June 30, 1997	Warranty Deed	Tract 41a (30.5 acres) donated by Erhardt Steinborn et ux. under authority of the Fish and Wildlife Act of 1956 "for the development, advancement, management, conservation, and protection of fish and wildlife resources …." General purpose derived from the Urban Refuge Policy and the Refuge Land Protection Plan and EA.
December 10, 1998	Warranty Deed	Tract 49 (7.99 acres) purchased from Charles Foster under authority of the Fish and Wildlife Act of 1956 "for the development, advancement, management, conservation, and protection of fish and wildlife resources …" using the Land and Water Conservation Fund. General purpose derived from the Urban Refuge Policy and the Refuge Land Protection Plan and EA.
February 24, 1999	Warranty Deed	Tracts 56 and 56a (totaling 36.51 acres) purchased from Gary White under authority of the Fish and Wildlife Act of 1956 "for the development, advancement, management, conservation, and protection of fish and wildlife resources …" using the Land and Water Conservation Fund. General purpose derived from the Urban Refuge Policy and the Refuge Land Protection Plan and EA.
February 24, 1999	Easement	Tract 56R (0.2 acre) purchased from Gary White under authority of the Fish and Wildlife Act of 1956 "for the development, advancement, management, conservation, and protection of fish and wildlife resources …" using the Land and Water Conservation Fund. General purpose derived from the Urban Refuge Policy and the Refuge Land Protection Plan and EA.
August 1, 2000	Warranty Deed	Tract 89 (131.5 acres) purchased from Larry Oleson, Trustee of the Trusts of Alden O. Oleson and Oleta W. Oleson, under authority of the Fish and Wildlife Coordination Act, Section 1 (48 Stat/401 as amended; 16 U.S.C. 661 et seq.) and the Fish and Wildlife Act of 1956, Section 7 (16 U.S.C. 742f [a][4]), which permit acceptance of funds for the acquisition and enhancement of real property. General purpose derived from the Urban Refuge Policy and the Refuge Land Protection Plan and EA. More specific purposes for acquisition and management are found within the memorandum of agreement between USFWS and Bonneville Power Administration (BPA) for Refuge Real Property Acquisition and Enhancement, and the Oleson Tracts I and II Five-Year Restoration and Management Plan.
October 20, 1999	Agreement	The agreement provided a mechanism for BPA to fund and USFWS to implement projects for the mitigation, enhancement, and permanent protection of wildlife habitat to help fulfill BPA's responsibilities under the Northwest Power Act. BPA will receive full credit for Habitat Units, including those from both the acquisition of real property

Date	Legal Document	Direction
		interests and from habitat enhancement activities that are a direct result of BPA funding. A five-year restoration and management plan and a habitat evaluation procedure analysis were both completed as required by BPA. Restoration and enhancement of historically rare seasonal and scrub-shrub wetlands, wet meadow prairie, Oregon ash riparian forest, mixed coniferous/deciduous forests, and oak savanna communities provided an opportunity to compensate for wildlife habitat losses resulting from construction and inundation activities at Dexter and Detroit Dams. The habitat evaluation procedure analysis for the Oleson parcels determined how many habitat units for specific species could be credited to BPA. Species targeted for analysis included mink, yellow warbler, black-capped chickadee, wood duck, beaver, western meadowlark, Wilson's snipe, mallard, red-tailed hawk, American kestrel, ring-necked pheasant, and the black-tailed deer. In general, the success of providing beneficial attributes for these species is dependent upon achieving goals to restore 30 acres of seasonal emergent wetland, 15 acres of riparian forest, 10 acres of scrub-shrub wetland, and 120 acres of oak savanna.
October 20, 1999	Easement	Tract 89R (0.5 acre) purchased from Larry Oleson, Trustee of the Trusts of Alden O. Oleson and Oleta W. Oleson, under authority of the Fish and Wildlife Coordination Act, Section 1 (48 Stat/401 as amended; 16 U.S.C. 661 et seq.) and the Fish and Wildlife Act of 1956, Section 7 (16 U.S.C. 742f [a][4]), which permit acceptance of funds for the acquisition and enhancement of real property. General purpose derived from the Urban Refuge Policy and the Refuge Land Protection Plan and EA. More specific purposes for acquisition and management are found within the memorandum of agreement between USFWS and BPA for Refuge Real Property Acquisition and Enhancement, and the Oleson Tracts I and II Five-Year Restoration and Management Plan.
February 8, 2001	Warranty Deed	Tract 97 (98.25 acres) purchased from Oleson Trusts under authority of the Fish and Wildlife Coordination Act, Section 1 (48 Stat/401 as amended; 16 U.S.C. 661 et seq.) and the Fish and Wildlife Act of 1956, Section 7 (16 U.S.C. 742f [a][4]), which permit acceptance of funds for the acquisition and enhancement of real property. General purpose derived from the Urban Refuge Policy and the Refuge Land Protection Plan and EA. More specific purposes for acquisition and management are found within the memorandum of agreement between USFWS and BPA for Refuge Real Property Acquisition and Enhancement, and the Oleson Tracts I and II Five-Year Restoration and Management Plan.
December 23, 1999	Warranty Deed	Tract 88 (32.01 acres) purchased from Jack Harmon et ux. under authority of the Fish and Wildlife Act of 1956 "for the development, advancement, management, conservation, and protection of fish and wildlife resources …" using the Land and Water Conservation Fund. General purpose derived from the Urban Refuge Policy and the Refuge Land Protection Plan and EA.
February 4,	Warranty	Tracts 57b and 57c (totaling 30.92 acres) purchased from Dennis Reese

Date	Legal Document	Direction
2000	Deed	under authority of the Fish and Wildlife Act of 1956 "for the development, advancement, management, conservation, and protection of fish and wildlife resources …" using the Land and Water Conservation Fund. General purpose derived from the Urban Refuge Policy and the Refuge Land Protection Plan and EA.
February 4, 2000	Easement	Tracts 57R-1 and 57R-2 (totaling 1.5 acres) purchased from Dennis Reese under authority of the Fish and Wildlife Act of 1956 "for the development, advancement, management, conservation, and protection of fish and wildlife resources …" using the Land and Water Conservation Fund. General purpose derived from the Urban Refuge Policy and the Refuge Land Protection Plan and EA.
February 16, 2000	Warranty Deed	Tract 80 (31.82 acres) purchased from Betty Bissell under authority of the Fish and Wildlife Act of 1956 "for the development, advancement, management, conservation, and protection of fish and wildlife resources …" using the Land and Water Conservation Fund. General purpose derived from the Urban Refuge Policy and the Refuge Land Protection Plan and EA.
March 13, 2000	Warranty Deed	Tract 27 (20.4 acres) purchased from Ron and Joann Bump under authority of the Fish and Wildlife Act of 1956 "for the development, advancement, management, conservation, and protection of fish and wildlife resources …" using the Land and Water Conservation Fund. General purpose derived from the Urban Refuge Policy and the Refuge Land Protection Plan and EA.
August 8, 2001	Agreement	Tract 5M (50.0 acres) (Morand property) owned by Metro and managed by USFWS under authority of the Fish and Wildlife Act of 1956 (16 U.S.C. 742) and the Fish and Wildlife Coordination Act (16 U.S.C. 661-667). General purpose derived from the Urban Refuge Policy and the Refuge Land Protection Plan and EA. More specific purposes for management are found within the intergovernmental agreement between USFWS and Metro on behalf of the refuge, and in the Restoration Plan for Metro—Morand Property. The intergovernmental agreement establishes a framework for managing a portion of the Morand property located within the refuge boundary to be administered by the Service as part of the National Wildlife Refuge System (Refuge System). As designated land manager, the Service desired to restore and manage habitats for migratory birds and other fish and wildlife. The property is to be managed as open space in accordance with the National Wildlife Refuge Improvement Act of 1997, the Comprehensive Conservation Plan (CCP) developed by the refuge, and the restoration and management plan for the Morand property. The Service is responsible for the designated property on a perpetual basis through agreement renewal, as referenced in the Service's North American Wetlands Conservation Act grant application submitted in July 1997. The plan articulates a partnership with Metro for the purpose of restoring and managing 50 acres of floodplain bottomland on the Morand property. The plan states that Morand project objectives are to

Date	Legal Document	Direction
		restore 13 acres of grassland/savanna, 6 acres of seasonal emergent wetland, and 3.5 acres of mixed deciduous/coniferous forest.
July 9, 2003	Warranty Deed	Tract 25 (15.1 acres) purchased from John and Dawn Westphal under authority of the Fish and Wildlife Act of 1956 "for the development, advancement, management, conservation, and protection of fish and wildlife resources …" using the Land and Water Conservation Fund. General purpose derived from the Urban Refuge Policy and the Refuge Land Protection Plan and EA.
July 9, 2003	Easement	Tract 25R (10.0 acres) donated by John and Dawn Westphal under authority of the Fish and Wildlife Act of 1956 "for the development, advancement, management, conservation, and protection of fish and wildlife resources …" General purpose derived from the Urban Refuge Policy and the Refuge Land Protection Plan and EA.
October 21, 2005	Warranty Deed	Tract 23 (88.3 acres) purchased from Lynn S. and Jane Henriksen under authority of the Fish and Wildlife Act of 1956 "for the development, advancement, management, conservation, and protection of fish and wildlife resources …" using the Land and Water Conservation Fund. The tract is managed under authority of the Fish and Wildlife Coordination Act, Section 1 (48 Stat/401 as amended; 16 U.S.C. 661 et seq.) and the Fish and Wildlife Act of 1956, Section 7 (16 U.S.C. 742f [a][4]), which permit acceptance of funds for the enhancement of real property. General purpose derived from the Urban Refuge Policy and the Refuge Land Protection Plan and EA. More specific purposes for acquisition and management are found within the memorandum of agreement between USFWS and BPA for Refuge Real Property Acquisition and Enhancement, and the Oleson Tracts I and II Five-Year Restoration and Management Plan.
October 21, 2005	Easement	Tracts 23M and 23R (totaling 1.3 acres) purchased from Henriksen under authority of the Fish and Wildlife Act of 1956 "for the development, advancement, management, conservation, and protection of fish and wildlife resources …" using the Land and Water Conservation Fund. The tracts are managed under authority of the Fish and Wildlife Coordination Act, Section 1 (48 Stat/401 as amended; 16 U.S.C. 661 et seq.) and the Fish and Wildlife Act of 1956, Section 7 (16 U.S.C. 742f [a][4]), which permit acceptance of funds for the enhancement of real property. General purpose derived from the Urban Refuge Policy and the Refuge Land Protection Plan and EA. More specific purposes for acquisition and management are found within the memorandum of agreement between USFWS and BPA for Refuge Real Property Acquisition and Enhancement, and the Oleson Tracts I and II Five-Year Restoration and Management Plan.
December 1, 2006	Warranty Deed	Tract 98 (2.28 acres) purchased from Robert M. Burchfield et ux. under authority of the Fish and Wildlife Act of 1956 "for the development, advancement, management, conservation, and protection of fish and wildlife resources …" using the Land and Water Conservation Fund. General purpose derived from the Urban Refuge Policy and the Refuge

Date	Legal Document	Direction
		Land Protection Plan and EA. More specific purposes for acquisition and management are found within the Project Summary and Decision for the Burchfield Addition. The project land acquisition supported and complemented conservation actions of other partners, specifically those of the BPA, which funded an adjacent restoration project enhancing biological diversity and native landscape habitats for wintering waterfowl, breeding songbirds, migrating shorebirds, marshbirds and other waterbirds, and habitats supporting federally listed and sensitive classified species of fish and wildlife. The addition is a critical link to successfully meeting habitat goals in the most effective manner for restoring 30 acres of seasonal emergent wetland.

Purpose and Acquisition History of Establishment Tualatin River NWR – Wapato Lake Unit

Date	Legal Document	Direction
June 11, 1992	Easement Deed	Tract 610c (32.77 acres) transferred from U.S. Department of Agriculture (USDA) Farmers Home Administration to the Service under authority of the Consolidated Farm and Rural Development Act (7 U.S.C. 1981, 1985, and 2002, Section 331, 335, and 354); Executive Order 11990; and Executive Order 11988, **"**providing for the protection of wetlands" and "providing for the management of floodplains."
August 28, 1992	Warranty Deed	Tracts 610a and 610b (totaling 97.16 acres) transferred from USDA FmHA to the Service under authority of the Food Security Act of 1985 (Public Law 99-198) conveying lands suitable as surplus, of marginal value for agricultural production, and environmentally sensitive or having special management importance for administration as part of the Refuge System.
October 6, 1992	Warranty Deed	Tract 610 (10.98 acres) transferred from USDA FmHA to the Service under authority of the Food Security Act of 1985 (Public Law 99-198) conveying lands suitable as surplus, of marginal value for agricultural production, and environmentally sensitive or having special management importance for administration as part of the Refuge System.
February, 2007	Wapato Lake Addition Land Conservation Plan (LCP) and EA	**Authority:** Migratory Bird Conservation Act of 1929 (16 U.S.C. 715 et. seq.). Established a Migratory Bird Conservation Commission to approve areas recommended by the Secretary of the Interior for acquisition with the Migratory Bird Conservation Fund. **Purpose:** "for use as an inviolate sanctuary, or for any other management purpose, for migratory birds …" General authority and purpose applies to all tracts within the 4,310-acre approved acquisition boundary of the refuge unit.
February, 2007	Wapato Lake Addition LCP	**Purpose:** The purpose of the Wapato Lake Unit is to protect, manage, and restore habitats for migratory birds, fish, and other native fish and

Date	Legal Document	Direction
	and EA	wildlife of the Willamette Valley; maintain and enhance the biological diversity of native plant communities and animals key to watershed health and function; and provide opportunities for people of all ages to enjoy wildlife-dependent recreation and further awareness about the natural world. The Wapato Lake wetland complex supports a variety of regionally and nationally important resources benefitting 1) patches of remnant rare native habitat such as emergent and scrub-shrub wetlands, upland and wet meadow prairies, and Oregon ash riparian hardwood forests; 2) important migratory bird habitat, especially for wintering waterfowl and breeding neotropical songbirds; 3) habitat for anadromous fish such as upper Willamette River winter-run steelhead and spring-run Chinook salmon, coho salmon, Pacific lamprey, and coastal cutthroat trout; and 4) cultural resources of historical importance. The Pacific Coast Joint Venture and Regional Shorebird Management Plans identified and targeted Wapato Lake for acquisition and restoration due to its historical importance to waterfowl of the Willamette Valley and as habitat for shorebirds. Oregon's Natural Heritage Program has referenced Oregon ash and Oregon white oak habitats as well as scrub-shrub wetland as among the rarest that remain in the Tualatin River Valley, and suggests they be considered highest in priority for protection because of their historical status and range of importance for promoting biological diversity. General purpose applies to all tracts within the 4,310-acre approved acquisition boundary of the refuge unit.
June 11, 2008	Wapato Lake Migratory Bird Conservation Commission Memo #1	**Purpose:** Purpose of acquisition is to manage lands as a migration and wintering area for waterbirds with special emphasis on tundra swans and on developing a breeding area for neotropical migratory birds. Important goals of the unit are to restore and protect rare native habitats such as wetlands, meadow prairies, and bottomland forests; manage and protect migratory bird habitat, especially for wintering waterfowl and breeding neotropical migratory birds; and provide opportunities for high-quality priority public uses of the Refuge System, including hunting and fishing. The unit supports wetlands, prairies, and a riverine complex of bottomland forest, all considered imperiled wildlife habitats. Unique organic peat soils support a relic shrub wetland community fringed by Oregon ash and dense stands of wapato, an important food source for tundra swan. Imperiled habitats support regionally and nationally important wildlife species including waterfowl, shorebirds, marshbirds, federally listed anadromous fish, raptors, and breeding neotropical migratory birds. Specifically, the Wapato Lake area supports populations of tundra swan, mallard, northern pintail, canvasback, ring-necked duck, lesser scaup, and Canada geese including dusky, cackling, and Aleutian subspecies. Pacific white-fronted geese use the area as well. General purpose applies to all tracts within the 4,310-acre approved acquisition boundary of the refuge unit.

Date	Legal Document	Direction
November 12, 2008	Warranty Deed	Tract 662 (40.0 acres) purchased from McCready Family Trust under authority of the Migratory Bird Conservation Act of 1929 (16 U.S.C. 715 et. seq.) to approve areas recommended by the Secretary of the Interior for acquisition with the Migratory Bird Conservation Fund "for use as an inviolate sanctuary, or for any other management purpose, for migratory birds …" General purpose derived from the Wapato Lake Addition LCP and EA. Appendix K. Public Involvement

Public involvement was sought throughout the development of the Tualatin River National Wildlife Refuge (NWR) comprehensive conservation plan (CCP), starting in November 2010. Public involvement strategies included communication with federally elected officials (or their aides), Tribal governments, key agencies, local refuge users, and the general public.

Three planning updates were mailed to a mailing list that included over 800 recipients representing Federal, local, and state agencies; congressional representatives; state and local elected officials; Tribal representatives; nongovernment organizations; businesses; learning institutions; media; private landowners; and individual citizens. The refuge also maintained a website where CCP information could be found and where the public could provide comments during the scoping phase.

Two public meetings and one agency meeting were held inviting discussion and soliciting feedback. Below is a brief summary of the events, meetings, and outreach tools that were used in our public involvement efforts.

K.1 Summary of Public Involvement Process

Federal Register Notice

- November 3, 2010. Federal Register published the Notice of Intent to Prepare a Comprehensive Conservation Plan and Environmental Assessment; and the Request for Comments.

Coordination with Congressional Representatives and/or Their Aides

- November 1, 2010. Letter sent to Oregon's two U.S. Senators and five U.S. Representatives. Letter described the start of the CCP process; invited coordination during initial public scoping; and provided public meeting dates and times.

- November 30, 2010. John Valley, aide to U.S. Senator Jeff Merkley, attended public open house.

Coordination with Tribes

- November 1, 2010. Letter to Tribal Chairwoman, Confederated Tribes of Grand Ronde. Letter described the start of the CCP process, invited coordination during initial public scoping through attendance at public meetings, and/or supplemental meetings directly with the Tribe.

- March 16, 2011. Letter to Tribal Chairwoman, Confederated Tribes of Grand Ronde. Letter invited Tribe to a face-to-face meeting with refuge staff to discuss tribal input to the CCP.

- April 13, 2011. Letter to Tribal Chairwoman, Confederated Tribes of Grand Ronde. Letter invited Tribe to a face-to-face meeting with refuge staff to discuss tribal input to the CCP.

Coordination with State, Regional, and Local Agencies

- November 1, 2010. Letter to state, regional, and local agency stakeholders, including Oregon Department of Fish and Wildlife (ODFW) representatives. Letter described the start of the CCP process; invited coordination during initial public scoping; invited participation in an agency scoping meeting; and provided public meeting dates and times.

- November 16, 2010. Meeting with agency representatives. Refuge hosted a round-table discussion to solicit input and feedback on identified issues, opportunities, and concerns.

Planning Updates

- November 2010. *Planning Update Number 1* described planning process, preliminary issues to be considered, and announcement of public meetings.

- April 2011. *Planning Update Number 2* summarized public scoping results, presented draft refuge vision statement, and presented draft refuge goals.

- October 2011. *Planning Update Number 3* summarized preliminary alternatives.

Public Open Houses/Scoping Sessions

- November 30, 2010 (evening). Public open house for CCP scoping. Sherwood, Oregon.

- December 2, 2010 (evening). Public open house for CCP scoping. Forest Grove, Oregon.

Meetings with Local Community Organizations on CCP Issues

- March 21, 2011. Presentation about the CCP process to the Friends of Tualatin River NWR.

Outreach and Media

- October 8, 2010. Press release sent to media. Announcement of upcoming public meetings published in several regional and community newspapers and newsletters, including *The Oregonian*.

- October 2010 to present. Website (http://www.fws.gov/tualatinriver/refugeplanning.htm) featuring CCP information, public involvement opportunities, reports, and progress.

K.2 Summary of Comments Received on Draft CCP/EA

The draft Comprehensive Conservation Plan/Environmental Assessment (CCP/EA) for the Tualatin River NWR was issued October 22, 2012, and was made available for review during a 30-day public comment period that extended from October 22 to November 22. Copies of the planning document were available at local libraries, refuge headquarters, and online. A planning update announcing the availability of the CCP/EA was distributed to everyone on the CCP mailing list, which totaled approximately 838 individuals and organizations.

A total of 102 comments were received from individuals and organizations, either in the mail or on the Public Comment Form that was contained within the mailing update. Some letters contained just one comment, while others contained multiple comments on various topics. The majority of the comments received were from the general public, while some were received from non-profit organizations, and Federal and state agencies. Some commenters indicated the alternative that they preferred, while others expressed their comments across the variety of alternatives.

All of the comments received were considered and are organized below by subject matter with the U.S. Fish and Wildlife Service's (USFWS's; Service's) response. Similar comments on a topic were grouped together and the Service response applies to the comments as a group.

Land Acquisition

Comment: The Service should not purchase any more lands for conservation.

Response: The mission of the National Wildlife Refuge System is to administer a national network of lands and waters for the conservation, management, and, where appropriate, restoration of the fish, wildlife, and plant resources and their habitats within the United States for the benefit of present and future generations of Americans. The Service purchases lands for conservation that have been designated inside an approved acquisition boundary. Lands are only purchased from willing sellers and at fair market value. Currently, consistent with the America's Great Outdoors Initiative, the Service is exploring the feasibility of revising the refuge's acquisition boundary.

Acquisition funds come from several sources: the Migratory Bird Conservation Commission, which receives revenue from the sale of duck stamps, Land and Water Conservation Funds, which are funds from offshore oil and gas leases, and import taxes on weapons. When lands are acquired by the Service, they are removed from the tax rolls. However, the Refuge Revenue Sharing Act (1995 [16 U.S.C. 715s]) allows the Service to offset the tax losses by annually paying the county or other local government unit an amount that often equals or exceeds that which would have been collected from taxes if in private ownership. Funds to pay for this comes from the net income the Service receives from products or privileges like timber sales, grazing fees, and such that are deposited in the fund for revenue sharing payment. If there is a shortage, then Congress has the authority to appropriate money to make up the difference.

Various Management Plans

Comment - State Plans: The ODFW requested various state management plans be included in the draft CCP under Chapter 1, Section 1.7.2, State Plans.

Response: While the Service recognizes the various state plans that are available to land managers for guidance on habitat management and restoration, and on various species, the list was not meant to be comprehensive and instead focused on those plans that were most relevant to the process of developing the draft CCP. Language was added in Chapter 1 to reflect this process.

Comment: Comments were received on the importance of developing a habitat management plan and a land protection plan to assist and guide management direction in the next 15 years. Comments were also received asking for clarification on the priority system for acquisition.

Response: Appendix C: Implementation Plan, Table C-1, outlines some of the step-down plans that will be developed over the life of the CCP. The Service has added habitat management and restoration step-down plans, and a land protection plan to this table.

The refuge currently has a land acquisition priority plan that was developed and outlines the five priority areas for land acquisition at the Sherwood Units. There is a focus on the top three areas for acquisition, and the plan includes maps and descriptions of each area. This plan is used extensively by refuge management to develop annual funding requests and work plans in cooperation with the realty program in our Regional Office. Most importantly, this plan provides a long-term guide for future planning. The Service has added language on this plan in Chapter 2, Description of Management Direction, Land Acquisition and Habitat Protection.

Comment: Support for the refuge developing an elk management plan.

Response: Appendix C, Implementation Plan, Table C-1 lists the elk management plan as a step-down management plan that will be prepared in coordination with the Willamette Valley NWR Complex.

Key Issues

Comment: Comments were received asking why issues such as climate change and inventory and monitoring were not addressed under the Key Issues section.

Response: We do feel these issues are important and addressed them in other sections of the CCP. Climate change is addressed in the Description of Management Direction section in Chapter 2 (Section 2.3), and again in Chapter 3, Physical Environment, in Section 3.1.2. We do have a goal for inventory and monitoring and our objectives and strategies are covered in Chapter 2 under Goal 8.

Refuge Integrated Pest Management (IPM)

Comment: The refuge received several comments relating to the refuge IPM program, ranging from concerns over herbicide use, the refuge's role in mosquito control, and invasive and nuisance species control.

Response**:** The refuge follows IPM policy guidelines when planning and implementing the use of herbicides, which recommend using the minimum amount of approved chemicals to achieve desirable goals. The refuge will continue to work closely with local county partners to establish guidelines in our IPM and mosquito control contingency plan regarding mosquito control action on the refuge. Nuisance species removal will be carried out under the guidelines of IPM policy.

Maps

Comment: Clarification of what the maps were conveying among the alternatives and what habitat was changing among the alternatives was requested.

Response: The Final CCP will include only two maps showing habitat types. The first one will be *current management,* depicting the habitats that currently exist or the restoration direction originally planned. The second map will be for the *preferred alternative – future management direction,* and

will depict the habitats that the refuge will work to restore and manage over the next 15 years. Table 2.1 of Chapter 2 also shows the changes through acreages.

Fire

Comment: Support was expressed for prescribed fire as a habitat management strategy as were concerns about the potential off-refuge effects to visibility and overall air quality. "Would machines be used to reduce the smoke?"

Response: Prescribed fire is listed as a strategy to reduce hazardous fuels and enhance and maintain wildlife habitat, particularly prairie, wetland, and savanna habitats. All prescribed fire activity will comply with applicable Federal, state, and local air quality laws and regulations. Visibility is a major consideration in smoke management. The planning for a prescribed fire must include the potential for hazardous situations, including impaired visibility created by smoke both on and off our lands. All prescribed burns must meet the provisions of the Clean Air Act and the State Implementation Plan. Burning machines will not be used due to their high cost and terrain constraints.

Species Management

Comment: We received comments regarding management actions specifically directed at certain species.

Response: Service policy supports biological integrity, diversity, and environmental health (BIDEH) of the landscape. To this end we maintain diverse habitat types to support a myriad of species across many guilds. In addition we focus on state and federally listed threatened and endangered species, and species of concern. We often include management activities for certain species or guilds providing it does not detract from the overall BIDEH mandate. For example, wetlands are primarily managed for waterfowl and other waterbirds, but early spring drawdowns are conducted to provide habitat for shorebirds. Additionally, managing for increased wet prairie acreage should provide benefits to species such as streaked horned larks and western meadowlarks.

Comment: We received comments from ODFW recommending management of specific fish and wildlife species and guilds, as well as habitat management suggestions.

Response: The Service mission and BIDEH policy both support the conservation of a diversity of habitats in support of fish, wildlife, and plants. We agree with ODFW that we should continue to look for opportunities to enhance habitats in support of an appropriate diversity of habitats and will continue to work in close partnership with ODFW on habitat, fish, and wildlife issues.

Grazing

Comment: We received comments regarding grazing as a habitat management tool.

Response: The refuge currently does not use grazing as a management tool. However, grazing may be a useful management tool in the future. Grazing could be used to remove non-native invasive species such as Himalayan blackberry (with goats) or reed canarygrass (cattle) for management purposes to improve habitat. Any grazing program implemented in the future will be for management purposes only and not as a commercial economic program.

Habitat

Comment: Some comments suggested restoring all areas to historic habitat conditions (e.g., convert managed wetlands to other habitat types).

Response**:** As noted above, the refuge maintains a variety of habitat types to support BIDEH. These habitat types sometimes include intensively managed tracts to support a diversity of species. Historic conditions such as frequent fire and flooding no longer exist as they did in pre-European settlement times. Therefore the refuge must manage habitats to mimic historic conditions to the best of our ability. Historic conditions did play a large role in determining current and future restoration opportunities, and using this information, the refuge is planning on significant historic vegetation restoration projects on the refuge. Not all areas will be converted to historic conditions though, either because it is no longer feasible due to the extent of the alternations or because focus will be on converting habitat to an imperiled valley habitat, such as oak.

Comment: We received comments concerning habitat corridors and connectivity.

Response: During the planning process much of our focus was to provide larger contiguous blocks of habitat while still supporting appropriate diverse habitats that support wildlife corridors and connectivity to habitats off of the refuge. Many of the habitat changes proposed will provide better corridors and connectivity for fish and wildlife as a result of these changes. The refuge will continue to pursue acquisition and restoration projects that increase connectivity.

Comment: Comments were received about the proposed change of habitat restoration from wet prairie to riparian forest on the northern portion of the Atfálat'i Unit, managed by the Service and owned by Metro. Comments were also received suggesting an increase of wet prairie habitats at other units on the refuge.

Response: The preferred alternative in the draft CCP identified the northern portion of the Atfálat'i Unit to be restored to riparian forest. After discussions with natural resource managers and biologists, the Service determined that this area would be better restored to wet prairie habitat based on hydrology, soils, and historic conditions. This change has been reflected throughout the final document as appropriate. Additionally, the Service recognizes the importance of wet prairie and as indicated in Chapter 2, Table 2.1, wet prairie habitat will increase from the current 27 acres to 138 acres on the refuge.

Comment: Concern was expressed over the loss of prairie and encroachment of other habitat types on small endemic plant populations located on the refuge. Some of these plants are rare and significant, and the encroachment of other species will cause the loss of those rare species on the refuge.

Response: The Service recognizes the importance of these rare plants and will maintain and restore wet prairie as identified in the management direction. The plants of concern will be protected from encroachment to the best of the refuge's ability. If the plants are growing in a location suited for restoration other than wet prairie, then, if appropriate and necessary, they will be moved to a more suitable location.

Comment: Commenters were concerned about converting oak to other habitat types and loss of wet prairie habitat.

Response: After further consideration, the final CCP will include maintaining oak habitat (savanna and woodland) and conversion of some areas that were planned for oak habitat to other habitat types in order to meet several habitat goals. In addition, existing wet prairie habitats will remain, and additional areas will be restored to wet prairie. Chapter 2 outlines in detail the changes to be made in regard to habitat, both in Table 2.1 and in the various habitat goals and objectives.

Comment: Comments were received suggesting alternative dates for mowing due to impacts to grassland birds.

Response: We agree that the timing of mowing is very important so as to not disturb grassland nesting birds. We have changed our strategies to reflect that mowing will be conducted after August 1 to protect ground-nesting birds. This date is a guideline, and we recognize that weather patterns may alter the timing. This will be evaluated on a seasonal basis.

Water (Quality and Management)

Comment: Comments were received related to refuge management and the potential impact on water quality, and on the importance of working with partners to facilitate high water quality, ensure total daily maximum load (TDML) amounts are not exceeded, and prevent future algal blooms at the Wapato Lake Unit. There were also comments received regarding the drinking water provided at the public facilities.

Response: The Service recognizes the need to develop and maintain good working partnerships for water quality with the local watershed council, Joint Water Commission, Department of Environmental Quality (DEQ), and others. The Service is committed to working with these partners to maintain high standards of water quality as consistent with the Service's mission. The refuge will work with partners to write a TDML plan for discharging water from Wapato Lake and will follow recommended pump deadlines in DEQ's water management plan. The refuge will work closely in coordination with the Joint Water Commission on Wapato Lake discharging timelines and any issues that may arise that could impact their operations downstream on the Tualatin River. Additionally, coordination will take place for future restoration plans on the Sherwood Unit that may affect water quality through creek restoration or other actions.

The Service also recognizes the need for and is required to follow health regulations in providing safe drinking water to the public. This is achieved through regular water testing and maintenance of the water systems in place.

Comment: The Service received comments supporting a more natural hydrology approach to habitat management using limited water manipulations with water control structures. Comments favored using historic hydrology instead of the managed wetlands currently found on the refuge.

Response: While exploring the various options for habitat restoration opportunities for the refuge, the Service researched historic conditions and examined habitats that are imperiled in the Willamette Valley. Using this information and other physical environment characteristics such as soils and elevations, the refuge identified the best possible habitat to promote while ensuring compliance with the BIDEH policy. This policy promotes a mixture of healthy habitats to maintain diversity and biological health. Currently, the refuge manages 294 acres of herbaceous wetlands using various water control structures and levees. These wetlands are managed to mimic seasonal flooding and to maximize foraging and stopover habitat for migratory waterfowl and other waterbirds. However, the

Service, through the process of developing the draft CCP/EA, recognized a need to have a more natural hydrologic system in some floodplain areas, and the management direction will show a decrease of managed wetlands by 100 acres. These 100 acres are now designated to be more historic habitats such as wet prairie and riparian forest.

Comment: The water control structures that would be removed during implementation of the CCP should be identified.

Response: The Service plans on developing restoration plans for the changes to be implemented on the refuge over the next 15 years. Appendix C: Implementation, Table C-1, identifies the various step-downs plans to be developed. Prior to any restoration project, a plan will be developed that details the objectives and strategies outlined in Chapter 2. While the maps found in Appendix P show the habitat change from herbaceous wetland to another type, the identification of specific water control structures to be removed are unknown until a restoration plan is completed.

Comment: There were comments on water management on the Wapato Lake Unit. Comments received emphasized the importance of making water quality and research a high priority; wanted to see the Service maintain the current irrigation system in place; stated the need to balance irrigation capabilities, in partnership with Tualatin Valley Irrigation District (TVID), with habitat and wildlife goals; and requested a detailed water management plan.

Response: The Service has a contract with the United States Geological Survey to gather data on water hydrology characteristics of the lakebed and surrounding area. The Service is waiting to develop a water management plan and restoration plan for Wapato Lake until these data are reviewed and a better understanding of the infrastructure is achieved. The Service recognizes the need for collaboration and partnerships for water quality and future restoration planning as they fit with the Service's mission. Currently, infrastructure owned by the Service is used by TVID for water distribution to their customers within the Bureau of Reclamation's project area, which includes the Wapato Lakebed and surrounding landowners. Interim management of Wapato Lake will include working with the TVID to provide access to the infrastructure for their delivery needs as long as the infrastructure remains intact. Restoration of the lakebed will most likely require removal of some irrigation infrastructure. However, at both the Wapato Lake Unit and the Sherwood Units, there needs to be more information gathered and engineering design acquired prior to any construction.

Artificial Structures

Comment: The refuge received comments concerning use of artificial structures, such as water control structures, as habitat management tools that may favor some species over others.

Response: The refuge's CCP management direction moves toward addressing these concerns by managing toward more native historic habitats and natural water flow regimes that could benefit a wider variety of species.

Cooperative Farming

Comment: The refuge received comments requesting clarification on the continued use of farming as a management tool.

Response: Cooperative farming has long been a traditional tool used by refuges to meet wildlife management goals. Cooperative farming provides a mechanism for the refuge to maintain a "clean" landscape free of weeds, until restoration can be implemented. Meanwhile, cooperative farmers are able to grow their crop in exchange for 30 percent of the harvest set aside for the refuge as wildlife food. The refuge will continue to evaluate the potential to continue cooperative farming as a management tool as we move forward in our restoration planning efforts. Cooperative farming is a valuable tool and will continue to be used as long as it is feasible and consistent with the goals of the refuge.

Impacts to Agriculture and Farmers

Comment: The refuge received comments with concern to our future commitments to farming and how it might impact area farmers. Commenters stated the importance of working with the agricultural community, both farmers and organizations/agencies, and assessing whether the Wapato Lake Unit is considered part of the Conservation Reserve Program (CRP) as identified under the 1985 Farm Bill.

Response: The refuge continues to work closely with our farming community as it relates to our farming program and will keep them involved during the process of implementing our management plan. Agreements are entered into annually with farmers from the local agricultural community. Communications will ensure the best opportunities are available for farmers as well as for the refuge. The refuge recognizes the need to continue communications and to partner with the Natural Resources Conservation Service (NRCS) and other agricultural organizations.

The CRP is a program that encourages farmers to convert cropland or other sensitive acreage to resource-conserving vegetative cover. This program enhances landscape-level conservation of habitat on farmland while offering incentives and a source of income for famers. The CRP program is implemented on private lands by willing farmers. Lands already owned in fee title by the Service utilize a cooperative farming program as described above. Lands not owned by the Service have the potential to be part of the CRP, and farmers are encouraged to contact their local farm agency for further information.

Inventorying and Monitoring

Comment: We received comments supporting the inventory and monitoring of wildlife species.

Response: We agree that inventorying and monitoring wildlife species and habitats is essential to understanding their needs and providing appropriate management. We currently survey for a wide variety of species and will continue to expand these efforts as we are able. Inventory and monitoring are conducted using approved protocols and support refuge management and/or regional and national monitoring programs.

Fees

Comment: User fees were supported for a variety of public uses including hunting, wildlife photography blinds, and special events. Others suggested that reduced fees be available for low-income visitors.

Response: In 2009, the refuge received approval to establish an entrance fee program (USFWS 2009) but has not implemented one to date. As identified in Description of Management Direction section in Chapter 2, the refuge will continue to evaluate the desirability of establishing entrance fees to supplement Federal appropriations, grants and other less reliable funding, and volunteer support. When planning for new uses such as hunting, fishing, and new photography blinds, the refuge will assess the need for user fees based on the circumstances at that time. If a user and/or entrance fee is implemented, the refuge will consider strategies to accommodate low-income users.

Public Access and Facilities

Comment: Commenters provided feedback on a wide range of access and facility issues, including: providing for disabled access; expanding new facilities slowly and conservatively; improving the safety of the Highway 99W entrance to the refuge; providing new pedestrian and wildlife observation access points; the use and placement of new wildlife photography and hunting blinds; the use of refuge meeting facilities for community activities; and developing connections with regional multimodal trail systems. Several commenters were concerned about the negative impact to wildlife and habitat should additional public access be provided.

Response: All public uses of the refuge must be found appropriate and compatible; there must be documentation that the uses will not materially interfere with or detract from the purposes of the refuge and the mission of the Refuge System. For a full discussion, see Appendix B.

As an urban refuge, we are committed to providing high-quality opportunities for visitors to connect with nature and understand the natural resource conservation work of the National Wildlife Refuge System. In support of those opportunities, we are committed to providing thoughtful, well-planned, accessible, and sustainably built facilities that meet the needs of our visitors while still meeting the needs of the refuge and its operations. However, facilities such as refuge meeting rooms are reserved for Service staff hosting and/or directly participating in a mission-based activity and are not available for private use

The refuge is aware of the safety concerns regarding the Highway 99W access and is actively seeking opportunities with Oregon Department of Transportation and Federal transportation agencies to address the issue.

The refuge supports connections to regional trails at existing entrance points to the refuge. At this time, no new access points or open areas are being proposed. Objective 10.4 has been clarified to reflect this.

The placement of new wildlife photography blinds will take into account minimizing disturbance to wildlife and habitat and providing high-quality opportunities. The shared use of potential hunt blinds with wildlife photographers and observers will be assessed as hunting and other public uses are considered at the Wapato Lake Unit. This will occur as habitat restoration planning and implementation progresses.

Environmental Education

Comment: Support was expressed for continuing to provide environmental education and some new ideas were proposed. Additional access into current sanctuary areas was suggested in order to facilitate education activities. A suggestion was made to include more landscape conservation

concepts into the existing curriculum. One commenter expressed concern that there may be too many students on the refuge in the future.

Response: Additional access for education will be provided by way of a defined "free roam" study area along the forest trail and a nature play area near the beginning of the year-round trail. Otherwise, all seasonal closures and sanctuary areas will remain in effect to reduce wildlife disturbance and minimize conflict with other wildlife-dependent public uses. Additional strategies will be added to the environmental education objectives to place more emphasis on holistic teaching related to landscape conservation issues. The refuge will continue to ensure that the level of refuge visitors is compatible with managing wildlife and habitat resources and/or does not affect the quality of the education program. In some cases, education programs will be provided off-site and thus will not have a direct impact on refuge habitats. Refer to Compatibility Determination (CD) B7 for a full discussion.

Fishing

Comment: Comments reflected support for establishing a fishing program. However, some commenters were concerned about a low-quality fishing experience due to the height of the river overlook above the surface of the water and due to the distance disabled visitors would have to travel to reach the fishing location.

Response: Fishing is one the Refuge System's priority wildlife-dependent public uses and, if implemented, the refuge will strive to provide a high-quality fishing experience. The intention of the program is to expose first-time anglers and youth to fishing, rather than providing a high-use fishery for experienced anglers. The fishing program will emphasize the experience of fishing and will accompany quality educational programs that enhance the experience, such as programs led by the refuge.

The river overlook, where fishing may occur, is located 0.5 mile from the parking lot via a trail designed to be fully accessible to disabled users. If an individual were unable to access the overlook via the trail, the refuge would endeavor to make appropriate accommodations.

Hunting—Youth Hunt

Comment: Comments were received both in support of and opposed to the proposed youth waterfowl hunt on the Riverboat Unit of the refuge.

Comments opposed to the youth hunt expressed concern at the quality of the hunt, disturbance to wildlife on and adjacent to the refuge, and disturbance to other people using the Tualatin River and other trails for wildlife observation. There were also concerns about details found in the CD for the youth waterfowl hunt.

Response: Congress included hunting as one of the six priority wildlife-dependent uses of refuges. When managed appropriately through careful planning and coordination with the ODFW, youth waterfowl hunting will allow youth the opportunity to learn to hunt in an ethical and safe manner. To minimize disturbance to people and wildlife near and adjacent to the refuge, the Service will carefully consider timing and placement of the hunt blinds to be used during the hunt.

The draft CD for the youth waterfowl hunt specified details such as the number of blinds and hunting dates. After further consideration, these details were eliminated from the CD. The refuge must go through a formal process to develop a hunt plan and prepare an opening package for publishing in the Code of Federal Regulations. At such time, details on timing, number of blinds, and other factors will be considered and agreed upon.

Comment: Comments were received supporting a youth waterfowl hunt as it would provide a public place for waterfowl hunting and also be a way to teach youths about hunting and hunting ethics.

Response: The Service believes that with careful planning and coordination with the ODFW, a high-quality youth hunt can be offered at the Riverboat Unit of the refuge. The refuge will evaluate the hunt on an annual basis and make adjustment to the program based on participant feedback. The Service recognizes that conditions of the habitat and fluctuations in weather patterns and wildlife populations may also alter the quality of the hunt program. These will also be evaluated and responded to appropriately on a yearly basis.

Hunting—Waterfowl

Comment: Comments were received both supporting and opposed to hunting on the refuge. Concern was expressed about noise related to hunting, accounting for unretrieved or wounded birds, and too much acreage being included in the hunt area at the Wapato Lake Unit.

Response: The National Wildlife Refuge Improvement Act recognizes hunting as a priority public use on refuges. Noise from hunting on the refuge should not be greater than noise that is currently occurring from hunting on neighboring lands. All hunts will be conducted in accordance with state and Federal regulations with respect to bag limits for birds. These bag limits take into consideration overall waterfowl population goals and are carefully monitored throughout the continent. The refuge intends to continue with plans to have a youth waterfowl hunt on the Riverboat Unit, and eventually have general waterfowl hunting at the Wapato Lake Unit. However, the details related to Wapato Lake hunting opportunities have been removed from the CD (see Appendix B) until pending restoration plans and implementation are sufficient enough to provide a compatible hunt. At that time, working with the ODFW, specific details on the waterfowl hunt will be examined and implemented to ensure a high-quality hunt.

Boating

Comment: The refuge received comments expressing interest in boat access to the Tualatin River and kayaking opportunities on the refuge.

Response: Boating and kayaking are not priority public uses on refuges and currently boating and kayaking are not allowed in refuge ponds, which serve as sanctuary for migratory birds. There are currently no refuge-owned lands that could accommodate safe boat access. The refuge will continue to follow policy guidelines when evaluating these uses as we move forward in the management planning and land acquisition process. This does not eliminate the potential to explore further options to boat access if new opportunities become available.

Outreach and Diversity

Comment: Comments were received emphasizing the need to provide opportunities for our diverse community to connect with nature.

Response: As an urban refuge, Tualatin River NWR is committed to continuing our current programming and outreach for our diverse community and we intend to expand our offerings in the future. We will continue to work with diverse partners and community members. We support inclusiveness and outreach within and outside boundaries of the refuge with programs covering a wide range of conservation-related topics relevant to the public. Refer to Goal 13 Objectives 2 and 3 for a range of strategies.

Appendix L. Hydrological Modeling

L.1 Introduction/Overview

To identify habitat alternatives, the Tualatin River National Wildlife Refuge developed a habitat modeling exercise to determine what habitats would likely develop if the refuge relied solely on natural flows (flows as they currently exist) from the Tualatin River. The essential question that we attempt to answer in this analysis can be framed as: *Given our current ecological understanding and best available data, how much support do we have that current habitat patch* ***x*** *will develop into future habitat type* ***y*** *if the Tualatin River National Wildlife Refuge managed the refuge using the current natural flows of the Tualatin River*?"

The refuge was interested in modeling four floodplain habitat types for the refuge: emergent wetland, wet prairie, bottomland riparian forest, and scrub-shrub wetland.

L.2 Methods

L.2.1 Overview of Methods

The methods for this modeling exercise incorporate Light Detection and Ranging (LiDAR) topographic data, hydrological data from the Farmington Gaging Station, a hydrological model to understand the potential future conditions on the refuge under the management direction, and a decision support modeling framework to use the best existing knowledge on soils and current and historical vegetation to predict future habitat types (Figure L-1).

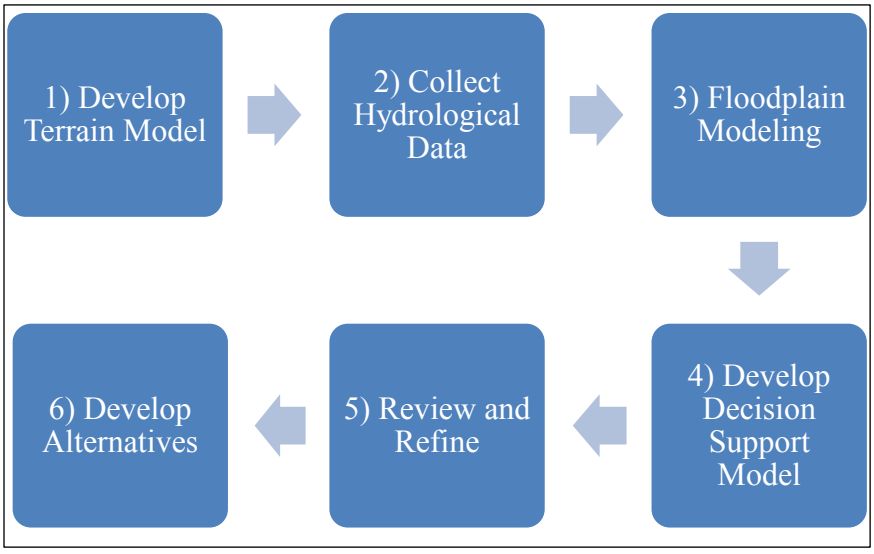

Figure L-1. Steps taken in the modeling process.

L.2.1.1 Develop a Terrain Model

LiDAR topographic data were acquired over the entire refuge as part of the Portland Metro LiDAR acquisition of 2005-2007. A digital elevation model (DEM) was produced that provides a terrain model of these data.

The LiDAR data were acquired during the fall of 2005. Thus, several of the wetland ponds were full of water during the acquisition. This made terrain modeling across the wetland ponds impossible. A mixture of ground-based surveys and engineering as-built data provided a data source to "fill-in" the flat areas caused by water. These data were collected and "burnt-in" to the LiDAR-based DEM.

L.2.1.2 Collect Hydrological Data

Daily data were gathered over a 10-year period from the Farmington Gaging Station located about 8 miles upstream of the nearest refuge unit. From this, we developed hydrographs (Figure L-2) that depict the frequency that river levels on the Tualatin reached for particular heights.

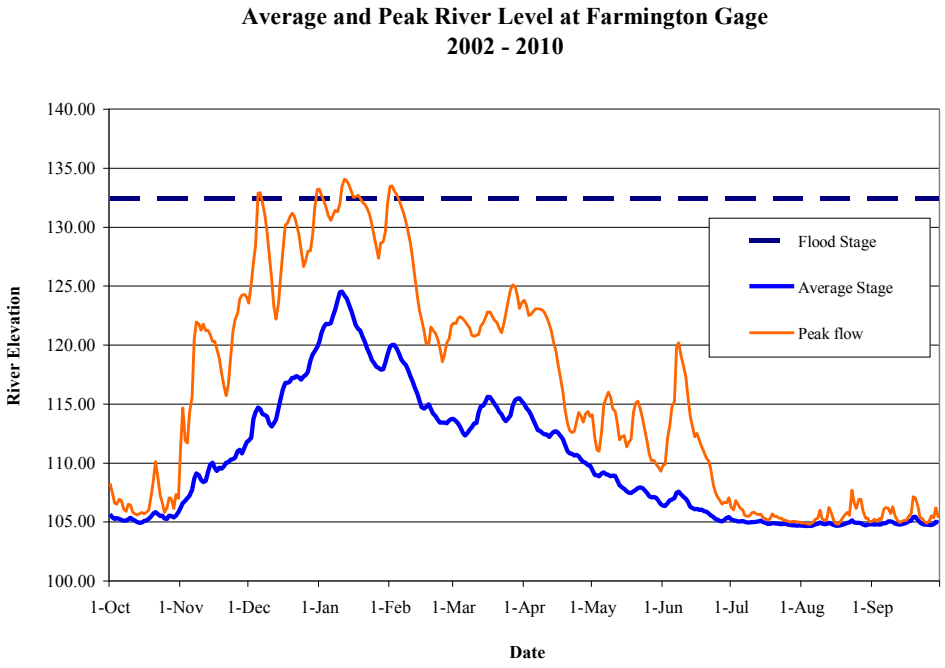

Figure L-2. Average and peak river level at Farmington Gage.

L.2.1.3 Floodplain Modeling

Hydrological modeling was conducted using a set of ArcGIS tools for floodplain and riparian areas, the Riparian Topography Toolbox (Dilts et al. 2009). This method works primarily by developing height above river (HAR) layers. The HAR outputs can be used to calculate ecologically important variables such as inundation area with some knowledge of the terrain, high-resolution LiDAR data, and information on the stream gage.

The first step was to develop a HAR layer. For this, we needed the LiDAR DEM and a binary stream/not-stream data layer. A kernel size of 3,500 meters was used to determine the height of the surrounding landscape above the river. Larger kernel sizes mean that larger stretches of river are being averaged. HAR is estimated by subtracting the elevation from the weighted average of the river elevation. The elevation was simply subtracted from the river elevations to come up with HAR. Then, flood scenarios were developed for different river elevations at an increment of 0.5 foot, starting at 118 feet (see Figures L-3 to L-5), which is normal river winter flow.

The Riparian Topography Toolbox has an algorithm that takes the flows of the river at a given height and develops a flow model based upon least cost path estimates. For the water to flow realistically across the landscape, we had to refine the LiDAR DEM. This included doing typical "hydro-enforcement," or removing structures that impede the flow of water on the LiDAR data such as levees and culverts.

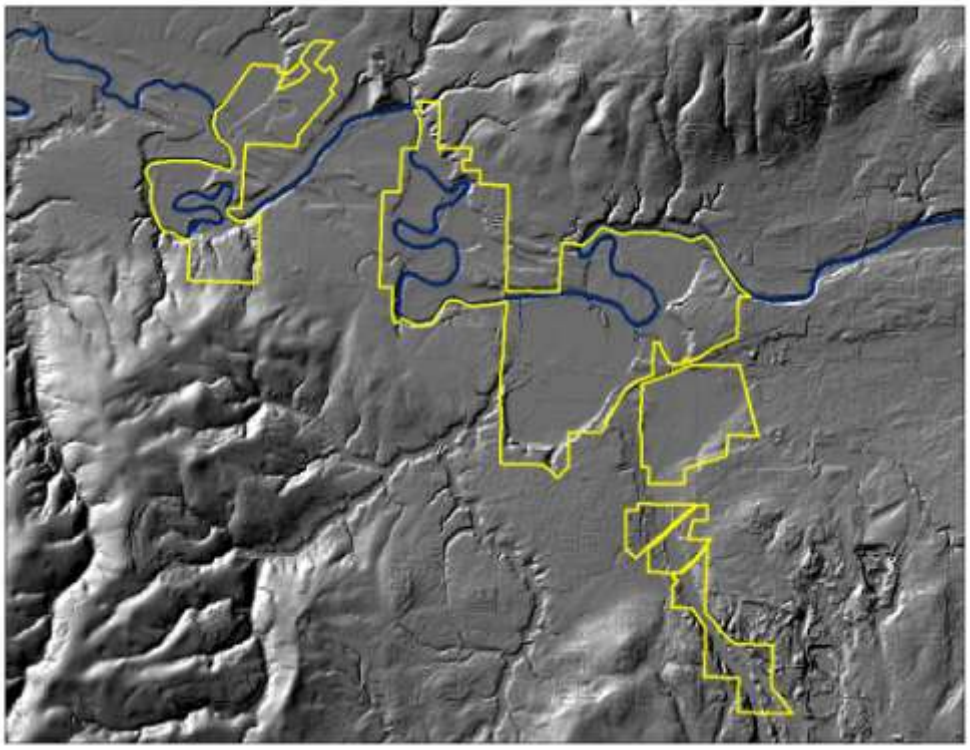

Figure L-3. Floodplain model at 120.5 feet.

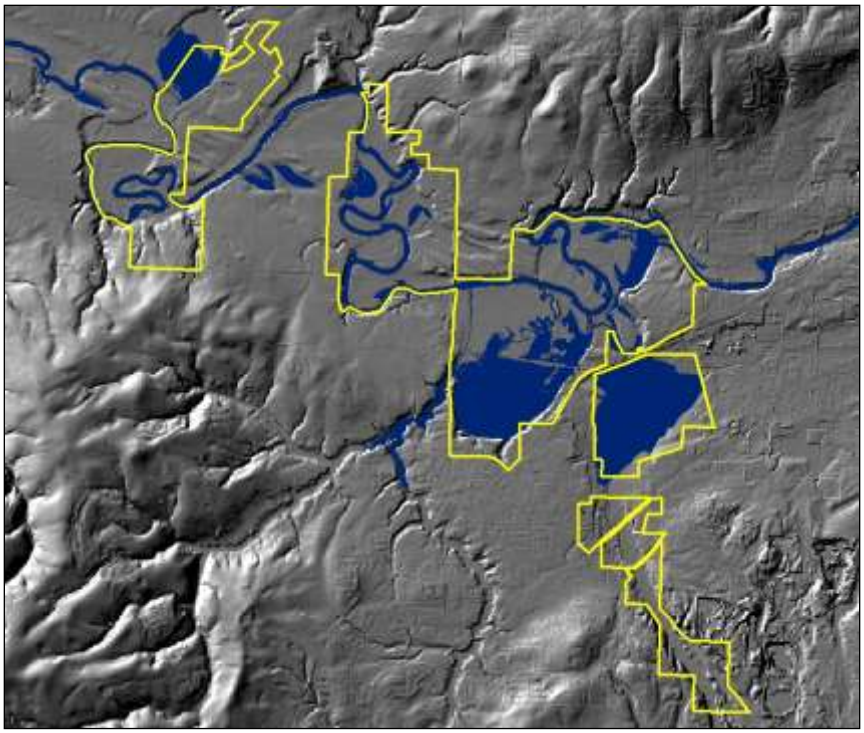

Figure L-4. Floodplain model at 128 feet.

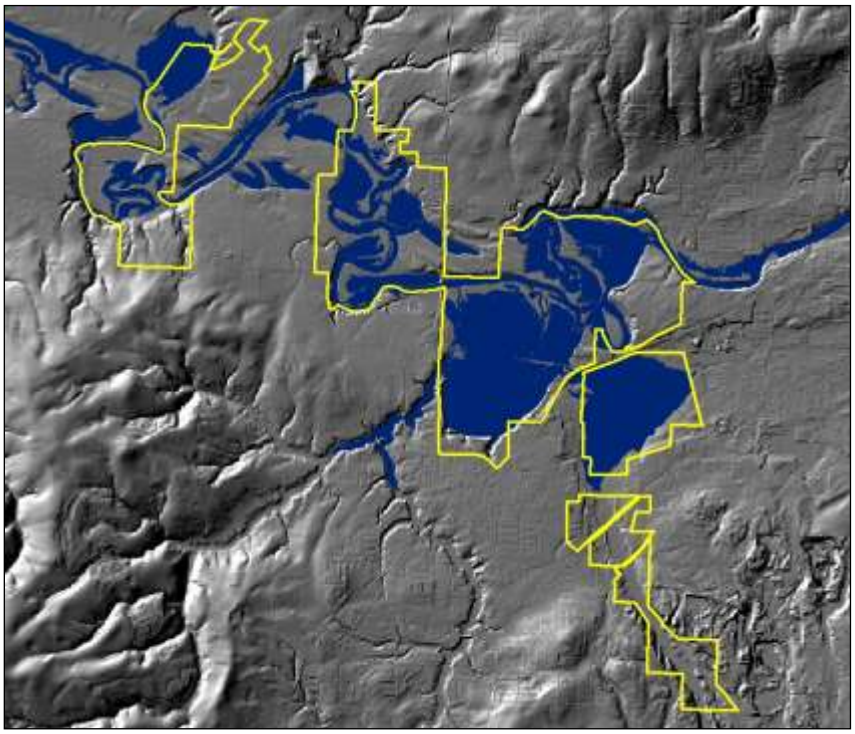

Figure L-5. Floodplain model at 132 feet.

L.2.1.4 Decision Support Modeling

The process outlined above provides modeling for planners to know how frequently a patch of vegetation is flooded by the flows of the Tualatin River. The next step involved incorporating these data with other information including soils and vegetation.

Ecosystem Management Decision Support (EMDS) provides a flexible tool for managers to assess various scenarios with a quantifiable amount of certainty that an outcome will occur. From a geographic information system (GIS) perspective, it provides many advantages to traditional overlay analyses. In concept, EMDS provides functionality that is similar to combining different layers into an index. However, it uses formal logic operators, combined with methods and concepts from fuzzy logic and knowledge-based decision support (Reynolds et al. 2000). Using EMDS, a "knowledge base" is developed that articulates formal logic specifications of how attributes relate to a proposition. For example, one of our propositions is that "scrub-shrub wetlands will develop over time." The attributes in our knowledge base to support this proposition are flooding frequency, soils, and current and historical vegetation. EMDS allows the user to specify the "good" and "poor" qualities of these attributes to support the proposition. For example, we know that areas that are not flooded are "poor" for supporting scrub-shrub wetland. Instead of merely a binary "good" and "poor," EMDS allows fuzzy gradations between good and poor, which is more realistic in the real world.

The decision support model was developed with the refuge biologist and Regional Office staff. The initial exercise involved the refuge biologist providing suitability scores for soils, historical vegetation, current vegetation, and flooding frequency. These scores were translated to the EMDS system. A score of +1 indicates "Full Support" for the proposition, and a score of −1 indicates "No Support" for the proposition, with varying levels of support in between.

For example, if the refuge biologist determined that a high frequency of flooding was highly suitable in terms of supporting scrub-shrub wetlands, then that characteristic would get a +1. If the biologist determined that a certain soil type would never support scrub-shrub wetlands, then that characteristic would receive a score of −1. Or, if the current vegetation type is an indicator that scrub-shrub wetlands are not likely, but would be possible if other characteristics were favorable, then an intermediate score of .25 or .50 would have been given to that attribute.

As noted, four attributes were used in the decision support model. Below is a list of the attributes, their rationale, and source data.

- **Flood Frequency**
  - *Rationale*: Predicted flood frequency is a primary influence on potential wetland types.
  - *Data source:* Described in the water modeling section.
- **Soils**
  - *Rationale*: Soil types are a good indicator of potential vegetation types. For example, Labish Mucky Clays are very likely to support scrub-shrub wetlands.
  - *Data source:* U.S. Department of Agriculture (USDA) Soils Survey data (SSURGO), Washington County.

- **Current Vegetation**
  - *Rationale*: Current vegetation type provides some support for what could develop. It also provides support for where habitat will not develop. For example, developed areas will remain developed in the future.
  - *Data source:* Vegetation map developed by the refuge in 2007.

- **Historical Vegetation**
  - *Rationale*: Historical vegetation provides another piece of evidence to support the habitat propositions. For example, if an area was historically oak savanna, it would provide low support for an emergent wetland proposition.
  - *Data source:* Oregon Natural Heritage Program

Each patch of vegetation was given a score that is a summary of the four different attributes.

L.2.1.5 Review and Refine the Model

The results are spatial depictions of the amount of support for the different habitat types of interest. This could be interpreted as a suitability model. It is similar in concept, but what is being quantified is the amount of support for a given proposition. Higher scores from −1 to 1 indicate higher support. Figures L-6 to L-9 provide spatial depictions of all the different habitat types that were assessed.

L.2.1.6 Development of Alternatives

Refuge staff spent a day going over the modeling results. This provided the science-based data that facilitated the decision-making process. In the figures below, darker blue represents higher support.

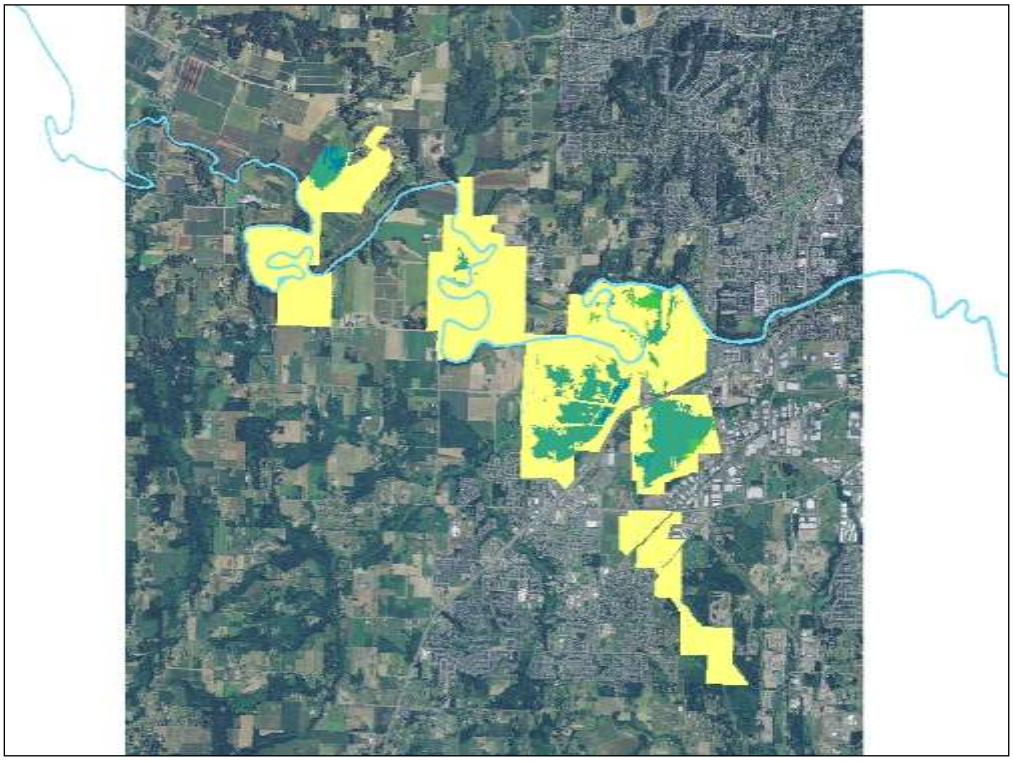

Figure L-6. Decision support for emergent wetland.

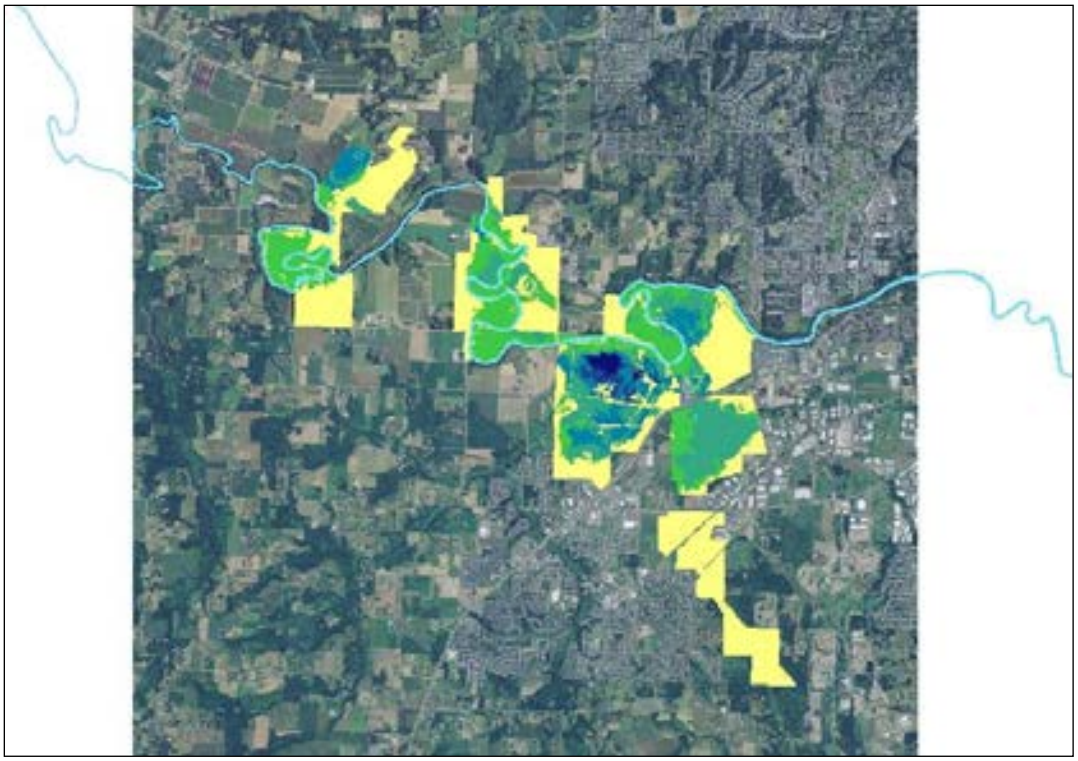

Figure L-7. Decision support for wet prairie

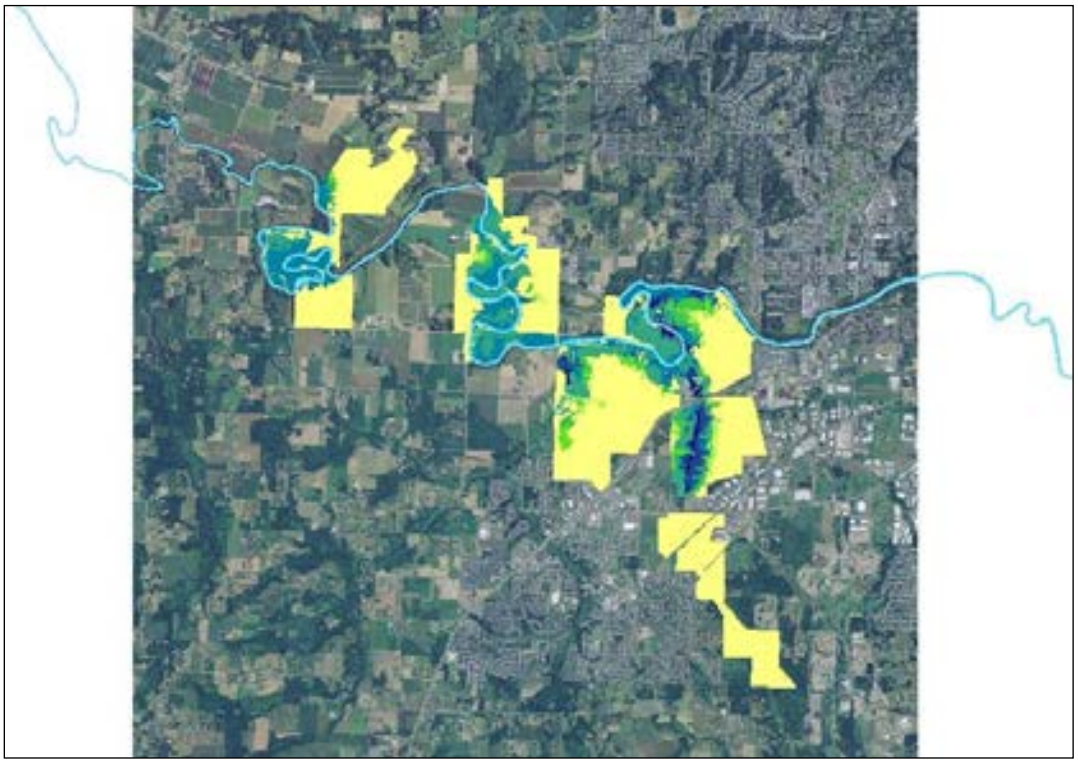

Figure L-8. Decision support for bottomland riparian forest.

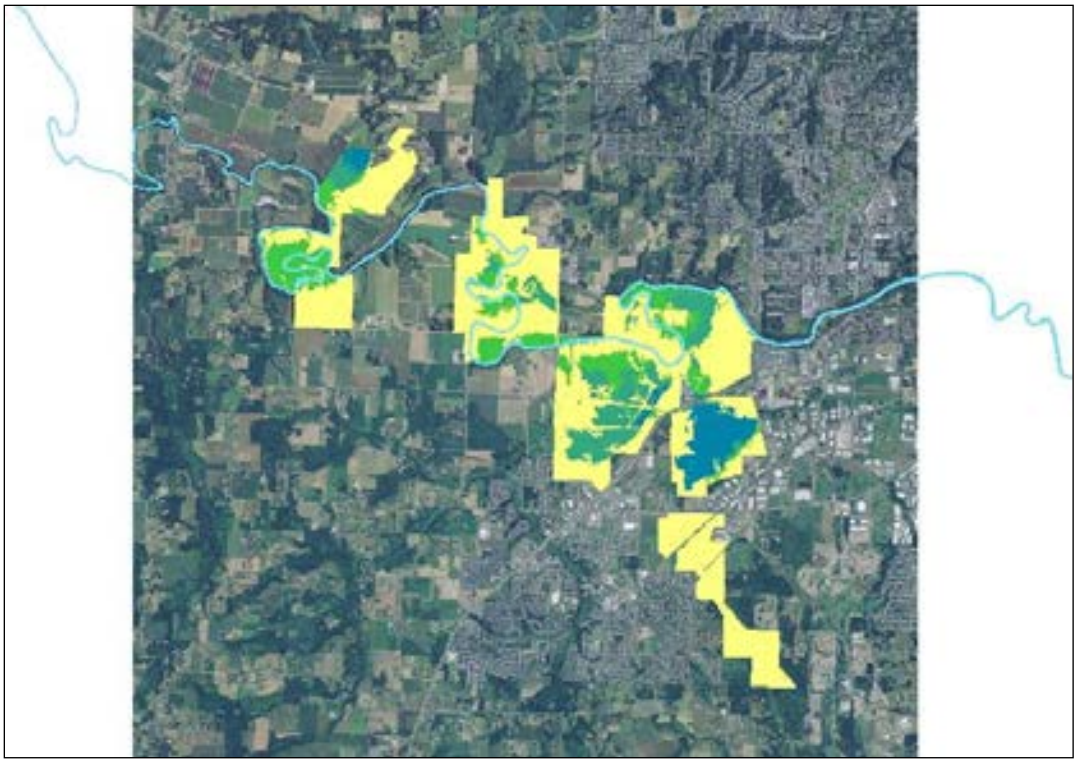

Figure L-9. Decision support for scrub-shrub wetland.

L.3 Conclusion

It is important to note that the modeling exercise did not make the decision, but rather provided support for the final decisions. Models and data played an important role in the alternative development dialogue.

Appendix N. List of Refuge Species

This is a list of species that have been documented currently on the refuge. More species are expected to be added to this list upon conducting additional surveys.

N.1 Birds

Common Name	Scientific Name
Grebes (family Podicipedidae)	
Eared Grebe	*Podiceps nigricollis*
Horned Grebe	*Podiceps auritus*
Pied-billed Grebe	*Podilymbus podiceps*
Red-necked Grebe	*Podiceps grisegena*
Western Grebe	*Aechmophorus occidentalis*
Clark's Grebe	*Aechmophorus clarkii*
Pelicans (family Pelecanidae)	
American White Pelican	*Pelecanus erythrohynchos*
Cormorants (family Phalacrocoracidae)	
Double-crested Cormorant	*Phalacrocorax auritus*
Bitterns, Herons, and Egrets (family Ardeidae)	
American Bittern	*Botaurus lentiginosus*
Great Blue Heron	*Ardea herodias*
Great Egret	*Ardea alba*
Green Heron	*Butorides virescens*
Snowy Egret	*Egretta thula*
Little Blue Heron	*Egretta caerulea*
Ibises and Spoonbills (family Threskiornithidae)	
White-faced Ibis	*Plegadis chihi*
New World Vultures (family Cathartidae)	
Turkey Vulture	*Cathartes aura*
Swans, Geese, and Ducks (family Anatidae)	
Aleutian Canada Goose	*Branta canadensis leucopareia*
American Wigeon	*Anas americana*
Black Brant	*Branta bernicla nigricans*
Blue-winged Teal	*Anas discors*

Common Name	Scientific Name
Bufflehead	*Bucephala albeola*
Cackling Canada Goose	*Branta canadensis minima*
Canvasback	*Aythya valisineria*
Cinnamon Teal	*Anas cyanoptera*
Common Goldeneye	*Bucephala clangula*
Common Merganser	*Mergus merganser*
Dusky Canada Goose	*Branta canadensis occidentalis*
Emperor Goose	*Chen canagica*
Eurasian Wigeon	*Anas penelope*
Gadwall	*Anas strepera*
Greater Scaup	*Aythya marila*
Greater White-fronted Goose	*Anser albifrons*
Green-winged Teal	*Anas crecca*
Hooded Merganser	*Lophodytes cucullatus*
Lesser Canada Goose	*Branta canadensis parvipes*
Lesser Scaup	*Aythya affinis*
Mallard	*Anas platyrhynchos*
Northern Pintail	*Anas acuta*
Northern Shoveler	*Anas clypeata*
Redhead	*Aythya americana*
Ring-necked Duck	*Aythya collaris*
Ross' Goose	*Chen rossii*
Ruddy Duck	*Oxyura jamaicensis*
Snow Goose	*Chen caerulescens*
Tavener's Canada Goose	*Branta canadensis taverneri*
Tule White-fronted Goose	*Anser albifrons gambeli*
Tundra Swan	*Cygnus columbianus*
Western Canada Goose	*Branta canadensis moffitti*
White-winged Scoter	*Melanitta fusca*
Wood Duck	*Aix sponsa*
Osprey (family Pandionidae)	
Osprey	*Pandion haliaetus*

Common Name	Scientific Name
Kites, Hawks, and Eagles (family Accipitridae)	
Bald Eagle†	*Haliaeetus leucocephalus*
Northern Harrier	*Circus cyaneus*
Sharp-shinned Hawk	*Accipiter striatus*
Cooper's Hawk	*Accipiter cooperii*
Red-shouldered Hawk	*Buteo lineatus*
Red-tailed Hawk	*Buteo jamaicensis*
Rough-legged Hawk	*Buteo lagopus*
Swainson's Hawk	*Buteo swainsoni*
White-tailed Kite	*Elanus leucurus*
Falcons and Caracaras (family Falconidae)	
American Kestrel	*Falco sparverius*
Merlin	*Falco columbarius*
Peregrine Falcon	*Falco peregrinus*
Gallinaceous Birds (order Galliformes- families Odontophoridae, Phasianidae)	
California Quail	*Callipepla californica*
Northern Bobwhite	*Colinus virginianus*
Ring-necked Pheasant	*Phasianus colchicus*
Rails (family Rallidae)	
American Coot	*Fulica americana*
Sora	*Porzana carolina*
Virginia Rail	*Rallus limicola*
Cranes (family Gruidae)	
Sandhill Crane	*Grus canadensis*
Plovers (family Gruidae)	
Black-bellied Plover	*Pluvialis squatarola*
Killdeer	*Charadrius vociferus*
Semipalmated Plover	*Charadrius semipalmatus*
Stilts and Avocets (family Recurvirostridae)	
Black-necked Stilt	*Himantopus mexicanus*
Sandpipers and Phalaropes (family Scolopacidae)	
Buff-breasted Sandpiper	*Tryngites subruficollis*

Common Name	Scientific Name
Dunlin	*Calidris alpina*
Greater Yellowlegs	*Tringa melanoleuca*
Least Sandpiper	*Calidris minutilla*
Lesser Yellowlegs	*Tringa flavipes*
Long-billed Curlew	*Numenius americanus*
Long-billed Dowitcher	*Limnodromus scolopaceus*
Marbled Godwit	*Limosa fedoa*
Pectoral Sandpiper	*Calidris melanotos*
Red Phalarope	*Phalaropus fulicarius*
Red-necked Phalarope	*Phalaropus lobatus*
Ruff	*Philomachus pugnax*
Sharp-tailed Sandpiper	*Calidris acuminata*
Short-billed Dowitcher	*Limnodromus griseus*
Solitary Sandpiper	*Tringa solitaria*
Spotted Sandpiper	*Actitis macularius*
Stilt Sandpiper	*Calidris himantopus*
Western Sandpiper	*Calidris mauri*
Wilson's Phalarope	*Phalaropus tricolor*
Wilson's Snipe	*Gallinago delicata*
Skuas, Jaegers, Gulls, and Terns (family Laridae)	
Black Tern	*Chlidonias niger*
Bonaparte's Gull	*Chroicocephalus philadelphia*
California Gull	*Larus californicus*
Caspian Tern	*Hydroprogne caspia*
Forster's Tern	*Sterna forsteri*
Glaucous-winged Gull	*Larus glaucescens*
Mew Gull	*Larus canus*
Stilts and Avocets (family Columbidae)	
Band-tailed Pigeon†	*Patagioenas fasciata*
Eurasian Collared-dove*	*Streptopelia decaocto*
Mourning Dove	*Zenaida macroura*
Rock Pigeon*	*Columba livia*

Common Name	Scientific Name
Barn Owls (family Tytonidae)	
Barn Owl	*Tyto alba*
Typical Owls (family Strigidae)	
Barred Owl	*Strix varia*
Great Horned Owl	*Bubo virginianus*
Northern Pygmy-owl	*Glaucidium gnoma*
Short-eared Owl	*Asio flammeus*
Western Screech Owl	*Megascops kennicottii*
Snowy Owl	*Nyctea scandiaca*
Swifts (family Apodidae)	
Vaux's Swift	*Chaetura vauxi*
Hummingbirds (family Trochilidae)	
Anna's Hummingbird	*Calypte anna*
Rufous Hummingbird	*Selasphorus rufus*
Kingfishers (family Alcedinidae)	
Belted Kingfisher	*Megaceryle alcyon*
Woodpeckers (family Picidae)	
Downy Woodpecker	*Picoides pubescens*
Hairy Woodpecker	*Picoides villosus*
Northern Flicker	*Colaptes auratus*
Pileated Woodpecker	*Dryocopus pileatus*
Red-breasted Sapsucker	*Sphyrapicus ruber*
Tyrant Flycatchers (family Tyrannidae)	
Black Phoebe	*Sayornis nigricans*
Eastern Kingbird	*Tyrannus tyrannus*
Hammond's Flycatcher	*Empidonax hammondii*
Olive-sided Flycatcher†	*Contopus cooperi*
Pacific-slope Flycatcher	*Empidonax difficilis*
Say's Phoebe	*Sayornis saya*
Western Kingbird	*Tyrannus verticalis*
Western Wood-pewee	*Contopus sordidulus*
Willow Flycatcher†	*Empidonax traillii*

Common Name	Scientific Name
Shrikes (family Laniidae)	
Northern Shrike	*Lanius excubitor*
Vireos (family Vireonidae)	
Cassin's Vireo	*Vireo cassinii*
Hutton's Vireo	*Vireo huttoni*
Warbling Vireo	*Vireo gilvus*
Crows, Jays, and Magpies (family Corvidae)	
American Crow	*Corvus brachyrhynchos*
Common Raven	*Corvus corax*
Steller's Jay	*Cyanocitta stelleri*
Western Scrub-jay	*Aphelocoma californica*
Swallows (family Hirundinidae)	
Bank Swallow	*Riparia riparia*
Barn Swallow	*Hirundo rustica*
Cliff Swallow	*Petrochelidon pyrrhonota*
Northern Rough-winged Swallow	*Stelgidopteryx serripennis*
Purple Martin†	*Progne subis*
Tree Swallow	*Tachycineta bicolor*
Violet-green Swallow	*Tachycineta thalassina*
Titmice and Chickadees (family Paridae)	
Black-capped Chickadee	*Poecile atricapillus*
Chestnut-backed Chickadee	*Poecile rufescens*
Bushtits (family Aegithalidae)	
Bushtit	*Psaltriparus minimus*
Nuthatches (family Sittidae)	
Red-breasted Nuthatch	*Sitta canadensis*
White-breasted Nuthatch	*Sitta carolinensis*
Creepers (family Certhiidae)	
Brown Creeper	*Certhia americana*
Wrens (family Troglodytidae)	
Bewick's Wren	*Thryomanes bewickii*
House Wren	*Troglodytes aedon*

Common Name	Scientific Name
Marsh Wren	*Cistothorus palustris*
Pacific Wren	*Troglodytes pacificus*
Kinglets (family Regulidae)	
Golden-crowned Kinglet	*Regulus satrapa*
Ruby-crowned Kinglet	*Regulus calendula*
Thrushes (family Turdidae)	
American Robin	*Turdus migratorius*
Swainson's Thrush	*Catharus ustulatus*
Varied Thrush	*Ixoreus naevius*
Western Bluebird	*Sialia mexicana*
Starlings (family Sturnidae)	
European Starling*	*Sturnus vulgaris*
Wagtails and Pipits (family Motacillidae)	
American Pipit	*Anthus rubescens*
Waxwings (family Bombycillidae)	
Cedar Waxwing	*Bombycilla cedrorum*
Wood Warblers (family Parulidae)	
Black-throated Gray Warbler	*Setophaga nigrescens*
Common Yellowthroat	*Geothlypis trichas*
MacGillivray's Warbler	*Geothlypis tolmiei*
Orange-crowned Warbler	*Oreothlypis celata*
Townsend's Warbler	*Setophaga townsendi*
Wilson's Warbler	*Cardellina pusilla*
Yellow Warbler	*Setophaga petechia*
Yellow-breasted Chat†	*Icteria virens*
Yellow-rumped Warbler	*Setophaga coronata*
Tanagers (family Cardinalidae)	
Western Tanager	*Piranga ludoviciana*
Sparrows and Towhees (family Emberizidae)	
Chipping Sparrow	*Spizella passerina*
Dark-eyed Junco	*Junco hyemalis*
Fox Sparrow	*Passerella iliaca*

Common Name	Scientific Name
Golden-crowned Sparrow	*Zonotrichia atricapilla*
Lincoln's Sparrow	*Melospiza lincolnii*
Savannah Sparrow	*Passerculus sandwichensis*
Song Sparrow	*Melospiza melodia*
Spotted Towhee	*Pipilo maculatus*
White-crowned Sparrow	*Zonotrichia leucophrys*
White-throated Sparrow	*Zonotrichia albicollis*
Cardinals, Grosbeaks, and Allies (family Cardinalidae)	
Black-headed Grosbeak	*Pheucticus melanocephalus*
Lazuli Bunting	*Passerina amoena*
Blackbirds and Orioles (family Icteridae)	
Brewer's Blackbird	*Euphagus cyanocephalus*
Brown-headed Cowbird	*Molothrus ater*
Bullock's Oriole	*Icterus bullockii*
Red-winged Blackbird	*Agelaius phoeniceus*
Western Meadowlark	*Sturnella neglecta*
Yellow-headed Blackbird	*Xanthocephalus xanthocephalus*
Finches (family Fringillidae)	
American Goldfinch	*Spinus tristis*
Evening Grosbeak	*Coccothraustes vespertinus*
House Finch	*Carpodacus mexicanus*
Lesser Goldfinch	*Spinus psaltria*
Pine Siskin	*Spinus pinus*
Purple Finch	*Carpodacus purpureus*
Red Crossbill	*Loxia curvirostra*
Old World Sparrows (family Passeridae)	
House Sparrow*	*Passer domesticus*

*=Introduced Species

†= Species of Concern

N.2 Mammals

Common Name	Scientific Name
Beaver	*Castor canadensis*
Black-tailed Deer	*Odocoileus hemionus*
Bobcat	*Lynx rufus*
Brush Rabbit	*Sylvilagus bachmani*
California Ground Squirrel	*Spermophilus beecheyi*
Coyote	*Canis latrans*
Creeping Vole	*Microtus oregoni*
Deer Mouse	*Peromyscus maniculatus*
Douglas Squirrel	*Tamiasciurus douglasii*
Eastern Fox Squirrel*	*Sciurus niger*
Feral Cat*	*Felis catus*
Mink	*Mustela vison*
Muskrat	*Ondatra zibethicus*
Northern Flying Squirrel	*Glaucomys sabrinus*
Nutria*	*Myocastor coypus*
Pacific Jumping Mouse	*Zapus trinotatus*
Raccoon	*Procyon lotor*
River Otter	*Lontra canadensis*
Roosevelt Elk	*Cervus elaphus*
Short-tailed Weasel	*Mustela erminea*
Shrew-mole	*Neurotrichus gibbsii*
Striped Skunk	*Mephitis mephitis*
Townsend's Chipmunk	*Tamias townsendii*
Trowbridge’s Shrew	*Sorex trowbridgii*
Vagrant Shrew	*Sorex vagrans*
Virginia Opossum*	*Didelphis virginiana*
Western Gray Squirrel	*Sciurus griseus*
Western Pocket Gopher	*Thomomys mazama*

*=Introduced Species

N.3 Reptiles and Amphibians

Common Name	Scientific Name
Alligator lizard	*Elgaria sp.*
Bullfrog*	*Rana catesbeiana*
Chorus Frog	*Pseudacris regilla*
Ensatina	*Ensatina eschscholtzii*
Long-toed Salamander	*Ambystoma macrodactylum macrodactylum*
Northern Red-legged Frog†	*Rana aurora aurora*
Northwestern Salamander	*Ambystoma gracile*
Red-eared Slider*	*Trachemys scripta elegans*
Red-spotted Garter Snake	*Thamnophis sirtalis concinnus*
Rough-skinned Newt	*Taricha granulosa*
Rubber Boa	*Charina bottae*
Western Painted Turtle	*Chrysemys picta belli*
Western Pond Turtle	*Clemmys marmorata marmorata*
Western Terrestrial Garter Snake	*Thamnophis elegans*

*=Introduced Species

†= Species of Concern

N.4 Fish

Common Name	Scientific Name
Bluegill*	*Lepomis macrochirus*
Catfish*	*Ameiurus sp.*
Coastal Cutthroat Trout†	*Oncorhynchus clarki ssp*
Common Carp*	*Cyprinus carpio*
Mosquito fish*	*Gambusia affinis*
Pacific Lamprey†	*Entosphenus tridentatus*
Redside Shiner	*Richardsonius balteatus*
Sculpin	*Cottus sp.*
Smallmouth Bass*	*Micropterus dolomieu*
Steelhead/Rainbow Trout	*Oncorhynchus mykiss*
Threespine Stickleback	*Gasterosteus aculeatus*
Warmouth*	*Chaenobryttus gulosus*

Western Brook Lamprey	*Lampetra richardsoni*
White Crappie*	*Pomoxis annularis*

*=Introduced Species
†= Species of Concern

N.5 Invertebrates

Bees (order Hymenoptera) (identified to Genus)

Common Name	Genus
Bald-faced Hornet	*Dolichovespula*
Bumble Bee	*Bombus*
Honey Bee	*Apis*
Wasp (yellow jacket)	*Vespula*

Dragonflies and Damselflies (order Odonata)

Common Name	Species Name
Blue Dasher	*Pachydiplax longipennis*
California Darner	*Aeshna californica*
Cardinal Meadowhawk	*Sympetrum illotum*
Common Green Darner	*Anax junius*
Common Whitetail	*Plathemis lydia*
Eight-spotted Skimmer	*Libellula forensis*
Pacific Forktail	*Ischnura cervula*
Spot-winged Glider	*Pantala hymenaea*
Striped Meadowhawk	*Sympetrum pallipes*
Tule Bluet	*Enallagma carunculatum*
Twelve-spotted Skimmer	*Libellula pulchella*
Variegated Meadowhawk	*Sympetrum corruptum*
Western Forktail	*Ischnura perparva*
Western Pondhawk	*Erythemis collocata*

Butterflies and Moths (order Lepidoptera)

Common Name	Species Name
Western Tiger Swallowtail	*Papilio rutulus*

Beetles (Order Coleoptera)

Common Name	Family
Carrion Beetle	Silphidae

Freshwater Mussels (family Margaritiferidae)

Common Name	Species Name
Western Pearlshell Mussel	*Margaritifera falcata*

Aquatic Invertebrates (identified to order)

Common Name	Order
Backswimmer	Hemiptera
Caddisfly	Trichoptera
Copepods	Copepoda
Cranefly	Diptera
Crawling Water Beetle	Coleoptera
Crayfish	Decapoda
Dobsonfly	Neuroptera
Fairy Shrimp	Anostraca
Fingernail Clam	Veneroida
Giant Waterbug	Hemiptera
Mayfly	Ephemeroptera
Mosquito	Diptera
Orb Snail	Basommatophora
Phantom Midge	Diptera
Predaceous Diving Beetle	Coleoptera
Scud	Amphipoda
Sowbug	Isopoda
Water Boatman	Hemiptera
Water Scavenger Beetle	Coleoptera
Water Scorpion	Hemiptera
Water Strider	Hemiptera
Whirligig Beetle	Coleoptera

N.6 Plants

Herbaceous (forbs)

Common Name	Scientific Name
Velvetleaf*	*Abutilon theophrasti*
Yarrow	*Achillea millefolium*
Vanilla Leaf	*Achlys triphylla*
Pathfinder	*Adenocaulon bicolor*
Maidenhair Fern	*Adiantum pedatum*
Lanceleaf Water Plantain*	*Alisma lanceolatum*
Water Plantain	*Alisma plantago-aquatica*
Field Garlic*	*Allium vineale*
Powell's Amaranth*	*Amaranthus powellii*
Ragweed*	*Ambrosia artemisiifolia*
Scarlet Pimpernel*	*Anagallis arvensis*
Pearly Everlasting	*Anaphalis margaritacea*
Three-leaved Anemone	*Anemone deltoidea*
Corn Chamomile*	*Anthemis arvensis*
Stinking Chamomile	*Anthemis cotula*
Bur Chervil*	*Anthriscus caucalis*
Spreading Dogbane	*Apocynum androsaemifolium*
Red Columbine	*Aquilegia formosa*
Mouseear Cress*	*Arabadopsis thaliana*
Hairy Rockcress	*Arabis hirsuta*
Greater Burdock*	*Arctium lappa*
Wild Ginger	*Asarum caudatum*
Lady Fern	*Athyrium filix-femina*
Fat Hen	*Atriplex patula*
Mexican Mosquitofern	*Azolla mexicana*
American Winter Cress	*Barbarea orthoceras*
English Daisy*	*Bellis perennis*
Nodding Beggarticks	*Bidens cernua*
Three-lobed Beggarticks	*Bidens tripartita*

Herbaceous (forbs)

Common Name	Scientific Name
Deer Fern	*Blechnum spicant*
Black Mustard*	*Brassica nigra*
Crown Brodiaea	*Brodiaea coronaria*
Clustered Moss	*Bryum pseudotriquetrum*
Pond Water-starwort	*Callitriche stagnalis*
Morning-glory*	*Calystegia microcarpus*
Small Camas	*Camassia quamash*
Shepherd's Purse*	*Capsella bursa-pastoris*
Nuttall's Bitter-cress	*Cardamine nuttallii*
Western Bitter-cress	*Cardamine occidentalis*
Few-seeded Bitter-cress	*Cardamine oligosperma*
Italian Thistle*	*Carduus pycnocephalus*
Slender-beaked Sedge	*Carex athrostachya*
Dense Sedge	*Carex densa*
Greensheath Sedge	*Carex feta*
Henderson's Sedge	*Carex hendersonii*
Tapefruit Shortscale Sedge	*Carex leptopoda*
Slough Sedge	*Carex obnupta*
Chamisso Sedge	*Carex pachystachya*
Sawbeak Sedge	*Carex stipata*
One-sided Sedge	*Carex unilateralis*
Awlfruit Sedge	*Carex stipata*
Spotted Knapweed*	*Centaurea stoebe*
Doubtful Chickweed*	*Cerastium dubium*
Big Chickweed*	*Cerastium fontanum*
Sticky Chickweed*	*Cerastium viscosum*
Coon's Tail	*Ceratophyllum demersum*
Spotted Sandmat*	*Chamaesyce maculata*
Fireweed	*Chamerion angustifolium*
Lambsquarters*	*Chenopodium album*
Chicory*	*Cichorium intybus*

Herbaceous (forbs)

Common Name	Scientific Name
Enchanter's Nightshade	*Circaea alpina*
Canada Thistle*	*Cirsium arvense*
Edible Thistle	*Cirsium edule*
Bull Thistle*	*Cirsium vulgare*
Farewell-to-spring	*Clarkia amoena*
Winecup Clarkia	*Clarkia purpurea*
Miner's-lettuce	*Claytonia perfoliata*
Candy Flower	*Claytonia sibirica*
Western Clematis	*Clematis ligusticifolia*
Yerba Buena	*Clinopodium douglasii*
Poison-hemlock*	*Conium maculatum*
Field Bindweed*	*Convolvulus arvensis*
Candian Horseweed*	*Conyza canadensis*
Nursery Cotoneaster*	*Cotoneaster buxifolius*
Five-angled Dodder	*Cuscuta pentagona*
Strawcolored Flatsedge	*Cyperus erythrohizos*
Queen Anne's Lace*	*Daucus carota*
Tansy Mustard	*Descurainia pinnata*
Deptford Pink*	*Dianthus armeria*
Northern Saitas	*Dichelostemma congestum*
Pacific Bleeding Heart	*Dicentra formosa*
Fuller's Teasel*	*Dipsacus fullonum*
Showy Downingia	*Downingia elegans*
Willamette Downingia	*Downingia yina*
Whitlow Grass	*Draba verna*
False Dog Fennel	*Dyssodia papposa*
Needle Spikerush	*Eleocharis acicularis*
Ovate Spikerush	*Eleocharis ovata*
Common Spikerush	*Eleocharis palustris*
Small Spikerush	*Eleocharis parvula*
Fewflower Spikerush	*Eleocharis quinqueflora*

Herbaceous (forbs)

Common Name	Scientific Name
Autumn Willowherb	*Epilobium brachycarpum*
Chaparral Willowherb	*Epilobium minutum*
Tall Willowherb	*Epilobium palustre*
Swamp Willowherb	*Epilobium densiflorum*
Marsh Horsetail	*Equisetum palustre*
Giant Horsetail	*Equisetum telmateia*
Philadelphia Daisy*	*Erigeron philadelphicus*
Fleabane Daisy	*Erigeron strigosus*
Oregon Sunshine	*Eriophyllum lanatum*
Redstem Stork's Bill*	*Erodium cicutarium*
Oregon Coyote Thistle	*Eryngium petiolatum*
Wormseed Wallflower*	*Erysimum cheiranthoides*
Giant White Fawnlily	*Erythronium oregonum ssp oregonum*
California Poppy	*Eschschoizia californica*
Petty Spurge*	*Euphorbia peplus*
Roughleaf Aster	*Eurybia radulina*
Japanese Knotweed*	*Polygonum cuspidatum*
Woodland Strawberry	*Fragaria vesca*
Coastal Strawberry	*Fragaria chiloensis*
Virginia Strawberry	*Fragaria virginiana*
Checker Lily	*Fritillaria affinis*
Cleavers Bedstraw	*Galium aparine*
Northern Bedstraw	*Galium boreale*
Oregon Bedstraw	*Galium oreganum*
Threepetal Bedstraw	*Galium trifidum ssp.columbianum*
Cut-leaved Geranium*	*Geranium dissectum*
Shiny Leaf Geranium*	*Geranium lucidum*
Dovefoot Geranium*	*Geranium molle*
Herb-Robert*	*Geranium robertianum*
Largeleaf Avens	*Geum macrophyllum*
Bluehead Gilia	*Gilia capitata*

Herbaceous (forbs)

Common Name	Scientific Name
Western Marsh Cudweed*	*Gnaphalium palustre*
Marsh Cudweed*	*Gnaphalium uliginosum*
Bractless Hedgehyssop	*Gratiola ebracteata*
English Ivy*	*Hedera helix*
Tawny Daylily*	*Hemerocallis fulva*
Cowparsnip	*Heracleum maximum*
Coral Bells	*Heuchera glabra*
Pacific Waterleaf	*Hydrophyllum tenuipes*
St. Johnswort*	*Hypericum perforatum*
Hairy Cat's Ear*	*Hypochaeris radicata*
Orange Balsam*	*Impatiens capensis*
Douglas Iris	*Iris douglasiana*
Oregon Iris	*Iris tenax*
Tapertip Rush	*Juncus acuminatus*
Toad Rush	*Juncus bufonius*
Common Rush	*Juncus effusus*
Spreading Rush	*Juncus patens*
Poverty Rush	*Juncus tenuis*
Pointed Rush	*Juncus oxymeris*
Prickly Lettuce*	*Lactuca serriola*
Yellow Archangel*	*Lamiastrum galeobdolon*
Nipplewort	*Lapsana communis*
Purple Peavine	*Lathyrus nevadensis*
Sweetpea*	*Lathyrus odoratus*
Leafy Pea	*Lathyrus polyphyllus*
Pacific Pea	*Lathyrus vestitus*
Duckweed*	*Lemna minor*
Fall Dandelion*	*Leontodon autumnalis*
Hairy Hawkbit*	*Leontodon taraxacoides*
Field Pepperweed*	*Lepidium campestre*
Oxeye Daisy*	*Leucanthemum vulgare*

Herbaceous (forbs)

Common Name	Scientific Name
Celeryleaf Licorice-root	*Ligusticum apiifolium*
Columbia Lily	*Lilium columbianum*
False-pimpernel	*Lindernia dubia*
Barestem Biscuitroot	*Lomatium nudicaule*
Orange Honeysuckle	*Lonicera ciliosa*
Hairy Honeysuckle	*Lonicera hispidula*
Twinberry Honeysuckle	*Lonicera involucrata*
Bird's-foot Lotus*	*Lotus corniculatus*
Small-flowered Lotus	*Lotus micranthus*
Spanish-Clover	*Lotus purshianus*
Sicklekeel Lupine	*Lupinus albicaulis*
Miniature Lupine	*Lupinus bicolor*
Bigleaf Lupine	*Lupinus polyphyllus*
Skunk Cabbage	*Lysichiton americanus*
Spatulaleaf Loosestrife*	*Lythrum portula*
Purple Loosestrife*	*Lythrum salicaria*
Elegant Tarweed	*Madia elegans*
Small Tarweed	*Madia exigua*
Slender Tarweed	*Madia gracilis*
Coast Tarweed	*Madia sativa*
Feathery False Lily of the valley	*Maianthemum racemosum*
Starry False Lily of the Valley	*Maianthemum stellatum*
Common Mallow*	*Malva neglecta*
Disc Mayweed*	*Matricaria discoidea*
Black Medick*	*Medicago lupulina*
Common Balm*	*Melissa officinalis*
Sweetclover*	*Melilotus alba*
Wild Mint*	*Mentha arvensis*
Pennyroyal*	*Mentha pulegium*
Stinky Mint	*Mentha villosa*
Seep Monkeyflower	*Mimulus guttatus*

Herbaceous (forbs)

Common Name	Scientific Name
Linearleaf Snapdragon	*Misopates orontium*
Largeleaf Sandwort	*Moehringia macrophylla*
Indianpipe	*Monotropa uniflora*
Blinking Chickweed	*Montia fontana*
Narrowleaf Minerslettuce	*Montia linearis*
Changing Forget-me-not*	*Myosotis discolor*
Bay Forget-me-not	*Myosotis laxa*
Spring Forget-me-not	*Myosotis verna*
Tiny Mousetail	*Myosurus minimus*
Western Watermilfoil	*Myriophyllum hippuroides*
Daffodil	*Narcissus pseudonarcissus*
Skunkbush	*Navarretia squarrosa*
Smallflower Nemophila	*Nemophila parviflora*
Water Parsley	*Oenanthe sarmentosa*
Sweetcicely	*Osmorhiza berteroi*
Redwood-Sorrel	*Oxalis oregana*
Suksdorf Woodsorrel	*Oxalis suksdorfii*
Yellow Glandweed*	*Parentucellia viscosa*
Rydberg's Penstemon	*Penstemon rydbergii*
Gardner's Yampah	*Perideridia gairdneri*
Fragrant Popcornflower	*Plagiobothyrus figuratus*
Scouler's Popcornflower	*Plagiobothyrus scouleri*
Narrowleaf Plantain*	*Plantago lanceolata*
Common Plantain*	*Plantago major*
Shortspur Seabrush	*Plectritis congesta*
Water Knotweed	*Polygonum amphibium*
Prostrate Knotweed*	*Polygonum arviculare*
Japanese Knotweed*	*Polygonum cuspidatum*
Curlytop Knotweed*	*Polygonum lapathifolium*
Spotted Ladysthumb*	*Polygonum persicaria*
Licorice Fern	*Polypodium glycyrrhiza*

Herbaceous (forbs)

Common Name	Scientific Name
Sword Fern	*Polystichum munitum*
Little Hogweed*	*Portulaca oleracea*
Leafy Pondweed	*Potamogeton foliosus*
English Cinquefoil*	*Potentilla anglica*
Slender Cinquefoil	*Potentilla gracilis*
Drops-of-gold	*Prosartes hookeri*
Common Selfheal*	*Prunella vulgaris*
Bracken Fern	*Pteridium aquilinum*
Tall Buttercup	*Ranunculus acris*
Lesser celandine*	*Ranunculus ficaria*
Lesser Buttercup	*Ranunculus flammula*
Western Buttercup	*Ranunculus occidentalis*
Redbacked Buttercup	*Ranunculus orthorhynchus*
Smallflower Buttercup*	*Ranunculus parviflorus*
Creeping Buttercup	*Ranunculus repens*
Celery-leaved Buttercup	*Ranunculus sceleratus*
Little Buttercup	*Ranunculus uncinatus*
Cultivated Radish*	*Raphanus sativus*
Bluntleaf Yellowcress	*Rorippa curvipes*
Curvepod Yellowcress	*Rorippa curvisiliqua*
Bog Yellowcress	*Rorippa palustris*
Sheep Sorrel*	*Rumex acetosella*

1. INTRODUCTION

1.1. PURPOSE OF THE FIRE MANAGEMENT PLAN

This Fire Management Plan (FMP) is written to meet the U.S. Department of the Interior (USDOI) and U.S. Fish and Wildlife Service (USFWS; the Service) requirement that every area with burnable vegetation have an approved FMP (620 DM 1.4). It also enables the Tualatin River National Wildlife Refuge (the refuge) to meet the Service requirement that refuges review and/or revise the FMP at a minimum of 5-year intervals or when significant land use changes are proposed (621 FW 2).

The goal of wildland fire management is to plan and implement actions that help accomplish the mission of the National Wildlife Refuge System (Refuge System). That mission is to administer a national network of lands and waters for the conservation, management, and, where appropriate, restoration of fish, wildlife, and plant resources and their habitats within the United States for the benefit of present and future generations of Americans (095 FW 3.2).

The approval of this FMP enables the refuge to consider a full range of appropriate suppression strategies and to conduct prescribed fires; without this FMP, prescribed fires cannot be conducted and only wildfire suppression strategies may be implemented.

This plan outlines both wildland fire suppression and prescribed fire activities on the refuge within the context of an approved comprehensive conservation plan (CCP). The CCP planning process began in 2010 and is scheduled to be completed by 2013. The FMP defines a program to manage wildland fires and to ensure that wildland fire management goals and components are coordinated and in compliance with all required direction.

Figure 1: Tualatin River National Wildlife Refuge

1.2. General Description of the Area in the Fire Management Plan

Tualatin River National Wildlife Refuge, which includes both the Sherwood Units and the Wapato Lake Unit, is located within the Tualatin River Basin in the northern portion of the Willamette Valley, in Washington and Yamhill Counties, Oregon. The refuge preserves a wetland ecosystem and provides a Wildlife Center in the shadow of Oregon's largest metropolitan area, Portland. The overall management focus cited for the Sherwood Units in the Land Protection Plan (1992) is to "protect, enhance, and manage upland, wetland, and riparian habitats for a variety of migratory birds and resident fish and wildlife, as well as for the enjoyment of people." The Wapato Lake Unit serves a similar purpose as the Sherwood Units and supports many of the same types of habitats. The approved acquisition boundary of the refuge totals approximately 7,370 acres. The refuge may purchase any lands within the boundary from willing sellers (Figures 3 and 4).

Figure 2: Regional Vicinity Map of Tualatin River National Wildlife Refuge

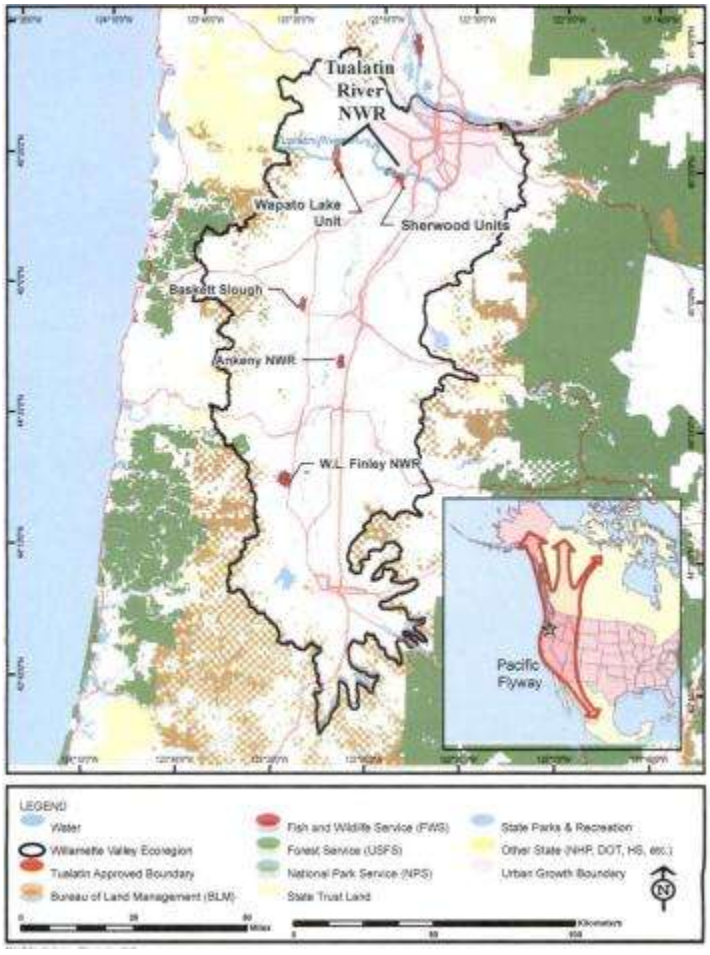

Figure 3: Sherwood Units Land Status on Tualatin River National Wildlife Refuge

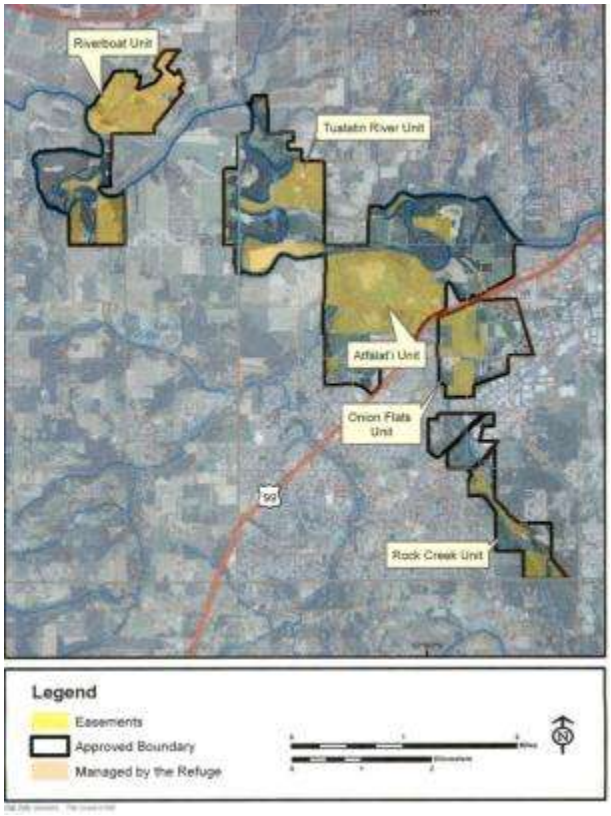
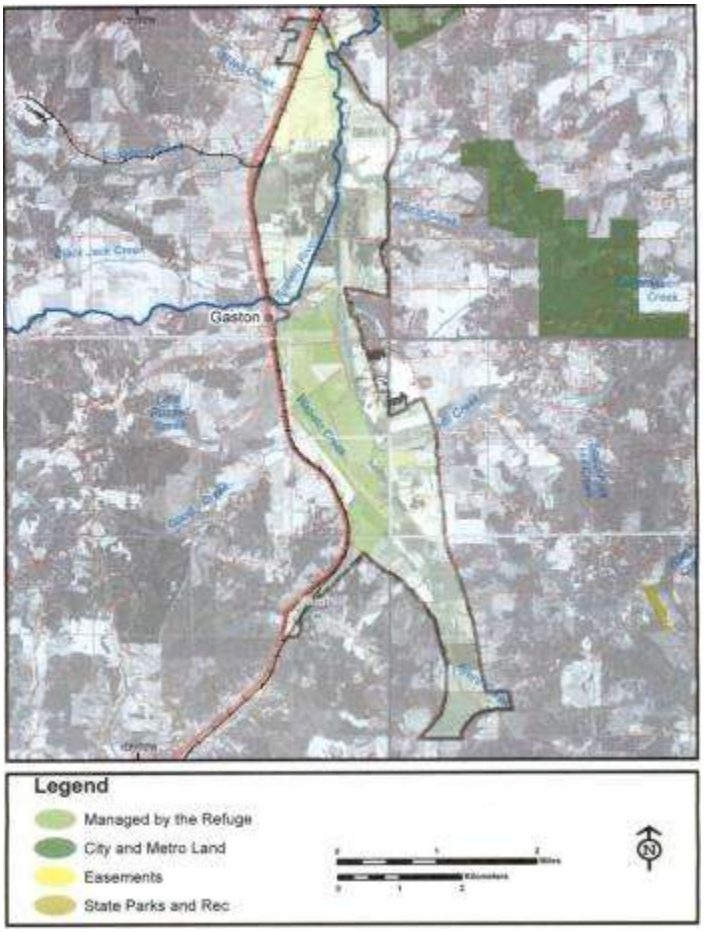


Current acreage owned or managed by the refuge is distributed among six management units (Table 1). The Tualatin River Valley consists of low foothills, terraces, alluvial fans, and floodplains. The refuge's landscape is predominately flat bottomland bordered by uplands with elevations ranging from 105 to 300 feet above sea level. Habitats consist of rivers and streams; herbaceous and scrub-shrub wetlands; riparian forests; wet prairie; oak and mixed coniferous/deciduous forested uplands.

Table 1: Management Units on Tualatin River National Wildlife Refuge

Management Unit	Acres
Riverboat	348
Tualatin River	221
Atfálat'i	555
Onion Flats	139
Rock Creek	75
Wapato Lake	879
Total	2217

Figure 4: Land Status of Wapato Lake Unit on Tualatin River National Wildlife Refuge



1.3. Significant Values to Protect

1.3.1. Cultural Resources

Three pre-European sites have been recorded on the refuge. They are not listed but may be eligible for listing on the National Register of Historic Places (NRHP). Two post-European sites have not been evaluated, but may also qualify for listing on the NRHP. Ground disturbance will be avoided if possible during suppression activities on all archeological sites. The regional archeologist will be notified of any suppression actions taken on refuge lands.

1.3.2. Fish and Wildlife

The diverse habitat types found on the refuge host a variety of fish and wildlife. Over 165 species of birds have been recorded on the refuge. Mammals, reptiles, amphibians, and fish have not been inventoried on the refuge, but a diverse number of species breed, migrate, or forage on refuge properties. Large concentrations of waterfowl including Canada geese, northern pintails, and green-winged teal occur during late fall and winter. In spring and summer, numerous species of neotropical migrant songbirds migrate through or nest on the refuge. There is one known bald

eagle nesting territory on the refuge. In addition, peregrine falcons are present during fall through early spring. Western pond turtles and red-legged frogs use many of the refuge wetlands.

1.3.3. Structures and Facilities

There are numerous refuge facilities that serve both the visitor services and biological programs and range from boundary fencing, barns, outbuildings, and numerous water control structures to residences and public use facilities, such as the Wildlife Center and environmental education shelter. In addition, there are structures that serve as offices for other Service programs, such as Cultural Resources.

There is a mixture of properties adjacent to the refuge. Many of the properties adjacent to the Sherwood Units have a rural agricultural nature as well as highly urbanized components. Many of the rural lots have single-family homes with other structures such as barns. The urban areas include closely spaced single- and multi-family residences and commercial businesses of various types. Adjacent and in the vicinity of refuge boundaries are large subdivisions within the urban growth boundary Properties adjacent to the Wapato Lake Unit are mostly rural in nature with some single-family homes.

2. Policy, Land Management Planning, and Partnerships

2.1. Implementation of Fire Policy

2.1.1. Federal Interagency Wildland Fire Policy

This FMP implements these guiding principles of Federal wildland fire policy:

- Firefighter and public safety is the first priority in every fire management activity.
- The role of wildland fire as an essential ecological process and natural change agent has been incorporated into the planning process. Federal agency land and resource management plans set the objectives for the use and desired future condition of the various public lands.
- FMPs, programs, and activities support land and resource management plans and their implementation.
- Sound risk management is a foundation for all fire management activities. Risks and uncertainties relating to fire management activities must be understood, analyzed, communicated, and managed as they relate to the cost of either doing or not doing an activity.
- Fire management programs and activities are economically viable, based upon values to be protected, costs, and land and resource management objectives.
- FMPs and activities are based upon the best available science.
- FMPs and activities incorporate public health and environmental quality considerations.
- Federal, state, Tribal, local, interagency, and international coordination and cooperation are essential.
- Standardization of policies and procedures among Federal agencies is an ongoing objective.

2.1.2. National Fire Plan

This FMP emphasizes the following primary goals of the 10-year Comprehensive Strategy and the Cohesive Strategy for Protecting People and Sustaining Natural Resources:

- Improving fire prevention and suppression
- Reducing hazardous fuels
- Restoring fire-adapted ecosystems
- Promoting community assistance

2.1.3. U.S. Department of Interior Fire Policy

This FMP incorporates and adheres to USDOI policy stated in 620 DM 1, by giving full consideration to use of wildland fire as a natural process and tool during the land management planning process and by providing for the following guidelines.

Wildland fires, whether on or adjacent to lands administered by the USDOI, that threaten life, improvements, or are determined to be a threat to natural and cultural resources or improvements under the USDOI's jurisdiction will be considered emergencies and their suppression given priority over other USDOI programs.

Bureaus shall cooperate in the development of interagency preparedness plans to ensure timely recognition of approaching critical wildland fire situations; to establish processes for analyzing situations and establishing priorities; and for implementing appropriate management responses to these situations.

Bureaus will enforce rules and regulations concerning the unauthorized ignition of wildland fires, and aggressively pursue violations.

2.1.4. U.S. Fish and Wildlife Service Fire Policy

This FMP addresses a full range of potential wildland fires and considers a full spectrum of tactical options (from monitoring to intensive management actions) for appropriate management response (AMR) to meet Fire Management Unit (FMU) objectives. It fully applies procedures and guidelines in the Service Fire Management Handbook and the National Interagency Fire Center's Interagency Standards for Fire and Fire Aviation Operations and affirms these key elements of Service fire policy:

- Firefighter and public safety is the first priority of the wildland fire management program and all associated activities.
- Only trained and qualified leaders and agency administrators will be responsible for, and conduct, wildland fire management duties and operations.
- Trained and certified employees will participate in the wildland fire management program as the situation requires, and noncertified employees will provide needed support as necessary.

- Fire management planning, preparedness, wildfire and prescribed fire operations, other hazardous fuel operations, monitoring, and research will be conducted on an interagency basis with involvement by all partners to the extent practicable.
- The responsible agency administrator must have coordinated, reviewed, and approved this FMP to ensure consistency with approved land management plans, values to be protected, and natural and cultural resource management plans, and to ensure that it addresses public health issues related to smoke and air quality.
- Fire, as an ecological process, will be integrated into resource management plans and activities on a landscape scale, across agency boundaries, based upon the best available science.
- Wildland fire will be used to meet identified resource management objectives and benefits when appropriate.
- Prescribed fire and other treatment types will be employed whenever they are the appropriate tool to reduce hazardous fuels and the associated risk of wildfire to human life, property, and cultural and natural resources and to manage our lands for habitats as mandated by statute, treaty, and other authorities.
- Appropriate management response will consider firefighter and public safety, cost effectiveness, values to protect, and natural and cultural resource objectives.
- Staff members will work with local cooperators and the public to prevent unauthorized ignition of wildfires on our lands.

2.2. Land/Resource Management Planning

2.2.1. Land Resource Management Documents

The refuge is in the process of developing a CCP. The CCP will create a roadmap to guide refuge management over the next 15 years and beyond. An environmental assessment (EA) will be developed with the CCP to analyze the effects of the proposed plan and alternatives.

2.2.2. Compliance with Regulatory Acts

Compliance with regulatory acts (i.e., National Environmental Policy Act [NEPA]) associated with fire management activities will be documented in the CCP and associated EA.

2.3. Fire Management Partnerships

2.3.1. Internal Partnerships

The refuge does not have a dedicated fire position on the refuge. Fire management activities are coordinated by the zone fire management officer (FMO) stationed at the W.L. Finley National Wildlife Refuge. The Zone FMO is responsible for updating suppression agreements, providing fire management guidance in the event of a wildfire, and assisting with implementing prescribed fire projects identified by the refuge. The Zone FMO is also responsible for maintaining training records and ensuring that current policy and procedures are followed.

2.3.2. External Partnerships

A memorandum of understanding with Tualatin Valley Fire and Rescue (TVFR) and Gaston

Rural Fire Department is in the process of being developed to cover suppression response in the Sherwood FMU and the Wapato Lake Unit. Once finalized, the MOU's will be included in the appendices of the FMP and will be reviewed annually by the Zone FMO.

3. Fire Management Units Characteristics

The intent of this portion of the FMP is to articulate and describe the general fire management situation within the local area and describe the specific fire management goals and objectives for the refuge. In addition, this portion of the FMP will describe the particular FMUs defined within the refuge. The FMUs attempt to categorize lands on the refuge based on fire suppression response and are not limited to vegetation type or fuel model.

3.1. Area-wide Considerations

3.1.1. Fire Management Organization

The refuge has no dedicated fire personnel. It relies on local fire departments for fire suppression and the Zone FMO to keep agreements for suppression up to date. The Zone FMO also provides program oversight for the development of annual dispatch plans and prescribed fire projects.

3.1.2. The History of Prescribed Fire at the Refuge

The earliest historical records indicate that Native Americans started fires that burned extensive areas of the Willamette Valley annually. What role fire played prehistorically is not known. In general, fire is considered beneficial to the native grassland areas and oak savanna uplands. Fire is considered essential in the prairie areas to maintain the grassland condition and suppress encroaching woody vegetation. Previous versions of the FMP for Tualatin River National Wildlife Refuge only allowed for pile burning, and prescribed fire broadcast burning was not addressed. With the approval of this document, prescribed fire broadcast burning will be considered as a management tool available to managers. Each prescribed fire project will have an approved prescribed fire plan outlining procedures, notifications, and permits required for implantation of prescribed fire.

3.1.3. Management Goals, Objectives, and Constraints in the CCP

3.1.3.1. Goals for Tualatin River National Wildlife Refuge

The following goals were derived from the refuge CCP that is currently being developed with expected completion in 2013.

1. Maintain, enhance, and restore bottomland riparian habitat to a historical range of variability representative of the Willamette Valley ecosystem in order to support breeding and migratory landbirds and other native species.

2. Maintain, enhance, and restore mixed coniferous/deciduous forest habitat to a historical range of variability representative of the Willamette Valley ecosystem in order to support breeding and migratory landbirds and other native species.

3. Maintain, enhance, and restore oak habitats to a historical range of variability representative of the Willamette Valley ecosystem in order to support breeding and migratory landbirds and other native species.

4. Maintain, enhance, and restore native Willamette Valley wet prairie habitat, with an emphasis on management for rare and listed plant species.

5. Maintain, enhance, and restore a diversity of wetlands to support migratory landbirds, waterbirds, and shorebirds with special emphasis on wintering waterfowl.

6. Maintain, enhance, and, where feasible, restore streams and off-channel backwater slough habitats in order to benefit salmonids and other native aquatic species.

7. Cultivate and maintain croplands as an interim measure to control nonnative invasive species.

8. Collect scientific information (surveys, scientific assessments, and research) necessary to support adaptive management decisions that are associated with Goals 1 through 7.

9. Protect and manage the refuge's unique cultural resources for their cultural, scientific, and educational values, while consulting with appropriate Native American groups and preservation organizations and complying with historic preservation legislation.

10. Provide visitors, local residents, volunteers, and partners with opportunities to understand and appreciate fish and wildlife conservation as well as the purpose, ecology, and management of the refuge and the Refuge System.

11. Provide students and teachers from the greater Portland area with compatible and high-quality opportunities to participate in environmental education.

12. Provide refuge visitors with diverse, compatible, and high-quality opportunities to participate in wildlife-dependent recreation and interpretation.

13. Build a broad-based natural resource conservation constituency with a focus on urban audiences to create a conservation ethic within urban communities; increase relevance of habitat conservation, wildlife heritage, and the Refuge System in the eyes of urban citizens; and instill a sense of empowerment for urban communities to work together to actively support conservation, in both local and global settings. Specific Resource Management Goals Related to Fire Management

3.1.3.2. SPECIFIC RESOURCE MANAGEMENT OBJECTIVES RELATED TO FIRE MANAGEMENT

Objective 2.1 Enhance and maintain mixed coniferous/deciduous forest
Strategies Applied to Achieve Objective
• Use common forest health practices including prescribed fire and mechanical removals to create variable age structure.
Objective 2.2 Restore mixed coniferous/deciduous forest
Strategies Applied to Achieve Objective
• Use prescribed fire as appropriate to control invasive species and reduce the build-up of unwanted fuel.
Objective 3.1 Enhance and maintain oak savanna habitat
Strategies Applied to Achieve Objective
• Use prescribed fire during fall with burn interval of 3 to 5 years, to reduce encroachment of woody species and to reduce thatch.
Objective 3.2 Restore oak savanna habitat
Strategies Applied to Achieve Objective
• Use prescribed fire during spring to control non-native species prior to initial planting. • Use prescribed fire during fall with burn intervals of 3 to 5 years to reduce thatch and control invasive species.
Objective 3.3 Enhance and maintain oak/pine woodland
Strategies Applied to Achieve Objective
• Use common forest health practices including prescribed fire and mechanical removal to create variable age structure.
Objective 3.4 Restore oak/pine woodland
Strategies Applied to Achieve Objective
• Use prescribed fire as appropriate to control invasive species and reduce the build-up of unwanted fuel.
Objective 4.1 Enhance and maintain native wet prairie
Strategies Applied to Achieve Objective
• Use prescribed fire at burn intervals of 3 to 5 years.
Objective 4.2 Restore native wet prairie
Strategies Applied to Achieve Objective
• Use prescribed fire during spring to control nonnative species prior to initial planting. • Use prescribed fire at burn intervals of 3 to 5 years.
Objective 5.1 Enhance and maintain herbaceous wetland
Strategies Applied to Achieve Objective
• Use prescribed fire to reduce extent of emergent plants and/or remove encroaching woody species (e.g. willow, ash)
Objective 5.2 Enhance and maintain scrub-shrub wetland

Strategies Applied to Achieve Objective
• Use prescribed fire to increase diversity in older stands
Objective 5.3 Restore scrub-shrub wetland
Strategies Applied to Achieve Objective
• Pretreat (e.g., herbicide, prescribed fire, discing) for 1-2 years to exhaust non-native seed bank prior to restoration actions.
Objective 8.2 Research
Strategies Applied to Achieve Objective
• Conduct study to evaluate timing of prescribed fire to best promote native herbaceous cover and control invasive plants.

3.1.3.3. OBJECTIVES FOR FIRE MANAGEMENT AT TUALATIN RIVER NWR

The overall objectives for fire management at Tualatin River NWR are to: (1) promote a program to provide for firefighter and public safety, (2) reduce the occurrence, threat, and resource impacts of human-caused fires, (3) ensure appropriate suppression response to meet expected wildland fire complexity, and (4) increase the use of prescribed fire.

Specific fire management objectives are:

- Promote a fire management program that includes both prescribed fire as well as a wildland fire suppression component.

- Provide for the protection of life, property, and resources from wildland fires at costs commensurate with resource values at risk.

- Utilize prescribed fire and mechanical treatments to reduce hazardous fuels and enhance and maintain wildlife habitat.

3.1.3.4. CONSTRAINTS FOR IMPLEMENTING FIRE MANAGEMENT AT TUALATIN RIVER NWR

Constraints for implementing fire management on the Refuge include:

- The use of retardants is prohibited unless life or property is in imminent risk or in consultation with the Resource Advisor and approval from the Line Officer prior to their use is necessary. Foams may be used with prior Refuge approval.

- Heavy equipment can be used with prior approval from the Line Officer.

Specific constraints for implanting prescribed fire on the Refuge include:

- Spring burning for areas targeted for restoration.

- Fall burning every 3-5 years for areas targeted for maintenance and enhancement of habitat.

Although not a managed fire management unit, plant and wood debris piles are located on various sites around the Refuge. These piles could be periodically burned to remove the collected debris.

3.2. Fire Management Units

3.2.1. Fire Management Units—Specific Descriptions

Fire Management Units (FMUs) are areas on the refuge that have common wildland fire management objectives and strategies, are manageable as units from a wildland fire standpoint, and are based on natural or human-made fuel breaks. An FMU may coincide with a prescribed fire burn block or treatment area or unit, but this is not always the case. Current acreage owned and managed by the refuge is distributed among six management units within the Sherwood and Wapato Lake Units. Five management units are located within the Sherwood Units and one on the Wapato Lake Unit. Due to the similarity in fire response within the management units, the refuge is categorized into two FMUs. Other factors, including the geographic separation within the urban setting, allow for the simple organization of the refuge into two FMUs.

The two FMUs at Tualatin River National Wildlife Refuge are:

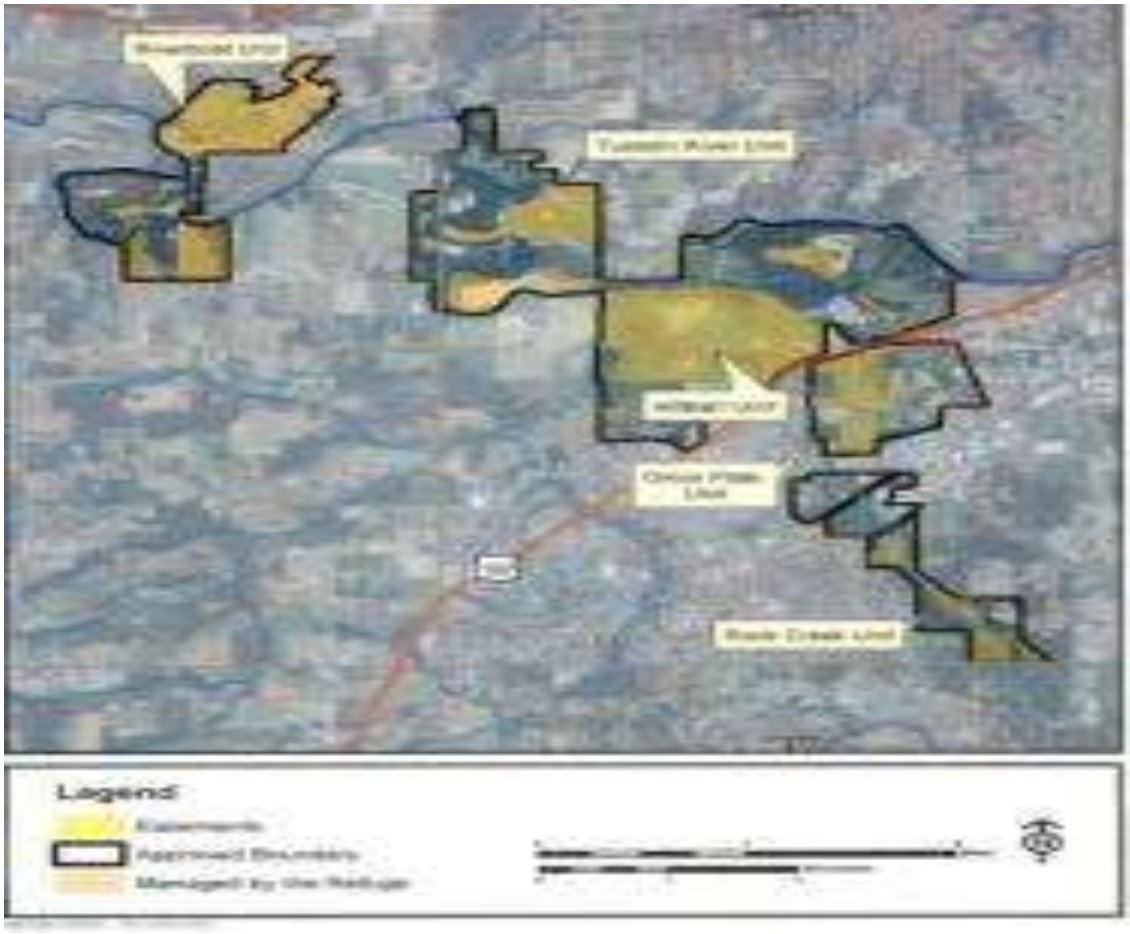
FMU 1: Sherwood;
Riverboat Unit (348acres)
Tualatin River Unit (221 acres)
Atfálat'i Unit (555 acres)
Onion Flats Unit (139acres)
Rock Creek Unit (75 acres)

FMU 2: Wapato Lake (879 acres)

3.2.2. FMU 1—Sherwood

The Sherwood FMU is 1,338 acres and includes the Riverboat, Tualatin River, Atfálat'i, Onion Flats, and Rock Creek Units (Figure 5). These management units are defined in the CCP, and would elicit a similar response in the event of a wildfire. FMU 1 is predominately flat bottomland bordered by uplands. It has oak savanna habitat, mixed coniferous/deciduous forested uplands, riparian forests, scrub-shrub wetlands, and wet prairies. In the event of a fire within this FMU, suppression actions would include using existing natural and human-made fire breaks to catch the fire at the smallest possible size. The lands surrounding the Sherwood FMU are primarily a mix of urban and agricultural lands. The City of Sherwood abuts the southern and western edge of the Sherwood FMU. The City of Tualatin is to the east, and King City is to the northeast.

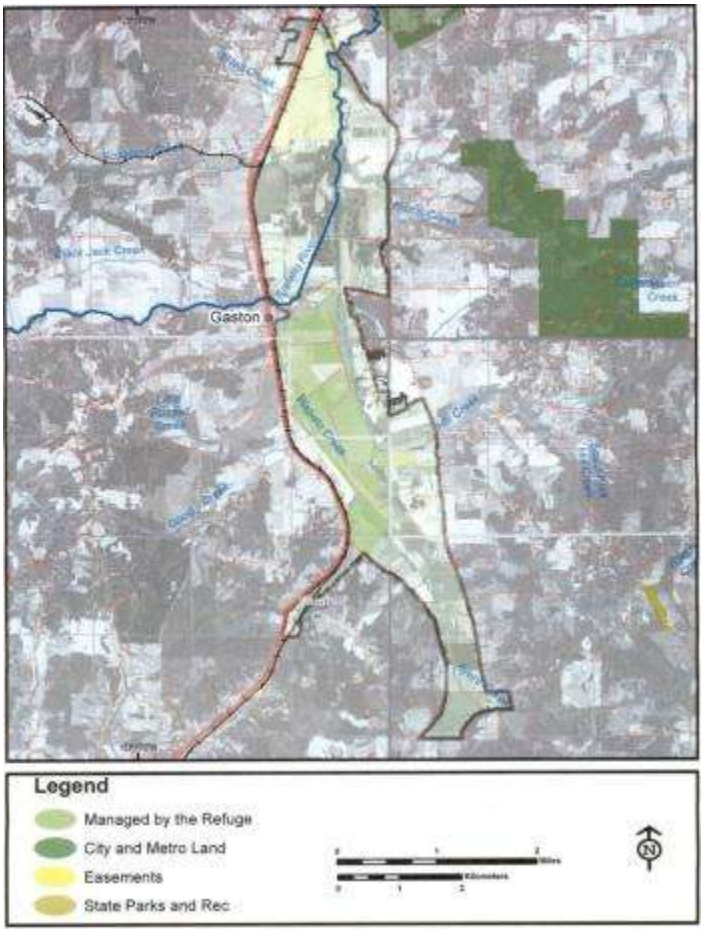
Figure 5: FMU 1 (Sherwood)



3.2.3. FMU 2—WAPATO LAKE

The Wapato Lake FMU is approximately 879 acres (Figure 6). The Wapato Lake Unit was established in 2007. This unit serves a similar purpose as the Sherwood Units and supports many of the same types of habitats. . Current ownership is primarily of a historical lake bed where a series of dikes and levees were built in the 1930s to support irrigation of onion farming practices. The City of Gaston is adjacent to the western boundary of the Wapato Lake FMU and Forest Grove sits to the north.

Figure 6: FMU 2 (Wapato Lake)



4. WILDLAND FIRE OPERATIONAL GUIDANCE

The procedures used to implement the FMP for the refuge are covered in this section. Information pertaining to this management is either directly provided or references are cited. Interagency standards for fire and fire aviation operations have been developed, and are documented and available for reference in the Interagency Standards for Fire and Fire Aviation Operations (National Interagency Fire Center's National Fire Equipment System [NFES] No. 2724). The Interagency Standards for Fire and Fire Aviation Operations is commonly referred to as the ~~–~~Redbook".

Structural fire suppression is the responsibility of local governments. USFWS may assist with exterior structural protection activities under formal Fire Protection Agreements that specify mutual responsibilities, including funding (Redbook 01-3).

All wildfires will be supervised by a qualified incident commander (IC), through a delegation of

authority (0 of FMP) from the project leader. The IC is responsible for the following:

- Assessing the fire situation and making a report to dispatch as soon as possible.
- Using guidance in this FMP and/or a delegation of authority to determine and implement an appropriate management response.
- Determining organization, resource needs, strategy, and tactics.
- Brief incoming and assigned resources on the organization, strategy and tactics, weather and fire behavior, Lookouts, communications, escape routes and safety zones LCES, seasonal and historical Energy Release Component ERCs, and radio frequencies.
- Advising dispatch of resources needed for the appropriate management response.
- Managing the incident until relieved or until the fire is suppressed.

The FMP and a delegation of authority can provide a general strategy to an IC, who has the discretion to select and implement appropriate tactics within the limits described for the FMU, including when and where to use minimum impact suppression tactics (MIST), unless otherwise specified.

All resources, including mutual aid resources, will report to the IC, in person or by radio and receive an assignment prior to tactical deployment.

The refuge is dedicated to providing for the safety of each visitor and all residents and property adjacent to the refuge's boundary. Residents adjacent to the refuge will be notified with as much advance warning possible of any wildfire that poses the threat of burning outside refuge boundaries. A contact list can be found in Appendix A of this FMP.

4.1. PREPAREDNESS

Preparedness is the work accomplished prior to fire occurrence to ensure that the appropriate response, as directed by the FMP, can be carried out. Preparedness activities include budget planning, equipment acquisition, equipment maintenance, dispatch planning, equipment inventory, personnel qualifications, and training. The preparedness objective is to have a well-trained and equipped fire management organization to manage all fire situations within the refuge. Preparedness efforts are to be accomplished outside the normal fire season dates. The general fire season recognized by the Oregon Department of Forestry runs from June 10 through October 15.

Wildland fire training, experience, and position qualifications information will be maintained through the Service's Incident Qualification and Certification System (IQCS) database. The information will be updated annually.

The minimum qualification will be Firefighter Type 2 (FFT2), which requires the annual firefighter refresher. Specific training and certification requirements can be found in the Redbook Chapter 13.

Fire lines consisting of vegetation-cleared area will be constructed around the perimeter of the

refuge annually. Work on these lines will begin after July 16. Fire lines will consist of combination mow and disc lines, and will be cleared to make them accessible to Type 6 engines.

There are two apparatus available at Baskett Slough National Wildlife Refuge (35 miles to the south of Tualatin River National Wildlife Refuge) for suppression and prescribed fire. Equipment is primarily designed and maintained for use in support of prescribed fire activities on-refuge. They are:

- Type 6 engine (E-76 fire-ready)
- Type 4 engine (unmaintained)

E-76 is a Type 6 engine and will be maintained fire-ready during the specified fire season. The Type 4 engine requires an operator with a Commercial Driver's License (CDL) and will be maintained for fire suppression and used if qualified personnel are available to operate it. Personal protective equipment (PPE) will be assigned to qualified personnel. Assigned PPE will be inspected annually as part of the annual fire refresher.

Additional equipment and supplies are available through cooperators and the interagency cache system and would be ordered through the Columbia Cascade Communications Center.

4.2. Detection

Most wildland fires at Tualatin River National Wildlife Refuge are caused by human-related activities. Many times the person who started the fire will call refuge headquarters for help or the local fire department if the refuge office is closed after hours. Fires are typically reported through 911 emergency services, and the refuge is contacted along with the TVFR.

4.3. Communications

Cellular phones are the primary means of communication on the refuge. All immediate emergency notifications and contacts can be found in Appendix A of the FMP. During emergency fire operations, local radio frequencies will be used. Frequencies that will be used are found in Table 2.

Table 2: Radio Frequencies

Channel Name	Assignment	Tx:	Rx:
ODF Red Net	Command	151.3400	151.3400
ODF White Net	Air to Ground	151.3100	151.3100
NIFC Tac 1	Tactical	168.0500	168.0500
NIFC Tac 2	Tactical	168.2000	168.2000
NIFC Tac3	Tactical	168.6000	168.6000

4.4. Dispatch, Initial Response, and Initial Attack

Upon report of wildfire, qualified refuge personnel will respond initially and provide the dispatch center with a fire update. These procedures and criteria for status reports are outlined in the dispatch plan (Appendix D of FMP). Qualified and available refuge staff should respond to assist

with tasks such as securing the point of origin, fire suppression, protecting visitors at risk, and implementing necessary closures. In most cases, initial attack (IA) resources will respond from TVFR. The refuge will use the Incident Command System (ICS) as a guide for suppression organization and actions.

4.5. Extended Attack and Large Fire Management

If the fire exceeds the capabilities of IA resources and transitions into extended attack, additional resources and logistics will be handled through Columbia Cascade Communication Center. The development of the Wildland Decision Support System, delegations of authority, and briefing regarding incoming resources will be initiated by the Zone FMO. Specific incident management procedures for transition into extended attack can be found in the Redbook Chapter 11.

4.6. Aviation Operations

All fire-related aviation operations will follow applicable guidelines of the USDOI National Business Center Aviation Management Directorate. Aviation requests and operations will be coordinated with regional office staff.

Aircraft may be used in all phases of fire management operations. All aircraft must be approved by the National Business Center (NBC) or the U.S. Forest Service (USFS). An Office of Aircraft Services OAS Aviation Policy Department Manual will be provided by OAS.

Helicopters may be used for reconnaissance, bucket drops, and transportation of personnel and equipment. Natural helispots and parking lots are readily available in most cases. Clearing for new helispots should be avoided where possible. Improved helispots will be rehabilitated following a fire.

As in all fire management activities, safety is the primary consideration. Qualified aviation personnel will be assigned to all flight operations.

4.7. Reviews and Investigations

Reviews and investigations are used by wildland fire and aviation managers to assess and improve the effectiveness and safety of organizational operations. Brief descriptions of various reviews and associated procedures and requirements, including those for serious wildland fire accidents, entrapments, and trespass are listed in the Redbook Chapter 18.

4.8. Reports

The Zone FMO will complete and file an individual fire report (DI-1202) for the following types of fires within 10 days of a fire being declared out:

- All wildfires on Service lands.
- Wildfires threatening Service lands on which Service personnel take action.
- All escaped prescribed fires. When a fire exceeds prescription, it must be declared a wildfire and a separate new report filed to report acres burned by the wildfire from the time of declaration to the time of being declared out.

- All false alarms responded to by field office staff.

DI-1202s are required regardless of who takes action, whether it is a Service engine, cooperator, or contractor. When we take IA off our lands, the agency with jurisdiction over where the fire occurs will file a report and we will file a limited report to document our response and to support potential billing to non-Federal entities for trespass fires.

4.9. Hazardous Fuels Management

4.9.1. Prescribed Fire Program for Hazardous Fuels and Habitat Restoration

The annual prescribed fire and fuels treatment schedule should be prepared in February/March and included as an important aspect in the annual work plan. Prescribed fire plans (i.e., burn plans) should be completed and submitted prior to the burn season.

4.9.1.1. Program Overview

All prescribed fires must comply with NEPA requirements. An EA for management actions associated with prescribed fire was completed as part of the CCP development process. The CCP recognizes prescribed fire as a necessary tool for habitat management and restoration. All prescribed fire activities must also adhere to Service requirements, which can be found in the Interagency Prescribed Fire Planning and Implementation Procedures Reference Guide in Chapter 17 of the USFWS Fire Management Handbook and the Redbook.

The fire management program consults with the refuge wildlife biologist to formulate a prescribed fire program for the annual work plan that:

- Identifies the annual target acreage scheduled for treatment.
- Designates the burn units to be treated.
- Determines prescribed burn unit complexities.
- Identifies the preferred treatment interval (this can vary by fuel type).
- Recommends the approved method of treatment (fire, fire/mechanical/chemical, etc.).
- Recommends an effective treatment sequence (rotation).
- Identifies the type of monitoring and frequency.

4.9.1.2. Prescribed Burn Program Objectives

Prescribed fire is a useful tool for restoring and maintaining natural conditions and processes. The goals of prescribed fire are to:

- Restore and maintain native wetland prairies and oak habitat using fire to set back and reduce woody vegetation, such as Douglas-fir.
- Enrich soil nutrients that benefit vegetation.
- Provide benefits to specific rare plant species, such as Nelson's checker-mallow (*Sidalcea nelsoniana*).
- Provide opportunities for research of fire-dependent species and plant communities.

- Remove unwanted accumulations of residual vegetation in association with wetland restoration.
- Realize beneficial effects upon native prairie plant species.

Upland grasslands are burned to maintain an open oak savanna habitat by inhibiting the encroachment of shrubs and woody vegetation, and to invigorate native plant species. Wetland habitats on the refuge may be burned to remove dense stands of reed canarygrass, which dominate the shallow moist soil areas. Some areas may be treated with herbicide post-burn, as reed canarygrass sprouts quickly following fire. The increase in sunlight and exposed soil will allow native species to germinate, thereby promoting and supporting a healthy wetland ecosystem.

The Willamette Valley native prairies evolved under a regime of fire. There are no known ecological equivalents to the use of fire, although mowing can be used to mimic some of the effects. Mowing is used as a restoration tool as it provides a disturbance. Timing of mowing allows nonnative species to be targeted prior to the development of seed heads. Mowing is used as an alternative treatment type to burning if burn windows are not available during a given field season.

4.9.1.3. Effect of National and Regional Preparedness Levels

Prescribed fires may be ignited during National Preparedness Levels 4 or 5 as specified in the National Interagency Mobilization Guide.

The program relies on interagency cooperators from the USFS, the Bureau of Land Management (BLM), and the Bureau of Indian Affairs (BIA) to accomplish prescribed fire projects. Elevated preparedness levels are indicative of an active fire season, and resource availability may be limited due to local resources being committed to ongoing incidents.

4.9.1.4. Project Planning

Prescribed fire will be used to reduce hazard fuel accumulations, restore fire-dependent ecological communities, improve conditions for federally listed threatened and endangered species, improve wildlife habitat, and contribute to research. All prescribed fire activity will comply with applicable Federal, state, and local air quality laws and regulations.

Prescribed fire plans for the units to be treated will be prepared and approved prior to treatment. Prescribed fire plans should be prepared well enough in advance to allow for as much time as possible for review prior to the start of a burn season or burn execution phase.

A smoke management section is required and must contain adequate information to meet Oregon State requirements. No permits are required.

All burn plans are prepared by a qualified burn boss, reviewed by a technical reviewer and the Zone FMO, and then approved by the project leader.

Which qualified burn boss will be assigned burn boss duties is determined near the time of the burn by the Zone FMO or designated member of the Zone FMO's staff. The approved burn plan must be reviewed and signed by the designated burn boss before implementation. Procedures for prescribed fire implementation are covered within the Interagency Prescribed Fire Planning and Implementation Procedures Reference Guide.

4.9.1.5. PROJECT IMPLEMENTATION

Site-specific treatment objectives are developed to guide project operations. Prescribed fire objectives describe what a treatment must accomplish in order to meet a resource management objective. Each prescribed burn plan contains objectives for the project that are quantifiable and measurable.

The Zone FMO shall assign the burn boss appropriate to the complexity level of the planned burn. The burn boss will follow all the guidelines and procedures that are contained in the prescribed fire plan.

Cooperators, contractors, and administratively determined emergency hires may be used to implement prescribed fires. All individuals working on Federal agency prescribed fires must meet the Fire Management Handbook and Wildland Fire Qualification Guide (published by the National Wildfire Coordinating Group [NWCG], PMS 310-1) standards unless local agreements specify otherwise. The complexity of each prescribed burn determines the organization needed to safely achieve the objectives specified in the burn plan. Further information on qualifications is found in Chapter 17 of the 2008 Interagency Standards for Fire and Fire Aviation Operations. The Zone FMO will be responsible for ensuring that refuge personnel maintain the qualifications necessary to implement prescribed fire programs.

A prescribed fire must be declared a wildfire by those identified in the burn plan when those person(s) determine that the contingency actions have failed or are likely to fail and cannot be mitigated by the end of the next burning period. An escaped prescribed fire must be declared a wildfire when the fire has spread outside the project boundary, or is likely to do so, and cannot be contained by the end of the next burning period. A prescribed fire can be converted to a wildfire for reasons other than an escape. An appropriate management response will be made to such incidents. A formal analysis using a required wildfire decision support tool will be undertaken when needed. The refuge manager and project leader will be notified of an escaped prescribed fire.

The public will be informed of prescribed fires through news releases, interpretive messages, and educational programs. Individual prescribed fires should not be conducted without informing agencies and members of the public likely to be impacted.

4.9.1.6. SMOKE MANAGEMENT

All grass burning in the Willamette Valley is strictly regulated by the Oregon Department of Environmental Quality (DEQ) through the Oregon Department of Agriculture, Division of Smoke Management (DSM), to comply with smoke dispersal requirements in the Willamette Valley. DSM decides, on a daily basis, whether burning will be allowed and how many acres

may be burned. No prescribed burns are conducted without DSM approval. Approval is obtained by contacting DSM on the morning of a proposed burn. In addition to smoke management by DSM, the refuge lands are also constrained by fire danger ratings for the area. If the fire danger rating is extreme, then no prescribed burning will be allowed even when weather conditions are favorable for smoke dispersion.

4.9.1.7. After Action Reviews and Escaped Fire Reviews

The burn boss will ensure an informal After Action Review (AAR) is conducted for each operational period on a prescribed fire, as described in the Incident Response Pocket Guide (IRPG).

All prescribed fires declared a wildfire will have an investigative review initiated by the refuge manager or project leader. The level and scope of the review will be determined by policy and procedures of the Redbook and the USFWS Fire Management Handbook.

4.9.1.8. Reports

Burn plans will specify information to be included in a project file. The burn boss will ensure this information is provided to the refuge manager and/or Zone FMO as specified. This includes documenting conditions and fire behavior during the prescribed fire to assess how well actual fire characteristics fit those predicted, documenting any unanticipated difficulties encountered during implementation, and assessing how well the fire accomplished the intended objectives.

The burn boss will complete an Individual Fire Report (DI-1202) with the Zone FMO, who will file an Individual Fire Report (DI-1202) electronically within 10 days of the fire being declared out.

4.9.2. Non-fire Hazard Fuels Treatment Program

Many activities associated with normal habitat maintenance are similar to pre-suppression fire activities. Mowing is a regular tool used to treat invasive species of grasses and shrubs and to mimic a fire disturbance. These activities may not be funded through the fire program but directly benefit the fire program as well as the habitat. Mowing is used in pretreatment of prescribed fire units to lower flame lengths near the control lines. These areas may not be classified as hazardous fuels but their treatment would aid in suppression if a fire were to occur on the refuge.

4.9.3. Process to Identify Hazard Fuels Treatments

Due to the difficulty of access to areas within the refuge, most hazardous fuels treatments are identified to aid in creating defensible space and engine access. An annual site visit is conducted with the project leader, refuge biologist, and the Zone FMO to identify areas that would benefit ecologically as well as aid in suppression in the event of a wildfire.

4.10. Emergency Stabilization and Burned Area Rehabilitation

Immediate post-wildfire actions are needed to minimize the threat to life and health and prevent unacceptable degradation to natural and cultural resources (see the NWCG Interagency Burned

Area Emergency Response Guidebook). Required repair of damage resulting for wildland fire activities will be completed before crews and resources are released from assignment to the incident.

Rehabilitation and restoration efforts will be undertaken to protect and sustain ecosystems, public health, and safety, and to help communities protect infrastructure. Natural recovery is the preferred emergency stabilization or burned area rehabilitation (BAR) treatment.

The goal of the Emergency Stabilization and Rehabilitation (ESR) Plan is to promote public safety, stabilize and prevent further degradation of natural and cultural resources, and rehabilitate the stability, productivity, diversity, and ecological integrity of refuge lands after a wildland fire as described in approved refuge management plans. The ESR Plan is tiered to the refuge CCP, FMP, and operations or step-down plans. Development of ESR Plan objectives is guided by resource management objectives, general management practices, and constraints identified in an approved CCP, habitat management plan, and/or supporting step-down plans.

If burned area ESR is required to reduce the effects of a wildland fire, then the refuge should request appropriate funding through the ESR fund. The Service representative at the National Interagency Fire Center administers the ESR fund. A rehabilitation and restoration survey, plan, and request must be prepared and submitted according to agency guidelines. Smaller incidents may only need simple plans prepared by refuge staff. Larger incidents with extensive rehabilitation efforts should employ an ESR team. An ESR team is composed of personnel who specialize in key disciplines of resource management and are experts in ESR Plan preparation. A formal request for an ESR team should be made in consultation with the Incident Management Team as soon as it appears that damage may be significant. Instructions for ESR team mobilization can be found in the NWCG mobilization guide. Delays in making a request may hinder funding approval and magnify the damage. Once an ESR team is employed, the project leader or their representative should provide guidance to the ESR team leader with expectations. The project leader, biologist, and Zone FMO will review all ESR plans. The final plan will be submitted to the Regional Office for review prior to submission to the Washington Office. Direction on ESR guidelines can be found in the Service Fire Management Handbook.

4.11. Prevention, Mitigation and Education

4.11.1. Prevention/Mitigation

The objective of fire prevention activities is to prevent human-caused wildfires. The inadvertent or intentional ignition of wildland fuels by humans is illegal. All human-caused wildfires will be investigated at the earliest possible time. The investigation may range from a documented determination of cause by the IA crew to criminal investigation by a qualified arson investigator.

Educating the public on the value of fire as a natural process is important to increasing public understanding and support for the fire management program. The refuge will use the most appropriate and effective means to explain the overall future of the fire and smoke management programs. This may include supplemental handouts, signage, personal contacts, auto tour routes,

or media releases. When deemed necessary, interpretive presentations will address the fire management program and explain the role of fire in the environment.

The public information program would include the following options.

1. The concepts of the prescribed burn program will be incorporated, as appropriate, in publications, brochures, and handouts.
2. During periods when prescribed burns are ignited, handouts will be prepared and distributed to all visitors entering areas of fire activity.
3. The fire management program may be incorporated into visitor contacts. Particular attention will be given when fires are conspicuous from roads or visitor use areas.
4. News releases will be distributed to the media as appropriate.
5. The public information outlets of neighboring and cooperating agencies and the Regional Office will be provided with all fire management information.
6. The fire management program will be discussed in informal talks with all employees, volunteers, residents, and neighbors.

5. Monitoring and Evaluation

The intent of this section is to document the processes for determining whether the FMP is being implemented as planned and fire-related goals and objectives are being achieved. Information obtained from monitoring is used to update the FMP and land management plans.

5.1. Fire Management Plan Monitoring

5.1.1. Annual Fire Management Plan Review

This FMP will be reviewed annually and updated as needed, upon local agency administrator approval. Revisions of FMPs with regional review and concurrence are required every 5 years and following completion of a new (or significantly revised) CCP or habitat management plan.

5.2. Hazard Fuels Treatment Monitoring

Any prescribed fire treatment will be monitored according the 2010 Pacific Region Hazardous Fuels Monitoring Framework. At a minimum, a perimeter of the treatment area will be collected and archived in the regional database.

5.3. Fire Critiques

Fire reviews will be documented and filed with the final fire report. The Zone FMO will retain a copy for the refuge files.

5.4. Fire Management Terminology

Terms in the FMP are defined by the NWCG, at http://www.nwcg.gov/pms/pubs/glossary.

Appendix A. *Directory (update annually)*

Appendix B. *Fire Management—Roles and Responsibilities*

Agency Administrator/Project Leader

- Is responsible for implementation of all fire management activities within the refuge, and will ensure compliance with USDOI, Service, and refuge policies.
- Selects the appropriate management responses to wildland fire.
- Coordinates refuge programs to ensure personnel and equipment are made available and utilized for fire management activities including fire suppression, prescribed burning, and fire effects monitoring.
- Ensures that the fire management program has access to refuge and resources when needed.
- Ensures that staff consider the fire management program during refuge-related planning and implementation.

Refuge Biologist

- Identifies prescribed burn units and biological objectives to the Zone FMO, notifies Zone FMO of prescribed fire project constraints, and ensures that refuge resources are available to accomplish prescribed fire and fire suppression objectives.
- Acts as the primary refuge resource management specialist during fire management planning and operations.
- Drafts wildland fire rehabilitation plans for project leader.
- Coordinates through project leader to provide biological input for the fire program to the Zone FMO.
- Assists in design and implementation of fire effects monitoring for the Zone FMO.
- Participates, as requested, and is appropriately trained in prescribed burning and wildland fire suppression.

Fire Management Officer

- Maintains oversight and review role for fire management activities on refuge lands.
- Responsible for all fire-related planning and implementation.
- Responsible for implementation of this FMP. This responsibility includes coordination and supervision of all prevention, pre-suppression, detection, wildland fire, prescribed fire, suppression, monitoring, and post-fire activities involving refuge lands.
- Prepares burn plans.
- Integrates biological refuge objectives into all fire management planning and implementation.
- Solicits program input from the project leader.
- Supervises prescribed fire planning.
- Responsible for planning, coordinating, and directing preparedness activities including fire training, physical fitness testing, and Interagency Fire Qualification System (IFQS) data entry, fire cache and equipment inventory accountability, maintenance, and operation, and cooperation with cooperative agencies.
- Responsible for setting up rural fire assistance agreements and grants.

- Responsible for setting up and overseeing wildland urban interface (WUI) and hazardous fuels treatment contracts.
- Responsible for preparation of fire reports following the suppression of wildland fires and for operations undertaken while conducting prescribed fires.
- Prepares an annual report detailing fire occurrences and prescribed fire activities undertaken in each calendar year. This report serves as a post-year fire management activities review, as well as provides documentation for development of a comprehensive fire history record for the refuge.
- Nominates personnel to receive fire-related training, as appropriate.
- Responsible for interagency coordination.
- Ensures fire management policies are observed.
- When available, may serve as prescribed fire burn boss and propose prescribed fire projects.
- Prepares refuge fire prevention plan, and coordinates fire prevention with other employees.
- Assists in updates of this FMP, maintains fire records, reviews fire reports (DI-1202) for accuracy, and enters fire reports into Fire Management Information System (FMIS).
- Maintains engines and fire-related equipment in state of readiness.

Fire Management/Suppression Personnel

- Consists of all refuge personnel, whether permanent or seasonal, who meet the minimum standards set by the NWCG for firefighters.
- Are fully equipped with proper PPE, have taken and passed the minimum classroom training, and meet physical fitness standards required.
- Undertake fire management duties as assigned by the qualified IC on each suppression action or by the prescribed fire burn boss on each prescribed fire project.
- Responsible for their PPE and physical conditioning, qualifying annually with the work capacity test.

Incident Commander

ICs (of any level) use strategies and tactics as directed by the project leader and Wildland Fire Decisions Support System (WFDSS) where applicable to implement selected objectives on a particular incident. A specific Delegation of Authority (0 of FMP) will be provided to each IC prior to their assuming responsibility for an incident. Major duties of the IC are given in the NWCG Fireline Handbook.

Initial Attack Teams

IA teams consist of experienced, fully qualified firefighters. Teams will be prepared and equipped with hand and power tools as needed and will be dispatched self-sufficient to function up to 24 hours without additional support.

Employees participating in any wildland fire activities on Service or cooperator lands will meet fitness requirements established in PMS 310-1, except where Service-specific fitness requirements apply.

Resource Advisor
Resource advisors (RAs) are technical specialists appointed by the agency administrator; they report to the IC or designee and provide guidance for natural and cultural resource protection from suppression operations. The RA provides input to the IC in the development of fire suppression strategies and tactics to minimize or mitigate the expected impacts of fire and fire suppression actions upon natural and cultural resources. The RA also provides input required for the development of rehabilitation plans. RA responsibilities include providing analysis, information, and advice to fire managers for areas of concern, including:

- Critical watersheds, riparian areas, fisheries, and water sources
- Threatened or endangered species
- Prehistoric and historic archaeological sites and cultural landscapes
- Fuelbreaks—locations and specifications
- Urban interface impact—structures and improvements
- Hazardous materials

The RA also:

- Assists the planning function in developing fire maps and identifying areas of concern,
- Determines environmental restrictions commensurate with FMP resource protection in the fire area,
- Provides recommendations to fire management personnel and agency administrators for fire suppression rehabilitation needs,
- Documents potential and actual suppression/fire-related resource impacts and the rationale for protection of priority areas, and
- Provides resource information to local IA ICs, dispatchers, or other fire personnel during pre-season training and planning meetings

Appendix C. *Fire Danger Indices*

The fire season at Tualatin River National Wildlife Refuge can begin in July and continue through October during drought years. Fire season can be influenced by both moist Pacific weather systems and drying trends created through a warm easterly flow. The wettest months are November through March, when over 70 percent of the precipitation occurs. There is a pronounced warm, dry period beginning in mid-July and running through late September. This period accounts for less than 10 percent of the average annual precipitation. During this period, temperatures are generally at their highest levels (80 to 90 degrees Fahrenheit) and relative humidity at the lowest (20% to 30%).

Wildland fire danger in the United States is characterized by a system called the National Fire Danger Rating System (NFDRS). This system has indices that are used to display and provide context to fire danger on a subregional scale. The most accurate way of displaying the relationship of weather and fuels to fire danger in the short term at the refuge is through the NFDRS Burning Index, or BI. The BI is an estimate of the potential difficulty of containment of a wildland fire as it relates to the flame length at the head of the fire. The BI value is a function of the spread component (how fast the fire could spread) and the energy release component (how hot the fire could burn). The BI is scaled such that a BI value of 40 would indicate a predicted average flame length of 4 feet. Wildland fires where the flame length exceeds 4 feet are judged to be too hazardous for hand crews and engines to attack along the direct edge of the fire. The BI may also communicate the relative fire danger in a rating area. The ninetieth percentile defines the index that 90 percent of all BIs are at or below for the time period calculated, and the same is true for the ninety-seventh percentile. When overlaid with historical fire occurrence, a relationship with fire weather can assist with more accurate preparedness planning. A representative NFDRS fire weather station is located 70 miles south of the refuge area at W.L. Finley National Wildlife Refuge. The following graphs display seasonal fire danger trends for the period from 2003 to 2009.

Appendix D. *Dispatching Plans*

FIRE DISPATCH PLAN 2013
TUALATIN RIVER NATIONAL WILDLIFE REFUGE

To comply with Service policy these procedures should be followed for wildland fire initial response on our refuges.

1. Call 911 for emergency management services for assistance. Provide dispatcher with fire size up.
2. Inform refuge project leader or refuge manager.
3. Utilize qualified engine bosses that are responding from our interagency partners to supervise suppression activities.
4. Engines require two qualified firefighters to operate. If responding alone, scout fire and complete fire size-up documentation and wait for assistance.
5. Be safe; no fire is worth risking your safety and well being.

You cannot legally participate in any extended attack or prescribed fire activities until you have cleared the work capacity process and fire refresher for 2012.

Elements of Initial Fire Size-up:

- Location of smoke or fire: (plot on map if possible)
- Location, name, and telephone # of reporting party
- Estimated size
- Fuel type: (1) Grass (2) Brush (3) Timber (4) Slash
- Fire behavior: (1) Smoldering (2) Creeping (3) Running (4) Torching (5) Crowning
- Structures threatened: (1) Yes (2) No
- Weather conditions: temperature, sky/cloud cover, wind/speed/direction
- Slope: (1) 0-25% (2) 26-40% (3) 41-55% (4) 56+%
- Potential for spread: (1) Low (2) Moderate (3) High
- Additional resources needed for control

Appendix E. *Memorandum of Understanding, Tualatin Valley Fire and Rescue*

MEMORANDUM OF UNDERSTANDING

BETWEEN
THE UNITED STATES FISH AND WILDLIFE SERVICE
AND
TUALATIN VALLEY FIRE AND RESCUE
FOR
TUALATIN RIVER NATIONAL WILDLIFE REFUGE

This Memorandum of Understanding (MOU) is made and entered into and between the U.S. Fish and Wildlife Service, Tualatin River National Wildlife Refuge (Service) and Tualatin Valley Fire and Rescue (TVFR), and is effective upon signing by both parties.

I. AUTHORITIES

The Service has entered into this MOU under the following authorities;

- Reciprocal Fire Protection Act of May 27th, 1955 (69 Stat. 66, 42 U.S.C 1856a-d)
- Economy Act of June 30, 1932, (31 U.S.C. 1535 as amended)
- Robert T. Stafford Disaster Relief and Emergency Assistance Act, (Public Law 93-288, as amended, 42 U.S.C. 5121-5207)

II. PURPOSE

The purpose of this agreement is to coordinate and provide cooperative fire protection between the Service and TVFR, in order to more efficiently and effectively suppress wildfires from damaging structures and lands managed by the Service. This MOU is consistent with the existing Master Cooperative Fire Protection Agreement (FWS agreement #: 10132-9-J102) and further describes the working relationship, financial arrangements, and joint activities between the Service and TVFR not otherwise specified under the terms of the Master Cooperative Fire Protection Agreement.

III. RECITALS

Whereas, both parties have fire protection responsibilities upon lands of their respective jurisdiction, intermingles and adjoining fire protection responsibilities, and limited fire protection resources;
Whereas, the Service is the jurisdictional agency responsible for fire protection on Service lands;
Whereas, the Service has limited specialized equipment and qualified personnel required to fight structural and wild land fires;
Whereas, TVFR can provide initial attack capability to support and supplement the Service's and other fire protection cooperator's resources; and
Whereas, TVFR can provide multiple engines and overhead for fire suppression activities within TVFR's jurisdiction, including suppression of accessible wild land fires on Service lands within TVFR's fire protection boundary.
Whereas, if initial attack suppression actions by TVFR are unsuccessful and the fire will not be contained within the next burning period, dispatching and continued incident support services will likely be transferred to Columbia Cascade Communication Center (CCCC). CCCC will then provide extended attack dispatching support for the incident. This transfer will occur in consultation with the FWS fire representative.
Therefore, for the mutual consideration herein stated, the parties herby enter into this MOU.

IV. DEFINITION OF TERMS

A. Principal Contacts. A list of appropriate contacts for TVFR and the Service.

B. Direct Costs. Costs directly related to the suppression effort. These costs do not include dispatch or other administrative costs.

C. Jurisdictional Agency. Agency which has overall land and resource management and/or protection responsibility as provided by Federal or State law.

D. Overhead Costs. Costs not directly chargeable to suppression efforts, but which are part of the overall cost of operation.

E. Suppression Work. All work of confining and extinguishing a fire beginning with its discovery.

F. Reimbursable Work. Providing monetary compensation at the Oregon State Fire Marshal's Standardized Costs Schedule, Fire Service Mobilization Plan hourly reimbursement rate table, as updated annually for the use of any fire engines, fire support vehicles or equipment and wages for qualified wildland fire personnel and support staff responding to wildfires on Service lands.

G. Appropriate Charges. Comprises all charges related to direct fire suppression, initial attack, fire control and mop up. Appropriate charges include: personnel charges and equipment operating costs (per Oregon State Fire Marshal Rate Schedule).

The following charges are excluded from reimbursement and are not considered Appropriate Charges:

a. Backfill for station personnel engaged in fire suppression on Service lands for period of less than 8 hours.
b. Replacement of equipment damaged during initial or extended attack not pre-approved by the Service.
c. Billing for services that are outside of the Oregon State Fire Marshals Rate Schedule and not pre-approved by FWS officials prior to submission for billing.

H. Multijurisdictional Incident. An incident requiring action from multiple agencies that each have jurisdiction to manage certain aspects of an incident. In ICS, these incidents will be managed under Unified Command.

I. Unified Command. An application of ICS used when there is more than one agency with incident jurisdiction or when incidents cross political jurisdictions. Agencies work together through the designated members of the Unified Command to establish their designated Incident Commanders at a single ICP and to establish a common set of objectives and strategies and a single Incident Action Plan.

V. FIRE PROTECTION

The Service shall:

A. Reimburse TVFR for all Direct Costs, Overhead Costs, Suppression Work, and Reimbursable Work as defined in article IV.

B. Reimburse TVFR under the provisions within this MOU no less frequently than every 30 days. Reimbursement shall be at the rates provided under Section IV-F. Reimbursement for costs not specified in in the Oregon State Fire Marshal's Standardized cost Schedule must be pre-approved by appropriate Service fire management staff prior to submission for reimbursement.

C. Annually provide TVFR with an updated principal contact list.

TVFR shall:

A. Upon request by the Service, conduct initial attack on structural and/or wildland fires occurring on Service lands.

B. Provide resources as current conditions permit. Assistance will only be provided when TVFR determines, in its sole discretion that the resources are available and can be committed without jeopardizing TVFR's ability to protect its own jurisdiction.

C. Follow all fire suppression guidelines addressed in **Error! Reference source not found.** this OU.

D. Report fires promptly to the Principal Contacts (Exhibit A) for the Service upon discovering or receiving reports of structural and/or wildland fire on Service lands.

E. Forward the necessary fire report data to the responsible Service representative identified in the Principal Contact list (Exhibit A) when TVFR suppresses structural and/or wildland fires burning wholly or in part on Service lands.

F. Dispatch only personnel who meet or exceed the minimum training requirements of the TVFR when responding pursuant to this MOU.

Both the Service and TVFR shall:

A. The parties will annually provide Principal Contact information prior to the initiation of fire season. The information will include protection area maps for any new lands acquired by the Service, names and numbers for principle contacts (Exhibit A) and the updated Oregon State Fire Marshal's Standardized Costs Schedule, Fire Service Mobilization Plan hourly reimbursement rate table. These rates can be found in Appendix C of the Oregon Fire Service Mobilization Plan found at the following link.
http://www.oregon.gov/osp/SFM/docs/emergency_mobilization/mobplan2012.pdf

B. Waive all claims between and against each other which may arise from the performance of work under this MOU, including compensation for loss or damage to each party's property and personal injury, including death of employees, agents and contractors of each party. This waiver shall not apply to intentional torts or acts of violence against persons or property. Furthermore, the requesting party agrees to save and hold harmless the responding party from and indemnify the responding party against any and all third party liability for or on account of any death or injury to a person, or damage to property arising out of any action by the personnel of the responding party excluding gross negligence or intentional torts.

C. Agree that the officer-in-charge who arrives first at a wildfire burning on or near lands of both parties will act as Incident Commander (IC). When representatives of both parties have arrived at a fire, the officers-in-charge for each party will mutually agree to designate an IC, provided that nothing shall prevent a party to whom a request is made from refusing to respond when the sole determination of that party's commanding officer is that responding to the incident would create an unreasonable risk of danger to that party's employees, equipment or a third party.

D. Shall be responsible for the training and welfare of personnel they dispatch, including the treatment of any personal injuries which may result during any fire or en route to or from any fire as provided by the laws and regulations under which each party operates.

E. Each party is responsible for operating, servicing, repairing and replacing their own equipment, except as agreed upon in writing by both parties in advance.

F. Regardless of an incident's location employees of TVFR and the Service will be subject only to the laws, regulations and rules governing their respective employers. No employee shall be

entitled to compensation and/or benefits under this MOU except as specifically provided for under the terms of his or her employment with respective employer.

VI. GENERAL PROVISIONS

A. Neither party shall be required to incur expenses under the terms of this MOU, except as necessary to effectively implement this MOU. Additional expenditures and/or rates for equipment OVHD and/or personnel not specified in Appendix C of the Oregon Fire Service Mobilization Plan shall be subject to reimbursement as agreed by the parties hereto and approved by appropriate Service fire management staff prior to submission for payment.

B. Parties shall provide upon request any maps, documents, instructions and law enforcement reports which either party considers necessary to conduct work associated with this MOU.

C. Both parties shall comply with all Federal statutes relating to nondiscrimination and all applicable requirements of other Federal laws, executive orders, regulations and policies, including but not limited to;

   i. Title VI of the Civil Rights Act of 1964 (USC 2000d) which prohibits discrimination on the basis of race, color, handicap or national origin;

   ii. Title IX of the Education amendments of 1972, as amended (USC 1681-1683) which prohibits the discrimination on the basis of sex.

D. Either Party, through their authorized representatives, and after providing reasonable notice to the other party, shall have the right to obtain access to and examine all books papers or documents related to this MOU.

E. Modification of this MOU shall be made by mutual consent of both parties through the issuance of a written modification that is signed and dated by both parties prior to any changes being performed or taking effect.

F. Either party may terminate this MOU by providing 60 days written notice to the other.

G. Unless terminated by written notice, this MOU shall remain in effect for five years from the date of the last signature.

The party's hereto have executed this Memorandum of Understanding by and through their authorized representatives on the day and year last written below.

Exhibit A. Principal Contacts

TUALATIN RIVER NWR MOU			
PRINCIPAL CONTACT LIST			
NAME	**TITLE**	**OFFICE**	**CELL**
Erin Holmes	Project Leader Tualatin River NWR	(503) 625-5944	(503) 816-1227
Greg Hagedorn	Zone Fire Management Officer, FWS	(541) 757-7236	(503) 913-2883
Michael Duyck	Fire Chief, Tualatin Valley Fire & Rescue	(503) 259-1500	(503) 302-7629

Exhibit B. General fire suppression guidelines

Due to the urban nature of Tualatin River NWR any unwanted fires within the Refuge boundary will be fully suppressed. The appropriate Service personnel should be contacted immediately to assist with fire suppression strategies. In general, minimum suppression impact tactics (MIST) should be utilized to minimize resource damage due to suppression actions. Suppression actions would include using existing natural and human-made fire breaks to catch the fire at the smallest possible size. Unless there is an imminent threat to life or property, the use of heavy equipment should be avoided without consulting with Service personnel. Air resources can be utilized on Service lands. Water bucket drops are authorized; however, the use of retardant is prohibited without consulting with Service personnel.

Appendix F. *Memorandum of Understanding, Gaston Rural Fire Department*

MEMORANDUM OF UNDERSTANDING

BETWEEN
THE UNITED STATES FISH AND WILDLIFE SERVICE
AND
GASTON RURAL FIRE DISTRICT
FOR
TUALATIN RIVER NATIONAL WILDLIFE REFUGE

This Memorandum of Understanding (MOU) is made and entered into and between the U.S. Fish and Wildlife Service, Tualatin River National Wildlife Refuge (Service) and Gaston Rural Fire District (GRFD), and is effective upon signing by both parties.

VII. AUTHORITIES

The Service has entered into this MOU under the following authorities;

- Reciprocal Fire Protection Act of May 27th, 1955 (69 Stat. 66, 42 U.S.C 1856a-d)
- Economy Act of June 30, 1932, (31 U.S.C. 1535 as amended)
- Robert T. Stafford Disaster Relief and Emergency Assistance Act, (Public Law 93-288, as amended, 42 U.S.C. 5121-5207)

VIII. PURPOSE

The purpose of this agreement is to coordinate and provide cooperative fire protection between the Service and GRFD, in order to more efficiently and effectively suppress wildfires from damaging structures and lands managed by the Service. This MOU is consistent with the existing Master Cooperative Fire Protection Agreement (FWS agreement #: 10132-9-J102) and further describes the working relationship, financial arrangements, and joint activities between the Service and GRFD not otherwise specified under the terms of the Master Cooperative Fire Protection Agreement.

IX. RECITALS

Whereas, both parties have fire protection responsibilities upon lands of their respective jurisdiction, intermingles and adjoining fire protection responsibilities, and limited fire protection resources;
Whereas, the Service is the jurisdictional agency responsible for fire protection on Service lands;
Whereas, the Service has limited specialized equipment and qualified personnel required to fight structural and wild land fires;
Whereas, GRFD can provide initial attack capability to support and supplement the Service's and other fire protection cooperator's resources; and
Whereas, GRFD can provide multiple engines and overhead for fire suppression activities within GRFD's jurisdiction, including suppression of accessible wild land fires on Service lands within GRFD's fire protection boundary.
Whereas, if initial attack suppression actions by GRFD are unsuccessful and the fire will not be contained within the next burning period, dispatching and continued incident support services will likely be transferred to Columbia Cascade Communication Center (CCCC). CCCC will then provide extended attack dispatching support for the incident. This transfer will occur in consultation with the FWS fire representative.
Therefore, for the mutual consideration herein stated, the parties herby enter into this MOU.

X. DEFINITION OF TERMS

J. Principal Contacts. A list of appropriate contacts for GRFD and the Service.

K. Direct Costs. Costs directly related to the suppression effort. These costs do not include dispatch or other administrative costs.

L. Jurisdictional Agency. Agency which has overall land and resource management and/or protection responsibility as provided by Federal or State law.

M. Overhead Costs. Costs not directly chargeable to suppression efforts, but which are part of the overall cost of operation.

N. Suppression Work. All work of confining and extinguishing a fire beginning with its discovery.

O. Reimbursable Work. Providing monetary compensation at the Oregon State Fire Marshal's Standardized Costs Schedule, Fire Service Mobilization Plan hourly reimbursement rate table, as updated annually for the use of any fire engines, fire support vehicles or equipment and wages for qualified wildland fire personnel and support staff responding to wildfires on Service lands.

P. Appropriate Charges. Comprises all charges related to direct fire suppression, initial attack, fire control and mop up. Appropriate charges include: personnel charges and equipment operating costs (per Oregon State Fire Marshal Rate Schedule).

The following charges are excluded from reimbursement and are not considered Appropriate Charges:

a. Backfill for station personnel engaged in fire suppression on Service lands for period of less than 8 hours.
b. Replacement of equipment damaged during initial or extended attack not pre-approved by the Service.
c. Billing for services that are outside of the Oregon State Fire Marshals Rate Schedule and not pre-approved by FWS officials prior to submission for billing.

Q. Multijurisdictional Incident. An incident requiring action from multiple agencies that each have jurisdiction to manage certain aspects of an incident. In ICS, these incidents will be managed under Unified Command.

R. Unified Command. An application of ICS used when there is more than one agency with incident jurisdiction or when incidents cross political jurisdictions. Agencies work together through the designated members of the Unified Command to establish their designated Incident Commanders at a single ICP and to establish a common set of objectives and strategies and a single Incident Action Plan.

XI. FIRE PROTECTION

The Service shall:

D. Reimburse GRFD for all Direct Costs, Overhead Costs, Suppression Work, and Reimbursable Work as defined in article IV.

E. Reimburse GRFD under the provisions within this MOU no less frequently than every 30 days. Reimbursement shall be at the rates provided under Section IV-F. Reimbursement for costs not specified in in the Oregon State Fire Marshal's Standardized cost Schedule must be pre-approved by appropriate Service fire management staff prior to submission for reimbursement.

F. Annually provide GRFD with an updated principal contact list.

GRFD shall:

G. Upon request by the Service, conduct initial attack on structural and/or wildland fires occurring on Service lands.

H. Provide resources as current conditions permit. Assistance will only be provided when GRFD determines, in its sole discretion that the resources are available and can be committed without jeopardizing GRFD's ability to protect its own jurisdiction.

I. Follow all fire suppression guidelines addressed in Exhibit B of this MOU.

J. Report fires promptly to the Principal Contacts (Exhibit A) for the Service upon discovering or receiving reports of structural and/or wildland fire on Service lands.

K. Forward the necessary fire report data to the responsible Service representative identified in the Principal Contact list (Exhibit A) when GRFD suppresses structural and/or wildland fires burning wholly or in part on Service lands.

L. Dispatch only personnel who meet or exceed the minimum training requirements of the GRFD when responding pursuant to this MOU.

Both the Service and GRFD shall:

G. The parties will annually provide Principal Contact information prior to the initiation of fire season. The information will include protection area maps for any new lands acquired by the Service, names and numbers for principle contacts (Exhibit A) and the updated Oregon State Fire Marshal's Standardized Costs Schedule, Fire Service Mobilization Plan hourly reimbursement rate table. These rates can be found in Appendix C of the Oregon Fire Service Mobilization Plan found at the following link.
http://www.oregon.gov/osp/SFM/docs/emergency_mobilization/mobplan2012.pdf

H. Waive all claims between and against each other which may arise from the performance of work under this MOU, including compensation for loss or damage to each party's property and personal injury, including death of employees, agents and contractors of each party. This waiver shall not apply to intentional torts or acts of violence against persons or property. Furthermore, the requesting party agrees to save and hold harmless the responding party from and indemnify the responding party against any and all third party liability for or on account of any death or injury to a person, or damage to property arising out of any action by the personnel of the responding party excluding gross negligence or intentional torts.

I. Agree that the officer-in-charge who arrives first at a wildfire burning on or near lands of both parties will act as Incident Commander (IC). When representatives of both parties have arrived at a fire, the officers-in-charge for each party will mutually agree to designate an IC, provided that nothing shall prevent a party to whom a request is made from refusing to respond when the sole determination of that party's commanding officer is that responding to the incident would create an unreasonable risk of danger to that party's employees, equipment or a third party.

J. Shall be responsible for the training and welfare of personnel they dispatch, including the treatment of any personal injuries which may result during any fire or en route to or from any fire as provided by the laws and regulations under which each party operates.

K. Each party is responsible for operating, servicing, repairing and replacing their own equipment, except as agreed upon in writing by both parties in advance.

L. Regardless of an incident's location employees of GRFD and the Service will be subject only to the laws, regulations and rules governing their respective employers. No employee shall be

entitled to compensation and/or benefits under this MOU except as specifically provided for under the terms of his or her employment with respective employer.

XII. GENERAL PROVISIONS

H. Neither party shall be required to incur expenses under the terms of this MOU, except as necessary to effectively implement this MOU. Additional expenditures and/or rates for equipment OVHD and/or personnel not specified in Appendix C of the Oregon Fire Service Mobilization Plan shall be subject to reimbursement as agreed by the parties hereto and approved by appropriate Service fire management staff prior to submission for payment.

I. Parties shall provide upon request any maps, documents, instructions and law enforcement reports which either party considers necessary to conduct work associated with this MOU.

J. Both parties shall comply with all Federal statutes relating to nondiscrimination and all applicable requirements of other Federal laws, executive orders, regulations and policies, including but not limited to;

- **i.** Title VI of the Civil Rights Act of 1964 (USC 2000d) which prohibits discrimination on the basis of race, color, handicap or national origin;
- **ii.** Title IX of the Education amendments of 1972, as amended (USC 1681-1683) which prohibits the discrimination on the basis of sex.

K. Either Party, through their authorized representatives, and after providing reasonable notice to the other party, shall have the right to obtain access to and examine all books papers or documents related to this MOU.

L. Modification of this MOU shall be made by mutual consent of both parties through the issuance of a written modification that is signed and dated by both parties prior to any changes being performed or taking effect.

M. Either party may terminate this MOU by providing 60 days written notice to the other.

N. Unless terminated by written notice, this MOU shall remain in effect for five years from the date of the last signature.

The party's hereto have executed this Memorandum of Understanding by and through their authorized representatives on the day and year last written below.

Appendix G. *Example: Delegation of Authority to Incident Commanders*

Subject: Delegation of Authority to Manage Type VI and Type V Incidents

To: ICT5, ICT5(T), ICT4, ICT4 (T) Fill in Name

From: ********, Project Leader, U.S. Fish and Wildlife Service, Tualatin River National Wildlife Refuge

You are delegated authority to manage the suppression of Type V Incidents to which you are assigned and qualified as Incident Commander, in accordance with the following guidelines, priorities, and constraints, until such time as you are relieved of command by my representative or me.

Goals and constraints for managing Type V Incidents are as follows:

- Ensure the safety of firefighters and the public.
- Adhere to the 10 Standard Fire Orders, LCES, and 18 Situations at all times.
- Protect life and property.
- Be cost efficient when ordering resources.
- Follow all guidelines that pertain to the use of retardants and foam.
- Maintain communication with (insert dispatch center here) and Complex Duty Officer at all times.
- Be considerate of cooperating agency policies when assisting in fire suppression on non-Service lands.
- Use appropriate management response suppression tactics as defined in the Fire Management Plan.
- Maintain accurate records for fire reporting and documentation.
- Protect fire origin and order an investigator on fires where cause may be other than lightning.
- Conduct regular tailgate safety sessions to discuss job hazards and what measures are necessary to mitigate accidents to injuries. Document, as needed and submit any safety records to Zone FMO or his/her acting.
- Utilize information/processes in the ~~"I~~ncident Response Pocket Guide" and ~~"W~~allet Card."

Fire Management Officer, Greg Hagadorn, or his designee have been assigned as my representative. He, or his acting, is authorized to make decisions and recommendations regarding the management of Type V and Type VI Incidents within the level of authority delegated to me.

Appendix H. *Annual Review Check List*

Element	Yes	No	Comment
1. Date FMP was approved _____ • Annual Review yrs 1 – 4 by Refuge Manager • Year 5 of Plan, Contact Complex FMO. FMP requires revision and Regional Director approval.			
2. Will the FMP continue to adequately provide for firefighter and public safety as the first priority in every fire management activity this year?			
3. Does this FMP continue to support land and resource management Plans? • Completion of CCP or new habitat management plan might require more extensive FMP revision.			
4. Were there any significant fire management activities from the previous year that were not adequately addressed within the scope of this FMP?			
5. Does the direction in this Plan remain economically viable given the values needing protection, and the costs to administer?			
6. Does this FMP continue to be based on best available science?			
7. Does the FMP provide for adequate response to wildland fire (wildfire) and prescribed fire (if applicable)? • Directories/Contact List(s) updated • Agreements and Operating Plans current • Staffing/equipment meet Service policy and ready • Annual work and Prescribed Burn Plans completed • Seasonal Assessment made by Complex FMO			
8. Were there additional lands added to the refuge last year? • Total acres to amend _____ • Burnable acres _____			
9. If additional lands were added, will environment compliance requirements (EA for this FMP) adequately allow for fire management program activities to be conducted if appropriate?			
10. Based on FMO advice, are there changes in national fire policy or direction that now conflict with direction within the FMP? • Policy changes warrant an amendment. • Policy changes are significant – need for immediate revision. • Policy changes can be incorporated within the 5-year revision.			
11. Considering the responses above, can this FMP be amended without further review? • If yes, attach amended information, including maps. Refuge Manager approval. Notify the Complex FMO. • If no, most likely the FMP and/or environmental compliance require Plan revision and Regional Director approval. Contact Complex FMO for assistance.

Landowner's Guide for Compatible Use of BPA Rights-of-Way

February 2011

We need your help to keep the way clear for safe and reliable service

Keeping transmission lines safe and reliable is a critical priority for the Bonneville Power Administration. The key element in achieving those objectives is BPA's ability to construct, operate and maintain its transmission lines and rights-of-way — the area under and around the lines.

You can help BPA keep these rights-of-way clear of trees, brush and structures that could affect the safety or reliability of the transmission system.

Keep the way clear for safety and service

Prior to planting, digging, or constructing within BPA's rights-of-way, fill out BPA's Land Use Application Form. The information you provide on the application helps BPA understand your proposed use and the potential impacts to public safety, and the safety of our crews. BPA also reviews the application to determine whether a proposed use of land is compatible with the construction, operation and maintenance of BPA transmission lines. Coordinating with BPA early in your planning process can keep you safe and avoid wasting time and money.

Coordination of land uses

BPA's rights-of-way can sometimes be available for other, compatible, uses. BPA wants to help you carry out your plans in ways that are safe and satisfactory for everyone. Therefore, you are encouraged to make prior arrangements with BPA through the Land Use Application process.

BPA takes several factors into consideration when applications for use of the right-of-way are reviewed.

Our transmission lines were designed to take topography, physical features, environmental and cultural constraints into consideration. BPA's land rights as they relate to the location of your proposed use are also reviewed. If your project is not compatible with BPA's transmission lines, you may be asked to modify your design. In extreme cases, BPA may be able to modify its transmission facilities; however, you would be required to pay for the modifications.

Please consider the following guidelines when preparing your application:

- Maintain at least 50 feet of clearance from BPA's poles, structures or guy wires, whether it be vegetation, roads, fences, utilities, pipelines, or any other improvements.
- Maintain at least 25 feet of clearance from the top of any vegetation and the lowest point of BPA's wires. Do not attempt to measure this distance yourself! You only need to identify the species of the vegetation you propose to plant in the right-of-way so that BPA can consider the mature height of the vegetation.
- Design roads, underground utilities and piplines to withstand HS-20 loadings (a federal highway standard).

Who we are

The Bonneville Power Administration is a federal agency headquartered in Portland, Ore., that markets wholesale electricity and transmission services to the Pacific Northwest's public and private utilities as well as to some large industries.

BPA provides about one-third of the electricity used in the Northwest and operates more than 15,000 circuit miles of transmission lines. To deliver power, BPA operates and maintains a transmission network throughout Oregon, Washington, Idaho and Montana with small portions into Wyoming, Nevada, Utah and California.

- Design roads, utilities and pipelines to cross BPA's rights-of-way, rather than a long, parallel alignment.
- Ensure concurrence of underlying property owner when not BPA.

Three important steps

There are three important steps that you can take to keep safe and avoid wasting time and money:

1. Call BPA before you plant, dig or build: 1-800-836-6619.
2. Fill out BPA's Land Use Application: *www.transmission.bpa.gov/LanCom/Real_Property.cfm.*
3. Obtain a written Land Use Agreement from BPA before proceeding with your project.

Location surveys

You are encouraged to have a licensed surveyor determine the location of the BPA rights-of-way before beginning any construction activities. Unfortunately, many people inadvertently build structures on BPA rights-of-way because they believe they know the boundaries of their property, and believe measuring off the conductor or centerline of the towers is sufficient to fix the location of the rights-of-way. Without survey instruments, knowledge of survey law and an understanding of BPA's rights-of-ways, it is impossible to accurately locate property boundaries. By having your surveyor coordinate with the BPA Survey Section, we can prevent many of the encroachment problems that BPA experiences (call 1-800-836-6619 and ask to be connected to BPA's Survey Section).

Danger trees

BPA must identify and arrange to cut trees that, although outside the rights-of-way, may threaten the transmission line because they could fall into the conductor (wires) or structures. Trees that are unstable, diseased, dead or leaning toward the transmission facilities don't need to touch power lines to be dangerous. Electricity can "arc" or

Never cut or trim a tree near a power line. Call BPA!

"flashover" from wires, through the air, to trees or equipment, where it can cause fires, injuries or even fatalities to anyone near the tree or equipment. BPA will arrange to remove these trees.

Available uses of BPA-owned land

Although BPA acquired most of its transmission line rights-of-way as easements, some of BPA's transmission lines are constructed on property BPA owns in fee. BPA also has fee ownership of most of its substation sites as well as other properties BPA acquired to meet its responsibilities. There are three possible options if you wish to use land that BPA owns in fee. You will need to fill out BPA's Land Use Application so that we can determine whether your proposed use interferes with BPA's use. Easements may be granted for permanent uses such as private road crossings or utilities. Leases may be granted primarily for agricultural purposes on occupied or vacant BPA property. Nontransferrable Land Use Agreements may also be granted for use of BPA's fee owned property. Current market value of the land is the basis for the consideration for these transactions.

Information resources

For more information, including regional realty specialist contacts, or access to BPA's electronic Land Use Application form visit BPA's Web site at: *www.transmission.bpa.gov/LanCom/Real_Property.cfm.*

Should you have any questions or would like assistance in completing the application, please call 1-800-836-6619. A BPA realty representative will return your call within two business days.

DOs and DON'Ts

BPA does not permit any use of rights-of-way that are unsafe or might interfere with constructing, operating or maintaining our facilities. These restrictions are part of the legal rights BPA acquires for its rights-of-way. Even when no transmission line has been constructed on the rights-of-way, BPA's rights are maintained for future use. You can avoid or minimize incurring redesign or removal costs and benefit from developing reasonable construction schedules by being aware of the prohibited uses and by applying early in your planning process to BPA for concurrence.

DO call BPA before planting, digging or constructing.

DO check your property and review your property records for transmission rights-of-way encumbrances.

DO take the time to plan projects that conform to proper use of the rights-of-way which includes submitting a BPA Land Use Application form for approval.

DO comply with the terms and conditions of the Land Use Agreement provided by BPA for your safety.

DO consult with BPA when planning subdivisions. Backyards and BPA rights-of-way may not be compatible.

DO report criminal or suspicious activities to local authorities and to BPA's federal Crime Witness Hotline at 1-800-437-2744.

DON'T cut or trim a tree near a power line. Call BPA!

DON'T plant, dig or construct in BPA's rights-of-way without first contacting BPA and submitting a BPA Land Use Application for approval.

DON'T store equipment, materials, waste, flammable material or anything that would cause a fire hazard or other safety issue or impede access by line crews to towers and lines.

DON'T assume the location of BPA's fee-owned or rights-of-way boundaries without first contacting a licensed surveyor and having them coordinate with BPA's surveyors by calling 1-800 836-6619.

Vandalizing BPA property is a crime.

Please report any vandalism or theft to BPA property by calling BPA's 24-hour toll-free hotline at 1-800-437-2744. All information reported through the Crime Witness Program is kept confidential. Cash rewards of up to $25,000 will be paid to those providing information that leads to the arrest and conviction of persons committing the crime.

1. Executive Summary

This document is the City of Hillsboro's Housing Production Strategy (HPS). The HPS is a plan required by state law (OAR 660-048-0050) that describes how the City will promote the creation of housing to meet the needs identified in the City's 2023 Housing Needs Analysis (HNA). The HPS includes a variety of tools and actions the City will use to help improve the production, availability, and affordability of housing in Hillsboro, both across the income spectrum and for protected classes. The HPS was created in partnership with a variety of community and local stakeholders, including residents, community leaders, and experts on housing policy and development.

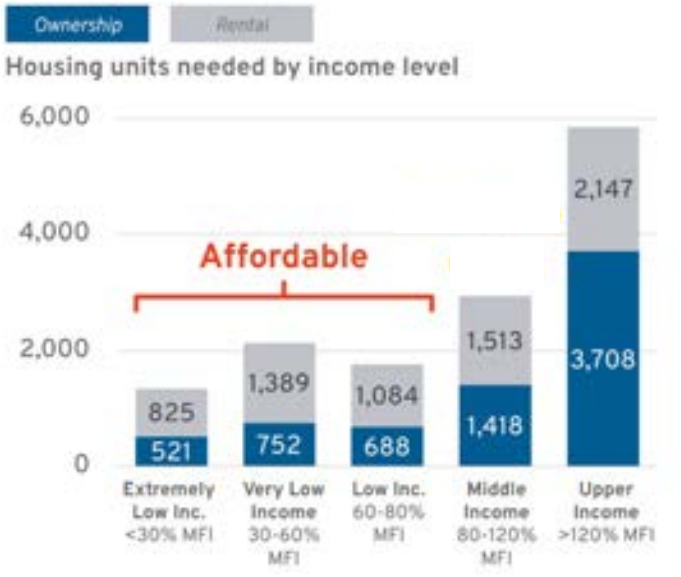
The HPS is organized into seven sections:

1. **Executive Summary.**
2. **Overview of Hillsboro's Contextualized Housing Needs.** This section summarizes current and future housing needs, demographic trends, market factors affecting housing production, and the housing needs of various groups and protected classes.
3. **Community Engagement.** This section summarizes stakeholder and community input used to develop the HPS's actions.
4. **Existing Actions to Promote the Development of Needed Housing.** This section summarizes the actions that Hillsboro has already undertaken to ensure the production of needed housing.
5. **Strategies to Meet Future Housing Need.** This section describes 21 actions the City will undertake to support housing production and fulfill its commitment to meeting its housing needs.
6. **Achieving Fair and Equitable Housing Outcomes.** This section offers a narrative summary of how the actions in the HPS, in combination with other City actions, will achieve equitable housing outcomes.
7. **Measuring Progress.** This section recommends methods and performance metrics for monitoring progress on HPS actions.

Hillsboro's Housing Need

Overall Need

The City of Hillsboro's 2023 HNA showed that the City needs 14,046 new housing units over the next 20 years, including 5,259 units affordable to households earning less than 80% of the median income for a family. The HNA also showed that the housing Hillsboro needs will take a variety of forms, from single detached houses to multi-unit dwellings (i.e. apartments). Roughly half of the need is expected to be for rental units, and the other half is expected to be for ownership units.



Source (Figure on Right): City of Hillsboro's 2023 HNA, Tables EX 5-6

Population-Specific Housing Needs

The diversity of Hillsboro's population is reflected in the diverse range of housing needs present in the City. The list below offers examples of the housing needs experienced by different groups:

Low-income households (less than 80% of median family income). These households represent over 1/3 of the city's need. Due to their limited budgets, they have an elevated need for affordable housing.

Communities of Color. Nearly half (46%) of Hillsboro's residents are People of Color. People of Color have historically had less access to homeownership and tend to be cost burdened (meaning they spend over 30% of their household income on housing) more often than other residents. This means Communities of Color can experience elevated need for affordable housing, particularly ownership housing.

People with disabilities. About 11% of Hillsboro's population has a disability. In Oregon, people with disabilities are more than twice as likely to live in poverty, and some people with disabilities experience difficulties with mobility. This elevates their needs for affordable and physically accessible (e.g. built to Americans with Disabilities Act (ADA) standards) housing.

Seniors. Seniors are 11% of Hillsboro's population and represent a quickly growing population segment in the City. They experience housing problems like cost burden and overcrowding at higher-than-average rates and may experience difficulties with mobility. This elevates their needs for affordable and physically accessible housing.

People experiencing homelessness. As of the 2023 point-in-time count, Washington County has an estimated 773 people experiencing homelessness. This is likely an undercount, given that 753 students in the Hillsboro School District reported extreme housing insecurity or homelessness that same year. People experiencing homelessness have elevated needs for affordable housing, which is sometimes provided with intensive services and given the designation "permanent supportive housing."

The City's housing need is described in greater depth in "Section 2: Overview of Hillsboro's Contextualized Housing Needs."

The City of Hillsboro's HPS Actions

Throughout 2024, City staff—alongside contracted consulting and engagement partners—gathered input from community stakeholders and developed a list of housing actions. These actions aimed at addressing the overall and population-specific housing needs identified in the City's 2023 HNA and Section 2: Overview of Hillsboro's Contextualized Housing Needs. The list of actions draws directly from community members' suggestions, from the team's policymaking experience, from an ongoing audit of Hillsboro's community development code and housing policies, from best practices research, and from a list of potential actions published by Oregon's Department of Land Conservation and Development (DLCD).

The actions are divided into five categories: Regulatory, Land-Based, Partnership, Incentives, and Investments. Later in the document, Section 5: Strategies to Meet Future Housing Need offers a detailed summary of each action, providing with the following information:

- Overview, background, and rationale for the action
- Steps to implement the action, considerations for implementation, and a timeline

- An estimate of magnitude of the action's impact on housing production
- The types of housing need the action addresses (across income, housing type, and tenure)
- The fiscal and administrative impacts of the action on the City
- The Department or Division of the City that will lead implementation

Actions will impact the production of needed housing over time, with some actions having nearer-term effects and others longer-term effects.

Regulatory Actions

- Action 1.1: Evaluate Comprehensive Plan amendments and Zoning Map updates
- Action 1.2: Increase housing in Multi-Dwelling Zones
- Action 1.3: Increase housing in Commercial & Mixed-Use Zones
- Action 1.4: Refine middle housing development standards
- Action 1.5: Streamline design standards
- Action 1.6: User-friendly code
- Action 1.7: Identify and reduce process barriers
- Action 1.8: Explore adopting pre-approved housing plans

Land-Based Actions

- Action 2.1: Coordinate with partners to identify underutilized land
- Action 2.2: Pursue residential land UGB expansion(s)

Partnership Actions

- Action 3.1: Develop new strategic partnerships for state/federal advocacy
- Action 3.2: Continue and expand affordable homeownership partnerships
- Action 3.3 Undertake a Calle Diez Equitable Development Strategy

Incentive Actions

- Action 4.1: Explore fee structure adjustments
- Action 4.2: Analyze scaling select SDCs
- Action 4.3: Evaluate MUPTE to incentivize needed housing and extension of the VHDZ program
- Action 4.4: Evaluate additional tax abatements

Investment Actions

- Action 5.1: Explore strategic infrastructure investments to unlock housing production
- Action 5.2: Explore creation of an ongoing revenue source for affordable and middle-income housing production
- Action 5.3: Build a year-round homeless shelter
- Action 5.4: Explore ways to support Permanent Supportive Housing production

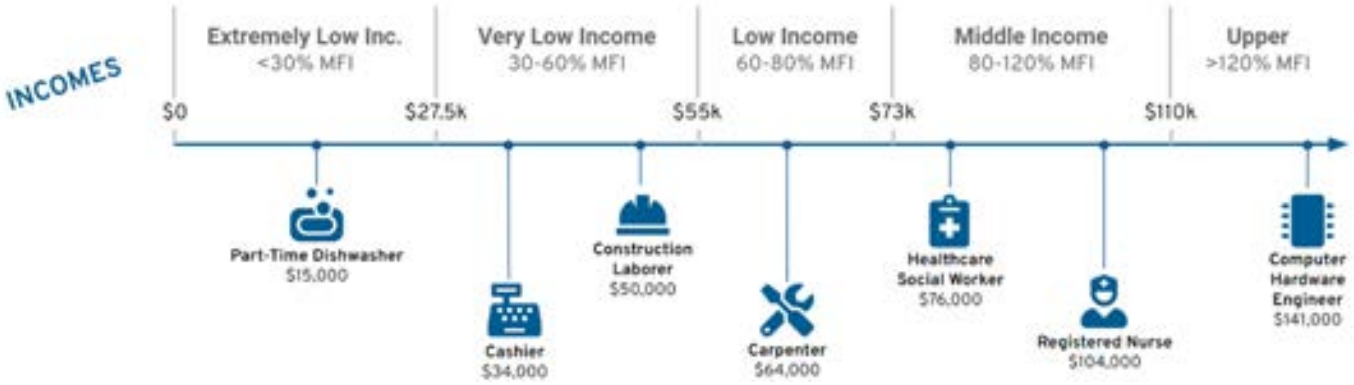
2. Overview of Hillsboro's Contextualized Housing Needs

Hillsboro completed and adopted the 2023 Housing Needs Analysis (HNA) in early 2024. The HNA assesses the City's future land and housing needs and prepares the City to make data-informed decisions about how to respond. This section overviews and reiterates the City's housing needs, ensuring the Housing Production Strategy (HPS) and the actions it includes reflect that latest data. This section fulfills state requirements for a contextualization of the City's current and future housing needs, as found in OAR 660-008-0050 (1).

Understanding the Relationship Between Income & Attainability

Hillsboro's households have a variety of incomes

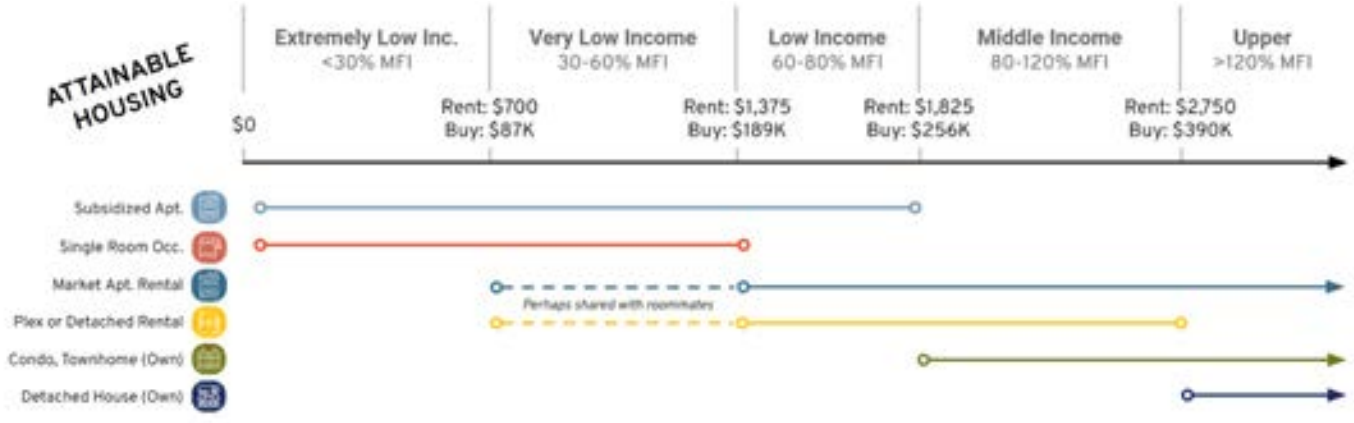
Hillsboro's median household income is about $99,000. This is higher than the statewide and regional medians of $76,500 and $90,500.[1] Despite tending to have more higher income households than a typical Oregon community, Hillsboro still has a range of jobs and incomes. That range is visualized in the graphic below as a spectrum of wages for different common jobs for a community like Hillsboro.



Sources: City of Hillsboro's 2023 HNA, and Bureau of Labor Statistics modeled wage estimates for Oregon, 2022-Vintage. Analyst calculations assume 40 hours per week for a full-time salary.

Income determines the housing price each household can afford, and a variety of housing types are needed to serve households with different incomes

The amount of money a household earns determines how much it can afford to pay for housing. Housing is considered "affordable" when a household spends 30% of their income or less on it. The graphic below



Source: City of Hillsboro's 2023 HNA, specifically for the attainable housing rent and sale prices.

illustrates the idea that different types of housing (e.g. apartments, condos) are available at different prices. This diagram is conceptual – the price ranges it shows are hypothetical rather than based on exact rent data by product type. However, it helps communicate an important principle: a variety of housing types are needed to serve the wide income spectrum in Oregon's communities, Hillsboro included. Ideally, everyone can find housing in their budget. Hillsboro's estimated needs by housing type and income are offered below.

Hillsboro needs 14,046 new housing units over the next 20 years, including 5,259 units affordable to households earning less than 80% of the Median Family Income

As suggested by the graphics on the previous page, the HNA found that the City will need new housing units serving its full income spectrum and taking a variety of forms, from single detached houses to multi-unit dwellings (i.e. apartments). Roughly half of the need will be for rental units, and the other half will be for ownership units. The HNA also projects that over half of the need will be for various forms of attached housing, like townhomes, two-to-four-unit buildings, and apartments. This diverse range of need reflects the diversity of Hillsboro's population and existing housing stock, both of which are described in greater detail below.

Source: City of Hillsboro's 2023 HNA, Tables EX 5-6

Demographic Profile

The City of Hillsboro is a diverse, young, and higher-income place, relative to Oregon as a whole

Per the US Census' American Community Survey, Hillsboro is comparatively:

- **Racially diverse**. Roughly 46% of Hillsboro's residents are people of color, significantly above the statewide rate of 27%. Latino (24%) and Asian (12%) residents are the largest of Hillsboro's communities of color, with Black (3%), Indigenous (1%), and multiracial (6%) populations comprising smaller proportions. F
- **Young**. About 22% of Hillsboro's residents are children – above the statewide rate of 20% – and 11% are seniors – below the statewide rate of 18%. The City's status as a job hub appears to have attracted families with working age parents and children.

- **Has more renters**. Renters comprise half of Hillsboro's households, whereas renters are just over a third of households in the Portland metropolitan region and statewide. This likely stems from a combination of factors, from the housing and job types in Hillsboro, its racial and ethnic makeup, and its age profile.
- **Has higher incomes**. The median household income in Hillsboro is about $8,000 above the regional median, and $20,000 above the state median. This is likely powered by Hillsboro's well-paying semiconductor and tech job sectors. It also reveals the larger budgets the City's middle- and upper-income households have for housing. Despite tending to have a higher income profile, half of the City's households still earn less than that median income and 40% of households are cost burdened.

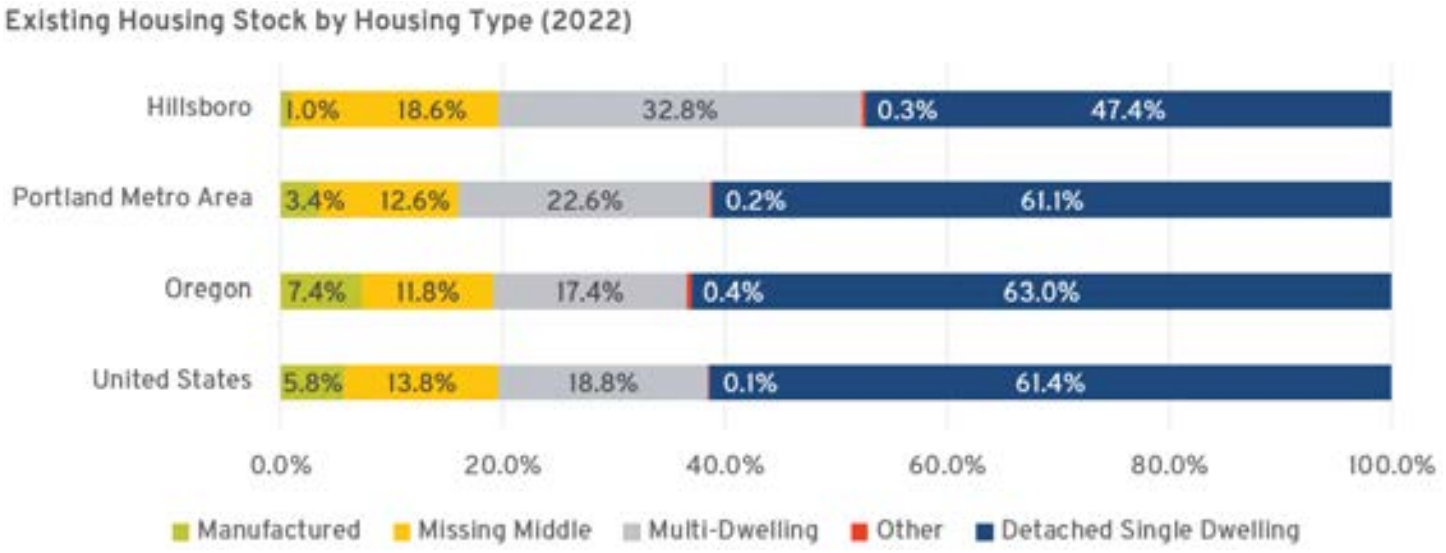
	Hillsboro	Portland Metro Area	Oregon
Race and Ethnicity			
American Indian, Alaska Native	0.4%	0.5%	0.7%
Asian	11.5%	6.8%	4.4%
Black	2.9%	2.8%	1.8%
Hispanic or Latino	24.0%	12.7%	13.8%
Native Hawaiian, Pacific Islander	0.8%	0.5%	0.4%
Other Race	0.4%	0.4%	0.4%
Two or More Races	5.9%	5.6%	5.2%
White	54.1%	70.6%	73.3%
Age			
Under 18	21.8%	20.7%	20.2%
18 to 64 years	67.0%	63.6%	61.5%
Over 65	11.2%	15.6%	18.3%
Tenure			
Renters	49.5%	37.8%	36.8%
Homeowners	50.5%	62.2%	63.2%
Median Household Income	$98,891	$90,451	$76,632

Sources: American Community Survey 5-Year Estimates, 2022-Vintage, Tables B03002, B01001, B19013, and B25003

Existing Housing & Who Lives In Different Kinds of Housing

Hillsboro's housing stock is relatively diverse

About 47% of Hillsboro's housing stock is single detached and 33% is multi-unit. The rest is missing middle housing (e.g. townhomes, two-to-four-unit buildings) and manufactured homes. This stands in contrast with state and regional trends where 63% and 61% of housing is single detached and only 17% and 22% is multi-unit. It also puts Hillsboro's housing stock more in line with the more urban City of Portland (not visualized) than the Portland region as a whole.



Source: American Community Survey 5-Year Estimates, 2022-Vintage, Table 25024

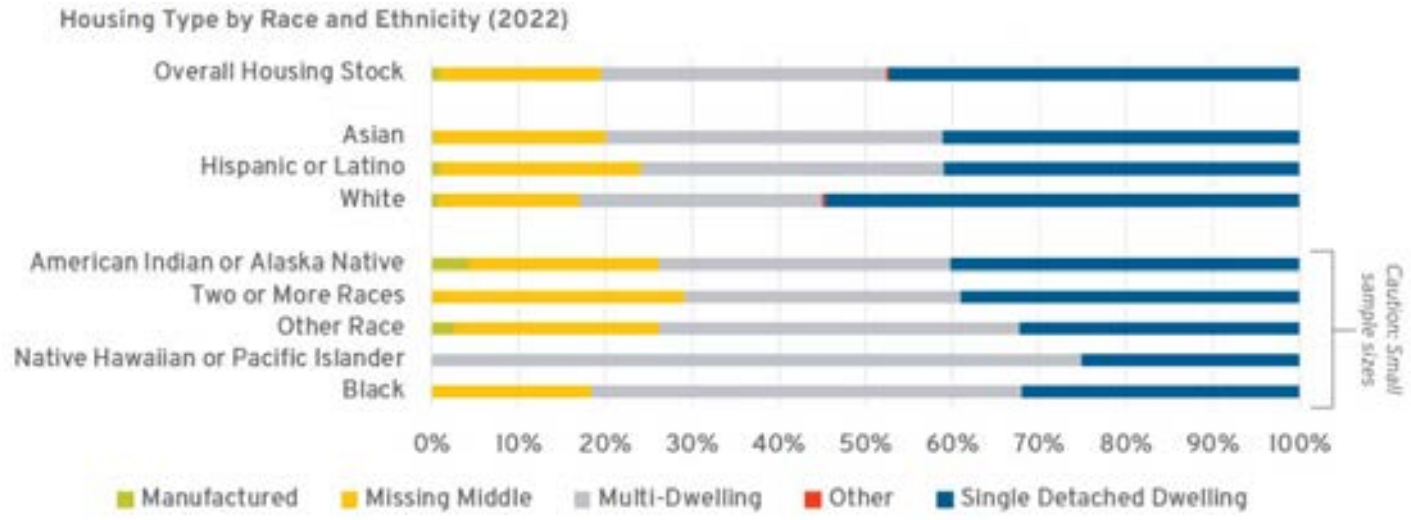
Hillsboro's renter households often live in multi-unit housing

Over 60% of renters live in multi-unit housing, and another 20% live in attached missing middle housing, like townhomes or two-to-four-unit buildings. Initiatives that support further growth of multi-unit and missing middle housing in Hillsboro will help meet the needs of renters and support a competitive rental market in which rents are less likely to rise quickly.

Source: American Community Survey 5-Year Estimates, 2022-Vintage, Table B25032

Hillsboro's Communities of Color households disproportionately live in multi-unit housing

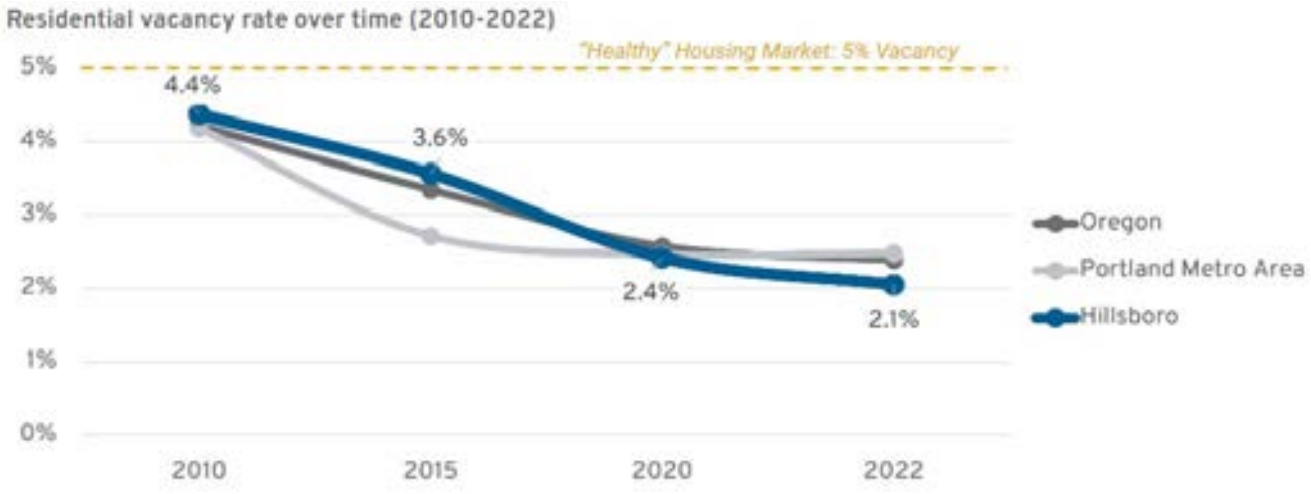
Like renters, Hillsboro's households of color are also less likely to live in Single Detached Units. Whereas 55% of White households live in the 47% of Hillsboro's housing stock that are Single Detached Units, only 41% of Asian and Latino households and only 32% of Black households do. White households' increased access to detached units, which are often ownership housing, increase opportunity for wealth building. However, the prevalence of missing middle housing in Hillsboro – particularly townhomes, which are often ownership housing too – assists other groups in accessing homeownership. 23% of Latino households, 20% of Asian households, and 29% of multiracial households live in missing middle housing, despite that housing type representing only 18% of housing stock. About 40% of that missing middle housing is ownership housing. This suggests that missing middle likely has served (and could continue to serve) as a key tool in building homeownership among Communities of Color. This data also reveals the importance of multi-unit as a housing type that disproportionately serve various Communities of Colors.



Source: American Community Survey 5-Year Estimates, 2022-Vintage, Table B25032 B-I

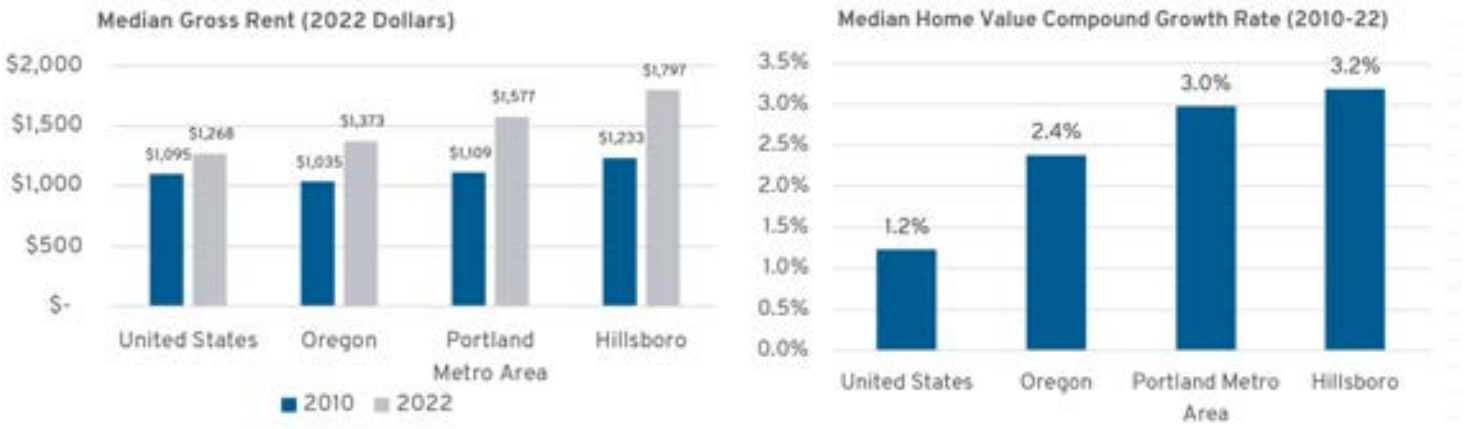
Hillsboro is experiencing very low housing vacancy, which is putting upward pressure on prices

Much of Hillsboro's 20-year housing need comes from forecasted population growth and in-migration. This need is made greater by the underproduction of new housing in the city and region. Hillsboro's residential vacancy rate points to the fact that not enough housing has been built to meet the need. Vacancy has fallen from 4.4% in 2010 to 2.1% in 2022. In practical terms, that means Hillsboro went from a situation where about 1 in 20 homes were available on the rental or for-sale market, to only 1 in 50 homes available as of 2022. This mirrors the vacancy trend seen across Oregon and the Metro Area.



Source: American Community Survey 5-Year Estimates, 2022-Vintage, Table B25004. Note the analyst's calculations include "typical" market vacancy (e.g. for sale, for rent), but excludes vacant units that are actually "recreational or seasonal" housing, and "other" vacancy (e.g. due to abandonment, foreclosure)

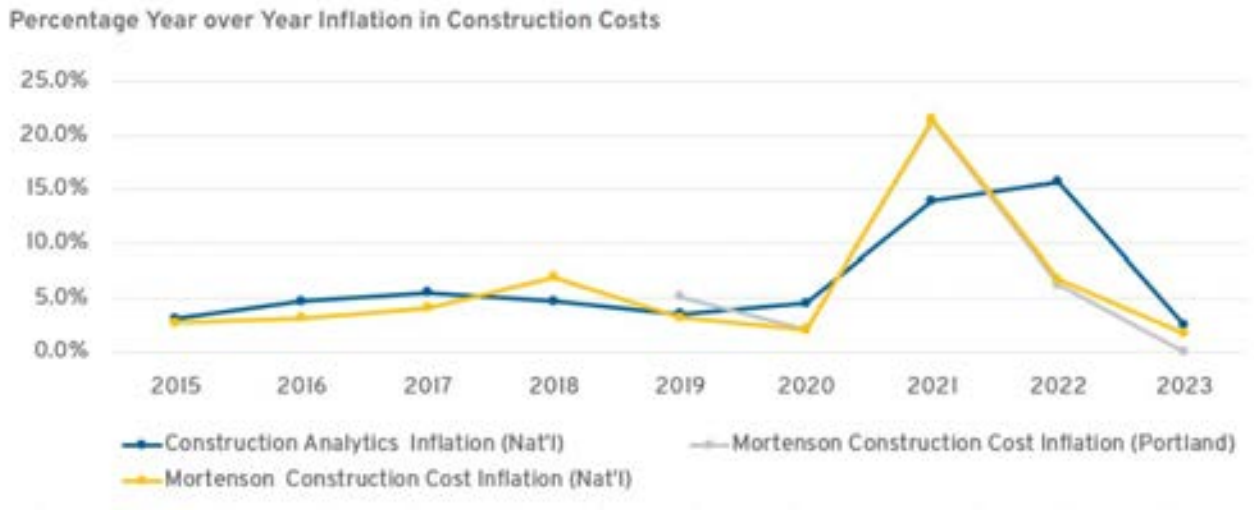
When vacancy is low, typically price increases are observed due to competition among renters and buyers for the limited available stock of housing. Between 2010 and 2022, Hillsboro's median gross monthly rents grew by over $560 after adjusting for inflation, compared with $340 statewide. Likewise, Hillsboro's home values grew at a faster annual rate than state- and nationwide (3.2% vs. 2.4% vs. 1.2 respectively). Increasing housing supply and alleviating low vacancy is crucial to moderating future price increases.



Source: American Community Survey 5-Year Estimates, 2022-Vintage, Tables B25064, B25077

Rapid increases in costs have posed a fresh barrier to production

Since 2020, development costs have risen sharply. Mortenson's Construction Cost Index for Portland indicates the Portland region experienced a 29% total increase in construction costs between 2020 and 2024. Interest rates have also increased, dramatically raising the cost of borrowing for both buyers and builders. These macroeconomic headwinds cause rents and sales prices to fall out of sync with development costs, reducing the financial feasibility of development and ultimately posing a significant barrier to near-term housing production.



Sources: Mortenson Construction Cost Index, accessed in 2024, https://www.mortenson.com/cost-index, and Construction Analytics Inflation Index, accessed in 2024, https://edzarenski.com/2024/01/17/construction-inflation-2024/

A statewide survey of government staff and developers by the University of Oregon's Institute for Policy and Research and Engagement reinforces this perspective that construction costs are major barriers to production.[2] Six of the 12 barriers perceived by respondents as "extreme" barriers had to do with construction costs (both materials and labor) and labor availability. The report also finds the land cost and, relatedly, the availability of development-ready, adequately zoned land were also considered major barriers. Infrastructure, systems development charges, and various regulatory details were deemed more moderate barriers to production. Materials costs and labor availability are difficult to improve with local action. Discussion among members of Hillsboro's Housing Production Strategy Technical Advisory Committee acknowledged the challenges with labor and materials, but also highlighted local zoning, development standards, difficult review and approval processes, and overall fee burden as significant local barriers to production.

Real estate is cyclical, and eventually cost, price, and rent conditions will reach a new equilibrium in which development is more feasible. In the meantime, adopting policies that support lower development costs, broaden the labor pool, open land to development, and prepare that land for development will be crucial to counteracting these conditions.

[2] University of Oregon Development Barriers Survey Brief and Summary Report, 2022. https://www.oregon.gov/lcd/UP/Documents/Appx_F_UO_IPRE_Barriers_Housing_Production.pdf.

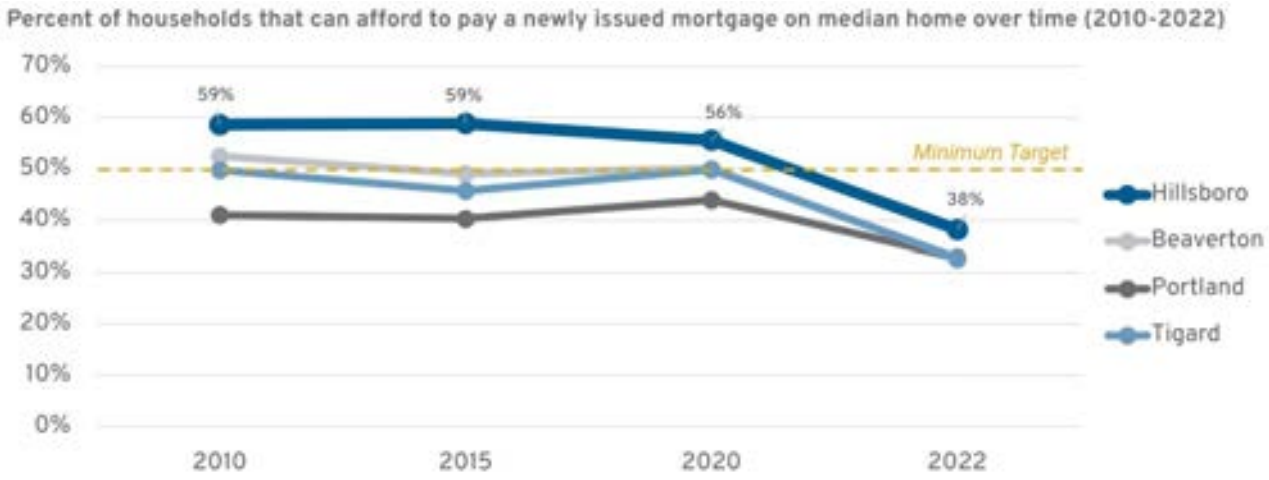
Over 40% of Hillsboro's renter households are cost burdened

Hillsboro as over 22,000 renters, and 43% are cost burdened or severely cost burdened, less than the national (46%), statewide (48%), and regional (49%) rates. However, it does not appear the City's cost burden is lower due to having lots of low-priced housing. In fact, Hillsboro's gross median rent is considerably higher per month than state and national averages ($1,797 vs. $1,373 and $1,268). Rather, Hillsboro's rates of cost burden appear to be lower due to the City's income profile skewing higher than is typical in Oregon and the region.

Source: American Community Survey 5 Year Estimates, 2022-Vintage, Table B25070

After price and interest rate spikes, fewer than half of Hillsboro's households can afford a typical mortgage

While the American Community Survey tracks cost burden among owners, it falls short of capturing an up-to-date picture of engaging with the ownership housing market in 2024. This is because a large share of owners locked in low mortgage rates and decades-old housing prices, resulting in low-cost burden today. The percentage of households that can afford to pay a newly issued mortgage on the median home is a better



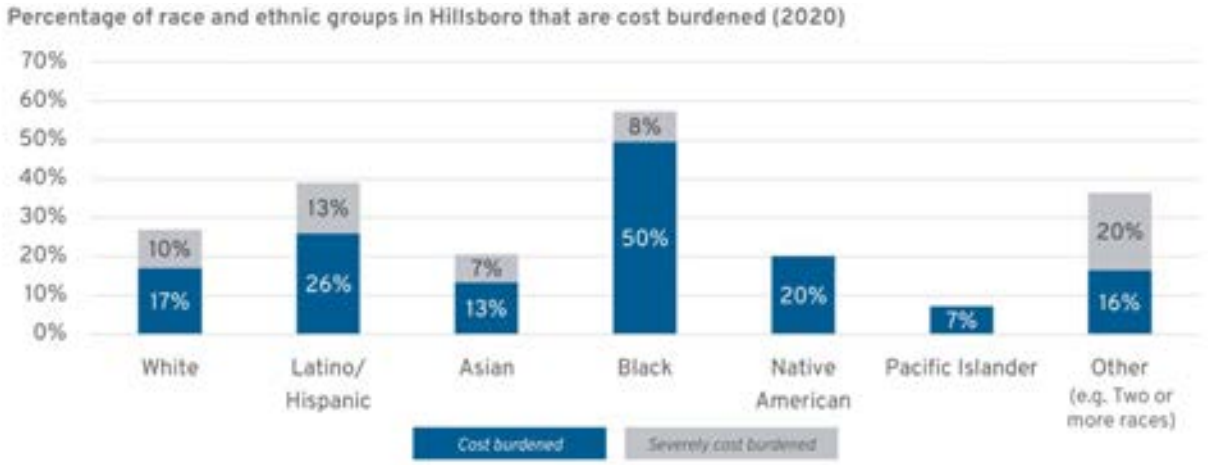
Sources: Zillow Home Value Index, seasonally adjusted for all for sale homes, accessed in 2024; Federal Reserve Bank of St. Louis average 30-year mortgage rates, Table MORTGAGE30US, accessed in 2024; analyst estimate of tax and insurance costs for Oregon using SmartAsset and Nerdwallet

reflection of the *in-the-moment* level of affordability a buyer will experience at any given time. For the past decade, due to its higher than typical income profile, Hillsboro enjoyed relative success in having the majority of its households being able to afford the mortgage on the typical home in the City. However, when rates climbed, Hillsboro, like other peer areas suffered a large blow to ownership affordability. As of 2022, only 38% of households could afford a newly issued mortgage on the City's median-priced home.

Needs of Communities of Color

Hillsboro has a high percentage of residents of color relative to the state as a whole, and Black & Latino households – whether owners or renters – are cost burdened most often

Roughly 46% of Hillsboro's residents are people of color, significantly above the statewide rate of 27%. This alone indicates the importance of planning for the housing needs of communities of color. What's more, people of color in Hillsboro tend to be cost burdened at higher rates than the City's White population. Per the Department of Housing and Urban Development, roughly 58% of Hillsboro's Black residents and 39% of Latino residents are cost burdened. This exceeds the rate of cost burden among White residents (27%) and Asian residents (20%). This demonstrates the connection between the production of affordable housing and meeting the housing needs of communities of color, in particular Hillsboro's Black and Latino residents and others within those cultural communities who might wish to locate in Hillsboro.



Source: HUD Comprehensive Housing Affordability Strategy (CHAS) 5-Year estimates, Table 9, 2020-vintage

For further information on the housing needs of Communities of Color, see the "Needs of People Experiencing Homelessness" and "Existing Housing & Who Lives in Different Kinds of Housing" sections, which contain housing-need data disaggregated by race and ethnicity.

More Washington County residents are experiencing homelessness and are disproportionately from Communities of Color

According to the Oregon Statewide Homelessness Estimates report, 7,480 people in the Portland Tri-County Region were experiencing homelessness as of January 2023.[3] Washington County's Homeless Services Division—the organization (i.e. Continuum of Care) responsible for providing programs to prevent and end homelessness in the County—counted 773 people experiencing homelessness at that time, up from 591 people experiencing homelessness in 2015.[4] This amounts to 3.4% annual growth over those eight years. This is the most granular data available to the City of Hillsboro, which falls within Washington County's Continuum of Care, does not maintain its own city-specific point-in-time count, and cannot access the same federal funds for fighting homelessness as the Continuum of Care can. People experiencing homelessness in Washington County are disproportionately Black (9.6% of homeless population vs. 2.9% of total population), Indigenous (1.9% vs. 1.2%), Native Hawaiian or Pacific Islander (4.7% vs. 0.6%), and Multiracial (6.3% vs. 4.9%). White, Asian, and Hispanic populations are more proportionately represented or are even underrepresented among people experiencing homelessness.

Sources: Washington County, Oregon: Homeless Counts and PIT Resources, accessed 2024, *https://www.washingtoncountyor.gov/housing/efforts-end-homelessness/homeless-counts-and-pit-resources*

Nearly 1 in 25 grade-school students experienced severe housing insecurity or homelessness

Data collected on student homelessness in 2024 under the federal McKinney-Vento Homeless Assistance Act shows that many students in Hillsboro's School District (3.9% of students) experience severe housing insecurity and homelessness. This is roughly equal to the statewide rate of 4%. Much of this homelessness is likely missed by the Continuum of Care's count. That data found that 551 students were living doubled-up with another family, 51 were living out of a hotel or motel, 69 were living in a shelter, and 83 were living unsheltered.

Source: McKinney Vento Act, 2022-2023 Houseless Student Data, accessed in 2024, https://www.oregon.gov/ode/schools-and-districts/grants/esea/mckinney-vento/pages/default.aspx

Homelessness services use and provision has risen sharply since 2020, funded by a new tax

The County and region have responded to rising homelessness with investment in homelessness services, funded by the regional supportive services tax. In recent years and as indicated by the figure above, shelter capacity rose, meaning a smaller percentage of people experiencing homelessness in Washington County were counted as unsheltered. Furthermore, Washington County's Longitudinal Systems Analysis of homeless services shows that the number of households served by some facet of the County's homelessness response system –not just shelter, but other forms of housing for people experiencing homelessness–more than doubled between 2020 and 2022, rising from 505 households to 1,275 households over the course of a full year.[5] Put more simply, more people are being served in shelter, transitional housing, rapid rehousing, and Permanent Supportive Housing in Washington County in response to the rise in homelessness.

Needs of Seniors & People with Disabilities

Seniors in Hillsboro are less prevalent than statewide, but more commonly face housing problems

Per the 2022 American Community Survey, Hillsboro had a significantly smaller percentage of seniors than the state as a whole (11% vs. 18%). However, in line with state and national trends, Hillsboro's percentage of seniors among its population has risen steadily over the last decade. Per the Department of Housing and Urban Development, about 38% of Hillsboro's residents ages 62 and above face at least one of the following housing problems: cost burden, overcrowding, or inadequate kitchen or plumbing facilities.[6] This figure is 33% statewide, meaning seniors in Hillsboro tend to have those housing problems at higher rates. Given the growth in the senior population and the housing challenges they face, senior needs are key to plan for in terms of accessibility, affordability, and other housing problems, even if the City is several years behind the statewide curve for population aging.

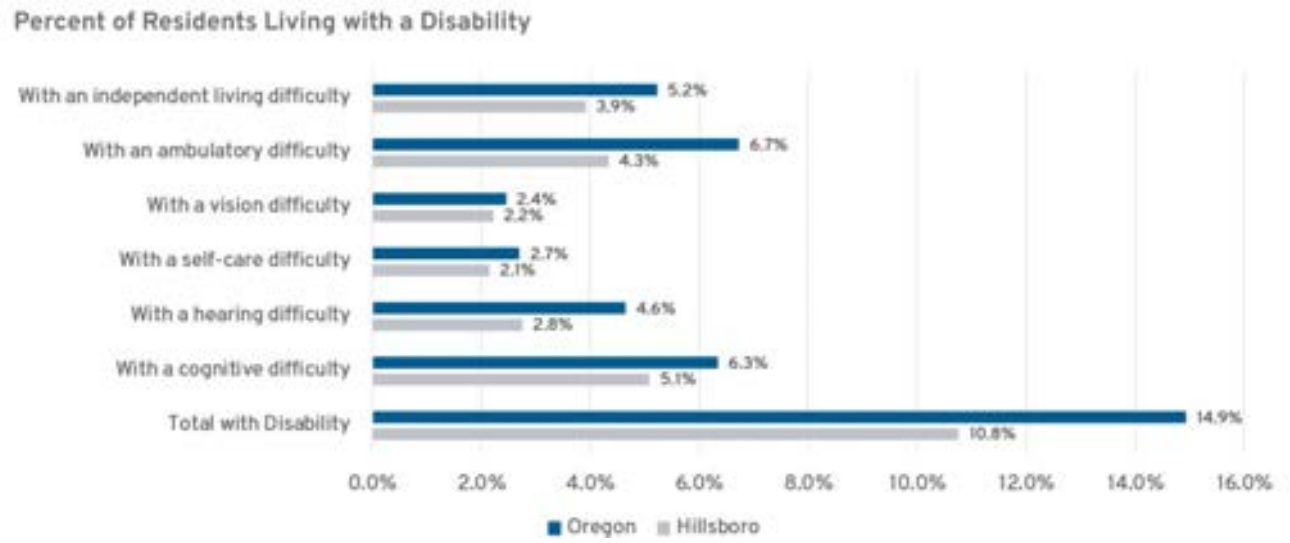
[5] Washington County Longitudinal Systems Analysis, 2023, accessed in 2024, https://www.washingtoncountyor.gov/housing/efforts-end-homelessness/documents/coc-presentation-2022-lsafinal/download?inline

[6] HUD Comprehensive Housing Affordability Strategy (CHAS) 5-Year estimates, Table 5, 2020-Vintage

About 11% of Hillsboro's residents have a disability, and they are more likely to live in poverty

Likely in part due to the fact that Hillsboro's age distribution skews younger, the City also has fewer individuals with disabilities than the state as a whole (11% vs. 15%). This is true overall, but also across disability categories tracked by the US Census. As the City ages, it should expect the percentage of residents living with a disability to rise.

People with disabilities are more likely than people without them to live in poverty, with 21% of Oregon's population with a disability below the poverty line compared with 10% for the no-disability population.[7] This data is not available at the City level, but the statewide trend implies that the City can expect to serve the needs of more households with disabilities if it successfully adds more housing affordable to lower-income households. There are likely people with disabilities who would like to live in Hillsboro but cannot afford to, and affordable, accessible housing is a key route to meeting that need.



Source: American Community Survey 5-Year Estimates, 2022-Vintage, Table S1810

Conclusion

This section provides critical context regarding the City of Hillsboro's housing needs. It demonstrates the extent of the need, as found by the City's HNA. It also demonstrates the diversity of the need, which stems from the diversity of the City's residents themselves—owing to their various backgrounds, life stages, budgets, and needs for support. Subsequent sections of the Housing Production Strategy will describe the many types of actions the City will explore and implement in order to meet those diverse housing needs. The actions will range from activities already ongoing to entirely new initiatives intended to address one or more housing needs experienced within the City.

[7] American Community Survey 5 Year Estimates, 2022-Vintage, Table B18130

3. Community Engagement

This section overviews the Community Engagement conducted by the City of Hillsboro and its partners as part of the City's HNA and HPS processes. The section also describes how that engagement impacted which actions were included in the HPS. This section fulfills state requirements for a narrative summary of how the City engaged both consumers and producers of needed housing, as described in OAR 660-008-0050 (2).

2023 Housing Needs Analysis Engagement

Prior to HPS project commencement, the 2023 HNA involved an extensive community engagement process that reached a representative cross-section of Hillsboro's diverse communities. This included a robust mix of Community Advisory Committee (CAC) members. The CAC was a voluntary committee comprised of 15 community members including people who live or work in Hillsboro, and for-profit and non-profit developers. The CAC met five times from October 2022 through April 2023 and has its final meeting on June 13, 2023. The CAC reviewed and provided feedback on housing data and provided input on the high-level housing policy themes.

The City contracted with two community-based organizations beginning in the fall of 2022 to provide an opportunity for English and a Spanish-language historically marginalized communities (HMC) focus groups (each 12 to 15 community members) to receive valuable input on current and future housing needed in Hillsboro. The role of the HMC focus groups was to provide input and have a voice in the HNA process as they historically have not had this opportunity. A total of four focus group meetings were held (two in English and two in Spanish. A project webpage was established early in the project on the City website, which offered a variety of opportunities to get involved in the project and provided an engagement timeline and project timeline and other relevant project information.

The HNA established a series of high-level policy themes through engagement with the HNA's CAC, Historically Marginalized Communities focus groups, Council and Planning Commission work sessions, and targeted stakeholder interviews. These themes established a starting point for discussion when developing HPS actions that directly address the City's housing needs. The themes include:

- Increase housing development opportunities in multi-dwelling and mixed-use zones
- Identification, acknowledgment, and discussion of multi-generational housing
- Extend high-amenity housing discussion beyond large lot size, since high-amenity housing can come in all forms and lot sizes
- Identification, acknowledgment, and discussion around homelessness
- Support housing for all incomes to align with the results of the HNA
- Support homeownership opportunities for low-and moderate-income community members

Housing Production Strategy Engagement

The City conducted additional community engagement for the HPS. As a first step, the City created the HPS Public Communications and Engagement Plan was approved by the City's Public Engagement Committee and can be found in Appendix C. This plan called for input from a wide variety of stakeholders, including historically marginalized community members and other residents, land and housing developers,

representatives of nearby partner jurisdictions and service districts, representatives of local employment interests, and the Planning Commission. HPS engagement built on the HNA's efforts by engaging with many members of the HNA's HMC focus groups, who had already developed a relationship with the City and its partners by collaborating on this topic. The engagement process during the HPS included:

- Four meetings of a Technical Advisory Committee
- Three rounds of historically marginalized communities focus groups, three in English and three in Spanish
- Three City Council public work sessions
- Two Planning Commission public work sessions
- Two meetings with the Advanced Manufacturing Training & Education Collaborative of Hillsboro (AM-TECH)
- Multiple inter-departmental coordination meetings
- A public facing website ("Housing Production Strategy") with an email address for public question and comment

Technical Advisory Committee (TAC)

The City and its consultant team conducted four TAC meetings between May and September of 2024. The TAC included representatives from Hillsboro's School District, the Washington County Chamber of Commerce, nearby partner jurisdictions, and Hillsboro's technology sector, two planning commissioners, members of the real estate and housing development communities (including multi-unit, detached, small-home, and affordable housing developers), and Hillsboro residents. The following subsections summarize the guidance and themes that emerged from the TAC meetings:

General Guidance

- Be specific about levers that City can pull versus the levers that it cannot.
- Housing production should support a variety of household situations occurring over a lifetime (e.g. various home sizes, housing for rent and ownership).
- Developers support actions that make development more affordable, faster, predictable, and that mitigate risks. Assistance with land and gap funding make the biggest difference in the feasibility of affordable housing development. New housing is supported as well as efforts to preserve affordable housing.
- Make clear each action's goals and how its impact and implementation will be measured

Feedback on Code and Permitting Processes

- Expedite timelines through better coordination of plan approval across departments.
- Avoid pushing projects to Type III review processes, which are long, risky, and costly.

- Pre-application meetings seem to sometimes act as discretionary review points and design negotiations, which increase project uncertainty, the time to receive approval, and the number of de facto approvals required to build.
- Incentivizing density outright is preferable to density bonuses.
- A more user-friendly community development code could get more involved in building. Pre-approved plans could help too.
- Some felt design guidelines are not clear, objective, and achievable.

Feedback on Location of New Housing

- Build community around amenities and employment opportunities. Employer housing partnerships could be fruitful for meeting housing needs.
- Increasing density in residential zones for new housing should align with existing infrastructure capacity.
- Adjacency to transit should come with higher density allowances.
- Mixed-use development in both commercial and residential zones is supported.
- The City should track HOAs, explore how they curtail capacity for new housing, and audit the community development code for ways its "pushes" developers to use HOAs.
- Integrate Permanent Supportive Housing into the broader community rather than isolating it. Support workforce development for Permanent Supportive Housing.

Feedback on Investments and Incentives

- The City should consider exploring land purchases for housing, similar to how it has done for industrial land. Both employment and housing are critical issues in Hillsboro and should be equally elevated.
- SDCs are high in Hillsboro. Not all SDCs are scaled by unit size, meaning large units with large impacts on City systems often pay very similar impact fees to small homes. Other jurisdictions have scaled SDCs.
- The City should consider raising revenue through mechanisms that tap into the strong employment sector, such as a commercial construction excise tax or a business receipts tax.
- Tax exemptions for naturally occurring affordable housing could promote preservation.
- Tax exemptions are best targeted at developments that would not currently be feasible otherwise.
- Some smaller developers might be interested in producing affordable middle-housing units too, and the City should find ways to support them.

City Council Work Sessions

Staff from the City's Community Development Department and its consultant team conducted City Council work sessions in April, June and October of 2024. These work sessions offered information on and solicited feedback regarding Hillsboro's Contextualized Housing Need, Housing Production Strategy requirements and process, and draft actions proposed for the HPS. Council direction fell into several major themes:

Feedback on Prioritization of Financial Resources

- The City has limited financial resources and should focus those resources on affordable housing (targeting <80% MFI) and middle-income housing (targeting 80-120% MFI).
- With financial resources focused on affordable and middle-income housing, the City should use actions with lower fiscal impacts to promote market-rate housing. The City should continue to maintain a development-friendly environment and remove regulatory barriers to promote production. One council member advocated for exploring higher minimum required densities for development when revising the City's community development code.

Feedback on Homeownership

- The Council tended to voice strong support for expanding homeownership and making it attainable to middle-income families, while still understanding the need to balance actions focused on ownership and rental housing.
- One council member emphasized the importance of achieving a policy outcome where homeownership was affordable to middle incomes without subsidy. Across two work sessions, another member emphasized middle housing as a tool and its importance in helping achieve affordable homeownership. The Councilor advocated for setting the City setting ambitious targets in terms of the price it wants to achieve for homes available on the ownership market.

Feedback on Incentives and Investments

- The Council had a variety of creative ideas for funding and producing needed housing. Some on the Council expressed interest in strategies that would raise money while disincentivizing non-desired behaviors in the housing market (e.g. speculation, home flipping, construction of certain housing types). One council member suggested the City be intentional during implementation of being sure developers cannot layer too many incentives together, effectively tipping the balance of benefits away from the City and public. One council member suggested using a construction excise tax to raise money for affordable housing and sought confirmation that it would be considered during the implementation stages of the work.
- The Council supported changes to City controlled fees, with one council member advocating for creating fee incentives related to particular types of needed housing, such as middle housing. The Council acknowledged at multiple points the need for fiscal sustainability when adjusting fees, as well as the administrative difficulties that might come with some changes, in particular fee deferrals.

Other Ideas and Guidance

- The Council wants to see households able to access complete communities, open space, amenities at all income levels. With zoning map changes, two members of the Council expressed concerns around traffic and their desire to manage those impacts carefully.

- One member of the Council expressed clear support for statewide advocacy, in particular around construction defect liability law.
- One member of the Council recommended revising an action related to design-standards streamlining, to emphasize housing production or affordability rather than preservation of difficult-to-define City character.
- The Council wants to better understand where HOAs are and how they're affecting affordability and the ability to produce housing.
- One member advocated for making as strong of policy commitments as the City could, while acknowledging the reasonableness of using language when describing HPS actions that helps the City flexibly and efficiently explore and select from its options during the HPS's implementation phase.

Planning Commission Work Sessions

City staff presented at the May 8 Planning Commission work session and gave an overview of the project timeline, housing needs as outlined in the 2023 Housing Needs Analysis, and the broad categories of potential housing production strategies. Planning Commissioners discussion included:

- Feedback on the importance of presenting data in concise and clear manner, with sources cited. This would allow a better understanding of the existing housing needs in Hillsboro.
- Commentary as to the cyclical nature of housing economics, with periods of slow production due to market conditions.
- Advised staff to look to periods in Hillsboro's development history when the City was seeing more diversity in housing product type.

Staff also presented at the October 9th, Planning Commission work session, giving an overall project status update and shared the final draft new actions. Planning Commissioners expressed appreciation for the proposed final draft actions and anticipation for their involvement in the development code implementation work to follow Council adoption of the Housing Production Strategy Report in 2024.

Advanced Manufacturing Training and Education Collaborative (AM-TECH) of Hillsboro

The City of Hillsboro hosts AM-TECH, which champions public-private partnerships with industry, educational institutions, community organizations and government to support workforce development. The HPS project team presented at the June 12th and August 22nd meetings. The June meeting included a presentation of the project overall and the August meeting focused on discussion. When asked if their employees were having trouble finding affordable housing in Hillsboro, several members of the committee representing large companies in the advanced manufacturing industry shared they themselves could not find affordable housing in Hillsboro. Being unable to live in the community in which they are working causes additional stress with commuting and traffic time. Members also expressed the desire for more single-story housing that would be more accessible. Others noted the cost of living arrangements are increasing more than annual salary increases. Several large-scale employers who often have summer interns also expressed a need for short-term affordable housing. Members also commented on that Hillsboro's housing needs are very unique due to the high employment opportunities, and the need for housing at low and medium densities.

Historically Marginalized Community Focus Groups

The City conducted the first round of historically marginalized communities focus groups on May 14th, 2024, and May 23rd, 2024, conducted in English and in Spanish respectively. Members of the focus groups were recruited by engagement consultant PKS International and were provided with a stipend to each meeting to compensate for their time and participation in the project. There were 14 participants for the English focus group and 20 for the Spanish focus group.

Detailed below are the high-level themes that came out of the focus group discussions:

- The need for a range of housing options at a range of prices
- Importance of having homes near public transportation
- Preference for mixed-use development
- Prioritizing compact, mixed-use development as critical solution to improve transportation access and reduce pollution
- Frustration at having to work two jobs to make ends meet
- High cost of rental housing in Hillsboro
- Feeling priced out of certain neighborhoods or even the city as a whole
- Demand for affordable housing is greater than the supply
- There is a greater need for middle-income housing to help households struggling to pay rent and whose household income is just beyond qualifying for affordable housing
- Challenges in finding accessible and ADA-compliant housing

The second English focus group occurred on July 18 with 11 participants and the Spanish focus group occurred on July 25th with 12 participants. PKS International asked the same individuals to participate in the second round to continue relationship building. In that same vein, prior to the second focus groups, the project team decided to add a third round of focus groups to close the outreach and information-sharing loop. The first round of focus groups included more information sharing by City staff whereas the second focus group centered more around discussion questions. Below is a summary of the questions asked and responses received.

1. What do people think about increased density (and more apartments) in neighborhoods?

The city's growth and population increase have led to a high demand for housing, creating infrastructure issues like heavy traffic and pressure on roads. Participants voiced concerns about how increased density affects quality of life, the rising cost of living, and the need for affordable housing. They stressed the importance of sustainable development, preserving green spaces, and using energy-efficient materials. Despite these concerns, participants recognized the economic benefits of job creation and increased local business activity. Transportation and mixed-use development were highlighted as critical solutions to improve accessibility and reduce pollution, especially in underserved areas.

2. What are the potential upsides and downsides of focusing affordable and workforce housing in new city areas?

The participants consider that housing construction in new areas is often accompanied by infrastructure improvements, such as the creation of parks and schools. This can improve quality of life and offer more services to residents. Participants highlighted the importance of mixed-use housing and transportation

options, expressing concern over limited public transit in some areas. While new housing often brings infrastructure improvements like parks and schools, participants stressed the need to balance accessible green space with affordable housing. They also noted the potential for increased traffic and parking problems if transportation infrastructure does not keep pace with development, despite the economic benefits of new residents stimulating the local economy.

3. Do you know people whose rents are going up and causing them to seek housing outside of Hillsboro?

Participants discussed the rising cost of living in Hillsboro. Many shared concerns about escalating housing costs, others considering moving outside Hillsboro or even out of state. Participants called for regulations to maintain affordable rent in new developments and suggested assistance programs to help control rent increases. Maintenance costs were also mentioned as an added burden.

4. Are you or people you know able to find accessible/ADA housing?

Participants discussed challenges and progress in finding accessible and ADA-compliant housing. While some newer developments include features like ramps, wide doors, and roll-in showers, older buildings often lack these accommodations, and modifications can be costly. Fully affordable, accessible housing remains scarce, and resources for those needing accommodations are limited. Participants stressed the importance of researching accessibility features and increasing awareness of available assistance programs.

5. Are there other programs or housing ideas the City should look into?

During the meeting, several proposals were made to improve housing programs in the city. These included prioritizing housing for families with disabilities, older adults, and youth facing financial challenges. Environmental considerations, such as using ecological materials and recycling systems in construction, were emphasized. Participants also suggested improving park and sidewalk accessibility for people with disabilities, hiring local builders for housing projects, and offering affordable housing options for older adults. Additionally, a free community shuttle service was proposed to improve transportation access, similar to shuttles offered by companies like Intel.

6. Additional comments

During the meeting, participants highlighted the importance of community involvement to improve communication between residents and authorities. There was also a reflection on the city's diversity, with a focus on including Latino perspectives in planning. Attendees expressed a desire for updates on the progress of previous initiatives and suggested creating committees to address community needs, such as transportation and housing. Concerns about the lack of public transportation in Hillsboro were raised, with proposals for a shuttle system connecting to MAX lines to reduce the city's exclusivity to car owners. Parking challenges for larger families living in small apartments were also discussed.

A detailed summary report for each individual focus group is included in Appendix C.

Implementing Community Feedback into HPS

How the HNA Themes Are Incorporated into the HPS

As described above, the HNA's community outreach had several important themes, which the HPS actions directly incorporated.

The HPS includes several regulatory actions aimed at increasing the development capacity in multi-dwelling, mixed-use, and commercial zones, as well as establishing plans to explore new or updated tax abatements for multi-unit housing. The HPS will also explore expanding the areas of the City that allow multi-unit housing through zoning map adjustments. Such adjustments would allow the City to intentionally direct new housing toward high-amenity, high-opportunity neighborhoods.

The HPS includes actions that support housing attainable at all levels of the income spectrum. This includes market rate housing, affordable housing, and specifically homeownership opportunities for low- and moderate-income community members through potential new tax abatements, fee waivers and SDC scaling, middle housing code improvements, and new affordable-ownership partnerships. Homelessness is also addressed, both indirectly by promoting a better functioning housing market and directly through a variety of investment and partnership activities. Those activities include siting and building the City's first year-round shelter, pursuing an equitable development strategy in the Calle Diez neighborhood, supporting Permanent Supportive Housing, and exploring new revenue streams for affordable housing. SDC scaling could also reduce the impact fees imposed on constructing the smallest housing units most easily attainable on a very tight budget, like studios and SROs.

How Outreach During HPS Development Is Incorporated into the HPS

Input from the TAC, the Historically Marginalized Communities focus groups, AM-TECH, inter-departmental input, other stakeholders, and City Leadership directly shaped the actions included in the HPS. Many ideas were added to the HPS wholesale, such as:

- Taking action to make missing middle and affordable homeownership opportunities easier to build.
- Committing to code, design guideline, and review process changes that make it easier and faster to build housing.
- Using zoning map changes to promote access to high opportunity, high amenity, transit adjacent areas.
- Exploring tax abatements to support multi-unit, middle-income, and affordable housing.
- Exploring SDC scaling.

Other ideas, such as how exactly to establish a new revenue source for affordable and middle-income housing, were added, but in more explorative and general terms given the many possibilities advocated for by the stakeholders consulted.

Ultimately, the actions closely resemble the input provided by stakeholders, but with an additional filter applied: the expertise, fiscal knowledge, and anticipated administrative capacity of the City's staff.

Improving Future Engagement Practices

The City's Housing Production Strategy will impact a diverse range of stakeholders, from residents (across age, race and ethnicity, gender, ability, household type, tenure, and protected classes), to businesses who rely on a functioning housing market and may be affected by new tax or incentive programs, to developers, owners, and renters of housing, to non-profits and partner organizations and jurisdictions. Through the City's advisory committees, focus groups, collaboration with community-based organizations, public meetings, and website, the City has created many avenues to reach those different stakeholders. The City should continue this approach. A key idea for the City to consider improving its approach is to explore using a quantitative method for gathering community input, such as a statistically reliable poll that attempts to mirror the City's demographics and gather input on a larger scale (e.g. hundreds of respondents). The City should also consider ways to take advantage of community gatherings, such as Tuesday Night Markets in downtown.

4. Existing Actions to Promote the Development of Needed Housing

Hillsboro has already undertaken many actions to ensure the production of needed housing. Each of these actions has been detailed below, organized by category: regulatory, land, partnership, incentives, and investments. Actions that will continue are marked as such in the "Action Status" category on the table's right. Actions that are marked complete have already been fully implemented or will not continue. Collectively, this list of actions provides important detail regarding the City's pro-housing commitment that contextualizes the City's draft actions to meet future need.

Action Title + Description		Affordability Target	Tenure	Housing Type	Magnitude of Impact	Action Status
		Deeply Affordable, Affordable, Middle-Income, Market, All	*Renter, Owner, Both*	*Single Detached, Middle Housing, Multi-unit, All*	*Low, Medium, High*	*Continuing, Complete*
Regulatory						
E1	**Ensure land zoned for higher density isn't developed at lower densities.** The Community Development Code requires a minimum density for all zones, prohibits new single detached units in high density zones, and requires single detached units in medium density zones to meet minimum density. The code also requires lot divisions to conform to minimum density.	All	Both	All	Medium	Complete
E2	**Offer density or height bonuses for Affordable housing.** SB 8 was adopted into code in 2022. The Witch Hazel Village South Plan District includes automatic density and height bonuses beyond requirements of SB 8.	Affordable	Renter	Multi-Unit	Medium	Complete
E3	**Reduce parking standards for Affordable housing.** Parking standards for Affordable housing have been reduced to 1 space per unit (80% AMI and below) citywide and 0.85 space per unit within a quarter mile of high-frequency transit. Upcoming code amendments, resulting from the state's Climate Friendly and Equitable Communities rulemaking, will remove minimum vehicle parking requirements for affordable housing.	Affordable	Renter	Multi-Unit	Medium	Complete
E4	**Allow for Single Room Occupancy in Residential Zones.** The Community Development Code allows SROs up to 8 bedrooms in all standard residential zones. Multi-Dwelling residential zones allow group living outright.	Affordable, Middle-Income	Renter	Multi-Unit	Medium	Complete
E5	**Provide incentives for ADUs.** The Community Development Code was amended to ease architectural standards and remove off-street parking	All	Renter	Middle Housing	Low	Complete

	requirements for ADUs. In 2022, the approval process for ADUs switched from requiring Type II Development Review to now only requiring a Zoning Review approval. This change removes the requirement for public noticing. The City has a practice of charging SDCs for primary dwelling unit but not Accessory Dwelling Units.					
E6	**Regulate short-term rentals.** The City updated its short-term rental regulations to respond to potential impacts of short-term rentals on current and future rental housing availability and affordability.	Middle-Income, Market	Both	All	Low	Complete
E7	**Incentivize accessible design.** Witch Hazel Village South includes outright setback reductions for visitable units to encourage single story design or visitable units with zero rise entries and bedroom/bathroom on main story.	All	Both	All	Low	Complete
E8	**Adopt a pro housing agenda.** Hillsboro's commitments to allow for the market's development and delivery of a variety of housing choices including Market Rate and Middle Housing, as well as Affordable Housing are demonstrated in the Hillsboro 2035 Community Plan guiding document, Hillsboro Comprehensive Plan goals and policies, and the 2020–2024 Washington County Consolidated Plan.	All	Both	All	Low	Complete
E9	**Adopt Affirmatively Furthering Fair Housing as a Comprehensive Plan Housing Policy.** Comprehensive Policy H 2.7: Employ strategies that support the Fair Housing Act and affirmatively further fair housing; Policy H 2.9: Employ strategies that support the Fair Affordable housing partnerships. Partner with nonprofit housing developers and other agencies to create the opportunity to provide moderate- and low-income housing and rehabilitation activities in Hillsboro.	All	Both	All	Low	Complete
Land-Based						
E10	**Evaluate City land for affordable housing.** Continue to evaluate the utilization of City-owned remnant land for affordable housing.	Affordable	Both	Middle Housing, Multi-Unit	Medium	Continuing
E11	**Evaluate land acquisition in Downtown Hillsboro.** The Hillsboro Economic Development Council will continue to evaluate the acquisition of land in the downtown Urban Renewal Area to spur residential, mixed-use development such as Block 67.	All	Renter	Multi-Unit	Medium	Complete

E12	**Track affordable housing inventory.** Continue to track the inventory of all existing regulated affordable housing units in the City to inform future policy and programs.	Affordable	Renter	Multi-Unit	Low	Continuing
Partnerships						
E13	**Continue to explore strategic partnerships to advocate for state and federal policy changes and funding.** Maintain strategic partnerships for coordinated multi-jurisdictional advocacy for state and federal policy changes and funding.	All	Both	All	High	Continuing
Incentives						
E14	**Continue property tax exemption for non-profit affordable housing.** Continue to offer tax exemptions to non-profits operating qualified affordable rental housing in the city.	Affordable	Renter	Multi-Unit	High	Continuing
E15	**Finance SDCs for the residential development.** Continue to support City financed SDCs for residential development, such as what was done with the 4th Main project in downtown Hillsboro and Orenco Station's Platform District buildings.	Market Rate	Both	Multi-Unit	Medium	Complete
Investments						
E16	**Continue providing gap funding investments.** Continue providing direct investment via gap funding into affordable housing projects and Permanent Supportive Housing, with prioritization of low and extremely low income units for individuals and families. Consider expanding investments for middle-income housing.	Affordable	Renter	Multi-Unit	Medium	Continuing
E17	**Continue administering CDBG program.** Continue administering CDBG federal funds supporting affordable housing programs, such as affordable homeownership, housing rehabilitation, public facility improvements, fair housing awareness, and emergency rent assistance.	Affordable, Middle-Income	Both	All	Medium	Continuing
	Support nonprofit housing organizations, such as the Community Housing Fund. Support and contribute to organizations such as the Community Housing Fund to support land acquisition and predevelopment costs for affordable housing.	Affordable	Renter	Multi-Unit	Medium	Continuing
E18	**Continue partnering on HOME implementation.** Continue partnering with Washington County to guide use of federal funds for affordable housing investment through participation on the Policy Advisory Board.	Affordable	Renter	Multi-Unit	Low	Continuing

5. New Actions to Meet Future Housing Needs

City of Hillsboro's staff and consulting team, considering the input received from community stakeholders, identified a list of housing actions aimed at addressing the needs in Section 2: Overview of Hillsboro's Contextualized Housing Needs. These actions derive from the team's policymaking experience in Oregon, an ongoing audit of Hillsboro's community development code and housing policies, stakeholder consultation, best practices research, and a list of potential actions published by Oregon's Department of Land Conservation and Development (DLCD).

Documentation Format for Each Action

Each action in this document falls into one of five categories:

1. Regulatory actions
2. Land-based actions
3. Partnership actions
4. Incentive actions
5. Investment actions

Each action is documented in a summary table, which includes an:

- Overview, background, and rationale for the action
- An adoption and implementation timeline
- Steps to implement the action
- Considerations for implementation, including discussion of constraints, opportunities, and externalities
- An estimate of magnitude of the action's impact on housing production
- The types of housing need the action addresses (across income, housing type, and tenure)
- The fiscal and administrative impacts of the action on the City

Actions will impact the production of needed housing over time, with some actions having nearer-term effects and others longer-term effects.

Types of Housing Need

Each action's documentation indicates the anticipated impacts it will have on different housing needs:

- **Affordability Targets:** This evaluates the degree to which an action will help to produce housing affordable to various income levels. The evaluation is based on the housing types that are most likely to be produced as a result of the action and the extent to which the City can direct the action to meet housing for certain income levels. The following table summarizes the affordability targets used for this report.

Affordability Target	Percent of Area Median Income (AMI)	Monthly Housing Cost Range
Deeply Affordable	30% and below	$663 or less
Affordable	30% to 80%	$664 to $1,770
Middle Income	80% to 120%	$1,771 to $2,655
Market Rate	Over 120%	$2,656 or more

Source: Oregon Housing and Community Services 2024, 1 Bdrm Income & Rent Limits for Washington County

  - **Deeply Affordable:** Deeply affordable housing refers to housing units that are affordable to households earning 30% and below of the area median income. These housing units are typically rental properties that are developed with public subsidies and include mechanisms such as regulatory agreements to ensure residents meet income requirements.

  - **Affordable:** Affordable housing refers to housing units that are affordable to households earning between 30% and 80% of the area median income. Affordable housing units are typically rental properties that are developed with public subsidies and include mechanisms such as regulatory agreements to ensure residents meet income requirements. Some affordable housing is not regulated due to public subsidies but may be provided by the market. This is often older and lower quality housing stock and may be referred to as naturally occurring affordable housing (NOAH).

  - **Middle Income:** Middle income housing, sometimes called workforce housing, refers to housing units that are affordable to households earning between 80% and 120% of the area median income. Such housing can be rental or ownership units that target middle-income workers, may or may not be developed with public subsidies or support.

  - **Market:** Market rate housing refers to non-subsidized housing properties that are rented or owned by those who pay market rate rents or market value to purchase the property.

- **Housing Type Targets:** This evaluates the degree to which an action will help to produce single detached, middle housing, and multi-unit housing. In this document, these terms are used to refer to housing types as defined below:

  - **Single Detached Housing:** A single detached unit located on its own lot.

  - **Middle Housing:** A range of detached and attached housing types that are typically higher density than single detached units. The types include duplexes, triplexes, quadplexes, townhouses, and cottage cluster housing.

  - **Multi-Unit Housing:** A building with 5 or more attached housing units located on a single lot.
  - **Tenure Targets:** This evaluates the degree to which an action will help to produce housing that is either for-sale or for-rent, regardless of housing type.

Magnitude of Impact

Each action's summary table offers an assessment of the action's magnitude of impact on housing production. Each action is assigned to one of the following categories:

◯ **Low impact**: This indicates that the action is likely to have a minimal or limited effect on housing production. It may support housing production but on its own it is not likely to spur significant new housing development.

◒ **Medium impact**: This indicates that the action is likely to have a substantial impact on housing production generally or on meeting a specific housing need. It may be impactful enough on its own to spur new housing development.

● **High impact**: This indicates that the action is likely to have a significant, wide-reaching impact on housing production or would directly spur housing development that meets a specific housing need.

When an action's impact is particularly uncertain, reasons the impact may or may not be as large as anticipated are documented. A discussion of how the actions collectively promote equity, fair housing, and meet the housing needs of marginalized groups is given in Section 6: Achieving Fair and Equitable Housing Outcomes.

Impacts on the City

The City will incur costs due to the actions taken under the HPS. Those costs take two forms: administrative costs and fiscal costs. Each action's summary table offers a brief assessment of the magnitude of those costs, from low to high.

- **Administrative Time**
  - **Low:** Requires low staff time to develop the action and requires low on-going staff time to implement the action.
  - **Medium:** Requires more staff time to develop the action and requires more ongoing staff time to implement the action.
  - **High:** Requires significant staff time to develop the action and/or significant ongoing staff time to implement the action. May also include adding additional staff.
- **Fiscal Impact**
  - **Low:** Requires little or no local funding (in addition to staff time) to implement.
  - **Medium:** Requires some funding (in addition to staff time) to implement. Acquiring this funding may require new sources of revenue and/or a federal or state grant.
  - **High:** Requires significant funding (in addition to staff time) to implement. Acquiring this funding will likely require new sources of revenue and/or a federal or state grant.
- **Department Lead**
  - **Community Development Department**
    - Planning Division
    - Affordable Housing Team

- Building Division
- Administrative Division
- Economic Development Department

❖ **City Manager's Office**

❖ **Finance Department**

Summary Table of New Actions

Action Group	Action Title	Implementation Years 1-2	3-4	5-6	7-8	Impact on Housing Production
Regulatory Actions	Action 1.1: Evaluate Comprehensive Plan amendments and Zoning Map updates					Medium
	Action 1.2: Increase housing in Multi-Dwelling Zones					High
	Action 1.3: Increase housing in Commercial & Mixed-Use Zones					High
	Action 1.4: Refine middle housing development standards					Medium
	Action 1.5: Streamline design standards					Medium
	Action 1.6: User-friendly code					Low
	Action 1.7: Identify and reduce process barriers					Low
	Action 1.8: Explore adopting pre-approved housing plans					Medium
Land Based Actions	Action 2.1: Coordinate with partners to identify underutilized land	Ongoing				Medium
	Action 2.2: Pursue residential land UGB expansion(s)					High
Partnership Actions	Action 3.1: Develop new strategic partnerships for state/federal advocacy	Ongoing				Medium
	Action 3.2: Continue and expand affordable homeownership partnerships	Ongoing				Medium
	Action 3.3 Undertake a Calle Diez Equitable Development Strategy					Low
Incentive Actions	Action 4.1: Explore fee structure adjustments					Medium
	Action 4.2: Analyze scaling select SDCs					High
	Action 4.3: Evaluate MUPTE to incentivize need housing and extension of the VHDZ program					Medium
	Action 4.4: Evaluate additional tax abatements					Medium
Investment Actions	Action 5.1: Explore strategic infrastructure investments to unlock housing production	Ongoing				Medium
	Action 5.2: Explore creation of an ongoing revenue source for affordable and middle-income housing production					Medium
	Action 5.3: Build a year-round homeless shelter					Low
	Action 5.4: Explore ways to support Permanent Supportive Housing production	Ongoing				Low

1. REGULATORY ACTIONS

Action 1.1: Evaluate Comprehensive Plan amendments and Zoning Map updates

Regulatory Actions

Timeline	**1-2 Years**	3-4 Years	5-6 Years	7-8 Years

Description

Overview: Evaluate Comprehensive Plan amendments and updates to the City's zoning map, including identifying areas where additional multi-unit housing capacity would be permitted and encouraged, especially in high-opportunity areas that are close to amenities such as connection to light rail, bus lines, schools, employment and commercial centers, and parks

Background: According to the 2023 Housing Needs Analysis (HNA), the City needs 14,046 new housing units over the next 20 years. The City's Buildable Land Inventory shows that the City currently falls short of having sufficient buildable land to meet that need, including multi-unit need. This and Actions 1.2, 1.3, 1.4, and 2.2 will help add capacity to meet that need.

In addition, a wide range of policy literature has demonstrated that prohibiting denser, multi-unit housing facilitates the creation of high-income, high-opportunity enclaves that lower-income households cannot afford. Through this action, the City can increase zoned capacity in high-opportunity neighborhoods for the type of housing with the greatest chance of achieving deep affordability: multi-unit housing. This will promote fair housing, reduce racial segregation, and expand affordable housing options in high opportunity areas, such as those with quality amenities, schools, transit service, and employment and commercial access. This action will also help the City encourage the creation of more compact, mixed-use neighborhoods.

Implementation Steps

- Identify infrastructure constraints and other barriers to allowing additional housing capacity in the City through the Housing Production Strategy's Development Ready Lands Analysis and Action 5.1.
- Conduct a staff or consultant-led project to holistically consider and recommend where housing capacity be added, alongside any needed Comprehensive Plan amendments.
- Adopt a package of changes to amend the Comprehensive Plan and rezone parts of the City to allow more housing.

Implementation Considerations

Equity

- The City should define and identify high opportunity neighborhoods to guide density increases and rezoning. There are many ways to do this (e.g. California Tax Credit Allocation Committee's Opportunity Map, Opportunity Insight's Opportunity Atlas, City of Portland's Opportunity Map). When defining opportunity, consider the formal definition of affirmatively furthering fair housing and relevant aspects of the City's comprehensive plan language.
- Allowing more construction in existing residential neighborhoods raises the possibility of displacement, both direct (e.g. eviction, demolition) and indirect (e.g. rising rents, loss of neighborhood identity).[8] While research has generally found that increased housing supply holds down housing costs at the regional and neighborhood level, a handful of studies have complicated these findings, showing conflicting local rent effects depending on the quality of the housing and increased churn among

[8] See "Gentrification, Displacement, and the Role of Public Investment." *https://www.urbandisplacement.org/wp-content/uploads/2021/08/gentrification.pdf*.

	neighborhood residents following new housing construction.[9] For these reasons, the City should take care to holistically consider where it adds housing capacity in order to minimize displacement while still facilitating greater housing production. A general rule is allowing more multi-unit housing in already expensive, high opportunity areas bears the least risk of displacement and inadvertently putting upward pressure on the nearby rents of existing housing.[10] <u>Administrative</u> • Each buildable site is unlikely to be developed in any given year, and all of the City's buildable sites are unlikely to be developed over the 20-year planning horizon.[11] To encourage development activity sufficient to meet the need, the City should plan to create more zoned capacity than the minimum amount physically needed to accommodate the City's housing need.
Magnitude of Impact	**Medium impact**. However, the impact could be high if the zoning map changes are significant and provide large upgrades in the total amount of zoned housing capacity in the City in development ready areas.

Action 1.2: Increase Housing in Multi-Dwelling Zones

Regulatory Actions

Timeline	1-2 Years	3-4 Years	5-6 Years	7-8 Years

Description

Overview: Increase the maximum density, Floor Area Ratio, and height in Multi-Dwelling Zones and explore density bonuses to further increase affordable, middle-income, and accessible units along with mixed-income projects. Evaluate increasing minimum density requirements.

Background: The maximum density standards, Floor Area Ratio, and height standards of many of the City's multi-dwelling zones pose barriers to housing production and affordability by limiting density below levels that are achievable while meeting other form-based standards. For example, it is common for a low rise (2-3 story) apartment development with surface parking of around one space per unit to achieve densities of 30-40 units per acre even while meeting lot coverage, open space, and setback requirements. Additionally, the MR-1, MR-2, MR-3, SCR-DNC, SCR-MD, and SCR-HD zones allow multi-unit structures but limit densities below 30 units per acre. Increasing the maximum density in these zones will bring standards better into alignment with what is physically achievable and reduce the cost of development. Where allowed, the market is producing housing at these and higher densities in much of the Metro region.

Implementation Steps

- As part of the Housing Code Audit, determine an increased maximum density to apply to each multi-dwelling zone. Consider changing form-based standards, such as increased height and floor-area ratios, to ensure desired densities are achievable.
- Explore density bonuses to further increase affordable, middle-income, and accessible units in multi-dwelling zones.
    - Incentives for affordable or middle-income housing would define the level of affordability required as a percentage of Department of Housing and Urban Development's (HUD) annual Area Median Income (AMI) limits and overall percentage of units in a development that are affordable.
    - Incentives for accessible housing units could require the unit to meet certain standards, such as Universal Design or Lifelong Housing Certification.
- Adopt a package of changes through a public hearing process.

Implementation Considerations

Equity

- Rising construction costs make it impossible to build and offer new residential units below certain price thresholds without subsidy. Increasing capacity in multi-dwelling zones could help counteract rising costs by decreasing land cost per unit. Further, the City can help minimize construction costs by pairing increased densities with other code changes that simplify standards (e.g. Action 1.4: Streamline Design Standards) and encourage the affordable construction typologies: 3-4 story, wood framed multi-unit dwellings.[12] This in turn will benefit middle and lower income households via improved affordability within the multi-unit dwelling submarket.
- Adding density bonuses may help the City secure more housing to meet the needs of priority populations (e.g. low-income households). However, if density bonuses reduce

[12] See "Returns to scale in residential construction: The marginal impact of building height." https://onlinelibrary.wiley.com/doi/abs/10.1111/1540-6229.12357

base entitlements and add further process, negotiation, delay, and uncertainty to the development process, the negative effects could outweigh the benefits.[13]

Administrative

- The City should consider adopting that changes to multi-dwelling zones alongside other actions from the regulatory section to maximize overall benefit and allow for holistic consideration of the City's development pattern, goals, and ability to mitigate for any negative externalities of development.

Magnitude of Impact	**High impact**. This action offers a fast and direct way to facilitate the development of more housing units on the City's existing multi-dwelling development sites.

Affordability Targets	●	Deeply Affordable	●	Middle Income
	●	Affordable	●	Market Rate

Action 1.3: Increase Housing in Commercial and Mixed-Use Zones

Regulatory Actions

Timeline	1-2 Years	3-4 Years	5-6 Years	7-8 Years

Description

Overview: Provide more flexibility for housing in Commercial and Mixed-Use Zones such as not requiring a portion of the ground floor to be commercial uses, allowing for single-use residential buildings with no commercial space, increasing maximum densities. Explore increasing minimum density requirements and offering density bonuses to further increase affordable, middle-income, and accessible units along with mixed-income projects.

Background: Housing is allowed in most of the commercial and mixed-use zones in Hillsboro's Community Development Code, but with a variety of limitations. Some zones limit housing to upper stories, some allow housing on the ground floor only in certain locations, and some zones require a minimum amount of commercial space in mixed-use developments. These kinds of requirements pose several challenges to prospective developments. Residential developers are often less comfortable with commercial construction and products, and therefore prefer not to build them. Commercial tenants interested in such spaces can sometimes be hard to find, necessitating higher residential rents to offset anticipated lost commercial rent. And affordable housing developers often try to avoid including ground floor commercial space in their projects as it triggers state-level prevailing wages for construction labor.

In response to these issues, the City will evaluate options for providing more flexibility for housing in mixed-use and commercial zones (e.g. Commercial - Neighborhood (C-N), Commercial - General (C-G), Mixed-Use-Neighborhood (MU-N) zones). Strategies to provide more flexibility may include allowing for horizontal mixed-use development (residential behind commercial), only requiring a portion of the ground floor to be commercial uses, allowing for single-use residential buildings with no commercial space, and increasing maximum densities for residential uses in commercial zones.

Implementation Steps

- Holistically evaluate regulations on housing in commercial and mixed-use zones/plan districts to identify the most appropriate strategy for reducing barriers to housing in each zone/plan district as part of the Housing Code Audit.
- Explore incorporating density bonuses in commercial and mixed-use zones to further increase affordable, middle-income, and accessible units there.
    - Incentives for affordable or middle-income housing would define the level of affordability required as a percentage of Area Median Income (AMI) and overall percentage of units in a development that are affordable.
    - Incentives for accessible housing units could require the unit to meet certain standards, such as Universal Design or Lifelong Housing Certification.
- Adopt a package of changes through a public hearing process.

Implementation Considerations

Equity

- Redevelopment of commercial properties for housing could make commercial space scarcer, putting upward pressure on commercial rents and raising the possibility of economic displacement of businesses. The City can combat this by ensuring adequate land zoned for commercial uses and through anti-displacement actions, such as the Calle Diez Equitable Development Strategy (Action 3.3).
- Many commercial areas are along high-traffic, car-oriented roads. Housing added in these areas could come with the drawbacks of limited walkability for residents and

close proximity to particulate pollution from traffic. The City should consider investments to improve walkability and reduce car dependency in and around commercial zones to maximize the livability of new housing built there.

- Adding density bonuses may help the City secure more housing to meet the needs of priority populations (e.g. low-income households). However, if density bonuses 1) reduce base entitlements and therefore development feasibility and 2) add layers of process and negotiation that increase delay and uncertainty in the development process, the negative effects could outweigh the benefits.[14]

Administrative

- The City is required by state law to ensure there is adequate employment land to serve expected job growth. Introducing residential uses to more commercial lands could, over the long term, affect the supply of land for employment.
- The City should consider adopting that changes to Commercial and Mixed-Use zones alongside other actions from the regulatory section to maximize overall benefit and allow for holistic consideration of the City's development pattern, goals, and ability to mitigate for any negative externalities of development.

Magnitude of Impact	**High impact**. This action offers a fast and direct way to facilitate the development of more housing units on the City's existing mixed-use development sites and open more commercial land to multi-unit housing development.

Affordability Targets	●	Deeply Affordable	●	Middle Income
	●	Affordable	●	Market Rate

[14] *For more on this debate, see: "The Pretext Problem: The Pitfalls of Planning While Bargaining."* https://www.planetizen.com/features/113615-pretext-problem-pitfalls-planning-while-bargaining.

Action 1.4: Refine middle housing development standards

Regulatory Actions

Timeline	1-2 Years	3-4 Years	5-6 Years	7-8 Years

Description

Overview: Explore refinement of development standards to encourage more middle housing, such as allowing detached duplexes and more than one ADU on the same lot, attached units in cottage cluster developments, assessing minimum lot sizes, and clarifying the middle housing land division process.

Background: The CDC complies with state requirements to allow middle housing types in all zones that allow single detached units. However, there remain some barriers within the CDC to developing middle housing. Examples include:

- Minimum lot sizes that could prevent infill development on existing lots
- Restrictions on detached duplexes, attached units in cottage cluster developments, and multiple ADUs on the same lot
- Lack of clarity and certainty in the middle housing land division process

Implementation Steps

- Identify middle-housing related development standards to consider for refinement as part of the Housing Code Audit.
- Evaluate the benefits and tradeoffs of modifying those standards.
- Calibrate and draft code amendments to produce desired outcomes.
- Determine if these changes should be packaged with other code and zoning changes.
- Bring amendments through a public hearing process and adopt a package of changes that increase feasibility of middle housing development.

Implementation Considerations

Equity

- Reducing barriers to middle housing development may add to the supply of housing that is affordable to middle-income households. For instance, some code refinements (such as reduced minimum lot sizes) encourage development of smaller units, which tend to be more affordable and serve priority populations.
- Allowing detached middle-housing units and clarifying the middle housing land division process may encourage developers to build more modestly sized housing units for ownership. Section 2 of the HPS suggests that communities of color may disproportionately rely on missing middle housing to access homeownership (p. 10).

Administrative

- The City should consider adopting refined middle housing standards alongside other actions from the regulatory section to maximize overall benefits and allow for holistic consideration of the City's development pattern, goals, and ability to mitigate for any negative externalities of development.

Magnitude of Impact

Medium impact. The American Community Survey (Table 25024, 5-year data) estimates that Hillsboro added on net 670 attached single detached units, duplex units, triplex units, and fourplex units between 2018 and 2022. By comparison, the City added over 1,700 units in larger apartment buildings with five or more units. While improving middle housing standards should meaningfully increase production, actions aimed at development standards for larger-scale buildings appear more likely to have a high impact.

Affordability Targets	○	Deeply Affordable	●	Middle Income
	◒	Affordable	●	Market Rate
Housing Type Targets	○	Single Detached Unit	○	Multi-Unit
	●	Middle Housing		
Tenure Targets	◒	For Rent	●	For Sale

Fiscal Impact: Low **Admin Needs:** Medium **Lead:** Community Development Department's Planning Division

Action 1.5: Streamline design standards

Regulatory Actions

Timeline	1-2 Years	**3-4 Years**	5-6 Years	7-8 Years

Description

Overview: Clarify and streamline design standards across existing and new neighborhoods to promote and expedite housing production.

Background: Some CDC 12.50.710 Design Standards for All Residential Development and similar standards affecting certain zones and plan districts may impose unnecessary costs and risks on housing development. This may occur, for instance, when standards require using expensive materials, such as with minimum window glazing standards. It may also occur when standards limit development teams' design options or require more expensive construction techniques, causing developers to conclude the standards are unachievable and forcing them to seek discretionary approval for an alternative solution. SB 1537 includes provisions allowing developers greater ability to request variances, and this may provide an avenue for adjustments to challenging design standards. However, that process is not yet well established, nor does it constitute a clear and objective approval path. The City should instead modify its design standards to focus on elements of design that are essential to the character of Hillsboro across existing and new neighborhoods, while limiting the impact on the cost of development and design flexibility. Under this action, the City would evaluate the cost impacts of various design standards, achievability of design standards, identify alternative approaches to meeting the intent of those standards, and adopt code amendments for the purpose of streamlining design standards.

Implementation Steps

- Evaluate the cost impacts of various design standards as part of Housing Code Audit.
- Identify alternative approaches to meeting design standards' intent. Evaluate tradeoffs.
- Calibrate and draft related code amendments to produce desired outcomes. Determine if these changes should be packaged with other code and zoning changes.
- Adopt streamlined development standards via a public hearing process.

Implementation Considerations

- Streamlining design standards and reducing development costs and timelines, specifically for multi-unit developments, may add to the supply of housing that is affordable to low and middle-income households.
- The City should consider adopting streamlined design standards alongside other actions from the regulatory section to maximize overall benefits and allow for holistic consideration of the City's development pattern, goals, and ability to mitigate for any negative externalities of development.

Magnitude of Impact

Medium impact. This action could meaningfully improve the ease of developing by making design standards less costly and more achievable, reducing discretionary reviews.

Action 1.6: User-friendly code

Regulatory Actions

Timeline

1-2 Years | 3-4 Years | **5-6 Years** | 7-8 Years

Description

Overview: Evaluate reorganizing and streamlining the CDC to make it a more user-friendly document, identifying and resolving any redundancies, conflicts, or inconsistencies that may cause confusion or uncertainty.

Background: The CDC is a complex set of regulations that may require substantial time for applicants to navigate to identify applicable regulations. The City has an opportunity to improve the user experience of the code by streamlining the number of zones, plan districts, and/or overlays and taking other steps to reduce the complexity of the CDC. This project could also allow the City to identify and resolve any redundancies, conflicts, or inconsistencies that may cause confusion or uncertainty for users and for staff. This process would also include creating a user guide for the CDC to support less-experienced developers and community members navigate the code.

Implementation Steps

- Evaluate options for reorganizing and streamlining the code to make it user friendly, as well as associated benefits and tradeoffs as part of Housing Code Audit.
- If moving forward with reorganization and streamlining, draft and calibrate code amendments to produce desired outcomes.
- Determine if amendments should be adopted as a whole, in phases, and packaged with other code and zoning changes.
- Adopt user-friendly code through a public hearing process.

Implementation Considerations

Equity

- Creating a more streamlined, user-friendly code may reduce development timelines and add to the supply of housing affordable at various income levels.
- A user-friendly code could expand the development ecosystem by reducing barriers to entry, helping development better reflect and serve a greater diversity of people.

Administrative

- The City should consider adopting a more user-friendly code alongside other actions from the regulatory section, allowing staff to efficiently amend the code as the City proceeds with code-related actions taken during the implementation period.

Magnitude of Impact

Low impact. A user-friendly code could help grow the development ecosystem. However, the user unfriendliness of the existing code likely does not deter sophisticated, large-scale developers from investing in Hillsboro, and those actors tend to build the most housing.

Affordability Targets	○ Deeply Affordable	◒ Middle Income
	◒ Affordable	◒ Market Rate
Housing Type Targets	◒ Single Detached Unit	◒ Multi-Unit
	◒ Middle Housing	
Tenure Targets	◒ For Rent	◒ For Sale

Fiscal Impact: Low **Admin Needs:** High **Lead:** Community Development Department's Planning Division

Action 1.7: Identify and reduce process barriers

Regulatory Actions

Timeline	**1-2 Years**	3-4 Years	5-6 Years	7-8 Years

Description

Overview: Identify and mitigate process barriers, such as creating greater clarity in the review process while streamlining land use, development review, & permitting processes.

Background: Technical Advisory Committee members provided input indicating that some elements of the land use review and approval process can be time-consuming and add risk to the development process by pushing developers into discretionary reviews and negotiations. Implementation of Actions 1.4-1.6 has the potential to reduce several key process barriers, particularly if the City creates more clarity around the middle housing land division process, streamlines its design and/or overlay standards, and creates additional clear, objective, non-discretionary approval pathways for infill and multi-unit development. The action will seek to identify additional process barriers to eliminate, such as by consolidating and coordinating approvals and review by different departments, which was recommended by TAC members.

Implementation Steps

- Identify process barriers not addressed by other actions.
- Evaluate options for reducing barriers, in coordination with assessment and implementation of actions 1.4-1.6.
- Evaluate the benefits and tradeoffs of options for introducing process changes.
- Determine if these changes should be packaged with other regulatory changes.
- Implement process changes.

Implementation Considerations

Equity

- Reducing barriers in the development process may reduce development costs and timelines and help grow Hillsboro's reputation as a place developers want to build. Over time, this should enhance the City's supply of housing, supporting greater affordability across income levels.
- Reducing barriers may create more opportunities for infill and small-scale developers.

Administrative

- The City should consider reducing process barriers alongside other actions from the regulatory section to maximize overall benefits and avoid duplicate efforts.

Magnitude of Impact

Low impact. However, if significant process barriers remain following Actions 1.4 – 1.6, then the magnitude of this action's impact could be larger.

	● Middle Housing	
Tenure Targets	● For Rent	● For Sale

Fiscal Impact: Low **Admin Needs:** High **Lead:** Community Development Department's Admin Division

Action 1.8: Explore adopting pre-approved housing plans

Regulatory Actions

Timeline	1-2 Years	**3-4 Years**	5-6 Years	7-8 Years

Description

Overview: Explore adopting pre-approved housing plans, especially for ADUs and middle housing typologies, allowing for expedited review time.

Background: Pre-approved plan sets are building designs that have been reviewed for compliance with the building code, compliance with any development standards regulating form and design, and are approved to build. The plans could be designed for constrained lots and cost minimization. They could also focus on accessibility and energy efficiency to support other City goals and housing needs. Pre-approved plans would streamline permitting procedures, thereby reducing development timelines, uncertainty, and costs. Pre-approved plans would also reduce architectural costs and barriers to entry for less seasoned builders, such as homeowners.

Implementation Steps

- Continue participating at the State level in code efforts to create residential building codes changes, estimated to roll out in 2029.
- Determine if plan sets developed by DLCD can be adapted for the City.
- Consider consulting developers and general contractors that have built middle housing and ADU projects in the City to understand how to best create pre-approved plans that will garner uptake and that general contractors will pitch to customers.
- Fund or secure funding to develop pre-approved plans with architects and builders.
- Advertise the pre-approved plans to property owners, contractors, and builders.

Implementation Considerations

Equity

- Consider focusing on accessible and visitable designs to meet the needs of people with disabilities and seniors.

Administrative

- Site plan review would still be required, minimizing time saving component of pre-made, pre-approved plans.

Magnitude of Impact

Medium impact. Pre-approved plans could meaningfully help grow the development ecosystem by reducing barriers to entry for small-scale developers of ADUs and missing middle housing. However, pre-approved plans are less likely to raise the activity of sophisticated, large-scale developers, who often have their own design teams or partners.

2. LAND-BASED ACTIONS

Action 2.1: Coordinate with partners to identify underutilized land

Land-Based Actions

Timeline	Ongoing across implementation period
Description	Overview: Coordinate with civic, cultural and religious organizations, and real estate developments partners, to identify the limited underutilized land potentially available for affordable and middle-income housing. Background: Some mission-driven organizations or institutional landowners may have property that exceeds their long-term needs. They may also view income-restricted housing development and work benefiting homeless and very-low-income populations as consistent with their missions and are therefore be interested in partnerships with affordable housing developers to support housing development. Parcels owned by institutions may have additional advantages, ranging from property tax exemptions to supportive legal provisions (ORS 227.500, SB 8 (2021)) to eligibility for specialized funding sources or fundraising mechanisms.
Implementation Steps	• Engage with civic, cultural, and religious organizations and other institutional landowners to understand long-term plans for their sites and to encourage partnerships to meet housing needs. • Offer technical support to help institutional landowners understand housing-related zoning and infrastructure issues and pursue relevant grants. • Facilitate connections with local developers that may be interested in partnering to build on institution-owned sites.
Implementation Considerations	• Housing developed through partnerships with institutional or mission driven landowners would likely directly benefit low-income populations and members of marginalized communities. • Income-restricted housing developed through forming partnerships with institutional landowners typically reduces land basis development costs that help translate into lower sales and rental costs. These lower cost housing options would benefit marginalized populations. • This action could also include engaging with local employers regarding land available for middle-income housing development targeted at local workers.
Magnitude of Impact	**Medium impact.** This action may seem limited, at first glance but could lead to one or more new affordable housing developments over 8 years that would not have otherwise been built, at relatively low cost to the City. This action can significantly benefit housing production for homeless and low-income populations.

Action 2.2: Pursue residential land UGB expansion(s)

Land-Based Actions

Timeline	1-2 Years	**3-4 Years**	5-6 Years	7-8 Years

Description

Overview: Per the 2023 Housing Needs Analysis, pursue increased housing development in centers and along corridors, and additional residential lands through Urban Growth Boundary expansion(s) to address homeownership needs.

Background: Hillsboro's most recent HNA forecasted a need for roughly 14,050 housing units over the next 20 years, based on Metro's forecasted growth rate. This need exceeds total estimated capacity by roughly 2,300 units. While the HNA found a modest surplus of land available for medium-density housing, the projected demand for low-density housing exceeds existing capacity by an estimated 163 gross acres. Additionally, the projected deficit of land for high-density housing types is approximately 36 gross acres. The HNA recommended that a range of potential housing policies and strategies be considered within the HPS to offset these deficits, including considering the ability of future planning areas to meet the need for different types of housing during the 20-year planning period. UGB expansion could be an additional way to offset deficits of land for low- and high-density housing that were identified in the HNA.

Implementation Steps

- Monitor results of Metro's forthcoming growth report, which will determine viability.
- Determine whether housing production targets to be created by the 2025 Oregon Housing Needs Analysis (OHNA) affect the City's process for seeking a UGB expansion
- Re-assess land capacity after accounting for more efficient use of the City's developable land due to actions undertaken as a result of the Code Audit and HPS.
- Pursue UGB expansion in accordance with the requirements of OAR 660-024-0000 and Metro's process for mid-cycle expansion requests.

Implementation Considerations

- New housing created as a result of a UGB expansion is most likely to be primarily market rate housing, often single detached units. Density minimums, housing mix requirements, affordability requirements, and direct investments in non-market rate housing projects in expansion areas could help expansion areas meet a greater diversity of housing needs.
- UGB expansion could pose challenges to meeting Community Plan goals to reduce carbon emissions, enhance transit service, and increase housing density.

Magnitude of Impact

High impact. Hillsboro's adopted Housing Needs Analysis identified the need for additional land to support over 1,500 units of needed housing. This action supports the development of housing for that identified housing need.

Fiscal Impact: Medium **Admin Needs:** High **Lead:** Community Development Department's Planning Division

3. PARTNERSHIP ACTIONS

Action 3.1: Develop new strategic partnerships for state and federal advocacy

Partnership Actions

Timeline	Ongoing across implementation period
Description	Overview: Develop new strategic partnerships for coordinated advocacy on state and federal policy changes and funding, such as more funding for infrastructure, affordable and middle-income housing, and changes to construction defect liability law. Background: Continued state and federal funding and regulatory reform are needed to help cities meet their housing production targets. Recent state legislation has provided important regulatory changes and additional funding to support housing development. However, additional funding would be highly beneficial in supporting homeownership, preserving and expanding affordable housing, and supporting production of new housing for households at all income levels. Likewise, state regulatory reforms – such as to Oregon's construction defect liability laws, which deter developers from building condominiums – could help raise overall housing production of ownership housing. Through this action, the City would seek to form new partnerships to advocate for funding and regulatory reforms. The City may support many more state and federal policy changes than just the examples given above.
Implementation Steps	• Work with City Council on an annual basis to identify key issues to target for legislative lobbying efforts and policy direction. • Explore and develop local, regional and issue-based partnerships for the purpose of lobbying the state Legislature. • Collaborate with state representatives to advocate for proposed changes.
Implementation Considerations	• Additional, targeted funding from the state or federal government would provide critical gap funds for the creation and preservation of affordable housing. • Additional funding for housing-supportive infrastructure could overcome a major cost barrier to unlock additional housing production at all income levels. • State level regulatory reform (e.g. construction defect liability law, stair and egress rules, sprinkler requirements) could unlock development activity previously stifled, enabling new housing types and greater flexibility to meet people's broad needs.
Magnitude of Impact	**Medium impact**. The magnitude of impact depends on which issues the City advocates for and the extent of new funding or regulatory changes from the state.

	● Affordable	◒ Market Rate
Housing Type Targets	◒ Single Detached Unit	● Multi-Unit
	◒ Middle Housing	
Tenure Targets	◒ For Rent	◒ For Sale

Fiscal Impact: Low **Admin Needs:** Medium **Lead:** Community Development Dept's Admin Division

Action 3.2: Continue and expand affordable homeownership partnerships

Partnership Actions

Timeline	Ongoing across implementation period
Description	Overview: Continue partnering with Proud Ground and Habitat for Humanity, and seek additional partnerships with the development community, to support affordable and middle-income homeownership opportunities. Background: Promoting affordable homeownership is a priority for the HPS actions. The City has an ongoing partnership with Proud Ground, a community land trust, to support acquisition and rehabilitation of existing homes for affordable homeownership in Hillsboro. The City also partners with Habitat for Humanity, which has resulted in the recent development of Century Commons (18 homes) and Alder Commons (8 homes). Pursuing additional partnerships with similar organizations could increase and diversify the total unit count of this housing product.
Implementation Steps	• Continue to collaborate with and support community land trusts and other affordable homeownership providers, including ongoing funding support. • Engage developers and service providers who work – or might be interested in working – in the affordable homeownership space to understand and support their needs. • Explore whether incentive actions related to fees and taxes could broaden the pool of developers building housing for affordable and middle-income homeownership. • Explore additional partnership opportunities, including with educational and outreach programming related to affordable homeownership.
Implementation Considerations	• The City should consider coordinating this action with Actions 4.1 and 4.3, which reference the City's interest in financial support for middle-income housing, including ownership housing. A tax abatement could prove an effective tool for expanding or creating new affordable homeownership partnerships. • This action intends to benefit marginalized communities, including BIPOC populations and people with disabilities, as they are the groups more likely to have incomes qualifying for this action.
Magnitude of Impact	**Medium impact.** Paired with other actions (e.g. Actions 2.1, 4.1, and 4.3), expanded partnerships could yield modest unit counts of a deeply needed and desired housing type: affordable ownership housing.

