demonstrated land need.

With that introduction in mind, we turn to a discussion of the first factor. The applicant discusses the first locational factor as follows:

> Urban reserves are lands outside the existing urban growth boundary that are considered suitable for accommodating urban development and expanding the growth boundary when additional urban land is determined to be needed over a 50-year period. The following urban reserve areas are within the Sherwood School District Boundary and are identified in Staff Report Attachment 6 (Figure 7 in petition):
>
> Sherwood North – North of Sherwood UGB
> Sherwood South – South of Sherwood UGB
> Sherwood West – West of Sherwood UGB
> Tonquin – South and West of Sherwood UGB
> Grahams Ferry – Northwest of Wilsonville

I-5 East – East of I-5 and north of Wilsonville
Elligsen Road - East of I-5 and north of Wilsonville

I-5 East, Elligsen Road and Grahams Ferry Urban Reserve Areas
These urban reserve areas were immediately rejected from further consideration due to the distance from west and south Sherwood where the majority of the student enrollment resides. These areas are 2 to 5 miles away in a straight line and even further when traveling on the road network.

Tonquin Urban Reserve Area
This area is directly south of the Sherwood Tonquin Employment UGB area and west of the Southwest Tualatin UGB area. The Tonquin Urban Reserve area encompasses approximately 571 acres. The area has parcels large enough to accommodate the high school site. However, much of the property is mapped as containing Upland Habitat Class A (Metro Title 13) and Riparian Areas Class I, II and III (Metro Title 3). This urban reserve area and it is likely to be designated industrial and/or employment due to its close proximity to other industrial areas. This urban reserve area is on the east side of the City and not centrally located for use by the majority of the School District students. The area is further isolated by a rock bluff that forms the eastern boundary of the current urban growth boundary and Sherwood City limits. This bluff is perched above the Rock Creek stream corridor that effectively isolates this area from the existing residential neighborhoods of Sherwood. Finally, the area does not have adopted concept plan or plan for how utilities will be extended to serve the area.

Sherwood North Urban Reserve Area
This area represents slivers of land along the existing urban growth boundary at the north end of the City of Sherwood. The area was designated urban reserve because it is not within the floodplain of the Tualatin River. However, this land is not large enough to accommodate a high school site and therefore was rejected from further consideration.

Sherwood South Urban Reserve Area
This area is directly south of the Brookman Road UGB area. This area consists of rolling hills with much of the area identified by Metromap online mapping system having slopes greater than 10%. There is also two stream corridors that travel through the area with many areas mapped by Metromap as being riparian or upland habitat. One potential site is located between Oberst Road and Labrousse Road that is not mapped as having upland habitat or

riparian areas. However, this land is mapped by Metro as having slopes of greater than 10% making development of a high school campus and ballfields difficult. The biggest challenge of developing in this area is that the Brookman Road UGB area would need to be annexed and developed first before this area can be made available for development. Therefore, development in this urban reserve area is likely years away and the only promising site is at the south end of and not next to the existing Brookman Road UGB area. This area also does not have a concept plan. For these reasons, this area was rejected from further consideration.

Sherwood West Urban Reserve Area

In February 2016, Sherwood completed a Preliminary Concept Plan for the Sherwood West Planning area (aka Metro Urban Reserve Area 5B). Sherwood West encompasses 1,291 acres along the west border of Sherwood's existing urban growth boundary. The Sherwood West Planning Area is shown in Staff Report Attachment 7 (Figure 8 in petition).

Six alternative high school sites (A-F) were identified within the Sherwood West Urban Reserve Area that are large enough to accommodate a new high school. The six alternative sites (A-F) within the Sherwood West Concept Plan Area were evaluated based on site selection criteria. The site locations and evaluation criteria are indicated in Staff Report Attachment 8 (Figures 9 to 14 in petition). The School District's site alternative analysis is summarized in the table below.

(Table 1 – Alternative Sites Summary in petition)

Alternative Selection Criteria	***Alternative Sites****					
	A	***B***	***C***	***D***	***E***	***F***
Flat Topography	*N*	***U***	***Y***	*U*	*U*	*U*
Wetlands	*N*	***Y***	***Y***	*U*	*Y*	*N*
Water Service	*N*	***Y***	***Y***	*Y*	*N*	*N*
Sanitary Sewer Service	*N*	***Y***	***Y***	*N*	*N*	*Y*
Storm Drainage	*Y*	***Y***	***U***	*N*	*N*	*Y*
** Y-Meets Criteria - N-Does Not Meet Criteria – U-Undetermined*						

From the site alternatives analysis, it became clear that Sites B and C were the most promising with other sites lacking utilities, having significant wetlands, drainage issues and/or significant topography that would make construction challenging. Alternative Sites B and C are located near each other both west of SW Elwert Road at SW Haide Road, just north of Highway 99W. Site C was selected due

to having more of a gentle slope and less grade changes. Most of Site C has a consistent slope change of approximately 40 feet over the length of the site with only a small valley and ridge. Site B has a more drastic slope change of 50 to 60 feet with a more defined ridge running through the middle of the site. Site B would be far more challenging to grade and develop for a high school than Site C. The Sherwood West Concept Plan contained a phasing and funding strategy. The phasing plan identified six phases (A-F). The subject site (Site C) is located within Phase A of the concept plan.

The subject site represents an efficient location because:

- The location is next to existing western Sherwood and close to the vast majority of the District's student population (90%).
- City utilities are available to serve this site or can be extend as the site is adjacent to the city limits.
- Direct and efficient access will be available via major streets that are intended to accommodate significant motor vehicle, pedestrian and bicycle needs.
- The site will be developed on the north, south and west along existing right-of-ways and will be developed to the existing City limits and UGB. This location is a logical location to develop first within the Sherwood West Concept Plan, as it is really the first site north of 99W. Other sites in Sherwood West would result in undesirable leapfrog development.
- Utilizing the approximate 76-acre site to ultimately accommodate the large 2,400-student high school and the School District/City shared ballfields will provide greater efficiency than developing play fields independently. The district and City have a long history of partnering to maximize use of shared ball field resources.

As set forth in the District's narrative and response to MC 3.07.1440(a), there is an identified need for a major amendment of the UGB to provide for a new high school site and this need cannot wait until the next analysis of the building land supply under ORS 197.299. As allowed by MC 3.07.1425(b), the District specified characteristics necessary for land to be suitable for the identified need, *i.e.*, the new high school. *See* Applicant's Narrative at 18-19, 33-35. These characteristics included a minimum site size of 50 acres; zoning that would allow for an institutional use; within or contiguous to Sherwood, where 90% of the children served by the District reside; flat to mostly flat topography; no or minimal constraints such as streams, wetlands, intact upland habitat; adequate/feasible access to public utilities, including water, sanitary sewer, and storm sewer; and near to major (collector or arterial) streets to accommodate high school-level transportation impacts. As also required by MC 3.07.1425(b), the District has demonstrated that the need for the new high school cannot be accommodated on land already inside the UGB.

As shown above, the District undertook an analysis of seven urban reserve areas that are within the district boundary, three of which are not adjacent to the city of Sherwood. The Metro Code does not allow for the creation of an island of urban land so the analysis must be limited to those properties that are directly adjacent to the current UGB. MC 3.07.1425(f).

The Seven Urban Reserve Areas

Within the District's boundary, there are seven areas that contain urban reserves (*see* Application Narrative p. 22 of 39, showing map of all seven areas). They are:

- Sherwood North
- Sherwood South
- I-5 East
- Elligsen Road
- Tonquin
- Graham's Ferry
- Sherwood West

Each will be discussed in turn.

The Sherwood North Urban Reserve Area

The Sherwood North urban reserve area is comprised of slivers of land without flood plain constraints north of the existing city limits and south of Tualatin River. This area does not contain one or more contiguous parcels that would be large enough to meet any of the District's siting criteria for a high school site. Therefore, the hearings officer finds that the Sherwood North urban reserve area cannot accommodate the need for a new high school.

The Sherwood South Urban Reserve Area

The Sherwood South urban reserve area is adjacent to the Brookman Road UGB area. Some of the Brookman Road UGB area was recently annexed to the city, but much of it still has not been annexed. The Sherwood South area consists of rolling hills with much of the area identified by Metro Map as having slopes greater than ten percent, which would not meet the District's siting criterion of a flat to relatively flat site. (See Attachment 3.) There are also two stream corridors that traverse the area with many areas mapped by Metro as being riparian or upland habitat. (See Attachment 4.) There is a potential site located between Oberst Road and Labrousse Road that is not mapped as being constrained by upland habitat or riparian areas, but is mapped as having slopes greater than ten percent, which would not meet the District's siting criterion for a flat to relatively flat site. A challenge in the overall development of this area is that the Brookman Road area within the UGB must be annexed and developed first before the Sherwood South area will have the public services it needs to be able to develop. Further, Sherwood South is not even concept planned yet. As far as the hearings officer is aware, no such planning has been scheduled. As noted earlier, MC 3.07.1110 requires that urban reserve areas be concept planned before they be considered for inclusion in the UGB. As set forth in response

to MC 3.07.1440(a) there is a pressing need for the new high school. To wait at least one or more years for the City to concept plan the Sherwood South urban reserve area under MC 3.07.1110 is not consistent with the pressing need for the new high school that precipitated this major amendment application. Therefore, the hearings officer concludes Sherwood South cannot accommodate the need for a new high school.

The I-5 East Urban Reserve Area

The I-5 East urban reserve area is at the extreme eastern end of the District's boundary, east of I-5, next to Tualatin. This urban reserve area does not meet the District's siting criterion that the new high school site be within or contiguous to Sherwood, where 90% of the children served by the District reside. Further, as set forth in the staff report, these urban reserves are constrained by natural resources issues and steeper slopes yielding no buildable areas big enough to accommodate a new high school. For all of these reasons, the hearings officer finds and concludes that this urban reserve cannot accommodate the new high school.

The Elligsen Road Urban Reserve Area

Similarly, the Elligsen Road urban reserve area is at the extreme eastern end of the District's boundary, east of I-5, next to Tualatin, and immediately south of the I-5 East urban reserve area. This urban reserve area does not meet the District's siting criterion that the new high school site be within or contiguous to Sherwood, where 90% of the children served by the District reside. Travel to western Sherwood would be at least five miles for the vast majority of students along the already-congested Tualatin-Sherwood Road (*see* Application Narrative p. 22 of 39, showing map). Further, as set forth in the staff report, these urban reserves are constrained by natural resources issues and steeper slopes yielding no buildable areas big enough to accommodate a new high school. For all of these reasons, the hearings officer finds and concludes that this urban reserve cannot accommodate the new high school.

The Tonquin Urban Reserve Area

The fifth urban reserve is the Tonquin urban reserve area. This area lies on the east side of Sherwood and is contiguous to Sherwood's city boundary. As set forth in the Narrative, this urban reserve area is directly south of the Sherwood Tonquin Employment UGB area and, according to Julia Hajduk, the City's Community Development Director, will be used to accommodate the City's future industrial and employment needs given its proximity to other industrial uses and Sherwood's employment/industrial core. Therefore it is not likely to allow for zoning for an institutional use. As noted in the staff report, another issue with building a new high school in this area is that the majority of adjacent land within the UGB is not yet developed to urban standards. Any out-of-sequence development in this area, then, would require a costly and inefficient extension of public services. Further, much of the property in this urban area is mapped as containing Upland Habitat Class A (Metro Title 13) and Riparian Areas Class I, II, and III (Metro Title 13). (See Attachment 1.) This area is further isolated by a rock bluff that forms the eastern boundary of the current UGB and city limits. This bluff is perched above the Rock Creek stream corridor that effectively isolates the area from the existing residential neighborhoods of Sherwood, thereby making it less efficient to serve the student population

given that the bulk of that population is in the southern and western areas of the city. Significant areas of the urban reserve also have substantial slopes of ten percent and greater, along with floodplain constraints, which would not meet the District's siting criterion of a flat to relatively flat site. (See Attachment 2.) Further, this urban reserve area does not have a concept plan in place or a plan for how utilities might be extended to serve the area. Concept planning has not been completed for this area. MC 3.07.1110 requires that urban reserve areas be concept planned before these areas can be considered for inclusion in the UGB. As set forth in response to MC 3.07.1440(a) there is a pressing need for the new high school. To wait at least one or more years for the City to concept plan the Tonquin urban reserve area under MC 3.07.1110 is not consistent with the pressing need for the new high school that precipitated this major amendment application.[12] Therefore, the hearings officer concludes the Tonquin urban reserve area cannot accommodate the need for a new high school.

The Grahams Ferry Urban Reserve Area

The Grahams Ferry urban reserve area is at the District's extreme southeast boundary next to Wilsonville. This urban reserve areas meet the District's siting criterion that the new high school site be within or contiguous to Sherwood, where 90% of the children served by the District reside. Travel to from Graham's Ferry to western Sherwood would be at least seven miles for the vast majority of students along the already-congested Tualatin-Sherwood Road (*see* Application Narrative p. 22 of 39, showing map). Further, as set forth in the staff report, this urban reserve area is constrained by natural resources and steeper slopes yielding no buildable areas big enough to accommodate a new high school. For all of these reasons, the hearings officer finds and concludes that these urban reserves cannot accommodate the new high school.

The Sherwood West Urban Reserve Area

The seventh and final urban reserve area studied was Sherwood West. The hearings officer finds this is the only urban reserve area that can efficiently accommodate a new high school consistent with the citing criteria, for these reasons: Sherwood West has been MC 3.07.1110 concept planned and so may be considered for inclusion within the UGB. Sherwood West is adjacent to the city's existing UGB and in close proximity to the bulk of the District's student population. The area is planned for predominantly residential uses, including schools, and so as Sherwood West develops even more of the student population will reside in the vicinity of the proposed high school site. The District studied the 1,291-acre Sherwood West urban reserve for places within it that could accommodate a new high school site. The applicant District did this by utilizing an engineer and architect to evaluate all sites in the urban reserve that were flat to relatively flat; had a minimum buildable site size of approximately 50 acres or more; no or minimal constraints from streams, wetlands, and intact upland habitat; adequate/feasible access to public utilities; and proximity to a major (collector or arterial) street network. Findings addressing MC 3.07.1425(c) can be found in the Narrative and in the staff report. The applicant District included an analysis of the six areas within Sherwood West. Therefore, the hearings officer finds that, given the framework of MC 3.07.1425(b) and (c), no urban reserve except for

[12] Urban Reserve Areas are intended to provide a 50-year supply of land. Given that the City has no plans to complete a concept plan for the area, and because contiguous areas within the UGB would need to develop first to extend the needed infrastructure, it is safe to conclude that development of this area is at least several years away.

Sherwood West should advance to MC 3.07.1425(c) to determine which urban reserve can best meet the identified need, because no other urban reserve can meet that need.

The Six Sites Studied within the Sherwood West Urban Reserve Area

The District identified six sites (designates Sites A through F) within the Sherwood West urban reserve area that were large enough to accommodate a new high school campus. Each of the six is discussed in turn:

Site A – The hearings officer finds this site cannot efficiently accommodate the new high school due to slope, natural area constraints, public infrastructure issues or a combination of these factors. There is a small wetland in the center of this site. The western portion is mostly occupied by Chicken Creek. There is no water service available from SW Elwert Road, and water extensions would be required along Elwert frontage and east from SW Edy Road. The site is low-lying and sanitary sewer connection is not available from SW Edy Road, so a major pumping station would have to be built.

Site B - The hearings officer finds this site *could* possibly accommodate the new high school. However, it has a significant ridge running through the middle of the site, which would require extensive grading, with slopes running both east and west with a 50-60 foot grade change. Both public water and a 15" sanitary sewer pipe are available off SW Elwert Road.

Site C - This site is quite flat, with no more than a 40 foot grade change required. It has water and sewer connections off SW Elwert Road. There are no wetlands. The hearings officer finds that Sites B and C are the two areas that can most efficiently accommodate a new high school, but Site C is clearly superior because Site B has a significant topographic ridge running north-south through the middle of the site with an approximately 50-60 foot grade change. Site C has less topography to manage, which is important when one considers that ballfields, tracks, and other sports facilities needed as part of the new high school cannot be developed on slopes. Therefore, the hearings officer concludes and finds Site C can most efficiently meet the identified need of a new high school.

Site D - The hearings officer finds this site cannot efficiently accommodate the new high school due to slope, natural area constraints, and public infrastructure issues. The entire site slopes down to the east towards private property, with a grade change in excess of 50 feet. There is no sanitary sewer service available. A very costly sewer line extension and public system improvements would be necessary. There are no established public storm drains in the vicinity. Street improvements on Kruger Road and offsite improvements would likely be required. Sites D also suffers from not being adjacent to the existing Sherwood UGB, which means more land would be required to be brought into the UGB than is necessary for the school site in order to ensure contiguity and public infrastructure would have to be extended further to serve the new high school, which is inefficient and expensive.

Site E - The hearings officer finds this site cannot efficiently accommodate the new high school due to slope, natural area constraints, and public infrastructure issues. The entire site slopes down to the east towards Highway 99, with a grade change around 75 feet. There is no

sanitary sewer service available. A very costly sewer line extension and public system improvements would be necessary. There are no established public storm drains in the vicinity.

Site F - The hearings officer finds this site cannot efficiently accommodate the new high school due to wetlands, drainage, powerlines, and lack of public water supplu. While quite flat, this site has wetlands, drainage, and a BPA power line easement running through it. While there is a nearby sewer line, there is no water line, and costly improvements would have be made to supply the school with drinking and irrigation water as well as meeting firefighting needs. Site F is further constrained by a BPA easement that cuts diagonally through what would otherwise be the flattest, least constrained part of that area and this flat area is segregated from the existing UGB by Chicken Creek and protects a riparian corridor. Site F also suffers from not being adjacent to the existing Sherwood UGB, which means more land would be required to be brought into the UGB than is necessary for the school site in order to ensure contiguity and public infrastructure would have to be extended further to serve the new high school, which is inefficient and expensive.

Conclusion of the Alternative Sites Analysis for the Six Sites in Sherwood West

The District evaluated the alternative sites related to five selection criteria noted above and determined that four of the six sites (A, D, E & F) lacked utilities, had significant wetlands, drainage issues or topography that restricted the ability to efficiently accommodate the identified land need. In addition, site D is not adjacent to the current UGB and therefore would create an island of urban land which is not allowed under Metro Code. Areas B & C better met the selection criteria with site C being the best site due to less grading and site work to accommodate the identified land need. Based on the urban reserve areas analyzed site C in the Sherwood West urban reserve best meets the need considering efficient accommodation of the identified land need. For these reasons, the hearings officer concludes and finds that proposed Site C (on the northwest corner of SW Elwert and Kruger Roads) can most efficiently meet the identified need of a new high school.

MC 3.07.1425(c)(2): If the Council determines there is a need to amend the UGB, the Council shall evaluate areas designated urban reserve for possible addition to the UGB and shall determine which areas better meet the need considering:

(2) the orderly and economic provision of public facilities and services.

Hearings Officer's Analysis: This suitability factor focuses on the orderly and economic provision of public facilities and services. Because Sherwood West has been concept planned pursuant to MC 3.07.1110, the provision of public facilities and services within the Sherwood West Concept Plan area has been studied to a larger degree than other URAs. The Sherwood West Concept Plan was prepared with analyses of existing sanitary sewer, water, storm water, and transportation conditions and analyses of how those systems need to be upgraded, extended, and phased to meet the future development of Sherwood West. (See Sherwood West Concept Plan, pages 15-21, 40-44, Appendix 3 (Existing Conditions Report), and Appendix 8 (Transportation Options Alternative Analysis Report and Cost Estimates). The concept plan was prepared in coordination with all of the future service providers, including those services that

will be provided by the City and those that will be provided by others, including Clean Water Services, ODOT, Tualatin Valley Fire & Rescue, and Washington County. (*See* Sherwood West Concept, acknowledgements page and Appendix 6 (Service Provider Interviews). The District was also part of the Technical Advisory Committee that informed the concept planning effort. Because all of this extensive analysis and coordination work had already been done for Sherwood West, the District used that work as the jumping off point for its analysis of the area for orderly and efficient accommodation of public services.

As demonstrated in the Narrative, pages 24-31, four of the six sites (A, D, E, and F) have significant barriers to provision of public infrastructure. Sites B and C have the fewest barriers and are most feasible for public infrastructure service. This is consistent with the findings of the Sherwood West Concept Plan, which anticipates phasing public infrastructure to serve the area encompassed by Sites B and C first, i.e., Area A. (*See* Sherwood West Concept Plan, pages 40-44.) Service provider interviews conducted as part of the concept planning effort also identified Area A as the "first stage development area." (*See* Sherwood West Concept Plan, Appendix 6, page 5.) It is also worth noting that, according to the concept plan, Area A of the concept plan has most infrastructure in place, "presents the best near-term opportunity for development in Sherwood West," and the cost to serve is on the lower end of the cost scale. (Sherwood West Concept Plan, pages 42-43.) The District also engaged a licensed traffic engineer to prepare the March 15, 2017, Sherwood High School UGB Expansion Transportation Study (the "Transportation Study") to address effects of a new high school on Site C on the surrounding transportation system. The Transportation Study found that, with appropriate mitigation, Site C can accommodate the new high school while maintaining an adequate transportation system. See also District's findings in response to Goals 11 and 12 with respect to the provision of public facilities and services to Site C.

As part of this UGB amendment application effort, the District obtained service provider comments from the City of Sherwood, Washington County, Tualatin Valley Fire and Rescue, and Clean Water Services, all of whom supported the siting of the new school on Site C from an infrastructure provision standpoint, consistent with the Sherwood West Concept Plan.

In sum, Sites B and C best meet the need for a new high school considering the orderly and economic provision of public services per the Sherwood West Concept Plan and the District's own analysis.

The primary opponent makes only a desultory effort to challenge the applicant's proposed findings. *See* letter from Jennifer Brager dated June 23, 2017, at p. 7. Ms. Bragar concludes, without much in the way of analysis, that "Site C is unworkable." The only evidence that the opponent cites as support for this theory is the DKS Traffic Study dated March 15, 2017, which shows that currently there are several failing intersections in the vicinity. However, failing intersections is not in any way determinative when considering the locational factors.

The proposed site has positive attributes from the transportation and traffic perspective. The site is close to the area's major north-south highway (Highway 99) and east-west arterial (the Tualatin-Sherwood Road). It has a relatively flat topography, reducing hazards in wet or snowy conditions. With the planning modifications, the site will have adequate access and

capacity for peak school commuting times (7.15 to 8 am and 2.50 to 3:45 pm). Road widths and sightlines will be sufficient for safety purposes, an important consideration for less-experienced drivers, such as high school juniors and seniors.

The traffic issue has been addressed by unrebutted evidence from the applicant's civil and traffic engineers - the *only* expert testimony in the record - and is belied by the fact that all of the public service providers for the Sherwood West area, including Washington County, the City of Sherwood, and Clean Water Services, submitted service provider letters that support the new high school on Site C, and state that such services can be provided. (*see* Appendix to the Application Narrative for copies of these letters).

At the public hearing, local residents Carolyn McBee and Karen Labahn raised issues of traffic safety at the proposed site, specifically on Kruger and Elwert Roads. They testified, convincingly, that the roads abutting the preferred alternative site are rural in nature and not capable of handling the traffic generated by the school. As the hearings officer emphasized at the hearing, the analysis is comparative in nature. A site does not have to be good; it just has to be better than the alternatives. This is true even if all of the alternatives are objectively bad. In fact, it will undoubtedly be the case that the roads in all seven of the candidate urban reserve areas are rural in nature and incapable of handling urban levels of traffic. At this stage, the analysis is high level and really only focused on identifying issues that made any one site particularly good or horrendously bad in relation to the others.

In this case, the applicant's traffic engineers Scott Mansur, P.E. and Carl Springer, P.E. of DKS Associates wrote the following in a June 28, 2017 memorandum:

> DKS prepared the March 15, 2017, Sherwood High School UGB Expansion Transportation Study ("March Transportation Study"). The March Transportation Study assesses the proposed UGB amendment impacts and identifies a roster of system improvements for the short-term and long-term. This study acknowledges that several local intersections are heavily congested during peak hours, and that the rural street infrastructure nearby the proposed UGB amendment site does not meet either the City's or the County's facility design standards today. What this study also tells us, however, is that with proper mitigation the proposed school site can be adequately served with transportation infrastructure. The next step in the planning process is the post-UGB amendment Title 11 planning, as required by Metro, and it is during that process that the next transportation planning steps will be taken. These planning steps include designating urban zoning and land use types within the newly added UGB area. During this stage, we will engage in additional technical studies, including a second transportation impact study, to (1) refine the specific project needs, (2) ensure that the Transportation Planning Rule is met, (3) ensure that performance standards can be maintained over time, and (4) ensure that a safe transportation network is provided for the new

> high school. Based on our transportation analyses so far, we are confident that the Sherwood School District can provide adequate state and local transportation facilities to support the proposed Site C high school.

While the residents' traffic safety concerns are well meant, and taken seriously by the hearings officer, the engineers are undoubtedly correct that the applicant's preferred alternative site can be improved with reasonable cost expenditure. The improvements discussed at the hearing were typical of what one would expect when land urbanizes, and do not involve any highly extravagant technical solutions such as bridges over wetlands / streams, or expensive highway overpasses. The hearings officer had the opportunity to evaluate these engineering experts and considers their representations highly credible. No evidence was presented pertaining to other sites that would suggest that any other site would be significantly better from a transportation standpoint, and several of the sites required more expensive improvements.

The opponents argue that the applicant gamed the system by counting traffic in the middle of winter. *See* letter from Jennifer Brager dated June 23, 2017, at p. 8. Again, this argument seems to lose focus of the intended exercise. That argument might have merit if the applicant's traffic engineers had performed their traffic counts at some locations in winter, but at other locations in summer (when traffic is lighter because school is out of session and many workers are not commuting, due to vacations). That did not happen. The applicant's traffic study clearly states:

> To perform the intersection analysis, traffic counts were collected during the AM peak (7:00 – 9:00 am) on Feb 1, 2017 and the PM peak (4:00-6:00 pm) on Jan 31, 2017. Study intersections on ODOT facilities (i.e. OR 99W) were analyzed using estimated 30th highest hour traffic volume (30 HV) conditions. The 30 HV development process for existing conditions *includes the determination of seasonal adjustments*. (DKS "Sherwood High School UGB Expansion Transportation Study" dated March 15, 2017, p. 9, italic emphasis added).

Site C is located in close proximity to existing urban arterials, which in and of itself makes it a better site as compared to alternatives such as Sites D and F, which are more isolated and remote. Sites A, E, and F will be more expensive to develop than Sites B and C. Sites D and F suffer from not being contiguous with the existing UGB and so public infrastructure would have to be extended further, out of sequence, to reach those sites. This creates a significant unnecessary expense. Further, sites with steeper topography and natural resource constraints, like Sites A, D, E, and F will also be more costly to develop. Sites B and C will cost less than the other sites to develop, but Site C will cost even less than Site B due to its flatter topography.

The hearings officer wishes to emphasize that the public will have many additional opportunities to comment on and influence the types of transportation improvements that will be built.

MC 3.07.1425(c)(3): If the Council determines there is a need to amend the UGB, the Council shall evaluate areas designated urban reserve for possible addition to the UGB and shall determine which areas better meet the need considering:

(3) ***comparative environmental, energy, economic, and social consequences.***

A comparison of the six sites with respect to environmental, energy, economic, and social consequences of development is set forth below:

Environmental Consequences: There are areas within Sherwood West that have significant natural resources within them. The maps at Figure 6 of the Sherwood West Concept Plan and Appendix B of Appendix 3 of the Sherwood West Concept plan are instructive in this regard. From those maps one can see that Sites A, D, and F have significant areas of floodplains, wetlands, protected stream corridors, and inventoried wildlife habitat. In contrast, Sites B and C have little to no environmental resources on them. Further, Sites B and C are closest to the city's existing urban core, which give them the most direct transportation connections, thus limiting air quality degradation. Therefore, development of these sites with a high school would have the least negative environmental consequences of all of the alternative sites.

Energy Consequences: From an energy standpoint, all of the sites are reasonably close to the bulk of the student population to be served, but Sites E and F are more remote. This will be exacerbated as Sherwood West develops with mostly residential uses. Sites A, B, C, and D are most centrally located, which will allow more students to walk and bike to school and reduces the number of students being bused and driven to school, and allows for the least vehicle miles traveled for those who use cars and buses. Site D would require an out-of-sequence extension of public infrastructure to the more interior of the urban reserve, however, which ticks its adverse energy consequences somewhat higher than Sites A, B and C.

Economic Consequences: Public bond dollars are finite and must not be wasted. Taxpayers expect that school districts will be good stewards of the public money and building new school facilities is no exception. Being more remote from the existing urban area and public infrastructure, Sites A, E, and F will be more expensive to develop than Sites B and C. Sites D and F suffer from not being contiguous with the existing UGB and so public infrastructure would have to be extended further, out of sequence, to reach those sites. This creates a significant unnecessary expense. Further, sites with steeper topography and natural resource constraints, like Sites A, D, E, and F will also be more costly to develop. Sites B and C will cost less than the other sites to develop, but Site C will cost even less than Site B due to its flatter topography. The effect of topography on the cost of building a high school site with its need for ball fields and other sports facilities should not be under estimated. Even small amounts of slope will have significant, expensive consequences on a school site due to the cost of grading.

Site C has another factor that weighs in its favor over Site B, which is that Site B contains a number of single-family residences that would have to be purchased and demolished to build the new high school. Purchasing houses to tear them down is not a good use of bond dollars if it can be avoided. Therefore, Site C clearly comes out ahead in this consideration.

Social Consequences: Siting the new high school in the most centrally located area possible is important to fostering a sense of civic and school pride. Although high schools can have fairly significant impacts on an area, they should be sited where the bulk of the population resides and be a use that brings people together in a place that the citizens identify as an integral part of their community. One of the alternatives that the District considered in its facilities planning to alleviate the capacity issue at the existing Sherwood High School was building a second high school. The community, however, was very much opposed to that idea. A small, cohesive community like Sherwood wants to remain bound together not divided by different allegiances to different high schools. All of the sites analyzed in Sherwood West would be superior to any sites in any other urban reserve for these reasons alone; however, within Sherwood West Sites B and C are most centrally located - both now and in the future as the city continues to grow to the south and west. Even so, development of Site B has a more immediate social consequence that Site C does not have. There are a number of residences in Site B that would have to be purchased and demolished in order to develop the new high school. Displacing residents from their homes needlessly is a very adverse social consequence and should not occur if it can be avoided, which in this case it can. Therefore, Site C comes out ahead here, too.

Conclusion: Sites B and C are the two sites that come out the most favorably when one factors in the environmental, energy, economic, and social consequences. However, Site C edges ahead of Site B due to Site B's increased adverse economic and social consequences.

MC 3.07.1425(c)(4): If the Council determines there is a need to amend the UGB, the Council shall evaluate areas designated urban reserve for possible addition to the UGB and shall determine which areas better meet the need considering

(4) compatibility of proposed urban uses with nearby agricultural and forest activities occurring on land outside the UGB designated for agriculture or forestry pursuant to a statewide planning goal.

Hearings Officer's Analysis: The District identified a number of site characteristics that a new site would need to meet in order to accommodate a new high school. As discussed above, is one urban reserve area that can efficiently accommodate a new high school - Sherwood West. Sherwood West has been MC 3.07.1110 concept planned and so may be considered for inclusion within the UGB. Sherwood West is adjacent to the city's existing UGB and in close proximity to the bulk of the District's student population. The area is planned for predominantly residential uses, including schools, and so as Sherwood West develops even more of the student population will reside in the vicinity of the proposed high school site. The District studied the 1,291-acre urban reserve for areas within it that could accommodate a new high school site. The District did this by utilizing an engineer and architect to evaluate all sites in the urban reserve that were flat to relatively flat; had a minimum buildable site size of approximately 50 acres or more; no or minimal constraints from streams, wetlands, and intact upland habitat; adequate/feasible access to public utilities; and proximity to a major street network. This analysis yielded six sites, which were then ranked according to the site criteria.

With respect to how the six sites meet the need for a new high school considering the compatibility of proposed urban uses with nearby agricultural and forest activities, it is important to note that the entire Sherwood West area is slated for eventual urban development, regardless of the current uses and zoning of land within it. It was designated as an urban reserve instead of a rural reserve partly due to its small-scale, intermittent farming and forestry activity, parcelization, and rural residential development. That said, urbanizing land that is adjacent to existing urban development is more consistent with this boundary location factor than urbanizing land further into the undeveloped portions of an area, which will likely remain in rural use much longer whether the new high school is built in the area or not. Sites A, B, and C are closest to existing urban development. Sites D, E, and F are more remote from existing urban development. Therefore, in this respect, A, B, and C will have fewer impacts on any nearby agricultural and forest activities. Site A does not appear to have any adjacent agricultural or forest activities occurring adjacent to it. The other sites have very minor to small amounts of agricultural activities occurring on adjacent land. Therefore, none of the sites would appear to have much impact on agricultural or forest activities. Given the sites' rough equivalency in this regard, Sites B and C are the least costly to serve and most readily developable according to the Sherwood West Concept Plan, so developing in those areas "now" will have fewer impacts on nearby agricultural and forest activities than jumping ahead to an area that might have otherwise remained rural for the next 20 years. This gives Sites B and C the edge in considering this factor.

MC 3.07.1425(c)(5): If the Council determines there is a need to amend the UGB, the Council shall evaluate areas designated urban reserve for possible addition to the UGB and shall determine which areas better meet the need considering

(5) equitable and efficient distribution of housing and employment opportunities throughout the region.

Hearings Officer's Analysis: This factor is not directly relevant to the siting of a new high school and therefore is not determinative in any way.

MC 3.07.1425(c)(6): If the Council determines there is a need to amend the UGB, the Council shall evaluate areas designated urban reserve for possible addition to the UGB and shall determine which areas better meet the need considering

(6) contribution to the purposes of Centers and Corridors.

Hearings Officer's Analysis: This factor is not found within Statewide Planning Goal 14 but is instead a consideration created internally at Metro. According to Metro's 2040 Growth Concept Map, the proposed site is not in a Regional or Town center, nor is it directly on a Corridor. Site A is closest to a Corridor, but as staff pointed out in the staff report, it is mostly undeveloped or in single-family residential use. None of the other sites are close enough to any Centers or Corridors to contribute to them at this point in time. Therefore, none of the alternatives support the purposes of Centers and Corridors in any significant way.

MC 3.07.1425(c)(7): If the Council determines there is a need to amend the UGB, the Council shall evaluate areas designated urban reserve for possible addition to the UGB and shall determine which areas better meet the need considering:

(7) protection of farmland that is most important for the continuation of commercial agriculture in the region.

Hearings Officer's Analysis: This factor is not found within Statewide Planning Goal 14 but is instead a consideration created internally at Metro.

As noted by staff in the staff report, Metro and Washington County completed an urban and rural reserve process that designated the most important land for commercial agriculture in the county as rural reserve and the land most suitable for urban development as urban reserve. This means that development within any urban reserve will, at least presumptively, protect farmland that is most important for the continuation of commercial agriculture in the region.

However, this factor seems to reach beyond that concern and require further differentiation of urban reserve areas, at least to the extent that any of these urban reserves are still in commercial agricultural production. Of the six sites studied in Sherwood West urban reserve area, none appear to have any significant commercial agriculture. As such, it seems their agricultural output does not form a significant component of the Sherwood area's economy.

The applicant points out that development of sites within an urban reserve that are closest to the existing UGB and to areas within the UGB that actually contain urban-level development, helps to keep agricultural and forest land further from the UGB and urban areas in unaffected operation until such time as urban development grows further in that direction.

MC 3.07.1425(c)(8): If the Council determines there is a need to amend the UGB, the Council shall evaluate areas designated urban reserve for possible addition to the UGB and shall determine which areas better meet the need considering

(8) avoidance of conflict with regionally significant fish and wildlife habitat.

Hearings Officer's Analysis: This factor is not found within Statewide Planning Goal 14 but is instead a consideration created internally at Metro.

The Sherwood West urban reserve has some significant fish and wildlife habitat within in it, much of which is associated with Chicken Creek. According to the Sherwood West Concept Plan, Steelhead *(Oncorhynchus mykill),* a federally listed species, are known to exist within Chicken Creek. Sites located closer to Chicken Creek would therefore tend to be less suitable for this project.

All of the sites *except* for Sites B and C are constrained by a significant or moderate level of natural resources:

Site A has a wetland right in the middle, and the entire western portion of this site is mostly creek, and its drainage discharge is right into Chicken Creek (see Narrative, p. 25).

Site D has creek drainage running through the southern portion of the site. Since there is no established public storm drainage anywhere in the vicinity, so a costly system to route storm discharge would have to be built with input from the City of Sherwood and Clean water Services to avoid negatively impacting significant fish and wildlife habitat.

Site E is steeply sloped down to the east towards Highway 99, with a grade change around 75 feet. There are no established public storm drains in the vicinity. so a costly system to route storm discharge would have to be built with input from the City of Sherwood and Clean water Services to avoid negatively impacting significant fish and wildlife habitat.

Site F has creek drainage and potential wetlands running through the entire site (see Narrative, p. 30), so extensive mitigation measures could be required to avoid negatively effecting significant fish and wildlife habitat.

As shown on Figure 6 of the Sherwood West Concept Plan, the western edge of Site B abuts a tributary of Chicken Creek and includes some associated wildlife habitat. Site C has no such identified resources, and, therefore, the hearings officer concludes and finds that Site C best avoids conflicts with regionally significant fish and wildlife habitat.

MC 3.07.1425(c)(9): If the Council determines there is a need to amend the UGB, the Council shall evaluate areas designated urban reserve for possible addition to the UGB and shall determine which areas better meet the need considering

(9) ***a clear transition between urban and rural lands, using natural and built features to mark the transition.***

Hearings Officer's Analysis: This factor is not found within Statewide Planning Goal 14 but is instead a consideration created internally at Metro.

The boundaries of Sherwood West do not appear to have been designated according to providing a clear transition between urban and rural reserves using natural or built features. It is bisected in large part at its northern end by Chicken Creek. But Chicken Creek will not form a natural barrier between urban and rural uses, as the Sherwood West Concept Plan contemplates development on either side of the creek. So, Chicken Creek will end up being a natural area within an urban area - not a boundary between urban and rural uses. Because the boundaries of Sherwood West were not created according to natural or built features, and because all of the six sites studied within Sherwood West for a new high school are internal to Sherwood West and will eventually be in the midst of other urban area, this factor is not particularly relevant to this application. Even so, as staff notes in the staff report, there are no built or natural features that would mark even an internal transition from urban to rural lands for Sites C and E. Site B is flanked by Chicken Creek, which could form such a barrier, but, again, there will be urban development on the other side of that "barrier" one day. Site A is also flanked by Chicken Creek, but the creek and natural resources associated with that site also limit the development

potential of that site for a new high school. Further, there will be urban development on the other side of those natural barriers one day, so they will not really mark the transition that this factor contemplates. Site D has some natural resources on it that could provide a barrier of sorts, but which also reduce the buildable area, and, again, the concept plan does not contemplate these natural areas being any sort of permanent barrier between urban and rural uses. Site F has a large amount of wildlife habitat, but that habitat, too, cuts into the buildable area and will provide no such barrier as contemplated by this factor.

Hearings Officer's Analysis and Summary of the Nine MC 3.07.1425(c) Locational Factors

In summary, little weighing and balancing is needed in this case, because the applicant's preferred alternative, Site C, nearly always came out as the site that best met the intent of each individual factor. With respect to two factors, Sites B and C equally met the intent of the factor, and with respect to another factor Site B came in a fairly close second to Site C. All in all, however, Site C best met all of the factors. In sum, all of the factors were applied and evaluated, and on-balance, Site C came out ahead. Thus, whatever weighing and balancing of all of the nine locational factors with respect to the six sites that could potentially accommodate a new high school is required, the Hearings officer finds that the applicant's analysis clearly demonstrates that the proposed site, Site C, better meets the applicable locational factors than the other sites.

No discussion presented by any opponent to the contrary is convincing. In disputing the District's location factor analysis, the primary opponent pointed to individual aspects of different sites and argued why it believed those aspects made one site better than another with respect to a given, discrete aspect. The opponent's sniping is ineffective, however, because unlike the applicant, the opponent did not evaluate the sites *holistically* based on the nine enumerated factors. Stated it another, it may be the case, that some of the alternative sites fair better than the applicant's preferred alternative in some particular or another. No site is perfect, after all, and each site has its positives and its negatives. However, when viewed as a whole, on balance, the applicant's preferred alternative fairs the best over the broadest consideration of the nine factors. Therefore, the opponent failed to demonstrate that the MC 3. 07.1425(C) factors findings are deficient.

The opponent also argues that Sherwood South cannot be ruled out as a possible area for the Major Amendment even though it has not been concept planned under MC 3.07.1110, because MC 3.07.1110(6) provides that such an area can be added even if it has not yet been concept planned. *See* Brager letter dated June 23, 2017 at p.7. MC 3.07.1110(6) states:

> ***"If the local governments responsible for completion of a concept plan under this section are unable to reach agreement on a concept plan by the date set under subsection (a), then the Metro Council may nonetheless add the area to the UGB if necessary to fulfill its responsibility under ORS 197.299 to ensure the UGB has sufficient capacity to forecasted growth."***

First, the MC 3.07.1110(6) exception is restricted to situations where "the local governments responsible for completion of a concept plan under this section are unable to reach agreement on a concept plan." There is no evidence that any local governments responsible for a concept plan for Sherwood South are unable to reach agreement on that concept plan. In fact, there seems to be no question that the City of Sherwood will be planning for Sherwood South-it just hasn't done it yet, and has no current plans to do so. Second, the fact that no pre-UGB expansion concept planning has been done for Sherwood South is just one of many reasons the District gave for why Sherwood South ceased to be considered as a viable area for the new high school. The opponent has not pointed to an area within Sherwood South that would meet the District's siting criteria. In fact, in the opponent's June 23, 2017, letter, the opponent points to "a large block of property" south of the recent Brookman Road annexation area, but then appears to agree that it is too sloped to work as a high school site. See Letter from Jennifer Brager dated June 23, 2017, at p.6.

Metro Code section 3.07.1425(D) The Council may consider land not designated urban or rural reserve for possible addition to the UGB only if it determines that:

1. ***Land designated urban reserve cannot reasonably accommodate the need established pursuant to subsection B of this section; or***
2. ***The land is subject to a concept plan approved pursuant to section 3.07.1110 of this chapter, involves no more than 50 acres not designated urban or rural reserve and will help the concept plan area urbanize more efficiently and effectively.***

Hearing Officer's Analysis: The proposed expansion is within an urban reserve. This criterion is not relevant because the site and surrounding properties to the north, east and south are within an Urban Reserve area (no property within or next to the subject site is outside of urban reserve areas).

This criterion is not applicable.

Metro Code section 3.07.1425(E): The Council may not add land designated rural reserve to the UGB.

Hearing Officer's Analysis: The proposed expansion is not within a rural reserve. This criterion is not relevant because the subject site and surrounding properties to the north, east and south are within an Urban Reserve area.

This criterion is either not applicable or has been met.

Metro Code section 3.07.1425(F): The Council may not amend the UGB in such a way that would create an island of urban land outside the UGB or an island of rural land inside the UGB.

Hearing Officer's Analysis: The subject site and the remaining portion of the Sherwood West urban reserve are adjacent to the City of Sherwood. The transformation of this area from rural to urban represents a logical and methodical way to enlarge an urban area, which will not create an island of urban development outside of the UGB.

The proposed expansion will not create an island of urban land outside the UGB or an island of rural land inside the UGB. The applicant has met its burden of showing compliance with this factor by substantial evidence in the whole record.

Metro Code section 3.07.1440 (B)(1) The applicant shall also demonstrate that:

(1) The proposed uses of the subject land would be compatible, or through measures can be made compatible, with uses of adjacent land.

Hearing Officer's Analysis: The applicant addresses this criterion as follows:

> The proposed major amendment site is surrounded by land that is either within the City of Sherwood or the Sherwood Urban Reserve Area 5B (aka Sherwood West Preliminary Concept Plan Area) (see Attachment 6). The land in the City located north and east of SW Elwert Road is fully urbanized with single-family subdivisions and constructed houses. City land located south and east of SW Elwert Road is the location of the Sherwood Elks Lodge. The Elks Lodge site contains a large area of vacant land around the existing building and parking lot. The Elks Lodge and undeveloped surrounding land is zoned Low Density Residential (LDR).
>
> Land to the north, south and west is currently rural and within the urban reserve area (Sherwood West Concept Plan). This County land is zoned Agricultural Forest (AF) and is a patchwork of sites zoned AF-5, AF-10 and AF-20 with the subject site zoned AF-20. AF-5 has a minimum lot size of 5 acres, AF-10 of 10 acres and AF-20 has a minimum lot size of generally 80 acres. The surrounding property has been highly parcelized and consists of a patchwork of small forests/farms and rural residential properties with none more than 80 acres and many under five acres in size.
>
> The site is compatible with surrounding residential properties as the property has separation provided by existing streets on the north (Haide Road), south (Kruger Road) and west (Elwert Road) boundaries. The eastern boundary consists of mostly forestland with only one house near the site boundary near the northwest corner of the site. All school traffic will be able to access the site

from Elwert Road and will not be routed through existing or proposed residential areas or streets.

While the development of a school site will be the first urban development in the Sherwood West Concept Plan Area, the regional and local plans anticipate redevelopment of this entire area for primarily residential land. Schools typically locate within residential areas and are considered to be compatible with residential land uses when the impacts of the school on residential uses are considered within the design.

The first urban development projects to occur within rural areas typically can cause some tension between existing residents who welcome the change, and those who are content with its current rural character. So well-designed solutions to deal with compatibility issues may still feel like "encroachment" to rural residents. The development of the site will include public involvement during the design development and permit approval process, allowing ample opportunity for the neighbors to help address specific compatibility issues. In the long term, establishing the school will provide the opportunity for subsequent urban developments to be oriented and designed to optimize their physical relationship with the school. This will allow the development of future Sherwood West properties to "grow up together" compared to infilling a large public facility into an established residential neighborhood.

The subject site borders the UGB on the east along SW Elwert Road. Adjacent land uses include single family homes and the Sherwood Robin Hood Elk Lodge that also includes some vacant land that is zoned for residential use, which is expected to develop over time. Directly to the southeast across Highway 99W is the Sherwood Regional Family YMCA. To the north across SW Haide Road is mostly open land with some out-buildings and one dwelling that appears to be vacant. To the west are forested parcels with one dwelling adjacent to the NW corner of the subject parcel. To the south across SW Kruger Road is the Countryside Community Church, limited agricultural activities and four dwellings. The typical weekend use of the church complements the weekday uses of a school. The land to the south also borders Highway 99W.

The District has developed a preliminary site plan that shows the school buildings located in the center of the property with sports fields generally to the south and west and parking located to the north. The southeast corner of the site will contain the realignment of SW Elwert and SW Kruger Roads. The three adjacent roads provide some buffering for the very few adjacent homes and the NW Natural Gas Easement also buffers the southwest corner of the site. The district currently has a High School Design Committee charged with working with the design team to provide advice on a number of design elements and a couple of community input meetings will be scheduled in 2017. In addition there will be public input opportunities during the City's development review and permit approval process.

Finally the subject site is within a very large urban reserve area that has the potential to urbanize over time. As noted previously this portion of the Sherwood West urban reserve was identified as phase A in the preliminary concept plan the City completed. This allows the adjacent land to be designed and developed in a manner that enhances and embraces this important community facility. Therefore the proposed use of the site can be made compatible, through measures, with the uses of the adjacent land.

The applicant has met its burden of showing compliance with this factor by substantial evidence in the whole record.

Metro Code section 3.01.1440 (B)(2) The applicant shall also demonstrate that:

If the amendment would add land for public school facilities, the coordination required by subsection C(5) of section 3.07.1120 of this chapter has been completed.

Hearing Officer's Analysis: MC 3.07.1120(C)(5) states:

> ***"Provision for the amount of land and improvements needed, if any, for public school facilities sufficient to serve the area added to the UGB in coordination with affected school districts. This requirement includes consideration of any school facility plan prepared in accordance with ORS 195.110."***

The applicant addresses this requirement as follows:

> This requirement is satisfied as described in Section III of the application. In summary, the Sherwood School District adopted a long-term facilities plan in January of 2008. The long-term plan assumed that additional school capacity would likely be needed within 10 years of the plan's adoption. (The 2008 Long Term Facilities Plan is provided in Appendix C).
>
> In 2014 to 2016, the School District did significant planning prior to placing a bond on the November 2016 ballot that was ultimately approved by voters. This included inventorying existing school facilities, completing updated demographic information, as well as significant planning and public outreach to identify a plan for school facilities that includes the proposed new high school.

As the District points out, it experienced substantial growth in the late 1990's and early 2000's leading to a community effort in 2005 to determine facility needs. This resulted in the successful 2006 bond measure which included funding for an addition to the current high school to increase capacity to 1,550 students, consistent with phase 1 of the 2006 high school master plan. The District completed a long term facilities plan in 2008. Current enrollment at the high school is over 1,700 students and projections show over 2,250 students by the 2025-26 school

year. In early 2014 the District's Long Range Planning Committee made recommendations to the School Board regarding enrollment and growth challenges, facilities analysis and needs and financing options. In 2015 the District documented the condition and educational adequacy of its facilities, leading to bond visioning and steering committees in 2016. This resulted in the District's voters approving a bond measure in 2016 providing funding for school improvements including construction of a new high school. The District and the city of Sherwood have an intergovernmental agreement to share sport fields with most of the facilities occurring on school grounds. Thus the coordination required by subsection C(5) of Metro Code Section 3.07.1120 has been completed.

The applicant has met its burden of showing compliance with this factor by substantial evidence in the whole record.

Metro Code section 3.01.1440(B)(3) The applicant shall also demonstrate that:

If the amendment would add land for industrial use pursuant to section 3.07.1435, a large site or sites cannot be reasonably be created by land assembly or reclamation of a brownfield site.

Hearing Officer's Analysis: The proposed expansion is not for industrial use. This criterion is not applicable.

Findings Addressing OAR 660- Division 24 and the Applicable Statewide Planning Goals.

OAR 660-024-0020 requires that all UGB amendments apply the Statewide Planning Goals to the amendment process. This directive applies to the whole gamut of UGB amendments, from the every-six-year Metro legislative review of its UGB to a quasi-judicial major amendment under the Metro code to provide land for a specific public need, such as a school or other public facilities. However, this does not mean that the Goals will apply equally and in the same way in each situation. It may even be that one or more of the Goals may not apply at all to a given situation.

The primary opponent asserts that the applicant failed to adequately address the Statewide Planning Goals. *See* Letter from Jennifer Bragar dated June 6, 2017. While that was correct at the time Ms. Brager wrote her letter, the applicant followed up two days later with proposed findings. The Hearings officer finds that the applicant did adequately demonstrate compliance with the applicable Statewide Planning Goals by substantial evidence in the whole record, and adopts the applicant's suggested findings, with slight modification, as set forth below. The opponent's specific objections are also addressed below.

OAR 660-024 -0020

OAR 660-024-0020 sets out which of the Statewide Planning Goals are applicable to UGB amendments. The Goals will have a somewhat limited applicability to a UGB amendment for a specific need, but the relevant Goals are addressed below.

Goal 1 - Citizen Involvement

"To develop a citizen involvement program that insures the opportunity for citizens to be involved in all phases of the planning process."

Hearings Officer Analysis: This Major Amendment application does not alter Metro's citizen involvement program. Consequently, compliance with Goal 1 is established through compliance with the public involvement requirements of Metro's code. Those requirements have been followed.

Goal 2 - Land Use Planning
"To establish a land use planning process and policy framework as a basis for all decisions and actions related to use of land and to assure an adequate factual base for such decisions and actions."

Hearings Officer Analysis: OAR 660-024-0020(1)(a) states that the exceptions process in Goal 2 and OAR 660, Division 4 are not applicable unless a goal exception is part of the application. A goal exception is not part of the Major Amendment application and so those provisions will not be addressed. Other than goal exceptions, Goal 2 requires the establishment of a comprehensive plan, a need for coordination of government entities in planning, and the need for public hearings and an opportunity for comment and review.

1) Coordination: This Major Amendment application has required coordination with and between Metro, Washington County, the City of Sherwood, and public service providers including ODOT, Tualatin Valley Fire & Rescue, and Clean Water Services. This includes coordination at the Major Amendment level and at the Sherwood West Concept Plan level. Therefore, the required coordination has occurred.

2) Public Hearings/Opportunities for Comment and Review: Metro staff sent the required notice for the hearing before the hearings officer, and there has been opportunity for comment and review of the application materials. The hearing was continued, which provides additional opportunity for comment and review, and the hearings officer has stated he is likely to leave the record open after the second hearing concludes. There will also be at least one hearing before Metro Council. Further, the proposed high school will have additional approvals to obtain after the Major Amendment application has been approved, such as annexation, a zone change and a conditional use permit, all of which include a public involvement component. Therefore, there has been and will continue to be public hearings and an opportunity for comment and review.

Goal 3- Agricultural Lands

Hearings Officer Analysis: Not applicable under OAR 660-024-0020(3)(b).

Goal 4 - Forest Lands

Hearings Officer Analysis: Not applicable under OAR 660-024-0020(3)(b).

Goal 5 - Natural Resources, Scenic and Historic Areas, and Open Spaces

"To protect natural resources and conserve scenic and historic areas and open spaces."

Hearings Officer Analysis: OAR 660-024-0020(1)(c) requires states that Goal 5 and its related rules apply only in areas added to the UGB. The area to be added to the UGB is the site identified in this application. There are no Goal 5 resources on the site identified by Metro, Washington County or the City of Sherwood in the Sherwood West Concept Plan. Therefore, this goal is not applicable.

Goal 6 - Air, Water and Land Resources Quality
"To maintain and improve the quality of the air, water and land resources of the state."

Hearings Officer Analysis: As LUBA recently stated:

> "[t]he relevant Goal 6 inquiry for a decision that amends comprehensive plan and zoning map designations, without approving any particular new development, is whether there is a reasonable expectation that applicable state and federal environmental quality standards can be met at the time the property is developed in the future. *See Friends of the Applegate Watershed v. Josephine County*, 44 Or LUBA 786, 802 (2003), (at the post-acknowledgment plan amendment stage, a local government need only show it is reasonable to expect that applicable state and federal environmental quality standards can be met); *see also Salem Golf Club v. City of Salem*, 28 Or LUBA 561, 583 (1995) (same).

See Nicita v. City of Oregon City, ___ Or LUBA ___ (LUBA No. 2016-045, Jan 25, 2017, slip op. at 27.

The hearings officer does not see how there could not be any "reasonable expectation that applicable state and federal environmental quality standards can be met at the time the property is developed [as a school]." The proposed school campus poses no significant adverse air, land or water quality impacts. There are no expected significant "waste or process discharges" from the new high school campus. The high school does not "process" anything and so there are no process discharges associated with the high school. Any waste that will be produced by high school activities will be handled through the normal course of business. For example, any solid waste generated by the school will be subject to recycling and solid waste collection by the franchised garbage hauler for the area. Any waste associated with sanitary sewers or storm events will be handled as part of the public sanitary and storm water facilities. As the property develops, the District will be required to coordinate with the state Department of Environmental Quality and with Clean Water Services to ensure that air, land and water resources are not degraded. As noted in response to Goal 5, no significant Goal 5 resources have been mapped on this property by Metro, Washington County or the City. Further, the proposed new high school site is adjacent to the existing UGB and will allow for efficient multi-modal transportation of the

bulk of the student population - especially as Sherwood West builds out with primarily residential uses in the decades to come.

The primary opponents make a half-hearted attempt to challenge the applicant's Goal 6 compliance, but its argument is too vague and too unfocused to provide a basis for denial. First, the opponent state that "air quality issues should be examined for a new school to be built near Highway 99." *See* letter from opponent's counsel Jennifer Brager, at p. 2, 6. This argument appears to assume that highway 99 causes sufficient level of pollution that a school should not be located in close proximity thereof. The opponents suggest that a "buffer" and "distancing is needed. The opponent never suggests what a proper buffer would be. The Hearings officer finds this concern to be speculative, unsupported by substantial evidence in the record, and beyond the scope of Goal 6's reach. Even if the hearings officer believed this was a valid concern, the hearings officer finds the air quality benefits of locating a school away from a major arterial would be offset by the additional VMT needed to transport school children a further distance.

Goal 7- Natural Hazards

"To protect life and property from natural disasters and hazards."

Hearings Officer Analysis: Goal 7 (Areas Subject to Natural Hazards). Goal 7 requires local governments to evaluate risks to people "upon receiving notice" of new hazard information from DLCD, and based on evaluation of that risk to prohibit development in areas "where the risk to public safety cannot be mitigated." Natural hazards for purposes of this goal are: floods (coastal and riverine), landslides, earthquakes and related hazards, tsunamis, coastal erosion, and wildfires.

No natural hazards have been mapped on the properties that comprise the proposed school site. (*See, e.g.,* Sherwood West Concept Plan, figures 6 and 7.) The applicant's proposed site appears to be devoid of any natural hazards: It is not in a flood plain or a coastal zone. It does not have steep slopes that would be vulnerable to landslides. It does not contain soils that are exceptionally vulnerable to being an earth quake hazard (at least any more so in comparison to the rest of the Portland Metro region generally). Therefore, this goal is inapplicable.

Goal 8- Recreational Needs

"To satisfy the recreational needs of the citizens of the state and visitors and, where appropriate, to provide for the siting of necessary recreational facilities including destination resorts."

Hearings Officer Analysis: As set forth in the Narrative, the District provides most of the athletic fields for the City of Sherwood. The City and the District have had a long history of partnering in the provision, use, and maintenance of these fields so that recreational opportunities are provided as efficiently as possible. The new high school campus will include a number of new fields and sports facilities on which the City and the District will continue to partner. The new fields and sports facilities will be in addition to the existing fields and sports facilities already in use as part of the existing school facilities. See page 32 of the Narrative for additional

detail. The new high school campus, then is supportive of this goal, as it will help satisfy the need for recreational facilities in the city and in the District.

Goal 9 - Economic Development

> ***"To provide adequate opportunities throughout the state for a variety of economic activities vital to the health, welfare, and prosperity of Oregon's citizens."***

Hearings Officer Analysis: Goal 9 applies to areas within an urban growth boundary. OAR 660-09-0010(1). *Port of St. Helens v. Land Conservation & Development Committee*, 164 Or App 487, 495, 996 P 2d 1014 (2000). Goal 9 requires that jurisdictions provide adequate opportunities for a variety of economic activities. Goal 9 planning is limited to areas within UGBs, and local land use plans are required to comply with Goal 9 at periodic review and whenever a jurisdiction undergoes a post-acknowledgment plan amendment that changes the plan designation of more than two acres of land from industrial/employment use to a nonindustrial/non-employment use. OAR 660-009-0010(1), 0010(2), and 0010(4).)

Pursuant to OAR 660-024-0020, certain Goals, including Goal 9, are also applicable when the UGB is amended. The Major Amendment application expands the UGB to allow an existing high school to move several miles away from one site within the City of Sherwood to another site that will be annexed into the City of Sherwood for that purpose. This appears to be fairly neural from the standpoint of economic opportunities.

The opponent cites *Barkers Five, LLC v. LCDC*, 261 Or App 259, 289 (2014), and states that Goal 9 "requires a determination of the potential future land need for employment and is supposed to occur at the time the UGB is expanded, " and that "the school itself has to be analyzed as an 'other employment use' as defined under OAR 660-009-0005 because it will involve a governmental employment activity. " *See* letter from Jennifer Bragar dated June 6, 2017, at p. 2. That might be true for a UGB amendment that proposes to add employment land, but it not explain the relevance of Goal 9 to this particular UGB application, which is specific to a need for land for a new high school. In this case, the UGB amendment is targeting a specific need, *i.e.,* the relocation of an existing high school several miles away within the same city. Goal 9 is not applicable as the UGB expansion is for a specific need for a high school.

The cited passage from *Barkers Five* should be read in context. LCDC was referring to OAR 660-027-0050(2) and Metro's analysis for employment land needs occurring as part of its urban growth report. There is nothing in that passage that would make such an analysis a requirement for a major amendment application submitted under ORS 197.299(4). As stated in the findings for Goal 9, this goal is not applicable to a UGB amendment for a specific high school need. To the extent that the high school will have any Goal 9 impacts, the Hearings officer finds those impacts will be positive in terms of temporary construction jobs during development and provision of part-and-full time employment year-round.

Furthermore, if the opponent is implying that Metro must engage in a full-blown economic opportunities analysis in the context of a major amendment application for a high school, that conclusion does not follow from the opponent's stated premises or from Goal 9. The

opponent's argument is not developed well enough to allow the hearings officer to evaluate it on the merits: the opponent has not explained how this application actually impacts the requirements or scope of Goal 9.

Goal 10 - Housing

"To provide for the housing needs of citizens of the state."

Hearings Officer Analysis: The applicant states that Goal 10 is not applicable as the UGB expansion is for a specific need for a high school. The opponent states that "Goal 10 is implicated because housing opportunities will be lost as a result of this large land grab by the school district." *See* letter from Jennifer Bragar dated June 6, 2017, at p. 2. While it is true that any use of land for non-residential purposes results in that land not being available for housing, that truism does not create a Goal 10 violation. As best as the hearings officer can determine, the opponent is arguing that the Preliminary Sherwood West Concept Plan shows a small school site surrounded by housing, and the applicant's current plan shows the entire site being used for a school and no housing. The opponent concludes that this change in plans 'will limit the planned housing in the Sherwood West Concept Plan Area," which, according to the opponent, "has Goal 10 implications." *See* letter from Jennifer Bragar dated June 6, 2017, at p. 2-3. It appears that the opponent is arguing that the Concept Plan locks in the density and mix of housing, and any change to the Concept Plan requires an analysis of Goal 10 compliance.

The hearings officer finds that the concept plan does not have the regulatory effect that the opponent assigns to it. The opponent cites to nothing in any local zoning code or Comprehensive Plan that gives this sort of regulatory effect to this (or any other) concept planning effort. Goal 10 would not have that type of regulatory effect until the property subject to the Concept Plan is brought into the UGB and assigned urban zoning designations. As currently situated, the land at issue is not within the UGB and so is not considered "buildable lands" under Goal 10 and Goal 14, and is not included in any buildable land inventory. Therefore, there is no buildable lands inventory to measure the Major Amendment application against and Goal 10 does not anticipate that there would be in this situation. By its terms, Goal 14 requires that jurisdictions "provide for the housing needs of citizens of the state" by inventorying "buildable lands for residential use. " Goal 10 defines buildable lands as lands in "urban and urbanizable areas that are suitable, available and necessary for residential use. " Under the definitions section of the Statewide Planning Goals, "urban land" is defined as "land inside an urban growth boundary, " and "urbanizable land" is defined as urban land, i.e., land inside a UGB, that is presently unavailable for any number of reasons. Therefore, the opponent' argument that, in the context of a Major Amendment, Goal 10 requires Metro to "demonstrate that its actions do not leave it with less than adequate residential land supplies" is wrong..

Moreover, as the applicant points out, the City's urban reserves include a 50-year land supply for the City. There is no evidence that siting a new high school in Sherwood West, in the location that the Concept plan contemplated a new school, will in any way negatively impact the ability of the City to provide for its housing needs, especially when Sherwood West is combined with Sherwood North and Sherwood South.

.

The opponent also complains that the applicant is seeking to bring in 82 acres when it defined its current need as requiring only a 50-acre site. *See* letter from Jennifer Bragar dated June 6, 2017, at p. 2. The hearings officer is at a loss to understand the relevance of this argument to a Goal 10 challenge. The opponent's argument is simply not developed sufficiently to allow the hearings officer to understand the nature of the complaint.

The opponent also argues that an 82-acre school site "contradicts the two school sites considered in the Preliminary Sherwood West Concept Plan. *See* letter from Jennifer Bragar dated June 6, 2017, at p. 2. However, Concept Plans are not regulatory documents in the sense that they do not limit the size of planned facilities. The Concept Plan took the provision of additional school sites into account when it was developed. Although the concept plan includes two identified school sites, it is important to remember that the Concept Plan is a general plan that addresses how the area will develop generally. The Concept Plan does not specify the types of schools that the conceptual school sites reflect, e.g., elementary, middle or high school. Therefore, one should not view the blue squares denoting school sites in the Concept Plan in the literal sense of trying to determine how big the Concept Plan believed the sites will ultimately be. Such information comes from future refinement of the Concept Plan after areas are brought into the UGB.

Moreover, as the applicant points out, Goal 10 concerns itself with land already within a UGB, which the subject property is not. Therefore, Goal 10 has very limited applicability to a Major Amendment application for a new public school site. That said, the justification for the proposed expansion area of 82 acres is included in the Narrative. (Narrative at 31-32.) As set forth in the Narrative, approximately seven of the 82 acres will be needed for transportation improvements that will support the new high school. There is also a 40-foot wide gas pipeline easement that runs across the site, occupying approximately 2.2 acres but requiring protection of additional, adjacent property of approximately 20 feet on either side. This pipeline easement essentially gives the site an irregular shape, which reduces the efficiency with which it can be developed. The Narrative also discusses the shared sports fields arrangement between the City of Sherwood and the District that provides for additional ballfields. The District would also note that Figure 3 of the Narrative depicts a conceptual layout of the high school site and related transportation improvements over the entire 82-acre area. (Narrative at 7.) As one can see on that conceptual layout, the entire site will be fully utilized.

In the Appendix 6 Service Provider Interviews, the District warns that the current high school was at-capacity at the time of the interview (the appendix is dated June 15, 2015), and with the growth expected in Sherwood the high school could be expected to become over-capacity. (See Appendix 6, pages 3-4.) The District stated that expanding the existing high school and adding a new high school to the District would both be explored. The relevant information to be gleaned from the Concept Plan is that the majority of Sherwood West is intended to be developed with varying densities of housing and that the Concept Plan integrated the need for at least two additional school sites, with an understanding that the existing Sherwood High School would soon be over-capacity.

In its June 23, 2017 letter, the opponent argues that Metro "must demonstrate that its actions do not leave it with less than adequate residential land supplies in the types, locations,

and affordability ranges affected." *See* letter from Jennifer Bragar dated June 23, 2017, at p.2. As support for this requirement, the opponent relies on *Burk v. Umatilla County*, 20 Or LUBA 54 (1990). In *Burk*, the Port of Umatilla filed an application with the City of Umatilla to amend the city's comprehensive plan map for a 42-acre area within the city's urban growth boundary, but outside the city limits, from single-family residential to industrial. The city's buildable land inventory for housing included the 42 acres, because that acreage was within its UGB. Even with the 42 acres included in the buildable lands inventory, the city was deficient in land available for single-family housing. The city approved the map amendment even though it increased that deficiency, which earned the city a remand by LUBA.

The facts of *Burk* are different than those presented by this Major Amendment application. The land in question in *Burk* was inside a UGB and was already planned for zoned and residential uses. That is a key factual difference from the present case, because the land in this case is planned for agriculture and forestry. The land proposed to be added to the UGB is not "buildable land," and is not in any current inventory. For this reason, the Goal 10 analysis required in *Burk* is not applicable here.

Goal 11 - Public Facilities and Services

> ***"To Plan and develop a timely, orderly and efficient arrangement of public facilities and services to serve as a framework for urban and rural development."***

Hearings Officer Analysis: As set forth in response to MC 3.07.1425(c)(2), the Sherwood West Concept Plan extensively studied the provision of public facilities and services with respect to that urban reserve. The concept plan was prepared with analyses of existing sanitary sewer, water, and storm water conditions and analyses of how those systems need to be upgraded, extended, and phased to meet the future development of Sherwood West. The concept plan was prepared in coordination with all of the future service providers, including those services that will be provided by the City and those that will be provided by others, including Clean Water Services. The concept plan discusses the provision of public facilities and services to the area at pages 16-18 and 40-44, as well as in Appendix 3 (Existing Conditions Report) and Appendix 6 (Service Provider Interviews). According to the Concept Plan, the area in which the school site is proposed "presents the best near-term opportunity for development in Sherwood West," and the cost to serve the area is on the lower end of the cost scale. (Sherwood West Concept Plan, pages 42-43.) The District used this work as a jumping off point to study the proposed site for inclusion in the UGB (as well as other sites within Sherwood West). See Narrative, pages 24-31 and Application Appendix A (New High School Preliminary Site and Utility Exhibit) and Appendix B (Service Provider Letters). All of the foregoing information addresses the orderly and efficient arrangement of sanitary sewer, water, and storm drainage facilities to serve the new school property, as well as the larger Sherwood West area and all of the evidence consistently points to the chosen property as a property that can served in a timely, orderly, and efficient manner.

The opponents argue that Goal 11 is not met, because the local sewer and water agency (Clean Water Services) has a concern about the installation of a temporary pump station. *See* letter from Jennifer Brager dated June 23, 2017, at p. 5. The opponents offer no testimony, expert

opinion, or evidence that would call into question the conclusions reached by the applicant's engineers, KPFF. Goal 11 does not require that every technical engineering solution be worked out at the time of UGB amendment. The KPFF engineers seem to believe that an engineering solution is not only possible, but likely, which is all that is required at this stage. See KPFF memo dated June 13, 2017. This Hearings officer has evaluated the opinion of the KPFF engineers, and finds them more credible.

The opponents further argue that "fire flow tests have not been completed." *See* Letter from Jennifer Brager dated June 23, 2017, at p. 5. The opponents do not explain why fire flow tests are mandated by Goal 11 in the context of a UGB amendment, nor is it obvious why they would be. The KPFF engineers seem to be satisfied that the fire flow issue can be adequately handled, and this hearings officer finds them more credible.

Goal 12 - Transportation

"To provide and encourage a safe, convenient and economic transportation system."

Hearings Officer Analysis: Early LUBA cases suggested that a local government could not "pass the buck" by deferring compliance with Goal 12 and the TPR until the time of site plan review.[13] However, more recent case law clarifies that conditions of approval can be used to limit new development until such time as the TPR is addressed. For example, in *Citizens for Protection of Neighborhoods v. City of Salem*, 47 Or LUBA 111 (2004) (*Citizens*), the City of Salem approved a zone change to allow mixed residential and commercial use of a 275-acre property. That approval included a condition that prohibited development of the property until later adoption of a master plan for the property. The City of Salem's code criteria applicable during the master plan process included requirements that were substantially identical to the requirements of the TPR. Based on the condition requiring master plan approval, the city found that the zone change did not significantly affect the transportation facility because no development could occur until the subsequent master plan phase. *Id*. at 115, 116. LUBA held that the city could properly conclude that the rezoning of the property did not significantly affect any transportation facility because the condition essentially prohibited development on the property without first showing that any allowed development is consistent with the function, capacity and performance standards of affected transportation facilities. *Id*. at 120.

In *ODOT v. City of Klamath Falls (Southview Dev'l, LLC)*, 39 Or LUBA 641, 660, *aff'd* 177 Or App 1, 34 P2d 667 (2001), LUBA affirmed that portion of a county decision which approved a zone change with a condition that prevented additional development from impacting a transportation facility until such a time in the future when the TPR is addressed. LUBA found that this condition was sufficient to ensure compliance with the TPR in the interim.

Finally, in *Willamette Oaks, LLC v. City of Eugene,* 59 Or. LUBA 60 (2009), the city approved a zone change, and imposed a condition of approval prohibiting development of the property without approval of a planned unit development (PUD) application and a showing of

[13] *1000 Friends of Oregon v. City of North Plains*, 27 Or LUBA 372 (1994), *aff'd*, 130 Or App 406 882 P2d 1130 (1994); *Concerned Citizens of the Upper Rogue v. Jackson County*, 33 Or LUBA 70 (1997).

consistency with the TPR as part of the PUD application and review. LUBA approved this approach, stating as follows:

> In sum, with one caveat discussed below,[14] we think it is permissible for the city to defer consideration of compliance with the TPR to a subsequent review process at the time actual development is proposed, provided that the zone change or plan amendment is effectively conditioned to prohibit traffic or other impacts inconsistent with the TPR's requirements unless and until those requirements are fully addressed. Applicant offers no reason in the present case why deferring the application of the provisions of the TPR to a later PUD application process is insufficient to ensure that allowed uses of the subject property are consistent with

---

[14] LUBA stated in a footnote that the PAPA procedural requirements would still need to be satisfied as part of the deferred process:

> The caveat mentioned above is that unless the local government takes steps to ensure otherwise, the subsequent review process may not require a comprehensive plan or land use regulation amendment and therefore will not trigger [**12] the notice obligations of a post-acknowledgement action under ORS 197.610 *et seq*. Under those statutes, a local government that amends its comprehensive plan or land use regulations, including zone changes, must provide to the Department of Land Conservation and Development (DLCD) timely notice of the hearing on the proposed amendments as well the decision adopting the amendments. DLCD, in turn, provides notice of the proposed amendments and any subsequent adoption to persons or agencies who request such notice. OAR 660-018-0025. The requirement to provide notice of post-acknowledgment plan amendments to DLCD and other parties is a critical component of a statutory and rule-based scheme that is designed to ensure that post-acknowledgment plan and land use amendments comply with the applicable statewide planning goals and rules, including the TPR. *See Oregon City Leasing, Inc. v. Columbia County, 121 Or App 173, 177, 854 P2d 495 (1993)* (failure to provide DLCD the notice required under ORS 197.610 *et seq*. is a substantive, not procedural error). The efficacy of that scheme is undermined if a local government defers consideration [**13] of compliance with the TPR to a subsequent review process that does not provide equivalent notice to that required by ORS 197.610 *et seq*. Without such notice, it is possible that DLCD and parties who may rely on DLCD's re-notice, potentially including ODOT, may not learn of the review proceeding or have an opportunity to participate in that proceeding.

> the function, capacity and performance standards of the affected transportation facilities. *ODOT v. City of Klamath Falls,* 39 Or LUBA at 660.

Under OAR 660-024-0020(1)(d), the Transportation Planning Rule ("TPR") need not be applied to a UGB amendment if the land will remain zoned as urbanizable. That will be the case with the properties subject to the proposed UGB amendment. The current AF-20 zoning will remain until the is annexed into the City of Sherwood. During the forthcoming Metro Title 11 concept planning process for the properties, the City will determine the appropriate zone and this will include a TPR analysis. The zoning will not actually be changed, however, until after annexation.

With respect to Goal 12 generally, as set forth in response to MC 3.07.1425(c)(2), the Sherwood West Concept Plan extensively studied the provision of public facilities and services, including transportation, with respect to that urban reserve. The concept plan analyzed the existing transportation system and how that system will need to be upgraded, extended, and phased to meet the future development of Sherwood West. The concept plan was prepared in coordination with all of the future transportation service providers, including Washington County and ODOT. The concept plan discusses the transportation system within the plan area at 18-21, 40-44, as well as in Appendix 3 (Existing Conditions Report), Appendix 6 (Service Provider Interviews), and Appendix 8 (Transportation Options Alternative Analysis Report). The District used this work as the jumping off point to study the proposed site for inclusion in the UGB (as well as other sites within Sherwood West). See Narrative at pages 10-11, and Appendix B (Service Provider Letters). The District also engaged a licensed traffic engineer to prepare the March 15, 2017, Sherwood High School UGB Expansion Transportation Study (the "Transportation Study") to address the provision of a safe, convenient, and economic transportation system for the new high school site. (The Transportation Study has been submitted to the record.) The Sherwood West Concept Plan takes a higher-level look at the transportation needs of the Sherwood West area in general, including the need for new streets and intersection improvements. The Narrative provides general information about how the school site will be served and the Transportation Study provides more detail than is commonly found at the UGB expansion stage, but finds that, with some mitigation improvements, a new high school on the proposed site can be served by the appropriate transportation system. The Transportation Study will become more relevant at the Title 11 concept planning and annexation stages of the high school site development. Because the new high school is very near to an existing, urban-level street system, and because Washington County and the City will be constructing a new intersection improvement adjacent to the new high school, the provision of transportation services to the new school will be more economical. According to the concept plan, the area in which the school site is proposed "presents the best near-term opportunity for development in Sherwood West," and the cost to serve the area is on the lower end of the cost scale. (Sherwood West Concept Plan, pages 42-43.) In sum, all of the cited evidence supports a finding that it is possible to safely, conveniently, and economically provide for the transportation needs of the new high school.

For this reason, the applicant proposes a condition of approval to the UGB amendment that prohibits any new development on the subject property until a Comprehensive Plan Map and Zoning Map Amendment are completed, and that the TPR will be addressed at that time.

Several opponents expressed concerns about the adequacy of the surrounding transportation system to support the proposed high school. It is tempting to jump ahead to the specific traffic impacts of a proposed use even at this early stage of the land use process. It is important to keep in mind, however, that the Major Amendment application is just the first application in a series of land use proceedings that must occur prior to the high school actually being approved on the property. With respect to the Major Amendment application, Goal 12, OAR 660-024-0060(8), and MC 3. 07. l425(c)(2) are applicable and implicate transportation facilities. The District has submitted findings with supporting substantial evidence to address all of those provisions. The District also submitted additional evidence from its traffic engineer to address particular issues raised with respect to the March 15, 2017, Sherwood High School UGB Expansion Transportation Study. (See June 28, 2017, DKS memorandum.)

No one besides the District provided any evidence or testimony from a traffic engineer regarding any aspect of the Major Amendment application. Opponents correctly point out that there are existing transportation deficiencies in the area that surrounds the proposed high school site. Those opponents also correctly point out that if those deficiencies are not addressed then the new high school will exacerbate them. All of that is true, but it would be expected to be true regardless of where the new high school is sited, *i.e.,* nearly every area in and around Sherwood has existing transportation deficiencies and siting a new high school in any of those areas would impact the transportation system. Where the opponent's logic fails is in the apparent assumption that the transportation impacts of the new high school will not be addressed as part of the planning and permitting processes that are required prior to the new school opening its doors in 2020. That assumption is incorrect.

The laws and regulations that govern the permitting of the new high school simply do not allow the new school to be plopped down anywhere without transportation impacts being analyzed and mitigated in accordance with the law. The specifics of that analysis and mitigation for the chosen site are largely irrelevant at the UGB amendment stage. Instead, those specific transportation impacts will be addressed through subsequent Title ll planning for the UGB amendment area, and through annexation, zone change, and conditional use permit processes. Through these processes, the Transportation Planning Rule will be addressed, appropriate off-site mitigation within an appropriate timeframe will be required, and appropriate frontage improvements for all of the abutting streets will be conditioned. Public involvement is included in each of those steps as part of each of the planning and permitting processes. (See June 28, 2017, DKS & Associates memorandum.)

Goal 13 - Energy Conservation
"To conserve energy."

Hearings Officer Analysis: LUBA and the Courts have never given any regulatory affect to this Goal. The Hearings officer views this goal as being essentially meaningless. The general practice has been for applicants and staff to write some flowery prose that extorts the energy

saving virtues of the project. In this vein, the applicant states:

> As explained under the District's response to MC 3.07.1425(c)(3), which is the analog of Goal 14, Location Factor 3 (ESEE energy consequences), the proposed school site's adjacency to the existing UGB, served by major streets, facilitates multi-modal access for students, teachers, families, and administrative staff to and from the school campus. This will multi-modal facilitation will only increase as Sherwood West builds out into a predominantly residential area with nodes of neighborhood commercial.

Without some baseline standard to measure against, it is difficult to evaluate whether any given proposal will "conserve energy" or not. But at least it sounds good.

For its part, the opponent's arguments do not shed much light on the issue. They merely state that an "energy analysis" must be provided. *See* Letter from Jennifer Brager dated June 6, 2017, at p. 3. The opponents do not explain exactly what an "energy analysis" entails, nor it is particularly apparent on its face. Given that no focused argument concerning Goal 13 was raised by any party, the hearings officer finds that the applicant's proposed findings comply with Goal 13 – whatever it means.