Action 3.3: Undertake a Calle Diez Equitable Development Strategy

Partnership Actions

Timeline	**1-2 Years**	3-4 Years	5-6 Years	7-8 Years

Description

Overview: Produce a Calle Diez Equitable Development Strategy, which includes residential and commercial anti-displacement components, in partnership with the community and non-profits.

Background: The Equitable Development Strategy is intended to assist the City and partners to navigate decision-making and avoid negative consequences within and adjacent to the Calle Diez area, a neighborhood centered on 10th Avenue. The City intends to continue making infrastructure investments and business grants and has identified development opportunities in the Calle Diez area. The Equitable Development Strategy is needed to guide these and other initiatives to ensure that Calle Diez is a vibrant and welcoming place for diverse communities. Preventing and mitigating the involuntary displacement of residents and businesses is a central tenet of this work.

Implementation Steps

- Finalize Equitable Development Strategy
- Create Implementation and Evaluation Plan

Implementation Considerations

- This action is aimed at benefiting marginalized communities in Calle Diez, including BIPOC populations and people with disabilities, as they are the groups more likely to experience involuntary displacement.

Magnitude of Impact

Low impact. While this action does not directly relate to housing production, anti-displacement actions are an important component of fair and equitable housing considerations included in the HPS.

4. INCENTIVE ACTIONS

Action 4.1: Explore fee structure adjustments

Incentive-Based Actions

Timeline	**1-2 Years**	3-4 Years	5-6 Years	7-8 Years

Description

Overview: Evaluate reducing or waiving fees through adjusting fee structures (i.e., plan review fees, permitting fees) to incentivize new affordable housing and middle-income housing with affordability covenants.

Background: The City of Hillsboro levies plan review and permitting fees on new construction to help cover City administrative and program costs. With this action, the City will evaluate whether to forego that fee revenue for housing projects that deliver income-restricted housing. While fee amounts are small relative to overall development costs, fee waivers can help income-restricted projects on the edge of financial feasibility fill their final gap and break ground, getting more such housing produced and faster.

Implementation Steps

- Determine policy objectives for tax abatements.
- Conduct a fee study that identifies the kinds of projects that would be offered fee waivers, the extent of those waivers, the significance of those waivers from a financial feasibility standpoint, and the resulting fiscal impacts to the City.
- Based on the study, determine a recommended fee waiver program design and a recommendation on whether the City should adopt.
- Send the program to Council for adoption
- Inform developers and owners of the opportunity, clarifying which fees are affected and how, and disambiguating this opportunity from SDC scaling.

Implementation Considerations

- Consider speaking with developers of affordable and middle-income housing to qualitatively assess the impact of this foregone revenue on their projects' feasibility. Assess their openness to adding affordability covenants, assuming they do not already apply them to their projects.
- If fiscal capacity remains a key constraint, explore the possibility of a program design that offers fee waivers less often and only in cases in which they would "tip" a project from financially infeasible to feasible. Still advertise the option to pursue fee waivers to partners building needed housing in Hillsboro.

Magnitude of Impact

Medium impact. Fee amounts are modest relative to overall development costs, so fee waivers will likely have a small to medium impact on overall production. However, they will assist income-restricted projects with financial gaps and achieving feasibility faster.

Affordability Targets	○	Deeply Affordable	◒	Middle Income
	◒	Affordable	○	Market Rate
Housing Type Targets	○	Single Detached Unit	●	Multi-Unit
	◒	Middle Housing		
Tenure Targets	●	For Rent	●	For Sale

Fiscal Impact: High **Admin Needs:** Medium **Lead:** Community Development Department's Administrative Division

Action 4.2: Analyze scaling select SDCs

Incentive-Based Actions

Timeline	1-2 Years	3-4 Years	5-6 Years	7-8 Years

Description

Overview: Evaluate scaling select SDCs based on unit size to align the fee amount with the impact of construction and ongoing system impact. Exploring the scaling of select SDCs will include multi-jurisdictional coordination.

Background: System Development Charges (SDCs) are a substantial upfront cost of housing development. The City of Hillsboro levies sewer, water, parks, supplemental parks and supplemental transportation SDCs, Washington County levies a transportation development tax, and various other water or sewer service providers in Hillsboro levy fees on development within the City's boundaries.

SDCs levied on development in Hillsboro are not all scaled to the expected impact of the development. For example, in the case of the City's Parks SDC and the County's Transportation Development Tax, large dwelling units pay the same amount as smaller dwelling units of the same housing type, despite the fact that the latter will typically produce lower impacts. Scaling SDCs by the size of the unit (e.g. per square foot) could more fairly distribute the cost of SDCs across housing developments. Scaled SDCs incentivize developers to build more modestly sized units as a way to reduce their projects per unit or even total costs. These smaller units tend to be more affordable to occupants, and more such units can fit on each individual site, serving to boost housing production at the project level.

Implementation Steps

Hillsboro has initiated a comprehensive study of its fees and SDC rates. Such an analysis will include the following aspects:

- Identify alternatives for scaling SDCs (e.g. by square footage, by bedroom, by fixture)
- Evaluate the relative incentives and disincentives to housing production that would be created by each alternative
- Evaluate the fiscal impacts of each alternative to the City and overlapping jurisdictions, such as Washington County and Tualatin Valley Water District.
- Explore ways to achieve fiscal balance within each alternative (e.g. raising some rates while lowering others)
- Audit the City's engineering standards to lower the financial obligations they place on the City, thereby increasing its ability to lower the SDCs it levies on development
- Adopt any recommended changes of the study that are fiscally feasible.

Implementation Considerations

Equity

- Scaling is a fairer method of charging development fees, because it seeks to align impact with costs.
- Scaling has positive equity implications. It reduces costs for smaller units, which are usually more affordable than larger ones. Thus, its incentives building more, lower-cost, small units. This benefits households with lower incomes, which have disproportionately high shares of people of color and people with disabilities in Hillsboro.

Fiscal

- May result in lower overall fee revenue, which could hinder key community investments. However, revenue shortfalls can be mitigated by planning for revenue

	neutrality and tailoring SDC rates accordingly, such as by adding a base fee (or increasing the existing base fee) or by raising the SDCs on larger units. <u>Administrative</u> • Recalibrating the fees will require staff time and interjurisdictional collaboration. • Permitting system may need adjustments to collect information related to SDC tiers.
Magnitude of Impact	**High impact**. Hillsboro's Housing Production Strategy Technical Advisory Committee felt that efforts by the City to reduce the SDC burden it levies on developers would significantly improve the attractiveness of adding housing in Hillsboro. Scaling SDCs also incentivizes building lower-cost, small housing units, which may benefit lower-income households and key demographic groups that tend to have lower incomes (e.g. people of color, seniors, people with disabilities).

Affordability Targets	◒ Deeply Affordable	● Middle Income
	● Affordable	● Market Rate
Housing Type Targets	◒ Single Detached Unit	● Multi-Unit
	● Middle Housing	
Tenure Targets	● For Rent	● For Sale

Fiscal Impact:	Variable	**Admin Needs:**	Medium	**Lead:**	Community Development Department's Administrative Division

Action 4.3: Evaluate MUPTE to incentivize needed housing and extension of the Vertical Housing Development Zone program

Incentive-Based Actions

Timeline	**1-2 Years** 3-4 Years 5-6 Years 7-8 Years
Description	Overview: Evaluate a Multi-Unit Property Tax Exemption (MUPTE) and extension of the Vertical Housing Development Zone (VHDZ) program to encourage the production of more multi-dwelling housing units. Background: MUPTE is a state-enabled program that allows cities to incentivize the production of needed housing in specific locations and with specific features that provide a public benefit. Using MUPTE, jurisdictions may grant a property tax exemption on a multi-unit structure's improvement value for up to ten (10) years. The property owner continues to pay taxes on the land value and any commercial portion of the property. The City may cap the total tax abatement available each year. In the past, the City of Hillsboro has used a VHDZ program to offer partial property tax exemptions for mixed-use residential development projects with ground floor commercial space. A legislative extension of the VHDZ program, which is set to sunset in 2026, is anticipated and will be necessary if new VHDZ tax abatements are going to be granted. Unlike MUPTE, VHTZ-qualified projects must include ground-floor commercial space. Despite this limitation, the City may wish to continue using this tool since it is already familiar with its mechanics.

Implementation Steps	• Determine policy objectives for tax abatements, such as overall unit production, affordability, and other public benefits of development.
	• Compare program requirements and potential program designs for a VHDZ program and MUPTE. Review other jurisdictions' programs for design inspiration.
	• Evaluate fiscal impacts to the City, then determine whether to use neither, one, or both programs.
	• If the City elects to pursue MUPTE:
	  • Determine eligibility criteria for the program, such as target locations, tenure status, minimum unit number, potential minimum percentage of dedicated affordable or middle-income housing units, and other public benefits to require (such as accessible units).
	  • Meet with overlapping taxing districts to gather support. In addition to gaining Council approval, MUPTE must be approved by the majority (over 50%) of taxing districts.

Implementation Considerations	Equity • MUPTE and VHDZ programs can promote the development of income-restricted units within market-rate developments. This would reduce housing disparities for marginalized populations and open a new pathway for meeting low- and middle-income housing need separate from common, often oversubscribed tools like low income housing tax credits (LIHTC). MUPTE and VHDZ also have the advantage that they can act as funded, opt-in inclusionary zoning, where the revenue downside of having income-restricted units is offset by a property tax abatement, which encourages developers participate in producing these types of needed housing.

Fiscal

- MUPTE is designed to only grant tax abatements in cases in which it would "tip" a project from financially infeasible to feasible. In other words, MUPTE can be set up to primarily support projects that would not be built in the near term without tax relief or another form of subsidy. This helps the program have a net positive impact on the City's tax base over time by minimizing foregone revenue dedicated to projects that would move forward regardless of tax relief. Consider building a third-party pro-forma review into the application fee and process, which the City can use to help determine if the project is not financially feasible but for the tax abatement.

Administrative

- The City should consider analyzing multiple incentives and investment actions at once, allowing them to adopt a financially calibrated package of policy changes. This would help avoid adopting one policy change only to unintentionally counteract its intended effect via a subsequent policy change.
- The impact of this strategy will depend on the number of taxing districts that participate. This should be part of the City's analysis in the point above.

Magnitude of Impact	**Medium impact**. This action could promote more multi-unit production overall. If the City includes affordability requirements to earn the tax abatements, it the action could also yield income-The American Community Survey (Table 25024, 5-year data) estimates that Hillsboro added roughly 3,100 units in large apartment buildings with five or more units between 2015 and 2022—an eight-year period akin to the HPS implementation timeline. If production over the next eight years holds steady, half of new apartment developments opt into a MUPTE or VHTZ program, and 10% of units produced are income-restricted affordable housing, this action would produce roughly 150 affordable housing units, similar in magnitude to one large LIHTC project.

Affordability Targets	○	Deeply Affordable	●	Middle Income
	◒	Affordable	◒	Market Rate
Housing Type Targets	○	Single Detached Unit	●	Multi-Unit
	○	Middle Housing		
Tenure Targets	●	For Rent	◒	For Sale

Fiscal Impact:	High	**Admin Needs:**	Medium	**Lead:**	Economic Development Department

Action 4.4: Evaluate additional tax abatements

Incentive-Based Actions

Timeline	1-2 Years	**3-4 Years**	5-6 Years	7-8 Years

Description

Overview: Evaluate extending tax abatements beyond existing non-profit housing for new middle-income housing, conversion of naturally occurring affordable housing (NOAH) to regulated affordable housing, and manufactured home parks all with affordability covenants.

Background: The City of Hillsboro will evaluate property tax abatements for multi-unit dwellings as part of Action 4.4. However, additional needed housing types could be incentivized via tax abatements. The City will explore potential mechanisms for incenting private market actors to build or preserve income-restricted housing via tax abatements.

Implementation Steps

- Determine policy objectives for tax abatements.
- Compare program requirements and potential designs across tax abatement mechanisms that may serve the housing needs listed in the Overview, such as:
    - New construction of middle income housing, including ownership housing: MUPTE, Homebuyer Opportunity Limited Tax Exemption (HOLTE)
    - Preservation or rehabilitation of NOAH, manufactured home parks: MUPTE, HB2377/ORS 307.867
- Design the program(s) per state statute and calibrate tax incentives such that developers and owners will be attracted to participate in the program(s). Evaluate the impact in income-restricted units per dollar spent.
- Adopt the program and gather any needed support from other taxing jurisdictions
- Inform developers and owners of the opportunity.

Implementation Considerations

- The action could help preserve forms of affordable housing at risk of significant price increases because no affordability covenant is in place.
- Depending on the situation, preservation and rehabilitation may cause displacement during renovation or if current tenants exceed new income restrictions.
- Some tax abatement programs can be designed to only grant abatements in cases in which they would "tip" a project from financially infeasible to feasible. This can help programs have a net positive impact on the City's tax base over time by minimizing foregone revenue dedicated to projects that would be built regardless of tax relief.

Magnitude of Impact

Medium impact. The impact of this action depends on the tax abatements adopted and uptake of the abatements.

5. INVESTMENT ACTIONS

Action 5.1 Explore strategic infrastructure investments to unlock housing production

Investment Actions

Timeline	Ongoing across implementation period
Description	Overview: Explore ways to maximize housing production via strategic infrastructure investments for key sites that would significantly improve housing development potential. Background: A common development challenge is maintaining financial viability while paying for infrastructure needed to service a site or district. Sometimes, the expense of needed infrastructure is too great for a single project to bear, requiring collective action (e.g. a Local Improvement District) or government intervention. The City of Hillsboro's ability to fund new infrastructure to facilitate housing development is limited. This means the City must invest strategically to maximize its impact, determining which infrastructure projects unlock the most housing production per dollar spent (along with other City goals for infrastructure). In this action, the City will explore the opportunities available to maximize housing production via strategic infrastructure investments—identifying strategic investments and potential paths for funding them.
Implementation Steps	• Conduct a Development Ready Lands Analysis (see Appendix B) to help identify locations with infrastructure deficiencies that must be resolved to develop them. • Coordinate with Public Works to estimate the costs of infrastructure projects and understand which projects are already in the City's pipeline. Discuss opportunities to reprioritize planned infrastructure projects to focus on unlocking housing production. • Conduct outreach to landowners. Estimate the total housing developable on key sites. Determine whether covering the infrastructure costs for those sites without government assistance is feasible. • Determine which investments unlock the most housing units per infrastructure dollar • Explore potential funding paths, and work to secure or dedicate funding toward the most strategic investments.
Implementation Considerations	• While total housing potential unlocked is a useful filter for infrastructure investments, many other considerations should bear on investment decisions: overall infrastructure or system goals, fair housing goals of facilitating access to high opportunity areas and investing equitably across the City's neighborhoods. • There may be affordable housing projects in pre-development phases that would benefit from an infrastructure investment that helps the project achieve financial feasibility and compete for additional funding.
Magnitude of Impact	**Medium Impact.** Spending limited infrastructure funds more effectively could effectively accelerate or increase the scale of developments across a number of parcels.

Affordability Targets	○	Deeply Affordable	●	Middle Income
	◒	Affordable	●	Market Rate

	○	Middle Housing		
Tenure Targets	●	For Rent	◒	For Sale

Fiscal Impact: High **Admin Needs:** Medium **Lead:** Community Development Dept Admin Division

Action 5.2: Explore creation of an ongoing revenue source for affordable and middle-income housing production

Investment Actions

Timeline	1-2 Years	**3-4 Years**	5-6 Years	7-8 Years

Description

Overview: Explore the creation of an ongoing City, County, or Regional revenue source for affordable and middle-income housing production.

Background: Hillsboro's adopted Housing Needs Analysis found that the City will need 5,259 affordable housing units and 2,931 middle-income housing units over the next 20 years. While the market does build some middle-income housing units, it does not typically build affordable units without subsidy. Having a local revenue source to dedicate to affordable and middle-income housing will help more of those units get built and attract more state and federal funding to Hillsboro. The vehicle to create these funds will be determined in concert with overall HPS implementation efforts.

Implementation Steps

- If in 2025 Metro asks voters and they approve of using regional SHS funds on affordable housing with supportive services, focus in the near term on accessing and deploying such funds in Hillsboro.
- If SHS funds are not opened to use for affordable housing, identify additional specific revenue source options.
- Decide which, if any, revenue source to pursue tapping and create a plan for receiving necessary approvals and using raised revenue.
- Internally establish guiding principles for a new revenue source, such as flexibility in how funds are spent, not creating counterproductive disincentives (e.g. to development, to business investment) and being politically feasible.
- Implement that plan, begin collecting revenue, and administer the funds.

Implementation Considerations

Fiscal

- The City of Hillsboro reported a $20M General Fund shortfall in 2023. This limits the extent to which the City can expect to draw on existing City revenue streams to financially support housing investments. Exploring a new City, County, or Regional ongoing revenue source would likely be required.

Equity & Economy

- This action would raise revenue to help fill financial gaps for affordable or deeply affordable housing developments. This would help counter disparities in Hillsboro's housing market experienced acutely by low-income households, communities of color, seniors, and people with disabilities.
- Hillsboro and Washington County are home to the state's largest, traded-sector employers. These organizations are key to the state's economy and are major engines of future job growth. Part of the state's economic development strategy (exemplified by the Oregon CHIPS program) is to offer regulatory flexibility and financial support for these organizations as they pursue expansion in Oregon. With this action, the City must navigate a significant potential tradeoff: raising money to address middle- and low-income housing needs versus offering a favorable tax environment to promote business investment in Hillsboro and Oregon. Ideally, the City would identify and pursue a funding source that balances the two sides of this tradeoff or sidesteps it by finding a politically feasible revenue source to tap other than key business sectors. Administrative
- Newly adopted revenue sources may influence the incentive structure of building or operating housing in the City. As such, the City should consider analyzing multiple

	incentives and investment actions at once, allowing them to adopt a financially calibrated package of policy changes. This would help avoid adopting one policy change only to unintentionally counteract its intended effect via a subsequent policy change.
Magnitude of Impact	**Medium impact**. The impact of this strategy will vary significantly depending on the extent of funds raised and the source used to raise them.

Action 5.3 Build a year-Round Homeless Shelter

Investment Actions

Timeline	**1-2 Years**	3-4 Years	5-6 Years	7-8 Years

Description

Overview: Build the City's first year-round homeless shelter.

Background: To respond to the local needs of persons living unsheltered, the Hillsboro City Council approved acquisition of a property to be developed into the first year-round emergency shelter for single adults in Hillsboro and neighboring communities. This site has immediate access to frequently serviced bus line, employment opportunities, food, medical care and proximity to day center services.

Once operational this site will provide 24/7, year-round, low barrier shelter to 75 adults. The site will offer both congregate and non-congregate, pod style, shelter options to meet diverse needs. Shelter services will be coupled with housing navigation and supportive services provided by a qualified operator. Operational services will be funded through Supportive Housing Services resources, with Washington County as a close project partner.

Amenities planned for the site include additions such as showers, laundry, meal prep and dining areas, pet areas, storage for belongings, bike parking, and spaces for co-location of services, such as case management and mental health supports. Amenities support participants towards permanent housing and employ trauma informed design and ADA access.

Implementation Steps

- Acquire site, conduct engagement, select design-build contractor (Completed)
- Shepard project through design and permitting
- Assist with operator selection and collaborate on Good Neighbor Agreement prior to shelter opening for first guests

Implementation Considerations

Shelter is not housing, but it is a critical step on the way to housing and it offers a chance to link residents with services. The City has several opportunities, such as helping the shelter staff serve guests as effectively as possible by facilitating connections with affordable housing operators and non-profits active nearby.

Magnitude of Impact

Low impact. This project will not produce housing, but it will produce needed year-round shelter serving as a critical steppingstone to housing.

Action 5.4 Explore ways to support Permanent Supportive Housing production

Investment Actions

Timeline	Ongoing across implementation period
Description	Overview: Explore further investment and support for creation of affordable housing units with rental assistance and wrap-around services to serve individuals and families exiting homelessness, also known as Permanent Supportive Housing. Background: Permanent Supportive Housing (PSH) is a model that combines housing assistance with supportive services. PSH aims to provide housing stability, often for households with at least one member who has a disability. It is needed throughout the region and has been one of Metro's focuses in deploying the region's Affordable Housing Bond and Supportive Housing Services (SHS) measure. The City recognizes the need for more Permanent Supportive Housing and is interested in supporting its development in Hillsboro. In this action, the City will explore its options for supporting the creation of more of this housing type, such as direct investment or the strategic use of funds the City accesses as an implementing jurisdiction.
Implementation Steps	Convene City staff and County partners, then affordable housing developers to identify potential resources for supporting the development of Permanent Supportive Housing in Hillsboro. Consider: • Discretionary General Funds the City anticipates having • Remnant land the City could stretch to deploy for housing • State, regional, county, and federal funds and vouchers the City could access, including Supportive Homeless Service funds following a potential 2025 vote • Corporate and business-sector support the City could garner
Implementation Considerations	• Consider conducting a meeting with the Housing Development Center, whose consultants may be able to help identify uncommonly used federal funding sources • Leverage Hillsboro's uniquely strong business and corporate sector and their interest in reducing unsheltered homelessness • Consider how a focus on Permanent Supportive Housing could bolster the City's case when evaluating a new City, County, or Regional ongoing revenue source for affordable and middle-income housing production (Action 5.2)
Magnitude of Impact	**Low impact** until a significant mechanism or resource is identified and dedicated to bolster the production of Permanent Supportive Housing.

Affordability Targets	● Deeply Affordable	○ Middle Income
	◒ Affordable	○ Market Rate

6. Achieving Fair and Equitable Housing Outcomes

Evaluation of Actions Across Fair and Equitable Housing Factors

As a collection, the draft actions included in the HPS will achieve equitable outcomes across all six fair and equitable housing factors described in OAR 660-008-0050. The subsections below define each such factor and how the outcomes of the draft action fulfill the intent of that factor.

Location of Housing

OAR Definition

How the city is striving to meet statewide greenhouse gas emission reduction goals, established under Executive Order No. 20-04, by creating compact, mixed-use neighborhoods available to people part of state and federal protected classes.

Impact of Draft Actions

This HPS outlines multiple actions that will help Oregon meet its statewide greenhouse gas emissions reductions goals and create compact, mixed-use communities. The HPS directly supports the creation of more compact, mixed-use neighborhoods through actions to increase housing allowances and permitted densities in mixed-use, commercial, and multi-dwelling zones. The HPS also supports compactness through its action to explore scaling its SDCs by unit size, which incentivizes smaller housing units and greater density within each development. The HPS also includes several actions to facilitate more compact neighborhoods through the production of middle housing throughout the City, from code revisions to exploring the potential for pre-approved building plans. Finally, the HPS provides for evaluating zoning map changes to allow dense, multi-unit housing in more places, particularly in high opportunity, high amenity, and transit-oriented places. Not only can this action improve housing production in such areas, but it can help target the effects of actions mentioned in other subsections—to promote affordable and accessible housing, increase housing choice, and avoid displacement—on Region 2040 centers and other high opportunity areas.

Collectively, these actions set the City's course toward a more compact, mixed-use built form with more attached and dense housing and smaller distances between homes and businesses. That built form will offer per capita greenhouse gas emissions reductions both in the form of improved energy efficiency via attached housing and reduced vehicle miles traveled.

While other actions indirectly assist in fulfilling this fair and equitable housing goal, the actions that most directly promote the goal are:

- Action 1.1: Evaluate Comprehensive Plan amendments and Zoning Map updates
- Action 1.2: Increase housing in multi-dwelling zones
- Action 1.3: Increase housing in commercial and mixed-use zones
- Action 1.4: Refine middle housing development standards
- Action 1.8: Explore adopting pre-approved housing plans
- Action 4.2: Analyze scaling select SDCs

Fair Housing

OAR Definition

How the city is affirmatively furthering fair housing for all state and federal protected classes. Affirmatively furthering fair housing means addressing disproportionate housing needs, patterns of integration and segregation, racially or ethnically concentrated areas of poverty, and disparities in access to housing opportunity.

Impact of Draft Actions

The HPS's actions collectively affirmatively further fair housing. The "Housing Choice" and "Affordable Homeownerships and Affordable Rental Housing" subsections provide detailed descriptions of how the HPS's actions work to reduce disparities in access to opportunity and break down patterns of segregation and concentrated poverty. The HPS includes two "steps" of actions that assist in affirmatively furthering fair housing. The first step involves actions to reduce barriers to the most affordable forms of housing and allow them to be built in more areas, including in high opportunity areas. The second step involves evaluating a slate of direct investments and incentives that can help produce more income-restricted units, which typically take the forms promoted by the first step. These actions work in tandem to help low-income households access more affordable housing, particularly in high opportunity areas. Because many protected classes disproportionately fall into the lower end of the income spectrum, actions to support lower-income households tend to benefit protected classes, such as communities of color and people with disabilities. Collectively, this is how the HPS's actions affirmatively further fair housing.

While other actions indirectly assist in fulfilling this fair and equitable housing goal, the actions that most directly promote the goal are:

- Action 1.1: Evaluate Comprehensive Plan amendments and Zoning Map updates
- Action 1.2: Increase housing in multi-dwelling zones
- Action 1.3: Increase housing in commercial and mixed-use zones
- Action 1.4: Refine middle housing development standards
- Action 2.1: Coordinate with partners to identify underutilized land
- Action 4.1: Explore fee structure adjustments
- Action 4.3: Evaluate MUPTE to incentivize need housing and extension of the VHDZ program
- Action 4.4: Evaluate additional tax abatements
- Action 5.2: Explore creation of an ongoing revenue source for affordable and middle-income housing production

Housing Choice

OAR Definition:

How the city is facilitating access to housing choice for communities of color, low-income communities, people with disabilities, and other state and federal protected classes. Housing choice includes access to existing or new housing that is located in neighborhoods with high-quality community amenities, schooling, employment and business opportunities, and a healthy and safe environment.

Impact of Draft Actions

This HPS takes two sets of coordinated actions to grow housing choice for low-income communities, communities of color, people with disabilities and other protected classes. First, the HPS plans for actions to

ease regulatory hurdles that make it difficult to build the most affordable forms of housing in high opportunity, high amenity areas. Those actions include code changes to support multi-unit and middle housing and an exploration of zoning map changes to allow denser forms of housing in more places. Second, the City will take action to evaluate a slate of investments and incentives to support the financial feasibility of building housing, especially with affordability covenants. That slate includes exploring new revenue sources for income-restricted housing, plan and permit fee reductions for income-restricted housing, and tax abatements for new multi-unit housing, new middle- and low-income ownership housing, and preservation of existing naturally occurring affordable housing. As alluded to above, these opt-in incentives could require affordability covenants as a condition of approval, guaranteeing some or all units in a property are affordable to middle- or lower-income households. Likewise, for new units, incentives could be designed to require a percentage of units meet accessibility standards beyond those required under the Americans with Disabilities Act. These incentives and investments will benefit communities of color, people with disabilities, and other protected classes that tend to have lower incomes. And because they are paired with an evaluation of zoning map changes, the incentives and investments can flow toward opening doors into high opportunity areas.

While other actions indirectly assist in fulfilling this fair and equitable housing goal, the actions that most directly promote the goal are:

- Action 1.1: Evaluate Comprehensive Plan amendments and Zoning Map updates
- Action 1.2: Increase housing in multi-dwelling zones
- Action 1.3: Increase housing in commercial and mixed-use zones
- Action 1.4: Refine middle housing development standards
- Action 4.1: Explore fee structure adjustments
- Action 4.2: Analyze scaling select SDCs
- Action 4.3: Evaluate MUPTE to incentivize need housing and extension of the VHDZ program
- Action 4.4: Evaluate additional tax abatements
- Action 5.2: Explore creation of an ongoing revenue source for affordable and middle-income housing production

Housing Options for Residents Experiencing Homelessness

Definition:

How the city is advocating for and enabling the provision of housing options for residents experiencing homelessness and how the city is partnering with other organizations to promote services that are needed to create Permanent Supportive Housing and other housing options for residents experiencing homelessness

Impact of Draft Actions

The HPS includes actions to provide housing and service options for residents experiencing homelessness. At the broadest level, the HPS actions collectively act to increase housing production and reduce scarcity, which research suggests correlates with lower rates of rent increases and homelessness.[1]

More specifically, the HPS plans actions to both reduce displacement—which can prevent someone's homelessness—and provide affordable housing options—which can end someone's homelessness. The HPS's anti-displacement actions are described in the "Gentrification, Displacement, and Housing Stability" section, and include actions like exploring incentives to preserve naturally occurring forms of affordable housing. The HPS's actions to provide affordable housing are described in depth in the "Affordable Homeownership and Affordable Rental Housing" section but include actions such as exploring options for raising money and

identifying underutilized land held by partner organizations for affordable housing. The City recognizes that housing exists on a continuum, and for that reason includes two additional actions that bridge the gap between homelessness and housing. The HPS includes the action of building the City's first year-round shelter, which provides a critical stabilizing safety net and connection point to services and housing. The HPS also includes a general action around Permanent Supportive Housing signals the importance of using limited land and financial resources for deeply affordable forms of housing with services that many residents experiencing homelessness need.

While other actions indirectly assist in fulfilling this fair and equitable housing goal, the actions that most directly promote the goal are:

- Action 2.1: Coordinate with partners to identify underutilized land
- Action 4.4: Evaluate additional tax abatements
- Action 5.2: Explore creation of an ongoing revenue source for affordable and middle-income housing production
- Action 5.3: Build a year-round homeless shelter
- Action 5.4: Explore ways to support Permanent Supportive Housing production

Affordable Homeownership and Affordable Rental Housing

OAR Definition

How the city is supporting and creating opportunities to encourage the production of affordable rental housing and the opportunity for wealth creation via homeownership, primarily for state and federal protected classes that have been disproportionately impacted by past housing policies.

Impact of Draft Actions

The HPS supports the production of affordable rental housing and homeownership opportunities through nearly all of its actions. Specifically, there are three main types of actions present in the HPS that support affordable housing.

1. The HPS plans a suite of regulatory actions to support the production of the most affordable types of rental and ownership housing: multi-unit housing and middle housing. In addition to naturally being more affordable due to their efficient use of land and infrastructure, these two types of housing are most likely to earn subsidy and be income-restricted, helping low-income households—and protected classes that tend to be lower-income—afford their rent or mortgage.
2. The HPS builds upon those regulatory changes by planning the exploration of various incentives and investments to both encourage the production of middle-income ownership housing and affordable rental housing. These incentives and investments can support developments that are fully income-restricted—for example, by providing fee reductions or gap funding—as well as mixed-income developments—for example, by creating an opt-in program that offers a tax abatement in exchange for the creation of income-restricted units.
3. The HPS plans several actions for the City to identify partnerships and outside resources (e.g. funding, land) to assist in producing affordable housing. Such partners include local landowning organizations, affordable ownership housing providers, and the state government.

While other actions indirectly assist in fulfilling this fair and equitable housing goal, the actions that most directly promote the goal are:

- Action 1.1: Evaluate Comprehensive Plan amendments and Zoning Map updates
- Action 1.2: Increase housing in multi-dwelling zones
- Action 1.3: Increase housing in commercial and mixed-use zones
- Action 1.4: Refine middle housing development standards
- Action 2.1: Coordinate with partners to identify underutilized land
- Action 3.1: Develop new strategic partnerships for state/federal advocacy
- Action 3.2: Continue and expand affordable homeownership partnerships
- Action 4.1: Explore fee structure adjustments
- Action 4.3: Evaluate MUPTE to incentivize need housing and extension of the VHDZ program
- Action 4.4: Evaluate additional tax abatements
- Action 5.2: Explore creation of an ongoing revenue source for affordable and middle-income housing production

Gentrification, Displacement, and Housing Stability

Definition

How the city is increasing housing stability for residents and mitigating the impacts of gentrification, as well as the economic and physical displacement of existing residents resulting from investment or redevelopment.

Impact of Draft Actions

Prior to the HPS, the City collaborated with a consultant to map and better understand the vulnerability to gentrification and displacement experienced in the City's different neighborhoods. That work, presented in Appendix D, will inform City implementation.

The HPS itself plans three sets of actions to increase housing stability and mitigate displacement.

The HPS plans a set of actions to reduce housing scarcity and provide opportunities for homeownership, two outcomes that are useful to increasing housing stability. Such actions described at length in subsections above, but generally operate by reducing regulatory barriers and pursuing new incentives and partnerships.

The HPS creates a set of actions that more directly aim to reduce displacement and increase housing stability. For example, the City identified the Calle Diez area south of downtown Hillsboro as vulnerable to residential and commercial displacement and launched an effort to create the Calle Diez Equitable Development Strategy in response. The HPS includes the implementation of that equitable development strategy as an anti-displacement and partnership action. Further, the HPS plans several actions aimed at supporting the production and preservation of affordable housing, which mitigate displacement by providing more affordable housing options. Those actions include the exploration of new tax and fee incentives as well as the exploration of a new ongoing City, County, or Regional revenue source for affordable and middle-income housing production.

The HPS's includes a set of actions that engage the balancing act implied by the dual goals of producing more housing—including through redevelopment—while also mitigating displacement. The HPS plans an evaluation of zoning map changes but does so with the guidance that changes be oriented toward high opportunity areas. In this way, the City can avoid concentrating housing production in lower-income areas with the cheapest land. Likewise, for housing that *is* built in areas where displacement is a risk and redevelopment is necessary, the HPS provides for exploring incentives that exchange tax or fee abatements for income-restricted units. This provides the opportunity for new housing that could include affordable housing alongside market rate housing.

While other actions indirectly assist in fulfilling this fair and equitable housing goal, the actions that most directly promote the goal are:

- Action 1.1: Evaluate Comprehensive Plan amendments and Zoning Map updates
- Action 1.4: Refine middle housing development standards
- Action 3.2: Continue and expand affordable homeownership partnerships
- Action 3.3: Undertake a Calle Diez Equitable Development Strategy
- Action 4.3: Evaluate tax abatements for preservation and ownership
- Action 4.4: Evaluate MUPTE to incentivize need housing and extension of the VHDZ program
- Action 5.2: Explore creation of an ongoing revenue source for affordable and middle-income housing production

Assessment of Benefits and Burdens

As part of its HPS, the City must consider the anticipated benefits and burdens of each HPS action for populations that have been negatively impacted historically by housing policies and actions ("marginalized populations"). Those populations include: (1) low-income communities; (2) communities of color; (3) people with disabilities, and; (4) other state and federal protected classes. Actions vary in how well they lend themselves to evaluation of benefits or burdens for each of these specific populations. Since communities of color, people with disabilities, and members of protected classes comprise a disproportionate share of low-income communities, this evaluation posits that actions benefitting low-income communities are likely to also benefit communities of color, people with disabilities, and members of other state and federally protected classes who are disproportionately impacted by income disparities. The evaluation assumes that actions burdening low-income communities are likely to also disproportionately burden communities of color, people with disabilities, and members of other state and federally protected classes.

	Action	Benefit	Burden
Regulatory Actions			
1.1	Evaluate Comprehensive Plan amendments and Zoning Map updates	This action will benefit populations across the income spectrum by increasing housing allowances for affordable and market-rate multi-unit projects alike. The amount of benefit to low-income and marginalized populations depends on the zoning map changes the City ultimately elects to adopt. If the City adds significant development capacity for multi-unit housing in high opportunity, high amenity, transit-rich areas, this action will benefit in particular low- and middle-income populations who will have new avenues for accessing housing there. Not only that, if the City adds significant development capacity for multi-unit housing in high opportunity areas, it will boost the maximum benefit of a host of other HPS actions that seek to produce more affordable forms of housing throughout the City. s.	This action could increase rent or displacement-pressure burdens on low-income and marginalized populations if zoning map changes disproportionately add development capacity in lower-income, displacement-vulnerable areas, or areas that are home to naturally occurring affordable housing susceptible to rapid rent increases or redevelopment. The City can mitigate for this possibility by evaluating displacement risk and level of opportunity, comparing those maps with proposed zoning map changes, and electing to add housing capacity primarily in high opportunity areas. The City can also mitigate for displacement risk by prioritizing actions to mitigate and prevent displacement (see the "Gentrification, Displacement, and Housing Stability" subsection above)

1.2	Increase housing in multi-dwelling zones	This action will benefit populations across the income spectrum by easing standards for affordable and market-rate multi-unit projects alike. It may provide additional benefit to low-income households if code changes include a density or other development standard bonus in exchange for affordable housing.	This action could increase rent or displacement-pressure burdens on low-income and marginalized populations if current multi-dwelling zones disproportionately fall in displacement-vulnerable areas or are currently home to naturally occurring affordable housing that may be susceptible to rapid rent increases or redevelopment. The City can mitigate for this possibility by evaluating displacement risk relative to its zoning map and by prioritizing actions to mitigate and prevent displacement (see the "Gentrification, Displacement, and Housing Stability" subsection above)
1.3	Increase housing in Commercial & Mixed-Use Zones	This action will benefit populations across the income spectrum by easing standards for affordable and market-rate multi-unit projects alike. It may provide additional benefit to low-income households if code changes include a density or other development standard bonus in exchange for affordable housing.	This action could increase rent or displacement-pressure burdens on low-income and marginalized populations if current mixed-use and commercial zones disproportionately fall in displacement-vulnerable areas or are currently home to naturally occurring affordable housing that may be susceptible to rapid rent increases or redevelopment. The City can mitigate for this possibility by evaluating displacement risk relative to its zoning map and by prioritizing actions to mitigate and prevent displacement (see the "Gentrification, Displacement, and Housing Stability" subsection above)
1.4	Refine middle housing development standards	This action will benefit populations across the income spectrum by easing standards for affordable homeownership and market-rate projects alike.	This action is unlikely to increase burdens experienced by marginalized populations.
1.5	Streamline design standards	This action will benefit populations across the income spectrum by easing standards for affordable and market-rate multi-unit projects alike.	This action is unlikely to increase burdens experienced by marginalized populations.
1.6	User-friendly code	This action will benefit populations across the income spectrum.	This action is unlikely to increase burdens experienced by marginalized populations.
1.7	Identify and reduce process barriers	This action will benefit populations across the income spectrum (e.g. by easing standards for affordable and market-rate multi-unit projects alike).	This action is unlikely to increase burdens experienced by marginalized populations.
1.8	Explore adopting pre-approved housing plans	This action will benefit populations across the income spectrum, though likely primarily middle- and high-income households that can afford to live in market-rate housing or build housing themselves.	This action is unlikely to increase burdens experienced by marginalized populations.
Land Actions			
2.1	Coordinate with partners to identify underutilized land	This action will benefit low- and middle-income populations. Housing built through this action could also potentially offer additional benefits to specific marginalized	This action is unlikely to increase burdens experienced by marginalized populations.

		groups, such as communities of color and people with disabilities, depending on the development program (e.g. culturally specific housing, accessible housing with services, Permanent Supportive Housing).	
2.2	Pursue residential land UGB expansion(s)	This action will benefit populations across the income spectrum, though likely primarily middle- and high-income households that can afford market-rate housing.	This action is unlikely to directly increase burdens experienced by marginalized populations. However, inefficient land use patterns tend to overextend public infrastructure and services and promote vehicle miles traveled and greenhouse gas emissions. Marginalized populations appear most likely to face the strongest negative consequences of those trends. UGB expansion may be necessary to facilitate growth and meet important housing production goals. As it has in the past, the City should still strive to create compact, accessible, income-diverse communities within UGB expansion areas.
Partnership Actions			
3.1	Develop new strategic partnerships for state/federal advocacy	This action will benefit populations across the income spectrum, though it will depend on the positions the City advocates for and the outcomes of that advocacy. For example, the City has expressed interest in construction defect liability reform and more funding for affordable housing. The former would most benefit middle- and high-income households, while the latter would most benefit low-income households.	This action is unlikely to increase burdens experienced by marginalized populations.
3.2	Continue and expand affordable homeownership partnerships	This action will primarily benefit low- and middle-income households. Communities of color, people with disabilities, and other members of protected classes tend to be disproportionately represented among low-income households, meaning this action will likely provide strong benefits to protected classes.	This action is unlikely to increase burdens experienced by marginalized populations.
3.3	Undertake a Calle Diez Equitable Development Strategy	This action will primarily benefit low- and middle-income households. Communities of color, people with disabilities, and other members of protected classes tend to be disproportionately represented among low-income households, meaning this action will likely provide strong benefits to protected classes.	This action is unlikely to increase burdens experienced by marginalized populations.
Incentive Actions			
4.1	Explore fee structure adjustments	This action will primarily benefit low- and middle-income households. Communities of color, people with disabilities, and other members of protected classes tend to be	This action is unlikely to increase burdens experienced by marginalized populations. However, the action will not have the maximum positive effect for marginalized

		disproportionately represented among low-income households, meaning this action will likely provide strong benefits to protected classes.	populations if the City elects not to adopt the fee adjustments or does not calibrate the adjustments to meaningfully incentivize owners and developers to opt into production of income-restricted units.
4.2	Analyze scaling select SDCs	This action will benefit populations across the income spectrum. It may provide extra benefit to low- and middle-income households by reducing the per-unit SDC cost borne by projects that build modestly sized units, which tend to be most affordable. Any benefits to low-income populations would likely correspond with boosted benefits to communities of color, people with disabilities, and other members of protected classes.	This action is unlikely to increase burdens experienced by marginalized populations. However, the action will not have the maximum positive effect for marginalized populations if the City elects not to scale SDCs following analysis, or the City is not able to convince other jurisdictions that levy SDCs to scale theirs as well.
4.3	Evaluate MUPTE to incentivize need housing and extension of the VHDZ program	This action could primarily benefit low- and middle-income households if it is designed to secure income-restrictions in exchange for tax abatements. Communities of color, people with disabilities, and other members of protected classes tend to be disproportionately represented among low-income households, meaning that—with the design described above—this action would likely provide strong benefits to protected classes. Per the Implementaton Considerations, the City will consider calibrating these tax abatements to compensate developers for providing income-restricted units as a percentage of units built.	This action will not have the maximum positive effect for marginalized populations if the City elects not to adopt the tax abatements or does not calibrate the abatements to meaningfully incentivize owners and developers to opt into the production of new units, particularly income-restricted units. In very specific cases, this action could burden marginalized populations if its ultimate design offered tax abatements to market-rate new construction in displacement-vulnerable areas without securing income restricted units in exchange.
4.4	Evaluate additional tax abatements	This action will primarily benefit low- and middle-income households. Communities of color, people with disabilities, and other members of protected classes tend to be disproportionately represented among low-income households, meaning this action will likely provide strong benefits to protected classes.	This action is unlikely to increase burdens experienced by marginalized populations. However, the action will not have the maximum positive effect for marginalized populations if the City 1) elects not to adopt the tax abatements or 2) does not calibrate the abatements to meaningfully incentivize owners and developers to opt into preservation or production of income-restricted units.
Investment Actions			
5.1	Explore strategic infrastructure investments to unlock housing production	This action will benefit populations across the income spectrum.	To avoid any risk of displacement, the City should evaluate whether any strategic infrastructure investments is likely to cause rapid rent appreciation or redevelopment within existing naturally occurring affordable housing. If so, the City should prioritize Action 4.3 and offering a tax abatement in exchange for preserving that housing as formally income restricted.
5.2	Explore creation of an ongoing revenue source for affordable and	This action will primarily benefit very low, low-, and middle-income households. Communities of color, people with disabilities, and other members of	In general, this action is unlikely to increase burdens experienced by marginalized populations.

	middle-income housing production	protected classes tend to be disproportionately represented among low-income households, meaning this action will likely provide strong benefits to protected classes. Housing built through this action could also potentially offer additional benefits to specific marginalized groups, such as communities of color and people with disabilities, depending on the development program (e.g. culturally specific housing, accessible housing with services, Permanent Supportive Housing). The City may wish to create goals or requirements to ensure such benefits.	However, the creation of an ongoing revenue source may impose direct or indirect costs on marginalized populations (e.g. a residential CET could be passed on to tenants, a GO Bond could raise the property tax obligation of low-income homeowners, a business receipts tax could reduce job opportunities). However, in such cases, costs stemming from the new revenue source would likely be borne across the income spectrum, while the benefits would be concentrated in the middle- and lower-income range. This action will not have a positive effect for marginalized populations if the City, County, or Region ultimately elect not to create a revenue source.
5.3	Build a year-round homeless shelter	This action will primarily benefit very low and low-income households. Communities of color, people with disabilities, and other members of protected classes tend to be disproportionately represented among low-income households, meaning this action will likely provide strong benefits to protected classes. In Washington County specifically, communities of color are overrepresented among residents experiencing homelessness. That means this action will likely provide strong benefits to them. The City will likely need to lean on partners and conduct outreach to maximize benefits to all protected classes and ensure some aren't missed.	This action is unlikely to increase burdens experienced by marginalized populations. The action won't have maximum positive effect for marginalized populations unless the City conducts outreach to such populations and works with partner organizations that specialize in working with those communities.
5.4	Explore ways to support Permanent Supportive Housing production	This action will primarily benefit very low and low-income households. Communities of color, people with disabilities, and other members of protected classes tend to be disproportionately represented among low-income households, meaning this action will likely provide strong benefits to protected classes.	This action is unlikely to increase burdens experienced by marginalized populations. This action will not have the maximum positive effect for marginalized populations if the City ultimately does not identify or create a revenue source in Action 5.2.

[1] See Gregg Colburn's "Homelessness is a Housing Problem" (2022), with summary highlights in the slides linked here. https://caeh.ca/wp-content/uploads/Feb-13-Webinar-Slides.pdf.

7. Measuring Progress

Per OAR 660-008-0060, Hillsboro will track progress on implementing the actions detailed in the HPS. By December 31st three years after adopting the HPS, the city will submit a narrative report to DLCD summarizing its progress on implementation. The report must include a summary of the steps already taken by the city to implement the actions included in the HPS. If the city has not implemented actions on the schedule specified in the HPS, an explanation of the conditions that posed a barrier to implementation and a plan for addressing the identified need that the strategy targeted must be provided. Additionally, the report will include an assessment of the relative efficacy of implemented actions as well as a reflection on actions taken in response to achieving fair and equitable housing outcomes.

In anticipation of this reporting requirement, the following methods and performance metrics for monitoring progress on HPS actions are recommended. The quantity of housing permitted and produced, both Citywide and in areas targeted by actions, should be tracked on an annual basis. The City already tracks number of dwelling units permitted each year. These data should be compared to data from before actions were implemented to monitor the effects of the changes on total production, type of production, and location of production. More specific metrics for measuring progress are included below for each action group.

Type	Methods	Metrics
Regulatory Actions	Progress on implementation of regulatory-based actions can be indicated by the following: • Defining and identifying high opportunity neighborhoods • Adopting one or more packages of regulatory changes that rezone parts of the City to allow more housing, increase housing potential in multi-dwelling zones, commercial zones, and mixed-use zones, make middle-housing related code amendments, and streamline design standards • Adopting streamlined design standards • Evaluating options for reorganizing and streamlining the code and making the code more user friendly. • Evaluating pre-approved plans • Collecting periodic feedback from local developers to gain additional information about the efficacy of various regulatory changes and how well they are facilitating increased housing production	Many of these metrics will benefit from the comparison with data from the years prior to the HPS and peer jurisdictions • # of housing units permitted and produced • # of middle housing units permitted and produced • # of units produced in multi-dwelling zones • # of units produced in commercial and mixed-use zones • % of City land zoned for multi-unit housing • % of high opportunity areas zoned for multi-unit housing • # of pre-approved plans available through the city and # of units produced using pre-approved plans • % of units permitted that are accessible • # (average) days from application submittal to approval, by housing type • % of housing units approved that required at least one discretionary approval
Land Based Actions	Progress on implementation of land-based actions can be indicated by the following:	• # of ownership units produced by landowners contacted for partnership

	• Engaging with key landowners and maintaining a list that tracks which owners may currently have surplus land or may have surplus land in the future they may wish to use for housing. • Pursuing UGB expansion in accordance with the requirements of OAR 660-024-0000 • Continue to track City owned land and look for opportunities to use remnant City land for affordable housing production	• # of affordable units (0-80% AMI) and shelter beds produced by landowners contacted for partnership • # of middle-income units (80-120% AMI) produced by landowners contacted for partnership • # of housing units permitted and produced in residential expansion areas, by type • # of affordable or middle-income units produced on underutilized land the City may possess or track
Partnership Actions	Progress on implementation of partnership actions can be indicated by the following: • Staff reporting of Council and City management activities related to state and federal lobbying on housing production • Staff reporting on existing and new partnerships established with developers and service providers working in the affordable homeownership space • Completion of the Calle Diez Equitable Development Strategy and status updates on outcomes achieved	• # of pro-housing legislative proposals developed in collaboration with partners and state representatives • # of pro-housing legislative proposals formally supported alongside partners and state representatives • # of affordable ownership units (0-80% AMI) produced by affordable homeownership partners • # of middle-income ownership units (80-120% AMI) produced by affordable homeownership partners
Incentive Actions	Progress on implementation of incentive actions can be indicated by the following: • Conducting a fee and SDC rate study • Any adjustments to fee structures that are made as the result of a fee and rate study • Evaluation and availability of tax abatements for middle-income housing, including ownership housing • Evaluation and availability of tax abatements for preservation of naturally occurring affordable apartments and manufactured home parks • Evaluation and availability of a Multi-Unit Property Tax Exemption (MUPTE) and extension of the Vertical Housing Development Zone (VHDZ) program	Many of these metrics will benefit from the comparison with data from the years prior to the HPS and peer jurisdictions • # of housing units permitted and produced, by housing type, tenure and unit size (compared to historical and baseline trends to track size changes after SDC scaling) • # of eligible projects and units produced using one or more incentive programs, broken out by program, housing type, tenure and affordability level • # of eligible properties and # of units preserved using tax abatement programs such as MUPTE, by housing type, tenure and affordability level • Average $ abatement per unit, by incentive program, housing type, tenure and affordability level

Investment Actions	Progress on implementation of investment actions can be indicated by the following: • Identification of specific infrastructure investments with high housing development potential • Evaluation of the creation of an ongoing City, County, or Regional revenue source for affordable and middle-income housing production • Reporting on work in progress to build a year-round homeless shelter • Convening staff and partners and identifying resources to support the development of Permanent Supportive Housing (PSH)	• Amount of funds secured or dedicated toward strategic infrastructure investments and anticipated amount of housing unit potential unlocked • $ raised through new revenue source for affordable and middle-income housing • outside $ attracted to projects supported by new revenue source • # of affordable units (0-80% AMI) produced or otherwise supported via the new revenue source • # of middle-income units (80-120% AMI) produced or otherwise supported via the new revenue source • # year-round shelter beds added • # of permanent shelter guests served • # of permanent shelter guests moved into permanent housing • # units of Permanent Supportive Housing (PSH) created • $ (local or from governmental partners) allocated to PSH

Appendix A: Pre-HPS Survey

#	Strategy	Encourage needed housing (Y/N)	Increase affordability (Y/N)	Reduce Rent Burden (Y/N)	Any Additional Comments
Category A: Zoning and Code Changes					
A01	Ensure Land Zoned for Higher Density is not Developed at Lower Densities	Y	N	N	Community Development Code already requires a minimum density for all zones, prohibits new detached single dwellings in high density zones, and requires single detached dwellings in medium density zones meet minimum density.
A02	Zoning Changes to Facilitate the Use of Lower-Cost Housing Types	Y	Y	N	Manufactured Housing code section was updated in 2022 with Housing Hillsboro to allow manufactured housing below 1,000 square feet. ADU code was also updated to reduce barriers that existed in the code. CDC has provisions for temporary housing placement and construction.
A03	FAR, Density, or Height Bonuses for Affordable Housing	Y	N	N	SB8 was adopted into code in 2022, Witch Hazel Village South Plan District includes automatic density and height bonuses beyond requirements of SB8.
A04	Housing Rehabilitation Codes				
A05	Code Provisions for ADUs	Y	Y	N	Community Development Code was amended to ease architectural standards and remove the off-street parking requirements.
A06	Broaden the Definition of Housing Type				
A07	Allow for Single Room Occupancy in Residential Zones	Y	Y	Y	Community Development Code allows SROs up to 8 bedrooms in all standard residential zones. Multi-Dwelling residential zones allow group living outright.
A08	Promote Cottage Cluster Housing	Y	N	N	Added to Community Development Code to address HB 2001 in 2022.
A09	Short-Term Rentals Regulations	N	Y	N	Community Development Code amendment underway for STR regulations, City Council hearing scheduled for 2/20.
A10	Inclusionary Zoning				
A11	Add Restrictive Covenants to Ensure Affordability	Y	Y	Y	City has executed restrictive covenants/regulatory agreements on affordable housing projects
A12	Align Lot Division Density with Zoning Density	Y	N	N	Lot divisions require applicants to show that minimum density will be met during housing construction.
A13	FAR & Density Transfer Provisions				
A14	Re-examine Requirements for Ground-floor Retail/Commercial				
A15	Encourage Diverse Housing Types in High-Opportunity Neighborhoods				
A16	Manufactured Housing Community Preservation Zone				
A17	Small Dwelling Unit Developments				
A18	Increase Density near Transit Stations and Regional Multi-use Trails				
A19	High Density Requirements for to-be- Annexed Land				
A20	Pre-Approved Plan Sets for Middle Housing Typologies				
A21	Pre-Approved Plan Sets for ADUs				

A22	Mixed Housing Types in Planned Unit Developments				
A23	Accessible Design	Y	N	N	Witch Hazel Village South includes outright setback reductions for visitable units to encourage single story design or visitable units with zero rise entries and bedroom/bathroom on main story.
A24	Legalize Alternative Housing Types on Wheels and in Parks				
A25	Legalize and Encourage Tiny Homes and Villages				

Category B: Reduce Regulatory Impediments					
B01	Remove or Reduce Minimum Parking Requirements	Y	Y	N	Hillsboro reduced parking standards for affordable housing to 1 space per unit (80% AMI and below) citywide and 0.85 space per unit within a quarter-mile of high-frequency transit.
B02	Remove Development Code Impediments for Conversions	Y	Y	N	Conversion of single dwelling to plex requires a "Type 0"/alternative review which has no public notice and 21 day review period. Low-cost application and checklist based.
B03	Expedite Permitting for Needed Housing Types				
B04	Expedite Lot Division for Affordable Housing	Y	N	N	While the regulatory timeframe for these is 120-days, Hillsboro has a typical review timeframe of 4-6 weeks which is much faster than regulatory requirement.
B05	Reduce Regulatory Barriers to Lot Division				
B06	Streamline Permitting Process	Y	N	N	Hillsboro's permit review timelines are very short compartively to other jurisdictions. Our permits have a 2-week first review cycle and 1-week cycles after that for any needed revisions. Permitting is all done through online review system which provides real time transparency to applicants.
B07	Flexible Regulatory Concessions for Affordable Housing				
B08	Waive Off-Site Infrastructure Requirements for Needed or Affordable Housing				
B09	Capital Improvements Programming (CIP)				
B10	Public Facility Planning				
B11	Pro-Housing Agenda	Y	Y	Y	Demonstrated in the Hillsboro 2035 Community Plan, 2020–2024 Washington County Consolidated Plan and the Hillsboro Comprehensive Plan.
B12	Pro Affordable Housing Agenda	Y	Y	Y	Demonstrated in the Hillsboro 2035 Community Plan, 2020–2024 Washington County Consolidated Plan and the Hillsboro Comprehensive Plan and the Affordable Housing Policy and Action Plan. Addressing Affordable Housing and Homelessness is an ongoing City Council priority.
B13	Align Bike Parking Requirements with Actual Use	N	N	N	Multi-dwelling residential requires 0.25 spaces per unit.
B14	Adopt Affirmatively Furthering Fair Housing as a Housing Policy in Comprehensive Plan	Y	Y	Y	Comprehensive Policy H 2.7: Employ strategies that support the Fair Housing Act and affirmatively further fair housing. Policy H 2.9: Employ strategies that support the Fair Affordable housing partnerships. Partner with nonprofit housing developers and other agencies to create the opportunity to provide moderate- and low-income housing and rehabilitation activities in Hillsboro.
B15	Reduce the Power of NIMBYism to stop, slow, change, or reduce affordable housing				
B16	Holistic Planning to Distribute New Density More Equitably				
B17	Reduce on-site Common/Active Open Space Requirements				

B18	Prioritize Home Ownership	Y	Y	Y	Demonstrated in the 2020–2024 Washington County Consolidated Plan and the CDBG Annual Action Plan and the Hillsboro Comprehensive Plan and the Affordable Housing Policy and Action Plan. Addressing Affordable Housing and Homelessness is an ongoing City Council priority.
B19	Survey Applicants on Development Program Decision-Making				

Category C: Financial Incentives					
C01	Reduce or Exempt SDCs for Needed Housing				
C02	Modify SDC fee schedules	Y	Y	Y	On a case-by-case basis, the City has modified/deferred collection of City-controlled SDCs
C03	Reduce or Exempt SDCs for ADUs	Y	Y	Y	ADUs are not charged SDCs in Hillsboro.
C04	Incentivize Manufactured and Modular Housing				
C05	Waive or Finance Park Impact Fees for Affordable Housing				
C06	Publicly Funded Infrastructure Improvements				
C07	Reconsider Applying Park SDCs				
C08	Transportation SDCs Tied to Parking				

Category D: Financial Resources					
D01	Community Development Block Grant (CDBG)	Y	Y	Y	Hillsboro CDBG funds are used to support affordable homeownership, housing rehabilitation, public facility improvements, fair housing awareness, and emergency assistance.
D02	Low Income Housing Tax Credit (LIHTC)	Y	Y	Y	A number of affordable housing projects in Hillsboro have leveraged LIHTC equity funding
D03	Housing Trust Funds				
D04	Operating Subsidies for Affordable Housing Developments				
D05	Employer - Assisted Housing Programs				
D06	HOME Program	Y	Y	Y	Partnership with Washington County.
D07	Dedicated Revenue Sources for Affordable Housing	Y	Y	Y	Includes General Fund resources and Metro Housing Bond funding
D08	Demolition Taxes				
D09	Construction Excise Tax (CET)				
D10	Tax Increment Financing (TIF) Set- Aside				

D11	Flexible Use of Housing Choice Vouchers				
D12	Targeted Vouchers	Y	Y	Y	Partnership with Washington County.
D13	Low-Interest Loans / Revolving Loan Fund	Y	Y	N	Hillsboro contributes since the early 2000's to Community Housing Fund, that funds loans for land acquisition and predevelopment costs.
D14	Eviction Prevention Programs	Y	Y	Y	Hillsboro funded an Emergency Rent Assistance program withCDBG-CV funds in 2020 through 2023
D15	Bond - for Resident Support Services and Permanent Supportive Housing Services	Y	Y	Y	Metro Housing Bond funds allocated to Hillsboro
D16	General Obligation Bonds – for Affordable Housing	Y	Y	Y	Leveraged City general funds and Metro bond funds to support affordable housing projects, specifically $300K in general funds to Willow Creek Crossing Apartments and $17M in Metro bond funds to Nueva Esperanza.
D17	Use IHBG funds for Urban Native Americans				
D18	Weatherization Funds through Community Action Agencies				
D19	Transit-Oriented Development Grants				
D20	Local Innovation and Fast Track (LIFT) Program for Affordable Rental Housing Development	Y	Y	Y	OHCS set-aside for Hillsboro - $2.4 Million in LIFT funds
D21	Mental Health Trust Fund Awards				
D22	Foundations Awards				
D23	State of Oregon Debt				
D24	State of Oregon Debt Support				
D25	Luxury Tax for Equitable Housing				
D26	Reallocate Health and Public Safety Resources to Housing				
D27	Georgist Land Tax				

Category E: Tax Exemption and Abatement **These are a list of tax exemption and abatement programs that are intended to encourage developers to produce housing.**					
E01	Nonprofit Low-Income Rental Housing Exemption	Y	Y	N	Adopted property tax exemption for non-profit affordable housing.
E02	Property Tax Exemption for Affordable Housing Tied to Level of Affordability				
E03	Vertical Housing Development Zone Tax Abatement	Y	N	N	
E04	Multiple Unit Property Tax Exemption (MUPTE)				
E05	Multiple Unit Limited Tax Exemption (MULTE)				

E06	Homebuyer Opportunity Limited Tax Exemption Program (HOLTE)				
E07	Homestead Tax				
E08	Property Tax Relief for Income-Qualified Homeowners				
E09	Investing into Federal Opportunity Zones (OZ)				
E10	Delayed Tax Exemptions				

Category F: Land, Acquisition, Lease, and Partnerships					
F01	Land Banking	Y	Y	N	The city has partnered with Proud Ground for several years.
F02	Joint Development Agreements				
F03	Community Land Trusts	Y	Y	Y	The City partners with Proud Ground to support acquisition and rehabilitation of existing homes for affordable homeownership.
F04	Public/Private Partnerships (P3)	Y	Y	Y	
F05	Preserving Low-Cost Rental Housing to Mitigate Displacement	N	Y	Y	Rehab work supported through CDBG & HOME funds.
F06	Preserving Safe, Affordable Manufactured Homes				Rehab work supported through CDBG
F07	Providing Information and Education to Small Developers				
F08	Conversion of Underperforming or Distressed Commercial Assets				
F09	Enhanced Use Lease of Federal Land				
F10	Prioritize Housing on City/County Owned Land	Y	Y	Y	Conveyed/Donated two city-owned properties totaling nearly 10 acres for the development of affordable housing.
F11	Combine Community Land Trust with Limited Equity Cooperative Model				
F12	Surplus Land for Affordable Housing	Y	Y	Y	See F10
F13	McKinney-Vento Federal Surplus				
F14	Right of First Refusal for Land Purchase				
F15	Ordinances that Address Zombie Housing				
F16	Regulatory Agreement	Y	Y	Y	
F17	Designated Affordable Housing Sites				

F18	Utilize Surplus Land Owned by Faith-Based Organizations for Affordable Housing				
F19	Affordable Housing Preservation Inventory	N	N	Y	City maintains list of total existing regulated units.
F20	Fair Housing Education, Referral, and Other Services	Y	Y	Y	Work carried out through CDBG including sponsored Fair Housing events.
F21	Public or Mission-Driven REITs and Turn-Key Delivery				

Category Z: Custom Options					
Z01	TBD				

Appendix B. Development Ready Lands Analysis

In Progress

Appendix C: Public Communications and Engagement Plan

Housing Production Strategy
Draft Public Communications and Engagement Plan (PCEP)

1. Introduction

The City of Hillsboro is a diverse community of more than 110,000 residents. House Bill 2003 requires cities with a population over 10,000 create a Housing Production Strategy (HPS). The HPS is a guiding planning document that will contain specific and meaningful plans, tools, actions, and policies to address housing needs identified in the 2023 Hillsboro Housing Needs Analysis (HNA). The HPS will include a timeline for adopting and executing each strategy.

The HPS builds upon the work undergone by the City for the HNA. The HNA is an important document that assesses whether Hillsboro has an adequate supply of housing for all household income levels for the next 20 years. Housing can take many forms to meet the community's needs. A housing supply that meets community needs typically offers people a range of places to live and a variety of housing types to choose from that do not overburden the financial resources of any group. An HNA provides the data basis a city needs to develop its approach to meeting the housing needs of its resident and will inform the policies and strategies highlighted in the HPS.

The HPS is estimated to take place between January and December 2024. The City has contracted with consulting firm Cascadia Partners to assist with this work and draft the HPS document.

The HPS final deliverable is a document consistent with Statewide Goal 10 and associated state administrative statutes and administrative rules. The approach will include synthesizing work and data collected in the HNA, Hillsboro Local Implementation Strategy for Metro Housing Bond, Hillsboro Affordable Housing Tools Reports, Hillsboro Displacement and Gentrification Risks and Potential Mitigations Memo, Hillsboro 2035 Community Plan, Hillsboro Comprehensive Plan, and the Washington County Consolidated Plan. Outreach and engagement will include convening Technical Advisory Committee, focus groups, and multiple meetings with City leadership along with informing the public at large of this next phase in City housing-related work.

2. Project Background

City Council for years has included housing in its annual list of priorities. When providing input on multiple land use planning projects involving housing, the Council has expressed interest in a holistic analysis to increase housing production. The City undertaking an HPS also responds to the state requirement to complete this work.

The HPS Report will include a detail description of the contextualized housing needs and development ready lands, summaries of existing measures and final proposed strategies and

new measures, and how the City's existing measures and final proposed strategies and new measures help to achieve fair and equitable housing outcomes, affirmatively further fair housing, and overcome discriminatory housing practices and racial segregation.

The final chapter of the HPS Report will detail a qualitative assessment of how the strategies and measures collectively address the contextualized housing needs identified in both the HNA and HPS and will include a discussion of how the proposed actions, taken collectively, will increase housing options, especially for historically marginalized communities. The final chapter will explore how the City's existing and proposed strategies and measures will affirmatively further fair housing and provide access to areas of opportunity. This chapter will also address needs for people facing homelessness and explore ways to create opportunities for rental housing and homeownership. The HPS will also include the City's plan for monitoring progress on the housing production strategies.

3. Public Engagement Program Overview

The International Association for Public Participation (IAP2) developed The Spectrum of Public Participation to help organizations define the public's role in any public engagement process. The Spectrum is a tool to help project leaders identify the level of influence community members will have over the final decisions being made. The Spectrum includes five levels are that includes Inform, Consult, Involve, Collaborate, and Empower. The Public Communications and Engagement Plan focuses on three levels of engagement: **Inform, Consult, and Involve**.

Inform: To provide the public with balanced and objective information to assist them in understanding the problem, alternatives, opportunities and/or solutions.

Consult: To obtain public feedback on analysis, alternatives and/or decisions.

Involve: To work directly with the public throughout the process to ensure that public concerns and aspirations are consistently understood and considered.

The City will engage the general public at the **Inform** level through a project website, social media posts, and promoting in City publications. The project website will include a comment box that will be checked regularly by staff and staff contact information. The City will be pursuing an HPS informational video in multiple languages and keep the public at-large informed of key project milestones and importance adoption dates.

The City will **Consult** with historically marginalized communities through focus groups. The City will conduct two focus groups in English and two in Spanish. At the Consult level of engagement, members of the focus groups can expect to be informed of project updates, provide input to the City, and to receive a report back how their input was incorporated into the overall HPS.

The City will also engage individually with housing stakeholders at the **Consult** level of engagement on the HPS through individual stakeholder discussions.

The Technical Advisory Committee (TAC) will be engaged at the **Involve** level, meeting with the City directly at a regular basis through the project timeline. TAC members will have an opportunity to voice concerns and opinions in the draft housing production strategies developed and the City will share why select input is not integrated into the final housing production strategies.

TAC members will include:

- Becky Coutinho, Senior Planner
- Dan Rutzick, Long Range Planning Manager
- Chris Hartye, Senior Project Manager
- Omar Martinez, Project Coordinator
- Dan Dias, Economic and Community Development Director
- 4 Market Rate Housing Developer Representatives
- 2 Affordable Housing Developer Representatives
- 2 Community Residents Interested in Housing
- Residential Property Manager Representative
- Residential Real Estate Representative
- Permanent Supportive Housing Representative
- School District Representative
- Large Employer Representative
- 2 Planning Commission members

Public Engagement Goal: *Commit to an open and transparent community engagement process focused on input from housing professionals, informing the public, and conducting targeted outreach to underrepresented communities and key stakeholders throughout the development of the HPS.*

Public Engagement Principles:

1. Ensure the public engagement process offers opportunities that are equitably provided across the spectrum of community members.
2. Provide information to the public in accessible and easy to understand formats, including multiple languages where appropriate.
3. Design public engagement activities in a manner that identifies and addresses participatory barriers such as language and availabilities of technology.
4. Inform and include stakeholders at key decision-making points/milestones throughout the process.
5. Delineate topics for which the City requires and/or desires input and feedback.
6. Establish two-way communications processes with stakeholders to ensure maximum transparency while providing timely feedback.
7. Work to build lasting community relationships and lay the groundwork for development of private/public partnership opportunities.

8. Provide a hospitable and welcoming environment to all participants.
9. Create opportunities to bridge issues, communities, and neighborhoods, building upon common values.

Housing Professionals

Market-rate developers, affordable housing developers, property managers, and realtors will have multiple opportunities to voice ideas and concerns through participation in the TAC.

Historically Marginalized Community Members

Historically marginalized community members will be invited and encouraged to participate in the focus groups, where they can voice ideas and concerns for housing that meets their needs.

Hillsboro Community

The Hillsboro community includes but is not limited to renters, homeowners, property owners, historically marginalized communities, public agencies, social service providers, civic organizations, businesses, special interest groups, faith-based organizations, and others in the community. The Hillsboro community and housing stakeholders will have opportunities to voice ideas and concerns during this project by attending the TAC and focus group meetings, reaching out directly to City staff, and providing feedback on the project website via a comment box.

Public Agencies

Public agencies such as the Department of Land Conservation and Development, Washington County, the Hillsboro School District, and Metro will be invited to provide comment on the HPS Draft Report and supporting documents.

Public Engagement Committee

Information will be shared during the project with the Public Engagement Committee so members can spread awareness through their networks.

Planning Commission

Two Planning Commissioners will serve on the TAC to provide overall guidance on of this projects. The HPS will also go before the Planning Commission at two work sessions to provide project updates. Because the HPS Report approval is not a land use decision, it will not be going to a Planning Commission public hearing for recommendation to City Council.

City Council

City Council work sessions will be held 4-5 times over the course of the project and lead up to the Council final decision-making process and adoption of the proposed HPS Report.

Project Manager

The City's HPS Project Manager is Senior Planner Becky Coutinho. The Project Manager is charged with keeping the project moving forward and on schedule, as well as leading project public engagement for the historically marginalized community focus groups. The City's Project Manager will work closely with the Project Consultants to develop and deliver the HPS and

other project deliverables on time. The City's Project Manager will also meet to coordinate tasks, problem-solve, and provide operational guidance for the project.

Project Consultants

The lead project consultant is Cascadia Partners, and the Consultant's Project Manager is Alex Joyce who is charged with keeping the project moving forward and on schedule, as well as leading and managing the TAC, drafting the HPS document, and other aspects of the project as identified in the project's scope of work.

4. Implementation

The following is a draft schedule of public engagement that will provide opportunities to inform the public and to seek feedback:

January 2024	**Project Kick-Off with Consultants**
	Public Engagement Committee Meeting Input on the draft Public Engagement Plan
	Technical Advisory Committee Recruitment
March 2024	**TAC Meeting #1** Introduction to HPS/Project Overview and Next Steps
	Council Work Session #1 Introduction to HPS/Project Overview
	Planning Commission Work Session #1 Introduction to HPS/Project Overview
April 2024	**TAC Meeting #2** Initial discussion to develop project goals and policies
	Focus Groups (English and Spanish) #1 Introduction to HNA/Project Overview
May 2024	**Council Work Session #2** Update on TAC and focus groups input, receive input on HPS options

June 2024	**TAC Meeting #3** Discussion refining draft strategies and policies
July 2024	**Focus Groups (English and Spanish) #2** Discussion on draft, goals, policies, and strategic actions **Council Work Session #3** Update on TAC and focus groups input, receive input on HPS options
September 2024	**TAC Meeting #3** Report back from focus groups and Council, discussion of draft policy recommendations **City Council Work Session #4** Receive input on HPS options
October 2024	**Planning Commission Work Session #2** Report back from focus groups, TAC, and Council, discussion of policy recommendations **Council Work Session #5** Present final draft HPS and policy recommendations
December 2024	**City Council Meeting** HPS Resolution – 1st Reading **City Council Meeting** HPS Resolution – 2nd Reading/Approval

5. Communication Tools (or Public Awareness Activities)

- **Project Webpage:** Set up a project webpage on the City web site. Post regular project news, updates, upcoming public engagement activities, events, agendas, and background materials. Web materials will also be created and maintained to facilitate automated translation into languages other than English.

- **City Views Newsletter**

- **Social Media:** Utilize the @CityofHillsboro Twitter account, and both the English and Spanish language City Facebook page to publicize upcoming Planning Commission and City Council workshops and public hearings.

- **E-newsletters:** Spanish-language *Creciendo Juntos* Newsletter, and bi-monthly *Happening in Hillsboro* articles (timed with public hearings).

- **Engage Hillsboro:** Online engagement platform

- **HPS Video:** Informational video in multiple languages and keep the public at-large informed of key project milestones and importance adoption dates.

- **Translation:**
    - Produce an HPS executive summary and other content in Spanish and post to the project webpage and Engage Hillsboro webpage.
    - Consider translation style that is informal and easy to understand.

6. Assessment

Periodic assessment will allow staff to improve engagement. This section details plans and expectations for assessment.

Overall indicators and metrics of outreach

Staff will periodically examine key indicators and metrics to help determine the overall performance of the project public engagement program and help illustrate what areas need additional attention or improvement. There are many metrics that can be helpful, but at a minimum, staff intends on tracking the following information about the project on an ongoing basis:

General Participation	• Frequency of people visiting webpage (number of "touches") • Share of repeat webpage participants
Project Engagement	• Attendance at TAC meetings • Attendance at focus groups
Input Characteristics	• Number and means of comments (written, online, email, meetings, etc.) • Overall topic mix of comments
Improvement Opportunities	• Number and frequency of requests for assistance in locating project resources

Assessment outcomes and deliverables

Assessment data, such as the successes and challenges of project public engagement, revisions, or refinements to the PCEP, and specific metrics, will be shared with the Public Engagement Committee in summary form following project completion.

Appendix D: Gentrification and Displacement Memo

ECONorthwest
ECONOMICS • FINANCE • PLANNING

DATE: April 11, 2022
TO: Chris Hartye and Omar Martinez, City of Hillsboro
FROM: Becky Hewitt and Ariel Kane ECONorthwest
SUBJECT: Displacement and Gentrification Risks and Potential Mitigations

Introduction

In 2017, the City of Hillsboro worked with ECONorthwest to prepare a study titled *Affordable Housing Tools: A Review of Policy Options for Hillsboro*. One of the recommendations from that study was to inventory existing "naturally occurring" affordable housing (low-cost market rate housing that offers below-average rents based on its age and/or condition rather than because of a subsidy or affordability agreement) and explore strategies to acquire or otherwise preserve it. This memorandum picks up on that recommendation. It identifies areas within the City where displacement and gentrification risks are highest based on a variety of housing and demographic factors, sets the stage for identifying specific properties within those areas where displacement may be a concern and where the City may wish to explore interventions and provides further evaluation of potential interventions and mitigation measures to address displacement and gentrification risks.

Who is at Risk of Displacement?

Overview

Displacement occurs when a household is forced to relocate due to circumstances beyond household-specific disruptions. Risk of displacement primarily derives from the intersection of two interrelated factors: (1) changes in market conditions that result in rising rents and/or increasing redevelopment potential, and (2) household characteristics that lead to increased susceptibility to changing market conditions.

Our analysis of displacement focuses on households that rent because they are more directly affected by changing market conditions than those that own their property because they are subject to the decisions of the property owner about redevelopment, remodels, rent increases, etc. Property owners in Oregon are largely insulated from the financial effects of market changes due to the property taxation system, which decouples market value from taxable value, meaning that rising property values only impact the owners' property taxes in very limited circumstances. While Oregon state law limits the amount a landlord can raise residential rents annually for most older market-rate rental housing, these increases can still reach about 10 percent per year.[1]

[1] ORS 90.600; rent stabilization provisions were added in 2019 by Senate Bill 608. See this summary from Oregon Law Center for details: https://www.oregonhousingalliance.org/wp-content/uploads/2019/03/Oregon-Law-Center-Detailed-Outline-SB-608-cites-and-page-numbers-Final.pdf.

Among households who rent, those who face disadvantages or discrimination in the real estate market tend to be at greater risk of displacement and experience more harm if they are forced to move. These include low-income and cost-burdened households (spending more than 30% of their income on rent), people without advanced degrees, people of color, people who do not speak English, immigrants and refugees, seniors, and people with disabilities.

Who is at Higher Risk in Hillsboro?

The City/County's latest Consolidated Plan provides information about populations experiencing cost-burden:[2]

- *The largest group of severely cost-burdened households earn between 0 and 30% of MFI and are majority renters. These extremely low-income renters have the most trouble finding affordable units.*
- *Severely cost-burdened owners are generally owners who cannot afford to keep up with property taxes and home insurance costs and are usually elderly owners.*
- *Cost-burden differs somewhat by race and ethnicity: Black/African American households face the highest rate of cost burden (43%) yet the same rate of severe cost burden as most other groups. Hispanic households have the highest rate of severe cost burden (24%) but moderate rates of cost burden.*

To understand how rates of cost-burdening vary by housing type, ECONorthwest analyzed Census data for the Hillsboro area overall, as shown in Exhibit 1. This analysis can help the City target housing types that are most likely to be home to cost-burdened renters.

Exhibit 1: Rates of Cost-Burden By Housing Type, Hillsboro PUMA[3]
Source: ECONorthwest analysis of 2015-2019 PUMS data

	# of cost-burdened HH	% of all cost-burdened HH who live in this type of housing	% of HH living in this type of housing who are cost burdened
Single family house detached	1278	17.5%	36.9%
Single family house attached	911	12.5%	36.2%
Duplex, Triplex and Quadplex	599	8.2%	35.3%
5-9 Apartments	1195	16.4%	44.4%
10-19 Apartments	1046	14.4%	33.4%
20 or more Apartments	2217	30.4%	44.0%
Mobile home or trailer	39	0.5%	57.4%

[2] *2020-2024 Consolidated Plan for Washington County and the Cities of Beaverton and Hillsboro*, Hillsboro section, page 15.

[3] This analysis uses 2015-2019 data from the U.S. Census Bureau's Public Use Microdata Sample (PUMS). The Public Use Microdata Area (PUMA) that best represents Hillsboro is not fully contiguous with City boundaries and includes some adjacent areas in unincorporated Washington County.

This shows:

- Renters living in mobile homes and trailers are more likely to be cost-burdened than those living in other types of housing, though they comprise a very small share of the total cost-burdened renters in the area.
- Apartments with 20 or more units are home to the largest share of cost-burdened renters of any housing type, and the rate of cost-burdening is higher for these larger apartments than for most other types of housing.
- Smaller apartments and plexes combined account for roughly 39% of cost-burdened renters; another 30% live in single-family attached or detached houses. Rates of cost-burdening in these types of housing are generally below the average for renters in the Hillsboro area.

Looking at the existing housing supply within the City of Hillsboro:

- An estimated 3.5% of housing units citywide are both renter-occupied and at moderate to high risk for redevelopment based on their age, property type/number of units, and property value relative to land area. This includes older (built before 2007), unregulated rental housing with 4 or fewer units that is in the bottom quartile for property value per land area and manufactured home parks.
- Roughly 32% of housing units citywide are estimated to be renter-occupied with some risk of rent increases or major remodels that could trigger displacement. This includes older (built before 2007)[4], unregulated rental housing with any number of units, though roughly 60% of these units are in apartments with 20 or more units.

This suggests that focusing the City's efforts on older apartment buildings with 20 or more units will target the housing with the highest concentrations of renters who are more vulnerable to displacement from rising rents due to lower incomes and existing cost-burden.

[4] Newer rental housing can also experience rent increases and tends to closely track changes in the housing market; it is also excluded from Oregon's statewide limitations on rent increases. However, while some older properties are regularly maintained and updated, other older housing may become dated with rents that have fallen below those of newer housing. Older housing that has not been updated may become "naturally occurring affordable housing" where a change in ownership or other factors can lead to larger rent increases or major remodels that can trigger displacement.

Which Areas Have the Greatest Concentrations of Households and Housing at Risk?

Demographic Factors

The following maps show the share of the population/households in demographic categories that may be more likely to experience harm from displacement by Census tract[5], based on the following metrics:

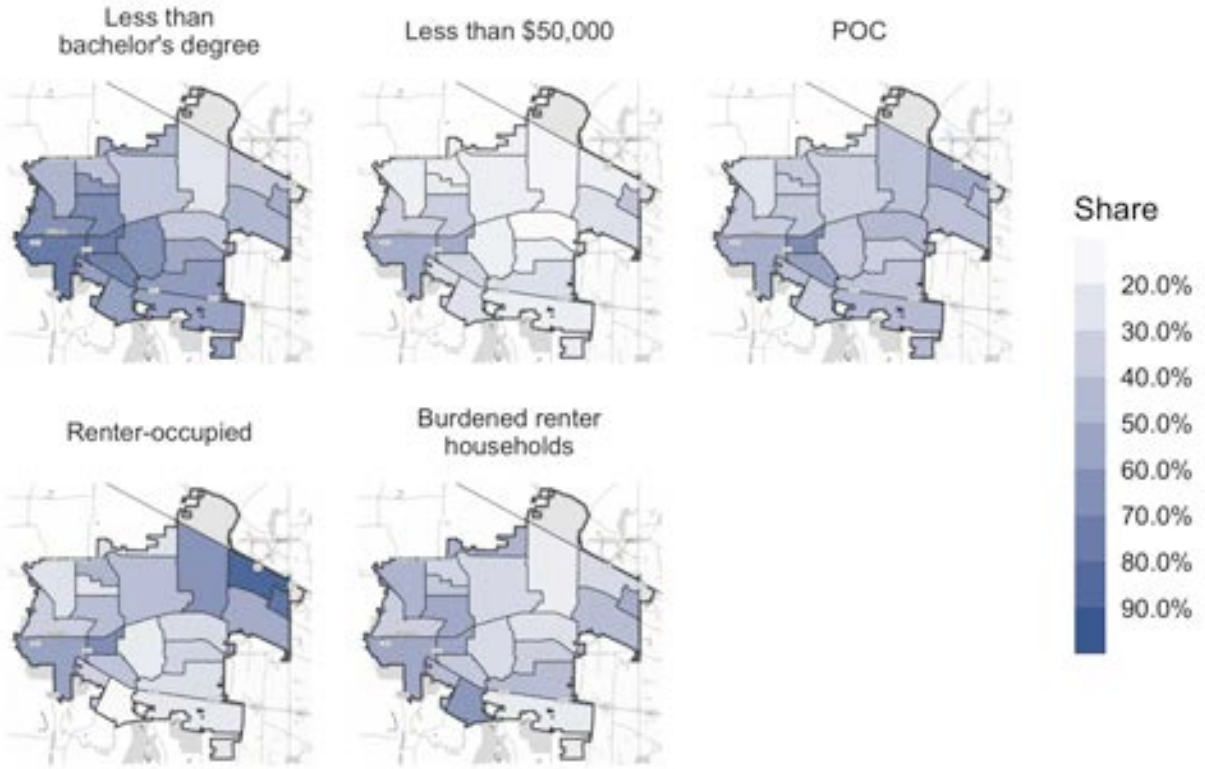
- Households earning less than $50,000 (roughly 50% of the Area Median Income for the Portland region) as a share of all households in the tract
- People of color (POC; combined: all except white non-Hispanic) as a percent of the population in the tract
- Renter households as a share of all households in the tract
- Cost-burdened renter households as a share of all households in the tract
- Adults with less than a bachelor's degree as a percent of all adults in the tract

These metrics are common demographic indicators of vulnerability in displacement risk studies, including those done by the cities of Portland and Seattle, though the details of how they are used vary.[6] Low-income, cost-burdened renters are at greatest risk of being forced to move due to rising rents, since they have little ability to absorb further rent increases, and may already be facing trade-offs between paying rent and covering their household's other basic needs. Those without college degrees have less ability to increase their income to cover higher housing costs and may have to work multiple low-wage jobs to make ends meet. People of color tend to face greater housing discrimination and may have a harder time purchasing a home or finding another apartment if they are forced to move.

[5] The map shows only the portion of the Census tracts that falls within City limits. Several tracts at the north and south edges extend well beyond City limits, but there is relatively little other housing in rural areas outside the City, so data on the population share in a given category is likely relatively accurate for the area in City limits.

[6] Those with limited English proficiency, which is also sometimes used as an indicator, had low statistical reliability at the tract level for Hillsboro and was not included in this analysis.

Exhibit 2. Vulnerability Metric by Share of Population in Tract
Source: ECONorthwest Analysis of 2015-2019 ACS data



This shows that lower-income households and adults without four-year degrees are largely clustered near the downtown, where there are also relatively high concentrations of renters and people of color. This aligns with the latest Washington County Consolidated Plan, which identifies "one R/ECAP [Racially/ethnically-concentrated areas of poverty] in Washington County located in west-central Hillsboro—home to predominately Hispanic residents of Mexican origin."[7]

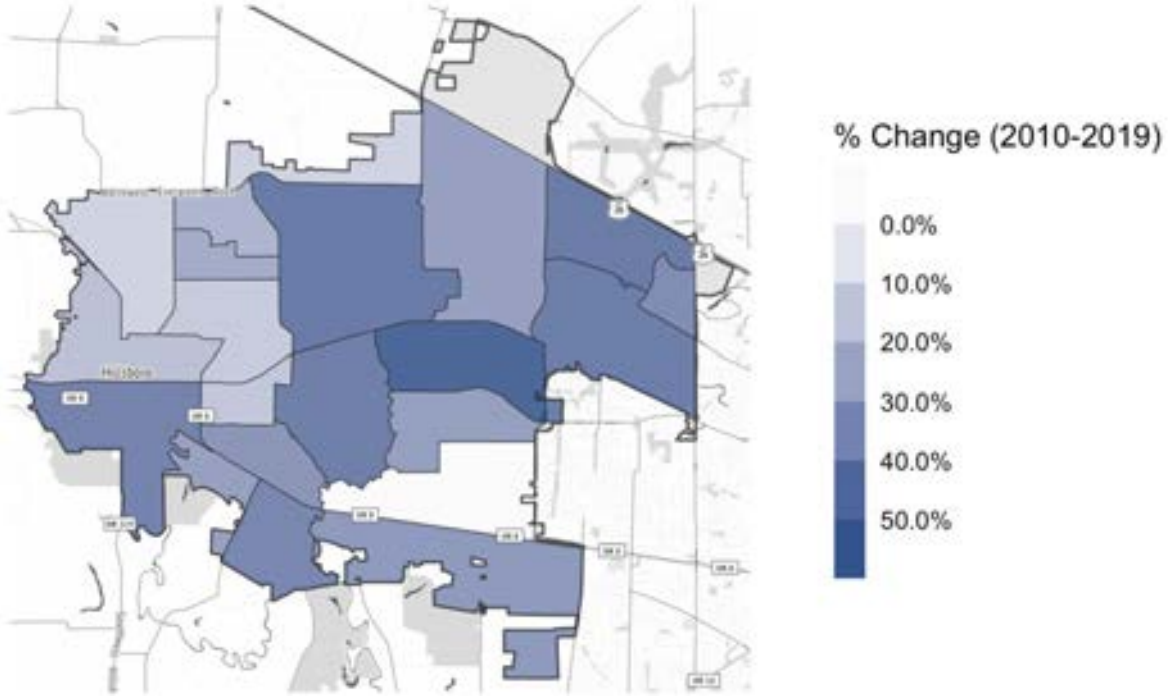
There is also a high concentration of renter-occupied housing in the northeastern portion of the City, around Tanasbourne, because there are a number of apartment complexes in the area and little other housing. However, the Tanasbourne area has a relatively low share of low-income households, cost-burdened renter households, and adults without a college degree, which suggests that these renters may be better able to withstand fluctuations in the housing market.

[7] *2020-2024 Consolidated Plan for Washington County and the Cities of Beaverton and Hillsboro*, page 111.

Rent Trends

Another factor that influences gentrification and displacement risk is the rate of rent increases. While the Census's rent data is an imperfect indicator of changing market conditions,[8] it provides one indicator that aligns with Census geographies. Exhibit 3 shows rent changes highest in central and eastern Hillsboro between 2014 and 2019, with the rents in the downtown increasing less than in other areas.

Exhibit 3. Median Gross Rent Change Since 2010 in Hillsboro by Tract
Source: ECONorthwest Analysis of 2020 Census and ACS 5 Year Data 2010- 2014 and 2015-2019

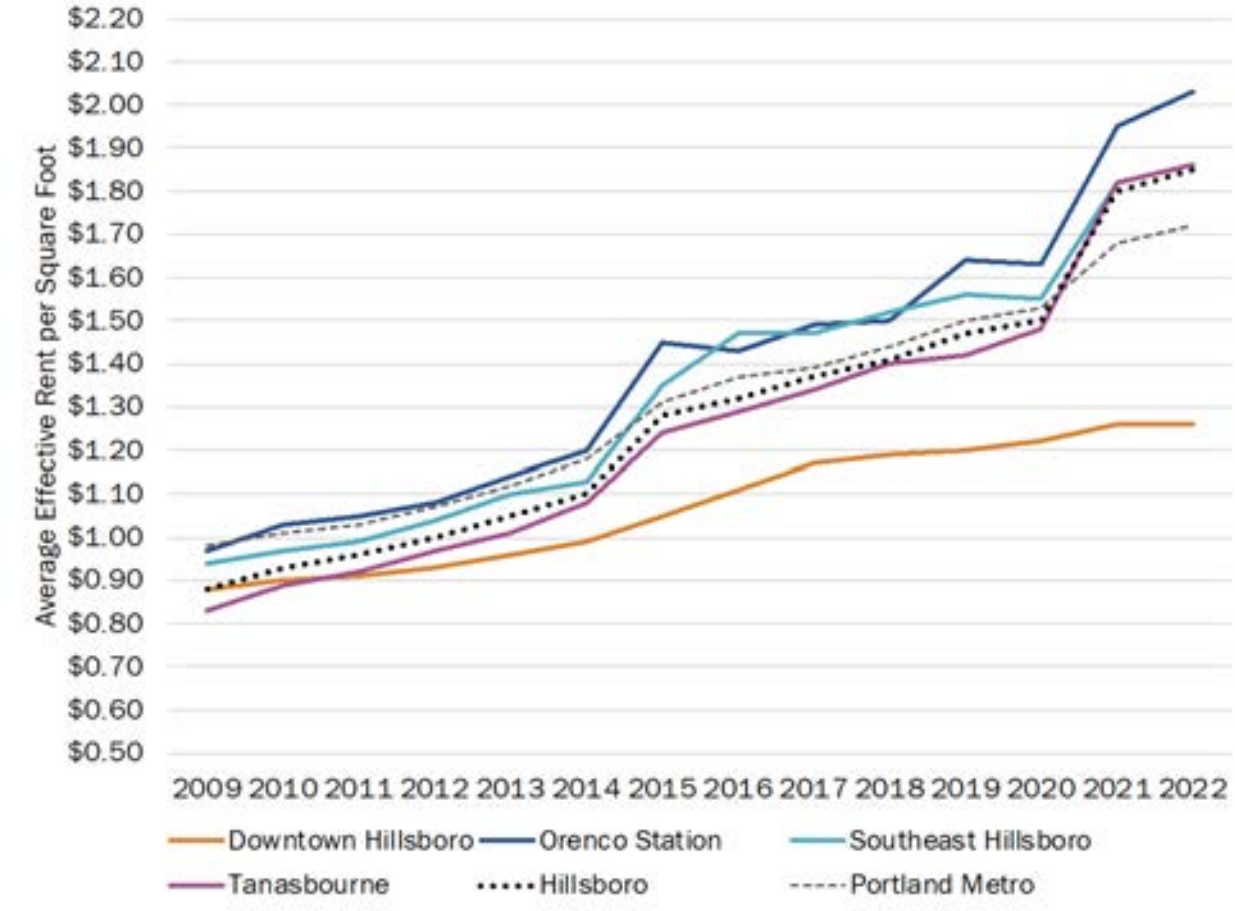


Another indicator of rent trends is the change in rents for older apartment buildings whose rents are tracked in CoStar, a proprietary source of rent and other market data. CoStar is also an imperfect data source,[9] but it provides a more timely sense of rent trends and the ability to identify trends within a subset of the housing market. Exhibit 4 shows how rents for older market-rate apartments (built before 2007) have changed between 2009 and 2022. Excluding new construction from the data allows us to focus on changes for existing housing stock and prevents the addition of newer development at higher rents from skewing the results.

[8] Issues include timeliness of the data and the fact that rents are self-reported and are not adjusted in any way for unit size.

[9] Data for smaller, older apartment buildings is often missing or unreliable because CoStar data is gathered primarily from recent internet listings, and older apartment buildings do not always list availability online. Where listing data is unavailable, CoStar typically estimates likely rent increases at the property level based on trends in the surrounding area. CoStar also does not track the rents that existing tenants are paying or how rent is changing at lease renewal; it only tracks rent for available units.

Exhibit 4. Multifamily Rent Trends in Buildings Built Before 2007, 2009-2021
Source: ECONorthwest Analysis of CoStar March 2022 data



This shows that rents have increased dramatically for older apartments across much of the City and the region, more than doubling from 2009 to early 2022, with substantial rent increases since 2020. However, rents in Downtown Hillsboro, where demographic indicators suggest higher concentrations of vulnerable renters, have increased more slowly than the citywide average. This may change going forward, given the City's current efforts to support redevelopment and revitalizations in Downtown Hillsboro and the 10th Avenue corridor, but suggests that the City may still be ahead of major market-driven displacement in this high-vulnerability area.

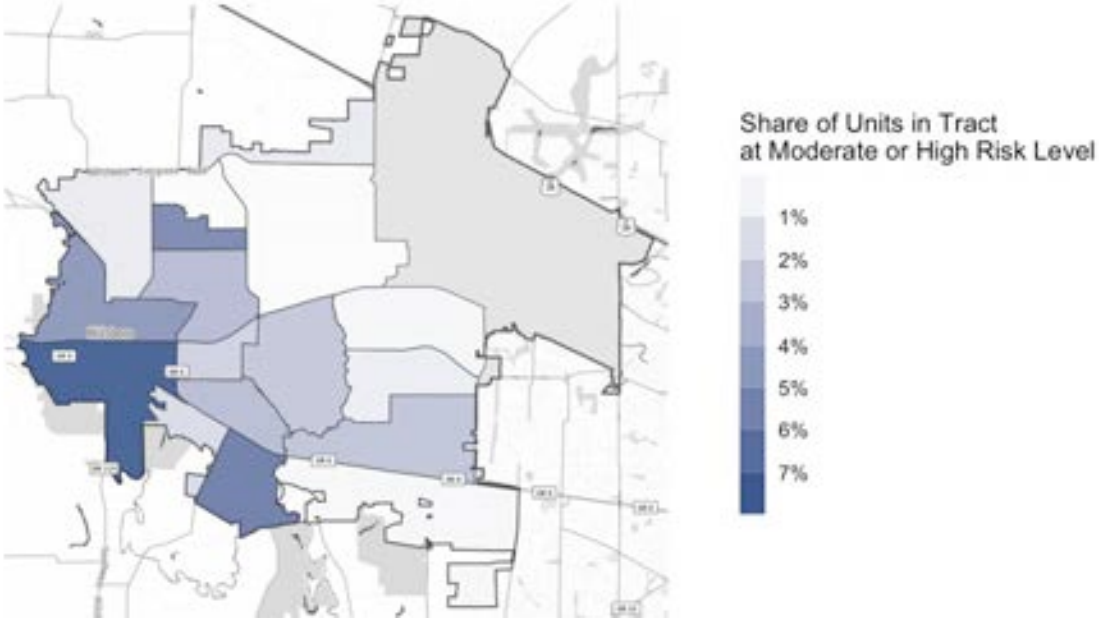
Housing Stock

As an additional indicator, ECONorthwest analyzed characteristics of the existing housing stock to identify two sources of potential for displacement:

- **Redevelopment Risk:** Small, older rental properties with low property values[10] were identified as moderate risk, or high risk if they are part of a group of adjacent properties under common ownership. Manufactured home parks, which can be targeted for redevelopment despite some state protections, were identified as being at moderate risk.
- **Rent Increase Risk:** Older market-rate rentals where changes in ownership or investment strategy or upgrades to units could lead to larger rent increases that could displace current renters were identified as being at some risk. Further property-specific analysis would be required to establish risk in more detail within this group of properties.

The distribution of housing units that are both renter-occupied and at moderate to high risk for redevelopment is shown in Exhibit 5. While there are few units at risk of redevelopment, they are more concentrated in southwestern Hillsboro (surrounding and south of the downtown). The concentration in this area reflects the presence of a number of manufactured home parks along with some low-value rental homes.

Exhibit 5. Share of Units that are Rentals with Moderate to High Redevelopment Risk by Tract
Source: ECONorthwest, using data from Metro's Regional Land Information System (RLIS) tax lot layer



The greatest concentration of units at higher risk of rent increases is in northeast Hillsboro, as shown in Exhibit 6, because of the concentration of market-rate apartments in that area. Most of

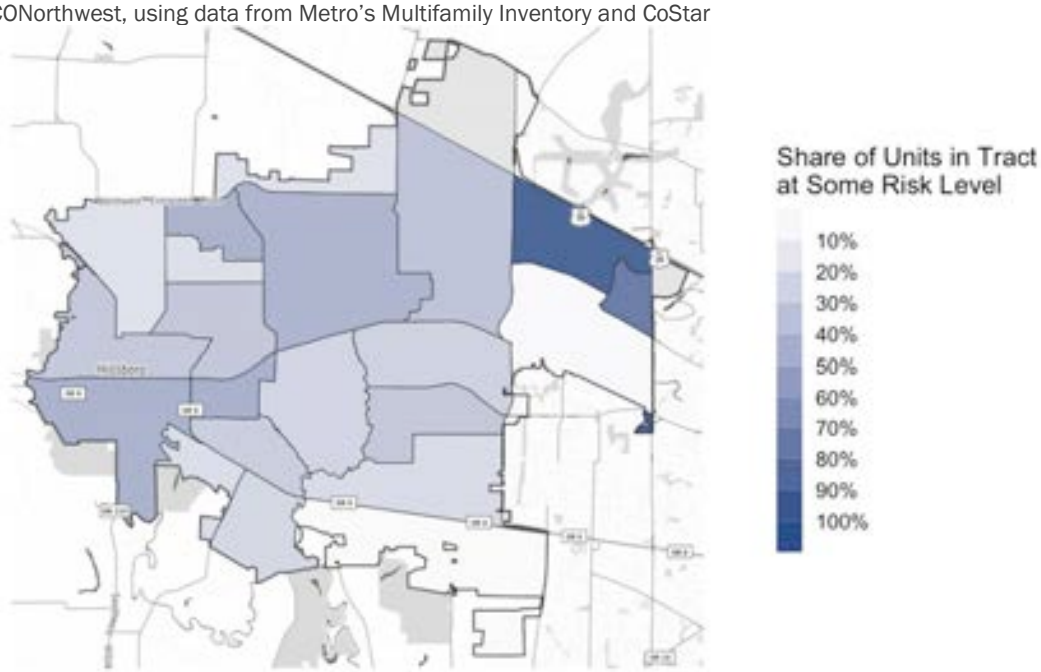
[10] This is defined as properties in the bottom quartile for all single-family homes in the city based on real market value (per tax assessor's records) per square foot of land area.

the older apartments in that area were built in the 1990s; while they may need repairs and upgrades, they are mostly larger properties with more amenities, which tend to be professionally managed and upgraded over time as units turn over. This decreases the risk that tenants will be displaced due to upgrades; however, rents at these properties are also more likely to track the market over time, as the rent trend data shows. Tenants in these properties may be more likely to face rent increases at the upper limit of what is allowed under state law when rents are escalating as fast as they have over the past two years. However, as noted above, demographic data suggests that renters in the Tanasbourne area may be better able to withstand fluctuations in the housing market without experiencing displacement.

Older, smaller apartment developments with few amenities are less likely to be professionally managed and upgraded over time; they can become deteriorated and potentially need major upgrades that would require tenants to move out, but they also tend to be slower to raise rents in the absence of upgrades. Apartments with under 100 units that are more than 30 years old and have few amenities are largely concentrated in Downtown Hillsboro. Many of the older apartments in Downtown Hillsboro have less than 40 units, and there are many smaller apartments with less than 20 units in Downtown Hillsboro as well.

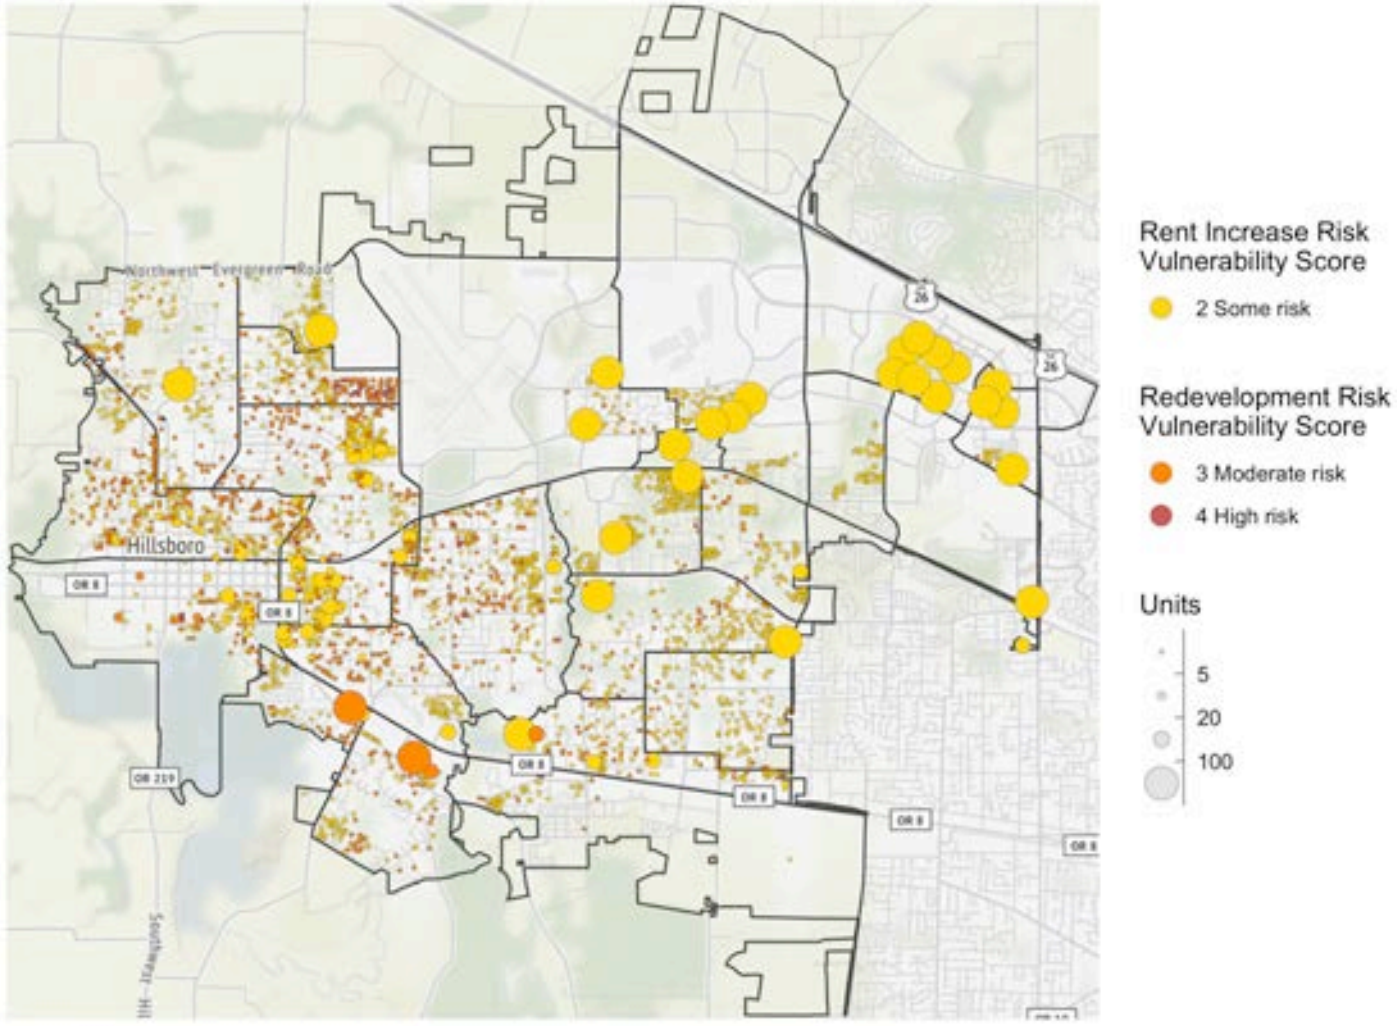
Exhibit 6. Share of Units that are Rentals at Some Risk of Displacement due to Rent Increase by Tract

Source: ECONorthwest, using data from Metro's Multifamily Inventory and CoStar



Properties identified as being at risk of either redevelopment or rent increase are shown in Exhibit 7.

Exhibit 7: Housing with Greater Potential for Displacement Due to Redevelopment or Rent Increases from Repositioning
Source: ECONorthwest, using data from Metro's Multifamily Inventory and Regional Land Information System (RLIS) tax lot layer



ECONorthwest will provide additional detail on properties in higher risk areas that City staff may want to evaluate for potential interventions as a follow-up step under the current contract.

Manufactured Home Communities

In the early 2000's there was a loss of 15 manufactured housing communities in Washington county, estimated to have displaced 1,100 households with a loss of about 1 in 5 spaces for manufactured housing. In Hillsboro there are 8 MHCs with 392 spaces presently.[11]

Exhibit 8: Manufactured Dwelling Spaces in Hillsboro

Potential Interventions and Mitigation Measures

Overview

The City wants to increase housing stability and has already taken steps to expand the supply of affordable, stable rental housing in Hillsboro. (These are described in more detail in a separate memorandum.) Potential measures to support housing stability include:

- **Prioritizing displaced or at-risk households for housing support**. The City could augment or focus existing housing programs and investments in higher-risk areas. For example:
  - Investing in additional regulated affordable housing within gentrifying areas to give residents more access to stable housing (the City is already doing this)
  - Targeting homebuyer assistance (including housing acquisition with Proud Ground) to renters living in areas with greater displacement risks through additional marketing efforts or prioritization of funding
  - Increasing funding for home repair for low-income homeowners in areas where the for-sale housing market is changing quickly
- **Supporting tenant protections.** Cities are pre-empted from establishing local rent regulations by state statute,[12] and many renter protections are addressed at the state level, including rent stabilization and eviction protections enacted with Senate Bill 608 in 2019. Programs providing information on tenant rights, legal support for tenants facing eviction or other housing issues, and emergency rent assistance are largely handled by the County and nonprofit organizations. However, the City could explore opportunities to support partners in these efforts through targeted outreach, funding, referrals, or other means.
- **Preserving and stabilizing existing "naturally occurring affordable housing"**. There are two general approaches to preservation of older apartments for cities that do not have their own Housing Authority to own and manage housing directly:
  - Supporting **acquisition and rehabilitation** by nonprofits or others who would keep rents affordable or convert to regulated affordable housing
  - **Incentives for property owners** (e.g., tax abatement, grants/loans) to make needed health and safety improvements while stabilizing rents

  The City can also explore options to help support preservation of manufactured housing parks, drawing on the findings of an ongoing Washington County study.

Preservation measures are the focus of the balance of this memorandum and are discussed in more detail below.

[12] ORS 91.225

Acquisition and Rehabilitation

Acquisition and rehabilitation of existing apartments by providers of regulated affordable housing for conversion to regulated affordable housing can be funded through state and federal programs such as the Low-Income Housing Tax Credit (LIHTC).

Acquisition/rehabilitation projects are complex on many levels, including understanding the capital needs required to rehabilitate the property, analyzing rents and cash flow, and converting units to be income-qualified without displacing existing renters (who may not be eligible for the income-restricted units). There are ways for the City to support these efforts without undertaking the acquisition and rehabilitation directly. An additional challenge is the need to compete with private investors, which often requires acting quickly when a property becomes available for purchase. The City can potentially help overcome this challenge in a few ways:

- Establish a **flexible local funding** source that can be deployed quickly to help with property acquisition and preservation.
- Research and **evaluate potential target properties** to identify a short-list of properties where acquisition and rehabilitation would be a priority if they came available and reach out to property owners to gauge interest in selling for preservation when they are ready to part with the property.

Example Acquisition/Rehabilitation Project: Rosewood Place (Gresham)

Nonprofit Human Solutions acquired a 26-unit market-rate apartment building in Gresham with a history of property issues and converted it into regulated affordable housing with supportive services. The project also included development of 19 additional affordable housing units on the site and a community dental clinic. Rents are affordable to households earning 30-50% of AMI. Acquisition cost $1.37 million (in 2013), and the total project budget was over $13 million. Funding included $937,500 from the Network of Oregon Affordable Housing and a $350,000 property acquisition loan from the Housing Development Center's Community Fund; Gresham HOME funds; LIHTC equity and state funds; and a capital campaign by Human Solutions.[13]

Some communities require that property owners seeking to sell certain types of rental housing (e.g., properties with 20 or more units built before a certain year or manufactured home parks) offer a **"right of first refusal"** (ROFR) to the local housing authority, the current tenants, and/or qualified nonprofit organizations. The ROFR generally allows the opportunity for the housing authority or other party to purchase the property for the same terms as the potential buyer. Oregon has ROFR policies in place for regulated affordable housing with expiring affordability restrictions[14] and for manufactured housing parks[15]. There are no existing programs in Oregon that apply a ROFR to other market rate rental housing. While such programs do exist in other communities (for example, Montgomery and Prince George's Counties in Maryland), they may require state-level changes to statute in Oregon and are not considered further here.

[15] ORS 90.800 to 90.850

Flexible Local Funding for Acquisition/Preservation

Flexible local funding that can be deployed quickly for acquisition can come from a variety of sources, including general fund or a Construction Excise Tax. In the example programs described below, public funding was pooled with funds from philanthropic partners, banks, and/or CDFIs.

Examples

The **Oregon Housing Preservation Project** offers acquisition loans that provide bridge financing until the buyer is able to complete the necessary steps to secure long-term funding and prepare to rehabilitate the property.[16] The program offers acquisition loans with favorable terms to help borrowers acquire unregulated market rate properties and transition them to regulated affordable housing. This funding provides time to align public subsidies and obtain long-term or construction financing. (There are other loan programs specific to preservation of regulated affordable housing with expiring restrictions—this program has been a bigger priority for the organization.) Funding comes from public partners, such as the City of Portland, Oregon Housing and Community Services, Fannie Mae, and CDFI funds, private foundations, and private banks.

Greater Minnesota Housing Fund - NOAH Impact Fund is a social impact fund in the Minneapolis-St. Paul region that connects developers and owner-operators with social impact investors to preserve low-cost market rate housing. The fund offers a double-bottom line impact to investors in the form of social impact and return on equity, with the goal of investor repayment in ten years. Since the fund's inception in 2015, it has leveraged $25 million in capital investments to invest $100 million in property acquisitions to preserve 1,000 at-risk unregulated affordable housing units in the Twin Cities area. The fund acquires and rehabilitates these unregulated affordable housing properties (Class B and C properties, from 40 to 200 units), and partners with local affordable housing organizations to operate them with 15-year affordability restrictions.[17] NOAH Impact Fund investors include several banks, the Minnesota Housing Finance Agency, the county, and local philanthropic organizations.[18]

Key Questions

- Where would City funding come from to capitalize an acquisition/preservation fund? Capitalizing a fund from a flexible funding source (e.g., general fund, or potentially in the future a Construction Excise Tax) would allow the fund to be more nimble.
- Would the City want to partner with others (e.g., the existing Oregon Housing Preservation Project) to leverage additional public and private resources, even if it meant less control over the program and where it would focus?

---

[16] Preserve Oregon Housing, "Loans: Purchase of Existing Project to Convert to Affordable," http://www.preserveoregonhousing.org/loans.php

[17] NOAH Impact Fund Presentation. Greater Minnesota Housing Fund. September 7, 2017.

[18] NOAH Impact Fund, "About," https://noahimpactfund.com/about/

- How much risk is the City willing to take on its participation in an acquisition/preservation fund?
- Would the City want to provide funds as grants or loans? In some cases, all or a portion of the funds may be repaid from other sources later when the project receives financing.
- Can the City provide enough capital to enable acquisition of a typical property without partnering with others? The average sale price for recent transactions of older apartments with few amenities in Hillsboro is approximately $150,000 per unit.[19] For a 20-unit property, this could mean roughly $3 million in acquisition costs.

Property Inventory and Research

Oregon Housing and Community Services (OHCS) currently maintains an inventory of regulated affordable properties with affordability restrictions that are near expiring. This strategy is focused on identifying unregulated "naturally occurring affordable housing" that could be targeted for acquisition and preservation or for incentive programs. ECONorthwest will provide a preliminary property inventory as part of this project, focused on older, unregulated apartments. ECONorthwest will work with staff to refine the criteria for inclusion in the inventory, including year built, number of units, location, property value, presence of amenities such as a pool, recent sales or remodels, and current rent levels (if known).[20]

Manufactured Home Communities Preservation

Washington County's recent report on manufactured home communities provides a summary of state protections for manufactured home communities and options for local actions to support their preservation. Currently, Oregon regulates the sale of manufactured home communities through various laws. Tenants must be given notice of intent to sell with 25 days to express purchase interest. If the landlord sells to a nonprofit, the gains are exempt from Oregon Income Tax, at least until the end of 2025. There must also be a year's notice if the community will close.[21] The report identifies opportunities for local governments to support the preservation of manufactured home communities, including:

- Assist with the purchase and preservation of manufactured homes as permanently affordable housing. This could include use of the Washington County Housing Production Opportunity Fund (HPOF), which has up to $500,000 available annually to support a resident-owned cooperative or nonprofit organization purchase of manufactured home communities, or Community Development Block Grants.

[19] ECONorthwest analysis of CoStar data for apartment properties built before 1992 with more than 12 units, rated as 2 stars by CoStar based on amenities and quality, sold since 2018.

[20] While ECONorthwest has access to proprietary data sources such as CoStar that detailed information about the properties, we are prohibited from transferring this data to third parties. However, we can use it to filter and identify properties that likely meet the City's criteria for further evaluation.

[21] Washington County Manufactured Housing Communities Facts, Risks, and Resources Final Report (April 2022).

- Target outreach of existing and future programs for preservation or displacement mitigation at manufactured homeowners and communities. Oregon Housing and Community Services worked with other partners to develop The Local Agency Toolkit with guidance on rapid response organization to a community closure.[22] This could include working with Washington County to develop a plan for assisting households displaced from MHCs and assisting with outreach and services reach key populations including older adults, people with disabilities, Latinx/Hispanic families, veterans, and households with lower incomes.
- Target manufactured homes communities and owners for state and federal repair, rehabilitation, weatherization, and replacement assistance and programs, such as the Home Access and Repair for the Disabled and Elderly (HARDE) program, the Community Action Weatherization Program,[23] and energy efficiency incentives from Energy Trust of Oregon.[24]
- Explore the opportunity to preserve manufactured home communities through land use regulation. Several Oregon cities have made efforts to preserve communities through overlay zones or code development:
  - The City of Cornelius adopted a Manufactured Home Park zone allowing manufactured housing communities as a permitted use with a prohibition of conventional single-family and multi-family units. Redevelopment would likely trigger a zone change requiring public testimony and council and commission discussion.[25]
  - The City of Portland adopted a manufactured housing zone in 2018.[26]

Incentives for Property Owners

Some property owners may want to help their tenants and keep their rents low but may not have the resources to maintain and improve the property without raising rents. Others may be willing to consider stabilizing rents if there are strong enough financial incentives to do so. The main approaches that cities can use to incentivize property owners to invest in property maintenance or upgrades without increasing rents are grants, low-interest loans, or tax abatements. Any of these can be paired with a requirement to provide affordability commitments.

Grants/Loans for Stabilization

Funds could be distributed as grants or loans with varying terms to increase affordability and incentives for landlords to participate. There are meaningful trade-offs between offering grants or loans, and the City could offer both funding types, choosing between them depending on the borrower's creditworthiness.

- If the City offered grants, there is potential for deeper affordability for the units or the borrower, because grant funds do not accrue interest and are not expected to be repaid. As such, the funds are gifted to the property to help lower the cost of the rehabilitation project and thus increase affordability. However, the City would not receive its funding back and it cannot be used for future preservation projects.
- If the City were to offer loans, it would become a real-estate lender to the private market. Loans come with the expectation that the borrower repays the full principal plus interest over the life of the loan. If the City offered loans, although affordability can vary based on loan terms, it is not as affordable for the borrower as a grant. However, loans mean that the City can reinvest its funds in future preservation projects, and loans may induce greater accountability (such as through a lien on the property), for the borrower.

Either way, funding would be distributed in exchange for an agreement with the landlords or property owners to rehabilitate the properties to adhere to certain safety, code, or habitability standards, and provide a certain level of affordability for a defined period of time. The City would need to ensure that any loans could be paid back with the affordability restrictions in place. If the City were the only source of funds for the project, the City would also need to take on monitoring and enforcement to ensure the terms of the affordability agreement were being met.

Example

The City of Beaverton has been working on a Housing Preservation Pilot Project for the past several years. Housing staff has been exploring partnerships with a few interested property owners to stabilize existing multifamily rental housing while retaining existing property ownership. However, current low interest rates are creating little incentive to take a City loan with affordability requirements, which has hampered program implementation to date.[27]

Tax Abatements

There are two property tax abatement programs authorized under state statute that the City could consider as incentives for preservation and rehabilitation of older apartments:

- Multiple-Unit tax abatement (also called MUPTE or MULTE in some jurisdictions)[28]

[27] ECONorthwest, *Beaverton Downtown Equity Strategy: Summary of Potential Best Practices for Displacement Prevention and Mitigation and Inclusive Downtown,* February 15, 2022.

[28] ORS 307.600 to ORS 307.637

- Rehabilitated Residential Property tax abatement[29]

Multiple Unit Tax Abatement

The Multiple Unit tax abatement (referred to here as the MULTE program) is a flexible tax abatement program for multiple-unit rental housing that offers substantial local control over eligibility. It can apply to apartments and/or to middle housing, depending on how the city sets the local requirements. It exempts the full value of the residential improvements, but not land value. It is normally limited to a 10-year abatement; however, if there is an affordability agreement in place, the abatement can last as long as the term of the affordability agreement. The City may only exempt its own taxes, unless the boards of districts representing at least 51% of combined levy agree to the exemption for a given property, in which case all districts are included. (If Washington County agreed to participate in the program, County taxes could also be included in the exemption.)

State statute allows for the MULTE program to be used for existing multiple-unit housing that is or becomes subject to an affordability agreement with a public agency. This means that the City could offer the tax abatement in exchange for signing an agreement with a public agency (such as the Washington County Housing Authority or another affordable housing provider) to regulate rents. Because the statute is flexible about the nature of the affordability agreement, it could be structured to limit the annual increase in rents or to require a reduction based on the value of the tax abatement. The City could require that participating property owners invest in renovations in order to qualify, but this is not required under statute. Possible options include:

- **Rehabilitation emphasis:** Make renovations an eligibility requirement, with a required investment amount that is proportional to (and less than) the value of the tax abatement to the property owner. Require that participating property owners prioritize investments in health and safety improvements first, and then improvements for energy efficiency, universal accessibility, etc. Limit the rate of rent increases for the duration of the tax abatement (e.g., 2% or less). This would not require income qualification.
- **Rent reduction emphasis:** Do not require renovations (except in cases where they are needed for health and life safety) but require that rents be reduced in proportion to the tax abatement, with a limit on the rate of increase year-to-year. This would not necessarily require income qualification.
- **Income-restricted affordability emphasis:** Do not require renovations (except in cases where they are needed for health and life safety) but require that a percentage of the units be made affordable at a specific income level and require income qualification. The share of units to be made affordable and the income level could be set on a property-by-property basis.

Requiring income qualification has some downsides: it creates an administrative burden for the property owner, and some existing residents may not qualify. For enforcement, participating property owners could be required to submit current rent rolls and provide written notice to all

[29] ORS 308.450 to ORS 308.481

tenants of the affordability agreement with contact information to report any potential violations. If income qualification was not required, the City could in theory establish affordability contracts directly with property owners. This would require some additional administrative effort, but much less than income certification.

Additional testing of MULTE as an incentive for specific properties and outreach to property owners would be needed as a follow-up step to determine whether it could provide a viable incentive for rehabilitation and stabilization. However, as an initial indication, older apartments in Downtown Hillsboro with few amenities are currently paying roughly $950 per unit per year in property taxes.[30] If 80-90% of this is based on improvement value,[31] that means an abatement through MULTE could be worth roughly $760-860 per unit per year (roughly $60-70 per month per unit), or $7,600 to $8,600 per unit over 10 years (in today's dollars, assuming that the 3% annual increase in property value is counteracted by 3% average annual inflation). Whether this would provide a sufficient financial incentive to reduce/stabilize rents or invest in needed property upgrades depends on the property's condition and current rents, but the amount is likely not enough on its own to support rehabilitation if major repairs are needed. This program could potentially be paired with a low-interest loan or grant as described above for projects with more extensive capital needs.

Rehabilitated Residential Property Tax Abatement

This program provides a 10-year property value freeze for rehabilitation of existing units in substandard condition, and for the conversion of transient accommodation or nonresidential structures to permanent residential units, in areas designated by the jurisdiction as "distressed"—residential areas that are deteriorated, lacking proper facilities, or that have vacant or abandoned homes or structures. No more than 20% of the jurisdiction's total land area may be included. For properties subject to affordability restrictions, the freeze can remain in place for the duration of the restrictions. The City may only exempt its own taxes, unless the boards of districts representing at least 51% of combined levy agree to the exemption for a given property, in which case all districts are included.

Structures must be at least 25 years old and not meet local building or housing codes prior to the improvement. The value of the improvements must be at least 50% of the existing assessed value of the property. All housing types are eligible, which would make the program available for single-family (rental or owner-occupied), middle housing, or apartments. This versatility could make it a good choice for areas where much of the lower-cost housing stock is in poor condition but includes a mix of housing types.

This program is more restrictive than the MULTE program and offers less of an incentive because only a portion of the improvement value is exempt. However, because both programs

[30] ECONorthwest analysis of CoStar data for apartment properties built before 1992 with more than 12 units, rated as 2 stars by CoStar based on amenities and quality, located in Downtown Hillsboro. CoStar provides 2020 property taxes per unit, which were adjusted to a 2022 estimate.

[31] Based on Washington County tax assessor records for selected example apartment properties within this set.

require support from overlapping taxing districts in order to apply to more than just the City's taxes, the fact that this program does not decrease the tax base may make it more acceptable to other taxing districts. In addition, the flexibility in housing type and tenure could make it a good fit for certain areas.

Conclusions and Next Steps

Demographic indicators of vulnerability to displacement (low-income households, cost-burdened renters, adults without college degrees, and people of color) all point to an area near Downtown Hillsboro (just east of 10th Avenue) as the area with the greatest vulnerability to displacement. While rents for older apartments in that area have been growing more slowly than the City overall, upcoming investments in the 10th Avenue corridor and ongoing revitalization efforts downtown could increase the potential for repositioning of older properties. The Tanasbourne/Amberglen area stands out for its high concentration of market-rate apartments, including many large apartment complexes where rents have increased dramatically in recent years. However, renters in that area tend to have higher incomes, lower rates of cost-burden, and higher levels of education than those in the Downtown area, which reduces their risk of displacement due to the rising rents and increases the chances that they will find other suitable housing if they do have to move. This suggests that the area near 10th Avenue should be Hillsboro's top priority for preservation efforts and housing stabilization programs.

Local efforts to preserve "naturally occurring affordable housing" are challenging because of the need to intervene in the private market in ways that are beneficial for both the property owner (so that they are willing to participate) and the tenants (so that the preservation efforts succeed in preventing displacement) while protecting the City's interests. This is especially true with the staffing limitations of a city without a housing authority. Still, there are a range of potential interventions the City should consider exploring further, including:

- Grants or loans to support acquisition and rehabilitation by affordable housing providers;
- Grants or loans and/or property tax abatements as incentives to the existing owners for preservation/stabilization; and
- Augmenting existing programs to support low-income homeownership in higher-risk areas.

The City's ability to dedicate flexible, locally-controlled funding and the support of potential partners (e.g., affordable housing providers, other funders, and overlapping taxing districts) will determine which of the available interventions are most appropriate for implementation. Feedback from potential partners and stakeholders will also inform how those programs should be structured.

In the near term, the City should engage with stakeholders and partners to gather feedback on the potential interventions identified in this memorandum. This should include:

- Overlapping taxing districts—particularly Washington County and Hillsboro School District—to gauge support for adopting a tax abatement for preserving affordability of low-cost market-rate apartments.
- Property owners/managers of target properties identified by ECONorthwest's upcoming analysis to gauge their interest in participating in a preservation program through tax abatements or grants/loans, and whether they would consider selling to an affordable housing provider in the future.
- Washington County Housing Authority, nonprofit affordable housing providers, and other funders to explore program design options for City acquisition and/or preservation grant/loan programs.

Over the coming years, City should also consider how it can dedicate additional local funding to support preservation and housing stabilization efforts, including:

- Identifying an appropriate flexible local funding source (e.g., CET or general fund) to support acquisition and/or preservation grant/loan programs.
- Allocating additional funding to homebuyer assistance and home repair programs for low-income households in areas at higher risk of displacement.

*The Third Party Demographic Reports are prepared using ESRI's Business Analyst Online (BAO). Reports are created by overlaying the Sherwood School District boundary onto the ESRI BAO data. These reports are for informational purposes only; DD is not responsible for the accuracy of the data.

INTRODUCTION

The Sherwood School District has contracted with Davis Demographics & Planning, Inc. (DD) to develop and analyze demographic data relevant to the District's facility planning efforts. The scope of contracted work includes mapping the District, address matching the current student file, developing, and researching pertinent demographic data, identifying future residential development plans, and developing a ten-year student population forecast. DD will then assist the District in developing solutions for housing future student population. Additionally, this study was prepared to assist the District's efforts in evaluating future site requirements and attendance area changes.

The purpose of this report is to identify and inform the District of current trends occurring in the community; how these trends may affect future student population; and to assist in illustrating facility adjustments that may be necessary to accommodate the potential student population shifts. The District can then use this information to better plan for the need, location and timing of facility or boundary adjustments.

The **Sources of Data** section details where the two sources of data, geographic and non-geographic, are collected and how each data item is used in the ten-year student population forecast model.

The **Ten Year Forecast Methodology** section discusses in detail how the factors used in the study were calculated and why they were used. These factors include the calculation of incoming kindergarten classes, additional students from new housing (referred to as student yield), the effects of student mobility, and a detailed review of planned residential development within the District.

While reading this report, it is important to remember that this is a snapshot of current (October 2022), and potential student population based upon data gathered in Fall 2022. DD uses known residential housing projects that have been filed with the City or County and estimates future annual phasing of only these projects. DD does not estimate any additional units beyond the "known" filed projects and therefore it is possible that more units could be built during this ten-year timeframe. Population demographics, development plans, funding opportunities and district priorities can all change, and therefore, new forecasts and adjustments to the overall Master Plan will continue to be necessary in the future.

On February 12, 2020, the Sherwood SD Board of Directors approved new elementary school boundaries that went into effect in time for the 2020/21 SY and a series of changes took place. The new location for Sherwood HS is located in the western portion of the District. The former Sherwood HS site became the new district-wide middle school. Four main elementary schools still exist, but the old Hopkins ES site became the new District Office, and the former Sherwood MS site is now called Hawks View ES. The former Laurel Ridge MS site was combined with its former Edy Ridge ES site to become a larger campus called Ridges ES. The 10-year forecasted figures in this report will focus on these new boundaries.

EXECUTIVE SUMMARY

Davis Demographics & Planning, Inc. is assisting the Sherwood School District in planning for future student population changes. By factoring current and historical student data with demographic data and planned residential development, DD calculated a ten-year student population forecast. This forecast is based upon the residence of the students and is designed to alert the District as to when and where student population shifts will occur.

On February 12, 2020, the Sherwood SD Board of Directors approved new elementary school boundaries that went into effect in time for the 2020/21 SY and a series of changes took place. A new location for Sherwood HS was located in the western portion of the District. The former Sherwood HS site became the new district-wide middle school. Four main elementary schools are still in existence, but the old Hopkins ES site is now the new District Office and the former Sherwood MS is now called Hawks View ES. The former Laurel Ridge MS site combined with its neighboring Edy Ridge ES to become a larger campus called Ridges ES. The 10-year forecasted figures in this report will focus on these new boundaries.

The Sherwood School District experienced growth in resident student population from 2012 to 2017 but has seen some declines over the last few years, especially in 2020. The District experienced a big jump in its K-12 Student population from fall 2014 to fall 2015, but in 2016 the growth was minimal, and that slow growth trend continued in 2017. Between 2018 and 2019 the Sherwood SD declined by 83 K-12 students and in 2020 that drop was more dramatic; the District lost 400 K-12 students in 2020. Most of the decline in 2020 occurred in the elementary school grades (K-5). The K-5 loss was 18% or 324 students, while the middle school grades 6-8 lost 5.5% (67 6-8 students) and the high school grades lost only 9 total students. The main reason for the loss in 2020 was due to the impact of COVID and the parents pulling their students out of public school (mostly at the Kindergarten level). Over the last few years, the Sherwood SD student population gained back some students, but not many. As of 2022, the District contained 4,674 K-12 students, only 56 more than in 2020; not really gaining back much from that initial 400 student loss.

According to the forecast, the Sherwood School District should see one more year of slight declines in 2023 and then start to see its K-12 student population over the next five years as some of the larger new development begins to start construction. In 2022, the K-12 student population is at 4,674 and that is projected to grow by almost 246 more students over the next five years (to 4,920 K-12 by 2028). It is possible that more students will return to the District over the next few years, but the current trends show otherwise. Now that we are a few years out from the worst of the pandemic, it might be safe to say that the "numbers are the numbers" and that the current forecast might be the most accurate looking forward than in recent years. The lower sized grade classes currently within the elementary school grades eventually reach the District's middle and high school grades and therefore produce a set of declining forecasts for most of the next ten years, despite the growth in new

housing. Most of the District is "aging out" with less students transitioning from grade to grade as well as the birth rate figures continuing to lower.

The progress of the large specific plans, including the beginning of the Autumn Sunrise projects (within the Basalt Creek Planning Area) and the Middlebrook Subdivision (within the Brookman Road Concept plan) all play a large role in whether there is going to be additional student growth within the District boundary. The start-up of these two large projects is included in the 10-year forecast, but the long-delayed Sherwood West units are not. The Autumn Sunrise units began in 2022 and will have their first occupants in 2023 and build for about 5-6 years. The Brookman Road Concept Plan units are currently underway (Middlebrook) and go through 2028. If any changes to these large projects occur (a ramp up or a decline) then they will have an impact on the forecast. Further delays could even cause declines to continue. On the other hand, the ramping-up of the unit construction could generate even more students than forecasted in this report. The progress of this future development will need to be closely monitored by the District.

According to the forecast contained in this report, the K-5 resident student population is expected to see very little growth over the next ten years. The K-5 student count for 2020 dropped down to 1,801 and only regained some of those lost students by 2022 when it reached 1,850. The forecast shows that the K-5 student population may bottom out at around 1,778 by 2023 and then start to see annual increases as it climbs back over 1,800 students by 2024 and then peaks at 1,948 by 2028 (5.2% net growth). The Kindergarten class size took a dramatic hit in 2020 (only 232 K in 2020 compared to 301 in 2019, 332 in 2018 and 331 in 2017). COVID was the main reason for the decline in 2020, but the K class size has only slightly recovered in 2022 with a count of 256 K. These lower Kindergarten class size, causes a ripple effect in future K and other grades as those students matriculate through the grades. The projected increase in new housing over the next 10 years will contribute to net growth in certain areas of the District. However, if the larger Kindergarten class sizes do not get restored, then even the new residential development may not even be enough to help the District's enrollment.

Middle school grades are expected to decline for most of the next ten years as smaller incoming 6th grade classes enter from the declining elementary schools. As of fall 2020, the District had a middle school population of 1,209 students. Now in 2022, the 6th grade class size is even lower at 1,135. If current trends continue, then the middle school counts could peak at 1,155 6-8 by 2025 and then see it drop down to 1,053 by 2032 (a net loss of 82 6-8 students or a net decline of 7.3%).

The current forecast shows a reversal of what was expected for the District's high school compared to previous reports. There is expected to be growth at the high school level but it might peak at around 1,838 9-12 students by 2027. By 2028, the high school population could start to see annual declines as smaller 9th grade classes start to enter the District. Currently (2022), the District has 1,689 9-12 students and

the forecast shows that the District's 9-12 student population could drop down to 1,610 by 2032 (a net loss of 79 9-12 students, a drop of nearly 5%).

SOURCES OF DATA

Geographic Map Data

Five geographic data layers were created for use in the ten-year student population forecasts:

1. Street Centerline Database
2. Study Areas
3. Schools
4. Students – Historical and Current
5. Planned Residential Development

1) Street Centerline Data

The street database has associated attributes that contains but are not limited to, the following fields: full street name, address range and street classification.

The main function of the streets is in the geo-coding process of the student data. Each student is address-matched to the streets by their given address. The geo-coding process places a point on the map for every student in the exact location that student resides. This enables DD to analyze the student data in a geographic manner.

Another vital utilization of the digital street database is in the construction of study areas. Freeways, major streets, and neighborhood streets are used as boundaries for the study areas.

2) Study Areas

Study areas are small geographic areas and the building blocks of a school district; they are similar to neighborhoods. Study areas are geographically defined following logical boundaries of the neighborhood, such as freeways, streets, railroad tracks, rivers, etc. Each study area is then coded with the elementary, middle, and high school that area is assigned to attend. By gathering information about the District at the study area level, you can closely monitor growth and demographic trends in particular regions and spot potential need for boundary changes or new facilities. There are 109 study areas created for the Sherwood SD.

3) Schools

The District provided school detailed information to DD for mapping the District facilities.

4) Student Data

a. Historical Student Data - Historical enrollment is used to compare past student population growth and trends as well as the effects of mobility (move in, move out from existing housing) throughout the District. DD utilized the last three

years (2019, 2020, and 2021) of student enrollment data for each October from fall 2019 through fall 2021.

b. Current Student Data - A student data file representing October 2022 (received by DD as a computer data file from the School District) summarized by grade level and by study area is used as a base for student forecasts. Existing students were categorized by study area through the address-matching process that locates each student within a particular area based upon their given address. The forecasts run each of the next ten years from fall 2022 through fall 2032.

The Student Accounting Summary (Table 1) indicates the total student enrollment as of October 1, 2022 and the number of students used in the ten year student population forecasts. The forecast model is based upon student residence and excludes students residing outside of the District's boundary, students with Grades = 13, Special Education students, independent study students, prekindergarten students and students in which DD was unable to match. Special Education students were excluded from the forecasts (due to different classroom loading standards and not all of the District's elementary schools housed Special Education Students).

Table 1– Student Accounting Summary

Fall 2022 Actual Enrollment (Representing October 1, 2022)

Total Students Provided by the District to DD	4,730
Students Living outside of District boundary	-155
Students with Grades = 13 (excluded from study)	-14
Students with a grade = -1 (excluded from study)	-44
STUDENTS USED IN FORECAST (K-12)	**4,517**

5) Planned Residential Development - This data was obtained through discussions with District staff, developers that have current or future projects within District boundaries, and planning officials from the cities of Sherwood and Tualatin. Data includes, when available, development name, developer/owner, location, housing type, total number of units, and projected move-in dates (phasing estimates). Phasing for planned housing is factored into the ten-year forecast. (See Section Two for a detailed listing of the planned residential development). In the student population forecast, DD includes all Approved and Tentative tract maps in addition to any planned or proposed development that possibly will occur within the forecast timeframe. The planned residential development information and phasing estimates show a snapshot of the District at the time of this study. Any of the residential development information contained within this report may change and should therefore, be updated at least annually.

Non-Geographic Data

Two basic sets of non-geographic data were compiled and reviewed for use in the ten-year student population forecasts by residence:

1. Births by Zip Code
2. Mobility Factors

1) Births by Zip Code Data - Birth data by postal zip code was obtained from the Oregon State Center for Health Statistics, for the years 2004-2019 and roughly correlated to the Sherwood School District's boundary. Past changes in historical birthrates are used to estimate incoming kindergarten student population from existing housing.

2) Mobility Factors - Mobility refers to the increase/decrease in the migration of students within the District boundary (move-in/move-out of students from existing housing). Mobility, similar to a cohort, is applied as a percentage of increase/decrease among each grade for every year of the forecasts. The Mobility Factors help account for apartment movement, housing resales, and dropout rates at the high school level.

TEN YEAR "RESIDENCE" FORECAST METHODOLOGY

The forecast methodology used in this study combines historical student population figures, and past and present demographic characteristics to forecast future student population at the study area level. District-wide forecasts are summarized from the individual study area forecasts. **These forecasts are based upon where the students reside and where they should be attending school. DD uses the actual location of where the students reside, as opposed to their school of enrollment, in order to provide the most accurate estimate of where future school facilities should be located.** The best way to plan for future student population shifts is to know where the next group of students will be residing. The following details the methodology used in preparing the student population forecasts by residence.

Ten-Year Forecasts

Forecasts are calculated ten years from the date of forecast for several reasons. The planning horizon for any type of facility is typically no less than five years, often longer. Ten years is sufficient to adequately plan for any facility. It is a short to mid-term solution for planning needs. Forecasts beyond ten years are based upon speculation due to the lack of reliable information on birthrates, new home construction, economic conditions etc.

Why Forecasts are Calculated by Residence

Typically, school district forecasts are based on enrollment by school. However, this method is inadequate when used to locate future school facility needs because the location of the students is not taken into consideration. A school's enrollment can fluctuate due to variables in the curriculum, program changes, school administration, and open enrollment policies. These variables can skew the apparent need for new or additional facilities in an area.

The method used by DD is unique because it modifies a standard cohort forecast with demographic factors and actual student location. **DD bases its forecasts on the belief that school facility planning is more accurate when facilities are located where the greatest number of students reside.**

The best way to plan for future schools is to know where the next group of students will be coming from. The following details the methodology used in preparing the student population forecasts.

1) Progression - Each year of the forecasts, 12th grade students graduate, and continuing students' progress through to the next grade level. This normal progression of students is modified by the following factors.

2) Incoming Kindergarten – Live birth data is reported to the Oregon State Center for Health Statistics, by the resident postal zip code of the mother. DD uses birth data

by zip code so, if need be, a different birth factor can be applied to various areas of the District.

Incoming kindergarten classes, for existing homes, are estimated by comparing changes in past births and birthrates. Table 2 shows the total births for the two main zip codes in the Sherwood School District area from 2004 to 2021. Incoming kindergarten classes are determined by multiplying the existing kindergarten class (2022) by the percent increase/decrease in the birthrate for the year the kindergarten class was born (2017). Assuming that the fall 2022 kindergarten class was born in 2017, DD compared the total births in 2017 to the total births in 2018, to determine a factor for next year's kindergarten class (Fall 2023). Similarly, 2017 was compared to 2019 (Fall 2023 K class), 2017 to 2020 (Fall 2025 K class) and 2017 to 2021 (Fall 2026 K class). 2022 live birth data was not yet available at the time of this report.

Table 2– Birth Data by Zip Code

Births by Zip Code					Birth Rate		
Birth Year	Kinder Year	97140 (Washington)	97140 (Clackamas)	Total	% Change*	Birthrate Used in Forecast	School Year
2004	2009	299	7	306	137.8%		2009/10
2005	2010	316	0	316	142.3%		2010/11
2006	2011	351	0	351	158.1%		2011/12
2007	2012	318	2	320	144.1%		2012/13
2008	2013	311	14	325	146.4%		2013/14
2009	2014	269	13	282	127.0%		2014/15
2010	2015	266	11	277	124.8%		2015/16
2011	2016	231	10	241	108.6%		2016/17
2012	2017	255	9	264	118.9%		2017/18
2013	2018	240	11	251	113.1%		2018/19
2014	2019	225	7	232	104.5%		2019/20
2015	2020	220	10	230	103.6%		2020/21
2016	2021	234	10	244	109.9%		2021/22
2017	2022	211	11	222	Base Year		2022/23
2018	2023	205	7	212	95.5%	0.955	2023/24
2019	2024	231	10	241	108.6%	1.086	2024/25
2020	2025	176	5	181	81.5%	0.815	2025/26
2021	2026	210	8	218	98.2%	0.982	2026/27
2022	2027	Birth Data was not available at the time of study.			96.1%	0.961	2027/28
2023	2028				91.9%	0.919	2028/29
2024	2029				95.4%	0.954	2029/30
2025	2030				94.5%	0.945	2030/31
2026	2031				93.9%	0.939	2031/32
2027	2032				94.6%	0.946	2032/33

** % Change refers to the change in total births for each year compared to the base year.*

Source: Oregon Department of Health Statistics

= Peak year in births

According to Table 2, the birth data for zip code 97140 (the District's predominant zip code) shows that there was a decrease of births from 2006 to 2011. Births had been relatively unstable with average births from 2003 to 2010 around 312. There was a peak in births in 2006 of 351 live births and then annual declines occurred through 2011 (down to 231). A slight resurgence occurred in 2012 (2017 K) and 2013 (2018 K) and then the births count started to drop again. The future birth rates show that future kindergarten classes should be declining in 2023 then see a spike

for 2024 before returning to more declines in 2025-2026. Birth factors for 2027-2032 are an average of the previous three years and are conducted in this manner because the birth data is not available, or the children have not yet been born. DD elects to follow this common practice because it does not want to over or under project incoming future kindergarteners.

3) Student Mobility Factors - Student mobility factors further refine the ten-year student population forecasts. Mobility refers to the increase/decrease in the migration of students within the District boundary (move-in/move-out of students from existing housing). This factor considers the apartment movement within the District, as well as housing resales and dropout rates at the high school level. Mobility, similar to a cohort, is applied as a percentage of increase/decrease to each grade for every year of the forecasts. DD used the District's historical student data (representing data taken from the fall timeframe) for calculating these factors. The sampling used for the Mobility Factors are taken from the District's established neighborhoods without any recent new housing construction. The idea is to capture the trends of the students where and when they enter the District and apply those similar rates to future grade classes.

A net increase or decrease of zero students over time is represented by a factor of 100%. A net student loss is represented by a factor less than 100% and a net gain by a factor greater than 100% (see the example below).

Example: 100 K grade students in the Archer Glen ES area for fall 2022
X 101.0% (the K-1 Archer Glen ES area Mobility Factor)
101.0 1st grade students in fall 2023 for that area in Archer Glen

The sampling used was taken over a four-year period (student data from 2019 through 2022) and three yearly groupings were calculated. For example, a comparison was made for the fall 2019 K student population to the fall 2020 1st grade students. This comparison was also conducted for the fall 2020 & fall 2021 and fall 2021 & Fall 2022 groupings. Table 3, below, shows the Mobility Factors that were used for this year's report.

Table 3-Mobility Factors

Attendance Area	K to 1	1 to 2	2 to 3	3 to 4	4 to 5	5 to 6	6 to 7	7 to 8	8 to 9	9 to 10	10 to 11	11 to 12
Archer Glen ES	1.01	0.99	0.98	0.99	1.01	1.02	1.00	0.93	1.08	0.97	0.99	0.97
Hawks View ES	0.96	0.94	0.96	1.09	0.96	1.01	0.95	0.97	1.07	0.97	1.00	0.95
Middleton ES	1.03	0.98	0.98	1.04	0.95	1.00	0.97	1.04	1.03	0.95	0.99	0.98
Ridges ES	1.02	0.95	1.02	1.02	1.03	1.03	0.98	0.99	1.06	0.98	0.93	1.02
District-wide Average:	1.01	0.97	0.99	1.04	0.99	1.02	0.98	0.98	1.06	0.97	0.98	0.98

Using Fall 2019 through 2022 Student Data (3 Years of Change) by Elementary Attendance Area

Ridges ES's K to 1 Mobility Factor is 102.0%. That means that for Ridges' area, as students transition from Kindergarten to 1st grade (K to 1st) there is an average student increase of 2%. Since kindergarten is not a required grade, many parents choose to keep their children in daycare facilities through kindergarten and then

bring them into 1st grade at the public school. Hawks View ES area is the only one that sees a net loss from K to 1 (-4%). Most of the Districts mobility factors (56%) are red (less than 1.00). This means that, for the most part, parents are choosing to move out of the Sherwood School District. Most of the losses (red) seen above are some very slight high school dropout rates (in the 2-3% range). The Grade 8 to 9 transition is also typically high (green), and this is due to student entering the District from private or parochial K-8 schools and enrolling in the District's high schools. Slight but typical drop-out rates (red cells) occur in the later high school grades; however, Sherwood SD's figures show a high retention rate of students at that particular level.

4) Student Yield Factors (SYF'S) – Ten-Year Forecasts **-** The Student Yield Factors, when applied to planned residential development units, determine how many additional students will be generated from new housing construction within the District (see **Section Two** for details on planned residential development schedules). Student Yield Factors are sometimes referred to as Student Generation Rates (SGR's). For the 2018-19 study, Davis Demographics conducted a survey of 358 Single-Family Detached (SFD) units built over the last 20 years (1998-2017) and included the results in the table below. However, due to a lack of a large enough sample size for multi-family units, Davis Demographics still used Student Yield Factors from neighboring West Linn-Wilsonville SD (see below). It was not part of Davis Demographics' scope of work this year to update the SYF's, therefore, the same yield factors that were used in last year' study were applied in the 2020 report.

Table 4- Student Yield Factors

Student Yield Factors used in the Sherwood SD 2022/23 Study

Grade	Single Family Detached		Multi-Family (MF) Units	
	358 Units*		605 Units**	
	Students	Factor	Students	Factor
K-6	172	0.480	68	0.112
7-8	60	0.168	19	0.031
9-12	112	0.313	37	0.061
K-12	344	0.961	124	0.205

* = Units constructed within the Sherwood SD area from 1998 - 2018 (20 year period)

Condos, townhomes and apartments, etc.

** = Unit sample from neighboring West Linn-Wilsonville SD (units built between 2007-2013)

Before the SYF's can be applied to the current housing units, the year of construction for each housing type must be analyzed. In general, new housing attracts young families with elementary school aged children. Over the next 12 to 15 years, the children grow older and pass through the grades. This cycle is then repeated throughout the life of the home. Analyzing the year of construction for new housing units can help estimate the number of facilities needed to accommodate new students.

5) <u>Planned Residential Development and Student Yield Factors</u> **-** Closely related to the Student Yield Factors (SYF) are planned residential development units. Planned residential development data is collected to determine the number of new residential units that will be built over the ten-year period of the student population forecasts. The units built within the next ten years will have the appropriate SYF applied to it to determine the number of new students the planned residential development will yield.

This residential development data was obtained through the District, developers that have current or future projects within District boundaries and planning officials from the cities of Sherwood and Tualatin. A database and map of the planned residential development was created, including, when available, project name, location, housing type, total number of units and estimated move in dates (phasing schedule). Projected phasing is based upon occupancy of the unit and is used to help time the arrival of students from these new developments. (see **Section Two** for details on planned residential development occupancy).

In the resident student forecasts, DD includes all Approved and Tentative tract maps in addition to any planned or proposed development that possibly will occur within the forecast timeframe. The planned residential development information and phasing estimates is a snapshot of the District at the time of this study. The residential development information changes quite often and should be updated at least on an annual basis.

APPLYING THE VARIABLES TO GENERATE THE FORECASTS

The following paragraphs summarize how DD uses the factors to determine the student population forecasts. Remember that these forecasts are based on residence.

The Sherwood School District has been broken up into 109 study areas and each are coded for each of the District's elementary, middle, and high school, depending upon what attendance area they fall in. The residential forecasts are calculated at the study area level. This means that DD conducts 109 individual forecasts that are based upon the number of students residing in each study area.

The first step in running these forecasts involves listing the number of students that live in a particular study area by each individual grade (Kindergarten through 12th grade). The current student base (Fall 2022) is then passed onto the next year's grade (2022's K become 2023's 1st graders, 2022's 1st graders become 2023's 2nd graders, and so on). After the natural progressions of students through the grades are applied, Birth Factors are then multiplied to the current Kindergarten class to generate a base for the following year's Kindergarten class (*Section One*).

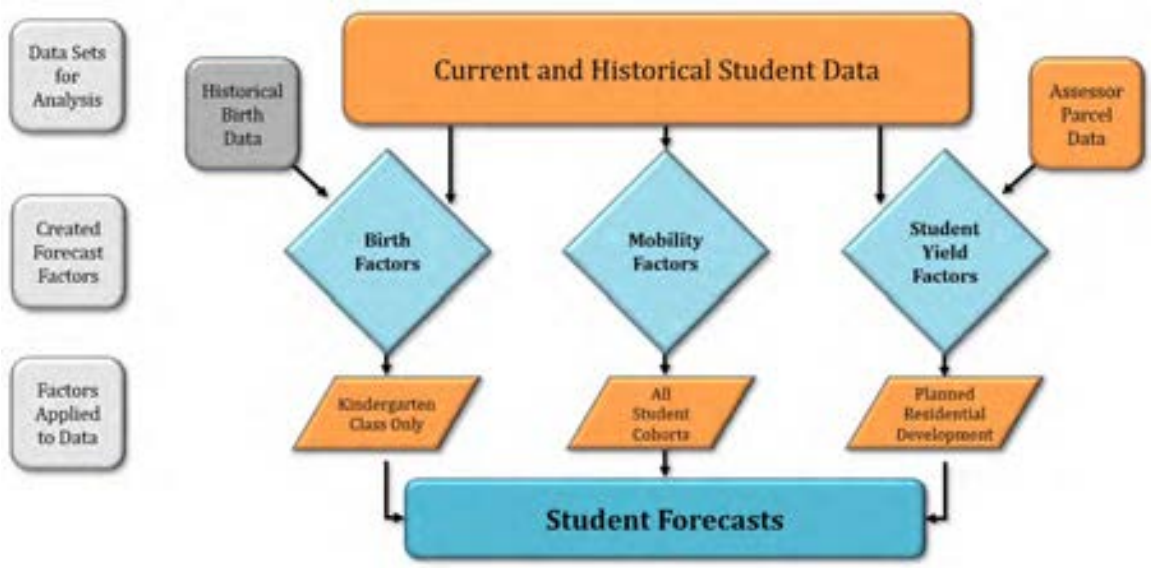
Next, a Mobility Factor is applied to all grades. Again, these factors consider the natural in/out migration of students throughout the District. A specific Mobility Factor was calculated for each grade transition (K to 1st, 1st to 2nd, etc.) within each elementary attendance area and is applied to the appropriate grade (and school area) to estimate the next year's progressed students.

The last essential layer applied to the forecasts deals with additional students from planned residential development (*Section Two*). This is a simple calculation, again conducted at the study area level, where the estimated number of new housing units for a particular year is multiplied by the appropriate Student Yield Factors. For example, if 100 single-family detached (SFD) units are to be built in a specific study area in a given year, then you would multiply this number (100 units, for example) by the SFD K-6 Student Yield Factor (.480) and the resulting number (48 K-6 students) is divided evenly among the six grades (*Section One*).

To finish generating the forecasts by residence, the same process is conducted for each of the 109 study areas. Once the forecasts have been run at the study area level, then it is simple addition to determine forecasts for each of the District's attendance areas or for a district-wide summary. For example, the residential forecasts for Archer Glen Elementary School are simply the summary of all of the study areas that make up this specific attendance area (see *Section Five* for the forecasts of each elementary attendance area). The District Summary for the "residence" forecasts (*Section Four)* is a total summary of all 109 study areas, which excludes all of the students that attend a district school and live outside of the District's boundaries and students unable to be mapped. Then out-of-district students are factored back into the forecasts by simply adding the existing totals in

at the bottom of the forecasts (please see the Attendance Matrices in *Section Three* for a breakdown of the out-of-district students by school). DD adds the current total out-of-district to each year of the forecasts because there is no accurate way to forecast these students in the future.

Davis Demographics' Forecast Methodology Flowchart



PLANNED RESIDENTIAL DEVELOPMENT

This data was obtained through discussions with District staff, developers that have current or future projects within District boundaries and planning officials from the Cities of Sherwood and Tualatin. A database and map of the planned residential development was created, including, when available, project name, location, housing type, total number of units and estimated move in dates (phasing schedule). Projected phasing is based upon occupancy of the unit and is used to help time the arrival of students from these new developments. Please see the next page (page 12) for a map of the known residential projects in the Sherwood School District area. Following the map (on page 13) is a breakdown of the estimated occupancy date for new housing units over the next ten years (from Fall 2023 through Fall 2032) by Study Area and by the three main housing types (single family detached – SFD – units; multi-family attached – MFA – units; and apartments – APT – units). This document is referred to as the District-Wide Residential Development Summary. In addition, DD has included a Residential Development List (page 13), which is sorted by Study Area and is an inventory of all known residential projects that are expected to be active over the next ten years.

DD estimates that as many as 1,552 Single-Family Detached units, 454 multi-family units, and 67 Apartment units could be built within the Sherwood District boundary over the next ten years (a grand total of 2,073 mixed units). This number of units is definitely possible and is not unprecedented. Most of these units are estimated to be constructed within a six-year period (fall 2022 through fall 2028 school years) with an estimated average of 301 units to be built each year during that time span.

Please note that all phasing schedules are based on occupancy, all Approved and Tentative maps plus proposed and potential development are included on these lists, the Summary only includes units that may be occupied in the ten year timeframe of the forecasts and are based upon data gathered during October to December of 2022 and may not reflect recent changes.

THE K-5 ATTENDANCE MATRIX

An Elementary (K-5) Attendance Matrix has been included to provide a better understanding of where students reside and where they attend school. This matrix helps to see a "snapshot" of the District's current Open Enrollment patterns. DD has also created a Middle and High Attendance Matrix on the following pages. The following three matrices are based upon the new boundaries, approved by the Board on 2/12/2020; which just took effect this year, in time for the 2020/21 SY.

The attendance matrix acts as a checks and balance for student accounting. It shows where the students reside (what is their School of Residence) based upon our address matching capabilities and what school they attend (School of Attendance) based upon data in the student file supplied by the District. The inclusion of this matrix is essential to showing how the students used in the forecasts match up to the District's records of enrollment for each school. The best way to plan for future facilities is to know where the next group of students will be coming from, not necessarily which school they are currently attending.

Remember, DD's forecasts are based upon where the students reside, not where they attend school. DD uses the actual location of where the students reside, as opposed to their school of enrollment, in order to provide the most accurate depiction of where future facilities (if necessary) should be located. Therefore, since the forecasts are based upon where the students reside, the figures DD uses as a base for each school's resident forecast may be slightly higher or lower than the actual reported enrollment for each school.

READING THE MATRIX

Looking at the K-5 Elementary School Attendance Matrix on page 16, let us begin with Archer Glen ES as an example. Following down the second column with the "Archer Glen ES (#1334)" heading, on the first row you see that there are 316 K-5 grade students attending Archer Glen ES and residing in the Archer Glen ES attendance area. Continuing downward, 7 students attended Archer Glen ES, but resided in the Hawks View ES attendance area. Next, it shows that no students attend Archer Glen ES and reside in the Middleton ES attendance area, and two students attended Archer Glen ES in October 2022, but lived within the Ridges ES boundary.

The row entitled "Pre Kindergarten" shows the number of PK students attending Archer Glen ES in October 2022; there were no PK students attending Archer Glen ES. The row named "Special Education" refers to all elementary level Special Day Class students attending the District. Eleven special education students attended Archer Glen ES in 2022. The row entitled "Out-of-District" refers to students living completely outside of Sherwood School District but attending one of the District's schools. There are six Out-of-District students attending Archer Glen ES. The "K-5 Totals" row shows the total number of K-5 students attending a school regardless of where they reside; this should reflect the District's enrollment counts for each school as of October 1st, 2022. There were 331 students attending Archer Glen ES as

of October 2022. At the bottom of the matrix, DD lists the District's "Open Enrollment Percentage," a figure that lists the total number of students attending the particular school but live outside of the designated boundary. There were 15 out-of-zone students attending Archer Glen ES in October 2022; a percentage of 4.6% of Archer Glen ES's students came from outside of its current boundary.

The next step is to read across the matrix, beginning with the Archer Glen ES attendance area row. It is now understood that the 316 represent the total number of K-5 grade students that reside in the Archer Glen ES attendance area and attend Archer Glen ES. The next column, titled "Hawks View ES (#1191)", lists the number of K-5 grade students that reside in the Archer Glen ES attendance area, but attend Hawks View ES. Eight K-5 students reside in the Archer Glen ES attendance area but attend Hawks View ES as of October 2022, and so on.

The K-5 Students column in the beginning represents the total number of students living in that particular attendance area. There are 3302 K-5 students residing in the Archer Glen ES attendance area. Reading down the Totals column, you will find the number of K-5 students used in the fall 2022 forecasts - - 1,795 K-5 students (excluding Special Education and Out-of-District students). A total of 1,894 PK-5 students attended a District school as of October 1, 2022 (with a District-wide "Transfer-In" rate of 5.4%).

The Middle School 6-8 Matrix (on page 17) and the High School 9-12 Matrix (on page 18) is read in the same manner as the Elementary School Matrix.

DISTRICT-WIDE STUDENT FORECASTS (BY "RESIDENCE")

The student population is projected out ten years for each of the study areas and for the entire Sherwood School District. The District-Wide Summary enables the District to see a broad overview of future growth and what impact this growth will have on existing facilities. The study area listings enable the District to monitor student population growth or decline in smaller geographic areas within the District (please see *Appendix A* for the individual 109 Study Area forecasts).

At any point in time, study areas and their projected resident students can be shifted between schools to assist in balancing enrollment growth. Together, these forecast summaries present the means for identifying the timing of additional student arrival and overall facility requirements and location to accommodate the District's expected growth.

The following page shows the District-Wide Forecasts by "Residence" using the fall 2022 (early-October) student data as the base; the fall 2019 through fall 2021student listings are there for reference. Ten consecutive years are then projected from fall 2023 through fall 2032 with the Out-of-District students separated from the sub-totals. The Out-of-District are added back into the 10-year forecast using the same fall 2022 figures. At the bottom of the District-Wide Forecast, a projected annual change is listed.

For an exact breakdown of how many Out-of-District, Special Education and Unmatched students there were for each elementary school as of fall 2022, please see the K-5 Attendance Matrix on page 16, the 6-8 Middle School Matrix on page 17, and the 9-12 High School Matrix on page 18.

The above projections are based upon a student data file provided to Davis Demographics by the Sherwood School District representing October 1, 2022.

Forty four (44) students with a grade = -1 were given to Davis Demographics in the original student data file and were excluded from the above projections.
Fourteen (14) students with a grade = 13 were given to Davis Demographics in the original student data file and were excluded from the above projections.

District Wide Student Population Forecast Trends ("Residence" Method)

The Sherwood School District experienced growth in resident student population from 2012 to 2017 but has seen some declines the last few years, especially in 2020. The District experienced a big jump in its K-12 Student population from fall 2014 to fall 2015, but in 2016 the growth was minimal, and that slow growth trend continued in 2017. Between 2018 and 2019 the Sherwood SD declined by 83 K-12 students and in 2020 that drop was more dramatic; the District lost 400 K-12 students in 2020. Most of the decline in 2020 occurred in the elementary school grades (K-5). The K-5 loss was 18% or 324 students, while the middle school grades 6-8 lost 5.5% (67 6-8 students) and the high school grades lost only 9 total students. The main reason for the loss in 2020 was due to the impact of COVID and the parents pulling their students out of public school (mostly at the Kindergarten level). Over the last few years, the Sherwood SD student population gained back some students, but not many. As of 2022, the District contained 4,674 K-12 students, only 56 more than in 2020; not really gaining back much from that initial 400 student loss.

According to the forecast, the Sherwood School District should see one more year of slight declines in 2023 and then start to see its K-12 student population over the next five years as some of the larger new development begins to start construction. In 2022, the K-12 student population is at 4,674 and that is projected to grow by almost 246 more students over the next five years (to 4,920 K-12 by 2028). It is possible that more students will return to the District over the next few years, but the current trends show otherwise. Now that we are a few years out from the worst of the pandemic, it might be safe to say that the "numbers are the numbers" and that the current forecast might be the most accurate looking forward than in recent years. The lower sized grade classes currently within the elementary school grades eventually reach the District's middle and high school grades and therefore produce a set of declining forecasts for most of the next ten years, despite the growth in new housing. Most of the District is "aging out" with less students transitioning from grade to grade as well as the birth rate figures continuing to lower.

The progress of the large specific plans, including the beginning of the Autumn Sunrise projects (within the Basalt Creek Planning Area) and the Middlebrook Subdivision (within the Brookman Road Concept plan) all play a large role in whether there is going to be additional student growth within the District boundary. The start-up of these two large projects is included in the 10-year forecast, but the long-delayed Sherwood West units are not. The Autumn Sunrise units began in 2022 and will have their first occupants in 2023 and build for about 5-6 years. The Brookman Road Concept Plan units are currently underway (Middlebrook) and go through 2028. If any changes to these large projects occur (a ramp up or a decline) then they will have an impact on the forecast. Further delays could even cause declines to continue. On the other hand, the ramping-up of the unit construction could generate even more students than forecasted in this report. The progress of this future development will need to be closely monitored by the District.

According to the forecast contained in this report, the K-5 resident student population is expected to see very little growth over the next ten years. The K-5 student count for 2020 dropped down to 1,801 and only regained some of those lost students by 2022 when it reached 1,850. The forecast shows that the K-5 student population may bottom out at around 1,778 by 2023 and then start to see annual increases as it climbs back over 1,800 students by 2024 and then peaks at 1,948 by 2028 (5.2% net growth). The Kindergarten class size took a dramatic hit in 2020 (only 232 K in 2020 compared to 301 in 2019, 332 in 2018 and 331 in 2017). COVID was the main reason for the decline in 2020, but the K class size has only slightly recovered in 2022 with a count of 256 K. These lower Kindergarten class size, causes a ripple effect in future K and other grades as those students matriculate through the grades. The projected increase in new housing over the next 10 years will contribute to net growth in certain areas of the District. However, if the larger Kindergarten class sizes do not get restored, then even the new residential development may not even be enough to help the District's enrollment.

The middle school grades are expected to decline for most of the next ten years as smaller incoming 6th grade classes enter from the declining elementary schools. As of fall 2020, the District had a middle school population of 1,209 students. Now in 2022, the 6th grade class size is even lower at 1,135. If current trends continue, then the middle school counts could peak at 1,155 6-8 by 2025 and then see it drop down to 1,053 by 2032 (a net loss of 82 6-8 students or a net decline of 7.3%).

The current forecast shows a reversal of what was expected for the District's high school compared to previous reports. There is expected to be growth at the high school level but it might peak at around 1,838 9-12 students by 2027. By 2028, the high school population could start to see annual declines as smaller 9th grade classes start to enter the District. Currently (2022), the District has 1,689 9-12 students and the forecast shows that the District's 9-12 student population could drop down to 1,610 by 2032 (a net loss of 79 9-12 students, a drop of nearly 5%).

Sherwood
SCHOOL DISTRICT

NOTE: Current counts are based on 2022/23 SY resident K-5 counts. The 2025, 2027 and 2032 projected resident counts are based on K-5 counts for the new boundaries. All counts EXCLUDE out-of-District students (see Matrix).

Forecast Trends for the District's Elementary School (K-5) Attendance Areas ("Residence" Forecasts)

On February 12, 2020, the Sherwood SD Board of Directors approved new elementary school boundaries that went into effect in time for the 2020/21 SY and a series of changes took place. A new location for Sherwood HS is now located in the western portion of the District. The former Sherwood HS site has become the new district-wide middle school. The four main elementary schools will still be in place, but the old Hopkins ES site will become the new District Office and the former Sherwood MS will be the "new" Hawks View ES. The former Laurel Ridge MS site will be combined with its neighboring Edy Ridge ES to become a larger campus now called Ridges ES. The 10-year forecasted figures in this report will focus on these new boundaries.

In the current set of forecasts, the Sherwood School District is now projected to experience minimal growth in its resident student population among the elementary grades over the next ten years. Since 2019, the District has lost 275 K-5 students, mostly due the impact of COVID (starting in 2020), but over the following two years the District did not fully recover the number of "missing" students (2,125 K-5 in 2019 and 1,850 K-5 in 2022). The incoming residence Kindergarten class in 2020 was much lower than anticipated. The Kindergarten class sizes the previous four years were 301 K in 2019, 332 K in 2018, 331 K in 2017 and 292 in 2016. In 2020, the resident K class size was 232 (obviously low due to parents holding back their Kindergarteners). In 2021, the K class size did climb back up to 297, but in 2022 it dropped back down to 256 which does impact this years' forecast. In this year's report, the District is expected to see its resident K-5 student population bottom out around 1,734 in 2023 and then see increases each year through 2028, reaching 1,903 and then slowing dropping off until it settles around 1,842 in 2032.

The new Archer Glen attendance area is the only one of the four elementary boundaries that is expected to see a net decline over the next 10 years. The areas with the largest projected resident K-5 gains over the next ten years are, in order (1) Hawks View ES (+72 K-5), (2) Middleton ES (+33 K-5) and (3) Ridges ES (+26 K-5). Archer Glen's new boundary could lose 96 K-5 students. The new Hawks View area could have 1,023 new housing units built over the next 10 years, the new Ridges ES area has the potential for 682 new housing units and the Middleton boundary area does have a potential for 368 new housing units over the next ten years. Archer Glen's new area does not have any new planned development at this time. Overall, the student forecasts in this report are lower than those prior to the pandemic.

INDIVIDUAL ELEMENTARY SCHOOL ATTENDANCE AREA ANALYSIS

The **Archer Glen Elementary School** attendance area is the only region among the District's four elementary zones that is expected to decline over the next ten years. After the boundary changes a few years ago, the Archer Glen ES boundary is now the District's smallest elementary school both in terms of its geography as well as its

resident population. In addition, as of now there are no new housing units planned for this region. As of fall 2022, the Archer Glen ES attendance area contained 331 resident K-5 students living within its boundaries, after having as many as 398 as recently as 2019. Obviously, a lot of this decline was due to COVID, but the counts in the region did not rebound after 2020. Based on the current set of forecasts, the Archer Glen boundary is expected to lose another 96 K-5 students by 2032. The capacity for the Archer Glen ES is 390. Therefore, it appears that the new Archer Glen ES should be able to handle its projected resident count for the next ten years. Archer Glen ES should have the capacity to help out some of its neighboring schools.

For the 2020/21 school year, the **Ridges Elementary School** campus expanded with the incorporation of the previous Edy Ridge campus plus the former Laurel Ridge MS site. The new capacity for Ridges ES is at around 955. Therefore, it made sense to expand the Ridges' boundary when exploring new adjustments. The new Ridges ES attendance area is forecasted to experience growth over the next ten years. As of fall 2019, there were 771 resident K-5 students living within the new Ridges new attendance area and that figure dropped to 640 K-5 students in 2020 (a net loss of 131 K-5 students in one year). There was a slight rebound in 2021 when the Ridges ES had 691 resident K-5 students, but then dropped down again in 2022 to 668 residents. The impact of COVID hit this area the most and it affected its forecast as well; not as high a count of students is expected in this report compared to those previous to 2020. Over the next year, the Ridges area could actually drop a bit more (660 K-5 residents in 2023), but it should then start to see annual increases through 2028 as the residential development picks up (770 K-5 residents by 2028). At that point, the resident K-5 counts for the Ridges area could slowly drop down to around 694 students by 2032. The majority of the Brookman Road Concept Plan is now located within the Ridges boundary and its portion contains just 722 new SFD units. These new housing units are the biggest contributor to the projected increase in students for the Ridges area. The first of the Brookman projects is the Middlebrook Subdivision, which contains 145 units and its first occupants were expected in late 2022/early 2023. In previous reports it was looking like the Ridges ES may exceed its design capacity due to this development, but with the reduction of students due to COVID, it does not appear likely over the next 10 years. However, the District will need to closely monitor the progress of the new housing units and if it grows faster than expected, then interim measures may need to be made to house additional students, such as diverting some students to other sites or adding temporary portables.

Starting the 2020/21 school year, **Hawks View Elementary School** is now permanently located at the former Sherwood MS site. The Hawks View ES attendance area shows 16% growth over the next ten years. In 2019, the Hawks View ES area contained 502 K-5 students and in 2020, that figure has dropped to 442 in 2022. The forecast in this year's report shows that the Hawks View area could drop a bit more down to 431 in 2023 and then see its resident counts rise up to 570 by 2026. In 2027, slow declines could occur and then the Hawks View ES area could settle down to around 514 resident K-5 students by 2032: still a net

growth of 72 K-5 students. During the boundary process an ideal capacity figure of 506 was used for the Hawks View ES site (however, as Sherwood MS that site regularly housed student counts around 700 students). The Hawks View ES boundary does contain the District's portion of the Autumn Sunrise projects (aka Basalt Creek Planning Area), which consists of 454 single-family homes, 454 condos/townhomes and 67 apartment units. The Autumn Sunrise projects should see its first occupants this year (2023) and continuing for at least the next seven years. These new units are the largest contributor to the Hawks View area growth. It appears that the Hawks View ES site should be able to house these additional students from this new housing. However, the progress of this development will need to be followed closely by the District and temporary portables may be necessary if the growth is larger than expected.

The new **Middleton Elementary School** boundary could see a small net growth of another 33 K-5 students over the next 10 years. In fall 2019, the new Middleton ES attendance area contained 427 K-5 students, but the 2020 K-5 dropped by 53 K-5 students (374 K-5). Since then, the resident K-5 counts for the Middleton ES area have dropped a bit more, to 369 in 2021 and 364 in 2022. The Kindergarten class size alone went from 65 in 2019 to 42 in 2020, back up to 60 in 2021 and then down to 49 in 2022. The lower K class size in 2022 alone caused this year's forecast to be lower than in the past. COVID was the main contributor for the sudden decline in Middleton residents in 2020 but many of those "missing" students really didn't return. Therefore, this set of forecasts for the Middleton area has the resident K-5 counts bottom out at 320 in 2025 and then climb back up to 410 K-5 students by 2031. A piece of the Brookman Road Concept Plan (362 SFD units) is still located within the Middleton ES boundary and could start to see new occupants as soon as 2024 or 2025. The goal capacity used for Middleton ES was 470 during the boundary adjustments a few years back; therefore, Middleton ES should be fine if this forecast is correct. Middleton ES has had enrollment in the range of 544 (2019) to 621 (2015) K-5 students. The purpose of the boundary adjustments was to have Middleton ES have a more reasonable total enrollment, but it appears that it could hold up to 600 K-5 students, if necessary. Like the Ridges ES area, the District will need to closely monitor the residential development within the Middleton area and may need to take additional measures to properly house the additional students if it rebounds and resembles higher counts from previous forecasts.

ELEMENTARY SCHOOL CONCLUSIONS

Adjustments to all four of the District's current elementary school boundaries were approved by the Board of Directors on February 12, 2020. Two of the main site changes included the expansion of Edy Ridge ES site (combining with the former Laurel Ridge MS site) to form the new Ridges ES campus and Hawks View ES taking over the former Sherwood MS site. In the forecast contained within this report shows that the Sherwood SD is expected to only grow by 35 more K-5 students through 2032, much lower than forecasts prior to COVID. The areas with the largest projected resident K-5 gains over the next ten years are, in order (1) Ridges ES (+73 K-5), (2) Hawks View ES (+38 K-5), and (3) Middleton ES (+13 K-5). Archer Glen's new boundary could lose 88 K-5 students. With the now larger Ridges and Hawks View sites, the District should be able to accommodate the new growth in their areas over the next ten years. The exact start dates of some of the larger planned residential developments such as the Brookman Road Concept Plan and the Autumn Sunrise projects (within the Basalt Creek Planning Area), need to be closely monitored by the District. The Autumn Sunrise and Middlebrook Subdivision already has occupants arriving this upcoming school year. Units from these projects are included in the ten-year forecasts in this report. If any of these projects are sped up or delayed, then the forecasts included in this report could change. Temporary actions, such as using portables, may be needed in order to properly house some of the future students. However, it does appear that based on previous enrollment counts at these existing sites the District should be able to accommodate the projected K-5 growth over the next 10 years.

NOTE: On February 12, 2020, the Sherwood SD Board of Directors approved new boundaries for the school district that will take effect in time for the 2020/21 school year. One of those changes was to open a new high school site (on the west side of the District) and repurpose the "old" Sherwood HS site to be a district-wide middle school. The old Sherwood MS opened as the new Hopkins ES (the old Hopkins site is going to be the new District Office) and the old Laurel Ridge MS site was combined with its neighboring Edy Ridge ES to form Ridges ES, which now has a much larger capacity. Therefore, there will no longer be multiple middle school boundary zones. The new Sherwood Middle School (the former Sherwood HS) has district-wide boundaries.

Above forecasts EXCLUDE Out-of-District students.
Please see the Middle School 6-8 Attendance Matrix for a detailed breakdown of this student group.

Forecast Trends for the District's Middle School (6-8) Attendance Areas ("Residence" Forecasts)

Starting in the current 2020/21 SY, the Sherwood SD went from a two middle school District to a one middle school district. The former Sherwood HS site was converted into the new Sherwood MS, which now can house even more 6-8 students than in its previous design.

MIDDLE SCHOOL CONCLUSIONS

The District's middle school population had been growing about 40-50 students a year up until 2019. In 2020, the 6-8 student population declined by 67 students, which was most likely due to COVID, but still lost another 74 7-8 students between 2020 and 2022. As a result, the 10-year forecast has the 6-8 student population dropping by 82 students through 2032 (a 7.2% decline). It is possible that some of the decline was due to parents pulling their students out of the public school system as a result of COVID, but it is now looking unlikely at this point that those "missing" students are actually going to return to the District. Currently, the District contains 1,135 6-8 students and it drop down to 1,053 6-8 students by 2032. New housing developments are included in this estimate, but those new units and students do not make up enough growth to counter the smaller grade classes entering the system plus the lower birth counts (it is starting to "age out" over most of the District territory). Overall, it appears that the District's middle school should have no problems accommodating the forecasted 6-8 student population contained within this report.

The District will need to closely monitor the progress of the two specific plans, in addition to the delayed Sherwood West units, especially if these developments start sooner than expected and generate more students than forecasted.

NOTE: On February 12, 2020, the Sherwood SD Board of Directors approved new boundaries for the school district that took effect in time for the 2020/21 school year. One of those changes was to open a new high school site (on the west side of the District) and repurpose the "old" Sherwood HS site to be a district-wide middle school. The old Sherwood MS site opened as the new Hopkins ES (the old Hopkins site is the new District Office) and the old Laurel Ridge MS site combined with its neighboring Edy Ridge ES to form Ridges ES, which has a much larger capacity. Therefore, there will no longer be multiple middle school boundary zones. The new middle school (the former Sherwood HS) will have district-wide boundaries. The above forecasts for the new Sherwood High School forecasts remain the same, except for the actual location of the "new" Sherwood HS.

Above forecasts EXCLUDE 80 9-12 Out-of-District students
and 14 students with a grade designation of 13.

Forecast Trends for the District's High School (9-12) Attendance Area ("Residence" Forecasts)

The Sherwood School District has one high school, Sherwood HS. The high school has experienced growth within the 9-12 resident student population from 2012 to 2017, but then saw slight declines starting in 2018 and has continued through 2020. An uptick in the 9-12 student population happened in 2021 and 2022, but most of that was due to increasing number of high school students from outside the District (32 9-12 out-of-District students in 2020, up to 60 in 2021 and then up to 80 for 2022). A net decline of 79 9-12 students is expected over the next ten years as smaller 9th grade classes begin to enter the District's high schools. Therefore, based on this current set of forecasts, the District's new high school should have no problems accommodating its resident population though 2032.

Overall, the District will need to closely monitor the progress of the large specific plans (especially the delayed Sherwood West units) within the District boundary since those developments may potentially start sooner than expected and could generate more students than forecasted.

School Codes and School Assignments by Study Area

The Sherwood School District has assigned each school a code and DD has incorporated these same codes in the databases and data layers that they have created/maintained for the district. Each study area is then coded with the elementary, middle, and high school that the area is assigned to attend.

ELEMENTARY SCHOOLS (K-5)

Only Schools with assigned attendance areas are listed. The below boundaries are based upon those approved by the Sherwood School District Board of Directors on February 12th, 2020.

School Code	Elementary School Name	Study Areas for Each Attendance Area
1334	Archer Glen ES **16 Study Areas**	58, 59A, 59B, 60, 61, 62, 63, 65, 66, 67, 68, 69A, 69B, 78, 79, 80
4730	Ridges ES **37 Study Areas**	1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11A, 11B, 12, 13, 14, 15, 16, 17A, 17B, 18A, 18B, 18C, 19, 20, 21, 22, 33A, 33B, 34, 35, 36, 37A, 45, 45D, 86A, 86D, 87
1191	Hawks View ES **33 Study Areas**	23A, 23B, 24A, 24B, 25A, 25B, 25C, 26, 27, 28, 29, 30, 31, 32, 64, 70, 71, 72, 73, 74, 75, 76, 77, 81, 82A, 82B, 82C, 83, 84, 85A, 85B, 86B, 86C
3222	Middleton ES **23 Study Areas**	37B, 38, 39, 40, 41, 42, 43, 44, 46A, 46B, 46C, 47, 48, 49, 50, 51, 52, 53, 54A, 54B, 55, 56, 57
	4 Elementary Schools	**109 Study Areas**

School Codes and School Assignments by Study Area (continued)

MIDDLE SCHOOLS (6-8) and HIGH SCHOOLS (9-12)

Only Schools with assigned attendance areas are listed. The below boundaries are based upon those approved by the Sherwood School District Board of Directors on February 12th, 2020.

Middle School Name	Study Areas for Each Attendance Area
Sherwood MS (109 Study Areas)	1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11A, 11B, 12, 13, 14, 15, 16, 17A, 17B, 18A, 18B, 18C, 19, 20, 21, 22, 23A, 23B, 24A, 24B, 25A, 25B, 25C, 26, 27, 28, 29, 30, 31, 32, 33A, 33B, 34, 35, 36, 37A, 37B, 38, 39, 40, 41, 42, 43, 44, 45, 45D, 46A, 46B, 46C, 47, 48, 49, 50, 51, 52, 53, 54A, 54B, 55, 56, 57, 58, 59A, 59B, 60, 61, 62, 63, 64, 65, 66, 67, 68, 69A, 69B, 70, 71, 72, 73, 74, 75, 76, 77, 78, 79, 80, 81, 82A, 82B, 82C, 83, 84, 85A, 85B, 86A, 86B, 86C, 86D, 87
1 Middle School	**109 Study Areas**

High School Name	Study Areas for Each Attendance Area
Sherwood HS (109 Study Areas)	1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11A, 11B, 12, 13, 14, 15, 16, 17A, 17B, 18A, 18B, 18C, 19, 20, 21, 22, 23A, 23B, 24A, 24B, 25A, 25B, 25C, 26, 27, 28, 29, 30, 31, 32, 33A, 33B, 34, 35, 36, 37A, 37B, 38, 39, 40, 41, 42, 43, 44, 45, 45D, 46A, 46B, 46C, 47, 48, 49, 50, 51, 52, 53, 54A, 54B, 55, 56, 57, 58, 59A, 59B, 60, 61, 62, 63, 64, 65, 66, 67, 68, 69A, 69B, 70, 71, 72, 73, 74, 75, 76, 77, 78, 79, 80, 81, 82A, 82B, 82C, 83, 84, 85A, 85B, 86A, 86B, 86C, 86D, 87
1 High School	**109 Study Areas**

On February 12th, 2020, the Sherwood School District Board of Directors approved new boundaries that went into effect starting at the beginning of the 2020/21 school year. Among the changes in the boundaries included consolidating the 2 middle schools into now one District-wide boundary to be housed at the former "old" Sherwood HS site. The boundaries for the District's high schools did not change. The HS boundaries are still district-wide, but now are housed at a new Sherwood HS site (located on the west side of the District).

INTRODUCTION

The Sherwood School District has contracted with Davis Demographics & Planning, Inc. (DD) to develop and analyze demographic data relevant to the District's facility planning efforts. The scope of contracted work includes mapping the District, address matching the current student file, developing, and researching pertinent demographic data, identifying future residential development plans, and developing a ten-year student population forecast. DD will then assist the District in developing solutions for housing future student population. Additionally, this study was prepared to assist the District's efforts in evaluating future site requirements and attendance area changes.

The purpose of this report is to identify and inform the District of current trends occurring in the community; how these trends may affect future student population; and to assist in illustrating facility adjustments that may be necessary to accommodate the potential student population shifts. The District can then use this information to better plan for the need, location and timing of facility or boundary adjustments.

The **Sources of Data** section details where the two sources of data, geographic and non-geographic, are collected and how each data item is used in the ten-year student population forecast model.

The **Ten Year Forecast Methodology** section discusses in detail how the factors used in the study were calculated and why they were used. These factors include the calculation of incoming kindergarten classes, additional students from new housing (referred to as student yield), the effects of student mobility, and a detailed review of planned residential development within the District.

While reading this report, it is important to remember that this is a snapshot of current (October 2022), and potential student population based upon data gathered in Fall 2022. DD uses known residential housing projects that have been filed with the City or County and estimates future annual phasing of only these projects. DD does not estimate any additional units beyond the "known" filed projects and therefore it is possible that more units could be built during this ten-year timeframe. Population demographics, development plans, funding opportunities and district priorities can all change, and therefore, new forecasts and adjustments to the overall Master Plan will continue to be necessary in the future.

On February 12, 2020, the Sherwood SD Board of Directors approved new elementary school boundaries that went into effect in time for the 2020/21 SY and a series of changes took place. The new location for Sherwood HS is located in the western portion of the District. The former Sherwood HS site became the new district-wide middle school. Four main elementary schools still exist, but the old Hopkins ES site became the new District Office, and the former Sherwood MS site is now called Hawks View ES. The former Laurel Ridge MS site was combined with its former Edy Ridge ES site to become a larger campus called Ridges ES. The 10-year forecasted figures in this report will focus on these new boundaries.

EXECUTIVE SUMMARY

Davis Demographics & Planning, Inc. is assisting the Sherwood School District in planning for future student population changes. By factoring current and historical student data with demographic data and planned residential development, DD calculated a ten-year student population forecast. This forecast is based upon the residence of the students and is designed to alert the District as to when and where student population shifts will occur.

On February 12, 2020, the Sherwood SD Board of Directors approved new elementary school boundaries that went into effect in time for the 2020/21 SY and a series of changes took place. A new location for Sherwood HS was located in the western portion of the District. The former Sherwood HS site became the new district-wide middle school. Four main elementary schools are still in existence, but the old Hopkins ES site is now the new District Office and the former Sherwood MS is now called Hawks View ES. The former Laurel Ridge MS site combined with its neighboring Edy Ridge ES to become a larger campus called Ridges ES. The 10-year forecasted figures in this report will focus on these new boundaries.

The Sherwood School District experienced growth in resident student population from 2012 to 2017 but has seen some declines over the last few years, especially in 2020. The District experienced a big jump in its K-12 Student population from fall 2014 to fall 2015, but in 2016 the growth was minimal, and that slow growth trend continued in 2017. Between 2018 and 2019 the Sherwood SD declined by 83 K-12 students and in 2020 that drop was more dramatic; the District lost 400 K-12 students in 2020. Most of the decline in 2020 occurred in the elementary school grades (K-5). The K-5 loss was 18% or 324 students, while the middle school grades 6-8 lost 5.5% (67 6-8 students) and the high school grades lost only 9 total students. The main reason for the loss in 2020 was due to the impact of COVID and the parents pulling their students out of public school (mostly at the Kindergarten level). Over the last few years, the Sherwood SD student population gained back some students, but not many. As of 2022, the District contained 4,674 K-12 students, only 56 more than in 2020; not really gaining back much from that initial 400 student loss.

According to the forecast, the Sherwood School District should see one more year of slight declines in 2023 and then start to see its K-12 student population over the next five years as some of the larger new development begins to start construction. In 2022, the K-12 student population is at 4,674 and that is projected to grow by almost 246 more students over the next five years (to 4,920 K-12 by 2028). It is possible that more students will return to the District over the next few years, but the current trends show otherwise. Now that we are a few years out from the worst of the pandemic, it might be safe to say that the "numbers are the numbers" and that the current forecast might be the most accurate looking forward than in recent years. The lower sized grade classes currently within the elementary school grades eventually reach the District's middle and high school grades and therefore produce a set of declining forecasts for most of the next ten years, despite the growth in new

housing. Most of the District is "aging out" with less students transitioning from grade to grade as well as the birth rate figures continuing to lower.

The progress of the large specific plans, including the beginning of the Autumn Sunrise projects (within the Basalt Creek Planning Area) and the Middlebrook Subdivision (within the Brookman Road Concept plan) all play a large role in whether there is going to be additional student growth within the District boundary. The start-up of these two large projects is included in the 10-year forecast, but the long-delayed Sherwood West units are not. The Autumn Sunrise units began in 2022 and will have their first occupants in 2023 and build for about 5-6 years. The Brookman Road Concept Plan units are currently underway (Middlebrook) and go through 2028. If any changes to these large projects occur (a ramp up or a decline) then they will have an impact on the forecast. Further delays could even cause declines to continue. On the other hand, the ramping-up of the unit construction could generate even more students than forecasted in this report. The progress of this future development will need to be closely monitored by the District.

According to the forecast contained in this report, the K-5 resident student population is expected to see very little growth over the next ten years. The K-5 student count for 2020 dropped down to 1,801 and only regained some of those lost students by 2022 when it reached 1,850. The forecast shows that the K-5 student population may bottom out at around 1,778 by 2023 and then start to see annual increases as it climbs back over 1,800 students by 2024 and then peaks at 1,948 by 2028 (5.2% net growth). The Kindergarten class size took a dramatic hit in 2020 (only 232 K in 2020 compared to 301 in 2019, 332 in 2018 and 331 in 2017). COVID was the main reason for the decline in 2020, but the K class size has only slightly recovered in 2022 with a count of 256 K. These lower Kindergarten class size, causes a ripple effect in future K and other grades as those students matriculate through the grades. The projected increase in new housing over the next 10 years will contribute to net growth in certain areas of the District. However, if the larger Kindergarten class sizes do not get restored, then even the new residential development may not even be enough to help the District's enrollment.

Middle school grades are expected to decline for most of the next ten years as smaller incoming 6th grade classes enter from the declining elementary schools. As of fall 2020, the District had a middle school population of 1,209 students. Now in 2022, the 6th grade class size is even lower at 1,135. If current trends continue, then the middle school counts could peak at 1,155 6-8 by 2025 and then see it drop down to 1,053 by 2032 (a net loss of 82 6-8 students or a net decline of 7.3%).

The current forecast shows a reversal of what was expected for the District's high school compared to previous reports. There is expected to be growth at the high school level but it might peak at around 1,838 9-12 students by 2027. By 2028, the high school population could start to see annual declines as smaller 9th grade classes start to enter the District. Currently (2022), the District has 1,689 9-12 students and

the forecast shows that the District's 9-12 student population could drop down to 1,610 by 2032 (a net loss of 79 9-12 students, a drop of nearly 5%).

SOURCES OF DATA

Geographic Map Data

Five geographic data layers were created for use in the ten-year student population forecasts:

1. Street Centerline Database
2. Study Areas
3. Schools
4. Students – Historical and Current
5. Planned Residential Development

1) Street Centerline Data

The street database has associated attributes that contains but are not limited to, the following fields: full street name, address range and street classification.

The main function of the streets is in the geo-coding process of the student data. Each student is address-matched to the streets by their given address. The geo-coding process places a point on the map for every student in the exact location that student resides. This enables DD to analyze the student data in a geographic manner.

Another vital utilization of the digital street database is in the construction of study areas. Freeways, major streets, and neighborhood streets are used as boundaries for the study areas.

2) Study Areas

Study areas are small geographic areas and the building blocks of a school district; they are similar to neighborhoods. Study areas are geographically defined following logical boundaries of the neighborhood, such as freeways, streets, railroad tracks, rivers, etc. Each study area is then coded with the elementary, middle, and high school that area is assigned to attend. By gathering information about the District at the study area level, you can closely monitor growth and demographic trends in particular regions and spot potential need for boundary changes or new facilities. There are 109 study areas created for the Sherwood SD.

3) Schools

The District provided school detailed information to DD for mapping the District facilities.

4) Student Data

a. Historical Student Data - Historical enrollment is used to compare past student population growth and trends as well as the effects of mobility (move in, move out from existing housing) throughout the District. DD utilized the last three

years (2019, 2020, and 2021) of student enrollment data for each October from fall 2019 through fall 2021.

b. Current Student Data - A student data file representing October 2022 (received by DD as a computer data file from the School District) summarized by grade level and by study area is used as a base for student forecasts. Existing students were categorized by study area through the address-matching process that locates each student within a particular area based upon their given address. The forecasts run each of the next ten years from fall 2022 through fall 2032.

The Student Accounting Summary (Table 1) indicates the total student enrollment as of October 1, 2022 and the number of students used in the ten year student population forecasts. The forecast model is based upon student residence and excludes students residing outside of the District's boundary, students with Grades = 13, Special Education students, independent study students, prekindergarten students and students in which DD was unable to match. Special Education students were excluded from the forecasts (due to different classroom loading standards and not all of the District's elementary schools housed Special Education Students).

Table 1– Student Accounting Summary

Fall 2022 Actual Enrollment (Representing October 1, 2022)

Total Students Provided by the District to DD	4,730
Students Living outside of District boundary	-155
Students with Grades = 13 (excluded from study)	-14
Students with a grade = -1 (excluded from study)	-44
STUDENTS USED IN FORECAST (K-12)	**4,517**

5) Planned Residential Development - This data was obtained through discussions with District staff, developers that have current or future projects within District boundaries, and planning officials from the cities of Sherwood and Tualatin. Data includes, when available, development name, developer/owner, location, housing type, total number of units, and projected move-in dates (phasing estimates). Phasing for planned housing is factored into the ten-year forecast. (See Section Two for a detailed listing of the planned residential development). In the student population forecast, DD includes all Approved and Tentative tract maps in addition to any planned or proposed development that possibly will occur within the forecast timeframe. The planned residential development information and phasing estimates show a snapshot of the District at the time of this study. Any of the residential development information contained within this report may change and should therefore, be updated at least annually.

Non-Geographic Data

Two basic sets of non-geographic data were compiled and reviewed for use in the ten-year student population forecasts by residence:

1. Births by Zip Code
2. Mobility Factors

1) Births by Zip Code Data - Birth data by postal zip code was obtained from the Oregon State Center for Health Statistics, for the years 2004-2019 and roughly correlated to the Sherwood School District's boundary. Past changes in historical birthrates are used to estimate incoming kindergarten student population from existing housing.

2) Mobility Factors - Mobility refers to the increase/decrease in the migration of students within the District boundary (move-in/move-out of students from existing housing). Mobility, similar to a cohort, is applied as a percentage of increase/decrease among each grade for every year of the forecasts. The Mobility Factors help account for apartment movement, housing resales, and dropout rates at the high school level.

TEN YEAR "RESIDENCE" FORECAST METHODOLOGY

The forecast methodology used in this study combines historical student population figures, and past and present demographic characteristics to forecast future student population at the study area level. District-wide forecasts are summarized from the individual study area forecasts. **These forecasts are based upon where the students reside and where they should be attending school. DD uses the actual location of where the students reside, as opposed to their school of enrollment, in order to provide the most accurate estimate of where future school facilities should be located.** The best way to plan for future student population shifts is to know where the next group of students will be residing. The following details the methodology used in preparing the student population forecasts by residence.

Ten-Year Forecasts

Forecasts are calculated ten years from the date of forecast for several reasons. The planning horizon for any type of facility is typically no less than five years, often longer. Ten years is sufficient to adequately plan for any facility. It is a short to mid-term solution for planning needs. Forecasts beyond ten years are based upon speculation due to the lack of reliable information on birthrates, new home construction, economic conditions etc.

Why Forecasts are Calculated by Residence

Typically, school district forecasts are based on enrollment by school. However, this method is inadequate when used to locate future school facility needs because the location of the students is not taken into consideration. A school's enrollment can fluctuate due to variables in the curriculum, program changes, school administration, and open enrollment policies. These variables can skew the apparent need for new or additional facilities in an area.

The method used by DD is unique because it modifies a standard cohort forecast with demographic factors and actual student location. **DD bases its forecasts on the belief that school facility planning is more accurate when facilities are located where the greatest number of students reside.**

The best way to plan for future schools is to know where the next group of students will be coming from. The following details the methodology used in preparing the student population forecasts.

1) Progression - Each year of the forecasts, 12th grade students graduate, and continuing students' progress through to the next grade level. This normal progression of students is modified by the following factors.

2) Incoming Kindergarten – Live birth data is reported to the Oregon State Center for Health Statistics, by the resident postal zip code of the mother. DD uses birth data

by zip code so, if need be, a different birth factor can be applied to various areas of the District.

Incoming kindergarten classes, for existing homes, are estimated by comparing changes in past births and birthrates. Table 2 shows the total births for the two main zip codes in the Sherwood School District area from 2004 to 2021. Incoming kindergarten classes are determined by multiplying the existing kindergarten class (2022) by the percent increase/decrease in the birthrate for the year the kindergarten class was born (2017). Assuming that the fall 2022 kindergarten class was born in 2017, DD compared the total births in 2017 to the total births in 2018, to determine a factor for next year's kindergarten class (Fall 2023). Similarly, 2017 was compared to 2019 (Fall 2023 K class), 2017 to 2020 (Fall 2025 K class) and 2017 to 2021 (Fall 2026 K class). 2022 live birth data was not yet available at the time of this report.

Table 2– Birth Data by Zip Code

Births by Zip Code					Birth Rate		
Birth Year	Kinder Year	97140 (Washington)	97140 (Clackamas)	Total	% Change*	Birthrate Used in Forecast	School Year
2004	2009	299	7	306	137.8%		2009/10
2005	2010	316	0	316	142.3%		2010/11

2026	2031				93.9%	0.939	2031/32
2027	2032				94.6%	0.946	2032/33

** % Change refers to the change in total births for each year compared to the base year.*

Source: Oregon Department of Health Statistics

= Peak year in births

According to Table 2, the birth data for zip code 97140 (the District's predominant zip code) shows that there was a decrease of births from 2006 to 2011. Births had been relatively unstable with average births from 2003 to 2010 around 312. There was a peak in births in 2006 of 351 live births and then annual declines occurred through 2011 (down to 231). A slight resurgence occurred in 2012 (2017 K) and 2013 (2018 K) and then the births count started to drop again. The future birth rates show that future kindergarten classes should be declining in 2023 then see a spike

for 2024 before returning to more declines in 2025-2026. Birth factors for 2027-2032 are an average of the previous three years and are conducted in this manner because the birth data is not available, or the children have not yet been born. DD elects to follow this common practice because it does not want to over or under project incoming future kindergarteners.

3) Student Mobility Factors - Student mobility factors further refine the ten-year student population forecasts. Mobility refers to the increase/decrease in the migration of students within the District boundary (move-in/move-out of students from existing housing). This factor considers the apartment movement within the District, as well as housing resales and dropout rates at the high school level. Mobility, similar to a cohort, is applied as a percentage of increase/decrease to each grade for every year of the forecasts. DD used the District's historical student data (representing data taken from the fall timeframe) for calculating these factors. The sampling used for the Mobility Factors are taken from the District's established neighborhoods without any recent new housing construction. The idea is to capture the trends of the students where and when they enter the District and apply those similar rates to future grade classes.

A net increase or decrease of zero students over time is represented by a factor of 100%. A net student loss is represented by a factor less than 100% and a net gain by a factor greater than 100% (see the example below).

Example: 100 K grade students in the Archer Glen ES area for fall 2022
X 101.0% (the K-1 Archer Glen ES area Mobility Factor)
101.0 1st grade students in fall 2023 for that area in Archer Glen

The sampling used was taken over a four-year period (student data from 2019 through 2022) and three yearly groupings were calculated. For example, a comparison was made for the fall 2019 K student population to the fall 2020 1st grade students. This comparison was also conducted for the fall 2020 & fall 2021 and fall 2021 & Fall 2022 groupings. Table 3, below, shows the Mobility Factors that were used for this year's report.

Table 3-Mobility Factors

Attendance Area	K to 1	1 to 2	2 to 3	3 to 4	4 to 5	5 to 6	6 to 7	7 to 8	8 to 9	9 to 10	10 to 11	11 to 12
Archer Glen ES	1.01	0.99	0.98	0.99	1.01	1.02	1.00	0.93	1.08	0.97	0.99	0.97
Hawks View ES	0.96	0.94	0.96	1.09	0.96	1.01	0.95	0.97	1.07	0.97	1.00	0.95
Middleton ES	1.03	0.98	0.98	1.04	0.95	1.00	0.97	1.04	1.03	0.95	0.99	0.98
Ridges ES	1.02	0.95	1.02	1.02	1.03	1.03	0.98	0.99	1.06	0.98	0.93	1.02
District-wide Average:	1.01	0.97	0.99	1.04	0.99	1.02	0.98	0.98	1.06	0.97	0.98	0.98

Using Fall 2019 through 2022 Student Data (3 Years of Change) by Elementary Attendance Area

Ridges ES's K to 1 Mobility Factor is 102.0%. That means that for Ridges' area, as students transition from Kindergarten to 1st grade (K to 1st) there is an average student increase of 2%. Since kindergarten is not a required grade, many parents choose to keep their children in daycare facilities through kindergarten and then

bring them into 1st grade at the public school. Hawks View ES area is the only one that sees a net loss from K to 1 (-4%). Most of the Districts mobility factors (56%) are red (less than 1.00). This means that, for the most part, parents are choosing to move out of the Sherwood School District. Most of the losses (red) seen above are some very slight high school dropout rates (in the 2-3% range). The Grade 8 to 9 transition is also typically high (green), and this is due to student entering the District from private or parochial K-8 schools and enrolling in the District's high schools. Slight but typical drop-out rates (red cells) occur in the later high school grades; however, Sherwood SD's figures show a high retention rate of students at that particular level.

4) Student Yield Factors (SYF'S) – Ten-Year Forecasts **-** The Student Yield Factors, when applied to planned residential development units, determine how many additional students will be generated from new housing construction within the District (see **Section Two** for details on planned residential development schedules). Student Yield Factors are sometimes referred to as Student Generation Rates (SGR's). For the 2018-19 study, Davis Demographics conducted a survey of 358 Single-Family Detached (SFD) units built over the last 20 years (1998-2017) and included the results in the table below. However, due to a lack of a large enough sample size for multi-family units, Davis Demographics still used Student Yield Factors from neighboring West Linn-Wilsonville SD (see below). It was not part of Davis Demographics' scope of work this year to update the SYF's, therefore, the same yield factors that were used in last year' study were applied in the 2020 report.

Table 4- Student Yield Factors

Student Yield Factors used in the Sherwood SD 2022/23 Study

Grade	Single Family Detached		Multi-Family (MF) Units	
	358 Units*		605 Units**	
	Students	Factor	Students	Factor
K-6	172	0.480	68	0.112
7-8	60	0.168	19	0.031
9-12	112	0.313	37	0.061
K-12	344	0.961	124	0.205

* = Units constructed within the Sherwood SD area from 1998 - 2018 (20 year period)

Condos, townhomes and apartments, etc.

** = Unit sample from neighboring West Linn-Wilsonville SD (units built between 2007-2013)

Before the SYF's can be applied to the current housing units, the year of construction for each housing type must be analyzed. In general, new housing attracts young families with elementary school aged children. Over the next 12 to 15 years, the children grow older and pass through the grades. This cycle is then repeated throughout the life of the home. Analyzing the year of construction for new housing units can help estimate the number of facilities needed to accommodate new students.

5) <u>Planned Residential Development and Student Yield Factors</u> **-** Closely related to the Student Yield Factors (SYF) are planned residential development units. Planned residential development data is collected to determine the number of new residential units that will be built over the ten-year period of the student population forecasts. The units built within the next ten years will have the appropriate SYF applied to it to determine the number of new students the planned residential development will yield.

This residential development data was obtained through the District, developers that have current or future projects within District boundaries and planning officials from the cities of Sherwood and Tualatin. A database and map of the planned residential development was created, including, when available, project name, location, housing type, total number of units and estimated move in dates (phasing schedule). Projected phasing is based upon occupancy of the unit and is used to help time the arrival of students from these new developments. (see **Section Two** for details on planned residential development occupancy).

In the resident student forecasts, DD includes all Approved and Tentative tract maps in addition to any planned or proposed development that possibly will occur within the forecast timeframe. The planned residential development information and phasing estimates is a snapshot of the District at the time of this study. The residential development information changes quite often and should be updated at least on an annual basis.

APPLYING THE VARIABLES TO GENERATE THE FORECASTS

The following paragraphs summarize how DD uses the factors to determine the student population forecasts. Remember that these forecasts are based on residence.

The Sherwood School District has been broken up into 109 study areas and each are coded for each of the District's elementary, middle, and high school, depending upon what attendance area they fall in. The residential forecasts are calculated at the study area level. This means that DD conducts 109 individual forecasts that are based upon the number of students residing in each study area.

The first step in running these forecasts involves listing the number of students that live in a particular study area by each individual grade (Kindergarten through 12th grade). The current student base (Fall 2022) is then passed onto the next year's grade (2022's K become 2023's 1st graders, 2022's 1st graders become 2023's 2nd graders, and so on). After the natural progressions of students through the grades are applied, Birth Factors are then multiplied to the current Kindergarten class to generate a base for the following year's Kindergarten class (*Section One*).

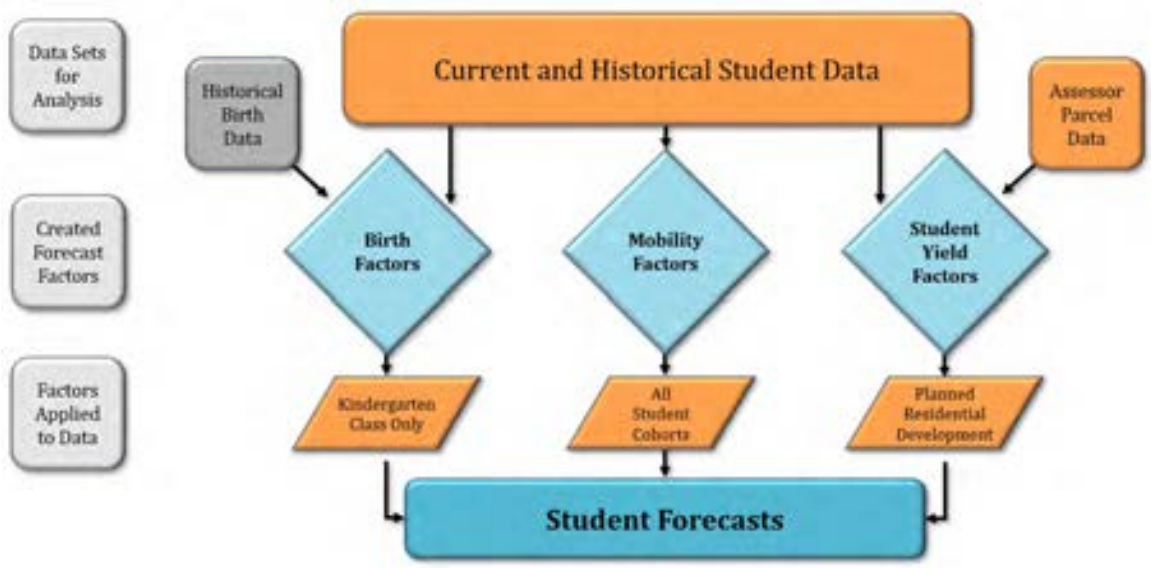
Next, a Mobility Factor is applied to all grades. Again, these factors consider the natural in/out migration of students throughout the District. A specific Mobility Factor was calculated for each grade transition (K to 1st, 1st to 2nd, etc.) within each elementary attendance area and is applied to the appropriate grade (and school area) to estimate the next year's progressed students.

The last essential layer applied to the forecasts deals with additional students from planned residential development (*Section Two*). This is a simple calculation, again conducted at the study area level, where the estimated number of new housing units for a particular year is multiplied by the appropriate Student Yield Factors. For example, if 100 single-family detached (SFD) units are to be built in a specific study area in a given year, then you would multiply this number (100 units, for example) by the SFD K-6 Student Yield Factor (.480) and the resulting number (48 K-6 students) is divided evenly among the six grades (*Section One*).

To finish generating the forecasts by residence, the same process is conducted for each of the 109 study areas. Once the forecasts have been run at the study area level, then it is simple addition to determine forecasts for each of the District's attendance areas or for a district-wide summary. For example, the residential forecasts for Archer Glen Elementary School are simply the summary of all of the study areas that make up this specific attendance area (see *Section Five* for the forecasts of each elementary attendance area). The District Summary for the "residence" forecasts (*Section Four)* is a total summary of all 109 study areas, which excludes all of the students that attend a district school and live outside of the District's boundaries and students unable to be mapped. Then out-of-district students are factored back into the forecasts by simply adding the existing totals in

at the bottom of the forecasts (please see the Attendance Matrices in *Section Three* for a breakdown of the out-of-district students by school). DD adds the current total out-of-district to each year of the forecasts because there is no accurate way to forecast these students in the future.

Davis Demographics' Forecast Methodology Flowchart



PLANNED RESIDENTIAL DEVELOPMENT

This data was obtained through discussions with District staff, developers that have current or future projects within District boundaries and planning officials from the Cities of Sherwood and Tualatin. A database and map of the planned residential development was created, including, when available, project name, location, housing type, total number of units and estimated move in dates (phasing schedule). Projected phasing is based upon occupancy of the unit and is used to help time the arrival of students from these new developments. Please see the next page (page 12) for a map of the known residential projects in the Sherwood School District area. Following the map (on page 13) is a breakdown of the estimated occupancy date for new housing units over the next ten years (from Fall 2023 through Fall 2032) by Study Area and by the three main housing types (single family detached – SFD – units; multi-family attached – MFA – units; and apartments – APT – units). This document is referred to as the District-Wide Residential Development Summary. In addition, DD has included a Residential Development List (page 13), which is sorted by Study Area and is an inventory of all known residential projects that are expected to be active over the next ten years.

DD estimates that as many as 1,552 Single-Family Detached units, 454 multi-family units, and 67 Apartment units could be built within the Sherwood District boundary over the next ten years (a grand total of 2,073 mixed units). This number of units is definitely possible and is not unprecedented. Most of these units are estimated to be constructed within a six-year period (fall 2022 through fall 2028 school years) with an estimated average of 301 units to be built each year during that time span.

Please note that all phasing schedules are based on occupancy, all Approved and Tentative maps plus proposed and potential development are included on these lists, the Summary only includes units that may be occupied in the ten year timeframe of the forecasts and are based upon data gathered during October to December of 2022 and may not reflect recent changes.

THE K-5 ATTENDANCE MATRIX

An Elementary (K-5) Attendance Matrix has been included to provide a better understanding of where students reside and where they attend school. This matrix helps to see a "snapshot" of the District's current Open Enrollment patterns. DD has also created a Middle and High Attendance Matrix on the following pages. The following three matrices are based upon the new boundaries, approved by the Board on 2/12/2020; which just took effect this year, in time for the 2020/21 SY.

The attendance matrix acts as a checks and balance for student accounting. It shows where the students reside (what is their School of Residence) based upon our address matching capabilities and what school they attend (School of Attendance) based upon data in the student file supplied by the District. The inclusion of this matrix is essential to showing how the students used in the forecasts match up to the District's records of enrollment for each school. The best way to plan for future facilities is to know where the next group of students will be coming from, not necessarily which school they are currently attending.

Remember, DD's forecasts are based upon where the students reside, not where they attend school. DD uses the actual location of where the students reside, as opposed to their school of enrollment, in order to provide the most accurate depiction of where future facilities (if necessary) should be located. Therefore, since the forecasts are based upon where the students reside, the figures DD uses as a base for each school's resident forecast may be slightly higher or lower than the actual reported enrollment for each school.

READING THE MATRIX

Looking at the K-5 Elementary School Attendance Matrix on page 16, let us begin with Archer Glen ES as an example. Following down the second column with the "Archer Glen ES (#1334)" heading, on the first row you see that there are 316 K-5 grade students attending Archer Glen ES and residing in the Archer Glen ES attendance area. Continuing downward, 7 students attended Archer Glen ES, but resided in the Hawks View ES attendance area. Next, it shows that no students attend Archer Glen ES and reside in the Middleton ES attendance area, and two students attended Archer Glen ES in October 2022, but lived within the Ridges ES boundary.

The row entitled "Pre Kindergarten" shows the number of PK students attending Archer Glen ES in October 2022; there were no PK students attending Archer Glen ES. The row named "Special Education" refers to all elementary level Special Day Class students attending the District. Eleven special education students attended Archer Glen ES in 2022. The row entitled "Out-of-District" refers to students living completely outside of Sherwood School District but attending one of the District's schools. There are six Out-of-District students attending Archer Glen ES. The "K-5 Totals" row shows the total number of K-5 students attending a school regardless of where they reside; this should reflect the District's enrollment counts for each school as of October 1st, 2022. There were 331 students attending Archer Glen ES as

of October 2022. At the bottom of the matrix, DD lists the District's "Open Enrollment Percentage," a figure that lists the total number of students attending the particular school but live outside of the designated boundary. There were 15 out-of-zone students attending Archer Glen ES in October 2022; a percentage of 4.6% of Archer Glen ES's students came from outside of its current boundary.

The next step is to read across the matrix, beginning with the Archer Glen ES attendance area row. It is now understood that the 316 represent the total number of K-5 grade students that reside in the Archer Glen ES attendance area and attend Archer Glen ES. The next column, titled "Hawks View ES (#1191)", lists the number of K-5 grade students that reside in the Archer Glen ES attendance area, but attend Hawks View ES. Eight K-5 students reside in the Archer Glen ES attendance area but attend Hawks View ES as of October 2022, and so on.

The K-5 Students column in the beginning represents the total number of students living in that particular attendance area. There are 3302 K-5 students residing in the Archer Glen ES attendance area. Reading down the Totals column, you will find the number of K-5 students used in the fall 2022 forecasts - - 1,795 K-5 students (excluding Special Education and Out-of-District students). A total of 1,894 PK-5 students attended a District school as of October 1, 2022 (with a District-wide "Transfer-In" rate of 5.4%).

The Middle School 6-8 Matrix (on page 17) and the High School 9-12 Matrix (on page 18) is read in the same manner as the Elementary School Matrix.

DISTRICT-WIDE STUDENT FORECASTS (BY "RESIDENCE")

The student population is projected out ten years for each of the study areas and for the entire Sherwood School District. The District-Wide Summary enables the District to see a broad overview of future growth and what impact this growth will have on existing facilities. The study area listings enable the District to monitor student population growth or decline in smaller geographic areas within the District (please see *Appendix A* for the individual 109 Study Area forecasts).

At any point in time, study areas and their projected resident students can be shifted between schools to assist in balancing enrollment growth. Together, these forecast summaries present the means for identifying the timing of additional student arrival and overall facility requirements and location to accommodate the District's expected growth.

The following page shows the District-Wide Forecasts by "Residence" using the fall 2022 (early-October) student data as the base; the fall 2019 through fall 2021student listings are there for reference. Ten consecutive years are then projected from fall 2023 through fall 2032 with the Out-of-District students separated from the sub-totals. The Out-of-District are added back into the 10-year forecast using the same fall 2022 figures. At the bottom of the District-Wide Forecast, a projected annual change is listed.

For an exact breakdown of how many Out-of-District, Special Education and Unmatched students there were for each elementary school as of fall 2022, please see the K-5 Attendance Matrix on page 16, the 6-8 Middle School Matrix on page 17, and the 9-12 High School Matrix on page 18.

The above projections are based upon a student data file provided to Davis Demographics by the Sherwood School District representing October 1, 2022.

Forty four (44) students with a grade = -1 were given to Davis Demographics in the original student data file and were excluded from the above projections.
Fourteen (14) students with a grade = 13 were given to Davis Demographics in the original student data file and were excluded from the above projections.

District Wide Student Population Forecast Trends ("Residence" Method)

The Sherwood School District experienced growth in resident student population from 2012 to 2017 but has seen some declines the last few years, especially in 2020. The District experienced a big jump in its K-12 Student population from fall 2014 to fall 2015, but in 2016 the growth was minimal, and that slow growth trend continued in 2017. Between 2018 and 2019 the Sherwood SD declined by 83 K-12 students and in 2020 that drop was more dramatic; the District lost 400 K-12 students in 2020. Most of the decline in 2020 occurred in the elementary school grades (K-5). The K-5 loss was 18% or 324 students, while the middle school grades 6-8 lost 5.5% (67 6-8 students) and the high school grades lost only 9 total students. The main reason for the loss in 2020 was due to the impact of COVID and the parents pulling their students out of public school (mostly at the Kindergarten level). Over the last few years, the Sherwood SD student population gained back some students, but not many. As of 2022, the District contained 4,674 K-12 students, only 56 more than in 2020; not really gaining back much from that initial 400 student loss.

According to the forecast, the Sherwood School District should see one more year of slight declines in 2023 and then start to see its K-12 student population over the next five years as some of the larger new development begins to start construction. In 2022, the K-12 student population is at 4,674 and that is projected to grow by almost 246 more students over the next five years (to 4,920 K-12 by 2028). It is possible that more students will return to the District over the next few years, but the current trends show otherwise. Now that we are a few years out from the worst of the pandemic, it might be safe to say that the "numbers are the numbers" and that the current forecast might be the most accurate looking forward than in recent years. The lower sized grade classes currently within the elementary school grades eventually reach the District's middle and high school grades and therefore produce a set of declining forecasts for most of the next ten years, despite the growth in new housing. Most of the District is "aging out" with less students transitioning from grade to grade as well as the birth rate figures continuing to lower.

The progress of the large specific plans, including the beginning of the Autumn Sunrise projects (within the Basalt Creek Planning Area) and the Middlebrook Subdivision (within the Brookman Road Concept plan) all play a large role in whether there is going to be additional student growth within the District boundary. The start-up of these two large projects is included in the 10-year forecast, but the long-delayed Sherwood West units are not. The Autumn Sunrise units began in 2022 and will have their first occupants in 2023 and build for about 5-6 years. The Brookman Road Concept Plan units are currently underway (Middlebrook) and go through 2028. If any changes to these large projects occur (a ramp up or a decline) then they will have an impact on the forecast. Further delays could even cause declines to continue. On the other hand, the ramping-up of the unit construction could generate even more students than forecasted in this report. The progress of this future development will need to be closely monitored by the District.

According to the forecast contained in this report, the K-5 resident student population is expected to see very little growth over the next ten years. The K-5 student count for 2020 dropped down to 1,801 and only regained some of those lost students by 2022 when it reached 1,850. The forecast shows that the K-5 student population may bottom out at around 1,778 by 2023 and then start to see annual increases as it climbs back over 1,800 students by 2024 and then peaks at 1,948 by 2028 (5.2% net growth). The Kindergarten class size took a dramatic hit in 2020 (only 232 K in 2020 compared to 301 in 2019, 332 in 2018 and 331 in 2017). COVID was the main reason for the decline in 2020, but the K class size has only slightly recovered in 2022 with a count of 256 K. These lower Kindergarten class size, causes a ripple effect in future K and other grades as those students matriculate through the grades. The projected increase in new housing over the next 10 years will contribute to net growth in certain areas of the District. However, if the larger Kindergarten class sizes do not get restored, then even the new residential development may not even be enough to help the District's enrollment.

The middle school grades are expected to decline for most of the next ten years as smaller incoming 6th grade classes enter from the declining elementary schools. As of fall 2020, the District had a middle school population of 1,209 students. Now in 2022, the 6th grade class size is even lower at 1,135. If current trends continue, then the middle school counts could peak at 1,155 6-8 by 2025 and then see it drop down to 1,053 by 2032 (a net loss of 82 6-8 students or a net decline of 7.3%).

The current forecast shows a reversal of what was expected for the District's high school compared to previous reports. There is expected to be growth at the high school level but it might peak at around 1,838 9-12 students by 2027. By 2028, the high school population could start to see annual declines as smaller 9th grade classes start to enter the District. Currently (2022), the District has 1,689 9-12 students and the forecast shows that the District's 9-12 student population could drop down to 1,610 by 2032 (a net loss of 79 9-12 students, a drop of nearly 5%).

Sherwood
SCHOOL DISTRICT

NOTE: Current counts are based on 2022/23 SY resident K-5 counts. The 2025, 2027 and 2032 projected resident counts are based on K-5 counts for the new boundaries. All counts EXCLUDE out-of-District students (see Matrix).

Forecast Trends for the District's Elementary School (K-5) Attendance Areas ("Residence" Forecasts)

On February 12, 2020, the Sherwood SD Board of Directors approved new elementary school boundaries that went into effect in time for the 2020/21 SY and a series of changes took place. A new location for Sherwood HS is now located in the western portion of the District. The former Sherwood HS site has become the new district-wide middle school. The four main elementary schools will still be in place, but the old Hopkins ES site will become the new District Office and the former Sherwood MS will be the "new" Hawks View ES. The former Laurel Ridge MS site will be combined with its neighboring Edy Ridge ES to become a larger campus now called Ridges ES. The 10-year forecasted figures in this report will focus on these new boundaries.

In the current set of forecasts, the Sherwood School District is now projected to experience minimal growth in its resident student population among the elementary grades over the next ten years. Since 2019, the District has lost 275 K-5 students, mostly due the impact of COVID (starting in 2020), but over the following two years the District did not fully recover the number of "missing" students (2,125 K-5 in 2019 and 1,850 K-5 in 2022). The incoming residence Kindergarten class in 2020 was much lower than anticipated. The Kindergarten class sizes the previous four years were 301 K in 2019, 332 K in 2018, 331 K in 2017 and 292 in 2016. In 2020, the resident K class size was 232 (obviously low due to parents holding back their Kindergarteners). In 2021, the K class size did climb back up to 297, but in 2022 it dropped back down to 256 which does impact this years' forecast. In this year's report, the District is expected to see its resident K-5 student population bottom out around 1,734 in 2023 and then see increases each year through 2028, reaching 1,903 and then slowing dropping off until it settles around 1,842 in 2032.

The new Archer Glen attendance area is the only one of the four elementary boundaries that is expected to see a net decline over the next 10 years. The areas with the largest projected resident K-5 gains over the next ten years are, in order (1) Hawks View ES (+72 K-5), (2) Middleton ES (+33 K-5) and (3) Ridges ES (+26 K-5). Archer Glen's new boundary could lose 96 K-5 students. The new Hawks View area could have 1,023 new housing units built over the next 10 years, the new Ridges ES area has the potential for 682 new housing units and the Middleton boundary area does have a potential for 368 new housing units over the next ten years. Archer Glen's new area does not have any new planned development at this time. Overall, the student forecasts in this report are lower than those prior to the pandemic.

INDIVIDUAL ELEMENTARY SCHOOL ATTENDANCE AREA ANALYSIS

The **Archer Glen Elementary School** attendance area is the only region among the District's four elementary zones that is expected to decline over the next ten years. After the boundary changes a few years ago, the Archer Glen ES boundary is now the District's smallest elementary school both in terms of its geography as well as its

resident population. In addition, as of now there are no new housing units planned for this region. As of fall 2022, the Archer Glen ES attendance area contained 331 resident K-5 students living within its boundaries, after having as many as 398 as recently as 2019. Obviously, a lot of this decline was due to COVID, but the counts in the region did not rebound after 2020. Based on the current set of forecasts, the Archer Glen boundary is expected to lose another 96 K-5 students by 2032. The capacity for the Archer Glen ES is 390. Therefore, it appears that the new Archer Glen ES should be able to handle its projected resident count for the next ten years. Archer Glen ES should have the capacity to help out some of its neighboring schools.

For the 2020/21 school year, the **Ridges Elementary School** campus expanded with the incorporation of the previous Edy Ridge campus plus the former Laurel Ridge MS site. The new capacity for Ridges ES is at around 955. Therefore, it made sense to expand the Ridges' boundary when exploring new adjustments. The new Ridges ES attendance area is forecasted to experience growth over the next ten years. As of fall 2019, there were 771 resident K-5 students living within the new Ridges new attendance area and that figure dropped to 640 K-5 students in 2020 (a net loss of 131 K-5 students in one year). There was a slight rebound in 2021 when the Ridges ES had 691 resident K-5 students, but then dropped down again in 2022 to 668 residents. The impact of COVID hit this area the most and it affected its forecast as well; not as high a count of students is expected in this report compared to those previous to 2020. Over the next year, the Ridges area could actually drop a bit more (660 K-5 residents in 2023), but it should then start to see annual increases through 2028 as the residential development picks up (770 K-5 residents by 2028). At that point, the resident K-5 counts for the Ridges area could slowly drop down to around 694 students by 2032. The majority of the Brookman Road Concept Plan is now located within the Ridges boundary and its portion contains just 722 new SFD units. These new housing units are the biggest contributor to the projected increase in students for the Ridges area. The first of the Brookman projects is the Middlebrook Subdivision, which contains 145 units and its first occupants were expected in late 2022/early 2023. In previous reports it was looking like the Ridges ES may exceed its design capacity due to this development, but with the reduction of students due to COVID, it does not appear likely over the next 10 years. However, the District will need to closely monitor the progress of the new housing units and if it grows faster than expected, then interim measures may need to be made to house additional students, such as diverting some students to other sites or adding temporary portables.

Starting the 2020/21 school year, **Hawks View Elementary School** is now permanently located at the former Sherwood MS site. The Hawks View ES attendance area shows 16% growth over the next ten years. In 2019, the Hawks View ES area contained 502 K-5 students and in 2020, that figure has dropped to 442 in 2022. The forecast in this year's report shows that the Hawks View area could drop a bit more down to 431 in 2023 and then see its resident counts rise up to 570 by 2026. In 2027, slow declines could occur and then the Hawks View ES area could settle down to around 514 resident K-5 students by 2032: still a net

growth of 72 K-5 students. During the boundary process an ideal capacity figure of 506 was used for the Hawks View ES site (however, as Sherwood MS that site regularly housed student counts around 700 students). The Hawks View ES boundary does contain the District's portion of the Autumn Sunrise projects (aka Basalt Creek Planning Area), which consists of 454 single-family homes, 454 condos/townhomes and 67 apartment units. The Autumn Sunrise projects should see its first occupants this year (2023) and continuing for at least the next seven years. These new units are the largest contributor to the Hawks View area growth. It appears that the Hawks View ES site should be able to house these additional students from this new housing. However, the progress of this development will need to be followed closely by the District and temporary portables may be necessary if the growth is larger than expected.

The new **Middleton Elementary School** boundary could see a small net growth of another 33 K-5 students over the next 10 years. In fall 2019, the new Middleton ES attendance area contained 427 K-5 students, but the 2020 K-5 dropped by 53 K-5 students (374 K-5). Since then, the resident K-5 counts for the Middleton ES area have dropped a bit more, to 369 in 2021 and 364 in 2022. The Kindergarten class size alone went from 65 in 2019 to 42 in 2020, back up to 60 in 2021 and then down to 49 in 2022. The lower K class size in 2022 alone caused this year's forecast to be lower than in the past. COVID was the main contributor for the sudden decline in Middleton residents in 2020 but many of those "missing" students really didn't return. Therefore, this set of forecasts for the Middleton area has the resident K-5 counts bottom out at 320 in 2025 and then climb back up to 410 K-5 students by 2031. A piece of the Brookman Road Concept Plan (362 SFD units) is still located within the Middleton ES boundary and could start to see new occupants as soon as 2024 or 2025. The goal capacity used for Middleton ES was 470 during the boundary adjustments a few years back; therefore, Middleton ES should be fine if this forecast is correct. Middleton ES has had enrollment in the range of 544 (2019) to 621 (2015) K-5 students. The purpose of the boundary adjustments was to have Middleton ES have a more reasonable total enrollment, but it appears that it could hold up to 600 K-5 students, if necessary. Like the Ridges ES area, the District will need to closely monitor the residential development within the Middleton area and may need to take additional measures to properly house the additional students if it rebounds and resembles higher counts from previous forecasts.

ELEMENTARY SCHOOL CONCLUSIONS

Adjustments to all four of the District's current elementary school boundaries were approved by the Board of Directors on February 12, 2020. Two of the main site changes included the expansion of Edy Ridge ES site (combining with the former Laurel Ridge MS site) to form the new Ridges ES campus and Hawks View ES taking over the former Sherwood MS site. In the forecast contained within this report shows that the Sherwood SD is expected to only grow by 35 more K-5 students through 2032, much lower than forecasts prior to COVID. The areas with the largest projected resident K-5 gains over the next ten years are, in order (1) Ridges ES (+73 K-5), (2) Hawks View ES (+38 K-5), and (3) Middleton ES (+13 K-5). Archer Glen's new boundary could lose 88 K-5 students. With the now larger Ridges and Hawks View sites, the District should be able to accommodate the new growth in their areas over the next ten years. The exact start dates of some of the larger planned residential developments such as the Brookman Road Concept Plan and the Autumn Sunrise projects (within the Basalt Creek Planning Area), need to be closely monitored by the District. The Autumn Sunrise and Middlebrook Subdivision already has occupants arriving this upcoming school year. Units from these projects are included in the ten-year forecasts in this report. If any of these projects are sped up or delayed, then the forecasts included in this report could change. Temporary actions, such as using portables, may be needed in order to properly house some of the future students. However, it does appear that based on previous enrollment counts at these existing sites the District should be able to accommodate the projected K-5 growth over the next 10 years.

NOTE: On February 12, 2020, the Sherwood SD Board of Directors approved new boundaries for the school district that will take effect in time for the 2020/21 school year. One of those changes was to open a new high school site (on the west side of the District) and repurpose the "old" Sherwood HS site to be a district-wide middle school. The old Sherwood MS opened as the new Hopkins ES (the old Hopkins site is going to be the new District Office) and the old Laurel Ridge MS site was combined with its neighboring Edy Ridge ES to form Ridges ES, which now has a much larger capacity. Therefore, there will no longer be multiple middle school boundary zones. The new Sherwood Middle School (the former Sherwood HS) has district-wide boundaries.

Above forecasts EXCLUDE Out-of-District students.
Please see the Middle School 6-8 Attendance Matrix for a detailed breakdown of this student group.

Forecast Trends for the District's Middle School (6-8) Attendance Areas ("Residence" Forecasts)

Starting in the current 2020/21 SY, the Sherwood SD went from a two middle school District to a one middle school district. The former Sherwood HS site was converted into the new Sherwood MS, which now can house even more 6-8 students than in its previous design.

MIDDLE SCHOOL CONCLUSIONS

The District's middle school population had been growing about 40-50 students a year up until 2019. In 2020, the 6-8 student population declined by 67 students, which was most likely due to COVID, but still lost another 74 7-8 students between 2020 and 2022. As a result, the 10-year forecast has the 6-8 student population dropping by 82 students through 2032 (a 7.2% decline). It is possible that some of the decline was due to parents pulling their students out of the public school system as a result of COVID, but it is now looking unlikely at this point that those "missing" students are actually going to return to the District. Currently, the District contains 1,135 6-8 students and it drop down to 1,053 6-8 students by 2032. New housing developments are included in this estimate, but those new units and students do not make up enough growth to counter the smaller grade classes entering the system plus the lower birth counts (it is starting to "age out" over most of the District territory). Overall, it appears that the District's middle school should have no problems accommodating the forecasted 6-8 student population contained within this report.

The District will need to closely monitor the progress of the two specific plans, in addition to the delayed Sherwood West units, especially if these developments start sooner than expected and generate more students than forecasted.

NOTE: On February 12, 2020, the Sherwood SD Board of Directors approved new boundaries for the school district that took effect in time for the 2020/21 school year. One of those changes was to open a new high school site (on the west side of the District) and repurpose the "old" Sherwood HS site to be a district-wide middle school. The old Sherwood MS site opened as the new Hopkins ES (the old Hopkins site is the new District Office) and the old Laurel Ridge MS site combined with its neighboring Edy Ridge ES to form Ridges ES, which has a much larger capacity. Therefore, there will no longer be multiple middle school boundary zones. The new middle school (the former Sherwood HS) will have district-wide boundaries. The above forecasts for the new Sherwood High School forecasts remain the same, except for the actual location of the "new" Sherwood HS.

Above forecasts EXCLUDE 80 9-12 Out-of-District students
and 14 students with a grade designation of 13.

Forecast Trends for the District's High School (9-12) Attendance Area ("Residence" Forecasts)

The Sherwood School District has one high school, Sherwood HS. The high school has experienced growth within the 9-12 resident student population from 2012 to 2017, but then saw slight declines starting in 2018 and has continued through 2020. An uptick in the 9-12 student population happened in 2021 and 2022, but most of that was due to increasing number of high school students from outside the District (32 9-12 out-of-District students in 2020, up to 60 in 2021 and then up to 80 for 2022). A net decline of 79 9-12 students is expected over the next ten years as smaller 9th grade classes begin to enter the District's high schools. Therefore, based on this current set of forecasts, the District's new high school should have no problems accommodating its resident population though 2032.

Overall, the District will need to closely monitor the progress of the large specific plans (especially the delayed Sherwood West units) within the District boundary since those developments may potentially start sooner than expected and could generate more students than forecasted.

School Codes and School Assignments by Study Area

The Sherwood School District has assigned each school a code and DD has incorporated these same codes in the databases and data layers that they have created/maintained for the district. Each study area is then coded with the elementary, middle, and high school that the area is assigned to attend.

ELEMENTARY SCHOOLS (K-5)

Only Schools with assigned attendance areas are listed. The below boundaries are based upon those approved by the Sherwood School District Board of Directors on February 12th, 2020.

School Code	Elementary School Name	Study Areas for Each Attendance Area
1334	Archer Glen ES **16 Study Areas**	58, 59A, 59B, 60, 61, 62, 63, 65, 66, 67, 68, 69A, 69B, 78, 79, 80
4730	Ridges ES **37 Study Areas**	1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11A, 11B, 12, 13, 14, 15, 16, 17A, 17B, 18A, 18B, 18C, 19, 20, 21, 22, 33A, 33B, 34, 35, 36, 37A, 45, 45D, 86A, 86D, 87
1191	Hawks View ES **33 Study Areas**	23A, 23B, 24A, 24B, 25A, 25B, 25C, 26, 27, 28, 29, 30, 31, 32, 64, 70, 71, 72, 73, 74, 75, 76, 77, 81, 82A, 82B, 82C, 83, 84, 85A, 85B, 86B, 86C
3222	Middleton ES **23 Study Areas**	37B, 38, 39, 40, 41, 42, 43, 44, 46A, 46B, 46C, 47, 48, 49, 50, 51, 52, 53, 54A, 54B, 55, 56, 57
	4 Elementary Schools	**109 Study Areas**

School Codes and School Assignments by Study Area (continued)

MIDDLE SCHOOLS (6-8) and HIGH SCHOOLS (9-12)

Only Schools with assigned attendance areas are listed. The below boundaries are based upon those approved by the Sherwood School District Board of Directors on February 12th, 2020.

Middle School Name	Study Areas for Each Attendance Area
Sherwood MS (109 Study Areas)	1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11A, 11B, 12, 13, 14, 15, 16, 17A, 17B, 18A, 18B, 18C, 19, 20, 21, 22, 23A, 23B, 24A, 24B, 25A, 25B, 25C, 26, 27, 28, 29, 30, 31, 32, 33A, 33B, 34, 35, 36, 37A, 37B, 38, 39, 40, 41, 42, 43, 44, 45, 45D, 46A, 46B, 46C, 47, 48, 49, 50, 51, 52, 53, 54A, 54B, 55, 56, 57, 58, 59A, 59B, 60, 61, 62, 63, 64, 65, 66, 67, 68, 69A, 69B, 70, 71, 72, 73, 74, 75, 76, 77, 78, 79, 80, 81, 82A, 82B, 82C, 83, 84, 85A, 85B, 86A, 86B, 86C, 86D, 87
1 Middle School	**109 Study Areas**

High School Name	Study Areas for Each Attendance Area
Sherwood HS (109 Study Areas)	1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11A, 11B, 12, 13, 14, 15, 16, 17A, 17B, 18A, 18B, 18C, 19, 20, 21, 22, 23A, 23B, 24A, 24B, 25A, 25B, 25C, 26, 27, 28, 29, 30, 31, 32, 33A, 33B, 34, 35, 36, 37A, 37B, 38, 39, 40, 41, 42, 43, 44, 45, 45D, 46A, 46B, 46C, 47, 48, 49, 50, 51, 52, 53, 54A, 54B, 55, 56, 57, 58, 59A, 59B, 60, 61, 62, 63, 64, 65, 66, 67, 68, 69A, 69B, 70, 71, 72, 73, 74, 75, 76, 77, 78, 79, 80, 81, 82A, 82B, 82C, 83, 84, 85A, 85B, 86A, 86B, 86C, 86D, 87
1 High School	**109 Study Areas**

On February 12th, 2020, the Sherwood School District Board of Directors approved new boundaries that went into effect starting at the beginning of the 2020/21 school year. Among the changes in the boundaries included consolidating the 2 middle schools into now one District-wide boundary to be housed at the former "old" Sherwood HS site. The boundaries for the District's high schools did not change. The HS boundaries are still district-wide, but now are housed at a new Sherwood HS site (located on the west side of the District).

Housing Affordability and Development in Hillsboro, OR

Portland State University
Toulan School of Urban Studies and Planning
Community Recovery Fellowship

Diego Murphy-Mendez
Spring 2024
Dr. Megan Horst

Funding for this fellowship was provided by the Institute for Metropolitan Studies at Portland State University. This paper was prepared for Farmland First, a 501(c)(3) nonprofit with a mission to protect farmland and build livable cities in Oregon, now and into the future.

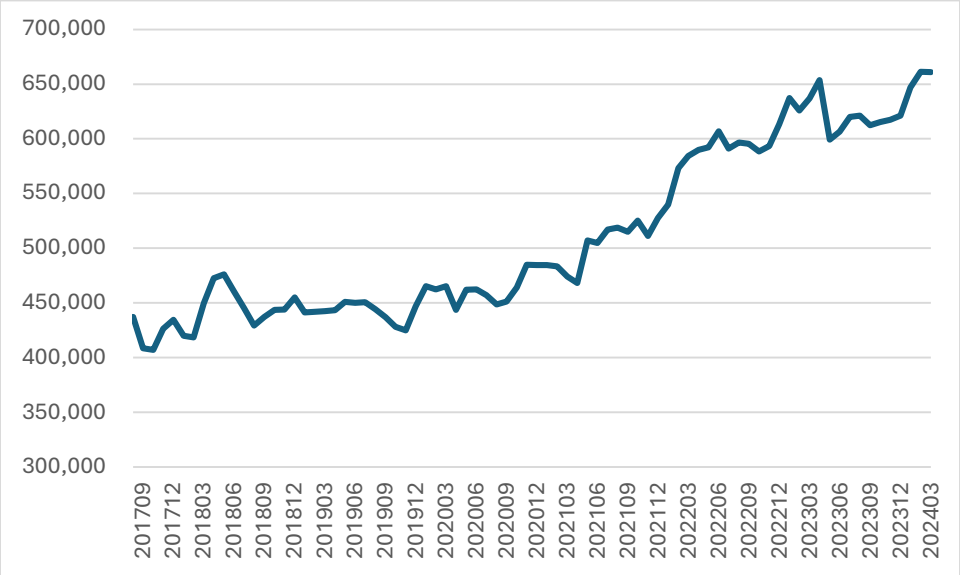
Summary

Housing in Hillsboro has remained unaffordable, and homeownership has become inaccessible to many residents. This is a potential cause for Hillsboro's changing tenure composition. While Hillsboro has historically been a homeowner's community, over the past decade the number of renter-occupied units has grown faster than the number of owner-occupied units to the point where there is now an even split between owners and renters. Rental units are more affordable compared to owner-occupied units in Hillsboro, but rents have remained high. This may pose a strong barrier to entry for outsiders interested in moving to Hillsboro.

Hillsboro has made efforts to address its growing housing need and new housing development in the city has centered on three areas: Amberglen, Orenco Station, and South Hillsboro. Development in Amberglen is defined by the construction of small multi-unit rentals, while development in South Hillsboro is defined by the construction of large single-unit owner-occupied structures. Comparatively, Orenco's development has involved a mix of housing types. Sales prices in South Hillsboro are high, but not necessarily atypical for the city. At the same time, rents in South Hillsboro are extremely high and can often be twice as high as the city's median. South Hillsboro is also the only development that involved expansions to the city's urban growth boundary.

Cost of Homeownership in Hillsboro

Figure 1. Hillsboro Median Home Listing Price 2017-2024



Source: Realtor.com residential data

The median listing price for a home in Hillsboro is currently $661,000. Assuming there is a 15% down payment ($99,150) and a 7.322% interest rate (the going rate in Hillsboro as of March 2024), then a new homeowner would have to pay roughly $3,860 per month, or $46,320 per year. Using the most recent American Community Survey (ACS) data, the cost of a mortgage for the median household in 2022 earning $98,891 per year would be roughly 41.9% of their

income. For a median renter who earns $77,697 per year, the cost of homeownership would take up roughly 59.6% of their income. This does not include payments to homeowners insurance, HOA fees, property taxes, or maintenance costs.

Table 1 breaks down yearly costs over time for Hillsboro, assuming a similar interest rate, and it likewise does not include additional costs in the form of property taxes, HOA fees, homeowners insurance, or maintenance costs. Understanding that these are a basic reality of homeownership, we can safely assume that the real cost is greater than what is listed in Table 1. However, just focusing on the primary costs is enough to get a sense of how expensive housing is in Hillsboro.

Table 1: Median Yearly Mortgage Cost with Ratio to Median Household Income 2017-2022

	2017	2018	2019	2020	2021	2022
Principal + 7% Interest	$35,676	$36,288	$35,520	$36,636	$38,532	$41,460
Down Payment	$76,352	$77,676	$76,039	$78,408	$82,476	$88,750
Ratio of Cost to MHI	39.5%	39.8%	37.7%	37.8%	38.9%	41.9%
Cost / MHI for Owners	31.9%	32.1%	30.7%	30.7%	31.4%	33.7%
Cost / MHI for Renters	52.3%	50.2%	47.0%	46.7%	48.6%	53.4%

Source: Calculated from American Community Survey 2018-2022 and Realtor.com residential data, assuming a 15% down payment on the 30-year fixed mortgage with roughly 7.3% interest.

Table 1 mirrors what we have already seen in Figure 1, that housing costs in Hillsboro have risen over time. However, Table 1 also gives us a more precise look at rising ownership costs in comparison to income and shows that principal and interest costs have not grown significantly as a proportion of median household income, but instead have fluctuated over time. This pattern remains true when distinguishing between owners and renters. For both groups, the cost of ownership has somewhat increased overall but has mostly fluctuated.

The steady proportion of costs to income may signify some level of stability in Hillsboro's housing, but it does not signify affordability. It is common wisdom in real estate to not pay more than 30% of your income on housing and the federal government considers a household "cost-burdened" if it has to pay more than this figure on housing costs ("severely cost-burdened" if a household has to pay more than 50% on housing). This threshold is worth questioning as it is not always an effective gauge for affordability, but in Hillsboro's case it is not important to interrogate the 30% figure as the city's housing costs stretch beyond this threshold anyway.

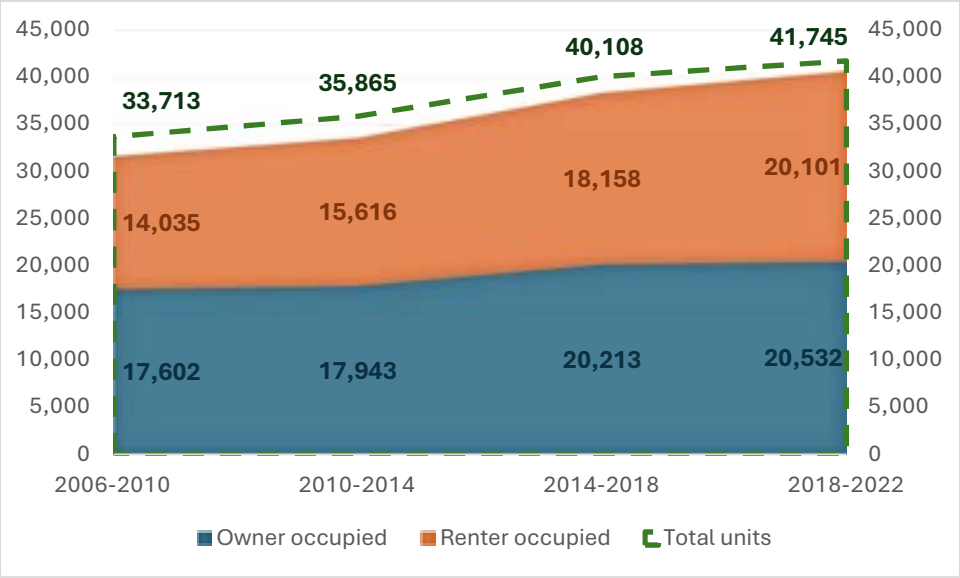
The median homeowner in Hillsboro is putting at least a third of their income towards their mortgage, while the median renter who aspires to homeownership would have to spend more than a year's salary on a down payment and put over half their income towards a mortgage. This means that, in Hillsboro, homeownership is a cost burden on many homeowners and is entirely inaccessible for most renters. Median household income across Oregon and in Portland

is roughly similar to renters in Hillsboro, meaning that homeownership is also inaccessible to many outsiders who may be thinking of moving to Hillsboro.

Growing Rental Community

Over the past decade, Hillsboro has developed a sizeable rental community that now comprises nearly half of the city's residents. While homeowners still outnumber renters by a small proportion, renter-occupied units in the city have grown much faster than owner-occupied ones. Currently, the proportion of renters-to-owners, shown in Figure 2, is about an even split. This indicates that most of the new units constructed in Hillsboro are rented out instead of sold to a homeowner. This also indicates that population in Hillsboro has continued to grow despite inaccessible homeownership costs, and may signify that this inaccessibility is playing a role in the city's changing tenure composition.

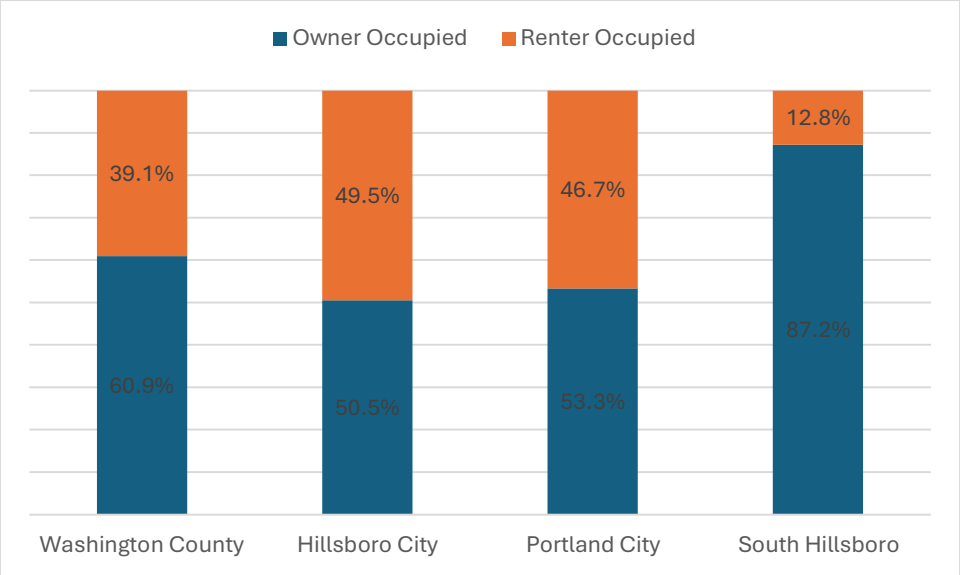
Figure 2. Hillsboro Tenure Type 2006-2022



Source: US Census Bureau (2010, 2014, 2018, 2022). *American Community Survey 5-Year Estimates*

Figure 3 shows the same composition contrasted with Washington County and Portland. One surprising fact shown in this figure is that there is now a greater proportion of homeowners in the city of Portland than there are in Hillsboro. Also included in this figure is the composition of the South Hillsboro census tract. This is one of the three major development areas that Hillsboro has focused on to manage its housing crisis, and it is the only one that involved expansions to Hillsboro's urban growth boundary. Although not enough to reverse the trend, South Hillsboro stands here as a clear counter-example to the rest of the city.

Figure 3. Tenure Composition 2022



Source: US Census Bureau (2022). *American Community Survey 5-Year Estimate*

In contrast to homeownership, renting in Hillsboro is generally more affordable as a proportion of the median renter's household income. Table 2 shows that rent increases in Hillsboro have mostly kept pace with rising incomes among renters. At the same time, rents in Hillsboro have remained high even by the 30% standard. Just like homeownership, rentals have not gotten much more expensive between 2006 and 2022, but they also have not become much more affordable either.

Table 2: Median Gross Rent and Rent as % of Median Household Income 2006-2022

	2006-2010		2010-2014		2014-2018		2018-2022	
	Median Gross Rent	as % of Renter MHI	Median Gross Rent	as % of Renter MHI	Median Gross Rent	as % of Renter MHI	Median Gross Rent	as % of Renter MHI
Washington County	1,193	27.8	1,257	29.5	1,482	29.7	1,695	29.6
Portland City	1,095	33.4	1,171	34.5	1,385	33.4	1,530	31.9
Hillsboro City	1,275	27.5	1,350	28.3	1,686	18.8	1,797	27.8
South Hillsboro							2,226	22.2

Source: Calculated from US Census Bureau (2010, 2014, 2018, 2022). *American Community Survey 5-Year Estimates,* adjusted for 2022 dollars

The story is different for outside renters who are thinking of moving to Hillsboro. Growing rents in Hillsboro may not necessarily make the city out of reach for outsiders, but may still pose a strong barrier to entry. The median renter in Portland would have to spend about 37% of their income to bill a $1,797 per month rental. The median renter across all of Oregon would have to spend about 42% of their income for the same rental.

Housing Development in Hillsboro: Amberglen, Orenco, and South Hillsboro

Housing development in Hillsboro over the last decade has centered around three primary areas, highlighted in Figure 4 for reference. They are Amberglen (the two eastern most geographies) Orenco Station (the three central-eastern geographies), and South Hillsboro (the large southern-most geography). The majority of the new units in Hillsboro since 2010 (somewhere between 54% and 69%) were constructed in one of these three areas. It is worth comparing these examples because of the stark differences in their recent development patterns.

Figure 4.

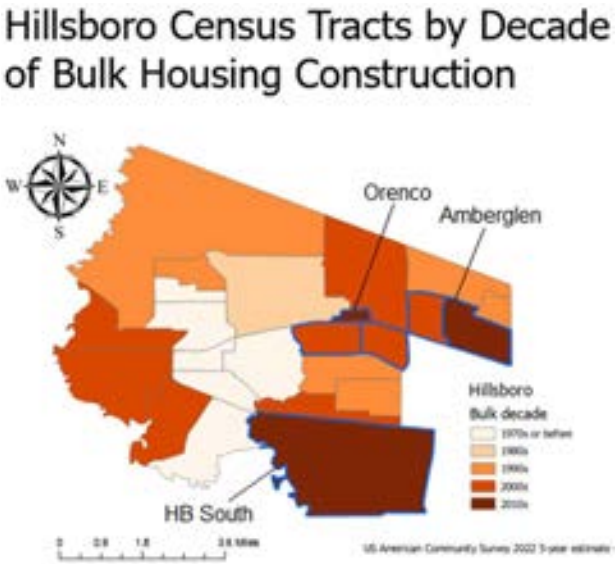


Figure 5. Metro 2040 Growth Concept

Amberglen and Orenco have been areas of interest for Metro as urban centers for the 2040 Growth Concept, shown on Figure 5. Hillsboro has developed these two areas with an explicit motive toward dense transit-oriented construction that could provide greater connection to Portland and to downtown Hillsboro while also efficiently adding to the city's housing supply. Between 2010 and 2022, Amberglen added 1999 units to Hillsboro's housing supply while Orenco added 1332 units.

South Hillsboro's development was pursued to accommodate Hillsboro's current and projected demand for housing. The first development phase was the Witch Hazel expansion, while the second phase is covering the larger part of South Hillsboro and is comprised of Reed's Crossing and Butternut Creek. Much of this second development phase is still underway. Between 2010 and 2022, South Hillsboro has added 994 units to Hillsboro's housing supply.

Table 3. Total Units by Tenure

Census Tracts	Total Units	% owner occupied	% renter occupied
Amberglen	4402	27.5%	71.4%
Orenco	4856	40.6%	54.5%
South Hillsboro	2361	85.1%	12.5%
Median	1701	46.3%	41.4%

Source: US Census Bureau (2022). *American Community Survey 5-Year Estimates*

Table 3 compares total units and tenure for the three development areas with the median for all 25 of Hillsboro's census tracts. Amberglen and Orenco are primarily rental communities, although Orenco still has more of a mixed tenure. South Hillsboro, as was seen earlier in Figure 3, is overwhelmingly an ownership community with a proportion of owner-occupied units that is almost twice the median for Hillsboro. Figures 6 and 7 visualize this owner-renter divide and likewise show a large density of owners in South Hillsboro, a large density of renters in Amberglen, and a mix of tenure in Orenco.

Figure 6.

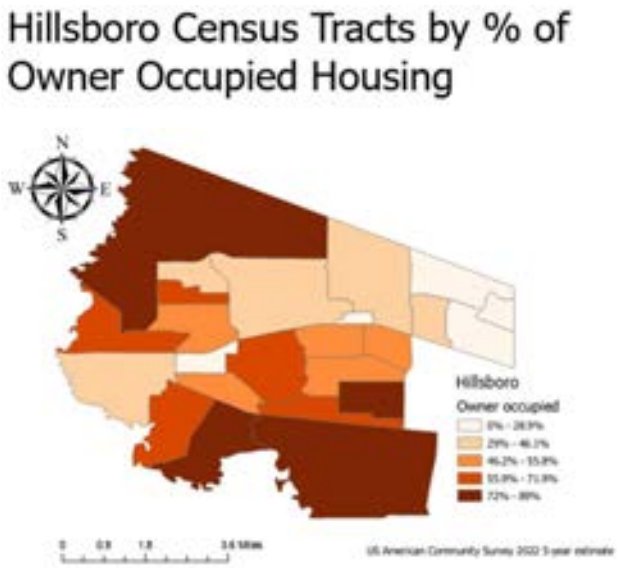

Figure 7.

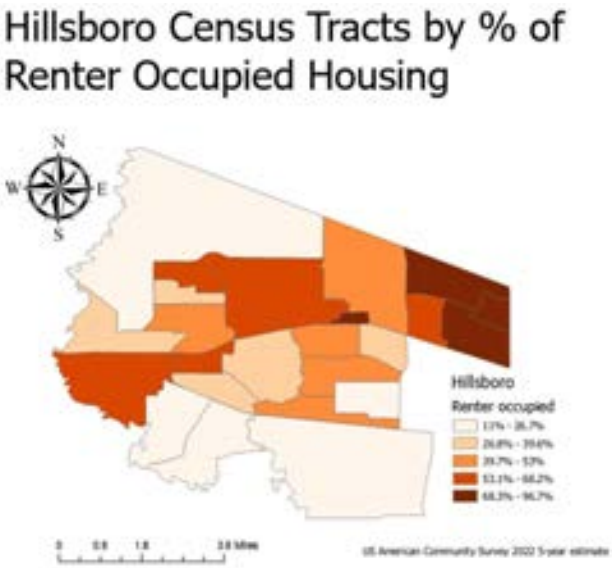

Table 4 shows three related metrics—the proportion of units that are single-unit (versus multi-unit), the proportion of those single-units that are detached, and the average number of bedrooms for all housing units in these areas. Relative to the rest of Hillsboro, Amberglen has a low proportion of single-unit structures. Of the single-unit homes that do exist in Amberglen, a low proportion of them are detached. South Hillsboro again stands in stark contrast to Amberglen. The South Hillsboro development is made up almost entirely of single-unit homes (99.6%!), over two-thirds of which are detached.

Table 4. Housing Unit Data

Census Tracts	% of single units	% of single units that are detached	Average # of bedrooms per unit
Amberglen	31.6%	33.5%	1.62
Orenco	54.1%	81.9%	2.29
South Hillsboro	99.6%	77.8%	3.49
Median	66.7%	82.8%	2.45

Source: US Census Bureau (2022). *American Community Survey 5-Year Estimates*

Another important data set included in Table 4 is the average number of bedrooms per unit. The number of bedrooms is a good way to gauge the average size of a home, and homes with a high number of bedrooms are typically accompanied by a very high listing price. The average number of bedrooms for each census tract follows the pattern, with small structures in Amberglen, typically-sized structures in Orenco, and large structures in South Hillsboro. In fact, South Hillsboro holds the highest average for the entire city, holding roughly one fourth (26%) of all the five-bedroom units in Hillsboro. This proportion is far above both Amberglen and Orenco, which collectively hold only 8% of the five-bedroom units in the city.

Finally, its important to look at differences in income and value. Table 5 outlines the comparison between the three areas and the median for all of Hillsboro's census tracts. Interestingly, it is here where Orenco breaks its previous middle-of-the-road pattern by having a median household income that is even higher than South Hillsboro. Despite this, South Hillsboro's median home value is higher than Orenco's. Amberglen's income is expected of a primarily renter community, but like Orenco their median home value is unexpectedly high. Figures 8 and 9 visualize these categories.

Table 5.

Census Tracts	Median Household Income	Median Home Value
Amberglen	76,100	102,547
Orenco	125,139	134,375
South Hillsboro	122,227	160,341
Hillsboro Median	91,066	108,503

Source: US Census Bureau (2022). *American Community Survey 5-Year Estimate*

Figure 8.

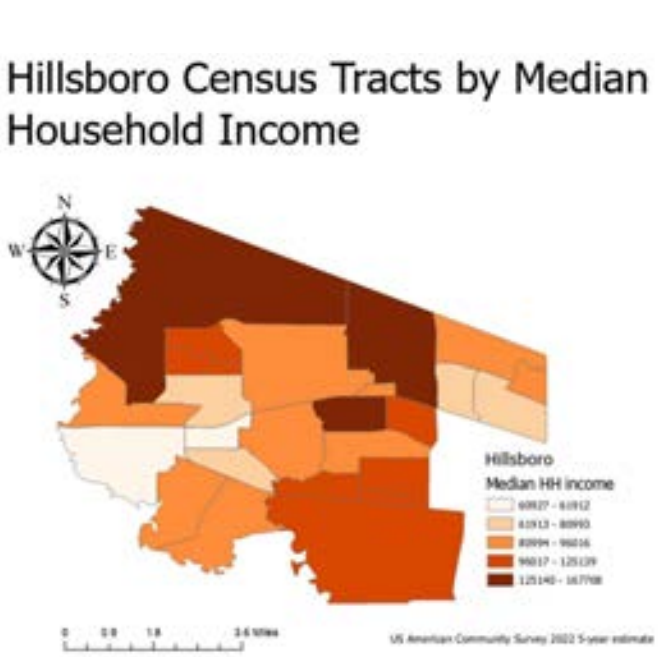

Figure 9.

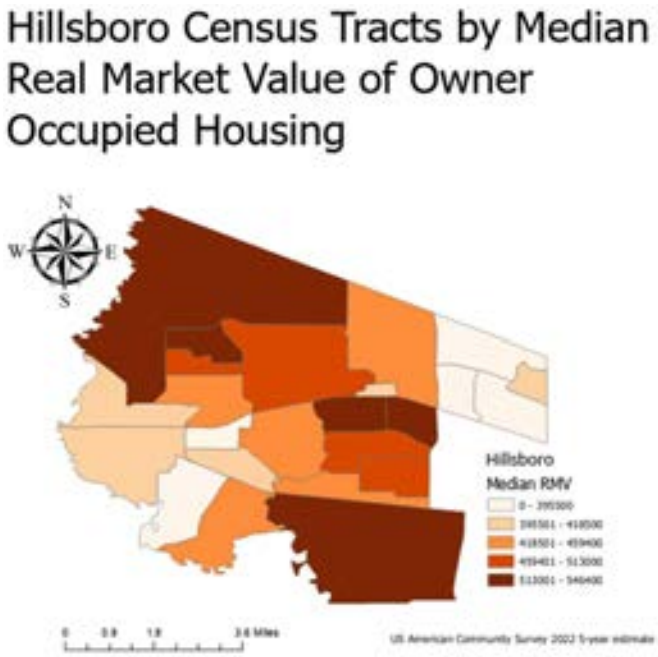
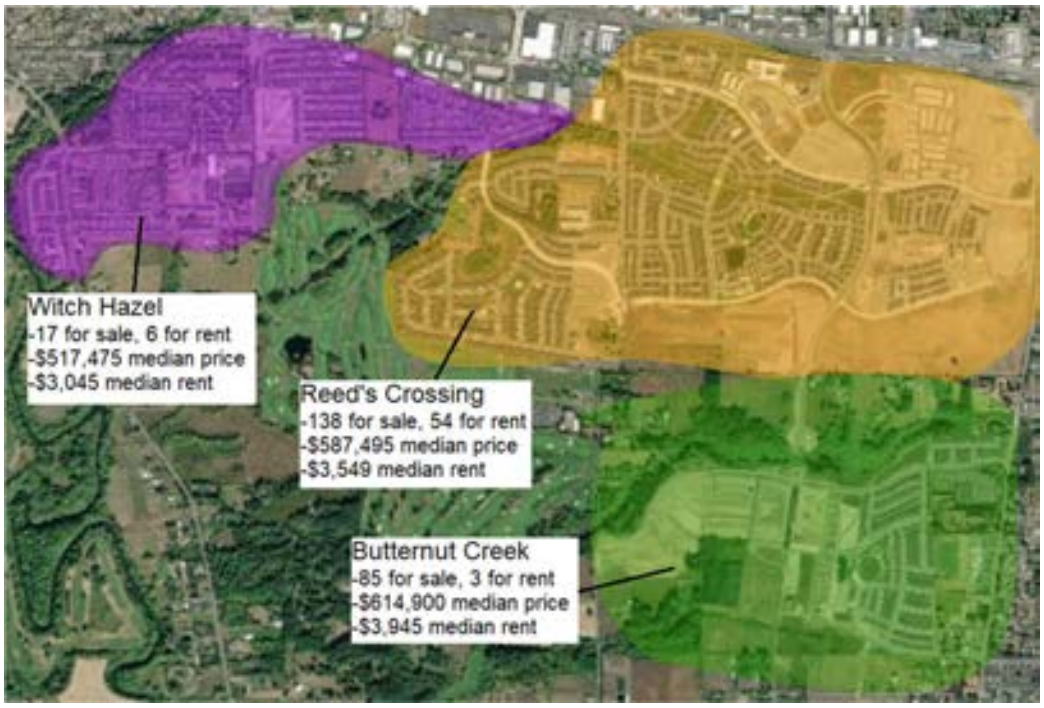


It is essential to note that real market value (RMV) is often not a precise reflection of what a home will actually cost. For example, Hillsboro's current median listing price is $661,000, which is far above any of the median RMVs of the tracts shown on Figure 9. RMV can be a decent reflection of the wealth of a homeowner, but a more precise metric is needed to determine actual listing prices for smaller geographies.

While more work would need to be done to provide a precise look at housing prices by census tract (or other small geographies), a quick look at Zillow can provide us with an accurate reflection of what the housing market in an area is actually like for prospective residents. To do this, I divided South Hillsboro into three areas reflecting its development phases: Witch Hazel, Reed's Crossing, and Butternut Creek. The three areas and their different Zillow figures can be seen in Figure 10. Notice how Reed's Crossing and Butternut Creek are still in the midst of development and thus still hold large empty lots.

Figure 10: South Hillsboro Phases of Housing Development 2024



Source: Satellite image from Google Maps, housing data accessed through Zillow on May 2nd 2024

On May 2nd 2024, there were 240 units available for sale and 63 units available for rent in South Hillsboro. Prices ranged from $424,990 at the lowest end to $1,300,000 at the highest, with a median price of $579,990. This is fairly below the median listing price for Hillsboro. Interestingly, the median price varies depending on which development area we look at, with lower prices at the first phase of development (Witch Hazel) and higher prices at the two ongoing developments (Reed's Crossing and Butternut Creek). This may either suggest that prices in Witch Hazel have gone down over time, or that new construction in South Hillsboro is continually growing more expensive.

The median rent for South Hillsboro as of May 2nd 2024 is $3,549 per month, with a range of $1,550 at the lowest end to $9,000 at the highest end. This is significantly higher than the median rent for the city ($1,797) and reflects the high costs of South Hillsboro's housing construction as well as its low supply of rental units. Like the listing prices, rents appear to grow higher with each phase of development.

Conclusion

Housing costs in Hillsboro have grown over time, but have remained stable as a proportion of median household income. Homeownership has remained a cost burden for many owners and is largely inaccessible for most renters in the city. Hillsboro is a higher-income area compared to the rest of Oregon, and high housing costs can pose a strong barrier to entry for outsiders who are thinking of moving into the city. Rentership comes with high costs as well, but is relatively more affordable as a proportion of the median renter's income. This may be a driving force behind Hillsboro's fast growing rental community, which is beginning to outpace homeownership in the city,

Hillsboro's efforts to manage the housing crisis have centered on three main areas: Amberglen, Orenco Station, and South Hillsboro. Amberglen represents dense affordable development of small multi-unit rentals, Orenco represents a mix of housing types that tends to reflect the median for Hillsboro, and South Hillsboro represents large single-unit development. Housing development in South Hillsboro is still ongoing and conditions are likely to change as new units are constructed. As it stands right now, ownership prices in South Hillsboro are very expensive but remain below the median for the city, although there is variation between different phases of development. Rents remain far above the median for the city and have a similar variation across the different phases of development.

City Council
Agenda Item Type: Decision

CITY OF GRESHAM

Resolution No. 3560:
2023-2029 Gresham Housing Production Strategy

Agenda Item Number: E-1
Meeting Date: June 6, 2023

Service Area Manager: Ashley Miller
Service Area: Urban Design and Planning

REQUESTED COUNCIL ACTION & SUGGESTED MOTION

Move to approve Resolution No. 3560 adopting the 2023-2029 Gresham Housing Production Strategy, as shown in Exhibit A.

PUBLIC PURPOSE AND COMMUNITY OUTCOME AND STRATEGIC PLAN ALIGNMENT

This Council Agenda Item, the 2023-2029 Gresham Housing Production Strategy (HPS), is the second of two June 6, 2023, agenda items under the Housing Production Strategy Project. On July 20, 2021, City Council initiated the Housing Production Strategy Project to proactively address the housing needs of Gresham's residents.

The HPS is a detailed land use and operations plan, which contains a suite of actions to be evaluated and/or executed by the City over the next 6 years. When combined, these actions advance equitable housing outcomes for all residents of Gresham. The HPS emphasizes improving outcomes for underserved communities, lower-income households, people in state and federal-protected classes, and people experiencing homelessness. The HPS considers issues of Fair Housing and is intended to support access to housing choice for everyone.

One of the primary goals of the Housing Production Strategy Project has been to align the City's housing plans. The three key plans are Gresham's Comprehensive Plan (the City's guiding land use document), the 2023-2029 Gresham Housing Production Strategy (the 6-year housing action plan), and the City's 2022-2025 Strategic Plan. The Strategic Plan guides City Council and the community's shared vision for the future. It focuses City resources on five strategic priorities including the Housing for All Priority. The Housing for All Goal states:

> *Everyone in Gresham can live in a secure and reliable place they call home, and no one experiences housing uncertainty. All Gresham community members can access housing that meets their changing needs and wants.*

To ensure that these plans are closely coordinated, the project team used the

adopted Housing for All Goal and its three housing objectives as the foundation for the HPS and a Gresham Community Development Plan update. The strategic plan's Housing for All Objectives are:

- *To provide resources to those experiencing homelessness or housing insecurity.*
- *To promote and support housing development that is affordable to the Gresham community across all housing types.*
- *To support housing stability.*

The purpose of this agenda item is to review the recommendations of the project team and consider approval of Resolution 3560 to adopt the 2023-2029 Gresham Housing Production Strategy. The proposed Gresham 2023-2029 Housing Production Strategy is attached to the Resolution and includes an Executive Summary.

BACKGROUND

State Legislation

The Housing Production Strategy is required by Oregon as part of House Bill 2003 (HB 2003), adopted by the State Legislature in 2019. HB 2003 was adopted to help communities meet the diverse housing needs of Oregonians and requires cities to develop strategies to encourage production of needed housing. The plan must advance the following outcomes:

- Affordable homeownership,
- Affordable rental housing,
- Housing stability,
- Housing choice for protected classes,
- Location of housing in compact, mixed-use neighborhoods,
- Fair housing, and
- Housing options for people experiencing homelessness.

The City will review its progress toward the plan annually and report progress to the State Department of Land Conservation and Development (DLCD) in three years.

RECOMMENDATION AND ALTERNATIVES

Recommendation:

Staff recommends that City Council move to approve Resolution No. 3560 adopting the Gresham 2023-2029 Housing Production Strategy, as shown in Exhibit A.

Alternative:

The alternatives to the staff recommendation are to:

1. Approve the 2023-2029 Gresham Housing Production Strategy with deletions, additions, or modifications.
2. Delay the approval of Resolution No. 3560. The consultant services for this

project are grant funded, with a deadline of June 30, 2023. If a delay results in additional consultant labor, then the delay would have an unanticipated budgetary impact.

3. Deny Resolution No. 3560, which would result in noncompliance with State regulations.

No action:
Council may choose not to approve Resolution No. 3560, which would result in noncompliance with State regulations.

BUDGET / FINANCIAL IMPACT
The HPS includes a 2023-2029 timeline for evaluating and potentially adopting actions to support the production of needed housing at the discretion of Council. Initial resource assumptions (staffing and budget) were considered in the development of this timeline. However, implementation of the individual actions in the HPS will include further budget analysis for Council's consideration as needed.

PUBLIC INVOLVEMENT
Key public involvement activities included:

- March 11, 2022: Immigrant/Refugee Focus Group
- March 16, 2022: Latinx Focus Group
- March 24, 2022: Subsidized Housing Focus Group
- March 30, 2022: Black Community Focus Group
- April 14, 2022: Advisory Group 1
- June 19, 2022: Juneteenth Community Event
- June 30, 2022: Advisory Group 2
- July 16, 2022: Arts Festival Community Event
- July 22, 2022: Housing Developer and Service Provider Interviews
- July 25, 2022: Planning Commission Work Session
- August 28, 2022: I Heart Rockwood Event
- August 30, 2022: Virtual Open House 1
- October 17, 2022: Advisory Group 3
- January 24, 2023: Virtual Open House 2
- February 27, 2023: Planning Commission Work Session

NEXT STEPS
Post adoption notice including the HPS will be submitted to DLCD for review and acceptance. The individual actions in the HPS will be evaluated and considered by Council according to the timeline in the document.

RESOLUTION NO. 3560

A RESOLUTION ADOPTING THE 2023-2029 GRESHAM HOUSING PRODUCTION STRATEGY RELATED TO 2019 OREGON HOUSE BILL 2003

The City of Gresham Finds:

A. In 2019, the Oregon Legislature passed House Bill 2003, which requires Oregon's cities with a population of over 10,000 people to study the future housing needs of their residents and to develop strategies that encourage the production of needed housing.

B. In 2021 the City of Gresham conducted a Housing Capacity Analysis, which may also be referred to as a Housing Needs Analysis.

C. The City of Gresham acknowledged and adopted the Housing Capacity Analysis as a text amendment to the Gresham Community Development Plan.

E. In 2021, the City of Gresham was awarded a grant by the Department of Land Conservation and Development to produce a Housing Production Strategy consistent with OAR 660- 008 and ORS 197.290(2).

F. The City conducted community engagement to provide input (including an advisory group, focus groups, individual interviews, open houses, and community events).

G. The City of Gresham has prepared a Housing Production Strategy, which is attached as Exhibit A and incorporated by reference.

THE CITY OF GRESHAM RESOLVES:

1. The City of Gresham hereby adopts the Gresham 2023-2029 Housing Production Strategy, which is attached as Exhibit A and incorporated by reference.

2. The Council directs staff to begin the implementation of the 2023-2029 Housing Production Strategy as described in Exhibit A and adopted by this resolution.

3. Nothing in this resolution is or shall be construed as a final decision by the Council that concerns the adoption, amendment or application of statewide planning goals, a Comprehensive Plan provision, or land use regulation.

4. This resolution is effective upon adoption.

Executive Summary

Recognizing the need for greater City support for housing, the City of Gresham Strategic Plan for 2022-2025 includes the following goal:

> Housing for All: Everyone in Gresham can live in a secure and reliable place they call home, and no one experiences housing uncertainty. All Gresham community members can access housing that meets their changing needs and wants.

Gresham's Housing Production Strategy (HPS) builds on this goal. It is a six-year plan required by the State of Oregon that outlines initiatives and actions that combine to achieve equitable housing outcomes for all residents of Gresham. The HPS emphasizes improving outcomes for underserved communities, lower-income households, people in state and federal-protected classes, and people experiencing homelessness. The HPS considers issues of Fair Housing, which is intended to provide access to housing choice by everyone, free from discrimination. In developing the HPS, the City considered equity as both an outcome and a process.

DLCD requires that the HPS includes an analysis of unmet housing need in Gresham, actions to meet future housing need, and an evaluation of achieving fair and equitable housing outcomes. When Gresham produces its next HPS in 2029, the City will be required to summarize the efficacy of each action included in this HPS.

Housing Conditions in Gresham

As the City weighs potential strategies to encourage the development of housing affordable to community members, the City must understand the needs of its residents. Key local housing conditions and demographics that will drive the City's policies in future years include:

- **Housing produced in recent years is not meeting the needs of all Gresham residents.** Across the Portland region, developers have focused on building a limited number of housing types without public subsidies, including market-rate apartments and single-family detached housing that is affordable to people with higher incomes. The 2018 passage of the Metro Affordable Housing Bond has allowed for the production of more housing (the goal is 3900 units throughout the region) but will not be enough to meet the overall need.
- **Gresham lacks financially attainable housing**: 44% of Gresham households are cost burdened (pay more than 30% of their income for housing).
- **Compared to the Portland region, a greater share of Gresham households makes less than 80% MFI.** In 2022, 70% of Gresham households had an income of 80% or less of the median family income for Multnomah, Washington, and Clackamas counties in contrast to 55% of households in the Portland region.[1]

[1] U.S. Department of HUD, Multnomah, Washington, and Clackamas Counties, 2021. U.S. Census Bureau, 2015-2019 ACS Table 19001.

- **Many low- and middle-income households have unmet housing needs.** Gresham's residents lack options for both ownership and rental units, despite Gresham's relatively low rent levels and home sales prices.
- **The City has a large share of BIPOC households.** About 36% of Gresham's population identifies as Black, Indigenous, and People of Color (BIPOC) and/or Latinx. BIPOC households are more than twice as likely to be extremely low-income (less than 30% of MFI) and almost twice as likely to be very low-income (30-50% of MFI).
- **Future population growth will only increase the need for new housing development.** Gresham is forecast to grow by 6,229 new households between 2021 and 2041.

Building Equity into the HPS

Gresham's goal of producing equitable housing goes beyond affordability. Equitable housing comprises reasonably priced, quality homes to buy or rent that are accessible across all ages, household sizes, abilities, and incomes, and are convenient to everyday needs such as schools, childcare, grocery stores, and parks.

The City applied an equity framework to the HPS that embeds equity considerations into the HPS development process, implementation, and how the City measures the impact of its actions. In moving forward with implementation of the HPS, the City will continue to refine its understanding and engagement of underserved communities, lower-income households, and people in State and federal-protected classes.

HPS Engagement included:

- **Four focus groups** with members of the Latinx, African American, Immigrant, and Refugee communities and those living in subsidized housing.
- **Staff presence** at Juneteenth, I Heart Rockwood, and the Gresham Arts Festival
- **Eight interviews** with service providers and developers
- **Three advisory group meetings**
- **Two virtual open houses**

Meeting the Housing Needs of Gresham Residents

The HPS recognizes that the City needs to use different strategies to meet the housing needs of Gresham households. This section describes housing needs for people at different parts of the income spectrum.[2,3]

[2] Estimates are based on Gresham's current income distributions.

[3] Metro's 2050 Household Distributed Forecast shows that in 2020, the Gresham city limits had 41,195 households. The Metro forecast shows Gresham growing to 49,067 households in 2045, an average annual growth rate of 0.7% for the 25-year period. Using this growth rate, ECONorthwest extrapolated the forecast to 2021 (41,484 households). This forecast is based on Gresham city limits' official household forecast from Metro for the 2020 to 2050 period.

Housing Needs for Extremely Low-Income Households (Less than 50% MFI)

Housing Need	Households Would Benefit From:
Existing Households: 19,523 Estimated New Households: 3,037 (2021-2041)	Income-restricted affordable housing.

Housing Needs for Low-Income Households (50-80% MFI)

Housing Need	Households Would Benefit From:
Existing Households: 8,468 Estimated New Households: 1,317 (2021-2041)	Naturally occurring affordable housing, income-restricted affordable housing, rent assistance, and market-rate housing.

Housing Needs for Middle-Income Households (80-120% MFI)

Housing Need	Households Would Benefit From:
Existing Households: 7,056 Estimated New Households: 1,097 (2021-2041)	A combination of the development of rental housing and lower-cost housing for homeownership.

Housing Needs of People of Color

Housing Need	Households Would Benefit From:
15% of Gresham's population identify as non-Hispanic Black, Asian, American Indian or Alaska Natives, Native Hawaiian or Pacific Islanders, two or more races, or another race. 21% of Gresham's population identify as Latino (any race).	Black, Indigenous, and People of Color are cost burdened more frequently than the average household in Gresham and would benefit from housing that is affordable to their household and available without discrimination.

Housing Needs of People with Disabilities

Housing Need	Households Would Benefit From:
13% of Gresham's population have one or more disability, such as ambulatory, vision, hearing, cognitive, self-care, or independent living disabilities.	Specially designed housing units that are affordable to each household.

Housing Needs of People Experiencing Homelessness

Housing Need	Households Would Benefit From:
An estimated 48 households experienced unsheltered homelessness in Gresham in 2022, according to the 2022 Point-in-Time Count for Multnomah County.[4] 1,106 students in the Gresham-Barlow, Centennial, and Reynolds School Districts experienced homelessness according to the McKinney Vento, Homeless Student Data for 2019-2020.	Actions ranging from emergency assistance to housing with supportive services.

Four Housing Outcomes

The City of Gresham has identified four desired outcomes to address residents' housing needs. The HPS includes strategies that address each of these outcomes:

Outcomes	Income Range Impacted (Median Family Income[5] for a 4-Person Household)
Open Up Affordable Ownership Opportunities	Less than 120% MFI (up to $127,800)
Preserve Existing Low- and Middle-Income Affordable Housing	60%-80% MFI ($63,900 - $85,200)
Reduce Barriers to Producing Low and Middle Income Affordable Rental Housing	60%-80% MFI ($63,900 - $85,200)
Encourage Production of Publicly Subsidized Affordable Housing Units	Up to 60% MFI (under $63,900), sometimes 80% MFI (under $85,200)

Matching Actions to Funding

One of the limitations to implementing the HPS is the availability of funding. The City needs funding not only to build units, preserve affordable housing, and provide access to equitable housing, but also to fund staff time to implement the HPS. The City has direct access to funding for the development of affordable housing, such as the Metro Housing Bond, Community Development Block Grant Program (CDBG), and HOME Investment Partnership Program

[5] Based on 2022 Median Family Income that is defined by the U.S. Department of Housing and Urban Services (HUD) for Multnomah County.

(HOME) funding. However, it is limited or one-time funding. Identifying a set of realistic funding sources is necessary for achieving the vision of housing choice for all in Gresham. The City of Gresham has a lower tax rate than most jurisdictions in the Portland region and is facing financial challenges. Using just the funding from existing resources will have less impact than also adding new funding resources, such as future TIF District(s) and/or a Construction Excise Tax (CET).

Barring additional funding, many of the actions identified in the HPS can only be implemented within an existing or potential TIF District. Therefore, the City has organized the actions in the HPS as follows:

- Actions to be implemented within the existing and potential new TIF districts
- Actions for evaluation exclusively within potential new TIF district(s)
- City-wide action

Housing Actions

The suite of actions below comprises Gresham's Housing Production Strategy for 2023-2029. Based on the project team's evaluation, these actions would increase fair and equitable housing choices. Implemented together and with adequate funding, the actions will achieve more equitable housing outcomes for all residents.

Gresham's Housing Production Strategy Actions (2023-2029)
Within Existing and Potential New TIF District(s)
Explore provision of grants/loans for new development
Explore rehabilitation grants to low-cost, market rate rental property owners in exchange for affordability agreements
Explore partnerships to acquire and stabilize existing low-cost market rate housing
Explore funding and partnerships for housing-related infrastructure development
Exclusively Within Potential New TIF District(s)
Explore land banking, parcel assembly, and public land disposition efforts
City-Wide
Explore and reduce barriers for affordable homeownership models
Reduce zoning barriers for housing development, with a focus on multifamily and townhouse development
Streamline permitting processes for all housing types, with a focus on barriers to townhouse and multifamily housing
Implement a rent assistance pilot program for individuals experiencing homelessness and explore partnerships to address and prevent homelessness
Extend/expand the City's tax abatement agreement with Home Forward

Gresham's Housing Production Strategy Actions (2023-2029)
Explore a reduction and/or waiver of System Development Charges for certain needed housing types
Evaluate the Multiple Unit Property Tax Exemption
Evaluate the Nonprofit Corporate Low-Income Tax Exemption
Explore a Gresham-specific Construction Excise Tax

Monitoring and Reporting

The City will follow DLCD's requirements for monitoring and reporting. The City will review progress annually and create an implementation progress report every three years. Since many of the actions in the HPS entail additional study, the City may include goal setting and evaluation as metrics to track. Then, if the City moves forward with implementation, the City will measure outcomes.

1. Introduction

Housing affordability is a key issue in Gresham and the City has many efforts underway to address housing needs. Most recently, the City made housing a priority in the 2022-2025 Gresham Strategic Plan, completed a Housing Capacity Analysis (HCA) in 2021, and updated its Consolidated Plan for the 2021-2025 period. The City has made progress but there is still work to be done to ensure that Gresham's existing and future housing needs are met.

The Gresham Strategic Plan 2022-2025 includes the following goal:

> Housing for All: Everyone in Gresham can live in a secure and reliable place they call home, and no one experiences housing uncertainty. All Gresham community members can access housing that meets their changing needs and wants.

Gresham's Housing Production Strategy (HPS) is one of the ways Gresham plans to implement this goal. It includes initiatives and strategic actions that combine to achieve equitable housing outcomes for all residents of Gresham, with an emphasis on improving outcomes for underserved communities, lower-income households, and people in state and federal-protected classes. The HPS is also based in Fair Housing, which is intended to provide access to housing choice by everyone, free from discrimination.

The City received a grant from the Department of Land Conservation and Development (DLCD) in 2021 to produce the HPS in accordance with State of Oregon requirements. This HPS is a six-year strategy running through 2029. It provides information about Gresham's housing needs, using the recently completed Housing Capacity Analysis (HCA) as its foundation. It provides an understanding of the unmet housing needs (in Chapter 1), before solutions are proposed (in Chapter 2).

Requirements of the Housing Production Strategy

DLCD requires that the HPS includes the following information.[6] It is noted where this information is included in this report:

- **Unmet Housing Need in Gresham** (Chapter 1, Appendix A, Appendix B, and Appendix C) covers the socio-economic and demographic trends of households in Gresham, the existing policies the City has adopted to meet housing needs, and a summary of engagement the City has had with interested parties about housing needs (especially with Gresham residents in underrepresented groups).

[6] Oregon Administrative Rule (OAR) 660-008 describes the requirements of a HPS in sections 660-008-0050 through 660-008-0070.

- **Actions to Meet Future Housing Need** (Chapter 2 and Appendix D) identifies specific actions, measures, and policies needed to address housing needs identified in Gresham's HCA.
- **Achieving Fair and Equitable Housing Outcomes** (Chapter 3 and Appendix E) evaluates the entire list of strategies to achieve equitable outcomes. The valuation considers factors such as location of housing, Affirmatively Furthering Fair Housing, facilitating housing choice, identifying housing options for residents experiencing homelessness, supporting development of affordable housing, and increasing housing stability.

The City must submit the HPS to DLCD after its adoption by the City Council. Then, the City must monitor progress on implementation of the HPS and the production of housing related to the initiatives and actions in this report (Chapter 3 and Appendix E). Linking housing development directly to implementation of the actions in this report may be challenging and difficult to quantify, but City staff will be able to report changes in building activity that occur before and after implementation of specific actions and will provide qualitative feedback on implementation of actions.

Gresham must submit a report to DLCD three years after the City adopts the HPS, as required. If the City is unable to or chooses not to implement an action within 90 days of the timeline proposed in the HPS, the City must notify DLCD about the action(s) that the City is taking to address this issue. The City may propose an alternative schedule for implementing the action or may identify a different action (or actions) to meet the specific housing need addressed by this action.

Building Equity into the HPS

Gresham's goal of producing equitable housing goes beyond affordability. Equitable housing comprises reasonably priced, quality homes to buy or rent that are accessible across all ages, household sizes, abilities, and incomes and that are convenient to everyday needs such as schools, childcare, grocery stores, and parks. In pursuing equitable housing, Gresham seeks to reduce cost burden and increase access to homeownership, especially for low-income households and vulnerable groups such as seniors, workers with low pay, people with disabilities, and communities of color.

In developing the HPS, the team considered equity as both an outcome and a process. Exhibit 1 provides an equity framework that embeds equity considerations into the HPS process, implementation, and measurement of impact. The actions in the HPS are intended to increase equitable housing outcomes.

Exhibit 1. Gresham Housing Production Strategy Equity Framework

Equity as a process	Equity as an outcome
• The City seeks to understand, question, and disrupt historical and contemporary inequitable systems and structures. • From there, the City will create policies that are based on equitable opportunity and resources. The City will ensure that those most impacted by policies and practices are meaningfully involved in their creation and implementation. • Creating equitable processes will help ensure that diverse and underrepresented communities (including vulnerable and low-income communities) can influence and inform policies and programs.	• Race or other markers of social identity no longer predict one's life outcomes (for instance in health, socioeconomic advantages, educational access, life expectancy, etc.). • Achieving equity remains a challenge because our economic systems were, sometimes unintentionally, designed and built to maintain inequality—and they continue to do so.

Interested Parties Involvement in the HPS

The outreach process for developing the HPS was collaborative. It included housing developers, housing service providers, consumers of needed housing, and individuals belonging to historically underserved communities. The team consulted community members in focus groups, virtual open houses, and in person at community events to learn about their priorities, needs, and challenges related to housing. Gresham City Council, Planning Commission, and the Coalition of Gresham Neighborhood Associations were consulted on the development of this plan.

Takeaways from Gresham residents that attended outreach activities are outlined below and details of the public involvement activities are included in Appendix A:

- Cost is the most important factor when looking for housing and it is the number one barrier to attaining housing appropriate for a household's needs.
- Different communities experience different barriers to housing: some people face language challenges, some find down payment or credit score requirements a challenge, and others have difficulty finding housing with enough bedrooms.
- Different communities have different priorities for housing location: while parks and open spaces are important to some people, others care about being close to family or grocery stores.
- Not all landlords know about fair housing laws and some people stated that they face discrimination in housing.

- The city lacks appropriately sized units, particularly small ownership, or family-sized rental units.
- There is a lack of units accessible to people in disability communities.
- Residents support encouraging neighborhoods with a mix of incomes, places to live, work, and play, and a greater variety of housing types in neighborhoods.
- Lack of privacy can be a challenge in rental units (particularly in subsidized housing).
- Some people want or need assistance in finding housing and with the process of applying for or purchasing it.
- Low-quality construction leading to noise and lack of maintenance is a challenge.
- Some neighborhoods lack diversity and therefore are missing some culturally relevant services and activities.
- Community members want the City to be part of the housing conversation and to help connect people looking for housing with providers, advocates, and non-profits.

Key Terms in the HPS

A common understanding of the variety of terms used in this HPS is important for interpretation.

The following key terms and definitions are used herein and will be incorporated into the Definitions section of OAR 660-008 (if they are not already), per the Department of Land Conservation and Development:

- **Consumers of Needed Housing:** Any person who inhabits or is anticipated to inhabit Needed Housing, as described in the definition of "Needed Housing" in ORS 197.303.
- **Housing Production Strategy Report:** The report cities must adopt within one year of their deadline to complete an updated Housing Capacity Analysis, pursuant to OAR 660-008-0050.
- **Housing Production Strategy:** A specific tool, action, policy, or measure a city will implement to meet the housing needs described in an adopted Housing Capacity Analysis. A Housing Production Strategy is one component of a Housing Production Strategy Report.
- **Needed Housing:** Housing types determined to meet the need shown for housing within an urban growth boundary at particular price ranges and rent levels, including (but not limited to) renter and owner-occupied attached and detached single-family housing, multifamily housing, and manufactured homes.
- **Producers of Needed Housing:** Developers, builders, service providers, or other persons or entities providing materials and funding needed to build housing. Producers of Needed Housing may include non-profit organizations or public entities.

- **Unmet Housing Needed:** Occurs when housing need determined is greater than the housing capacity (i.e., buildable, residential land is insufficient to accommodate demand for housing).

In addition, the terms and definitions below use throughout this report:

- **Cost Burdened:** A household is defined as cost burdened if their housing costs exceed 30% of their gross income.
- **Displacement:** The process of groups or individuals moving out of a neighborhood for economic reasons.
- **Gentrification:** A process of neighborhood change that includes economic change in a historically disinvested neighborhood, by means of real estate investment and new higher-income residents moving in as well as demographic change, not only in terms of income level, but also in terms of changes in the education level or racial make-up of residents.
- **Federally Protected Classes:** Are race, color, national origin, religion, gender, familial status, and disability. Oregon's additional protected classes are marital status, source of income, sexual orientation and gender identity, and status as a domestic violence survivor. Under Fair Housing laws, it is illegal to deny access to housing based on the characteristics of people within these protected classes.
- **Median Family Income (MFI): T**hroughout this report, housing affordability is based on 2022 Median Family Income that is defined by the U.S. Department of Housing and Urban Services (HUD) for Multnomah County for a family of four people ($106,500). The terms used to describe housing affordability by income group are:
    - Extremely Low-Income: Less than 30% MFI or $31,500 or less for a family of four
    - Very Low-Income: 30% to 50% of MFI or $31,500 to $53,250 for a family of four
    - Low-Income: 50% to 80% of MFI or $53,250 to $85,200 for a family of four
    - Middle-Income: 80% to 120% of MFI or $85,200 to $127,800 for a family of four
    - High-Income: 120% of MFI or more $127,800 or more for a family of four
- **Naturally Occurring Affordable Housing:** Naturally occurring affordable housing is housing that is not regulated but is currently affordable to lower income households, often because of its location and condition.
- **Severely Cost Burdened:** A household is defined as severely cost-burdened if its housing costs exceed 50% or more of its gross income.

The data used in this plan comes from a variety of sources, which are dated and referenced. Housing costs and income are very sensitive to changes in the economy and can change quickly over a short period of time. The body of this report generally uses the most up-to-date information about Median Family Income, Housing Sale Prices, and Homelessness. Most data in the appendices use the most up-to-date information that was available at the beginning of the project when the analysis was performed. The rent estimates provided in this report are from:

- **Average Multifamily Asking Rent**, from CoStar at $1,430 per unit. This is the estimate of rent used most frequently because it represents the best available data about rent when the project started.
- **Median Gross Rent**, from the 2015-2019 American Community Survey of $1,178. This estimate of rent was cited in the Housing Capacity Analysis and is included here to illustrate how rents vary across cities within the Portland region.
- **Multnomah County Fair Market Rent** for 2022, from the U.S. Department of Housing and Urban Services of $1,467. This is a standard source of information about rents for a region.

2. Unmet Housing Need in Gresham

The HPS connects unmet housing needs with strategies to address those needs. The City already understands the housing needs of current and future residents of Gresham based on certain demographic and socioeconomic characteristics, such as age and income, from the 2021 Gresham Housing Capacity Analysis (HCA).[7] However, as the City weighed potential strategies to encourage affordable housing, the City sought to develop a deeper understanding of the needs that are specific to Gresham residents. Therefore, this chapter summarizes key information from the HCA and describes additional detailed data about housing needs for other demographic characteristics, such as race, ethnicity, disability status, or housing status (which were not included in the HCA).[8]

Housing Needs Addressed by the Housing Production Strategy[9]

Across the Portland region, developers have been able to build some types of housing without need for public intervention, for example, single-family detached housing that is affordable to people with higher incomes. However, the market has been unable to keep up with the needs for housing affordable to low- and middle-income households. Housing at this part of the income spectrum, and housing that meets the special needs of specific groups, usually requires public intervention and is the focus of the strategies in the HPS.

Gresham has a larger proportion of low-income (less than 80% MFI) households than the Portland region.

Gresham has a higher proportion of extremely low-, very low-, and low-income households than the average for the Portland Region, as shown in Exhibit. Almost half of Gresham's households had incomes of less than 50% of the Median Family Income (MFI) ($53,250)[10] as shown in Exhibit 3. The median rent in Gresham is lower than most surrounding cities and Multnomah County's median gross rent (see Appendix A, Exhibit 47), yet these households

[7] The HCA was produced in June 2021 and adopted into Gresham Community Development Plan as Volume 1, Section 4.800 2021-2041 Housing Capacity Analysis, and Volume 2, Section 10.600 Housing.

[8] This chapter uses standard sources of information from the U.S. Census. It adds information from other sources, such as Oregon's Housing and Community Services Department, the United States Department of Housing and Urban Development, Redfin, Costar, and the City of Gresham. The detailed data underlying the summary information presented in this chapter is in Appendix A.

[9] This section describes Gresham's housing needs based on analysis from the Gresham Housing Capacity Analysis report (June 2021), household income shown in Exhibit 2 and on additional analysis of unmet housing needs for underserved groups (based on analysis in Appendix A).

[10] Throughout this report, housing affordability is discussed based on 2022 Median Family Income (MFI) that is defined by the U.S. Department of Housing and Urban Services (HUD) for Multnomah County for a family of four people ($106,500).

cannot afford a two-bedroom apartment at Multnomah County's Fair Market Rent (FMR) of $1,467 in 2022.

Exhibit 2. Share of Households by Median Family Income (MFI) for Multnomah, Washington, and Clackamas Counties ($106,500), Gresham, 2022

Source: U.S. Department of HUD, Multnomah, Washington, and Clackamas Counties, 2021. U.S. Census Bureau, 2015-2019 ACS Table 19001.

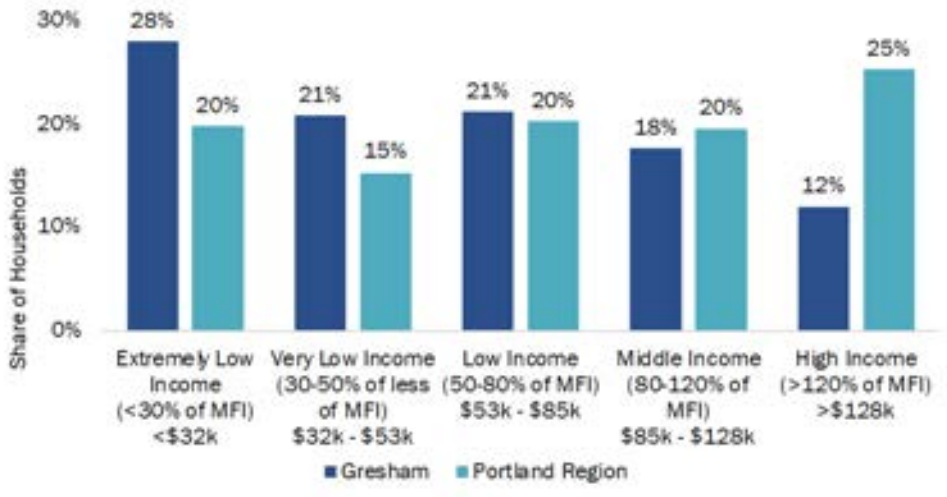

Exhibit 3. Share of Households by Median Family Income (MFI) for Multnomah County ($106,500), Gresham, 2022

Source: U.S. Department of HUD, Multnomah County, 2022. U.S. Census Bureau, 2015-2019 ACS Table 19001.

Median Family Income varies by household size.

The actual income thresholds vary in MFI based on household size. For example, a one-person household with an income of 80% of MFI ($59,680) makes much less than a household of four ($85,200) or a household of six ($98,880). This is shown in Exhibit 4. The housing needs for a single person are also different than those of a household of four people or six people. Throughout the HPS, the income for a household of four is used to illustrate housing needs.

For reference, the median gross rent in Gresham was $1,178 in the 2015-2019 ACS 5-year estimate period (Exhibit 47) and Multnomah County's Fair Market Rent was $1,467 in 2022.

Exhibit 4. Median Family Income and Housing Affordability by Household Size, Multnomah County, 2022

Source: Analysis by ECONorthwest; U.S. Department of HUD, Multnomah County, 2022

	30% MFI	60% MFI	80% MFI	100% MFI	120% MFI
1-person					
Annual Income	$ 22,380	$ 44,760	$ 59,680	$ 74,550	$ 89,460

Affordable Monthly Housing Cost	$ 799	$ 1,598	$ 2,130	$ 2,663	$ 3,195
6-people					
Annual Income	$ 37,080	$ 74,160	$ 98,880	$ 123,540	$ 148,248
Affordable Monthly Housing Cost	$ 927	$ 1,854	$ 2,472	$ 3,089	$ 3,706

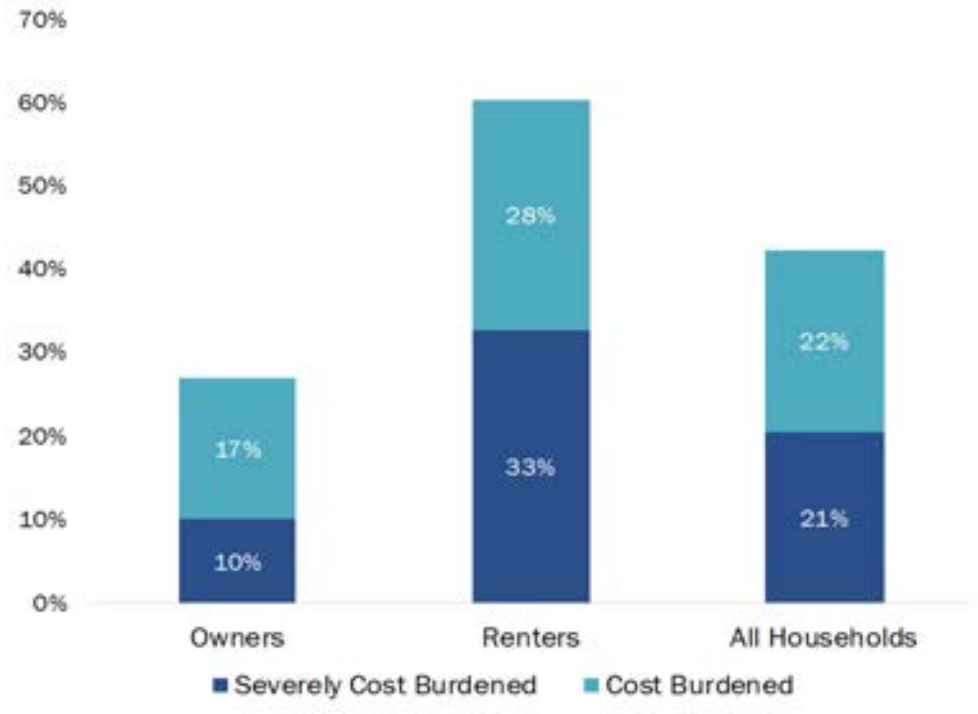
Many households in Gresham pay more than 30% of their income for housing.