Goal 14 - Urbanization

> ***"To provide for an orderly and efficient transition from rural to urban land use, to accommodate urban population and urban employment inside urban growth boundaries, to ensure efficient use of land, and to provide for livable communities."***

Hearings Officer Analysis: Goal 14 is addressed throughout this submittal.

Goals 15 through 19

Hearings Officer Analysis: These goals are not applicable, as the proposed UGB expansion does not include Willamette River Greenway, Estuarine Resources, Coastal Shorelands, Beaches and Dunes or Ocean Resources.

OAR 660-024-0040 - 0050

OAR 660-024-0050 directs local governments to inventory land inside the UGB to determine whether there is adequate development capacity to accommodate 20-year needs determined in OAR 660-024-0040. The District's Major Amendment application does not directly implicate these rule provisions, because the need for the new high school site did not arise out of an OAR 660-024-0040 overall land needs analysis and subsequent OAR 660-024-0050 buildable lands analysis. A specific need for a new high school site arose out of long-term facilities planning engaged in by the District. However, once the need for the new high school was identified, the District analyzed land that was within both the District boundaries and the Sherwood, Wilsonville, and Tualatin UGBs for land that could accommodate the need for the

new high school based on its suitability criteria. (See Narrative at pages 8-21.) There was no suitable land within those areas. The analysis required by OAR 660-024-0050 tracks closely in some respects with the analysis required by MC 3.07.1425(a), which was addressed by the District in its application. The caveat, however, is that identified specific land need, such as land for a new school, is not the same as a generalized need for more residential land or employment land. Given the specific need for a new school site, MC 3.07.1440(a) allows a UGB expansion tailored to just that need under certain circumstances.

OAR 660-024-0060 - Metro Boundary Local Alternatives Analysis

OAR 660-024-0060 sets forth the provisions that apply when a need within the Metro UGB has been specified and there is no land within the UGB that can accommodate that need. The provisions in OAR 660-024-0060 track closely with the provisions contained in MC 3.07.1425(c), which have been addressed in the District's application submittal, the Metro staff report, and the additional findings submitted by the District in response to the hearings officer's request.

OAR 660-024-0060:

(1) When considering a Metro UGB amendment, Metro must determine which land to add by evaluating alternative urban growth boundary locations. For Metro, this determination must be consistent with the priority of land specified in ORS 197.298 and the boundary location factors of Goal 14, as follows:

(a) Beginning with the highest priority of land available, Metro must determine which land in that priority is suitable to accommodate the need deficiency determined under OAR 660-024-0050.

Hearings Officer Analysis: The highest priority of land available is land designated urban reserve. (ORS 197.298(1)(a).) The District's application included an analysis of urban reserve land.

(b) If the amount of suitable land in the first priority category exceeds the amount necessary to satisfy the need deficiency, Metro must apply the location factors of Goal 14 to choose which land in that priority to include in the Metro UGB.

Hearings Officer Analysis: As set forth in the District's Major Amendment application, there is suitable land within an existing urban reserve to satisfy the need deficiency, i.e., the new high school. Accordingly, the location factors of Goal 14 were applied to that land. Those location factors are the first four location factors found in MC 3.07.1425(c)(1)-(9) and have been addressed in the District's application submittal, the Metro staff report, and the additional findings submitted by the District in response to the hearings officer's request.

(c) If the amount of suitable land in the first priority category is not adequate to satisfy the identified need deficiency, Metro must determine which land in the next priority is suitable to

accommodate the remaining need, and proceed using the same method specified in subsections (a) and (b) of this section until the land need is accommodated.

Hearings Officer Analysis: This is not applicable as there is urban reserve land that can accommodate the need.

(d) Notwithstanding subsection (a) to (c) of this section, Metro may consider land of lower priority as specified in ORS 197.298(3).

Hearings Officer Analysis: This is not applicable as there is urban reserve land that can accommodate the need.

(e) For purposes of this section, the determination of suitable land to accommodate land needs must include consideration of any suitability characteristics specified under section (5) of this rule, as well as other provisions of law applicable in determining whether land is buildable or suitable.

Hearings Officer Analysis: This provision is similar to MC 3.07.1425(b), in which site characteristics may be specified for land to be suitable for an identified need. The District specified such characteristics in the Narrative at page 19.

(2) Notwithstanding OAR 660-024-0050(4) and subsection (1)(c) of this rule, except during a legislative review of the Metro UGB, Metro may approve an application under ORS 197.610 to 197.625 for a Metro UGB amendment proposing to add an amount of land less than necessary to satisfy the land need deficiency determined under OAR 660-024-0050(4), provided the amendment complies with all other applicable requirements.

Hearings Officer Analysis: This provision is not applicable.

(3) The boundary location factors of Goal 14 are not independent criteria. When the factors are applied to compare alternative boundary locations and to determine the Metro UGB location, Metro must show that all the factors were considered and balanced.

Hearings Officer Analysis: This provision is consistent with how Metro interprets its analogous boundary location factors in MC 3.07.1425(c), which were applied to the District's Major Amendment application.

(4) In determining alternative land for evaluation under ORS 197.298, "land adjacent to the UGB" is not limited to those lots or parcels that abut the UGB, but also includes land in the vicinity of the UGB that has a reasonable potential to satisfy the identified need deficiency.

Hearings Officer Analysis: The District's analysis took into account all of the land in the urban reserves that otherwise met the District's siting criteria. Some of the land analyzed did not abut the UGB, but was rejected for other reasons.

(5) If Metro has specified characteristics such as parcel size, topography, or proximity that are necessary for land to be suitable for an identified need, Metro may limit its consideration to land that has the specified characteristics when it conducts the boundary location alternatives analysis and applies ORS 197.298.

Hearings Officer Analysis: This provision is similar to MC 3.07.1425(b), in which site characteristics may be specified for land to be suitable for an identified need. The District specified such characteristics in the Narrative at page 19.

(6) The adopted findings for a Metro UGB adoption or amendment must describe or map all of the alternative areas evaluated in the boundary location alternatives analysis. If the analysis involves more than one parcel or area within a particular priority category in ORS 197.298 for which circumstances are the same, these parcels or areas may be considered and evaluated as a single group.

Hearings Officer Analysis: The District mapped all of the alternative areas evaluated in the boundary location alternatives analysis and evaluated them separately.

(7) For purposes of Goal 14 Boundary Location Factor 2, "public facilities and services" means water, sanitary sewer, storm water management, and transportation facilities.

Hearings Officer Analysis: The District took into account the public facilities and services enumerated in this provision when it evaluated MC 3.07.1425(c)(2), which is the analog to Goal 14 Boundary Location Factor 2.

(8) The Goal 14 boundary location determination requires evaluation and comparison of the relative costs, advantages and disadvantages of alternative Metro UGB expansion areas with respect to the provision of public facilities and services needed to urbanize alternative boundary locations. This evaluation and comparison must be conducted in coordination with service providers, including the Oregon Department of Transportation (ODOT) with regard to impacts on the state transportation system. "Coordination" includes timely notice to service providers and the consideration of evaluation methodologies recommended by service providers. The evaluation and comparison must include:

(a) The impacts to existing water, sanitary sewer, storm water and transportation facilities that serve nearby areas already inside the Metro UGB;

(b) The capacity of existing public facilities and services to serve areas already inside the UGB as well as areas proposed for addition to the Metro UGB; and

(c) The need for new transportation facilities, such as highways and other roadways, interchanges, arterials and collectors, additional travel lanes, other major improvements on existing roadways and, for urban areas of 25,000 or more, the provision of public transit service.

Hearings Officer Analysis: As set forth in the responses to Goals 11 and 12, Sherwood West has been concept planned pursuant to MC 3.07.1110, and so the provision of public

facilities and services within the Sherwood West concept plan area and as those services relate to the rest of the city have been studied extensively, as required by MC 3.07.1110. The Sherwood West Concept Plan was prepared with analyses of existing sanitary sewer, water, stormwater, and transportation conditions and analyses of how those systems need to be upgraded, extended, and phased to meet the future development of Sherwood West without adversely impacting the existing city development. The concept plan was prepared in coordination with all of the future service providers, including those services that will be provided by the City and those that will be provided by others, including Clean Water Services, ODOT, and Washington County.[15]

Additional Issues Raised by Opponents

1. **Metro Staff Provided Proper Notice to DLCD.**

Opponents allege that Metro failed to provide notice to DLCD of a proposed plan map amendment under ORS 197.610. *See* Letter from Jennifer Bragar dated June 23, 2017, at p. 8. This is not correct. Metro submitted the requisite notice to DLCD on April 20, 2017, as evidenced on the weekly DLCD notice summary dated April 21, 2017, which is attached to the June 30, 2017 letter from Metro counsel Roger Alfred.

2. **The Fair Housing Act Is Inapplicable.**

The opponent argues that Metro must apply the Fair Housing Act ("FHA") to the Major Amendment application, because "Metro has a duty to affirmatively further fair housing." *See* Letter from Jennifer Bragar dated June 23, 2017, at p. 3-5.

The opponent does not point to any approval criterion that requires Metro to apply the FHA directly to this application, and did not include any convincing argument as to why a UGB expansion to accommodate a new public high school would require the FHA to be addressed. As best as the hearings officer can ascertain, the opponent's core argument is that the FHA is a *de-facto* approval standard for every Comprehensive Plan Amendment and zone change decision. In this regard, Ms. Brager states that "Metro has a duty to affirmatively further fair housing" and that "Metro needs to address fair housing implications in this Major Amendment application through analysis under Goal 10 and under Metro's locational factors, Metro Code 3.07.1425(c)(5) regarding equitable and efficient distribution of housing." The argument is not well-developed; the opponent seems to be arguing that the FHA must be complied with, but that compliance with Goal 10 and the Metro Code establishes compliance with the FHA.

Beyond that, the opponent complains that Sherwood does not have enough subsidized housing, which "does not properly address the housing issues in Washington County for low-income households, especially protected classes." That statement is followed up with the conclusion that the "failure to analyze the school siting in context of the regional need for fair housing only exacerbates the inequitable distribution of affordable housing in the Metro region."

[15] This coordination effort included service provider interviews included as Appendix 6 of the Sherwood West Concept Plan. Appendix 8 provides more detail regarding the provision of transportation infrastructure to the Sherwood West Concept Plan area.

Letter from Jennifer Bragar dated June 23, 2017, at p. 5. Again, the hearings officer is at a loss to understand the opponent's argument, especially since the opponent does not tie their ultimate policy concern back to any specific language in the FHA or any other law for that matter. This argument is simply not developed sufficiently to allow for its review and evaluation. If the argument is that every school siting project has an inclusionary zoning requirement for additional low-income / subsidized housing, that argument is rejected.

SECTION IV: HEARINGS OFFICER'S SUMMARY, RECOMMENDATION, AND PROPOSED CONDITIONS OF APPROVAL.

The applicant seeks to amend the UGB to include approximately 82 acres for a high school with sports fields and the realignment of SW Elwert and SW Kruger Roads. The Applicant has provided sufficient evidence to demonstrate that the criteria are satisfied and the locational factors have been addressed. As detailed herein, the applicant has demonstrated that the high school is currently over capacity and by 2025 will be severely over capacity. Delaying the decision to await a legislative amendment of the UGB by the Metro Council which may or may not occur in the 2018 timeframe only exacerbates the capacity issues which impacts the District's ability to meet the goals of its strategic plan. The applicant provided adequate comparison of the proposed UGB expansion area with other possible expansion areas in seven different urban reserve areas and a determination that the need cannot be met on land currently within the urban growth boundary. In addition the applicant has shown the proposed use can be made compatible with adjacent uses through site design and the city's development design review process provides for public involvement. Additionally the adjacent land is within an urban reserve and is expected to urbanize over time, allowing for the development of a cohesive neighborhood and school/park facility.

Therefore, the hearings officer forwards a recommendation to the Metro Council for ***approval*** of this petition, with the following two conditions of approval:

1. The property must be used for a public high school, associated accessory uses, and public transportation improvements consistent with the application are required for this Major Amendment.

2. The applicant must comply with the Transportation Planning Rule (TPR) at the time the zoning is established on the subject property.

Respectfully submitted this 21st day of July, 2017.

ANDREW H. STAMP, P.C.

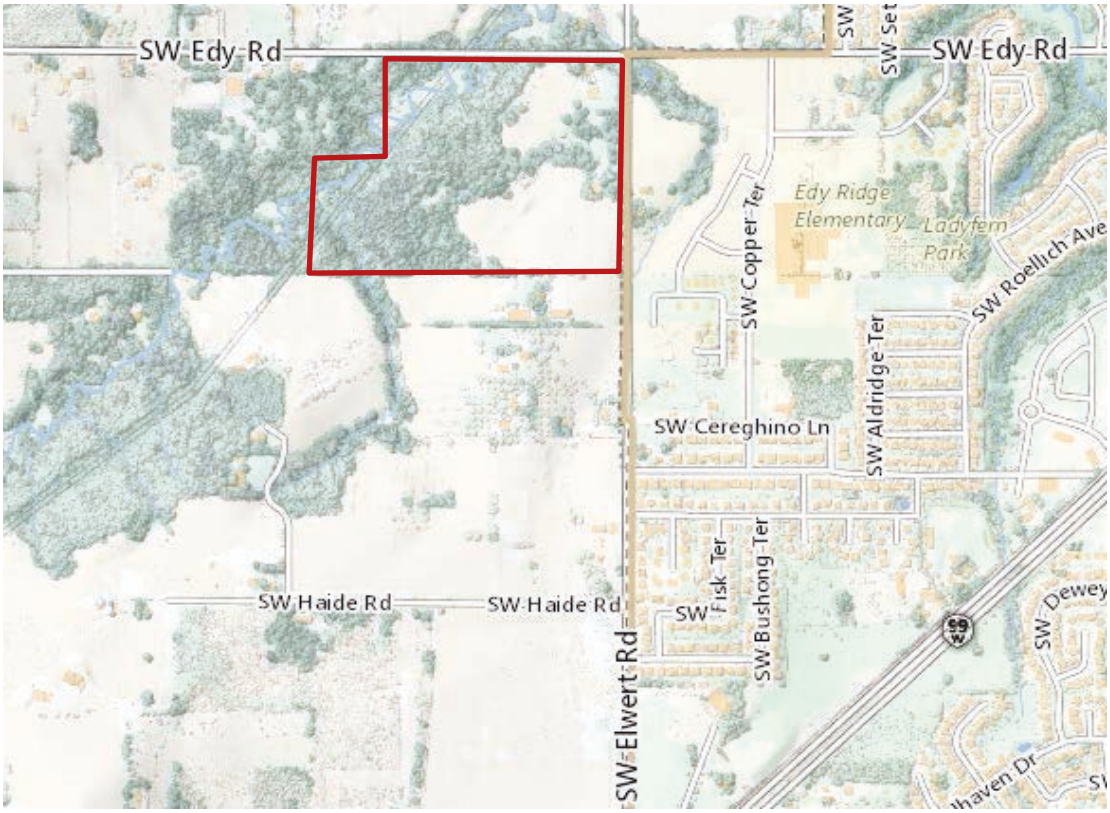
Alternative High School Site A
(SW Corner of Edy & Elwert Road)



Topography (USGS GIS Lidar Mapping)	Wetlands (National Wetlands Inventory)	Water Utility (City of Sherwood)	Sanitary Utility (Clean Water Services)
✗ Low-lying, relatively flat. Approximately 25 feet grade across site. Very low lying for sanitary sewer. Significant portion of site below elevation 200. Western portion mostly creek.	✗ Small wetland in center of site. Western portion of site mostly drainage area.	✗ No water available adjacent in Elwert. Would require water extensions along Elwert frontage and east on Edy.	✗ Low lying site - sanitary sewer not available in Elwert. Would require significant extension in Edy or pump station.

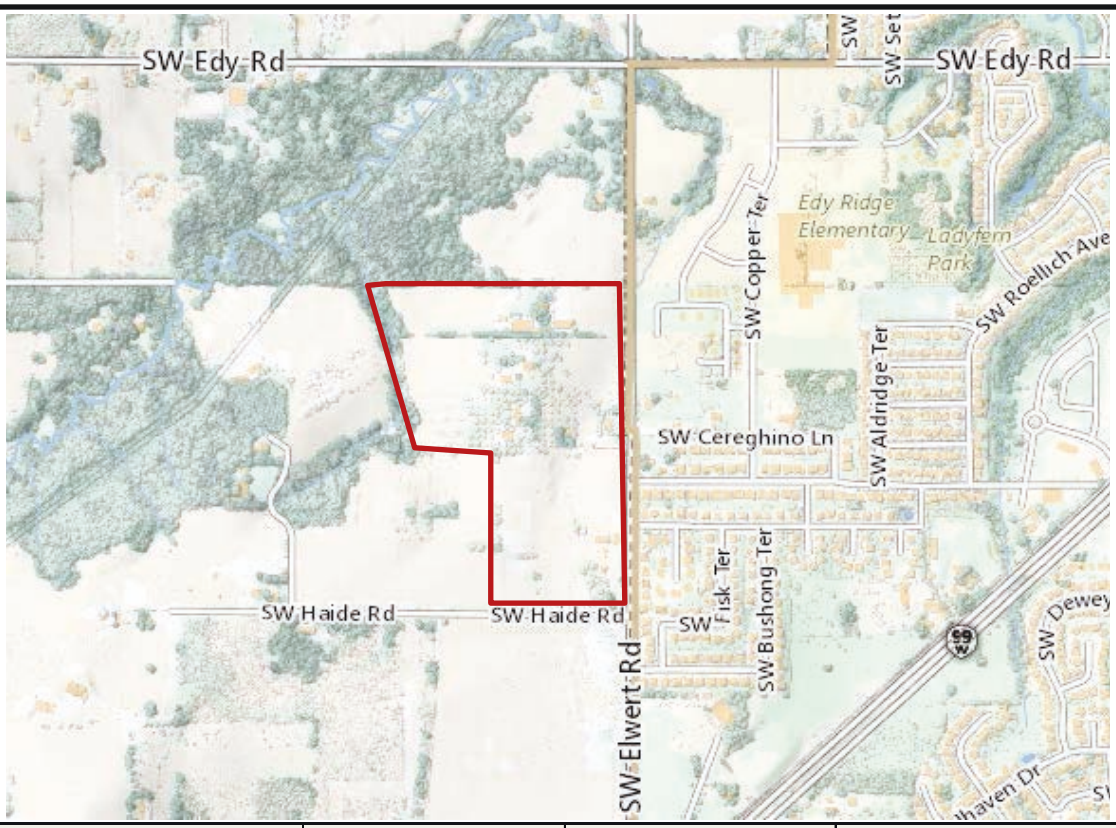
Storm Drainage	Public ROW Improvements
✓ Drainage discharge available onsite into Chicken Creek.	1. Water extension along Elwert frontage. 2. Sanitary upgrades in Edy and Elwert. 3. Storm drainage improvements along Elwert. 4. Street improvements on Elwert and Edy frontages.

LEGEND

✓ = Advantage ○ = Still to be Determined ✗ = Disadvantage

Attachment 8 continued

Alternate High School Site B
(NW corner of Haide & Elwert)



Topography (USGS GIS Lidar Mapping)	Wetlands (National Wetlands Inventory)	Water Utility (City of Sherwood)	Sanitary Utility (Clean Water Services)
O Significant topographic ridge running N-S through middle of site. Site slopes both east and west. Approximately 50-60 feet grade change. Significant grading for fields.	✓ No wetlands shown.	✓ 12" City of Sherwood public water main available in Elwert.	✓ 15" sanitary sewer and manhole available in Elwert at Daybreak subdivision. (Confirmed with City of Sherwood). City would likely still require public sanitary improvement in Elwert.

Storm Drainage	Public ROW Improvements
✓ North-south ridge running through site. West portion could drain directly to Chicken Creek. East portion drains to public improvements and across road to Chicken Creek.	1. Although not needed for site development, sanitary and storm sewer improvements likely needed in Elwert frontage as part of public frontage improvements. 2. Street improvements on Elwert & Haide frontages.

LEGEND

✓ = Advantage O = Still to be Determined ✗ = Disadvantage

Attachment 8 continued

Alternate High School Site C (Preferred Site)
(NW Corner Krugger & Elwert)

Topography (USGS GIS Lidar Mapping)	Wetlands (National Wetlands Inventory)	Water Utility (City of Sherwood)	Sanitary Utility (Clean Water Services)
✓ Entire site slopes down to the east toward Elwert. Relatively gentle topography. Approx. 40 feet grade change across entire site. Note: shallow valley and ridge complicates storm drainage.	✓ No wetlands shown.	✓ 12" City of Sherwood public water main in Elwert; also 18" public water main in Kruger.	✓ Feasible to extend 15" sanitary sewer main south on Elwert. Would require approximate 2,000 linear foot public extension. (Confirmed with City of Sherwood).

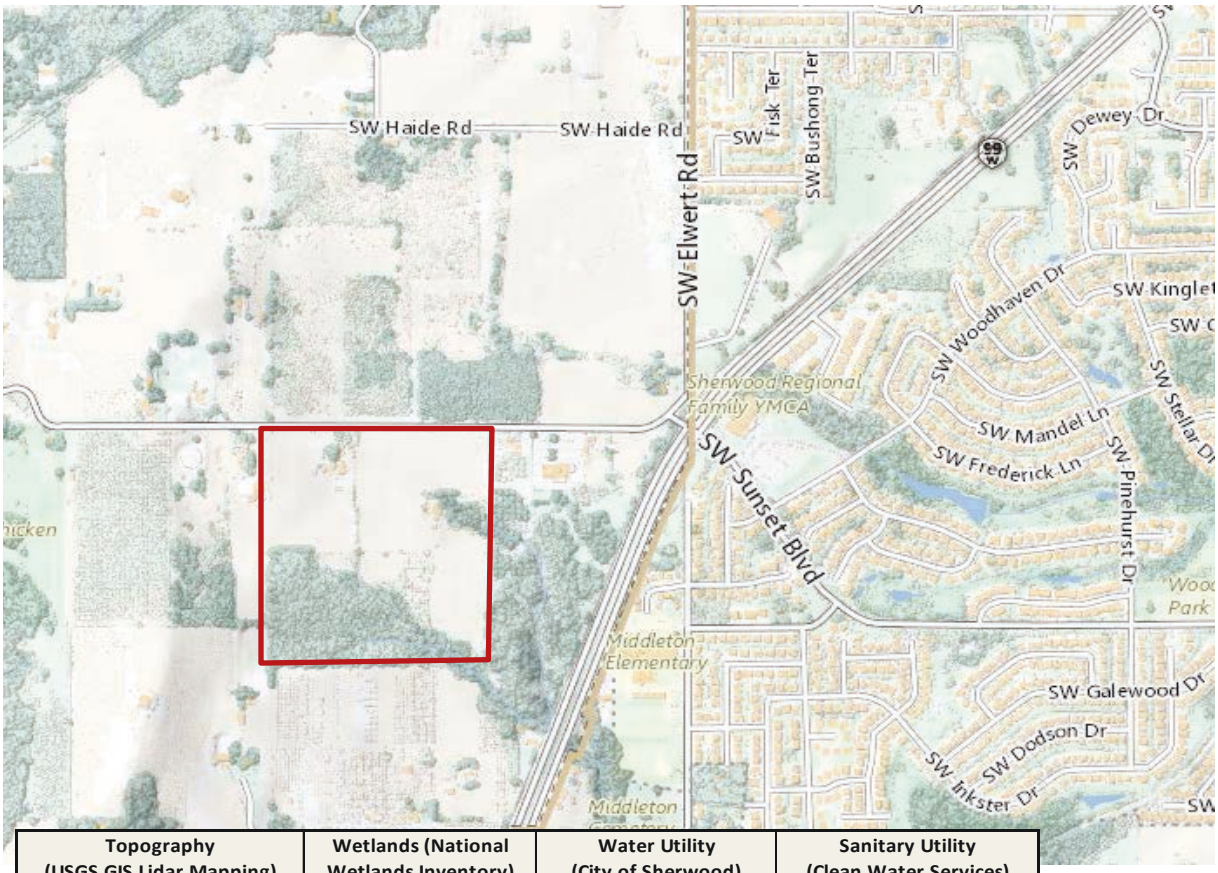
Storm Drainage	Public ROW Improvements
○ East-west ridge running through site. North portion could require long public storm extension to Chicken Creek. South portion would need to drain to new City intersection improvements at Elwert & Kruger intersection.	1. Sanitary extension in Elwert. 2. Storm drainage improvements along Elwert north to Chicken Creek. 3. Street improvements on Elwert frontage. 4. Need to consult with CWS to work out storm discharge.

LEGEND

✓ = Advantage ○ = Still to be Determined ✗ = Disadvantage

Attachment 8 continued

Alternative High School Site D
(South Side of Kruger Road)



Topography (USGS GIS Lidar Mapping)	Wetlands (National Wetlands Inventory)	Water Utility (City of Sherwood)	Sanitary Utility (Clean Water Services)
O Entire site slopes down to the east toward private property. Moderate topography. Approximately 50-60 feet grade change.	O No wetlands shown, but creek drainage runs through south portion of site.	✓ 18" public water main in Kruger.	✗ No sanitary sewer services available. Significant sewer extension and public system improvements necessary.

Storm Drainage	Public ROW Improvements
✗ No established public storm drainage systems in vicinity. Storm discharge would need to be worked out with the City and CWS along 99W. Storm extension likely required.	1. Sanitary sewer extension (exact route to be determined). 2. Storm drainage extension (exact route to be determined). 3. Street improvements on Kruger. 4. Offsite street improvements likely required.

Attachment 8 continued

Alternative High School Site E
(NW Corner Chapman & Pacific Highway)

Topography (USGS GIS Lidar Mapping)	Wetlands (National Wetlands Inventory)	Water Utility (City of Sherwood)	Sanitary Utility (Clean Water Services)
O Entire site slopes down to the east toward Pacific Highway. Slightly steeper topography. Approximately 75 feet grade change. Would need to evaluate for fields.	✓ No wetlands shown.	✗ No public water service in immediate vicinity of site. Need to extend water south from Kruger or under Pacific Highway.	✗ No sanitary sewer services available. Significant sewer extension and public system improvements necessary.

Storm Drainage	Public ROW Improvements
✗ No established public storm drainage systems in vicinity. Storm discharge would need to be worked out with the City and CWS along 99W. Storm extension likely required.	1. Sanitary sewer extension (exact route to be determined). 2. Storm drainage extension (exact route to be determined). 3. Street improvements on Chapman.

EXHIBIT C to Ordinance No. 17-1406

Memo

Metro
600 NE Grand Ave.
Portland, OR 97232-2736

Date: August 15, 2017
To: Metro Council
From: Roger Alfred, Senior Assistant Attorney
Subject: Sherwood School District UGB Amendment; Metro Ordinance No. 17-1406
Responses to Issues Raised at Public Hearing

This memorandum provides responses to issues raised in the letter submitted by attorney Jennifer Bragar on behalf of Byers Properties LLC ("Byers") at the public hearing before the Metro Council on August 10, 2017. For the reasons set forth below, the Office of Metro Attorney concludes that the arguments are without merit, and the Metro Council may adopt the hearings officer's recommendation of approval.

Most of the issues raised in the Byers letter have been considered and addressed in the hearings officer's decision. Where that is the case, this memo refers to the appropriate pages of that decision.

1. This UGB amendment process is quasi-judicial, not legislative

Byers first contends that Metro is making a legislative decision, rather than a quasi-judicial decision. This issue is thoroughly analyzed at pages 13-16 of the hearings officer's decision, where he correctly reaches the fairly obvious conclusion that this is a quasi-judicial process. The hallmark of a quasi-judicial land use process is that it is initiated by an application, which the local government is then obligated to either approve or deny. Here, the "major amendment" process is initiated when an applicant files a request for a UGB amendment with Metro. Metro then appoints a hearings officer, who holds a public hearing that is governed by the quasi-judicial procedures set forth in Oregon statute (ORS 197.763). It is worth noting that, during the hearing before the hearings officer, Byers invoked the quasi-judicial procedures in that statute by requesting that the record be held open for additional evidence, a request that was granted by the hearings officer. Metro's final decision on the application is based on applying preexisting criteria to the facts of the application, and it impacts a discrete parcel of property, rather than a broad population. The process is clearly quasi-judicial under the relevant case law.

2. This UGB amendment does not involve or implicate housing

The reason Byers contends this process is legislative is in order to implicate ORS 197.296(2), which is the statute that directs Metro to ensure there is a 20-year supply of housing inside the UGB when it conducts the 6-year "regular cycle" urban growth management process (which is a legislative process, not quasi-judicial). As correctly concluded by the hearings officer, the arguments raised by Byers regarding the decision being legislative are a "red herring," because even if this UGB major amendment process was legislative, ORS 197.296(2) would still not apply because the express purpose of the major amendment process is to provide land for non-housing uses. There is no legal,

or rational, reason why Metro would undertake a regionwide housing need analysis as part of a decision to expand the UGB for a non-housing use. The fact that this UGB amendment process is governed by a different statutory section, and does not implicate housing need under ORS 197.296, is analyzed in detail by the hearings officer at pages 16-24 of his decision, and is also addressed in my memorandum to the hearings officer dated June 9, 2017.

Byers also argues, for the first time, that the ESEE analysis is inadequate because it fails to address social consequences arising out of "the loss of housing land" resulting from approving this UGB expansion. Byers is correct that this issue is not addressed in the hearings officer's analysis, but that is because Byers failed to raise this issue below. Under Metro Code, this proceeding before the Metro Council is "on the record" of what was before the hearings officer. Specifically, section 3.07.1430(u) of the Metro Code provides: "Argument must be based upon the record of those [hearings officer] proceedings." Accordingly, participants before the Metro Council may not introduce new evidence or issues beyond what was presented to the hearings officer. *See DLCD v. Tillamook County*, 34 Or LUBA 586, 591 (1998) (noting that where a hearing is held on the record, "petitioner could not have raised a new issue at that stage of the proceeding.") Allowing parties to raise new issues before the Metro Council could trigger a need to respond with new evidence, which is not permitted in an "on the record" process.

Adoption of this memorandum by the Metro Council in support of approving the application is an express interpretation by the Council of 3.07.1430(u) to mean that any issues not raised before the hearings officer are waived. This interpretation is consistent with the meaning of "on the record" expressed in the statutes governing LUBA's scope of review (ORS 197.835(2)(a) and (3)), which prohibit new issues from being raised on appeal.

Even if this issue had not been waived by Byers, the hearings officer expressly rejected Byers' argument below that approval of this UGB amendment results in a "loss of housing land." The land being added to the UGB is currently zoned for agricultural use, not housing. Accordingly there are no social impacts arising out of a loss of land for housing.

3. The application is based on a demonstrated need for a high school, not for parks

Byers contends that the application includes a request for a park use, and is deficient because it did not consider "alternatives to the park use separate from collocation with the high school." Like the ESEE argument addressed above, Byers did not raise this issue in the proceedings before the hearings officer, and has therefore waived the ability to raise it before the Metro Council.

In the event this issue was not waived, on the merits Byers mischaracterizes the nature of the UGB amendment application. The application is for a high school use, a use that necessarily and customarily includes active play space, including a number of ball fields, and other sports facilities, such as a track and tennis courts. This is depicted on the concept plan for the high school, which is included in the application, and explained in the application narrative and in the applicant's

testimony before the hearings officer. The UGB amendment application is not for park land, and the references to the future shared use of the new high school's active ball fields should not be construed to that effect. The nature and purpose of the application is not changed by the facts that (1) the city does not generally provide ball fields or other active sports facilities, and (2) the city and the school district have an IGA that generally allows the community to use the District's ball fields and other active sports facilities when those fields and facilities are not in use by the school district. As set forth in the record, the property proposed for the relocated high school will be fully utilized by the needs of the high school, and the larger campus of the new high school (when compared to the existing high school) will allow for the full range of facilities normally provided at a comprehensive high school. The availability of more sports fields that can be shared with the community is merely an additional benefit arising out of the agreement between the school district and the city.

On this point, one aspect of the hearings officer's findings should be clarified. At page 29 the hearings officer includes a finding that the applicant has shown there is a "demonstrated land need to accommodate both school and park services." This is a mis-statement by the hearings officer, as the school district's application is based on the need for a new school, and not on a need to provide park services.

4. The application is "consistent with" Metro's 20-year population range forecast

One criterion for a UGB expansion under the Metro Code is that the application must show a need to accommodate future urban population "consistent with a 20-year population range forecast." Byers argued below, and argues again to the Council, that this requires Metro to undertake a new regionwide 20-year population forecast, and the school district's 10-year school population forecast is therefore deficient. The hearings officer addressed this argument at page 26, concluding that the code requires the applicant to show a need that is "consistent with" a 20-year forecast, which "in this context simply means using the same or similar growth rates contemplated in the 2015 UGR, and that appears to be the case here."

In support of this argument Byers references materials attached to their August 10, 2017 letter to the Metro Council regarding a 2016 study of race and ethnicity impacts. This is a new document that was not part of the evidentiary record before the hearings officer and therefore cannot be considered by the Metro Council in this proceeding.

5. Public facilities and services are available to serve the proposed site, and the applicant must comply with the TPR upon rezoning

As part of the consideration of alternative urban reserves areas for potential expansion of the UGB, one location-related factor that must be considered is the "orderly and economic provision of public facilities and services." This issue is analyzed and addressed at pages 43-45 of the hearings officer's decision. The hearings officer also correctly notes, at page 35, that these are locational "factors" that

must be *considered* by Metro, and are not criteria that must be satisfied: "one point that cannot be over-emphasized is that no one locational factor can be considered to be a determinative reason to include or exclude any one particular site. Thus, a decision to include or exclude land from a UGB must be based on a balancing of all these factors, rather than a reliance on any one factor."

Nonetheless, Byers contends that this factor is a criterion that must be satisfied, arguing that the applicant must show whether the proposal will impact availability of public facilities. Byers then contends that the applicant's traffic impact analysis does not demonstrate that nearby intersections will meet applicable level of service standards.

The issue raised by Byers is not relevant to the applicable inquiry for purposes of a UGB expansion, which is a much more general question of whether public facilities are available to serve the site. Questions related to traffic impacts from a new school on existing and planned transportation facilities in the area will need to be addressed as part of the comprehensive plan and zoning map amendments that will be necessary to develop a school, which will trigger application of the state Transportation Planning Rule (TPR). The ordinance proposed for adoption by the Metro Council includes the hearings officer's recommended condition of approval requiring application of the TPR at the time zoning for the school is being adopted.

6. Metro has satisfied the coordination requirement

Byers contends that Metro failed to coordinate with affected local governments as required by ORS 195.025. This issue was not raised before the hearings officer and is therefore waived. In the event the issue is not waived, the hearings officer adopted the following findings regarding the coordination requirement at page 58 of his decision:

"This Major Amendment application has required coordination with and between Metro, Washington County, the City of Sherwood, and public service providers including ODOT, Tualatin Valley Fire & Rescue, and Clean Water Services. This includes coordination at the Major Amendment level and at the Sherwood West Concept Plan level. Therefore, the required coordination has occurred."

The record includes evidence that Metro fulfilled its coordination obligation by providing written notice to all cities and counties inside the UGB regarding the proposed UGB amendment, as well as to ODOT and relevant service providers. The City of Sherwood supports approval of the application and included the following comments in its service provider letter dated March 11, 2017:

"The Sherwood West preliminary concept plan was developed through community input and had community and Council support. The voters within the Sherwood School District approved a bond for the new high school. While there will be challenges to building a new school within the Sherwood West area, and coordination between the District, City, County and ODOT will be

required, the District is committed to ensuring that is serves as a great cornerstone to the future growth in the area."

In response to questions at the public hearing from members of the Metro Council regarding coordination with the City of Sherwood, the school district representatives verbally stated that the district is currently working with the city on Title 11 concept planning and that district representatives attended a city planning commission meeting earlier in the week where they were told that the planning effort is on the right track. These are evidentiary statements that were not included in the record before the hearings officer and therefore will not be considered or relied upon by the Metro Council in its final decision.

Finally, Byers suggests that the school district has not satisfied a coordination obligation, but cites no authority regarding why or how the school district is obligated to coordinate as part of its application. The coordination requirement applies to Metro through the major amendment process and ORS 195.025, and not to the school district. Byers also states that comments received from Washington County "suggest that coordination is incomplete as the management of transportation systems has not been finalized." It is not entirely clear what this means; however, there is no requirement, coordination-related or otherwise, that management of transportation systems must be "finalized" at the point of a UGB amendment. The Metro Ordinance includes a condition of approval requiring the city to finalize its concept plan for the area prior to development occurring on the site, which will include coordination with the county regarding transportation planning. Additional transportation planning will occur at the time of annexation by the city and rezoning of the property, at which point the TPR must be applied to ensure that transportation facilities serving the new school will be adequate.

All coordination obligations have been satisified.

STAFF REPORT

IN CONSIDERATION OF ORDINANCE NO. 17-1406, FOR THE PURPOSE OF AMENDING THE URBAN GROWTH BOUNDARY IN THE VICINITY OF THE CITY OF SHERWOOD UPON APPLICATION BY THE SHERWOOD SCHOOL DISTRICT

Date: July 27, 2017

Prepared by: Tim O'Brien
Principal Regional Planner

PROPOSED ACTION

Adoption of Ordinance 17-1406, approving *UGB Case 17-02: Sherwood School District,* a major amendment to the urban growth boundary (UGB). The proposed amendment area is shown on Attachment 1. Staff recommends approval of the ordinance as described below, which would add approximately 82 acres to the UGB west of Sherwood for a high school campus and sports fields. In addition a portion of the land will be used for the construction of a roundabout at SW Elwert and SW Kruger Roads.

SUMMARY OF PROCESS

The proposed amendment is a "major amendment" to the UGB under the Metro Code, which is a special process reserved for requests to include land for public facilities and other non-housing needs that cannot wait until the next UGB cycle. An application for a major amendment is first considered at a public hearing before a hearings officer appointed by Metro. After receiving testimony from interested parties, the hearings officer prepares a proposed order, with findings of fact and conclusions of law recommending approval or denial of the application, and forwards the recommendation to the Metro Council along with the record of the hearing. The Metro Council must consider the hearings officer's report and recommendation at an "on the record" public hearing where individuals who participated in the proceeding before the hearings officer are allowed to submit oral and written argument. The argument must be based on the evidence that was provided to the hearings officer, and no new evidence may be submitted to the Metro Council. If the Council decides to approve the application and expand the UGB, the Council must adopt an ordinance within 15 days after holding a public hearing.

BACKGROUND AND ANALYSIS

Proposal Description:
The Sherwood School District filed an application for an 80-acre amendment to the UGB for a high school campus and sports fields. The site consists of four tax lots located within unincorporated Washington County on the west side of SW Elwert Road, between SW Haide Road and SW Kruger Road, immediately west of the City of Sherwood. The site has frontage on all three roads, is zoned Agriculture and Forest (AF-20) and is located within Sherwood West Urban Reserve 5B. The adjacent properties to the north, south and west are also within Urban Reserve 5B and contain rural residences with limited agriculture and a church to the south, wooded lots and rural residences to the west and open fields and rural residences to the north. The subject properties have been used for various agricultural activities including a Christmas tree farm, tree plantation and row crops. The tax lot in the southeast corner of the site, adjacent to the intersection of SW Elwert and SW Kruger Roads is owned by the City of Sherwood, a portion of which will be used for the SW Elwert and SW Kruger Road roundabout improvement. A 40-foot wide permanent Northwest Natural gas easement zigzags along the western edge of the site, separating the northwest corner of the site from the remainder of the property.

The Sherwood School District is centered on the city of Sherwood and extends into the surrounding rural area in all directions, including a small area east of I-5, between Wilsonville and Tualatin. The District includes an area of 4.31 square miles and an estimated population of 18,884. The District has seven schools that provide educational services to just over 5,000 students, the majority of which live in the city of Sherwood. The District experienced substantial growth in the late 1990s and early 2000s leading to a community effort in 2005 to determine facility needs. This resulted in the successful 2006 bond measure which included funding for an addition to the current high school to increase capacity to 1,550 students, consistent with phase 1 of the 2006 high school master plan. Current enrollment at the high school is over 1,700 students and projections show over 2,250 students by the 2025-26 school year. In early 2014 the District's Long Range Planning Committee made recommendations to the School Board regarding enrollment and growth challenges, facilities analysis and needs and financing options. In 2015 the District documented the condition and educational adequacy of its facilities, leading to bond visioning and steering committees in 2016. This resulted in the District's voters approving a bond measure in 2016 providing funding for school improvements including construction of a new high school. The District continues to engage the community through a design committee and community input sessions.

Public Hearing before the Hearings Officer

The hearings officer, Andrew H. Stamp, conducted a public hearing at the Sherwood Police Department Community Room on May 24, 2017. Metro staff recommended approval of the application. Six people testified at the hearing, five in favor of the application and one against the application. The hearings officer continued the hearing to June 13, 2017 in response to a procedural question. Three people testified at the June 13th hearing, all in opposition to the application, including one who had also testified at the May 24th hearing. The hearings officer granted a request to keep the record open for ten days, followed by additional time for rebuttal by participants and final argument by the applicant; the record closed on July 7, 2017.

The primary opponent of the application is Byers Properties, LLC, which is the entity that owns one of the parcels of property to be included in the proposed expansion. Byers is currently involved in condemnation proceedings with the Sherwood School District regarding acquisition of the property for public use. Byers raised numerous legal issues in the proceedings before the hearings officer, all of which were ultimately rejected in the final order and recommendation to the Metro Council.

Hearings Officer Recommendation and Proposed Findings

On July 21, 2017 the hearings officer submitted a proposed order recommending approval of Case 17-02, based upon the findings and conclusions in his report. The hearings officer included two conditions of approval in his recommendation:

1. The property must be used for a public high school, associated accessory uses, and public transportation improvements consistent with the application for this Major Amendment.
2. The applicant must comply with the state Transportation Planning Rule (TPR) at the time the zoning is established on the subject property.

A hearing on the recommendation before the Metro Council is set for August 10, 2017. All parties to the case were notified in writing of the Council hearing date and the notice was also posted on Metro's website. In addition, the hearings officer's proposed order was made available for review by all parties.

SUMMARY/OPTIONS

According to Metro Code 2.05.045(b), the Council may either:

- Adopt Ordinance 17-1406 to approve *Case 17-02: Sherwood School District* based on the findings of fact and conclusions of law in the hearings officer's order. Staff recommends this option.
- Vote in favor of adopting Ordinance 17-1406 to approve *Case 17-02: Sherwood School District* based on revised findings of fact and conclusions of law to be prepared by Metro staff.
- Remand the proceeding to the Hearings Officer for further consideration.
- Vote to adopt a Resolution entering an order to deny *Case 17-02: Sherwood School District* based on revised findings of fact and conclusions of law to be prepared by Metro staff.

In addition, pursuant to Code Section 3.07.1455, the Council may establish conditions of approval it deems necessary to ensure the addition of land complies with state planning laws and the Regional Framework Plan. Metro staff recommends the Council include the following three conditions of approval, the first two of which were recommended by the hearings officer:

1. The property must be used for a public high school, associated accessory uses, and public transportation improvements consistent with the application for this Major Amendment.
2. The applicant must comply with the state Transportation Planning Rule (TPR) at the time the zoning is established on the subject property.
3. The City of Sherwood shall complete the requirements of Urban Growth Management Functional Plan Title 11, section 3.07.1120: Planning for Areas Added to the UGB, prior to development occurring.

INFORMATION

Known Opposition: Attorney Jennifer Bragar, representing one of the subject property owners, testified verbally and in writing in opposition to the application before the hearings officer and by providing additional written information during the open record period. Two persons who live in the vicinity of the proposed UGB expansion area testified verbally and in writing in opposition to the application before the

hearings officer and by providing additional written information during the open record period. One person who lives in the vicinity of the proposed UGB expansion area testified in writing in opposition to the application during the continued public hearing timeframe.

Legal Antecedents: The Metro Regional Framework Plan and Urban Growth Management Functional Plan Title 14: Urban Growth Boundary authorizes amending the Urban Growth Boundary through the major amendment process.

Anticipated Effects: The adoption of Ordinance 17-1406 will add 82.3 acres of land to the urban growth boundary in the vicinity of Sherwood for a high school campus with sports fields and road improvements.

Budget Impacts: There is no budget impact from adopting this ordinance.

BEFORE THE METRO COUNCIL

FOR THE PURPOSE OF AMENDING THE URBAN GROWTH BOUNDARY IN THE VICINITY OF THE CITY OF SHERWOOD UPON APPLICATION BY THE SHERWOOD SCHOOL DISTRICT	)	Ordinance No. 17-1406
	)	
	)	Introduced by Chief Operating Officer
	)	Martha Bennett with the Concurrence of
	)	Council President Tom Hughes

WHEREAS, the Metro Urban Growth Management Functional Plan Title 14: Urban Growth Boundary provides a mechanism to amend the urban growth boundary (UGB) through a major amendment process for public facilities and other non-housing purposes; and

WHEREAS, the Sherwood School District filed an application for a major amendment pursuant to Metro Code Section 3.07.1430 to add approximately 82 acres to the UGB for the purpose of constructing a new high school to serve the Sherwood area; and

WHEREAS, the application was considered by a hearings officer appointed by Metro at public hearings in the City of Sherwood on May 24, 2017 and June 6, 2017; and

WHEREAS, on July 21, 2017 the hearings officer submitted to Metro a proposed order recommending approval of the application, together with findings of fact and conclusions of law in support of a decision by the Metro Council that the application satisfies the requirements of the Metro Code and applicable state law; and

WHEREAS, the Council considered the proposed order and testimony at a public hearing on August 10, 2017 under the procedural requirements of Metro Code Section 3.07.1430(u); now, therefore,

THE METRO COUNCIL ORDAINS AS FOLLOWS:

1. The UGB is hereby amended, as indicated in Exhibit A, attached and incorporated into this ordinance, to add 82.3 acres to the UGB for development of a high school with sports fields and a roadway improvement, subject to the following three conditions of approval:

    a. The property must be used for a public high school, associated accessory uses, and public transportation improvements consistent with the application for this UGB amendment.

    b. The applicant must comply with the state Transportation Planning Rule (TPR) at the time the zoning is established on the subject property.

    c. The City of Sherwood shall complete the requirements of Urban Growth Management Functional Plan Title 11, section 3.07.1120: Planning for Areas Added to the UGB, prior to development occurring.

2. The Findings of Fact and Conclusions of Law contained in the hearings officer's recommendation attached as Exhibit B and hereby incorporated into this ordinance, explain how this amendment to the UGB complies with applicable provisions of the Regional Framework Plan, Metro Code, and applicable statewide planning laws.

3. The Metro Council adopts as supplemental findings in support of its decision the legal memorandum dated August 15, 2017 attached as Exhibit C and hereby incorporated into this ordinance, which includes responses to issues raised at the public hearing by opponents of the application.

ADOPTED by the Metro Council this 17 day of August 2017.

Tom Hughes, Council President

Attest:

Nellie Papsdorf, Recording Secretary

Approved as to form:

Alison R. Kean, Metro Attorney

SECTION I: APPLICATION SUMMARY

FILE NAME:	UGB Case 17-02: Sherwood School District Urban Growth Boundary Major Amendment
APPLICANT:	Sherwood School District 23295 SW Main Street Sherwood, OR 97140
PROPOSAL:	82-acre expansion of the urban growth boundary (UGB) for a high school campus with sports fields. Realign SW Elwert Road and SW Kruger Road in Sherwood.
LOCATION:	Tax Lots 2S236-200, -201, -206, and -207
SITE ADDRESSES:	18880 SW Haide Road, 22895 SW Elwert Road and 18985 SW Kruger Road, Sherwood, Oregon 97140
URBAN RESERVE AREA:	Area 5B.
CURRENT ZONING:	AF-20
METRO CODE:	Metro Code Sections 3.07.1425 (B, C, D, E & F) and 3.07.1440 (A & B). Code Section 3.07.1425(C)(1-9)

SECTION II: BACKGROUND INFORMATION

Proposal Description: The applicant requests an expansion of the City of Sherwood UGB to include approximately 82 acres for a high school campus with sports fields. This proposal also seeks to realign the intersection of SW Elwert Road and SW Kruger Road for improved and safer traffic flow.

Site Information: The site consists of four tax lots located within unincorporated Washington County on the west side of SW Elwert Road, between SW Haide Rd and SW Kruger Rd as shown in Attachment 1. The property has frontage on SW Elwert, SW Haide and SW Kruger Roads. The entire property is zoned AF-20 (Agricultural and Forest District) by Washington County with a minimum lot size of 80 acres. The entirety of the property is located within the Sherwood West Preliminary Concept Plan area (Metro Urban Reserve Area 5B). The site slopes

gently down to the east towards SW Elwert Road with approximately 40 foot grade change across the site. There is a shallow valley and ridge within this slope.

The properties have been used for various agricultural activities including a Christmas tree farm, tree plantation and row crops. The tax lot in the southeast corner of the site, adjacent to the intersection of SW Elwert and SW Kruger Roads is owned by the City of Sherwood, a portion of which will be used for the road realignment. A 40-foot wide permanent Northwest Natural gas easement zigzags along the western edge of the site, separating the northwest corner of the site from the remainder of the property.

Case History: The Sherwood School District (District) is centered on the city of Sherwood and extends into the surrounding rural area in all directions, including a small area east of I-5, between Wilsonville and Tualatin. The District includes an area of 4.31 square miles and an estimated population of 18,884. The District has seven schools that provide educational services to just over 5,000 students, the majority of which live in the city of Sherwood. The District experienced substantial growth in the late 1990's and early 2000's leading to a community effort in 2005 to determine facility needs. This resulted in the successful 2006 bond measure which included funding for an addition to the current high school to increase capacity to 1,550 students, consistent with phase 1 of the 2006 high school master plan. Current enrollment at the high school is over 1,700 students and projections show over 2,250 students by the 2025-26 school year. In early 2014 the District's Long Range Planning Committee made recommendations to the School Board regarding enrollment and growth challenges, facilities analysis and needs and financing options. In 2015 the District documented the condition and educational adequacy of its facilities, leading to bond visioning and steering committees in 2016. This resulted in the District's voters approving a bond measure in 2016 providing funding for school improvements including construction of a new high school. The District continues to engage the community through a design committee and community input sessions.

Local Government Statement: This UGB major amendment is being considered at the request of the Sherwood School District. The City of Sherwood completed the Sherwood West Preliminary Concept Plan for urban reserve area 5B and submitted a service provider form supporting the school district's application. The school district participated in the concept planning process and the subject site is one of the school locations identified in the preliminary concept plan. Washington County submitted a written statement supporting the application with proposed conditions for Metro to consider. Tualatin Valley Fire and Rescue submitted a written statement supporting the application and Clean Water Services is neutral on the application.

SECTION III: APPLICABLE REVIEW CRITERIA

The criteria for a Major Amendment to the UGB are contained in Metro Code Section 3.07.1425(B, C, D, E, & F) and 3.07.1440 (A & B). The approval criteria appear ***bold 12-pt Aerial Narrow font)***, and the hearings officer's analysis follows.

> ***Metro Code Section 3.07.1440(A) The purpose of the major amendment process is to provide a mechanism to address needs for land that cannot wait until the next analysis of buildable land supply under ORS 197.299. Land may be added to the***

UGB under this section only for the following purposes: public facilities and services, public schools, natural areas, land trades and other non-housing needs;

This code section requires that the applicant show, by substantial evidence in the whole record, that it is an eligible entity allowed to use the interim ORS 197.299 Major Amendment UGB process rather than wait until the next regular Metro UGB amendment cycle (in December, 2018).

Hearings Officer's Analysis: Title 14 of the Metro Code (*i.e.* Metro's Urban Growth Management Functional Plan) includes the Major Amendment process to amend the UGB for a number of specific non-housing needs, including schools and public parks. This process, which is designed to implement ORS 197.299(4), is intended to provide an opportunity to meet these specific land needs outside of the legislative housing needs process the Metro Council conducts on a six-year cycle as required by ORS 197.299(1) and ORS 197.296.

As part of the six-year legislative housing needs process, Metro conducts an inventory of the current residential and employment capacity within the UGB, forecasts population and employment growth over a 20-year timeframe, determines the capacity of the current UGB to accommodate that growth and documents the results of these analyses in an urban growth report. ORS 197.296(6)(a), which is one of the state's needed housing statutes, envisions that local governments with populations over 25,000 will factor in land for schools at the same time as they determine the amount of land needed to be brought in to the UGB for housing. In this regard, the need for land for schools under ORS 197.296(6)(a) is a "derivative need" which is linked to, and dependent upon, a finding that there is a need for land to be brought into the UGB to accommodate an identified housing need. As noted in more detail below, this process has proven to be long, drawn out affair, which is not sensitive to short-term needs. Furthermore, because it is done on a large-scale regional basis, is not always sensitive to more localized school and park needs.

In fact, Metro's most recent urban growth report, adopted in 2015, did not address school and park land needs at the regional level at all. Some school districts anticipate growth, others see declining enrollment and none look out over the 20-year timeframe that the urban growth report considers. Depending on the particular physical, financial and expected growth characteristics of each school district, plans for accommodating projected increases in enrollment vary. Similarly, park districts acquire property and develop park facilities based on numerous operational and funding parameters that can't be considered at the regional level. In addition, it is quite common for school districts and cities to collaborate on opportunities to meet the city's recreation needs as well as the school district's team needs. For these reasons, the Major Amendment process is the appropriate means of addressing specific school district and park needs that can be accommodated through UGB expansions.

Metro has adopted specific criteria to implement ORS 197.299(4). There are two criteria contained in Metro Code section 3.07.1440(A) that are analyzed separately below:

1) The proposal must be for a non-housing need, and

2) The proposal must be intended to meet needs that cannot wait until the next analysis of land supply (December 2018).

There does not appear to any disagreement that the first criterion is met: the applicant proposes to add land to the boundary for a public school and a public facility need, both of which are non-housing needs. The Sherwood School District's Sherwood High School is a "public school" within the meaning of Metro Code Section 3.07.1440(A).

However, whether the applicant has met the second criterion has proven to be more controversial. The applicant addresses its need as follows:

> As of 2015, the Sherwood School District encompasses 4.31 square miles serving a population of approximately 18,884 residents and 5,000 students. The Sherwood School District includes:
> - The City of Sherwood city limits;
> - Portion of the western area of the City of Tualatin (mostly industrial land);
> - Rural Clackamas County (primarily between Sherwood and Wilsonville); and
> - Rural Washington County north and west of Sherwood, as well as a small area east of I-5 between Wilsonville and Tualatin.
>
> To facilitate future planning and to comply with State requirements for a fast-growing school district, the District adopted a long-term facilities plan in January of 2008, which assumed that additional school capacity would therefore likely be needed within ten years of the plan's adoption. As predicted school facilities have recently become overtaxed. In 2015, to assess current resources, the Sherwood School District completed a Facilities Planning and Assessment Report to determine both condition and available capacity. Enrollment based on the most current demographic data and capacity shows that school capacity is near or over capacity at all school levels as shown in Staff Report Attachment 2 (Table 1 in petition).
>
> The School District commissioned Davis Demographics & Planning Inc. to complete an updated 10-year demographic study in May of 2016. The study reviewed the following factors that determine student enrollment: (1) the current and planned residential development over the next ten years; (2) student yield factors that apply to new residential development; (3) birth factors for the District area; and (4) mobility factors, which examine the in/out migration of students within existing housing units. The forecast projects a deficiency in capacity in all levels, with the

high school level having the largest deficiency. Staff Report Attachment 3 (Table 2 in petition) shows 10-year enrollment projections compared with existing school building capacity. The table demonstrates that if no capacity is added (no-build) the school facilities will be far over capacity in 10 years with the Sherwood High School having the largest capacity issue operating at 141% of capacity.

From the updated capacity assessment and demographic data, it became apparent that facilities must be expanded to keep pace with continued student enrollment growth. A Long Range Planning Committee, Bond Steering Committee, Bond Visioning Committee and Sherwood High School Programming Committee were formed to study facility needs. Led by the Bond Management Team, these committees met from 2014 to 2016, making recommendations to the Sherwood School District Board. The process included input from a number of participants from the community including City Council and staff representation, School District staff, architects, civil engineers, financial advisors, business leaders, citizens, parents and students. Throughout this process, the Sherwood City Council was provided with updates and community input was sought via various public outreach methods.

As evidenced by capacity study and demographic growth data, the high school level is where there is the biggest need for additional capacity both now and to a greater extent within 7 to 10 years. Therefore, the Bond Management Team first looked to the existing high school campus for opportunities for expansion to accommodate this growth. With the conclusion that the existing high school cannot be upsized to meet demand, the District's Bond Management Team began looking for a long-term solution and the School Board, with voter approval, ultimately decided to build a new high school. The new high school is planned to be sized to initially accommodate 2,000 students, but allow for easy expansion to 2,400 students. This size will allow for projected growth over the next 10 years and foreseeable future.

Once a new high school is online, the existing high school building can be repurposed as a consolidated middle school with both existing middle schools (Laurel Ridge and Sherwood Middle) being relocated to the existing high school campus. Once this occurs, the two existing middle schools can be converted to elementary school use to expand needed elementary school capacity. Finally, the proposal allows for Hopkins Elementary School, a building nearing its useful lifespan, to be taken out of

> school service and converted to administrative functions. The existing administrative offices consist of portable buildings in varying locations and with the conversion of Hopkins, office space can be centralized for increased efficiencies.

The primary opponent argues that the applicant has not justified the use of the Major Amendment process instead of waiting until the normally scheduled Metro 2018 UGB expansion. Their attorney states: "Metro's scheduled UGB expansion in 2018 is the appropriate time to analyze the expansion for the proposed high school because more data will be available and the full set of impacts can be analyzed. The delay will also resolve the issues with inadequate notice in the current application." *See* Letter from Jennifer Bragar dated June 6, 2017, at p. 8.

What the opponents appear to be arguing is that this application is premature, and the applicant should wait until 2018 when the 20-year buildable lands analysis will be available. Furthermore, the opponents do believe that the Major Amendment process authorized by ORS 197.299(4)(a)(A) requires the same type and level of analysis required when Metro conducts its periodic legislative housing need analysis required by ORS 197.299(1) and ORS 197.296. The opponent's unstated assumption is that school needs must be evaluated as a derivative need of housing using the ORS 197.296(6) process.

Metro staff weighed in on the debate via a Memorandum dated June 9, 2017, which states, in relevant part:

> Metro's legislative process for reviewing the UGB is guided partially by ORS 197.296. Subsection 197.296(2) directs Metro to demonstrate that there is sufficient buildable land within the UGB to accommodate estimated housing needs for 20 years. A housing need is the only need identified in the statute. ORS 197.296(6) says if the housing need is greater than the capacity of the UGB Metro shall take one or more actions that could include amending the UGB to include sufficient buildable lands to accommodate housing needs for 20 years. Subsection (6)(a) goes on to say that if the UGB was amended to accommodate housing needs for the next 20 years, then the amendment shall include sufficient land reasonably necessary to accommodate the siting of new public school facilities.
>
> The statutory directive to Metro is to include sufficient land for school facilities as part of any UGB expansion that is required to meet a 20-year need for housing. In Metro's most recent analysis of the 20-year housing supply (the 2015 UGR), Metro determined there was sufficient capacity inside the existing UGB to accommodate housing needs; therefore, no corresponding analysis for public school facilities was required.

> Even if the Metro Council had determined there was a need to expand the UGB in 2015 to accommodate a 20-year housing need, there is no certainty that the location where the land would be added to meet the housing need is also a location where a local school district needs additional land to meet its facility needs. Likewise there is no certainty that the specific land needs of a school district are coordinated with the local jurisdictions desire for additional housing. For instance, a UGB expansion adjacent to Hillsboro to meet a regional housing need would not support the Sherwood School District's need for a new high school.
>
> These difficulties arise, in part, from the size of the Metro region and the fact that it consists of 24 individual cities and 17 different school districts. It is important to recognize that the provisions of ORS 197.296(6)(a) regarding planning for accommodation of new school facilities is included in the statutory section that describes the analysis required for all cities in the State of Oregon. While it would not be as difficult for a smaller jurisdiction to coordinate future public school needs with future housing needs in making UGB expansions, that task is much more complicated in the Metro region.
>
> The disconnect in the Metro region between the location of UGB expansions to meet a 20-year housing need and the needs of existing school districts is addressed, in part, by ORS 197.299(4)(a), which is the statute that directs Metro to establish the process being utilized by the Sherwood School District in this proceeding. ORS 197.299(4)(a) requires Metro to allow "off-cycle" UGB expansions as necessary to accommodate a need for land for a public school that cannot reasonably wait.

Given that the opponents have a very different interpretation of the purpose and meaning of ORS 197.299(4) when compared to Metro staff and the applicant, a discussion of statutory interpretation is in order.

A statute is considered "ambiguous" if it is capable of at least two reasonable interpretations. *State v. Tarrence*, 161 Or App 583, 985 P2d 225 (1999); *Kenton Neighborhood Ass'n v. City of Portland and Oregon Waste Systems, Inc.,* 17 Or LUBA 784, 797 (1990) (when code is internally inconsistent, it is ambiguous).[1] If the legislation is unambiguous, local governments and courts are bound to apply the statute in that manner, regardless of how inartful the enactment seems. *Sanchez v. Clatsop County*, 146 Or App 159, 164 n 4, 932 P2d 557 (1997). Stated another way, an unambiguous statute should not be "interpreted." *City of Hillsboro v. Housing Dev'l Corp of Washington County*, 61 Or App 484, 488, 657 P2d 726 (1983). *See GTE*

[1] *See also Fisher v. City of Gresham,* 69 Or App 411, 416, 685 P2d 486 (1984); *McCoy v. Linn County,* 90 Or App 271, 276 nl, 752 P2d 323 (1988).

Northwest, Inc., v. Oregon Public Utility Comm'n, 179 Or App 46, 39 P3d 201 (2002). Rather, unambiguous words should be given their plain, natural, and ordinary meaning. *PGE v. BOLI*, 317 Or at 611.[2]

In this case, the hearings officer believes that the relationship between ORS 197.296 and ORS 197.299 creates sufficient ambiguity to warrant an exercise of statutory interpretation.

Text and Context.

When construing a statute, the court will often first look directly at the text of the statute itself. *See Whipple v. Howser*, 291 Or 475, 635 P2d 782 (1981) (citing *Greyhound Corp. v. Mount Hood Stages, Inc.*, 437 US 322, 330, 98 S Ct 2370, 2375 (1978)). Emphasizing the need to look first to the language of the statute, the *Whipple* court stated:

> "The cardinal rule for the construction of a statute is to ascertain from the language thereof the intent of the law makers as to what the purpose was to be served, or what the objective was designed to be attained."

Whipple, 291 Or at 479 (citing *Swift & Co. and Armour & Cove, Co. v. Peterson,* 192 Or 97, 233 P2d 216 (1951). *See also State of Oregon v. Buck,* 200 Or 87, 92, 262 P2d 495 (1953). The *Whipple* court also cited to *State ex rel. Cox v. Wilson*, 277 Or 747, 562 P2d 172 (1977), in which the court stated:

> "There is, of course, no more persuasive evidence of the purpose of a statute then the words by which the legislature undertook to give impression to its wishes."

Courts do not view the text in a vacuum; they consider the context of the language at issue as well. In fact, the context of the statute is as important to the interpretation as the text. *State v. Webb*, 324 Or 380, 927 P2d 79 (1996); *Friends of Neaback Hill v. City of Philomath*, 139 Or App 39, 48, 911 P2d 350 (1996). *See e.g*., *Shadrin v. Clackamas County*, 34 Or LUBA 154 (1998). In some cases, the court may consider the context before examining the text, in situations where the context "provided perspective on the text." *See Plotkin v. Washington County*, 165 Or App 246, 250, 997 P2d 226 (2000). In this case, consider the two statutes in tandem.

ORS 197.299 provides as follows:

---

[2] *See also OSHU v. Hass*, 325 Or 492, 501, 942 P2d 261 (1997); *Zidell Marine Corp. v. West Painting, Inc.*, 322 Or 347, 906 P2d 809 (1995); *State v. Langley*, 314 Or 247, 256, 839 P2d 692 (1992); *Curly's Dairy, Inc. v. State Dept of Agriculture*, 244 Or 15, 415 P2d 740 (1966) (If statute is clear and unambiguous, the court may not resort to rules of statutory construction in ascertaining and declaring the legislative intent.); *Sullivan v. City of Ashland*, 130 Or App 480, 882 P2d 633, *rev den*, 320 Or 453, 887 P2d 792 (1994) (An unambiguous code provision cannot be interpreted, even if that provision is contrary to the express purposes of the provision.); *City of Portland v. White*, 61 Or App 120, 655 P2d 629 (1982).

197.299 Metropolitan service district analysis of buildable land supply; schedule for accommodating needed housing; need for land for school; extension of schedule.

(1) A metropolitan service district organized under ORS chapter 268 shall complete the inventory, determination and analysis required under ORS 197.296(3) not later than six years after completion of the previous inventory, determination and analysis.

(2)(a) The metropolitan service district shall take such action as necessary under ORS 197.296(6)(a) to accommodate one-half of a 20-year buildable land supply determined under ORS 197.296 (3) within one year of completing the analysis.

(b) The metropolitan service district shall take all final action under ORS 197.296(6)(a) necessary to accommodate a 20-year buildable land supply determined under ORS 197.296 (3) within two years of completing the analysis.

(c) The metropolitan service district shall take action under ORS 197.296(6)(b), within one year after the analysis required under ORS 197.296(3)(b) is completed, to provide sufficient buildable land within the urban growth boundary to accommodate the estimated housing needs for 20 years from the time the actions are completed. The metropolitan service district shall consider and adopt new measures that the governing body deems appropriate under ORS 197.296 (6)(b).

(3) The Land Conservation and Development Commission may grant an extension to the time limits of subsection (2) of this section if the Director of the Department of Land Conservation and Development determines that the metropolitan service district has provided good cause for failing to meet the time limits.

(4)(a) The metropolitan service district shall establish a process to expand the urban growth boundary to accommodate a need for land for a public school that cannot reasonably be accommodated within the existing urban growth boundary. The metropolitan service district shall design the process to:

(A) Accommodate a need that must be accommodated between periodic analyses of urban growth boundary capacity required by subsection (1) of this section; and

(B) Provide for a final decision on a proposal to expand the urban growth boundary within four months after submission of a complete application by a large school district as defined in ORS 195.110.

(b) At the request of a large school district, the metropolitan service district shall assist the large school district to identify school sites required by the school facility planning process described in ORS 195.110. A need for a public school is a specific type of identified land need under ORS 197.298 (3). [1997 c.763 §2; 2001 c.908 §2; 2005 c.590 §1; 2007 c.579 §2; 2014 c.92 §5]

As quoted above, ORS 197.299(1) cross-references ORS 197.296(3), which, in term, cross-references to ORS 197.296(2). These two statutes together set forth a process for evaluating and accommodating housing needs:

> ***(2) At periodic review pursuant to ORS 197.628 to 197.651 or at any other legislative review of the comprehensive plan or regional framework plan that concerns the urban growth boundary and requires the application of a statewide planning goal relating to buildable lands for residential use, a local government shall demonstrate that its comprehensive plan or regional framework plan provides sufficient buildable lands within the urban growth boundary established pursuant to statewide planning goals to accommodate estimated housing needs for 20 years. The 20-year period shall commence on the date initially scheduled for completion of the periodic or legislative review.***
>
> ***(3) In performing the duties under subsection (2) of this section, a local government shall:***
>
> ***(a) Inventory the supply of buildable lands within the urban growth boundary and determine the housing capacity of the buildable lands; and***
>
> ***(b) Conduct an analysis of housing need by type and density range, in accordance with ORS 197.303 and statewide planning goals and rules relating to housing, to determine the number of units and amount of land needed for each needed housing type for the next 20 years.*** (Underlined emphasis added).

As the underlined language indicates, ORS 197.296 is a statute narrowly-tailored towards the process used to establish and fulfill an identified *housing* need. It is an expansion of the basic concepts set forth in Statewide Planning Goal 10, but it goes beyond Goal 10 in scope.

As part of that process, the effect of ORS 197.296(6) should also be considered as context:

> ***(6) If the housing need determined pursuant to subsection (3)(b) of this section is greater than the housing capacity determined pursuant to subsection (3)(a) of this section, the local government shall take one or more of the following actions to accommodate the additional housing need:***
>
> ***(a) Amend its urban growth boundary to include sufficient buildable lands to accommodate housing needs for the next 20 years. As part of this process, the local government shall consider the effects of measures taken pursuant to paragraph (b) of this subsection. The amendment shall include sufficient land reasonably necessary to accommodate the siting of new public school facilities. The need and inclusion of lands for new public school facilities shall be a coordinated process between the affected public school***

districts and the local government that has the authority to approve the urban growth boundary;

(b) Amend its comprehensive plan, regional framework plan, functional plan or land use regulations to include new measures that demonstrably increase the likelihood that residential development will occur at densities sufficient to accommodate housing needs for the next 20 years without expansion of the urban growth boundary. A local government or metropolitan service district that takes this action shall monitor and record the level of development activity and development density by housing type following the date of the adoption of the new measures; or

(c) Adopt a combination of the actions described in paragraphs (a) and (b) of this subsection.

A few key points can be quickly gleaned from ORS 197.296. First, by its terms, ORS 197.296(2) only applies to periodic review or another "*legislative* review of the [.. .] regional framework plan that concerns the urban growth boundary and requires the application of a statewide planning goal relating to buildable lands for residential use. " This Major Amendment application is not periodic review and is also not a legislative review of Metro's regional framework plan, *i.e.*, the every six-year UGB amendment cycle. The Major Amendment application is subject to a quasi-judicial process and will result in a quasi-judicial decision by the Metro Council.

Strawberry Hill 4 Wheelers v. Board of Comm'rs sets out a list of factors to be weighed to determine whether a land use decision is legislative or quasi-judicial. 287 Or 591, 602-603, 601 P2d 769 (1979). Under *Strawberry Hills,* the Major Amendment is quasi-judicial because (a) the application process is bound to result in a decision, (b) the decision must apply pre-existing criteria to concrete facts, and (c) the action is directed at a closely circumscribed factual situation.

With regard to the first question, the *Strawberry Hills 4-Wheelers* Court asks practitioners to consider the following question: "Does the statute require the [local government] to reach a decision after the hearing, as in an adjudication, or may it indefinitely postpone or abandon the issue, like a legislative proposal?" 287 Or at 605. At first glance, one might assume that any land use decision that originates from an application being submitted (as opposed to be initiated by the local government itself) would be "bound to result in a decision." Indeed, that seems to have been the original intent of the *Strawberry Hill* Court. However, over the years LUBA and the Court of Appeals have increasingly read this factor more and more narrowly and will only find that that a decision is "bound to result in a decision" if the code either expressly requires a decision to be made, or if that requirement can be fairly read into the language of the code based on the context. *Estate of Gold v. City of Portland*, 87 Or App 45, 48, 740 P2d 812 (1987) ("the statute simply says that the governing body *may* approve the proposal, not that it *must* do anything."); *Johnson v. City of La Grande*, 37 Or LUBA at 388; *Valerio v. Union County*, 33 Or LUBA 604 (1997); *Miner v. Clatsop County*, 46 Or LUBA 467 (2004). In some cases, LUBA has not been as exacting in its analysis, holding that although the code did not:

> "expressly state that once a person requests an interpretation of a provision of the city's zoning ordinance that the person is entitled to a decision. We believe, however, that any reasonable person reading this ordinance would conclude that if a person requested an interpretation from the planning director, received that interpretation and then appealed the interpretation to the planning commission and to the city council, the person filing the appeal would be entitled to a decision from the city council."

Hoffman Ind. Inc. v. City of Beaverton, 2 Or LUBA 411 (1981); *Dean v. City of Oakland*, 33 Or LUBA 806, 809 (1997)("While the cited policy does not require a decision within a specified time, the most natural reading of its terms requires a decision.") The fact that any given ordinance in question states that the decision-maker "may" make a decision should not be a fact which is determined to be indicative of a legislative decision, but unfortunately, in practice it is just that. In this regard, the statute at issue in *Strawberry Hill* did not expressly require that a decision be made. However, the Supreme Court found no difficulty in concluding that "although affirmative action is optional, the statute appears to contemplate that the County Court will *eventually* reach and pronounce some decision whether to act or not. *Id*. at 606. (Emphasis added).

In this case, the MC 3.07.1440(g) requires the Metro Council to make a final decision on the petition. Therefore, this factor suggests that the decision is quasi-judicial.

The second of the *Strawberry Hill* questions has, in practice, become somewhat of a non-factor. Both LUBA and the Court of Appeals have recognized that all land use decisions in Oregon are subject to "preexisting criteria" and apply to concrete facts. LUBA has addressed this issue as follows:

> Turning to the "apply existing criteria to concrete facts" factor, that factor is present to some extent in all land use decisions. *Valerio*, 33 Or LUBA at 607. This factor is therefore less important than the other two factors, particularly where, as is the case here, the decisions are adopting new land use laws rather than applying existing land use laws to grant land use approval for a single property or a small number of properties. *Churchill v. Tillamook County*, 29 Or LUBA 68, 71 (1995); *McInnis v. City of Portland*, 27 Or LUBA 1, 5-7 (1994).

Carver v. Deschutes County, 58 Or LUBA 323 (2009). *See also Casey Jones Well Drilling, Inc. v. City of Lowell*, 34 Or LUBA 263, 271 (1998); *Johnson v. Jefferson Country*, 56 Or LUBA 72 (2008). In this case, the MC 3.07.1440 sets forth criteria for a Major Amendment to a UGB. Therefore, this factor suggests that the decision at issue is quasi-judicial.

Under the third factor, LUBA and the Courts are supposed to assess whether the decision either (1) affects either a small number of owners and properties or (2) the "action directed at a closely circumscribed factual situation," or whether the decision has more broad

applicability. According to early decisions by the Court of Appeals, "the number of people affected and the size of the area covered are less important considerations," and the focus should instead be on "the importance of assuring that the decision is factually correct and that the decision-maker gives fair attention to affected individuals." *1000 Friends of Oregon v. Wasco Co. Court*, 80 Or App 532, 536, 723 P2d 1034 (1986), *rev'd on other grounds*, 304 Or 76, 742 P2d 39 (1987). In practice, this third bean-counting "factor" has become the most critical issue to LUBA, and, despite suggestions to the contrary, in most cases it is more-or-less the dispositive factor. In fact, LUBA has found decisions to be legislative even when the other two factors favored a determination that a decision was quasi-judicial. *Davenport v. City of Tigard*, 22 Or LUBA 577 (1992).

In this case, the proposal involves 82 acres consisting of four tax lots in unknown ownerships. This is well within the size and ownership limits that would allow the conclusion that the decision is quasi-judicial.

The primary opponent argues that this Major Amendment is a "legislative decision," The primary opponent states that "[t]he decision amends the Metro Boundary map that is incorporated into the Metro Urban Growth Functional Plan, and as such the change is legislative." *See* Letter from Jennifer Brager dated June 23, 2017 at p. 1. However, map amendments are not necessarily or inherently legislative or quasi-judicial in nature. *Compare Thomas v. City of Veneta*, 44 Or LUBA 5 (2003) (TSP and zoning map amendment affecting two tax lots comprising 6.4 acres); *Dan Giles & Assoc., Inc. v. McIver*, 113 Or App 1, 3, 831 P2d 1024 (1992)(zone change for single 29-acre parcel in unified ownership is quasi-judicial); *Neuberger v. City of Portland*, 288 Or 155, 603 P2d 771 (1979) (re-zoning involving 601 acres of land owned by three landowners is quasi-judicial).[3] *Contrast Valerio v. Union County*, 33 Or LUBA 604 (1997) (comprehensive plan amendment and zone change pertaining to 185 acres in a "number of different ownerships" is legislative); *Friends of Cedar Mill v. Washington County*, 28 Or LUBA 477 (1995) (PAPA relocating arterial and changing it from 5 lanes to 3 lanes is legislative, where it affects 40 properties and will carry 17,000 – 18,000 trips per day.); *McInnis v. City of Portland*, 27 Or LUBA 1 (1994) (Proposal which rezones 5000 acres in 110 different ownerships is legislative.); *Davenport v. City of Tigard*, 22 Or LUBA 577 (1992) (Transportation plan map amendment that directly involves nine property owners, but has "indirect effects" on a broader population is legislative). Nor is a UGB amendment inherently legislative in nature. *BenjFran Development, Inc. v. Metro*, 17 Or LUBA 30 (1988) (denial of request for UGB amendment comprising almost 500 acres in three ownerships is quasi-judical).

Cases such as *Davenport* and *Friends of Cedar Mill* suggest that large transportation projects will be considered legislative due to the broad secondary effects that transportation facilities can have on commuters. The hearings officer does not believe that this line of cases can be extended to a school, however, based simply on the fact that many kids will attend the school. If that were the case, then any land use decision involving a Wal-Mart or Home Depot store would be legislative, because those uses have higher usage / trip generation rates than a typical school.

[3] *See Neuberger v. City of Portland*, 37 Or App 13 (1978), *rev'd in part, aff'd in part*, 288 Or 155, 603 P2d 771 (1979).

Opponent's counsel cites *Colwell v. Washington County*, 79 Or App 82, 87-8 (1986) for the proposition that this Major Amendment is a legislative (and not a quasi-judicial) decision (*see* Bragar letter dated 23 June 2017, pp 1-2). *Colwell* does not support that conclusion, and is easily distinguished. In *Colwell,* the Washington County Planning Commission made a land use decision which opponents wished to appeal to the Board of Commissioners, but their appeal was dismissed for failure to timely pay for the quasi-judicial Planning Commission hearing transcript. *Colwell*, 79 Or App at 85. Opponents appealed to the LUBA, which dismissed the appeal for failure to exhaust remedies at the local (County) level. The Oregon Court of Appeals reversed and remanded, finding that the Washington County governing body (*i.e.* the elected Board of County Commissioners) - and not the unelected County Planning Commission - must make Comprehensive Plan amendments, pursuant to ORS 215.050(1) and ORS 215.060.

Opponent's argument might have some merit if this unelected hearings officer was the one to make the final decision on this Major Amendment land use application. Only the elected Metro Council has that authority, however. This hearings officer's findings and determination are merely a recommendation to the Metro Council, and the Council is free to accept or reject this Hearings officer's decision, as the Council sees fit. Since the Metro Council will be the governmental body to make the final land use decision in this case, the Court of Appeals' holding in *Colwell* shall be followed for this application.

Despite the lengthy analysis set forth above, the hearings officer does not really believe that the quasi-judicial vs. legislative debate is dispositive, in any event. Rather, it is a red herring. Stated another way, the hearings officer does not believe that ORS 196.296 would apply to this UGB Amendment even it was a legislative decision. By its terms, ORS 197.296 only applies to UGB amendments that "require the application of a statewide planning goal relating to buildable lands for residential use." As discussed elsewhere in this recommendation, an amendment to a UGB which adds AF-20 zoned land for use as a school does not implicate Goal 10 in any meaningful way .

Second, ORS 197.296 sets forth a mandatory periodic process that is focused on only one type of land need: a need for housing. We can credit the Home Builder Association for being active in the legislature over the past 30+ years and influencing the adoption of specific statutory language, such as ORS 197.296, which relates specifically to their industry. But we should also not lose sight of the fact that there are other types of land need under Goal 14 that don't implicate ORS 197.296.

Taking a step back, recall that Goal 14 states that a UGB amendment must be based on consideration of six factors set forth in the Goal. The first two factors are commonly referred to as the "need" factors. The need factors require either a demonstrated need to accommodate long range urban population, consistent with a 20-year population forecast coordinated with affected local governments, <u>or</u> a demonstrated need for housing, employment opportunities, livability or uses such as public facilities, streets and roads, schools, parks or open space, or any combination of the need categories. While the need for housing is governed by ORS 197.296, other land needs are governed by Statewide Planning Goal 14, and in some cases, by OAR Ch. 660, Div 24. Note, as an example, that OAR Ch. 660, Div. 24 does not address now a livability need is established; Goal 14 seems to be the sole administrative pronouncement of its use. What is important to understand for purposes of this case is that ORS 197.296 is not the sole way to

establish land need, and a school need is not limited to being established as a derivative need of housing under ORS 197.296(6).

Among the more common types of land need mentioned in Goal 14 include a need for employment land, a need for public facilities, a need for schools, a need for parks, and the amorphous catch-all known as a "livability need."[4] With one exception related to public schools, ORS 197.296 does not govern substantively how these other types of land needs are established. Nor does it establish a *process* by which those other needs are established. Rather, ORS 197.296(2) & (3) are narrowly focused on accommodating a housing need, and as shown below, accommodating land for public schools as a derivative need stemming from housing need.

Consider ORS 197.296(6) as context: this statute applies when a local government is undertaking periodic review or a legislative review of a UGB that implicates Goal 10. If during such a process, the local government determines that a need exists for additional residential land and that accommodating that land need must necessarily involves a UGB amendment, then ORS 197.296(6)(a) requires that local government to "include sufficient land reasonably necessary to accommodate the siting of new public school facilities." Thus, under that process, a public school facility is considered a derivative need that arises by operation of a demonstrated need for housing. However, there is nothing in ORS 197.296(6) that makes ORS 197.296 the exclusive process by which a need for schools can be established. As demonstrated by the applicant a need for new school facilities can exist independent of housing needs. And while the primary opponent chalks up the applicant's current need to poor planning on the District's part (a sentiment that may have some basis in fact), ORS 197.299(4) appears to written as a safety value that can be used by school districts regardless of the causes that led to the need.

ORS 197.299(4)(a)(A) provides additional key textual clues which helps understand the nature of the process currently being undertaken. This provision authorizes Metro to "establish" and "design" a "process" that will fulfill a need that must be accommodated "*between*" periodic analyses of urban growth boundary capacity required by subsection (1) of this section." By giving Metro the authority to "establish" and "design" a unique UGB amendment process for schools, the statute makes clear that the school need specific "4(a)" process is not the *same* process as the legislative six-year process required by ORS 197.299(1) and 197.296(3). The ORS 197.296 process is already "established" and "designed" by statute, and really only puts a regional government much as Metro in an implementation role. On the other hand, ORS 197.299 delegates to Metro a role that is greater than mere implementation of a pre-existing process. Furthermore, ORS 197.299(4)(a)(4) further emphasizes that the school-specific process is only supposed to be used "between" the 6-year legislatively-mandated processes for accommodating housing needs, and it can only be invoked if the identified school need cannot wait until the next scheduled six-year legislative process.

[4] LUBA cases confirm that a need to improve livability can provide a basis for adding land to a UGB. Such an analysis requires, in addition to identifying a significant livability problem, an evaluation of probable and negative impacts on livability that may occur if the UGB is amended, and an explanation of why the livability benefits outweigh negative impacts on livability. *1000 Friend of Oregon v. City of North Plains,* 27 Or LUBA 372, 383, *aff'd.,* 130 Or App 406 (1994); *1000 Friends of Oregon v. Metro Service Dist*., 18 Or LUBA 311, 320 (1989).

The gravamen of opponents' complaints with respect to ORS 197.299(4) stem from a misunderstanding of the relationship between the ORS 197.299(1) six-year UGB amendment process with the ORS 197.299(4) public school amendment process. Much of opponent counsel's testimony at the June 13, 2017, hearing and again in her June 23, 2017 letter, was directed generally at a dissatisfaction with how Metro plans for regional housing and employment needs and opponents' opinion that allowing out-of-cycle UGB expansions for public schools exacerbates Metro's alleged poor planning. In its June 23, 2017 letter, opponents argued that this Major Amendment application does not meet the requirements of ORS 197.296(2).

At its core, the opponent's argument hinges on the assumption that the school-specific process must be substantively the same as the periodic six-year legislative process. Stated another way, the opponents argue that the substantive standards and criteria that govern the school specific process are the same as the housing-specific legislative process under which school need can be established as a derivative need. However, if that were truly the case, however, there would be no need for Metro to "establish" and "design" a new process. Rather, if the legislative intent was to mandate the same rigorous process that is used to establish housing need and to otherwise limit school need as a derivative need, the legislature would have simply stated that a school-related need can form the basis for accelerating the time frame under which the legislative housing need process is conducted. And that in itself does not make any sense because nothing in ORS 197.299(1) or ORS 197.296 prohibits Metro from conducting the legislative housing-needs process sooner than on a 6-year increment. In fact, ORS 197.299(1) merely states that Metro must undertake the ORS 197.296 process "*not later than six years after completion of the previous inventory, determination and analysis."* In theory, Metro could voluntarily conduct that inventory and analysis on a bi-annual or other timeline. In light of this observation, ORS 197.299(4) would be a redundancy if interpreted in the manner that the primary opponent advocates.

Courts strive to give effect to all parts of a statute, in order to produce a harmonious whole. ORS 174.010.[5] As a corollary, courts will avoid interpretations that render a portion of the statute redundant or meaningless surplusage.[6] *See State v. Stamper,* 197 Or.App. 413, 418, 106 P.3d 172, *rev. den.,* 339 Or. 230, 119 P.3d 790 (2005) ("we assume that the legislature did not intend any portion of its enactments to be meaningless surplusage"). If the school-specific process were not a separate process governed by different substantive criteria than ORS 197.296, it would not accomplish anything that Metro did not already have the right to do.

Rather than being drafted as an authorization to conduct the existing six-year legislative housing needs process at any time increment earlier than six years if a need exists that cannot wait six years, ORS 197.299(4)(a)(A) contemplates a *new* process *designed* by Metro to cater to

---

Stamper,* 197 Or.App. 413, 417, 106 P.3d 172, *rev. den.,* 339 Or. 230, 119 P.3d 790 (2005); *EQC v. City of Coos Bay,* 171 Or.App. 106, 110, 14 P.3d 649 (2000).

school needs as a primary independent need, not as a secondary derivative need resulting from a housing need. Because it is a different process that is intended to evaluate a needs other than a housing needs, the process and requirements (*i.e.* inventory, determination, and analysis) of ORS 197.296 do not apply to this separate process. And discussed below, the legislative history confirms this analysis.

Legislative History

Prior to 2001, the case of *Portland Gen. Elec. Co. v. Bureau of Labor & Indus.,* 317 Or 606, 611–612, 859 P2d 1143 (1993) (hereinafter *PGE*) made clear that legislative history could not be used to determine legislative intent if the text and context of the law made the meaning of that law unambiguous. The case of *State v. Gaines,* 346 Or 160, 171–172, 206 P3d 1042 (2009) essentially acknowledges that the *PGE v. BOLI* approach was legislatively modified in 2001 via amendments to ORS 174.020, and that the statute now permits the consideration of legislative history even when the text and context seem to make the meaning unambiguous. For this reason, a careful treatment of *Gaines* is warranted here.

The OSB publication entitled "Interpreting Oregon Statutes" Steve Johansen, Hon. Jack Landau, and Anne Villella ed. OSB CLE (2009) contains a lengthy but highly relevant discussion of *Gaines,* as follows:

> In *Gaines,* the defendant was convicted of obstructing governmental administration when she refused to cooperate in being photographed after her arrest. On appeal, she argued that her behavior did not constitute a "'means of . . . physical . . . interference or obstacle' "within the meaning of the relevant statute. *Gaines,* 346 Or at 162 (quoting ORS 162.235(1)). She argued further that the 2001 amendments to ORS 174.020 required the court to consider the legislative history of ORS 162.235(1) along with the text and context of the statute, even if the court found that its analysis of the text and context did not render the legislative intent ambiguous. *Gaines,* 346 Or at 165. Interestingly, in assessing the meaning of the 2001 amendments to ORS 174.020, the court found that a text-and-context analysis suggested that the amendments did not significantly change the *PGE* standard. *Gaines,* 346 Or at 166. However, the court did not stop its analysis at the text-and-context level. As the plaintiff argued that ORS 174.020 required, the court went on to examine the legislative history. The legislative history revealed a clear legislative intent to eliminate the requirement that a court only look to legislative history "if but only if" the text and context left the meaning ambiguous. *Gaines,* 346 Or at 169.
>
> * * * * *.

> The court will now consider proffered legislative history even when the text and context of a statute appear to render it unambiguous. In effect, *Gaines* brings legislative history into the step-one analysis along with the text and context of a statute. That said, legislative history remains a second step of statutory analysis—the court will consider it only after analyzing the text and context of a statute. The weight the court gives that legislative history also remains within the discretion of the court. A party attempting to overcome seemingly plain and unambiguous text through reference to legislative history has "a difficult task before it." *Gaines,* 346 Or at 172.

Although *Gaines* modifies the *PGE* methodology, the full extent of that modification remains to be seen. However, a recent appellate court decision suggests the extent may be relatively slight. *State v. Kelly,* 229 Or App 461, 211 P3d 932 (2009). *Kelly* raised the issue of the meaning of ORS 811.335(1)(b), which requires drivers to signal a turn "during not less than the last 100 feet traveled by the vehicle before turning." The defendant, who signaled a turn after he had stopped at an intersection, argued that the legislative history showed that the intent of the statute was to require a signal for at least as long as it took to travel the last 100 feet, but not to signal for the specified distance. The court agreed that under *Gaines* it needed to consider the legislative history. The court also made several points as to what weight it would give that legislative history.

The court first made clear that legislative history alone cannot overcome statutory text that is truly capable of only one interpretation. *Kelly,* 229 Or App at 466. Beyond that caution, the court explained the traditional limits of legislative history: legislative history is most helpful when it uncovers the general legislative intent of a statute (*Kelly,* 299 Or App at 466); statements of single legislators or non-legislators are generally, though not always, less helpful (*Kelly,* 299 Or App at 466–467), and the existence of a particular problem that precipitated a bill does not necessarily mean the statute was intended to address only that problem (*Kelly,* 299 Or App at 468). What *Kelly* does not suggest is that *Gaines* changes in any significant way *how* courts use legislative history. Rather, it only changes *when* the court will consider legislative history. Thus, even under *Gaines,* legislative history will be most helpful when an analysis of the text and context does not resolve an ambiguity of the statute. Legislative history may also be useful to reinforce an apparently unambiguous interpretation of a statute. (Emphasis added).

Courts are not likely to be persuaded by legislative history when that history does not give any indication that the precise legal question at issue was considered during the legislative enactment.[7]

The subsection in question, subsection 4, was added to ORS 197.299 in 2005 as part of Senate Bill 1032. Testimony at legislative committee hearings from bill authors and proponents indicates SB 1032 was intended to grant Metro new expedited authority to expand the UGB for the purpose of allowing construction of new schools, and such a process would be separate from the "normal" UGB expansion process typically required by state statutes.

Testimony of several speakers during the May 17, 2005 public hearing provide insight regarding the policy goals behind SB 1032. The main speaker, Gary Conkling, represented the Beaverton School District and was one of the authors of the bill. Mr. Conkling began his testimony in favor of the bill by outlining the pressing problems that face the city of Beaverton. He stated that "in the last decade or so the Beaverton School District has added more than ten thousand students" and that those students alone would make up the fifteenth largest school district in the state.[8]

Mr. Conkling explained that overabundance problems are common in the metropolitan areas of Portland, and most suitable plots of land for schools have been used for other projects intended to spur economic development. Mr. Conkling "anticipate[d] [Beaverton] will have to look outside the UGB for one or more additional school sites" to meet the growing demand. He ended his testimony by stating two main objectives of SB 1032. First, the bill is designed to gain "guidance from Metro, cities, and urban service providers as to where we should look outside the UGB" for suitable plots of land for schools. Second, the bill has language that "will encourage Metro to provide an accelerated process to add those lands once . . . the need has been established . . . so that lands can be added on an accelerated basis to the UGB."[9]

Metro Legislative Affairs Director Randy Tucker, a second advocate of SB 1032, added some additional points regarding the purpose and scope of the bill. Mr. Tucker explained that developing lands for schools requires additional planning considerations than developing lands for other purposes because schools must be located in particular locations. These additional considerations include that ideally, schools should be located near city centers, and schools must fall within existing school district boundaries. This makes it even more difficult to find suitable land for new school construction without expanding the UGB.

---

[7] For example, the court often dispense with legislative history in one sentence by stating simply that the legislative history is silent on the particular issue facing the court. *Ritcherson v. State,* 131 Or App 183, 186, 884 P2d 554 (1994) (seeking to determine if ORS 138.510(2) included retroactive application of its two-year statute of limitations period); *see also Windsor Ins. Co. v. Judd,* 321 Or 379, 387, 898 P2d 761 (1995) ("[W]hat little [discussion of the amendment] there was reveals nothing that sheds light directly on the question posed in this case."); *State v. Holloway,* 138 Or App 260, 267, 908 P2d 324 (1995) ("Unfortunately, our examination of the legislative history sheds no light on the matter."); *In Def. of Animals v. Or. Health Scis. Univ.,* 199 Or App 160, 173 n 9, 112 P3d 336 (2005) ("We note that the legislative history . . . provides no assistance in determining the provision's meaning.").

[8] Hearing on S.B. 1032 Before the S. Comm. on Environment & Land Use, 2005 Leg., 73rd Assemb., Reg. Sess. (Or. 2005) (statement of Gary Conkling, Representative of Beaverton School District).

[9] *Id.*

Finally, Mr. Tucker added that Metro intended to implement SB 1032 by amending its own code to make it easier to expand the UGB for schools "when [new schools] cannot be reasonably accommodated in the UGB, and when they must be accommodated before we would normally do an UGB expansion." Here, Mr. Tucker indicated that Metro should be authorized to quickly initiate UGB expansion for schools outside of the "typical" or "normal" legislative process of reevaluating the buildable land supply inside the UGB every [six] years.

Later, in a May 31, 2005 work session on SB 1032, Messrs. Conkling and Tucker again provided testimony in support of the bill and explained its purpose and scope. Mr. Conkling stated the bill's main purpose is to provide Metro "[with a] process that can work in between its periodic review, and provide for an accelerated process to bring these school sites inside the UGB."

After the testimony of Mr. Tucker, Senator Charlie Ringo, Chair of the Committee, asked if the bill will "facilitate Metro addressing the problem with high growth districts not finding land for schools."[10] Mr. Tucker stated his answer was yes, and that the bill would provide the basis for immediate negotiation as to what land should be included in the UGB as part of an amendment. Mr. Tucker explained that the bill would be beneficial to districts like Beaverton because "it facilitates the process for expanding the UGB for a school district that has need." Mr. Tucker stated that ideally, after revising the Metro code to implement the statute, the process to expand the UGB to include land for a school would take only four months.

The legislative history of HB 1032 indicates that one main purpose of the bill was to streamline the process for amending the UGB for the purpose of building new schools. The testimony of both Conkling and Tucker describe a pressing need for land in metropolitan areas for new school construction that cannot always be met within the typical five-year UGB cycle. Proponents of the bill clearly express intent to grant Metro authority to amend the UGB through a process that would be separate from the regular review cycle and corresponding 20-year need analysis.

Proponents of the bill used words such as "streamline" and "accelerated" in the context of a new expansion process that could occur outside and separate from the "normal" time intensive 20-year need analysis, and described a process that would be based exclusively on a demonstrated need for additional school facilities. Testimony regarding the purpose of SB 1032 indicates that the purpose of the legislation was to allow a separate and expedited process exclusively for school siting, which would not be tied to the 20-year buildable land supply analysis that is required under ORS 197.296.

As described above, it is clear from legislative history that the 2005 Oregon legislature was acutely aware of the problem of holding school districts to a six year Metro planning cycle during the enactment of SB 1032. Metro's Randy Tucker specifically stated that SB1032

[10] Work Session on S.B. 1032 Before the S. Comm. on Environment & Land Use, 2005 Leg., 73rd Assemb., Reg. Sess. (Or. 2005) (statement of Sen. Charlie Ringo, Chair, S. Comm. on Environment & Land Use).

"facilitated" school districts obtaining a UGB amendment for school facilities.[11] According to the Merriam-Webster dictionary, the word "facilitate" means "to make (an action or process) easy or easier." It makes little sense to believe that the legislature would desire to make obtaining a Metro UGB amendment *just as, or even more difficult* for schools while simultaneously creating an "accelerated" process specifically for schools. Indeed, Metro's own Legislative Affairs Director – no stranger to tightly-crafted statutory language - was quite clear in stating that the purpose of SB 1032 was to "facilitate" (that is, make easier) the process for Metro-area schools.

In addition, the hearings officer finds that the ORS 197.299's school-specific UGB amendment process is no less thorough or exacting than an application that could have been filed in due course of the next six-year Metro planning cycle. It is true, as opponents claim, that the next Metro 20-year buildable lands analysis is not yet available, and thus cannot be taken into account during this application. The law does not require that, however, and requiring school applicants to wait until the next six-year Metro planning cycle would render the passage of ORS 197.299 pointless. The entire point of ORS 197.299 was to provide schools with an interim, accelerated, easier ("facilitated") application process, rather than waiting for the next 6 year Metro planning cycle. Statutes should not be construed such that they make other statutes completely meaningless.

As noted above, the Metro Council is required to complete a 20-year forecast and analysis of land need to maintain a 20-year supply of residential and employment land inside the UGB on a six-year cycle. However the Metro Council has directed staff to complete an urban growth report in 2018, three years after the urban growth report was adopted in 2015, with a possible growth management decision occurring in December 2018 that may or may not result in an expansion of the UGB. Delaying the proposed amendment for these specific school and park needs until that time, when these types of specific needs are not addressed in the regional analysis, is not an appropriate or an efficient way to provide these needed services and would result in the District experiencing ever-increasing overcrowding of their facilities.

Thus, in summary, review of the text and context of ORS 197.299 and ORS 197.296 in combination with the legislative history of the 2005 Amendments which created ORS 197.299(4) bring the legislative intent into clear focus. ORS 197.299(4) explicitly provides a "safety valve" of sorts for public school needs. The statute de-couples the need for schools from the derivative secondary needs analysis set forth in ORS 197.296(6). The legislature apparently understood the critical nature of schools to serve the community and felt strongly enough about that to provide a mechanism to ensure that needed schools can be built. Opponents' attempt to saddle Major Amendments with all of the trappings of a six-year legislative review of the region's UGB is contrary to both the plain text of ORS 197.299(4) and its legislative history.

Having resolved the statutory interpretation question, we turn back to the evidence of need. The District originally adopted a long-term facilities plan in January 2008 that assumed additional school capacity would be needed in ten years. This proved true, as of 2017 the high

[11] Testimony before the Senate Environment and land Use Committee, May 31, 2005, beginning at minute 1.13, available at http://records.sos.state.or.us/webdrawer/webdrawer.dll/webdrawer/rec/4193397/ Mr. Tucker's statement is found at minute 1.18, in response to a question from Senator Ginnie Burdick.

school is at 109% of capacity and the four elementary schools are at 99% capacity. A ten-year demographic study by Davis Demographics & Planning Inc., completed in May 2016, forecasted a deficit in capacity at all levels with the high school operating at 141% of capacity. In order to meet the growing need, the District determined, with the assistance of numerous committees, that a new high school would be needed. Voters approved a bond measure in 2016 to construct a new high school and make other facility improvements. The applicant adequately addressed the urgent need for the new high school by substantial evidence in the whole record in its application submittal and its subsequent submittals. (*See* application narrative ("Narrative") at 14-15, 33, Appendices G, H, and I; June 8, 2017, District letter at 1-3, Attachment i; June 13, 2017, District letter at 5.)

The applicant has met its burden of showing compliance of the two criteria found in Metro Code section 3.07.1440(A) by substantial evidence in the whole record.

Metro Code Section 3.07.1440(B)

> **3.07.1440 Major Amendments - Criteria**
> **(b) The applicant shall demonstrate that the proposed amendment to the UGB will provide for an orderly and efficient transition from rural to urban land use and complies with the criteria and factors in subsections (b), (c), (d), (e), and (f) of section 3.07.1425. The applicant shall also demonstrate that: (1) The proposed uses of the subject land would be compatible, or through measures can be made compatible, with uses of adjacent land; (2) If the amendment would add land for public school facilities, the coordination required by subsection (c)(5) of section 3.07.1120 of this chapter has been completed; and (3) If the amendment would add land for industrial use pursuant to section 3.07.1435, a large site or sites cannot reasonably be created by land assembly or reclamation of a brownfield site.**

[Note: This Provision Incorporates by Reference: 3.07.1425(B), (C), (D), (E), & (F), which are Discussed Below].

MC 3.07.1425(B)(1): Demonstrated need to accommodate future urban population, consistent with a 20-year population range forecast coordinated with affected local governments;

Hearing Officer's Analysis: MC 3.07.1425(b)(1) requires that the Major Amendment application show a [d]emonstrated need to accommodate future urban population, consistent with a 20-year population forecast coordinated with affected local governments. " This criterion is taken word for word from the first need factor set forth in Statewide Planning Goal 14. In the context of periodic review, Factor 1 pertains to a determination of overall land need in order to accommodate population growth. In this case, the need is for additional school capacity to alleviate an overcrowding situation at the Sherwood high School. For this reason, the first need factor set forth at MCC 3.07.1425(B)(1) is to be considered, but it is not determinative by itself.

In *Residents of Rosemont v. Metro,* 173 Or App 321, 328, 21 P3d 1108 (2001), the Court of Appeals explained that "[w]e held in *Baker [v. Marion County,* 120 Or App 50, 852 P2d 254, *rev den*, 317 Or 485, 858 P2d 875 (1993),] that factors 1 and 2 of Goal 14 are interdependent and

that, if one of the factors is not fully satisfied, or is less determinative, that factor must still be considered and discussed in deciding if a need for expansion of a UGB has been shown under factors 1 and 2 of Goal 14."

This factor requires the applicant to show, by substantial evidence in the whole record, that there is a demonstrable need for the new Sherwood High School based on a forecast that is consistent with the adopted 20-year population range forecast which has been coordinated with affected local governments.

The District and Metro staff address this provision at: Application Narrative at pp. 15, 34, App'x H; May 4, 2017, staff report ("Staff Report") at 5; June 9, 2017, Metro memo; June 13, 2017, District letter at 1-2. In particular, the applicant attempts to meet its burden of proof with the following analysis:

> *As described herein, the need for additional school capacity including the need for a new high school is well documented as described in Section III of the petition. The existing high school is operating overcapacity and the constraints of the existing high school site and building do not allow for feasible expansion to 2,400 students to serve long-term needs. Building a new high school will also allow the existing high school building to be converted to middle school use by consolidating the two existing middle schools to one location. This will further allow for the conversion of the two existing middle schools to elementary school use. The capacity analysis and 10-year demographic projections indicate that there will be capacity issues at all school levels if nothing is done. The proposed project will provide the long-term capacity needed.*
>
> *The School District commissioned Davis Demographics & Planning Inc. to complete an updated 10-year demographic study in May of 2016. The study reviewed the following factors that determine student enrollment: (1) the current and planned residential development over the next ten years; (2) student yield factors that apply to new residential development; (3) birth factors for the District area; and (4) mobility factors, which examine the in/out migration of students within existing housing units. The forecast projects a deficiency in capacity in all levels, with the high school level having the largest deficiency. Staff Report Attachment 3 (Table 2 in petition) shows 10-year enrollment projections compared with existing school building capacity. The table demonstrates that if no capacity is added (no-build) the school facilities will be far over capacity in 10 years with the Sherwood High School having the largest capacity issue operating at 141% of capacity.*

Metro's 20-year population range forecast is part of the 2015 urban growth report ("UGR"). Therein, the Metro Council determined that the region could meet the expected 20-year residential and employment forecast need within the UGB and no expansion of the UGB was needed to meet housing or employment needs. The UGR did not address specific school and park land needs. As a result, the District prepared a ten-year demographic study that supports a need for additional land for a new high school in order to accommodate future urban population. The District completed this demographic study using population and demographic projections for the cities of Sherwood and Tualatin.

The parties do not focus much, if any, of their debate on whether the population and demographic projections in the District's 10-year study are "consistent" with the assumptions in the 2015 UGR. Such as comparison is complicated by the fact that the UGR takes a high-level regional look at residential and employment needs, whereas the District's 10-year demographic study is much more narrowly focused on Sherwood's population. Nonetheless, the hearings officer reviewed both the 10-year study and the UGR and finds that there is no glaring inconsistency between them. The 2105 UGR anticipates continued high levels of growth in our region. The UGR further recognizes that there is still a considerable amount of vacant and redevelopable land located in and near the City of Sherwood. This would indicate that the District needs to be prepared to accommodate a large amount of additional school children. Given that the regional 20-year forecast did not address school and park land needs, the District's ten-year demographic study, which supplements the long-term facility plan completed in 2008, demonstrates a need to accommodate future urban population by substantial evidence in the whole record. The applicant has provided information regarding a ten-year demographic study showing a need for providing specific school facilities to meet present and future populations based on established methodologies for the proposed use. The applicant also provided written and verbal testimony from experts such as architect Karina Ruiz of Dull Olson Weekes IBI Group Architects, Inc, planner Keith Jones AICP of Harper Houf Peterson Righellis Inc, and traffic engineers Scott Mansur, P.E. and Carl Springer, P.E. of DKS Associates. Having reviewed these materials and observed their testimony, the hearings officer finds them more credible and assigns great weight to their views.

Staff is also correct when it states that even if Metro had expanded the UGB in 2015 for a 20-year housing need, there is no guarantee that the location of the added land would have accommodated the specific need for a new high school in Sherwood. ORS 197.299(4) provides a safety valve for such a situation.

The primary opponent argues that the District could only demonstrate consistency with the 2015 UGR by submitting a new 20-year demographic study. *See* letter from Jennifer Bragar dated June 23, 2017, at p. 20. The opponent points to no specific law which expressly states such a requirement, and the hearings officer does not believe that such a requirement exists. As far as the hearings officer can determine, "consistency" in this context simply means using the same or similar growth rates contemplated in the 2015 UGR, and that appears to be the case here. *See* the updated 10-year demographic study conducted by Davis Demographics & Planning Inc. dated May, 2016. This is consistent with Goal 2, which requires the factual inventories and assumptions included in the comprehensive planning documents to form the "basis for all decisions and actions related to land use." *Rivergate Residents Ass'n v. LCDC*, 38 Or App 149,

5990 P2d 1233, *rev den*. 286 Or 521 (1979); *Hildenbrand v. City of Adair Village*, 217 Or App 623, 177 P3d 401 (2008) ("Plan policies or inventories can serve to justify subsequent and related plan amendments because comprehensive plans must be internally consistent under Goal 2.)" *See also 1000 Friends of Oregon v. Metro (Ryland Homes)*, 174 Or App 406, 26 P3d 151 (2001). *Compare GMK Developments v. City of Madras,* 225 Or App 1, 199 P3d 882 (2008) (Nothing in Goal 2 itself requires the sort of continuous data correction that the opponents urge us to impose in this case).

MC 3.07.1425(B)(1) requires the District to demonstrate a need to accommodate future urban population; consistent with the demographic study contained in the 2015 UGR. The District has done that, and that is all that is required. The applicant has met its burden of showing compliance with this factor by substantial evidence in the whole record.

MC 3.07.1425(B)(2): Demonstrated need for land suitable to accommodate housing, employment opportunities, livability or uses such as public facilities and services, schools, parks, open space, or any combination of the foregoing in this paragraph;

This factor requires the applicant to show, by substantial evidence in the whole record, that there is a demonstrable "need for land suitable to accommodate * * * uses such as * * * schools * * *." The applicant presents its case as follows:

> As described herein, the need for additional school capacity including the need for a new high school is well documented as described in Section III of the petition. The existing high school is operating overcapacity and the constraints of the existing high school site and building do not allow for feasible expansion to 2,400 students to serve long-term needs. Building a new high school will also allow the existing high school building to be converted to middle school use by consolidating the two existing middle schools to one location. This will further allow for the conversion of the two existing middle schools to elementary school use. The capacity analysis and 10-year demographic projections indicate that there will be capacity issues at all school levels if nothing is done. The proposed project will provide the long-term capacity needed.
>
> The School District commissioned Davis Demographics & Planning Inc. to complete an updated 10-year demographic study in May of 2016. The study reviewed the following factors that determine student enrollment: (1) the current and planned residential development over the next ten years; (2) student yield factors that apply to new residential development; (3) birth factors for the District area; and (4) mobility factors, which examine the in/out migration of students within existing housing units. The forecast projects a deficiency in capacity in all levels, with the high school level having the largest deficiency. Staff Report Attachment

3 (Table 2 in petition) shows 10-year enrollment projections compared with existing school building capacity. The table demonstrates that if no capacity is added (no-build) the school facilities will be far over capacity in 10 years with the Sherwood High School having the largest capacity issue operating at 141% of capacity.

The City of Sherwood and the Sherwood School District have an intergovernmental agreement to share ballfields. The City of Sherwood owns an extensive system of parks and trails. However, the City's ballfield resources are very limited with only one soccer field located at the City's Snyder Park. In the early 1990s, prior to rapid growth in the preceding 20 years, the City took measures to protect natural resources. This included the protection of floodplains and wetland areas surrounding the Cedar Creek stream corridor that flows south to north through the center of the City limits to the Tualatin National Wildlife Refuge. The City acquired much of this land and maintains these areas as natural open space, wetlands and walking paths. Since most of the areas are sensitive and passive recreation areas, they are off limits to ballfield construction. Because Sherwood has a very active sports community, the City and School District decided to share sports fields with most of these facilities being on school grounds.

In the case of the new High School site, the City owns the approximately 20-acre parcel in the southeast corner of the property. Some of this land, approximately 4 acres, will be used for the Elwert and Kruger Road realignment and roundabout, but the remaining balance will become part of the new high school campus and allow for construction of additional ballfields to be shared with both school and City sports functions.

As documented in Section III of the petition, viable high school sites are not available within the current UGB. The only viable sites, including the proposed site, have been identified within the Sherwood West Concept Planning Area (Urban Reserve Area 5B).

The subject site ("Site C") is the best alternative site considering that it has:

- No mapped sensitive areas (habitats, wetlands or waterways),
- Gently sloping topography to allow for construction of ballfields,
- Close proximity to SW Elwert Road and Highway 99W for ease of access,
- Availability of public utilities (water and sewer),

- Available downstream discharge point for stormwater, and
- Sufficient area to provide high school campus for 2,400 students and needed City/School District shared ballfields.

As shown above, the applicant has shown a compelling need for providing specific school facilities to meet present and future populations.

The City of Sherwood and the District have an intergovernmental agreement to share sports fields with most of the facilities on school grounds. The City has an extensive system of parks and trails but sport field resources are very limited with one soccer field located in a city park. Thus, the applicant has shown there is a demonstrated land need to accommodate both school and park services by substantial evidence in the whole record. That evidence may be found in the following: Applicant's Narrative at p. 12-32, 34, Appendices C, G, H, and I; June 8, 2017, District letter pp 1-3. Additionally, the applicant demonstrated that district bond financing rules require moving ahead with the application now, rather than wait until the end of 2018. *See* letter from applicant's counsel Kelly Hossaini dated June 8, 2017, page 3 (discussing the district's finances).

The applicant has met its burden of showing compliance with this factor by substantial evidence in the whole record.

MC 3.07.1425 (B)(3): A demonstration that any need shown under paragraphs (1) and (2) of this subsection cannot be accommodated on land already inside the UGB.

MC 3.07.1425(B)(3) requires an alternatives sites analysis showing that the needed new school cannot be accommodated within the existing UGB. This requirement stems from state law. Among other laws, Statewide Planning Goal 14 requires the applicant to consider, as part of the needs analysis, all suitable lands inside the UGB as positive alternatives, and even requires the City to consider whether zone changes could make land suitable for the project. *See Brandt v. Marion County*, 22 Or LUBA 473, 481 (1991); *Turner v. Washington County*, 8 Or LUBA 234, 258 (1982), *aff'd*, 70 Or App 575,689 P2d 1318 (1984).

The applicant's narrative discusses MC 3.07.1425(B)(3) at p. 19-21, 34-35. For example, on pages 16-17 of the narrative, the applicant states as follows:

> As evidenced by capacity study and demographic growth data, the high school level is where there is the biggest need for additional capacity both now and to a greater extent within 7 to 10 years. Therefore, the Bond Management Team first looked to the existing high school campus for opportunities for expansion to accommodate this growth.
>
> **Expansion of Existing High School**
>
> The existing Sherwood High School is located on approximately 37.8 acres of land at 16956 SW Meinecke Road. The existing high

school has capacity for 1,550 students and, as of the writing of this report, is well over capacity with an enrollment of 1,689. This growth is expected to continue with a needed student capacity of approximately 2,200 by the year 2025 and peaking at approximately 2,400 students. Therefore, the School District will need a long-term high school capacity for 2,400 students.

Expanding the existing high school campus to meet this need is problematic on many fronts due to existing size limitation and irregular configuration of the site boundaries. Further, the campus cannot expand beyond its current boundaries as the campus is completely surrounded by existing residential development to the north, south and west and Stella Olsen Park and the sensitive wetland areas along Cedar Creek to the east as shown in Staff Report Attachment 4(Figure 5 in petition).

With respect to the buildings themselves, the School District has made additions over the years to accommodate growth, but the buildings are now completely overtaxed. Based on capacity analysis performed by the School District's contract architect, DOWA, the existing high school campus could be renovated to accommodate only another 450 students. This would increase capacity from 1,550 to approximately 2,000 students. However, at 2,000 students, the school would only have capacity for 7 years requiring the School District to add capacity again down the road. In review of the School District's bonding capacity, the School District will not be in a financial position to make any changes in 7 years and would be saddled with overcapacity schools for the foreseeable future. Therefore expanding the existing campus would provide for a short-term fix but would not provide the long-term solution the District is looking for.

New High School Siting Criteria

With the determination that a new high school is needed, the Bond Management Team identified the following criteria for aid in locating sites for further consideration:

1. Minimum Size: 50 acres
2. Zoning: Site must be zoned or planned for residential or institutional use that allow schools
3. Location: Site must be in Sherwood or contiguous to Sherwood (The City of Sherwood and mostly western Sherwood is where 90% of the student population resides)
4. Topography: Flat to mostly flat to accommodate ballfields

5. Wetlands and Waterways: No wetlands or minimal wetlands/waterways
6. Water and Sanitary Sewer: Adequate public utilities must be available or can feasibly be extended to serve the site
7. Stormwater Drainage: Downstream drainage capacity must exist to accommodate new impervious areas
8. Transportation: Site must be located near major streets to allow ease of access for students and limited routing of school traffic and buses through existing or planned residential areas

Inside the Current UGB

Using Metro's Regional Land Information System, City's Residential Buildable Lands Map and concept planning documents, potential sites were searched within the Sherwood School District Boundary that is inside the Existing Sherwood Urban Growth Boundary and within the Wilsonville or Tualatin existing Urban Grown Boundary.

Northeast Sherwood (Commercial and Industrial Land)

Sherwood City Limits

The northwest area of the City of Sherwood is zoned commercial and industrial, zoning that does not allow for school uses. In addition, much of the commercial and industrial land is built-out or contains wetlands and sensitive areas that cannot be developed. The largest vacant developable site in this area is located at the southeast corner of SW Langer Farms Parkway and SW Century Drive and is only 22 acres, too small for a high school.

Tonquin Employment Area

In 2004, 300 acres of industrial land was added to the Sherwood urban growth boundary in east Sherwood, known as the Tonquin Employment Area. A concept planning document was completed for this area in October of 2010. None of the area has of yet been annexed into the City of Sherwood to allow for urban development. There is an 88 acre parcel that fronts SW Tualatin-Sherwood Road that has potential to accommodate a new high school (12900 SW Tualatin Sherwood Road – 2S128D000100). However, this parcel was added to the UGB for the purpose of providing industrial uses and not for school uses. In addition, this site is located at the far east end of the existing Sherwood city limits and is not close to the student population that predominately resides on the west side of Sherwood. Therefore, locating the

school here would result in an inconvenient and isolated high school campus in the midst of industrial uses. Thus, the site was rejected from further consideration.

South and West Sherwood (Residential Land)

The southern and western areas of Sherwood are mostly residential. Residential zoning allows for school uses. This is also where most of the School District's student population resides (more than 90% of the student population lives in southern and western Sherwood). South of the existing city limits and within the urban growth boundary is the 250-acre Brookman Road Addition Concept Planning Area (Brookman Planning Area). The primarily-residential Brookman Planning Area has a completed concept plan from May of 2009. However, the area has not yet been annexed into the City of Sherwood and therefore has not been developed for urban uses.

The City of Sherwood recently completed a draft Housing Needs Analysis dated June 2015 for the existing urban growth boundary. The housing needs analysis contained a 2014 residential buildable lands inventory map that identified vacant buildable residential land within the City's UGB including the Brookman Planning Area. The residential buildable lands inventory map identified some available residential land. However, the available land is fragmented and/or constrained with no large developable sites that would accommodate a high school campus of 50 acres. Further there is no opportunity to consolidate this fragmented land in a way that would meet the District's criteria for a high school site. The Sherwood Buildable lands map is shown in Staff Report Attachment 5(Figure 6 in petition).

Within the Wilsonville or Tualatin Urban Growth Boundary

There are some limited areas of the Sherwood School District that are within Wilsonville and Tualatin's urban growth boundary, including the following:

Southwest Tualatin Concept Planning Area

Adjacent and east of the Sherwood Tonquin Employment Area is the Southwest Tualatin Concept Planning Area. Similar to Tonquin, this 614-acre area was added to the urban growth boundary in 2004. The area is planned for industrial use, and is even further away from west Sherwood students than Tonquin Road. Therefore, the area was rejected from further consideration.

Basalt Creek and Coffee Creek Planning Areas

Both of these planning areas are too far from the west Sherwood student population to be seriously considered. In addition, discussions with the City of Tualatin, who is leading the planning for Basalt Creek, indicates that there are no sites large enough with the correct zoning within Basalt Creek that would accommodate a new high school. The Coffee Creek planning area is designated by Metro as Regionally Significant Industrial land. This designation does not allow for school uses under any circumstances.

In summary as noted in Section III of the petition there are no suitable sites for a new high school within the current UGB to serve the Districts target population.

As noted in the findings set forth above, the District first examined the ability to expand the current high school to meet future capacity needs. However expanding the existing high school building is problematic due to existing size limitation and the configuration of the existing school campus. The current high school building includes a series of additions designed and constructed in an attempt to incrementally accommodate growth in the student population, resulting in a crowded non-operational and functional facility. Thus additional expansions to meet long term needs are not possible. In addition, the current high school campus is surrounded by residential development on three sides with the fourth side bordering a city park and natural resource area, thereby not allowing expansion of the campus itself.

The District identified eight site location criteria to help guide their search for appropriate site locations within the Sherwood city limits as well as limited areas within Tualatin and Wilsonville that are within the District boundary. The analysis of land within the city limits offered no usable sites. The city's industrial and commercial zones don't allow school uses and the vacant and developable land within the residentially zoned portions of the city is fragmented and constrained with no large enough sites available. The industrial designated land within the UGB but not in the city (Tonquin Employment Area) does contain one site large enough to meet the need; however it was included in the UGB for industrial purposes, is adjacent to existing industrial uses including an active quarry site and is located away from the main student population base. The limited land area within Tualatin and Wilsonville also include either industrially zoned land or very limited parcel sizes that does not provide an opportunity to site a high school. In addition, these areas are even a longer distance from the main student population base in the central and western portions of the city.

No opponents take issue with the applicant's analysis.

The hearings officer believes that it is relatively obvious that there are no sites within the City limits that could meet the need, even considering rezoning as an option. While there is vacant land in the existing UGB, the applicant has shown there are no suitable sites within the

UGB to meet the identified land need. The applicant has met its burden of showing compliance with this factor by substantial evidence in the whole record.

MC 3.07.1425 (C)(1): If the Council determines that there is a need to amend the UGB, the Council shall evaluate areas designated urban reserve for possible addition to the UGB and shall determine which areas better meet the need considering the following factors:

(1) efficient accommodation of identified land needs;

Hearing Officer's Analysis: Once a local government establishes a "demonstrated need" to expand the urban growth boundary, it then must apply the Goal 14's four "locational factors." When Goal 14 was amended in 2005, the locational factors were amended to make clear that the analysis is to be comparative in nature, as opposed to establishing minimum thresholds. The rule now states:

> The location of the urban growth boundary and changes to the boundary shall be determined *by evaluating alternative boundary locations* consistent with ORS 197.298 and with consideration of the following factors:
>
> (1) efficient accommodation of identified land needs
> (2) orderly and economic provision of public facilities and services;
> (3) *comparative* environmental energy, economic and social consequences; and
> (4) compatibility of the proposed urban uses with nearly agricultural and forest activities accruing on farm and forest land outside the UGB. (Underline emphasis added).

Metro has taken the four state-mandated locational factors set forth in Goal 14 and expended them to nine factors. Regardless of this, the goal of the locational analysis remains the same as state law, which is to determine the "best" land to include within the UGB to meet the land need**,** based on appropriate *consideration and balancing* of each factor. *1000 Friends of Oregon v. Metro (Ryland Homes)*, 38 Or LUBA 565, 584 (2000), *rev'd in part on other grounds* 174 Or App 406, 26 P3d 151 (2001). In *Barkers Five, LLC v. LCDC*, 261 Or App 259, 289 (2014), the court stated that consideration of factors means that the local government must:

> "(a) apply and evaluate each factor, (b) weigh and balance the factors which are not independent approval criteria-as a whole, and (c) meaningfully explain why a designation as urban or rural reserves is appropriate. "

Barkers Five, 261 Or App at 300.

OAR 660-024-0060(3) also provides guidance for how one "considers" the location factors and states:

> The boundary location factors of Goal 14 are not independent criteria. When the factors are applied to compare alternative boundary locations and to determine the Metro UGB location, Metro must show that all of the factors were considered and balanced.

In conducting this analysis, one point that cannot be over-emphasized is that no one locational factor can be considered to be a determinative reason to include or exclude any one particular site. Thus, a decision to include or exclude land from a UGB must be based on a *balancing* of all these factors, rather than reliance on any one factor. OAR 660-024-0060(3). *See also Branscomb v. LCDC*, 64 Or App 738, 745, 669 P2d 1192 (1983)(Court held that land could not be excluded from consideration *solely* because it was agricultural land and, as such, fared badly under factor 6). *D.S. Parklane*, 165 Or App at 25; *1000 Friends of Oregon v. Metro (Ryland Homes)*, 174 Or App 406, 409-10 (2001).

A related issue is that local governments often incorrectly treat the locational factors as threshold criteria. In fact, this misunderstanding was so pervasive that at one point LUBA even wrongly suggested that each of the locational factors had a "minimum objective threshold" that had to be identified and met by each site included in a UAR/UGB. *See D.S. Parklane Development, Inc., v. Metro*, 35 Or LUBA 516, 572-3 (1999), *aff'd as modified*, 165 Or App 1, 24, 994 P2d 1205 (2000). However, on appeal, the Court of Appeals clarified that the locational factors were not intended to be applied as threshold ("go - no go") criteria. *Id.* In other words, the intent is *not* to confirm that the preferred site was "good enough" to urbanize based on minimum threshold standards. Rather, the locational factors were intended to be "applied equally" to include lands into a UGB only "where all of the factors justify that inclusion." *Id.* In other words, the intent in establishing these factors was to assist in evaluating and ranking which site(s) amongst *all* potential candidate sites were, relative to one another, the *best* sites to urbanize in order to meet the demonstrated land need.

With that introduction in mind, we turn to a discussion of the first factor. The applicant discusses the first locational factor as follows:

> Urban reserves are lands outside the existing urban growth boundary that are considered suitable for accommodating urban development and expanding the growth boundary when additional urban land is determined to be needed over a 50-year period. The following urban reserve areas are within the Sherwood School District Boundary and are identified in Staff Report Attachment 6 (Figure 7 in petition):
>
> Sherwood North – North of Sherwood UGB
> Sherwood South – South of Sherwood UGB
> Sherwood West – West of Sherwood UGB
> Tonquin – South and West of Sherwood UGB
> Grahams Ferry – Northwest of Wilsonville

I-5 East – East of I-5 and north of Wilsonville
Elligsen Road - East of I-5 and north of Wilsonville

I-5 East, Elligsen Road and Grahams Ferry Urban Reserve Areas
These urban reserve areas were immediately rejected from further consideration due to the distance from west and south Sherwood where the majority of the student enrollment resides. These areas are 2 to 5 miles away in a straight line and even further when traveling on the road network.

Tonquin Urban Reserve Area
This area is directly south of the Sherwood Tonquin Employment UGB area and west of the Southwest Tualatin UGB area. The Tonquin Urban Reserve area encompasses approximately 571 acres. The area has parcels large enough to accommodate the high school site. However, much of the property is mapped as containing Upland Habitat Class A (Metro Title 13) and Riparian Areas Class I, II and III (Metro Title 3). This urban reserve area and it is likely to be designated industrial and/or employment due to its close proximity to other industrial areas. This urban reserve area is on the east side of the City and not centrally located for use by the majority of the School District students. The area is further isolated by a rock bluff that forms the eastern boundary of the current urban growth boundary and Sherwood City limits. This bluff is perched above the Rock Creek stream corridor that effectively isolates this area from the existing residential neighborhoods of Sherwood. Finally, the area does not have adopted concept plan or plan for how utilities will be extended to serve the area.

Sherwood North Urban Reserve Area
This area represents slivers of land along the existing urban growth boundary at the north end of the City of Sherwood. The area was designated urban reserve because it is not within the floodplain of the Tualatin River. However, this land is not large enough to accommodate a high school site and therefore was rejected from further consideration.

Sherwood South Urban Reserve Area
This area is directly south of the Brookman Road UGB area. This area consists of rolling hills with much of the area identified by Metromap online mapping system having slopes greater than 10%. There is also two stream corridors that travel through the area with many areas mapped by Metromap as being riparian or upland habitat. One potential site is located between Oberst Road and Labrousse Road that is not mapped as having upland habitat or

riparian areas. However, this land is mapped by Metro as having slopes of greater than 10% making development of a high school campus and ballfields difficult. The biggest challenge of developing in this area is that the Brookman Road UGB area would need to be annexed and developed first before this area can be made available for development. Therefore, development in this urban reserve area is likely years away and the only promising site is at the south end of and not next to the existing Brookman Road UGB area. This area also does not have a concept plan. For these reasons, this area was rejected from further consideration.

Sherwood West Urban Reserve Area

In February 2016, Sherwood completed a Preliminary Concept Plan for the Sherwood West Planning area (aka Metro Urban Reserve Area 5B). Sherwood West encompasses 1,291 acres along the west border of Sherwood's existing urban growth boundary. The Sherwood West Planning Area is shown in Staff Report Attachment 7 (Figure 8 in petition).

Six alternative high school sites (A-F) were identified within the Sherwood West Urban Reserve Area that are large enough to accommodate a new high school. The six alternative sites (A-F) within the Sherwood West Concept Plan Area were evaluated based on site selection criteria. The site locations and evaluation criteria are indicated in Staff Report Attachment 8 (Figures 9 to 14 in petition). The School District's site alternative analysis is summarized in the table below.

(Table 1 – Alternative Sites Summary in petition)

Alternative Selection Criteria	***Alternative Sites****					
	A	***B***	***C***	***D***	***E***	***F***
Flat Topography	*N*	***U***	***Y***	*U*	*U*	*U*
Wetlands	*N*	***Y***	***Y***	*U*	*Y*	*N*
Water Service	*N*	***Y***	***Y***	*Y*	*N*	*N*
Sanitary Sewer Service	*N*	***Y***	***Y***	*N*	*N*	*Y*
Storm Drainage	*Y*	***Y***	***U***	*N*	*N*	*Y*
** Y-Meets Criteria - N-Does Not Meet Criteria – U-Undetermined*						

From the site alternatives analysis, it became clear that Sites B and C were the most promising with other sites lacking utilities, having significant wetlands, drainage issues and/or significant topography that would make construction challenging. Alternative Sites B and C are located near each other both west of SW Elwert Road at SW Haide Road, just north of Highway 99W. Site C was selected due

to having more of a gentle slope and less grade changes. Most of Site C has a consistent slope change of approximately 40 feet over the length of the site with only a small valley and ridge. Site B has a more drastic slope change of 50 to 60 feet with a more defined ridge running through the middle of the site. Site B would be far more challenging to grade and develop for a high school than Site C. The Sherwood West Concept Plan contained a phasing and funding strategy. The phasing plan identified six phases (A-F). The subject site (Site C) is located within Phase A of the concept plan.

The subject site represents an efficient location because:

- The location is next to existing western Sherwood and close to the vast majority of the District's student population (90%).
- City utilities are available to serve this site or can be extend as the site is adjacent to the city limits.
- Direct and efficient access will be available via major streets that are intended to accommodate significant motor vehicle, pedestrian and bicycle needs.
- The site will be developed on the north, south and west along existing right-of-ways and will be developed to the existing City limits and UGB. This location is a logical location to develop first within the Sherwood West Concept Plan, as it is really the first site north of 99W. Other sites in Sherwood West would result in undesirable leapfrog development.
- Utilizing the approximate 76-acre site to ultimately accommodate the large 2,400-student high school and the School District/City shared ballfields will provide greater efficiency than developing play fields independently. The district and City have a long history of partnering to maximize use of shared ball field resources.

As set forth in the District's narrative and response to MC 3.07.1440(a), there is an identified need for a major amendment of the UGB to provide for a new high school site and this need cannot wait until the next analysis of the building land supply under ORS 197.299. As allowed by MC 3.07.1425(b), the District specified characteristics necessary for land to be suitable for the identified need, *i.e.*, the new high school. *See* Applicant's Narrative at 18-19, 33-35. These characteristics included a minimum site size of 50 acres; zoning that would allow for an institutional use; within or contiguous to Sherwood, where 90% of the children served by the District reside; flat to mostly flat topography; no or minimal constraints such as streams, wetlands, intact upland habitat; adequate/feasible access to public utilities, including water, sanitary sewer, and storm sewer; and near to major (collector or arterial) streets to accommodate high school-level transportation impacts. As also required by MC 3.07.1425(b), the District has demonstrated that the need for the new high school cannot be accommodated on land already inside the UGB.

As shown above, the District undertook an analysis of seven urban reserve areas that are within the district boundary, three of which are not adjacent to the city of Sherwood. The Metro Code does not allow for the creation of an island of urban land so the analysis must be limited to those properties that are directly adjacent to the current UGB. MC 3.07.1425(f).

The Seven Urban Reserve Areas

Within the District's boundary, there are seven areas that contain urban reserves (*see* Application Narrative p. 22 of 39, showing map of all seven areas). They are:

- Sherwood North
- Sherwood South
- I-5 East
- Elligsen Road
- Tonquin
- Graham's Ferry
- Sherwood West

Each will be discussed in turn.

The Sherwood North Urban Reserve Area

The Sherwood North urban reserve area is comprised of slivers of land without flood plain constraints north of the existing city limits and south of Tualatin River. This area does not contain one or more contiguous parcels that would be large enough to meet any of the District's siting criteria for a high school site. Therefore, the hearings officer finds that the Sherwood North urban reserve area cannot accommodate the need for a new high school.

The Sherwood South Urban Reserve Area

The Sherwood South urban reserve area is adjacent to the Brookman Road UGB area. Some of the Brookman Road UGB area was recently annexed to the city, but much of it still has not been annexed. The Sherwood South area consists of rolling hills with much of the area identified by Metro Map as having slopes greater than ten percent, which would not meet the District's siting criterion of a flat to relatively flat site. (See Attachment 3.) There are also two stream corridors that traverse the area with many areas mapped by Metro as being riparian or upland habitat. (See Attachment 4.) There is a potential site located between Oberst Road and Labrousse Road that is not mapped as being constrained by upland habitat or riparian areas, but is mapped as having slopes greater than ten percent, which would not meet the District's siting criterion for a flat to relatively flat site. A challenge in the overall development of this area is that the Brookman Road area within the UGB must be annexed and developed first before the Sherwood South area will have the public services it needs to be able to develop. Further, Sherwood South is not even concept planned yet. As far as the hearings officer is aware, no such planning has been scheduled. As noted earlier, MC 3.07.1110 requires that urban reserve areas be concept planned before they be considered for inclusion in the UGB. As set forth in response

to MC 3.07.1440(a) there is a pressing need for the new high school. To wait at least one or more years for the City to concept plan the Sherwood South urban reserve area under MC 3.07.1110 is not consistent with the pressing need for the new high school that precipitated this major amendment application. Therefore, the hearings officer concludes Sherwood South cannot accommodate the need for a new high school.

The I-5 East Urban Reserve Area

The I-5 East urban reserve area is at the extreme eastern end of the District's boundary, east of I-5, next to Tualatin. This urban reserve area does not meet the District's siting criterion that the new high school site be within or contiguous to Sherwood, where 90% of the children served by the District reside. Further, as set forth in the staff report, these urban reserves are constrained by natural resources issues and steeper slopes yielding no buildable areas big enough to accommodate a new high school. For all of these reasons, the hearings officer finds and concludes that this urban reserve cannot accommodate the new high school.

The Elligsen Road Urban Reserve Area

Similarly, the Elligsen Road urban reserve area is at the extreme eastern end of the District's boundary, east of I-5, next to Tualatin, and immediately south of the I-5 East urban reserve area. This urban reserve area does not meet the District's siting criterion that the new high school site be within or contiguous to Sherwood, where 90% of the children served by the District reside. Travel to western Sherwood would be at least five miles for the vast majority of students along the already-congested Tualatin-Sherwood Road (*see* Application Narrative p. 22 of 39, showing map). Further, as set forth in the staff report, these urban reserves are constrained by natural resources issues and steeper slopes yielding no buildable areas big enough to accommodate a new high school. For all of these reasons, the hearings officer finds and concludes that this urban reserve cannot accommodate the new high school.

The Tonquin Urban Reserve Area

The fifth urban reserve is the Tonquin urban reserve area. This area lies on the east side of Sherwood and is contiguous to Sherwood's city boundary. As set forth in the Narrative, this urban reserve area is directly south of the Sherwood Tonquin Employment UGB area and, according to Julia Hajduk, the City's Community Development Director, will be used to accommodate the City's future industrial and employment needs given its proximity to other industrial uses and Sherwood's employment/industrial core. Therefore it is not likely to allow for zoning for an institutional use. As noted in the staff report, another issue with building a new high school in this area is that the majority of adjacent land within the UGB is not yet developed to urban standards. Any out-of-sequence development in this area, then, would require a costly and inefficient extension of public services. Further, much of the property in this urban area is mapped as containing Upland Habitat Class A (Metro Title 13) and Riparian Areas Class I, II, and III (Metro Title 13). (See Attachment 1.) This area is further isolated by a rock bluff that forms the eastern boundary of the current UGB and city limits. This bluff is perched above the Rock Creek stream corridor that effectively isolates the area from the existing residential neighborhoods of Sherwood, thereby making it less efficient to serve the student population

given that the bulk of that population is in the southern and western areas of the city. Significant areas of the urban reserve also have substantial slopes of ten percent and greater, along with floodplain constraints, which would not meet the District's siting criterion of a flat to relatively flat site. (See Attachment 2.) Further, this urban reserve area does not have a concept plan in place or a plan for how utilities might be extended to serve the area. Concept planning has not been completed for this area. MC 3.07.1110 requires that urban reserve areas be concept planned before these areas can be considered for inclusion in the UGB. As set forth in response to MC 3.07.1440(a) there is a pressing need for the new high school. To wait at least one or more years for the City to concept plan the Tonquin urban reserve area under MC 3.07.1110 is not consistent with the pressing need for the new high school that precipitated this major amendment application.[12] Therefore, the hearings officer concludes the Tonquin urban reserve area cannot accommodate the need for a new high school.

The Grahams Ferry Urban Reserve Area

The Grahams Ferry urban reserve area is at the District's extreme southeast boundary next to Wilsonville. This urban reserve areas meet the District's siting criterion that the new high school site be within or contiguous to Sherwood, where 90% of the children served by the District reside. Travel to from Graham's Ferry to western Sherwood would be at least seven miles for the vast majority of students along the already-congested Tualatin-Sherwood Road (*see* Application Narrative p. 22 of 39, showing map). Further, as set forth in the staff report, this urban reserve area is constrained by natural resources and steeper slopes yielding no buildable areas big enough to accommodate a new high school. For all of these reasons, the hearings officer finds and concludes that these urban reserves cannot accommodate the new high school.

The Sherwood West Urban Reserve Area

The seventh and final urban reserve area studied was Sherwood West. The hearings officer finds this is the only urban reserve area that can efficiently accommodate a new high school consistent with the citing criteria, for these reasons: Sherwood West has been MC 3.07.1110 concept planned and so may be considered for inclusion within the UGB. Sherwood West is adjacent to the city's existing UGB and in close proximity to the bulk of the District's student population. The area is planned for predominantly residential uses, including schools, and so as Sherwood West develops even more of the student population will reside in the vicinity of the proposed high school site. The District studied the 1,291-acre Sherwood West urban reserve for places within it that could accommodate a new high school site. The applicant District did this by utilizing an engineer and architect to evaluate all sites in the urban reserve that were flat to relatively flat; had a minimum buildable site size of approximately 50 acres or more; no or minimal constraints from streams, wetlands, and intact upland habitat; adequate/feasible access to public utilities; and proximity to a major (collector or arterial) street network. Findings addressing MC 3.07.1425(c) can be found in the Narrative and in the staff report. The applicant District included an analysis of the six areas within Sherwood West. Therefore, the hearings officer finds that, given the framework of MC 3.07.1425(b) and (c), no urban reserve except for

[12] Urban Reserve Areas are intended to provide a 50-year supply of land. Given that the City has no plans to complete a concept plan for the area, and because contiguous areas within the UGB would need to develop first to extend the needed infrastructure, it is safe to conclude that development of this area is at least several years away.

Sherwood West should advance to MC 3.07.1425(c) to determine which urban reserve can best meet the identified need, because no other urban reserve can meet that need.

The Six Sites Studied within the Sherwood West Urban Reserve Area

The District identified six sites (designates Sites A through F) within the Sherwood West urban reserve area that were large enough to accommodate a new high school campus. Each of the six is discussed in turn:

Site A – The hearings officer finds this site cannot efficiently accommodate the new high school due to slope, natural area constraints, public infrastructure issues or a combination of these factors. There is a small wetland in the center of this site. The western portion is mostly occupied by Chicken Creek. There is no water service available from SW Elwert Road, and water extensions would be required along Elwert frontage and east from SW Edy Road. The site is low-lying and sanitary sewer connection is not available from SW Edy Road, so a major pumping station would have to be built.

Site B - The hearings officer finds this site *could* possibly accommodate the new high school. However, it has a significant ridge running through the middle of the site, which would require extensive grading, with slopes running both east and west with a 50-60 foot grade change. Both public water and a 15" sanitary sewer pipe are available off SW Elwert Road.

Site C - This site is quite flat, with no more than a 40 foot grade change required. It has water and sewer connections off SW Elwert Road. There are no wetlands. The hearings officer finds that Sites B and C are the two areas that can most efficiently accommodate a new high school, but Site C is clearly superior because Site B has a significant topographic ridge running north-south through the middle of the site with an approximately 50-60 foot grade change. Site C has less topography to manage, which is important when one considers that ballfields, tracks, and other sports facilities needed as part of the new high school cannot be developed on slopes. Therefore, the hearings officer concludes and finds Site C can most efficiently meet the identified need of a new high school.

Site D - The hearings officer finds this site cannot efficiently accommodate the new high school due to slope, natural area constraints, and public infrastructure issues. The entire site slopes down to the east towards private property, with a grade change in excess of 50 feet. There is no sanitary sewer service available. A very costly sewer line extension and public system improvements would be necessary. There are no established public storm drains in the vicinity. Street improvements on Kruger Road and offsite improvements would likely be required. Sites D also suffers from not being adjacent to the existing Sherwood UGB, which means more land would be required to be brought into the UGB than is necessary for the school site in order to ensure contiguity and public infrastructure would have to be extended further to serve the new high school, which is inefficient and expensive.

Site E - The hearings officer finds this site cannot efficiently accommodate the new high school due to slope, natural area constraints, and public infrastructure issues. The entire site slopes down to the east towards Highway 99, with a grade change around 75 feet. There is no

sanitary sewer service available. A very costly sewer line extension and public system improvements would be necessary. There are no established public storm drains in the vicinity.

Site F - The hearings officer finds this site cannot efficiently accommodate the new high school due to wetlands, drainage, powerlines, and lack of public water supplu. While quite flat, this site has wetlands, drainage, and a BPA power line easement running through it. While there is a nearby sewer line, there is no water line, and costly improvements would have be made to supply the school with drinking and irrigation water as well as meeting firefighting needs. Site F is further constrained by a BPA easement that cuts diagonally through what would otherwise be the flattest, least constrained part of that area and this flat area is segregated from the existing UGB by Chicken Creek and protects a riparian corridor. Site F also suffers from not being adjacent to the existing Sherwood UGB, which means more land would be required to be brought into the UGB than is necessary for the school site in order to ensure contiguity and public infrastructure would have to be extended further to serve the new high school, which is inefficient and expensive.

Conclusion of the Alternative Sites Analysis for the Six Sites in Sherwood West

The District evaluated the alternative sites related to five selection criteria noted above and determined that four of the six sites (A, D, E & F) lacked utilities, had significant wetlands, drainage issues or topography that restricted the ability to efficiently accommodate the identified land need. In addition, site D is not adjacent to the current UGB and therefore would create an island of urban land which is not allowed under Metro Code. Areas B & C better met the selection criteria with site C being the best site due to less grading and site work to accommodate the identified land need. Based on the urban reserve areas analyzed site C in the Sherwood West urban reserve best meets the need considering efficient accommodation of the identified land need. For these reasons, the hearings officer concludes and finds that proposed Site C (on the northwest corner of SW Elwert and Kruger Roads) can most efficiently meet the identified need of a new high school.

MC 3.07.1425(c)(2): If the Council determines there is a need to amend the UGB, the Council shall evaluate areas designated urban reserve for possible addition to the UGB and shall determine which areas better meet the need considering:

(2) the orderly and economic provision of public facilities and services.

Hearings Officer's Analysis: This suitability factor focuses on the orderly and economic provision of public facilities and services. Because Sherwood West has been concept planned pursuant to MC 3.07.1110, the provision of public facilities and services within the Sherwood West Concept Plan area has been studied to a larger degree than other URAs. The Sherwood West Concept Plan was prepared with analyses of existing sanitary sewer, water, storm water, and transportation conditions and analyses of how those systems need to be upgraded, extended, and phased to meet the future development of Sherwood West. (See Sherwood West Concept Plan, pages 15-21, 40-44, Appendix 3 (Existing Conditions Report), and Appendix 8 (Transportation Options Alternative Analysis Report and Cost Estimates). The concept plan was prepared in coordination with all of the future service providers, including those services that

will be provided by the City and those that will be provided by others, including Clean Water Services, ODOT, Tualatin Valley Fire & Rescue, and Washington County. (*See* Sherwood West Concept, acknowledgements page and Appendix 6 (Service Provider Interviews). The District was also part of the Technical Advisory Committee that informed the concept planning effort. Because all of this extensive analysis and coordination work had already been done for Sherwood West, the District used that work as the jumping off point for its analysis of the area for orderly and efficient accommodation of public services.

As demonstrated in the Narrative, pages 24-31, four of the six sites (A, D, E, and F) have significant barriers to provision of public infrastructure. Sites B and C have the fewest barriers and are most feasible for public infrastructure service. This is consistent with the findings of the Sherwood West Concept Plan, which anticipates phasing public infrastructure to serve the area encompassed by Sites B and C first, i.e., Area A. (*See* Sherwood West Concept Plan, pages 40-44.) Service provider interviews conducted as part of the concept planning effort also identified Area A as the "first stage development area." (*See* Sherwood West Concept Plan, Appendix 6, page 5.) It is also worth noting that, according to the concept plan, Area A of the concept plan has most infrastructure in place, "presents the best near-term opportunity for development in Sherwood West," and the cost to serve is on the lower end of the cost scale. (Sherwood West Concept Plan, pages 42-43.) The District also engaged a licensed traffic engineer to prepare the March 15, 2017, Sherwood High School UGB Expansion Transportation Study (the "Transportation Study") to address effects of a new high school on Site C on the surrounding transportation system. The Transportation Study found that, with appropriate mitigation, Site C can accommodate the new high school while maintaining an adequate transportation system. See also District's findings in response to Goals 11 and 12 with respect to the provision of public facilities and services to Site C.

As part of this UGB amendment application effort, the District obtained service provider comments from the City of Sherwood, Washington County, Tualatin Valley Fire and Rescue, and Clean Water Services, all of whom supported the siting of the new school on Site C from an infrastructure provision standpoint, consistent with the Sherwood West Concept Plan.

In sum, Sites B and C best meet the need for a new high school considering the orderly and economic provision of public services per the Sherwood West Concept Plan and the District's own analysis.

The primary opponent makes only a desultory effort to challenge the applicant's proposed findings. *See* letter from Jennifer Brager dated June 23, 2017, at p. 7. Ms. Bragar concludes, without much in the way of analysis, that "Site C is unworkable." The only evidence that the opponent cites as support for this theory is the DKS Traffic Study dated March 15, 2017, which shows that currently there are several failing intersections in the vicinity. However, failing intersections is not in any way determinative when considering the locational factors.

The proposed site has positive attributes from the transportation and traffic perspective. The site is close to the area's major north-south highway (Highway 99) and east-west arterial (the Tualatin-Sherwood Road). It has a relatively flat topography, reducing hazards in wet or snowy conditions. With the planning modifications, the site will have adequate access and

capacity for peak school commuting times (7.15 to 8 am and 2.50 to 3:45 pm). Road widths and sightlines will be sufficient for safety purposes, an important consideration for less-experienced drivers, such as high school juniors and seniors.

The traffic issue has been addressed by unrebutted evidence from the applicant's civil and traffic engineers - the *only* expert testimony in the record - and is belied by the fact that all of the public service providers for the Sherwood West area, including Washington County, the City of Sherwood, and Clean Water Services, submitted service provider letters that support the new high school on Site C, and state that such services can be provided. (*see* Appendix to the Application Narrative for copies of these letters).

At the public hearing, local residents Carolyn McBee and Karen Labahn raised issues of traffic safety at the proposed site, specifically on Kruger and Elwert Roads. They testified, convincingly, that the roads abutting the preferred alternative site are rural in nature and not capable of handling the traffic generated by the school. As the hearings officer emphasized at the hearing, the analysis is comparative in nature. A site does not have to be good; it just has to be better than the alternatives. This is true even if all of the alternatives are objectively bad. In fact, it will undoubtedly be the case that the roads in all seven of the candidate urban reserve areas are rural in nature and incapable of handling urban levels of traffic. At this stage, the analysis is high level and really only focused on identifying issues that made any one site particularly good or horrendously bad in relation to the others.

In this case, the applicant's traffic engineers Scott Mansur, P.E. and Carl Springer, P.E. of DKS Associates wrote the following in a June 28, 2017 memorandum:

> DKS prepared the March 15, 2017, Sherwood High School UGB Expansion Transportation Study ("March Transportation Study"). The March Transportation Study assesses the proposed UGB amendment impacts and identifies a roster of system improvements for the short-term and long-term. This study acknowledges that several local intersections are heavily congested during peak hours, and that the rural street infrastructure nearby the proposed UGB amendment site does not meet either the City's or the County's facility design standards today. What this study also tells us, however, is that with proper mitigation the proposed school site can be adequately served with transportation infrastructure. The next step in the planning process is the post-UGB amendment Title 11 planning, as required by Metro, and it is during that process that the next transportation planning steps will be taken. These planning steps include designating urban zoning and land use types within the newly added UGB area. During this stage, we will engage in additional technical studies, including a second transportation impact study, to (1) refine the specific project needs, (2) ensure that the Transportation Planning Rule is met, (3) ensure that performance standards can be maintained over time, and (4) ensure that a safe transportation network is provided for the new

> high school. Based on our transportation analyses so far, we are confident that the Sherwood School District can provide adequate state and local transportation facilities to support the proposed Site C high school.

While the residents' traffic safety concerns are well meant, and taken seriously by the hearings officer, the engineers are undoubtedly correct that the applicant's preferred alternative site can be improved with reasonable cost expenditure. The improvements discussed at the hearing were typical of what one would expect when land urbanizes, and do not involve any highly extravagant technical solutions such as bridges over wetlands / streams, or expensive highway overpasses. The hearings officer had the opportunity to evaluate these engineering experts and considers their representations highly credible. No evidence was presented pertaining to other sites that would suggest that any other site would be significantly better from a transportation standpoint, and several of the sites required more expensive improvements.

The opponents argue that the applicant gamed the system by counting traffic in the middle of winter. *See* letter from Jennifer Brager dated June 23, 2017, at p. 8. Again, this argument seems to lose focus of the intended exercise. That argument might have merit if the applicant's traffic engineers had performed their traffic counts at some locations in winter, but at other locations in summer (when traffic is lighter because school is out of session and many workers are not commuting, due to vacations). That did not happen. The applicant's traffic study clearly states:

> To perform the intersection analysis, traffic counts were collected during the AM peak (7:00 – 9:00 am) on Feb 1, 2017 and the PM peak (4:00-6:00 pm) on Jan 31, 2017. Study intersections on ODOT facilities (i.e. OR 99W) were analyzed using estimated 30th highest hour traffic volume (30 HV) conditions. The 30 HV development process for existing conditions *includes the determination of seasonal adjustments*. (DKS "Sherwood High School UGB Expansion Transportation Study" dated March 15, 2017, p. 9, italic emphasis added).

Site C is located in close proximity to existing urban arterials, which in and of itself makes it a better site as compared to alternatives such as Sites D and F, which are more isolated and remote. Sites A, E, and F will be more expensive to develop than Sites B and C. Sites D and F suffer from not being contiguous with the existing UGB and so public infrastructure would have to be extended further, out of sequence, to reach those sites. This creates a significant unnecessary expense. Further, sites with steeper topography and natural resource constraints, like Sites A, D, E, and F will also be more costly to develop. Sites B and C will cost less than the other sites to develop, but Site C will cost even less than Site B due to its flatter topography.

The hearings officer wishes to emphasize that the public will have many additional opportunities to comment on and influence the types of transportation improvements that will be built.

MC 3.07.1425(c)(3): If the Council determines there is a need to amend the UGB, the Council shall evaluate areas designated urban reserve for possible addition to the UGB and shall determine which areas better meet the need considering:

(3) ***comparative environmental, energy, economic, and social consequences.***

A comparison of the six sites with respect to environmental, energy, economic, and social consequences of development is set forth below:

Environmental Consequences: There are areas within Sherwood West that have significant natural resources within them. The maps at Figure 6 of the Sherwood West Concept Plan and Appendix B of Appendix 3 of the Sherwood West Concept plan are instructive in this regard. From those maps one can see that Sites A, D, and F have significant areas of floodplains, wetlands, protected stream corridors, and inventoried wildlife habitat. In contrast, Sites B and C have little to no environmental resources on them. Further, Sites B and C are closest to the city's existing urban core, which give them the most direct transportation connections, thus limiting air quality degradation. Therefore, development of these sites with a high school would have the least negative environmental consequences of all of the alternative sites.

Energy Consequences: From an energy standpoint, all of the sites are reasonably close to the bulk of the student population to be served, but Sites E and F are more remote. This will be exacerbated as Sherwood West develops with mostly residential uses. Sites A, B, C, and D are most centrally located, which will allow more students to walk and bike to school and reduces the number of students being bused and driven to school, and allows for the least vehicle miles traveled for those who use cars and buses. Site D would require an out-of-sequence extension of public infrastructure to the more interior of the urban reserve, however, which ticks its adverse energy consequences somewhat higher than Sites A, B and C.

Economic Consequences: Public bond dollars are finite and must not be wasted. Taxpayers expect that school districts will be good stewards of the public money and building new school facilities is no exception. Being more remote from the existing urban area and public infrastructure, Sites A, E, and F will be more expensive to develop than Sites B and C. Sites D and F suffer from not being contiguous with the existing UGB and so public infrastructure would have to be extended further, out of sequence, to reach those sites. This creates a significant unnecessary expense. Further, sites with steeper topography and natural resource constraints, like Sites A, D, E, and F will also be more costly to develop. Sites B and C will cost less than the other sites to develop, but Site C will cost even less than Site B due to its flatter topography. The effect of topography on the cost of building a high school site with its need for ball fields and other sports facilities should not be under estimated. Even small amounts of slope will have significant, expensive consequences on a school site due to the cost of grading.

Site C has another factor that weighs in its favor over Site B, which is that Site B contains a number of single-family residences that would have to be purchased and demolished to build the new high school. Purchasing houses to tear them down is not a good use of bond dollars if it can be avoided. Therefore, Site C clearly comes out ahead in this consideration.

Social Consequences: Siting the new high school in the most centrally located area possible is important to fostering a sense of civic and school pride. Although high schools can have fairly significant impacts on an area, they should be sited where the bulk of the population resides and be a use that brings people together in a place that the citizens identify as an integral part of their community. One of the alternatives that the District considered in its facilities planning to alleviate the capacity issue at the existing Sherwood High School was building a second high school. The community, however, was very much opposed to that idea. A small, cohesive community like Sherwood wants to remain bound together not divided by different allegiances to different high schools. All of the sites analyzed in Sherwood West would be superior to any sites in any other urban reserve for these reasons alone; however, within Sherwood West Sites B and C are most centrally located - both now and in the future as the city continues to grow to the south and west. Even so, development of Site B has a more immediate social consequence that Site C does not have. There are a number of residences in Site B that would have to be purchased and demolished in order to develop the new high school. Displacing residents from their homes needlessly is a very adverse social consequence and should not occur if it can be avoided, which in this case it can. Therefore, Site C comes out ahead here, too.

Conclusion: Sites B and C are the two sites that come out the most favorably when one factors in the environmental, energy, economic, and social consequences. However, Site C edges ahead of Site B due to Site B's increased adverse economic and social consequences.

MC 3.07.1425(c)(4): If the Council determines there is a need to amend the UGB, the Council shall evaluate areas designated urban reserve for possible addition to the UGB and shall determine which areas better meet the need considering

(4) compatibility of proposed urban uses with nearby agricultural and forest activities occurring on land outside the UGB designated for agriculture or forestry pursuant to a statewide planning goal.

Hearings Officer's Analysis: The District identified a number of site characteristics that a new site would need to meet in order to accommodate a new high school. As discussed above, is one urban reserve area that can efficiently accommodate a new high school - Sherwood West. Sherwood West has been MC 3.07.1110 concept planned and so may be considered for inclusion within the UGB. Sherwood West is adjacent to the city's existing UGB and in close proximity to the bulk of the District's student population. The area is planned for predominantly residential uses, including schools, and so as Sherwood West develops even more of the student population will reside in the vicinity of the proposed high school site. The District studied the 1,291-acre urban reserve for areas within it that could accommodate a new high school site. The District did this by utilizing an engineer and architect to evaluate all sites in the urban reserve that were flat to relatively flat; had a minimum buildable site size of approximately 50 acres or more; no or minimal constraints from streams, wetlands, and intact upland habitat; adequate/feasible access to public utilities; and proximity to a major street network. This analysis yielded six sites, which were then ranked according to the site criteria.

With respect to how the six sites meet the need for a new high school considering the compatibility of proposed urban uses with nearby agricultural and forest activities, it is important to note that the entire Sherwood West area is slated for eventual urban development, regardless of the current uses and zoning of land within it. It was designated as an urban reserve instead of a rural reserve partly due to its small-scale, intermittent farming and forestry activity, parcelization, and rural residential development. That said, urbanizing land that is adjacent to existing urban development is more consistent with this boundary location factor than urbanizing land further into the undeveloped portions of an area, which will likely remain in rural use much longer whether the new high school is built in the area or not. Sites A, B, and C are closest to existing urban development. Sites D, E, and F are more remote from existing urban development. Therefore, in this respect, A, B, and C will have fewer impacts on any nearby agricultural and forest activities. Site A does not appear to have any adjacent agricultural or forest activities occurring adjacent to it. The other sites have very minor to small amounts of agricultural activities occurring on adjacent land. Therefore, none of the sites would appear to have much impact on agricultural or forest activities. Given the sites' rough equivalency in this regard, Sites B and C are the least costly to serve and most readily developable according to the Sherwood West Concept Plan, so developing in those areas "now" will have fewer impacts on nearby agricultural and forest activities than jumping ahead to an area that might have otherwise remained rural for the next 20 years. This gives Sites B and C the edge in considering this factor.

MC 3.07.1425(c)(5): If the Council determines there is a need to amend the UGB, the Council shall evaluate areas designated urban reserve for possible addition to the UGB and shall determine which areas better meet the need considering

(5) equitable and efficient distribution of housing and employment opportunities throughout the region.

Hearings Officer's Analysis: This factor is not directly relevant to the siting of a new high school and therefore is not determinative in any way.

MC 3.07.1425(c)(6): If the Council determines there is a need to amend the UGB, the Council shall evaluate areas designated urban reserve for possible addition to the UGB and shall determine which areas better meet the need considering

(6) contribution to the purposes of Centers and Corridors.

Hearings Officer's Analysis: This factor is not found within Statewide Planning Goal 14 but is instead a consideration created internally at Metro. According to Metro's 2040 Growth Concept Map, the proposed site is not in a Regional or Town center, nor is it directly on a Corridor. Site A is closest to a Corridor, but as staff pointed out in the staff report, it is mostly undeveloped or in single-family residential use. None of the other sites are close enough to any Centers or Corridors to contribute to them at this point in time. Therefore, none of the alternatives support the purposes of Centers and Corridors in any significant way.

MC 3.07.1425(c)(7): If the Council determines there is a need to amend the UGB, the Council shall evaluate areas designated urban reserve for possible addition to the UGB and shall determine which areas better meet the need considering:

(7) protection of farmland that is most important for the continuation of commercial agriculture in the region.

Hearings Officer's Analysis: This factor is not found within Statewide Planning Goal 14 but is instead a consideration created internally at Metro.

As noted by staff in the staff report, Metro and Washington County completed an urban and rural reserve process that designated the most important land for commercial agriculture in the county as rural reserve and the land most suitable for urban development as urban reserve. This means that development within any urban reserve will, at least presumptively, protect farmland that is most important for the continuation of commercial agriculture in the region.

However, this factor seems to reach beyond that concern and require further differentiation of urban reserve areas, at least to the extent that any of these urban reserves are still in commercial agricultural production. Of the six sites studied in Sherwood West urban reserve area, none appear to have any significant commercial agriculture. As such, it seems their agricultural output does not form a significant component of the Sherwood area's economy.

The applicant points out that development of sites within an urban reserve that are closest to the existing UGB and to areas within the UGB that actually contain urban-level development, helps to keep agricultural and forest land further from the UGB and urban areas in unaffected operation until such time as urban development grows further in that direction.

MC 3.07.1425(c)(8): If the Council determines there is a need to amend the UGB, the Council shall evaluate areas designated urban reserve for possible addition to the UGB and shall determine which areas better meet the need considering

(8) avoidance of conflict with regionally significant fish and wildlife habitat.

Hearings Officer's Analysis: This factor is not found within Statewide Planning Goal 14 but is instead a consideration created internally at Metro.

The Sherwood West urban reserve has some significant fish and wildlife habitat within in it, much of which is associated with Chicken Creek. According to the Sherwood West Concept Plan, Steelhead *(Oncorhynchus mykill),* a federally listed species, are known to exist within Chicken Creek. Sites located closer to Chicken Creek would therefore tend to be less suitable for this project.

All of the sites *except* for Sites B and C are constrained by a significant or moderate level of natural resources:

Site A has a wetland right in the middle, and the entire western portion of this site is mostly creek, and its drainage discharge is right into Chicken Creek (see Narrative, p. 25).