The local housing market cannot produce income-restricted, subsidized affordable housing at sufficient levels, and it cannot often produce middle-income housing without subsidy, therefore, nearly half (44%) of households in Gresham are cost burdened (as shown in Exhibit 5 below, and Exhibit 50 through Exhibit 57 in Appendix A). About 61% of Gresham's renters were cost burdened or severely cost burdened, compared to 27% of homeowners.

A household is defined as cost-burdened if their housing costs exceed 30% of their gross income. A household that spends 50% or more of their gross income on housing costs is said to be severely cost-burdened.

Exhibit 5. Housing Cost Burden by Tenure, Gresham, 2015-2019

Source: U.S. Census Bureau, 2015-2019 ACS Tables B25091 and B25070.



Another way to understand the need for affordable housing is through the federal poverty rate. According to Census data, 15% of Gresham's population had income below the poverty level in 2021, compared with 22% of Gresham's population in 2014. The change in poverty rates is consistent with changes in Multnomah County, where the percent of population below the poverty line decreased from 19% in 2014 to 13% in 2021. The change in poverty rates is, at least partially, reflective of changes in the overall economy of the state and nation.[11]

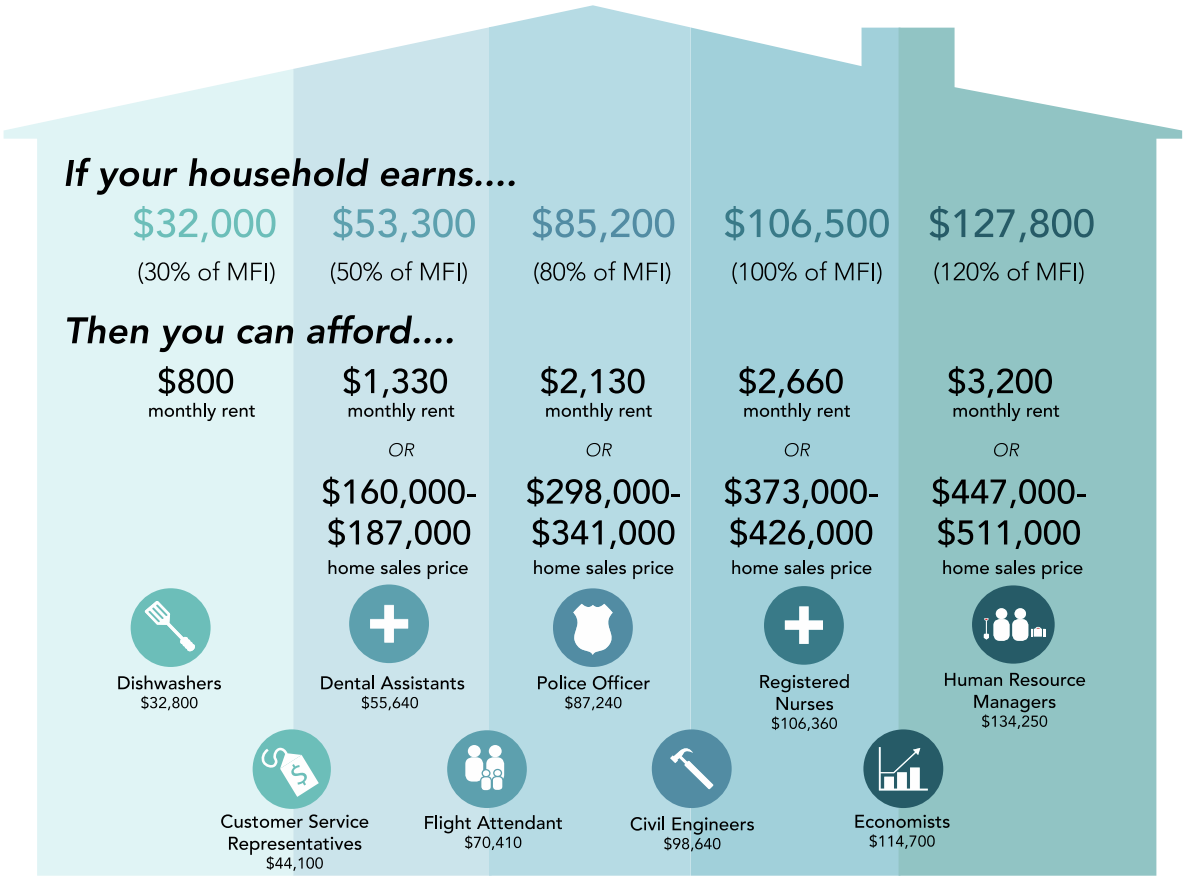
Low-income households have few options for either homeownership or rental units.

Even though Gresham is one of the more affordable communities within the Portland region, housing costs for both rental and ownership units are higher than many residents can afford. Exhibit 6 shows financially attainable housing costs for households across the income spectrum in Multnomah County.

[11] Based on information from the 2009-2014 American Community Survey and 2017-2021 American Community Survey from the U.S. Census.

Exhibit 6. Financially Attainable Housing, by Median Family Income (MFI) for Multnomah County ($106,500), Gresham, 2022

Source: U.S. Department of Housing and Urban Development, Multnomah, 2022. Oregon Employment Department.
Note: The estimates of affordable home sales prices below are rough estimates. The affordable home sales prices will vary for each borrowing household, based on interest rates, loan term, down payment, and similar factors. These sales prices are illustrative estimates and do not make assumptions about interest rates, amount of down payment, whether mortgage insurance will be required, or other factors that are unique to an individual household's mortgage.



In Gresham, a family of four must make 107% of MFI ($114,000) to afford the median sales price of a home ($456,000) and 54% of MFI ($57,000) to afford Gresham's median apartment rent ($1,430 per month).

Gresham is forecast to grow by 6,229 new housing units between 2021 and 2041.

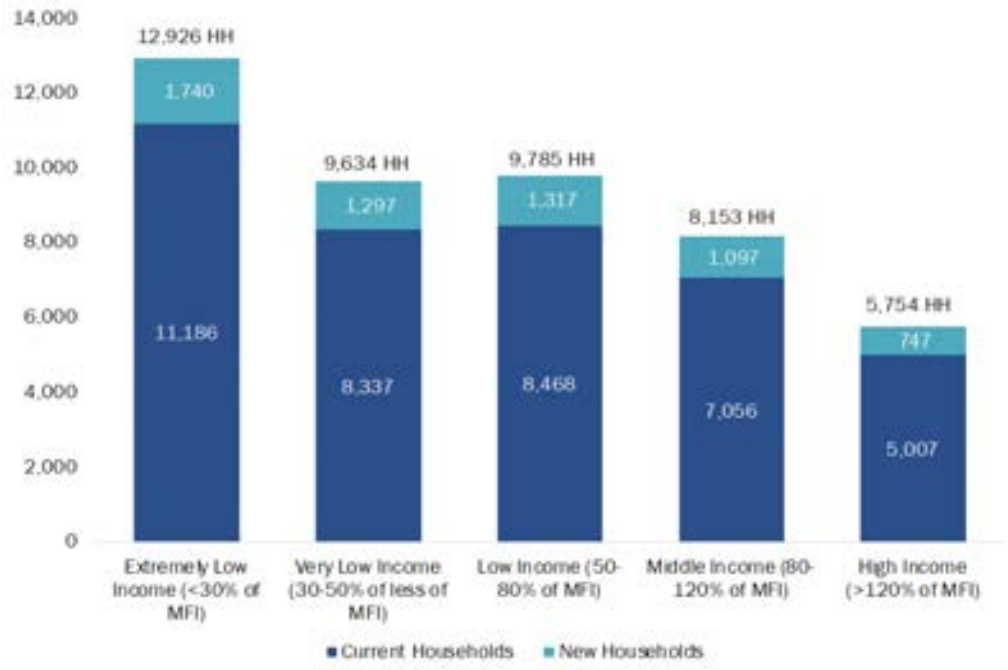
These housing units will need to be available at a variety of income levels.

Exhibit 7 shows Gresham's current and estimated future households by income.[14] While the HPS does not anticipate building new units for all existing households with unmet housing need, the new development and other policies that stabilize housing affordability are likely to benefit existing households with unmet need, as well as new households.

Nearly half of new housing units will need to be for those with very low or extremely low-incomes (below 50% MFI).[12] [13]

Exhibit 7. Gresham's Current and Estimated Future Households by Income, 2021 to 2041

Source: U.S. Census Bureau, 2015-2019 ACS 5-year estimate, Table B19001, U.S. Department of HUD 2022 MFI, and Metro's *2050 Household Distributed Forecast*, 2021 to 2041 as found in Gresham's Housing Capacity Analysis. Note: Median Family Income (MFI) is estimated for a family of 4.



Housing Needs for Various Income Levels

The purpose of the HPS is to identify actions that will benefit Gresham's households with the most significant unmet needs. Exhibit 8 describes the most significant unmet housing needs by

[12] Given the fact that incomes have grown at a relatively slow pace over the last two decades in comparison to housing costs (especially home sales prices) this may be a conservative assumption about the future affordability of housing.

[13] Assuming future Gresham residents have an income distribution that is the same as existing residents. The HPS does not anticipate building new units for all existing households in Gresham that have problems affording housing costs. But the HPS does propose actions to stabilize the housing costs of existing lower income households and may result in development of housing that is more affordable to these households, enabling them to stay in Gresham. Information about lower income households and cost burden for existing households illustrates the existing housing need in Gresham.

[14] Gresham's current housing income levels were used to estimate future household income levels.

income level (extremely low-income, low-income, and middle-income). For each income level, the table includes the number of existing households in Gresham, the number of new households estimated or 2021-2041, affordable monthly rent, and generally what is needed to meet the housing need.

Exhibit 8. Housing Needs by Income Level

Income level	Existing households	Estimated new households (2021-2041)	What can they afford? *Rents (including basic utility costs)*	How to meet the need?
Extremely Low-Income (less than 50% MFI)	19,523	3,037	Rents up to $1,330 per month. *A household would need to earn $57,000 to afford average multifamily rent of $1,430 (about 54% of MFI for a family of four).*	• Preserve existing income-restricted housing • Develop new income-restricted affordable housing; this typically requires extensive subsidy, with funding from state and federal sources, in addition to any support from the City and other partners
Low-Income (50%-80% MFI)	8,468	1,317	Rents between $1,330 to $2,130 per month. *Households with this income range are likely to live in rental housing predominantly.*	• Preserve existing "naturally occurring affordable housing" • Develop new income-restricted housing • Develop new market-rate housing • Provide rent assistance, such as a Housing Choice Voucher • Provide homeownership opportunities related to housing developed by nonprofit organizations (possibly with subsidy, such as through a community land trust). • Provide down payment assistance
Middle-Income (80%-120% MFI)	7,056	1,097	Rents between $2,130 to $3,200 per month. *Households within this income range can afford rents higher than the average multifamily rent ($1,430). Some households can afford the median home sales price in Gresham ($456,000). Households with incomes in the lower part of this income range may need assistance in attaining homeownership.*	• Develop rental housing • Develop lower-cost housing for homeownership. • Provide down payment assistance, or housing developed by nonprofit organizations (possibly with some subsidy, such as land banking or a community land trust).

Housing Needs for Underserved Households: Addressing Equitable Access

As the City applied the HPS Equity Framework, it considered issues of Fair housing and equitable access to housing options. Part of this process has been and will continue to be iterative, a continual refining of the City's understanding and engagement of underserved communities, lower-income households, and people in state and federal-protected classes. This

will be critical to creating policies that are based on equitable opportunity and resources.

Housing Needs of People of Color

Understanding the race and ethnicity characteristics[15] in Gresham is important for understanding housing needs because Black, Indigenous, and People of Color often face discrimination when looking for housing. In addition, comparing household income for Black, Indigenous, and People of Color (BIPOC) households with White non-Hispanic households to shows disparities in income levels, as shown in Exhibit 9 and Appendix A, Exhibits 17-19.

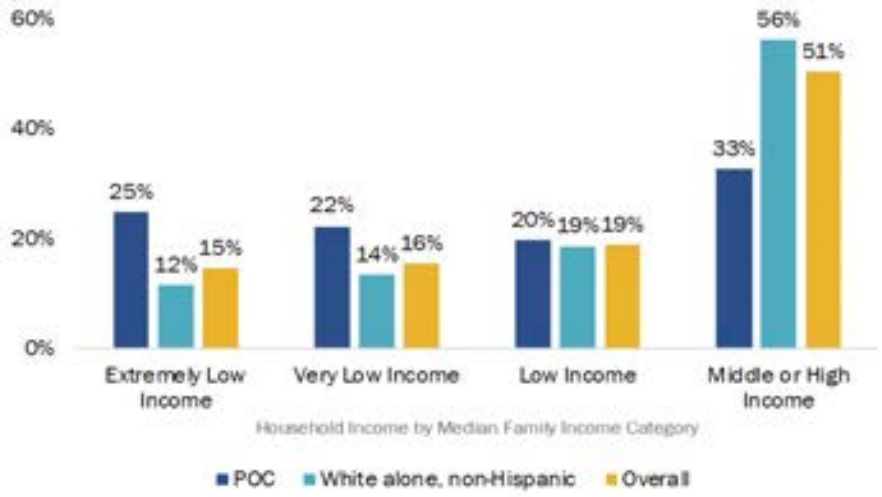
About 33% of BIPOC households were middle- or high-income compared to 56% of White, non-Hispanic households.

Extremely or very low-income households were more likely to be BIPOC.

Exhibit 9. Household Income by BIPOC, White non-Hispanic, and All Households, Gresham, 2014-2018

Source: CHAS, Table 2.

Note: BIPOC includes Hispanic/Latinx households



About **15% of Gresham's population** identify as non-Hispanic Black, Asian, American Indian or Alaska Natives, Native Hawaiian or Pacific Islanders, two or more races, or another race. About 21% of Gresham's population identify as Latino (any race). Black, Latino, American Indian or Alaska Natives, and Native Hawaiian or Pacific Islanders are more likely to rent their homes and to live in multifamily housing than the overall average in Gresham. Black, Indigenous, and People of Color are cost burdened more frequently than the average household in Gresham.[16] 55% of BIPOC households were cost burdened or severely cost burdened compared to 38% of White households and 31% of BIPOC households were severely cost burdened compared to 17% of White households. Addressing the affordability issues, discussed above, as well as ensuring that Black, Indigenous, and People of Color have access to housing without

[15] The U.S. Census Bureau considers race and ethnicity as two distinct concepts. Latino is an ethnicity and not a race, meaning individuals who identify as Latino may be of any race. BIPOC as used in this report does not include individuals who identify as white and Hispanic/Latinx.

[16] Black, Indigenous and People of Color includes Black, Latino, American Indian or Alaska Native, Asian, Native Hawaiian and Pacific Islanders, and people of another or multiple races. These categories were combined due to limited data availability.

discrimination. This will require increasing awareness of Fair Housing rules for property owners and managers, tenants, City decision makers, and City staff. It will also require careful decision making to change policies that have created barriers to accessing housing for Black, Indigenous, and People of Color.

Housing Need of People with Disabilities

The Census reports that about **13% of Gresham's population** have one or more disabilities, such as ambulatory, vision, hearing, cognitive, self-care, or independent living disabilities. Appendix A, Exhibit 20 has more details about this population group in Gresham.

Disabilities include those that are visible, such as ambulatory or vision disabilities, and those that are not readily apparent, such as self-care, independent living, or cognitive disabilities. Other conditions may require special accommodation, such as disabling diseases or mental health conditions.

Addressing the affordability issues discussed above, as well as ensuring that people with disabilities have access to housing that addresses their disability and that they have access to housing without discrimination. This will require increasing awareness of Fair Housing rules for property owners and managers, tenants, City decision makers, and City staff. It will also require approaches that encourage development of housing with specialized design standards to accommodate special needs.

Housing Need of People Experiencing Homelessness

There were approximately **48 households** experiencing unsheltered homelessness in Gresham in 2022.[17] In addition**, 1,106 students** in the Gresham-Barlow, Centennial, and Reynolds School Districts experienced homelessness according to the McKinney Vento, Homeless Student Data. 2019-2020. . The number of people experiencing unsheltered homelessness in Multnomah County was 5,228 in 2022. [18] These numbers may be underestimated, especially because people experiencing homelessness may move between cities in the Portland region. Appendix A, Exhibits 41-44 have more details about this population group in Gresham.

Strategies will range from emergency assistance (including rent and utility assistance), permanent supportive housing (including supportive housing with services), and improved access to affordable units.

[17] 2022 Point-In-Time Count, Count of people experiencing HUD homelessness in Portland/Gresham/Multnomah County, Oregon on January 26, 2022, Joint Office of Homeless Services.

[18] This is the total count of people experiencing homelessness, sheltered, in transitional housing, and unsheltered. It includes those who are experiencing chronic homelessness as well as those experiencing temporary homelessness.

Development of Needed Housing: Opportunities and Barriers

Supporting the development of needed housing is a complex and challenging task. The City of Gresham faces challenges that can be placed into eight broad categories. In order to inform the efficacy of potential strategies, the City has identified barriers and opportunities presented by each challenge.

Exhibit 10. Summary of Gresham's Challenges to the Development of Needed Housing

Challenges	Barriers include…	Opportunities: The City can…
Development Standards. Existing development regulations limit higher-density multifamily housing	Standards (such as open space, landscaping, ground floor uses, building height, and maximum densities), which constrict developers' abilities to provide needed housing at affordable rents; parking minimums that have historically been viewed by developers as a barrier (these standards are changing in response to Climate Friendly and Equitable Communities rulemaking.)	Remove complex or restrictive zoning and make housing, multifamily housing development less difficult, and less costly.
		Identify locations appropriate for increased density and amend the development code can increase financial feasibility of building new multifamily housing in targeted locations.
	Numerous residential and mixed-use zones. The quantity of different zones adds to development complexity.	Evaluate the quantity and complexity of zones that permit residential uses, and potentially consolidating zones or standards can ease developer confusion, time, and cost.
Few Opportunity Sites. Few opportunity sites exist for development of regulated, income-restricted affordable housing in high-opportunity locations.	Developers face challenges finding sites that are affordable, allow multi-unit development, and are in an appropriate location.	Review zoning in specific locations with transportation options and service to ensure appropriate development is allowed.
		Explore the use of TIF Districts to allow the City to engage in land banking. The City can seek to secure land in high opportunity areas, such as those with access to transit, near services (both social services and other services), and near jobs (or with easy access to transit).
	There are concerns that as Climate Friendly and Equitable Communities requirements take place, the removal of required parking minimums may be offset by increased land prices near MAX stations.	Review site and building design standards in conjunction with the changes needed to meet Climate and Equitable Communities requirements to increase financial feasibility in areas with transportation options and services.

Challenges	Barriers include…	Opportunities: The City can…
Development and Redevelopment Risk. Development of key infill and redevelopment opportunity sites in Gresham's centers may be too complex and risky for many developers.	Only some developers will be willing to take on the risk of redeveloping key opportunity sites, given the cost and challenges with redevelopment.	Continue to proactively engage and partner with owners and the development community to provide technical assistance for key opportunity sites for redevelopment to foster community-responsive development. Sites include the Rockwood Triangle, Downtown (Gresham Town Fair, Hogan/Burnside, and Beech Street), and in the Civic Neighborhood District (K-Mart site and properties near the MAX station).
		The City can be mindful of these barriers when taking actions under the State's Climate Friendly and Equitable Communities requirements and changing how these projects can develop.
		Explore expanded/new TIF Districts to allow the City to partner in redevelopment of these areas.
Infrastructure Needs. A portion of Gresham's residential capacity is in Pleasant Valley and Springwater, which have significant infrastructure needs.	The costs of development of this new infrastructure will be considerable.	Review the mechanisms for furthering infrastructure development in Pleasant Valley, and Springwater to accommodate the potential demand for housing in these areas.
		Evaluate the housing component of Pleasant Valley and Springwater's zoning in upcoming planning projects to ensure compatibility with the City's goals and site constraints.
Limited Resources for Development. Limited funding and resources are available to support development of: • income-restricted affordable housing (for incomes below 60% of MFI), and • new housing affordable to middle income households (60% to 120% of MFI).	An increasing need to secure federal, state, and local subsidies to cover the costs of development and operations with restricted rents.	Support housing for these income ranges through direct funding (i.e., monetary contributions for housing), contributions of land, and cost reductions (e.g., tax abatements or waiving fees), when funding and resources are available.
	No continuous, large, locally controlled, dedicated funding sources to develop subsidized affordable housing.	
	Federal and state funding is harder to access for building housing affordable to the 60%-120% MFI income ranges.	Focus on removing zoning barriers and ensuring that infrastructure is available to support housing development.
Limited Staff Capacity. Implementing the actions in the HPS will take considerable City staff capacity.	Limited staff capacity to work on the items in the HPS may slow or halt implementation of the HPS and the development of needed housing.	Designate a portion of one or more staff member's job to implement the HPS to help ensure that actions occur within the required timelines.

Challenges	Barriers include…	Opportunities: The City can…
Local Context. Lack of awareness of housing needs and the community benefits of affordable housing could lead to insufficient support for housing programs and affordable housing development.	Community concern and resistance may hinder the development of affordable housing and limit the City's ability to support housing programs.	Increase community engagement to help the City to understand and gain support for the development of affordable housing. Developers and city staff will need to reach out to neighborhood groups and other stakeholders to gain support for development by providing information about newer housing types and discussing how different housing types can fit into existing neighborhoods.
		Staff should highlight the benefits of diverse housing types including lower climate impacts, preservation of green space, attainability of housing for people who grew up in the community or who are ready to downsize and promoting energy efficiency.
Local Income Levels. Many households in Gresham cannot afford the high cost of new market-rate, multifamily development.	Nearly half of Gresham residents had incomes less than the 50% of MFI for Multnomah County; the lower income in Gresham makes it difficult for many residents to afford market rents.	Create incentives; financial and other support, to help offset high construction costs and lower incomes in Gresham so that developers are able to build multi-unit housing that is both financially feasible for the developer and affordable to average households in Gresham.
	Developers often cannot afford to build market-rate multi-unit rental housing that is affordable to households in Gresham.	

3. Strategies to Meet Future Housing Need

The City of Gresham has identified four outcomes to address its housing needs. Each is associated with potential city-led actions, funding sources, and potential partnerships with other entities that help to achieve an overarching goal by bundling strategies and funding sources. The City acknowledges that several strategies and partnerships are necessary to achieve the City's housing goals.

HPS Outcomes

- Encourage Production of Publicly Subsidized Affordable Housing Units
- Reduce Barriers to Producing Low- and Moderate-Income Affordable Rental Housing
- Open Up Opportunities for Affordable Homeownership
- Preserve Existing Low- and Moderate-Income Affordable Housing

The City will lead and implement each action with the support of its partners. The actions arose as the best opportunities for responding to immediate needs while also establishing a framework for the City to continue its work for the long term.

What actions will the City pursue by 2029?

After evaluating potential actions for inclusion in the HPS, within each initiative, the project team identified actions to include in the HPS. Based on the project team's evaluation, the strategies presented in the HPS would increase fair and equitable housing choices. Using just the funding from existing resources to implement strategies will have less impact than also adding in new funding resources such as a future TIF District(s) and/or a Construction Excise Tax (CET). The table below shows the actions organized by:

1. Actions to be implemented within the existing TIF District
2. Actions for evaluation within potential new TIF District(s)
3. City-wide strategies

These actions, along with the tenure and income level they serve and the potential scale of impact on housing development, are included in Exhibit 11. Exhibit 11 includes exploring three tools that would result in a loss of revenue for the City: a targeted reduction/waiver of Systems Development Charges, the Multiple Unit Property Tax Exemption, and the Nonprofit Corporation Low-Income Tax Exemption (actions 3F, 3G and 3H). Therefore, pursuing any of these three actions would require implementing a CET to backfill the City's foregone revenue. The City will explore balancing these strategies with a potential future CET (action 3I). For more details about the evaluation criteria for all the actions on Exhibit 11, see Appendices D and E.

DRAFT

Exhibit 11. Housing Production Actions

Funding

One of the key limitations to implementing the actions in the HPS is the availability of funding. Funding is needed not only to build units, preserve affordable housing, and provide access to equitable housing, but also for staff time to implement the HPS. Gresham's general fund limitations are a key barrier. Gresham has one of the lowest property tax rates in the state and similar size cities are operating with larger budgets and more staff. Identifying a set of realistic funding sources is necessary for achieving the vision of housing choice for all in Gresham.

A robust set of housing preservation and development programs requires funding sources that are dedicated toward these activities and that are stable and flexible. In addition to existing available funding options, the City will explore new funding sources that can help fund its programs. More information on locally controlled and other sources of funding is summarized below with details in Appendix D.

Locally Controlled Funding

- **Potential New TIF District(s).** Tax increment financing is a flexible tool that can fund many of the key strategies identified in the HPS if they are used within a TIF District. The City could pursue one or more new TIF District(s) with housing goals that complement the neighborhood(s) within the district(s). Extensive public involvement would be needed, as any new TIF District(s) would be voter approved. Upon establishment of a new district(s) some years would be needed to accumulate enough increment to invest in development.
- **Existing Urban Renewal Districts**. In May 2022, Gresham voters approved an extension of the Rockwood-West Gresham Urban Renewal Area until 2029.[19] Over the next six years, the Gresham Redevelopment Commission is forecasted to have approximately $30 million remaining to invest toward new projects, technical assistance such as business grants, debt,

[19] https://greshamoregon.gov/Urban-Renewal/

and agency administration. Some of these projects are likely to include infrastructure investments to support housing, direct project subsidies or low-interest loans for mixed-use or infill housing developments, land acquisition or assembly, and anti-displacement initiatives.

- **Potential Construction Excise Tax (CET).** A CET is a percentage-based fee on new residential and/or commercial construction charged at the time of permitting. Cities may adopt a CET on the value of new construction projects to raise funds for affordable housing projects. The City will explore a potential future CET to back fill loss of revenue, if the City chooses to implement a targeted reduction/waiver of Systems Development Charges, the Multiple Unit Property Tax Exemption and/or the Nonprofit Corporation Low-Income Tax Exemption.

Other Sources of Funding

- **Current and Future Metro General Obligation Bond Funding.** Metro's Affordable Housing Bond has funded production of rental units in Gresham. The City could consider lending bond proceeds to home developers to finance land acquisition and development. The Metro Housing Bond requires a 60-year restrictive covenant on any land on which a low-income housing development is placed. The City can engage with Metro on funding criteria for any future Metro Bond. The City can also leverage funding through the Metro Supportive Services Bond.
- **State funding** through Oregon Housing and Community Services, Oregon Brownfields Program, and Oregon Facilities Bonds, which could create a revolving loan fund for construction costs, for housing projects affordable to households earning 80% to 120% MFI. Funding levels may also increase for a variety of programs and there may be upcoming opportunities to fund the development of affordable rental and ownership units.
- **Funding from nonprofit and foundation partners,** such as Oregon Community Foundation or Meyer Memorial Trust**.**

Implementation Schedule for Actions

The table below presents a draft schedule for implementation of the Housing Production Strategy. The table shows each of the actions below. Each action will go through a period of development and evaluation where staff works with decision makers to develop the specifics of the action, then potential adoption and implementation. The activities for each of these are described below.

- **Further refinement:** The actions will require some level of further refinement prior to adoption, which may range from simple logistics (such as developing materials about an existing program) to complicated coordination between multiple internal and external stakeholders (such as the implementation of a tax abatement). The refinement period will occur before adoption.
- **Adoption or Official Determination:** This occurs when the City takes official action to adopt a strategic action (or uses another official acknowledgment that the City is going to execute the strategic action). The table shows the expected time of adoption, with the expectation that the official action will be taken by the last day of the year specified below.

DRAFT

- **Implementation:** This occurs when the City officially begins using the strategic action represented by a tan color in the table.

4. Evaluation and Monitoring: Achieving Fair and Equitable Housing Outcomes

Evaluation of the Strategic Actions

The actions included in Gresham's Housing Production Strategy work together to achieve equitable outcomes for all residents of Gresham. An evaluation of the HPS for achieving the following types of outcomes is required[20]:

- Affordable Homeownership,
- Affordable Rental Housing,
- Housing Stability,
- Housing Choice for Protected Classes,
- Location of Housing in Compact, Mixed-Use Neighborhoods,
- Fair Housing, and
- Housing Options for People Experiencing Homelessness.

The evaluation is consolidated in Exhibit 13 below with details in Appendix E. Moving forward, the City has choices in how it structures its programs to emphasize various goals, particularly housing choice, location, and fair housing. Throughout implementation the City will closely evaluate program criteria and application to maximize benefit.

Exhibit 13. Evaluation of Actions in the HPS for Achieving Fair and Equitable Housing Outcomes

	Action	Affordable Rental Housing	Affordable Homeownership	Housing Stability	Housing Choice, Location of Housing, and Fair Housing	Addressing Homelessness
1A, 2A	Explore provision of grants/loans for new development within existing and potential new TIF District(s)	✓	✓		Depends on criteria	Depends on program focus
1B, 2B	Explore rehabilitation grants to low-cost, market rate rental property owners in exchange for affordability agreements within existing and potential new TIF District(s)	✓		✓	Depends on criteria	

[20] This evaluation is required in OAR 660-008.

	Action	Affordable Rental Housing	Affordable Homeownership	Housing Stability	Housing Choice, Location of Housing, and Fair Housing	Addressing Homelessness
1C, 2C	Explore partnerships to acquire and stabilize existing low-cost market rate housing in exchange for affordability agreements within existing and potential new TIF District(s)	✓		✓	Depends on criteria	
1D, 2D	Explore funding and partnerships for housing-related infrastructure development in existing and potential new TIF Districts.	✓	✓		Depends on criteria	Depends on criteria
2E	Explore land banking, parcel assembly, and public land disposition efforts within potential new TIF District(s)	✓	✓	Depends on criteria	Depends on criteria	
3A	Explore and reduce barriers for affordable homeownership models		✓			
3B	Reduce zoning barriers for housing development, with a focus on multifamily and townhouse development	✓				
3C	Streamline permitting processes for all housing types, with a focus on barriers to townhomes and multifamily housing	✓	✓			
3D	Implement Rent Assistance Pilot Program for individuals experiencing homelessness and explore partnerships to address and prevent homelessness					✓
3E	Extend/expand the City's tax abatement agreement with Home Forward	✓			Depends on criteria	
3F	Explore reduction/waiver of Systems Development Charges	✓			Depends on criteria	Depends on program focus
3G	Evaluate the Multiple Unit Property Tax Exemption	✓		✓	Depends on criteria	
3H	Evaluate the Nonprofit Corporation Low-Income Tax Exemption	✓			Depends on criteria	✓
3I	Explore a Gresham-Specific Construction Excise Tax	✓	✓	Depends on criteria	Depends on criteria	Depends on criteria

Assessment of Benefits and Burdens from the Action

Gresham is required to consider the anticipated benefit and burden from each action for the following groups of people who have been historically marginalized: low-income communities, communities of color, people with disabilities, and other state and federal protected classes. This includes potential indirect and/or marginal impacts that result from how the City implements each policy.

Federal protected classes include: race, color, religion, national origin, age, sexual orientation, gender identify, familiar status, and disability. Oregon's protected classes include: race, color, national origin, religion, disability, sex (including pregnancy), sexual orientation, gender identify, age, and marital status.

Exhibit 2. Assessment of Benefit and Burden for Historically Marginalized Communities as a Result of Each Action

	Actions	Benefits	Burdens
1A,2A	Explore provision of grants/loans for new development within existing and potential new TIF District(s)	• Will benefit extremely low-income, very low-income, and low-income households. The groups more likely to have incomes qualifying for this action have a proportionately larger percentage of POC, people with disabilities, and seniors. • The City should continue to identify approaches to displacement of existing residents and to ensure that these grants and loans benefit POC, people with disabilities, and seniors.	• May increase burdens on POC, people with disabilities, and seniors if development displaces existing residents through redevelopment.
1B,2B	Explore rehabilitation grants to low-cost, market rate rental property owners in exchange for affordability agreements within existing and potential new TIF District(s)	• Will benefit low- to middle-income households. The groups more likely to have incomes qualifying for this action have a proportionately larger percentage of POC, people with disabilities, and seniors. • The City may want to incorporate specific criteria into its policies about rehabilitation grants to ensure that the programs benefit people in protected classes.	• Burdens on these communities may increase after required affordability periods expire unless the program builds in a renewal option.
1C,2C	Explore partnerships to acquire and stabilize existing low-cost market rate housing within existing and potential new TIF District(s)	• Will benefit low- to middle-income households. The groups more likely to have incomes qualifying for this action have a proportionately larger percentage of POC, people with disabilities, and seniors. • The City may want to incorporate specific program criteria to ensure that POC, people with disabilities, and seniors benefit from this action.	• Unlikely to increase burdens for these communities.
1D,2D	Explore funding and partnerships for housing-related infrastructure development in existing and potential new TIF Districts.	• Will benefit extremely low-, very low, low- and middle-income households, depending on how the City prioritizes funding. The groups more likely to have incomes qualifying for this action are disproportionately marginalized communities, including POC, people with disabilities, and seniors.	• May increase burdens on POC, people with disabilities, and seniors if the City does not mitigate redevelopment displacement pressures on existing residents.

	Actions	Benefits	Burdens
2E	Explore land banking, parcel assembly, and public land disposition efforts within potential new TIF District(s)	• Depending on the structure, could benefit households at extremely low-income, very low-income, low-income, and limited moderate-income households. The groups more likely to have incomes qualifying for this action are disproportionately marginalized communities, including POC, people with disabilities, and seniors. • Some land trusts specialize in providing services to these communities. To increase benefits to people in state and federal protected classes, the City may want to consider focus on working with land trusts that prioritize working with people in protected classes.	• Unlikely to increase burdens for these communities. • Could have a less positive impact for POC, people with disabilities, or seniors if these communities are not recruited from for participation in the resulting development or if the City does not mitigate potential effects of potential displacement from land assembly.
3A	Explore and reduce barriers for affordable homeownership models	• Will benefit low- to middle-income households. The groups more likely to have incomes qualifying for this action are disproportionately marginalized communities, including POC, people with disabilities, and seniors. • Some land trusts specialize in providing services to these communities. To increase benefits to people in state and federal protected classes, the City may want to consider focus on working with land trusts that prioritize working with people in protected classes.	• Unlikely to increase burdens for these communities unless funding for this action reduces funding for other programs to support low-income housing.
3B	Reduce zoning barriers for housing development, with a focus on multifamily and townhome development	• Depending on the structure, could benefit households at all income levels.	• Unlikely to increase burdens for these communities.
3C	Streamline permitting processes for all housing types, with a focus on barriers to townhomes and multifamily housing	• Depending on the structure, could benefit households at all income levels.	• Unlikely to increase burdens for these communities.
3D	Implement rent assistance pilot program for individuals experiencing homelessness and explore partnerships to address homelessness	• Will benefit extremely low-, and very low-income households and people experiencing homelessness. The groups more likely to have incomes qualifying for this action are disproportionately POC, people with disabilities, and seniors. • The City may want to incorporate specific program criteria to ensure these groups benefit from this action.	• Unlikely to increase burdens for these communities. • Could have less positive impact for POC, people with disabilities, or seniors if these communities are not recruited from for participation in the program.

	Actions	Benefits	Burdens
3E	Extend/expand the City's tax abatement agreement with Home Forward	▪ Will benefit extremely low and very low-income households. The groups more likely to have incomes qualifying for this action are disproportionately POC, people with disabilities, and seniors.	• Unlikely to increase burdens for these communities. • Could have less positive impact for POC, people with disabilities, or seniors if these communities are not recruited from for participation in the resulting development.
3F	Explore reduction/waiver of System Development Charges	• Will benefit extremely low-income, very low-income, and low-income households. The groups more likely to have incomes qualifying for this action are disproportionately POC, people with disabilities, and seniors.	• Unlikely to increase burdens for these communities. • Could have less positive impact for POC, people with disabilities, or seniors if these communities are not recruited from for participation in the resulting development. • If the action results in lower funding for developing infrastructure, this could negatively impact areas of the City with infrastructure deficiencies, which are more likely to be where lower-income households live. POC, people with disabilities, and seniors may be more likely to live in these areas.
3G	Evaluate the Multiple Unit Property Tax Exemption (MUPTE)	• Will benefit low- to middle-income households.	• Unlikely to increase burdens for these communities.
3H	Evaluate the Nonprofit Corporate Low-Income Tax Exemption	• Will benefit extremely low-income, very low-income, and low-income households. The groups more likely to have incomes qualifying for this action are disproportionately POC, people with disabilities, and seniors.	• Unlikely to increase burdens for these communities.
3I	Explore a Gresham-specific Construction Excise Tax	• The CET could benefit extremely low-, very low-, low- and middle-income households, depending on the City's funding priorities. • The City is required to use half of the funds for developer incentives for multifamily housing, but the City could target these incentives to households making less than 80% MFI.	• Developers have indicated that they may pass along some of the costs of the tax to future renters. However, many renters in new market-rate buildings would be middle- to high-income households.

	Actions	Benefits	Burdens
		• Fifteen percent of funds go toward statewide affordable housing programs, which would benefit low- and middle-income households. • Thirty five percent of funds go toward affordable housing programs. The City has full discretion on how to use these funds.	

Monitoring Outcomes of the HPS

Gresham will report progress on implementation of the HPS to DLCD every three years.[21] This report will include:

- **A summary of the actions taken to implement the HPS**. If the City has not implemented the actions scheduled for the first three years of the HPS, the City will explain the barriers to implementation and a plan for addressing the need that the action was intended to address. That plan could include identifying other actions in the HPS that will meet the need, or it could include developing a new action to meet the need.
- **A reflection of the efficacy of the actions the City has implemented**. This reflection will discuss the outcomes the City is observing from the actions they have implemented to date and could include expectations for future outcomes.
- **A reflection of the efficacy of the actions in the context of the outcomes described above.** The report will describe whether the goals and actions implemented have resulted in the expected outcomes described above: affordable homeownership, affordable rental housing, housing stability, housing options for people experiencing homelessness, housing choice, location of housing, and Fair Housing.

The City will notify DLCD if it cannot implement an action within 90 days of the end of the timeline as presented in Chapter 3 (Exhibit 12) and Appendix D. The notice will identify the actions or combinations of actions that the City will take to address the need that the action was intended to address. This could include identification of other actions in the HPS that will meet the identified need, or it could include development of a new action to meet the need.

The City will review its progress toward the plan annually. During the review, the City will document implementation over the previous year and housing development activity. Key questions that the City can consider in its assessment include:

- Are additional actions needed to address new or changing conditions?
- Is staff capacity sufficient to meaningfully advance the strategies?

[21] This report is due to DLCD no later than December 31 three years after Gresham adopts its HPS.

- What benefits has the City seen from its efforts to date? Are the City's residents, and especially its lower-income residents and communities of color, seeing a return on the investments that the City has made?

The City will develop its own metrics for tracking progress toward its desired outcomes. Exhibit 15 provides an overview of potential metrics that the City may track as part of its reviews. Since many of the actions in the HPS entail additional study, the City may include goal setting and evaluation as metrics to track. If the City moves forward with implementation, then the City can measure outcomes. The table below provides a menu of potential metrics.

Exhibit 15. Potential Metrics by Housing Production Strategy Action

	Actions	Evaluation/Exploration Metrics	Metrics that Measure Outcomes (if action is pursued)
1A, 2A	Explore provision of grants/loans for new development within existing and potential new TIF District(s)	• Evaluate funding potential and timeline	• Amount of funding dispersed for new affordable housing development • Number of projects (and units) receiving project subsidies
1B, 2B	Explore rehabilitation grants to low-cost, market rate rental property owners in exchange for affordability agreements within existing and potential new TIF District(s)	• Complete study • Establish a pilot program	• Amount of funding used for rehabilitation • Number of units where funding was given for rehabilitation or preservation • Average amount of funding per unit • Number of additional units under affordability agreements
1C, 2C	Explore partnerships to acquire and stabilize existing low-cost market rate housing within existing and potential new TIF District(s)	• Conduct outreach with local nonprofits • Establish inventory of affordable housing	• Amount of funding dispersed for affordable homeownership • Number of projects (and units) receiving project subsidies • Number of households receiving homeownership assistance • New partnerships established or expanded to support affordable homeownership
1D, 2D	Explore funding and partnerships for housing-related infrastructure development in existing and potential new TIF Districts.	• For new districts, evaluate infrastructure development needs based on district boundaries and goals • For existing districts, evaluate use of funds to support infrastructure development	• Amount of funding dispersed for off-site infrastructure that supports housing development
2E	Explore land banking, parcel assembly, and public land disposition efforts within potential new TIF District(s)	• Develop inventory of City, public, and non-profit owned parcels	• Number of lots/acres dedicated to affordable housing development • Amount of funding used to support land banking

	Actions	Evaluation/Exploration Metrics	Metrics that Measure Outcomes (if action is pursued)
		• Establish and document the City's land banking goals and role in land banking	
3A	Explore and reduce barriers for affordable homeownership models	• Identify barriers for affordable homeownership models	• Amount of funding dispersed for affordable homeownership and/or cooperative housing models • Number of projects (and units) receiving project subsidies • Number of households receiving homeownership assistance • New partnerships established or expanded to support affordable homeownership
3B	Reduce zoning barriers for housing development, with a focus on multifamily and townhome development	• Determine barriers in zoning code	• Number of newly developed regulated and market-rate multifamily and townhouse units • Densities of newly developed multifamily housing
3C	Streamline permitting processes for all housing types, with a focus on barriers to townhomes and multifamily housing	• Determine barriers in the permitting processes	• Number of newly developed multifamily and townhouse units
3D	Implement rent assistance pilot program for individuals experiencing homelessness and explore partnerships to address homelessness	• Establish a rent assistance pilot • Explore partnerships	• New partnerships established or expanded for homelessness services • Amount of funding dedicated to homelessness services • Number of beds/units accessed by people experiencing homelessness • Number and demographics of people who access services
3E	Extend/expand the City's tax abatement agreement with Home Forward	▪ Evaluate pros and cons of extension/expansion ▪ Evaluate potential terms of an expansion or extension	• Number of projects (and units) granted tax exemption
3F	Explore reduction/waiver of System Development Charges	• Evaluate pros and cons of establishing SDC reduction/waivers • Evaluate backfilling foregone revenue	• Number of inquiries about SDC waiver program • Number of projects (and units) granted SDC waiver
3G	Evaluate the Multiple Unit Property Tax Exemption (MUPTE)	• Evaluate pros and cons of establishing MUPTE • Evaluate backfilling foregone revenue	• Number of inquiries about tax exemption • Number of projects (and units) granted tax exemption

	Actions	Evaluation/Exploration Metrics	Metrics that Measure Outcomes (if action is pursued)
3H	Evaluate the Nonprofit Corporate Low-Income Tax Exemption	• Evaluate pros and cons of establishing exemption • Evaluate backfilling foregone revenue	• Number of inquiries about tax exemption • Number of projects (and units) granted tax exemption
3I	Explore a Gresham-specific Construction Excise Tax	• Evaluate pros and cons of CET • Evaluate CET design and potential CET revenue projections	• Amount of funding investments made with CET to support affordable housing • Number of affordable housing projects supported

In addition to the metrics outlined above, the City could monitor current market conditions to help the Council understand the context in which the overall Housing Production Strategy is operating:

- Number and type of new homes produced and total within the City over time (tenure, size, sales price/asking rent, and unit type)
- Share of rent-burdened residents
- Sales prices and rents for existing homes
- Number, location, and expiration date of regulated affordable units with change in units provided over time

When Gresham produces its next HPS in six years (2029), the City will be required to summarize the efficacy of each action included in this HPS. The information resulting from these metrics will help Gresham to summarize the outcomes and efficacy of the actions in this HPS.

5.Recommendations for Future Actions

The following actions are included as recommendations for the City to potentially act on in the 6-year planning period or to re-consider when next developing an HPS. They are important and useful but are not currently included as strategies in the HPS for a variety of reasons. Some of these recommendations are broad, without a clearly defined action at this point for the City. Others are good ideas but less likely to gain support as actions or have a high impact.

Recommendations

1. The City has begun monitoring expiration of existing affordability requirements for income-restricted housing. The City can continue this practice and proactively work with owners to preserve units as affordable housing. Preservation of existing and expiring income-restricted affordable housing is a more cost-effective action than building new affordable housing. Gresham has 994 regulated housing units with Low-Income Housing Tax Credit (LIHTC) funding. This represents a portion of Gresham's regulated affordable housing. Of those, 488 are privately owned. 240 of the privately-owned units have LIHTC that will expire in 2023 and 248 units have LIHTC that will expire in 2028/2029.[22] With nothing in place to protect from loss of these units upon expiration of the LIHTC, these affordable units could lose their guaranteed affordable rates.

   The City can continue to track the expiration of the subsidies for these properties. Recent state legislation established a regulatory framework for expiration of LIHTC multifamily rental housing developments with expiring affordability restrictions across a range of state funding programs. Owners must give notice to local government and the state when affordability restrictions will expire, and owners must provide the opportunity for the state, local government, or designee (such as Home Forward) to make an offer to purchase the property and to match a competing offer.

   For these or other properties in a similar situation (such as HUD and Rural Development properties), the City could work to identify organizations (e.g., nonprofit affordable housing providers) that might be willing and able to acquire the properties if the owners seek to sell or convert them to market rate. The City could also reach out to the property owner before the end of the affordability period to offer technical assistance with preservation options and make them aware of any City programs or incentives available at that time to maintain affordability (e.g., tax exemptions).

[22] HUD National Low-Income Housing Tax Credit (LIHTC) Database provides unit numbers: https://lihtc.huduser.gov/. The Oregon Housing and Community Services Low-Income Housing Tax Credit project provides applicant names: https://www.oregon.gov/ohcs/development/Documents/applicants-recipients/LIHTC-Statewide-List.pdf.

2. The City could update the Comprehensive Plan and other policies to center equity**.** Centering equity in the Comprehensive Plan will help ensure that policies and land use decisions are made in a way that considers the needs of diverse groups. This can help improve housing outcomes for underserved populations. Gresham also currently certifies that it will affirmatively further fair housing via the HUD funding process. However, HUD's fair housing regulations have changed in recent years with changes in national leadership. Gresham, Portland, and Multnomah County have a joint analysis of impediments related to fair housing from approximately 2011. The consortium of Portland, Gresham, and Multnomah County will likely undergo a formal process to create an updated joint fair housing plan in the coming years. Gresham could implement recommendations from the plan. Policies the City should consider adopting are:

    - An Affirmatively Furthering Fair Housing policy
    - Equity goal(s), policies, and action items in the Comprehensive Plan including policies about housing attainability/affordability and mixed-income neighborhoods
    - Updating other goals, policies, and action items in the Comprehensive Plan to support equity and equitable outcomes

3. The City could encourage accessible design to increase the number of accessible units designed to meet Universal Design, Lifelong Housing Certification, and other similar standards. Increasing the number of units that meet accessibility standards will provide more options for people to live independently or in a housing setting of their choice. Examples of universal design features that can help people age in place or assist people with disabilities include ramps, lever door handles, automatic doors, or flat panel light switches. Potential recommendations include:

    - Use the Oregon Lifelong Housing Certification program**,**[23] which lists accessibility at different "levels" of accessible design elements, such as visitor accessible (which is basic accessibility for visitors) and enhanced accessible (which is accessible for a person in a wheelchair for the central living floor).
    - Develop pre-approved plan sets (e.g., single-family detached and attached homes with barrier-free, universal design), within the context of American with Disability Act (ADA) and Federal Housing Administration (FHA) rules.
    - Fund a grant to decrease Building Division charges (plan check fee) by some percentage for pre-approved plans and work to reduce approval times for projects meeting accessible design goals.
    - Consider adoption of code incentives for accessible units such as floor area ratio, building height or density bonuses scaled by number of units.

[23] Information about this certification program can be found at: https://rvcog.org/home/sds-2/lifelong-housing-program/#:~:text=The%20Lifelong%20Housing%20Certification%20Project,call%20541%2D423%2D1383.I

4. Use current and future Metro General Obligation Bond funding to support affordable homeownership. Gresham currently has a request for proposals out for Metro bond funding accepting proposals for ownership. While the Metro Housing Bond permits funds to be used for ownership housing, Metro did not specifically designate any funds for ownership. Metro also requires a 60-year restrictive covenant on any land on which a low-income housing development is placed. The covenant is enforceable so long as bond proceeds are outstanding. A 60-year covenant on land on which affordable "owner-occupied" housing sits severely restricts the options available to build such housing at any scale. The City could consider lending bond proceeds to home developers to finance land acquisition and development. The City could put in place the following, which would support development, although additional subsidy might still be needed:

    - 60-year restrictive covenant on the loan: Development must be managed to preserve affordability.
    - Deed restriction on each home: Price on re-sale of home limited to annualized 1.5% return on investment.

    After home construction is complete, the developer would pay the bond in full. Beginning in year 5 following repayment of bond proceeds, deed restriction is phased out over next 5 years. The developer could re-borrow funds directly from the municipality – no additional bonding required. The capital could be used to develop new affordable for-sale housing. The deed restriction could stipulate that the return on re-sale is limited to 2.5% until 5 years following repayment of development loan.

5. Consider if/how CDBG and Home Dollars could be used more effectively to support affordable housing development. Staff should continue to evaluate how these funds could be used to support programs and actions identified in the HPS.

6. State and regional advocacy/collaboration:

    - Advocacy for preservation uses and other desirable provisions to be included in any upcoming Metro affordable housing bond
    - Advocacy for preservation funding at the state level
    - Advocacy for a statewide capital gains tax exemption for affordable developments losing their tax credits whose affordability will be preserved through the sale of the development
    - Advocate for federal and state legislation that would establish new funding sources for local implementation of housing production strategies and development of affordable housing.
    - Advocate for federal and state legislation aimed at reducing housing cost burden, resources for tenant education related to rights and landlord-tenant law, and protecting low-income owners and renters from predatory practices.

7. In recent years, Gresham has expanded services to include homeless services and a housing resource coordinator position. Some of these positions were funded with one-time funding. Gresham should seek to secure permanent funding for the positions and look for ways to expand the services for community members and the connections to other resources/services in the community.

APPENDIX A: CONTEXTUALIZING GRESHAM'S HOUSING NEEDS

This appendix provides information to contextualize Gresham's housing needs. The data included in this section is from the HPS past housing planning efforts in the City of Gresham including information gathered through the City of Gresham's HPS engagement efforts and past engagement with housing producers and consumers, including underrepresented communities.

As a part of providing context to better understand Gresham's housing needs, this appendix presents information about housing in Gresham for race, ethnicity, age, disability status, and other characteristics of the community to understand disproportionate housing impacts on different groups.

Interested Parties Engagement for the HPS

HPS Advisory Group. City staff and ECONorthwest solicited input from the HPS Advisory Group (AG) to develop the HPS. The AG had seven members composed of people from the development community and service providers. The project relied on the AG to review draft deliverables and provide input at key points. During the development of the HPS, the AG met three times.

Meeting 1: Summary of housing need (April 14, 2022)
Meeting 2: Gaps in actions and strategies to fill gaps (June 30, 2022)
Meeting 3: Draft of selected strategies (October 17, 2022)

Focus Groups. To better understand the housing needs in Gresham, ECONorthwest and the City subcontracted the Community Engagement Liaison Services (CELs) program to hold four 90-minute focus groups in March 2022 with communities that have historically been underserved. The goal of these focus groups was to 1) identify barriers to needed housing and develop an understanding of community housing needs, 2) understand housing preferences including satisfaction with current housing and hopes for the future, and 3) identify strategies the City could pursue to alleviate those challenges. Focus groups included:

- Latino community members, with a strong preference for those with household incomes below $75,000: 6 participants (held in Spanish)
- Black and African American community members, with a strong preference for those with household incomes below $75,000: 3 participants
- People living in subsidized housing: 3 participants
- People from the immigrant/refugee communities: 4 participants

The project team learned:

- Participants in each focus group were concerned about the affordability of housing now and the potential for cost increases.
- Participants in each focus group described that they faced non-cost related barriers to attaining housing. Barriers included social security number requirements, credit or rental history, the amount/complexity of paperwork, and written or spoken language barriers.
- Each focus group discussed lack of availability of housing in terms of affordability or size or both.
- Participants in each focus group, except the focus group for immigrant residents, cited lack of privacy as a challenge. The participants in the focus group for immigrants was least likely to be living in multifamily housing.
- Immigrant, Latinx, and subsidized housing focus group participants stated that they would want/need assistance in finding housing and support through the process of applying for or buying it.
- The quality of housing was mentioned by Latinx and Black focus group participants; they described low quality construction leading to noise and lack of maintenance.
- Black and Latinx focus group participants stated that they faced discrimination in housing.
- Black focus group participants stated that the communities they live in lack diversity; therefore, are missing some services and activities appropriate for them.
- Immigrant focus group participants were concerned with safety and wanted to see more mixed income neighborhoods.

Discussions with Housing Developers and Service Providers. The project included eight interviews with stakeholders to solicit feedback. The project team spoke with:

- Service providers for vulnerable populations to better understand the range of unmet housing needs, particularly for people experiencing disabilities, mental illness, and/or discrimination. These discussions highlighted a lack of accessible units that are affordable for people with a range of disabilities, limited support services for people experiencing mental illness, and a lack of affordable units for caregivers of vulnerable populations. Preserving affordable housing and providing support to update/retrofit housing came up as important ways to help prevent displacement for vulnerable populations.
- Affordable housing developers to better understand the specific challenges to developing income-restricted housing affordable to low-income households. These interviews revealed regulatory barriers to affordable housing development including parking requirements, ground floor use requirements, and design review. Participants also identified a need for flexible funding and financing and suggested the City could help with acquiring properties for affordable homeownership (such as through land banking) as well as preserving naturally occurring affordable housing.
- Local housing developers and builders to understand the unique challenges in developing market-rate housing and identify policies and actions that could help support market-rate

housing development affordable to middle-income households. This group identified zoning and permitting as barriers to development, citing too many zoning districts, extensive landscaping requirements, and outdated design review requirements and processes. Market rate developers indicated that allowing/incenting density as well as tax abatements and other financial incentives can help get affordable, multifamily developments to pencil.

Public Open Houses. In the summer 2022 and winter of 2023, the project team held two public open houses that included opportunities for community members to ask questions about the project, share their housing experiences, and suggest potential solutions.

Community Conversation at City Events. In the summer of 2022 staff tabled three large community events and collected data regarding housing priorities, barriers the community faced in finding appropriate housing, and strategies the City could pursue. The events were held in different areas of the City. The early summer Juneteenth event was held in the Centennial neighborhood of west Gresham, the mid-summer Arts Festival was held in Downtown Gresham (a regional center), and the late summer I Heart Rockwood event was held in Rockwood (a town center). Demographic information was not collected. Over 90 community members engaged in a "sticky dot" exercise indicating prioritizing what they are looking for in housing, what barriers they have faced in finding housing, and what types of strategies they want the City to explore. The project team learned:

- Cost is the most important factor people consider when looking at housing and also the number one barrier to attaining housing appropriate for a household's needs.
- Different communities have different barriers to housing: some people face language challenges, some find the down payment or credit score requirements a problem, others need more bedrooms than they can find.
- Not all landlords know about fair housing laws.
- Different communities have different priorities in housing: while parks and open spaces are important to some people, being close to family or grocery stores are more important to others.
- There is a lack of small units and units accessible to people in the disability community.
- Community members would like the City to be part of the housing conversation.
- Community members want the City to help connect people looking for housing with providers, advocates, and non-profits.
- There is community support for encouraging neighborhoods with a mix of places to live, work and play, and a greater variety of housing types in neighborhoods.

Planning Commission. ECONorthwest provided a mid-way update on the HPS project to the Planning Commission in the summer 2022, gathering their feedback and thoughts on potential strategies. ECONorthwest then presented a draft of the Comprehensive Plan text amendments that are associated with the HPS at a work session in early 2023 before presenting the proposed Comprehensive Plan text amendments in Spring 2023.

City Council. ECONorthwest presented to the City Council in September 2022 and December 2022, gathering their feedback and thoughts on potential strategies. ECONorthwest delivered the final HPS and presentation in Spring 2023.

Incorporation of Input. The strategies included in this HPS draw from the conversations held throughout the project process with focus groups participants, open house participants, and other interested parties. In each of these conversations, the project team learned about the similarities and differences between Gresham's housing market and the rest of the region. Ground truthing potential strategies allowed the team to develop strategies that are attuned to the specific needs of Gresham residents.

The project team's experience in developing the HPS brought forward several considerations the City should account for when implementing the HPS and engaging residents on housing issues in the future. To understand the specific needs of different population groups in the city, the City should prioritize compensating residents for their time and making engagement easy and accessible for participants. Ongoing relationships with housing service providers, housing developers, and property owners will be key to implementing strategies that are attuned to the residents' needs. The City should invest time into building and maintaining relationships with people deeply involved in housing production.

Demographic and Socio-Economic Characteristics Affecting Gresham's Housing Needs

This section describes unmet housing needs for people in Gresham by age, race and ethnicity, disability, household size and composition, and household income.

Data Used in this Analysis

Throughout this analysis data is used from multiple well-recognized and reliable data sources. One of the key sources for housing and household data is the U.S. Census. This report primarily uses data from two Census sources:[24]

- The **Decennial Census**, which is completed every ten years and is a survey of *all* households in the U.S. The Decennial Census is considered the best available data for information such as demographics (e.g., number of people, age distribution, or ethnic or racial composition), household characteristics (e.g., household size and composition), and housing occupancy characteristics. As of 2020, the Decennial Census does not collect more detailed household

[24] The American Community Survey (ACS) is a national survey that uses continuous measurement methods. It uses a sample of about 3.54 million households to produce annually updated estimates for the same small areas (census tracts and block groups) formerly surveyed via the decennial census long-form sample. It is also important to keep in mind that all ACS data are estimates that are subject to sample variability. This variability is referred to as "sampling error" and is expressed as a band or "margin of error" (MOE) around the estimate.

This report uses Census and ACS data because, despite the inherent methodological limits, they represent the most thorough and accurate data available to assess housing needs. We consider these limitations in making interpretations of the data and have strived not to draw conclusions beyond the quality of the data.

information, such as income, housing costs, housing characteristics, and other important household information.

- The **American Community Survey (ACS)**, which is completed every year and is a *sample* of households in the U.S. The ACS collects detailed information about households, including demographics (e.g., number of people, age distribution, ethnic or racial composition, country of origin, language spoken at home, and educational attainment), household characteristics (e.g., household size and composition), housing characteristics (e.g., type of housing unit, year unit built, or number of bedrooms), housing costs (e.g., rent, mortgage, utility, and insurance), housing value, income, and other characteristics.

This report primarily uses data from the 2014-2018 and 2015-2019 ACS for Gresham and comparison areas.[25] Where information is available and relevant, we report information from the 2000 and 2010 Decennial Census.[26] Among other data points noted throughout this analysis, this report also includes data from Oregon's Housing and Community Services Department, the United States Department of Housing and Urban Development, Redfin, Costar, and other sources.

Age of People in Gresham

Population growth is the primary driver of growth in housing. Between 2000 and 2020, Gresham's population grew by about 23,204 people, with most of the growth occurring in the early 2000's. Over that period, Gresham's population grew by nearly 15,400 people, and by about 7,800 new residents between 2010 and 2020. Between 2000 and 2020, Gresham grew at a rate consistent with Multnomah County, but faster than the state of Oregon and the United States.

Gresham has higher percentage of its population under the age of 5 (6.5%) and under the age of 18 (23.7%) than Multnomah County (4.7% and 18%) and Oregon generally (5.0% and 20.3%). More information about how this impacts housing need is shown in Exhibit 24.

Growth in Gresham's senior population, as well as other age cohorts, will continue to shape the City's housing needs. The population aged 60 and older grew by nearly 10,000 residents in Gresham between 2000 and 2018, and seniors now account for 19% of Gresham's existing population. Oregon's population of residents 60 years and older is forecasted to grow by 36% (385,089) between 2020 and 2040, the largest growth of all age groups.

Growth in the number of seniors will result in demand for housing types specific to seniors, such as small and easy-to-maintain dwellings, assisted living facilities, or age-restricted developments. Senior households will make a variety of housing choices, including remaining in their homes as long as they are able, downsizing to smaller single-family homes (detached and

[25] Five-year 2020 ACS data was not available when this report was compiled.

[26] The 2020 Census was completed at the end of 2020. However, extenuating circumstances brought on by the COVID-19 pandemic has led to some challenges with the data. The Census Bureau is undergoing a post-enumeration survey to understand the accuracy of the 2020 Census which was not complete as of February 2022. The 2020 Decennial Census data is more limited than usual as a result of the COVID-19 pandemic.

attached) or multifamily units, moving in with family, or moving into group housing (such as assisted living facilities or nursing homes), as their health declines.

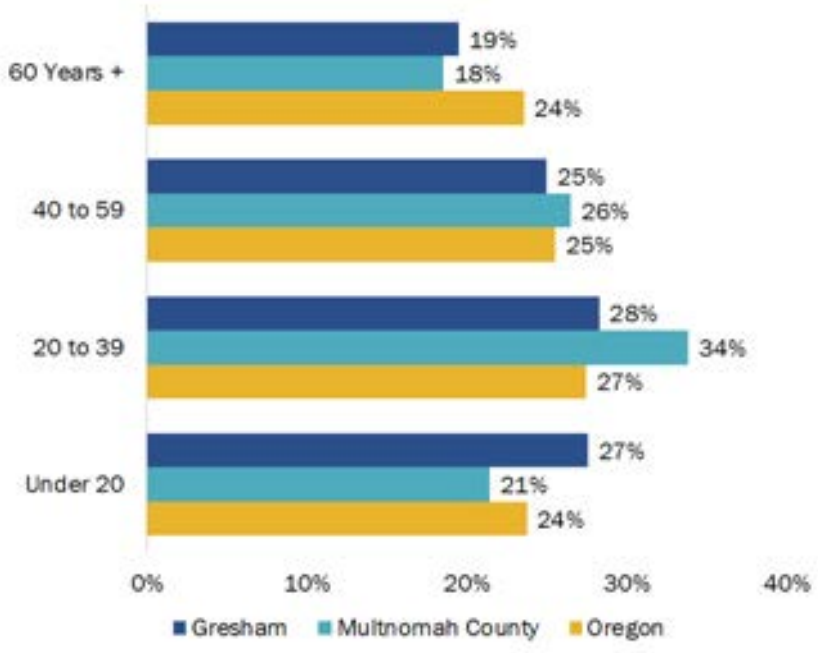
About 53% of Gresham's residents were between the ages of 20 and 59 years.

Gresham had a smaller share of people over the age of 60 than the state.

27% of Gresham's population was under 20 years old, compared to 21% of Multnomah County's population and 24% of Oregon's.

Exhibit 16. Population Distribution by Age, Gresham, Multnomah County, and Oregon, 2014-2018 ACS 5-Year Estimates

Source: U.S. Census Bureau, 2014-2018 ACS, Table B01001.

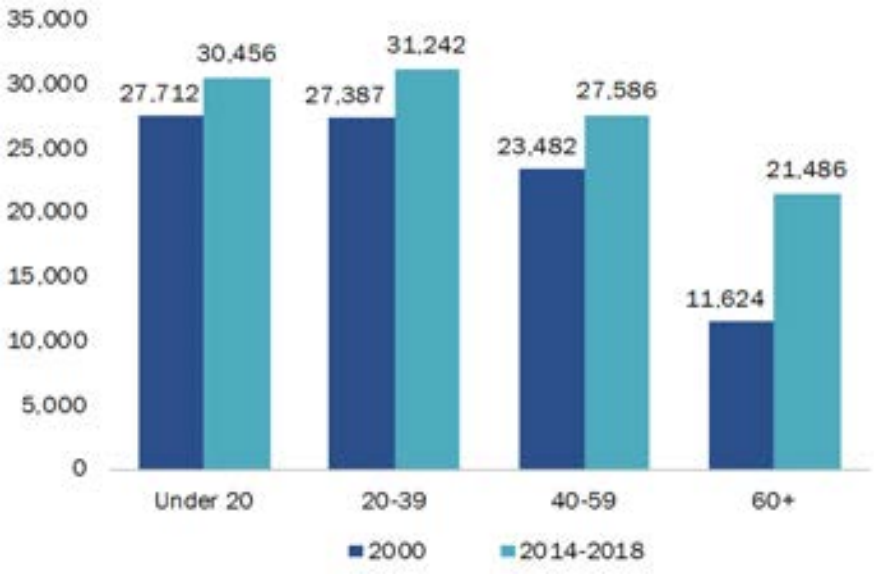


Between 2000 and 2018, the population within all age groups in Gresham grew.

The largest increase in residents were those aged 60 and older at nearly 10,000 people.

Exhibit 17. Population Growth by Age, Gresham, 2000 to 2014-2018 ACS 5-Year Estimates

Source: U.S. Census Bureau, 2000 Decennial Census Table P012 and 2014-2018 ACS, Table B01001.



Race and Ethnicity

Understanding the race and ethnicity characteristics[27] in Gresham is important for understanding housing needs because Black, Indigenous and People of Color often face discrimination when looking for housing.

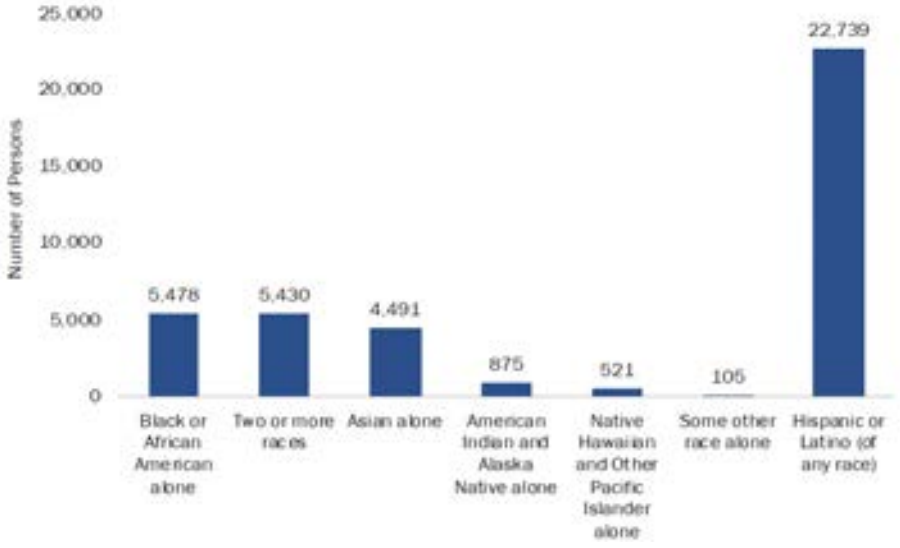
[27] The U.S. Census Bureau considers race and ethnicity as two distinct concepts. Latino is an ethnicity and not a race, meaning individuals who identify as Latino may be of any race. BIPOC as used in this report does not include individuals who identify as white and Hispanic/Latinx.

In Gresham, about 16,900 persons identified as a non-Hispanic or Latino and a race other than White alone, and over 22,700 persons identified as Hispanic or Latino of any race.

About 71,000 persons identified as White alone, non-Hispanic or Latino.

Exhibit 18. Number of Persons by Race and Ethnicity, Excluding White Alone, Gresham, 2014-2018 ACS 5-Year Estimates

Source: U.S. Census Bureau, 2014-2018 ACS, Table B03002.



Gresham was more racially diverse than Oregon.

Exhibit 19. Population by Race as a Percent of Total Population, Gresham, Multnomah County, Oregon, 2014–2018 ACS 5-Year Estimates

Source: U.S. Census Bureau, 2014–2018 ACS 5-Year Estimates Table B03002.

*Note: Categories of race comprising less than one percent of the population are included in "Some other race alone."

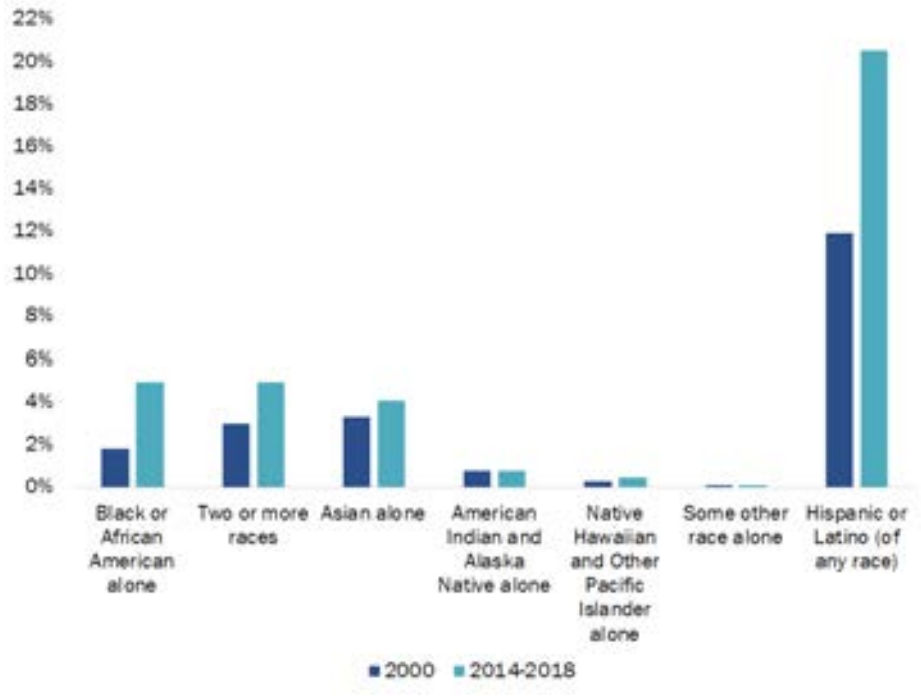
	Gresham	Multnomah Co.	Oregon
Non-Hispanic White Alone	64%	70%	76%
Hispanic or Latino (Any Race)	21%	11%	13%
Non-Hispanic Black or African American Alone	5%	5%	2%
Non-Hispanic Two or More Races	5%	5%	4%
Non-Hispanic Asian Alone	4%	7%	4%
*Some Other Race Alone	1%	2%	1%
American Indian and Alaska Native Alone	*	*	*
Native Hawaiian and Other Pacific Islander Alone	*	*	*

Gresham grew more racially diverse between 2000 and 2018.

The number of Gresham's households that identified as Latino (of any race) increased from 10,732 people in 2000 to 22,739 people in 2018, consistent with regional trends.

Exhibit 20. Change in Population by Race and Ethnicity as a Percent of the Total Population, Gresham, 2000 and 2014–2018

Source: U.S. Census Bureau, 2000 Decennial Census Table P008, 2014–2018 ACS Table B03002.



People with a Disability

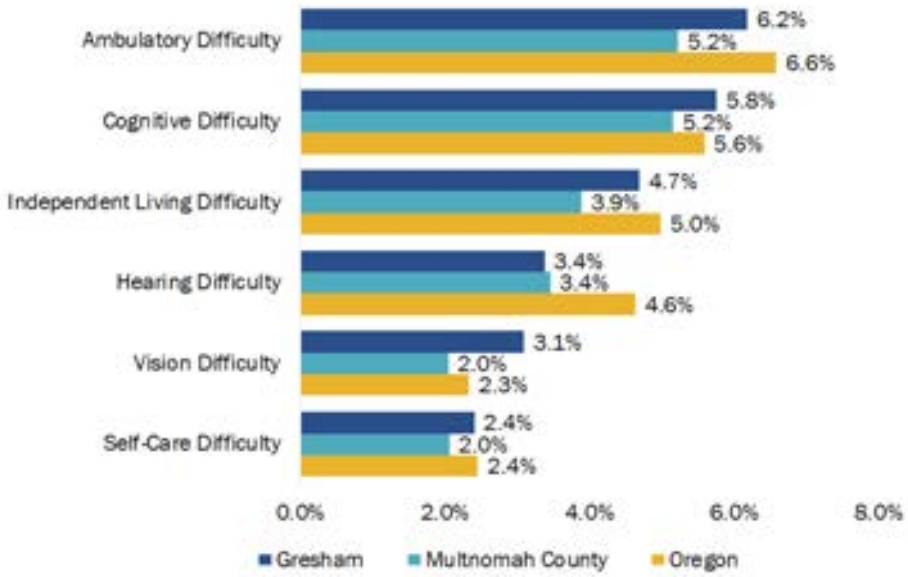
People with one or more disabilities have special housing needs because they may need housing that is physically accessible, housing that meets the needs of people with cognitive disability, or housing with specialized services.

Gresham had a higher share of persons living with a disability than Multnomah County.

Gresham had a total of 14,579 people with one or more disabilities, accounting for 13% of people in Gresham. The most common disabilities were ambulatory, cognitive, and independent living difficulty.

Exhibit 21. Persons Living with a Disability[28] by Type and as a Percent of Total Population, Gresham, Multnomah County, Oregon, 2014–2018 ACS 5-Year Estimates

Source: U.S. Census Bureau 2014-2018 ACS, Table K201803.



Household Size and Composition

Housing need varies by household size and composition. The housing needs of a single-person household are different than those of a multi-generational family. On average, Gresham's households are larger than both Multnomah County and Oregon.

Gresham's average household size was slightly larger than that of both Multnomah County and Oregon.

Exhibit 22. Average Household Size, Gresham, Multnomah County, Oregon, 2014–2018

Source: U.S. Census Bureau, 2014-2018 ACS 5-year estimate, Table B25010.

2.72 Persons	2.42 Persons	2.51 Persons
Gresham	Multnomah County	Oregon

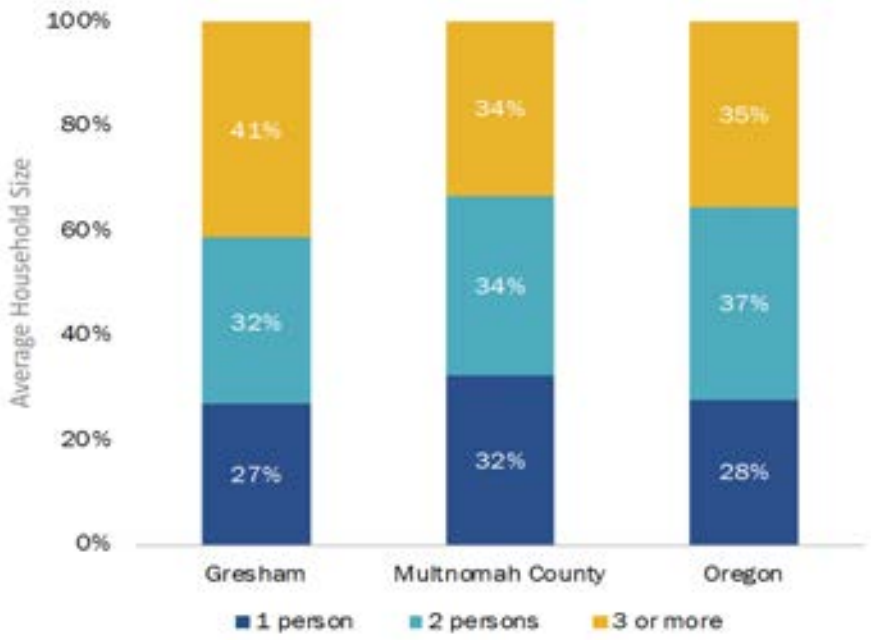
[28] The Census Bureau has identified people with disabilities as a hard-to-count population, which means it is likely these number are an undercount.

Gresham had a smaller share of one- and two-person households compared to Multnomah County and Oregon.

Gresham had a higher share of 3+ person households than the county or the state.

Exhibit 23. Household Size, Gresham, Multnomah County, and Oregon, 2014–2018

Source: U.S. Census Bureau, 2014-2018 ACS 5-year estimate, Table B25010.



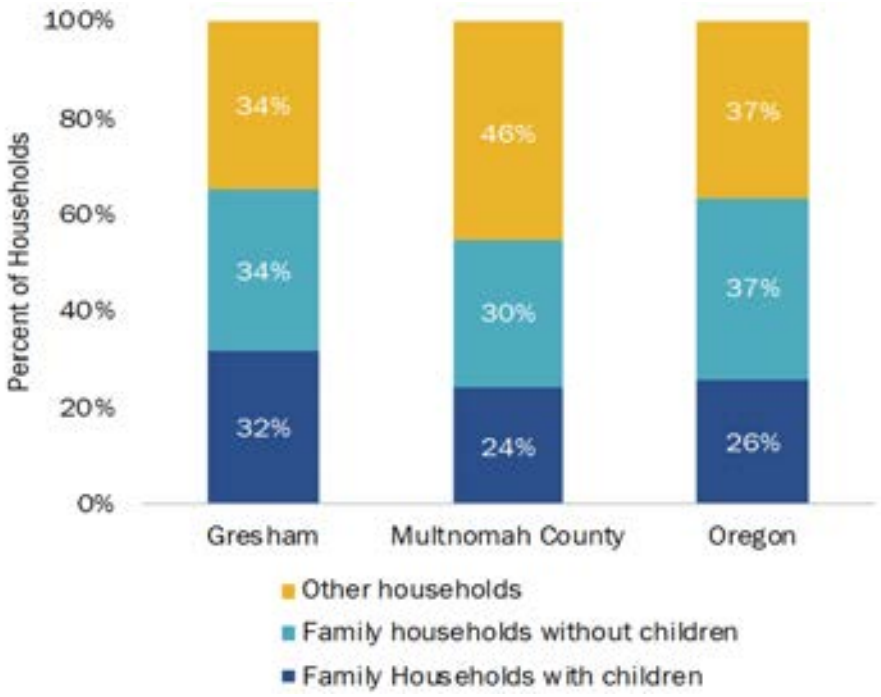
Gresham had a larger share of households with children than Multnomah County and Oregon.

About 32% of Gresham households had children, compared with 24% of Multnomah County households and 26% of Oregon households.

The US Census Bureau defines family households as households with two or more people related by birth, marriage, or adoption.

Exhibit 24. Household Composition, Gresham, Multnomah County, and Oregon, 2014–2018.

Source: U.S. Census Bureau, 2014-2018 ACS 5-year estimate, Table DP02.



Household Income

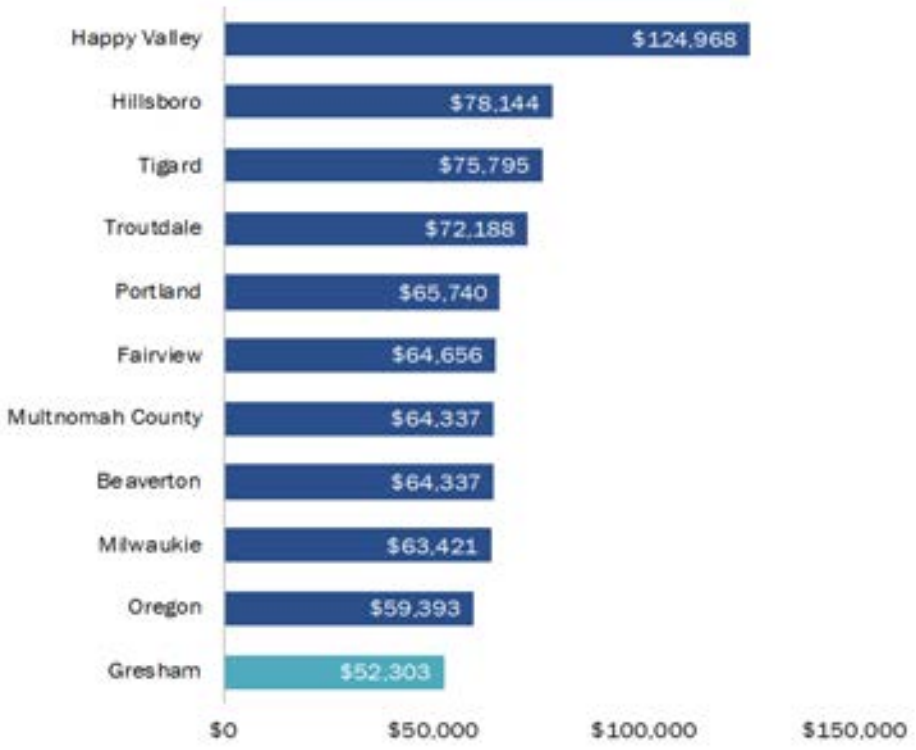
Income is one of the key determinants in housing choice and households' ability to afford housing. Income for residents living in Gresham was lower than the Multnomah County median income and the state's median income.

Gresham's median household income (MHI) was below that of the county, the state, and all comparison cities.

Over this period, Gresham's MHI was $52,303. Multnomah County's MHI was $64,337 and Oregon's MHI was $59,393.

Exhibit 25. Median Household Income, Gresham, Multnomah County, Oregon, and Comparison Cities, 2014-2018

Source: U.S. Census Bureau, 2014-2018 ACS 5-year estimate, Table B25119.



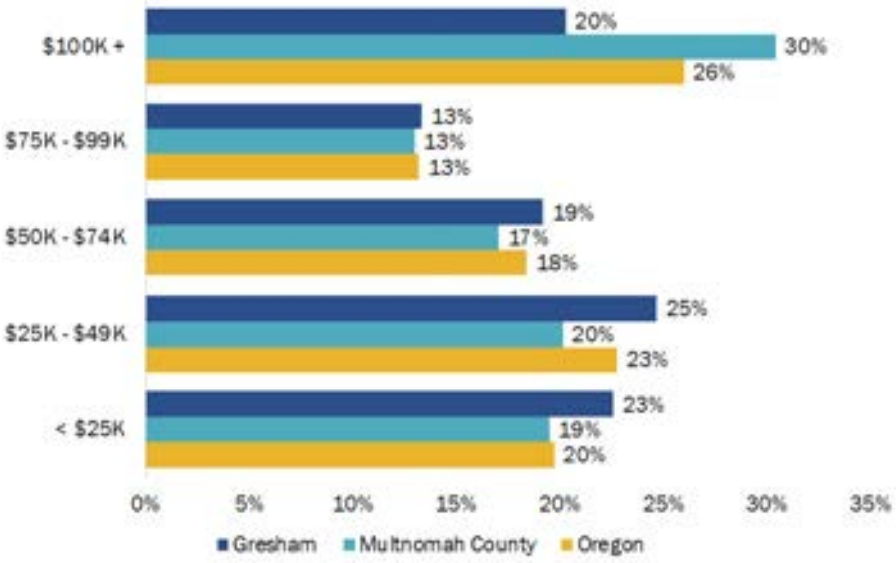
Gresham had a higher percentage of households that made less than $50,000 than the county or the state.

About 48% of Gresham households made less than $50,000 per year, compared to 39% of Multnomah County households, and 43% of Oregon households.

Similarly, Gresham had fewer households making more than $100,000 compared to Multnomah County and Oregon.

Exhibit 26. Household Income Distribution, Gresham, Multnomah County, and Oregon, 2014-2018

Source: U.S. Census Bureau, 2014-2018 ACS 5-year estimate, Table B19001.



In general, larger households in Gresham had higher household incomes than smaller ones.

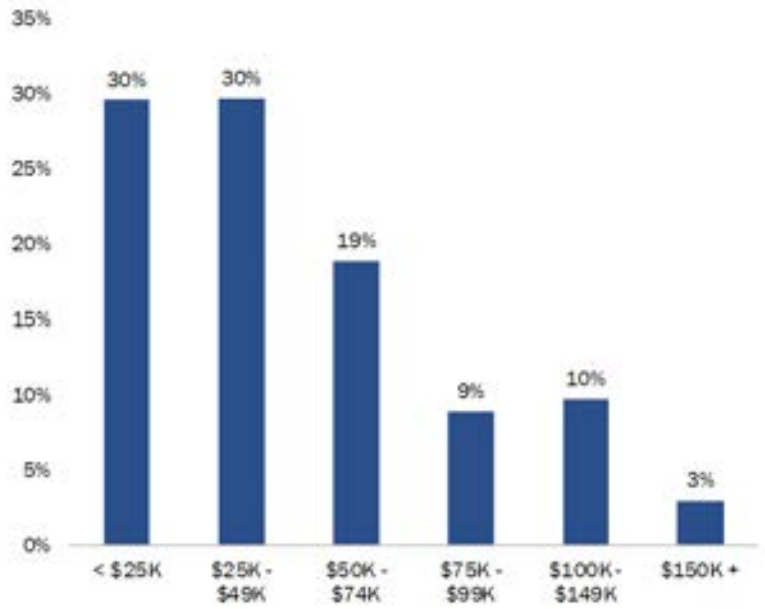
Exhibit 27. Median Household Income by Household Size, Gresham, 2014-2018

Source: U.S. Census Bureau, 2014-2018 ACS 5-year estimate, Table B19019

Sixty percent of Gresham households with a head of householder aged 65 or older earned less than $50,000 per year.

Exhibit 28. Household Income Distribution for Householders Aged 65 Years and Older, Gresham, 2014-2018

Source: U.S. Census Bureau, 2014-2018 ACS 5-year estimate, Table B19037.



Households that identify as Asian, Some Other Race, Two or More Races, or White had incomes above the City's median, ranging from $53,349 to $54,190.

Black, American Indian / Alaska Native, and Hispanic or Latino households had incomes below the City's median income, ranging from $24,777 to $38,066.

Exhibit 29. Median Household Income by Race/Ethnicity of the Head of Household, Gresham, 2014-2018 ACS 5-Year Estimates

Source: U.S. Census Bureau, 2014-2018 ACS 5-year estimate, Table B19013A-I.

Note: The black lines for each bar in this chart denote an estimate's margin of error. These are displayed because when parsing Census survey data for a cross-section of data, there is more statistical noise when computing estimates. The inclusion of the bars indicates the range in which the true estimate likely lies (within a degree of statistical certainty).

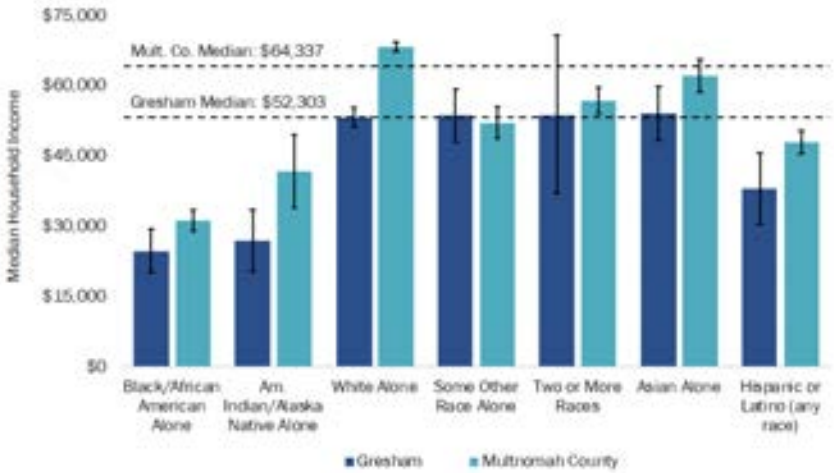


Exhibit 30 to

Exhibit 32 compares household income for Black, Indigenous and People of Color (BIPOC) households with White non-Hispanic households to show disparities in come levels. The income levels shown in these graphs are the same used throughout this report:

- Extremely Low-Income: Less than 30% MFI
- Very Low-Income: 30% to 50% of MFI
- Low-Income: 50% to 80% of MFI
- Middle-Income: 80% to 120% of MFI
- High-Income: 120% of MFI or more

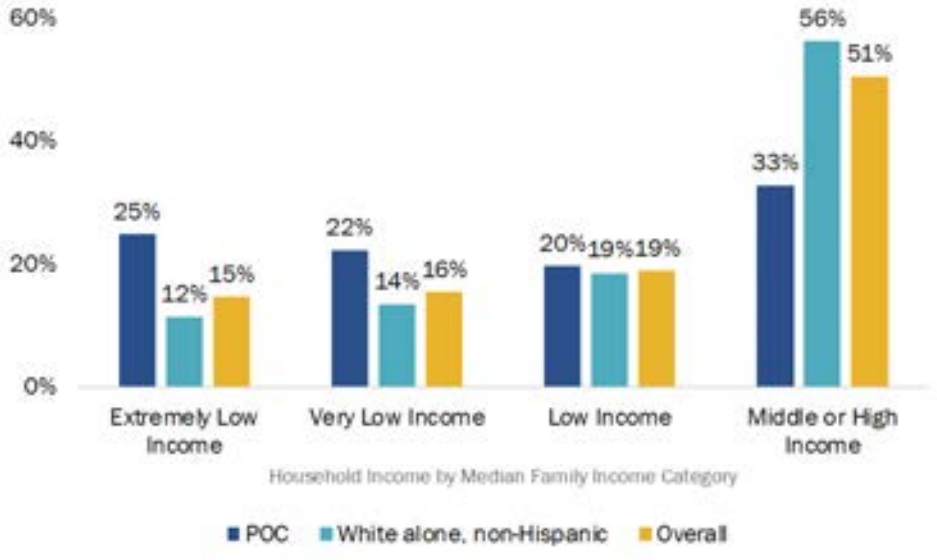
About 33% of BIPOC households were middle or high income compared to 56% of White, non-Hispanic households.

Extremely or very low-income households were more likely to be BIPOC.

Exhibit 30. Household Income by BIPOC, White non-Hispanic, and All Households, Gresham, 2014-2018

Source: CHAS, Table 2.

Note: BIPOC includes Hispanic/Latinx households



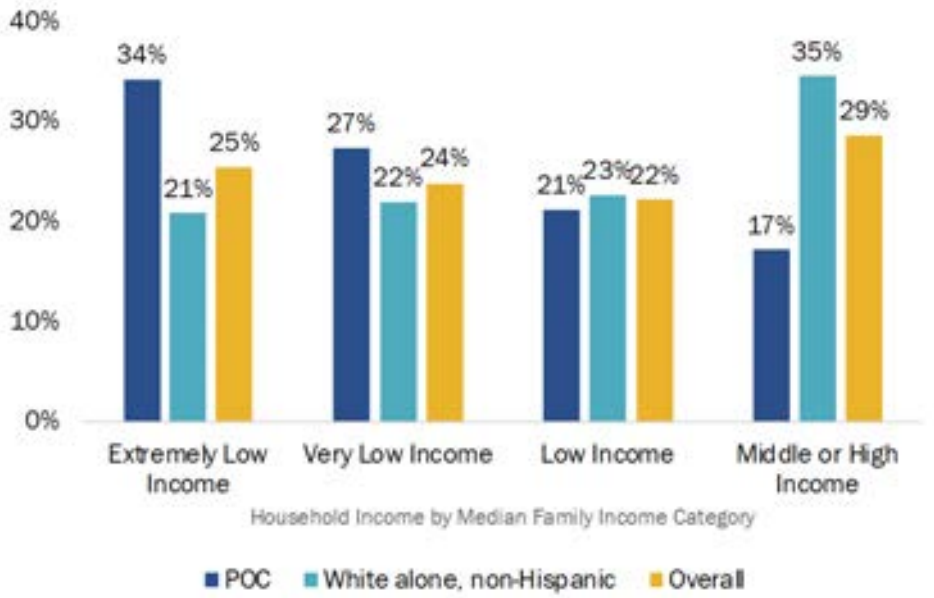
BIPOC renter households were more likely to be extremely low or very low-income compared to the average overall.

White, non-Hispanic renter households were more likely to be middle or high income.

Exhibit 31. Renter Income by Income Grouping for BIPOC, White non-Hispanic, and All Households, Gresham, 2014-2018

Source: CHAS, Table 2.

Note: BIPOC includes Latino households.



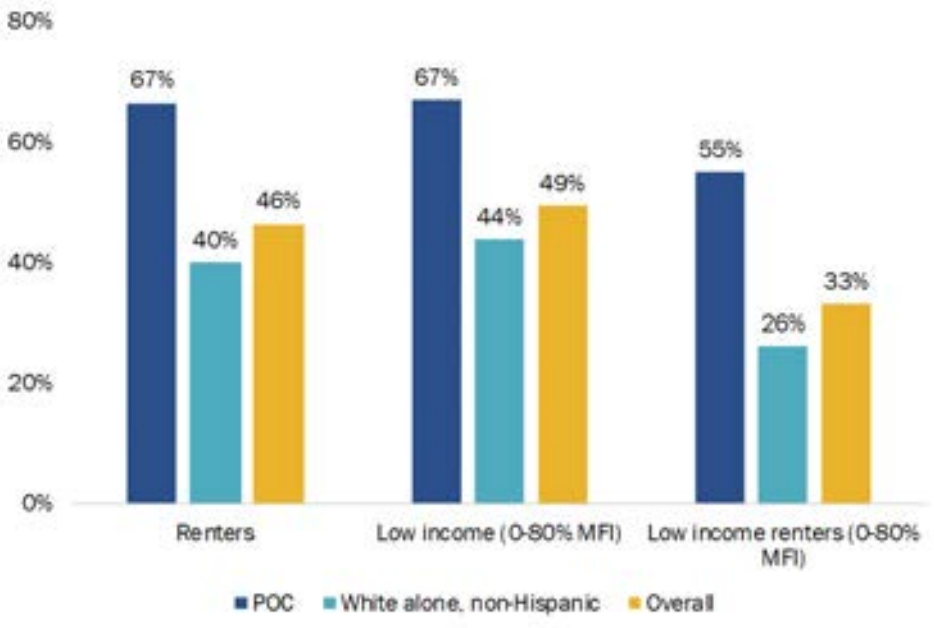
Compared to non-Hispanic White households, BIPOC households were more likely to rent and have low incomes.

Over half of BIPOC households in Gresham were low-income renters in 2018.

Exhibit 32. Comparison by Tenure and Income BIPOC, White non-Hispanic, and All Households, Gresham, 2014-2018

Source: CHAS, Table 2.

Note: BIPOC includes Latino households.



Housing Market Conditions and Trends

This section provides an analysis of Gresham's housing market conditions and trends. The housing types used in this analysis are consistent with needed housing types as defined in ORS 197.303:

- **Single-family detached** includes single-family detached units, manufactured homes on lots and in mobile home parks, and accessory dwelling units.
- **Single-family attached** is all structures with a common wall where each dwelling unit occupies a separate lot, such as row houses or townhouses.
- **Multifamily** is all attached structures (e.g., duplexes, triplexes, quadplexes, and structures with five or more units) other than single-family detached units, manufactured units, or single-family attached units. This analysis groups multifamily units into two sub-categories: (1) duplexes, triplexes, and quadplexes and (2) multifamily units in buildings with five or more units per structure.

Existing Housing Stock

According to the 2014-2018 American Community Survey (ACS) from the U.S. Census, Gresham had 42,497 dwelling units, an increase of 7,191 dwelling units from 2000. A majority of new units built were single-family units. In that time, about 1,823 units of multifamily housing were built in Gresham, accounting for 25% of the 7,191 new units over that period.

About 55% of Gresham's housing stock was single-family detached housing.

Gresham's share of multifamily housing is similar to Multnomah County but larger than Oregon's overall.

Exhibit 33. Housing Mix, Gresham, Multnomah County, and Oregon, 2014-2018

Source: U.S. Census Bureau, 2014-2018 ACS Table B25024.

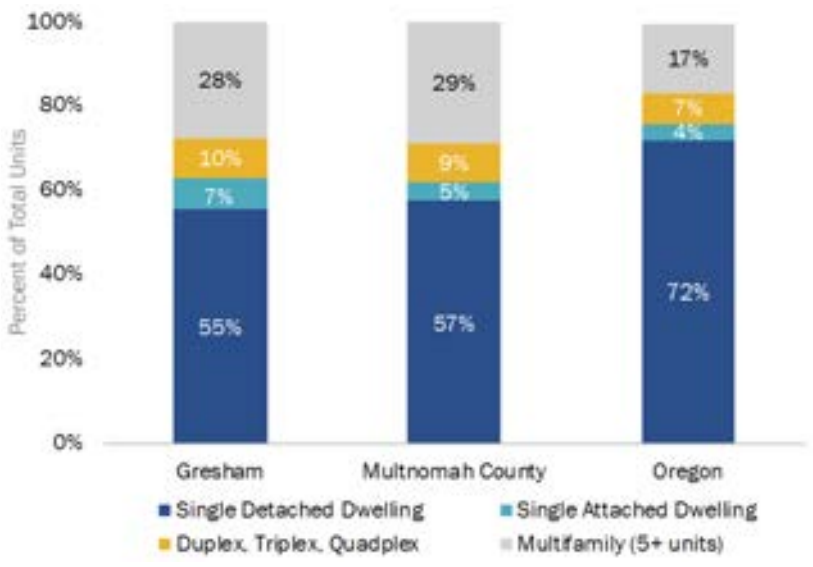


Exhibit 34 shows that White households and Asian households in Gresham had higher rates of living in single-family detached housing (58% and 71%, respectively). The groups most likely to

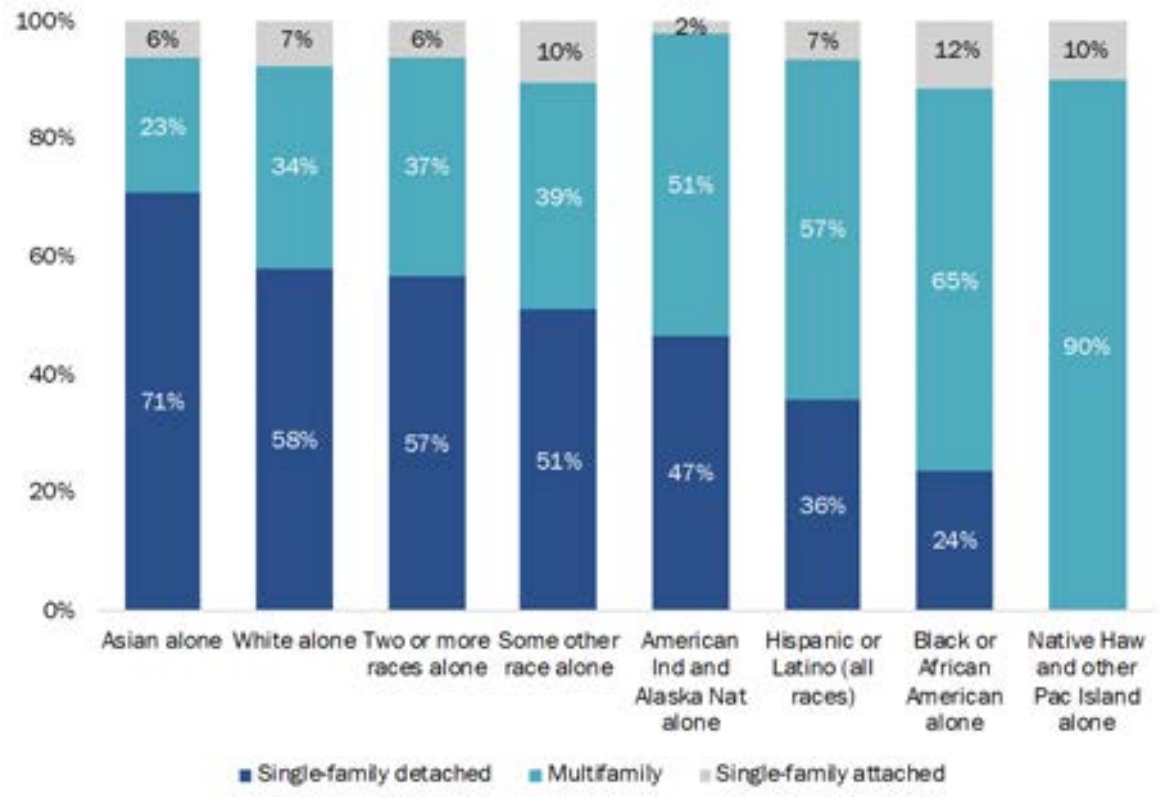
live in multifamily housing were Native Hawaiian and Pacific Islander, Black or African American, and Hispanic or Latino (of all races) households. While this exhibit reflects the types of housing these groups *currently* live in and/or what they can currently afford to live in, it may not reflect their housing preferences.

Exhibit 34. Occupied Housing Structure by Race and Ethnicity, Gresham, 2014-2018

Source: U.S. Census Bureau, 2014-2018 ACS Table B25032 A-I.



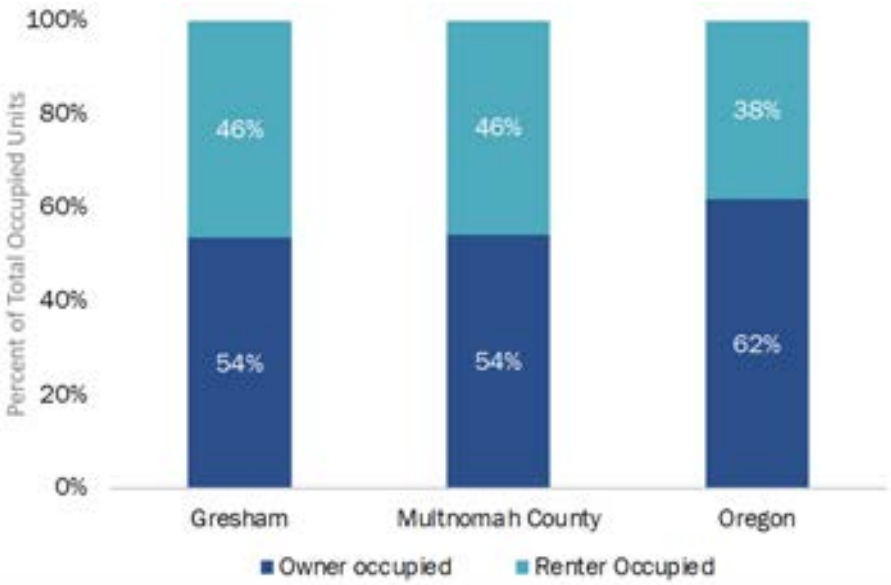
Housing Tenure

Housing tenure describes whether a dwelling is owner- or renter-occupied. In the 2014-2018 period, about 54% of Gresham's housing stock was owner occupied and 46% was renter occupied. Gresham's homeownership rate decreased by one percentage point from 2000 to 2018.

Gresham had the same homeownership rate as Multnomah County and a lower homeownership rate than Oregon.

Exhibit 35. Tenure, Occupied Units, Gresham, Multnomah County, and Oregon, 2014-2018

Source: U.S. Census Bureau, 2014-2018 ACS 5-Year Estimates, Table B24003.

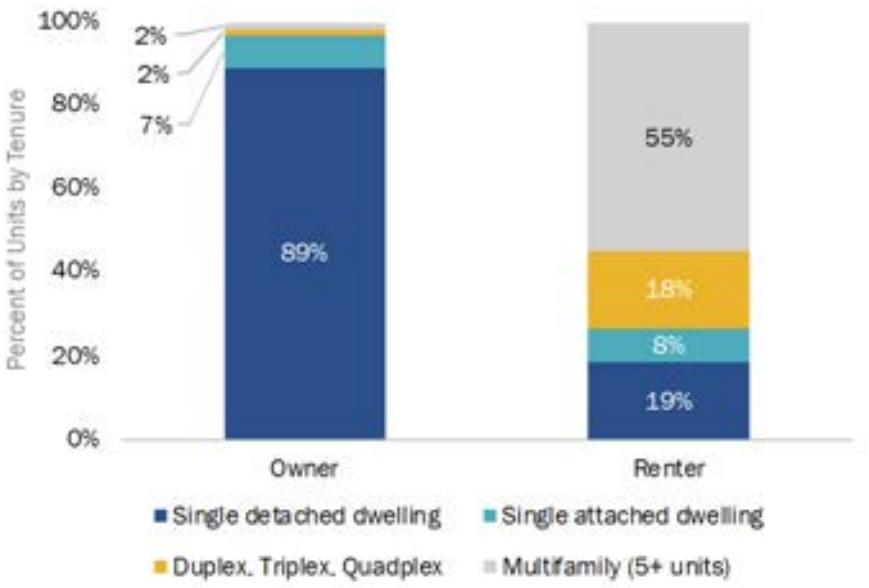


Most renters (73%) lived in multifamily housing, including duplexes, triplexes, and quadplexes.

In comparison, nearly all of Gresham's homeowners (89%) lived in single-family detached housing.

Exhibit 36. Housing Units by Type and Tenure, Gresham, 2014-2018

Source: U.S. Census Bureau, 2014-2018 ACS Table B25032.

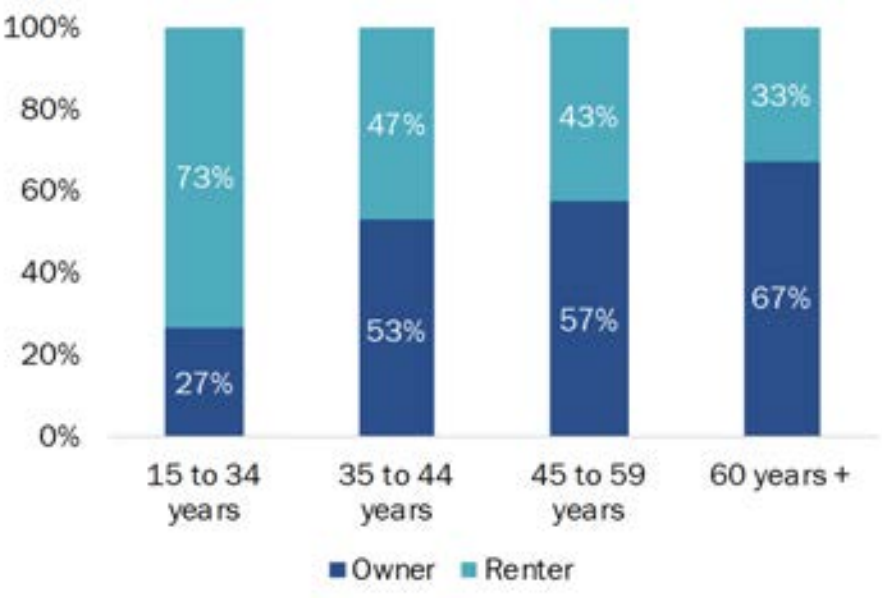


Older households had higher homeownership rates.

In Gresham, about 67% of householders sixty years of age or older owned their homes.

Exhibit 37. Housing Tenure by Age of the Head of Household, Gresham, 2015-2019

Source: U.S. Census Bureau, 2015-2019 ACS Table B25007.

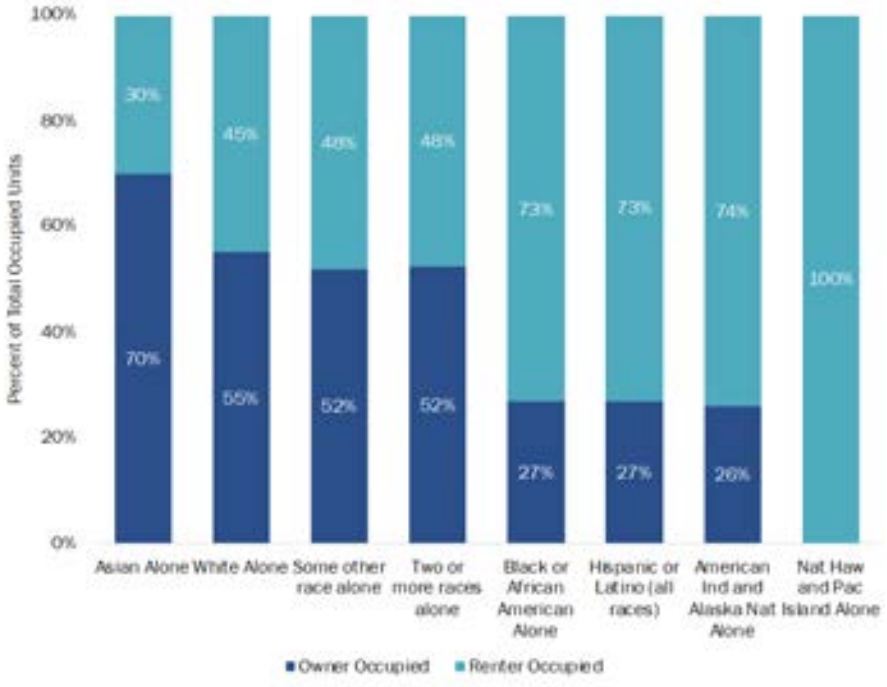


Asian, White, some other race, and two or more race households were more likely to live in owner-occupied housing. Native Hawaiian and Pacific Islander, American Indian and Alaska Native, Black or African American, and Hispanic or Latino (all races) households were more likely to live in rental housing.

These differences are more likely to reflect availability of affordable housing for homeownership, rather than different preferences for renting or owning by race or ethnicity.

Exhibit 38. Tenure by Race and by Ethnicity, Gresham, 2014-2018

Source: U.S. Census Bureau, 2014-2018 ACS Table B25003A-I.



Rent-Restricted and Emergency Housing

As of 2020, there were 50 income-restricted housing developments in Gresham, with 2,397 units.[29] Exhibit 39 shows an aggregation of income-restricted housing inventories from Oregon Housing and Community Services (OHCS) and Metro. The OHCS inventory includes information by bedroom and is also reported in this table where available.

As of 2019, the Portland, Gresham/Multnomah County (Continuum of Care) region had 1,470 emergency shelter beds and 663 transitional shelter beds supporting persons experiencing homelessness in the region. Due to the COVID-19 pandemic and increased funding, the number of beds available has increased and is expected to continue to increase with planned investments.

[29] This number does not capture the 374 units from two income restricted developments coming online in 2022.

Manufactured Homes

Manufactured homes provide a source of affordable housing in Gresham. They provide a form of homeownership that can be made available to low- and moderate-income households. Cities are required to plan for manufactured homes—both on lots and in parks (ORS 197.475-492). Gresham has 126 manufactured home parks within city limits. Within these parks, there are a total of 1298 spaces, six of which were vacant as of Winter 2022.

People Experiencing Homelessness

Gathering reliable data from individuals experiencing homelessness is difficult precisely because they are unstably housed. People can cycle in an out of homelessness and move around communities and shelters. The 2022, Point-in-Time Count describes that there were approximately 48 households experiencing unsheltered homelessness in Gresham.[31] About 1,106 students in the Gresham-Barlow, Centennial, and Reynolds School Districts experienced homelessness. However, it should be noted that these districts include areas outside of the Gresham City limits. Housing needs for people experiencing homelessness range, including temporary shelter to rapid re-housing, permanently supportive housing, rental assistance, and income-restricted affordable housing.

Homelessness Data Sources

Point-in-Time (PIT) count: The PIT count is a snapshot of individuals experiencing homelessness on a single night in a community. The count records the number and characteristics of people who live in emergency shelters, transitional housing, rapid re-housing, Safe Havens, or PSH; as well as recording those who are unsheltered.

McKinney Vento data: This data records the number of school-aged children who live in shelters or hotels/motels and those who are doubled up, unsheltered, or unaccompanied. This is a broader definition of homelessness than that used in the PIT.

The following exhibits provide estimates of homelessness in Gresham and Multnomah County.

Based on the Point-in-Time Count the number of households experiencing unsheltered homelessness in Gresham was 64 in 2017, 103 in 2019, and 48 in 2022.[32]

Exhibit 42. Unsheltered Population, Gresham, Point-in-Time Count, 2017, 2019, and 2022

Source: Joint Office of Homeless Services and Multnomah County, Point-In-Time Count of Homelessness in Portland/Gresham/Multnomah County, Oregon, 2019

64 Households	103 Households	48 Households
2017	2019	2022

According to HUD's 2022 Annual Homeless Assessment Report (AHAR), across the United States, the number of people experiencing homelessness increased slightly (less than one percent) between 2020 and 2022. This increase reflects a three percent increase in people experiencing *unsheltered* homelessness, offset by a two percent decline in people experiencing *sheltered* homelessness. However, between 2021 and 2022, *sheltered* homelessness increased

[31] HUD defines "sheltered" homeless as people living in emergency shelters and transitional housing or other temporary settings. "Unsheltered" is defined as people who are staying in places not meant for people to live such as in cars, parks, abandoned buildings, and on the street.

[32] Due to data availability limitations for the City of Gresham, this count is in households. The rest of the chapter uses individual counts.

by seven percent, possibly due to the easing of pandemic-related restrictions that resulted in fewer beds being available and declines in the perceived health risks of staying in a shelter.

Exhibit 43 shows the number of persons experiencing homelessness in Multnomah County in 2017, 2019, 2021[33] and 2022.

Multnomah County's homeless count increased by 30% from 2019 to 2022.

Source: 2022: News Release: Tri-county Point in Time Count numbers, Joint Office of Homeless Services, May 4, 2022

Note: OHCS reported two counts in 2021 – estimated and reported counts. This report uses the estimated counts.

4,177 Persons	4,019 Persons	4,555 Persons	5,228 Persons
2017	2019	2021 (estimated)	2022

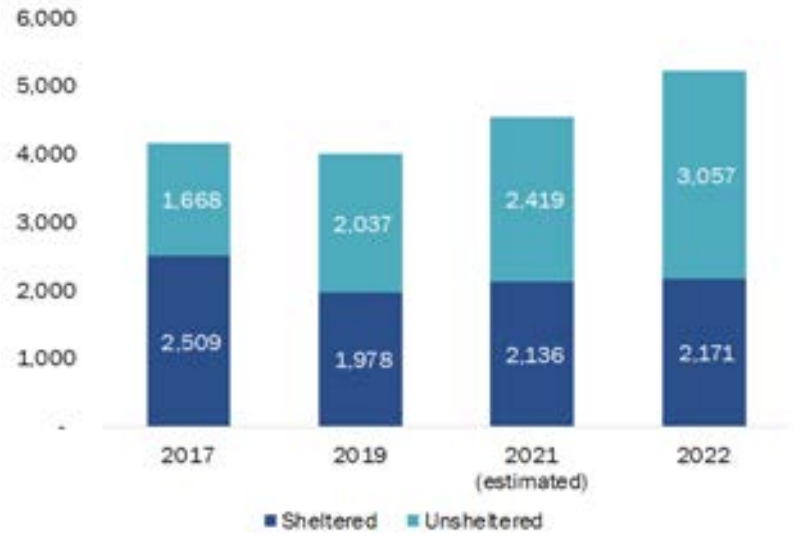
The unsheltered homeless population in Multnomah County has been increasing since 2017. In 2022, an estimated 3,057 people experienced unsheltered homelessness.

Exhibit 44. Point-in-Time Homelessness Estimates for Multnomah County, Portland/Multnomah Continuum of Care, 2017-2022.

Source: Annual Homeless Assessment Report (AHAR) data. 2017-2021

Source: 2022: News Release: Tri-county Point in Time Count numbers, Joint Office of Homeless Services, May 4, 2022[34]

Note: OHCS reported two counts in 2021 – estimated and reported counts. This report uses the estimated counts.



[33] Oregon Statewide Homelessness Estimates report from the Oregon Housing and Community Services presented two counts in their report – *estimated* and *reported* counts. The estimated count was developed to address concerns that data limitations imposed by the COVID-19 pandemic resulted in an undercount. The estimated count is actually just the highest shelter count that was reported during the 2019-2021 period. This report uses the estimated count for 2021. For unsheltered, the 2021 PIT count is not available for all counties, so the report modeled it by adding the predicted 2019-2021 change, determined through analysis of past trends and other homelessness data, to the 2019 PIT count.

[34] The 2022 PIT count breaks homelessness down into three categories: unsheltered, sheltered, and transitional housing. In the graph transitional housing is combined with sheltered. In 2022, 686 people were in transitional housing in Multnomah County.

About 1,106 students experienced homelessness in the 2019-20 school year. students.

Of these students, 145 were unaccompanied.

Housing Affordability Considerations

This section describes changes in sales prices, rents, and housing affordability in Gresham and a comparison of geographies. Both housing sale prices and rents have increased steadily in Gresham and the greater region over the last several years.

Housing Sale Prices

Gresham's median home sales price was $456,000 in December 2021.

Gresham's median home sale price is lower than Multnomah County and most comparison cities.

Exhibit 46. Median Home Sale Price, Gresham and Comparison Cities, December 2021

Source: Redfin.

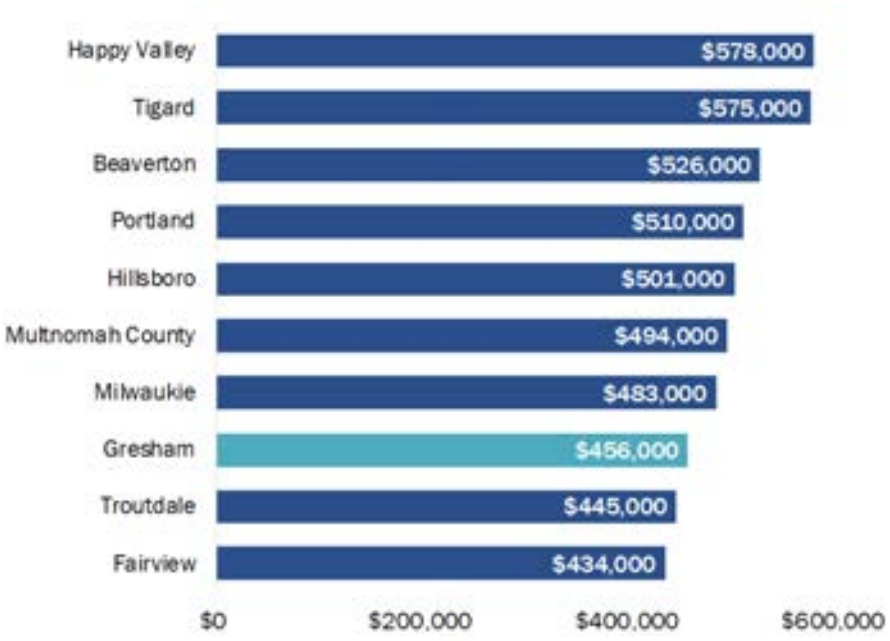

Exhibit 47 shows that Gresham's median home sale price was generally lower than other cities in the region. Between December 2018 and December 2021, the median sale price in Gresham increased by $110,500 (32%).

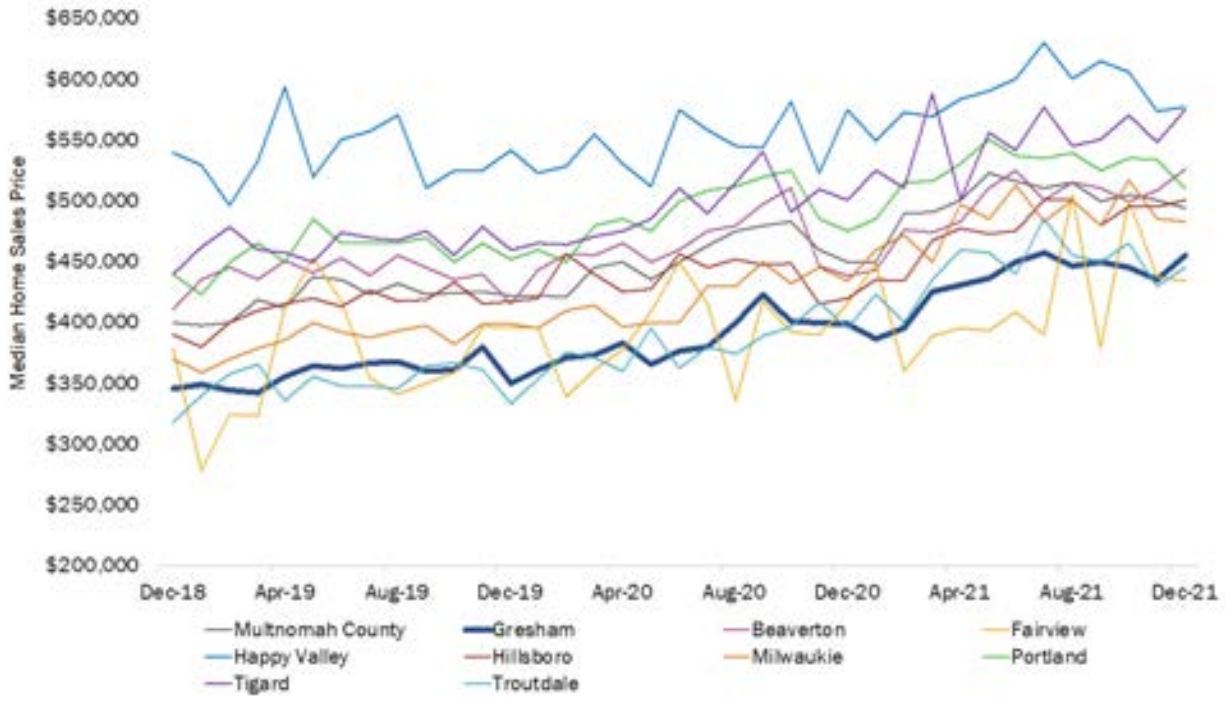
Exhibit 47. Median Sales Price, Gresham and Comparison Cities, 2018 through 2021

Source: Redfin.



Rental Costs

Gresham has some of the lowest rents in the Portland region, due to its large stock of relatively lower cost market rate housing. The median gross rent in Gresham was $1,178 in the 2015-2019 period, up from $661 in 2000. However, based on a Costar survey of *currently available* rental properties in Gresham in December 2021, the average asking rent for an apartment was about $1,430.

The median gross rent in Gresham was $1,178 in the 2015-2019 ACS 5-year estimate period.

Rent in Gresham is lower than most surrounding cities and Multnomah County's median rent.

Exhibit 48. Median Gross Rent, Gresham, Multnomah County, Oregon, and Comparison Cities, 2015-2019

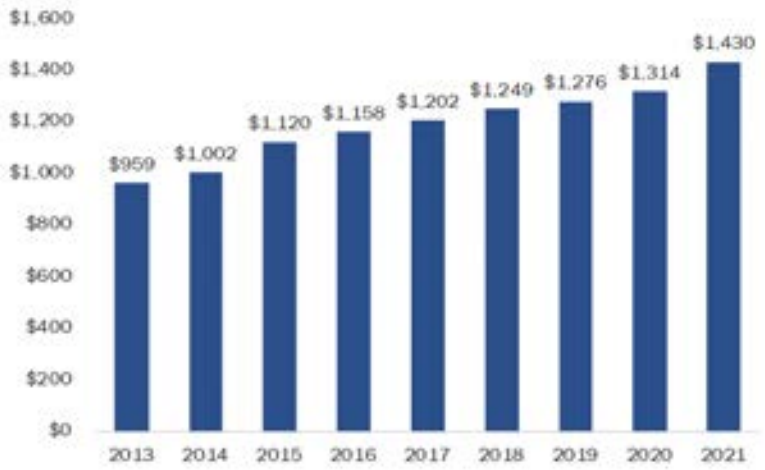
Source: U.S. Census Bureau, 2015-2019 ACS 5-year estimate, Table B25064.

The average asking price per multifamily unit in Gresham has increased steadily over the past decade.

Between 2013 and 2021, Gresham's average multifamily asking rent increased by about 50% or $471, from $959 per month to $1,430 per month.

Exhibit 49. Average Multifamily Asking Rent per Unit, Gresham, 2013 through 2021

Source: CoStar.

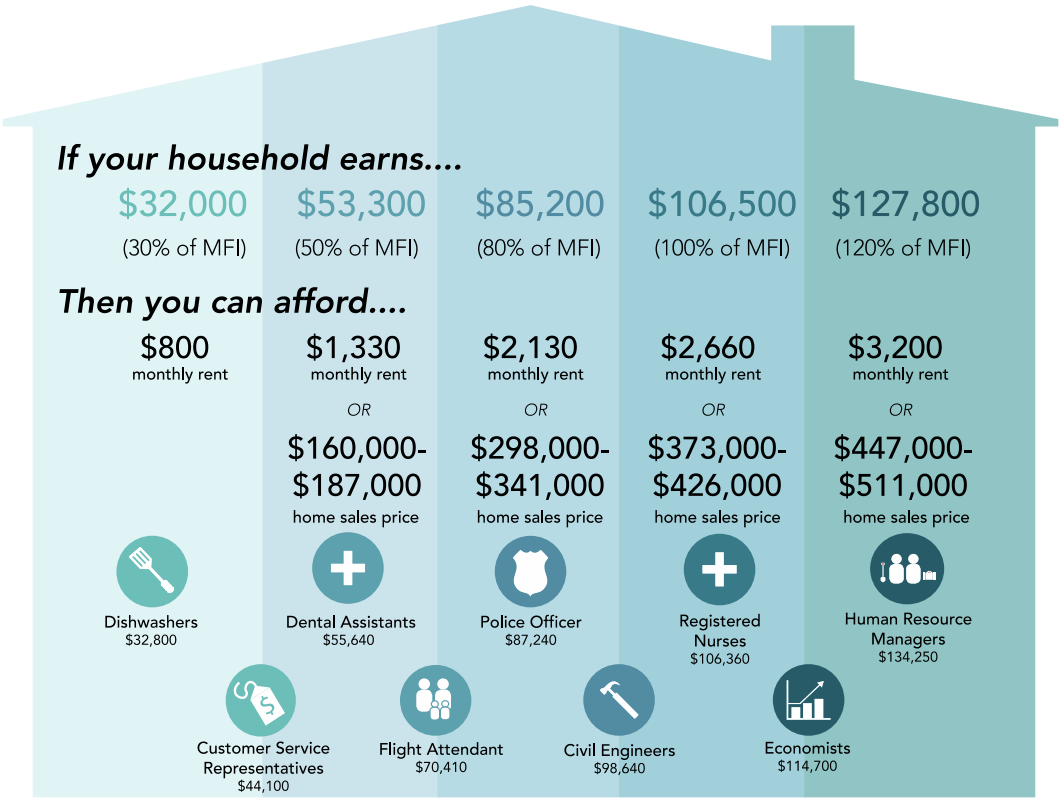


Housing Cost Burden

Financially attainable housing costs for households across the income spectrum in Multnomah County are identified in Exhibit 50. It also provides examples of annual salaries for different job types that fall into each income bracket. For example, a household earning median family income in Multnomah County (about $106,500 per year)[35] can afford a monthly rent of about $2,660 or a home roughly valued between $373,000 and $426,000 without cost burdening themselves. In Gresham, a household would need to earn $114,000 to $130,000 (107% to 122% of MFI for a family of four) to afford the median sales price of a home in Gresham. A household would need to earn about $57,000 (54% of MFI for a family of four) to afford the rent of a market-rate, apartment in Gresham ($1,430 per month, not accounting for basic utilities).

Exhibit 50. Financially Attainable Housing, by Median Family Income (MFI) for Multnomah County ($106,500), Gresham, 2022

Source: U.S. Department of Housing and Urban Development, Multnomah, 2022. Oregon Employment Department.
Note: The estimates of affordable home sales price in below are rough estimates. The affordable home sales prices will vary for each borrowing household, based on interest rates, loan term, down payment, and similar factors. These sales prices are illustrative estimates and do not make assumptions about interest rates, amount of down payment, whether mortgage insurance will be required, or other factors that are unique to an individual household's mortgage.



[35] Note that Median Family Income for the region is different than Median Household Income (MHI) for Gresham (see Exhibit 26). MFI is determined by HUD for each metropolitan area and non-metropolitan county. It is adjusted by family size – in that, 100% MFI is adjusted for a family of four. MHI is a more general term. MHI includes the income of the householder and all other individuals 15 years old and over in the household, whether they are related to the householder or not.

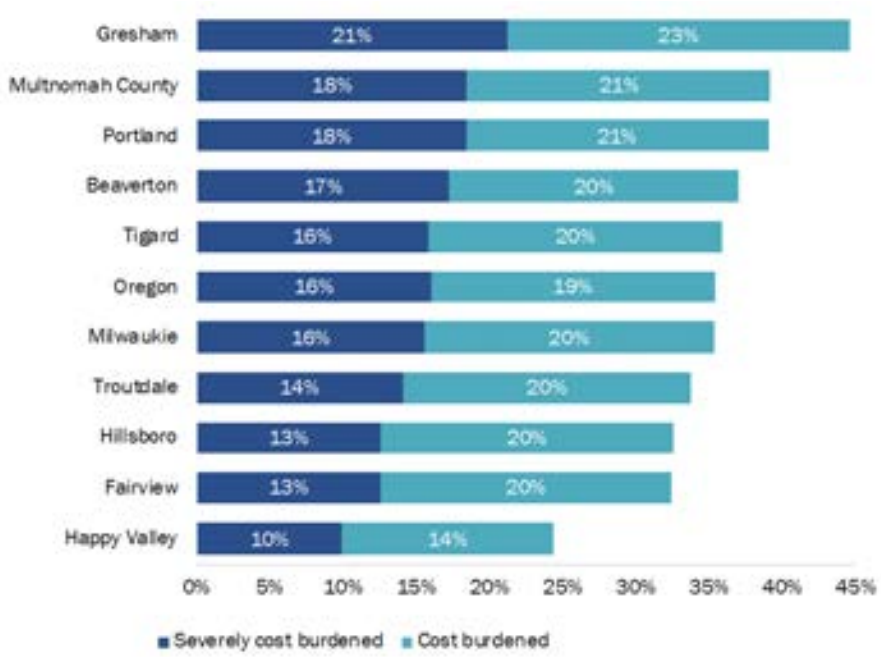
Because the local housing market cannot produce income-restricted, subsidized affordable housing at sufficient levels – and because it cannot often produce middle income housing without subsidy, many households in Gresham are cost burdened (as Exhibit 51 through Exhibit 56 show). A household is defined as cost burdened if their housing costs exceed 30% of their gross income. A household that spends 50% or more of their gross income on housing costs is said to be severely cost burdened.

Overall, about 44% of all households in Gresham were cost burdened.

Gresham had one of the largest shares of cost burdened households relative to all comparison cities as well as Multnomah County and Oregon for the 2014-2018 ACS 5-year estimate period.

Exhibit 51. Housing Cost Burden, Gresham, Multnomah County, Oregon and Other Comparison Cities, 2014-2018

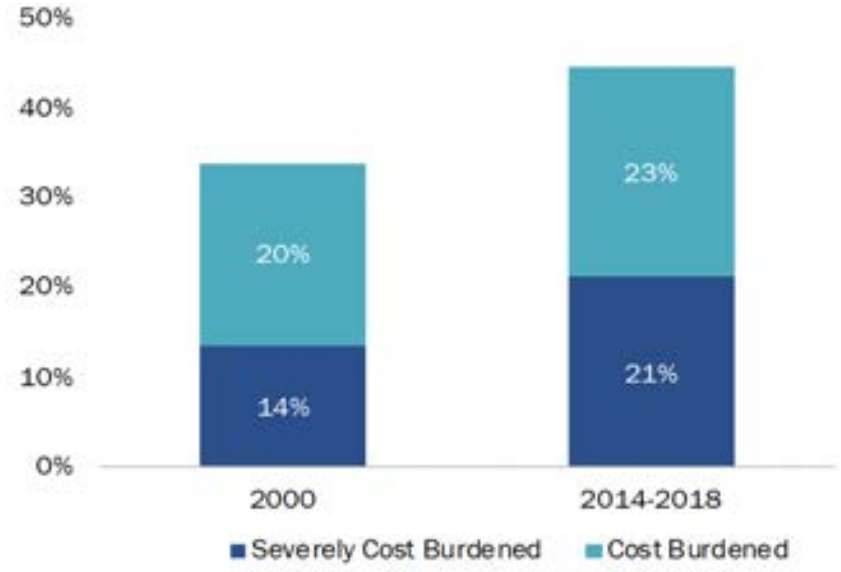
Source: U.S. Census Bureau, 2014-2018 ACS Tables B25091 and B25070.



From 2000 to 2018, the number of cost-burdened and severely cost-burdened households grew by 10% in Gresham.

Exhibit 52. Change in Housing Cost Burden, Gresham, 2000 to 2014-2018

Source: U.S. Census Bureau, 2000 Decennial Census, Tables H069 and H094 and 2014-2018 ACS Tables B25091 and B25070.



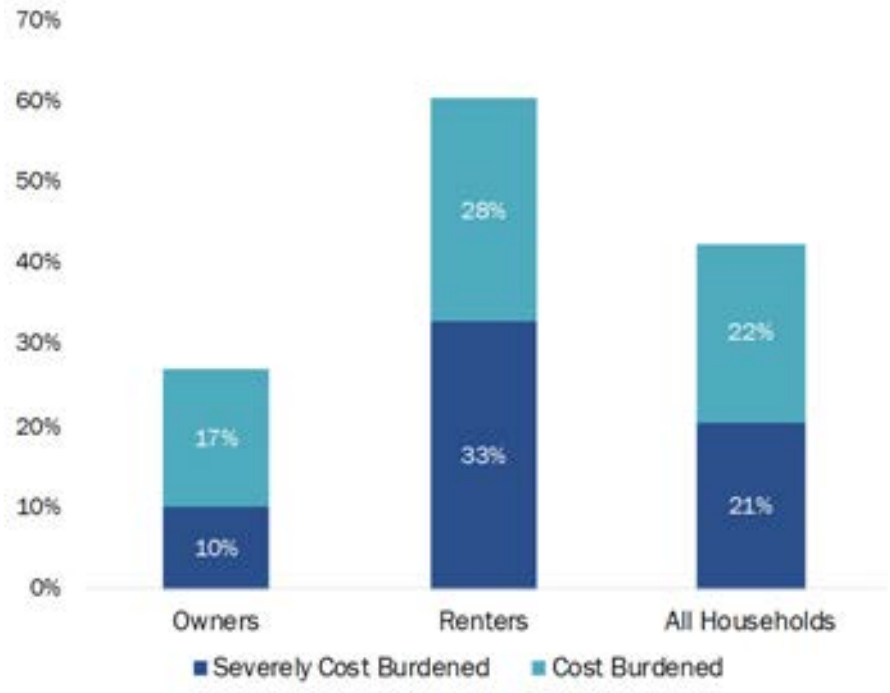
Renters in Gresham were much more cost burdened than homeowners.

About 61% of Gresham's renters were cost burdened or severely cost burdened, compared to 27% of homeowners.

About 33% of Gresham's renters were severely cost burdened (meaning they paid more than 50% of their income on housing costs alone).

Exhibit 53. Housing Cost Burden by Tenure, Gresham, 2015-2019

Source: U.S. Census Bureau, 2015-2019 ACS Tables B25091 and B25070.



Nearly three-quarters of renter households earning less than $20,000 were severely cost burdened.

Most households (95%) earning between $20k and $35k per year are cost burdened and over half of households earning between $35k and $50k per year are cost burdened. This pattern of cost burden by income is consistent with statewide trends.

Exhibit 54. Cost Burdened Renter Households, by Household Income, Gresham, 2015-2019

Source: U.S. Census Bureau, 2015-2019

ACS Table B25074.

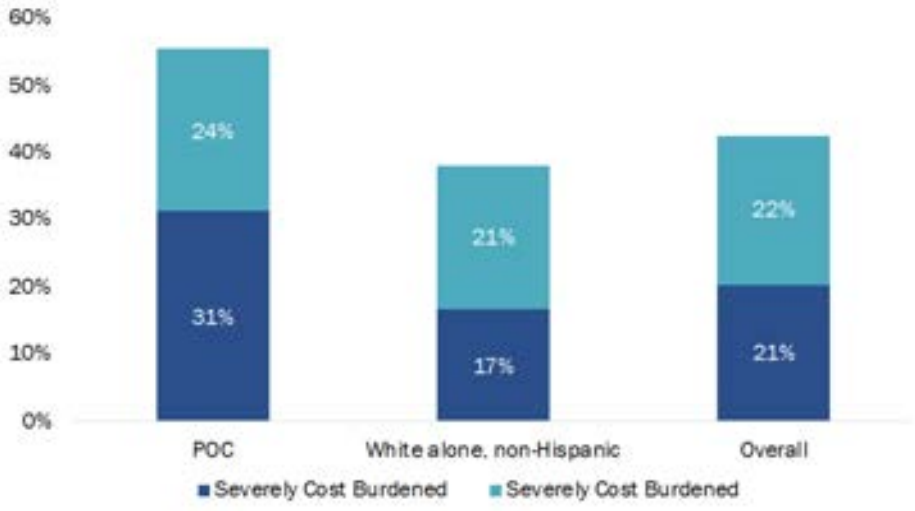
55% of BIPOC households were cost burdened or severely cost burdened compared to 38% of White households.

31% of BIPOC households were severely cost burdened spending 50% or more of their gross income on housing.

Exhibit 55. Cost Burdened for BIPOC, White non-Hispanic, and All Households, Gresham, 2014-2018

Source: CHAS Table 9

Note: BIPOC includes Hispanic/Latinx households.



BIPOC households were more likely to be severely cost burdened whether they rent or own a home compared to White households.

68% of BIPOC households that rent were cost burdened or severely cost burdened compared to 56% of White households.

Exhibit 56. Cost Burdened by Tenure for BIPOC, White non-Hispanic, and All Households, Gresham, 2014-2018

Source: CHAS Table 9.

Note: BIPOC includes Hispanic/Latinx households.

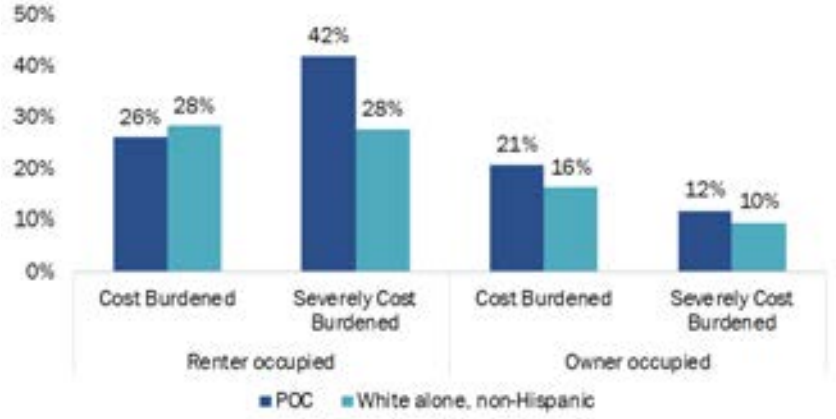


Exhibit 57 and Exhibit 58 show cost burden in Oregon for renter households for seniors, people of color, and people with disabilities.[36] This information is not readily available for a city with a population as small as Gresham, which is why we present statewide information. These exhibits show that these groups experience cost burden at higher rates than the overall statewide average.

[36] From the report *Implementing a Regional Housing Needs Analysis Methodology in Oregon*, prepared for Oregon Housing and Community Services by ECONorthwest, March 2021.

Renters 65 years of age and older were disproportionately rent burdened compared to the state average.

About 60% of renters aged 65 years and older were rent burdened, compared with the statewide average of 48% of renters.

APPENDIX B: INTERESTED PARTY ENGAGEMENT CONDUCTED BEFORE THE HPS

Between 2018 and 2022, the City of Gresham convened residents in several planning processes related to housing. The following is a summary of Gresham's primary public engagement efforts regarding housing and housing production along with key findings from each effort.[37]

Prior Public Engagement

2018-2019 Task Force on Housing

Purpose: Discuss existing housing conditions in Gresham, explore policies that impact housing, discuss best practices, and develop toolkits to provide for the housing needs of residents in the City of Gresham. This Task Force met nine times and ended with a presentation to the City Council

Attendees: Members/Representatives of: Home Forward, Gresham Planning Commission, Property Owner/Landlords, Port of Portland, Task Force on Homelessness, Multifamily Property Managers, Neighborhood Association, Tenant Groups, Multnomah County CIC, Community Development and Housing Subcommittee, Tri-Met Board, Native American Youth and Family Center

Key Findings:

Household support - The Task Force recommended actions that support residents in finding and remaining in a home:

- Increase services for renters.
- Provide down payment assistance and rent assistance.
- Strengthen the rental inspection program. Meeting attendees expressed concern of potential retaliation to renters who report violations. The Task Force recommended the City explore protections to reduce the risk of retaliation and/or discriminatory practices that could arise during inspections.
- Monitor and support implementation of state rules.
- Increase education for renters, home buyers and property managers.

[37] Please note that in addition to these efforts the City has a Community Development and Housing Subcommittee. The Subcommittee advises on community development and housing goals via the process of budgeting Gresham's federal CDBG and HOME funding. They provide input for the City's Consolidated Plan submitted to HUD every 5 years. The Consolidated Plan includes goals related to housing and community development. The City also hosts a regular Development Advisory Group to keep the development community informed and learn from their experiences.

Need for all types of housing and recommended actions to increase the supply and affordability of housing - Altogether, the Task Force recommended over thirty actions for housing in the City. Examples include:

- **Site Selection and Land Control** - The Task Force recommended actions to assist in land acquisition for housing, including expanding current relationships with land trusts and programs to identify purchasing rights and expiring contracts for affordability.
- **Project Design and Permitting** - There are several actions that can support more efficient and cost-effective development approvals including pre-development assistance, fast tracking permitting, and exploring space efficient housing in more locations throughout the City.
- **Financing** - Development grants and other mechanisms can lower the overall cost of development.
- **Operations** - This recommendation includes actions to make operations more efficient for housing investments.

2018-2019 Metro Affordable Housing Bond Local Implementation Planning

Purpose: Inform Gresham priorities for the Local Implementation Strategy with Metro for Gresham's share of Metro Housing Bond funding.

Meetings:

- Residential Service Coordinators meeting
- East County community-based organization meeting
- Coalition of Gresham Neighborhood Associations
- Planning Commission (twice)
- City Council (twice)
- Nonprofit and developer outreach
- Focus groups and listening sessions
- El Progama Hispano Catolico - Latinx community (including one in Spanish)
- Beyond Black – African American community

Key findings:

Meeting participants agreed that homeownership should be a priority.

- The plan should consider the special needs of families, elders and/or disabled people, renters, those transitioning into housing (from houselessness/the criminal justice system/foster care/education), and those from historically underserved populations.
- The needs of Gresham's neighborhoods should be met, including community meeting spaces (schools and parks), services, and property maintenance.

- General issues included transit access, perceived safety, need for services, commuting out of Gresham for work, lengthy screening processes, and aging/unmaintained housing stock.
- General desires included financial assistance, increasing services, infrastructure provided at time of development, more housing for "working families" (between market rate and deeply affordable housing), new development that complements or enhances existing neighborhood character, opportunities for mixed use developments, a balance of investments in different parts of the City, matching housing types to access and services, and having standards to prevent poor quality development.

Annual Community Needs Hearing

Purpose: House Bill 4006 (2018) requires cities greater than 10,000 in population with severely rent-burdened households (including Gresham) to hold a public meeting to discuss the causes of severe rent burdens, the barriers to reducing rent burdens, and possible solutions. In 2021, 14 individuals participated in the discussion. The annual community needs meeting also acts as community engagement to help inform the Community Development and Housing Subcommittee as well as Gresham City Council on community needs and priorities for Gresham's annual allocations of federal HUD CDBG and HOME funding. See Appendix B for a summary of the 2021 Multnomah County and Gresham Community Needs Hearing.

Attendees: Local service providers, representatives from community organizations and other community members.

Key Findings:

- There is a strong need for services that help lift families out of poverty or chronic houselessness. This would include housing assistance and wrap around services to help residents address needs such as mental health services, food assistance, free and affordable childcare, and eviction prevention.
- The Black, Indigenous, and People of Color (BIPOC) communities have faced ongoing housing discrimination impacting both renters and homebuyers.
- Often the only units that are "affordable" for lower income families are older units that are in poor condition.
- There is a need for various upgrades and repairs to improve transportation and pedestrian safety.
- There is need for job training and placement programs that focus on helping residents attain living wage employment are needed.

Other Engagement

Other one-time engagement or engagement for specific projects are listed in Exhibit 59. Since March 2019, Gresham has had more than two dozen meetings focused on housing issues, ranging from community meetings, online surveys, discussion groups, and hearings.

APPENDIX C: EXISTING POLICIES TO ADDRESS GRESHAM'S HOUSING NEED

In early 2022, The City of Gresham created the following list of housing measures (or policies or strategies) that were in place to address the community's housing needs. Several of the potential or in-development strategies identified on this list are now effective, including allowance of middle housing development and the extension of the Rockwood Urban Renewal Area timeframe.

Existing Housing Policies (2022)

Zoning

Zoning Changes to Facilitate the Use of Lower-Cost Housing Types. Middle Housing is allowed as required by HB 2001 as well as in other districts. The code broadens the definition of multifamily to include attached and detached configurations.

Code Provisions for ADUs. There is an existing development code section permitting ADUs under certain provisions.

Promote Cottage Cluster Housing. Cottage Cluster is in the draft Middle Housing code and is currently in the Innovative Housing Development Code section. Cottage Clusters are allowed through zoning, but not yet promoted.

Add Restrictive Covenants to Ensure Affordability. The City applies these covenants in specific applications such as Metro Housing Bond projects, HOME, CDBG.

Align Lot Division Density with Zoning Density. Part of the City's current land division process.

Increase Density near Transit Stations and Regional Multi-use Trails. Built into land use district density provisions. When Gresham begins to implement the requirements of the State's new Climate Friendly and Equitable Communities rule, development near transit stations and in other key areas of the City will continue to have an emphasis on higher density development.

Ensure Land Zoned for Higher Density is not Developed at Lower Densities. Minimum density provisions and standard practice as planners work with developers.

Reduce Regulatory Impediments

Reduce parking requirements. Per HB 2001, Middle Housing in HB 2001 districts will have lower parking requirements. When Gresham begins to implement the requirements of the State's new Climate Friendly and Equitable Communities rule, the City will need to comply with rules for reduced parking requirements in Climate Friendly Areas.

Conversions. Per HB 2001 the proposed 7.0420-40 Design Standards will not apply to conversions to a middle housing type.[38]

Expedite Permitting for Needed Housing Types. Expedited permitting for affordable multifamily developments only, per code, the City reviews these applications within a 100-day review period instead of 120 days.

Financial Incentives

Reduce or Exempt SDCs for ADUs. ADUs do not pay water or sewer SDCs, Transportation SDCs apply and stormwater SDCs are based on the site's impervious area.

New practice being implemented. Deferral of SDCs for multifamily residential development (financing also available). SDCs related to new single family construction payable prior to request for final inspection (effective for all single-family residential development, developers need not apply for this timing). In place since Fall 2021.

Financial Resources

Community Development Block Grant (CDBG). Gresham typically receives between $1 million and $1.2 million annually in CDBG funding from HUD. Development of affordable housing and down payment assistance are eligible CDBG funding categories. Gresham historically utilizes HOME funding for those activities because both HOME and CDBG funding levels are limited, and CDBG presents more flexibility in the use of funds. Gresham has utilized the Section 108 loan program to facilitate a loan to Human Solutions for the acquisition/development of the Rockwood building/associated rental housing. Opening a line of credit for a non-profit/developer to utilize a Section 108 loan is a potential development tool. While not related to housing production, Gresham funds many programs that support housing stability with CDBG funding. The programs include emergency home rehabilitation and accessibility upgrades and programs that provide rent assistance and other stability services.

HOME Program. The City directs a significant portion of its $400,000 to $650,000 in HOME funding toward homebuyer down payment assistance and rental assistance, new development projects, and an ongoing partnership with Proud Ground community land trust. Gresham will receive a 1-time allocation of just under $2.3 million in specific HOME-ARP funding in 2022. The City is using these funds for supportive services, such as rental assistance, support for renters, and job training and placement programs.

General Obligation Bonds. The City has developed a plan for how it would spend Metro Housing Bond Dollars. Gresham's share of the bond funding totals $26.7 million. Gresham's target number of affordable housing units is 187, with 77 deeply affordable and 93 family-sized units. Gresham has allocated funding to two projects and has approximately $10 million remaining. The two projects funded include 194 units, and the City met the target for deeply

[38] This applies to the existing structure being converted (internal conversions), but any new structures on site will be subject to the design standard.

affordable units. Gresham's remaining metric is to produce 23 more family-sized units with the remaining $10 million.

Gresham opened an RFP in January and expects to allocate the remaining funding this year. The remaining funding will be utilized for development over approximately the next two years. Affordable homeownership, new construction of affordable rental housing, and the rehab and conversion of market-rate housing to affordable are all eligible development types. Bond regulations dictate a 60-year affordability period, so any ownership development would likely take the form of a land trust model.

Tax Exemption and Abatement

Vertical Housing Development Zone Tax Abatement. VHDZ includes an additional property tax abatement (on the land) for housing affordability, per State statute. The City's current VHDZs are restricted to Downtown and Civic area. The City is exploring expanding the zone to Rockwood Triangle and 223rd Ave and Glisan Street and altering the criteria by which the City evaluates VHDZ proposals. This will be presented to Council in mid-2023. The City is open to inclusion of other areas in the future.

Other: Home Forward statutory incentive for tax exemption. Gresham has an IGA/partnership pilot program with housing developers that mitigates the City's loss of tax revenues over a 20-year horizon. When Home Forward collects the fee from a developer, the City gets a portion of the fee.

Land, Acquisition, Lease, and Partnerships

Public/Private Partnerships (P3). Metro Partnership for mixed use development of the Civic Sites.

Other

Rockwood Urban Renewal Extension. The Gresham Redevelopment Commission has extended the existing urban renewal area for 6 years to fully use the area's maximum indebtedness. Gresham is currently exploring an Urban Renewal Area expansion.

APPENDIX D: EVALUATION CRITERIA FOR HPS ACTIONS AND ACTION DESCRIPTIONS

This appendix summarizes the evaluation criteria used to evaluate actions for inclusion in the HPS and contains a description of each action in the HPS. The evaluation criteria (summarized below) fall into five categories: income-level served, development impact, administrative complexity, funding required, and political acceptability.

Actions Evaluation Criteria

MFI Targeted

Gresham would like to see development and preservation of housing affordable at all income levels. ECONorthwest defined income levels based on 2022 Median Family Income for Multnomah County (as defined by the U.S. Department of Housing and Urban Development) for a household of four people, as follows:

Extremely Low and Very Low Income	**Low Income**	**Middle Income**	**High Income**
Extremely Low Income: Less than 30% MFI Less than $31,950 Very Low Income: 30% to 50% of MFI $31,950 to $53,250	50% to 80% of MFI $53,250 to $85,200	80% to 120% of MFI $85,200 to $127,800	120% of MFI+ $127,800+
49% of Gresham households	*21% of Gresham households*	*18% of Gresham households*	*13% of Gresham households*

Impact

Does the action result in a little or a lot of change in the housing market? How many units might be produced, relative to other tools? Can the tool leverage investments from other partners?

How long will the impact last? The scale of impact depends on conditions in the City, such as the City of Gresham's other existing or newly implemented housing policies, land supply, and housing market conditions. ECONorthwest defined the scale of impact as follows:

Small	Medium	Large
Will not directly result in development of new housing or it may result in development of a small amount of new housing. May not improve housing affordability in and of itself. May be necessary but not sufficient to increase housing affordability.	Could directly result in development of new housing. May not improve housing affordability in and of itself. May be necessary but not sufficient to increase housing affordability.	Could directly result in development of new housing. May improve housing affordability in and of itself. May still need to work with other policies to increase housing affordability.
~1-3% of needed housing	*~3% to 5% of needed housing*	*~5% to 10% (or more) of needed housing*

Administrative Burden

How much staff time is required to implement the action? Is it difficult to administer once it is in place? ECONorthwest defined administrative complexity, as follows:

Low	Medium	High
Requires some staff time to develop the action and requires some on-going staff time to implement the action.	Requires more staff time to develop the action and requires more on-going staff time to implement the action.	Requires significant staff time to develop the action and/or significant on-going staff time to implement the action.

Funding Required

What financial resources are required to implement the action? This includes the cost to establish and maintain a program. For funding sources, the easier it is to administer the tax or fee, the more net revenue will be available to offset costs for housing production or preservation. ECONorthwest defined funding required, as follows:

Low	Medium	High

Has relatively small funding impacts.	Has relatively moderate funding impacts.	Has relatively larger funding impacts.

Acceptability

Political acceptability assesses the acceptability of the action for stakeholders. It considers expected political acceptability for elected officials and the public at large. If the action is dependent on the action of another organizational entity, the action is less likely than if the City controlled all aspects of tool implementation. ECONorthwest defined political acceptability, as follows:

	Low	**Medium**	**High**
Potential resistance from stakeholder groups, the public at large, and/or elected officials	Likely significant resistance	Moderate resistance	Little resistance
Coordination with another entity required	Significant	One-time or ongoing coordination	Little or none
Planning Commission review and/or City Council acceptance/adoption required	Review and/or adoption required	Review and/or adoption required	Little or none

Funding Evaluation

While this project did not include a robust funding analysis component, Exhibit 60 provides an overview of which funding sources advanced to inclusion in the HPS.

Exhibit 60. Funding Sources Evaluated

Revenue Source	Recommendation HPS Inclusion?	Rationale for Inclusion/Exclusion?
Future TIF District(s)	Yes	Could provide a stable, dedicated revenue source in an area with limited existing infrastructure.
Use of CET funding	Yes	Evaluation of a CET as a funding source to support a potential System Development Charge waiver/reduction and/or tax exemption
Grants and State funding	No	Pursue as the City has staff capacity, without dedicated staff grants may not provide substantial source of funding
Private donations and gifts	No	Pursue as the City has staff capacity, without dedicated staff this is not likely to be a substantial source of funding
New local option levy	No	Requires voter approval, unlikely to pass
Increased lodging tax	No	Only 30% increased revenue could go to housing; 70% dedicated to tourism promotion
Increase Systems Development Charges	No	Would place burden on market-rate development
Increased utility fee	No	Difficult to target charges, not a large nexus between source and use of funds
New business license fee	No	May hinder local business development
New food and beverage tax	No	Requires voter approval, unlikely to pass
New sales tax	No	Not politically feasible
New payroll/business income tax	No	May not be politically feasible
New real estate transfer tax	No	Not legal in Oregon
New vacant/second home tax	No	Untested and possibly not legal in Oregon

Potential Partners

Implementing the actions in this strategy will require participation of key partners who have roles essential to the construction, delivery, and preservation of housing units. Exhibit 61 shows how each of the partners would play a role in different actions.

Exhibit 61. City and Partner Roles

Actions	City of Gresham	Other Government Agencies	Affordable and Market Rate Developers	Local Nonprofits	Other Partners
1A. 2A. Explore provision of grants/loans for new development within existing and potential new TIF District(s)	Develop program; funding	Funding	Provide input

Action Descriptions

For each HPS action, a rationale, description, the role of the City, anticipated impacts, potential risks, implementation steps, and implementation timeline is described below.[39] There are several actions to be implemented in potential new TIF Districts (2A-2E). Prior to implementing this action, new district(s) must be established. New TIF District(s) will need clear objectives and community support, as they are voter approved.

For brevity, implementation steps to pursuing a new district are broadly generalized below:

[39] For each action partners are described in Exhibit 60.

- Work with City Council to identifying potential district boundaries, housing and non-housing goals, and key projects,
- Forecast funding; match funding projections to URA goals and projects,
- Conduct community outreach, and
- Seeking voter approval.

1A, 2A. Explore provision of grants and loans for new development within existing and potential new TIF District(s)

Rationale: Tax increment financing is a flexible funding tool that can support new housing development within a TIF District. Building affordable housing often costs more than the funding available for the development, leaving a funding gap, therefore, developers need subsidies. Gresham has one TIF District, the Rockwood-West Gresham TIF District, which was established in 2003. In May 2022, Gresham voters approved an extension of the Rockwood-West Gresham TIF District until 2029.[40] Over the next six years, the Gresham Redevelopment Commission is forecasted to have approximately $30 million remaining to invest toward new projects, technical assistance such as business grants, debt, and agency administration.[41]

The City is also considering creating a new TIF District. One or more new TIF Districts with housing goals could be created. The Agency could choose to spend a portion of the funding on projects to support new affordable housing development.

Description: A city can use tax increment dollars to directly invest in a specific affordable housing project. These grants or loans can serve as gap funding to improve development feasibility. The City could consider contributing to programs that are successfully operating, such as non-profit land trusts or even other government agencies that have the administrative capacity to maintain compliance requirements over time, using intergovernmental agreements.

The City can help reduce the funding gap by providing direct subsidies to support the development of multifamily rental, middle housing, and affordable ownership projects that are affordable to families making up to 100% of MFI in the long term. These subsidies could fund predevelopment costs (e.g., due diligence), serve as lower-cost capital for construction financing (with lower interest rates), or provide direct up-front grants during the development phase in exchange for deeper levels of affordability.

The City could fund these using tax increment financing in existing and potential future TIF Districts. Within the Rockwood-West Gresham TIF District, funding might focus on the development of housing affordable to 80% to 120% of MFI. In new TIF Districts, funding might focus on housing affordable from 0% to 120% of MFI.

[40] https://greshamoregon.gov/Urban-Renewal/

[41] https://gresham.granicus.com/MetaViewer.php?view_id=2&clip_id=911&meta_id=57971

City Role: The City could provide direct funding to support affordable housing development. City would need to set up investment criteria and monitor any agreements made in coordination with the grants.

Anticipated Impacts:

Populations Served	Income	Housing Tenure	Magnitude of New Units Produced
Extremely, very, and low-income (rental) and (ownership)	0-60% MFI (rental) 60-120% MFI (ownership)	Both	Medium*

*Medium. Depending on the level of funding, the City's ability to provide locally generated gap funding could help to attract more affordable housing producers to the area.

Potential Risks: A key risk with using urban renewal to support affordable housing development in the TIF District is granting too many property tax exemptions for new affordable housing development, reducing growth of the property tax base in the URA. In addition, funds spent on affordable housing reduce funds available for other priorities. Generally, if the TIF investments align with City goals, the City is less likely to encounter political headwinds, especially if the investments achieve multiple community goals.

Implementation Steps:

- Within the Rockwood-West Gresham Urban Renewal District, identify investments that align with the plan goals.
- Determine type(s) of new construction subsidies the City would offer (e.g., direct project loans/grants, etc.)
- Determine investment criteria:
    - Level of affordability the City will prioritize for funding. The options are (1) publicly subsidized housing affordable to households earning less than 60% of MFI, (2) low- and moderate-income affordable housing affordable to households earning between 60% and 120% of MFI, or (3) both.
    - Other criteria could include long-term affordability requirements, locations for project subsidy, alignment with Climate Action Plan goals, size of development, distance to key amenities, access to transit, equity considerations, sustainability considerations, and other criteria.
- Quantify the level of subsidy the City is willing to commit to on any given project. Should there be a cap on direct project subsidy investments for any one site or a cap based on funding per new dwelling unit?

Funding or Revenue Implications: Tax increment financing would be used to implement this action in TIF Districts.

1B, 2B. Explore rehabilitation grants to low-cost market-rate property owners in exchange for affordability agreements within existing and potential new TIF District(s)

Rationale: Much of the housing in Gresham that is affordable to low- and moderate-income households is older, privately-owned housing that is not subject to affordability restrictions. This housing may have deferred maintenance issues (and, in some cases, owner neglect) because of a lack of resources to make improvements and pay for repairs. When rehabilitating housing units in multifamily buildings, most property owners increase rents because they make improvements that enhance what they can charge. Keeping low-cost housing both habitable and affordable reduces the need to subsidize new construction. By offering rehabilitation grants tied to affordability requirements, the City could prevent the loss of affordable units while also ensuring that low- and moderate-income households have access to safe, updated housing.

Description: The City can work with property owners of low-cost unregulated housing to support needed repairs without displacing residents. The City would work with partners to assemble a pool of money to help unregulated properties recapitalize their loans and/or pay for necessary capital repairs. Low interest loans or grants to non-regulated affordable housing owners would be made in exchange for agreements to rent units below market for a specified period.

The City would need to consider the terms of affordability (how far below market would the units be required to rent and how long would units have to remain affordable), required level of habitability, how the City would monitor and enforce compliance, how to minimize displacement of residents due to rehabilitation.

City Role: Funder and monitor of rehabilitation and affordability per agreements.

Community Housing Fund or the Network for Oregon, Affordable Housing could be potential partners to explore program structure, guidance, and collaboration. Portland Affordable Housing Preservation Partnership could help to identify properties and investors.

Anticipated Impacts:

Populations Served	Income	Housing Tenure	Magnitude of New Units Produced
Moderate	60-80% MFI	Rental	Depending on funding levels, these funds can be a powerful tool for preservation.

Potential Risks: Rehabilitation assistance must be enough to entice owners to participate and should be commensurate with the restrictions. The City will want to carefully consider affordability requirements, so that these properties maintain long-term affordability.

Implementation Steps:

- Conduct additional study. The City can explore:
    - What rate of return would the City expect on its investment?
    - How long would the City be willing to lend?
    - How much risk is the City willing to take?
    - To what level of habitability would the City require of rehabilitated units?
    - How would the City monitor compliance?
    - How would the City qualify borrowers?
    - What are the consequences of noncompliance?
    - How would the City value its return (years of below-market rent in exchange for a given investment)? How far below market would units be required to rent?
    - How much would the City invest in these sorts of programs? Where would this funding come from?
- Consider conducting a pilot program for a set number of years where there may be available funding, such as in the Rockwood-West Gresham TIF District. The City of Beaverton developed a pilot program in 2018 in which it explored offering subsidized funding for rehabilitation in exchange for 10 years of reduced rents. It was targeting rents appropriate for households making 60%-80% of the area median income.
- Identify City staffing needs to support this program. For example, offering loans may require staff who are knowledgeable about finance. Alternatively, the City could contract with a nonprofit organization that has a similar program to run the City's program or contribute funding to an existing program.
- Establish criteria for participation in this program, such as income level, whether owners or renters are eligible, types of housing condition problems the City will support addressing, and other criteria. Conduct additional analysis using example properties to determine the appropriate investment amount and affordability requirements for properties.

Funding or Revenue Implications: Tax increment financing would be used to implement this action in TIF Districts.

1C, 2C. Explore partnerships to acquire and stabilize existing low-cost market rate housing within current and potential future TIF District(s)

Rationale: Acquisition and rehabilitation of existing apartments by providers of regulated affordable housing preserves existing housing. Placing conditions on the sale, demolition, or replacement of certain housing types, and providing renter protections can increase the availability of affordable housing. This makes redevelopment less attractive or cost-effective, preserving existing housing.

Description: The City of Gresham has a large stock of small- to medium-sized apartment

buildings which provide some of the region's naturally occurring affordable housing. As Gresham's neighborhoods change, some of these units may be ripe for "repositioning," meaning that an investor would buy the units, rehabilitate them, and then rent them at a higher price. If this occurs, many Gresham residents could be at risk of displacement. Preservation of existing housing may focus on preservation of smaller, more affordable housing and aging apartment complexes. The City could explore supporting acquisition and rehabilitation of existing apartments by providers of regulated affordable housing. The City could look for opportunities to expand policies requiring or incenting purchase rights to the local housing authority,[42] current tenants, the City, and/or qualified nonprofit organizations within Oregon law. The City could also establish an acquisition loan fund to acquire and compete for aging apartment complexes. These types of loans can provide bridge financing until the buyer is able to complete the necessary steps to secure long-term funding and prepare to rehabilitate the property.[43] The City could provide financial support to Home Forward in purchasing developments with expiring LITHC contracts. Home Forward has first right of refusal for units with Section 8 and LIHTC properties. The City could also advocate for this to be an eligible use of future Metro Housing Bond funds.

City Role: The City would be a convener and could also provide incentives and funding.

Anticipated Impacts:

Populations Served	Income	Housing Tenure	Magnitude of New Units Produced
Low- and middle-income	60-120% MFI	Owner and Renter	Low to Med

Potential Risks: This action is limited to the existing stock of housing and would focus on the preservation (or careful redevelopment) of smaller, more affordable housing. The City should be careful to calibrate such regulations to ensure that moderate density developments such as middle housing development types are not blocked.

Implementation Steps:

- Conduct outreach with local nonprofits (particularly Network for Oregon Affordable Housing), property owners, and service providers to understand which type of preservation strategies may be most successful in preserving affordable housing.
- Establish an inventory of "naturally occurring affordable housing" that could be targeted for acquisition and preservation. Staff would need to determine criteria for inclusion in the inventory, including year build, number of units, location, property value, presence of

[42] Home Forward has first right of refusal, along with state and local governments.

[43] Preserve Oregon housing, "Loans: Purchase of Existing Project to Convert to Affordable," http://www.preserveoregonhousing.org/loans.php

amenities, recent sales or remodel, and current rent levels. The City of Beaverton conducted an inventory of their naturally occurring affordable housing which might be useful to review.

- Discuss any potential strategies or regulations with City Council at work sessions and in public hearings.

Funding or Revenue Implications: Tax increment financing would be used to implement this action in TIF Districts. This could also be a potential use of future Metro Housing Bond funds; in that case, implementation could expand beyond TIF Districts.

1D, 2D. Explore funding and partnerships for housing-related infrastructure development within existing and potential new TIF Districts

Rationale: Tax increment financing is a funding source that can support the development of various types of infrastructure improvements needed for housing development. On-site and off-site infrastructure improvements could meet multiple community goals such as facilitating housing and multimodal transportation. **Description:** Tax increment financing can be used to defray the costs of infrastructure development needed for multifamily rental, middle housing, and affordable ownership projects. Incentives can be structured in various ways. For example, contributions to the developer for infrastructure development, or an agreement for the Urban Renewal Agency to complete infrastructure improvements that are required as a condition of development approval.

City Role: The Gresham Redevelopment Commission would continue to implement the Rockwood-West Gresham Urban Renewal Plan and select projects to fund using the Tax Increment Financing tool. For one or more new TIF District(s), the City Council would adopt, and the Urban Renewal Agency Board would implement, the plan.

Anticipated Impacts:

Populations Served	Income	Housing Tenure	Magnitude of New Units Produced
Extremely low-, very low-, low- and middle-income households	0-120% of MFI	Renter or Owner	Moderate

Potential Risks: Funds spent on housing related infrastructure improvements will need to be balanced with other TIF District priorities, and (where possible) used to achieve multiple priorities. Property owners may not want to develop on the same time frame as identified in the urban renewal plan timeline. New TIF District(s) will need clear objectives and community support, as they are voter approved.

Implementation Steps: Decide how to use and leverage the TIF funding to support infrastructure and affordable housing development. The best use of funding may be in

coordination with other actions in the HPS, such as with land banking and support of development of income-restricted housing.

Determine desired project characteristics and partner with developers and nonprofits.

Funding or Revenue Implications: Tax increment financing would be used to implement this action in TIF Districts.

2E. Explore land banking, parcel assembly, and public land disposition efforts within potential new TIF District(s)

Rationale: Public sector land banking can support affordable housing by reducing or eliminating land cost from development. Developers interviewed through the HPS cited land costs as a substantial portion of overall development costs. Any action the City takes to assemble land for affordable housing would support the City's housing production goals.

Description: Through land banking, the City can pursue a pipeline of land for future development and control the type of development that may occur on the land. The City could:

- Designate vacant city-owned land as surplus and contribute that land to the land bank, eventually conveying that land to affordable housing developers for development of housing at agreed-on level of affordability (e.g., 60% of MFI or below).
- Look for opportunities to:
    - Purchase and assemble smaller sites into a larger site to support multiunit development, especially in high-opportunity neighborhoods.
    - Purchase larger sites properties for the purpose of building affordable housing and convey that land to affordable housing developers for development of housing at agreed-on level of affordability. Land can be acquired cost-effectively if purchased in down-cycles and used to leverage developer investment.

Land banking is likely to focus on land within potential new TIF Districts, which is where funding to support land banking may be available. If the City has funds to support land banking outside of TIF Districts, then the City could look for opportunities for land banking citywide.

City Role: The City may participate in multiple projects using different types of land banking strategies, such as assisting with land purchase and assembly, providing funding to support land purchase, or leading development as well as other strategies.

Anticipated Impacts:

Populations Served	Income	Housing Tenure	Magnitude of New Units Produced
Extremely low-income, very low–income, low-income, and	0-60% of MFI	Renter or Owner	Moderate to Large

Populations Served	Income	Housing Tenure	Magnitude of New Units Produced
limited moderate-income households	(Could include projects for households with income below 120% of MFI)		

Potential Risks: If public land is used for affordable housing, typically it cannot be used for other city functions. However, if the land were identified as surplus or excess, it would likely not be needed for city functions. Staff would need to be well-versed in real estate. Not all public sector land may be eligible for public sector disposition. Vacant land in high opportunity areas with willing sellers is scarce.

Implementation Steps: The following steps would most likely focus on land in new TIF Districts, if the City establishes any:

- Identify the City's land banking investment goals. Does the City want long term control of land through a ground lease? Or would the City be open to land write downs upon sale in exchange for projects that meet the City's investment criteria?
- Identify criteria for purchasing or dedicating city-surplus land for land banking. These could include lot size, ability to assemble adjacent parcels, willingness of the owner to sell at appraised value, zoning, distance to key amenities/transit, and displacement risk. The City should consider where it would focus its efforts in high-opportunity areas (e.g., transit corridors, downtown, and existing TIF Districts). The City should also consider how land banking activity aligns with Gresham's Climate Action Plan.
- Inventory city-owned properties for land banking. If appropriate, surplus publicly owned land identified as suitable for land banking could be contributed to the bank. The City could implement a policy that establishes when to convey surplus land to the land bank for affordable housing. The City could explore opportunities to vacate unused streets that are functioning as alleys and have no underground utilities for the land bank.
- Inventory other public and nonprofit owned land. Consider potential partnerships on land owned by Metro, ODOT, County, State, schools, and faith-based properties.
- Consider internal staffing capacity to support land banking, with a focus on the ability to act quickly and flexibly when opportunities arise and seeking opportunities with partners.
- Determine the City's requirements for sale or long-term ground lease, including long-term affordability and how those requirements should be enforced (e.g., deed restriction)
- Evaluate the use of state brownfield funding to evaluate potential brownfields in high-opportunity areas. If those properties were declared brownfields, the City could tap into State funding for cleanup and redevelopment.

Funding or Revenue Implications: Tax increment financing would be used to implement this action in TIF Districts.

3A. Explore and reduce barriers for affordable homeownership models.

Rationale: Access to homeownership is uneven for low-income and BIPOC populations who face systemic barriers to homeownership. The barriers to development of affordable homeownership projects are myriad, from a lack of developer capacity, financing challenges for prospective homeowners, and development regulations. Alternative models of ownership could improve ownership opportunities but are particularly challenging for small, attached housing units on single lots. These building types cannot always support fee simple owner-occupancy and are costly to develop as condos.

Description: The City could pursue a multi-pronged approach which could include advocacy at the state level to reduce barriers to development, incentives in exchange for affordability requirements, and innovative approaches to acquiring foreclosed homes, and exploring alternative homeownership models.

Advocate for and pursue State and Metro funding resources for Gresham, such as:

- The State's Homeownership Development Program, which has $40 million for alternative homeownership models across the State.[44] Through this program Gresham could be eligible for gap funding sources and predevelopment and capacity building grants. As of 2023, the City will support some of the development costs of a planned affordable ownership cottage cluster development. That project will be an innovative use of a limited amount of one-time funding from the state and Gresham's HOME-funded down payment assistance.
- Future Metro Housing Bond proceeds, which may continue to include homeownership project as eligible projects.
- LIFT funding, which would require advocacy to lift restrictions on depth of affordability to make this program a better match for homeownership projects.[45]

Support alternative affordable homeownership models. The City could build capacity and technical assistance support for organizations pursuing affordable homeownership:

- Support conversions of existing low-cost market rate buildings or manufactured home communities to limited equity housing cooperatives, working with tenant advocacy groups in areas threatened with redevelopment and displacement. These types of investments could provide proof of concept for novel ownership formats, such as cooperative housing. This support may be limited to areas in current or future TIF District(s) unless other funding is available.
- Examine and reduce the City's code for barriers to alternative ownership models**.** The City has addressed some barriers to middle housing already, including removing

[44] A summary of the program and a framework of the Homeownership Development Program can be found on page 41 of the OHCS Housing Stability Council meeting packet from September 2022: Housing Stability Council (oregon.gov)

[45] LIFT funding may change substantially in the 2023-2025 biennium depending on the funding provided in the 2023 Legislative Session.

maximum densities for duplexes, triplexes, (most) townhouses, and cottage cluster developments. Middle housing types are allowed outright in most areas and do not require public notice.

- Support education programs to build awareness of alternative homeownership models like limited-equity cooperatives among the financial and development communities.[46]
- Work with existing organizations to create revolving loan programs to reduce construction loan costs for affordable homeownership.
- Collaborate with Oregon communities to advocate for changes to the State's construction defect laws (CDL). CDL is a state-enabled law that "places an obligation on developers to correct or compensate for any defects in design, materials, and/or workmanship of a recently constructed building."[47] Oregon's CDL statutes stipulates that the term for which CDL can be pursued is 10 years, which is longer than other West Coast states. Advocacy could involve reducing the 10-year term and bolstering existing notice-and-opportunity-to-repair laws. This would reduce barriers to condominium and cooperative models.

City Role: The City could provide seed money or revolving loan funds, educational programs, and advocacy for changes to the States' construction defect laws. There could also be code changes (e.g., occupancy restrictions) that the City could make to remove barriers.

Anticipated Impacts:

Populations Served	Income	Housing Tenure	Magnitude of New Units Produced
Low- and Middle-Income	60-120% MFI	Owners	Small

Potential Risks: Funds spent on alternative homeownership models will be unavailable for other city services and affordable rental housing opportunities. Homeownership programs may serve a smaller portion of the population than larger developments focused on affordable rental opportunities. Lower income households that buy a home may struggle to maintain or keep that home without additional support. For co-op models there are often few banks who will provide loans.

Implementation Steps:

[46] A summary of the program and a framework of the Homeownership Development Program can be found on page 41 of the OHCS Housing Stability Council meeting packet from September 2022: Housing Stability Council (oregon.gov)

[47] Impact of Construction Defect Liability on Condominium Production in Oregon Frequently Asked Questions.

https://olis.oregonlegislature.gov/liz/2019R1/Downloads/CommitteeMeetingDocument/196263

- Determine partners that the City could work with to advocate for changes to the State's construction defect liability laws.
- Engage developers and service providers who are working in the affordable homeownership space or interested in branching out into this space to better understand the type of support they need and to identify how City code may be limiting this type of development.
- Examine City code for barriers to alternative type of ownership model (e.g., occupancy restrictions) and revise the code as appropriate.
- Establish a revolving loan program to reduce construction loan costs using funding such as a potential CET, TIF dollars, or future Metro bond dollars.
- Collaborate with community land trusts or small-scale developers to support affordable homeownership or cooperative housing pilot projects. Consider providing financial support using future Metro bond dollars, urban renewal dollars, or CDBG/HOME.
- Explore partnerships to better support educational programs to build awareness of affordable ownership opportunities and promote their benefits in the community.

Funding or Revenue Implications: The City could direct a portion of potential future Metro bond proceeds, potential Construction Excise Tax revenues, and TIF dollars to provide seed money or a revolving loan fund for construction. Education, advocacy, and changes to codes could be partially accomplished with existing staff time but may need additional employees to support more intensive efforts. Private or foundation dollars could support key projects.

3B. Reduce zoning barriers for housing development, with a focus on multifamily and townhouse development.

Rationale: Reducing complex or restrictive zoning can make multifamily and townhouse development less difficult, time consuming, and costly. Increasing development densities in select locations can also increase the financial feasibility of development projects. This could attract more developers to Gresham or encourage developers already working in Gresham to look for other properties to develop.

Description: Gresham has barriers in its Development Code that limit or prevent multifamily development. Based on conversations as part of the HPS development, the City could consider if and how it can update the Development Code to alleviate these barriers while still achieving other City goals. The City also recently contracted an outside consultant (MIG) to evaluate the Development Code. Implementing recommendations within this evaluation could assist with easing and clarifying multifamily development standards. Examples of regulations to consider are listed below:

- Gresham currently has numerous residential and mixed-use districts which could be consolidated to reduce complexity and encourage development.

- More flexible open space and landscaping requirements could be adopted. More flexible open space and landscaping requirements would provide developers with flexibility on the types of housing products they build and could help to reduce the overall cost of building housing units. Developers cited the following requirements as hindering development feasibility: (1) transition spaces between public, semi-public, and private open spaces, (2) private outdoor spaces, (3) landscape requirements that detail deciduous/evergreen, spacing, caliper, shade, color, scale, mulch type, pathway material, and more detail that varies depending on the setback side.
- The design standards could be streamlined. The standards could be streamlined to focus on key urban design and pedestrian-oriented development strategies and to eliminate overly prescriptive standards.
- Parking requirements (particularly in affordable units) have been discussed as a barrier to be considered. However, as the City responds to the State's Climate Friendly and Equitable Communities regulations parking requirements are changing. Allowing market demand to determine parking supply gives developers more flexibility on the types of housing products they could build, as fewer parking spaces can reduce the overall cost of development.
- Increase flexibility for ground floor use requirements. The current ground floor requirements for multifamily and mixed-use developments are complex and were cited as overly restrictive. The City's goal is to transition to a more walkable and active street frontage, but the current market demand for these commercial spaces is lower than the requirements. Instead, the policies could result in vacant ground floor spaces, which reduces development feasibility. Allowing more residential units on the ground floor will help to meet the current demand for housing in these city areas. However, the City should look for ways to ensure that standards do not preclude commercial development in the future and support a pedestrian-friendly environment.
- Relax maximum density requirements. Some districts specify maximum densities, minimum lot sizes, and have lenient minimum densities. The City can identify areas where these standards can be amended including revisiting density allowances in high opportunity areas. The City may have opportunities to upzone certain areas and rezone or allow multifamily buildings in commercial zones without commercial uses (Station Center, Community Commercial, and Moderate Commercial land use districts).
- The City's minimum floor area ratios for mixed-use and multifamily vary. The City can revisit minimum and max floor area standards to ensure that they are supporting development as intended.
- The development code does not explicitly or clearly address standards for some housing types, such as density calculations for congregate shelters or allowances for single-room occupancy units. The development code can be updated to clearly address standards for a wider variety of housing types.

Despite challenges with the zoning code, developers indicated that City staff are easy to work with and provide timely assistance helping them navigate these barriers. Addressing these barriers can make the overall process easier for developers and free up staff time to focus on

other tasks.

City Role: The Gresham Urban Design and Planning Department should amend the Development Code to reduce barriers to allow selectively greater densities and increase flexibility of certain standards.

Anticipated Impacts:

Populations Served	Income	Housing Tenure	Magnitude of New Units Produced
Low-income and middle-income households	80-120% of MFI	Owner and Renter	Small

Potential Risks: Reducing development code barriers to achieve greater multifamily development must be balanced with other city objectives such as preserving tree canopy and open space and promoting walkable, active streets (among others). Staff capacity is needed for implementation.

Implementation Steps:

- Engage the development community to better understand how the development code is impacting multifamily and townhome development.
- Review the barriers in Gresham's Development Code and consider implementing revisions to the Development Code discussed in the description above.
- Advance other recommendations from the outside consultant's evaluation of the development code and land use review processes.
- Identify potential sites for future multifamily development and ensure that the zoning will allow development of these housing types outright to reduce developer uncertainty and make overall development easier and faster.

Funding or Revenue Implications: Staff time and Planning Department tools and resources will be relied on to accomplish this action.

3C. Streamline permitting processes for all housing types, with a focus on barriers to townhouses and multifamily housing.

Rationale: Reducing development delays and costs can make it easier to build middle housing or multifamily housing types.

Description: In 2018 the City adopted code in response to the State's SB 1051 which created a slightly expedited land use review process for qualifying affordable housing applications. As of February 2023, the expedited process has not been utilized. In 2023, Gresham codified a new

exemption from the land use review process for the conversion of a hotel or motel into an emergency shelter or qualifying affordable housing from the land use review process. This was based on the State's requirements in House Bill 3261 (ORS 197.748). The City could build off of this code amendment in a variety of ways. The City has also engaged the consulting firm, MIG, to conduct a deeper dive into Gresham's design review processes and pre-application meetings. The City could consider the following actions to further streamline the permitting process and make it easier to develop multifamily and townhouse developments:

- The City could streamline the process land use review process for townhouses in corridor districts.
- The City could continue to provide support for developers as they navigate the planning and permitting process. Despite challenges with the permitting process, developers indicated that City staff are easy to work with and provide timely assistance helping them navigate these barriers. As Gresham continues to grow, the City should focus on maintaining the approachable and helpful style and ensure that City departments continue to collaborate internally so that the City can provide timely and accurate support to developers.
- The planning and building departments could evaluate changes to permitting processes to reduce development timelines.

Anticipated Impacts:

Populations Served	Income	Housing Tenure	Magnitude of New Units Produced
Extremely Low- to High-Income	0-120%+ of MFI	Owner and Renter	Small

Potential Risks: While it would reduce holding costs for developers, expediting the development review timeline alone will not have much impact on development costs on its own. Reducing/streamlining some design standard requirements may have a limited impact on housing costs. Implementation will take significant staff capacity in the short- to mid-term.

Implementation Steps:
Engage the development community to:

- Review findings from this process and the separate consulting contract.
- Understand how City could alter the review process to reduce barriers to multifamily development.
- Develop criteria for multifamily housing types that would trigger an expedited process.
- Consider developing preapproved plan sets for some housing typologies.
- Identify potential sites for future middle housing and multifamily development and ensure that the zoning will allow development of these housing types outright.

- Consider ways to continue to improve City staff and developer relationships throughout the development process.

Funding or Revenue Implications: No direct funding required. Requires re-prioritization of staff activities and may increase staff workload if process includes additional assistance to applicants. A continued focus on streamlining affordable housing permitting should not increase staff workload in the long-term.

3D. Implement Rent Assistance Program for individuals experiencing homelessness and explore partnerships to address and prevent homelessness.

Rationale: While many strategies that reduce homelessness do not directly result in the development of new housing, they are essential to providing opportunities to transition from homelessness or housing instability to long-term housing.

Description: The City will consider the following actions to address and prevent homelessness:

- Ensure the continuation of existing homeless services programs by pursuing funding and collaboration opportunities.
- Implement rent assistance pilot program for people experiencing homelessness in Gresham. The program will provide:
    - Payment of move-in costs and rent for up to 12 months.
    - Case management by City homeless services staff that fits individual circumstances including job training and placement, financial literacy, and other resources for success.
    - The City will consider how to fund additional staff and resources to support expanded programming. There may be opportunities for the City to explore regional partnerships and secure additional State funding in the next legislative session.
    - Expand partnerships to support temporary and permanent supportive housing options and services to address and prevent homelessness (align with regional funding resources).

City Role: The City will continue to provide and pursue expanding homeless services of outreach and case management including resource navigation, rent assistance, partnerships, and advocacy.

Anticipated Impacts:

Populations Served	Income	Housing Tenure	Magnitude of New Units Produced
Extremely low-income households and people experiencing homelessness	0-30% of MFI	Renter	Low

Potential Risks: The action will require explicit consideration of ongoing funding sources to support City-led and partner-led homeless services. Residents may be concerned with the location of certain homeless services.

Implementation Steps:

- Continue to share Gresham's successful programming to provide homeless services (homelessness approach, resource navigation, code enforcement such as RV parking permit program, etc.) with regional partners to encourage information sharing, collaboration, and additional investment.
- Implement a rent assistance pilot. Consider program parameters (who can qualify for assistance and what type of assistance). Identify funding sources necessary to support the program such as the Metro Supportive Housing Services Bond
- Work with the Oregon Mayor's Association to communicate the City's homeless services program and funding needs to support the programs (such as funding for additional staff, other resources, etc.)
- Collaborate with Multnomah County Joint Office of Homelessness Services to navigate the City's regulatory process.
- Continue to work with local nonprofits and service providers to understand their needs and how the City may be able to support them in navigating planning processes and regulatory requirements.

Funding or Revenue: Maximizing usage of Metro Supportive Housing Services Bond and other regional resources could help produce new units to meet the needs of the population experiencing homelessness. Expanding City programming will require additional staff time and resources. The City should work with the Oregon Mayor's Association to advocate for additional funding to support desired programs in the 2023 State Legislative session.

3E. Extend/expand the City's tax abatement agreement with Home Forward

Rationale: The City is interested in providing property tax exemptions for affordable housing projects but doing so would require the City to forgo substantial tax revenue. The current intergovernmental agreement with Home Forward allows the City to recoup its foregone property tax revenue through a fee that is shared with Home Forward.

Description: The City could explore extending and expanding the existing intergovernmental agreement with Home Forward to exempt property taxes on income-restricted developments in which Home Forward has an ownership stock. This would expand on the City's IGA/partnership pilot, which encompasses up to four projects and runs through Fiscal Year 2022/23. As of early 2023, the only project that has used this process is Rockwood Village. The general process includes the following steps:

- Home Forward comes forward with a new housing project in which it is a limited partner.
- Gresham and Home Forward collaboratively review the proposal, and if Gresham is in concurrence with the proposal, Home Forward approves a 20-year property tax exemption from all taxing districts. After 20 years, upon mutual agreement of both parties, the property tax exemption may be renewed if the project is still in compliance with the requirements and conditions.
- A Special Limited Partner fee (SLP) is calculated by Home Forward
- The developer pays the SLP to Home Forward. The fee is equal to the lesser of $1,000,000 or 25% of the full property tax exemption for 20 years.
- Sixty percent of the SLP is distributed to the City of Gresham and 40% is distributed to Home Forward who must use the fee for the primary purpose of resident services in Gresham.

City Role: Manage the IGA.

Anticipated Impacts:

Populations Served	Income	Housing Tenure	Magnitude of New Units Produced
Extremely low- to low-income	0-60%	Renter	Medium

Potential Risks: Within the current program, risks have been identified as minimal. Potential expansion of the IGA will require further risk analysis for the different product types/outcomes and would be presented to City Council for review and approval as part of any IGA expansion.

Implementation Steps:

- Extend the IGA and consider increasing the number of eligible projects.
- Explore expanding the use of the IGA to include housing preservation as an eligible use.

Funding or Revenue: The IGA allows the benefit of tax exemption while also recouping some of Gresham's tax revenue that would be lost with a full exemption. Overall, the agreement provides a tax benefit to developers and requires minimal loss to the City.

3F. Explore a reduction/waiver of Systems Development Charges for certain needed housing types.

Rationale: The City of Gresham collects System Development Charges (SDCs) for wastewater, water, stormwater, transportation, and parks.[48] These fees increase the cost of producing affordable housing in Gresham. Programs that reduce or waive SDCs reduce development costs and can incentivize development of qualifying housing types or building features. Qualifying housing types can be defined to support the development of needed affordable housing that is not currently able to be produced by the market.

Description: The City has several options to reduce the cost of SDCs for affordable housing, which are discussed below. The first option, exempting affordable housing from City SDCs without specifically "backfilling" funding from another source, is described below for reference, but it is not recommended for the City.

- Exempt affordable housing from City SDCs without specifically "backfilling" funding from another source.[49] Policy-based reductions, waivers, or exemptions that do not have a basis in reduced impacts or costs are not explicitly addressed in Oregon's SDC laws,[50] and local jurisdictions have taken a range of approaches to navigating this ambiguity. Most jurisdictions that waive SDCs have separately adopted ordinances that provide for the exemption and simply offer the exemption without transferring funding from another source; others allocate other funds to cover the foregone revenue (see discussion below). If revenues are not backfilled, this will reduce SDC collections and could delay funding of some infrastructure projects. SDC waivers or exemptions are typically available only for the SDCs associated with affordable units, so for a mixed-income project, SDCs that are not calculated on a per-unit basis could be reduced proportionately with the percentage of units that are affordable.
- Use non-SDC City funds to subsidize SDC reductions or waivers for affordable housing. To do this, the City would require a funding source such as TIF (in TIF Districts) or CET revenue to

[48] These infrastructure services are provided by the City of Gresham for most of the City. The exception is that a part of west Gresham gets water services from the Rockwood Water PUD.

[49] Most communities that do not charge SDCs for affordable housing describe this as an "SDC Exemption." Some make a distinction between "waivers" given on a case-by-case basis and "exemptions" that are set in policy. Others use these terms interchangeably.

[50] The 2016 Oregon law enabling inclusionary zoning (Senate Bill 1533) identifies SDC and permit fee reductions or waivers as incentives that may be offered to development impacted by an inclusionary zoning requirement. While SB 1533 does not include further discussion on SDC or permit fee waivers or reductions for affordable housing generally, it has been interpreted by some as authorizing SDC reductions or waivers for affordable multifamily development. (To the authors' knowledge, policy-based exemptions, reductions and waivers have not been tested in court.) The equal protection clause of the 14th amendment is also relevant here, in that the government must have a rational basis to treat similar cases or individuals differently (the legal standard is higher if there is a direct or indirect impact on certain protected groups). The City Attorney should continue to advise on the legality of this option.

"backfill" the costs of SDCs. As with exemptions, SDC subsidies should be scaled to the percentage of units in the project that are affordable.

- Allow SDC deferral and financing of SDCs at a low interest rate for affordable housing. The City already offers a program for SDC financing and deferral. Deferral allows the SDCs to be paid when a certificate of occupancy is issued. The interest rate for financing is set at the rate paid on U.S. Treasury Notes plus 2%. The standard security for SDC deferral or financing is a priority lien on property. The City Manager may, at their discretion, offer alternative security which may include a second position lien, security in alternative property, or a financial guarantee acceptable to the Manager. The Manager is authorized to set a lower rate for specific projects based on market rates and development incentives.[51] A potential change could be to offer more flexible and preferable terms for affordable housing developments as standard if the City does not opt to reduce or waive SDCs for those projects. The City could offer a lower interest rate (e.g., 0.25% above the Oregon Prime rate) and/or allow the lien to be in second position for affordable housing developments. This would not require any direct subsidy, although it would still slightly reduce the City's SDC revenues and increase its risk. It has less impact on total development costs than SDC waiver but requires less subsidy from the city. Because SDC financing applies to all SDCs for a project, the City would need to set a minimum percentage of the units that would have to be affordable to use the special financing terms or restrict it only to non-profit affordable housing development.
- Reduce or Exempt SDCs for ADUs - ADUs do not pay water or sewer SDCs, but transportation SDCs apply and stormwater SDCs are based on the site's impervious area. The City could explore SDC waiver/reductions for qualifying affordable housing developments.

City Role: The City would create a program with specific eligibility criteria, and work with City departments to implement it.

Anticipated Impacts:

Populations Served	Income	Housing Tenure	Magnitude of New Units Produced[52]
Extremely, very, and low-income	0-80% MFI	Owner and Renter	Moderate

[51] Resolution No. 3332: Relating to the Deferral and or Financing of System Development Charges. https://gresham.granicus.com/MetaViewer.php?view_id=2&clip_id=503&meta_id=46334

[52] Magnitude of new housing developed is approximate number of new units that the action may reasonably be expected to result in. See the discussion under the section "

Impact ," later in this memorandum.

Potential Risks: The City would want to ensure that implementing this action does not negatively impact the City's near-term finances or ability to fund needed capital projects. There is some legal risk associated with offering exemptions that are not funded by another source.

Implementation Steps: In evaluating potential SDC incentives the City could:

- Consider SDC waivers for income-restricted units.
- Consider SDC deferral interest rates for income-restricted units.
- Develop eligibility criteria for SDC reductions or waivers (e.g., project size, depth of affordability (60% MFI or below).
- Review SDC charges by unit size (review coming up in next three years).
- Revisit SDC financing terms.
- Evaluate funding sources to backfill loss of revenue.

Funding or Revenue: If the City implements a Construction Excise Tax, the City could use a portion of those revenues to backfill foregone revenue from SDC waivers.

3G. Evaluate the Multiple Unit Property Tax Exemption.

Rationale: The Multiple Unit Property Tax Exemption (MUPTE) program is flexible and eligibility criteria can be set locally, allowing the City to target the exemption to meet its needs. It offers an incentive for preservation and development of housing for low- to moderate-income households. It can offer an incentive for mixed-income housing, providing a way to leverage private, market-rate development to expand affordable housing.

Description: MUPTE allows cities to offer a partial property tax exemption (limited to the value of the housing, not the land) for multifamily development that meets specific locally established criteria, such as having an affordability agreement with a public agency. The terms of the affordability agreement can be set by the City—there are no specific income or affordability requirements in the state statute that enables the program. The City could explore using MUPTE in two ways:

- To incent mixed income development through inclusion of below-market units (units affordable below 80% of MFI) in otherwise market-rate developments.
- To incent owners of existing low-cost market rate housing to rehabilitate properties without displacing existing tenants or escalating rents.

What does the exemption apply to? It applies to rental housing for low-income and moderate-income people, often in a mixed-income multifamily building. The exemption applies only to improvement value of the housing.

How long does it apply? The property tax exemption can be granted for up to 10 years. Housing would be required to remain affordable for the term of the property tax exemption.

What taxing districts would participate? The property tax exemption only applies to city property taxes (which account for about 20% of property taxes in Gresham, inclusive of levies) unless the City gets affirmative support from at least 51% of overlapping taxing districts for the exemption to apply to their tax collections.

What impact might MUPTE have? The property tax exemption would only apply to qualifying newly built multifamily buildings where the City Council granted an exemption. For example, The Archibald is a newly built multifamily building, with 37 dwelling units. In 2021, this building generated approximately $10,500 of property tax revenue for Gresham or $284 per dwelling unit in the building. If this building was granted a tax exemption, it would be similar to this amount of taxes. In return, the City would get more multifamily development and development that meets the criteria identified in the City's MUPTE program.

City Role: The City could implement the exemption and conduct annual reporting and administration procedures

Partners and Their Role: Overlapping taxing districts would weigh in on the exemption.

Anticipated Impacts:

Populations Served	Income	Housing Tenure	Magnitude of New Units Produced
Low- and middle-income households	60-80% MFI	Renter	Moderate

Potential Risks: The City and participating taxing districts would forgo property tax income for the duration of the exemption, reducing revenue for city services and revenue for participating taxing districts.

Next Steps: Initiate additional study to explore:

- Desired eligibility criteria (percentage of affordable or workforce housing or other public benefits, where the program applies, etc.).
- Estimates of the revenue loss that could result from the tax exemption and identify a replacement revenue source to support police and fire services.
- Potential agreement from taxing districts representing 51% or more of the combined levying authority on the property to include all the taxing jurisdictions in the abatement. If the City is unable to get agreement from other taxing districts, the abatement will only apply to the City's portion of property taxes.
- Discussions with City Council at work sessions and in public hearings. City Council may choose to adopt MUPTE by resolution or ordinance following a public hearing.

- Establishing annual reporting and administration procedures.
- Promoting exemption to qualified projects.

Funding or Revenue: MUPTE reduces general fund revenues for all overlapping taxing districts. The City of Gresham must weigh the loss of tax revenue, including revenue that funds public safety, against value of the rent discounts offered by qualifying development. The City also chooses which projects to support and how long the property will receive the exemption.

3H. Evaluate the Nonprofit Corporation Low-Income Tax Exemption

Rationale: The Nonprofit Corporation Low-Income Tax Exemption can lower operational costs, such as property tax costs, and make affordable housing projects more feasible for nonprofit affordable housing developers. Affordable housing owned by a public agency is already exempt from all property taxes, and nonprofits can partner with public agencies to get a tax exemption in some cases. However, this adds complexity to the development. This program would reduce development barriers and lower operating costs for publicly subsidized affordable housing (affordable at 60% of MFI or below).

Description: The Nonprofit Corporation Low-Income Rental Housing Exemption[53] provides a full property tax exemption for new and existing affordable housing owned and operated by a 501(c)(3) or (4) nonprofit organization, and land held by a nonprofit for future affordable housing development. This tax exemption allows nonprofit developers of affordable housing to access a property tax exemption without partnering with the housing authority, who is already exempt from property taxes.

The exemption can apply for as long as the property meets eligibility criteria. These include requirements that tenants must initially qualify at 60% of Median Family Income (MFI) or below, which is about $58,100 for a family of four people in Gresham based on 2022 MFI. Once qualified, existing tenant incomes may rise to as much as 80% of MFI ($77,500 for a family of four) over time. Annual renewal is required to ensure compliance with these requirements.[54]

Some examples of Oregon cities that have adopted this tax exemption include Newport, Beaverton, Portland, Tigard, Forest Grove, Cornelius, and Wilsonville.

City Role: The City would implement the exemption and conduct annual reporting and administration procedures.

[53] This tax exemption is authorized in ORS 307.540 to 307.548.

[54] This requirement is stated in ORS 307.545.

Anticipated Impacts:

Populations Served	Income	Housing Tenure	Magnitude of New Units Produced
Extremely low- and very low-income households	0-60% MFI	Renter	Small to Moderate

Potential Risks: The City and participating taxing districts will lose property tax income for the duration of the exemption, reducing revenue for city services and revenue for participating taxing districts. One income-restricted housing development in Gresham receives a property tax exemption through an agreement with Home Forward. The City may want to assess how many other income-restricted affordable housing buildings may be newly eligible for this property tax exemption, to assess potential impact on Gresham's property tax revenues.

Next Steps: The City has options to consider in evaluating the tax exemption:

- Which taxing districts? Only the City's property taxes (which account for about 20% of property taxes in Gresham, inclusive of levies) would be exempted unless there is sufficient support from overlapping taxing districts. If the City and other taxing districts that comprise at least 51% of the local tax roll participate in the program, qualifying developments could have 100% of their property taxes waived. With this majority, all taxing districts would be obligated to participate. Without the support of at least 51% of overlapping districts, only city taxes would be affected by the exemption.
- Which depth of affordability is eligible? The City must select a definition of affordability (if different from the one stated above of having income at or below 60% of MFI)
- What other requirements would the City impose?
- Length of exemption: Exemption can be granted for as long as the property meets eligibility criteria, but the property owner must reapply on an annual basis to demonstrate on-going eligibility. For land held for future affordable housing development, the City sets a limit on how long the exemption can apply, with the option for property owners to apply for an extension after that time.

If the City determined that it wants to move forward with the program, the City would:

- Seek agreement from taxing districts representing 51% or more of the combined levying authority on the property to include all the taxing jurisdictions in the abatement. If the City is unable to get agreement from other taxing districts, the abatement will only apply to the City's portion of property taxes.
- Discuss topic with City Council at work sessions and in public hearings. City Council may choose to adopt this exemption by resolution or ordinance following a public hearing. Adopt standards and guidelines for applications and enforcement mechanisms.
- Follow up with overlapping taxing districts to request that they pass resolutions to support the exemption.

- Promote exemption to qualified projects.

Funding or Revenue: This exemption will result in foregoing property tax revenues for all overlapping taxing districts. The City of Gresham must weigh forgoing of property tax revenue against the benefit of housing more income-restricted affordable housing in the community. The City could backfill lost property tax revenues through funds from a CET, if the City adopts a local CET (Action 3I). Staff time and available Community Development Department tools and resources will be relied on to accomplish this action.

3I. Explore a Gresham-specific Construction Excise Tax.

Rationale: One of the largest limitations that cities generally face in supporting affordable housing development is a lack of funding. A Construction Excise Tax (CET) could be a potential funding source to pay for other affordable housing policies, such as paying SDCs for low-income affordable housing. A CET is intended to provide funding to support development of affordable housing and other initiatives by pooling funds aimed at serving low-income households. The funds from the CET are required by State law to be spent on developer incentives, affordable housing programs, and homeownership programs.

Description. A CET is a development-driven funding tool. It is a tax assessed on construction permits issued by local cities and counties. The tax is assessed as a percent of the value of the improvements for which a permit is sought unless the project is exempted from the tax.

In 2016, the Oregon Legislature passed Senate Bill 1533 which permits cities to adopt a construction excise tax (CET) on the value of new construction projects to raise funds for affordable housing projects. CETs may be assessed on residential only, commercial only, or residential and commercial. If the City were to adopt a CET, the tax would be up to 1% of the permit value on residential construction and an uncapped rate on commercial and industrial construction.

The allowed uses for CET funding are defined by state statute. The City may retain up to 4% of funds to cover administrative costs. The funds remaining must be allocated as follows, depending on whether the CET is on residential or commercial and industrial development:

- For a residential CET:
    - 50% must be used for developer incentives for multifamily housing. These incentives could include City payment of permit fees and SDCs for development, tax abatements, or finance-based incentives. The City may use the CET to fund voluntary developer incentives that:
        - Increase the number of affordable housing units in a development.
        - Decrease the sale or rental price of affordable housing units in a development.

    - Build affordable housing units that are affordable to households with incomes equal to or lower than 80% of MFI.[55]
  - 35% may be used flexibly for affordable housing programs, as defined by the jurisdiction.
  - 15% flows to Oregon Housing and Community Services for homeownership programs that provide down payment assistance in Gresham.
- The State allows for more flexible use of commercial/industrial CET:
  - 50% of the funds must be used for housing-related programs, as defined by the jurisdiction (note that these funds are not necessarily limited to affordable housing).
  - The remaining 50% is unrestricted.

City Role: The City would implement plans for using CET funds for affordable housing development.

Anticipated Impacts:

Populations Served	Income	Housing Tenure	Magnitude of New Units Produced
Extremely low-, very low-, low- and middle-income households	0-120% of MFI	Renter or Owner	Moderate

Potential Risks: In tight markets, the cost may be passed on in the form of higher housing costs. In weaker markets, the increased cost can make development less feasible: Since the revenue is generated from building permits, when new development activity slows, little revenue is collected. Interested parties may oppose the CET, but opposition could be reduced with robust outreach and input on how the program will be used. Gresham's school districts and Metro already have a CET which increases development costs.

Implementation Steps:

- Evaluate potential adoption of a CET. Consider how a CET could impact feasibility and attractiveness of building in Gresham.
- If City Council chooses to pursue adoption of a CET, work with stakeholders to develop the rules and program to implement CET. Determine what use (zone) CET will be tied to. Justify the rationale for the tax amount, for example 1% vs 0.5%. Estimate the revenue resulting from the CET.

[55] Based on information in ORS 197.309(7).

- Create a plan for the CET in collaboration with stakeholders and determine how to use CET funds. Identify the affordable housing program(s) that CET will support.
- Work with stakeholders to develop buy-in from community prior to CET adoption through proactive outreach to stakeholders.

Funding or Revenue Implications: To some extent, revenues generated depend on structure (applied only to residential or also to commercial / industrial properties). CET funding relies on an active construction cycle and, as such, fluctuates from year to year. Funds can be used for preservation or for new construction. The City will want to ensure that the CET is set at a rate that generates revenue for the City but does not discourage development. The City will also want to ensure that it has the staff capacity to implement a CET.

APPENDIX E: EVALUATION OF OUTCOMES

Evaluation of Outcomes

The actions included in Gresham's Housing Production Strategy work together to achieve equitable outcomes for all residents of Gresham. They emphasize improving outcomes for underserved communities, lower-income households, and people in state and federal protected classes. OAR 660-008 requires an evaluation of the HPS for achieving the following types of outcomes:

Affordable Homeownership

This outcome is achieved through actions that support development of housing affordable at less than 120% of MFI.

Existing actions and programs (including but not limited to):

- Zoning and code changes that support development of affordable ownership housing, such as allowing middle housing as required by House Bill 2001 and adding restrictive covenants to specific applications such as Metro Housing Bond projects, HOME, and CDBG.
- The allocation of a significant portion of the City's HOME funding toward homebuyer down payment assistance and an ongoing partnership with Proud Ground community land trust.

Actions in the HPS:

- Action 1A and 1B are focused on reducing the funding gap for new development, including development of affordable homeownership projects.
- Action 2E could include dedicating city-owned surplus land or acquiring land for development of affordable housing, including affordable ownership housing.
- Action 3A focuses on removing barriers to affordable homeownership models by advocating at the state level to reduce barriers to development, providing incentives in exchange for affordability requirements, and exploring alternative homeownership models.
- Action 3C streamlines permitting processes for townhouses, which can make it easier to build this housing type.
- Action 1A, 2A, and 2D advocate for using TIF District funding to support housing and infrastructure development. Some of this investment could support development of affordable housing for homeownership through direct project subsidies or infrastructure investments.
- Action 3I evaluates a Gresham-specific Construction Excise Tax (CET) which the City could use to support development of affordable housing for homeownership; 15% of CET would flow to Oregon Housing and Community Services for homeownership programs that provide down payment assistance in Gresham.

Affordable Rental Housing

Supporting affordable rental housing includes actions that support both income-restricted affordable housing (affordable to households with incomes below 60% of MFI) and privately developed affordable housing (affordable for households with incomes between 60% and 120% of MFI).

Existing actions and programs (including but not limited to):

- Zoning and code changes that support development of affordable rental housing, such as allowing middle housing as required by House Bill 2001, adding restrictive covenants to specific applications such as Metro Housing Bond projects, HOME, and CDBG, and increasing densities near transit and multi-use trails.
- Expedited permitting for affordable multifamily developments as required by Senate Bill 1051.Deferment of SDCs for multifamily residential development.
- A one-time allocation of just under $2.3 million in specific HOME-American Rescue Plan funding in 2022. The City will use these funds for supportive services, such as rental assistance, support for renters, and job training and placement programs.
- Two new affordable housing projects with a total of 194 units funded by the Metro Housing Bond.
- The Vertical Housing Development Zone Tax Abatement, which supports mixed-use housing development.

Actions in the HPS:

- Action 1A and 2A are focused on reducing the funding gap for new development, including development of affordable rental housing.
- Action 2E could include dedicating city-owned surplus land or acquiring land for development of affordable rental housing.
- Action 1B, 1C, 2B, and 2C focus on partnering and providing funding to support the rehabilitation or acquisition of existing low-cost unregulated rental housing to support long-term affordability.
- Action 3B and 3C focus on reducing zoning and permitting barriers to multifamily housing development. Reducing these barriers can make development less difficult, time consuming, and costly.
- Action 3F focuses on potentially reducing the cost of developing affordable rental housing by exploring waiving or reducing SDCs.
- Action 3E, 3F, 3G, and 3H focus on evaluating tax exemption and offers incentives for the development of rental housing for low to moderate income households in mixed-income, market-rate developments, and publicly subsidized affordable rental developments (affordable at 60% of MFI or below).

- Action 1A, 2A and 2D advocates for using TIF District funding to support housing and infrastructure development. Some of this investment could support development of affordable rental housing through direct project subsidies or infrastructure investments.
- Action 3I explores a potential Gresham-specific CET which could be used to support development of affordable rental housing.

Housing Stability

Increasing housing stability includes actions that increase the stability of existing households and prevent displacement resulting from public investments or redevelopment.

Existing actions and programs (including but not limited to):

- City programs that support housing stability with CDBG funding, including emergency home rehabilitation and accessibility upgrades and programs that provide rent assistance and other stability services.

Actions in the HPS:

- Action 1B, 1C, 2B and 2C focus on partnering and providing funding to support the rehabilitation or acquisition of existing low-cost unregulated rental housing to support long-term affordability and prevent displacement.
- Action 2E could include acquiring land for development of affordable housing in areas at risk of gentrification and displacement.
- Action 3G explores implementing the Multiple Unit Property Tax Exemption. The City could structure the program to incent the preservation of rental housing for low- to moderate-income households in mixed-income, market-rate developments. This can be used to support rehabilitation of multifamily rental housing, with agreements about retaining naturally occurring affordable housing costs.

Housing Choice for Protected Classes

Increasing housing choice involves increasing access to housing for communities of color, low-income communities, people with disabilities, and other state and federal protected classes. It also means increasing access to existing or new housing that is in neighborhoods with healthy and safe environments and high-quality community amenities, schools, and employment and business opportunities.

Existing actions and programs (including but not limited to):

- Zoning and code changes that support development of a variety of housing types in different neighborhoods such as increasing density near transit stations and multi-use trails and allowing middle housing as required by House Bill 2001.
- Programs that support housing choice, including emergency home rehabilitation and accessibility upgrades, rent assistance, and project subsidies or incentives for affordable housing development.

- Gresham's down payment assistance programs support households in purchasing market-rate housing in locations of their choice.

Actions in the HPS:

- Actions 1A, 2A and 2E focus on providing financial support and other resources (including land) to support development of affordable housing. Depending on the criteria used to identify projects, this could be in locations with access to amenities or other equity considerations.
- Actions 1B, 2B, 1C and 2C focus on ensuring that existing rental housing is safe and affordable and can support the rehabilitation of this housing to be more accessible for community members. Depending on the criteria used to identify projects, this could be in locations with access to amenities or other equity considerations.
- Action 3E, 3F, 3G, and 3H focus on tax exemptions or fee waivers that offer incentives for the development of housing for low to moderate income households. Depending on the criteria used to identify projects, if these are implemented, the actions could be used in locations with access to amenities or other equity considerations.
- Actions 3H and 3I include TIF and CET funds. Depending on the criteria used to identify projects, if these are implemented, these funds could be targeted in locations with access to amenities or other equity considerations.

Location of Housing in Compact, Mixed-Use Neighborhoods

Diversifying the location of housing requires increasing options for residential development that is compact, in mixed-use neighborhoods, and available to people within state and federal protected classes. This measure is intended, in part, to meet statewide greenhouse gas emission reduction goals.

Existing actions and programs:

- A Vertical Housing Development Zone Tax Abatement to support development of mixed-use housing.
- Zoning and code changes that can support development of a variety of housing types in different neighborhoods such as increasing density near transit stations and multi-use trails and allowing middle housing as required by House Bill 2001.

Actions in the HPS:

- Actions 1A, 2A, 1D, and 2E focus on providing financial support and other resources (including land) to support development of affordable housing. Depending on the criteria used to identify projects, this could be in locations with access to amenities or other equity considerations.
- Actions 1B, 2B, 1C and 2C focus on ensuring that existing rental housing is safe and affordable and can support the rehabilitation of this housing to be more accessible for

community members. Depending on the criteria used to identify projects, this could be in locations with access to amenities or other equity considerations.

- Action 3E, 3F, 3G, and 3H focus on evaluating potential tax exemptions or fee waivers that offer incentives for the development of housing for low to moderate income households. Depending on the criteria used to identify projects, if these are implemented, they could be used in locations with access to amenities or other equity considerations.
- Actions 3H and 3I include potential TIF and CET funds. Depending on the criteria used to identify projects, if these are implemented, then these funds could be targeted in locations with access to amenities or other equity considerations.

Fair Housing

Supporting Fair Housing is accomplished by increasing access to housing for people in state and federal protected classes, addressing disparities in access to housing opportunity for underserved communities, and decreasing patterns of segregations or concentrations of poverty.

Existing actions and programs (including but not limited to):

- Gresham has a rental housing inspection program, which helps ensure housing units are up to fire, life, and safety codes.
- Gresham's rental housing codes includes protections against landlord retaliation and have a requirement for landlords to provide tenants with a document titled, "Rights and Responsibilities of Tenants and Landlords."
- Gresham hosts an annual Fair Housing training for landlords, which includes information about Section 8 vouchers and the Rent Well program.
- Gresham's housing resource coordination provides support related to Fair Housing, as that staff person connects with tenants and landlords.
- Zoning and code changes that can support development of a variety of housing types in different neighborhoods such as increasing density near transit stations and multi-use trails.
- Allowing middle housing as required by House Bill 2001. This can help address patterns of segregation by ensuring affordable housing options in a variety of neighborhoods.

Actions in the HPS:

- Actions 1A, 2A and 2E B focus on providing financial support and other resources (including land) to support development of affordable housing. Depending on the criteria used to identify projects, this could be in locations with access to amenities or other equity considerations.
- Actions 1B, 2B, 1C and 2C focus on ensuring that existing rental housing is safe and affordable and can support the rehabilitation of this housing to be more accessible for community members. Depending on the criteria used to identify projects, this could be in locations with access to amenities or other equity considerations.

- Action 3E, 3F, 3G, and 3H focus on evaluating tax exemptions or fee waivers that offer incentives for the development of housing for low to moderate income households. Depending on the criteria used to identify projects, if implemented this could be in locations with access to amenities or other equity considerations.
- Actions 3H and 3I include exploring TIF and CET funds. Depending on the criteria used to identify projects, if implemented these funds could be targeted in locations with access to amenities or other equity considerations.

Housing Options for People Experiencing Homelessness

Increasing options for people experiencing homelessness includes working with partners and identifying ways to address homelessness and reduce the risk of households becoming homeless (especially for households with income below 30% of MFI).

Existing actions and programs (including but not limited to):

- The City has created a Homeless Services team which does field outreach to people experiencing homelessness to provide shelter, housing and other resources that fit the individuals' needs.
- Providing rent assistance and support via contracts with CDBG and HOME funding.
- Taking the steps to pilot a rent assistance program for people experiencing homelessness in Gresham.
- Addition of Housing Resources Coordinator position to assist people at risk of becoming homeless by connecting them to resources to stay in their housing.

Actions in the HPS:

- Action 3D focuses on implementing a rent assistance pilot program for people experiencing homelessness in Gresham which will include payment of move in costs and rent for up to 12 months and case management.

APPENDIX F: TRENDS IN GENTRIFICATION AND DISPLACEMENT RISK IN GRESHAM

As the City of Gresham set the stage for its Housing Production Strategy, staff were interested in understanding current trends in gentrification and displacement risk in Gresham. Therefore, ECONorthwest produced this appendix, which the Housing Production Strategy Project Team used to inform potential actions that the City could take to mitigate the risk that the City's most vulnerable populations would be displaced from their housing. As the City implements the actions in the HPS, this information can help City staff structure housing and development policies and programs. This work builds on the Gresham Neighborhood Change report that ECONorthwest completed in 2015.[56]

The high-level results of our analysis reveal that:

- **Powell Blvd/Highway 26 is a dividing line when it comes to gentrification and socioeconomic vulnerability**. In general, there are more vulnerable and gentrifying areas to the north of the highway and more stable areas to the south.
- **Most Gresham residents live in neighborhoods that are at risk of gentrification.** Approximately 75% of households live in areas that are either susceptible to gentrification or in the early stages of gentrification. These areas are generally those that also have high levels of socioeconomic vulnerability, Ih may lead to housing insecurity or displacement.
- **Gresham has a substantial number of households that are at-risk of displacement and vulnerable, especially in the northern parts of the city.** Gresham has higher concentrations of vulnerable populations such as people with less than a bachelor's degree, Hispanic/Latinx population, and Black, Indigenous, and other People of Color (BIPOC).

In the following sections, we will examine results and trends in further detail. An overview of the methodologies used in this analysis is within this memorandum.

Analysis Methodology

ECONorthwest conducted this analysis by combining two parallel models that look at (1) where the city's most **socioeconomically vulnerable populations** are currently clustered and (2) where **gentrification** has been most rapidly advancing within Gresham since 2010. While the causal relationship between gentrification and displacement is complicated, this analysis considers both gentrification and socioeconomic vulnerability, which are markers that can help planners

[56] Gresham Neighborhood Change Analysis. 2015. ECONorthwest. https://greshamoregon.gov/WorkArea/DownloadAsset.aspx?id=1409

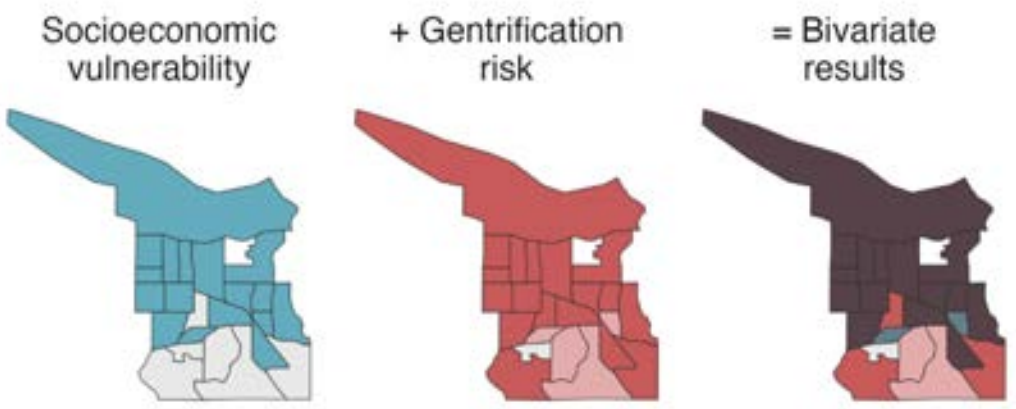
and elected officials identify neighborhoods where policy interventions should be prioritized. Some research has shown that displacement comes before gentrification.

There are very few investigations into gentrification and displacement that have resulted in "accurate" predictors of displacement, as there is no real way to measure whether the predictors captured the events. This analysis is to be used to recommend how to target the location of policy approaches to the specific characteristics and needs of neighborhoods.

Within the **socioeconomic model**, we designed a model that identified the Portland Metro region's most disproportionately cost-burdened demographic groups (such as households with children present or households with people of color, or households with people with a disability) using 2016-2020 ACS Public Use Microdata Survey data, then compiled Census tract-level estimates of these demographic groups.

Within the **gentrification model**, we used Dr. Lisa Bates' 2018 gentrification methodology that the Portland Bureau of Planning and Sustainability (BPS) used for the City of Portland, which identifies areas in different stages of gentrification, from stable (low risk of gentrification) to early-stage gentrification to late-stage gentrification. The data we used was similar to the data Dr. Bates used but shifted over a few years for ease of accessibility, for example: rather than using decennial census, we used American Communities Surveys for the years of 2006-2010, 2011-2015, and 2016-2020. For housing market conditions, we utilized RLIS data to capture median sale prices within a census tract for the years of 2010 and 2020.

Exhibit 62. Bivariate Analysis Outline



Socioeconomic Vulnerability Methodology

In this part of the analysis, ECONorthwest answers the question, "Who is most likely to be displaced if housing market conditions were to further appreciate in price or stay the same?"

We began by identifying groups that are inequitably burdened by housing costs, meaning that these groups have higher rates of cost burden compared to all households. First, we developed a weighted vulnerability indexing analysis, based on Oregon's 2019 Public-Use Microdata Survey (PUMS) data at the state level to identify demographic groups that are unequally burdened by housing costs. This means that a given group's share of the state's cost-burdened households is greater than its total share of all state households. For example, households with a Hispanic/Latinx head comprise 8.6% of the state's households, but 13.4% of the state's cost-burdened households, a difference of 4.8% points.

Our analysis identified six demographic groups that were most disproportionately burdened:

- Households with children present
- Black, Indigenous and People of Color (neither White non-Hispanic, nor Hispanic/Latino people are included in this group)
- People of Hispanic/Latino origin, any race
- People five years and older who speak English "not well"
- People with one or more disabilities
- People 25 years and older who have an educational attainment of less than a bachelor's degree

Disproportionate cost burdening varies across the state. To capture this variation, ECONorthwest compared disproportionate cost burdening among these groups for six geographic areas of the state and compared levels of disproportionate cost burden among the demographic groups for Census tracts in Gresham with state and regional results.[57]

The result of this analysis is identification of Census tracts with lower and higher percentages of people in vulnerable groups. Census tracts with higher vulnerability levels would indicate places where it is more likely that not only current, but where future housing cost burdening and possible displacement are more likely to occur.

Gentrification and Displacement Methodology

Displacement takes many forms and does not have a singular definition. The researcher operationalizes displacement differently within their analytical approach. Displacement is caused by many factors and there is not a clear causal relationship between displacement and gentrification. Put another way, investment in an area does not need to lead to residents

[57] ECONorthwest rank-ordered vulnerable demographic groups by six geographic areas of the state. We used the rank (1 through 6) as a weighting factor. Based on this rank-ordered list, we next used tract-level 2019 ACS estimates of all six demographic groups to calculate each tract's percentage of its region's total number of vulnerable groups. This share was then converted to decile ranks, and each decile rank was multiplied by the rank-ordered weighting factor. These "scores" were then summed for each tract, with total scores ranging between 21 to 210. Lastly, this score was then divided by the maximum possible value to compute a more intuitive percentage value, with "100%" indicating tracts with the **highest** levels of **all** vulnerable demographic groups.

leaving the area, especially if the city takes actions to avoid displacement. This awareness of the potential for displacement with neighborhood investment can allow a city to prevent or reduce displacement associated with investments.

The analysis identifies Census tracts in Gresham where gentrification is taking place or may take place in the future. These tracts where place-specific ordinances and location-specific research can serve to protect vulnerable populations and determine how much the data matches the lived experience of residents on the ground.

The Gentrification and Displacement Risk Analysis methodology used in this analysis mirrors closely to what BPS and Dr. Lisa Bates utilized in 2018 with an additional typology, explained below.[58] The analysis considers the following characteristics:[59]

Vulnerable populations are ones with:

- High rates of renting households relative to the region
- Large shares of communities of color relative to the region
- Large shares of adults (25 years and older) without a four-year degree relative to the region
- Large shares of low-income households (below 80% Median Family Income) relative to the region

Demographic changes (over the last decade or so) require three of the following four conditions being true or the **two bolded** were true:

- Share of homeowners increased or decreased slower than the regional average
- **Share of white population increased or decreased slower than the regional average**
- **The share of adults with a four-year degree increased faster than the regional average**
- Median household income increased faster than the regional average

Housing market conditions are Census tracts with the following conditions:

- Adjacent tracts
    - Had low or moderate 2010 home values/rents
    - Experienced low or moderate 2010-2020 appreciation (or 2015-2020 rental appreciation)
    - Touched the boundary of at least one tract with high 2020 values and/or high 2010 appreciation (or 2010-2020 rental appreciation)
- Accelerating tracts

[58] The methods used by ECONorthwest draw from the work of Dr. Lisa Bates and BPS, but used the observation years of 2010, 2015, and 2020 for both Census and American Communities Surveys years.

[59] More information about the definitions for the "Vulnerable Population", "Demographic Change", and "Housing Market Condition" can all be found in the 2018 report here.

    - Had low or moderate 2020 home values/rents
    - Experienced high 2010-2020 appreciation (or 2010-2020 rental appreciation)
- Appreciated tracts
    - Had low or moderate 2010 home values/rents
    - Had high 2020 home values/rents
    - Experienced high 2010-2020 appreciation

This analysis of change (in populations, demographics, and housing markets) over time is completed at the regional and Census-tract levels, rather than at the household level. A basic limitation of census and ACS data is that they cannot provide longitudinal data on individual households between surveys (e.g., over +10-year spans of time). Whether or not low-income families in Gresham have been displaced from other neighborhoods in that time (tracts labeled Late: Type 1 or Dynamic) requires a much deeper level of analysis and qualitative analysis done by either academics or the City.

Exhibit 63 shows a summary of the typologies used in this analysis. They are:

Early-Stage Gentrification. These tracts have not started to gentrify or show early signs that they could be gentrifying.

- **Susceptible**. These tracts have higher shares of vulnerable populations but have not yet experienced demographic changes. Their housing market sales and rents were low or moderate in costs, but they are adjacent to tracts whose housing costs are already high or are increasing rapidly.
- **Early Type 1.** These tracts have higher shares of vulnerable populations but have not yet experienced demographic changes. Their housing market is still low or moderate in cost but has experienced high appreciation since 2010.
- **Early Type 2.** These tracts have higher shares of vulnerable populations but have experienced demographic changes showing the loss of vulnerable populations. Their housing market is low or moderate in costs, but they are adjacent to tracts whose housing costs are already high or are increasing rapidly.

Mid-Stage Gentrification.

- **Dynamic**. These tracts are currently undergoing gentrification. They have higher shares of vulnerable populations and have experienced demographic changes by losing vulnerable populations. Their housing market is still low or moderate in costs but has experienced high appreciation since 2010.

Late-Stage Gentrification. These tracts have mostly gentrified but vulnerable populations may still reside there. The housing market has completely shifted from low or moderate to high housing costs.

- **Late Type 1.** These tracts have higher shares of vulnerable populations but have experienced demographic changes by losing vulnerable populations proportionally. Their

housing market used to be low or moderate in 2010 but has appreciated rapidly since, and now values are high.

- **Late Type 2.** These tracts no longer have high shares of vulnerable populations like they used to in 2010. They have experienced demographic changes by losing their once-high share of vulnerable populations. Their housing market is still low or moderate but has experienced high appreciation since 2010.

Continued loss. These tracts no longer have high shares of vulnerable populations like they used to in 2010 or in 2015. The share of white people is growing and/or the share of people with a four-year degree is growing. Their housing market used to be low or moderate in 2010 but has appreciated rapidly since, and now values are high.

Stable Low-Vulnerability Communities. These tracts are ones that have had historically low levels of vulnerable populations relative to the region (from 2010-2020).

Exhibit 63. Gentrification/Displacement Methodology

Typology	Vulnerable Population?	Demographic Change?	Housing Market Condition
Early-Stage Gentrification			
Susceptible	Yes	No	Adjacent
Early: Type 1	Yes	No	Accelerating
Early: Type 2	Yes	Yes	Adjacent
Mid-Stage Gentrification			
Dynamic	Yes	Yes	Accelerating
Late-Stage Gentrification			
Late: Type 1	Yes	Yes	Appreciated
Late: Type 2	Used to be in 2010 or 2015	Yes	Accelerating
Continued Loss	Used to be in 2010 or 2015	Increasing share of white people and adults with bachelor's degree	Appreciated
Stable - Low Vulnerability **	No	No	Any**

What neighborhoods are at most risk of gentrification and displacement?

The most at-risk neighborhoods are in the northern, denser areas of Gresham, while the more stable, low-risk neighborhoods are located south of US 26.

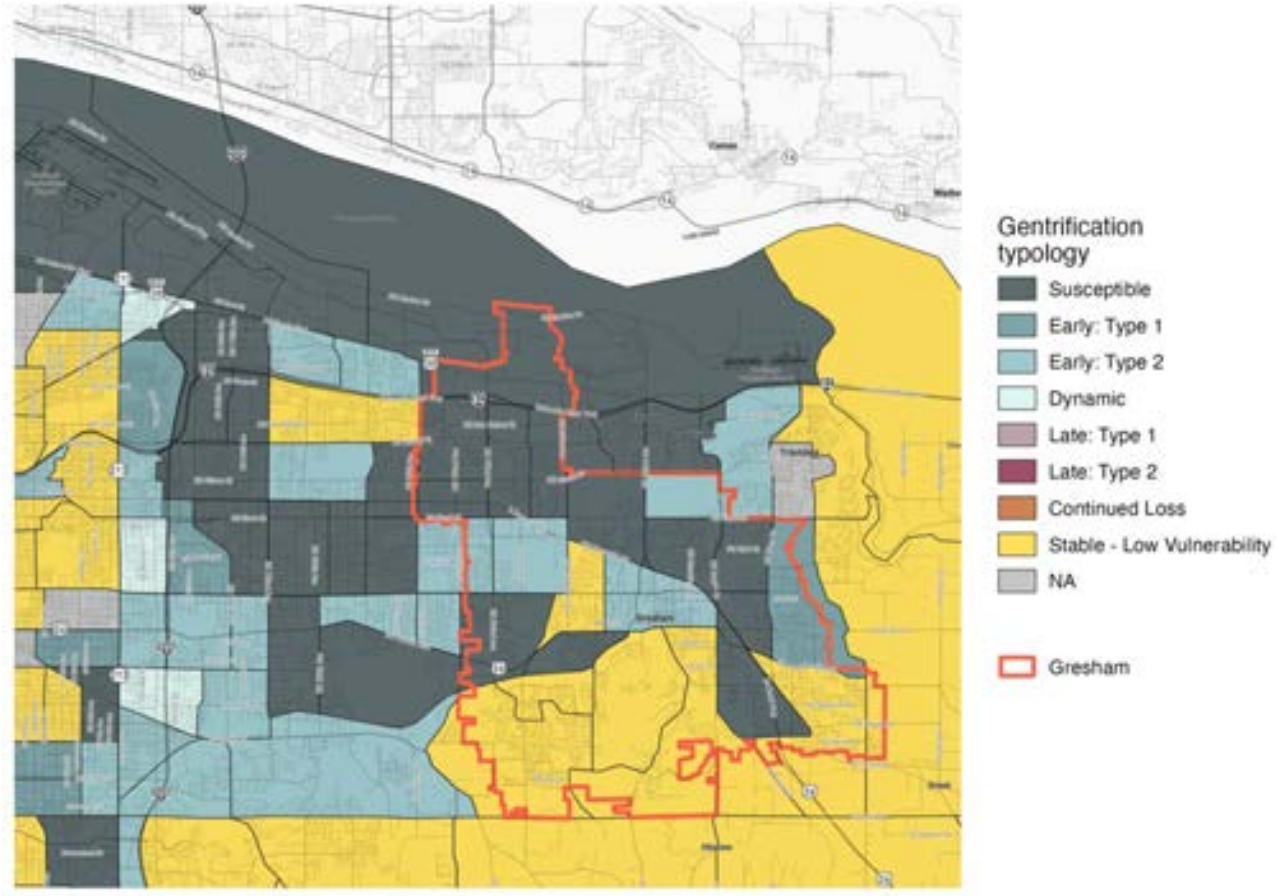
Most households (53%) live in Census tracts that are susceptible to gentrification, with 22% of households in the early stages of gentrification, while around 25% are in low-risk areas (see Exhibit 65).

Most tracts north of Powell Blvd/Highway 26 are classified as Early: Type 2 or Susceptible (see Exhibit 64). Demographic changes and housing price increases suggest that these areas are in the early stages of gentrification. This indicates that economically vulnerable neighborhoods may be at-risk of experiencing gentrification which ultimately leads to rising housing costs, and potentially displacement. Early: Type 1 may indicate that some areas are already experiencing gentrification to some degree, while Early: Type 2 indicates demographics of the neighborhood are changing relative to the Metro area while also being near tracts that are increasing in housing value (both rent and sale value).

Areas south of Highway 26 are generally classified as Stable – Low Vulnerability (see Exhibit 64). In these neighborhoods, incomes and housing prices are generally higher and have not changed over the study period (2010-2020). However, some pockets of Susceptible tracts are found in this area around Hogan Butte and Hogan Cedars.

Exhibit 64. Gresham's Gentrification Typology by Census Tract.

Source: ACS 2010, 2015, 2019 (5-year), RLIS, ECONorthwest, Bates/BPS

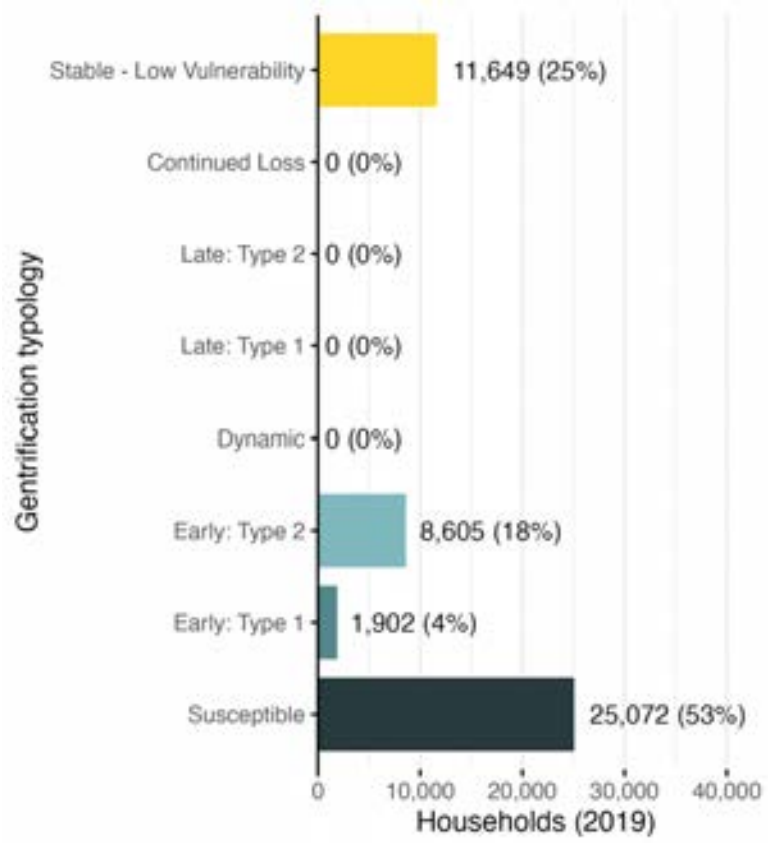


About three-fourths (~75%) of households in Gresham live in tracts that are in the early or susceptible stages of gentrification, as shown in

Exhibit . While this does not necessarily indicate that three-fourths of *all households* are at risk of gentrification, it indicates that the majority of Gresham shows signs of housing instability relative to the Metro region.[60]

Exhibit 65. Total Gresham Households by Tract Gentrification Typology

Source: ACS 2010, 2015, 2019 (5-year), RLIS, ECONorthwest



[60] Gresham's tracts are small enough that they cannot be compared to each other. As a result, the methodology used in the analysis compares Gresham to the Metro region, which makes additional examination of regional differences difficult.

Neighborhood-Level Observations Results

Gentrification can be quite a nuanced topic. While the data presents one story about an entire census tract, Gresham's neighborhoods that are in the process of being gentrified may be a much smaller portion of that Census tract.

For Gresham, most tracts and households within those tracts fall under the definition of **Early: Type 2** and **Susceptible**. These typologies are characterized by having high levels of economic vulnerability, low rates of demographic change, and having either nearby tracts (called "adjacent" tracts) becoming more valuable (rents and/or sale prices appreciating quickly) or being in an "appreciated" tract where rent values and home sale prices rose drastically between 2010 and 2020. These tracts are ones where the City may want to focus active monitoring to make sure that residents who are already cost-burdened are not forced to leave due to gentrification.

Where do Gresham's most vulnerable residents live?

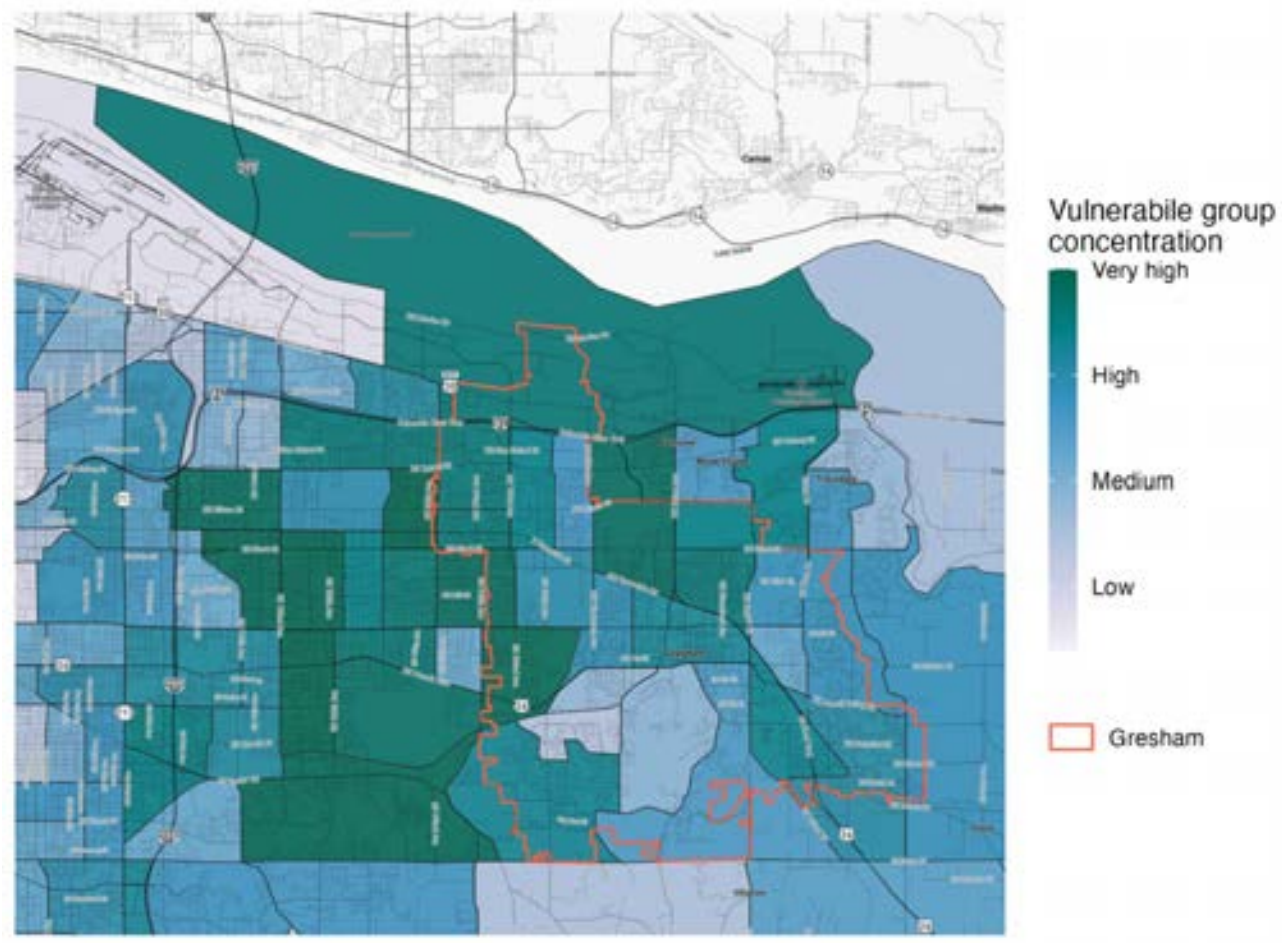
While the previous section provides information on how tracts in Gresham have or have not gentrified, based in part on the Dr. Bates/BPS methodology, this does not answer the question of which neighborhoods and demographic groups are most disproportionately burdened by housing costs. To address this issue, ECONorthwest developed a separate model (described on page 124) using ACS/census datasets to determine which tracts in Gresham are most acutely and unequally burdened by housing prices – the implication being that, should trends hold, the most burdened households today will likely be the first to be displaced tomorrow.

Tracts showing the highest levels of vulnerability are mainly clustered around Gresham's western and northern boundary.

Error! Reference source not found.shows the results of the Socioeconomic Vulnerability model. These "high vulnerability" tracts contain the combined largest shares of the Metro region's most disproportionately cost burdened demographic groups, such as people without a bachelor's degree or higher, people of color, and people living with one or more disabilities. Low-vulnerability tracts in Gresham are mostly found in the south-central areas of the city, around Hollybrook neighborhood and southwards. Most vulnerable tracts are clustered in the northern portion of Gresham, but the unique groups that make up those tracts vary around the city.

Exhibit 66. Overall Socioeconomic Vulnerability by Tract

Source: ACS 2010, 2015, 2019 (5-year), RLIS, ECONorthwest



Who is most likely to be displaced if housing market conditions housing market conditions continue to appreciate or stay the same?

Some interesting trends include a noticeable clustering of Limited English Proficiency (LEP) households along Gresham's northwestern boundary, higher BIPOC shares in the Centennial neighborhood area, and higher clustering of households with at least one disabled person around the North Central neighborhood.
Exhibit 6 shows the results of our Socioeconomic Vulnerability analysis, broken out by each demographic group examined.

Across the state of Oregon, having less than a bachelor's degree was the strongest determinant of cost-burdened households. Gresham largest vulnerable group is "Less than a Bachelor's Degree", though this group can also include relatively more financially secure elder or retired residents.

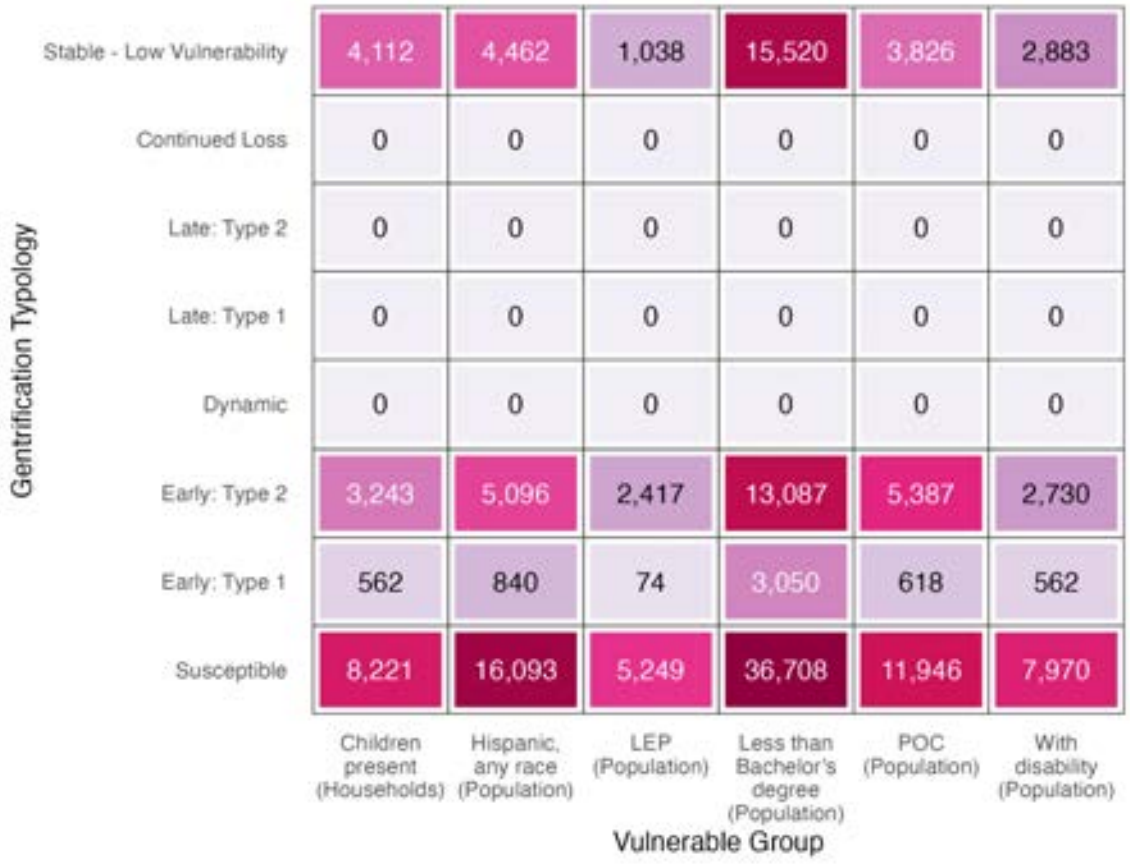
Exhibit 67. Vulnerable Group Concentration by Tract

Source: ACS 2010, 2015, 2019 (5-year), RLIS, ECONorthwest

Exhibit 68 depicts the combined Socioeconomic Vulnerability model results in terms of number of households that reside in tracts with intersecting gentrification typologies and socioeconomic vulnerability groupings. For instance, we find that the most common intersection of our model are the 36,708 households living in a Susceptible to gentrification tract and having a head of household educational attainment of less than a bachelor's degree. These demographic groups are not mutually exclusive, so many households would be counted in multiple groups (i.e., a BIPOC head of household, with children present, and with someone in the household having a disability).

Exhibit 68. Estimated Households or Population by Vulnerability Group and Gentrification Typology

Source: ACS 2010, 2015, 2019 (5-year), RLIS, ECONorthwest
Note: The colors in the graph indicate total number of households facing a level of vulnerability to a typology of gentrification. The darker the color, the higher the number of households.



Most socioeconomically vulnerable residents in Gresham are in the "Less than bachelor's degree" group, which falls in line with high degrees of housing cost-burdening across the state of Oregon. This sub-group is concentrated in tracts that are susceptible to gentrification, or have started the process of gentrifying, thus placing them even more at risk. Interestingly, there are also pockets of neighborhoods in Gresham that are stable with low levels of vulnerability for their neighborhood gentrifying, while also having a high number of households without a bachelor's degree.

Where do areas with higher gentrification risk and vulnerable populations intersect?

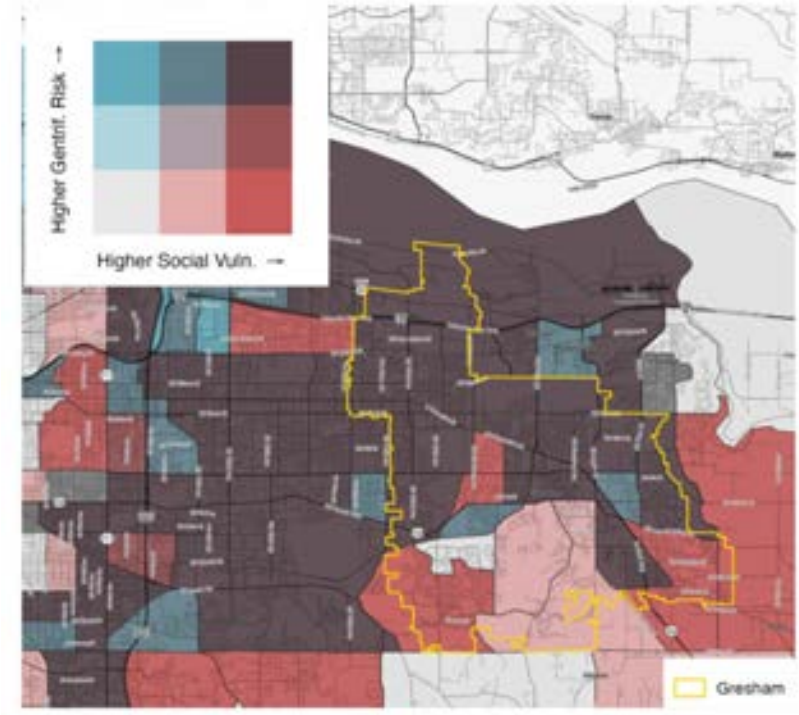
Powell Blvd/Highway 26 is a dividing line when it comes to gentrification and vulnerability.

Gresham, along with portions of East Portland, contains large amounts of the Metro region's most vulnerable tracts when considering both gentrification and displacement risk. The denser tracts north of Powell Blvd./Highway 26 exhibit signs of highest gentrification risk combined with high socioeconomic vulnerability to displacement. By comparison, areas south of Highway 26 (which are lower density and have a larger share of homeowners) show signs of low gentrification risk or low levels of socioeconomic vulnerability.

Exhibit 69 shows areas with higher gentrification risk and areas with higher social vulnerability.

Exhibit 69. Composite Gentrification and Socioeconomic Vulnerability Risk, by Tract

Source: ACS 2010, 2015, 2019 (5-year), RLIS, ECONorthwest



Indicators of higher gentrification risk include:

- High shares of low-income households
- Changing socioeconomic demographics as compared to the region
- Rising prices of housing for sales and rent

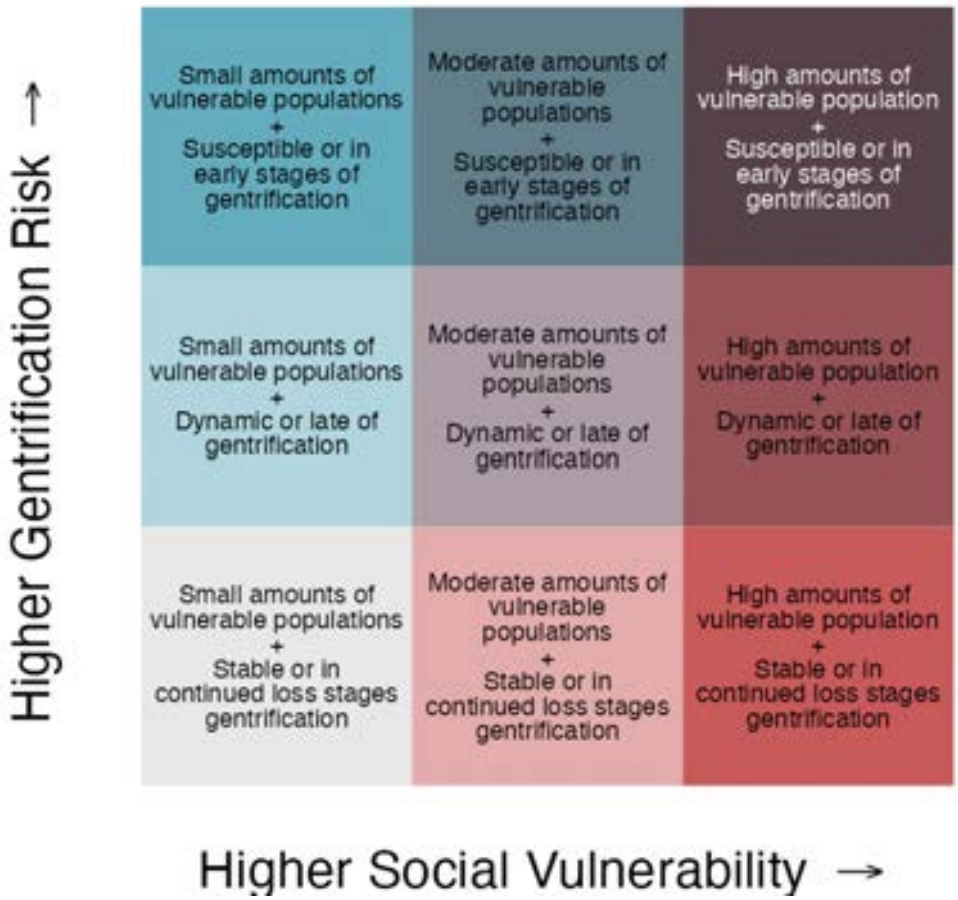
Indicators of higher social vulnerability include:

- higher shares of the region's BIPOC
- higher shares of the region's population without a bachelor's degree or higher

Exhibit 70 provides more context about the risk for gentrification and the level of social vulnerability in Exhibit 69. The following describes the gentrification risk and social vulnerability at each corner of the matrix.

- Top row left side – in blue. These areas are at risk of displacing existing populations but the populations in these areas are generally less vulnerable as compared to the region. This may also indicate that neighborhoods nearby are experiencing appreciations in home sales and rents.
- Top row left side – in dark grey.
- These areas are the highest risk of displacement of existing vulnerable population, such as lower-income households, people of color, Latino households, or other vulnerable populations.
- Bottom row left side – in light grey. These are areas with little risk of displacement and few vulnerable populations.
- Bottom row right side – in pink. These areas have little existing risk of displacement but are home to vulnerable populations.

Exhibit 70. Gentrification and Socioeconomic Vulnerability Risk Matrix



Most Gresham residents live in neighborhoods that are at risk of gentrification.

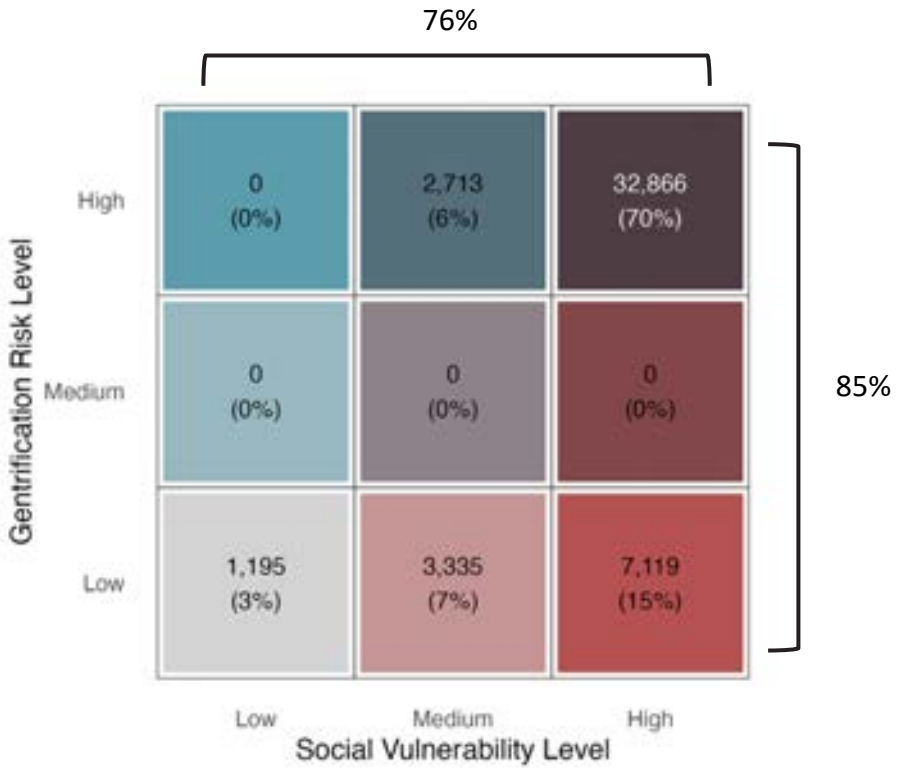
Many Gresham residents are at risk of displacement. The analysis describes the households and tracts that may be at most risk of displacement or additional cost-burdening if the City continues business as usual. Nearly two thirds (63%) of Gresham households live in Census tracts that combine a high gentrification risk and a high socioeconomic vulnerability level.

Exhibit 71 shows the percentage of the population in Gresham in each of the groupings shown in Exhibit 69 and Exhibit 70.

- 76% of Gresham households reside within tracts identified as at high risk of gentrification (either in early or susceptible stages).
- 85% of households reside in tracts identified as at high socioeconomic risk of housing displacement.

Exhibit 71. Gresham Households Within Composite Gentrification and Socioeconomic Vulnerability Groups

Source: ACS 2010, 2015, 2019 (5-year), RLIS, ECONorthwest



Implications and Next Steps for the Housing Production Strategy

This analysis shows that substantial parts of Gresham are in the early stages of gentrification or at-risk of gentrification, especially where there are higher concentrations of vulnerable population. As neighborhoods that were once low-income begin to appear appealing to new residents, it is important to recognize that the people living in those neighborhoods may not have the same economic opportunities as the people moving in.

For the City of Gresham to validate what is happening on the ground, it is important to consider neighborhood characteristics and design community charettes to accurately represent what change looks like to the residents there now. Gresham may want to take steps to further understand potential for gentrification and potential displacement of vulnerable population, such as conducting additional research about areas at risk for gentrification to better understand the demographic characteristics of people who may be displaced. This could include an analysis of whether existing and new regulated housing reduces risk of gentrification and/or displacement gentrification. Preserving existing affordable housing, stabilizing households, and preventing future displacement and gentrification are considerations for the HPS.

APPENDIX G: PRE-HPS SURVEY

Below is the survey that City of Gresham staff submitted to the Department of Land Conservation and Development prior to starting the HPS.

Executive Summary

In 2021, the Oregon legislature passed House Bill 3040 (HB 3040), directing Oregon Housing and Community Services (OHCS) to prepare a study of System Development Charges (SDCs)—a form of one-time impact fees charged on new development to help pay for infrastructure that serves or provides capacity for growth. The legislature requested that the study cover the history of the charges, methodologies for setting the fees, recent trends in fee levels, how the fees relate to other development costs, and how they ultimately affect the cost and production of housing. The findings from this study can inform future policy discussions related to SDCs, but the legislature's direction for this study did not include making policy recommendations.

OHCS contracted with ECONorthwest and subcontractors FCS GROUP and Galardi Rothstein Group to undertake this report. The team drew its findings from reviews of national and local studies; surveys of cities, counties, and special districts; interviews and focus groups with local government officials and housing developers; original data analyses; and decades of experience conducting SDC studies, analyzing residential development, and evaluating infrastructure funding mechanisms.

Key Findings

SDCs have become an essential funding mechanism in many Oregon communities, for practical, political, and policy reasons.

- **SDCs are increasing faster than inflation due to lack of alternative funding and increasing infrastructure costs.** Over the last several decades, flat or declining state and federal infrastructure spending, limitations on property taxes, and increasing costs for operations, maintenance, and regulatory compliance have increased dependence on SDCs and other local revenue sources. On average, both SDCs and water and sewer utility rates have increased faster than construction costs over the past 10-15 years. Even so, many jurisdictions report falling behind in their ability to pay for infrastructure, especially in the last few years as costs have escalated so quickly that annual indexed adjustments have not kept up.
- **SDCs are a critical component of local funding for infrastructure needed to support growth.** SDCs can allow communities to build the infrastructure needed to accommodate orderly growth, making them an important part of Oregon's growth management system. They can benefit both developers (by funding investments that make development possible and distributing costs among multiple benefitting parties) and existing residents (by reducing reliance on utility rates, bonds, and other community-wide funding mechanisms that can disproportionately impact lower-income households). Further, the requirements associated with other local funding sources for capital improvements (e.g., voter approval for general obligation bonds) can increase jurisdictions' reliance on SDCs. However, small, slow-growing communities tend to use

SDCs less, as they have less need to increase infrastructure capacity, few costs attributable to growth, and little development that would generate revenue.

- **The variation in SDC rates across the state reflects differences in local needs, cost factors, and priorities.** Oregon's SDC Act and the broader legal context provide guardrails to ensure SDCs recover an equitable share of costs of capacity, while also providing flexibility to tailor the approach to community values and local circumstances. Local differences in funding choices, system needs, and construction and land costs can lead to differences in the total costs that SDCs are expected to cover. Local choices related to how costs are linked to development impacts can also lead to differences in SDC rates for similar development in different communities. Further, because SDCs are adopted by local elected officials, some communities intentionally keep SDC rates down to avoid discouraging development, either by discounting the calculated charges or reducing the size of the capital improvements list.

SDCs also increase the cost of building new housing in ways that can skew housing development towards higher-cost homes and can impact buyers and renters. SDCs likely account for anywhere from just under 2 percent to nearly 13 percent of total development costs for housing in Oregon, depending on the housing type, SDC rates, other cost factors, and market conditions. There are many other factors driving home prices, rents, and development costs—SDCs are just one contributor that impacts the market by influencing development decisions. In an accounting sense, housing developers pay the SDC (e.g., write a check), but the cost is typically shared with other actors, including landowners, homebuyers, renters, and (rarely) investors. A large body of evidence, including new analysis for Oregon, finds that higher SDCs/impact fees tend to be associated with higher home prices, though there are multiple possible explanations. This study identifies several ways that SDC costs may affect buyers and renters:

- **Smaller and lower-cost housing units tend to be more affected by SDCs than larger and more expensive homes.** SDCs typically account for a larger share of total costs for smaller homes, middle housing, and moderately priced apartments. These housing types are often targeted to moderate-income households who may not be able to absorb higher prices or rents, making them sensitive to small increases in development costs. They often also have lower system impacts than larger homes. *Scaling fees for smaller units based on lower demand for infrastructure (as a growing number of communities are doing) can even out financial impacts across housing types and sizes, but only if implemented across multiple infrastructure systems at a meaningful discount.*
- **SDCs can combine with other factors to exacerbate challenges for housing production and affordability,[1] even if they are not the primary driver**.
  - **Communities with lower home prices and rents tend to be more sensitive to SDCs (and other development costs).** The market may not support passing costs on to

[1] As used in this report, *housing affordability* means households' ability to find housing within their financial means, with or without public support or restrictions in place, across a range of income levels.

buyers/renters and lower land values mean less room to absorb SDCs or other costs through land price negotiations. Over time, lack of housing production can lead to higher rents and home prices for existing housing, which can indirectly affect buyers and renters. However, SDC rates in these communities tend to be lower. *Keeping SDC rates low in areas with lower home prices and rents can reduce barriers to housing production, if key projects to enable growth can still be funded.*

- **Communities with strong demand and limited new housing supply are more likely to see rising costs—including SDCs—shift to homebuyers and renters.** Higher SDCs in this context likely reinforce other market factors—including high land costs and demand from higher-income households—that encourage more expensive housing development. Higher land and construction costs can contribute to both higher SDC rates and higher home prices/rents. In addition, some infrastructure investments (e.g., parks) can serve as amenities, and affluent buyers and renters may choose to pay more to live in places that are making more investments in that infrastructure, though low and moderate-income households may not have this option. Keeping SDC rates low overall may be neither politically palatable nor aligned with infrastructure needs, but when SDC rates are both relatively high and relatively flat among different types and sizes of housing, it can increase the barriers to building smaller and lower-cost housing. For medium or large single-family homes in moderate and high-cost areas, ECONorthwest's analysis suggests that SDCs typically represent a relatively small percentage of costs (e.g., 2 to 7 percent), and reductions would likely have at most a modest impact on new home prices. *However, for smaller and lower-cost units in moderate and high-cost areas, evidence from a few Oregon communities suggests a major reduction or elimination of SDCs can sometimes enable development that would not be financially feasible otherwise.*

- **SDCs on affordable housing development[2] can increase the difficulty of securing adequate funding for the development and, even as a small percentage of total development costs, likely consume millions of dollars per year in funding for affordable housing statewide.** Smaller affordable housing developments and those with less traditional funding sources (which often includes affordable homeownership projects) are more impacted. *SDC exemptions or reductions for affordable housing development can allow funding for affordable housing to stretch further and reduce obstacles to affordable housing development, provided the needed infrastructure can still be funded.*

Some jurisdictions have implemented SDC measures to support affordability, but broader adoption is hindered by administrative, legal, and financial concerns. SDCs must remain rooted in recovering an equitable share of costs based on the impacts of the development, but jurisdictions have discretion over many choices that can affect how and to what extent SDCs impact housing development. Many jurisdictions are concerned about housing affordability, and a growing number have implemented new SDC rate structures and policies in response.

[2] As used in this report, *affordable housing* means income and/or rent-restricted housing that is affordable to households earning a certain income level (e.g., at or below 80 percent of area median income).

Some have adopted scaled rates that account for lower demand from smaller dwelling units, some offer policy-based exemptions for affordable housing, and some allow developers to defer paying SDCs until construction is complete rather than before it begins. other jurisdictions express serious reservations about some of these measures, and each has trade-offs to consider.

- **Scaled SDC rates for smaller units** are typically tied to evidence of lower development impacts, which is well within the discretion allowed under statute. Scaling reduces costs for smaller units while remaining revenue neutral for the jurisdiction, but it can increase complexity for both applicants and jurisdictions. *The primary barriers to broader adoption include the effort associated with a methodology update, collecting and analyzing supporting data, and updating permitting systems to collect the necessary information.*
- **SDC waivers** can offer substantial savings for affordable housing development, but there are differing views on their validity. Some practitioners believe that jurisdictions implicitly have the discretion to exempt certain classes of development, including affordable housing. Others see legal risks if lost funds are not paid from another source because the issue is not explicitly addressed in statute,[3] and the loss of revenue may prevent an agency from completing the project list upon which the SDCs were calculated. *Overcoming these concerns would require clear legal authority and ways to mitigate lost revenue.*
- **SDC deferrals** reduce financing costs for developers, which can be 10 to 25 percent of the SDC amount. While the financial impacts for jurisdictions are minimal, many expressed concerns about their ability to collect fees after permits are issued, increasing administrative cost and complexity, and, in some cases, delaying revenue collection. Those that have implemented deferrals reported mixed results: Some saw a substantial increase in administrative effort, while for others this was minor. Major challenges with nonpayment were rare (and mostly linked to commercial development) but time-consuming to resolve. This suggests that there is potential for more jurisdictions to adopt administrative approaches to deferrals that have worked well for others, but that the level of effort may depend on jurisdiction-specific systems and practices and may not allow for a one-size-fits-all approach. *Broader adoption may require additional focused discussions with stakeholders to identify a range of approaches to administering deferrals that could work for jurisdictions of different sizes and staffing levels and additional/better mechanisms for enforcement that reduce the risk of (and costs associated with) nonpayment.*

Difficulty estimating SDC costs up front can create challenges for multifamily, affordable housing, middle housing, and greenfield development. Developers value being able to estimate total SDC costs with some certainty during early project budgeting, but this is difficult for some types of development. Multifamily SDCs can be especially hard to calculate early in a

[3] Oregon's SDC statutes emphasize that new users should contribute no more than an equitable share of costs but say little about assigning costs to individual developments. Other state statutes make clear that jurisdictions may waive SDCs for affordable multifamily housing in at least some circumstances, but they do not clearly address whether "backfilling" lost revenue is required.

project because they are often not a flat rate per unit. When they exceed initial estimates after financing and budgets are set, this can cause major challenges, especially for affordable housing. Rates for middle housing types are often not listed or defined. Policies related to credits for building SDC-eligible projects, which is common for greenfield development, can also be difficult to discern. While most jurisdictions provide some information about SDCs online, many do not yet fully comply with recent updates to statute increasing requirements for transparency and may not be aware of the change. *SDC rate structures and approach to SDC changes can lead to variability between initial estimates and final SDC costs, but uncertainty for middle housing SDCs and SDC credit policies could be addressed through clearer information for applicants.*

Conclusion

At their core, SDCs are a funding mechanism; reducing SDC costs broadly in the interest of housing production and affordability would require greater availability of other funding for infrastructure that does not increase development costs or burden low-income households. The jurisdictions and special districts that provide water, sewer, stormwater, transportation, and park infrastructure have a clear mandate to keep those systems functioning and provide sufficient capacity for planned development. Given fiscal constraints, SDCs are likely to remain central to local funding for infrastructure, and most stakeholders agree that development should contribute to growth-related infrastructure costs at some level. SDCs provide a consistent and relatively predictable mechanism for development contributions to growth-related costs, and they can support housing production by funding capital projects needed for growth. However, the equity implications of relying on SDCs to fund eligible infrastructure projects are mixed. Residential SDCs can be regressive, with higher impacts on lower-cost housing (especially when applied more uniformly to all housing), but some alternatives (e.g., raising utility rates) can also be regressive and directly impact lower-income households. *Expanding other funding mechanisms or increasing state funding for infrastructure with a focus on mitigating impacts to affordable and lower-cost housing could help even the playing field for lower-cost housing development while retaining SDCs as a key funding source for infrastructure to serve growth.*

Even in the current fiscal context, jurisdictions can take steps to mitigate the impacts of SDCs on housing production and affordability. SDC rates must relate to impacts, which limits jurisdictions' ability to align them with housing costs. However, some jurisdictions have implemented measures that offer improvements at the margins. This includes changes to rate structures (e.g., scaling by unit size), policies (e.g., allowing discounts or waivers for regulated affordable housing), and administrative practices (e.g., allowing deferral to certificate of occupancy for some residential development, offering clear SDC estimates for more housing types). All have trade-offs and can increase administrative costs, suggesting that these changes may not be appropriate in the same form for all communities. Still, broader implementation of these measures could yield a meaningful change. *Jurisdictions can identify locally appropriate measures to reduce or mitigate SDCs' impact on housing development during SDC methodology updates, housing production strategies, infrastructure funding plans, or other policy discussions related to infrastructure and/or housing.*

Introduction

In 2021, the Oregon legislature passed House Bill 3040 (HB 3040), directing Oregon Housing and Community Services (OHCS) to prepare a study of System Development Charges (SDCs)—one-time fees charged on new development to help pay for existing and planned infrastructure to serve growth. The legislature requested that the study cover the history of the charges, methodologies for setting the fees, recent trends in fee levels, how the fees relate to other development costs, and how they ultimately affect the cost and production of housing. OHCS contracted with ECONorthwest and subcontractors FCS GROUP and Galardi Rothstein Group to undertake this study. This report's framework is drawn from the legislative request.

This report is not intended to pit SDCs against housing production or affordability, but rather to clarify how they interact. The scope of this study, as established in HB 3040, does not include a comprehensive evaluation of local funding mechanisms for infrastructure, cost drivers for housing development, the impact of housing production on affordability, or strategies to reduce the cost of housing development or support housing production. Other recent and on-going studies address some of these topics in greater detail;[4] others may need further study. Furthermore, HB 3040 did not direct the study to include recommendations, though the study's findings provide a fact base to inform consideration of related future policy choices as they emerge in the legislative process.

What Is a System Development Charge?

SDCs are one-time fees paid by new development (or, in some cases, re-development) at the time of development. They are intended to capture an equitable share of the cost of "system" capacity—large backbone facilities that provide service system-wide or to a portion of the service area, with extra capacity beyond an individual development's needs. They can be based on the value of existing facility capacity available to serve growth and/or the cost of building future facilities to provide additional capacity to serve growth.

This report provides a statewide look at how SDC rates are established, the role they play in funding infrastructure, and how they impact housing cost and production. In addition to research, data collection, and analysis by the consultant team, this report is based on input from stakeholders, including a wide range of service providers—cities, counties, and special districts—that charge SDCs and housing developers. (See Appendix A and Appendix B for summaries of the input from stakeholders.)

Blue Sky Consulting Group for Oregon Housing and Community Services, "Affordable Housing Cost Study: Analysis of the Factors that Influence the Cost of Building Affordable Housing in Oregon," 2019.

A summary of findings follows this introduction, followed by more detailed discussions of SDC History and Legal Context, The Role of SDCs in Funding Infrastructure, How and Why SDCs Vary Across Oregon, SDCs and Housing Costs, and SDC Administrative Policy Implications that document the project team's research and analysis as well as input from stakeholders, where applicable. A list of acronyms and a glossary are included following the Conclusions, followed by appendices with additional details of data and analysis discussed in the report.

Similar studies have been conducted recently in different contexts. The University of California Berkeley's Tener Center for Housing and Innovation completed a study of residential impact fees in California in 2019. The Federal Highway Administration completed a national study of development impact fees and other development charges in 2021. Topics in both works include impact fee structure, design, transparency, and timing; legislative history and case law; alternative funding options; impact of housing affordability, development feasibility, and cost incidence; and case studies and nexus studies. This report explores many of these topics within Oregon's context.

Housing Affordability vs. Affordable Housing

This report addresses the implications of SDCs for *housing affordability* and for *affordable housing* and *lower-cost housing*. As used in this report, these terms are differentiated as follows:

- *Housing affordability* means households' ability to find housing within their financial means, with or without public support or restrictions in place, across a range of income levels. This is commonly measured based on spending no more than 30 percent of gross income on housing (rent or mortgage, plus utilities). Housing affordability is a greater challenge for low-income households than higher-income households, but it is not exclusively focused on households at a particular income level.[5]
- *Affordable housing* means income and/or rent-restricted housing that is affordable to households earning a certain income level (generally below 60 or 80 percent of the area median income). Sometimes described as "income-qualified affordable housing" or "regulated affordable housing."
- *Lower-cost housing* means market-rate housing (without income or rent/price restrictions) that offers lower sale prices or rents than most new housing in a given area and typically also has lower development costs.

[5] The 30 percent standard is widely used but simplistic. See discussion and additional context related to defining affordability and affordable housing in the following memorandum:

Nick Meltzer, Sadie DiNatale, Bob Parker & Rebecca Lewis, University of Oregon, "Definitions of Affordable Housing," to the Department of Land Conservation and Development and the HB 4079 Rulemaking Advisory Committee (RAC), September 19, 2016. https://www.oregon.gov/lcd/UP/Documents/UO-Defining_Affordability.pdf

Summary of Findings

History and Legal Framework

- **Impact fees have a long history, emerging nationally after World War II and in Oregon in the 1970s**. Requiring developers to build public improvements became common during the Great Depression.[6] After World War II, local governments began to require that developers pay money instead of or in addition to dedicating land or public improvements.[7] The first SDC in Oregon was enacted in 1972 by the City of Corvallis.[8]
- **U.S. Supreme Court rulings on development exactions inform how impact fees are set, though it's unclear whether they apply directly.** Legal doctrine surrounding development exactions (required dedications of land, money, or anything else of value as a condition of development approval) requires that they be clearly related and roughly proportional to the development's impact. A 2013 Supreme Court ruling raises questions about whether the same tests extend to impact fees, given that they are established in a legislative policy context rather than ad hoc for individual properties, but this broader legal context informs local approaches to impact fees.[9]
- **The Oregon SDC Act of 1989 established guidelines on the purpose and use of the charges and the methods for developing SDC rates**. The Act intended to help Oregon public agencies equitably recover the costs of infrastructure needed to serve growth from growth, thereby reducing the likelihood that those costs would be shifted to existing rate and taxpayers. The statutes allow SDCs to be used for capital improvements for five categories of public facilities: 1) water supply, treatment, and distribution; 2) wastewater collection, transmission, treatment, and disposal; 3) drainage and flood control; 4) transportation; and 5) parks and recreation. SDCs can be based on future improvements (an "improvement fee") identified in a capital improvement program or comparable plan and/or on available capacity in systems the jurisdiction has already built (a "reimbursement fee").[10]

Fiscal Context and the Role of SDCs

- **Federal infrastructure spending has declined since the 1980s, particularly for water infrastructure, while state and local infrastructure spending has increased**. Much of the increase in local infrastructure spending has been for system operations and

maintenance, rather than capital projects.[11] The 2021 Bipartisan Infrastructure Law promises substantial federal investment in transportation and water infrastructure over the coming years, much of which is targeted at the repair and replacement of aging or unsafe infrastructure.[12] However, given the scale of the need, it will not fully close the gap for needed investment, and some funding will come in the form of loans rather than grants that must be repaid from local sources.[13]

- **In Oregon, declining state gas tax revenues and reductions in timber payments to many Oregon counties have caused further declines in available funding for transportation.**[14] This has limited available revenue at the state and county level to fund major road improvements.
- **Oregon property tax limitations imposed in the 1990s slowed the growth of property tax revenue and sharply reduced localities' abilities to use property taxes to finance infrastructure improvements.** Oregon's Measures 5 and 50 limited property tax rates and the growth in assessed values, respectively. New operating or bond levies require voter approval under Measure 50, and special operating levies are subject to Measure 5 limits on total tax rate. These changes have constrained property tax revenue at the local level, which has generally grown at less than 5 percent per year for the past 2 decades,[15] and they make funding infrastructure investments through property taxes more challenging.
- **At the same time, higher environmental and safety standards have increased the cost of infrastructure investments and maintenance, while construction costs and personnel costs (including pensions) have also risen.** Factors such as Clean Water Act requirements, requirements to manage water pollution from roadway runoff, and improvements to address particular pollutants and combined sewer overflows have increased the cost burden on local governments.[16, 17, 18] Increasing awareness of risks from natural hazards such as earthquakes and tsunamis has also led to higher costs for many infrastructure capital projects, even before accounting for changes in material and labor

costs. Smaller cities and rural communities may be disproportionately impacted by these costs.[19]

- **Local governments and special districts have increased water/sewer rates and added user fees to close funding gaps.** Water and wastewater utility rates have risen faster than inflation for many years, increasing by over 80 percent in total from 2008 levels compared to an increase of a little over 20 percent in the Consumer Price Index (CPI) over the same period.[20] At least 50 cities across Oregon also impose on-going user fees for government services like parks, streets, and public safety to fill the void that tax limitations created.[21]
- **SDCs are not the only local funding mechanism for infrastructure, even for growth-related infrastructure needs, but they are a key part of local infrastructure funding plans, particularly in fast growing communities.**
  - **SDCs can benefit developers by helping fund key infrastructure investments to make growth possible.** For example, SDCs often account for a substantial share of funding for infrastructure in new growth areas, with much of the rest coming from other development-derived sources.[22] In this case, SDCs may make greenfield development costs more predictable and more evenly distributed, but not necessarily higher, if they substitute for other forms of exactions or developer contributions. In addition, several Oregon communities have used SDCs to help fund major water supply projects needed to allow residential development to continue, although they also needed to bond against utility rate revenue to provide a dependable income stream for debt payments.[23, 24]
  - **SDCs also provide an important source of local matching funds** for state and federal infrastructure grants, particularly for parks and transportation.[25]
  - **SDCs may be more viable than the alternatives.** Given the political challenges and legal or financial limitations associated with other potential local funding sources, jurisdictions face obstacles in using other funding sources to pay for infrastructure. This can increase pressure to maximize the use of SDCs for eligible costs, within the bounds of state law and legal precedent.

- **SDCs can benefit existing residents by supporting infrastructure investments and mitigating utility rate and property tax increases.** While not all of a jurisdiction's capital needs are related to growth and eligible for SDC funding, being able to draw on SDCs for costs that are eligible means less cost needs to be allocated to ratepayers or property owners. Increases to utility rates and property taxes impact residents' cost of living on an on-going basis and may not track with household income (particularly for utility rates), creating their own affordability challenges for low-income households. Investments that maintain current service levels or create facilities that the whole community can use (e.g., new parks) also benefit existing residents.

SDCs Across Oregon

- **Most cities in Oregon charge at least one of the five allowable SDCs, but total rates vary substantially.** The total 2022 SDCs for a single-family residence range from under $5,000 in some small cities to close to $50,000 in some Portland Metro area jurisdictions based on data collected by FCS GROUP. Some of the smallest cities, particularly in Eastern Oregon, do not charge SDCs at all.
  - Based on 2022 data collected by FCS GROUP, the average total SDC rate for a single-family residence statewide is roughly $15,000. SDCs for water, wastewater, transportation, and parks all average between $3,800 and $4,600 per single-family dwelling for the jurisdictions included in the sample, but substantial variability exists in these amounts across the state.
  - There is less aggregated data available on SDC rates for other housing types (e.g., multifamily and townhouses), but rates are typically less than those applied to single-family detached homes (roughly two-thirds as much for apartments and roughly 90 percent of the single-family detached rate for townhouses based on a review of several example communities).
- **SDC rates have increased over time in most Oregon communities for most infrastructure systems.** The average increase between 2007 and 2022 in total SDCs for single-family homes was roughly 105 percent over 15 years, with the highest increases for parks and transportation SDCs (101 and 110 percent, respectively).[26] For comparison, construction costs escalated by roughly 60 percent nationally and the Seattle area (the closest city included in the available construction cost index data) over the same period of time. Because many SDCs are indexed to construction cost escalation (increases in labor and material costs broadly), a faster pace of increase suggests other factors at play, such as regulatory mandates that drive more costly facility designs; less grant funding; changes to SDC methodology or discounting policies; land cost escalation (especially for parks); or under-reporting of some regional and district charges in 2007.

[26] 2007 data comes from the earliest available SDC survey data from the League of Oregon Cities (LOC). 2022 data is from data collected by FCS GROUP for the same jurisdictions who participated in the 2007 survey. Note that regional and district charges may not be consistently reported in the 2007 LOC data, which could exaggerate the magnitude of increases to some extent.

- **Many other states use impact fees, but comparing SDCs in Oregon to impact fees in other states can be misleading.** While a few studies have published national data on impact fees, differences between states in terminology and in which infrastructure systems or public services impact fees may apply to make it difficult to draw useful comparative conclusions. For example, both Idaho and Washington have separate statutes applicable to water and wastewater charges, and facilities charges related to these systems may not be consistently reported as impact fees. These studies primarily serve to highlight that impact fees in one form or another are used extensively in many states, and that total rates vary substantially between different communities in the states where they are in use.
- **Variation in local SDC rates stems from several factors, not all of which are related to the SDCs themselves.** Key factors include planning and policy choices made prior to establishing or updating an SDC rate that determine future system needs, methodology choices during rate-setting, and cost factors that service providers do not control.
  - **SDC project lists typically draw from local infrastructure system plans, which can vary widely in type and level of planned capital investments.**
    - Water, sewer, and stormwater master planning efforts are largely technical exercises informed by state and federal regulations. Depending on the nature and condition of the system, some communities may need to make more costly investments than others.
    - For transportation, while state standards and requirements can impact local project lists, local governments generally have discretion over priorities and standards for city streets. Communities may need different amounts and types of investment to meet local goals and state standards.
    - Parks plans are generally responsive to community-defined goals and informed by public input. This aligns investments with local priorities but can also result in greater variations in SDC-eligible project lists.
  - **Decisions about use of other local funding mechanisms to pay for infrastructure may occur prior to SDC updates.** For example, if there is support by the local community, a General Obligation (GO) bond may be used to fund a recreation center or a group of high-profile transportation projects.
  - **In establishing the SDC methodology, jurisdictions have flexibility on many elements that can impact SDC rates while staying within the bounds of statute.** There are many methodology variables that can impact the total costs the SDCs are designed to recover or how those costs are allocated to future users. Within the framework of Oregon SDC law, local governments have flexibility in selecting approaches that balance local objectives and data availability. Examples of SDC methodology choices that could impact rates include:
    - Narrowing projects to include in the SDC project list to keep costs down.
    - Valuing existing facilities based on replacement cost vs. original cost (with or without depreciation) in setting a fee based on available capacity.

- How costs are allocated to growth vs. existing users when facilities serve both (e.g., relative to existing level of service, based on the incremental cost of an oversized facility, or based on share of demand).
- Whether grants or other sources are assumed to cover a portion of eligible costs for bigger projects (e.g., aquatic centers or major transportation improvements).
- Whether rates account for financing and administrative costs.
- How demand is measured (e.g., meter size for water, impervious surface area for stormwater, trip ends for transportation, or population for parks).

- **A growing number of jurisdictions are adopting SDC methodologies that adjust rates to reflect differences in demand or impact based on housing unit size.** These adjustments are typically based on local demand data. While they often pivot off an average rate for an average-size unit, they can lead to substantial differences in SDCs across jurisdictions for smaller or larger units.
- **Many jurisdictions make policy choices to reduce SDC rates below what their methodology would support.** Among jurisdictions surveyed in 2020, 14 percent reported discounting a wastewater SDC, and 29 percent reported implementing a discounted parks SDC.[27] In focus groups, service providers highlighted elected officials' concern about impacts to development and desire to remain competitive with peer jurisdictions as primary reasons for these choices. Some also noted phasing in larger SDC increases over several years for similar reasons.
- **The cost of constructing capital improvements varies across the state.** Local cost drivers include lack of local labor and materials in some rural areas, high land costs in some urban areas, and geological and soil factors (e.g., steep slopes, rock outcroppings, or soils at risk of liquefaction) that can increase the costs of grading and construction.

Implementation Considerations

- **Beyond the SDC rates themselves, administrative decisions can play a big role in how SDCs affect developers and jurisdictions.** Key factors include the timing of SDC payment, exemptions for affordable housing or other types of development, policies related to credits for making improvements on the SDC project list, and availability of information about SDCs.
  - **There are differing views on the validity of SDC exemptions for affordable housing** (or any purpose that is unrelated to a reduced demand for system capacity). Several cities and service providers have waiver policies in place for regulated affordable housing, while others do not feel it is fair (or, in some cases, legal) to waive fees for affordable housing unless the foregone revenue is "backfilled" from

[27] FCS GROUP analysis of data from League of Oregon Cities, System Development Charges Survey Report (February 2020).

other sources. A growing number of communities offer SDC exemptions for regulated affordable housing, but this is still the exception rather than the rule.

- **SDC credits for developers that build public improvements on the SDC project list can be a win-win for developers and jurisdictions, particularly in greenfield settings, but how they are administered matters.** Credit policies differ across providers in terms of project eligibility, creditable costs, and transferability. This variation, combined with a lack of clear information regarding how to calculate credit-eligible costs, can create uncertainty for developers. In addition, jurisdictions occasionally require developers to pay SDCs up front that will be reimbursed later even when they are building eligible projects, and this further increases carrying costs. Transferability was cited as a valuable benefit by multiple developers, especially given statutory limits on how long credits are valid (10 years). However, transfers can increase administrative costs for jurisdictions and reduce cash flow as more developers build projects or buy credits rather than paying SDCs directly.
- **The timing of SDC payment is important for both jurisdictions and developers, but for different reasons.** Jurisdictions have flexibility under statute to assess and collect SDCs at issuance of a development or building permit, or connection to or increased usage of a capital improvement.
  - **Many developers prefer to pay later in the process, primarily for financial reasons.** Payment at certificate of occupancy or even at time of sale (for for-sale housing) reduces financing costs or allows the money to go towards early construction costs, reducing the impact of the SDCs.
  - **Most service providers prefer to collect SDCs at issuance of the building permit as this offers the greatest certainty of payment with the least administrative effort.** Many expressed concerns about challenges with collecting payment at certificate of occupancy, and even more so at time of sale. However, the timing of the revenue was less of a concern, except in limited situations (e.g., park land acquisition within a new growth area). Jurisdictions that offer (or previously offered) deferral to certificate of occupancy report mixed results. All noted an increase in administrative effort to process and track deferrals, but the magnitude varies widely. Nonpayment issues and avoidance behavior do not appear to be common (some were linked to commercial development or to a specific developer) but were time-consuming when they did occur.
- **Developers value certainty about SDC costs for a particular project.** Unexpected increases to SDC costs can be difficult for both market-rate and affordable housing developers to absorb after financing and budgets are set. Estimating costs for multifamily development can be particularly challenging when SDCs are based on detailed characteristics such as fixture counts that may not be known early on. Clear definitions of housing types (particularly related to middle housing) are also important to allow for accurate early estimates of SDC costs. And if developers that defer SDCs are subject to the SDCs at time of payment, the uncertainty about SDC rate changes erodes the value of the interest cost savings from the deferral.

- **Some jurisdictions go above and beyond statutory notice and information availability requirements to engage and inform stakeholders, while others may not fully comply with (or be aware of) recent additions to state law regarding transparency.** Some jurisdictions pro-actively engage stakeholders in methodology decisions, provide simplified summary information about SDCs for the general public, and/or offer SDC estimation tools for developers. However, based on focus groups and review of several jurisdictions' websites, newly required informational items (current SDC rates, methodology reports, project lists, and contact information for questions) are not consistently available online—most jurisdictions provide at least one of these items, but not all.

SDC Impacts on Housing Costs and Production

- **SDCs fund infrastructure that is needed to support growth, which can enable development and benefit future residents, but they also increase the cost of building new housing. Both factors can influence housing costs and housing production.**
- **In an accounting sense, housing developers pay the SDC (e.g., write a check). But the cost burden of the charge can be shared with a variety of other actors, including investors, landowners, homebuyers, and renters**. Developers need to weigh SDCs and other cost inputs against the sales prices or rents they are expecting to achieve on each project. Because SDC costs are outside developers' control, they must make choices about other aspects of the development to bring total costs and prices or rents into alignment. How the SDC costs are ultimately distributed among the various market actors depends on the actors' relative sensitivity to prices. Economic theory assumes the party with fewer alternatives is less sensitive to change in price and bears a greater portion of the SDC.
  - **Homebuyers and renters in tight housing markets likely bear a greater share of SDC costs**. If developers build larger units to justify higher prices, build smaller units to stay within what buyers or renters are willing to pay, or charge higher prices/rents for the same housing, end users are getting less value for their money and absorbing some of the costs, even if they are paying the same amount. Developers cannot charge higher prices or rents unless the market demand is strong enough to accept the increase. This is more likely to occur if demand exceeds supply. Affluent households are less likely to be cost-sensitive than lower-income households, but limited supply and lack of lower-cost options can also affect lower-income households, even if they are not absorbing costs directly.
  - **Theory suggests that landowners should absorb SDCs in large part by receiving less value for their land, though this may not always be the case**. Whether and to what extent SDCs are absorbed in land prices depends on the availability of other developable land within the same market, how much SDCs vary between comparable pieces of developable land, and the timing of the land purchase relative to when SDCs are known.
  - **Investors, lenders, and developers are unlikely to absorb SDCs by accepting lower returns except in very unusual circumstances or when SDC costs increase unexpectedly during development and cannot be passed on to others.** Generally,

market-rate development will not occur unless the expected revenues from the project exceed the expected costs by a sufficient margin to create financial returns for investors, lenders, and developers that justify the risk of their investment. Investors and lenders usually have other options to invest in across multiple markets and will avoid places that generate lower risk-adjusted returns. Developers may absorb costs when they exceed initial expectations, but they avoid this as much as possible through contingency funds and by getting estimates of SDC costs up front.

- **Studies from Oregon and across the country have consistently shown a pattern of higher home prices in areas with higher SDCs. However, the reasons behind this remain unclear.**
  - **Academic research from across the country and across several decades shows positive correlations between impact fees and housing prices in a range of contexts.** The difference in home prices was larger than the difference in impact fees in some studies and smaller in others, but the direction of the relationship was consistently positive (higher home prices in areas with higher impact fees). Studies that evaluated relationships between impact fees and land prices or housing production had mixed results, with some finding positive relationships and others finding negative ones. These studies could not control for all other potentially relevant variables and do not establish causation, though some authors posit that the amenity value of the infrastructure itself is responsible for the relationship, rather than the costs of the impact fees. Others suggest potential cost-related explanations.[28]
  - **Academic literature has also established a link between property values and key infrastructure**. Studies suggest that property values are higher closer to parks and that congestion is associated with "disamenity" (negative) values for some economic indicators, while bicycle and pedestrian infrastructure can increase property values. These factors can potentially drive home prices and rents in areas where SDCs are providing infrastructure that is valued by housing consumers.
  - **A comparison between average single-family home values and single-family SDC rates for 76 cities in Oregon shows a general pattern of higher SDC rates in areas with higher home values, but also substantial variation between communities.** Statistically this relationship accounts for only 33 percent of the variation in the data without controlling for any other factors. Service provider focus groups suggest that policy direction to keep rates low due to elected officials' concern about impacts on development could account for some of the observed relationship (i.e., areas with lower home values and weaker housing markets may be less willing to impose high SDCs, even if infrastructure needs would justify them).
  - **An original analysis by ECONorthwest found a positive relationship between SDC levels and home prices for new development in Washington County, Oregon.** ECONorthwest analyzed sales transactions for new homes in three urban expansion areas and adjacent recent subdivisions in Beaverton, Hillsboro, and Tigard. Current SDC rates for the areas range from roughly $33,000 to $53,000 per

[28] See Appendix G for works cited.

single-family detached unit, with higher rates in the expansion areas and differences between jurisdictions. A linear regression model showed higher housing prices in places with higher SDCs after controlling for other readily available housing characteristics: a $10,000 difference in SDCs was associated with a $7 per-square-foot difference in the price of newly built housing (about $16,800 for a 2,400-square-foot home). However, developer interviews suggest the difference may also be due to the overall amount of infrastructure needed in the expansion areas and use of premium design and amenities to capture demand from higher-income households.

  - **Longitudinal data from the City of Bend shows that changes in new home prices have not tracked closely with changes in SDC rates over time.** While both have increased over the past decade, new home prices have tracked with broader housing market conditions while SDC rates have tracked with construction cost indices that are used to adjust the rates year to year. While rising SDC costs could still be a contributing factor in rising home prices in Bend, they are not the primary driver.

- **SDCs affect some housing more than others—smaller entry-level homes, lower-cost middle housing and apartments, and communities with weaker markets are disproportionately affected by SDCs.** High-end single-family detached housing is generally impacted least.

  - **For a typical new single-family home, SDCs account for a relatively small share of development costs** (estimated at roughly 3 percent in Oregon at average costs). Even a relatively high SDC rate (e.g., $30,000) would account for 6 percent or less of development costs in many medium and large cities. For larger single-family homes, the share of costs is even less.

  - **SDCs are a greater share of costs for lower-cost housing types—multifamily, middle housing, and smaller single-family detached houses.** ECONorthwest's estimates suggest SDCs account for roughly 4 to 5.5 percent of total development costs for these housing types at average costs for Oregon, but potentially 10 percent or more in high-cost markets with high SDCs. SDCs have a greater impact on financial returns and feasibility for these housing types as a result. This is supported by findings from developer focus groups, which highlighted entry-level homes and middle housing as particularly sensitive to SDC costs.

  - **When SDCs are scaled to unit size, their share of development costs is more consistent across housing types and unit sizes.** Compared to SDCs that are applied per unit, scaled SDCs result in a lower SDC share of development costs for lower-cost housing types with smaller units.

  - **While SDCs are typically lower in areas with weaker housing markets and lower land costs, these areas are also more sensitive to increases in SDCs.** For example, in a small city outside a metropolitan area, typical SDC costs for a single-family detached home might account for only 2 to 3 percent of development costs. However, a $10,000 change in fee for a single-family unit would have a greater impact on financial feasibility in such a city than for developments inside a metropolitan area where land and housing prices are relatively expensive.

- **In communities without SDC exemptions, affordable housing development can also face substantial SDC costs.** Data from several Oregon communities shows that SDCs for an income-qualified affordable apartment development can cost from tens of thousands to over a million dollars in some jurisdictions. While other cost drivers may have a greater impact on affordable housing development costs overall, the cumulative expenditures on SDCs for affordable housing development across the state likely total millions of dollars per year.
- **SDC reductions do not guarantee lower prices or rents for market-rate housing, but targeted exemptions or reductions for certain housing types or price-points can support production of lower-cost housing options.** Evidence from communities that offer exemptions for lower-cost housing without long-term affordability restrictions shows that in some cases eliminating SDCs for housing that meets specific price points (or for small units like ADUs) can increase production of that type of housing by for-profit developers. However, the difference must be enough to meaningfully change development costs, and the development must be close to viable already. For more expensive housing, cost savings may or may not be passed on to buyers or renters, depending on how competitive the housing market is.

1.1 History of System Development Charges

1.1.1 Origins of American Impact Fees

System development charges (also referred to as impact fees) are a form of exaction. When an owner of land plans to develop that land, the local government may determine that the planned development will create a need for additional public infrastructure. Having made such a determination, the local government may require the owner to provide some form of contribution or payment as compensation for the additional infrastructure that the local government must provide. This requirement is known as an exaction.

Exactions have long been viewed as the legitimate exercise of a local government's police power. Requiring developers to build public improvements became common during the Great Depression.[30] Exaction of land or public improvements is still common today, and such an exaction is known as a dedication.

> *In terms of the police power, most local governments have great discretion in regulating to protect the public's health, safety, and general welfare. In contrast, local governments have almost no discretion in the exercise of their power to tax. It was natural, then, that local governments would turn to the police power, where they had discretion, in order to finance infrastructure needs.*[29]

After World War II, local governments began to require that developers pay money instead of, or in addition to, dedicating land or public improvements.[31] These monetary exactions come in two forms. An ad hoc monetary exaction is a customized calculation that is unique to a single development, its impacts, and the means of mitigating those impacts. A legislative monetary exaction is a rate or set of rates adopted by a governing body and applied consistently to development applications. These exactions are known generally as impact fees and known in Oregon as SDCs.

The first impact fee imposed in the United States (U.S.) may have been a "tap in" fee for new users imposed by the Hinsdale, Illinois, Sanitary District in 1947. The purpose of the fee was to finance expansion of the water treatment plant. The fee was challenged in court, but the Illinois Supreme Court ruled that the impact fee was "legal if used for capital and not operating expenses."[32] The first SDC in Oregon was enacted in 1972 by the City of Corvallis.[33]

1.1.2 The Rise of State Enabling Acts

States have explicitly authorized impact fees in a variety of forms, for a variety of public services, since 1987. By 1995, 21 states had authorized impact fees of one form or another. By 2007, 27 states had authorized impact fees.[34] It is now estimated that as many as 34 of the 50 United States have codified impact fee authority and accompanying constraints.[35] All 4 of the states neighboring Oregon—Washington, California, Idaho, and Nevada—have impact fee statutes.[36]

Local governments in Oregon and other states have always had the authority to impose impact fees on developers, but constitutional, statutory, and case laws constrain that authority.

The Oregon SDC Act: A Brief History

The Homebuilders Association (HBA) sponsored an SDC bill in Oregon that was vetoed by then Governor Goldschmidt in 1987. A small group of city and homebuilder representatives subsequently collaborated on a bill that became the initial law. In 1989, the Oregon Legislative Assembly passed the first provisions of the SDC Act, which is now codified in Chapter 223 (223.297 to 223.316) of the Oregon Revised Statutes (ORS). The SDC Act became effective in 1991.

The SDC Act's broad objective was to "provide a uniform framework for the imposition of system development charges by local governments, to provide equitable funding for orderly growth and development in Oregon's communities and to establish that the charges may be used only for capital improvements."[37] It was thought that having a uniform framework would protect both developers and public agencies—and reduce the cost of potential future litigation.

More specifically, the law was intended to help Oregon public agencies equitably recover the costs of infrastructure needed to serve growth from growth, thereby reducing the likelihood that those costs would shift to existing ratepayers and taxpayers.

Since its original passing in 1989, there have been multiple attempts to modify key provisions of the Oregon SDC Law, including expansion and restriction of the types of costs that may be included in the SDCs, clarification of legislative intent and other "housekeeping" modifications, and changes to procedural and methodological requirements.