Site D has creek drainage running through the southern portion of the site. Since there is no established public storm drainage anywhere in the vicinity, so a costly system to route storm discharge would have to be built with input from the City of Sherwood and Clean water Services to avoid negatively impacting significant fish and wildlife habitat.

Site E is steeply sloped down to the east towards Highway 99, with a grade change around 75 feet. There are no established public storm drains in the vicinity. so a costly system to route storm discharge would have to be built with input from the City of Sherwood and Clean water Services to avoid negatively impacting significant fish and wildlife habitat.

Site F has creek drainage and potential wetlands running through the entire site (see Narrative, p. 30), so extensive mitigation measures could be required to avoid negatively effecting significant fish and wildlife habitat.

As shown on Figure 6 of the Sherwood West Concept Plan, the western edge of Site B abuts a tributary of Chicken Creek and includes some associated wildlife habitat. Site C has no such identified resources, and, therefore, the hearings officer concludes and finds that Site C best avoids conflicts with regionally significant fish and wildlife habitat.

MC 3.07.1425(c)(9): If the Council determines there is a need to amend the UGB, the Council shall evaluate areas designated urban reserve for possible addition to the UGB and shall determine which areas better meet the need considering

(9) ***a clear transition between urban and rural lands, using natural and built features to mark the transition.***

Hearings Officer's Analysis: This factor is not found within Statewide Planning Goal 14 but is instead a consideration created internally at Metro.

The boundaries of Sherwood West do not appear to have been designated according to providing a clear transition between urban and rural reserves using natural or built features. It is bisected in large part at its northern end by Chicken Creek. But Chicken Creek will not form a natural barrier between urban and rural uses, as the Sherwood West Concept Plan contemplates development on either side of the creek. So, Chicken Creek will end up being a natural area within an urban area - not a boundary between urban and rural uses. Because the boundaries of Sherwood West were not created according to natural or built features, and because all of the six sites studied within Sherwood West for a new high school are internal to Sherwood West and will eventually be in the midst of other urban area, this factor is not particularly relevant to this application. Even so, as staff notes in the staff report, there are no built or natural features that would mark even an internal transition from urban to rural lands for Sites C and E. Site B is flanked by Chicken Creek, which could form such a barrier, but, again, there will be urban development on the other side of that "barrier" one day. Site A is also flanked by Chicken Creek, but the creek and natural resources associated with that site also limit the development

potential of that site for a new high school. Further, there will be urban development on the other side of those natural barriers one day, so they will not really mark the transition that this factor contemplates. Site D has some natural resources on it that could provide a barrier of sorts, but which also reduce the buildable area, and, again, the concept plan does not contemplate these natural areas being any sort of permanent barrier between urban and rural uses. Site F has a large amount of wildlife habitat, but that habitat, too, cuts into the buildable area and will provide no such barrier as contemplated by this factor.

Hearings Officer's Analysis and Summary of the Nine MC 3.07.1425(c) Locational Factors

In summary, little weighing and balancing is needed in this case, because the applicant's preferred alternative, Site C, nearly always came out as the site that best met the intent of each individual factor. With respect to two factors, Sites B and C equally met the intent of the factor, and with respect to another factor Site B came in a fairly close second to Site C. All in all, however, Site C best met all of the factors. In sum, all of the factors were applied and evaluated, and on-balance, Site C came out ahead. Thus, whatever weighing and balancing of all of the nine locational factors with respect to the six sites that could potentially accommodate a new high school is required, the Hearings officer finds that the applicant's analysis clearly demonstrates that the proposed site, Site C, better meets the applicable locational factors than the other sites.

No discussion presented by any opponent to the contrary is convincing. In disputing the District's location factor analysis, the primary opponent pointed to individual aspects of different sites and argued why it believed those aspects made one site better than another with respect to a given, discrete aspect. The opponent's sniping is ineffective, however, because unlike the applicant, the opponent did not evaluate the sites *holistically* based on the nine enumerated factors. Stated it another, it may be the case, that some of the alternative sites fair better than the applicant's preferred alternative in some particular or another. No site is perfect, after all, and each site has its positives and its negatives. However, when viewed as a whole, on balance, the applicant's preferred alternative fairs the best over the broadest consideration of the nine factors. Therefore, the opponent failed to demonstrate that the MC 3. 07.1425(C) factors findings are deficient.

The opponent also argues that Sherwood South cannot be ruled out as a possible area for the Major Amendment even though it has not been concept planned under MC 3.07.1110, because MC 3.07.1110(6) provides that such an area can be added even if it has not yet been concept planned. *See* Brager letter dated June 23, 2017 at p.7. MC 3.07.1110(6) states:

> ***"If the local governments responsible for completion of a concept plan under this section are unable to reach agreement on a concept plan by the date set under subsection (a), then the Metro Council may nonetheless add the area to the UGB if necessary to fulfill its responsibility under ORS 197.299 to ensure the UGB has sufficient capacity to forecasted growth."***

First, the MC 3.07.1110(6) exception is restricted to situations where "the local governments responsible for completion of a concept plan under this section are unable to reach agreement on a concept plan." There is no evidence that any local governments responsible for a concept plan for Sherwood South are unable to reach agreement on that concept plan. In fact, there seems to be no question that the City of Sherwood will be planning for Sherwood South-it just hasn't done it yet, and has no current plans to do so. Second, the fact that no pre-UGB expansion concept planning has been done for Sherwood South is just one of many reasons the District gave for why Sherwood South ceased to be considered as a viable area for the new high school. The opponent has not pointed to an area within Sherwood South that would meet the District's siting criteria. In fact, in the opponent's June 23, 2017, letter, the opponent points to "a large block of property" south of the recent Brookman Road annexation area, but then appears to agree that it is too sloped to work as a high school site. See Letter from Jennifer Brager dated June 23, 2017, at p.6.

Metro Code section 3.07.1425(D) The Council may consider land not designated urban or rural reserve for possible addition to the UGB only if it determines that:

1. ***Land designated urban reserve cannot reasonably accommodate the need established pursuant to subsection B of this section; or***
2. ***The land is subject to a concept plan approved pursuant to section 3.07.1110 of this chapter, involves no more than 50 acres not designated urban or rural reserve and will help the concept plan area urbanize more efficiently and effectively.***

Hearing Officer's Analysis: The proposed expansion is within an urban reserve. This criterion is not relevant because the site and surrounding properties to the north, east and south are within an Urban Reserve area (no property within or next to the subject site is outside of urban reserve areas).

This criterion is not applicable.

Metro Code section 3.07.1425(E): The Council may not add land designated rural reserve to the UGB.

Hearing Officer's Analysis: The proposed expansion is not within a rural reserve. This criterion is not relevant because the subject site and surrounding properties to the north, east and south are within an Urban Reserve area.

This criterion is either not applicable or has been met.

Metro Code section 3.07.1425(F): The Council may not amend the UGB in such a way that would create an island of urban land outside the UGB or an island of rural land inside the UGB.

Hearing Officer's Analysis: The subject site and the remaining portion of the Sherwood West urban reserve are adjacent to the City of Sherwood. The transformation of this area from rural to urban represents a logical and methodical way to enlarge an urban area, which will not create an island of urban development outside of the UGB.

The proposed expansion will not create an island of urban land outside the UGB or an island of rural land inside the UGB. The applicant has met its burden of showing compliance with this factor by substantial evidence in the whole record.

Metro Code section 3.07.1440 (B)(1) The applicant shall also demonstrate that:

(1) The proposed uses of the subject land would be compatible, or through measures can be made compatible, with uses of adjacent land.

Hearing Officer's Analysis: The applicant addresses this criterion as follows:

> The proposed major amendment site is surrounded by land that is either within the City of Sherwood or the Sherwood Urban Reserve Area 5B (aka Sherwood West Preliminary Concept Plan Area) (see Attachment 6). The land in the City located north and east of SW Elwert Road is fully urbanized with single-family subdivisions and constructed houses. City land located south and east of SW Elwert Road is the location of the Sherwood Elks Lodge. The Elks Lodge site contains a large area of vacant land around the existing building and parking lot. The Elks Lodge and undeveloped surrounding land is zoned Low Density Residential (LDR).
>
> Land to the north, south and west is currently rural and within the urban reserve area (Sherwood West Concept Plan). This County land is zoned Agricultural Forest (AF) and is a patchwork of sites zoned AF-5, AF-10 and AF-20 with the subject site zoned AF-20. AF-5 has a minimum lot size of 5 acres, AF-10 of 10 acres and AF-20 has a minimum lot size of generally 80 acres. The surrounding property has been highly parcelized and consists of a patchwork of small forests/farms and rural residential properties with none more than 80 acres and many under five acres in size.
>
> The site is compatible with surrounding residential properties as the property has separation provided by existing streets on the north (Haide Road), south (Kruger Road) and west (Elwert Road) boundaries. The eastern boundary consists of mostly forestland with only one house near the site boundary near the northwest corner of the site. All school traffic will be able to access the site

from Elwert Road and will not be routed through existing or proposed residential areas or streets.

While the development of a school site will be the first urban development in the Sherwood West Concept Plan Area, the regional and local plans anticipate redevelopment of this entire area for primarily residential land. Schools typically locate within residential areas and are considered to be compatible with residential land uses when the impacts of the school on residential uses are considered within the design.

The first urban development projects to occur within rural areas typically can cause some tension between existing residents who welcome the change, and those who are content with its current rural character. So well-designed solutions to deal with compatibility issues may still feel like "encroachment" to rural residents. The development of the site will include public involvement during the design development and permit approval process, allowing ample opportunity for the neighbors to help address specific compatibility issues. In the long term, establishing the school will provide the opportunity for subsequent urban developments to be oriented and designed to optimize their physical relationship with the school. This will allow the development of future Sherwood West properties to "grow up together" compared to infilling a large public facility into an established residential neighborhood.

The subject site borders the UGB on the east along SW Elwert Road. Adjacent land uses include single family homes and the Sherwood Robin Hood Elk Lodge that also includes some vacant land that is zoned for residential use, which is expected to develop over time. Directly to the southeast across Highway 99W is the Sherwood Regional Family YMCA. To the north across SW Haide Road is mostly open land with some out-buildings and one dwelling that appears to be vacant. To the west are forested parcels with one dwelling adjacent to the NW corner of the subject parcel. To the south across SW Kruger Road is the Countryside Community Church, limited agricultural activities and four dwellings. The typical weekend use of the church complements the weekday uses of a school. The land to the south also borders Highway 99W.

The District has developed a preliminary site plan that shows the school buildings located in the center of the property with sports fields generally to the south and west and parking located to the north. The southeast corner of the site will contain the realignment of SW Elwert and SW Kruger Roads. The three adjacent roads provide some buffering for the very few adjacent homes and the NW Natural Gas Easement also buffers the southwest corner of the site. The district currently has a High School Design Committee charged with working with the design team to provide advice on a number of design elements and a couple of community input meetings will be scheduled in 2017. In addition there will be public input opportunities during the City's development review and permit approval process.

Finally the subject site is within a very large urban reserve area that has the potential to urbanize over time. As noted previously this portion of the Sherwood West urban reserve was identified as phase A in the preliminary concept plan the City completed. This allows the adjacent land to be designed and developed in a manner that enhances and embraces this important community facility. Therefore the proposed use of the site can be made compatible, through measures, with the uses of the adjacent land.

The applicant has met its burden of showing compliance with this factor by substantial evidence in the whole record.

Metro Code section 3.01.1440 (B)(2) The applicant shall also demonstrate that:

If the amendment would add land for public school facilities, the coordination required by subsection C(5) of section 3.07.1120 of this chapter has been completed.

Hearing Officer's Analysis: MC 3.07.1120(C)(5) states:

> ***"Provision for the amount of land and improvements needed, if any, for public school facilities sufficient to serve the area added to the UGB in coordination with affected school districts. This requirement includes consideration of any school facility plan prepared in accordance with ORS 195.110."***

The applicant addresses this requirement as follows:

> This requirement is satisfied as described in Section III of the application. In summary, the Sherwood School District adopted a long-term facilities plan in January of 2008. The long-term plan assumed that additional school capacity would likely be needed within 10 years of the plan's adoption. (The 2008 Long Term Facilities Plan is provided in Appendix C).
>
> In 2014 to 2016, the School District did significant planning prior to placing a bond on the November 2016 ballot that was ultimately approved by voters. This included inventorying existing school facilities, completing updated demographic information, as well as significant planning and public outreach to identify a plan for school facilities that includes the proposed new high school.

As the District points out, it experienced substantial growth in the late 1990's and early 2000's leading to a community effort in 2005 to determine facility needs. This resulted in the successful 2006 bond measure which included funding for an addition to the current high school to increase capacity to 1,550 students, consistent with phase 1 of the 2006 high school master plan. The District completed a long term facilities plan in 2008. Current enrollment at the high school is over 1,700 students and projections show over 2,250 students by the 2025-26 school

year. In early 2014 the District's Long Range Planning Committee made recommendations to the School Board regarding enrollment and growth challenges, facilities analysis and needs and financing options. In 2015 the District documented the condition and educational adequacy of its facilities, leading to bond visioning and steering committees in 2016. This resulted in the District's voters approving a bond measure in 2016 providing funding for school improvements including construction of a new high school. The District and the city of Sherwood have an intergovernmental agreement to share sport fields with most of the facilities occurring on school grounds. Thus the coordination required by subsection C(5) of Metro Code Section 3.07.1120 has been completed.

The applicant has met its burden of showing compliance with this factor by substantial evidence in the whole record.

Metro Code section 3.01.1440(B)(3) The applicant shall also demonstrate that:

If the amendment would add land for industrial use pursuant to section 3.07.1435, a large site or sites cannot be reasonably be created by land assembly or reclamation of a brownfield site.

Hearing Officer's Analysis: The proposed expansion is not for industrial use. This criterion is not applicable.

Findings Addressing OAR 660- Division 24 and the Applicable Statewide Planning Goals.

OAR 660-024-0020 requires that all UGB amendments apply the Statewide Planning Goals to the amendment process. This directive applies to the whole gamut of UGB amendments, from the every-six-year Metro legislative review of its UGB to a quasi-judicial major amendment under the Metro code to provide land for a specific public need, such as a school or other public facilities. However, this does not mean that the Goals will apply equally and in the same way in each situation. It may even be that one or more of the Goals may not apply at all to a given situation.

The primary opponent asserts that the applicant failed to adequately address the Statewide Planning Goals. *See* Letter from Jennifer Bragar dated June 6, 2017. While that was correct at the time Ms. Brager wrote her letter, the applicant followed up two days later with proposed findings. The Hearings officer finds that the applicant did adequately demonstrate compliance with the applicable Statewide Planning Goals by substantial evidence in the whole record, and adopts the applicant's suggested findings, with slight modification, as set forth below. The opponent's specific objections are also addressed below.

OAR 660-024 -0020

OAR 660-024-0020 sets out which of the Statewide Planning Goals are applicable to UGB amendments. The Goals will have a somewhat limited applicability to a UGB amendment for a specific need, but the relevant Goals are addressed below.

Goal 1 - Citizen Involvement

"To develop a citizen involvement program that insures the opportunity for citizens to be involved in all phases of the planning process."

Hearings Officer Analysis: This Major Amendment application does not alter Metro's citizen involvement program. Consequently, compliance with Goal 1 is established through compliance with the public involvement requirements of Metro's code. Those requirements have been followed.

Goal 2 - Land Use Planning
"To establish a land use planning process and policy framework as a basis for all decisions and actions related to use of land and to assure an adequate factual base for such decisions and actions."

Hearings Officer Analysis: OAR 660-024-0020(1)(a) states that the exceptions process in Goal 2 and OAR 660, Division 4 are not applicable unless a goal exception is part of the application. A goal exception is not part of the Major Amendment application and so those provisions will not be addressed. Other than goal exceptions, Goal 2 requires the establishment of a comprehensive plan, a need for coordination of government entities in planning, and the need for public hearings and an opportunity for comment and review.

1) Coordination: This Major Amendment application has required coordination with and between Metro, Washington County, the City of Sherwood, and public service providers including ODOT, Tualatin Valley Fire & Rescue, and Clean Water Services. This includes coordination at the Major Amendment level and at the Sherwood West Concept Plan level. Therefore, the required coordination has occurred.

2) Public Hearings/Opportunities for Comment and Review: Metro staff sent the required notice for the hearing before the hearings officer, and there has been opportunity for comment and review of the application materials. The hearing was continued, which provides additional opportunity for comment and review, and the hearings officer has stated he is likely to leave the record open after the second hearing concludes. There will also be at least one hearing before Metro Council. Further, the proposed high school will have additional approvals to obtain after the Major Amendment application has been approved, such as annexation, a zone change and a conditional use permit, all of which include a public involvement component. Therefore, there has been and will continue to be public hearings and an opportunity for comment and review.

Goal 3- Agricultural Lands

Hearings Officer Analysis: Not applicable under OAR 660-024-0020(3)(b).

Goal 4 - Forest Lands

Hearings Officer Analysis: Not applicable under OAR 660-024-0020(3)(b).

Goal 5 - Natural Resources, Scenic and Historic Areas, and Open Spaces

"To protect natural resources and conserve scenic and historic areas and open spaces."

Hearings Officer Analysis: OAR 660-024-0020(1)(c) requires states that Goal 5 and its related rules apply only in areas added to the UGB. The area to be added to the UGB is the site identified in this application. There are no Goal 5 resources on the site identified by Metro, Washington County or the City of Sherwood in the Sherwood West Concept Plan. Therefore, this goal is not applicable.

Goal 6 - Air, Water and Land Resources Quality
"To maintain and improve the quality of the air, water and land resources of the state."

Hearings Officer Analysis: As LUBA recently stated:

> "[t]he relevant Goal 6 inquiry for a decision that amends comprehensive plan and zoning map designations, without approving any particular new development, is whether there is a reasonable expectation that applicable state and federal environmental quality standards can be met at the time the property is developed in the future. *See Friends of the Applegate Watershed v. Josephine County*, 44 Or LUBA 786, 802 (2003), (at the post-acknowledgment plan amendment stage, a local government need only show it is reasonable to expect that applicable state and federal environmental quality standards can be met); *see also Salem Golf Club v. City of Salem*, 28 Or LUBA 561, 583 (1995) (same).

See Nicita v. City of Oregon City, ___ Or LUBA ___ (LUBA No. 2016-045, Jan 25, 2017, slip op. at 27.

The hearings officer does not see how there could not be any "reasonable expectation that applicable state and federal environmental quality standards can be met at the time the property is developed [as a school]." The proposed school campus poses no significant adverse air, land or water quality impacts. There are no expected significant "waste or process discharges" from the new high school campus. The high school does not "process" anything and so there are no process discharges associated with the high school. Any waste that will be produced by high school activities will be handled through the normal course of business. For example, any solid waste generated by the school will be subject to recycling and solid waste collection by the franchised garbage hauler for the area. Any waste associated with sanitary sewers or storm events will be handled as part of the public sanitary and storm water facilities. As the property develops, the District will be required to coordinate with the state Department of Environmental Quality and with Clean Water Services to ensure that air, land and water resources are not degraded. As noted in response to Goal 5, no significant Goal 5 resources have been mapped on this property by Metro, Washington County or the City. Further, the proposed new high school site is adjacent to the existing UGB and will allow for efficient multi-modal transportation of the

bulk of the student population - especially as Sherwood West builds out with primarily residential uses in the decades to come.

The primary opponents make a half-hearted attempt to challenge the applicant's Goal 6 compliance, but its argument is too vague and too unfocused to provide a basis for denial. First, the opponent state that "air quality issues should be examined for a new school to be built near Highway 99." *See* letter from opponent's counsel Jennifer Brager, at p. 2, 6. This argument appears to assume that highway 99 causes sufficient level of pollution that a school should not be located in close proximity thereof. The opponents suggest that a "buffer" and "distancing is needed. The opponent never suggests what a proper buffer would be. The Hearings officer finds this concern to be speculative, unsupported by substantial evidence in the record, and beyond the scope of Goal 6's reach. Even if the hearings officer believed this was a valid concern, the hearings officer finds the air quality benefits of locating a school away from a major arterial would be offset by the additional VMT needed to transport school children a further distance.

Goal 7- Natural Hazards

"To protect life and property from natural disasters and hazards."

Hearings Officer Analysis: Goal 7 (Areas Subject to Natural Hazards). Goal 7 requires local governments to evaluate risks to people "upon receiving notice" of new hazard information from DLCD, and based on evaluation of that risk to prohibit development in areas "where the risk to public safety cannot be mitigated." Natural hazards for purposes of this goal are: floods (coastal and riverine), landslides, earthquakes and related hazards, tsunamis, coastal erosion, and wildfires.

No natural hazards have been mapped on the properties that comprise the proposed school site. (*See, e.g.,* Sherwood West Concept Plan, figures 6 and 7.) The applicant's proposed site appears to be devoid of any natural hazards: It is not in a flood plain or a coastal zone. It does not have steep slopes that would be vulnerable to landslides. It does not contain soils that are exceptionally vulnerable to being an earth quake hazard (at least any more so in comparison to the rest of the Portland Metro region generally). Therefore, this goal is inapplicable.

Goal 8- Recreational Needs

"To satisfy the recreational needs of the citizens of the state and visitors and, where appropriate, to provide for the siting of necessary recreational facilities including destination resorts."

Hearings Officer Analysis: As set forth in the Narrative, the District provides most of the athletic fields for the City of Sherwood. The City and the District have had a long history of partnering in the provision, use, and maintenance of these fields so that recreational opportunities are provided as efficiently as possible. The new high school campus will include a number of new fields and sports facilities on which the City and the District will continue to partner. The new fields and sports facilities will be in addition to the existing fields and sports facilities already in use as part of the existing school facilities. See page 32 of the Narrative for additional

detail. The new high school campus, then is supportive of this goal, as it will help satisfy the need for recreational facilities in the city and in the District.

Goal 9 - Economic Development

> ***"To provide adequate opportunities throughout the state for a variety of economic activities vital to the health, welfare, and prosperity of Oregon's citizens."***

Hearings Officer Analysis: Goal 9 applies to areas within an urban growth boundary. OAR 660-09-0010(1). *Port of St. Helens v. Land Conservation & Development Committee*, 164 Or App 487, 495, 996 P 2d 1014 (2000). Goal 9 requires that jurisdictions provide adequate opportunities for a variety of economic activities. Goal 9 planning is limited to areas within UGBs, and local land use plans are required to comply with Goal 9 at periodic review and whenever a jurisdiction undergoes a post-acknowledgment plan amendment that changes the plan designation of more than two acres of land from industrial/employment use to a nonindustrial/non-employment use. OAR 660-009-0010(1), 0010(2), and 0010(4).)

Pursuant to OAR 660-024-0020, certain Goals, including Goal 9, are also applicable when the UGB is amended. The Major Amendment application expands the UGB to allow an existing high school to move several miles away from one site within the City of Sherwood to another site that will be annexed into the City of Sherwood for that purpose. This appears to be fairly neural from the standpoint of economic opportunities.

The opponent cites *Barkers Five, LLC v. LCDC*, 261 Or App 259, 289 (2014), and states that Goal 9 "requires a determination of the potential future land need for employment and is supposed to occur at the time the UGB is expanded, " and that "the school itself has to be analyzed as an 'other employment use' as defined under OAR 660-009-0005 because it will involve a governmental employment activity. " *See* letter from Jennifer Bragar dated June 6, 2017, at p. 2. That might be true for a UGB amendment that proposes to add employment land, but it not explain the relevance of Goal 9 to this particular UGB application, which is specific to a need for land for a new high school. In this case, the UGB amendment is targeting a specific need, *i.e.,* the relocation of an existing high school several miles away within the same city. Goal 9 is not applicable as the UGB expansion is for a specific need for a high school.

The cited passage from *Barkers Five* should be read in context. LCDC was referring to OAR 660-027-0050(2) and Metro's analysis for employment land needs occurring as part of its urban growth report. There is nothing in that passage that would make such an analysis a requirement for a major amendment application submitted under ORS 197.299(4). As stated in the findings for Goal 9, this goal is not applicable to a UGB amendment for a specific high school need. To the extent that the high school will have any Goal 9 impacts, the Hearings officer finds those impacts will be positive in terms of temporary construction jobs during development and provision of part-and-full time employment year-round.

Furthermore, if the opponent is implying that Metro must engage in a full-blown economic opportunities analysis in the context of a major amendment application for a high school, that conclusion does not follow from the opponent's stated premises or from Goal 9. The

opponent's argument is not developed well enough to allow the hearings officer to evaluate it on the merits: the opponent has not explained how this application actually impacts the requirements or scope of Goal 9.

Goal 10 - Housing

"To provide for the housing needs of citizens of the state."

Hearings Officer Analysis: The applicant states that Goal 10 is not applicable as the UGB expansion is for a specific need for a high school. The opponent states that "Goal 10 is implicated because housing opportunities will be lost as a result of this large land grab by the school district." *See* letter from Jennifer Bragar dated June 6, 2017, at p. 2. While it is true that any use of land for non-residential purposes results in that land not being available for housing, that truism does not create a Goal 10 violation. As best as the hearings officer can determine, the opponent is arguing that the Preliminary Sherwood West Concept Plan shows a small school site surrounded by housing, and the applicant's current plan shows the entire site being used for a school and no housing. The opponent concludes that this change in plans 'will limit the planned housing in the Sherwood West Concept Plan Area," which, according to the opponent, "has Goal 10 implications." *See* letter from Jennifer Bragar dated June 6, 2017, at p. 2-3. It appears that the opponent is arguing that the Concept Plan locks in the density and mix of housing, and any change to the Concept Plan requires an analysis of Goal 10 compliance.

The hearings officer finds that the concept plan does not have the regulatory effect that the opponent assigns to it. The opponent cites to nothing in any local zoning code or Comprehensive Plan that gives this sort of regulatory effect to this (or any other) concept planning effort. Goal 10 would not have that type of regulatory effect until the property subject to the Concept Plan is brought into the UGB and assigned urban zoning designations. As currently situated, the land at issue is not within the UGB and so is not considered "buildable lands" under Goal 10 and Goal 14, and is not included in any buildable land inventory. Therefore, there is no buildable lands inventory to measure the Major Amendment application against and Goal 10 does not anticipate that there would be in this situation. By its terms, Goal 14 requires that jurisdictions "provide for the housing needs of citizens of the state" by inventorying "buildable lands for residential use. " Goal 10 defines buildable lands as lands in "urban and urbanizable areas that are suitable, available and necessary for residential use. " Under the definitions section of the Statewide Planning Goals, "urban land" is defined as "land inside an urban growth boundary, " and "urbanizable land" is defined as urban land, i.e., land inside a UGB, that is presently unavailable for any number of reasons. Therefore, the opponent' argument that, in the context of a Major Amendment, Goal 10 requires Metro to "demonstrate that its actions do not leave it with less than adequate residential land supplies" is wrong..

Moreover, as the applicant points out, the City's urban reserves include a 50-year land supply for the City. There is no evidence that siting a new high school in Sherwood West, in the location that the Concept plan contemplated a new school, will in any way negatively impact the ability of the City to provide for its housing needs, especially when Sherwood West is combined with Sherwood North and Sherwood South.

.

The opponent also complains that the applicant is seeking to bring in 82 acres when it defined its current need as requiring only a 50-acre site. *See* letter from Jennifer Bragar dated June 6, 2017, at p. 2. The hearings officer is at a loss to understand the relevance of this argument to a Goal 10 challenge. The opponent's argument is simply not developed sufficiently to allow the hearings officer to understand the nature of the complaint.

The opponent also argues that an 82-acre school site "contradicts the two school sites considered in the Preliminary Sherwood West Concept Plan. *See* letter from Jennifer Bragar dated June 6, 2017, at p. 2. However, Concept Plans are not regulatory documents in the sense that they do not limit the size of planned facilities. The Concept Plan took the provision of additional school sites into account when it was developed. Although the concept plan includes two identified school sites, it is important to remember that the Concept Plan is a general plan that addresses how the area will develop generally. The Concept Plan does not specify the types of schools that the conceptual school sites reflect, e.g., elementary, middle or high school. Therefore, one should not view the blue squares denoting school sites in the Concept Plan in the literal sense of trying to determine how big the Concept Plan believed the sites will ultimately be. Such information comes from future refinement of the Concept Plan after areas are brought into the UGB.

Moreover, as the applicant points out, Goal 10 concerns itself with land already within a UGB, which the subject property is not. Therefore, Goal 10 has very limited applicability to a Major Amendment application for a new public school site. That said, the justification for the proposed expansion area of 82 acres is included in the Narrative. (Narrative at 31-32.) As set forth in the Narrative, approximately seven of the 82 acres will be needed for transportation improvements that will support the new high school. There is also a 40-foot wide gas pipeline easement that runs across the site, occupying approximately 2.2 acres but requiring protection of additional, adjacent property of approximately 20 feet on either side. This pipeline easement essentially gives the site an irregular shape, which reduces the efficiency with which it can be developed. The Narrative also discusses the shared sports fields arrangement between the City of Sherwood and the District that provides for additional ballfields. The District would also note that Figure 3 of the Narrative depicts a conceptual layout of the high school site and related transportation improvements over the entire 82-acre area. (Narrative at 7.) As one can see on that conceptual layout, the entire site will be fully utilized.

In the Appendix 6 Service Provider Interviews, the District warns that the current high school was at-capacity at the time of the interview (the appendix is dated June 15, 2015), and with the growth expected in Sherwood the high school could be expected to become over-capacity. (See Appendix 6, pages 3-4.) The District stated that expanding the existing high school and adding a new high school to the District would both be explored. The relevant information to be gleaned from the Concept Plan is that the majority of Sherwood West is intended to be developed with varying densities of housing and that the Concept Plan integrated the need for at least two additional school sites, with an understanding that the existing Sherwood High School would soon be over-capacity.

In its June 23, 2017 letter, the opponent argues that Metro "must demonstrate that its actions do not leave it with less than adequate residential land supplies in the types, locations,

and affordability ranges affected." *See* letter from Jennifer Bragar dated June 23, 2017, at p.2. As support for this requirement, the opponent relies on *Burk v. Umatilla County*, 20 Or LUBA 54 (1990). In *Burk*, the Port of Umatilla filed an application with the City of Umatilla to amend the city's comprehensive plan map for a 42-acre area within the city's urban growth boundary, but outside the city limits, from single-family residential to industrial. The city's buildable land inventory for housing included the 42 acres, because that acreage was within its UGB. Even with the 42 acres included in the buildable lands inventory, the city was deficient in land available for single-family housing. The city approved the map amendment even though it increased that deficiency, which earned the city a remand by LUBA.

The facts of *Burk* are different than those presented by this Major Amendment application. The land in question in *Burk* was inside a UGB and was already planned for zoned and residential uses. That is a key factual difference from the present case, because the land in this case is planned for agriculture and forestry. The land proposed to be added to the UGB is not "buildable land," and is not in any current inventory. For this reason, the Goal 10 analysis required in *Burk* is not applicable here.

Goal 11 - Public Facilities and Services

> ***"To Plan and develop a timely, orderly and efficient arrangement of public facilities and services to serve as a framework for urban and rural development."***

Hearings Officer Analysis: As set forth in response to MC 3.07.1425(c)(2), the Sherwood West Concept Plan extensively studied the provision of public facilities and services with respect to that urban reserve. The concept plan was prepared with analyses of existing sanitary sewer, water, and storm water conditions and analyses of how those systems need to be upgraded, extended, and phased to meet the future development of Sherwood West. The concept plan was prepared in coordination with all of the future service providers, including those services that will be provided by the City and those that will be provided by others, including Clean Water Services. The concept plan discusses the provision of public facilities and services to the area at pages 16-18 and 40-44, as well as in Appendix 3 (Existing Conditions Report) and Appendix 6 (Service Provider Interviews). According to the Concept Plan, the area in which the school site is proposed "presents the best near-term opportunity for development in Sherwood West," and the cost to serve the area is on the lower end of the cost scale. (Sherwood West Concept Plan, pages 42-43.) The District used this work as a jumping off point to study the proposed site for inclusion in the UGB (as well as other sites within Sherwood West). See Narrative, pages 24-31 and Application Appendix A (New High School Preliminary Site and Utility Exhibit) and Appendix B (Service Provider Letters). All of the foregoing information addresses the orderly and efficient arrangement of sanitary sewer, water, and storm drainage facilities to serve the new school property, as well as the larger Sherwood West area and all of the evidence consistently points to the chosen property as a property that can served in a timely, orderly, and efficient manner.

The opponents argue that Goal 11 is not met, because the local sewer and water agency (Clean Water Services) has a concern about the installation of a temporary pump station. *See* letter from Jennifer Brager dated June 23, 2017, at p. 5. The opponents offer no testimony, expert

opinion, or evidence that would call into question the conclusions reached by the applicant's engineers, KPFF. Goal 11 does not require that every technical engineering solution be worked out at the time of UGB amendment. The KPFF engineers seem to believe that an engineering solution is not only possible, but likely, which is all that is required at this stage. See KPFF memo dated June 13, 2017. This Hearings officer has evaluated the opinion of the KPFF engineers, and finds them more credible.

The opponents further argue that "fire flow tests have not been completed." *See* Letter from Jennifer Brager dated June 23, 2017, at p. 5. The opponents do not explain why fire flow tests are mandated by Goal 11 in the context of a UGB amendment, nor is it obvious why they would be. The KPFF engineers seem to be satisfied that the fire flow issue can be adequately handled, and this hearings officer finds them more credible.

Goal 12 - Transportation

"To provide and encourage a safe, convenient and economic transportation system."

Hearings Officer Analysis: Early LUBA cases suggested that a local government could not "pass the buck" by deferring compliance with Goal 12 and the TPR until the time of site plan review.[13] However, more recent case law clarifies that conditions of approval can be used to limit new development until such time as the TPR is addressed. For example, in *Citizens for Protection of Neighborhoods v. City of Salem*, 47 Or LUBA 111 (2004) (*Citizens*), the City of Salem approved a zone change to allow mixed residential and commercial use of a 275-acre property. That approval included a condition that prohibited development of the property until later adoption of a master plan for the property. The City of Salem's code criteria applicable during the master plan process included requirements that were substantially identical to the requirements of the TPR. Based on the condition requiring master plan approval, the city found that the zone change did not significantly affect the transportation facility because no development could occur until the subsequent master plan phase. *Id*. at 115, 116. LUBA held that the city could properly conclude that the rezoning of the property did not significantly affect any transportation facility because the condition essentially prohibited development on the property without first showing that any allowed development is consistent with the function, capacity and performance standards of affected transportation facilities. *Id*. at 120.

In *ODOT v. City of Klamath Falls (Southview Dev'l, LLC)*, 39 Or LUBA 641, 660, *aff'd* 177 Or App 1, 34 P2d 667 (2001), LUBA affirmed that portion of a county decision which approved a zone change with a condition that prevented additional development from impacting a transportation facility until such a time in the future when the TPR is addressed. LUBA found that this condition was sufficient to ensure compliance with the TPR in the interim.

Finally, in *Willamette Oaks, LLC v. City of Eugene,* 59 Or. LUBA 60 (2009), the city approved a zone change, and imposed a condition of approval prohibiting development of the property without approval of a planned unit development (PUD) application and a showing of

[13] *1000 Friends of Oregon v. City of North Plains*, 27 Or LUBA 372 (1994), *aff'd*, 130 Or App 406 882 P2d 1130 (1994); *Concerned Citizens of the Upper Rogue v. Jackson County*, 33 Or LUBA 70 (1997).

consistency with the TPR as part of the PUD application and review. LUBA approved this approach, stating as follows:

> In sum, with one caveat discussed below,[14] we think it is permissible for the city to defer consideration of compliance with the TPR to a subsequent review process at the time actual development is proposed, provided that the zone change or plan amendment is effectively conditioned to prohibit traffic or other impacts inconsistent with the TPR's requirements unless and until those requirements are fully addressed. Applicant offers no reason in the present case why deferring the application of the provisions of the TPR to a later PUD application process is insufficient to ensure that allowed uses of the subject property are consistent with

---

[14] LUBA stated in a footnote that the PAPA procedural requirements would still need to be satisfied as part of the deferred process:

> The caveat mentioned above is that unless the local government takes steps to ensure otherwise, the subsequent review process may not require a comprehensive plan or land use regulation amendment and therefore will not trigger [**12] the notice obligations of a post-acknowledgement action under ORS 197.610 *et seq*. Under those statutes, a local government that amends its comprehensive plan or land use regulations, including zone changes, must provide to the Department of Land Conservation and Development (DLCD) timely notice of the hearing on the proposed amendments as well the decision adopting the amendments. DLCD, in turn, provides notice of the proposed amendments and any subsequent adoption to persons or agencies who request such notice. OAR 660-018-0025. The requirement to provide notice of post-acknowledgment plan amendments to DLCD and other parties is a critical component of a statutory and rule-based scheme that is designed to ensure that post-acknowledgment plan and land use amendments comply with the applicable statewide planning goals and rules, including the TPR. *See Oregon City Leasing, Inc. v. Columbia County, 121 Or App 173, 177, 854 P2d 495 (1993)* (failure to provide DLCD the notice required under ORS 197.610 *et seq*. is a substantive, not procedural error). The efficacy of that scheme is undermined if a local government defers consideration [**13] of compliance with the TPR to a subsequent review process that does not provide equivalent notice to that required by ORS 197.610 *et seq*. Without such notice, it is possible that DLCD and parties who may rely on DLCD's re-notice, potentially including ODOT, may not learn of the review proceeding or have an opportunity to participate in that proceeding.

> the function, capacity and performance standards of the affected transportation facilities. *ODOT v. City of Klamath Falls,* 39 Or LUBA at 660.

Under OAR 660-024-0020(1)(d), the Transportation Planning Rule ("TPR") need not be applied to a UGB amendment if the land will remain zoned as urbanizable. That will be the case with the properties subject to the proposed UGB amendment. The current AF-20 zoning will remain until the is annexed into the City of Sherwood. During the forthcoming Metro Title 11 concept planning process for the properties, the City will determine the appropriate zone and this will include a TPR analysis. The zoning will not actually be changed, however, until after annexation.

With respect to Goal 12 generally, as set forth in response to MC 3.07.1425(c)(2), the Sherwood West Concept Plan extensively studied the provision of public facilities and services, including transportation, with respect to that urban reserve. The concept plan analyzed the existing transportation system and how that system will need to be upgraded, extended, and phased to meet the future development of Sherwood West. The concept plan was prepared in coordination with all of the future transportation service providers, including Washington County and ODOT. The concept plan discusses the transportation system within the plan area at 18-21, 40-44, as well as in Appendix 3 (Existing Conditions Report), Appendix 6 (Service Provider Interviews), and Appendix 8 (Transportation Options Alternative Analysis Report). The District used this work as the jumping off point to study the proposed site for inclusion in the UGB (as well as other sites within Sherwood West). See Narrative at pages 10-11, and Appendix B (Service Provider Letters). The District also engaged a licensed traffic engineer to prepare the March 15, 2017, Sherwood High School UGB Expansion Transportation Study (the "Transportation Study") to address the provision of a safe, convenient, and economic transportation system for the new high school site. (The Transportation Study has been submitted to the record.) The Sherwood West Concept Plan takes a higher-level look at the transportation needs of the Sherwood West area in general, including the need for new streets and intersection improvements. The Narrative provides general information about how the school site will be served and the Transportation Study provides more detail than is commonly found at the UGB expansion stage, but finds that, with some mitigation improvements, a new high school on the proposed site can be served by the appropriate transportation system. The Transportation Study will become more relevant at the Title 11 concept planning and annexation stages of the high school site development. Because the new high school is very near to an existing, urban-level street system, and because Washington County and the City will be constructing a new intersection improvement adjacent to the new high school, the provision of transportation services to the new school will be more economical. According to the concept plan, the area in which the school site is proposed "presents the best near-term opportunity for development in Sherwood West," and the cost to serve the area is on the lower end of the cost scale. (Sherwood West Concept Plan, pages 42-43.) In sum, all of the cited evidence supports a finding that it is possible to safely, conveniently, and economically provide for the transportation needs of the new high school.

For this reason, the applicant proposes a condition of approval to the UGB amendment that prohibits any new development on the subject property until a Comprehensive Plan Map and Zoning Map Amendment are completed, and that the TPR will be addressed at that time.

Several opponents expressed concerns about the adequacy of the surrounding transportation system to support the proposed high school. It is tempting to jump ahead to the specific traffic impacts of a proposed use even at this early stage of the land use process. It is important to keep in mind, however, that the Major Amendment application is just the first application in a series of land use proceedings that must occur prior to the high school actually being approved on the property. With respect to the Major Amendment application, Goal 12, OAR 660-024-0060(8), and MC 3. 07. l425(c)(2) are applicable and implicate transportation facilities. The District has submitted findings with supporting substantial evidence to address all of those provisions. The District also submitted additional evidence from its traffic engineer to address particular issues raised with respect to the March 15, 2017, Sherwood High School UGB Expansion Transportation Study. (See June 28, 2017, DKS memorandum.)

No one besides the District provided any evidence or testimony from a traffic engineer regarding any aspect of the Major Amendment application. Opponents correctly point out that there are existing transportation deficiencies in the area that surrounds the proposed high school site. Those opponents also correctly point out that if those deficiencies are not addressed then the new high school will exacerbate them. All of that is true, but it would be expected to be true regardless of where the new high school is sited, *i.e.,* nearly every area in and around Sherwood has existing transportation deficiencies and siting a new high school in any of those areas would impact the transportation system. Where the opponent's logic fails is in the apparent assumption that the transportation impacts of the new high school will not be addressed as part of the planning and permitting processes that are required prior to the new school opening its doors in 2020. That assumption is incorrect.

The laws and regulations that govern the permitting of the new high school simply do not allow the new school to be plopped down anywhere without transportation impacts being analyzed and mitigated in accordance with the law. The specifics of that analysis and mitigation for the chosen site are largely irrelevant at the UGB amendment stage. Instead, those specific transportation impacts will be addressed through subsequent Title ll planning for the UGB amendment area, and through annexation, zone change, and conditional use permit processes. Through these processes, the Transportation Planning Rule will be addressed, appropriate off-site mitigation within an appropriate timeframe will be required, and appropriate frontage improvements for all of the abutting streets will be conditioned. Public involvement is included in each of those steps as part of each of the planning and permitting processes. (See June 28, 2017, DKS & Associates memorandum.)

Goal 13 - Energy Conservation
"To conserve energy."

Hearings Officer Analysis: LUBA and the Courts have never given any regulatory affect to this Goal. The Hearings officer views this goal as being essentially meaningless. The general practice has been for applicants and staff to write some flowery prose that extorts the energy

saving virtues of the project. In this vein, the applicant states:

> As explained under the District's response to MC 3.07.1425(c)(3), which is the analog of Goal 14, Location Factor 3 (ESEE energy consequences), the proposed school site's adjacency to the existing UGB, served by major streets, facilitates multi-modal access for students, teachers, families, and administrative staff to and from the school campus. This will multi-modal facilitation will only increase as Sherwood West builds out into a predominantly residential area with nodes of neighborhood commercial.

Without some baseline standard to measure against, it is difficult to evaluate whether any given proposal will "conserve energy" or not. But at least it sounds good.

For its part, the opponent's arguments do not shed much light on the issue. They merely state that an "energy analysis" must be provided. *See* Letter from Jennifer Brager dated June 6, 2017, at p. 3. The opponents do not explain exactly what an "energy analysis" entails, nor it is particularly apparent on its face. Given that no focused argument concerning Goal 13 was raised by any party, the hearings officer finds that the applicant's proposed findings comply with Goal 13 – whatever it means.

Goal 14 - Urbanization

> ***"To provide for an orderly and efficient transition from rural to urban land use, to accommodate urban population and urban employment inside urban growth boundaries, to ensure efficient use of land, and to provide for livable communities."***

Hearings Officer Analysis: Goal 14 is addressed throughout this submittal.

Goals 15 through 19

Hearings Officer Analysis: These goals are not applicable, as the proposed UGB expansion does not include Willamette River Greenway, Estuarine Resources, Coastal Shorelands, Beaches and Dunes or Ocean Resources.

OAR 660-024-0040 - 0050

OAR 660-024-0050 directs local governments to inventory land inside the UGB to determine whether there is adequate development capacity to accommodate 20-year needs determined in OAR 660-024-0040. The District's Major Amendment application does not directly implicate these rule provisions, because the need for the new high school site did not arise out of an OAR 660-024-0040 overall land needs analysis and subsequent OAR 660-024-0050 buildable lands analysis. A specific need for a new high school site arose out of long-term facilities planning engaged in by the District. However, once the need for the new high school was identified, the District analyzed land that was within both the District boundaries and the Sherwood, Wilsonville, and Tualatin UGBs for land that could accommodate the need for the

new high school based on its suitability criteria. (See Narrative at pages 8-21.) There was no suitable land within those areas. The analysis required by OAR 660-024-0050 tracks closely in some respects with the analysis required by MC 3.07.1425(a), which was addressed by the District in its application. The caveat, however, is that identified specific land need, such as land for a new school, is not the same as a generalized need for more residential land or employment land. Given the specific need for a new school site, MC 3.07.1440(a) allows a UGB expansion tailored to just that need under certain circumstances.

OAR 660-024-0060 - Metro Boundary Local Alternatives Analysis

OAR 660-024-0060 sets forth the provisions that apply when a need within the Metro UGB has been specified and there is no land within the UGB that can accommodate that need. The provisions in OAR 660-024-0060 track closely with the provisions contained in MC 3.07.1425(c), which have been addressed in the District's application submittal, the Metro staff report, and the additional findings submitted by the District in response to the hearings officer's request.

OAR 660-024-0060:

(1) When considering a Metro UGB amendment, Metro must determine which land to add by evaluating alternative urban growth boundary locations. For Metro, this determination must be consistent with the priority of land specified in ORS 197.298 and the boundary location factors of Goal 14, as follows:

(a) Beginning with the highest priority of land available, Metro must determine which land in that priority is suitable to accommodate the need deficiency determined under OAR 660-024-0050.

Hearings Officer Analysis: The highest priority of land available is land designated urban reserve. (ORS 197.298(1)(a).) The District's application included an analysis of urban reserve land.

(b) If the amount of suitable land in the first priority category exceeds the amount necessary to satisfy the need deficiency, Metro must apply the location factors of Goal 14 to choose which land in that priority to include in the Metro UGB.

Hearings Officer Analysis: As set forth in the District's Major Amendment application, there is suitable land within an existing urban reserve to satisfy the need deficiency, i.e., the new high school. Accordingly, the location factors of Goal 14 were applied to that land. Those location factors are the first four location factors found in MC 3.07.1425(c)(1)-(9) and have been addressed in the District's application submittal, the Metro staff report, and the additional findings submitted by the District in response to the hearings officer's request.

(c) If the amount of suitable land in the first priority category is not adequate to satisfy the identified need deficiency, Metro must determine which land in the next priority is suitable to

accommodate the remaining need, and proceed using the same method specified in subsections (a) and (b) of this section until the land need is accommodated.

Hearings Officer Analysis: This is not applicable as there is urban reserve land that can accommodate the need.

(d) Notwithstanding subsection (a) to (c) of this section, Metro may consider land of lower priority as specified in ORS 197.298(3).

Hearings Officer Analysis: This is not applicable as there is urban reserve land that can accommodate the need.

(e) For purposes of this section, the determination of suitable land to accommodate land needs must include consideration of any suitability characteristics specified under section (5) of this rule, as well as other provisions of law applicable in determining whether land is buildable or suitable.

Hearings Officer Analysis: This provision is similar to MC 3.07.1425(b), in which site characteristics may be specified for land to be suitable for an identified need. The District specified such characteristics in the Narrative at page 19.

(2) Notwithstanding OAR 660-024-0050(4) and subsection (1)(c) of this rule, except during a legislative review of the Metro UGB, Metro may approve an application under ORS 197.610 to 197.625 for a Metro UGB amendment proposing to add an amount of land less than necessary to satisfy the land need deficiency determined under OAR 660-024-0050(4), provided the amendment complies with all other applicable requirements.

Hearings Officer Analysis: This provision is not applicable.

(3) The boundary location factors of Goal 14 are not independent criteria. When the factors are applied to compare alternative boundary locations and to determine the Metro UGB location, Metro must show that all the factors were considered and balanced.

Hearings Officer Analysis: This provision is consistent with how Metro interprets its analogous boundary location factors in MC 3.07.1425(c), which were applied to the District's Major Amendment application.

(4) In determining alternative land for evaluation under ORS 197.298, "land adjacent to the UGB" is not limited to those lots or parcels that abut the UGB, but also includes land in the vicinity of the UGB that has a reasonable potential to satisfy the identified need deficiency.

Hearings Officer Analysis: The District's analysis took into account all of the land in the urban reserves that otherwise met the District's siting criteria. Some of the land analyzed did not abut the UGB, but was rejected for other reasons.

(5) If Metro has specified characteristics such as parcel size, topography, or proximity that are necessary for land to be suitable for an identified need, Metro may limit its consideration to land that has the specified characteristics when it conducts the boundary location alternatives analysis and applies ORS 197.298.

Hearings Officer Analysis: This provision is similar to MC 3.07.1425(b), in which site characteristics may be specified for land to be suitable for an identified need. The District specified such characteristics in the Narrative at page 19.

(6) The adopted findings for a Metro UGB adoption or amendment must describe or map all of the alternative areas evaluated in the boundary location alternatives analysis. If the analysis involves more than one parcel or area within a particular priority category in ORS 197.298 for which circumstances are the same, these parcels or areas may be considered and evaluated as a single group.

Hearings Officer Analysis: The District mapped all of the alternative areas evaluated in the boundary location alternatives analysis and evaluated them separately.

(7) For purposes of Goal 14 Boundary Location Factor 2, "public facilities and services" means water, sanitary sewer, storm water management, and transportation facilities.

Hearings Officer Analysis: The District took into account the public facilities and services enumerated in this provision when it evaluated MC 3.07.1425(c)(2), which is the analog to Goal 14 Boundary Location Factor 2.

(8) The Goal 14 boundary location determination requires evaluation and comparison of the relative costs, advantages and disadvantages of alternative Metro UGB expansion areas with respect to the provision of public facilities and services needed to urbanize alternative boundary locations. This evaluation and comparison must be conducted in coordination with service providers, including the Oregon Department of Transportation (ODOT) with regard to impacts on the state transportation system. "Coordination" includes timely notice to service providers and the consideration of evaluation methodologies recommended by service providers. The evaluation and comparison must include:

(a) The impacts to existing water, sanitary sewer, storm water and transportation facilities that serve nearby areas already inside the Metro UGB;

(b) The capacity of existing public facilities and services to serve areas already inside the UGB as well as areas proposed for addition to the Metro UGB; and

(c) The need for new transportation facilities, such as highways and other roadways, interchanges, arterials and collectors, additional travel lanes, other major improvements on existing roadways and, for urban areas of 25,000 or more, the provision of public transit service.

Hearings Officer Analysis: As set forth in the responses to Goals 11 and 12, Sherwood West has been concept planned pursuant to MC 3.07.1110, and so the provision of public

facilities and services within the Sherwood West concept plan area and as those services relate to the rest of the city have been studied extensively, as required by MC 3.07.1110. The Sherwood West Concept Plan was prepared with analyses of existing sanitary sewer, water, stormwater, and transportation conditions and analyses of how those systems need to be upgraded, extended, and phased to meet the future development of Sherwood West without adversely impacting the existing city development. The concept plan was prepared in coordination with all of the future service providers, including those services that will be provided by the City and those that will be provided by others, including Clean Water Services, ODOT, and Washington County.[15]

Additional Issues Raised by Opponents

1. **Metro Staff Provided Proper Notice to DLCD.**

Opponents allege that Metro failed to provide notice to DLCD of a proposed plan map amendment under ORS 197.610. *See* Letter from Jennifer Bragar dated June 23, 2017, at p. 8. This is not correct. Metro submitted the requisite notice to DLCD on April 20, 2017, as evidenced on the weekly DLCD notice summary dated April 21, 2017, which is attached to the June 30, 2017 letter from Metro counsel Roger Alfred.

2. **The Fair Housing Act Is Inapplicable.**

The opponent argues that Metro must apply the Fair Housing Act ("FHA") to the Major Amendment application, because "Metro has a duty to affirmatively further fair housing." *See* Letter from Jennifer Bragar dated June 23, 2017, at p. 3-5.

The opponent does not point to any approval criterion that requires Metro to apply the FHA directly to this application, and did not include any convincing argument as to why a UGB expansion to accommodate a new public high school would require the FHA to be addressed. As best as the hearings officer can ascertain, the opponent's core argument is that the FHA is a *de-facto* approval standard for every Comprehensive Plan Amendment and zone change decision. In this regard, Ms. Brager states that "Metro has a duty to affirmatively further fair housing" and that "Metro needs to address fair housing implications in this Major Amendment application through analysis under Goal 10 and under Metro's locational factors, Metro Code 3.07.1425(c)(5) regarding equitable and efficient distribution of housing." The argument is not well-developed; the opponent seems to be arguing that the FHA must be complied with, but that compliance with Goal 10 and the Metro Code establishes compliance with the FHA.

Beyond that, the opponent complains that Sherwood does not have enough subsidized housing, which "does not properly address the housing issues in Washington County for low-income households, especially protected classes." That statement is followed up with the conclusion that the "failure to analyze the school siting in context of the regional need for fair housing only exacerbates the inequitable distribution of affordable housing in the Metro region."

[15] This coordination effort included service provider interviews included as Appendix 6 of the Sherwood West Concept Plan. Appendix 8 provides more detail regarding the provision of transportation infrastructure to the Sherwood West Concept Plan area.

Letter from Jennifer Bragar dated June 23, 2017, at p. 5. Again, the hearings officer is at a loss to understand the opponent's argument, especially since the opponent does not tie their ultimate policy concern back to any specific language in the FHA or any other law for that matter. This argument is simply not developed sufficiently to allow for its review and evaluation. If the argument is that every school siting project has an inclusionary zoning requirement for additional low-income / subsidized housing, that argument is rejected.

SECTION IV: HEARINGS OFFICER'S SUMMARY, RECOMMENDATION, AND PROPOSED CONDITIONS OF APPROVAL.

The applicant seeks to amend the UGB to include approximately 82 acres for a high school with sports fields and the realignment of SW Elwert and SW Kruger Roads. The Applicant has provided sufficient evidence to demonstrate that the criteria are satisfied and the locational factors have been addressed. As detailed herein, the applicant has demonstrated that the high school is currently over capacity and by 2025 will be severely over capacity. Delaying the decision to await a legislative amendment of the UGB by the Metro Council which may or may not occur in the 2018 timeframe only exacerbates the capacity issues which impacts the District's ability to meet the goals of its strategic plan. The applicant provided adequate comparison of the proposed UGB expansion area with other possible expansion areas in seven different urban reserve areas and a determination that the need cannot be met on land currently within the urban growth boundary. In addition the applicant has shown the proposed use can be made compatible with adjacent uses through site design and the city's development design review process provides for public involvement. Additionally the adjacent land is within an urban reserve and is expected to urbanize over time, allowing for the development of a cohesive neighborhood and school/park facility.

Therefore, the hearings officer forwards a recommendation to the Metro Council for ***approval*** of this petition, with the following two conditions of approval:

1. The property must be used for a public high school, associated accessory uses, and public transportation improvements consistent with the application are required for this Major Amendment.

2. The applicant must comply with the Transportation Planning Rule (TPR) at the time the zoning is established on the subject property.

Respectfully submitted this 21st day of July, 2017.

ANDREW H. STAMP, P.C.

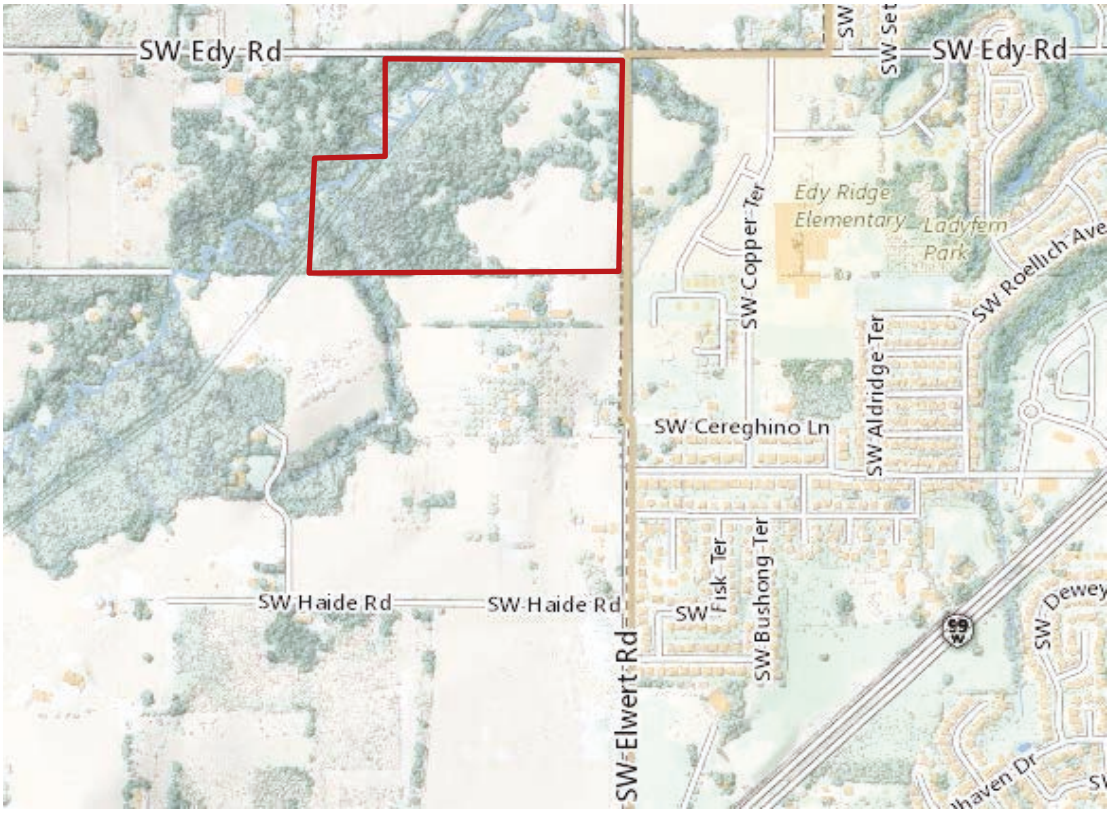
Attachment 8

Alternative High School Site A
(SW Corner of Edy & Elwert Road)



Topography (USGS GIS Lidar Mapping)	Wetlands (National Wetlands Inventory)	Water Utility (City of Sherwood)	Sanitary Utility (Clean Water Services)
✗ Low-lying, relatively flat. Approximately 25 feet grade across site. Very low lying for sanitary sewer. Significant portion of site below elevation 200. Western portion mostly creek.	✗ Small wetland in center of site. Western portion of site mostly drainage area.	✗ No water available adjacent in Elwert. Would require water extensions along Elwert frontage and east on Edy.	✗ Low lying site - sanitary sewer not available in Elwert. Would require significant extension in Edy or pump station.

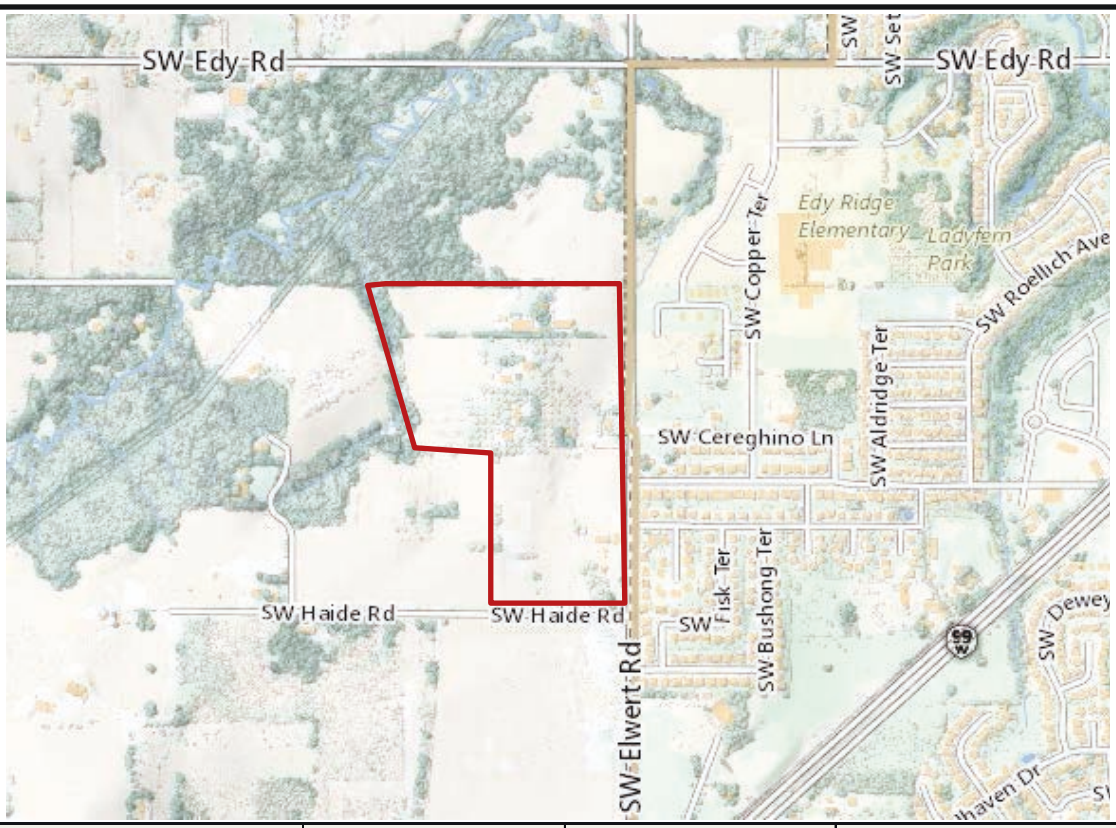
Storm Drainage	Public ROW Improvements
✓ Drainage discharge available onsite into Chicken Creek.	1. Water extension along Elwert frontage. 2. Sanitary upgrades in Edy and Elwert. 3. Storm drainage improvements along Elwert. 4. Street improvements on Elwert and Edy frontages.

LEGEND

✓ = Advantage ○ = Still to be Determined ✗ = Disadvantage

Attachment 8 continued

Alternate High School Site B
(NW corner of Haide & Elwert)



Topography (USGS GIS Lidar Mapping)	Wetlands (National Wetlands Inventory)	Water Utility (City of Sherwood)	Sanitary Utility (Clean Water Services)
O Significant topographic ridge running N-S through middle of site. Site slopes both east and west. Approximately 50-60 feet grade change. Significant grading for fields.	✓ No wetlands shown.	✓ 12" City of Sherwood public water main available in Elwert.	✓ 15" sanitary sewer and manhole available in Elwert at Daybreak subdivision. (Confirmed with City of Sherwood). City would likely still require public sanitary improvement in Elwert.

Storm Drainage	Public ROW Improvements
✓ North-south ridge running through site. West portion could drain directly to Chicken Creek. East portion drains to public improvements and across road to Chicken Creek.	1. Although not needed for site development, sanitary and storm sewer improvements likely needed in Elwert frontage as part of public frontage improvements. 2. Street improvements on Elwert & Haide frontages.

LEGEND

✓ = Advantage O = Still to be Determined ✗ = Disadvantage

Attachment 8 continued

Alternate High School Site C (Preferred Site)
(NW Corner Krugger & Elwert)

Topography (USGS GIS Lidar Mapping)	Wetlands (National Wetlands Inventory)	Water Utility (City of Sherwood)	Sanitary Utility (Clean Water Services)
✓ Entire site slopes down to the east toward Elwert. Relatively gentle topography. Approx. 40 feet grade change across entire site. Note: shallow valley and ridge complicates storm drainage.	✓ No wetlands shown.	✓ 12" City of Sherwood public water main in Elwert; also 18" public water main in Kruger.	✓ Feasible to extend 15" sanitary sewer main south on Elwert. Would require approximate 2,000 linear foot public extension. (Confirmed with City of Sherwood).

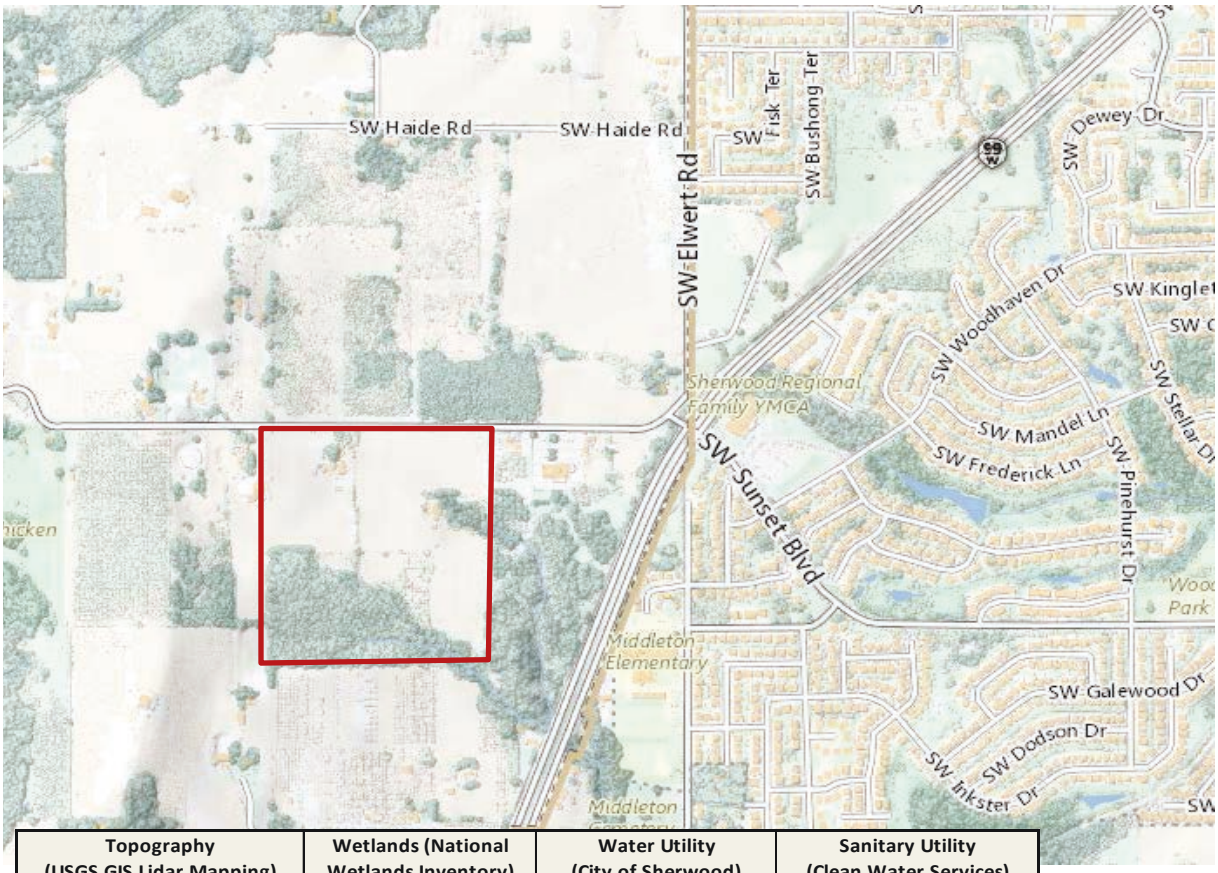
Storm Drainage	Public ROW Improvements
○ East-west ridge running through site. North portion could require long public storm extension to Chicken Creek. South portion would need to drain to new City intersection improvements at Elwert & Kruger intersection.	1. Sanitary extension in Elwert. 2. Storm drainage improvements along Elwert north to Chicken Creek. 3. Street improvements on Elwert frontage. 4. Need to consult with CWS to work out storm discharge.

LEGEND

✓ = Advantage ○ = Still to be Determined ✗ = Disadvantage

Attachment 8 continued

Alternative High School Site D
(South Side of Kruger Road)



Topography (USGS GIS Lidar Mapping)	Wetlands (National Wetlands Inventory)	Water Utility (City of Sherwood)	Sanitary Utility (Clean Water Services)
O Entire site slopes down to the east toward private property. Moderate topography. Approximately 50-60 feet grade change.	O No wetlands shown, but creek drainage runs through south portion of site.	✓ 18" public water main in Kruger.	✗ No sanitary sewer services available. Significant sewer extension and public system improvements necessary.

Storm Drainage	Public ROW Improvements
✗ No established public storm drainage systems in vicinity. Storm discharge would need to be worked out with the City and CWS along 99W. Storm extension likely required.	1. Sanitary sewer extension (exact route to be determined). 2. Storm drainage extension (exact route to be determined). 3. Street improvements on Kruger. 4. Offsite street improvements likely required.

Attachment 8 continued

Alternative High School Site E
(NW Corner Chapman & Pacific Highway)

Topography (USGS GIS Lidar Mapping)	Wetlands (National Wetlands Inventory)	Water Utility (City of Sherwood)	Sanitary Utility (Clean Water Services)
O Entire site slopes down to the east toward Pacific Highway. Slightly steeper topography. Approximately 75 feet grade change. Would need to evaluate for fields.	✓ No wetlands shown.	✗ No public water service in immediate vicinity of site. Need to extend water south from Kruger or under Pacific Highway.	✗ No sanitary sewer services available. Significant sewer extension and public system improvements necessary.

Storm Drainage	Public ROW Improvements
✗ No established public storm drainage systems in vicinity. Storm discharge would need to be worked out with the City and CWS along 99W. Storm extension likely required.	1. Sanitary sewer extension (exact route to be determined). 2. Storm drainage extension (exact route to be determined). 3. Street improvements on Chapman.

LEGEND

✓ = Advantage O = Still to be Determined ✗ = Disadvantage

EXHIBIT C to Ordinance No. 17-1406

Memo

Metro
600 NE Grand Ave.
Portland, OR 97232-2736

Date: August 15, 2017
To: Metro Council
From: Roger Alfred, Senior Assistant Attorney
Subject: Sherwood School District UGB Amendment; Metro Ordinance No. 17-1406
Responses to Issues Raised at Public Hearing

This memorandum provides responses to issues raised in the letter submitted by attorney Jennifer Bragar on behalf of Byers Properties LLC ("Byers") at the public hearing before the Metro Council on August 10, 2017. For the reasons set forth below, the Office of Metro Attorney concludes that the arguments are without merit, and the Metro Council may adopt the hearings officer's recommendation of approval.

Most of the issues raised in the Byers letter have been considered and addressed in the hearings officer's decision. Where that is the case, this memo refers to the appropriate pages of that decision.

1. This UGB amendment process is quasi-judicial, not legislative

Byers first contends that Metro is making a legislative decision, rather than a quasi-judicial decision. This issue is thoroughly analyzed at pages 13-16 of the hearings officer's decision, where he correctly reaches the fairly obvious conclusion that this is a quasi-judicial process. The hallmark of a quasi-judicial land use process is that it is initiated by an application, which the local government is then obligated to either approve or deny. Here, the "major amendment" process is initiated when an applicant files a request for a UGB amendment with Metro. Metro then appoints a hearings officer, who holds a public hearing that is governed by the quasi-judicial procedures set forth in Oregon statute (ORS 197.763). It is worth noting that, during the hearing before the hearings officer, Byers invoked the quasi-judicial procedures in that statute by requesting that the record be held open for additional evidence, a request that was granted by the hearings officer. Metro's final decision on the application is based on applying preexisting criteria to the facts of the application, and it impacts a discrete parcel of property, rather than a broad population. The process is clearly quasi-judicial under the relevant case law.

2. This UGB amendment does not involve or implicate housing

The reason Byers contends this process is legislative is in order to implicate ORS 197.296(2), which is the statute that directs Metro to ensure there is a 20-year supply of housing inside the UGB when it conducts the 6-year "regular cycle" urban growth management process (which is a legislative process, not quasi-judicial). As correctly concluded by the hearings officer, the arguments raised by Byers regarding the decision being legislative are a "red herring," because even if this UGB major amendment process was legislative, ORS 197.296(2) would still not apply because the express purpose of the major amendment process is to provide land for non-housing uses. There is no legal,

or rational, reason why Metro would undertake a regionwide housing need analysis as part of a decision to expand the UGB for a non-housing use. The fact that this UGB amendment process is governed by a different statutory section, and does not implicate housing need under ORS 197.296, is analyzed in detail by the hearings officer at pages 16-24 of his decision, and is also addressed in my memorandum to the hearings officer dated June 9, 2017.

Byers also argues, for the first time, that the ESEE analysis is inadequate because it fails to address social consequences arising out of "the loss of housing land" resulting from approving this UGB expansion. Byers is correct that this issue is not addressed in the hearings officer's analysis, but that is because Byers failed to raise this issue below. Under Metro Code, this proceeding before the Metro Council is "on the record" of what was before the hearings officer. Specifically, section 3.07.1430(u) of the Metro Code provides: "Argument must be based upon the record of those [hearings officer] proceedings." Accordingly, participants before the Metro Council may not introduce new evidence or issues beyond what was presented to the hearings officer. *See DLCD v. Tillamook County*, 34 Or LUBA 586, 591 (1998) (noting that where a hearing is held on the record, "petitioner could not have raised a new issue at that stage of the proceeding.") Allowing parties to raise new issues before the Metro Council could trigger a need to respond with new evidence, which is not permitted in an "on the record" process.

Adoption of this memorandum by the Metro Council in support of approving the application is an express interpretation by the Council of 3.07.1430(u) to mean that any issues not raised before the hearings officer are waived. This interpretation is consistent with the meaning of "on the record" expressed in the statutes governing LUBA's scope of review (ORS 197.835(2)(a) and (3)), which prohibit new issues from being raised on appeal.

Even if this issue had not been waived by Byers, the hearings officer expressly rejected Byers' argument below that approval of this UGB amendment results in a "loss of housing land." The land being added to the UGB is currently zoned for agricultural use, not housing. Accordingly there are no social impacts arising out of a loss of land for housing.

3. The application is based on a demonstrated need for a high school, not for parks

Byers contends that the application includes a request for a park use, and is deficient because it did not consider "alternatives to the park use separate from collocation with the high school." Like the ESEE argument addressed above, Byers did not raise this issue in the proceedings before the hearings officer, and has therefore waived the ability to raise it before the Metro Council.

In the event this issue was not waived, on the merits Byers mischaracterizes the nature of the UGB amendment application. The application is for a high school use, a use that necessarily and customarily includes active play space, including a number of ball fields, and other sports facilities, such as a track and tennis courts. This is depicted on the concept plan for the high school, which is included in the application, and explained in the application narrative and in the applicant's

testimony before the hearings officer. The UGB amendment application is not for park land, and the references to the future shared use of the new high school's active ball fields should not be construed to that effect. The nature and purpose of the application is not changed by the facts that (1) the city does not generally provide ball fields or other active sports facilities, and (2) the city and the school district have an IGA that generally allows the community to use the District's ball fields and other active sports facilities when those fields and facilities are not in use by the school district. As set forth in the record, the property proposed for the relocated high school will be fully utilized by the needs of the high school, and the larger campus of the new high school (when compared to the existing high school) will allow for the full range of facilities normally provided at a comprehensive high school. The availability of more sports fields that can be shared with the community is merely an additional benefit arising out of the agreement between the school district and the city.

On this point, one aspect of the hearings officer's findings should be clarified. At page 29 the hearings officer includes a finding that the applicant has shown there is a "demonstrated land need to accommodate both school and park services." This is a mis-statement by the hearings officer, as the school district's application is based on the need for a new school, and not on a need to provide park services.

4. The application is "consistent with" Metro's 20-year population range forecast

One criterion for a UGB expansion under the Metro Code is that the application must show a need to accommodate future urban population "consistent with a 20-year population range forecast." Byers argued below, and argues again to the Council, that this requires Metro to undertake a new regionwide 20-year population forecast, and the school district's 10-year school population forecast is therefore deficient. The hearings officer addressed this argument at page 26, concluding that the code requires the applicant to show a need that is "consistent with" a 20-year forecast, which "in this context simply means using the same or similar growth rates contemplated in the 2015 UGR, and that appears to be the case here."

In support of this argument Byers references materials attached to their August 10, 2017 letter to the Metro Council regarding a 2016 study of race and ethnicity impacts. This is a new document that was not part of the evidentiary record before the hearings officer and therefore cannot be considered by the Metro Council in this proceeding.

5. Public facilities and services are available to serve the proposed site, and the applicant must comply with the TPR upon rezoning

As part of the consideration of alternative urban reserves areas for potential expansion of the UGB, one location-related factor that must be considered is the "orderly and economic provision of public facilities and services." This issue is analyzed and addressed at pages 43-45 of the hearings officer's decision. The hearings officer also correctly notes, at page 35, that these are locational "factors" that

must be *considered* by Metro, and are not criteria that must be satisfied: "one point that cannot be over-emphasized is that no one locational factor can be considered to be a determinative reason to include or exclude any one particular site. Thus, a decision to include or exclude land from a UGB must be based on a balancing of all these factors, rather than a reliance on any one factor."

Nonetheless, Byers contends that this factor is a criterion that must be satisfied, arguing that the applicant must show whether the proposal will impact availability of public facilities. Byers then contends that the applicant's traffic impact analysis does not demonstrate that nearby intersections will meet applicable level of service standards.

The issue raised by Byers is not relevant to the applicable inquiry for purposes of a UGB expansion, which is a much more general question of whether public facilities are available to serve the site. Questions related to traffic impacts from a new school on existing and planned transportation facilities in the area will need to be addressed as part of the comprehensive plan and zoning map amendments that will be necessary to develop a school, which will trigger application of the state Transportation Planning Rule (TPR). The ordinance proposed for adoption by the Metro Council includes the hearings officer's recommended condition of approval requiring application of the TPR at the time zoning for the school is being adopted.

6. Metro has satisfied the coordination requirement

Byers contends that Metro failed to coordinate with affected local governments as required by ORS 195.025. This issue was not raised before the hearings officer and is therefore waived. In the event the issue is not waived, the hearings officer adopted the following findings regarding the coordination requirement at page 58 of his decision:

"This Major Amendment application has required coordination with and between Metro, Washington County, the City of Sherwood, and public service providers including ODOT, Tualatin Valley Fire & Rescue, and Clean Water Services. This includes coordination at the Major Amendment level and at the Sherwood West Concept Plan level. Therefore, the required coordination has occurred."

The record includes evidence that Metro fulfilled its coordination obligation by providing written notice to all cities and counties inside the UGB regarding the proposed UGB amendment, as well as to ODOT and relevant service providers. The City of Sherwood supports approval of the application and included the following comments in its service provider letter dated March 11, 2017:

"The Sherwood West preliminary concept plan was developed through community input and had community and Council support. The voters within the Sherwood School District approved a bond for the new high school. While there will be challenges to building a new school within the Sherwood West area, and coordination between the District, City, County and ODOT will be

required, the District is committed to ensuring that is serves as a great cornerstone to the future growth in the area."

In response to questions at the public hearing from members of the Metro Council regarding coordination with the City of Sherwood, the school district representatives verbally stated that the district is currently working with the city on Title 11 concept planning and that district representatives attended a city planning commission meeting earlier in the week where they were told that the planning effort is on the right track. These are evidentiary statements that were not included in the record before the hearings officer and therefore will not be considered or relied upon by the Metro Council in its final decision.

Finally, Byers suggests that the school district has not satisfied a coordination obligation, but cites no authority regarding why or how the school district is obligated to coordinate as part of its application. The coordination requirement applies to Metro through the major amendment process and ORS 195.025, and not to the school district. Byers also states that comments received from Washington County "suggest that coordination is incomplete as the management of transportation systems has not been finalized." It is not entirely clear what this means; however, there is no requirement, coordination-related or otherwise, that management of transportation systems must be "finalized" at the point of a UGB amendment. The Metro Ordinance includes a condition of approval requiring the city to finalize its concept plan for the area prior to development occurring on the site, which will include coordination with the county regarding transportation planning. Additional transportation planning will occur at the time of annexation by the city and rezoning of the property, at which point the TPR must be applied to ensure that transportation facilities serving the new school will be adequate.

All coordination obligations have been satisified.

STAFF REPORT

IN CONSIDERATION OF ORDINANCE NO. 17-1406, FOR THE PURPOSE OF AMENDING THE URBAN GROWTH BOUNDARY IN THE VICINITY OF THE CITY OF SHERWOOD UPON APPLICATION BY THE SHERWOOD SCHOOL DISTRICT

Date: July 27, 2017

Prepared by: Tim O'Brien
Principal Regional Planner

PROPOSED ACTION

Adoption of Ordinance 17-1406, approving *UGB Case 17-02: Sherwood School District,* a major amendment to the urban growth boundary (UGB). The proposed amendment area is shown on Attachment 1. Staff recommends approval of the ordinance as described below, which would add approximately 82 acres to the UGB west of Sherwood for a high school campus and sports fields. In addition a portion of the land will be used for the construction of a roundabout at SW Elwert and SW Kruger Roads.

SUMMARY OF PROCESS

The proposed amendment is a "major amendment" to the UGB under the Metro Code, which is a special process reserved for requests to include land for public facilities and other non-housing needs that cannot wait until the next UGB cycle. An application for a major amendment is first considered at a public hearing before a hearings officer appointed by Metro. After receiving testimony from interested parties, the hearings officer prepares a proposed order, with findings of fact and conclusions of law recommending approval or denial of the application, and forwards the recommendation to the Metro Council along with the record of the hearing. The Metro Council must consider the hearings officer's report and recommendation at an "on the record" public hearing where individuals who participated in the proceeding before the hearings officer are allowed to submit oral and written argument. The argument must be based on the evidence that was provided to the hearings officer, and no new evidence may be submitted to the Metro Council. If the Council decides to approve the application and expand the UGB, the Council must adopt an ordinance within 15 days after holding a public hearing.

BACKGROUND AND ANALYSIS

Proposal Description:
The Sherwood School District filed an application for an 80-acre amendment to the UGB for a high school campus and sports fields. The site consists of four tax lots located within unincorporated Washington County on the west side of SW Elwert Road, between SW Haide Road and SW Kruger Road, immediately west of the City of Sherwood. The site has frontage on all three roads, is zoned Agriculture and Forest (AF-20) and is located within Sherwood West Urban Reserve 5B. The adjacent properties to the north, south and west are also within Urban Reserve 5B and contain rural residences with limited agriculture and a church to the south, wooded lots and rural residences to the west and open fields and rural residences to the north. The subject properties have been used for various agricultural activities including a Christmas tree farm, tree plantation and row crops. The tax lot in the southeast corner of the site, adjacent to the intersection of SW Elwert and SW Kruger Roads is owned by the City of Sherwood, a portion of which will be used for the SW Elwert and SW Kruger Road roundabout improvement. A 40-foot wide permanent Northwest Natural gas easement zigzags along the western edge of the site, separating the northwest corner of the site from the remainder of the property.

The Sherwood School District is centered on the city of Sherwood and extends into the surrounding rural area in all directions, including a small area east of I-5, between Wilsonville and Tualatin. The District includes an area of 4.31 square miles and an estimated population of 18,884. The District has seven schools that provide educational services to just over 5,000 students, the majority of which live in the city of Sherwood. The District experienced substantial growth in the late 1990s and early 2000s leading to a community effort in 2005 to determine facility needs. This resulted in the successful 2006 bond measure which included funding for an addition to the current high school to increase capacity to 1,550 students, consistent with phase 1 of the 2006 high school master plan. Current enrollment at the high school is over 1,700 students and projections show over 2,250 students by the 2025-26 school year. In early 2014 the District's Long Range Planning Committee made recommendations to the School Board regarding enrollment and growth challenges, facilities analysis and needs and financing options. In 2015 the District documented the condition and educational adequacy of its facilities, leading to bond visioning and steering committees in 2016. This resulted in the District's voters approving a bond measure in 2016 providing funding for school improvements including construction of a new high school. The District continues to engage the community through a design committee and community input sessions.

Public Hearing before the Hearings Officer

The hearings officer, Andrew H. Stamp, conducted a public hearing at the Sherwood Police Department Community Room on May 24, 2017. Metro staff recommended approval of the application. Six people testified at the hearing, five in favor of the application and one against the application. The hearings officer continued the hearing to June 13, 2017 in response to a procedural question. Three people testified at the June 13th hearing, all in opposition to the application, including one who had also testified at the May 24th hearing. The hearings officer granted a request to keep the record open for ten days, followed by additional time for rebuttal by participants and final argument by the applicant; the record closed on July 7, 2017.

The primary opponent of the application is Byers Properties, LLC, which is the entity that owns one of the parcels of property to be included in the proposed expansion. Byers is currently involved in condemnation proceedings with the Sherwood School District regarding acquisition of the property for public use. Byers raised numerous legal issues in the proceedings before the hearings officer, all of which were ultimately rejected in the final order and recommendation to the Metro Council.

Hearings Officer Recommendation and Proposed Findings

On July 21, 2017 the hearings officer submitted a proposed order recommending approval of Case 17-02, based upon the findings and conclusions in his report. The hearings officer included two conditions of approval in his recommendation:

1. The property must be used for a public high school, associated accessory uses, and public transportation improvements consistent with the application for this Major Amendment.
2. The applicant must comply with the state Transportation Planning Rule (TPR) at the time the zoning is established on the subject property.

A hearing on the recommendation before the Metro Council is set for August 10, 2017. All parties to the case were notified in writing of the Council hearing date and the notice was also posted on Metro's website. In addition, the hearings officer's proposed order was made available for review by all parties.

SUMMARY/OPTIONS

According to Metro Code 2.05.045(b), the Council may either:

- Adopt Ordinance 17-1406 to approve *Case 17-02: Sherwood School District* based on the findings of fact and conclusions of law in the hearings officer's order. Staff recommends this option.
- Vote in favor of adopting Ordinance 17-1406 to approve *Case 17-02: Sherwood School District* based on revised findings of fact and conclusions of law to be prepared by Metro staff.
- Remand the proceeding to the Hearings Officer for further consideration.
- Vote to adopt a Resolution entering an order to deny *Case 17-02: Sherwood School District* based on revised findings of fact and conclusions of law to be prepared by Metro staff.

In addition, pursuant to Code Section 3.07.1455, the Council may establish conditions of approval it deems necessary to ensure the addition of land complies with state planning laws and the Regional Framework Plan. Metro staff recommends the Council include the following three conditions of approval, the first two of which were recommended by the hearings officer:

1. The property must be used for a public high school, associated accessory uses, and public transportation improvements consistent with the application for this Major Amendment.
2. The applicant must comply with the state Transportation Planning Rule (TPR) at the time the zoning is established on the subject property.
3. The City of Sherwood shall complete the requirements of Urban Growth Management Functional Plan Title 11, section 3.07.1120: Planning for Areas Added to the UGB, prior to development occurring.

INFORMATION

Known Opposition: Attorney Jennifer Bragar, representing one of the subject property owners, testified verbally and in writing in opposition to the application before the hearings officer and by providing additional written information during the open record period. Two persons who live in the vicinity of the proposed UGB expansion area testified verbally and in writing in opposition to the application before the

hearings officer and by providing additional written information during the open record period. One person who lives in the vicinity of the proposed UGB expansion area testified in writing in opposition to the application during the continued public hearing timeframe.

Legal Antecedents: The Metro Regional Framework Plan and Urban Growth Management Functional Plan Title 14: Urban Growth Boundary authorizes amending the Urban Growth Boundary through the major amendment process.

Anticipated Effects: The adoption of Ordinance 17-1406 will add 82.3 acres of land to the urban growth boundary in the vicinity of Sherwood for a high school campus with sports fields and road improvements.

Budget Impacts: There is no budget impact from adopting this ordinance.

Metro affordable housing bond program

oregonmetro.gov/housing

Metro respects civil rights

Metro fully complies with Title VI of the Civil Rights Act of 1964 that requires that no person be excluded from the participation in, be denied the benefits of, or be otherwise subjected to discrimination on the basis of race, color or national origin under any program or activity for which Metro receives federal financial assistance.

Metro fully complies with Title II of the Americans with Disabilities Act and Section 504 of the Rehabilitation Act that requires that no otherwise qualified individual with a disability be excluded from the participation in, be denied the benefits of, or be subjected to discrimination solely by reason of their disability under any program or activity for which Metro receives federal financial assistance.

If any person believes they have been discriminated against regarding the receipt of benefits or services because of race, color, national origin, sex, age or disability, they have the right to file a complaint with Metro. For information on Metro's civil rights program, or to obtain a discrimination complaint form, visit oregonmetro.gov/civilrights or call 503-797-1536.

Metro provides services or accommodations upon request to persons with disabilities and people who need an interpreter at public meetings. If you need a sign language interpreter, communication aid or language assistance, call 503-797-1700 or TDD/TTY 503-797-1804 (8 a.m. to 5 p.m. weekdays) 5 business days before the meeting. All Metro meetings are wheelchair accessible. For up-to-date public transportation information, visit TriMet's website at trimet.org.

Memo

Date: June 10, 2024
To: Metro Council
From: Metro Housing Bond Community Oversight Committee
Subject: 2023 Annual Report

A report to the Metro Council and the community from the Metro Housing Bond Community Oversight Committee

We are pleased to present the 2023 annual report for the Metro affordable housing bond, covering the period from January 1, 2023 through December 31, 2023.

The Metro Housing Bond Community Oversight Committee has reviewed progress reports from all eight implementation partner agencies, as well as an analysis of regional progress and performance presented by Metro staff. The committee also reviews quarterly progress and expenditure reports on an ongoing basis to monitor and evaluate progress toward production and policy goals outlined in the Metro Council's adopted policy framework for the bond.

The bond framework established a goal of creating at least 3,900 new homes as well as policy expectations for advancing racial equity throughout the implementation process. This report demonstrates that the bond is delivering on its promises. Metro and its partners are on track to build 800 more homes than expected, bringing 4,700 affordable homes to the region. These new affordable homes will help tackle the region's housing shortage and stabilize communities so that all people can thrive.

KEY HIGHLIGHTS

In its fourth year of implementation, the bond program outpaced housing production targets while continuing to make significant progress in advancing regional goals to increase equitable access to housing.

Production progress

As of December 2023, there were 52 bond-funded projects underway that will provide 4,361 new affordable homes. These homes represent 112% of the bond's total unit production target of 3,900 affordable homes.

- **Total units:** The 4,361 affordable homes (which are collectively referred to as the "bond portfolio" throughout the report) include 1,410 units that have completed construction, 1,374 units under construction and 1,577 units in pre-construction.

Regional progress toward production goals

- **Very affordable units:** 1,635 of these homes will be affordable to households with incomes at or below 30% of area median income, representing 102% of the program's production goal for deeply affordable homes.
- **Family-size units:** 2,233 of these homes will have two or more bedrooms, representing 115% of the program's production goal for family-size homes.

Plans are in place that will commit nearly all remaining bond funds by 2024 with final projects expected to break ground by 2026. **The program is projected to achieve at least 120% of its original production target once all funds are expended**, creating an estimated 4,700 affordable homes that will provide housing for 9,000 to 15,000 people across the region.

By December 2023, 1,443 people had moved into their new homes in 10 bond-funded projects located in Beaverton, Forest Grove, Gladstone, Gresham, Happy Valley, Portland and Tigard.

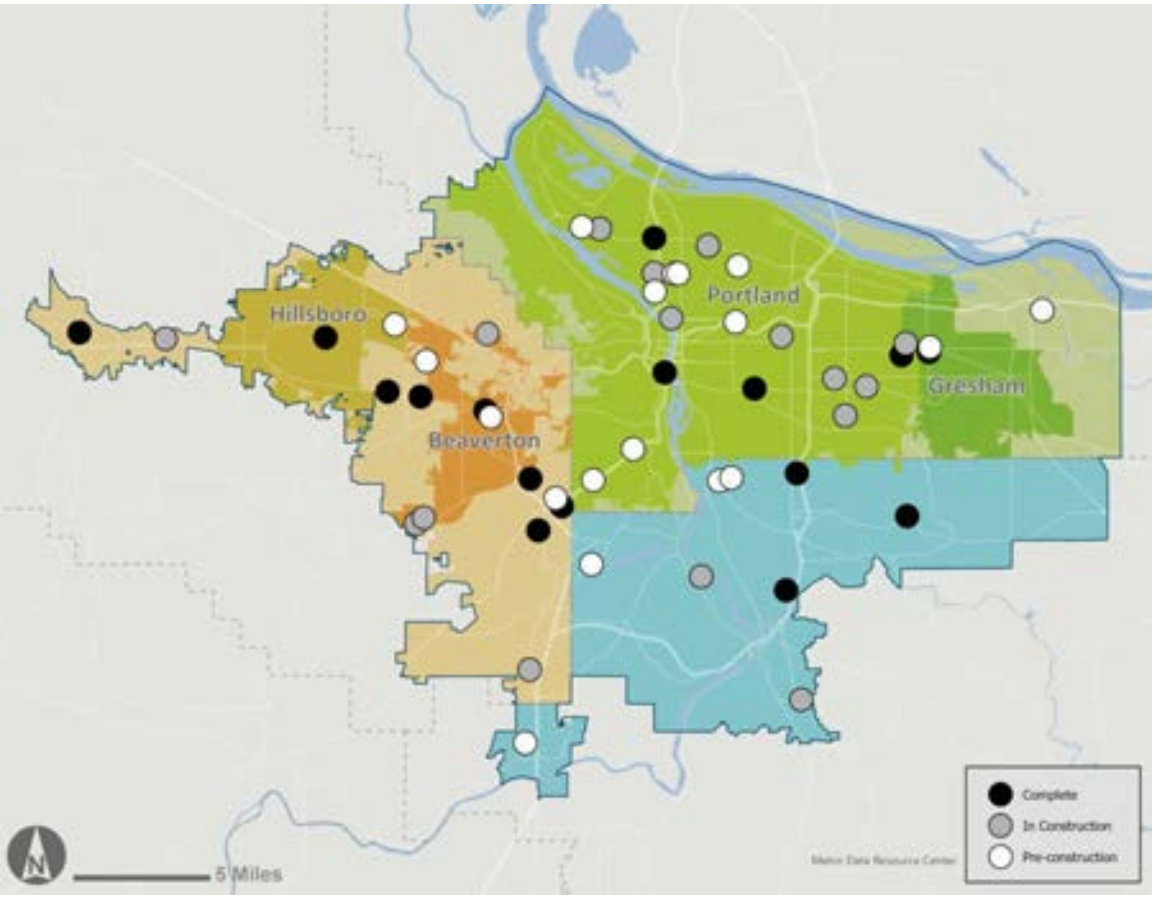
Addressing disparities and advancing racial equity

Metro and its implementation partners are making ongoing progress in moving forward the bond program's goals of addressing disparities, increasing equitable access to housing and advancing racial equity:

- **Addressing disparities through project location:** The locations of the bond portfolio's homes expand access to housing options in a diversity of areas throughout the region: 42% of units are located in areas that have historically lacked affordable housing, 58% are located in areas where communities at risk of displacement live today and 42% are located in areas historically inaccessible to communities of color. This not only improves access to affordable housing in communities across greater Portland and provides residents with greater choice about where to live, it also helps connect people

to schools, jobs and other opportunities while preventing displacement in changing neighborhoods.

Affordable housing bond project locations



- **Advancing economic opportunity through construction:** Bond-funded projects represented about 15% of regional multifamily housing construction in 2023 and have supported an average of 3,286 jobs in the construction sector annually – jobs that pay an average of $91,000 per year in wages and benefits. To ensure equitable access to the economic opportunities provided by bond investments, the program aims to direct construction contracts to underrepresented firms. The bond's development projects are on track to meet or exceed the regional goal of at least 20% of construction contract funding going to state certified minority- or women-owned and/or emerging small businesses (MWESB). Ten projects reached completion in 2022 and 2023 with a combined $50.3 million in contracts paid to certified MWESB firms, representing 24.9% of total construction costs.
- **Promoting equitable access through marketing and lease-up:** All bond projects are required to develop plans for affirmatively marketing housing opportunities and reducing lease-up barriers to ensure equitable access to bond-funded units. Data from projects that have completed lease-up suggest that these affirmative marketing and lease-up strategies are working, with a

higher percentage of people of color housed in bond-funded units than the percentage of households with low incomes that are people of color in the surrounding neighborhoods and the region as a whole.

- **Advancing housing stability through services:** On-site services can support households with low incomes to remain stably housed. Across the 52 projects in the portfolio, 96% include formal partnerships with culturally responsive or culturally specific organizations to provide resident services and other programming. In addition, 54% of projects will provide ongoing case management for households in permanent supportive housing units intended for people exiting long-term homelessness; 57% of these projects are leveraging funding from Metro's supportive housing services fund.
- **Promoting community engagement:** Implementation partners and developers are expected to conduct outreach and organize engagement opportunities to involve the community in providing input on project design, services and other priorities. In 2023 more than 1,103 people participated in community engagement opportunities to inform planning for 16 projects. Their input led to modifications to outdoor areas, common spaces, unit amenities, on-site services, security features and parking.

Addressing emerging opportunities and challenges

Metro works with its partners on an ongoing basis to support regional alignment and coordination in response to emerging challenges and opportunities. Key policy and program refinement work undertaken in 2023 included:

- **Convening stakeholders to regionalize best practices:** Metro worked with stakeholders and partners to improve post-occupancy reporting on marketing, screening and demographic data, resulting in improved data quality. Metro also worked with partners to create standards and templates for affordable homeownership projects, supporting the addition of four homeownership developments to the portfolio. The Tri-County Planning Body, which develops regional strategies to support implementation of Metro's supportive housing services fund, identified six regional goals that will guide investments to address homelessness.
- **Strengthening system integration and alignment:** Metro dedicated funding and staff capacity to strengthen regional permanent supportive housing coordination and alignment, which includes supporting jurisdictional partners to align housing bond and supportive housing services resources. Metro also continued to coordinate with Oregon Housing and Community Services on funding alignment while supporting federal legislative changes that would increase the availability of private activity bonds.
- **Analysis and planning for the future:** Metro Council laid the groundwork for a community conversation to explore how the region can continue to work

together to create affordable homes as well as provide services that keep people housed. A stakeholder advisory table was convened in early 2024 that will inform a recommendation from Metro's chief operating officer to the Metro Council on future funding options. Metro also expanded its staffing capacity to focus on programmatic integration and policy alignment of Metro's capital development and supportive housing services funds – work that is critical to the region's ability to deliver on its housing commitments.

RECOMMENDATIONS

The committee commends Metro and its implementation partners on the milestones reached this year. The bond program is on track to exceed unit production goals, and considerable progress has been made on the committee's previous recommendations. This sets a firm platform for the committee to make the following recommendations to continue to optimize the impact of these resources and set up the region to continue to address pressing regional housing needs.

- **Funding coordination and alignment:** 20 projects (1,577 units) have received a commitment of Metro bond funds and are still in the pre-construction stage. These projects continue to face challenges due to unprecedented cost escalation and statewide shifts necessary to address private activity bond constraints, presenting significant risks to reaching construction start. Metro should continue to work with funding and development partners to ensure that projects have the flexibility and support they need to navigate funding gaps or other barriers. Metro should continue to coordinate with Oregon Housing and Community Services and jurisdictional partners on funding processes and alignment to provide predictability and certainty for developers, ensure that funding and underwriting standards are responsive to their needs, and prioritize deeply affordable and permanent supportive housing units.
- **Affordable housing operations:** While the bond program is exceeding its housing production goals and demonstrating strong outcomes for racial equity in construction and initial marketing, the ongoing stability of residents – and the organizations that own and operate the housing – will be the long-term measure of success for this program. Affordable housing owners and operators face new challenges navigating rising operating costs and supporting property management and operational practices that are responsive to the needs of residents. Metro should conduct an analysis and convene stakeholders to evaluate needs/gaps and identify opportunities to support property management and operational practices that will ensure long-term stewardship of the community assets created through this investment program.

- **Plan for the future:** Metro should continue working with partners and stakeholders to develop plans to ensure the region can address its affordable housing needs into the future. This includes planning for continued funding for affordable housing, coordination of local strategies to eliminate barriers to affordable housing production in alignment with State Land Use Goal 10, and planning for the intentional integration and alignment of Metro's capital and supportive housing services funds. This work is necessary to ensure that we are maximizing the impact of these combined investments in addressing our region's housing and homelessness crisis.

The Portland region should be proud that we are addressing the national issues of affordable housing and homelessness with an active approach that centers racial equity. This bond continues to be successful and will exceed the commitments made to voters. We have an opportunity to build upon this work and expand its impact. We would like to applaud Metro and jurisdictional partner staff for their continued dedication, and we are honored to have the opportunity to provide oversight for this important program for our region.

INTRODUCTION

Across greater Portland, communities continue to struggle with having enough affordable housing to meet everyone's needs. According to the most recent data from the National Low-Income Housing Coalition, the Portland region is short about 81,000 homes for households making 50% or less of the area median income ($56,400 for a household of four).[1]

This shortage has resulted in a housing crisis that puts households with low incomes at risk of housing instability and homelessness. Populations with additional barriers to housing have been hit particularly hard. These groups include people of color, immigrants, veterans, people with disabilities, older adults and families.

On November 6, 2018, voters took action to address the region's housing crisis, passing the nation's first regional affordable housing bond. The voter-approved bond generates $652.8 million in funding, with the goal of building 3,900 affordable homes to house about 12,000 people. Since voter approval, Metro and partners in community, government and business have worked together to deliver the results sought by voters.

This report provides an update on implementation progress for the Metro affordable housing bond. The report summarizes bond implementation through December 2023, building upon and aggregating information provided in progress reports from seven local implementing partner jurisdictions plus Metro's site acquisition program. The report includes:

- A summary of local and regional progress toward unit production targets, funding commitments and expenditures
- Analysis of progress to advance racial equity through geographic distribution of investments, commitments for equitable contracting and hiring, low-barrier screening, affirmative marketing and strategies to provide ongoing services to meet the needs of residents
- Activities and outcomes for community engagement to ensure that feedback from communities of color and other priority groups meaningfully shapes project outcomes to meet their needs
- Financial analysis of the current portfolio to analyze efficient use of subsidy and alignment with leveraged funds to maximize the benefits of these investments.

[1] Data are for the Portland-Vancouver-Hillsboro Metropolitan Statistical Area.

BACKGROUND

When Metro Council referred the 2018 bond to voters, it adopted an implementation framework developed through months of engagement with partners and community members. The framework continues to guide implementation today.

Core values

The framework includes four core values:

1. **Lead with racial equity.** Ensure that racial equity considerations guide and are integrated throughout all aspects of implementation, including community engagement, project location, inclusive workforce, tenant marketing and screening, and resident and/or supportive services strategies.
2. **Create opportunity for those in need.** Ensure that program investments serve people currently left behind in the region's housing market, especially communities of color, families with children and multiple generations, people with disabilities, seniors, veterans, households experiencing or at risk of homelessness and households at risk of displacement.
3. **Create opportunity throughout the region.** Ensure that investments are distributed across the region to: a) expand affordable housing options in neighborhoods that have not historically included sufficient supply of affordable homes, b) increase access to transportation, employment, education, nutrition, parks and natural areas, and c) help prevent displacement in changing neighborhoods where communities of color live today.
4. **Ensure long-term benefits and good use of public dollars.** Provide for community oversight to ensure transparency and accountability in program activities and outcomes. Ensure financially sound investments in affordable, high-quality homes. Allow flexibility and efficiency to respond to local needs and opportunities, and to create immediate affordable housing opportunities for those in need.

Leading with racial equity

Because people of color have been and continue to be among those most harmed by housing discrimination and lack of access to safe, stable, affordable homes, the Metro Council directed the housing bond program to lead with racial equity in all aspects of the program. Explicitly focusing policies and investments to benefit communities of color can reduce racial disparities while benefiting the whole community.

The housing bond program partially addresses these barriers through its ambitious goals for family-size and deeply affordable homes. The program also prioritizes racial equity throughout implementation – from community engagement that informs projects, to the geographic distribution of investments, to creating economic opportunity with the development of affordable housing, to strategies for reducing barriers to access and promoting culturally responsive services to meet the needs of future residents.

Implementation partner jurisdictions

Metro works to deliver the housing bond program in close partnership with seven local implementation partners: the cities of Beaverton, Gresham, Hillsboro and Portland; Clackamas and Washington counties; and Home Forward, as the implementation partner for east Multnomah County. In recognition of the unique knowledge, experience and opportunities in communities across the region, each partner has developed its own implementation strategy to meet local needs while serving the bond's regional goals. Jurisdictions are responsible for administering funds to invest in property acquisition and eligible development projects. Some projects are being developed and operated by public housing authorities, but the majority are public-private partnerships with third-party affordable housing developers, owners and property managers.

Metro is responsible for providing oversight and accountability, including reviewing each proposed investment at concept and final stages to ensure alignment with program requirements and contribution to the production outcomes promised to voters. In addition, Metro directly invests housing bond funds through its site acquisition program, which strategically acquires and invests in the development of promising sites for affordable housing in collaboration with local implementation partners.

Work plan and local implementation strategies

In 2019, the Metro Council adopted a housing bond work plan to provide operational guidance for program administration activities including roles and responsibilities, funding allocation and eligibility criteria, and processes for funding approvals. In accordance with requirements set forth in the work plan, each implementing partner created a local implementation strategy informed by community engagement. Each strategy includes a development plan to achieve the local share of unit production goals and commitments for advancing racial equity and ensuring community engagement input informs projects.

Community Oversight Committee

Independent community oversight is a hallmark of accountability to voters and the community. The Metro Council appointed a Housing Bond Community Oversight

Committee in January 2019 to provide independent and transparent oversight of implementation, including evaluating local implementation strategies for consistency with program goals and guiding principles, monitoring investment outcomes and providing an annual report to the Metro Council.

Throughout 2019, the committee reviewed and recommended local partners' implementation strategies for approval by Metro Council. During this time, the committee also identified considerations for ongoing monitoring and evaluation. In 2020, the committee monitored early implementation. Beginning in 2021, the committee submitted annual reports to Metro Council. The most recent annual report, released in 2023, recommended convening stakeholders to regionalize best practices, focusing on systemic integration, and evaluating the bond's impact to support planning for the future (*Exhibit G*).

Funding requirements and intergovernmental agreements

The Metro Council approved local implementation strategies as part of intergovernmental agreements with each implementation partner describing the terms and conditions for using bond funds for eligible investments and program administration. Intergovernmental agreements include these provisions:

- All projects selected for bond funding must demonstrate contribution to unit production targets and consistency with approved local implementation strategies as confirmed through Metro staff review at the concept endorsement and final approval stages.
- All funded projects will have a regulatory agreement ensuring long-term affordability and monitoring obligations for a term of at least 60 years (or 30 years for acquired buildings that are more than 10 years old).
- Implementing jurisdictions will submit annual progress reports to Metro, to support the oversight committee's annual progress review.
- Metro will disburse administrative funding to implementation partners annually based on a schedule established in the intergovernmental agreement. One exception is City of Portland, which will have its administrative share included in project funding, to be reimbursed to the City through a "project delivery fee."
- Implementing jurisdictions will submit annual end-of-fiscal-year reports to Metro summarizing direct project expenditures and program administrative expenditures, the latter of which is subject to the 5% administrative cap included in the housing bond measure.

The community oversight committee completed its review and recommendation of local implementation strategies between July 2019 and February 2020, and Metro Council approved strategies as part of intergovernmental agreements. Six intergovernmental agreements were executed between November 2019 and August

2020. The intergovernmental agreement for Home Forward was approved in March 2021 due to the relatively small funding allocation in Multnomah County outside the cities of Portland and Gresham.

Funding allocation

The housing bond framework called for funding to be allocated region-wide based on assessed value of property in each of the three counties and set a 5% cap on administrative funding across the program.

As of December 2023, the housing bond work plan allocated $662,001,105 for investments in property acquisition and development, to be allocated as follows:

- Ten percent of original project allocation ($62,016,000) allocated for investment through Metro's site acquisition program, which acquires regionally significant sites and supports their development in coordination with local implementing jurisdictions.
- All remaining funds ($599,985,105) allocated to support local implementation, with distribution on the basis of share of assessed property value to achieve a proportionate distribution of investments across the region (45% in Multnomah County, 34% in Washington County and 21% in Clackamas County).

This includes additional funding generated through bond sale premiums and interest earnings, which has been allocated toward investments in air conditioning, permanent supportive housing, and additional project and administration costs in alignment with Metro Council direction. Current funding availability and adjusted allocations are shown in *Exhibit F*.

The bond measure included an administrative funding cap of 5% of total bond proceeds. Including interest earnings through December 2023, $34,842,163 is available for administrative costs. Of these funds, $19,409,319 is directed to Metro's regional oversight and accountability functions, and $12,803,823 is allocated for the administrative costs of implementing partners and Metro's site acquisition program.[2] The remaining $2,629,021 within the 5% cap is reserved for future allocation.

The administrative activities for the bond program are expected to span fiscal years 2019-2028. Averaged over that 10-year period, the program has a total of $3,484,216 per year in administrative funding for all implementation and oversight activities of Metro and its local implementation partners combined. This funding is insufficient to cover the full administrative costs of implementation, a

[2] Portland does not receive an allocation for administrative costs as Portland uses a Program Delivery Fee, not paid for by Metro's affordable housing bond, to cover administrative expenses.

challenge which has led to capacity gaps and the need for supplemental administrative funding from Metro and other funding sources.

Targets and metrics

From 2019 through 2020, Metro engaged implementation partners, stakeholders, practitioners and the community oversight committee to further define metrics for evaluating progress toward goals and targets in the measure.

The implementation framework established the following goals for the program:

- Create 3,900 affordable homes.
    - Reserve 1,600 homes for people with very low incomes (30% or less of area median income).
    - Build half of the homes with two or more bedrooms – big enough to accommodate families.
    - Up to 10% of homes may be moderately affordable for people with below average incomes (61-80% of area median income).
- Distribute investments across the region to create 21% of homes in Clackamas County, 34% in Washington County and 45% in Multnomah County.
- No more than 5% of total funding may be spent on program administration activities.
- At least 20% of construction contracts for each project should be awarded to state certified minority- or women-owned and emerging small business (MWESB) firms, and jurisdictions should demonstrate progress toward increasing equitable contracting outcomes over time.

Metro defined additional metrics to further operationalize the values and goals in the framework and support program evaluation. These metrics relate to the following areas:

- Community engagement outcomes, including demographics of participants and how feedback changed processes and projects
- Location outcomes related to access, fair housing and community stabilization
- Outreach to MWESB/COBID (Certification Office for Business Inclusion and Diversity) certified firms
- Construction workforce diversity
- Affirmative marketing activities and outcomes (e.g., referral sources)
- Screening and lease-up outcomes (e.g., application denials)
- People served and resident diversity
- Efficient use of subsidy.

It is important to note that many metrics will not be reported until after projects reach completion (e.g., contracting/workforce outcomes) and lease-up (e.g., marketing/lease-up outcomes, resident demographics). The first post-completion outcomes were reported in December 2022.

Metro supportive housing services fund

In May 2020, voters in greater Portland approved a new regional tax to fund supportive housing services, an unprecedented effort to direct funding toward investments in rental assistance and supportive services for people experiencing or at risk of homelessness. The fund aims to stabilize 5,000 households experiencing prolonged homelessness with complex disabilities and 10,000 households experiencing short-term homelessness or at risk of homelessness. Implementation is guided by a commitment to lead with racial equity, with community-informed strategies, goals and outcome metrics.

The supportive housing services fund presents an opportunity to integrate rental assistance and supportive services funding with the bond program's capital investments to maximize the ability of both programs to serve households experiencing or at risk of homelessness, with a particular focus on providing permanent supportive housing. Integration of supportive housing services funding with bond investments also enables the bond program to further advance its racial equity commitments.

2023 POLICY EFFORTS

In June 2023, the Housing Bond Oversight Committee presented recommendations to the Metro Council designed to maximize the impact of housing bond resources and equip the region to plan for the future. The committee noted that Metro's strong stewardship of the housing bond made it possible to start thinking about long-range and big-picture planning.

The committee's recommendations focused on regionalizing best practices, strengthening system alignment and integration, and conducting analysis and planning for the future. Fully responding to these recommendations will take ongoing coordination with jurisdictional partners and housing providers to improve and align practices, policies and systems and to invest in capacity and technical assistance needs across a range of areas related to affordable housing funding, construction and operations. Key policy and program refinement work undertaken in 2023 in response to the recommendations is summarized below.

Convening stakeholders to regionalize best practices

- **Post-occupancy reporting**: In 2023, Metro worked with partners and stakeholders to improve post-occupancy reporting on marketing, screening and demographic data. The updated reporting templates resulted in more comprehensive and accurate data on occupancy outcomes for bond-funded projects that completed lease up in 2023. Among the improvements, projects consistently reported on data at the occupant level rather than just the household level, which was an issue for previous reporting.
- **Affordable homeownership standards**: Metro reviewed and approved four affordable homeownership developments for bond funding in 2023. To support the inclusion of homeownership projects in the bond portfolio, Metro worked with jurisdictions and development partners to create regional standards, including templates for affordability covenants. Established local partners Habitat for Humanity and Proud Ground provided support with this work.
- **Tri-County Planning Body**: The Tri-County Planning Body (TCPB), which develops regional strategies to support implementation of Metro's supportive housing services fund, identified six regional goals in 2023 that will guide regional investment priorities to address homelessness. These goals focus on coordinated entry, regional landlord recruitment, healthcare systems alignment, training, technical assistance, and employee recruitment and retention. The TCPB's first implementation plan focuses on increasing the availability of readily accessible and appropriate housing units to support housing placements.
- **Regional training and technical assistance**: Metro is building a regional capacity team charged with developing technical assistance and training programs to support the capacity of housing and homeless service providers.

The team is leading a cooperative regional procurement process to expand the number and types of consultants available to partner with Metro and jurisdictions to provide technical assistance and capacity building support. The team will also work with partners to develop a series of regional capacity building trainings and support programs.

Strengthening system integration and alignment

- **Permanent supportive housing pilot funding**: In fall 2022, Metro earmarked $20 million in unallocated bond interest earnings to support additional investments in expanding permanent supportive housing (PSH). These investments are aligned with supportive housing services (SHS) funding commitments for ongoing rental assistance and wraparound services tailored to meet the needs of individuals and families experiencing long-term homelessness. Funding was proportionately allocated to the three counties as administrators of SHS funding. In 2023, Clackamas County directed its $4.2 million allocation to support funding for 20 additional PSH units. Multnomah County, with an allocation of $9.1 million, is working with Portland Housing Bureau and has released a notice of funding available to solicit projects via a competitive process; the County will submit PSH projects to Metro for initial concept endorsement review in summer 2024. Washington County, with an allocation of $6.7 million, is continuing to explore options to commit the PSH pilot funding to acquisition or new construction projects.
- **Permanent supportive housing systems alignment**: In 2023, Metro strengthened its commitment to PSH by dedicating staff capacity to support regional PSH coordination and alignment. Initial work is focused on supporting jurisdictional partners to align housing bond and SHS resources and identifying opportunities for regional definitions, quality standards, financial planning, and training and technical assistance needs. To date, the work has included the development of a financial planning tool, identification of potential regional definitions, and planning for an engagement strategy to gather input from key stakeholders that will inform recommendations for improving service and resource levels to meet growing project and tenant needs.
- **State and federal resources:** Metro staff continued work with Oregon Housing and Community Services (OHCS) to advance strategies for state and local funding alignment. Metro staff participated in an OHCS affordable rental housing engagement series focused on creating a coordinated funding process for available OHCS resources. Staff provided feedback regarding funding allocations to the Metro region and shared information about funding needs and gaps for upcoming projects in the Metro bond pipeline. The availability of private activity bonds continues to be an issue statewide. Metro is coordinating with a coalition of partners across the state to advocate for federal legislative changes that would increase access to private activity bonds.

Analysis and planning for the future

- **Exploration of future funding options**: With Metro housing bond funding soon coming to an end, Metro Council laid the groundwork for a community conversation to explore how the region can continue to work together to create affordable homes as well as provide services that keep people housed. This conversation will inform a potential recommendation by the Metro chief operating officer to the Metro Council in late spring 2024, including a possible new funding proposal for voters' consideration. A stakeholder advisory table was convened in early 2024 that will help shape the recommendations.
- **Integration and alignment of Metro funding**: Metro expanded its staffing capacity to support programmatic integration and regional policy alignment of Metro's housing bond and supportive housing services fund – work that is critical to the region's ability to deliver on the commitments in these funding measures. The team is in the early stages of launching several bodies of research, analysis and engagement to support development of regional frameworks for permanent supportive housing, affordable housing production and asset management of existing housing funded by the bond.

UNIT PRODUCTION PROGRESS

The housing bond program is on track to exceed the goal of creating 3,900 affordable homes, including 1,950 family-size homes and 1,600 homes regulated for affordability to households making 30% of area median income or below.

As of December 2023, the program had committed funding to 52 projects representing 4,361 new affordable homes, including:

- 16 projects (1,410 units) that have completed construction
- 16 projects (1,374 units) that are under construction
- 20 projects (1,577 units) that are in pre-construction

Of these homes:

- 2,233 will have two or more bedrooms, representing 115% of the program's production goal of 1,950 family-size homes.
- 1,635 will be affordable to households with incomes at or below 30% of area median income (AMI)[3], representing 102% of the program's production goal of 1,600 deeply affordable homes.

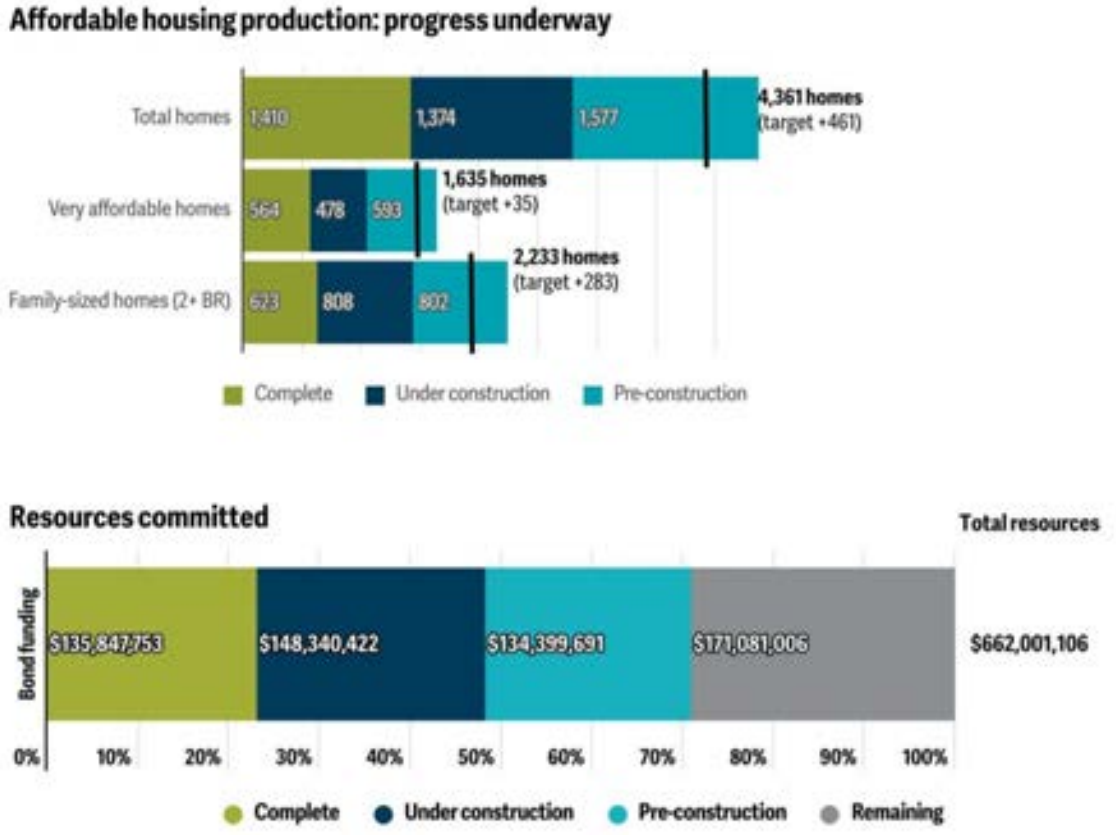
The 4,361 homes in the current portfolio will provide affordable housing for an estimated 8,000 to 14,000 people (detailed occupancy estimates are available in *Exhibit A*).

By December 2023, 1,443 of these occupants had moved into their new homes in the first 10 projects to complete lease-up, located across the region in Beaverton, Forest Grove, Gladstone, Gresham, Happy Valley, Portland and Tigard.

The current portfolio's 4,361 affordable homes represent 112% of the bond program's total production target. Figure 4.1 shows regional progress toward production goals relative to funding committed. About 74% of total bond resources have been encumbered to fund the 4,361 homes already in progress. Plans are in place that will commit nearly all remaining bond resources to projects in 2024 with all funds committed in 2025.

[3] In the Portland metropolitan area, 30% of area median income in 2023 was an annual income of $23,700 for a household with one person and $33,840 for a household with four people.

Figure 4.1 Regional progress toward production goals relative to funding committed



While the program is currently tracking ahead on unit production relative to funding committed, changes in the funding and financial landscape present significant challenges.

The production goals for the affordable housing bond were established based on modeling that reflected conditions and projections in 2018. Favorable tax credit pricing and low interest rates, as well as swift action by implementing partners, enabled the program to exceed expectations in early phases of implementation. Staff expected that market cost escalation would impact costs and subsidy needs throughout the course of the implementation timeframe (2019-2026), but the past three years have brought unprecedented cost escalation due to broader economic factors impacting the cost and availability of materials and labor. Ongoing impacts of the COVID-19 pandemic have created a construction cost premium for wood-framed projects with slab-on-grade foundations that is estimated at 8%-12% above that which would have occurred with standard, pre-COVID construction cost escalation. Inflation and interest rate increases since early 2022 have further impacted costs, with the Portland Housing Bureau reporting an average 1% increase in construction "hard" costs per month for projects in its pipeline.

In addition, the state of Oregon faces new funding constraints as a result of oversubscription of private activity bonds, necessary for financing 4% low income housing tax credits, which represent the largest source of leveraged funding across

the portfolio. Limitations in tax credit availability create uncertainty across the state's affordable housing development pipeline and subject projects to funding delays, resulting in higher cumulative cost escalation.

These challenges have contributed to significant increases in housing production costs. Across the bond-funded portfolio, the weighted average total project cost per unit was $447,053 in 2023 compared with $387,283 in 2022. Analysis of more recent projects in the portfolio indicates that project costs are trending toward a weighted average of $508,188 per unit.

Due to these increases, many projects are requiring higher Metro bond subsidy amounts. The average Metro bond subsidy for a typical project in the portfolio is $106,456 per unit, but for more recent projects the average is trending toward $148,766 per unit. (This analysis excludes outliers, such as projects using Metro bond subsidy to fill a small gap and projects relying on unusually high levels of bond funding.)

Local production progress

As of December 2023, five of the seven implementing jurisdictions had already met or exceeded their local share of the bond's production goal:

- **Beaverton's** portfolio achieved 100% of its unit goal, 69% of its goal for 30% AMI units and 100% of its goal for family-size units, with 98% of funding committed.
- **Clackamas County's** portfolio achieved 119% of its unit goal, 124% of its goal for 30% AMI units and 138% of its goal for family-size units, with 90% of funding committed.
- **Gresham's** portfolio achieved 158% of its unit goal, 100% of its goal for 30% AMI units and 147% of its goal for family-size units, with 78% of funding committed.
- **Portland's** portfolio achieved 104% of its unit goal, 90% of its goal for 30% AMI units and 103% of its goal for family-size units, with 75% of funding committed.
- **Washington County's** portfolio achieved 107% of its unit goal, 102% of its goal for 30% AMI units and 108% of its goal for family-size units, with 97% of funding committed.

Hillsboro's portfolio achieved 76% of its unit goal, 77% of its goal for 30% AMI units and 106% of its goal for family-size units, with 67% of funding committed. Planning is underway for a final project that will utilize the remaining funding to meet the city's production targets.

Home Forward achieved 85% of its unit goal for east Multnomah County, 85% of its goal for 30% AMI units and 85% of its goal for family-size units. It will not be

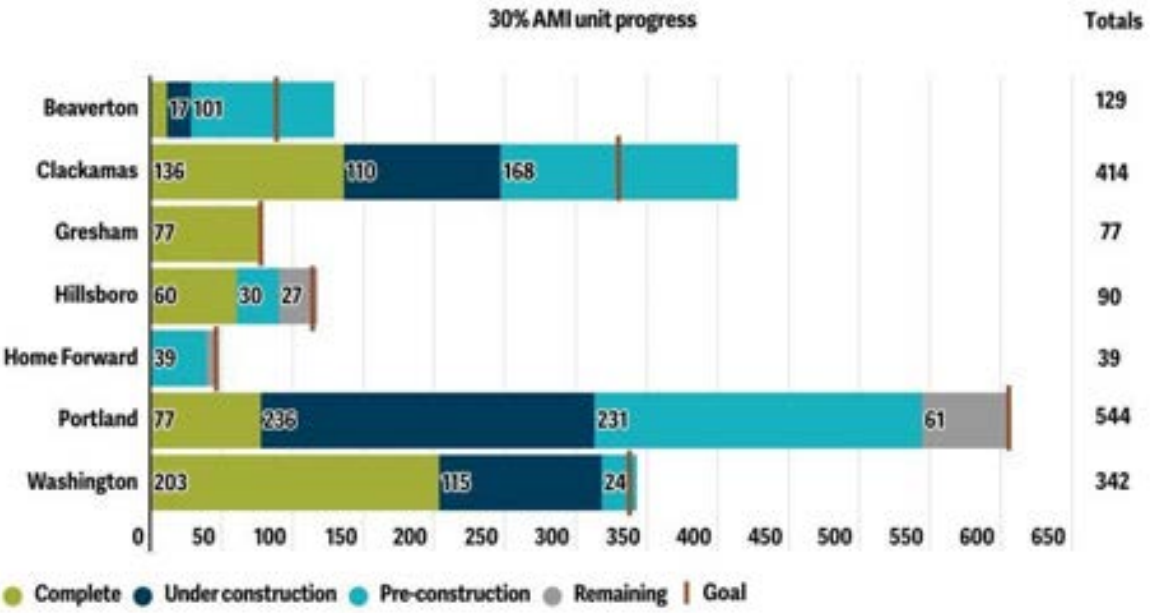
able to add more units because it is using bond funding for a single project that has encountered challenges with parking requirements and land use approvals. However, any shortfall will be offset by the units produced by other jurisdictions.

Local progress toward the total, family-size and very affordable units goals is shown in Figures 4.2-4.4. Details about local implementation partners' plans for remaining funds are included in their local progress reports, posted on the bond program's webpage.

Figure 4.2 Local progress toward total unit production goals

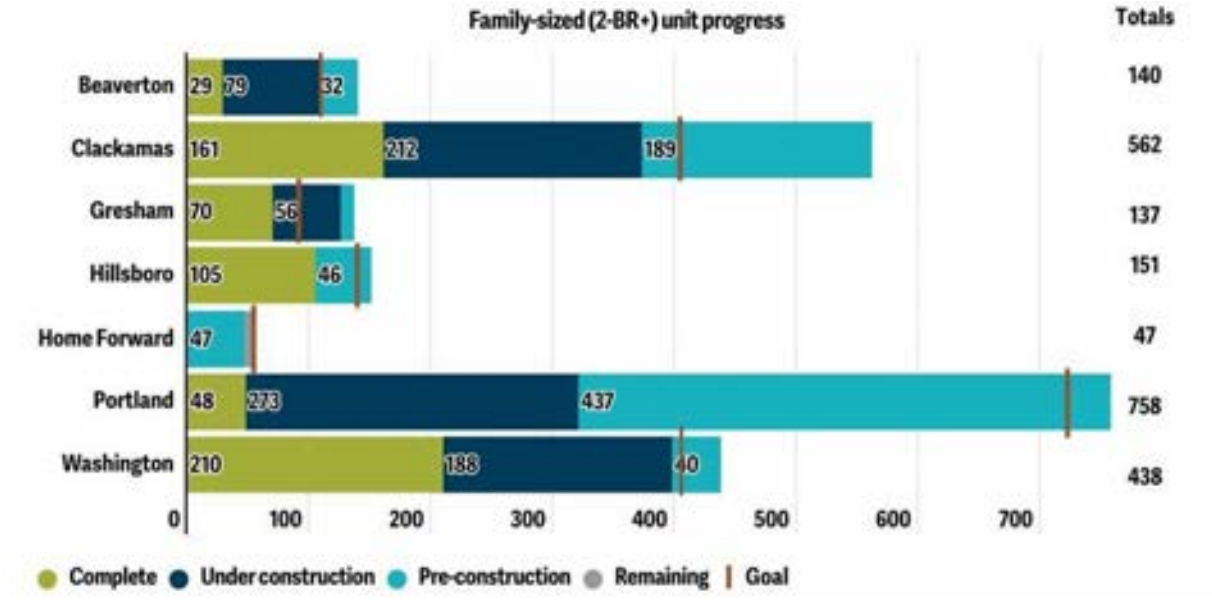
Implementation partners are on track to meet overall targets for very affordable (30% AMI or below) units, with funding committed to 1,635 units currently planned to serve households with incomes at or below 30% AMI (102% of the regional goal for very affordable units). As anticipated, the targets for very affordable units have been particularly challenging to achieve. These units require additional subsidy because their rental income is lower and their operating expenses can be higher, creating operating funding gaps and limiting projects' ability to carry debt. Additionally, buildings serving households with very low incomes often require investment in ongoing services that are beyond the scope of traditional real estate related operating expenses.

Figure 4.3 Local progress toward 30% AMI unit production goals



Implementation partners are also on track to exceed the overall 1,950 goal for homes with two or more bedrooms, with funding committed to 2,233 family-size units in the portfolio (115% of the target for family-size homes). Of the family-size homes in the portfolio, 30% are regulated for affordability at 30% AMI or below and 31% are larger unit sizes with three or more bedrooms.

Figure 4.4 Local progress toward family-size production goals



The bond program limits the number of homes provided for households making 61%- 80% AMI to 10% of overall units. To date, 108 of the bond-funded units (less than 3%) are affordable to households making 61%-80% AMI. This includes 22 units located in the Scholls Ferry project, 32 units in the

Wilsonville Transit Oriented Development project and 54 units in the portfolio's homeownership projects – Abbey Townhomes, Carey Boulevard, Oak Row and Shortstack Milwaukie. Flexibility to allow these more moderately affordable units in bond-funded developments was an intentional policy choice intended to support cross-subsidization of deeply affordable units. This is particularly important given that many of the bond portfolio's very affordable (30% AMI or below) units do not include long-term rental assistance.

Metro site acquisition program

Metro's site acquisition program (SAP) manages implementation of 10% of total bond funds toward investments in property acquisition as well as development of sites already controlled by Metro. Development is facilitated through joint solicitations with implementing jurisdictions, and properties are transferred from Metro to a long-term owner prior to development. The site acquisition program aims to proportionately invest funds in implementing jurisdictions to contribute toward local production goals; funds remaining after acquisition support the development of the site. In most cases, projects developed on Metro-acquired properties require additional development funding from an implementing jurisdiction's bond allocation.

As of December 2023, the program had reserved 100% of SAP funds for sites in all seven implementing jurisdictions. SAP acquires property in areas with strong access to amenities important to households with low incomes such as transit, grocery stores, parks and elementary schools, and in areas with limited existing regulated affordable housing. The program prioritizes deep stakeholder engagement to set priorities for the development of its sites. By acquiring and competitively offering high-quality development sites, SAP brings regulated affordable housing to communities where affordable housing developers have not been able to secure property and is able to attract proposals from a wide range of developers, not just those that control properties within the implementing jurisdiction.

Figure 4.5 Site acquisition program resources reserved per jurisdiction

Jurisdiction	Total SAP allocation	SAP funds reserved: For due diligence and site acquisition	SAP funds reserved: For development of Metro owned sites	SAP funds reserved: Total reserved	SAP funds reserved: Percent reserved	Notes
Beaverton	$3,460,066	$0	$3,460,066	$3,460,066	100%	All funds invested in previous Metro TOD program property purchased at Elmonica Station; developer: REACH CDC; construction start: late 2024
Clackamas	$12,909,788	$2,621,532	$10,288,256	$12,909,788	100%	Metro SAP program acquired Boone's Ferry Road site in Lake Oswego's Lake Grove neighborhood; developer: Hacienda CDC; construction start: spring 2025

Gresham	$2,972,999	$18,744	$2,954,255	$2,972,999	100%	All funds committed to previous Metro TOD program property purchased at northeast portion of Gresham Civic Station; developer: Home Forward; construction start: early 2025
Hillsboro	$4,517,453	$2,695,267	$1,822,186	$4,517,453	100%	Metro SAP program acquired Walker Road site in Hillsboro's Tanasbourne neighborhood; developer: Hacienda CDC; construction start: summer 2024
Home Forward	$1,764,347	$0	$1,764,347	$1,764,347	100%	Project acquired and developed by Home Forward; construction start: summer 2024
Portland	$23,450,731	$4,618,725	$18,832,006	$23,450,731	100%	All funds committed to development of two sites: Glisan Landing (TOD-purchased site); developer: Related NW; construction complete: late 2024. Barbur Portland Value Inn (SAP-funded acquisition); developer: Community Partners for Affordable Housing in partnership with HAKI Community Organization and Urban League; construction start: spring 2025
Washington	$12,940,615	$3,085,407	$9,855,208	$12,940,615	100%	Metro purchased property at 209th and TV Highway in Aloha-Reedville; developer: Housing Authority of Washington County; construction start: fall 2025
Totals	**$62,015,999**	**$13,039,675**	**$48,976,324**	**$62,015,999**	**100%**	

Affordable homeownership

In 2023, Metro worked with jurisdictions to add four developments to the bond portfolio that will offer affordable homeownership to 87 households: Abbey Townhomes in Northeast Portland, Carey Boulevard in North Portland, Shortstack Milwaukie in Milwaukie's Ardenwald neighborhood and Oak Row at Rockwood Townhomes in Gresham. The projects will use a community land trust model in partnership with Proud Ground to provide permanent affordability that will benefit multiple generations of future owners through a shared equity model. Total funding for the four projects combined is about $10 million, or roughly 2% of total bond funds. The projects will expand access to homeownership, particularly for communities of color who have been intentionally excluded from opportunities to build intergenerational wealth due to racist policies like redlining and restrictive covenants.

Pipeline forecasting

Implementation partners are actively working on funding solicitations and plans to commit remaining funds. Nearly all remaining funds are expected to be committed in 2024 with final projects currently expected to break ground by 2026.

Figure 4.6 shows the anticipated timeline for disbursement of remaining funds and completion of remaining units. In 2024 and 2025, annual disbursements are expected in the range of $105-$143 million. The final disbursements of approximately $102 million are expected in 2026. Projects typically take 39 to 47 months from solicitation and pre-development through construction and lease-up. Most remaining units are expected to be complete by 2027 with the final 53 units reaching completion in 2028 or 2029.

Figure 4.6 Forecasted timeline for remaining disbursements and unit completion

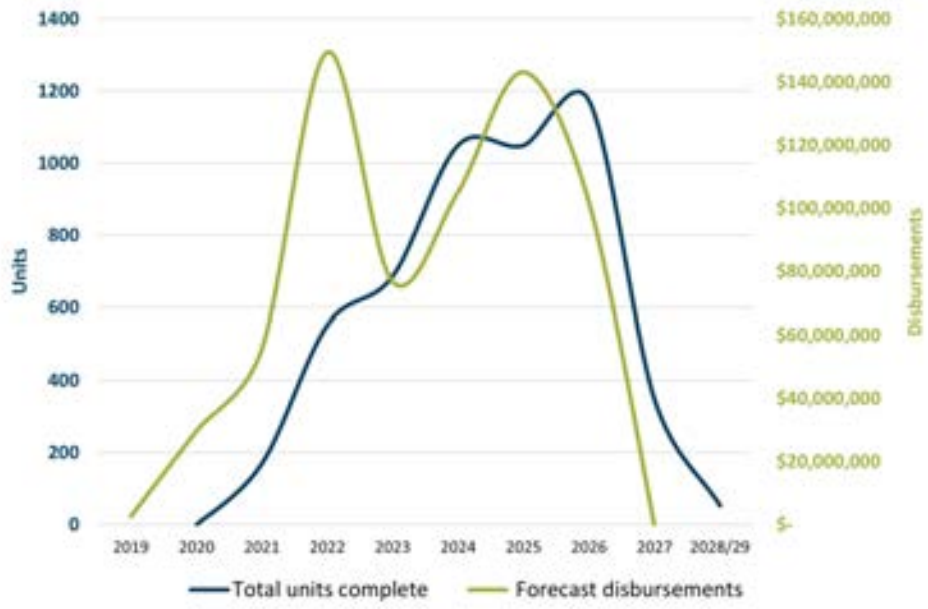


Figure 4.7 shows expected outcomes when accounting for all remaining funds. **The bond program is projected to achieve at least 120% of its original production target once all funds are expended, with an estimated total production of 4,700 units that will provide housing for 9,000 to 15,000 people.** These projections are based on conservative assumptions about cost escalation and delays due to private activity bond availability.

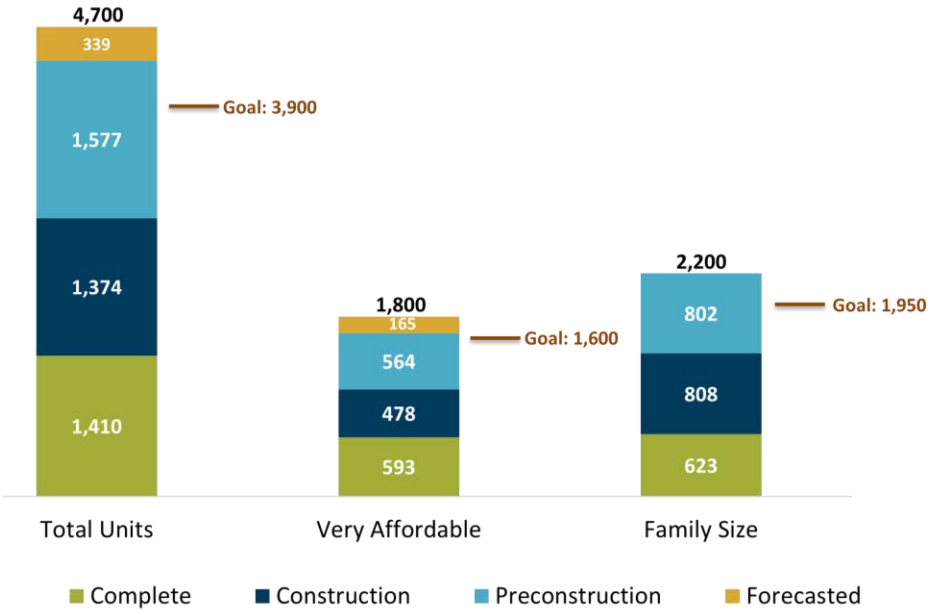
Figure 4.7 Forecasted production outcomes



ADVANCING RACIAL EQUITY THROUGH PROJECT LOCATION

Metro's bond work plan required local implementation partners to develop a project location strategy that considers geographic distribution of housing investments, access to opportunity, strategies to address racial segregation, and strategies to prevent displacement and stabilize communities.

Metro analyzes project locations to assess how they are distributed and how they support goals for advancing access to opportunity and racial equity. Each implementing jurisdiction's progress report provides additional detail on access to transportation, employment, education, nutrition, parks and natural areas for specific project locations.

Figure 5.1 summarizes the percentages of the total eligible units that meet different location-based characteristics. See *Exhibit B* for a more detailed table. Each metric is described after Figure 5.1, including how it supports the program's core values and how it has been measured for this analysis.

Figure 5.1 Summary of project location metrics

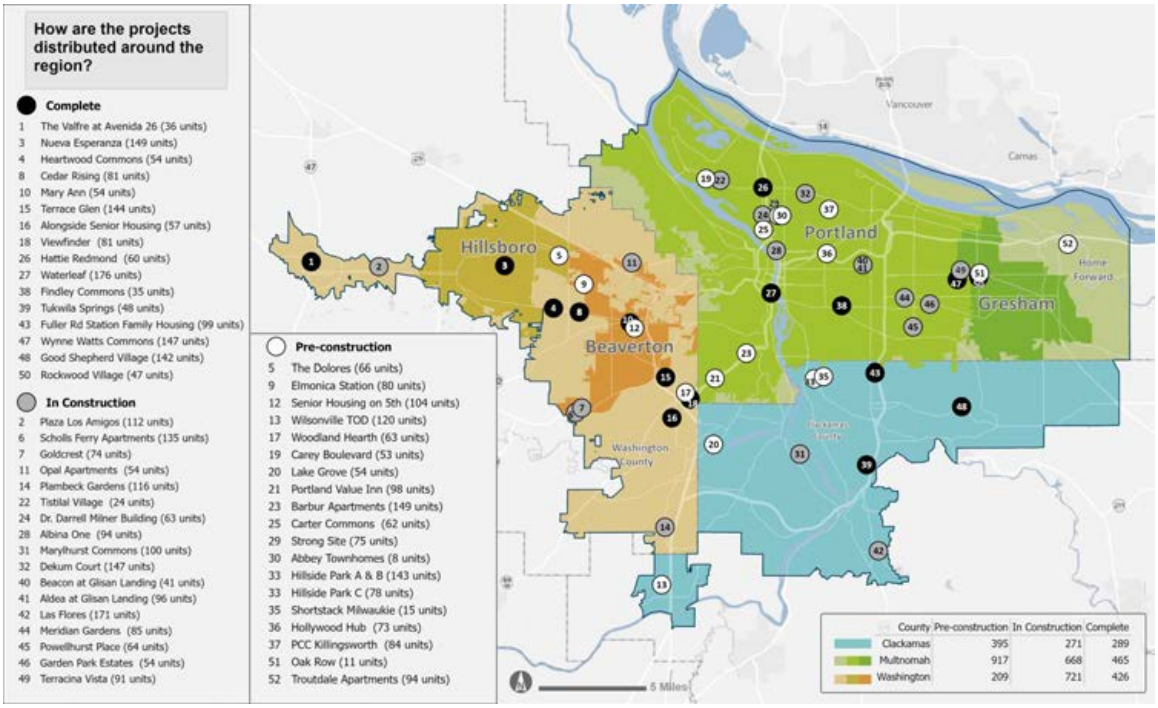
Geographic distribution

The housing bond framework allocates funding to achieve the following distribution of new homes across the region: 45% in Multnomah County, 34% in Washington County and 21% in Clackamas County. This distribution formula was based on the assessed value of property within the portion of each county located in Metro's jurisdictional boundary, and the percentages also tie closely to population distribution. Local implementation strategies include goals for distributing investments across each partner jurisdiction in locations that advance fair housing choices, stabilize communities vulnerable to displacement and expand access to transit, food, jobs and amenities.

Figure 5.2 Affordable housing bond project locations



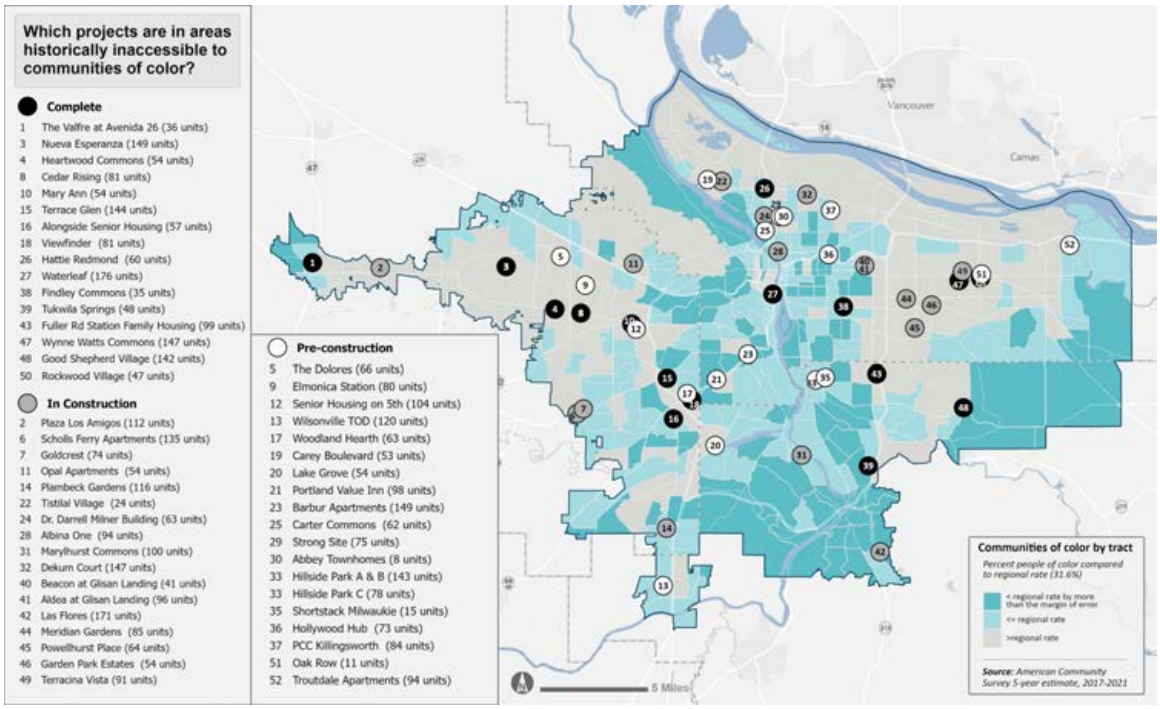
Larger versions of the maps in this section are available in *Exhibit B*.

Advancing fair housing access and reducing segregation

The geographic distribution of affordable homes in the bond portfolio demonstrates strong outcomes for advancing regional fair housing access and reducing segregation. This goal is measured by analyzing the percentage of bond-funded homes located in areas where (a) the population has a lower proportion of people of color than the region and (b) the rate of affordable housing units is lower than the average rate for the region.

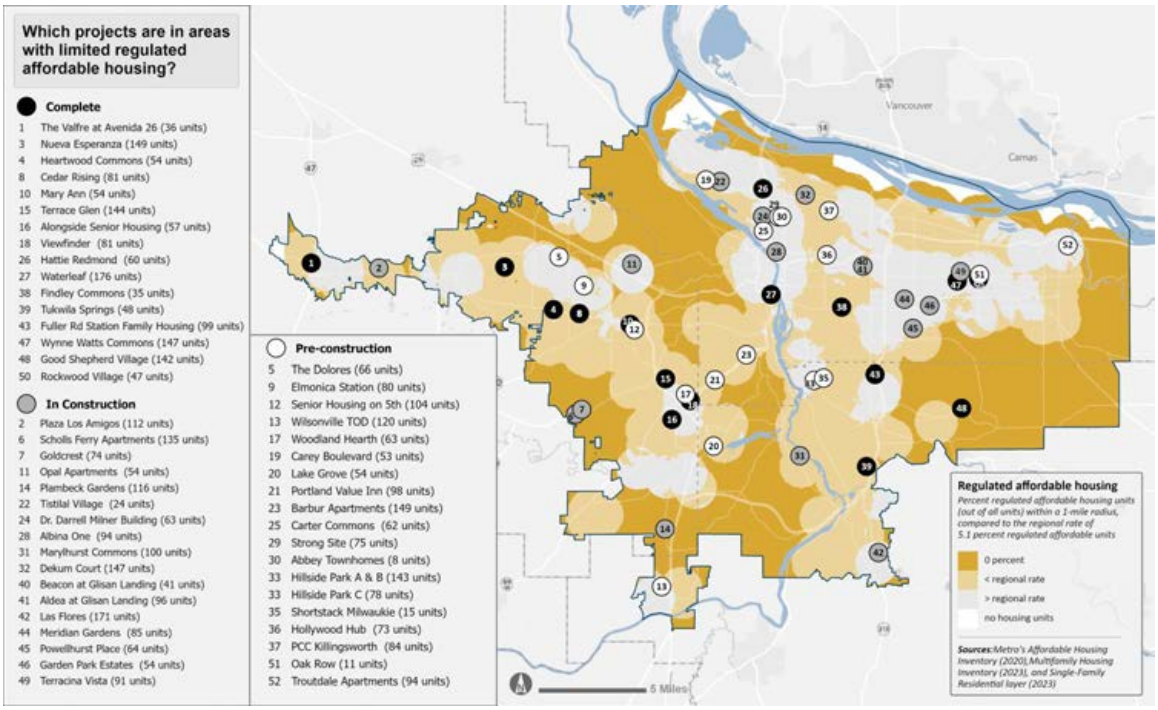
Of the total affordable homes in the current bond portfolio, 42% are in areas historically inaccessible to communities of color, defined as areas where the percentage of people of color is less than or equal to the regional average (based on recent American Community Survey estimates).

Figure 5.3 Projects located in areas that have been inaccessible to communities of color



Of the total affordable homes in the current portfolio, 42% are in areas with limited existing affordable housing, defined as areas where the percentage of regulated affordable housing units (out of all units within a one-mile radius) is lower than the average rate for the region. Four projects, representing 11% of the total units, have no existing regulated affordable housing within a one-mile radius.

Figure 5.4 Project locations relative to existing regulated affordable housing



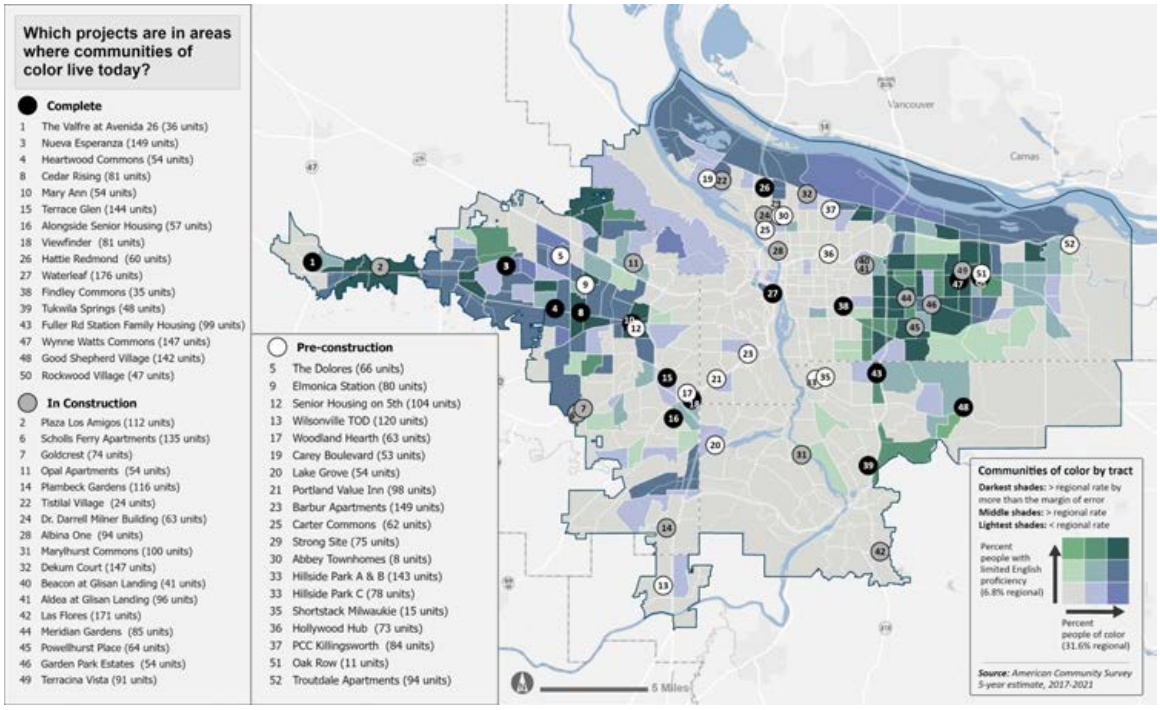
Preventing displacement and stabilizing communities

In addition to supporting investments in places that have historically lacked affordable homes, the housing bond framework also includes a goal of supporting investments in places that stabilize communities at higher risk of displacement. This is measured by identifying which projects are located in areas where the population has a high proportion of people of color and/or people with limited English proficiency (people age five or older who speak English less than "very well"), based on recent American Community Survey estimates. **Of the total affordable homes in the current portfolio, 58% are in areas with higher proportions than the region of people of color and/or people with limited English proficiency.**

Because there are limitations in American Community Survey estimates, the analysis also identifies areas where the percentage of people of color and/or people with limited English proficiency exceeds the regional average by more than the margin of error. These represent areas where there is more certainty of

concentrations of communities of color and people with limited English proficiency: census tracts with up to 61% people of color and up to 27% people with limited English proficiency, compared to regional averages of 32% people of color and 7% people with limited English proficiency. See the detailed table in *Exhibit B* for more information.

Figure 5.5 Projects located in areas where communities of color live today



Access to transit and amenities

Of the total eligible units in the portfolio, 70% are within either ¼ mile of a frequent service bus stop or ½ mile of a MAX station, and 75% are rated with a Walkscore of 50 ("somewhat walkable") or better. The detailed table in *Exhibit B* provides the Walkscore and the distance to the nearest frequent service bus stop or light rail station for each project location.

Many of the projects also have access to a range of amenities including grocery stores, natural areas, schools and jobs. Each implementing jurisdiction's progress report provides additional detail on nearby amenities.

ADVANCING ECONOMIC OPPORTUNITY THROUGH CONSTRUCTION

Economic impact

Metro affordable housing bond investments have had a significant impact on the local economy. Across the region, bond-funded units represented about 15% of multifamily housing construction in 2023. Bond-funded projects have supported an average of 3,286 direct jobs in the construction sector annually. These are living wage jobs, paying an average of $91,000 per year in wages and benefits. Bond investments have also supported jobs in related industries such as insurance, finance, raw materials, architecture and engineering.

Equitable contracting progress

To ensure equitable access to the economic opportunities provided by bond investments, the program aims to direct construction contracts to underrepresented firms. In their local implementation strategies, all implementing partners established a minimum goal of awarding 20% of project contracts to minority- or women- owned and/or emerging small businesses (MWESB) certified by the state Certification Office for Business Inclusion and Diversity (COBID), and the City of Portland committed to a goal of 30% COBID participation. In certain cases, projects have set higher aspirational goals exceeding the jurisdictional minimum.

Metro requires that projects report on contracting outcomes within six months of certificate of occupancy. While most projects have not reached this milestone, 10 projects reached completion in 2022 and 2023 and submitted contracting and workforce outcomes data. Across the 10 projects, **COBID certified firms were paid a combined $50.3 million in contracts, representing 24.9% of total construction costs for those projects.** With these contracts, firms can grow their businesses and create high-paying local jobs, while providing opportunities for workers to learn new skills and further their careers.

Figure 6.1 Summary of equitable contracting goals and outcomes for completed projects

Jurisdiction	Project	Construction costs	COBID contract dollars paid	COBID goal		COBID outcome	
				Hard costs	Soft costs	Hard costs	Soft costs
Beaverton	Mary Ann	$14,389,822	$3,921,179	20%	20%	27.5%	22.6%
Clackamas County	Tukwila Springs	$11,208,808	$2,476,081	20%	20%	21.9%	75.0%

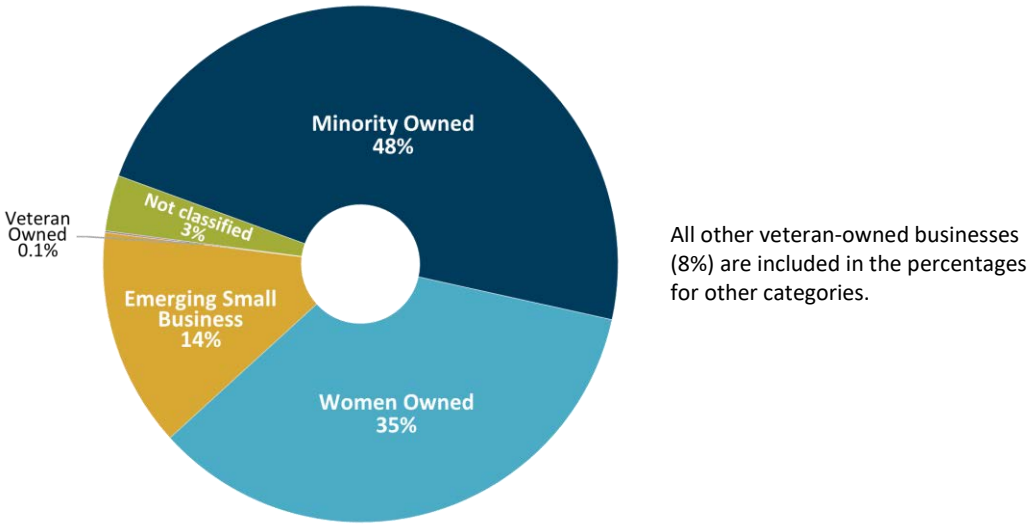
	Terrace Glen	$31,186,415	$9,718,240	20%	20%	31.2%	n/a
Totals		**$202,121,071**	**$50,303,749**	**24.9% of total construction dollars paid to COBID firms**			

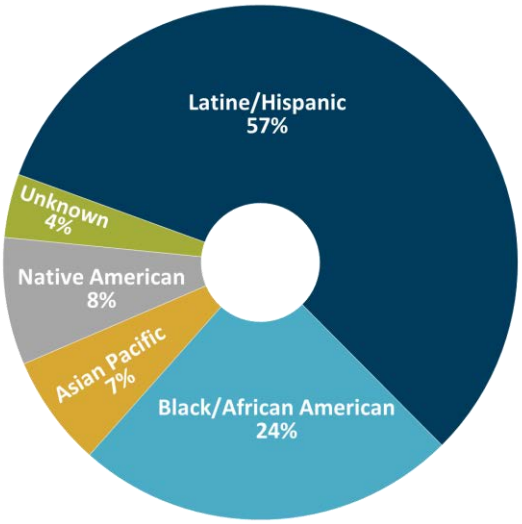
Of the $50.3 million in construction dollars paid to COBID certified firms, 48% went to minority-owned business enterprises (MBE), 35% went to women-owned business enterprises (WBE), 14% went to emerging small businesses (ESB) and 8% went to service-disabled veteran-owned business enterprises (SDVBE). In Figure 6.2, businesses that fell into multiple categories are reported based on the following hierarchy: MBE, WBE, SDVBE and ESB.

Figure 6.2 Payments to COBID certified firms by firm type



Among the minority-owned businesses, 57% were Latine/Hispanic, 24% were Black/African American, 8% were Native American and 7% were Asian Pacific. (The remaining 4% did not provide race/ethnicity data.)

Figure 6.3 Minority-owned businesses by race/ethnicity



Workforce diversity progress

While equitable contracting goals measure participation by smaller firms and those owned by women and people of color, workforce diversity goals aim to track the diversity of workers involved in the construction process. Efforts to support construction workforce diversity are limited in jurisdictions without a history of setting goals or tracking workforce diversity. Currently, no projects located outside Multnomah County have established project-specific goals for workforce diversity. All implementation strategies included, at a minimum, a commitment to explore opportunities to support workforce diversity, and several jurisdictions stated an intention to consider tracking and reporting on workforce diversity if they determined this to be feasible based on contractor and jurisdiction capacity. Additionally, some jurisdictions have taken steps to invest in their own capacity to support tracking through implementing new software. Currently, 37 of 52 projects (71%) have committed to report on workforce diversity outcomes. This data will help to establish a baseline on which future workforce diversity goals could be established.