The most significant changes to the law occurred with the passage of Senate Bill 939 in 2003. Ultimately, SB 939 was a negotiated solution to a longer list of changes sought by the

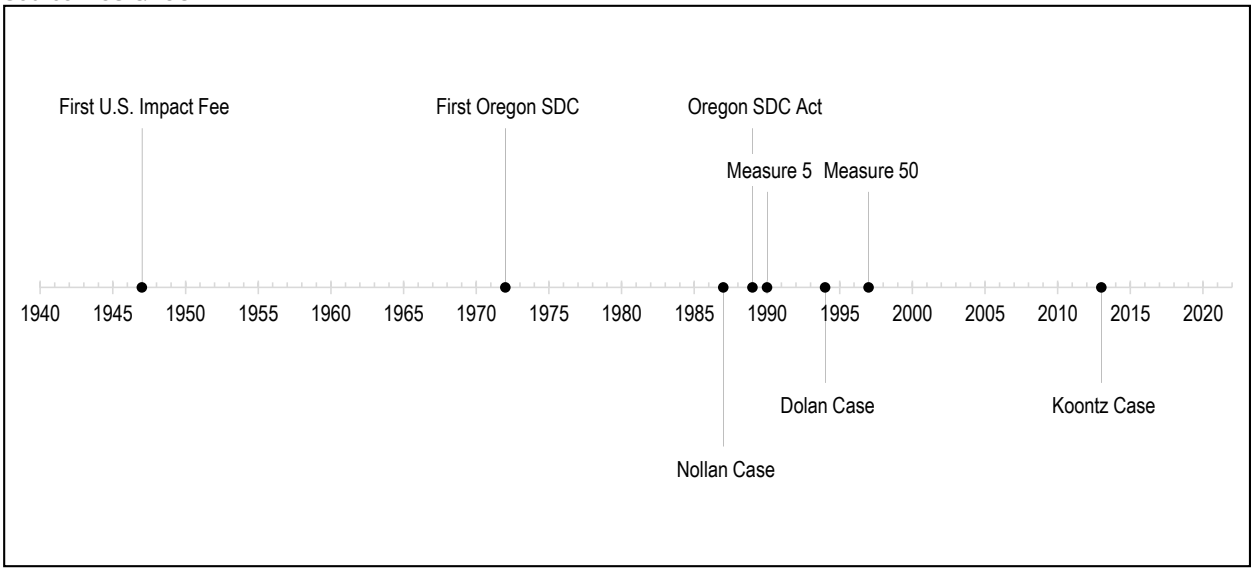
Homebuilders Association. The most recent change to the statutes occurred in 2021. Section 1.2.2 outlines the key elements of ORS 223.297 – 223.316.

1.2 Legal Framework

1.2.1 Landmark Case Law

A number of U.S. Supreme Court cases related to exactions have defined tests of their constitutionality for exactions generally and monetary exactions. The most recent of these raises questions about whether the same tests extend to impact fees given that they are established in a legislative policy context rather than ad hoc for individual properties, but this broader legal context informs local approaches to impact fees. These cases are summarized below. The timing of these cases relative to other key events in SDC history is shown in Exhibit 1.

Exhibit 1. Impact Fee/SDC Historical Timeline
Source: FCS GROUP



Nollan (1987): Essential Nexus

Whether authorized by statute or not, all impact fees in the U.S. are subject to the Fifth Amendment of the U.S. Constitution, which created a distinction between an exaction that is a legitimate use of a local government's police power and a taking that would require the local government to compensate the property owner.

The U.S. Supreme Court further clarified the line between exaction and taking in 1987 with its ruling on *Nollan v. California Coastal Commission*.[38] This ruling introduced the concept of "essential nexus" as a test for the validity of an exaction: Whatever is being required (exacted) as a condition of development approval must be clearly and directly related to the impact of the proposed development.

In this case, the California Coastal Commission was concerned that the new, larger home that the Nollans proposed would obstruct the public's view of the ocean. But instead of imposing a

[38] Nollan v. California Coastal Commission, 483 U.S. 825, 837 (1987)

restriction on the house's height or width, the Commission required an easement for public access to the beach. The Court found that this requirement (exaction) did not fulfill the purpose of maintaining the public's view and was therefore a taking. In other words, if the impact of the development is an obstructed view, a valid exaction must mitigate that particular problem. This is the "essential nexus" that was henceforth required of a valid exaction.

Dolan (1994): Rough Proportionality

Like the Nollan case, *Dolan v. City of Tigard*,[39] was about dedications, not monetary exactions. Taking a step beyond an "essential nexus," the U.S. Supreme Court ruling held that a "rough proportionality" must exist between the impact of the proposed development and the exaction intended to mitigate that impact.

However, the exaction in Dolan was a land dedication, or "possessory exaction," required ad hoc at the time of permit approval, leaving open the question of whether the "rough proportionality" standard applied to legislatively adopted, non-possessory (monetary) exactions, like impact fees. The court also noted that generally applicable legislative regulations should be treated with more deference than property-specific determinations.[40]

Koontz (2013): Monetary Exactions

In 2013, the U.S. Supreme Court finally ruled on a case involving monetary exactions. In *Koontz v. St. Johns River Water Management District*,[41] the Court held that the Nollan and Dolan tests apply to monetary exactions just as they do to dedications, at least in the case of adjudicative exactions (specific to an individual parcels). However, the ruling may still leave open (to lower courts) the question of whether the more restrictive essential nexus test applies to legislative exactions that are programmatic or apply to development more broadly (e.g., service area-wide).[42, 43, 44]

1.2.2 Oregon SDC Act: Overview of Key Elements

As mentioned previously, the broad objective of the Oregon SDC Act was to provide a uniform framework for the imposition of SDCs by local governments. The essential elements of this

framework are listed below. More specific requirements and local approaches to each element are addressed later in this report. Appendix C summarizes Oregon case law that clarifies some provisions of the Oregon SDC Act.

Definition of Capital Improvements

SDCs may be used for capital improvements for the following public facilities:

- Water supply, treatment, and distribution
- Wastewater collection, transmission, treatment, and disposal
- Drainage and flood control
- Transportation
- Parks and recreation

Previous legislative bills to amend the law by broadening facilities to include schools, police or fire improvements have been unsuccessful.[45] However, because of some of these efforts, the legislature did adopt a construction excise tax that is charged per square foot for new residential development to provide additional funding for schools.[46]

Determination of SDC Amount and Methodology

SDCs may consist of a reimbursement fee, an improvement fee, or both. Improvement fees are associated with capital improvements to be constructed, while reimbursement fees are designed to recover the costs associated with capital improvements already constructed or under construction. The statutes put some constraints on the costs that may be included in each fee component:

- Reimbursement fees exclude existing facility costs funded by gifts or grants and costs associated with "used capacity" (facility capacity needed to meet existing development service demands).
- Improvement fees are based on the projected costs of capital improvements included on an SDC capital project list that expand capacity to meet the service demands of future system users.[47]

An SDC methodology based on a combination reimbursement and improvement fee structure must demonstrate that the charge is not based on providing the same system capacity.[48]

---

[45] For example, HB 2581 from the 2007 Oregon Legislature.

[46] ORS 320.176

[47] An increase in system capacity may be established if a capital improvement increases the level of performance or service provided by existing facilities or provides new facilities. ORS 223.307

[48] This requirement is straightforward to meet if there is no overlap in specific facility improvements between the two fee components, and if the value of used capacity in facility components is excluded from the reimbursement fee.

Beyond these constraints, the statutes provide flexibility in determining SDC amounts and methodologies, provided that new users contribute no more than an equitable share of costs.[49] It is important to note that the statutes do not prescribe specific bases for charging individual developments, nor do they preclude local governments from providing discounts, waivers, or exemptions for certain classes of development, consistent with modern rate-making principles.[50]

SDC Capital Project List

Local governments are required to prepare a capital improvement program or comparable plan, prior to the establishment of an improvement SDC, that includes a list of the improvements that the jurisdiction intends to fund with improvement fee revenues and the estimated timing, cost, and eligible portion of each improvement.[51] This requirement was an added provision to the original statute to provide greater transparency on the basis for improvement fee costs and expenditures. Since reimbursement fees are based on facilities already constructed or under construction, the project list requirement is not applicable.

SDC Credits

A credit must be provided against the improvement fee for the construction of "qualified public improvements." Qualified public improvements are improvements required as a condition of development approval, identified in the SDC capital project list, and either:

a) Not located on or contiguous to property that is the subject of development approval; or
b) Located in whole or in part on or contiguous to property that is the subject of development approval and required to be built larger or with greater capacity than is necessary for the particular development project to which the improvement fee is related."[52]

SDC Expenditures, Accounting, and Appeals

Expenditures of SDC revenues are limited to payment for capital improvements (including repayment of indebtedness) for the systems for which the fees are collected. Improvement fee revenues are limited to capacity-increasing capital improvements needed to provide service to future users, in accordance with the SDC capital project list.[53] SDC revenue may also be spent

[49] ORS223.297 (Policy) indicates that the imposition of SDCs is intended "to provide equitable funding for orderly growth and development in Oregon's communities…" and 223.304 indicates that reimbursement fees must "promote the objective of future system users contributing no more than an equitable share to the cost of existing facilities."

[50] See for example, "Affordability and Equity Considerations for Rate-Setting" (Eric Rothstein, Stacey Isaac Berahzer, Joe Crea, and Michael Matichich for *Journal AWWA*, September 2021) which argues that water, wastewater, and stormwater service providers have a social responsibility to ensure universal, affordable access to services, as part of their rate-setting framework. Not all service providers or experts agree with this interpretation.

[51] ORS 223.309

[52] ORS 223.304(4)

[53] Per 223.307(2), "an increase in system capacity may be established if a capital improvement increases the level of performance or service provided by existing facilities or provides new facilities."

on the cost of complying with the statutes, but not for administrative office facilities or operation and maintenance costs associated with capital facilities.

Local governments are required to deposit SDC revenues into dedicated accounts and provide an annual accounting of revenues and expenditures.[54] Furthermore, local governments must create administrative procedures for individuals to challenge SDC revenue expenditures or calculations, and to provide adequate notice regarding review procedures, including the right to petition for review pursuant to ORS 34.010 to 34.100.

Methodology Notification, Review, Updating, and Transparency

The local government must maintain a list of persons who have made a written request for notification of establishment or modification of an SDC and provide notice to such individuals at least 90 days prior to the first public hearing to enact a new or modified SDC. The SDC methodology must also be made available for review 60 days prior to the first public hearing.[55]

Application of one or more cost indices periodically is not considered a change in the methodology, provided that the index is published by a recognized agency, independent from the methodology, and incorporated into the methodology or adopted separately by ordinance or resolution.[56]

Similarly, the SDC capital project list may be updated at any time. However, if an SDC is to be increased by a proposed modification to the list then written notice must be provided to interested parties at least 30 days prior to adoption of the proposed modification, and if requested within 7 days of the planned adoption, a public hearing must be held.[57]

As a result of the most recent amendments in 2021, local governments are required to make information on SDC rates, methodologies, planned capital improvement project funding, and local official contact information available on a website or other means free of charge upon request.[58]

[54] ORS 223.311. While not required, some local governments track fund balances for improvement fees and reimbursement fees separately, because there are fewer restrictions on reimbursement fee spending.

Part 2: The Role of SDCs in Funding Infrastructure

Primary Contributors: ECONorthwest, FCS GROUP, Galardi Rothstein Group

2.1 Evolving Fiscal Context

There are a number of potential funding sources for water, wastewater, stormwater, transportation and parks infrastructure. However, the level of funds available to support development-driven infrastructure is constrained by local, state, and federal laws (that limit overall funding) and by rising costs for system operations, repair and replacement, and other capital improvements (that compete for some of the same funds). Beyond legal restrictions, broad local funding sources, like utility fees, are also increasingly constrained by concerns over ratepayer affordability, as ongoing user fees place an added burden on local households.

Exhibit 2 provides a list of potential infrastructure funding sources, which are described in more detail in Appendix D. While it is beyond the scope of this study to fully evaluate the trade-offs associated with each option, Sections 2.1.1 through 2.1.4 discuss key local, state and federal cost and funding trends that have elevated the importance of SDCs for funding development-driven infrastructure costs and implications of shifting the cost burden to other local sources like user fees.

Exhibit 2: Potential Infrastructure Funding Sources

Category	Examples
State and federal grants or low-interest loans	Water Wastewater Fund, Congestion Mitigation and Air Quality Improvement Program, Safe Drinking Water Revolving Loan Fund
Property tax-based funding	General obligation bonds, designating existing permanent rate operating tax revenue, or redirecting growth in operating revenue through tax increment financing
User-based funding	Utility rates, parking fees, facility rental fees, tolls, and system-wide user charges
Development-based funding	System-wide or area-specific SDCs, exactions, development agreements, local improvement districts
Fees or taxes on economic activity	Franchise fees, local gas tax, vehicle registration fees, prepared food and beverage tax, or transient lodging tax

2.1.1 Federal and State Funding Trends

Trends in Federal Funding for Infrastructure

Historical Trends

The U.S. Congressional Budget Office (CBO) describes historical trends in federal funding for infrastructure compared to state and local funding, going back to the 1950s:

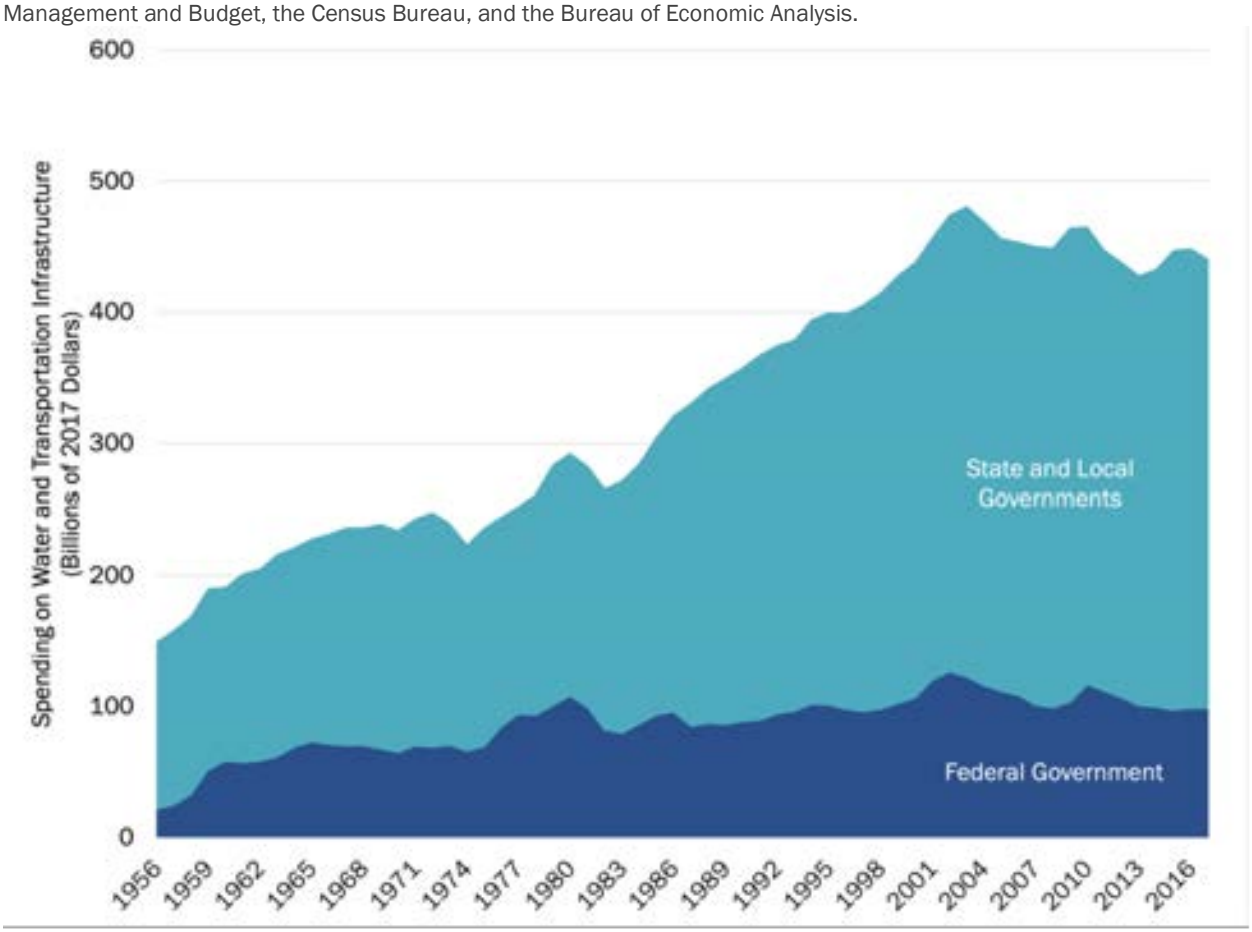
> *From the 1950s to the 1980s, the federal share of public infrastructure spending was typically much larger than it is today, reaching a high of 38 percent in 1977. But that share started to decrease in the 1980s, when state and local governments began to invest more in transportation and water infrastructure while federal spending on infrastructure remained relatively stable. Since 1987, federal spending has accounted*

for roughly one quarter of public spending on transportation and water infrastructure.[59]

This is shown in Exhibit 3.

Exhibit 3: Public Spending on Transportation and Water Infrastructure by Level of Government, 1956-2017

Source: ECONorthwest using data from the Congressional Budget Office, originally drawn from data from the Office of Management and Budget, the Census Bureau, and the Bureau of Economic Analysis.



Dollar amounts are adjusted to remove the effects of inflation using price indexes for government spending that measure the prices of materials and other inputs used to build, operate, and maintain transportation and water infrastructure.

The CBO notes that the American Recovery and Reinvestment Act (ARRA) "temporarily boosted federal outlays for infrastructure by $55 billion, in nominal terms, over the 2009–2014 period; about one-half of that amount was spent in 2009 and 2010."[60]

Impact of Recent Infrastructure Spending Packages

The summary referenced above from the CBO predates passage of the federal Bipartisan Infrastructure Law introduced in mid-November of 2021, which allocated funding to over 350

[59] Congressional Budget Office, "Public Spending on Transportation and Water Infrastructure, 1956 to 2014," https://www.cbo.gov/sites/default/files/114th-congress-2015-2016/reports/49910-infrastructure.pdf, March 2015, page 27.

[60] Ibid, page 16.

programs across several federal departments and agencies to improve broadband, rail and transit, clean energy, water, and other infrastructure.[61] This infrastructure bill specifically budgeted almost $570 billion for transportation projects, including roads, bridges, public transit, passenger and freight rail, and airports and waterways projects.[62] Furthermore, the bill's budget allocated over $100 billion to resilience, water infrastructure, and clean drinking water projects. These investments far exceed those noted above from the ARRA and could dwarf federal spending on transportation and water infrastructure in 2017.

Exhibit 4: Bipartisan Infrastructure Law Budget, 2021: Transportation and Water Investments
Source: The White House. 2022. "Data Guidebook." A Guidebook to the Bipartisan Infrastructure Law.

Investment Category	Budgeted (in billions)
Transportation	569
Roads, Bridges, and Major Projects	326
Public Transit	83
Passenger and Freight Rail	63
Electric Vehicles, Buses, and Ferries	19
Airports, Ports, and Waterways	42
Safety	38
Resilience, Water Infrastructure, and Clean Drinking Water	102
Total Transportation, Resilience, and Water	671

Additional discussion of recent federal legislation related to infrastructure funding for specific types of infrastructure is included in the following sections.

Variation by Infrastructure System

Federal contributions to infrastructure have varied between water and transportation over time, as shown in Exhibit 5. This shows that federal contributions to water infrastructure have dropped more dramatically as a share of total public spending, while federal transportation investments have remained relatively flat relative to total public spending.

Federal Spending on Water and Wastewater Infrastructure

Historical Trends in Federal Water and Wastewater Spending

Data on public spending for water resources and water and wastewater utilities[63] specifically (Exhibit 6) shows the rise of state and local spending for water-related infrastructure, and the decline in federal investment since the 1980s.[64] Spending on water supply and wastewater treatment facilities increased in the mid-1970s when the federal government provided grants to state and local governments under the Clean Water Act of 1972.[65]

[63] According to the CBO data notes, "Water resources include water containment systems (dams, levees, reservoirs, and watersheds) and sources of freshwater (lakes and rivers). Water utilities include water supply and wastewater treatment facilities."

[64] The rise in spending may be attributed to numerous factors including state and federal mandates and extensive need for infrastructure repair and replacement. In Oregon, recent changes to land use laws imposed on communities over 25,000 population by House Bill 2001 will further increase infrastructure spending needs for some local agencies to upgrade infrastructure to accommodate higher density development.

[65] Congressional Budget Office, "Public Spending on Transportation and Water Infrastructure, 1956 to 2014," March 2015, page 16.

Exhibit 6. Public Spending on Water Infrastructure* by Level of Government, 1956-2017

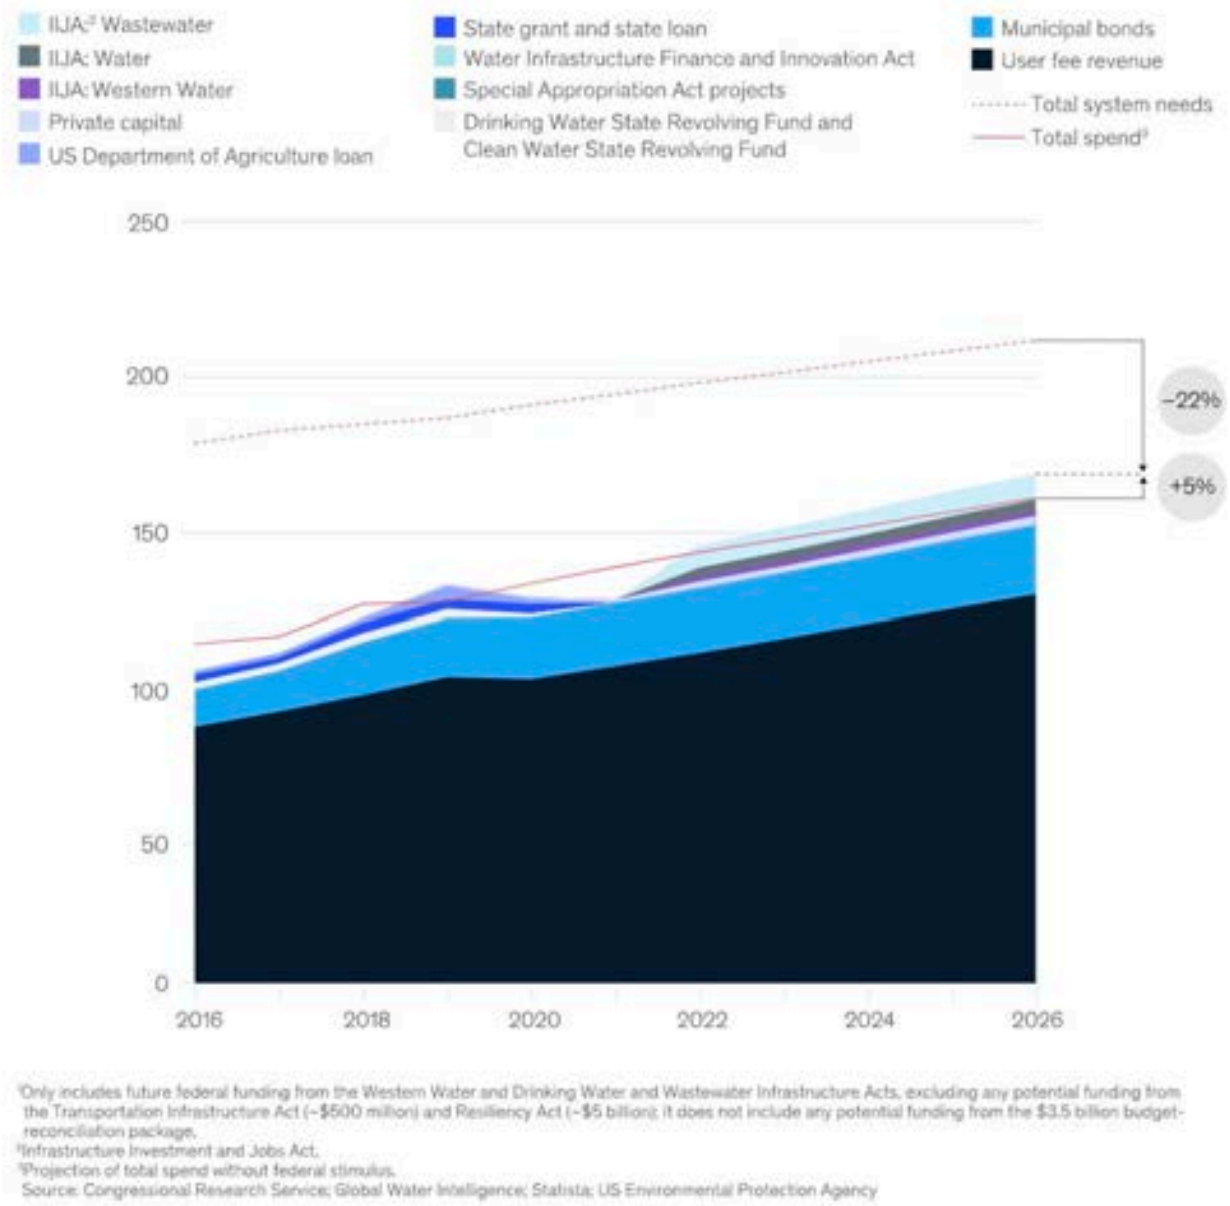
*Combines data on water resources, which include water containment systems (dams, levees, reservoirs, and watersheds) and sources of freshwater, and water utilities, which include water supply and wastewater treatment facilities.

Recent Federal Funding Commitments for Water and Wastewater

Federal legislation like the Water Infrastructure Finance and Innovation and Infrastructure Investment and Jobs Acts have also contributed new critical funds for restoration and improvement since 2017 not reflected in Exhibit 6, including over $55 billion of new investment. However, as Exhibit 7 shows, the combination of user fee revenue, municipal bonds, and increased funding from state and federal sources is still projected to leave a gap between available and necessary funds for these systems.[66]

[66] McKinsey & Company, "US Water Infrastructure: Making Funding Count," November 24, 2021, https://www.mckinsey.com/industries/electric-power-and-natural-gas/our-insights/us-water-infrastructure-making-funding-count.

Exhibit 7. Water and Wastewater Funding Sources by Year, $ billions
Source: McKinsey and Company[67]



Some of the largest federal contributions will be under the existing Drinking Water State Revolving Fund and Clean Water State Revolving Funds. While roughly half of their $22 billion allocation is required to be in the form of grants or forgivable loans, the remainder will need to be repaid over time by the agencies receiving the funds.[68]

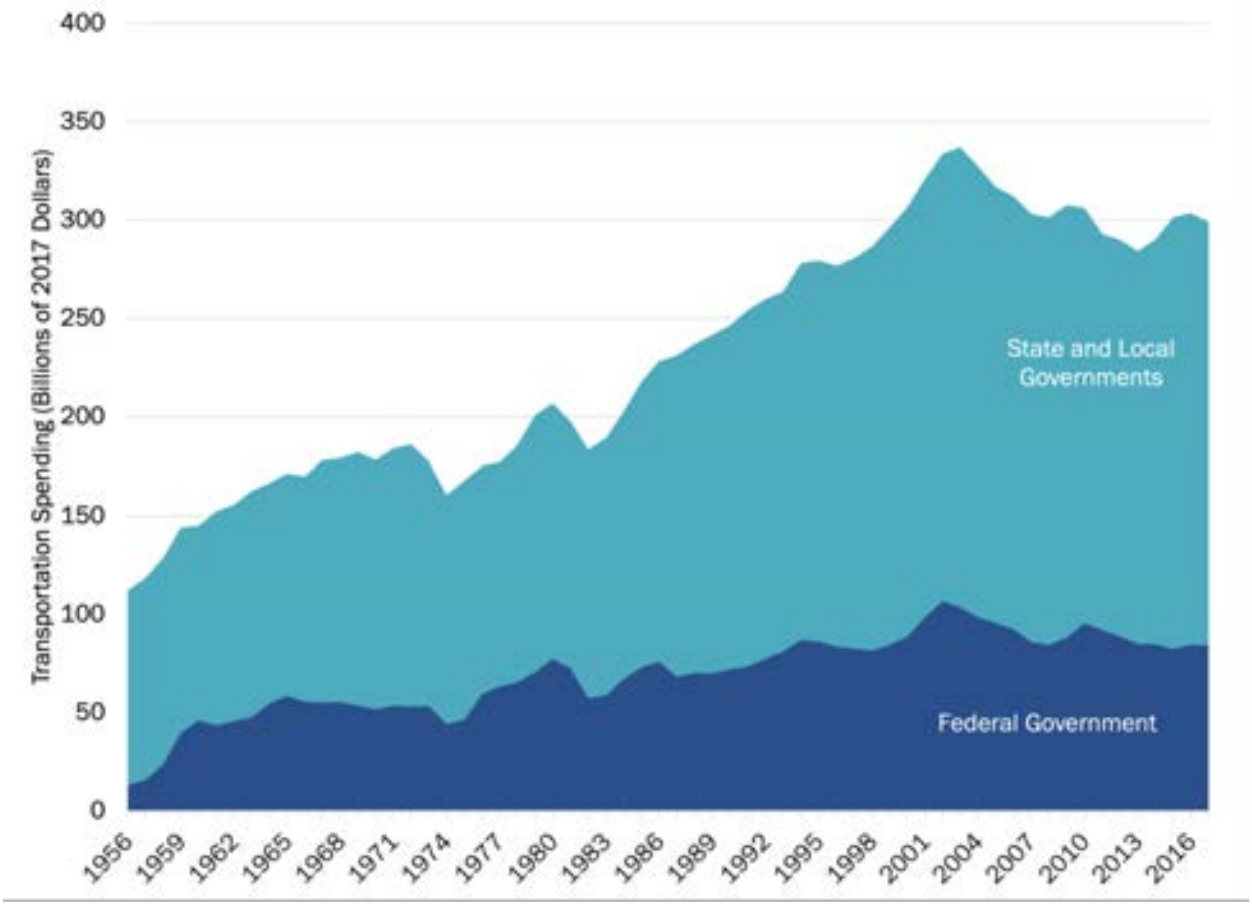
Federal Spending on Transportation

Historical Trends in Federal Transportation Spending

According to the CBO, "spending on highways increased under the Federal-Aid Highway Act of 1956 when the federal government funded construction of the Interstate Highway System. In the late 1990s, spending on highways and mass transit increased under the Transportation Equity Act for the 21st Century." As shown in Exhibit 8, federal transportation spending has been relatively flat to slightly declining since the late 1990s in real terms.

Exhibit 8: Public Spending on Transportation* Infrastructure by Level of Government, 1956-2017

Source: ECONorthwest using data from the Congressional Budget Office, originally drawn from data from the Office of Management and Budget, the Census Bureau, and the Bureau of Economic Analysis.



* Transportation infrastructure includes highways, mass transit and rail, aviation, and water transportation.

According to one study:

> *The highway system that was to be primarily funded by federal sources has fallen into disrepair with increasing congestion because of inadequate federal funding. States elected not to assume the primary role that the federal government was abandoning for precisely the same reason that the federal government was abandoning it: cost. The*

responsibility for highway maintenance and other major public investments has fallen to local jurisdictions by default.[69]

Another component of federal funding for transportation in Oregon comes from federal timber payments in lieu of property taxes, 75 percent of which are dedicated to transportation. With declining timber harvests, these payments have been reduced, even with special allocations to address the decline.[70]

Recent Federal Funding Commitments for Transportation

The Bipartisan Infrastructure Law is expected to boost federal spending on transportation in Oregon, some of which will include projects that would otherwise be funded (in whole or in part) at the local level, including bridge replacements, safety improvements, and climate resilience. (Note that these types of capital improvements are generally not growth-related, and they are less likely to include projects that would be eligible for significant funding from SDCs.) Much of the funding that could go towards local projects will be allocated through competitive grants.[71]

State Funding for Transportation

Revenue limitations have affected state funding for transportation as well. Oregon's State Highway Fund is shared among the state highway program, county roads, and city streets under a formula in which approximately 50 percent of revenues go to the state, 30 percent to counties, and 20 percent to cities. The State Highway Fund's revenue sources include state fuel taxes, state weight-mile taxes on trucks, state vehicle registration and title fees, and federal funds. Neither fuel taxes nor user fees are indexed to inflation, and increasing vehicle efficiency, along with hybrid and electric vehicles, are reducing fuel consumption, which have led to flat or decreasing funding from these sources.[72]

Federal Financial Backing for Subdivision Development

The spike in federal transportation spending in the post-World War II era was accompanied by federal housing policies that supported new housing development and developers' ability to finance greenfield development costs. During that period, the Federal Housing Association (FHA) incentivized developers to build large new segregated single-family subdivisions through guaranteeing bank loans and mortgage insurance by way of pre-construction plan approvals.[73] The FHA's approval of subdivision plans ensured builders' ability to obtain low-

[73] Rothstein, Richard. 2018. *The Color of Law*. New York, NY: Liveright Publishing Corporation. p. 70, 75.

interest loans issued by banks to finance their construction projects.[74] At this time, banks were usually cautious about issuing loans for working families, but they often did so when the mortgages were insured.[75] Therefore, because the FHA's approval of the pre-construction plans would automatically guarantee mortgage insurance, this meant little risk for the banks, and so they regularly financed these massive subdivision construction projects and land aquations costs, sometimes covering the full cost of entire suburbs.[76]

However, there was a major caveat to attaining the FHA's approval and mortgage insurance: the requirement of an "openly stated prohibition on sales to African Americans."[77] FHA rejected subdivision construction proposals that either considered housing African Americans and/or were to be built too close to where predominantly non-white communities resided. Anything that threatened possible integration was not federally insured.[78] The FHA (and later the Department of Veterans Affairs) required that any mortgage insurance approval would be reliant upon the addition of racially restrictive covenants in every one of the subdivisions' property deeds, often with overt racist language such as "*no lot or portion of a lot or building erected thereon shall be sold, leased, rented, or occupied by any other than those of the Caucasian race*."[79]

Thus, suburban development during the post-World War II era enjoyed federally supported low-interest financing that facilitated infrastructure investments by private developers, but only for segregated, white-only subdivisions.

2.1.2 Infrastructure Cost Trends

Costs Associated with Changing Environmental Regulations

A growing understanding of the importance of environmental and public health protections has led to an increase in federal regulations that affect water, wastewater, stormwater, and transportation infrastructure, including the National Environmental Policy Act (NEPA) of 1969, the Clean Air Act (CAA) of 1970, the Clean Water Act (CWA) of 1972 (CWA), and the Endangered Species Act (ESA) of 1973. These policies have led to major improvements in environmental protection and human health, but not without cost.

A study of the state and local costs associated with the Clean Water Act (CWA), for example, found that local government wastewater expenditures increased by $157 per capita, or over 230 percent, after the implementing CWA mandates. Total city expenditures increased by

[74] Rothstein, Richard. 2018. *The Color of Law*. New York, NY: Liveright Publishing Corporation, p. 10.

[79] *Ibid.*, p. 84-85.

approximately 33 percent, primarily driven by increased wastewater spending. To recoup the expenditures, cities increased wastewater user fees by $40.80 per capita.[80]

Another study found that the cost of water pollution control for streets also increased the cost burden on local governments:

> *As a result of new federal environmental mandates, local jurisdictions were also being directed to make massive investments in water pollution control facilities. These investments originally were funded up to 85 percent by federal grants. They are now funded by federal loans amounting to 45 percent.*[81]

Other regulatory requirements that improve safety and resilience but increase the amount of capital needed for improvements include addressing levels of harmful polyfluoroalkyl substances (PFAS) in drinking water, combined-sewer overflows, phosphorus and nitrogen levels that impact algae blooms, and preparation for extreme weather events.[82]

In Oregon, the rising cost of keeping up with safety improvements may have disparate impacts across the state. Many smaller cities lack the funding capacity to add additional expenses for treatment and may not qualify for grants or loans because of population size or leverage in the form of matching funds.[83]

Operations and Maintenance Costs

As the total amount of infrastructure has grown over time and major facilities built in previous decades have aged, the cost of operations and maintenance for existing facilities has increased, with much of this cost falling on local governments.

> *Spending for the operation and maintenance of all types of transportation and water infrastructure has increased steadily since 1956. Spending for capital—particularly for mass transit and rail, for aviation, and for water utilities—has also increased since then, but it has typically done so at a lower rate.*[84]
>
> *Since 1956, state and local governments' expenditures for the operation and maintenance of infrastructure have grown at an average annual rate of 2.4 percent, roughly three times faster than the 0.9 percent average annual growth rate of*

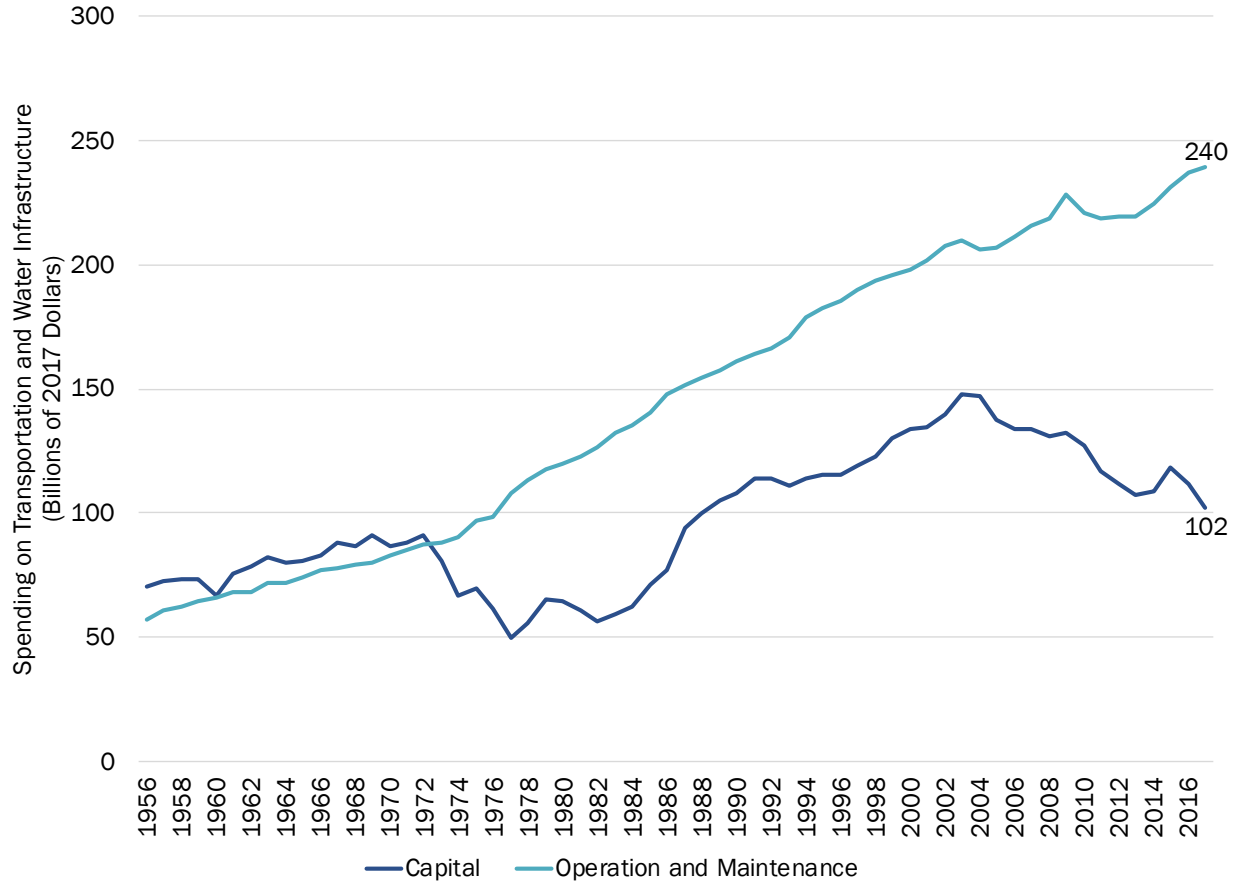
spending on capital. As a result, although state and local governments spent more for capital than for operation and maintenance in 1956, state and local spending for operation and maintenance has exceeded capital spending each year since 1973.[85]

This is shown in Exhibit 9.

Exhibit 9: State and Local Spending on Transportation and Water Infrastructure, by Category of Spending, 1956 to 2017

Source: ECONorthwest using data from Congressional Budget Office originally drawn from data from the Office of Management and Budget, the Census Bureau, and the Bureau of Economic Analysis.



State and local spending is net of federal grants and loan subsidies.
a. Dollar amounts are adjusted to remove the effects of inflation using price indexes for government spending that measure the prices of goods and services consumed by governments, including materials and other inputs used to operate and maintain transportation and water infrastructure.
b. Dollar amounts are adjusted to remove the effects of inflation using price indexes for government spending that measure the prices of materials and other inputs used to build transportation and water infrastructure.

The Bipartisan Infrastructure Law's focus on bridge repair and replacing lead drinking water pipes[86] could mitigate some of the more costly maintenance needs affecting water and transportation infrastructure, but it will not eliminate local operations and maintenance and

[85] Congressional Budget Office, "Public Spending on Transportation and Water Infrastructure, 1956 to 2014," https://www.cbo.gov/sites/default/files/114th-congress-2015-2016/reports/49910-infrastructure.pdf, March 2015, page 22.

[86] The White House, "President Biden's Bipartisan Infrastructure Law", https://www.whitehouse.gov/bipartisan-infrastructure-law/

other system replacement costs. A recent assessment found that "even a large increase in federal funding won't fully cover the needed investment."[87] Some localities are employing strategies like new metering technology to more efficiently track and plan for demand (ideally saving costs in the long run), but that may require startup capital for these upgrades.[88]

Rising Capital Construction Costs

The most widely used construction cost indices in the Pacific Northwest are the Construction Cost Index (CCI) for Seattle and the 20-City Average Index, both published by the *Engineering News-Record (ENR)*. Exhibit 10 shows the annual average percent change in each index between 2007 and 2021. While the Seattle index has greater variation from year-to-year (particularly during the Great Recession and the few years following recovery), the longer-term trends of both indices are similar, with each increasing an average of about 3.0 percent per year. However, national and regional costs have increased significantly in the first half of 2022. Both the Seattle and 20-City average indices increased by 8-10 percent through June, compared to the 2021 annual average indices.

[88] *Ibid.*

2.1.3 Property Tax Limitations

Starting around 1974, the U. S. experienced an inflationary period that significantly affected home prices. In areas where property tax bills were based on the market value of the home, resulting tax increases drew resistance. In 1978, voters in California passed the first of many such anti-tax measures across the country. Proposition 13 amended the California Constitution in three important ways:

- Real property valuations were rolled back to their 1975-76 values.
- Increases in assessed value were limited to 2 percent per year.
- Except for some voter-approved levies, total property tax per year was limited to 1 percent of a property's assessed value.

Oregon Property Tax Measures

Oregon's property tax system changed substantially in the 1990s, following the trend in California and other states. The system as it existed in the early 1990s, and the major changes to it, are described in a publication from the Oregon Department of Revenue.[89] Excerpts of this summary are included below:

> *Measure 5, which introduced tax rate limits, was passed in 1990 and became effective in the 1991-92 tax year. When fully implemented in 1995-96, Measure 5 cut tax rates an average of 51 percent from their 1990-91 levels. Measure 50, passed in 1997, cut taxes, introduced assessed value growth limits, and replaced most tax levies with permanent tax rates. It transformed the system from one primarily based on levies to one primarily based on rates. When implemented in 1997-98, Measure 50 cut effective tax rates an average of 11 percent from their 1996-97 levels.*
>
> ***Pre-Measure 5***
>
> *Pre-Measure 5 Oregon had a pure levy-based property tax system until 1991-92. Each taxing district calculated its own tax levy based on its budget needs. … Generally speaking, the full market value of property was taxable; there was no separate definition of assessed value. …Most levies were constitutionally limited to an annual growth rate of 6 percent, and levies that would increase by more than 6 percent required voter approval. …The annual growth in taxes on an individual property depended on a number of factors, including new or larger levies and the amount of new construction within the district. …*
>
> ***Measure 5***
>
> *Measure 5 introduced limits, starting in 1991-92, on the taxes paid by individual properties. The limits of $5 per $1,000 real market value for school taxes and $10 per*

[89] Oregon Department of Revenue, "A Brief History of Oregon Property Taxation," 150-303-405-1 (Rev. 6-09). https://www.oregon.gov/DOR/programs/gov-research/Documents/303-405-1.pdf

$1,000 real market value for general government taxes apply only to operating taxes, not bonds. If either the school or general government taxes exceeded its limit, then each corresponding taxing district had its tax rate reduced proportionately until the tax limit was reached. This reduction in taxes to the limits is called "compression." …

Measure 50

The objective of Measure 50 was to reduce property taxes in 1997-98 and to control their future growth. It achieved these goals by cutting the 1997-98 district tax levies, and by making three changes: switching to permanent rates, reducing assessed values, and limiting annual growth of assessed value.

While Measure 5 simply limited the tax rates used to calculate taxes imposed, Measure 50 changed the concepts of both assessed values and tax rates. Assessed value is no longer equal to real market value. For 1997-98, the assessed value of every property was reduced to 90 percent of its 1995-96 assessed value. …

For existing property, Measure 50 limited the annual growth in assessed value to 3 percent. …For new property (e.g., newly constructed homes), assessed value is calculated by multiplying the new property's real market value by the ratio of assessed value to real market value of similar property. …

Under Measure 50, permanent tax rates replaced most levies, making the permanent rates central to the property tax system. There are three types of property taxes that taxing districts may impose: taxes from the permanent rates, local option levies, and bond levies. Only the permanent rates are fixed. …

Taxes from the permanent rates, typically referred to as operating taxes, are used to fund the general operating budgets of the taxing districts. … Local option taxes represent the only way taxing districts can raise operating revenue beyond the permanent rate amount. Even so, these taxes are the first to be reduced if the Measure 5 limitations are exceeded. Because voters at the local level must approve these levies, they represent one aspect of local control over the level of property taxes.

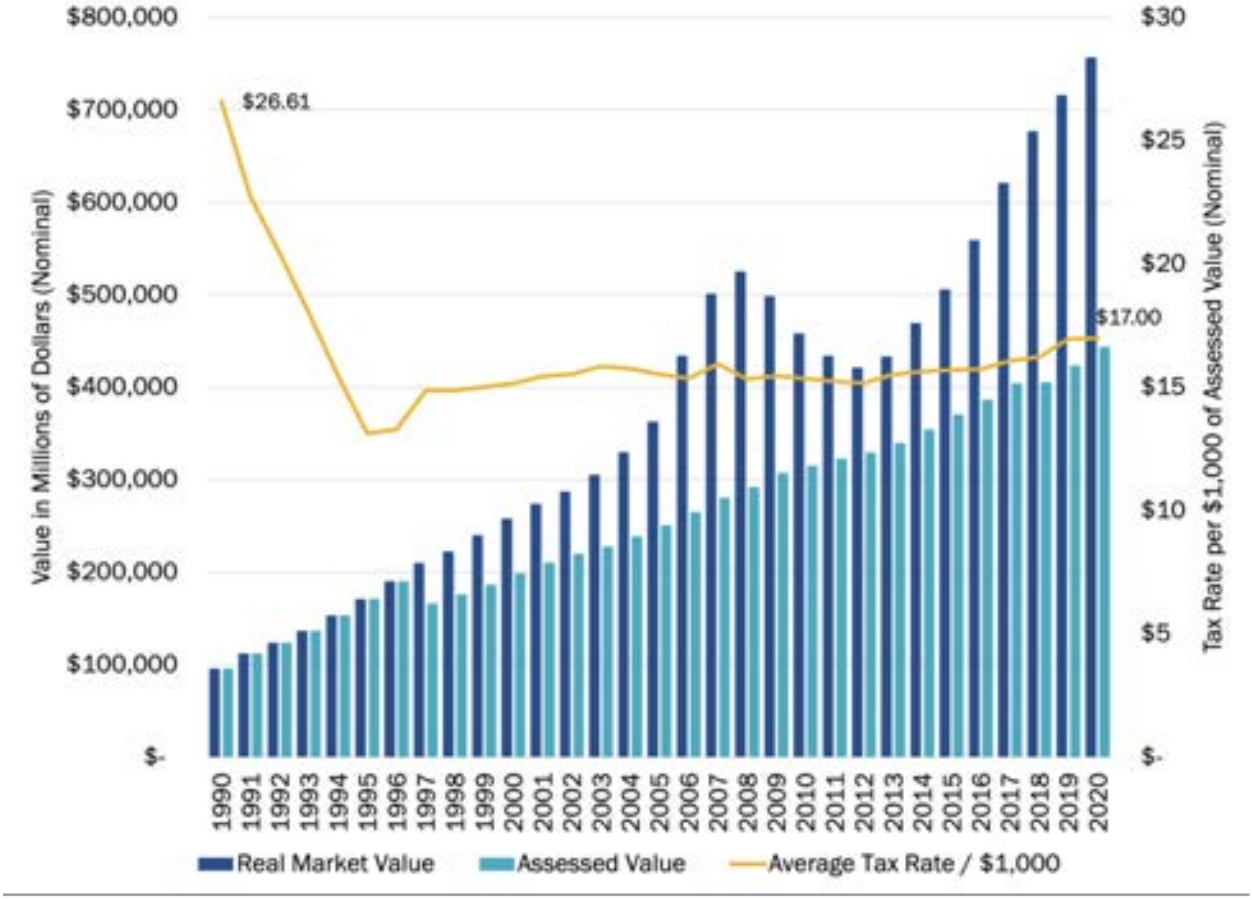
Bond levies have remained largely unchanged. They are used to pay principal and interest for bonded debt. Under the provisions of Measure 50, new bond levies, like new local option levies, are subject to a 50 percent voter participation requirement if the election is not a general election.

The statewide revenue implications of these measures can be seen in data from tables published by the Oregon Legislative Revenue Office, as summarized in Exhibit 11 and Exhibit 12, based on data from the Oregon Department of Revenue.

In Exhibit 11, the impact of Measure 5 can be seen by the decrease in the "Average Tax Rate/$1,000" beginning in July 1991 (the start of FY 1991-92). Similarly, the impacts of Measure 50 are reflected in the July 1997 decrease and then generally smaller increases in "Assessed Value," as compared to the "Real Market Value" column.

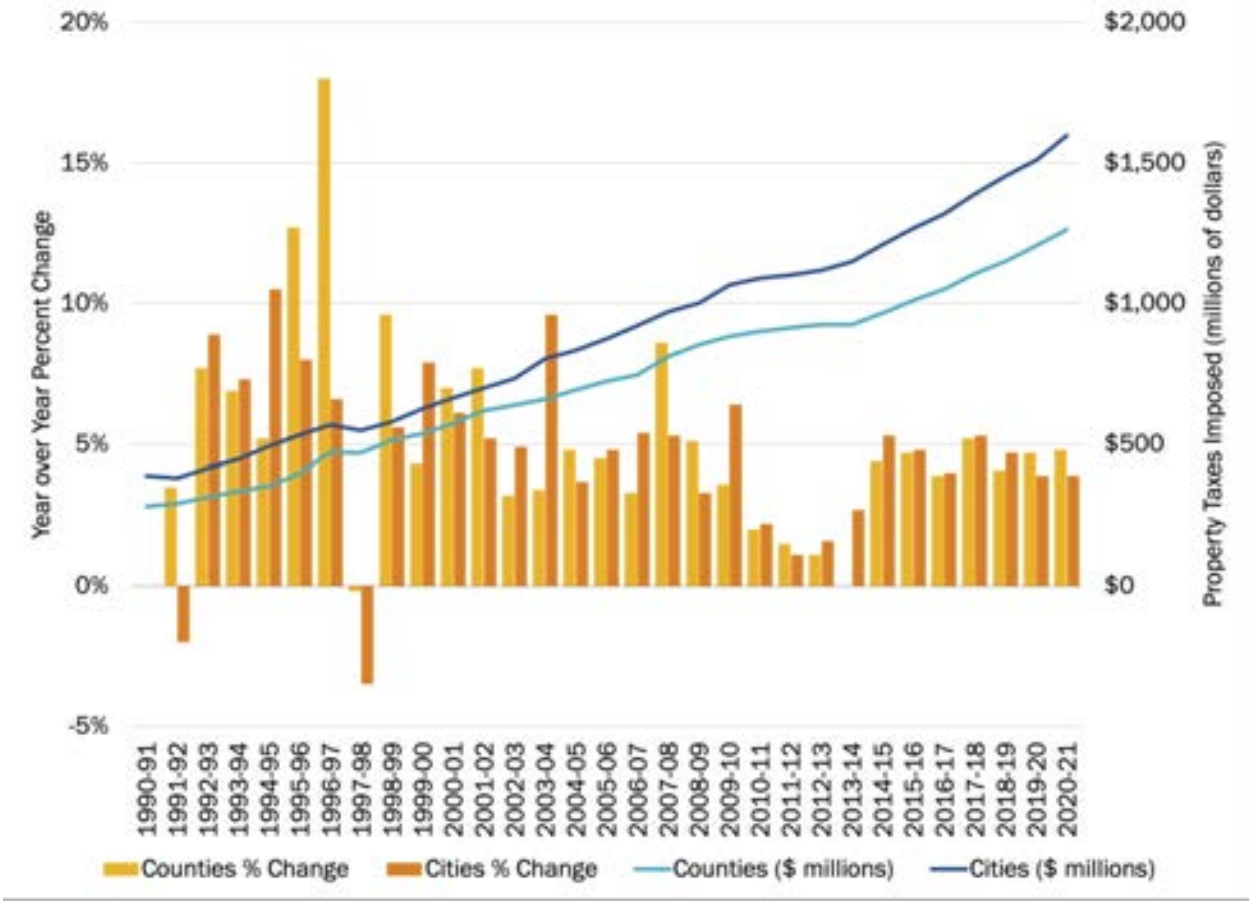
Exhibit 11. Property Value (Real Market Value and Assessed Value) and Effective Tax Rate History, Oregon (Statewide), 1990-2020

Source: ECONorthwest and FCS GROUP, using data from Oregon Legislative Revenue Office, *2022 Oregon Public Finance: Basic Facts*, page D6



The impacts of these measures on city and county revenues become even clearer when the resulting property tax imposed for the same period are considered, as shown in Exhibit 12.

Exhibit 12. Property Tax Revenue History
Source: ECONorthwest and FCS GROUP, using data from Oregon Legislative Revenue Office, *2022 Oregon Public Finance: Basic Facts*, page D10



In addition to constraining property tax revenue, the requirement for voter approval of new bond levies increases the political difficulty of using this mechanism to fund capital improvements in infrastructure.

2.1.4 Trends in Utility Rates and Other User Fees

The combined effect of state property tax limitations and flat or reduced federal funding has been increased pressure on local government-controlled user fees to meet growing infrastructure funding needs (both operation and maintenance and capital investment). This has resulted in significant increases in water, wastewater, and stormwater utility rates (ongoing charges to utility customers based on system-specific usage measures) and imposition of new user fees for other government services (e.g., parks and transportation).

Utility Rates

National Rate Trends

For the past several decades, utility rate increases have significantly outpaced growth in the Consumer Price Index (CPI). Between the mid-1980s and 2000, the increase in water and sewer

bills exceeded CPI growth by 50 percent.[90] More recently, the growth in utility bills relative to the CPI has become even more pronounced. Between 1997 and 2017, utility bills (water, sewer, and trash combined) increased an estimated 130 percent (4.3 percent per year on average), compared to 52 percent increase in the CPI (2.1 percent per year on average), as shown in Exhibit 13.[91] Even more recent data (see Exhibit 14) shows average utility rate increases for water and wastewater services of roughly 80 percent as of 2020 compared to 2008 levels (5.1 percent per year on average), while the CPI increased a little over 20 percent over the same period (1.7 percent per year on average).

Percent change is cumulative increase relative to 2008 baseline.

Drivers of Rate Increases

As discussed in prior subsections, historical cost increases have reflected landmark regulations and growth in system operation and maintenance needs. Other cost factors include growing infrastructure replacement needs and investments to address climate and seismic resiliency.

National data suggests that operating expenses account for a substantial share of utility rates: between 45 and 67 percent of water and wastewater rates typically go towards operating expenses depending on the year and the scale of the service provider, with an average of 52 percent for water utilities and 54 percent for wastewater utilities in 2020.[93] However, growth in operations and maintenance costs are not the only reasons for increasing rates.

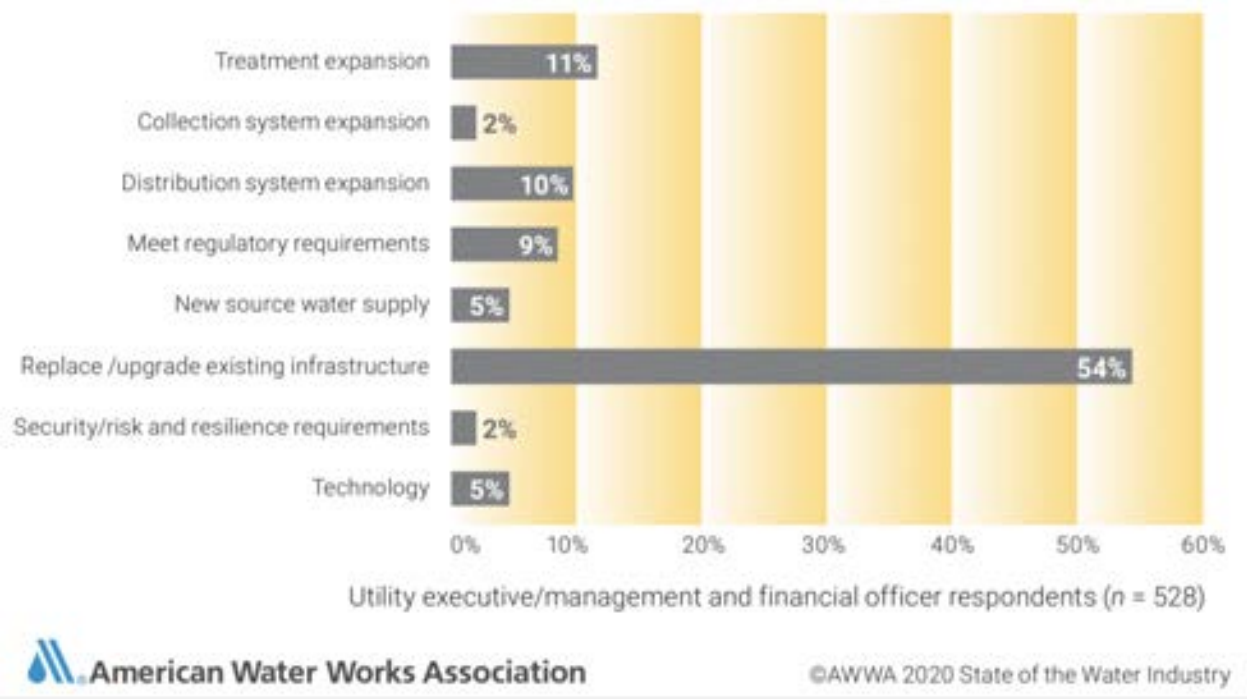
One study, which estimated an average 43.2 percent increase in water and wastewater bills from 2012 to 2021, pointed to regional differences in what was driving those increases (e.g., utilities in the Western U.S. investing in new water supplies due to drought vs. those in the Northeast facing aging pipe and treatment systems) and noted that "the most significant water

[93] American Water Works Association and Raftelis Financial Consultants, Inc., *2021 Water and Wastewater Rate Survey.*

rate increases have been in response to specific capital investment needs," including wastewater treatment plant upgrades to address water quality issues and a major water system improvement plan.[94]

A range of drivers within capital-related costs is also reflected in data from a national survey regarding anticipated capital expenditures by water utilities, as shown in Exhibit 15. Based on this survey, more than half of expected capital expenditures for water utilities in 2020 were expected to be for replacements and upgrades to existing infrastructure, but expansion of treatment, collection, and distribution systems as well as new source water supplies were expected to account for a total of 28 percent of capital spending.[95]

Exhibit 15: Anticipated Water Utility Capital Spending in 2020
Source: American Water Works Association[96]



While the specific drivers vary for each community and over time, recent examples from two Oregon communities illustrate the role that capital improvements can play in driving rate increases in some communities:

[94] Bluefield Research, "Up 43% over Last Decade, Water Rates Rising Faster than Other Household Utility Bills," August 23, 2021. https://www.bluefieldresearch.com/ns/up-43-over-last-decade-water-rates-rising-faster-than-other-household-utility-bills/

[95] American Water Works Association, *State of the Water Industry 2020*, page 21. https://www.awwa.org/Portals/0/Awwa/Professional%20Development/2020SOTWIreport.pdf

[96] *Ibid.*

- In a 2017 rate study for the City of Newport, FCS GROUP estimated that debt payments on needed capital improvements would increase revenue requirements for water and sewer by 4 to 8 percent per year over 5 years.[97]
- A 2018 Water Affordability Assessment Report from the City of Hillsboro highlighted the role of rising capital costs in recent and projected rate increases: *"…over the last few years, rate increase percentages have been on the rise due primarily to rising capital costs caused by needed improvements to the existing infrastructure and also the construction of a second water supply system to serve Hillsboro's growing needs. A Water Rate Study is underway and will most likely suggest double-digit percentage rate increases until 2026."*[98]

Taken together, the data suggest that utility rates are increasing faster than inflation largely due to factors that are unrelated (or minimally related) to growth, including increasing operation and maintenance costs and the need to replace or upgrade older infrastructure to meet current standards or due to deterioration, though growth-related costs can contribute to rate increases in some cases. Consequences for rate affordability and capital funding choices are discussed in Section 2.2.4.

Other System-Wide User Charges

In the context of fiscal constraints, local governments have increasingly implemented other types of user fees for a broader suite of government services such as parks, streets, public safety, and others. In 2018, research by the City of Salem found 50 cities charging such user charges (sometimes referred to "operating fees") across the state, for various services.[99]

While on-going user charges or operating fees have helped to fill the void created by tax limitations, they typically rely on political/public support for fee increases, and as discussed later in this report (Section 2.2.4), fee levels are approaching unaffordable levels for larger segments of the population. Limitations on fee increases often mean that the fees for some services such as transportation and parks may only be sufficient to fund ongoing operation and maintenance costs (e.g., pavement preservation), as opposed to large-scale capital projects.

2.2 SDCs' Role in Local Infrastructure Funding

2.2.1 Perspectives From Oregon Jurisdictions

As noted previously, the Oregon SDC Act was intended to provide a mechanism for recovering growth-related infrastructure costs from new development and to avoid shifting those costs to existing rate and taxpayers. Local agencies participating in the Oregon SDC Project Focus Groups indicated that SDCs have become an increasingly important way to address these intergenerational equity concerns, particularly in fast-growing communities.

In focus groups, most service providers highlighted how important SDCs are to their ability to fund infrastructure. As detailed in Appendix A, participants noted several ways in which they play a key role in funding infrastructure:

- Growing communities rely heavily on them, and they are a key part of delivering infrastructure in new growth areas. (Slower growing communities see less SDC revenue and need to rely on other sources.)
- Some service providers highlighted SDCs' importance in contributing to major infrastructure projects that might not have been possible without that contribution.
- Parks and transportation providers in particular noted SDCs' importance for leveraging other funds (e.g., matching funds for state and federal infrastructure grants).
- Those with utility rates highlighted the importance of SDCs to balance out reliance on user rates, and highlighted equity considerations from putting the cost of capacity increases on existing users.

2.2.2 SDCs as Part of an Infrastructure Funding Plan: Examples From Oregon

This section summarizes examples from a number of jurisdictions and situations—urban growth boundary expansion area funding plans, a citywide transportation funding strategy, and funding for major water supply capacity increases—to give a sense of how SDCs contribute to funding local infrastructure in Oregon.

Transportation Funding Plans

Washington County Urban Growth Boundary Expansion Areas

As part of preparing an Infrastructure Funding Plan Toolkit for Washington County as a resource for future infrastructure funding plans for new urban growth areas, ECONorthwest compiled information from several infrastructure funding plans completed for newly urbanizing areas across Washington County. As shown in Exhibit 16, the contribution from SDCs (including the County's Transportation Development Tax (TDT), which is a form of SDC, and supplemental SDCs for some areas) varies substantially between the different expansion areas. The funding plans also include a variety of other sources. Some are simply other

mechanisms for development to contribute, including developer contributions/requirements, a "supplemental fee,"[100] and a local improvement district where the assessment is being paid off as homes are sold. Most, but not all, include some contribution from another source that is not development-derived, such as grants; contributions from Washington County's Major Streets Transportation Improvement Program (MSTIP), which is funded through a general fund allocation; Tax Increment Financing (TIF); and a utility fee surcharge.

Exhibit 16: Example Transportation Infrastructure Funding Plan Strategies
Source: "Infrastructure Funding Plan Toolkit: Guidance for Title 11 Concept and Comprehensive Planning," Prepared by ECONorthwest for Washington County, October 2020. Original data compiled by ECONorthwest using infrastructure funding plans for each planning area.

Planning Area	Total Cost (in $millions)	Transportation funding strategy
URA 6D – King City West	$57.3m	• Supplemental fee: 100% - offset by existing SDCs
River Terrace	$149.6m	• Private cost: 40% • SDC citywide: 20% • Developer contribution: 18% • Transfers: 7% • TDT: 7% • Utility fee surcharge: 3% • SDC subdistrict: 2% • Grants: 2% • Washington County share: unknown
South Hillsboro	$225m	• New tools: 39% • Regional share (e.g., MSTIP): 34% • SDCs: 27%
Evergreen	$51.6m	• Developer requirements: 95% • TIF: 16% • *(surplus revenues identified)*
South Cooper Mountain	$112.4m	• TDT: 27% • Developer contribution: 27% • New SDC: 24% • MSTIP: 21% • Other: <1%

Notes:
TDT = Transportation Development Tax (Washington County's version of a transportation SDC)
MSTIP = Major Streets Transportation Improvement Program, a County program funded through a general fund allocation
The "New tools" listed for South Hillsboro include a Local Improvement District.

Another older example from Washington County is the North Bethany Transportation Funding Strategy. This strategy included up to $10 million from the County's MSTIP; over $21 million from TDT; over $22 million from a new, supplemental North Bethany Transportation System

[100] Some jurisdictions use using "supplemental fees" that are similar to area-specific SDCs but can combine projects from multiple infrastructure systems. These may be imposed as part of annexation agreements for new growth areas rather than implemented under SDC statute.

Development Charge; and over $13 million in additional property taxes from a new North Bethany County Service District for Roads.[101]

While the reality may not always align perfectly with the infrastructure funding plan, this gives a sense of how SDCs can be combined with other funding tools to deliver infrastructure to serve new growth areas. Despite the variation in specifics, **development-derived funding accounts for the majority of the funding for infrastructure in these new growth areas, and SDCs specifically account for a substantial share of funding in most cases.**

City of Bend Transportation System Plan Funding Strategy

As part of the City of Bend's recent Transportation System Plan (TSP) update, ECONorthwest helped develop a Funding Strategy for how revenue from multiple sources would pay for capital costs as well as operations, maintenance, and programs (OM&P) with a focus on projects prioritized for near-term implementation (within the first 10 years of the planning horizon). Exhibit 17 illustrates one of two alternative funding strategies, showing how the available amounts from existing sources and potential new funding sources could be allocated to capital projects vs. OM&P, including existing funding commitments as well as priority new projects and programs. It shows that:

- Nearly all the existing state and federal funding plus local general fund allocations are being directed towards existing operations and maintenance responsibilities.
- Nearly all of the 10-year projected revenue from the existing TSDC was already committed to projects on the near-term capital improvement plan (CIP) list plus debt payments for past capital projects.
- Funding sources such as franchise fees play a comparatively small role in the overall infrastructure funding plan, but they were large enough to include as a relevant funding source.
- The City considered (and ultimately passed[102]) a General Obligation (GO) bond to fund a citywide package of new projects.

[101] Washington County, North Bethany Funding Strategy, October 10, 2021. https://www.washingtoncountyor.gov/lut/documents/north-bethany-transportation-funding-strategy/download?inline

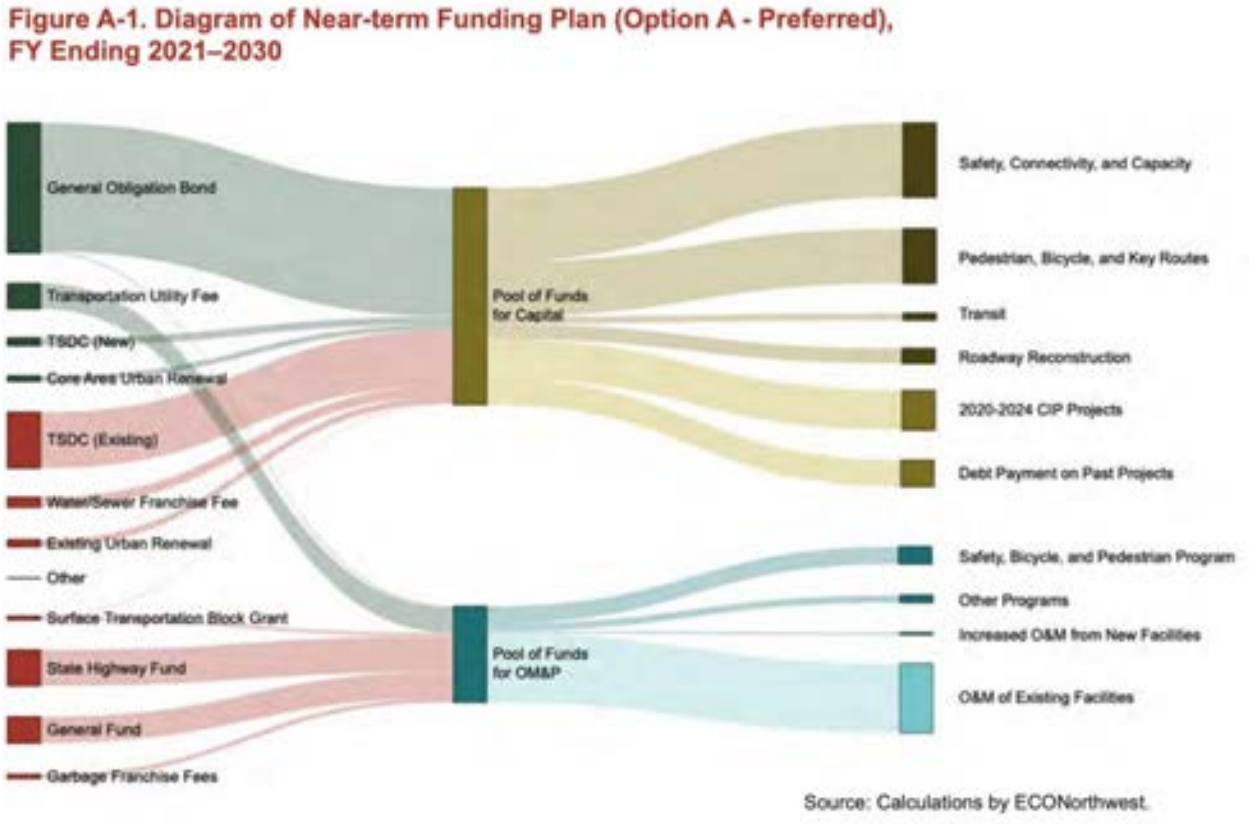
Exhibit 17: Illustrative Diagram of Transportation Funding Sources and Uses for City of Bend Near-Term Funding Plan (2021-2030)

Source: City of Bend Transportation System Plan, Appendix A. Near-term Funding Action Plan, page A-2.[103]



The committee that advised on the TSP and Funding Strategy did recommend some increase to the City's existing TSDC rates as part of the overall funding plan, but limited reliance on this solution due to volatility with development cycles, steep recent increases in TSDC rates and concerns about impacts to development and housing costs, and desire to leave room for use of supplemental TSDCs as a funding option for projects in UGB expansion areas.[104] The City has recently undertaken an TSDC update project that will determine the portion of projected capital improvements that will be funded through TSDCs.

Water Supply Funding

City of Wilsonville Development Moratorium

In the late 1990s, the City of Wilsonville adopted a moratorium on development due to lack of water system capacity. A city memo from that time notes that Wilsonville had relied on wells as its sole municipal water supply source until the 1970s when "it became evident that local aquifers would not be adequate to meet the needs of this growing community" and the City was granted a water right on the Willamette River. By the time of the moratorium, the

[103] Available online at https://www.bendoregon.gov/home/showpublisheddocument/47764/637381859539770000.

[104] City of Bend, *Transportation System Plan Appendix L—Initial Funding Assessment*, January 30, 2019. https://www.bendoregon.gov/home/showpublisheddocument/47702/637372519699600000

"unprecedented growth" had "increased peak water demand to the limit of the City's ability to meet such demand, even with all the operational and capital improvements being undertaken."[105]

As part of the correction plan to allow development to go forward, the City needed to identify funding and financing to pay for costly water supply improvements. The City proposed to increase both water SDCs and water utility rates, using a voter-approved revenue bond to finance the improvements.

This example highlights the role of SDCs in helping fund critical capacity improvements to enable development to resume, even though SDCs reduce but do not eliminate the need to bond against rate revenue to build large infrastructure projects.

City of North Plains

In 2018, the City of North Plains faced water system capacity constraints that had the potential to limit additional growth. As noted in a memorandum from Business Oregon[106]:

> *The City of North Plains storage capacity is limited due to substantial growth within the last few years. The current wholesale water agreement with the Joint Water Commission (JWC) requires the city to maintain a three-day supply at all times. The current storage is meeting the agreement requirements at this time, but the city will be in violation with construction of approximately 700 homes in the near future.*
>
> *The construction of a new two-million-gallon pre-stressed concrete reservoir and pump station and implementation of a new Supervisory Control and Data Acquisition (SCADA) control system will provide for water storage needs through the 25 year Master Plan period, based upon the JWC agreement for required water storage.*

As part of the funding strategy for the new project, the City increased water SDCs to pay for the new reservoir and associated financing costs.[107] The revenue from the updated SDCs was included in the financial proforma the city submitted to Business Oregon as part of its funding package.

2.2.3 Benefits to Developers

In a greenfield setting, and in situations where capacity constraints are severe, infrastructure investments to increase capacity may be essential to enable new development to occur, and SDCs are often a critical part of the infrastructure funding plan to pay for the new facilities or expanded capacity. The alternative could be that development cannot move forward or that the

[106] Memorandum to Chris Cummings, Assistant Director, Economic Development related to City of North Plains, Reservoir & Pump Stations Improvements (June 21, 2018).

[107] Water System Development Charges Methodology Report, Prepared for City of North Plains by Galardi Rothstein Group (December 18, 2017).

first development(s) must take on major infrastructure investments as a condition of approval or through a development agreement, making it more difficult to allocate costs among multiple benefitting property owners or developments. **SDCs may make greenfield development costs more predictable and more evenly distributed, but not necessarily higher, because SDCs may substitute for other forms of exactions or developer contributions.** Area-specific SDCs are sometimes used for this purpose, but jurisdiction-wide SDCs can play the same role if they are providing SDC credits to developers who build the needed infrastructure and charge SDCs to other developers that benefit from it.

SDCs collected across a broad area and used to fund incremental capacity increases in many locations may offer less direct substitution for property-specific exactions. However, the infrastructure they help to fund can contribute to the value of homes in the area generally, as discussed below.

Based on developer interviews, the value that developers ascribe to SDCs depends on how clear it is what is being funded through SDCs and how critical the funded projects are to enabling development to occur.

2.2.4 Benefits to Residents

Amenity Value of Infrastructure

There is strong evidence that living in a community with functioning infrastructure has value to future residents.

- There is substantial literature demonstrating the value of parks to nearby residents. A review of 33 studies suggests that: a) property values are higher closer to parks, b) the price premium is higher for larger parks, and c) the price premium is higher for "passive" parks than for "active" parks.[108]
- There are also studies that show a positive relationship between bicycle and pedestrian facilities and home values.[109] Others show negative economic impacts from transportation delays.[110]

Mitigating Utility Rate and Property Tax Increases

Existing residents also benefit from SDCs by reducing the need for jurisdictions to increase utility rates, pass General Obligation (GO) bonds that increase property taxes, or implement other funding mechanisms that could increase their costs. **While not all of a jurisdiction's capital needs are related to growth and eligible for SDC funding, being able to draw on**

[108] John L. Crompton. 2020. "Impact on property values of distance to parks and open spaces: An update of U.S studies in the new millennium." *Journal of Leisure Research*, 51(2): 127-146.

[110] Transportation Research Board. 2001. NCHRP Report 436. Economic Implications of Congestion. National Cooperative Highway Research Program.

SDCs for costs that are eligible means less cost needs to be allocated to ratepayers or property owners. Without SDCs, existing residents may have to pay for capital improvement projects related to growth through higher utility bills or property taxes.

Utility Cost Impacts Due to Capital Projects

As discussed in Section 2.1.4, utility rates have increased over time. Even with those increases, they typically account for a small percentage of household income and are small in comparison to housing costs (rent or mortgage and other costs of homeownership). However, given the number of other expenses that households must cover, even a small percentage of household income (e.g., less than 10 percent for a lower-income household) can be unaffordable.[111]

In Oregon, a recent League of Oregon Cities rate survey shows an average of roughly $99 per month (about $1,200 per year) in water and sewer rates for a typical single-family home,[112] which is roughly 1.8 percent of the state's median household income.[113] **However, while utility rates may not be problematic for a median-income household, they can be burdensome for low-income households because utility rates and costs do not generally scale with income**. National data suggests that 20 percent of households (as of 2019) and closer to 24 percent of households (in 2021) were spending more than 4.5 percent of their household income on water and sewer bills.[114] A 2018 survey of water customers in the City of Hillsboro found that 10 percent of customers considered their rates so high that "paying them is a struggle."[115]

Many jurisdictions attempt to mitigate affordability issues for their most vulnerable customers through payment assistance options for income-qualified households and/or seniors on fixed income who are unable to afford their bills. (For example, both Newport and Hillsboro, which were used as examples in Section 2.1.4, offer such programs.)

Given that, as described in Section 2.1.4, utility rates are already increasing faster than inflation in many places (mostly due to factors other than growth-related capital costs), even if growth-related capital costs account for a small share of total utility rates, they may layer onto other cost increases. And although utility rates are generally small in comparison to household income and housing costs, utility rate increases can disproportionately affect lower-income households unless the service provider provides a robust customer assistance program. To the extent that

[111] R. Raucher, PhD. And J. Clements (Corona Environmental Consulting), E. Rothstein, CPA (Galardi Rothstein Group) and J. Mastracchio, CFA and Z. Green (Raftelis Financial Consultants), Developing a New Framework for Household Affordability and Financial Capability Assessment in the Water Sector, (April 17, 2019). As described in this report, the approach to defining and measuring affordability is evolving, and there is not a clear agreed-upon standard of affordability for water and wastewater utility rates.

[112] Aljets Consulting. *2021 Water Rates Survey Report*. December 2021. League of Oregon Cities.

[113] Median household income for Oregon is $65,667 based on 2016-2020 American Community Survey data.

[114] McKinsey & Company, "US water infrastructure: Making funding count," November 24, 2021, https://www.mckinsey.com/industries/electric-power-and-natural-gas/our-insights/us-water-infrastructure-making-funding-count

[115] City of Hillsboro Water, "Affordability Program Assessment Report," October 2018, page 3.

SDCs reduce the need for utility rate increases, they can benefit existing residents through lower costs, particularly lower-income households.

Property Tax Impacts Due to Capital Projects

While the details can vary among communities, a few recent examples illustrate the magnitude of property tax increases that could be due to new bonds for funding infrastructure projects:

- The City of Bend GO Bond discussed in Section 2.2.2, for example, had an estimated cost of $170 per year for an average-value home in the City.[116]
- Tualatin Hills Park and Recreation District's 2008 bond measure established a $0.34/$1,000 of assessed value levy,[117] which translates to roughly $100 per year for an average-value home (using an average assessed value for improved residential properties in Washington County of $295,978 as of the 2021/22 tax year[118]).

The magnitude of these costs suggests that the impact of GO bonds on affordability is likely modest for an average household and would account for a small share of an average household's budget. (With the example of Bend's GO Bond, with a median household income of $67,973 as of 2020, the bond cost for an average-value home would account for roughly a quarter of a percent of a median household's annual income.) Because property taxes vary with property value, lower-income households would likely face somewhat lower costs from GO bonds to the extent that they live in lower-value housing, but the costs may not scale linearly with income because all housing costs typically represent a larger share of income for lower-income households.

Part 3: How and Why SDCs Vary Across Oregon

Primary Contributors: Galardi Rothstein Group, FCS GROUP

3.1 SDC Rates: Geographic Variations and Trends

3.1.1 System Development Charges Across the State

Data Sources

Several organizations in Oregon publish compilations of SDC rates for multiple jurisdictions:

- The League of Oregon Cities (LOC) surveys its member cities every three years regarding their usage of SDCs and current rates. LOC's most recent available report is from 2020 based on survey data collected in 2019. LOC has statewide coverage and relatively high participation. In the 2020 report (2019 survey), 96 jurisdictions responded. The respondents were distributed across the state with overrepresentation in the Metro, North Willamette Valley, and Central Oregon regions and underrepresentation of cities in the Coast regions, South-Central Oregon, and the Gorge.[119] Variation in which jurisdictions participate in a given survey can affect year-to-year comparisons. Because survey participants represent cities, there are some inconsistencies in how SDCs administered by special districts and other service providers are reported, given that city staff may not know the rates for all other service providers operating in their jurisdiction. Reported rates focus on single-family detached homes and an office building using example projects.
- The Homebuilders Association of Metropolitan Portland (HBA of Metro Portland) publishes estimates for most jurisdictions in the greater Portland region. The most recent estimates are from 2020 and include both single-family detached and multifamily summaries. Special district SDCs appear to be consistently reported, and special rates for specific subareas are listed in addition to citywide fees. However, the data does not attempt to provide estimated SDCs for an example multifamily project and may not reflect all the adjustments that would apply to a given project. For example, water rates are listed for the same meter size as listed for single-family development, which is typically not the case. The data encompasses most jurisdictions in Washington, Clackamas, and Multnomah Counties, as well as select jurisdictions in Hood River, Yamhill, and Columbia Counties, but it does not cover the balance of the state.[120]
- The Oregon Building Officials Association (OBOA) sends annual fee surveys to members. The most recent available data dates from January 2018 and covers 39

[119] League of Oregon Cities, "System Development Charges Survey Report," February 2020.

[120] Home Builders Association of Metropolitan Portland, "System Development Charges," https://www.hbapdx.org/system-development-charges.html

jurisdictions in various parts of the state. The data covers single-family detached, multifamily, and commercial office development using example projects.[121]

Given that all available sources are at least two years old and that some sources may not capture all special district or county SDCs, FCS GROUP collected data on current (mid-2022) SDC rates from jurisdictions across the state. To allow for historical comparisons, FCS GROUP collected data from jurisdictions that were represented in the oldest LOC survey data available, from 2007, which included a robust number of respondents.[122] Research was based on a combination of fee schedules published on City websites and direct communication with City staff. The 2022 data include regional and district charges that apply in the researched cities, to the extent data were verifiable. Where jurisdictions have area-specific SDCs, the 2022 data collected reflects the citywide rate and does not include supplemental area-specific fees.

To make effective comparisons between jurisdictions, the 2022 SDC calculations are based on the same single-family residence used in the LOC survey, as described in Exhibit 18.

Exhibit 18. Sample Survey Residence
Source: League of Oregon Cities, System Development Charges Survey Report (February 2020), page 3

Single-family, 3-bedroom home	Amount	Units
Lot size:	9,000	sq. ft.
Building size:	2,000	sq. ft.
Development value:	$190,000	
Land value:	$60,000	
Parking spaces:	2	
Water meter size:	¾	inch
Water flow (gallons/month):	6,000	
Fixture units:	16	
Number of employees:	N/A	
Impervious square footage:	1,000	sq. ft.

FCS GROUP did not collect additional data for multifamily SDC rates.

Who Charges and Who Doesn't?

Most cities in Oregon charge at least one of the five allowable SDCs—66 percent of the 2007 LOC survey respondents charge SDCs in 2022.[123] Exhibit 19 shows the number of services charged among those researched, and the average population of those cities.

[121] Oregon Building Officials Association, "OBOA Standards Committee," https://www.oregonbuildingofficials.com/standards

[122] LOC reports that 121 out of 242 Oregon cities (50 percent) responded to the 2007 SDC survey. Of the 121 respondents, 79 (65 percent) charged at least one SDC. Of the 121 initial respondents, updated (2022) SDCs could be verified for 76.

[123] In the 2020 LOC survey, which captured a different sample of Oregon cities, 82 percent of the 96 respondents reported charging at least one SDC.

Exhibit 19. Surveyed Cities Charging SDCs in 2022
Source: FCS GROUP

Cities Charging SDCs	Number of Services Charged						Total
	0	1	2	3	4	5	
# of Respondents	39	3	12	10	17	34	115
% of Respondents	34%	3%	10%	9%	15%	30%	100%
Total population	82,810	18,006	21,750	33,886	247,174	1,406,700	1,810,326
Average population	2,123	6,002	1,813	3,389	14,540	41,374	15,742

This sample data suggests that more populous cities are more likely to use SDCs than less populous cities. This pattern appears in both the most recent LOC data and the HBA of Metro Portland data.

As noted in the *Oregon SDC Study: Summary of Service Providers Focus Groups* (included as Appendix A), factors contributing to local decisions not to charge SDCs include:

- Little development activity.
- Political concerns about affordability or economic development.
- Developers required to install infrastructure directly via exactions.

How Do Rates Vary Across the State?

The cities included in the 2022 data are shown on Exhibit 20 by the total amount charged for the sample single-family detached residence described in Exhibit 18. Cities with no SDCs are largely (but not exclusively) located in eastern Oregon and away from major metropolitan areas. The highest tier of SDCs (between $25,000 and $50,000) are primarily found in the Portland Metro region, though the City of Bend and a few smaller communities, including Carlton, Philomath, Donald, and Newberg, also have SDCs towards the lower end of this range. While not directly comparable due to the age of the data, the 2020 data from the HBA of Metro Portland suggests that there are likely more Portland region jurisdictions with rates in this range than were included in the 2022 update by FCS GROUP. The charges for each city and each infrastructure system are listed in Appendix D.

Exhibit 20. Total Single-Family Detached SDCs by City in Oregon, 2022
Source: ECONorthwest, using data from FCS GROUP

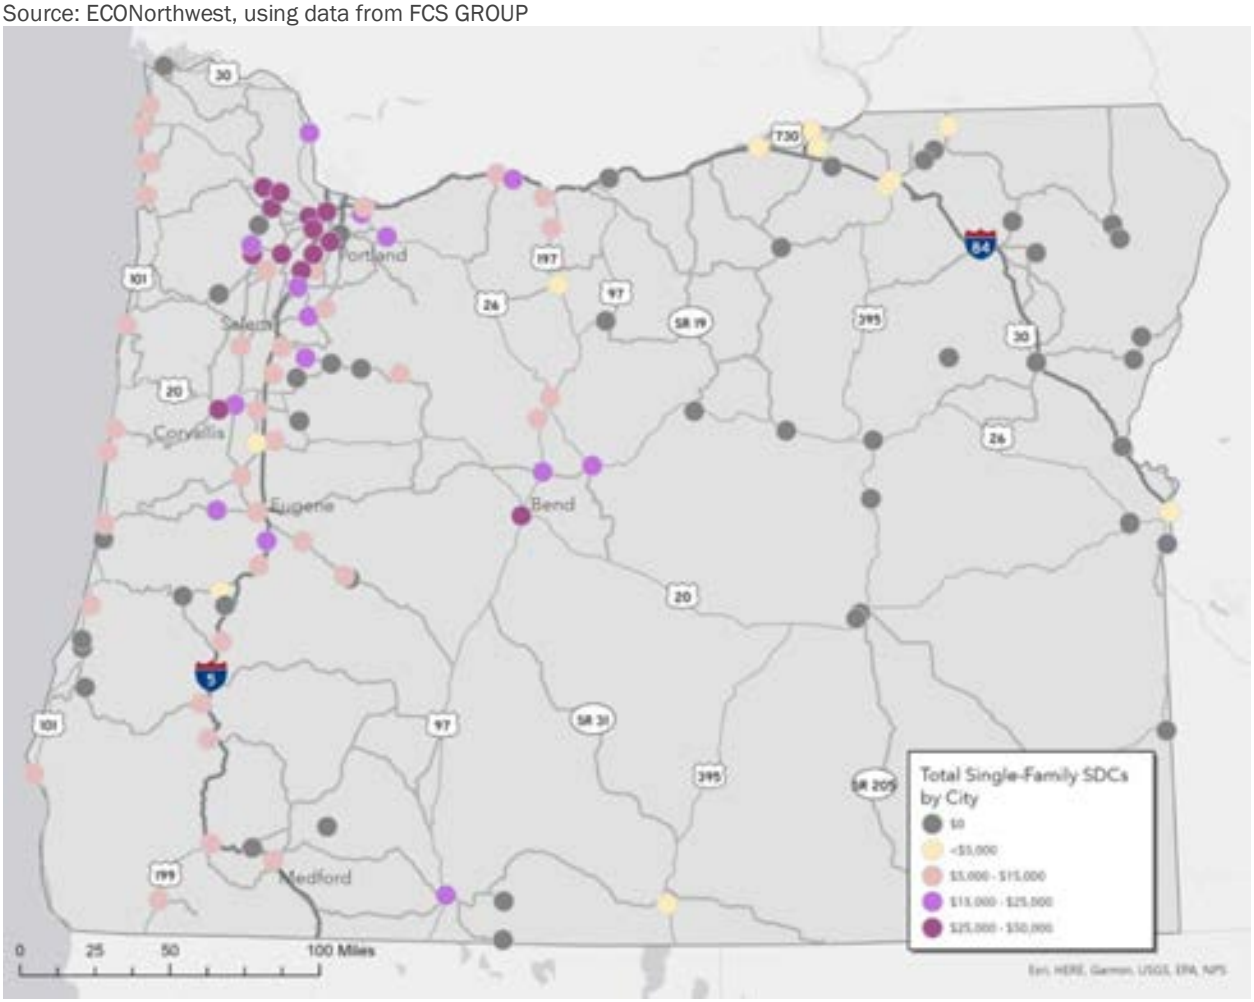

Exhibit 21 provides mean and median values by system.

Exhibit 21. Summary of City Mean and Median SDCs (2022)
Source: FCS GROUP

Mean and Median SDCs	Number of Cities	Mean	Median
Water	72	$4,500	$3,830
Wastewater	72	$4,644	$4,353
Stormwater	45	$1,078	$756
Transportation	51	$4,433	$3,489
Parks	55	$3,829	$2,535
Totals	**76**	**$15,047***	**$12,168**

* This value represents the average of the totals for each jurisdiction, rather than a sum of the averages for each system.

For comparison, the 2020 LOC survey report found average total estimated SDC costs for single-family residential of $13,135 for fiscal year 2018,[124] though, as noted previously, this figure likely undercounts special district and county SDCs. The average across the jurisdictions and special areas included in the HBA of Metro Portland 2020 data is just over $27,000, though this data set is weighted towards larger jurisdictions and has little coverage outside the

[124] League of Oregon Cities, *System Development Charges Survey Report* (February 2020), page 17.

Portland metropolitan region.[125] The average of the total SDC rates for jurisdictions included in the January 2018 OBOA data was roughly $14,500.[126] This variability suggests that aggregate statewide numbers from any given subset of communities may not be representative of the state as a whole.

Exhibit 22 shows the distribution of each SDC type as well as the distribution of total SDCs from the 2022 FCS GROUP survey data. The "box" captures the middle two quartiles of values for each set of data (25th percentile to the median in the lower box and median to 75th percentile in the upper box). Lines ("whiskers") encompass the minimum and maximum range within the survey data.

Exhibit 22. Distribution of SDCs Among Surveyed Oregon Jurisdictions that Charge One or More SDCs by Infrastructure System (2022)

Source: ECONorthwest, using data from FCS GROUP

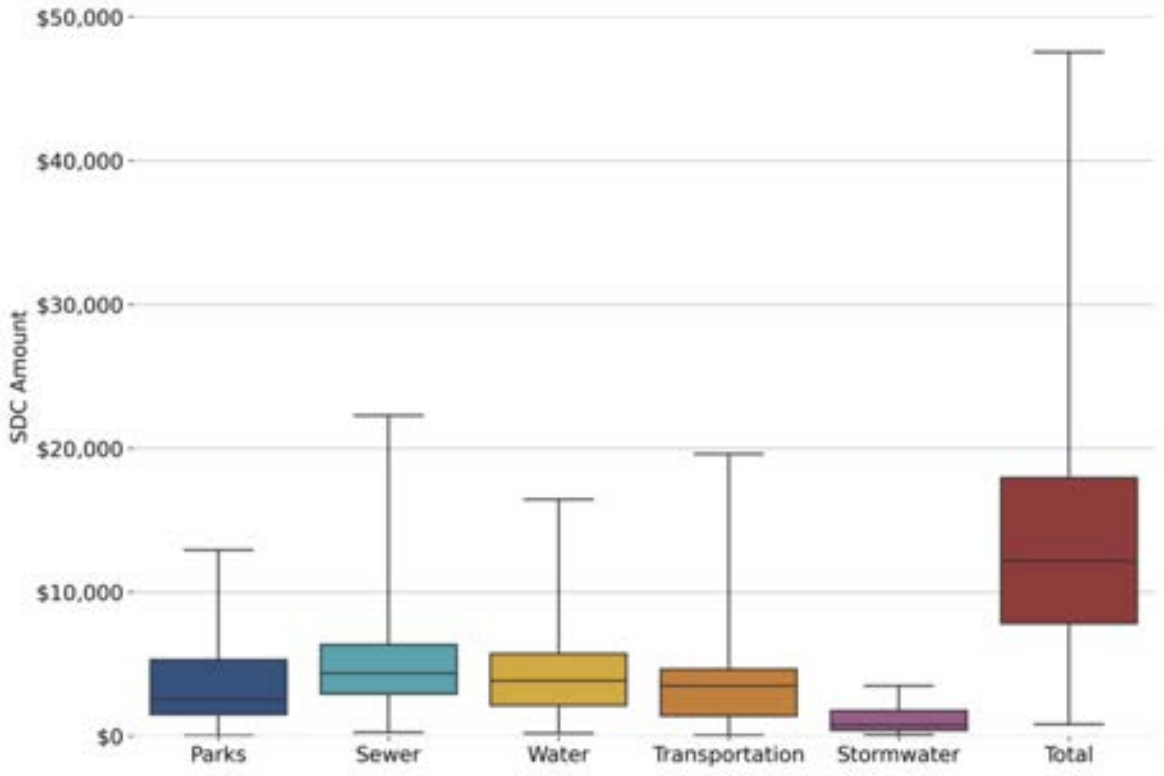

Exhibit 22 shows substantial variation in SDC amounts across all SDC types, with the greatest range for transportation and sewer SDCs. In total, the range is even more pronounced, from a low of $819 (Lakeview) to a high of $47,550 (Tigard).

[125] Home Builders Association of Metropolitan Portland, "System Development Charges," https://www.hbapdx.org/system-development-charges.html

[126] Oregon Building Officials Association, "OBOA Standards Committee," https://www.oregonbuildingofficials.com/standards. This figure excludes excise taxes, which are also listed in this data set.

Multifamily SDCs

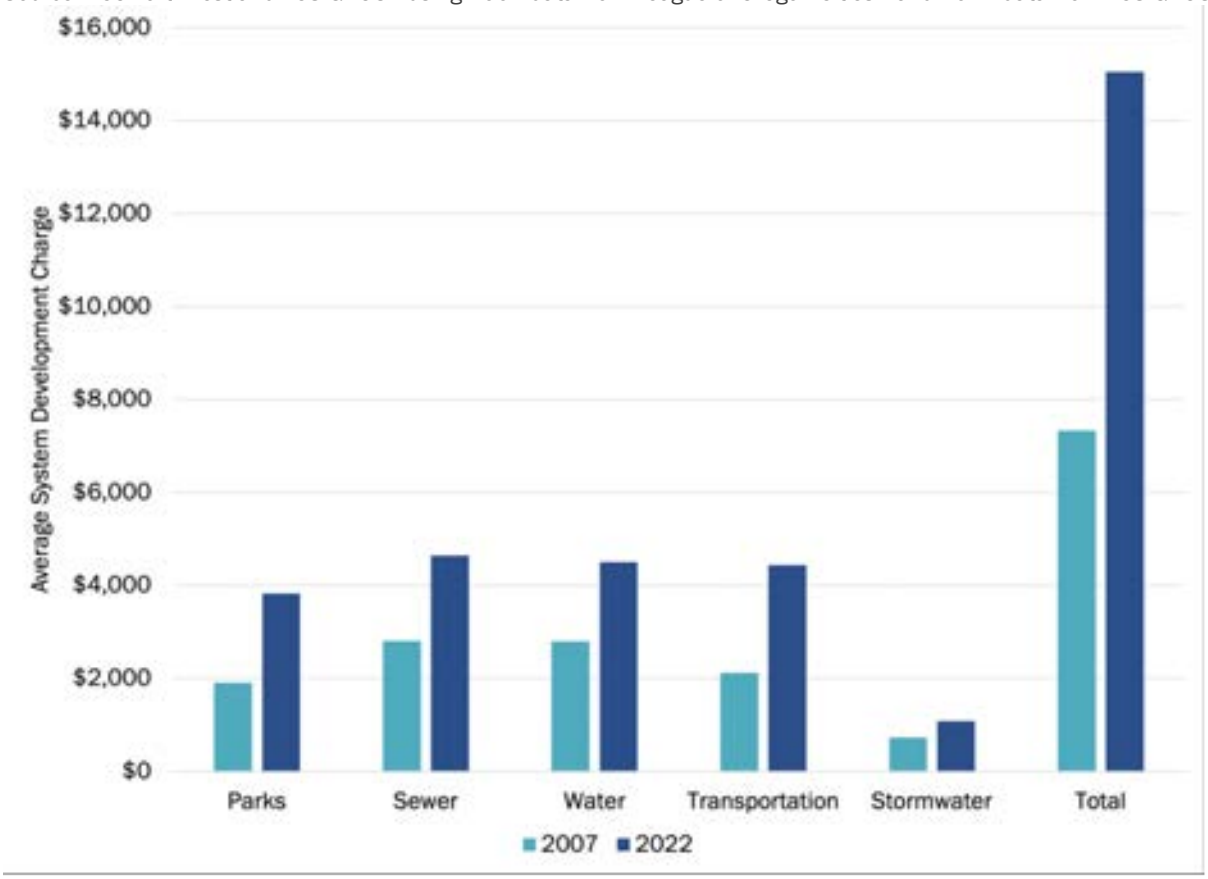
In OBOA's 2018 survey data, the only readily available data that includes fees for example single-family detached and multifamily projects,[127] the ratio of the average multifamily SDC rate to the average single-family SDC rate is about 66 percent. The data shows there is a wide range of relationship between multifamily and single-family SDC rates.

3.1.2 Trends in System Development Charge Levels

Using the data on SDC fee levels by infrastructure system for 2007 and 2022 for the sample cities, Exhibit 23 shows fee level trends for each type of SDC.

Exhibit 23. Average SDC Levels by Infrastructure System for Surveyed Cities in Oregon, 2007 and 2022

Source: ECONorthwest and FCS GROUP using 2007 data from League of Oregon Cities* and 2022 data from FCS GROUP

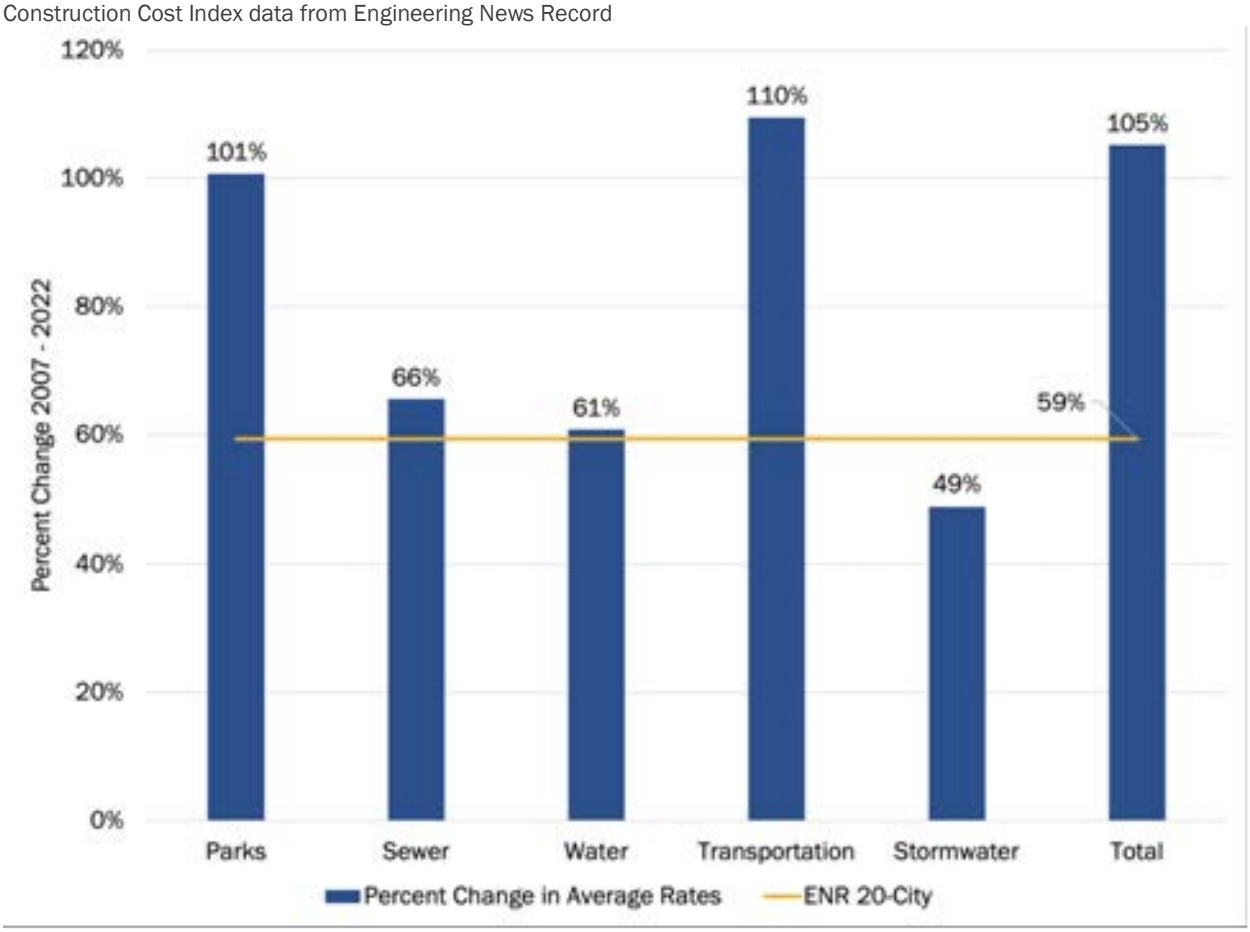


* Regional and district charges may not be consistently reported in the 2007 LOC data, which could result in an underestimate of average fees in that data.

[127] As noted above, while the 2020 data from the HBA of Metro Portland provides SDC rates for multifamily, the data does not attempt to provide estimated SDCs for an example project and may not reflect all the adjustments that would apply to a given project. For example, water SDC rates are listed for the same meter size as listed for single-family development, which is typically not the case.

Exhibit 24. Percent Change in SDC Levels by Infrastructure System for Surveyed Cities in Oregon Compared to Change in Construction Costs, 2007-2022

Source: ECONorthwest and FCS GROUP using 2007 data from League of Oregon Cities*, 2022 data from FCS GROUP, and Construction Cost Index data from Engineering News Record



* Regional and district charges may not be consistently reported in the 2007 LOC data, which could result in an underestimate of average fees in that data.

This shows that average SDC rates have increased across all infrastructure systems over the 15-year period. Most infrastructure systems have seen increases that have outpaced the increase in construction costs over the same period, in some cases by a substantial margin. As noted above, regional and district charges may not be consistently reported in the 2007 LOC data, which could exaggerate the magnitude of increases. On average, transportation and parks SDCs have increased most over the past 15 years, exceeding the increase in construction costs. This could be due to land values escalating faster than construction costs, as many parks service providers account for land costs in their SDC indexing methodology, and right-of-way acquisition costs can drive cost increases for transportation projects as well.[128] Water and sewer SDCs have

[128] While comprehensive statewide data on trends in land values is not readily available, there is evidence that land prices are escalating faster than construction costs at least in recent years and in areas experiencing strong development. For example, a review of documents related to SDC rate increases for some parks providers showed that in 2017, data from the Washington County Assessor's office (within the Tualatin Hills Park and Recreation District) showed an increase in vacant land value of 19.54 percent, compared to the ENR CCI increase of 2.15 percent. Similarly, data from Deschutes County Assessor's Office showed an increase in land values of 18.06 percent over the 12-month period ending December 2021, which was significantly higher than the ENR 20-city CCI of 7.36 percent.

roughly kept pace with construction costs, and stormwater SDCs have lagged behind construction costs. Appendix D provides tables containing the 2007 and 2022 data.

3.1.3 Comparison to National Data

A limited number of sources offer national data on impact fees. Duncan Associates' 2019 National Impact Fee Survey covers a sample of jurisdictions from many states. The Terner Center report referenced previously includes impact fee data for a number of California jurisdictions, but it does not include observations from other states.

The Duncan Associates Survey acknowledges a variety of limitations, including difficulty parsing impact fees that are referred to by different names or may be combined with other service fees, limited and non-random samples of which jurisdictions are included, and estimations of the cost of standard developer exactions for communities that use those in place of monetary impact fees. In addition, many impact fee surveys suffer from under-reporting of fees from regional service providers.[129] This appears to be an issue with the Terner Center data that makes it less appropriate to compare to Oregon data in the aggregate.

Beyond these limitations, it is difficult to draw useful comparative conclusions from national surveys because of differences in state statutes, terminology, and methodology constraints. As noted previously, Oregon's SDC law provides for water, wastewater, stormwater, transportation, and parks charges. Among neighboring states, while all authorize impact fees, there is variation in which systems are included:

- California authorizes the use of impact fees for any public facilities.[130] Survey results for California public agencies appear to under-count regional water and wastewater fees.
- In Washington, impact fees are authorized for only transportation, parks, fire, and schools,[131] while water, wastewater, and stormwater fees are authorized in a different statute[132] and are referred to general facilities charges. In surveys of impact fees, many Washington agencies report only their transportation, parks, fire, and schools impact fees, and exclude water, wastewater, and stormwater.
- Idaho also has two statutes. Impact fees[133] have been used historically for transportation and parks, although they are available for water, wastewater, and stormwater. Water and wastewater charges are typically charged under the authority provided in a separate statute.[134] These fees are generally less cumbersome to administer than "impact fees," although a 2015 supreme court case[135] essentially prohibits the inclusion of future

[134] IC §§ 67-82

[135] NIBCA v. City of Hayden

facilities costs in the charge calculation—a methodology constraint not present in Oregon (or Washington or California).

These challenges undermine the value of comparing Oregon to its neighboring states in terms of total impact fee amounts. In the 2019 Duncan Associates survey, for example, cities such as Olympia and Tumwater reported no water, wastewater, or stormwater "impact fees" when in fact they have robust general facilities charges. Olympia also has a park impact fee which was not included. The totals for the five Oregon-comparable services should be $25,663.03 for Olympia and $20,119.30 for Tumwater—not the $4,830 and $3,853 shown for each, respectively.

There are also differences between states in the availability of state funding for infrastructure and the constraints on alternative local funding sources, which can lead to different levels of reliance on impact fees.

3.2 Key Factors Affecting SDC Rates

As illustrated in Section 3.1.1, SDC rates vary substantially across the state. As shown in Exhibit 25, these variations are the result of a multitude of factors including both internal decisions made by local governments and external factors that impact the relative costs of building infrastructure across the state and in different service delivery and infrastructure contexts. Internal factors include both infrastructure planning and funding decisions "upstream" of the SDC methodology that impact local governments' total infrastructure investment needs and the portion of costs that may be eligible for SDC funding, as well as decisions specific to the development of the SDC methodology and final rate-setting. Key external factors include regional construction market conditions and local construction cost factors (e.g., soils or geotechnical requirements), service provider scale and efficiency (e.g., regional vs. individual service provider), and infrastructure-specific considerations.

Exhibit 25: Factors Affecting SDC Rates
Source: Galardi Rothstein Group, ECONorthwest

This section summarizes some of the key factors that lead to differences in SDC rates across Oregon. While each factor—and its potential impact on SDC rates—is discussed individually, the collective decisions and factors are ultimately reflected in the adopted SDC rates. For example, a community with a larger, more expensive transportation system capital plan may have a similar SDC than another community with a smaller capital plan if other funding sources (e.g., voter approved taxes) are used to fund a portion of the improvements. Similarly, the impacts of different individual SDC methodology decisions may be neutralized by other decisions upstream or downstream (i.e., at the time of rate-setting). Because survey data shows that there are significant variations in SDCs across the state, this section provides some insights into what may drive those differences.

3.2.1 Broad Infrastructure Planning and Funding Decisions

Infrastructure System Plans and Capital Project Needs

As discussed in Section 1.2.2, Oregon SDC statutes allow local governments to charge SDCs for five broad types of infrastructure: water, wastewater, stormwater, transportation, and parks.

Furthermore, local governments are required to prepare a capital improvement plan or comparable plan prior to the establishment of an SDC, assuming a forward-looking "improvement fee" is to be included.

Capital planning for all five SDC-eligible infrastructure systems generally involves preparation of broader system plans (e.g., master plans, public facilities plans, or transportation system plans) to determine future investment needs and priorities based on an in-depth technical evaluation and input from regulatory agencies and the local community.

Water, sewer, and stormwater master planning efforts are largely technical exercises, where state and federal permitting and other requirements drive the need for facility design, sizing, and quantity. While discretion is involved in selecting among different technologies, siting facilities, and prioritizing improvements for these systems, some decisions are beyond local control, due to the need for state and federal regulatory compliance. For transportation, while Oregon Department of Transportation (ODOT) standards and transportation planning rule requirements can influence project design and prioritization in communities with state highway facilities, local governments generally have discretion in setting level of service standards and prioritizing improvements for city streets to align with local goals. Local governments also have discretion in planning for a park system that aligns with community-defined goals around livability and equity.

Because the system plans generally set the stage for the SDC project list, decisions made as part of the broader system planning process can impact the size and cost of the project list as the service providers seek to comply with regulations and be responsive to community stakeholders engaged in the planning process. Even if only a portion of the project costs are allocated to SDCs, a larger, more expensive project list can increase SDC levels. Developer focus groups conducted as part of this study indicate a strong perception that differences in locally established service levels and project priorities for parks and transportation facilities drive differences in SDCs for these systems in particular.

Overall Infrastructure Funding Choices

As part of their financial planning process, service providers may make decisions to utilize other non-SDC funds up front (i.e., before embarking on an SDC update) for a specific project or group of projects, which then reduces the list of potential projects that may end up on the SDC project list. For example, if there is support by the local community, a GO bond may be used to fund a recreation center or a group of high-profile transportation projects. However, given the political challenges and legal or financial limitations associated with other potential local funding sources, it can be more difficult to implement other local funding options than to maximize the use of SDCs for eligible costs, within the bounds of state law and legal precedent.

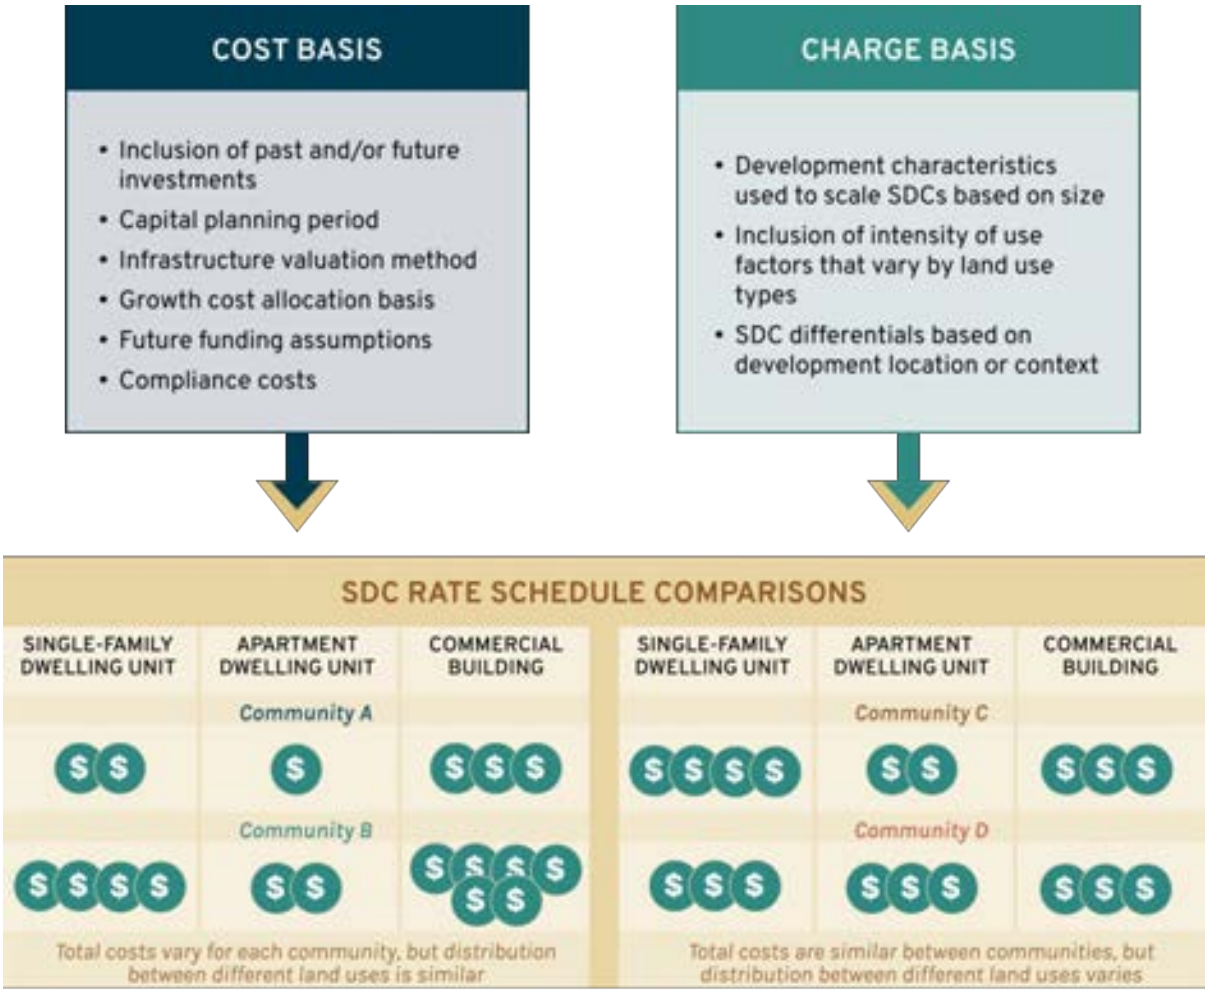
Additionally, many transportation capital plans include projects on state highways that serve as local arterials through cities. Many cities decide to include only the "local" share of such project costs, intending to leverage the participation of the Oregon Department of Transportation in funding those projects. These up-front funding decisions may have a direct impact on SDCs if they result in reduced SDC-eligible costs.

3.2.2 SDC Methodology Factors

An SDC methodology has many individual components, and within the framework of Oregon SDC law, local governments have flexibility in selecting approaches to each methodology component to balance local objectives and data availability. Methodology component choices may be grouped in two primary areas: 1) decisions related to the total infrastructure costs to be recovered from SDCs (the "cost basis"), and 2) decisions related to how the SDC costs will be allocated across different development types, sizes, and contexts (the "charge basis").

As shown in Exhibit 2, cost basis decisions generally impact overall SDC levels. A community with a higher cost per unit of growth (as is the case with Community B) has higher SDCs across all development types, compared to Community A, which is assumed to have a lower cost basis. On the other hand, decisions related to the charge basis tend to impact relative fee levels within a given development type (e.g., residential or commercial) and across development types, locations, and contexts. In the example in Exhibit 2, Community C charges a lower cost per unit for multifamily relative to single-family, while Community D charges a uniform SDC for all homes of a given type.

Exhibit 26: Example of SDC Methodology Choices and their Impact on SDC Rates
Source: Galardi Rothstein Group, ECONorthwest



This section provides a high-level summary of individual methodology components, choices, and the general impacts of each choice. However, as mentioned previously, it is the collective decisions and factors that are ultimately reflected in the adopted SDC rates, and some individual component choices may be offset by other decisions within the methodology, as well as upstream and rate-setting decisions.

Cost Basis

As mentioned previously, the "cost basis" is the total cost that the SDCs are intended to recover. Development of the cost basis involves a number of methodological decisions, beginning with selection of investments to include in the SDCs, the methods for placing a value on those investments, assumptions related to future funding sources, and basis for determining an equitable share of capacity costs for new development. Key decisions impacting the SDC cost basis are discussed below and their potential impact on overall SDC levels.

Selection of Investments to Include in SDC Cost Basis

Reimbursement, Improvement, or Combined SDC Methodology

As discussed in Section 1.2.2, an SDC methodology can include a reimbursement fee, an improvement fee, or a combination, so the first cost basis decision is whether to include existing or future system capital investments, or both. This is generally a technical decision based on whether existing facilities have capacity beyond existing development service demands (a requirement for a reimbursement fee) and whether that capacity is sufficient to satisfy future growth needs entirely, or if additional improvements are also required.

In many communities, the cost of existing facilities (per unit of service capacity) is lower than the cost of providing the same amount of capacity in the future due to greater availability of grant funding historically, new design standards which make construction of planned improvements more costly, cost inflation, and other factors. Therefore, SDCs based on a stand-alone reimbursement fee methodology are likely to be lower than SDCs that use stand-alone improvement or combined reimbursement and improvement fee methodologies.

Reducing the Size of the Improvement SDC Project List

Improvement SDCs may vary among communities due to upstream planning and funding decisions (as discussed in 3.2.1), but also internal decisions to reduce the SDC project list by including projects planned for a shorter time period or a more focused and prioritized list. As noted in *Oregon SDC Study: Summary of Service Providers* (Appendix A), some communities described using "funded" and "unfunded" project lists or working to narrow and prioritize a project list that would align with the maximum SDC amount the community was comfortable charging (often a fee level comparable with other SDCs in the region).[136]

[136] It is worth noting that projects assumed to be "unfunded" will remain unfunded (which also has implications for SDC credits as discussed in 1.6.2) if not included on SDC project list or another funding source is identified.

Assigning Costs or Values to Investments

Costs Estimates for Improvement Fees

The costs for planned projects used in the improvement fee calculation typically represent planning level estimates from system plans, brought current to the time SDCs are calculated and adopted based on a construction cost index. Future cost escalation (from the time the SDC is calculated to the time a project is constructed) is typically addressed through periodic updates to the project list or SDCs tied to a construction cost index, as allowed by statute. However, as noted in *Oregon SDC Study: Summary of Service Providers* (Appendix A), many communities indicate that their SDCs have not been indexed every year or at all since initially adopted, so variation in indexing practices is likely a factor in SDC differences.

Approach to Valuation of Existing Facilities for Reimbursement Fees

While the SDC statutes refer to "the value … or the cost of the existing facilities"[137] in calculating a reimbursement fee, a specific valuation basis is not prescribed. In fact, there are a wide range of valuation approaches used in Oregon and across the country for SDC calculation purposes. For example, the American Water Works Association M1 Manual (Principles of Water Rates, Fees, and Charges) lists four common approaches for valuation of existing system facilities for calculation of SDCs: 1) original cost, 2) original cost less accumulated depreciation, 3) replacement cost new, 4) replacement cost new less depreciation.[138]

Reimbursement fees based on original cost less depreciation tend to generate the lowest fees of the options (all things being equal), while replacement cost-based fees would tend to be higher. To the extent that local SDCs include a reimbursement component, the valuation method can impact the overall fee level and result in differences across communities.

Allocation of Costs to Growth ("Growth Share")

The determination of the portion of costs that may equitably be allocated to growth through reimbursement and improvement SDCs is primarily a technical process that involves consideration of upstream planning targets and other technical information. As discussed in Section 1.5.1, the system plans establish facility design standards and service delivery targets for each system. These targets form the basis for how system capacity and existing and future user demands are measured, which then allows for existing system facility and future improvement costs to be allocated to growth.

While there are some methodological differences in how local governments approach allocation of costs to growth, the upstream planning decisions along with other technical considerations generally have a greater influence on the allocation of costs to growth and resulting variations in SDC fees. Nevertheless, a high-level summary of the technical process is provided along with potential differences in approaches, given the importance of this methodology component to

[137] ORS 223.304(1)(a)(D)

[138] Principles of Water Rates, Fees, and Charges, Seventh Edition, American Water Works Association, Denver, CO, 2017, page 332.

development of the cost basis and because it lays the groundwork for understanding different "charge bases" (discussed later in this section).

System Capacity/Demand Measures

Measures of capacity and demand vary by infrastructure system. At a very high level, water systems must be able to deliver water to users under various demand conditions, so production and delivery facilities are generally designed based on peak water demands. Wastewater and stormwater facilities need to be able to collect and treat wastewater or stormwater discharges from users consistent with standards established by regulatory permits, so capacity and demand measures may relate to both user wastewater flows and strengths. Demand for parks is measured by people, as potential users of parks and service targets generally relate to the desired quantity of facilities per capita and in some cases access measures (e.g., a neighborhood park located within a short walking distance). Transportation systems are designed to accommodate trips of all modes of travel (e.g., auto, bike, pedestrian, transit) generated by businesses and households throughout the week and at peak hours of travel.

Determining Growth Share of Existing Facility Costs

The service needs of existing users are estimated from various data sources and compared to the capacity of existing facilities under the same demand conditions. For example, water system production data can be used to estimate the peak demands of existing users, which is then compared to the peak hydraulic capacity of various facility types (e.g., production, storage, distribution) to determine if and how much capacity is available for growth. Similar processes are used for other infrastructure systems.

Existing facilities are generally assumed to first meet the service requirements of the existing users who have paid for their construction through contribution of user fees, taxes, and other mechanisms. Any capacity beyond existing user needs may then be allocated to growth through the reimbursement SDCs. If existing facility capacity is equal to or less than existing user service requirements, then there is no available capacity for purposes of developing a reimbursement fee, which means that growth needs will be met through future system improvements. Insufficient capacity for existing users also has implications for allocation of SDC project list costs (discussed below), as a portion of planned new capacity costs may remedy existing service deficiencies.

Existing system available capacity is generally evaluated system-wide or by major system function (e.g., water production, transmission, storage). Local approaches reflect system design and other considerations.

Project Cost Allocation for Improvement Fees

There are two conditions that need to be met for SDC project list costs to be eligible for improvement fee funding: 1) the improvement expands capacity, and 2) the capacity is needed to meet the service demands of future system users. Related to the first condition, the statutes clarify that improvements are considered capacity increasing if they provide new facilities (e.g., new pump stations, parks, roads, etc.) or if they increase the level of performance or service provided by existing facilities (e.g., new technologies that provide a higher level of water or wastewater treatment, park amenities that expand the number of users that may be served, etc.).

As mentioned previously, determining what portion of new capacity costs may equitably be allocated to future system users depends on the amount of capacity needed to meet their service demands (as determined by the service delivery targets and growth projections) and whether any of the new capacity costs are related to addressing existing users service needs (either by addressing existing system deficiencies or by replacing existing facility capacity serving existing users). Again, these are generally technical decisions that can be evaluated based on information developed as part of the system plans (upstream of the SDC methodology development). However, there may be some methodological variations to apportioning costs for dual purpose improvements which may influence improvement SDC fee level.

For example, if an 8" pipe that currently serves existing system users has to be replaced by a 12" pipe to accommodate the additional service demands of future users, the share of the cost for the 12" pipe that is attributable to growth could be based on the share of future flow from future users vs. existing users, the incremental cost of installing a 12" pipe vs. replacing an 8" pipe (if the pipe is nearing the end of its useful life anyway), or the cost of a new 8" pipe (the minimum pipe size that would be required to serve future development from a separate stand-alone pipe if the original pipe is still well within its useful life and would not require replacement within the planning period but for the need for additional capacity). These different approaches can result in different growth-attributable shares of project costs.

Assumptions Related to Other Funding Sources

Future Funding Assumptions for Improvement Fees

As discussed in 3.2.1, local governments generally exclude planned improvement costs earmarked for other known sources of funding (e.g., GO bonds). However, detailed information on other funding sources like grants or developer contributions may not be available years in advance of the planned project construction. Therefore, local jurisdictions may make assumptions about other potential funding sources based on past experience (which may vary across jurisdictions), or they may assume that SDCs will cover any local match that is required for grant funding. Reductions to the cost basis for other funding sources may lead to variations in SDCs, particularly if large, high-cost projects (e.g., major road improvements, aquatic centers, new water or wastewater treatment facilities, etc.) are assumed to be funded by non-SDC revenues.

Past Funding Sources for Reimbursement Fees

As mentioned in 1.2.2, reimbursement fees must consider gifts or grants from federal or state government or private persons (i.e., these are excluded from the SDC cost basis). Therefore, local governments whose existing facilities were funded with significant support from state or federal agencies or developers, may have relatively lower fee levels than those who have had to rely more heavily on local government sources.

Assumptions About Use and Costs of Debt Financing

Assumptions about long-term debt financing may also impact the SDC levels across jurisdictions. SDC revenue may be used for repayment of indebtedness;[139] therefore, some local

[139] ORS 223.307

governments include both financing and construction costs in the cost basis for the SDCs, while other may exclude debt-funded facilities from the SDCs altogether. In other cases, the reimbursement fee cost basis may be discounted for outstanding debt principal, or a future looking present value debt service credit may be incorporated into the SDC methodology.

Compliance Costs

SDC revenue may also be spent "on the costs of complying with the provisions of ORS 223.297 to 223.316, including the costs of developing system development charge methodologies and providing an annual accounting of system development charge expenditures."[140] This has generally been interpreted to mean that an estimate of these allowed expenditures can be added to the total cost basis of the SDC for calculation purposes.

Many local governments track a broader range of SDC administration costs, including the following which also relate to SDC compliance:

- SDC Fund management.
- Management of project lists (planning, engineering, legal).
- Developer credit calculations and tracking.

Compliance costs are another area where diverse approaches and assumptions lead to differences in overall SDC levels. The types of costs included vary from the most basic (costs associated with developing methodologies and the required annual accounting) to more comprehensive SDC processing and potentially other related costs.

Many local governments include compliance costs in the calculation of the SDC cost basis, and the compliance cost portion of the total SDC generally ranges from 1-5 percent. Other local governments exclude compliance costs from their SDC cost bases altogether. For those service providers who do not add these costs into the SDCs, revenue is either diverted from project costs or funding must come from non-SDC sources.

Charge Basis

Overview

Perhaps the largest and most visible source of methodological variation in SDCs is the choice of charge basis: the specific characteristic(s) of a development used to determine its proportionate impact on an infrastructure system in relationship to the system-specific capacity or demand measures discussed previously. Development size, type, or class (e.g., single family residential, middle housing, apartments, commercial, industrial), and location or context are all potential characteristics that may form the basis for charging SDCs, as summarized in Exhibit 27.

[140] ORS 223.307(5)

Exhibit 27. Common SDC Charge Bases by Infrastructure System
Source: Galardi Rothstein Group and FCS GROUP

System	Capacity/ Demand Measure	Development Size (Scaling Factors)	Development Type (Intensity of Use Factors)	Development Location Factors
Water	Average or peak water volumes	Water meter size, plumbing fixture units, building or dwelling area (square feet), lot size, class-specific characteristics*	Peak water demands or fire protection requirements	Infill vs. greenfield; base vs. upper pressure zones
Sewer	Wastewater flow volumes and pollutant loads	Water meter size, plumbing fixture units, building or dwelling area (square feet), class-specific characteristics*	Wastewater strength concentrations	Infill vs. greenfield
Stormwater	Stormwater quantity and quality	Impervious area, gross area (total lot size)	Water quality factors; run-off coefficients	Infill vs. greenfield
Transportation	Vehicle or person trips	Number of dwelling units, building or dwelling unit area (square feet), class-specific characteristics*	Trip rates and adjustment factors (e.g., trip length, pass-by trips)	Infill vs. greenfield; transit proximity
Parks	Persons or person hours	Number of dwelling units, building or dwelling unit area (square feet)	Persons per household; employees per square feet	Infill vs. greenfield

*Special characteristics specific to a particular land use type or class of service (e.g., number of school students, restaurant seats, vehicle fueling stations, car wash bays, etc.).

Oregon statutes do not prescribe charge bases, with a few exceptions noted in ORS 223.301.[141] Instead, local governments may select approaches that balance data and administrative considerations, and policy objectives. Charge bases have evolved over time to include additional characteristics or factors that allow local governments to promote equity, economic efficiency, and affordability objectives while still maintaining a rate structure that ties fees to impacts. However, along with the greater complexity that results from inclusion of different charge basis factors, the need arises for greater transparency, education, and tools for estimating charges for specific developments.

While the charge basis does not, in theory, impact the total amount of revenue to be collected through SDCs (for any given cost basis) overall, it does impact fee levels and revenue recovery among different development types. Therefore, when comparing SDCs across communities for a particular development typography, different charge bases can result in substantially different SDCs.

Key decisions involved in selecting a charge basis are discussed below.

[141] SDCs may not be charged based on the number of additional employees hired after a specific date without regard to new construction, new development, or new use of an existing structure by the employer or for increased use of a transportation facility that results from the production of marijuana on a property located in an exclusive farm use zone.

Characteristics Used to Scale SDCs Based on Development Size

Development size is an indicator of potential service demands or capacity needs, so an SDC charge basis includes one or more development characteristics used to estimate the potential scale of impact. The same scaling measures may apply uniformly across all development types, as in the case of water meter size or plumbing fixture units used for estimating water and wastewater demands, or the quantity of impervious area (used as an indicator of potential stormwater runoff).

In other cases, scaling measures may be specific to a type or class of development, where local or industry data establish a relationship between a size of a dwelling unit or building for commercial business, and estimated system demand (e.g., water demand, person trips, etc.). The wide range of development sizes makes the importance of scaling particularly acute for commercial and industrial customers. For example, a large, big box retail business would be expected to generate significantly more person trips than a small specialty retail store.

Scaling residential SDCs based on the size of the house (in square feet of living area or number of bedrooms) has become more common practice in in the last decade. Scaled residential SDCs may be implemented for single family and multifamily development individually or applied uniformly to all residential development (regardless of the type of dwelling). A scaling structure can lead to significant differences in SDCs for difference sizes of dwellings, as shown in the three examples in Exhibit 28. The first two examples are tiered approaches applicable to a specific type of dwelling (i.e., single family or multifamily). Example 1 tiers are based on the size of the dwelling in square feet (sq. ft.), while Example 2 tiers are based on the number of bedrooms in the dwelling.

Exhibit 28. Sample Scaled Residential Parks SDC Structures

Sources: Galardi Rothstein Group, using data from Tualatin Hills Parks and Recreation Department, 2021/22 SDC Fee Schedule, City of Bend Systems Development Charges July 1, 2022–June 30, 2023 (pg. 5), City of Eugene SDC Methodologies (Table 7)

Example	Agency and SDC Category	SDC
1.	**Tualatin Hills Park and Recreation District Single-Family SDCs per Dwelling Unit (Districtwide)**	
	Tiered (Square Feet Category) Basis	
	<1,500 sq. ft.	$9,088
	1,500-2,500 sq. ft.	$10,717
	2,501-3,500 sq. ft.	$12,217
	>3,500 sq. ft.	$13,075
2.	**Bend Park and Recreation District Multifamily Parks SDCs per Dwelling Unit**	
	Tiered (Bedroom Category) Basis	
	0 Bedroom	$4,207
	1 Bedroom	$4,636
	2 Bedroom	$7,517
	3+ Bedroom	$9,738
3.	**City of Eugene Residential Sewer SDCs**	
	Base SDC per Dwelling Unit	$485.63
	Scaled SDC per sq. ft. Living Area	$0.1177

Exhibit 28 also provides an example of an alternative scaling approach that is applicable to all residential housing (single and multifamily alike). Rather than charging a flat rate per dwelling unit within a defined tier, each additional square foot of living area is charged an additional fee on top of a base amount applied to each dwelling unit based on a regression analysis.

Intensity of Use Factors That Differentiate SDCs Based on Development Type

In addition to development size, the type of land use or class of service may be a factor in estimating system demand.

For residential development, dwelling type (e.g., single family, duplex, apartment) is a common charge basis, particularly for systems where demand for service is measured directly by people (like parks), as the average number of occupants generally differ and may be estimated for local areas based on readily available U.S. census data. Differences in the number of occupants also may drive differences in demand for other infrastructure systems such as water, wastewater, and transportation systems, where local utility billing data and national trip generation surveys show differences in average demands by dwelling type.

Single family and multifamily dwelling types are the most common factor for differentiating SDCs. However, as zoning regulations continue to evolve across the state to support a broader diversity of housing types and configurations, consideration is often given to pricing SDCs for smaller and more affordable dwelling types, based on estimated system demands and policy objectives. Examples of other dwelling types include:

- Accessory Dwelling Units (ADUs) – This practice of charging reduced SDCs for ADUs is theoretically consistent with data from a 2014 ADU survey conducted by the Oregon Department of Environmental Quality (DEQ). The DEQ survey found average occupancy of all ADUs was 1.45 persons per household, which is generally significantly lower than the average occupancy for a single-family home.
- Middle housing – As a result of House Bill 2001, cities with population over 25,000 must allow development of up to four dwelling units on properties previously restricted to single-family housing. As the density of housing increases, system demands per dwelling unit also tend to decrease (relative to single-family housing) due to lower average occupancy and smaller lot sizes which may reduce stormwater runoff and water use per unit.
- Other housing types – As with middle housing, consideration of specific demands per unit for manufactured housing, cottage cluster, and tiny homes may also be considered as more data becomes available to evaluate relative occupancy rates and system-specific demands.

As with dwelling type, the intensity of system use/demand may vary greatly across different nonresidential (commercial, industrial, and institutional) development types. Many communities charge different transportation SDCs per 1,000 sq. ft. of building area for dozens of different nonresidential development types, reflecting national data on trip generation. For example, surveys indicate that an average convenience market generates significantly more trips per 1,000 sq. ft. of building size than a small specialty retail store. Similarly, some

communities differentiate water and wastewater SDCs for different classes of nonresidential development based on volume or wastewater strength factors. For example, a restaurant generally is assumed to demand more water/discharge more wastewater volume (and pollutant loads) per 1,000 sq. ft., compared to an office building.

For parks, intensity of use considerations impact both the allocation of growth-related costs between residential and commercial development and the SDC per 1,000 sq. ft. for different nonresidential development types. On average, a resident is assumed to have a higher potential park use than a business employee based on some limited survey data and theoretical estimates that take into accounts the hours per week available for park use. The number of employees per 1,000 sq. ft. of building area also differs among nonresidential development classes, which further forms the basis for charging SDCs in many communities.

Other intensity of use factors that may help establish different SDCs by type of development include seasonal variations in water use (i.e., peak water demands), stormwater quality, and transportation trip characteristics (like trip length and pass-by trip adjustments).

SDC Differentials Based on Development Location or Context

Development location is often considered in three contexts that can drive differences in cost of service or capacity needs: 1) infill vs. greenfield areas, 2) areas requiring specialized facilities (e.g., upper water pressure zones that require storage and pumping facilities), and 3) development context (considerations around density, mixed use developments and proximity to transit may impact service demands). Location-based overlay SDCs are relatively common in greenfield areas (e.g., City of Hillsboro) or in areas of major redevelopment (e.g., City of Portland Transportation SDCs). Accessibility to public transit—as in the case of transit corridors—may have a measurable impact on the cost of providing transportation system infrastructure in urban settings, so may be reflected in the SDC charge basis and lead to significant fee levels across jurisdictions.

3.2.3 Rate-Setting: Implementing a Reduced SDC

In addition to methodological and cost differences, some local governments choose to implement SDCs at levels lower than the calculated amounts. Implementing an SDC that is less than what is calculated in the methodology is an approach that is technically and legally simple, however, it sets up a situation where the SDCs are lower than required to fund the growth-related costs. Choosing a lower SDC requires no findings or justification, though many local governments will articulate a basis for the charges in the implementing resolution.

Implementing a lower SDC typically takes one of two forms. The simple form is implementation of the SDC at the desired level (i.e., some percentage of the calculated SDC). The more nuanced form is a multi-year phase-in schedule that may (or may not) terminate at the calculated SDC. This approach provides an initial concession to developers that may have planned projects in the pipeline.

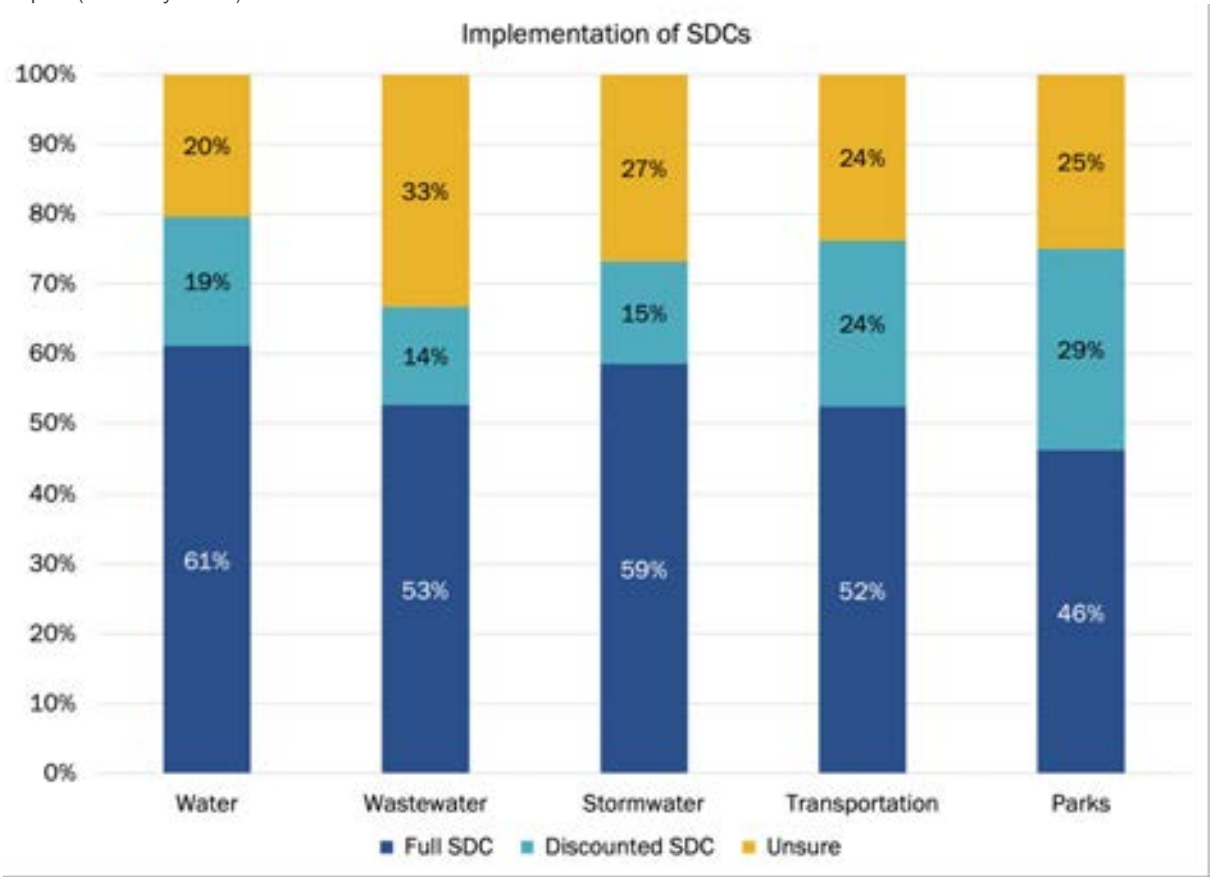
This is reflected in the *Oregon SDC Study: Summary of Service Providers* (Appendix A). Many communities noted charging less than the full amount justified in their methodology, generally

because of local elected officials' desire to remain competitive for development relative to other nearby communities, or because of concerns about the impact on housing costs and affordability. Other communities noted using phase-in periods when a change in methodology would lead to a notably higher rate. (As noted above, other jurisdictions adjust their SDC-eligible project list to achieve a lower cost basis and lower SDC rate instead.)

The LOC recently added questions on this subject to its annual SDC survey, asking whether the city adopted an SDC that was less than what was calculated in the methodology for each infrastructure system. As shown in Exhibit 29, a majority of cities report implementing the full SDC for most infrastructure systems, but 14 percent reported discounting a wastewater SDC, and 29 percent reported implementing a discounted parks SDC.[142]

Exhibit 29. SDC Discounting Among Survey Respondents

Source: FCS GROUP and ECONorthwest using data from League of Oregon Cities, System Development Charges Survey Report (February 2020)



[142] FCS GROUP analysis of data from League of Oregon Cities, System Development Charges Survey Report (February 2020). The possible responses were "yes," "no," and "unsure."

3.2.4 Underlying Cost Drivers

Cost of Capital Improvements

Regional Cost Differences

While national and even international factors impact the costs of material and supplies, regional cost differences may impact infrastructure costs and SDC levels across the state. Regional cost factors may include the following:

- Rural areas may have less access to labor and supplies, particularly during busy construction periods, which may drive-up project costs. This is particularly acute in areas where limitations in affordable workforce housing further limit the pool of local contractors.
- Land values vary significantly.
- Differences in geology impact costs of grading and excavation.

The rising cost of labor has created upward pressure on project costs for all types of projects throughout the state. However, Central and Eastern Oregon seem to be impacted disproportionately because of a shortage of local contractors. This shortage limits the number of bids received for a project, and the limited number bidding contractors increases the pricing power of those who do bid.

Infrastructure-Specific Cost Drivers

Different kinds of infrastructure projects incur different kinds of costs, and different kinds of costs are subject to different market forces. Examples of specific cost factors by infrastructure system include:

- Pipe is a major cost driver of water, wastewater, and stormwater projects, and the cost of pipe has risen dramatically in recent years.[143]
- Land is a significant cost factor for many park and transportation infrastructure projects, and land values in many areas have risen substantially more than construction cost indices in some years.[144]

Beyond the costs of materials and land, infrastructure systems may be impacted by varying types of regulatory requirements that result in more costly facility designs (e.g., seismic resiliency standards and water and wastewater treatment requirements).

---

[143] According to data reported by the Bureau of Labor Statistics the producer price index for plastic construction products (primarily, PVC pipe) increased almost 30 percent in 2021 (January to December).

[144] For example, in 2017, data from the Washington County Assessor's office (within the Tualatin Hills Park and Recreation District) showed an increase in vacant land value of 19.54 percent, compared to the ENR CCI increase of 2.15 percent. Similarly, data from Deschutes County Assessor's Office showed an increase in land values of 18.06 percent over the 12-month period ending December 2021, which was significantly higher than the ENR 20-city CCI of 7.36 percent.

For water SDCs, securing new and expanded sources of supply are a significant cost component in most SDC project lists. Available water sources vary significantly across the state and the cost of developing new sources vary based on the type, location, and other factors.

Cost Escalation and Timing of Indexing Rates

As described in Section 2.1.2, construction costs have escalated rapidly in the past two years as measured by the ENR Construction Cost Index (CCI) (both the 20-city average and Seattle indices). Many local governments use one of these indices to adjust their SDCs each year in accordance with statute. However, these increases may not yet be incorporated into the SDCs shown in Appendix D, as many cities adjust SDCs annually, but the timing of updates and the timeframes used to calculate the index vary.

Service Delivery Structure

SDC variations across the state may reflect differences in service delivery due to economies of scale for different types of service providers. The cost of producing a gallon of water or treating a gallon of wastewater may be less for large regional utilities compared to single-utility service providers.

Part 4: SDCs and Housing Costs

Primary Contributors: ECONorthwest

4.1 Overview

Part 4 of the report focuses on the relationship between SDCs and housing costs, including:

- How and to what extent SDC costs are passed on to housing consumers, and which other entities absorb those costs ("**SDC cost incidence**").
- How **SDC costs compare to other costs of housing development**, including land, labor, and materials for construction, permitting, and development review costs, carrying and financing costs, cost of building on-site infrastructure (where applicable), etc., and how this varies for different types of housing.
- How and to what extent **SDC costs affect overall housing costs** and the **housing options** delivered by the private market, including **differential impacts** for housing at different sizes and price points.
- How SDC cost incidence varies for **market-rate and affordable housing** development.

The findings in Part 4 draw on a combination of published literature (both theoretical and empirical studies); case studies of housing development under varying SDC rate structures; analysis of a range of hypothetical housing developments across different market conditions to show how SDCs impact housing types differently; and interviews with housing developers and homebuilders with experience building housing across Oregon, including single-family homebuilders and multifamily developers working in different market niches, and developers of affordable housing.

4.1.1 How SDCs Affect Development Outcomes: Overview

SDCs affect development outcomes in two primary ways:

- SDCs fund infrastructure that is needed to support growth, which can add value to development, or make development possible in newly developing areas or areas without sufficient infrastructure.
- SDCs are a cost imposed on development, which increases the cost of building new housing.

Both factors can influence housing costs and housing production. Section 2.2 addressed the value and benefits of SDCs to development. Sections 4.2 to 4.5 address SDCs as a cost that impacts housing development.

4.2 SDCs as a Cost in Housing Development: Conceptual Framework

4.2.1 Introduction

Who Pays? An Introduction to Cost Incidence

SDCs are one cost among many that developers typically pay as part of building housing. Like the other costs of housing development (e.g., land, construction labor and materials, design fees, financing costs, etc.), these costs are typically paid by developers initially and factored into their financial decisions. Although developers initially pay SDCs, they can recoup at least a part of the cost by passing on the cost to others involved in the housing development process or transactions. Thus, it is important to ask not only who pays SDCs, but who ultimately incurs the cost. This economic concept is referred to as **cost incidence**. Cost incidence describes who ultimately incurs the cost, which can be split among parties, or incurred entirely by one party.

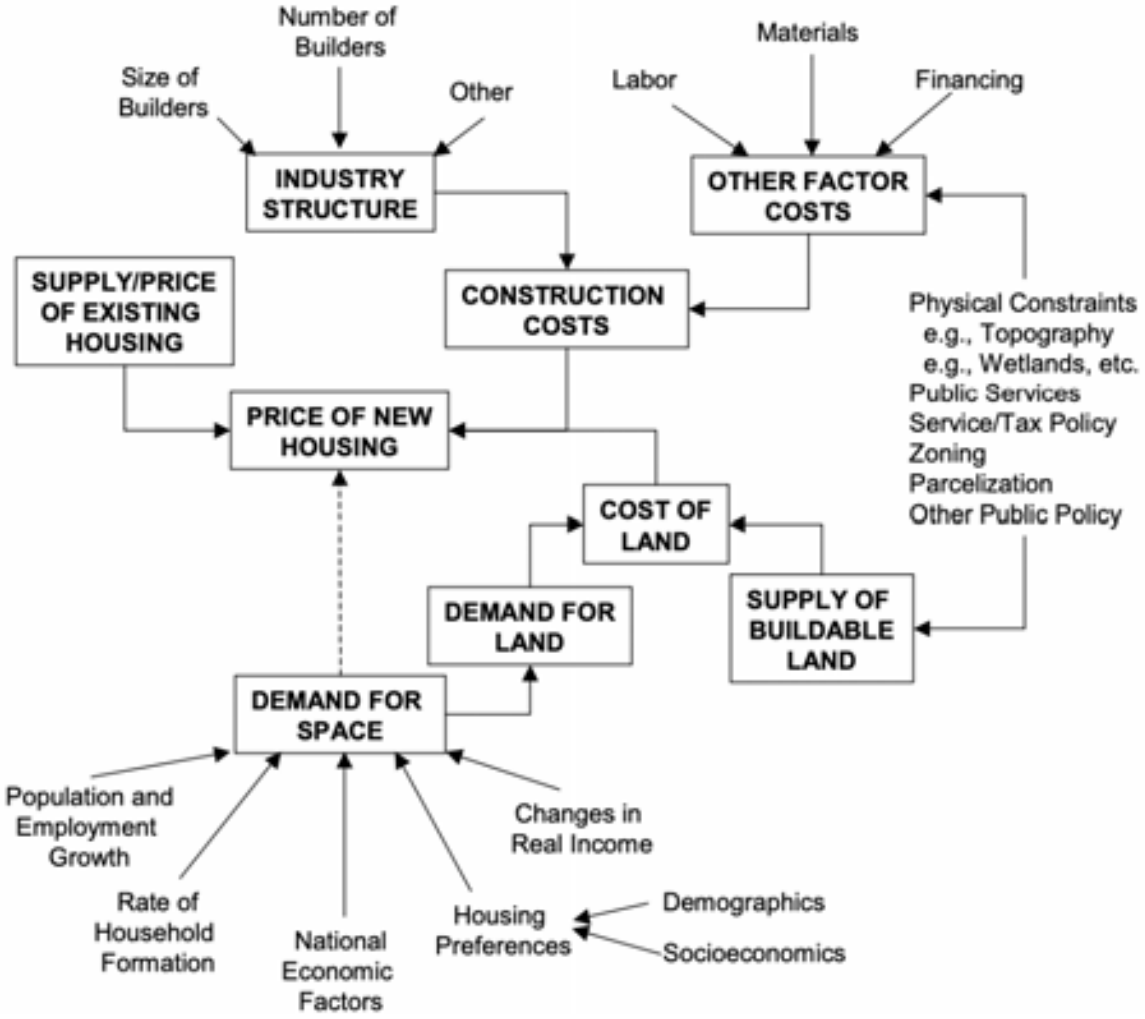
Housing Development 101

Understanding cost incidence in housing markets requires an understanding of housing development. Market-rate housing development is a business, and, like other businesses, must generate a financial return to operate. Generally, market-rate development will not occur unless the expected revenues from the project exceed the expected costs by a sufficient margin to create financial returns for developers, lenders, and investors that justify the risk of their investment. Developers must identify sites and development products that they expect to be financially feasible.

SDCs are one of many costs that developers take into consideration when determining whether a project is feasible, which is part of a broader decision-making process that considers density, location, design, and market conditions along with development costs. Exhibit 30 illustrates the different factors that feed into overall housing cost and price. SDCs are one of many jurisdictional policies and practices that affect development costs, including: speed and complexity of permitting; zoning regulations; and other direct costs such as permit fees and construction excise taxes. Developers often have an estimate of their SDC costs prior to securing land and financing, but the accuracy of this estimate can vary with the timing of the land purchase, the complexity of the development, and how much SDC rates change during the pre-development period. Developers need to weigh SDCs and other cost inputs against the sales prices or rents they are expecting to achieve on each project. Because SDCs costs are outside the developers' control, they must make choices about other aspects of the development to bring total costs and prices or rents into alignment.

Exhibit 30. Detailed Model of Housing Cost and Price

Source: ECONorthwest, originally published in "Cost Components of Housing"[145]



For affordable housing developers, whose revenues are constrained to keep rents or sales prices affordable at specific income levels, and who are often (though not always) nonprofit organizations, SDCs are also one cost among many that must be covered either by the project's limited revenues or by other sources to cover any funding gaps. As with market-rate development, affordable housing developers must find ways to balance their costs against their combined revenues and subsidies, but their options are more limited. When costs are too high, they may modify the project to reduce costs, seek out additional sources of subsidy (though these are often competitive and higher per-unit costs can make projects less likely to receive the funding they need to move forward), or, in limited cases, adjust the targeted affordability levels to the extent that the funding sources allow.

[145] Nick Meltzer, Bob Parker, Rebecca Lewis & Sadie DiNatale, University of Oregon, Memorandum to HB 4079 Rulemaking Advisory Committee (RAC), October 20, 2016, page 3.

Other Drivers of Housing Costs and Affordability

As illustrated in Exhibit 30, the prices that consumers experience in the housing market are a function of both supply and demand factors. There is strong evidence whether and to what extent housing production keeps up with demand has a pronounced effect on the pace of housing price and rent increases.[146] The cost to build new housing affects both the minimum sale price or rent that is required to make development feasible and the amount of housing entering the market. SDCs, as one among many factors that influence the cost of producing housing, play a role in broader market factors that determine home prices and rents.

4.2.2 Economic Theory on Cost Incidence of SDCs

Economic theory on impact fees suggests that impact fees "shift the burden of financing new infrastructure from the community at large to the owners of developable land, developers, or buyers of new homes."[147] Landowners may receive lower offers for their land, developers and their investors may receive lower financial returns, and/or homebuyers and renters would either pay more for housing or receive lower-quality housing.

How additional costs or taxes are distributed among buyers and sellers depends on each party's relative sensitivity to prices. Economic theory suggests the party with fewer alternatives is less sensitive to change in price and would bear a greater portion of costs (absorb more of the costs) when additional costs are incurred. For example, the incidence is higher for consumers on tobacco and gas purchases when taxes increase because they have few substitutes (choices), while the producers bear less of the increased costs because they can find new customers and markets.[148, 149]

Similarly, the theoretical impacts of SDCs can be understood in terms of alternatives and price sensitivity. Whether and by how much developers can pass on the cost of SDCs depends on market contexts.

- Because land's location is fixed, **landowners** have few alternatives other than waiting for new offers from developers or policy changes that would improve the value of the land. The cost incidence for landowners depends on the availability of other developable land within the same market and how much SDCs vary between comparable pieces of

[146] See, for example, Up for Growth, "Housing Underproduction in Oregon," January 28, 2019; Jared Bernstein et al, "Alleviating Supply Constraints in the Housing Market," *The White House Council of Economic Advisers*, September 1, 2021 (https://www.whitehouse.gov/cea/written-materials/2021/09/01/alleviating-supply-constraints-in-the-housing-market/); and Josh Lehner, "Construction, Housing Supply, and Affordability," *Oregon Office of Economic Analysis: Oregon Economic News, Analysis and Outlook*, February 15, 2022 (https://oregoneconomicanalysis.com/2022/02/15/construction-housing-supply-and-affordability).

developable land. If developers have factored SDCs into their land budgets (the price they are willing to pay for land) before they acquire a property, it will constrain the price landowners are able to obtain for their land. So, landowners who sell at a lower price than similar locations with lower SDCs, are bearing some of the cost. Alternatively, they may choose not to sell.

- **Homebuyers and renters** are generally tied to a given regional housing market and sometimes to a specific submarket within the region based on employment, ties to family members or a school district, or other factors.
  - In tighter housing markets (or "sellers' markets"[150]), homebuyers and renters have fewer housing options; theory suggests they would bear a greater share of costs when there is strong competition for limited housing units. For example, in exclusive or highly desirable communities within a metropolitan area, studies show that the strength of the competition would allow developers to pass on more of the added costs.[151]
  - In communities with many similar options for new housing, the cost incidence is expected to be lower for homebuyers because they have many choices within a reasonable distance. Studies show this pattern in communities around a dense metropolitan area where households would be willing to consider housing in multiple nearby cities.[152]
- **Investors, lenders, and developers** are unlikely to absorb SDCs by accepting lower returns except in very usual circumstances or when SDC costs increase unexpectedly during development and cannot be passed on to others. Investors and lenders usually have other options to invest in across multiple markets and will avoid areas that generate lower risk-adjusted returns. Studies show that **developers** are less likely to absorb added costs in lightly regulated, fast-growing cities where they can quickly adjust their business strategies to target different housing markets.[153] However, developers are less likely to pass on the cost in more competitive markets with many developers and few development opportunities. When they are not able to achieve the expected prices or rents and financial returns fall below the expected rates, the developers absorb some of the cost of SDCs (as well as all a share of the other costs).

4.2.3 How SDCs Affect Development Decisions

Overview

Developers may balance costs and revenues in a variety of ways to adjust to the cost of SDCs, as described below. Which of these options are viable and which are most likely depends on timing, market conditions, and other factors, as summarized below. (As a reminder, this discussion focuses on how the cost of SDCs affects development decisions, while Section 2.2 discusses ways that the infrastructure funded by SDCs affects development.)

Exhibit 31. Summary of Potential Developer Actions to Cover the Cost of SDCs
Source: ECONorthwest

Developer Action	Limitations and Consequences
Seeking lower-cost land to build on or negotiating a lower price with the landowner	If SDCs are known early in the development process so that a developer can negotiate for a lower land price, and if there are many options for developable land, the cost incidence is likely to be greater for the landowners who would accept a lower price. Other landowners may not accept a lower price, choosing to hold off on selling their land, and absorbing some of the influence of higher SDCs through the delay. If land is already acquired or cannot be negotiated further, a lower land price is no longer an option.[154]
Seeking efficiencies on design and construction to lower cost Adjusting unit size, finishes, and/or amenities to command higher sales prices or rents Raising the asking prices or rents	If SDCs are known before the housing design and finishes are determined or finalized, developers may choose to build smaller units, limit some aesthetic features or amenities, or use lower-cost building materials or processes (which could increase operating or maintenance costs over time). However, cost-saving decisions need to be balanced with households' demand for quality. Alternatively, developers can build larger units (for single-family homes), use higher quality products, or add amenities to justify higher prices and rents that can cover the cost of added features along with the cost of higher SDCs. The cost-saving approach could marginally increase the housing supply for lower-income households, while the quality-enhancing approach could marginally increase the housing supply for higher-income households. In both cases that change the value proposition, the cost incidence would fall, at least in part, on housing consumers, through lower value for their money or less availability of lower-cost housing options. Raising the asking price or rent for the finished housing without changing the design or features—which passes costs more directly to housing consumers—is a viable option only if there is sufficient demand among buyers and renters

[154] Understanding cost incidence of SDCs within a land transaction is complicated by various business models and landownerships that exist. A vertically integrated developer that is also a long-term landowner would bear a greater portion of SDCs (at least within the context of land transactions) since SDCs would not be incurred until well after land acquisition. Business models that specialize in taking undeveloped land and making them "ready for development" by obtaining regulatory approvals (e.g., for new uses and lot divisions) could incur a relatively smaller cost incidence even in a market with many buildable lands because their "development-ready" lands offer more valuable and rare opportunities for developers.

Developer Action	Limitations and Consequences
	of newly constructed housing, compared to supply that lower-cost options are not readily available.
Lowering expectations for financial returns	Because developers and investors will typically not pursue a development project if expected financial returns do not meet a particular threshold that justifies the risk of the investment, there are limited situations where SDCs will translate to lower return expectations. This is particularly true for investors and lenders who operate nationally—if one area offers lower risk-adjusted returns than other market areas, they will tend to place funds in areas that offer higher returns relative to their risks. However, SDCs can impact financial returns for market-rate housing development when they are significantly different than initial expectations. Most developers allow for some contingency funds to absorb unexpected cost increases because there is uncertainty in development and costs and revenues are often different from what is projected. However, once development is underway, developers have fewer options for adjustments to bring revenues and costs in line. Thus, when costs (including SDCs) unexpectedly increase during a project, developers must absorb those costs or make adjustments elsewhere if they still can. If unexpected cost increases are attributable to a policy choice by a public agency or local government, it can erode trust in that public agency, impact the feasibility of subsequent phases of development, and in some cases make developers less likely to build in that jurisdiction in the future.
Delaying or abandoning the development	If developers are not able to balance the costs and revenues, the development may not move forward, or may be put on hold. If higher SDCs result in less or slower housing production, pushing up the overall price of housing due to a supply/demand imbalance, its undesirable impact would be shared among all prospective buyers and renters of housing, new or existing, while existing homeowners would benefit from the higher housing prices.

Findings From Developer Interviews

As captured in Appendix B, developers described a range of responses to SDC costs:

- Developers can rarely move a project forward that doesn't meet investor and lender return expectations. If SDCs contribute to making a project financially infeasible, the project will not be able to attract funding to move forward to construction. (See additional discussion in Section 4.3.4.)
- Developers tend to specialize in certain types and forms of housing (e.g., single-family vs. multifamily, mixed-use infill vs. suburban garden apartments), and report that they primarily respond to the market when choosing what to build. SDCs are generally not a major factor in determining what housing type a given developer will build or what market segment they will target (e.g., entry-level vs. luxury homes) except where the difference in SDCs is substantial or where the developer is flexible and the market is similarly strong for multiple housing options. However, developers may adjust their offering at the margins in response to SDCs, such as by building somewhat larger or smaller homes. Over time, if certain housing types or products become easier to build

(e.g., middle housing being authorized in many new areas) and/or more financially viable (e.g., increasing demand for walkable infill development), developers may adjust their business models to respond; SDCs can contribute to (or inhibit) those trends, but they are unlikely to be the sole reason for them.

- Land developers noted that SDCs are factored into homebuilders' pro forma calculations when they purchase lots to build on, which means they can affect the price/value of finished lots. However, some other developers noted that they tend to build on land they have owned for many years, and SDC costs do not factor into the land value or price.
- Many developers and builders report that SDCs are one of several factors when considering where to build. (Others, which can outweigh the importance of SDCs, include market conditions, land costs, and permitting speed/staff responsiveness.) When SDC costs are out of line with market conditions (i.e., achievable rents or sales prices are too low to allow developers to recoup the cost of SDCs), developers may look elsewhere. If there are other options in the area with lower SDC costs and comparable market conditions and land costs, developers may choose those areas instead. However, when there are few good alternatives, developing somewhere else isn't an option. In this situation, developers must find other ways to make development pencil or not pursue development at all.
- Most developers noted that the market determines what prices/rents are possible, but several gave examples where high SDCs caused them to push the upper limits of what the market would accept to achieve feasibility.
- Developers budget for SDCs and may plan for escalation to some extent and/or carry a contingency for increases, but dramatic and unexpected changes to SDCs, or lack of clarity about SDC rates up front, can mean money taken from other parts of the project or more total costs to cover.
- Because rents are fixed based on income for affordable (income-qualified, rent-restricted) housing development, developers of regulated affordable housing do not have the option to pass it on through rents. Costs are generally factored into funding applications to the extent they are known early. Affordable housing developers were more likely to rely on cost-savings and value engineering to balance SDC costs after funding is secured.

4.3 SDC Costs in Context: SDCs as a Share of Development Costs

SDCs are one cost among many that developers typically pay as part of building housing (e.g., land, construction labor and materials, design fees, financing costs, etc.). While most development costs (e.g., raw materials, financing, and specialized labor) are determined by a regional, national, or international markets, SDCs are determined at a local level through a governmental process, and they do not necessarily track other development costs.

To understand what portion of development costs SDCs comprise, ECONorthwest considered several different types of information:

- National data on costs to develop single-family and multifamily housing, including impact fees as one component of costs (Section 4.3.1)
- Oregon SDC rate data (from Section 3.1.1) compared to typical market-rate housing development costs in the state, accounting for variation by housing type and variation in other cost factors across several market areas in the state (Section 4.3.2)
- Data on SDCs and total development costs for example affordable housing developments in Oregon (Section 4.3.3)

4.3.1 National Data on Impact Fees Relative to Housing Costs

The National Association of Home Builders (NAHB) Construction Costs Surveys offer a national summary of impact fees and other development costs for single-family housing. NAHB collected construction cost data from builders since 1998 to understand the trends in various cost components of single-family housing. The breakdown of costs includes finished lot cost, total construction cost, financing cost, overhead and general expenses, marketing cost, and sales commission. Impact fees are itemized as one component of the costs, specifically a component of total construction cost. Impact fees were separated from other development fees, such as building permit fees and water and sewer fees and inspection costs.

The NAHB survey data shows that impact fees alone are a very small portion of total costs for single-family housing at the national level, **0.88 percent** of total costs.[155] Water and sewer fees and inspection costs are about as large. Impact fees as a share of total costs ranged between 0.41 percent and 0.96 percent in past surveys. The average impact fee in 2019 was 1.30 percent of construction costs (which do not include other development costs) and 0.80 percent of average sales price (which includes all development costs and developers' profit margin).

These findings, however, are underestimates of typical SDC share of total costs for three reasons.

[155] Carmel, Ford. *Cost of Constructing a Home*. NAHB Economics and Housing Policy Group. January 2, 2020.

1. The national average amount for impact fees reported in the NAHB survey may not be representative of a true national average. In addition to general issues related to sampling variability with a nonrandom sample, the sample in the NAHB survey would have included communities with and without impact fees. Thus, the calculated estimate is likely weighted downward by many observations of communities without impact fees. In contrast, the average numbers cited elsewhere in this report are averages only of places that charge impact fees.
2. It is unclear which impact fees are included in the self-reported SDC amounts. Some water and sewer impact fees may have been classified by respondents as water and sewer fees and inspection costs (a separate line item in the listed costs), some of which may capture water and sewer impact fees.
3. The estimate for SDC share of total costs is low because the reported average finished area of the home is 2,594 sq. ft., resulting in relatively high total costs. Impact fees would likely account for a larger share of the prices and costs for smaller units, which tend to have lower construction costs on a per-unit basis.

Another survey by NAHB and the National Multifamily Housing County (NMHC) in 2022 contains information on impact fees for multifamily projects. Fees charged when building construction is authorized, which could include impact fees and other fees (e.g., building permit fees), accounted for about **4.4 percent** of total costs across all multifamily properties, on average.[156] This suggests that the impact fee share of total development costs is likely somewhat less than 4.4 percent, on average, though no data is available to disaggregate these costs further to identify the share specifically from impact fees, and the survey included another cost category where impact fees may have been reported, making it more difficult to estimate the share from impact fees specifically. In addition, like the NAHB single-family data, the data behind this national average likely includes projects from communities both with and without impact fees and may be lower as a result.

The two surveys provide reference points on impact fee share of development costs across the U.S., but their limitations make them less useful to understand SDCs as a share of housing development costs in Oregon.

4.3.2 SDCs and Development Costs in Oregon

Data Sources

SDC levels, other development costs, and housing prices vary by housing type and region. There is no centralized data set that allows us to calculate SDCs as a percentage of development costs across a representative sample of completed market-rate housing development projects across Oregon. As a result, to understand the variation in SDC share of total development costs,

[156] Paul Emrath and Caitlin Sugrue Walter. Regulation: 40.6 Percent of the Cost of Multifamily Development. NAHB and NMHC. June 8, 2022.

ECONorthwest compared various SDC amounts to typical development costs across a range of housing types and a range of market conditions in different parts of Oregon.

- **SDC costs** for single-family detached housing referenced in this section are based on the 2022 data collected by FCS GROUP discussed in Section 1.4.1. The average SDC in the data was about $15,050. As described in Section 1.4.1, the estimated typical SDCs for multifamily units are roughly 66 percent of the single-family SDC amount. Due to insufficient data for townhouses, ECONorthwest estimated typical SDCs for townhouses at 90 percent of the single-family SDC amount, based on a review of several examples and the consultant team's professional experience.
- **Construction costs** are based on interviews with housing developers primarily operating in the Portland Metro region and reflect differences based on housing type and unit sizes. They are adjusted for each market area using national publications that provide regional cost indices.[157]
- **Land costs** are based on research of recent land transactions in each market area.

SDCs as a Share of Costs for a Typical Single-Family Dwelling in Oregon

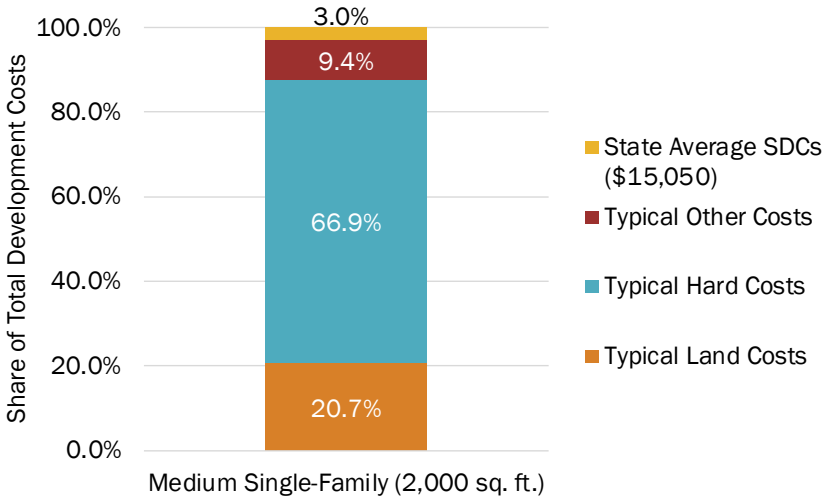
ECONorthwest's analysis suggests that the average SDC rate for single-family housing in Oregon (roughly $15,050 according to the 2022 data by FCS GROUP) would make up about **3.0 percent** of the total development costs of a typical, newly built, medium-sized single-family dwelling in a moderate-cost region in the state (e.g., the mid-Willamette Valley) as shown in Exhibit 32.[158] In comparison, land costs would make up an estimated 20.7 percent of total development costs, construction "hard" costs (labor and materials) about 66.9 percent, and other costs (e.g., financing, permit fees, design and engineering, survey, etc.) about 9.4 percent.

[157] RSMeans City Cost Index and the 2022 National Building Cost Manual, 46th Edition

[158] The example "Medium Single-Family Dwelling" assumes a 2,000 square-foot (sq. ft.) unit, a two-car garage, density of 6.7 units per acre, and development costs of $479,000 per unit, excluding the SDC amount.

Exhibit 32. Components of Development Costs of Medium Single-Family Dwelling in a Moderate-Cost Area

Source: ECONorthwest



Variation in SDC Share of Costs by Housing Type

This section focuses on how SDCs costs would vary as a percentage of total development costs for a variety of housing types, using SDC and cost assumptions that approximate statewide averages. However, costs and specific SDC rates vary by city, and the findings below do not represent all communities.

To demonstrate how the SDC share of total development costs can vary across housing types, ECONorthwest evaluated six different example housing types that are found commonly across much of the state, as shown in Exhibit 33. These housing types illustrate the directional pattern of the relationship between SDCs and other development costs. ECONorthwest approximated typical construction and land costs for these housing types in different parts of the state. Among the housing types included in this analysis, the cost to build each unit tends to be lower for densely built housing types that require less land per unit and tend to have smaller unit sizes.[159] More detail on the example housing types and their typical development costs across markets are available in Appendix F.

[159] This pattern does not apply to high-rise multifamily construction in which higher-density multifamily housing can have higher per-unit costs than lower-density multifamily housing due to higher construction costs associated with materials used for high-rise buildings.

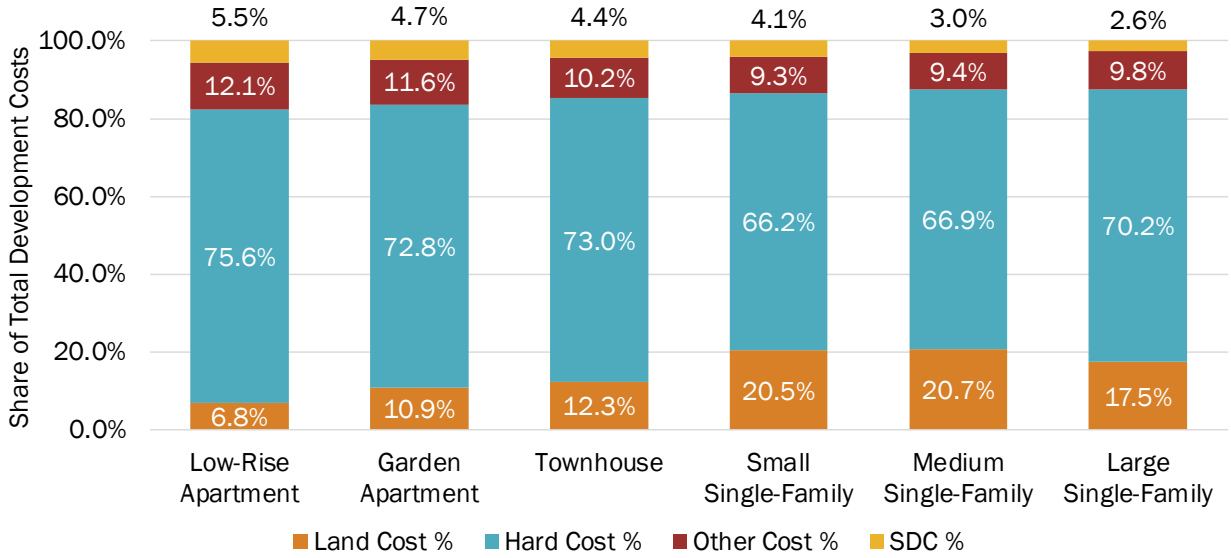
Exhibit 33. Evaluated Example Housing Types
Source: ECONorthwest

Example Housing Type	Building Height (Floors)	Density (Units per Acre)	Average Unit Size (Square Feet)	Parking
Low-Rise Apartment	3	55.0	738	1.0 Stalls per Unit (surface parking)
Garden Apartment	3	30.0	811	1.5 Stalls per Unit (surface parking)
Townhouse	2	18.2	1,500	Single-Car Garage
Small Single-Family	2	9.1	1,550	Single-Car Garage
Medium Single-Family	2	6.7	2,000	Two-Car Garage
Large Single-Family	2	6.7	2,650	Two-Car Garage

Exhibit 34 shows the share of total development costs that a given SDC amount could make up across housing types of different densities. Even with the adjustments to assumed SDC rates to reflect typical differences between single family, multifamily, and townhouse SDCs, **SDCs make up a greater portion of total development costs for housing types with lower per-unit construction costs when they are applied per unit.** For example, for the Low-Rise Apartment housing type—the highest density housing type in Exhibit 34—a $9,933 per unit SDC would make up about 5.5 percent of the total development cost. For the Large Single-Family housing type—the lowest density example—a $15,050 per unit SDC would make up only about 2.6 percent of the total development cost. Thus, SDCs make up a greater portion of more densely built housing types included in the analysis.

Other development costs range from 6.8 percent to 20.7 percent for land costs (a higher share for lower-density housing types), from 66.2 percent to 75.6 percent for hard costs (a higher share for higher-density housing types), and from 9.3 percent to 12.1 percent for other costs (generally higher for higher-density housing types).

Exhibit 34. Components of Development Costs in a Moderate-Cost Area, by Housing Type
Source: ECONorthwest



Notes: Assumes $15,050 per unit SDC for single-family, $13,545 per unit for townhouse, and $9,933 per unit for apartments.

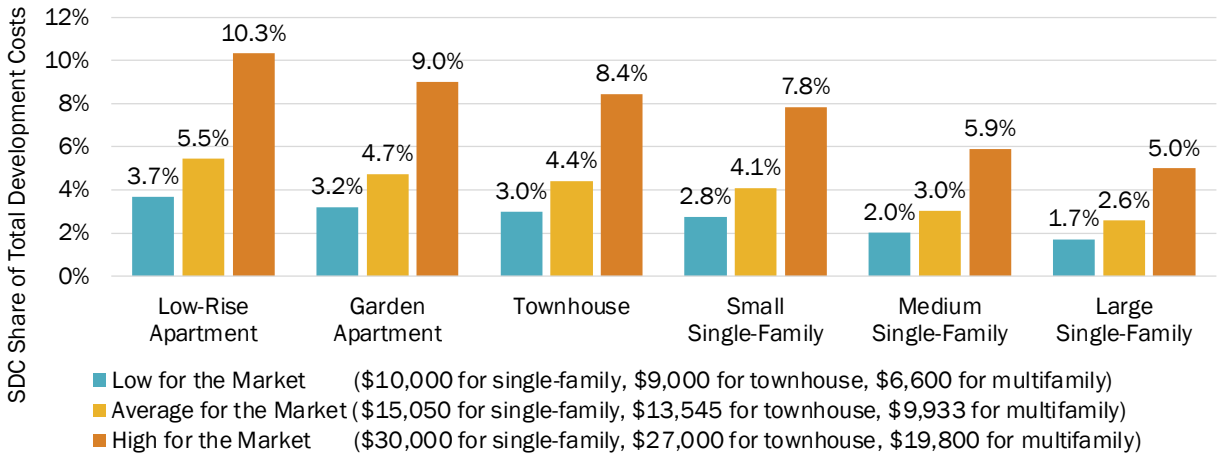
Variation in SDC Amounts in the Same Market

This section addresses how SDCs as a share of total development costs can vary for the same housing type and in the same market when SDCs vary between communities.

A geographic region can share similar market conditions, construction costs, and typical land costs, but different developments could be subject to different SDC rates when there are multiple jurisdictions in the same market or when a given jurisdiction differentiates rates geographically. For example, a city in a moderate-cost area could have an SDC amount close to the state average ($15,050 per single-family unit), but another city in the same area could have an SDC amount that is much lower or higher (e.g., as low as $10,000 or as high as $30,000 per single-family unit, given the observed variation in the FCS GROUP data[160]).

Exhibit 35 illustrates the impact of these variations on the SDC share of total development costs. **The variation in SDC rates across cities within the same general market area means the SDC share of total development costs can also vary widely.** In the example shown in Exhibit 35, the variation can be between 1.7 percent and 5.0 percent for a Large Single-Family housing type and between 3.7 percent and 10.3 percent for a Low-Rise Apartment housing type.

Exhibit 35. SDC Share of Development Costs in a Moderate-Cost Area, By Housing Type, By SDC Amount
Source: ECONorthwest



This illustrative example also shows that the difference in SDC rates has a more pronounced effect on lower-cost housing types. For example, for the Large Single-Family housing type, SDC share of development costs could be 5.0 percent with a high SDC and 2.6 percent with a low SDC. In contrast, for the Low-Rise Apartment housing type, SDCs could be between 3.7 percent and 10.3 percent of development costs.

[160] These SDC amounts are based on the 2022 survey results by FCS GROUP, after further segmenting the data into different market context areas.

Variation in SDC Structure

This section explores the importance of SDC structure. Specifically, it compares SDCs that are applied per unit (adjusted by housing type) to SDCs that are scaled by unit size, as discussed in "Characteristics Used to Scale SDCs Based on Development Size" on page 58.

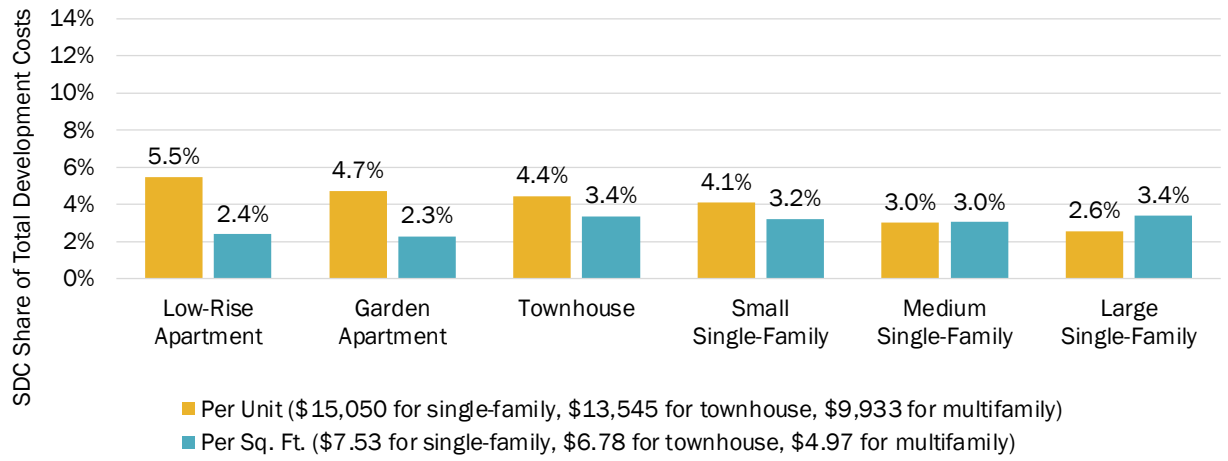
Many SDC rates are applied on a per-unit basis, and their structure partly drives the variations across housing types. When SDCs are applied per-unit, SDCs make up a smaller portion of total costs for housing types with larger unit sizes and higher development costs.

In contrast, applying SDCs per square foot of building area can remove the relationship between density and the share of costs that SDCs make up. (More on the scaling structure is discussed in Section 1.5.3.) Exhibit 36 shows that if SDCs were applied linearly per square foot,[161] it would produce a lower variation in SDC share of costs. Across the housing types, SDCs as a share of development costs could range between 2.3 percent and 3.4 percent with a linear per-square-foot SDC rate.

The per-square-foot SDC rate in Exhibit 36 is selected for illustrative purposes and is calculated by dividing the $15,050 per unit fee by 2,000 sq. ft. unit size of the Medium Single-Family housing type. The rate for Townhouse is 90 percent of the rate for single-family. The rate for Low-Rise Apartment and Garden Apartment is 66 percent of the rate for single-family.

When SDCs are scaled to unit size, the SDC share of development costs is more consistent across housing types. Compared to SDCs that are applied per unit, scaled SDCs result in lower SDC share of development costs for lower-cost housing types with smaller units. This shows that the variation in SDC share of total development costs can depend on not only the housing type but also the SDC structure.

Exhibit 36. Comparison of SDC Structures and SDC Share of Development Costs in a Moderate-Cost Area, by Housing Type
Source: ECONorthwest



[161] It is unlikely that all SDCs would be appropriate to scale in this way, but it is presented here to illustrate the general point about the impact of scaling by unit size compared to fixed per-unit SDC rates.

Variation by Market Context

This section explores how SDC share of development costs can vary between market areas, which have different SDC amounts and different development costs.

To illustrate the variation in SDC share of development costs across the state, ECONorthwest estimated typical development costs in seven parts of the state and compared them to a typical SDC amount in each region. The seven market context areas generalized market and cost conditions based on geography, market factors, and development cost factors. They are broad categories that reflect typical housing prices and construction costs across the cities that fall within each geographic region. The values used for each geographic market are not intended to represent a specific city, and average housing prices and costs vary by city. Rather, the values are representations of likely values observed across many parts of the geographic market. The market context areas are:

1. **Willamette Valley**: Larger cities along Interstate 5, with some similar housing options within a local housing market. Does not include cities in the Portland Metro area.
2. **Small Cities**: Smaller cities along Interstate 5 or remotely located in eastern Oregon. Relatively stagnant growth, lower demand, and lower land costs are observed in comparison to other market context areas.
3. **Coast**: Coastal cities with many vacation rentals and second homes.
4. **Metro Low**: Suburban cities and neighborhoods in the Portland Metro area with moderate demand for new housing and limited production of new housing.
5. **Metro Mid**: Suburban cities and neighborhoods in the Portland Metro area with relatively strong demand for new housing and, sometimes, large tracts of planned developments.
6. **Metro High**: More exclusive neighborhoods in the Portland Metro area with higher prices and relatively few options for new housing.
7. **Cascades**: Cities east of the Willamette Valley that experienced a strong level of housing demand and production in recent years.

For this section of the report, the findings from the analysis of the seven market context areas are summarized into three market types that typify the lower, middle, and upper points of the analyzed markets. A full analysis for all market areas is available in Appendix F. The three market types presented in this section are:

- **Low-Cost Market** that typifies small cities in eastern Oregon with relatively stagnant growth, lower housing demand, and lower land costs in comparison to other markets.
- **Moderate-Cost Market** that typifies large cities along Interstate 5 and south of the Portland Metro area.
- **High-Cost Market** that typifies a subset of suburban cities in the Portland Metro area with strong demand for new housing.

Exhibit 37 shows the typical SDC amounts estimated for each market and for different housing categories.[162] The townhouse SDCs are assumed to be 90 percent of the single-family SDCs, consistent with analysis above. The multifamily SDCs are assumed to be 66 percent of the single-family SDCs, consistent with analysis above.

Exhibit 37. Selected SDC Rates for Analyzed Markets

Source: ECONorthwest

	Low-Cost Market	Moderate-Cost Market	High-Cost Market
Single-Family SDC	$8,600	$15,050	$48,800
Townhouse SDC (90%)	$7,740	$13,545	$43,920
Multifamily SDC (66%)	$5,676	$9,933	$32,208

Exhibit 38 illustrates the findings from analysis. Given the estimated SDCs and other development costs, the analysis shows **the variation in SDC share of total development costs can also depend on the market.**

- SDCs could make up between 1.8 percent of single-family development costs to 3.5 percent of multifamily development costs in Low-Cost Market.
- SDCs could make up between 2.6 percent of single-family development costs to 5.5 percent of multifamily development costs in Moderate-Cost Market.
- SDCs could make up between 5.2 percent of single-family development costs to 12.5 percent of multifamily development costs in High-Cost Market.

[162] The typical SDC amounts in Low-Cost and High-Cost Markets are rounded numbers of the average of reported SDC amounts in the 2022 survey of SDCs by FCS GROUP for cities that typify the market contexts described. The statewide average is used as the typical SDC amount for the Moderate-Cost Market, consistent with all analysis and charts in this section.

4.3.3 SDCs as a Share of Affordable Housing Development Costs

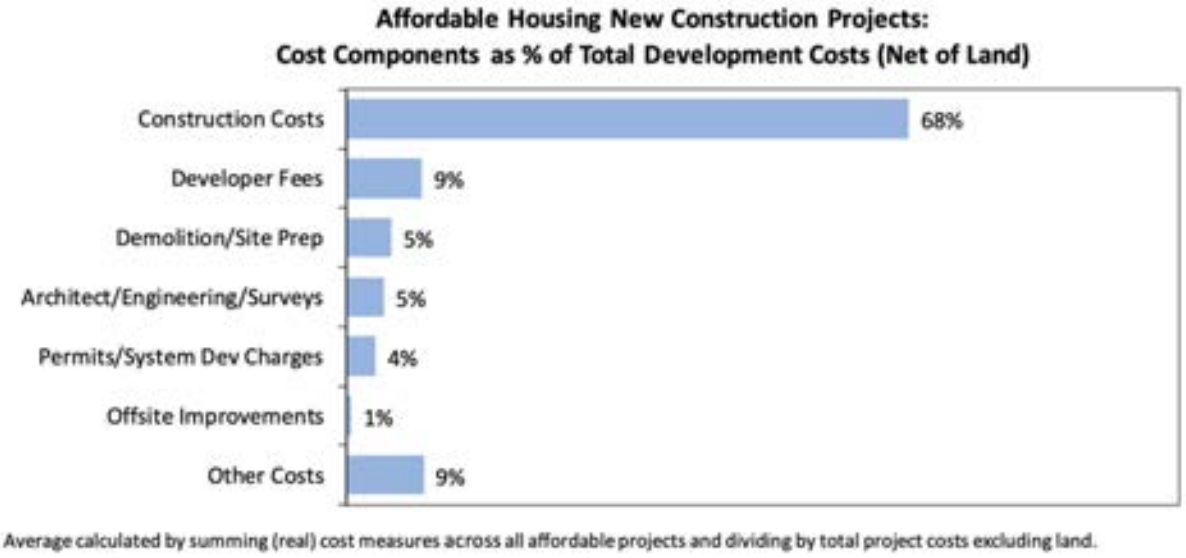
Affordable Housing Costs in Oregon

ECONorthwest reviewed the Affordable Housing Cost Study prepared for OHCS in 2019 to understand the relative cost of SDCs in comparison to other factors in affordable housing development. The report analyzed project cost data from over 200 regulated affordable multifamily housing projects built from 2001-2017, spread throughout urban and rural areas of Oregon with a range of size, unit mix, and total project cost. The study used a regression model

to test the relationship between different variables in affordable housing development and total project costs over this large sample.

In reviewing the breakdown of different cost factors associated with new affordable multifamily development, the report's data combines permit fees with SDCs as a single variable in many cases. This does not allow for differentiation between other types of charges (like planning and building permit fees) but does provide context for their relative importance in construction. Exhibit 39 shows that overall, the permits and SDCs accounted for about 4 percent of development costs (excluding land) on average. The report also notes that as of 2019, SDCs average more than $8,000 per affordable housing unit on average across the state.[163]

Exhibit 39. Breakdown of Affordable Housing Development Costs in Oregon (Excluding Land)
Source: Blue Sky Consulting Group, OHCS Affordable Housing Cost Study



Although permit fees and SDCs were estimated to account for a relatively low share of total costs overall, the study also showed that these costs grew to a greater extent between 2000 and 2017 than any of the other components. Exhibit 40 shows that affordable housing costs associated with permits and SDCs increased by an average 8.9 percent per year, more than twice as much as any other cost category.

[163] Blue Sky Consulting Group, "Affordable Housing Cost Study: Analysis of the Factors That Influence the Cost of Building Affordable Housing in Oregon" (Oregon Housing and Community Services, June 27, 2019).

Exhibit 40. Growth in Cost Components for Affordable Housing Over Time
Source: Blue Sky Consulting Group, OHCS Affordable Housing Cost Study

	Avg Real Cost per Unit*		Change	Change	Annual
	2000-'03	2014-'17	($)	(%)	Pct Change
Construction Costs	116,347	167,277	50,930	44%	2.6%
Developer Fees	14,413	23,927	9,514	66%	3.7%
Demolition/ Site Prep	9,871	13,876	4,005	41%	2.5%
Architect/ Engineering/ Surveys	8,769	10,317	1,548	18%	1.2%
Permits/ System Dev Charges	3,659	12,020	8,361	228%	8.9%
Other Costs	16,902	20,718	3,816	23%	1.5%
TOTAL COSTS NET OF LAND	**169,962**	**248,137**	**78,175**	**46%**	**2.7%**

** Costs represent 4-year moving average and are converted to real (2019) dollars using CPI.*

The report evaluates a range of possible cost factors influencing the cost of affordable housing development. A regression analysis suggested that the key factors that drive development costs for affordable multifamily housing include:[164]

- **Project characteristics** including type and size, as larger buildings and units tend to drive up costs.
- **Local factors** like community opposition and low availability of labor, which can result in expenses for additional public meetings and competitive wages.
- **Economies of scale,** which can reduce the cost per unit, but are effectively limited for certain projects based on the cap on the amount of Low Income Housing Tax Credits (LIHTC) available.
- **Building quality and durability** can increase costs for high quality developments but can lower ongoing maintenance and repair costs.
- **Land costs,** which varied across the state and by local census tract characteristics like income level and population density.

This list does not call out local fees explicitly, though they may be encompassed within "local factors." While this might suggest that SDCs are not a major driver of affordable housing development costs in Oregon compared to all the other factors evaluated, the report does call out the pace of increases as a key finding.

Case Study: SDCs Paid by Affordable Housing Development in Hillsboro

ECONorthwest summarized the amount that affordable housing developments in the City of Hillsboro have paid in SDCs over the past 10 years in a memorandum to the City of Hillsboro as part of their consideration of SDC exemptions.[165] The City does not offer SDC exemptions today,

[164] Blue Sky Consulting Group, "Affordable Housing Cost Study: Analysis of the Factors That Influence the Cost of Building Affordable Housing in Oregon" (Oregon Housing and Community Services, June 27, 2019).

[165] ECONorthwest, "Progress Report of Hillsboro Affordable Housing Tools and Evaluation of Additional Tools," prepared for the City of Hillsboro, April 12, 2022.

nor do Washington County or Clean Water Services (CWS), which also charge SDCs for projects in Hillsboro.

Exhibit 41: SDCs for Recent Affordable Housing Developments in Hillsboro
Source: ECONorthwest summary based on data provided by the City of Hillsboro; OHCS[166,167]

	Willow Creek Crossing	Orchards at Orenco II	Orchards at Orenco III	Alma Gardens	Nueva Esperanza	Total
Year Funded	2018	2015	2017	2013	2022	
Units	120	58	52	45	150	425
Parks SDC (City of Hillsboro)	$644,410	$258,158	$267,748	$175,950	$958,800	$2,305,066
Water SDCs (City of Hillsboro)	$0	$54,430	$55,350	$45,380	$88,280	$243,440
Sewer & Stormwater SDCs (CWS)	$663,084	$289,282	$283,104	$212,150	$912,750	$2,360,370
TDT (Washington County)	$663,960	$304,906	$281,580	$94,365	$944,400	$2,289,211
SDC total	**$1,971,454**	**$906,776**	**$887,782**	**$527,845**	**$2,904,230**	**$7,198,087**
Total SDCs per Unit	$16,429	$15,634	$17,073	$11,730	$19,362	$16,937
Total Development Costs	$31,523,563	$13,547,334	$14,860,640	$9,273,520	$53,954,156	$123,159,213
SDCs as a % of Total Development Costs	**6.3%**	**6.7%**	**6.0%**	**5.7%**	**5.4%**	**5.8%**

In total, over $7 million of affordable housing funding has gone towards SDCs over the past 10 years for projects within the City of Hillsboro alone. This represents **nearly 6 percent of the total development costs** on average.

Note that these example projects are located outside the South Hillsboro area, which has additional area-specific SDCs. Apartment projects located in South Hillsboro, including affordable housing development, are subject to over $17,800 in additional SDCs (as of 2022).[168] Using Nueva Esperanza as an example, since it is currently under construction, the total SDC cost if it had been located in South Hillsboro would have been over $5.5 million, or over $37,000

[166] Oregon Housing and Community Services, https://www.oregon.gov/ohcs/development/Documents/applicants-recipients/4-percent-lihtc-affordable-housing.pdf

[167] Oregon Housing and Community Services, https://www.oregon.gov/ohcs/development/Documents/applicants-recipients/LIHTC-Statewide-List.pdf

[168] City of Hillsboro, "Citywide Fees and Charges," August 2022, page 44-45. SDC rate assumes property is not part of the Local Improvement District (LID) for the area, which applies some infrastructure costs in the form of an LID assessment rather than a supplemental SDC.

per unit—close to 10 percent of the total costs (even after accounting for the increase in total costs due to higher SDCs).

4.3.4 SDCs Compared to Other Development-Related Costs

Overview

As noted previously, SDCs are just one of many costs of housing development. HB 3040 directed the study to include a comparison of SDCs to "other housing cost drivers, including, but not limited to, the costs of land, labor and materials, utility rates, the costs of infrastructure and costs associated with regulatory compliance." In comparing other cost drivers to SDCs, it is important to consider not only the magnitude of the costs but also the level of public sector influence over those costs, which varies among the cost drivers listed. It is also important to note that the total cost impact of a given input to housing development depends both on the unit costs of that input and the amount needed (e.g., the cost of a given amount of land and the amount of land required per unit). While it is beyond the scope of this report to conduct a detailed analysis of how each of these cost factors has changed over time and the extent to which the public sector can increase or decrease the costs or their impact on housing, this section provides a high-level summary of how market forces and public-sector policies and regulations can affect these costs and the available data on their relative contribution to the cost of housing development or to housing costs more generally.

Land

Land Cost Factors

As illustrated in Exhibit 30 (page 67), the cost of land in the context of housing development is affected by a combination of the supply of buildable land that is available and suitable for residential development, and demand for land based on overall growth drivers. As discussed further in Section 4.2.3, expected costs associated with developing the land (including providing infrastructure) and projected revenues from development also affect the market price for land. Local governments have an influence on land supply (e.g., through setting urban growth boundaries), land use regulations, and infrastructure investments and requirements, all of which can affect land cost to some extent. Local regulations also impact how much land is required for a given housing development through minimum lot size, maximum density, and other development standards.

Land Costs as a Share of Development Costs

Land costs are included in the estimates described in Section 4.3.2. ECONorthwest's analysis suggests that land costs likely account for roughly 7 to 21 percent of total development costs for typical market-rate housing development in Oregon, depending on the housing type.

The 2019 study of affordable housing costs in Oregon referenced earlier found that "land costs as a percent of total project cost ranged from as little as 2 percent to as much as 15 percent. On

average, land costs accounted for slightly less than 7 percent of total project costs."[169] This data was drawn from a sample of affordable housing new construction projects with arms-length land transactions. It cited an average of $17,000 in land costs per unit and a median of $14,000 per unit (in 2019 dollars).[170] The study noted that land costs were lower in rural areas than in non-rural areas.[171]

This is generally somewhat higher than SDC's share of development costs. However, this varies by region and by community. In a recent opinion piece, Habitat for Humanity of Metro Portland noted that "when Habitat for Humanity develops housing in [the Portland] region, permitting fees plus 'System Development Charges' paid to local jurisdictions generally exceed the market-rate cost for land."[172]

Construction Labor and Materials

Construction Labor and Materials Cost Factors

The cost of construction labor is affected by labor supply factors (including availability of other employment opportunities, availability of training programs to build relevant skills, and licensing requirements), labor demand factors (including amount of construction taking place at any one time), regional cost of living, and government regulations including minimum wage standards and prevailing wage requirements. Government regulations can also affect the amount of construction labor required through design standards, building codes, and worker health/safety regulations.

The cost of construction materials (e.g., lumber, concrete, steel, but also plumbing fixtures and appliances) is largely set through commodities markets based on broader supply and demand trends, though limited availability of certain materials in smaller markets can increase materials costs in specific areas. Local regulations have little impact on the unit cost of materials, but they can affect the amount and type of materials required through design standards and building codes.

Construction Labor and Materials as a Share of Development Costs

The costs of labor and materials ("hard costs") are included in the estimates described in Section 4.3.2. ECONorthwest's analysis suggests that hard costs likely account for two-thirds or more (66 to 76 percent) of total development costs for typical market-rate housing development in Oregon, depending on the housing type.

---

[170] *Ibid.*, page 34.

[171] *Ibid.*, page 38.

[172] Sam Diaz, Kim McCarty and Steve Messinetti, "Opinion: Undoing urban growth boundary isn't the answer to our housing crisis," *The Oregonian*, December 4, 2022. https://www.oregonlive.com/opinion/2022/12/opinion-undoing-urban-growth-boundary-isnt-the-answer-to-our-housing-crisis.html.

In the 2019 study of affordable housing costs found that construction costs (including labor and materials for building construction) accounted for 68 percent of total development costs (excluding land), as shown in Exhibit 39 on page 83.

This is much higher than the cost of SDCs as a share of housing development costs, but the degree to which the public sector can impact these costs is less (see Regulatory Costs beginning on page 89).

Infrastructure Costs

Infrastructure Cost Factors

Infrastructure costs in this context refers to costs for improvements made directly by the developer that are not eligible for SDC credits. This could include local streets and water/wastewater lines within a subdivision, sidewalk improvements for an infill development, or off-site improvements required as a condition of development (e.g., intersection improvements, crosswalks, etc.). The factors driving the unit costs of infrastructure are discussed in Section 2.1.2 beginning on page 22. Total direct infrastructure costs borne by a given development are also driven by the availability and adequacy of infrastructure nearby, local government standards related to infrastructure design and construction (e.g., required street cross-sections and engineering specifications for streets and utilities), and local government policies and regulations that determine what improvements are required for a development (e.g., traffic impact assessments, frontage improvement requirements).

Infrastructure as a Share of Development Costs

There is no comprehensive data on these costs, and it is difficult to estimate "typical" costs for residential development across the state, given that direct infrastructure costs are highly variable between different developments depending on their context. Some infill projects may have no infrastructure costs, while major greenfield developments or large-scale redevelopment projects may require extensive new infrastructure construction and/or upgrades to existing facilities. The extent to which infrastructure costs can be defrayed through SDC credits also varies, as discussed further in Section 5.3.

As one way of estimating direct infrastructure costs for a simple single-family subdivision that does not require major street extensions or off-site improvements, ECONorthwest analyzed typical local street improvements costs using unit cost estimates used by various cities on recent infrastructure funding and analysis projects.[173] The estimated costs ranged from about $23,800 to $41,100 per unit. (The higher estimate is from a smaller city and includes extending utility lines within the street.) In comparison, the average SDC per unit for single-family development ranges from $8,600 in a low-cost market to $15,050 in a moderate-cost market to $48,800 in a high-cost market, as shown in Exhibit 37 on page 79.

[173] The analysis assumes 50-foot-wide lots on a double-loaded street meeting the narrowest street design for which costs were available. Unit costs were derived from analysis related to Beaverton's South Cooper Mountain, South Hillsboro, and an analysis of infrastructure needs associated with vacant land in Newport.

The 2019 Affordable Housing Cost Study did not isolate the cost of infrastructure improvements specifically, but it did estimate costs for "Offsite improvements" and for "Demolition/Site Prep." Given that the projects included in the analysis are all multifamily, for which utility extensions and circulation from a main road are generally provided through the site on private land rather than in public right-of-way, a portion of the cost of extending infrastructure through the site may be included in the "Demolition/Site Prep" category. "Offsite Improvements" is likely to be mostly attributable to infrastructure improvements, though this category is not further defined in the report. As shown in Exhibit 39 on page 83, offsite improvements were estimated at roughly 1 percent of total development costs (excluding land), on average, for affordable housing new construction statewide.[174]

ECONorthwest also reviewed several example pro formas provided by OHCS from recent affordable housing projects. These pro formas showed off-site costs accounting for roughly 1 to 2 percent of total development costs (including land). The pro formas grouped on-site utility extensions with other on-site and site preparation costs, but one included a note indicating a specific amount for on-site utilities, which, for that specific project, accounted for roughly an additional $11,000 per unit, and 4 percent of total development costs. (For that example project, SDCs were just over $3,000 per unit and roughly 1 percent of total development costs.)

Taken together, the limited available data suggest wide variation in direct infrastructure costs across different housing projects, which can be more or less than the costs of SDCs.

Regulatory Costs

Regulatory Cost Factors

The cost of regulatory compliance is difficult to measure for several reasons. First, there are many ways to define the costs of regulations, some broader than others. Second, even if there is a consensus on the categories of regulatory costs to track, measuring them can be challenging. Potential categories within regulatory costs include:

- **Permitting and compliance costs**: There are costs directly attributable to demonstrating compliance with government regulations (e.g., permit fees, inspections, environmental testing or evaluations, the cost to prepare permit applications and special studies, the cost to prepare for and attend public meetings if required). Some of these are easy to measure (e.g., permit fees), while others may be a hidden component of other costs (e.g., preparing permit applications may be included in an architect's fee).
- **Delay-imposed costs:** Regulations can increase the time it takes to complete a development, which can impact financing/interest costs and other development costs (e.g., costs associated with having adjacent streets closed or modified, the cost of having contractors or equipment on site). Delay due to permitting processes can also mean delayed cash flows or unproductive capital, although the time value of money can differ

[174] Blue Sky Consulting Group, "Affordable Housing Cost Study: Analysis of the Factors That Influence the Cost of Building Affordable Housing in Oregon" (Oregon Housing and Community Services, June 27, 2019).

from person to person, developer to developer, and city to city. These costs are rarely itemized specifically, though they can be estimated.

- **Standards-related costs:** Regulations can also impact the cost of other inputs to development, including land, construction labor and materials, infrastructure, and engineering/design fees by setting minimum standards that a development must meet, as noted in the prior subsections. The extent to which regulations *do* impact the cost of other inputs depends on how different the requirements are from what developers would choose to do (or what lenders, investors, or end users would demand that they do) absent the regulations, which varies depending on the context and can be difficult to ascertain.

Like SDCs, in a full evaluation, the costs of these requirements should be weighed against the benefits to public safety, health, environmental quality, and community well-being, but such an evaluation of trade-offs is beyond the scope of this study.

Regulatory Costs as a Share of Development Costs

National Estimates of Regulatory Impacts on Multifamily Development Costs

A recent and oft-cited study of regulatory costs by NAHB and NMHC estimated that as much as 40.6 percent of multifamily development costs are due to the cost of regulatory compliance, based on a survey of 49 developers across the country. The survey asked respondents about how much various factors contribute to total development costs for a typical project.[175] A breakdown of the specific cost components included in this total is shown in Exhibit 42.

[175] Paul Emrath and Caitlin Sugrue Walter. Regulation: 40.6 Percent of the Cost of Multifamily Development. NAHB and NMHC. June 8, 2022. https://www.nmhc.org/globalassets/research--insight/research-reports/cost-of-regulations/2022-nahb-nmhc-cost-of-regulations-report.pdf

Exhibit 42: Average Regulatory Costs as a Share of Total Multifamily Development Costs Nationally
Source: NAHB and NMHC[176]

	Share With the Regulatory Cost	Regulation as a Percent of Total Development Cost	
		Average When Present*	Average Across All Properties
Cost of applying for zoning approval	93.9%	3.4%	3.2%
Costs when site work begins (fees, required studies, etc.)	98.0%	8.7%	8.5%
Dev. requirements (layout, mats, etc.) beyond the ordinary	91.8%	5.8%	5.4%
Cost of land dedicated to the goverment or left unbuilt	51.0%	4.7%	2.4%
Fees charged when building construction is authorized	95.9%	4.6%	4.4%
Costs of affordability mandates (e.g., inclusionary zoning)	38.8%	6.9%	2.7%
Changes to building codes over the past 10 years	100.0%	11.1%	11.1%
Complying with OSHA/other labor regulations	93.9%	2.7%	2.6%
Pure cost of delay (if regulation imposed no other cost)	95.9%	0.5%	0.5%
TOTAL COST OF REGULATION	**100.0%**	**40.6%**	**40.6%**

* The base is different for every percentage in this column, so the line items are not additive.

- **Permitting and compliance costs** such as the cost of applying for zoning approval (including costs of traffic impact studies or other required studies), fees and required studies when site work begins (which can include hook-up or impact fees in some cases), and fees charged when building construction is authorized (though this can also include impact fees) total an estimated 16.1 percent of total development costs on average.[177] ("Soft costs," which include these costs as well as design, financing, legal, and insurance costs, typically account for 20 to 35 percent of total development costs.)
- **Delay** is estimated to account for 0.5 percent of total development costs based on typical construction timelines and loan terms combined with survey results regarding the typical timing associated with various stages of development.[178]
- **Standards-related costs**, including development requirements beyond the ordinary, the cost of land dedications, changes to building codes, and complying with labor regulations were estimated to total 21.5 percent of development costs, with building code changes representing the largest share of these costs.[179]

The study also estimated cost impacts associated with inclusionary zoning/affordable housing requirements, but it is unclear whether this reflects fee-in-lieu costs or other costs associated with these programs.

Prevailing Wage

Governments can require its contractors and grant awardees to satisfy certain labor standards and wage requirements. U.S. Department of Labor determines federal prevailing wage rates and Oregon Bureau of Labor and Industries determines Oregon's prevailing wage rates.

Estimates of the cost impact of prevailing wage requirements have largely focused on affordable housing development. Some affordable housing developments are subject to prevailing wage requirements while others are not, as described in the excerpt below. According to a 2015 study by the Meyer Memorial Trust:

> *Work Group experts generally agreed that meeting BOLI requirements added about 10 percent to the hard costs of a project. However, in the case of a mixed-use project including ground floor commercial uses, BOLI typically holds the entire project to the significantly higher commercial BOLI wages (in effect, treating a three-story stick-built apartment building the same as a high-rise office building made of steel and concrete). Commercial BOLI rates can add as much as 20 percent to construction costs over a non-prevailing wage project.*[180]

An academic study from 2005 found that prevailing wage requirements increase the costs of constructing affordable housing by 9 to 37 percent.[181] Even if these cost increases are only on the construction "hard costs," they may exceed the cost impacts associated with SDCs in cases where prevailing wage requirements apply.

Study of Cost Savings From Regulatory Changes

In an analysis for the City of Seattle, ECONorthwest developed a model that showed sensitivity of housing affordability to various regulatory changes, including reducing permitting time, removing a retail frontage requirement. The study estimated that reducing permitting time from 24 to 12 months for multifamily development and from 18 to 9 months for townhouse development could reduce the rents and sales prices required to make development feasible by roughly 4 to 6 percent. It also showed potential for roughly a 1 percent reduction in rents and sales prices from removing a ground-floor retail requirement. The study also considered changes to impact fees and suggested that substantial reductions to permitting time could have a greater impact than a $4,700 to $6,000 difference in impact fees.[182]

Comparison to SDCs

While the available data is limited and the cost impacts are harder to accurately measure, these studies suggest that other permitting and compliance costs (e.g., fees, inspections, cost to prepare applications, etc.) and certain development or labor regulations (e.g., prevailing wage requirements) can impact total development costs by a similar order of magnitude as SDC costs,

[182] *Seattle Affordable Middle-Income Housing Advisory Council: Policy Recommendations to Mayor Jenny A. Durkan*, January 2020. Analysis by ECONorthwest.

and that permitting speed can affect total costs, though the magnitude may be less or more than the impact of SDCs.

Construction Excise Tax

Jurisdictions in Oregon are allowed to assess a Construction Excise Tax (CET) on new residential and non-residential developments as a means of funding affordable housing strategies. Though a variety of CETs exist, a CET can be imposed at no greater than 1 percent of a building's permit value for residential development. Permit value is typically an approximation of construction hard costs and much less than the total development costs. Therefore, CETs make up less than 1 percent of total development costs for residential developments in jurisdictions that elect to adopt a CET, which will generally be less than the impact of SDCs.

Utility Rates

Unlike the other cost factors identified in the legislative directive for this study, utility rates do not affect the cost of housing development. Instead, they affect households' on-going monthly costs. Thus, while both SDCs and utility rates are related to funding for infrastructure and to broader affordability concerns, their impacts are observed in different ways. Utility costs are generally paid by residents directly (except in some cases with apartments that have shared meters, where water costs are included in rent). SDCs are generally not paid by residents directly and have more nuanced impacts on housing production and affordability including how much new housing gets built, where it gets built, and what sizes/types of housing the market can deliver.

Typical utility costs and the share that is attributable to capital improvement costs are discussed in Section 2.1.4, and affordability impacts of utility cost increases are discussed in Section 2.2.4.

A 2021 survey of local jurisdictions by LOC offers a summary of the size of some utility rates and how they vary across the state. Survey responses from 105 jurisdictions show that monthly water and wastewater utility bills[183] can add up to between $65.89 and $129.39, with the average at $99.32. Utility rates vary less by region than SDCs do, and they do not follow the same geographic patterns (see Section 3.1.1). The estimated utility bills in the survey data are higher for coastal regions, for example, than they are for the Portland metropolitan area. In contrast, the highest SDCs are generally observed in the Portland metropolitan area.[184]

Over 20 years, water and wastewater utility bills can add up to about $17,000 to $33,000 in today's dollars, depending on the region.[185] These values are somewhat higher than the

[183] For a hypothetical customer who used 5,000 gallons (6.684 CCFs) of water and has a ¾" meter size.

[184] Aljets Consulting. *2021 Water Rates Survey Report*. December 2021. League of Oregon Cities.

[185] ECONorthwest calculated the present value using an assumed 5 percent annual inflation rate for utility expenses (based on information from Section 2.1.4) and a 4 percent discount rate to account for time value of money. For reference, the yield on U.S. 10 Year Treasury was about 3.8 percent and the yield on U.S. 20 Year Treasury was about 4.1 percent in the fall of 2022.

estimated median SDC amount (just over $15,000), though the 20-year value of water and wastewater bills is not a perfect comparison to SDCs, and utility rates are largely covering the cost of operations, maintenance, and system modernization, as discussed in Section 2.1.4, which SDCs generally cannot pay for.

4.4 Impact of SDCs on Financial Feasibility of Market-Rate Residential Development

4.4.1 Testing Impacts Across the State

Approach

To understand the financial impact SDCs can have on development feasibility and the relationship between SDCs and development outcomes, ECONorthwest constructed pro forma models that are sensitive to change in input costs. A more detailed methodology is included in Appendix F.

The key measure of development financial feasibility used to demonstrate the marginal impact of SDCs is **expected returns** of for-profit developers of market-rate housing. (Impacts of SDCs on affordable housing developers are addressed in Section 5.2.2.) If a change in SDCs results in a decrease in the expected returns, developments are less likely to occur.

Although there are many methods to calculate and measure investor returns, the metric selected for this study is internal rate of return (IRR). IRR is a commonly used financial metric in the real estate industry to estimate the profitability of real estate investments. Although expected IRR can vary based on the type of development, location, market contexts, and investor-specific considerations, it is typically between 15 percent and 25 percent. Therefore, a one percentage point change in IRR may be within a margin of error and not impact development decisions, but a change of five percentage points is likely to have an impact.

As noted above, the impact of SDCs on housing can vary across geographic markets and housing types in Oregon. To isolate the potential impact of SDCs on housing development feasibility, ECONorthwest used a pro forma analysis that reflects market and cost differences across the state, using seven market context areas discussed in Section 4.3.2, beginning on page 80. The analysis measured the marginal impact of higher vs. lower SDC amounts on financial feasibility, based on the sensitivity of developers' expected returns to changes in SDCs. (More detail on the analysis is discussed in Appendix F.)

Findings

Although specific site or economic conditions will influence development outcomes for any given development, the analysis suggests some generalizable takeaways.

- The marginal impact of SDCs on development feasibility is greater for lower-cost and higher-density housing developments. Because SDCs often make up a greater portion of total development costs in a housing development that is less costly to build on a per-unit basis, a fixed change in SDCs has a greater marginal impact on lower-cost (and higher-density) housing types. This relationship is generally true across markets. For example:

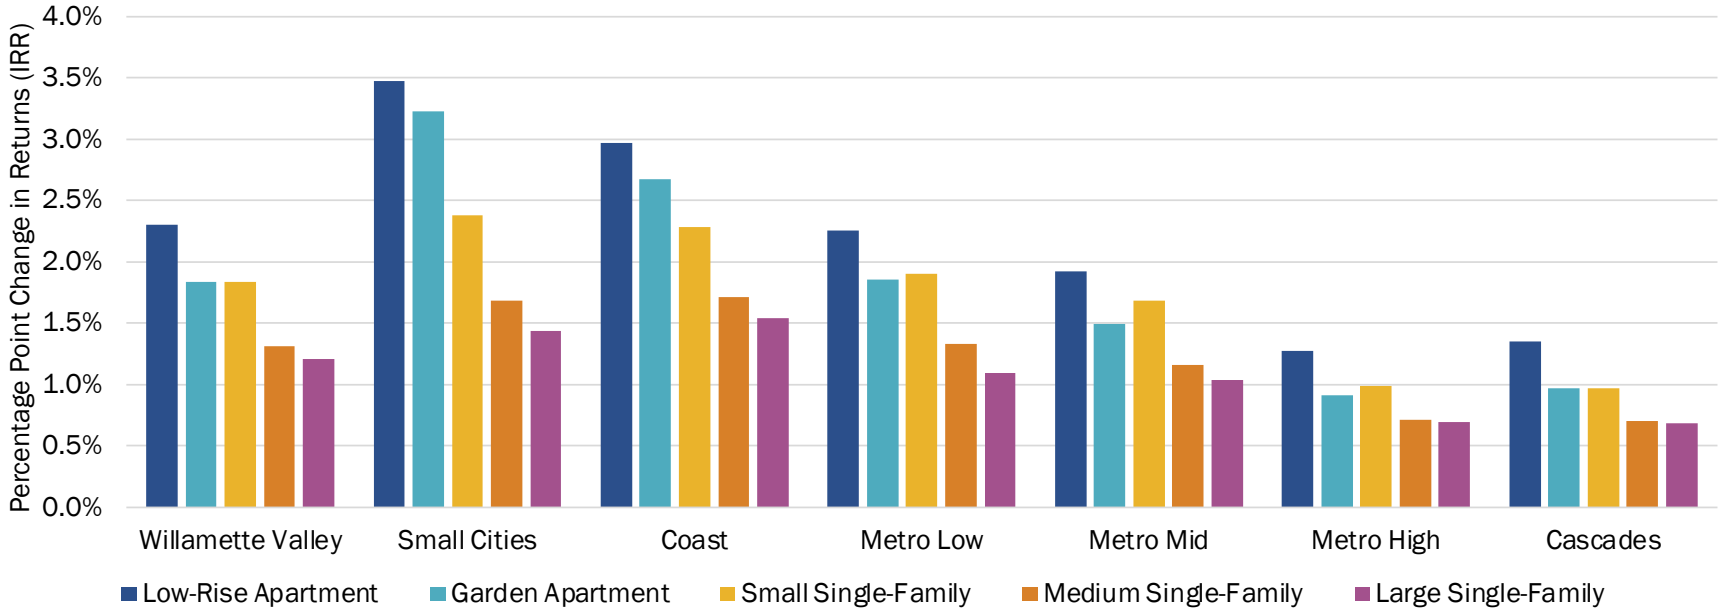
- A $10,000 change in fee would have a greater marginal impact on the financial feasibility of Small Single-Family housing than on Large Single-Family housing (see Exhibit 43).
- A $6,600 change in fee would have a greater marginal impact on the financial feasibility of Low-Rise Apartment housing than on Garden Apartment housing (see Exhibit 43).

- Similarly, the marginal impact of SDCs is greater in markets where it is less costly to build. Because a fixed SDC amount makes up a greater portion of total development costs in markets with lower land costs, a change in SDCs has a greater marginal impact on the types of housing markets can deliver in markets with lower costs for land and construction.
  - For example, a $10,000 change in fee for a single-family unit would have a greater marginal impact on financial feasibility in a small city outside a metropolitan area than inside a metropolitan area where land and housing prices are relatively expensive (see Exhibit 44).

A key limitation of the results shown in Exhibit 43 and Exhibit 44 is the simplifying assumption that SDCs could vary by the same amount across all market context areas. While the assumption is useful for demonstrating the directional relationship between SDCs and development feasibility, it does not account for the fact that SDCs vary widely across markets. For simplicity, the analysis uses a constant amount of change in SDCs across all market areas.

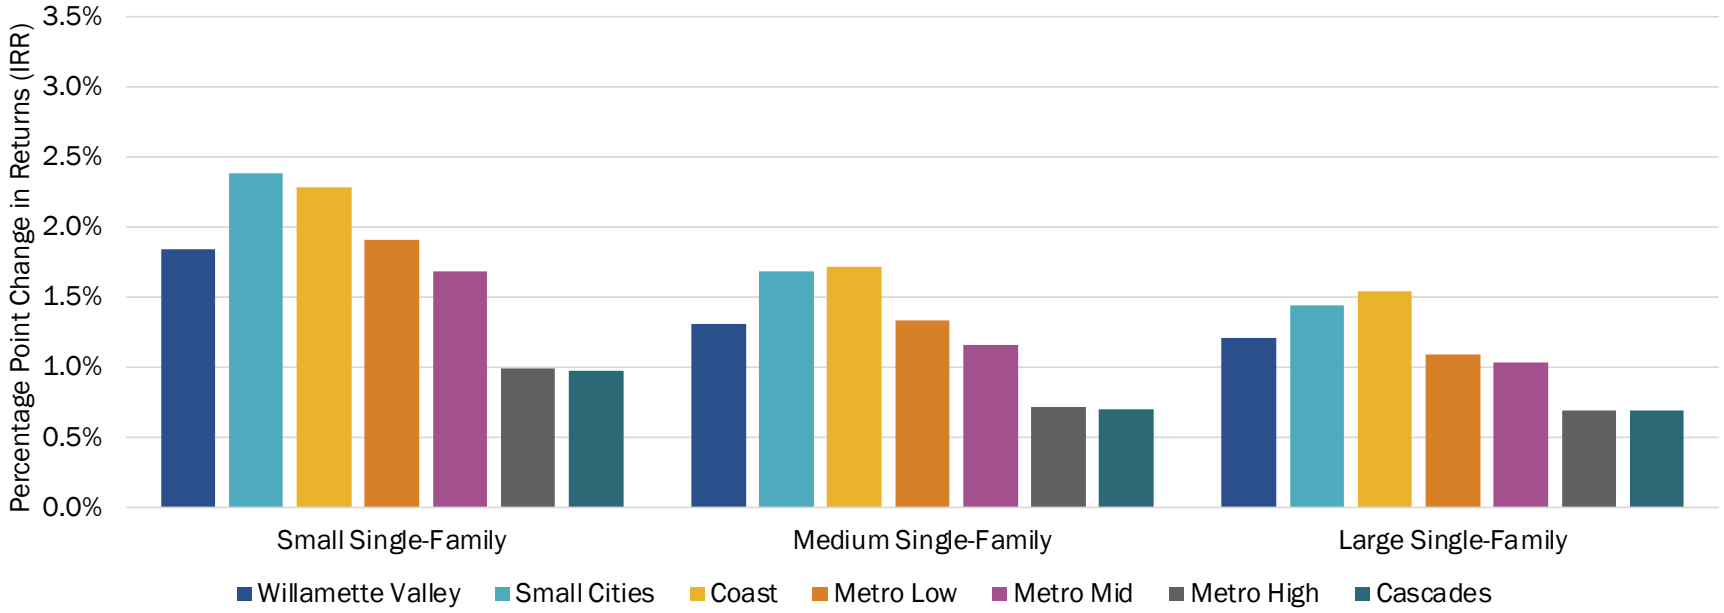
Exhibit 43. Marginal Impact of Change in SDCs on Development Feasibility by Housing Type and Market Context Area

Source: ECONorthwest



Note: A $10,000 change is modeled for single-family housing types. A $6,600 change is modeled for apartment housing types. Section 1.4.1 explains multifamily SDCs are about 66 percent of single-family SDCs, on average.

Exhibit 44. Marginal Impact of $10,000 Change in SDCs on Single-Family Development Feasibility by Unit Size and Market Context Area
Source: ECONorthwest



4.4.2 Findings From Developer Interviews

The patterns noted above are generally consistent with findings from developer interviews.

- In some cases, SDCs are enough to make a project infeasible, especially for very cost sensitive housing types. Entry-level homes are cost-sensitive, including middle housing. Attached product can sometimes cost more to build than a single-family home and often sells for less relative to a detached house. Multifamily can also be affected by high SDCs if they are disproportionate to other costs.
- When SDCs are low compared to other costs, they have little impact on development feasibility.

SDCs are not typically an important factor for high end housing types, such as custom homes, because they represent a small portion of the cost, and high-income/wealthy buyers tend not to be cost-sensitive.

4.5 Relationship Between SDCs and Home Prices

This section summarizes various sources of data and research regarding the relationship between SDCs and home prices, including peer reviewed literature, Oregon-specific case studies, and data on home prices compared to SDCs in communities across the state.

4.5.1 Evidence From Empirical Literature

Overview and Limitations

The effect of impact fees on various housing market outcomes has been analyzed empirically in numerous studies within the context of specific cities and states in the U.S. However, findings from the empirical research should be interpreted carefully for a few reasons:

- Although the empirical research utilized commonly used statistical models to understand the relationship between impact fees and cost incidence, they failed to establish a definitive causal relationship. Observed changes in prices or housing production in places with impact fees could be due to the impact fees increasing housing costs or other reasons, including reduced production of new entry-level homes, lower overall housing production, a higher level of amenities and services in places with higher SDCs, a greater willingness to impose high impact fees in places with strong housing markets, or other factors. Thus, the results of the studies mentioned are interpreted as correlations rather than definitively establishing causal relationships.
- None of the studies were conducted in Oregon, which has a unique growth management planning system that affects housing markets. While some places included in the research could resemble a city in Oregon, there is no generalizable takeaway from the empirical studies that would be applicable across Oregon.
- There are many variations in the outcome variables of the empirical research. While all studies on housing prices looked at the prices for newly constructed, single-family units, some also included the data for existing units or multifamily units. Other studies looked instead at land prices, which could be differentiated as either undeveloped (vacant) land or developed land. The applicability of each research's findings depends on the data that is used.

Summary of Studies, Approach, and Findings

Exhibit 45 is a summary of key information presented in academic research that studied the relationship between impact fees and the housing market. A more detailed summary is available in Appendix G. The 15 summarized studies provide a snapshot of the existing range of research that exists, but they are not a comprehensive list of impact fee studies. The key takeaways are:

- Most studies measured the relationship between impact fees and housing prices (for new homes only or for all homes in an area). These studies consistently found higher home prices in areas with impact fees. The differential in housing prices ranged from 25 percent to 300 percent of the value of the impact fee.
- A few studies analyzed the relationship between impact fees and land prices. While the economic theory discussed in Section 4.2.2 suggests that land prices should be lower in areas with impact fees, studies were mixed on this point.
- A few studies analyzed the relationship between impact fees and housing production. Most of these observed a negative relationship—higher impact fees were associated with less housing production—although one found the opposite.
- More recent studies that attempted to distinguish the effects of different types of impact fees found that not all impact fees have the same effect.
- There are no studies that measured the potential effect of removing impact fees, providing no direct evidence to suggest taking away existing impact fees could reduce housing prices.

Bae, Kwon, Coutts, Park, and Feiock (2015)	N/A	N/A	(+)

Key: (+) = Positive correlation between impact fees and the variable in question; (–) = Negative correlation between impact fees and the variable in question. N/A = variable not addressed in study in question.

While none of the studies can clearly establish causality, some authors assert that the observed relationship between impact fees and housing prices primarily reflects the value of the infrastructure funded by the impact fees: that the higher prices of new housing reflect the desirability of the newly built infrastructure, rather than the cost of it. They posit that the added cost of impact fees can be counterbalanced by the positive effect they have on infrastructure services.[186, 187] The added benefits are reflected in higher housing values through an economic concept called "capitalization."[188, 189] Thus, according to the view of capitalization theory, the higher housing prices of dwellings with SDCs reflect a properly functioning economic market in which the long-term benefits of impact fees are measured in today's market prices.

Other studies focus more on costs being passed on to housing consumers, either directly or indirectly.

4.5.2 Oregon Case Studies and Data

To evaluate whether the relationship observed consistently in the literature—showing higher housing prices in areas with impact fees—holds in Oregon, ECONorthwest analyzed available statewide data (at a simplified level) and more detailed data from two case studies. The first case study compared trends in housing prices to trends in SDC fees in one community. The second case study compared housing prices in similar areas but with different SDC rates. These analyses are current and Oregon-specific, but they do not control for all variables that could affect housing prices and they cannot establish causation.

SDC Rates vs. Average Housing Values by Community

ECONorthwest compared single-family SDC rates from the 2022 SDC rate data collected by FCS GROUP to June 2022 single-family housing values from Zillow. The simplified approach did not include other variables that could relate to SDC rates and/or housing values, such as population, population growth rate, infrastructure quality, access to jobs or amenities, buildable land supply, political attitudes towards growth, and other development costs. Moreover, the housing value data includes all single-family units, so the data do not specifically identify a relationship between SDCs and prices of *new* housing.

Exhibit 46 shows that higher SDCs tend to be associated with higher average housing values. The relationship has a moderate correlation (R-squared of 0.3309), without controlling for other variables. The observed correlation does not indicate causality. The relationship could reflect

the impact of SDCs on housing development costs and development feasibility. It could also reflect (a) a greater willingness to impose higher SDCs in areas with higher housing prices and stronger housing markets, (b) higher infrastructure quality driving both higher SDCs and higher housing values, or (c) other factors at play that happen to be related to both SDCs and housing prices (e.g., higher land and construction costs). The relationship appears to be stronger in areas with low and moderate housing values, and weaker in areas with high home values—there is a much greater range of SDC rates in communities with average housing values above roughly $600,000 compared to the range for communities with lower housing values.

Exhibit 46. SDCs and Estimated Housing Values in Selected Oregon Cities
Source: ECONorthwest using data from FCS GROUP and Zillow Home Value Index (ZHVI) of Single-Family Units

The data comparing SDC rates and housing values in Oregon also suggests implications for how SDCs may affect housing development. ECONorthwest's analyses in Section 4.3.4 and developer input suggest that SDCs may have different impacts for communities that fall on different parts of this chart. As illustrated in Exhibit 47:

- Communities with below-average home values and average to above-average SDC rates could see greater impacts of SDCs on development potential. There appear to be only a few communities among the sample set where this could be a concern.
- Communities with above-average home values and above-average SDCs may not be inhibiting all housing development, but may be exacerbating challenges for lower-cost housing, particularly in places where SDCs are the highest. These areas could also potentially see a greater share of SDC costs passed through to homebuyers given the strength of the market demand.

- In communities with above-average home values and below-average SDCs, SDCs are probably not a major factor driving home values, and lower SDCs may not translate to lower home prices.
- In communities with below-average home values and below-average SDCs, SDCs may not be enough to substantially impact development feasibility, and market conditions may make development challenging with or without SDCs.

Exhibit 47. SDCs and Estimated Housing Value in Oregon Cities, By SDC Level
Source: ECONorthwest using data from FCS GROUP and Zillow Home Value Index (ZHVI) of Single-Family Units

Case Study: Trends in SDCs and Sales Prices in Bend, Oregon

To observe the potential relationship between SDCs and sales prices in Bend, Oregon, ECONorthwest compiled data from various sources. Data from 2005 to 2019 comes from previous work by Oregon's Office of Economic Analysis to compare Bend's Parks SDC rate and total SDCs to typical prices of new construction units. ECONorthwest updated the data for more recent years.

As shown in Exhibit 48, the total SDC in FY 2022 is about 220 percent higher than the level in FY 2005. During the same time, housing prices increased by about 190 percent.

However, and more importantly, the rate of change is different. The total SDC increased every year, but it increased faster before FY 2010 and after FY 2018. In contrast, the median housing

price in Bend is more cyclical and experiences greater swings. It increased at an even greater pace than SDCs in FY 2006 and FY 2007, dipped for almost six years, recovered for seven years, and then experienced a very large increase since FY 2020. The comparison shows housing prices are more volatile and likely to be influenced by many other factors beyond SDCs.

Exhibit 48. Percent Change in Single-Family SDCs and Median Housing Price in Bend, Oregon, Since Fiscal Year 2005

Source: ECONorthwest using data from Oregon Office of Economic Analysis, Central Oregon Association of Realtors, City of Bend

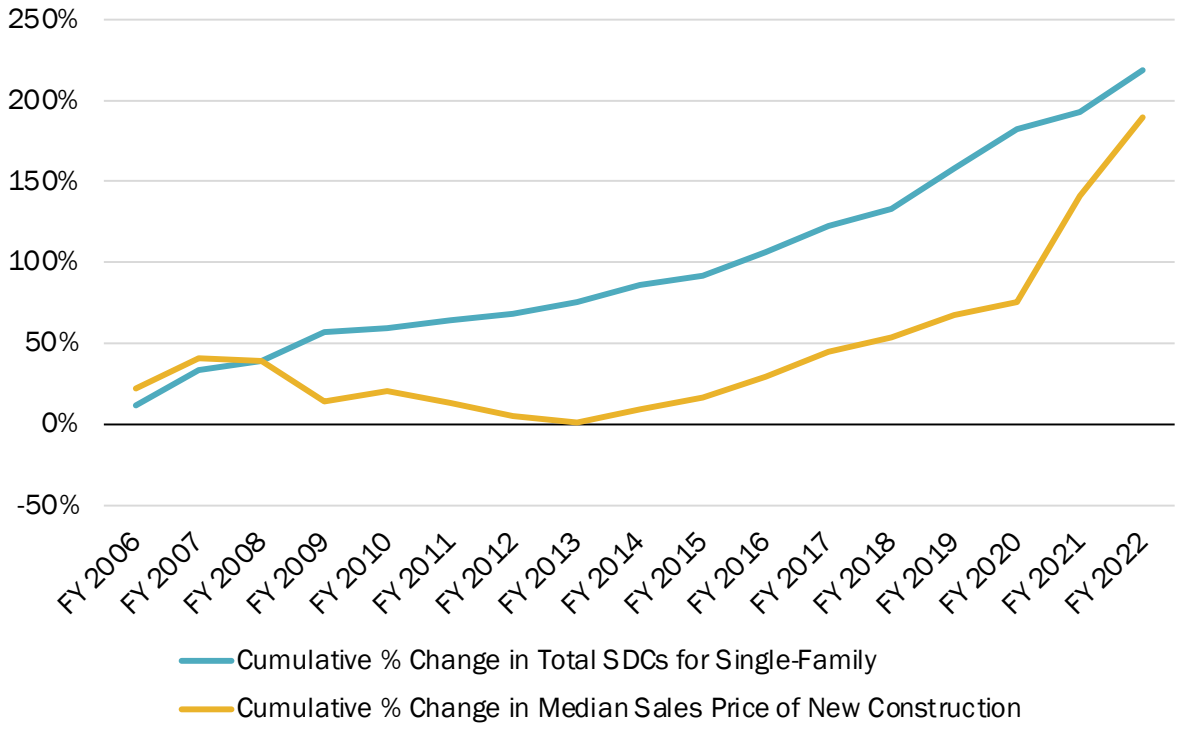

Exhibit 49. Percent Change in Bend Single-Family SDCs, Bend Median Housing Price, ENR Construction Cost Index, and Case-Shiller Index Since Fiscal Year 2005

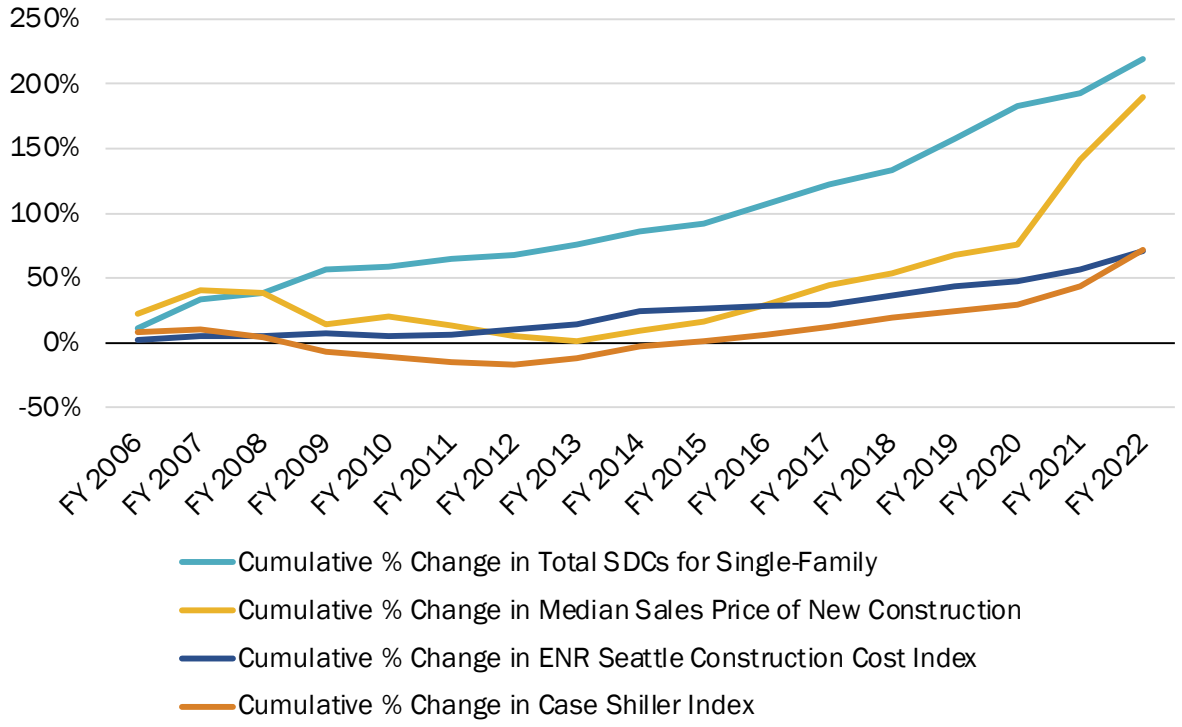
Source: ECONorthwest using data from Oregon Office of Economic Analysis, Central Oregon Association of Realtors, City of Bend, Engineering New-Record, Federal Reserve Bank of St. Louis



Bend's SDCs and median sales prices are more likely to be driven by regional or national factors. Exhibit 49 shows Engineering News-Record (ENR) Construction Cost Index for Seattle[190] has a closer trend to Bend's SDCs than the median sales price does; the SDCs and the ENR Seattle Construction Cost Index move steadily upward without falling. It also shows that the Case Shiller Index, a national benchmark for single-family housing prices, has a closer trend to the median sales price than the SDCs do; the median sales price and the Case Shiller Index fall from FY 2008 to FY 2012 before starting to recover.

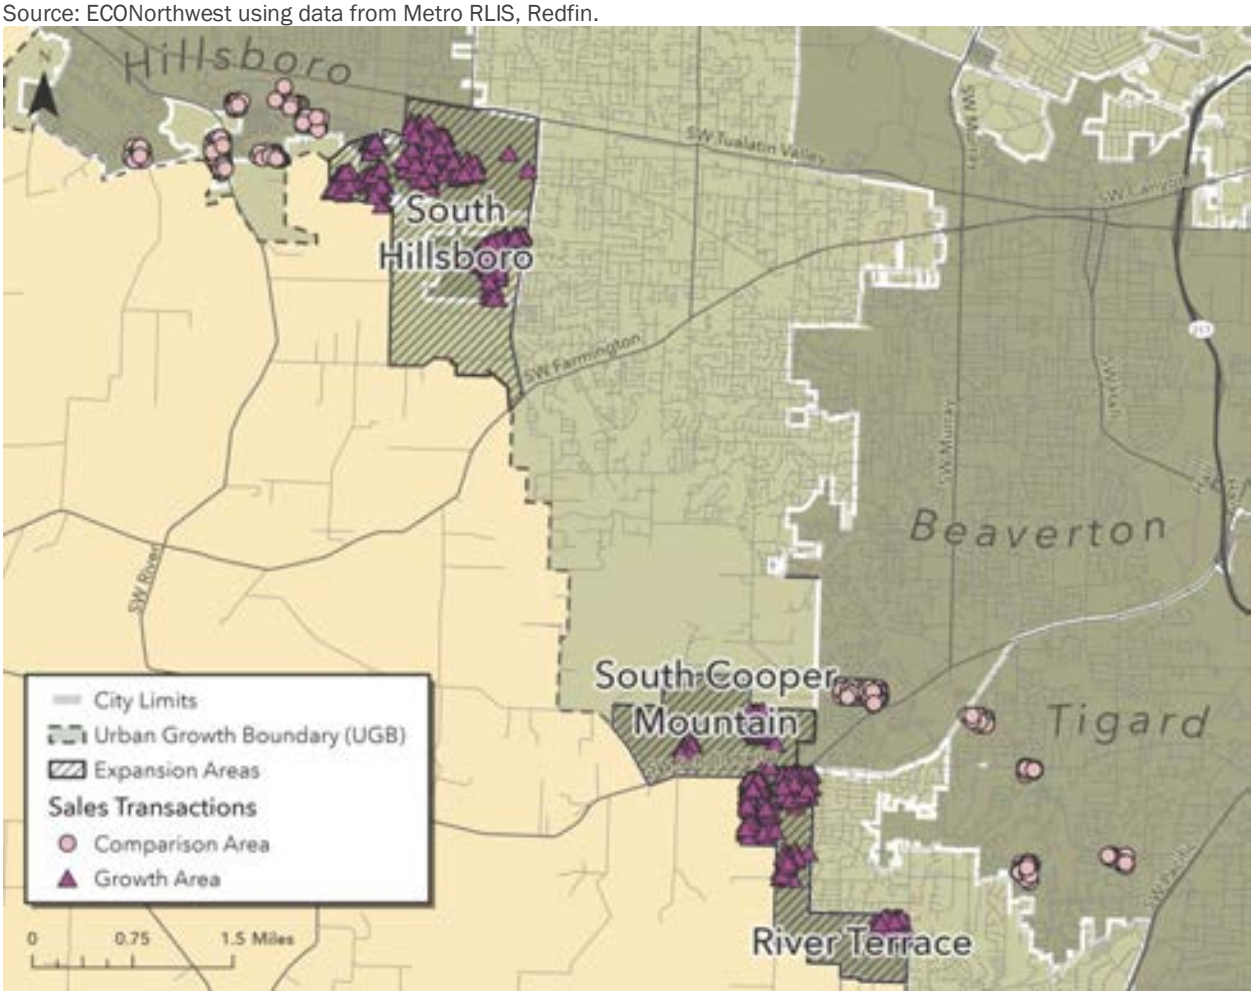
The correlation coefficient between SDCs and median sales prices in Bend is 0.82. In contrast, the correlation coefficient between SDCs and the ENR Seattle Construction Cost Index (CCI) is 0.98 (likely due to use of ENR CCI data for 20-cities to index SDC rates), and the correlation coefficient between Bend new construction home prices and the Case Shiller Index is 0.96. This suggests that within a given jurisdiction, home price trends are affected much more by broad housing market trends than by changes in SDC rates.

[190] Seattle is the closest city to Oregon in the markets tracked by ENR.

Case Study: SDCs vs. Home Prices in Planned Developments in Oregon

ECONorthwest identified several recent developments in Washington County that provide an opportunity to examine an example of the relationship between SDCs and housing prices at a more granular level. Each development faced different SDC costs, but all compete within the same subregional housing market. This analysis considered three areas that were recently brought into the Portland Metro urban growth boundary (UGB): South Cooper Mountain in the City of Beaverton, South Hillsboro in the City of Hillsboro, and River Terrace in the City of Tigard. Within these areas, ECONorthwest collected data on sales transactions for newly built homes and SDC rates to analyze whether there is a relationship between the SDC rates and home prices. ECONorthwest also considered development in adjacent subdivisions that were not part of these growth areas but were in one of the three jurisdictions and the same subregional housing market. These "comparison" developments were built in a similar span of time to the development in the growth areas, which allows for a statistical analysis of the impact of SDC on development outcomes within a similar set of market conditions. Exhibit 50 shows the locations of the three study areas and the analyzed properties. Appendix H includes more detail on the three areas.

Exhibit 50. Washington County Urban Growth Areas and Housing Observations
Source: ECONorthwest using data from Metro RLIS, Redfin.



Each of the urban growth areas has both standard citywide SDCs and supplemental area-specific SDCs to support new infrastructure development needed for each growth area. Additionally, developments in all three jurisdictions are subject to SDCs for sanitary sewer and stormwater imposed by Clean Water Services (CWS) and SDCs for transportation imposed by Washington County. Exhibit 51 summarizes the SDCs applied to single-family construction in South Cooper Mountain, South Hillsboro, and River Terrace ("growth areas") and the standard citywide rates applicable to adjacent developments that are not part of the growth area. Appendix H includes more detail on the SDCs.

Exhibit 51. System Development Charges for Detached Single-Family Housing, 2021
Source: ECONorthwest using data from City of Beaverton, City of Hillsboro, City of Tigard, and Washington County.

	Beaverton		Hillsboro		Tigard	
	Standard	South Cooper Mountain	Standard	South Hillsboro	Standard	River Terrace
Total SDCs	$37,940	$46,767	$33,905	$53,030	$43,809	$47,640
Difference from standard SDCs for Growth Areas	--	+23%	--	+56%	--	+9%

As shown in Exhibit 51, Hillsboro's standard citywide SDCs are the lowest among the three studied areas (about $34,000), but its supplemental SDCs are the largest (about $19,000). In contrast, Tigard has the highest standard citywide charges (about $44,000), but it has the lowest supplemental SDCs (about $4,000). Note that the supplemental SDCs were largely used to distribute costs for area-specific facilities such as collector roads and local parks among property owners within the growth area. Developers who made the improvements generally received SDC credits for at least a share of those costs.

Using the data from sales transactions for new homes in these areas and the information on SDC rates, ECONorthwest constructed a linear regression model to test for a relationship between SDC rates and housing prices after controlling for other factors such as year built, year sold, home size, and lot size that are available in the sales transaction data or the tax lot data. (See Appendix H for methodology.)

The regression model showed that SDC rates are positively correlated with housing prices—that is to say, that higher housing prices were observed in places with higher SDCs—after controlling for building size, lot size, number of bedrooms and bathrooms, year built, and year sold. The model suggests that the observed difference in housing prices is greater than the difference in SDCs. Every $10,000 in SDCs was associated with about $7 greater per-square-foot price of newly built housing—about $16,800 for a 2,400-square-foot single-family unit. This is illustrated graphically in Exhibit 52 for different SDC amounts. For example, when comparing a 2,400-square-foot single-family unit with SDCs that total $35,000 to an identical unit with SDCs that total $45,000, the $10,000 difference in SDCs is associated with $16,800 greater housing price.

Exhibit 52. Estimated Sale Prices of a Typical 2,400-Square-Foot Single-Family Housing Unit Associated with Varying SDC Levels

Source: ECONorthwest

There are several important limitations to keep in mind with this finding:

- A linear model was applied, but many of the underlying factors affecting price likely have nonlinear effects on housing prices. For example, an additional 100 square feet of living area is more valuable for a small home than a large one. More complex (but still imperfect) models attempt to capture more of this nonlinearity.
- Actual SDC rates paid for each unit are not known; instead, ECONorthwest estimated the likely SDC amounts associated with each unit based on the jurisdiction, whether it

was within a growth area with supplemental SDCs or not, and the year the home was built.[191]

- As noted previously, a positive correlation does not mean that higher SDCs **cause** higher home prices. There are several other possible explanations for this relationship, which are discussed below.
- Many of the factors that influence home prices are not captured in the available data (e.g., finish quality and design, neighborhood features, views, etc.). If these factors are also correlated with SDCs, the model would be over-estimating the relevance of SDCs by capturing the influence of some of these factors instead. An alternative regression model that compared home prices in the expansion areas to those in the comparison areas (without controlling for differences in SDCs) showed a positive relationship between home prices and location in an expansion area, with a similar level of statiscal reliability as the SDC model. (See Appendix H for details.) Developer interviews also suggest this could be a factor, as discussed below.

While this case study does not show why SDCs correlate with higher housing prices, the additional price effect beyond the amount of the SDCs themselves observed in this analysis could support the interpretation that higher SDCs can increase costs beyond the direct cost of the SDC itself. Financing costs are one possible explanation for this type of pattern, as discussed in Section 5.1.3.

Findings From Developer Interviews

Interviews with developers involved in one or more of these areas suggest that some growth areas needed more expensive amenities—from home features to streetscape materials and green space design—to appeal to buyers and capture much of the demand for housing in this part of the region at the higher prices that make development feasible. Adding value to the home with these amenities offsets higher development costs due to SDCs and other infrastructure/land development costs and may have contributed to a price premium beyond direct SDC costs.

Developers were also heavily involved in creating the infrastructure funding plans for each of the growth areas. This allowed them to influence the supplemental SDC rates (to some extent) and to anticipate in advance of development what the total SDC costs might be. Because the amount of new infrastructure needed often makes land development in a new growth area expensive, developers may have known early on that housing in these areas would need to command some premium compared to other areas with lower infrastructure needs. This would suggest that the total amount of infrastructure needed along with the need to capture substantial demand from higher-income households may have driven a difference in housing prices.

[191] SDCs paid at time of development were estimated by adjusting FY 2021 rates to the year before the unit was completed, using the *Engineering News-Record*'s Construction Cost Index for Seattle. This index is the method each of these Washington County jurisdictions uses to adjust their SDC rates each year.

Part 5: SDC Administrative Policy Implications

Primary Contributors: Galardi Rothstein Group, ECONorthwest

5.1 Timing of SDC Assessment and Collection

5.1.1 Requirements and Current Practices

Issues related to timing include both the timing of the initial fee determination or assessment and collection of payment. In some cases, fee assessment and collection occur at the same time; however, collection policies may provide for deferral of payment to a later point in the development process or financing the SDCs over a period of time.

Statutory Requirements

As part of the definition of an SDC, ORS 223.299(4)(a) provides that SDCs must be "assessed or collected at the time of increased usage of a capital improvement or issuance of a development permit, building permit or connection to the capital improvement." This provision implies ten distinct options for the timing of the assessment and collection of SDCs, as shown in Exhibit 53. Taken together, the statutes provide a high degree of flexibility for local governments to choose the timing for assessing and collecting SDCs.

Exhibit 53. Timing Options, Earliest to Latest
Source: FCS GROUP, based on ORS 223.299(4)(a)

Option	Assess	Collect
1	Issuance of development permit	Issuance of development permit
2	Issuance of development permit	Issuance of building permit
3	Issuance of building permit	Issuance of building permit
4	Issuance of development permit	Connection to the capital improvement
5	Issuance of building permit	Connection to the capital improvement
6	Connection to the capital improvement	Connection to the capital improvement
7	Issuance of development permit	Increased usage of a capital improvement
8	Issuance of building permit	Increased usage of a capital improvement
9	Connection to the capital improvement	Increased usage of a capital improvement
10	Increased usage of a capital improvement	Increased usage of a capital improvement

Notes: Reference to "increased usage of a capital improvement" is assumed to occur at occupancy.

Oregon Revised Statutes 223.208 also authorizes (but does not compel) local governments to provide financing of SDCs under the provisions of the Bancroft Bonding Act. These provisions allow local governments to provide loan-like financing of SDCs. Provider financing programs vary in terms of the type of development eligible, maximum financing term, interest rates charged, and program application fees and other requirements.

Survey Responses and Testimony

As part of its most recent survey on SDCs, LOC asked its members to provide information on any policies or practices related to "timing or payment accommodations." Exhibit 54 summarizes cities' responses.

Exhibit 54. Sample SDC Payment Timing Policies and Practices
Source: FCS GROUP, based on League of Oregon Cities, System Development Charges Survey Report (February 2020), pages 119-128.

City	SDC Payment Policy
Cornelius	SDC payments "delayed until a later date, such as the time of occupancy."
Forest Grove	"Payments delayed have been for non-profit housing developments to allow the project to occur. Delayed payments are due prior to the issuance of certificate of occupancy."
Lafayette	"Allowed a payment plan for SDCs as required by statute."
Madras	"We will allow deferrals on payments up to 9 months or Certificate of Occupancy (whichever comes first)."
Medford	SDC payments "delayed until a later date, such as the time of occupancy." A payment plan ("called bancrofting") is also available.
Milwaukie	"Bancroft financing over a ten-year period or less."
Newport	"Installment plan is an option to allow payment to be financed over time."
Pendleton	SDC payments "delayed until a later date, such as the time of occupancy."
Redmond	"Delaying collection of SDCs to occupancy" is available in enterprise zones.
Sherwood	SDCs can be deferred to occupancy if the transportation and/or parks SDC is greater than $50,000.
Veneta	SDC payments "delayed until a later date, such as the time of occupancy" for affordable housing.
West Linn	SDCs can be financed under the provisions of the Bancroft Bonding Act.
Wilsonville	SDC payments "delayed until a later date, such as the time of occupancy."
Winston	SDCs can be financed over ten years with semi-annual payments.

In some cases, payment accommodations vary based on the type of development (for example, multifamily and affordable housing).

5.1.2 Timing Implications for Service Providers

Much of the written testimony provided on House Bill 3040 responds specifically to the proposed amendments that related to the timing of SDC payments. Many service providers raised concerns about an increase in administrative costs and increased risk of nonpayment. Some testimony points to particular concerns around the potential for deferring SDCs until time of sale rather than certificate of occupancy, because local governments are not involved in the sale transaction. (See Appendix I for a summary of relevant testimony.)

Focus groups echoed this. As noted in *Oregon SDC Study: Summary of Service Providers* (Appendix A), the effort (and cost) required to collect SDCs varies with the public agency's leverage at different points in the development process. For most public agencies, their moment of maximum leverage is when building permits are issued. If full payment of SDCs is a requirement for obtaining building permits, the public agency need not worry about enforcing payment, because developers are unlikely to begin work before building permits have been issued. While development is required to obtain a certificate of occupancy when the building is constructed prior to its use, some service providers expressed concern that the public agency's leverage is greatly reduced at this stage, out of concern that some developers may forego the certificate of occupancy in order to avoid the fee. Other service providers noted that they make scheduling a final inspection contingent on the SDCs being paid, which has avoided these issues.

Based on follow-up correspondence with several jurisdictions that offer (or previously offered) deferral to certificate of occupancy, deferral programs have had mixed results in different communities. All noted an increase in administrative effort, but the magnitude ranged from less than an hour of staff time per application to multiple hours for multiple staff, depending on permitting systems and deferral program requirements. The most challenging non-payment issues reported were linked to commercial development, though some reported needing to follow up with residential developers when payment was due (e.g., if there was a time limit on the deferral in addition to a trigger at certificate of occupancy). Several reported little use of the program, while others see (or saw) substantial usage.

Some service providers are also concerned about the timing of revenues relative to the need for expenditures. In many cases, infrastructure needs to be constructed and land acquired in advance of when service to new development will be required. Delay in collection of SDC payments to later in the process may impact service levels or require other upfront funding sources. Focus groups with service providers suggest that the importance of timing of SDC collection varies among service providers. Some types of projects (e.g., park land acquisition in a new urban growth area) are highly sensitive to timing. Some agencies use SDC revenues to pay a portion of debt service on prior capital improvements and expend revenue quickly after it comes in. Others collect revenue for several years prior to funding projects and are less impacted by collecting funds later. Several service providers noted that the uncertainty inherent in SDC collections means that they cannot rely too heavily on revenue they have not yet collected, regardless of when the fees are collected during the development process.

Public agencies can also maximize interest earnings (to be used for future project costs) and minimize additional administrative costs by collecting SDCs early in the process. However, the financial value of the added interest earnings may be inconsequential. Although SDC revenues can be (and often are) used to help make debt payments, those payments must be made regardless of SDC revenue, so there is no change in interest payments or earnings based on when SDCs are received. However, for communities that are using SDC revenues for pay-as-you-go projects, there could be short-term interest earnings. Assuming an annual interest rate of 3 to 4 percent in a money market account, the financial impact of deferring by 2 years would be roughly 6 to 8 percent of the SDC amount.

5.1.3 Timing Implications for Developers

When a developer must pay SDCs can impact financial feasibility, because SDCs add costs before the value of the development is fully realized. The earlier that SDCs are paid, the longer the developer must "carry" the costs. The total cost of SDCs to developers includes not only the SDC amount but also the added interest payments associated with it if it needs to be financed over the construction period.

The size of the "carrying cost" of SDCs depends on loan terms and the duration of the development. For a construction loan, which is taken out prior to the construction of the project and paid back, refinanced, or converted to a long-term ("permanent") loan after construction is

completed, interest rates are typically higher than they are for permanent loans on completed buildings, because there is less collateral to secure a loan.

The carrying cost can be calculated as the compounded interest rate on a loan. Although the carrying costs can vary based on specific project or developer characteristics and financing opportunities, typical rates range from 8-10 percent and the construction loan can last for 1 to 3 years. For example, if a construction loan has an annual interest rate of 8 percent and the loan is borrowed for 2 years of construction period, the monthly compounded interest cost is 16.64 percent of the SDC amount. If the entire SDC amount is financed, the total cost of SDCs to the developer would be 116.64 percent of the SDC amount. The interest cost would rise to 21.00 percent if the annual interest rate is 10 percent (for 2 years), and it would rise to 25.97 percent if the loan period is 3 years (at an 8 percent interest rate).

A delayed or deferred payment of SDCs would reduce the carrying costs and reduce the total cost of housing development at the margin. The likely impact is greater for projects that take longer to build and greater for developers that are less creditworthy and would borrow at a higher interest rate.

For developers who opt to pay SDCs from working capital rather than adding them to the construction loan, developer interviews suggest that there is still an opportunity cost associated with tying up the developer's available funds. Some suggested that this up-front cost means less money is available to pay for other pre-development and early construction costs that can accelerate project delivery.

While many developers pointed to timing of SDC payment as a factor that impacts their developments, others expressed indifference at when the cost is paid and whether it is financed, given that the construction loan is generally capped at a fixed percentage of total project costs, and the same amount will need to be financed either way.

5.2 SDC Exemptions and Waivers

5.2.1 Requirements and Current Practices

SDCs may be exempted for certain developments or redevelopment in cases where system impact is deemed negligible (in some cases of redevelopment or for specific development types). Exemptions or waivers may also be provided because of local policy objectives.

Exemptions Based on Negligible Impact

Redevelopment is generally exempt from SDCs unless the new use is estimated to place greater demand on the infrastructure system. System-specific exemptions may include:

- Parks – hospice or other end of life care facilities
- Water and sewer – ADUs that do not require an additional water meter

Exemptions or Waivers Based on Policy Objectives

Waivers (permanent or temporary) and exemptions have also been implemented by some local governments for developments like childcare facilities, ADUs, and economic development projects that are in enterprise zones or meet a target level of new job creation. Some communities also offer exemptions or waivers for affordable housing development, which are discussed in greater detail below.

Affordable Housing Exemptions or Waivers[192]

There are differing views on the validity of SDC waivers or exemptions for any purpose that is unrelated to a reduced demand for system capacity. Some experts are of the opinion that it is inconsistent with ratemaking principles to grant SDC adjustments or exemptions for reasons that are not cost-based. Others point to modern rate-making principles that integrate affordability and equity considerations.[193] Oregon's SDC Act does not explicitly address exemptions for affordable housing (or for any other class of development), as it says little about how SDCs should be calculated for specific developments (see Section 1.2.2). Other parts of state statute make clear that jurisdictions may offer whole or partial SDC waivers in exchange

[192] Most communities that do not charge SDCs for affordable housing describe this as an "SDC Exemption". Some make a distinction between "waivers" given on a case-by-case basis and "exemptions" that are set in policy. Others use these terms interchangeably. Throughout this document, when referring to programs that do not collect SDCs from affordable housing, both terms are used to mean policy-based exclusions that are applied consistently to all qualifying projects, unless a budgetary limit is set.

[193] See for example, "Affordability and Equity Considerations for Rate-Setting" (Eric Rothstein, Stacey Isaac Berahzer, Joe Crea, and Michael Matichich for *Journal AWWA*, September 2021) which argues that water, wastewater, and stormwater service providers have a social responsibility to ensure universal, affordable access to services, as part of their rate-setting framework.

for local affordability requirements,[194] but some experts recommend that agencies should "backfill" any foregone SDC revenue with resources external to the SDC fund to ensure the agency can complete necessary infrastructure projects and avoid compromising equitable share protection for other SDC payers. (Nationally, 14 of the 26 states that have explicit impact fee enabling statutes require impact fees to be waived for qualifying affordable housing developments. Five of these require fees to be paid from an unrelated funding source; nine enable—and require—waivers without making up the lost revenue.[195]) A Construction Excise Tax (CET) is one option available to local governments to backfill lost SDC revenue from exemptions for affordable housing.[196]

Oregon communities that offer SDC exemptions for affordable housing include Portland, Bend, Tigard, Eugene, Salem, Lake Oswego, Ashland, McMinnville, Florence, Newberg, and Forest Grove. Most service providers that offer SDC exemptions/waivers for affordable housing limit it to regulated/income-restricted affordable housing. Some cities and service providers have set a cap on the amount of waivers (number of units or dollar amount) they will issue for a given time period, but most do not backfill foregone revenue from other sources.[197] (Section 5.2.2 describes specific example policies and their results.)

In communities that have not implemented affordable housing exemptions/waivers, staff sometimes expressed concerns about monitoring and enforcement over time. Many raised questions about where replacement funding would come from. In some cases, revenue from construction excise taxes is used to offset lost SDC revenue from affordable housing exemptions.

---

[194] ORS 197.309 indicates that SDCs may be waived for qualifying affordable multi-family housing and lists such waivers as one of several "incentives" that jurisdictions must choose among if they impose local affordable housing set-aside requirements ("inclusionary zoning").

[195] Newport Partners and Virginia Polytechnic Institute and State University, *Impact fees & Housing Affordability: A Guide for Practitioners*, prepared for the U.S. Department of Housing and Urban Development Office of Policy Development and Research, June 2008. https://www.huduser.gov/portal/publications/impactfees.pdf

[196] Construction Excise Taxes also increase the cost of housing development, but scale with permit value, making them inherently more progressive than SDCs. Affordable housing is also automatically exempt from CETs under Oregon law.

[197] ECONorthwest research and City of Lake Oswego Council Report: Review of System Development Charge for Affordable Housing, December 21, 2021, Agenda item Number 5.2. https://www.ci.oswego.or.us/WebLink/DocView.aspx?id=1911236&dbid=0&repo=CityOfLakeOswego&cr=1

5.2.2 Impacts on Affordable and Lower-Cost Housing Development

Benefits for Regulated Affordable Housing Development

Based on past interviews by ECONorthwest with affordable housing providers related to local measures to support regulated affordable housing development, there are two main benefits of SDC exemptions, based on their reduction to development costs:

- **Less funding from state, federal, or local sources is needed to make a given affordable housing development financially feasible**. This can mean less time and effort spent securing gap financing, particularly for smaller projects and those not using typical funding sources (see details below).
- **Lower costs help projects score better for competitive funding opportunities**, which often score projects based, in part, on costs per unit.

The impacts and benefits of exemptions vary somewhat depending on the specific funding sources and project scale, as summarized below.[198]

- **Low Income Housing Tax Credit (LIHTC) projects**: SDCs are included as an eligible cost in calculating tax credit equity for a given project, which means that waiving SDCs reduces development costs but also reduces the amount of equity available to the project to some extent. (Tax credit equity typically covers roughly 30-70 percent of project costs depending on the specific tax credit program, with the balance coming from loans or gap financing.) While exemptions are still beneficial, and interviews with affordable housing developers suggest that they can make a difference in making projects work, only a portion of the savings translates into reduced need for gap financing or debt. However, some LIHTC funding that is awarded competitively includes a scoring system related to a project's cost-effectiveness relative to similar projects, so reducing or eliminating SDC costs can help achieve a higher score by reducing the cost per unit.[199]
- **Other competitive state funding sources**: Many state funding programs for affordable housing have limits on the amount of funding per unit and projects needing less subsidy per unit are scored higher.[200] For these projects, all cost reductions are helpful and benefit the project on a dollar-for-dollar basis.

[198] ECONorthwest, "Progress Report of Hillsboro Affordable Housing Tools and Evaluation of Additional Tools," prepared for the City of Hillsboro, April 12, 2022.

[199] Oregon Housing and Community Services, "NOTICE OF FUNDING AVAILABILITY (NOFA) #2022-5: Affordable Rental Housing Projects with 9% Federal Low Income Housing Tax Credits," https://www.oregon.gov/ohcs/development/Documents/nofa/2022/LIHTC9-NOFA-2022-5-v1.1.pdf

[200] Examples include the LIFT program (https://www.oregon.gov/ohcs/development/Documents/nofa/2022/2022-2-LIFT-Rental-NOFA.pdf) and the General Housing Account Program (https://www.oregon.gov/ohcs/development/Documents/nofa/2021/VETS-21/2021-Vets-NOFA.pdf).

- **Small projects and other funding sources:** Smaller affordable projects that may have many smaller funding sources tend to be more sensitive to development cost per unit because of the difficulty of securing funding. This can include affordable middle housing development, some affordable homeownership projects, and other small, innovative projects. For these projects, the primary concern is closing the gap between project costs and what the affordable units will generate in revenue, and waiving SDCs can offer a substantial benefit.

From a statewide perspective, reducing cost per unit should mean the ability to fund more housing units with the same pool of funds. This is likely true in practice at least to some extent, though the total amount of affordable housing funds going towards SDCs is not being tracked at present, and there are many other factors driving the cost of building affordable housing (see Section 4.3.3). Given the estimates in Section 4.3.3, SDCs represent a small share of overall affordable housing costs; however, given the number of new affordable housing units funded by OHCS each year, the total SDC-related expenditures associated with affordable housing development are likely substantial. From 2016 through the end of 2021, OHCS approved nearly 13,000 new construction affordable rental housing units for funding. Of these, roughly 7,100 are located in 11 communities with known SDC exemption programs for affordable housing (see list in Section 5.2.1).[201] While the SDCs charged for those projects have not been specifically tracked, at the estimated average total SDC rate for multifamily housing statewide (close to $10,000 per unit[202]), this would mean roughly $71 million in SDC savings (in today's dollars) from jurisdictions offering exemptions, and roughly $59 million (in today's dollars) spent on SDCs in jurisdictions that do not offer exemptions across six years of projects.

On the other hand, if the funding not provided for SDCs needs to be made up from other state, federal, or local sources, then exemptions shift that cost from one funding source to another. Funds for both affordable housing and local infrastructure investments are in short supply relative to needs.

Case Studies: Impacts of SDC Exemption Programs

The case studies that follow offer evidence of strong participation by affordable housing developers in local SDC exemption programs, and of cost savings for those developments. As noted above, However, it is difficult to measure the extent to which the SDC exemptions have changed the amount or type of affordable housing development that has occurred in those communities.

[201] Oregon Housing and Community Services, "Affordable Rental Housing Draft Dashboard," updated December 4, 2022. https://public.tableau.com/app/profile/oregon.housing.and.community.services/viz/AffordableRentalHousingDraftDashboard_16154170714140/Story1

[202] While the Affordable Housing Cost Study estimated an average of $8,000 per affordable housing unit for SDCs statewide, this includes projects with and without SDC exemptions.

In addition, sometimes SDC exemptions for affordable housing units can incent developers who primarily build market-rate housing to build some units at a defined price point or income affordability level to qualify for the exemption. Based on developer interviews and focus groups, the SDC exemptions have been essential to market-rate developers' ability to produce housing at a lower price point, even if these units may not remain affordable over the long-term to the same extent they generally do with more traditional affordable housing development.

Bend Exemptions for Affordable Housing

About the Program

Since December 2017, the City of Bend has offered SDC exemptions to all rental and for-sale housing affordable to households making 80 percent or less of area median income (AMI) through a deed restriction.[203] The City's Affordable Housing Advisory Committee has the authority to approve exemptions on City water, sewer, and transportation SDCs, and can also recommend exemptions for parks SDCs levied by the Bend Park and Recreation District. Upon approval, the exemptions are structured as a forgivable loan at 3 percent annual interest, with no payments due as long as the property remains affordable for at least five years. If the affordability restrictions are removed within five years of the project's completion, the SDCs become payable, with interest, by the original applicant.[204]

Program Impacts

Between 2016 and 2021, Bend granted exemptions on 577 units of affordable housing, for a total value of $5.2 million (Exhibit 55). Nearly all of these exemptions have been granted to nonprofit developers of affordable housing.

Exhibit 55. City of Bend Affordable Housing SDC Exemptions, 2016–2021
Source: ECONorthwest, using data provided by City of Bend

Housing Type	Units	City SDCs Exempted	Parks SDCs Exempted
Single-Family	140	$1,112,517	$205,628
Multifamily	407	$3,731,480	$2,017,896
Other (incl. shelters)	30	$383,670	$165,520
Total	**577**	**$5,227,666**	**$2,389,044**

For the few projects by market-rate developers in Bend that have been granted SDC exemptions to date, the program achieved only short-term affordability. One example is Revere Avenue Renaissance, a 12-unit development of five market-rate townhomes, one affordable townhome, and six one-bedroom rental apartments affordable at 60 percent of AMI. The seven affordable units were granted SDC exemptions by the Bend City Council in 2015; the project also received funding from the City's Affordable Housing Fund.[205] Three years after completion, the affordable townhome and rental units were sold at market rate as an investment property.[206]

---

[203] Prior to December 2017, the City Council granted SDC exemption requests on a case-by-case basis.

[204] City of Bend, Municipal Code Chapter 12.10.120 (https://bend.municipal.codes/BC/12.10.120)

[205] City of Bend, "Request for Proposals for System Development Charge Exemptions: Program Year 2015." https://bend.granicus.com/MetaViewer.php?view_id=9&clip_id=359&meta_id=13633

[206] Zillow sales listing (https://www.zillow.com/homedetails/135-NW-Revere-Ave-Bend-OR-97703/250781754_zpid/)

Given City policies, the property owner would most likely have been required to repay both the SDCs and Affordable Housing Funds with interest at that time.

Portland Exemptions for Affordable Homeownership

About the Program

The City of Portland offers SDC exemptions for affordable rental and for-sale housing through several different programs. Exemptions are available for affordable rental units as part of the City's Inclusionary Housing policy, which applies to developments with 20 or more units.[207] Another program grants exemptions for rental housing affordable at 60 percent of median family income for developments not subject to Inclusionary Housing requirements.[208] Portland also offers SDC exemptions for affordable homeownership, linked to the City's Home Ownership Limited Tax Exemption (HOLTE) program. The focus here is on the homeownership SDC exemption because its link to a tax abatement program means that there is more data available regarding its usage and to consider its potential as an incentive for market-rate developers to build affordable homes.

For-sale homes qualify for the exemptions on water, sanitary sewer, transportation, and parks SDCs if they are new construction, have at least three bedrooms, and have a sale price no more than $430,000.[209] Exemptions are applied at the time of permitting, before construction begins, but must be verified when the house is sold. Qualifying buyers for affordable units must have an income no greater than 100 percent of median family income, adjusted for household size. If a project that applied for SDC exemptions is sold above the price cap, or to a non-qualifying buyer, the SDCs must be paid, with interest and fees.[210]

Program Impacts

In addition to some City data on SDC exemptions for homeownership, the impact of these exemptions can be approximated based on data from the HOLTE program, which has the same income and sale requirements.[211] In practice, all HOLTE-eligible properties also receive SDC exemptions.

In the most recent City report on HOLTE from fiscal year (FY) 2017–2018, 59 eligible properties sold within the 2017 price limit of $350,000 or the 2018 limit of $375,000 (Exhibit 56). Among the

---

[207] In Portland's Central City, the SDC exemptions apply to all residential units when the Inclusionary Housing requirements are met.

[208] Portland Housing Bureau, "SDC Exemption Program for Rental Projects," https://www.portland.gov/phb/sdc-exemption/rentals.

[209] Projects located within City-designated transit corridors qualify with two bedrooms. See: https://www.portland.gov/phb/holte/property-eligibility#toc-two-bedroom-eligibility-areas

[210] Portland Housing Bureau, "SDC Exemption for Home Ownership," https://www.portland.gov/phb/sdc-exemption/home-ownership; Portland Housing Bureau, "Homebuyer Opportunity Limited Tax Exemption (HOLTE) Program," https://www.portland.gov/phb/holte.

[211] HOLTE is a 10-year tax abatement program. The City limits approvals to 100 units per year.

59 properties produced through the program in FY 2017-18, nearly half (29) were built by for-profit builders.[212]

Exhibit 56. Average Sale Price of HOLTE-Qualified Homes, 2017–2018
Source: ECONorthwest, using data from City of Portland[213]

Geographic Area	Total Units	Average Sales Price	Units (For-Profit Builders)	Average Sales Price (For-Profit Builders)
North Portland	1	$349,950	1	$349,950
Northeast Portland	11	$357,625	2	$362,500
Southeast Portland	47	$316,295	26	$335,679
Southwest Portland	-	-	-	-
Total	59	$324,571	29	$338,021

By 2018, there were more than 1,200 active HOLTE properties in Portland, down from 1,346 the prior tax year due to the tax exemption expiring.[214] This suggests that more than 1,300 units were built under the program from its inception through 2018.

A more recent City report provides data on the units produced through the SDC exemption and HOLTE program between 2016 and 2019 and the income levels of the buyers, as shown in Exhibit 57. Participation increased in 2019, with the increase mostly in units purchased by households earning over 80 percent of AMI.[215] These units are more likely to have been produced by for-profit builders, and are not subject to lasting affordability restrictions, but must meet the maximum sales price and buyer income requirements for the program.

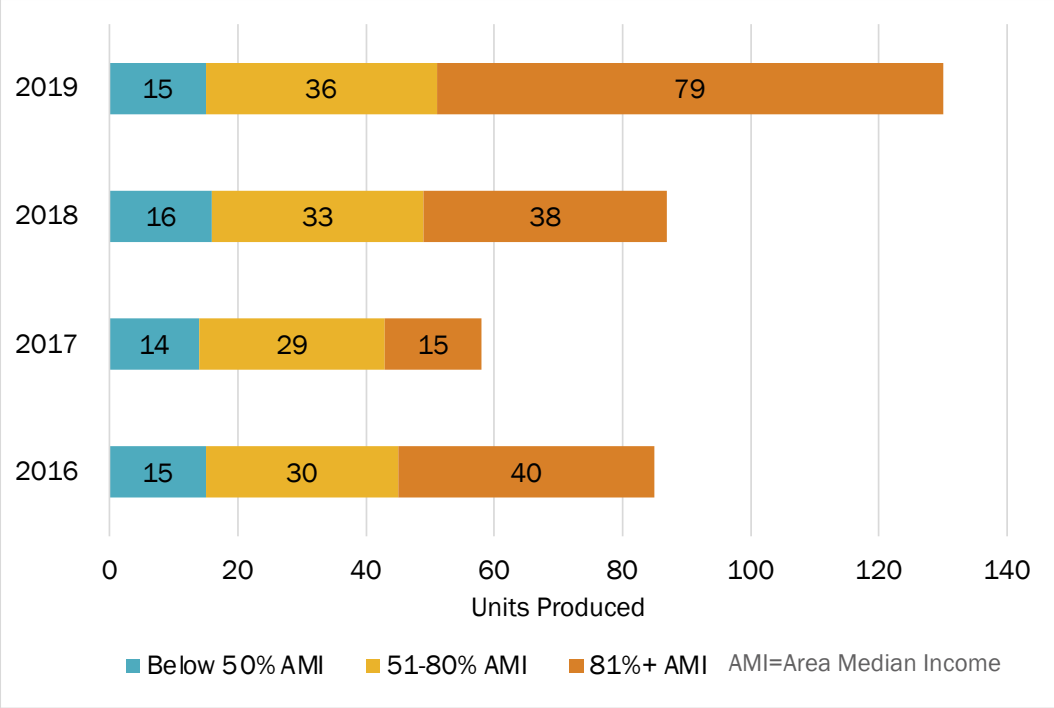
Exhibit 57. Units Produced by Buyer Income as a Share of Area Median Income for Portland's Homeownership SDC Exemption, 2016–2019

Source: ECONorthwest, using data from City of Portland[216]



Between 2016 and 2019, the number of units built using HOLTE and SDC exemptions was less than the City's annual 100-unit cap,[217] despite the fact that the cap was reached within roughly 6 months in fiscal year 2017-18.[218] This is likely because some properties approved for the exemption are ultimately not sold to a qualified buyer or do not meet other transaction criteria and do not receive the exemption. There is less data available on the units that are initially approved for the program but ultimately do not qualify for the exemption, but some recent sales transactions and input from developers familiar with the program suggests that some sell for more than the maximum sale price under the program, though they may still be lower-cost than other new homes.

There are a number of examples of homes built by market-rate developers under the HOLTE program that have offered a lower price to qualifying buyers than to other buyers, passing on the SDC savings directly.[219] This was also noted in developer focus groups. This shows that the

[216] Portland Housing Bureau, City of Portland, "State of Housing 2020," December 2020. https://www.portland.gov/sites/default/files/2021/phb-soh-2020-web-part-4.pdf

[217] *Ibid.*

[218] Portland Housing Bureau, *Residential Property Tax Exemption Programs 2017-18 Annual Report*, https://www.portlandoregon.gov/phb/article/739936

[219] Based on a review of recent sales transactions where the HOLTE program is mentioned in the listing.

SDC exemption is, at least some cases, directly translating to lower home prices and supporting production of lower-cost housing that is affordable to moderate-income households.

5.3 SDC Credits

5.3.1 Statutory Requirements

As discussed in Section 1.2.2, the Oregon SDC statutes require local governments to provide credits for "qualified public improvements" (QPIs). The required credit is only for the improvement fee charged for the type of improvement being constructed. Furthermore, for onsite QPIs[220], the required credit is only for the portion of cost that exceeds the local government's minimum standard facility size or capacity needed to serve the particular development project or property."[221]

The statutes provide flexibility to local governments to provide greater credits by providing credit beyond the improvement fees that would have otherwise been imposed, allowing for the transferability of credits, or providing credits for a capital improvement not identified in the SDC capital project list.

5.3.2 Credit Implications for Service Providers

Credit policies differ across providers in terms of project eligibility, creditable costs, and transferability. Service providers indicate that credits provide important incentives to construct needed infrastructure, particularly in green field areas. Furthermore, developers may be able to construct projects at lower costs than would be incurred by the local government. Local credit policies reflect the need to balance infrastructure needs and project flexibility with revenue sufficiency and capital project prioritization.

As discussed previously, some jurisdictions enact SDCs that are based on a fiscally-constrained project list in order to keep the fee levels lower than they otherwise would be. Limiting credits to projects on the adopted SDC project list may provide local governments with greater control over the timing and prioritization of projects. The greatest risk to capital improvement project control may result from extension of credits to projects that are not on a fiscally-constrained project list, as there would be no disincentive to developers to build these projects. Foregoing SDC revenue in exchange for a developer-constructed facility that is not included in the SDC means that less funding for projects that are on the project list and may be higher priority.

For determination of the creditable amount, the statute differentiates between onsite and offsite improvements, where the required credit for improvements on or contiguous to the development property (onsite improvements) are limited to the portion of costs that exceed "the local government's minimum standard facility size or capacity needed to serve the particular

[220] Improvements that are located in whole or in part, on or contiguous to property that is the subject of development approval.

[221] ORS 223.304(5)

development project or property."[222] This differentiation has potential implications for development of the SDC project list and calculation of the SDC cost basis. If certain project types (e.g., local streets and water utility mains sized for local needs or minimum standards only) are assumed to be funded directly by developers without eligibility for SDC credits, then they are excluded from the SDC calculations.

In cases where calculated credits do not fully compensate a developer for all eligible QPI costs, the statutes provide for application of credits "against improvement fees that accrue in subsequent phases of the original development project." In some cases, local governments will also allow developers to transfer credits to other developments or developers. However, expansion of a credit program may require additional administrative costs owing to the need to track projects and reimbursements over time and across developers.

5.3.3 Credit Implications for Developers

Like SDCs, infrastructure constructed as a condition of development approval is a cost to developers that needs to be factored into calculations to determine project feasibility. To the extent that the required infrastructure exceeds the capacity needed to serve the development, SDC credits provide a mechanism to reimburse the developer for this additional cost.

SDC policies vary across local governments, and the level of specificity in published SDC and credit policy information also varies, which may make it difficult for developers to have a clear estimate up-front of the total cost burden. This is particularly the case when (as the statute requires) credits are limited to the improvement fees levied on the new development, given the complexities of some charge bases.

In conversations with developers, many noted the importance of SDC credits, and several identified concerns or opportunities for improvement in how they are administered, as summarized below (see Appendix B for details):

- Several developers expressed frustration with the lack of certainty regarding SDC credits, often due to lack of clarity about what share of costs are attributable to excess capacity.
- Carrying costs can erode the value of the credits, because the developer is paying for infrastructure up front and has to pay interest on those costs.
    - In some cases, jurisdictions require developers to pay SDCs up front even if they are building infrastructure that will qualify for credits, and then reimburse or refund the credit eligible share at the end. This particularly increases carrying costs.

[222] ORS 223.304 (5)(a)

- Some noted that allowing SDC credits to be transferred to future development on other sites makes them more valuable and can allow developers to take on larger infrastructure projects.

5.4 Program Information and Transparency

5.4.1 Statutory Requirements

As discussed previously, prior to 2021, statutory requirements related to annual SDC program accounting and information sharing were limited to annual revenue and expenditure accounting and making the methodology available to interested parties 60 days in advance of a public hearing. With respect to annual reporting, the specific requirements are as follows:

> *The local government shall provide an annual accounting, to be completed by January 1 of each year, for system development charges showing the total amount of system development charge revenues collected for each system and the projects that were funded in the previous fiscal year. The local government shall include in the annual accounting: (a) A list of the amount spent on each project funded, in whole or in part, with system development charge revenues; and (b) The amount of revenue collected by the local government from system development charges and attributed to the costs of complying with the provisions of ORS 223.297 to 223.316.*

With the passage of House Bill 3040 in 2021, public agencies must now meet the additional informational requirements codified in ORS 223.316. Specifically, any local government that imposes one or more SDCs must publish on its website or by alternate accessible means (free of charge), the following information:

- The current SDC fee rates for each type of development.
- Details of the methodology used to determine SDC fee rates.
- A list of capital improvement projects that will receive funding from system development charge fee revenue.
- Contact information for a local official responsible for answering questions about system development charges.[223]

Even before the most recent changes to the statutes, many local governments made significant efforts to make information related to SDCs readily available and understandable. Service providers use a wide variety of tools and practices, and the cost and level of effort required to manage these programs similarly varies. Some local governments have dedicated staff that manage one or more aspects of the SDC program, while others need to rely more heavily on outside consultants.

As with other elements of the SDC program, a local government must balance the administrative requirements and costs associated with the development of educational tools

[223] ORS 223.316

and transparency measures—which may impact SDC fee levels by increasing program compliance costs—with the desire for enhanced public understanding and transparency.

5.4.2 Common Practices and Local Jurisdiction Perspectives

In considering program transparency best practices, it is important to consider points in the process where information is developed and how that information may be shared most efficiently and effectively to different audiences.

Methodology Development and Adoption

Service providers note that developing a SDC methodology is a significant undertaking. This is particularly true for agencies that desire a high level of stakeholder engagement in the process. Some providers indicate involvement of a standing or ad hoc committee in the development of the SDC methodology and project list. Involvement of stakeholders in the process helps some communities to evaluate the various methodological options to reflect local policy objectives and priorities. A number of service providers noted the importance of stakeholder engagement in the development of the SDC project list, to ensure investment in infrastructure is equitably distributed across the service area.

As discussed previously, the statute has had a long-standing requirement that an SDC methodology must be made available to interested parties at least 60 days in advance of the first public hearing. Most service providers typically go beyond this requirement by making methodology reports available more broadly on public websites and in public buildings (e.g., city hall or public library). Furthermore, because methodology reports are generally technical documents, many jurisdictions provide summary information in the form of fact sheets, frequently asked questions, and presentation graphics, in an effort to make the information more accessible to the general public.

While the general public may best be served by information at a summary level in order to understand the context of SDCs in infrastructure funding, it is critical that those paying the fees have a more in-depth understanding of the basis for the charges and be able to estimate the impact that the fees and other program policies will have on their development project. In this case, best practices include providing detailed fee schedules and administrative policies and procedure documents, and "SDC calculators" that help more accurately estimate SDC charges based on specific development characteristics.[224]

[224] For example, see City of Gresham fee calculate (https://greshamoregon.gov/SDC-Calculator/#!/) that allows a developer to enter data about a development project directly on the city's webpage and then see the calculated charges. The City of Corvallis (https://www.corvallisoregon.gov/ds/page/permit-fees) offers a similar tool.

Ongoing Reporting and Information Sharing

SDC Schedules

Once the SDC methodology and project list have been adopted, fee levels may change over time due to application of inflationary indices, phase-in plans, or changes to project list costs. Updated SDC schedules need to be readily available on the website through one or more mechanisms such as a comprehensive agency-wide fee schedule, dedicated SDC portion of the website, or on individual infrastructure department pages.

Project Lists

Project lists should be reviewed and updated periodically (e.g., in conjunction with capital improvement plan updating) and any modifications documented. The SDC statutes allow for the project list to be updated at any time, and formal notification of changes is only required if the SDC is to be increased. It is not uncommon for changes to be made to the project list without a need to increase the SDC (as in the case of replacing a lower priority project with a higher priority project of similar cost). While not required by statute, some local governments will formally adopt the new project list by resolution to increase transparency and facilitate internal tracking.

Annual Accounting

The level of information included in annual SDC accounting varies across jurisdictions. Generally, total annual SDC revenue is tracked and readily available by infrastructure system. In some cases, revenues by SDC component (reimbursement, improvement, and compliance) are accounted for individually, as each has different limitations on eligible expenditures.[225]

Service providers participating in focus groups indicate some reporting challenges with the level of detail available for project expenses. While reporting of annual project expenses is generally straightforward, projects that span multiple years are more complicated to report and track due to differences in internal project numbers used for identifying a project as it moves from SDC project list to the capital budget and then finally to a fixed asset.

Though not required by statute, some service providers prepare annual accounting reports and send them to interested stakeholders.

[225] Reimbursement fee revenue may be spent on any capital cost associated with the system for which it was collected, while improvement fee revenue is limited to SDC-eligible costs on the project list, and compliance-related expenditures must be accounted for separately.

5.4.3 Implications for Development and Developer Perspectives

SDC Rate Information and SDC Estimates for Specific Developments

As described in the developer focus group summary in Appendix B, many developers highlighted the importance of knowing how much the SDCs would be in advance. Several developers noted issues with major changes to SDCs during the pre-development and development period. Some set money aside specifically to address fee increases, but there are fewer options to adjust to cost-increases that occur later in the development process. Certainty on SDCs is particularly important for affordable housing development. When SDC costs increase unexpectedly, it can be very hard to find additional funding or cost-savings in other areas at the last minute when funding amounts have been set in advance.

Multifamily developers also highlighted challenges with estimating SDCs early in the development process because they can vary depending on the unit configurations (e.g., number of bedrooms and bathrooms) and site layout (e.g., impervious surface), which may not be known until late in the process. Developers who build middle housing (e.g., duplexes, triplexes, fourplexes, townhouses, and cottage clusters) also noted that many jurisdictions do not have separate SDC rates for middle housing. It can be difficult to determine which SDC rates should apply to a middle housing development when housing type definitions are not clearly listed in published SDC rate or methodology documents.

Part 6:Conclusions

This study responds to a legislative request for a comprehensive review of Oregon's historical and current policy and practice for implementing system development charges, with a particular focus on their interaction with housing affordability. While it is beyond the scope of the study to make recommendations, its findings can help inform future policy discussions.

For several decades, SDCs have provided a consistent mechanism for growth to pay for growth in Oregon. Today, SDCs are an essential part of funding the infrastructure needed for growth given limitations on other funding mechanisms and growing infrastructure needs and costs. A shift away from SDCs at the local level could have unintended consequences by increasing reliance on mechanisms like utility rates or user fees (which can burden low-income households) and direct developer exactions (which can make it more difficult to allocate costs among multiple parties), or by delaying needed infrastructure projects.

At the same time, the state faces a housing affordability crisis. It has become increasingly clear that housing production is essential for keeping prices and rents from escalating out of reach of most households. SDCs can be essential to funding the infrastructure needed to enable new development, but also contribute to the cost of building housing. While SDCs are just one among many cost drivers for housing development, they disproportionately impact lower-cost housing, including entry-level homes, middle housing, and smaller housing units, exacerbating other cost and market factors that make these types of housing harder to build. In communities with demand for high-end housing, SDCs can tip the scales further in favor of higher-cost housing development; in those without demand for high-end housing, they can create one more barrier to housing production overall. SDCs also increase the amount of state, federal, or local funding needed to make affordable housing development possible. It remains appropriate and important for growth to contribute proportionately to growth-related costs. Designing and using SDCs to accomplish this goal while balancing the need to build a broad range and abundant supply of housing requires a nuanced approach.

Jurisdictions have—and value—the flexibility to establish SDCs that reflect their local cost conditions, system needs, funding and policy priorities, and development context. They also have options to design SDC rate structures that reflect differences in impacts by type or size of housing unit, to allow SDCs to be paid later in the housing development process, and to offer reductions or exemptions for affordable housing. Successful programs in some Oregon communities suggest that these measures can benefit housing production and affordability to some extent while retaining SDCs' core function as a funding mechanism for the infrastructure that enables growth to continue. Broader adoption would require overcoming common concerns, such as revenue loss and legal uncertainties for exemptions, and administrative costs and nonpayment risks associated with deferring SDC payments, some of which the state could help address. At the local level, jurisdictions making updates to SDCs, housing policy, or infrastructure funding strategies could consider some of these measures for implementation, learning from the experience of other jurisdictions to craft successful programs. The magnitude

of the benefits from these programs can be hard to measure, but this report suggests they can make a difference for some of the developments that are most sensitive to SDC costs.

Because there are legal limits to jurisdictions' ability to align SDCs with housing cost, a bigger shift in how SDCs affect housing production and affordability would require targeting alternative funding sources towards SDC and infrastructure costs associated with affordable and lower-cost housing development. If the alternative funding sources have less impact on these housing types and on lower-income households generally, this could help level the playing field for these types of housing without undermining the purpose and value of SDCs or increasing cost burden on low-income households in other ways.

Acronyms and Glossary

Acronyms

ADUs – Accessory Dwelling Units

ARRA – American Recovery and Reinvestment Act

CAA – Clean Air Act 1970

CWA – Clean Water Act of 1972

CBO – Congressional Budget Office

CCI – Construction Cost Index

CPI – Consumer Price Index

ENR – Engineering News Record

ERUs – Equivalent Residential Units

FHA – Federal Housing Association

GO bonds – General Obligation bonds

HBA – Homebuilders Association

HOLTE – Home Ownership Limited Tax Emption Program

LOC – League of Oregon Cities

LIHTC – Low Income Housing Tax Credit

NAHB – National Association of Home Builders

NMHC – National Multifamily Housing County

OBOA – Oregon Building Officials Association

OMB – Office of Management and Budget

ORS – Oregon Revised Statutes

Glossary

Adjudicative Exactions – exactions specific to an individual parcels determined through a property-specific decision process

Affordable Housing – income and/or rent-restricted housing that is affordable to households earning a certain income level

Area Median Income (AMI) – also known as Median Family Income (MFI), this is an estimate of the median income for a given metropolitan area adjusted by household size, produced annually by the U.S. Housing and Urban Development (HUD) as the basis for affordable housing projects' income limits, rent limits, and loans

Assessed Value – the taxable value of a property

Asset – facility or structure that is part of the infrastructure system

Capacity – the amount of demand that an infrastructure system or facility can accommodate

Capital Improvements – major improvements to public facilities (excluding routine maintenance), including water supply, treatment, and distribution; wastewater collection, transmission, treatment, and disposal; drainage and flood control, transportation; and/or parks and recreation (see ORS 223.299 for the statutory definition)

Carrying Costs – costs of owning a property, including property taxes and interest financing costs

Certificate of Occupancy – a document verifying that all inspections have been completed for a new building and that the structure meets the applicable codes

Charge Basis – how SDC costs will be allocated across different development types, sizes, and contexts

Compliance Costs – the costs of complying with SDC statutes, including the costs of developing SDC methodologies and providing an annual accounting of SDC expenditures, and potentially other costs related to SDC administration

Cost Basis – the pool of eligible infrastructure costs to be recovered from the SDC

Cost Incidence – which party or parties ultimately incur a given cost

Depreciation – reduction in value of an asset or structure over time

Equity (financial) – ownership investment in real estate; the difference between the value of an asset and the debt on the asset

Equity (distributional) – fairness and justice in how costs and benefits are allocated

Essential Nexus – a concept established by the U.S. Supreme Court in *Nollan v. California Coastal Commission*[226] as a test for the validity of an exaction: whatever is being required (exacted) as a condition of development approval must be clearly and closely related to the impact of the proposed development

Exaction – a requirement the local government for proposed development to provide some form of contribution or payment as compensation for impacts of the development on infrastructure systems or public goods

Excess Capacity – a share of the capacity of an infrastructure facility that exceeds the needs of a given development

Financial Feasibility – a determination of whether a project's value or revenues will justify the costs to construct it, given the expected level of risk

Fixture Units – a unit of measure of plumbing (water or wastewater) demand, calculated based on the plumbing code

Hard Costs – construction labor and material costs

Housing Affordability – households' ability to find housing within their financial means, with or without public support or restrictions in place, across a range of income levels. This is commonly measured based on spending no more than 30 percent of gross income on housing (rent or mortgage, plus utilities)[227]

Housing Production – new housing development or other increases to the supply of housing units

Impact Fees – legislative monetary exactions adopted by a governing body and applied consistently to development applications

Improvement Fee – an SDC fee for costs associated with capital improvements to be constructed

Infrastructure Systems Plans – master plans or public facility plans for a given infrastructure system (e.g., parks master plans, transportation system plans, water or wastewater system master plans, or stormwater master plans)

---

[226] Nollan v. California Coastal Commission, 483 U.S. 825, 837 (1987)

[227] The 30 percent standard is widely used but simplistic. See discussion and additional context related to defining affordability and affordable housing in the following memorandum:

Nick Meltzer, Sadie DiNatale, Bob Parker & Rebecca Lewis, University of Oregon, "Definitions of Affordable Housing," to the Department of Land Conservation and Development and the HB 4079 Rulemaking Advisory Committee (RAC), September 19, 2016. https://www.oregon.gov/lcd/UP/Documents/UO-Defining_Affordability.pdf

Internal Rate of Return (IRR) – a commonly used financial metric in the real estate industry to estimate the profitability of real estate investments as discount rate measured in percentage points

Level of Service (LOS) – a way of defining the quality or amount of service provided by a given infrastructure system or facility

Local Jurisdictions – cities, counties, or special districts

Local Option Levies – a special voter-approved property tax levy outside the limitations on permanent property tax rates under Oregon's property tax system

Lower-Cost Housing – market-rate housing (without income or rent/price restrictions) that offers lower sale prices or rents than most new housing in a given area and typically also has lower development costs

Market Context Area – generalized geographies capturing differences across the state in housing market factors and development cost factors

Market-Rate Development/Housing – housing in which prices or rents are (or can be) based on market demand and willingness to pay rather than meeting a defined level of affordability

Measure 5 – an Oregon ballot measure from the early 1990s that introduced property tax rate limits and cut tax rates

Measure 50 – an Oregon ballot measure from the late 1990s that cut taxes, introduced assessed value growth limits, and replaced most tax levies with permanent tax rates

Middle Housing – duplexes, triplexes, quadplexes, townhouses, and cottage clusters

Monetary Exactions – requirements by local governments that developers pay money as a condition of development approval

Multifamily Residence/Dwelling – a property with multiple dwelling units on a common lot, excluding middle housing (the dwelling units may be occupied by families or nonfamily households)

Nominal Dollars – dollar value based on the year of expenditure, unadjusted for inflation

Original Cost – the cost of building a facility at the time it was built

Pro Forma – a financial model that estimates the feasibility of a new real estate development based on the building's financial performance

Qualified Public Improvements (QPIs) – according to ORS 223.304(4): "Qualified public improvements are improvements required as a condition of development approval, identified in the SDC capital project list, and either: a) Not located on or contiguous to property that is the

subject of development approval; or b) Located in whole or in part on or contiguous to property that is the subject of development approval and required to be built larger or with greater capacity than is necessary for the particular development project to which the improvement fee is related."

Ratemaking Principles – not defined in statute, but generally considered to include establishing fee levels consistent with the costs of providing the service and recovering costs from system users in proportion to their use or impact; however, modern interpretations argue that water, wastewater, and stormwater service providers have a social responsibility to ensure universal, affordable access to services as part of their rate-setting framework

Rate-setting – methodology and policy decisions associated with establishing an SDC rate and fee structure

Real Market Value – an estimate of the market value of a property in an arms-length sales transaction

Reimbursement Fee – a fee for costs associated with capital improvements already constructed, or under construction when the fee is established, for which the local government determines that capacity exists[228]

Replacement Cost – the cost to replace an existing asset with a similar asset at current construction costs

Rough Proportionality – a concept established by the U.S. Supreme Court in *Dolan v. City of Tigard*[229] as a test for the validity of an exaction: the amount of the exaction must be roughly proportionate to the magnitude of the impact that the exaction is intended to address

Scaling Factors – development characteristics that relate to potential system impact used to set SDC rate structures to account for those differences in impacts

Service Providers – local jurisdictions (cities, counties, or special districts) that build and operate water, wastewater, stormwater, transportation, or parks systems

Single-Family Residence/Dwelling – a single detached dwelling unit on its own lot (the dwelling unit may be occupied by a family or a nonfamily household)

Soft Costs – development costs excluding the direct cost of construction, such as design and engineering, project management, financing, permits, and fee costs

Special Districts – a form of local government that provides specific public services

---

[228] ORS 223.299(3)

[229] Dolan v. City of Tigard, 512 U.S. 374 (1994)

System Development Charges (SDCs) – impact fees established and administered consistent with Oregon's SDC Act

SDC Act – State statute (ORS 223.297 to 223.316) that regulates SDCs, first passed in 1989

SDC Credits – credits against SDC fees for construction of a qualified public improvement

SDC-eligible Projects – capacity-increasing projects that are included in an infrastructure system plan project list

SDC Methodology – documentation of an SDC calculation in compliance with the SDC Act

SDC Exemptions or Waivers – policies to not to charge a certain type or category of development an SDC. Most communities that do not charge SDCs for affordable housing describe this as an "SDC Exemption". Some make a distinction between "waivers" given on a case-by-case basis and "exemptions" that are set in policy. Others use these terms interchangeably. Throughout this document, when referring to programs that do not collect SDCs from affordable housing, both terms are used to mean policy-based exclusions that are applied consistently to all qualifying projects, unless a budgetary limit is set

Tax Levies – taxes established to provide a specific amount of tax revenue

Total Development Costs – the full cost of a development project, including construction labor and material, land costs, and "soft costs" such as design and engineering, project management, financing, permits, and fees

Townhouse – units that share common walls with each unit on an individual lot or parcel

Trip Ends – the beginning (origin) or end (destination) of a one-way trip

User Fees – fees local governments charge for the use or ongoing availability of government services like parks, streets, public safety, and others

Water Resources – According to the Congressional Budget Office, water resources include "water containment systems (dams, levees, reservoirs, and watersheds) and sources of freshwater"[230]

Water Utilities – According to the Congressional Budget Office, water utilities include "supply systems for distributing potable water as well as wastewater and sewage treatment systems and plants" [231]

---

[230] Congressional Budget Office, "Public Spending on Transportation and Water Infrastructure, 1956 to 2014," March 2015, page 3.