Metro has developed reporting metrics and templates to support consistent tracking for projects and jurisdictions that are able to report on workforce diversity. Figure 6.4 summarizes the outcomes for the projects that completed construction in 2022 and 2023 and reported on workforce diversity. Some projects that are not yet complete provided preliminary workforce data in their local progress reports.

Figure 6.4 Summary of workforce outcomes for completed projects

Jurisdiction	Project	Workforce goal *% of labor hours worked by:*			Workforce outcomes *% of labor hours worked by:*		
		Apprentices	**POC**	**Women**	**Apprentices**	**POC**	**Women**
Portland	Findley Commons	20%	18%	9%	18.4%	41.9%	<1%
Washington County	Viewfinder	Jurisdiction did not set workforce diversity goals			18.4%	42.3%	2.5%
Beaverton	Mary Ann	Jurisdiction did not set workforce diversity goals			11.8%	41.9%	<1%
Clackamas	Fuller Road Station	Jurisdiction did not set workforce diversity goals			12.7%	61.8%	2.7%

Of the four completed projects tracking workforce participation, only Portland's Findley Commons had defined workforce goals. The Beaverton, Clackamas and Washington County projects committed to tracking workforce participation in order to understand workforce activity and establish a baseline on which future workforce diversity goals could be established.

Across the four projects, 41%-62% of labor hours were worked by people of color (POC), 12%-18% of labor hours were worked by apprentices, and less than 3% of labor hours were worked by women. More work is needed to ensure that affordable housing investments can tackle broader workforce equity issues, which also require upstream investments to create a pipeline of diverse workers.

A project-by-project breakdown of COBID goals, workforce tracking commitments and prevailing wage requirements is provided in *Exhibit C*.

ADVANCING EQUITABLE ACCESS TO HOUSING

The housing bond is guided by a commitment to advance equitable access to housing for communities of color and other populations with disproportionate barriers to housing. Jurisdictions are working to advance equitable access through the use of affirmative marketing and low barrier screening and by designating units to serve specific populations. Leasing data for projects that have reached full occupancy demonstrate the impact of these strategies in expanding access to housing for priority communities.

Serving priority communities

The housing bond framework identified the following priority communities to be served by program investments:

- People of color
- Families with children and multiple generations
- Seniors and older adults
- Veterans
- Households experiencing or at risk of homelessness
- Households experiencing or at risk of displacement
- People with disabilities

The regional portfolio includes buildings with different mixes of unit sizes intended to serve different household sizes and configurations. Additionally, many units are restricted for households with very low incomes and/or households experiencing homelessness, including a subset of units designated as permanent supportive housing (PSH) for individuals and families living with a disability who have experienced prolonged homelessness.

Figure 7.1 provides information on the projects and units designated to serve each of the bond's priority populations and the outcome metrics used to track the program's effectiveness in serving each priority population.

Figure 7.1 Designated units/projects and outcome metrics for serving priority populations

Priority population	Designated units/projects	Outcome metrics
People of color	▪ All projects committed to low-barrier screening and affirmative marketing to ensure access for people of color ▪ 40 projects include partnerships with culturally specific organizations	▪ Race/ethnicity for occupants
Families with children and multiple generations	▪ 43 projects include family-size units ▪ 4 projects aim to serve multiple generations	▪ Number/percent of households that include children
Seniors and older adults	▪ 9 projects aim to serve seniors or older adults	▪ Number/percent of seniors/older adults
Veterans	▪ 4 projects aim to serve veterans experiencing chronic homelessness	▪ Number/percent of veterans
Households experiencing or at risk of homelessness	▪ 1,635 units are restricted for households with extremely low incomes (30% AMI) ▪ 1,052 units have project-based rental assistance ▪ 747 units are designated as PSH for people who have experienced prolonged homelessness and have at least one disabling condition	▪ Number of households referred through coordinated access or local HUD Continuum of Care approved referral systems into PSH units
Households experiencing or at risk of displacement	▪ 7 projects are participating in the City of Portland's N/NE Preference Policy ▪ 30 projects are located in areas where communities at risk of displacement live today	▪ Number of residents placed through N/NE Preference Policy ▪ Number of units located in areas where communities at risk of displacement live today
People with disabilities	For projects that provided data on physical accessibility features: ▪ 23% of units are ground floor units ▪ 6% of units are ADA (Type A) units ▪ 89% of projects have universal design	▪ Number of applicants requesting reasonable accommodations who were matched with a unit ▪ Number/percent of households that include a person with a disability

Strategies for affirmative marketing and low-barrier screening

All local implementation strategies included commitments to affirmative marketing and low-barrier screening. Affirmative marketing approaches include working with property management companies to ensure materials and services are accessible to people with limited English proficiency via translation and interpretation in multiple languages, as well as strategies to market units through partnerships with community-based organizations that can leverage informal channels and word of mouth.

Across the 52 bond-funded projects, 71% report partnerships with culturally specific organizations to support their affirmative marketing strategies. These partners include organizations serving a wide range of populations, such as Native American Rehabilitation Association (NARA), Native American Youth and Family Center (NAYA), Urban League of Portland, Beyond Black, El Programa Hispano

Católico, Centro Cultural, HAKI Community Organization, Somali Empowerment Circle, Asian Pacific American Network of Oregon, Immigrant and Refugee Community Organization (IRCO), Muslim Educational Trust and more.

Many projects also partner with a wide range of other types of organizations to support affirmative marketing, such as homeless services providers, social service agencies, school districts and community colleges, public libraries, organizations serving children and families, organizations serving seniors, government agencies such as the Department of Veterans Affairs, and community-based organizations such as The Rosewood Initiative and Living Cully.

The following examples illustrate how bond-funded projects engage with partners to implement affirmative marketing:

- Fuller Road Station is a 100-unit development in unincorporated Clackamas County for families and households with very low incomes, including 25 PSH units for households experiencing homelessness. In advance of opening the waitlist, emails and marketing flyers were sent to partners such as Asian Health and Service Center, IRCO, NAYA, Urban League, Oregon Outreach, Impact NW, Independent Living Resources and surrounding employers. The leasing team also worked closely with the project's supportive services partners, Dev NW and Clackamas Women's Shelter, to house applicants from their waitlists.
- Hillsboro's Nueva Esperanza provides 150 affordable homes for households with low and very low incomes, with a focus on serving families of color from Latine, Somali and other immigrant communities. Project co-sponsor Bienestar developed marketing materials designed to reach Spanish-speaking households and African and other immigrant populations in Hillsboro. Bienestar partnered with Somali Empowerment Circle, Adelante Mujeres, Family Promise, Community Action and others to support outreach and distribution of the marketing information.
- Portland's Waterleaf is a 176-unit development for families and veterans with very low incomes. The project's partners conducted research to identify the demographic groups least likely to apply and targeted outreach to those groups through community-based organizations and by placing ads in culturally specific newspapers. Applicants were referred by 41 community-based and culturally specific organizations such as Central City Concern, Urban League, Northwest Pilot Project, Transition Projects, Community Vision, Veterans Affairs, Cascadia Health, New Narrative, Street Roots, Do Good Multnomah, Our Just Future, New Avenues for Youth, Outside In, Path Home and Impact NW.

In addition to affirmative marketing, low-barrier screening is a key strategy for promoting equitable access to housing. Low-barrier screening is specifically designed to promote accessibility for households with adverse credit, rental and legal histories, and with very low incomes.

Among the examples of ways that sponsors are implementing low-barrier screening practices for bond-funded projects:

- The leasing team for Clackamas County's Good Shepherd Village developed screening criteria designed to eliminate common screening barriers. Credit score minimums are not used, alternative forms of identification are accepted, a lack of rental history or rectified past debt are not penalized, and the leasing team worked with community partners to establish application fee assistance for their clients and referrals. The leasing team also established clear procedures and timelines to ensure applicants receive adequate communication and time to assemble documentation.
- Bienestar, the project co-sponsor for Hillsboro's Nueva Esperanza, worked with project partners and supportive housing experts to identify common screening barriers such as negative credit history, past evictions, inadequate income and criminal records. In the project's screening criteria, prior eviction is not grounds for denial if the eviction was due to severe rent burden. The criminal conviction review process also removes any crimes that are no longer illegal at the state or federal level. Each application is reviewed with consideration of relevant individualized evidence of mitigating factors using an equity lens.

Leasing outcomes

Bond-funded projects are required to submit a leasing outcome report once they reach at least 95% occupancy. The report collects data on applications received, applicant screening results (including denials and appeals), PSH unit placements, placements in accessible units and affirmative marketing outcomes. As of December 2023, 10 projects had submitted leasing outcome reports.

Figure 7.2 Projects reaching at least 95% occupancy by December 2023

Project	Location	Eligible units	30% AMI units	2+ BR units	PSH units
The Valfre	Forest Grove	36	8	30	8
Rockwood Village	Gresham	47	47	39	0
Mary Ann	Beaverton	54	11	29	0
Tukwila Springs	Gladstone	48	48	0	48
Viewfinder	Tigard	81	34	56	30
Findley Commons	Portland	35	0	0	35
Hattie Redmond	Portland	60	60	0	60
Fuller Road Station	Happy Valley	99	30	82	25
Waterleaf	Portland	176	17	48	20
Wynne Watts Commons	Gresham	147	30	31	30
	Totals	**783**	**285**	**315**	**256**

The occupancy reports submitted in 2022 for the first six fully leased-up projects (The Valfre, Rockwood Village, Mary Ann, Tukwila Springs, Viewfinder and Findley Commons) pointed to areas where occupancy data collection and reporting could be improved. Metro worked with jurisdiction partners on improvements to reporting templates and methodologies in 2023, resulting in more accurate and comprehensive data for the projects that submitted occupancy reports in 2023 (Hattie Redmond, Fuller Road Station, Waterleaf and Wynne Watts Commons). Because occupancy data is only submitted once for each project, the data for the projects that leased up in 2022 continues to include some incomplete information.

Unit availability relative to applications

The volume of applications across the 10 properties demonstrates that the need for affordable units is greater than the number of units available. Figure 7.3 shows the number of applications received compared with the number of units available across the projects, broken out by unit size. The number of applications received far outpaced unit availability, and these data do not include the prospective applicants who remained on waitlists and were not able to apply for a unit.

Figure 7.3 Availability of units relative to applications across the leased properties

	Studios	1 BR units	2 BR units	3 BR units	Total
Total units available*	208	299	288	168	963
Total rental applications received	983	1,223	852	449	3,507
Total percentage of applicants housed	21%	24%	34%	37%	27%

**Rockwood Village reported leasing information for all of its affordable units (224) rather than just the bond-funded units (47), increasing the total units and applications included in the analysis.*

The discrepancy between applications and available units highlights both the important role of the bond in alleviating the region's severe shortage of affordable housing and the continuing need for affordable units. In total, only 27% of applicants were able to be housed in the available units. The percentages ranged by unit size, with the lowest percentages of applicants housed in studios and one bedroom units. Additional analysis of regional need by household size may support future leasing outcome data analysis.

Demographics of building occupants

The leasing outcome reports also collect information on the demographics of the initial building occupants, including race and ethnicity, disability status, age, veteran status, household size and household composition. It is important to note that demographic characterizations of diverse, multifaceted and intersectional communities are often difficult to get right. For Metro's demographic collection and reporting purposes, efforts have been made to align with existing data and reporting sources specific to the affordable housing industry and emerging best practices in reporting on priority communities.

Across the 10 projects, demographic data were reported for 57% of occupants, although the reporting percentages varied significantly from project to project. In some cases the projects only reported on household-level demographics rather than the demographics of individual occupants, and some occupants chose not to disclose demographic information. This section provides an analysis of the available data while recognizing that it is incomplete.

For each demographic category, the data for occupants of bond-funded units are compared with data at the neighborhood and regional levels. The neighborhood comparison data points were created using a half-mile buffer around each site. The data sources for the comparisons are based on Census and American Community Survey data sets.

Metro recognizes the importance of analyzing intersectionality across demographic data categories and providing fully disaggregated data when reporting on demographics. However, because occupancy data are submitted to Metro in aggregate form, not as individual client-level records, analysis of intersectionality is not feasible. Inconsistencies in data reporting categories across the projects also create barriers to accurately reporting on fully disaggregated demographic data. For this reason, data on race and ethnicity are analyzed in this section for people of color as a whole but not for individual races/ethnicities. The improvements to reporting templates and methodologies implemented in 2023 will support analysis of disaggregated data in future reports.

Race and ethnicity

Figure 7.4 shows the percentage of total occupants of bond-funded units who provided race and ethnicity data followed by the percentage of those occupants who identified as people of color (POC), defined as all races and ethnicities except white non-Hispanic. The table compares these percentages with the percentage of people of color households within a half-mile buffer around each project location, and the percentage of people of color households with incomes less than $60,000 within the half-mile buffer.

Figure 7.4 Occupancy outcome data: race and ethnicity

				Demographic data for surrounding neighborhood	
	# of occupants in bond-funded units	% of occupants who provided race/ ethnicity data	% POC of occupants who provided race/ ethnicity data	% of households that are POC	% of households with incomes <$60,000 that are POC
The Valfre	92	100%	79%	20%	26%
Rockwood Village	141	22%	65%	45%	50%
Mary Ann	117	74% of households	25% of households	48%	71%

Tukwila Springs	48	77%	41%	16%	19%
Viewfinder	189	33%	19%	20%	34%
Findley Commons	35	94%	12%	19%	30%
Fuller Road Station	274	31%	14%	28%	30%
Hattie Redmond	60	100%	100%	19%	26%
Waterleaf	271	71%	54%	24%	41%
Wynne Watts	216	86%	44%	41%	47%
Total	**1,443**	**57%**	**48%**	**29%**	**41%**
Region				**26%**	**30%**

Overall, 48% of occupants of bond-funded units were people of color, compared with a regional rate of 26% (30% for households with incomes less than $60,000) and a rate of 29% in the neighborhoods surrounding the projects (41% for households with incomes less than $60,000). Six of the 10 projects have a higher percentage of households of color than their surrounding neighborhoods and the regional rate.

Disability status

Figure 7.5 shows the percentage of occupants of bond-funded units who provided disability status, followed by the percentage of those occupants who are living with a disability. These data are compared with the percentage of the population living with a disability in the surrounding neighborhood.

Figure 7.5 Occupancy outcome data: disability status

	# of occupants in bond-funded units	% of occupants who provided disability status	% living with a disability of occupants who provided data	% living with a disability in surrounding neighborhood
The Valfre	92	92%	11%	11%
Rockwood Village	141	33%	11% of households	13%
Mary Ann	117	N/A	N/A	16%
Tukwila Springs	48	100%	69%	17%
Viewfinder	189	43%	7% of households	15%
Findley Commons	35	100%	34%	13%
Fuller Road Station	274	1%	N/A	17%
Hattie Redmond	60	100%	30%	8%

Waterleaf	271	100%	16%	15%
Wynne Watts	216	92%	28%	19%
Total	**1,443**	**57%**	**22%**	**14%**
Region				**12%**

Overall, the percentage of occupants living with a disability ranges from 7% to 69%. Only Rockwood Village and Viewfinder – both of which have low reporting rates – show the percentage living with a disability as lower than the comparison neighborhood data points and the regional rate of 12%. The percentage of occupants living with a disability at the Valfre is one percentage point lower than the regional rate but equal to the percentage for the surrounding neighborhood.

Age

Figure 7.6 shows the percentage of occupants of bond-funded units who are children under age five, children and youth under age 18, and seniors ages 62 and older. These data are compared with age demographics for the surrounding neighborhood.

Figure 7.6 Occupancy outcome data: age

	Occupants of bond-funded units			Demographic data for surrounding neighborhood		
	% under age 5	% under age 18	% 62 or over	% under age 5	% under age 18	% 62 or over
The Valfre	18%	51%	1%	5%	24%	11%
Rockwood Village	23%	55%	6%	8%	31%	12%
Mary Ann	N/A	N/A	N/A	5%	20%	19%
Tukwila Springs	0%	0%	35%	3%	16%	25%
Viewfinder	21%	50%	4%	6%	21%	20%
Findley Commons	0%	0%	37%	4%	16%	12%
Fuller Road Station	24%	57%	2%	4%	17%	23%
Hattie Redmond	0%	0%	35%	4%	14%	13%
Waterleaf	12%	25%	11%	1%	3%	18%
Wynne Watts	13%	26%	1%	7%	22%	18%
Total	**16%**	**38%**	**8%**	**5%**	**19%**	**16%**
Region				**5%**	**20%**	**18%**

In projects with a focus on families with larger unit sizes – The Valfre, Rockwood Village, Viewfinder and Fuller Road Station – more than half of the occupants are

under age 18. This is higher than both the neighborhood averages and the regional rate of 20%. Tukwila Springs, Findley Commons and Hattie Redmond, which are all permanent supportive housing projects, have rates of residents over age 62 that are higher than the neighborhood averages and the regional rate of 18%.

ADVANCING HOUSING STABILITY

Metro's bond framework established expectations that affordable housing projects offer connections to services to support residents' housing stability. All bond-funded projects provide access to resident services that connect individuals and families to resources such as energy assistance, food, health services, transportation and financial planning. Many projects include partnerships that offer additional programs and services for residents on site or in the community. Some homes, including those designated as permanent supportive housing, provide individual residents with one-on-one case management and connections to wraparound services to meet their unique needs.

Culturally responsive service partnerships

Ninety-six percent of bond-funded projects report partnerships with culturally responsive organizations that will provide resident services, case management, wraparound services or other programming. (The remaining projects have not finalized service partnerships yet.) For 77% of the projects, these partnerships include culturally specific service providers such as Hacienda CDC, Latino Network, Virginia Garcia Health Center, Native American Rehabilitation Association (NARA), NAYA, IRCO, Islamic Social Services of Oregon, Somali American Council of Oregon, Black Parent Initiative, Self Enhancement, Urban League and Black Community of Portland.

The following examples illustrate how bond-funded projects are incorporating partnerships with culturally responsive and culturally specific service providers to support housing stability:

- Plambeck Gardens in Tualatin will provide housing for individuals and families with low and extremely low incomes, including people transitioning out of homelessness into permanent supportive housing. Project sponsor Community Partners for Affordable Housing is partnering with Centro Cultural for employment-related services, Virginia Garcia and NARA for health and wellness activities, Neighborhood Health Center for youth health services, and NARA and Community Action for permanent supportive housing services.
- Meridian Gardens in outer southeast Portland will provide single room occupancy and studio apartments to individuals and couples experiencing or at risk of homelessness who are in recovery from substance use disorders. Project sponsor Central City Concern will provide recovery-focused programming for all residents, including peer-delivered services. On-site culturally specific services will be provided by Puentes, the Imani Center and Flip the Script.
- Albina One, which is being co-developed by Albina Vision Trust in Portland's Eliot neighborhood, will provide affordable homes to families as well as displaced or longtime residents of North and Northeast Portland. Designed to

counter intentional displacement of Black people through urban renewal, freeway siting and long-term gentrification, the mix of one, two and three bedroom units will serve young Portlanders, notably those who work in the trades. Portland Opportunities Industrialization Center + Rosemary Anderson High School will support residents with culturally specific education, mentoring, family support, employment training and career placement.

- The Opal in Cedar Mill will provide affordable homes for older adults with low and extremely low incomes, with an emphasis on serving LGBTQ+ residents. The project was developed through a partnership between Home First Development Partners and Christ United Methodist Church, which owns the land and the adjacent church. Friendly House Elder Pride Services will provide resident services, with the goal of creating a safe, welcoming community where residents have the support and resources they need to live healthy, active, independent lives. Church members made over 60 quilts to welcome new residents. The church is also donating supplies for the communal kitchen.

Permanent supportive housing

The policy framework for the affordable housing bond included a commitment to serve households experiencing homelessness. For households with disabilities experiencing prolonged homelessness, permanent supportive housing (PSH), which pairs a housing unit with long-term rental assistance and wraparound services, is the nationally recognized solution. Because resources for PSH were limited when the housing bond measure passed in 2018, Metro's framework included goals for deep affordability (30% AMI units) but not a regional goal for PSH. Two partners established PSH goals:

- Portland set a goal of 300 PSH units that would be supported with capital investments through the Metro bond. As of December 2023, Portland had exceeded that goal with 311 Metro bond-funded PSH units open or in the pipeline. This includes 289 PSH units in existing projects plus 22 PSH units in projects that are still moving through Metro's concept endorsement process.
- Washington County's local implementation strategy for the Metro bond included a goal of at least 100 PSH units. As of December 2023, Washington County had exceeded that goal with 157 Metro bond-funded PSH units open or in the pipeline.

While other local implementation strategies did not establish formal PSH goals, the regional portfolio includes PSH units distributed across the region, in alignment with the goal of serving households experiencing homelessness. **As of December 2023, partners reported a total of 747 PSH units across the bond-funded portfolio.** This includes five projects that are entirely PSH (Findley Commons, Hattie Redmond, Heartwood Commons, Tukwila Springs and Beacon at Glisan Landing) and an additional 23 projects that include a subset of PSH units. PSH

units make up 17% of total bond-funded units, and 54% of all bond-funded projects contain PSH units.

Units designated as PSH offer deep affordability along with ongoing case management and wraparound services to support housing stability. Voters' approval of the Metro supportive housing services (SHS) measure in 2020 has created opportunities to increase PSH production by matching bond-funded units with SHS-funded rent subsidies, case management and wraparound services. Of the 28 bond-funded projects with PSH units, 25% are using SHS funding for rental assistance and 57% are using SHS funding for services. Several additional projects are likely to use SHS funding for PSH units, with the details finalized closer to completion of construction.

Among the examples of ways that jurisdictions are aligning bond capital funding with SHS-funded services and rent assistance:

- The Housing Authority of Clackamas County has been offering service packages that pair rental assistance with wraparound services to encourage project sponsors to dedicate additional PSH units in their bond-funded projects. Staff worked with the project sponsors for Tukwila Springs and Good Shepherd Village to add 59 more PSH units beyond what was originally contemplated across the two projects. In addition, each subsequent Metro bond-funded rental project in Clackamas County's pipeline includes PSH units that are supported by SHS-funded services and/or rent assistance.
- The Portland Housing Bureau partnered with Multnomah County's Joint Office of Homeless Services to integrate SHS-funded services in three PSH projects. Meridian Gardens is a recovery-focused project with 65 PSH units and SHS-funded services provided by Central City Concern. Powellhurst Place has 12 PSH units with SHS-funded services provided by Native American Rehabilitation Association of the Northwest. Beacon at Glisan Landing includes 41 PSH units with services provided by Catholic Charities and IRCO.

Figure 8.1 summarizes PSH units across the bond portfolio as of December 2023 based on information provided in partners' annual progress reports and post-completion reporting. For some projects, PSH unit commitments and other details are still being finalized.

Metro worked with partners in 2023 to ensure greater clarity and consistency in the definition of PSH for reporting. All units defined as PSH (a) serve people with extremely low incomes who have one or more disabling conditions and are experiencing or at imminent risk of experiencing long-term or frequent episodes of literal homelessness and (b) use coordinated access systems for referrals.

Figure 8.1 Distribution, target population and service partners for permanent supportive housing units across the portfolio

Jurisdiction	Project	Total units	PSH units	PSH target population	Service partners
Beaverton	Senior Housing on 5th	104	30	Seniors 55+	NARA, Bienestar
Clackamas	Fuller Road Station	99	25	Families and individuals, including foster youth exiting or having exited the system	Clackamas Women's Services, Cornerstone Community Housing, DevNW
	Good Shepherd Village	142	58	Families and individuals, including 15 units expressly for veterans	Catholic Charities of Oregon, APANO, El Programa Hispano Católico, Familias en Acción, Do Good Multnomah
	Las Flores	171	9	Families and individuals	Northwest Housing Alternatives
	Tukwila Springs	48	48	Age 50 or older; leasing preference for Gladstone residents and applicants who request culturally specific services for Native Americans	NARA
	Marylhurst Commons	100	40	Families	Mercy Housing NW
	Hillside Park A & B	143	13	Families	Impact NW, Community Vision, Unite Oregon
	Hillside Park C	78	8	Families	Impact NW, HACC Service Team
	Lake Grove	54	10	Latine, families	New Narrative
	Wilsonville TOD	120	20	Latine, families	Latino Network
Gresham	Wynne Watts Commons	147	30	Those with intellectual and developmental disabilities	Integration with the State's K Plan which provides services to those living independently, Albertina Kerr
Hillsboro	The Dolores	66	10	Individuals and families	New Narrative
Portland	Hattie Redmond	60	60	BIPOC singles/couples experiencing chronic homelessness	Urban League of Portland, Home Forward
	Findley Commons	35	35	Veterans	Veterans Administration, Do Good Multnomah
	Waterleaf	176	20	Veterans	Veterans Administration
	Beacon at Glisan Landing	41	41	BIPOC seniors, survivors of domestic violence/sexual assault coming out of homelessness	Catholic Charities
	Meridian Gardens	85	65	People in substance use disorder treatment, people experiencing chronic homelessness	Central City Concern, Puentes, Imani Center, Flip the Script
	Tistilal Village	24	16	Native American families	NARA, NAYA
	Portland Value Inn	98	15	Formerly homeless families, intergenerational families, BIPOC families at risk of displacement, with disabilities	Urban League of Portland, CPAH, HAKI Community Organization

Jurisdiction	Project	Total units	PSH units	PSH target population	Service partners
	Powellhurst Place	64	12	People exiting homelessness, BIPOC community	Northwest Housing Alternatives, NARA
	Garden Park Estates	54	25	Individuals	Innovative Housing, Inc.
Washington	Heartwood Commons	54	54	Individuals	Community Partners for Affordable Housing (CPAH), Sequoia Mental Health
	Plambeck Gardens	116	16	Individuals and families	Centro Cultural, Virginia Garcia, NAYA
	Terrace Glen	144	3	Youth	HomePlate Youth Services, IRCO
	The Valfre at Avenida 26	36	8	Individuals and families, Latine	Bienestar, Sequoia Mental Health
	Alongside Senior Housing	57	24	Seniors, veterans	Veterans Administration
	Viewfinder	81	30	Individuals and families, veterans	Project Homeless Connect, Cornerstone Partners
	Woodland Hearth	63	22	Individuals and families	HAKI, NAYA
	Total PSH units		**747**		

COMMUNITY ENGAGEMENT TO SHAPE PROJECT OUTCOMES

Metro's bond work plan requires jurisdictional partners to conduct community engagement to inform implementation planning. To remedy decades of disinvestment and displacement, engagement activities are expected to focus on reaching communities of color and other priority populations, including people with low incomes, seniors, people with disabilities, immigrants and refugees, existing tenants in acquired buildings, and people who have experienced or are experiencing housing instability or homelessness. Each jurisdiction reports on this community engagement, including participant demographic information, descriptions of outreach and activities, themes from engagement and how feedback informed implementation.

In 2023, community engagement was conducted for 16 projects across the seven implementing jurisdictions and Metro's site acquisition program. A total of 29 specific engagement opportunities were organized for the 16 projects, with more than 1,103 participants.

Engagement of communities of color and other priority populations

Demographic information on race/ethnicity was collected for 53% of the participants in the 2023 engagement opportunities. Of those participants, 73% were people of color.

Participant information was not tracked consistently for other priority populations. Information on income was collected for 17% of the participants; of those participants, 78% were people with low incomes. Reports from the engagement opportunities where other demographic information was collected show additional participation by immigrants, refugees, existing tenants, and people with lived experience of homelessness and housing instability.

Themes of input

Most of the engagement opportunities were for projects that are in the design and planning phases. The most common themes from the input across the projects were related to:

- **Community gathering spaces**, such as requests for community rooms and common areas as well as exterior spaces that support community building
- **Outdoor spaces** including community gardens, green spaces, covered outdoor gathering spaces and play areas
- **Unit design and amenities**, such as closets, storage and larger units
- **On-site services**, including community building for residents, culturally specific services, services to support transitions from homelessness, and services that are responsive to residents' needs and experiences

- **Safety and security**, such as lighting, controlled access, staffing and security cameras
- **Parking** to meet residents' needs and reduce the impact on the surrounding neighborhood

How engagement input informed projects

Partner jurisdictions' reports demonstrate how input gathered during community engagement was incorporated into project planning. Some examples of ways that projects were changed in response to feedback include:

Input to inform developer selection

- Metro's site acquisition program and the Housing Authority of Clackamas County conducted stakeholder outreach to gather input on priorities for Clackamas County's Lake Grove site. A workgroup of neighbors and community members met six times over four months to develop a statement of values that was used to evaluate developer proposals. Guided by these values, Hacienda CDC's proposal was selected.

Input to inform project design and planning

- During engagement for Portland's Albina One project, participants highlighted the opportunity for storytelling about Black Portland. In response, the building incorporates exterior metal screens to be designed by artists and other opportunities for storytelling through art. Discussions with social service providers also led to the inclusion of laundry in larger family-size units and an enclosed outdoor play space near the shared laundry room.
- In response to feedback related to service priorities for Washington County's Woodland Hearth, project sponsor Community Partners for Affordable Housing will work closely with service partners NARA and Community Action to develop programming that addresses the identified priorities, including Rent Well classes, trauma-informed training with property management, safety meetings and wellbriety.
- In focus groups and a virtual public town hall to gather input for Clackamas County's Hillside Park project, participants emphasized the importance of community garden spaces. In response, the project's design team added garden boxes to the landscape plan for Buildings A and B and increased the scope of the community garden in Building C.
- Gresham's Oak Row at Rockwood Townhomes is a homeownership project co-sponsored by Habitat for Humanity. At three information sessions, a key theme from participants' input was the need for streamlined and transparent applications. In response, the project partners revamped the application and updated the website to better communicate about the application process and the available homes.

EFFICIENT USE OF FUNDS

Good use of public funds is a core guiding principle of the affordable housing bond for Metro and its partners. In 2023, the average per-unit investment of Metro bond subsidy was $108,570, which is considerably lower than the average of $143,000 per unit in Metro bond subsidy available to achieve the goals. This reflects a variety of factors, including some projects that are only utilizing Metro bond funds to fill a small gap. In general, it is anticipated that higher Metro bond subsidy levels will be needed for remaining projects due to significant cost escalation and anticipated delays due to emerging constraints in the availability of private activity bonds, which are necessary to finance 4% low income housing tax credits.

This section highlights key findings related to development costs and capital and operating funding sources. *Exhibit A* provides a summary of the portfolio projects, including configuration, size, unit mix, cost and Metro bond subsidy. *Exhibit D* provides additional detail regarding capital financing sources, and *Exhibit E* provides a summary of ongoing rental assistance and services funding attached to Metro bond units.

Development costs

The Metro affordable housing bond portfolio includes 52 properties that range in size from 10,200 to 245,705 square feet, with an average size of 117,290 square feet. The portfolio's 48 multifamily rental projects range from one to 17 buildings, with an average of three buildings, and they range from 35 to 224 apartments, with an average of 122 units. The portfolio's four homeownership projects range from eight to 53 units, with an average of 35 units, in two to 21 buildings, with an average of seven buildings.

The housing development industry recognizes two general categories of cost: *hard costs*, which are focused on construction itself, and *soft costs*, which include a variety of project development, permitting and financing costs. Compared to market rate housing, affordable housing is widely recognized to have higher per-unit soft costs, due to the need to combine various public and private funding sources and greater regulatory and compliance requirements.

In general, the housing bond portfolio's development costs align with similar affordable housing trends in the region and nationally. Development costs across the portfolio span a wide range and are influenced by a variety of factors including project size, unit configurations and construction type. The bond program's priority focus on family-size units contributes to higher average hard costs per unit. For this reason, cost per square foot and cost per bedroom are important metrics. Similarly, the program's priority focus on advancing racial equity was established with an understanding that prioritizing equitable contracting and workforce diversity may mean additional development costs. A

number of other factors impact costs including prevailing wage requirements, parking requirements and more.

Figure 9.1 Average total project costs

Metric	Weighted average
Total project cost per unit	$447,053
Total project cost per bedroom	$259,190
Total project cost per square foot	$462.83

Development costs have escalated across the affordable housing industry over the past three years due to broader economic factors impacting the cost of materials and labor. Supply chain issues and labor shortages along with inflation and interest rate increases have significantly increased construction costs. The impact of these increases is evident in the construction costs for bond projects approved after 2021. The average cost of construction per square foot for new construction projects financed with 4% low income housing tax credits was $287 for bond projects approved in 2021 or earlier and $363 for projects approved after 2021. The full impact of the cost increases is masked by wide variations in other factors that affect construction costs across the portfolio, such as construction type, prevailing wage requirements, on- and off-site construction requirements, and the availability or absence of building fee exemptions and/or systems development charge waivers.

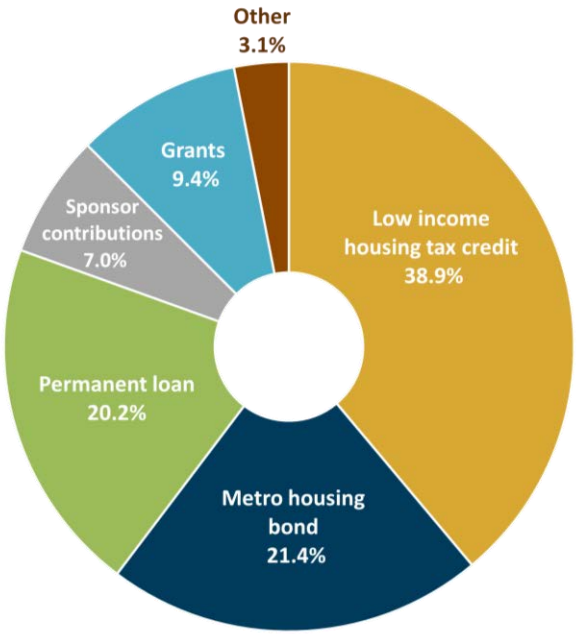
Alignment with other subsidy sources

The affordable housing bond program was structured to provide flexible gap funding that can be layered with other capital sources to achieve desired outcomes. While the production goals were modeled assuming the leverage of 4% low income housing tax credits and modest bank debt, the program requirements are intentionally flexible to allow for a range of models.

The current affordable housing bond portfolio represents $2.18 billion in investments, of which approximately 21.4%, or $466 million, is Metro affordable housing bond funding and $1.71 billion is leveraged from other sources.

Figure 9.2 provides a high-level breakdown of funding sources; Figure 9.3 provides more detail.

Figure 9.2 Project funding sources



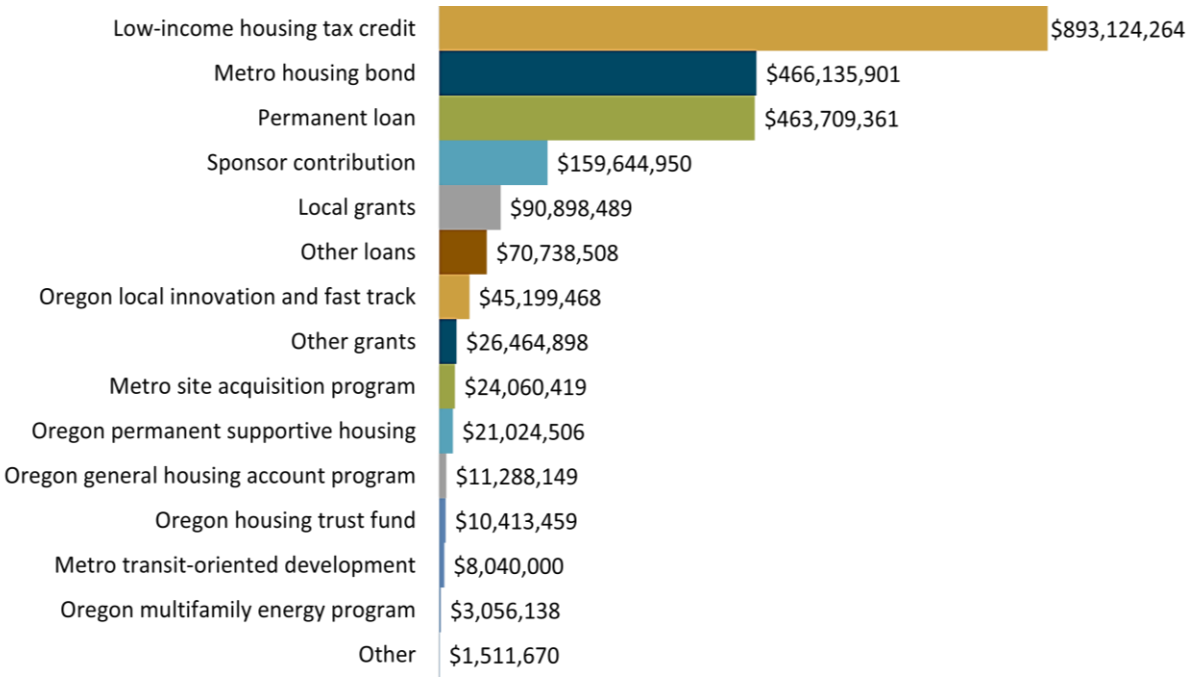
Low income housing tax credits (LIHTC) represent the most substantive leveraged funding source in bond projects. Of the 48 rental projects in the portfolio, 46 are utilizing LIHTC. Of these, four projects (the Mary Ann, Tistilal Village, Garden Park and Meridian Gardens) are financed using highly competitive 9% LIHTCs. For these projects, the Metro bond subsidy represents 17% of project costs due to deep subsidy from the tax credits. The remaining 42 projects are utilizing or plan to utilize 4% LIHTCs. These projects require higher levels of Metro bond funding, representing 21% of project costs.

Unlike 9% LIHTCs, 4% LIHTCs are not subject to an annual cap but are based on federal requirements for utilization of private activity bonds (PABs), which are dependent on a federal allocation to states. Historically, PABs were undersubscribed in Oregon. However, in 2021, Oregon Housing and Community Services announced a pause on reviewing 4% LIHTC applications due to oversubscription of PABs. Combined with construction cost escalation, this poses a significant challenge for the bond program and the statewide affordable housing pipeline. Metro is working with implementation partners and Oregon Housing and Community Services to develop a coordinated strategy to ensure that projects with local funding commitments and deeply affordable units are prioritized and don't face delays in accessing PABs.

Two projects – Findley Commons and Heartwood Commons – are being financed without tax credits, relying primarily on Metro bond funds and other local sources. Heartwood Commons is an acquisition rehab project sponsored by Washington County. The project is 100% PSH units and Washington County wanted to keep costs as low as possible. Findley Commons is also a 100% PSH unit project. At 35 total units the project is too small to effectively utilize LIHTC funding.

After LIHTC, other funding sources include Metro housing bond funds, permanent loans, sponsor contributions and state and local grants and loans. Figure 9.3 shows a breakdown of total leveraged funding by source. *Exhibit D* provides additional details on the financing mix for each project.

Figure 9.3 Capital funding sources



Operating costs and subsidy

The affordable housing bond program includes ambitious goals for very affordable units, defined as those affordable to households making less than 30% of the area median income (AMI). In 2023, this was an annual income of $23,700 for a household with one person and $33,840 for a household of four. Providing deeply affordable units requires additional subsidy. Rental income from these units is lower and their operating expenses can be higher, creating operating funding gaps and limiting projects' ability to carry debt.

Across the housing bond portfolio, 1,635 units are designated to serve households with very low incomes (30% AMI or below); 1,052 units include project-based rental assistance, funded through a combination of federal and local sources, including Metro's supportive housing services fund.

Additionally, buildings serving households with very low incomes often require investment in ongoing services that are beyond the scope of traditional real estate related operating expenses and require external operating funding to be financially feasible. Lender and/or tax credit investors may also require the capitalization of reserves to mitigate the risk that these operating expenses may not be able to be adequately funded from projects' operating revenue. Across the buildings serving very low income households, **747 units are designated as**

permanent supportive housing and include additional funding commitments to provide wraparound services.

Exhibit E provides a summary of the total units, 30% AMI units and units with project-based rental assistance and ongoing services funding.

Local affordable housing policy tools and incentives

Affordable housing development can be supported or hindered by local jurisdictions' policies and regulations. Some bond projects have encountered barriers or delays due to zoning and permitting challenges in local jurisdictions. For example, approval of Home Forward's land use application for the Troutdale Apartments was delayed for 18 months due to concerns about density, parking and traffic. Home Forward finally secured land use approval in 2023 for a modified plan that includes a reduction in the number of affordable units and more parking. The delay was particularly impactful during a time of high cost escalation, increasing the project's construction costs by $2.87 million.

There are also affordable housing policy tools and incentives in place across the region that can ease the development of affordable housing, including housing bond projects. In 2020, Metro staff surveyed all 24 cities in the region to identify incentives and policies in place to support affordable housing development. This information was further refined and updated in spring 2022. Tracking these policies helps the program anticipate what resources and incentives exist to encourage the development of affordable housing throughout the region, and which are being leveraged in Metro affordable housing bond projects.

Administrative costs

The Metro affordable housing bond framework includes a cap of 5% of bond proceeds for administrative costs. While only a small portion of the overall budget, these costs are vital to delivering on bond outcomes through effective and efficient implementation of the work plan. They include expenses related to financial and legal administration and oversight, monitoring and evaluation, oversight committee engagement, communications and policy development, to name a few.

While most of the administrative funding was allocated to implementing partners and Metro via the initial work plan, Metro Council action in March 2023 allocated an additional $12,706,638 in administrative funding within the 5% funding cap. Any administrative costs over the 5% cap stipulated in the bond measure must be funded with non-bond funding sources.

As of December 2023, $19,736,206 in administrative funding had been expended or disbursed to partners and Metro; this is 57% of the administrative funding budgeted in the work plan. Details of administrative expenditures can be found in *Exhibit F.*

SUSTAINABILITY AND CLIMATE RESILIENCE

In the Portland region, as in many places around the globe, events in recent years have made the effects of climate change clear. With issues such as prolonged wildfires and extreme heat, the building industry will need to adapt to new climate-related challenges. These challenges are much bigger than a single funding program can address and will require ongoing work to support policy and funding alignment.

While Metro has not developed sustainability related metrics or requirements for bond-funded projects, the program tracks information reported by partners on each project's sustainability features. In addition, Metro has provided policy guidance and funding to encourage development partners to incorporate in-unit cooling strategies into bond-funded buildings.

Cooling strategies

Metro issued a policy statement in September 2021 strongly encouraging implementing jurisdictions to work with development partners to incorporate cooling strategies for projects, including in-unit air conditioning, to ensure safety and livability for residents. Metro also allocated $8 million in unprogrammed affordable housing bond interest earnings/premiums to support additional investments in cooling.

The projects added to the bond portfolio since the guidance was issued all include in-unit air conditioning, and jurisdictions incorporated the requirement into funding solicitations for future projects. A few projects that were already near completion when the guidance was issued will not be able to incorporate in-unit air conditioning but will offer other cooling options.

Sustainability strategies

The affordable housing bond reduces energy use and greenhouse gas emissions by funding new homes in multifamily affordable housing buildings. If these units were not available, many residents would likely live in older, less dense housing. According to data from the Energy Information Administration's Residential Energy Consumption Survey, the average multifamily housing unit consumes roughly one-third of the energy and produces one-third the greenhouse gas emissions of a typical single-family unit.

Jurisdictional partners' annual progress reports demonstrate a strong commitment to additional energy efficiency and sustainability measures across the portfolio. Many projects pursue Earth Advantage certification and commonly achieve the silver, gold or platinum levels. About two-thirds of projects also participate in Oregon Housing and Community Services' Multifamily Energy

Program, which provides financial incentives to affordable housing projects for energy efficiency measures aimed at reducing electricity consumption.

Highlights of partners' sustainability strategies include:

- Hillsboro's Dolores project will be designed to meet or exceed Earth Advantage Gold certification through specific strategies for the building envelope, energy, water and indoor air quality. The development team will use highly efficient systems, including LED lighting, occupancy sensor controls, in-unit energy recovery ventilation, mini-splits and energy efficient appliances. Low-flow water-saving fixtures are incorporated to save water and energy. To achieve additional energy savings, the project will include a highly efficient central hot water production system.
- The development team for Clackamas County's La Flores Apartments collaborated with the Center for Public Interest Design, which promotes socially conscious, environmentally sustainable and economically accessible design. The development team integrated packaged thermal air conditioner (PTAC) heat pumps into every unit and is targeting Earth Advantage Multifamily Gold certification. Included among the project's various sustainable design elements is a functioning solar panel array on the community building, and all of the residential buildings will be solar ready.
- The Wilsonville Transit Oriented Development project will include a rooftop photovoltaic solar system, enhanced insulation, high-performance windows, LED lighting, Energy Star appliances and smart thermostats in every unit. The landscape design will use native water-smart plants, and the units will include low-flow water fixtures. Each residential unit will include through-wall PTAC air conditioning combined with ceiling fans in each bedroom. The common areas of the building will be serviced by roof-top condensers. The development will also include electric vehicle parking spaces on site for residents and guests.
- The design for Home Forward's Troutdale Apartments incorporates energy-efficient mini-split heat pumps for heating and cooling in all units. In community spaces, a combination of single-zone and multi-zone split system heat pumps will be utilized for effective heating and cooling. Funding has been secured to integrate solar panels into the project, providing solar powered electrical energy to reduce the costs of common area electricity.

LESSONS LEARNED

The first four years of the bond program's implementation offer insights that can help to inform the region's affordable housing strategies into the future. While the bond program has been successful in meeting its goals, there are lessons learned and areas for improvement.

Metro compiled the following list of lessons learned from jurisdictions' annual report presentations to the Housing Bond Oversight Committee and from conversations with jurisdictional partners and technical experts in the affordable housing community:

- **Site acquisition:** Site acquisition is a helpful tool. The use of bond funds to acquire property brought affordable housing to strategic locations throughout the region and helped to remove barriers for smaller organizations to participate in affordable housing development. Future site acquisition efforts should maintain this intentionality while improving efficiency by ensuring there is clarity of jurisdictional and sponsor roles throughout the development process. Future efforts should also consider flexible tools that can be responsive to opportunities in the market.
- **Predevelopment funding:** Lack of predevelopment funding is a persistent issue for affordable housing development and a barrier for the ability of smaller organizations, including culturally specific organizations, to participate in development. This challenge is deepening as operating cost escalation puts smaller, nonprofit organizations into more difficult financial positions. However, due to restrictions of general obligation bonds, the Metro bond funds are not able to be used to support predevelopment activities.
- **Funding coordination:** Coordination with funding partners, including Oregon Housing and Community Services, is essential to the success of a local gap funding program. Alignment on timing and criteria among state and local funders will reduce risks and impacts of cost escalation for affordable housing developments. Opportunities exist to streamline funding processes to reduce complexity for affordable housing developers and to improve outcomes and impacts across funding streams.
- **Affirmative marketing:** Community networks are critical for equitable access. Affirmative marketing strategies, including partnering with culturally specific organizations and service providers, have led to successful and timely lease-up processes for bond-funded properties. In addition to ensuring fair housing access, timely lease up is also essential for the financial stability of a property.
- **Deeply affordable units:** Deeply affordable units have higher operating costs and require an array of resident services and other supports to meet resident needs and ensure long-term property stability, requiring additional non-leasable space to support offices and other service areas. This can be especially

true in high quality permanent supportive housing. Future funding opportunities should consider the unique funding needs of different unit and property types and levels of affordability, as well as the impacts of changing economic conditions.

- **Regional standards and best practices:** Throughout the implementation of the affordable housing bond, Metro convened jurisdictional partners and stakeholders to develop regional standards to support best practices in the industry, provide clarity and guidance on policy goals, establish metrics and benchmarks to track progress and outcomes, and build relationships that have the potential to improve coordination over time. For example, Metro established regional net cash developer fee guidelines to support fiscal stewardship and racial equity. However, more evaluation of the unintended consequences of net cash developer fee caps is needed to ensure these policies do not impede small nonprofit and culturally specific organizations' ability to respond to cost escalations or build organizational capacity.
- **Balancing local discretion and regional alignment:** Allowing for local discretion can support jurisdictional partners in addressing local housing priorities, but it can also make regional accountability and transparency more difficult. While balancing local discretion with regional alignment can prove challenging, such efforts result in stronger outcomes and more consistency and transparency in reporting on outcomes.
- **Communication and engagement:** The bond program has been successful at creating new affordable housing that is specific to the needs of each community. Metro and its partners should proactively share the success of this and any future programs with partners, local leaders and voters in a way that resonates with their values and priorities.

LOOKING AHEAD

The Metro bond program has exceeded its housing production targets while making significant progress in advancing regional goals to increase equitable access to housing. As the program prepares to commit the remaining bond funds, Metro is committed to working with its partners to strengthen the long-term impact of these investments. The oversight committee has proposed recommendations to support the ongoing success of the bond-funded portfolio while positioning the region to continue to address critical housing needs. Metro housing staff will work in collaboration with the oversight committee, jurisdictional partners and other stakeholders to move forward these recommendations over the upcoming year.

Funding coordination and alignment: Metro will work with its partners to develop creative solutions to help remaining projects in the bond pipeline navigate current funding and development challenges. This includes actively coordinating with funding partners to monitor the remaining pipeline and ensure that projects have the flexibility they need to navigate funding gaps or other barriers, and continuing to advocate for changes at the federal level to address state funding limitations due to the private activity bond volume cap. Metro has initiated work to better understand the current challenges in development and operations of affordable housing across the region. Metro will continue its work with Oregon Housing and Community Services and jurisdictional partners to integrate and align funding resources to create a more efficient and effective affordable housing funding system.

Affordable housing operations: Metro housing policy staff will convene stakeholders and decision makers to move forward a body of work focused on the successful management and operations of bond-funded housing. This work will address the current challenges faced by properties, operators and residents. It will also aim to identify regionally aligned solutions that can be supported by Metro's new regional capacity team, which is charged with developing technical assistance and training programs to help housing and homeless services providers enhance their capacity. Metro is also planning to develop a regional framework for asset management of existing housing funded by the bond to ensure long-term monitoring and stewardship of these critical resources.

Planning for the future: Metro housing staff will support ongoing planning to address the region's future housing needs through research, analysis and engagement. In coming months, the Metro housing department will share findings from technical research and engagement with affordable housing funders and providers – work that is intended to support near-term and ongoing planning for affordable housing production in the region. In the coming year, Metro's housing and planning, development and research departments will work jointly to develop a state-mandated regional housing coordination strategy, with the goal of

identifying regional strategies to expand resources and eliminate barriers for affordable housing production that meets the needs and income levels of residents. Additionally, Metro will continue working to strengthen the integration of Metro's capital and supportive housing services funds through the development of a regional framework for permanent supportive housing and other strategies that align with implementation of the Tri-County Planning Body's established regional priorities to address homelessness.

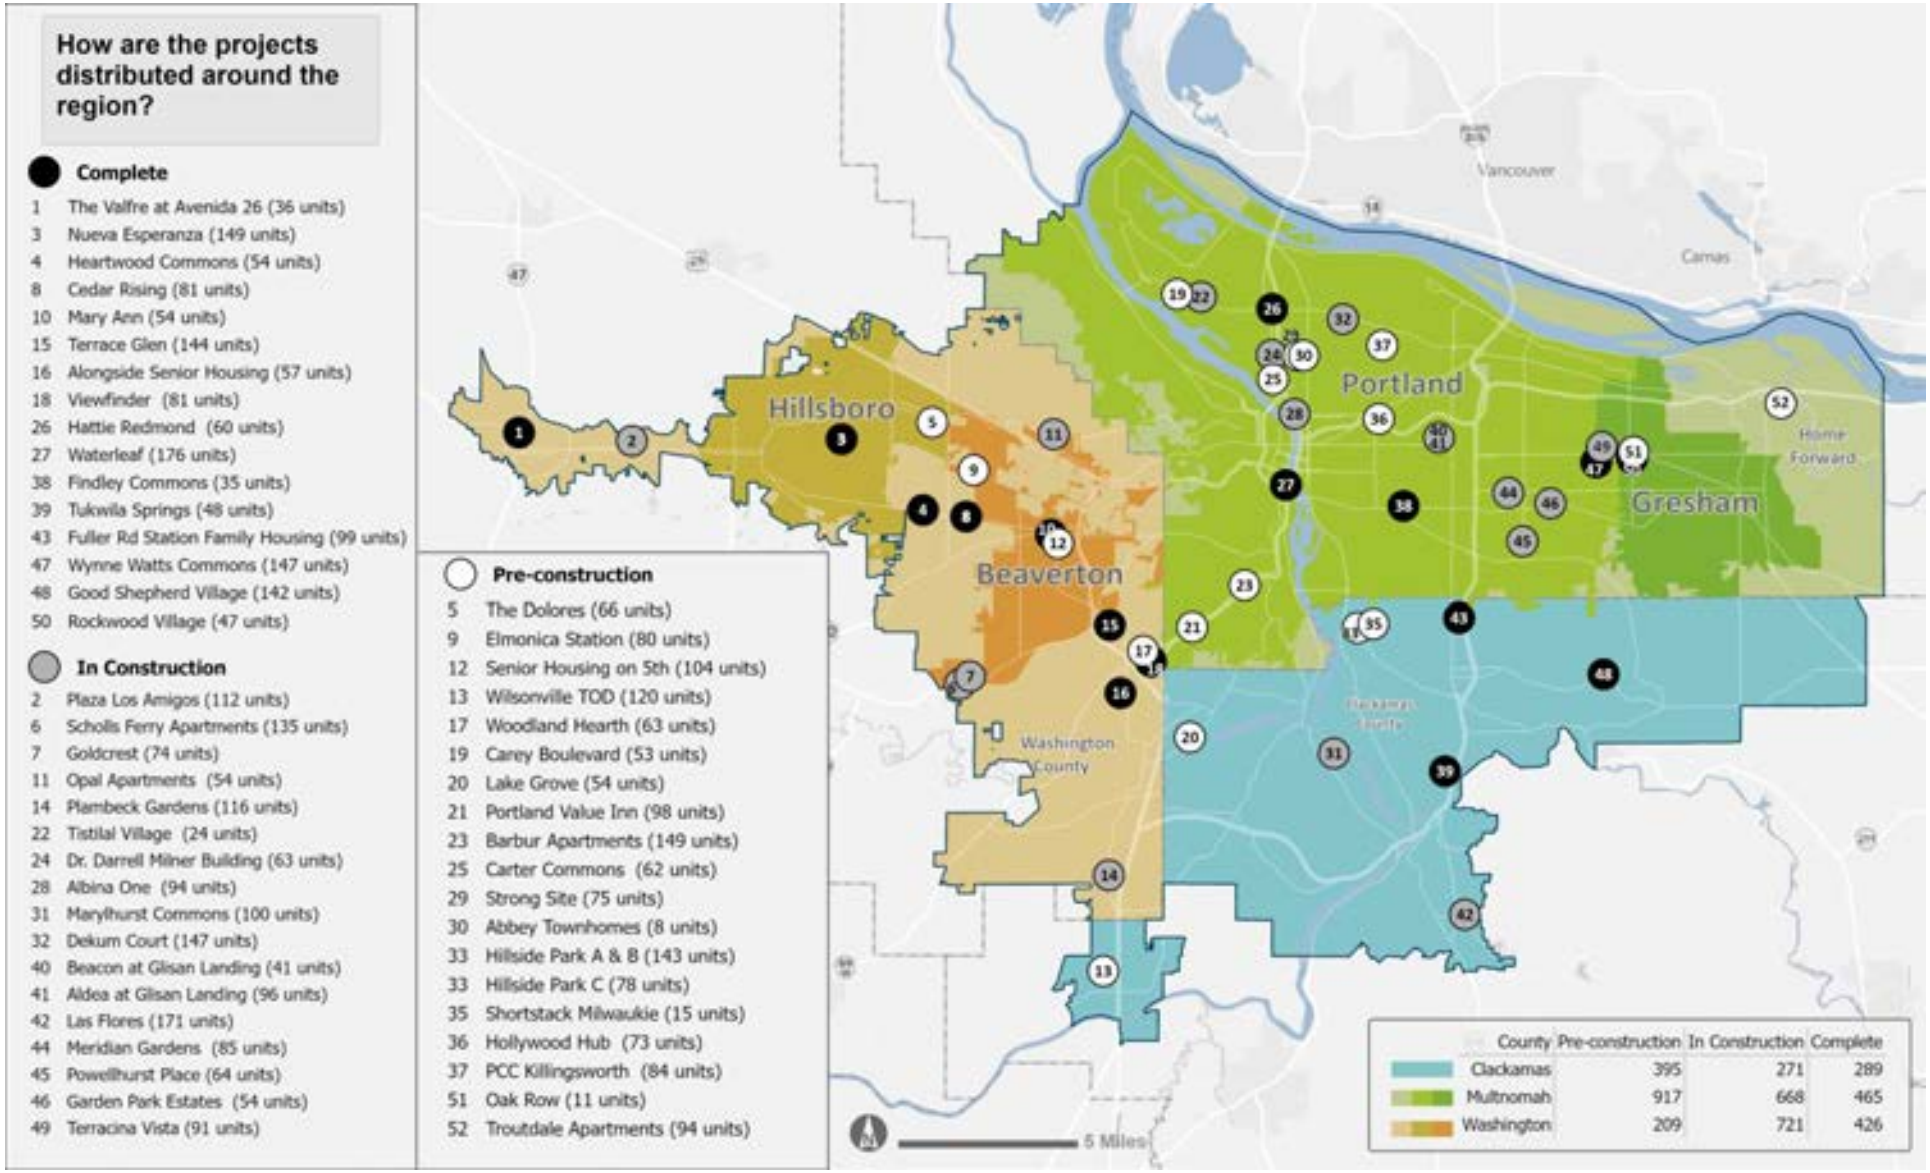
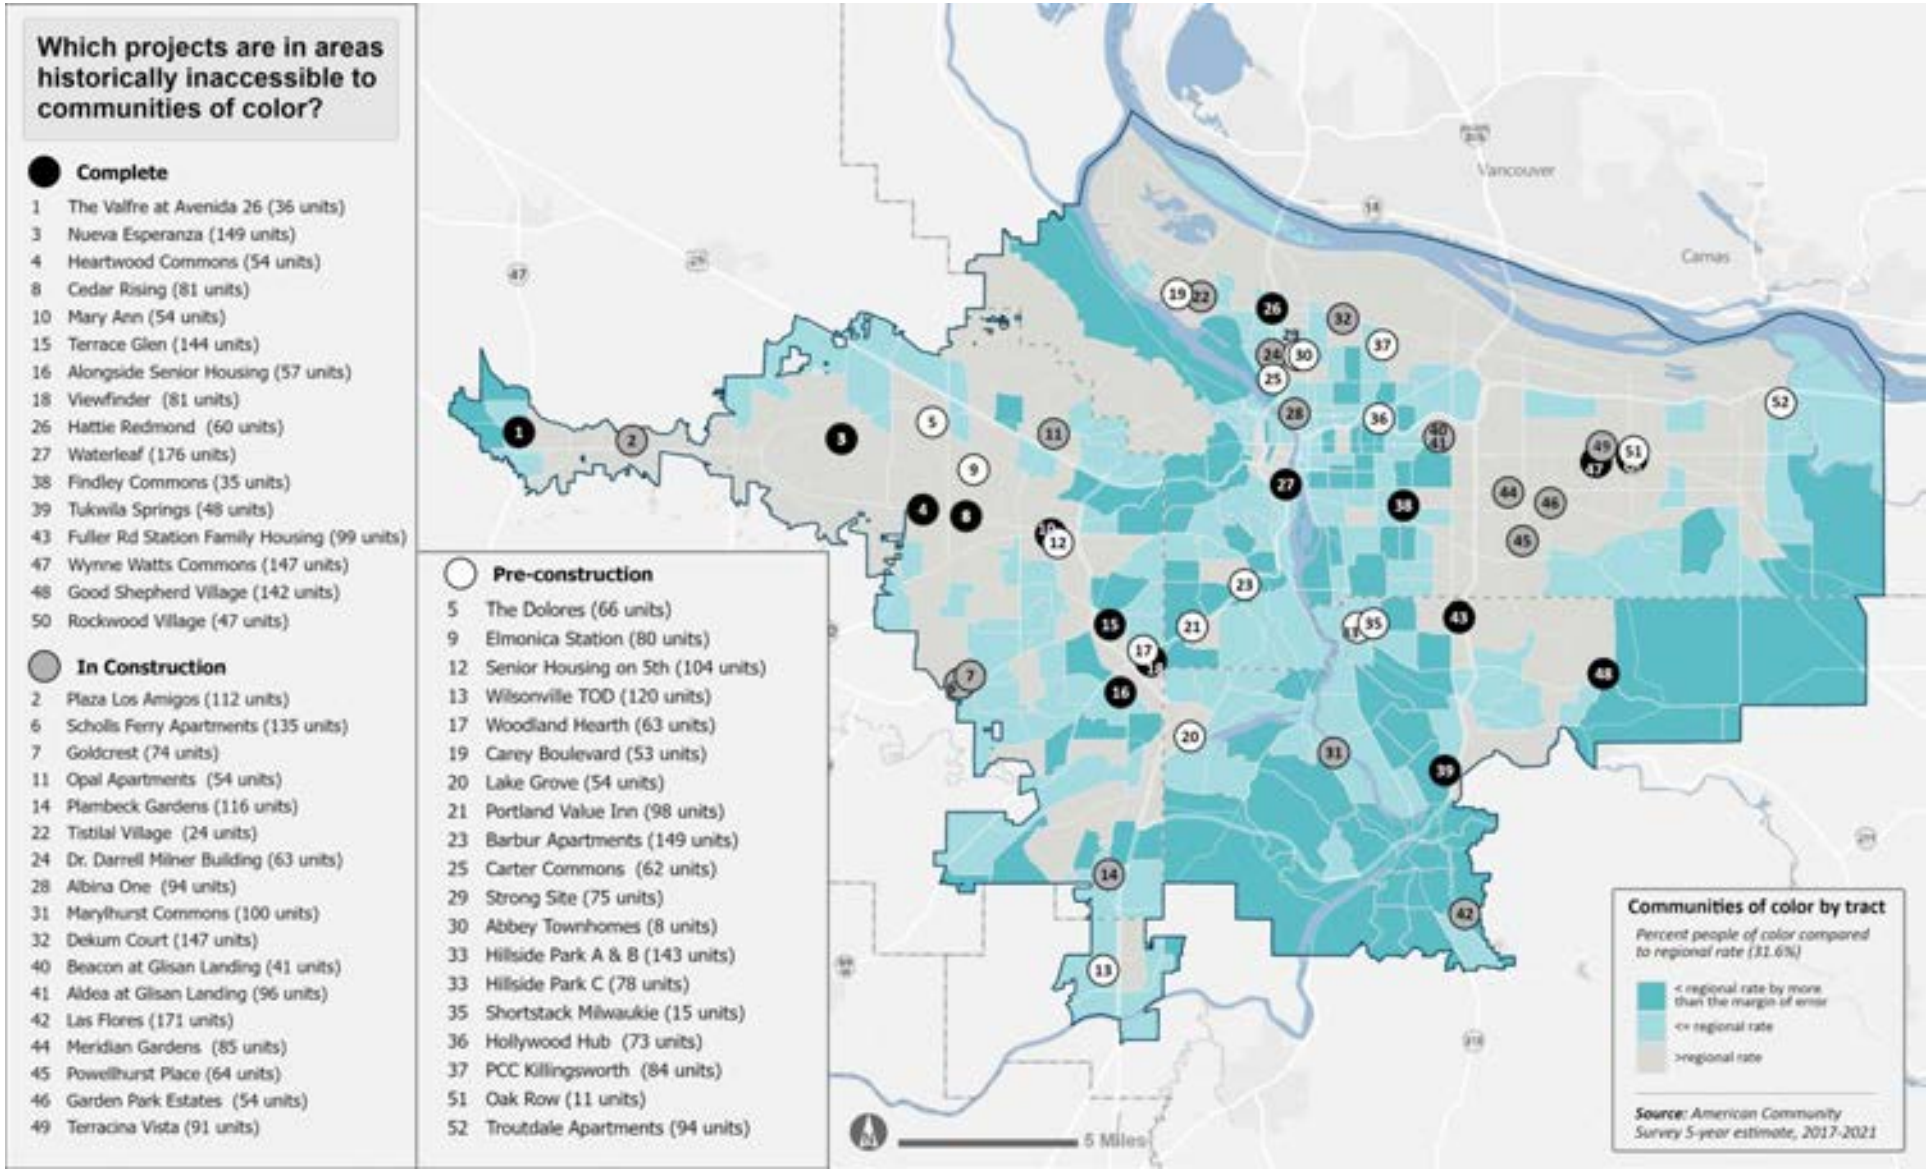
** Note: The project costs for Clackamas County's Hillside Park projects include infrastructure costs required to build an entirely new street grid and related infrastructure.*

EXHIBIT B. MAPS AND DETAILED SUMMARY OF LOCATION METRICS FOR AFFORDABLE HOUSING BOND PROJECTS





Which projects are in areas historically inaccessible to communities of color?
Complete
1 The Valfre at Avenida 26 (36 units)
3 Nueva Esperanza (149 units)
4 Heartwood Commons (54 units)
8 Cedar Rising (81 units)
10 Mary Ann (54 units)
15 Terrace Glen (144 units)
16 Alongside Senior Housing (57 units)
18 Viewfinder (81 units)
26 Hattie Redmond (60 units)
27 Waterleaf (176 units)
38 Findley Commons (35 units)
39 Tukwila Springs (48 units)
43 Fuller Rd Station Family Housing (99 units)
47 Wynne Watts Commons (147 units)
48 Good Shepherd Village (142 units)
50 Rockwood Village (47 units)
In Construction
2 Plaza Los Amigos (112 units)
6 Scholls Ferry Apartments (135 units)
7 Goldcrest (74 units)
11 Opal Apartments (54 units)
14 Plambeck Gardens (116 units)
22 Tistilal Village (24 units)
24 Dr. Darrell Milner Building (63 units)
28 Albina One (94 units)
31 Marylhurst Commons (100 units)
32 Dekum Court (147 units)
40 Beacon at Glisan Landing (41 units)
41 Aldea at Glisan Landing (96 units)
42 Las Flores (171 units)
44 Meridian Gardens (85 units)
45 Powellhurst Place (64 units)
46 Garden Park Estates (54 units)
49 Terracina Vista (91 units)
Pre-construction
5 The Dolores (66 units)

51	Oak Row	11	Multnomah	high	high	highhigh	54%	±9%	> / >	15%	±8%	54%	±9%	high	8.6%	0.2	0.1	85
52	Troutdale Apartments	94	Multnomah	low	low	lowlow	25%	±12%	≤ / ≤	4%	±3%	25%	±12%	high	7.3%	2.9	1.5	59

Percent of Total Eligible Units

22% Clackamas	27% > regional	30% > regional	19% > regional	4% < regional
44% Multnomah	31% ≥ regional	28% ≥ regional	19% ≥ regional	38% ≤ regional
33% Washington	42% ≤ regional	42% ≤ regional	62% ≤ regional	58% ≥ regional

> or ≥ region for either POC or LEP

11% none	24% FS Bus and MAX	39% score ≥ 70
31% < regional	46% FS bus or MAX	36% score 50-69
58% > regional	30% neither	25% score < 50

Abbreviations: FS = frequent service; LEP = limited English proficiency; MOE = margin of error; POC = people of color.

Notes on data sources and assumptions

A Regional rates are calcuated based on Metro's jurisdictional boundary.

B People of color and people with limited English proficiency (people age 5 and older who speak English less than "very well") use the American Community Survey 2017-2021 5-year estimate, by tract.

C The darkest cell shading for people of color or people with limited English proficiency means greater (or less) than the regional rate by more than the MOE. Middle shades are greater (or less) than the regional rate but within the MOE.

D Affordable housing share is based on Metro's inventories of affordable housing (2023), multifamily housing (2023), and single-family housing (2023).

E Access to transit is calculated based on linear distance ("as the crow flies"), using Metro's data on existing transit (RLIS).

F Walkscore is calculated at https://www.walkscore.com. A score of 50-69 is "somewhat walkable" and a score of 70+ is "very walkable" or "walker's paradise"

EXHIBIT C. SUMMARY OF CONTRACTING GOALS AND PRELIMINARY OUTCOMES, WORKFORCE TRACKING COMMITMENTS AND PREVAILING WAGE REQUIREMENTS

[1] PHB uses a Project Delivery Fee, not paid for by Metro's Affordable Housing Bond, to reimburse their administrative expenses.

[2] Administrative expenses in support of Metro's Site Acquisition Program are combined with Metro's total Administrative expenses and included in "Metro Accountability and Financial Transaction Costs."

METRO COSTS ANNUAL BASIS[3]	FY2023-24 YTD Actuals	FY2023-24 Metro Budget	YTD % Spent
	1,215,003	3,068,547	40%

[3] In addition to Metro's Administrative costs, these costs include certain Metro Direct Costs reported under the "Project" Cost table above (e.g. Metro Site Acquisition Program Staff and Other Metro Direct) that were not provided a Work Plan Funding allocation, and therefore must be covered by Metro's Administrative Funding allocation.

EXHIBIT G. OVERSIGHT COMMITTEE 2022 ANNUAL REPORT MEMO TO THE METRO COUNCIL (SUBMITTED MAY 2023)

Memo

Metro
600 NE Grand Ave.
Portland, OR 97232-2736

Date: May 25, 2023
To: Metro Council
From: Metro Housing Bond Community Oversight Committee
Subject: 2022 Annual Report

A report to the Metro Council and the community from the Metro Housing Bond Community Oversight Committee

We are pleased to present the 2022 annual report for the Metro affordable housing bond, covering the period from January 1, 2022 through December 31, 2022.

The Metro Housing Bond Community Oversight Committee has reviewed progress reports from all eight implementation partner agencies, as well as an analysis of regional progress and performance presented by Metro staff. The committee also reviews quarterly progress and expenditure reports on an ongoing basis to monitor and evaluate progress toward production and policy goals outlined in the Metro Council's adopted policy framework for the bond.

The bond framework established a goal of creating at least 3,900 new homes, as well as policy expectations for advancing racial equity throughout the implementation process. This report demonstrates that the bond is delivering on the promises made to voters, creating housing opportunities and addressing racial disparities in access to housing for people across the region. These new affordable homes help tackle the crisis of homelessness and stabilize communities so that all people can thrive.

KEY HIGHLIGHTS

In its third year of implementation, the bond program outpaced housing production targets while continuing to make significant progress in advancing regional goals to increase equitable access to housing.

Production progress

As of December 2022, there were 34 bond-funded projects underway representing 3,243 new affordable homes.

- **Total units:** The pipeline of bond projects underway represents 83% of the total unit production target of 3,900 affordable homes. These projects (which are collectively referred to as the "bond portfolio" throughout the report) include 7 projects that have completed construction, 17 projects under construction and 10 projects in pre-construction.

Regional progress towards production goals relative to funding committed

- **Family-size units:** 1,678 of these homes will have two or more bedrooms, representing 86% of the program's production goal for family-size homes.
- **Deeply affordable units:** 1,242 of these homes will be affordable to households with incomes at or below 30% of area median income, representing 78% of the program's production goal for deeply affordable homes; 747 of these units also have project-based rental assistance, ensuring even those with very low or no income can be served.

Plans are in place that will commit all remaining bond funds by 2024 with final projects expected to break ground by 2026. **The program is projected to achieve at least 120% of its original production target once all funds are expended**, creating an estimated 4,700 affordable homes that will provide housing for 9,000 to 15,000 people across the region.

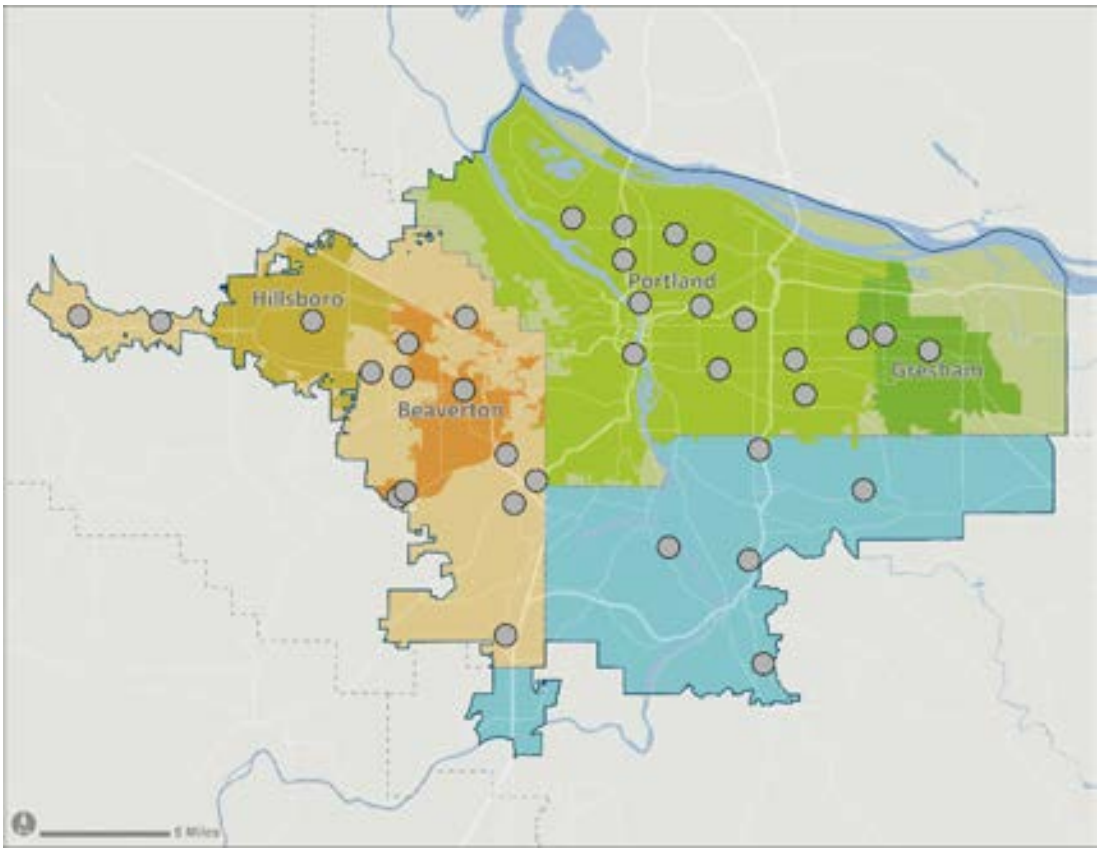
The bond program reached an important milestone in 2022, with the first cohort of projects completing construction and lease-up. **By December 2022, 528 people had moved into their new homes in six bond-funded projects** located in Beaverton, Forest Grove, Gladstone, Gresham, Portland and Tigard.

Addressing disparities and advancing racial equity

Metro and its implementation partners are making ongoing progress in moving forward the bond program's goals of addressing disparities, increasing equitable access to housing and advancing racial equity:

- **Addressing disparities through project location:** The locations of the bond portfolio's homes expand access to housing options in a diversity of areas throughout the region: 42% of units are located in areas that have historically lacked affordable housing, 67% are located in areas where communities at risk of displacement live today and 45% are located in areas historically inaccessible to communities of color. This not only improves access to affordable housing in communities across greater Portland and provides residents with greater choice about where to live, it also helps connect people to schools, jobs and other opportunities while preventing displacement in changing neighborhoods.

Affordable housing bond project locations



- **Advancing racial equity through opportunity in construction:** To ensure equitable access to the opportunities provided by bond investments, the bond program aims to direct construction contracts to underrepresented firms. The bond's development projects are on track to meet or exceed the regional goal of at least 20% of construction contract funding going to state certified minority- or women-owned and/or emerging small businesses (MWESB). Seven projects reached completion in 2022 with a combined $33.1 million in contracts paid to certified MWESB firms, representing 24.7% of total construction costs.
- **Promoting equitable access through marketing and lease-up:** All bond projects are required to develop plans for affirmatively marketing housing opportunities and reducing lease-up barriers to ensure equitable access to bond-funded units. Initial data from the six projects that completed lease-up in 2022 suggest that the projects' affirmative marketing

and lease-up strategies are working, with a higher percentage of people of color housed in bond-funded units than the percentage of low-income households in the region that are people of color.

- **Advancing housing stability through services:** On-site services can support households with low incomes to remain stably housed. Many bond-funded projects include formal partnerships with culturally responsive and culturally specific service providers to provide resident services. Twenty projects will also provide ongoing case management for 587 households (representing more than 18% of total households served) in permanent supportive housing units intended for people exiting long-term homelessness. Many of these units are leveraging funding for services and rent assistance from Metro's regional supportive housing services fund.
- **Promoting community engagement:** Implementation partners and developers are working with a wide range of community-based organizations to conduct outreach and engage the community. In 2022, more than 720 people and 43 community-based organizations participated in community engagement opportunities to inform planning for 12 projects.

Addressing emerging opportunities and challenges

Along with significant progress, the past year was marked by continued challenges with funding gaps due to cost escalations related to interest rate increases, hard cost escalation and constraints in the availability of state-issued private activity bonds (PABs), which are necessary for the financing of 4% low income housing tax credits. Metro worked with its partners to respond to these challenges, including:

- **Advocacy to focus and expand private activity bonds:** Metro worked with partners to advocate for federal expansion of PAB availability and statewide strategies to focus and prioritize limited PAB resources for affordable housing, including Metro bond-funded projects. This includes advocacy for state legislation (SB 225), expected to pass during the 2023 session, that would ensure that PABs are prioritized for affordable housing and would support stronger coordination in the affordable housing pipeline.
- **Coordination and alignment with state funding:** Metro worked with Oregon Housing and Community Services to advance strategies for state and local funding alignment to ensure that limited resources are focused on projects with the greatest benefits for communities of color and those experiencing or at risk of homelessness. This includes the development of a suballocation framework for directing Housing Trust Fund and Local Innovation Fast Track (LIFT) funding for layering with Metro bond-funded projects.

Metro also worked with its partners to support regional coordination to strengthen housing access and stability, including:

- **Supportive housing services fund integration and alignment:** Metro earmarked $20 million in unallocated bond interest earnings to support additional investments in expanding permanent supportive housing. These investments will be aligned with funding

from Metro's supportive housing services fund to support rental assistance and wraparound services to meet the needs of people experiencing long-term homelessness.

- **Evaluation and engagement to support effective equitable leasing practices:** Metro has continued to engage jurisdictional partners and housing providers to identify barriers to and effective practices for equitable lease-up, and to refine lease-up and demographic reporting tools to support strong accountability for ensuring low-barrier access to housing.

RECOMMENDATIONS

The committee applauds the work of Metro and its implementation partners in building a successful funding program for regional affordable housing production and addressing opportunities and challenges as they have arisen throughout the life of the program. This solid foundation allows the committee to make the following recommendations that aim to further maximize the impact of this important resource and equip the region for essential work to come.

Convene stakeholders to regionalize best practices

In 2022, our region celebrated the lease up of the first seven Metro Housing Bond projects. A review of these early projects has allowed the committee to identify inconsistencies in local approaches and a need for Metro to convene stakeholders to define and share effective strategies.

As this report outlines, real improvements can and should be made in systematizing best practices that strengthen equitable access to bond-funded homes. We must also be sure that when bond units are designated as permanent supportive housing, they are able to effectively house and serve those who need it most. Through better understanding existing local standards and practices, barriers to access, and effective practices for affirmative marketing and proactive leasing supports, Metro can support greater consistency and improved long-term outcomes throughout the region. Metro can also explore opportunities for creative partnerships and other models, such as those in affordable homeownership.

Additionally, for the public to fully understand the program's progress toward its stated racial equity goals, we recommend that Metro and its partners prioritize improvements in reporting and data quality, especially related to occupancy and workforce outcomes. The committee is eager to see reporting improvements that allow for a more disaggregated picture of bond outcomes. We must also be mindful of the impact of data collection on both housing providers and the people who are sharing their personal information. Data collection should be actionable to outcomes, which means limited to necessary areas of focus and of reliable quality. Through collaboration and sharing of emerging best practices and standards, Metro can aid implementing partners in collecting, monitoring and reporting the information that most fully tells the story of the bond program's successes and allows for timely adjustments to improve outcomes when needed.