[231] *Ibid.*, page 3.

Working Capital – the available financial resources that a company can readily use to pay near-term costs

Appendices

Appendix A. Summary of Input from Service Providers

Contributors: ECONorthwest, Galardi Rothstein Group, FCS Group

ECONorthwest, along with consultants from the FCS Group and the Galardi Rothstein Group, conducted seven focus groups for large cities and small cities, special districts, parks providers, and the Portland Bureaus. The focus groups are important for understanding the varying perspectives on the importance of SDCs for infrastructure funding, factors driving SDC setting, timing of collection, and considerations related to measures to reduce the impact of SDCs on housing.

Questions Asked

Below is the set of questions used to help guide the focus groups.

1. **Role of SDCs in Funding Infrastructure:** How important are SDCs to your jurisdiction/district?
2. **SDC Rate Increases vs Cost Escalation:** Are you indexing your SDCs based on changes in construction costs or other measures? Has that been enough for them to keep up with increases in actual project costs over time?
3. **Actual Rates and Factors Influencing Rate Setting:** Is your organization currently charging the maximum that your methodology supports? If not, why not? What are some of the top factors that influenced your organization's most recent SDC setting decisions?
4. **Equity Considerations:** How and to what extent did equity considerations factor into your rate-setting decisions? If it did, how did you address equity in the rate-setting process and in evaluating equitable outcomes?
5. **Strategies to reduce impacts of SDCs on housing:** Some communities and districts are considering measures to reduce the impact of SDCs housing affordability. Does your organization currently have any affordable housing measures in place? If so, how are they working? If not, what concerns do you have about implementing them?
6. **Timing:** How does the timing of SDC collection compare to when you need to build facilities? To what extent does the specific timing within the development process (e.g., certificate of occupancy vs. building permit) affect your organization's ability to build facilities when they are needed? Do you have other concerns related to the timing of when SDCs are paid?
7. **Transparency Requirements:** As you may know, HB 3040 also included a requirement to make information about SDCs including rates, methodology, and the project list available to the public via a website (unless the jurisdiction/district does not have a website). Has addressing this requirement been a challenge? Does your jurisdiction/district have any additional tools to provide information to the public regarding SDCs?

8. **Questions for us / other thoughts** *(if time permits)*: Do you have questions for OHCS or the consultant team about the study? Are there other things you are concerned about related to SDC requirements?

Summary of Stakeholder Feedback and Themes

The balance of this memorandum summarizes feedback from the focus groups by topic and theme. Paraphrased statements from attendees are shown in *italics*. Where relevant, the type of service provider making the statement in question is indicated in brackets (e.g., *[small city]*).

Themes	Stakeholder Feedback
Role of SDCs in Funding Infrastructure	
Critical funding source for infrastructure in communities experiencing growth	• Some jurisdictions would not be able to make land available for development within the UGB without SDCs to extend infrastructure. • Some Metro jurisdictions use specific SDCs or higher SDC rates in high-growth areas. ○ In many new growth areas, service providers have evaluated how the areas needed to be served from a parks and recreation standpoint and added area specific supplemental SDCs. This method has been successful, as developers see the market value in parks and recreation facilities. • Several small cities noted they had not experienced a lot of growth occurring and little SDC revenue, but more recently there have been more developments that have brought in more SDCs and there's more need for capacity-increasing projects to support growth. • Some in larger cities feel there is a disconnect between for-profit developers and jurisdictions when developers want to reduce or waive the SDCs jurisdictions rely on to help pay for infrastructure investments that facilitate housing development.
SDCs prevent over-reliance on user fees and utility rates to cover cost of new capacity	• Public utilities rely on political/public support for raising capital (unlike investor-owned utilities). SDCs are key to messaging that growth is paying for growth, and utility rate increases are for meeting other capital and operating needs. • Some believe user fees should only be used for maintenance and operations of existing facilities, as cities do not want to burden existing users with helping to pay for new development (through an increase in user fees). • Would need to replace revenue with large utility rate increases, new fees (transportation), and GO bonds (parks). Equity issues from redistribution of growth-related costs.
Critical for funding large infrastructure like major sewer interceptor, water and sewer plants	• A number of water/sewer service providers noted the importance of SDCs in helping pay for major projects, that may not have happened without them. While not the sole source, they often contributed a meaningful amount or helped pay debt service.

Themes	Stakeholder Feedback

SDC credits for improvements built by developers are an important component of SDC expenditures in some communities	• For larger developments and greenfields, credits play an important role, especially in larger cities.
	  ○ Jurisdictions have seen a number of capacity expanding infrastructure projects being built by developers then getting SDC credits.
	  ○ Some report not charging parks SDCs in expansion areas because developers typically opt to build the park and get credits instead. Will also issue transportation credits for oversized facilities. This is less common outside of expansion areas.
	• SDC credits sometimes provide cost savings when developers build infrastructure.
	  ○ Jurisdictions or providers (particularly parks districts) have worked more with developers to deliver infrastructure need for their developments at better rates with economies of scale, and then receive SDC credits.

Revenues can be limited in places with slow growth	• Communities experiencing mostly infill may get less SDC revenue.
	  ○ *Most development consists of tear-down/rebuilds and no SDCs are collected because usually get credit for previous development.*
	  ○ *Would love to rely on SDCs for capital improvements but landlocked—little expansion room, no empty land in town, only comes from infill or teardown and build more housing.*

There are other funding options beyond SDCs and utility rates, but they are limited	• Tax limitations in Oregon have had particularly acute impact on parks and transportation funding.
	  ○ *Areas with enterprise zones and Urban Renewal districts further limit revenue.*
	• Urban renewal more and more relied on to fill gaps, capturing revenue from other districts
	• Some jurisdictions use general fund allocations or special property tax levies to supplement SDCs
	  ○ Larger cities have supplemented SDCs with discretionary allocations from the General Fund, but very limitedly.
	  ○ One county has a voter-approved tax they levy to help pay for county road projects on major arterials.
	• One community with a tourism-based economy adopted a prepared food tax.
	• A few communities have implemented utility fees for transportation and parks to pay for maintenance and improvements.

Themes	Stakeholder Feedback
	○ But for parks, this now gets stretched to cover things like ROW and greenways in addition to the parks • State and federal funds are more limited now than in the past • It can be a struggle to fund parks and transportation projects the most, because they often do not collect user fees like water, sewer, and stormwater
SDCs are key to leveraging other funds	• Parks providers noted they often leverage SDCs as grant matching dollars to close gaps and have few other sources available as a local match. Many jurisdictions also noted using SDCs as local match for transportation projects.
SDC revenue is volatile year to year, and varies as a share of capital funding	• Portion of infrastructure funding from SDCs varies from year-to-year due to various factors including the rate of growth and the type of improvements being constructed.
Lack of funding for operations and maintenance can limit use of SDCs	• SDCs cannot be used for maintenance or operations of existing facilities. • Hard to justify building more facilities when struggling to fund existing facilities ○ Some jurisdictions do not feel like it is feasible to expand without an adequate and stable source of revenue for maintenance and operation.
Some small cities do not charge SDCs at all	• Reasons why small cities are not collecting SDCs: ○ Little development (which requires less infrastructure development) ○ Political concerns ○ Developers required to install infrastructure ○ Voter approval required by local policy in some communities

Themes	Stakeholder Feedback
Methodology Choices and Cost Allocation	
Infill and denser developments are sometimes, but not always, less costly to serve	• New density requirements create capacity issues with infill development, such that it may be more. expensive to serve due to the need to upsize existing infrastructure in a developed area o Waiving or reducing SDCs for higher density housing can be problematic since those housing types are more reliant on parks. • Infill may have lower transportation impacts, so some jurisdictions offer discounts for denser developments or to areas with better access to transit or that are more walkable.
Infill areas may need a different approach	• Some jurisdictions are changing approach to fund upgrades to existing facilities that expand capacity and may also replace existing aging infrastructure. o Areas experiencing more infill development than greenfield development may need a different way of defining LOS and growth capacity—specifically, improvements that increase capacity through more efficient use of existing facilities versus building new facilities.
Some service providers have implemented or are working on a tiered approach for residential SDCs based on unit size	• Tiered fees are typically based on local data showing reduced household size, trips, or other measures of impact. o Some researched how occupancy changes by square footage, showing there was less impact when fewer people lived in a unit. • Others are considering making this shift, or in the process of working on it.
Many expressed concerns about a "one size can fit most" approach	• Service providers value local discretion in SDC methodology and policy. o Some felt that the nuance of affordability and quality of life people get from infrastructure investments is best dealt with at the local level.

Themes	Stakeholder Feedback
Cost Recovery	

Many are not charging the maximum amount supported by methodology	• Many communities made policy choices to charge less than the full SDC determined by methodology and project list.
	  ○ Some policy makers are hesitant to levy the maximum amount the methodology would support to stay competitive or support affordable housing development.
	  ○ Decision-makers often want to see how proposed SDC rates compare to other jurisdictions in an effort to not be the highest.
	• Some small cities in particular have avoided setting SDCs rates at the maximum their methodology supports in order to remain competitive.
	  ○ *Needed to stay below "closest neighbor of similar size."*
	  ○ *More important not to create disincentives to development, remain competitive with other similar communities.*
	• Some adjust project lists rather than reducing SDC rates from max to keep SDC rates lower.
	  ○ Use of funded and unfunded project lists, or SDC project lists established based on viable SDC rate.
	  ▪ *Not all projects made it onto funded list. Created kind of a target max SDC that they would charge, prioritized project to that amount.*
	• Some phase in SDC rate increases over multiple years to avoid making big jumps.
	  ○ Large increases sometimes prompted phase-in periods.

Other cities and service providers charge the full amount or have made bigger increases	• Some communities have a policy inclination that growth should pay for itself and charge max SDC rates. • Others have caught up more recently (after keeping SDC rates artificially low for many years), and come to recognize a greater/urgent need for infrastructure upgrades.

Themes	Stakeholder Feedback

Most (but not all) service providers index SDC rates	• Many use Engineering News Record (ENR) Construction Cost Index (CCI), either the 20-City average or the City of Seattle index, but the timeframes vary and this can change the outcome.
	• Parks providers often also account for changes in land costs.
	• A few do not index SDC rates.
	  ○ Some only increase SDC rates when they believe there's a viable justification.
	  ○ *Calculate every year—effectively renew methodology every year, no cost escalator. Not that much work – have staff capacity [in a large city] to do it in house.*

SDCs not keeping pace with rising costs due to a variety of factors	• Inconsistent indexing.
	• Some felt that available indices are not representative of local variations in costs (e.g., Seattle ENR not representative of Portland construction market).
	• Methodology for indexing can create lag.
	  ○ *Even when SDC rates are indexed year-to-year, they don't appear to keep up because indexes tend lag on their own.*
	• Some infrastructure systems can lag more than others.
	  ○ *Index numbers for land cost (for parks) are based on assessed values rather than market values, so they continue to fall behind on top of the existing lag.*
	  ○ *Transportation costs have the hardest time keeping up with construction cost escalations.*
	  ○ *Park districts are experiencing the same cost increases as developers but are not able to recoup any costs.*
	• Many (though not all) are seeing actual costs rise faster than their index.
	  ○ *Not keeping up with cost of materials. Index only includes cost of construction (not land), falling further behind.*

Methodology updates are a substantial undertaking	• Methodologies and project lists are not updated regularly.
	  ○ *Takes 5-10 years to update SDC. Hard to keep system plans fresh—spend increment on updating master plans, CIP, and methodology. [small city]*
	  ○ *Methodology updates every 10 years. [large city]*

With SDC escalation falling behind costs,	• Districts haven't been able to move capital projects forward due to stagnant SDCs (against costs). ○ *Have had to make some reductions to projects with costs increasing.*

Themes	Stakeholder Feedback
some service providers can fund less	○ *It is becoming more common for sudden projects to come up, but funding hasn't been allocated for them.* ○ *Falling behind on ability to expand capacity because of cost escalations of past 5 years or more. Far exceed ability to update methodology to keep pace. [small city]*
Equity and Affordability Considerations	
Varying perspectives on what the relevant equity issues are for SDCs	• Some felt SDCs should only consider impact, not ability to pay (particularly in the context of affordable housing waivers). ○ *SDC is based on the impact—equity is more about reflecting differences in impacts.* • Some felt the key equity consideration is putting costs on development vs. existing users. ○ There's substantial concern around over-burdening existing users/long-term residents if user-fees are increased. • Some emphasized supporting affordable housing regardless of impact. ○ *Backfilling to support regulated affordable housing with guaranteed longevity. Very much an equity and need for affordable housing conversation, understanding that market won't deliver it.* • Some focused on reflecting differences in impact for different housing types and larger vs. smaller homes. ○ *Recognize equity piece related unit size.* • Some focused on equitable expenditures of SDC revenue/provision of facilities ○ *Access to walkable parks is an important element of the equity conversation.* ○ *Equity considerations on allocation side, how to decide what gets funded. Major factor in deciding where to spend the revenue.* ○ *Understanding who benefits from the investments is more important than where the money comes from (true equity impact is at the backend, when investments are made).* • Some focused on equity in the process ○ *Existing residents often hold historic influence in investment decisions, so residents who might be disproportionately affected by reducing or eliminating SDCs might not be at the table.* ○ Some communities use standing or ad hoc committees to help in the SDC-setting process.

Themes	Stakeholder Feedback

Increase in interest in/use of affordable housing waivers	• Several cities and service providers have waiver policies in place for regulated affordable housing and more jurisdictions reported considering waivers.
	• But concerns about administration and enforcement for affordable housing waivers were raised.
	  ○ In communities that have not implemented affordable housing waivers, staff sometimes expressed concerns about monitoring and enforcement over time:
	  ▪ How to guarantee that rents stay low?
	  ▪ What happens if owner changes rents? If rents do change to market-rate, is there a way to get SDC payment?
	  ▪ Major administrative tracking concerns.
	• Most service providers that offer SDC waivers for affordable housing limit it to regulated / income-restricted affordable housing.
	  ○ *Some use a deed restriction that requires them to pay back the SDCs if the property does not remain affordable.*
	  ○ *Some noted waivers have increased admin costs because they must review for eligibility, other said it was minimal.*

Concerns about implications of foregone revenue from eliminating or reducing SDCs for affordable housing	• Some do not feel it is fair (or, in some cases, legal) to waive fees for affordable housing.
	  ○ *SDCs are charged based on infrastructure needs, and affordable housing still creates an impact on infrastructure.*
	• Some cities and service providers have set a cap on the amount of waivers they will issue.
	• Many raised questions about where replacement funding would come from.
	  ○ *When SDCs are waived on certain projects, the revenue will need to come from other sources so projects can be built.*
	  ○ *User fees or general funds may be used to backfill whatever SDCs are waived.*
	  ○ *Want to know that if SDCs are reduced or eliminated, how can they ensure investments are made in lower income areas?*
	  ○ *If there was a policy to waive, would have to be a policy to backfill—that money has to come from somewhere. What do you backfill it with is the question, not whether to backfill.*
	  ○ *Concerned that State will require SDCs be waived or reduced for certain types of development projects. If this becomes the case, state funding should be provided to help backfill.*

Themes	Stakeholder Feedback
Timing	
Most jurisdictions collect SDCs at building permit issuance, but some offer flexibility	• Jurisdictions offering deferral to certificate of occupancy (C of O) often do so selectively, but each jurisdiction is different in their approach and criteria. ○ Water SDCs are sometimes linked to meter placement, which typically occurs about 3/4 of the way through finishing the house, before C of O, but after BP (usually). Have leverage because the meter needs to be installed. Several indicated they won't install the meter if SDCs haven't been paid.

Concerns about administering deferrals	• Administratively, it's easiest for jurisdictions to collect at building permit.
	  ○ Easier to collect SDCs with Building Permit when applicant is already paying permit fee - more efficient.
	  ○ When fees are not collected all at once, funding streams become disconnected and project execution can become uncertain.
	• At Certificate of Occupancy, service providers still have some leverage, though there were differing opinions about this.
	  ○ Some said certificate of occupancy is fine, since there's still a lever the jurisdiction has control over.
	  ○ Some cities expressed that once permits are issued, they can't hold up C of O for any unmet conditions or unpaid fees.
	  ▪ *Pretty common opinion from building officials—if don't get fee up front, no hammer to collect any more.*
	  ▪ *Permitting system wouldn't allow carrying a balance—can't call for inspection.*
	• Many service providers are concerned about nonpayment and being in a difficult position with deferral to C of O. For example:
	  ○ *If ready for final inspection, ready to close and move in, and SDC payment holds it up, would look like City holding up final inspection. Creates perception issue.*
	• Single-family development can be more challenging for deferrals.
	  ○ *SF permits all come in individually. Would have to monitor and track every unit individually.*

Themes	Stakeholder Feedback
	○ *For a subdivision phased in over time can deferral create delays in implementing improvements.* • Collecting at time of sale is especially concerning ○ *Rental properties are not sold, there's no trigger in place to collect SDCs* ○ *Large scale planned development that might be built out over several years with piecemeal sales, might not allow for SDCs to be collected in a timely manner.* ○ *Since cities are not involved in the sale of a property, there may be no trigger in place for collection (years down the road) and fees may never get paid.* ○ *Concerned about level of effort and staff time to track and make sure it happens.* ○ *City has no connection to sale, no involvement. Unless appropriately recorded—have to rely on someone else to trigger it, no guarantee it will show up.*
Most service providers are not affected by a small delay in receiving funds, but there are a few cases where timing is more important	• Most service providers are not utilizing SDC revenues for projects within the same year and would generally not be greatly affected by a 6 or 12-month delay in collections. Projects are usually planned out several years through the CIP with current revenues funding projects in later years. • For new parks in master planned areas, timing of SDC collection is important, especially for land acquisition, since this needs to occur prior to development. Timing for developing the park land is less critical. Having parks and playgrounds before first homes come up isn't necessarily as important. However, others felt that people expect park and rec facilities when they move in. • In some cases, utility impacts are immediate (e.g., water use during construction). • Some service providers use SDCs to pay debt service on previously built projects and expend it in the year it is received.
Transparency	
Basic ORS requirements are not a problem for most agencies	• Most provide some info online, but amount and type vary. ○ Methodologies, project lists, fee schedules posted on website. ○ Funding can be tracked in budgets, CIP, and annual reports. • Some charge small administrative charges to recover a portion of the compliance requirements and include a part of master planning costs on the project list.

Themes	Stakeholder Feedback

Additional simpler explanations of SDCs are common	• Cities that only post their methodology online without providing more user-friendly materials for community members to navigate the methodology can create confusion and tie up staff time with fielding questions.
	• Many communities have at least a brief explanation online.
	• Larger agencies have staff dedicated to SDC program, so can provide more tools, such as
	  ○ Dedicated webpage
	  ○ SDC calculators
	  ○ Transportation SDC video
	  ○ Historical SDC tracking and comparisons
	  ○ FAQs
	  ○ Mail CIP reports to citizens
	  ○ Training of front counter staff key to communication/understanding
	  ○ Public info campaign for projects that are funded with SDCs - want people to see how being used
	• Some smaller service providers noted that simple explainers from the state that explain what SDCs are would be helpful.

Providing information on SDC expenditures is more complex	• Would have been concerned if had to clearly show what SDC are paying for specifically.
	  ○ *Gets complicated when multiple revenue sources are applied due to mix of project components (growth and maintenance).*
	  ○ Small communities report it would be difficult to track at a subsystem (neighborhood) level.
	  ○ *There is a lack of tracking where new dwelling units are being constructed relative to where funding is being spent.*

Appendix B. Summary of Input from Developers

Contributors: ECONorthwest

ECONorthwest conducted seven interviews and focus groups with market rate and affordable housing developers and home builders to gather insights on how SDCs affected developers' choices and development outcomes.

Discussion Topics

While the interviews and focus groups varied depending on the developers' experience and expertise, the range of topics addressed in these conversations included:

1. How do SDCs affect your development decisions? Can you give examples of times when SDCs affected and or all of the following:
   - Land negotiations
   - Walking away from a potential project
   - Changing what you would build / target price point
2. How does the impact of SDCs on housing vary across different geographic areas?
3. What are the implications of the timing of when SDCs are due within the development process?
4. How important are the following factors related to SDCs:
   - amount of the SDC relative to the strength of the local housing market;
   - amount of the SDC compared to other similar communities;
   - how the SDCs are used, and being able to see clear value from the SDCs; and
   - certainty about how much the final SDC cost will be.
5. Are there jurisdictions that you think are good models to look to for mitigating impacts of SDCs on housing?

Summary of Stakeholder Feedback and Themes

Themes and stakeholder feedback from the interviews and focus groups are summarized on the following pages by topic.

Themes	Stakeholder Feedback
Do SDCs Affect Development Decisions?	

SDCs are part of underwriting and decision-making, as one of many costs that developers consider	• Most developers, report that SDCs are included as a line item in the proforma as a development cost. Some identified SDCs as a **major** cost category, along with land costs, hard costs, and off-site improvements.
	  ◦ *Moves the needle for cost of housing across the board, combined with everything else.*
	  ◦ *Not only SDCs. One of the biggest costs though.*
	  ◦ *Have decided not to do maybe $20m of work because of how SDCs skewed proforma.*

How SDCs Can Affect Feasibility of Projects	

In some cases, SDCs are enough to make a project infeasible, especially for very cost sensitive housing types	• Entry-level homes are often cost-sensitive because of the need to keep sale prices down.
	  ◦ *Worked for a homebuilder that did entry-level homes for first-time buyers and it was a burden.*
	  ◦ *SDCs are $35-36k on an entry-level house. Sale price needs to be about another $45k just to break even.*
	  ◦ *Try to build a home and SDC fees are almost $30k before building permits. Would have to build something that nobody can afford.* (Small coastal community)
	  ◦ *If just barely pencils and SDC rates go up, they walk away if it's entry-level. In the middle adjust up or down, at bottom it's go/no-go.*
	• Middle housing (attached product) tends to be cost-sensitive because it can cost more to build than a single-family home and sells for less relative to a single-family dwelling, but SDCs are not proportionately lower.
	  ◦ *Jurisdictions often have just a multifamily and single-family SDC rate so middle housing doesn't get the same discount as you would for larger multifamily. Some SDC rates differentiate based on square footage, but those often don't have a substantial discount and other SDCs don't vary in the same way so SDC rates don't change that much.*
	  ◦ *Had a half-acre of land on hold in* [medium-sized mid-Willamette Valley city], *waiting for HB 2001, but when they got the estimate back for SDCs for the 12-unit project it was about $200,000*

Themes	Stakeholder Feedback
	(just for building SDCs). Doesn't include utility costs. Means 20 percent of unit costs going to soft costs outside of architecture & engineering. Considering bailing on it. o *It's a hard sell to propose middle housing when single family performs better. SDCs make up a larger percentage of the sale price for middle housing so they perform even worse.* • Multifamily can also be affected by high SDCs when rents won't cover the costs. o *SDC fees (plus other local fees, including building permit) made it prohibitive to underwrite project. Were about $40k per unit, and those areas had been more like $20-30k historically. If the fees for that area were lower, it would still have been questionable, but would have helped.* o *24-unit project in* [medium-sized mid-Willamette Valley city]. *If it costs more than about $15k per unit, it gets tough. Now getting closer to $20k per unit.* o *12-unit project in* [small city]. *Did some napkin math, got SDC numbers from City up front and said wouldn't work period. Didn't bother refining project. With SDCs in normal range would have been tight anyway.*
Lower SDCs aren't always enough to make an infeasible project feasible	• When projects don't work, it's often about more than just SDCs—construction costs and market conditions are big drivers. o *If it doesn't pencil out, there are probably multiple drivers, not just SDCs.* o *Construction costs have gone up from around $200/sf. Now coming in around $250/sf. Not SDC related, just market right now.* o *Deal-killer now is supply, labor, construction costs. SDCs have become a smaller factor.* o *If a community doesn't have reliable growth, reliable rents won't get near it.* • Lower-cost housing types tend to face obstacles beyond SDCs. o *ADUs are super expensive to build per SF basis and the return on them doesn't align.* o *For middle housing, you're putting a product on a site that would otherwise have a single-family home on it. Lenders always compare to what else could be built there. Have to justify that it performs better than single-family dwelling, but middle housing often doesn't. Attached product depending on market particulars can cost 20 percent more to build than a single-family home (more complex to build) and dramatically undersells relative to a single-family dwelling (30-50 percent of a sf dwelling).* o *Larger homes often perform better than smaller ones. Incentive is to build the largest marketable product on the lot.*

Themes	Stakeholder Feedback

Where SDCs are low relative to other costs, they have little impact on projects	• When a jurisdiction's fees are low, they may not be a source of concern.
	  ○ *SDCs* [for duplexes in a small coastal city] *were about $6,000 per unit, that amount just doesn't move needle too much because rent growth in area is so high and the SDCs were low. Not significant relative to overall budget cost.*
	• Residential adaptive reuse projects can have low SDCs compared to new construction.
	  ○ *Adaptive reuse of a former senior care center that was 70 rooms, which resulted in a reduced fixture count (ended up with about 56 units after completed). Resulted in less than 50k in SDCs on that project, less than 1k per unit.*
	• SDCs are not typically an important factor for high end housing types, such as custom homes.
	  ○ *SDCs are just one other fee on a several-million-dollar house, just a small component. Not that important to their business model.*
	  ○ *Property owner typically pays the SDC for custom homes.*
	  ○ *The bigger the home, the less impactful the SDCs are on the construction of the unit.*
	  ○ *For a second home or custom home it is what it is - nonissue.*
	  ○ *If high end subdivision and there's enough price elasticity it's part of the cost of doing business.*

How SDCs Can Affect the Type or Scale of Housing Developers Build	

In many cases, SDCs are not a factor in determining what a given developer will build.	• Developers tend to specialize in certain types and forms of housing.
	  ○ *Try to build relatively the same types of plans. Pretty standard finish, build all Earth Advantage houses. Everyone wants granite counter tops.*
	  ○ *Always build multifamily, not single-family or townhomes.*
	  ○ *Strictly infill builder, 99 percent in* [one large jurisdiction].
	  ○ *Custom homebuilder, mostly higher-end.*
	  ○ *Target to 80-120 percent AMI projects with mission-centric landowners because land is the largest frontload on the cost. Often work with legacy employers. No lease-up, stabilized at occupancy, saves money.*

Themes	Stakeholder Feedback
	• Product is usually based on what aligns with the market. Many wouldn't change what they build just because of SDCs. This is particularly true for multifamily, given that SDCs are often not known up front. ○ *Trying to get the right combination of unit sizes for the market and pricing. Designing and building to what works for the market and sense of place and what city wants it to look like. Then come up with final product. SDCs aren't last calculated but not first either.* ○ *When underwriting a project, if we know a market, know what finishes make sense for the market - that goes into the hard cost budget. We let the general contractor know what finishes we're targeting. When we run the proforma if all doesn't pencil out it just doesn't work.* ○ *Wouldn't change from entry-level to market because of SDCs, would deliver what's best for the market regardless of SDCs.* ○ *There are a lot more components than SDCs that go into deciding the form of multifamily.*
Sometimes developers will adjust unit size in response to SDCs and other costs.	• SDCs combined with high land costs sometimes push developers to build bigger, more expensive homes to cover the costs. This is particularly true for single-family homes where SDCs are more predictable in advance. ○ *If can't make* [SDC exemption program] *work could be 1700 sf house to get to higher sales price that makes the numbers work. Currently building 3 houses in a neighborhood that's nicer, know they won't be under price cap* [for SDC exemption]. *Had to build 1800 sf house to justify higher sales price and afford SDCs. End up building bigger more expensive house to cover the cost.* ○ *SDCs aren't really stopping things in* [large Metro-area city] - *pushing houses to be larger and more expensive.* • Other developers may build smaller units to cut costs while keeping pricing aligned with the market. ○ *One area had lots of expensive requirements and high fees. Can only charge so much for a house, still have to the price house to be competitive. Think those units might be smaller, higher cost for those features. Typically get a smaller lot, maybe a smaller house but it's new.* ○ *Will change product offering, shrink product to what people will be able to pay. But will the market accept that?* ○ *Have seen house sizes reduced to counter-act increasing costs.*

Themes	Stakeholder Feedback
	○ *For lower sales price, go for a smaller house. Might have to build a 1300 sf house.*
Sometimes when the difference in SDCs is based on product type or scale is substantial, developers will choose the option with the substantially lower SDCs	• In some instances, if SDCs are waived for homes that sell to income-qualified buyer (below 120 percent AMI), market-rate developers will build a lower-cost home to qualify. ○ *When working with the SDC waiver program, homes are priced at $430k to qualified buyer, $475k to nonqualified buyer. If SDC-qualified buyer, get the discount. Sold 3 to SDC-qualified buyer, 2 to nonqualified. Like to sell at lower price point, but a wash either way.* • When SDCs are much lower for small units, this can have a big impact on some projects. ○ *Were able to take advantage of building cottage homes, reduced SDC fees. City figured that cluster code allowed them to put 4 units on one lot, and were only going to get one SDC if put a larger home there, justified that still covering the impact of one larger home. Could build up to 4 units, 1 SDC divided by 4. Were able to do 4 for-sale units, hadn't been an option before. Small fee for hook-up, but not the full $35-40k.*
Other times, when SDC differences are minor, they are not enough to change the unit size or other features.	• Scaled SDCs that do not vary substantially have less impact on what will get built. ○ *In* [one medium-sized mid-Willamette Valley city], *City was reviewing parks fees as well as transportation and water fees. Had asked them to think about a tiered study, because of HB 2001 regulations. There was a push by Council to ask staff to do it. Took about 18 months to come back with recommendation, tiered. It's a little different from* [other tiered approaches]. *Based on Census data—average square footage that are being permitted. Reduced amount on smaller square footage, increased on larger. But doesn't get to where you need to be—not aggressive enough to make it work. When look at fixed cost of what it takes—land, building costs, SDCs, won't be able to get cost down enough to meet area median income.*
How SDCs Affect Housing Prices & Rents	
The market determines what prices/rents are possible, but SDCs can influence whether developers need to	• In a supply-constrained environment when other costs are inflexible, builders may try to push sales prices to recoup at least some of the costs. ○ *If there's lack of supply of land and SDCs are fixed and costs are pretty fixed, have to sell the house for more—there's not much else that can move. Seems like demand is strong enough relative to supply that builders feel like they can push the market.*

Themes	Stakeholder Feedback
push the upper limits or not	○ *Cost typically goes down to buyer on for-sale products, which causes the buyer's buying power to go down. If house was supposed to be $350k and city fees were $60k per home, that does get passed on. Maybe have to increase to $375k.* • Multifamily developers generally indicated they have limited ability to push rents, unless rents are already increasing anyway. ○ *Can't raise rents just to raise rents.* ○ *Unsure if will need to increase rents—don't want to be uncompetitive in pricing. Could lead to longer lease up, might not hit the numbers.* ○ *Trying to get numbers down to make it work with market rents.* ○ *Fees increased for parks district during development. Pandemic helped because rents went through the roof—allowed them to pass through the costs. Otherwise probably would have been on pause until rents went up.*
How SDCs Can Affect Land Prices & Negotiations	
SDCs affect land negotiations and what developers are willing to pay in some cases	• SDCs are one of the factors that impact what landowners and land developers can sell finished lots for, as part of the builder's overall proforma. ○ *Trying to keep SDCs down generally speaking—keeps land values higher as a seller of land.* ○ *Developers come back on the land, that's where the haggling is. But in a supply-constrained development, their business requires land, so maybe they can push on subs or see what else can give.* ○ *If one jurisdiction charging $30k, another is charging $75k that goes into the formula. Either try to pay less for land or know that will have to sell homes for more.* ○ *For any deal that works, they have successfully addressed the impact fees as part of purchase price (for the land).* • There are times where a seller's expectation on the price of land and high SDC costs have kept projects from moving forward because seller won't take a lower price. This can be particularly true when land costs are already low and there is limited room to absorb SDC costs by lowering the land price.

Themes	Stakeholder Feedback
	○ *Expectation from seller that land would sell for similar price of recently sold parcel next door (parcel next-door zoned for single-family units, whereas this one required attached housing, no single family). This particular city had higher SDCs relative to neighboring jurisdictions (new growth area), so could only offer about 35 percent of what the seller was looking for. SDCs were baked into the proposed purchase price and so if they could have come to a deal, the SDCs would have been pushed onto the landowner because they couldn't be baked into the attached product.* ○ *SDCs were a factor in not being able to come to an agreement on land price* ○ *Have passed on projects in* [large Metro-area city]*, and properties that are still for sale where couldn't make the numbers work. Some land people just won't sell if they're not going to make enough.* ○ *Could pay SDCs but landowner needs to take less money—tried to negotiate but would've been $100k on a $300k property.*
Other times, land prices or negotiations do not play a role	• Some developers build on land that has been held for a long time, and land price negotiations aren't a factor. ○ *Already own everything they will develop, not in an acquisitions mode to develop projects.* • Some developers are strictly infill builders, so they do not do any large land acquisitions. ○ *Not much land acquisition negotiation, mostly buying older homes and demo or keep and add to it.*
How SDCs Can Affect Where Development Occurs	
SDCs can make developers choose one area over another in some instances	• Many developers and builders report that land costs and SDCs are differentials when considering what adjacent jurisdiction to build in. When SDC costs are out of line with market conditions, developers may look elsewhere. ○ *In some communities SDCs have been part of decision—don't look at* [one jurisdiction] *because of some of the SDCs there.* ○ *Particularly an issue in older cities that have a lot of infrastructure costs that need to be funded. May pay $500k in SDCs and still have to replace utility lines.* ○ *Won't build in* [certain small towns] *- too expensive. Build in places that have more reasonable SDC fees.*

Themes	Stakeholder Feedback

	• If there are other options in the area with lower SDC costs and comparable market conditions and land costs, developers may choose those areas instead.
	  ○ *If SDC fees are $30k less somewhere* (but markets are similar) *will just go somewhere else. For market-rate apartments almost the same. If can only do a certain number of deals, would choose the lower-cost one (all else equal).*
	  ○ *There are markets where rents or sales prices are similar—closer to urban usually higher, lower further out. Similar housing markets, similar drive to core. Even with state income tax differences, it was similar. There are markets where could get similar pricing with lower fees.*
	• Others said SDCs would generally not be enough for them to choose a different community to build in.
	  ○ *Nearby communities are smaller, don't have diversified economies. Generally wouldn't consider building there. SDC difference would have to be a lot.*
	  ○ *Not so concerned about that* [comparison to other jurisdictions]. *All have different priorities, respect that.*
	  ○ *Affects willingness to build in a given community, but not the only factor.*

Other jurisdiction-specific factors can have a bigger impact than SDCs on where developers want to build.	• In some instances, developers and builders said there were other costs that were more important factors than SDCs, including permitting speed, ease of communicating with and getting clarity from staff, and zoning regulations.
	  ○ *If paying more in SDCs could equate to permit speed and consistency/more predictable way then that might make a difference. Build SDCs into proforma and they are predictable, but the permitting speed is more of an unknown.*
	  ○ *Very different permitting and SDC experience* [between two small towns]. *In one, permitting is great, super fast: 5 weeks from plans to permits issued. Can call directly, very responsive. But a lot of coastal cities have issues with retaining staff for city departments—people move on to bigger communities after a few years. Hard to get timely responses to any questions—planning, land use, permitting, or clear info from Public Works.*
	  ○ *One new growth area had a whole other level of requirements on single-family home developers - specific architectural design guidelines, sustainability requirements that all put a burden on the developer. And municipal fees were high.*

Themes	Stakeholder Feedback
	○ *When you get better service overall, it feels like city is working with you, but in other communities it feels like they don't care if your project happens. It makes a difference. Time savings from a more streamlined process can make up for some of the SDC cost.*
Ability to charge high SDCs varies by size of community and market demand	• Many developers noted that small towns are more sensitive to SDC costs. ○ *Should ideally be some sensitivity that smaller communities won't be able to absorb big SDC fees. More impact in smaller communities. Maybe can pass along in larger communities—maybe a little more expensive than wanted it to be. Almost like gas prices.* ○ *Smaller fees can make a big difference in a small town.* ○ *Less room for error, less variability in cost in emerging markets. Any cost increases would put more strain on the project. Less flexibility to maneuver.* ○ *In other parts of the state* [outside the Portland region]*, price points are lower that you can sell homes for. Jurisdictions have a harder time raising SDCs, haven't seen them as aggressive as they are in Portland region. Market is softer. Not pushing as hard on the amenity side as Portland metro jurisdictions—that keeps costs down.* • Affluent and high-demand, supply-constrained communities may be able to charge higher SDCs. ○ *Small affluent jurisdiction in Portland Metro region, strong market, strong school system. SDCs are considerably higher than other jurisdictions. Higher SDCs tend to correlate with communities that are more difficult to work in and more affluent communities.* ○ *An area with higher income might be able to afford a higher SDC package than a* [medium-sized mid-Willamette Valley city]. ○ *Portland metro jurisdictions know that developers have less options, think they can pay more.* ○ [SDCs for one greenfield development project in the Portland metro region] *were highly negotiated with City and 3 primary developers. They had kind of a line in the sand on how high they could go. Knew what product mix they were anticipating. They intended to have some executive housing—street of dreams, job proximity, golf course proximity. Were banking on being able to charge a premium for new community with parks, schools, amenities. Had come up with a mix of products that would allow them to absorb some cost.*

Themes	Stakeholder Feedback
Whether Developers & Investors Accept Lower Returns When SDCs Are Higher	

Developers can rarely move a project forward that doesn't meet investor and lender return expectations just because SDCs are higher, but sometimes project-specific circumstances can mean the developer absorbs a portion of the cost.	• Pro forma needs to work before moving forward (noted above). Lenders and investors have their requirements / expectations.
	  ○ *Work the proforma backwards. Think they can get X in rent for the units. If they build this many units with those rents, what is NOI* [net operating income]. *Have to make 6.5 percent return on investment or won't loan on it—if can't hit that they walk away. If developer puts $1m in, they want to make sure they are getting a return on that.*
	  ○ *Buyers* [of finished lots] *generally build a proforma on all the costs of building a home for sale, look at what their margins need to be—usually deal with national homebuilders. They look at what SDCs are going to be.*
	• Very rarely, for a major development, investors may intentionally accept lower returns in some phases if later phases will make up for the lower returns.
	  ○ *Did an apartment complex in* [a master planned area]. *Fees were a burden on the project. Developer was tied into the equity investors in the overall development. They were asked by the equity partner to do the deal with lower returns to be the first in. Couldn't negotiate on land to make it lower, couldn't raise rents, so took lower returns on the investment. Didn't meet company requirements, but equity partner needed the master plan to get up and going to get homebuilders to sign contracts. Would not have done that deal otherwise. Was kind of a loss leader.*
	• Developers that hold projects long-term in areas with strong market conditions may be able to pay more up front and still achieve returns over the longer-term.
	  ○ *Depends on who's building the project—20-year hold vs. 5-year hold and sell to institutional equity. Different metrics. Longer view can afford to amortize costs over a longer basis.*
	• Once budgets and financing are locked in, changes to SDCs or other fees can affect financial returns based on how much contingency is needed
	  ○ *Build in escalation into municipal fees. Sometimes they don't go up and it's a win. Other times they go up more and do the best they can.*

Themes	Stakeholder Feedback
How SDCs Can Affect Affordable Housing Developments	

SDCs have to be covered by the combination of rents (limited based on incomes) and other sources of funds that help make the project feasible.	• When SDC costs are known early, they can be incorporated into funding applications.
	  ○ *Have to know costs early and with precision before you get your funding, especially if not using a conventional lender.*
	  ○ *When applied for funding had about $80k plugged in for SDCs after conversation with Public Works—rough math.*
	• For Low Income Housing Tax Credit (LIHTC) projects, the tax credit equity covers a share of the SDC costs when financing closes (project completion), but not all.
	  ○ *4 percent LIHTC—getting about 36 cents back on the dollar—some offset for basis eligible costs. Get about 1/3rd of it back. Doesn't make you whole but helps a little.*

SDC waivers can make a substantial difference to affordable housing developments, but they can also introduce complexity.	• Waived SDCs or exemptions can help close funding gaps.
	  ○ *Had a site for affordable housing development. Original developer couldn't make it work because infrastructure costs were so expensive, including Parks portion of the site. City was trying to come up with an alternative. Reduced number of affordable units, but the only reason they could make it work was because SDC fees were waived or reduced for affordable units.*
	  ○ *Saved almost 900k in SDCs on a 140-unit project. Huge savings.*
	• Requirements from the jurisdictions for qualifying projects can be challenging to meet.
	  ○ *City wants to see a 99-year cash flow projection and you're agreeing to a 99-year affordability covenant that runs with the land. City wants to be in top lien position—they were negotiating with OHCS and the permanent lender for position. Some lenders are flexible, others would walk away before giving up first lien position. The end result is good, but the mechanics are problem. Probably cost another $50k in lawyer fees.*

Certainty on SDCs is particularly important for affordable housing development.	• When SDC costs increase unexpectedly, it can be very hard to find additional funding or cost-savings in other areas at the last minute when funding amounts have been set in advance. ○ *On one project, spent about 3 months with architects and engineers to try to get an SDC fee estimate. No one at the City was willing to have back of napkin conversation. Needed to be ready to issue building permits to calculate the SDC fee. Had SDC fee calculator online, but those are always wrong,*

Themes	Stakeholder Feedback
	often by a lot, even if you get an engineer involved. Staff was difficult to get ahold of—had a line in the proforma from a conversation a year and a half ago where someone gave a rough guess, which ended up being $150k short. Had to take it out of the building. Then a week from closing got a note from Public Works that said they needed another permit that was another $5k that they hadn't planned on. Can't weather those types of surprise costs today. Had to make hard decisions—playground equipment cost cut, landscaping, and site amenities cut. When get close to closing and have been doing everything to keep construction scope in place things are down to very fine margins. At one point almost had to eliminate a floor to make the budget work.
How SDCs Timing of Payment Can Affect Development	

Paying SDCs at building permit increases financing costs and impacts availability of capital	• When SDCs are financed on a construction loan, the developer has to carry interest on that cost throughout the whole development process, so it increases the overall cost of SDCs.
	  ○ *Often pay out of construction loan. Would be nice not to have to add hundreds of thousands to construction loan on day 1, especially with interest rates rising. Have to carry SDC fee debt.*
	  ○ *$40k in SDCs could become $50k with construction interest.*
	  ○ *If include with bank loan on the very front end, might take 6 months to completion plus time to sell, could be 9 months interest.*
	  ○ *Payment at final inspection—a big cost-saver. Pay a set amount on any payment of fees. Savings there is very beneficial. Essentially lowers the cost of the SDC. Have to make fee payment before they'll send an inspector out.*
	• Developers of multifamily projects may have higher carrying costs due to longer development periods.
	  ○ *Should be due at certificate of occupancy instead of permit, especially if 100+ unit multifamily or large industrial project—it's a lot to carry for the development. An 8 percent construction loan for 24 months on $600k SDC fee = $48k in interest.* [market-rate multifamily developer]
	  ○ *It's just cash flow—when money is coming in. Typically don't get a construction loan until have the building permit. To get the building permit have to pay the SDC. Can be 2 years before delivering the product. If can offset for a few years, it helps with cash flow.* [market-rate multifamily developer]

Themes	Stakeholder Feedback
	○ *Not cheap to service debt on something that large that early in a project.* [affordable multifamily developer] • Paying SDCs before construction takes away from the resources available to pay for pre-construction work and early stages such as site preparation. ○ *If use cash on hand, if its $35k per house, could be $700k in SDCs—reduces working capital to build more units.* ○ *Allows putting that money to other parts of the project, e.g. early buy-outs for construction, getting sitework done early—allows getting started on construction before construction loan is in place. First draw is typically like $2m. Instead of paying those fees can get construction started.* ○ *Developers are putting in a lot more cash up front, loans are decreasing (e.g. 60 percent) so might be just equity contribution before construction loan kicks in. Would rather put up-front costs to something more tangible.*
Not all developers agree that deferring to Certificate of Occupancy is helpful	• Some developers are indifferent to when they pay the SDC cost, since they have to pay it eventually. ○ *If it's a $100m project and will have $60m construction loan, nothing says SDC fees have to go in construction loan. Financing same amount either way.* ○ *Deferrals haven't made sense—just delaying the inevitable. Have to pay either way.*
Some developers expressed a desire to defer SDCs past Certificate of Occupancy	• Some builders noted that paying at time of sale would be preferable. ○ *If tie to occupancy—what happens if a small builder is over budget and don't have the funds, can't get final, can't pay the city. Could be a mess. At transfer of title, have the funds to pay it off.* ○ *For build to sell, payable at closing, or at least at C of O so not paying interest on the SDC.* • For rental, some suggested delaying or financing for longer. ○ *Having SDCs payable upon stabilization for rental - equity bump when property is built and stabilized. Could be a lien that gets attached to the property to pay once stabilized.*
Timing of payment vs. timing of impact matters to some developers	• Some developers feel that paying later is more appropriate based on when SDCs are used or when impacts occur. ○ *Cost for essentially nothing—they're designed to offset impacts to systems but impact doesn't start until there's a buyer.*

Themes	Stakeholder Feedback
	○ *Jurisdictions (especially large ones) don't need those dollars for a long time.* ○ *Think should be later—at occupancy. Should be tied to when the impact starts.*
How Important Certainty/Predictability in SDC Costs is to Developers	
Many developers highlighted the importance of knowing how much the SDCs would be in advance.	• Several developers noted issues with major changes to SDCs during the pre-development and development period. Some set money aside specifically to address fee increases, but there are fewer options to adjust to cost-increases that occur later in the development process. ○ *Update fees in April/May, check in with cities on whether and how much they're going up. Occasionally there can be significant changes. But none have ever caused backing out of a deal, just reforecast and reallocating costs. Also carry a municipal fee contingency—pull from that. Try to avoid using soft-cost contingency.* ○ *Relied on numbers from city that accounted for SDC credit. When had final approvals to HUD and couldn't change it got a letter that they ran out of credits. Had baked SDCs into proforma for construction loan for HUD. Immediate hit to contingency before starting.* • Estimating fees is typically more challenging for multifamily development. ○ *Typically find out SDCs later in the process on the multifamily side. When you have your unit mix, then you have the parking ratio, then figure out impervious surface, trying to make it fit and make numbers work at the same time. Can be 6-12 months into project before you know that, and you can't get a great estimate of SDCs before that.* ○ *Certainty is important to developers—timing, amount, etc.* [multifamily developer]
How Important the Usage of SDCs is to Developers	
Many developers see value in the infrastructure that SDCs fund.	• Parks and lack of traffic congestion were identified as factors that particularly offer benefits for housing demand, which supports development. ○ *Parks are necessary, great amenity for dense urban projects*

Themes	Stakeholder Feedback
	○ *Developers like parks, trees, open spaces. If they can see that a community is proactively spending in a beneficial way, it would be a more beneficial offering for housing. If people can see that have the amenities and open space, services, lack of traffic congestion, they will make their decision.* ○ *Projects need to be done. They're necessary. But existing residents aren't paying today's prices for the infrastructure they have.* • Some developers noted the importance of funding needed infrastructure to allow development to move forward. ○ *The biggest benefit of SDCs in Oregon is that they provide a mechanism so jurisdictions can't place moratoriums on development. In other parts of the Country, if they don't have infrastructure and don't have SDCs in place, you end up with moratoriums and can't get things built.*
Developers like to know that SDCs are being put to good use generally, and many would like more transparency about how funds are being used.	• Many placed value on accountability and transparency generally. ○ *Important to see the benefit. Any taxpayer or investor wants to see where their money is going. Goes to government accountability.* ○ *Don't look at what they get for each penny, but do look at governance quality, SDCs are part of that. How much crumbling infrastructure, will there be population flight because tax burden too high or services are poor. Look for great long-term governance.* ○ *Care about overall business environment. What is city charging and how is it being used.* • Some would like to see a more direct and tangible connection between the SDCs paid and the projects they build. ○ *People should know where the dollars are working for them, and may be more willing to pay if they're presented with a project list of where the money will be spent. The area where the money is generated should see the investment.* • Some pointed out that the way SDCs are used varies between infill and suburban contexts, and that suburban projects can be more visible. ○ *Don't build in* [suburban Portland region community], *but hear from other builders that they feel like they're getting value for their parks SDCs—they use the funds.* [Urban jurisdiction] *can't go out and build new parks, they use funds mostly to increase parks capacity (e.g. converting grass field to turf with lights to increase how much of the time it can be used). In more suburban jurisdictions you can see them using the funds.*

Themes	Stakeholder Feedback
	○ *In* [urban jurisdiction] *you rarely see something close that's a direct impact funded by SDCs. Mostly larger capital projects (e.g. major roads). Wish they would put up signs saying "this was paid by X."* • Some developers expressed concern that projects included in SDCs may not get built. ○ *Park fees are challenging because they vary so widely. Sometimes they encompass projects that are unlikely to get built but inflate the fees. No requirement that what they put in the plans actually gets built.* ○ *Have experienced where collecting SDCs for parks but not being used because couldn't afford to maintain them, do the construction, etc.* ○ *Looking at a small community—high parks SDC but talking about decommissioning parks. Where are fees going?* • Some expressed particular concerns about paying for administrative costs. ○ *In informal conversations some have had with city staff, staff say a lot of the SDCs go to admin costs for things like benefits and personnel.* ○ *Are the admin charges really proportional to the service/mechanics received?*
SDC credit policy is as important to some developers as the SDC rate.	• Developers generally like being able to get SDC credits for building needed infrastructure. ○ *Love it when can take advantage—it's a win / win. Jurisdiction gets infrastructure built at lower cost than if they had to build it. Not money directly coming out of their coffers. Developer gets localized benefit rather than SDCs going to a project that might be across town. Helps if a needed improvement might not be proportional to the project.* • Some noted that the credit-eligible portion of infrastructure improvement costs can be more ambiguous than the SDC fee itself. ○ *If projects are on-site or contiguous, only get credit for excess capacity—lots of negotiations on what that means. Often developer gets negotiated down a lot. More clarity on what that means would be helpful.* ○ *City is judge, jury, and executioner. They decide how credits work, what's oversizing, etc. Could sue in theory, but not going to do that. Devil is in the details. Time is money, want to get project done.* ○ *Having to put in a park within a certain distance—city may require that but not getting credit for putting in those parks.*

Themes	Stakeholder Feedback

	• Some said financing cost reduces the value of the credits, particularly if developers are required to pay SDCs and be reimbursed for credit-eligible portion of improvements.
	  o *Had an experience where developer was building infrastructure that will earn them credits, but at the same time as the project. Had to pay SDCs and then reimburse at the end—city wanted the money for free, still wanted to charge interest to defer the SDCs.*
	  o *Deferred because getting credit for significant off-site improvements. Instead of paying fees and then City paying the developer back, defer and reconcile at the end.*
	  o *People sometimes think it's 1:1, but builder has to finance it, carrying costs can erode the value of the credit.*
	• Some noted that provisions allowing transfer of SDC credits are helpful so that developers can get the full benefit of the credit.
	  o *Have successfully received credits and sold to other developers.*
	• [One large city] *made SDC credits not transferrable to other projects, imposed limits geographically. Think that's a mistake. That would further incentivize developers to take on larger improvements and could monetize by selling credits.*

Appendix C. Key Oregon SDC Court Cases

Contributors: Galardi Rothstein Group, FCS Group

The cases listed in this section are not an exhaustive list of Oregon case law, however, they highlight and provide clarity on some key issues associated with implementing an SDC program in Oregon.

Key Case: Home Builders Association (HBA) of Metropolitan Portland v. Tualatin Hills PRD
The Portland HBA brought suit against Tualatin Hills Park and Recreation District (District), essentially claiming that the park SDCs the District adopted constituted an illegal "taking." The Oregon Court of Appeals ruled with the District in 2003 that its SDC met applicable tests of constitutionality as a quasi-legislative exaction. In its ruling, the Court reviewed the District's methodology and stated the following:

> *Plaintiffs (HBA) do not suggest that the SDC is unrelated to the resolution's stated objective of providing parks and recreational facilities, nor do they provide any argument, analysis, or information indicating that the amount of the fees that the resolution imposes is, as a matter of law, unreasonable or arbitrary. Such arguments would not be successful.*

The Court further stated that "The SDC methodology here meets the 'reasonable relationship' standard. That being the case, it also meets, a fortiori, the Due Process 'rational basis' test." The effect of this ruling was to clarify and affirm that a reasonable approach to proportionality would generally be upheld.

Key Case: Portland Metropolitan Association of Realtors, et al v. City of Portland, Multnomah County Circuit Court Case No. 15CV19696
The plaintiffs in this case brought suit against the City of Portland after adoption of a new (2015) park SDC methodology. The Portland Metropolitan Association of Realtors argued a number of points, with one found to have merit. In its project list, the city grouped planned projects into categories and noted the total category cost and SDC eligibility. In its ruling, the Court stated the following:

> *The sheer number of projects aggregated, and the loose descriptions do not provide sufficient evidence to demonstrate to the detail contemplated by the statutes.*

The Court remanded the supporting project list to the city "for greater specificity in the costs, timing and percentage of costs eligible for SDCs for capital improvements needed to increase capacity." This ruling provided additional clarity as to the level of detail required in an SDC project list, as delineated in ORS 223.309.

Another key outcome of the decision was upholding the city's methodology to change the level of service from a traditional acres of park land per 1000 people to current investment per person. As noted by the Court:

> *The level of service becomes the current investment per person in park land and improvements. What exists has been acquired for the use and benefit of the current population. With every new person added, the investment becomes diluted. Capital improvements return the investment to the existing level of service per person. In that sense, there is equilibrium, and the starting point remains static.*

Key Case: Home Builders Association of Lane County, an Oregon Non-Profit Corporation, and Home Builders Construction Company, an Oregon Corporation v. City of Springfield, a Municipal Corporation and Metropolitan Wastewater Management Commission, Lane County Circuit Court Case No. 16-04-15534 and 16-04-15996

In June 2005, the Circuit Court of Lane County upheld a wastewater SDC methodology adopted by the Metropolitan Wastewater Management Commission of Eugene Springfield (MWMC) that was challenged by the Home Builders Association of Lane County. The methodology and project list were challenged on a variety of technical as well as procedural issues. Ultimately, the circuit court ruling upheld MWMC's SDC methodology and project list. Key issues highlighted in the decision included:

1. SDC statute requires that the SDC methodology provide a framework for imposition of SDCs but does not mandate a particular type of methodology.
2. In consideration of what determines an equitable and proportionate share of costs allocated to growth, the standard of review is substantial evidence and reliance on expert opinions and recommendations constitutes substantial evidence.

   > *The SDC statute simply directs that the allocation of fees is done equitably and proportionately—concepts that are not rooted in any legal test but are dependent wholly upon the facts of a given situation. Given the purely factual nature of this assignment of error, it will be reviewed by this court under the substantial evidence standard (i.e., whether a reasonable person could accept the finding as adequate to support a conclusion)*

3. Establishment of an SDC is not a land use decision and the statue does not require projects to be included in a land use plan prior to their inclusion on the SDC project list requirement by ORS 223.309.

Key Case: HBA of Metropolitan Portland v. City of West Linn (2003, 2006)

This matter first came to the Clackamas County Circuit Court as a Writ of Review, and the Court ruled that only one of their claims had merit. The City of West Linn was found to have included open space in its park inventory which did not qualify as parks and recreation facilities. The effect of the larger inventory was to increase the existing level of service provided by the city, and the resulting SDC. In 2003, the Court remanded the matter back to the city, which removed nonqualifying open space and recalculated the fee. The HBA appealed. In 2006, the Court of Appeals of the State of Oregon sided with the city, acknowledging that the city had fixed the only meritorious issue.

Key Case: COBA v. City of Redmond, Deschutes County Circuit Court Case No. 02-CV-0528 ST
The Central Oregon Builders Association (COBA) brought suit against the City of Redmond, claiming that the city had improperly modified its transportation SDC methodology because the City did not provide a 90-day notice to interested parties, as specified in ORS 223.304(6) and (7). In the judgment, the Court found that eliminating pass-by trips from the calculation was in fact a methodology change and that the City "did not provide notice to COBA at least 90 days prior to the first public hearing conducted to consider the transportation SDC as required."

The suit and the resulting 2004 judgment served to elevate the importance of the noticing requirements in ORS 223.304.

Appendix D. Other Potential Infrastructure Funding Sources

State and Federal Funding Programs Available for Local Infrastructure Projects

There are many specific grant programs at the state and federal level that are available to fund certain types of local infrastructure projects. These generally fall into one of the following categories:

- **Discretionary grant programs** (e.g., Water Wastewater Fund and many federal grant programs[232]), which are allocated on a competitive basis and often require local matching funds.
- **Formula grant programs** (e.g., Community Development Block Grants), some of which are allocated to states or regions and distributed based on state or regional priorities (e.g., Congestion Mitigation and Air Quality Improvement Program).
- **Low-interest loans** and Revolving Loan Funds (e.g., Safe Drinking Water Revolving Loan Fund,[233] U.S. Department of Transportation loan financing programs) that offer low-interest financing but are repaid by local sources over time.

Other Local or Regional Funding Mechanisms

Beyond SDCs, there are other funding mechanisms available at a local level that can contribute to funding infrastructure. Some derive funding from property taxes, others from user fees, specific developers/property owners, or broader economic activity. Not all of these options are equally viable, effective, or appropriate for funding infrastructure capital projects, and not all are available or suitable for every community. All have impacts on whichever entities are bearing the costs or competing for revenues, though the nature and extent of the impacts vary.

Property tax-based tools

These tools allocate property tax revenue to infrastructure, either by dedicating existing revenues or (in some cases) establishing additional dedicated taxes. Most apply across all properties within a particular jurisdiction or district.

Options to raise revenue through additional property taxes:

---

[232] For examples and details see https://www.fhwa.dot.gov/bipartisan-infrastructure-law/grant_programs.cfm.

[233] For other federal water and wastewater grant and loan programs, see https://www.epa.gov/waterfinancecenter/effective-funding-frameworks-water-infrastructure.

- **General obligation bonds** increase property taxes throughout a jurisdiction or district over a long period of time (e.g., 20-30 years) to repay debt issued to fund capital projects and require voter approval.
- **Local option levies** also increase property taxes for up to 10 years (though they are subject to limitations on property taxes discussed in Section 2.1.3) and require voter approval.
- **Special districts** (e.g., the North Bethany County Service District for Roads, Tualatin Hills Parks and Recreation District) can establish their own tax rates to generate dedicated property tax revenue for infrastructure construction and/or maintenance within the district boundary but are subject to limitations on property taxes discussed in Section 2.1.3 and require voter approval.

Options to allocate existing tax revenue or revenue growth from increasing property value without increasing tax rates:

- **General fund[234]/property tax revenue allocation** (e.g., Washington County's Major Streets Improvement Program) does not require new property tax revenue but competes with other local priorities and is subject to limitations on property taxes discussed in Section 2.1.3.
- **Urban Renewal/Tax Increment Financing** diverts property tax revenues from increases in assessed value inside a specific area for investment in capital projects that improve the area; it does not increase property taxes within the boundary but reduces revenue growth for existing taxing districts.

Development-Based Funding

Contributions from developers can take several forms, including:

- **Exactions** (improvements required as a condition of development approval), which can include on-site and/or off-site improvements. As discussed in Section 1.2.1, exactions are subject to constitutional limitations of rational nexus and rough proportionality.
- **Development agreements** or annexation agreements, which are generally voluntary, negotiated agreements between the jurisdiction and the developer that establish what each party will contribute and be responsible for.
- **Improvements in exchange for additional development rights** (e.g., planned development options that provide regulatory flexibility and/or additional density linked to providing public open space), which depend on there being demand for the additional development rights.

[234] The general fund is technically not a funding mechanism, but an account that all local governments have, where a variety of unrestricted revenue sources are collected.

There are other mechanisms where project costs are paid up front by either a developer or the jurisdiction and recovered from subsequent development or property owners within a specific area that benefits from a specific improvement(s). Examples include:

- **Reimbursement districts** allow the jurisdiction or a developer to recoup a proportionate share of capital investments that benefit multiple properties from subsequent development on those properties.
- **Local improvement districts** (LIDs) establish a special assessment on properties within a defined area that benefit from a specific capital improvement based on their degree of benefit (rather than the value of the property); a majority of affected property owners must support formation of the district.

These are often used to fund projects with a geographically-defined benefit, but they may have limited revenue capacity, especially within smaller areas.

User-Based Funding

There are a number of fees and taxes that derive funding from specific users and activities related to the infrastructure systems themselves. Examples include:

- Broad-based user fees:
  - Utility rates (e.g., water and sewer rates)
  - System-wide user fees (e.g., monthly or annual charges for all residents and/or businesses or fees for use of specific facilities)
- Facility-specific use charges:
  - Parking fees (e.g., permit parking or metered on-street parking revenue)
  - Tolls
  - Facility rental fees

The allowed uses vary by the type of fee or tax, but some can be used for infrastructure funding in whole or in part. Utility rates are commonly used to fund infrastructure improvements for water and sewer, and other types of user fees are becoming more common—see discussion in Section 2.1.4.

Taxes and Fees on Economic Activity

Taxes and fees on economic activity that is relevant to a given infrastructure system (e.g., transportation) can sometimes provide funding to support infrastructure investments. Examples include:

- Franchise fees (fees on utility company/service providers for use of public rights-of-way)
- Fuel (or gas) taxes
- Vehicle registration fees (county level)

Taxes and user fees unrelated to infrastructure can also sometimes generate revenue that can be used flexibly (at least in part) and can be applied to infrastructure among other purposes. These include:

- Targeted sales tax (e.g., prepared food and beverage tax)
- Transient lodging tax

Appendix F. Pro Forma Model Methodology

Contributors: ECONorthwest

ECONorthwest used a pro forma analysis to analyze SDC share of total development costs and the impacts of SDCs on the financial feasibility of new developments. This work typically involves researching market data based on past transactions, gathering inputs from the local development community, and understanding zoning and other regulatory requirements. A more robust research of input data helps build a more accurate model of development feasibility within local contexts.

However, many simplifying assumptions are made to develop a consistent approach that can capture different economic conditions across Oregon. The assumptions result in a few development examples called prototypes whose exact physical and financial characteristics are unlikely to be observed in all markets. Instead, the prototypes serve as representative examples of the categories of housing developments that are possible in Oregon. Analyzing the difference in model results generates key findings that are applicable across all housing types, beyond the few specific ones modeled through the prototypes.

It is not easy to create a single model for a statewide study that involves many varieties of housing markets. There are many geographic markets, and within each are markets for housing types. Some markets resemble each other, but unique circumstances of some markets are difficult to generalize or summarize with other markets. Although many variations and combinations of geographic markets and housing types are possible, seven geographic markets and seven housing types are selected for analysis.

To test the effects of different levels and structures of SDCs across housing markets and types, ECONorthwest used a pro forma analysis, which is a financial model that estimates the feasibility of a new real estate development based on the building's financial performance. Real estate professionals regularly use pro forma analysis to model the revenues and costs of potential developments, evaluate their returns, and understand sources of funding needed for a project to move forward. For the purposes of this study, pro forma analysis is an economic model that can demonstrate the impact of SDCs on potential business decisions that housing developers could face.

Geographic Markets

ECONorthwest modeled seven geographic categories of housing markets in Oregon. They are broad categories that reflect typical housing prices and construction costs across the cities that fall within each geographic region. The market context areas are:

1. **Willamette Valley**: Larger cities along Interstate 5, with some similar housing options within a local housing market. Does not include cities in the Portland Metro area.

2. **Small Cities**: Smaller cities along Interstate 5 or remotely located in eastern Oregon. Relatively stagnant growth, lower demand, and lower land costs are observed in comparison to other market context areas.
3. **Coast**: Coastal cities with many vacation rentals and second homes.
4. **Metro Low**: Suburban cities and neighborhoods in the Portland Metro area with moderate demand for new housing and limited production of new housing.
5. **Metro Mid**: Suburban cities and neighborhoods in the Portland Metro area with relatively strong demand for new housing and, sometimes, large tracts of planned developments.
6. **Metro High**: More exclusive neighborhoods in the Portland Metro area with higher prices and relatively few options for new housing.
7. **Cascades**: Cities east of the Willamette Valley that experienced a strong level of housing demand and production in recent years.

The values used for each geographic market are not intended to represent a specific city, and average housing prices and costs vary by city. Rather, the values are representations of likely values observed across many parts of the geographic market. Moreover, specific economic conditions in some cities or neighborhoods could mean that they resemble the market conditions of a geographic market category that is outside the geographic location. Therefore, the presented data should be interpreted as data "commonly observed in a city like cities in X market."

ECONorthwest defined the geographic markets based both on their geography and on economic factors including relative size of market for new housing, competitiveness or tightness of housing market, substitutability of new housing, and price of vacant parcels that could be developed with new housing. Market size is related to the population of a city or a few adjacent cities where a potential homebuyer or renter could consider relocating to. Substitutability is related to the presence (and production) of similar alternatives for new housing within a market, as previously described in the review of academic literature. Exhibit 60 and Exhibit 61 summarize the factors and the markets.

The evaluation of factors that defined the geographic markets were based on a relative comparison of cities within Oregon. While some cities are producing more housing than others, housing production across the state generally does not match the demand and contributes to the lack of housing affordability.

Exhibit 60. Characteristics of Geographic Markets in Oregon
Source: ECONorthwest

	Willamette Valley	Small Cities	Coast	Metro Low	Metro Mid	Metro High	Cascades
Market Size	Large	Small	Small	Medium	Large	Small	Medium
Competitiveness (Demand)	Moderate	Low	Moderate	Moderate	High	Very High	High
Substitutability (Production)	Moderate	Low	Low	Low	High	Low	Moderate
Land Price	Moderate	Low	Low	Moderate	Moderate	High	High

Housing Types

ECONorthwest modeled seven housing types: two scales of a three-story apartment building, two townhouses, and three different sizes of detached single-family units. These housing types are based on new housing types that are likely to occur in all or most of the geographic markets. They do not include taller apartments because they are unlikely to be built in less populated cities, and they do not include single-family dwellings on larger lots because they are unlikely to be built in urban areas where buildable land is scarcer.

Physical Assumptions by Housing Type

The following is a more detailed description of the prototypes, and a summary is provided in Exhibit 62.

- Low-Rise Apartment is a three-story building with 55 units on an acre. Landscape covers 20 percent of the lot. The average leasable unit size is 738 sq. ft. It has 55 surface parking stalls.
- Garden Apartment is a three-story building with 120 units on four acres. Landscape covers 42 percent of the lot. The average leasable unit size is 811 sq. ft. It has 180 surface parking stalls.
- Townhouse prototypes are 1,500-sq.-ft. units with 2,400 sq. ft. of site area per unit. They are two-story structures with a one-car garage for each unit. One prototype is a rental unit, and the other is an ownership unit.

- Small Single-Family is a 1,550-sq.-ft. unit on a lot measuring 4,800 sq. ft. It has a one-car garage.
- Medium Single-Family is a 2,000-sq.-ft. unit on a lot measuring 6,500 sq. ft. It has a two-car garage.
- Large Single-Family is a 2,650-sq.-ft. unit on a lot measuring 6,500 sq. ft. It has a two-car garage and a higher finish quality.

Exhibit 62. Summary of Physical Features of Prototypes
Source: ECONorthwest

Example Housing Type	Building Height (Floors)	Density (Units per Acre)	Average Unit Size (Square Feet)	Parking
Low-Rise Apartment	3	55.0	738	1.0 Stalls per Unit (surface parking)
Garden Apartment	3	30.0	811	1.5 Stalls per Unit (surface parking)
Townhouse	2	18.2	1,500	Single-Car Garage
Small Single-Family	2	9.1	1,550	Single-Car Garage
Medium Single-Family	2	6.7	2,000	Two-Car Garage
Large Single-Family	2	6.7	2,650	Two-Car Garage

Two scales of apartments—**Low-Rise Apartment** and **Garden Apartment**—are included to demonstrate how the impact of SDCs on development feasibility vary by residential density. The review of academic literature revealed that developers of apartments are unlikely to increase unit sizes to spread out the fixed cost of SDCs that are applied per unit. The notion is tested with two housing types that have the same land cost and building height but a different unit mix, residential density, and parking ratio. The average unit size in Low-Rise Apartment is smaller, but it has more units than Garden Apartment. Low-Rise Apartment allows for 1.0 parking stall per unit, whereas Garden Apartment allows for 1.5 parking stalls per unit.

Two versions of townhouses demonstrate the relationship between SDCs and tenure. The two modeled buildings have the same physical form (thus the same development costs), but their tenure is different (i.e., **Townhouse Rental** and **Townhouse Ownership**).

Three different sizes of detached single-family units demonstrate how the impact of SDCs vary with unit size and lot size. All are ownership units. **Medium Single-Family** serves as a reference point. **Small Single-Family** has a smaller unit size and lot size. Because it has a higher residential density, it is effectively the same test as the test for apartments. **Large Single-Family** has a large unit size on the same lot (thus no change in residential density). It tests the assertion made in the review of academic literature that spreading SDCs over a larger unit size is preferred because it reduces cost per square foot.

Financial Assumptions by Housing Type

Exhibit 63 summarizes the total development costs for each geographic market and housing type used in the model (rounded to the nearest thousand). Total development costs include construction labor and material (called "hard costs"), land costs, and "soft costs" such as design and engineering, project management, financing, permits, and fees. They do not include SDCs

or profit margins (investor returns) since those are key variable inputs and outputs of the analysis. Land costs are based on recent transactions of small, vacant lots recorded on Redfin. Cost indices from RSMeans and 2022 National Building Cost Manual[235] are used to differentiate the construction costs across markets. Within each market, the construction costs of all prototypes are based the same kitchen, bathroom, and bedroom costs per square foot of building area; garage cost; surface parking cost; parking ratio; driveway cost; and landscape cost.

Exhibit 63. Total Development Cost Per Unit, Excluding SDCs

Small Single-Family	$353,000	$385,000	$325,000	$371,000	$419,000	$583,000	$544,000
Medium Single-Family	$479,000	$387,000	$442,000	$503,000	$568,000	$791,000	$737,000
Large Single-Family	$570,000	$474,000	$535,000	$607,000	$672,000	$895,000	$826,000

Typical SDCs in each market used in the analysis are summarized in Exhibit 64. The single-family SDCs are determined by calculating the average SDC rate in the 2022 SDC rate data collected by FCS GROUP. Townhouse SDCs are 90 percent of single-family SDCs. Multifamily SDCs are 66 percent of single-family SDCs.

To reflect the realities of each housing market, the model uses different prices, rents, and costs for each market and prototype. ECONorthwest collected price and rent data as well as some data on the physical dimensions of the prototypes from CoStar and Redfin using representative samples of recently built and transacted housing. Exhibit 65 summarizes the monthly rents (rounded to nearest ten) and sales prices (rounded to nearest thousand) for each geographic market and housing type used in the model. A consistent vacancy rate and operating expense ratio (as a percentage of rent) are used for rental prototypes.

Full Results for SDC Share of Total Development Costs

Section 4.3.2 presented the variation in SDC share of development costs across the state for three markets with different levels of development costs. The three markets are a shorter list of seven market context areas that were analyzed for this report. Exhibit 66 compares the typical development costs and per-unit SDC amounts in the seven markets.

For each market context area, ECONorthwest calculated an average of single-family SDC rates reported in the 2022 LOC survey by FCS GROUP. The townhouse SDC rates are 90 percent of the single-family SDC rates. The multifamily SDC rates are 66 percent of the single-family SDC rates.

Exhibit 67 shows the SDC share of development costs. Depending on the housing type and the market, the SDC share of development costs can range from 1.8 percent to 12.8 percent in Oregon.

Exhibit 66. SDCs and Other Development Costs, By Market Context Area and Housing Type

Key Assumptions for Feasibility Evaluation

The key output of the pro forma model is investor returns, and how they change with the amount or structure of SDCs. Although there are many methods to calculate and measure investor returns, the metric selected for this study is internal rate of return (IRR). IRR is a commonly used financial metric in the real estate industry to estimate the profitability of real estate investments. It is a form of discount rate and measured in percentage points. The feasibility analysis includes a cash flow model with expenses and sales related to housing construction occurring at different points in time. A 3 percent annual escalation is assumed for costs, rents, and prices. A 2 percent annual escalation for operating expenses. All units are assumed to be fully occupied at the end of the analysis period.

To estimate the impact of SDCs on development feasibility, ECONorthwest estimated the change in IRR resulting from fixed changes in SDC amounts. The amounts are $10,000 for single-family, $9,000 for townhouse, and $6,600 for multifamily across all markets. More specifically, ECONorthwest measured the percentage point change in IRR when the modeled per-unit SDC amount for a single-family unit is reduced from $15,050 to $5,050 or increased from $15,050 to $25,050, and when then SDC amount for townhouse and multifamily units are adjusted accordingly.

Exhibit 68 illustrates the results of the feasibility calculations. The sizes of the bars indicate the IRR with a $15,050 SDC per single-family unit, a $13,545 SDC per townhouse unit, and $9,933 SDC per multifamily unit. The error bars indicate the difference in IRR from the specified change in SDC amount, all else equal. The absolute change in IRR, or about half of the size of the error bars, is the estimates represented in Exhibit 43 and Exhibit 44 (Section 4.4.1).

The wide range of the IRR estimates are partly due to the simplifying assumptions made to develop a consistent approach that can capture different economic conditions across Oregon. Realistically, the types and specific characteristics of housing units that market-rate developers would pursue differ by geographic markets and site-specific conditions. Moreover, the $15,050 baseline for the single-family SDC amount and the $10,000 change are also simplifying assumptions designed to produce analytical results rather than predict market activity.

Exhibit 69. Summary of Empirical Studies on Impact Fees

Source: ECONorthwest

Author(s) (Publication Year)	Data Year	Location	Context	Outcome Variable and Methodology	Results
Delaney and Smith (1989)	1971 to 1982	Dunedin, FL	Coastal city near Tampa	Housing price (new single-family) in Dunedin compared to three other cities in the same county before and after fee adoption	Increase in housing prices was greater than in nearby cities with no or minimal impact fees. Suggests the total cost of fee is passed on to new homebuyers.
Singell and Lillydahl (1990)	1983 to 1985	Loveland, CO	Fast economic growth during 1970s. Impact fee in adopted in 1984	Housing price (new and existing units) before and after fee adoption	New housing prices were higher by 3 times the fee for new housing and 6 times the fee for existing housing.
Dresch and Sheffrin (1997)	1992 to 1996	Contra Costa County, CA	Declining economic conditions, particularly in eastern county	Housing price (new and existing units) across the county leveraging within-county variation in fee amount	Impact fee is associated with higher housing prices—by 25% of fee in eastern county and 188% of fee in western county.
Baden and Coursey (1999)	1995 to 1997	8 suburb cities near Chicago, IL	Fast economic growth during 1980s	Housing price (new and existing units) in suburban cities. Impact fee amounts vary across the cities	Price of new housing is higher by 70-120% of the impact fee.
Mathur, Waddell, and Blanco (2004)	1991 to 2000	King County, WA	Period of rapid economic growth. Cities with impact fees grew from 2 in 1994 to 14 in 2000	Housing price (new single-family) in cities with different fee amounts, controlling for year sold and other factors	166% of the fee amount is reflected in prices of new units.
Mathur (2013)	1991 to 2000	King County, WA	Period of rapid economic growth. Cities with impact fees grew from 2 in 1994 to 14 in 2000	Housing price (single-family), correlation with impact fees	Impact fee is positively correlated with single-family housing prices.

Author(s) (Publication Year)	Data Year	Location	Context	Outcome Variable and Methodology	Results
Skidmore and Peddle (1998)	1977 to 1992	DuPage County, IL	Fast growing suburb of Chicago	New residential construction (single-family and multifamily), comparing cities with and without impact fees	Impact fee is correlated with 25% reduction in residential development.
Mayer and Somerville (2000)	1985 to 1996	44 U.S. metro areas	Urban cities across U.S.	New residential construction (single-family), correlation with presence of impact fees	Up to 45% less construction starts observed in metro areas with more regulations.
Burge and Ihlanfeldt (2006)	1993 to 2003	FL (statewide)	Nearly two-thirds of Florida's counties have impact fees.	New residential construction, correlation with presence of impact fees in a given year	Impact fee for public services (excluding water and sewer) is correlated with increase in residential construction.
Skaburskis and Qadeer (1992)	1977 to 1986	Toronto	City's growth period varied during the study period.	Land price of vacant subdivision lots, correlation with impact fees	Impact fee is associated with higher land prices for vacant subdivision lots by 120% of the fee.
Ihlanfeldt and Shaughnessy (2004)	1985 to 2000	Dade County, FL	Impact fee since 1989	Undeveloped land price (new and existing units), correlation with impact fees	Housing prices are higher by 160% of the fee. Land prices are lower by 100% of the fee.
Evans-Cowley, Forget, and Rutherford (2005)	1997	Texas (43 cities in Austin, Dallas, Fort Worth, and Houston metro areas)	Cities of various sizes in Texas that have impact fees	Land price (Vacant and developed lots), correlation with impact fees, controlling for population growth among other factors	1.3% higher lot values for each $1,000 of impact fees.
Burge (2014)	1994 to 2009	FL (statewide)	Impact fees for different kinds of infrastructure	Value of developable land parcels, correlation with impact fees	School impact fee is negatively correlated with value of residentially zoned land and positively correlated with commercially zoned. Water and sewer impact fee is negatively correlated with residentially zoned land value.

Author(s) (Publication Year)	Data Year	Location	Context	Outcome Variable and Methodology	Results
Bae, Kwon, Coutts, Park, and Feiock (2015)	1998 to 2007	FL (statewide)	Nearly two-thirds of Florida's counties have impact fees	Value of developable land parcels, correlation with impact fees	Impact fee is positively correlated with value of developable land parcels.
Lawhon (2015)	1960 to 2010	Loveland, CO	Period of rapid population growth	Number of rental units per nonwhite resident and annual MFI over time in Loveland and nearby towns	Impact fee is not significantly correlated with either outcome variable.

Appendix H. Case Study Methodology

Contributors: ECONorthwest

ECONorthwest identified several recent developments in Washington County that provide an opportunity to examine an example of the relationship between SDCs and housing prices within Oregon. Each development faced different SDC costs, but all compete within the same subregional housing market. ECONorthwest considered three areas that were recently brought into the Portland Metro urban growth boundary (UGB): South Cooper Mountain in the City of Beaverton, South Hillsboro in the City of Hillsboro, and River Terrace in the City of Tigard.

Study Areas

South Cooper Mountain is a 544-acre area that was brought into the UGB in 2011 and became part of Beaverton in 2013. The area sits at the far southwest edge of the city, along the border with Tigard. The community plan for South Cooper Mountain includes a mix of high-density, medium-density, and low-density residential areas to create a walkable, bikeable, and family-friendly neighborhood with a variety of housing options.

South Hillsboro includes 1,400 acres of farms, open space, and developed land at the southeastern edge of Hillsboro, along the border with Aloha. This area was brought into the regional UGB over several years, with the largest piece—1,062 acres—added in 2011. The South Hillsboro Community Plan approved in 2015 creates a new town center along Tualatin Valley Highway and a smaller village center, both with high-density housing, commercial, and retail spaces. The rest of the plan area includes a mix of apartments, townhomes, and lower-density housing and a network of open spaces linked by a trail system.

River Terrace is a 490-acre area just south of South Cooper Mountain that was added to the UGB in 2002 and 2011 and incorporated into the City of Tigard in 2014. The community plan for River Terrace envisions a primarily medium-density neighborhood of about 2,300 homes with one commercial core and a network of open spaces and parks.

SDCs in the Study Areas

Exhibit 70 summarizes the SDCs applied to single-family construction in South Cooper Mountain, South Hillsboro, and River Terrace ("growth areas") and the standard citywide SDC rates applicable to adjacent developments that are not part of the growth area.[236]

Exhibit 70. System Development Charges for Detached Single-Family Housing, 2021
Source: City of Beaverton, City of Hillsboro, City of Tigard, and Washington County.

	Beaverton		Hillsboro		Tigard	
	Standard	Growth Area	Standard	Growth Area	Standard	Growth Area
Clean Water Services and County SDCs						
Sewer*	$6,085		$6,085		$6,085	
Stormwater*	$1,252		$585		$585	
Transportation **	$9,623		$9,623		$9,623	
City-Specific SDCs						
Parks	$11,787***		$6,577	$12,177	$10,345	$10,903
Transportation	-	$8,826	-	$13,523	$7,076	$10,348
Water	$9,193		$11,035		$10,095	
Total	$37,940	$46,767 (+23%)	$33,905	$53,030 (+56%)	$43,809	$47,640 (+9%)

* Connection charges for Clean Water Services
** Transportation Development Tax for Washington County
*** Parks SDC from Tualatin Hills Park and Recreation District (THPRD)

Regression Model

ECONorthwest employed a linear regression model to analyze the relationship between SDCs and housing prices within the Portland metro area housing market, specifically in three cities in Washington County with recent urban growth areas. The data in the model are based on transaction data of home sales in each of the urban growth areas and in nearby neighborhoods with similar housing and access to transportation and retail amenities.

ECONorthwest created a dataset using property transaction data from Redfin. ECONorthwest analyzed sales transactions between January 2017, when the new construction in urban growth areas appeared on the market, and February 2022. This dataset included 1,519 unique properties in Washington County. ECONorthwest filtered the data to include only detached single-family units. Each observation was categorized as either within an urban growth area or in a comparison area. Each property was assigned an estimated total SDC amount based on the total SDC rates of each jurisdiction and the supplemental SDCs for units in urban growth areas.

[236] Beaverton, Hillsboro, and Tigard adjust their SDCs annually using the Seattle Construction Cost Index—an inflation index—published by Engineering News-Record. Each city uses the data from a different month to set their updated fees. This table records fees at the start of the fiscal year in July 2021.

ECONorthwest adjusted the SDC rates to one year prior to construction to approximate SDC rates at the time of permitting, using the *Engineering News Record*'s Construction Cost Index for Seattle.[237] Finally, parcel sizes were joined from the Metro RLIS database and outliers were filtered out, for a total of 974 observations. The distribution of these observations by location is summarized in Exhibit 71.

Exhibit 71. Distribution of Observations in the Dataset by Location
Source: ECONorthwest, Redfin

Development Area	
Growth Area	689
Comparison Area	285
Total	**974**
City	
Beaverton	172
Hillsboro	467
Tigard	335
Total	**974**

ECONorthwest created three regression models to understand the relationship between aspects of development costs, location, amenities, and housing prices. Exhibit 72 summarizes the results of these analyses. The first model tested the per dollar relationship between SDCs and the price per square foot of a detached single-family unit. The results of this model indicate that for every dollar of SDCs, all else being equal, the price per square foot of a unit is higher by $0.0007. In other words, $10,000 in SDCs is related to about $7 higher housing price per square foot. A second model tested the impact of location inside an urban growth area on housing prices. The results of this regression indicate that units inside urban growth areas sold for $14.69 per square foot more than units outside of these growth areas, all else being equal. ECONorthwest also tested the effects of SDCs within each city. These city-specific analyses generally supported the findings of the first two models: Higher SDCs correlate with higher prices per square foot and prices per square foot are generally higher inside urban growth areas. However, the results are not reported in Exhibit 72 because there were not enough observations in the dataset for all the results of the third model to be statistically significant.

The regression models were able to explain about 74.4 to 75.4 percent of the variance in the dependent variable. In addition to the positive correlation between total SDCs and price per square foot, ECONorthwest also observed positive correlations between price per square foot and newer houses and a negative correlation with total square footage. This negative correlation is expected, the total development costs can be spread out across a greater unit size. While this linear model does capture some important relationships, it does not account for nonlinear phenomena such as construction costs, or the economies of scale that a developer might achieve when building a planned development.

[237] This index is the method by which the City of Beaverton, the City of Hillsboro, and the City of Tigard adjust their SDC rates each year.

Exhibit 72. Summary of Linear Regression Results
Source: ECONorthwest

	Model 1	Model 2
	Coefficient (p-value)	
Total SDCs (dollars)	0.0007 (0.000)	-
Year Sold	13.7188 (0.000)	13.6446 (0.000)
Square Feet	-0.0470 (0.000)	-0.0480 (0.000)
Lot Size (square feet)	0.0096 (0.000)	0.0101 (0.000)
Number of Bedrooms	-5.329 (0.000)	-4.697 (0.000)
Number of Bathrooms	0.0456 (0.983)	0.557 (0.789)
Growth Area Development	-	14.6935 (0.000)
R^2	0.744	0.754

To help interpret the results of the regression models, ECONorthwest created a prototypical house with features frequently observed across all three cities. Exhibit 73 summarizes the features of this prototype. ECONorthwest applied the results of the primary regression model to this prototype to understand the relationship between SDCs of different amounts and a standardized detached home.

Exhibit 73. Housing Prototype Characteristics
Source: ECONorthwest

Feature	Value
Square Feet	2,400
Year Sold	2022
Year Built	2022
Beds	4
Baths	2.5
Lot Size (sq. ft)	4,500

Model 1 predicts that a $10,000 difference in SDCs for this prototypical single-family unit would be associated with a $16,800 higher sale price. Model 2 predicts that being in a growth area would be associated with roughly a $35,260 higher sale price for this example home.

Appendix I. Testimony on HB 3040 Related to Timing of SDC Payment

Contributors: Galardi Rothstein Group

Exhibit 74. Testimony on House Bill 3040 Related to Timing of SDC Payments
Source: Summarized by ECONorthwest and Galardi Rothstein Group

File	Author	Testimony
16223	Unknown	Deferrals are an option for the local government.
16313	City of Wilsonville	Local governments should not be forced to defer SDCs or provide financing to developers.
16477	Multiple local governments	"Interest savings from delaying a SDC payment are minimal."
16483	City of Cave Junction	"Deferring SDC charges would raise our administrative costs because we do not have the resources or capacity to track when a sale happens and then follow through with the SDC collection process. Where is the consequence if a new owner homeowner doesn't pay the SDC charges? This bill puts the burden unfairly on the city."
16512	City of Irrigon	"It should be up to each local jurisdiction if they want to defer collection . . . Deferring for a time after closing . . . shows that the state is in cooperation and working with developers and big businesses, not buyers or local governments."
16567	Tualatin Hills PRD	Required deferrals would "come at a substantial cost and risk to local government."
16571	City of Springfield	Required deferrals would "unnecessarily limit our ability to determine the timing of SDCs."
16588	City of Gresham	Required deferrals "would create additional administrative burden" for the City.
16608	Special Districts Association of Oregon	Required deferrals would impose costs on local governments with no guarantee of savings for homebuyers.
16650	City of Hillsboro	Required deferrals would increase administrative burden.
16659	City of Portland	Local governments should continue to have the flexibility to determine the timing of SDC payments.
16664	Multnomah County	"Requiring that SDCs be assessed when a certificate of occupancy is issued or at the point of sale would make it difficult, if not impossible, for local governments to ensure collections from non-paying developers. Furthermore, this bill does not require that developers pass on cost savings to homebuyers or reduce housing prices."
16690	Jim Brewer (affiliated with multiple cities)	Proposed deferral provisions are poorly worded and would have unintended consequences.
16694	City of Independence	"Changing the collection date will result in small savings on interest for developers and increase costs for local governments."
16777	Metropolitan Wastewater Management Commission	Required deferrals would increase costs for ratepayers.
16819	Oregon Association of Clean Water Agencies	Required deferrals would increase costs for ratepayers.

File	Author	Testimony
16964	Unknown	"Changing the collection date will result in small savings on interest for developers and increase costs for local governments."
17156	City of Prineville	Required deferrals would "not be effective in achieving the overarching goal of supporting affordable housing."
17195	City of Sherwood	Required deferrals would impose costs on local governments with no guarantee of savings for homebuyers.
17208	City of Eugene	"Local governments are not involved in private property transactions and this requirement would result in an excessive burden on local governments to track real estate transactions to ensure that the public fees, which a project owes, are paid. Additionally, it is unclear how payment deferral for commercial and industrial developments assists with affordable housing."
17407	Oregon Building Officials Association	"Tying SDC payment to 'time of sale' would create additional administration and local government involvement in a part of the process the local government has thus far been removed from, create a dramatic loss of efficacy because the local government would need to audit unsold properties continually until they sold and their associated SDC payments were verified, and place the local government in the 'no-win' position to create additional enforcement, potentially against the new homeowner, if the fees were not paid upon sale."
17423	Metropolitan Mayors' Consortium	Proposed provisions preempt local authority.
17430	American Planning Association Oregon Chapter	Deferral of SDCs should be at the discretion of the local government.
17433	Washington County	Required deferrals would "leave the County with a significantly higher administrative burden."

Appendix J. Summary of Feedback on SDC Deferral Experience

To better understand the implications of SDC deferral programs for the jurisdiction, FCS GROUP and Galardi Rothstein Group contacted nine cities that have (or previously had) an SDC deferral program with questions regarding administration of this program (Exhibit 75).

Exhibit 75. SDC Deferral Program Contact Log
Source: ECONorthwest

Jurisdiction	Status
Cornelius	Current program
Madras	Current program
Medford	No response
Pendleton	Provided details only for installment payments (not deferrals)
Redmond	Had a program in the past; sunset program as of 2021.
Sherwood	Current program
Tigard	Current program
Veneta	Current program
Wilsonville	Had a program in the past; cancelled program in 2019 code update.

Each jurisdiction received the following questions:

- What are the eligibility criteria for SDC deferral?
- What are the program requirements (e.g., application process, is a lien required, is interest charged, etc.)?
- How often is the deferral option used, and what types of development use it most?
- How long does the deferral typically last (i.e., how long does most development that uses the deferral take between building permit and certificate of occupancy or when the SDCs are due)?
- Has non-payment been an issue for any of the developments that have used the deferral option? If so, how often has this been an issue?
- How much additional staff time is required for developments participating in the SDC deferral program compared to developments that pay SDCs at building permit? Which parts of the process require additional staff time?
- Do you have any additional comments or lessons learned to share about how the program is working in your jurisdiction?

In addition, one jurisdiction submitted comments on the Public Review Draft that described their deferral system. These comments have been integrated to the extent possible.

Feedback Summary

Eligibility & Program Requirements

Eligibility criteria varied widely among the jurisdictions contacted. Some allow deferrals for all residential and commercial projects or for all new residential development, while others limit eligibility based on SDC amount (e.g., Sherwood allows a deferral if the total City Transportation and Parks System Development Charges exceed $50,000), or allow deferrals only for non-profits developing income-restricted housing (e.g., Cornelius).

Typical application processes require developers to submit a formal request, which the City reviews and approves. Roughly half of the jurisdictions report requiring a lien[238] as a condition of SDC deferral. Others require agreements notarized by the property owner. None require interest payments for SDC deferral.

Timing of Payment

For most jurisdictions contacted, the deferred payment is due prior to receiving the Certificate of Occupancy (C of O); a few use a time limit in addition to or instead of the C of O (e.g., 9 months or a year). The jurisdiction that offered their experience as a comment on the Public Review Draft of the report noted they currently require payment at C of O, but have discussed moving the deadline to the final framing inspection (earlier in the construction process), so that any issues can be resolved before a homebuyer is expecting to move in, avoiding impacting the future resident or the jurisdiction appearing to be the problem if there is a hold-up at C of O.

Utilization

Many of the jurisdictions that responded receive a small number of deferral requests annually (Cornelius and Wilsonville have used their program twice, Pendleton uses it roughly once every ten years). However, Madras, which allows deferral for all residential development, saw a steady decrease in deferral requests over the last three years, where nearly half of all SDC payments were deferred. In its program history, Madras has seen 187 total deferrals and five in 2022, mostly for subdivisions. In Tigard, Sherwood, and Wilsonville deferrals were more likely to be taken by large developments due to deferrals not being advertised and/or eligibility criteria.

Administrative Time and Costs

All jurisdictions noted an increase in administrative effort associated with the deferral program, though some said it was a major increase and some said it was less than an hour of staff time. Tasks involved in the deferral process include reviewing and approving the deferral request, filing a lien (if required), communication between agencies or departments regarding the

[238] Liens are legal rights to property by creditors. Liens typically remain in effect until the debt obligation is satisfied and allow the creditor to use the property as collateral if the debt obligation is not fulfilled.

application, tracking status through the development process, and closing out liens or updating permit systems when SDCs have been paid. In Madras, certificates of occupancy are granted by the county, so the process requires an additional level of coordination. Jurisdictions reported that deferral requests can take anywhere from 15 minutes to 7 hours per request. Two smaller jurisdictions use paper filing and mentioned if the number of deferrals increased, they would need to move to an electronic tracking system. In Redmond, the staff burden made the program cumbersome to administer (staff reported it was used frequently), which was one reason the City went on to sunset the program. However, Tigard and Veneta report the additional time spent on deferral is negligible.

There were also costs associated with follow-up and enforcement of payment in some cases. In Wilsonville, one notable non-payment dispute took four years to litigate, which led the city to end the program in 2019 during their SDC code update (see below).

Non-Payment

Three of the seven jurisdictions that provided detailed information reported instances where follow up or enforcement was necessary:

- In Sherwood, one development remains vacant with outstanding fees. (While staff didn't specify, this is presumably a commercial development, given that it is unlikely an apartment or single-family home would be completed but unoccupied for a long period of time.)
- Wilsonville has had at least two instances where deferrals for commercial developments have resulted in disputes with developers who sought to renegotiate the terms of the deferral agreement.
- In Madras, a few deferrals (out of over 100) required follow up at the one-year deadline (perhaps because this is an arbitrary timeline relative to the construction timeline), but did subsequently pay upon follow up. The City noted that one developer in particular had sought to avoid payment. This was the only nonpayment issue attributed specifically to residential development.

Key Findings

The two key concerns with deferrals are administrative burden and nonpayment. Take-aways related to these concerns are summarized below.

- **Administrative Burden:** The responses suggest that administrative burden can be quite variable depending on a jurisdiction's permitting system and deferral procedures. For jurisdictions where the program is broadly available and well-understood within the residential development community, the volume of deferral applications can be challenging due to the total amount of staff time required. In some communities, some of this staff time is linked to filing liens, which are more time consuming to establish and remove, but give the jurisdiction more leverage if there is a nonpayment issue.

Streamlining seems to have helped some jurisdictions to an extent, but there are limits to the ability to streamline if a jurisdiction must coordinate with other agencies (e.g., the county) or does not have an efficient permitting system. Even for jurisdictions that process few deferrals, the amount of effort for each application can be substantial for some, depending on how their program and permitting system works.

- **Nonpayment:** Many of the most egregious examples of nonpayment were linked to commercial projects. Some factors specific to commercial development may have contributed: there is greater variability in SDCs for commercial development depending on the specific end user, which may not be known in detail up front, and could increase the risk of a developer seeking to change the total SDC amount later, when tenants are known. In addition, commercial development tends to have fewer tenants and can take longer to lease up compared to apartments where there are many tenants who typically begin to move in immediately upon C of O. Issues related to residential development appear to be primarily where a time-based deadline was reached before C of O without the developer noticing immediately. This is unsurprising, given that the date may not correspond to any particular construction milestone. One jurisdiction also noted one developer who attempted to avoid requirements on several occasions.

While the negative experiences of some jurisdictions led them to advise caution related to deferrals, the successful (or mixed) experiences of other jurisdictions suggest that some of the concerns could potentially be avoided or mitigated through program requirements and eligibility criteria. However, given the variation in how jurisdictions handle permitting, it may be easier for some jurisdictions to offer deferrals than others, and even at the low end of effort per application, a broadly-used program could potentially become burdensome.

Exhibit 76. Deferral Program Feedback Summary

OREGON CHIPS BIANNUAL REPORT

Report #1 | January-June 2024

Business Oregon, the state's economic development agency, invests in Oregon businesses, communities, and people to promote a globally competitive, diverse, and inclusive economy. Learn more at biz.oregon.gov.

Oregon CHIPS Biannual Report #1

January – June 2024

In April of 2023, the Oregon State Legislature adopted the most significant economic development legislation in a generation to enhance the competitiveness of the state's semiconductor industry. This is the first report issued by Business Oregon on the Oregon CHIPS Program, covering the period from January 1 to June 30, 2024.

Senate Bill 4 included several provisions intended to maximize the opportunity of the federal CHIPS for America Act. This legislation created the Oregon CHIPS Fund and allocated up to $240 million of direct incentives to Oregon semiconductor companies applying for Federal CHIPS Act resources. Oregon Governor Tina Kotek signed Senate Bill 4[1] into law on April 13, 2023.

While this report focuses on the Oregon CHIPS program, the State's efforts to support the semiconductor industry go beyond direct incentives. Oregon's comprehensive approach was borne out of the recommendations from the Semiconductor Task Force, a strategic planning effort led by Senator Ron Wyden, then-Governor Kate Brown, and Portland General Electric CEO Maria Pope. Additional initiatives passed by the Oregon State legislature in 2023 to enhance the competitiveness of the state's semiconductor industry included:

- The Research & Development Tax Credit for Semiconductors, which dedicated $255 million over the next six years to support leading-edge innovations in the state's semiconductor sector.
- The Semiconductor Industrial Land Loan Program, allocating $10 million to advance Oregon's inventory of buildable land necessary for semiconductor manufacturers and suppliers to locate and expand.
- The Oregon Semiconductor Center for Innovation Excellence to sustain engagement between industry, education, and research partners to encourage development and commercialization of new technologies.
- A temporary authority for Governor Kotek to designate a limited number of parcels and acreage as new Industrial areas, to address Oregon's limited land supply for additional semiconductor uses.

Oregon's legislature continued to support local growth of the industry in the 2024 Session by dedicating additional resources to semiconductor-related workforce development and child-care availability through these actions:

- The Future Ready Oregon $200 million investment in education and training includes several Workforce Ready Grants that support new and innovative education and training programs for the semiconductor industry. The State Legislature allocated an additional $10 million in 2024 to Oregon State University, University of Oregon, Oregon Institute of

[1] OR Laws 2023 ch. 25 §§1–6, 7, 8 & 8b

Technology, Portland State University, and Mt. Hood and Portland Community Colleges for talent advancement in the semiconductor industry.[2]

- Creation of the CHIPS Child Care Fund, along with an initial $2.5 million for high-quality childcare to enable skilled, diverse construction workers building the state's semiconductor facilities. Governor Tina Kotek has also committed another $5 million for the CHIPS Child Care Fund from the Oregon CHIPS Fund.

This year, Governor Kotek assembled a team to pursue the location of a National Semiconductor Technology Center (NSTC) in Oregon. The NSTC and CHIPS R&D Program Office were appropriated approximately $11 billion by Congress through the CHIPS and Science Act of 2022 for the creation of a national R&D program, including the development of key national R&D facilities. NATCAST (the non-profit consortium leading the NSTC) has recently announced plans and a site selection process for three separate NSTC Facilities.

The State of Oregon and key partners are proposing an NSTC-funded center in Hillsboro that is essential for securing global leadership in the development and manufacture of the world's most advanced chips. The Governor's proposal contends that the State of Oregon should be the home to the largest NSTC flagship R&D facility based on economic and national security concerns, the capability to execute a sustainable business model, and the contributions that can be made from the substantial existing semiconductor ecosystem footprint within the state.

With funding support from both the federal CHIPS Act and the Oregon CHIPS Act, the center will bring the most advanced companies of the semiconductor ecosystem together to design, construct and ultimately operate the most advanced fab in the world, which is vital for U.S. national security.

For a more detailed update on Oregon's other semiconductor industry programs, refer to the Special Topics section at the end of this report.

Oregon CHIPS Program Overview

Business Oregon and the Governor's Office developed the Oregon CHIPS Program to provide conditioned grants to businesses to support eligible projects.[3] The CHIPS Program has executed seven contracts with a total allocation of $190.7 million since the beginning of 2024. These grants help leverage massive private sector investments to construct, expand, and/or modernize semiconductor commercial facilities around the state. This report provides an update on the progress of six of these projects and the economic impact of the expansions on Oregon businesses, workers, and communities. The seventh award, to Stratacache, Inc., in Eugene, was executed in FY 2024-25 and will be included in more detail in the next Oregon CHIPS Report. The Governor's Office continues to negotiate contracts with several businesses and expects to finalize the remaining contracts by Fall 2024.

[2] More detail on these programs is available at: https://www.oregon.gov/highered/about/Documents/Future-Ready/OnePager-FutureReadyOregon-WorkforceReadyGrants-Semiconductors.pdf

Oregon CHIPS At-a-Glance

Company	**Contract Start Date**	**Project Summary**	**Oregon CHIPS Award**	**Oregon CHIPS Expended**	**Federal CHIPS & Science Act Award**	**Project Capital Expenditures to date**	**Oregon-based suppliers*** (project-specific unless noted)
Microchip Technology, Inc.	January 5th	Modernization and expansion project to triple production at its 140-acre facility in Gresham.	$11,000,000	$4,750,000	$72 million	$162 million	127
Intel Corporation	January 5th	Expansion of Intel's D1X wafer fabrication facility at the company's center for global R&D in Hillsboro.	$115,000,000	$115,000,000	Portion of $8.5 billion	More than $1 billion	$5.62 billion spent in 2023* **company-wide*
HP, Inc.	January 5th	Modernization and expansion to advance development and manufacturability of microfluidics technology in Corvallis.	$9,500,000	$4,250,000	$50 million	$43 million	18
Analog Devices, Inc.	May 7th	Expansion, infrastructure improvements, and new equipment at the company's largest site in Beaverton.	$12,000,000	$5,250,000	Awaiting decision	Hundreds of millions	162
Siltronic Corporation	May 16th	Tools & equipment to modernize metrology capabilities at Portland production facility.	$2,200,000	$0	Awaiting decision	$2.3 million	0
Lam Research Corporation	May 29th	Major expansion, construction of new advanced R&D center at its Tualatin campus.	$22,000,000	$0	Awaiting decision	Land acquisition & project design costs	7
Stratacache, Inc.	July 2nd	Construction of GaNSi MicroLED foundry through reuse of semiconductor production facility in Eugene.	$19,000,000	$0	Awaiting decision	Will commence reporting in 2025	

Leveraging FEDERAL CHIPS Act Resources

The Oregon CHIPS Program has already been successful in attracting federal resources to our state. Oregon has the dual distinction of being the home to the first CHIPS Act project announced – to Microchip in Gresham – as well as the company receiving the largest CHIPS Act award, Intel, that will go in part towards a major expansion of its research and development headquarters in Hillsboro. Three of the 17 federal CHIPS for America Act awards to date have been for semiconductor expansions in Oregon, including:

Microchip was awarded **$72 million** to modernize, and support workforce development efforts at its mature-node semiconductor fabrication facility in Gresham.

Intel Corporation was awarded **$8.5 billion** for projects in Oregon, Arizona, New Mexico, and Ohio. A portion of this funding will support construction of the company's D1X facility at Ronler Acres.

HP, Inc. was awarded **$50 million** to construct a pilot line to expand production at its "lab to fab" facility in Corvallis and bring the company's groundbreaking innovations in microfluidics to market applications in artificial intelligence, bioscience, and sustainability.

Oregon CHIPS Key Indicators

Project Capital Expenditures To-Date

- >$1.35 billion

Economic Impact

- 316 Oregon-based businesses are suppliers for Oregon CHIPS projects
- >500 Oregon-based businesses are supplying Oregon CHIPS awardees

Jobs created

- **Intel** created 200 jobs to support its Oregon CHIPS project during the reporting period.

R&D Expenditures

- **HP:** $13 million in R&D spend for its Corvallis Microfluidics Project
- **Intel:** $16 billion in fiscal year 2023 across the company (Hillsboro is a center for the company's R&D operations).

When viewed together, the project updates demonstrate the massive level of industry investment in Oregon to drive innovation, expand production, and bring new technologies to market. Public sector investment will help ensure that Oregon is a thriving center of research & development for the semiconductor industry, lifting our nation and improving lives around the world with the innovations created locally. State support also helps ensure the resilience of our local companies, which manufacture and supply a diverse array of electronic control products with end uses from automotive to bioscience to artificial intelligence. Public support is critical to ensure that Oregon

continues to grow our workforce and enable more Oregonians to pursue good-paying jobs in the industry.

The economic impact of the Oregon CHIPS projects highlighted in this report are only beginning to take shape. In the coming months, companies will continue to construct facilities, purchase additional tools, and install equipment, often from vendors and suppliers with operations in Oregon. These operational expansions will in turn generate additional demand for semiconductor supply chain companies that produce specialized materials or support the advanced processing and packaging required to produce these devices. Business Oregon has seen recruitment activity from the semiconductor industry increase, with six separate recruitments in the first half of 2024 vs. one such recruitment in H2 2023.

The semiconductor industry is highly cyclical, and Oregon CHIPS Program is launching during a cyclical downturn caused by post-pandemic inventory correction. This downturn has negatively impacted Oregon CHIPS recipients during the reporting period. Microchip furloughed employees in both March and June and plans to complete its full Gresham campus expansion only when market demand returns. In June, employees at Analog Devices in Beaverton delivered a written petition to the company demanding higher wages and better working conditions. Most recently, Intel announced that the company will lay off 15,000 people from its global workforce to address revenue shortfalls while maintaining its turnaround strategy.

While these events are concerning, the long-term outlook for the semiconductor industry remains strong. As semiconductors become ubiquitous in consumer, household, and automotive products, and the demand for data processing skyrockets, there is broad agreement amongst market analysts that existing and new markets will drive global sales of semiconductors to reach $1 trillion by 2030-2032. Key markets driving growth include smart mobility, smart manufacturing, smart medical technology, as well as data centers and artificial intelligence. Oregon's peer states with significant semiconductor clusters such as New York, Arizona, Ohio, Texas, Idaho and Indiana are continuing to provide incentives and workforce programming to maximize the long-term opportunity from the world's most important traded sector.

Any investment of public funds is worthy of careful monitoring, and especially those of this magnitude. The Oregon CHIPS Program includes return on investment provisions that require companies to meet state and local tax revenue generation obligations, job creation targets, or a combination of both.[4] These requirements are consistent across CHIPS agreements:

- **Oregon CHIPS recipients with revenue targets under 5-year agreements:** for every $1 million in grant proceeds received, the business must generate at least $1.25 million in state and local revenue.
- **Oregon CHIPS recipients with revenue targets under 10-year agreements:** for every $1 million in grant proceeds received, the business must generate at least $1.5 million in state and local revenue.
- **Oregon CHIPS recipients with job creation targets**: one job must be created per $45,000 in grant funds. At least 65 percent of these jobs must be permanent full-time positions; and the jobs must pay (on average) at least the average median income for the region.

[4] Statutory requirements are found in Section 1 (4) of SB 4 (2023).

These specifics for each Oregon CHIPS contract are noted below.

COMPANY	AGREEMENT TYPE	OREGON CHIPS CONTRACT REQUIREMENT
HP, INC.	5-year	$11,875,000 of new state and local tax revenue
INTEL CORPORATION	5-year	$143,750,000 of new state and local tax revenue
MICROCHIP TECHNOLOGY, INC.	5-year	245 new jobs from the project (160 of which must be full-time positions retained for a minimum of 2 years)
ANALOG DEVICES, INC.	5-year	$15,000,000 of new state and local tax revenue
SILTRONIC CORPORATION	10-year	$3,300,000 of new state and local tax revenue
LAM RESEARCH CORPORATION	10-year	$33,000,000 of new state and local tax revenue; or creation of 489 new jobs from the project (318 of which must be full-time positions retained for a minimum of 2 years)
STRATACACHE, INC.	5-year	$23,750,000 of new state and local tax revenue

Next Steps for Oregon CHIPS

The Governor's Office is continuing to negotiate with several companies that have received a notification of intent to award from the Oregon CHIPS program and anticipates further contract announcements in the second half of 2024. However, because some companies that received a notice of intent to award have not proceeded with projects as initially planned, Oregon CHIPS Round 2 was made available for eligible applicants in June 2024. Oregon CHIPS Round 2 provided an additional funding opportunity of at least $10 million. Project submissions include significant operational expansions and foreign direct investment to the state. Business Oregon was also able to use the Oregon CHIPS program as a recruitment incentive for one company to locate its next manufacturing facility in the Silicon Forest. The Governor's Office will be announcing its intent to award from this funding opportunity by the end of September, and contracts for CHIPS Round 2 are expected to be established by end of the calendar year.

Any additional Oregon CHIPS projects that come under contract in 2024 will reported on in more detail in the next Oregon CHIPS Report issued to the State Legislature in September 2025. The second Oregon CHIPS report will cover the period from July 1 to December 31, 2024.

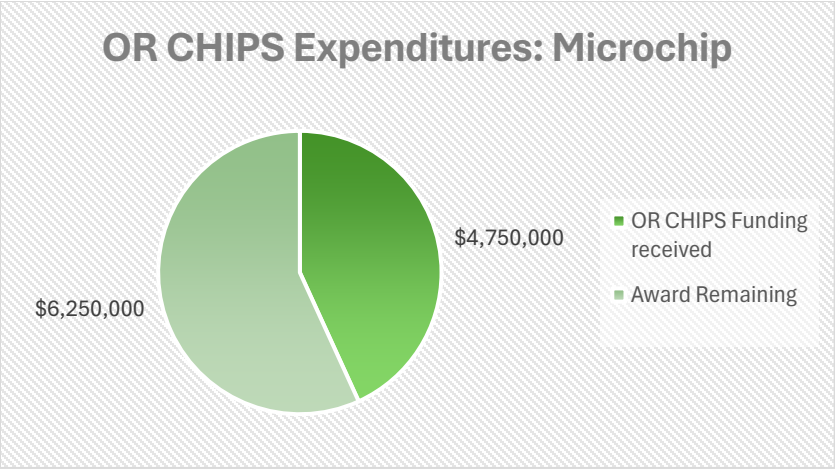
Business Oregon invites you to follow news and announcements tracking the momentum of the semiconductor industry in Oregon by visiting this program page: Business Oregon : Oregon's Semiconductor Industry : Oregon's Semiconductor Industry : State of Oregon[5]

[5] https://www.oregon.gov/biz/programs/semiconductor_chips/pages/default.aspx

Microchip Technology Inc.

Microchip is a mature-node semiconductor manufacturer serving approximately 125,000 customers across the industrial, automotive, consumer, aerospace and defense, communications and computing markets. The company has operated a production facility on its 140-acre campus in Gresham since 2002. In 2024, Microchip received an $11 million Oregon CHIPS award to support the company's Fab 4 Expansion Project, part of a $42.4 million incentive package from the State, the City of Gresham, and Multnomah County.

Microchip's expansion project is designed to triple production by onshoring production capacity to address extreme shortages in the marketplace and received the first federal CHIPS Act award of $72 million announced by the federal CHIPS Program Office in January 2024.



The company reports significant progress on the project to date, including the completion of its cleanroom expansions, which are now in service. Microchip's facility upgrades continue, and has completed its Nitrogen Plant, Ultra Pure Water Plant, and Solvent Exhaust expansion projects. Several more are on track for completion this calendar year. Finally, Microchip continues to install tools, with 70 tools in the process of installation.

The remaining expansion will further increase capacity levels by an estimated 75%. Depending on business conditions and other factors, the remainder of the overall project is expected to be

completed in 4-6 years. Total Project costs for tools and equipment purchase and installation of the tools and equipment, including installation infrastructure and system expansion and upgrades necessary to sustain the site, is estimated at greater than $490 million.

Microchip has weathered significant volatility over the course of this year, with an inventory correction causing an industry-wide 50% drop in revenue from the peak. The company managed the downturn with furloughs in March and June but has not made any layoffs. Microchip also provided company stock to employees more than their unpaid leave. While no new jobs have been added during the reporting period, 350 are expected to be created from the expansion project.

Economic Impacts

The economic impacts from this project on Oregon-based businesses are significant, with Microchip logging $162 million in receivables to date from 129 local vendors. The company also notes additional community benefits through its local purchase of incidental operating and construction supplies, as well as boosting catering, hospitality, and local hotel occupancy.

Environmental Impacts

Microchip entered a public-private partnership with the City of Gresham for the expansion of a system-wide Wastewater Treatment plant, providing the City of Gresham $16 million for its ammonia treatment program.

Workforce & Community Partnerships

Microchip has continued its strategic partnership with Mount Hood Community College (MHCC), providing approximately $100,000 annually to support Incumbent Worker training, internships, and Mobile Learning opportunities. The Incumbent Worker program at MHCC has exceeded enrollment expectations by reducing barriers to advancement for entry level employees. As part of the company's Oregon CHIPS agreement, Microchip will continue to pursue partnerships with community-based organizations to better reach women, people of color, veterans, and people with disabilities. To this end, the company is providing direct financial contributions of $100,000 to the Portland Opportunities Industrialization Center (POIC) and $25,000 for Portland Youth Builders.

Microchip has also built connections with K-12 during the reporting period, through a partnership with Davis Elementary School, high school outreach, and the sponsorship of its first robotics contest.

Child Care

Microchip offers a strategic agreement with KinderCare for employee discounts.

HP Inc

Background

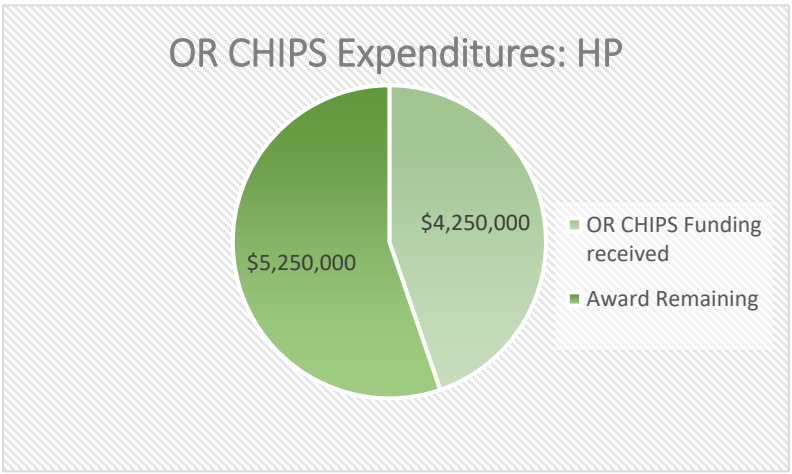
HP Inc is a company with over 40 years of operations in Oregon. The inkjet printer, invented in Corvallis, provides the technological basis for HP's development of microfluidics technology for bioscience and artificial intelligence applications.

Project

HP's Oregon CHIPS award supports facility modernization and expansion to support the use of microfluidics technology, the manipulation of fluids on a microscopic scale. The company recently received an award of $50 million from the Federal CHIPS and Science Act, announced on August 27, 2024, which will help to build a "lab-to-fab" model in which new research and is translated quickly into production.

The project has achieved two significant milestones during the reporting period:

- HP continued risk production of the first G5 product in January 2024. This milestone enables the first production material intended to ship to end customers to start in the fabrication facilities and is the start of the planned manufacturing capacity ramp.
- Manufacturing Release of the first G5 product in May 2024. This milestone indicates that the material produced in the Corvallis, Oregon fabrication facilities has passed all performance and reliability requirements and can be shipped to end customers.



The first product using the G5 technology is now in active manufacturing in the Corvallis semiconductor and advanced packaging fabrication facilities. These milestones indicate the start of the capacity and yield ramps to enable full production volumes over the next few years on the G5 technology.

R&D

Research and development is a significant component of HP's Corvallis Microfluidics project, with $13 million in R&D expenses incurred during the reporting period. The company has continued development work on subsequent products and additional capabilities for the G5 technology platform. During the current reporting period, two new designs were completed and photomasks ordered for first silicon processing, and one new design was completed for the first Precision Over Mold processing. In addition, two new designs had first prototypes delivered from the advanced packaging fabrication facility.

Economic Impacts

Project capital installed to date for this project totals $43 million. The company engaged 18 local suppliers for the project during the reporting period, two of which are small businesses.

Environmental Impacts

HP reports that many environmental impacts of the company are decreasing. Year to date, the company reduced electricity usage roughly 3% year-over-year, reduced its water usage roughly 5.5% year-over-year, and increased its solid waste diversion rate from 89.5% to 92%. The company partners with Energy Trust of Oregon on its energy reduction and tracking initiatives.

Workforce Partnerships

During this period, HP has hired and onboarded 24 interns in Corvallis for the summer of 2024 and will be assessing them for full time conversions. The company's partnership with the Linn Benton Community College Mechatronics program continues to assist HP in getting interns and new hire technician level workers. In addition, Andersen Construction, a key project contractor, offers program offerings and placement programs.

HP is the main partner of Corvallis Microfluidics (CorMic), a Tech-Hub designated by the Economic Development Administration. Through CorMic, HP has partnered with OSU, UO, and OHSU, as well as Clackamas and Linn-Benton community colleges to create workforce development programs and help to accelerate technology development.

K-12

HP provides Education Externships for local K-12 teachers in the STEM fields. Teachers from the local area come and tour our facility where we provide insights into potential career paths for

students in traditional STEM fields as well as technical and trade jobs that support our site. This is the company's second year of hosting this program.

In addition, HP also sponsors two robotic clubs in the Corvallis area with financial and mentoring support, offering participation opportunities at both the elementary and high school level.

Community Partnerships

HP hosted the Oregon Bioscience Association's "Bio in the Valley" and has started a collaboration with the organization for the advancement of life-sciences and workforce development.

Intel Corporation

Background

Intel Corporation is the only advanced logic semiconductor maker that develops its process technology in the United States. Intel develops, ramps, and manufactures all new logic process nodes in its Oregon facilities before transfer to other high-volume manufacturing sites. Many would argue that this makes Intel's Oregon facilities the nation's most important semiconductor innovation cluster.

Intel directly employs over 23,000 people in Oregon and is the state's largest private employer. Intel's Oregon operations create an innovation ecosystem that contributes to the statewide economy through R&D spending, purchasing with local organizations, and generating tax revenue. Since 1974, Intel has invested more than $65 billion in capital to support its operations in Oregon.

Project

For its project supported by the Oregon CHIPS Program, Intel will expand cleanroom manufacturing space at the site of its D1 wafer fabrication facility at Gordon Moore Park in Hillsboro. The building construction and purchase and installation of equipment and tools is expected to be a multi-billion-dollar investment. Oregon CHIPS is slated to be used toward the costs of building design and construction of MSB2, one of the support buildings for the new cleanroom space.

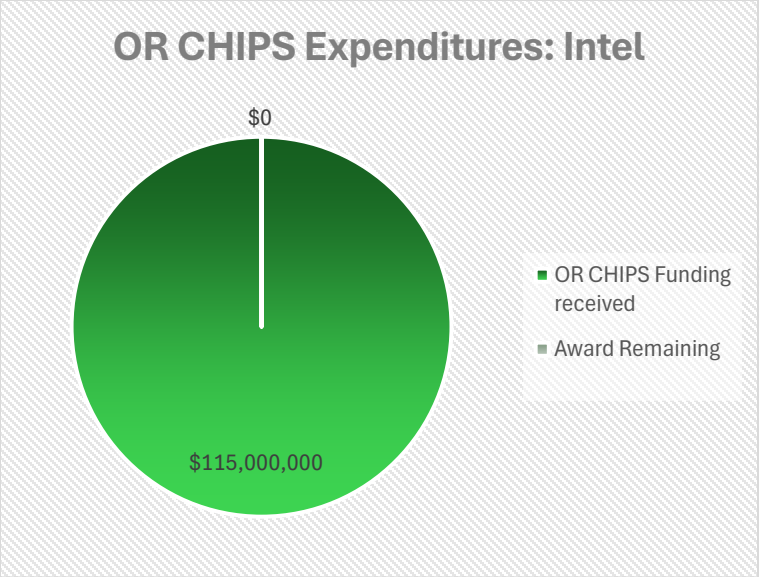
Intel has invested more than $1 billion on its projects cumulatively in the report timeframe to June 30, 2024. Progress on the project during the reporting period includes continued modernization of D1 facilities and installing tools to enable new fabrication capabilities and production capacity. Additionally, the MSB2 building foundation work has been completed, and construction has commenced on the upper floors. The D1 expansion design progressed through space planning and utilities infrastructure validation.

Economic Impacts

In 2023, Intel spent $5.62B with Oregon-based suppliers, and $7.72B total with Oregon and southwest Washington-based suppliers. Intel spent $101.7M with Oregon-based diverse suppliers in 2023.

The company is committed to cultivating a robust network of local suppliers that stimulates the local economy and enhances the resilience and flexibility of its supply chain. More than 200 suppliers in Oregon are considered micro and small businesses.

With regards to R&D, the company reported total R&D investments of more than $16 billion in fiscal year 2023. Intel Oregon remains one of the company's most important R&D centers.



Environmental Impacts

At a company-wide level, Intel has set aggressive goals on reducing greenhouse gas emissions, water recycling and reuse, and restoration. These goals inform the company's approach to its modernization and expansion project at Gordon Moore Park. Specific permits received for the Oregon project include:

- The Oregon Department of Environmental Quality requires an air permit to authorize emissions from modifying or constructing equipment at Gordon Moore Park at Ronler Acres and Aloha campuses.
- A wetlands permit was received from the U.S. Army Corps of Engineers to authorize the expansion of an existing semiconductor fabrication facility.
- Development Review Application approval received from the City of Hillsboro for expansion of an existing semiconductor fabrication facility.

Intel has several ways of engaging with the community to share information and address impacts from operations and construction:

1. **Neighbor Relations program**: Intel is committed to fostering strong relationships with over 3000 members of its neighboring communities to develop investments that are responsive to local needs. This program enables proactive two-way communication between Intel and its near residential neighbors to address concerns and feedback on topics such as significant new construction, changes in visual or audible manufacturing operations from the public perimeter, and progress on commitments made to neighbors.
2. **Air Quality Advisory Committee:** One of the company's objectives is to have open communications between Intel, its neighbors, and the community. The Air Quality Advisory Committee provides a quarterly forum to meet with the community to discuss the company's environmental operations. Those meetings are virtual and open to the public.

3. The **Quarterly Community Advisory Panel** (CAP) plays a pivotal role as a volunteer advisory group, serving as a crucial bridge for communication between Intel and the local community. Comprising community leaders and representatives, this diverse group includes members from business, government, environmental organizations, community organizations, and neighbors.

Workforce & Educational Partnerships

Community Colleges:

Quick Start Technician Training Program: Intel partners with Worksystems, Portland Community College, Worksource, Washington County, and the City of Hillsboro to offer the 2-week, paid Quick Start training program in Oregon. Quick Start aims to support the growing semiconductor industry's employment needs and welcome diverse talent into the technical workforce. The accelerated two-week program is designed to prepare students for a rewarding career as a semiconductor technician with hands-on learning.

A.I. for Workforce: Intel has made significant investments to establish comprehensive digital readiness programs to demystify and democratize emerging technologies for diverse audiences across all segments of society. This includes preparing the wider U.S. workforce with key Artificial Intelligence (A.I.) skills. Oregon's A.I. for Workforce program has expanded to Umpqua Community College to create a pathway for A.I. mechanics and technicians. Intel is collaborating with faculty at Portland Community College to bring the program to their schools.

Universities:

Intel works with Oregon colleges and universities to tailor curricula to meet the semiconductor industry's needs, and through internship programs, Intel provides real-world experience for both undergraduate and graduate-level students. Intel also funds research projects with university students and faculty to foster collaborations and the development of communities among Intel and academia.

K-12

Oregon Robotics Tournament & Outreach Program (ORTOP)

Intel has continued its 21-year partnership with ORTOP by supporting the FIRST LEGO League (FLL), a robotics program engaging more than 3,300 youth in 4th through 8th grade through nearly 500 robotics teams. For the past five years, Intel has donated over $130,000 in direct grants to ORTOP. Intel's support provides scholarships to girls, minority participants, and teams who meet financial need criteria. Intel also hosts the FLL Qualifying Tournaments annually at its Jones Farm campus. In 2023, Intel volunteers provided over 1,841 volunteer hours as judges, referees, and team coaches to support ORTOP programs.

Hillsboro School District Foundation

Intel has a deep partnership with the Hillsboro School District. Each year, Intel employees contribute thousands of hours of volunteer work to the district, from teaching, mentoring, and coaching. Intel has contributed over $320,000 in direct grants to the Hillsboro Schools Foundation over the past five years to support the district's STEAM and CTE programming. As part of a Strikeouts for STEM community partnership with the local baseball team (Hillsboro Hops), Intel funded the Career Technical Education (CTE) and the Hillsboro Schools Foundations' "Imagine your Adventure/Imagina tu Aventura" program, which brings bilingual, bicultural career exploration kits and programs to all kindergarten through sixth-grade classrooms in HSD.

In April 2024, Intel invited the ReVamped robotics team, supported by nonprofit Project LEDO, to demonstrate their robot at our CHIPS gathering event. Governor Tina Kotek and Congresswoman Suzanne Bonamici met with the students at the event. Since their meeting, Bonamici met with Project LEDO to learn more about their work at a meeting at their Portland office with Intel.

In addition, Intel employees serve on CTE and Career Pathways Advisory Councils.

Beaverton Education Foundation

For several years, Intel has partnered with the Beaverton Education Foundation on various STEAM-related grants, totaling over $170,000 over the past five years. Most recently, the company’s $20,000 investment went to support the Building STEAM 4 All Initiative which supports in-class, afterschool, and summer programming in science, technology, engineering, art, and math achievement, focusing on expanding access for students who are underrepresented in the sciences: girls, low-income students, and students of color. In addition, we have partnered with the district to donate $20,000 on a strategic initiative to support their specialized Career Technical Education (CTE) programs, encouraging students to pursue careers in the trades.

Portland Metro STEM Partnership

Intel has partnered with the Portland Metro STEM Partnership to advance efforts that promote equity in STEAM, such as enabling school certification and developing educational programs in partnership with BIPOC communities in the Portland Metro area. Intel was a founding member of the Portland Metro STEM Partnership advisory board in 2009 and advocated for developing the STEM Hub network to serve all of Oregon in 2013. Intel has partnered with Portland Metro STEM and has partnered on several programs, such as our annual National Engineers Week event. Intel has collaborated with the Portland Metro STEM Partnership for seven consecutive years to celebrate National Engineers Week by hosting two days of hands-on learning in Beaverton and Hillsboro fourth-grade classrooms, reaching over 2,200 students. In 2023, more than 350 Intel volunteers visited over 90 classrooms where they guided students through the Intel Future Skills Lunar Lander

project. The company supports professional development for local teachers through its partnership with Portland Metro STEM, hosting an annual "Externship" event during which teachers come to the Intel campus to learn about our industry, careers, and essential skills to share with students. Since 2019, Intel has donated over $100,000 to support Portland Metro STEM's efforts.

Community Partnerships

Intel is working with nonprofits Building Blocks to Success and Self Enhancement, Inc. to support their programming related to establishing career pathways for their students in semiconductor manufacturing. Intel volunteers have engaged with these organizations previously. With both organizations awarded funding from the Higher Education Coordinating Commission for their programming, Intel is partnering to support their efforts to build semiconductor career pathways.

This summer, the company facilitated a joint effort between BB2S, SEI, Intel, and Portland Community College to identify pathways to support this programming. Intel will begin efforts to partner by welcoming 15 middle school students from Building Blocks 2 Success to our Intel campus for a day led by employee volunteers from Intel's Employee Resource Group NIA (Network of Intel African Ancestry). During this visit, Intel plans to share an overview of Intel and a fun STEM activity to inspire our next generation of innovators. The company is also connecting with Self Enhancement, Inc. to plan a larger engagement in the fall.

Intel employee volunteers are also championing community initiatives to support an inclusive talent pipeline. The Empowering Students with Disabilities (ESWD) program, initiated by a team of dedicated Intel volunteers in partnership with the Oregon Department of Education local school districts and the Department of Education, is distinguished by its immersive and hands-on approach to education for students with disabilities. Through this program, volunteers welcome local students with disabilities to the Intel campus to experience a specialized curriculum that encompasses technical learning sessions, soft skills development, and mentorship. Since its inception, the ESWD program has experienced remarkable growth, now serving over twenty-five students from the Hillsboro, Beaverton, and Forest Grove School Districts. So far, Intel has hired two students from this program as summer interns.

Child Care

To help its employees have more access to safe, reliable childcare, Intel plans to expand its current childcare options in the U.S. The company has reviewed programs to address the two most significant issues identified by employees in a recent internal survey on childcare: *availability* and

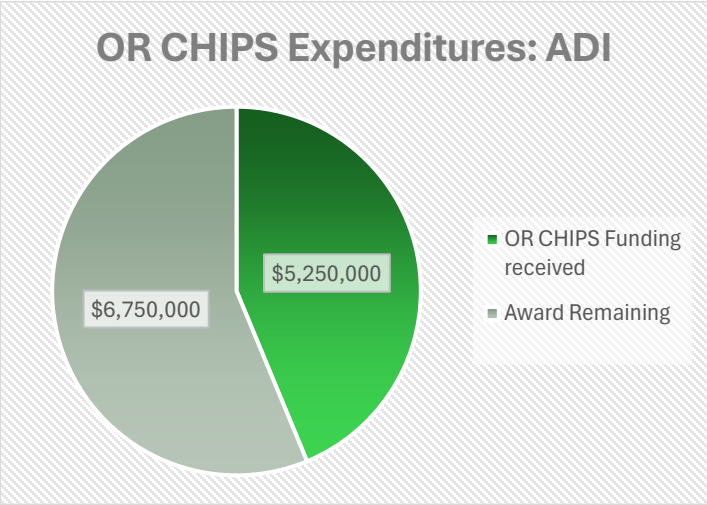
affordability. Childcare enhancements have been identified as a meaningful way to alleviate Intel parents' challenges.

In the U.S., Intel plans to add a second discounted childcare provider network and a new navigation tool to help improve search functionality with access to a vetted network of childcare providers for those looking for alternative solutions, doubling the number of near-site centers. The company will also increase its backup childcare program's reimbursement amount and duration by over 200%. In addition, the company will pilot a childcare reimbursement program for its non-exempt U.S. employees.

Analog Devices, Inc

Analog Devices, Inc. (ADI) is a global semiconductor company that designs, manufactures, tests, and markets a broad portfolio of solutions, including integrated circuits, software, and subsystems that leverage high-performance analog, mixed-signal, and digital signal processing technologies. ADI's comprehensive product portfolio, deep domain expertise, and advanced manufacturing capabilities extend across high-performance precision and high-speed mixed-signal, power management, and processing technologies – including data converters, amplifiers, power management, radio frequency integrated circuits, edge processors, and other sensors.

ADI's largest production facility is in Beaverton, Oregon, where the company creates solutions for customers in various end markets including automotive, industrial automation, technology, communications, healthcare, and various consumer markets.



ADI's Oregon CHIPS agreement for $12 million was executed on May 7, 2024. The company is currently awaiting decision regarding its Federal CHIPS and Science Act application. Oregon CHIPS is supporting ADI's capital project to further modernize and expand its Beaverton facility, to increase its wafer manufacturing capacity. ADI expects to invest an estimated $545M in capital expenditures, which commenced in July 2023.

ADI's Oregon CHIPS project includes two key components:

1) the purchase and acquisition of an adjacent parcel of land, including the existing facilities on that land, and

2) upgrades to ADI's existing Beaverton facility, including infrastructure improvements and the purchase and installation of new equipment and technology.

Key milestones and developments during the reporting period include:

- Significant new tool installations at the site
- Achieved over 100 new tool-level output records (over last six months)
- Reduced manual chemical pours by over 40% and manual chemical cylinder changes by over 75% through moving to bulk supply
- Installed new automated material handling system and automated elevator now under test
- Nearing completion of new N2 air separation unit to supply reliable nitrogen to the fab
- Made significant progress on full qualification of key process technology

Economic Impacts

ADI has invested hundreds of millions of dollars in its facilities expansion and new equipment, including transformation of warehouse space into a new clean room. Impressively, 162 of the suppliers used to export its project to-date are Oregon-based. Approximately one-third of these companies were directly involved in the expansion of the fab and clean room space, resulting in spending and job creation. The remaining spend with these suppliers is for recurring inventory and operational goods and services.

Environmental Impacts

ADI is focused on minimizing its facilities' environmental impacts and reducing Greenhouse Gas emissions. As part of that commitment, the company has issued public Greenhouse Gas emissions goals for its global operations. ADI's environmental targets include:

- Achieving Net Zero across all 3 Scopes of emissions by 2050 or sooner.
- Achieving Carbon Neutrality by 2030 with at least a 50% absolute reduction in Scope 1 and 2 emissions (vs. 2019).
- Diversion of 100% of its waste from its manufacturing facilities from the landfill by 2030.
- Reduction of its water withdrawal intensity normalized to production output by 50% by 2027 (vs. 2022).
- Use of 100% renewable energy across all manufacturing facilities by 2025.

ADI's steps to help achieve these goals include investing in state-of-the-art abatement equipment as part of the company's expansion. This investment will help reduce the impacts of the chemicals used in the semiconductor manufacturing process. ADI is also deploying its own sensor technology to manage water use, driving efficiency, and increasing recycling where possible.

Workforce & Community Partnerships

The company's plans for the expanded Beaverton campus include ecosystem-supporting initiatives to support regional workforce training for careers in the industry. ADI is enhancing Beaverton as the center of its Pacific Northwest Technology Hub by:

- Scaling the Semiconductor Advanced Manufacturing Upskilling Program (SAMU) to expand and increase the qualifications of the PNW semiconductor workforce. This includes donations of surplus tooling to support real-world technical training, co-investment from an equipment supplier, and offering an 8-week "bootcamp" technician training co-designed by a group of semiconductor manufacturers.
- Partnering with universities in the region to provide research space, curriculum development, and internships. Federal CHIPS funding will enable unique fellowship opportunities and other collaborations.

This summer, ADI Beaverton employed four interns from Oregon State University and three from the University of Oregon.

Child Care

With CHIPS funding ADI proposes to stand up a new program to support its employees' childcare expenses. With federal support, the childcare program will consist of (1) an agreement with primary and back-up childcare providers to offer discounts to employees, and (2) a direct ADI subsidy in addition to this discount.

Siltronic Corporation

Siltronic Corporation manufactures 200mm silicon wafers in Portland and is 1 of 4 manufacturers of such silicon wafers in the United States. Silicon wafers are the first building block in supporting vehicle electrification and safety, sustainable energy grids, industrial automation, 5G, and cloud infrastructure. With the financial assistance of the Oregon and Federal CHIPS Acts, Siltronic plans to modernize and expand its Portland facility, enabling the company to meet growing demand and maintain and strengthen its technological leadership.

Project

Oregon CHIPS funding will be used to purchase tools and equipment to modernize the facility's metrology capabilities, to produce wafers that meet the technology needs of the semiconductor industry.

Siltronic reports that the tools listed in its OR CHIPS Grant Agreement have been purchased and are in the process of being installed, and that total project capital expenditures to date is $2.3 million. The company planned to submit its federal CHIPS and Science Act application in August 2024.

Workforce & Community Partnerships

Siltronic hired two MECOP (Multiple Engineering Cooperative Program) interns for the summer of 2024.

Lam Research

Lam Research is Oregon's largest semiconductor equipment company and has had a strong presence in Oregon for more than 20 years. The company's process labs are centers of semiconductor innovation that deliver differentiated experimental and product development results aligned with the nation's CHIPS Act objectives. The semiconductor process tools developed by Lam are complex electro-mechanical systems that apply advanced physics and chemistry to perform critical steps in the creation of microscopic semiconductor devices. Lam's process tools are used by every leading global chipmaker to produce their most advanced devices.

Creating these cutting-edge semiconductor process tools requires two key development deliverables – hardware capable of providing precision control of chemicals to create nano-scale structures on silicon wafers, and process recipes to fine tune the hardware to yield each customer's unique desired results. Lam's process labs are essential to both deliverables. Furthermore, performing this work at Lam's labs allows customers to define and validate production recipes ahead of installation to ensure a rapid ramp to full production.

Oregon CHIPS Project

Lam Research received an Oregon CHIPS award of $22,000,000 to support the expansion of its Research and Development operations with the construction of the company's most advanced R&D center at its campus in Tualatin. This new R&D center will accelerate the development of technology solutions across the company's entire spectrum of chipmaking processes. This state-of-the-art semiconductor process R&D center, still in active development, will be comprised of cleanroom lab space and supporting infrastructure and facilities.

The project is in its beginning stages, with early design work ongoing through the reporting period. Architectural and site master plans have been submitted to the City of Tualatin to kick off the review and feedback process. Capital expenditures to date include the company's land acquisition & project design costs.

Economic Impacts

Lam Research provides high-paying jobs, contributing to lower unemployment rates and increased local spending in Tualatin and surrounding communities. The company's presence in Oregon has

contributed to business growth, attracting suppliers, service providers and other businesses, and helping to boost the local economy. The company anticipates investing hundreds of millions of dollars in the Tualatin Lab expansion project, which will create hundreds of local construction jobs and opportunities for small businesses. For the reporting period, seven companies supplying the TUX project are in Oregon and three of those are considered small businesses.

Environmental Impacts

Lam expects the first construction permits for the project to be issued in the first half of 2025.

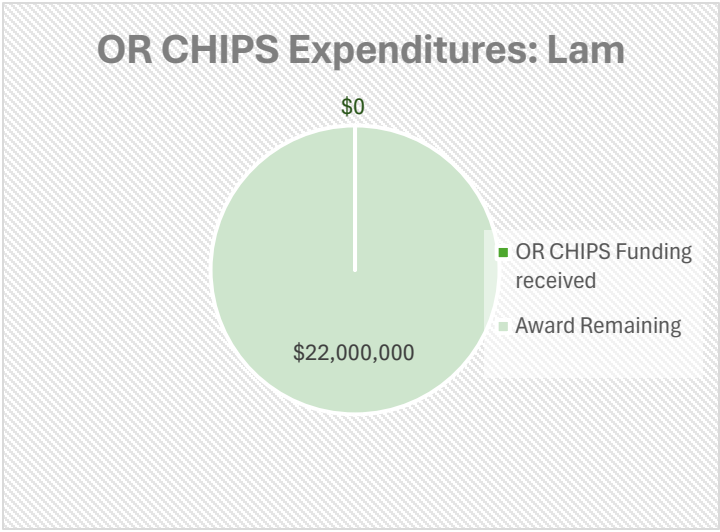
Workforce Partnerships

Lam is actively partnering with various degree programs at Portland Community College and Clackamas Community College to recruit candidates for Lam's Manufacturing Apprentice Program.

Lam has an ongoing collaboration with Portland Community College to provide an 8-week, college-level program that includes both instruction and hands-on labs for manufacturing employees, conducted on-site at Lam Research. Additionally, Lam is expanding this partnership to offer a second college-level program focused on metrology, available to both external individuals and to Lam employees.

Community Partnerships

As a leading semiconductor equipment manufacturer, Lam has maintained a presence in Tualatin for more than thirty years. Over the course of this time, Lam has had a notable impact on the local Tualatin community. Though its expansion project is still in early stages, Lam expects to maintain an ongoing commitment to economic, educational, and social initiatives and expects to continue driving positive change in the community.



The company is known for its charitable contributions and support for local non-profits such as Girls Inc. and IUrban Teen, school support, and volunteering where employees often participate in community service, further strengthening the bond between the company and the community. Lam also supports local community organizations through its social impact program, most recently with organizations like In4all and Family Promise of Tualatin.

Special Topics

Semiconductor Industrial Lands Loan Program

There are numerous industrial properties where, due to the high costs of development to make them site-ready, are not able to advance toward attracting high-wage, high-employment industries. Upfront financial assistance for industrial land development projects ensures a ready supply of properties available to attract, retain, and expand key growth industries, such as semiconductor manufacturers, that typically pay workers above-average wages. Additional funding for a program of this type will create new opportunities for other industrial land development projects, helping Oregon compete nationally and globally.

Established as part of Senate Bill 4, the Semiconductor Industrial Lands Loan Fund addresses this challenge to business recruitment and expansion by providing $10 million in financial assistance in the form of a forgivable loan for certain expenses related to industrial land development that is supportive of the semiconductor industry. Allowable expenses include property acquisition, transportation improvements, natural resource mitigation, land grading activities, and construction costs and expenses, amongst others.

To date, five project from the Semiconductor Industrial Land Loan Fund are currently being negotiated with public and private recipients across the state:

- **Valliscor LLC**: $2,500,000 in funds that will allow purchase of a vacant parcel in Albany for the development of a new facility to produce hexafluorobutadiene (C4F6), an important etchant for the semiconductor industry.
- **Ravin Ventures**: $2,069,000 for wetland mitigation and site infrastructure development (water, sewer, and roads) for an existing property in Coburg.
- The **City of St. Helens:** $2,314,000 for development of a new substation in partnership with Portland General Electric (PGE) that will increase supply and resiliency of electricity to the area.
- **Columbia County**: $94,000 to create a map for electrical transmission routes between six and twenty miles long.
- The **City of Hillsboro**: up to $1,900,000 to acquire a parcel in the heart of the Silicon Forest. This land will be aggregated to create an attractive site for semiconductor use.

Business Oregon staff are currently working on drafting contracts with the awardees noted above. The agency anticipates executing contracts and distributing funds to awardees by January 15, 2025. The balance of funds remaining, approximately $1,123,000, may be made available for distribution through a second competitive funding opportunity in late 2024 or early 2025.

Research & Development Tax Credit for Semiconductors

As a global center for semiconductor research & development, many Oregon companies play a critical role in the nation's efforts to regain technological leadership in the production of semiconductors. The Research and Development Tax Credit for Semiconductors (R&D Tax Credit) is intended to build on Oregon's strengths in this area by recognizing and furthering the contributions of the industry to our economy. The R&D Tax Credit offers a roughly 15% credit for new research and development expenses incurred in Oregon and is available tax years 2024 – 2029. The credit is capped at $4 million annually so that the program can benefit both large and small companies.

While no taxpayers have yet claimed the R&D Tax Credit, the one-time registration required to qualify for the credit in tax year 2024 provided information on expected utilization. An analysis issued by the Legislative Resource Office in March 2024 identified 26 qualified taxpayers, projecting a total $600 million in R&D expenses and an estimated tax credit usage of $23.9 million in 2024.[6]

The number of qualifying taxpayers will likely vary year to year, though Business Oregon expects the number of applicants to increase. The 26 registered taxpayers for 2024 are likely a subset of potential recipients, due to the short time frame and challenge of notifying all possible program stakeholders of the initial registration process in 2023.

Applications for Certification for tax year 2024 will be due on October 15, 2024, and Business Oregon will certify a maximum credit amount for each qualified taxpayer one month later. While only taxpayers that have received a notice of registration for tax year 2024 are qualified to receive this year's R&D Tax Credit, new taxpayers can apply for the benefit in 2025.

The R&D Tax Credit is expected to benefit semiconductor companies of all sizes that represent different aspects of the production cycle, from software design start-ups to leading-edge chip manufacturers. Business Oregon anticipates the credit to serve as both a retention incentive for semiconductor companies conducting research and development, and a recruitment offering for new businesses interested in locating or expanding in the state. Expanding the research and development ecosystem for semiconductors increases both the supply of and demand for a highly skilled workforce, which in turn supports further recruitment of semiconductor, advanced manufacturing, and technology companies to Oregon.

[6] For more on the R&D Tax Credit for Semiconductors, visit https://www.oregon.gov/biz/programs/tax_credit_semiconductors/Pages/default.aspx

Workforce Programs

The availability of skilled operators, technicians and engineers are among the top concerns of semiconductor companies considering whether to locate or expand in Oregon. Top university graduates will continue to drive the innovation that makes Oregon a hub for research and development in the semiconductor space. Business Oregon estimates that Oregon has approximately 38,000 jobs supporting the semiconductor industry, which represents 9% of national semiconductor-related employment. That's compared to having only 1.27% of the overall population in the United States, according to the 2022 US Census.

Despite the current downturn, workforce demands are expected to far outpace supply in the next few years. Oregon CHIPS Round 1 awardees projected the creation of 6500 new jobs across all applications, and Oregon CHIPS Round 2 submissions continue that trajectory despite a more modest amount of available funding. Continued support and focus on semiconductor workforce and talent development over the next 5-10 years is crucial to maintaining the state's ability to attract and retain companies in this sector.

The Future Ready Oregon $200 million investment in education and training includes several Workforce Ready Grants that support new and innovative education and training programs for the semiconductor industry.[7] Several Workforce Ready Grants strengthen partnerships with Oregon CHIPS recipients, including the "Quick Start" program launched and administered in partnership with Intel. Quick Start is an accelerated two-week program designed to prepare students for a career as a semiconductor technician with hands-on learning.

Given that the demand for additional headcount is currently muted, many semiconductor companies are focused on incumbent worker training, i.e., upskilling of existing employees. A Workforce Ready Grant for the Incumbent Worker and Mobile Training program at Mount Hood Community College turned an underutilized mechatronics class into an oversubscribed program by reduced barriers and offering wraparound supports and tuition reimbursements. This program is offered in partnership with both Microchip and Onsemi in Gresham.

Analog Devices' workforce strategy features a partnership with an innovative program called Semiconductor Advanced Manufacturing Upskilling Program (SAMU). SAMU is an independently operated third-party semiconductor workforce training program and facility located in Beaverton. The program was created in 2023 through industry collaboration to

[7] For a more complete case study on Future Ready Oregon's Workforce Development grants supporting the semiconductor industry, view this case study by the Higher Education Coordinating Commission: https://www.oregon.gov/highered/about/Documents/Future-Ready/OnePager-FutureReadyOregon-WorkforceReadyGrants-Semiconductors.pdf

support the labor requirements of semiconductor companies and increase the qualifications of the semiconductor workforce in the Pacific Northwest. SAMU aims to alleviate the resources, time allocation, and financial burdens incurred by individual industry companies who are currently each tasked to develop their own solution around recruiting, training, and retention. This includes donations of surplus tooling to support real-world technical training, co-investment from an equipment supplier, and offering an 8-week "bootcamp" technician training co-designed by a group of semiconductor manufacturers. Though the program is currently completely industry funded, SAMU and workforce partner Acara Solutions have more recently explored public sector partnerships to upgrade the tools and facilities at the training location in Beaverton and offer a paid apprenticeship program, with the goal of creating an ongoing pipeline of qualified semiconductor technicians in the PNW.

In 2024, the Oregon State Legislature passed House Bill 4154 establishing the Semiconductor Talent Sustaining Fund and requiring the Higher Education Coordinating Commission to allocate any future resources going into the fund to provide education, training and research to assist the semiconductor industry. The legislature also allocated an additional $10 million to support talent advancement within the semiconductor industry. Oregon CHIPS recipients Intel, Analog Devices, and Microchip are working alongside Oregon schools supported by this legislation, including Oregon State University, University of Oregon, Oregon Institute of Technology, Portland State University, and Mt. Hood and Portland Community Colleges to ensure this additional funding strengthens the connection between industry needs and the state's training and research programs.

Child Care

With the passage of HB 4098, the Oregon State Legislature established the CHIPS Child Care Fund and appropriated $2.5 million for the new fund with a goal of providing high-quality childcare for construction workforce building out semiconductor facilities around the state. Additionally, Governor Tina Kotek committed another $5 million for the CHIPS Child Care Fund from Oregon CHIPS. Since June, Business Oregon has been facilitating a CHIPS Child Care Work Group with representatives from the semiconductor and childcare provider industries, elected officials, and agency representatives to provide recommendations to the State Legislature by November 15th regarding requirements for Oregon CHIPS awardees to contribute to the CHIPS Child Care Fund, and the mechanism for any such requirements.

Oregon CHIPS awardees Intel, Analog Devices, and Microchip each provided details for this report on their plans to improve access to high-quality childcare for employees. See each company's section for more information.

Business Recruitments and Economic Growth

Based on economic development activity observed in the first half of 2024, it seems likely that the state's suite of semiconductor incentives is improving the business environment for this sector. Examples include:

- **Recruitments:** Business Oregon has seen recruitment activity from the semiconductor industry increase during the reporting period, with six separate recruitments in the first half of 2024 vs. one such recruitment in July – December 2023.

- **Foreign Direct Investment:** Oregon CHIPS Round 2 project submissions demonstrate a trend of local expansions funded by foreign direct investment. The agency was also able to use the Oregon CHIPS program as a recruitment incentive for one company to locate its next manufacturing facility here in the Silicon Forest.
- **Delegation Visits:** Business Oregon received one of the agency's first major international inbound delegations since the pandemic, a 23-member group of Taiwanese semiconductor executives visiting the state in mid-June. In late October, Business Oregon will partner with the Japan External Trade Organization (JETRO) to host a delegation of Japanese semiconductor business representatives. These visits provide an opportunity for agency, academic, and elected leaders to share the value proposition for investing in the semiconductor industry in Oregon.

In July, Business Oregon celebrated the state's position as a global center for the semiconductor industry at SEMICON West 2024 in San Francisco. The agency collaborated with economic development partners from Hillsboro, Sherwood, Portland and Greater Portland, Inc. to host a sellout reception featuring SEMI Americas President Joe Stockunas.

The State of Oregon will soon be helping to administer the federal CHIPS Regional Strategy. Oregon is one of six states designated to lead a Regional Cluster. Business Oregon will serve as the lead strategic implementation partner on the ground to promote the success of federal CHIPS Act investments. This includes coordinating across government parties to measure ecosystem development, facilitate site availability, monitor infrastructure improvements, prioritize workforce training, explore childcare solutions, and engage with tribal communities, and share knowledge across regions.

Conclusion

This Oregon CHIPS Biannual Report is the first of a series of reports that will describe progress on specific Oregon CHIPS projects, as well as provide an update on the state of the industry. The bold actions taken by the Oregon State Legislature to support the semiconductor industry in Oregon over the last few years will have profound impacts on our state's economic future. The early indicators on business recruitment, foreign direct investment, and delegation activity are trending positively, but time will tell if Oregon's semiconductor sector grows at rates comparable to our peer states in the industry. These states see value in addressing the key challenges faced by the semiconductor industry through support for workforce development programs, provision of incentives, and streamlining of regulatory hurdles. The business environment for the semiconductor industry (as well as other types of advanced manufacturing) in Oregon could benefit from further legislative action in these areas:

- **Continued funding for workforce development,** with a focus on programs that connect industry needs directly to program offerings.
- **Match funding for universities** to compete for federal grants to grow Oregon's capacity for research and talent development.
- **Incentives for expansion and modernization projects at local supply chain companies**, to help Oregon-based businesses compete for the dramatic growth in demand for materials and processing that will come from local chip manufacturer expansions.
- **Additional industrial site readiness resources** to create shovel-ready land for recruitments and expand the footprint of where industry can locate across the state.

Thank you for reviewing the progress of Oregon CHIPS and other state programs supporting the growth of the semiconductor industry. Business Oregon values your feedback!

Were there sections that you found especially insightful? Do you have suggestions on what you'd like to see in future CHIPS reports? Send Business Oregon your comments at Oregon.CHIPS@oregon.gov.

2040 SHERWOOD COMPREHENSIVE PLAN

ATTRACTIVE AND ATTAINABLE HOUSING

DRAFT BACKGROUND REPORT

JULY 15, 2020

I. Introduction

Context

In past years, Sherwood has been one of the fastest growing cities in Oregon. While a bedroom community in the Portland/Vancouver Metropolitan Region, Sherwood's population grew from about 3,000 residents in 1990 to nearly 20,000 residents in 2019. Despite this record growth, Sherwood maintains an exceptional quality of life, driven by access to renowned schools, quality medical services, high level of public safety, a unique park and recreation system, a revived central business district, and excellent cultural facilities and community events.

Community Vision and Goals

In 2018, the City conducted a visioning process for the Comprehensive Plan Update and the community identified the desire for "*attractive and attainable housing*." This theme will constitute a section of the City's updated Comprehensive Plan. The vision states:

> *"By 2040, Sherwood aims to develop a range of housing choices for a diversity of ages and income levels, providing community members the ability to live in Sherwood throughout all stages of life."*

Purpose

The City of Sherwood is preparing a series of background reports intended to inform community conversations about Sherwood's future. This report explores the topic of housing in Sherwood, recapping the major themes and policy questions identified in the City's Housing Needs Analysis (HNA) for the 2019 to 2039 period. The housing needs analysis provides Sherwood with a factual basis to support future planning efforts related to housing and prepares to update and revise the City's Comprehensive Plan policies. The HNA was updated for the Sherwood West Preliminary Concept Plan in 2015, and then again in 2019 as part of the City's UGB expansion request, which was ultimately withdrawn by City Council. The HNA will need to be adopted prior to, or as part of, the Comprehensive Plan adoption process.

The housing needs analysis is intended to comply with requirements of statewide planning policies that govern planning for housing and residential development (Statewide Planning Goal 10), its implementing Metropolitan Housing Rule (OAR 660-007), and Metro's 2040 Functional Growth Management Plan. Taken together, the City's primary obligations are to:

(1) designate land in a way that provides the opportunity for 50% of new housing to be either multifamily or single-family attached housing (e.g., townhouses);

(2) achieve an average density of six dwelling units per net acre; and

(3) provide enough land to accommodate forecasted housing needs for the next 20 years.

Sherwood is already in compliance with these requirements and can accommodate most of the new housing forecast, based on existing conditions, assets and trends as described in the following sections. Key policy questions, and potential housing goals and design principles, are offered at the

end of this report. To help support discussion, Appendix A includes a suite of cut sheets for different housing types that exist, or could exist, in Sherwood, based on the community's 2040 vision statement.

How has Sherwood's Population Changed in Recent Years?

The basis for the housing needs analysis is an understanding of the demographic characteristics of Sherwood's residents.[1]

- **Sherwood's population grew relatively fast in recent years.** Sherwood's population increased from 3,000 people in 1990 to nearly 18,600 people in 2013, averaging 8% annual growth. Sherwood's fastest period of growth was during the 1990s, consistent with statewide trends. Between 2000-2013, Sherwood grew by 6,600 people, at an average rate of nearly 3.5% per year. For comparison, Washington County grew at 2.5% annually between 1990-2013 and the Portland Region grew at 1.6% per year.
- **Sherwood's population is aging.** People aged 45 years and older were the fastest growing age group in Sherwood between 2000 and 2010, consistent with state and national trends. By 2035, people 60 years and older will account for 24% of the population in Washington County (up from 18% in 2015) and 25% in the Portland Region (up from 19% in 2015). It is reasonable to assume that the share of people 60 years and older will grow relatively quickly in Sherwood as well.
- **Sherwood is attracting younger people and more households with children**. In 2010, the median age in Sherwood was 34.3 years old, compared to Washington County's median age of 35.3 years and the State median of 38.4. Sherwood has a larger share of households with children (47% of households), compared with Washington County (33%) or the Portland Region (29%). The Millennial generation—people born roughly between 1980 to 2000—are the largest age group in Oregon and will account for the majority of household growth in Sherwood over the next 20 years.
- **Sherwood's population is becoming more ethnically diverse.** About 6% of Sherwood's population is Latino, an increase from 4.7% in 2000. In comparison to Washington County and the Portland Region, Sherwood is less ethnically diverse. In the 2009-2013 period, 16% of Washington County residents, and 12% Portland Region residents, were Latino.

What Factors May Affect Future Growth in Sherwood?

If these trends continue, population will result in changes in the types of housing demanded or "needed" in Sherwood in the future.

- **The aging of the population is likely to result in increased demand for smaller single-family housing, multifamily housing, and housing for seniors.** People over 65 years old

[1] The majority of data quoted in this analysis is from the U.S. Census American Community survey, with population data from the Population Research Center at Portland State University and development data from the City's Building Permit database.

will make a variety of housing choices, including: remaining in their homes as long as they are able, downsizing to smaller single-family homes (detached and attached) or multifamily units, or moving into group housing (such as assisted living facilities or nursing homes) as they continue to age.

- **The growth of younger and diversified households is likely to result in increased demand for a wider variety of housing, affordable and appropriate for families with children, such as small single-family housing, townhouses, duplexes, and multifamily housing.** If Sherwood continues to attract young residents, then it will continue to have demand for housing for families, especially housing affordable to younger families with moderate incomes. Growth in this population will result in growth in demand for both ownership and rental opportunities, with an emphasis on housing that is comparatively affordable.[2]
- **Changes in commuting patterns could affect future growth in Sherwood.** Sherwood is part of a complex, interconnected regional economy. Demand for housing by workers at businesses in Sherwood may change with significant fluctuations in fuel and commuting costs, as well as substantial decreases in the capacity of highways to accommodate commuting.
- **Sherwood households have relatively high income, which affects the type of housing that is affordable, particularly for young people and new families.** Income is a key determinant of housing choice. Sherwood's median household income ($78,400) is more than 20% higher than Washington County's median household income ($64,200). In addition, Sherwood has a smaller share of population below the federal poverty line (7.6%) than the averages of Washington County (11.4%) and the Portland Region (13.9%).

What are the Characteristics of Sherwood's Housing Market?

The existing housing stock in Sherwood, homeownership patterns, and existing housing costs will shape changes in Sherwood's housing market in the future.

- **Sherwood's housing stock is predominantly single-family detached.** About 75% of Sherwood's housing stock is single-family detached, 8% is single-family attached (such as townhomes), and 18% is multifamily (such as duplexes or apartments). Sixty-nine percent of new housing permitted in Sherwood between 2000 and 2014 was single-family detached housing.
- **Almost three quarters of Sherwood's residents own their homes.** Homeownership rates in Sherwood are above Washington County (54%), the Portland Region (60%), and Oregon (62%) averages.

[2] The housing needs analysis assumes that housing is affordable if housing costs are less than 30% of a household's gross income. For a household earning $65,000, monthly housing costs of less than $1,960 are considered affordable.

- **Homeownership costs increased in Sherwood, consistent with national trends.** Median sales prices for homes in Sherwood increased by about 30% between 2004 and 2014, from about $245,000 to $316,500. The median home value in Sherwood is 3.8 times the median household income, up from 2.9 times the median household income in 2000.
- **Housing sales prices are higher in Sherwood than the regional averages.** As of January 2015, median sales price in Sherwood was $316,500, which is higher than the Washington County ($281,700), the Portland MSA ($269,900), and Oregon ($237,300) median sales prices. Median sales prices were higher in Sherwood than in other Portland westside communities such as Tigard, Tualatin, and Beaverton, but lower than Wilsonville or West Linn. The average price per square foot in Sherwood is also higher than Portland westside communities.
- **Rental costs are higher overall in Sherwood than the regional averages.** The median rent in Sherwood was $1,464, compared to Washington County's average of $1,270.
- **More than one-third of Sherwood's households are cost-burdened.** Thirty-eight percent of Sherwood's households were cost-burdened (i.e., paid more than 30% of their income on rent or homeownership costs). Renters were more likely to be cost-burdened (40% of renters were cost-burdened), compared to homeowners (35% were cost-burdened) in Sherwood. These levels of cost burden are consistent with regional averages. In Washington County in the 2009-2013 period, 38% of households were cost burdened, compared to 41% in the Portland Region.

Future housing affordability will depend on the relationship between income and housing price. The key question is whether housing prices will continue to outpace income growth. Answering this question is difficult because of the complexity of the factors that affect both income growth and housing prices. Sherwood will need to provide the opportunity for development of a wider variety of housing, including housing affordable to low- and moderate-income households.

How much Housing Growth is Forecast, and can that Growth be Accommodated within Sherwood?

As required by state law, household growth in Sherwood is based on Metro's coordinated forecast. The forecast includes growth in both areas within the city limits, as well as areas currently outside the city limits that the City expects to annex for residential uses (most notably the Brookman area).

- **Sherwood is forecast to add 1,728 new households between 2019 and 2039.** Of these, 700 new households are inside the existing city limits; 1,029 new households are outside the current city limits in the Brookman Area.
- **Sherwood's land base can accommodate most of the forecast for growth.** Vacant and partially vacant land in the Sherwood Planning Area has capacity to accommodate 1,121 new dwelling units. Sherwood can accommodate about 65% of the forecast for new housing in areas within the city limits and Brookman Area.

- **Sherwood has a deficit of land for housing.** Sherwood has a deficit of land for 608 dwelling units. The largest deficits are in Medium Density Residential-Low (154 dwelling units), Medium Density Residential-High (252 dwelling units), and High Density Residential (145 dwelling units).
- **To provide adequate land supply, Sherwood will need to continue to annex the Brookman area and plan for Sherwood West.** Without the Brookman area developing, the City has a projected deficit of about 1,155 dwelling units. Sherwood will need to continue to annex the Brookman area in order to accommodate the City's forecast of residential growth. The City recently annexed about 98 acres in the Brookman Area. The annexed land is in the center of the Brookman Area and has relatively few owners (about 8 property owners). Annexing and developing other areas, with a larger number of owners, may be more challenging, to the extent that the property owners have to come to agreement about development.

What if Sherwood Grows Faster?

- **The forecast for growth in Sherwood is considerably below historical growth rates.** Metro's forecast for new housing in Sherwood shows that households will grow at an average annual growth rate of 1.1% per year. In comparison, Sherwood's population grew at 3.4% per year between 2000 and 2013 and 8% per year between 1990 and 2013. If Sherwood grows faster than Metro's forecast during the 2019 to 2039 period, then Sherwood will have a larger deficit of land needed to accommodate growth.
- **At faster growth rates, Sherwood's land base has enough capacity for several years of growth.** At growth rates between 2% to 4% of growth annually, land inside the Sherwood city limits can accommodate two to five years of growth. With capacity in the Brookman Area, Sherwood can accommodate four to ten years of growth at these growth rates.
- **Additional housing growth in Sherwood depends the availability of development-ready land.** The amount of growth likely to happen in Sherwood over the next few years is largely dependent on how the Brookman Area is annexed, when the Sherwood West area is brought into the urban growth boundary and annexed, and when urban services (such as roads, water, and sanitary sewer) are developed in each area. The City recently annexed about 98 acres in the Brookman Area.

What are the Implications for Sherwood's Housing Policies?

- **Sherwood will need Sherwood West to accommodate future growth beyond the existing city limits and Brookman area.** The growth rate of Metro's forecast for household growth (1.1% average annual growth) is considerably lower than the City's historical population growth rate over the last two decades (8% average annual growth). Metro's forecast includes growth that can be generally accommodated within the Sherwood city

limits and Brookman. Given the limited supply of buildable land within Sherwood, it is likely that the City's residential growth will slow until Sherwood West is development ready.

- **Sherwood has a relatively limited supply of land for moderate- and higher-density multifamily housing.** The limited supply of land in these zones is a barrier to development of townhouses and multifamily housing, which are needed to meet housing demand resulting from growth of people over 65, young families, and moderate-income households.

Key Policy Questions for Consideration

The results of the Housing Needs Analysis highlight questions for the update of the City's Comprehensive Plan. The following are some key policy questions to consider, followed by additional information to help guide understanding and discussion.

- Providing housing opportunities for first time home buyers and community elders (who prefer to age in place or downsize their housing) will require a range of housing types. Examples of these housing types include: single family homes on smaller lots, clustered housing, cottages or townhomes, duplexes, tri-plexes, four-plexes, garden apartments, or mid-rise apartments. Where should Sherwood consider providing a wider range of housing types? What types of housing should Sherwood plan for?
- Changes in demographics and income for Sherwood and regional residents will require accommodating a wider range of housing types. How many of Sherwood's needed units should the city plan to accommodate within the city limits? How much of Sherwood's needed units should be accommodated in the Brookman Area and in Sherwood West?
- What design features and greenspaces would be important to consider for new housing?
- What other design standards would be needed to "keep Sherwood *Sherwood*"?
- What is the appropriate mix of residential land and employment land in the city to balance the city's tax base?

Housing Goals and Design Principles for Consideration

Given the information outlined in this background report, and to help guide discussion around these key policy questions, the following suggests potential neighborhood design principles and goals for enabling a variety of housing options in Sherwood, as per the community's 2040 vision statement. The following may help guide updates to policy language in the Housing element of the City's Comprehensive Plan.

Potential Sherwood Neighborhood Design Principles

- Cultivate a mix of housing types, including missing middle and multi-family residences that are designed in a way to increase density and preserve neighborhood character.
- Create walkable neighborhoods that respond to their surrounding landscape.

- Provide safe and effortless connectivity to schools, parks, and commercial centers for pedestrians, cyclists, and cars.
- Enhance existing natural assets and integrate greenspaces and parks into new development.
- Enhance Sherwood's small-town character and historic core through human scale development that is accessible and inviting to all.

Potential goals for enabling a variety of housing options

- Encourage a variety of housing types and sizes that offer options at multiple price points and contribute positively to the character of the neighborhood and walkable streetscape.
- Provide housing type options that transition between mixed-use and multi-family zones and single-family zones.
- Provide housing alternatives for community members that are older, younger, single-parent households and anyone that would prefer a smaller dwelling.
- Provide housing type options that increase density while maintaining consistency of building scale and character with existing single-family dwellings.
- Provide attractive and highly functional open spaces that benefit residents and enhance the walking experience within the neighborhood.
- Promote cohesive architecture that is visually appealing, context sensitive and uses high-quality building materials.
- Minimize the impact of vehicular uses on the pedestrian environment and adjacent properties.
- Promote massing, scale and architectural features of new dwellings that contribute to the envisioned neighborhood pattern and address compatibility and transitions between developments.

APPENDIX A. Housing Type Cut Sheets

The following cut sheets provide an overview of various housing types, some of which may or may not already exist in Sherwood. These cut sheets provide information on each housing type and their general design principles in order to provide a foundational understanding of residential development patterns in Sherwood.

As Sherwood updates the City's Comprehensive Plan, the development potential for each of the housing types within the *current* development context will change with shifts in the regional housing market and with development in Sherwood. For example, a regional or national recession may slow population growth and demand for housing in Sherwood. Alternatively, development of one or more of the housing types below may make future development of the same or similar housing types more likely, if development is successful.

Accessory-Dwelling Units (ADUs)

Separate, private dwellings that are secondary to a primary dwelling on a property and can be developed as a detached structure or integrated with the main dwelling in a basement, attic, or addition.

- Development standards often require ADUs to match the scale, architectural form, and materials of the primary dwelling.
- Small (typically 300-800sf) dwellings that provide kitchen, bathroom, bedroom or loft, and are often targeted towards single residents, empty-nesters, or small families.
- ADUs are flexible to fit on a variety of sites with different access options, such as ADUs built above a garage accessed by an alleyway bisecting a block.

DESIGN AND CHARACTER PRINCIPLES

ADUs are well-suited for corner lots, where a separate street access can be provided, and the structure helps fill in the fabric of the neighborhood.

ADUs can be **located on properties in a variety of ways** and provide flexible options to bolster neighborhood character and increase housing stock.

New home construction can include ADUs in the primary structure, such as in these narrow-lot homes that include ground-floor ADUs accessed via a shared center pathway.

SHERWOOD EXAMPLES

ADU addition above a garage

Detached ADU

A variety of stand-along, attached, and attic/basement ADUs exist throughout Sherwood and are permitted on single-family lots.

No. of Dwellings
One dwelling per ADU

Lot Size
Varies, as ADUs are constructed on existing home lots

Dwelling Size
200-800sf typically

Approx. Density
One or more can be permitted on a lot and usually don't count against density regulations.

Building Size
Varies; may be a small shed or garage conversion, a larger stand-alone structure, or part of a primary dwelling

Single Family

A detached, stand-alone house on its own lot, single family homes can vary greatly in size, design style, lot size, bedroom count, features, and numerous other details.

- Usually defined as a stand-along structure with private garage or surface parking and private outdoor yards.
- Contemporary designs may include smaller lots, alley-access parking, and accessory-dwellings units built as part of original construction.
- Development and design standards establish some restrictions, but single-family homes often vary greatly in size and style even within neighborhoods and blocks, from traditional to modern, and designed to suit a variety of household compositions.

DESIGN AND CHARACTER PRINCIPLES

Homes set on relatively smaller lots can make use of **varied facades, recessed parking, and numerous materials** to reduce the perceived bulk of the structure and make a more walkable neighborhood.

New subdivision homes often draw **design influence from their regional setting**, such as these new houses in Central Oregon, using rustic materials and featuring alley-access parking.

Infill and new construction homes emphasize modern designs, are often set closer to the street, and may prioritize backyard open space.

SHERWOOD EXAMPLES

SW Windrow Ln.
Zone: HDR - PUD
Dwelling Size: approx. 1,900sf
Lot Size: approx. 2,600sf

SW Handley St.
Zone: HDR
Dwelling Size: approx. 3,000sf
Lot Size: approx. 8,200sf

Single family homes comprise most of Sherwood's housing stock and vary widely from century-old homes to new-construction subdivisions, and from small-lots to large, rural-feeling lots.

No. of Dwellings
One per lot, with accessory dwelling units permitted in Sherwood on all single-family lots

Lot Size
Typically 2,000-10,000sf or more depending on the setting

Dwelling Size
800-3,000sf or more

Approx. Density
5-18 dwellings per acre on a net basis

Building Size
Can vary significantly but usually designed for compatibility with adjacent housing and structures

Duplex

A small, typically 1-2.5 story structure that contains two separate dwelling units on one lot.

- Duplexes often look very similar to single-family home, making them well-suited as infill compatible with existing neighborhoods.
- Cities may choose to define duplexes as two detached dwellings occupying a single lot or parcel.
- Duplexes may also be created by interior division of an existing home, ensuring to provide separate entrances and other requirements such as kitchens and bathrooms in each.

DESIGN AND CHARACTER PRINCIPLES

Duplexes can generally match existing single-family homes in height and scale, and are **ideal for corner lots** with multiple access points.

Rear-access parking from an alley (if present) helps provide an appealing front façade and contributes to a safer walking environment.

Internal conversions turn one home into two within the character of a single-family home. This example uses one main entrance, which then connects to upper and lower dwellings.

SHERWOOD EXAMPLES

SW Daffodil St.
Zone: HDR
Dwelling Size: approx.. 1,400sf per unit
Lot Size: approx. 4,500sf per unit

SW Windflower Ave.
Zone: HDR
Dwelling Size: approx.. 1,000sf per unit
Lot Size: approx. 4,000sf per unit

Sherwood's duplex-style homes are mostly found in 1990s-era subdivisions where every home is two-attached.

No. of Dwellings
Two dwellings per lot; multiple buildings can be adjacent

Lot Size
Typically 4,000-10,000sf per duplex

Dwelling Size
600-2,400sf per dwelling

Approx. Density
8-15 dwellings per acre

Building Size
Can vary significantly but usually designed for compatibility with adjacent housing and structures

Triplex and Quadplex

Three or four dwellings arranged in either attached or detached structures on one lot.

- Ideal for both infill and new subdivision development as they maintain a single-family character while providing a broader range of dwelling sizes and price-points.
- Shared open space and consolidated driveways can help create a walkable environment with minimal vehicle conflict points.
- Dwellings can be stacked or side-by-side in a variety of configurations.

DESIGN AND CHARACTER PRINCIPLES

Varied rooflines and facades help create a small-scale home look and feel.

A shared sidepath provides access to 3 of the units in this quadplex, allowing the building to present a **well-scaled front façade** to the street.

A variety of parking options (front access, or none) provides unit type and cost variety.

Patios and porches provide private outdoor space.

SHERWOOD EXAMPLES

SW Pine (used as four apartments)
Zone: MDRH
Dwelling Size: approx. 2,900sf total
Lot Size: approx. Unknown

Triplexes and quadplexes are rare in Sherwood, especially in new construction. Most examples are small apartment units without contemporary design features.

No. of Dwellings
3 or 4 per property

Lot Size
4,000-10,000sf

Dwelling Size
8,00-1,800sf per dwelling

Approx. Density
20-30 dwellings per acre on net

Building Size
Generally matches the proportions and design qualities of single-family homes, at a somewhat larger overall scale

Townhome

A small- to medium-sized building usually containing 2-8 attached single-family homes. Often arranged in groupings along a public street or an interior street, with each dwelling having an individual street-facing entry.

- Smaller townhome groupings can be used as infill, compatible with existing neighborhoods.
- Townhomes help support a walkable, urban fabric along corridors, neighborhood centers, and parks.
- Townhomes can provide a moderate-density single-family option in subdivisions and new development.

DESIGN AND CHARACTER PRINCIPLES

Entryway patios and front doors create a **traditional and compatible building presence** on the street

Varied building fronts create more interesting design

Landscape and pathways enhance the site design in this townhouse courtyard

Rear- or interior-access parking minimizes street-side impacts and creates appealing front facades – this option is most feasible on larger, deeper lots that have room for internal driveways

SHERWOOD EXAMPLES

SW Berkshire Terrace
Zone: HDR – PUD
Dwelling Size: approx. 1,600sf
Lot Size: approx. 1,500sf

SW Vinter Lane
Zone: HDR
Dwelling Size: approx. 1,600-1,900sf
Lot Size: approx. 1,750-2,500sf

Many of Sherwood's newer townhomes are part of PUD (planned-unit development) subdivisions.

Most are suburban in character, with front garages, wide lots for the townhouse type, and containing three or more bedrooms.

No. of Dwellings
2-8 per attached grouping; Sherwood limits townhomes to six units per cluster

Lot Size
1,500-3,000sf per dwelling

Dwelling Size
1,000-2,400sf

Approx. Density
Up to 20-24 dwellings per acre

Building Size
Each dwelling typically 2-3 stories and attached in blocks of 2-8 dwellings

Cottage Cluster / Pocket Neighborhood

Generally, 8 or more cottage or small-home detached or attached dwellings clustered around common open spaces and shared low- or no-vehicle streets.

- Cottage clusters often use accessible pathways to link homes to parking areas located on the edges of the site in order to be non-intrusive.
- Dwellings are typically 600-1,000 square feet are rarely exceed 2 stories.
- The size of cottage clusters usually requires a larger lot, or the assembly of multiple lots.

DESIGN AND CHARACTER PRINCIPLES

Quality designs and materials and efficient units layouts create for **intimate, invitingly-scaled homes** and cluster configurations.

Cottage cluster designs should take cues from the **context and ecology of the site**, working around tree groves, wetlands, and other natural features.

Parking on the outer edges of the site allow **pathways and safe, kid-friendly open spaces** to link between cottages and common buildings.

SHERWOOD EXAMPLES

Sherwood does not contain any cottage *cluster development*.

No. of Dwellings
6-12 per cluster; multiple clusters may be placed on a site

Lot Size
10,000-20,000sf per cluster

Dwelling Size
Up to 1,400sf

Approx. Density
8-24 dwellings per acre

Building Size
Generally smaller average homes sizes of 1-2 stories; multiple dwellings may be attached within the cluster

Courtyard

Multiple dwellings placed side-by-side or stacked in a 1-3 story building oriented around a shared courtyard.

- The courtyard provides shared open space and access to dwellings and can be made more or less private to the street depending on surrounding activity and needs for privacy.
- The typical U-shape pattern can be formed by a single building or multiple buildings oriented around the courtyard; this shape provides daylight access and privacy for units while giving most or all dwellings a view on the central courtyard.
- The size of courtyard housing usually requires a larger lot, or the assembly of multiple lots.

DESIGN AND CHARACTER PRINCIPLES

Central courtyards can be fully enclosed for privacy, and may include usable open spaces and sustainable site features such as stormwater catchment.

Entryways and patios overlooking the courtyard ensure foot traffic and visibility on common areas.

Locating parking on the edges of the site (not shown in this photo) allows **buildings to form naturally around courtyard areas** and pedestrian routes.

SHERWOOD EXAMPLES

Cedar Creek Village
Zone: HDR
Dwelling Size: Unknown
Lot Size: approx. 4.8 acres

Triplexes and quadplexes are rare in Sherwood, especially in new construction. Most examples are small apartment units without contemporary design features.

No. of Dwellings
8-16 dwellings, typically

Lot Size
10,000-40,000sf per apartment grouping

Dwelling Size
600-1,400sf

Approx. Density
16-25 dwellings per acre

Building Size
Can vary significantly in size and number to better blend into neighborhood and commercial nodes

Small Multifamily

Medium-size structures providing between 6 and 20 or more dwellings, usually no more than 3 stories, and efficient unit sizes of 300-700sf in studio, one-bedroom, or two-bedroom configurations.

- Heights similar or only slightly exceeding the neighborhood context help match scale and character.
- Parking, if provided, is best hidden to the side or rear of the buildings.
- Multifamily is most suitable as a mid-scale housing product that helps transition between single-family neighborhoods and more dense main streets and downtowns.

DESIGN AND CHARACTER PRINCIPLES

Varied facades, multiple materials, porches, and other design features help break up the scale of these relatively larger buildings within a neighborhood.

Walkup multifamily apartments often use porches, gables roofs, and extensive landscaping to help integrate buildings into existing neighborhood character.

Small multifamily may replace existing, outdated single-family homes to provide **mid-range density and housing options**, especially in areas with recent up-zoning and near transit options and business services.

SHERWOOD EXAMPLES

SW Roy Rogers (mixed-use)
Zone: GC
Dwelling Size: Unknown
Lot Size: approx. 3.4 acres

Creekview Crossing – SW Cedar Brook
Zone: HDR
Dwelling Size: Estimated 1,700sf / unit
Lot Size: 7.4 acres (180 dwellings)

Recent new apartment complexes in Sherwood include mixed-use projects along arterial roads (SW Roy Rogers) and high-density PUD subdivisions comprising numerous small -plexes (Creekview Crossing).

No. of Dwellings
10 to over 100, depending on the size of the development

Lot Size
10,000-25,000sf or more

Dwelling Size
500-1,200sf

Approx. Density
20+ dwellings per acre

Building Size
Usually up to 3 stories and scaled to be a quarter or half block, or less

Executive Summary

This is an executive summary of the findings of the Sherwood Housing Needs Analysis for the 2019 to 2039 period. The housing needs analysis provides Sherwood with a factual basis to support future planning efforts related to housing, including Concept Planning for Sherwood West, and prepares to update and revise the City's Comprehensive Plan policies.

The housing needs analysis is intended to comply with requirements of statewide planning policies that govern planning for housing and residential development, Goal 10, it's implementing Metropolitan Housing Rule (OAR 660-007), and Metro's 2040 Functional Growth Management Plan. Taken together, the City's primary obligations from Goal 10 are to (1) designate land in a way that provides the opportunity for 50% of new housing to be either multifamily or single-family attached housing (e.g., townhouses); (2) achieve an average density of six dwelling units per net acre; and (3) provide enough land to accommodate forecasted housing needs for the next 20 years. Sherwood is able to meet these requirements and can accommodate most of the new housing forecast, as described in this summary.

How has Sherwood's Population Changed in Recent Years?

The basis for the housing needs analysis is an understanding of the demographic characteristics of Sherwood's residents.[1]

- **Sherwood's population grew relatively fast in recent years.** Sherwood's population increased from 3,000 people in 1990 to nearly 18,600 people in 2013, averaging 8% annual growth. Sherwood's fastest period of growth was during the 1990s, consistent with statewide trends. Between 2000-2013, Sherwood grew by 6,600 people, at an average rate of nearly 3.5% per year. For comparison, Washington County grew at 2.5% annually between 1990-2013 and the Portland Region grew at 1.6% per year.

- **Sherwood's population is aging.** People aged 45 years and older were the fastest growing age group in Sherwood between 2000 and 2010, consistent with state and national trends. By 2035, people 60 years and older will account for 24% of the population in Washington County (up from 18% in 2015) and 25% in the Portland Region (up from 19% in 2015).

[1] The majority of data quoted in this analysis is from the U.S. Census American Community survey, with population data from the Population Research Center at Portland State University and development data from the City's Building Permit database.

It is reasonable to assume that the share of people 60 years and older will grow relatively quickly in Sherwood as well.

- **Sherwood is attracting younger people and more households with children**. In 2010, the median age in Sherwood was 34.3 years old, compared to Washington County's median age of 35.3 years and the State median of 38.4. Sherwood has a larger share of households with children (47% of households), compared with Washington County (33%) or the Portland Region (29%). The Millennial generation—people born roughly between 1980 to 2000—are the largest age group in Oregon and will account for the majority of household growth in Sherwood over the next 20 years.

- **Sherwood's population is becoming more ethnically diverse.** About 6% of Sherwood's population is Latino, an increase from 4.7% in 2000. In comparison to Washington County and the Portland Region, Sherwood is less ethnically diverse. In the 2009-2013 period, 16% of Washington County residents, and 12% Portland Region residents, were Latino.

WHAT FACTORS MAY AFFECT FUTURE GROWTH IN SHERWOOD?

If these trends continue, population will result in changes in the types of housing demanded or "needed" in Sherwood in the future.

- **The aging of the population is likely to result in increased demand for smaller single-family housing, multifamily housing, and housing for seniors.** People over 65 years old will make a variety of housing choices, including: remaining in their homes as long as they are able, downsizing to smaller single-family homes (detached and attached) or multifamily units, or moving into group housing (such as assisted living facilities or nursing homes) as they continue to age.

- **The growth of younger and diversified households is likely to result in increased demand for a wider variety of affordable housing appropriate for families with children, such as small single-family housing, townhouses, duplexes, and multifamily housing.** If Sherwood continues to attract young residents, then it will continue to have demand for housing for families, especially housing affordable to younger families with moderate incomes. Growth in this population will result in growth

in demand for both ownership and rental opportunities, with an emphasis on housing that is comparatively affordable.[2]

- **Changes in commuting patterns could affect future growth in Sherwood.** Sherwood is part of a complex, interconnected regional economy. Demand for housing by workers at businesses in Sherwood may change with significant fluctuations in fuel and commuting costs, as well as substantial decreases in the capacity of highways to accommodate commuting.

- **Sherwood households have relatively high income, which affects the type of housing that is affordable.** Income is a key determinant of housing choice. Sherwood's median household income ($78,400) is more than 20% higher than Washington County's median household income ($64,200). In addition, Sherwood has a smaller share of population below the federal poverty line (7.6%) than the averages of Washington County (11.4%) and the Portland Region (13.9%).

WHAT ARE THE CHARACTERISTICS OF SHERWOOD'S HOUSING MARKET?

The existing housing stock in Sherwood, homeownership patterns, and existing housing costs will shape changes in Sherwood's housing market in the future.

- **Sherwood's housing stock is predominantly single-family detached.** About 75% of Sherwood's housing stock is single-family detached, 8% is single-family attached (such as townhomes), and 18% is multifamily (such as duplexes or apartments). Sixty-nine percent of new housing permitted in Sherwood between 2000 and 2014 was single-family detached housing.

- **Almost three quarters of Sherwood's residents own their homes.** Homeownership rates in Sherwood are above Washington County (54%), the Portland Region (60%), and Oregon (62%) averages.

- **Homeownership costs increased in Sherwood, consistent with national trends.** Median sales prices for homes in Sherwood increased by about 30% between 2004 and 2014, from about $245,000 to $316,500. The median

[2] The housing needs analysis assumes that housing is affordable if housing costs are less than 30% of a household's gross income. For a household earning $6,500 (the median household income in Sherwood), monthly housing costs of less than $1,960 are considered affordable.

home value in Sherwood is 3.8 times the median household income, up from 2.9 times the median household income in 2000.

- **Housing sales prices are higher in Sherwood than the regional averages.** As of January 2015, median sales price in Sherwood was $316,500, which is higher than the Washington County ($281,700), the Portland MSA ($269,900), and Oregon ($237,300) median sales prices. Median sales prices were higher in Sherwood than in other Portland westside communities such as Tigard, Tualatin, and Beaverton, but lower than Wilsonville or West Linn.

- **Rental costs are higher overall in Sherwood than the regional averages.** The median rent in Sherwood was $1,064, compared to Washington County's average of $852.

- **More than one-third of Sherwood's households have housing affordability problems.** Thirty-eight percent of Sherwood's households were cost-burdened (i.e., paid more than 30% of their income on rent or homeownership costs). Renters were more likely to be cost-burdened (40% of renters were cost-burdened), compared to homeowners (35% were cost-burdened) in Sherwood. These levels of cost burden are consistent with regional averages. In Washington County in the 2009-2013 period, 38% of households were cost burdened, compared to 41% in the Portland Region.

  Future housing affordability will depend on the relationship between income and housing price. The key question is whether housing prices will continue to outpace income growth. Answering this question is difficult because of the complexity of the factors that affect both income growth and housing prices. Sherwood will need to provide the opportunity for development of a wider variety of housing, including housing affordable to low- and moderate-income households.

How Much Housing Growth is Forecast, and Can that Growth be Accommodated within Sherwood?

The housing needs analysis in this report is based on Metro's coordinated forecast of household growth in Sherwood. The forecast includes growth in both areas within the city limits, as well as areas currently outside the city limits that the City expects to annex for residential uses (most notably the Brookman area).

- **Sherwood is forecast to add 1,728 new households between 2019 and 2039.** Of these, 700 new households are inside the existing city limits; 1,029 new households are outside the current city limits in the Brookman Area.

- **Sherwood's land base can accommodate most of the forecast for growth.** Vacant and partially vacant land in the Sherwood Planning Area has capacity to accommodate 1,121 new dwelling units. Sherwood can accommodate about 65% of the forecast for new housing on areas within the city limits and Brookman Area.

- **Sherwood has a deficit of land for housing.** Sherwood has a deficit of land for 608 dwelling units. The largest deficits are in Medium Density Residential-Low (154 dwelling units), Medium Density Residential-High (252 dwelling units), and High Density Residential (145 dwelling units).

- **To provide adequate land supply, Sherwood will need to continue to annex the Brookman area.** Without the Brookman area developing, the City has a projected deficit of about 1,155 dwelling units. Sherwood will need to continue to annex the Brookman area in order to accommodate the City's forecast of residential growth. The City recently annexed about 98 acres in the Brookman Area. The annexed land is in the center of the Brookman Area and has relatively few owners (about 8 property owners). Annexing and developing other areas, with a larger number of owners, may be more challenging, to the extent that the property owners have to come to agreement about development.

What if Sherwood Grows Faster?

- **The forecast for growth in Sherwood is considerably below historical growth rates.** Metro's forecast for new housing in Sherwood shows that households will grow at an average annual growth rate of 1.1% per year. In comparison, Sherwood's population grew at 3.4% per year between 2000 and 2013 and 8% per year between 1990 and 2013. If Sherwood grows faster than Metro's forecast during the 2019 to 2039 period, then Sherwood will have a larger deficit of land needed to accommodate growth.

- **At faster growth rates, Sherwood's land base has enough capacity for several years of growth.** At growth rates between 2% to 4% of growth annually, land inside the Sherwood city limits can accommodate two to five years of growth. With capacity in the Brookman Area, Sherwood can accommodate four to ten years of growth at these growth rates.

- **Additional housing growth in Sherwood depends the availability of development-ready land.** The amount of growth likely to happen in Sherwood over the next few years is largely dependent on when the Brookman Area is annexed, when the Sherwood West area is brought into the urban growth boundary and annexed, and when urban services (such as roads, water, and sanitary sewer) are developed in each area. The City recently annexed about 98 acres in the Brookman Area.

WHAT ARE THE IMPLICATIONS FOR SHERWOOD'S HOUSING POLICIES?

- **Sherwood will need Sherwood West to accommodate future growth beyond the existing city limits and Brookman area.** The growth rate of Metro's forecast for household growth (1.1% average annual growth) is considerably lower than the City's historical population growth rate over the last two decades (8% average annual growth). Metro's forecast includes growth that can be generally accommodated within the Sherwood city limits and Brookman. Given the limited supply of buildable land within Sherwood, it is likely that the City's residential growth will slow until Sherwood West is made development-ready.
- **Sherwood has a relatively limited supply of land for moderate- and higher-density multifamily housing.** The limited supply of land in these zones is a barrier to development of townhouses and multifamily housing, which are needed to meet housing demand resulting from growth of people over 65, young families, and moderate-income households.
- **The results of the Housing Needs Analysis highlight questions for the update of the City's Comprehensive Plan and the Concept Planning of Sherwood West.**
    - Providing housing opportunities for first time home buyers and community elders (who prefer to age in place or downsize their housing) will require a wider range of housing types. Examples of these housing types include: single family homes on smaller lots, clustered housing, cottages or townhomes, duplexes, tri-plexes, four-plexes, garden apartments, or mid-rise apartments. Where should Sherwood consider providing a wider range of housing types? What types of housing should Sherwood plan for?

- Changes in demographics and income for Sherwood and regional residents will require accommodating a wider range of housing types. How many of Sherwood's needed units should the city plan to accommodate within the city limits? How much of Sherwood's needed units should be accommodated in the Brookman Area and in Sherwood West?
- What design features and greenspaces would be important to consider for new housing?
- What other design standards would be needed to "keep Sherwood Sherwood"?

1 Introduction

This report presents the Sherwood Housing Needs Analysis 2019 to 2039. The housing needs analysis provides Sherwood with a factual basis to support future planning efforts related to housing, including Concept Planning for Sherwood West, and prepares to update and revise the City's Comprehensive Plan policies. This report was based on the draft Sherwood Housing Needs Analysis 2015 to 2035 report, from June 2015.

It is intended to comply with statewide planning policies that govern planning for housing and residential development, Goal 10, OAR 660-007, and Metro's Functional Growth Management Plan. The methods used for this study generally follow the *Planning for Residential Growth* guidebook, published by the Oregon Transportation and Growth Management Program (1996).

This report provides Sherwood with a factual basis to support future planning efforts related to housing and options for addressing unmet housing needs. It provides specific analysis that is required for a jurisdiction in Oregon to comply with state policies.

Background

Sherwood is located at the southwestern edge of the Portland metropolitan urban growth boundary (UGB). Over the 2000 to 2014 period, Sherwood had a substantial amount of residential growth. Residential development included all of the different housing types with single family detached housing concentrated in the 2000 to 2005 period. In part due to this growth and limited land supply for new homes, Sherwood is embarking on a Concept Plan for the Sherwood West urban reserve. Concurrently, the City is updating its factual basis for an eventual update of its Comprehensive Plan.

This housing needs analysis provides a factual basis to inform both an update of the residential Comprehensive Plan polices and the Concept Plan for Sherwood West. This analysis provides:

- Information about the characteristics of Sherwood's housing market, in the context of Washington County, the Portland metropolitan region, and Oregon,
- Information about the types and density of housing developed since 2000, changes in homeownership patterns,
- Changes in housing cost and affordability, and other housing market characteristics; and
- A forecast of residential growth in Sherwood for the 2019 to 2039 period.

As required by OAR 660-024, this forecast is based on Metro's household forecast and demographics and economic trends that will affect housing demand over the next 20 years.

ORGANIZATION OF THE REPORT

The main body of this report presents a summary of key data and analysis used in the housing needs analysis. The appendices present detailed tables and charts for the housing needs analysis. This document is organized as follows:

- **Chapter 2. Historical and Recent Development Trends** presents a high-level summary of residential development in Sherwood.
- **Chapter 3. Housing Demand and Need** presents a housing needs analysis consistent with requirements in the Planning for Residential Growth Workbook. Detailed tables and charts supporting the demographic and other information discussed in Chapter 4 is presented in Appendix B.
- **Chapter 4. Residential Land Sufficiency** estimates the residential land sufficiency in Sherwood needed to accommodate expected growth over the planning period.
- **Appendix A. Residential Buildable Land Inventory Report**
- **Appendix B. Trends Affecting Housing Need in Sherwood**

FRAMEWORK FOR A HOUSING NEEDS ANALYSIS

People view homes and communities in a wide range of ways. Economists view housing as a bundle of services for which people are willing to pay. Shelter is one service, but housing typically also includes:

- Proximity to other attractions (job, shopping, recreation),
- Amenities (type and quality of fixtures and appliances, landscaping, views), prestige, and
- Access to public services (quality of schools).

Because it is impossible to maximize all these services and simultaneously minimize costs, households must, and do, make tradeoffs. What individuals can purchase for their money is influenced by individuals' life circumstances as well as economic forces and government policy. Among households and income levels, preferences vary. Attributes homebuyers and renters seek are a function of many factors that may include income, age of household head, number of people and children in the household, number of workers and job locations, educational opportunities, number of automobiles, neighborhood amenities and so on.

Thus, the housing choices of individual households are influenced in complex ways by dozens of factors; and the housing market in the Portland Region, Washington County, and Sherwood is the result of the individual decisions of thousands of households. These points help to underscore the complexity of projecting what types of housing will be built in Sherwood between 2019 and 2039.

The complex nature of the housing market was demonstrated by the unprecedented boom and bust during the past decade. This complexity does not eliminate the need for some type of forecast of future housing demand and need and the resulting implications for land demand and consumption. Such forecasts are inherently uncertain. Their usefulness for public policy often derives more from the explanation of their underlying assumptions about the dynamics of markets and policies than from the specific estimates of future demand and need.

Thus, we begin our housing analysis with a framework for thinking about housing and residential markets, and how public policy affects those markets.

OREGON HOUSING POLICY

Statewide planning Goal 10

Sherwood's primarily obligations under Goal 10 are to:

- Designate land in a way that 50% of new housing could be either multifamily or single-family attached housing (e.g., townhouses)
- Provide opportunities to achieve an average density of six dwelling units per net acre
- Provide opportunities for development of needed housing types: single-family detached, single–family attached, and multifamily housing.

The passage of the Oregon Land Use Planning Act of 1974 (ORS Chapter 197), established the Land Conservation and Development Commission (LCDC), and the Department of Land Conservation and Development (DLCD). The Act required the Commission to develop and adopt a set of statewide planning goals. Goal 10 addresses housing in Oregon and provides guidelines for local governments to follow in developing their local comprehensive land use plans and implementing policies.

At a minimum, local housing policies must meet the requirements of Goal 10 and the statutes and administrative rules that implement it (ORS 197.295 to 197.314, ORS 197.475 to 197.490, and OAR 600-008).[3] Jurisdictions located in the Metro UGB are also required to comply with Metropolitan Housing in OAR 660-007 and Title 7 of Metro's Urban Growth Management Functional Plan in the Metro Code (3.07 Title 7).

Goal 10 requires incorporated cities to complete an inventory of buildable residential lands and to encourage the availability of adequate numbers of housing units in price and rent ranges commensurate with the financial capabilities of its households.

Goal 10 defines needed housing types as "housing types determined to meet the need shown for housing within an urban growth boundary at particular price ranges and rent levels." ORS 197.303 defines needed housing types:

(a) Housing that includes, but is not limited to, attached and detached single-family housing and multiple family housing for both owner and renter occupancy;

(b) Government assisted housing;[4]

(c) Mobile home or manufactured dwelling parks as provided in ORS 197.475 to 197.490; and

(d) Manufactured homes on individual lots planned and zoned for single-family residential use that are in addition to lots within designated manufactured dwelling subdivisions.

[3] ORS 197.296 only applies to cities with populations over 25,000.

[4] Government assisted housing can be any housing type listed in ORS 197.303 (a), (c), or (d).

In summary, Sherwood must identify needs for all of the housing types listed above as well as adopt policies that increase the likelihood that needed housing types will be developed.

The Metropolitan Housing Rule

OAR 660-007 (the Metropolitan Housing rule) is designed to "assure opportunity for the provision of adequate numbers of needed housing units and the efficient use of land within the Metropolitan Portland (Metro) urban growth boundary." OAR 660-0070-005(12) provides a Metro-specific definition of needed housing:

> "Needed Housing" defined. Until the beginning of the first periodic review of a local government's acknowledged comprehensive plan, "needed housing" means housing types determined to meet the need shown for housing within an urban growth boundary at particular price ranges and rent levels.

The Metropolitan Housing Rule also requires cities to develop residential plan designations:

> (1) Plan designations that allow or require residential uses shall be assigned to all buildable land. Such designations may allow nonresidential uses as well as residential uses. Such designations may be considered to be "residential plan designations" for the purposes of this division. The plan designations assigned to buildable land shall be specific so as to accommodate the varying housing types and densities identified in OAR 660-007-0030 through 660-007-0037.

OAR 660-007 also specifies the mix and density of new residential construction for cities within the Metro Urban Growth Boundary (UGB):

> "Provide the opportunity for at least 50 percent of new residential units to be attached single family housing or multiple family housing or justify an alternative percentage based on changing circumstances" (OAR 660-007-0030 (1).

OAR 660-007-0035 sets specific density targets for cities in the Metro UGB. Sherwood average density target is six dwelling units per net buildable acre.[5]

[5] OAR 660-024-0010(6) defines Net Buildable Acres as follows: "Net Buildable Acre" consists of 43,560 square feet of residentially designated buildable land after excluding future rights-of-way for streets and roads.

Metro Urban Growth Management Functional Plan

The Metro Urban Growth Management Functional Plan describes the policies that guide development for cities within the Metro UGB to implement the goals in the Metro 2040 Plan.

Title 1: Housing Capacity

Metro's *2016 Compliance Report* concludes that Sherwood is in compliance for the City's Title 1 responsibilities.

Title 1 of Metro's Urban Growth Management Functional Plan is intended to promote efficient land use within the Metro UGB by increasing the capacity to accommodate housing capacity. Each city is required to determine its housing capacity based on the minimum number of dwelling units allowed in each zoning district that allows residential development, and maintain this capacity.

Title 1 requires that a city adopt minimum residential development density standards by March 2011. If the jurisdiction did not adopt a minimum density by March 2011, the jurisdiction must adopt a minimum density that is at least 80% of the maximum density.

Title 1 provides measures to decrease development capacity in selected areas by transferring the capacity to other areas of the community. This may be approved as long as the community's overall capacity is not reduced.

Metro's *2016 Compliance Report* concludes that Sherwood is in compliance for the City's Title 1 responsibilities.

Title 7: Housing Choice

Metro's *2016 Compliance Report* concludes that Sherwood is in compliance for the City's Title 7 responsibilities.

Title 7 of Metro's Urban Growth Management Functional Plan is designed to ensure the production of affordable housing in the Metro UGB. Each city and county within the Metro region is encouraged to voluntarily adopt an affordable housing production goal.

Each jurisdiction within the Metro region is required to ensure that their comprehensive plans and implementing ordinances include strategies to:

- Ensure the production of a diverse range of housing types,
- Maintain the existing supply of affordable housing, increase opportunities for new affordable housing dispersed throughout their boundaries, and
- Increase opportunities for households of all income levels to live in affordable housing (3.07.730)

Metro's *2016 Compliance Report* concludes that Sherwood is in compliance for the City's Title 7 responsibilities.

Title 11: Planning for New Urban Areas

Title 11 of Metro's Urban Growth Management Functional Plan provides guidance on the conversion of land from rural to urban uses. Land brought into the Metro UGB is subject to the provisions of section 3.07.1130 of the Metro Code, which requires lands to be maintained at rural densities until the completion of a concept plan and annexation into the municipal boundary.

The concept plan requirements directly related to residential development are to prepare a plan that includes:

(1) A mix and intensity of uses that make efficient use of public systems and facilities,

(2) A range of housing for different types, tenure, and prices that addresses the housing needs of the governing city, and

(3) Identify goals and strategies to meet the housing needs for the governing city in the expansion area.

Metro's *2016 Compliance Report* concludes that Sherwood is in compliance for the City's Title 11 responsibilities.

In addition, the City needs to comply with the Fair Housing Act, administered by the U.S. Department of Housing and Urban Service (HUD). Complying with this Act requires meeting the Affirmatively Furthering Fair Housing (AFFH) goal of the Fair Housing Act. The City must comply with these regulations to qualify for federal grant funds for housing.

2 Historical and Recent Development Trends

Analysis of historical development trends in Sherwood provides insights into how the local housing market functions. The intent of the analysis is to understand how local market dynamics may affect future housing—particularly the mix and density of housing by type. The housing mix and density by type are also key variables in forecasting future land need. The specific steps are described in Task 2 of the DLCD *Planning for Residential Lands* Workbook:

1. Determine the time period for which the data must be gathered.
2. Identify types of housing to address (at a minimum, all needed housing types identified in ORS 197.303).
3. Evaluate permit/subdivision data to calculate the actual mix, average actual gross density, and average actual net density of all housing types.

The period used in the analysis of housing density and mix is 2000 to 2014, which includes both times of high housing production and times of low housing production. The reasons for choosing this period were:

(1) The 2000 to 2014 period includes more than one economic cycle, with extreme highs and extreme lows in the housing market and

(2) Data prior to 2005 was less easily available and obtaining and compiling data for 2000 to 2004 was difficult to acquire.

The housing needs analysis presents information about residential development by housing types. For the purposes of this study, we grouped housing types based on: (1) whether the structure is stand-alone or attached to another structure and (2) the number of dwelling units in each structure. The housing types used in this analysis are:

- **Single-family detached:** single-family detached units and manufactured homes on lots and in mobile home parks.
- **Single-family attached:** all structures with a common wall where each dwelling unit occupies a separate lot, such as row houses or townhouses.
- **Multifamily**: all attached structures other than single-family detached units, manufactured units, or single-family attached units. Multifamily units include duplexes, tri-plexes, quad-plexes, and structures with more than five units (such as apartments).

The reason for choosing these categories of housing type for the analysis is that they meet the requirements definition of needed housing types in ORS 197.303.[6]

In general, this report uses data from the 2009-2013 American Community Survey (ACS) for Sherwood, as described in Appendix B. Where information is available, we report information from the 2010 Decennial Census. This section summarizes historical and recent development trends, described in detail in Appendix B.

The primary geographies used throughout this report are:

- **Sherwood.** This generally refers to the Sherwood city limits. Census data for Sherwood uses this geography.
- **Sherwood Planning Area.** This is the Sherwood city limits and land that is within the Metro urban growth boundary but outside of the Sherwood city limits, primarily the Brookman Area.
- **Sherwood West.** The urban reserve to the west of Sherwood that may be brought into the Metro urban growth boundary when needed regionally and determined beneficial locally.

While this report presents the forecast for housing growth in Sherwood for the 2019-2039 period, it is based on analysis completed for the 2015 HNA.

Residential development trends[7]

Three-quarters of Sherwood's housing is single-family detached housing.

Single-family detached housing makes up the largest share of Sherwood's housing stock (Figure B- 1**).** Currently:

- Single-family detached housing accounts for about 75% of Sherwood's housing stock.
- Single-family attached housing accounts for about 8% of Sherwood's housing stock.
- Multifamily housing accounts for about 18% of Sherwood's housing stock.

[6] The analysis of development in Sherwood attempts to separate single-family detached and single-family attached housing. However, the City's building permit system does not distinguish between these two types of housing. City staff manually identified single-family attached housing where there was a concentration of it developed (i.e., a development of townhouses). City staff were unable to identify small-scale single-family attached development that was scattered throughout the city.

[7] Except where otherwise noted, data in this section is from the U.S. Decennial Census (for 2010 data) or the U.S. Census's American Community Survey for 2009-2013.

Over the 2000-2014 period, 69% of new housing permitted by Sherwood was single-family detached housing.

The majority of housing developed in Sherwood between 2000 and 2014 was single-family detached housing (Table B- 1 **and** Figure B- 2**).**[8]

- Over the 2000 to 2014 period, Sherwood issued permits for nearly 2,225 dwellings, with about 148 units permitted each year.
- Sixty-nine percent of new housing permitted in Sherwood between 2000 and 2014 was single-family. Roughly 1,721 single-family dwelling units were permitted over the 15-year period.
- Nine percent of the building permits issued in Sherwood over 2000 to 2014 were single-family attached (i.e., townhouses) and 23% were for multifamily housing.
- The majority of new housing in Sherwood was built between 2000 and 2006, before development decreased with the national housing crisis.
- The majority of new multifamily housing in Sherwood was permitted in 2006, 2009, and 2014. The majority of new single-family attached housing was permitted in 2004 and 2005.
- Between 2015 and 2018, Sherwood permitted about 160 new single-family detached units.

Almost three quarters of Sherwood's residents own their homes (Figure B- 3**,** Figure B- 4**, and** Figure B- 5**).** Homeownership rates in Sherwood are above Washington County and Oregon's averages.

- Homeownership rates declined slightly over the last decade. Roughly 79% of housing in Sherwood was owner-occupied in 2000 compared to about 75% in 2010.
- Most owner-occupied housing is single-family detached, about 89%.
- Renter-occupied housing is a mixture of multifamily (57%), single-family detached (35%), and single-family attached (9%).

Sherwood's vacancy rate is lower than Multnomah, Washington, and Clackamas counties, and lower than the State average (Table B- 2 **and** Figure B- 6**).**

- In 2010, Sherwood's vacancy rate (3.9%) was below that of Multnomah (6.2%), Washington (5.4%), and Clackamas (7.1%) counties, and lower than Oregon's (9.3%).
- The vacancy rates for apartments in the Tigard/Tualatin/Sherwood area varied from a high of 5.8% in Spring 2010 to a low of 2.6% in Fall 2013

[8] Building permit data is from the City of Sherwood Building Permit Database.

and were within 1% of the vacancy rate for the Portland/Vancouver metro area.[9]

Sherwood's residential development between 2000 and 2014 averaged 8.2 dwelling units per net acre, above the State's requirement in OAR 660-007 for six dwelling units per net acre (Table B- 3 Table B-4**).**[10]

- Average density in Sherwood was 8.2 dwelling units per net acre over the 2000 to 2014 period.
- Density was lowest in the Very Low Density Residential Zone (2.9 dwelling units per net acre) and Medium Density Residential Low Zone (6.1 dwelling units per net acre).
- Density was highest in Office Commercial (24.4 dwelling units per net acre) and High Density Residential (19.1 dwelling units per net acre).

[10] City of Sherwood Building Permit Database.

3 Housing Need in Sherwood

This chapter presents the analysis of housing needs in Sherwood over the 2019 to 2039 period. Estimates of needed units by structure type and by density range follows.

Chapter 1 described the framework for conducting a housing "needs" analysis. The specific steps in conducting a housing needs analysis are:

1. Project number of new housing units needed in the next 20 years.
2. Identify relevant national, state, and local demographic and economic trends and factors that may affect the 20-year projection of structure type mix.
3. Describe the demographic characteristics of the population and, if possible, housing trends that relate to demand for different types of housing.
4. Determine the types of housing that are likely to be affordable to the projected households based on household income.
5. Estimate the number of additional needed units by structure type.
6. Determine the needed density ranges for each plan designation and the average needed net density for all structure types.

This chapter presents information for these steps for Sherwood's housing needs analysis.

PROJECTION OF NEW HOUSING UNITS NEEDED IN THE NEXT 20 YEARS

The housing needs analysis in this report is based on the Metroscope forecast of household growth in Sherwood over the next 25 years.

As required by OAR 660-024, the housing needs analysis in this report is based on a coordinated forecast from Metro (the Metro 2040 TAZ Forecast by Households, January 2016), which is a necessary prerequisite to estimate housing needs. The projection of household growth includes areas currently within the city limits, as well as areas currently outside the city limits that the City expects will be annexed for residential uses (most notably the Brookman area). In 2017, a portion of the Brookman area annexed into the city limits. We call these areas combined the "Sherwood planning area."

While the housing needs analysis presents information for Sherwood West, this area is currently outside of the regional UGB. Housing need in Sherwood West is not considered part of Sherwood's overall housing need for the purposes of this study. The information in this report, however, can inform the ongoing Concept Planning for Sherwood West.

The housing needs analysis focuses on housing growth in Sherwood over the 2019 to 2039 period.

The forecast shows that Sherwood will add 1,729 new households over the 20-year period.

The forecast shows growth of 4,337 new dwelling units in Sherwood West. While Metro's forecast assumes that growth will take place over the next 20-years, it may occur over a 50-year period.

Table B-6 in Appendix B presents Metro's forecast for housing in Sherwood for the 2010 to 2040 period. Table 1 presents ECONorthwest's extrapolation of Metro's forecast for Sherwood to the 2019 to 2039 period. Table 1 shows that **the Sherwood planning area is expected to add 1,729 new households between 2019 and 2039. Regional models and informed projections suggest 700** new households will be accommodated inside the existing city limits. Approximately 1,029 new households are expected to be accommodated outside the current city limits in the Brookman Area.

Table 1. Extrapolated Metro forecast for household growth, Sherwood planning area, 2019 to 2039

	Households			
Year	Sherwood City Limits	Brookman Area	Sherwood Planning Area	Sherwood West (50-Year Forecast)
2019	6,916	304	7,220	293
2039	7,616	1,333	8,949	4,630
Change 2019 to 2039				
Households	700	1,029	1,729	4,337
Percent	10%	338%	24%	1480%
AAGR	0.5%	7.7%	1.1%	14.8%

DEMOGRAPHIC AND SOCIOECONOMIC FACTORS AFFECTING HOUSING CHOICE

Demographic trends are important to a thorough understanding of the dynamics of the Sherwood housing market. Sherwood exists in a regional economy; trends in the region impact the local housing market. This section documents national, state, and regional demographic, socioeconomic, and other trends relevant to Sherwood.

The Factors that Affect Housing Choice

The factors that have the largest impact on a household's housing choice are: age of the householder, household size and composition, and income.

Analysts typically describe housing demand as the preferences for different types of housing (i.e., single-family detached or apartment), and the ability to pay for that housing (the ability to exercise those preferences in a housing market by purchasing or renting housing—in other words, income or wealth).

Metro, the agency responsible for regional planning within the Portland metropolitan UGB, uses a decision support tool called Metroscope to model changes in measures of economic, demographic, land use, and transportation activity. Metroscope includes a residential location model, which projects the locations of future households based on factors such as land availability and capacity, cost of development, changes in demographics, changes in employment, and changes in transportation and transit infrastructure. The housing needs analysis in this report is based on the Metroscope forecast of household growth in Sherwood over the next 25 years.

Many demographic and socioeconomic variables affect housing choice. However, the literature about housing markets finds that age of the householder, size of the household, and income are most strongly correlated with housing choice.[11]

[11] The research in this chapter is based on numerous articles and sources of information about housing, including:

The Case for Multi-family Housing. Urban Land Institute. 2003

E. Zietz. *Multi-family Housing: A Review of Theory and Evidence.* Journal of Real Estate Research, Volume 25, Number 2. 2003.

C. Rombouts. *Changing Demographics of Homebuyers and Renters.* Multi-family Trends. Winter 2004.

J. McIlwain. *Housing in America: The New Decade.* Urban Land Institute. 2010.

D. Myers and S. Ryu. *Aging Baby Boomers and the Generational Housing Bubble*. Journal of the American Planning Association. Winter 2008.

M. Riche. *The Implications of Changing U.S. Demographics for Housing Choice and Location in Cities.* The Brookings Institution Center on Urban and Metropolitan Policy. March 2001.

- **Age of householder** is the age of the person identified (in the Census) as the head of household. Households make different housing choices at different stages of life.
- **Size of household** is the number of people living in the household. Younger and older people are more likely to live in single-person households. People in their middle years are more likely to live in multiple person households (often with children).
- **Income** is the household income. Income is probably the most important determinant of housing choice. Income is strongly related to the type of housing a household chooses (e.g., single-family detached, duplex, or a building with more than five units) and to household tenure (e.g., rent or own).

This section focuses on these factors, presenting data that suggests how changes to these factors may affect housing need in Sherwood over the next 20 years.

National housing trends

Appendix B presents a full review of national housing trends. This brief summary builds on previous work by ECONorthwest, Urban Land Institute (ULI) reports, and conclusions from *The State of the Nation's Housing, 2014* report from the Joint Center for Housing Studies of Harvard University. The Harvard report summarizes the national housing outlook as follows:

> "With promising increases in home construction, sales, and prices, the housing market gained steam in early 2013. But when interest rates notched up at mid-year, momentum slowed. This moderation is likely to persist until job growth manages to lift household incomes. Even amid a broader recovery, though, many hard-hit communities still struggle and millions of households continue to pay excessive shares of income for housing."

Several challenges to a strong domestic housing market remain. Demand for housing is closely tied to jobs and incomes, which are taking longer to recover than in previous cycles. While trending downward, the number of underwater homeowners, delinquent loans, and vacancies remains high. *The State of the Nation's Housing* report projects that it will take several years for market conditions to return to normal and, until then, the housing recovery will likely unfold at a moderate pace.

L. Lachman and D. Brett. *Generation Y: America's New Housing Wave.* Urban Land Institute. 2010.

National housing market trends include: [12]

- **Post-recession recovery slows down**. Despite strong growth in the housing market in 2012 and the first half of 2013, by the first quarter of 2014, housing starts and existing home sales were both down by 3% from the same time a year before, while existing home sales were down 7% from the year before. Increases in mortgage interest rates and meager job growth contributed to the stall in the housing market.
- **Continued declines in homeownership**. After 13 successive years of increases, the national homeownership rate declined each year from 2005 to 2013, and is currently at about 65%. The Urban Land Institute projects that homeownership will continue to decline to somewhere in the low 60% range.

In 2012, more than one-third of households across the US had housing affordability problems, with the lowest income households having the most difficulty finding affordable housing.

- **Housing affordability**. In 2012, more than one-third of American households spent more than 30% of income on housing. Low-income households face an especially dire hurdle to afford housing. Among those earning less than $15,000, more than 80% paid over 30% of their income and almost 70% of households paid more than half of their income. For households earning $15,000 to $29,000, more than 60% were cost burdened, with about 30% paying more than half of their income on housing.

Since 1990, the average size of new dwelling units increased both for single-family and multifamily housing. At the same time, the average lot size for new housing decreased.

- **Changes in housing characteristics**. National trends show that the size of single-family and multifamily units, and the number of household amenities (e.g., fireplace or two or more bathrooms) has increased since the early 1990s. Between 1990 and 2013 the median size of new single-family dwellings increased 25% nationally from 1,905 square feet to 2,384 square feet and 18% in the western region from 1,985 square feet to 2,359 square feet. Moreover, the percentage of units smaller than 1,400 square feet nationally decreased from 15% in 1999 to 8% in 2013. The percentage of units greater than 3,000 square feet increased from 17% in 1999 to 29% of new one-family homes completed in 2013. In addition to larger homes, a move towards smaller lot sizes is seen nationally. Between 2009 and 2013, the percentage of lots less than 7,000 square feet increased from 26% of lots to 30% of lots. Similarly, in the western region, the share of lots less than 7,000 square feet increased from 43% to 48% of lots.

[12] These trends are based on information from: (1) The Joint Center for Housing Studies of Harvard University's publication "The State of the Nation's Housing 2013," (2) Urban Land Institute, "2011 Emerging Trends in Real Estate," and (3) the U.S. Census.

- **Long-term growth and housing demand**. The Joint Center for Housing Studies forecasts that demand for new homes could total as many as 13.2 million units nationally between 2015 and 2025. Much of the demand will come from Baby Boomers, Millennials,[13] and immigrants.
- **Changes in housing preference**. Housing preference will be affected by changes in demographics, most notably the aging of the Baby Boomers, housing demand from the Millennials, and growth of foreign-born immigrants. Baby Boomers' housing choices will affect housing preference and homeownership, with some boomers likely to stay in their home as long as they are able and some preferring other housing products, such as multifamily housing or age-restricted housing developments.

  In the near-term, Millennials and new immigrants may increase demand for rental units. The long-term housing preference of Millennials and new immigrants is uncertain. They may have different housing preferences as a result of the current housing market turmoil and may prefer smaller, owner-occupied units or rental units. On the other hand, their housing preferences may be similar to the Baby Boomers, with a preference for larger units with more amenities. Recent surveys about housing preference suggest that Millennials want affordable single-family homes in areas that that offer transportation alternatives to cars, such as suburbs or small cities with walkable neighborhoods. [14]

Future housing preferences will be affected by demographic changes, such as the aging of the Baby Boomers, growing housing demand from Millennials, and growth of foreign-born immigrants.

[13] Millennials are, broadly speaking, the children of Baby Boomers, born from the early 1980's through the early 2000's.

State Trends

Oregon's *2011-2015 Consolidated Plan* includes a detailed housing needs analysis as well as strategies for addressing housing needs statewide.[15] The plan concludes that "Oregon's changing population demographics are having a significant impact on its housing market." It identified the following population and demographic trends that influence housing need statewide. Oregon is:

- Facing housing cost increases due to higher unemployment and lower wages, as compared to the nation.
- Since 2005, is experiencing higher foreclosure rates compared with the previous two decades.
- Losing federal subsidies on about 8% of federally-subsidized Section 8 housing units.
- Losing housing value throughout the State.
- Losing manufactured housing parks, with a 25% decrease in the number of manufactured home parks between 2003 and 2010.
- Increasingly older, more diverse, and has less affluent households.[16]

Regional and Local Demographic Trends

Sherwood has a growing population (Table B- 5**).** Sherwood's growing population will drive future demand for Sherwood over the planning period.

- Sherwood grew by more than 15,000 people, a 501% increase in population, at an average annual rate of 8.1% over the 1990 to 2013 period. [17]
- Sherwood grew at a faster rate than the nation as a whole (1.0% per year), Oregon (1.4% per year), and the Portland Region (1.6%) over this period.
- Metro forecasts that the number of households in the Sherwood Planning Area will grow by about 1,729 households over the 2019-2039 period, at an average annual growth rate of 1.1%.
- Metro forecasts that Sherwood West, an area that is adjacent to Sherwood but currently outside of the Metro Urban Growth Boundary, will grow by 4,337 households. Growth in Sherwood West will not begin until the area is included in the Metro UGB and annexed into Sherwood. While Metro's forecast assumes that Sherwood West may be fully

[15] http://www.ohcs.oregon.gov/OHCS/HRS_Consolidated_Plan_5yearplan.shtml

[16] State of Oregon *Consolidated Plan 2011 to 2015*. http://www.oregon.gov/ohcs/hd/hrs/consplan/2011_2015_consolidated_plan.pdf

[17] 2013 Population Estimates in Oregon come from Portland State University's Population Research Center.

developed by 2040, it may take longer, perhaps until 2065, for Sherwood West to fully develop.

- Metro's forecast of household growth considers residential capacity within Sherwood's city limits to accommodate growth. Much of Sherwood's future growth depends on bringing new land into the city limits, including the Brookman Area and Sherwood West.

The growth of younger and diversified households will result in increased demand for a wider variety of affordable housing appropriate for families with children, such as small single-family housing, townhouses, duplexes, and multifamily housing.

Sherwood's population is younger than the state, on average (Table B- 7**,** Table B- 8**, and** Figure B- 8**).** Sherwood has a larger share of people younger than 30 years of age, and a relatively small share of people over 50 years. If Sherwood continues to attract young residents, then it will continue to have demand for housing for families, especially housing affordable to younger families with moderate incomes. Recent studies suggest that growth in younger residents (e.g., Millennials) will result in increased demand for both affordable single-family detached housing, as well as increased demand for affordable townhouses and multifamily housing. Growth in this population will result in growth in demand for both ownership and rental opportunities, with an emphasis on housing that is comparatively affordable.

- In 2010, the median age in Sherwood was 34.3 years old, compared to the State median of 38.4.
- A higher percentage of Sherwood's population is younger than 30 years (44%) compared to the state as a whole (39%). Furthermore, a smaller share of Sherwood's population is younger than 50 years (21%), compared to the state as a whole (34%).

The aging of the population will result in increased demand for smaller single-family housing, multifamily housing, and housing for seniors.

Sherwood's population is growing older (Figure B- 9**).** Although Sherwood has a smaller share of people over 50 years old than the State average, Sherwood's population is growing older, consistent with State and national trends. Demand for housing for retirees will grow over the planning period, as the Baby Boomers continue to age and retire. However, Sherwood's demand for housing for seniors may grow at a slower rate than across the State.

Growth of seniors will have the biggest impacts on demand for new housing through demand for housing types specific to seniors, such as assisted living facilities or age-restricted developments. These households will make a variety of housing choices, including: remaining in their homes as long as they are able, downsizing to smaller single-family homes (detached and attached) or multifamily units, or moving into group housing (such as assisted living facilities or nursing homes), as their health fails.

- The fastest-growing age group over the 2000 to 2010 period in Sherwood was people aged 45 years and older, with the most growth in the number of people aged 45 to 64.
- In Sherwood, people aged 45 to 64 grew by 102%, from 1,936 to 3,917 people between 2000 and 2010.

- By 2035, people 60 years and older will account for 24% of the population in Washington County (up from 18% in 2015). The percent of total population in each age group younger than 60 years old will decrease. The age distribution in the Portland Region will change in a similar pattern.[18]
- Given the growth of people 45 years and older in Sherwood and the forecast for growth of people 60 years and older between 2019-2039 in Washington County and the Portland Region, it is reasonable to expect that Sherwood will have growth in the senior population.

Sherwood is becoming more ethnically diverse (Figure B- 10**).** Growth in Hispanic and Latino population will affect Sherwood's housing needs in a variety of ways. Growth in first and, to a lesser extent, second and third-generation Hispanic and Latino immigrants tend to increase demand for larger dwelling units to accommodate the on average larger household sizes for these households. Households for Hispanic and Latino immigrants are more likely to include multiple generations, requiring more space than smaller household sizes. As Hispanic and Latino households integrate over generations, household size typically decreases and housing needs become similar to housing needs for all households.

Growth in Hispanic and Latino households will result in increased demand for housing of all types, both for ownership and rentals, with an emphasis on housing that is comparatively affordable.

- Sherwood's Hispanic and Latino population grew by 99% from 2000 to the 2009-2013 period, from 557 to 1,107 people, increasing its share of the population from 4.7% to 6.0%.
- Nonetheless, Sherwood's percentage of Hispanic or Latino population remains below that of the state as a whole. In the 2009-2013 period, Hispanic and Latino population accounted for 12% of the state's population, compared to Sherwood's average of 6.0%.

Sherwood's household size is larger than State averages (Table B- 9**).** The larger household size is indicative of a larger share of households with children or multigenerational households.

- Sherwood's average household size was 2.89 persons per household, compared with the regional average of 2.54 persons per household, and the state average of 2.49 persons per household.
- The size of households in Sherwood grew from 2000 to the 2009-2013 period (2.77 to 2.89). Over the same period, the average household size

[18] Demographic forecast for Washington County by the Oregon Office of Economic Analysis.

in the Portland Region rose slightly from 2.53 to 2.54, while the State's average fell from 2.51 to 2.49.

Sherwood has a relatively high share of households with children (Figure B-11**).** Households with children are more likely to prefer single-family detached housing, if it is relatively affordable.

- Sherwood has a larger share of households with children (47%) than the State average (27%), the Portland Region (29%), or Washington County (33%).
- In the 2009-2013 period, Sherwood had a smaller share of single-person households (19%) than the regional average (29%).
- In the 2009-2013 period, Sherwood had a smaller share of non-family households (23%) than the regional average (38%).

Sherwood is part of a complex, interconnected regional economy (Figure B- 12**,** Table B- 11**, and** Table B- 12**).** Most people working at businesses in Sherwood do not live in Sherwood. Demand for housing by workers at businesses in Sherwood may change with fluctuations in fuel and commuting costs, as well as the capacity of highways to accommodate commuting. [19]

- Commuting is typical throughout the region: 91% of Sherwood's working residents commuted outside the city, and about 85% of those who work in the city live outside the city itself.

Summary of the Implications of Demographic and Socioeconomic Trends on Housing Choice

The purpose of the analysis thus far has been to provide background on the kinds of factors that influence housing choice, and in doing so, to convey why the number and interrelationships among those factors ensure that generalizations about housing choice are difficult and prone to inaccuracies.

There is no question that age affects housing type and tenure. Mobility is substantially higher for people aged 20 to 34. People in that age group will also have, on average, less income than people who are older. They are less likely to have children. All of these factors mean that younger households are much more likely to be renters, and renters are more likely to be in multifamily housing.

The data illustrate what more detailed research has shown and what most people understand intuitively: life cycle and housing choice interact in ways that are predictable in the aggregate; age of the household head is correlated with household size and income; household size and age of household head affect housing preferences; income affects the ability of a household to afford a

[19] US Census Bureau, LED on the Map, http://lehdmap3.did.census.gov/themap3/.

preferred housing type. The connection between socioeconomic and demographic factors and housing choice is often described informally by giving names to households with certain combinations of characteristics: the "traditional family," the "never marrieds," the "dinks" (dual-income, no kids), the "empty nesters."[20] Thus, simply looking at the long wave of demographic trends can provide good information for estimating future housing demand.

Thus, one is ultimately left with the need to make a qualitative assessment of the future housing market. The following is a discussion of how demographic and housing trends are likely to affect housing Sherwood over the next 20 years:

- **Growth in housing will be driven by growth in population.** Between 2000 and the 2009-2013 period, the number of housing units in Sherwood increased by 47% from about 4,500 to 6,600 (Figure B- 4), while its population grew by roughly 55% from 11,963 to 18,575 from 2000 to 2013 (Table B- 5).[21]
- **On average, future housing will look a lot like past housing.** That is the assumption that underlies any trend forecast, and one that allows some quantification of the composition of demand for new housing. As a first approximation, the next three to five years of residential growth will look a lot like the last three to five years.
- **If the future differs from the past, it is likely to move in the direction (on average) of smaller units and more diverse housing types.** Most of the evidence suggests that the bulk of the change will be in the direction of smaller average house and lot sizes for single-family housing.

  Key demographic trends that will affect Sherwood's future housing needs are: (1) the aging of the Baby Boomers, (2) aging of the Millennials, (3) growth of family households, and (4) continued growth in Hispanic and Latino population.

  - *The Baby Boomer's population is continuing to age.* By 2035, people 60 years and older will account for 24% of the population in Washington County (up from 18% in 2015). The changes that affect Sherwood's housing demand as the population ages are that household sizes decrease and homeownership rates decrease.
  - *Millennials will continue to age.* By 2035, Millennials will be roughly between about 35 years old to 55 years old. As they age, generally speaking, their household sizes will increase and homeownership rates will peak by about age 55. Between 2019 and 2039,

[20] See *Planning for Residential Growth: A Workbook for Oregon's Urban Areas* (June 1997).

[21] 2013 Population Estimates come from come from the Portland State University Population Research Center's Annual Population Estimates.

Millennials will be a key driver in demand for housing for families with children.

- *Growth of households with children.* Sherwood has an unusually high percentage of households with children, compared to the regional averages. If Sherwood continues to attract families with children, demand for housing for families, such as affordable single-family detached or townhouses, will increase.
- *Hispanic and Latino population will continue to grow.* The U.S. Census projects that by about 2040, Hispanic and Latino population will account for more than one-quarter of the nation's population. The share of Hispanic and Latino population in the western U.S. is likely to be higher. Growth in Hispanic and Latino population will drive demand for housing for families with children. Given the lower income for Hispanic and Latino households,[22] growth in this group will also drive demand for affordable housing, both for ownership and renters.

In summary, an aging population, increasing housing costs, housing affordability concerns for Millennials and the Hispanic and Latino populations, and other variables are factors that support the conclusion of smaller and less expensive units and a broader array of housing choices.

Millennials and immigrants will drive demand for affordable housing types, including demand for small, affordable single-family units (many of which may be ownership units) and for affordable multifamily units (many of which may be rental units).

- **No amount of analysis is likely to make the distant future any more certain: the purpose of the housing forecasting in this study is to get an approximate idea about the future so policy choices can be made today.** Economic forecasters regard any economic forecast more than three (or at most five) years out as highly speculative. At one year, one is protected from being disastrously wrong by the shear inertia of the economic machine. But a variety of factors or events could cause growth forecasts to be substantially different.

---

[22] The following article describes household income trends for Hispanic and Latino families, including differences in income levels for first, second, and third generation households. In short, Hispanic and Latino households have lower median income than the national averages. First and second generation Hispanic and Latino households have median incomes below the average for all Hispanic and Latino households.

Pew Research Center. *Second-Generation Americans: A Portrait of the Adult Children of Immigrants*, February 7, 2012

REGIONAL AND LOCAL TRENDS IN HOUSING COSTS AND AFFORDABILITY

Sherwood's income is higher than state averages (Figure B- 19**).** Income is a key determinant of housing affordability. Since 2000, Sherwood's income has decreased (in inflation-adjusted dollars), consistent with state trends.

- Sherwood's median household income ($78,400) was about 55% higher than the state median ($50,229) in the 2009-2013 period.
- Inflation-adjusted income for households in Sherwood decreased by about 10% from about $87,500 in 2000 to $78,400 (in 2013 dollars) from 2000 to the 2009-2013 period. This is consistent with state and regional trends.
- Poverty rates increased in Sherwood from 2.7% of the population below poverty in 2000 to 7.6% in 2010. The increase is consistent with state and regional trends.
- Sherwood had a smaller share of population below the federal poverty line in the 2009-2013 period (7.6%) than the state average (16.2 %).

Housing costs in Sherwood increased by 30% since 2000.

Sales prices in Sherwood are higher than the regional averages.

Homeownership costs have increased in Sherwood (Figure B- 13**,** Figure B- 14**,** Figure B- 15 **and** Figure B- 16**).** Sales prices for single-family housing increased over the period from 2004 to 2014, consistent with national trends. While housing prices peaked in 2007, before falling during the recession, sales prices grew by about 30% from 2004 to 2014. Sales prices have continue to increase through 2017 and may be above the 2007 peak.

The increases in housing costs have made Sherwood less affordable than most other communities on the southwest side of Portland.

- Median sales prices for homes in Sherwood increased by about 30% between 2004 and 2014, from about $245,000 to $318,000.[23]
- As of January 2015, median sales prices in Sherwood were about $316,500, higher than in Washington County ($281,700), the Portland MSA ($269,900), and Oregon ($237,300). Median sales prices were higher in Sherwood than in other Portland westside communities such as Tigard, Tualatin, and Beaverton but lower than Wilsonville or West Linn.
- Prices per square foot rose in Sherwood from $130 per square foot in October 2004 about $170 dollars in October 2014, comparable to the price in Washington County and the Portland Region (both about $170). The cost of housing per square foot was comparable in Sherwood to other

[23] Recent median home sale price, including price per square foot, comes from Zillow Real Estate Research.

cities on the southwest side of Portland, such as Tigard, Tualatin, Beaverton, and Wilsonville.

- The sales price data suggest that, overall, owner-occupied housing being produced in Sherwood was more expensive because it is larger than housing built in other cities in the southwestern Portland area.
- The ratio of home value to income increased by 32% from 2000 to 2009-2013. In 2000, the median home value was 2.9 times the median household income. By 2009-2013, the median home value was 3.8 times the median household income. In comparison, in 2009-2013, the typical value of an owner-occupied house in Washington County was 4.4 times the median income and the state average was 4.74 times the median income.

Rental costs are about 25% higher than the regional average.

Rental costs are higher in Sherwood than the average in Washington County, with a slightly lower rental cost on a cost per square foot basis (Table B- 14**, and** Figure B- 17 **and** Figure B- 18**).**

- The median contract rent in Sherwood in the 2009-2013 period was $1,064, compared to Washington County's average of $852.
- Average rent in the Tigard/Tualatin/Sherwood area submarket was $1.13 per square foot in Fall 2014, lower than the regional average of $1.22 per square foot. Between Spring 2010 and Spring 2013, average rent in Tigard/Tualatin/Sherwood area increased by 38%, consistent with the regional increase of 36%.

More than one-third of Sherwood's households have housing affordability problems, similar to regional averages.

More than one-third of Sherwood's households have housing affordability problems (Figure B- 20 **and** Figure B- 21**).**

- Thirty-eight percent of Sherwood's households were cost burdened (i.e., paid more than 30% of their income on rent or homeownership costs) in the 2009-2013 period.[24] This is consistent with the state averages.
- Roughly 40% of Sherwood's renter households were cost burdened in the 2009-2013 period. About one-fifth of renters were severely cost burdened (i.e., pay more than 50% of their income on rent).
- About 35% of Sherwood's homeowners were cost burdened in the 2009-2013 period. Only about 1% of homeowners were severely cost burdened (i.e., paid more than 50% of their income on homeownership costs).

[24]A household is considered cost burdened if they pay more than 30% of their gross income on housing costs. For renters, housing costs include the following: monthly rent, utilities (electricity, gas, and water and sewer), and fuels (wood, oil, etc.). For homeowners, housing costs include the following: mortgage payments, real estate taxes, insurance, mobile home costs, condominium fees, utilities, and fuels.

- When considering housing and transportation costs combined, the average household in Sherwood spends 54% of its income on housing costs and transportation costs. Metro considered a household that spends 45% or more of its income on transportation and housing as paying more they can afford. For context, the average households in Tualatin, Wilsonville, and Tigard pay 50% to 52% of their income for housing and transportation costs.

Future housing affordability will depend on the relationship between income and housing price. Households in Sherwood generally have higher than average incomes and housing prices are higher than average. In addition, Sherwood is at the edge of the Metro UGB, making transportation costs higher for households in Sherwood, compared to households who live in more central parts of the region. Determining whether housing in Sherwood will be more or less affordable is difficult to answer when based on historical data. The key questions are whether housing prices will continue to outpace income growth and whether transportation costs will continue to grow in the future.

FORECAST OF HOUSING BY TYPE AND DENSITY OF HOUSING

Table 2 shows the forecast of needed housing units in Sherwood based on the total estimate of housing need shown in Table 1. The forecast in Table 2 assumes: that the forecast for new housing will be: 50% single-family detached, 25% single-family attached, and 25% multifamily. This forecast is consistent with the requirements of OAR 660-007-0035.

The forecast shows increased demand for lower-cost housing types such as single-family attached and multifamily units, which meets the needs resulting in the changing demographics in Sherwood and the Portland region. The changes in demographics are the aging of the Baby Boomers, growth in Millennial households, and increases in ethnic diversity. The previous section described these trends and the implications for housing need in Sherwood.

The forecast assumes an equal share of single-family attached and multifamily housing based on the existing types of housing in Sherwood, which are predominantly single-family detached. Both single-family attached and multifamily housing provide opportunities for housing costing less than single-family detached housing, both for owners and renters.

Table 2. Forecast of needed housing units by mix, Sherwood planning area, 2019-2039

Housing Type	New Dwelling Units (DU)	Percent
Single-family detached	865	50%
Single-family attached	432	25%
Multifamily	432	25%
Total	**1,729**	

Source: ECONorthwest

The assumed housing mix meets the requirement of OAR 660-007-0030 to "designate sufficient buildable land to provide the opportunity for at least 50 percent of new residential units to be attached single family housing or multiple family housing."

The needed density in Sherwood is consistent with the densities achieved in residential zones Sherwood over the 2000-2014 period (Table B-4). These densities are:

- Very Low Density Residential (VLDR): 2.9 dwelling units per net acre

- Low Density Residential (LDR): 6.5 dwelling units per net acre[25]
- Medium Density Residential – Low (MDRL): 6.1 dwelling units per net acre
- Medium Density Residential – High (MDRH): 7.7 dwelling units per net acre
- High Density Residential (HDR): 19.1 dwelling units per net acre

These densities, when applied to Sherwood's supply of buildable land in the capacity analysis (Table 6) results in an overall density of 7.3 dwelling units per net acre. This housing density meets the requirements of OAR 660-007-0035 to "provide for an overall density of six or more dwelling units per net buildable acre."

Table 3 allocates the needed housing units to Sherwood's zones. The allocation is based on allowed uses in Sherwood's zoning code, historical development trends, and Sherwood's inventory of vacant buildable residential land.

Table 3. Allocation of needed housing units to zones, Sherwood planning area, 2019-2039

	Zone					
	Very Low Density Residential	Low Density Residential	Medium Density Residential-Low	Medium Density Residential-High	High Density Residential	Total
Dwelling Units						
Single-family detached	95	182	450	121	17	865
Single-family attached	-	-	-	259	173	432
Multifamily	-	-	86	138	208	432
Total	95	182	536	518	398	1,729
Percent of Units						
Single-family detached	5%	11%	26%	7%	1%	50%
Single-family attached	0%	0%	0%	15%	10%	25%
Multifamily	0%	0%	5%	8%	12%	25%
Total	5%	11%	31%	30%	23%	100%

Source: ECONorthwest

Needed housing by income level

Step four of the housing needs analysis is to develop an estimate of need for housing by income and housing type. This requires an estimate of the income distribution of current and future households in the community. The estimates

[25] The historical density achieved in LDR, 6.5 dwelling units per acre, is higher than the maximum allowable density in LDR, 5 dwelling units per net acre. This fact can be explained in large part by the fact that 60% of new development in LDR was part of a Planned Unit Development (PUD), which averaged 7.6 dwelling units per acre.

presented in this section are based on (1) secondary data from the Census, and (2) analysis by ECONorthwest.

The analysis in Table 4 based on American Community Survey data about income levels in Sherwood, using income information shown in Table B- 17. Income is categorized into market segments consistent with HUD income level categories, using the Portland Region's 2014 Median Family Income (MFI) of $69,400. Table 4 is based on current household income distribution, assuming approximately that the same percentage of households will be in each market segment in the future.

Based on Sherwood's current household income distribution, Table 4 shows that about 31% of households in Sherwood have incomes below 80% of the MFI. These households will need a range of housing, such as lower-cost single-family detached housing, townhouses, manufactured homes, or multifamily housing. These households will predominantly be renters. Sixty-nine percent of households have incomes above 80% of MFI. These households will be a mix of owners and renters. Their housing needs will include single-family detached, townhouses, and multifamily housing.

Growth in lower-income demographic groups, such as the Millennials, or in Baby Boomers who want to downsize their homes, may increase demand for smaller single-family detached houses, townhouses, and multifamily housing.

Table 4. Estimate of needed new dwelling units by income level, Sherwood, 2019-2039

				Commonly Financially Attainable Housing Products		
Market Segment by Income Portland MSA MFI: $69,400	Income Range	Number of New Households in Sherwood	Percent of Households in Sherwood (currently)	Owner-occupied	Renter-occupied	
High (120% or more of MFI)	$83,280 or more	725	42%	All housing types; higher	All housing types; higher	
Upper Middle (80%-120% of MFI)	$55,520 to $83,280	467	27%	All housing types; lower	All housing types; lower	Primarily New Housing
Lower Middle (50%-80% of MFI)	$34,700 to $55,520	232	13%	Single-family attached;	Single-family attached;	Primarily Used Housing
Lower (30%-50% of less of MFI)	$20,820 to $34,700	117	7%	Manufactured in parks	Apartments; manufactured	
Very Low (Less than 30% of MFI)	Less than $20,820	188	11%	None	Apartments; new and used	

Source: ECONorthwest
MFI is Median Family Income

Need for government assisted and manufactured housing

ORS 197.303 requires cities to plan for government-assisted housing, manufactured housing on lots, and manufactured housing in parks.

- **Government-assisted housing.** Government subsidies can apply to all housing types (e.g., single family detached, apartments, etc.) Sherwood allows development of government-assisted housing in all Residential zones, with the same development standards for market-rate housing. This analysis assumes that Sherwood will continue to allow government-assisted housing in all its Residential zones. Because government-assisted housing is similar in character to other housing (with the exception of the subsidies), it is not necessary to develop separate forecasts for government-assisted housing.
- **Manufactured housing on lots.** Sherwood allows manufactured housing in all residential zones as a permitted use. As manufactured homes are allowed as a permitted use in all zones, it is not necessary to develop separate forecasts for manufactured housing on lots.
- **Manufactured housing in parks (**Table B- 13**).** OAR 197.480(4) requires cities to inventory the mobile home or manufactured dwelling parks sited in areas planned and zoned or generally used for commercial, industrial or high-density residential development. According to the Oregon Housing and Community Services' Manufactured Dwelling Park Directory,[26] Sherwood has four manufactured dwelling parks:
    - Carriage Park Estates with 58 spaces, all occupied
    - Crown Court with 14 spaces, except for one vacancy
    - Orland Villa with 24 spaces, all occupied
    - Smith Farm Estates with 90 spaces, all occupied

  ORS 197.480(2) requires Sherwood to project need for mobile home or manufactured dwelling parks based on: (1) population projections, (2) household income levels, (3) housing market trends, and (4) an inventory of manufactured dwelling parks sited in areas planned and zoned or generally used for commercial, industrial, or high-density residential.

    - Table 1 shows that the Sherwood planning area will grow by 1,729 dwelling units over the 2019 to 2039 period.
    - Analysis of housing affordability (in Table 4) shows that about 18% of Sherwood's new households will be low income, earning 50% or less

[26] Oregon Housing and Community Services, Oregon Manufactured Dwelling Park Directory, http://o.hcs.state.or.us/MDPCRParks/ParkDirQuery.jsp

of the County's median family income. One type of housing affordable to these households is manufactured housing.

- Manufactured housing in parks accounts for about 2.4% (258 dwelling units) of Sherwood's current housing stock, according to 2009-2013 Census data.
- National, state, and regional trends during the 2000 to 2010 period showed that manufactured housing parks were closing, rather than being created. For example, between 2003 and 2010, Oregon had a statewide decrease of 25% in the number of manufactured home parks. The trend of closing of manufactured housing parks slowed during the housing recession but is likely to increase as housing prices and land prices increase.
- The longer-term trend for closing manufactured home parks is the result of manufactured home park landowners selling or redeveloping their land for uses with higher rates of return, rather than lack of demand for spaces in manufactured home parks. Manufactured home parks contribute to the supply of lower-cost affordable housing options, especially for affordable home ownership. The trend in closure of manufactured home parks increases the shortage of manufactured home park spaces. Without some form of public investment to encourage continued operation of existing manufactured home parks and construction of new manufactured home parks, this shortage will continue.

Table 4 shows that the households most likely to live in manufactured homes in parks are those with incomes between $20,820 and $34,700 (30 to 50% of median family income). Assuming that about 1.5% to 2.5% of Sherwood's new households (1,729 new dwellings) choose to live in manufactured housing parks, the City may need 26 to 43 new manufactured home spaces. At an average of 8 dwelling units per net acre, this results in demand for 3.3 to 5.4 acres of land.

The City allows development of manufactured housing parks in MDRL zones, where the City has 66 vacant suitable buildable acres of land. Development of a new manufactured home park in Sherwood over the planning period seems unlikely. The land needed for development of a manufactured housing park is part of the forecast in Table 2.

4 Residential Land Sufficiency

This chapter presents an evaluation of the sufficiency of vacant residential land in Sherwood to accommodate expected residential growth over the 2019 to 2039 period. This chapter includes an estimate of residential development capacity (measured in new dwelling units) and an estimate of Sherwood's ability to accommodate needed new housing units for the 2019 to 2039 period. The chapter also includes conclusions and recommendations based on the results of the housing needs analysis.

Residential Buildable Land

Table 5 presents the City's inventory of buildable land. The buildable lands inventory is based on City of Sherwood and Metro GIS data. Appendix A presents a complete description of the methodology used to develop the buildable lands inventory. The key assumptions in the inventory are:

- **Vacant land** was defined as land that is fully vacant (as determined by Metro's Regional Land Information System (RLIS) GIS data and local data), or tax lots that are at least 95% vacant, or tax lots that have less than 2,000 square feet developed, with development covering less than 10% of the entire lot.
- **Unbuildable land** was removed from the inventory, including land with: public tax exemptions (i.e., land owned by the city or state), schools, churches, and other tax-exempt social organizations, private streets, rail properties, parks, and tax lots that do not meet the City's requirements for infill development.
- **Environmental resources and constraints** were deducted from the inventory of vacant land, including floodways and slopes over 25%.
- **Future rights-of-way** were accounted for based on lot sizes, with tax lots larger than one acre assumed to have 18.5% of land set aside for future rights-of-way.

Table 5 shows that Sherwood has 175 net acres of suitable buildable residential land. Fifty-five percent of Sherwood's vacant land (96 acres) is within the city limits and 45% (79 acres) is within the Brookman Area or other unincorporated areas within the current Urban Growth Boundary.

Table 5. Inventory of suitable buildable residential land, net acres, Sherwood city limits and areas within the UGB, 2014

Zone	Gross Acres	Percent of Total
Land within City Limits		
Very Low Density Residential (VLDR)	24	14%

RESIDENTIAL DEVELOPMENT CAPACITY

This section presents a summary of the analysis used to estimate Sherwood's residential development capacity.

The capacity analysis estimates the number of new dwelling units that can be accommodated on Sherwood's residential land supply.[27] The capacity analysis evaluates ways that vacant suitable residential land may build out by applying different assumptions.

In short, land capacity is a function of buildable land, housing mix (as determined by plan designation or zoning), and density. The basic form of any method to estimate capacity requires (1) an estimate of *buildable* land, and (2) assumptions about density. The arithmetic is straightforward:

Buildable Land (ac) * Density (du/ac) = Capacity (in dwelling units)

For example:

100 acres * 8 du/ac = 800 dwelling units of capacity

The example is a simplification of the method, which skips some of the nuances that can be incorporated into a detailed capacity analysis such as variations in densities and housing mix among different Comprehensive Plan Designations.

Capacity analysis results

The capacity analysis estimates the development potential of vacant residential land to accommodate new housing based a range of density assumptions by zoning designation. Table 6 shows the capacity of Sherwood's residential land based on the buildable vacant and partially vacant land in Sherwood and a range of potential density assumptions.

The analysis of capacity in Table 6 is meant to illustrate the potential capacity of Sherwood's land based on current development policies and on historical development densities. Table 6 shows development capacity using: (1) the minimum allowable densities and (2) the maximum allowable densities (ensuring that lots meet the minimum lot size requirements. Table 6 also shows capacity based on historical densities.

- **Buildable Acres.** The Buildable Lands Inventory identified 175 net acres of vacant and partially vacant land, with 96 acres within Sherwood's city

[27] In this report, the term "capacity analysis" is used as shorthand for estimating how many new dwelling units the vacant residential land in the UGB is likely to accommodate.

limits and 79 acres in the Brookman and other unincorporated areas within the Metro UGB.

- **Capacity based on Zoning: Minimum Densities.** The analysis considered the capacity of Sherwood's land based on minimum densities in Sherwood's zoning code. This analysis shows that Sherwood has capacity of 940 new dwelling units at 5.4 dwelling units per net acre based on minimum zoning in all districts.
- **Capacity based on Zoning: Maximum Densities and Minimum Lot Sizes.** The analysis considered the capacity of Sherwood's land based on maximum densities in Sherwood's zoning code and the minimum lot size. This analysis was developed based on parcel-specific data. The amount of buildable land was identified in each parcel and the potential capacity was evaluated based on development standards in Sherwood's zoning code.

  The maximum capacity estimate estimates the capacity of Sherwood's land based on the maximum density allowed by zone by parcel, assuming that each parcel of buildable land meets the minimum lot size of the zone it is in.

  Table 6 shows that Sherwood's buildable land has capacity to accommodate 1,510 new dwelling units under these assumptions. This estimate results in an overall average of 8.6 dwelling units per net acre. About 44% of Sherwood's development capacity is in the Brookman area and other unincorporated areas within the Metro UGB.
- **Historical Development Densities.** The analysis considered the capacity of Sherwood's land based on historical development density by zone. In this analysis, we applied the historical density to the total vacant land in each zone to estimate the number of dwelling units that could be accommodated.

  Table 6 shows that Sherwood's buildable land has capacity to accommodate 1,286 new dwelling units based on historical development densities. This estimate results in an overall average of 7.3 dwelling units per net acre. About 44% of Sherwood's development capacity is in the Brookman area and other unincorporated areas within the Metro UGB.

Source: Sherwood buildable lands inventory; Sherwood zoning code; Analysis of historical development densities; and Analysis by ECONorthwest

*Note: There is one lot in the Brookman Area that is split zoned MDRL/MDRH. Of this 15 acre lot, 13 acres is assumed MDRH and two acres is assumed MDRL. The density assumptions for that lot are consistent with the density assumptions shown in Table 6.

Table 6 compares the difference in the capacity estimates for the "maximum density (and minimum lot size) capacity" estimate and the "historical development density" estimate. Table 6 shows that the capacity estimate based on historical development densities results in 232 fewer dwelling units than the capacity based on maximum densities. The average density using the historical development densities is 1.3 dwelling units per acre lower than the maximum density analysis.

This difference shows that development in Sherwood is generally occurring at lower than the maximum allowed densities, showing underbuild in Sherwood. Further analysis shows that residential development between 2000 and 2014 occurred at between 70% to 80% of the maximum allowable densities. The exception is Low Density Residential, where development occurred at higher than allowable densities approximately 60% of LDR development between 2000 and 2014 was in Planned Unit Developments – neighborhoods that were approved to provide a more compact development option.

Underbuild is expected as a result of development constraints that lower development capacity, such as slopes. In addition, parcel configuration contributes to underbuild, with parcels that are oddly shaped or have more land than the minimum requirement but not enough for additional housing.

Table 6 demonstrates that development in Sherwood occurred at considerably higher densities than the minimum allowable densities in each zone.

Based on the analysis in Table 6, we conclude that **both the maximum density (and minimum lot size) and the historical development density estimates exceed the State requirement** (OAR 660-007-0035(2)) to "provide for an overall

density of six or more dwelling units per net buildable acre." The estimate results in an average density of between 7.3 to 8.6 dwelling units per net acre.

The conclusion of the housing needed analysis is that Sherwood's historical densities by housing type (shown in Table B- 3) meet Sherwood's future housing needs. Table B- 3 shows Sherwood's historical densities as 6.5 dwelling units per acre for single-family detached, 17.9 dwelling units per acre for single-family attached, and 20.5 dwelling units per acre for multifamily. If future residential development continues to occur at approximately these densities and with the mix of housing shown in Table 2, then Sherwood will be meeting its Goal 10 requirements.

In addition to the capacity shown in Table 6, Sherwood could have additional residential development capacity resulting in development of housing in commercial zones and from redevelopment of residential properties with existing development (where redevelopment results in a net increase in the number of dwelling units on the property).

About 9% of Sherwood's residential development over the 2000 to 2014 period occurred in commercial zones. It is reasonable to assume that some residential development over the next 20 years would occur in commercial zones, as long as housing is considered a secondary use to the commercial use, as required by Sherwood's development code.

Sherwood has limited opportunities for redevelopment because much of Sherwood's housing stock was developed over the last two decades. In addition, residential land in Sherwood is parcelized and meeting existing density requirements in areas with existing development would be difficult.

Table 7 presents a revision of the capacity shown in Table 6 for capacity based on historical densities. Between January 1, 2015 and December 31, 2018, Sherwood issued 160 permits for housing, all in the MDRL, MDRH, and HDR zones. Table 7 reduces the capacity estimate by 160 units, resulting in a capacity of 571 units on land within the city limits.

Table 7. Revised capacity based on historical development densities accounting for building permits issued in 2015 to 2018, dwelling units, 2018

RESIDENTIAL LAND SUFFICIENCY

The last step in the analysis of the sufficiency of residential land within Sherwood is to compare the demand for land by zone (Table 3) with the capacity of land by zone based on historical development densities (Table 6 and Table 7). Table 9 shows that Sherwood has a deficit of capacity in each zone, for a total deficit of about 608 dwelling units. The largest deficits are in Medium Density Residential-Low (154 dwelling units), Medium Density Residential-High (252 dwelling units), and High Density Residential (145 dwelling units).

The conclusion from Table 9 is that the current inventory of buildable residential land is **not** sufficient to accommodate Sherwood's expected growth. To comply with Goal 10, the City will need to either change its policies to allow for more development on the inventory of vacant land, request a UGB expansion from Metro, or both. The types of land with the largest deficit are Medium Density Residential-Low, Medium Density Residential-high, and High Density Residential.

Table 9. Comparison of capacity of existing residential land with demand for new dwelling units, dwelling units, Sherwood planning area, 2019-2039

Zone	Capacity (Needed Densities)	Housing Demand	Comparison Capacity *minus* Demand (dwelling units)
Very Low Density Residential	76	95	-19
Low Density Residential	144	182	-38
Medium Density Residential-Low	382	536	-154
Medium Density Residential-High	266	518	-252
High Density Residential	253	398	-145
Total	**1,121**	**1,729**	**-608**

Source: ECONorthwest
Note: DU is dwelling unit.

POTENTIAL GROWTH IN SHERWOOD WEST

Development capacity in Sherwood West will vary from 3,300 to 6,500 dwelling units. The Concept Plan will begin to identify housing types and development scenarios that fit with the community's vision for Sherwood West and that are possible, given likely development and infrastructure costs

The Concept Planning work for Sherwood West is ongoing. The results of the Concept Planning work and later concept and master planning phases will determine more precisely the type and amount of housing in Sherwood West. Table 10 presents estimates of capacity in Sherwood West based on a range of density assumptions, from an average of 6.0 to 12.0 dwelling units per acre. The purpose of the information in Table 10 is to provide some idea of potential development capacity in Sherwood West.

The timing of development in Sherwood West is being discussed through the Concept Planning process. A number of factors will affect the timing of development in Sherwood West, such as when the area is brought into the Metro UGB, provisions of services, and future concept planning for the area. Sherwood West may not be fully built out until 2065. The areas expected to develop first in Sherwood West are Areas A, B, and a portion of C in the Concept Plan, which are located in the southeast part of Sherwood West, adjacent to the Brookman Area. The Sherwood School District has plans to develop a high school in Area A in the next few years.

Table 10. Potential residential development capacity, Sherwood West

	Dwelling Units	Notes
Estimate of Buildable Land		
Gross Acres	670	
Net Acres	546	We assumed an average net-to-gross factor of 18.5% for rights-of-way, regardless of parcel size.
Potential Capacity based on Density Assumptions		
Required average from OAR 660-007 - 6 DU/net acre	3,276	Under this assumption, Sherwood West would be primarily built-out with single-family detached housing. Given Sherwood's historical development densities and the City's requirement to provide opportunity that half of new development is single-family attached and multifamily, this density seems too low for Sherwood West. Issues related to costs of services and development density will be discussed in the pre-concept planning process (and again in the concept planning process) may indicate that this density assumption is too low to support development costs for Sherwood West.
Historical Development Density* - 7.8 DU/net acre	4,259	Issues related to costs of services and development density will be discussed in the pre-concept planning process (and again in the concept planning process) may indicate that this density assumption is too low to support development costs for Sherwood West.
10 DU/net acre	5,460	Metro's forecast for capacity in Sherwood West (4,844) would be accommodated at an average of 10 dwelling units per acre, with some additional capacity for other development.
12 DU/net acre	6,552	

Source: Buildable Lands Estimate from OTAK and analysis by ECONorthwest
*Note: Historical Development Density includes only development in residential zones over the 2000-2014 period.

CONCLUSIONS AND RECOMMENDATIONS

The key findings and recommendations from the housing needs analysis are as follows:

Sherwood is able to accommodate 65% of the forecast for growth within the Sherwood Planning Area.

- **Sherwood is able to meet state requirements for housing mix and density.** The City's primary obligations are to (1) designate land in a way that 50% of new housing could be either multifamily or single-family attached housing (e.g., townhouses) and (2) achieve an average density of six dwelling units per net acre. Put another way, the City is required to plan that 50% of their new housing will have the opportunity to be multifamily or single-family attached housing (e.g., townhouses), with all housing at an average density of 6 dwelling units per net acre. Sherwood is able to meet these requirements.
- **Sherwood is meeting its obligation to plan for needed housing types for households at all income levels.** Sherwood's residential development policies include those that allow for development of a range of housing types (e.g., duplexes, manufactured housing, and apartments) and that allow government-subsidized housing. This conclusion is supported by the fact that Metro's 2016 *Compliance Report* concluded that Sherwood was in compliance with Metro Functional Plan and Title 7 (Housing Choice). Sherwood will have an ongoing need for providing affordable housing to households with all income levels.
- **Sherwood has a deficit of land for housing.** Sherwood can accommodate about 65% of the forecast for new housing on areas within the city limits and Brookman Area. However, Sherwood has a deficit of land for 608 dwelling units. The largest deficits are in Medium Density Residential-Low (154 dwelling units), Medium Density Residential-High (252 dwelling units), and High Density Residential (145 dwelling units).
- **To provide adequate supply, Sherwood will need to continue to annex the Brookman area.** Sherwood will need to continue to annex the Brookman area in order to accommodate the City's forecast of residential growth. The City recently annexed about 98 acres in the Brookman Area. The annexed land is in the center of the Brookman Area and has relatively few owners (about 8 property owners). Annexing and developing other parts of the Brookman area, with a larger number of owners, may be more challenging, to the extent that the property owners have to come to agreement about development.
- **Sherwood will need Sherwood West to accommodate future growth beyond the existing city limits and Brookman Area.** The growth rate of Metro's forecast for household growth (1.1% average annual growth) is considerably lower than the City's historical population growth rate over the last two decades (8% average annual growth). Metro's forecast only

includes growth that can be accommodated with the Sherwood Planning area, which does not include Sherwood West.

Given the limited supply of buildable land within Sherwood, it is likely that the City's residential growth will slow, especially if portions of Sherwood West are not brought into the Metro UGB in the earlier part of the 20-year planning period. It is likely that Sherwood's future growth over the 2019-2039 period would be considerably slower than its historical growth rate, if for no other fact than it is mathematically more difficult to maintain a high growth rate with a larger population. In addition, Sherwood's fast growth during the last two decades was driven by historically fast in-migration in to the Portland region, a trend that Metro's forecast shows slowing, and the availability of vacant buildable residential land in Sherwood.

Sherwood's fast growth during the last two decades was driven by historically fast in-migration in to the Portland region, a trend that Metro's forecast shows slowing, and the availability of vacant buildable residential land in Sherwood.

Sherwood will need Sherwood West to accommodate future growth beyond the existing city limits and Brookman Area.

- **Sherwood has a relatively limited supply of land for moderate- and higher-density multifamily housing.** Sherwood has 41 vacant acres of MDRH land and 17 acres of HDR land. If the City wants more multifamily housing growth in core areas of Sherwood, the City could evaluate whether to make policy changes that either increase the capacity of MDRH and HDR land or designate more land for these uses. Some specific considerations:
  - MDRH allows up to 11 dwelling units per acre. However the lot development requirements[28] for multifamily make it difficult to achieve the maximum development density. The City should evaluate the implications of changing MDRH development standards to allow densities of at least 11 dwelling units per acre or a moderate increase in the maximum allowable densities in MDRH.
  - The City's supply of HDR land is very limited, with 17 vacant acres of HDR. As part of the Comprehensive Plan update, the City may choose to evaluate opportunities to upzone land to HDR, to allow more multifamily land in areas such as centers or along transportation corridors.
  - Sherwood's development code does not provide opportunities for development of housing at moderate multifamily densities of 11.1 to 16.7 dwelling units per acre, the gap in densities between MDRH and HDR. As part of the Comprehensive Plan update, the City may choose to evaluate the need for a zone that allows development in this density,

Sherwood's development code does not provide opportunities for development of housing at moderate multifamily densities between 11 to 16 dwelling units per acre.

Providing opportunities for housing in these densities may address and provide opportunities for development of a wider range of affordable housing types.

[28] Sherwood has an 8,000 square foot minimum lot size for the first two multifamily units, with a requirement for 3,200 additional square feet for each multifamily unit beyond the first two units.

which might include townhouses and moderate-sized apartment or condominium buildings.

- About 9% of Sherwood's residential development over the 2000 to 2014 period occurred in commercial zones., Sherwood may be able to accommodate additional multifamily residential development in these zones. The City may choose to evaluate and identify opportunities for additional multifamily development in commercial zones, as part of the Comprehensive Plan update.

- **Sherwood should monitor residential development.** The city may wish to develop a monitoring program that will allow Sherwood to understand how fast land is developing. The monitoring program will inform Metro's UGB planning process by providing more detailed information about housing growth and development capacity in Sherwood. This information can help City staff and decision-makers make the case to Metro staff and decision-makers about the need for residential expansion areas. We recommend using the following metrics to monitor residential growth:

  - **Population.** The City already routinely monitors population growth by using the annual population estimates prepared by the Center for Population Research at Portland State University.

  - **Building permits.** The Housing Needs Analysis included a review of building permits by dwelling type, plan designation, zone, and net density. Because the City collects most of the data used in the analysis of historical development density, we recommend that city staff update this analysis on an annual basis.

  - **Subdivision and partition activity.** This metric is intended to measure the rate and density of land divisions in Sherwood. Specific data to include with subdivision and partition activity are the area of the parent lot, the area in child lots, the number of child lots, the average size or density of lots, and the area in dedicated right-of-way.

  - **Land consumption.** This metric relates closely to the building permit data. The building permit data should include tax lot identifiers for each permit. The City should match each permit to data in the buildable lands inventory and report how much land is being used by plan designation, zone, and land classification (e.g., vacant, redevelopable, infill, etc.). Additionally, we recommend the City map the location of development on an annual basis.

Appendix A. Appendix A. Residential Buildable Lands Inventory

This appendix presents the methodology used to develop the buildable lands inventory and the results of the buildable lands inventory. The information in this appendix was developed by City of Sherwood staff.[29]

METHODOLOGY

Definitions used in the inventory

Vacant land

- Any tax lot that is fully vacant as determined by RLIS GIS Data[30], aerial photography, field checks and local records.
- Tax lots that are at least 95% vacant are considered vacant land.
- Tax lots that are less than 2,000 sq. feet developed AND developed part is under 10% of entire lot

Developed land

- Part vacant/part developed tax lots are considered developed and will be treated in the redevelopment filter

Steps in developing the buildable land inventory

Step 1: Inventory and map fully vacant residential lands

a. Sort City tax lot data by zoning designation within the City boundary.

The residential zones including any planned unit development overlay utilized within this study include:

- Very Low Density Residential (VLDR)
- Low Density Residential (LDR)
- Medium Density Residential Low (MDRL)
- Medium Density Residential High (MDRH)
- High Density Residential (HDR)

b. Identify parcels that are fully vacant.

[29] Michelle Miller, AICP, Senior Planner at the City of Sherwood developed the buildable lands inventory.

[30] Metro's Data Resource Center collaborates with local partners to develop and deliver the Regional Land Information System (RLIS) – more than 100 layers of spatial data that supports strategic decision-making for governments, businesses and organizations across the region.

1. Remove developed parcels using most recent Metro's RLIS GIS data.
2. Planning staff review based on current aerial photography, field checks, and local records

Step 2: Subtract unbuildable acres

a. Remove tax lots that d/n have potential to provide residential growth.

1. Tax exempt with property codes for City, State, Federal and Native American designations
2. Schools
3. Churches and social organizations-based solely on tax exempt codes
4. Private streets
5. Rail properties
6. Tax lots under the minimum lot size of the zone or 4,250 sq. ft. for residential land due to infill standards
7. Parks

b. Calculate deductions for environmental resources[31].

1. Remove Floodways-100% removed
2. Recognize environmental constraints such as slopes over 25 % and constrained areas as defined by Cities and Counties under Metro Functional Plan Title 13-Riparian Corridors (Class I and II) and Upland Wildlife Habitat (Class A and B) -100%
3. By assumption, allow one dwelling unit per residentially zoned tax lot if environmental encumbrances would limit development such that by internal calculations no dwelling units would otherwise be permitted.

c. Calculate for future streets. [32]

This methodology sets aside a portion of the vacant land supply (not redevelopment supply) in order to accommodate future streets and sidewalks. This assumption is calculated on a per tax lot basis.

1. Tax lots less than 3/8 acre assume 0% set aside future streets.33
2. Tax lots between 3/8 acre and 1 acre assume a 10% set aside for future streets
3. Tax lots greater than an acre assume an 18.5% set aside for future streets

---

[31] Environmental resources are considered to include Title 3, Title 13 FEMA floodway and slopes over 25 %.

[32] The BLI accounts for future streets on a tax lot by tax lot basis. The buildable area of each tax lot is reduced based on individual tax lot size.

[33] The basis for these net street deduction ratios derive from previous research completed by the Data Resource Center and local jurisdictions for the 2002 UGR.

4. Industrial zoning assumes a 10% set aside regardless of size.

Step 3: Inventory and map re-developable lands

a. Definition:

Re-developable: applies to lots that are classified as developed that are now likely to redevelop or during the 20-year planning period**.**

b. Query performed that identifies previously developed lots that have potential to redevelop over time due to the relationship between the size of the lot and the value of improvements.

1. Sites between .26-.54 acres with improvements less than $ 50 K
2. Sites over .55 acres with improvement between $50,001-100 K
3. Sites over 1 acre with improvement values between $ 100,001-150 K
4. Results of this query include land that is wholly re-developable, meaning existing improvements would be replaced, and land that is partially vacant, meaning the lot could be divided to allow for additional development.

Step 4: Planning staff review of draft map-(Investigative step)

a. Remove under construction or pending construction as of October 1, 2014

b. Added back and redefined areas of special concern (Areas like Brookman for example)[34]

c. Review and add City owned properties that are developable and not held for public purpose

d. For parcels zoned MDRH and HDR determine densities based on location and likelihood that parcel will develop with multifamily or single-family dwelling units and base densities on minimum lot size for single-family and maximum density for multifamily.

e. Re-developable or partially vacant sites that include:

- Properties currently for sale
- Lots that are more than twice the minimum lot size required to support the number of existing dwelling units including tax lots that have land division potential
- Sites that should have been identified as partially vacant but not caught earlier
- Lands with single-family development zoned for multifamily development

f. Remove from Map and defined the following as Not Likely to Redevelop

- Sites occupied by active religious institutions
- Sites with known deed restrictions
- Sites currently under development

[34] Assume Brookman Concept Plan Zoning

- Sites occupied by utility infrastructure
- Commercially zoned land greater than ½ mile from either residential or town center lots-most likely won't be mixed use with residential

g. Redevelop Strike Price Analysis

- Perform on all tax lots planned for residential and commercial development, to identify Multifamily and Commercial sites with a market redevelopment strike price of less than $10 per square foot.[35]

$$\text{Strike Price} = \frac{\text{(Improvement value + land value)}}{\text{Total Sq. Ft of lot}}$$

h. Identify possible rezone properties that would either be added or subtracted from the inventory over time.

[35] This formula is part of the draft proposed Metro methodology for identifying sites zoned for Multifamily and Mixed Use Development that are likely to redevelop. $10/sq.ft. is the estimated threshold for the market supporting redevelopment of suburban sites that are zoned for multifamily development.

RESULTS OF THE BUILDABLE LANDS INVENTORY

Table A- 1 presents the City's inventory of buildable land. The buildable lands inventory is based on City of Sherwood and Metro GIS data. Table A- 1 shows that Sherwood has 175 net acres of suitable buildable residential land. Fifty-five percent of Sherwood's vacant land (96 acres) is within the city limits and 45% (79 acres) is within the Brookman Area or other unincorporated areas within the current Urban Growth Boundary.

Table A- 1. Inventory of suitable buildable residential land, net acres, Sherwood city limits and areas within the UGB, 2014

Zone	Gross Acres	Percent of Total
Land within City Limits		
Very Low Density Residential (VLDR)	24	14%
Very Low Density Residential Planned Unit Development (VLDR-PUD)	1	1%
Low Density Residential (LDR)	22	13%
Medium Density Residential-Low (MDRL)	14	8%
Medium Density Residential-High (MDRH)	21	12%
High Density Residential (HDR)	14	8%
Subtotal	**96**	**55%**
Brookman and Other Unincorporated Areas		
Very Low Density Residential (VLDR)	1	1%
Medium Density Residential-Low (MDRL)	52	30%
Medium Density Residential-High (MDRH)	8	4%
Medium Density Residential- Low/High* (MDRL/H)	15	8%
High Density Residential (HDR)	3	2%
Subtotal	**79**	**45%**
Total	**175**	**100%**

Source: City of Sherwood
*Note: There is one lot split between MDRL and MDRH.

Table A- 2 presents a revision of the capacity shown in Table A- 1 for capacity based on historical densities. Between January 1, 2015 and December 31, 2018, Sherwood issued 160 permits for housing, all in the MDRL, MDRH, and HDR zones. Table A- 2 reduces the capacity estimate by 160 units, resulting in a capacity of 571 units on land within the city limits.

Table A- 2.. Revised capacity based on historical development densities accounting for building permits issued in 2015 to 2018, dwelling units, 2018

Zone	Capacity based on Historical Development Densities	Building Permits Issued 2015 to 2018	Revised Capacity
Land within City Limits			
VLDR	69		69
VLDR_PUD	3		3
LDR	144		144
MDRL	88	34	54
MDRH	161	52	109
HDR	266	74	192
Subtotal	**731**	**160**	**571**

Appendix B. Trends Affecting Housing Need in Sherwood

Historical and Recent Development Trends

Analysis of historical development trends in Sherwood provides insights into how the local housing market functions. The intent of the analysis is to understand how local market dynamics may affect future housing—particularly the mix and density of housing by type. The housing mix and density by type are also key variables in forecasting future land need. The specific steps are described in Task 2 of the DLCD *Planning for Residential Lands* Workbook:

- Determine the time period for which the data must be gathered.
- Identify types of housing to address (at a minimum, all needed housing types identified in ORS 197.303).
- Evaluate permit/subdivision data to calculate the actual mix, average actual gross density, and average actual net density of all housing types.

The period used in the analysis of housing density and mix is 2000 to 2014, which includes both times of high housing production and times of low housing production. This reasons for choosing this period were: (1) the 2000 to 2014 period includes more than one economic cycle, with extreme highs and extreme lows in the housing market and (2) data prior to 2005 was less easily available and obtaining data for 2000 to 2004 required a considerable amount of work by City staff to compile the data.

The housing needs analysis presents information about residential development by housing types. For the purposes of this study, we grouped housing types based on: (1) whether the structure is stand-alone or attached to another structure and (2) the number of dwelling units in each structure. The housing types used in this analysis are:

- **Single-family detached:** single-family detached units and manufactured homes on lots and in mobile home parks.
- **Single-family attached:** all structures with a common wall where each dwelling unit occupies a separate lot, such as row houses or townhouses.

Multifamily: all attached structures other than single-family detached units, manufactured units, or single-family attached units.

These categories of housing type were chosen for the analysis because they meet the requirements of needed housing types in ORS 197.303.[36]

Data used in this analysis

Throughout this analysis, we use data from multiple well-recognized and reliable data sources. One of the key sources for data about housing and household data is the U.S. Census. This report primarily uses data from two Census sources:

- The **Decennial Census**, which is completed every ten years and is a survey of all households in the U.S. The Decennial Census is considered the best available data for information such as demographics (e.g., number of people, age distribution, or ethnic or racial composition); household characteristics (e.g., household size and composition); and housing occupancy characteristics. As of the 2010 Decennial Census, it does not collect more detailed household information, such as income, housing costs, housing characteristics, and other important household information. Decennial Census data is available for 1990, 2000, and 2010.

- The **American Community Survey (ACS)**, which is completed every year and is a sample of households in the U.S. The 2009-2013 ACS sampled about 16.2 million households, or about 2.8% of the households in the nation. The ACS collects detailed information about households, such as demographics (e.g., number of people, age distribution, ethnic or racial composition, country of origin, language spoken at home, and educational attainment); household characteristics (e.g., household size and composition); housing characteristics (e.g., type of housing unit, year unit built, or number of bedrooms); housing costs (e.g., rent, mortgage, utility, and insurance); housing value; income; and other characteristics.

In general, this report uses data from the 2009-2013 ACS for Sherwood. Where information is available, we report information from the 2010 Decennial Census.

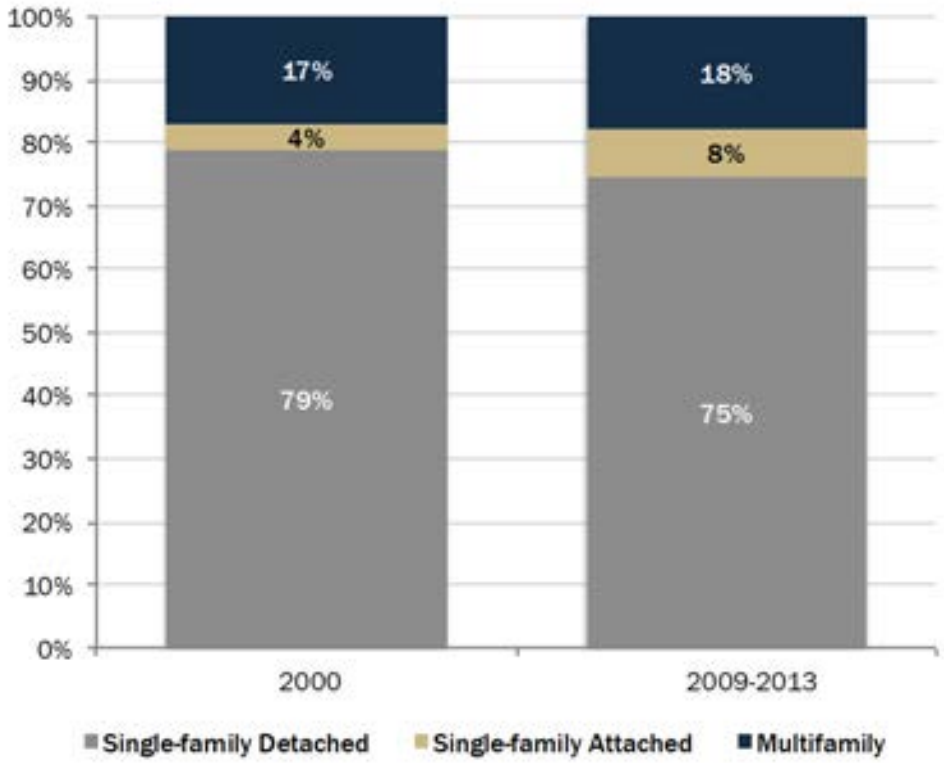
Trends in housing mix in Sherwood

According to the American Community Survey, Sherwood had more than 6,500 housing units in the 2009-2013 period. Figure B- 1 shows that Sherwood's housing stock is predominantly single-family detached housing. In 2000, 79% of

[36] The analysis of development in Sherwood attempts to separate single-family detached and single-family attached housing. However, the City's building permit system does not distinguish between these two types of housing. City staff manually identified single-family attached housing that was developed with a concentration of single-family attached housing. City staff were unable to identify small-scale, single-family attached development scattered throughout the city.

Sherwood's housing stock was single-family detached and 77% was single-family detached in 2009-2013. The share of multifamily units increased from 17% of Sherwood's housing stock in 2000 to 18% in 2009-2013.

Figure B- 1. Mix of Housing Types, Sherwood, 2000 to 2009-2013



Source: U.S. Census 2000 SF3 Table H030, American Community Survey 2009-2013, Table B25024.

Table B- 1 and Figure B- 2 show that the mix of housing developed over the 2000 to 2014 period was predominantly single-family housing (including single-family detached, single-family attached, and manufactured housing), accompanied by intermittent growth in multifamily.

Over the entire 2000 to 2014 period, Sherwood issued permits for nearly 2,225 dwelling units, with about 148 permits issued per year. About 69% of dwellings permitted were single-family detached, 9% were single-family attached, and 23% were multifamily.

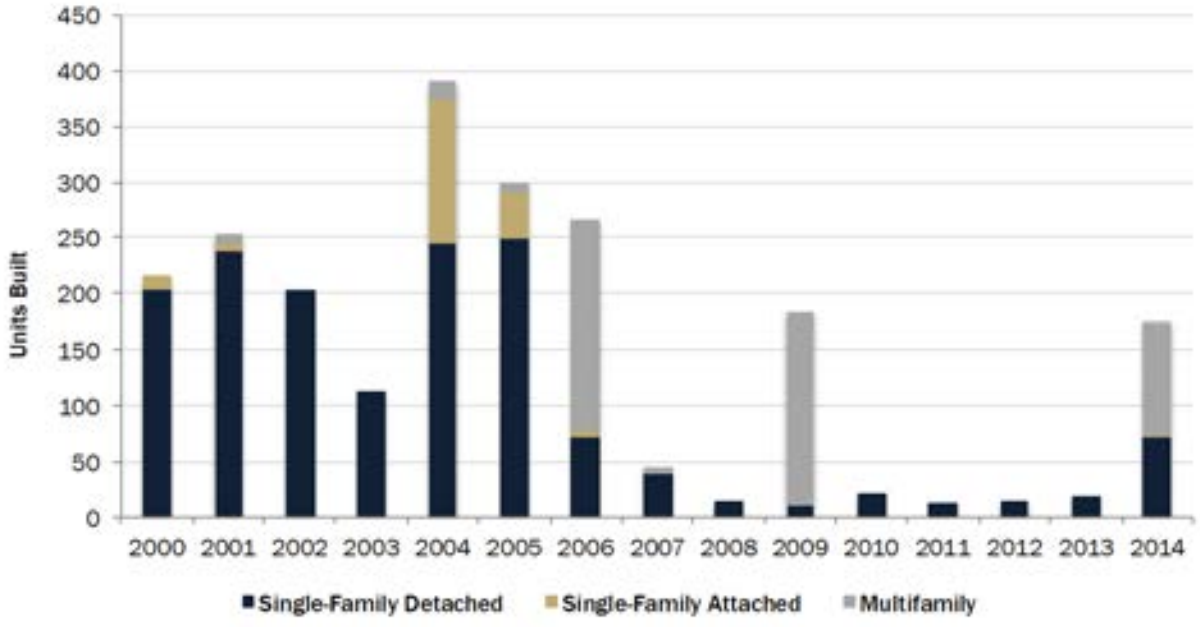
In addition, 160 units were permitted during the January 1, 2015 to December 31, 2018 period. All units permitted were single-family detached. These permits are not shown in Table B- 1 and Figure B- 2.

Table B- 1. Building permits by type of unit, Sherwood, 2000-2014

Housing Type	New Units Permitted	Average of New Units Permitted Annually	Mix of New Units
Single-Family Detached	1,525	102	69%
Single-Family Attached	196	13	9%
Multifamily	504	34	23%
Total	2,225	148	100%

Source: City of Sherwood Building Permit Database.
Notes: Single-Family Detached includes manufactured housing.

Figure B- 2. Building permits by type of unit, Sherwood, 2000 to 2014

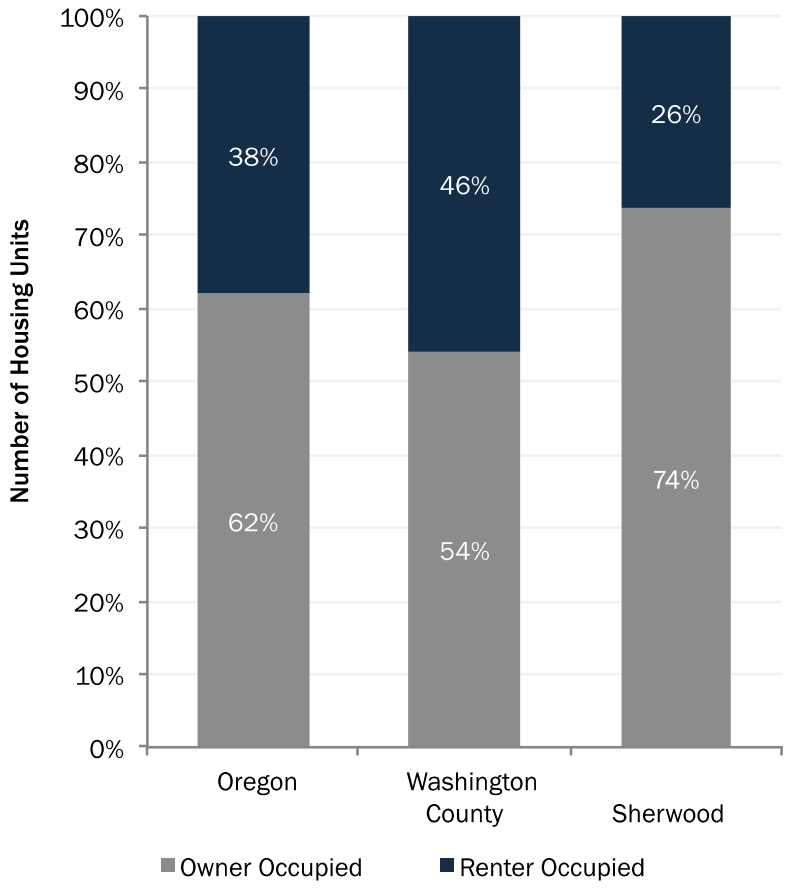


Source: City of Sherwood Building Permit Database.
Notes: Single-Family Detached includes manufactured housing.

Trends in Tenure

Figure B- 3 shows housing tenure in Oregon, Washington County, and Sherwood for the 2009-2013 period. Sherwood has a higher rate of ownership (74%) than the county (54%) and the state (62%).

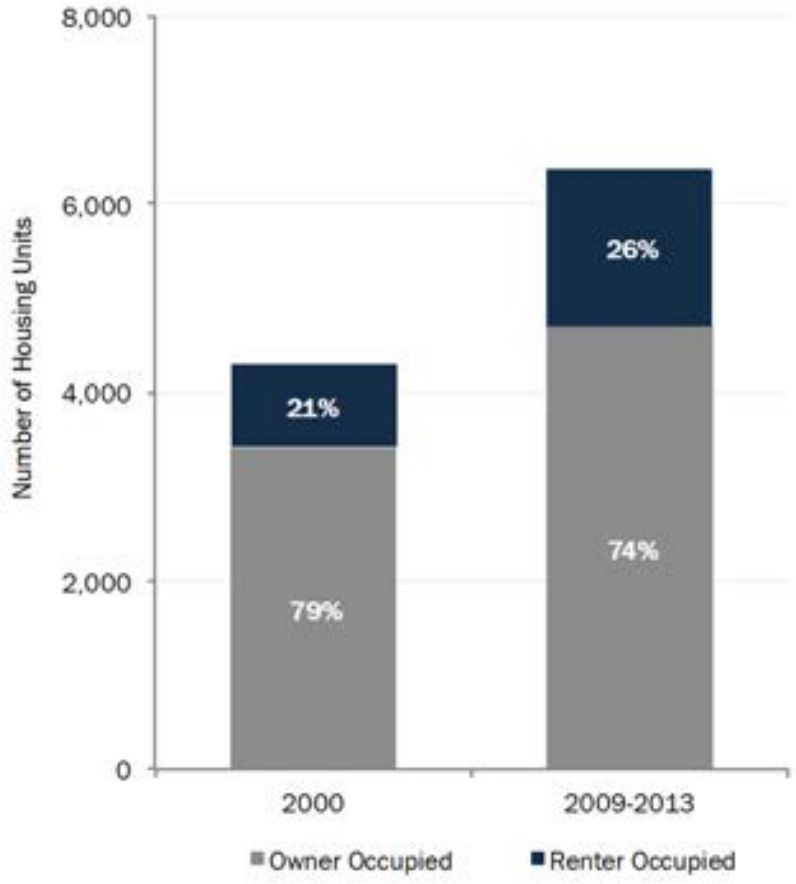
Figure B- 3. Housing Tenure, Oregon, Washington County, Sherwood, 2009-2013



Source: American Community Survey 2009-2013, Table B25003.

Figure B- 4 shows change in tenure (owner versus renter-occupied housing units) for the City of Sherwood over the 2000 to 2009-2013 period. The overall homeownership rate declined, from 79% to 74% between 2000 to 2009-2013, while renting increased by 5%. This change is consistent with national and statewide trends in homeownership.

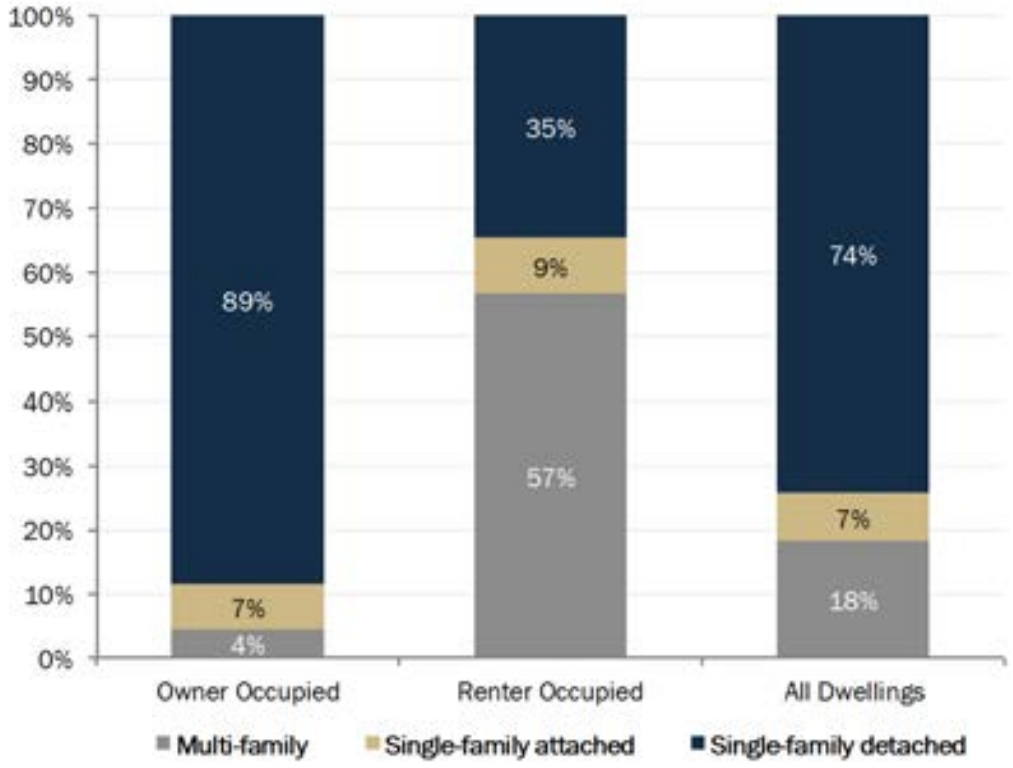
Figure B- 4. Tenure, occupied units, Sherwood, 2000 to 2009-2013



Source: U.S. Census 2000 SF3 Table H032, American Community Survey 2009-2013 Table B25003.

Figure B- 5 shows the types of dwelling in Sherwood in 2009-2013 by tenure (owner/renter-occupied). The results indicate that in Sherwood, single-family housing types are most frequently owner-occupied (70% of all housing is single-family, owner-occupied housing) and multifamily housing is most frequently renter-occupied (15% of all housing is multifamily renter-occupied housing).

Figure B- 5. Housing units by type and tenure, Sherwood, 2009-2013



Source: American Community Survey 2009-2013 Table B25032.

Housing Vacancy Rates

Table B- 2 shows vacancy rates in Oregon, Multnomah, Washington, and Clackamas counties, and Sherwood between 2000 and 2009-2013. Vacancy rates increased in in Oregon, and Clackamas counties, but fell in Multnomah and Washington counties, and in Sherwood. As the 2009-2013 period, Sherwood had a relatively low vacancy rate (2.7%) compared to the regional counties, whose rates ranged from 5.5% to 7.0%, and to Oregon (9.6%).

Table B- 2. Housing vacancy rate, Oregon, Multnomah, Washington and Clackamas Counties, and Sherwood, 2000 to 2009-2013

	Oregon	Multnomah County	Washington County	Clackamas County	Sherwood
2000	8.2%	6.4%	5.7%	5.5%	3.6%
2009 - 2013	9.6%	5.9%	5.5%	7.0%	2.7%
Change 2000 to 2009-2013	17.1%	-7.5%	-3.6%	28.3%	-24.7%

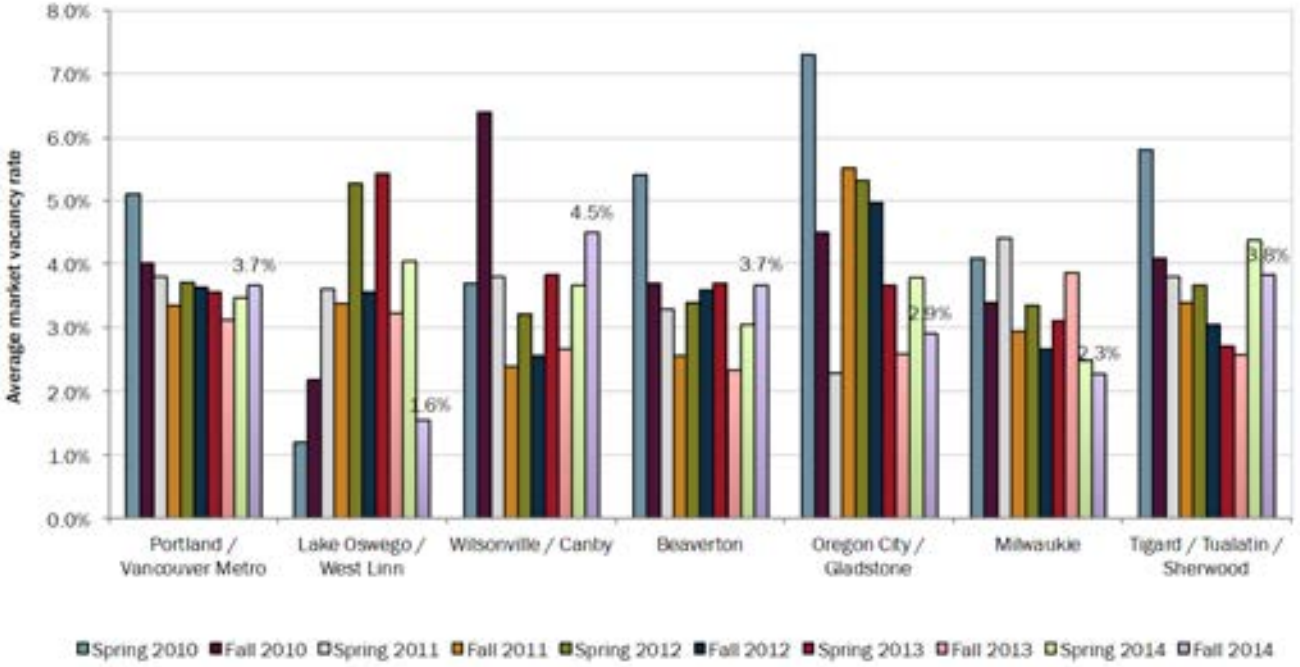
Source: U.S. Census 2000 SF1 Table H003, American Community Survey 2009-2013 Table B25002.

Multifamily NW tracks trends in the Portland area rental market and publishes a semi-annual report. Figure B- 6 shows average market vacancy rates for apartments for the Portland/Vancouver region and selected submarkets in the south-central Portland Region. The vacancy rates in the

Tigard/Tualatin/Sherwood area varied from a high of 5.8% in Spring 2010 to a low of 2.6% in Fall 2013. The vacancy rate in this area was within 1% (above or below) the vacancy rate for the Portland /Vancouver metro area. According to the Fall 2014 Apartment Report, the vacancy rate for apartments in the Tigard/Tualatin/Sherwood area was 3.8%, slightly higher than the regional average of 3.7%.

Multifamily vacancy rates vary, in part, as a result of building new multifamily developments. When a new multifamily development comes on the market, it may take months (or longer) for the new units to be absorbed into the housing market through rental of new units. During this absorption period, the vacancy rate will generally increase for multifamily housing.

Figure B- 6. Average market vacancy rates for apartments, Portland/Vancouver Metro area and selected submarkets, 2010-2014



Multifamily NW Apartment Reports, Spring 2010 – Fall 2014.

Density

Housing density is the density of housing by structure type, expressed in dwelling units per net or gross acre.[37] The U.S. Census does not track residential development density.

This study analyzes housing density based on new residential development within Sherwood between 2000 and 2014, similar to the analysis of achieved mix. The analysis of housing density uses data from the City of Sherwood's building permits database.

Table B- 3 shows that development that was permitted between 2000 and 2014 achieved overall average densities of 8.2 dwelling units per net acre. The majority of permitted housing was single-family detached housing, which averaged 6.5 dwelling units per net acre. Multifamily housing achieved an average of 20.5 and single-family attached achieved and average of 17.9 dwelling units per net acre.

Table B- 3. Estimated density by type of unit, net acres, Sherwood, 2000-2014

Housing Type	New and Existing Units	Acres	Density (dwelling unit per acre)
Single-Family Detached	1,641	251	6.5
Single-Family Attached	196	11	17.9
Multifamily	504	25	20.5
Total	2,341	286	8.2

Source: City of Sherwood Building Permit Database.
Note: Single-Family Detached includes manufactured housing
Note: The number of new single-family detached housing is higher in Table B- 3 than in Table B- 1 because Table B- 3 includes 116 existing manufactured dwellings in manufactured housing parks. These dwellings were included as part of the density calculation to correctly calculate the densities of manufactured housing in the manufactured housing parks with one or more newly permitted dwellings over the 2000 to 2014 period.

Table B-4 shows an analysis of residential development density (dwelling units per net acre) over the 15-year period for Sherwood by zoning designation. Table B-4 shows:

- Ninety-two percent of residential development was in residential zones, which had an overall density of 7.8 dwelling units per net acre.
- Density in residential zones varied from 2.9 dwelling units per net acre in the Very Low Density Residential zone to 19.1 dwelling units per net acre in the High Density Residential zone.

[37] OAR 660-024-0010(6) uses the following definition of net buildable acre. "Net Buildable Acre" "…consists of 43,560 square feet of residentially designated buildable land after excluding future rights-of-way for streets and roads." While the administrative rule does not include a definition of a gross buildable acre, using the definition above, a gross buildable acre will include areas used for rights-of-way for streets and roads. Areas used for rights-of-way are considered unbuildable.

- Density in the Low Density Residential zone averaged 6.5 dwelling units per net acre. Development in Planned Unit Developments (PUD) in this zone achieved an average of 7.6 dwelling units per net acre, which explains the relatively high density in this zone.
- Density in Commercial and Mixed-Use zones averaged 15.6 dwelling units per net acre.

Table B-4. Housing density by Zone, net acres, Sherwood, 2000 to 2014

Zone	New and Existing Units	Acres	Density (dwelling unit per acre)
Residential Zones			
Very Low Density Residential	53	18	2.9

NATIONAL HOUSING TRENDS

The overview of national, state, and local housing trends builds from previous work by ECONorthwest, Urban Land Institute (ULI) reports, and conclusions from *The State of the Nation's Housing, 2014* report from the Joint Center for Housing Studies at Harvard University.[38] The Harvard report summarizes the national housing outlook as follows:

> "With promising increases in home construction, sales, and prices, the housing market gained steam in early 2013. But when interest rates notched up at mid-year, momentum slowed. This moderation is likely to persist until job growth manages to lift household incomes. Even amid a broader recovery, though, many hard-hit communities still struggle and millions of households continue to pay excessive shares of income for housing."

Several challenges to a strong domestic housing market remain. Demand for housing follows trends in jobs and incomes, which are taking longer to recover than in previous cycles. While trending downward, the numbers of underwater homeowners, delinquent loans, and vacancies remain high. *The State of the Nation's Housing* report projects that it will take several years for market conditions to return to normal and, until then, the housing recovery will likely unfold at a moderate pace.

Trends in housing development

The single-family housing market began strong in 2013, but by the arrival of 2014, housing starts were down 3% and new home sales had fallen 7% from the year before. The *State of the Nation's Housing Report* attributes most of the decline to increases in mortgage interest rates and meager improvements in employment and wages.

Thirty-year mortgage interest rose in 2014, bucking a downward trend. After falling to a low of around 3.4% in 2013, rates rose to around 5% in 2014. The rise of mortgage interest rates increased the cost of investment in a home and contributed to the fall in the rate of housing starts. In addition to the rise of mortgage interest rates, "steady but unspectacular job growth" presented a fundamental obstacle to the housing market's progress, according to the report. Employment grew, but slowly, and incomes continued to fall. As long as job and wage growth remain slow, potential homebuyers will not create sufficient demand for robust growth in the housing market.

[38] The State of the Nation's Housing, Harvard University, 2014, accessed January 2014. http://www.jchs.harvard.edu/research/state_nations_housing

Other recent trends in the housing market included: home inventories remained low (homes now spend less than six months on the market), investors purchased fewer distressed properties, the renter market grew, and a larger share of young people chose to live with their parents.

Supplies of existing homes for sale remained low in 2013, which may reflect the unwillingness or inability of owners to sell at current prices (Figure A- 1). As home prices return to levels that are more acceptable to sellers, more homes will go on the market.

Figure A- 1. Inventories of Homes for Sale Against Months Supply, 2002-2013

Multifamily home construction continued robust growth for a third consecutive year. Multifamily starts increased 25% to over 300,000 in 2013, approaching pre-recession levels of around 350,000. In contrast to strong multifamily housing growth, single-family home starts grew slowly, at only about 15%, well below pre-recession levels of production: less than 620,000 starts in 2013, compared to over 1.5 million in 2006. These growth trends are shown in Figure A- 2.

Figure A- 2. Housing Starts, 2003-2014

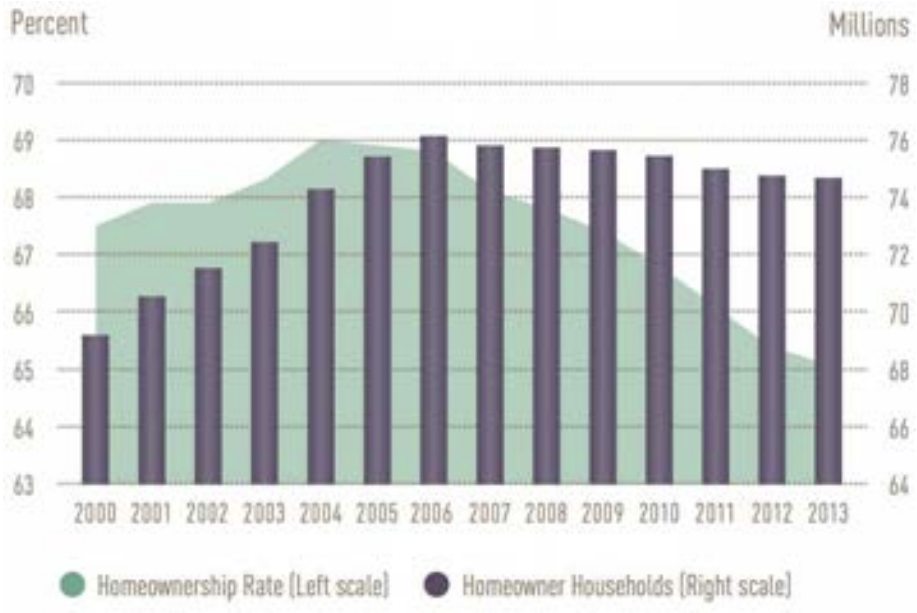
Long run trends in home ownership and demand

The housing market downturn and foreclosure crisis had an immediate and potentially lasting impact on homeownership. After 13 successive years of increases, the national homeownership rate declined each year from 2005 to 2013, and is currently at approximately 65%. However, while the rate declined again in 2013, it was the smallest drop since 2008. As seen in Figure A- 3, the US homeownership rate fell only 0.3 percentage points.

Figure A- 3. Homeownership Rates and the Number of Homeowner Households, 2000-2013



Source: The State of The Nation's Housing, 2014, The Joint Center for Housing Studies of Harvard University, p. 10. http://www.jchs.harvard.edu/sites/jchs.harvard.edu/files/sonhr14-color-full.pdf.

The long-term market outlook shows that homeownership is still the preferred tenure. While further homeownership gains are likely during the next decade, they are not assured. Additional increases depend, in part, on the effect of foreclosures on potential owner's ability to purchase homes in the future, as well as whether the conditions that have led to homeownership growth can be sustained.

The Joint Center for Housing Studies indicates that demand for new homes could total as many as 13 million units nationally between 2015 and 2025. The location of these homes may differ from recent trends, which favored lower-density development on the urban fringe and suburban areas. The Urban Land Institute identifies the markets that have the most growth potential as "global gateway, 24-hour markets," which are primary coastal cities with international airport hubs (e.g., Washington D.C., New York City, San Francisco, or Seattle). Development in these areas may be nearer city centers, with denser infill types of development.[39]

The Joint Center for Housing Studies also indicates that demand for higher density housing types exists among certain demographics. They conclude that because of persistent income disparities, as well as the movement of the

[39] Urban Land Institute, "2011 Emerging Trends in Real Estate" and "2012 Emerging Trends in Real Estate"

Millennials into young adulthood, housing demand may shift away from single-family detached homes toward more affordable multifamily apartments, town homes, and manufactured homes.

Home rental trends

Nationally, the rental market continues to grow. In 2013, the number of households living in rental units increased by half a million, marking the ninth consecutive year of expansion. In addition to growth in rentals in 2013, the million-plus annual increases observed in 2011 and 2012 puts current growth rates on pace to easily surpass the record 5.1 million gain in the 2000s.

Rental markets across the country have been tightening, pushing up rents across the majority of markets. Rental vacancy rates also continued to drop in 2013, both nationwide and in most metros. The US rental vacancy rate stood at 8.3% in 2013 and, while this is the lowest level observed since 2001, this was still high relative to the 7.6% averaged in the 1990s.

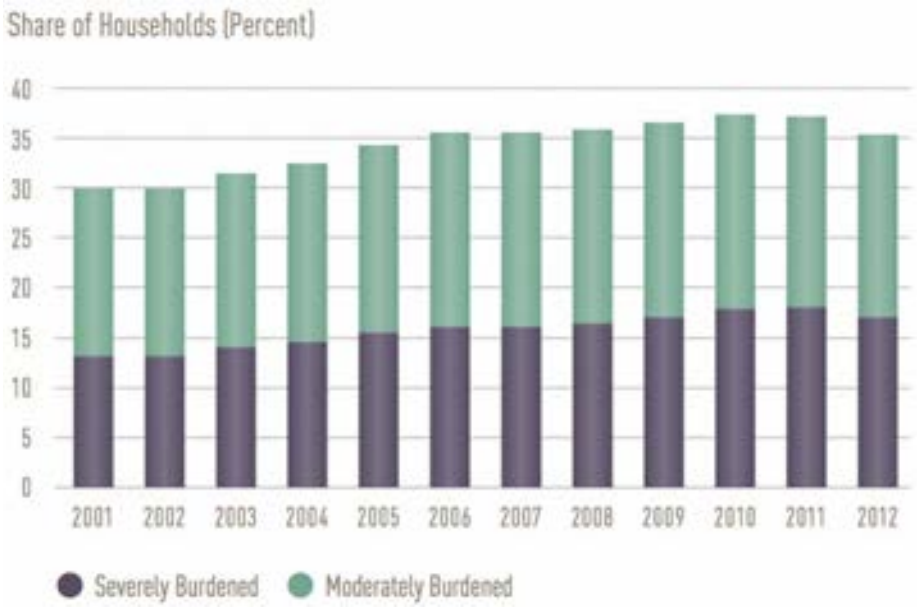
Over the longer term, the Joint Center for Housing expects demand for rental housing to continue to grow. Minorities will be the largest driver of rental demand because they are on average younger and less likely to own homes than whites. Demographics will also play a role. Growth in young adult households will increase demand for moderately priced rentals, in part because the oldest Millennials reached their late-20s around 2010. Meanwhile, growth among those between the ages of 45 and 64 will lift demand for higher-end rentals.

As the homeownership market recovers, the growth in renter households will likely slow. Since much of the increased demand for rental housing has been met through the conversion of single-family homes to rentals, future market adjustments may come from a return of these units to owner-occupancy. Additionally, the echo-boom generation should provide strong demand for rental units in the coming years.

Trends in housing affordability

Many homeowners pay a disproportionate share of their income on housing, with 35% of households in the U.S. who are cost burdened.[40] While the share of households that are cost burdened fell by about 4% in 2012, the share of households that were cost burdened increase between 2001 and 2011 (Figure A-4). More than 15% of U.S. households are severely cost burdened.

Figure A- 4. Share of Cost-burdened Households, 2001-2012



Source: The State of The Nation's Housing, 2014, The Joint Center for Housing Studies of Harvard University, p. 10. http://www.jchs.harvard.edu/sites/jchs.harvard.edu/files/sonhr14-color-full.pdf.

The Joint Center for Housing Studies points to widening income disparities, decreasing federal assistance, and depletion of inventory through conversion or demolition as three factors exacerbating the lack of affordable housing. While the Harvard report presents a relatively optimistic long-run outlook for housing markets and for homeownership, it points to the significant difficulties low- and moderate-income households face in finding affordable housing and preserving the affordable units that do exist.

According to the Joint Center for Housing Studies, these statistics understate the true magnitude of the affordability problem because they do not capture the tradeoffs people make to hold down their housing costs. For example, these figures exclude people who live in crowded or structurally inadequate housing units. They also exclude the growing number of households that move to

[40] Households are considered cost burdened if they spent 30% or more of their gross income on housing costs. Households who spent 50% or more of their gross income on housing costs are considered severely cost burdened.

locations distant from work where they can afford to pay for housing, but must spend more for transportation to work. Among households in the lowest expenditure quartile, those living in affordable housing, spent an average of $100 more on transportation per month in 2010 than those who are severely housing cost-burdened. With total average monthly outlays of only $1,000, these extra travel costs could amount to roughly 10 percent of the entire household budget.

Demographic trends in housing preference

Demographic changes likely to affect the housing market and homeownership are:

- The aging of the Baby Boomers, the oldest of whom were in their late-60's in 2012.
- Housing choices of younger Baby Boomers, who were in their early to mid-50's in 2010.
- The children of Baby Boomers, called the Millennials, who ranged from their late teens to late twenties in 2012.
- Immigrants and their descendants, who are a faster growing group than other households in the U.S. [41]

The aging of the Baby Boomers will affect housing demand over the next decades. People prefer to remain in their community as they age.[42] The challenges that aging seniors face in continuing to live in their community include: changes in healthcare needs, loss of mobility, the difficulty of home maintenance, financial concerns, and increases in property taxes.[43] Not all of these issues can be addressed through housing or land use policies. Communities can address some of these issues through adopting policies that:

- Diversify housing stock to allow development of smaller, comparatively easily-maintained houses in single-family zones, such as single-story townhouses, condominiums, and apartments.
- Allow commercial uses in residential zones, such as neighborhood markets.
- Allow a mixture of housing densities and structure types in single-family zones, such as single-family detached, single-family attached, condominiums, and apartments.

---

[41] Urban Land Institute, "2011 Emerging Trends in Real Estate"

[42] A survey conducted by the AARP indicates that 90% of people 50 years and older want to stay in their current home and community as they age. See http://www.aarp.org/research.

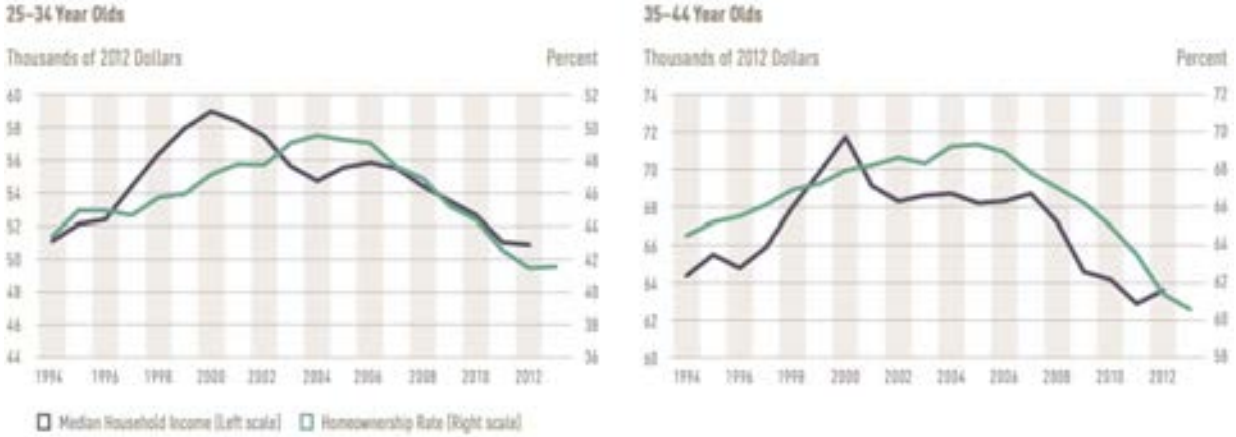
[43] "Aging in Place: A toolkit for Local Governments" by M. Scott Ball.

- Promote the development of group housing for seniors that are unable or do not choose to continue living in a private house. These facilities could include retirement communities for active seniors, assisted living facilities, or nursing homes.
- Design public facilities so that they can be used by seniors with limited mobility. For example, design and maintain sidewalks so that they can be used by people in wheelchairs or using walkers.

Household formation fell to around 600,000 to 800,000 in the 2007-2013 period, well below the average rate of growth in previous decades. Despite sluggish growth recently, several demographic factors indicate increases in housing growth to come. The Millennial generation (those born after 1985) is the age group most likely to form the majority of new households. While low incomes have kept current homeownership rates among young adults below their potential, Millennials may represent pent-up demand that will release when the economy fully recovers. As Millennials age, they may increase the number of households in their 30s by 2.4 to 3.0 million over the through 2025.

While the population of young adults between 20 and 29 years grew in the 2003-2013 decade by more than 4 million from the previous decade, the rate at which members of this age group formed their own households fell. As a result, household growth has not kept pace with overall population growth**.** Even if today's low household formation rates were to persist, however, the aging of the Millennials into their 30s will likely raise household headship rates due to lifecycle effects. About 60% of all 35–44 year-olds head an independent household, compared with less than 42% of all 25–34 year-olds. Thus, the Millennial generation, more populous than the Baby Boomers, is expected to be the primary driver of new household formation over the next twenty years.

Figure A- 5. Homeownership Rates and Incomes for Young and Middle-Aged Adults, 1994-2012



Source: The State of The Nation's Housing, 2014, The Joint Center for Housing Studies of Harvard University, p. 10. http://www.jchs.harvard.edu/sites/jchs.harvard.edu/files/sonhr14-color-full.pdf.

It is currently unclear what housing choices the Millennials will make. Some studies suggest that their parents' negative experience in the housing market, with housing values dropping so precipitously and so many foreclosures, will make Millennials less likely to become homeowners. In addition, high unemployment and underemployment may decrease Millennials' earning power and ability to save for a down payment. It is not clear, however, that Millennials' housing preferences will be significantly different from their parents over the long run.

Recent surveys suggest that as Millennials age and form families, they will increasingly prefer to live in single-family homes in suburban locations. A recent survey by the National Association of Homebuilders finds that roughly three-quarters of Millennials want to live in a single-family home and would prefer to live in a suburb, compared to just 10% that would prefer to live in a city center.

Other recent surveys suggest that Millennials prefer to live in walkable communities, where there are alternatives to driving. According to surveys from the American Planning Association and Transportation For America, at least three quarters of Millennials want their city to offer opportunities to live and work without relying on a car. While Millennials may choose housing that satisfies these preferences, the cost of living will place parameters on their housing choices. According to the APA survey, 71% percent of Millennials rated affordable housing as a high priority for metro areas.

In coming years Millennials will pursue homes that provide a combination of space, "walkability," and affordability. They will demonstrate these preferences in the market soon: according to the APA survey, more than half of Millennials

consider themselves at least somewhat likely to move within the next five years.[44]

From 2004 to 2013, homeownership rates for 25-34 year olds and 35-44 year olds fell by around 8% and 9% respectively, with ownership rates for people 25 to 54 years old at the lowest point since recordkeeping started in 1976 (Figure A- 5). Nonetheless, the 25 and 34 year-old age group still makes up the majority of first-time homebuyers. Young adults in this cohort make up 54.3 percent of first-time homebuyers. Their majority among first-time homebuyers means that their ability to buy homes will play an important role in growth of the housing market in the near future.

The fall in homeownership among young adults results largely from the decline in income. Approximately 6 million more individuals between 20 and 29 years earned less than $25,000 than in 2003, while the number of those earning between $25,000 and $50,000 fell by over a million. Furthermore, the share of households younger than 30 years with student loan debt increased by more than 7% since 2007, from 33.9% to 41.0%.

According to the Joint Center for Housing Studies, immigration and increased homeownership among minorities will also play a key role in accelerating household growth over the next 10 years. Current Population Survey estimates indicate that the number of foreign-born households rose by nearly 400,000 annually between 2001 and 2007, and accounted for nearly 30 percent of overall household growth. Beginning in 2008, the influx of immigrants was staunched by the effects of the Great Recession. After a period of declines, however, the foreign born are again contributing to household growth. Census Bureau estimates of net immigration in 2011–12 indicate an increase of 110,000 persons over the previous year, to a total of nearly 900,000. Furthermore, as shown in Figure A- 6, the Harvard report forecasts that minorities will make up about 76% of the household growth between 2015 and 2025. The greater diversity among young adults partly explains the increased share of growth that will belong to minorities. For example, about 45% of Millennials are minorities, compared to 28% of Baby Boomers.

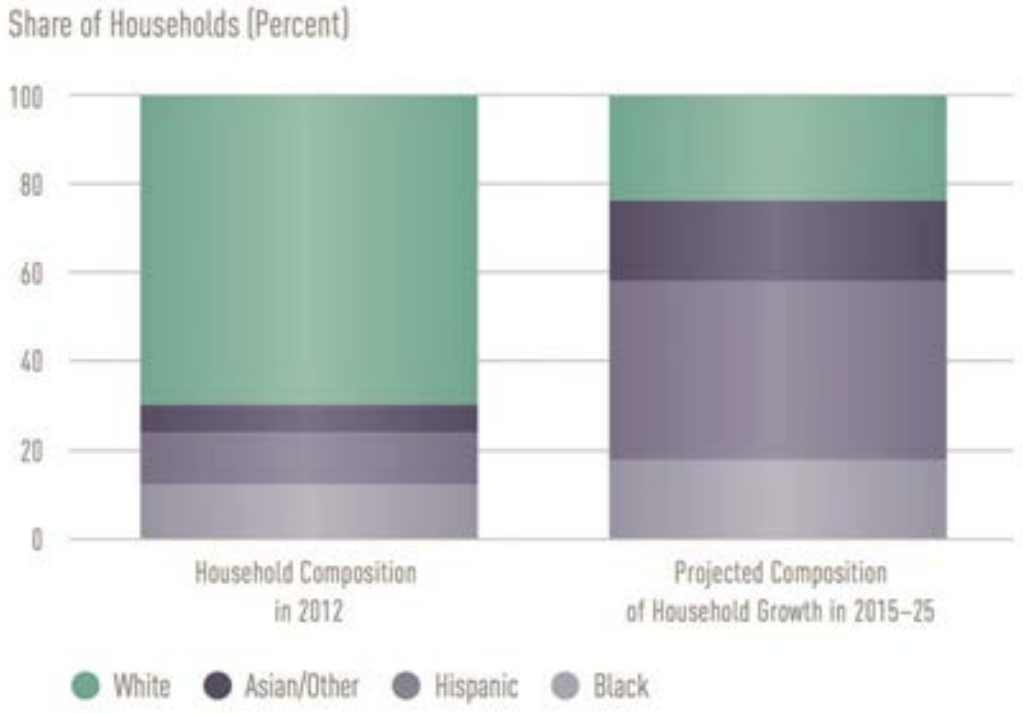
Figure A- 6. Share of Households by Racial/Ethnic Group, 2012 and 2015-25



Source: The State of The Nation's Housing, 2014, The Joint Center for Housing Studies of Harvard University, p. 10. http://www.jchs.harvard.edu/sites/jchs.harvard.edu/files/sonhr14-color-full.pdf.

The growing diversity of American households will have a large impact on the domestic housing markets. Over the coming decade, minorities will make up a larger share of young households, and constitute an important source of demand for both rental housing and small homes. This makes the growing gap in homeownership rates between whites and blacks and whites and Hispanics troubling. Since 2001, the difference in homeownership rates between whites and blacks rose from 25.9 to 29.5 in 2013. Similarly the gap between white and Hispanic homeownership rates increased since 2008, from below 26%, to over 27% in 2013. This growing gap between racial and ethnic groups will hamper the country's homeownership rate as minority households constitute a larger share of the housing market.

Trends in Housing Characteristics

The U.S Census Bureau's Characteristics of New Housing Report (2013) presents data that show trends in the characteristics of new housing for the nation, state, and local areas. Several long-term trends in the characteristics of housing are evident from the New Housing Report:[45]

[45] https://www.census.gov/construction/chars/highlights.html

- **Larger single-family units on smaller lots**. Between 1990 and 2013 the median size of new single-family dwellings increased 25% nationally from 1,905 sq. ft. to 2,384 sq. ft., and 19% in the western region from 1,985 sq. ft. to 2,359 sq. ft. Moreover, the percentage of units fewer than 1,400 sq. ft. nationally decreased by almost half, from 15% in 1999 to 8% in 2012. The percentage of units greater than 3,000 sq. ft. increased from 17% in 1999 to 29% of new one-family homes completed in 2013. In addition to larger homes, a move towards smaller lot sizes is seen nationally. Between 1990 and 2013, the percentage of lots less than 7,000 sq. ft. increased from 27% of lots to 36% of lots.
- **Larger multifamily units**. Between 1999 and 2013, the median size of new multiple family dwelling units increased by 2% nationally and 3% in the western region. The percentage of new multifamily units with more than 1,200 sq. ft. increased from 28% in 1999 to 32% in 2013 nationally, and increased from 25% to 32% in the western region.
- **More household amenities**. Between 1990 and 2013, the percentage of single-family units built with amenities such as central air conditioning, 2 or more car garages, or 2 or more baths all increased. The same trend in increased amenities is seen in multifamily units.

During the recession, the trend towards larger units with more amenities faltered. Between 2007 and 2009, for example, the median size of new single-family units decreased by 6% throughout the nation, including in the West. In addition, the share of new units with amenities (e.g., central air conditioning, fireplaces, 2 or more car garages, or 2 or more bath) all decreased slightly during this time. With the recovery, however, housing sizes have been increasing annually; median housing sizes increased by 12% between 2009 and 2013 nationwide, and 10% in the western region. The short term, post-recession trends regarding amenities are mixed, but generally appear to be increasing (albeit more slowly than housing sizes).

It appears that the decreases in unit size and amenities were a short-term trend, resulting from the housing crisis. However, numerous articles and national studies suggest that these changes may indicate a long-term change in the housing market, resulting from a combination of increased demand for rental units because of demographic changes (e.g., the aging of the baby boomers, new immigrants, and the echo-boomers), as well as changes in personal finance and availability of mortgages.[46]

These studies may be correct and the housing market may be in the process of a long-term change, with some fluctuations over time in unit size and amenities.

[46] These studies include "Hope for Housing?" by Greg Filsram in the October 2010 issue of Planning and "The Elusive Small-House Utopia" by Andrew Rice in the New York Times on October 15, 2010.

On the other hand, long-term demand for housing may not be substantially affected by the current housing market. The echo-boomers and new immigrants may choose single-family detached housing and mortgages may become easier to obtain.

Studies and data analysis have shown a clear linkage between demographic characteristics and housing choice. This is more typically referred to as the linkage between lifecycle and housing choice and is documented in detail in several publications. Analysis of data from the Public Use Microsample (PUMS) in the 2000 Census helps to describe the relationship between selected demographic characteristics and housing choice. Key relationships identified through this data include:

- Homeownership rates increase as income increases;
- Homeownership rates increase as age increases;
- Choice of single-family detached housing types increases as income increases;
- Renters are much more likely to choose multiple family housing types than single-family; and
- Income is a stronger determinate of tenure and housing type choice for all age categories.

STATE DEMOGRAPHIC TRENDS

Oregon's *2011-2015 Consolidated Plan* includes a detailed housing needs analysis as well as strategies for addressing housing needs statewide.[47] The plan concludes that, "Oregon's changing population demographics are having a significant impact on its housing market." It identified the following population and demographic trends that influence housing need statewide. Oregon is:

- Facing housing cost increases due to higher unemployment and lower wages, when compared to the nation.
- Experiencing higher foreclosure rates since 2005, compared with the previous two decades.
- Losing federal subsidies on about 8% of federally subsidized Section 8 housing units.
- Losing housing value throughout the State.
- Losing manufactured housing parks, with a 25% decrease in the number of manufactured home parks between 2003 and 2010.

[47] http://www.ohcs.oregon.gov/OHCS/HRS_Consolidated_Plan_5yearplan.shtml

- Increasingly older, more diverse, and has less affluent households.[48]

REGIONAL AND LOCAL DEMOGRAPHIC TRENDS

Regional demographic trends largely follow the statewide trends discussed above, but provide additional insight into how demographic trends might affect housing in Sherwood. Demographic trends that might affect the key assumptions used in the baseline analysis of housing need are: (1) the aging population, (2) changes in household size and composition, and (3) increases in diversity. This section describes those trends.

The following section presents data tables. In a few places, additional explanatory text is included. For the most part, the text describing the implications of the tables is in the main part of the document.

Growing population

Sherwood has a growing population. Table B- 5 shows population growth in the U.S., Oregon, the Portland Region, Washington County, and Sherwood, between 1990 and 2013.

Table B- 5. Population in U.S., Oregon, the Portland Region, Washington County, and Sherwood, 1990-2013

	Population			Change 1990 to 2013		
Area	1990	2000	2013	Number	Percent	AAGR
U.S.	248,709,873	281,421,906	311,536,594	62,826,721	25%	1.0%
Oregon	2,842,321	3,421,399	3,919,020	1,076,699	38%	1.4%
Portland Region	1,174,291	1,444,219	1,693,600	519,309	44%	1.6%
Washington County	311,554	445,342	550,990	239,436	77%	2.5%
Sherwood	3,093	11,963	18,575	15,482	501%	8.1%

Source: US Census Bureau Decennial Census 1990 and 2000; Portland State University, Population Research Center
Note: AAGR is average annual growth rate.

The housing needs analysis in this report is based on a coordinated household forecast from Metro (the January 2016 2040 TAZ Forecast), which is a necessary prerequisite to estimate housing needs. The projection of household growth includes areas currently within the city limits, as well as areas currently outside the city limits that the City expects to annex for residential uses (most notably the Brookman area). We call these areas combined the "Sherwood planning area."

Table B-6 presents Metro's forecast for household growth and new housing development in the Sherwood planning area for the 2010 to 2040 period. The table shows Metro's forecast for the Sherwood city limits, areas currently outside

[48] State of Oregon *Consolidated Plan 2011 to 2015*. http://www.oregon.gov/ohcs/hd/hrs/consplan/2011_2015_consolidated_plan.pdf

the city limits that are expected to be annexed by 2040, which are together the Sherwood planning area. Table B-6 shows Metro's forecast for the number of households in each of the following years:

- **2010.** Metro's forecast uses an estimate of the number of households in 2010 as the starting point of the forecast.
- **2015.** Estimate of number of households in 2015.
- **2040.** Metro's forecast estimates household growth of 2,078 dwelling units or 30%, by 2040. Part of the forecasting process was providing jurisdictions an opportunity to review and comment on the forecast for growth through 2040.

Table B-6 also shows Metro's forecast for the Sherwood West area, which is forecast to grow by 4,337 dwelling units by 2040. While Metro forecasts that this development will occur over the 2015 to 2040 period, the discussion of timing of this development in the Concept Planning process suggests that Sherwood West may take 50 years (2015 to 2065) to develop the 4,337 dwelling units in Metro's forecast.

Table B-6. Metro forecast for housing growth, Sherwood planning area, 2010 to 2040

	Households			
Year	Sherwood City Limits	Brookman Area	Sherwood Planning Area	Sherwood West (50-Year Forecast)
2010	6,476	242	6,718	270
2015	6,784	226	7,010	293
2040	7,653	1,435	9,088	4,811
Change 2015 to 2040				
Households	869	1,209	2,078	4,518
Percent	13%	535%	30%	1542%
AAGR	0.5%	7.7%	1.0%	11.8%

Source: Metro 2040 TAZ Forecast by Households, January 2016
Note: The Sherwood City Limits are the following Metro Transportation Analysis Zones (TAZs): 989 to 997.
The Brookman area is predominantly in Transportation Analysis Zone 978, with a small area in 988. Brookman is an area that the City expects to annex for residential growth over the planning period.
Sherwood West is parts of Transportation Analysis Zones 1428, 1429, and 1432.

Sherwood's housing needs analysis must be based on a 20-year period, but Metro's forecast describes growth over a 25-year period. Table B- 7 shows an extrapolation of Metro's forecast for the 2019 to 2039 period. ECONorthwest extrapolated Metro's forecast to 2018 based on the number of households in 2015 and the growth rate in the forecast between 2015 and 2040. We assumed that little to no growth happened in Sherwood West between 2015 and 2018, an

assumption that is supported by the relative lack of building permit activity in these areas.

Table B- 7 shows that the Sherwood planning area will add 1,729 new households between 2019 and 2039, with 700 new households inside the existing city limits and 1,029 new households in outside the current city limits in the Brookman Area.

Table B- 7. Extrapolated Metro forecast for housing growth, Sherwood planning area, 2019 to 2039

	Households			
Year	Sherwood City Limits	Brookman Area	Sherwood Planning Area	Sherwood West (50-Year Forecast)
2019	6,916	304	7,220	293

Aging population

In 2010, the median age in Sherwood was 34.3 years old, compared to the median of 35.3 in Washington County, and the State median of 38.4. Figure B- 7 shows the populations of Oregon, the Portland Region, Washington County, and Sherwood by age in 2010.

Figure B- 8 shows the population distribution by generation and age in Oregon in 2015. The largest groups are the Millennials (27% of Oregon's population) and the Baby Boomers (25% of Oregon's population). By 2035, the end of the planning period for this analysis, Millennials will be between 35 and 54 years old. Baby Boomers will be 71 to 89 years old.

Figure B- 9 shows the Office of Economic Analysis's (OEA) forecast of population change by age group, from 2015 to 2035, for the Portland Region. By 2035, people 60 years and older will account for 24% of the population in Washington County (up from 18% in 2015). The percent of total population in each age group younger than 60 years old will decrease. The age distribution in the Portland Region will change in a similar pattern.

Figure B- 9. Current and projected population by age, Portland Region and Washington County, 2015 and 2035

Increased ethnic diversity

Figure B-10 shows the percentage of the total population that is of Hispanic or Latino origin for Oregon, the Portland Region, and Sherwood, in 2000 and 2009-2013. Between 2000 and 2009-2013, Hispanic or Latino population increased from 5% of the population to 6% of the population, adding 550 additional Hispanic or Latino residents. Sherwood has a smaller percentage of Hispanic or Latino population than the county or regional average.

Commuting trends

Commuting within the Portland region is common, with small cities like Sherwood seeing the vast majority of workers commute out of the city for work and the majority of people working in the city commuting in from other parts of the region. Figure B- 12 shows this pattern in Sherwood, with the majority of people living in Sherwood commuting out for work and the majority of people working in Sherwood commuting into the city for work.

MANUFACTURED HOMES

Manufactured homes are and will be an important source of affordable housing in Sherwood. They provide a form of homeownership that can be made available to low- and moderate-income households. Cities are required to plan for manufactured homes—both on lots and in parks (ORS 197.475-492).

Generally, manufactured homes in parks are owned by the occupants who pay rent for the space. Monthly housing costs are typically lower for a homeowner in a manufactured home park for several reasons, including the fact that property taxes levied on the value of the land are paid by the property owner rather than the manufactured homeowner. The value of the manufactured home generally does not appreciate in the way a conventional home would, however. Manufactured homeowners in parks are also subject to the mercy of the property owner in terms of rent rates and increases. It is generally not within the means of a manufactured homeowner to relocate a manufactured home to escape rent increases. Living in a park is desirable to some because it can provide a more secure community with on-site managers and amenities, such as laundry and recreation facilities.

Sherwood had 258 manufactured homes in 2000 and 155 manufactured homes in the 2009-2013 period, a decrease of 103 dwellings. According to Census data, roughly 83% of the manufactured homes in Sherwood were owner-occupied in the 2009-2013 period.

OAR 197.480(4) requires cities to inventory the mobile home or manufactured dwelling parks sited in areas planned and zoned or generally used for commercial, industrial, or high-density residential development. Table B- 13 presents the inventory of mobile and manufactured home parks within Sherwood in 2014. The results show that Sherwood had 4 manufactured home parks with 186 spaces and 1 vacant space.

Table B- 13. Inventory of Mobile/Manufactured Home Parks, City of Sherwood, 2014

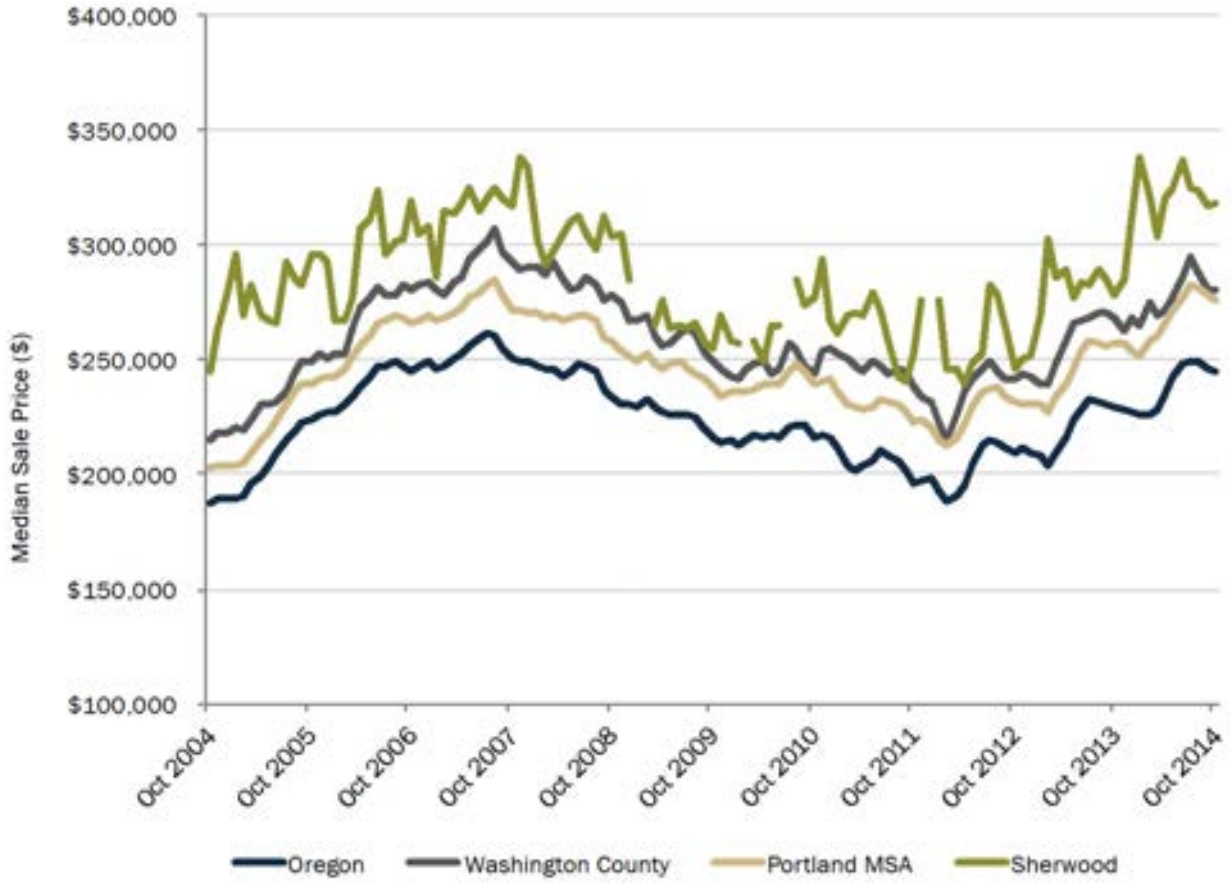
Changes in housing cost

According to Zillow, the median sales price of a home in Sherwood increased by about 30% between 2004 and 2014. Housing prices rose steeply prior to 2007, reaching a high of roughly $338,000, before the housing bubble and recession led to a period of declining housing prices. Housing prices in Sherwood, while following the same general pattern, remain higher than those observed in other parts of the region and the State as a whole.

Housing values

Figure B- 13 shows the median sales price in Oregon, the Portland MSA, Washington County, and Sherwood between 2004-2014. As of January 2015, median sales prices in Sherwood were $331,300, higher than in Washington County ($281,700), the Portland MSA ($269,900), and Oregon ($241,400).

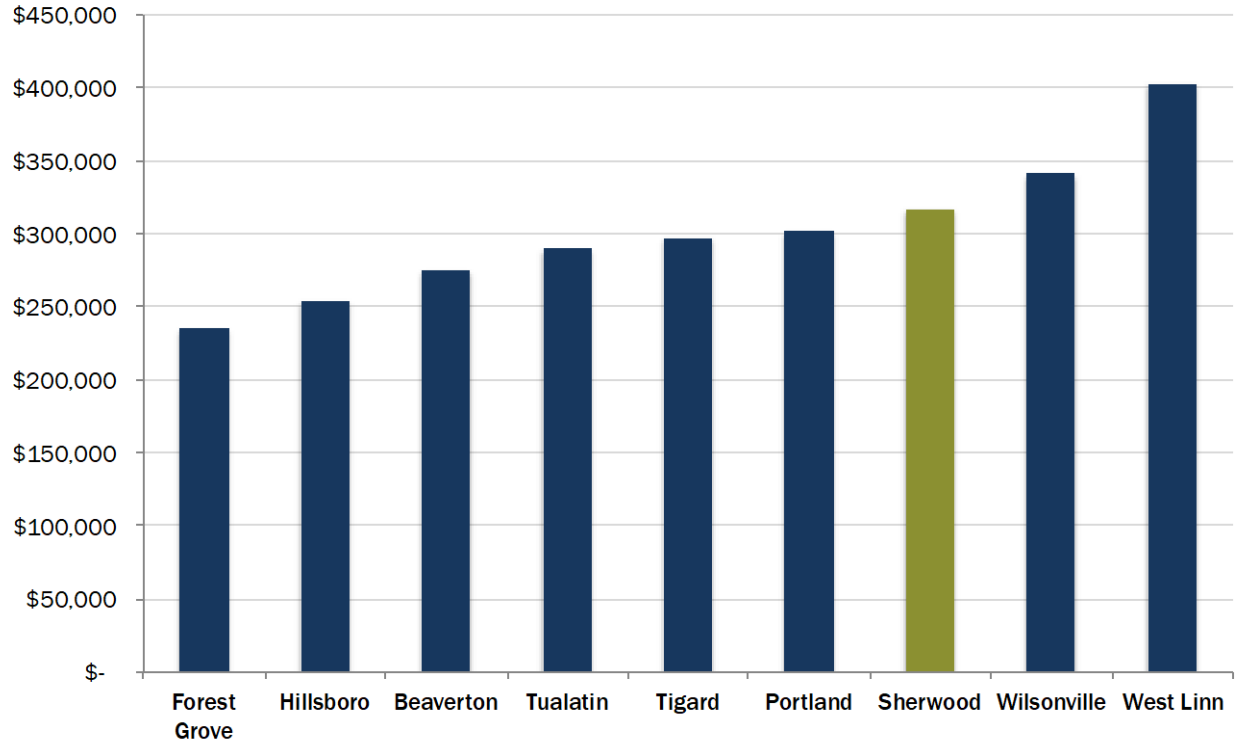
Figure B- 13. Median Sales Price, Oregon, Portland MSA, Washington County and Sherwood, 2004-2014



Source: Zillow Real Estate Research.
Note: Gaps in Sherwood's median sales price occur where data was not available.

Figure B- 14 shows median home sales prices for Sherwood and regional cities in January 2015. In that month, median home sale prices in Sherwood were about $316,500, above sales prices in other Portland westside communities such as Tigard, Tualatin, and Beaverton. Median sales prices in Wilsonville and West Linn were higher than those in Sherwood.

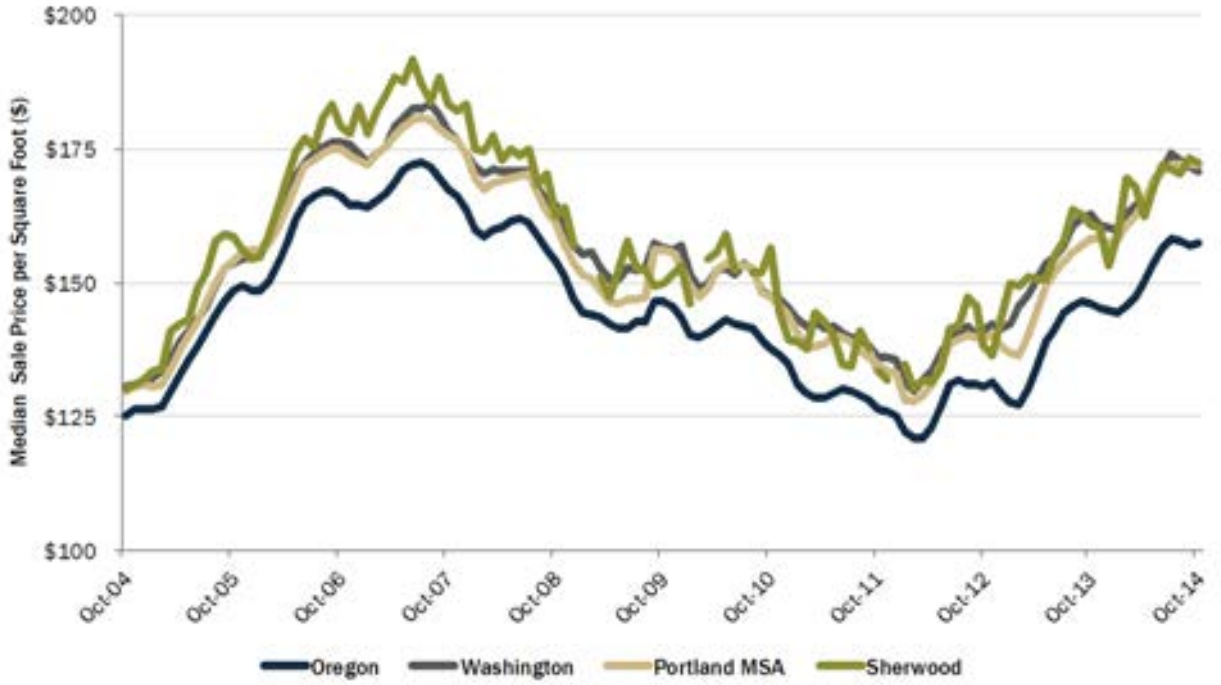
Figure B- 14. Median Home Sales Price, Sherwood, Tualatin, Tigard, Beaverton, Hillsboro, Forest Grove, Portland, January 2015



Source: Zillow Real Estate Research.

Figure B- 15 shows median home sales price per square foot for Oregon, the Portland MSA, Washington County and Sherwood from 2004-2013. Prices per square foot rose in Sherwood from $130 per square foot in October 2004 to $192 in July 2007. Prices fell after 2007 and rose again starting in 2011. In October 2014, the median price per square foot in Sherwood was about $170 dollars, comparable to the price in Washington County and the Portland Region (both about $170) and above that of the state as a whole ($157 per square foot).

Figure B- 15. Median Sales Price per Square Foot, Oregon, Portland MSA, Washington County and Sherwood, 2004-2014



Source: Zillow Real Estate Research.
Note: Gaps in Sherwood's median sales price occur where data was not available.

Figure B- 16 shows median home sales price per square foot for Sherwood and regional cities in January 2015. Of the cities sampled, Sherwood had the third-highest price per square foot, at $176 per square foot. Prices per square foot in West Linn and Portland were higher, at $180 and $237 respectively. While Sherwood's prices were the third highest, they compared very closely to other cities such as Tigard ($174), Tualatin ($174), Beaverton ($173), and Wilsonville ($171).

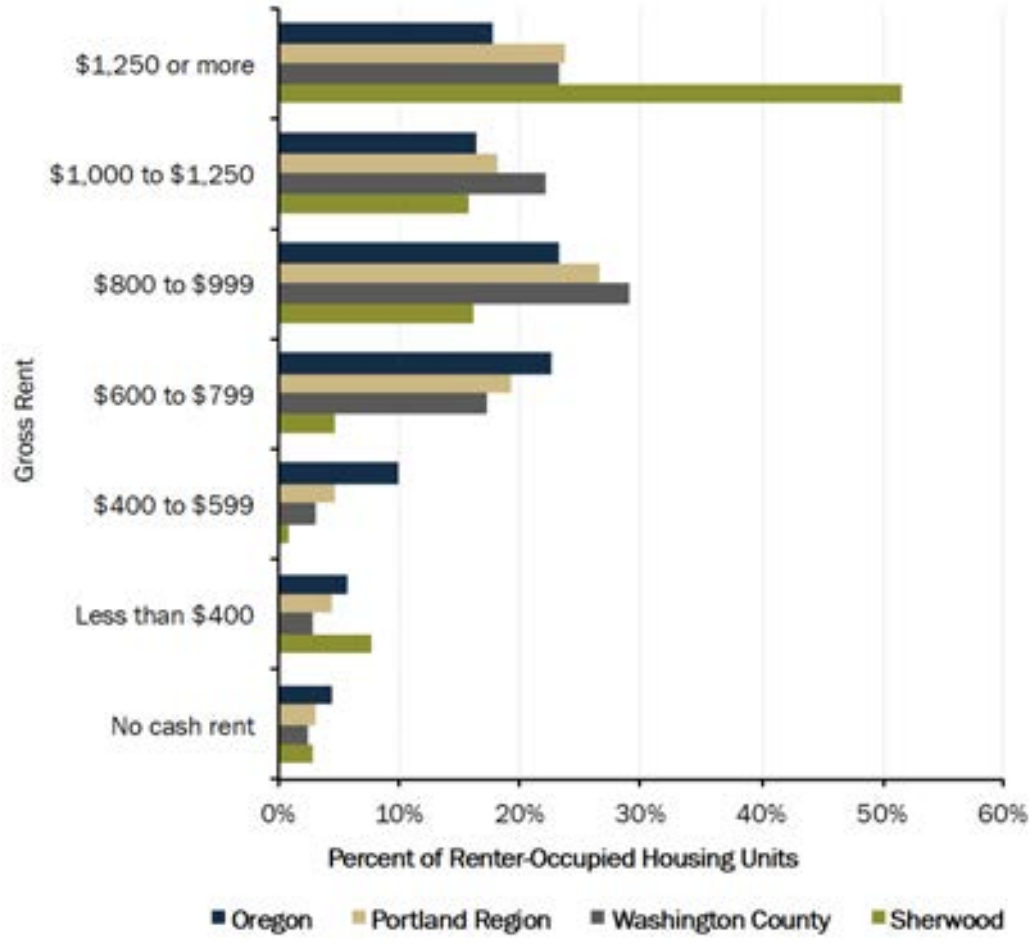
Note: The average rent price shown on the graph is for Fall 2014

Figure B- 18 shows a comparison of gross rent for renter-occupied housing units in Oregon, the Portland Region, Washington County, and Sherwood in 2009-2013.[49]

Figure B- 18. Gross rent, renter occupied housing units, Oregon, Portland Region, Washington County, and Sherwood, 2009-2013.



Source: American Community Survey 2009-2013 Table B25063.

[49] The U.S. Census defines gross rent as: "the amount of the contract rent plus the estimated average monthly cost of utilities (electricity, gas, and water and sewer) and fuels (oil, coal, kerosene, wood, etc.) if these are paid for by the renter (or paid for the renter by someone else)."

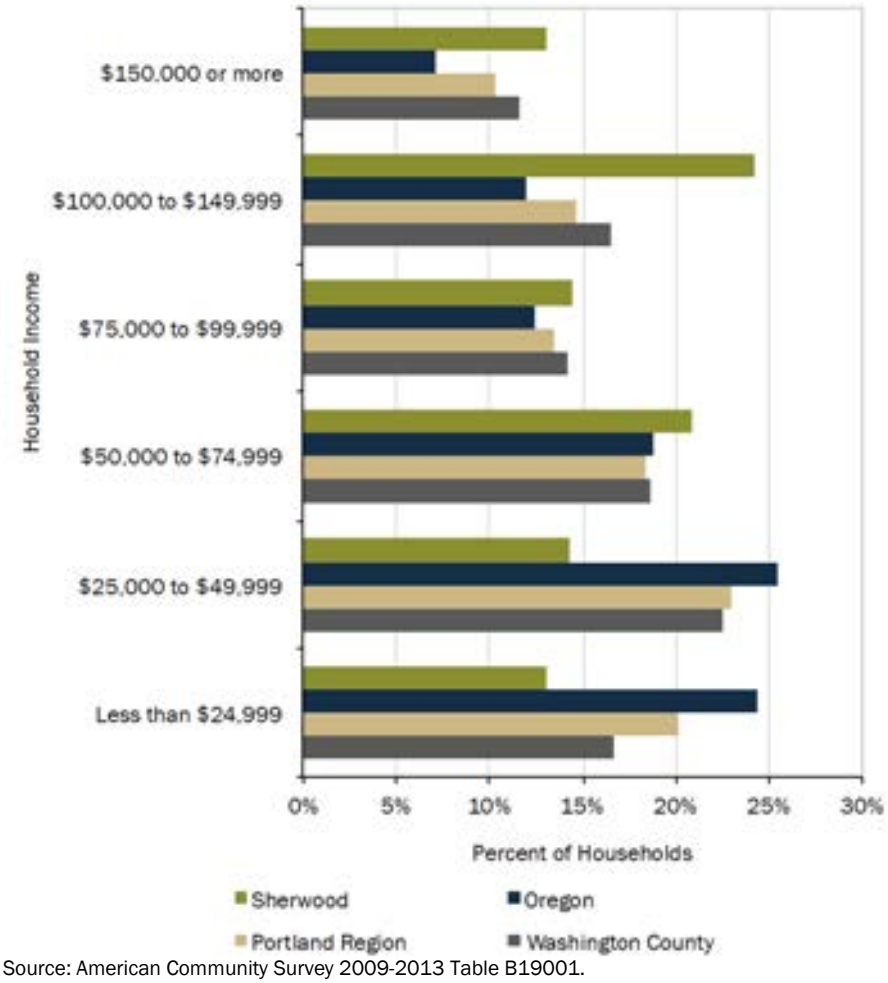
INCOME AND AFFORDABILITY OF HOUSING

This section summarizes regional and local income and housing cost trends. Income is a key determinant in housing choice and a households' ability to afford housing. A review of historical income and housing price trends provides insight into the local and regional housing markets.

The median household income in Sherwood was higher than in nearby counties and the state as a whole in the 2009-2013 period. Median household income in Sherwood was about $78,400, compared to $64,200 in Washington County, $64,400 in Clackamas County, and $52,500 in Multnomah County. Statewide, the median income was about $50,300.

Figure B- 19 shows the distribution of household income in Oregon, the Portland Region, and Sherwood in the 2009-2013 period. Sherwood had the highest share of households earning over $100,000 and the lowest share of households earning less than $25,000.

Figure B- 19. Household Income, Oregon, Portland Region, Washington County, and Sherwood, 2009-2013.



Source: American Community Survey 2009-2013 Table B19001.

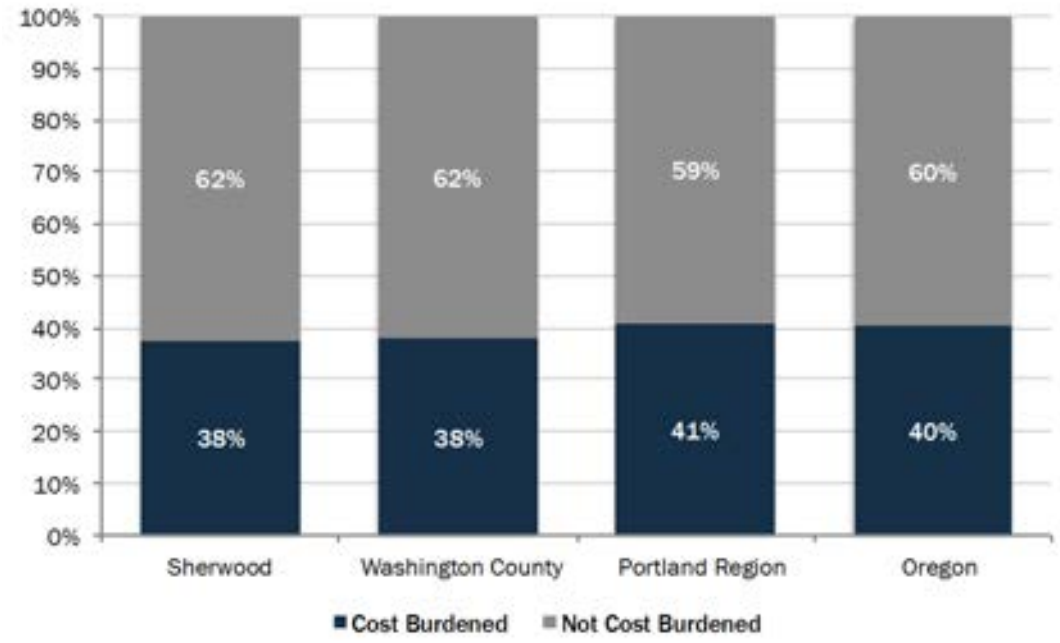
A typical standard used to determine housing affordability is that a household should pay no more than a certain percentage of household income for housing, including payments and interest or rent, utilities, and insurance.[50] HUD guidelines indicate that households paying more than 30% of their income on housing experience "cost burden," and households paying more than 50% of their income on housing experience "severe cost burden." Using cost burden as an indicator of housing affordability is consistent with the Goal 10 requirement to provide housing that is affordable to all households in a community.

According to the U.S. Census, nearly 2,345 households in Sherwood—or 38%—paid more than 30% of their income for housing expenses in the 2009-2013 period. About 44% of renter households in Sherwood were cost burdened, compared with 35% of owner households. In comparison, 40% of Oregon's households were cost burdened in the 2009-2013 period, with 54% of renter households and 32% of owner households cost burdened.

[50] Cost burden for renters accounts for the following housing costs: monthly rent, utilities (electricity, gas, and water and sewer), and fuels (wood, oil, etc.). Cost burden for homeowners accounts for the following housing costs: mortgage payments, real estate taxes, insurance, mobile home costs, condominium fees, utilities, and fuels.

Figure B- 20 shows the percentage of the population experiencing housing cost burdens in Oregon, the Portland Region, Washington County, and Sherwood in 2009-2013.

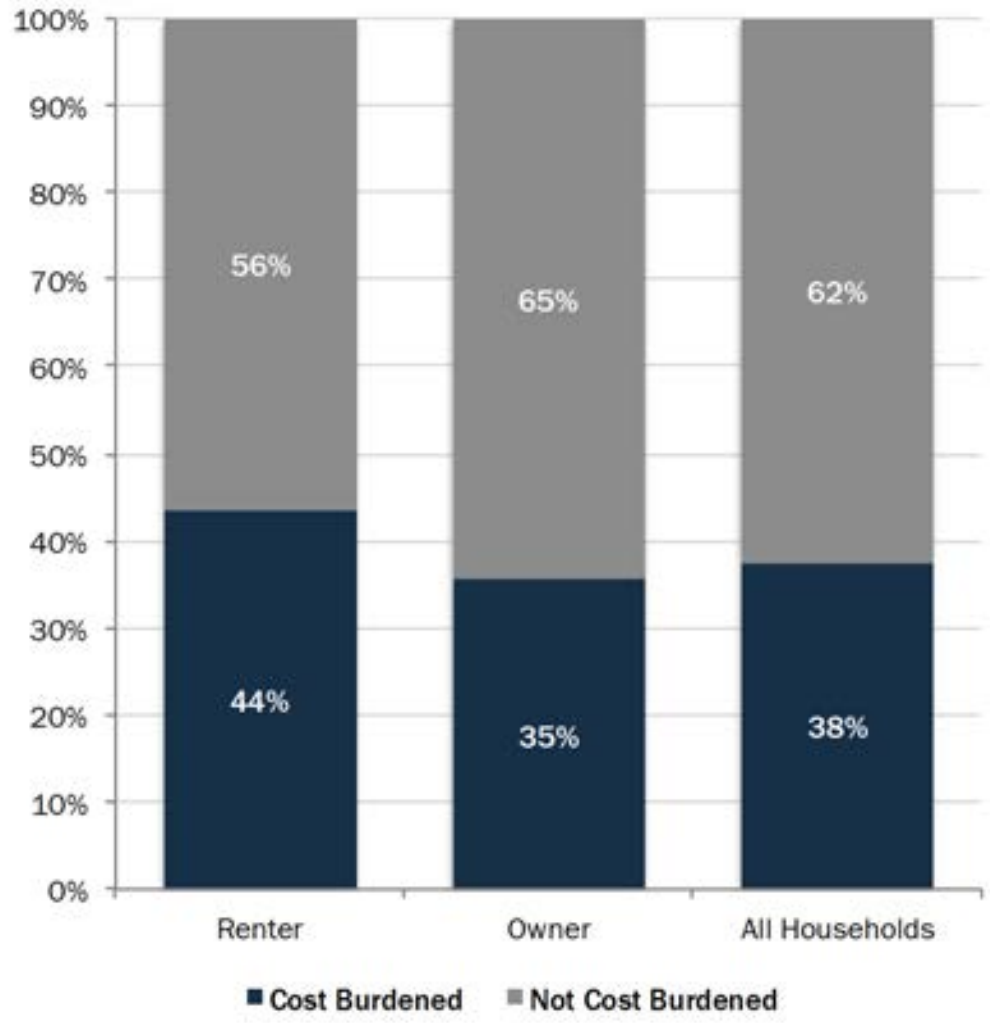
Figure B- 20. Housing cost burden, Oregon, Portland Region, Washington County and Sherwood, 2009-2013.



Source: American Community Survey 2009-2013 Tables B25070 and B25091.
Note: Households which the Census classifies as "Not computed" were excluded from the above calculations.

Figure B- 21 shows housing cost burden, by tenure, for Sherwood households in 2009-2013. Forty-four percent of Sherwood's renter households are cost burdened, compared to 49% of renter households in Washington County. Thirty-five percent of owner households are cost burdened, compared to 31% of owner households in Washington County.

Figure B- 21. Housing cost burden by tenure, Sherwood, 2009-2013.



Source: American Community Survey 2009-2013 Tables B25070 and B25091.

Another way to measure cost burden is to consider the costs of housing combined with the costs of transportation. In the *Draft 2014 Urban Growth Report*, Metro considered this perspective on cost burden. Metro considered a household that spends 45% or more of its income on transportation and housing as cost burdened.

According to data from the Location Affordability Portal, from HUD and the U.S. Department of Transportation, the average household in Sherwood spends 54% of its income on housing costs and transportation costs. Figure B- 22 and Figure

B- 23 show the percentage of income spent on housing and transportation costs in Sherwood and the southwestern part of the Portland region. In comparison to cities such as Tualatin, Wilsonville, and Tigard, households in Sherwood pay a slightly larger percentage of their income on housing and transportation costs. On average, households in these cities pay 50% to 52% of their income on housing and transportation costs.

Figure B- 22. Housing and transportation costs as a percentage of median family income, Sherwood, 2014

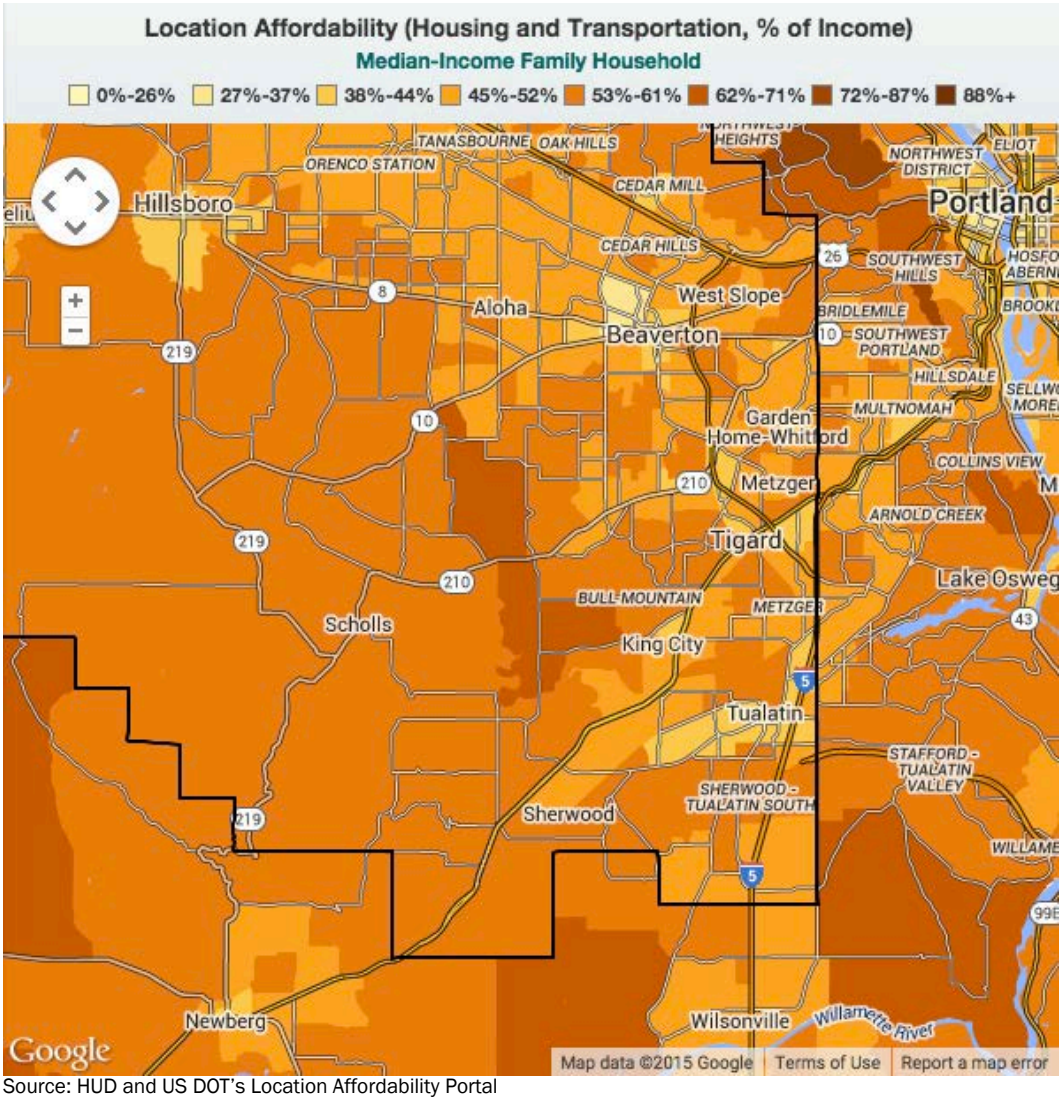
Figure B- 23. Housing and transportation costs as a percentage of median family income, southwestern Portland region, 2014



Source: HUD and US DOT's Location Affordability Portal
http://locationaffordability.info/

While cost burden is a common measure of housing affordability, it does have some limitations. Two important limitations are:

- A household is defined as cost burdened if the housing costs exceed 30% of their income, regardless of actual income. The remaining 70% of income is expected to be spent on non-discretionary expenses, such as food or medical care, and on discretionary expenses. Households with higher income may be able to pay more than 30% of their income on housing without impacting the household's ability to pay for necessary non-discretionary expenses.
- Cost burden compares income to housing costs and does not account for accumulated wealth. As a result, the estimate of how much a household can afford to pay for housing does not include the impact of accumulated

wealth on a household's ability to pay for housing. For example, a household with retired people may have relatively low income but may have accumulated assets (such as profits from selling another house) that allow them to purchase a house that would be considered unaffordable to them based on the cost burden indicator.

Cost burden is only one indicator of housing affordability. Another way of exploring the issue of financial need is to review wage rates and housing affordability. Table B- 15 shows an illustration of affordable housing wage and rent gap for households in the Portland MSA at different percentages of median family income (MFI). The data are for a typical family of four. The results indicate that a household must earn $17.73 an hour to afford a two-bedroom unit according to HUD's market rate rent estimate.

Table B- 15. Affordable Housing Wage Gap, Portland MSA, 2014

Value	Minimum Wage	30% MFI	50% MFI	80% MFI	100% MFI	120% MFI
Annual Hours	2,080	2,080	2,080	2,080	2,080	2,080
Derived Hourly Wage	$9.10	$10.01	$16.68	$26.69	$33.37	$40.04
Annual Wage	$18,928	$20,820	$34,700	$55,520	$69,400	$83,280
Annual Affordable Rent	$5,678	$6,246	$10,410	$16,656	$20,820	$24,984
Monthly Affordable Rent	$473	$521	$868	$1,388	$1,735	$2,082
HUD Fair Market Rent (2 Bedroom)	$922	$922	$922	$922	$922	$922
Is HUD Fair Market Rent Higher Than The Monthly Affordable Rent?	Yes	Yes	Yes	No	No	No
Rent Paid Monthly OVER 30% of Income	$449	$402	na	na	na	na
Rent Paid Annually OVER 30% of Income	$5,386	$4,818	na	na	na	na
Percentage of Income Paid OVER 30% of Income for Rent	28%	23%	na	na	na	na
Percentage of Income Spent on Housing	58%	53%	32%	20%	16%	13%
For this area what would the "Affordable Housing Wage" be?	$17.73	$17.73	$17.73	$17.73	$17.73	$17.73
The Affordable Housing Wage Gap IS:	**$8.63**	**$7.72**	**$1.05**	**na**	**na**	**na**

Source: FMR comes from HUD's FY 2014 Two-Bedroom FMR for Portland-Vancouver-Hillsboro MSA. Minimum wage from Oregon's Bureau of Labor and Industries. MFI from HUD's FY 2014 MFI for Portland- Vancouver -Hillsboro MSA.

Table B- 16 shows a rough estimate of affordable housing cost and units by income levels for Sherwood in 2014 based on Census data about household income, the value of owner-occupied housing in Sherwood, and rental costs in Sherwood. Several points should be kept in mind when interpreting this data:

- Affordable monthly housing costs and estimate of affordable purchase prices are based on HUD income standards and assume that a household will not spend more than 30% of household income on housing costs. Some households pay more than 30% of household income on housing costs, generally because they are unable to find more affordable housing or because wealthier households are able to pay a larger share of income for housing costs.
- HUD's affordability guidelines for Fair Market Rent are based on median family income and provide a rough estimate of financial need. These guidelines may mask other barriers to affordable housing such as move-in costs, competition for housing from higher-income households, and availability of suitable units. They also ignore other important

factors such as accumulated assets, purchasing housing as an investment, and the effect of down payments and interest rates on housing affordability.

- Households compete for housing in the marketplace. In other words, affordable housing units are not necessarily *available* to low-income households. For example, if an area has a total of 50 dwelling units that are affordable to households earning 30% of median family income, 50% of those units may already be occupied by households that earn more than 30% of median family income.

The data in Table B- 16 indicate that in 2014:

- About 20% of households in Sherwood could not afford a two-bedroom apartment at HUD's fair market rent level of $922.
- A household earning median family income ($69,400) could afford a home valued up to about $173,500.
- Sherwood has a deficit of about 660 dwellings to households earning less than $35,000 (or 50% of the Portland metropolitan area's median family income).

Table B- 16. Rough estimates of housing affordability, Sherwood, 2009-2013

Income Level	Number of HH	Percent	Affordable Monthly Housing Cost	Crude Estimate of Affordable Purchase Owner-Occupied Unit	Est. Number of Owner Units	Est. Number of Renter Units	Surplus (Deficit)	HUD Fair Market Rent (FMR) in 2014

Source: FMR comes from HUD's FY 2014 Two-Bedroom FMR for Portland-Vancouver-Hillsboro MSA. Minimum wage from Oregon's Bureau of Labor and Industries. MFI from HUD's FY 2014 MFI for Portland-Vancouver-Hillsboro MSA; Data about the share of owner and renter households and their income in Sherwood comes from the American Community Survey, 2009-2013 Tables B25075, B25063, B19001.

Table B- 17 shows that between 2000 and 2009-2013, both median household income and housing values increased substantially, with increases in home value outpacing growth in income. Median household income increased between 2000 and the 2009-2013 period.

Housing in Sherwood has become less affordable since 2000, consistent with county and statewide trends. In 2009-2013, the median home value was 3.8 times the median household income in Sherwood, up from 2.9 in 2000.

Housing in Sherwood is relatively affordable, compared to the county and state. In 2009-2013, the median home value was 4.4 times the median household income in Washington County, with a statewide average of 4.7.

Table B- 17. Household income to home value, 2013 dollars, Oregon, Washington County, and Sherwood, 2000 and 2009-2013.

ORDINANCE NO 490

AN ORDINANCE OF THE CITY COUNCIL OF THE CITY OF NORTH PLAINS, OREGON, AMENDING THE URBAN GROWTH BOUNDARY AND APPROVING ASSOCIATED COMPREHENSIVE PLAN TEXT AMENDMENTS

WHEREAS, the City of North Plains ("City") initiated an expansion of the City's Urban Growth Boundary ("UGB") and associated Comprehensive Plan text amendments; and

WHEREAS, the City used the updated Housing Needs Analysis (2022) ("HNA"), and the updated Economic Opportunities Analysis (2022, as approved by Ord. No. 484) ("EOA") to identify the City's 20-year land needs; and

WHEREAS, the UGB Expansion Final Report and associated Comprehensive Plan text amendments detail the City's analysis in determining how much land to include in the expansion area and where to expand, as well as associated policies; and

WHEREAS, the Planning Commission conducted a duly-noticed public hearing on the UGB expansion proposal at its May 10, 2023 meeting, and made a recommendation of approval to the City Council; and

WHEREAS, the City Council conducted a duly-noticed public hearing on the UGB expansion proposal at its June 5, 2023 meeting and considered all information in the record.

Now, therefore:

THE CITY OF NORTH PLAINS ORDAINS AS FOLLOWS:

Section 1. The City Council hereby adopts the UGB amendment, as described in the North Plains Urban Growth Boundary Expansion: Final Report, attached hereto as Exhibit A, as modified by the Planning Commission Recommendation, attached hereto as Exhibit B. The City Council also hereby adopts the Comprehensive Plan text amendments described in Exhibit C, attached hereto.

Section 2. In support of its decision, the City Council adopts the findings of the Planning Commission Recommendation, see Exhibit B, and the Staff Report for File No. CPA 23-056(1), attached hereto as Exhibit E

Section 3. The City Manager is authorized to prepare planning documents to reflect the changes adopted by this Ordinance, including deleting and adding textual

material and maps, renumbering pages or sections, and making any technical changes not affecting the substances of these amendments as necessary to conform to the North Plains Comprehensive Plan format.

Section 4 This Ordinance shall become effective on the 30th day after its adoption.

INTRODUCED on the 5th day of June, 2023. ADOPTED on the 20th day of June, 2023; EFFECTIVE on the 20th day of July, 2023.

1. Introduction

North Plains is one of the fastest growing communities in Washington County. According to Portland State University's Population Research Center, the City's population is expected to nearly double by 2035. North Plains' North and East Urban Growth Boundary (UGB) Expansion Areas were annexed in 2017 so that the UGB and city limits are now contiguous, leaving the City without any UGB expansion areas to meet emerging employment and housing land needs.

The City's 2017, updated in 2022, Housing Needs Analysis (HNA) identifies a need for 167 acres of land, to meet residential demands through 2037, including land for parks and infrastructure. The 2018 Economic Opportunities Analysis (EOA), updated in 2022, identifies a need for 515 acres to meet industrial land needs and 172 acres to meet commercial land needs through 2038, including land for infrastructure. Combined, these studies estimate a need for 854 acres to meet the city's 20-year land need.

This UGB Expansion Report follows the guidance provided by Statewide Planning Goal 14 (Urbanization), which incorporates the requirements of ORS 197A.300 to 197A.325 Amendment of Urban Growth Boundary Outside Metro. The report answers the following questions to justify a UGB expansion for North Plains:

1. Is any additional land needed for one or more urban uses, and if so how much?
2. If additional land is needed, how much can be accommodated within the current UGB?
3. If additional land is needed outside the UGB, where is the best place to expand the boundary?
4. What other amendments are needed to comply with the statewide planning goals?

Policy Framework

Urban growth boundary expansions in Oregon are guided by Statewide Planning Goal 14: Urbanization. The purpose of Goal 14 is "to provide for an orderly and efficient transition from rural to urban land use, to accommodate urban population and urban employment inside urban growth boundaries, to ensure efficient use of land, and to provide for livable communities."

To amend an urban growth boundary, a city must complete a location analysis, comparing alternative locations and considering which addition to the UGB will result in the most accommodating and cost-effective boundary, while creating the fewest conflicts with neighboring land uses, and causing the fewest negative environmental and economic impacts.

Through discussions with staff from the Department of Land Conservation and Development (DLCD), the City determined that the Standard Method for UGB expansions best suits North Plains. The Standard Method is governed by Oregon Administrative Rule (OAR) 660-024. The rule regulates

how to establish a study area to evaluate land for inclusion in the UGB and the priority of land for inclusion in the UGB. In addition, the four boundary location factors of Goal 14 must be applied. These rules will be described in greater detail later in the report.

The 2004 *Washington County – North Plains Urban Planning Area Agreement* establishes (1) a site-specific Urban Planning Area within which both the County and the City maintain an interest in comprehensive planning, (2) a process for coordinating comprehensive planning and development in the Urban Planning Area, and (3) a process to amend the Urban Planning Area Agreement (UPAA). The UPAA stipulates the procedure for amending the UPAA and/or the Urban Planning Area Boundary including the responsibilities of each jurisdiction.

The North Plains Comprehensive Plan governs UGB expansions. Objective 1 of the Urbanization chapter calls for the City "to identify and utilize accepted growth management techniques in a manner that will implement the Comprehensive Plan vision statement, goals, objectives, and policies." Subsequent policies guide the City's efforts to maintain and amend the UGB.

The proposed UGB amendment must be approved by the City of North Plains and Washington County and then by DLCD.

Process Overview

The North Plains UGB Expansion Report provides information to meet the following steps in the UGB expansion process:

1. Establish Land Need
2. Establish Study Area
3. Analyze Study Area
4. Evaluate Urbanization Potential
5. Review and Acknowledgement

The UGB Expansion project was initiated in August 2020 and completed in March 2023. A Project Advisory Committee (PAC) was convened to guide the process and make recommendations for Planning Commission and City Council consideration. The PAC met eight times over the course of the project. All meetings were noticed and open to the public. In addition, a public meeting was held to gather community input on the proposed UGB expansion study area.

The PAC was made up of the following representatives:

- Teri Lenahan, Mayor
- Stewart King, Planning Commission Chair
- Lonnie Knodel, Planning Commissioner
- Doug Nunnenkamp, Planning Commissioner/Parks Board Chair
- Eric Lawson, Economic Development Committee
- Charlie Hopewell, Jewett Cameron COO

- Laura Kelly, DLCD
- Kevin Young, DLCD
- Glen Bolen, ODOT Region 1
- Kate Hawkins, ODOT Region 1
- Jessica Pelz, Washington County
- Shannon Wilson, Washington County Housing

2. Establish Land Need

This chapter details the steps taken to establish North Plains' land need:

- Analyze Population Growth Forecast (from Portland State University (PSU)
- Identify Housing Land Need (from acknowledged HNA)
- Identify Other Land Need e.g., parks, public facilities (from acknowledged plans)
- Identify Employment Land Need (from acknowledged EOA)
- Identify Site Characteristics of Land Needed
- Examine Sites within Existing UGB

Population Growth Forecast

The land needed to accommodate the projected growth of residential and employment uses in the 20-year planning horizon is based on the official population forecast, housing type mix and employment land needs identified in the City's adopted 2022 HNA and 2022 EOA. These two studies used the population forecast prepared by the Portland State University (PSU) Population Research Center in 2020.

In June 2020, PSU released a new population forecast for North Plains, forecasting a population of 7,076 in 2040. This is an increase of 3,666 people at an average annual growth rate of 3.7%. The 2017 HNA was updated to reflect this forecast and will be adopted by the City of North Plains along with the UGB Expansion. The EOA was also updated to reflect the new forecast and was adopted by the City of North Plains on November 7, 2022, and ultimately acknowledged by DLCD.

Land Need: Residential, Parks, and Public Facilities

The 2022 HNA update identifies a total need for 1,348 dwelling units over the 20-year planning horizon, 558 of which can be accommodated within the existing UGB. This leaves a deficit of 790 dwelling units that cannot be accommodated inside the current North Plains UGB (Table 1).

Table 1. North Plains 2020 HNA UGB Expansion Average Residential Density Scenarios

Plan Designation	Dwelling Units Capacity of Buildable Land	Needed Dwelling Units (2020-2040)	Surplus or Deficit of Dwelling Units
Low Density Residential (R7.5)	11	591	(580)
Medium Density Residential (R5)	19	84	(65)
High Density Residential (R2.5)	24	169	(145)
Neighborhood Commercial	504	504	0
Total	558	1,348	(790)

In order to determine how much land is needed to accommodate the 790 dwelling units, the City must determine an average density (or densities) of housing. The HNA prepared several average

density scenarios to help illustrate the approximate amount of land that would be needed exclusively for housing at lower, moderate, and higher average densities (Table 2).

Table 2. North Plains 2020 HNA UGB Expansion Average Residential Density Scenarios

Average Density	Density	Land Need
Lower density	6.7 units per acre	118 acres
Moderate density	8.4 units per acre	94 acres
Higher density	9.7 units per acre	82 acres

The 2019 Comprehensive Plan includes maximum residential densities for each of the city's three residential zoning designations (Table 3), as well as a standard for future residential development of 70% single family detached and 30% single-family attached and multifamily.

Table 3. North Plains 2019 Comprehensive Plan Residential Densities

Comprehensive Plan Designation	Maximum Density	Corresponding Zoning District
Medium/Low Density Residential	5.8 dwelling units per net acre	R-7.5
Medium/High Density Residential	8.7 dwelling units per net acre	R-5
High Density Residential	17.4 dwelling units per net acre	R-2.5

Determining the amount of land needed for housing requires application of an average density for each residential zone as well as inclusion of the required housing type mix (70% single-family detached/30% single-family attached and multifamily). In identifying an average density for each zone, the City took into account several factors. North Plains is likely to retain an auto-dominated transportation system as public transit is not currently available or planned for the City. It is also important to City policy makers and residents to maintain a rural, small town identity but to accommodate reasonable population growth that would support certain uses, such as a grocery store and a vibrant downtown core.

After consideration of the HNA residential density scenarios (Table 2), the Comprehensive Plan densities (Table 3) and the community's growth objectives, the PAC refined the proposed residential densities for inclusion in the UGB Expansion Area (Table 4).

Table 4 UGB Expansion Area Residential Densities

Zoning Designation	Average Density	Acres	Dwelling Units
R-7.5 (Low Density)	5.5 dwelling units per net acre	84.5	464
R-5 (Medium Density)	8.0 dwelling units per net acre	14.0	112
R-2.5 (High Density)	17.4 dwelling units per net acre	12.3	214
Total	7.1 dwelling units per net acre	110.8	790

In addition to the dwelling units themselves, the City must accommodate parks, trails, open space, schools, and public infrastructure. Land need was estimated for each of these uses as detailed below.

Parks, Trails and Open Space: The amount of land needed for parks, open spaces and trails is estimated at 40 acres. This is based on the current deficit and future need of park land in the City to meet the goal level of service (LOS) in the Parks and Open Space Master Plan of 6.25 acres of parks per 1,000 residents, plus open spaces and trails to connect all residents to a park.

The 2040 population estimate of 7,076 people translates to 44.23 acres of developed core parks. Adding 2.0 acres for trails and pathways brings the total need in year 2040 to approximately 46.23 acres. According to the Parks Plan, there are 6.24 acres of parks in the city[1]. Therefore, the amount of land needed for parks, trails and open space in the UGB expansion is 40 acres.

Schools: All public schools in North Plains are owned and operated by Hillsboro School District (HSD). HSD completed construction of a new elementary school in 2021 that, combined with the existing elementary school, will accommodate all K-6 students in North Plains in the 20-year planning horizon of the UGB expansion.

Middle school students in North Plains attend Evergreen Middle School and high school students attend Glencoe High School, both of which are in Hillsboro. Evergreen currently has just over 800 students and capacity for another 400 students. The District's current demographic study shows a Student Yield Factor of 0.053 middle school students per household in North Plains for the Glencoe High School feeder group. The addition of an estimated 790 housing units in the next 20 years within the UGB expansion area would yield approximately 42 new middle school students in North Plains in the next 20 years. While a middle school may eventually be built in North Plains, there is no

[1] The Sunset Ridge and Brynhill Master Plan areas include privately-owned parks that are accessible to the public that are not included in the Parks Plan inventory as they were not fully constructed at the time of inventory and are not owned or maintained by the City.

plan to do so in the 20-year planning horizon of the UGB expansion. Similarly, there are no plans for high school construction in the city. Therefore, the needs analysis for public schools results in no land need for the UGB Expansion project.

Public Infrastructure: The amount of land needed for public infrastructure is estimated at 15% of the acreage needed for residential dwellings (for example, 100 acres of land for dwellings requires 15 acres for streets and infrastructure).

In determining the residential land need, including areas for parks, trails, open spaces, schools and infrastructure, the City has determined that a total of 168 acres of land are needed for residential uses in the UGB expansion (Table 5).

Table 5. Residential Land Need (Recommended to PAC in May 2021)

Land Use	Acres
Housing	110.8
Parks, Trails and Open Space	40.0
Schools	0
Infrastructure	16.6
Total Residential Land Need	167.4

Land Need and Site Characteristics: Employment and Public Facilities

The 2022 EOA and associated land need estimates are based on the adopted City Council Vision for future economic growth and diversification as permitted and encouraged by OAR 660-024. The Vision includes Four Priorities for community and economic development with the UGB expansion study process:

PRIORITY 1: Reverse the worsening trend of bedroom community status for North Plains with a thriving jobs-housing balance by expanding and diversifying employment opportunity and industry profile and presence.

PRIORITY 2: Grow business investment in North Plains to encourage expansion and diversification of the City's property tax base to reverse the imbalance created by a growing bedroom community development trend.

PRIORITY 3: Ensure and sustainably fund community-supporting infrastructure, economy-supporting infrastructure, and expanded City services such as recreational offerings that enhance community health and diversify the City economy.

PRIORITY 4: Expand the local presence of important, everyday commercial services for the residents of North Plains which offers a shorter and safer distance rather than at extended and costly distance to other cities.

The 2022 EOA identified a deficit of 687.8 acres of employment land in the 20-year planning period (2020-2040). This includes 172.4 acres for commercial uses and 515.4 acres for industrial uses. These totals include an allowance for needed for right-of-way (infrastructure) estimated at 25% of the acreage needed for employment uses. Therefore, the total land area needed to accommodate employment lands and associated infrastructure is 687.8 acres (Table 6).

Table 6. Employment Land Need (Recommended by PAC in May 2021)

Land Use	**Acres**
Commercial	172.4
Office	*91.5*
Institutional	*21.2*
Retail	*72.3*
Industrial	515.4
Flex/Business Park	*167.6*
General Industrial	*324.5*
Warehouse	*52.9*
Total Employment Land Need	687.8

In addition to the amount of land needed, the 2020 EOA also identified target services and industries for future economic growth consistent with City Council's Vision directive that export-oriented employers need to be pursued and recruited to broaden and strengthen its economy and employment opportunities. These services and industries include:

- A full-service grocery store
- Export-oriented employers
  - Computer & Electronic (C&E) Mfg.54 (5-100+ acres typical site range)
  - Multi-tenant Office Complex55 (5-20 acres typical site range)
  - Business Incubator (5-25+ acres typical site range)
  - Food Processing (5-25+ acres typical site range)
  - Small-scale manufacturing (electronics mfg., machinery mfg. (i.e., agriculture or industrial machinery), metals fabricating, specialty food & beverage manufacturing, renewable and alternative energy products) (10-50 acres typical site range)
  - Small-scale warehouse, distribution & wholesale (5-50 acres typical site range)
  - Professional services
  - Personal services (residents, senior and visitors)

The EOA goes on to identify specific site characteristics needed to accommodate these services and industries. Table 7 shows the number and size of sites needed to accommodate various users.

Table 7. Specific Land Demand by Plan Designation and Size

Number of Sites by Use Type	Typical Acreage	Sites Needed
Industrial		
Tech-based Anchor or Large Industrial	100 or more	2
Large Park/Cluster	50-100	1
Medium and Smaller Park	20-50	1
Expanding Users	5 – 20	8
Independent Small Businesses	5 or less	7
Totals	515.4 Acres	**19**
Commercial – Office & Retail		
Large Business Park or Retail Center	20 – 40	1
Medium Business Park or Retail Complex	5 – 20	5
Small Office and Retail, Lodging Site	5 or less	9
Totals	172.4 acres	**15**

Source: PNW Economics, LLC

Note: Typical Acreage includes 25% addition for infrastructure

Table 8 shows the total 20-year residential and employment land need of 855.2 acres.

Table 8. North Plains UGB Expansion Area Land Need

Land Use	Land Need
Residential (Including housing, parks, trails, open space and right-of-way)	167.4 acres
Employment (Including commercial and industrial properties and right-of-way)	687.8 acres
Total UGB Expansion Area Land Need	855.2 acres

Examine Sites within Existing UGB

Prior to pursuing a UGB expansion, the City must demonstrate that the land needs cannot reasonably be accommodated on land already inside the UGB. The City is required to evaluate opportunities to provide efficient development of residential land within the existing UGB.

The supply of vacant land inside the UGB is limited. As illustrated on the Building Lands Inventory Map (Figure 1), there are no opportunities for medium- or large-scale residential development, aside from the Brynhill Master Plan/North Expansion Area that has received land use approval to develop at 8.4 dwelling units per acre and is under construction.

Due to the small supply of vacant land in North Plains, it is unlikely that land use efficiency measures will significantly reduce the current land need. However, these measures will apply to UGB expansion areas and therefore promote more efficient use of land in the future.

The City was instructed by DLCD to reference a table of "Measures to Accommodate Housing Needs within the UGB" found in OAR 660-038-0190(5). These measures can be sorted into four provision categories:

- Housing Type Provisions
- Density and Maximum Lot Size Provisions
- Street and Parking Provisions
- Financial Provisions

The City evaluated the land use efficiency measures and determined which would result in a meaningful change in the land development pattern in North Plains. Efficiency measures are presented separately by category in tables 9-12.

Figure 1. Buildable Lands Inventory

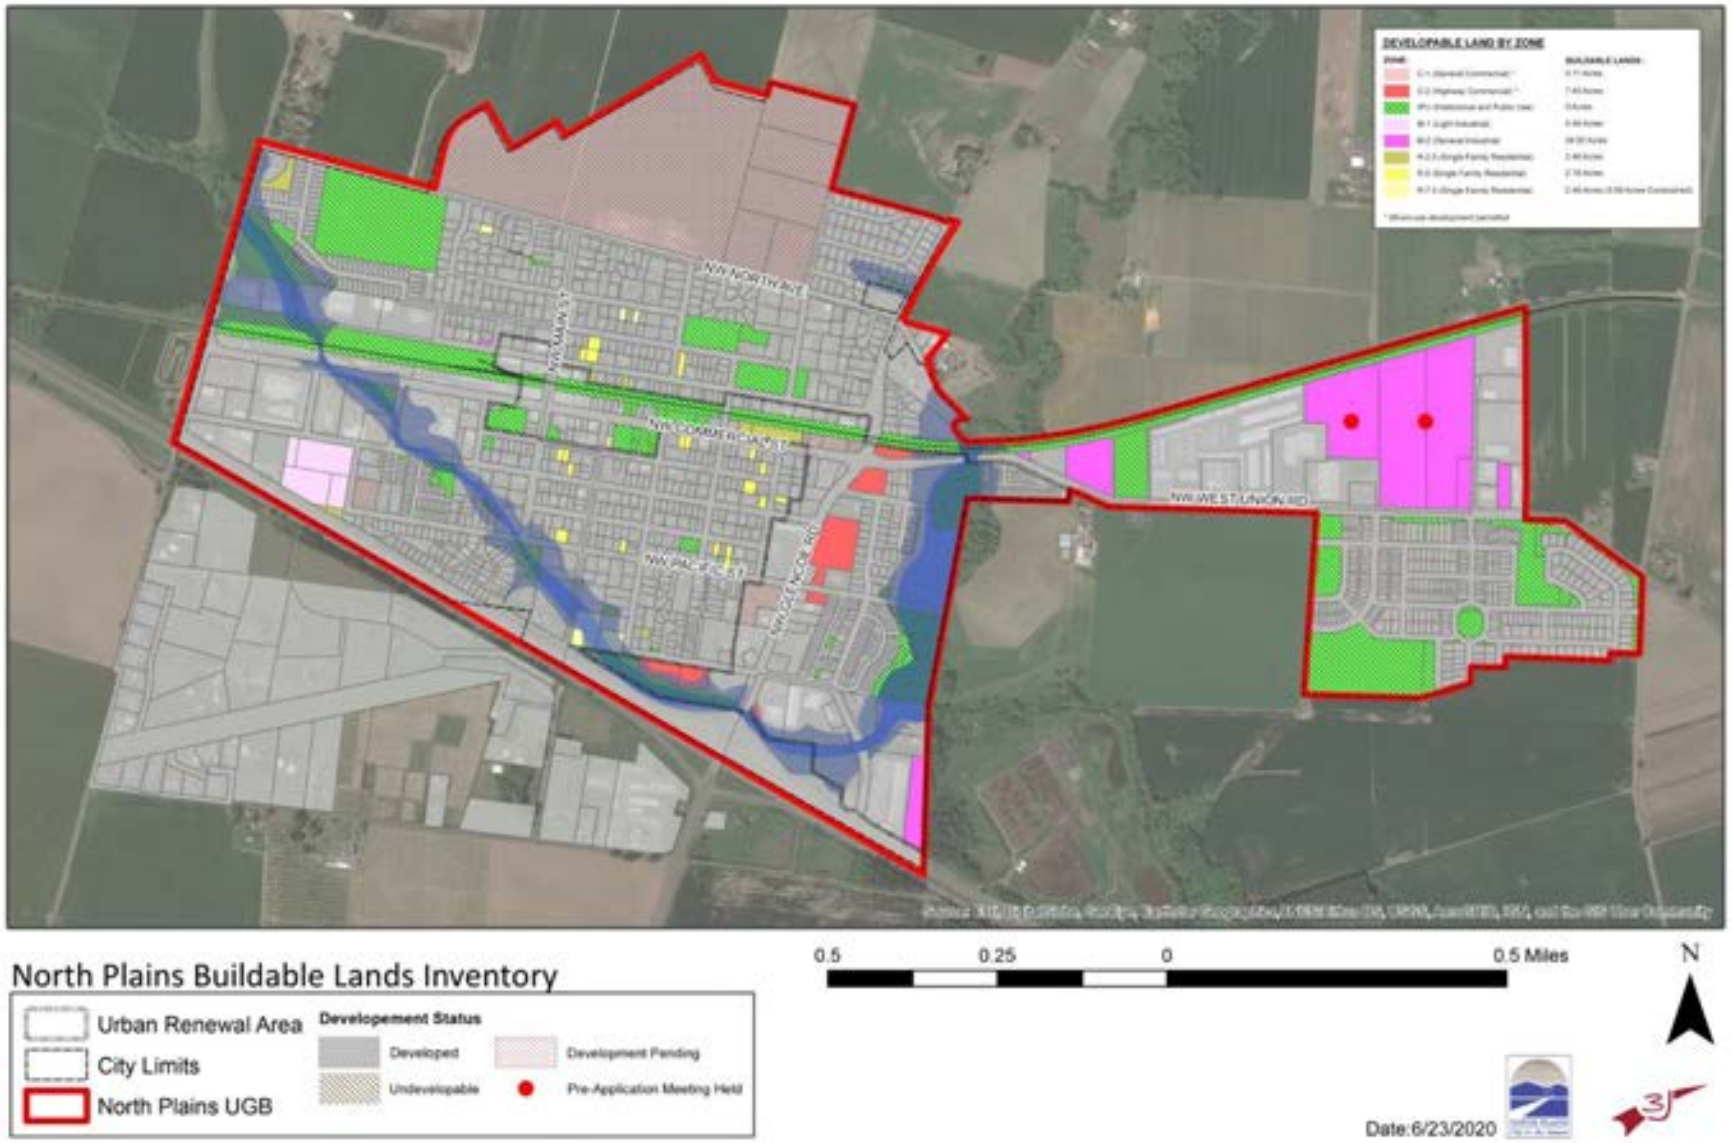

Table 9. Efficiency Measures- Housing Type Provisions

Efficiency Measure	**North Plains Response**
Prohibit detached single-family housing in the high density (R-2.5) zone.	Update Zoning Code to prohibit new detached single-family in the R-2.5 zone
Permit attached single-family housing outright in the medium density (R-5) zone.	Update Zoning Code to permit outright attached single-family housing in the R-5 zone
Permit duplexes outright on all lots where detached single-family housing is permitted with no additional development review standards.	Update Zoning Code to permit outright duplexes in the R-5 zone with no additional development standards (not in the low density, R-7.5 zone)
Adopt a cottage housing code provision authorizing at least 12 dwelling units per acre.	Update Zoning Code to include a cottage housing provision, allowing outright in the R-2.5 zone (17.4 dwelling units/acre max. density)
Limit the development of detached single-family housing in the medium density (R-5) zone to no more than 25% of the residences in a development application, unless the detached home is on a lot less than or equal to 3,000 square feet.	The proposed R-5 zone average density of 8.0 dwelling units/acre results in average lot sizes of 5,445 square feet. The density clearly supports primarily detached single-family housing. A limit on this type of housing in the R-5 zone would effectively prohibit development of housing in the R-5 zone.
Permit accessory dwelling units (ADUs) outright in all zones that permit detached single-family housing with no additional off-street parking requirement, in attached or detached configuration with primary residence, and without an owner occupancy requirement.	The Zoning Code currently permits ADUs outright in all R-zones with no additional off-street parking requirement, in attached or detached configuration with primary residence and without an owner occupancy requirement.
Permit residences in commercial districts (this standard only applies to cities with a population of 10,000).	The City population does not warrant compliance with this efficiency measure.

Table 10. Efficiency Measures- Density and Maximum Lot Size

Efficiency Measure	**North Plains Response**
Set a minimum density of at least 70 percent of maximum density for all residential zoning districts.	Update Zoning Code to set minimum density of at least 70% of maximum density in all R-zones.
Allow a density bonus for affordable housing (with specific provisions)	Update Zoning Code to allow a density bonus in the R-2.5 zone for affordable housing (with specific provisions).

Set a maximum lot size for detached single-family dwellings of 5,000 square feet.	The proposed R-7.5 zone average density of 5.5 dwelling units/acre results in average lot sizes of 7,920 square feet. The proposed R-5 zone average density of 8.8 dwelling units/acre results in average lot sizes of 5,445 square feet. If detached single-family dwellings are not permitted in the R-2.5 zone, there is no zone where a maximum lot size for detached single-family dwellings could be set at 5,000 square feet.

Table 11. Efficiency Measures- Street and Parking Provisions

Efficiency Measure	**North Plains Response**
Reduce public street right-of-way width standard by at least two feet.	This would not impact the efficiency of land use within the existing UGB as the street network is built out.
Change parking requirements to maximum of no more than one space per multi-family dwelling unit. Allow on-street parking to count toward requirement.	This is not feasible in North Plains due to the lack of transit and services within the City limits.

Table 12. Efficiency Measures- Financial Provisions

Efficiency Measure	**North Plains Response**
Allow waiver or deferral of system development charges (SDCs) for certain housing types (such as ADUs, affordable or multifamily)	The City is in the process of reviewing all SDCs and will consider waivers and deferrals as part of that review process.
Exempt certain types of housing (such as affordable or multifamily) from paying property taxes.	The City has very low local property taxes. Property tax exemptions would not have a meaningful impact on efficient land development but would negatively impact the City.

Due to its population (under 10,000) and location (outside of Metro), North Plains is not required to meet the "middle housing" provisions of House Bill 2001 (accessory dwelling unit standards are required and met in the city's development code). However, city decision makers realized that the efficient development of land within the existing UGB would require an expansion of permitted housing types and a reduction in the barriers to the construction of these housing types (such as a conditional use permit). In 2002, the city adopted development code amendments to:

- Prohibit new single-family detached housing in the R-2.5 zoning district.
- Allow outright duplexes, triplexes and townhouses in the R-5 zoning district.
- Add cottage cluster standards and permit this housing type outright in the R-2.5 zoning district.
- Set minimum density at 70% of maximum density in all residential zoning districts.
- Allow density bonus for affordable housing in the R-2.5 zoning district.

The city maintains an on-going review of System Development Charges (SDCs) and has included consideration for waivers and reductions for certain housing types.

3. Establish Study Area

This chapter details the steps taken to establish the North Plains UGB Expansion Study Area:

- Create Preliminary Study Area
- Evaluate Preliminary Study Area/ Exclusion of Lands
- Create Final Study Area

Create Preliminary Study Area

Establishing the land to be considered for expansion, known as the Preliminary Study Area, is dictated by OAR 660-024-0065. It states that the Preliminary Study Area must include all lands in a city's acknowledged urban reserves, and lands within a certain distance from the acknowledged UGB: one-half mile for jurisdictions of less than 10,000 and one mile for jurisdictions of more than 10,000, or land beyond the specified distances at the discretion of the jurisdiction. The city of North Plains has no urban reserves and is surrounded by rural reserves and "undesignated" areas shown in green in Figure 2. The City decided to consider land within one mile of the current UGB, excluding rural reserves, to address its 20-year land need. Since at least a portion of all parcels not designated as rural reserve are within one mile of the current UGB, the City decided to include all undesignated land in the Preliminary Study Area.

Evaluate Preliminary Study Area / Exclusion of Lands

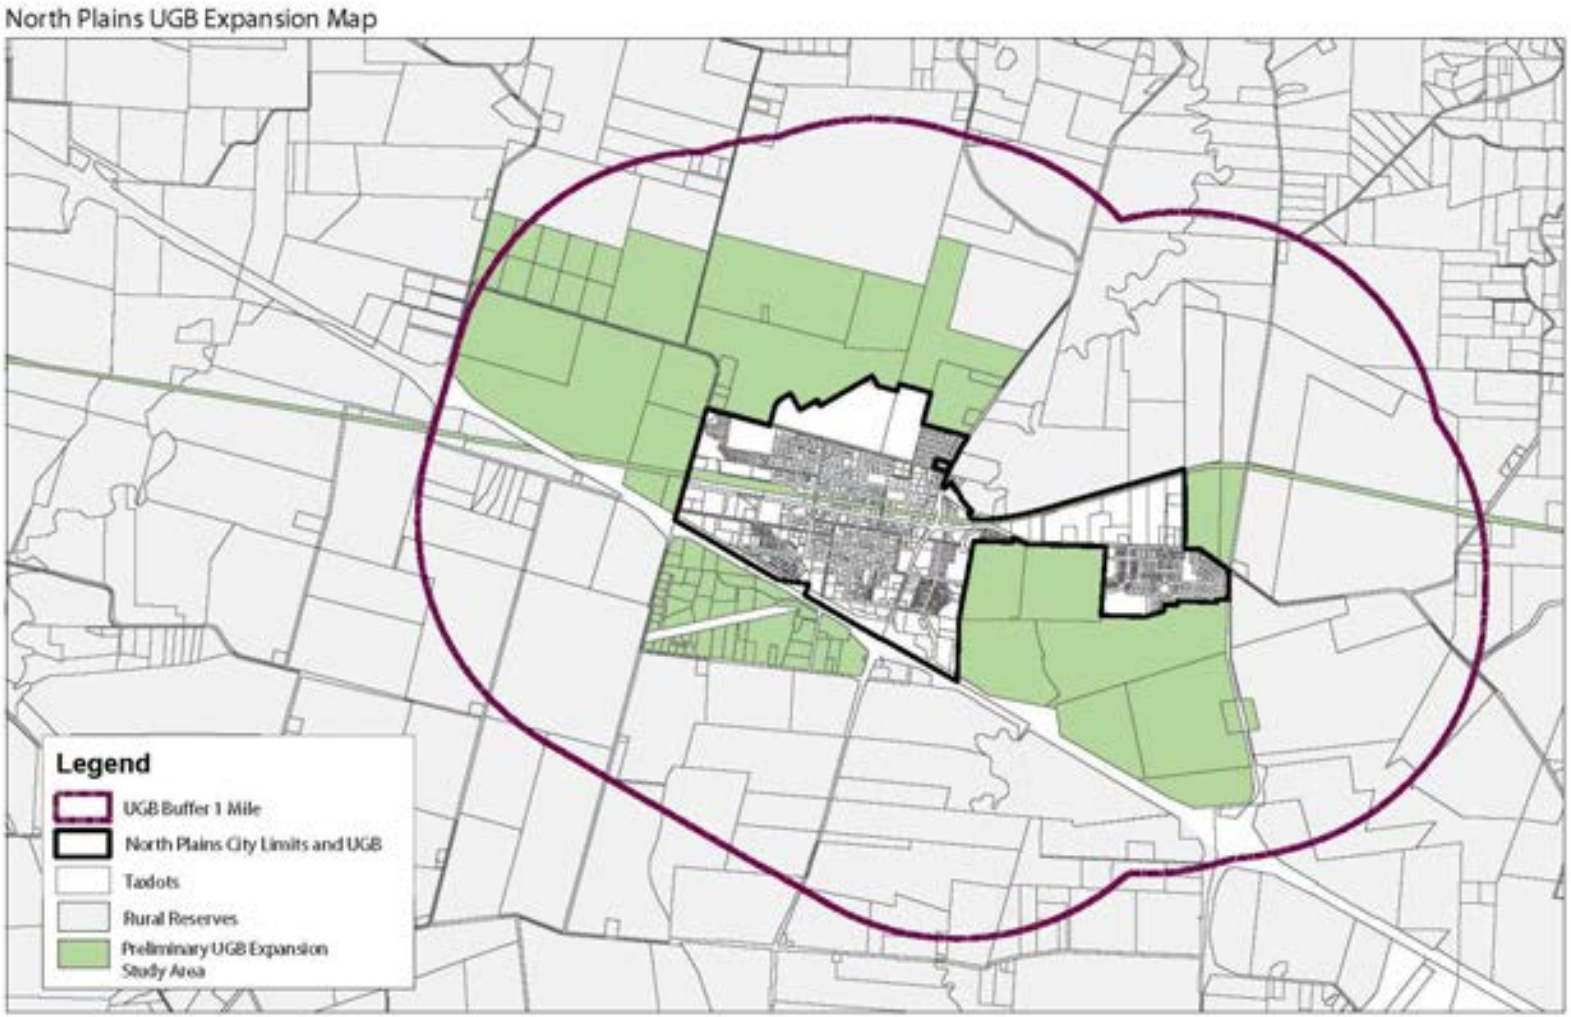
Regulations allow for certain categories of land to be excluded from the preliminary study area, including land that, cannot accommodate a specific industrial or public facility need, is impracticable to serve, is subject to natural hazards, contains a specific scenic, natural, cultural or recreational resource, or is non-urban federal lands.

Specifically, the City of North Plains has determined that certain properties meet the exclusion criteria of Oregon Administrative Rule (OAR) 660-024-0065, state and county airport regulations, and the City's Comprehensive Plan and Transportation System Plan. The City's proposes to exclude a portion of the exception land south of Highway 26 and north of NW Beach Road.

The exclusion area consists primarily of the Sunset Air Strip and surrounding Air Acres and Sunset Orchard Estates residential subdivisions that are bound to the airport by restrictive covenants. The continuing operation of the Sunset Air Strip is a significant impediment to development at urban intensities. Development within the Air Strip and surrounding residential development is unlikely to occur during the planning period as the property owners intend to continue to operate the airport and additional development would impact its operations. Also, the cost of further developing the airport at urban intensities, and specifically developing the transportation network, would be prohibitively expensive, if not impossible in light of ORS 836.608.

Exclusion of these parcels of land is addressed, in detail, in Appendix A of this report.

Figure 2. North Plains UGB Expansion Preliminary Study Area



Create Final Study Area

After excluding the Sunset Air Strip and surrounding Air Acres and Sunset Orchard Estates residential subdivisions, the Final Study Area is reflected in Figure 3.

Figure 3. North Plains UGB Expansion Final Study Area

4. Analyze Study Area

This chapter details the steps taken to analyze the North Plains UGB Expansion Study Area:

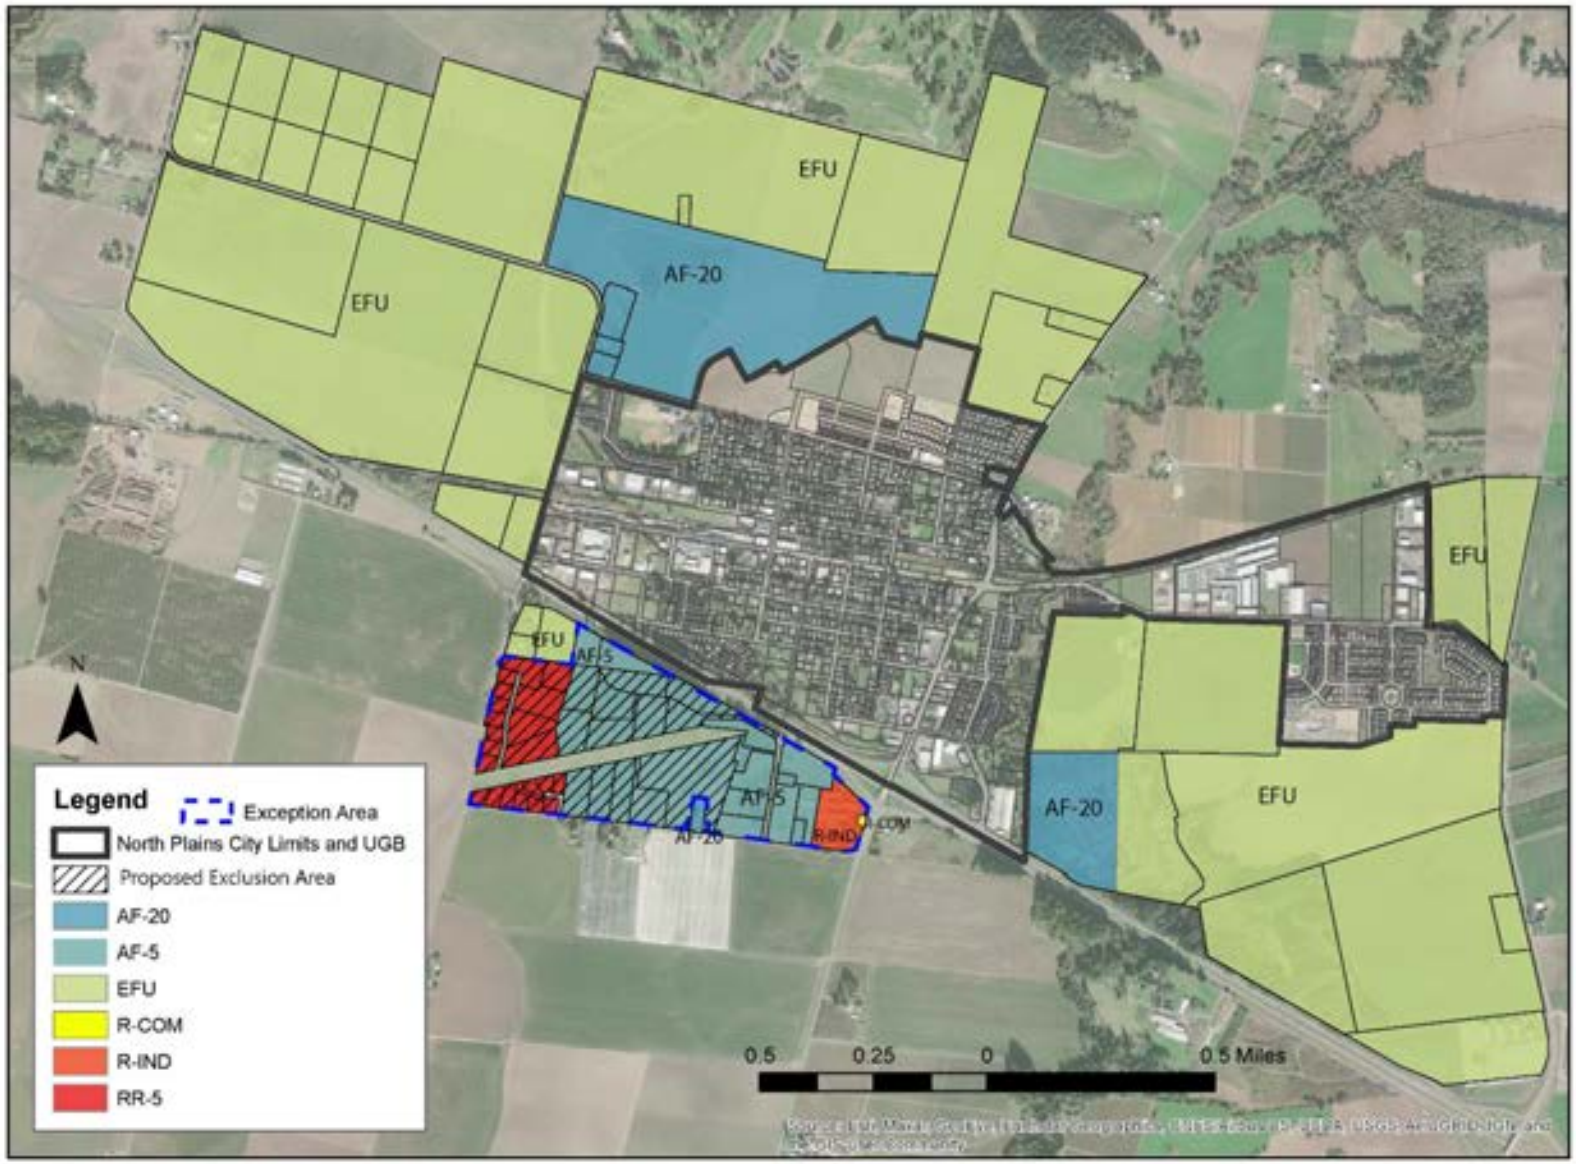
- Establish Parcel Prioritization Using Statutory Priorities (ORS 197A.320)
- Apply Suitability Criteria (OAR 660-024-0067(5))
- Apply Goal 14 Location Factor

Establish Parcel Prioritization

Lands in the Study Area are evaluated against priorities set by OAR 660-024-0067. The First Priority includes urban reserves, exception land, and nonresource land. North Plains does not have any acknowledged urban reserves as it is surrounded by rural reserves and "undesignated" land. The Study Area does contain an area of exception land south of Highway 26, as shown in Figure 4. There are 140.85 acres of exception land in the study area; 125.61 acres when you remove the airstrip exclusion area (15.24 acres). The exception land has County zoning designations of Rural Residential-5 Acres (RR-5), rural Commercial (R-COM), Rural Industrial (R-IND), and Agricultural and Forest District-5 (AF-5).

The Second Priority is marginal lands, of which North Plains has none. The Third Priority is forest or farmland tracts, defined as contiguous parcels under common ownership, that are not predominantly high value. The process for determining the value of farmland was established in response to the passing of Measure 49, passed by Oregon voters in 2007. Measure 49 provides land owners a pathway to claim compensation if land uses restrict their farm practice and reduce the fair market value of their property. The Study Area, minus the exception land, was evaluated for the Third Priority by analyzing Washington County zoning, Washington County assessor records, United Stated Department of Agriculture (USDA) CropScape data, Oregon's Department of Geology and Mineral Industries (DOGAMI) LiDAR topographic data, 2007 National Resources Conservation Service (NRCS) soil data, and Oregon Water Resources data in ArcGIS.

Figure 4. North Plains UGB Expansion Study Area with Zone Designations



As dictated by ORS 195.300 and 215.710, defining high-value farmland relies on a series of soil, crop, water, and topographic analyses. Land is determined high-value farmland if predominantly composed of soils classified as Class I or Class II by NRCS. Class I and Class II soils are high-value soils because they are resilient to damage, easy to manage, and have few limitations for field crops. The Study Area is predominantly, meaning at least fifty percent coverage, composed of Class I or Class II (high-value) soils.

The Study Area is further tested against the remaining sections of ORS 195.300 and 215.710. Land located in EFU zones within irrigation districts or water use permit holdings, the prevalence of wine grape crops, and land containing named high-value soils or specific elevations, slopes, and aspects within the Willamette Valley viticultural area are determined high-value farmland. While these factors are considered in the determination of farmland value, the predominance of Class I or Class II soils is enough standing to consider the Study Area high-value farmland. The Study Area does not contain predominantly low-value farmland based on a series of evaluative steps as listed above. Figure 5 illustrates areas of predominantly high-value and low-value farmland.

The Fourth Priority is areas of predominantly high-value farmland that do not contain prime or unique soils. All land in the Study Area, minus the exception land area to the south, is considered predominantly high-value farmland. The consideration of areas predominantly made up of prime or unique farm soils is only allowed if there is an insufficient amount of land in the previous priority categories to meet the identified land need. As shown in Figure 6, an analysis of prime or unique farmland shows the majority of the Study Area, almost mirroring the high-value farmland area, consists of prime soils as defined by the USDA NRCS.

Apply Suitability Criteria

Applying the suitability criteria analysis to the areas of high-value farmland and prime soils, the “undesignated” lands, contain several areas of natural resources and two cemeteries, as shown in Figure 7. These areas will be included in the analysis, but will not contribute to the acreage needed to meet future housing and employment needs. The acreages of areas listed as wetlands or floodplains will not be removed as those areas may be viable for parks or public facilities. There is a total of 1,307.02 acres of undesignated land (non-exception land) in the study area, and 1,302.59 acres after removing the two cemeteries (4.43 acres). All of the undesignated lands consist of predominantly high-value farmland and prime soils and are eligible to help meet the land need that remains after the exception lands are considered.

Figure 5. Low Value and High Value Farmland, North Plains UGB Study Area

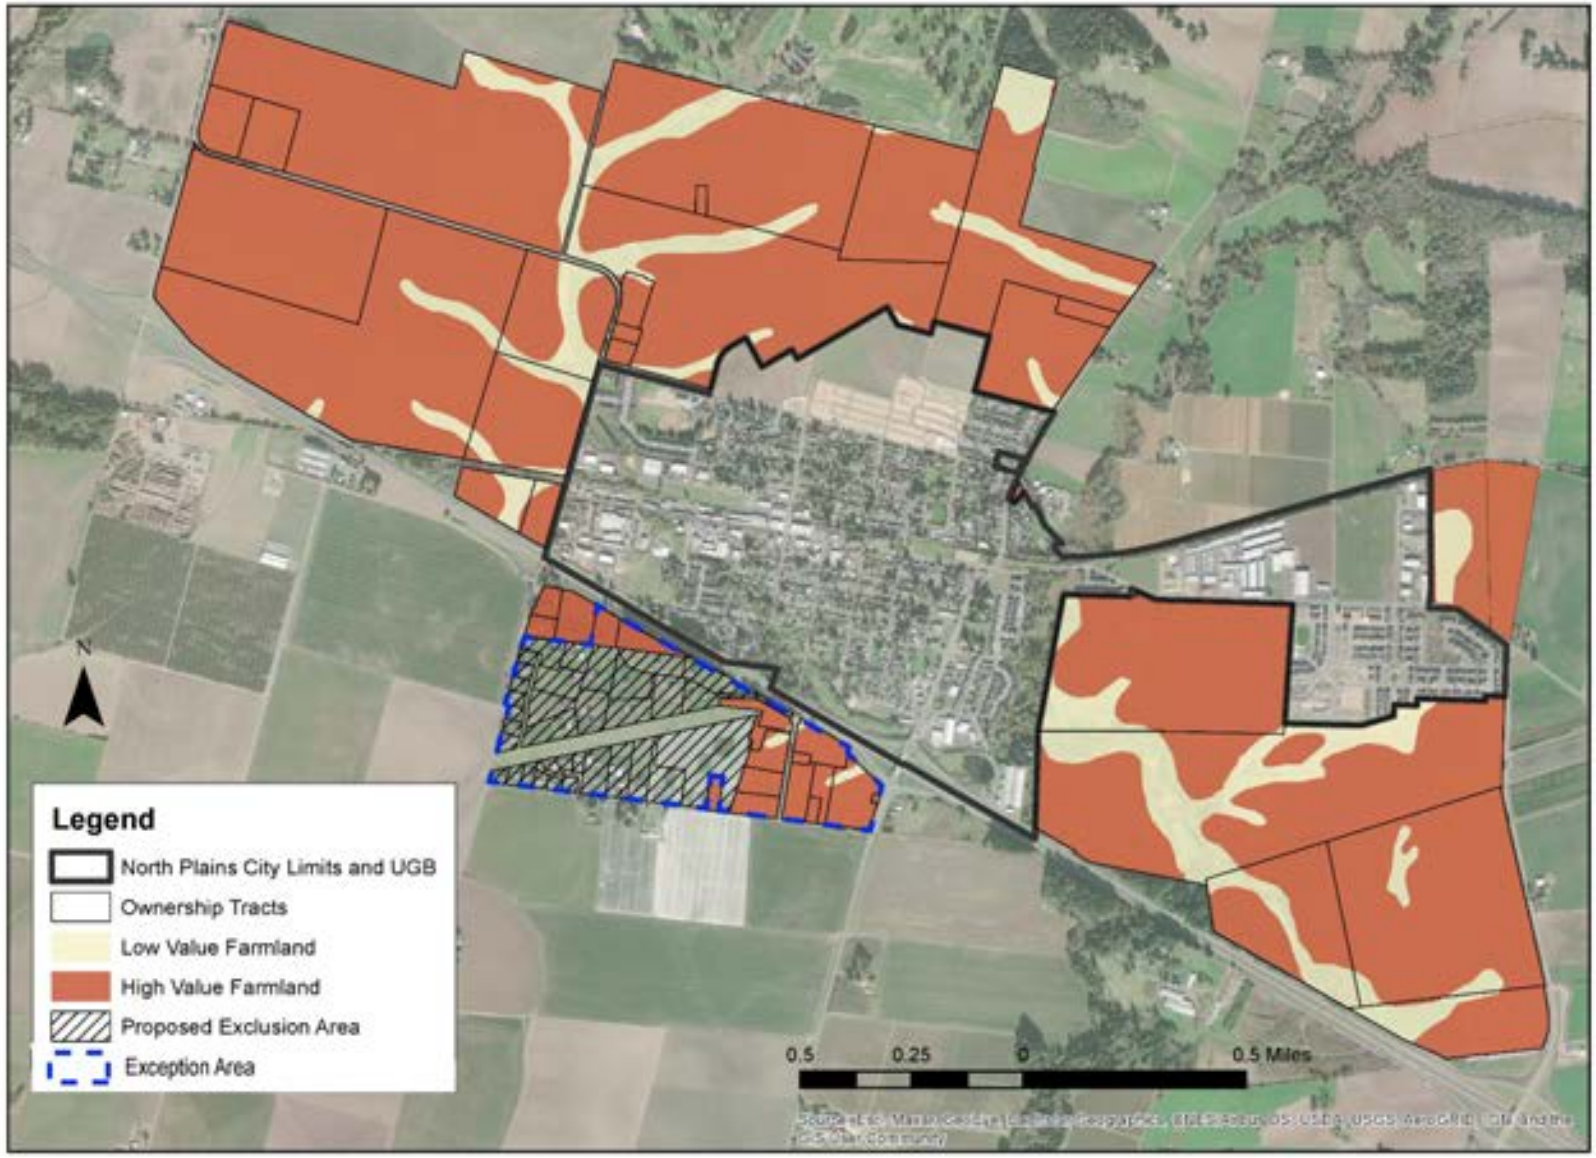


Figure 6. Prime Soils, North Plains UGB Study Area

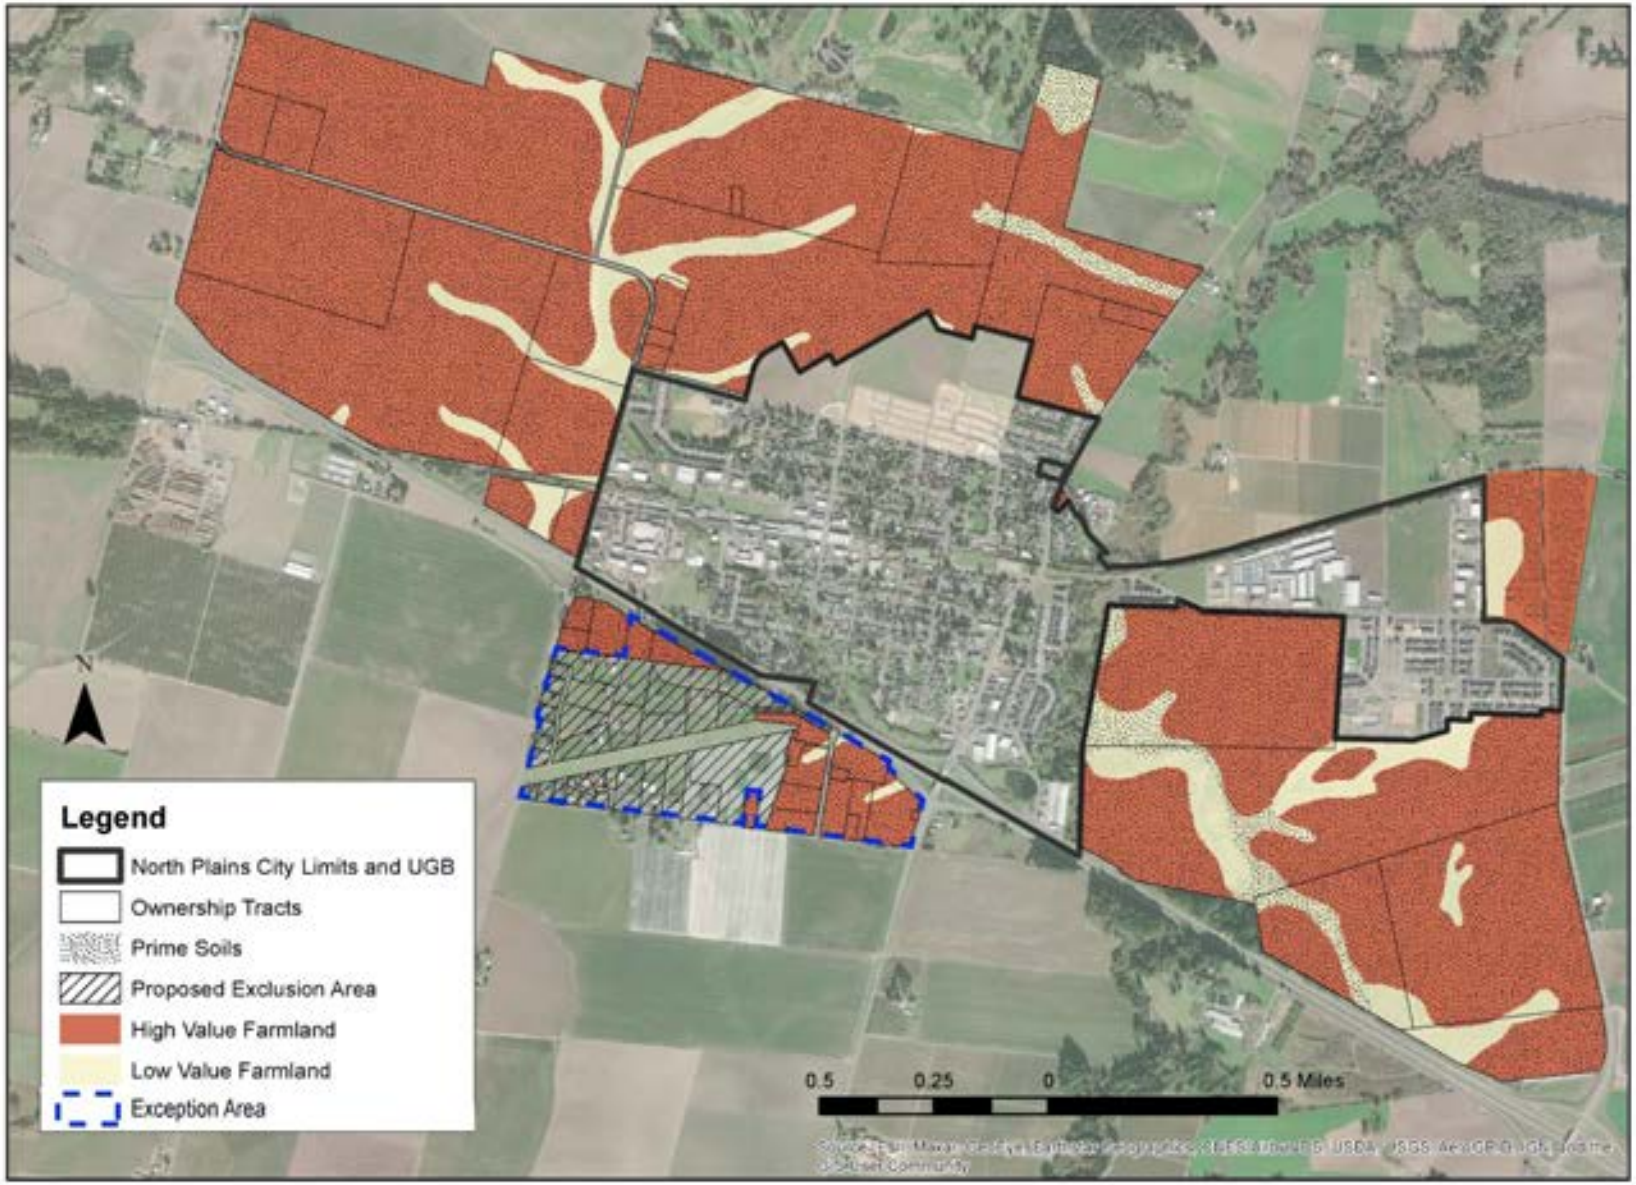

Figure 7. North Plains UGB Expansion Study Area “Suitability”

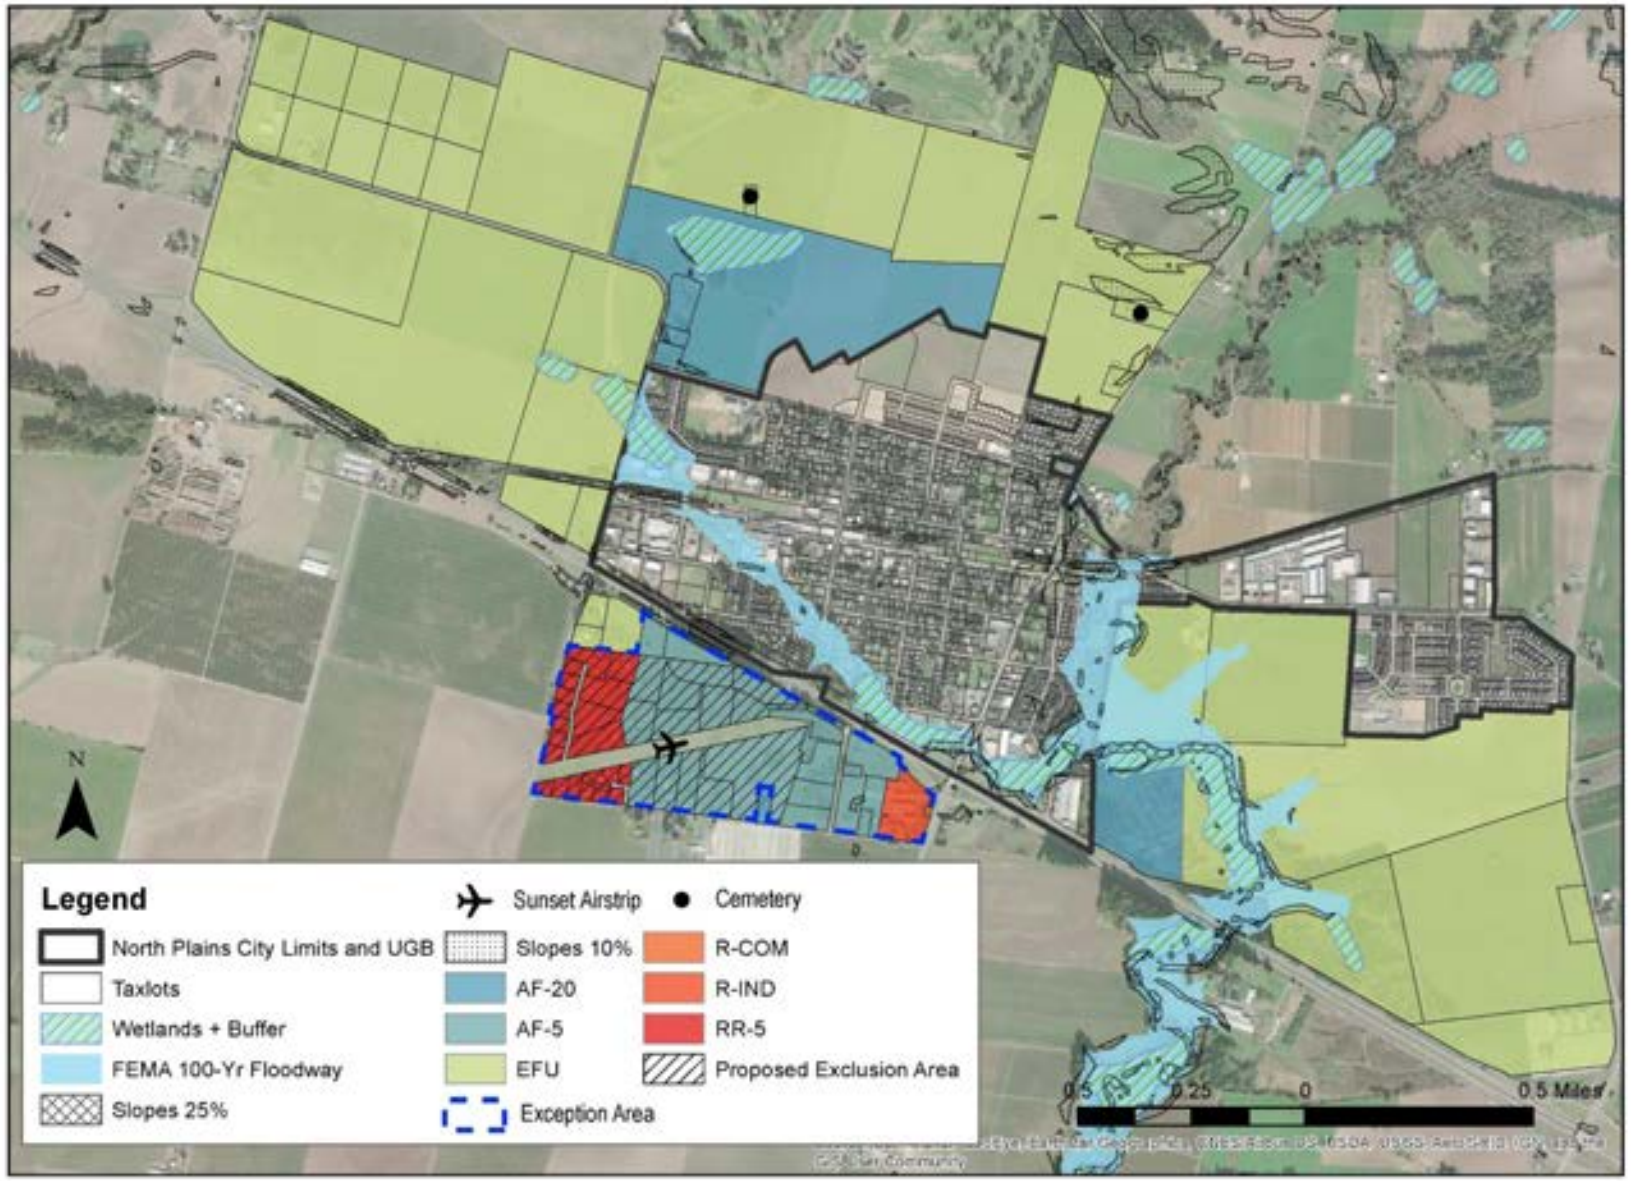


Apply Goal 14 Location Factors

To expand the UGB, North Plains must complete a boundary location analysis, comparing alternative locations and considering which addition to the UGB will result in the most accommodating and cost-effective boundary, while creating the fewest conflicts with neighboring land uses, and causing the fewest negative environmental, economic, social and energy consequences.

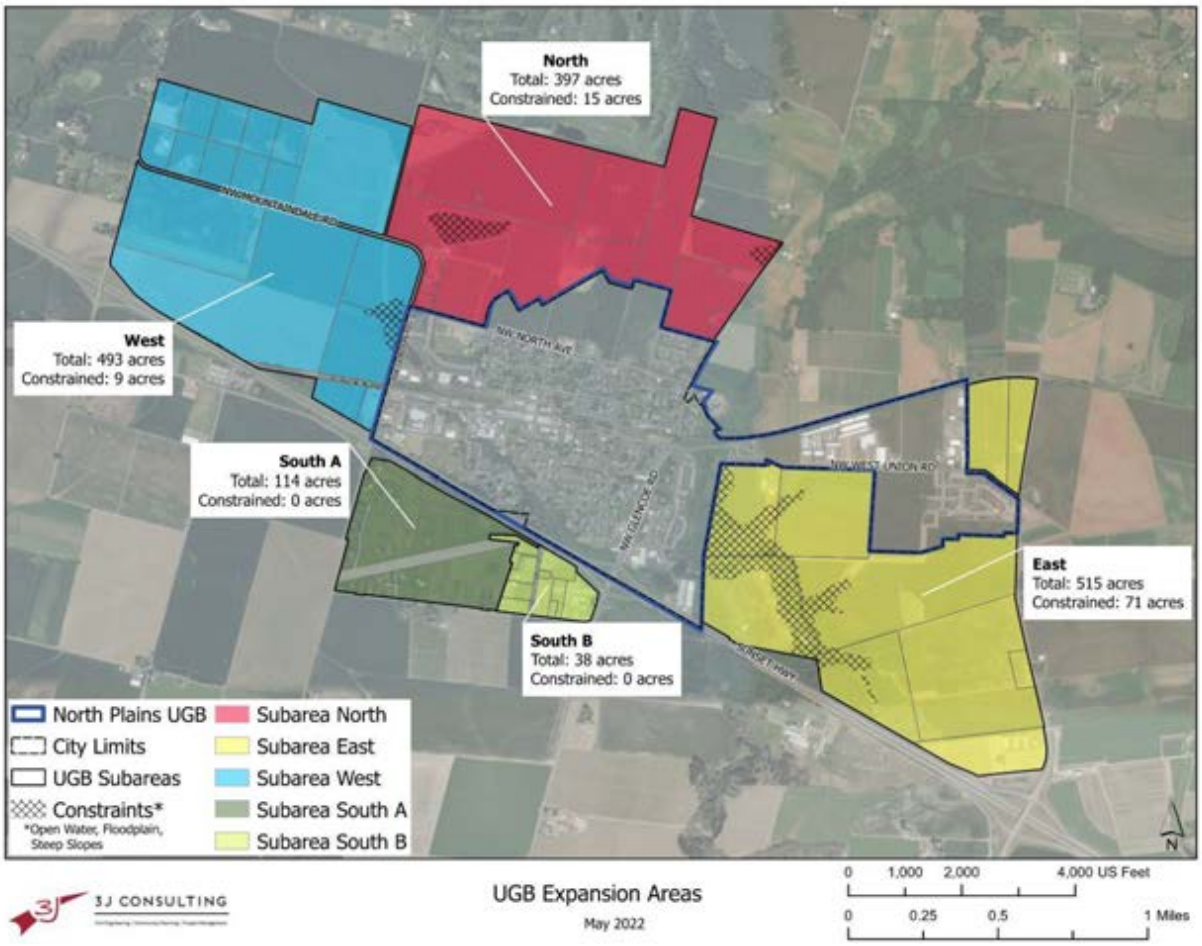
The boundary location analysis process is governed by Goal 14 and ORS 197A.320 and with consideration of the following factors:

1. Efficient accommodation of identified land needs
2. Orderly and economic provision of public facilities and services
3. Comparative environmental, energy, economic and social consequences
4. Compatibility of the proposed urban uses with nearby agricultural and forest activities occurring on farm and forest land outside the UGB

The four factors are weighted equally to create a balanced analysis and are considered concurrently rather than sequentially. The analyses that follow do not provide any definitive conclusion as to where the North Plains UGB should be expanded. Rather, they provide the data City leaders need to make an informed decision about how the City should grow over the next 20 years.

In order to apply the Goal 14 Location Factors, the City created subareas within the overall Study Area for evaluation purposes. Taking a cue from the last North Plains UGB expansion process in 2005, the 1,543-acre study area is divided into five subareas, North, South A, South B, West and West, as shown in Figure 8 and Table 13. Subareas were determined based on factors such as environmental features, taxlot lines, and transportation corridors. The southern area is divided into two subareas to make it easier to discuss the parcels the City proposes to exclude from the UGB expansion process (South Subarea A) from those the City intends to include in the expansion (South Subarea B).

Figure 8. North Plains UGB Study Area, Subareas



The **North Subarea** is located just north of the Brynhill Development and south of Pumpkin Ridge Golf Club. The Subarea consists of 11 parcels and has a gross area of 397 acres, including 15 acres with environmental constraints. The Subarea includes four parcels zoned AF-20 and seven parcels zoned EFU. Land use is primarily agriculture. The Subarea contains some wetland constraints. Two small parcels contain cemeteries, which are included in the study area, but will not be considered land that can accommodate North Plains' residential or employment needs.

The **South Subarea A** contains 152 acres on 53 parcels south of Highway 26. The Subarea includes the 141 acres of exception land and no environmental constraints. The South Subarea is divided into two sections.

- South Subarea A is 114 acres on 41 parcels in the western section of the subarea. The area consists of predominantly rural residential uses and includes the Sunset Airstrip. The exception land includes 22 parcels zoned RR-5, 13 parcels zoned AF-5, 1 parcel zones AF-20, and 3 parcels zoned EFU.
- South Subarea B is 38 acres on 12 parcels located on the eastern side of the subarea

consisting of residential and industrial uses. Ten parcels are zoned AF-5, 1 parcel is zoned R-COM, and 1 parcel is zoned R-IND.

The **West Subarea** consists of 493 acres on 16 parcels, with about 9 acres with environmental constraints. All parcels are zoned EFU and land use is primarily agriculture.

The **East Subarea** includes 515 acres on 10 parcels located near the Sunset Ridge Development and bordered by Highway 26 to the south, Jackson School Road to the west, and North Plains city limits to the west and north. Current uses are primarily agricultural, though most of the westernmost portion is occupied by the Recology Organics processing facility. There is also approximately 71 acres of wetlands and areas within the 100-year floodway on the western portion of the site. One parcel is zoned AF-20 and eight are zoned EFU, and one parcel is split between AF-20 and EFU zones.

Table 13. North Plains UGB Expansion Study Area Zoning and Acres by Subarea and Section

Subarea	Zoning	Parcels	Gross Acres	Acres w/o Env Const	Exception Land Acres
North	AF-20	4	132.42	120.80	0.00
	EFU	7	264.75	261.64	0.00
South A	AF-5	15	72.83	72.83	72.83
	AF-20	1	1.40	1.40	0.00
	EFU	3	9.80	9.80	0.00
	RR-5	22	30.07	30.07	30.07
South B	AF-5	10	29.17	29.17	29.17
	R-COM	1	0.20	0.20	0.20
	R-IND	1	8.75	8.75	8.75
West	EFU	16	493.10	483.67	0.00
East	AF-20	1	42.36	18.18	0.00
	AF-20	1	34.82	26.63	0.00
	EFU		28.82	10.71	0.00
	EFU	8	409.12	388.48	0.00
TOTAL		*90*	*1,557.61*	*1,462.33*	*38.02*

When evaluating the priority of land for inclusion the city must first evaluate the approximately 140 acres of exception land south of Highway 26 and north of NW Beach Road and select as much of the land as necessary to satisfy the 855-acre land need. Since the acreage of the exception land is less than the established land need, the city will also evaluate the remaining 1,391 gross acres (1,294

acres without environmental constraints) within the study area, all of which is considered predominantly high-value farmland.

1. EFFICIENT ACCOMMODATION OF IDENTIFIED LAND NEEDS

The City is using several criteria to determine where the City could most efficiently meet its land needs for the next 20 years – proximity, parcel size, and buildable land. Proximity to schools, employment, commercial areas, and amenities relieves pressure on the transportation system and provides more access to daily needs to higher concentrations of residents, resulting in a decrease in vehicle miles traveled (VMT). Parcelization is an indicator of both availability for development and the ability to develop an area in an efficient, coordinated manner. Looking at the gross acres available in an area may be misleading if there are environmental or other constraints on the land. Buildable land indicates how much of the land is available to be developed.

Proximity

The proximity criterion is based on the idea that land adjacent to the existing UGB offers the City multiple benefits:

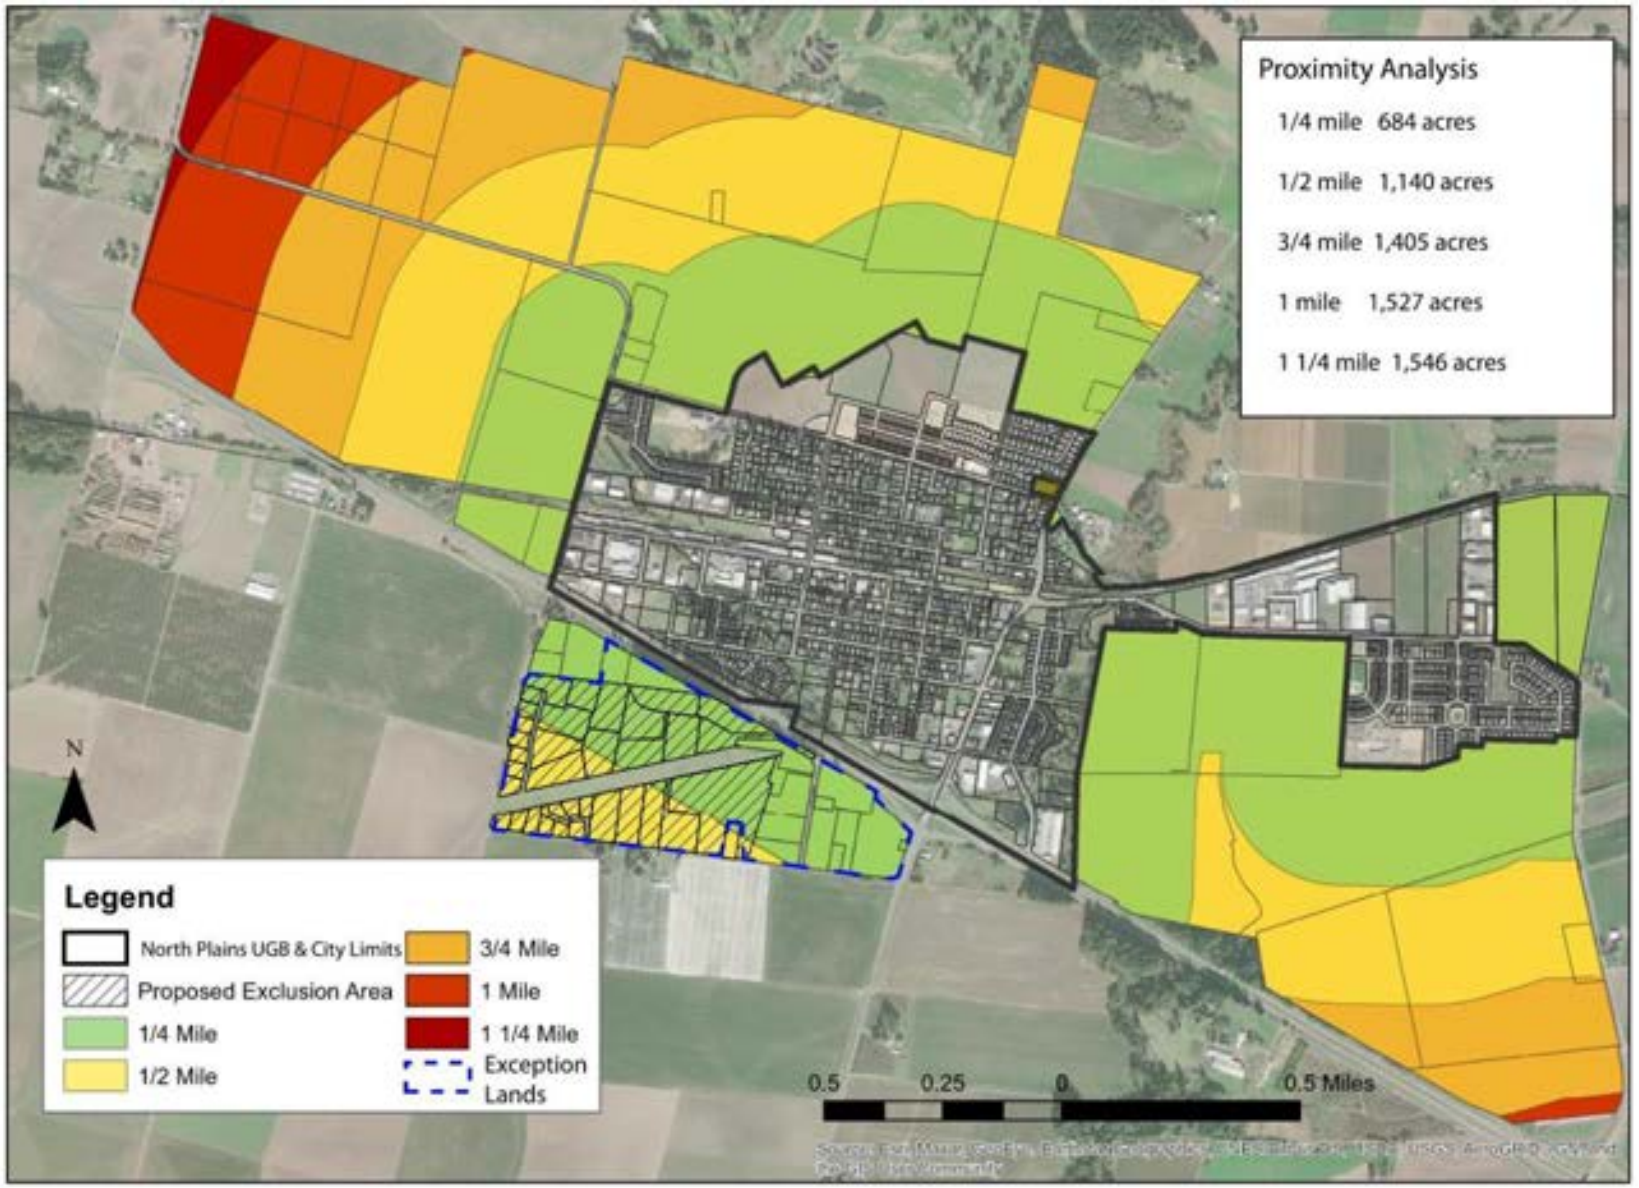
- Leverages prior infrastructure investments
- Provides access to current services and amenities
- Supports downtown businesses
- Reduces VMT and supports active modes of transportation (walking and biking)
- Increases housing choice and promotes affordability
- Preserves valuable agriculture and forest land

"Leapfrog" development bypasses available land located closer to the city, requiring new infrastructure investments, car-dependency, and greater land consumption.

Figure 9 illustrates the distance parcels within the study area are from the existing UGB. In general, parcels within ¼ mile (green) can meet the city's needs more efficiently than those within ¼ and ½ mile (yellow), which are in turn better suited than parcels between ½ and ¾ miles away. There are about 618 gross acres of land within ¼ mile of the existing UGB, but that does not necessarily mean that all of this land should be brought into the UGB. The proximity criterion does not take land characteristics and other considerations into account. For example, the East Subarea includes significant environmental constraints and is the location of the Recology Organics processing facility.

The entire South Subarea, including all of the Exception Land, is within ½ mile of the UGB. It is important to note that the South Subarea is separated from the rest of the city by Highway 26, which makes it less suitable for residential development, as the highway is a barrier to walking and biking as well as access to shopping and services in the city.

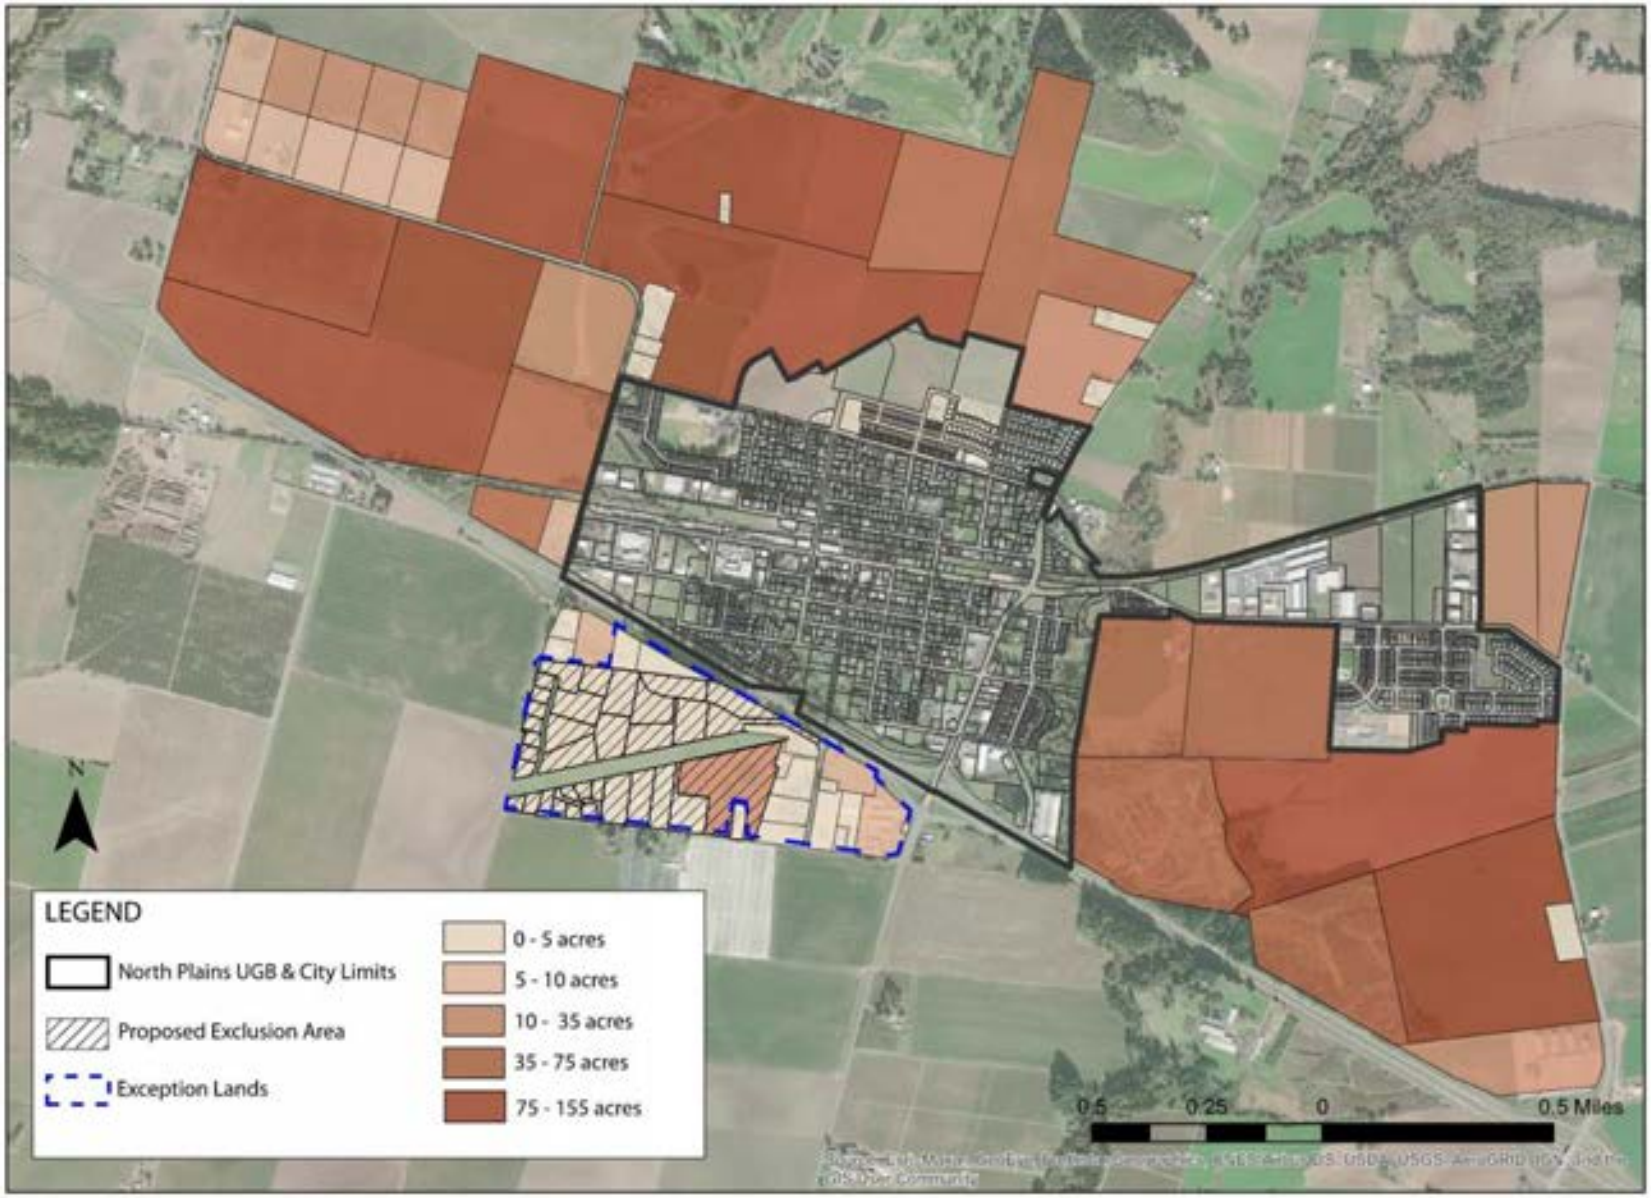
Figure 9. Proximity of Study Area Parcels to the Existing Urban Growth Boundary



Parcel Size

The next criterion is parcel size or parcelization. Larger parcels facilitate new development more efficiently than smaller parcels which often times need to be consolidated. The development of larger tracts of land tends to have a higher return on investment than the development/ redevelopment of smaller tracts of land. However, a diversity of sizes is also advantageous to meeting residential and neighborhood-scale commercial needs. Figure 10 shows the range of parcel sizes and can be viewed together with the North Plains' Economic Opportunity Analysis, which details the parcel sizes needed for various employment uses, or the Housing Needs Analysis to determine residential suitability. Table 7 from Chapter 2 shows specific site characteristics needed to accommodate target services and industries, as identified in the 2022 EOA.

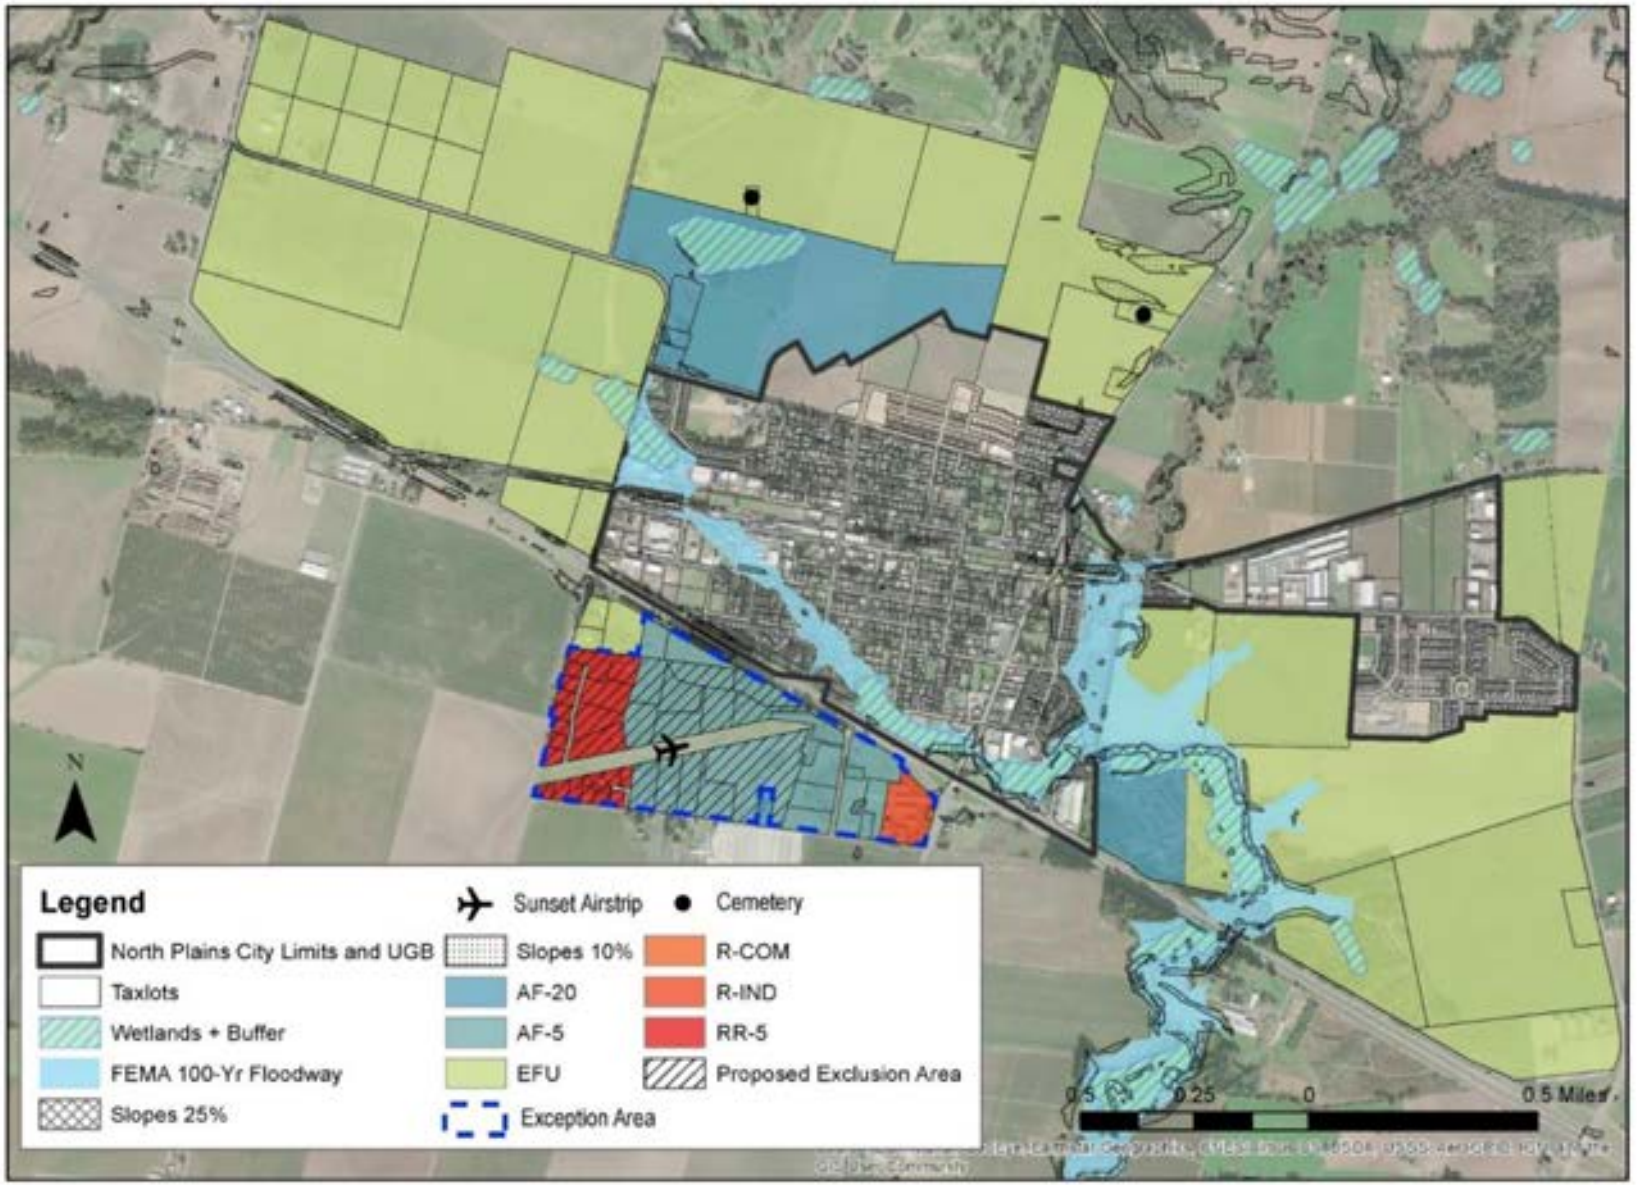
Figure 10. Study Area Parcel Sizes



Buildable Land

Buildable land is the land that remains for development after existing structures and environmental constraints are removed. Though a vast majority of the study area is currently used for agriculture and is free from existing structures, there are some subareas and specific parcels with residential or commercial buildings and uses that reduce the amount of buildable land available or may hinder or prevent future development. Figure 11 shows environmental constraints in the study area.

Figure 11. Study Area Environmental Constraints



Tables 14-18 provide an analysis of the Subareas relative to Goal 14, Factor 1, the efficient accommodation of identified land needs. Subareas are scored on a scale of 0 to 2 based on the three criteria: proximity, parcel size, and buildable land.

<tr><td colspan="4">Summary</td></tr>
<tr><td colspan="4">South Subarea B is separated from the city by Highway 26 and includes smaller parcel sizes, but does have frontage on Glencoe Road making it a candidate for UGB expansion for commercial development/redevelopment.</td></tr>
</table>

Table 17: Factor 1 West Subarea Summary and Evaluation

WEST SUBAREA	Evaluation Criteria		Evaluation Results	
Description and Illustration	Evaluation Criteria	Ideal Definition	Score	Comments
The West Subarea is bounded by Dersham Road (west), US 26 (south), and NW Gordon Road (east). The northern boundary of West Subarea is not confined by a physical limitation. 	Proximity	Area is directly adjacent to the current UGB without major barriers and all land is within ¼ mile of the UGB.	+1	The West Subarea is adjacent to the UGB. More than 25% of the subarea is within ¼ mile of the UGB and 50% within ½ mile. Land uses to the east are primarily industrial.
	Parcel Size	Larger tracts of land are more conducive to development and meeting the city's specific commercial and industrial land needs.	+2	The West Subarea consists of 15 parcels totaling 493 acres. All parcels are more than five acres and three are more than 50 acres. Larger parcels in the North Subarea make it more conducive to development. Parcel Size / Parcels 50 or more: 3 25 – 50: 2 10 – 25: 4 5 – 10: 6 5 or less: 0
	Buildable Land	Land free from environmental constraints and existing structures is better suited to facilitate future development.	+2	The West Subarea is mostly farmland with a few wetlands near the eastern edge and few rural residences.
	Summary			
	Given its location relative to the existing UGB and large, mostly unconstrained parcels, the West Subarea is well-suited for UGB expansion.

<table><tr><th>Parcel Size</th><th>Parcels</th></tr><tr><td>50 or more</td><td>4</td></tr><tr><td>25 – 50</td><td>4</td></tr><tr><td>10 – 25</td><td>1</td></tr><tr><td>5 – 10</td><td>1</td></tr><tr><td>Less than 5</td><td>0</td></tr></table></td></tr>
<tr><td>Buildable Land</td><td>Land free from environmental constraints and existing structures is better suited to facilitate future development.</td><td>+2</td><td>The East Subarea is mostly farmland with significant environmental constraints in the western portion along with the Recology Organics processing site. The remainder of the site is mostly free of constraints other than several rural residences and farm-related structures.</td></tr>
<tr><td colspan="4"></td></tr>
<tr><td>Summary</td><td colspan="3"></td></tr>
<tr><td colspan="4">The East Subarea is a good candidate for UGB expansion given its location relative to the existing UGB and large, parcels even though the amount of buildable land is lower due to environmental constraints.</td></tr>
</table>

2a. ORDERLY AND ECONOMIC PROVISION OF PUBLIC FACILITIES AND SERVICES: TRANSPORTATION

OAR Chapter 660 Division 12, Transportation Planning was reviewed to identify relevant goals and objectives, applicable for the development of the transportation evaluation criteria for the North Plains Urban Growth Boundary Expansion. The relevant objectives included as part of Chapter 660 are identified below:[2]

(a) Promote the development of transportation systems adequate to serve statewide, regional and local transportation needs and the mobility needs of the transportation disadvantaged;

(b) Encourage and support the availability of a variety of transportation choices for moving people that balance vehicular use with other transportation modes, including walking, bicycling and transit in order to avoid principal reliance upon any one mode of transportation;

(c) Provide for safe and convenient vehicular, transit, pedestrian, and bicycle access and circulation;

(d) Facilitate the safe, efficient and economic flow of freight and other goods and services within regions and throughout the state through a variety of modes including road, air, rail and marine transportation;

(e) Protect existing and planned transportation facilities, corridors and sites for their identified functions;

(f) Provide for the construction and implementation of transportation facilities, improvements and services necessary to support acknowledged comprehensive plans;

~~(g) Identify how transportation facilities are provided on rural lands consistent with the goals;~~

~~(h) Ensure coordination among affected local governments and transportation service providers and consistency between state, regional and local transportation plans; and~~

(i) Ensure that changes to comprehensive plans are supported by adequate planned transportation facilities.

[2] Objectives shown in strikethrough are not relevant to this project.

Subarea Evaluation and Transportation Criteria

The transportation evaluation criteria were developed to qualitatively assess the five (5) subareas considered for potential urban growth boundary (UGB) expansion. The criteria development was largely influence by the relevant objective identified in Chapter 660 Division 12, Transportation Planning, and the Goals and Objectives identified in the North Plains Transportation System Plan (TSP – Reference 1). The transportation evaluation criteria are defined below:

- Local Mobility
- Regional Mobility
- Safe Access
- Environmental
- Feasibility
- Balanced System

Evaluation Methodology

Subareas were evaluated based on the set of six (6) criteria with a scoring scale of 0 - +2, as shown in Tables 19-23. The "Ideal Definition" summarizes the description in achieving the highest value (+2). Subareas that do not meet the ideal definition are scored zero (0), while subareas that partially meet the ideal definition are score one (+1).

Explanatory narrative describing the justification and reasoning of the evaluation scoring for each subarea is provided under the "Comment" column. The evaluation criteria were applied to the subareas based on a subarea to subarea comparative approach.

Table 19: Factor 2 Transportation North Subarea Summary and Evaluation

NORTH SUBAREA	Transportation Evaluation Criteria		Evaluation Results	
Concept Description and Illustration	**Evaluation Criteria**	**Ideal Definition**	**Score** *(0 - +2)*	**Comments**
The North Subarea is bounded by Pumpkin Ridge Golf Club (north), Pumpkin Ridge Road and Mountaindale Road (west), North Avenue and recently incorporated, undeveloped land (south), and Shadybrook Road (east). 	**Local Mobility**	Has close proximity to established roadway and active transportation infrastructure, allowing for numerous multi-modal connections that are intuitive and feasible.	**+2**	Local street extensions from the adjacent North Avenue development are feasible. There are opportunities to integrate collector street connections to NW North Avenue and NW Shadybrook Road.
	Regional Mobility	Has direct, convenient, and efficient access to regional travel infrastructure.	**0**	Regional connections are available via NW Mountaindale Road, NW Old Pumpkin Ridge Road, and NW Shadybrook Road. However, these connections to interchange areas are less direct and require travel through alternative subareas or existing UGB.
	Safe Access	Has safe and convenient access to schools, parks, shopping, and employment centers.	**+2**	Area is in close proximity to North Plains Elementary School, access across NW North Avenue to essential destinations (parks, library, downtown amenities).
	Environmental	Has no environmentally sensitive areas such as wetlands, streams, and exclusion areas.	**+1**	Area has minor environmental constraints associated with Lind Reservoir. Future development must consider the Lind Reservoir and establish appropriate buffers.
	Feasibility	Can support future development without fundamental changes to existing and planned infrastructure identified in adopted planning documents.	**+1**	Urban standard roadway upgrades would be needed along portions of NW Old Pumpkin Ridge Road and NW Mountaindale Road. NW North Avenue and NW Shadybrook Road will require more moderate upgrades.
	Balanced System	Can support a balanced transportation network and avoids reliance upon any one travel mode.	**+1**	Future development can be integrated into the adjacent multimodal system due to its proximity with the new North Avenue development.
	Summary			
	The North Subarea has the potential to naturally tie into the existing North Plains transportation infrastructure. However much of this infrastructure will require urban upgrades to support future development. Although large in area, significant portions of the North Subarea are in close proximity to the established portions of North Plains. As such, it has strong, safe, and convenient multimodal access to essential destinations. In comparison to other subareas, regional mobility is limited due to the lack of direct, convenient, and efficient access to regional travel infrastructure.			

Table 20: Factor 2 Transportation South Subarea A Summary and Evaluation

SOUTH SUBAREA A	Transportation Evaluation Criteria		Evaluation Results	
Concept Description and Illustration	**Evaluation Criteria**	**Ideal Definition**	**Score** *(0 - +2)*	**Comments**
South Subarea A is bounded by US 26 (north/northeast), NW Gordon Road (west), and NW 316th Place (east). South Subarea A is largely built out with large lot residential parcels. The subarea is divided by the Sunset Air Strip, a private airport managed and owned by the residential neighborhood located within South Subarea A. 	**Local Mobility**	Has close proximity to established roadway and active transportation infrastructure, allowing for numerous multi-modal connections that are intuitive and feasible.	**0**	Area is located south of US 26 which has minimal local street connectivity to the established North Plains grid network. A connection is available via NW Gordon Road, but the bridge across US 26 does not accommodate bicycle and pedestrian movements.
	Regional Mobility	Provides direct, convenient, and efficient access to regional travel infrastructure.	**+1**	Despite being located adjacent to US 26, regional mobility is not direct and is dependent upon unimproved Washington County roadways to either the US 26/Glencoe Road and US 26/NW Dersham Road interchanges.
	Safe Access	Has safe and convenient access to schools, parks, shopping, and employment centers	**0**	Area is isolated with residential parcels built out with large lots. Access to and from the area are vehicle centric with no walking, biking, or rolling facilities to/from the subarea.
	Environmental	Avoids environmental impacts, including those to wetlands, streams, and exclusion areas.	**+2**	No known environmental or sensitive areas have been identified.
	Feasibility	Avoids necessary changes to existing and planned infrastructure identified in adopted planning documents.	**0**	The US 26/NW Glencoe Road Interchange Area Management Plan assumed limits future development within the area bounded by US 26, NW Gordon Road, and NW Beach Road. Future urbanization assumptions would require an updated IAMP to reevaluate and assess interchange infrastructure and access management upgrades. Urban standard upgrades would be needed along NW Beach Road and NW Gordon Road. The development of local infrastructure to serve long-term redevelopment will be a challenge.
	Balanced System	Provides equal opportunity of transportation choices and avoids reliance upon any one mode	**0**	Development will attract vehicular centric activity in an area with no active transportation connectivity. NW Gordon Rd and NW Beach Rd will need to be upgraded to provide balanced modal options accessing the sub area.
	Summary			
	South Subarea A has good regional mobility characteristics, but they are not as strong as South Subarea B. The existing land uses, and residential parcels occupy the majority of South Subarea A with limited inter subarea connectivity available due to the air strip. US 26 serves as a barrier to South Subarea A and limits future connectivity to the urbanized segments of North Plains.			

Table 21: Factor 2 Transportation South Subarea B Summary and Evaluation

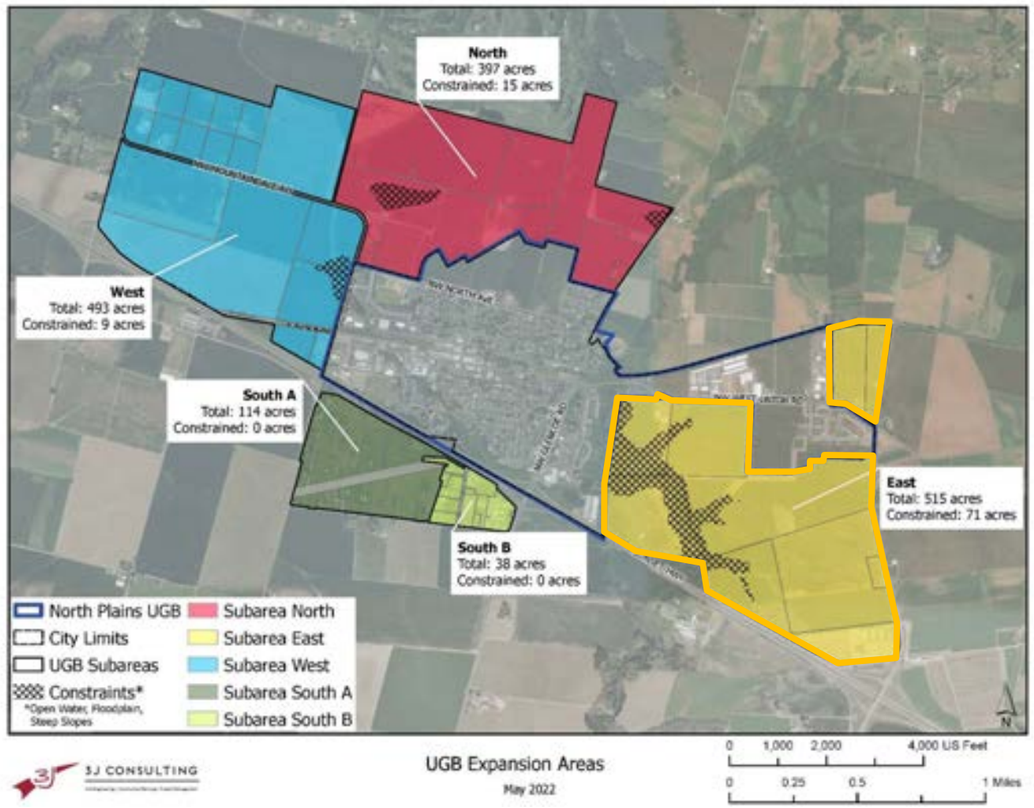
SOUTH SUBAREA B	Transportation Evaluation Criteria		Evaluation Results	
Concept Description and Illustration	**Evaluation Criteria**	**Ideal Definition**	**Score** *(0 - +2)*	**Comments**
South Subarea B is bounded by US 26 (north), NW 316th Place (west), NW Beach Road (south), and NW Glencoe Road (east). 	**Local Mobility**	Has close proximity to established roadway and active transportation infrastructure, allowing for numerous multi-modal connections that are intuitive and feasible	**0**	Area is located south of US 26 which has no local street connectivity to the established North Plains grid network. A connection is available via NW Glencoe Road, but traversing this corridor is not ideal for all ages and abilities.
	Regional Mobility	Provides direct, convenient, and efficient access to regional travel infrastructure.	**+2**	Regional mobility is direct and convenient via NW Glencoe Road and the adjacent US 26/NW Glencoe Road interchange.
	Safe Access	Has safe and convenient access to schools, parks, shopping, and employment centers	**0**	Adjacent land uses and infrastructure are vehicle centric with limited access for people walking, biking, rolling. Access to essential destinations will require traversing the US 26/NW Glencoe Road interchange.
	Environmental	Avoids environmental impacts, including those to wetlands, streams, and exclusion areas.	**+2**	No known environmental or sensitive areas have been identified.
	Feasibility	Avoids necessary changes to existing and planned infrastructure identified in adopted planning documents.	**0**	The US 26/NW Glencoe Road Interchange Area Management Plan assumed limited future development/urbanization along the NW Beach Road corridor. Future urbanization assumptions would require an updated IAMP to reevaluate and assess interchange infrastructure and access management upgrades. Urban standard upgrades would be needed along NW Beach Road and NW Glencoe Road.
	Balanced System	Provides equal opportunity of transportation choices and avoids reliance upon any one mode	**0**	Development will attract vehicular centric activity in an area with limited active transportation connectivity.
	Summary			
	South Subarea B has strong regional mobility potential due to its proximity to the NW Glencoe Road interchange. However, US 26 serves as a barrier to South Subarea B and limits future connectivity to the urbanized segments of North Plains.			

Table 22: Factor 2 Transportation West Subarea Summary and Evaluation

WEST SUBAREA	Transportation Evaluation Criteria		Evaluation Results	
Concept Description and Illustration	**Evaluation Criteria**	**Ideal Definition**	**Score** *(0 - +2)*	**Comments**
The West Subarea is bounded by Dersham Road (west), US 26 (south), and NW Gordon Road (east). The northern boundary of West Subarea is not confined by a physical limitation. 	**Local Mobility**	Has close proximity to established roadway and active transportation infrastructure, allowing for numerous multi-modal connections that are intuitive and feasible	**+1**	Local street extensions across NW Gordon Road are limited based on existing development patterns and environmentally sensitive areas. There are opportunities to integrate collector street extensions via NW North Avenue, NW Commercial Street, and NW Cottage Street.
	Regional Mobility	Provides direct, convenient, and efficient access to regional travel infrastructure	**+2**	Regional connections are more directly available to the US 26/NW Dersham Road interchange via NW Mountaindale Road and NW Dersham Road. Significant levels of potential development may require modernization and upgrades of the US 26/Dersham Road interchange.
	Safe Access	Has safe and convenient access to schools, parks, shopping, and employment centers	**0**	Access to NW North Avenue and NW Commercial Street provide connections to essential destinations (North Plains Elementary School, parks, library, downtown amenities). Area connectivity will rely on upgrades to rural unimproved County roadways.
	Environmental	Avoids environmental impacts, including those to wetlands, streams, and exclusion areas.	**+1**	A small portion of the eastern area has some known environmental constraints.
	Feasibility	Avoids necessary changes to existing and planned infrastructure identified in adopted planning documents.	**0**	Railroad infrastructure splits the lower portion of the Area limiting the ability to integrate potential extensions of the NW Commercial Street and NW Cottage Street corridors. Development will require urban standard roadway upgrades to NW Mountaindale Road, NW Gordon Road, NW Dersham Road, and Pumpkin Ridge Road.
	Balanced System	Provides equal opportunity of transportation choices and avoids reliance upon any one mode	**+1**	Future development can integrate into the adjacent multimodal system, but it will require the extension and integration of new connections across the NW Gordon Road and NW Mountaindale Road. Transportation choices for the northern area will be most convenient and accessible through vehicular travel.
	Summary			
	The West Subarea has strong regional mobility potential to its proximity to the NW Dersham Road interchange. Integration with existing North Plains multimodal infrastructure to the east is challenged in many locations due to development patterns that limit local street connectivity, environmental constrains, and a railroad splitting the lower portion of the area. To establish connectivity, the eastern portion of the area would need to develop first and integrate into existing street networks. Development will rely on extension of NW North Avenue and urban upgrades of NW Mountaindale Road.			

Table 23: Factor 2 Transportation East Subarea Summary and Evaluation

EAST SUBAREA	Transportation Evaluation Criteria		Evaluation Results	
Concept Description and Illustration	**Evaluation Criteria**	**Ideal Definition**	**Score** *(0 - +2)*	**Comments**
The East Subarea is broken up into two portions. The larger portion is bounded by NW West Union Road (north), new residential development and Atfalati Ridge Elementary School (north), US 26 (south) and NW Jackson School Road (east). The smaller portion of the East Subarea is bounded by the railroad (north), industrial land uses adjacent to NW 298th Place (west), NW Jackson School Road (east) and NW West Union Road (south).	**Local Mobility**	Has close proximity to established roadway and active transportation infrastructure, allowing for numerous multi-modal connections that are intuitive and feasible	**+1**	While close in proximity to the established local street network, local street extensions to the west are challenging due to McKay Creek. Local mobility will need to rely on access via NW West Union Road or a future connection over McKay Creek.
	Regional Mobility	Provides direct, convenient, and efficient access to regional travel infrastructure.	**+2**	Regional connections are available via NW West Union Road and NW Jackson School Road. The southeast portion has direct access to the NW Jackson School Road interchange which provides convenient regional mobility to the US 26 corridor.
	Safe Access	Has safe and convenient access to schools, parks, shopping, and employment centers	**+1**	Atfalati Ridge School and Sunset Ridge Park are located within the Subarea. Access to destinations in downtown are limited to NW West Union Road by McKay Creek. A shared use path along NW West Union Road provides safe access; however, the distance and reliance of a single connection are less favorable.
	Environmental	Avoids environmental impacts, including those to wetlands, streams, and exclusion areas.	**0**	Large portions of the East Area, primarily the western half are traversed by McKay Creek.
	Feasibility	Avoids necessary changes to existing and planned infrastructure identified in adopted planning documents.	**+1**	Future development in the eastern portion can occur without major investment upgrades to existing system as recent development in the Sunset Ridge subdivision was built to accommodate future roadway connections. The western portions of the East Area will require connections that navigate McKay Creek.
	Balanced System	Provides equal opportunity of transportation choices and avoids reliance upon any one mode	**+1**	Area provides an opportunity to balance transportation choices (if Mckay Creek can be spanned) while also serving regional connections.
	Summary			
	In the East subarea, local mobility, safe access, and balanced multimodal connectivity to the established North Plains infrastructure to the west are limited by the need to span the McKay Creek corridor or rely on NW West Union Road. The western portion of the Subarea contains a large swath of environmentally sensitive land. The eastern portion of the Subarea has strong regional access and connectivity NW Jackson School Road interchange. The Subarea has strong opportunity for a mix of uses and development types.			



2b. ORDERLY AND ECONOMIC PROVISION OF PUBLIC FACILITIES AND SERVICES: PUBLIC UTILITIES

The following presents utility-related assessments for the City of North Plains to evaluate the serviceability for water, sanitary sewer, and storm drainage in UGB expansion subareas.

Subarea Evaluation and Utility Criteria

Utility improvements required to serve the proposed UGB expansion subareas were evaluated by reviewing relevant plans and policies, City Master Plans, existing infrastructure mapping, location of subareas, and other relevant information obtained from City staff.

Utility service needs of the UGB expansion areas are evaluated based on the following utility criteria:

Sanitary Sewer Service

- Does the subarea have existing sanitary infrastructure to support development?
- Does the subarea have planned sanitary infrastructure upgrades to support development?
- Is a mainline extension required to serve the subarea?
- Are there any identified deficiencies within or adjacent to the subarea?
- Relative to other options, what is the cost to provide service?

Storm Drainage Service

- Does the subarea have existing storm infrastructure to support development?
- Does the subarea have planned storm infrastructure upgrades to support development?
- Is a mainline extension required to serve the subarea?
- Are there any identified deficiencies within or adjacent to the subarea?
- Relative to other options, what is the cost to provide service?

Water Service

- Does the subarea have existing water infrastructure to support development?
- Does the subarea have planned water infrastructure upgrades to support development?
- Is a mainline extension required to serve the subarea?
- Are there any identified deficiencies within or adjacent to the subarea?
- Relative to other options, what is the cost to provide service?

Evaluation Methodology

A scoring matrix was created to evaluate each subarea's utility service needs. The subareas are evaluated on Sanitary Sewer, Storm Drainage and Water with a scoring scale of 0 – +2.

The "Ideal Definition" summarizes the description in achieving the highest value (+2). Subareas that do not meet the ideal definition are scored zero (0), while subareas that partially meet the ideal definition are scored one (+1).

Tables 24-28 list evaluation criteria, results, and an overall utility service summary.

Summary of Findings

The East Subarea is the best prepared for expansion. The subarea has the best existing and planned utility infrastructure to support development with a low cost to provide utility service to the subareas. The North Subarea is the next best for development with existing water and storm infrastructure support, however, sanitary upsizing would be required.

South A Subarea, South B Subarea and West Subarea are the least prepared for expansion based on the utility evaluations. These subareas require the most infrastructure development and cost to provide utility service.

Table 24: Factor 2 Public Utilities North Subarea Utility Summary and Evaluation

NORTH SUBAREA	Utility Evaluation Criteria		Evaluation Results	
Concept Description and Illustration	**Evaluation Criteria**	**Ideal Definition**	**Score (0 - 2)**	**Comments**
The North Subarea is bounded by Pumpkin Ridge Golf Club (north), Pumpkin Ridge Road and Mountaindale Road (west), North Avenue and recently incorporated, undeveloped land (south), and Shadybrook Road (east). 	**Sanitary Service**	Has existing sanitary infrastructure or planned sanitary infrastructure to support development.	0	Existing sanitary facilities located just South of Subarea are not sized for expansion. Sanitary connections will be present, but downstream upgrades are required to serve the subarea.
	Storm Service	Has existing storm infrastructure or planned storm infrastructure to support development.	2	Existing storm facilities located just South of Subarea are adequately prepared for expansion. Storm connections will be present with the planned development to the south.
	Water Service	Has existing water infrastructure or planned water infrastructure to support development.	2	Proposed water facilities spread through entire region just South of Subarea. Water connections will be present with the planned development to the south.
	Summary			
	North Subarea has the potential to naturally tie into existing or planned storm and water infrastructure without the need for mainline extensions. The area just south of North Subarea is currently under development and will be completed within the next few years. Sanitary infrastructure exists in several regions just South of the Subarea, which will provide multiple tie in points but the system will likely need to be upsized to support the subarea development. The storm infrastructure has multiple tie in locations; but ditches also remain. The water system should provide many tie in points as there are many proposed locations adjacent North Subarea. The cost to support the North Subarea is moderate since the downstream sanitary system will need upsizing.			

Table 25: Factor 2 Public Utilities South Subarea A Utility Summary and Evaluation

SOUTH SUBAREA A	Utility Evaluation Criteria		Evaluation Results	
Concept Description and Illustration	**Evaluation Criteria**	**Ideal Definition**	**Score (0 - 2)**	**Comments**
South Subarea A is bounded by US 26 (north/northeast), NW Gordon Road (west), and NW 316th Place (east). South Subarea A is largely built out with large lot residential parcels. The subarea is divided by the Sunset Air Strip, a private airport managed and owned by the residential neighborhood located within South Subarea A. 	**Sanitary Service**	Has existing sanitary infrastructure or planned sanitary infrastructure to support development.	0	No existing or proposed sanitary infrastructure on South side of US 26 near or adjacent to the subarea.
	Storm Service	Has existing storm infrastructure or planned sanitary infrastructure to support development.	0	No existing or proposed sanitary infrastructure on South side of US 26 near or adjacent to the subarea.
	Water Service	Has existing water infrastructure or planned sanitary infrastructure to support development.	0	Nearest water infrastructure is on other side of US 26; JWC Supply Pipeline runs through South B Subarea, but will require PRV for service in the area.
	Summary			
	South A Subarea does not have readily available sanitary, storm, or water infrastructure to tie into. Existing and proposed sanitary and storm infrastructure exist on the other side of US 26 (east side) and nearby water infrastructure located in South Subarea B relies on an addition of a PRV to the JWC Supply Pipeline. Mainline extensions for sanitary, storm and water would be required to service the subarea. The cost to support the South A Subarea would be significant comparatively to other subareas due to the need to build supportive utility infrastructure to service the area.			

Table 26: Factor 2 Public Utilities South Subarea B Utility Summary and Evaluation

SOUTH SUBAREA B	Utility Evaluation Criteria		Evaluation Results	
Concept Description and Illustration	**Evaluation Criteria**	**Ideal Definition**	**Score (0 - 2)**	**Comments**
South B Subarea is bounded by US 26 (north), NW 316th Place (west), NW Beach Road (south), and NW Glencoe Road (east). 	**Sanitary Service**	Has existing sanitary infrastructure or planned sanitary infrastructure to support development.	0	No existing or proposed sanitary infrastructure on South side of US 26 between Gordon Rd and Glencoe Rd.
	Storm Service	Has existing storm infrastructure or planned sanitary infrastructure to support development.	0	No existing or proposed sanitary infrastructure on South side of US 26 between Gordon Rd and Glencoe Rd.
	Water Service	Has existing water infrastructure or planned sanitary infrastructure to support development.	1	Nearest water infrastructure is on other side of US 26. JWC Supply Pipeline runs through the subarea, but will require PRV for service in the area.
	Summary			
	South B Subarea does not have readily available sanitary or storm infrastructure to tie into; available water infrastructure relies on an addition of a PRV to the JWC Supply Pipeline. Existing and proposed sanitary and storm infrastructure exist on the other side of US 26 (east side). Mainline extensions for sanitary and storm would be required to service the subarea. The cost to support the South B Subarea would be significant comparatively to other subareas due to the need to build supportive utility infrastructure to service the area.			

Table 27: Factor 2 Public Utilities West Subarea Utility Summary and Evaluation

WEST SUBAREA	Utility Evaluation Criteria		Evaluation Results	
Concept Description and Illustration	**Evaluation Criteria**	**Ideal Definition**	**Score (0 - 2)**	**Comments**
The West Subarea is bounded by Dersham Road (west), US 26 (south), and NW Gordon Road (east). The northern boundary of West Subarea is not confined by a physical limitation. 	**Sanitary Service**	Has existing sanitary infrastructure or planned sanitary infrastructure to support development.	0	Existing sanitary infrastructure exists at the southeastern edge of West Subarea and existing infrastructure near the northeastern edge isn't far. A pump station and mainline extension will likely be required to support the entire subarea.
	Storm Service	Has existing storm infrastructure or planned sanitary infrastructure to support development.	1	Existing storm infrastructure exists along the eastern edge of the subarea. Ditches and creeks exist along the eastern portion of the UGB. Mainline extension or downstream deficiency upgrades would be required to support the entire subarea.
	Water Service	Has existing water infrastructure or planned sanitary infrastructure to support development.	1	Existing and proposed water infrastructure adjacent UGB and West Subarea. Upgrades to identified deficiencies would need to occur.
	Summary			
	West Subarea has the potential to naturally tie into storm infrastructure for some portions of the subarea. A sanitary pump station will likely be required to support the subarea. Existing water infrastructure adjacent to the West Subarea has identified deficiencies which would need to be upgraded to support servicing subarea. The potential need for sanitary or storm mainline extension would likely be required to support the entire subarea. The cost to support the West Subarea would be significant comparatively to other subareas.			

Table 28: Factor 2 Public Utilities East Subarea Utility Summary and Evaluation

EAST SUBAREA	Utility Evaluation Criteria		Evaluation Results	
Concept Description and Illustration	**Evaluation Criteria**	**Ideal Definition**	**Score (0 - 2)**	**Comments**
The East Subarea is broken up into two portions. The larger portion is bounded by NW West Union Road (north), new residential development and Atfalati Ridge Elementary School (north), US 26 (south) and NW Jackson School Road (east). The smaller portion of the East Subarea is bounded by the railroad (north), industrial land uses adjacent to NW 298th Place (west), NW Jackson School Road (east), and NW West Union Road (south). 	**Sanitary Service**	Has existing sanitary infrastructure or planned sanitary infrastructure to support development.	2	Existing sanitary facilities exist at the north, south and middle of the subarea. The subarea is adequately prepared for expansion.
	Storm Service	Has existing storm infrastructure or planned sanitary infrastructure to support development.	2	Existing storm facilities are adjacent to subarea and McKay Creek runs through the western portion of the subarea. The subarea is adequately prepared for expansion.
	Water Service	Has existing water infrastructure or planned sanitary infrastructure to support development.	2	Existing water facilities are adjacent to subarea to the north and planned water is adjacent to the subarea to the east. The subarea is adequately prepared for expansion. A fire flow deficiency has been identified at the most northeastern portion of the subarea where upgrades are required.
	Summary			
	East Subarea has the potential to naturally tie into the existing sanitary, storm, and water infrastructure. Sanitary infrastructure passes through the subarea and provides multiple tie in possibilities. Storm infrastructure is adjacent to the subarea along with McKay Creek running through the western portion of the subarea. Existing and planned water infrastructure is adjacent to the subarea in multiple locations, however, there is an identified fire flow deficiency at the northeastern most portion of the subarea which will need to be fixed prior to developemnt of that portion. With multiple tie in points for each of the previously listed utilities, the area is well equipped for expansion. The cost to support the East Subarea is low since most infrastructure exists or is already planned.			

3. OCOMPARATIVE ENVIRONMENTAL, ENERGY, ECONOMIC AND SOCIAL CONSEQUENCES

The Goal 14 Boundary Location Factor Analysis requires research of the Economic, Social, Environmental, and Energy (ESEE) consequences of developing within each proposed subarea. The ESEE consequences were used to determine potential positive or negative consequences of development. Like the other boundary location analyses, the ESEE analysis does not provide a definitive conclusion as to where the North Plains UGB shouldbe expanded but contains information to help inform decision makers.

The ESEE consequences were identified using several points of data. Information was gleaned from Metro's Regional Land Information System, Google Earth, Washington County, and USDA Cropscape datasets. Each ESEE category was measured against a set metrics, and given a score from 0 to +2, with 0 being the lowest/most likely for negative consequences, and 2 being the highest/most likely for positive consequences. Each ESEE category was given a score based on potential **Residential** or **Employment** (industrial and commercial) uses, as shown in Tables 29-33.

Economic

The economic consequences of developing each subarea include:

- Cost of land/transportation facilities/utilities/services
- Parcel size (employment- specific uses)
- Development potential (i.e., existing uses)
- Balancing residential and employment priorities for a diversified tax base

Social

The social consequences of developing each subarea include:

- Ease of access to services such as schools, parks, library, commercial services
- Community health indicators such as increased physical activity via active transportation and recreational offerings
- Compatible nearby uses
- Cost of construction (i.e., cost of land and utility provision per unit or lot)
- Balancing residential and employment priorities to reverse the bedroom community trend

Environmental

The environmental consequences of developing each subarea include:

- Hazard Risk (slope, floodplain)
- Goal 5 resources present

Energy

The energy consequences of developing each subarea include:

- Ability to reduce VMT of development
- Alternate modes of transportation feasible
- Heating/cooling of structures (i.e., existing large trees)

- Table 29: Factor 3 North Subarea Summary and Evaluation

NORTH SUBAREA	Evaluation Criteria		Evaluation Results	
Description and Illustration	**Evaluation Criteria**	**Ideal Definition**	**Score**	**Comments**
The North Subarea is bounded by Pumpkin Ridge Golf Club (north), Pumpkin Ridge Road and Mountaindale Road (west), North Avenue and recently incorporated, undeveloped land (south), and Shadybrook Road (east).  	**Economic**	• Low cost of land/transportation facilities/utilities/services • Variety of parcel sizes • High development potential	**R=2** **E=1**	Land uses south of the North Subarea are predominantly residential (R-2.5 and R-7.5). The new Brynhill Development adds about 500 residential units and the new North Plains Elementary School. The North Subarea consists of large parcels, which may have positive outcomes for development return on investment, and sanitary sewer and water service can efficiently tie into existing and planned infrastructure. Plans to extend Main Street north are conducive to development.
	Social	• Easy access to services • Active transportation and recreational offerings • Compatible nearby uses • Lower cost of construction	**R=2** **E=1**	No steep slopes or other hazards exist in the subarea. The North Subarea abuts residential uses and the North Plains Elementary School to the south. The subarea is in close proximity to commercial activities in downtown North Plains. Due to these considerations, the North Subarea has the potential for continuous and safe multimodal transportation networks, which is a safety benefit to residents, students, and visitors. The subarea does contain two cemetery sites on small lots, and the Lind Reservoir area is likely to development as park land in the future.
	Environmental	• No presence of Goal 5 resources • Low hazard risks	**R=2** **E=2**	Future development in the North Subarea will need to account for the Lind Reservoir, which is classified as a wetland, and a few smaller environmental constraints. The area does not contain steep slopes, streams, or otherareas of environmental constraints.
	Energy	• Opportunities to reduce VMT of development • Opportunities for alternate modes of transportation • Presence of heating/cooling structures	**R=1** **E=1**	As opportunities exist to connect North Subarea to the urbanized areas of North Plains via NW North Ave and Main St, the subarea has strong potential to provide multimodal transportation options to residents and visitors, resulting in decreased VMT. The area does not currently have a vast or established tree canopy as agricultural uses cover muchof the area.
	Summary			
	The North Subarea, consists of large, unconstrained parcels, is adjacent to residential uses and can tie in efficiently to city utilities and existing and planned vehicle and active transportation networks. The Lind Reservoir could develop as park land, creating recreational opportunities for residents, and the ease of access to commercial services in the subarea, as well as nearby areas, reduces VMT.			

Table 30: Factor 3 South A Subarea Summary and Evaluation

SOUTH SUBAREA A	Evaluation Criteria		Evaluation Results	
Description and Illustration	**Evaluation Criteria**	**Metrics**	**Score**	**Comments**
South Subarea A is bounded by US 26 (north/northeast), NW Gordon Road (west), and NW 316th Place (east). South Subarea A is largely built out with large lot residential parcels. The subarea is divided by the Sunset Air Strip, a private airport managed and owned by the residential neighborhood located within South Subarea A. 	**Economic**	• Low cost of land/transportation facilities/utilities/services • Variety of parcel sizes • High development potential	**R=0** **E=0**	Parcels south of South Subarea A are primarily residential and agricultural. Zoning includes 22 parcels of RR-5, 15 parcels of AF-5, one parcel of AF-20, and three parcels of EFU. Most of the area is within the Air Acres development and the Sunset Airstrip overlay districts. Compared to other subareas, many of the lots in South Subarea A are small and considered exception land. Highway 26 provides regional mobility, but is a barrier to reaching North Plains' civic and commercial amenities by walking or biking. Internal circulation would be a challenge due to the air strip. Utilities development would be costly as mainline extensions would be required for water and sanitary sewer.
	Social	• Easy access to services • Active transportation and recreational offerings • Compatible nearby uses • Lower cost of construction	**R=0** **E=1**	Highway 26 separates South Subarea A from the current North Plains UGB.This physical and mental barrier may have negative social consequences forresidents and visitors traveling to and from South Subarea A. Air Acres residences to the south of South Subarea A hold restrictive covenants and development specifications in accordance with the airport overlay district, which could create a disjointed residential area. Utilities development would be costly as mainline extensions would be required for water and sanitary sewer.
	Environmental	• No presence of Goal 5 resources • Low hazard risks	**R=2** **E=2**	South Subarea A does not contain wetlands, steep slopes, or floodplains.
	Energy	• Opportunities to reduce VMT of development • Opportunities for alternate modes of transportation • Presence of heating/cooling structures	**R=0** **E=0**	While South Subarea A is connected regionally via Highway 26, the area isseparated from urbanized North Plains via the highway. Ultimately, this may cause auto-centric development, which has negative implication for VMT and alternative modes of transportation. Current agricultural uses do not support an established and extensive tree canopy.
	Summary			
	South Subarea A is not well-suited for future development. Highway 26 creates a physical and mental barrier to the urbanized areas of North Plains. The adjacent Air Acres development and the airport overlay district hold restrictive covenants or development specifications, which could create a disjointed residential area, and vehicle-centric development in the area would increase VMT.			

Table 31: Factor 3 South Subarea B Summary and Evaluation

SOUTH SUBAREA B	Evaluation Criteria		Evaluation Results	
Description and Illustration	**Evaluation Criteria**	**Metrics**	**Score**	**Comments**
South Subarea B is bounded by US 26 (north), NW 316th Place (west), NW Beach Road (south), and NW Glencoe Road (east). 	**Economic**	• Low cost of land/transportation facilities/utilities/services • Variety of parcel sizes • High development potential	**R=0** **E=2**	Current uses in South Subarea B are agricultural and rural industrial (R-IND) and rural commercial (R-COM), including a retail and wholesale seed company, Jewett Cameron Seed Company, on the R-IND and R-COM parcels. The subarea is predominantly exception land. Highway 26 and Glencoe Rd provide regional and local access, and adjacent uses to the north include C-2 (Highway Commercial) and North Plains Veteran Park. Highway 26 provides visibility to commercial uses in the subarea. Utilitiesfor water, sanitary sewer, and stormwater would have to be developed in the subarea.
	Social	• Easy access to services • Active transportation and recreational offerings • Compatible nearby uses • Lower cost of construction	**R=0** **E=2**	Highway 26 and Glencoe Road provide visibility to commercial uses in the subarea, but it is abarrier for residential uses. Current land uses and zoning in the subarea are supportive of commercial or industrial development.
	Environmental	• No presence of Goal 5 resources • Low hazard risks	**R=2** **E=2**	South Subarea B does not contain steep slopes, wetlands, or floodplains.
	Energy	• Opportunities to reduce VMT of development • Opportunities for alternate modes of transportation • Presence of heating/cooling structures	**R=0** **E=1**	Residential development of South Subarea B would encourage auto-centric development as Highway 26 makes it difficult to connect via alternative modes of transportation. This would have negative implicationsfor VMT. The area is currently used as industrial and commercial spaces, soredevelopment with similar uses would be more efficient.
	Summary			
	Land uses and zoning in South Subarea B support commercial and industrial uses, increasing the diversity of economic offerings in North Plains. Highway 26 acts as a benefit to auto-centric commercial activities due to accessibility and visibility.			

Table 32: Factor 3 West Subarea Summary and Evaluation

WEST SUBAREA	Evaluation Criteria		Evaluation Results	
Description and Illustration	**Evaluation Criteria**	**Metrics**	**Score**	**Comments**
The West Subarea is bounded by Dersham Road (west), US 26 (south), and NW Gordon Road (east). The northern boundary of West Subarea is not confined by a physical limitation. 	**Economic**	• Low cost of land/transportation facilities/utilities/services • Variety of parcel sizes • High development potential	**R=2** **E=2**	Areas adjacent to city limits in the West Subarea are conducive to future development. Land uses east of the subarea are primarily industrial. Large, unconstrained lots and access to Highway 26 and local connectors such as NW Gordon Rd and NW Commercial St support future development. Eastern portions of the subarea could efficiently tie into existing sanitary sewer and water utilities. Development further west would be contingent upon development to the east to tie into the local street network and utilities.
	Social	• Easy access to services • Active transportation and recreational offerings • Compatible nearby uses • Lower cost of construction	**R=2** **E=2**	The subarea is adjacent to the North Plains Elementary School and residential uses to the east. Downtown North Plains is also in close proximity and multimodal transportation options are available via NW Commercial Street. For industrial uses, the area is accessible via the Highway 26/NW Dersham Rd interchange by way of NW Mountaindale Rdand NW Dersham Rd. Development in areas further north and west would be contingent upon development in the eastern portions.
	Environmental	• No presence of Goal 5 resources • Low hazard risks	**R=2** **E=2**	The West Subarea contains a small amount of wetlands in its eastern portion. EastFork Dairy Creek runs along the western portion of the subarea. There are no steep slopes orfloodplain concerns.
	Energy	• Opportunities to reduce VMT of development • Opportunities for alternate modes of transportation • Presence of heating/cooling structures	**R=1** **E=2**	There is potential for multimodal transportation options in the subarea and industrial development could create job opportunities for North Plains residents, decreasing VMT. Development in areas further north and west would be contingent upon development in the eastern portions. Current agricultural uses mean the subarea does not have an extensive existing tree canopy.
	Summary			
	Proximity of the Dersham Rd interchange to the West Subarea is conducive to industrial development. There is also convenient access from the eastern portions of the subarea to downtown North Plains via NW Commercial Street. Opportunities for multimodal facilities and conditions conducive to industrial development could decrease commute time for residents.			

Table 33: Factor 3 East Subarea Summary and Evaluation

EAST SUBAREA	Evaluation Criteria		Evaluation Results	
Description and Illustration	**Evaluation Criteria**	**Metrics**	**Score**	**Comments**
The East Subarea is broken up into two portions. The larger portion is bounded by NW West Union Road (north), new residential development and Atfalati Ridge Elementary School (north), US 26 (south) and NW Jackson School Road (east). The smaller portion of the East Subarea is bounded by the railroad (north), industrial land uses adjacent to NW 298th Place (west), NW Jackson School Road (east) and NW West Union Road (south). 	**Economic**	• Low cost of land/transportation facilities/utilities/services • Variety of parcel sizes • High development potential	**R=2** **E=2**	The East Subarea B is well-suited for development, with access to the Jackson School Road interchange with Highway 26 that provides visibility and regional mobility. The western portion of the subarea contains wetland and floodplain constraints, though a significant amount of developable land free of constraints remains. The western portion of the subarea adjacent to city limits also contains the Recology Organics, which is not currently suitable for redevelopment. The subarea abuts the new Sunset Ridge development, which is mainly residential, and Atfalati Ridge Elementary School, as well as industrial uses to the north across NW Union Rd.
	Social	• Easy access to services • Active transportation and recreational offerings • Compatible nearby uses • Lower cost of construction	**R=2** **E=2**	McKay Creek Corridor poses challenges to development, though a future east-west connection to downtown North Plains is planned and would potentially connect residential and employment uses. Access to Atfalati Ridge Elementary School, Sunset Ridge Park, and residential uses to the north The McKay Creek Trail System extension could be conducive to recreational activities, and the lands surrounding McKay Creek are likely to develop aspark land.
	Environmental	• No presence of Goal 5 resources • Low hazard risks	**R=1** **E=1**	The majority of the subarea is free of environmental constraints. There are some 25% slope areas in the western portion of the subarea, andthe McKay Creek Corridor poses flooding hazards. An identifiedFEMA 100-Year Floodplain also follows the McKay Creek in this area.
	Energy	• Opportunities to reduce VMT of development • Opportunities for alternate modes of transportation • Presence of heating/cooling structures	**R=1** **E=1**	The East Subarea is connected to surrounding areas via local connectors such as NW Union Rd, and the Highway 26/Jackson School Rd interchange. VMT reduction is possible as residents, students, and visitors can easily access Atfalati RidgeElementary School, Sunset Ridge Park, and potential future employment centers. The McKay Creek Corridor does pose a challenge to east-west connectivity. Tree canopy exists in the western portion, but the remaining area is currently used for agricultural purposes, and therefore, does not have an existing tree canopy.
	Summary			
	The East Subarea is well-suited to future development. There is good access to the adjacent Sunset Ridge development, Atfalati Ridge Elementary, and several parks, and a connection to downtown is planned. The McKay Creek Trail System extension could increase access to recreational activities, which has positive community health benefits. Highway 26/Jackson School Rd interchange and active transportation options via West Union Rd could decrease VMT.			

4. COMPATABILITY OF THE PROPOSED URBAN USES WITH NEARBY AGRICULTURAL AND FOREST ACTIVITIES ON FARM AND FOREST LAND OUTSIDE THE UGB

As part of the Goal 14 Location Factor analysis, the City researched the adjacent agricultural and forest uses per subarea. The agricultural and forest uses were determined via data from USDA CropScape (Figure 12), Google Earth, and Washington County land use datasets. This compatibility analysis was conducted to identify the potential conflicts between current agricultural uses and proposed uses for each subarea. Criteria were established to consider how specific agricultural uses, such as livestock or poultry processing operations, may interact with proposed development. A dairy operation, for example, has the potential for year-round continuous and daily operations, which could result in complaints from nearby residential uses about noise, odor, hours of operation, and create pet and livestock conflicts. New residents may complain about increased traffic, spray drift, or specific farming practices. Urbanizing an area could also have negative implications for agricultural uses and could increase the risk of trespassing, litter, or vandalism. The agricultural and forest compatibility analysis is an additional guide for decision makers in determining the best area(s) for UGB expansion.

The following criteria were used to determine potential levels of conflict between each subarea and adjacent agricultural or forest uses, as shown in Table 34. The subareas with the least potential conflict with surrounding agricultural and forest uses scored a 2-low potential conflict. The majority of subareas scored a 1-moderate potential conflict. There were no subareas that ranked 0-high potential conflict.

0-high potential conflict	Intensive livestock or poultry processing operations, feedlots, dairies, etc.	Potential for year-round continuous/ongoing, or daily conflicts and impacts; potential for pet and livestock interaction and conflict; potential for trespass/litter/nuisance/vandalism; potential for complaints about noise, odor, hours of operation.
1-moderate potential conflict	Commodity crops, row crops, orchards, vineyards, hay, grass seed	Potential for seasonal conflicts and impacts, potential seasonal beehives; potential for complaints about noise, odor, spray drift, hours of operation, burning; potential for trespass/litter/nuisance/vandalism
2- low potential conflict	Woodlots, pasture, grazing, passive management uses	Potential for infrequent conflicts or no significant continuous impacts, may be multi-year cycle for harvest for certain uses, or routine harvest of only a portion of the resource (woodlot, etc.). Routine resource management activities may also be low impact. Potential for trespass/litter/nuisance/vandalism; potential for complaints about certain resource management and harvest operations.

Figure 12. USDA CropScape Map of Surrounding Agricultural Uses:

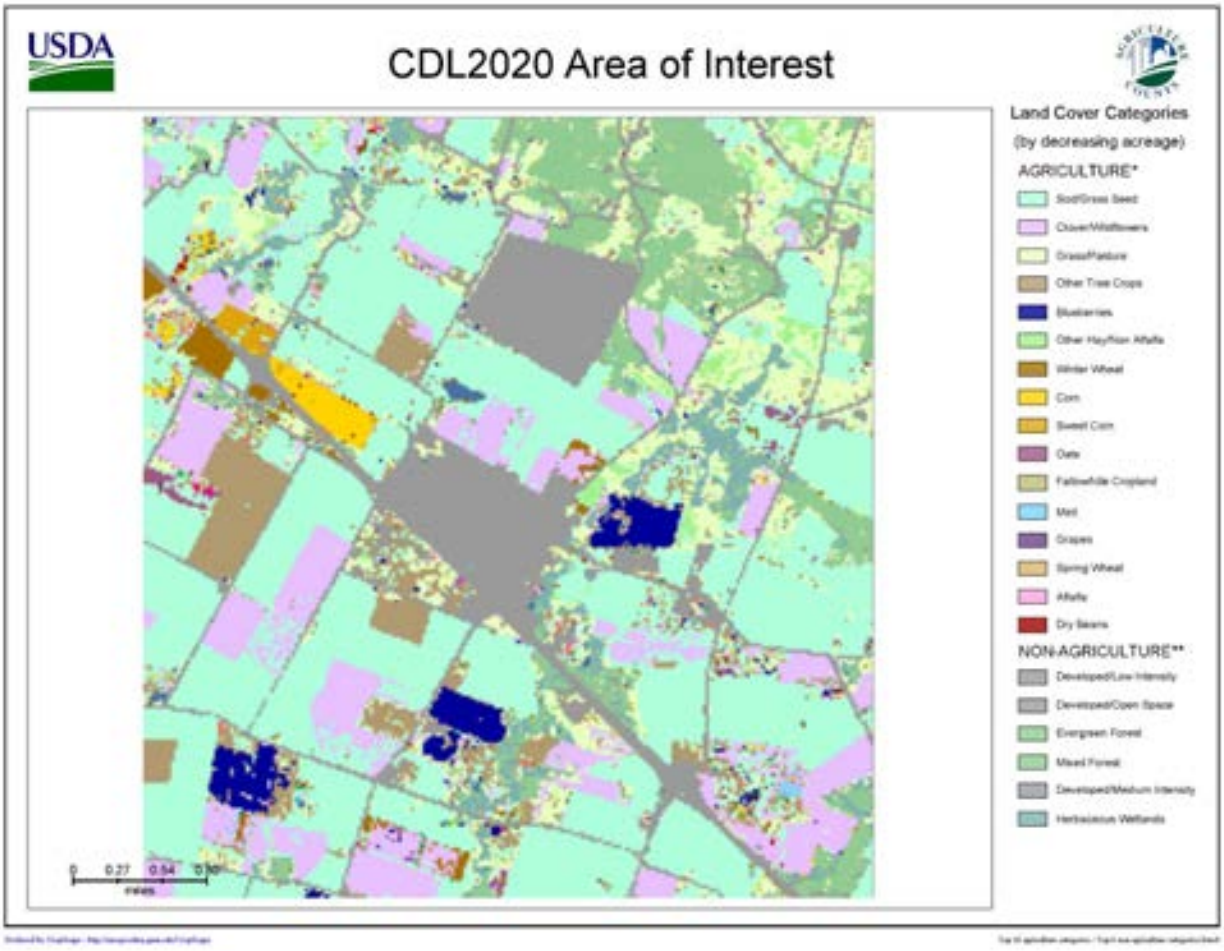


Table 34: Agricultural and Forestry Compatibility Analysis

Agricultural and Forestry Compatibility Analysis	Evaluation Criteria		Evaluation Results	
Description and Illustration	**Evaluation Criteria**	**Ideal Definition**	**Score**	**Comments**
 3J CONSULTING UGB Expansion Areas May 2022	**Potential conflict with adjacent farm and forest uses.** Potential for infrequent conflicts or no significant continuous impacts, may be multi-year cycle for harvest for certain uses, or routine harvest of only a portion of the resource (woodlot, etc.). Routine resource management activities may also be low impact. Potential for trespass/litter/nuisance/vandalism; potential for complaints about certain resource management and harvest operations.		**+2**	Zoned EFU, AF-20 and AF-5, the **North Subarea** is adjacent to predominantly sod/grass seed farming, clover/wildflower farming, tree crops, and grass/pasture; Pumpkin Ridge Golf Course to the north of the subarea
			+1	Zoned EFU and R-IND, **South Subarea A** is adjacent to urbanized North Plains to the north; and predominantly sod/grass seed, clover/wildflower, tree crops, and corn to the south and west. Pacific Fiber Products operates a wood chip and trucking business northwest of the subarea.
			+1	Zoned EFU, AF-5, and R-COM, **South Subarea B** is adjacent to urbanized North Plains to the north, commercial uses and grass/pasture to the west, and predominantly pasture/grass, sod/grass seed, wildflower/clover farming to the south and east. Blueberry farming is present to the southeast of the subarea.
			+1	Zoned EFU and R-IND, the **West Subarea** is adjacent to urbanized North Plains to the east, predominantly clover/wildflower farming, sweet corn, and pasture/grass to the west, predominantly winter wheat, sod/grass seed and farming, and a variety of fruits/vegetable farming to the southwest. Pacific Fiber Products operates wood chip and trucking business to the south of the subarea.
			+1	Zoned EFU and AF-20, the **East Subarea** is predominantly adjacent to clover/wildflower farming, sod/grass seed farming, tree crops, and grass/pasture. Other adjacent agricultural uses include blueberry farming, fruit/vegetable farming, and other hay/non alfalfa agricultural uses. A turkey and vegetable farm and Christmas Tree farm are found further east. A vineyard, and horse stables further south of Highway 26.
	Summary			
	Adjacent to urbanized North Plains and the Pumpkin Ridge Golf Course, the North Subarea is best-suited for UGB expansion relative to adjacent agriculture and forest uses. All other subareas are also well-suited with moderate potential for conflict.			

5. Evaluate Urbanization Potential

This chapter details the steps taken to analyze the North Plains UGB Expansion Study Area:

- Evaluate/Revise Comprehensive Plan Policies
- Examine Efficiency Measures in Existing UGB
- Develop Urbanization/Serviceability Analysis
- Finalize Expansion Recommendation

Evaluate/Revise Comprehensive Plan Policies

The North Plains Comprehensive Plan was last updated in 2019 subsequent to approval of the 2017 Housing Needs Analysis (HNA) and 2018 Economic Opportunities Analysis (EOA). All policies were reviewed and approved by the North Plains Planning Commission and City Council at that time. The recent City Council Vision and adopted 2022 EOA resulted in significant changes to cities policy direction for economic development that are reflected in amendments that were made to the Comprehensive Plan. The 2022 HNA Update did not result in a significant change in population projection or housing needs, therefore the policies contained in the 2019 Comprehensive Plan are current. No other changes to the Comprehensive Plan are required at this time, though Comprehensive Plan policies will be reviewed again as part of the Concept Plan process for the UGB expansion area, expected to begin in Fall 2023.

Examine Efficiency Measures in Existing UGB

As stated in Chapter 2, prior to pursuing a UGB expansion, the City must demonstrate that identified land needs cannot reasonably be accommodated on land already inside the UGB. The City is required to evaluate opportunities to provide efficient development of residential land within the existing UGB.

The City evaluated possible land use efficiency measures and determined which would result in a meaningful change in the land development pattern in North Plains. Efficiency measures adopted in 2022 include:

- Prohibit new single-family detached housing in the R-2.5 zoning district.
- Allow outright duplexes, triplexes and townhouses in the R-5 zoning district.
- Add cottage cluster standards and permit this housing type outright in the R-2.5 zoning district.
- Set minimum density at 70% of maximum density in all residential zoning districts.
- Allow density bonus for affordable housing in the R-2.5 zoning district.

Develop Urbanization/Serviceability Analysis

An analysis of urbanization/serviceability was included in Chapter 4 relative to transportation, water, sanitary sewer, and stormwater services. The information provided in the analysis was used by the Project Advisory Committee, Planning Commission, and City Council when making their final UGB

Expansion Recommendation. The City will expand on this analysis when preparing a Concept Plan for the UGB expansion area.

Finalize Expansion Recommendation

Once the Goal 14 Location Factor Analysis was complete, the PAC used that information to deliberate various options for the direction of the UGB Expansion over the course of three meetings. At PAC meeting #6 on August 4, 2022, the PAC discussed possible 40-year growth scenarios that envisioned the best location for various land uses when the City is full built out. At meeting #7 on February 2, 2023, the PAC discussed a Proposed UGB Expansion that was based on the previous meetings discussion. Three variations of the Proposed UGB Expansion were created for PAC discussion at meeting #8 on February 28, 2023. Ultimately, the PAC decided to recommend Scenario 2 (Figures 13 and 14) for Planning Commission consideration. The final location of specific land uses will be determined through the Concept Plan process. The distribution of land in the various subareas to meet the 855.2-acre land need is shown in Table 35.

Table 35. Recommended UGB Expansion by Subarea

Subarea	Buildable Acres
North	90.1
South B	34.0
West	319.1
East	412.0
Total	855.2

The 34 buildable acres in South Subarea B was the first priority as it is exception land and must be considered first. In line with the City Council vision, the next top priority was the majority (412 acres) of the East Subarea since the land is most development-ready. This does not include eastern-most 64 acres of the East Subarea as that area is already fully-occupied by the operations for Recology, a waste management and resource recovery company. The third priority was the 90.1 acres in the North Subarea, which is the location envisioned for a large community park. The remaining 319.1 acres was allocated to the West Subarea as it is the least development ready, with an emphasis on the southern portion of that Subarea. The UGB expansion area also includes a small triangle of land located west of NW 314th Avenue and north of Highway 26. An existing structure and Highway 26 right-of-way leave just 0.5 acres of buildable land on the two-acre parcel. A narrative description of the new North Plains Urban Growth Boundary is included in Appendix B.

The PAC recommendation was not unanimous. Two PAC members were concerned about the traffic that would be generated by growth in the North Subarea and would like to see a different configuration in that Subarea that completes the road network of the Sunset Ridge Subdivision. One PAC member would like to see more residential uses in the East Subarea and less in the North Subarea.

Figure 13. Proposed North Plains UGB Expansion Proposed by Project Advisory Committee with Land Uses

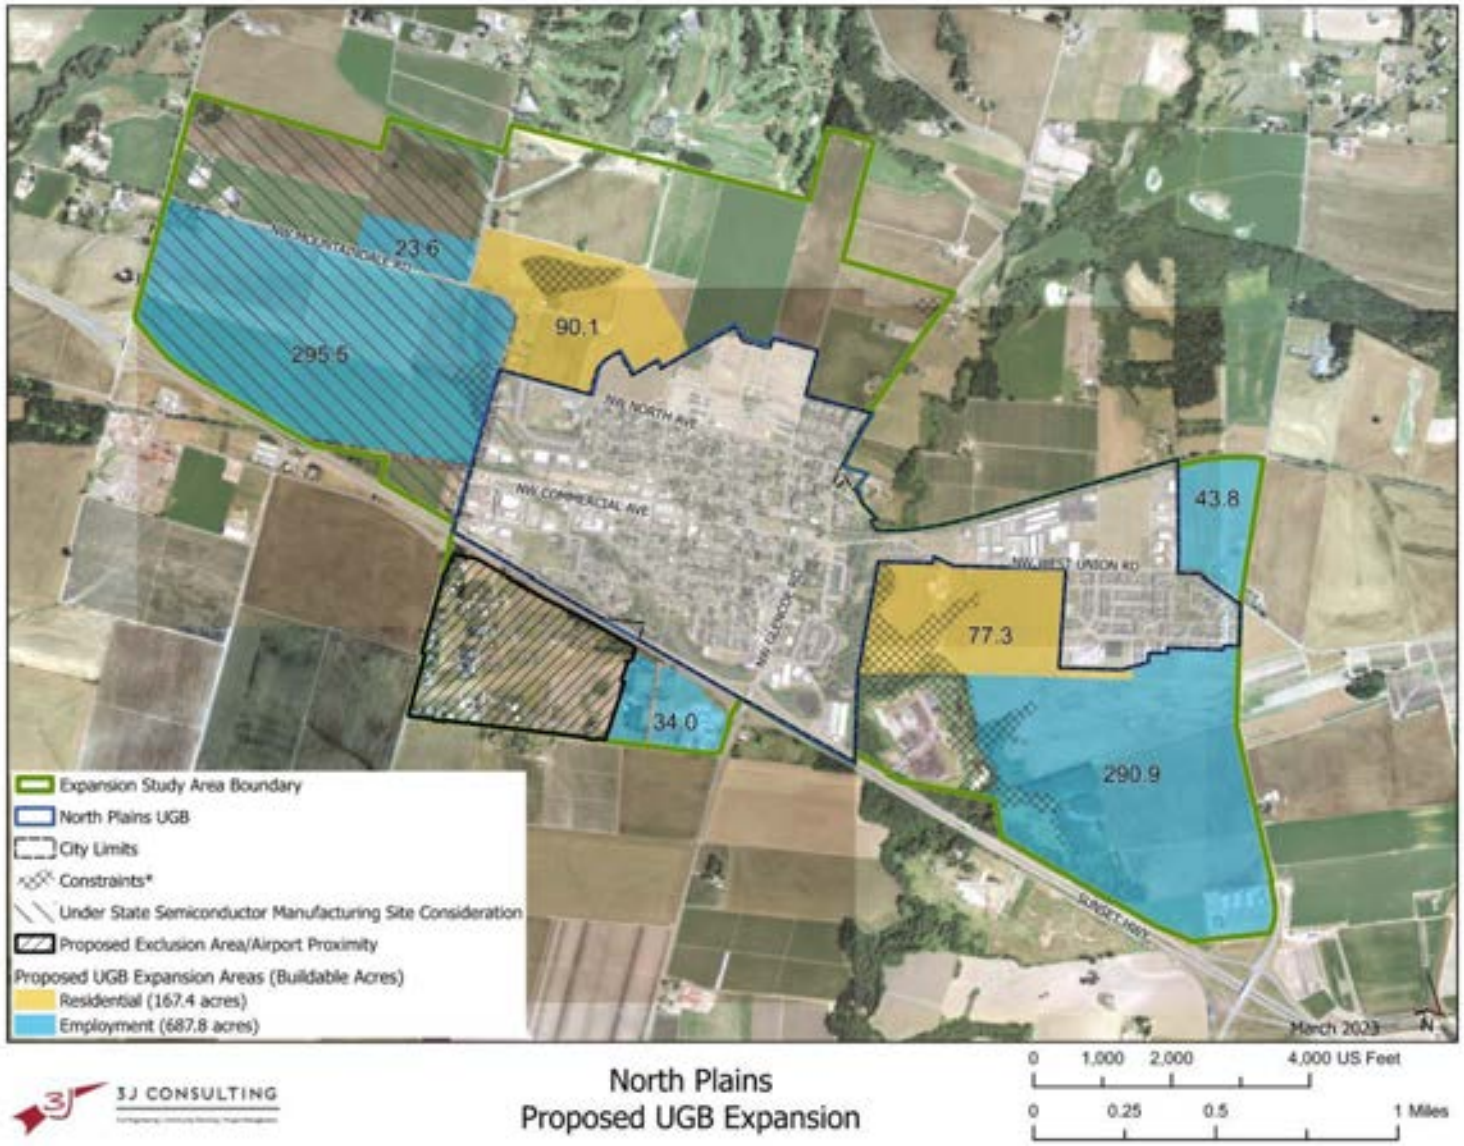

Figure 14. Proposed North Plains UGB Expansion Proposed by Project Advisory Committee

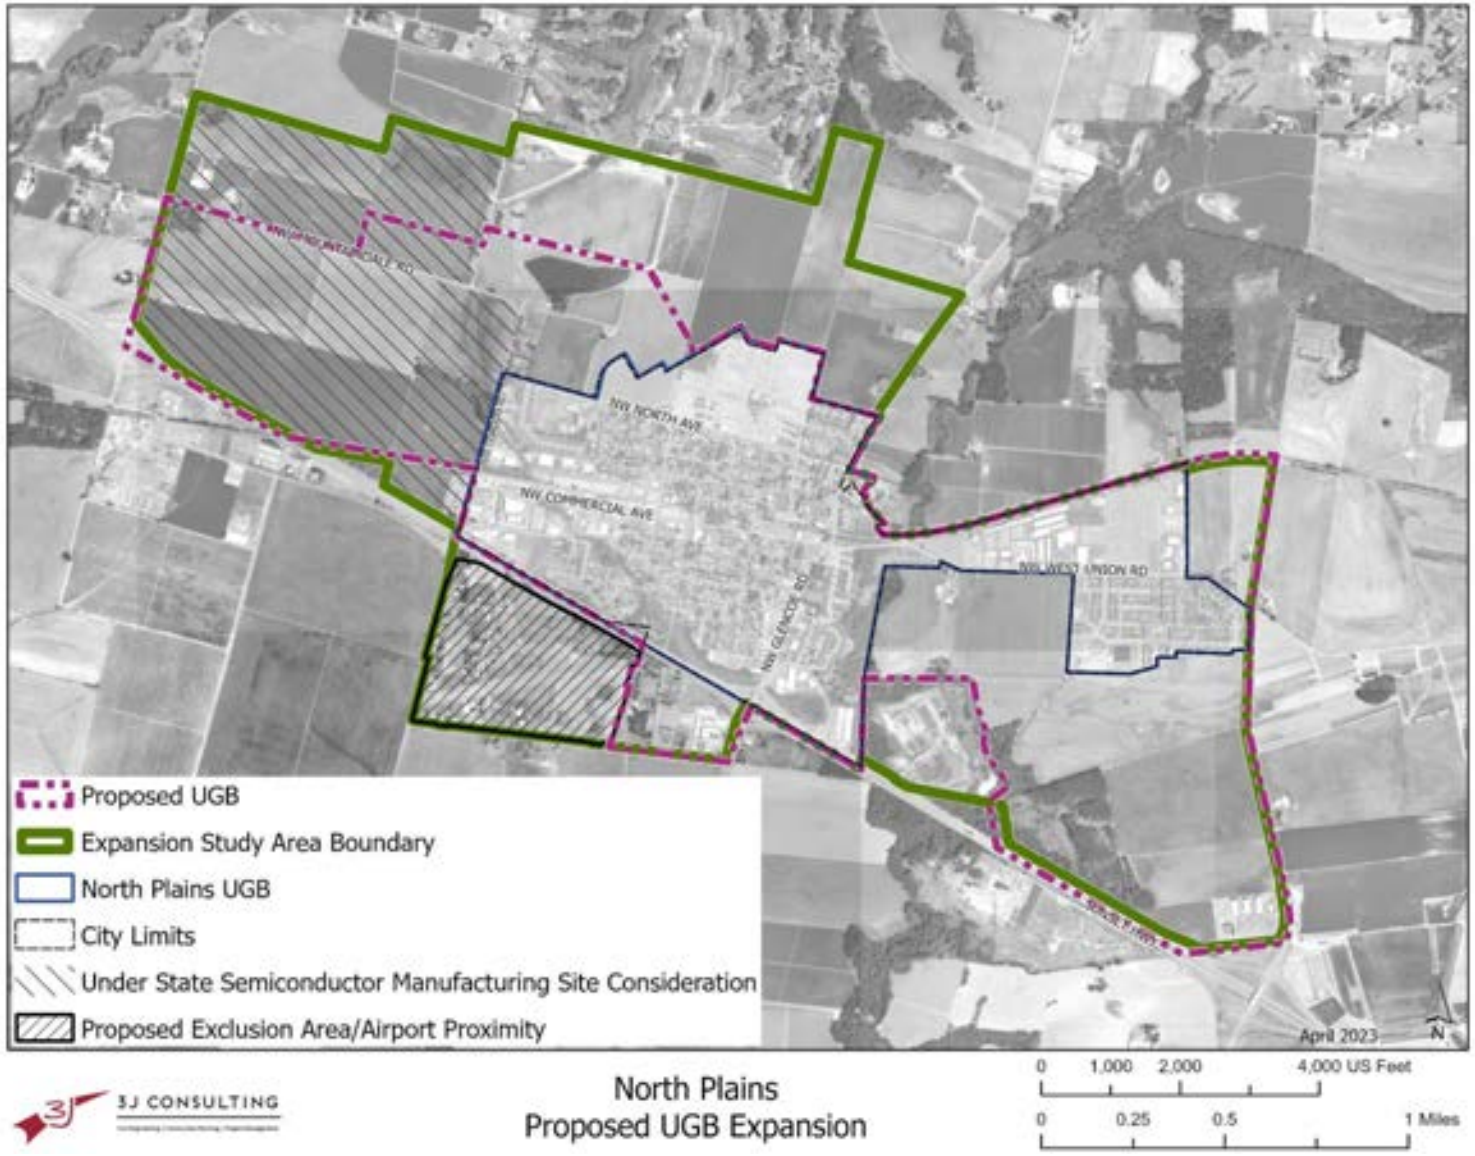

6. Review and Acknowledgement

The City of North Plains must complete the following steps to complete the North Plains UGB Expansion process:

- Receive City and County Approval
- Submit Post-Acknowledgement Plan Amendment (PAPA) to DLCD
- Submit Final Ordinance and Record to DLCD (for review in manner of periodic review)
- Await Conclusion of 21-day Period for Participant Filing of Objections
- Review Director Decision Including Consideration of Objections (if any) (within 120 days from date the department receives a complete submittal)
- Participate in LCDC Meeting to Acknowledge Expansion (if DLCD Director Forwards the
- Application to LCDC

The City has scheduled a series of meetings for the Planning Commission and City Council to finalize and approve the Proposed UGB Expansion:

- April 16 Joint Planning Commission and City Council Work Session
- May 10 Planning Commission Hearing
- June 5 City Council Hearing

A PAPA notice was submitted to DLCD along with this report on April 5, 2023. Following adoption of the UGB Expansion by City Council, the City will work with Washington County to approve the UGB Expansion before completing the final steps in the process with DLCD and the Land Conservation and Development Commission.

Appendix A. South Subarea A Exclusion

In determining the preliminary study area of the UGB Expansion project, the City of North Plains has determined that certain properties, identified on Figure A-1 as “South Subarea A”, meet the criteria for exclusion from the UGB study area. South Subarea A, as well as South Subarea B, are considered “Exception Lands” and are therefore considered high priority when the city is conducting the UGB expansion boundary analysis. The City acknowledges the Exception Land designation and therefore does not propose exclusion of the entire South Subarea from the UGB study area. Documentation of compliance with the applicable criteria for exclusion for South Subarea A are detailed in this appendix.

0 0.25 0.5 1 Miles

OAR 660-024-0065 Establishment of Study Area to Evaluate Land for Inclusion in the UGB

Applicable subsections of OAR 660-024-0065:

(4) The city may exclude land from the preliminary study area if it determines that:

(a) Based on the standards in section (7) of this rule, it is impracticable to provide necessary public facilities or services to the land;

(7) For purposes of subsection (4)(a), the city may consider it impracticable to provide necessary public facilities or services to the following lands:

(b) Land that is isolated from existing service networks by physical, topographic, or other impediments to service provision such that it is impracticable to provide necessary facilities or services to the land within the planning period. The city's determination shall be based on an evaluation of:

(A) The likely amount of development that could occur on the land within the planning period;

(B) The likely cost of facilities and services; and,

(C) Any substantial evidence collected by or presented to the city regarding how similarly situated land in the region has, or has not, developed over time.

(c) As used in this section, "impediments to service provision" may include but are not limited to:

(A) Major rivers or other water bodies that would require new bridge crossings to serve planned urban development;

(B) Topographic features such as canyons or ridges with slopes exceeding 40 percent and vertical relief of greater than 80 feet;

(C) Freeways, rail lines, or other restricted access corridors that would require new grade separated crossings to serve planned urban development;

(D) Significant scenic, natural, cultural or recreational resources on an acknowledged plan inventory and subject to protection measures under the plan or implementing regulations, or on a published state or federal inventory, that would prohibit or substantially impede the placement or construction of necessary public facilities and services.

FINDINGS regarding OAR 660-024-0065:

Subsection (7)(b)(A), above, identifies "the likely amount of development that could occur on the land within the planning period" as a reason to exclude certain lands from the UGB study area. The properties proposed for exclusion from the preliminary study area, South Subarea A, are developed primarily with single-family homes, the majority of which have airplane hangars and access to the airfield. There are certain amounts of land and access needed by these lots to allow maneuvering of private aircraft between the individual lots and the airfield.

Significant redevelopment of this area to accommodate residential or employment needs for the City of North Plains would impact the use and practicality of the airstrip. The airstrip is shared by 33 property owners (many of whom own plane hangars abutting the airfield.) The airport is licensed by the state, and subject to deed restrictions governing its use and maintenance. Abandoning the

airport requires a majority vote of the property owners, and a vote may not occur more than once every 10 years. The current property owners within the air-acre subdivision at issue have expressed their desire to maintain use of the airfield. In addition to the airstrip, the private streets in this area are an impediment to infill or redevelopment of this area, as access is severely limited to the majority of the area. Due to the presence of the airstrip and the private streets, the lots proposed for exclusion are unlikely to redevelop within the 20-year planning period of the UGB expansion, allowing the City to consider it impracticable to provide necessary public facilities or services to these lots based on Subsection (7)(b)(A), above.

Subsection (7)(b)(B), above, identifies "the likely cost of facilities and services" as a reason to exclude certain lands. The area proposed for exclusion is developed with residential properties and, as such, if included in the UGB Expansion Area, would be included for residential development. The small number of residential units that could redevelop within the area proposed for exclusion would require extensive facilities and services, with an extremely high utility cost per residential dwelling unit, making provision of such impracticable to provide, satisfying the provisions of Subsection (7)(b)(B), above.

Subsection (7)(b)(C), above, identifies "any substantial evidence collected by or presented to the city regarding how similarly situated land in the region has, or has not, developed over time" as a reason to exclude certain lands from the UGB study area. The City has collected evidence that the presence of the airport has an impact on the residential designation of any surrounding lands and would result in conflicts between homeowners and airport operations. Noise, vibration, overflights and other issues arise between airports and their residential neighbors. The city of Portland has faced constant issues of takings because of the residential designations placed around the Portland International Airport and has been required to place an overlay zone on lands surrounding that airport to require those residential uses to include noise insulation to prevent further nuisance suits against both the city and the Port of Portland.

In addition, the problematic land economics matters described above, which are unlikely to result in development of South Subarea A in the 20-year planning period, have played out elsewhere in the region, including at the former Exception Land Area in the nearby Hillsboro Industrial Area along both sides of NW Sewell Road between NW Evergreen and NW Meek Road that contains approximately 530 acres of land occupied by a long-established rural residential community which were added to the Metro UGB in 2005. Land redevelopment impediments such as significantly-higher rural residential land values than industrial land values (which persists even more in 2021 due to limited residential land supply), and land assembly and acquisition difficulties due to many owners of strategically-located rural properties needed for industrial developments – and for new supporting urban infrastructure - unwilling to sell their properties to interested industrial developments (which further exacerbated already then-existing high costs of infrastructure provision) have precluded urban infill development ever since the Area was added to the UGB in 2005.

The substantial evidence of residential development near airport facilities and land economics that the City has collected satisfies the provisions of Subsection (7)(b)(C), above.

Subsection (7)(c), above, identifies some of the "impediments to service provision" that may be used to determine exclusion of certain areas in the UGB study area. Specifically, subsection (C) identifies "freeways, rail lines, or other restricted access corridors that would require new grade separated crossings to serve planned urban development" as impediments. The airport itself serves as an "other restricted access corridor" that would limit the provision of transportation and utility services within South Subarea A. In addition, NW Redhaven Street and NW 236th Place are private streets and an eastern extension of NW Beach Court is precluded by a 1'x50' Tract (see 'Tract A' on Air Acres No. 2 Plat, recorded May 3, 1972), further limiting the feasibility of providing transportation and utility services. These restricted access corridors within South Subarea A limit the inclusion of these properties in the UGB study area, meeting the provisions of Subsection (7)(c)(C), above.

State and County Airport Regulations

Applicable State Regulations

Oregon Revised Statutes (ORS) 836.600 to 836.630 deal with Local Government Airport Regulation. The policy of these statutes is "to encourage and support the continued operation and vitality of Oregon's airports." ORS 836.608(1) declares continued operation and vitality of airports as a matter of state concern.

ORS 836.608(2) states that a local government shall recognize in its planning documents the location of private-use airports and establish a boundary showing areas in airport ownership, or subject to long-term lease, that are developed or committed to airport uses. Areas committed to airport uses shall include those areas identified by the airport owner that the local government determines can be reasonably expected to be devoted to airport uses allowed under 836.616(2). ORS 836.616(3)(a) goes on to say that "a local government shall not impose limitations on the continued operation of uses described in ORS 836.616(2) that existed at any time during 1996 at an airport described in subsection (2) of this section.

ORS 836.616(2) authorizes customary and usual aviation-related activities and uses within airport boundaries that include but are not limited to takeoffs, landings, aircraft hangars, tie-downs, construction and maintenance of airport facilities, fixed-based operator facilities and other activities incidental to the normal operation of an airport, and those aeronautic recreational and sporting activities that may occur on the airport site.

Applicable County Regulations

Policy 42 of the Washington County Comprehensive Framework Plan states that "It is the policy of Washington County to protect the function and economic viability of existing public use airports, while

ensuring public safety and compatibility between airport uses and surrounding land uses for public use airports and for private use airports identified by the Oregon Department of Aviation (DOA)."

"Policy 42 outlines implementing strategies which, in part, set forth Airport Overlay Districts to regulate safety concerns, land uses and land use compatibility issues on airport properties and within surrounding areas. These are structured to address state-recognized airports in two categories, generally referred to herein as Public Use Airports and Private Use Airports."

Policy 42, Implementing Strategy 'a' states that the County will "Adopt and implement Airport Overlay Districts consistent with LCDC Airport Planning Rules and ORS Chapter 836 in order to… 2. Protect privately owned, private use airports identified by the DOA. Each airport's specific level of risk and usage shall be used to guide the continued safe aeronautical access to and from these airports, considering the type of aircraft approved to use the field." Washington County Development Code, Article III, Sections 385-386 carry out implement state regulations and County policies.

FINDINGS regarding Airport Regulations:

Roth Development is the owner of the Sunset Airstrip (airport code 1OR3) a private residential airpark located in Washington County, south of the City of North Plains and south of Highway 26. Roth Development's 33 shareholders are the owners of Air Acres, Air Acres 2, Sunset Orchard Estates 1 and Sunset Orchard Estates 2 (identified as "South Subarea A" in the UGB Expansion boundary analysis). The airstrip qualifies as an airport under Oregon Revised Statutes (ORS) 836.605(2) as it was the base for 25 aircraft on December 31, 1994 as shown on ODOT records.

The airport that exists in the exception area lies diagonally across 18 lots zoned Rural Residential-5. These homesites, landing strip, and associated aviation facilities comprise the Air Acres Subdivision. All of the lots are occupied and all the facilities are actively used. The Air Acres subdivision has existed on this site since before the area was zoned in the early 1970s and has had a licensed airport since 1970.

Urban development of the area surrounding the Sunset Airstrip would limit the normal operation of the airport in violation of state and county regulations. Air Acres is subject to deed restrictions governing its use and maintenance. Abandoning the airport requires a majority vote of the property owners, and a vote may not occur more than once every 10 years. The current property owners within the air-acre subdivision at issue have expressed their desire to maintain use of the airfield. Therefore, the City finds that the RR-5 and AF-5 land near the airport cannot reasonably accommodate the City's residential or employment land need.

Due to the orientation of this airstrip, development of the area with additional dwellings would necessitate abandoning the facility, which is shared by 33 property owners, many who own plane hangers abutting the airfield. The continuing operation of the Sunset Airstrip is a significant impediment to development at urban intensities. As stated previously regarding land economics,

residential development would be the appropriate use for inclusion of South Subarea A in the UGB study area; however, infill residential development is extremely unlikely to occur during the planning period as the property owners intend to continue to operate the airport and additional development would impact its operations.

North Plains Comprehensive Plan

As this land is developed residentially, any future UGB expansion into South Subarea A would be for residential uses. Therefore, the policies identified from the North Plains Comprehensive Plan address Statewide Planning Goal 10: Housing.

Goal 10: Housing

Objective 4: To require that land that is brought into the UGB primarily to meet residential land needs is concept planned before it is annexed into the city limits, and master planned before development is allowed.

> *Policy 3): Newly developed residential areas will be in master planned areas that may include parks, schools, public services and facilities, shopping, services, and activity centers, providing pedestrian access to these amenities.*
>
> *Policy 4): Newly developed residential areas will include landscaping and open space to provide an amenity to the residential development and reduce potential conflicts with surrounding uses.*

FINDINGS regarding North Plains Comprehensive Plan:

A new residential development in South Subarea A would not have sufficient land to include parks, schools, shopping, services, and activity centers with pedestrian access.

A new residential development in South Subarea A would not be able to provide sufficient open space to reduce conflicts with the Sunset Airstrip. The presence of the airport has an impact on the residential designation of any surrounding lands and would result in conflicts between homeowners and airport operations. Noise, vibration, overflights and other issues arise between airports and their residential neighbors. Redevelopment of these properties with additional residential dwelling units would not meet the identified provisions of the North Plains Comprehensive Plan.

North Plains Transportation System Plan

1. Objective: To create a multi-modal transportation system for all users. All users will have safe and convenient access.

> *Policy 1.D): Provide complete access for pedestrians and bicycles to key locations.*

5. Objective: To encourage design and improvements that reduce the environmental impact of the transportation system.

> *Policy 5.A): Reduce emissions by encouraging connectivity and design that reduces vehicle miles traveled.*

FINDINGS regarding North Plains Transportation System Plan:

Complete access for pedestrians and bicycles to key locations within the City of North Plains is extremely limited from this location. Residents of new housing units in South Subarea A would not have safe and convenient access to key locations for pedestrians and bicycles. New residential development or redevelopment in South Subarea A would not encourage connectivity to reduce vehicle miles traveled as the airport limits connectivity and the existing roadway network is comprised of privately owned streets and tracts. Development of new residential units in this area would not meet the applicable objectives of the Transportation System Plan.

RESULTS OF EXCLUSION ANALYSIS

The City of North Plains finds that the South Subarea A properties identified on the map at the beginning of this appendix meet the criteria for exclusion from the preliminary UGB study area. The properties identified for exclusion meet the applicable criteria of OAR 660-024-0065, as demonstrated within this appendix. Further evidence supporting exclusion of these properties from the preliminary study area are found in the findings related to the State and County Airport Regulations, North Plains Comprehensive Plan and North Plains Transportation System Plan.

The City acknowledges that South Subarea A is considered Exception Lands and is therefore compelled to consider these lands first for inclusion in the UGB; however, the City finds that urbanization of South Subarea A would be incompatible with the operation of the Air Acres airport and that South Subarea A is incapable of reasonably meeting any portion of the City's residential or employment land need over the 20-year planning horizon.

Appendix B. North Plains UGB Description

A. Begin at centerline of the intersection of Highway 26 and Glencoe Road, following the centerline of Highway 26 east to the western boundary of Tax Lot 1N2070000200.
A. Exclude Tax Lot 1N2070000200, follow western property boundary of 1N2070000200 south and follow western boundaries and include tax lots 1N2070001400 and 1N2070000300 back to centerline of Highway 26.
A. From the intersection of the southwest corner of tax lot 1N2070000300 and Highway 26, follow the centerline of Highway 26 east to the southern boundary of tax lot 1N2070000400.
A. Follow the southern boundary of tax lot 1N2070000400 to the centerline of NW Jackson School Road.
A. Follow the centerline of NW Jackson School Road to the northern boundary of tax lot 1N2050000401.
A. Include tax lots 1N2050000401 and 1N2060000151 but not the ODOT railroad Right-of-Way. Connect to existing UGB heading west along northern boundary of Brynhill.
A. At a point approximately 90 feet northeast of where NW Main Street is approved to intersect the existing UGB line per the Brynhill Master Plan design, head northwest to the northern property line of tax lot 1N3010000400 (south of Jackson Cemetery).
A. Head west along the northern boundary of tax lot 1N3010000400 for 2,400 feet to the centerline of Old Pumpkin Ridge Road.
A. Head south along the centerline of Old Pumpkin Ridge Road 245 feet, then head west within tax lot 2N3350000900 to the western boundary of this tax lot.
A. At the western boundary of 2N3350000900, head south to the centerline of NW Mountaindale Road.
A. Follow the centerline of NW Mountaindale Road to its intersection with the centerline of NW Dersham Road, then head south along the centerline of NW Dersham Road to the centerline of Highway 26.
A. Follow the centerline of Highway 26 east to the southern boundary of tax lot 1N3020000402.
A. Follow the southern boundary of tax lot 1N3020000402 east, excluding the ODOT railroad right-of-way, but include the portion of tax lot 1N3020000200 that is north of the ODOT railroad right-of-way.
A. Connect to the existing UGB. Head south of NW Gordon Road to the centerline of Highway 26. This stretch of existing UGB does not follow the center line of NW Gordon Road.
A. Follow the centerline of Highway 26 to the point where heading south would connect with the western property boundary of tax lot 1N312B000100.
A. This includes the western, triangle-shaped portion of Tax Lot 1N301CD02200 that was specifically identified by the Planning Commission for inclusion in the UGB Boundary Expansion in their recommendation on May 10, 2023.
A. Follow the western boundary of 1N312B000100 to the western boundaries of tax lots 1N312B000101, 1N312B000201 and 1N312B000200 to the centerline of NW Beech Street.
A. Follow the centerline of NW Beech Street east to the centerline of NW Glencoe Road.
A. Follow the centerline of NW Glencoe Road to the centerline of NW Highway 26.

Before the Planning Commission of the City of North Plains

In the matter of an application for the City of North Plains UGB Amendment and Comprehensive Plan Amendment and Updated Housing Needs Analysis (HNA)
City of North Plains, APPLICANT

) **RECOMMENDATION TO CITY COUNCIL**
) **CPA 23-056 (1) and (2) -** UGB Expansion
) & Updated Housing Needs Analysis (HNA)
) **PC Hearing Date: May 10, 2023**

Whereas, the City of North Plains adopted an update to the City's Housing Needs Analysis (HNA) on December 4, 2017 with Ordinance No. 449; and

Whereas, Portland State University Population Research Center (PRC) prepared a new Coordinated Population Forecast for Washington County, its Urban Growth Boundaries (UGB), and Areas Outside UGBs, 2020-2070 on June 30, 2020 that included an updated forecast of population for the City of North Plains' UGB for that timeframe; and

Whereas, to provide a current City Housing Needs Analysis reflective of the most recent Portland State University PRC forecast of population for the North Plains UGB, the City initiated an update to the City's HNA to inform both a broader proposed Comprehensive Plan amendment and proposed Urban Growth Boundary amendment; and

Whereas, the Planning Commission conducted a duly-noticed public hearing, and reviewed the proposed UGB Amendment and Comprehensive Plan Amendment and Updated Housing Needs Analysis (HNA) and staff reports at its meeting on May 10, 2023; and

Whereas, the Planning Commission considered the submitted staff report and reviewed the proposed UGB Amendment and Comprehensive Plan Amendment and Updated Housing Needs Analysis (HNA) for compliance with the North Plains Comprehensive Plan, which incorporates the Statewide Planning Goals, and

Whereas, having considered the application, public testimony and the evidence in the record, the Planning Commission adopted a motion to recommend approval to the City Council of file **23-056 (1) and (2)** Amended Housing Needs Analysis and Comprehensive Plan and Amended Urban Growth Boundary with the following modifications: adjust the UGB boundary so it takes in the small "triangle" of land associated with the property located at 10105 NW 314th Ave., and all county roadways to the extent feasible, and instructed staff to prepare findings and conclusions in a written recommendation.

Now therefore, it is hereby recommended by the North Plains Planning Commission:

The Planning Commission recommends approval to the City Council of the proposed UGB Amendment and Comprehensive Plan Amendment and Updated Housing Needs Analysis (HNA), based on the findings and conclusions contained in Exhibit A (attached) along with the following modifications: adjust the UGB boundary so it takes in the small "triangle" of land associated with the property located at 10105 NW 314th Ave., and all county roadways to the extent feasible, which the Planning Commission hereby adopts as its findings, and determines to be reasonable.

Stewart King - Chairperson

Date 5/16/2023

North Plains UGB Expansion and Updated Housing Needs (HNA) Analysis
File# CPA 23-056(1) and (2)
Planning Commission Recommendation to City Council
Exhibit A FINDINGS

General Findings

1. Finding: Applications for an Urban Growth Boundary (UGB) amendment, Comprehensive Plan text amendment, updated Housing Needs Analysis (HNA) and/or zoning map amendments require Type IV legislative reviews and decisions. The Planning Commission conducts a public hearing on the matter and forwards a recommendation to the City Council. The City Council is the City's decision-making body.

2. Finding: The proposed Urban Growth Boundary (UGB) amendment, Comprehensive Plan text amendment, and updated Housing Needs Analysis (HNA) is applicable citywide. As such, public notice was posted on the City's webpage at least ten (10) days prior to the public hearing.

3. Finding: The proposed amended Urban Growth Boundary (UGB) amendment, Comprehensive Plan text amendment, and updated Housing Needs Analysis (HNA) complies with Section 155.127 of the North Plains Zoning Ordinance, specifically subsection (A) Comprehensive Plan & Zoning Amendments Review Criteria, Text Amendment, as addressed in the staff report to Planning Commission dated May 3, 2023. The proposed amended Urban Growth Boundary (UGB) amendment, Comprehensive Plan text amendment, and updated Housing Needs Analysis (HNA) complies with the North Plains Comprehensive Plan and Statewide Planning Goals.

4. Finding: *Procedures:* In accordance with ZOO Chapter 155.032 Application Review and Procedures, on May 10, 2023, the Planning Commission conducted a public hearing to discuss and make a recommendation regarding this application.

Specific Findings based on North Plains Municipal Code (NPMC)

(Code text is **Bold.** All findings are from the Staff Report to Planning Commission)

COMPLIANCE WITH CITY OF NORTH PLAINS MUNICIPAL CODE
COMPREHENSIVE PLAN & ZONING AMENDMENTS

Urban Growth Boundary (UGB) Amendment and Comprehensive Plan Text Amendment

COMPLIANCE WITH CITY OF NORTH PLAINS MUNICIPAL CODE

COMPREHENSIVE PLAN & ZONING AMENDMENTS
§155.127 Review Criteria

(A) Text Amendment

An amendment to the text of the Comprehensive Plan or this Ordinance shall be based upon a need for such an amendment identified by the City Council or the Planning Commission. Such an amendment shall be consistent with the following review criteria:

(1) Impact of the proposed amendment on land use and development patterns within the city, as measured by:

(a) Traffic generation and circulation patterns in compliance with the Transportation System Plan (TSP);
(b) Demand for public facilities and services, in compliance with the City utility master plans;
(c) Level of park and recreation facilities;
(d) Economic activities;
(e) Protection and use of natural resources;
(f) Compliance of the proposal with existing adopted special purpose plans or programs, such as public facilities improvements.

Finding: The City Council and Planning Commission identified a need for the UGB expansion and supporting comprehensive plan text amendments based on the lack of available land for the city to support identified employment and residential growth over the next 20 years. The City Council has a stated goal to overturn the "bedroom community" dynamic in the city with robust planning and for employment land development over the coming years. The amount of land identified for inclusion in the UGB expansion is based on the adopted Economic Opportunities Analysis (EOA) and an updated Housing Needs Analysis (HNA) that is being approved concurrently with this UGB expansion. The included UGB Expansion Report provides high-level analysis of traffic generation and circulation patterns, public facilities and services, parks and recreation facilities, economic activities, protection and use of natural resources and compliance with existing and adopted special purpose plans and programs. As part of their recommendation on the UGB amendment to the City Council, the Planning Commission recommended at their May 10th hearing that the UGB boundary be modified to include the small "triangle" shaped piece of land associated with the property located at 10105 NW 314th Ave., as well as all county roadways within the proposed UGB boundary to the extent feasible.

The next step in the UGB expansion process is to concept plan the UGB areas. This will allow the city to dig deeper into the details of these city services and determine the impact of each on land use and development patterns within the existing city limits and within the proposed UGB expansion areas. This standard is met.

(2) The proposed amendment complies with all applicable Statewide Planning Goals and administrative rule requirements.

Finding: Oregon's 19 Statewide Planning Goals are addressed below. Though several of the goals are not applicable to the proposed UGB expansion and comprehensive plan text amendments, those that are applicable are responded to in detail.

Goal 1 Citizen Involvement
The North Plains Urban Growth Boundary Expansion Project Advisory Committee (UGB PAC), comprised of elected and appointed officials, community residents, local business owners and agency representatives, met eight (8) times over the course of three (3) years in publicly noticed, hybrid in-person/virtual open meetings. Public testimony was always received at each UGB PAC meeting. The Planning Commission and City Council also held two publicly noticed joint work sessions with opportunity for public comment. The city maintained a robust website throughout the project, https://www.northplains.org/planning/page/urban-growthboundary-expansion, allowing full access to up-to-date project documents and information about upcoming opportunities to participate via a scheduled PAC meeting or connection with City staff.

This land use process to approve the proposal is subject to a City of North Plains Type IV land use review, which includes a significant citizen involvement component. This process has been established by the city and determined to be consistent with this goal. The mandatory public notice of the action and decision, and the hearings on this case before the Planning Commission and City Council are all avenues of citizen participation.

***Goal 2* Land Use Planning**
This statewide goal requires that land use decisions 1) have an adequate factual base, 2) that alternatives have been considered, and 3) that implementation measures are consistent with and adequate to carry out comprehensive plan. The proposed UGB expansion area was established utilizing the guidance provided by Statewide Planning Goal 14 (Urbanization) which incorporates the requirements of ORS 197A.300 to 197A.325, which establishes requirements for a factual basis. Alternatives to the proposed expansion were reviewed and discussed throughout the eight (8) Project Advisory Committee Meetings and two (2) joint Planning Commission-City Council Work Sessions. The proposed UGB expansion and associated comprehensive plan text amendment are consistent with and adequate to carry out the Comprehensive Plan.

***Goal 3* Agricultural Lands and *Goal 4* Forest Lands**
This goal does not apply because the City does not include areas designated for agricultural or forest use. The areas designated for UGB expansion are all within either the "exception land" or "undesignated" urbanization categories. No "rural reserves" are proposed for inclusion in the UGB expansion.

***Goal 5* Open Spaces, Scenic and Historic Areas, and Natural Resources**
There are no proposed changes to text regarding Goal 5 open spaces, scenic and historic areas and natural resources. Therefore, the intent of this goal remains satisfied by the policies of the Comprehensive Plan and implementation in the Zoning Ordinance.

***Goal 6* Air, Water and Land Resources Quality**
There are no proposed changes to text regarding air, water, or land resources. Therefore, the intent of this goal remains satisfied by the policies of the Comprehensive Plan and implementation in the Zoning Ordinance.

***Goal 7* Areas Subject to Natural Hazards**
There are no proposed changes to text regarding areas subject to natural hazards. Therefore, the intent of this goal remains satisfied by the policies of the Comprehensive Plan and implementation in the Zoning Ordinance.

***Goal 8* Recreational Needs**
The proposed UGB expansion includes 40 acres of parks and open space to meet the need identified in the Housing Needs Analysis (HNA) to support current and future residents of the city. This amount of parks and open space land included in the UGB expansion area calculation is consistent with Goal 8.

***Goal 9* Economic Development**
The proposed UGB Expansion includes 515 acres to accommodate industrial land needs and 172 acres to meet commercial land needs through 2038, including infrastructure such as roadways. This employment land need was established through the city's adopted Economic Opportunities Analysis. The city is also in on-going discussions with the State of Oregon regarding potential designation of 500 acres as a special opportunity area for semi-conductor manufacturing and related business development. The proposed UGB expansion and associated Comprehensive Plan Text Amendments support the city's ongoing compliance with Goal 9.

***Goal 10* Housing**
The proposed UGB Expansion includes 167 acres to meet residential land needs through 2038, including parks and infrastructure. This residential land need was established through the city's updated Housing Needs Analysis. The proposed UGB expansion and associated Comprehensive Plan Text Amendments support the city's ongoing compliance with Goal 10.

***Goal 11* Public Facilities and Services**
There are no proposed changes to text regarding public facilities and services. The UGB Expansion includes land for provision of public roadways and infrastructure. The intent of this goal remains satisfied by the policies of the Comprehensive Plan and implementation in the Zoning Ordinance.

***Goal 12* Transportation**

The Transportation Planning Rule (TPR), OAR 600-012.0060, requires that, where an amendment to a comprehensive plan or zoning regulation would significantly affect an existing or planned transportation facility, the local government shall put in place measures that assure that allowed land uses are consistent with the function, capacity, and performance standards of the facility. The proposed UGB Expansion and associated Comprehensive Plan Text Amendment do not propose any changes to an existing or planned transportation facility and, as such, the proposal does not affect the transportation system of the City. More detail regarding transportation analysis will be included with the city's UGB Concept Planning Process, which will commence once the UGB Expansion is adopted and finalized.

Goal 13 Energy Conservation
There are no identifiable energy consequences of this land use action. The city continues to be in compliance with Goal 13 through adopted Comprehensive Plan policies.

Goal 14 Urbanization
The UGB Expansion Report follows the guidance provided by Statewide Planning Goal 14 (Urbanization), which incorporates the requirements of ORS 197A.300 to 197A.325 Amendment of Urban Growth Boundary Outside Metro. The report answers the following questions to justify a UGB expansion for North Plains: 1. Is any additional land needed for one or more urban uses, and if so, how much? 2. If additional land is needed, how much can be accommodated within the current UGB? 3. If additional land is needed outside the UGB, where is the best place to expand the boundary? 4. What other amendments are needed to comply with the statewide planning goals? The UGB Expansion Report details the analysis of the above questions and provides a logical, efficient expansion of the city's UGB to include an additional 855.2 acres to meet the city's 20year land need. The proposed UGB Expansion and Comprehensive Plan Text Amendment meet the provisions of Goal 14.

Goal 15 Willamette River Greenway
Goal 16 Estuarine Resources
Goal 17 Coastal Shorelands
Goal 18 Beaches and Dunes
Goal 19 Ocean Resources
The City is not within the plan boundary for the Willamette River Greenway, does not have any estuarine resources, and is not on the Oregon Coast, so goals 15 through 19 do not apply. As discussed above, the proposed UGB Expansion and Comprehensive Plan Text Amendment area generally consistent with all of the applicable Oregon Statewide Planning Goals.

(3) The amendment is appropriate as measured by at least one of the following criteria:
(a) It corrects identified error(s) in the provisions of the plan.
(b) It represents a logical implementation of the plan.
(c) It is mandated by changes in federal, state, or local law.
(d) It is otherwise deemed by the City Council to be desirable, appropriate, and proper.

Finding: The proposed UGB expansion and Comprehensive Plan Text Amendment have been deemed to be desirable, appropriate and proper accommodate the city's projected residential and employment growth over the next 20 years. The proposed amendment is appropriate as measured by at least one of the criteria and this standard is met.

(4) Compliance with the statewide Transportation Planning Rule. When a development application includes a Comprehensive Plan, Zone Map or Text Amendment, the proposal shall be reviewed to determine whether it significantly affects a transportation facility, in accordance with Oregon Administrative Rule (OAR) 660-012-0060, the Transportation Planning Rule. "Significant" means the proposal would:

- ***(a) Change the functional classification of an existing or planned transportation facility (exclusive of correction of map errors). This would occur, for example, when a street classification, requiring traffic to exceed the levels associated with a "collector" street classification, requiring a change in the classification to an "arterial" street as identified by the City's Transportation System Plan (TSP);***

or

- ***(b) Change the standards implementing a functional classification system; or***
- ***(c) As measured at the end of the planning period identified in the North Plains TSP or Comprehensive Plan; or***
- ***(d) Reduce the performance of an existing or planned transportation facility below the minimum acceptable performance identified in the North Plains TSP or Comprehensive Plan; or***
- ***(e) Worsen the performance of an existing or planned transportation facility that is otherwise projected to perform below the minimum acceptable performance standard identified in the North Plains TSP or Comprehensive Plan.***

(5) Amendments that affect Transportation Plans. Except as provided in subsection 6 Exceptions, amendments to the Comprehensive Plan or land use regulations which significantly affect a transportation facility shall assure that allowed land uses are consistent with the function, capacity and level or service of the facility identified in the North Plains TSP. This shall be accomplished by one of the following:

- ***(a) Adopting measures that demonstrate that allowed land uses are consistent with the planned function of the transportation facility; or***
- ***(b) Amending the North Plains TSP or Comprehensive Plan to provide transportation facilities, improvements, or services adequate to support the proposed land uses; such amendments shall include a funding plan to ensure the facility, improvement , or service will be provided by the end of the planning period; or***
- ***(c) Altering land use designations, densities, or design requirements to reduce demand for automobile travel and meet travel needs through other modes of transportation; or***
- ***(d) Amending the planned function, capacity or performance standards of the transportation facility; or***
- ***e) Providing other measures as a condition of development or through a development agreement or similar funding method, specifying when such measures will be provided.***

(6) Exceptions. Amendments to the Comprehensive Plan or land use regulation with a significant effect on a transportation facility, where the facility is already performing below the minimum acceptable performance standard identified in the North Plains TSP or Comprehensive Plan, may be approved when all of the following criteria are met:

- ***(a) The amendment does not include property located in an interchange area, as defined under applicable law;***
- ***(b) The currently planned facilities, improvements or services are not adequate to achieve the standard;***
- ***(c) The currently planned facilities, improvements or services at a minimum mitigate the impacts of the amendment in a manner that avoids further degradation to the performance of the facility by the time of the development; and***
- ***(d) The road authority provides a written statement that the proposed funding and timing for the proposed development mitigation are sufficient to avoid degradation to the facility.***

Finding: The proposed UGB Expansion and Comprehensive Plan Text Amendment do not include changes to the Transportation System Plan or significantly affect a transportation facility. The proposal is to approve the UGB expansion area, but does not include land use designations or roadway alignments within the UGB area. A more detailed analysis of transportation system impact will be forthcoming with UGB Concept Planning. Approval of the proposed UGB Expansion and Comprehensive Plan Text Amendment will comply with the Transportation Planning Rule.

§155.129 Findings
Findings justifying a decision on an application shall be made in writing, and shall be provided to the applicant.

Finding: The City Council's final decision will include written findings. As the City is the applicant, they will have the findings.

§155.129 Conditions

The granting of an approval of any land use action under Chapter 16.200 may be subject to such conditions as are reasonably necessary to protect the public health, safety or general welfare from potentially damaging effects resulting from approval of the permit, or to fulfill the public need for service demands created by approval of the request.

Finding: Staff does not find it necessary to subject this decision to any conditions of approval.

CONCLUSION

The Planning Commission is considering a recommendation to the City Council of the proposed UGB expansion and comprehensive plan text amendment. The Planning Commission may recommend that the City Council approve, approve with Conditions or deny the proposal.

Staff recommends the Planning Commission recommend approval of City File Number **CPA 23-056(1)**, Urban Growth Boundary Expansion and Comprehensive Plan Text Amendment, to the City Council for a public hearing at their regularly scheduled meeting on June 5, 2023.

Housing Needs Analysis (HNA) Update

COMPLIANCE WITH CITY OF NORTH PLAINS MUNICIPAL CODE

COMPREHENSIVE PLAN & ZONING AMENDMENTS
§155.127 Review Criteria

(A) Text Amendment
An amendment to the text of the Comprehensive Plan or this Ordinance shall be based upon a need for such an amendment identified by the City Council or the Planning Commission. Such an amendment shall be consistent with the following review criteria:

- ***(1) Impact of the proposed amendment on land use and development patterns within the city, as measured by:***
  - ***(a) Traffic generation and circulation patterns in compliance with the Transportation System Plan (TSP);***
  - ***(b) Demand for public facilities and services, in compliance with the City utility master plans;***
  - ***(c) Level of park and recreation facilities;***
  - ***(d) Economic activities;***
  - ***(e) Protection and use of natural resources;***
  - ***(f) Compliance of the proposal with existing adopted special purpose plans or programs, such as public facilities improvements.***

Finding: The City Council and Planning Commission identified a need for this proposed update to the HNA to ensure the base residential land need assumptions used for the UGB expansion project were as up-to-date and reliable as possible. The proposed HNA update includes estimated residential land need through the year 2040, including supporting transportation and utility services. Park and recreation facilities are specifically included in the HNA with an estimated need of 40 acres over the planning horizon, as identified on Pages 60-61, Exhibit 57. Economic activities are addressed in the city's adopted Economic Opportunities Analysis (EOA). Chapter 2 of the HNA, and specifically Exhibits 5 and 6, include the Buildable Lands Inventory (BLI), which identifies natural resources (floodplain) and would identify any applicable special purpose plans or programs that would affect residential land growth. The provisions of this standard are met.

- ***(2) The proposed amendment complies with all applicable Statewide Planning Goals and administrative rule requirements.***

Finding: Oregon's 19 Statewide Planning Goals are addressed below. Though several of the goals are not applicable to the proposed update to the HNA, those that are applicable are responded to in detail.

***Goal 1* Citizen Involvement**

The proposed update to the HNA was reviewed by the North Plains Urban Growth Boundary Project Advisory Committee (UGB PAC), comprised of elected and appointed officials, community residents, local business owners and agency representatives. All UGB PAC meetings were open to the public with public comment opportunity. In addition, this land use process to approve the proposal is subject to a City of North Plains Type IV land use review, which includes a significant citizen involvement component. This process has been established by the city and determined to be consistent with this goal. The mandatory public notice of the action and decision, and the hearings on this case before the Planning Commission and City Council are all avenues of citizen participation.

***Goal 2* Land Use Planning**

This statewide goal requires that land use decisions 1) have an adequate factual base, 2) that alternatives have been considered, and 3) that implementation measures are consistent with and adequate to carry out comprehensive plan. The proposed HNA update is based on the 2020 certified population estimate from the PSU Population Research Center. The state of Oregon has determined this resource to be the factual basis on which cities shall base population growth assumptions. Through this HNA update and the concurrent UGB expansion process, the city identified and implemented several land use efficiency measures to accommodate as much of the projected growth as possible within the existing city limits. Alternative land use efficiency measures were considered and those projected to have the most impact on efficient development of land were adopted by the city. The proposed HNA update is consistent with the housing and urbanization chapters of the Comprehensive Plan, which are proposed to be updated in conjunction with this HNA and the UGB expansion project. Therefore, the proposed HNA update is consistent with and adequate to carry out the city's comprehensive plan.

***Goal 3* Agricultural Lands**

This goal does not apply because the City does not include area designated for agricultural use.

***Goal 4* Forest Lands**

This goal does not apply because the City does not include area designated for forest use.

***Goal 5* Open Spaces, Scenic and Historic Areas, and Natural Resources**

There are no proposed changes regarding Goal 5 open spaces, scenic and historic areas and natural resources. Therefore, the intent of this goal remains satisfied by the policies of the Comprehensive Plan and implementation in the Zoning Ordinance.

***Goal 6* Air, Water and Land Resources Quality**

There are no proposed changes regarding air, water, or land resources. Therefore, the intent of this goal remains satisfied by the policies of the Comprehensive Plan and implementation in the Zoning Ordinance.

***Goal 7* Areas Subject to Natural Hazards**

There are no proposed changes regarding areas subject to natural hazards. Therefore, the intent of this goal remains satisfied by the policies of the Comprehensive Plan and implementation in the Zoning Ordinance.

***Goal 8* Recreational Needs**

The proposed HNA update includes an analysis and identified need for 40 additional acres of parks and open space land to support the city's growth over the planning horizon. This analysis and identification of land need is consistent with Goal 8 as the city is accommodating the recreational needs of its current and future residents.

Goal 9 Economic Development There are no proposed changes regarding economic development. Therefore, the intent of this goal remains satisfied by the policies of the Comprehensive Plan and implementation in the Zoning Ordinance.

Goal 10 Housing
Goal 10 is "to provide for the housing needs of citizens of the state" by estimating population growth, establishing a buildable lands inventory and planning for residential land development to accommodate the need. The proposed HNA update includes the population growth estimate and buildable lands inventory needed by the city to provide for the housing needs of the current and future residents of North Plains and therefore this proposed HNA update complies with Goal 10.

Goal 11 Public Facilities and Services
There are no proposed changes to text regarding public facilities and services. Therefore, the intent of this goal remains satisfied by the policies of the Comprehensive Plan and implementation in the Zoning Ordinance.

Goal 12 Transportation
The Transportation Planning Rule (TPR), OAR 600-012.0060, requires that, where an amendment to a comprehensive plan or zoning regulation would significantly affect an existing or planned transportation facility, the local government shall put in place measures that assure that allowed land uses are consistent with the function, capacity, and performance standards of the facility. The proposed HNA update does not propose any changes to an existing or planned transportation facility and, as such, the HNA update does not affect the transportation system of the City.

Goal 13 Energy Conservation
There are no identifiable energy consequences of this land use action. The proposed text amendments will not result in any appreciable difference in waste production or recycling compared with development under the existing zoning.

Goal 14 Urbanization
The proposed update to the city's HNA will support the city's reasonable and efficient urbanization of UGB expansion areas. Land use efficiency measures were identified and adopted with the first phase of the UGB expansion project that will help accommodate some of the city's residential growth within the current city boundary. Additional growth projected between now and 2040 would need to be accommodated within an expanded UGB, which is being proposed in compliance with the provisions of Goal 14 for urbanization. This proposed updated HNA supports the city's continued compliance with Goal 14.

Goal 15 Willamette River Greenway
Goal 16 Estuarine Resources
Goal 17 Coastal Shorelands
Goal 18 Beaches and Dunes
Goal 19 Ocean Resources
The City is not within the plan boundary for the Willamette River Greenway, does not have any estuarine resources, and is not on the Oregon Coast, so goals 15 through 19 do not apply. As discussed above, the proposed update to the city's Housing Needs Analysis is generally consistent with all of the applicable Oregon Statewide Planning Goals.

(3) The amendment is appropriate as measured by at least one of the following criteria:
- ***(a) It corrects identified error(s) in the provisions of the plan.***
- ***(b) It represents a logical implementation of the plan.***
- ***(c) It is mandated by changes in federal, state, or local law.***
- ***(d) It is otherwise deemed by the City Council to be desirable, appropriate, and proper.***

Finding: The proposed updated HNA generally represents a logical implementation of the Comprehensive Plan and has been deemed by the City Council to be desirable, appropriate and proper to establish the city's residential land need through 2024. The proposed amendment is appropriate as measured by at least two of the criteria and this standard is met.

(4) Compliance with the statewide Transportation Planning Rule. When a development application includes

a Comprehensive Plan, Zone Map or Text Amendment, the proposal shall be reviewed to determine whether it significantly affects a transportation facility, in accordance with Oregon Administrative Rule (OAR) 660-012-0060, the Transportation Planning Rule. "Significant" means the proposal would:

- ***(a) Change the functional classification of an existing or planned transportation facility (exclusive of correction of map errors). This would occur, for example, when a street classification, requiring traffic to exceed the levels associated with a "collector" street classification, requiring a change in the classification to an "arterial" street as identified by the City's Transportation System Plan (TSP); or***
- ***(b) Change the standards implementing a functional classification system; or***
- ***(c) As measured at the end of the planning period identified in the North Plains TSP or Comprehensive Plan; or***
- ***(d) Reduce the performance of an existing or planned transportation facility below the minimum acceptable performance identified in the North Plains TSP or Comprehensive Plan; or***
- ***(e) Worsen the performance of an existing or planned transportation facility that is otherwise projected to perform below the minimum acceptable performance standard identified in the North Plains TSP or Comprehensive Plan.***

(5) Amendments that affect Transportation Plans. Except as provided in subsection 6 Exceptions, amendments to the Comprehensive Plan or land use regulations which significantly affect a transportation facility shall assure that allowed land uses are consistent with the function, capacity and level or service of the facility identified in the North Plains TSP. This shall be accomplished by one of the following:

- ***(a) Adopting measures that demonstrate that allowed land uses are consistent with the planned function of the transportation facility; or***
- ***(b) Amending the North Plains TSP or Comprehensive Plan to provide transportation facilities, improvements, or services adequate to support the proposed land uses; such amendments shall include a funding plan to ensure the facility, improvement , or service will be provided by the end of the planning period; or***
- ***(c) Altering land use designations, densities, or design requirements to reduce demand for automobile travel and meet travel needs through other modes of transportation; or***
- ***(d) Amending the planned function, capacity or performance standards of the transportation facility; or***
- ***(e) Providing other measures as a condition of development or through a development agreement or similar funding method, specifying when such measures will be provided.***

(6) Exceptions. Amendments to the Comprehensive Plan or land use regulation with a significant effect on a transportation facility, where the facility is already performing below the minimum acceptable performance standard identified in the North Plains TSP or Comprehensive Plan, may be approved when all of the following criteria are met:

- ***(a) The amendment does not include property located in an interchange area, as defined under applicable law;***
- ***(b) The currently planned facilities, improvements or services are not adequate to achieve the standard;***
- ***(c) The currently planned facilities, improvements or services at a minimum mitigate the impacts of the amendment in a manner that avoids further degradation to the performance of the facility by the time of the development; and***
- ***(d) The road authority provides a written statement that the proposed funding and timing for the proposed development mitigation are sufficient to avoid degradation to the facility.***

Finding: The proposed updated HNA does not include changes to the Transportation System Plan or significantly affect a transportation facility. The proposed updated HNA is in compliance with the Transportation Planning Rule.

§155.129 Findings
Findings justifying a decision on an application shall be made in writing, and shall be provided to the applicant.

Finding: The City Council's final decision will include written findings. As the City is the applicant, they will have the findings. §155.129 Conditions The granting of an approval of any land use action under Chapter 16.200 may be subject to such conditions as are reasonably necessary to protect the public health, safety or general welfare from potentially damaging effects resulting from approval of the permit, or to fulfill the public need for service demands created by approval of the request. Finding: Staff does not find it necessary to subject this decision to any conditions of approval.

CONCLUSION

The Planning Commission is considering a recommendation to the City Council of the proposed updated Housing Needs Analysis (HNA). The Planning Commission may recommend that the City Council approve, approve with Conditions or deny the updated HNA. Staff recommends the Planning Commission recommend approval of City File Number CPA 23056(2), updated Housing Needs Analysis, to the City Council for a public hearing at their regularly scheduled meeting on June 5, 2023.

INTRODUCTION

The City of North Plains is a rural residential community located in western Washington County on the western fringe of the Portland metropolitan area. Platted in 1910, the community was incorporated in 1963. In 1980 the community had approximately 750 residents. By 2010, the population reached 1,970, and by 2021, the certified population estimate was 3,455. Population ~~population~~ forecasts indicate that the City will continue to grow rapidly.

While maintaining its small town character, the citizens and elected officials of North Plains look to continued growth and prosperity. To this end, the City has embarked on a comprehensive land use planning process designed to:

- Address the statewide planning goals of the Land Conservation and Development Commission (LCDC);
- Encourage orderly and coordinated urban growth and provide urban level services in an efficient and economic manner;
- Enhance community livability and encourage economic expansion; and
- Preserve the community's character and natural resources for future generations.

TERMINOLOGY USED IN COMPREHENSIVE PLAN

GOAL: The Statewide Planning Goal as determined by the State Legislature and administered by the Land Conservation and Development Commission.

OBJECTIVE: The specific City concerns toward which effort is to be directed.

POLICY: The policy statements set forth a guide to City courses of action which are intended to carry out the Goals and Objectives of the Plan. The policy statements present to City officials and potential developers a clear picture of the City Council's position on matters pertaining to physical improvements and developments.

PLAN ELEMENT: A section of the Plan. Each section begins with a general statement of conclusions on which the policies are based.

INVENTORY: The known facts (supportive material) that are applicable to the plan element.

IMPLEMENTATION: The process by which policy will be realized in the community.

VISION STATEMENT

The people of the City of North Plains have seen many changes in their community. They have decided to create this Vision Statement as the foundational document for:

1. Taking a pro-active approach to controlling their own destiny by creating a new community identity for the Year 2035.

2. Improving their ability to accommodate future growth by expanding their jurisdictional boundaries, where appropriate.

3. Enhancing the livability of and encouraging pride in the community by stressing the City's unique character that includes, but is not limited to, North Plains' agricultural and forest products, railroad legacy and pioneer heritage. To plan for growth that is compatible and well-connected with the existing city, the City shall make a livable, walkable community a key element of the City's future.

4. Striving to be a complete community that provides a place for its citizens to live, work, shop and have convenient access to schools, and maximizes access to fire, life and safety services.

5. Striving also to be a sustainable community by providing jobs and services within the city. Maintaining a compact urban form while having access to jobs and services will reduce the reliance on the automobile and vehicle miles traveled. This will lead to improvement in air quality and further enhancement of the livability of North Plains.

6. Providing guidance to the City for interpreting and amending the Comprehensive Plan and Zoning and Development Ordinance.

NORTH PLAINS VISION STATEMENT

In the year 2035, residents of North Plains enjoy a safe and welcoming community as a livable place for people of all ages. North Plains is an independent community within Washington County that maintains a small town character while accommodating current and future residents. Citizen participation is strong and community members can see the results of their involvement. Community gathering places and events form the heart of North Plains.

Community

Our events are inclusive and connect neighbors frequently. Residents and visitors enjoy events such as the North Plains Elephant Garlic Festival and a rich variety of social and cultural activities to celebrate the city, its history and its people. North Plains' residents are active and engaged in civic events and decision-making processes.

Neighborhoods

Historic structures are maintained and rehabilitated to accommodate new homes and businesses. There is a range of quality housing for all ages and income levels. Housing is attractive, compatible and builds upon historic North Plains' patterns. Land uses and housing types transition cohesively among neighborhoods.

Connectivity

North Plains is a well planned and connected city where residents and visitors enjoy pedestrian and bicycle paths between neighborhoods and to downtown. Walking is safe. Bicyclists understand designated routes and share the road safely. North Plains is connected to surrounding recreational, economic and cultural amenities.

Economic Opportunity

Downtown North Plains retains its old town atmosphere and is a vibrant, walkable, attractive place to shop, dine and gather. Glencoe Road and Commercial Street supply business-friendly, mixed-use areas for residential and commercial development. Employment areas provide land for industrial and other employment opportunities. Proximity to US 26 provides easy access to well paying jobs in the region. North Plains is recognized as a gateway to the Oregon Coast.

Heritage & Natural Resources

North Plains' agricultural heritage is visible and accessible in places like Lakeview Farms. City policies preserve natural assets and areas, such as McKay Creek and Ghost Creek tributaries.

ENVISION NORTH PLAINS' FUTURE

Public Services

North Plains' families and visitors enjoy the City's parks, trails, community center and recreational opportunities. The library continues its vital role as a place of learning. Residents value first responders, community policing, fire prevention and emergency preparedness. Proficient government agencies maintain existing city assets and coordinate future development. Transportation routes for freight, automobiles, bicycles and pedestrians are well-marked and communicated. Parks and recreation activities are easily accessible, including walking, bicycling and golfing.

CITIZEN INVOLVEMENT

The opportunity for active participation by residents and landowners in the preparation of a community's comprehensive plan is not just mandated by state law, but is the only realistic means of assuring that the community's planning efforts will be worthwhile and meaningful endeavors.

A community's leaders must not only provide the public with a chance to view and respond to the planning documents and studies, but also affirmatively seek out the involvement of the community's citizens. Otherwise, all of the citizen feedback will come during the final hearings on the plan and a great deal of it may be negative due to the lack of participation throughout the process. Furthermore, small communities, such as the City of North Plains, do not have the resources to prepare, adopt, and revise plans that have limited support from its citizens.

Goal 2 of the Statewide Planning Goals also provides that "opportunities shall be provided for review and comment by citizens and affected governmental units during preparation, review, and revision of plans and implementation ordinances." Just as the involvement of North Plains' residents is important to preparation of the plan, review by providers of governmental services (e.g., Washington County, Hillsboro, School District, Tualatin Valley Fire & Rescue), public utilities (e.g., power, gas, and communications), and transportation services (e.g., public transit, railroad) is essential.

The community's businesses and industries also must be involved, as these activities are not only often strongly influenced by the results of a comprehensive planning effort, but are also, due to their impact on the economic health of the area through payrolls and taxes, often an important means by which the goals and objectives of a community may be achieved.

Many of the mechanisms for involvement of the area's residents are also appropriate for governmental, public utility, and transportation providers as well as businesses and industries.

STATEWIDE PLANNING GOAL 1

To develop a Citizen Involvement Program that insures the opportunity for citizens to be involved in all phases of the planning process.

CITY OBJECTIVES AND POLICIES

1. **OBJECTIVE: To maintain an effective Citizen Involvement Program, recognize an official body Committee for Citizen Involvement (CCI) to be responsible for overseeing and reviewing the effectiveness and impact of the program (ORS 197.160(b)).**

   POLICIES:

   1) The Citizen Involvement Program will be directed by the City's Planning Commission sitting as the Committee for Citizen Involvement.
   2) The Planning Commission shall evaluate the City's Citizen Involvement Process annually and report its findings in writing to the City Council along with recommendations as appropriate for improving the program.

2. **OBJECTIVE: To recognize the need for a number of different forms of communication in the Citizen Involvement Program.**

   POLICIES:

   1) Information about the City's planning activities and notices of upcoming meetings shall be included in the City newsletter.
   2) Notices of public hearings regarding the plan shall be mailed to all persons within the affected area and affected agencies.
   3) Opportunities to present the planning process before community organizations shall be actively sought.
   4) Maintain a dedicated webpage on the City's website to provide information about current and historic planning processes and documents.

3. **OBJECTIVE: To provide citizens the opportunity to be involved in all phases of the planning process.**

   POLICIES:

   1) Citizen assistance in the preparation of each phase of the planning process shall be actively encouraged.
   2) Strategies to reach underrepresented populations shall be implemented, as needed.

4. **OBJECTIVE: To present technical information that serves as the foundation of the plan in an understandable form.**

   POLICIES:

   1) Information necessary to reach policy decisions shall be available in a simplified and understandable form.
   2) Upon written request, information shall be made available in languages other than English within 10 working days.
   3) A copy of all technical information shall be available at the North Plains City Hall and on the City's website. Upon written request, assistance in interpreting and using technical information shall be provided within 10 working days.

5. **OBJECTIVE: To ensure all citizens receive a response from policy makers.**

   POLICIES:

   1) Recommendations resulting from the citizen involvement program shall be retained and made available for public assessment. Citizens who have participated in this program shall receive a response from policy makers. The rationale used to reach land use policy decisions shall be available in the form of a written record.

6. **OBJECTIVE: To allocate adequate human, financial, and informational resources to the Citizen Involvement Program.**

   POLICIES:

   1) The level of funding and human resources allocated to the Citizen Involvement Program should be an amount that will make citizen involvement an integral part of the planning process.

LAND USE PLANNING

The North Plains Comprehensive Plan was compiled and adopted in March 2000. In 2014, the City determined that a major revision to the Comprehensive Plan was necessary to address rapid population growth. Over the next four years, the City completed the following tasks in preparation for the Comprehensive Plan update:

- Reviewed the North Plains Comprehensive Plan and Development Code
- Made revisions to streamline and clarify the Development Code
- Prepared an economic opportunities analysis
- Prepared a housing needs analysis and buildable lands inventory
- Conducted a community design study and public workshop
- Updated the North Plains Parks and Recreation Master Plan
- Initiated an update to the Transportation System Plan

The City ~~is~~ used ~~using~~ the information compiled in these planning documents to prepare the 2019 North Plains Comprehensive Plan. The process was ~~is~~ guided by the Comprehensive Plan Work Group comprised of residents, business owners and elected officials. The Comprehensive Plan consists of:

- Vision – developed through a community-wide process
- Elements – correspond to applicable Oregon Statewide Planning Goals and consist of background information, goals, objectives and policies
- Inventories – the known facts and supportive materials that are applicable to the plan element
- Land Use Map – depicts a long-term vision of how and where the city will grow over the next 20 years

The 2019 Comprehensive Plan ~~is scheduled to be~~ was adopted in ~~May~~ June 2019. ~~Once adopted, the~~ The Plan ~~becomes~~ is the official policy statement of the City Council of the City of North Plains. The City will interpret the standards and requirements of the text and maps of the Comprehensive Plan pursuant to the adopted process. The City Council shall have final authority for the interpretation of the plan when such matters come before the City Council for consideration.

~~Upon completion of those revisions, the~~ The City will reviews and updates the Development Code on an on-going basis to ensure it is aligned with the Comprehensive Plan. The City expects to review the Comprehensive Plan approximately every 10 years to ensure the Plan remains a workable framework for development.

Land use categories ensure an adequate supply of land for residential, commercial and industrial development purposes and other uses that provide for a complete community. The following land use categories have been developed for use in the Comprehensive Plan map, which serves as the basis for the City's zoning map:

Residential: Historically, about 85% of North Plains housing was single-family detached. In order to address the City's housing needs identified in the housing needs analysis, the City will provide opportunity for development through zoning policies. ~~sufficient to allow: 70% of new housing will be single-family detached, 30% will be single-family attached and multi-family.~~ While 70% of new housing in North Plains is forecast to be single-family detached, the City will need to provide opportunities for development of new single-family attached (10% of new housing) and new multifamily (20% of new housing), which includes a wide range of housing types (e.g., duplexes, triplexes, apartments).

> *Low Density Residential:* Areas suited primarily for development of single family dwellings at a density not to exceed 5.8 dwelling units per net acre (a minimum lot size of 7,500 square feet per single family dwelling). Corresponds to R7.5 on the zoning map.
>
> *Medium Density Residential:* Areas suited for development of single dwellings, duplexes, attached two family and manufactured home parks and subdivisions at a density not to exceed 9.6 single-family detached, duplex or triplex dwelling units per net acre (a minimum lot size of 5,000 square feet per lot). The density of townhomes is not to exceed 14.5 dwelling units per net acre (a minimum lot size of 3,000 square feet per lot). Corresponds to R5 on the zoning map.
>
> *High Density Residential:* Areas suitable primarily for multi-family dwellings and manufactured home parks and subdivisions including townhouses (single-family attached dwellings). In this category, residential densities are not to exceed 21.8 dwellings units per net acre for new townhouse, multifamily and cottage cluster developments (a minimum lot size of 2,000 square feet per dwelling unit). The density of duplexes and triplexes shall be based on the minimum required lot size of 3,000 square feet for this type of dwelling. Corresponds to R2.5 on the zoning map.

Neighborhood Community: This comprehensive plan designation ~~is~~ was designed for the non-exception expansion areas brought into the City's urban growth boundary (UGB) in 2003 to 2023 ~~or after~~. This designation recognizes that a concept planning effort will be conducted prior to annexation into the city limits. The Concept Plan ensures a mix of residential and non-residential uses that meet the needs of the City.

~~Once land is annexed, a Master Plan is required prior to development of any portions of those areas. The master planning process should recognize the land needs identified in the Concept Plan. More information on growth management can be found in the section on Urbanization. Corresponds to Neighborhood Community (NC) on the zoning map.~~

Commercial: Encourages development of commercial uses supportive of the surrounding community and visitors. Includes areas to accommodate retail trade, service, banking, office and related cultural and governmental uses. Corresponds to C1 (General Commercial) and C2 (Highway Commercial) on the zoning map.

Industrial: Areas appropriate for wholesale trade and manufacturing activities. Corresponds to Light Industrial (M1) and General Industrial (M2) on the zoning map.

Public Facilities: Areas for necessary institutional uses such as schools and churches, and public and semipublic uses such as parks, a local government center and other governmental and public service uses. Corresponds to Institutional and Public Use Zone (IPU) on the zoning map.

In addition, three overlay zones have been created:

Flood Plain: Denotes areas lying within the 100-year flood plains of McKay Creek and Ghost Creek as shown in the comprehensive plan chapter on Goal 7.

for proposed alterations and demolitions.

Significant Natural Resources: Identifies significant natural resources, including significant wetlands and riparian corridors as identified in comprehensive plan chapters on Goal 5 and Goal 7.

STATEWIDE PLANNING GOAL 2

To establish a land use planning process and policy framework as a basis for all decisions and actions related to use of land and to assure an adequate factual basis for such decisions.

CITY OBJECTIVES AND POLICIES

1. **OBJECTIVE: To maintain a Comprehensive Plan that identifies issues, inventories and related data for use in the land use planning and decision making process.**

   POLICIES:

   1) Maintain a Comprehensive Plan that designates a range of land use areas based on findings with respect to:
      - Natural resource capacity and environmental quality;
      - Projected population and economic growth;
      - Location and capacity of services;
      - Existing land use patterns;
      - Projected land use needs;
      - Community land use needs; and
      - Energy conservation and resources.

   2) Keep the Comprehensive Plan and supporting documents on file and available to the public through the City Recorder at the North Plains City Hall.

2. **OBJECTIVE: To provide opportunities to community members and potentially affected government agencies to give input during the preparation, review and revision of plans and implementing ordinances by the City.**

   POLICIES:

   1) Encourage and provide ample opportunity for community members to provide input into the planning process for the City.
   2) Use intergovernmental agreements with Washington County and other public agencies as needed to establish areas of mutual interest and coordination procedures relative to urban growth management and green corridors.

3. **OBJECTIVE: To review the Comprehensive Plan and implementing ordinances periodically so that the City can keep the planning process dynamic and the comprehensive plan responsive to change.**

   POLICIES:

   1) Review the Comprehensive Plan and update or amend the plan every ten years.
   2) Review data inventories and projections used in the Comprehensive Plan as part of the update.

4. **OBJECTIVE: To ensure the Comprehensive Plan is the basis for specific implementation measures which are consistent with and adequate to carry out the Comprehensive Plan.**

POLICIES:

1) Development proposals shall be required to conform to the City's Zoning, Subdivision and Design Review Ordinances.

NATURAL RESOURCES, SCENIC AND HISTORIC AREAS, AND OPEN SPACES

The McKay Creek flood plain includes other resources which may include riparian corridors, wetlands, and stream corridors. Development in such areas is restricted by the City's Significant Natural Resources Overlay Zone and flood plain ordinance. The only allowable alteration of the flood plain is governed by the flood plain ordinance.

Based on the resource inventory, the City of North Plains contains no known:

- Rare or endangered species of flora and fauna;
- Commercially valuable mineral and aggregate resources;
- Outstanding scenic views and sites;
- Indigenous energy sources;
- Wilderness areas;
- Potential and approved Oregon recreation trails; or
- State/Federally designated wild and scenic waterways.

STATEWIDE PLANNING GOAL 5

To conserve open space and protect natural and scenic resources.

CITY OBJECTIVES AND POLICIES

1. **OBJECTIVE: To protect and enhance the natural resources of the area through proper use and development, especially McKay Creek and its tributaries.**

   POLICIES:

   1) Protect the fish and wildlife habitats in the McKay Creek and Ghost Creek stream corridors through application of its design review, zoning and significant natural resources and flood plain overlay zone districts.

2. **OBJECTIVE: To continually explore ways to develop and maintain an open-space network.**

   POLICIES:

   1) Maintain and update the master storm water management plan to encourage preservation of all natural drainageways.
   2) Provide and preserve greenways and open space along creeks or other water features for recreational purposes and visual aesthetics.

3. **OBJECTIVE: To identify sites and structures relating to the history of the State and the City that should be identified, protected and enhanced.**

POLICIES:

1) Utilize the Historic Resource Overlay District to identify and protect significant historic sites and structures. The City's list of significant historic sites and structures shall be maintained in the Comprehensive Plan Inventory.
2) Develop a program using public and private resources to revitalize those older residential structures which have been identified as having some historical or architectural significance.
3) Investigate the possibilities of receiving funding and tax benefits from the federal, state, and local levels in order to support historic preservation.
4) Cooperate with the Washington County Museum and the State Historic Preservation Office to identify and protect significant cultural resources.
5) Recognize and comply with applicable State and Federal Statutes governing the protection of cultural resources.
6) Seek to protect all archaeological sites found in the city.

4. **OBJECTIVE: To protect the groundwater supply essential to clean water and natural vegetation.**

POLICIES:

1) Work to preserve and maintain the quality of groundwater.