When we come together to address challenges, our community benefits. Metro staff should prioritize continued efforts to convene conversations and elevate regional best practices in partnership with jurisdictions, technical experts and communities with lived experience.

Focus on systemic integration

The bond program has made significant progress over the past year in aligning, integrating and streamlining resources to strengthen outcomes and mitigate against risks due to a shifting financial landscape. As mentioned above, highlights of this work include creating permanent supportive housing through layering supportive housing services fund (SHS), and coordinating with Oregon Housing and Community Services (OHCS) to facilitate suballocations of state and federal funding. There is more work to do to fully integrate and align funding resources across the system.

Local affordable housing developers have consistently called for better coordination between funding entities such as Metro and OHCS to reduce the risks and overall cost escalations due to lack of alignment in timing and criteria across different funding sources. Metro should work to strengthen its relationship and coordination with OHCS and participate in conversations to create a more efficient and effective system.

We also want to encourage Metro to think more holistically about system alignment opportunities. The committee is enthusiastic about the recommendations put forth by the Metro-convened Tri-County Planning Body, including planned work in aligning Medicaid tenancy support resources with SHS funding. Overall integration of SHS and bond funding remains a priority, given the opportunity to truly maximize the impact of both funds.

In addition to continuing to strengthen SHS and bond integration, we ask that Metro consider better supporting workforce diversity and other bond outcomes through regional workforce initiatives and by leveraging Metro programs such as the Careers to Construction Pathways Program. We want to see Metro developing more strategic, cross-system partnerships that address barriers to housing production, promote successful building operations and, most importantly, support opportunities for the people who call bond-funded properties home.

Analysis and planning for the future

The end of the bond pipeline is on the horizon, and the committee is confident the region has benefitted from these investments. Now is the time for Metro to evaluate its impact and plan for the future.

We are eager to see Metro continue this regional housing pipeline beyond its planned end and urge Metro to refer another measure to voters. This is an important moment to understand lessons learned from this bond and opportunities to strengthen Metro's role in supporting regional coordination.

This region and others stand to benefit from an analysis of the strengths of the program and through an independent review of areas where the structure or implementation could be

improved as well as other lessons learned. Areas of focus should include an understanding of the administrative gaps of the program and analysis of program policy decisions, such as the impact of cash developer fee limits in a shifting financial landscape.

We also support Metro in its planned work to launch bodies of analysis that will contextualize the bond within the broader housing landscape to best understand the overall impact of the program. Through considering the full housing pipeline, funding ecosystem, and projected population and systems shifts, Metro can best prepare for meeting future regional needs.

Along with assessing lessons learned and the housing landscape, it is imperative that Metro analyze risks related to the long-term asset management strategy of this new portfolio. We know that bond-funded properties have been evaluated for financial success, but also want to emphasize that proactive asset management is vital to maintaining the long-term public benefits in which voters invested. Managing these assets requires that we think not only on a property-by-property level, but also community-wide. Further analysis is needed to ensure Metro is adding beneficial and not duplicative support to the system and that all parties possess a comprehensive understanding of the roles and responsibilities for long-term stewardship of this new portfolio. We do not yet have a clear picture of how asset management will work and wish to understand this better as an oversight committee. We call for this to be a focus as the program moves forward.

As a region, we should be proud of having passed this bond measure and of the work completed to date. This bond has been successful, exceeding commitments to voters, and it is exciting that we are in a position to recommend improvements for additional impact. We are honored to have the opportunity to provide oversight for this important program and would like to thank Metro and jurisdictional partner staff for their support.

Introduction

This document presents the City of Portland's 2023 Residential Buildable Lands Inventory (BLI), which is based on a Geographic Information System (GIS) model developed by the Bureau of Planning and Sustainability (BPS). The Residential BLI is an assessment of the City's residential development capacity under current City plans and zoning and market conditions. Oregon's statewide planning goals require cities to maintain at least a 20-year supply of land to accommodate forecasted housing growth. This Residential BLI is a critical component of the Housing Needs Analysis (HNA)[1] to identify whether there is an adequate supply of land to meet future housing needs through the year 2045.

There are several reasons for conducting this analysis:

- to quantify the existing residential development capacity within Portland under the current Comprehensive Plan and zoning regulations;
- to identify likely redevelopment scenarios and prospective clusters of future development activity by identifying sites that are likely to develop based on market feasibility and development potential;
- to estimate development capacity for different areas of the City;
- to serve as a basis for predicting residential growth under different development scenarios; and
- to help measure the possible impact of recommended land use plans, by predicting where residential growth may occur, which provides a basis to evaluate impacts – for example, impacts to the transportation system, tree canopy, housing supply, and air quality.

Important note: This is a 'supply-side' analysis. The model does not predict market demand for new construction. It only identifies lands within the City that could potentially become available for development/redevelopment should market demand exist.

[1] Statewide Planning Goal 10 requires cities to inventory "buildable lands" and ensure there is enough zoned land to accommodate their housing needs over the next 20 years. The HNA addresses how the City of Portland will accommodate future population growth by ensuring there is enough zoned land for housing, and that specific housing production strategies are created to support the development of needed housing.

Buildable Lands Inventory (BLI) Model Methodology

The BLI is based on a GIS model developed by BPS that applies a market-feasible development capacity analysis, which calculates the likelihood of development for different housing types. This model identifies capacity where development is financially feasible.

The BLI model consists of five steps, each of which is explained in detail in the following pages.

1. Calculate existing development in terms of building square footage and number of residential units;
2. identify likely development parcels based on development feasibility and site condition (vacant/non-vacant underutilized);
3. calculate gross development capacity using a matrix derived from market research;
4. apply development constraints to determine remaining, estimated development capacity in terms of number of residential units; and
5. integrate permit data for new housing units built since 2020 as 'realized' capacity.

Step 1. Calculate Existing Development

The BLI model uses the latest taxlot data from Multnomah County as the base dataset. The model uses only those taxlots with a centroid (the center point of the parcel) within the Portland urban service boundary (USB). The primary fields used for the analysis include those relating to the property type and description, property value, and ownership. Several other datasets related to building footprints, location, zoning and overlays, market and development information, and other information are then joined to the taxlot data for the analysis to occur.

Existing Development

The first main step in the BLI model is to analyze existing development to determine how much of each development parcel's potential capacity is currently being used to understand whether a site is likely to have a net positive increase in capacity.

Existing building square footage and residential unit counts are determined using the City of Portland's building footprint GIS layer. If the building square footage is not known for a site, or the data is missing

from the dataset, the model treats that site as having no existing development (until a square footage value exists in the building footprints layer).[2]

The model takes residential units from the building footprint layer when that data exists. When data about residential units does not exist and the zone is residential, the model approximates the number of existing units by using the building square footage, if known, and calculates the residential portion by applying market data from the 'Zoning Capacity' spreadsheet (which is described in the following section). In the single-dwelling zones ('R' zones), the model assumes lots with a building footprint of at least 600 square feet are occupied by one unit unless a different number exists in the residential unit count of the building footprint layer.

Step 2. Identify Development Parcels

The second step in the BLI model is to identify potential vacant and non-vacant development sites that are significantly underutilizing their potential development capacity. The methodology used to identify non-vacant underutilized parcels is significantly more involved than for vacant parcels.

Table 1. Approaches to Identifying Vacant and Underutilized Sites

Site Status	Approach
Vacant	Determined by the property descriptions in the Multnomah County Assessor database ("Vacant Land"), as well as a building footprint coverage threshold. If the building footprint on a given site covers less than five percent of the site area, the site is considered vacant.
Non-vacant (Developed)	Properties that have redevelopment potential in residential, mixed-use, and commercial zones are determined by a pro forma feasibility analysis. This analysis is described in more detail below. Properties may also be manually added or removed from consideration by staff.

[2] Of the 247,262 current buildings in the urban service boundary (USB), 240,575 have square footage values (97 percent), as of July 24, 2023. BPS GIS staff undergo sporadic reviews of the building footprint data to ensure the footprints of the largest developments are complete with residential units, square footage, and number of floors.

Ignored Taxlots. Several taxlots are removed from consideration, regardless of being vacant or developed, unless the property is manually added to the inventory by staff. These include any taxlot:

- Occupied by a public agency, including schools, but not including property owned by the Port of Portland, Home Forward (Portland Housing Authority), and Prosper Portland (formerly Portland Development Commission);
- Owned by Portland General Electric (PGE), Pacific Power, and Northwest Natural Gas;
- Owned by a railroad, which is mostly Union Pacific or Burlington Northern Santa Fe (BNSF) railways;
- Considered a gas station, church, public building, or residential condominium (per the Assessor's property description);
- Considered a park, natural area, or cemetery (more than 33 percent of the taxlot must be covered by one of these polygons in Metro's ORCA data and City of Portland parks data to be considered); or
- Within the PDX security fence.

Further explanation about the evaluation of vacant and non-vacant parcels is as follow.

Vacant Properties

Using the Multnomah County property description field in the taxlot data, any parcel with the property description "vacant land" is identified as vacant (this does not apply to land within the EOA Industrial Geographies).

Land is also considered vacant if the building footprint used in Step 1 covers less than five percent of the lot area. A map of vacant residential land is included in the appendix.

Non-vacant Properties

The BLI model assesses the likelihood of redevelopment activity on non-vacant properties, or developed lots, through a development feasibility analysis. Campus institution (CI) zones have an FAR that was developed in an analysis conducted for the 2016 BLI model; lots zoned CI are automatically considered underutilized and net development capacity is calculated based on that FAR.

For all zones, recently developed lots are excluded from consideration. Using the City's permit database, properties are identified as recently developed if there is an addition, alteration, or new construction permit (using the work description field) that adds new residential units or building square feet and was finalized within the past 10 years (dating back to 2013). These properties are not expected to redevelop within the 2045 timeframe and are not included in the underutilized inventory.

Detailed information about the process to identify redevelopable and underutilized non-vacant lots is as follows.

Pro Forma Feasibility Analysis

Non-vacant properties in residential and mixed-use commercial zones are individually identified as underutilized if they meet a development feasibility threshold as determined by a development feasibility pro forma model.

A pro forma model simulates real estate investment decision-making tools by considering multiple market attributes such as revenue, construction costs, and land prices. Here, the financial pro forma model is used to calculate the residual land value (RLV)[3] for 17 residential prototypical developments, or prototypes. Each of the prototypes has varying scales of intensity and tenure and is loosely calibrated to different mixed-use and residential zones. The pro forma and related code were developed by ECONorthwest in 2021 and updated by BPS in early 2023. The list of the inputs and assumptions and the characteristics of the prototypes used in the analysis are in the appendix.

The 17 different housing prototypes evaluated in the pro forma model include:

- Detached single dwelling: regular and narrow lot,
- Middle housing (ownership): duplex, duplex in an R7 zone, triplex, fourplex in an R2.5 zone, and townhomes,
- Middle housing (rental): duplex, triplex, fourplex, townhomes, and
- Apartments (rental[4]): wood frame (x2)[5], podium (x2), and tower.

Using Multnomah County assessor data, underutilized or redevelopable sites are identified wherever a property's adjusted market value (AMV) per square foot is lower than the residual land value (RLV) per square foot for at least one of the housing types allowed in its zone. Any lot where the AMV exceeds the RLV is not considered an economically viable development site.

- AMV < RLV = Viable development site
- AMV > RLV = Not a viable development site

---

[3] Residual land value is a metric that shows the maximum price a developer could spend on land, after all costs of developing have been subtracted.

[4] Multi-dwelling prototypes are limited to rentals because of the lack of multi-dwelling condominium development since before the Great Recession. Condo construction activity has declined to near-zero levels because of the liability challenges; condo developers are liable for damages for up to 10 years after construction and the insurance premiums have become prohibitively expensive, rendering almost every condo project infeasible.

[5] The pro forma model includes a wood-frame inner and wood-frame outer prototype. The Wood frame Inner is excluded from the Outer market area and the Wood Frame Outer is excluded from the Central City and Inner market areas.

The AMV is an adjusted version of the Assessor's real market value (RMV), calculated by multiplying the RMV by an adjustment factor. This was deemed necessary to reflect property values more accurately after analyzing Multnomah County Assessor real market value data and recent residential sale data from RMLS (the median RMV was compared to the median sales price to determine how much the RMV should be adjusted). Adjustments vary spatially by market area, as shown in the table below.

Figure 11. Portland Market Areas

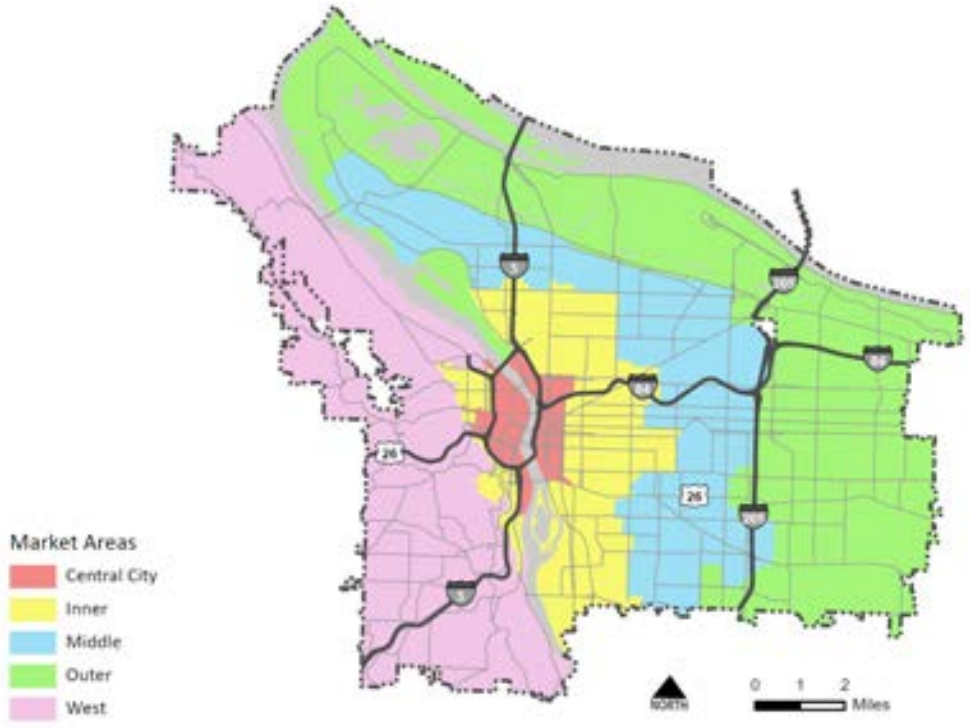

Table 2. Real Market Value (RMV) Adjustment Factors

Market Area	RMV Adj. Factor
Central City	1.20
Inner	1.20
Middle	1.22
Outer	1.40
West	1.25

RENT AND SALES PRICES

As revenue and land prices in Portland vary substantially compared to construction costs, the model uses revenue and land prices as spatial variables across Portland. Average predicted rents and sales prices for housing are generated for each of the City's 24 "Portland Plan Areas." The model populates

the revenue data in the pro forma for each site based on its Portland Plan Area. Rents and sales prices for each area are shown in the table below.

Rent Data Analysis. Rents were primarily estimated using Costar data in the Fall of 2022. This analysis excluded outlier observations that might indicate unreliable data. Rents were collected for middle housing developments and apartments.

To evaluate the possibility of different rent levels based on the building prototype and construction material, ECONorthwest ran model simulations to estimate the range of rents for different construction types. They found that high-rise buildings generated six percent (6%) higher rents than mid-rise buildings on average throughout the City. Low-rise buildings with fewer amenities were forecast to generate rents that are 20% lower than a podium-built prototype on average across Portland. These differences are applied as adjustment factors in the pro forma model.

The 'Middle Housing Rent' values in the table below populate the revenue assumptions for the duplex, triplex, fourplex, and townhome development types, while the 'Apartment Rent' values populate the wood frame, podium, and tower apartments.

Sales Price Data Analysis. Sales prices were calculated by analyzing five years of home sales (2018 to 2022) using the RMLS dataset. Staff implemented a trends-based analysis that determined the likely median sales price in 2023 for a single-dwelling home.

Where data was limited for a particular Portland Plan Area, resulting in smaller data sample sizes, the Area was combined with one or more adjacent Areas based on staff understanding of shared market conditions.

Table 3. Predicted Housing Revenue Data by Portland Plan Area

Portland Plan Area	Sale Price ($/sq.ft.)	Middle Housing Rent ($/sq.ft.)	Apartment Rent ($/sq.ft.)
122nd-Division	$303	$1.69	$2.19
Belmont-Hawthorne-Division	$385	$2.30	$2.79
Centennial-Glenfair-Wilkes	$307	$1.59	$2.04
Central City	$432	$2.07	$2.78
Forest Park-Northwest Hills	$337	$1.93	$2.41
Gateway	$291	$1.90	$2.42
Hayden Island-Bridgeton	$311	$1.92	$2.47
Hillsdale-Multnomah-Barbur	$357	$1.96	$2.68
Hollywood	$433	$2.23	$2.61
Interstate Corridor	$395	$2.07	$2.61

Tryon Creek-Riverdale	$328	$1.94	$2.43
West Portland	$334	$1.94	$2.44
Woodstock	$410	$2.21	$2.48

Source: BPS analysis using RMLS sales data and Costar rental data.

Manual Edits

The initial outputs of the Buildable Lands Inventory GIS model were thoroughly reviewed by the BPS staff. Based on staff knowledge, parcels that were known to have high development or redevelopment potential and were not identified by the model as underutilized were "manually" flagged as underutilized and included in subsequent model outputs. These "likely" parcels are all mapped as underutilized regardless of the existing or allowed development capacity.

Parcels that were not identified as constrained in Step 2 of the model, but that are known to have a very low likelihood for development or redevelopment, were manually flagged as "unlikely" to develop, and therefore not included in the final map of underutilized parcels, nor considered for capacity in the following step.

Step 3. Calculate Gross Residential Capacity

After identifying the underutilized and vacant lots in Step 2, the next step is to calculate the gross capacity (before constraints) for residential units.

Residential unit capacity is calculated different for single-dwelling (R) zones and multi-dwelling, mixed-use, and other (RM/CM/Other) zones.

R Zones

For economically viable vacant and non-vacant sites in the single-dwelling zones, the housing type in the pro forma with the highest number of units (no more than four units) is used to calculate the residential capacity of the lot. For all vacant sites in the single-dwelling zones, gross capacity is also capped at four units per lot, in keeping with recent housing production trends. The Residential Infill Project one-year report[6] showed a developer preference for four-unit townhouse and fourplex developments in the single dwelling zones; 73 percent of units permitted were middle housing, and of these, 76 percent were fourplexes and four-unit townhouse developments.

Land Divisions. If lots are 10,000 square feet or greater, the model reduces the area by 25 percent to reflect the likely reduction in buildable area due to right-of-way dedications, then divides the remaining square feet by the minimum lot size in the base zone, with the following exceptions:

[6] https://www.portland.gov/bps/planning/rip/news/2023/7/5/new-study-shows-promising-housing-production-results-residential

- Lots in a "Constrained Sites" overlay zone[7] (shown on the zoning map with the "z" map symbol) are limited to two units per lot. The model will undergo the land division process on lots larger than 10,000 square feet, but the resulting lots will still be subject to the two-unit maximum.
- Lots larger than two acres in RF zones are limited to two units and are not subject to the land division process.

RM/CM/Other Zones

For vacant and economically viable non-vacant sites in the mixed-use commercial (CM) and multi-dwelling (RM) zones, residential capacity is applied using a 'Zoning Capacity' matrix that dictates the likely densities, residential splits, and unit sizes for each geographic market area and zone. Capacity is not calculated for non-vacant sites that are not viable per the pro forma. The fields and attributes in the matrix are listed and described in the table below. The matrix was populated after extensive analysis and market research using the City's new construction permit data, Costar, and RMLS. and The full 'Zoning Capacity' matrix is provided in the appendix.

Gross residential capacity is calculated using the following formula:

Lot Area	X	Max FAR * FAR utilization rate	X	Residential split percentage	/	Average gross unit size

For example, a quarter-acre (10,000 square foot) site in the Middle market area with CM2 zoning has a maximum allowable FAR of 4 to 1 (after bonuses). An FAR utilization rate of 0.64 means the average development is expected to utilize 64 percent of the development entitlement, equating to an FAR of 2.6. Residential uses are expected to account for 60 percent of the development square footage, and at an average gross residential unit size (i.e., inclusive non-leasable space) of 750 square feet, this would result in 20.5 residential units of capacity on that site.

10,000	X	4.0 * 0.64	X	60%	/	750 sf	=	20.5 units

[7] The Constrained Sites overlay zone reduces development potential to comply with protective measures adopted and acknowledged pursuant to statewide land use planning goals. This overlay zone reduces risk to life or property from certain natural hazards.

Table 4. 'Zoning Capacity' Matrix Fields, Descriptions, and Attributes

Field	Description	Attributes
Market Area	Five areas of the City that share similar market conditions	Central City, Inner, Middle, Outer, West
Zone / Comprehensive Plan Designation	All City of Portland zoning and comprehensive plan designations	CE, CI1, CI2, CM1, CM2, CM3, CX, EG1, EG2, EX, IG1, IG2, IH, IR, IS, OS, R10, R2.5, R20, R5, R7, RF, RX, RM1, RM2, RM3, RM4, RMP, IC, MD-C, MD-N, MDP, MD-U, ME, MU-C, MU-D, MU-N, MU-U, CR
FAR	Allowable floor area ratio under base zoning	NA; 0.5:1 to 4.0:1
FAR + IH Bonus FAR	Total allowable floor area ratio after inclusionary housing bonus (applies to sites larger than 9,500 square feet).	NA; 1.5:1 to 6:0:1
FAR Utilization	Average utilization rate of allowable FAR under base zoning.	0.00 to 1.00
FAR + IH Bonus FAR utilization	Average utilization rate of allowable FAR under base zoning.	0.00 to 1.00
Residential Split	Percentage of total development square footage expected to be residential, based on permit trends.	0.00 to 1.00
MFR Split	Percentage of development expected to be residential, based on permit trends.	0.00 to 1.00
Parking Split	Percentage of development expected to be structured parking, based on permit trends.	0.00 to 1.00
Commercial Split	Percentage of development expected to be commercial, based on permit trends.	0.00 to 1.00
Average Unit Size	Anticipated gross residential unit size, in square feet.	600 to 3,000 square feet

FLOOR AREA RATIOS (FAR) AND UTILIZATION

Base FAR and Bonus FAR Selection. Portland's zoning and development regulations include a base FAR and a bonus FAR. Bonus FARs are intended to incentivize developers to build more affordable housing and can therefore be achieved by providing affordable housing units as part of the development. The City's Inclusionary Housing requires that all residential buildings proposing 20 or

more new units provide a percentage of the new units at rents affordable to households at 80% of the median family income or below.

Base FAR and Bonus FAR Selection. The base FAR is used wherever inclusionary housing does not apply—i.e., in non-residential zones—and on lots that are smaller than 9,500 square feet. The maximum FAR including IH bonus is used for lots in residential and mixed-use zones that are greater than 9,500 square feet. A recent analysis of 2019 to 2021 permit data by BPS found that 81 percent of two to 19-unit multi-dwelling developments were built on lots smaller than 10,000 square feet, compared to just 10 percent of 20+ unit multi-dwelling developments. The model, therefore, reflects the high probability that residential development on lots above 9,500 square feet will include at least 20 units and trigger inclusionary housing (9,500 was used instead of 10,000 to ensure the model captured most of the City's 'double' lots).

FAR Utilization Rate. An 'FAR Utilization Rate' is then applied to the base and bonus FARs to reflect the probable development densities. This approach 'right-sizes' the allowable densities to market realities. To come up with these rates, staff analyzed permit data from 2008 through 2019 to calculate the average FAR for each zone and market area and compared it to the maximum allowable FAR.

Plan Districts. Wherever a Plan District exists, the 'FAR' and 'FAR + IH Bonus FAR' outlined in the plan district override the development FAR limits in the Zoning Capacity matrix. The same utilization rates of the underlying zone then apply to the base and bonus development limits outlined in the Plan District. The same logic regarding lot size is used for bonus FARs in Plan District, i.e., bonus FARs are used, if applicable, for lots larger than 9,500 square feet.

LAND USE SPLITS

Once the overall development square footage is determined by the FAR and FAR Utilization Rates, the development is split between residential, commercial (or employment), and parking space using land use splits or ratios. These splits are based on an analysis of development trends using City permit data from 2008 through 2019.

For the residential component, the Zoning Capacity matrix (see appendix) includes average residential unit sizes (gross square feet) that are used to calculate the number of units from the residential square footage.

Step 4. Apply Development Constraints

Steps one through three calculate *gross* development capacity based on market potential, which does not consider development constraints that reduce the development capacity of the land.

BPS identified 26 different constraints to apply to the BLI model. Constraints are applied using a series of 'rates,' which range from 0.0 (completely constrained) to 1.0 (unconstrained) depending on the likely impact the presence of a given constraint has on development potential for housing, commercial, and employment uses. Development constraint rates were identified in an analysis of development permits that included constrained lands. Constrained lands include sites that lack needed urban infrastructure (for example, sites without sewer service), and physical or regulatory barriers to development (such as environmentally sensitive areas, historic landmarks, flood hazards, etc.).

Multiple Constraints. If multiple constraints exist on a site, the model applies the lowest applicable constraint rate (i.e., the most impactful). Then, to reflect the challenges that a developer might face where multiple constraints exist, the constraint rate is further reduced by 0.1 or 0.2 if two or three or more constraints exist, respectively.

Partial Lot Constraints. Constraints are incorporated into the model as two separate GIS feature classes, one for constraints that apply to an entire parcel (i.e., slope, brownfields, historic resources), and one for partial lot constraints (i.e., environmental protection overlays, wetlands, flood hazards). If a partial lot constraint exists, the BLI model uses a lot coverage threshold of 33 percent to determine whether or not to apply the constraint to the lot. In other words, if a partial lot constraint is on 50 percent of the lot, the BLI model proceeds as though that constraint impacts the entirety of the site; if a partial lot constraint is on 20 percent of the lot, the BLI model proceeds as though that constraint does not exist on the site, reflecting the general likelihood that a prospective developer can build around the constraint to such an extent that it does not infringe on development potential.

Following is a list of each constraint used in the BLI model. A full matrix that includes the constraint rates for housing and Central City, commercial, and industrial employment uses is in the appendix. Maps of each constraint can be found online on the BLI project webpage at https://www.portland.gov/bps/planning/bli/2023-documents.

Table 5. Constraint Rates

Category	Field	Description
Brownfields	conECSI	DEQ, Environmental Cleanup Sites I (ECSI)
Brownfields	conLUST	DEQ, Underground Storage Tank Cleanup Sites (UST)
Cultural Resources	conHist	Historic and Conservation districts
Cultural Resources	conHistLdm	Historic and Conservation Landmarks
Cultural Resources	conNatAm	Parcels requiring archaeological scan or consultation with Native American tribal governments
Environmental Overlays	conCovrly	Environmental Conservation Zones
Environmental Overlays	conPovrly	Environmental Protection Zones
Flight Limitations	conAirHgt	Approach and departure cones
Flight Limitations	conHeliprt	Heliport Landing (impacts several buildings near Portland Heliport)
Flight Limitations	conNoise	Noise contours (areas above LDN 65 and 68 noise contours)
Greenway	conGW	All land with g/r/n overlays; land within I overlay where 10% or more of the parcel is within 125' of OHW
Hazards	conFld100	FEMA 100-Year Floodplain Map
Hazards	conFldway	FEMA Floodway Map
Hazards	conLSHA	Parcels within 50' of a mapped landslide hazard area
Hazards	conSlp25	Parcels where 25% or more of the parcel has a slope of more than 25%
Infrastructure	conSewer	Infrastructure Constrained Areas: Sewer
Infrastructure	conStorm	Stormwater System
Infrastructure	conWater	Water System
Natural Resources	conWetland	Wetlands
Public Ownership	conInstit	Institutional Campuses
Public Ownership	conPrvCom	Private Common Open Space
Public Ownership	conPubOwn	Publicly owned or controlled lots that do not provide for residential uses
Scenic Areas	conView	Views
Transportation	conTranCap	2008 Volume to Capacity Ratios
Transportation	conTranInt	ODOT Highway Interchanges
Transportation	conTranSub	Substandard and Unimproved Streets

Constrained Lands Analysis. The constraint rates for each of the above constraints were determined by an analysis of development permit data from 2012 to 2022 on constrained and unconstrained land. Steps in the analysis that calculated the constraint rates are outlined below. This analysis was implemented for all constraints. For constraints that had an insufficient number of developments in the permit data to analysis, the constraint rates match those used in the 2016 BLI.

1. Starting with the 2012 BLI taxlot data, identify which sites were considered developed, underutilized, and vacant. This analysis focuses on the development rates of sites considered underutilized and vacant as of 2012.
2. Join all constraints to the 2012 BLI taxlot data in GIS, then join the General EOA Geographies.

3. Join the permit data from the past decade (2012-2022), including only finaled permits for new construction and a permit description of either "Residential 1 & 2 Family" or "Commercial Building Permit."
4. Flag any site as "developed" if the FAR increased by at least 0.2. Sum the total of the square footage of new construction permits during the FAR calculations because some multi-building developments have separate permits for each building.
5. For each constraint, calculate the constrained and unconstrained development rate on vacant and underutilized BLI lots. Divide the newly developed building square footage on constrained land by the constrained acreage, then divide the newly developed building square footage on unconstrained land by the unconstrained acreage.
6. To get the constraint rate for each constraint, divide the latter (unconstrained development rate) by the former (constrained development rate). The constraint rate reflects the anticipated rate of development on constrained sites compared to unconstrained sites.

The following table demonstrates the calculations using real data for the brownfield (ECSI) constraint.

Table 6. Constraint Rate Calculations (Brownfield Example)

	2012 BLI Lot Acres	Recently Developed Bldg. Sq. Ft.	Development Sq. Ft. per BLI Lot Acre	Calc. Rate: Constrained / Unconstrained	Constraint Rate Used in Model
Unconstrained					
Central City	1,032	7,198,223	6,974		
Commercial	3,236	12,714,202	3,929		
Industrial	7,942	5,106,873	643	*N/A*	
Institutional	671	393,996	587		
Residential	31,418	15,961,661	508		
Constrained					
Central City	158	1,831,849	11,619	167%	0.95
Commercial	143	1,195,073	8,382	213%	0.95
Industrial	5,843	1,874,275	321	50%	0.5
Institutional	86	0	0	0%	0.05
Residential	130	113,934	874	172%	0.95

Source: BPS Analysis of Permit and Taxlot data

Step 5. Integrate Recent Permit Data

The BLI uses 2020 as a base year. However, development continues in the real world. The model integrates actual development data as 'realized' capacity on recently developed sites. The BLI, therefore, incorporates permit data (housing unit counts and building square footage) on any lot not already deemed underutilized and with a build year in the Multnomah County taxlot layer of 2020 to 2023. The model draws this information from issued, under inspection, and finaled permits in the City's permit database from 2015 to 2023 to ensure that no permit activity is missed for newly developed lots. Specifically, housing unit counts and building square footage overrides the modeled capacity of any developed site, in recognition that newly developed sites are unlikely to redevelop again through 2045.

The table below provides a summary of the permit data that is integrated into the BLI model as realized capacity. A total of 2,856 properties were developed between 2020 and 2023 (through June), delivering almost 20,000 residential units across 695 acres at an average density of 29 units per acre and seven units per lot.

Table 7. Residential Permit Data for Lots Developed from 2020 through June 2023

District	Number of Properties	Residential Units	Total Taxlot Acres
Central City	45	5,121	24
East	509	2,016	144
North	471	3,424	121
Northeast	574	2,713	159
Southeast	876	3,858	109
West	381	2,772	139
Total	**2,856**	**19,904**	**695**

Source: BPS

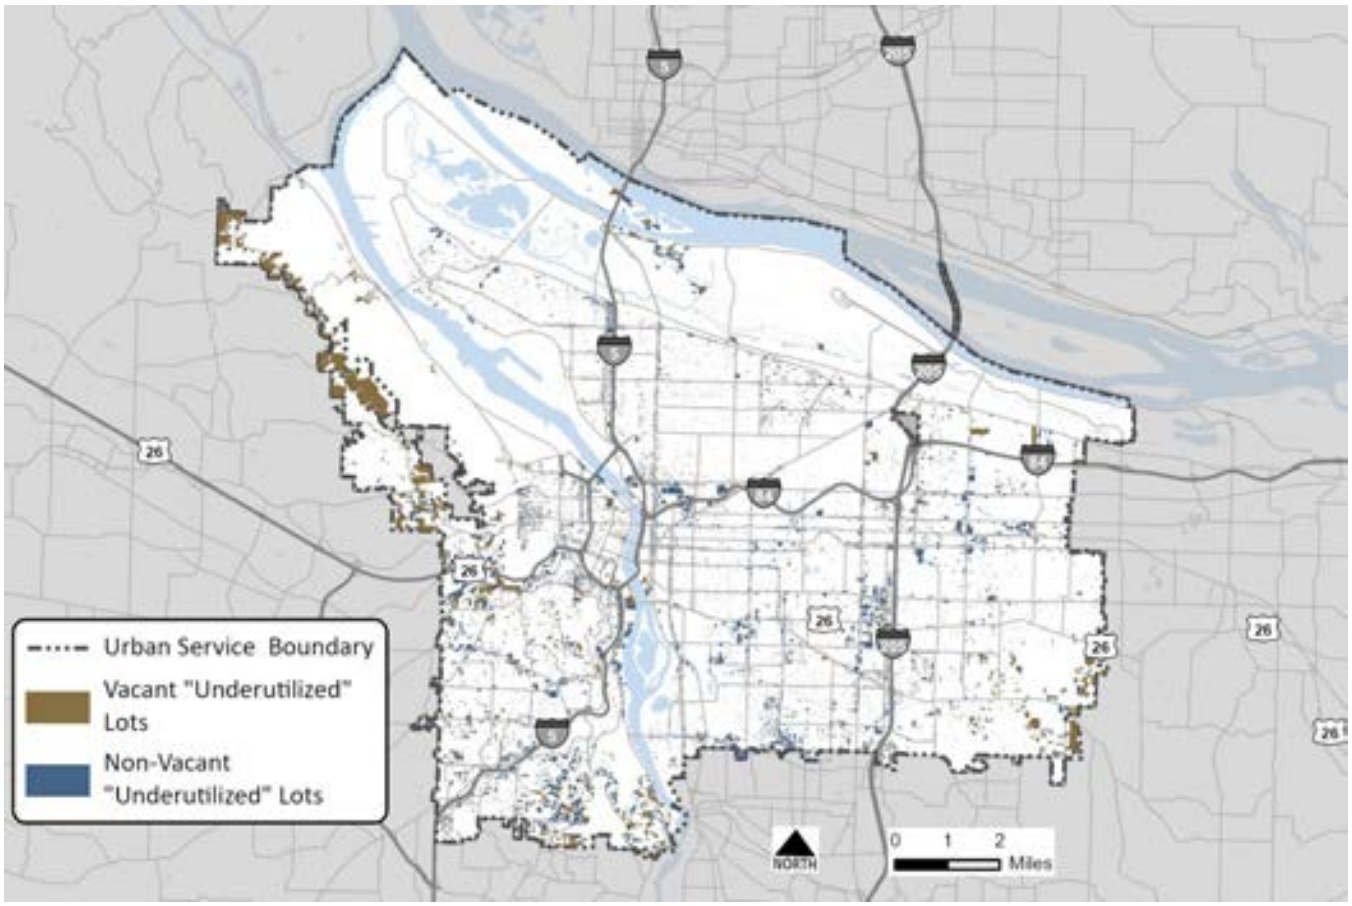
Residential Buildable Lands Inventory Results

This section describes the BLI model results, including vacant and underutilized land and capacity for new residential (units) development. For more detailed analysis, see the Housing Needs Analysis (HNA).

Vacant and Underutilized Residential Land

The map below shows vacant and non-vacant underutilized lots available for residential development and considered in the BLI model for residential unit capacity. Central City accounts for 4.6 percent of the vacant and non-vacant utilized lots, Inner Portland for 22.7 percent, Middle Portland for 31.0 percent, Outer Portland for 16.0 percent, and West Portland for 25.7 percent. These lots include both constrained and unconstrained land throughout Portland and do not necessarily correspond to potential unit capacity in each market area.

Figure 2. Vacant and Underutilized Residential Lots



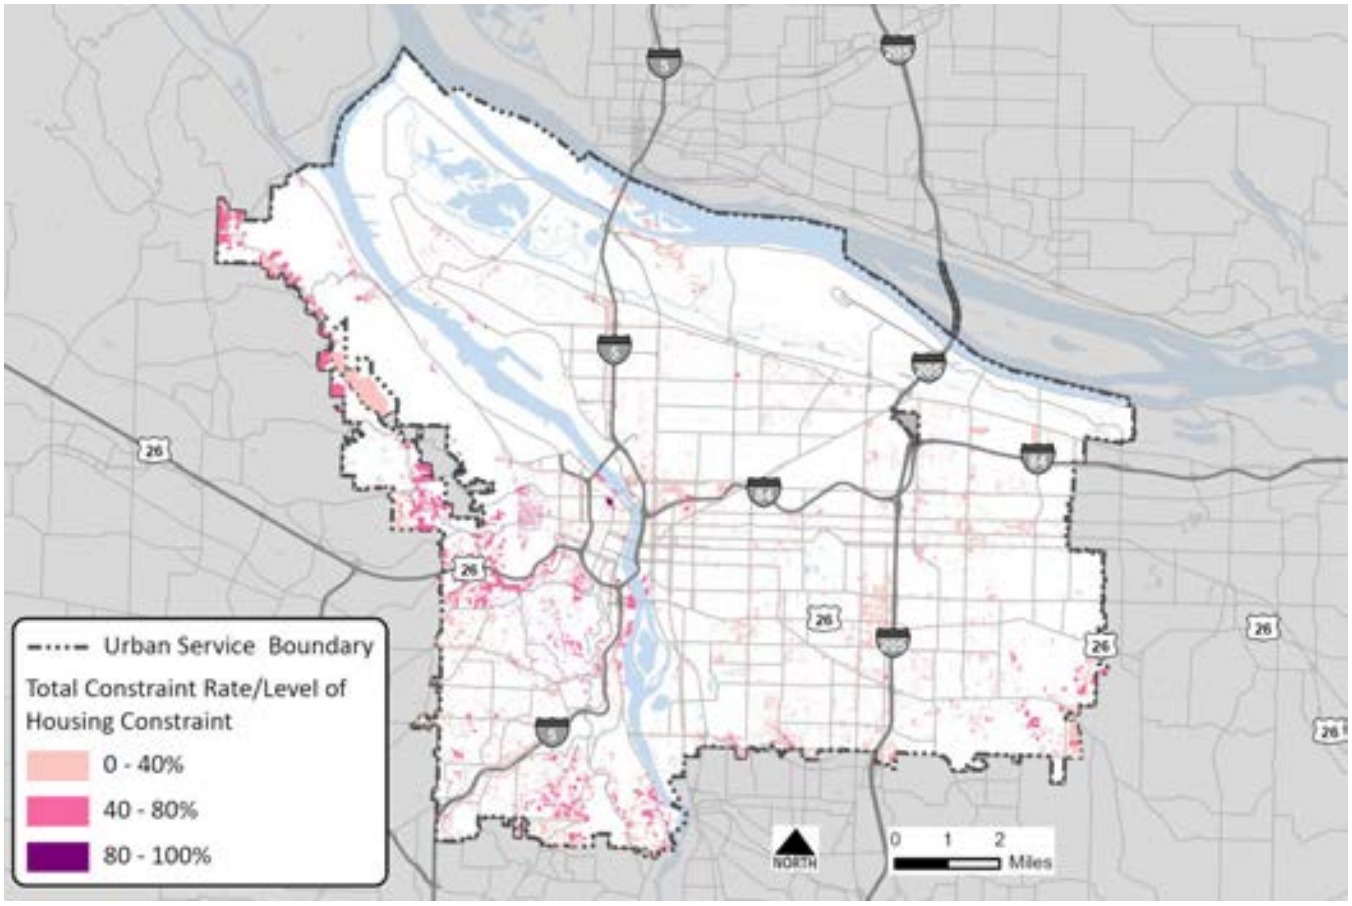
Source: BPS

Residential Constraints

The following map shows the total constraint rate used by the BLI model for residential development. The map shows three levels of housing constraints: 0-40 percent (unconstrained to mildly constrained), 40-80 percent (moderately to severely constrained), and 80-100 percent (severely to completely constrained).

About 83 percent of Portland's acreage is constrained by at least one of the 26 development constraints in the model. About 79 percent of Portland's underutilized residential land is constrained. West Portland, where steep slopes and environmentally sensitive areas are common, accounts for 58 percent of Portland's underutilized residential land acreage. East Portland accounts for 19 percent. Central City and Southeast, Northeast, and North Portland each account for less than 10 percent.

Figure 3. Level of Housing Constraint



Source: BPS

Net Residential Development Capacity

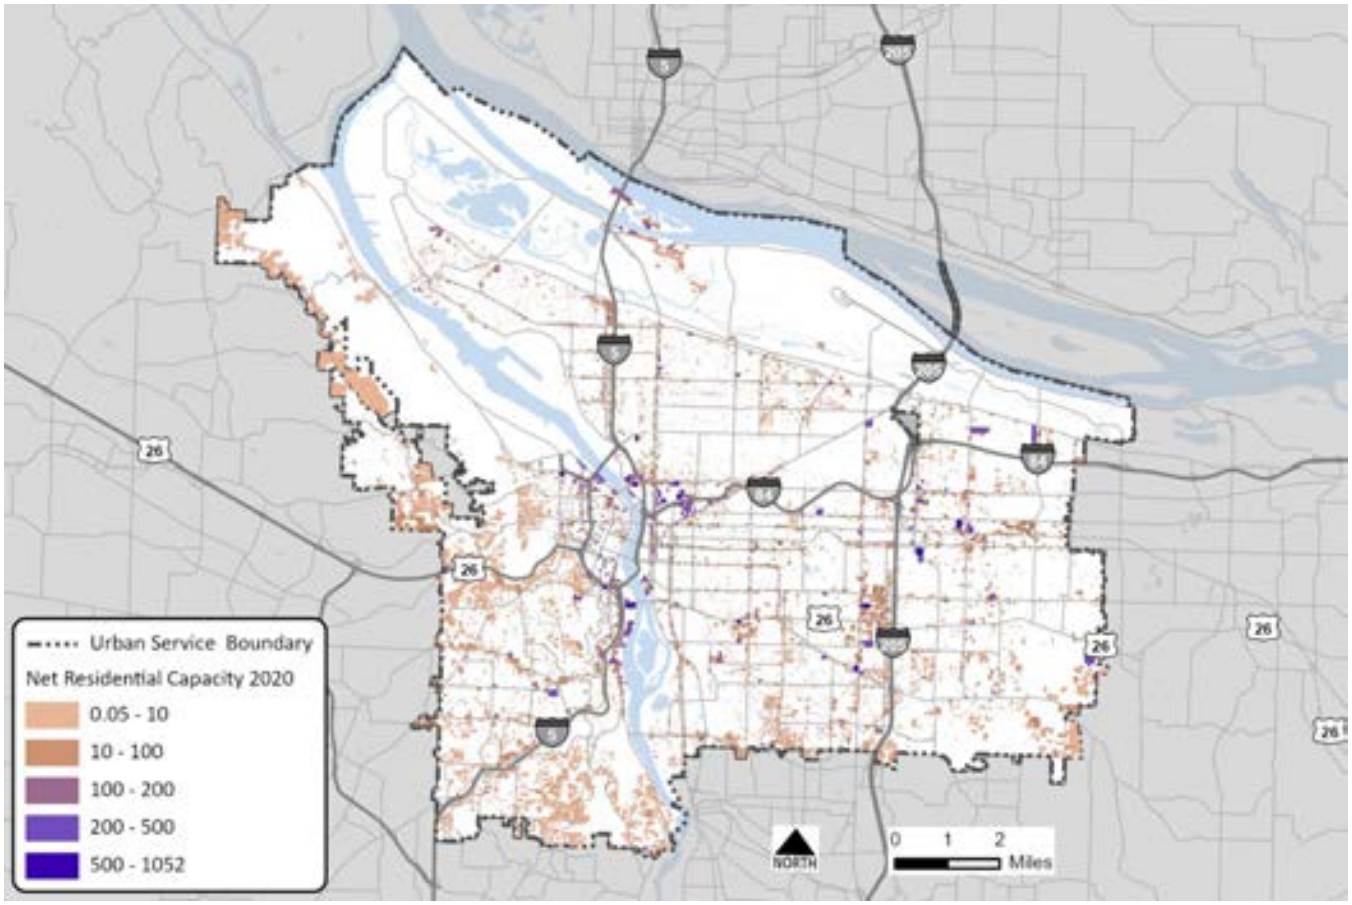
The results of the Buildable Lands Inventory show an estimated capacity for an additional 236,977 housing units in the City of Portland.

Table 8. Residential Capacity by District

District	Capacity (Dwelling Units)
Central City	67,052
East	38,527
North	22,621
Northeast	27,400
Southeast	47,785
West	33,593
Total	**236,977**

Source: BPS analysis

Figure 4. Housing Unit Capacity



Source: BPS

The Residential Capacity Map below illustrates residential capacity by Transportation Analysis Zone (TAZ), shown as housing units per acre (density). Areas of high-density residential capacity tend to be in Portland's centers and corridors where most of the City's mixed-use and multi-dwelling zoning currently exist. Central City accounts for 29 percent of new housing unit capacity citywide, but just five percent of Portland's vacant and underutilized lots, reflecting a concentration of high-density development capacity. At the opposite end of the spectrum, West Portland accounts for just seven percent of new housing unit capacity but 26 percent of Portland's vacant and underutilized lots, reflecting both the presence of development constraints and the concentration of lower-density zoning.

Appendix 4. Constraint Maps

All constraint maps are online in the 2023 BLI Documents folder at the following link: https://www.portland.gov/bps/planning/bli/2023-documents. Maps exist for each of the following constraints.

- Environmental Overlays
- Flight Limitations
- Flood Hazards
- Greenway Constraint
- Historic and Cultural Resources
- Institutional Properties
- ODOT Highway Interchanges
- Potentially Contaminated Sites
- Privately Owned Common Space
- Publicly Owned Land
- Scenic Views
- Sewer System
- Slope Landslide Hazards
- Stormwater System
- Transportation Capacity
- Unimproved and Substandard Streets
- Water System
- Wetlands

Category	Field	Description	Partial Lots	Housing	Central City Emp.	Industrial Emp.	Commercial Emp.	Institution Emp.
Brownfields	conECSI	DEQ, Environmental Cleanup Sites I (ECSI)	No	0.95	0.95	0.50	0.95	0.05

Sherwood High School

82 acres (=site added to the UGB by Metro in 2016)
350,000 square feet for school building (8 acres of interior space)
11 acres (approximately) of parking
Six ball fields
$250 million construction cost
Enrollment 1,636 (2022-23)
Built to accommodate 2,046 students by 2023 and 2,182 in 2025
2022 forecast for enrollment in 2032 is 1,530

Appendix A Memorandum, Application of Statewide Planning Program Laws to the Urban Link Segment of Roy Rogers Road

Appendix B Existing Section and Concepts for Widened Section, Urban Link Segment, Roy Rogers Road Improvements

Appendix C Effects of the Original Construction of Roy Rogers Road

Introduction

Washington County is considering an amendment to the County Transportation System Plan (TSP) to designate the Urban Link Segment (ULS) of Roy Rogers Road as having four to five lanes. The ULS extends from where the road leaves the Portland metro urban growth boundary (UGB) and Tigard city limits ½-mile south of Bull Mountain Road to where it re-enters the UGB and enters the Sherwood city limits about .8 mile from OR 99W. See Figure 1. The TSP now designates the ULS as an arterial and as having two lanes.[1] For the reasons contained in Appendix A, when the County adopts this amendment to the TSP, it must comply with ORS 215.296, which states:

> (1) A use allowed under ORS 215.213(2) . . . may be approved only where the local governing body or its designee finds that the use will not:
>
> (a) Force a significant change in accepted farm or forest practices on surrounding lands devoted to farm or forest use or
>
> (b) Significantly increase the cost of accepted farm or forest practices on surrounding lands devoted to farm or forest use.
>
> (2) An applicant for a use allowed under ORS 215.213(2) . . . may demonstrate that the standards for approval set forth in subsection (1) of this section will be satisfied through the imposition of conditions. Any conditions so imposed shall be clear and objective.
>
> * * *

The County will use the analysis in this report as a source when it prepares the findings required by ORS 215.296.

Roy Rogers Road is unusual in that it is one of only two single roads in Washington County that connect two parts of the Portland metro UGB.[2] This is why the segment of Roy Rogers Road between the UGB in Tigard and the UGB in Sherwood is called the ULS. The ULS serves urban travel demand through a rural agricultural area.

Background

History of Roy Rogers Road

Washington County built Roy Rogers Road in the late 1990s. Prior to its construction, there was no road connection between what are now the intersections of Roy Rogers Road with Bull Mountain Road and Elsner Road, as shown in Figure 2. The segment between Scholls Ferry Road and the intersection of Roy Rogers Road with Beef Bend Road existed prior to the construction of Roy Rogers Road and was called Beef Bend Road. There was a 90-degree turn at the location of the existing intersection. The road was called Beef Bend Road between Scholls Ferry Road and the turn, as well as east of the turn. Between the intersections of Roy Rogers Road with Elsner Road and Scholls-Sherwood Road, the road was called Elsner Road. There was a 90-degree turn in Elsner Road and it intersected with Scholls-Sherwood Road. What is now Roy Rogers Road between Scholls-Sherwood Road and OR 99W was called Scholls-Sherwood Road. Where Roy Rogers Road follows the prior alignments of Beef Bend, Elsner, and Scholls-Sherwood Roads, the

[1] Washington County, Transportation System Plan Users' Guide, Figure 3-10, Lane Numbers, p. 71.
[2] The other road is SW 175th Avenue immediately to the north of Roy Rogers Road at its intersection with Scholls Ferry Road.

Figure 1 Vicinity Map

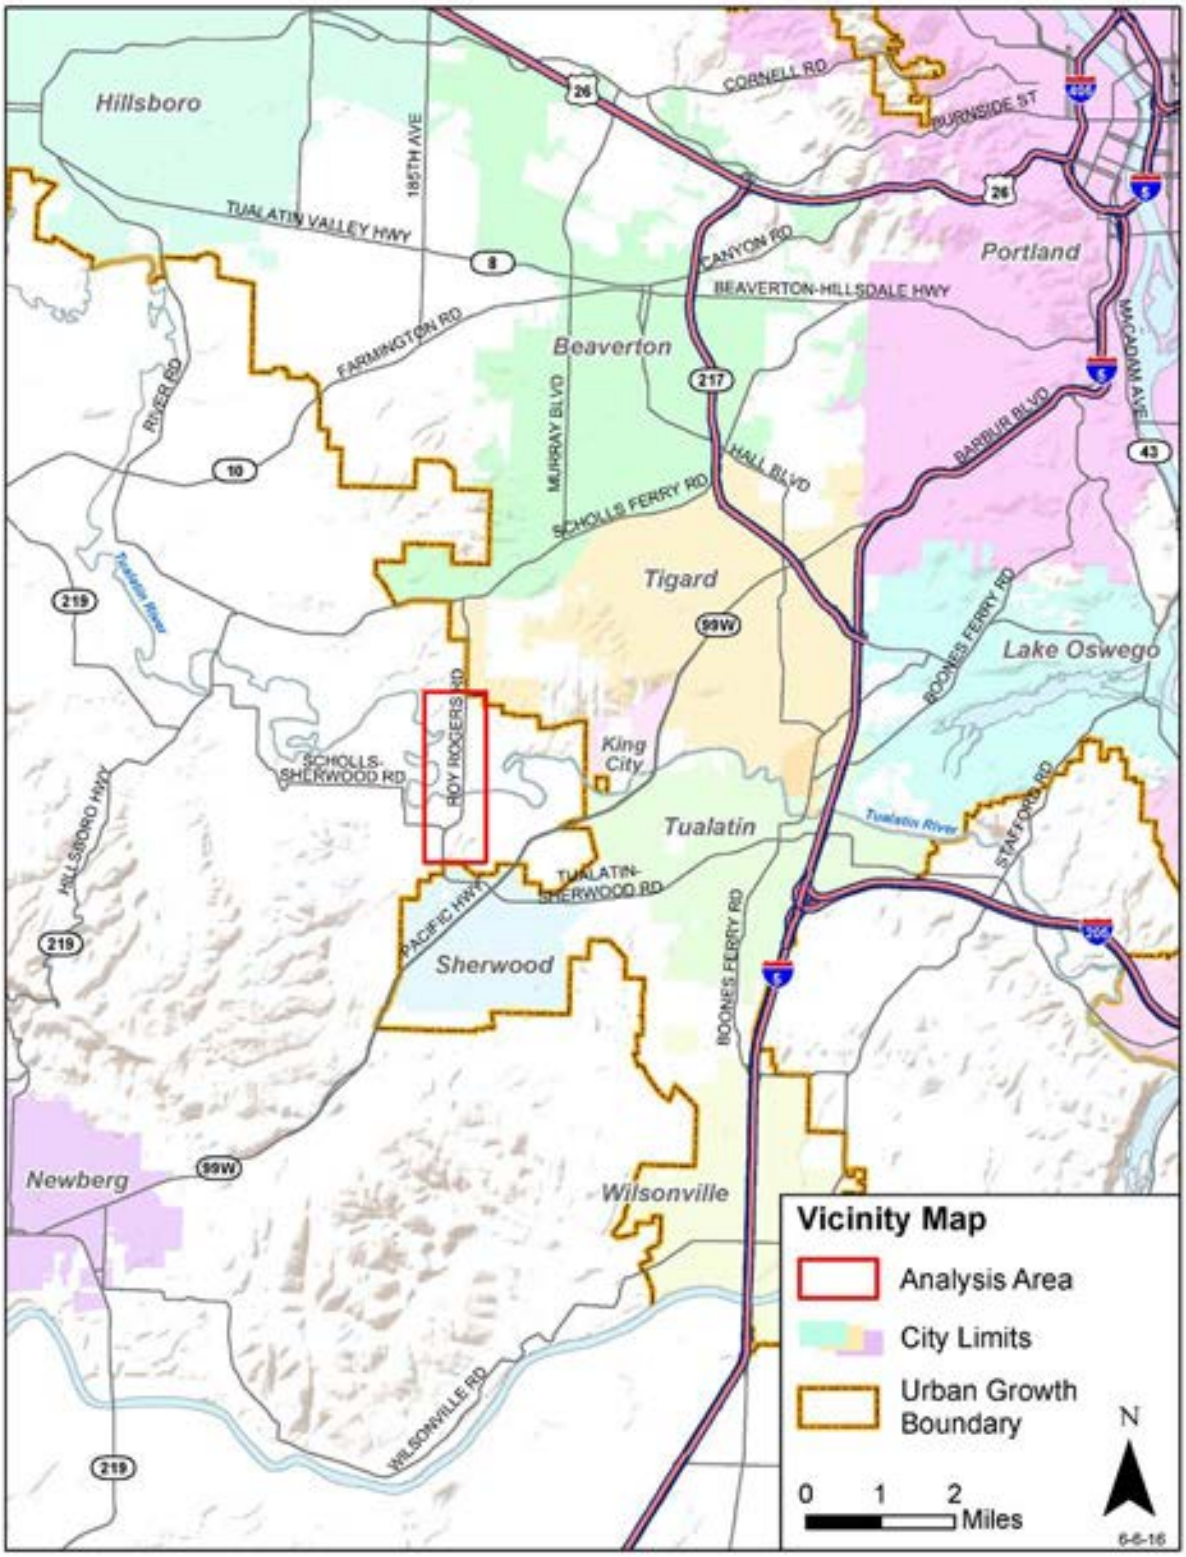

Figure 2 Urban and Rural Reserves and Road Alignments Before Construction of Roy Rogers Road

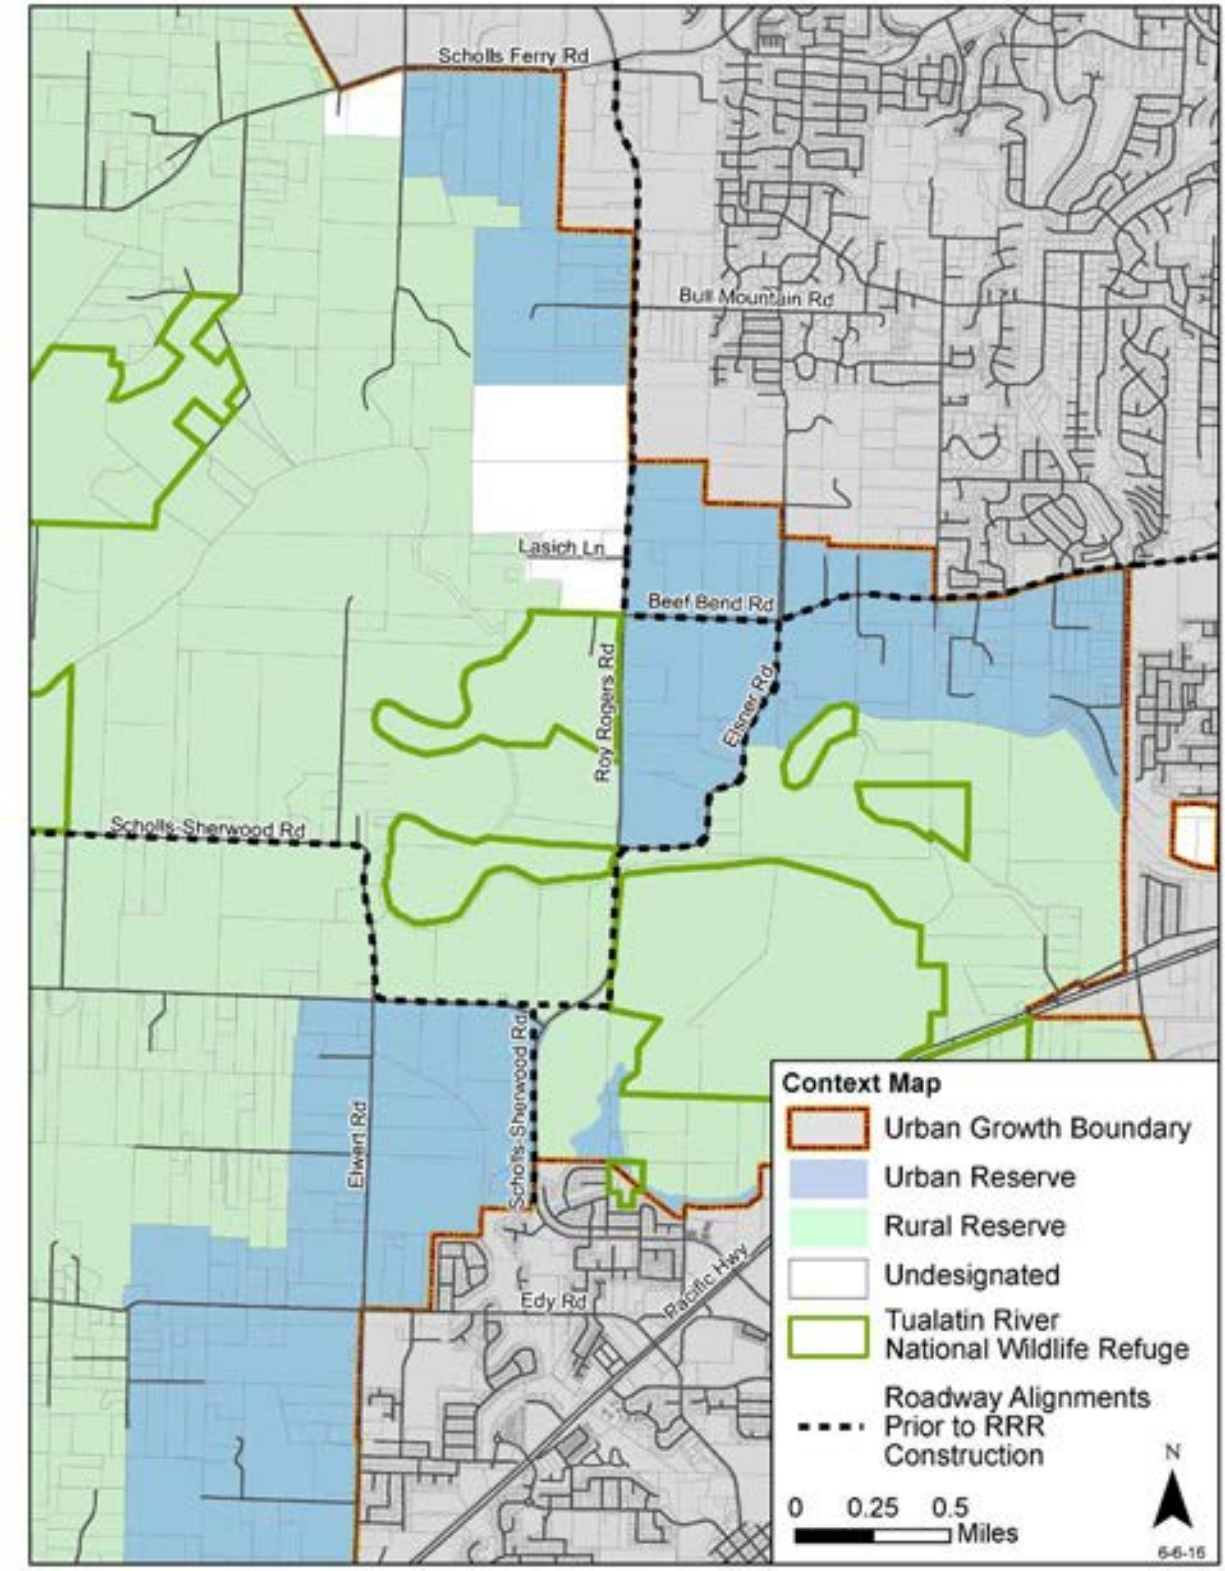


roadway was reconstructed and widened. As described below and shown in Figure 2, in the new segment of Roy Rogers Road, the roadway divided land parcels and farm fields. Roy Rogers Road was built as part of a transportation and land use strategy adopted by Metro in the 1990s as an alternative to a proposal that was called the Western Bypass. The proposal called for a freeway between I-5 south of Portland and U.S. 30 northwest of Portland.

The County is preparing to widen Roy Rogers Road from Scholls Ferry Road to the northern limits of the ULS segment, with construction scheduled to begin in 2018. The TSP already designates Roy Rogers Road in that segment, which is within the Portland metro UGB and the Tigard city limits, as having four to five lanes. Because of growing traffic volumes, the County would like to extend that widening project to approximately 1,000 feet south of Beef Bend Road. In the longer term, the County would like to widen Roy Rogers Road all the way to OR 99W, through the southern limit of the ULS, i.e., the UGB/Sherwood city limits. Roy Rogers Road has been selected as the route for the Willamette Water Supply pipeline to Hillsboro. Coordinating widening Roy Rogers Road with construction of the pipeline could result in a decision to widen Roy Rogers Road sooner than would otherwise be the case.

Plan Designations and Zoning

All of the land along the ULS is zoned Exclusive Farm Use (EFU). As Figure 2 shows, Washington County has designated some of the land Urban Reserve and some of the land Rural Reserve. While land within UGBs is designated to accommodate population and employment growth projected to occur within 20 years, land within Urban Reserves is designated to accommodate projected population and employment growth beyond 20 years in the future. Land within Rural Reserves is designated as being protected from urbanization for up to 50 years as a means "to provide long-term protection to the agricultural industry . . ."[3] As indicated above, the Portland metro UGB defines the north and south limits of the ULS. Figure 2 shows the distance between the land designated Urban Reserve and the UGB.

Proposed Widening

There is no design for how the ULS would be widened, but the County would apply and adapt its standard section for rural five-lane arterials. The top section in Appendix B shows the existing roadway. The left side of the lower section in Appendix B shows the County's standard for a rural five-lane arterial. In addition to a center turn lane/median, 12-foot travel lanes, 8-foot paved shoulder, 6-foot gravel shoulder, and clear zone, it includes a ditch to convey stormwater runoff. The right side of the lower section in Appendix B shows an alternative treatment for the improvements outside the paved shoulder. Under the alternative treatment, stormwater runoff would be contained within the roadway by mountable curbs. It would then be conveyed by storm sewer pipes located under the shoulder. With both alternatives, stormwater would be conveyed to detention and treatment ponds or swales.

Widening the ULS is expected to necessitate the acquisition of additional right-of-way and of permanent easements for slopes and drainage, but by how much and where will not be determined until the project design stage. The existing right-of-way boundary has not been surveyed, but is thought to be 90 feet wide for most of the ULS. At some locations, it may be possible to accommodate all of the improvements within the existing right-of-way. At other locations, improvements could result in right-of-way and easements that total 120 feet or more in total width. Factors affecting total width that will vary along the ULS are expected to include center turn lane locations, the slopes on each side of the roadway, stormwater treatment facilities,

[3] ORS 195.141(3).

and use of guard rails and retaining walls. If and where used, the alternative treatment for the improvements outside the paved shoulder, as shown on the right side of the lower section in Appendix B, may reduce total width. Generally, land would be acquired equally from each side of the road. However, at some locations, most or all of the acquisition could be from one side of the road. Where one side of the ULS borders land in the Tualatin River National Wildlife Refuge, it is expected that all of the widening will be on the other side of the roadway.[4]

Methodology and Terminology

The analysis in this report is based on information and judgements obtained from interviews with the owners and farmers of parcels along the ULS where farming is the principal use. These are the parcels that are "devoted to farm . . . use," in the language of ORS 215.296, and are referred to in this analysis as commercial farms. The analysis is also based on interviews with representatives of the Oregon Department of Agriculture, Oregon State University Extension Service, Washington County Farm Bureau, and Tualatin Valley Irrigation District. All of the interviews were conducted between May 6th and May 31st, 2016.

The analysis does not address the effect of widening the ULS on four uses in the analysis area, because the uses are not covered by ORS 215.296:

- parcels for which farming is incidental to the residential use of the parcel, because the parcels are not "devoted to farm . . . use."
- the parcel on the west side of Roy Rogers Road immediately north of its intersection with Beef Bend Road. This is because the City of Tigard has purchased the property for a park. Conversion of the existing farm and nursery operation to park use is expected to have occurred by or roughly at the same time as the widening of the ULS at the parcel's location.
- retail stores, because they are not farm uses within the meaning of ORS 215.296. Within the Analysis Area (AA), these are the Baggenstos Farm Store north of Beef Bend Road and Al's Garden Center south of Beef Bend Road. In the past, a farm stand has operated near the intersection of Roy Rogers Road with Scholls-Sherwood Road and operation of a farm stand there may resume in the future.
- the Tualatin River National Wildlife Refuge. Oregon law states, "'Farm use' also includes the propagation, cultivation, maintenance and harvesting of aquatic, bird and animal species that are under the jurisdiction of the State Fish and Wildlife Commission, to the extent allowed by the rules adopted by the commission."[5] While the Refuge propagates aquatic, bird, and animal species that are under the jurisdiction of the State Fish and Wildlife Commission, it is not covered by Oregon Fish and Wildlife Commission administrative rules and is outside the Commission's jurisdiction. Therefore, the Refuge is not a farm use for purposes of ORS 215.296.

The AA for this analysis comprises the lands abutting the ULS and the land abutting Scholls-Sherwood to Elwert Road, which is made up of parcels under the same ownership as lands abutting Roy Rogers Road.

[4] Section 4(f) of the Department of Transportation Act of 1966 makes it unlikely that the ULS could be widened into Refuge land.

[5] ORS 215.203(2)(a).

As used in this analysis:

- "ownership" refers to one or more contiguous parcels owned by the same person, members of the same family, or entity.
- "farmer" refers to either the owner or owners of a farm that produces products for human consumption or use or the person who actually farms or manages an "ownership."
- "tenant farmer" refers to the person or business that farms a parcel under either a contract or land lease.

Analysis

Existing Practices

What is Produced

Figure 3 shows what is produced by the commercial farm ownerships in the AA, as reported by the interviewed farmers. The MF Beef Bend, LLC, ownership, formerly operated as Fisher Farms, a wholesale nursery, is not currently in use. However, Metropolitan Land Group, LLC, which manages the parcel, is seeking tenants to operate there as wholesale nurseries.

Cultivation Practices

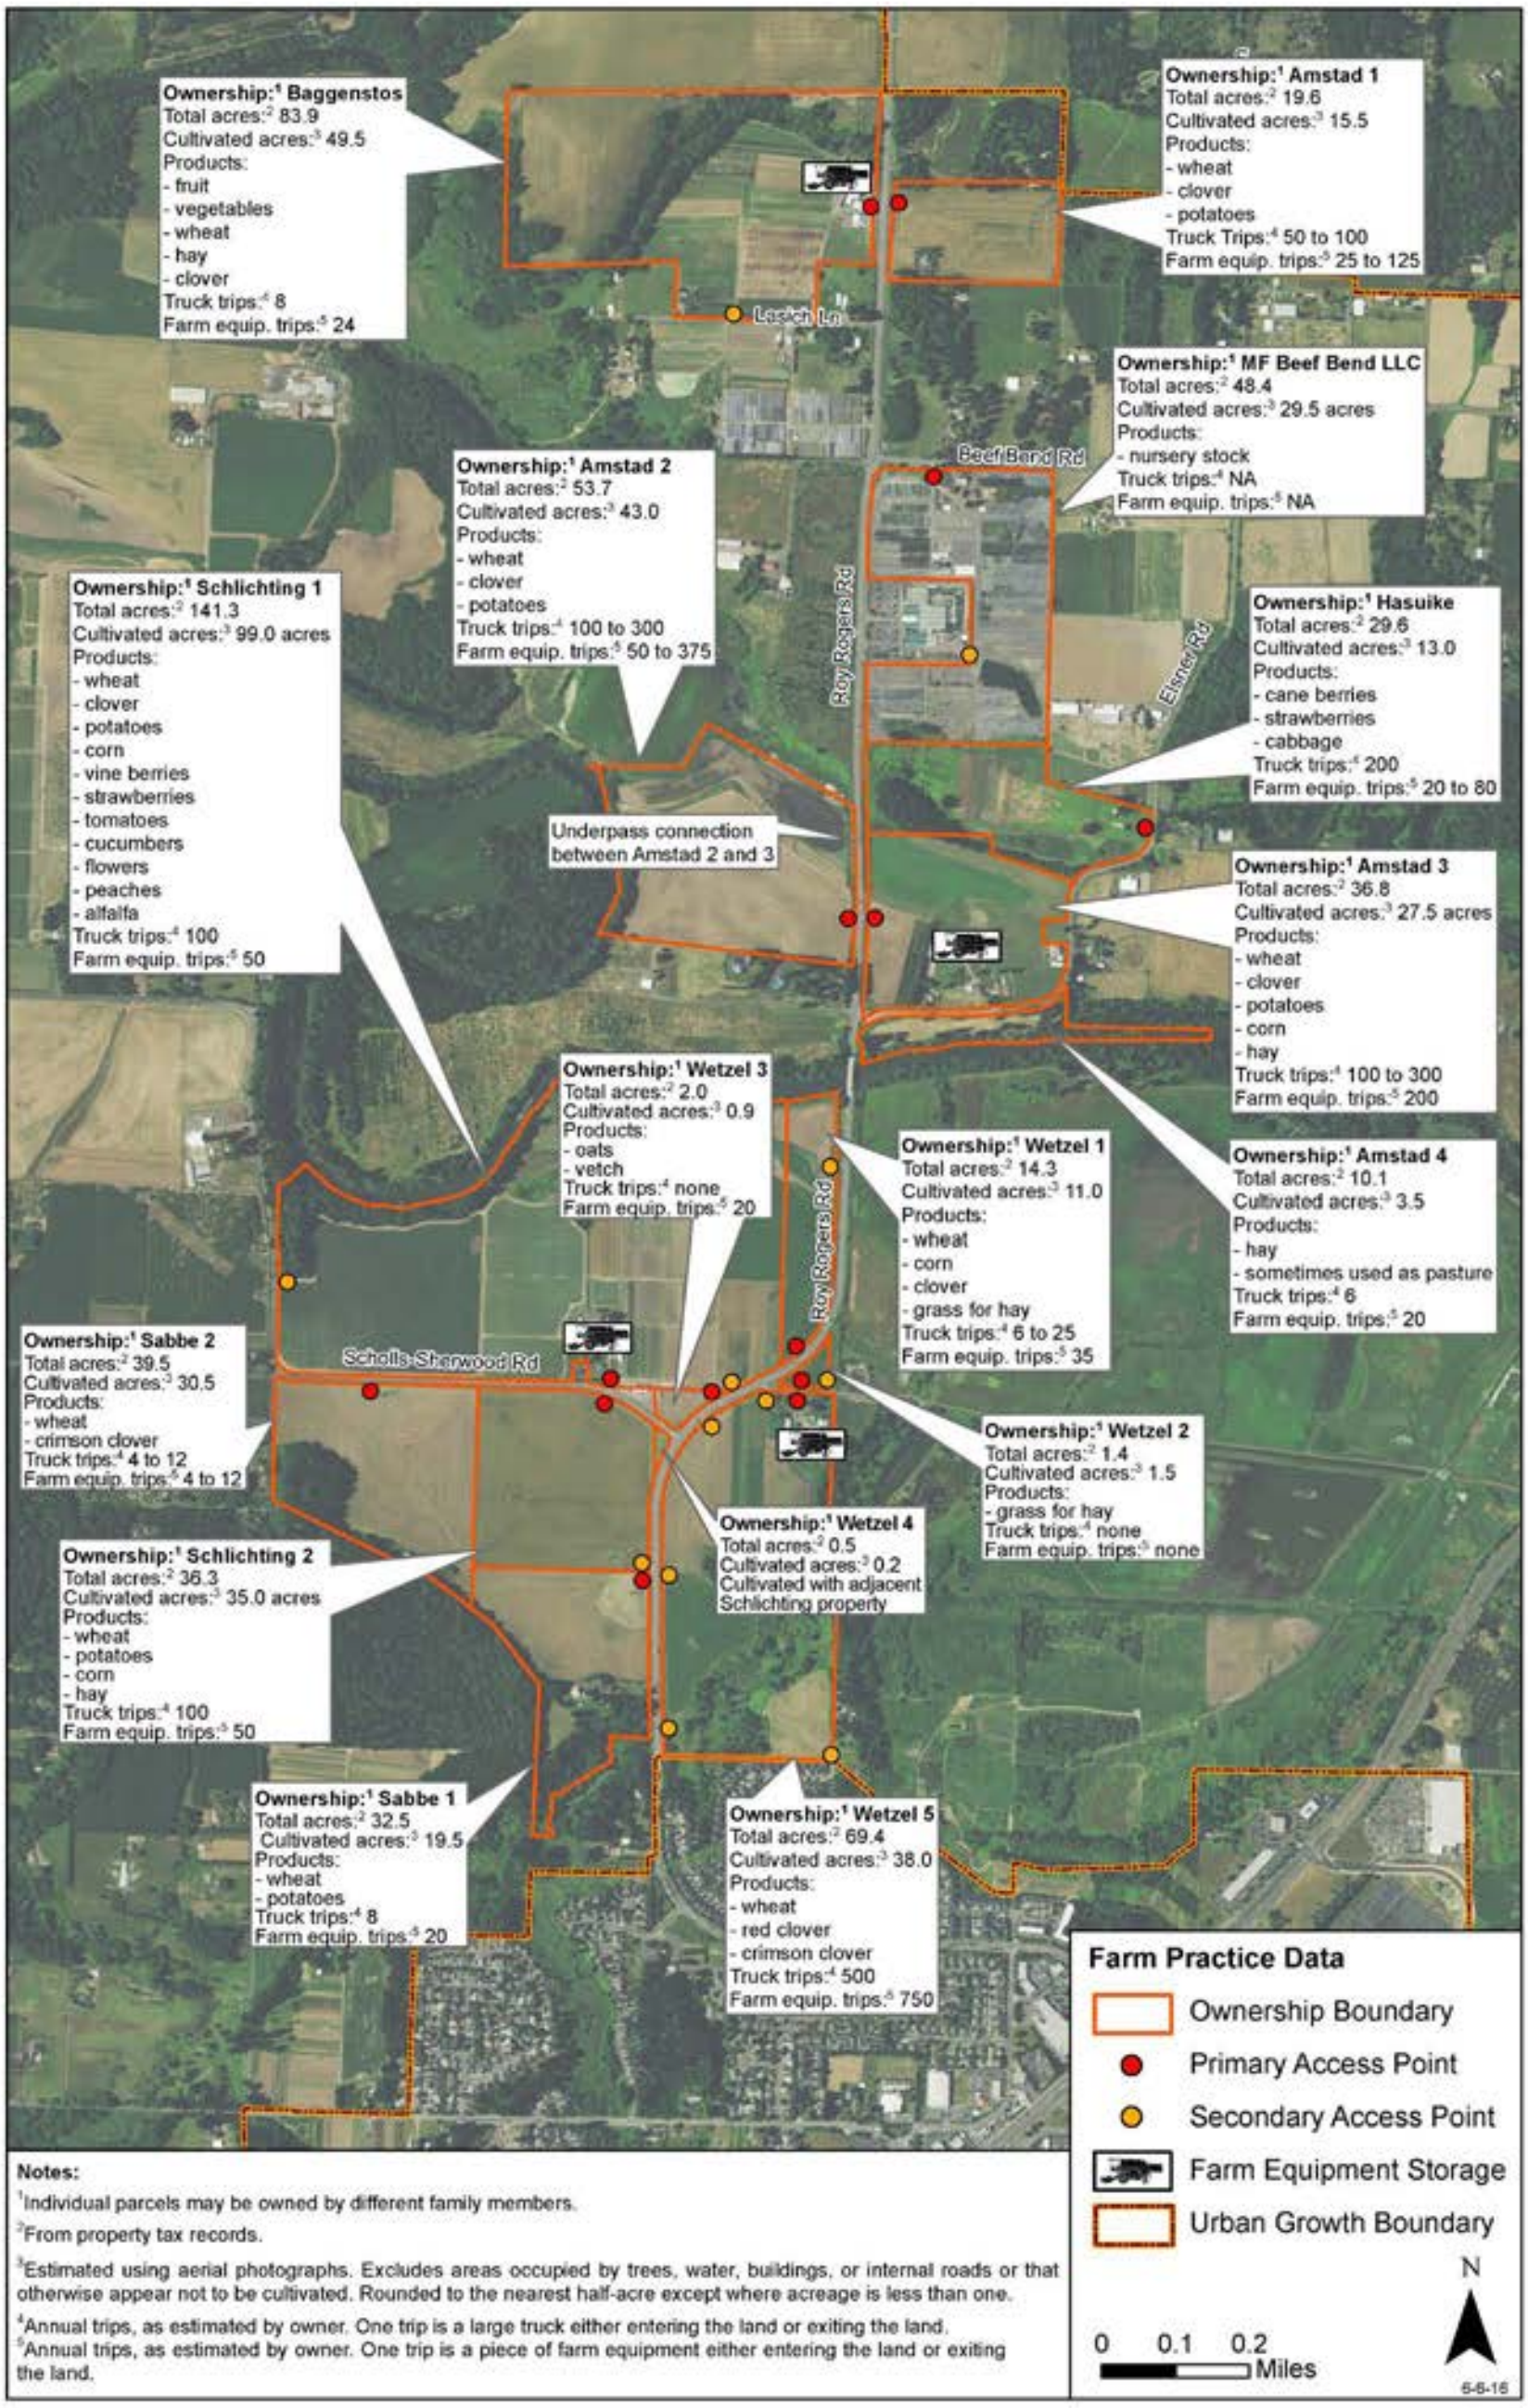
On most of the land, crops are rotated every one to three years, with some rotations extending up to five years. Conventional cultivation practices, including plowing and disking, are used. Herbicides and pesticides are applied multiple times per year at some ownerships and only once or not at all at others. Fertilizer use depends on the crop and, when used, is applied in most instances once per year. About one-half of the land in Figure 3 has irrigation rights and the other half does not. Whether irrigation is used depends on what crop is being produced, but, except for ownership Sabbe 2, irrigation pipes extend to all the ownerships. Some of the ownerships have private water rights and others have rights administered by the Tualatin Valley Irrigation District. Most of the water is pumped from the Tualatin River. In some cases, the tenant farmer uses water rights the tenant farmer owns. Irrigation methods include drip, overhead sprinkler, and traveler systems.[6] In most cases, only one crop is harvested per year. Harvest times depend on the crop, with strawberries in May or June, garden vegetables from July to as late as October, wheat in August, and potatoes in September. Cabbage is harvested in January. Grass for hay is grown from October to June. No products are certified organic or GMO-free.

Drainage

All of the ownerships have drain tiles. Because most drain tiles were installed many years ago, the exact location of drain tiles is mostly unknown.

[6] With a traveler irrigation system, a hose with a sprinkler head at the end of it is extended up to ¼-mile from a mobile base unit and the base unit slowly reels in the hose and sprinkler head.

Figure 3 Farm Practice Data



THIS PAGE INTENTIONALLY LEFT BLANK

Who Farms and Where

Farmers along Roy Rogers Road and in the area generally farm multiple, separate parcels. Referring to the ownerships shown on Figure 3, the following is known from the interviews. The referenced farmers may farm at additional locations.

- The Baggenstoses farm their ownership along Roy Rogers Road, as well as the Schlichting ownerships shown on Figure 3 and other parcels north of the AA;
- The Amstad family farms its three ownerships along Roy Rogers Road shown on Figure 3, other family property west of the AA, and parcels along Pacific Highway;The Hasuike family farms its ownership along Roy Rogers Road and other parcels outside the AA;
- The Wetzel family farms ownerships on both sides of Roy Rogers Road shown in Figure 3; and
- A tenant farmer farms the Sabbe family ownership on Roy Rogers Road and Scholls-Sherwood Road, as well as parcels elsewhere.

Movement of Farm Equipment and Products

Because farmers along Roy Rogers Road farm multiple parcels, farm equipment is moved between parcels within and outside of the AA. In addition, farm equipment is stored at some, but not all, of the farm properties. Figure 3 shows the locations in the AA where farm equipment is stored. With one exception, all farm products are transported offsite in trucks. The exception is that most fruits and vegetables grown at the Baggenstos ownership are sold to consumers onsite at the Baggenstos Farm Store. Figure 3 shows the annual number of large truck and farm equipment trips in and out of each ownership, as estimated by the owner or tenant farmer.

Effects of the Original Construction of Roy Rogers Road

According to interviews with the affected landowners, the original Roy Rogers Road had a range of effects on farming at the ownerships in Figure 3. These included loss of farmland;[7] the division of farm fields, which requires crossing the road for farm operations like irrigation and plowing; increases in travel time for farm equipment and trucks, resulting from delays in entering and exiting farms and fields; the removal of 90-degree field corners, which reduces the efficiency of plowing and other farm operations; the relocation of field access points away from corners, which has a similar effect; alterations in field drainage; damage to fields from overflows of roadway stormwater runoff into them; and use of replacement soil during construction that contained rock. Note that the effects described by the landowners have not been independently verified.

Potential Effects of Widening Roy Rogers Road

Potential Effects on Farm Practices

The principal *potential* effects of widening Roy Rogers Road are likely to be on the time it takes for farm equipment and large trucks to travel between storage locations and farm fields and between farm fields within the AA and elsewhere, and drainage. Potential effects follow.

1. A reduction in the farmland in the ownerships described above. The table below lists the ownerships and, for each, its total size, the estimated amount of land under cultivation, the

[7] According to records of the Statewide Planning Goal exceptions for the original Roy Rogers Road, right-of-way acquisition reduced the amount of agricultural land by 15 to 16 acres. See Beef Bend Extension Findings of Fact and Statement of Reasons in Support of Exceptions to Goals 3, 11, and 14, August 15, 1996, p. 4-25.

estimated acreage that could be converted to roadway use, and the percentage reduction in land under cultivation. Note that the estimates of cultivated acreages and reductions from widening in the table are rough approximations to indicate the relative magnitude of the potential reductions. Actual reductions will depend on project design.

Approximate Potential Reduction in Cultivated Area Due to Widening

Ownership	Total Acres[1]	Estimated Cultivated Acres[2]	Estimated Reduction from Widening (Acres)[2]	Percent Reduction of Estimated Cultivated Acres[3]
Baggenstos	83.9	49.5	0	0
Amstad 1	19.6	15.5	0	0
Amstad 2	53.7	43	.5	1
Amstad 3	36.8	27.5	.5	2
Amstad 4	10.1	3.5	0	0
MF Beef Bend, LLC	48.4	29.5	1	3
Hasuike	29.6	13	0	0
Wetzel 1	14.3	11	.5	5
Wetzel 2	1.4	1.5	.1	5
Wetzel 3	2.0	0.9	.05	3
Wetzel 4	0.5	0.2	.05	30
Wetzel 5	69.4	38	1	3
Schlichting 1	141.3	99	.1	.1
Schlichting 2	36.3	35	.2	1
Sabbe 1	32.5	19.5	.2	1
Sabbe 2	39.5	30.5	0.0	0
Total[4]	**619.3**	**417.0**	**4.5**	**1**

[1]From property tax records.
[2]Acreages rounded to the nearest ½-acre, except where under 1 acre.
[3]Rounded to the nearest percent, except where under .5 percent.
[4]Some totals do not add because of rounding.

2. Increases in travel times for farm equipment and large trucks. The potential for delay will be the net effect of several consequences of widening the ULS:

   a. Traffic volumes will continue to grow because of growth in population and employment, whether or not the ULS is widened, but traffic volumes will be even higher if the ULS is widened. In 2015, the estimated average daily traffic (ADT) was 20,500. With one travel lane in each direction, the forecasted 2035 ADT is 37,000, an increase of 80 percent. The 2035 ADT with two travel lanes in each direction has not been forecasted, but will likely be higher because the roadway's higher capacity may attract trips to the ULS from alternative routes. Higher traffic volumes may increase the amount of time required for large trucks and farm equipment to access and exit farms and fields and increase the

amount of time consumed for trucks and farm equipment to move between farming locations. The biggest potential for delay from higher traffic volumes may be for farm equipment making left turns out of farms and fields.

b. Widening Roy Rogers Road may increase traffic speeds because increased capacity and openness increases motorist speeds. This may increase the delays experienced by large trucks and farm equipment accessing and exiting farms and fields. Wide shoulders to accommodate farm equipment limits the use of landscaping and other measures to make a roadway convey less openness to motorists.

c. Adding a travel lane in each direction may help counteract the increase in the amount of time required for large trucks and farm equipment to access and exit from farm fields by increasing traffic "platooning." Platooning is the clustering of traffic after it has been stopped by a traffic signal. Platooning leaves gaps in the traffic flow, which can be used to make a left turn. The platooning effect dissipates with distance from a traffic signal. The existing traffic signals at the intersections of Roy Rogers Road with Beef Bend Road and Scholls-Sherwood Road help with platooning, but are 1.4 miles apart. Additional traffic signals in the ULS are not expected.

d. If a center turn lane is included in the widening of the ULS at the entrance to a farm or field, it could also help counteract the increase in the amount of time required for large trucks and farm equipment to exit a farm field. It would do this by providing a refuge for left turns, permitting a left-turning truck or piece of farm equipment to use a gap in the traffic flow from the left to enter the refuge, and a second gap in the traffic flow from the right to enter the travel lanes from the refuge.

3. Possible alterations in farm field drainage and damage to fields from overflows of stormwater runoff, if the drainage system is not correctly sized.

4. Increases in farm stand sales. By increasing pass-by traffic, widening the ULS could increase sales at the Baggenstos Farm Store, where, as stated above, most fruits and vegetables grown at the Baggenstos ownership are sold to consumers. This could positively affect the practice of the Baggenstos ownership of selling its products at the store. If farm stand operations at Schlichting ownership 1 resume, it could experience a similar benefit.

5. Reduced conflicts with motor vehicle traffic when farm equipment is traveling on the roadway. The addition of a travel lane in each direction and the wide shoulders in the County's standard section for a rural five-lane roadway will facilitate motor vehicle traffic passing farm equipment. This may reduce farmer reluctance to move farm equipment on the ULS caused by the stress of backing up traffic. It will benefit both the operators of the commercial farms along the ULS and other farmers who move farm equipment using the ULS.

Potential Effects on Cost

Item 1 in the list of potential effects above will impose a cost by reducing cultivated land. Items 2 and 3 in the list could increase the cost of farm practices in the AA. An increase in travel times for farm equipment and large trucks would increase costs by increasing the amount of time and fuel required for the movement of farm equipment and large trucks. An alteration in field drainage could impose a cost, if it necessitated the production of a crop with lower net revenue, and damage to a field could reduce its productivity and increase the cost of farming it. Item 4 in the list above may increase the revenue of the affected ownerships.

Conditions to Avoid Significant Changes in Farm Practices and Their Cost

Design

For the reasons stated below, when the County amends the TSP to designate the ULS as having four to five lanes, its findings should state that the amendment complies with ORS 215.296 because projects to widen the ULS will have to comply with Section 713-1 of the Community Development Code (CDC). Section 713-1 states:

> Category C projects located within the AF-20, EFU, and EFC Districts shall not:
>
> A. Force a significant change in accepted farm or forest practices on surrounding lands located in the AF-20, EFU and EFC Districts; nor
>
> B. Significantly increase the cost of accepted farm or forest practices on surrounding lands located in the AF-20, EFU and EFC Districts.
>
> An applicant may demonstrate that these standards for approval will be satisfied through the imposition of conditions. Any conditions so imposed shall be clear and objective.

The County included Section 713-1 in Article VII of the CDC to implement ORS 215.296. Section 713-1 will apply to all projects that widen the ULS, assuming the land is outside the UGB and zoned EFU at the time of the project. CDC Section 705-2.1.F makes a Category C project "construction of additional passing and travel lanes requiring the acquisition of right-of-way but not resulting in the creation of new land parcels, provided that the acquisition is no greater than the maximum specified for the road classification in the Transportation System Plan." Once the TSP has been amended to designate the ULS as having four to five lanes, projects to widen the ULS will fall within CDC Section 705-2.1.F and will therefore be subject to Section 713-1.

By taking this approach, the County establishes a clear and objective condition as required by ORS 215.296(2). For the following reasons, it is not feasible to determine project-level effects of the widening or to establish conditions that are clear and objective at the plan amendment stage:

- It is not known when the ULS (or possibly segments of it) will be widened. At the time of widening, the UGB may have been moved to include some of the land along the ULS and the land rezoned from EFU. In addition, the farm practices described above may have changed in ways that bear on both the effect on farm practices and how to avoid forcing significant changes to them. Also, forecasted traffic volumes may have changed.
- Widening the ULS at the same time the Willamette Water Supply pipeline to Hillsboro is constructed could influence the design of the widened roadway in ways that alter the effects of the widening on farm practices.
- The effects of widening the ULS on farm practices and their cost will depend on the exact footprint of the widened roadway and other aspects of the design of the widening, which will not be known until the project development process is underway.
- Similarly, clear and objective conditions that apply to the design and construction of projects to widen the roadway cannot be formulated until the project design stage.

The biggest *potential* effect of widening Roy Rogers Road appears to be an increase in travel times for farm equipment and large trucks. At the same time, the net change in travel times from widening the roadway is unknown, as described above. For this reason, when the County develops a project to widen the ULS, it should perform a simulation of traffic operations in the ULS with and without widening to compare travel times for farm equipment and large trucks to

and from the commercial farms along the ULS. Upon completing the traffic simulation and preliminary design, the County will be able to assess if the widening project will force a significant change in farm practices and their cost and, if so, to formulate conditions to avoid the significant change and/or cost.

If needed to avoid forcing significant changes in farm practices and/or their cost, the types of conditions the County considers in issuing approval of a project to widen the ULS under Section 713-1 of the CDC could include, where feasible:

1. Providing left-turn lanes and refuges at farm and field access points.
2. Reducing the posted speed to reduce the delays in entering and exiting farms and fields
3. Moving farm field access points from Roy Rogers Road to the corners of fields and providing wide paved aprons at access points to accommodate acceleration by farm equipment and vehicles turning right out of farms and fields.
4. Improving farm and field access and egress where possible. Areas of consideration could include the underpass connection between ownerships Amstad 2 and 3 and near Scholls-Sherwood Road, where there are issues of safe access to the Schlichting and Wetzel ownerships and the nearby Tualatin River National Wildlife Refuge visitor information facility.
5. To the extent feasible, widening into small farm parcels instead of larger ones, because the small parcels are already less efficient to farm.
6. Avoiding storm runoff from the roadway entering farm fields and avoiding roadway improvements altering field drainage.
7. Erecting signs on Roy Rogers Road alerting motorists that they are in an active agricultural area and may encounter farm equipment.
8. Supporting landowner retention of water rights, which may be reduced because of reductions in their land areas.

Construction

1. During construction, maintain access to and egress from farms and fields by large trucks and farm equipment, as well as by cars and light trucks.
2. When soil must be removed from farmland temporarily, retain and return the soil to the same location instead of introducing new soil.
3. If soil must be brought into farmland, ensure that it is clean fill or topsoil.
4. Avoid construction equipment bringing weeds to farm fields.
5. Avoid interruptions to irrigation.

April 18, 2016

To: Charlie Stearns, P.E., Senior Project Manager
Washington County Capital Project Management

From: John Kelly, Principal Planner

Subject: Application of Statewide Planning Program Laws to the Urban Link Segment of Roy Rogers Road
OBEC Project No. 0165-0031.00

This memorandum describes how Oregon Administrative Rule (OAR) 660-012-0065(3)(b), Oregon Revised Statute (ORS) 215.213(2)(p), ORS 215.213(2), ORS 215.296, and OAR 660-027-0070 apply to amending the Washington County Transportation System Plan (TSP) to designate the "urban link segment" (ULS) of Roy Rogers Road (RRR) as having four to five lanes. The ULS is from where the road leaves the Metro urban growth boundary (UGB) and Tigard city limits ½-mile south of Bull Mountain Road to where it re-enters the UGB and enters the Sherwood city limits about .8 mile from OR 99W. For any portion of the ULS to qualify for approval under Article VII of the Washington County Community Development Code, it would be necessary to amend the TSP to designate it as having four to five lanes.

OAR 660-012-0065(3)(b) and ORS 215.213(2)

Washington County may amend the TSP without adopting exceptions to Statewide Planning Goals. OAR 660-012-0065(3), part of the Transportation Planning Rule, states:

> The following transportation improvements are consistent with Goals 3, 4, 11, and 14 subject to the requirements of this rule:
>
> * * *
>
> (b) Transportation improvements that are allowed or conditionally allowed by ORS 215.213 . . .

ORS 215.213(2) states:

> . . . the following uses may be established in any area zoned for exclusive farm use subject to ORS 215.296:
>
> * * *
>
> (p) Construction of additional passing and travel lanes requiring the acquisition of right of way but not resulting in the creation of new land parcels.
>
> * * *

The ULS traverses land zoned exclusive farm use (EFU). Right-of-way acquisition may or may not be necessary to widen the ULS. If it is required, it would not create new land parcels. Therefore, widening the ULS would fall within ORS 215.213(2)(p). Consequently, it falls within OAR 660-012-0065(3)(b). This means amending the TSP to include widening the ULS would not require

County adoption of exceptions to Statewide Planning Goals. The exceptions that otherwise would be required are to Goal 3, Agricultural Lands; Goal 11, Public Facilities and Services; and Goal 14, Urbanization. Goal 4, Forest Lands, would not apply here because the ULS does not traverse designated forest lands.

It is ORS 215.213(2), not ORS 215.213(1), that allows the County to amend its TSP to allow widening the ULS. ORS 215.213(1) lists land uses, activities, and public improvements allowed in lands zoned EFU without Statewide Planning Goal exceptions. The transportation improvements listed are:

> (j) Climbing and passing lanes within the right of way existing as of July 1, 1987.
>
> (k) Reconstruction or modification of public roads and highways, including the placement of utility facilities overhead and in the subsurface of public roads and highways along the public right of way, but not including the addition of travel lanes, where no removal or displacement of buildings would occur, or no new land parcels result.
>
> (L) Temporary public road and highway detours that will be abandoned and restored to original condition or use at such time as no longer needed.
>
> (m) Minor betterment of existing public road and highway related facilities, such as maintenance yards, weigh stations and rest areas, within right of way existing as of July 1, 1987, and contiguous public-owned property utilized to support the operation and maintenance of public roads and highways.

Amending the TSP to designate the ULS as having four to five lanes would not fall within any of these categories, because the added lanes would be travel lanes, not all of the right-of-way for the ULS existed as of July 1, 1987, and widening the ULS to four to five lanes would be a permanent transportation improvement.

ORS 215.296

ORS 215.296 would allow the County to amend the TSP to designate the ULS as having four to five lanes as long as the County makes the findings the statute requires. ORS 215.296 states:

> (1) A use allowed under ORS 215.213(2) . . . may be approved only where the local governing body or its designee finds that the use will not:
>
> (a) Force a significant change in accepted farm or forest practices on surrounding lands devoted to farm or forest use or
>
> (b) Significantly increase the cost of accepted farm or forest practices on surrounding lands devoted to farm or forest use.
>
> (2) An applicant for a use allowed under ORS 215.213(2) . . . may demonstrate that the standards for approval set forth in subsection (1) of this section will be satisfied through the imposition of conditions. Any conditions so imposed shall be clear and objective.

This means that the County could amend the TSP to allow additional lanes in the ULS by making the specified findings, if necessary applying conditions to ensure avoidance of significant changes in farm practices or significant increases in the cost of the practices.

OAR 660-027-0070

Because the ULS borders or traverses both urban reserves and rural reserves, OAR 660-027-0070, Planning of Urban and Rural Reserves, applies to it. Section 660-027-0070(4) states:

> . . . counties may adopt or amend comprehensive plan provisions or land use regulations as they apply to lands in urban reserves, rural reserves or both, unless an exception to Goals 3, 4, 11 or 14 is required, in order to allow:
>
> * * *
>
> (c) Roads, highways and other transportation and public facilities and improvements, as provided in ORS 215.213 and 215.283, OAR 660-012-0065, and 660-033-0130 (agricultural land) or OAR chapter 660, division 6 (forest lands);
>
> * * *

This provision would allow the County to amend the TSP to increase the number of lanes in the ULS. As described above, ORS 215.213 and OAR 660-012-0065 would allow widening the ULS without exceptions to Goals 3, 4, 11 or 14. OAR 215.283 does not apply to Washington County. OAR 660-033-0130 establishes standards applicable to uses on agricultural lands, but includes no standards applicable to the ULS. OAR chapter 660, division 6, does not apply because the ULS does not traverse designated forest lands.

On first reading, Section 660-027-0070(5) appears to more specifically apply to the ULS because it refers to:

> ". . . land in an urban or rural reserve that is subject to an exception to Goals 3 or 4, or both, acknowledged prior to designation of the subject property as urban or rural reserves, in order to authorize an alteration or expansion of uses or lot or parcel sizes allowed on the land under the exception . . ."

A portion of RRR was built pursuant to an exception to Goal 3, as well as exceptions to Statewide Planning Goals 11 and 14. However, the terms of Section 660-027-0070(5) indicate that it applies to exception areas, such as rural communities, not to transportation facilities.

School Goals

Beaverton School District promotes a deep sense of belonging while supporting, challenging and inspiring all students to explore their passions, achieve their goals and graduate ready to thrive in their learning and life after high school. To achieve this mission, the district and its schools will implement strategies and track outcomes in four areas: Student Safety and Well-being, Strong Start in Early Learning, Academic Achievement for All, and Supporting Post-High School Success.

State Goals

The Oregon Department of Education is partnering with school districts and local communities to ensure a 90% on-time, four year graduation rate by 2027. To progress toward this goal, the state will prioritize efforts to improve attendance, provide a well-rounded education, invest in implementing culturally responsive practices, and promote continuous improvement to close opportunity and achievement gaps for historically and currently underserved students.

Safe & Welcoming Environment

WE are committed to providing all of our students and families with safe, caring and inclusive learning environments, free from bullying, intimidation, and harassment. We will not tolerate any form of discrimination and we will take swift action to address concerns. We have a Board Policy (AC) on non-discrimination. We will serve all students and families.

Students in grades 9 - 12 reporting:

- Feeling safe, welcomed, and accepted at school: 77%
- At least one adult at school really cares about them: 86%
- Not being bullied at or on the way to or from school: 67%

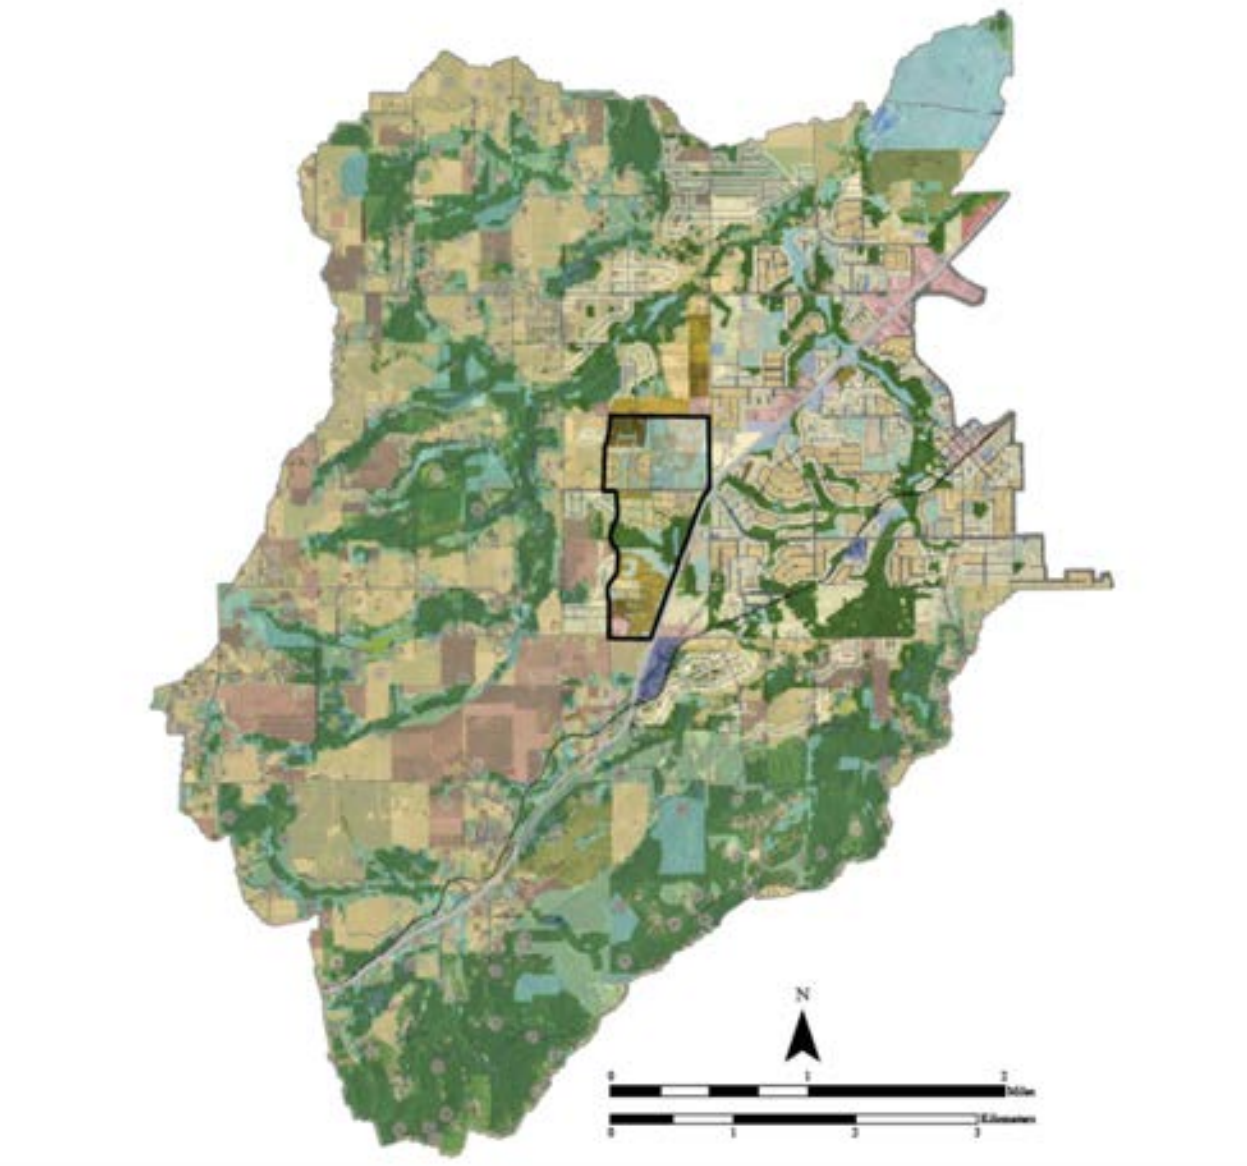
Background Information on Chicken Creek

Chicken Creek watershed approximately 4,000 hectares (10,000 acres) a major tributary to the Tualatin National Wildlife Refuge. (Image source ISE at University of Oregon.)



“CHICKEN CREEK borders the west and north edges of the fast-growing city of Sherwood, Oregon, flowing through agricultural lands and past suburban homes before emptying into the Tualatin River. Just beyond the city, Chicken Creek meanders for two and a half miles through the Tualatin River National Wildlife Refuge, one of very few urban refuges in the country, where surrounding wetlands provide a stopover sanctuary for migrating birds on the Pacific Flyway. This stretch of creek, located within a wildlife refuge yet so close to rapid urbanization, holds the promise of important benefits for our watershed.”

Source: Friends of Trees Chicken Creek Cas Study

Tualatin River National Wildlife Refuge Comprehensive Conservation Plan June 2013

Page: 3-11

In general, stream flow in the Tualatin River Basin reflects patterns of precipitation with high winter and low summer flows (Figure 3-6). . . . . Flooding in tributary streams is typically more prevalent during short-term heavy rainfall after the surrounding watershed is saturated by early season rainfall. In particular, the Chicken Creek watershed, which includes Cedar Creek, flows from the City of Sherwood and experiences heavy flooding. The population of Sherwood has increased from about 3,000 in 1990 to over 18,000 in 2010, and this has led to an increase in urban development (U.S. Census Bureau 2011). This change has created increased impervious surfaces (e.g., roads, rooftops) and has led to an increase in runoff and higher peak flows in Chicken Creek that flow into the refuge.

Page: 3-24

3.9.2 Refuge-specific Water Quality There are some data available on several creeks that enter the Tualatin River through the refuge. Chicken Creek, which supplies most of the water to the managed wetlands on the Atfálat’i Unit, enters the refuge through a diversion point from which water is then diverted to several different ponds using an irrigation canal. Over the years, as more urban development occurs upstream, the refuge has observed higher stream flows at the diversion. Higher flows have caused extra management responsibility and burden on the refuge to divert the water to the river to avoid flooding or damage to refuge infrastructure. In response to the increases in high flows, the refuge has installed some new infrastructure, including an emergency spillway to facilitate water reaching the river. In addition to high water flows, another concern of the refuge is the water quality of Chicken Creek, due to the runoff from urban development that occurs in the watershed. However, CWS has been monitoring the water quality for upper and lower Chicken Creek and as of date, all standards of temperature, dissolved oxygen, pH, and toxics are below applicable water quality criteria.

Sherwood Comprehensive Plan

Part 2 Chapter 5 Page 1

ENVIRONMENTAL RESOURCES A. INTRODUCTION

. . . . The Environmental Resources Element of the Plan includes a 1990 inventory of Sherwood's environmental resources and planning goals, policies and strategies for their management. It also includes the Regionally Significant Fish and Wildlife inventory completed by Metro in 2002 and adopted as Map V-2 of this Plan.

In 2002 Metro completed an inventory of regionally significant fish and wildlife habitats and in 2005, the Tualatin Basin Natural Resources Coordinating Committee, on which the City of Sherwood participated, forwarded a program to protect much of the inventoried resources after conducting a detailed ESEE analysis.

The program and supporting documents is adopted by reference and maintained by Washington County Department of Land Use and Transportation staff. The goals and policies of this plan provide the foundation for implementation of the Basin Program.

For the purposes of this element, environmental resource management shall be addressed under the categories of natural resources and hazards, environmental quality, recreational resources and energy resources. The following briefly describes the value of open spaces, and natural resources to the community of Sherwood. Goals and policies for the protection of designated historic resources are also included in this chapter.

Planning Goals: Environmental Quality

1. For the purpose of protecting the functions and values of water resources, protect the water quality of Rock Creek, Chicken Creek, Cedar Creek, and their tributaries through control of runoff water by the following means:

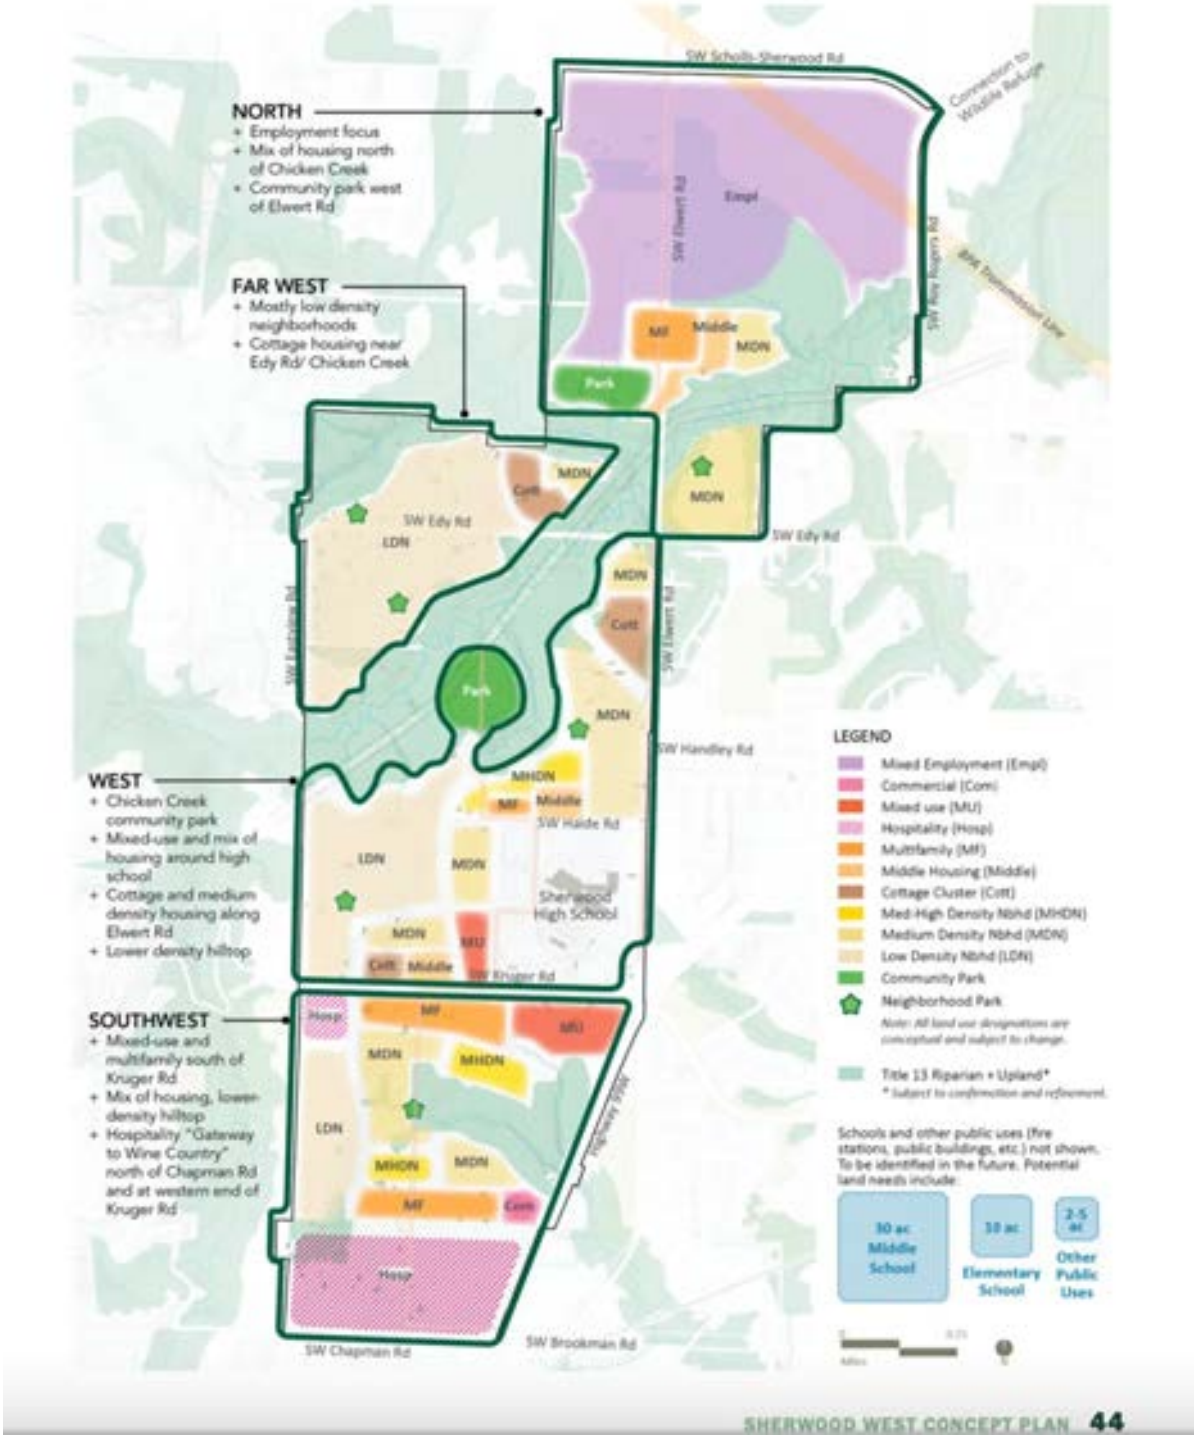
a. Construction site sediment control.
b. Storm sewer design and location.
c. Regulation of floodplain alterations.
d. Adoption of the regional Storm Water management plan.
e. Establish buffers between development and the designated wetlands.
f. Acquire through dedication at the time of development, or through purchase, all wetlands and floodplains.
g. Maintain or reduce stream temperatures.
h. Maintain natural stream corridors.
i. Minimize erosion, nutrient and pollutant loading into water.

Sherwood West Concept Plan (UGB expansion concept plan)

Excerpts related to Chicken Creek.

Figure 4. Natural Resources Existing Conditions

Figure 13. Land Use Plan Map



Comments: The plan seems to include the destruction of a chunk of the upland forest in the North District. What will be the effects of the development of light industrial and residential development on Chicken Creek?

Page 61:

Chicken Creek Greenway

Chicken Creek forms a natural greenway through the area, flowing southwest to northeast and eventually draining into the Tualatin River. It is fed by several other waterways: Cedar Creek, Goose Creek, and West Fork Chicken Creek. The future Chicken Creek Greenway preserves and enhances these natural corridors by providing wildlife crossings, incorporating stormwater management practices,and providing access to nature through a network of connected walking trails. As conceptualized, the Chicken Creek Greenway will incorporate the creek corridor as well as the surrounding riparian and upland habitat areas (as shown in Figure 23).

Overview

In 2023, the City of Portland adopted a Housing Needs Analysis (HNA) to understand current and future housing needs in Portland. The Housing Production Strategy (HPS) identifies specific actions (policies, programs, development regulations, financial incentives, etc.) that the City will implement over the next six years to meet those identified needs. The state requires the City to complete an HNA and HPS every six years.[1]

Why Is This Important?

A place to live is a basic human need, and ensuring access to fair and equitable housing is essential for providing Portlanders with the opportunities and security they need to lead healthy and successful lives. Unfortunately, Portland, like many other cities in the US, is facing an unprecedented housing crisis, making housing increasingly unaffordable for most residents. Escalating rents and home prices consistently outpace incomes, widening the gap between household earnings and housing costs. Affordable housing, defined as spending no more than 30 percent of income on housing costs, remains elusive for many. More than a third of Portland households spend more than 30 percent of their income on housing costs, and around 50 percent of renters in the city are cost burdened

In 2015 the City passed the Emergency Ordinance Declaring a State of Emergency for Housing and Houselessness, enshrining the urgency and great need faced by Portlanders to have access to more affordable and stable housing. The purpose of the Housing Production Strategy is to continue to implement policies and programs that will help Portland meet its need for quality, affordable homes for a growing and socioeconomically diverse population, and ensure equitable housing access in a time of increased urgency. The City of Portland's 2035 Comprehensive Plan serves as policy guidance to provide adequate access to housing for a socially- and economically diverse population; support fair, equitable, healthy, and physically accessible housing; and maintain and expand a supply of permanently affordable housing for Portland's most vulnerable residents.

In 2020, the City passed the Climate Emergency Declaration, acknowledging that Portland's policies, planning, and infrastructure investment practices has contributed to communities of color and low-income neighbors experiencing high temperatures, high utility bills, poor air quality, and greater risk to health. With this in mind, the Climate Emergency Workplan and Climate Investment Plan describes the actions the City and its partners will take to make Portland more resilient and explore ways to reduce the climate impact of new housing units on Portland's households.

---

[1] As provided in ORS 197A.100 a city with a population of more than 10,000 people must adopt a Housing Production Strategy Report that includes a list of specific actions that the City will undertake to promote development to address housing needs identified for the most recent period described in the Housing Need Analysis. The requirements are further documented in Oregon Secretary of State Administrative Rules.

Portland's Housing Need

Portland faces an increasingly wide range of housing needs and growing challenges in meeting those needs. Below is a summary of key findings from the HNA as well as the additional housing needs assessment prepared as part of the HPS process. These analyses emphasize equitable outcomes for Portland's current and future residents and recognize that some communities face bigger challenges to meeting their housing needs—especially low-income households, communities of color, elders, people with disabilities, and people experiencing houselessness.

In 2023, approximately 41 percent of home sales were affordable to households earning Portland's median income. In addition, renter households earning the renter median income could only afford the average rent in six out of Portland's twenty-four neighborhoods. This level of mismatch between incomes and home costs exacerbates the prevalence of cost-burdened households. In 2021, over 50 percent of renter households were cost-burdened. The housing affordability gap widens significantly when considering median income by race and ethnicity, particularly for Black, Indigenous, and Latine households. According to Portland's Housing Bureau's 2023 State of Housing report, these households earning the average income could not afford the average home sale price in any Portland neighborhood. Notably, the average Black household is also unable to afford the average rent in all but one any neighborhood.

How Much Growth Is Portland Planning For?

Metro's 2019 regional population forecast allocated 97,471 new households to Portland, about 35 percent of the region's growth, which is the basis for determining future needs. Adjustments are made

279,797 HOUSEHOLDS IN 2021

296,479 UNITS IN 2021

97,471 NEW HOUSEHOLDS FORECASTED

97,471 TO 120,560 NEW UNITS NEEDED

377,268 HOUSEHOLDS IN 2045
35% INCREASE

417,039 UNITS IN 2045
41% INCREASE

to account for a vacancy rate, housing for those facing houselessness and for underproduction since 2010. These adjustments bring the estimated demand to 120,560 dwelling units by 2045.[2]

At a basic level, Portland has an estimated overall development capacity for 236,977 housing units, which is sufficient to meet the estimated demand of 120,560 units. However, the needs analysis goes further to address specific housing types.[3] Portland needs to support the development of 120,560 new units of housing by 2045 - an average of 5,200 units per year. Additionally, to align with Governor Kotek's statewide housing production strategy, the City should "catch-up" the units from underproduction and for households experiencing houselessness and build 55,000 units by 2032, roughly, 6,000 units per year.

What Does the Need Look Like?

The City must plan to accommodate Portlanders with a diverse range of needs in terms of unit types and prices in locations that help meet the needs of all, including low-income populations, communities of color, and people of all ages and abilities. Portland's future housing needs are not evenly distributed among the population in the city. There are households facing historic and ongoing disadvantages, especially those impacted by limited housing choice and access. The housing needs of these populations are briefly summarized below.[4]

The City has made significant strides in addressing housing affordability over the last decade. Since declaring a housing emergency in 2015, the City has successfully opened and preserved more than 4,800 units of regulated affordable housing, one-third of which were deeply affordable to households earning 0 – 30 percent of the Area Median Income (AMI).[5] This achievement was primarily made possible with significant funding from local revenue sources and further supported by the City's implementation of an inclusionary housing program and code amendments expediting the permitting process. The housing emergency has also helped increase shelters and services for people experiencing homelessness.

However, despite these efforts, the urgency of the situation persists and demands continued action by the City to address housing affordability.

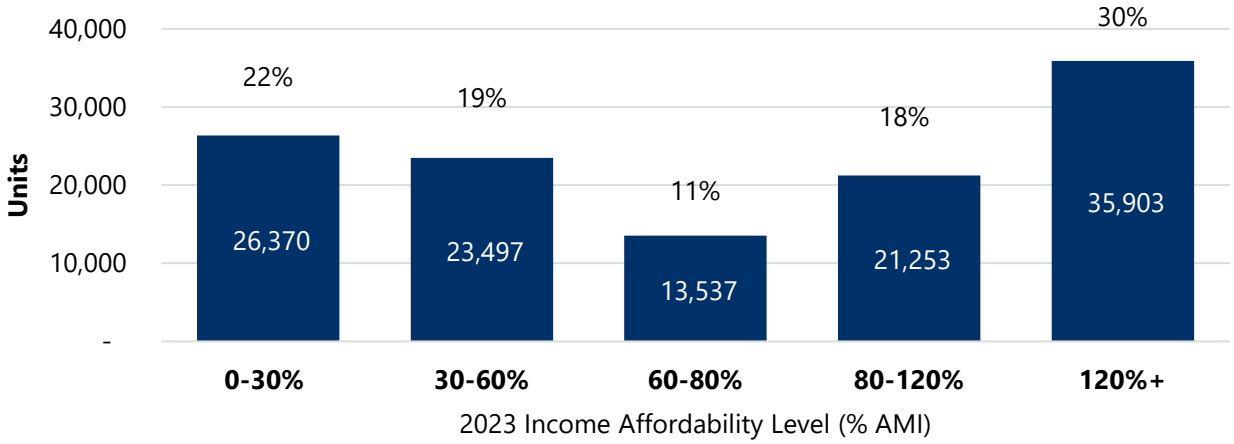
---

[2] This analysis is documented in the 2045 Housing Needs Analysis.
[3]The Buildable Land Inventory (BLI) considers vacant land, redevelopment feasibility, and constraints on development to estimate the future development capacity under current planning and zoning designations
[4] Additional context is provided in Additional Housing Need Context
[5] PHB State of Housing Report 2022 (using ACS 2022 5-Year Estimates), in this document, area median income and median family income are used interchangeably, it refers to the household income for the median/'middle' household in the region.

Housing Need by Income Affordability

In 2023, the Portland-Vancouver-Hillsboro regional 100% Area Median Income (AMI) ranged from $80,000 for a single-person household to $114,000 for a four-person family. If Portland is to maintain its income diversity, 53 percent, or more than 63,000 units, will need to be affordable to lower income (0-80% AMI) households. Development of new housing affordable to lower income households generally requires subsidy or other financial support.

Figure 1. Total Units Needed By Income Affordability



Source: BPS analysis

Extremely Low-Income Households (0 to 30% AMI)

Existing Households: 48,179
New Units: 18,211 to 26,370

In 2023, a single-person household could earn at most $23,700 and a household of four, $33,900. Monthly affordable housing costs would be between $700 and $900. Meeting the housing needs of these households will require a combination of preserving existing income-restricted affordable housing and the development of new income-restricted affordable housing.

Very Low-Income Households (30 to 60% AMI)

Existing Households: 51,408
New Units: 19,431 to 23,497

In 2023, a single-person household could earn at most $48,000 and a household of four, $68,600. Monthly affordable housing costs would be between $1,300 and $1,900. Meeting the needs of these households will require preserving existing affordable housing and development of new income-restricted affordable housing.

Low-Income Households (60 to 80% AMI)

Existing Households: 32,751
New Units: 12,379 to 13,537

In 2023, a single-person household would earn at most $63,200 and a household of four, $90,200. Monthly affordable housing costs would be between $1,800 and $2,500.

Middle-Income Households (80 to 120% AMI)

Existing Households: 53,579
New Units: 20,697 to 21,253

In 2023, a single-person household could earn at most $96,100 and a household of four would earn $137,300, with monthly affordable housing costs between $2,700 and $3,800.

High-Income Households (> 120% AMI)

Existing Households: 93,880
New Units: 35,853 to 35,903

In 2023, a single-person household would earn more than $96,100, and a household of four $137,300. Monthly affordable housing costs would be greater than $2,700.

Housing needs for high-earning households are likely to be met through private development. The development of housing that is affordable to high-income households is important in freeing up existing housing stock where households are renting or buying down, when it may be affordable to lower-income households.

Housing Needs of Specific Populations

Black, Indigenous, and People of Color (BIPOC) Households

Existing Households: 81,526
New Units: 26,582 to 30,071

In 2021, just 19 percent of Black householders earned more than 120 percent AMI, compared to 45 percent of white householders and 30 percent of BIPOC households overall. The impacts of a constrained housing supply are more starkly felt by Black, Indigenous and Households of Color.

In a challenging housing market, income disparities further impede the ability of households to enter the market, build wealth through ownership, and further burden renters. The share of BIPOC householders in Portland has increased from 20 percent in 2010 to 25 percent in 2021. Meeting the needs of these households will require addressing the affordability issues as well as ensuring that people of color have access to housing without discrimination.

Households Experiencing Houselessness

Existing Households: 2,516
New Units: 4,604

Many households currently experiencing houselessness have some income, but still cannot find an available, affordable home. To house households currently experiencing houselessness;

- 4,098 units are needed for households earning less than 30 percent AMI;
- 368 units are needed for households earning less than 60 percent but more than 30 percent AMI;
- 138 units are needed for households earning less than 80 percent but more than 60 percent AMI.

Meeting the housing needs of people experiencing houselessness ranges from emergency assistance to prevent houselessness, permanent supportive housing, and improved access to an affordable unit.

Households With Members Who Have Disabilities

Existing Households: 65,279
New Units: 21,277 to 26,318

Overall, an estimated 22 to 27 percent of all households in Portland have at least one household member with disabilities (CHAS 2019, ACS 2021). Households earning less than 50 percent AMI are more likely to have members with disabilities. Adults with disabilities are more likely to rely on supplemental security income (SSI), which is insufficient to meet most basic needs.

Meeting the housing needs of these households will require addressing affordability issues, considering the characteristics of housing design as accessible and/or visitable, as well as ensuring access to housing without discrimination.

Households With Older Adults

Existing Households: 63,514
New Units: 22,126 to 27,367

People over 65 years old are more likely to report a disability, and in Portland, 33 percent of people over 65 report having at least one disability, increasing the need for accessible units. As the proportion of older adults increases, the importance of establishing "aging in community" housing practices becomes increasingly significant and will drive demand for older adults. Meeting the housing needs of these households will require addressing affordability issues, as well as ensuring access to housing without discrimination, and promoting the development of a variety of housing types, such as intergenerational housing, small easy-to-maintain dwellings, or assisted-living facilities.

Large Households, Multigenerational Households, or Households with Children

Existing Households: 83,293

New Units: 22,694 and 35,890

If the trend for households from the 2017-2021 American Community Survey continues, 30 percent of new housing units will need to be able to accommodate three or more persons. Meeting the housing needs of these households in order to ensure there is not overcrowding will require providing larger units with a greater number of bedrooms and consideration of a variety of housing types in order to support intergenerational housing.

Figure 2. Summary of Total Units Needed by Affordability and Household Characteristic

	Existing Households	New Units
Extremely Low income (0 to 30%)	48,179	18,211 to 26,370
Very Low income (30 to 60%)	51,408	19,431 to 23,497
Low income (60 to 80%)	32,751	12,379 to 13,537
Middle income (80 to 120%)	72,244	20,697 to 21,253
High income (> 120%)	126,585	35,853 to 35,903
Black, Indigenous, and People of Color (BIPOC) Households	81,526	26,582 to 30,071
Households Experiencing Houselessness	2,516	4,604
Households with Members who Have Disabilities	65,279	21,277 to 26,318
Households with Older Adults	63,514	22,126 to 27,367
Households with Children	65,146	29,016 to 35,890

Where Is Housing Demand Located?

For the most part, the housing location analysis reveals a concentration of housing demand in key growth areas that are consistent with Portland's Comprehensive Plan policies such as focusing growth in complete neighborhoods, centers and corridors, and high-opportunity areas with access to services and amenities. However, when housing demand location is examined through an equity and resilience lens, the city's expected patterns of growth unveil additional considerations. The racially and ethnically concentrated areas of affluence and poverty analysis underscores the importance of addressing past exclusionary zoning practices to promote fair housing. These zoning patterns not only exclude low-income and protected-class households from accessing high-opportunity areas but also concentrate housing demand pressures in other neighborhoods, potentially driving up housing costs, which can be particularly harmful in economically vulnerable neighborhoods. Redressing these past practices can help distribute housing demand more evenly, increase housing opportunities in key growth areas, and thereby alleviate pressures in vulnerable neighborhoods. Furthermore, recognizing the overlap between climate risk areas, particularly urban heat islands, and high-risk liquefaction zones, and Portland's key growth areas are crucial for sustainable growth. Implementing policies to mitigate climate risk impacts will enhance the resilience of vulnerable residents living in regulated affordable housing units located in these areas.

What are the Barriers to Producing Needed Housing?

The barriers to the development of housing in Portland include issues that range across local, state, and federal issues, these are described in more detail in Appendix A. Additional Housing Need Context, Existing And Expected Barriers To The Development Of Needed Housing

- **Development and construction costs.** Nationally, development costs have significantly increased over the past few years. At the same time, rental rates and sale prices slowed, resulting in feasibility gaps for many residential projects.
- **Workforce availability.** Nationally and locally, limited availability of labor, particularly in the construction workforce, has also contributed to setbacks and challenges in the construction of needed housing.
- **Financing and investment funding and resources.** With banks and other lenders now less willing to lend, developers must seek other sources of funding. For some, that means reducing their capacity for other projects; for others, that means taking on less favorable loan conditions. For affordable housing developers, the pool of possible funders is small, and compliance can be challenging.
- **Regulatory burden.** The City continues to streamline the development review process to decrease the time it takes to obtain a permit. As well, the City will continue to review and amend development code regulations to consider how the cost of compliance affects development feasibility and housing affordability.
- **Mortgage and loan interest rates.** Interest rate increases have been consequential to development feasibility and housing affordability. For example; the monthly payment on a median-priced house has increased by more than 50 percent due to higher loan rates.
- **Resident ability to pay or compete.** Mismatches in the market, or underproduction of units at needed affordability levels, presents demand-side barriers, so even if housing gets built, it does not match the incomes or needs of current households, both renters and owners.

New Strategies to Meet Future Housing Need

Portlanders need access to high-quality affordable housing that accommodates their needs, preferences, and financial capabilities. Accordingly, future housing supply should accommodate different types, tenures, density, sizes, costs, and locations. The Housing Production Strategy identifies strategies and actions the City can take to promote housing development that meets the community's current and future needs, with a focus on more equitable and affordable housing options for a wider range of incomes, needs, and preferences.

There are several key themes that run through the strategies:

- **Produce more housing –** the overall goal is to produce more housing of all types to meet Portland's housing production targets that are assigned by the State of Oregon.
- **Additional funding for affordable housing** – the City has been successful in fully distributing the funds and exceeding development targets for the recent City and Metro affordable housing bonds. The City also has relied on tax increment financing along with state and federal funding. All of the funding sources will need to be sustained and increased to meet our affordable housing goals.
- **Increase capacity in high opportunity neighborhoods** – While overall the City has an adequate zoning capacity to meet future growth, that capacity needs to be better distributed to minimize displacement; increase capacity in high opportunity, complete neighborhoods through area planning and zone changes; breakdown exclusivity; and reduce carbon emissions.
- **Continuous improvement** – since the 2015 Housing Emergency Declaration, the City has adopted a number of changes to the zoning code and development review permitting. This work will continue to streamline the review process and remove code barriers to development.
- **Implement catalytic developments** – there are a number of large development projects in and around the Central City that represent the potential for thousands of housing units, including affordable housing. The City has an important role, both directly and supportive, to ensure these developments come to fruition.

This action plan and subsequent strategies aim to address the wide range of housing types and affordability levels in addition to overall net new housing production. Strategies are organized into the following eight initiatives:

A. **Promote Affordable Housing (0-80% AMI):** Increase the supply of regulated and unregulated affordable housing units.

B. **Increase Middle Income Housing and Homeownership**: Improve access to middle income housing and homeownership opportunity, by improving retention, and choice for people of color and others who have been historically underserved and under-represented.

C. **Increase Access to Opportunity**: Ensure equitable access to housing in safe, healthy neighborhoods with convenient access to jobs, goods and services.

D. **Reduce Barriers to Development and Improve Processes:** Address known regulatory impediments to building needed housing.

E. **Stabilize Current and Future Households:** Support current and future households to reduce housing insecurity and prevent houselessness.

F. **Promote Age and Disability Friendly Housing:** Ensure equitable access to housing for people with disabilities and older adults.

G. **Promote Climate Friendly and Healthy Homes:** Increase access to high-performance and climate resilient housing for Portlanders of all abilities and income levels.

H. **Advocate at the State and Federal Level:** To fully address housing needs locally, the City will need policy changes or funding at the state and federal level.

Each strategy includes the following information:

- **Description**: What is the strategy? How can the strategy work to address identified housing needs in Portland? What are potential outcomes?
- **Affordability target**: What income levels are served by the strategy?
- **Tenure target:** Are renters or owners served by the strategy?
- **Populations served:** What specific populations are served by the strategy?
- **Magnitude of Impact:** What is the anticipated impact for producing new and needed units? *(Low: Indirect or low impact on actual production, Medium: Likely to have some direct impact on the production of units, High: likely to directly produce or facilitate the production of units)*
- **Time Frame:** When does the City expect the action to be adopted and implemented? *(Near Term (1-2 years), Medium Term (within 3-5 years), and Longer Term (>5 years)).*
- **Priority:** How important is it for the City to adopt and implement this action in the next 6 years? *(Generally, High priority (1-2 years); Medium (3-5 years); Low (>5 years)).*
- **Lead:** The city department most likely to take the lead in implementing a strategy
- **Partners:** Likely collaborators in implementing a strategy

New Strategies By Initiative

A. Promote Affordable Housing (0-80% AMI)

1. Replace Housing Bonds Revenue Source
2. Create New Tax Increment Financing (TIF) Districts
3. Leverage Other State and Federal Funding Sources
4. Establish a Comprehensive Citywide Land Banking Strategy
5. Rezone Sites For Affordable Housing
6. Review and Update Inclusionary Housing (IH) Program
7. Update Short Term Rental Nightly Fee

B. Increase Middle Income Housing and Homeownership

1. Create New Middle-Income Financial Incentives
2. Update Land Division Code
3. Expand Homeownership Programs
4. Improve Middle Housing Permit Process

C. Increase Access To Opportunity

1. Implement and Support Catalytic Investments
2. Increase Housing Capacity in Inner Centers & Corridors
3. Revise Zoning Bonuses and Incentives
4. Kickstart Housing Demand in Central City
5. Increase Housing Capacity in the Central City
6. Identify Housing Opportunity Along 82nd Avenue
7. Promote Increased Transit Service
8. Incorporate Affirmatively Furthering Fair Housing

D. Reduce Barriers to Development and Improve Processes

1. Implement Regulatory Reform Project
2. Improve User Experience within Permitting Systems
3. Reform Development Services Funding Model
4. Explore Infrastructure Investments and Strategies
5. Revise System Development Charges (SDC)

E. Stabilize Current and Future Households

1. Preserve Existing Affordable Housing
2. Launch Affordable Housing Listing Service

F. Promote Age and Disability Friendly Housing

1. Implement Accessible Housing Production Strategies
2. Educate on Opportunities for Aging in Place & Community

G. Promote Climate Friendly and Healthy Homes

1. Support Mass Timber and Modular Innovations
2. Develop Low Carbon Building Policies
3. Promote Commercial to Residential Conversion / Adaptive Reuse
4. Implement Heat Adaptation Recommendations

H. Advocate at State and Federal Level

1. Advocate for Funding for Production and Preservation
2. Advocate for Regulatory and Code Changes to Meet Housing Need
3. Advocate for Policy that Supports the Building of Resilient Homes

New Strategies by Lead Bureau

Many of these actions and strategies will be collaborative efforts between multiple bureaus, in this table, lead bureau is simplified to one bureau, even where strong lead or collaboration is expected.

Portland Housing Bureau (PHB)

- Replace Housing Bonds Revenue Source
- Create New Tax Increment Financing (TIF) Districts
- Leverage Other State and Federal Funding Sources
- Establish a Comprehensive Citywide Land Banking Strategy
- Rezone Sites For Affordable Housing
- Review and Update Inclusionary Housing (IH) Program
- Update Short Term Rental Nightly Fee
- Expand Homeownership Programs
- Preserve Existing Affordable Housing
- Launch Affordable Housing Listing Service

Bureau of Planning and Sustainability (BPS)

- Rezone Sites for Affordable Housing
- Increase Housing Capacity in Inner Centers & Corridors
- Revise Zoning Bonuses and Incentives
- Increase Housing Capacity in the Central City
- Identify Housing Opportunity Along 82nd Avenue
- Incorporate Affirmatively Furthering Fair Housing
- Implement Accessible Housing Production Strategies
- Educate on Opportunities for Aging in Place & Community
- Support Mass Timber and Modular Innovations
- Develop Low Carbon Building Policies
- Implement Heat Adaptation Recommendations

Prosper Portland

- Create New Tax Increment Financing (TIF) Districts
- Create New Middle-Income Financial Incentives
- Implement and Support Catalytic Investments
- Kickstart Housing Demand in Central City
- Promote Commercial to Residential Conversion / Adaptive Reuse
- Explore Infrastructure Investments and Strategies

Infrastructure Bureaus:
Portland Bureau of Transportation (PBOT) / Portland Water Bureau (PWB) / Bureau of Environmental Services (BES) / Portland Parks and Recreation (PPR)

- Revise System Development Charges (SDC)
- Promote Increased Transit Service

Permitting and Development (PP&D)

- Improve Middle Housing Permit Process
- Implement Regulatory Reform Project
- Improve User Experience within Permitting Systems
- Reform Development Services Funding Model

Office of Government Relations (OGR)

- Advocate for Funding for Production and Preservation
- Advocate for Regulatory and Code Changes to Meet Housing Need
- Advocate for Policy that Supports the Building of Resilient Homes

New Strategies by Adoption And Implementation Timeline

Legend: ▶ **Project Start:** When the project was/will likely be initiated ⟶ **Adoption:** When a new policy/program is expected to be adopted by year ⋙ **Implementation**: When a new policy/program is expected to be effective by year

A. Promote Affordable Housing (0-80% AMI)

Portland has an adequate supply of land to meet its future housing needs. The challenge is to provide housing with a diverse range of unit types and prices in locations that help meet the needs of all. Without these strategies, access to quality, affordable homes will continue to be out of reach to those whom the market does not adequately serve, including low-income populations, communities of color and people of all ages and abilities.

The greatest need identified during HPS engagement, through the Black, Indigenous and other People of Color (BIPOC) focus groups, community meetings, survey responses, draft public comment and stakeholder meetings, was the need for more affordable housing, especially for lower-income households, including renters who are concerned about rent increases and people on the brink of or already experiencing houselessness. With a demonstrated need for 53 percent of Portland's future housing needing to be affordable at 80 percent AMI or below, and an existing shortage of affordable housing for current Portlanders, this initiative and the subsequent strategies are necessary to help meet those needs.

While the City works with partners at JOHS, Multnomah County, Metro and with community partners to implement the Homelessness Response Action Plan, this initiative, in combination with initiative E. Stabilize Current and Future Households, aim to increase access to housing choice and prioritize extremely low-income households who may be at risk of becoming houseless.

These strategies aim to increase the supply of regulated and unregulated affordable housing units in Portland to address the city's pressing need for quality, affordable homes for a growing and socioeconomically diverse population, and to help ensure equitable access to housing. The ability to produce substantial amounts of affordable housing is heavily dependent on funding availability to support affordable housing development. Past housing bonds have played a pivotal role in this effort. Therefore, replacing those bonds with alternative revenue sources is instrumental in significantly increasing Portland's inventory of affordable housing units.

Implementing these strategies requires coordinated action and strong public-private partnerships. A wide variety of stakeholders have a role, including agencies such as the Portland Housing Bureau and Home Forward, community development corporations and other nonprofit community organizations, and private sector real estate and development partners. Staff time will be required to develop and maintain these partnerships as well as review and revise existing programs and code regulations to better facilitate affordable housing development.

Figure 3. Existing and Ongoing Programs and Actions That Promote Affordable Housing

Existing and Ongoing Programs Promoting Affordable Housing	
Inclusionary Housing (IH) Program	Land Acquisition and Banking
Mixed Use Zoning	Public Land Inventory

Existing and Ongoing Programs Promoting Affordable Housing	
Manufactured Dwelling Park (MDP) Zoning	Expanding Opportunities for Affordable Housing
Deeper Housing Affordability (DHA) bonus	Construction Excise Tax
Tax Increment Financing (TIF) • Regulated Affordable Rental Housing • Property Acquisition and Rehabilitation • Gap Financing For Middle Income Housing	Short Term Rental Lodging Tax American Rescue Plan Act Funds Portland Clean Energy Fund (PCEF) Metro Supportive Housing Services Fund

Federal Funding • Community Development Block Grant (CDBG) • HOME Investment Partnerships (HOME) • Emergency Solutions Grants (ESG) • Housing Opportunities for Persons with AIDS (HOPWA)	State Funding • Permanent Supportive Housing (PSH) • LIFT and Housing Trust Funds (HTF) • 9% Low-Income Housing Tax Credit (LIHTC) • 4% Low-Income Housing Tax Credit (LIHTC)
Other Federal and State Funding	Affirmative marketing for City Incentives

NEW STRATEGIES

1. Replace Housing Bonds Revenue Source

The City has been successful in fully distributing the funds and exceeding development targets for the two recent affordable housing bonds ($258.4M (Portland) and $211M (Metro)). The City will continue to be responsible stewards of public funds and maintain the systems and processes put in place to quickly and effectively use bond funding to create new affordable housing. The City will use lessons learned from the bonds and establish a per unit funding level that assures the long-term affordability and viability of affordable housing projects. The City will identify a long-term sustainable funding source for affordable housing development that aligns resources with the Housing Needs Analysis' identified housing production needs. Essential to this production strategy will be to identify resources for continued long-term operational support for affordable housing as well as resources for a risk mitigation pool.

Impact

Affordability: 0-80%

Tenure: Both

Populations Served: Low-income communities

Magnitude: High

DLCD Category: Resources and Incentives

Priority: High

Lead: PHB

Partners: State, Metro, Multnomah County

Project Start: Jan 2024

Adoption: July 2026

Implementation: July 2027

2. Create New Tax Increment Financing (TIF) Districts

Prosper Portland and Portland Housing Bureau are exploring establishing up to six new TIF districts in East Portland (including along 82nd Avenue) and the Central City. The creation of new TIF districts will increase investment in those areas and provide funding, through the 45% set-aside policy, to support affordable housing development, as well as resources available to support middle income housing (B1) and the creation of quality jobs. The goal is for City Council to vote on the first set of TIF districts in October 2024. Should City Council approve new tax increment finance district(s), Prosper Portland and Portland Housing Bureau will support and staff community action planning processes that identify spending priorities for the first five years of each TIF district, which will include both the 45% Set Aside Policy resources for 0 – 60% AMI rental and 0-80% AMI ownership as well as middle income and market rate housing above those thresholds.

Impact

Affordability: 0-120%

Tenure: Both

Populations Served: Low-income communities + general

Magnitude: High (~5 years post-adoption)

DLCD Category: Resources and Incentives

Priority: High

Lead: Prosper, PHB

Partners: BPS, OMF, Multnomah County

Project Start: August 2023

Adoption: October 2024

Implementation: July 2025

3. Leverage Other State and Federal Funding Sources

There are additional resources or programs at the state and federal level that may offer funding for housing projects, especially affordable housing projects. Many of these programs are administered by the federal Department of Housing and Urban Development (HUD) or the state Oregon Department of Housing and Community Services (OHCS)

A. Build PHB's resource development capacity to increase participation in state and federal funding programs for affordable housing.
B. Identify and pursue grant opportunities to diversify funding sources for affordable housing.
C. Coordinate with OHCS to align local and state funding opportunities for affordable housing projects.
D. Explore new/expanded funding sources including a Private Activity Bond Recycling Program, 501c3 Bonds, PSH funding for capital and operating costs, and HUD/Fannie/Freddie sources.

Impact

Affordability: 0-120%

Tenure: Both

Populations Served: Low-income communities

Magnitude: High

DLCD Category: Resources and Incentives

Priority: Medium

Lead: PHB

Partners: OHCS, HUD, Prosper, BPS

Project Start: 2024

Adoption: July 2025

Implementation: July 2026

4. Establish a Comprehensive Citywide Land Banking Strategy

Impact

The City will create a comprehensive citywide land banking strategy for affordable residential and mixed-use development. The strategy will utilize information from the 2023 Public Land Inventory and integrate insights from market analyses, enhanced financial planning, land acquisition and tender procedures, and community engagement, and explore partnerships with other agencies.

- The City will initiate new formal coordination and processes among all local area land banking entities, organizations, and agencies in an effort to increase communication, advocacy, and support of land banking practices.
- The City will pursue a variety of local, regional, state, and federal funding sources for land acquisition, holding land, site clearance, land swapping, and land entitlement for affordable and middle-income housing development.

Affordability: 0-120%

Tenure: Both

Populations Served: Low-income communities

Magnitude: Medium

DLCD Category: Land and Infrastructure

Priority: High

Lead: PHB/Prosper

Partners: Metro, Multnomah County, local, state and federal agencies

Project Start: 2025

Adoption: July 2025

Implementation: July 2027

5. Rezone Sites for Affordable Housing

The City will conduct a project based on the Expanding Opportunities for Affordable Housing project to rezone additional sites.

The initiative aims to collaborate with affordable housing providers and faith-based organizations that own properties and are working on plans to develop or preserve affordable housing, but face zoning restrictions. The project strategically upzone land to increase housing unit capacity. BPS will coordinate with infrastructure bureaus to review proposed sites and identify any potential infrastructure capacity deficiencies.

Impact

Affordability: 0-80%

Tenure: Both

Populations Served: Low-income communities

Magnitude: Medium

DLCD Category: Zoning and Code

Priority: High

Lead: BPS

Partners: PHB, PP&D, Infrastructure Bureaus, Institutions, affordable developers

Project Start: July 2024

Adoption: June 2025

Implementation: July 2025

6. Review and Update Inclusionary Housing (IH) Program

Portland's IH program requires that buildings with 20 or more new units provide a percentage of the new units at rents or sale prices affordable to households making up to 80% AMI for a period of 99 years. The program offers incentives (such as property tax exemptions and development fee exemptions) to help offset the compliance costs to maintain the financial feasibility of new residential buildings. The program options and incentives promote affordable family-sized units and deeper affordability levels up to 60% AMI. In 2023, the City undertook a comprehensive review of the IH program, which resulted in changes to the regulations and financial incentives to account for the cost of compliance.

- Conduct IH Program Periodic Review - City Council committed to periodically reviewing the regulations and incentives of Portland's IH program and making necessary revisions based on policy intent, market conditions, and program goals. (Ordinance No. 191610).

Impact

Affordability: 0-80%

Tenure: Both

Populations Served: Low- and moderate-income communities

Magnitude: High

DLCD Category: Zoning and Code

Priority: High

Lead: PHB

Partners: BPS

Project Start: Jan 2027

Adoption: Dec 2027

Implementation: Spring 2028

7. Update Short Term Rental Nightly Fee

Portland charges a $4 nightly fee on short-term rentals, on Booking Agents and short-term rental hosts for each night a guest rents a room. The funds generated from this fee fund affordable housing and houselessness initiatives in the Portland area.

This project would update the existing transient occupancy tax policy to tie the City's current nightly rate to the consumer price index, or similar market metric, for increases tied to market conditions.

Impact

Affordability: 0-80%

Tenure: Rent

Populations Served: Low-income communities

Magnitude: High

DLCD Category: Resources and Incentives

Priority: Medium

Lead: PHB

Partners: State, Metro, Multnomah County

Project Start: Jan 2025

Adoption: July 2025

Implementation: July 2026

B. Increase Middle Income Housing and Homeownership

The high cost of housing is challenging for middle-income households, or those earning between 60 percent and 120 percent of the area median income (AMI). Only 46 percent of the for-sale housing stock in Portland was affordable to households earning the Median Household Income (MHI) in 2023. As a consequence of the uniformly high housing costs, middle-income households are still largely priced out of homeownership. Uniformly high housing costs are similarly pervasive in the rental housing market, which serves many middle-income households in Portland.

These strategies aim to increase housing availability and access across a broader range of incomes and to improve homeownership rates, homeownership and renter retention, and locational choice for historically under-served and under-represented groups, including communities of color. They also aim to encourage a variety of rental and ownership opportunities and choices that help address gaps in middle income housing.

Expanding homeownership opportunities increases opportunities to accumulate wealth and live in more stable and secure housing. This is particularly impactful for marginalized communities historically excluded from the housing market, who have had few opportunities to build generational wealth through property ownership. These efforts contribute to both individual and generational prosperity.

Proposed strategies that offer financial incentives to fund homeownership programs can come at the expense of forgoing tax revenue. Creating these programs, assessing the implications of reduced city revenue, and identifying alternative funding sources to expand existing programs will require significant staff time.

Figure 4. Existing and Ongoing Programs and Actions That Promote Middle Income Housing and Ownership

Existing and Ongoing Programs Promoting Ownership	
Tax Increment Financing (TIF) • Middle Income & Market Rate Housing • Large Scale Site Preparation for Significant, Multiphase Housing Production • Property Acquisition and Rehabilitation • Gap Financing For Middle Income Housing and to Attract Private Capital	Homebuyer Opportunity Limited Tax Exemption (HOLTE)
Down Payment Assistance Loan Program	N/NE Preference Policy

NEW STRATEGIES

1. Create New Middle-Income Financial Incentives

The City will create new programs for grants, loans, tax exemptions and charge/fee exemptions to support middle-income (80-120% AMI) housing development and strategically attract private investment to generate market rate housing. In 2024, Prosper Portland created new guidelines for loans targeting middle income and market rate housing development and to leverage and attract partner capital. Approved through Prosper Portland Board Resolution No. 7525, new Prosper Portland lending products include:

- Predevelopment loans for attached and/or multi-dwelling residential projects;
- Property acquisition and construction financing loans for attached and/or multi-dwelling residential projects;
- Property acquisition and permanent financing for middle-income and market-rate multi-dwelling rental and mixed-use projects;
- Leverage loan resources, including via new Tax Increment Finance districts, via partnership with community lenders to scale funding.

Prosper Portland will periodically review lending performance and consider updates to loan program guidelines to increase unit production; ensure consistent financial returns that sustains a revolving program; and establish regulatory affordability agreements.

Prosper Portland and Portland Housing Bureau are exploring establishing up to six new TIF districts in East Portland and the Central City to increase resources available to support middle income housing and spur new housing production at significant opportunity sites in the Central City (including Broadway Corridor, OMSI, and the Lloyd Mall areas) and along key corridors in East Portland (including along 82nd Avenue). The goal is for City Council to vote on the first set of TIF districts in October 2024 (A2).

Impact

Affordability: 80-120%

Tenure: Rent

Populations Served: General

Magnitude: Medium

DLCD Category: Resources and Incentives

Priority: High

Lead: Prosper

Partners: PHB

Project Start: October 2023

Adoption: March 2024

Implementation: March 2030

2. Update Land Division Code

Dividing land into smaller parcels can help increase housing development opportunities in areas with limited available land. This project aims to simplify the land division process for smaller, less complex properties by streamlining application requirements and creating clear and objective standards as alternatives to the existing discretionary criteria.

Impact

Affordability: All

Tenure: Own

Populations Served: General

Magnitude: Low

DLCD Category: Zoning and Code

Priority: High

Lead: BPS

Partners: PP&D, Infrastructure Bureaus

Project start: July 2022

Adoption: August 2024

Implementation: October 2024

3. Expand Homeownership Programs

The City will expand existing programs and develop new programs that create housing for low to moderate income homebuyers such as:

- Expand land availability, tax incentives, grants, density bonuses, and fee waivers or expedited permitting to develop new housing.
- Increase funding for downpayment assistance, homebuyer education, and matched savings programs.
- Implement new programs that support alternative homeownership models. For example, limited equity, cooperatives, limited profit housing models, and non-market housing.

Impact

Affordability: up to 120%

Tenure: Own

Populations Served: Low- and moderate-income households

Magnitude: Medium

DLCD Category: Resources and Incentives

Priority: High

Lead: PHB

Partners: BPS, Prosper

Project Start: 2026

Adoption: July 2027

Implementation: July 2028

4. Improve Middle Housing Permit Process

Middle housing, such as ADUs, duplexes and fourplexes, can provide a greater range of housing options, and allow for lower-cost homeownership. Middle housing development permitting could be more navigable for residents and developers.

- Review middle housing development projects to assess and improve permitting process and development standards.
- Evaluate opportunity to accelerate the review times for projects that use previously approved plans.
- Evaluate capacity for dedicated inspections for middle housing projects, similar to the Field Issuance Remodel program.
- Identify challenges associated with providing public infrastructure to serve middle housing developments and create strategies to overcome them.
- Initiate a zoning code project to simplify middle housing types and offer greater flexibility in site design.

Impact

Affordability: 80%+

Tenure: Own

Populations Served: General

Magnitude: Low

DLCD Category: Regulation and Process

Priority: Medium

Lead: Portland Permitting & Development

Partners: BPS, Infrastructure Bureaus

Project Start: January 2027

Adoption: January 2028

Implementation: January 2028

C. Increase Access to Opportunity

This initiative works to help ensure equitable access to housing and aims to increase the number of Portlanders of all income levels living in safe, healthy housing that provides convenient access to jobs, goods and services that meet daily needs. These strategies also aim to connect more households to the rest of the city and region by way of safe, convenient, and affordable multimodal transportation. Given that these strategies aim to increase the supply of housing in areas of high opportunity, it's important to consider how some of these strategies may have an impact on existing infrastructure, including transportation and utility systems.

There is a concentration of areas of high opportunity, complete neighborhoods, low carbon neighborhoods and areas with lower risk of natural and climate hazards in and around Portland's Inner Centers and Corridors. Many of the city's historic districts and landmarks, which are also located in the Central City and inner neighborhoods, have historically provided many different housing types and opportunities exist to expand on these typologies in the future both through adaptive reuse and new development. These strategies work to increase fair housing access by developing housing in compact, mixed-use neighborhoods and by supporting more neighborhoods to become more complete neighborhoods.

Through public comment and community meetings, staff heard about community desire to increase opportunity for households to be able to choose to live in these inner neighborhoods. Many of which are areas of racially concentrated affluence, with evidence of historic exclusion. The HPS aims to address these concerns through strategies like C1. Implement and Support Catalytic Investments, C2. Increase Housing Capacity in Inner Centers and Corridors and C4. Kickstart Housing Demand in Central City.

Additionally, through focus groups and community meetings, staff heard more about community desire to have greater access to transit service, to neighborhoods that feel safe and housing in their current neighborhoods that meets household needs. The HPS aims to address these community desires through strategies such as C5. Increase Housing Capacity in the Central City, C6. Identify Housing Opportunity Along 82nd Avenue, and C7. Promote Increased Transit Service.

Figure 5. Existing and Ongoing Programs and Actions That Increase Access to Opportunity

Existing and Ongoing Programs Supporting Increased Access to Opportunity	
Design Overlay Zone Assessment (DOZA)	Three-Bedroom Unit Bonus
Residential Infill Project (RIP)	Shelter 2 Housing Continuum (S2HC)
West Portland Town Center	Central City 2035
Lower Southeast Rising	Better Housing by Design (BHD)
Montgomery Park to Hollywood	N/NE Preference Policy
N/NE Community Development Initiative	N/NE Housing Strategy
PBOT New Mover Transportation Wallet	Advance Portland

NEW STRATEGIES

1. Implement and Support Catalytic Investments

There are a number of major signature projects across Portland that the City is playing a significant implementation role. Successful projects will result in a significant number of units developed by private and affordable developers.

- **Albina Vision Trust** – The City will coordinate with the Albina Vision Trust (AVT) on the preparation of a Central City Master Plan for the Portland Public Schools (PPS) Mathew Prophet Education Center site. The City is providing early technical feedback that will help to shape the redevelopment of this site into 1,000 new housing units and community space. At the same time AVT and the City have been awarded a $800,000 Reconnecting Communities Grant to create a framework plan for a 94+ acre area that includes the PPS site, the Rose Quarter, new highway cover, waterfront, and other portions of historic Albina. The framework plan will create a roadmap for restorative development efforts in Albina.
- **Broadway Corridor** – The City will implement infrastructure investments that will support the development of mixed-income residential development including at least 720 new affordable units along with small business and anchor employment opportunities, new parks and the green loop in a high-density mixed-use development across 14 acres and up to 4 million square feet of development potential. The City will extend NW Johnson Street and associated water and sewer utilities to support the construction of new affordable housing units with $6 million dollars from the State of Oregon, along with additional public investment in necessary infrastructure.
- **Lloyd Mall Redevelopment** – The current owner is preparing an application for a Central City Master Plan (CCMP), and a Technical Advisory Group made up of City bureaus has been meeting with the owner and consultant team to provide expertise on the city regulations including the zoning code, infrastructure requirements and design guidelines and other requirements that affect future site redevelopment.
- **Montgomery Park Area Plan** – The City is in the process of adopting an area plan that will create a new mixed-use, transit-oriented neighborhood in this high opportunity area. The City will change the zoning, including creating a new plan district, to facilitate the development of more than 2,000 units, including affordable housing that exceed inclusionary housing

Impact

Affordability: All

Tenure: Both

Populations Served: General, Low-income communities, communities of color

Magnitude: High

requirements. The City will adopt a public benefits agreement with the owners of the two largest opportunity sites in the area to increase the amount of affordable housing, public parks/plazas, and affordable commercial space. In addition, the City will proceed with work to extend the Portland Streetcar line to this area.

- **Oregon Museum of Science and Industry Redevelopment (OMSI) –** The City will make public infrastructure and affordable housing in alignment with the OMSI District Central City Master Plan. PBOT will construct New Water Avenue using $10.9 million in Tax Increment Finance, $6 million Site Infrastructure award from the State of Oregon and $5 million of additional State funding awarded to OMSI. Additional private investment will support the development of a 24-acres mixed-use transit-oriented development, with up to 1,200 housing units of which at least 20% will be affordable through the City's Inclusionary Housing Policy with the potential for additional affordable units to be delivered by investment by the Portland Housing Bureau.