AIR, WATER AND LAND RESOURCES QUALITY

The City of North Plains maintains air and water quality, and noise level standards in accordance with the following federal laws:

- Clean Air Act (42 U.S.C. Section 7401 et seq);
- Clean Water Act (33 U.S.C Section 1251-1376);
- Safe Drinking Water Act (42 U.S.C. Section 300f et seq);
- Resource Conservation and Recovery Act (U.S.C. Section 6901 et seq);
- Noise Control Act (42 U.S.C. Section 4901 et seq);

and state laws:

- Pollution Control (ORS 468);
- Sewage Treatment & Disposal System (ORS 454);
- Solid Waste Control Act (ORS 467); and
- Noise Control Act (ORS 467)

AIR QUALITY

Air quality is monitored by the Oregon Department of Environmental Quality (DEQ). According to the 2015 Oregon Air Quality Data Summaries (July 2016) the Hillsboro area, which is the nearest monitoring point, generally enjoys good air quality. As Washington County grows in population more detailed information is developed to describe the air quality. The Hillsboro area is regularly monitored for a variety of pollutants of which the greatest concern are:

- Fine particulate matter mostly from wood smoke, other combustion sources, cars and dust, known as PM2.5 (2.5 micrometers and smaller diameter)
- Air toxics, such as benzene and acetaldehyde
- Ground-level ozone, commonly known as smog
- Greenhouse gas (GHG) emissions

The following scale is used to interpret the air quality condition:

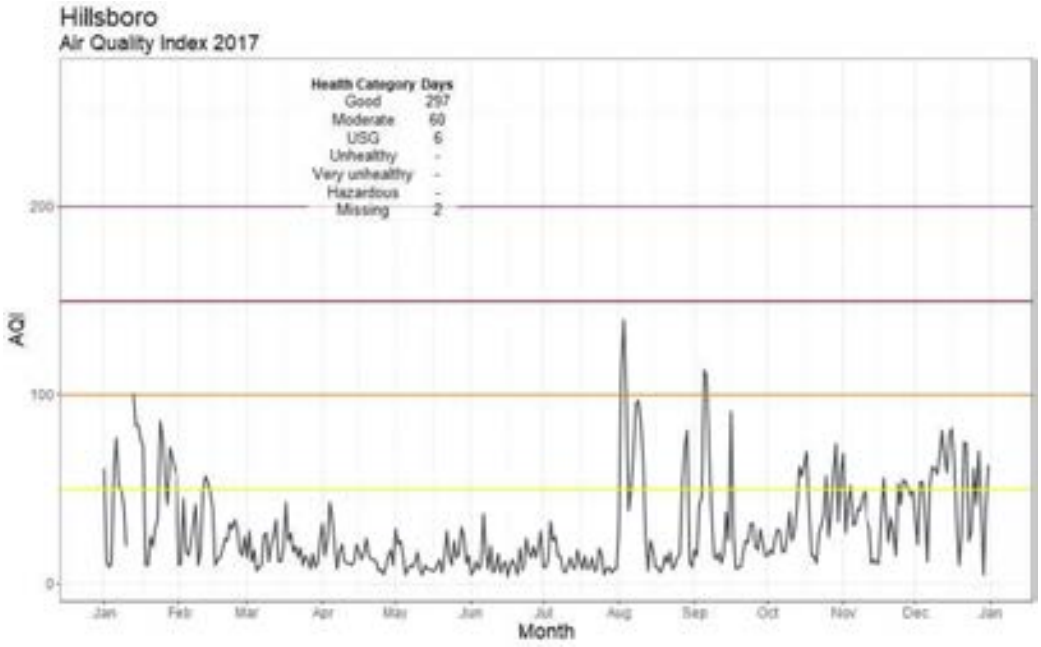
Air Quality Condition Scale

Air Quality	AQI	Health Advisory
Good	0-50	No health impacts expected .
Moderate	51-100	Unusually sensitive people should consider reducing prolonged or heavy outdoor exertion.
Unhealthy for Sensitive Groups	101-150	People with heart disease, respiratory disease (such as asthma), older adults, and children should reduce prolonged or heavy exertion. Active healthy adults should also limit prolong outdoor exertion.
Unhealthy	151-200	People with heart disease, respiratory disease (such as asthma), older adults, and children should avoid prolonged or heavy outdoor exertion. Everyone else should reduce prolonged or heavy outdoor exertion.
Very Unhealthy (Alert)	201-300	People with heart disease, respiratory disease (such as asthma), older adults, and children should avoid all physical activity outdoors. Everyone else should avoid prolonged or heavy exertion.

Air Quality Index Summary, Per Day 2006 – 2015

Year	Good	Moderate	UFSG	Unhealthy	Missing
2006	311	48	1	3	2
2007	306	48	10	1	0
2008	310	51	4	0	1
2009	288	62	7	0	8
2010	331	33	1	0	0
2011	308	50	7	0	0
2012	302	58	2	1	3
2013	281	71	8		4
2014	324	40	1	0	2
2015	309	54	1	1	0

When graphed, air quality in Hillsboro shows clear trends. Air quality tends to be best in the late spring, and the poorest in the winter months, when the air is more still and particulates cannot disperse. Forest fires can have a significant impact and were the cause of several spikes during the late summer months in 2017.



WATER QUALITY

The City operates and maintains the city's water system and is committed to delivering safe, high quality water to meet the health needs of residents and businesses. North Plains' water comes from the Tualatin River and is purchased from the City of Hillsboro and the Joint Water Commission. The City meets all state and federal requirements. Crews regularly inspect and service the water system. The City also administers a cross connection program to prevent contamination of the water supply by private wells. The Oregon Drinking Water Quality Act (OAR 333-061) implements state and national standards that limit the amount of contaminants in water provided by public water systems. The Water Quality Table below lists all of the drinking water contaminants that were detected in 2017.

Water Quality Table, City of North Plains, 2017

Contaminants	MCLG or MRDLG	MCL, TT, or MRDL	Your Water	Range Low	Range High	Sample Date	Violation	Typical Source
Disinfectants & Disinfectant By-Products								
(There is convincing evidence that addition of a disinfectant is necessary for control of microbial contaminants)								
Haloacetic Acids (HAA5) (ppb)	NA	.06	.03	NA		2017	No	By-product of drinking water chlorination
TTHMs [Total Trihalomethanes] (ppb)	NA	.08	.02	NA		2017	No	By-product of drinking water disinfection
Inorganic Contaminants								
Nitrate [measured as Nitrogen] (ppm)	10	10	0.49	0.12	0.49	2017	No	Runoff from fertilizer use; Leaching from septic tanks, sewage; Erosion of natural deposits

Wastewater treatment for North Plains is provided by Clean Water Services (CWS) at its Hillsboro facility. Since completion of the Hillsboro facility expansion in 1997, every parameter of the National Pollution Discharge Elimination System (NPDES) permit has been met.

NOISE, LIGHT AND ODOR POLLUTION

DEQ monitors noise pollution in the State of Oregon. The State has standards for motor vehicles, industry and commerce, motor sports vehicles and facilities and airports. Enforcement of these standards is conducted by DEQ. The single largest source of noise in the community is Highway 26 on the southern city limits. A moderate amount of noise can be heard at all hours of the day associated with freeway traffic. Vehicular traffic on local streets also is commonly heard at moderate levels. The Portland Hillsboro Airport is located nearby. Intermittent jet, airplane and helicopter traffic can be heard in North Plains. Burlington Northern Railway operates trains through town 2-6 times per day, mostly in the evening and early morning hours. While the trains do not stop they are required by Federal Law to signal their presence with horns. Several industrial facilities are located in and near the city, including Oregon Canadian Forest Products which operates a lumber mill on the eastern end of the City. Some noise also can be heard from industrial facilities in Cornelius off Vadis Road. Generally these facilities only operate day and swing shifts, and cannot be heard during evening hours. Locally, the City enforces the nuisance ordinance which addresses local sources of noise not regulated by the State or Federal government.

Light pollution has become a problem in many cities and rural communities. Light pollution disturbs wildlife, wastes energy and obscures the night sky. The City should consider local ordinances and regulations to minimize light pollution and glare, and preserve dark skies as a feature of rural character.

Emissions to the land, air or water can result in nuisance conditions that harm quality of life. State laws prohibit regulated facilities or sources from emitting odors which cause a nuisance. DEQ is responsible for implementing those laws and has developed a strategy for responding to odor complaints. The City should consider ways to support DEQ in efforts to prevent persistent and noxious odors from impacting its residents and businesses.

STATEWIDE PLANNING GOAL 6

To maintain and improve the quality of the air, water, and land resources of the state.

CITY OBJECTIVES AND POLICIES

1. **OBJECTIVE: To ensure all discharges from existing and future development are within the limits set forth in applicable state or federal environmental quality statutes and standards.**

   POLICIES:

   1) Enforce standards that enhance air and water quality, reduce noise and light pollution and meet or exceed state and federal environmental quality standards.
   2) Participate in appropriate environmental quality planning efforts on a regional level.
   3) Educate residents about and encourage them to prevent nonpoint source pollution.
   4) Encourage lighting design and practices that reduce the negative impacts of light pollution, including sky glow, glare, energy waste, impacts to public health and safety, disruption of ecosystems and hazards to wildlife.
   5) Explore measures to prevent nuisance odors from causing negative impacts to residents and businesses.

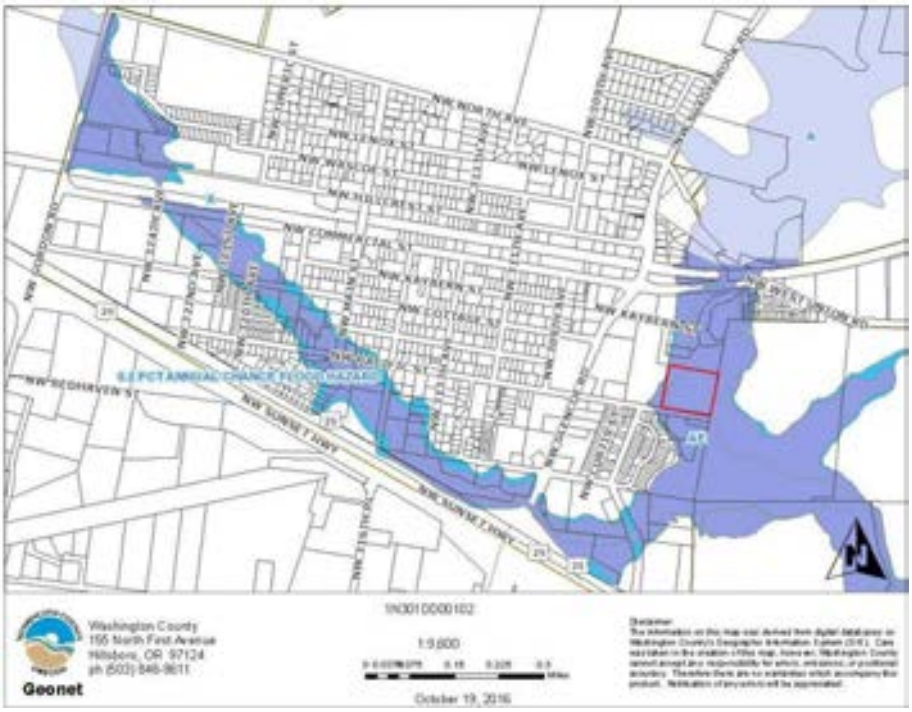
NATURAL HAZARDS

AREAS SUBJECT TO NATURAL DISASTERS AND HAZARDS

Steep slopes pose no significant hazard to development within the City of North Plains. However, there is a potential threat to life and property due to the following.

FLOODING

The City works with the Federal Emergency Management Agency (FEMA) to periodically update the delineation of the 100-year flood plain. The City contains approximately 77 acres of land located within the 100-year flood plain of McKay Creek, which lies at the eastern edge of the City, and Ghost Creek, a tributary that traverses the City from its northwest to southeast corners.



SOIL LIMITATIONS

Approximately 14% of the soils in North Plains have “moderate potential” for shrink-swell, which affects the stability of building foundations and roadways. Approximately 13% of the soils in the community are identified as having a seasonable high water table within 24 inches of the surface, which affects construction and development. Most of these soils are associated with or are in the vicinity of the 100-year flood plains.

STATEWIDE PLANNING GOAL 7

To protect people and property from natural hazards.

CITY OBJECTIVES AND POLICIES

1. **OBJECTIVE: To concentrate urban uses on suitable lands based on research of available information showing the absence of known hazards including but not limited to flooding, unfavorable soil conditions, and seasonally high water table.**

   POLICIES:

   1) Require specific information clearly identifying the degree of hazard present from applicants who seek approval to develop residential, commercial, or industrial uses within known areas of natural disasters and hazards.
   2) Prohibit development or land form alterations in areas with natural development limitations except upon showing that design or engineering techniques can eliminate any public harm or adverse effects to surrounding persons or properties.

2. **OBJECTIVE: To limit development in flood plains and natural drainageways.**

   POLICIES:

   1) Permit limited use of certain flood plain lands for recreational and agricultural purposes which do not endanger public health, safety or welfare.
   2) Any alteration to a drainageway shall be engineered and constructed in a manner to allow for the least possible change in the natural flow of water which existed prior to the alteration.
   3) To not allow construction or grading that will:
      - Cause any restriction which could cause backup of water and flood upstream properties;
      - Cause an increase in flow rate to downstream properties; or
      - Cause an increase of flood potential for the property which is undergoing alteration.
   4) Rely on the most recently adopted flood plain maps provided by the Federal Government as the basis for the flood plain Overlay District.
   5) Utilize the flood plain Overlay District to accomplish these policies, which will apply to private land owners, as well as city, county, and state projects.

3. **OBJECTIVE: To protect life and property from harm or loss due to construction on weak foundation soils.**

POLICIES:

1) Maintain procedures to advise applicants for development permits of the areas known to have a potential for weak foundation soils.
2) Require a soils report by a qualified soils engineer or consulting geologist licensed or registered by the State of Oregon in areas of known weak foundation soils.

4. **OBJECTIVE: To protect life and property from harm or loss due to activity or construction in areas of high groundwater.**

POLICIES:

1) Establish land development policies and regulations which take into consideration existing and evolving groundwater conditions.

RECREATION

The City of North Plains currently manages 6.24 acres of land designated as parks, open spaces, trails and recreation facilities. The City has three developed mini parks: Pacific Purple, LaMordden and Frank Wing Parks. Jessie Mays Park is North Plains' only neighborhood park and includes a Community Hall and picnic areas. Vern Galaway Park is a trailhead for the McKay Creek Trail. When Sunset Ridge Park is added to the existing park inventory, the total park acreage will increase to 7.24.

North Plains Elementary School has 10 acres of sports fields, playgrounds and recreation facilities that are available to the public during non-school hours. The McKay Creek Crossing, Sunset Terrace and Cottage Point Open Spaces are privately owned and the Community Garden on Commercial Street is leased by the City from a private property. Other outdoor activities, such as horseback riding, hiking, fishing, biking, gliding, golf, zipline, camping, and disc golfing are available in the surrounding countryside. The City of North Plains provides limited parks and recreation programs. Additional recreation programs are available through the North Plains Senior Center, Hillsboro School District and the City of Hillsboro Parks Department.

In the most recent Parks and Recreation Master Plan, the City determined that existing facilities are inadequate to meet future population growth needs. The Master Plan includes a list of needed improvements for existing park facilities and a need to acquire more park land to accommodate future growth. This includes the acquisition and development of at least one new community park and smaller improvements throughout the park system to enhance accessibility, safety and usability of park features. To connect North Plains' residents to destinations throughout the City and provide options for walking and biking, the Plan proposes development of 5.5 miles of new trails. Several of these new trail connections follow creekways to connect residents to nature and between parks.

NORTH PLAINS PARKS AND RECREATION VISION

To provide our community with safe parks, open spaces, recreational opportunities and a trail system that connects all neighborhoods, parks, schools and regional trails to enhance health and livability.

STATEWIDE PLANNING GOAL 8

To satisfy the recreational needs of the citizens of the state and visitors.

CITY OBJECTIVES AND POLICIES

1. **OBJECTIVE: To encourage and support public involvement in park and recreation issues.**

   POLICIES:

   1) Support the Parks & Recreation Board as the forum for public discussion of parks and recreation issues and conduct joint sessions as necessary between Board and City Council to improve coordination and discuss policy matters of mutual interest.
   2) Involve residents and stakeholders in park and recreation facility planning and design in order to solicit community input, facilitate project understanding and engender public support.
   3) Continue to promote and distribute information about recreational activities, programs, community services and events, and volunteer activities sponsored by the City and partner agencies and organizations.
   4) Use a variety of methods, such as the City's website, social media and news articles, to publicize and increase resident awareness about recreational opportunities available in local neighborhoods and citywide.
   5) Prepare, publish and promote a park and trail facilities map for online and print distribution to highlight existing and proposed sites and routes.
   6) Promote volunteer park improvement, beautification and clean-up projects from a variety of individuals, service clubs, churches and businesses.
   7) Promote and expand special events and recreational programming to enhance community identity, community activity and environmental education.

2. **OBJECTIVE: To acquire and develop a high-quality, diverse system of parks that provides adequate and equitable park access to all residents.**

   POLICIES:

   1) Provide a level of service standard of 6.25 acres per 1,000 residents of developed core parks (community, neighborhood and mini parks).
   2) Strive to provide a distributed network of parks and trails, such that all city residents live within one-half mile of a developed park.
   3) Provide a variety of active and passive park features and amenities, distributed equitably throughout the park system, to ensure residents have access to a range of park and recreation experiences.
   4) Identify and prioritize lands for inclusion in the parks system based on their potential contribution to level of service, ability to serve currently underserved residents, opportunities to improve connectivity, and provide enhanced recreational opportunities for residents.

5) Develop and maintain minimum design and development standards for park and recreation amenities within private developments to address community facility needs, equipment types, accessibility and installation procedures.

6) Formulate illustrative master plans for the development or redevelopment of each City park, as appropriate, to take advantage of grant or other funding opportunities.

3. OBJECTIVE: To preserve distinctive natural areas and features for their scenic, recreation and habitat value, as well as their contribution to North Plains' rural atmosphere, including riparian habitat along McKay and Ghost Creeks.

POLICIES:

1) Pursue low-cost and/or non-purchase options to preserve natural areas, including conservation easements, development agreements, and partnerships with public agencies.

2) Prioritize the preservation of natural drainageways, wetlands, and areas that are flood-prone as natural areas.

3) Coordinate with adjacent jurisdictions, Washington County and Clean Water Services to plan for and create a regional habitat corridor along McKay Creek and its tributaries.

4) Manage vegetation in natural areas to support or maintain native plant and animal species, habitat function and other ecological values; remove and control non-native or invasive plants as appropriate.

4. OBJECTIVE: To plan for a parks system that is efficient to maintain and operate, while protecting capital investment.

POLICIES:

1) Develop and maintain all parks and facilities in a manner that keeps them in safe and attractive condition. Repair or remove damaged components immediately upon identification. Maintain and update an inventory of assets including condition and expected useful life.

2) Design and maintain parks and facilities to offer universal accessibility for residents of all physical capabilities, skill levels and age as appropriate; assess planned and existing parks and trails for compliance with the recently adopted Americans with Disabilities Act (ADA) Standards for Accessible Design for requisite upgrades.

3) Establish and utilize design standards to provide continuity in furnishings (e.g., signage, trash cans, tables, benches, fencing) and construction materials to reduce inventory and maintenance costs and improve park appearance.

4) Estimate the maintenance costs and staffing levels associated with the acquisition, development or renovation of parks or open spaces, and pursue adequate long-term maintenance, life-cycle replacement and operation funding.

5. OBJECTIVE: To develop a network of shared-use pedestrian and bicycle trails to enable connectivity between parks, neighborhoods, schools, and public amenities.

POLICIES:

1) Strive to provide safe and convenient pedestrian and bicycle access to all new and existing park and open space areas.

2) Coordinate on- and off-street trail planning and development with the City's Transportation System Plan to provide a comprehensive pedestrian and bicycle network.

3) Coordinate with Washington County and ODOT to provide safe crossings on Glencoe Road.
4) Coordinate with Washington County and Metro to facilitate connections to regional trail corridors, such as the Banks-Vernonia Trail.
5) Coordinate with the Planning Department and integrate the siting of proposed trail segments and on-street improvements into the development review process. Require development projects along designated routes to be designed to incorporate trail segments as part of the project.
6) Partner with local utilities, public agencies and private landowners to secure easements and access to open space for trail and greenway connections.
7) Implement the Trail Guidelines adopted in the Community Trails Plan for trail siting, design and construction to provide recreational access.
8) Provide trailhead accommodations, as appropriate, at the terminus of the McKay Creek and Ghost Creek Greenway Trails to include parking, wayfinding signage, restrooms and other facilities.
9) Implement trail, route and wayfinding signage for trails and associated facilities, informational maps and materials identifying existing and planned trail facilities.

6. OBJECTIVE: To facilitate and promote a varied suite of recreation programs that accommodate a spectrum of ages, interests and abilities.

POLICIES:

1) Implement and support special events, festivals, concerts and cultural programming to promote arts, health and wellness, community identity and tourism, and to foster civic pride.
2) Leverage City resources by forming and maintaining partnerships with other public, non-profit and private recreation providers to deliver recreation services and secure access to existing facilities for community recreation.
3) Emphasize programming for children, teens, seniors, and other populations with limited access to market-based recreation options.
4) Partner and coordinate with the Hillsboro School District for access to existing facilities (e.g. schools gymnasiums, tracks, fields) for community recreational use, and to encourage provision of community education programming at schools.
5) Coordinate with public, private and non-profit providers, such as organized sports leagues, to plan for projects to expand facilities for athletic fields.

7. OBJECTIVE: To develop and manage a citywide system of parks, trails, and recreational facilities in a planned manner consistent with community goals and available resources.

POLICIES:

1) Update the comprehensive Parks Master Plan periodically to ensure facilities and services meet current and future community needs.
2) Periodically review and amend the North Plains Development Code's requirements for dedication of parkland and trails and system development charges.
3) Actively manage North Plains' park and recreation assets to ensure consistent service delivery, reduce unplanned reactive maintenance, and minimize economic, public health, and environmental risks.
4) Pursue traditional and new funding sources to adequately and cost effectively maintain and enhance the quality of North Plains' park and recreation system.

ECONOMIC DEVELOPMENT

North Plains' residents value their high quality of life stemming from affordable housing, a small-town feel and proximity to outdoor recreation activities. The City's location along Highway 26 provides good transportation access and makes it a gateway to the Oregon Coast. It also is close to major employment centers in western Washington County and has good access to the regional workforce. North Plains is located in an agricultural region, with a diverse offering of agricultural products including fruits, wheat, wine, and nursery plants.

North Plains' businesses attract workers from across the Portland Metro region. Approximately 17% of people who work in North Plains commute from Hillsboro, 8% from Portland, 6% from Beaverton, and 5% from Forest Grove. The remaining workers commute from elsewhere in Washington County and the Portland Metro region. The sectors with the greatest number of employees in 2014 were: Manufacturing (25%), Constructing and Agriculture (20%), and Food Services (16%).

North Plains had 823 covered employees in 2014 and an estimated 914 total employees within the urban growth boundary (UGB) in 2014. North Plains will have an estimated 2,612 employees within the UGB by 2038, an increase of 1,646 employees (170%) over the next 20 years. North Plains will need 162 additional acres of employment land to accommodate employment growth over the next 20 years.

Target industries for North Plains are based on the City's goals for economic development, economic conditions in North Plains and Washington County, and the city's competitive advantages. The target industries identified as having potential for growth in North Plains are:

- Small-scale manufacturing: electronics and computers, machinery, fabricated metal, specialty food and beverages, renewable and alternative energy.
- Small-scale warehouse, distribution and wholesale.
- Professional services: software development, research or environmental services.
- Services for residents: grocery store, other retail, restaurants, and government services, especially primary education.
- Services for seniors: assisted living facilities, retirement centers, and related medical services.
- Services for visitors: restaurants or a hotel.

STATEWIDE PLANNING GOAL 9

To diversify and improve the economy of the state.

CITY OBJECTIVES AND POLICIES

1. **OBJECTIVE: To plan for a 20-year supply of suitable commercial and industrial land on sites with a variety of characteristics (e.g., site sizes, locations, visibility).**

   POLICIES:

   1) Provide for an adequate supply of commercial and industrial land to accommodate the types and amount of economic development and growth anticipated in the future. The supply of commercial and industrial land should provide a range of site sizes and locations to accommodate the market needs of a variety of commercial and industrial employment uses.
   2) Provide for opportunities for development of commercial services along Glencoe Road and Commercial Street for residents and visitors to North Plains.
   3) Allow for development of small-scale commercial services to support local community needs.
   4) Support development of a grocery store or market to support local community needs.

2. **OBJECTIVE: To support development and redevelopment in downtown for commercial services, especially locally serving businesses.**

   POLICIES:

   1) Continue to implement policies and programs to support and encourage commercial development in downtown.
   2) Develop policies and programs to encourage infill and redevelopment in downtown as a way to use land and existing infrastructure efficiently.
   3) Support mixed-use development in downtown, such as development of two-story buildings with commercial uses on ground floor and residential uses on the second floor.
   4) Support actions that encourage business activities and events in downtown.

3. **OBJECTIVE: To create conditions that encourage growth of existing businesses, entrepreneurs, and attraction of new businesses to create jobs with a range of wages for North Plains' residents with the goal of increasing employment for people living in North Plains and improving the jobs-housing imbalance.**

   POLICIES:

   1) Develop a broader economic development plan that promotes and supports a diverse economic base through growth of businesses, such as the types of businesses identified in the Economic Opportunities Analysis.
   2) Encourage the planning and development of a sufficient amount of industrial lands for

manufacturing and other export-oriented businesses[1] that do not have negative impacts on surrounding areas while accommodating future City economic growth and development prescribed in the Comprehensive Plan.

3) Support development of tourism-related businesses to attract visitors to North Plans as a destination for day tourism.
4) Support growth of existing businesses and entrepreneurs by sharing technical resources, maintaining open communications with local business people, and providing available staff support for economic development projects initiated by the business community.
5) Coordinate economic development efforts with local and regional economic development organizations, including the North Plains Chamber of Commerce, the Westside Economic Alliance and Business Oregon.
6) Ensure that the City's building permitting and land use entitlement processes support business growth.

4. OBJECTIVE: To provide adequate infrastructure efficiently and fairly to support employment growth.

POLICIES:

1) Coordinate capital improvement planning to ensure infrastructure availability on employment land and pursue funding for needed infrastructure to support economic development activities.
2) Support home occupations and workers that telecommute by working with telecommunications and other service providers to improve services in North Plains.

5. OBJECTIVE: To work with community partners to support workforce and entrepreneurial training opportunities to meet the needs of North Plains' businesses.

POLICIES:

1) Provide strategic contributions in staff or dollars to partners to support workforce development.
2) Support workforce development of independent contractors and entrepreneurs in North Plains.

1 "Export-oriented businesses" are businesses that produce goods or services for consumption outside of North Plains, to serve needs in Washington County, the Portland metropolitan area, and beyond. Export-oriented businesses typically have higher wages than "locally serving" businesses. Many export-oriented businesses are manufacturing. Locally serving businesses include businesses such as retail, restaurants, or health care.

HOUSING

The City wishes to encourage a range of quality housing for all ages and income levels. Housing will be attractive, compatible and build upon historic North Plains patterns.

In 2020, the population of North Plains was estimated at 3,410 and forecast to grow to 7,076 by 2040. This increase in 3,666 people represents a 3.7% annual growth rate and will require approximately 1,348 new dwelling units in this 20-year timeframe to accommodate this growth. Of the needed 1,348 new dwelling units, 504 are expected to be built in the Brynhill Area, which is over halfway built-out in 2023. Outside of the Brynhill development, North Plains will need to provide about 844 new dwelling units to accommodate forecast population growth by 2040.

Of the 844 needed new dwelling units, about 591 (70%) will be single-family detached types, which includes manufactured dwellings. About 84 (10%) will be single-family attached, and 169 (20%) will be multifamily, which includes structures with four or more dwellings. Duplexes and triplexes are permitted in the R-2.5 zone and are included in the multifamily housing type percentage.

This mix represents a shift from the existing mix of housing, in which eighty-eight percent of the housing stock is single-family detached housing. The shift in mix is in response to the need for a wider range of relatively affordable housing types, including housing types such as duplexes, townhouses, and apartments. In addition, North Plains has need for relatively affordable smaller single-family attached and detached housing.

According to the 2023 Housing Needs Analysis (HNA), there is capacity for approximately 54 new dwelling units within the existing city limits in residentially-zoned districts. Therefore, an identified need of approximately 111 additional acres of residentially-designated property is identified by the HNA to accommodate 790 dwelling units at approximately 7.1 dwelling units per net acre average. When combined with needed parks, trails, open space and infrastructure (such as roads and sidewalks), the total land need for residential development in the 2023 Urban Growth Boundary expansion is 167.4 acres.

In 2017, North Plains has 356 acres of lands zoned for residential use inside the urban growth boundary (UGB). Approximately 148 acres of the residential lands are suitable for development, the majority of which are located in two UGB expansion areas. The two expansion areas were annexed into the North Plains city limits and are zoned Neighborhood Community. The East Expansion Area contains about 46 undeveloped acres, 10 of which will be used for a school. The North Expansion Area contains about 73 acres of undeveloped land, 15.5 of which is planned to be used for commercial, institutional and municipal parks. The two parcels contain approximately 87 acres that will be used for streets, parks, greenways and housing and will be developed at a minimum of 8.4 dwelling units per net acre.

~~According to the North Plains Housing Needs Analysis (HNA), the number of dwelling units increased from 637 units to 793 units between 2000 and 2014. The mix of new units is approximately 85% single-family detached, 3% single-family attached, and 12% multifamily, which is largely consistent with the pre-existing housing stock. About 78% of North Plains' households own their own home. Nearly all North Plains' homeowners (96%) live in single-family detached housing. The majority of renters (57%) live in multifamily units.~~

~~average of 2.6 persons per household, the City will need 1,547 dwelling units to accommodate the increased population, 70% of which will be single-family detached and 30% will be single-family attached and multi-family.[1] The City's existing vacant land can accommodate 755 dwelling units, leaving a deficit of 791 units. Using the housing mix described above, the city will need an additional 118 acres to accommodate the remaining need. This will require an expansion of North Plains' UGB.~~

1 More information on housing needs, including needed housing by income level, can be found in the adopted North Plains Housing Needs Analysis.

STATEWIDE PLANNING GOAL 10

To provide for the housing needs of citizens of the state.

CITY OBJECTIVES AND POLICIES

1. **OBJECTIVE: To plan to accommodate residential growth within the existing urban growth boundary if possible and plan for expansions of the urban growth boundary as necessary.**

   POLICIES:

   1) Insure adequate vacant land is zoned to meet residential land needs as defined in the housing needs analysis.
   2) Maintain specific and enforceable design standards for single-family housing, manufactured homes, single-family attached housing, and multifamily housing.
   3) Provide opportunities for efficient development of residential land within the urban growth boundary.
   4) Land newly brought into the urban growth boundary will be concept and master planned (per Objective 4). The plan will provide opportunity for development of the housing needs identified in the HNA through zoning sufficient land to allow: 70% of new housing will be single-family detached and 30% single-family attached and multifamily.
   5) Monitor residential land development to ensure that there is enough residential land to accommodate the long-term forecast for population growth.

2. **OBJECTIVE: To provide opportunities for needed housing types including: attached and detached single-family housing, and multifamily housing for both owner and renter occupancy, government assisted housing, and manufactured dwelling parks.**

   POLICIES:

   1) Allow flexibility in development of innovative housing types to meet medium and high density housing as described in the HNA.
   2) Accommodate the housing needs of retirees and assisted living housing where possible in locations within easy walking distance of business and commercial areas.

3. **OBJECTIVE: To encourage development of low-income households and moderate-income housing (as defined by HUD) through land use policies that allow and encourage affordable housing production and working with agencies and developers of affordable housing.** [1]

POLICIES:

1) Work with the Housing Authority of Washington County to identify sites, projects and developers to provide assisted housing units for low- and moderate-income households.
2) Develop regulations to encourage development of low- and moderate-income affordable housing.

4. **OBJECTIVE: To require that land that is brought into the UGB primarily to meet residential land needs is concept planned before it is annexed into the city limits, and master planned before development is allowed.**

POLICIES:

1) When land is brought into the UGB, a concept plan will be developed for the area, prior to annexation. Residential densities for the UGB expansion area will be established in the concept plan.
2) Lands newly annexed into the city limits will have the NC zone applied concurrent with annexation.
3) Newly developed residential areas will be in master planned areas that may include parks, schools, public services and facilities, shopping, services, and activity centers, providing pedestrian access to these amenities.
4) Newly developed residential areas will include landscaping and open space to provide an amenity to the residential development and reduce potential conflicts with surrounding uses.
5) Coordinate capital improvements planning with concept and master planning of land newly brought into the urban growth boundary to make land ready for residential development.

1 The U.S. Department of Housing and Urban Development (HUD) sets a Median Family Income (MFI) for each county in the nation based on information from the U.S. Census' American Community Survey. The MFI is meant to approximate the income of an average family. In 2018, Washington County's MFI was $81,400. Households earning less than 50% of MFI ($40,700 in 2018) are considered low-income households and those earning 50% to 80% of MFI ($40,700 to $65,120 in 2018) are considered moderate-income households.

PUBLIC FACILITIES AND SERVICES

Ongoing public facilities planning for the City of North Plains is necessary to keep pace with growth and population increase over the 20-year planning horizon.

The City of North Plains first adopted a "Water System Master Plan" in April 1980, and the "Sanitary Sewer Collection System", in January 1978. The existing Sewer Master Plan and Water Master Plan are updated by the City periodically and serve as the specific development and policy documents for the provision of water and sanitary sewer services. There is no Storm Water Master Plan for the City as the City relies upon Clean Water Services to oversee stormwater management.

WATER SYSTEM MASTER PLAN

The Water Master Plan planning horizon is 20 years. The Joint Water Commission (JWC) is the regional water supplier and a partnership of the Cities of Hillsboro, Forest Grove, Beaverton, Tigard and the Tualatin Valley Water District. Currently, the City of North Plains and the JWC have an agreement for a maximum rate of flow not to exceed 875 gallons per minute with a maximum volume of water not to exceed 1.05 million gallons per day. One of the City's existing groundwater wells, Well No. 3, is available as an emergency backup supply source, if needed.

Water System Planning and Capacity

The City's water supply and transmission systems must be capable of providing for estimated maximum day demands for the 20-year planning horizon. The Water System Master Plan analysis found that to provide for the anticipated growth over the planning horizon, the City will need to spend approximately $12.0 million for recommended improvements. The plan recommended funding the City's capital improvement program at $600,000 annually for storage, pumping, and distribution piping improvements.

SANITARY SEWER MASTER PLAN

Clean Water Services (CWS), a service district of Washington County, provides sewage services in the City of North Plains. CWS serves a 122-square mile area in the Tualatin River watershed, including 12 member cities. The Plan evaluations include development conditions representing 2006 (existing), 2015 and an undetermined buildout date. North Plains is served by the Hillsboro Treatment Facility. In 2004, the reported population in the Hillsboro Treatment Plant Basin was 34,564. The approximate population based on residential average daily water flow was 61,900 in 2015 and 121,300 at buildout.

Sewer System Planning and Capacity

The Plan analysis determined that upgrades to existing gravity sewers and to two existing pump stations and force mains are needed to meet service demands at buildout. In addition, CWS will need to construct more than 72,000 feet of new gravity sewer extensions and four new pump stations and force mains.

EMERGENCY SERVICES

The North Plains Police Department employs 2.5 full time equivalent officers (FTE) and six reserve officers. The department does not provide 24-hour coverage, but does receive rapid response for priority calls. North Plains contracts with the City of Hillsboro for report and evidence management and Washington County Justice Court to adjudicate traffic tickets.

Fire protection and emergency medical response within North Plains is provided by the Tualatin Valley Fire and Rescue. Station 17 is centrally located in downtown North Plains on Commercial Street next to City Hall. The station is a full-time career station staffed with four personnel: one officer, one driver and two firefighters. Equipment includes two engines, one tank truck, one rescue unit and one brush control truck.

EDUCATIONAL FACILITIES

The City of North Plains is within the Hillsboro School District. North Plains Elementary School was opened in 1954 and occupies 15 acres in the northwest corner of North Plains. There are no immediate plans for capital improvements. A new elementary school is planned as part of the east expansion area, recently annexed into city limits. Most North Plains' students attend Evergreen Junior High School and Glencoe High School in Hillsboro.

LIBRARY SERVICES

North Plains Public Library, constructed in 2006, is part of the Washington County Cooperative Library System. The cooperative allows all County residents to borrow from any municipal or other public library in the County, providing access to over a million items in its cumulative collection.

OTHER PUBLIC UTILITIES: GAS, ELECTRICAL, TELEPHONE, INTERNET

A variety of private companies provide these services to residents and businesses in North Plains.

STATEWIDE PLANNING GOAL 11

To plan and develop a timely, orderly and efficient arrangement of public facilities and services to serve as a framework for urban development consistent with the City's vision.

CITY OBJECTIVES AND POLICIES

1. **OBJECTIVE: To program and provide municipal facilities in the most efficient and cost-effective manner to adequately serve existing population and anticipated growth, in accordance with the Comprehensive Plan.**

   POLICIES:

   1) Prepare detailed public facility and utility studies to maintain current inventories of needs and costs.
   2) Develop, maintain, update, and expand water and sewer systems, and storm drains as necessary to provide adequate, efficient and cost-effective facilities and services to the community.
   3) Plan public facilities, utilities, and services to meet the expected demand through development of a capital improvement program.
   4) Work with the City of Hillsboro, Tualatin Valley Fire and Rescue and other agencies to provide emergency services to North Plains residents and businesses.
   5) Cooperate with agencies involved in providing and coordinating library and other community services.
   6) Coordinate with the Hillsboro School District to project all school land needs and to determine the location of future school sites.
   7) Work with Washington County and the Metropolitan Service District to insure adequate provision for and control of solid waste disposal sites.
   8) Work with private utility companies (gas, electric, telephone, internet) to ensure equitable access to services throughout the City.

2. **OBJECTIVE: To establish and utilize criteria to guide the location and design of new public facilities.**

POLICIES:

1) Weigh the following factors when determining public facility location:
   - Availability and cost of usable land;
   - Degree of disruption of residential areas;
   - Operational efficiency of alternate locations;
   - Geographic restrictions and requirements; and
   - Overall Comprehensive Plan objectives and the 2035 Vision.

3. **OBJECTIVE: To seek federal, state and other revenue sources to fund public facility needs and utilize these for capital improvements.**

POLICIES:

1) Complete local planning for high priority public facilities so that outside revenue sources can be used on short notice.
2) Develop local funding adequate to meet "matching" requirements of outside revenue sources.
3) Require equitable sharing of most public facility costs between new development and the existing community through means such as system development charges, local improvements districts, or other possible means.

TRANSPORTATION

TRANSPORTATION SYSTEM PLAN

The City of North Plains regularly updates the Transportation System Plan (TSP). The TSP provides the city with a long-range vision for the transportation system. Through coordination with Washington County, ODOT, and the community of North Plains, the TSP helps guide the priorities and budgeting to address transportation needs.

Transportation System Needs

North Plains is a small community located along US 26 with a majority of commercial, housing, and employment centered within a 1.5-mile walking distance. It has the potential to have a well-utilized pedestrian network with improvements to sidewalks and street crossings. Bicycle travel is important to safely accommodate travel within the city as it allows for trips longer than 1.5 miles. To comply with OAR-660-045, bikeways need to be provided along arterial and collector streets in North Plains.

As North Plains grows, there will be an increase in vehicle travel throughout the city, and accommodating this growth will require improvements to safety, mobility, connectivity, complete streets, and traffic calming to ensure safe and efficient vehicle travel. Traffic within the City is anticipated to increase along the key arterials of Glencoe Road and West Union Road as well as on key collectors including North Avenue and Gordon Road.

The city is currently served by a fixed transit route service through Ride Connection and a service provided by the Tillamook County Transportation district called “The Wave”. As the population of North Plains increases, there will be an increased need for transit improvements including additional stops and larger service areas.

The TSP outlines strategies and projects to accommodate a balanced and safe transportation system and enhance the quality of life for North Plains residents. The plan is intended to provide the City with flexibility on the timing and implementation of projects and to allow the city to make improvements responsive to how the community grows in the next 20 years.

STATEWIDE PLANNING GOAL 12

To provide and encourage a safe, convenient and economic transportation system.

CITY OBJECTIVES AND POLICIES

1. **OBJECTIVE: To create a multi-modal transportation system for all users. All users will have safe and convenient access.**

   POLICIES:

   1.A) Identify and plan for an expansion in the transit system.

   1.B) Prioritize projects that encourage and facilitate pedestrian and bicycle travel.

   1.C) Provide a network of interconnected streets to allow for efficient travel and reduction of out-of-direction travel.

   1.D) Provide complete access for pedestrians and bicycles to key locations.

   1.E) Ensure future connectivity to parcels that could be added to the UGB in the future.

2. **OBJECTIVE: To prioritize improvements and new projects that provide convenient access for pedestrians and bicycle routes to key destinations.**

   POLICIES:

   2.A) Identify and improve system gaps for pedestrian and bicycles.

   2.B) Improve safe access to key destinations.

   2.C) Identify potential or needed sidewalk and crossing improvements.

   2.D) Identify bikeway improvements.

   2.E) Integrate the City Parks and Trails Master Plan vision and applicable goals.

3. **OBJECTIVE: To encourage design and provide facilities that improve safety of all users of the transportation system.**

   POLICIES:

   3.A) Improve areas where crash risk factors are present.

   3.B) Improve and maintain transportation infrastructure to safe standards.

   3.C) Establish and design for safe routes to schools from residential neighborhoods.

   3.D) Transportation facilities should be designed to meet safety standards.

   3.E) City shall implement plans to educate public and provide enforcement on transportation safety.

4. **OBJECTIVE: To improve the economic vitality of North Plains businesses by providing safe and convenient access for all users.**

POLICIES:

4.A) Develop a system that provides safe and efficient movements of goods.

4.B) Create a system that allows for good access to businesses within the community.

4.C) Support improvements that make downtown and access to businesses safe and convenient for pedestrians and bicycles.

4.D) Design roadways and intersections for intended use based on street classification and needs of adjacent land uses.

4.E) Design a transportation system that reduces travel time and vehicle miles traveled.

5. **OBJECTIVE: To encourage design and improvements that reduce the environmental impact of the transportation system.**

POLICIES:

5.A) Reduce emissions by encouraging connectivity and design that reduces vehicle miles traveled.

5.B) Design and development that encourages walking and biking.

5.C) Design and development that minimizes impacts to waterways and other sensitive environments.

5.D) Encourage street cross sections to include width and storm water treatment systems that minimize environmental impacts.

5.E) Encourage strategies to reduce single vehicle occupancy trips.

ENERGY CONSERVATION

Energy conservation efforts lower the cost of energy for the City and its residents and reduce the production of harmful greenhouse gases. Transportation systems and city development patterns are two areas where energy use is highest and most likely to be affected. It is in these areas that energy policy is directed.

The objective of energy conservation reinforces the importance of focusing public facilities and urbanization toward infill development and redevelopment and connecting residential areas to downtown and employment, educational and recreational areas.

STATEWIDE PLANNING GOAL 13

To conserve energy.

CITY OBJECTIVES AND POLICIES

1. **OBJECTIVE: For new development to minimize the consumption of fuels and maximizes the efficiency of utilities.**

   POLICIES:

   1) The City will encourage land use patterns that:
   - Locate various land use activities (residential, employment, recreation, education, etc.) in close proximity;
   - Reduce or shorten energy consuming trips by increasing density and intensity of new development

   2) The City will encourage energy efficient development and redevelopment.
   - Encourage energy conservation in new development through site planning, landscaping and construction practices that take advantage of climatic conditions of light, heat, cooling, and ventilation, such as the Energy Star or PGE Savings by Design Programs.
   - Review possible ways of developing weatherization and insulation programs, especially in pre-1950 homes.
   - Encourage the use of solar energy in residential developments.
   - Encourage the reuse and recycling of materials resulting from the demolition of old buildings in compliance with Uniform Building Code.

2. **OBJECTIVE: To develop a transportation system that provides for a variety of travel options, including driving, biking and walking.**

   POLICIES:

   1) Design and build bicycle and pedestrian connections.
   2) Explore opportunities to increase public transit services.

3. **OBJECTIVE: To reuse and recycle materials, whenever feasible, to save money and reduce solid waste.**

   POLICIES:

   1) The City will educate residents on the benefits of recycling and waste prevention.
   2) The City will reuse City-owned materials when possible and recycle them when reuse is not possible.
   3) The City will support or facilitate required and voluntary measures to meet City recycling goals.

URBANIZATION

From 2020-2023, the City coordinated with state, regional and county agencies to provide a land supply enabling existing and future citizens to enjoy a livable North Plains consistent with its character as a rural town but acknowledging the City's goals of increasing the tax base and overcoming the status as a "bedroom community". This Urban Growth Boundary (UGB) expansion process included a project advisory committee comprised of community members, business owners, agency partners and appointed and elected officials who met eight times to consider how and where the City should expand. The resulting 2023 UGB Expansion includes 854 acres of land surrounding the existing City limits that should accommodate the residential and employment growth needs of North Plains for the next 20 years.

The acreage included in the UGB includes residential and employment land need estimates. The City's 2017 (updated in 2022) Housing Needs Analysis (HNA) identifies a need for 167 acres of land, to meet residential demands through 2037, including land for parks and infrastructure. The 2018 Economic Opportunities Analysis (EOA), updated in 2022, identifies a need for 515 acres to meet industrial land needs and 172 acres to meet commercial land needs through 2038, including land for infrastructure. Combined, these studies estimate a need for 854 acres to meet the city's 20-year land need.

~~In 2005, the City coordinated with state, regional and county agencies to provide a land supply enabling existing and future citizens to enjoy a livable North Plains consistent with its character as a rural town. The City identified land needed to provide a connected, walkable and non-auto oriented environment, supportive of the town center and east industrial area. The unanimous recommendation from the TGM Study was to increase density within the existing urban growth boundary (UGB) and amend the UGB to allow residential growth to the north and east, rather than expand to an "exception" area south of Highway 26 that would divide the city. Therefore, the City created an urbanizable land supply north of the freeway, connecting the downtown core and industrial areas with established and future neighborhoods.~~

~~Rapid residential growth following the Great Recession and state legislation passed in 2016 allowing certain annexations without voter approval resulted in the annexation of approximately 122 acres to the city in 2016 with plans for approximately 738 new homes and a new elementary school. The current Housing Needs Analysis (HNA) projects North Plains' population to grow and indicates that the City will need an additional 82 to 118 acres to accommodate future housing need.~~

URBAN GROWTH PROCESS

A Concept Plan is required for land brought into the UGB prior to annexation. The purpose of the Concept Plan is to ensure that areas brought into the UGB are urbanized efficiently and contribute to mixed-use, pedestrian-friendly, and multi-modal communities. The Concept Plan will generally identify the location of land uses and an overall average density. Land designations must accommodate needs identified in an adopted ~~HNA~~ housing needs analysis, economic opportunities analysis and other urban growth management plans. The Concept
Plan must demonstrate the ability of residential land to allow for 70% of new housing to be single-family detached and 30% to be single-family attached and multifamily. The Concept Plan also will identify potential funding sources for infrastructure improvements.

A Master Plan is required for properties within the city limits prior to any development. The master planning process encourages innovative and imaginative site planning to develop a sense of place where amenities, facilities, features and overall urban design could not be achieved through application of individual or combinations of zones. The master plan is intended to ensure that property will develop in a manner consistent with the previously approved concept plan. The Master Plan must include the locations of applicable land uses, including residential, commercial, industrial and institutional uses, transportation facilities, utilities, and parks, open space and natural areas.

STATEWIDE PLANNING GOAL 14

To provide for an orderly and efficient transition from rural to urban land use.

CITY OBJECTIVES AND POLICIES

1. **OBJECTIVE: To identify and utilize accepted growth management techniques in a manner that will implement the Comprehensive Plan vision statement, goals, objectives and policies.**

POLICIES:

1) Carry out implementation of the vision statement using accepted land use planning and management techniques to include, but not limited to, the following:

- Refine and update the 2005 Washington County-North Plains Urban Planning Area agreement. Proposed expansions of the area of interest shall be based upon an analysis of both short-term and long- term need for urban expansion in accordance with state law.
- Intergovernmental agreements with Washington County concerning planning, land division, land uses, and management of land uses and provision of public facilities and services within the City's area of interest. The City shall take an active role in the land use planning and development process for lands located in the area of interest. Through the intergovernmental agreement, the City shall assume this greater involvement, including delegation by the County to the City for planning and development regulation responsibilities in the area of interest. The agreement also shall require annexation, or a pre-annexation agreement, prior to development of urban uses outside of the City's UGB, and concerning the regulation of land divisions pursuant to ORS 92.042.
- Urban reserves. OAR 660 Division 21 authorizes planning for areas outside urban growth boundaries to be reserved for eventual inclusion of an urban growth boundary and to be protected from patterns of development which would impede urbanization. The City is adjacent to several undesignated areas. The authority provided by OAR 660 Division 21 provides the City a mechanism through which it can influence and affect the pattern of development outside the urban growth boundary, so that it does not conflict with the City's long-term plans for urbanization.
- Urban Growth Boundary amendments.
- The City will seek to influence, manage and control the transition from rural to urban uses on lands outside the City's urban growth boundary which are logically within the City's area of interest for future growth.
- The urban growth boundary will be updated and expanded when conditions exist that satisfy adopted local and state standards for amendments to urban growth boundaries.
- The City has an established urban growth boundary. Growth and development will be directed and encouraged within this area on developable lands. Development will be consistent with the capacity and capability of public services.

Commented [HA1]: Perhaps this was already done?

2. **OBJECTIVE: To ensure annexation to the city occurs in an orderly and coordinated manner, and public facilities are provided to support urban growth consistent with the 2035 Vision.**

POLICIES:

1) The following conditions should be met prior to or concurrent with the City processing of any annexation request:
   - The subject site should be located within the North Plains Urban Growth Boundary.
   - The subject site should be contiguous to the existing city limits.
   - The subject site should have an adopted Concept Plan that identifies the general location of land uses and an overall average density.
2) The proposed use for the site shall comply with the North Plains Comprehensive Plan and with the designation on the North Plains Comprehensive Plan Map. If a re-designation of the Plan Map is requested concurrent with annexation, the uses allowed under the proposed designation must comply with the Comprehensive Plan.
3) An adequate quantity and quality of urban services must be available, or there is evidence that it is feasible that they can be made available within a reasonable period of time after annexation. Annexation can be conditioned upon the provision of services through a Concept Plan. Increased levels of urban service shall not place unreasonable burdens on the service providers or existing users. An adequate level of urban services shall be defined as:
   - Municipal sanitary sewer and water service.
   - Roads with an adequate design capacity for the proposed use and projected future uses.
   - Police, fire, and school facilities and services.

   The burden of providing the above findings is placed upon the applicant.
4) Coordinate annexation requests with affected public and private agencies.
5) If water and sewer lines are proposed outside the UGB to serve an annexation, the annexation and extra-territorial utility extension request shall be coordinated.
~~6) Apply the NC zone to lands newly annexed into the city limits concurrent with annexation.~~
6) Newly developed residential areas will be in master planned areas that may include parks, shopping, services, and activity centers, providing pedestrian access to these amenities.
7) Coordinate capital improvements planning with concept and master planning of land newly brought into the urban growth boundary to make land ready for development.
8) Concept and Master Plans will provide an opportunity for development of the housing needs identified in the HNA through zoning sufficient land to allow: 70% of new housing single-family detached and 30% single-family attached and multifamily. Residential densities for the UGB expansion area will be established in the concept plan.

3. **OBJECTIVE: To establish a planning program and an efficient direction for growth that allows for complete and connected neighborhoods.**

POLICIES:

1) Promote the efficient use of land, including appropriate in-fill, redevelopment and new development at higher density than currently on the ground in the City.
2) Plan for complete and connected neighborhoods, either singularly or in conjunction with adjacent areas.
3) Encourage the city to grow its existing neighborhoods, amenities, town center and industrial areas into one connected compact city.
4) Reinforce geographic separation between North Plains' and Metro's urban growth boundary/ urban reserves.
5) Provide separation between urban and rural land uses to the extent possible, consistent with state law.

PLAN IMPLEMENTATION

as of March 2019

ZONING

Zoning is an official land use control established "for public interest, health, comfort, convenience, preservation of the public peace, safety, morals, order and the public welfare".[1] Zoning represents one means of carrying out the objectives set forth in the Comprehensive Plan.

Zoning must be consistent with the Comprehensive Plan in that a more intensive use of the land than permitted by the Plan cannot be allowed by the Zoning Ordinance.[2] Changes to the Zoning Ordinance or Comprehensive Plan can be requested and will be reviewed, but the burden of proof is upon the one seeking the change.[3] The requested change must be justified by proof that:

- The change is in conformance with the Comprehensive Plan, and
- The change has met the procedures and regulations of the Zoning and Development Ordinance; and,
- The change is consistent with the statewide planning goals.

ANNEXATION

Areas can be annexed to the city upon request~~,~~ and approval by Council ~~and approval of the majority of the electorate per City Charter Chapter I, Section 4. Additionally, areas can be annexed without vote with a petition submitted by all owners of land within the area, the area is within the urban growth boundary and at least one parcel in the area is contiguous to city limits.~~ All annexations must comply with the Comprehensive Plan and statewide planning goals. The burden of proof is on the proponents of the annexation, and the City must base its decision on findings of fact.

SUBDIVISION AND PARTITION

The subdivision and partition clause of the zoning code establishes procedures and standards for land partitioning, and subdividing of four or more lots.

1 ORS 227.220
2 Baker vs. Milwaukie
3 Fasano vs. Washington County Board of Commissioners

COOPERATIVE AGREEMENTS

Realization of the Comprehensive Plan can also be facilitated by certain cooperative agreements. Such agreements may include any agreement between two or more agencies, whether public, semi-public, or private, wherein any projects related to the Comprehensive Plan may be jointly or cooperatively planned, financed, constructed, administered, or any combination of these in a manner which is beneficial to the public.

The City and County have entered into a formal agreement by which both are fully cognizant of the governance and procedural aspects of the area external to the city and within the urban growth boundary. This agreement is entered into pursuant to Oregon Revised Statutes for the purpose of facilitating the orderly transition from rural to urban land use. The information will include, but not be limited to:

Introductory Information - Adoption dates, procedures, and similar background data.

General Provisions - Reference to appropriate zoning and subdivision ordinances, statements of consistency with appropriate statutes and case law, and with statewide planning goals.

Subdivision Applications - Statements of which and whose ordinances shall apply in regulation of properties within the area, and procedures to be followed.

Zone Change Applications - Statements of whose ordinances shall apply in the event that land use changes are requested, and the procedures therefore.

Conditional Use, Variance, and Major Partition Applications - Statements of applicable procedures and approval criteria.

City Services - Statement of the conditions for the extension of services into the urban growth area, requirements imposed and procedures, as specified in the Policies of the Comprehensive Plan and the ordinances of the City.

Annexation - Reference to the appropriate statutes and ordinances.

Roads and Streets – Jurisdiction and maintenance responsibility is defined for county roads, new public roads, future arterials, and the procedures for resolution of mutual public right of way matters.

Arbitration - Procedures.

Review and Amendment - Annual Review and Procedures.

NEXT STEPS

The Comprehensive Plan is intended to be a general guide to future community development and should not deal with detailed site planning. Therefore, to supplement the Comprehensive Plan, detailed planning should be undertaken to work out the specifics of the various Plan proposals.

PLANNING INVENTORY

NATURAL CONDITIONS

Description of Location

North Plains is in the northwestern portion of the Tualatin Valley near the edge of the Tualatin Drainage Basin. It is about two miles south of the rolling hills of the Tualatin Range. Topography in the area is generally flat with a gradient toward the southeast. The terrain includes several intermittent drainageways generally flowing south and east to McKay Creek. North Plains is located about four miles north of Hillsboro, the County seat, and is about 19 miles westerly from Portland. It is situated on Highway 26, a major regional corridor linking Portland with the coast.

History

North Plains is one of several small communities dispersed in the predominantly agricultural areas of central Washington County. Originally founded as the community of Glencoe in the mid-1800s, the community's first plat was created in 1910 by a predecessor of the Spokane, Portland, and Seattle Railway to serve as a processing and shipping point for locally grown farm and forest products. The City of North Plains was incorporated June 25, 1963.

Climate, Geology and Topography

North Plains has a moderate valley-type climate. Temperature extremes are rare and usually of short duration. Winters are mild and the frost-free season is usually between 160 and 250 days. There are few days with temperatures below 20 degrees and about 10 days below 28 degrees. An average year has 10 days with temperatures above 90 degrees. Rainfall is sporadic during all seasons. The principal rainy season is from mid-November through March. Yearly average rainfall is 45.5 inches for North Plains. The chart below reflects averages for Hillsboro, OR, the closest reporting weather station to North Plains.

Climate Hillsboro - Oregon

	Jan	Feb	Mar	Apr	May	Jun
Avg high in F	45	50	56	62	69	75
Avg low in F	32	34	36	39	44	49
Avg precipitation in inches	7.3	5.7	4.8	2.7	2.0	1.4
	Jul	Aug	Sept	Oct	Nov	Dec
Avg high in F	82	83	76	64	52	46
Avg low in F	52	52	47	41	37	34
Avg precipitation in inches	0.4	0.7	1.5	3.4	7.4	8.2

Hillsboro Weather Averages

Annual high temperature:	63.3°F
Annual low temperature:	41.3°F
Average temperature:	52.3°F
Average annual precipitation - rainfall:	45.5 in

Source: www.weatherbase.com

Winds are seldom a problem in the North Plains area. Average wind velocity is about 8 mph. West and northwest winds are predominant during the winter rainy months; southern and eastern winds are predominant in the summer months.

Alluvial valley fill and semi-consolidated sedimentary rock underlie the North Plains study area. Surface material includes unconsolidated, fine-grained deposits of silt, sand and gravel. Ground water occurs in unconfined conditions. Columbia River Basalt is between 300 and 400 feet below the surface of the valley soils at North Plains. Ground water in pressurized aquifers is typically found in the basalt formations.

The topography of the North Plains study area is characterized by the flat lowlands of the Northwestern portion of the Tualatin Valley. Stream, valleys, such as McKay Creek, are typically 20 feet below the main plain. The average elevation of North Plains is 200 feet above sea level. It gently slopes from 210 feet in the northwest portion of the City to about 190 feet in the southeast. The elevation rapidly falls to about 170 feet along McKay Creek along the east side of the City.

Forest Resources

Commercial: There are no commercial timber growing lands in the North Plains planning study area. Forest products are processed in the City: saw milling, lumber milling, and some fabrication.

Non-Commercial: The major non-commercial forest resources in North Plains are east of the city and form visual buffers along Highway 26 on the southern edge of town. Stands of hardwood and various conifers also line McKay Creek and related drainageways. Timber resources in and adjacent to North Plains are minimal, making Goal 4 inapplicable.

Open Space, Scenic, Historic and Natural Resouces

The City of North Plains manages 6.24 acres of land designated as parks, open spaces, trails and recreational facilities. The several year-round and intermittent waterways, including McKay Creek and Ghost Creek present excellent opportunities for usable open space within North Plains. The surrounding countryside provides abundant open space, ranging from orderly crop land, orchards, and truck farms to natural habitats found along waterways and in isolated tree stands.

Fish and Wildlife

McKay Creek supports a variety of resident game fish including rainbow trout (Salmo gairdneri), cutthroat trout (Salmo clarki), largemouth bass (Micropterus psalmodies), and yellow perch (Perca flavescens). Bullheads (Ptychocheilus oregonensis) are the principal non-game fish.

Black-tailed deer (Odocoileus columbianus) are found in the agricultural and woodlands throughout the year. There do not seem to be any fur-bearing animals of economic importance in the streams or on land. However, beaver (Castor Canadensis), weasels (Mustela erminea), skunks (Mephitis mephitis), and nutria (Myocaster coypus) are to be found.

The principal upland game birds in the area are ring-necked pheasants (Phascianus colchius), California quail (Lophortyx californicus), mourning doves (Zenaidura macroura), band-tailed pigeons (Columba fasciata) and ruffled grouse (Dendragapus obscurus). Several waterfowl species overfly the area in their migrations. There is no significant nesting of waterfowl in the area. The species who use the flyway for immigration are Canada Geese (Branta canadensis), mallards (Anas platyrhynchos), American widgeons (Maraca americana), wood ducks (Aix sponsa), and pintails (Anus acuta).[1]

Vegetation

The area around North Plains consists of bottom-lands. Principal crops are small grains, pasture, hay and some specialty crops. Interspersed with the farms are small tracts of timber. The vegetative cover on these tracts consists primarily of Douglas Fir (Pseudotsuga menziesii), big leaf maple (Acer macrophyllum), dogwood (Cornus stolonifera), snowberry (Symphoricarpos albus), blackberry (Rubus allegheniensis), and Poison Oak. There are no known rare or endangered plant species.

1 Environmental Assessment for United Sewerage Agency, Nero & Associates, July, 1977.

Historic Resources

When the Comprehensive Plan was acknowledged by the Land Conservation and Development Commission in 1981, the Plan identified the Walter Blacksmith Shop on West Union Road as the only historic structure in the North Plains area. The 1983 Plan amendment states: "There are no structures or sites of historic importance located within North Plains."

In 1983-84, researchers from the Washington County Museum identified three structures within North Plains for inclusion on the Washington County Cultural Resources Inventory. The three structures are:

a. True Value Hardware/Knights of Pythias Friendship Temple building (1914) 31520 NW Commercial St.
b. North Plains Commercial Bank building (1911) 31594 NW Commercial Street, currently home to the Last Waterin' Hole.
c. Residence at 31379 SW Kaybern (1911).

The Knights of Pythias Friendship Temple and the former North Plains Commercial Bank are cited as significant because they are two remaining commercial brick buildings which were built in the early 1900s, the years associated with land development and railway promotion. The home at 31379 Kaybern is one of the early residences constructed during the railroad boom. The house is in excellent condition.

All three properties are included in the City's historic overlay zone.

The 1989 Washington County Cultural Resources Inventory cites a number of historic and cultural resources in and around North Plains.

Other Goal 5 Resources

Within the City limits /UGB of North Plains, there are no:

- Commercially valuable mineral and aggregate resources;
- Ecologically and scientifically significant areas;
- Outstanding scenic views and sites;
- Indigenous energy sources;
- Wilderness areas;
- Potential and approved Oregon recreation trails; and
- State/federally designated wild and scenic waterways.

Soil Constraints

North Plains' soils, like most of the Northern Tualatin Valley, can require special engineering techniques for building. The techniques can include artificial drainage, runoff control, extended sewage absorption fields or soil excavation. Data provided in this section is from the Soil Conservation Service, (SCS).

About 83% of the area soils are the Willamette and Woodburn soil units. These soils are not as subject to soil engineering requirements and are relatively free of constraints to development. These soils are considered "primary buildable".

The remaining 17% of the urban area is designated “secondary buildable” because it has some development constraints and costly engineering requirements. The Chehalis, Aloha, and Dayton soil units are subject to a high water table within 24” of the surface. Amity, McBee, Wapato, Cove and Verboot soil units are subject to flooding and possible high water table conditions.

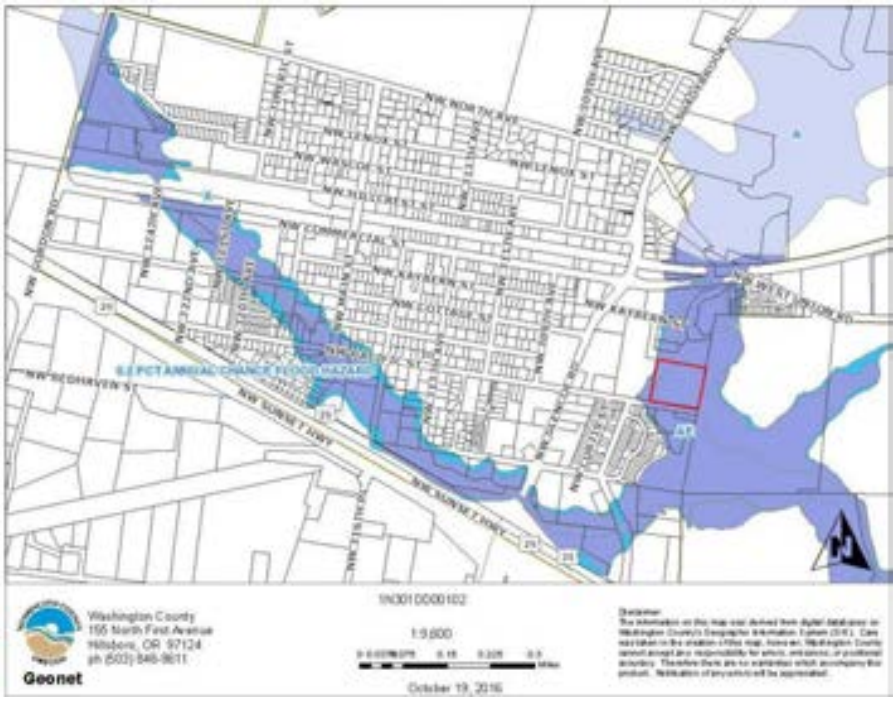
Natural Hazards

Flooding is the most serious hazard in the North Plains area. The City is located within the 100-year flood plains of McKay Creek, located on the city’s east boundary, and Ghost Creek, which runs from the northwest corner near the intersection of Wascoe Street and Gordon Road to the southeast corner at the intersection of Glencoe Road and Sunset Highway connecting to McKay Creek. Serious flooding has been reported in the past.

Undersized culverts were replaced at Glencoe Road, 314th Avenue, and Pacific, Cottage, Commercial, Hillcrest and Wascoe Streets. However, those improvements have simply displaced the flooding which now occurs near Gordon and Wascoe.

The U.S. Army Corps of Engineers has identified the elevations of the 100-year floodplain for both the creeks. Based on this data, Washington County has adopted a floodplain ordinance (No. 126) which essentially prohibits development in flood plain areas except where, after filling, construction can occur one foot above the flood elevation. However, filling permits are subject to stringent conditions.

Washington County calculated that the city has a total of 77 acres of land located within the 100-year flood plain of McKay Creek.



PUBLIC FACILITIES AND SERVICES

Supply and Storage

The City of North Plains is supplied domestic water by the Joint Water Commission (JWC) of Washington County. The primary transmission main from Hillsboro was installed in 2005. The JWC supplies potable water adequate to support both the residential, commercial and industrial uses as needed. The JWC treats the water with chlorine to disinfect it. The water is not fluoridated.

North Plains has a pressurized system, wherein water is pumped into a storage tank, directly from the transmission main and then into the distribution system. City staff is certified by the State of Oregon to maintain the system, and performs most repairs and some capital improvements.

The City has one 1.2-million-gallon storage tank which is adequate for domestic consumption and fire suppression over a short period and is building a new 3-million-gallon storage tank to prepare for future growth. The City has retained its rights to pump water from the local aquifer. The City has an approved capital program for the water system that is updated annually.

Distribution

The City maintains more than 13 miles of water mains, with appurtenant hydrants, valves and pumping systems. A plan for maintenance and improvements of the system is included in the Water System Master Plan.

Sanitary Sewage Systems

Clean Water Services owns and maintains the sanitary sewer collection system within the City of North Plains. The sewage flows by gravity to the southeast corner of the city to a pumping station located near the intersection of Highland Court and 307th Avenue. From there it is pumped through to Clean Water Service's Hillsboro treatment facility, which has adequate capacity to accommodate the city's sewage for the foreseeable future.

Storm Drain

North Plains has a limited storm drainage system that includes ditching and culverts that send storm water to the two major drainageways and Clean Water Services storm lines. Clean Water Services maintains all storm drainage facilities over 10 inches in size. The City maintains storm drain lines under 10 inches in size.

Solid Waste Disposal

Residential solid waste, recyclables and greenwaste is managed by Garbarino Disposal Services, which operates a corporation yard on Hillcrest Street. Prices are subject to periodic renegotiation between the collector and the Washington County Commission.

Emergency Services

The North Plains Police Department employs 2.5 full time equivalent officers (FTE) and six reserve officers. The department does not provide 24 hour coverage, but does receive rapid response for priority calls. The Police Department responds to dispatched calls, provides uniform patrol, interacts with the community, conducts criminal investigations, provides traffic enforcement, crime prevention, training and mutual aid to surrounding police agencies and supports other City departments. Detention and jail facilities are available through the Washington County jail located in Hillsboro, four miles away. North Plains contracts with the City of Hillsboro for report and evidence management and Washington County Justice Court to adjudicate traffic tickets.

Fire protection and emergency medical response within North Plains is provided by the Tualatin Valley Fire & Rescue. Station 17 is centrally located in downtown North Plains on Commercial Street next to City Hall. Station 17 is a full-time career station with four personnel: one officer, one driver and two firefighters. Equipment includes two engines, one tank truck, one rescue unit and one brush control truck.

The Washington County Emergency Medical Services (EMS) system serves the City of North Plains and includes an exclusive ambulance transportation franchise, seven fire department first response agencies, air medical scene support, four primary receiving hospitals and two level-1 trauma centers, and an advanced 911-E dispatch center. Regulatory oversight and direction for this system comes from Washington County and the State of Oregon.

Educational Facilities

The City of North Plains is within the Hillsboro School District. North Plains Elementary School was opened in 1954 and occupies 15 acres in the northwest corner of North Plains. There are no immediate plans for capital improvements. A new elementary school is planned as part of the east expansion area, recently annexed into city limits. North Plains' students attend the Evergreen Junior High Schools in Hillsboro. Most students rely on school-provided transportation. North Plains' students attend Glencoe High School in Hillsboro, which features athletic fields and an auditorium. Portland Community College offers post-graduate educational services to the North Plains area.

Library Services

North Plains Public Library, constructed in 2006, is part of the Washington County Cooperative Library System. The cooperative allows all County residents to borrow from any municipal or other public library in the County, providing access to over a million items in its cumulative collection.

Other Public Utilities: Telephone, Internet, Gas, Electrical

A variety of private companies provide these services to residents and businesses in North Plains.

Transportation Facilities

North Plains is located 19 miles from Portland and four miles north of Hillsboro and is outside the contiguous metropolitan urban growth boundary. However, it is not isolated due to several transportation advantages.

The Sunset Highway (US 26) is a major regional route connecting Portland with the coast. It forms the southern boundary of the existing City limits and is easily accessible via the Glencoe, Dersham, and Jackson Road interchanges. Highway 26 is a 4-lane highway and connects with Interstate 405 and is listed on the State Bicycle System.

Glencoe Road is maintained by Washington County as a two-lane rural highway. It connects North Plains with Hillsboro, and with the Dixie Mountain pass to the Columbia River Highway, about 12 miles north.

Of the 10.94 miles of currently platted right-of-way in North Plains, 8.18 miles are improved and in use. Of that total, 4.24 miles or 52% is paved and in good condition, and an additional 36% is graveled. Most of the residential streets in the south and west portions of town are hard packed gravel.

Commercial Street, North Avenue and Hillcrest Street are the most traveled east-west streets through North Plains. Glencoe, 311th and Main Streets are the most traveled north-south streets.

North Plains is served by a number of special transportation services including:

a. Ride Connection, which provides free transportation to TriMet facilities in Hillsboro and locations in Banks and Forest Grove, “Ride About” and “Door to Door” services for senior citizens.

b. Tillamook “Wave” bus service that connects Tillamook to Portland.

North Plains is served by a variety of other modes of transportation. The following are the most prominent for planning purposes:

- The Burlington Northern Railroad contains a single track line through the center of North Plains connecting Banks with the Portland rail yards. At least 4-5 times a day trains carry forest products and milled lumber as well as various seeds and produce from Portland.
- The residents of the Air Acres subdivision, in the unincorporated area immediately south of Highway 26, maintain a landing strip complete with lights and wind socks. This is a private field, available to the public for emergencies only. It is 3,000 feet long and can accommodate small, general aviation aircraft.
- The Port of Portland operates the Hillsboro Airport about five miles from North Plains. The Hillsboro Airport is an FAA-approved general aviation airport with two runways (4,050’ and 6,600’ lengths) that accommodate prop and small jet traffic. Hangar space and repair and maintenance services are available. The Port of Portland’s International Airport is in Portland, about 35 miles from North Plains.

ECONOMY

The Highway 26 Sunset Corridor is a major employment center in the Portland area and includes the greatest concentration of high tech industries in the state. The high-tech industries in the Sunset Corridor offer North Plains entrepreneurs the opportunity to provide supporting products and equipment to existing and developing businesses. More information on the local and regional economy can be found in the current Economic Opportunities Analysis.

THE PEOPLE OF NORTH PLAINS

US Census 2010 information indicates the following about North Plains based on the 2010 census: (www.factfinder2.census.gov). 2010 population was estimated at 1,947 persons. About 15% of residents are over age 60, and 31% are 19 or under. The median age is 36.5 years.

2010 Demographic Information

Subject	Number	Percent
Age		
Total population	1,947	100.0
Under 5 years	143	7.3
5 to 9 years	140	7.2
10 to 14 years	163	8.4
15 to 19 years	135	6.9
20 to 24 years	95	4.9
25 to 29 years	110	5.6
30 to 34 years	143	7.3
35 to 39 years	152	7.8
40 to 44 years	154	7.9
45 to 49 years	149	7.7
50 to 54 years	158	8.1
55 to 59 years	110	5.6
60 to 64 years	115	5.9
65 to 69 years	58	3.0
70 to 74 years	37	1.9
75 to 79 years	27	1.4
80 to 84 years	33	1.7
85 years and over	25	1.3
Median age (years)	36.5	(X)

Almost 63% of households have families with children, and half of these households have children under 18 years of age. About 17% of households, include a person 65-years-old or older. Almost 24% of households consist of one person living alone.

Households by Type

Total households	786
Family households (families)	493
With own children under 18 years	256
Married couple family	420
Male householder, no wife present, family	19
With own children, under 18 years	3
Female householder, no husband present, family	54
With own children under 18 years	37
Nonfamily households	293
Householder living alone	191
65 years and over	64
Households with one or more people under 18 years	262
Households with one or more people 65 years and over	133
Average household size	2.36
Average family size	2.98

The average household size is 2.36 persons. Family households are slightly larger at 2.98.

Some 581 children (31% of residents) were present in North Plains in 2010, with almost 200 attending grade school, and another 100 attending high school.

School Enrollment

Population 3 years and over enrolled in school	385
Nursery school, preschool	7
Kindergarten	5
Elementary school (grades 1-8)	197
High school (grades 9-12)	107
College or graduate school	69

English is the only language spoken by 84% of residents over age 5. About 8.7% speak Spanish. The remaining 8% speak other languages.

Per capita income (all population divided by earnings) in North Plains is $31,597. Median household income in North Plains is relatively high for the area at $71,346. Other area communities have lower medians.

Area	Median Household Income
North Plains	$71,346
Washington County	$63,814
Hillsboro	$64,197
Banks	$65,417
Beaverton	$55,155
Cornelius	$48,788
Forest Grove	$49,034

Most residents over 25 have completed high school. Almost 30% have attained a college degree, with 17% attaining a 4-year degree or higher.

Category	No.	Percent
Population 25 years and over	1,346	
Less than 9th grade	30	2.2%
9th to 12th grade, no diploma	84	6.2%
High school graduate (includes equivalency)	466	34.6%
Some college, no degree	370	27.4%
Associate's degree	164	12.2%
Bachelor's degree	173	12.8%
Graduate or professional degree	59	4.4%

HOUSING SUPPLY

In 2010, there were 852 housing units in North Plains census tract (which captures some homes outside of the incorporated City limits.) The City experienced substantial growth in the 1990's and early 2000's. Growth has been more gradual since 2005:

Year Structure Built	No.
Total housing units	852
Built 2005 or later	58
Built 2000 to 2004	104
Built 1990 to 1999	418
Built 1980 to 1989	63
Built 1970 to 1979	78
Built 1960 to 1969	31
Built 1950 to 1959	14
Built 1940 to 1949	25
Built 1939 or earlier	61

Most residences have 3 or fewer bedrooms:

Bedrooms	No.
Total housing units	852
No bedroom	12
1 bedroom	93
2 bedrooms	78
3 bedrooms	528
4 bedrooms	127
5 or more bedrooms	14

Of the occupied units at the time of the census, almost 75% were owner occupied.

Housing Tenure	No.
Occupied housing units	786
Owner-occupied	585
Renter-occupied	201
Average household size of owner-occupied unit	2.48
Average household size of renter-occupied unit	2.01

The value of most owner-occupied housing is above $200,000 in 2010.

Value	No.
Owner-occupied units	585
Less than $50,000	15
$50,000 to $99,999	6
$100,000 to $149,999	19
$150,000 to $199,999	150
$200,000 to $299,999	265
$300,000 to $499,999	125
$500,000 to $999,999	3
$1,000,000 or more	2
Median (dollars)	$237,400

About 15% of owners who occupy units (89) have no mortgage on their home.

Mortgages in North Plains tend to be modest in the range of $1,000-$2,000 per month, with a median of $1,601.

Selected Monthly Owner Costs	No.
Housing units with a mortgage	496
Less than $300	0
$300 to $499	3
$500 to $699	0
$700 to $999	14
$1,000 to $1,499	178
$1,500 to $1,999	217
$2,000 or more	84
Median (dollars)	1,601

Residential rental costs also tend to be modest in North Plains. About 23% of the City's residences are rented. Most multi-family units rent for less than $1,000/month, including housing for seniors.

Gross Rent	No.
Occupied units paying rent	198
Less than $200	4
$200 to $299	4
$300 to $499	9
$500 to $749	66
$750 to $999	45
$1,000 to $1,499	55
$1,500 or more	15
Median (dollars)	$887

Most occupied residences have access to vehicles:

Vehicles Available	No.
Occupied housing units	786
No vehicles available	49
1 vehicle available	155
2 vehicles available	320
3 or more vehicles available	262

Updated housing information can be found in the 2017 Housing Needs Analysis.

EXISTING LAND USE

As of October 3, 2017, land uses and acreages in the City of North Plains were as follows:

Zone	Acres
Low density residential (R10)	N/A
Medium/low density residential (R7.5)	100.55
Medium/high density residential (R5)	85.89
High density residential (R2.5)	89.21
Neighborhood community (NC)	24.33
Commercial (C1 and C2)	69.39
Industrial (M1 and M2)	183.75

Ordinance No. 490
Exhibit D

STAFF REPORT TO CITY COUNCIL

Urban Growth Boundary (UGB) Amendment and Comprehensive Plan Text Amendment

City File Number CPA 23-056(1)
Staff Report Date: May 31, 2023

From: Steve Miller, Planning Manager

Public Hearing Date: June 5, 2023

Proposal: The City of North Plains proposes an expansion to the city's current Urban Growth Boundary (UGB) and associated Comprehensive Plan Text Amendment. The City's 2017, updated in 2022, Housing Needs Analysis (HNA) identifies a need for 167 acres of land to meet residential demands through 2037, including land for parks and infrastructure. The 2018 Economic Opportunities Analysis (EOA), updated in 2022, identifies a need for 515 acres to meet industrial land needs and 172 acres to meet commercial land needs through 2038, including land for infrastructure. Combined, these studies estimate a need for 855.2 acres to meet the city's 20-year land need. The proposed UGB Expansion and associated Comprehensive Plan Text Amendment detail the city's analysis in determining how much land to include in the expansion area and where to expand, as well as the policies associated with such an expansion.

Process: The Planning Commission conducted a public hearing on the proposal at their May 10th, 2023, meeting and made a recommendation of approval to the City Council. As part of their recommendation to the City Council, the Planning Commission recommended that the UGB boundary be amended to include the small "triangle" piece of land (i.e. Tax Lot 1N301CD02200) associated with the property located at 10105 NW 314th Ave., which is currently inside the city limits. The Planning Commission also recommended that staff compile a narrative description of the proposed UGB boundary to accompany the Expansion Report. The City Council will review the Planning Commission's recommendation and conduct a public hearing at their June 5th meeting before making the city's final decision on the proposal. The proposed North Plains Urban Growth Boundary Expansion Report and associated text updates to the Comprehensive Plan are included with this staff report.

Background: The city is initiating an Urban Growth Boundary Expansion and an associated legislative comprehensive plan text amendment.

Summary Conclusions: This report includes findings regarding each applicable Comprehensive Plan and Zoning Code criterion, which incorporate the Oregon Statewide Planning Goals. The proposal is consistent with the Comprehensive Plan and Zoning Code criteria for a Comprehensive Plan Text Amendment and UGB Expansion.

COMPLIANCE WITH CITY OF NORTH PLAINS MUNICIPAL CODE

COMPREHENSIVE PLAN & ZONING AMENDMENTS
§155.127 Review Criteria
(A) Text Amendment
An amendment to the text of the Comprehensive Plan or this Ordinance shall be based upon a need for such an amendment identified by the City Council or the Planning Commission. Such an amendment shall be consistent with the following review criteria:

(1) Impact of the proposed amendment on land use and development patterns within the city, as measured by:

(a) Traffic generation and circulation patterns in compliance with the Transportation System Plan (TSP);

(b) Demand for public facilities and services, in compliance with the City utility master plans;

(c) Level of park and recreation facilities;

(d) Economic activities;

(e) Protection and use of natural resources;

(f) Compliance of the proposal with existing adopted special purpose plans or programs, such as public facilities improvements.

Finding: *The City Council and Planning Commission identified a need for the UGB expansion and supporting comprehensive plan text amendments based on the lack of available land for the city to support identified employment and residential growth over the next 20 years. The City Council has a stated goal to overturn the "bedroom community" dynamic in the city with robust planning and for employment land development over the coming years.*

The amount of land identified for inclusion in the UGB expansion is based on the adopted Economic Opportunities Analysis (EOA) and an updated Housing Needs Analysis (HNA) that is being approved concurrently with this UGB expansion. The included UGB Expansion Report provides high-level analysis of traffic generation and circulation patterns, public facilities and services, parks and recreation facilities, economic activities, protection and use of natural resources and compliance with existing and adopted special purpose plans and programs. The next step in the UGB expansion process is to concept plan the UGB areas. This will allow the city to dig deeper into the details of these city services and determine the impact of each on land use and development patterns within the existing city limits and within the proposed UGB expansion areas. This standard is met.

(2) The proposed amendment complies with all applicable Statewide Planning Goals and administrative rule requirements.

Finding: *Oregon's 19 Statewide Planning Goals are addressed below. Though several of the goals are not applicable to the proposed UGB expansion and comprehensive plan text amendments, those that are applicable are responded to in detail.*

Goal 1 Citizen Involvement

The North Plains Urban Growth Boundary Expansion Project Advisory Committee (UGB PAC), comprised of elected and appointed officials, community residents, local business owners and agency representatives, met nine (9) times over the course of three (3) years in publicly noticed, hybrid in-person/virtual open meetings. Public testimony was always received at each UGB PAC meeting. The city maintained a robust website throughout the project,

https://www.northplains.org/planning/page/urban-growth-boundary-expansion, allowing full access to up-to-date project documents and information about upcoming opportunities to participate via a scheduled PAC meeting or connection with City staff.

This land use process to approve the proposal is subject to a City of North Plains Type IV land use review, which includes a significant citizen involvement component. This process has been established by the city and determined to be consistent with this goal. The mandatory public notice of the action and decision, and the hearings on this case before the Planning Commission and City Council are all avenues of citizen participation.

Goal 2 Land Use Planning

This statewide goal requires that land use decisions 1) have an adequate factual base, 2) that alternatives have been considered, and 3) that implementation measures are consistent with and adequate to carry out comprehensive plan.

The proposed UGB expansion area was established utilizing the guidance provided by Statewide Planning Goal 14 (Urbanization) which incorporates the requirements of ORS 197A.300 to 197A.325, which establishes requirements for a factual basis. Alternatives to the proposed expansion were reviewed and discussed throughout the eight (8) Project Advisory Committee Meetings and two (2) joint Planning Commission-City Council Work Sessions. The proposed UGB expansion and associated comprehensive plan text amendment are consistent with and adequate to carry out the Comprehensive Plan.

Goal 3 Agricultural Lands and Goal 4 Forest Lands

This goal does not apply because the City does not include areas designated for agricultural or forest use. The areas designated for UGB expansion are all within either the "exception land" or "undesignated" urbanization categories. No "rural reserves" are proposed for inclusion in the UGB expansion.

Goal 5 Open Spaces, Scenic and Historic Areas, and Natural Resources

There are no proposed changes to text regarding Goal 5 open spaces, scenic and historic areas and natural resources. Therefore, the intent of this goal remains satisfied by the policies of the Comprehensive Plan and implementation in the Zoning Ordinance.

Goal 6 Air, Water and Land Resources Quality

There are no proposed changes to text regarding air, water, or land resources. Therefore, the intent of this goal remains satisfied by the policies of the Comprehensive Plan and implementation in the Zoning Ordinance.

Goal 7 Areas Subject to Natural Hazards

There are no proposed changes to text regarding areas subject to natural hazards. Therefore, the intent of this goal remains satisfied by the policies of the Comprehensive Plan and implementation in the Zoning Ordinance.

***Goal 8* Recreational Needs**

The proposed UGB expansion includes 40 acres of parks and open space to meet the need identified in the Housing Needs Analysis (HNA) to support current and future residents of the city. This amount of parks and open space land included in the UGB expansion area calculation is consistent with Goal 8.

***Goal 9* Economic Development**

The proposed UGB Expansion includes 515 acres to accommodate industrial land needs and 172 acres to meet commercial land needs through 2038, including infrastructure such as roadways. This employment land need was established through the city's adopted Economic Opportunities Analysis. The city is also in on-going discussions with the State of Oregon regarding potential designation of 500 acres as a special opportunity area for semi-conductor manufacturing and related business development. The proposed UGB expansion and associated Comprehensive Plan Text Amendments support the city's ongoing compliance with Goal 9.

***Goal 10* Housing**

The proposed UGB Expansion includes 167 acres to meet residential land needs through 2038, including parks and infrastructure. This residential land need was established through the city's updated Housing Needs Analysis. The proposed UGB expansion and associated Comprehensive Plan Text Amendments support the city's ongoing compliance with Goal 10.

***Goal 11* Public Facilities and Services**

There are no proposed changes to text regarding public facilities and services. The UGB Expansion includes land for provision of public roadways and infrastructure. The intent of this goal remains satisfied by the policies of the Comprehensive Plan and implementation in the Zoning Ordinance.

***Goal 12* Transportation**

The Transportation Planning Rule (TPR), OAR 600-012.0060, requires that, where an amendment to a comprehensive plan or zoning regulation would significantly affect an existing or planned transportation facility, the local government shall put in place measures that assure that allowed land uses are consistent with the function, capacity, and performance standards of the facility. The proposed UGB Expansion and associated Comprehensive Plan Text Amendment do not propose any changes to an existing or planned transportation facility and, as such, the proposal does not affect the transportation system of the City. More detail regarding transportation analysis will be included with the city's UGB Concept Planning Process, which will commence once the UGB Expansion is adopted and finalized.

Regarding the Planning Commission's recommendation that staff compile a narrative description of the proposed UGB boundary to accompany the Expansion Report. Compiling the description of the proposed UGB boundary, will allow the city to more accurately include either a portion or all of the impacted county roadways. The recommendation will allow the subject streets to be improved to city standards, as opposed to county standards, with the anticipated future development of the UGB lands. By improving these streets to city standards with the future development of the UGB lands, it will establish a system of safe, connected

bicycle/pedestrian paths which will encourage residents and commuters to walk and/or bike thereby reducing reliance on private motor vehicles. Thus, the resulting plan will allow support of a variety of transportation modes and meet the transportation needs of the future land uses within the proposed UGB boundary.

***Goal 13* Energy Conservation**

There are no identifiable energy consequences of this land use action. The city continues to be in compliance with Goal 13 through adopted Comprehensive Plan policies.

***Goal 14* Urbanization**

The UGB Expansion Report follows the guidance provided by Statewide Planning Goal 14 (Urbanization), which incorporates the requirements of ORS 197A.300 to 197A.325 Amendment of Urban Growth Boundary Outside Metro. The report answers the following questions to justify a UGB expansion for North Plains:

1. Is any additional land needed for one or more urban uses, and if so, how much?
2. If additional land is needed, how much can be accommodated within the current UGB?
3. If additional land is needed outside the UGB, where is the best place to expand the boundary?
4. What other amendments are needed to comply with the statewide planning goals?

The UGB Expansion Report details the analysis of the above questions and provides a logical, efficient expansion of the city's UGB to include an additional 855.2 acres to meet the city's 20-year land need.

Regarding the Planning Commission's recommendation to the City Council that the UGB boundary be amended to include the small "triangle" piece of land (i.e. Tax Lot 1N301CD02200) associated with the property located at 10105 NW 314th Ave., which is currently inside the city limits, Staff provides the following findings.

From an urbanizational perspective, the small "triangle" piece of land (i.e. Tax Lot 1N301CD02200) is easily serviceable and provides for the orderly provisions of public facilities via the existing public utilities located in the NW 314th Ave. right-of-way, will have no negative impact to surrounding farm or forest lands or farming/forest activities, protects productive resource lands outside of the proposed UGB boundary, and assists the city with the efficient accommodation of identified land needs. Urban growth boundaries (UGB) are intended to accommodate growth and reduce pressure to urbanize rural lands. By including the small "triangle" piece of land in the UGB boundary, it will assist the city in accommodating growth and reducing pressure to urbanize rural lands.

The proposed UGB Expansion and Comprehensive Plan Text Amendment meet the provisions of Goal 14.

***Goal 15* Willamette River Greenway**
***Goal 16* Estuarine Resources**
***Goal 17* Coastal Shorelands**
***Goal 18* Beaches and Dunes**
***Goal 19* Ocean Resources**

The City is not within the plan boundary for the Willamette River Greenway, does not have any estuarine resources, and is not on the Oregon Coast, so goals 15 through 19 do not apply.

As discussed above, the proposed UGB Expansion and Comprehensive Plan Text Amendment area generally consistent with all of the applicable Oregon Statewide Planning Goals.

(3) The amendment is appropriate as measured by at least one of the following criteria:
(a) It corrects identified error(s) in the provisions of the plan.
(b) It represents a logical implementation of the plan.
(c) It is mandated by changes in federal, state, or local law.
(d) It is otherwise deemed by the City Council to be desirable, appropriate, and proper.

Finding: *The proposed UGB expansion and Comprehensive Plan Text Amendment have been deemed to be desirable, appropriate and proper accommodate the city's projected residential and employment growth over the next 20 years. The proposed amendment is appropriate as measured by at least one of the criteria and this standard is met.*

(4) Compliance with the statewide Transportation Planning Rule. When a development application includes a Comprehensive Plan, Zone Map or Text Amendment, the proposal shall be reviewed to determine whether it significantly affects a transportation facility, in accordance with Oregon Administrative Rule (OAR) 660-012-0060, the Transportation Planning Rule. "Significant" means the proposal would:

(a) Change the functional classification of an existing or planned transportation facility (exclusive of correction of map errors). This would occur, for example, when a street classification,
requiring traffic to exceed the levels associated with a "collector" street classification, requiring a change in the classification to an "arterial" street as identified by the City's Transportation System Plan (TSP); or
(b) Change the standards implementing a functional classification system; or
(c) As measured at the end of the planning period identified in the North Plains TSP or Comprehensive Plan; or
(d) Reduce the performance of an existing or planned transportation facility below the minimum acceptable performance identified in the North Plains TSP or Comprehensive Plan; or
(e) Worsen the performance of an existing or planned transportation facility that is otherwise projected to perform below the minimum acceptable performance standard identified in the North Plains TSP or Comprehensive Plan.

(5) Amendments that affect Transportation Plans. Except as provided in subsection 6 Exceptions, amendments to the Comprehensive Plan or land use regulations which significantly affect a transportation facility shall assure that allowed land uses are consistent with the function, capacity and level or service of the facility identified in the North Plains TSP. This shall be accomplished by one of the following:

(a) Adopting measures that demonstrate that allowed land uses are consistent with the planned function of the transportation facility; or
(b) Amending the North Plains TSP or Comprehensive Plan to provide transportation facilities, improvements, or services adequate to support the proposed land uses; such amendments shall include a funding plan to ensure the facility, improvement , or service will be provided by the end of the planning period; or
(c) Altering land use designations, densities, or design requirements to reduce demand for automobile travel and meet travel needs through other modes of transportation; or

(d) Amending the planned function, capacity or performance standards of the transportation facility; or

(e) Providing other measures as a condition of development or through a development agreement or similar funding method, specifying when such measures will be provided.

(6) Exceptions. Amendments to the Comprehensive Plan or land use regulation with a significant effect on a transportation facility, where the facility is already performing below the minimum acceptable performance standard identified in the North Plains TSP or Comprehensive Plan, may be approved when all of the following criteria are met:

(a) The amendment does not include property located in an interchange area, as defined under applicable law;

(b) The currently planned facilities, improvements or services are not adequate to achieve the standard;

(c) The currently planned facilities, improvements or services at a minimum mitigate the impacts of the amendment in a manner that avoids further degradation to the performance of the facility by the time of the development; and

(d) The road authority provides a written statement that the proposed funding and timing for the proposed development mitigation are sufficient to avoid degradation to the facility.

Finding: *The proposed UGB Expansion and Comprehensive Plan Text Amendment do not include changes to the Transportation System Plan or significantly affect a transportation facility. The proposal is to approve the UGB expansion area, but does not include land use designations or roadway alignments within the UGB area. A more detailed analysis of transportation system impact will be forthcoming with UGB Concept Planning. Approval of the proposed UGB Expansion and Comprehensive Plan Text Amendment will comply with the Transportation Planning Rule.*

§155.129 Findings

Findings justifying a decision on an application shall be made in writing, and shall be provided to the applicant.

Finding: *The City Council's final decision will include written findings. As the City is the applicant, they will have the findings.*

§155.129 Conditions

The granting of an approval of any land use action under Chapter 16.200 may be subject to such conditions as are reasonably necessary to protect the public health, safety or general welfare from potentially damaging effects resulting from approval of the permit, or to fulfill the public need for service demands created by approval of the request.

Finding: *Staff does not find it necessary to subject this decision to any conditions of approval.*

CONCLUSION

The City Council is considering a recommendation from the Planning Commission to the City Council of the proposed UGB expansion and comprehensive plan text amendment. The City Council may approve, approve with Conditions or deny the proposal.

Staff recommends City Council approval of City File Number **CPA 23-056(1)**, Urban Growth Boundary Expansion and Comprehensive Plan Text Amendment at their regularly scheduled meeting on June 5, 2023.

Enrolled
House Bill 2003

Sponsored by Representative KOTEK; Representatives FAHEY, KENY-GUYER, WILDE

CHAPTER .....

AN ACT

Relating to buildings; creating new provisions; amending ORS 197.296, 197.299, 197.303, 197.319, 197.320, 215.416, 215.441, 227.175, 227.500 and 455.062 and section 1, chapter 47, Oregon Laws 2018, and section 3, chapter 97, Oregon Laws 2019 (Enrolled Senate Bill 39); and declaring an emergency.

Be It Enacted by the People of the State of Oregon:

SECTION 1. (1) As used in this section:

(a) "Area median income" means the median income for households established by the United States Department of Housing and Urban Development.

(b) "Existing housing stock" means housing, by affordability level and type, actually constructed in a city or Metro.

(c) "High income" means above 120 percent of the area median income.

(d) "Housing shortage" means the difference between the estimated housing units of different affordability levels and housing types needed to accommodate the existing population and the existing housing stock, measured in dwelling units.

(e) "Low income" means income above 50 percent and at or below 80 percent of the area median income.

(f) "Metro" means a metropolitan service district organized under ORS chapter 268.

(g) "Moderate income" means income above 80 percent and at or below 120 percent of the area median income.

(h) "Region" has the meaning given that term in ORS 284.752.

(i) "Very low income" means income at or below 50 percent of the area median income.

(2) The Housing and Community Services Department, in coordination with the Department of Land Conservation and Development and the Oregon Department of Administrative Services, shall develop a methodology for calculating:

(a) A regional housing needs analysis that identifies the total number of housing units necessary to accommodate anticipated populations in a region over the next 20 years based on:

(A) Trends in density and in the average mix of housing types of urban residential development;

(B) Demographic and population trends;

(C) Economic trends and cycles; and

(D) Equitable distribution of publicly supported housing within a region.

(b) An estimate of existing housing stock of each city and Metro.

(c) A housing shortage analysis for each city and Metro.

(d) An estimate of the number of housing units necessary to accommodate anticipated population growth over the next 20 years for each city and Metro.

(3) The methodologies for calculating the regional housing needs analysis, the estimate of existing housing stock, the housing shortage analysis and the estimate of housing necessary to accommodate growth that are developed under subsection (2) of this section must classify housing by:

(a) Housing type, including attached and detached single-family housing, multifamily housing and manufactured dwellings or mobile homes; and

(b) Affordability, by housing that is affordable to households with:

(A) Very low income;

(B) Low income;

(C) Moderate income; or

(D) High income.

(4) No later than September 1, 2020, the Housing and Community Services Department, in coordination with the Department of Land Conservation and Development and the Oregon Department of Administrative Services, shall conduct for each region a regional housing needs analysis and, for each city and Metro, shall estimate existing housing stock, conduct a housing shortage analysis and estimate the housing necessary to accommodate growth.

(5) In developing the methodologies and conducting the analyses under this section, the Housing and Community Services Department may:

(a) Consult or contract with subject matter experts, cities and Metro, regional solutions centers described in ORS 284.754 (2) and other jurisdictions that have created or conducted regional housing needs analyses.

(b) Consider the most recent consolidated population forecast produced by the Portland State University Population Research Center in making any relevant calculation or forecast.

(c) Consider any other relevant existing analyses, data and other information collected or produced by state agencies or public entities.

(d) Make changes to the regional boundaries in order to make regions more accurately align with shared employment, transportation or housing market dynamics.

SECTION 2. (1) No later than March 1, 2021, the Housing and Community Services Department, in consultation with the Department of Land Conservation and Development and the Oregon Department of Administrative Services, shall submit a report, in the manner provided in ORS 192.245 to an appropriate committee of the Legislative Assembly, that summarizes the findings of the regional housing needs analysis, estimate of housing stock, housing shortage analysis and estimate of housing necessary to accommodate growth conducted under section 1 (4) of this 2019 Act.

(2) No later than March 1, 2021, the Department of Land Conservation and Development, in consultation with the Oregon Department of Administrative Services and the Housing and Community Services Department, shall submit a report, in the manner provided in ORS 192.245, to an appropriate committee of the Legislative Assembly that evaluates:

(a) Whether a regional housing needs analysis and housing shortage analysis described in section 1 of this 2019 Act could appropriately allocate among the cities or local governments in a region the housing shortage described;

(b) How a regional housing needs analysis and housing shortage analysis may compare to existing assessments of housing need and capacity conducted by local governments under ORS 197.296 (3) and (10) in terms of:

(A) Cost and cost effectiveness;

(B) Reliability and accuracy;

(C) Repeatability; and

(D) Predictability;

(c) How a regional housing needs analysis and housing shortage analysis may relate to statewide planning goals related to housing and any rules and policies adopted pursuant to these goals and ORS 197.295 to 197.314;

(d) Whether different boundaries would be more appropriate for defining regions within the regional housing needs analysis based on:

(A) Relevance of data in appropriately defining a commuting, employment or housing market; or

(B) Ease or cost of collecting or analyzing data;

(e) Other ways in which the regional housing needs analysis or housing shortage analysis could be improved; and

(f) Whether the regional housing needs analysis, or an improved version, could serve as an acceptable methodology statewide for land use planning relating to housing.

(3) In preparing the report required under subsection (2) of this section, the Department of Land Conservation and Development may consult or contract with other state agencies, subject matter experts, private firms, local governments, regional solutions centers described in ORS 284.754 (2) and other jurisdictions that have created or conducted regional housing needs analyses.

SECTION 3. Sections 4 to 6 of this 2019 Act are added to and made a part of ORS 197.295 to 197.314.

SECTION 4. (1) A city with a population greater than 10,000 shall develop and adopt a housing production strategy under this section no later than one year after:

(a) The city's deadline for completing a housing capacity analysis under ORS 197.296 (2)(a);

(b) The city's deadline for completing a housing capacity analysis under ORS 197.296 (10)(b); or

(c) A date scheduled by the Land Conservation and Development Commission following the allocation of housing capacity to the city by a metropolitan service district under ORS 197.299 (2)(d).

(2) A housing production strategy must include a list of specific actions, including the adoption of measures and policies, that the city shall undertake to promote development within the city to address a housing need identified under ORS 197.296 (6) for the most recent 20-year period described in ORS 197.296 (2)(b). Actions under this subsection may include:

(a) The reduction of financial and regulatory impediments to developing needed housing, including removing or easing approval standards or procedures for needed housing at higher densities or that is affordable;

(b) The creation of financial and regulatory incentives for development of needed housing, including creating incentives for needed housing at higher densities or that is affordable; and

(c) The development of a plan to access resources available at local, regional, state and national levels to increase the availability and affordability of needed housing.

(3) In creating a housing production strategy, a city shall review and consider:

(a) Socioeconomic and demographic characteristics of households living in existing needed housing;

(b) Market conditions affecting the provision of needed housing;

(c) Measures already adopted by the city to promote the development of needed housing;

(d) Existing and expected barriers to the development of needed housing; and

(e) For each action the city includes in its housing production strategy:

(A) The schedule for its adoption;

(B) The schedule for its implementation;

(C) Its expected magnitude of impact on the development of needed housing; and

(D) The time frame over which it is expected to impact needed housing.

(4) The housing production strategy must include within its index a copy of the city's most recently completed survey under section 1 (2), chapter 47, Oregon Laws 2018.

(5) The adoption of a housing production strategy is not a land use decision and is not subject to appeal or review except as provided in section 5 of this 2019 Act.

SECTION 5. (1) No later than 20 days after a city's adoption or amendment of a housing production strategy under section 4 of this 2019 Act, a city shall submit the adopted strategy or amended strategy to the Department of Land Conservation and Development.

(2) The submission under subsection (1) of this section must include copies of:

(a) The signed decision adopting the housing production strategy or amended strategy;

(b) The text of the housing production strategy clearly indicating any amendments to the most recent strategy submitted under this section;

(c) A brief narrative summary of the housing production strategy; and

(d) The information reviewed and considered under section 6 (2) of this 2019 Act.

(3) On the same day the city submits notice of the housing production strategy or amended strategy, the city shall provide a notice to persons that participated in the proceedings that led to the adoption of the strategy and requested notice in writing.

(4) Within 10 days of receipt of the submission under subsection (1) of this section, the department shall provide notice to persons described under ORS 197.615 (3).

(5) The notices given under subsections (3) and (4) of this section must state:

(a) How and where materials described in subsection (2) of this section may be freely obtained;

(b) That comments on the strategy may be submitted to the department within 45 days after the department has received the submission; and

(c) That there is no further right of appeal.

(6) Based upon criteria adopted by the Land Conservation and Development Commission, including any criteria adopted under section 6 (2) of this 2019 Act, the department shall, within 120 days after receiving the submission under subsection (1) of this section:

(a) Approve the housing production strategy;

(b) Approve the housing production strategy, subject to further review and actions under section 6 (2) of this 2019 Act; or

(c) Remand the housing production strategy for further modification as identified by the department.

(7) A determination by the department under subsection (6) of this section is not a land use decision and is final and not subject to appeal.

SECTION 6. (1) The Land Conservation and Development Commission, in consultation with the Housing and Community Services Department, shall adopt criteria for reviewing and identifying cities with a population greater than 10,000 that have not sufficiently:

(a) Achieved production of needed housing within their jurisdiction; or

(b) Implemented a housing production strategy adopted under section 4 of this 2019 Act.

(2) The criteria adopted by the commission under subsection (1) of this section may include the city's:

(a) Unmet housing need as described in ORS 197.296 (6);

(b) Unmet housing need in proportion to the city's population;

(c) Percentage of households identified as severely rent burdened as described in section 1, chapter 47, Oregon Laws 2018;

(d) Recent housing development;

(e) Recent adoption of a housing production strategy under section 4 of this 2019 Act or adoption of actions pursuant to a housing production strategy;

(f) Recent or frequent previous identification by the Department of Land Conservation and Development under this section; or

(g) Other attributes that the commission considers relevant.

(3) The Department of Land Conservation and Development may review cities under the criteria adopted under subsection (2) of this section for the purposes of prioritizing actions by the department, including:

(a) Awarding available technical or financial resources;

(b) Providing enhanced review and oversight of the city's housing production strategy;

(c) Requiring a report and explanation if a city does not implement an action within the approximate time frame scheduled within a housing production strategy;

(d) Entering into agreements with the city relating to the city's modification or implementation of its housing production strategy; or

(e) Petitioning the commission to act under ORS 197.319 to 197.335 to require the city to comply with ORS 197.295 to 197.314 or statewide land use planning goals related to housing or urbanization.

SECTION 7. No later than December 31, 2019, the Land Conservation and Development Commission shall adopt a schedule by which metropolitan service districts and cities described in ORS 197.296 (2)(a)(B) and (10)(c)(B) shall demonstrate sufficient buildable lands. Dates in the schedule may not be earlier than two years following the commission's creation of rules implementing sections 4 to 6 of this 2019 Act and the amendments to ORS 197.296 and 197.299 by sections 8 and 9 of this 2019 Act.

SECTION 8. ORS 197.296 is amended to read:

197.296. (1)(a) The provisions of subsections (2) to (9) of this section apply to metropolitan service district regional framework plans and local government comprehensive plans for lands within the urban growth boundary of a city that is located outside of a metropolitan service district and has a population of 25,000 or more.

(b) The Land Conservation and Development Commission may establish a set of factors under which additional cities are subject to the provisions of this section. In establishing the set of factors required under this paragraph, the commission shall consider the size of the city, the rate of population growth of the city or the proximity of the city to another city with a population of 25,000 or more or to a metropolitan service district.

(2)**(a)** [*At periodic review pursuant to ORS 197.628 to 197.651 or at any other legislative review of the comprehensive plan or regional framework plan that concerns the urban growth boundary and requires the application of a statewide planning goal relating to buildable lands for residential use,*] A local government shall demonstrate that its comprehensive plan or regional framework plan provides sufficient buildable lands within the urban growth boundary established pursuant to statewide planning goals to accommodate estimated housing needs for 20 years**:**

(A) At periodic review under ORS 197.628 to 197.651;

(B) As scheduled by the commission:

(i) At least once each eight years for local governments that are not within a metropolitan service district; or

(ii) At least once each six years for a metropolitan service district; or

(C) At any other legislative review of the comprehensive plan or regional framework plan that concerns the urban growth boundary and requires the application of a statewide planning goal relating to buildable lands for residential use.

(b) The 20-year period shall commence on the date initially scheduled for completion of the [*periodic or legislative*] review **under paragraph (a) of this subsection**.

(3) In performing the duties under subsection (2) of this section, a local government shall:

(a) Inventory the supply of buildable lands within the urban growth boundary and determine the housing capacity of the buildable lands; and

(b) Conduct an analysis of housing need by type and density range, in accordance with ORS 197.303 and statewide planning goals and rules relating to housing, to determine the number of units and amount of land needed for each needed housing type for the next 20 years.

(4)(a) For the purpose of the inventory described in subsection (3)(a) of this section, "buildable lands" includes:

(A) Vacant lands planned or zoned for residential use;

(B) Partially vacant lands planned or zoned for residential use;

(C) Lands that may be used for a mix of residential and employment uses under the existing planning or zoning; and

(D) Lands that may be used for residential infill or redevelopment.

(b) For the purpose of the inventory and determination of housing capacity described in subsection (3)(a) of this section, the local government must demonstrate consideration of:

(A) The extent that residential development is prohibited or restricted by local regulation and ordinance, state law and rule or federal statute and regulation;

(B) A written long term contract or easement for radio, telecommunications or electrical facilities, if the written contract or easement is provided to the local government; and

(C) The presence of a single family dwelling or other structure on a lot or parcel.

(c) Except for land that may be used for residential infill or redevelopment, a local government shall create a map or document that may be used to verify and identify specific lots or parcels that have been determined to be buildable lands.

(5)(a) Except as provided in paragraphs (b) and (c) of this subsection, the determination of housing capacity and need pursuant to subsection (3) of this section must be based on data relating to land within the urban growth boundary that has been collected since the last [*periodic*] review [*or*] **under subsection (2)(a)(B) of this section** [*five years, whichever is greater*]. The data shall include:

(A) The number, density and average mix of housing types of urban residential development that have actually occurred;

(B) Trends in density and average mix of housing types of urban residential development;

(C) Demographic and population trends;

(D) Economic trends and cycles; and

(E) The number, density and average mix of housing types that have occurred on the buildable lands described in subsection (4)(a) of this section.

(b) A local government shall make the determination described in paragraph (a) of this subsection using a shorter time period than the time period described in paragraph (a) of this subsection if the local government finds that the shorter time period will provide more accurate and reliable data related to housing capacity and need. The shorter time period may not be less than three years.

(c) A local government shall use data from a wider geographic area or use a time period for economic cycles and trends longer than the time period described in paragraph (a) of this subsection if the analysis of a wider geographic area or the use of a longer time period will provide more accurate, complete and reliable data relating to trends affecting housing need than an analysis performed pursuant to paragraph (a) of this subsection. The local government must clearly describe the geographic area, time frame and source of data used in a determination performed under this paragraph.

(6) If the housing need determined pursuant to subsection (3)(b) of this section is greater than the housing capacity determined pursuant to subsection (3)(a) of this section, the local government shall take one or more of the following actions to accommodate the additional housing need:

(a) Amend its urban growth boundary to include sufficient buildable lands to accommodate housing needs for the next 20 years. As part of this process, the local government shall consider the effects of measures taken pursuant to paragraph (b) of this subsection. The amendment shall include sufficient land reasonably necessary to accommodate the siting of new public school facilities. The need and inclusion of lands for new public school facilities shall be a coordinated process between the affected public school districts and the local government that has the authority to approve the urban growth boundary;

(b) Amend its comprehensive plan, regional framework plan, functional plan or land use regulations to include new measures that demonstrably increase the likelihood that residential development will occur at densities sufficient to accommodate housing needs for the next 20 years without

expansion of the urban growth boundary. A local government or metropolitan service district that takes this action shall monitor and record the level of development activity and development density by housing type following the date of the adoption of the new measures; or

(c) Adopt a combination of the actions described in paragraphs (a) and (b) of this subsection.

(7) Using the analysis conducted under subsection (3)(b) of this section, the local government shall determine the overall average density and overall mix of housing types at which residential development of needed housing types must occur in order to meet housing needs over the next 20 years. If that density is greater than the actual density of development determined under subsection (5)(a)(A) of this section, or if that mix is different from the actual mix of housing types determined under subsection (5)(a)(A) of this section, the local government, as part of its periodic review, shall adopt measures that demonstrably increase the likelihood that residential development will occur at the housing types and density and at the mix of housing types required to meet housing needs over the next 20 years.

(8)(a) A local government outside a metropolitan service district that takes any actions under subsection (6) or (7) of this section shall demonstrate that the comprehensive plan and land use regulations comply with goals and rules adopted by the commission and implement ORS 197.295 to 197.314.

(b) The local government shall determine the density and mix of housing types anticipated as a result of actions taken under subsections (6) and (7) of this section and monitor and record the actual density and mix of housing types achieved. The local government shall compare actual and anticipated density and mix. The local government shall submit its comparison to the commission at the next [*periodic review or at the next legislative*] review of its urban growth boundary[*, whichever comes first*] **under subsection (2)(a) of this section**.

(9) In establishing that actions and measures adopted under subsections (6) and (7) of this section demonstrably increase the likelihood of higher density residential development, the local government shall at a minimum ensure that land zoned for needed housing is in locations appropriate for the housing types identified under subsection (3) of this section and is zoned at density ranges that are likely to be achieved by the housing market using the analysis in subsection (3) of this section. Actions or measures, or both, may include but are not limited to:

(a) Increases in the permitted density on existing residential land;

(b) Financial incentives for higher density housing;

(c) Provisions permitting additional density beyond that generally allowed in the zoning district in exchange for amenities and features provided by the developer;

(d) Removal or easing of approval standards or procedures;

(e) Minimum density ranges;

(f) Redevelopment and infill strategies;

(g) Authorization of housing types not previously allowed by the plan or regulations;

(h) Adoption of an average residential density standard; and

(i) Rezoning or redesignation of nonresidential land.

(10)(a) The provisions of this subsection apply to local government comprehensive plans for lands within the urban growth boundary of a city that is located outside of a metropolitan service district and has a population of less than 25,000.

(b) [*At periodic review pursuant to ORS 197.628 to 197.651 or at any other legislative review of the comprehensive plan that requires the application of a statewide planning goal relating to buildable lands for residential use,*] **As required under paragraph (c) of this subsection,** a city shall, according to rules of the commission:

(A) Determine the estimated housing needs within the jurisdiction for the next 20 years;

(B) Inventory the supply of buildable lands available within the urban growth boundary to accommodate the estimated housing needs determined under this subsection; and

(C) Adopt measures necessary to accommodate the estimated housing needs determined under this subsection.

(c) The actions required under paragraph (b) of this subsection shall be undertaken:

(A) At periodic review pursuant to ORS 197.628 to 197.651;

(B) On a schedule established by the commission for cities with a population greater than 10,000, not to exceed once each eight years; or

(C) At any other legislative review of the comprehensive plan that requires the application of a statewide planning goal relating to buildable lands for residential use.

[*(c)*] **(d)** For the purpose of the inventory described in this subsection, "buildable lands" includes those lands described in subsection (4)(a) of this section.

SECTION 8a. If House Bill 2001 becomes law, section 8 of this 2019 Act (amending ORS 197.296) is repealed and ORS 197.296, as amended by section 5, chapter _____, Oregon Laws 2019 (Enrolled House Bill 2001), is amended to read:

197.296. (1)(a) The provisions of subsections (2) to (9) of this section apply to metropolitan service district regional framework plans and local government comprehensive plans for lands within the urban growth boundary of a city that is located outside of a metropolitan service district and has a population of 25,000 or more.

(b) The Land Conservation and Development Commission may establish a set of factors under which additional cities are subject to the provisions of this section. In establishing the set of factors required under this paragraph, the commission shall consider the size of the city, the rate of population growth of the city or the proximity of the city to another city with a population of 25,000 or more or to a metropolitan service district.

(2)**(a)** [*At periodic review pursuant to ORS 197.628 to 197.651 or at any other legislative review of the comprehensive plan or regional framework plan that concerns the urban growth boundary and requires the application of a statewide planning goal relating to buildable lands for residential use,*] A local government shall demonstrate that its comprehensive plan or regional framework plan provides sufficient buildable lands within the urban growth boundary established pursuant to statewide planning goals to accommodate estimated housing needs for 20 years**:**

(A) At periodic review under ORS 197.628 to 197.651;

(B) As scheduled by the commission:

(i) At least once each eight years for local governments that are not within a metropolitan service district; or

(ii) At least once each six years for a metropolitan service district; or

(C) At any other legislative review of the comprehensive plan or regional framework plan that concerns the urban growth boundary and requires the application of a statewide planning goal relating to buildable lands for residential use.

(b) The 20-year period shall commence on the date initially scheduled for completion of the [*periodic or legislative*] review **under paragraph (a) of this subsection**.

(3) In performing the duties under subsection (2) of this section, a local government shall:

(a) Inventory the supply of buildable lands within the urban growth boundary and determine the housing capacity of the buildable lands; and

(b) Conduct an analysis of existing and projected housing need by type and density range, in accordance with all factors under ORS 197.303 and statewide planning goals and rules relating to housing, to determine the number of units and amount of land needed for each needed housing type for the next 20 years.

(4)(a) For the purpose of the inventory described in subsection (3)(a) of this section, "buildable lands" includes:

(A) Vacant lands planned or zoned for residential use;

(B) Partially vacant lands planned or zoned for residential use;

(C) Lands that may be used for a mix of residential and employment uses under the existing planning or zoning; and

(D) Lands that may be used for residential infill or redevelopment.

(b) For the purpose of the inventory and determination of housing capacity described in subsection (3)(a) of this section, the local government must demonstrate consideration of:

(A) The extent that residential development is prohibited or restricted by local regulation and ordinance, state law and rule or federal statute and regulation;

(B) A written long term contract or easement for radio, telecommunications or electrical facilities, if the written contract or easement is provided to the local government; and

(C) The presence of a single family dwelling or other structure on a lot or parcel.

(c) Except for land that may be used for residential infill or redevelopment, a local government shall create a map or document that may be used to verify and identify specific lots or parcels that have been determined to be buildable lands.

(5)(a) Except as provided in paragraphs (b) and (c) of this subsection, the determination of housing capacity pursuant to subsection (3)(a) of this section must be based on data relating to land within the urban growth boundary that has been collected since the last review [*or six years, whichever is greater*] **under subsection (2)(a)(B) of this section**. The data shall include:

(A) The number, density and average mix of housing types of urban residential development that have actually occurred;

(B) Trends in density and average mix of housing types of urban residential development;

(C) Market factors that may substantially impact future urban residential development; and

(D) The number, density and average mix of housing types that have occurred on the buildable lands described in subsection (4)(a) of this section.

(b) A local government shall make the determination described in paragraph (a) of this subsection using a shorter time period than the time period described in paragraph (a) of this subsection if the local government finds that the shorter time period will provide more accurate and reliable data related to housing capacity. The shorter time period may not be less than three years.

(c) A local government shall use data from a wider geographic area or use a time period longer than the time period described in paragraph (a) of this subsection if the analysis of a wider geographic area or the use of a longer time period will provide more accurate, complete and reliable data relating to trends affecting housing need than an analysis performed pursuant to paragraph (a) of this subsection. The local government must clearly describe the geographic area, time frame and source of data used in a determination performed under this paragraph.

(6) If the housing need determined pursuant to subsection (3)(b) of this section is greater than the housing capacity determined pursuant to subsection (3)(a) of this section, the local government shall take one or both of the following actions to accommodate the additional housing need:

(a) Amend its urban growth boundary to include sufficient buildable lands to accommodate housing needs for the next 20 years. As part of this process, the local government shall consider the effects of measures taken pursuant to paragraph (b) of this subsection. The amendment shall include sufficient land reasonably necessary to accommodate the siting of new public school facilities. The need and inclusion of lands for new public school facilities shall be a coordinated process between the affected public school districts and the local government that has the authority to approve the urban growth boundary.

(b) Amend its comprehensive plan, regional framework plan, functional plan or land use regulations to include new measures that demonstrably increase the likelihood that residential development will occur at densities sufficient to accommodate housing needs for the next 20 years without expansion of the urban growth boundary. A local government or metropolitan service district that takes this action shall adopt findings regarding the density expectations assumed to result from measures adopted under this paragraph based upon the factors listed in ORS 197.303 (2) and data in subsection (5)(a) of this section. The density expectations may not project an increase in residential capacity above achieved density by more than three percent without quantifiable validation of such departures. For a local government located outside of a metropolitan service district, a quantifiable validation must demonstrate that the assumed housing capacity has been achieved in areas that are zoned to allow no greater than the same authorized density level within the local jurisdiction or a jurisdiction in the same region. For a metropolitan service district, a quantifiable validation must demonstrate that the assumed housing capacity has been achieved in areas that are

zoned to allow no greater than the same authorized density level within the metropolitan service district.

(c) As used in this subsection, "authorized density level" has the meaning given that term in ORS 227.175.

(7) Using the housing need analysis conducted under subsection (3)(b) of this section, the local government shall determine the overall average density and overall mix of housing types at which residential development of needed housing types must occur in order to meet housing needs over the next 20 years. If that density is greater than the actual density of development determined under subsection (5)(a)(A) of this section, or if that mix is different from the actual mix of housing types determined under subsection (5)(a)(A) of this section, the local government, as part of its periodic review, shall adopt measures that demonstrably increase the likelihood that residential development will occur at the housing types and density and at the mix of housing types required to meet housing needs over the next 20 years.

(8)(a) A local government outside a metropolitan service district that takes any actions under subsection (6) or (7) of this section shall demonstrate that the comprehensive plan and land use regulations comply with goals and rules adopted by the commission and implement ORS 197.295 to 197.314.

(b) A local government shall determine the density and mix of housing types anticipated as a result of actions taken under subsections (6) and (7) of this section and monitor and record the actual density and mix of housing types achieved following the adoption of these actions. The local government shall compare actual and anticipated density and mix. The local government shall submit its comparison to the commission at the next [*periodic review or at the next legislative*] review of its urban growth boundary[*, whichever comes first*] **under subsection (2)(a) of this section**.

(9) In establishing that actions and measures adopted under subsections (6) and (7) of this section demonstrably increase the likelihood of higher density residential development, the local government shall at a minimum ensure that land zoned for needed housing is in locations appropriate for the housing types identified under subsection (3) of this section, is zoned at density ranges that are likely to be achieved by the housing market using the analysis in subsection (3) of this section and is in areas where sufficient urban services are planned to enable the higher density development to occur over the 20-year period. Actions or measures, or both, may include but are not limited to:

(a) Increases in the permitted density on existing residential land;

(b) Financial incentives for higher density housing;

(c) Provisions permitting additional density beyond that generally allowed in the zoning district in exchange for amenities and features provided by the developer;

(d) Removal or easing of approval standards or procedures;

(e) Minimum density ranges;

(f) Redevelopment and infill strategies;

(g) Authorization of housing types not previously allowed by the plan or regulations;

(h) Adoption of an average residential density standard; and

(i) Rezoning or redesignation of nonresidential land.

(10)(a) The provisions of this subsection apply to local government comprehensive plans for lands within the urban growth boundary of a city that is located outside of a metropolitan service district and has a population of less than 25,000.

(b) [*At periodic review pursuant to ORS 197.628 to 197.651 or at any other legislative review of the comprehensive plan that requires the application of a statewide planning goal relating to buildable lands for residential use,*] **As required under paragraph (c) of this subsection,** a city shall, according to rules of the commission:

(A) Determine the estimated housing needs within the jurisdiction for the next 20 years;

(B) Inventory the supply of buildable lands available within the urban growth boundary to accommodate the estimated housing needs determined under this subsection; and

(C) Adopt measures necessary to accommodate the estimated housing needs determined under this subsection.

(c) The actions required under paragraph (b) of this subsection shall be undertaken:

(A) At periodic review pursuant to ORS 197.628 to 197.651;

(B) On a schedule established by the commission for cities with a population greater than 10,000, not to exceed once each eight years; or

(C) At any other legislative review of the comprehensive plan that requires the application of a statewide planning goal relating to buildable lands for residential use.

[*(c)*] **(d)** For the purpose of the inventory described in this subsection, "buildable lands" includes those lands described in subsection (4)(a) of this section.

SECTION 9. ORS 197.299 is amended to read:

197.299. (1) A metropolitan service district organized under ORS chapter 268 shall complete the inventory, determination and analysis required under ORS 197.296 (3) not later than six years after completion of the previous inventory, determination and analysis.

(2)(a) The metropolitan service district shall take such action as necessary under ORS 197.296 (6)(a) to accommodate one-half of a 20-year buildable land supply determined under ORS 197.296 (3) within one year of completing the analysis.

(b) The metropolitan service district shall take all final action under ORS 197.296 (6)(a) necessary to accommodate a 20-year buildable land supply determined under ORS 197.296 (3) within two years of completing the analysis.

(c) The metropolitan service district shall take action under ORS 197.296 (6)(b), within one year after the analysis required under ORS 197.296 (3)(b) is completed, to provide sufficient buildable land within the urban growth boundary to accommodate the estimated housing needs for 20 years from the time the actions are completed.

(d) The metropolitan service district shall consider and adopt new measures that the governing body deems appropriate under ORS 197.296 (6)(b) **and shall allocate any housing capacity that is not accommodated under this section to be accommodated by the application of ORS 197.296 (6)(b) by cities within the metropolitan service district with a population greater than 10,000**.

(e) Cities to which housing capacity is allocated under paragraph (d) of this subsection shall take steps, at least once every six years as scheduled by the Land Conservation and Development Commission, to demonstrably increase the likelihood that residential development will occur at densities sufficient to accommodate housing needs for the next 20 years as required by ORS 197.296 (6)(b).

(3) The [*Land Conservation and Development*] commission may grant an extension to the time limits of subsection (2) of this section if the Director of the Department of Land Conservation and Development determines that the metropolitan service district has provided good cause for failing to meet the time limits.

(4)(a) The metropolitan service district shall establish a process to expand the urban growth boundary to accommodate a need for land for a public school that cannot reasonably be accommodated within the existing urban growth boundary. The metropolitan service district shall design the process to:

(A) Accommodate a need that must be accommodated between periodic analyses of urban growth boundary capacity required by subsection (1) of this section; and

(B) Provide for a final decision on a proposal to expand the urban growth boundary within four months after submission of a complete application by a large school district as defined in ORS 195.110.

(b) At the request of a large school district, the metropolitan service district shall assist the large school district to identify school sites required by the school facility planning process described in ORS 195.110. A need for a public school is a specific type of identified land need under ORS 197.298 (3).

(5) Three years after completing its most recent demonstration of sufficient buildable lands under ORS 197.296, a metropolitan service district may, on a single occasion, revise the determination

and analysis required as part of the demonstration for the purpose of considering an amendment to the metropolitan service district's urban growth boundary, provided:

(a) The metropolitan service district has entered into an intergovernmental agreement and has designated rural reserves and urban reserves under ORS 195.141 and 195.145 with each county located within the district;

(b) The commission has acknowledged the rural reserve and urban reserve designations described in paragraph (a) of this subsection;

(c) One or more cities within the metropolitan service district have proposed a development that would require expansion of the urban growth boundary;

(d) The city or cities proposing the development have provided evidence to the metropolitan service district that the proposed development would provide additional needed housing to the needed housing included in the most recent determination and analysis;

(e) The location chosen for the proposed development is adjacent to the city proposing the development; and

(f) The location chosen for the proposed development is located within an area designated and acknowledged as an urban reserve.

(6)(a) If a metropolitan service district, after revising its most recent determination and analysis pursuant to subsection (5) of this section, concludes that an expansion of its urban growth boundary is warranted, the metropolitan service district may take action to expand its urban growth boundary in one or more locations to accommodate the proposed development, provided the urban growth boundary expansion does not exceed a total of 1,000 acres.

(b) A metropolitan service district that expands its urban growth boundary under this subsection:

(A) Must adopt the urban growth boundary expansion not more than four years after completing its most recent demonstration of sufficient buildable lands under ORS 197.296; and

(B) Is exempt from the boundary location requirements described in the statewide land use planning goals relating to urbanization.

SECTION 10. ORS 197.303 is amended to read:

197.303. (1) As used in ORS [*197.307*] **197.295 to 197.314**, "needed housing" means all housing on land zoned for residential use or mixed residential and commercial use that is determined to meet the need shown for housing within an urban growth boundary at price ranges and rent levels that are affordable to households within the county with a variety of incomes, including but not limited to households with low incomes, very low incomes and extremely low incomes, as those terms are defined by the United States Department of Housing and Urban Development under 42 U.S.C. 1437a. "Needed housing" includes the following housing types:

(a) Attached and detached single-family housing and multiple family housing for both owner and renter occupancy;

(b) Government assisted housing;

(c) Mobile home or manufactured dwelling parks as provided in ORS 197.475 to 197.490;

(d) Manufactured homes on individual lots planned and zoned for single-family residential use that are in addition to lots within designated manufactured dwelling subdivisions; and

(e) Housing for farmworkers.

(2) Subsection (1)(a) and (d) of this section does not apply to:

(a) A city with a population of less than 2,500.

(b) A county with a population of less than 15,000.

(3) A local government may take an exception under ORS 197.732 to the definition of "needed housing" in subsection (1) of this section in the same manner that an exception may be taken under the goals.

SECTION 10a. If House Bill 2001 becomes law, section 10 of this 2019 Act (amending ORS 197.303) is repealed and ORS 197.303, as amended by section 6, chapter _____, Oregon Laws 2019 (Enrolled House Bill 2001), is amended to read:

197.303. (1) As used in ORS 197.295 to 197.314, "needed housing" means all housing on land zoned for residential use or mixed residential and commercial use that is determined to meet the need shown for housing within an urban growth boundary at price ranges and rent levels that are affordable to households within the county with a variety of incomes, including but not limited to households with low incomes, very low incomes and extremely low incomes, as those terms are defined by the United States Department of Housing and Urban Development under 42 U.S.C. 1437a. "Needed housing" includes the following housing types:

(a) Attached and detached single-family housing and multiple family housing for both owner and renter occupancy;

(b) Government assisted housing;

(c) Mobile home or manufactured dwelling parks as provided in ORS 197.475 to 197.490;

(d) Manufactured homes on individual lots planned and zoned for single-family residential use that are in addition to lots within designated manufactured dwelling subdivisions; and

(e) Housing for farmworkers.

(2) For the purpose of estimating housing needs, as described in ORS 197.296 (3)(b), a local government shall use the population projections prescribed by ORS 195.033 or 195.036 and shall consider and adopt findings related to changes in each of the following factors since the last [*periodic or legislative review or six years, whichever is greater,*] **review under ORS 197.296 (2)(a)(B)** and the projected future changes in these factors over a 20-year planning period:

(a) Household sizes;

(b) Household demographics [*in terms of age, gender, race or other established demographic category*];

(c) Household incomes;

(d) Vacancy rates; and

(e) Housing costs.

(3) A local government shall make the estimate described in subsection (2) of this section using a shorter time period than since the last [*periodic or legislative review or six years, whichever is greater,*] **review under ORS 197.296 (2)(a)(B)** if the local government finds that the shorter time period will provide more accurate and reliable data related to housing need. The shorter time period may not be less than three years.

(4) A local government shall use data from a wider geographic area or use a time period longer than the time period described in subsection (2) of this section if the analysis of a wider geographic area or the use of a longer time period will provide more accurate, complete and reliable data relating to trends affecting housing need than an analysis performed pursuant to subsection (2) of this section. The local government must clearly describe the geographic area, time frame and source of data used in an estimate performed under this subsection.

(5) Subsection (1)(a) and (d) of this section does not apply to:

(a) A city with a population of less than 2,500.

(b) A county with a population of less than 15,000.

(6) A local government may take an exception under ORS 197.732 to the definition of "needed housing" in subsection (1) of this section in the same manner that an exception may be taken under the goals.

SECTION 11. ORS 197.319 is amended to read:

197.319. (1) Before a person may request adoption of an enforcement order under ORS 197.320, the person shall:

(a) Present the reasons, in writing, for such an order to the affected local government; and

(b) Request:

(A) Revisions to the local comprehensive plan, land use regulations, special district cooperative or urban service agreement or decision-making process which is the basis for the order; or

(B) That an action be taken regarding the local comprehensive plan, land use regulations, special district agreement**, housing production strategy** or decision-making process that is the basis for the order.

(2)(a) The local government or special district shall issue a written response to the request within 60 days of the date the request is mailed to the local government or special district.

(b) The requestor and the local government or special district may enter into mediation to resolve issues in the request. The Department of Land Conservation and Development shall provide mediation services when jointly requested by the local government or special district and the requestor.

(c) If the local government or special district does not act in a manner which the requestor believes is adequate to address the issues raised in the request within the time period provided in paragraph (a) of this subsection, a petition may be presented to the Land Conservation and Development Commission under ORS 197.324.

(3) A metropolitan service district may request an enforcement order under ORS 197.320 (12) without first complying with subsections (1) and (2) of this section.

SECTION 12. ORS 197.320 is amended to read:

197.320. The Land Conservation and Development Commission shall issue an order requiring a local government, state agency or special district to take action necessary to bring its comprehensive plan, land use regulation, limited land use decisions or other land use decisions **or actions** into compliance with the goals, acknowledged comprehensive plan provisions**,** [*or*] land use regulations **or housing production strategy** if the commission has good cause to believe:

(1) A comprehensive plan or land use regulation adopted by a local government not on a compliance schedule is not in compliance with the goals by the date set in ORS 197.245 or 197.250 for such compliance;

(2) A plan, program, rule or regulation affecting land use adopted by a state agency or special district is not in compliance with the goals by the date set in ORS 197.245 or 197.250 for such compliance;

(3) A local government is not making satisfactory progress toward performance of its compliance schedule;

(4) A state agency is not making satisfactory progress in carrying out its coordination agreement or the requirements of ORS 197.180;

(5) A local government has no comprehensive plan or land use regulation and is not on a compliance schedule directed to developing the plan or regulation;

(6) A local government has engaged in a pattern or practice of decision making that violates an acknowledged comprehensive plan or land use regulation. In making its determination under this subsection, the commission shall determine whether there is evidence in the record to support the decisions made. The commission shall not judge the issue solely upon adequacy of the findings in support of the decisions;

(7) A local government has failed to comply with a commission order entered under ORS 197.644;

(8) A special district has engaged in a pattern or practice of decision-making that violates an acknowledged comprehensive plan or cooperative agreement adopted pursuant to ORS 197.020;

(9) A special district is not making satisfactory progress toward performance of its obligations under ORS chapters 195 and 197;

(10) A local government's approval standards, special conditions on approval of specific development proposals or procedures for approval do not comply with ORS 197.307 (4) or (6);

(11) A local government is not making satisfactory progress toward meeting its obligations under ORS 195.065; [*or*]

(12) A local government within the jurisdiction of a metropolitan service district has failed to make changes to the comprehensive plan or land use regulations to comply with the regional framework plan of the district or has engaged in a pattern or practice of decision-making that violates a requirement of the regional framework plan[.]**; or**

(13) A city is not making satisfactory progress in taking actions listed in its housing production strategy under section 4 of this 2019 Act.

SECTION 13. Section 1, chapter 47, Oregon Laws 2018, is amended to read:

Sec. 1. (1) For purposes of this section:

(a) A household is severely rent burdened if the household spends more than 50 percent of the income of the household on gross rent for housing.

(b) A regulated affordable unit is a residential unit subject to a regulatory agreement that runs with the land and that requires affordability for an established income level for a defined period of time.

(c) A single-family unit may be rented or owned by a household and includes single-family homes, duplexes, townhomes, row homes and mobile homes.

(2)(a) The Housing and Community Services Department shall annually provide to the governing body of each city in this state with a population greater than 10,000 the most current data available from the United States Census Bureau, or any other source the department considers at least as reliable, showing the percentage of renter households in the city that are severely rent burdened.

(b) [*The Housing and Community Services Department, in collaboration with*] The Department of Land Conservation and Development, **in consultation with the Housing and Community Services Department,** shall develop a survey form on which the governing body of a city may provide specific information related to the affordability of housing within the city, including[*, but not limited to:*]

[*(A)*] the actions relating to land use and other related matters that the [*governing body*] **city** has taken to **encourage the development of needed housing,** increase the affordability of housing and reduce rent burdens for severely rent burdened households[*; and*]**.**

[*(B) The additional actions the governing body intends to take to reduce rent burdens for severely rent burdened households.*]

(c) [*If the Housing and Community Services Department determines that at least 25 percent of the renter households in a city are severely rent burdened,*] The Department **of Land Conservation and Development** shall provide the governing body of the city with the survey form developed pursuant to paragraph (b) of this subsection.

(d) The governing body of the city shall return the completed survey form to the [*Housing and Community Services Department and the*] Department of Land Conservation and Development [*within 60 days of receipt*] **at least 24 months prior to a deadline for completing a housing production strategy under section 4 of this 2019 Act**.

(3)(a) In any year in which the governing body of a city is informed under this section that at least 25 percent of the renter households in the city are severely rent burdened, the governing body shall hold at least one public meeting to discuss the causes and consequences of severe rent burdens within the city, the barriers to reducing rent burdens and possible solutions.

(b) The Housing and Community Services Department may adopt rules governing the conduct of the public meeting required under this subsection.

(4) No later than February 1 of each year, the governing body of each city in this state with a population greater than 10,000 shall submit to the Department of Land Conservation and Development a report for the immediately preceding calendar year setting forth separately for each of the following categories the total number of units that were permitted and the total number that were produced:

(a) Residential units.

(b) Regulated affordable residential units.

(c) Multifamily residential units.

(d) Regulated affordable multifamily residential units.

(e) Single-family units.

(f) Regulated affordable single-family units.

SECTION 14. Section 15 of this 2019 Act is added to and made a part of ORS chapter 197.

SECTION 15. (1) As used in this section, "public property" means all real property of the state, counties, cities, incorporated towns or villages, school districts, irrigation districts, drainage districts, ports, water districts, service districts, metropolitan service districts, housing authorities, public universities listed in ORS 352.002 or all other public or municipal corporations in this state.

(2) Notwithstanding any land use regulation, comprehensive plan, or statewide land use planning goal, a local government may allow the development of housing on public property provided:

(a) The real property is not inventoried as a park or open space as a protective measure pursuant to a statewide land use planning goal;

(b) The real property is located within the urban growth boundary;

(c) The real property is zoned for residential development or adjacent to parcels zoned for residential development;

(d) The housing complies with applicable land use regulations and meets the standards and criteria for residential development for the underlying zone of the land or the adjacent residential land described in paragraph (c) of this subsection;

(e) At least 50 percent of the residential units provided under this section is affordable to households with incomes equal to or less than 60 percent of the area median income, as defined in ORS 456.270; and

(f) The affordability of the residential units described in paragraph (e) of this subsection is subject to an affordable housing covenant, as described in ORS 456.270 to 456.295, held by the local government or the Housing and Community Services Department and with a duration of no less than 60 years.

(3) Notwithstanding any statewide land use planning goal, a local government may amend its comprehensive plan and land use regulations to allow public property to be used for the purposes described in subsection (2) of this section.

SECTION 16. Notwithstanding ORS 197.646, a local government required to comply with the amendments to ORS 197.312 by section 6, chapter 745, Oregon Laws 2017, shall adopt land use regulations, or adopt amendments to its comprehensive plan, to comply with the amendments to ORS 197.312 by section 6, chapter 745, Oregon Laws 2017, no later than the effective date of this 2019 Act.

SECTION 17. ORS 215.416 is amended to read:

215.416. (1) When required or authorized by the ordinances, rules and regulations of a county, an owner of land may apply in writing to such persons as the governing body designates, for a permit, in the manner prescribed by the governing body. The governing body shall establish fees charged for processing permits at an amount no more than the actual or average cost of providing that service.

(2) The governing body shall establish a consolidated procedure by which an applicant may apply at one time for all permits or zone changes needed for a development project. The consolidated procedure shall be subject to the time limitations set out in ORS 215.427. The consolidated procedure shall be available for use at the option of the applicant no later than the time of the first periodic review of the comprehensive plan and land use regulations.

(3) Except as provided in subsection (11) of this section, the hearings officer shall hold at least one public hearing on the application.

(4)(a) A county may not approve an application if the proposed use of land is found to be in conflict with the comprehensive plan of the county and other applicable land use regulation or ordinance provisions. The approval may include such conditions as are authorized by statute or county legislation.

(b)(A) A county may not deny an application for a housing development located within the urban growth boundary if the development complies with clear and objective standards, including but not limited to clear and objective design standards contained in the county comprehensive plan or land use regulations.

(B) This paragraph does not apply to:

(i) Applications or permits for residential development in areas described in ORS 197.307 (5); or

(ii) Applications or permits reviewed under an alternative approval process adopted under ORS 197.307 (6).

(c) A county may not [*reduce the density of*] **condition** an application for a housing development **on a reduction in density** if:

(A) The density applied for is at or below the authorized density level under the local land use regulations; and

(B) At least 75 percent of the floor area applied for is reserved for housing.

(d) A county may not [*reduce the height of*] **condition** an application for a housing development **on a reduction in height** if:

(A) The height applied for is at or below the authorized height level under the local land use regulations;

(B) At least 75 percent of the floor area applied for is reserved for housing; and

(C) Reducing the height has the effect of reducing the authorized density level under local land use regulations.

(e) Notwithstanding paragraphs (c) and (d) of this subsection, a county may [*reduce the density or height of*] **condition** an application for a housing development **on a reduction in density or height only** if the reduction is necessary to resolve a health, safety or habitability issue or to comply with a protective measure adopted pursuant to a statewide land use planning goal. **Notwithstanding ORS 197.350, the county must adopt findings supported by substantial evidence demonstrating the necessity of the reduction.**

(f) As used in this subsection:

(A) "Authorized density level" means the maximum number of lots or dwelling units or the maximum floor area ratio that is permitted under local land use regulations.

(B) "Authorized height level" means the maximum height of a structure that is permitted under local land use regulations.

(C) "Habitability" means being in compliance with the applicable provisions of the state building code under ORS chapter 455 and the rules adopted thereunder.

(5) Hearings under this section shall be held only after notice to the applicant and also notice to other persons as otherwise provided by law and shall otherwise be conducted in conformance with the provisions of ORS 197.763.

(6) Notice of a public hearing on an application submitted under this section shall be provided to the owner of an airport defined by the Oregon Department of Aviation as a "public use airport" if:

(a) The name and address of the airport owner has been provided by the Oregon Department of Aviation to the county planning authority; and

(b) The property subject to the land use hearing is:

(A) Within 5,000 feet of the side or end of a runway of an airport determined by the Oregon Department of Aviation to be a "visual airport"; or

(B) Within 10,000 feet of the side or end of the runway of an airport determined by the Oregon Department of Aviation to be an "instrument airport."

(7) Notwithstanding the provisions of subsection (6) of this section, notice of a land use hearing need not be provided as set forth in subsection (6) of this section if the zoning permit would only allow a structure less than 35 feet in height and the property is located outside the runway "approach surface" as defined by the Oregon Department of Aviation.

(8)(a) Approval or denial of a permit application shall be based on standards and criteria which shall be set forth in the zoning ordinance or other appropriate ordinance or regulation of the county and which shall relate approval or denial of a permit application to the zoning ordinance and comprehensive plan for the area in which the proposed use of land would occur and to the zoning ordinance and comprehensive plan for the county as a whole.

(b) When an ordinance establishing approval standards is required under ORS 197.307 to provide only clear and objective standards, the standards must be clear and objective on the face of the ordinance.

(9) Approval or denial of a permit or expedited land division shall be based upon and accompanied by a brief statement that explains the criteria and standards considered relevant to the deci-

sion, states the facts relied upon in rendering the decision and explains the justification for the decision based on the criteria, standards and facts set forth.

(10) Written notice of the approval or denial shall be given to all parties to the proceeding.

(11)(a)(A) The hearings officer or such other person as the governing body designates may approve or deny an application for a permit without a hearing if the hearings officer or other designated person gives notice of the decision and provides an opportunity for any person who is adversely affected or aggrieved, or who is entitled to notice under paragraph (c) of this subsection, to file an appeal.

(B) Written notice of the decision shall be mailed to those persons described in paragraph (c) of this subsection.

(C) Notice under this subsection shall comply with ORS 197.763 (3)(a), (c), (g) and (h) and shall describe the nature of the decision. In addition, the notice shall state that any person who is adversely affected or aggrieved or who is entitled to written notice under paragraph (c) of this subsection may appeal the decision by filing a written appeal in the manner and within the time period provided in the county's land use regulations. A county may not establish an appeal period that is less than 12 days from the date the written notice of decision required by this subsection was mailed. The notice shall state that the decision will not become final until the period for filing a local appeal has expired. The notice also shall state that a person who is mailed written notice of the decision cannot appeal the decision directly to the Land Use Board of Appeals under ORS 197.830.

(D) An appeal from a hearings officer's decision made without hearing under this subsection shall be to the planning commission or governing body of the county. An appeal from such other person as the governing body designates shall be to a hearings officer, the planning commission or the governing body. In either case, the appeal shall be to a de novo hearing.

(E) The de novo hearing required by subparagraph (D) of this paragraph shall be the initial evidentiary hearing required under ORS 197.763 as the basis for an appeal to the Land Use Board of Appeals. At the de novo hearing:

(i) The applicant and other parties shall have the same opportunity to present testimony, arguments and evidence as they would have had in a hearing under subsection (3) of this section before the decision;

(ii) The presentation of testimony, arguments and evidence shall not be limited to issues raised in a notice of appeal; and

(iii) The decision maker shall consider all relevant testimony, arguments and evidence that are accepted at the hearing.

(b) If a local government provides only a notice of the opportunity to request a hearing, the local government may charge a fee for the initial hearing. The maximum fee for an initial hearing shall be the cost to the local government of preparing for and conducting the appeal, or $250, whichever is less. If an appellant prevails at the hearing or upon subsequent appeal, the fee for the initial hearing shall be refunded. The fee allowed in this paragraph shall not apply to appeals made by neighborhood or community organizations recognized by the governing body and whose boundaries include the site.

(c)(A) Notice of a decision under paragraph (a) of this subsection shall be provided to the applicant and to the owners of record of property on the most recent property tax assessment roll where such property is located:

(i) Within 100 feet of the property that is the subject of the notice when the subject property is wholly or in part within an urban growth boundary;

(ii) Within 250 feet of the property that is the subject of the notice when the subject property is outside an urban growth boundary and not within a farm or forest zone; or

(iii) Within 750 feet of the property that is the subject of the notice when the subject property is within a farm or forest zone.

(B) Notice shall also be provided to any neighborhood or community organization recognized by the governing body and whose boundaries include the site.

(C) At the discretion of the applicant, the local government also shall provide notice to the Department of Land Conservation and Development.

(12) A decision described in ORS 215.402 (4)(b) shall:

(a) Be entered in a registry available to the public setting forth:

(A) The street address or other easily understood geographic reference to the subject property;

(B) The date of the decision; and

(C) A description of the decision made.

(b) Be subject to the jurisdiction of the Land Use Board of Appeals in the same manner as a limited land use decision.

(c) Be subject to the appeal period described in ORS 197.830 (5)(b).

(13) At the option of the applicant, the local government shall provide notice of the decision described in ORS 215.402 (4)(b) in the manner required by ORS 197.763 (2), in which case an appeal to the board shall be filed within 21 days of the decision. The notice shall include an explanation of appeal rights.

(14) Notwithstanding the requirements of this section, a limited land use decision shall be subject to the requirements set forth in ORS 197.195 and 197.828.

SECTION 18. ORS 227.175 is amended to read:

227.175. (1) When required or authorized by a city, an owner of land may apply in writing to the hearings officer, or such other person as the city council designates, for a permit or zone change, upon such forms and in such a manner as the city council prescribes. The governing body shall establish fees charged for processing permits at an amount no more than the actual or average cost of providing that service.

(2) The governing body of the city shall establish a consolidated procedure by which an applicant may apply at one time for all permits or zone changes needed for a development project. The consolidated procedure shall be subject to the time limitations set out in ORS 227.178. The consolidated procedure shall be available for use at the option of the applicant no later than the time of the first periodic review of the comprehensive plan and land use regulations.

(3) Except as provided in subsection (10) of this section, the hearings officer shall hold at least one public hearing on the application.

(4)(a) A city may not approve an application unless the proposed development of land would be in compliance with the comprehensive plan for the city and other applicable land use regulation or ordinance provisions. The approval may include such conditions as are authorized by ORS 227.215 or any city legislation.

(b)(A) A city may not deny an application for a housing development located within the urban growth boundary if the development complies with clear and objective standards, including [*but not limited to*] clear and objective design standards contained in the city comprehensive plan or land use regulations.

(B) This paragraph does not apply to:

(i) Applications or permits for residential development in areas described in ORS 197.307 (5); or

(ii) Applications or permits reviewed under an alternative approval process adopted under ORS 197.307 (6).

(c) A city may not [*reduce the density of*] **condition** an application for a housing development **on a reduction in density** if:

(A) The density applied for is at or below the authorized density level under the local land use regulations; and

(B) At least 75 percent of the floor area applied for is reserved for housing.

(d) A city may not [*reduce the height of*] **condition** an application for a housing development **on a reduction in height** if:

(A) The height applied for is at or below the authorized height level under the local land use regulations;

(B) At least 75 percent of the floor area applied for is reserved for housing; and

(C) Reducing the height has the effect of reducing the authorized density level under local land use regulations.

(e) Notwithstanding paragraphs (c) and (d) of this subsection, a city may [*reduce the density or height of*] **condition** an application for a housing development **on a reduction in density or height only** if the reduction is necessary to resolve a health, safety or habitability issue or to comply with a protective measure adopted pursuant to a statewide land use planning goal. **Notwithstanding ORS 197.350, the city must adopt findings supported by substantial evidence demonstrating the necessity of the reduction.**

(f) As used in this subsection:

(A) "Authorized density level" means the maximum number of lots or dwelling units or the maximum floor area ratio that is permitted under local land use regulations.

(B) "Authorized height level" means the maximum height of a structure that is permitted under local land use regulations.

(C) "Habitability" means being in compliance with the applicable provisions of the state building code under ORS chapter 455 and the rules adopted thereunder.

(5) Hearings under this section may be held only after notice to the applicant and other interested persons and shall otherwise be conducted in conformance with the provisions of ORS 197.763.

(6) Notice of a public hearing on a zone use application shall be provided to the owner of an airport, defined by the Oregon Department of Aviation as a "public use airport" if:

(a) The name and address of the airport owner has been provided by the Oregon Department of Aviation to the city planning authority; and

(b) The property subject to the zone use hearing is:

(A) Within 5,000 feet of the side or end of a runway of an airport determined by the Oregon Department of Aviation to be a "visual airport"; or

(B) Within 10,000 feet of the side or end of the runway of an airport determined by the Oregon Department of Aviation to be an "instrument airport."

(7) Notwithstanding the provisions of subsection (6) of this section, notice of a zone use hearing need only be provided as set forth in subsection (6) of this section if the permit or zone change would only allow a structure less than 35 feet in height and the property is located outside of the runway "approach surface" as defined by the Oregon Department of Aviation.

(8) If an application would change the zone of property that includes all or part of a mobile home or manufactured dwelling park as defined in ORS 446.003, the governing body shall give written notice by first class mail to each existing mailing address for tenants of the mobile home or manufactured dwelling park at least 20 days but not more than 40 days before the date of the first hearing on the application. The governing body may require an applicant for such a zone change to pay the costs of such notice.

(9) The failure of a tenant or an airport owner to receive a notice which was mailed shall not invalidate any zone change.

(10)(a)(A) The hearings officer or such other person as the governing body designates may approve or deny an application for a permit without a hearing if the hearings officer or other designated person gives notice of the decision and provides an opportunity for any person who is adversely affected or aggrieved, or who is entitled to notice under paragraph (c) of this subsection, to file an appeal.

(B) Written notice of the decision shall be mailed to those persons described in paragraph (c) of this subsection.

(C) Notice under this subsection shall comply with ORS 197.763 (3)(a), (c), (g) and (h) and shall describe the nature of the decision. In addition, the notice shall state that any person who is adversely affected or aggrieved or who is entitled to written notice under paragraph (c) of this subsection may appeal the decision by filing a written appeal in the manner and within the time period provided in the city's land use regulations. A city may not establish an appeal period that is less than 12 days from the date the written notice of decision required by this subsection was mailed. The notice shall state that the decision will not become final until the period for filing a local ap-

peal has expired. The notice also shall state that a person who is mailed written notice of the decision cannot appeal the decision directly to the Land Use Board of Appeals under ORS 197.830.

(D) An appeal from a hearings officer's decision made without hearing under this subsection shall be to the planning commission or governing body of the city. An appeal from such other person as the governing body designates shall be to a hearings officer, the planning commission or the governing body. In either case, the appeal shall be to a de novo hearing.

(E) The de novo hearing required by subparagraph (D) of this paragraph shall be the initial evidentiary hearing required under ORS 197.763 as the basis for an appeal to the Land Use Board of Appeals. At the de novo hearing:

(i) The applicant and other parties shall have the same opportunity to present testimony, arguments and evidence as they would have had in a hearing under subsection (3) of this section before the decision;

(ii) The presentation of testimony, arguments and evidence shall not be limited to issues raised in a notice of appeal; and

(iii) The decision maker shall consider all relevant testimony, arguments and evidence that are accepted at the hearing.

(b) If a local government provides only a notice of the opportunity to request a hearing, the local government may charge a fee for the initial hearing. The maximum fee for an initial hearing shall be the cost to the local government of preparing for and conducting the appeal, or $250, whichever is less. If an appellant prevails at the hearing or upon subsequent appeal, the fee for the initial hearing shall be refunded. The fee allowed in this paragraph shall not apply to appeals made by neighborhood or community organizations recognized by the governing body and whose boundaries include the site.

(c)(A) Notice of a decision under paragraph (a) of this subsection shall be provided to the applicant and to the owners of record of property on the most recent property tax assessment roll where such property is located:

(i) Within 100 feet of the property that is the subject of the notice when the subject property is wholly or in part within an urban growth boundary;

(ii) Within 250 feet of the property that is the subject of the notice when the subject property is outside an urban growth boundary and not within a farm or forest zone; or

(iii) Within 750 feet of the property that is the subject of the notice when the subject property is within a farm or forest zone.

(B) Notice shall also be provided to any neighborhood or community organization recognized by the governing body and whose boundaries include the site.

(C) At the discretion of the applicant, the local government also shall provide notice to the Department of Land Conservation and Development.

(11) A decision described in ORS 227.160 (2)(b) shall:

(a) Be entered in a registry available to the public setting forth:

(A) The street address or other easily understood geographic reference to the subject property;

(B) The date of the decision; and

(C) A description of the decision made.

(b) Be subject to the jurisdiction of the Land Use Board of Appeals in the same manner as a limited land use decision.

(c) Be subject to the appeal period described in ORS 197.830 (5)(b).

(12) At the option of the applicant, the local government shall provide notice of the decision described in ORS 227.160 (2)(b) in the manner required by ORS 197.763 (2), in which case an appeal to the board shall be filed within 21 days of the decision. The notice shall include an explanation of appeal rights.

(13) Notwithstanding other requirements of this section, limited land use decisions shall be subject to the requirements set forth in ORS 197.195 and 197.828.

SECTION 19. ORS 215.441 is amended to read:

215.441. (1) If a church, synagogue, temple, mosque, chapel, meeting house or other nonresidential place of worship is allowed on real property under state law and rules and local zoning ordinances and regulations, a county shall allow the reasonable use of the real property for activities customarily associated with the practices of the religious activity, including:

(a) Worship services.

(b) Religion classes.

(c) Weddings.

(d) Funerals.

(e) Meal programs.

(f) Child care, but not including private or parochial school education for prekindergarten through grade 12 or higher education.

(g) Providing housing or space for housing in a building **or buildings** that [*is*] **are** detached from the place of worship, provided:

(A) At least 50 percent of the residential units provided under this paragraph are affordable to households with incomes equal to or less than 60 percent of the median family income for the county in which the real property is located;

(B) The real property is in an area zoned for residential use that is located within the urban growth boundary; and

(C) The housing or space for housing complies with applicable land use regulations and meets the standards and criteria for residential development for the underlying zone.

(2) A county may:

(a) Subject real property described in subsection (1) of this section to reasonable regulations, including site review or design review, concerning the physical characteristics of the uses authorized under subsection (1) of this section; or

(b) Prohibit or restrict the use of real property by a place of worship described in subsection (1) of this section if the county finds that the level of service of public facilities, including transportation, water supply, sewer and storm drain systems is not adequate to serve the place of worship described in subsection (1) of this section.

(3) Notwithstanding any other provision of this section, a county may allow a private or parochial school for prekindergarten through grade 12 or higher education to be sited under applicable state law and rules and local zoning ordinances and regulations.

(4) Housing and space for housing provided under subsection (1)(g) of this section must be subject to a covenant appurtenant that restricts the owner and each successive owner of [*the*] **a** building or any residential unit contained in [*the*] **a** building from selling or renting any residential unit described in subsection (1)(g)(A) of this section as housing that is not affordable to households with incomes equal to or less than 60 percent of the median family income for the county in which the real property is located for a period of 60 years from the date of the certificate of occupancy.

SECTION 20. ORS 227.500 is amended to read:

227.500. (1) If a church, synagogue, temple, mosque, chapel, meeting house or other nonresidential place of worship is allowed on real property under state law and rules and local zoning ordinances and regulations, a city shall allow the reasonable use of the real property for activities customarily associated with the practices of the religious activity, including:

(a) Worship services.

(b) Religion classes.

(c) Weddings.

(d) Funerals.

(e) Meal programs.

(f) Child care, but not including private or parochial school education for prekindergarten through grade 12 or higher education.

(g) Providing housing or space for housing in a building **or buildings** that [*is*] **are** detached from the place of worship, provided:

(A) At least 50 percent of the residential units provided under this paragraph are affordable to households with incomes equal to or less than 60 percent of the median family income for the county in which the real property is located;

(B) The real property is in an area zoned for residential use that is located within the urban growth boundary; and

(C) The housing or space for housing complies with applicable land use regulations and meets the standards and criteria for residential development for the underlying zone.

(2) A city may:

(a) Subject real property described in subsection (1) of this section to reasonable regulations, including site review and design review, concerning the physical characteristics of the uses authorized under subsection (1) of this section; or

(b) Prohibit or regulate the use of real property by a place of worship described in subsection (1) of this section if the city finds that the level of service of public facilities, including transportation, water supply, sewer and storm drain systems is not adequate to serve the place of worship described in subsection (1) of this section.

(3) Notwithstanding any other provision of this section, a city may allow a private or parochial school for prekindergarten through grade 12 or higher education to be sited under applicable state law and rules and local zoning ordinances and regulations.

(4) Housing and space for housing provided under subsection (1)(g) of this section must be subject to a covenant appurtenant that restricts the owner and each successive owner of [*the*] **a** building or any residential unit contained in [*the*] **a** building from selling or renting any residential unit described in subsection (1)(g)(A) of this section as housing that is not affordable to households with incomes equal to or less than 60 percent of the median family income for the county in which the real property is located for a period of 60 years from the date of the certificate of occupancy.

SECTION 21. ORS 455.062 is amended to read:

455.062. (1) A Department of Consumer and Business Services employee acting within the scope of that employment may provide typical plans and specifications:

(a) For structures of a type for which the provision of plans or specifications is exempted under ORS 671.030 from the application of ORS 671.010 to 671.220 and exempted under ORS 672.060 from the application of ORS 672.002 to 672.325; and

(b) Notwithstanding ORS 671.010 to 671.220 and 672.002 to 672.325, for structures that are metal or wood frame Use and Occupancy Classification Group U structures under the structural specialty code.

(2) A Department of Consumer and Business Services employee, who is licensed or registered under ORS 671.010 to 671.220 or 672.002 to 672.325, who is acting within the scope of that employment and who is providing typical plans and specifications under subsection (1) of this section, is not required to seal or sign the typical plans and specifications and is not subject to disciplinary action under ORS 671.010 to 671.220 or 672.002 to 672.325 based on providing those typical plans and specifications.

[*(2)*] **(3)** A building official or inspector, as those terms are defined in ORS 455.715, when acting within the scope of direct employment by a municipality, may provide typical plans and specifications for structures of a type for which the provision of plans or specifications is exempted under ORS 671.030 from the application of ORS 671.010 to 671.220 and exempted under ORS 672.060 from the application of ORS 672.002 to 672.325.

[*(3)*] This [*section*] **subsection** does not alter any applicable requirement under ORS 671.010 to 671.220 or 672.002 to 672.325 regarding stamps and seals for a set of plans for a structure.

SECTION 21a. If Senate Bill 39 becomes law, ORS 455.062, as amended by section 2, chapter 97, Oregon Laws 2019 (Enrolled Senate Bill 39), and section 21 of this 2019 Act, is amended to read:

455.062. (1) A Department of Consumer and Business Services employee acting within the scope of that employment may provide typical drawings and specifications:

(a) For structures of a type for which the provision of drawings or specifications is exempted under ORS 671.030 from the application of ORS 671.010 to 671.220 and exempted under ORS 672.060 from the registration requirements of ORS 672.002 to 672.325; and

(b) Notwithstanding ORS 671.010 to 671.220 and 672.002 to 672.325, for structures that are metal or wood frame Use and Occupancy Classification Group U structures under the structural specialty code.

(2) A Department of Consumer and Business Services employee, who is licensed or registered under ORS 671.010 to 671.220 or 672.002 to 672.325, who is acting within the scope of that employment and who is providing typical [*plans*] **drawings** and specifications under subsection (1) of this section, is not required to seal or sign the typical [*plans*] **drawings** and specifications and is not subject to disciplinary action under ORS 671.010 to 671.220 or 672.002 to 672.325 based on providing those typical [*plans*] **drawings** and specifications.

(3) A building official or inspector, as those terms are defined in ORS 455.715, when acting within the scope of direct employment by a municipality, may provide typical drawings or specifications for structures of a type for which the provision of drawings or specifications is exempted under ORS 671.030 from the application of ORS 671.010 to 671.220 and exempted under ORS 672.060 from the registration requirements of ORS 672.002 to 672.325. This subsection does not alter any applicable requirement under ORS 671.010 to 671.220 or 672.002 to 672.325 regarding stamps and seals for a set of plans for a structure.

SECTION 21b. If Senate Bill 39 becomes law, section 3, chapter 97, Oregon Laws 2019 (Enrolled Senate Bill 39), is amended to read:

Sec. 3. The amendments to ORS 455.062 and 672.060 by sections 1 and 2 [*of this 2019 Act*]**, chapter 97, Oregon Laws 2019 (Enrolled Senate Bill 39), and section 21a of this 2019 Act** apply to work performed, and offers made, on or after the effective date of [*this 2019 Act*] **chapter 97, Oregon Laws 2019 (Enrolled Senate Bill 39)**.

SECTION 22. In addition to and not in lieu of any other appropriation, there is appropriated to the Department of Land Conservation and Development, for the biennium beginning July 1, 2019, out of the General Fund, the amount of $1,000,000, to provide technical assistance to local governments to implement sections 4 to 6 and 15 of this 2019 Act and the amendments to ORS 197.296, 197.299, 197.303, 197.319, 197.320, 215.416, 215.441, 227.175 and 227.500 and section 1, chapter 47, Oregon Laws 2018, by sections 8 to 13 and 17 to 20 of this 2019 Act.

SECTION 23. In addition to and not in lieu of any other appropriation, there is appropriated to the Housing and Community Services Department, for the biennium beginning July 1, 2019, out of the General Fund, the amount of $655,274, for research, administration and reporting that relate to a regional housing needs analysis described in section 1 of this 2019 Act.

SECTION 24. (1) Sections 4 to 6 of this 2019 Act and the amendments to ORS 197.296, 197.299, 197.303, 197.319 and 197.320 and section 1, chapter 47, Oregon Laws 2018, by sections 8 to 13 of this 2019 Act become operative on January 1, 2020.

(2) The Land Conservation and Development Commission, the Department of Land Conservation and Development and the Housing and Community Services Department may take any action before the operative date specified in subsection (1) of this section that is necessary for the departments and the commission to exercise, on or after the operative date specified in subsection (1) of this section, all of the duties, functions and powers conferred on the departments and the commission by sections 4 to 6 of this 2019 Act and the amendments to ORS 197.296, 197.299, 197.303, 197.319, 197.320 and section 1, chapter 47, Oregon Laws 2018, by sections 8 to 13 of this 2019 Act.

SECTION 25. This 2019 Act being necessary for the immediate preservation of the public peace, health and safety, an emergency is declared to exist, and this 2019 Act takes effect on its passage.

I. INTRODUCTION

This report introduces analytical research presenting an Economic Opportunities Analysis (EOA) for the City of North Plains, Oregon. This analysis is an update of the prior EOA completed in 2018, which relied on population growth rate estimates that have since been revised. This revision created the opportunity to update some of the economic development goals and assumptions underlying the prior analysis. This report also reproduces some analysis from the prior report where still current.Cities are required under the Oregon Statewide Land Use Planning system to periodically prepare estimates of future employment land demand with existing inventories of vacant and redevelopable employment land within their Urban Growth Boundary (UGB). These estimates and the associated analysis of the local economy and policy recommendations are collectively known as an Economic Opportunities Analysis (EOA) and are an adopted ancillary document to the city's Comprehensive Plan. The principal purpose of the analysis is to plan for land supply for economic development and employment growth in the community. Findings on forecasted land need and supply inform land use policies, infrastructure planning, community involvement, and coordination among local governments and the state.

October 2022 Update
Although the EOA was completed in February of 2022, during its undertaking Oregon Governor Kate Brown convened the Oregon Semiconductor Competitiveness Task Force ("Oregon Task Force"), a blue-ribbon panel comprising Oregon-based stakeholders from the semiconductor industry, public sector, and other interests in order to position the State to best leverage the likely billions of dollars in federal funds authorized for investment by the federal CHIPS and Sciences Act ("CHIPS Act") when passed. After the CHIPS Act was signed by President Biden, the Oregon Task Force released a report[1] on August 17, 2022 that included urgent need for a significant variety of sizes and types of larger industrial sites needed to keep Oregon competitive for semiconductor manufacturing and supply chain investment and employment.

Being located at the edge of Oregon's "Silicon Forest" cluster of semiconductor and supply chain businesses and 15 minutes from Intel's Ronler Acres, and being the only city in or near the Silicon Forest actively planning a sizeable UGB expansion to meet significant industry need and opportunity, the City of North Plains communicated with representatives of the Oregon Task Force to coordinate and reflect industrial land planning for its UGB expansion. This report, therefore, includes amendments to reflect substantiation of identified employment land need by Oregon Task Force findings.

To these ends, this report is organized into the following primary sections:

- **Statement of Economic Goals:** This is the community's adopted set of priorities for economic development that help guide this analysis and its findings.
- **Economic Trends:** Provides an overview of national, state, and local economic trends affecting Washington County and the City of North Plains, including population projections, employment growth and a demographic profile.
- **Target Industries:** Analyzes current and projected representation of major industry sectors in North Plains, and implications for future growth and land need.
- **Employment Land Needs:** Presents projections of demand for industrial and commercial land based on anticipated employment growth rates by sector.

[1] http://oregonbusinessplan.org/wp-content/uploads/2022/08/Semiconductor-Task-Force-Report-for-Release1.pdf

- **Capacity:** Summarizes the City's inventory of vacant, partially vacant, and redevelopable industrial and commercial land (employment land) within City of North Plains' corporate limits.
- **Reconciliation:** Compares the projected short- and long-term demand for employment land to the existing land inventory to determine the adequacy and appropriateness of capacity over a five and twenty-year horizon.
- **Conclusions:** Presents a summary of findings and policy implications.

Oregon Statewide Planning Goal 9: Economic Development
In addition to providing an analysis of the City's economic opportunities and needs, this report is intended to meet the requirements of Oregon Statewide Planning Goal 9 and the requirements for an EOA as specified in the administrative rules that implement Goal 9 (OAR 660-009).

II. STATEMENT OF ECONOMIC DEVELOPMENT GOALS

The City Council of North Plains adopted a set of economic development priorities to guide the update of the Economic Opportunities Analysis, other City economic development initiatives, and partnerships with Washington County and the State of Oregon.

PRIORITY 1: Reverse the worsening trend of bedroom community status for North Plains with a thriving jobs-housing balance by expanding and diversifying employment opportunity and industry profile and presence.

PRIORITY 2: Grow business investment in North Plains to encourage expansion and diversification of the City's property tax base to reverse the imbalance created by a growing bedroom community development trend.

PRIORITY 3: Ensure and sustainably fund community-supporting infrastructure, economy-supporting infrastructure, and expanded City services such as recreational offerings that enhance community health and diversify the City economy.

PRIORITY 4: Expand the local presence of important, everyday commercial services for the residents of North Plains which offers a shorter and safer distance rather than at extended and costly distance to other cities.

(Resolution No. 2160, September 2021)

As an adopted statement of community priorities, this list provides the underlying framework for the analysis and recommendations presented in this report.

These priorities derive from and further explain a North Plains Vision for future economic growth adopted by its City Council in Resolution No. 2160 and attached in the Appendices. Both the Vision and Implementing Priorities inform the kinds of new, preferred industries (and their job opportunities) the City

wants to pursue and accommodate by providing the kinds of industry-suitable sites they need within an expanded City UGB boundary.

This visionary UGB expansion approach is rooted in and informed by the EOA work done in this document in accordance with the following Goal 9 Rules in OAR 660-009-0015. In pertinent parts these Rules require the following:

- A City EOA *must "identify the major categories of industrial and other employment uses that could reasonably be expected to locate or expand in the planning area based on information about national, state, regional, county or local trends. A (identified) use or category of use could reasonably be expected to expand or locate in the planning area if the area possesses the appropriate locational factors for the use or category of use."* 660-009-0015(1)

- A City EOA must *"identify the number of sites by type reasonably expected to be needed . . . based on the site characteristics typical of expected uses. Cities are encouraged to examine existing firms in the planning area to identify the types of sites that may be needed for (UGB) expansion. Industrial or other employment uses with compatible site characteristics may be grouped together into common site categories."* 660-009-0015(2)

- A City EOA *"must include an inventory of vacant and developed lands within the planning area designated for industrial or other employment use"*. 660-009-0015(3)

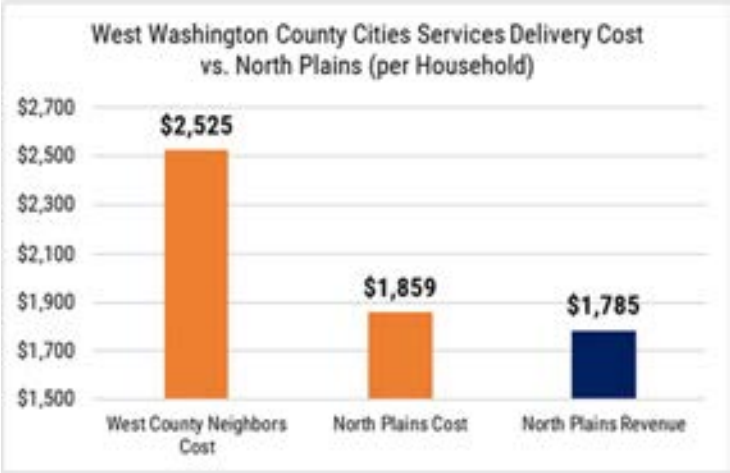
- A City EOA *"must estimate the types and amounts of industrial and other employment uses likely to occur in the planning area . . . and must consider the planning area's economic advantages and disadvantages . . . (that) include but are not limited to . . . availability of transportation facilities for access and freight mobility; labor market factors; access to suppliers and utilities; …." 660—009-0015(4)*

Finally, cities are "*strongly encouraged to assess community economic development potential through a visioning or some other public input-based process in conjunction with state agencies. Cities . . . are strongly encouraged to use the assessment of community development potential to form the community economic development objectives* (that will be city comprehensive plan directives to be accomplished by city UGB amendments that implement those directives)." 660-009-0015(5) and 660-009-0029(1)(a).

As enabled by these Rules, North Plains' pursuit of future, preferred economic development and growth focuses on identifying, attracting, and accommodating the types of new and expanding tech-based and supporting industries and businesses that already successfully exist nearby in the City of Hillsboro and Washington County and continue to seek more sites in the County and Portland Area. North Plains' border-like proximity to a fairly-massive cluster/agglomeration of such businesses and industries in Hillsboro/Washington County support applicability of much of the Goal 9 Rules cited above because that proximity makes it reasonable to expect like-kind businesses and industries to locate – and successfully thrive - at suitable sites within an expanded North Plains UGB.

North Plains' pursuit of such like-kind businesses and industries is driven by the City's "Livability" needs of its current residents and a rapidly growing population and expanding residential neighborhoods. Those needs obligate the City to have the adequate fiscal resources – to be generated largely by such new

industrial growth - that will enable the City to provide the full array of municipal services needed by its residents and businesses going forward.



North Plains wants to reverse its declining service levels and provide its current and future households with the breadth of municipal services and, thus, urban quality of life on par with the services and resulting livability now provided by its four closest City neighbors – Banks, Cornelius, Forest Grove, and Hillsboro – largely due to their broader revenue base. To do that, the City needs enough business investment to compensate for an almost $800-per-household deficit in City cost-of-services to residents versus property tax revenues from each household that will exist at full development of all City residential neighborhoods designated in its acknowledged Comprehensive Plan (see fiscal analysis in Appendix C.)

North Plains Livability needs demonstrates satisfaction of Oregon's Planning Goal 14, Factor 2 requirement that its proposed employment (and housing) land UGB expansion(s) derive from the City's current and future "livability" status and conditions. These priorities guide the discussion of target industries and site needs in North Plains as laid out in this report.

To be clear, this EOA describes and supports North Plains' UGB expansion pursuit of two (2) distinct categories of like-kind businesses in response to OAR 660-009-0025 and 660-024-0040(5):

- Successful, tech-based, large-employment, large-sites businesses that occupy land in the adjoining Hillsboro North Industrial Area to address both short-term and long-term City industrial land need; and,

- An agglomeration of mixed small- and mid-sized businesses that occupy sites directly north of that Industrial Area along NW West Union Road to address its short-term land needs. Some of these small and mid-size businesses support production, manufacturing and distribution/shipment of products made by some larger nearby employers in Hillsboro; others are independent producers of goods and services marketed locally and within and outside Oregon.

The average site size of such existing, nearby businesses in the first category, and the total land area within the second category are templates that can inform and guide the aggregate North Plains' UGB expansion employment land estimate.

III. ECONOMIC TRENDS

This section summarizes long and intermediate-term trends at the national, state, and local level that may influence economic conditions in the City of North Plains over the 20-year planning period. It focuses on potential changes in structural socioeconomic conditions both nationally and globally and considers local growth trends, demographics, and economic performance.

NATIONAL TRENDS

Coming out of the prior recession, the United States enjoyed a sustained economic expansion beginning in 2011, which was sharply curtailed by the Covid-19 pandemic beginning in March 2020. The economic climate of 2020 and 2021 has been volatile. However, as of the time of this report, widespread vaccination and the re-opening of the economy point towards recovery. Remaining challenges include periods of Covid resurgence, and disruptions to the global supply chain which have exacerbated inflation in 2021.

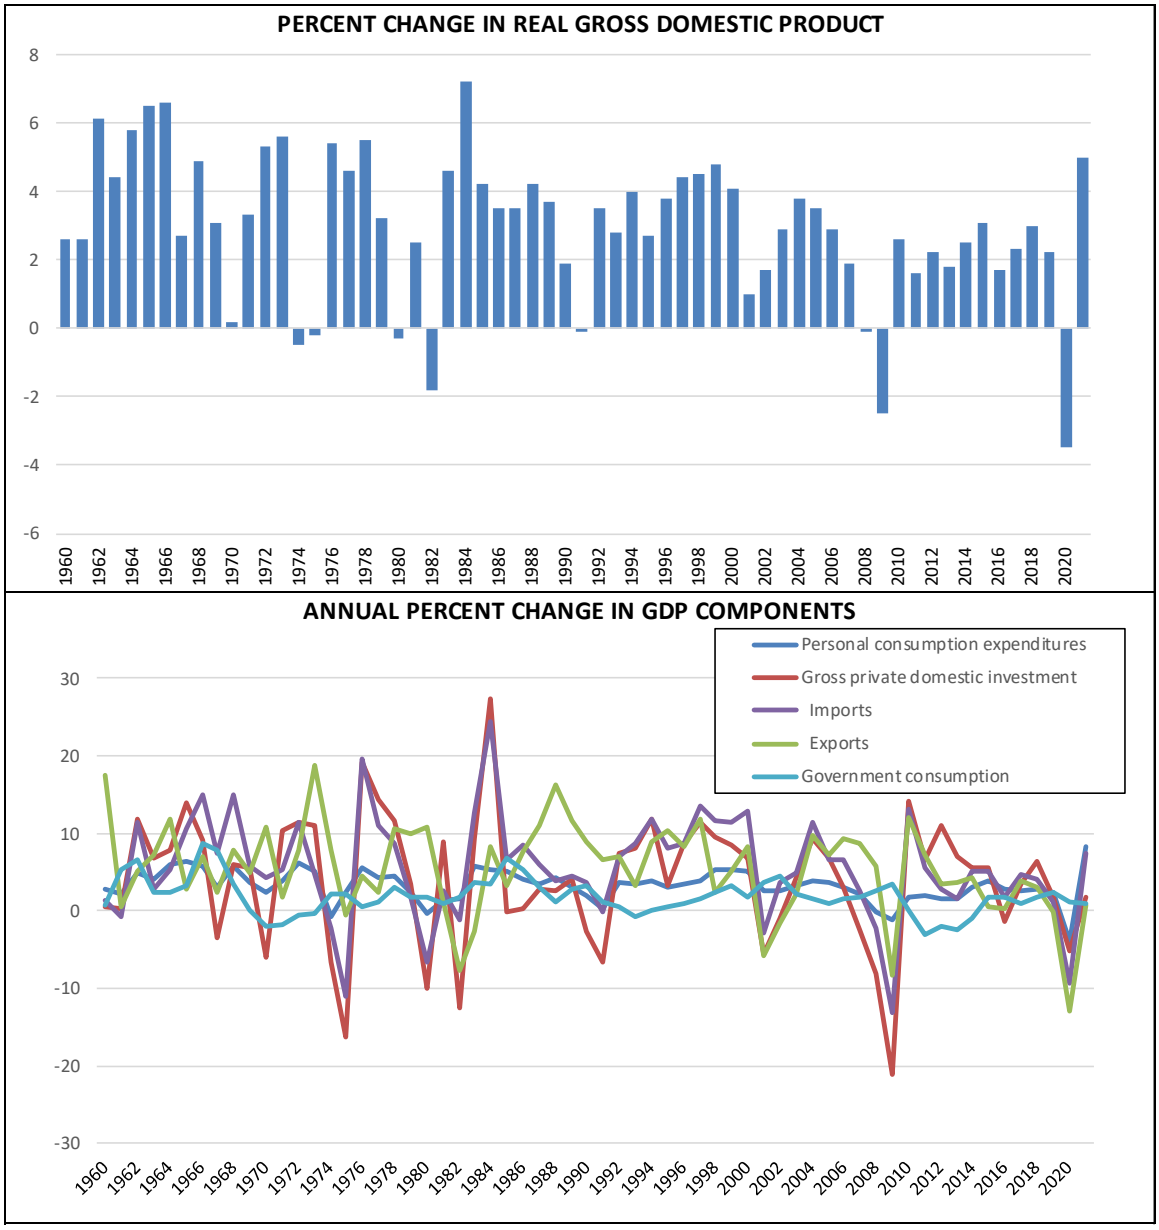
Specific observed and anticipated impacts of the pandemic on the economy will be addressed later in this report. Because of the temporary and extreme nature of the pandemic, much of this discussion focuses on longer-term trends that were in place before this period of disruption. The extent to which the economy will revert to long-term trends, and on which economic measures, is still unresolved at the time of this study.

At a national level there has been an on-going long-term shift within the economy from consumption of domestically produced goods to consumption of services, especially services oriented around personal well-being (health, private education, finance). At the same time, growth in fixed investment (equipment and structures) and government defense spending is moderating.

A measure of economic prosperity is real gross domestic product (GDP). Real GDP is essentially a measure of national wealth adjusted for inflation U.S. real GDP expanded at an average annual rate of 2.3% from 2010 through 2019, before falling 3.5% in 2020 due to the pandemic. To date in 2021, GDP has rebounded strongly from the prior year.

Potential GDP growth indicates future long-term growth at around 2.0% per year (correcting for volatility in inflation). Over the last century, the average annual growth rate has been 1.8%, 2.0% growth would represent a reversion to this mean, after a period of stronger growth over the second half of the 20th Century. Long-term economic growth is more related to broad trends, such as population growth and investment in physical and human capital, than temporary economic fluctuations.

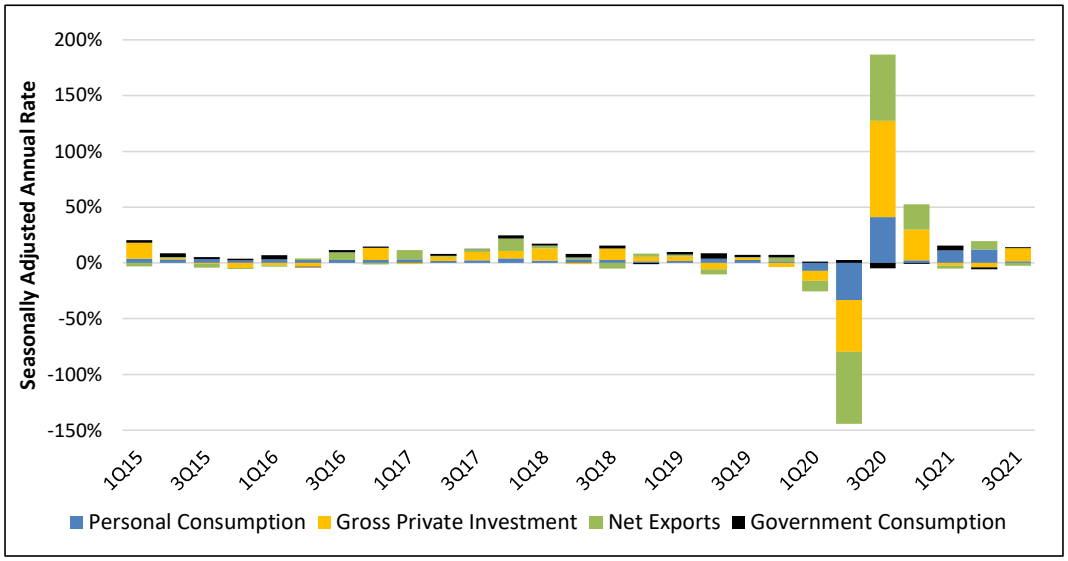
FIGURE 3.01: NATIONAL GROSS DOMESTIC PRODUCT TRENDS



SOURCE: US Bureau of Economic Analysis

The pandemic brought growth to an unprecedented halt in March 2020. Real GDP at the national level declined 5% during the first quarter, and then 31.4% in the second quarter of 2020, before rebounding strongly for the remainder of the year and in to 2021.

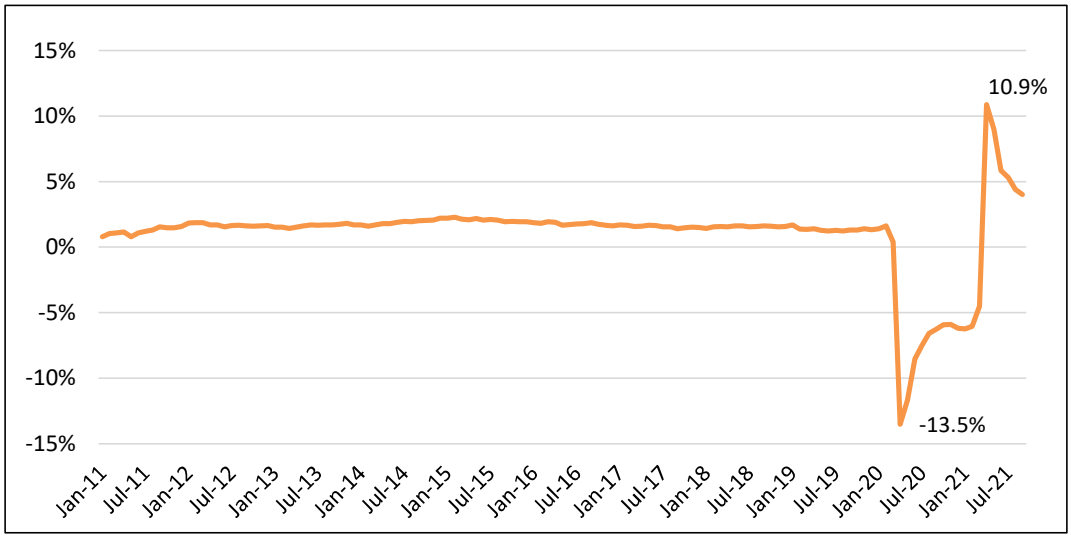
FIGURE 3.02: REAL GDP GROWTH BY CONTRIBUTING SECTOR



U.S. Bureau of Economic Analysis

Employment growth ranged between 1.4% and 2.2% (year-over-year) in the most recent expansion cycle from 2011 but declined an unprecedented 13.5% in Spring of 2020 as many businesses were forced to close. A significant amount of this loss has been recovered as the economy reopens, with recent growth of nearly 11% year-over-year compared to the lows.

FIGURE 3.03: YEAR OVER YEAR EMPLOYMENT GROWTH, UNITED STATES

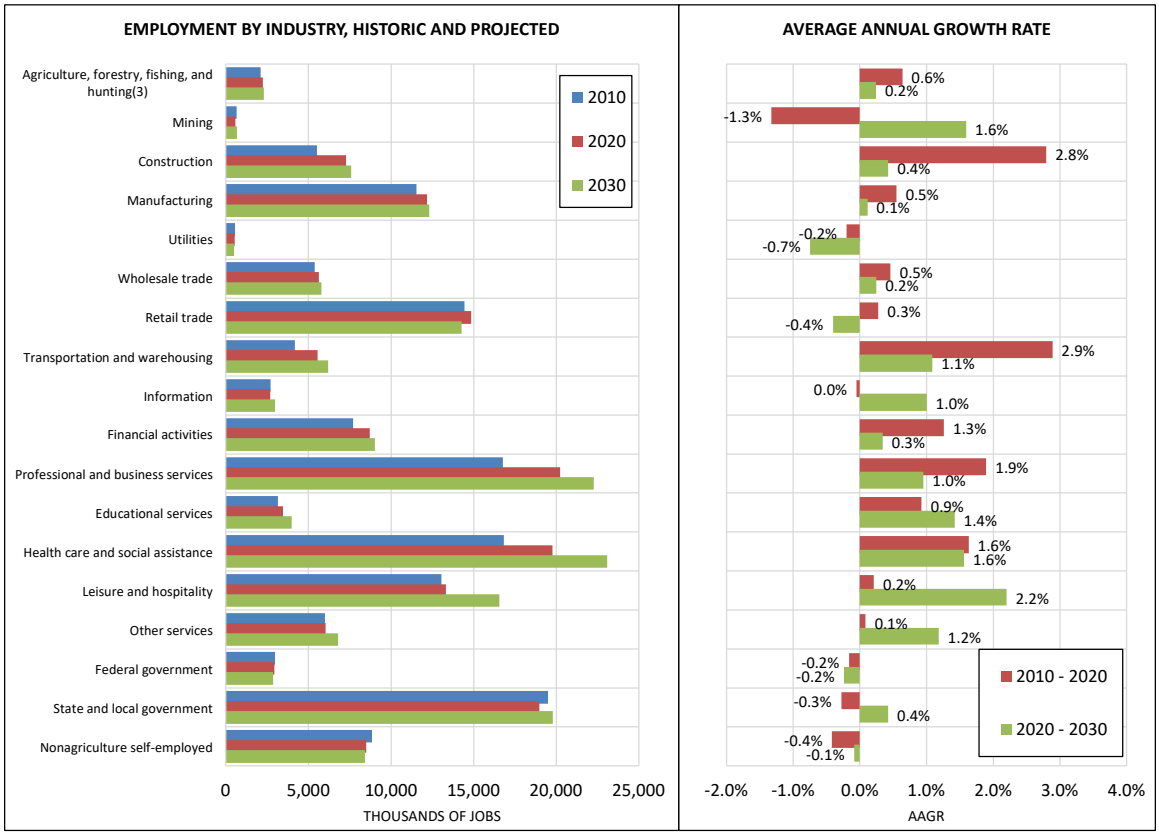


SOURCE: US Bureau of Labor Statistics, CES Data

At a national level, transportation and warehousing, professional services, tourism-related business, construction, and health care have seen some of the fastest growth over the last decade. Professional services and healthcare are now the sectors with the highest employment and are projected to provide the

most new employment going forward, but at a more moderate growth rate. The aging of the population is expected to drive the healthcare sector over the next few decades.

FIGURE 3.04: NATIONAL EMPLOYMENT GROWTH BY SECTOR, HISTORIC AND PROJECTED



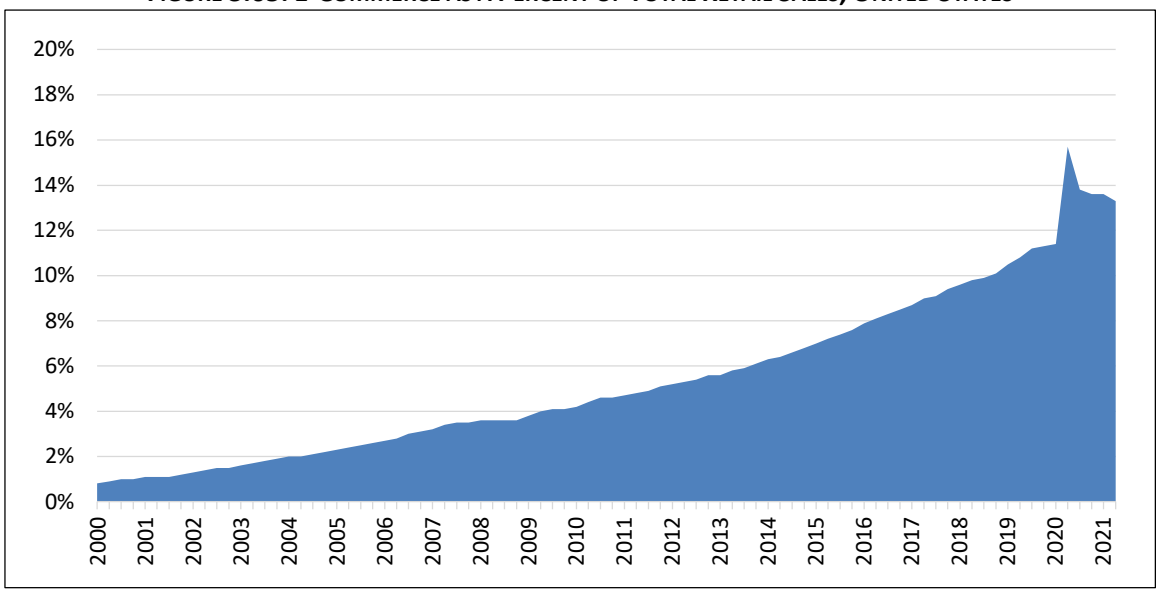
SOURCE: US Bureau of Economic Analysis

E-Commerce Trends: A national trend that is expected to have significant implications for the commercial and industrial real estate market is the anticipated growth in e-commerce. Online shopping is rapidly taking market share from brick-and-mortar retailers. In 2020, the market share of e-commerce jumped dramatically to more than 16% of all sales. It has since fallen to roughly 13% but is likely to remain higher than pre-pandemic levels. In 2020, consumers spent $787.9 billion online with U.S. retailers, up 32% from 2019[2].

This shift toward e-commerce is contributing to an increase in storage needs from retail stores to warehouses and distribution centers. At the same time, increased automation is driving consolidation within the warehousing and distribution industry and increasing the reliance on larger third-party operators able to make heavy investments in warehousing capital and expertise. Automation is also impacting the manufacturing industry, though to a lesser extent and primarily among large industry leaders. Increased productivity through automation continues to reduce the reliance on human labor over time.

2 US Department of Commerce

FIGURE 3.05: E-COMMERCE AS A PERCENT OF TOTAL RETAIL SALES, UNITED STATES



SOURCE: Retail Indicators Branch, US Census Bureau, JOHNSON ECONOMICS

Finally, changes in the use of mobile devices and growth in online services have caused a shift in the tech sector, from hardware manufacturing to software development. This pattern has been reflected in the State of Oregon, with e-commerce employment increasing at the expense of brick-and-mortar retail employment.

Work from Home Trends: A major and sudden shift caused by the shutdown of many workplaces during the Covid-19 pandemic. Many employers and employees were forced to adapt to a work-from-home model. This trend differed greatly across industries and job classification. On-going trends towards increased e-commerce and automation also accelerated.

A national poll conducted by Pew Research[3] in October of 2020 found that those with higher incomes and educational attainment level reported being able to work from home at a much higher rate than those with less education and lower incomes. However, most economists seem to agree that remote work is unlikely to remain at the peak level seen during the pandemic and may even fall significantly.

There is also widespread agreement that the nature of work for many workers has permanently changed, and many of the shifts seen since spring of 2020 will persist at much higher levels than seen before the pandemic. 54% of remote workers in the Pew poll reported that they would like to continue to work remotely, and a larger majority of the respondents reported that most aspects of the transition were easy.

The following are a few of the major trends and implications that are broadly predicted resulting from this unusual period:

- Professional work that typically took place in an office environment is anticipated to remain more flexible for many workers. The expectations of individual employers will matter greatly in whether workers remain remote, hybrid or return to the office full time. How this trend settles out in the

[3] Parker, Kim, Juliana Horowitz, and Rachel Minkin. "How the Coronavirus Outbreak Has - and Hasn't - Changed the Way Americans Work." Pew Research Center. 9 Dec. 2020.

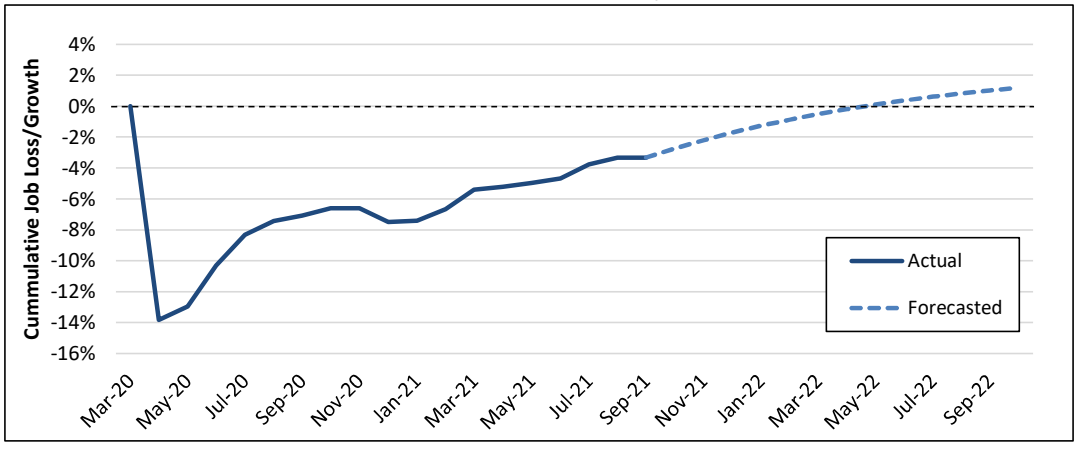
long term is unknown, but it seems a near certainty that many more professional workers will be working remotely or on a hybrid remote/on-site schedule.

- The difference between fully remote work and a hybrid schedule is important because hybrid workers must remain within a manageable commute distance from their external workplace.
- These trends are expected to put downward pressure on office rents. More available space and depressed rents would likely translate into less production of new office space in coming years as the existing supply is reabsorbed.
- The pandemic has accelerated workplace automation as companies have adopted new technology and software to adapt to the new reality. Many of these adaptations have created permanent efficiencies and will change the job responsibilities for some workers and potentially eliminate some jobs.
- Service industries that were not amenable to remote work, such as dining, entertainment, and retail have faced a very challenging period during the "occupancy and use" restrictions stemming from the pandemic. These industries all lost businesses and the accompanying jobs over this period.
- As the economy has rebounded, many businesses in these service industries have struggled to find sufficient new staff with the proper skills to return to full capacity. It appears that many prior workers in these industries transitioned to new types of employment, are hesitant to return to work, or have left the workforce altogether.

As the economy reopens and recovers, there is expected to be more vacant commercial real estate available, including spaces that retain full tenant improvements such as those for restaurant use. The misfortune of some businesses over the prior year may provide affordable opportunities for new businesses to grow in their place. Some large-format spaces, such as big box stores, movie theaters and shopping centers may face long term vacancies as they are more difficult to re-tenant.

Statewide Employment Projections: pandemic triggered an unprecedented contraction of economic activity. While over 70% of employment losses in the state have been reversed, the short- and mid-term prospects for the economy will be heavily dependent upon the speed of the continuing recovery. As of Fall 2021, trends in employment growth, consumer, and travel spending, shrinking unemployment rolls, and vaccination rates continue to point to a potentially robust reversal of the prior year's losses.

FIGURE 3.06: EMPLOYMENT PROJECTIONS, STATE OF OREGON



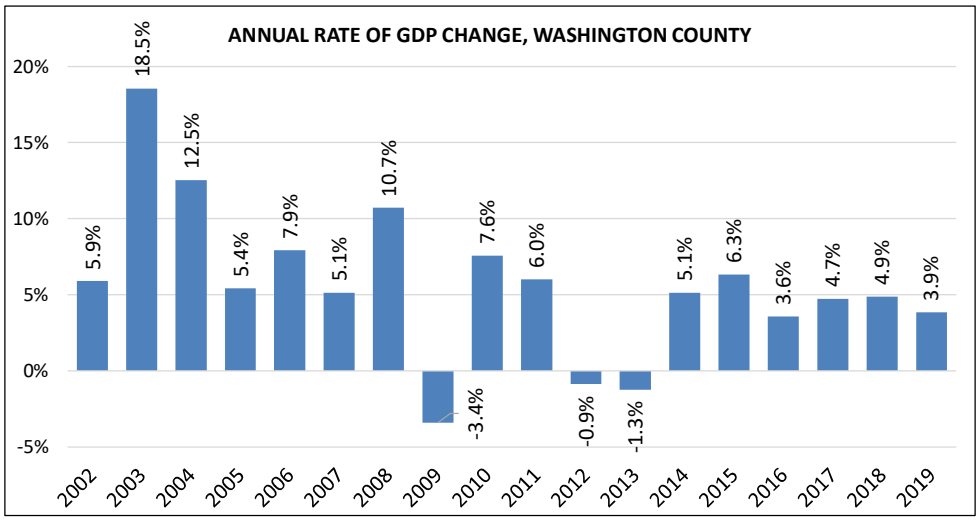
SOURCE: JOHNSON ECONOMICS

The State of Oregon projects a return to pre-pandemic employment levels will be achieved by Spring or Summer of 2022, but there is increased uncertainty regarding this forecast. One potential scenario is that most of the prior employment is recovered relatively quickly, while restoring the final 5% to 10% takes longer.

WASHINGTON COUNTY ECONOMIC TRENDS

GDP: Washington County recorded strong growth during the recent expansion cycle, with the annual rate of GDP change in the County averaging nearly 5% since 2014. After rebounding strongly from the recession of 2009, the County experienced flat growth in 2012 and 2013. In general, the 2010's experienced more moderated GDP growth than the 2000's which experienced some years of double-digit expansion.

FIGURE 3.07: ANNUAL RATE OF GDP CHANGE, WASHINGTON COUNTY



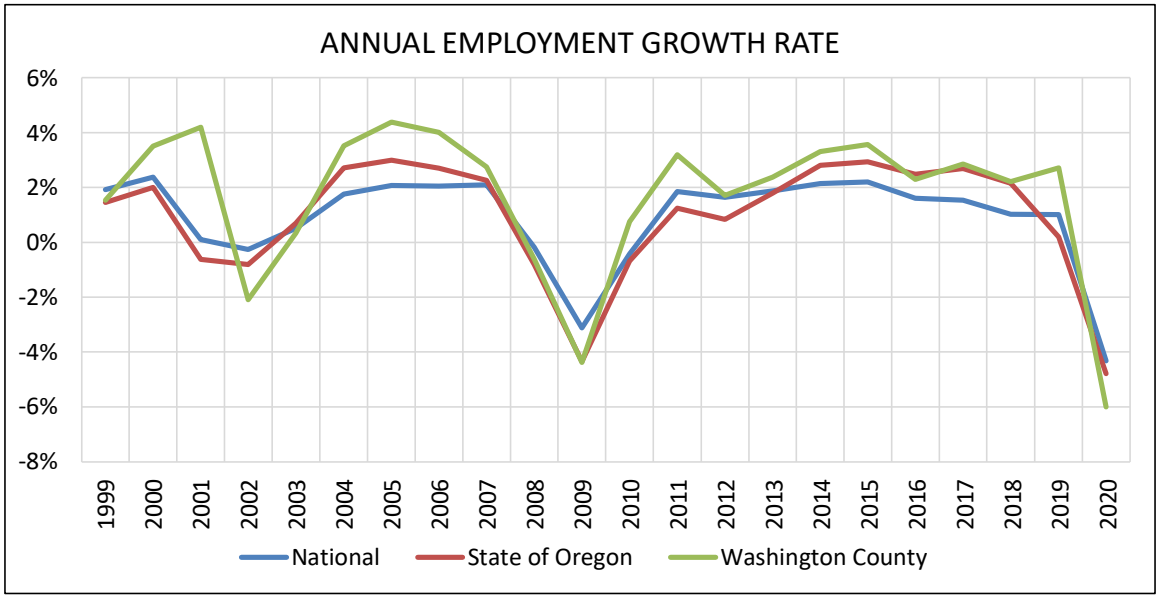
SOURCE: US Bureau of Economic Analysis

These data do not yet reflect the recession of 2020, in which the County is presumed to have experienced highly negative GDP in keeping with the national trend. While the impacts of the prior year are important, there currently is no reason to assume that broad economic trends will not revert to prior trendlines as the recovery takes hold and returns the country to low unemployment and economic growth. Given the long-term planning horizon of this analysis, a longer-term focus is ultimately more appropriate.

County Employment: Over the last two decades, Washington County has generally experienced a higher employment growth rate than the state or nation. The County also experienced a greater rate of job loss in the major recessions of 2001 and 2009, but the downtrends were short-lived. (Figure 3.08)

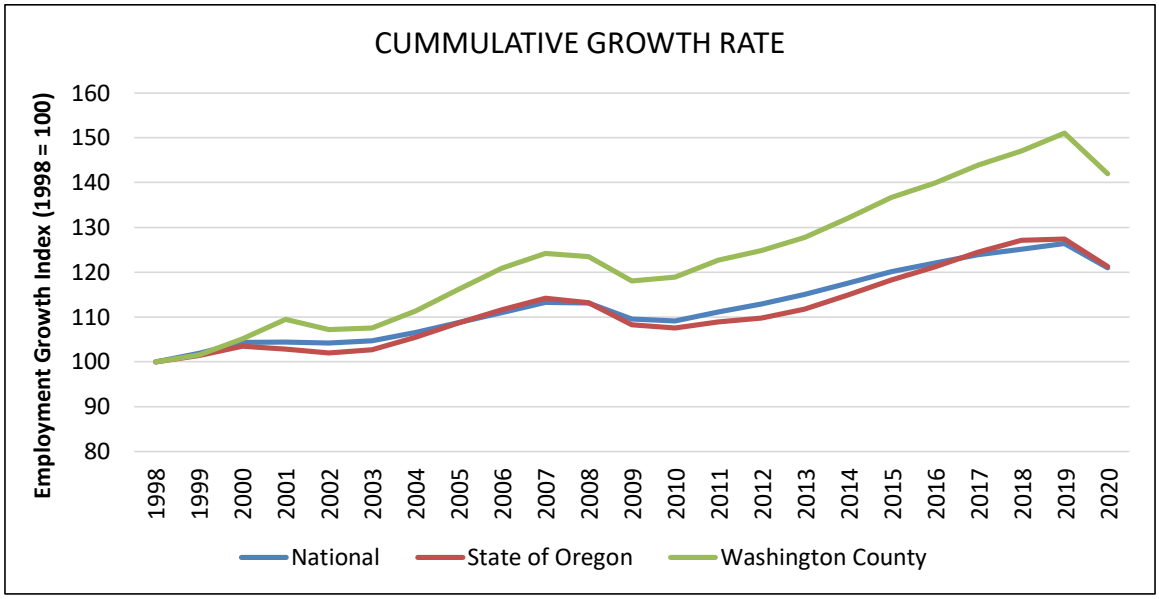
The cumulative impact of this growth was an over 50% expansion in the local employment base since 1998 in Washington County by 2019 (from 246k jobs to nearly 400k jobs). The County's cumulative growth was twice the relative growth in state or national employment (Figure 3.09). However, employment was estimated to fall by 6% in the County in 2020 due to the disruption of the pandemic, losing roughly 40,000 jobs. Since the low, it is estimated the county has regained nearly 30,000 jobs as of Fall of 2021.

FIGURE 3.08: COMPARISON OF ANNUAL EMPLOYMENT GROWTH RATES (COUNTY, STATE, NATION)



SOURCE: U.S. Bureau of Economic Analysis, JOHNSON ECONOMICS

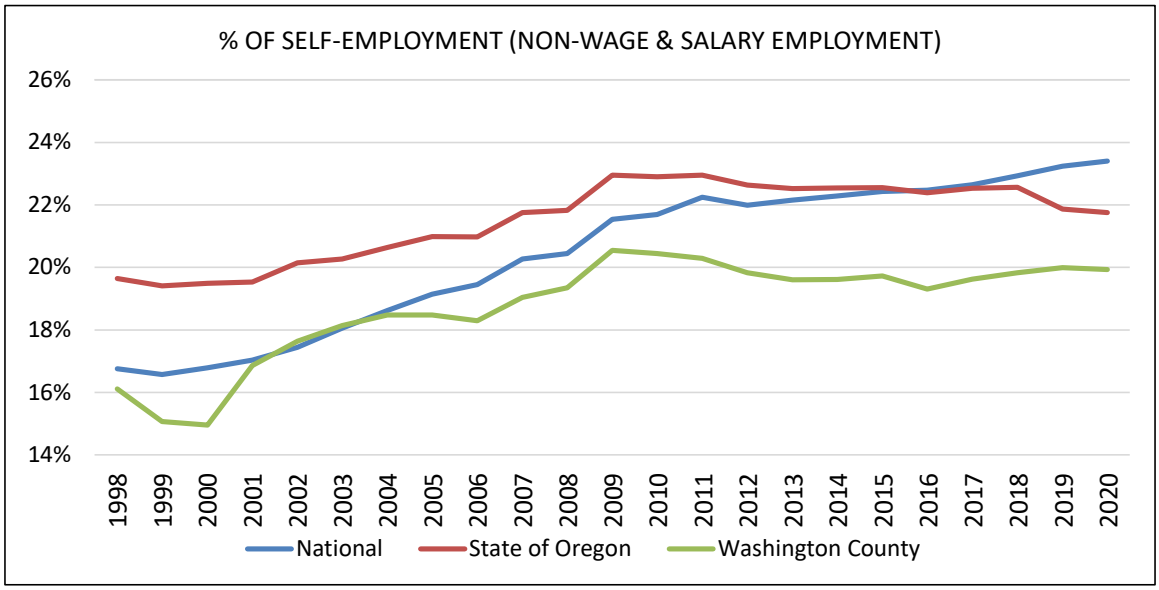
FIGURE 3.9: CUMULATIVE EMPLOYMENT GROWTH (1998 = 100) (COUNTY, STATE, NATION)



SOURCE: U.S. Bureau of Economic Analysis, JOHNSON ECONOMICS

The employment base in Washington County has a lower share of self-employed workers than the state and national averages, at roughly 20%, compared to 22% and 23% respectively. The somewhat lower level of self-employment in Washington County is likely due to the number of large established employers in the county. Wage and salary employment accounts for roughly 80% of overall estimated employment in the county, compared to roughly 77% statewide and nationally.

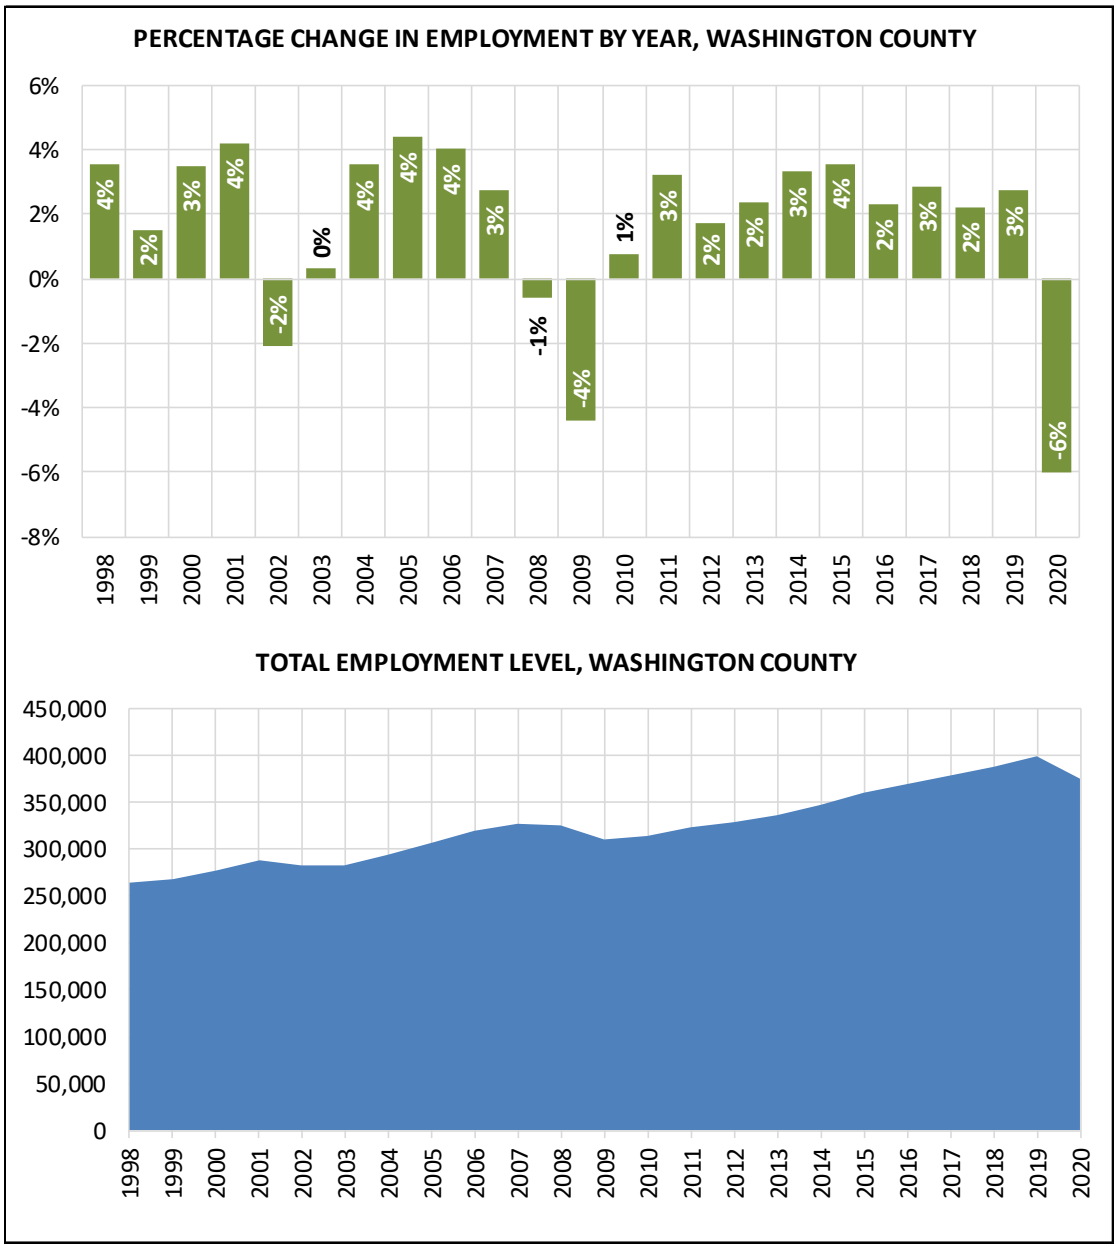
FIGURE 3.10: % OF TOTAL EMPLOYMENT REPRESENTED BY SELF-EMPLOYMENT (COUNTY, STATE, NATION)



SOURCE: U.S. Bureau of Economic Analysis, JOHNSON ECONOMICS

Countywide employment growth was robust over the last decade through 2019, with the county recovering the total job losses from the 2008 national financial crisis within three years (Figure 3.11). From 2011 through 2019, the County averaged 3% job growth per year, outpacing the average annual population growth in that period (1.2%).

FIGURE 3.11: WASHINGTON COUNTY EMPLOYMENT TRENDS

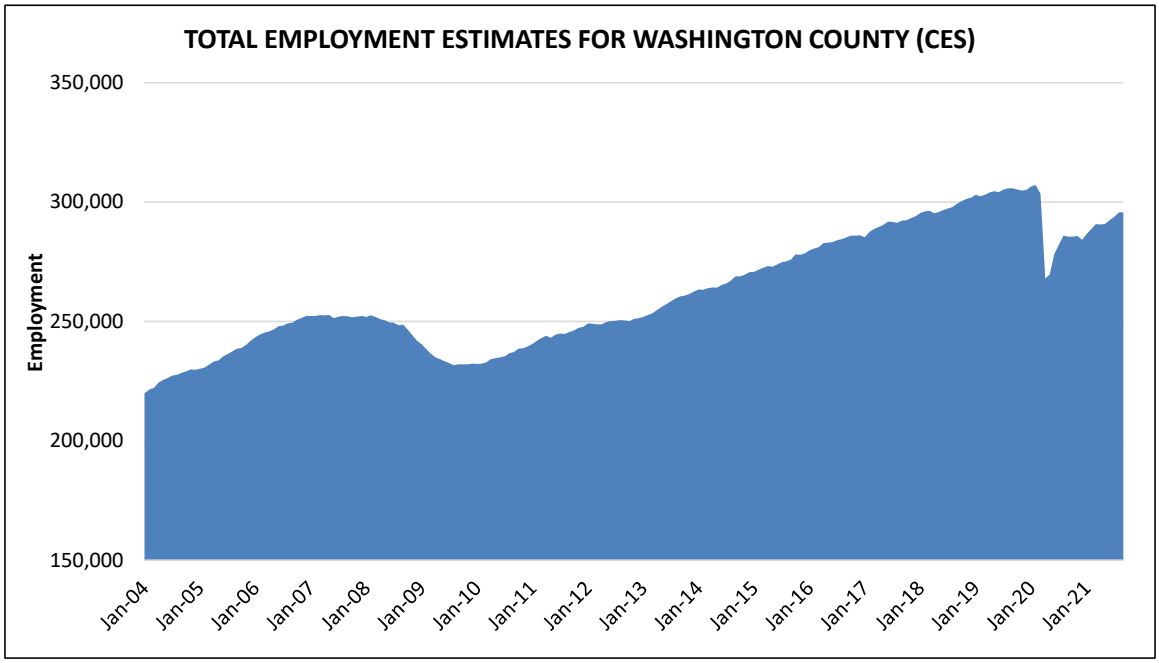


SOURCE: U.S. Bureau of Economic Analysis

Monthly Current Employment Statistics (CES) data and unemployment data provide a more current picture of the economic impacts of the pandemic in Washington County. Following the national trend, the impacts on employment were pronounced.

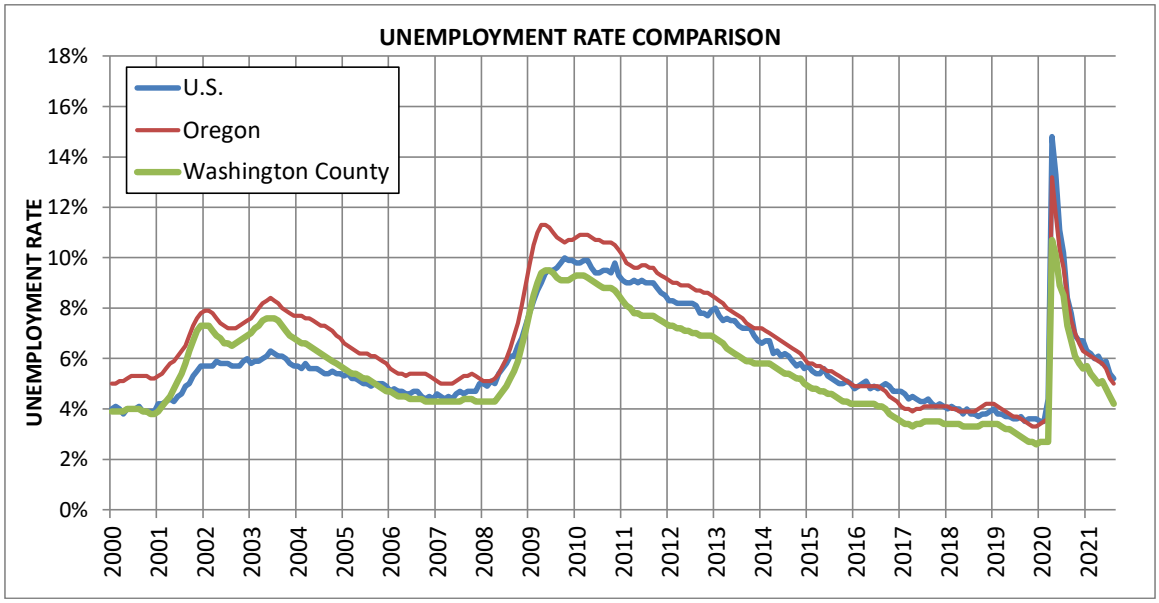
Initial estimates are that the county lost nearly 40,000 jobs (13%) from the high point in February 2020 to April 2020. Tepid job growth resumed the next month and has continued since, other than a small dip in December. (CES data excludes government, farm, and self-proprietor employment and therefore the total employment shown here differs from the total employment shown in the prior tables. Therefore, CES trends may best be seen as an indicator of the magnitude of employment trends, rather than quantity.)

FIGURE 3.12: WASHINGTON COUNTY EMPLOYMENT LEVEL BY MONTH



SOURCE: Oregon Employment Department, JOHNSON ECONOMICS

FIGURE 3.13: COMPARISON OF UNEMPLOYMENT RATE TRENDS



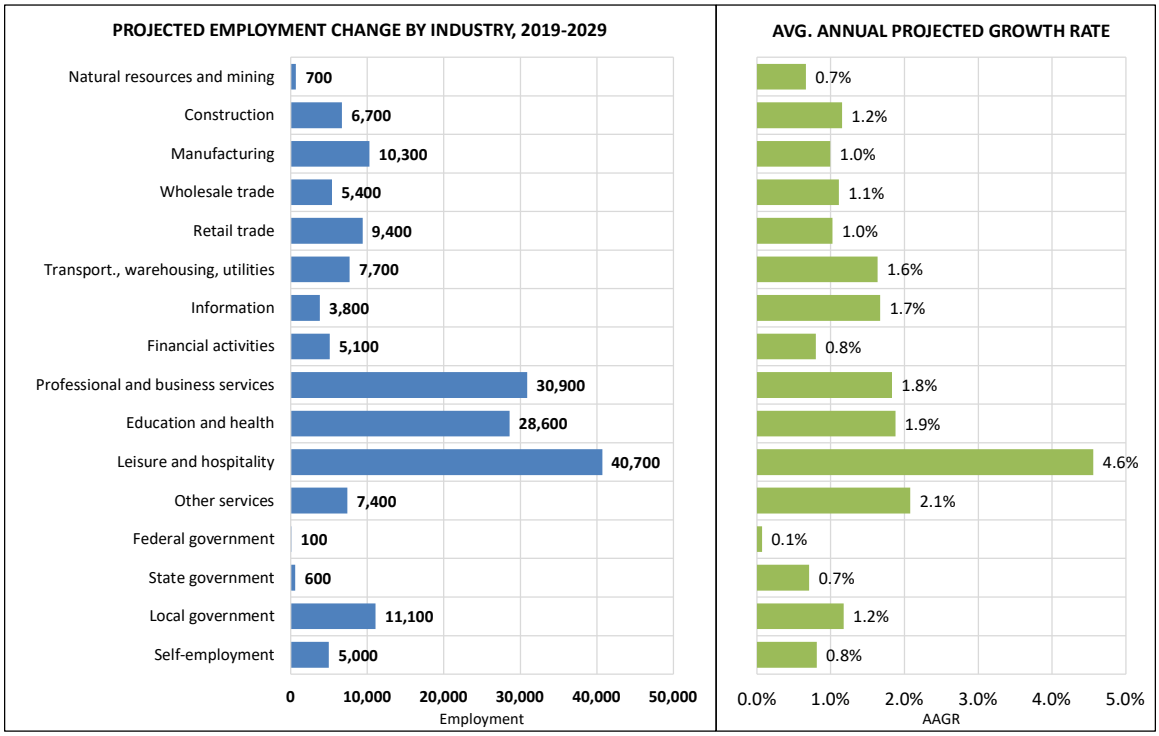
SOURCE: St. Louis Federal Reserve, JOHNSON ECONOMICS

Unemployment: After climbing to nearly 10% in 2009, the unemployment rate in Washington County fell steadily to 2.7% by early 2020, lower than the statewide or national rates. The sudden economic impact of the pandemic caused the unemployment rate to suddenly spike in April 2020 to nearly 11%, still lower than the rate at the state (13%) and national level (15%). At the peak of unemployment, over 25,000 Washington County workers claimed unemployment benefits.

Since then, unemployment has steadily fallen to an estimated at 4% (seasonally adjusted) by September 2021. This is a swift recovery, and an unemployment rate of 4%, while higher than the historically low pre-pandemic rate, is approaching what would be considered a healthy rate even in a strong economy. As the economic recovery continues, this rate should be expected to continue falling, while the recently reported hiring woes of employers indicate that many of these workers will return to employment at higher wage levels.

Industry Growth Forecast (Metro): The State of Oregon employment forecasts groups Washington County with Multnomah and Clackamas Counties into the broader Metro area. The most recent forecast anticipates a gain of over 173k jobs from 2020 through 2030, reflecting an average annual growth rate of 1.6% during the period. The forecasted rate would seem low considering recent growth in Washington County, a year of growth has been lost due to the pandemic.

FIGURE 3.14: PROJECTED EMPLOYMENT GROWTH BY SECTOR (2020-2030)
WASHINGTON, MULTNOMAH & CLACKAMAS COUNTIES



SOURCE: State of Oregon Employment Department, Workforce and Economic Research Division

All industry sectors are forecast to expand over the next decade. Those forecast to grow at a higher-than-average rate are leisure and hospitality (tourism), professional services, education and health services, information, and transportation, warehousing and utilities. Sectors projected to grow slower than the average rate of 1.6% include construction, manufacturing, retail, and government.

On an absolute basis, the greatest number of new jobs are forecast in tourism-related industries, professional services, education and health services. The strong growth in tourism is mostly due to the

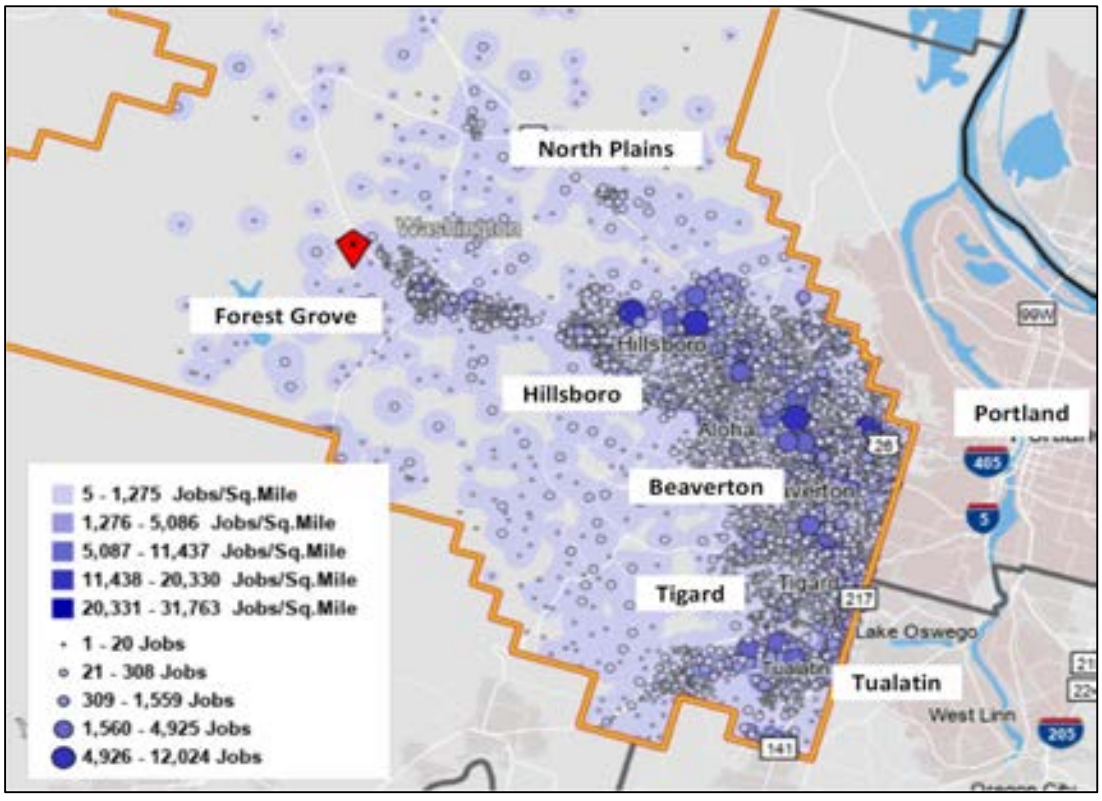
depressed starting point during the 2020 pandemic, when this industry was particularly devastated by business and travel shutdowns.

CITY OF NORTH PLAINS ECONOMIC TRENDS

Employment Distribution & Commuting (City): The distribution of employment in Washington County is concentrated within the UGB of the Portland Metro area. The greatest shares of county employment are found in Hillsboro (29%) and Beaverton (25%) which are home to the county's largest employers. North Plains is home to less than 1% of county employment.

Within North Plains, employment tends to be concentrated along the NW Commercial St. and NW Glencoe Rd. corridors, though recent employment growth in North Plains has been focused on industrial land along West Union Road towards Jackson School Road.

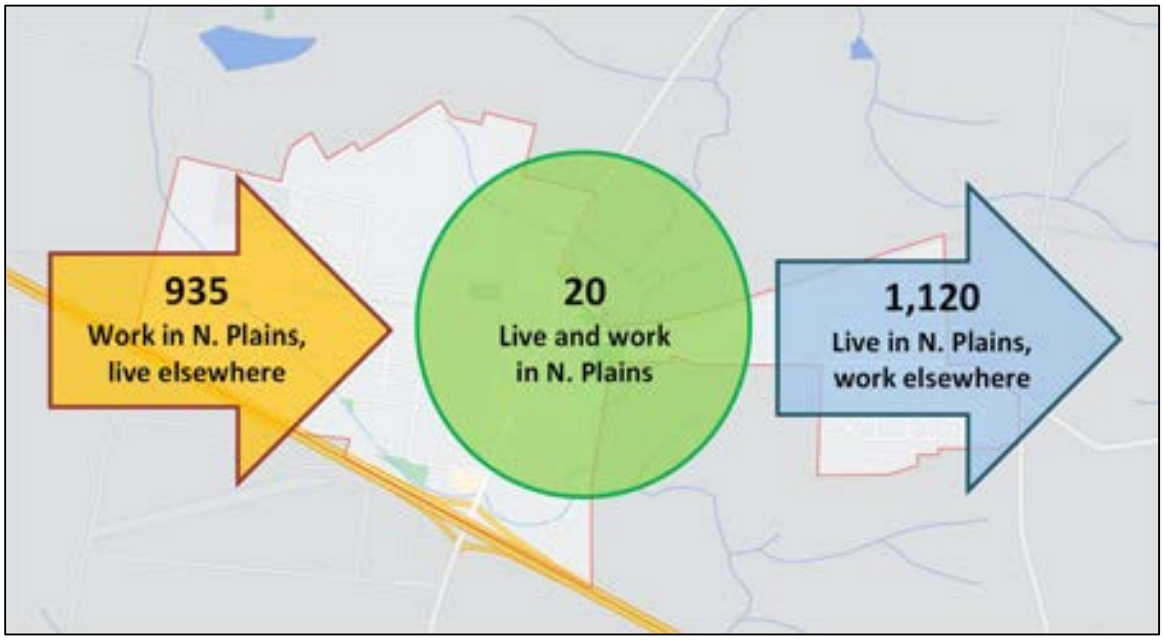
FIGURE 3.15: DISTRIBUTION OF EMPLOYMENT, WASHINGTON COUNTY, 2019



SOURCE: Census Bureau, LEHD Data

Figure 3.16 shows the inflow and outflow of commuters to North Plains according to the Census Employment Dynamics Database. These figures reflect "covered employment" as of 2019, the most recent year available. Covered employment refers to those jobs where the employee is covered by federal unemployment insurance. This category does not include many contract employees and self-employed and therefore is not a complete picture of local employment. The figure discussed here is best understood as indicators of the general pattern of commuting and not exact figures.

FIGURE 3.16: COMMUTING PATTERNS (COVERED EMPLOYMENT), CITY OF NORTH PLAINS, 2019



SOURCE: Census Bureau, LEHD Data

As of 2019, the most recent year available, the Census estimated there were roughly 955 *covered* employment jobs located in North Plains. Of these, *only an estimated 20 or 2%, are held by City residents, while over 900 employees commute into the city from elsewhere. The near total turnover of the local workforce is particularly stark here.* The most common homes of workers commuting into the city are Hillsboro, Portland, and Beaverton.

Similarly, of the estimated 1,140 employed North Plains residents (covered employment), 98% of them commute elsewhere to their employment. The most common destinations for North Plains commuters are also Hillsboro, Portland, and Beaverton, followed by Tualatin and Forest Grove. Over a quarter of these workers commute to Hillsboro (27%), and nearly a fifth commute to Portland (18%).

Implications: Commuting patterns are an important element in the local economy. Based on these Census estimates, North Plains experiences nearly total turnover of its working population, with local residents commuting to find appropriate employment, and the local workforce commuting from elsewhere. This pattern indicates why encouraging a range of local employment and transitioning from being a purely bedroom community is the first listed economic development priority adopted by local officials.

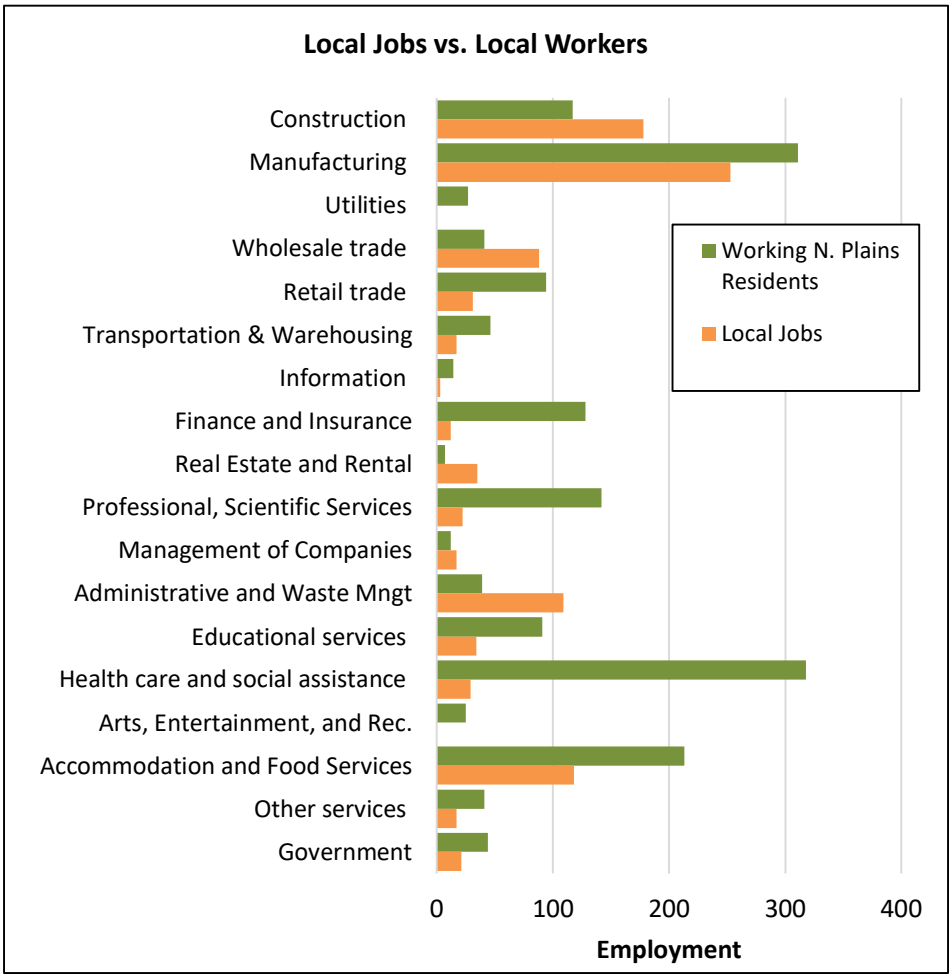
Local Employment Compared to Local Workers (City): Figure 3.17 shows a comparison of the estimated distribution of locally available employment by industry sector, and the estimated distribution of jobs that local North Plains residents hold (inside and outside the community) by industry sector.

This employment data includes non-covered employment, and therefore these figures present a more complete picture of total employment in North Plains. The profile of local jobs by industry is based on Quarterly Census of Employment and Wages (QCEW) data provided by the Oregon Employment

Department for the year 2020. Estimates of the industries in which local residents work (inside and outside the city) are based on Census data from 2019.

The data show that the employment available locally trails the number of local residents who work in those industry sectors. The exceptions are in construction, wholesale trade, real estate, and waste management where the local employment exceeds the number of local residents who work in those sectors. Industries in which residents work that are relatively unavailable in North Plains are manufacturing, professional occupations, health care, retail, and tourism. As we've seen, it is most common for workers to commute to employment outside of the city, in part because in many industry sectors local employment is unavailable closer to home.

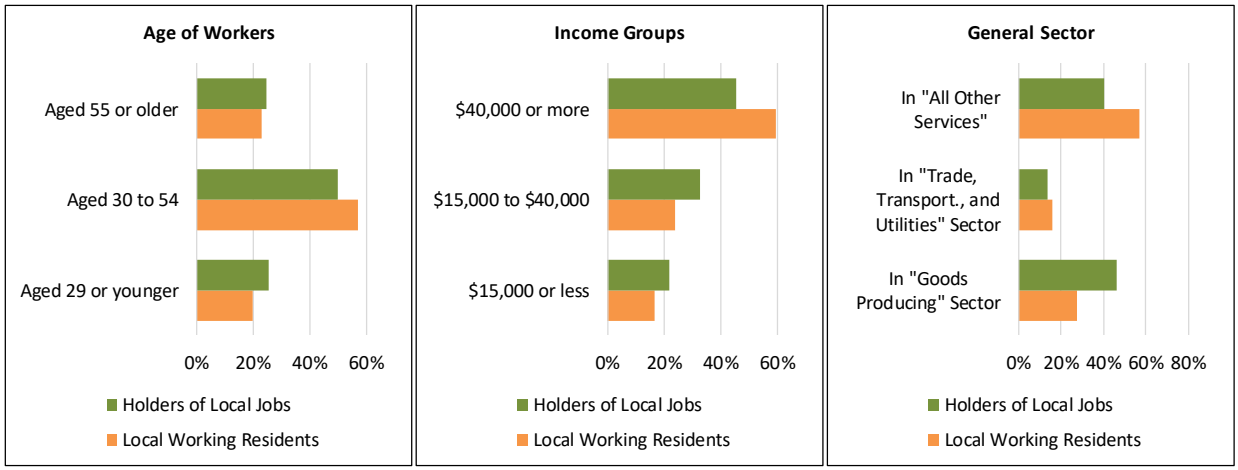
FIGURE 3.17: COMPARISON OF NUMBER OF LOCAL JOBS TO LOCAL WORKFORCE, BY INDUSTRY



SOURCE: Census Bureau, LEHD Data, Oregon Employment Department

The characteristics of the workforce commuting into and out of North Plains were similar in terms of incomes and age (Figure 3.18). Working North Plains residents are slightly more likely to be 30 years or older, and more likely to earn more than $40,000. (These are the broad categories provided by this Census data set.)

FIGURE 3.18: NET INFLOW-OUTFLOW DETAIL, CITY OF NORTH PLAINS AND WASHINGTON COUNTY, 2019



SOURCE: Census Bureau, LEHD Data

Jobs-to-Worker Ratio: There are an estimated 1,150 total local jobs (covered and non-covered[4]), and 1,730 working North Plains residents. This indicates *a ratio of 0.65 local jobs for each local working resident.* Or stated conversely, there are 1.5 local workers for each available local job. This indicates that to achieve a jobs-to-worker balance of one-to-one in the community today, there is a ***current deficit*** of roughly 580 jobs in North Plains. However, *eliminating that deficit will require providing new local jobs for residents who commute to work outside of the city*, jobs that are at least similar or comparable in type and salary to the jobs they currently hold elsewhere.

Jobs-to-Household Ratio: North Plains has an estimated 1,075 households, indicating a jobs-to-household ratio of 1.1 jobs per household, or roughly one job per household. However, in North Plains, each household has an average of 1.6 working members.

POPULATION AND WORKFORCE

The City of North Plains has an estimated population of 3,360 as of 2020 according to the PSU Population Research Center (Figure 3.19).

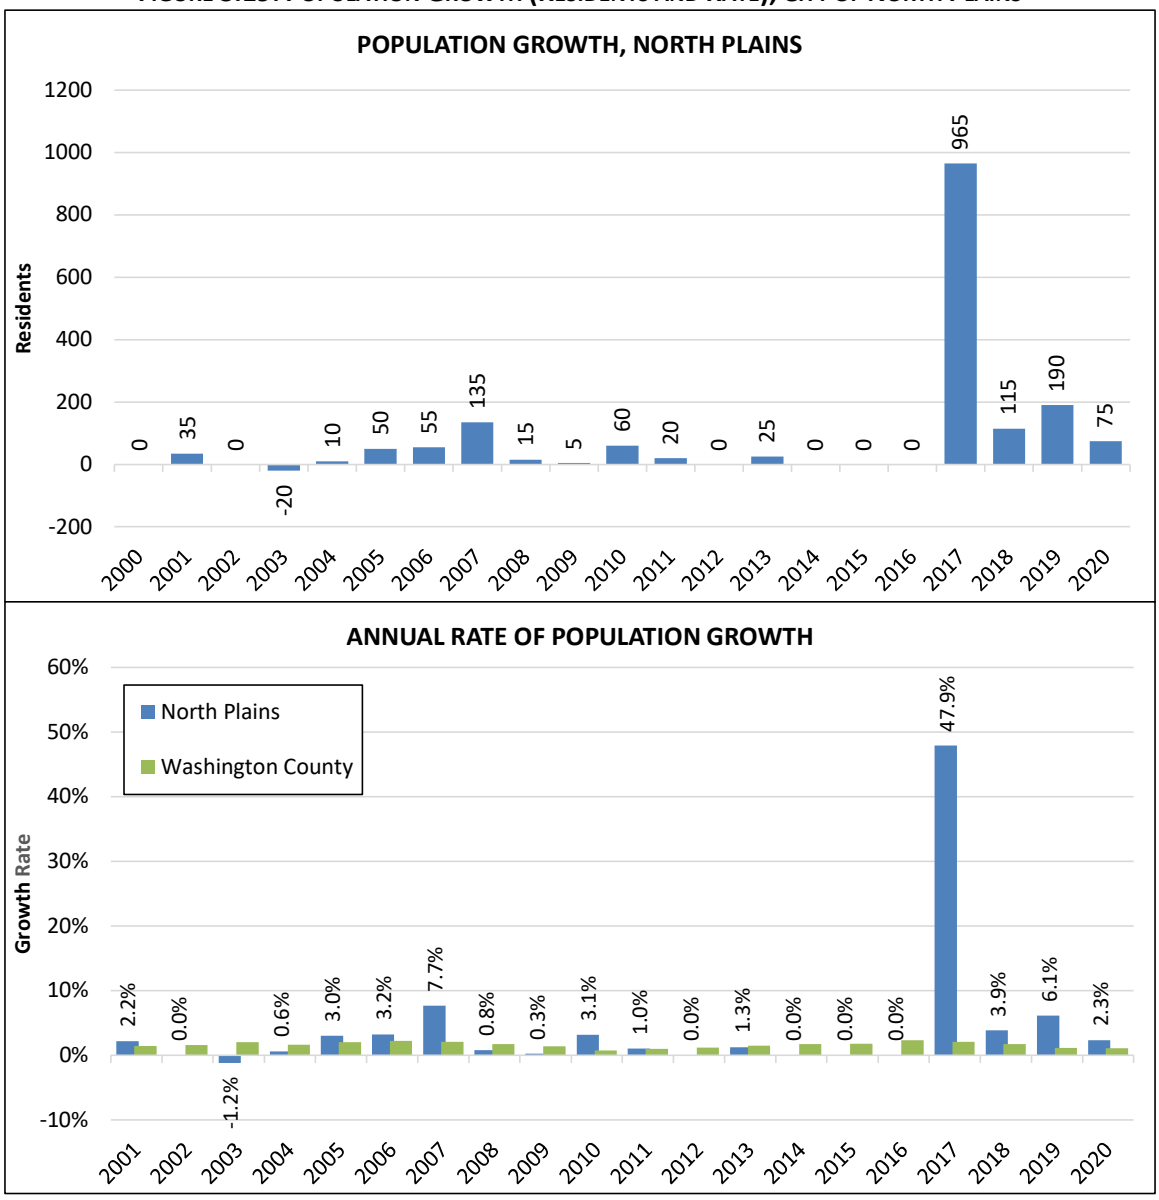
Population growth as tracked by PSU is very irregular year-to-year which is attributable to a reporting error that undercounted population growth for many years. The mistake was corrected in the 2017 estimate showing a jump in population of over 900 residents in one year, that was in fact spread over many years. Therefore, the data presented in Figure 3.19 is greatly distorted.

Comparing decennial Census estimates provides more reliable picture of population growth. Since 2000, North Plains has grown by an estimated 107% from 1,625 residents to 3,360 over two decades. This is an annual average growth of 87 residents or 4% per year. The state and county experienced annual growth of 1.1% and 1.7% respectively, over this period.

[4] The methodology to calculate total 2021 employment, including covered and non-covered employment is outlined in Section VI.

However, most of this growth has occurred over the last decade. The Census estimates North Plains grew 75% between 2010 and 2020. The city grew at nearly 6% per year, adding an average of 147 new residents each year.

FIGURE 3.19: POPULATION GROWTH (RESIDENTS AND RATE), CITY OF NORTH PLAINS



SOURCE: Population Research Center, Portland State University

The educational attainment level of residents in the City of North Plains varies from the statewide pattern, with a higher level of city residents having bachelor's or advanced degrees. Of an estimated 1,975 persons 25 years or older in the City of North Plains, an estimated 47% have an associate degree or higher. This compares to a 42% rate for Oregon. This represents a likely competitive advantage for the city, as an educated population attracts employers, retail and services, and other economic activity.

This also suggests that more highly educated City residents will seek local work opportunities that are commensurate with their education levels, training and/or experience: jobs that currently do not exist in North Plains. The lack of such available jobs helps explain why a considerable number of City residents work elsewhere in the County.

Working with community colleges and other partners on on-going education, workforce development and distance learning opportunities may also be an important part of a local economic development strategy to train segments of the workforce with lower educational attainment in the skills that local industries need.

FIGURE 3.20: EDUCATIONAL ATTAINMENT PROFILE, 2019
(POPULATION 25 YEARS AND OLDER)

	North Plains		State of Oregon

IV. COMMUNITY ECONOMIC DEVELOPMENT POTENTIAL

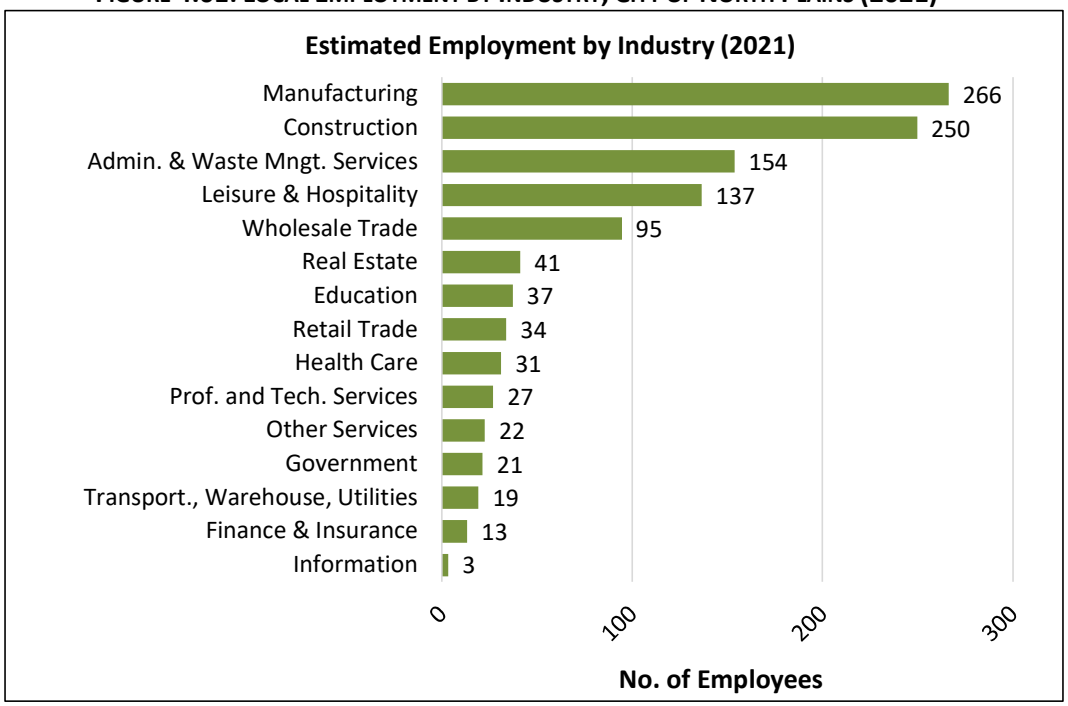
This Economic Opportunities Analysis presents a profile of current employment and employers in North Plains, and the community's economic development advantages.

LOCAL EMPLOYMENT SNAPSHOT

North Plains features an estimated 1,150 jobs within its corporate boundaries as of 2021. The distribution of current industrial employment is indicative of past and present trends, but as discussed in this report, does not necessarily form a good match with the city's current working population, or the City's economic development goals for its future.

The following table presents the North Plains major industry sectors and estimated number of employees. This reflects current employment patterns, but not necessarily future employment patterns.

FIGURE 4.01: LOCAL EMPLOYMENT BY INDUSTRY, CITY OF NORTH PLAINS (2021)



Source: Johnson Economics, Oregon Employment Department, BEA

Figure 4.02 presents the past growth in employment in North Plains by major industry sector since 2010 according to QCEW data provided by the Oregon Employment Department. Since 2010, the greatest employment growth was seen in the waste management, manufacturing, and wholesale trade industries. Many other sectors experienced falling employment over this period, led by the government and construction sectors.

FIGURE 4.02: EMPLOYMENT BY INDUSTRY, PRIVATE SECTOR, NORTH PLAINS (2010 - 2021)

Major Industry Sector (Private)	QCEW Employment		Employment Growth '10-'21	
	2010 Employment	2021 Employment	New Jobs	% Growth

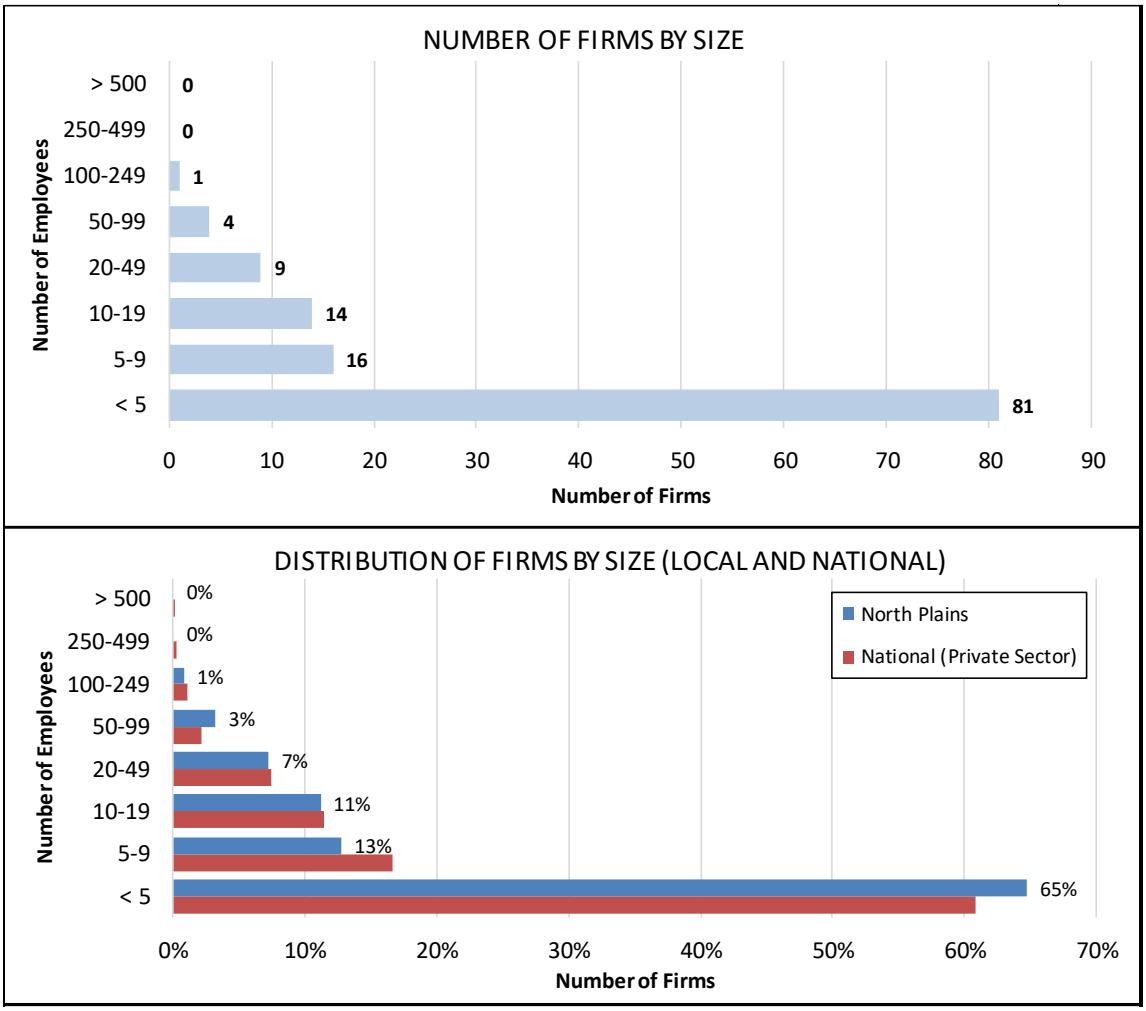
CHARACTERISTICS OF LOCAL FIRMS

The local employment base is largely dominated by small employers of fewer than five employees (65% of firms), which is a common pattern across many markets (see Figure 4.03, following page). There is one employer of over 100 or more employees, and 4 with between 50 and 100 employees. Compared to national averages, North Plains has a slightly larger share of firms with fewer than five employees, and slightly smaller share of firms with 5 to 9 employees.

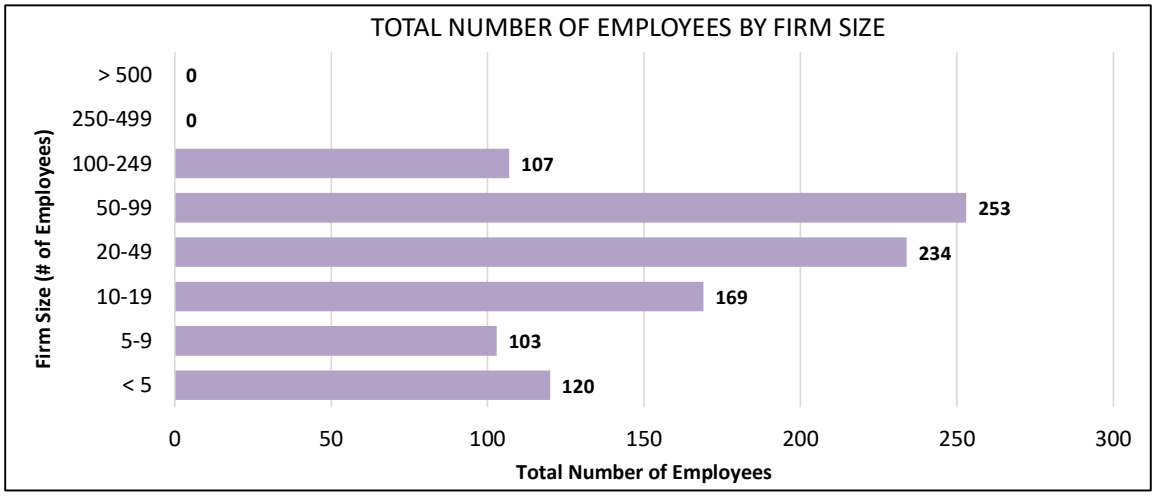
Figure 4.04 (following page) presents *the estimated number of employees* in the firms within the different size categories. While there are relatively few larger employers, they still represent a significant share of overall employment due to their high number of employees.

FIGURE 4.03: DISTRIBUTION OF CURRENT FIRMS BY SIZE, NORTH PLAINS OREGON



Source: Oregon Employment Department

FIGURE 4.04: DISTRIBUTION OF EMPLOYEES BY FIRM SIZE, NORTH PLAINS OREGON



Source: Johnson Economics, Oregon Employment Department

NORTH PLAINS: STRENGTHS, WEAKNESSES, OPPORTUNITIES, AND THREATS

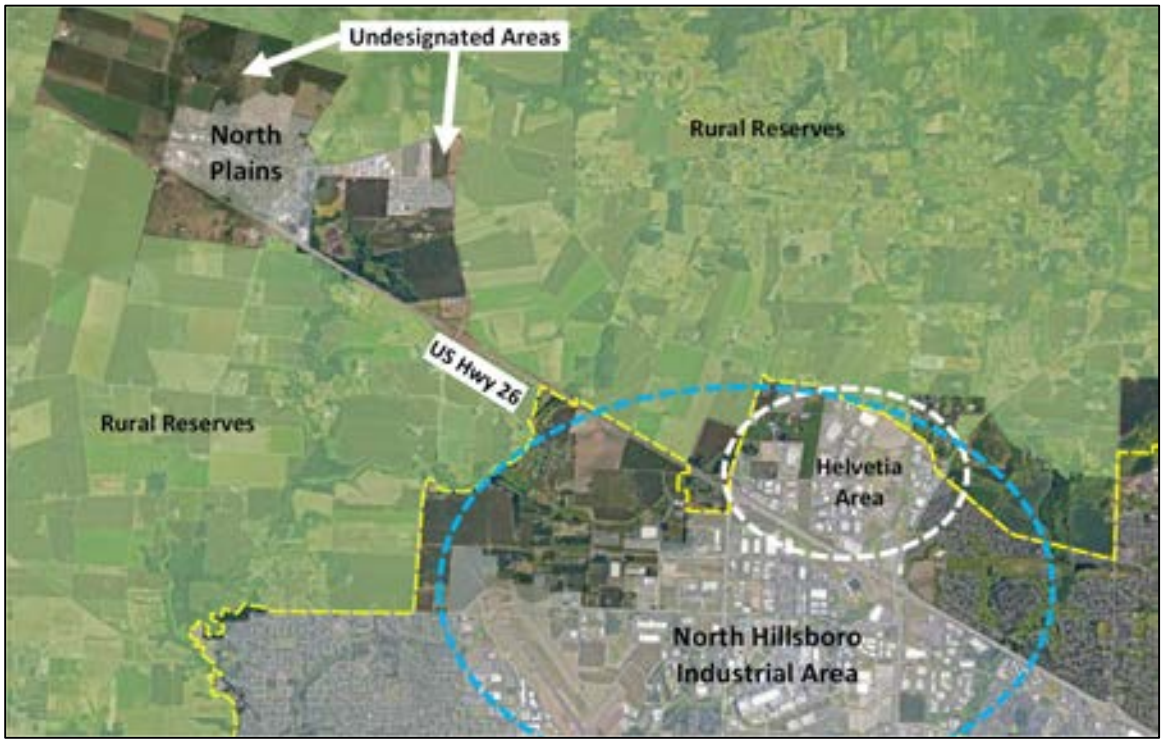
Based on this analysis and input from North Plains stakeholders, and real estate, industry, and site selection specialists the following are the City's economic development strengths, weaknesses, and opportunities.

STRENGTHS

Land need and opportunity findings of the Oregon Semiconductor Competitiveness Task Force underscore the unique strengths of the City of North Plains as part of the future of Oregon's semiconductor and supply chain industry by virtue of proximity to the existing industry cluster, direct transportation access to Highway 26 from North Plains, and being within the Silicon Forest job shed and a growing bedroom community of tech industry workers, among others. A summary of those findings can be found in Appendix D of this EOA.

- **Proximity to Oregon's largest and growing employment centers:** North Plains is located very close to existing high-tech "Silicon Forest" companies in western Washington County. The area is home to a large cluster_of_semi-conductor and advanced manufacturing companies, as well as supporting suppliers, parts manufacturers, packing companies, and other industrial employers. The area is also home to an emerging large data centers cluster. These industry clusters have continued to grow quickly over the past two decades with some of the largest, highest-paying, most advanced employers in Oregon. Demand for more suitable and readily available large, mid-size and smaller sites for such companies continues throughout the region and, especially in the western Washington County industrial areas 'next door" to North Plains. This area continues to be one of the state's largest economic engines and the prime location for large, emerging and, modern industrial companies.
- **The western Washington County "Path of Growth"**: North Plains is located roughly four miles, or a few-minutes' drive from the North Hillsboro industrial area where available parcels of land rapidly develop once they're served by infrastructure. That location puts it in the westerly growth path of these industrial clusters. As existing industrial land supply is built out or is constrained by a variety of regulatory or rural residential property ownership challenges, new employers seeking sites in this cluster will reasonably look to available industrial sites in North Plains as demonstrated by recent industrial inquiries made to the City.

FIGURE 4.05: "PATH OF GROWTH" WEST WASHINGTON COUNTY INDUSTRIAL ENVIRONS



Source: Johnson Economics, Metro RLIS

- **Transportation access via U.S. Route 26.** North Plains' direct access to US Highway 26 via the Glencoe Road and Evergreen Road Interchanges, and a potential third Interchange at Dersham Road, will connect its industrial companies directly to the state's highway network, provide quick access to the Silicon Forest companies, and reasonably quick access to Beaverton and central Portland. The broader I-5 corridor and Willamette Valley are accessible via multiple routes from US 26. The location also makes North Plains a gateway to the Oregon Coast. The Hillsboro Airport is located roughly 7 miles to the southeast, while the PDX is an estimated 30-to-45-minute drive from North Plains in low traffic.
- **Relatively affordable housing**. In comparison with nearby cities, North Plains' real estate market is relatively affordable. North Plains has a supply of new housing from recent development that helps to meet the demand from more constrained cities nearby. Available, quality housing for employees is a competitive advantage for recruiting businesses.
- **Agriculture**. North Plains is located in an agricultural region, with a diverse offering of agricultural products including fruits, wheat, wine, and nursery plants. The nearby agricultural activity as well as such activities throughout the extensive, protected farmland within Washington County's Rural Reserves designated areas provide inputs for locally produced food and beverage products.
- **High quality of life.** North Plains' accessible size and proximity to rural areas and outdoor recreation activities make it a desirable place to live. The city's size and setting distinguish it from communities in the combined Metro UGB nearby and will appeal to a subset of employers and workers.

WEAKNESSES

- **Lack of local commercial services.** North Plains has lacked a full-service grocery store and some other types of retail services that are needed to accommodate the convenience retail and business services needs of it rapidly growing population and expanding residential neighborhoods. North Plains residents must go elsewhere for regular shopping for many daily needs. However, there is a current initiative that will likely bring a grocer and additional retail to the city, which makes this also a key opportunity for near-term improvement (see below).
- **Fiscal constraints and lower level of public services.** North Plains has only recently undergone dramatic population growth for its size and the City is trending towards bedroom community status until it can pay for higher levels of services common to other competitive communities.
- **Car-centric transportation options.** Lack of sidewalks in some parts of downtown make North Plains less friendly to pedestrians. Transit options are limited but being explored contingent upon the addition of higher-density housing and population.
- **Limited commercial space or professional office space.** North Plains' business district has relatively little commercial or professional office space. The lack of suitable space makes it difficult to attract these types of businesses. Additional sites and developed commercial real estate will likely be necessary to expand sectors that use modern commercial service or office space.
- **Distance and access to I-5.** Although North Plains has excellent automotive access through U.S. Route 26, it is relatively far from I-5. This makes North Plains less competitive in attracting businesses that rely on trucking or access to major markets along I-5. North Plains is also somewhat remote from Portland International Airport. However, it shares these disadvantages with the North Hillsboro area which has been very successful in attracting large new high-wage businesses that rely on air shipment of goods and travel.
- **No Enterprise Zones.** North Plains does not utilize enterprise zone tax exemptions in its industrial areas. Until a zone is established, the City is at a competitive disadvantage for attracting businesses that purchase expensive equipment with rapid depreciation and quick replacement.
- **Electronic Commerce City.** The City of North Plains is the State of Oregon's only "E-Commerce City." The E-Commerce Zone designation this grants to the entire City and land within its UGB functions very similarly to a traditional Enterprise Zone incentive managed by the Oregon Business Development Department. As such, employers within the City of North Plains that conduct sufficient business activity strictly on-line have the ability to qualify for property tax incentives for qualifying investments such as equipment and internet infrastructure analogous to the benefits of a traditional Enterprise Zone.

OPPORTUNITIES

- **Improve services for residents**. Currently, the City's urban renewal district will incentivize development of a full-service grocery store in its commercial core, along with additional retail and service space for urgent care services. With annual population growth of nearly 6%, or 150 new residents per year, between 2010 and 2020, the number and types of businesses the community can support with local spending power continues to grow quickly (Census).
- **Attract high-tech and manufacturing employment.** As described above, North Plains' proximity to the nearby high-tech industry cluster in western Washington County places the city in a strong, suitable position to attract diverse, large, and high-wage technology firms and related supporting businesses

should suitable sites for such firms be available. Attracting such export-based industries and businesses that support them is a primary focus of the City's economic development goals because of their significant family-wage jobs and capacity to help improve the City's fiscal ability to provide residents and businesses a full array of municipal services.

- **Expand agricultural businesses.** North Plains' agriculture-related businesses could be a target industry for the city. In particular, North Plains could focus on expanding production and processing of local food and beverage products with specialty brands and promote agri-tourism. North Plains also has opportunities to develop manufacturing of cannabis products, such as oils or edible products.
- **(Re)develop vacant buildings and land.** North Plains' supply of vacant land and affordable real estate prices offer marginal opportunities for redevelopment, particularly in commercial areas. Like many other cities in the County, parcelization, ownership patterns and other constraining redevelopment issues limit the scale and/or suitability of such opportunities.

THREATS

- **National economic cycles.** North Plains, like all other cities, is subject to national and regional economic cycles. As of the time of this analysis, post-2020 pandemic shocks to the global supply chain and shortage of certain inputs continues although their_negative effects are expected to be transitory relative to the long-term perspective of this EOA analysis.
- **Loss of agricultural lands.** The Oregon Legislature's enactment of HB 4027 (2012) designated farmland to the north, east and west of North Plains as "undesignated" land, and land beyond that area as "Rural Reserves" that are protected from urban development for 50 years after designation. The Undesignated Lands are not subject to such long-term urban development prohibition thereby allowing North Plains to grow into such areas provided all pertinent State, County and North Plains land use requirements and processes are met.
- **Highway 26 Capacity Constraints:** While the Interchanges at Glencoe and Jackson School Roads may soon experience capacity issues due to usage by urban and farming traffic generated throughout West Washington County, their locations and design were intended to provide US 26 access to existing and future urban uses in North Plains. Interchanges "capacity-sharing" matters will need to be addressed during the City's UGB employment land expansion review process. In addition, providing potential trip capacities at the Mountaindale/Dersham Road Interchange to serve North Plains and other westerly communities and farming activities as well as creating a new interchange at the Gordon Road are future, long-term options that may merit consideration by ODOT and Washington County.

NORTH PLAINS: COMPETITIVE ADVANTAGES

In part, the following discussion addresses an EOA "community assessment" location and infrastructure consideration requirements set forth in OAR 660-009-0015(4) re: North Plain's advantages and disadvantages to attract and accommodate the targeted industrial uses within a proposed UGB industrial expansion planning area.

Economic development opportunities in North Plains will be impacted by local conditions as well as the national and state economic conditions addressed above, and more immediately by semiconductor and supply chain industry reshoring and growth encouraged by the CHIPS Act and focused by the Oregon Semiconductor Competitiveness Task Force findings and actions. Economic conditions in North Plains relative to these conditions in other portions of western Washington County and the region form North Plains' competitive advantage for economic development. North Plains' competitive advantages have implications for the types of firms most likely to locate and expand in the area.

There is little that metropolitan area jurisdictions can do to influence national and state conditions that affect economic development, though they can influence local factors. North Plains' primary competitive advantages are: well-educated, skilled and trained labor-force residents, government simplicity[5], path of growth, potential availability and cost of land, location, transportation access, and quality of life. These factors make North Plains attractive to residents and businesses that want to be part of the regional economic ecosystem around the Portland metro, but value the accessible size, available housing, and more rural setting. The following items describe certain City advantages relating to specific items in 600-009-0015(4) (a-h):

LOCATION

North Plains is a city with a population of approximately 3,450 people as of 2021 (PSU), located in western Washington County to the north of Forest Grove and Hillsboro. U.S. Route 26 runs along the southern boundary of North Plains. North Plains' location will impact the area's future economic development:

- North Plains is located within Washington County, the second-most populated county in the State, with roughly 605,000 residents in 2021. North Plains is located about 5 miles from Hillsboro, 14 miles from Beaverton, and 18 miles from Portland. Hillsboro, Beaverton, and Portland were the 5th, 7th, and 1st most populous cities in the state respectively. (ref: 660-009-0015(4)(a), (d) and (e))
- The Hillsboro-Beaverton area is the heart of the "Silicon Forest," the nickname for the cluster of high-tech companies in the Portland region. Most notably, Intel has major production and research facilities in Hillsboro. Intel reports more than 21,000 employees in Washington County, paying high average wages.
- Located near the foothills of the Coast Range, North Plains has access to outdoor recreational activities, including biking, fishing, and hiking. The award-winning Pumpkin Ridge Golf Club is located just outside North Plains city limits.
- Residents of North Plains have access to cultural activities and amenities such as the Elephant Garlic Festival and summer farmers' market. Nearby events include the Northwest String Summit, Helvetia Culture Fest, and the Dixie Mountain Strawberry Festival.

5 As a relatively small city outside the Portland Metro Region, the applicable UGB expansion process for North Plains does not include review and approval of its UGB expansion under Regional Government UGB planning policies, requirements, and procedures, consistent with the Legislative intent to streamline UGB expansion procedures applicable to small Oregon cities in ORS 197A.

North Plains' rural setting and proximity to larger cities in the region such as Hillsboro and Portland are primary competitive advantages for economic development in North Plains. (ref: 660-009-0015(4) (a), (d) (e) and (f)) The community is located on the far western edge of the urbanized metropolitan region, which will be a disadvantage to firms seeking a more central location but will not dissuade many other firms.

TRANSPORTATION ACCESS (REF: 660-009-0015(4)(B))

All firms are heavily dependent upon surface transportation for efficient movement of goods, customers, and workers. Access to an adequate highway and arterial roadway network is needed for all industries. Close proximity to a highway or arterial roadway is critical for firms that generate a large volume of truck or auto trips, rely on visibility from passing traffic to help generate business, and recruit employees from a broad labor market.

North Plains has good access to the State's highway system and other transportation opportunities. The Sunset Highway (U.S. Route 26) is the primary route past the city, connecting local businesses to employees, and residents to other cities in the region for employment, shopping and services. In light traffic, I-5 is about a 20-minute drive from North Plains via either central Portland or Route 217. However, traffic typically causes delays during peak times. North Plains is roughly 5 minutes via the highway from North Hillsboro, which is one of the state's largest and most dense concentration of high-wage employment.

Highway access is a major competitive differentiator between North Plains and other communities to the west of Hillsboro in western Washington Counties, such as Cornelius, Forest Grove, or Banks. While those communities each feature their own strengths, highway access is a key advantage for North Plains.

North Plains features two nearby highway interchanges, one at NW Glencoe Road in North Plains, and one two miles to the west at NW Dersham Road. The Dersham Rd. interchange is roughly a mile to the west of the current city boundary but is likely to provide an important access point in the future as the city grows and the Glencoe Rd. exit reaches traffic capacity. Another access point is the interchange at NW Jackson School Road located roughly two miles to the east of the city.

In a May 2022 meeting ODOT staff, who administer the State Transportation Planning Rule (TPR), NP UGB staff and consultants were preliminarily advised that on- and off-ramp mitigation improvements to the Jackson School Road Interchange and/or improvements to the Dersham Road Interchange would likely be required if NP UGB industrial expansion developments "significantly affects" the Interchanges' peak-travel and volume/capacity performance. It's anticipated that such mitigation improvements costs would be addressed and allocated in various land use planning/development funding mechanism tools such as conditions of approval, development agreements, memos of understanding. In addition, the City would capitalize on allowed "partial mitigation" cost offset opportunities provided by the TPR should targeted UGB industrial expansion developments "create direct benefits re: industrial or traded-sectors jobs" and are limited to such jobs.

US 26 is also the fastest route from Portland to the Oregon Coast. Residents and businesses in North Plains have access to other modes of transportation from the nearby Metro cities, including regional bus and light rail service and Amtrak rail service. The closest commercial airport is Portland International Airport (45 minutes away).

Ride Connection runs a free weekday bus that connects North Plains to the Hillsboro Transit Center, Banks, and Forest Grove. From the Hillsboro Transit Center, transit riders can connect to other TriMet routes including MAX light rail.

PUBLIC FACILITIES AND SERVICES

Provision of public facilities and services can impact a firm's decision regarding location within a region. Stakeholders have confirmed that businesses make locational decisions primarily based on factors that are similar across a subarea or region. These factors include the availability and cost of labor, transportation, raw materials, capital, and amenities. The availability and cost of these production factors are usually similar within a region. The discussions re: transportation access, power, water, wastewater in this EOA section address public infrastructure and services considerations under 660-009-0015(4) (c).

Once a business has chosen to locate within a region, they may consider the factors that vary more across localities: tax rates, the cost and quality of public services, and regulatory policies. Economists generally agree that these factors do affect economic development, but the effects on economic development are modest. Thus, most of the strategies available to local governments have only a modest effect on the level and type of economic development in the community.

TAX RATES

North Plains has among the lowest property tax rates in Washington County.[6] Property tax rates in North Plains for the tax year ending 2021 were $$15.37 per $1,000 of assessed value, compared with $17.65 for Banks, $16.62-$17.19 for Forest Grove, and $16.47-$19.56 for Hillsboro. The City permanent rate is $2.17 per $1,000, which is among the lowest in the area, and the City does not have any optional levies.

POWER

PGE is the provider of power in North Plains and is an attractive supplier for major industries. The relatively affordable cost and use of renewable sources such as wind and hydroelectric generation are attractive to large industrial users for whom reliable, high-capacity power is essential. These firms also often strive to meet corporate environmental goals through renewable energy. Power is one of the major inputs for data centers as well as advanced manufacturers.

WATER

North Plains purchases water from the Joint Water Commission, which is the primary drinking water supplier in Washington County. The Joint Water Commission is jointly owned by the City of Hillsboro, the City of Forest Grove, the City of Beaverton, and the Tualatin Valley Water District.[7] North Plains' water distribution system consists of roughly 13.5 miles of water lines. The City Department of Public Works operates and maintains the water distribution system.

An existing Water Supply/Delivery Agreement with a Joint Water Commission assures the City water delivery by the Commission as follows:
2020: Maximum Daily Demand – 1.2 mgd.

[6] League of Oregon Cities, City Property Tax Report, March 2016. Retrieved from: http://www.orcities.org/Portals/17/Library/City%20Property%20Tax%20Report%202016.pdf

[7] Joint Water Commission. Retrieved from: http://jwcwater.org/

2025: Maximum Daily Demand – 1.5 mgd.
2030: Maximum Daily Demand – 2.0 mgd.
2035: Maximum Daily Demand – 2.5 mgd.

Under a "Obligation to Supply Water" provision, the Agreement requires the City to maintain a Water Master Plan that describes "projections on population growth, number and types of customer connections, and water demand". It's anticipated that approved NP UGB expansions will require a Master Plan update followed by negotiated Agreement volume adjustments to the above-cited water delivery schedule.
Water rates in North Plains are currently higher than in other cities because in 2005 the City took out debt to in order to connect its water mains to the Joint Water Commission transmission main.[8] It is anticipated that approval of NP's UGB industrial expansion and subsequent development of the types of preferred new and expanding tech-based and supporting industries and businesses NP wishes to attract and accommodate (see. EOA p. 6, above) will direct their water supply and delivery costs directly to those businesses.

WASTEWATER

Wastewater treatment services for North Plains are provided by Clean Water Services, which is the regional wastewater management provider for urban Washington County.[9] By 2025, Clean Water Services anticipates that more than 675,000 people will live in its service area, and the agency is planning for that population growth.[10] Wastewater service is not likely to be a constraint on economic growth in North Plains.

INDUSTRIAL AND COMMERCIAL REAL ESTATE PRICES

Commercial and industrial space and land in North Plains is less expensive than land in Hillsboro, or Beaverton. Data from CoStar indicate that the market rate lease rate for commercial space in North Plains is roughly 30% lower than in those larger neighboring cities. The estimated average industrial space lease rate is lower than in Hillsboro and Beaverton. These differences in achievable lease rates are capitalized in achievable land prices. Industrial land in particular offer a competitive price advantage to land in Hillsboro while being very nearby. Commercial land value will be more closely tied to the support for specific goods and services in the local market, as retail and commercial services are locale-dependent, and sites are not substitutable across a broader area.

QUALITY OF LIFE

North Plains' quality of life is a key comparative advantage for economic development. Key quality of life factors in North Plains are:

- **Scenic setting within proximity to metro area**. North Plains has an accessible, livable scale within a scenic rural setting. North Plains is surrounded by farmland and is close to the foothills of the Coast Range, with nearby access to nature and recreation.

[8] City of North Plains. "Water". Retrieved from: http://cityofnp.org/index.php/departments/public-works/water/

[9] Clean Water Services. "Utility Billing." Retrieved from: http://www.cleanwaterservices.org/for-residents/utility-billing/

[10] Clean Water Services. "2016-2020 Capital Improvement Program." Retrieved from: https://www.cleanwaterservices.org/media/1293/capital-improvements-program-2016-2020.pdf

- **Growing housing options**. North Plains has experienced steady homebuilding that offers new neighborhoods of hundreds of homes in a county where home building has struggled to keep pace with demand. An attractive residential community for employees is an attractor for firms.
- **Cultural amenities and events.** Residents of North Plains have access to cultural amenities and activities in the city and elsewhere in western Washington County and the Portland region. Each August, North Plains hosts the Annual Elephant Garlic Festival. North Plains also has a weekly farmers market during the summer. Nearby cultural events include: Northwest String Summit at Hornings Hideout, Dixie Mountain Strawberry Festival, and Helvetia Culture Fest. In addition, North Plains residents can access the cultural amenities and events in the greater Portland region.
- **Outdoor recreational activities.** There are a number of outdoor recreational activities available near North Plains, including: biking, hiking, and fishing. North Plains is close to the Banks-Vernonia Trail, a 21-mile multiuse path. The Willamette Valley Soaring Club operates a glider port just outside of North Plains. The nearby Pumpkin Ridge Golf Club has been ranked as one of the country's best public golf courses.
- **Direct auto access to larger cities in the Portland region.** North Plains' proximity to Hillsboro, Beaverton, and Portland gives its residents access to the activities, amenities, markets, and jobs in these larger cities.

North Plains' quality of life makes the city attractive to in-migrants and businesses that are attracted to a livable atmosphere but value proximity to the larger cities of western Washington County and the Portland region.

ECONOMIC DEVELOPMENT AND REAL ESTATE - EXPERT OBSERVATIONS

City staff and consulting staff held discussions with a sample of experts in the regional economy, including economic development agency professionals, industrial real estate brokers, corporate site selection professionals, and neighboring city officials. The following is a summary of Stakeholders' comments that have informed the ensuing analysis, and the various report sections:

- Businesses are seeking industrial land locations all along the I-5 corridor from Portland to Eugene. They are willing to consider the whole Portland region, and most of the Willamette Valley, up to 30 miles to either side of the freeway.
- Western Washington County is its own submarket within the state and metro area. The Silicon Forest attracts companies that want the workforce, power, land and livability but less dependent on the immediate freeway access.
- Washington Co. is running out of industrial land. The price of industrial land in the area has doubled in the last four years and is still climbing. If infrastructure can be supplied within 24 months, land is basically considered development ready.
- Businesses identified by the stakeholders as potential "spillover" from the north Hillsboro area or broader western Washington County include:
  - Semi-conductor supply chain and support businesses (small-to-midsize firms).
  - Modern distribution and fulfillment businesses serving Washington County.
  - High tech advanced manufacturing (on mid- to large sites).

- Data centers, likely co-location, not enterprise, facilities (on mid- to large sites).
- Specialty food and beverage processing.
- Green energy businesses, including energy storage, batteries.

- As recently as five years ago, most business recruitment inquiries were for professional office development sites. Now roughly 80% of inquiries are from industrial and distribution users.
- Data centers are a continuing major source of interest in west Washington County. PGE can offer ample, low-cost power from renewable sources. Data centers will continue to seek large sites if available and can be served by sufficient power, data lines, and water. Lack of sales tax and other tax incentives are also attractive due to large scale of equipment investments.
- Some locations in North Plains will be better suited for employment uses than residential uses. Land near the highway will make the best industrial sites due to access and ability to coexist with the externalities of the highway. Residential uses might be better suited to locations farther from the highway.
- The sweet spot for industrial land demand is for sites between roughly 5 - 20 acres in size. Based on recent data center site selector inquiries made to the City, North Plains should seek and preserve at least two (2) 100-acres sites. Those big users come along less often, but they are out there. In North Hillsboro, areas that come available with 10-to 20-acre industrial parcels get snapped up as they become ready therefore, North Plains UGB expansion to attract and accommodate such smaller industrial uses would address the 660-024-0040(5) and 660-009-0025(3) requirements to "*include a determination of the need for a short-term supply of land for employment uses".*
- The region needs to maintain an available supply of large sites: sites that can be available and development ready for large uses such as large tech-based uses and larger data centers as well as sites that can be divided or sectioned off as the market dictates. In response to a key City priorities, North Plains needs and wants to be able to offer such large intact as well as divisible sites in its potential UGB expansion areas to readily capture both frequent demands for smaller (5-20 acres) sites and the occasional demand for large sites in west Washington County. Firms and business park developers can create the spaces the market demands.
- For marketing to prospective businesses, important factors are the availability of land that is readily served by infrastructure, lower land cost and power cost, and proximity to the "Silicon Forest." Quality of life and lower cost of housing are also differentiators. Western Washington County communities are in play for manufacturers and suppliers as long as sites are available.
- The region doesn't compete for the cheapest manufacturing; it competes for higher-value, higher-wage industries with such competitive advantages as a young and relatively educated workforce, lower costs relative to other West Coast metros, location at power and data nodes, and decent transportation connections.

V. TARGET INDUSTRIES

The "target industries" approach to identifying and pursuing UGB employment expansion land needs is recognized by DLCD as a methodology to ensure that local economic development priorities are reflected in land need estimates beyond a purely numbers-driven growth rate approach.[11] This EOA applies that approach to determine the number and types of land and sites needed to attract and accommodate:

- Targeted large-sites (50-100 acres) industrial users (which have typically been tech-based and export-based businesses in West Washington County) over the 20-year UGB planning horizon; and,

- Targeted mid-size (20-50 acres) and smaller-sites (5-20 acres) industrial users to provide a short-term land supply required by Goals 9 and 14.

This approach eschews the use of population growth forecasts to determine **industrial land need** for both planning time frames. However, North Plains population growth forecasts described in this EOA underpin the land need estimate for **commercial land** cited in this EOA.

The preceding analysis discusses the city's competitive advantages to attract a range of new large, mid-size and smaller employers in targeted industries of the types already existing in West Washington County to employment lands in North Plains. The following discussion addresses two main issues: (1) Which industries are most likely to grow in Washington County, and be attracted to North Plains? and (2) Which industries best meet North Plains economic development priorities?

For the City's future commercial land need estimates (Section VI), this EOA relies on a combination of the latest Oregon Employment Department industry-specific growth forecasts and PSU population growth forecast, adjusted to reflect the specific site needs of the target industries discussed here.

It should also be noted that the targeted industries approach to North Plains economic opportunity is consistent with and supported by the Oregon Semiconductor Competitiveness Task Force land and site need findings, a summary of which can be found in Appendix D. Semiconductor manufacturing and supply chain, and their resulting land need, were identified in the original February 2022 City of North Plains Economic Opportunities Analysis. The Oregon Task Force findings both reinforce City targeted industries planning with significant additional, independent verification of industry needs as well as put a rapid acceleration on those semiconductor-related land needs compared to a full twenty-year build-out period originally anticipated.

---

11 See. *1000 Friends of Oregon v. LCDC and City of Woodburn*, 260 Or App 444, 447-448 (2014):

> "[T]he target-industries approach considers a local government's employment-growth projections and goals for employment and establishes a framework for attracting the kind of employers that could reasonably be expected to support the kind and amount of employment growth to which the local government aspires. Given the site needs of those particular employers, the local government identifies potentially available land both within and outside its UGB and selects a group of sites and an amount of land that it believes will accommodate the employers that it seeks to attract. The target-industries approach differs from an 'employees-per-acre approach under which a local government simply projects employment growth and divides that growth by a statistically accepted number of employees per acre of land in order to arrive at the number of acres needed to support employment growth."

PROJECTED EMPLOYMENT GROWTH (REGIONAL)

As noted in Section III, the State of Oregon produces employment forecasts by sector within sub-regions, which groups Washington County with Multnomah and Clackamas Counties into the broader Metro area. This forecast is represented here for reference (Figure 5.01).

*Within the entire Metro area, a*ll industry sectors are forecast to *grow* over the next decade. Those sectors forecasted to grow at an above average rate are professional services, and education and health services. The health care sector is projected to continue growing with the aging of the population. Other strong sectors are transportation, warehousing, and information, reflecting the continuing growth of internet business, data centers, software, and remote shopping. Tourism is projected to experience the fastest growth reflecting low baseline of the 2020 pandemic year. On an absolute basis, the greatest number of new jobs are forecasted in tourism-related industries, professional services, and education and health services.

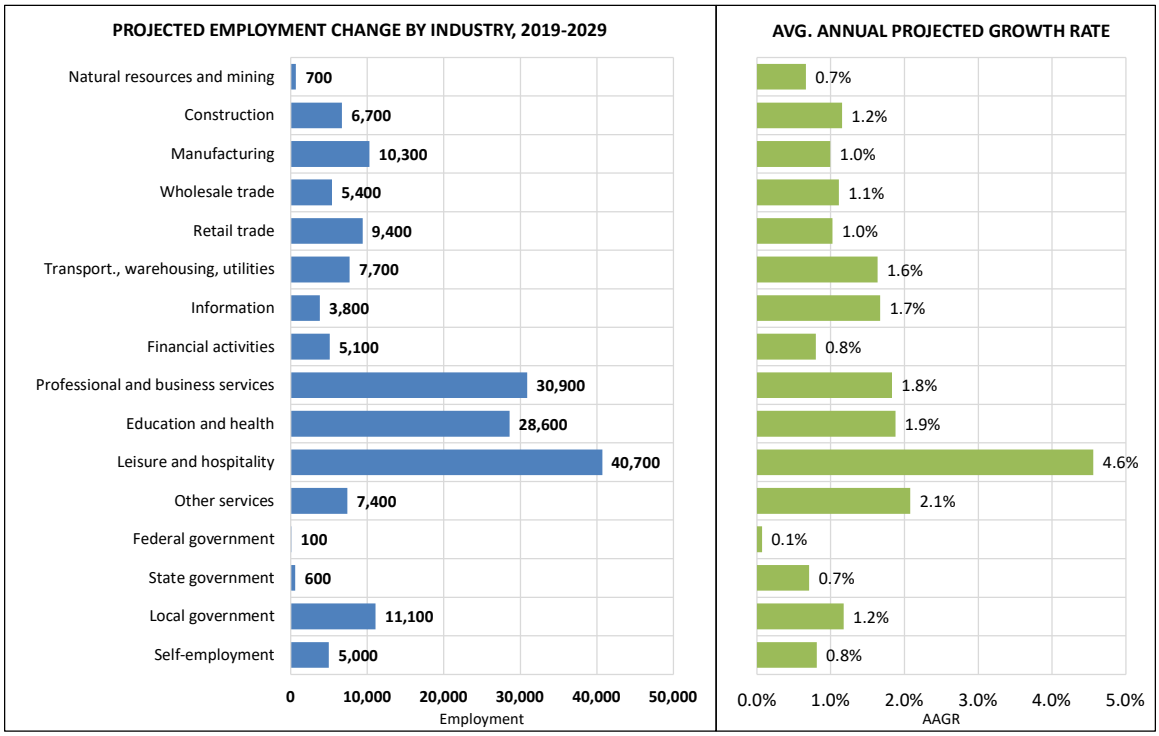
Notwithstanding the stronger projected performance of these sectors in the broader Metro area, some client-centric and customer-centric sectors that need close or convenient access to or by a critical population mass for their customers are not expected to be the greatest sources of potential job growth in North Plains which sits outside but near the Western edge of the Metro area. Clusters of these sectors tend to in more centralized and densely populated parts of the Metro areas, whereas North Plains is a better candidate for growth in other industry clusters. Nevertheless, North Plains will need some sites to accommodate the marginal growth in professional and health services, and tourism-related industry.

In addition, a considerable demand for convenience retail shopping and personal services businesses in the city is generated by existing and future residents predicted by population growth forecasts.

North Plains has good, though proportionately small employment representation in some of these industries such as tourism, education, and health care, but less representation in professional services and information sectors. Of employment located in North Plains, the greatest share is in manufacturing, construction, and waste management.

The applicability of these regional growth rates to local forecasts is uncertain – if not inapplicable - as they pertain to industrial and commercial business sectors that may not have competitive advantages or anticipated strong local demand if located in North Plains. Adjustments are applied to North Plains' land need estimates for these sectors to reflect the realities of the current and target employment distribution in North Plains.

FIGURE 5.01: PROJECTED EMPLOYMENT GROWTH BY SECTOR
WASHINGTON, MULTNOMAH & CLACKAMAS COUNTIES



SOURCE: State of Oregon Employment Department, Workforce and Economic Research Division

TARGET INDUSTRIES

The selection of target industries that follows are based on North Plains' economic development goals for employment and livability cited in Section II above, the relatively stagnant economic profile under current conditions in North Plains, and the city's locational competitive advantages. These targeted industries also respond to a persistent shortage of readily available development-ready industrial land in Washington County and Portland Region and the continuing need for sustained and ongoing industrial economic growth, health and diversification. A major emphasis of the City's economic development program is to change from being a bedroom community, by creating a better jobs-to-housing balance, and greater employment diversity. Also, the community would like to have a greater range of commercial good and services available locally, to serve the daily needs of residents. The following target industries reflect and will achieve these goals:

- **Small-scale and medium-scale manufacturing.** North Plains' attributes, especially its location along Highway 26, relatively low land prices, and proximity to Hillsboro and Beaverton, can attract manufacturing firms. Manufacturing firms are often export-based businesses, ranging from relatively small startups with 10 or fewer employees requiring smaller sites (5-10 acres) to larger manufacturers with 200 or more employees needing larger sites. Examples of manufacturing industries that may grow or locate on suitable North Plains sites include:

- Electronics and computer manufacturing, such as businesses that provide components to larger manufacturers in the Portland region – underscored by Oregon Task Force findings .
- Machinery manufacturing, such as agricultural or industrial machinery.
- Fabricated metal manufacturing.
- Specialty food and beverage manufacturing, such as wineries, beer brewing, fruit or vegetable products, or other products.
- Renewable and alternative energy products.
- Manufacturers providing components and supplies to larger firms – underscored by Oregon Task Force findings, particularly for supply chain businesses.

- **Data center(s).** Like much of the nearby industrial area in western Washington County, emerging demand for data center sites in North Plains is confirmed by recent inquiries about availability of such sites in the City from data center developers. That demand stems from a burgeoning, worldwide demand for data center services, which support everything that people do online. All types of businesses increasingly rely on these facilities for data storage and flow in the modern world. Existing nearby sources of the ample power and water resources needed by data centers, as well as proximity to existing large international data lines, gives North Plains a competitive advantage as a data center location, and timely development and operational advantages. Sites for data center and their ancillary uses can range from 50-100 acres in size. Discussions with economic development experts and site selectors are part of this analysis confirm that there would be latent near-term demand for many more large data center developments if suitable large industrial sites were available.
- **Small-scale and medium-scale warehouse, distribution, and wholesale.** North Plains' location along Highway 26, relatively low land prices may make the city attractive to small to medium-sized wholesale and distribution firms, especially of goods produced in Washington County. These uses and their ancillary uses often require 10-12-acre sites.
- **Professional services.** North Plains' high quality of life, lower commercial land costs, relatively affordable housing, and proximity to Hillsboro and Beaverton may attract professional and business services that prefer to locate in a smaller city like North Plains, such as software development, research or environmental services, or other services. Professional services may also include independent contractors, such as sole proprietors and others not covered by unemployment insurance. These types of businesses often locate within commerce centers that need at least 10-20-acre sites to accommodate a mix of professional services that need varying floor space as well as anchor retail stores and/or larger office complexes and their ancillary uses.
- **Services for residents.** Population growth will drive development of retail, such as a grocery store, general merchandise and specialty and retail shops, restaurants, government services, education and childcare facilities in North Plains. These types of convenient goods and service uses or complexes often require at least 5-acre sites and sometimes 10-acre sites.
- **Services for seniors.** The growing population of those near or in retirement in Washington County and the Portland region may attract or create demand for services for seniors, such as like assisted living facilities, retirement centers, and related medical services.

- **Services for visitors:** Growth in tourism will drive demand for services for visitors such as restaurants or lodging. Many tourist-related businesses also locate in retail and/or office locations.

VI. EMPLOYMENT AND LAND NEED FORECASTS

NORTH PLAINS EMPLOYMENT AND LAND FORECASTS

The EOA land need forecast contains two main components: a targeted-industries land need forecast aimed at accommodating new types of target industries businesses and a forecast of regarding additional land needed to accommodate job growth of existing North Plain to support City population growth. Both land need forecasts are merged into a single 20-year land need estimate. Except for businesses in the new large-site tech-based and industrial park categories (which do not now exist in North Plains), the City anticipates future industrial growth to contain a mixture of the targeted industry businesses as well as the other sectors.

A. BASELINE EMPLOYMENT FORECAST

Prior to factoring in the specific needs of targeted business sectors, a baseline City employment and land need projection was developed as a part of initial City EOA based on official population growth forecasts issued by Portland State University (PSU) that underestimated the City's future population and housing growth. This EOA updates that projection in response to corrected and updated (PSU) City population and housing growth data and forecasts for the City.

As noted earlier, however, the new forecast informs only the City's need for more commercial land over the 20-year UGB planning period as it correlates that land need to the amount of City population growth over that period that will generate the demand for greater retail and other business services than now exists within the City's current commercial uses and areas.

An updated "traditional jobs/acre" baseline employment forecast is not used exclusively to project the City's industrial land need over that planning period because it does not fully respond to and address the full aspirational City "targeted industries" economic development potential or priorities of the City from which the City's industrial employment land needs over the UGB planning period derive – as encouraged and enabled by the Goal 9 Rules. The City's industrial development potential and its economic growth priorities are addressed and set forth in the subsequent discussions to this analysis.

The first analytical step of the analysis is to update covered employment to the 2021 base year (Figure 6.01). To update these estimates, we use observed industry specific growth rates for Washington County between 2019 and 2021.

The second step in the analysis is to convert "covered"[12] employment to "total" employment, the results of which are described in Fig. 6.01 below. The adjusted 2021 total employment base for the City of North Plains is 1,050 jobs.

12 The Department of Labor's Quarterly Census of Employment and Wages (QCEW) tracks employment data through state employment departments. Employment in the QCEW survey is limited to firms with employees that are "covered" by unemployment insurance.

FIGURE 6.01: UPDATE TO 2021 BASELINE AND CONVERSION OF COVERED TO TOTAL EMPLOYMENT

Major Industry Sector	QCEW Employment: 2020 Employment	'20-'21 County Δ[1]	2021 Estimate	Total Emp. Conversion[2]	2021 Estimate
Construction	178	3.1%	183	73%	250
Manufacturing	253	2.7%	260	98%	266
Wholesale Trade	88	4.5%	92	97%	95
Retail Trade	31	3.1%	32	94%	34
Transport., Warehouse, Utilities	17	2.9%	17	91%	19
Information	3	5.1%	3	95%	3
Finance & Insurance	12	1.2%	12	92%	13

Government	21	1.4%	21	100%	21
TOTAL	**984**	**2.4%**	**1,031**	**90%**	**1,150**

1 Forecasted AAGR from 2019-2029 for the Portland Tri-County submarket. Oregon Employment Department

2 Bureau of Economic Analysis. Calculated as an eight-year average between 2010 and 2018

Once the 2021 baseline of employment is established, future growth forecasts are applied by industry sector for the baseline and adjusted scenarios, to forecast employment growth over the 20-year planning period (to 2041). In addition to these growth rates, an adjustment is made (to both scenarios) that reflects the employment needed to correct the current jobs-to-housing imbalance identified in North Plains, as explained below.

JOBS-TO-WORKERS BALANCE

As explained in Section III, North Plains has an estimated 1,150 total local jobs (covered and non-covered) working in current businesses that are mostly outside the target industries sectors, and 1,730 working North Plains residents, most of whom work outside the City. This indicates a ratio of 0.65 local jobs for each local working resident or 1.5 local workers for each available local job. To achieve a one-to-one jobs-per-worker balance a ***current deficit*** of roughly 580 jobs in North Plains needs to be eliminated. The new jobs needed within the City to eliminate that deficit need to be in sectors that match the job experiences, jobs interests and/or qualifications of existing and future City residents which is not now the case. Thus, the 1.5 local jobs/working City resident ratio does not truly reflect and may greatly understate that ratio and imbalance. More accurately, the future jobs profile in the City needs to far better match the job experiences, jobs interests and/or qualifications of existing and future City residents to achieve the desired local jobs/local residents ratio balance – one of several community objectives and priorities at which the targeted industries approach is directly aimed.

The targeted Industries approach recommended by this EOA is intended, over the course of the 20-year UGB planning period, to reverse and substantially lower the numbers of existing and new City residents working in jobs in the targeted industries sectors outside the City; thereby improving that ratio. Attracting and accommodating new businesses that fall under the listed targeted industries will provide many such jobs.

Simply applying numerical employment growth rates to current employment levels will not alleviate this deficit or establish a healthier jobs-to-worker balance in North Plains. Therefore, in addition to applying the baseline and adjusted growth rates, each forecast also includes an adjustment factor of new employment needed to create this balance. Specifically, **an adjustment of at least 582 additional needed jobs is added** to the forecast (see Figure 6.02). Practically, a much higher number of jobs should be added to an adjusted forecast when considering the profile of the types of new jobs the City will need to match the job qualifications and preferences of a generally well-educated North Plains resident population now and expected in the future over the 20—year UGB planning period.

BASELINE GROWTH FORECAST

The latest completed forecast for the North Plains UGB was completed in 2020 and forecasts an annual growth rate of 3.9% between 2021 and 2041. However, these official population estimates did not reflect robust house permitting activity in North Plains over many years. This mistake was since corrected around 2017, but the latest PSU forecast (2020), while reflecting the higher revised *current* population did not adjust the 20-year forecast higher by a concomitant amount. This translates to a much lower annual growth rate.

Until this discrepancy is resolved, the official PSU forecasted growth rate is not the most reliable figure to use in this analysis. It is used here as a foundation for the *adjusted* forecast.

ADJUSTED GROWTH FORECAST

Although it likely is very conservative based on the preceding jobs/residents ratio discussion, the adjusted forecast begin to reflect and address the local adopted economic development potential and adopted City economic growth/development priorities. The main adjustments increase the forecasted growth rate of the target industries, including domestic-based and export-based information and technology, manufacturing, warehousing, wholesale, information, and construction in the industrial land use sectors, and retail, financial, professional, and health services in the commercial sectors.

The result is total blended adjusted annual growth rate of 6.3% (see Figure 6.03). Resulting in the addition of over 3,300 new jobs over the planning period. This growth assumes the availability of suitable land and sites to meet the city's economic development goals. The greatest number of jobs are forecasted in manufacturing, construction, information (data center), technology and supporting businesses, professional services (business park), and health care.

The 20-year forecast was broken down into five-year increments, assuming a consistent rate of growth over the period. However, in practice, a 20-year forecast will include multiple business cycles, and that growth will be variable over time.

ADDITIONAL CONTEXT FOR THE ADJUSTED GROWTH FORECAST

The 3,440 jobs expected to be added to the North Plains economy by growth in planned Targeted Industry expansion can be viewed in the context of recent, relevant forecasts. A detailed discussion of forecast context is provided in Appendix D of this document.

- **2019 OED Employment Forecast for Washington, Multnomah & Clackamas Counties (Figure 6.05):** The ten-year job forecast by Oregon Employment Department for the tri-county Portland metro region sees 167,800 new industry jobs between 2019 and 2029 for sectors that North Plains also expected to grow in its own economy. Over a similar ten-year period, North Plains plans to add 1,672 jobs, or merely 1.0% of the regionwide total. Various Manufacturing sectors are among North Plains' Targeted Industries – including semiconductor manufacturing and supply chain – thus North Plain's planned job growth represents up to 4% of the regionwide total over ten years, objectively still a small share of regional growth.

FIGURE 6.05: CITY OF NORTH PLAINS & THREE-COUNTY METRO REGION JOB GROWTH FORECASTS

Industry Sector	10-Year Job Forecast OED - Tri-County	North Plains EOA	NP as % of Region
Construction	6,700	258	3.9%
Manufacturing	10,300	415	4.0%
Wholesale trade	5,400	93	1.7%
Retail trade	9,400	37	0.4%
Transport, warehousing, utilities	7,700	75	1.0%
Information	3,800	99	2.6%
Financial activities	5,100	43	0.8%
Professional and business services	30,900	217	0.7%
Education and health	28,600	225	0.8%
Leisure and hospitality	40,700	153	0.4%
Other services	7,400	42	0.6%
Government	11,800	15	0.1%
Three County 10-year forecast	167,800	1,672	
North Plains 10-year forecast	1,672		
North Plains Share of Tri-County Region	**1.0%**		

SOURCE: Figures 5.01 and 6.04

- **2022 OED & Metro Employment Forecasts for Washington, Multnomah & Clackamas Counties (Figure 6.06):** More recent total employment forecasts by both Metro and Oregon Employment Department, when compared, point to substantial employment occurring outside of the Portland metro UGB but still within Washington and Clackamas Counties, including North Plains. Of the 173,400 jobs projected by OED in the region, North Plains' planned ten-year growth amounts to only 0.96% of the regionwide forecast.

FIGURE 6.06: 2022 PORTLAND THREE-COUNTY EMPLOYMENT FORECAST, METRO & OED

	2020	2030	Employment Growth		Share of OED Forecast
OED Projection[1]					
3-County Area:	996,500	1,169,900	173,400	17%	100%
Metro Projection[2]					
3-County Area:	1,026,032	1,091,568	65,536	6%	38%
Metro UGB Cities:	869,782	916,928	47,146	5%	27%
Unincorporated Areas:	142,058	160,054	17,996	13%	10%
Non-Metro Cities:	156,250	174,640	18,390	12%	11%

[1] Portland Tri-County Industry Projections 2020-2030, Oregon Employment Department (11/21)

[2] 2045 Distributed Forecast of Population, Households, and Employment, Metro (2/21)

Metro for the same time period forecasts that 11% of all three-county job growth will locate in cities outside of the Portland metro UGB. Interestingly, the total number of jobs expected by Metro to be added over the next ten years to the tri-county region deviates dramatically from the OED forecast which is more consistent with past growth trend in the region and the state. In other words, communities like North Plains are not only projected to see substantial job growth spilling

over from the Metro UGB, but also prepare for even greater job growth spilling over per the OED forecast as Metro will plan for employment lands based on its own lower forecast.

- **2011 to 2022 Portland Metro Large Industrial Site Lack of Availability OED & Metro Employment Forecasts for Washington, Multnomah & Clackamas Counties (Figure 6.07):** A major background factor driving North Plains Targeted Industry growth and land need is the chronic, long-term and well-documented shortage of industrial land and sites for important Portland metro region industries. Figure 6.07 displays the official inventory of larger industrial sites suitable for important regional industries based on "tiers" of site readiness, whether immediately "shovel-ready" (Tier 1) to requiring substantial site investment such as brownfields remediation and off-site investment including substantial infrastructure and utilities extension (Tier 3) that may take several years. Over 11 years, the three-county region has seen only depletion of industrial sites suitable for Targeted Industries identified by the City of North Plains. The region now has half of the number of such industrial sites in 2022 than it did in 2011, the year that the first official inventory was conducted when industrial sites shortage was already a problem. Due to now "crisis" level shortage of industrial sites in the region and the overwhelming majority classified as Tier 3 sites requiring years to readiness, industry seeks site availability consistent with Metro's own forecast that sizeable employment growth is going to be forced outside of the Portland metro UGB, not to mention over 110,000 jobs that OED projects will also have to be accommodated outside of the Portland metro UGB that Metro will not be planning to accommodate (Figure 6.06).

FIGURE 6.07: PORTLAND METRO INVENTORY OF LARGE INDUSTRIAL SITES

B. TARGET INDUSTRY SITE AND LAND NEED

The table titled **Figure 6.07 North Plains Targeted Industrial & Commercial Businesses and Land Need Profile** (presented below in this section) identifies various target industry businesses and their estimated individual site-area requirements. These are EOA-identified targeted businesses that North Plains reasonably expects will seek available, suitable, and development-ready sites in the City.[13]

The profiles of these business and their typical site needs are informed by two land use and development research sources:

[13] The applicable the Goal 14 Urbanization Rule in 660-024-0040(1) does not require a total 20-year UGB land need estimate, and thus its contributing sub-estimates components, to be precise: *"[T]he 20-year (land) need determinations which, although based on the best available information and methodologies, should not be held to an unreasonably high level of precision*."

- Washington County and Metro RLIS GIS land use information covering nearby industrial areas that are representative of the types and sizes of businesses like North Plains' target industries, and
- Recent studies in Washington County on industrial site readiness, site preferences, and feedback from industry experts.

Such businesses continue to seek such sites throughout the Silicon Forest area, especially in nearby Hillsboro and other western Washington County communities where there continues to be a shortage of such sites.

Goal 9 "strongly encourages" cities to pursue its economic growth and development aspirations by assessing its community economic development potential and to use that potential to form its economic development objectives. Those objectives inform the community's future land need prescribed in its EOA and corresponding comprehensive plan UGB amendments that designates additional lands on which that potential will materialize and be realized.

The EOA acknowledges and addresses the need to satisfy Goals 9 and 14 compliance requirements that apply to a North Plains' UGB employment land expansion. The City applies current industry data about the customary land need requirements of needed future employment uses as well as nearby examples of target industry businesses, to estimate and determine its required Goal 14 City 20-year jobs land need/supply requirement.

Goal 9 rules[14] and recent Court decisions[15] make clear that North Plains has "reasonable discretion" in determining what method it uses to determine how much land it needs to accommodate a demonstrated need for improved City livability as allowed by Goal14, Factor 2[16]. LCDC determines whether the City's determinations satisfies both Goals 9 and 14 and are sufficiently supported by the requisite "substantial evidence" while the Court's role is to decide whether LCDC's determinations properly applied its review standards.[17]

Industrial Land Need: Based on the targeted industry site characteristics data sources cited above, the aggregate 20-year land need for Target Industries businesses is 545 additional industrial acres distributed among the various types of industrial uses described in the table on the following page. The prevalent site sizes and developable characteristics of existing nearby like-kind targeted businesses in and around western Washington County provided reasonable templates for determining the City's total need for additional UGB

---

14 OAR 660-009-0015 (1-5).

15 See e.g. *Zimmermann v. LCDC*, 274 Or App 512 (2015)

16 Goal 14, Factor 2 states in pertinent part that:

> "Establishment and change of urban growth boundaries shall be based on . . . demonstrated need for . . . livability", and "in determining (land) need, local government may specific characteristics, such as parcel size, topography or proximity, necessary for land to be suitable for an identified need. Prior to expanding an urban growth boundary, local governments shall demonstrate that needs cannot reasonably be accommodated on land already inside the urban growth boundary."

17 Zimmermann v. LCDC, Op cit.

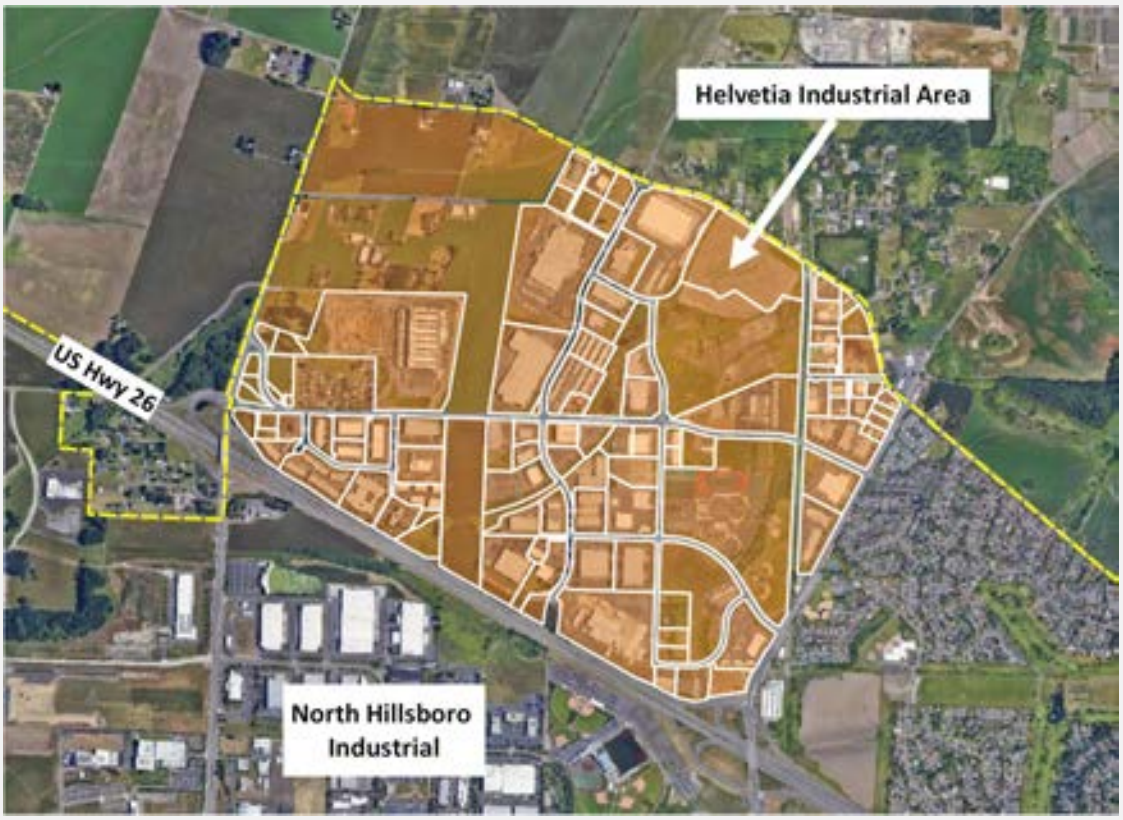
employment land and the needed individual site characteristics of the various types of targeted industry businesses.

Commercial Land Need: The City's commercial land need over that planning period is estimated at 185 acres. The types of commercial uses needed in the City described in the following table reflect and expected future demand for retail and business services, based on observed commercial centers in Washington County communities. Second, the amount of land needed to accommodate those prototypical commercial uses is estimated based on industry data about the typical site and building characteristics of the commercial uses identified. Only a small amount of that projected need for small-scale businesses can be accommodated within the current City UGB. These small lots are properly zoned for business uses and are expected to contain only small retail and other businesses.

HELVETIA INDUSTRIAL AREA IN NORTH HILLSBORO – MODEL DEVELOPMENT PATTERN

Through the planning process of this EOA and the preceding formulation of economic development goals by local officials, the area of industrial development in North Hillsboro including the Helvetia Area Special Industrial District (HSID) has been chosen as a general model of the potential development pattern for new employment areas in North Plains. For the purposes of this analysis, this area is referred to as the Helvetia Industrial Area. It is located north of US 26, east of NW Helvetia Road, and west of NE Cornelius Pass Road (Figure 6.08).

FIGURE 6.08: HELVETIA INDUSTRIAL AREA



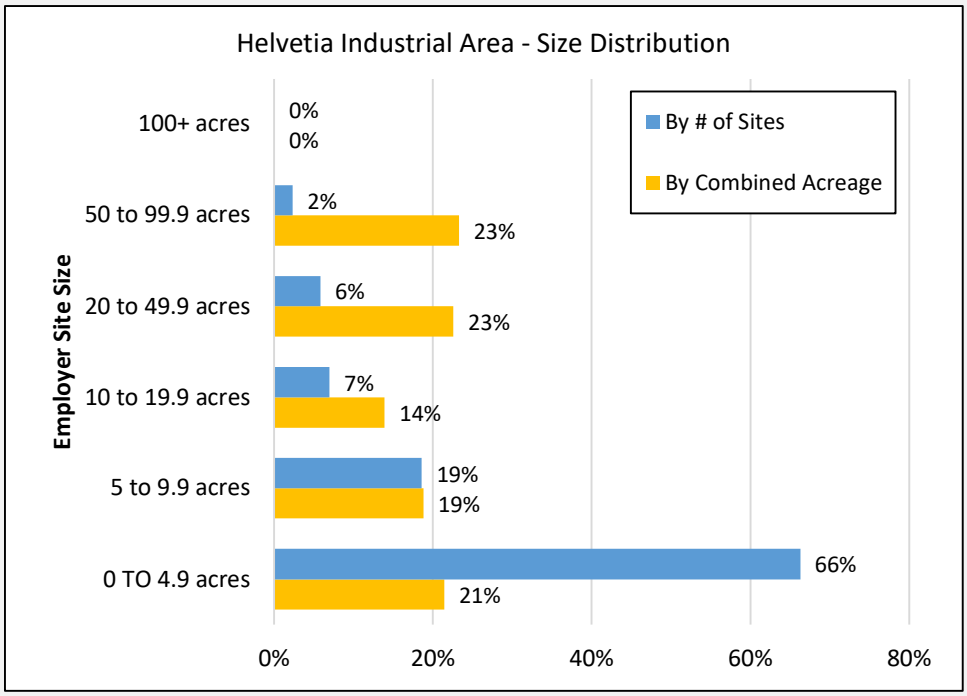
Source: Johnson Economics, Metro RLIS

For this analysis, the mostly developed portion of this area (with parcels outlined in white), was assessed as to the distribution of site sizes. The area includes a mix of industrial users, business park uses, and some commercial and institutional uses. This is seen as a demonstrated mix of the development and use pattern that might occur in new employment areas in North Plains to the west.

The distribution of the sites in this area is presented below in Figure 6.09 (adjacent taxlots with common ownership are combined.) There is a total of 86 such sites in the Helvetia Industrial Area.

A majority (66%) of these sites are small, at under 5 acres, with a diminishing share of larger sites. However, because they are smaller, the small sites represent only 21% of the total acreage (orange bars). Larger sites are fewer in number, but still represent a sizable share of the total acreage because they are larger.

FIGURE 6.09: HELVETIA INDUSTRIAL AREA



Source: Johnson Economics, Metro RLIS

This example development pattern was used as a primary source for determining the distribution of sites by size needed to accommodate the projected growth in employment. The distribution of projected need for sites under 100 acres closely matches this distribution of the Helvetia example.

Large Lot Needs: While the Helvetia example provides a good model for sites of under 100 acres, it does not include any larger industrial sites. The analysis presented in this EOA, based on the adopted economic development goals of North Plains officials, and the identified target industries, finds the need for multiple large lot industrial opportunity sites *in addition* to the site size distribution presented above. These larger sites are more analogous to major catalyst employers and data center development found south of the Helvetia area in the remainder of the North Hillsboro Industrial Area.

The EOA supports the need for a few such sites for the target industries: These large lots will be appropriate for a major semiconductor or advanced manufacturing employer similar in scale to the Ronler Acres and Hawthorne Farm Intel campuses; a mega-data center, similar in scale to the QTS and Digital Realty Data Centers in the Silicon Forest; a large business park development, with one or more large tenants such as high tech support companies and general industrial businesses, similar to the business agglomerations found in the Five Oaks and Sunset Highway Business Parks located in the Helvetia Industrial Area.

The above analysis contributed to the finding of site needs presented in the following table (Figure 6.10). In addition to the Helvetia Industrial Area model of development and use pattern, these findings are based on site characteristics detailed in the appendices. Specific sites/businesses in the western Washington County area were analyzed for example site characteristics for these types of target businesses (See Appendix B: Western Washington County Site Characteristics).

- **Appendix A: General Site Requirements by Industry**
- **Appendix B: Western Washington County Site Characteristics**

Figure 6.10: North Plains Targeted Industrial & Commercial Businesses 20-Year Land Need Profile

User Type (Based on Existing West Washington County Tech-based Large Site & West Union Rd. 19 Includes grocery store(s), other retail, and restaurants

C. Relationship Between Industry Site Needs & City Job Growth Forecast

Identifying specific North Plains' site needs (i.e., need for land by sites) involves two steps: (1) identifying target industries for North Plains described in Fig. 6.10 and applying the characteristics of sites needed by businesses in those industries, and (2) a forecast of jobs growth in Fig. 6.04 and allocation of that jobs growth to sites based on industry maximum site size standards (Appendix "A") and observed existing nearby site development patterns and characteristics (Appendix "B") Fig. 6.11 on the following page applies and describes that process and the application results (in terms of jobs and sites) for North Plains.

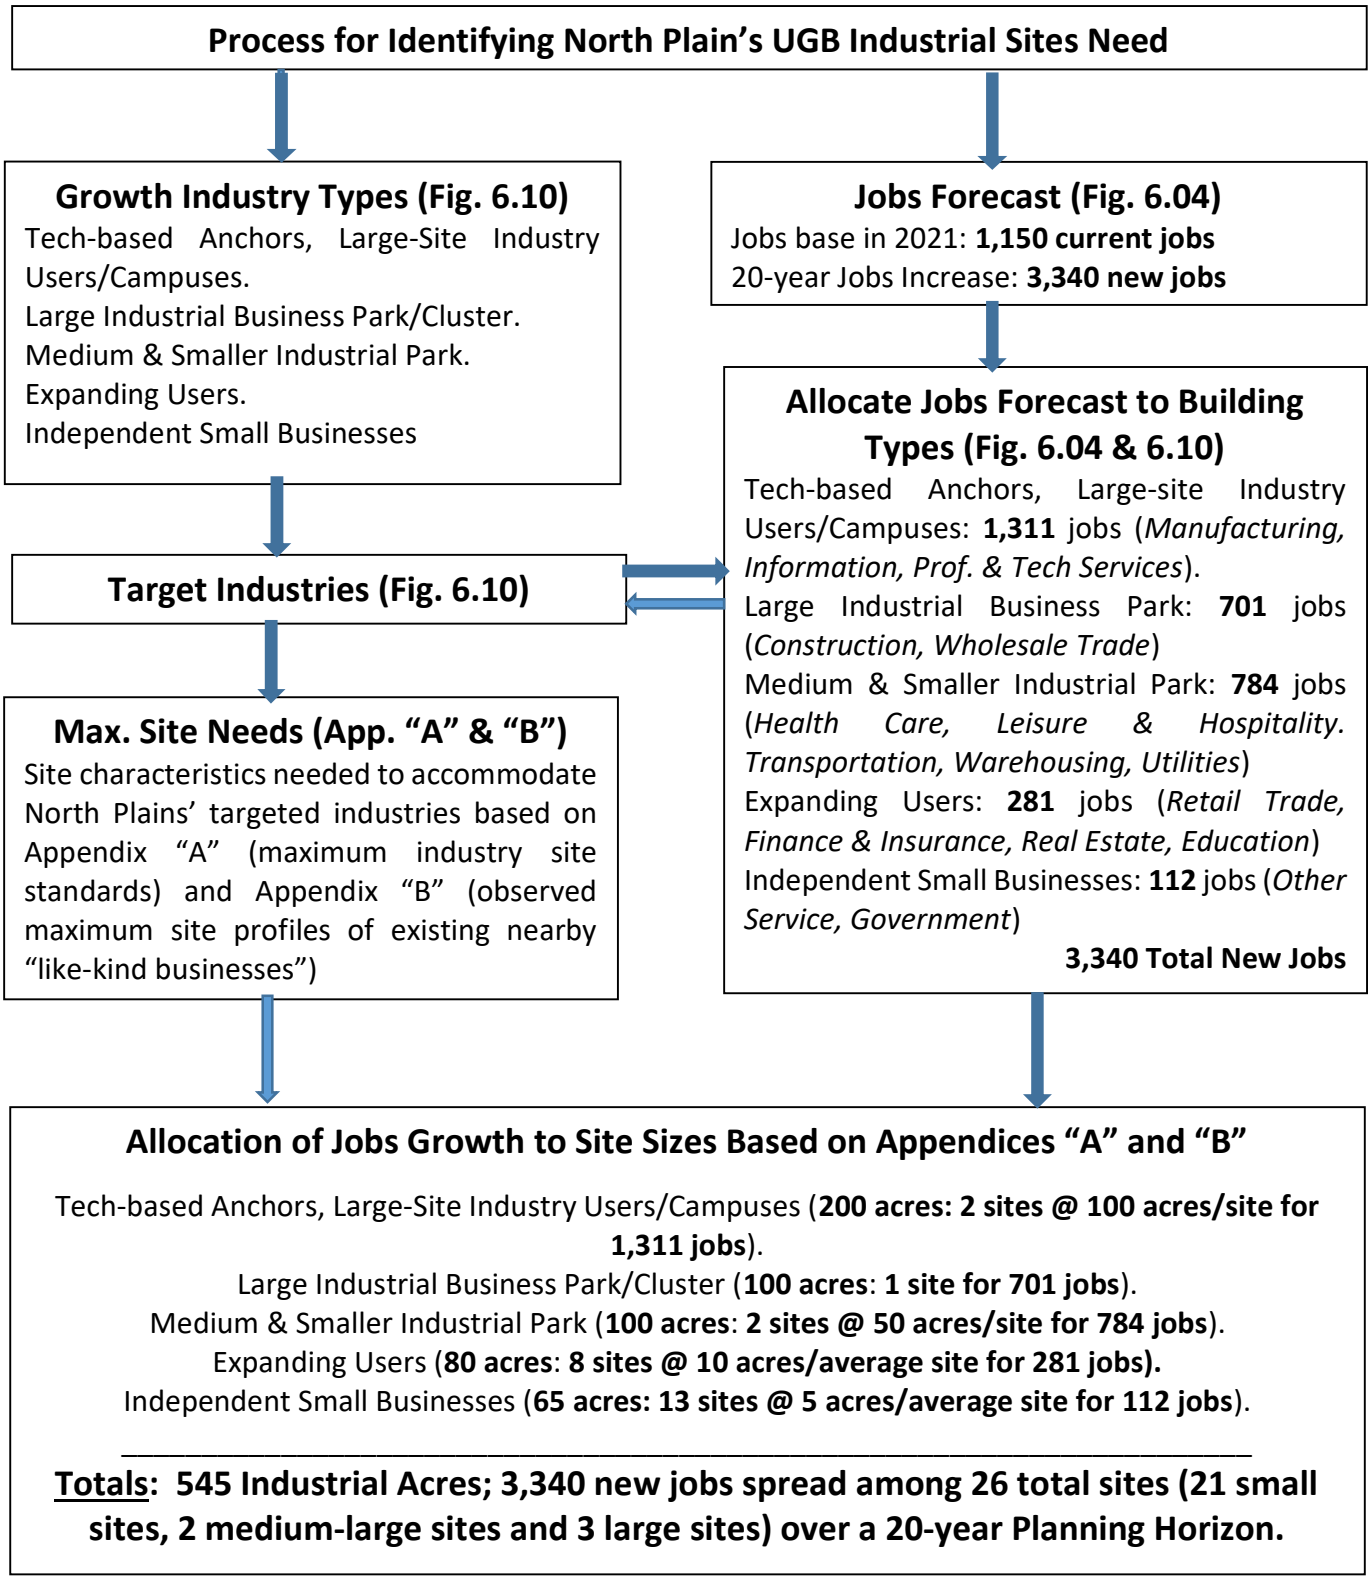
Need/Demand for the Targeted Large Industrial Sites:

- North Plains' need for and accommodation of the 100-acre and 50-acre large sites described in Fig. 6.11 derive from the City's Goal 14 livability-based continuing and growing fiscal need to better provide basic City services: Providing these large sites proposals will position North Plains to capture – within a 1-3 year timeframe - a part of the well-documented national, State and Silicon Forest clearly urgent need/demand for such sites for semiconductor campus as well as stand-alone manufacturing and supporting uses. In turn, accommodating such uses will dramatically and relatively-quickly improve the City fiscal resources/capacity to provide/support those City services.

- In Oregon, a clear and imminent industrial large-site demand is confirmed by the findings of the Oregon Semiconductor Competitiveness Task Force Industrial Lands Subcommittee: there is a clear State interest and related concern that the much of the supply of Oregon's large site, development-ready sites are highly constrained and need costly and time-consuming site assembly; need environmental remedies; and/or lack needed infrastructure. These constraints are common to the very few Oregon sites that can accommodate large industrial campuses (needing from 250-500 acres), stand-alone device manufacturers (needing 25-150 acres) and their major suppliers (needing 10-75 acres). Fig. 6.08 describes North Plains' effort to provide these types of medium-to-large industrial sites for such targeted industries businesses. These issues rob the State of the land resources it needs to compete nationally and internationally for these types of North Plains-targeted tech-based industries. North Plains' ability to pursue and do that is helped by a fairly straightforward and less-cumbersome UGB expansion policy and regulatory review process as well as the "Undesignated" Urban & Rural Reserves status of potential UGB expansion candidate sites that abut the City.

- In the heart of the nearby Oregon Silicon Forest there are about 20 businesses directly connected to semiconductor, high tech research/support and bio-tech sectors. (see Appendix "B"). Though product research, marketing and other administrative aspects of these sectors have been impacted by Pandemic-spurred live-work jobs location trends like other industries, the product-manufacturing and product-processing functions activities - and sites - for these sectors still must rely on a close and convenient access to their employees. Prospective North Plains UGB expansion areas/sites can provide such close-by workplaces to the considerable number of North Plains' working residents who do both on-site and off-site work for businesses in these sectors.

Figure 6.11: North Plains Job Growth to Sites Need by Size Allocation Schematic



VII. RECONCILIATION OF LAND NEED & SUPPLY

North Plains Buildable Land Inventory

A Buildable Lands Inventory (BLI) was prepared for the City of North Plains by 3J Consulting, identifying the remaining buildable parcels of land in the city's commercial and industrial zones. The available inventory for both commercial and industrial users is limited by the prior build-out of most of the city's employment land.

FIGURE 7.01: BUILDABLE LAND INVENTORY OF EMPLOYMENT LANDS, CITY OF NORTH PLAINS - 2021

LAND USE		Acres	Taxlots	Consolidated Sites	Largest Site (ac.)	0 to .9 acres	1 to 4.9 acres	5 to 9.9 acres	10 to 19.9 acres	20+ acres
Commercial										
C-1	General Commercial	0.7	5	5	0.2	5	0	0	0	0
C-2	Highway Commercial	12.0	14	14	3.1	10	4	0	0	0
		12.6	19	19	3.1	15	4	0	0	0
Industrial										
M-1	Light Industrial	5.5	4	1	5.5	0	0	1	0	0
M-2	General Industrial	24.1	8	6	20.8	4	1	0	0	1
		29.6	12	7	20.8	4	1	1	0	1
	TOTAL:	***42.2***	***31***	***26***	***24.0***	***19***	***5***	***1***	***0***	***1***

Source: 3J Consulting

The inventory found 42 total remaining employment acres in 26 consolidated parcels (31 individual tax lots). An estimated 30% of the remaining acreage has commercial zoning, and 70% has industrial zoning.

Of the 26 consolidated (buildable parcels adjacent to each other), 19 are of less than one acre. An additional 5 are larger than one but less than five acres. There is one industrial site over five acres, and one over 20 acres.

Comparing this inventory to the 20-year forecast of employment land need generated earlier in this analysis indicates that the projected demand exceeds the estimated remaining capacity for new employment development by a significant amount. Figure 7.02 presents a comparison of the 20-year land need projection (Section VI) and the BLI in gross acres.

Land Supply and Demand (acres): The comparison of BLI (supply) to the forecasted 20-year need for employment lands (demand) show a probable deficit of land over the planning period if North Plains is to accommodate the growth in employment projected by this analysis. There is a total projected demand for 730 gross acres of employment land, compared to 42 total acres of remaining buildable supply. There is a resulting deficit in both commercial and industrial lands compared to forecasted growth.

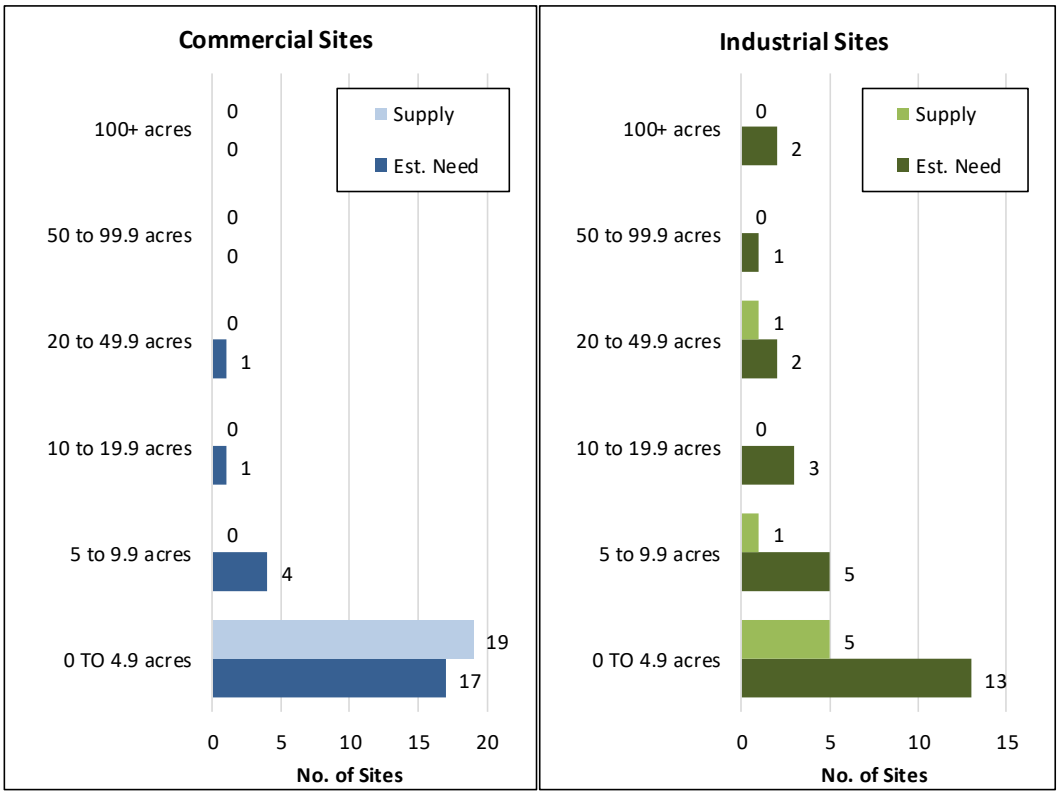
FIGURE 7.02: RECONCILIATION OF BLI CAPACITY AND PROJECTED DEMAND, CITY OF NORTH PLAINS– 20-YEAR

LAND CATEGORY	Land Demand (Gross Acres)	Land Supply (Gross Acres)	Land Sufficiency (Acres)
Commercial Total:	185.0	12.6	-172.4
Office	*91.5*		
Institutional	*21.2*		
Retail	*72.3*		
Industrial Total:	545.0	29.6	-515.4
Flex/B.P	*167.6*		
Gen. Ind.	*324.5*		
Warehouse	*52.9*		
TOTAL:	730	42	-687.8

Source: Johnson Economics, 3J Consulting

Land Supply and Demand (Site Size): The following figure presents a comparison of the estimated needed number and sizes of sites and the number of comparable sites in the BLI (Figure 7.01).

FIGURE 7.03: RECONCILIATION OF BLI CAPACITY AND PROJECTED DEMAND, BY SIZE OF SITE CITY OF NORTH PLAINS (2021-2041)



Source: Johnson Economics, 3J Consulting

As Figure 7.03 shows, much of the remaining available supply is in the smallest parcels of under five acres. Many of these are well less than one acre in size. Forecasted demand is for a range of site sizes, including of medium and very large sites to accommodate high-tech manufacturing and data center recruitment. While the needs of future prospective businesses are hard to predict, this comparison points to the need for an estimated 6 additional commercially zoned sites of five to 50 acres, and 19 additional industrial sites of all sizes.

CONCLUSION OF LAND NEED

The analysis presented in this EOA supports the needs for a full range of sites of appropriate size and location to meet the economic development priorities of the city.

The reconciliation of forecasted 20-year demand with available supply of buildable parcels indicates that the City of North Plains will face a deficit of available land to meet its economic development needs well within the 20-year planning horizon. This analysis concludes a probable deficit of over 680 acres of employment land and roughly 25 medium to large sites of differing sizes.

APPENDIX A: GENERAL SITE REQUIREMENTS BY INDUSTRY

The following series of tables summarize the key site preferences and/or requirements for a range of prospective tenant types.[20]

	CRITERIA / PROFILE		A	B	C	D	E	F	G	H	I	J
			Computer & Electronic Manufacturing (High-Tech R&D)	Software & Media	Multi-Tenant Office	Food Processing	Other Manufacturing	Life/Bioscience R&D Campus	Wholesaling	Retail	Data Center	Incubator
	GENERAL REQUIREMENTS		Use is permitted outright, located in UGB or equivalent and outside flood plain; and site (NCDA) does not contain contaminants, wetlands, protected species, or cultural resources or has mitigation plan(s) that can be implemented in 180 days or less.									
	PHYSICAL SITE											
1	TOTAL SITE SIZE*	Competitive Acreage**	5 - 100+	5 - 15	5 - 20	5 - 25+	5 - 15+	20 - 100+	10 - 25	5 - 20	10 - 25+	5 - 25+
2	COMPETITIVE SLOPE:	Maximum Slope	0 - 5%	0 - 7%	0 - 7%	0 - 5%	0 - 5%	0 - 7%	0 - 3%	0 - 7%	0 - 7%	0 - 5%
	TRANSPORTATION											
3	TRIP GENERATION:	Average Daily Trips per Acre	40 - 60	80 - 200[1]	120 - 240[2]	50 - 60	40 - 50	60 - 150	50 - 60[3]	400 - 500[4]	20 - 30	40 - 50
4	MILES TO INTERSTATE OR FREIGHT ROUTE:	Miles	w/in 10	w/in 5	w/in 5	w/in 30	w/in 20	w/in 5	w/in 5	w/in 5	w/in 30	N/A
5	MILES TO FREQUENT TRANSIT SERVICE (15 MIN OR LESS)	Miles	0.6	0.5	0.8	< 0.1	0.2	0.1	0.3	< 0.1	0.1	< 0.1
6	RAILROAD ACCESS:	Dependency	Preferred	Not Required	Not Required	Preferred	Preferred	Preferred	Preferred	Avoid	Avoid	N/A
7	PROXIMITY TO MARINE PORT:	Dependency	Preferred	Not Required	Not Required	Preferred	Preferred	Preferred	Preferred	Not Required	Not Required	N/A
8	PROXIMITY TO INTERNATIONAL/ REGIONAL AIRPORT:	Dependency	Competitive	Required	Preferred	Preferred	Preferred	Required	Not Required	Not Required	Competitive	N/A
		Distance (Miles)	The City of Hillsboro enjoys a competitive advantage that all industries within Hillsboro are located within 5 miles of an international airport (Hillsboro International Airport)

	PROFILE	A	B	C	D	E	F	G	H	I	J
	CRITERIA	Computer & Electronic Manufacturing (High-Tech R&D)	Software & Media	Multi-Tenant Office	Food Processing	Other Manufacturing	Life/Bioscience R&D Campus	Wholesaling	Retail	Data Center	Incubator
14	**SPECIAL CONSIDERATIONS:**	Acreage allotment includes expansion space (often an exercisable option). Very high utility demands in one or more areas common. Sensitive to vibration from nearby uses.	[1]: Research & Development @ 80 ADTs per acre on the low end, estimated 200 ADTs per acre for general office on the high end. Location specific.	[2]: Range represents FAR 0.25 - 0.5 of office uses. Location to other cluster industries.	May require high volume/supply of water and sanitary sewer treatment. Often needs substantial storage/yard space for input storage. Onsite water pre-treatment needed in many instances.	Adequate distance from sensitive land uses (residential, parks) necessary. Moderate demand for water and sewer. Higher demand for electricity, gas, and telecom.	High diversity of facilities within business parks. R&D facilities benefit from close proximity to higher education facilities. Moderate demand on all infrastructure systems.	[3]: General warehousing rates	[4]: Based on discount warehouse @ 0.25 FAR [5]: Dependent on use, i.e., brewery vs. restaurant. Location to cluster industries.	Larger sites may be needed. The 25 acre site requirement represents the more typical site. Power delivery, water supply, and security are critical. Surrounding environment (vibration, air quality, etc.) is crucial. May require high volume/supply of water and sanitary sewer treatment.	Often established by municipalities and have symbiotic relationships with colleges and/or universities.

Terms:

More Critical ↑ Less Critical	**'Required'** factors are seen as mandatory in a vast majority of cases and have become industry standards.
	'Competitive' significantly increases marketability and is *highly recommended by Business Oregon*. May also be linked to financing in order to enhance the potential reuse of the asset in case of default.
	'Preferred' increases the feasibility of the subject property and its future reuse. Other factors may, however, prove more critical.
	'Not Required' does not apply for this industry and/or criteria.
	'Avoid' factors act as deterrents to businesses in these industries because of negative impacts.

*Total Site: Building footprint, including buffers, setbacks, parking, mitigation, and expansion space.

**Competitive Acreage: Acreage that would meet the site selection requirements of the majority of industries in this sector.

† Data Center Water Requirements: Water requirement is reported as gallons per MWh to more closely align with the Data Center industry standard reporting of Water Usage Effectiveness (WUE).

‡ Data Center Sewer Requirements: Sewer requirement is reported as 200% of the domestic usage at the Data Center facility. Water and sewer requirements for Data Centers are highly variable based on new technologies and should be reviewed on a case-by-case basis for specific development requirements.

APPENDIX B: WESTERN WASHINGTON COUNTY SITE CHARACTERISTICS

BUSINESS OR COMPANY NAME	PRODUCT AND/OR SERVICES	INDUSTRIAL CATEGORY	TAX MAP/LOT NO.	TAX LOT AREA
SOFTWARE & INFORMATION TECHNOLOGY (Silicon Forest contains 216 Firms, 2,717 direct industry jobs, $128k average wage)				
NTT Global Data Center	Cloud Data Storage, Colocation, Data Management, Professional Services	Data Center Services	1N22 100 TL2100	19.77 Acres
QTS Data Centers	Data Storage, Retrieval; Cloud Connection, IP Network Services	Mega Data Center	1N22 100 TL 2500, 3100 & 3102	90.3 Acres
T5 Data Center	Data Storage, Solutions & Retrieval: Data Facilities Development, Management & Construction	Data Center	1N22 100 TL 2201	8.46 Acres
Stack Infrastructure (3 sites)	"Build-to-Suit" Data Center; Flexible digital infrastructure for client companies.	Data Center	1N22100 TL 2202	12.0 Acres
Digital Reality	Worldwide IT Services (data storage & control, networking of global enterprises)	Data Center	1N21500 TL 2650	46.7 Acres

NOTES

- Attracting/accommodating Data Centers like those identified in this Table is a North Plains industrial growth and development priority: Demand for Data Center sites within and near these existing Centers continues while suitable "development ready" sites that meet key data center site selection factors cited below are not now available in the Silicon Forest. Continuing growth of like-kind data centers in/near the Silicon Forest will spur growth in many of the high-tech support businesses identified in this Table.

- Key Data Centers Site Selection Factors: *Non-exposure to natural disasters, clean power source, fiber network connectivity, transportation, construction/permit costs, taxes/land & economic incentives, speed to market (go-live-time)*[21]. Potential North Plains UGB Expansion Sites abutting the City can offer these data center site-selection advantages due to their close Silicon Forest proximity.

- Existing Silicon Forest Data Centers in this Table range in site sizes: 90 acres (large site), 48 acres (mid-size site), 9-20 acres (smaller sites). NP 200 Acres UGB expansion proposal – 100 acres in 2 separate locations can accommodate:

21 Source: Site Selection Magazine: *Data Centers: Site Selection 101*, Nov. 2012

- One 100-acre large data center site on a 100-acre sites similar to the QTS Data Center., or
- Several mid-size and smaller-size data centers on the potentially divisible 100-acre site. These would be "Edge Data Centers"[22] such as *Digital Reality, NTT Global Data Center, T5 Data Center* and *Stack Infrastructure* Data Centers.

- Other Silicon Forest Software & IT Companies include *Salesforce, Synopsis, Laika, Oracle, Microsoft, Adobe.* Like-kind new companies seeking Silicon Forest locations can be accommodated on suitable sites w/in potential North Plains UGB Expansion sites (Recent Westside location patterns for such companies suggest this: i.e.; Synopsis & Salesforce co-locate on 34.82-acre, business park site: each user occupying multi-story structures.)

- The Silicon Forest contains a concentration of tech giants, software and medium firms indicating continuing land demand for more sites by such high tech companies, including "development ready" (per industry site location standards) sites. NP UGB expansion area can accommodate that demand within the two (2) 100-acre sites proposal.

COMPUTER & ELECTRONIC & ADVANCED MANUFACTURING **(Silicon Forest contains 71 firms, 39 semiconductor businesses, 23,404 direct industry jobs; $167k average wage)**				
JSR Micro, Inc. Materials Innovation	High Tech Products; Semiconductor Manufacturing & Supplier	High Tech	1N22 100 TL 1500	17.69 Acres
Intel Ronler Acres	Advanced Integrated Digital Technology Platforms; Product Development (5 campuses, 21,394 jobs)	High tech	1N22 700 TL 100, 104, 1650	410.73 Acres
Intel Jones Farm	New Technology Product Research & Development (5 campuses)	High Tech	1N22 900 TL 802	116.71 Acres
Intel Hawthorne Farms	Advanced Integrated Digital Technology Platforms	High Tech	1N2 34B TL 100	53.14 Acres
Applied Materials (5 campuses)	Semiconductor Manufacturing Equipment, Device Manufacturing (5 campuses; 500 jobs)	High Tech	1N22 6B Tl 100 (Hillsboro campus only)	4.3 Acres
Qorvo	Advanced RF Solutions, Device Manufacturing (1085 jobs)	High Tech	1N22 8DA TL 1300, 1400	29.71 Acres

22 "Edge Data Center" computing: Moves a business' data and cloud data storage and computing resources out of a central data center and closer to the business generating the data. Source: *"What is Edge Computing",* Bigelow, TechTarget

Lattice Semiconductor	Product Development (122 jobs)	High Tech	1N234B TL 300	11.04 Acres
Jireh Semiconductor	Power MOSFETs and Power ICS (481 jobs)	High Tech	1N226B TL 302	24.21 Acres
Hitachi High Tech America (3 sites; 2 w/in Ronler Acres & Jones Farm sites)	Semiconductor Equipment/Electron Microscope Production (275 jobs)	High Tech	1N226B TL 1500	2.51 Acres

NOTES

- Attracting/accommodating High tech Manufacturers and Advanced Manufacturing business, large and small, like those identified in this Table is a North Plains industrial growth and development priority. Demand for such sites within the Silicon Forest continues while suitable "development ready" sites that meet key data center site selection factors cited below are not now available in the Silicon Forest.
- Appendix A Table: Industry Standard: *High Tech Manufacturing & R&D Site Size Competitive Edge: 5 – 100+ Acres*. Silicon Forest High Tech Companies listed in this table reflect that site size range.
- Existing Silicon Forest High Tech Companies in this Table range in site sites: 100-400+ acres (large sites), 20-50 acres (mid-size sites), 5-20 acres (small sites). Potential North Plains UGB Expansion Sites abutting the City can accommodate:
    - One 100-acre large high-tech site like Intel Jones Farm or two (2) mid-size sites like Intel Hawthorne Farms on a 100-acre site, or
    - Several small high tech sites similar in size to the remaining existing tech companies listed in the Table within a divisible 100-acre site .
    - The lack of suitable large industrial sites within the Portland Region (Oregonian Articles by Mike Rogoway)

- Other Silicon Forest High Tech Companies: *Tokyo Electron, Leyard Planar, ASML.* Other Silicon Forest Advance Manufacturing Companies: *Dynic USA, Davis Tool, Inc., Ammcon, CST Cascade System Technology*
- NP UGB Expansion Proposal Table describes a need for three (3) 100-acre sites:

    - Two (2) 100-acre sites to accommodate stand-alone data centers and/or larger high tech companies that need large sites like those in the Intel campuses at *Ronler Acres* and *Hawthorne Farms* – 200 total acres.
    - One (1) 100-acre site to accommodate, alternatively, large, medium and/or smaller tech company site needs within one large industrial business park to accommodate a concentration of companies like *Tokyo Electron, Leyard Planar, ASML* and various Advance Manufacturing Companies *Dynic USA, Davis Tool, Inc., Ammcon, CST Cascade System Technology.*

HIGH TECH, & GENERAL INDUSTRIAL SUPPORT BUSINESSES

(These businesses are located in Helvetia/West Union Road Industrial Area[23]: Approx. 127 developed acres (excluding roads, BPA r/w, vacant parcels))				
Quantum Clean	High tech Outsourced Parts Cleaning and Coating (32 jobs)	High Tech Support	1N214AD TL 4800	4.00 Acres
Komico	Semiconductor equipment cleaning and refurbishing (under construction)	High Tech Support	1N222AA TL 400	5.58 Acres
Daifuku Cleanroom Automation America	Material Handling System (83 jobs)	High Tech Support	1N222 TL 3300	1.92 Acres
Sunset Highway Business Park	Tenants: *PSK, Style Motors, Party Pros, MFCP Motion & Flow Control Products, Stanley Steemer, Acme, JR, Evatec, CMC Materials, Ebara)*	Business Park	1N222BA TL 200	21.55 Acres
CMC Materials (part of Sunset Hwy. Bus. Park)	CMP Slurries and CMP polishing pads (282 jobs in all Silicon Forest sites)	High Tech Support	1N222AB TL 200	[4.22 Acres]
Evatec (part of Sunset Hwy. Bus. Park)	Physical Vapor Deposition (PVD) Systems (10 jobs)	High Tech Support	Por. 1N222BA TL 200	N/A
Ebara Technologies (part of Sunset Hwy. Bus. Park)	Vacuum Pumps, Water Processing Equipment (109 jobs)	High Tech Support	1N215CD TL 500	[4.10 Acres]
Five Oaks Business Park (4 bldgs.)	Tenants: *AMG, Ebara, Green Energy Solutions, North Coastal Solutions, Maxima USA, U.S. Linen & Uniform, Yamato Transport USA.*	Business Park	1N215CD TL 200, 300, 400 & 500	12.39 Acres
Pinefarm Business Park (5 bldgs.)	Tenants: *PuroClean, Muratec, SteepleJack*	Business Park	1N222AB TL 100	3.65 Acres
Fortior Solutions	Identification Management Programs & Services	Business Security Systems & Consulting	1N222AB TL 200	5.83 Acres
GXO Solutions	Logistics & Supply Chain Management	Business Consulting	1N215DC TL 100	4.66 Acres
Fiber SensSystems	Fiber-optic Intrusion Detection Systems for Perimeter Security & Physical Data Networks	High Tech Support	1N222AC TL 3400	1.96 Acres
Master Halco	Fencing Materials Production, Installation	Business & Property Fencing	1N222AC TL 3000	8.02 Acres
Micron Laser Technology	Electrical Equipment & Component Manufacturing, Electrical Equipment (30 jobs)	High Tech Support	1N222AC TL 102	9.87 Acres

[23] Area bounded by US Hwy. 26. Jacobsen Road & Croeni Road.

Edwards Vacuum	Machinery Manufacturing, Air & Gas Compressors (30 jobs)	High Tech Support	1n222AA TL 100, 200, 700	8.08 Acres
Tosoh Quartz	Quartz Glassware for Semiconductor Industry for Processing Integrated Circuits, Electronic Manufacturing (201-500 jobs: all company sites)	High Tech Support	1N222AC TL 108	5.00 Acres
Green Space	Design & Build, Solar Panels, Green Operations, Sustainable Construction, Green operations, Materials Reclamation (46 jobs)	Businesses Support & Display Consulting/Services	1N222AC TL 300 & 400	10.43 Acres
Javelin Logistics	Full spectrum of inventory/material management logistics and transportation services; material warehousing and distribution and order fulfillment services.	High tech and businesses support	1N22200 TL 1700	7.15 Acres
DHL Supply Chain	Businesses Logistical Solutions re: transportation, warehousing and management services	High tech and businesses support	1N222AAA TL 600	4.42 Acres

NOTES

- Three (3) Business Parks containing 37.59 acres containing a mix of high-tech support businesses and other smaller general business and professional services companies are located within the Helvetia/West Union Road Industrial Area. NP anticipates a moderate distribution of such Parks within the UGB expansion area, continuing a regionwide trend of industrial business park growth and development.

- NP UGB Expansion Proposal Table describes a need for two (2) 100-acre sites:
    - Each 100-acres site to accommodate 2-3 Industrial Parks similar in scale to the *Sunset Highway Business Park, Pinefarm Business Park* and the *Five Oaks Business Park* and contain those high tech and general industrial support businesses such as those scattered throughout the Helvetia/West Union Road Industrial Area.
    - Additionally, the 2 Parks would contain enough land to accommodate tech-based businesses such as *Salesforce, Synopsis, Oracle, Microsoft, Laika* separately or in smaller clustering sites.

- Replicating the mixture and array of various types of high-tech, high-tech support and general industrial uses within the Helvetia/West Union Road Industrial Agglomeration within new larger and smaller Industrial Parks on suitable UGB expansion areas is a North Plains priority per its Vision and adopted economic growth/development priorities. The existence of the list of such industrial uses w/in the Table demonstrates the reasonable feasibility of NP being able to attract/accommodate such like-businesses within new business parks situated in proposed industrial UGB expansion sites.
- Re: NP casting a "wide net" re: attracting a diverse industrial profile of fabricators, suppliers, research facilities, etc.
- All these high-tech support operations are scattered throughout this Area either on separate lots or in co-located structures.
- Site size range

BIOSCIENCE & MEDICAL DEVICES

(44 firms, 1,119 direct industry jobs; $71k average wage)

Genentech	Medical Fill Finish Packaging and Distribution Facility (450 jobs)	Biotech	1N221 TL 2800, 2801, 2802 & 2900	75 Acres
Acumed Facilities (2 sites)	Medical Implant Devices Research, Design and Manufacture (headquarters, 32 jobs) for global distribution.	Biotech	1N222C00900	8.49 Acres

NOTES

- The presence in the Silicon Forest of industry leaders in advance materials, software systems, precision manufacturing and health research create opportunities for biotechnology firms to locate in and near the Silicon Forest, including on North Plains UGB expansion sites. Existing companies like *Genentech, Acumed, Forest Equipment, Accute Innovations* reflect growth of this specialized industry cluster on the Westside

Other Major Businesses (Warehousing & Distribution; Other)				
Amazon	Consumer Goods Marketing, Sales & Distribution center (potential expansion site)	Wholesaler & Retailer Storage, Sales, Distribution	1N22100, TL 2600 & 2700	8.46 Acres
Columbia Industries	Outdoor Sports Equipment & Apparel Wholesale and Retail Complex	Consumer Goods Warehouse & Sale Outlet	1N222 TL 1400	8.85 Acres
WashCo. Consolidated Communications	Government Agency Communication Services	Government	1N215DC TL 200	6.00 Acres
Petersen CAT	Heavy Construction Equipment Sales & Rentals	Construction Industry Support	1N222 TL 3500	22.51 Acres
Cascade Wholesale Hardware	Hardware, Plumbing & Heating Equipment and Supplies (1 of 43 US companies) (50 jobs – all sites)	Wholesale Products	1N222 TL 1600	7.53 Acres
Seals Unlimited	Production of rubber extrusion, molding, gaskets, hydraulic gate seals for government and private industries.	General Industrial	1N22200 TL3200	4,64 Acres

NOTES

- The Amazon expansion site indicates NP potential to attract similar consumer goods operations on available and suitable larger UGB expansion sites. It is located on Huffman Road south of Hwy. 26.
- The Columbia Industries, WashCo. Consolidated Communications Agency and Petersen CAT businesses are located within the Helvetia/West Union Road Industrial Area.

APPENDIX C: NORTH PLAINS FISCAL ANALYSIS MEMO

Date: March 10, 2022

To: North Plains City Council
City Manager Andy Varner

From: Finance Director Bill Reid

Subject: Service Levels & Fiscal Sustainability of Urban Growth Boundary Expansion

---

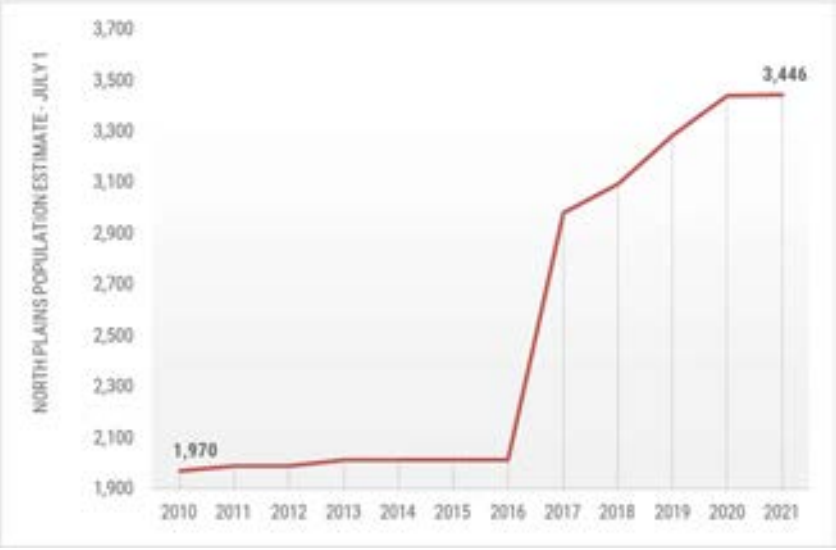
This memorandum is intended as a discussion of the fiscal trends and issues that face the City of North Plains as it currently determines an appropriate Urban Growth Boundary ("UGB") expansion.

This memo is divided into the following topics:

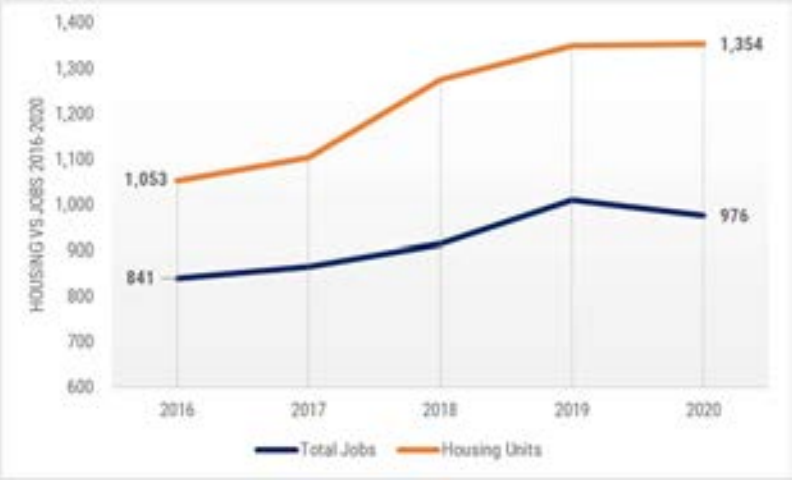
A. Recent & Future Growth Following End of Voter-Approved Annexations
B. North Plains Service Levels & Services Funding
C. City Council Four Priorities for UGB Expansion
D. Implications for UGB Expansion: Employment Investment vs. Residential Investment

A. Recent & Future Growth Following End of Voter-Approved Annexations

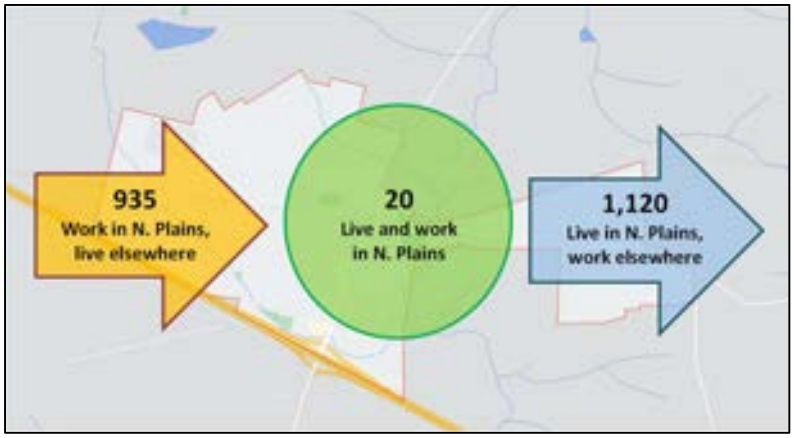
Since the passage of Senate Bill 1573 in 2016 and its affirmation by the Oregon Supreme Court in 2017, the City of North Plains has realized significant new population growth due to development of new housing via legislative annexations. The figure to the right graphically illustrates how North Plains added almost 1,500 residents between 2010 and 2021.



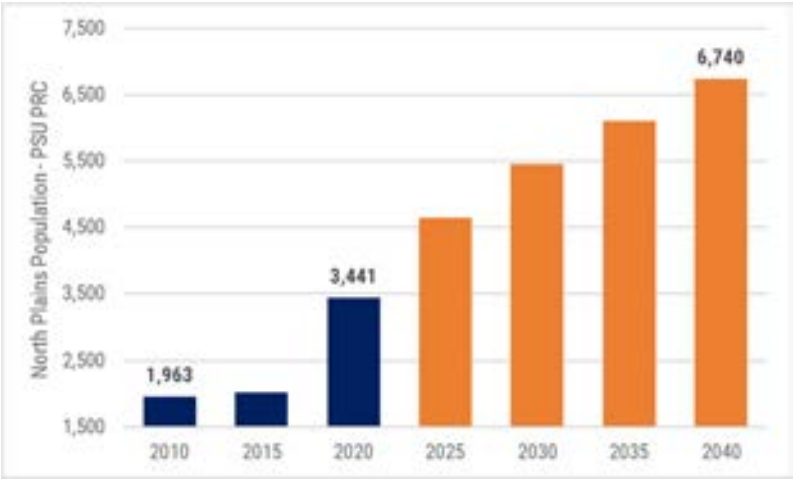
While North Plains has added new housing units and population, Oregon Employment Department data show that job growth has not kept pace as indicated in the figure to the right. The result has been a steady worsening of the City's jobs-housing balance. As will be discussed in the next section, this has also resulted in an increasingly severe fiscal imbalance for the City's tax base.



According to US Census Bureau Census on the Map data, North Plains residents overwhelmingly work for employers in other cities, most notably Intel in Hillsboro and Nike in Washington County near Beaverton. The figure to the right displays the bedroom community pattern data for 2019, the most recent year available.

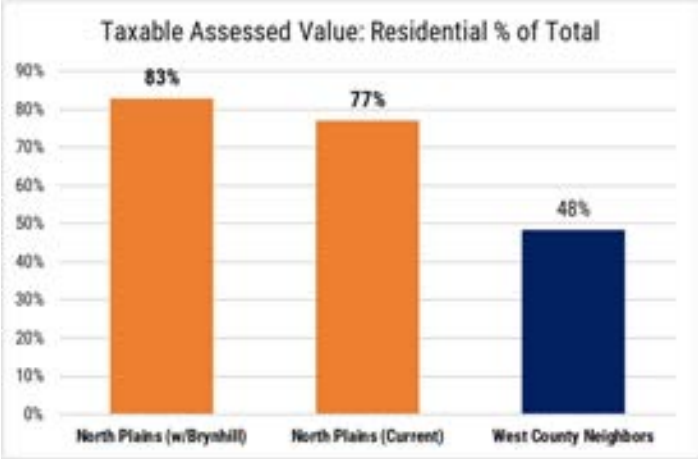


Moving forward, the City must plan for continuation of similar population growth over the next 20 years as forecasted by Portland State University's Population Research Center. As the figure to the right indicates, the City must plan for 6,740 residents in 2040 and then roughly 7,000 residents to be living in North Plains by 2042.

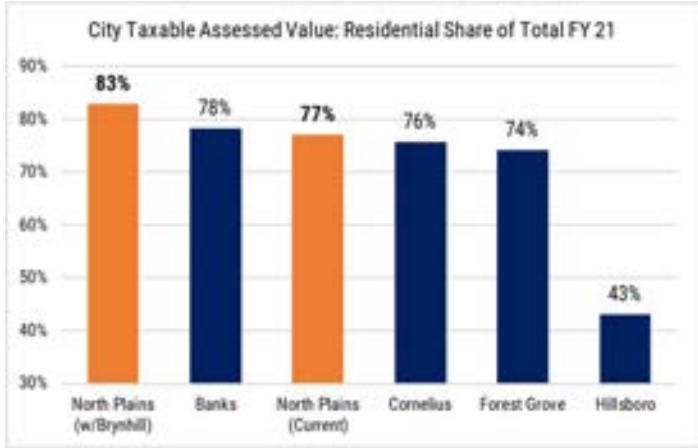


B. North Plains Service Levels & Services Funding

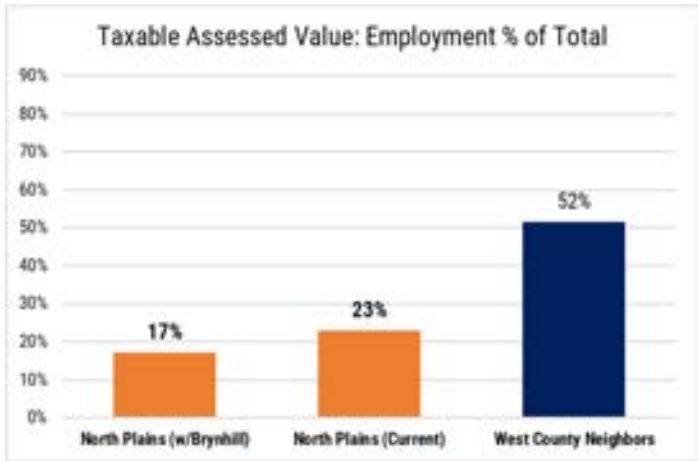
North Plains' growth as a bedroom community for employers in other cities has pushed the city tax base into severe overreliance on residential assessment. Washington County tax assessment data to the right indicates North Plains currently has the second-highest reliance on residential taxable assessed value ("TAV") (77%). With Brynhill built out in five years, the City will have the highest reliance on residential assessment among its neighbors (83%).



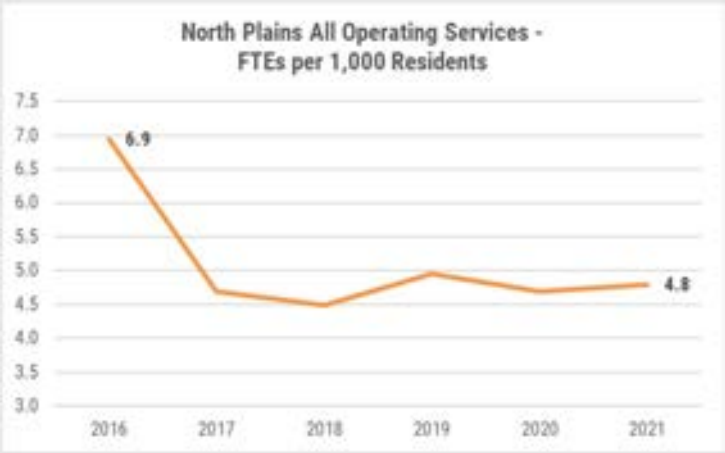
For more specific perspective, the figure on the right displays the share of City TAV that is residential land and improvements for North Plains now, after Brynhill build-out, and Banks, Cornelius, Forest Grove and Hillsboro.



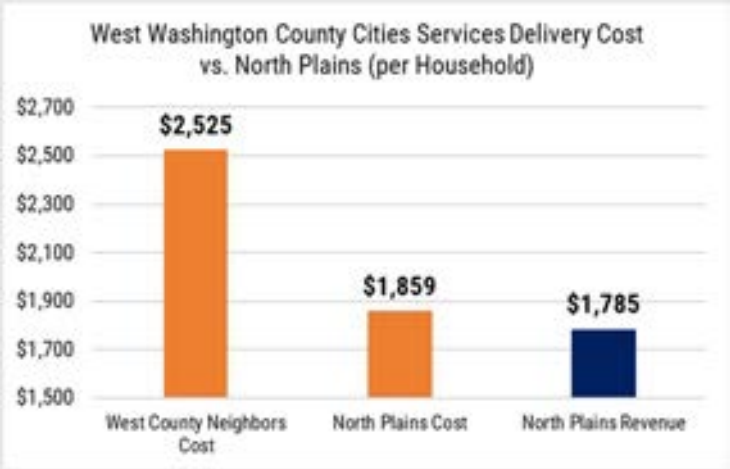
Taxable assessed value from employment uses, therefore, is among the lowest and will be the lowest among West County neighbors after Brynhill is built out (17%). Comparatively, North Plains' neighbors average 52% of total tax value attributable to employment investment value.



North Plains' rapid growth as a bedroom community since 2016 and increasing reliance on higher-cost residential tax assessment has led to declining service levels over time. The figure to the right displays annual FTEs per 1,000 population in North Plains, which is currently at an all-time low for staffing to meeting resident services needs. Staffing levels to the right include law enforcement that is now contracted with Washington County Sheriff's Office.



Every new household in North Plains costs the City $1,859 in services each year on average while revenue attributable to each household is currently $74 less at $1,785. Across all households in North Plains – and with 3% assessment growth under Measure 50 – that is a sizeable difference to be made up by limited existing employment tax base. That deficit grows each year as costs escalate by 4% to 5% in low-inflation years.



Given the current North Plains employment tax base, it would be fiscally impossible currently and worse with each passing year to provide higher quality of life services comparable to what residents of other nearby cities enjoy: North Plains' neighbors provide a calculated average of $2,525 in operating services per household with a significantly higher business tax base. In other words, if North Plains wanted to provide comparable services and quality of life to the average of its four closest neighbors, it would need enough business investment to make up an almost $800-per-household deficit.

C. North Plains City Council Four Priorities for UGB Expansion & City Quality of Life

Recognizing that the rapid descent into low-service level bedroom community status is not fiscally sustainable and provides a low quality of life, in fall 2021 the City Council of North Plains adopted a set of economic development priorities to guide the update of the Economic Opportunities Analysis, other City economic development initiatives, and partnerships with Washington County and the State of Oregon.

Priorities 2 and 3 in particular call for expansion of business investment in North Plains to allow the City to provide adequate services in a fiscally sustainable manner as population grows, specifically in a reversal of the current bedroom community trend. All Priorities speak to the need to act boldly to enhance City livability via improved jobs-housing balance, fiscal sustainability, adequate infrastructure and services, and local presence of shopping and services to reduce vehicle miles traveled and enhance safety.

PRIORITY 1: Reverse the worsening trend of bedroom community status for North Plains with a thriving jobs-housing balance by expanding and diversifying employment opportunity and industry profile and presence.

PRIORITY 2: Grow business investment in North Plains to encourage expansion and diversification of the City's property tax base to reverse the imbalance created by a growing bedroom community development trend.

PRIORITY 3: Ensure and sustainably fund community-supporting infrastructure, economy-supporting infrastructure, and expanded City services such as recreational offerings that enhance community health and diversify the City economy.

PRIORITY 4: Expand the local presence of important, everyday commercial services for the residents of North Plains which offers a shorter and safer distance rather than at extended and costly distance to other cities.
(Resolution No. 2160, September 2021)

D. Implications for UGB Expansion: Employment Investment vs. Residential Investment

In summary, the following are presently true of North Plains' fiscal path, service levels, and therefore quality of life for residents:

- North Plains population growth has accelerated dramatically following the end of voter-approved annexations in 2016.
- Portland State University Population Research Center forecasts North Plains' population growth will not abate over the next 20 years and drives a new need for city UGB expansion.
- Population growth has overwhelmingly been households employed in other cities; in other words, North Plains has grown as a provider of workforce housing and services to other cities' economies and resulting, growing employment tax base.
- Alternatively, other cities reap the benefit of property taxes and various fees from employers whose employees live in North Plains and depend upon the City of North Plains for public services.
- North Plains' rapid growth as bedroom community for employers outside North Plains has created a significantly worsening tax base balance between residential assessment and employment assessment.
- North Plains' service levels have decreased with population growth and created a fiscal situation that makes it impossible to enhance service levels to quality-of-life standards in other Western Washington County communities.
- Any enhancement to services without expansion of the employment tax base will result in a growing per-household revenue deficit that already exists.

Based on North Plains City Council directive to shore up fiscal sustainability, safety, and service levels that provide a comparable quality of life to other Western Washington County residents, the following table provides an analysis of the order of magnitude of employment land acreage and taxable assessed value (TAV) that would need to be added to within the North Plains UGB by 2042 (constant 2021 dollars from FY 21 taxable assessed value data from Washington County Department of Assessment & Taxation).

Depending upon whether North Plains employment areas have similar intensity to private investment in the Helvetia Industrial Area (HIA) of Hillsboro or achieve closer to 75% intensity of the HIA, North Plains would need between 554 acres to 739 acres of additional, developed employment land, facility and machinery/equipment investment to provide North Plains with a comparable tax base to the average tax base balance of its neighbors Banks, Cornelius, Forest Grove and Hillsboro.

Helvetia Industrial Area - Comparable Development Intensity	
Current + Brynhill + 2021 HNA Residential TAV	$646,003,460
Needed 2042 Employment TAV for 52% West County Average	$699,837,082
Current Employment TAV	$90,475,991
Net New Employment TAV Needed in a UGB Expansion	$609,361,091
TAV Per Acre: Helvetia Industrial Area	$1,100,000
Employment Land Acres Needed in UGB Expansion	**554**

Helvetia Industrial Area - 75% Development Intensity	
Current + Brynhill + 2021 HNA Residential TAV	$646,003,460
Needed 2042 Employment TAV for 52% West County Average	$699,837,082
Current Employment TAV	$90,475,991
Net New Employment TAV Needed in a UGB Expansion	$609,361,091
TAV Per Acre: Helvetia Industrial Area 75% Intensity	$825,000
Employment Land Acres Needed in UGB Expansion	**739**

APPENDIX D: METRO AREA LAND INVENTORY AND EMPLOYMENT GROWTH FORECASTS

APPENDIX D: METRO AREA LAND INVENTORY AND EMPLOYMENT GROWTH FORECASTS

A. REGIONAL INDUSTRIAL LAND SHORTAGE

The shortage of large industrial sites in Oregon, shovel-ready or not, is well established and has been an on-going topic of discussion in localities, the Portland Metro region, and statewide. The recent passage of the $52 billion Federal CHIPS Act, which should be a boon to the region's important semiconductor sector has triggered a renewed assessment of the industrial land inventory available to respond quickly when economic development opportunities arise.

The preliminary results of the Oregon Semiconductor Competitiveness Task Force, chaired by the Oregon's Governor, US Senator, and the CEO of Portland General Electric has recently reached dire conclusions about the State's ability to accommodate new large industrial users and suppliers with the available industrial land and site sizes available.

Metro has studied land readiness over the last decade, periodically updating its inventory of remaining industrial sites and assessing them for readiness. The sites are ranked in Tiers, indicating readiness for near-term development, with Tier 1 sites being ready and Tier 3 being the least ready. When last updated in 2017, there were 47 sites over 25 acres in size. The Task Force recently updated the inventory to find that the supply had fallen by 40% to 28 total sites. Only two non-contiguous Tier 1 sites remain, totally 82 acres, and these sites lack the size to be adequate for large industrial users.

FIGURE 1: PORTLAND METRO INVENTORY OF LARGE INDUSTRIAL SITES

	2011 Inventory	2014 Inventory	2017 Inventory	2022 Inventory
Tier 1	9	14	10	2
Tier 2	16	17	11	6
Tier 3	31	23	26	20
Total	56 sites	54 sites	47 sites	28 sites

Source: Oregon Semiconductor Competitiveness Task Force, Mackenzie

While the Task Force is focused on the semiconductor industry (discussed more below), it should be noted that this is the total industrial inventory available for all categories of industrial users in the Metro boundary. (This inventory is for industrial land within the Metro UGB, and not the more broadly defined metropolitan region.) As the Tier categories imply, much of the remaining inventory also faces barriers to quickly access and serve with infrastructure.

These findings support the conclusion that the region currently has few to no sites to offer a large new industrial business recruitment or major expansion of an established industry. As the Task Force points out:

> A major component of economic competitiveness is the time it takes to assemble the baseline ingredient of development: industrial land. In many states and countries this isn't a challenge, but in Oregon, it has become a serious barrier in achieving our goals surrounding shared economic prosperity.
>
> As established in this report's "Opportunity" section, Oregon is on the cusp of a 1990s-like semiconductor boom when billions were invested and industry employment more than doubled. That boom was facilitated by 2,000+ acres of industrial land.
>
> As discussed [in this report], this subcommittee found that Oregon faces a serious shortage of available, development-ready large industrial sites relative to 1990s-like demand. If left unaddressed, the shortage presents a critical threat to Oregon's semiconductor industry competitiveness….
>
> …Our lack of industrial land is a chronic problem that has been vividly exposed by the surge [of] interest in semiconductor expansion[1]
>
> - Oregon Semiconductor Competitiveness Task Force

B. CHIPS Act and Semiconductor Industry

The shortage of industrial sites is made especially pressing by the passage of the $52 billion CHIPS Act which is aimed to benefit domestic semiconductor chip manufacturers and suppliers. The Act also signals a strong commitment to boost the industry that may produce additional future funding and incentives as well.

A major beneficiary if not the largest beneficiary of this federal spending will be Intel, the world's largest semiconductor company and the largest private employer in Oregon with an estimated 22,000 employees statewide. Considering that Intel's Oregon campuses are the company's "largest and most comprehensive" sites, they may see a sizable allocation of the CHIPS subsidies to Intel. The allocation of funding to different companies, and thus states or regions, is unknown at this time but financial and stock analysts predict the company could see a benefit of $10 to $19 billion.

Intel is also the center of the large cluster of industry partners, competitors, and suppliers that Intel has attracted in the "Silicon Forest." This cluster is already arguably the most important statewide economic engine outside of natural resources, supplying very high-wage employment, attracting talent and investment, and driving high tech innovation in the state.

Besides Intel, Oregon is home to roughly 150 related companies employing 10,000 additional workers. Oregon's economic output from this sector is second only to Texas.[2] And the state is home to an estimated 15% of the sector's domestic workforce.

[1] "Seizing Opportunity, Initial Report and Subcommittee Findings", Oregon Semiconductor Competitiveness Task Force, August 2022. Pages 20, 23.
[2] Terry, Lynne. "Semiconductor bill that would benefit Oregon passes first hurdle," Oregon Capital Chronicle, July 2022.

As the Task Force's initial report finds "the semiconductor industry is especially prone to clustering" due to efficiencies of pooling talent, suppliers, and collaborators in one region. For this reason, the economic impact of the CHIPS Act is anticipated to be especially strong in the Portland metropolitan area, and Washington County where this cluster is already established. The report concludes that the industry "…is highly likely to continue clustering in the Metro region, with smaller but significant nodes of supplier-related activity in the Willamette Valley."

The Task Force concludes there is a "short-term" need for the following, with a goal to make progress "heading in to the 2023 legislative session":

- **Engaging local jurisdictions within Portland Metro and Willamette Valley** to determine land availability and site readiness for semiconductor expansion in their respective communities.
- Reviewing responses against criteria to create an updated map of sites of significance for semiconductor expansion **both inside and outside the Urban Growth Boundary** ***based on planning documents and community interest.***
- Creating an updated map to identify sites most suitable for semiconductor expansion during this next growth cycle, including the following, *keeping in mind demand could exceed these needs*:
    - **Two sites of approximately 500 acres** to accommodate large-scale semiconductor R&D and/or production fabrication operations.
    - **Four sites of 50-100 acres** suitable for independent device manufacturers or major semiconductor equipment manufacturers.
    - **At least eight sites of 15-35 acres** to enable key suppliers to the semiconductor cluster to expand.[3]

[All emphasis added]

- Oregon Semiconductor Competitiveness Task Force

As noted, the region does not current offer sites of anywhere near 500 acres, or even Tier 1 sites of 50+ acres. This new inventory must be identified quickly, as nearly half the funds of the CHIPS Act are planned to be spent in the first two years, and all funds over five years.

North Plains Readiness

The short-term process outlined by the Task Force specifies collaborating with local jurisdictions to find partners interested in making land and sites available, "both inside and outside the Urban Growth Boundary".

Because of the deliberative nature of Oregon land use planning and the Urban Growth Boundary amendment process it will be a challenge for most communities to respond expeditiously to this short-

[3] "Seizing Opportunity, Initial Report and Subcommittee Findings", Oregon Semiconductor Competitiveness Task Force, August 2022. Pages 22.

term need. This will increase the importance and priority of communities with the current "planning documents and community interest," as specified. These communities will be able to move the quickest to make more industrial land available to serve regional and state needs.

North Plains is in the process of a UGB Amendment study that has already identified the need for substantial new industrial land, including multiple large sites. As a community well underway in the planning process and located directly adjacent to the North Hillsboro semiconductor (and other industrial) cluster in the Silicon Forest, North Plains is an excellent potential partner for facilitating short-term industrial land readiness in keeping with the goals and identified needs of the State Task Force.

C. METRO UGB AND BROADER REGIONAL EMPLOYMENT FORECASTS

The City of North Plains is a neighbor to the boundary of the Metro regional government (Metro) that includes the nearby communities of Hillsboro, Cornelius, and Forest Grove. North Plains is part of the Portland metropolitan area in the colloquial sense that many of the community's residents work, shop, and conduct other business in the Metro area. Likewise, employees at local businesses commute from the Metro area to North Plains. At less than four miles, and a quick trip by highway, North Plains is one of the closer communities outside of the Metro UGB as discussed in the EOA report.

When looking at the three-county region (Washington, Multnomah, Clackamas Counties), it is the assumption that the lion's share of new job growth and employment will be within the Metro UGB where the largest population and job centers are located. Given this assumption, some may further assume that there will be comparatively little employment growth in the communities outside of the Metro UGB.

However, a comparison of the three-county employment forecasts prepared by Metro itself, and the three-county employment forecasts prepared by the Oregon Employment Department show that Metro is not planning to accommodate nearly as much employment as the state is predicting (Figure 2).

FIGURE 2: PORTLAND THREE-COUNTY EMPLOYMENT FORECAST, METRO AND OED

	2020	2030	Employment Growth		Share of OED Forecast
OED Projection[1]					
3-County Area:	996,500	1,169,900	173,400	17%	100%
Metro Projection[2]					
3-County Area:	1,026,032	1,091,568	65,536	6%	38%
Metro UGB Cities:	869,782	916,928	47,146	5%	27%
Unincorporated Areas:	142,058	160,054	17,996	13%	10%
Non-Metro Cities:	156,250	174,640	18,390	12%	11%

[1] Portland Tri-County Industry Projections 2020-2030, Oregon Employment Department (11/21)

[2] 2045 Distributed Forecast of Population, Households, and Employment, Metro (2/21)

Both Metro and OED have employment growth projections dating from 2021 and covering the 2020 to 2030 period. Metro's projection includes all land and communities within the three counties, not just those within the UGB, and will be used in Metro's updated Urban Growth Report. Some of the findings are summarized below:

- Metro projects just 38% of the total job growth projected by OED in the three counties (65k vs. 173k).
- OED projects an average annual employment growth rate of 1.6% per year during this period, while Metro projects a much lower rate of 0.6% per year.
- Metro's projected employment growth rate is much lower than the average annual *population* growth rate experienced over the last 10- or 20-year periods. In fact, Metro is planning for far fewer new jobs (65k) than the Metro's accompanying projection of the number of new households (114k) over the same period.
- As Metro uses this adopted employment forecast for regional land use planning, it will plan for only enough employment lands (commercial and industrial) to accommodate a fraction of what state economists predict the three-county region will see.
- Even if the Metro UGB were to absorb 100% of Metro's own projected employment growth, this would leave nearly 110k jobs (or 62% of the total) from the OED forecast for the three counties, unaccounted for over the next 10 years.
- As the state forecast seems more accurate, in keeping with historical and projected household growth rates and economic development goals to maintain sufficient employment land to facilitate business formation and job opportunities, it suggests that it is prudent for other communities within the three-county area to plan for excess employment growth that Metro is not currently anticipating or planning for. North Plains, due to its proximity and access, would be foremost among these communities.

Executive Summary

This is an executive summary of the findings of the Sherwood Housing Needs Analysis for the 2018 to 2038 period. The housing needs analysis provides Sherwood with a factual basis to support future planning efforts related to housing, including Concept Planning for Sherwood West, and prepares to update and revise the City's Comprehensive Plan policies.

The housing needs analysis is intended to comply with requirements of statewide planning policies that govern planning for housing and residential development, Goal 10, it's implementing Metropolitan Housing Rule (OAR 660-007), and Metro's 2040 Functional Growth Management Plan. Taken together, the City's primary obligations from Goal 10 are to (1) designate land in a way that provides the opportunity for 50% of new housing to be either multifamily or single-family attached housing (e.g., townhouses); (2) achieve an average density of six dwelling units per net acre; and (3) provide enough land to accommodate forecasted housing needs for the next 20 years. Sherwood is able to meet these requirements and can accommodate most of the new housing forecast, as described in this summary.

How has Sherwood's Population Changed in Recent Years?

The basis for the housing needs analysis is an understanding of the demographic characteristics of Sherwood's residents.[1]

- **Sherwood's population grew relatively fast in recent years.** Sherwood's population increased from 3,000 people in 1990 to nearly 18,600 people in 2013, averaging 8% annual growth. Sherwood's fastest period of growth was during the 1990s, consistent with statewide trends. Between 2000-2013, Sherwood grew by 6,600 people, at an average rate of nearly 3.5% per year. For comparison, Washington County grew at 2.5% annually between 1990-2013 and the Portland Region grew at 1.6% per year.

- **Sherwood's population is aging.** People aged 45 years and older were the fastest growing age group in Sherwood between 2000 and 2010, consistent with state and national trends. By 2035, people 60 years and older will account for 24% of the population in Washington County (up from 18% in 2015) and 25% in the Portland Region (up from 19% in 2015).

[1] The majority of data quoted in this analysis is from the U.S. Census American Community survey, with population data from the Population Research Center at Portland State University and development data from the City's Building Permit database.

It is reasonable to assume that the share of people 60 years and older will grow relatively quickly in Sherwood as well.

- **Sherwood is attracting younger people and more households with children**. In 2010, the median age in Sherwood was 34.3 years old, compared to Washington County's median age of 35.3 years and the State median of 38.4. Sherwood has a larger share of households with children (47% of households), compared with Washington County (33%) or the Portland Region (29%). The Millennial generation—people born roughly between 1980 to 2000—are the largest age group in Oregon and will account for the majority of household growth in Sherwood over the next 20 years.

- **Sherwood's population is becoming more ethnically diverse.** About 6% of Sherwood's population is Latino, an increase from 4.7% in 2000. In comparison to Washington County and the Portland Region, Sherwood is less ethnically diverse. In the 2009-2013 period, 16% of Washington County residents, and 12% Portland Region residents, were Latino.

WHAT FACTORS MAY AFFECT FUTURE GROWTH IN SHERWOOD?

If these trends continue, population will result in changes in the types of housing demanded or "needed" in Sherwood in the future.

- **The aging of the population is likely to result in increased demand for smaller single-family housing, multifamily housing, and housing for seniors.** People over 65 years old will make a variety of housing choices, including: remaining in their homes as long as they are able, downsizing to smaller single-family homes (detached and attached) or multifamily units, or moving into group housing (such as assisted living facilities or nursing homes) as they continue to age.

- **The growth of younger and diversified households is likely to result in increased demand for a wider variety of affordable housing appropriate for families with children, such as small single-family housing, townhouses, duplexes, and multifamily housing.** If Sherwood continues to attract young residents, then it will continue to have demand for housing for families, especially housing affordable to younger families with moderate incomes. Growth in this population will result in growth

in demand for both ownership and rental opportunities, with an emphasis on housing that is comparatively affordable.[2]

- **Changes in commuting patterns could affect future growth in Sherwood.** Sherwood is part of a complex, interconnected regional economy. Demand for housing by workers at businesses in Sherwood may change with significant fluctuations in fuel and commuting costs, as well as substantial decreases in the capacity of highways to accommodate commuting.

- **Sherwood households have relatively high income, which affects the type of housing that is affordable.** Income is a key determinant of housing choice. Sherwood's median household income ($78,400) is more than 20% higher than Washington County's median household income ($64,200). In addition, Sherwood has a smaller share of population below the federal poverty line (7.6%) than the averages of Washington County (11.4%) and the Portland Region (13.9%).

WHAT ARE THE CHARACTERISTICS OF SHERWOOD'S HOUSING MARKET?

The existing housing stock in Sherwood, homeownership patterns, and existing housing costs will shape changes in Sherwood's housing market in the future.

- **Sherwood's housing stock is predominantly single-family detached.** About 75% of Sherwood's housing stock is single-family detached, 8% is single-family attached (such as townhomes), and 18% is multifamily (such as duplexes or apartments). Sixty-nine percent of new housing permitted in Sherwood between 2000 and 2014 was single-family detached housing.

- **Almost three quarters of Sherwood's residents own their homes.** Homeownership rates in Sherwood are above Washington County (54%), the Portland Region (60%), and Oregon (62%) averages.

- **Homeownership costs increased in Sherwood, consistent with national trends.** Median sales prices for homes in Sherwood increased by about 30% between 2004 and 2014, from about $245,000 to $316,500. The median

[2] The housing needs analysis assumes that housing is affordable if housing costs are less than 30% of a household's gross income. For a household earning $6,500 (the median household income in Sherwood), monthly housing costs of less than $1,960 are considered affordable.

home value in Sherwood is 3.8 times the median household income, up from 2.9 times the median household income in 2000.

- **Housing sales prices are higher in Sherwood than the regional averages.** As of January 2015, median sales price in Sherwood was $316,500, which is higher than the Washington County ($281,700), the Portland MSA ($269,900), and Oregon ($237,300) median sales prices. Median sales prices were higher in Sherwood than in other Portland westside communities such as Tigard, Tualatin, and Beaverton, but lower than Wilsonville or West Linn.

- **Rental costs are higher overall in Sherwood than the regional averages.** The median rent in Sherwood was $1,064, compared to Washington County's average of $852.

- **More than one-third of Sherwood's households have housing affordability problems.** Thirty-eight percent of Sherwood's households were cost-burdened (i.e., paid more than 30% of their income on rent or homeownership costs). Renters were more likely to be cost-burdened (40% of renters were cost-burdened), compared to homeowners (35% were cost-burdened) in Sherwood. These levels of cost burden are consistent with regional averages. In Washington County in the 2009-2013 period, 38% of households were cost burdened, compared to 41% in the Portland Region.

  Future housing affordability will depend on the relationship between income and housing price. The key question is whether housing prices will continue to outpace income growth. Answering this question is difficult because of the complexity of the factors that affect both income growth and housing prices. Sherwood will need to provide the opportunity for development of a wider variety of housing, including housing affordable to low- and moderate-income households.

How Much Housing Growth is Forecast, and Can that Growth be Accommodated within Sherwood?

The housing needs analysis in this report is based on Metro's coordinated forecast of household growth in Sherwood. The forecast includes growth in both areas within the city limits, as well as areas currently outside the city limits that the City expects to annex for residential uses (most notably the Brookman area).

- **Sherwood is forecast to add 1,653 new households between 2018 and 2038.** Of these, 697 new households are inside the existing city limits; 956 new households are outside the current city limits in the Brookman Area.

- **Sherwood's land base can accommodate most of the forecast for growth.** Vacant and partially vacant land in the Sherwood Planning Area has capacity to accommodate 1,156 new dwelling units. Sherwood can accommodate about 70% of the forecast for new housing on areas within the city limits and Brookman Area.

- **Sherwood has a deficit of land for housing.** Sherwood has a deficit of land for 497 dwelling units. The largest deficits are in Medium Density Residential-Low (121 dwelling units), Medium Density Residential-High (153 dwelling units), and High Density Residential (179 dwelling units).

- **To provide adequate land supply, Sherwood will need to continue to annex the Brookman area.** Without the Brookman area developing, the City has a projected deficit of 922 dwelling units. Sherwood will need to continue to annex the Brookman area in order to accommodate the City's forecast of residential growth. The City recently annexed about 98 acres in the Brookman Area. The annexed land is in the center of the Brookman Area and has relatively few owners (about 8 property owners). Annexing and developing other areas, with a larger number of owners, may be more challenging, to the extent that the property owners have to come to agreement about development.

What if Sherwood Grows Faster?

- **The forecast for growth in Sherwood is considerably below historical growth rates.** Metro's forecast for new housing in Sherwood shows that households will grow at less than 1% per year. In comparison, Sherwood's population grew at 3.4% per year between 2000 and 2013 and 8% per year between 1990 and 2013. If Sherwood grows faster than Metro's forecast during the 2018 to 2038 period, then Sherwood will have a larger deficit of land needed to accommodate growth.

- **At faster growth rates, Sherwood's land base has enough capacity for several years of growth.** At growth rates between 2% to 4% of growth annually, land inside the Sherwood city limits can accommodate two to five years of growth. With capacity in the Brookman Area, Sherwood can accommodate four to ten years of growth at these growth rates.

- **Additional housing growth in Sherwood depends the availability of development-ready land.** The amount of growth likely to happen in Sherwood over the next few years is largely dependent on when the Brookman Area is annexed, when the Sherwood West area is brought into the urban growth boundary and annexed, and when urban services (such as roads, water, and sanitary sewer) are developed in each area. The City recently annexed about 98 acres in the Brookman Area.

WHAT ARE THE IMPLICATIONS FOR SHERWOOD'S HOUSING POLICIES?

- **Sherwood will need Sherwood West to accommodate future growth beyond the existing city limits and Brookman area.** The growth rate of Metro's forecast for household growth (0.8% average annual growth) is considerably lower than the City's historical population growth rate over the last two decades (8% average annual growth). Metro's forecast includes growth that can be generally accommodated within the Sherwood city limits and Brookman. Given the limited supply of buildable land within Sherwood, it is likely that the City's residential growth will slow until Sherwood West is made development-ready.
- **Sherwood has a relatively limited supply of land for moderate- and higher-density multifamily housing.** The limited supply of land in these zones is a barrier to development of townhouses and multifamily housing, which are needed to meet housing demand resulting from growth of people over 65, young families, and moderate-income households.
- **The results of the Housing Needs Analysis highlight questions for the update of the City's Comprehensive Plan and the Concept Planning of Sherwood West.**
    - Providing housing opportunities for first time home buyers and community elders (who prefer to age in place or downsize their housing) will require a wider range of housing types. Examples of these housing types include: single family homes on smaller lots, clustered housing, cottages or townhomes, duplexes, tri-plexes, four-plexes, garden apartments, or mid-rise apartments. Where should Sherwood consider providing a wider range of housing types? What types of housing should Sherwood plan for?

- Changes in demographics and income for Sherwood and regional residents will require accommodating a wider range of housing types. How many of Sherwood's needed units should the city plan to accommodate within the city limits? How much of Sherwood's needed units should be accommodated in the Brookman Area and in Sherwood West?
- What design features and greenspaces would be important to consider for new housing?
- What other design standards would be needed to "keep Sherwood Sherwood"?

1 Introduction

This report presents the Sherwood Housing Needs Analysis 2018 to 2038. The housing needs analysis provides Sherwood with a factual basis to support future planning efforts related to housing, including Concept Planning for Sherwood West, and prepares to update and revise the City's Comprehensive Plan policies. This report was based on the draft Sherwood Housing Needs Analysis 2015 to 2035 report, from June 2015.

It is intended to comply with statewide planning policies that govern planning for housing and residential development, Goal 10, OAR 660-007, and Metro's Functional Growth Management Plan. The methods used for this study generally follow the *Planning for Residential Growth* guidebook, published by the Oregon Transportation and Growth Management Program (1996).

This report provides Sherwood with a factual basis to support future planning efforts related to housing and options for addressing unmet housing needs. It provides specific analysis that is required for a jurisdiction in Oregon to comply with state policies.

BACKGROUND

Sherwood is located at the southwestern edge of the Portland metropolitan urban growth boundary (UGB). Over the 2000 to 2014 period, Sherwood had a substantial amount of residential growth. Residential development included all of the different housing types with single family detached housing concentrated in the 2000 to 2005 period. In part due to this growth and limited land supply for new homes, Sherwood is embarking on a Concept Plan for the Sherwood West urban reserve. Concurrently, the City is updating its factual basis for an eventual update of its Comprehensive Plan.

This housing needs analysis provides a factual basis to inform both an update of the residential Comprehensive Plan polices and the Concept Plan for Sherwood West. This analysis provides:

- Information about the characteristics of Sherwood's housing market, in the context of Washington County, the Portland metropolitan region, and Oregon,
- Information about the types and density of housing developed since 2000, changes in homeownership patterns,
- Changes in housing cost and affordability, and other housing market characteristics; and
- A forecast of residential growth in Sherwood for the 2018 to 2038 period.

As required by OAR 660-024, this forecast is based on Metro's household forecast and demographics and economic trends that will affect housing demand over the next 20 years.

ORGANIZATION OF THE REPORT

The main body of this report presents a summary of key data and analysis used in the housing needs analysis. The appendices present detailed tables and charts for the housing needs analysis. This document is organized as follows:

- **Chapter 2. Historical and Recent Development Trends** presents a high-level summary of residential development in Sherwood.
- **Chapter 3. Housing Demand and Need** presents a housing needs analysis consistent with requirements in the Planning for Residential Growth Workbook. Detailed tables and charts supporting the demographic and other information discussed in Chapter 4 is presented in Appendix B.
- **Chapter 4. Residential Land Sufficiency** estimates the residential land sufficiency in Sherwood needed to accommodate expected growth over the planning period.
- **Appendix A. Residential Buildable Land Inventory Report**
- **Appendix B. Trends Affecting Housing Need in Sherwood**

FRAMEWORK FOR A HOUSING NEEDS ANALYSIS

People view homes and communities in a wide range of ways. Economists view housing as a bundle of services for which people are willing to pay. Shelter is one service, but housing typically also includes:

- Proximity to other attractions (job, shopping, recreation),
- Amenities (type and quality of fixtures and appliances, landscaping, views), prestige, and
- Access to public services (quality of schools).

Because it is impossible to maximize all these services and simultaneously minimize costs, households must, and do, make tradeoffs. What individuals can purchase for their money is influenced by individuals' life circumstances as well as economic forces and government policy. Among households and income levels, preferences vary. Attributes homebuyers and renters seek are a function of many factors that may include income, age of household head, number of people and children in the household, number of workers and job locations, educational opportunities, number of automobiles, neighborhood amenities and so on.

Thus, the housing choices of individual households are influenced in complex ways by dozens of factors; and the housing market in the Portland Region, Washington County, and Sherwood is the result of the individual decisions of thousands of households. These points help to underscore the complexity of projecting what types of housing will be built in Sherwood between 2018 and 2038.

The complex nature of the housing market was demonstrated by the unprecedented boom and bust during the past decade. This complexity does not eliminate the need for some type of forecast of future housing demand and need and the resulting implications for land demand and consumption. Such forecasts are inherently uncertain. Their usefulness for public policy often derives more from the explanation of their underlying assumptions about the dynamics of markets and policies than from the specific estimates of future demand and need.

Thus, we begin our housing analysis with a framework for thinking about housing and residential markets, and how public policy affects those markets.

OREGON HOUSING POLICY

Statewide planning Goal 10

Sherwood's primarily obligations under Goal 10 are to:

- Designate land in a way that 50% of new housing could be either multifamily or single-family attached housing (e.g., townhouses)
- Provide opportunities to achieve an average density of six dwelling units per net acre
- Provide opportunities for development of needed housing types: single-family detached, single--family attached, and multifamily housing.

The passage of the Oregon Land Use Planning Act of 1974 (ORS Chapter 197), established the Land Conservation and Development Commission (LCDC), and the Department of Land Conservation and Development (DLCD). The Act required the Commission to develop and adopt a set of statewide planning goals. Goal 10 addresses housing in Oregon and provides guidelines for local governments to follow in developing their local comprehensive land use plans and implementing policies.

At a minimum, local housing policies must meet the requirements of Goal 10 and the statutes and administrative rules that implement it (ORS 197.295 to 197.314, ORS 197.475 to 197.490, and OAR 600-008).[3] Jurisdictions located in the Metro UGB are also required to comply with Metropolitan Housing in OAR 660-007 and Title 7 of Metro's Urban Growth Management Functional Plan in the Metro Code (3.07 Title 7).

Goal 10 requires incorporated cities to complete an inventory of buildable residential lands and to encourage the availability of adequate numbers of housing units in price and rent ranges commensurate with the financial capabilities of its households.

Goal 10 defines needed housing types as "housing types determined to meet the need shown for housing within an urban growth boundary at particular price ranges and rent levels." ORS 197.303 defines needed housing types:

(a) Housing that includes, but is not limited to, attached and detached single-family housing and multiple family housing for both owner and renter occupancy;

(b) Government assisted housing;[4]

(c) Mobile home or manufactured dwelling parks as provided in ORS 197.475 to 197.490; and

(d) Manufactured homes on individual lots planned and zoned for single-family residential use that are in addition to lots within designated manufactured dwelling subdivisions.

[3] ORS 197.296 only applies to cities with populations over 25,000.

[4] Government assisted housing can be any housing type listed in ORS 197.303 (a), (c), or (d).

In summary, Sherwood must identify needs for all of the housing types listed above as well as adopt policies that increase the likelihood that needed housing types will be developed.

The Metropolitan Housing Rule

OAR 660-007 (the Metropolitan Housing rule) is designed to "assure opportunity for the provision of adequate numbers of needed housing units and the efficient use of land within the Metropolitan Portland (Metro) urban growth boundary." OAR 660-0070-005(12) provides a Metro-specific definition of needed housing:

> "Needed Housing" defined. Until the beginning of the first periodic review of a local government's acknowledged comprehensive plan, "needed housing" means housing types determined to meet the need shown for housing within an urban growth boundary at particular price ranges and rent levels.

The Metropolitan Housing Rule also requires cities to develop residential plan designations:

> (1) Plan designations that allow or require residential uses shall be assigned to all buildable land. Such designations may allow nonresidential uses as well as residential uses. Such designations may be considered to be "residential plan designations" for the purposes of this division. The plan designations assigned to buildable land shall be specific so as to accommodate the varying housing types and densities identified in OAR 660-007-0030 through 660-007-0037.

OAR 660-007 also specifies the mix and density of new residential construction for cities within the Metro Urban Growth Boundary (UGB):

> "Provide the opportunity for at least 50 percent of new residential units to be attached single family housing or multiple family housing or justify an alternative percentage based on changing circumstances" (OAR 660-007-0030 (1).

OAR 660-007-0035 sets specific density targets for cities in the Metro UGB. Sherwood average density target is six dwelling units per net buildable acre.[5]

[5] OAR 660-024-0010(6) defines Net Buildable Acres as follows: "Net Buildable Acre" consists of 43,560 square feet of residentially designated buildable land after excluding future rights-of-way for streets and roads.

Metro Urban Growth Management Functional Plan

The Metro Urban Growth Management Functional Plan describes the policies that guide development for cities within the Metro UGB to implement the goals in the Metro 2040 Plan.

Title 1: Housing Capacity

Metro's *2016 Compliance Report* concludes that Sherwood is in compliance for the City's Title 1 responsibilities.

Title 1 of Metro's Urban Growth Management Functional Plan is intended to promote efficient land use within the Metro UGB by increasing the capacity to accommodate housing capacity. Each city is required to determine its housing capacity based on the minimum number of dwelling units allowed in each zoning district that allows residential development, and maintain this capacity.

Title 1 requires that a city adopt minimum residential development density standards by March 2011. If the jurisdiction did not adopt a minimum density by March 2011, the jurisdiction must adopt a minimum density that is at least 80% of the maximum density.

Title 1 provides measures to decrease development capacity in selected areas by transferring the capacity to other areas of the community. This may be approved as long as the community's overall capacity is not reduced.

Metro's *2016 Compliance Report* concludes that Sherwood is in compliance for the City's Title 1 responsibilities.

Title 7: Housing Choice

Metro's *2016 Compliance Report* concludes that Sherwood is in compliance for the City's Title 7 responsibilities.

Title 7 of Metro's Urban Growth Management Functional Plan is designed to ensure the production of affordable housing in the Metro UGB. Each city and county within the Metro region is encouraged to voluntarily adopt an affordable housing production goal.

Each jurisdiction within the Metro region is required to ensure that their comprehensive plans and implementing ordinances include strategies to:

- Ensure the production of a diverse range of housing types,
- Maintain the existing supply of affordable housing, increase opportunities for new affordable housing dispersed throughout their boundaries, and
- Increase opportunities for households of all income levels to live in affordable housing (3.07.730)

Metro's *2016 Compliance Report* concludes that Sherwood is in compliance for the City's Title 7 responsibilities.

Title 11: Planning for New Urban Areas

Title 11 of Metro's Urban Growth Management Functional Plan provides guidance on the conversion of land from rural to urban uses. Land brought into the Metro UGB is subject to the provisions of section 3.07.1130 of the Metro Code, which requires lands to be maintained at rural densities until the completion of a concept plan and annexation into the municipal boundary.

The concept plan requirements directly related to residential development are to prepare a plan that includes:

(1) A mix and intensity of uses that make efficient use of public systems and facilities,

(2) A range of housing for different types, tenure, and prices that addresses the housing needs of the governing city, and

(3) Identify goals and strategies to meet the housing needs for the governing city in the expansion area.

Metro's *2016 Compliance Report* concludes that Sherwood is in compliance for the City's Title 11 responsibilities.

In addition, the City needs to comply with the Fair Housing Act, administered by the U.S. Department of Housing and Urban Service (HUD). Complying with this Act requires meeting the Affirmatively Furthering Fair Housing (AFFH) goal of the Fair Housing Act. The City must comply with these regulations to qualify for federal grant funds for housing.

2 Historical and Recent Development Trends

Analysis of historical development trends in Sherwood provides insights into how the local housing market functions. The intent of the analysis is to understand how local market dynamics may affect future housing—particularly the mix and density of housing by type. The housing mix and density by type are also key variables in forecasting future land need. The specific steps are described in Task 2 of the DLCD *Planning for Residential Lands* Workbook:

1. Determine the time period for which the data must be gathered.
2. Identify types of housing to address (at a minimum, all needed housing types identified in ORS 197.303).
3. Evaluate permit/subdivision data to calculate the actual mix, average actual gross density, and average actual net density of all housing types.

The period used in the analysis of housing density and mix is 2000 to 2014, which includes both times of high housing production and times of low housing production. The reasons for choosing this period were:

(1) The 2000 to 2014 period includes more than one economic cycle, with extreme highs and extreme lows in the housing market and

(2) Data prior to 2005 was less easily available and obtaining and compiling data for 2000 to 2004 was difficult to acquire.

The housing needs analysis presents information about residential development by housing types. For the purposes of this study, we grouped housing types based on: (1) whether the structure is stand-alone or attached to another structure and (2) the number of dwelling units in each structure. The housing types used in this analysis are:

- **Single-family detached:** single-family detached units and manufactured homes on lots and in mobile home parks.
- **Single-family attached:** all structures with a common wall where each dwelling unit occupies a separate lot, such as row houses or townhouses.
- **Multifamily**: all attached structures other than single-family detached units, manufactured units, or single-family attached units. Multifamily units include duplexes, tri-plexes, quad-plexes, and structures with more than five units (such as apartments).

The reason for choosing these categories of housing type for the analysis is that they meet the requirements definition of needed housing types in ORS 197.303.[6]

In general, this report uses data from the 2009-2013 American Community Survey (ACS) for Sherwood, as described in Appendix B. Where information is available, we report information from the 2010 Decennial Census. This section summarizes historical and recent development trends, described in detail in Appendix B.

The primary geographies used throughout this report are:

- **Sherwood.** This generally refers to the Sherwood city limits. Census data for Sherwood uses this geography.
- **Sherwood Planning Area.** This is the Sherwood city limits and land that is within the Metro urban growth boundary but outside of the Sherwood city limits, primarily the Brookman Area.
- **Sherwood West.** The urban reserve to the west of Sherwood that may be brought into the Metro urban growth boundary when needed regionally and determined beneficial locally.

While this report presents the forecast for housing growth in Sherwood for the 2018-2038 period, it is based on analysis completed for the 2015 HNA.

Residential development trends[7]

Three-quarters of Sherwood's housing is single-family detached housing.

Single-family detached housing makes up the largest share of Sherwood's housing stock (Figure B- 1**).** Currently:

- Single-family detached housing accounts for about 75% of Sherwood's housing stock.
- Single-family attached housing accounts for about 8% of Sherwood's housing stock.
- Multifamily housing accounts for about 18% of Sherwood's housing stock.

[6] The analysis of development in Sherwood attempts to separate single-family detached and single-family attached housing. However, the City's building permit system does not distinguish between these two types of housing. City staff manually identified single-family attached housing where there was a concentration of it developed (i.e., a development of townhouses). City staff were unable to identify small-scale single-family attached development that was scattered throughout the city.

[7] Except where otherwise noted, data in this section is from the U.S. Decennial Census (for 2010 data) or the U.S. Census's American Community Survey for 2009-2013.

Over the 2000-2014 period, 69% of new housing permitted by Sherwood was single-family detached housing.

The majority of housing developed in Sherwood between 2000 and 2014 was single-family detached housing (Table B- 1 **and** Figure B- 2**).**[8]

- Over the 2000 to 2014 period, Sherwood issued permits for nearly 2,225 dwellings, with about 148 units permitted each year.
- Sixty-nine percent of new housing permitted in Sherwood between 2000 and 2014 was single-family. Roughly 1,721 single-family dwelling units were permitted over the 15-year period.
- Nine percent of the building permits issued in Sherwood over 2000 to 2014 were single-family attached (i.e., townhouses) and 23% were for multifamily housing.
- The majority of new housing in Sherwood was built between 2000 and 2006, before development decreased with the national housing crisis.
- The majority of new multifamily housing in Sherwood was permitted in 2006, 2009, and 2014. The majority of new single-family attached housing was permitted in 2004 and 2005.
- Between 2015 and 2017, Sherwood permitted about 125 new single-family detached units.

Almost three quarters of Sherwood's residents own their homes (Figure B- 3**,** Figure B- 4**, and** Figure B- 5**).** Homeownership rates in Sherwood are above Washington County and Oregon's averages.

- Homeownership rates declined slightly over the last decade. Roughly 79% of housing in Sherwood was owner-occupied in 2000 compared to about 75% in 2010.
- Most owner-occupied housing is single-family detached, about 89%.
- Renter-occupied housing is a mixture of multifamily (57%), single-family detached (35%), and single-family attached (9%).

Sherwood's vacancy rate is lower than Multnomah, Washington, and Clackamas counties, and lower than the State average (Table B- 2 **and** Figure B- 6**).**

- In 2010, Sherwood's vacancy rate (3.9%) was below that of Multnomah (6.2%), Washington (5.4%), and Clackamas (7.1%) counties, and lower than Oregon's (9.3%).
- The vacancy rates for apartments in the Tigard/Tualatin/Sherwood area varied from a high of 5.8% in Spring 2010 to a low of 2.6% in Fall 2013

[8] Building permit data is from the City of Sherwood Building Permit Database.

and were within 1% of the vacancy rate for the Portland/Vancouver metro area.[9]

Sherwood's residential development between 2000 and 2014 averaged 8.2 dwelling units per net acre, above the State's requirement in OAR 660-007 for six dwelling units per net acre (Table B- 3 Table B-4**).**[10]

- Average density in Sherwood was 8.2 dwelling units per net acre over the 2000 to 2014 period.
- Density was lowest in the Very Low Density Residential Zone (2.9 dwelling units per net acre) and Medium Density Residential Low Zone (6.1 dwelling units per net acre).
- Density was highest in Office Commercial (24.4 dwelling units per net acre) and High Density Residential (19.1 dwelling units per net acre).

3 Housing Need in Sherwood

This chapter presents the analysis of housing needs in Sherwood over the 2018 to 2038 period. Estimates of needed units by structure type and by density range follows.

Chapter 1 described the framework for conducting a housing "needs" analysis. The specific steps in conducting a housing needs analysis are:

1. Project number of new housing units needed in the next 20 years.
2. Identify relevant national, state, and local demographic and economic trends and factors that may affect the 20-year projection of structure type mix.
3. Describe the demographic characteristics of the population and, if possible, housing trends that relate to demand for different types of housing.
4. Determine the types of housing that are likely to be affordable to the projected households based on household income.
5. Estimate the number of additional needed units by structure type.
6. Determine the needed density ranges for each plan designation and the average needed net density for all structure types.

This chapter presents information for these steps for Sherwood's housing needs analysis.

PROJECTION OF NEW HOUSING UNITS NEEDED IN THE NEXT 20 YEARS

The housing needs analysis in this report is based on the Metroscope forecast of household growth in Sherwood over the next 25 years.

As required by OAR 660-024, the housing needs analysis in this report is based on a coordinated forecast from Metro (the Metro 2040 TAZ Forecast by Households, January 2016), which is a necessary prerequisite to estimate housing needs. The projection of household growth includes areas currently within the city limits, as well as areas currently outside the city limits that the City expects will be annexed for residential uses (most notably the Brookman area). In 2017, a portion of the Brookman area annexed into the city limits. We call these areas combined the "Sherwood planning area."

While the housing needs analysis presents information for Sherwood West, this area is currently outside of the regional UGB. Housing need in Sherwood West is not considered part of Sherwood's overall housing need for the purposes of this study. The information in this report, however, can inform the ongoing Concept Planning for Sherwood West.

The housing needs analysis focuses on housing growth in Sherwood over the 2018 to 2038 period.

The forecast shows that Sherwood will add 1,653 new households over the 20-year period.

The forecast shows growth of 4,157 new dwelling units in Sherwood West. While Metro's forecast assumes that growth will take place over the next 20-years, it may occur over a 50-year period.

Table B-6 in Appendix B presents Metro's forecast for housing in Sherwood for the 2010 to 2040 period. Table 1 presents ECONorthwest's extrapolation of Metro's forecast for Sherwood to the 2018 to 2038 period. Table 1 shows that **the Sherwood planning area is expected to add 1,653 new households between 2018 and 2038. Regional models and informed projections suggest nearly 700 (**697) new households will be accommodated inside the existing city limits. Approximately 956 new households are expected to be accommodated outside the current city limits in the Brookman Area.

Table 1. Extrapolated Metro forecast for household growth, Sherwood planning area, 2018 to 2038

	Households			
Year	Sherwood City Limits	Brookman Area	Sherwood Planning Area	Sherwood West (50-Year Forecast)
2018	6,883	282	7,165	293
2038	7,580	1,238	8,818	4,450
Change 2015 to 2040				
Households	697	956	1,653	4,157
Percent	10%	339%	23%	1419%
AAGR	0.5%	7.7%	1.0%	14.6%

Extrapolation from the 2015 forecast (the base year in the Metro forecast) to 2018 (not shown in Metro's forecast) by ECONorthwest

DEMOGRAPHIC AND SOCIOECONOMIC FACTORS AFFECTING HOUSING CHOICE

Demographic trends are important to a thorough understanding of the dynamics of the Sherwood housing market. Sherwood exists in a regional economy; trends in the region impact the local housing market. This section documents national, state, and regional demographic, socioeconomic, and other trends relevant to Sherwood.

The Factors that Affect Housing Choice

The factors that have the largest impact on a household's housing choice are: age of the householder, household size and composition, and income.

Analysts typically describe housing demand as the preferences for different types of housing (i.e., single-family detached or apartment), and the ability to pay for that housing (the ability to exercise those preferences in a housing market by purchasing or renting housing—in other words, income or wealth).

Metro, the agency responsible for regional planning within the Portland metropolitan UGB, uses a decision support tool called Metroscope to model changes in measures of economic, demographic, land use, and transportation activity. Metroscope includes a residential location model, which projects the locations of future households based on factors such as land availability and capacity, cost of development, changes in demographics, changes in employment, and changes in transportation and transit infrastructure. The housing needs analysis in this report is based on the Metroscope forecast of household growth in Sherwood over the next 25 years.

Many demographic and socioeconomic variables affect housing choice. However, the literature about housing markets finds that age of the householder, size of the household, and income are most strongly correlated with housing choice.[11]

[11] The research in this chapter is based on numerous articles and sources of information about housing, including:

The Case for Multi-family Housing. Urban Land Institute. 2003

E. Zietz. *Multi-family Housing: A Review of Theory and Evidence.* Journal of Real Estate Research, Volume 25, Number 2. 2003.

C. Rombouts. *Changing Demographics of Homebuyers and Renters.* Multi-family Trends. Winter 2004.

J. McIlwain. *Housing in America: The New Decade.* Urban Land Institute. 2010.

D. Myers and S. Ryu. *Aging Baby Boomers and the Generational Housing Bubble*. Journal of the American Planning Association. Winter 2008.

M. Riche. *The Implications of Changing U.S. Demographics for Housing Choice and Location in Cities.* The Brookings Institution Center on Urban and Metropolitan Policy. March 2001.

- **Age of householder** is the age of the person identified (in the Census) as the head of household. Households make different housing choices at different stages of life.
- **Size of household** is the number of people living in the household. Younger and older people are more likely to live in single-person households. People in their middle years are more likely to live in multiple person households (often with children).
- **Income** is the household income. Income is probably the most important determinant of housing choice. Income is strongly related to the type of housing a household chooses (e.g., single-family detached, duplex, or a building with more than five units) and to household tenure (e.g., rent or own).

This section focuses on these factors, presenting data that suggests how changes to these factors may affect housing need in Sherwood over the next 20 years.

National housing trends

Appendix B presents a full review of national housing trends. This brief summary builds on previous work by ECONorthwest, Urban Land Institute (ULI) reports, and conclusions from *The State of the Nation's Housing, 2014* report from the Joint Center for Housing Studies of Harvard University. The Harvard report summarizes the national housing outlook as follows:

> "With promising increases in home construction, sales, and prices, the housing market gained steam in early 2013. But when interest rates notched up at mid-year, momentum slowed. This moderation is likely to persist until job growth manages to lift household incomes. Even amid a broader recovery, though, many hard-hit communities still struggle and millions of households continue to pay excessive shares of income for housing."

Several challenges to a strong domestic housing market remain. Demand for housing is closely tied to jobs and incomes, which are taking longer to recover than in previous cycles. While trending downward, the number of underwater homeowners, delinquent loans, and vacancies remains high. *The State of the Nation's Housing* report projects that it will take several years for market conditions to return to normal and, until then, the housing recovery will likely unfold at a moderate pace.

L. Lachman and D. Brett. *Generation Y: America's New Housing Wave.* Urban Land Institute. 2010.

National housing market trends include: [12]

- **Post-recession recovery slows down**. Despite strong growth in the housing market in 2012 and the first half of 2013, by the first quarter of 2014, housing starts and existing home sales were both down by 3% from the same time a year before, while existing home sales were down 7% from the year before. Increases in mortgage interest rates and meager job growth contributed to the stall in the housing market.
- **Continued declines in homeownership**. After 13 successive years of increases, the national homeownership rate declined each year from 2005 to 2013, and is currently at about 65%. The Urban Land Institute projects that homeownership will continue to decline to somewhere in the low 60% range.

In 2012, more than one-third of households across the US had housing affordability problems, with the lowest income households having the most difficulty finding affordable housing.

- **Housing affordability**. In 2012, more than one-third of American households spent more than 30% of income on housing. Low-income households face an especially dire hurdle to afford housing. Among those earning less than $15,000, more than 80% paid over 30% of their income and almost 70% of households paid more than half of their income. For households earning $15,000 to $29,000, more than 60% were cost burdened, with about 30% paying more than half of their income on housing.

Since 1990, the average size of new dwelling units increased both for single-family and multifamily housing. At the same time, the average lot size for new housing decreased.

- **Changes in housing characteristics**. National trends show that the size of single-family and multifamily units, and the number of household amenities (e.g., fireplace or two or more bathrooms) has increased since the early 1990s. Between 1990 and 2013 the median size of new single-family dwellings increased 25% nationally from 1,905 square feet to 2,384 square feet and 18% in the western region from 1,985 square feet to 2,359 square feet. Moreover, the percentage of units smaller than 1,400 square feet nationally decreased from 15% in 1999 to 8% in 2013. The percentage of units greater than 3,000 square feet increased from 17% in 1999 to 29% of new one-family homes completed in 2013. In addition to larger homes, a move towards smaller lot sizes is seen nationally. Between 2009 and 2013, the percentage of lots less than 7,000 square feet increased from 26% of lots to 30% of lots. Similarly, in the western region, the share of lots less than 7,000 square feet increased from 43% to 48% of lots.

[12] These trends are based on information from: (1) The Joint Center for Housing Studies of Harvard University's publication "The State of the Nation's Housing 2013," (2) Urban Land Institute, "2011 Emerging Trends in Real Estate," and (3) the U.S. Census.

- **Long-term growth and housing demand**. The Joint Center for Housing Studies forecasts that demand for new homes could total as many as 13.2 million units nationally between 2015 and 2025. Much of the demand will come from Baby Boomers, Millennials,[13] and immigrants.

Future housing preferences will be affected by demographic changes, such as the aging of the Baby Boomers, growing housing demand from Millennials, and growth of foreign-born immigrants.

- **Changes in housing preference**. Housing preference will be affected by changes in demographics, most notably the aging of the Baby Boomers, housing demand from the Millennials, and growth of foreign-born immigrants. Baby Boomers' housing choices will affect housing preference and homeownership, with some boomers likely to stay in their home as long as they are able and some preferring other housing products, such as multifamily housing or age-restricted housing developments.

  In the near-term, Millennials and new immigrants may increase demand for rental units. The long-term housing preference of Millennials and new immigrants is uncertain. They may have different housing preferences as a result of the current housing market turmoil and may prefer smaller, owner-occupied units or rental units. On the other hand, their housing preferences may be similar to the Baby Boomers, with a preference for larger units with more amenities. Recent surveys about housing preference suggest that Millennials want affordable single-family homes in areas that that offer transportation alternatives to cars, such as suburbs or small cities with walkable neighborhoods. [14]

[13] Millennials are, broadly speaking, the children of Baby Boomers, born from the early 1980's through the early 2000's.

State Trends

Oregon's *2011-2015 Consolidated Plan* includes a detailed housing needs analysis as well as strategies for addressing housing needs statewide.[15] The plan concludes that "Oregon's changing population demographics are having a significant impact on its housing market." It identified the following population and demographic trends that influence housing need statewide. Oregon is:

- Facing housing cost increases due to higher unemployment and lower wages, as compared to the nation.
- Since 2005, is experiencing higher foreclosure rates compared with the previous two decades.
- Losing federal subsidies on about 8% of federally-subsidized Section 8 housing units.
- Losing housing value throughout the State.
- Losing manufactured housing parks, with a 25% decrease in the number of manufactured home parks between 2003 and 2010.
- Increasingly older, more diverse, and has less affluent households.[16]

Regional and Local Demographic Trends

Sherwood has a growing population (Table B- 5**).** Sherwood's growing population will drive future demand for Sherwood over the planning period.

- Sherwood grew by more than 15,000 people, a 501% increase in population, at an average annual rate of 8.1% over the 1990 to 2013 period. [17]
- Sherwood grew at a faster rate than the nation as a whole (1.0% per year), Oregon (1.4% per year), and the Portland Region (1.6%) over this period.
- Metro forecasts that the number of households in the Sherwood Planning Area will grow by about 1,653 households over the 2018-2038 period, at an average annual growth rate of 0.8%.
- Metro forecasts that Sherwood West, an area that is adjacent to Sherwood but currently outside of the Metro Urban Growth Boundary, will grow by 4,157 households. Growth in Sherwood West will not begin until the area is included in the Metro UGB and annexed into Sherwood. While Metro's forecast assumes that Sherwood West may be fully

[15] http://www.ohcs.oregon.gov/OHCS/HRS_Consolidated_Plan_5yearplan.shtml

[16] State of Oregon *Consolidated Plan 2011 to 2015*. http://www.oregon.gov/ohcs/hd/hrs/consplan/2011_2015_consolidated_plan.pdf

[17] 2013 Population Estimates in Oregon come from Portland State University's Population Research Center.

developed by 2040, it may take longer, perhaps until 2065, for Sherwood West to fully develop.

- Metro's forecast of household growth considers residential capacity within Sherwood's city limits to accommodate growth. Much of Sherwood's future growth depends on bringing new land into the city limits, including the Brookman Area and Sherwood West.

The growth of younger and diversified households will result in increased demand for a wider variety of affordable housing appropriate for families with children, such as small single-family housing, townhouses, duplexes, and multifamily housing.

Sherwood's population is younger than the state, on average (Table B- 7**,** Table B- 8**, and** Figure B- 8**).** Sherwood has a larger share of people younger than 30 years of age, and a relatively small share of people over 50 years. If Sherwood continues to attract young residents, then it will continue to have demand for housing for families, especially housing affordable to younger families with moderate incomes. Recent studies suggest that growth in younger residents (e.g., Millennials) will result in increased demand for both affordable single-family detached housing, as well as increased demand for affordable townhouses and multifamily housing. Growth in this population will result in growth in demand for both ownership and rental opportunities, with an emphasis on housing that is comparatively affordable.

- In 2010, the median age in Sherwood was 34.3 years old, compared to the State median of 38.4.
- A higher percentage of Sherwood's population is younger than 30 years (44%) compared to the state as a whole (39%). Furthermore, a smaller share of Sherwood's population is younger than 50 years (21%), compared to the state as a whole (34%).

The aging of the population will result in increased demand for smaller single-family housing, multifamily housing, and housing for seniors.

Sherwood's population is growing older (Figure B- 9**).** Although Sherwood has a smaller share of people over 50 years old than the State average, Sherwood's population is growing older, consistent with State and national trends. Demand for housing for retirees will grow over the planning period, as the Baby Boomers continue to age and retire. However, Sherwood's demand for housing for seniors may grow at a slower rate than across the State.

Growth of seniors will have the biggest impacts on demand for new housing through demand for housing types specific to seniors, such as assisted living facilities or age-restricted developments. These households will make a variety of housing choices, including: remaining in their homes as long as they are able, downsizing to smaller single-family homes (detached and attached) or multifamily units, or moving into group housing (such as assisted living facilities or nursing homes), as their health fails.

- The fastest-growing age group over the 2000 to 2010 period in Sherwood was people aged 45 years and older, with the most growth in the number of people aged 45 to 64.
- In Sherwood, people aged 45 to 64 grew by 102%, from 1,936 to 3,917 people between 2000 and 2010.

- By 2035, people 60 years and older will account for 24% of the population in Washington County (up from 18% in 2015). The percent of total population in each age group younger than 60 years old will decrease. The age distribution in the Portland Region will change in a similar pattern.[18]
- Given the growth of people 45 years and older in Sherwood and the forecast for growth of people 60 years and older between 2018-2038 in Washington County and the Portland Region, it is reasonable to expect that Sherwood will have growth in the senior population.

Sherwood is becoming more ethnically diverse (Figure B- 10**).** Growth in Hispanic and Latino population will affect Sherwood's housing needs in a variety of ways. Growth in first and, to a lesser extent, second and third-generation Hispanic and Latino immigrants tend to increase demand for larger dwelling units to accommodate the on average larger household sizes for these households. Households for Hispanic and Latino immigrants are more likely to include multiple generations, requiring more space than smaller household sizes. As Hispanic and Latino households integrate over generations, household size typically decreases and housing needs become similar to housing needs for all households.

Growth in Hispanic and Latino households will result in increased demand for housing of all types, both for ownership and rentals, with an emphasis on housing that is comparatively affordable.

- Sherwood's Hispanic and Latino population grew by 99% from 2000 to the 2009-2013 period, from 557 to 1,107 people, increasing its share of the population from 4.7% to 6.0%.
- Nonetheless, Sherwood's percentage of Hispanic or Latino population remains below that of the state as a whole. In the 2009-2013 period, Hispanic and Latino population accounted for 12% of the state's population, compared to Sherwood's average of 6.0%.

Sherwood's household size is larger than State averages (Table B- 9**).** The larger household size is indicative of a larger share of households with children or multigenerational households.

- Sherwood's average household size was 2.89 persons per household, compared with the regional average of 2.54 persons per household, and the state average of 2.49 persons per household.
- The size of households in Sherwood grew from 2000 to the 2009-2013 period (2.77 to 2.89). Over the same period, the average household size

[18] Demographic forecast for Washington County by the Oregon Office of Economic Analysis.

in the Portland Region rose slightly from 2.53 to 2.54, while the State's average fell from 2.51 to 2.49.

Sherwood has a relatively high share of households with children (Figure B-11**).** Households with children are more likely to prefer single-family detached housing, if it is relatively affordable.

- Sherwood has a larger share of households with children (47%) than the State average (27%), the Portland Region (29%), or Washington County (33%).
- In the 2009-2013 period, Sherwood had a smaller share of single-person households (19%) than the regional average (29%).
- In the 2009-2013 period, Sherwood had a smaller share of non-family households (23%) than the regional average (38%).

Sherwood is part of a complex, interconnected regional economy (Figure B- 12**,** Table B- 11**, and** Table B- 12**).** Most people working at businesses in Sherwood do not live in Sherwood. Demand for housing by workers at businesses in Sherwood may change with fluctuations in fuel and commuting costs, as well as the capacity of highways to accommodate commuting. [19]

- Commuting is typical throughout the region: 91% of Sherwood's working residents commuted outside the city, and about 85% of those who work in the city live outside the city itself.

Summary of the Implications of Demographic and Socioeconomic Trends on Housing Choice

The purpose of the analysis thus far has been to provide background on the kinds of factors that influence housing choice, and in doing so, to convey why the number and interrelationships among those factors ensure that generalizations about housing choice are difficult and prone to inaccuracies.

There is no question that age affects housing type and tenure. Mobility is substantially higher for people aged 20 to 34. People in that age group will also have, on average, less income than people who are older. They are less likely to have children. All of these factors mean that younger households are much more likely to be renters, and renters are more likely to be in multifamily housing.

The data illustrate what more detailed research has shown and what most people understand intuitively: life cycle and housing choice interact in ways that are predictable in the aggregate; age of the household head is correlated with household size and income; household size and age of household head affect housing preferences; income affects the ability of a household to afford a

[19] US Census Bureau, LED on the Map, http://lehdmap3.did.census.gov/themap3/.

preferred housing type. The connection between socioeconomic and demographic factors and housing choice is often described informally by giving names to households with certain combinations of characteristics: the "traditional family," the "never marrieds," the "dinks" (dual-income, no kids), the "empty nesters."[20] Thus, simply looking at the long wave of demographic trends can provide good information for estimating future housing demand.

Thus, one is ultimately left with the need to make a qualitative assessment of the future housing market. The following is a discussion of how demographic and housing trends are likely to affect housing Sherwood over the next 20 years:

- **Growth in housing will be driven by growth in population.** Between 2000 and the 2009-2013 period, the number of housing units in Sherwood increased by 47% from about 4,500 to 6,600 (Figure B- 4), while its population grew by roughly 55% from 11,963 to 18,575 from 2000 to 2013 (Table B- 5).[21]
- **On average, future housing will look a lot like past housing.** That is the assumption that underlies any trend forecast, and one that allows some quantification of the composition of demand for new housing. As a first approximation, the next three to five years of residential growth will look a lot like the last three to five years.
- **If the future differs from the past, it is likely to move in the direction (on average) of smaller units and more diverse housing types.** Most of the evidence suggests that the bulk of the change will be in the direction of smaller average house and lot sizes for single-family housing.

  Key demographic trends that will affect Sherwood's future housing needs are: (1) the aging of the Baby Boomers, (2) aging of the Millennials, (3) growth of family households, and (4) continued growth in Hispanic and Latino population.

  - *The Baby Boomer's population is continuing to age.* By 2035, people 60 years and older will account for 24% of the population in Washington County (up from 18% in 2015). The changes that affect Sherwood's housing demand as the population ages are that household sizes decrease and homeownership rates decrease.
  - *Millennials will continue to age.* By 2035, Millennials will be roughly between about 35 years old to 55 years old. As they age, generally speaking, their household sizes will increase and homeownership rates will peak by about age 55. Between 2018 and 2038,

[20] See *Planning for Residential Growth: A Workbook for Oregon's Urban Areas* (June 1997).

[21] 2013 Population Estimates come from come from the Portland State University Population Research Center's Annual Population Estimates.

Millennials will be a key driver in demand for housing for families with children.

- *Growth of households with children.* Sherwood has an unusually high percentage of households with children, compared to the regional averages. If Sherwood continues to attract families with children, demand for housing for families, such as affordable single-family detached or townhouses, will increase.
- *Hispanic and Latino population will continue to grow.* The U.S. Census projects that by about 2040, Hispanic and Latino population will account for more than one-quarter of the nation's population. The share of Hispanic and Latino population in the western U.S. is likely to be higher. Growth in Hispanic and Latino population will drive demand for housing for families with children. Given the lower income for Hispanic and Latino households,[22] growth in this group will also drive demand for affordable housing, both for ownership and renters.

In summary, an aging population, increasing housing costs, housing affordability concerns for Millennials and the Hispanic and Latino populations, and other variables are factors that support the conclusion of smaller and less expensive units and a broader array of housing choices.

Millennials and immigrants will drive demand for affordable housing types, including demand for small, affordable single-family units (many of which may be ownership units) and for affordable multifamily units (many of which may be rental units).

- **No amount of analysis is likely to make the distant future any more certain: the purpose of the housing forecasting in this study is to get an approximate idea about the future so policy choices can be made today.** Economic forecasters regard any economic forecast more than three (or at most five) years out as highly speculative. At one year, one is protected from being disastrously wrong by the shear inertia of the economic machine. But a variety of factors or events could cause growth forecasts to be substantially different.

---

[22] The following article describes household income trends for Hispanic and Latino families, including differences in income levels for first, second, and third generation households. In short, Hispanic and Latino households have lower median income than the national averages. First and second generation Hispanic and Latino households have median incomes below the average for all Hispanic and Latino households.

Pew Research Center. *Second-Generation Americans: A Portrait of the Adult Children of Immigrants*, February 7, 2012

REGIONAL AND LOCAL TRENDS IN HOUSING COSTS AND AFFORDABILITY

Sherwood's income is higher than state averages (Figure B- 19**).** Income is a key determinant of housing affordability. Since 2000, Sherwood's income has decreased (in inflation-adjusted dollars), consistent with state trends.

- Sherwood's median household income ($78,400) was about 55% higher than the state median ($50,229) in the 2009-2013 period.
- Inflation-adjusted income for households in Sherwood decreased by about 10% from about $87,500 in 2000 to $78,400 (in 2013 dollars) from 2000 to the 2009-2013 period. This is consistent with state and regional trends.
- Poverty rates increased in Sherwood from 2.7% of the population below poverty in 2000 to 7.6% in 2010. The increase is consistent with state and regional trends.
- Sherwood had a smaller share of population below the federal poverty line in the 2009-2013 period (7.6%) than the state average (16.2 %).

Housing costs in Sherwood increased by 30% since 2000.

Sales prices in Sherwood are higher than the regional averages.

Homeownership costs have increased in Sherwood (Figure B- 13**,** Figure B- 14**,** Figure B- 15 **and** Figure B- 16**).** Sales prices for single-family housing increased over the period from 2004 to 2014, consistent with national trends. While housing prices peaked in 2007, before falling during the recession, sales prices grew by about 30% from 2004 to 2014. Sales prices have continue to increase through 2017 and may be above the 2007 peak.

The increases in housing costs have made Sherwood less affordable than most other communities on the southwest side of Portland.

- Median sales prices for homes in Sherwood increased by about 30% between 2004 and 2014, from about $245,000 to $318,000.[23]
- As of January 2015, median sales prices in Sherwood were about $316,500, higher than in Washington County ($281,700), the Portland MSA ($269,900), and Oregon ($237,300). Median sales prices were higher in Sherwood than in other Portland westside communities such as Tigard, Tualatin, and Beaverton but lower than Wilsonville or West Linn.
- Prices per square foot rose in Sherwood from $130 per square foot in October 2004 about $170 dollars in October 2014, comparable to the price in Washington County and the Portland Region (both about $170). The cost of housing per square foot was comparable in Sherwood to other

[23] Recent median home sale price, including price per square foot, comes from Zillow Real Estate Research.

cities on the southwest side of Portland, such as Tigard, Tualatin, Beaverton, and Wilsonville.

- The sales price data suggest that, overall, owner-occupied housing being produced in Sherwood was more expensive because it is larger than housing built in other cities in the southwestern Portland area.
- The ratio of home value to income increased by 32% from 2000 to 2009-2013. In 2000, the median home value was 2.9 times the median household income. By 2009-2013, the median home value was 3.8 times the median household income. In comparison, in 2009-2013, the typical value of an owner-occupied house in Washington County was 4.4 times the median income and the state average was 4.74 times the median income.

Rental costs are about 25% higher than the regional average.

Rental costs are higher in Sherwood than the average in Washington County, with a slightly lower rental cost on a cost per square foot basis (Table B- 14**, and** Figure B- 17 **and** Figure B- 18**).**

- The median contract rent in Sherwood in the 2009-2013 period was $1,064, compared to Washington County's average of $852.
- Average rent in the Tigard/Tualatin/Sherwood area submarket was $1.13 per square foot in Fall 2014, lower than the regional average of $1.22 per square foot. Between Spring 2010 and Spring 2013, average rent in Tigard/Tualatin/Sherwood area increased by 38%, consistent with the regional increase of 36%.

More than one-third of Sherwood's households have housing affordability problems, similar to regional averages.

More than one-third of Sherwood's households have housing affordability problems (Figure B- 20 **and** Figure B- 21**).**

- Thirty-eight percent of Sherwood's households were cost burdened (i.e., paid more than 30% of their income on rent or homeownership costs) in the 2009-2013 period.[24] This is consistent with the state averages.
- Roughly 40% of Sherwood's renter households were cost burdened in the 2009-2013 period. About one-fifth of renters were severely cost burdened (i.e., pay more than 50% of their income on rent).
- About 35% of Sherwood's homeowners were cost burdened in the 2009-2013 period. Only about 1% of homeowners were severely cost burdened (i.e., paid more than 50% of their income on homeownership costs).

[24]A household is considered cost burdened if they pay more than 30% of their gross income on housing costs. For renters, housing costs include the following: monthly rent, utilities (electricity, gas, and water and sewer), and fuels (wood, oil, etc.). For homeowners, housing costs include the following: mortgage payments, real estate taxes, insurance, mobile home costs, condominium fees, utilities, and fuels.

- When considering housing and transportation costs combined, the average household in Sherwood spends 54% of its income on housing costs and transportation costs. Metro considered a household that spends 45% or more of its income on transportation and housing as paying more they can afford. For context, the average households in Tualatin, Wilsonville, and Tigard pay 50% to 52% of their income for housing and transportation costs.

Future housing affordability will depend on the relationship between income and housing price. Households in Sherwood generally have higher than average incomes and housing prices are higher than average. In addition, Sherwood is at the edge of the Metro UGB, making transportation costs higher for households in Sherwood, compared to households who live in more central parts of the region. Determining whether housing in Sherwood will be more or less affordable is difficult to answer when based on historical data. The key questions are whether housing prices will continue to outpace income growth and whether transportation costs will continue to grow in the future.

FORECAST OF HOUSING BY TYPE AND DENSITY OF HOUSING

Table 2 shows the forecast of needed housing units in Sherwood based on the total estimate of housing need shown in Table 1. The forecast in Table 2 assumes: that the forecast for new housing will be: 50% single-family detached, 10% single-family attached, and 40% multifamily. This forecast is consistent with the requirements of OAR 660-007-0035.

The forecast shows increased demand for lower-cost housing types such as single-family attached and multifamily units, which meets the needs resulting in the changing demographics in Sherwood and the Portland region. The changes in demographics are the aging of the Baby Boomers, growth in Millennial households, and increases in ethnic diversity. The previous section described these trends and the implications for housing need in Sherwood.

Table 2. Forecast of needed housing units by mix, Sherwood planning area, 2018-2038

Housing Type	New Dwelling Units (DU)	Percent
Single-family detached	827	50%
Single-family attached	165	10%
Multifamily	661	40%
Total	**1,653**	

Source: ECONorthwest

The assumed housing mix meets the requirement of OAR 660-007-0030 to "designate sufficient buildable land to provide the opportunity for at least 50 percent of new residential units to be attached single family housing or multiple family housing."

The needed density in Sherwood is consistent with the densities achieved in residential zones Sherwood over the 2000-2014 period (Table B-4). These densities are:

- Very Low Density Residential (VLDR): 2.9 dwelling units per net acre
- Low Density Residential (LDR): 6.5 dwelling units per net acre[25]
- Medium Density Residential – Low (MDRL): 6.1 dwelling units per net acre

[25] The historical density achieved in LDR, 6.5 dwelling units per acre, is higher than the maximum allowable density in LDR, 5 dwelling units per net acre. This fact can be explained in large part by the fact that 60% of new development in LDR was part of a Planned Unit Development (PUD), which averaged 7.6 dwelling units per acre.

- Medium Density Residential – High (MDRH): 7.7 dwelling units per net acre
- High Density Residential (HDR): 19.1 dwelling units per net acre

These densities, when applied to Sherwood's supply of buildable land in the capacity analysis (Table 6) results in an overall density of 7.3 dwelling units per net acre. This housing density meets the requirements of OAR 660-007-0035 to "provide for an overall density of six or more dwelling units per net buildable acre."

Table 3 allocates the needed housing units to Sherwood's zones. The allocation is based on allowed uses in Sherwood's zoning code, historical development trends, and Sherwood's inventory of vacant buildable residential land.

Table 3. Allocation of needed housing units to zones, Sherwood planning area, 2018-2038

	Zone					
	Very Low Density Residential	Low Density Residential	Medium Density Residential-Low	Medium Density Residential-High	High Density Residential	Total
Dwelling Units						
Single-family detached	90	174	430	116	17	827
Single-family attached	-	-	-	99	66	165
Multifamily	-	-	83	229	349	661
Total	90	174	513	444	432	1,653
Percent of Units						
Single-family detached	5%	11%	26%	7%	1%	50%
Single-family attached	0%	0%	0%	6%	4%	10%
Multifamily	0%	0%	5%	14%	21%	40%
Total	5%	11%	31%	27%	26%	100%

Source: ECONorthwest

Needed housing by income level

Step four of the housing needs analysis is to develop an estimate of need for housing by income and housing type. This requires an estimate of the income distribution of current and future households in the community. The estimates presented in this section are based on (1) secondary data from the Census, and (2) analysis by ECONorthwest.

The analysis in Table 4 based on American Community Survey data about income levels in Sherwood, using income information shown in Table B- 17. Income is categorized into market segments consistent with HUD income level categories, using the Portland Region's 2014 Median Family Income (MFI) of $69,400. Table 4 is based on current household income distribution, assuming approximately that the same percentage of households will be in each market segment in the future.

Based on Sherwood's current household income distribution, Table 4 shows that about 31% of households in Sherwood have incomes below 80% of the MFI. These households will need a range of housing, such as lower-cost single-family detached housing, townhouses, manufactured homes, or multifamily housing. These households will predominantly be renters. Sixty-nine percent of households have incomes above 80% of MFI. These households will be a mix of owners and renters. Their housing needs will include single-family detached, townhouses, and multifamily housing.

Growth in lower-income demographic groups, such as the Millennials, or in Baby Boomers who want to downsize their homes, may increase demand for smaller single-family detached houses, townhouses, and multifamily housing.

Table 4. Estimate of needed new dwelling units by income level, Sherwood, 2018-2038

				Attainable		
Market Segment by Income	**Income Range**	**Number of households**	**Percent of Households**	**Owner-occupied**	**Renter-occupied**	
High (120% or more of MFI)	$83,280 or more	693	42%	All housing types; higher prices	All housing types; higher	
Upper Middle (80%-120% of MFI)	$55,520 to $83,280	446	27%	All housing types; lower values	All housing types; lower values	Primarily New Housing
Lower Middle (50%-80% of MFI)	$34,700 to $55,520	222	13%	Single-family attached; condominiums; duplexes; manufactured on lots	Single-family attached; detatched; manufactured on lots;	Primarily Used Housing
Lower (30%-50% of less of MFI)	$20,820 to $34,700	112	7%	Manufactured in parks	Apartments; manufactured in parks; duplexes	
Very Low (Less than 30% of MFI)	Less than $20,820	180	11%	None	Apartments; new and used government assisted housing	

Source: ECONorthwest
MFI is Median Family Income

Need for government assisted and manufactured housing

ORS 197.303 requires cities to plan for government-assisted housing, manufactured housing on lots, and manufactured housing in parks.

- **Government-assisted housing.** Government subsidies can apply to all housing types (e.g., single family detached, apartments, etc.) Sherwood allows development of government-assisted housing in all Residential zones, with the same development standards for market-rate housing. This analysis assumes that Sherwood will continue to allow government-assisted housing in all its Residential zones. Because government-assisted housing is similar in character to other housing (with the exception of the subsidies), it is not necessary to develop separate forecasts for government-assisted housing.
- **Manufactured housing on lots.** Sherwood allows manufactured housing in all residential zones as a permitted use. As manufactured homes are allowed as a permitted use in all zones, it is not necessary to develop separate forecasts for manufactured housing on lots.
- **Manufactured housing in parks (**Table B- 13**).** OAR 197.480(4) requires cities to inventory the mobile home or manufactured dwelling parks sited in areas planned and zoned or generally used for commercial, industrial or high-density residential development. According to the Oregon Housing and Community Services' Manufactured Dwelling Park Directory,[26] Sherwood has four manufactured dwelling parks:
    - Carriage Park Estates with 58 spaces, all occupied
    - Crown Court with 14 spaces, except for one vacancy
    - Orland Villa with 24 spaces, all occupied
    - Smith Farm Estates with 90 spaces, all occupied

    ORS 197.480(2) requires Sherwood to project need for mobile home or manufactured dwelling parks based on: (1) population projections, (2) household income levels, (3) housing market trends, and (4) an inventory of manufactured dwelling parks sited in areas planned and zoned or generally used for commercial, industrial, or high-density residential.

    - Table 1 shows that the Sherwood planning area will grow by 1,653 dwelling units over the 2018 to 2038 period.
    - Analysis of housing affordability (in Table 4) shows that about 18% of Sherwood's new households will be low income, earning 50% or less

[26] Oregon Housing and Community Services, Oregon Manufactured Dwelling Park Directory, http://o.hcs.state.or.us/MDPCRParks/ParkDirQuery.jsp

of the County's median family income. One type of housing affordable to these households is manufactured housing.

- Manufactured housing in parks accounts for about 2.4% (258 dwelling units) of Sherwood's current housing stock, according to 2009-2013 Census data.
- National, state, and regional trends during the 2000 to 2010 period showed that manufactured housing parks were closing, rather than being created. For example, between 2003 and 2010, Oregon had a statewide decrease of 25% in the number of manufactured home parks. The trend of closing of manufactured housing parks slowed during the housing recession but is likely to increase as housing prices and land prices increase.
- The longer-term trend for closing manufactured home parks is the result of manufactured home park landowners selling or redeveloping their land for uses with higher rates of return, rather than lack of demand for spaces in manufactured home parks. Manufactured home parks contribute to the supply of lower-cost affordable housing options, especially for affordable home ownership. The trend in closure of manufactured home parks increases the shortage of manufactured home park spaces. Without some form of public investment to encourage continued operation of existing manufactured home parks and construction of new manufactured home parks, this shortage will continue.

Table 4 shows that the households most likely to live in manufactured homes in parks are those with incomes between $20,820 and $34,700 (30 to 50% of median family income). Assuming that about 1.5% to 2.5% of Sherwood's new households (1,653 new dwellings) choose to live in manufactured housing parks, the City may need 25 to 41 new manufactured home spaces. At an average of 8 dwelling units per net acre, this results in demand for 3.1 to 5.2 acres of land.

The City allows development of manufactured housing parks in MDRL zones, where the City has 66 vacant suitable buildable acres of land. Development of a new manufactured home park in Sherwood over the planning period seems unlikely. The land needed for development of a manufactured housing park is part of the forecast in Table 2.

4 Residential Land Sufficiency

This chapter presents an evaluation of the sufficiency of vacant residential land in Sherwood to accommodate expected residential growth over the 2018 to 2038 period. This chapter includes an estimate of residential development capacity (measured in new dwelling units) and an estimate of Sherwood's ability to accommodate needed new housing units for the 2018 to 2038 period. The chapter also includes conclusions and recommendations based on the results of the housing needs analysis.

Residential Buildable Land

Table 5 presents the City's inventory of buildable land. The buildable lands inventory is based on City of Sherwood and Metro GIS data. Appendix A presents a complete description of the methodology used to develop the buildable lands inventory. The key assumptions in the inventory are:

- **Vacant land** was defined as land that is fully vacant (as determined by Metro's Regional Land Information System (RLIS) GIS data and local data), or tax lots that are at least 95% vacant, or tax lots that have less than 2,000 square feet developed, with development covering less than 10% of the entire lot.
- **Unbuildable land** was removed from the inventory, including land with: public tax exemptions (i.e., land owned by the city or state), schools, churches, and other tax-exempt social organizations, private streets, rail properties, parks, and tax lots that do not meet the City's requirements for infill development.
- **Environmental resources and constraints** were deducted from the inventory of vacant land, including floodways and slopes over 25%.
- **Future rights-of-way** were accounted for based on lot sizes, with tax lots larger than one acre assumed to have 18.5% of land set aside for future rights-of-way.

Table 5 shows that Sherwood has 175 net acres of suitable buildable residential land. Fifty-five percent of Sherwood's vacant land (96 acres) is within the city limits and 45% (79 acres) is within the Brookman Area or other unincorporated areas within the current Urban Growth Boundary.

Table 5. Inventory of suitable buildable residential land, net acres, Sherwood city limits and areas within the UGB, 2014

Zone	Gross Acres	Percent of Total
Land within City Limits		
Very Low Density Residential (VLDR)	24	14%
Very Low Density Residential Planned Unit Development (VLDR-PUD)	1	1%
Low Density Residential (LDR)	22	13%
Medium Density Residential-Low (MDRL)	14	8%
Medium Density Residential-High (MDRH)	21	12%
High Density Residential (HDR)	14	8%

RESIDENTIAL DEVELOPMENT CAPACITY

This section presents a summary of the analysis used to estimate Sherwood's residential development capacity.

The capacity analysis estimates the number of new dwelling units that can be accommodated on Sherwood's residential land supply.[27] The capacity analysis evaluates ways that vacant suitable residential land may build out by applying different assumptions.

In short, land capacity is a function of buildable land, housing mix (as determined by plan designation or zoning), and density. The basic form of any method to estimate capacity requires (1) an estimate of *buildable* land, and (2) assumptions about density. The arithmetic is straightforward:

Buildable Land (ac) * Density (du/ac) = Capacity (in dwelling units)

For example:

100 acres * 8 du/ac = 800 dwelling units of capacity

The example is a simplification of the method, which skips some of the nuances that can be incorporated into a detailed capacity analysis such as variations in densities and housing mix among different Comprehensive Plan Designations.

Capacity analysis results

The capacity analysis estimates the development potential of vacant residential land to accommodate new housing based a range of density assumptions by zoning designation. Table 6 shows the capacity of Sherwood's residential land based on the buildable vacant and partially vacant land in Sherwood and a range of potential density assumptions.

The analysis of capacity in Table 6 is meant to illustrate the potential capacity of Sherwood's land based on current development policies and on historical development densities. Table 6 shows development capacity using: (1) the minimum allowable densities and (2) the maximum allowable densities (ensuring that lots meet the minimum lot size requirements. Table 6 also shows capacity based on historical densities.

- **Buildable Acres.** The Buildable Lands Inventory identified 175 net acres of vacant and partially vacant land, with 96 acres within Sherwood's city

[27] In this report, the term "capacity analysis" is used as shorthand for estimating how many new dwelling units the vacant residential land in the UGB is likely to accommodate.

limits and 79 acres in the Brookman and other unincorporated areas within the Metro UGB.

- **Capacity based on Zoning: Minimum Densities.** The analysis considered the capacity of Sherwood's land based on minimum densities in Sherwood's zoning code. This analysis shows that Sherwood has capacity of 940 new dwelling units at 5.4 dwelling units per net acre based on minimum zoning in all districts.
- **Capacity based on Zoning: Maximum Densities and Minimum Lot Sizes.** The analysis considered the capacity of Sherwood's land based on maximum densities in Sherwood's zoning code and the minimum lot size. This analysis was developed based on parcel-specific data. The amount of buildable land was identified in each parcel and the potential capacity was evaluated based on development standards in Sherwood's zoning code.

  The maximum capacity estimate estimates the capacity of Sherwood's land based on the maximum density allowed by zone by parcel, assuming that each parcel of buildable land meets the minimum lot size of the zone it is in.

  Table 6 shows that Sherwood's buildable land has capacity to accommodate 1,510 new dwelling units under these assumptions. This estimate results in an overall average of 8.6 dwelling units per net acre. About 44% of Sherwood's development capacity is in the Brookman area and other unincorporated areas within the Metro UGB.
- **Historical Development Densities.** The analysis considered the capacity of Sherwood's land based on historical development density by zone. In this analysis, we applied the historical density to the total vacant land in each zone to estimate the number of dwelling units that could be accommodated.

  Table 6 shows that Sherwood's buildable land has capacity to accommodate 1,286 new dwelling units based on historical development densities. This estimate results in an overall average of 7.3 dwelling units per net acre. About 44% of Sherwood's development capacity is in the Brookman area and other unincorporated areas within the Metro UGB.

Source: Sherwood buildable lands inventory; Sherwood zoning code; Analysis of historical development densities; and Analysis by ECONorthwest

*Note: There is one lot in the Brookman Area that is split zoned MDRL/MDRH. Of this 15 acre lot, 13 acres is assumed MDRH and two acres is assumed MDRL. The density assumptions for that lot are consistent with the density assumptions shown in Table 6.

Table 6 compares the difference in the capacity estimates for the "maximum density (and minimum lot size) capacity" estimate and the "historical development density" estimate. Table 6 shows that the capacity estimate based on historical development densities results in 232 fewer dwelling units than the capacity based on maximum densities. The average density using the historical development densities is 1.3 dwelling units per acre lower than the maximum density analysis.

This difference shows that development in Sherwood is generally occurring at lower than the maximum allowed densities, showing underbuild in Sherwood. Further analysis shows that residential development between 2000 and 2014 occurred at between 70% to 80% of the maximum allowable densities. The exception is Low Density Residential, where development occurred at higher than allowable densities approximately 60% of LDR development between 2000 and 2014 was in Planned Unit Developments – neighborhoods that were approved to provide a more compact development option.

Underbuild is expected as a result of development constraints that lower development capacity, such as slopes. In addition, parcel configuration contributes to underbuild, with parcels that are oddly shaped or have more land than the minimum requirement but not enough for additional housing.

Table 6 demonstrates that development in Sherwood occurred at considerably higher densities than the minimum allowable densities in each zone.

Based on the analysis in Table 6, we conclude that **both the maximum density (and minimum lot size) and the historical development density estimates exceed the State requirement** (OAR 660-007-0035(2)) to "provide for an overall

density of six or more dwelling units per net buildable acre." The estimate results in an average density of between 7.3 to 8.6 dwelling units per net acre.

The conclusion of the housing needed analysis is that Sherwood's historical densities by housing type (shown in Table B- 3) meet Sherwood's future housing needs. Table B- 3 shows Sherwood's historical densities as 6.5 dwelling units per acre for single-family detached, 17.9 dwelling units per acre for single-family attached, and 20.5 dwelling units per acre for multifamily. If future residential development continues to occur at approximately these densities and with the mix of housing shown in Table 2, then Sherwood will be meeting its Goal 10 requirements.

In addition to the capacity shown in Table 6, Sherwood could have additional residential development capacity resulting in development of housing in commercial zones and from redevelopment of residential properties with existing development (where redevelopment results in a net increase in the number of dwelling units on the property).

About 9% of Sherwood's residential development over the 2000 to 2014 period occurred in commercial zones. It is reasonable to assume that some residential development over the next 20 years would occur in commercial zones, as long as housing is considered a secondary use to the commercial use, as required by Sherwood's development code.

Sherwood has limited opportunities for redevelopment because much of Sherwood's housing stock was developed over the last two decades. In addition, residential land in Sherwood is parcelized and meeting existing density requirements in areas with existing development would be difficult.

Table 7 presents a revision of the capacity shown in Table 6 for capacity based on historical densities. Between January 1, 2015 and October 31, 2017, Sherwood issued 125 permits for housing, all in the MDRL, MDRH, and HDR zones. Table 7 reduces the capacity estimate by 125 units, resulting in a capacity of 606 units on land within the city limits.

Table 7. Revised capacity based on historical development densities accounting for building permits issued in 2015 to 2017, dwelling units, 2017

Zone	Capacity based on Historical Development Densities	Building Permits Issued 2015 to 2017	Revised Capacity

RESIDENTIAL LAND SUFFICIENCY

The last step in the analysis of the sufficiency of residential land within Sherwood is to compare the demand for land by zone (Table 3) with the capacity of land by zone based on historical development densities (Table 6 and Table 7). Table 9 shows that Sherwood has a deficit of capacity in each zone, for a total deficit of about 497 dwelling units. The largest deficits are in Medium Density Residential-Low (121 dwelling units), Medium Density Residential-High (153 dwelling units), and High Density Residential (179 dwelling units).

The conclusion from Table 9 is that the current inventory of buildable residential land is **not** sufficient to accommodate Sherwood's expected growth. To comply with Goal 10, the City will need to either change its policies to allow for more development on the inventory of vacant land, request a UGB expansion from Metro, or both. The types of land with the largest deficit are Medium Density Residential-Low, Medium Density Residential-high, and High Density Residential.

Table 9. Comparison of capacity of existing residential land with demand for new dwelling units, dwelling units, Sherwood planning area, 2018-2038

Zone	Capacity (Needed Densities)	Housing Demand	Comparison Capacity *minus*
Very Low Density Residential	76	90	-14
Low Density Residential	144	174	-30
Medium Density Residential-Low	392	513	-121
Medium Density Residential-High	291	444	-153
High Density Residential	253	432	-179
Total	**1,156**	**1,653**	**-497**

Source: ECONorthwest
Note: DU is dwelling unit.

POTENTIAL GROWTH IN SHERWOOD WEST

Development capacity in Sherwood West will vary from 3,300 to 6,500 dwelling units. The Concept Plan will begin to identify housing types and development scenarios that fit with the community's vision for Sherwood West and that are possible, given likely development and infrastructure costs

The Concept Planning work for Sherwood West is ongoing. The results of the Concept Planning work and later concept and master planning phases will determine more precisely the type and amount of housing in Sherwood West. Table 10 presents estimates of capacity in Sherwood West based on a range of density assumptions, from an average of 6.0 to 12.0 dwelling units per acre. The purpose of the information in Table 10 is to provide some idea of potential development capacity in Sherwood West.

The timing of development in Sherwood West is being discussed through the Concept Planning process. A number of factors will affect the timing of development in Sherwood West, such as when the area is brought into the Metro UGB, provisions of services, and future concept planning for the area. Sherwood West may not be fully built out until 2065. The areas expected to develop first in Sherwood West are Areas A, B, and a portion of C in the Concept Plan, which are located in the southeast part of Sherwood West, adjacent to the Brookman Area. The Sherwood School District has plans to develop a high school in Area A in the next few years.

Table 10. Potential residential development capacity, Sherwood West

	Dwelling Units	Notes
Estimate of Buildable Land		
Gross Acres	670	
Net Acres	546	We assumed an average net-to-gross factor of 18.5% for rights-of-way, regardless of parcel size.
Potential Capacity based on Density Assumptions		
Required average from OAR 660-007 - 6 DU/net acre	3,276	Under this assumption, Sherwood West would be primarily built-out with single-family detached housing. Given Sherwood's historical development densities and the City's requirement to provide opportunity that half of new development is single-family attached and multifamily, this density seems too low for Sherwood West. Issues related to costs of services and development density will be discussed in the pre-concept planning process (and again in the concept planning process) may indicate that this density assumption is too low to support development costs for Sherwood West.
Historical Development Density* - 7.8 DU/net acre	4,259	Issues related to costs of services and development density will be discussed in the pre-concept planning process (and again in the concept planning process) may indicate that this density assumption is too low to support development costs for Sherwood West.
10 DU/net acre	5,460	Metro's forecast for capacity in Sherwood West (4,844) would be accommodated at an average of 10 dwelling units per acre, with some additional capacity for other development.
12 DU/net acre	6,552	

Source: Buildable Lands Estimate from OTAK and analysis by ECONorthwest
*Note: Historical Development Density includes only development in residential zones over the 2000-2014 period.

CONCLUSIONS AND RECOMMENDATIONS

The key findings and recommendations from the housing needs analysis are as follows:

Sherwood is able to accommodate 70% of the forecast for growth within the Sherwood Planning Area.

- **Sherwood is able to meet state requirements.** The City's primary obligations are to (1) designate land in a way that 50% of new housing could be either multifamily or single-family attached housing (e.g., townhouses) and (2) achieve an average density of six dwelling units per net acre. Put another way, the City is required to plan that 50% of their new housing will have the opportunity to be multifamily or single-family attached housing (e.g., townhouses), with all housing at an average density of 6 dwelling units per net acre. Sherwood is able to meet these requirements.
- **Sherwood is meeting its obligation to plan for needed housing types for households at all income levels.** Sherwood's residential development policies include those that allow for development of a range of housing types (e.g., duplexes, manufactured housing, and apartments) and that allow government-subsidized housing. This conclusion is supported by the fact that Metro's 2016 *Compliance Report* concluded that Sherwood was in compliance with Metro Functional Plan and Title 7 (Housing Choice). Sherwood will have an ongoing need for providing affordable housing to households with all income levels.
- **Sherwood has a deficit of land for housing.** Sherwood can accommodate about 70% of the forecast for new housing on areas within the city limits and Brookman Area. However, Sherwood has a deficit of land for 497 dwelling units. The largest deficits are in Medium Density Residential-Low (121 dwelling units), Medium Density Residential-High (153 dwelling units), and High Density Residential (179 dwelling units).
- **To provide adequate supply, Sherwood will need to continue to annex the Brookman area.** Sherwood will need to continue to annex the Brookman area in order to accommodate the City's forecast of residential growth. The City recently annexed about 98 acres in the Brookman Area. The annexed land is in the center of the Brookman Area and has relatively few owners (about 8 property owners). Annexing and developing other parts of the Brookman area, with a larger number of owners, may be more challenging, to the extent that the property owners have to come to agreement about development.
- **Sherwood will need Sherwood West to accommodate future growth beyond the existing city limits and Brookman Area.** The growth rate of Metro's forecast for household growth (0.8% average annual growth) is considerably lower than the City's historical population growth rate over the last two decades (8% average annual growth). Metro's forecast only

includes growth that can be accommodated with the Sherwood Planning area, which does not include Sherwood West.

Given the limited supply of buildable land within Sherwood, it is likely that the City's residential growth will slow, especially if portions of Sherwood West are not brought into the Metro UGB in the earlier part of the 20-year planning period. It is likely that Sherwood's future growth over the 2018-2038 period would be considerably slower than its historical growth rate, if for no other fact than it is mathematically more difficult to maintain a high growth rate with a larger population. In addition, Sherwood's fast growth during the last two decades was driven by historically fast in-migration in to the Portland region, a trend that Metro's forecast shows slowing, and the availability of vacant buildable residential land in Sherwood.

Sherwood's fast growth during the last two decades was driven by historically fast in-migration in to the Portland region, a trend that Metro's forecast shows slowing, and the availability of vacant buildable residential land in Sherwood.

Sherwood will need Sherwood West to accommodate future growth beyond the existing city limits and Brookman Area.

- **Sherwood has a relatively limited supply of land for moderate- and higher-density multifamily housing.** Sherwood has 41 vacant acres of MDRH land and 17 acres of HDR land. If the City wants more multifamily housing growth in core areas of Sherwood, the City could evaluate whether to make policy changes that either increase the capacity of MDRH and HDR land or designate more land for these uses. Some specific considerations:
  - MDRH allows up to 11 dwelling units per acre. However the lot development requirements[28] for multifamily make it difficult to achieve the maximum development density. The City should evaluate the implications of changing MDRH development standards to allow densities of at least 11 dwelling units per acre or a moderate increase in the maximum allowable densities in MDRH.
  - The City's supply of HDR land is very limited, with 17 vacant acres of HDR. As part of the Comprehensive Plan update, the City may choose to evaluate opportunities to upzone land to HDR, to allow more multifamily land in areas such as centers or along transportation corridors.
  - Sherwood's development code does not provide opportunities for development of housing at moderate multifamily densities of 11.1 to 16.7 dwelling units per acre, the gap in densities between MDRH and HDR. As part of the Comprehensive Plan update, the City may choose to evaluate the need for a zone that allows development in this density,

Sherwood's development code does not provide opportunities for development of housing at moderate multifamily densities between 11 to 16 dwelling units per acre.

Providing opportunities for housing in these densities may address and provide opportunities for development of a wider range of affordable housing types.

[28] Sherwood has an 8,000 square foot minimum lot size for the first two multifamily units, with a requirement for 3,200 additional square feet for each multifamily unit beyond the first two units.

which might include townhouses and moderate-sized apartment or condominium buildings.

  - About 9% of Sherwood's residential development over the 2000 to 2014 period occurred in commercial zones., Sherwood may be able to accommodate additional multifamily residential development in these zones. The City may choose to evaluate and identify opportunities for additional multifamily development in commercial zones, as part of the Comprehensive Plan update.

- **Sherwood should monitor residential development.** The city may wish to develop a monitoring program that will allow Sherwood to understand how fast land is developing. The monitoring program will inform Metro's UGB planning process by providing more detailed information about housing growth and development capacity in Sherwood. This information can help City staff and decision-makers make the case to Metro staff and decision-makers about the need for residential expansion areas. We recommend using the following metrics to monitor residential growth:

  - **Population.** The City already routinely monitors population growth by using the annual population estimates prepared by the Center for Population Research at Portland State University.

  - **Building permits.** The Housing Needs Analysis included a review of building permits by dwelling type, plan designation, zone, and net density. Because the City collects most of the data used in the analysis of historical development density, we recommend that city staff update this analysis on an annual basis.

  - **Subdivision and partition activity.** This metric is intended to measure the rate and density of land divisions in Sherwood. Specific data to include with subdivision and partition activity are the area of the parent lot, the area in child lots, the number of child lots, the average size or density of lots, and the area in dedicated right-of-way.

  - **Land consumption.** This metric relates closely to the building permit data. The building permit data should include tax lot identifiers for each permit. The City should match each permit to data in the buildable lands inventory and report how much land is being used by plan designation, zone, and land classification (e.g., vacant, redevelopable, infill, etc.). Additionally, we recommend the City map the location of development on an annual basis.

This page intentionally left blank.

Appendix A. Appendix A. Residential Buildable Lands Inventory

This appendix presents the methodology used to develop the buildable lands inventory and the results of the buildable lands inventory. The information in this appendix was developed by City of Sherwood staff.[29]

METHODOLOGY

Definitions used in the inventory

Vacant land

- Any tax lot that is fully vacant as determined by RLIS GIS Data[30], aerial photography, field checks and local records.
- Tax lots that are at least 95% vacant are considered vacant land.
- Tax lots that are less than 2,000 sq. feet developed AND developed part is under 10% of entire lot

Developed land

- Part vacant/part developed tax lots are considered developed and will be treated in the redevelopment filter

Steps in developing the buildable land inventory

Step 1: Inventory and map fully vacant residential lands

a. Sort City tax lot data by zoning designation within the City boundary.

The residential zones including any planned unit development overlay utilized within this study include:

- Very Low Density Residential (VLDR)
- Low Density Residential (LDR)
- Medium Density Residential Low (MDRL)
- Medium Density Residential High (MDRH)
- High Density Residential (HDR)

b. Identify parcels that are fully vacant.

---

[29] Michelle Miller, AICP, Senior Planner at the City of Sherwood developed the buildable lands inventory.

[30] Metro's Data Resource Center collaborates with local partners to develop and deliver the Regional Land Information System (RLIS) – more than 100 layers of spatial data that supports strategic decision-making for governments, businesses and organizations across the region.

1. Remove developed parcels using most recent Metro's RLIS GIS data.
2. Planning staff review based on current aerial photography, field checks, and local records

Step 2: Subtract unbuildable acres

a. Remove tax lots that d/n have potential to provide residential growth.

1. Tax exempt with property codes for City, State, Federal and Native American designations
2. Schools
3. Churches and social organizations-based solely on tax exempt codes
4. Private streets
5. Rail properties
6. Tax lots under the minimum lot size of the zone or 4,250 sq. ft. for residential land due to infill standards
7. Parks

b. Calculate deductions for environmental resources[31].

1. Remove Floodways-100% removed
2. Recognize environmental constraints such as slopes over 25 % and constrained areas as defined by Cities and Counties under Metro Functional Plan Title 13-Riparian Corridors (Class I and II) and Upland Wildlife Habitat (Class A and B) -100%
3. By assumption, allow one dwelling unit per residentially zoned tax lot if environmental encumbrances would limit development such that by internal calculations no dwelling units would otherwise be permitted.

c. Calculate for future streets. [32]

This methodology sets aside a portion of the vacant land supply (not redevelopment supply) in order to accommodate future streets and sidewalks. This assumption is calculated on a per tax lot basis.

1. Tax lots less than 3/8 acre assume 0% set aside future streets.33
2. Tax lots between 3/8 acre and 1 acre assume a 10% set aside for future streets
3. Tax lots greater than an acre assume an 18.5% set aside for future streets

---

[31] Environmental resources are considered to include Title 3, Title 13 FEMA floodway and slopes over 25 %.

[32] The BLI accounts for future streets on a tax lot by tax lot basis. The buildable area of each tax lot is reduced based on individual tax lot size.

[33] The basis for these net street deduction ratios derive from previous research completed by the Data Resource Center and local jurisdictions for the 2002 UGR.

4. Industrial zoning assumes a 10% set aside regardless of size.

Step 3: Inventory and map re-developable lands

a. Definition:

Re-developable: applies to lots that are classified as developed that are now likely to redevelop or during the 20-year planning period**.**

b. Query performed that identifies previously developed lots that have potential to redevelop over time due to the relationship between the size of the lot and the value of improvements.

1. Sites between .26-.54 acres with improvements less than $ 50 K
2. Sites over .55 acres with improvement between $50,001-100 K
3. Sites over 1 acre with improvement values between $ 100,001-150 K
4. Results of this query include land that is wholly re-developable, meaning existing improvements would be replaced, and land that is partially vacant, meaning the lot could be divided to allow for additional development.

Step 4: Planning staff review of draft map-(Investigative step)

a. Remove under construction or pending construction as of October 1, 2014

b. Added back and redefined areas of special concern (Areas like Brookman for example)[34]

c. Review and add City owned properties that are developable and not held for public purpose

d. For parcels zoned MDRH and HDR determine densities based on location and likelihood that parcel will develop with multifamily or single-family dwelling units and base densities on minimum lot size for single-family and maximum density for multifamily.

e. Re-developable or partially vacant sites that include:

- Properties currently for sale
- Lots that are more than twice the minimum lot size required to support the number of existing dwelling units including tax lots that have land division potential
- Sites that should have been identified as partially vacant but not caught earlier
- Lands with single-family development zoned for multifamily development

f. Remove from Map and defined the following as Not Likely to Redevelop

- Sites occupied by active religious institutions
- Sites with known deed restrictions
- Sites currently under development

[34] Assume Brookman Concept Plan Zoning

- Sites occupied by utility infrastructure
- Commercially zoned land greater than ½ mile from either residential or town center lots-most likely won't be mixed use with residential

g. Redevelop Strike Price Analysis

- Perform on all tax lots planned for residential and commercial development, to identify Multifamily and Commercial sites with a market redevelopment strike price of less than $10 per square foot.[35]

$$\text{Strike Price} = \frac{\text{(Improvement value + land value)}}{\text{Total Sq. Ft of lot}}$$

h. Identify possible rezone properties that would either be added or subtracted from the inventory over time.

[35] This formula is part of the draft proposed Metro methodology for identifying sites zoned for Multifamily and Mixed Use Development that are likely to redevelop. $10/sq.ft. is the estimated threshold for the market supporting redevelopment of suburban sites that are zoned for multifamily development.

RESULTS OF THE BUILDABLE LANDS INVENTORY

Table A- 1 presents the City's inventory of buildable land. The buildable lands inventory is based on City of Sherwood and Metro GIS data. Table A- 1 shows that Sherwood has 175 net acres of suitable buildable residential land. Fifty-five percent of Sherwood's vacant land (96 acres) is within the city limits and 45% (79 acres) is within the Brookman Area or other unincorporated areas within the current Urban Growth Boundary.

Table A- 1. Inventory of suitable buildable residential land, net acres, Sherwood city limits and areas within the UGB, 2014

Zone	Gross Acres	Percent of Total
Land within City Limits		
Very Low Density Residential (VLDR)	24	14%
Very Low Density Residential Planned Unit Development (VLDR-PUD)	1	1%
Low Density Residential (LDR)	22	13%
Medium Density Residential-Low (MDRL)	14	8%
Medium Density Residential-High (MDRH)	21	12%
High Density Residential (HDR)	14	8%
Subtotal	**96**	**55%**
Brookman and Other Unincorporated Areas		
Very Low Density Residential (VLDR)	1	1%
Medium Density Residential-Low (MDRL)	52	30%
Medium Density Residential-High (MDRH)	8	4%
Medium Density Residential- Low/High* (MDRL/H)	15	8%
High Density Residential (HDR)	3	2%
Subtotal	**79**	**45%**
Total	**175**	**100%**

*Note: There is one lot split between MDRL and MDRH.

Table A- 2 presents a revision of the capacity shown in Table A- 1 for capacity based on historical densities. Between January 1, 2015 and October 31, 2017, Sherwood issued 125 permits for housing, all in the MDRL, MDRH, and HDR zones. Table A- 2 reduces the capacity estimate by 125 units, resulting in a capacity of 606 units on land within the city limits.

Table A- 2.. Revised capacity based on historical development densities accounting for building permits issued in 2015 to 2017, dwelling units, 2017

Zone	Capacity based on Historical Development Densities	Building Permits Issued 2015 to 2017	Revised Capacity
Land within City Limits

Appendix B. Trends Affecting Housing Need in Sherwood

Historical and Recent Development Trends

Analysis of historical development trends in Sherwood provides insights into how the local housing market functions. The intent of the analysis is to understand how local market dynamics may affect future housing—particularly the mix and density of housing by type. The housing mix and density by type are also key variables in forecasting future land need. The specific steps are described in Task 2 of the DLCD *Planning for Residential Lands* Workbook:

- Determine the time period for which the data must be gathered.
- Identify types of housing to address (at a minimum, all needed housing types identified in ORS 197.303).
- Evaluate permit/subdivision data to calculate the actual mix, average actual gross density, and average actual net density of all housing types.

The period used in the analysis of housing density and mix is 2000 to 2014, which includes both times of high housing production and times of low housing production. This reasons for choosing this period were: (1) the 2000 to 2014 period includes more than one economic cycle, with extreme highs and extreme lows in the housing market and (2) data prior to 2005 was less easily available and obtaining data for 2000 to 2004 required a considerable amount of work by City staff to compile the data.

The housing needs analysis presents information about residential development by housing types. For the purposes of this study, we grouped housing types based on: (1) whether the structure is stand-alone or attached to another structure and (2) the number of dwelling units in each structure. The housing types used in this analysis are:

- **Single-family detached:** single-family detached units and manufactured homes on lots and in mobile home parks.
- **Single-family attached:** all structures with a common wall where each dwelling unit occupies a separate lot, such as row houses or townhouses.

Multifamily: all attached structures other than single-family detached units, manufactured units, or single-family attached units.

These categories of housing type were chosen for the analysis because they meet the requirements of needed housing types in ORS 197.303.[36]

Data used in this analysis

Throughout this analysis, we use data from multiple well-recognized and reliable data sources. One of the key sources for data about housing and household data is the U.S. Census. This report primarily uses data from two Census sources:

- The **Decennial Census**, which is completed every ten years and is a survey of all households in the U.S. The Decennial Census is considered the best available data for information such as demographics (e.g., number of people, age distribution, or ethnic or racial composition); household characteristics (e.g., household size and composition); and housing occupancy characteristics. As of the 2010 Decennial Census, it does not collect more detailed household information, such as income, housing costs, housing characteristics, and other important household information. Decennial Census data is available for 1990, 2000, and 2010.

- The **American Community Survey (ACS)**, which is completed every year and is a sample of households in the U.S. The 2009-2013 ACS sampled about 16.2 million households, or about 2.8% of the households in the nation. The ACS collects detailed information about households, such as demographics (e.g., number of people, age distribution, ethnic or racial composition, country of origin, language spoken at home, and educational attainment); household characteristics (e.g., household size and composition); housing characteristics (e.g., type of housing unit, year unit built, or number of bedrooms); housing costs (e.g., rent, mortgage, utility, and insurance); housing value; income; and other characteristics.

In general, this report uses data from the 2009-2013 ACS for Sherwood. Where information is available, we report information from the 2010 Decennial Census.

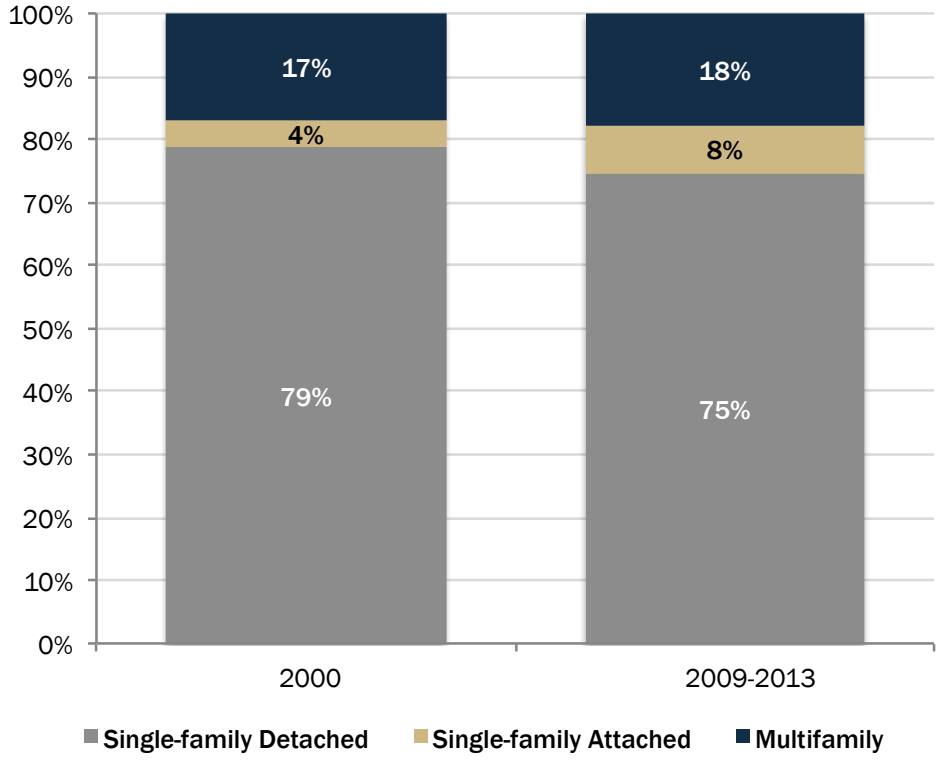
Trends in housing mix in Sherwood

According to the American Community Survey, Sherwood had more than 6,500 housing units in the 2009-2013 period. Figure B- 1 shows that Sherwood's housing stock is predominantly single-family detached housing. In 2000, 79% of

[36] The analysis of development in Sherwood attempts to separate single-family detached and single-family attached housing. However, the City's building permit system does not distinguish between these two types of housing. City staff manually identified single-family attached housing that was developed with a concentration of single-family attached housing. City staff were unable to identify small-scale, single-family attached development scattered throughout the city.

Sherwood's housing stock was single-family detached and 77% was single-family detached in 2009-2013. The share of multifamily units increased from 17% of Sherwood's housing stock in 2000 to 18% in 2009-2013.

Figure B- 1. Mix of Housing Types, Sherwood, 2000 to 2009-2013



Source: U.S. Census 2000 SF3 Table H030, American Community Survey 2009-2013, Table B25024.

Table B- 1 and Figure B- 2 show that the mix of housing developed over the 2000 to 2014 period was predominantly single-family housing (including single-family detached, single-family attached, and manufactured housing), accompanied by intermittent growth in multifamily.

Over the entire 2000 to 2014 period, Sherwood issued permits for nearly 2,225 dwelling units, with about 148 permits issued per year. About 69% of dwellings permitted were single-family detached, 9% were single-family attached, and 23% were multifamily.

In addition, 125 units were permitted during the January 1, 2015 to October 31, 2017 period. All units permitted were single-family detached. These permits are not shown in Table B- 1 and Figure B- 2.

Table B- 1. Building permits by type of unit, Sherwood, 2000-2014

Housing Type	New Units Permitted	Average of New Units Permitted Annually	Mix of New Units
Single-Family Detached	1,525	102	69%
Single-Family Attached	196	13	9%
Multifamily	504	34	23%
Total	2,225	148	100%

Source: City of Sherwood Building Permit Database.
Notes: Single-Family Detached includes manufactured housing.

Figure B- 2. Building permits by type of unit, Sherwood, 2000 to 2014

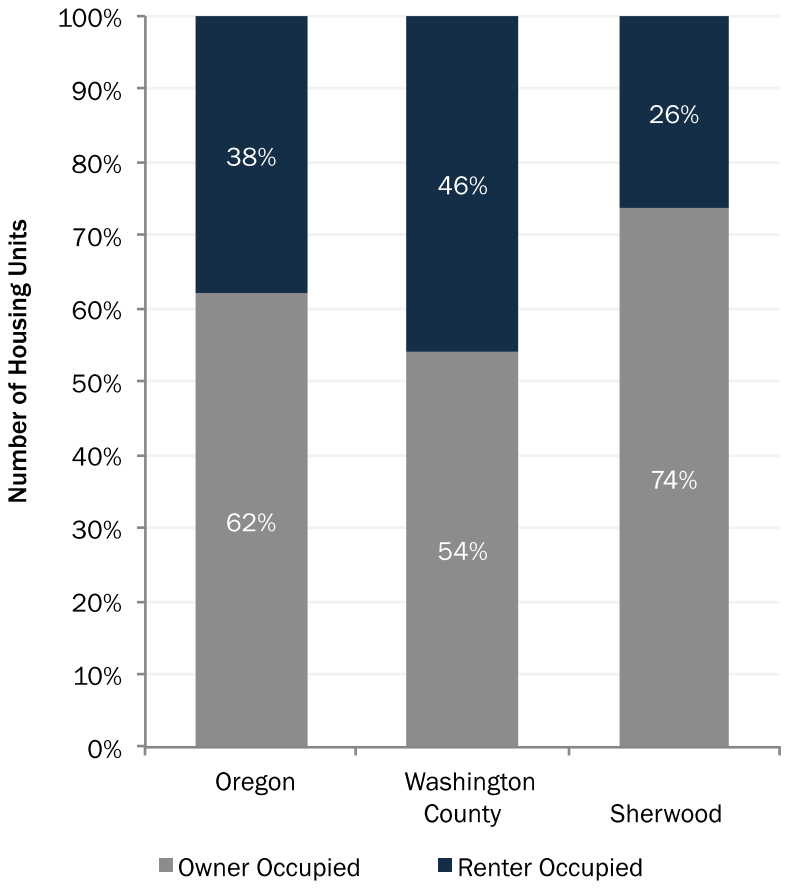
Notes: Single-Family Detached includes manufactured housing.

Trends in Tenure

Figure B- 3 shows housing tenure in Oregon, Washington County, and Sherwood for the 2009-2013 period. Sherwood has a higher rate of ownership (74%) than the county (54%) and the state (62%).

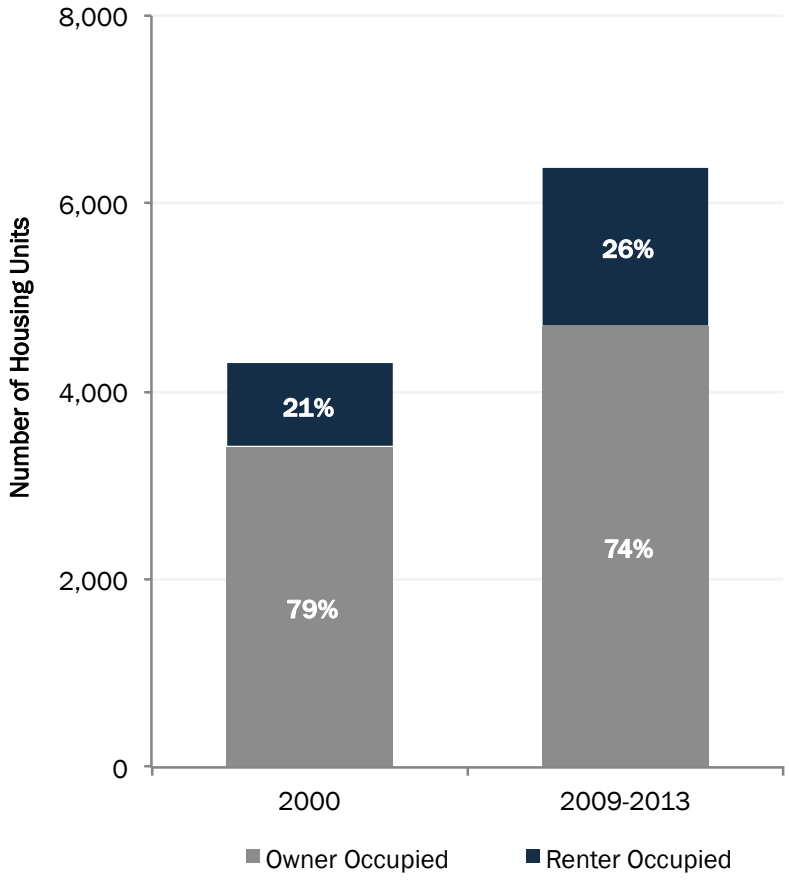
Figure B- 3. Housing Tenure, Oregon, Washington County, Sherwood, 2009-2013



Source: American Community Survey 2009-2013, Table B25003.

Figure B- 4 shows change in tenure (owner versus renter-occupied housing units) for the City of Sherwood over the 2000 to 2009-2013 period. The overall homeownership rate declined, from 79% to 74% between 2000 to 2009-2013, while renting increased by 5%. This change is consistent with national and statewide trends in homeownership.

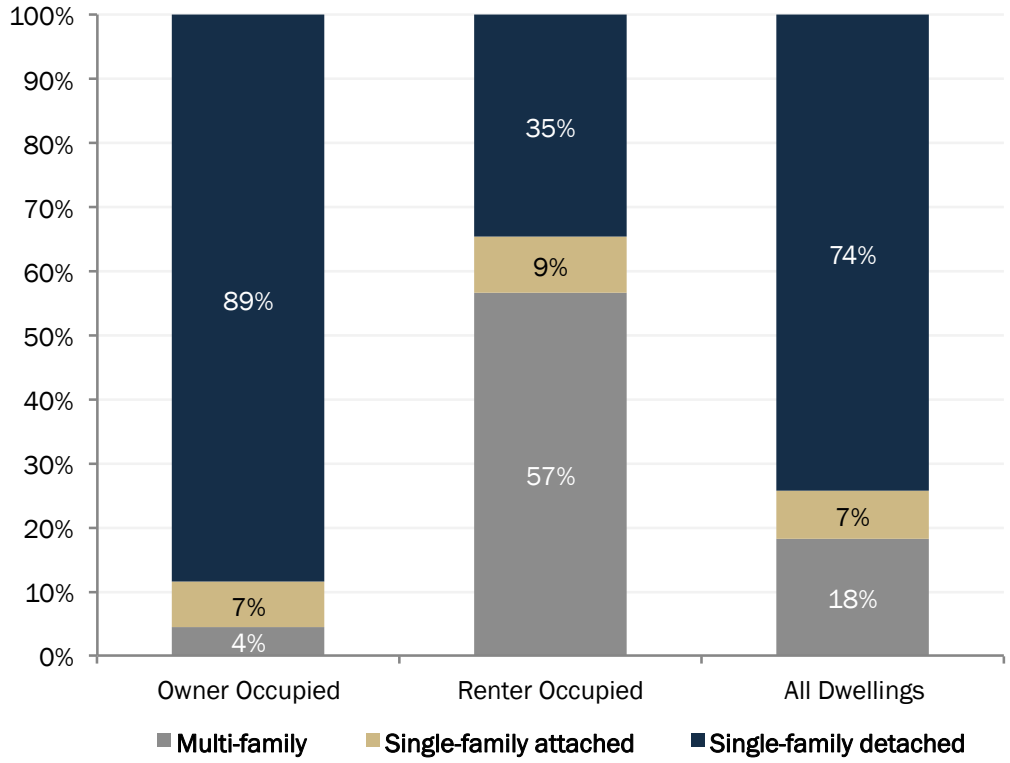
Figure B- 4. Tenure, occupied units, Sherwood, 2000 to 2009-2013



Source: U.S. Census 2000 SF3 Table H032, American Community Survey 2009-2013 Table B25003.

Figure B- 5 shows the types of dwelling in Sherwood in 2009-2013 by tenure (owner/renter-occupied). The results indicate that in Sherwood, single-family housing types are most frequently owner-occupied (70% of all housing is single-family, owner-occupied housing) and multifamily housing is most frequently renter-occupied (15% of all housing is multifamily renter-occupied housing).

Figure B- 5. Housing units by type and tenure, Sherwood, 2009-2013



Source: American Community Survey 2009-2013 Table B25032.

Housing Vacancy Rates

Table B- 2 shows vacancy rates in Oregon, Multnomah, Washington, and Clackamas counties, and Sherwood between 2000 and 2009-2013. Vacancy rates increased in in Oregon, and Clackamas counties, but fell in Multnomah and Washington counties, and in Sherwood. As the 2009-2013 period, Sherwood had a relatively low vacancy rate (2.7%) compared to the regional counties, whose rates ranged from 5.5% to 7.0%, and to Oregon (9.6%).

Table B- 2. Housing vacancy rate, Oregon, Multnomah, Washington and Clackamas Counties, and Sherwood, 2000 to 2009-2013

	Oregon	Multnomah County	Washington County	Clackamas County	Sherwood
2000	8.2%	6.4%	5.7%	5.5%	3.6%
2009 - 2013	9.6%	5.9%	5.5%	7.0%	2.7%
Change 2000 to 2009-2013	17.1%	-7.5%	-3.6%	28.3%	-24.7%

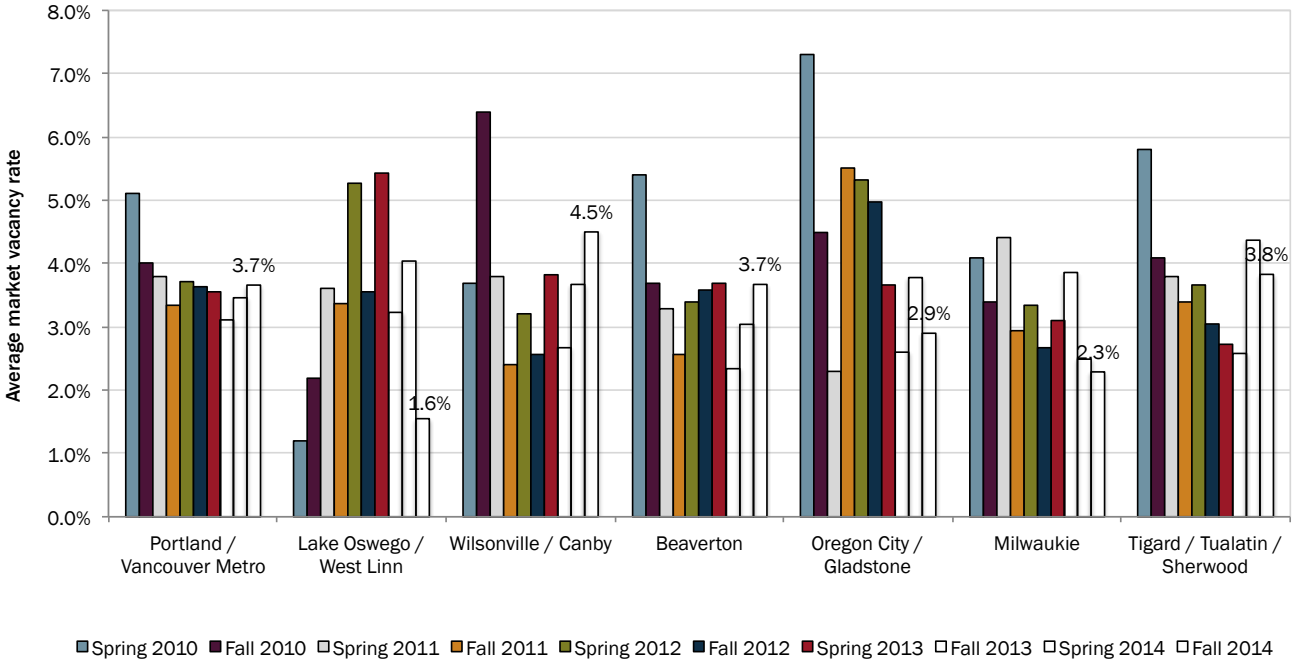
Source: U.S. Census 2000 SF1 Table H003, American Community Survey 2009-2013 Table B25002.

Multifamily NW tracks trends in the Portland area rental market and publishes a semi-annual report. Figure B- 6 shows average market vacancy rates for apartments for the Portland/Vancouver region and selected submarkets in the south-central Portland Region. The vacancy rates in the

Tigard/Tualatin/Sherwood area varied from a high of 5.8% in Spring 2010 to a low of 2.6% in Fall 2013. The vacancy rate in this area was within 1% (above or below) the vacancy rate for the Portland /Vancouver metro area. According to the Fall 2014 Apartment Report, the vacancy rate for apartments in the Tigard/Tualatin/Sherwood area was 3.8%, slightly higher than the regional average of 3.7%.

Multifamily vacancy rates vary, in part, as a result of building new multifamily developments. When a new multifamily development comes on the market, it may take months (or longer) for the new units to be absorbed into the housing market through rental of new units. During this absorption period, the vacancy rate will generally increase for multifamily housing.

Figure B- 6. Average market vacancy rates for apartments, Portland/Vancouver Metro area and selected submarkets, 2010-2014



Multifamily NW Apartment Reports, Spring 2010 – Fall 2014.

Density

Housing density is the density of housing by structure type, expressed in dwelling units per net or gross acre.[37] The U.S. Census does not track residential development density.

This study analyzes housing density based on new residential development within Sherwood between 2000 and 2014, similar to the analysis of achieved mix. The analysis of housing density uses data from the City of Sherwood's building permits database.

Table B- 3 shows that development that was permitted between 2000 and 2014 achieved overall average densities of 8.2 dwelling units per net acre. The majority of permitted housing was single-family detached housing, which averaged 6.5 dwelling units per net acre. Multifamily housing achieved an average of 20.5 and single-family attached achieved and average of 17.9 dwelling units per net acre.

Table B- 3. Estimated density by type of unit, net acres, Sherwood, 2000-2014

Housing Type	New and Existing Units	Acres	Density (dwelling unit per acre)
Single-Family Detached	1,641	251	6.5
Single-Family Attached	196	11	17.9
Multifamily	504	25	20.5
Total	2,341	286	8.2

Source: City of Sherwood Building Permit Database.
Note: Single-Family Detached includes manufactured housing
Note: The number of new single-family detached housing is higher in Table B- 3 than in Table B- 1 because Table B- 3 includes 116 existing manufactured dwellings in manufactured housing parks. These dwellings were included as part of the density calculation to correctly calculate the densities of manufactured housing in the manufactured housing parks with one or more newly permitted dwellings over the 2000 to 2014 period.

Table B-4 shows an analysis of residential development density (dwelling units per net acre) over the 15-year period for Sherwood by zoning designation. Table B-4 shows:

- Ninety-two percent of residential development was in residential zones, which had an overall density of 7.8 dwelling units per net acre.
- Density in residential zones varied from 2.9 dwelling units per net acre in the Very Low Density Residential zone to 19.1 dwelling units per net acre in the High Density Residential zone.

[37] OAR 660-024-0010(6) uses the following definition of net buildable acre. "Net Buildable Acre" "…consists of 43,560 square feet of residentially designated buildable land after excluding future rights-of-way for streets and roads." While the administrative rule does not include a definition of a gross buildable acre, using the definition above, a gross buildable acre will include areas used for rights-of-way for streets and roads. Areas used for rights-of-way are considered unbuildable.

- Density in the Low Density Residential zone averaged 6.5 dwelling units per net acre. Development in Planned Unit Developments (PUD) in this zone achieved an average of 7.6 dwelling units per net acre, which explains the relatively high density in this zone.
- Density in Commercial and Mixed-Use zones averaged 15.6 dwelling units per net acre.

Table B-4. Housing density by Zone, net acres, Sherwood, 2000 to 2014

Zone	New and Existing Units	Acres	Density (dwelling unit per acre)
Residential Zones			
Very Low Density Residential	53	18	2.9
Low Density Residential	807	124	6.5
PUD	487	64	7.6
Non-PUD	320	59	5.4
Medium Density Residential-High	301	39	7.7
Medium Density Residential-Low	368	60	6.1
High Density Residential	605	32	19.1
Residential subtotal	2,134	273	7.8
Commercial and Mixed Use Zones			
Office Commercial	150	6	24.4
Mixed-use Commercial and Condo	55	7	7.9
Retail Commercial	2	0	17.4
Commercial subtotal	207	13	15.6
Total	**2,341**	**286**	**8.2**

NATIONAL HOUSING TRENDS

The overview of national, state, and local housing trends builds from previous work by ECONorthwest, Urban Land Institute (ULI) reports, and conclusions from *The State of the Nation's Housing, 2014* report from the Joint Center for Housing Studies at Harvard University.[38] The Harvard report summarizes the national housing outlook as follows:

> "With promising increases in home construction, sales, and prices, the housing market gained steam in early 2013. But when interest rates notched up at mid-year, momentum slowed. This moderation is likely to persist until job growth manages to lift household incomes. Even amid a broader recovery, though, many hard-hit communities still struggle and millions of households continue to pay excessive shares of income for housing."

Several challenges to a strong domestic housing market remain. Demand for housing follows trends in jobs and incomes, which are taking longer to recover than in previous cycles. While trending downward, the numbers of underwater homeowners, delinquent loans, and vacancies remain high. *The State of the Nation's Housing* report projects that it will take several years for market conditions to return to normal and, until then, the housing recovery will likely unfold at a moderate pace.

Trends in housing development

The single-family housing market began strong in 2013, but by the arrival of 2014, housing starts were down 3% and new home sales had fallen 7% from the year before. The *State of the Nation's Housing Report* attributes most of the decline to increases in mortgage interest rates and meager improvements in employment and wages.

Thirty-year mortgage interest rose in 2014, bucking a downward trend. After falling to a low of around 3.4% in 2013, rates rose to around 5% in 2014. The rise of mortgage interest rates increased the cost of investment in a home and contributed to the fall in the rate of housing starts. In addition to the rise of mortgage interest rates, "steady but unspectacular job growth" presented a fundamental obstacle to the housing market's progress, according to the report. Employment grew, but slowly, and incomes continued to fall. As long as job and wage growth remain slow, potential homebuyers will not create sufficient demand for robust growth in the housing market.

---

[38] The State of the Nation's Housing, Harvard University, 2014, accessed January 2014. http://www.jchs.harvard.edu/research/state_nations_housing

Other recent trends in the housing market included: home inventories remained low (homes now spend less than six months on the market), investors purchased fewer distressed properties, the renter market grew, and a larger share of young people chose to live with their parents.

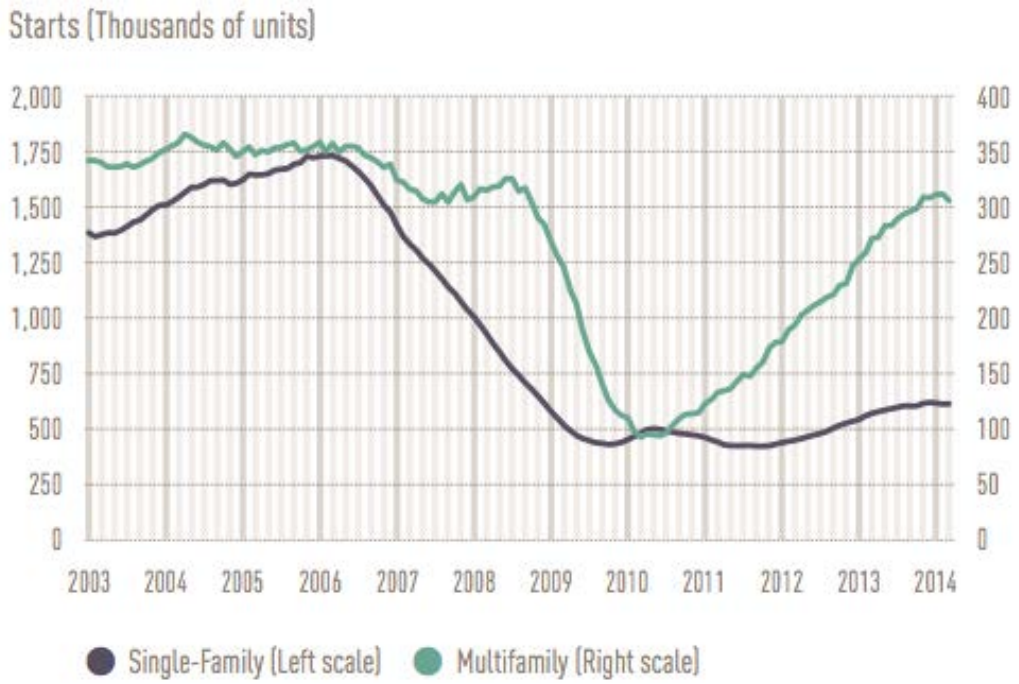
Supplies of existing homes for sale remained low in 2013, which may reflect the unwillingness or inability of owners to sell at current prices (Figure A- 1). As home prices return to levels that are more acceptable to sellers, more homes will go on the market.

Figure A- 1. Inventories of Homes for Sale Against Months Supply, 2002-2013

Source: The State of The Nation's Housing, 2014, The Joint Center for Housing Studies of Harvard University, p. 10. http://www.jchs.harvard.edu/sites/jchs.harvard.edu/files/sonhr14-color-full.pdf.

Multifamily home construction continued robust growth for a third consecutive year. Multifamily starts increased 25% to over 300,000 in 2013, approaching pre-recession levels of around 350,000. In contrast to strong multifamily housing growth, single-family home starts grew slowly, at only about 15%, well below pre-recession levels of production: less than 620,000 starts in 2013, compared to over 1.5 million in 2006. These growth trends are shown in Figure A- 2.

Figure A- 2. Housing Starts, 2003-2014

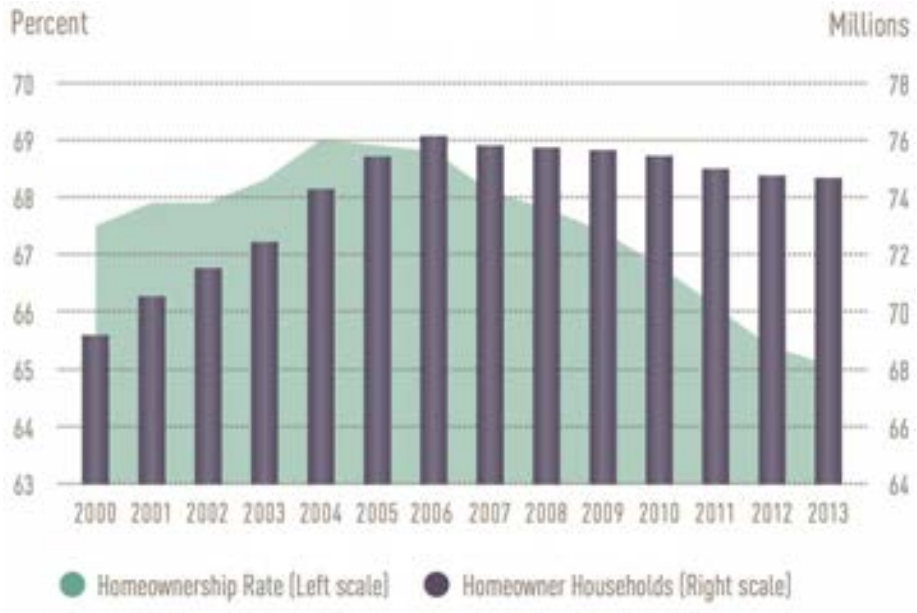


Source: The State of The Nation's Housing, 2014, The Joint Center for Housing Studies of Harvard University, p. 10. http://www.jchs.harvard.edu/sites/jchs.harvard.edu/files/sonhr14-color-full.pdf.

Long run trends in home ownership and demand

The housing market downturn and foreclosure crisis had an immediate and potentially lasting impact on homeownership. After 13 successive years of increases, the national homeownership rate declined each year from 2005 to 2013, and is currently at approximately 65%. However, while the rate declined again in 2013, it was the smallest drop since 2008. As seen in Figure A- 3, the US homeownership rate fell only 0.3 percentage points.

Figure A- 3. Homeownership Rates and the Number of Homeowner Households, 2000-2013



Source: The State of The Nation's Housing, 2014, The Joint Center for Housing Studies of Harvard University, p. 10. http://www.jchs.harvard.edu/sites/jchs.harvard.edu/files/sonhr14-color-full.pdf.

The long-term market outlook shows that homeownership is still the preferred tenure. While further homeownership gains are likely during the next decade, they are not assured. Additional increases depend, in part, on the effect of foreclosures on potential owner's ability to purchase homes in the future, as well as whether the conditions that have led to homeownership growth can be sustained.

The Joint Center for Housing Studies indicates that demand for new homes could total as many as 13 million units nationally between 2015 and 2025. The location of these homes may differ from recent trends, which favored lower-density development on the urban fringe and suburban areas. The Urban Land Institute identifies the markets that have the most growth potential as "global gateway, 24-hour markets," which are primary coastal cities with international airport hubs (e.g., Washington D.C., New York City, San Francisco, or Seattle). Development in these areas may be nearer city centers, with denser infill types of development.[39]

The Joint Center for Housing Studies also indicates that demand for higher density housing types exists among certain demographics. They conclude that because of persistent income disparities, as well as the movement of the

[39] Urban Land Institute, "2011 Emerging Trends in Real Estate" and "2012 Emerging Trends in Real Estate"

Millennials into young adulthood, housing demand may shift away from single-family detached homes toward more affordable multifamily apartments, town homes, and manufactured homes.

Home rental trends

Nationally, the rental market continues to grow. In 2013, the number of households living in rental units increased by half a million, marking the ninth consecutive year of expansion. In addition to growth in rentals in 2013, the million-plus annual increases observed in 2011 and 2012 puts current growth rates on pace to easily surpass the record 5.1 million gain in the 2000s.

Rental markets across the country have been tightening, pushing up rents across the majority of markets. Rental vacancy rates also continued to drop in 2013, both nationwide and in most metros. The US rental vacancy rate stood at 8.3% in 2013 and, while this is the lowest level observed since 2001, this was still high relative to the 7.6% averaged in the 1990s.

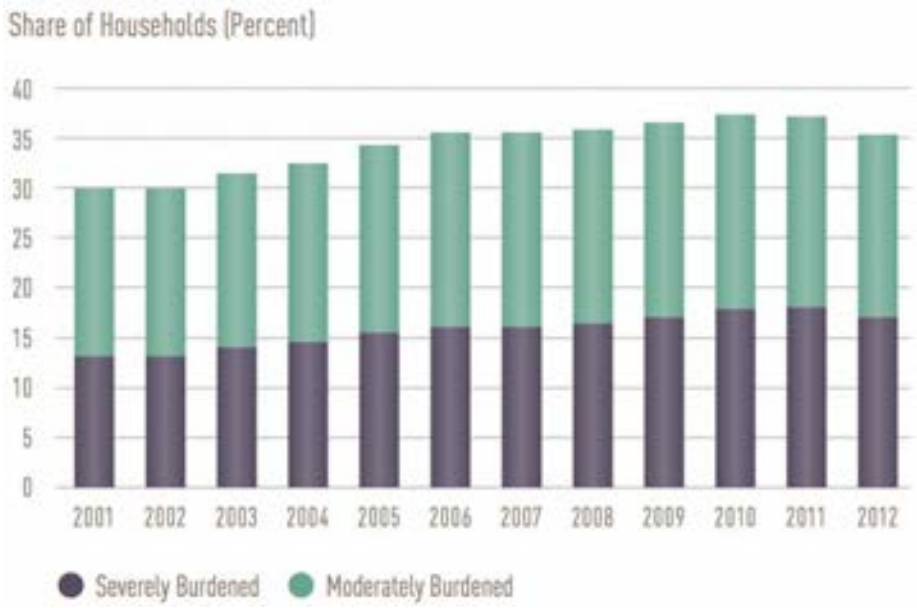
Over the longer term, the Joint Center for Housing expects demand for rental housing to continue to grow. Minorities will be the largest driver of rental demand because they are on average younger and less likely to own homes than whites. Demographics will also play a role. Growth in young adult households will increase demand for moderately priced rentals, in part because the oldest Millennials reached their late-20s around 2010. Meanwhile, growth among those between the ages of 45 and 64 will lift demand for higher-end rentals.

As the homeownership market recovers, the growth in renter households will likely slow. Since much of the increased demand for rental housing has been met through the conversion of single-family homes to rentals, future market adjustments may come from a return of these units to owner-occupancy. Additionally, the echo-boom generation should provide strong demand for rental units in the coming years.

Trends in housing affordability

Many homeowners pay a disproportionate share of their income on housing, with 35% of households in the U.S. who are cost burdened.[40] While the share of households that are cost burdened fell by about 4% in 2012, the share of households that were cost burdened increase between 2001 and 2011 (Figure A-4). More than 15% of U.S. households are severely cost burdened.

Figure A- 4. Share of Cost-burdened Households, 2001-2012



Source: The State of The Nation's Housing, 2014, The Joint Center for Housing Studies of Harvard University, p. 10. http://www.jchs.harvard.edu/sites/jchs.harvard.edu/files/sonhr14-color-full.pdf.

The Joint Center for Housing Studies points to widening income disparities, decreasing federal assistance, and depletion of inventory through conversion or demolition as three factors exacerbating the lack of affordable housing. While the Harvard report presents a relatively optimistic long-run outlook for housing markets and for homeownership, it points to the significant difficulties low- and moderate-income households face in finding affordable housing and preserving the affordable units that do exist.

According to the Joint Center for Housing Studies, these statistics understate the true magnitude of the affordability problem because they do not capture the tradeoffs people make to hold down their housing costs. For example, these figures exclude people who live in crowded or structurally inadequate housing units. They also exclude the growing number of households that move to

[40] Households are considered cost burdened if they spent 30% or more of their gross income on housing costs. Households who spent 50% or more of their gross income on housing costs are considered severely cost burdened.

locations distant from work where they can afford to pay for housing, but must spend more for transportation to work. Among households in the lowest expenditure quartile, those living in affordable housing, spent an average of $100 more on transportation per month in 2010 than those who are severely housing cost-burdened. With total average monthly outlays of only $1,000, these extra travel costs could amount to roughly 10 percent of the entire household budget.

Demographic trends in housing preference

Demographic changes likely to affect the housing market and homeownership are:

- The aging of the Baby Boomers, the oldest of whom were in their late-60's in 2012.
- Housing choices of younger Baby Boomers, who were in their early to mid-50's in 2010.
- The children of Baby Boomers, called the Millennials, who ranged from their late teens to late twenties in 2012.
- Immigrants and their descendants, who are a faster growing group than other households in the U.S. [41]

The aging of the Baby Boomers will affect housing demand over the next decades. People prefer to remain in their community as they age.[42] The challenges that aging seniors face in continuing to live in their community include: changes in healthcare needs, loss of mobility, the difficulty of home maintenance, financial concerns, and increases in property taxes.[43] Not all of these issues can be addressed through housing or land use policies. Communities can address some of these issues through adopting policies that:

- Diversify housing stock to allow development of smaller, comparatively easily-maintained houses in single-family zones, such as single-story townhouses, condominiums, and apartments.
- Allow commercial uses in residential zones, such as neighborhood markets.
- Allow a mixture of housing densities and structure types in single-family zones, such as single-family detached, single-family attached, condominiums, and apartments.

---

[41] Urban Land Institute, "2011 Emerging Trends in Real Estate"

[42] A survey conducted by the AARP indicates that 90% of people 50 years and older want to stay in their current home and community as they age. See http://www.aarp.org/research.

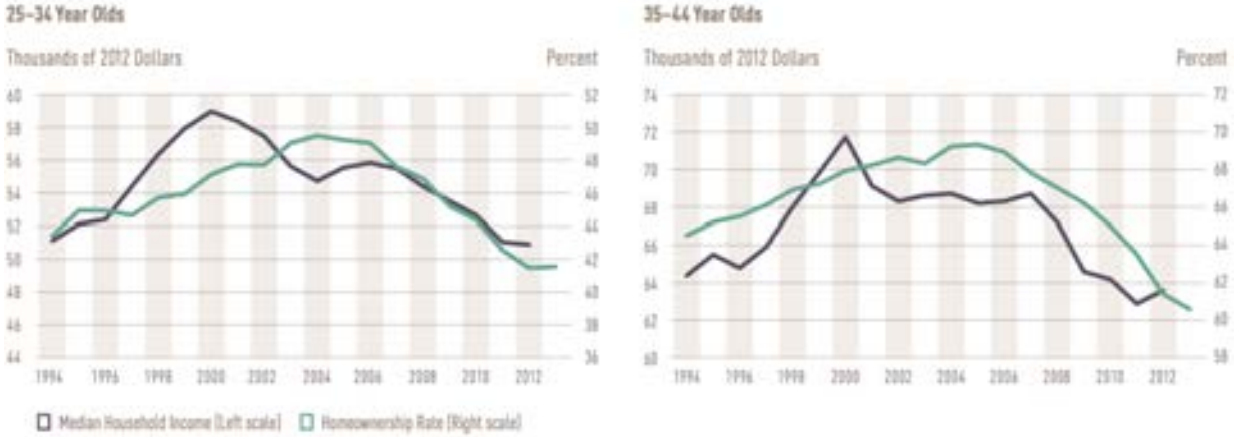
[43] "Aging in Place: A toolkit for Local Governments" by M. Scott Ball.

- Promote the development of group housing for seniors that are unable or do not choose to continue living in a private house. These facilities could include retirement communities for active seniors, assisted living facilities, or nursing homes.
- Design public facilities so that they can be used by seniors with limited mobility. For example, design and maintain sidewalks so that they can be used by people in wheelchairs or using walkers.

Household formation fell to around 600,000 to 800,000 in the 2007-2013 period, well below the average rate of growth in previous decades. Despite sluggish growth recently, several demographic factors indicate increases in housing growth to come. The Millennial generation (those born after 1985) is the age group most likely to form the majority of new households. While low incomes have kept current homeownership rates among young adults below their potential, Millennials may represent pent-up demand that will release when the economy fully recovers. As Millennials age, they may increase the number of households in their 30s by 2.4 to 3.0 million over the through 2025.

While the population of young adults between 20 and 29 years grew in the 2003-2013 decade by more than 4 million from the previous decade, the rate at which members of this age group formed their own households fell. As a result, household growth has not kept pace with overall population growth**.** Even if today's low household formation rates were to persist, however, the aging of the Millennials into their 30s will likely raise household headship rates due to lifecycle effects. About 60% of all 35–44 year-olds head an independent household, compared with less than 42% of all 25–34 year-olds. Thus, the Millennial generation, more populous than the Baby Boomers, is expected to be the primary driver of new household formation over the next twenty years.

Figure A- 5. Homeownership Rates and Incomes for Young and Middle-Aged Adults, 1994-2012



Source: The State of The Nation's Housing, 2014, The Joint Center for Housing Studies of Harvard University, p. 10. http://www.jchs.harvard.edu/sites/jchs.harvard.edu/files/sonhr14-color-full.pdf.

It is currently unclear what housing choices the Millennials will make. Some studies suggest that their parents' negative experience in the housing market, with housing values dropping so precipitously and so many foreclosures, will make Millennials less likely to become homeowners. In addition, high unemployment and underemployment may decrease Millennials' earning power and ability to save for a down payment. It is not clear, however, that Millennials' housing preferences will be significantly different from their parents over the long run.

Recent surveys suggest that as Millennials age and form families, they will increasingly prefer to live in single-family homes in suburban locations. A recent survey by the National Association of Homebuilders finds that roughly three-quarters of Millennials want to live in a single-family home and would prefer to live in a suburb, compared to just 10% that would prefer to live in a city center.

Other recent surveys suggest that Millennials prefer to live in walkable communities, where there are alternatives to driving. According to surveys from the American Planning Association and Transportation For America, at least three quarters of Millennials want their city to offer opportunities to live and work without relying on a car. While Millennials may choose housing that satisfies these preferences, the cost of living will place parameters on their housing choices. According to the APA survey, 71% percent of Millennials rated affordable housing as a high priority for metro areas.

In coming years Millennials will pursue homes that provide a combination of space, "walkability," and affordability. They will demonstrate these preferences

in the market soon: according to the APA survey, more than half of Millennials consider themselves at least somewhat likely to move within the next five years.[44]

From 2004 to 2013, homeownership rates for 25-34 year olds and 35-44 year olds fell by around 8% and 9% respectively, with ownership rates for people 25 to 54 years old at the lowest point since recordkeeping started in 1976 (Figure A- 5). Nonetheless, the 25 and 34 year-old age group still makes up the majority of first-time homebuyers. Young adults in this cohort make up 54.3 percent of first-time homebuyers. Their majority among first-time homebuyers means that their ability to buy homes will play an important role in growth of the housing market in the near future.

The fall in homeownership among young adults results largely from the decline in income. Approximately 6 million more individuals between 20 and 29 years earned less than $25,000 than in 2003, while the number of those earning between $25,000 and $50,000 fell by over a million. Furthermore, the share of households younger than 30 years with student loan debt increased by more than 7% since 2007, from 33.9% to 41.0%.

According to the Joint Center for Housing Studies, immigration and increased homeownership among minorities will also play a key role in accelerating household growth over the next 10 years. Current Population Survey estimates indicate that the number of foreign-born households rose by nearly 400,000 annually between 2001 and 2007, and accounted for nearly 30 percent of overall household growth. Beginning in 2008, the influx of immigrants was staunched by the effects of the Great Recession. After a period of declines, however, the foreign born are again contributing to household growth. Census Bureau estimates of net immigration in 2011–12 indicate an increase of 110,000 persons over the previous year, to a total of nearly 900,000. Furthermore, as shown in Figure A- 6, the Harvard report forecasts that minorities will make up about 76% of the household growth between 2015 and 2025. The greater diversity among young adults partly explains the increased share of growth that will belong to minorities. For example, about 45% of Millennials are minorities, compared to 28% of Baby Boomers.

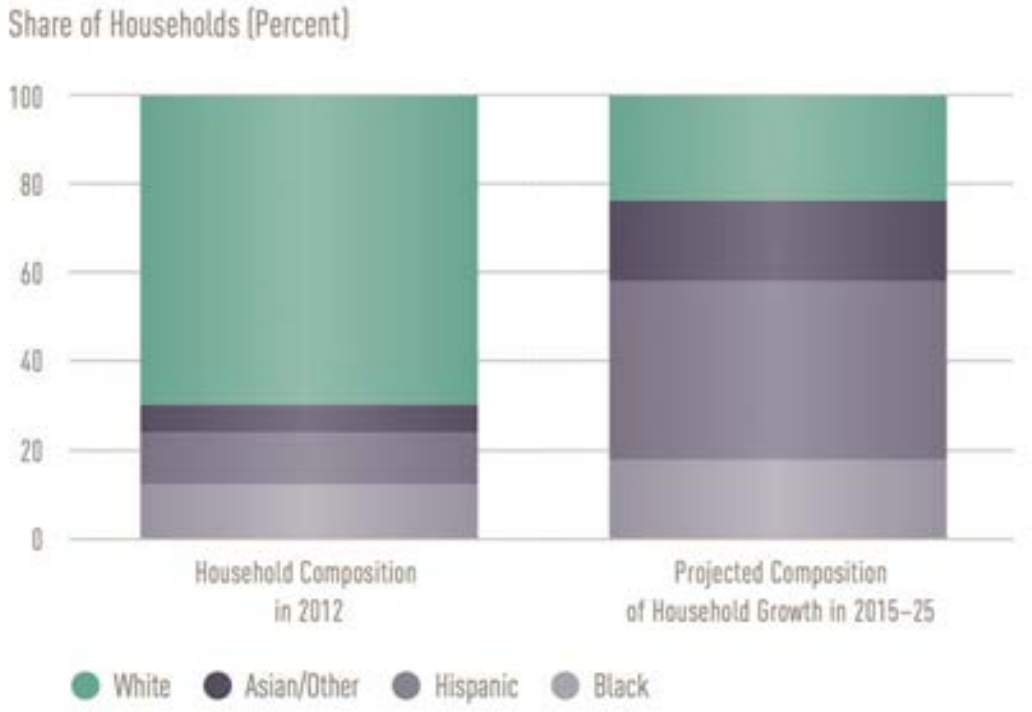
Figure A- 6. Share of Households by Racial/Ethnic Group, 2012 and 2015-25



Source: The State of The Nation's Housing, 2014, The Joint Center for Housing Studies of Harvard University, p. 10. http://www.jchs.harvard.edu/sites/jchs.harvard.edu/files/sonhr14-color-full.pdf.

The growing diversity of American households will have a large impact on the domestic housing markets. Over the coming decade, minorities will make up a larger share of young households, and constitute an important source of demand for both rental housing and small homes. This makes the growing gap in homeownership rates between whites and blacks and whites and Hispanics troubling. Since 2001, the difference in homeownership rates between whites and blacks rose from 25.9 to 29.5 in 2013. Similarly the gap between white and Hispanic homeownership rates increased since 2008, from below 26%, to over 27% in 2013. This growing gap between racial and ethnic groups will hamper the country's homeownership rate as minority households constitute a larger share of the housing market.

Trends in Housing Characteristics

The U.S Census Bureau's Characteristics of New Housing Report (2013) presents data that show trends in the characteristics of new housing for the nation, state, and local areas. Several long-term trends in the characteristics of housing are evident from the New Housing Report:[45]

[45] https://www.census.gov/construction/chars/highlights.html

- **Larger single-family units on smaller lots**. Between 1990 and 2013 the median size of new single-family dwellings increased 25% nationally from 1,905 sq. ft. to 2,384 sq. ft., and 19% in the western region from 1,985 sq. ft. to 2,359 sq. ft. Moreover, the percentage of units fewer than 1,400 sq. ft. nationally decreased by almost half, from 15% in 1999 to 8% in 2012. The percentage of units greater than 3,000 sq. ft. increased from 17% in 1999 to 29% of new one-family homes completed in 2013. In addition to larger homes, a move towards smaller lot sizes is seen nationally. Between 1990 and 2013, the percentage of lots less than 7,000 sq. ft. increased from 27% of lots to 36% of lots.
- **Larger multifamily units**. Between 1999 and 2013, the median size of new multiple family dwelling units increased by 2% nationally and 3% in the western region. The percentage of new multifamily units with more than 1,200 sq. ft. increased from 28% in 1999 to 32% in 2013 nationally, and increased from 25% to 32% in the western region.
- **More household amenities**. Between 1990 and 2013, the percentage of single-family units built with amenities such as central air conditioning, 2 or more car garages, or 2 or more baths all increased. The same trend in increased amenities is seen in multifamily units.

During the recession, the trend towards larger units with more amenities faltered. Between 2007 and 2009, for example, the median size of new single-family units decreased by 6% throughout the nation, including in the West. In addition, the share of new units with amenities (e.g., central air conditioning, fireplaces, 2 or more car garages, or 2 or more bath) all decreased slightly during this time. With the recovery, however, housing sizes have been increasing annually; median housing sizes increased by 12% between 2009 and 2013 nationwide, and 10% in the western region. The short term, post-recession trends regarding amenities are mixed, but generally appear to be increasing (albeit more slowly than housing sizes).

It appears that the decreases in unit size and amenities were a short-term trend, resulting from the housing crisis. However, numerous articles and national studies suggest that these changes may indicate a long-term change in the housing market, resulting from a combination of increased demand for rental units because of demographic changes (e.g., the aging of the baby boomers, new immigrants, and the echo-boomers), as well as changes in personal finance and availability of mortgages.[46]

These studies may be correct and the housing market may be in the process of a long-term change, with some fluctuations over time in unit size and amenities.

[46] These studies include "Hope for Housing?" by Greg Filsram in the October 2010 issue of Planning and "The Elusive Small-House Utopia" by Andrew Rice in the New York Times on October 15, 2010.

On the other hand, long-term demand for housing may not be substantially affected by the current housing market. The echo-boomers and new immigrants may choose single-family detached housing and mortgages may become easier to obtain.

Studies and data analysis have shown a clear linkage between demographic characteristics and housing choice. This is more typically referred to as the linkage between lifecycle and housing choice and is documented in detail in several publications. Analysis of data from the Public Use Microsample (PUMS) in the 2000 Census helps to describe the relationship between selected demographic characteristics and housing choice. Key relationships identified through this data include:

- Homeownership rates increase as income increases;
- Homeownership rates increase as age increases;
- Choice of single-family detached housing types increases as income increases;
- Renters are much more likely to choose multiple family housing types than single-family; and
- Income is a stronger determinate of tenure and housing type choice for all age categories.

STATE DEMOGRAPHIC TRENDS

Oregon's *2011-2015 Consolidated Plan* includes a detailed housing needs analysis as well as strategies for addressing housing needs statewide.[47] The plan concludes that, "Oregon's changing population demographics are having a significant impact on its housing market." It identified the following population and demographic trends that influence housing need statewide. Oregon is:

- Facing housing cost increases due to higher unemployment and lower wages, when compared to the nation.
- Experiencing higher foreclosure rates since 2005, compared with the previous two decades.
- Losing federal subsidies on about 8% of federally subsidized Section 8 housing units.
- Losing housing value throughout the State.
- Losing manufactured housing parks, with a 25% decrease in the number of manufactured home parks between 2003 and 2010.

[47] http://www.ohcs.oregon.gov/OHCS/HRS_Consolidated_Plan_5yearplan.shtml

- Increasingly older, more diverse, and has less affluent households.[48]

REGIONAL AND LOCAL DEMOGRAPHIC TRENDS

Regional demographic trends largely follow the statewide trends discussed above, but provide additional insight into how demographic trends might affect housing in Sherwood. Demographic trends that might affect the key assumptions used in the baseline analysis of housing need are: (1) the aging population, (2) changes in household size and composition, and (3) increases in diversity. This section describes those trends.

The following section presents data tables. In a few places, additional explanatory text is included. For the most part, the text describing the implications of the tables is in the main part of the document.

Growing population

Sherwood has a growing population. Table B- 5 shows population growth in the U.S., Oregon, the Portland Region, Washington County, and Sherwood, between 1990 and 2013.

Table B- 5. Population in U.S., Oregon, the Portland Region, Washington County, and Sherwood, 1990-2013

	Population			Change 1990 to 2013		
Area	1990	2000	2013	Number	Percent	AAGR
U.S.	248,709,873	281,421,906	311,536,594	62,826,721	25%	1.0%
Oregon	2,842,321	3,421,399	3,919,020	1,076,699	38%	1.4%
Portland Region	1,174,291	1,444,219	1,693,600	519,309	44%	1.6%
Washington County	311,554	445,342	550,990	239,436	77%	2.5%
Sherwood	3,093	11,963	18,575	15,482	501%	8.1%

Source: US Census Bureau Decennial Census 1990 and 2000; Portland State University, Population Research Center
Note: AAGR is average annual growth rate.

The housing needs analysis in this report is based on a coordinated household forecast from Metro (the January 2016 2040 TAZ Forecast), which is a necessary prerequisite to estimate housing needs. The projection of household growth includes areas currently within the city limits, as well as areas currently outside the city limits that the City expects to annex for residential uses (most notably the Brookman area). We call these areas combined the "Sherwood planning area."

Table B-6 presents Metro's forecast for household growth and new housing development in the Sherwood planning area for the 2010 to 2040 period. The table shows Metro's forecast for the Sherwood city limits, areas currently outside

[48] State of Oregon *Consolidated Plan 2011 to 2015*.
http://www.oregon.gov/ohcs/hd/hrs/consplan/2011_2015_consolidated_plan.pdf

the city limits that are expected to be annexed by 2040, which are together the Sherwood planning area. Table B-6 shows Metro's forecast for the number of households in each of the following years:

- **2010.** Metro's forecast uses an estimate of the number of households in 2010 as the starting point of the forecast.
- **2015.** Estimate of number of households in 2015.
- **2040.** Metro's forecast estimates household growth of 2,078 dwelling units or 30%, by 2040. Part of the forecasting process was providing jurisdictions an opportunity to review and comment on the forecast for growth through 2040.

Table B-6 also shows Metro's forecast for the Sherwood West area, which is forecast to grow by 4,157 dwelling units by 2040. While Metro forecasts that this development will occur over the 2015 to 2040 period, the discussion of timing of this development in the Concept Planning process suggests that Sherwood West may take 50 years (2015 to 2065) to develop the 4,157 dwelling units in Metro's forecast.

Table B-6. Metro forecast for housing growth, Sherwood planning area, 2010 to 2040

	Households			
Year	Sherwood City Limits	Brookman Area	Sherwood Planning Area	Sherwood West (50-Year Forecast)
2010	6,476	242	6,718	270
2015	6,784	226	7,010	293
2040	7,653	1,435	9,088	4,811
Change 2015 to 2040				
Households	869	1,209	2,078	4,518
Percent	13%	535%	30%	1542%
AAGR	0.5%	7.7%	1.0%	11.8%

Source: Metro 2040 TAZ Forecast by Households, January 2016
Note: The Sherwood City Limits are the following Metro Transportation Analysis Zones (TAZs): 989 to 997.
The Brookman area is predominantly in Transportation Analysis Zone 978, with a small area in 988. Brookman is an area that the City expects to annex for residential growth over the planning period.
Sherwood West is parts of Transportation Analysis Zones 1428, 1429, and 1432.

Sherwood's housing needs analysis must be based on a 20-year period, but Metro's forecast describes growth over a 25-year period. Table B- 7 shows an extrapolation of Metro's forecast for the 2018 to 2038 period. ECONorthwest extrapolated Metro's forecast to 2018 based on the number of households in 2015 and the growth rate in the forecast between 2015 and 2040. We assumed that little to no growth happened in Sherwood West between 2015 and 2018, an

assumption that is supported by the relative lack of building permit activity in these areas.

Table B- 7 shows that the Sherwood planning area will add 1,653 new households between 2018 and 2038, with 697 new households inside the existing city limits and 956 new households in outside the current city limits in the Brookman Area.

Table B- 7. Extrapolated Metro forecast for housing growth, Sherwood planning area, 2018 to 2038

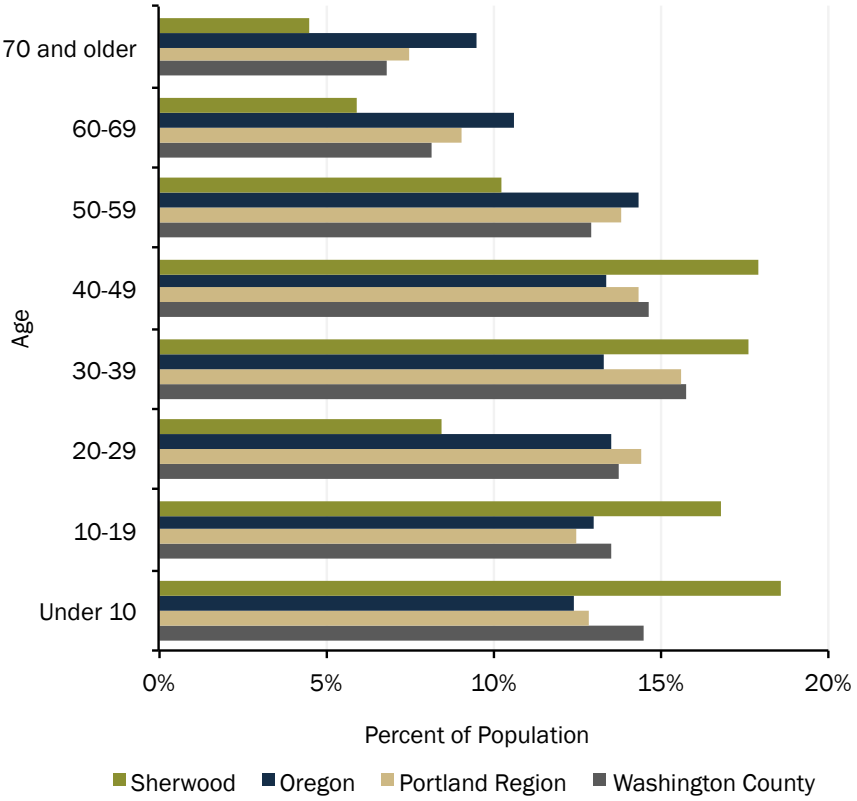
	Households			
Year	Sherwood City Limits	Brookman Area	Sherwood Planning Area	Sherwood West (50-Year Forecast)
2018	6,883	282	7,165	293
2038	7,580	1,238	8,818	4,450
Change 2015 to 2040				
Households	697	956	1,653	4,157
Percent	10%	339%	23%	1419%
AAGR	0.5%	7.7%	1.0%	14.6%

Source: Metro 2040 TAZ Forecast by Households, January 2016

Aging population

In 2010, the median age in Sherwood was 34.3 years old, compared to the median of 35.3 in Washington County, and the State median of 38.4. Figure B- 7 shows the populations of Oregon, the Portland Region, Washington County, and Sherwood by age in 2010.

Figure B- 7. Population Distribution by Age for Oregon, Sherwood, Oregon, Portland Region, Washington County



Source: U.S. Census 2010, Profile of General Population and Housing Characteristics

Table B- 8 shows population by age in Sherwood for 2000 and 2010. Over the 2000 to 2010 period, the population of people aged 45 to 64 years old grew the fastest, increasing from 1,936 to 3,917, or 102%.

Table B- 8. Population by Age, Sherwood, 2000 and 2010

	2000		2010		Change 2000-2010		
Age Group	Number	Percent	Number	Percent	Number	Percent	Share
Under 5	1,351	11%	1,518	8%	167	12%	-3%
5-17	2,383	20%	4,589	25%	2,206	93%	5%

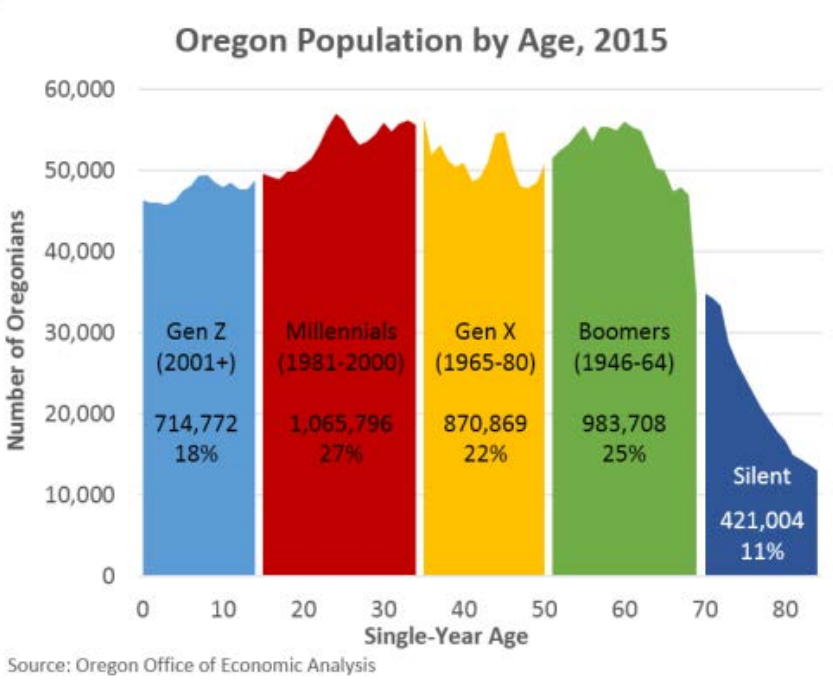
Figure B- 8 shows the population distribution by generation and age in Oregon in 2015. The largest groups are the Millennials (27% of Oregon's population) and the Baby Boomers (25% of Oregon's population). By 2035, the end of the planning period for this analysis, Millennials will be between 35 and 54 years old. Baby Boomers will be 71 to 89 years old.

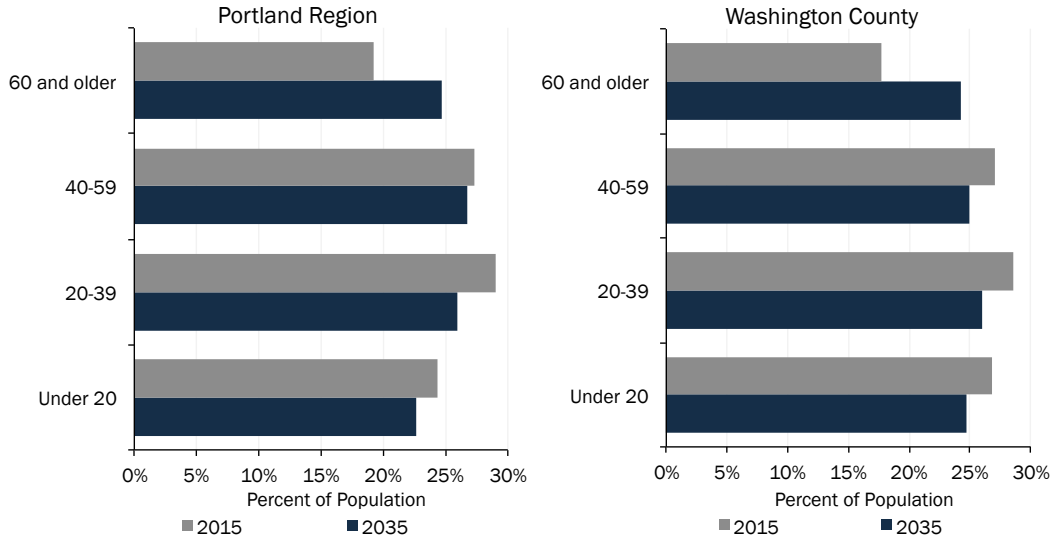
Figure B- 8. Population Distribution by Generation and Age, Oregon, 2015



Source: Oregon Office of Economic Analysis, "Population, Demographics, and Generations" by Josh Jehner, February 5, 2015.
http://oregoneconomicanalysis.com/2015/02/05/population-demographics-and-generations/

Figure B- 9 shows the Office of Economic Analysis's (OEA) forecast of population change by age group, from 2015 to 2035, for the Portland Region. By 2035, people 60 years and older will account for 24% of the population in Washington County (up from 18% in 2015). The percent of total population in each age group younger than 60 years old will decrease. The age distribution in the Portland Region will change in a similar pattern.

Figure B- 9. Current and projected population by age, Portland Region and Washington County, 2015 and 2035



Source: Oregon Office of Economic Analysis.
http://www.oregon.gov/DAS/OEA/docs/demographic/pop_by_ageandsex.xls

Increased ethnic diversity

Figure B-10 shows the percentage of the total population that is of Hispanic or Latino origin for Oregon, the Portland Region, and Sherwood, in 2000 and 2009-2013. Between 2000 and 2009-2013, Hispanic or Latino population increased from 5% of the population to 6% of the population, adding 550 additional Hispanic or Latino residents. Sherwood has a smaller percentage of Hispanic or Latino population than the county or regional average.

Figure B- 10 Hispanic or Latino population by percentage, Oregon, the Portland Region, Washington County, Sherwood, in 2000 and 2009-2013

Group Quarters

Table B- 10 shows the population living in group quarters in Oregon, the Portland Region, Washington County, and Sherwood in 2000 and 2010. Only seven out of 18,194 Sherwood residents lived in group quarters in 2010, less than 0.0%. In contrast, 2.3% of Oregon's population and 1.8% of the Portland region's population lives in group quarters.

Table B- 10. Persons in group quarters, Oregon, Portland Region, Washington County, and Sherwood, 2000 to 2010.

	2000	2010

Commuting trends

Commuting within the Portland region is common, with small cities like Sherwood seeing the vast majority of workers commute out of the city for work and the majority of people working in the city commuting in from other parts of the region. Figure B- 12 shows this pattern in Sherwood, with the majority of people living in Sherwood commuting out for work and the majority of people working in Sherwood commuting into the city for work.

Figure B- 12. Inflow and Outflow of Employment and Residence in Sherwood, 2011

Source: U.S. Census Bureau: LED on the Map, http://lehdmap3.did.census.gov/themap3/
The U.S, Census bases this data on Unemployment Insurance earnings data and the Quarterly Census of Employment and Wages (QCEW) data, combined with administrative data, additional administrative data and data from censuses and surveys. From these data, the program creates statistics on employment, earnings, and job flows at detailed levels of geography and industry and for different demographic groups.

Table B- 11 shows the places where Sherwood residents were employed in 2011. More than 90% of Sherwood residents worked outside of the city.

MANUFACTURED HOMES

Manufactured homes are and will be an important source of affordable housing in Sherwood. They provide a form of homeownership that can be made available to low- and moderate-income households. Cities are required to plan for manufactured homes—both on lots and in parks (ORS 197.475-492).

Generally, manufactured homes in parks are owned by the occupants who pay rent for the space. Monthly housing costs are typically lower for a homeowner in a manufactured home park for several reasons, including the fact that property taxes levied on the value of the land are paid by the property owner rather than the manufactured homeowner. The value of the manufactured home generally does not appreciate in the way a conventional home would, however. Manufactured homeowners in parks are also subject to the mercy of the property owner in terms of rent rates and increases. It is generally not within the means of a manufactured homeowner to relocate a manufactured home to escape rent increases. Living in a park is desirable to some because it can provide a more secure community with on-site managers and amenities, such as laundry and recreation facilities.

Sherwood had 258 manufactured homes in 2000 and 155 manufactured homes in the 2009-2013 period, a decrease of 103 dwellings. According to Census data, roughly 83% of the manufactured homes in Sherwood were owner-occupied in the 2009-2013 period.

OAR 197.480(4) requires cities to inventory the mobile home or manufactured dwelling parks sited in areas planned and zoned or generally used for commercial, industrial, or high-density residential development. Table B- 13 presents the inventory of mobile and manufactured home parks within Sherwood in 2014. The results show that Sherwood had 4 manufactured home parks with 186 spaces and 1 vacant space.

Table B- 13. Inventory of Mobile/Manufactured Home Parks, City of Sherwood, 2014

Name	Location	Park Type	Total Spaces	Vacant Spaces
Carriage Park Estates	23077 SW Main St	Family	58	0

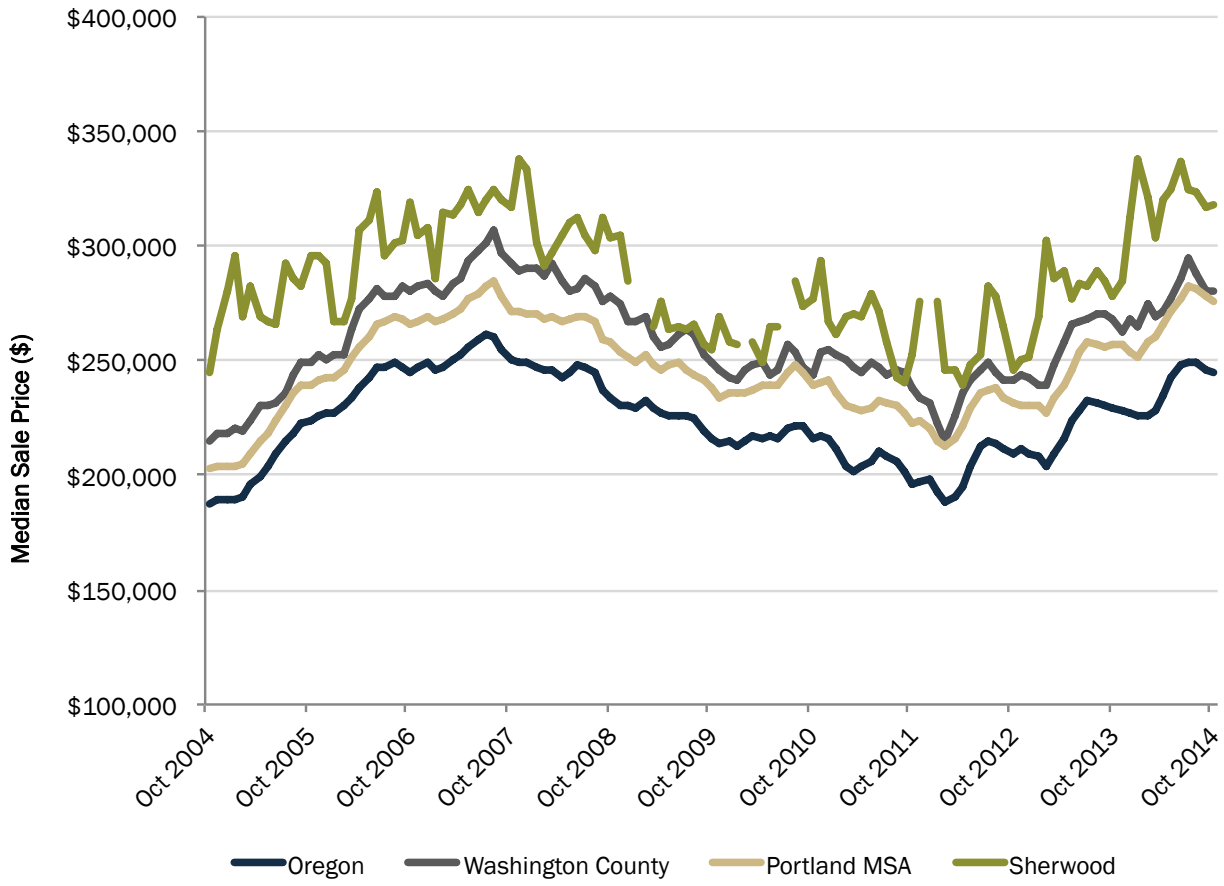
Changes in housing cost

According to Zillow, the median sales price of a home in Sherwood increased by about 30% between 2004 and 2014. Housing prices rose steeply prior to 2007, reaching a high of roughly $338,000, before the housing bubble and recession led to a period of declining housing prices. Housing prices in Sherwood, while following the same general pattern, remain higher than those observed in other parts of the region and the State as a whole.

Housing values

Figure B- 13 shows the median sales price in Oregon, the Portland MSA, Washington County, and Sherwood between 2004-2014. As of January 2015, median sales prices in Sherwood were $331,300, higher than in Washington County ($281,700), the Portland MSA ($269,900), and Oregon ($241,400).

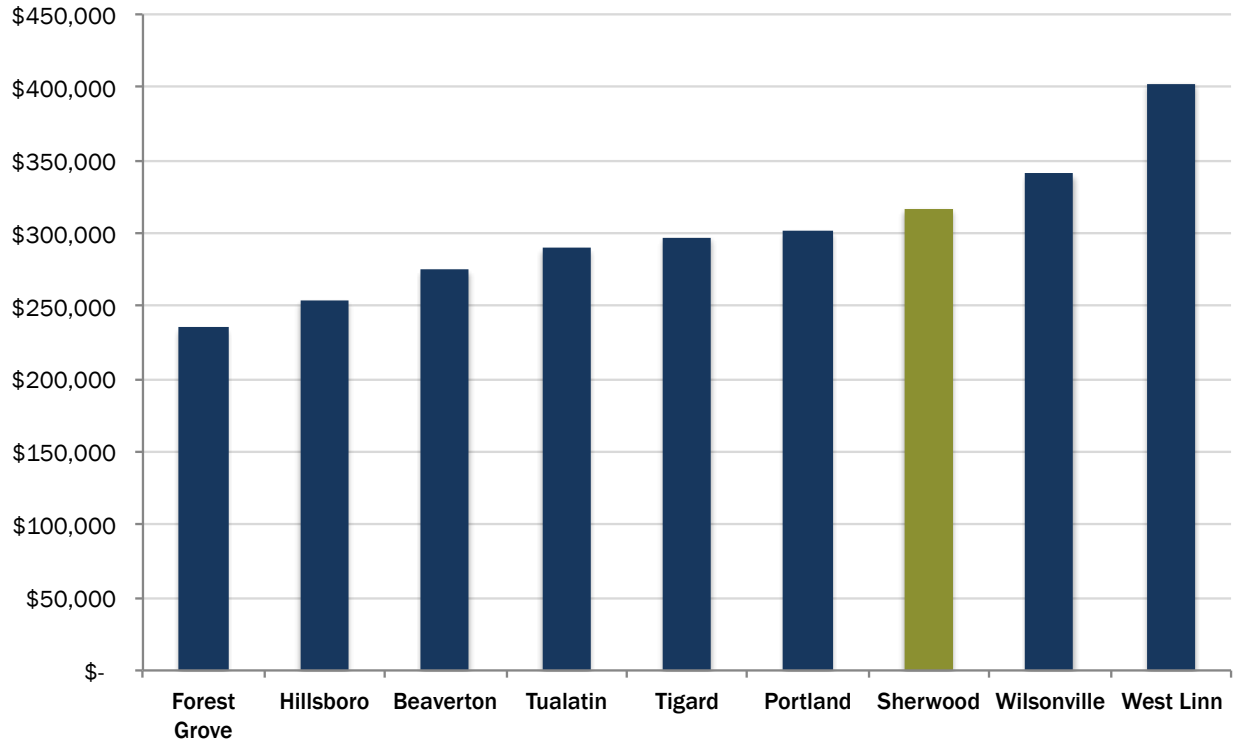
Figure B- 13. Median Sales Price, Oregon, Portland MSA, Washington County and Sherwood, 2004-2014



Source: Zillow Real Estate Research.
Note: Gaps in Sherwood's median sales price occur where data was not available.

Figure B- 14 shows median home sales prices for Sherwood and regional cities in January 2015. In that month, median home sale prices in Sherwood were about $316,500, above sales prices in other Portland westside communities such as Tigard, Tualatin, and Beaverton. Median sales prices in Wilsonville and West Linn were higher than those in Sherwood.

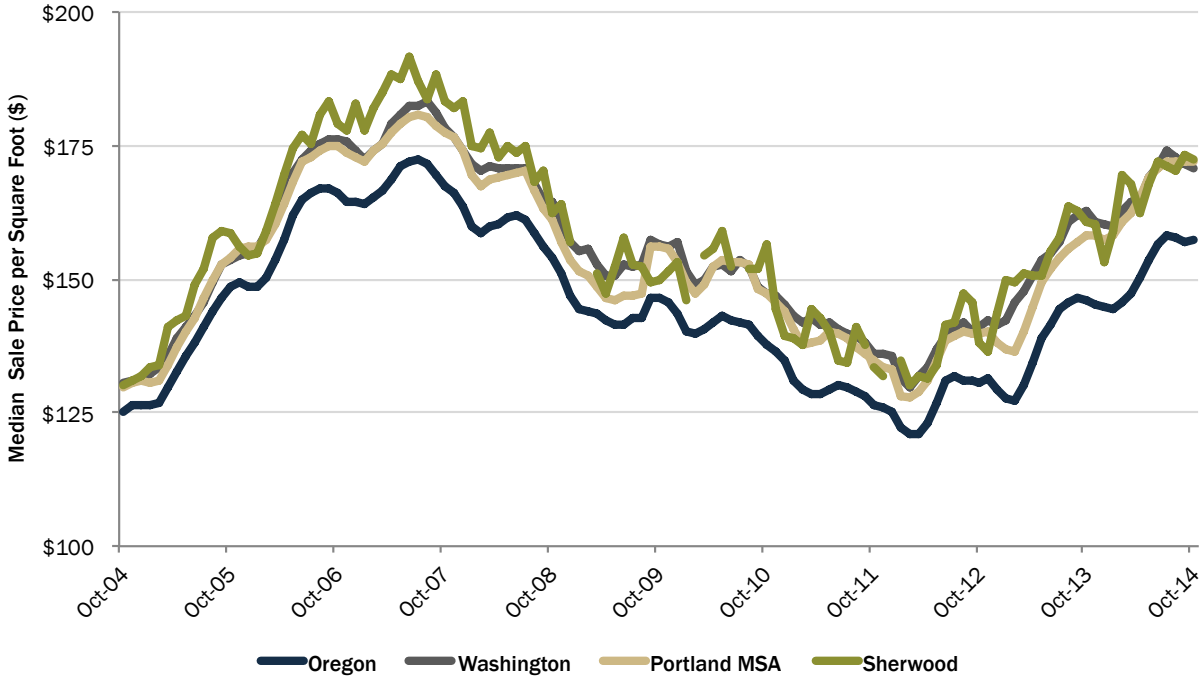
Figure B- 14. Median Home Sales Price, Sherwood, Tualatin, Tigard, Beaverton, Hillsboro, Forest Grove, Portland, January 2015



Source: Zillow Real Estate Research.

Figure B- 15 shows median home sales price per square foot for Oregon, the Portland MSA, Washington County and Sherwood from 2004-2013. Prices per square foot rose in Sherwood from $130 per square foot in October 2004 to $192 in July 2007. Prices fell after 2007 and rose again starting in 2011. In October 2014, the median price per square foot in Sherwood was about $170 dollars, comparable to the price in Washington County and the Portland Region (both about $170) and above that of the state as a whole ($157 per square foot).

Figure B- 15. Median Sales Price per Square Foot, Oregon, Portland MSA, Washington County and Sherwood, 2004-2014



Source: Zillow Real Estate Research.
Note: Gaps in Sherwood's median sales price occur where data was not available.

Figure B- 16 shows median home sales price per square foot for Sherwood and regional cities in January 2015. Of the cities sampled, Sherwood had the third-highest price per square foot, at $176 per square foot. Prices per square foot in West Linn and Portland were higher, at $180 and $237 respectively. While Sherwood's prices were the third highest, they compared very closely to other cities such as Tigard ($174), Tualatin ($174), Beaverton ($173), and Wilsonville ($171).

Housing rental costs

Table B- 14 shows the median contract rent in Oregon, Multnomah, Washington, and Clackamas counties, and Sherwood, in 2000 and 2009-2013. The median contract in Sherwood in 2009-2013 was $212 above the median in Washington County.

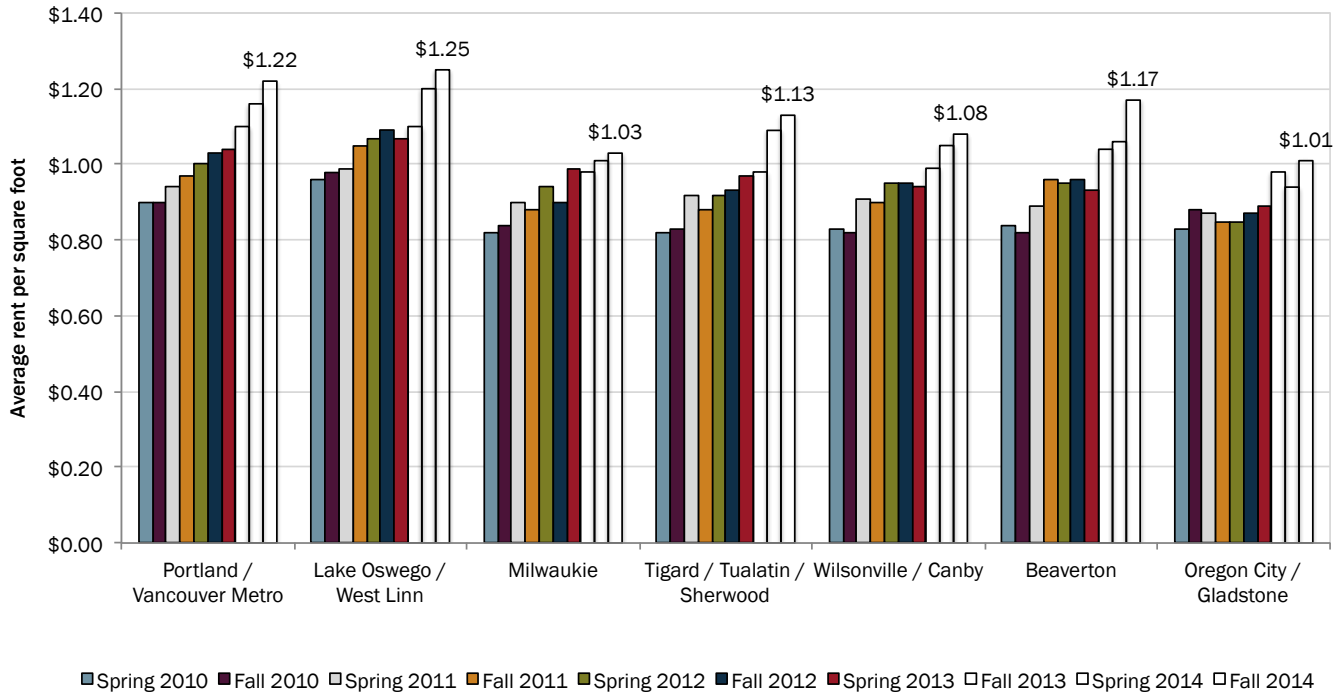
Table B- 14. Median contract rent, inflation-adjusted dollars, Oregon, Multnomah Washington, and Clackamas Counties, and Sherwood, 2000 to 2009-2013

Location	Rent		Change 2000 to 2009-2013	
	2000	2009-2013	Amount	Percent
Oregon	$741	$749	$8	1%
Multnomah County	$771	$799	$28	4%
Washington County	$878	$852	-$26	-3%
Clackamas County	$853	$858	$5	1%
Sherwood	$880	$1,064	$184	21%

Source: U.S. Census 2000 SF3 Table H56, American Community Survey 2012 Table B25058
Note: All data reported in 2013 dollars; 2000 figures were updated using Consumer Price Index.

Figure B- 17 shows average rent per square foot for apartments in the Portland/Vancouver Metro region and selected submarkets, according to Multifamily NW data between 2010 and 2014. Average rent in the Tigard/Tualatin/Sherwood area submarket was $1.13 per square foot in Fall 2014, lower than the regional average of $1.22 per square foot. Between Spring 2010 and Spring 2013, average rent in Tigard/Tualatin/Sherwood area increased by 38%, consistent with the regional increase of 36%.

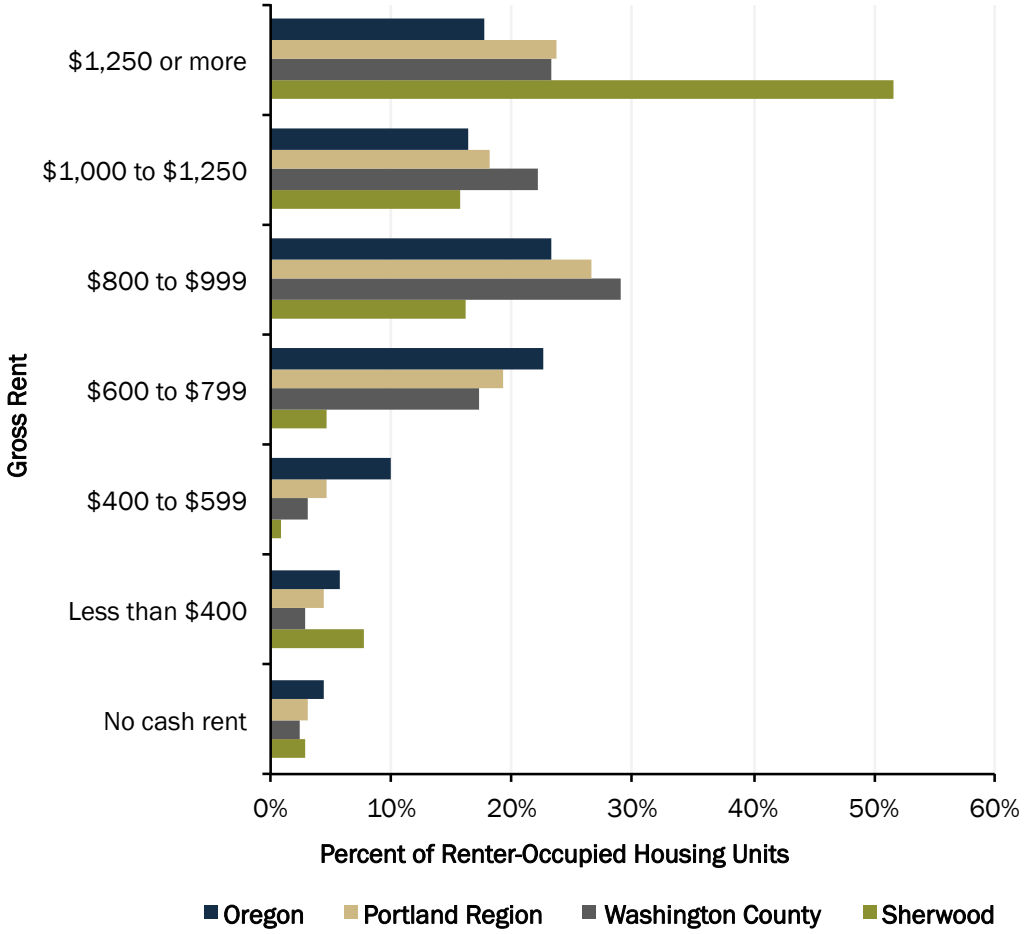
Figure B- 17. Average rent per square foot, Portland/Vancouver Metro and selected submarkets, 2010-2014



Source: Multifamily NW Apartment Reports, Spring 2010 through Fall 2014.
Note: The average rent price shown on the graph is for Fall 2014

Figure B- 18 shows a comparison of gross rent for renter-occupied housing units in Oregon, the Portland Region, Washington County, and Sherwood in 2009-2013.[49]

Figure B- 18. Gross rent, renter occupied housing units, Oregon, Portland Region, Washington County, and Sherwood, 2009-2013.



Source: American Community Survey 2009-2013 Table B25063.

[49] The U.S. Census defines gross rent as: "the amount of the contract rent plus the estimated average monthly cost of utilities (electricity, gas, and water and sewer) and fuels (oil, coal, kerosene, wood, etc.) if these are paid for by the renter (or paid for the renter by someone else)."

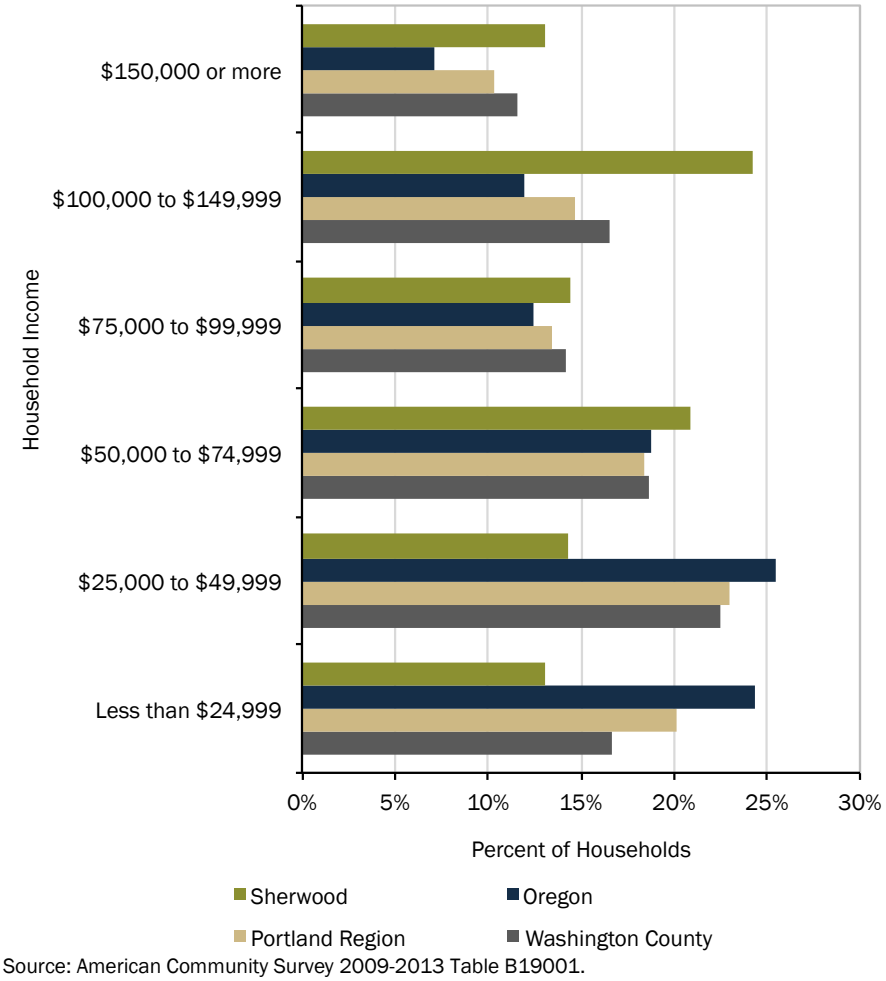
INCOME AND AFFORDABILITY OF HOUSING

This section summarizes regional and local income and housing cost trends. Income is a key determinant in housing choice and a households' ability to afford housing. A review of historical income and housing price trends provides insight into the local and regional housing markets.

The median household income in Sherwood was higher than in nearby counties and the state as a whole in the 2009-2013 period. Median household income in Sherwood was about $78,400, compared to $64,200 in Washington County, $64,400 in Clackamas County, and $52,500 in Multnomah County. Statewide, the median income was about $50,300.

Figure B- 19 shows the distribution of household income in Oregon, the Portland Region, and Sherwood in the 2009-2013 period. Sherwood had the highest share of households earning over $100,000 and the lowest share of households earning less than $25,000.

Figure B- 19. Household Income, Oregon, Portland Region, Washington County, and Sherwood, 2009-2013.



Source: American Community Survey 2009-2013 Table B19001.

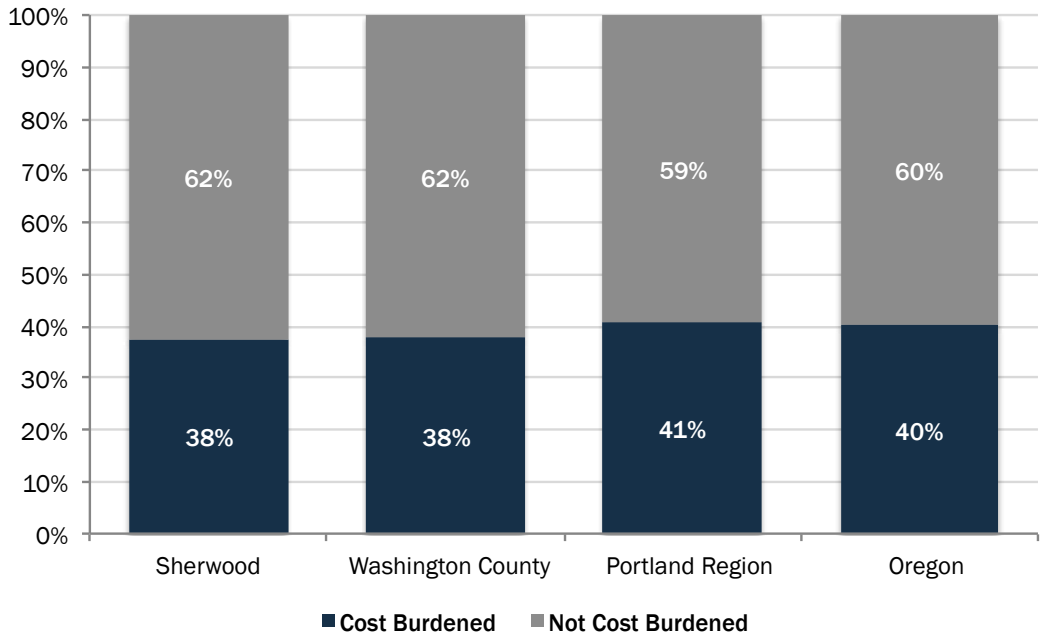
A typical standard used to determine housing affordability is that a household should pay no more than a certain percentage of household income for housing, including payments and interest or rent, utilities, and insurance.[50] HUD guidelines indicate that households paying more than 30% of their income on housing experience "cost burden," and households paying more than 50% of their income on housing experience "severe cost burden." Using cost burden as an indicator of housing affordability is consistent with the Goal 10 requirement to provide housing that is affordable to all households in a community.

According to the U.S. Census, nearly 2,345 households in Sherwood—or 38%—paid more than 30% of their income for housing expenses in the 2009-2013 period. About 44% of renter households in Sherwood were cost burdened, compared with 35% of owner households. In comparison, 40% of Oregon's households were cost burdened in the 2009-2013 period, with 54% of renter households and 32% of owner households cost burdened.

[50] Cost burden for renters accounts for the following housing costs: monthly rent, utilities (electricity, gas, and water and sewer), and fuels (wood, oil, etc.). Cost burden for homeowners accounts for the following housing costs: mortgage payments, real estate taxes, insurance, mobile home costs, condominium fees, utilities, and fuels.

Figure B- 20 shows the percentage of the population experiencing housing cost burdens in Oregon, the Portland Region, Washington County, and Sherwood in 2009-2013.

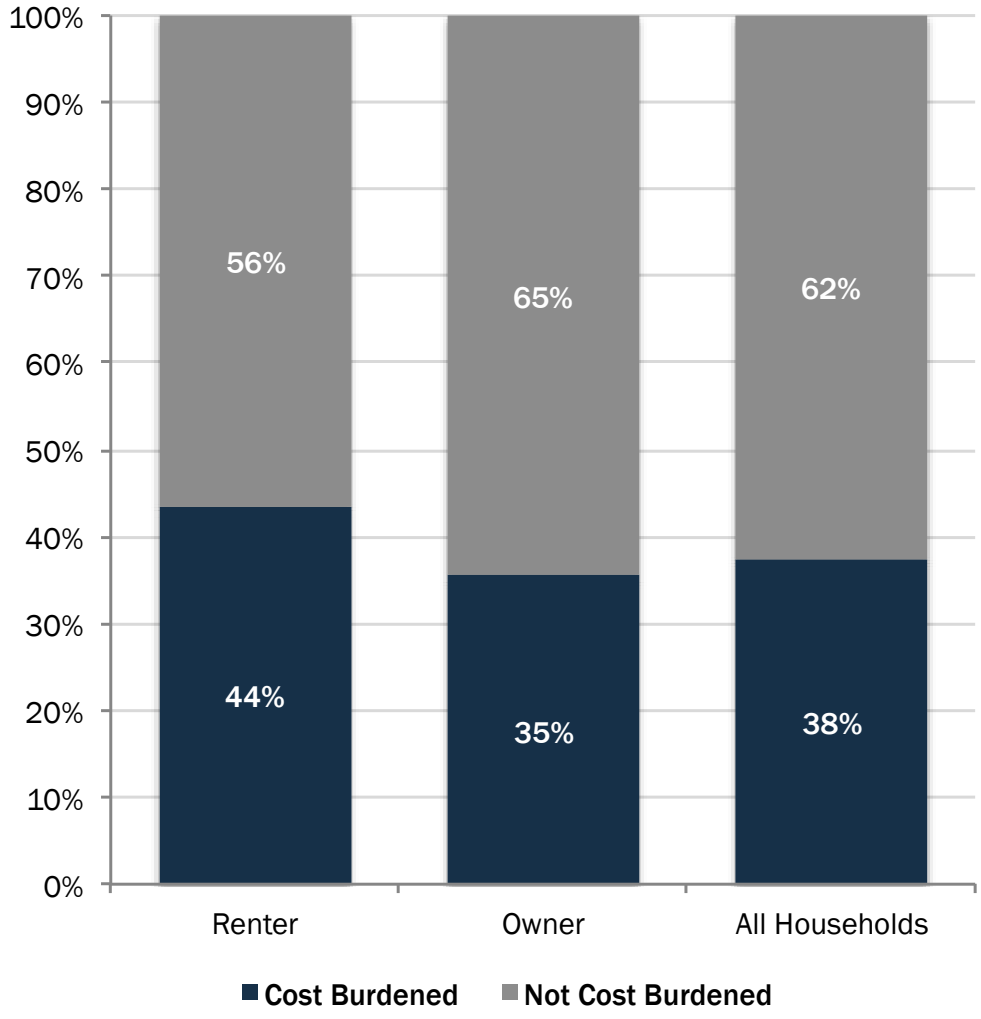
Figure B- 20. Housing cost burden, Oregon, Portland Region, Washington County and Sherwood, 2009-2013.



Source: American Community Survey 2009-2013 Tables B25070 and B25091.
Note: Households which the Census classifies as "Not computed" were excluded from the above calculations.

Figure B- 21 shows housing cost burden, by tenure, for Sherwood households in 2009-2013. Forty-four percent of Sherwood's renter households are cost burdened, compared to 49% of renter households in Washington County. Thirty-five percent of owner households are cost burdened, compared to 31% of owner households in Washington County.

Figure B- 21. Housing cost burden by tenure, Sherwood, 2009-2013.



Source: American Community Survey 2009-2013 Tables B25070 and B25091.

Another way to measure cost burden is to consider the costs of housing combined with the costs of transportation. In the *Draft 2014 Urban Growth Report*, Metro considered this perspective on cost burden. Metro considered a household that spends 45% or more of its income on transportation and housing as cost burdened.

According to data from the Location Affordability Portal, from HUD and the U.S. Department of Transportation, the average household in Sherwood spends 54% of its income on housing costs and transportation costs. Figure B- 22 and Figure

B- 23 show the percentage of income spent on housing and transportation costs in Sherwood and the southwestern part of the Portland region. In comparison to cities such as Tualatin, Wilsonville, and Tigard, households in Sherwood pay a slightly larger percentage of their income on housing and transportation costs. On average, households in these cities pay 50% to 52% of their income on housing and transportation costs.

Figure B- 22. Housing and transportation costs as a percentage of median family income, Sherwood, 2014

http://locationaffordability.info/

While cost burden is a common measure of housing affordability, it does have some limitations. Two important limitations are:

- A household is defined as cost burdened if the housing costs exceed 30% of their income, regardless of actual income. The remaining 70% of income is expected to be spent on non-discretionary expenses, such as food or medical care, and on discretionary expenses. Households with higher income may be able to pay more than 30% of their income on housing without impacting the household's ability to pay for necessary non-discretionary expenses.
- Cost burden compares income to housing costs and does not account for accumulated wealth. As a result, the estimate of how much a household can afford to pay for housing does not include the impact of accumulated

wealth on a household's ability to pay for housing. For example, a household with retired people may have relatively low income but may have accumulated assets (such as profits from selling another house) that allow them to purchase a house that would be considered unaffordable to them based on the cost burden indicator.

Cost burden is only one indicator of housing affordability. Another way of exploring the issue of financial need is to review wage rates and housing affordability. Table B- 15 shows an illustration of affordable housing wage and rent gap for households in the Portland MSA at different percentages of median family income (MFI). The data are for a typical family of four. The results indicate that a household must earn $17.73 an hour to afford a two-bedroom unit according to HUD's market rate rent estimate.

Table B- 15. Affordable Housing Wage Gap, Portland MSA, 2014

Value	Minimum Wage	30% MFI	50% MFI	80% MFI	100% MFI	120% MFI
Annual Hours	2,080	2,080	2,080	2,080	2,080	2,080
Derived Hourly Wage	$9.10	$10.01	$16.68	$26.69	$33.37	$40.04
Annual Wage	$18,928	$20,820	$34,700	$55,520	$69,400	$83,280
Annual Affordable Rent	$5,678	$6,246	$10,410	$16,656	$20,820	$24,984
Monthly Affordable Rent	$473	$521	$868	$1,388	$1,735	$2,082
HUD Fair Market Rent (2 Bedroom)	$922	$922	$922	$922	$922	$922
Is HUD Fair Market Rent Higher Than The Monthly Affordable Rent?	Yes	Yes	Yes	No	No	No
Rent Paid Monthly OVER 30% of Income	$449	$402	na	na	na	na
Rent Paid Annually OVER 30% of Income	$5,386	$4,818	na	na	na	na
Percentage of Income Paid OVER 30% of Income for Rent	28%	23%	na	na	na	na
Percentage of Income Spent on Housing	58%	53%	32%	20%	16%	13%
For this area what would the "Affordable Housing Wage" be?	$17.73	$17.73	$17.73	$17.73	$17.73	$17.73
The Affordable Housing Wage Gap IS:	**$8.63**	**$7.72**	**$1.05**	**na**	**na**	**na**

Source: FMR comes from HUD's FY 2014 Two-Bedroom FMR for Portland-Vancouver-Hillsboro MSA. Minimum wage from Oregon's Bureau of Labor and Industries. MFI from HUD's FY 2014 MFI for Portland- Vancouver -Hillsboro MSA.

Table B- 16 shows a rough estimate of affordable housing cost and units by income levels for Sherwood in 2014 based on Census data about household income, the value of owner-occupied housing in Sherwood, and rental costs in Sherwood. Several points should be kept in mind when interpreting this data:

- Affordable monthly housing costs and estimate of affordable purchase prices are based on HUD income standards and assume that a household will not spend more than 30% of household income on housing costs. Some households pay more than 30% of household income on housing costs, generally because they are unable to find more affordable housing or because wealthier households are able to pay a larger share of income for housing costs.
- HUD's affordability guidelines for Fair Market Rent are based on median family income and provide a rough estimate of financial need. These guidelines may mask other barriers to affordable housing such as move-in costs, competition for housing from higher-income households, and availability of suitable units. They also ignore other important

factors such as accumulated assets, purchasing housing as an investment, and the effect of down payments and interest rates on housing affordability.

- Households compete for housing in the marketplace. In other words, affordable housing units are not necessarily *available* to low-income households. For example, if an area has a total of 50 dwelling units that are affordable to households earning 30% of median family income, 50% of those units may already be occupied by households that earn more than 30% of median family income.

The data in Table B- 16 indicate that in 2014:

- About 20% of households in Sherwood could not afford a two-bedroom apartment at HUD's fair market rent level of $922.
- A household earning median family income ($69,400) could afford a home valued up to about $173,500.
- Sherwood has a deficit of about 660 dwellings to households earning less than $35,000 (or 50% of the Portland metropolitan area's median family income).

Table B- 16. Rough estimates of housing affordability, Sherwood, 2009-2013

Income Level	Number of HH	Percent	Affordable Monthly Housing Cost	Crude Estimate of Affordable Purchase Owner-Occupied Unit	Est. Number of Owner Units	Est. Number of Renter Units	Surplus (Deficit)	HUD Fair Market Rent (FMR) in 2014
Less than $10,000	186	3%	$0 to $250	$0 to $25,000	44	60	(82)	
$10,000 to $14,999	280	4%	$250 to $375	$25,000 to $37,000	40	69	(171)

Source: FMR comes from HUD's FY 2014 Two-Bedroom FMR for Portland-Vancouver-Hillsboro MSA. Minimum wage from Oregon's Bureau of Labor and Industries. MFI from HUD's FY 2014 MFI for Portland-Vancouver-Hillsboro MSA; Data about the share of owner and renter households and their income in Sherwood comes from the American Community Survey, 2009-2013 Tables B25075, B25063, B19001.

Table B- 17 shows that between 2000 and 2009-2013, both median household income and housing values increased substantially, with increases in home value outpacing growth in income. Median household income increased between 2000 and the 2009-2013 period.

Housing in Sherwood has become less affordable since 2000, consistent with county and statewide trends. In 2009-2013, the median home value was 3.8 times the median household income in Sherwood, up from 2.9 in 2000.

Housing in Sherwood is relatively affordable, compared to the county and state. In 2009-2013, the median home value was 4.4 times the median household income in Washington County, with a statewide average of 4.7.

Table B- 17. Household income to home value, 2013 dollars, Oregon, Washington County, and Sherwood, 2000 and 2009-2013.

	2000	2009-2013	Change 2000 to 2013	
			Number	Percent
Oregon				
Median HH Income	$57,282	$50,229	-$7,053	-12%
Median Owner Value	$204,120	$238,000	$33,880	17%

TINA KOTEK
GOVERNOR

SB4 Lands Determination

Introduction

This document serves as the required determination as referenced in Senate Bill 4 (2023) Section 10 that granted the Governor executive authority to bring within an existing urban growth boundary designated lands for the purposes of providing lands available for industrial use to become part of the state's covered incentive for specific federal CHIPS and Science Act programs that related to the semiconductor industry, advanced manufacturing or the supply chain for semiconductors or advanced manufacturing.

Oregon's Semiconductor Industry

The semiconductor industry is a priority industry for the Oregon economy. Not only are semiconductors Oregon's largest export, but Oregon is home to more than 200 semiconductor and semiconductor supply chain businesses filled with both critical suppliers and global innovation facilities. The Silicon Forest has the second largest concentration of semiconductor-related employment in the country with just over 40,300 employees (15% of U.S. semiconductor employment).

Oregon has a proud history as the national center of research and development in this industry. Some of the most important, leading semiconductor research has happened here. The US semiconductor industry is well established here in Oregon, and we are uniquely positioned to help achieve stated goals of economic and national security established by the CHIPS and Science Act.

Washington County/Hillsboro is home to the largest concentration of semiconductor and semiconductor supply chain businesses in Oregon. According to 2023 data, Hillsboro is home to 57 key semiconductor supply chain businesses. Approximately 89% of Hillsboro's manufacturing jobs are in the high-tech sector, and 44% of Oregon's high tech manufacturing jobs are in Hillsboro. Key industry players located in Hillsboro include Intel, Lam Research, Qorvo, Jireh, Lattice Semiconductors and many more. Because of the significant concentration of activity specific to the semiconductor industry in Hillsboro, the logical location for the Governor to exercise authority provided by Senate Bill 4 (2023) is in Hillsboro.

Senate Bill 4

In 2022, the Oregon Semiconductor Task Force was convened to ensure Oregon was prepared with a strategy to secure and maintain the once-in-a-generation investment and opportunities coming from the private and federal investments. The Task Force focused on five topics; 1. Research and Development Strength; 2. Talent Development; 3. Land Availability; 4. Incentives; 5. Regulation. Following the Semiconductor Task Force focus and recommendations, Senate Bill 4 (2023) was developed to address multiple topics including incentives and land availability.

Senate Bill 4 (2023), also known as the Oregon CHIPS Act, was designed to be complementary to and act as the required covered incentive program for the federal CHIPS and Science Act enacted by the Biden-Harris Administration.

The covered incentive opportunity established by Senate Bill 4 (2023) includes both direct incentives to companies and the authority granted to the Governor related to lands. The Oregon CHIPS Act has been

254 STATE CAPITOL, SALEM OR 97301-4047 (503) 378-4582 FAX (503) 378-6827
WWW.OREGON.GOV

TINA KOTEK
GOVERNOR

instrumental in the success of Oregon companies receiving federal funding and will continue to be instrumental in future opportunities, such as the potential to site a National Semiconductor Technology Center (NSTC) in Oregon.

To date, the Governor has awarded nearly all the $240 million in direct incentives made available by the Oregon CHIPS Act. Much of the funding has gone to companies located in the Washington County/Hillsboro area. The single largest award of $115 million was awarded to Intel for their proposed $36 billion investment at their Gordon Moore Park facility in Hillsboro. Other investments in the Washington County/Hillsboro area include companies such as Jireh and Analog Devices, Inc.

Round 2 applications were recently announced and ecosystem companies awarded funding include AGC Electronic America, Kokusai Semiconductor Equipment Corporation, Tokyo Ohka Kogyo America, and Project Fabrik (a recruitment opportunity that plans to locate in Hillsboro and has expressed a need for land). Because of investments like those mentioned here, Oregon will see continued supply chain activity and expansion to support the approximately $40 billion in contracted projects via the Oregon CHIPS Act. This commitment of investment from private industry reinforces that Oregon can secure and maintain our research and development position and see continued investment in the broader supply chain and semiconductor ecosystem.

Oregon-sited companies and their projects are seeing great success in the competition for federal investment from the CHIPS and Science Act. The first award announced was Microchip with a $72 million investment in their Gresham project. The largest award announced to date was the Intel award at $8.2 billion for projects occurring in four states with their project in Hillsboro being identified as one. Finally, HP has been awarded $50 million for their project in Corvallis.

Oregon and our semiconductor companies are competing at a high level for the available federal funding. This speaks to both our competitiveness in the semiconductor industry, but also our importance to the broader vision and goal of national economic security.

National Semiconductor Technology Center

It is important to note that the 2024 legislative session included the passage of HB 4154 (2024). In that bill was an amendment to Senate Bill 4 (2023), adding the National Semiconductor Technology Center to the programs available to receive funding and other covered incentive benefits of Senate Bill 4 (2023). The National Semiconductor Technology Center (NSTC) program is housed in the Research and Development (R&D) side of the CHIPS and Science Act legislation. The Biden-Harris Administration has announced $5 billion in funding for this program and created NATCAST, the non-profit entity that will run the NSTC program.

Earlier this year, NATCAST announced they would be siting three technical centers as part of the NSTC program: i. Administration and Design Facility; ii. EUV Center; iii. Prototyping and Packaging Center. Oregon is currently competing for both the EUV Center and the Prototyping and Packaging Center. The likely location, should Oregon receive a NSTC technical center, is Hillsboro.

DRAFT

TINA KOTEK
GOVERNOR

Industrial land availability is an important component to the siting of a NSTC. A NSTC technical center designation would bring with it an influx of investment into the Silicon Forest region. This will require the necessary infrastructure, including land, to accommodate such an investment. Additionally, the siting of a NSTC technical center in Oregon is paramount to the underlying goal of Oregon maintaining its status as the dominant research and development location for the United States, if not globally.

Action

Based on the authority granted to the Governor under Section 10 of Senate Bill 4 (2023), and the addition of the NSTC program as an eligible program for covered incentives in HB 4154 (2024), the Governor intends to issue an Executive Order to bring within the existing UGB adjacent to the City of Hillsboro approximately 373 acres of land identified for industrial purposes specific to the semiconductor and semiconductor supply chain industry. The land identified as part of this action will serve as critical infrastructure necessary for Oregon to remain the leading-edge research and development center for the United States as companies and technical centers like those identified earlier in this determination expand and locate here in the Silicon Forest.

Applicable Approval Criteria

Applicable approval criteria as outlined in Senate Bill 4 (2023) include:

Section 10(1): On or before December 31, 2024, the Governor by executive order and subject to section 11 of this 2023 Act may bring within an existing urban growth boundary designated lands for the purposes of providing lands available for industrial uses to become part of the state's covered incentive as defined in section 1 of this 2023 Act that relate to the semiconductor industry, advanced manufacturing or the supply chain for semiconductors or advanced manufacturing.

Response: On or before December 31, 2024, the Governor will issue an executive order in accordance with this section of Senate Bill 4 (2023). The executive order will be consistent with the applicable approval criteria of Senate Bill 4 (2023).

Section 10(2): Lands designated by an executive order under this section must be within a site that consists of one or more tracts of land that are:

(a) Contiguous to the city's existing urban growth boundary;

Response: The proposed site is contiguous to the existing urban growth boundary.

(b) Entirely within three miles of the city's existing urban growth boundary; and

Response: The proposed site, in its entirety, is within three miles of the city's existing urban growth boundary.

(c) Not within areas designated as acknowledged urban reserves or rural reserves under ORS 195.144(1), (2)(c) to (e) or (3).

DRAFT

TINA KOTEK
GOVERNOR

Response: The proposed site is not within areas designated as acknowledged urban reserves or rural reserves under the quoted ORS above.

ORS 195.144 (2) states: For purposes of land use planning in Oregon, the Legislative Assembly designates the land in Washington County that was designated as urban reserve in Metro Resolution No. 11-4245, adopted on March 15, 2011, as the acknowledged urban reserve in Washington County, except that:

(a)The real property in Area 8A on Metro's map denominated as the "Urban and Rural Reserves in Washington County, Attachment A to Staff Report for Resolution No. 11-4245 (03/17/11 DRAFT)," east of the east boundary of the right of way of Northwest Jackson School Road and east of the east bank of Storey Creek and the east bank of Waibel Creek is included within the acknowledged urban growth boundary.

(b)The real property in Area 8A on Metro's map denominated as the "Urban and Rural Reserves in Washington County, Attachment A to Staff Report for Resolution No. 11-4245 (03/17/11 DRAFT)," that is south of the south boundary of the right of way of Highway 26 and west of the real property described in paragraph (a) of this subsection is designated as acknowledged rural reserve.

(c)The real property in Area 8B on Metro's map denominated as the "Urban and Rural Reserves in Washington County, Attachment A to Staff Report for Resolution No. 11-4245 (03/17/11 DRAFT)," that is more particularly described as tax lot 100 in section 21AA of township 1 north, range 2 west, Willamette Meridian, and tax lots 900, 901, 1100, 1200, 1300 and 1400 in section 15 of township 1 north, range 2 west, Willamette Meridian, is not designated as a reserve area.

The area under consideration is entirely within the previously approved urban reserves which were converted to Rural Reserves by HB 4078 in 2014 and are in ORS 195.144 2(b). Therefore, this area is not prohibited by Senate Bill 4 (2023).

Additionally, Section 10 (3) of Senate Bill 4 (2023) states: Before issuing an executive order under this section, the Governor shall:

(a) Conduct one public meeting, in coordination with the city nearest to the site and each county in which the site is located, to be held in that city for the purpose of discussing bringing within the urban growth boundary the lands or potential lands;

Response: A public meeting in coordination with the City of Hillsboro and Washington County will be held on October 10, 2024, within the city limits of the City of Hillsboro. At that meeting the proposal under consideration will be discussed.

(b) Accept public comments for a period of no fewer than 20 days following the public meeting in paragraph (a) of this subsection; and

Response: Public comment will be accepted at both the public meeting and for a 20-day period following the public meeting. The public comment period will close on October 30, 2024 at 5pm. That will be advertised in the public meeting notice and at the public meeting.

DRAFT

TINA KOTEK
GOVERNOR

(c) Make a determination that existing lands within an urban growth boundary in this state would not meet the needs of the specific project.

Response: As previously stated in this determination, Washington County and the City of Hillsboro are the epicenter for the semiconductor industry in Oregon. Sizable investments resulting in approximately $40 billion worth of specific semiconductor and semiconductor supply chain projects are currently being made in Hillsboro and the surrounding Washington County area. Furthermore, Oregon is under consideration for a National Semiconductor Technology Center and the likely location for this specific project is Hillsboro. This substantial investment alone will require additional land proximate to the City of Hillsboro. Given the concentration of the semiconductor ecosystem in Hillsboro, and the requirement of the industry to be proximate to key research and development facilities located in Hillsboro, no other location in the state is suitable.

Finally, Section 10 (5) of Senate Bill 4 (2023) goes on to describe that the Governor may designate up to a maximum of eight sites, as follows:

(a) Two sites that exceed 500 acres; and
(b) Six sites that do not exceed 500 acres

Response: The site proposed is consistent with the parameters outlined in Section 10 (5) of Senate Bill 4.

Decision

Based on the findings made above on the applicable approval criteria, the Governor intends to act, consistent with the authority granted via Section 10 of Senate Bill 4 (2023), to bring in lands to the existing urban growth boundary adjacent to the City of Hillsboro and further identified as part of Exhibit A (Site Map). This decision is subject to the following conditions of approval:

1. Permitted uses for this land shall be limited to semiconductor industry, advanced manufacturing, or the supply chain for semiconductors or advanced manufacturing. Uses such as data centers and warehouses not directly associated with the semiconductor industry shall not be permitted.

RE: 2024 growth management decision: Sherwood West

Dear Metro Councilors,

Tualatin Riverkeepers (TRK) respectfully submits these comments asking that Metro refrain from bringing 1291 acres of urban reserves designated "Sherwood West" into the greater Portland region's existing urban growth boundary (UGB). TRK is a community-based organization that protects and restores the Tualatin River watershed. Our 500 members and thousands of volunteers help us build watershed stewardship through engagement, advocacy, restoration, access, and education. TRK's advocacy in water quality and the overall health of the Tualatin River watershed leads us to closely monitor UGB expansion proposals that affect important water bodies and surrounding riparian areas within the Tualatin Basin. Developing Sherwood West will disrupt important wildlife connectivity and undo massive efforts by the Tualatin National Wildlife Refuge and U.S. Fish and Wildlife Service to restore Chicken Creek's natural course and regenerate its stream, wetland, and floodplain functions. Further, Metro has not meaningfully considered alternative areas for proposed UGB expansion that would better meet the need for more housing. What's more, there exists viable land within the existing UGB for the proposed housing expansions that would not require expansion. TRK understands the pressures of growth in the greater Portland regions to support new jobs and housing, but urges Metro to consider bringing in other areas better suited to handle future growth and less environmentally harmful.

Background

Under Oregon state law, Metro is charged with managing the great Portland region's UGB, and works with citizens, elected leaders, and researchers to plan for future growth and meet the needs for housing, jobs, and transportation.[1] Every six years, Metro assesses whether

TUALATIN RIVERKEEPERS
11675 SW Hazelbrook Road | Tualatin, OR | 97062 | (503) 218 2580 | tualatinriverkeepers.org | info@tualatinriverkeepers.org

there is enough land inside of the UGB for 20 years of housing and job growth. In July of 2024, the Metro Council began to examine whether there is enough land inside of the existing UGB to support the next 20 years of growth. In response to Metro's call for city submissions for expansion proposals, the City of Sherwood has proposed bringing Sherwood West urban reserves, a 1291 acre parcel which cuts directly through Chicken Creek and its surrounding riparian areas, into the existing UGB to support the development of new homes and jobs. For the following reasons, Tualatin Riverkeepers opposes the City of Sherwood's proposal to bring Sherwood West into the UGB and urges Metro to reject the cities' proposal.

Argument

1. **Metro did not meaningfully consider alternatives areas for the proposed UGB expansion that would better meet the need to amend the existing UGB as required by Metro Code's Title 14.**

    A. Metro did not meet the requirements of its own Title 14 Code 3.07.1425 regarding legislative amendments to UGB procedures by failing to evaluate alternative areas that could better meet the need of amending the existing UGB.

To implement Metro-led regional goals and objectives, the Metro Council adopted the Urban Growth Management Functional Plan (hereinafter "the UGMFP").[2] The UGMFP contains 14 titles that provide performance standards and other requirements cities and counties must meet. Title 14 ("Urban Growth Boundary") addresses urbanization and calls for a clear transition from rural to urban development, including maps depicting the UGB as well as urban and rural reserves. Following a periodic analysis of the capacity of the current UGB, the Council shall make legislative amendments if it determines there is a need to add land to the UGB.[3] Legislative amendments to the UGB must meet several criteria, including an analysis of alternative areas designated as urban reserves, and a determination of which areas best meet the needs of the project.[4] In evaluating which areas best meet the need to amend the existing UGB, the following factors are considered:

1. Efficient accommodation of identified land needs;
2. Orderly and economic provision of public facilities and services
3. Comparative environmental, energy, economic and social consequences; and

[2] Metro Code 3.07.010 Purpose.
[3] Title 14 Metro Code 3.07.1420 Legislative Amendment to UGB Procedures.
[4] Title 14 Metro Code 3.07.1425(c) Legislative Amendment to the UGB: Criteria.

TUALATIN RIVERKEEPERS
11675 SW Hazelbrook Road | Tualatin, OR | 97062 | (503) 218 2580 | tualatinriverkeepers.org | info@tualatinriverkeepers.org

4. *Compatibility of propose urban uses with nearby agricultural and forest activities occurring on land outside UGB designated for agriculture or forestry pursuant to a statewide planning goal*
5. Equitable and efficient distribution of housing and employment opportunities throughout the region;
6. Contribution to the purposes of centers and Corridors;
7. *Protection of farmland that is most important for the continuation of commercial agriculture in the region;*
8. *Avoidance of conflict with regionally significant fish and wildlife habitat; and*
9. Clear transition between urban and rural lands, using natural and built features to mark the transition (emphasis added).[5]

While the Sherwood West Concept Plan provides land use alternatives for how to best meet proposed housing needs within Sherwood West,[6] no alternative urban reserve areas were considered by the City of Sherwood nor Metro. There are several other areas of land designated as urban reserves that Metro should have been analyzed to meet the requirements of Metro Code 3.07.1425(c) (see Figure 1 below).

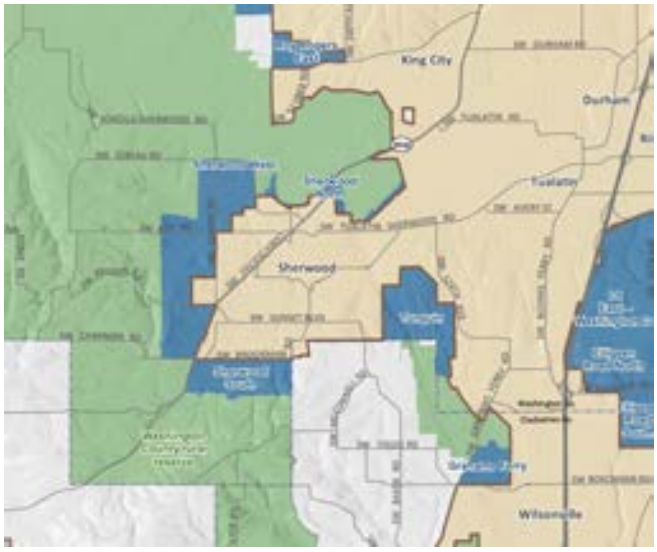

FIGURE 1: Metro Regional Urban Reserves Map

[5] Title 14 Metro Code 3.07.1425(c) Legislative Amendment to the UGB: Criteria.
[6] City of Sherwood, *Sherwood West Urban Growth Boundary Expansion Proposal 2024*, 31–9 (hereinafter "Sherwood West Concept Plan").

These areas include Sherwood South and Tonquin, which may better meet the needs criteria, but no evaluation of this area was conducted for this UGB expansion proposal. While a determination that Sherwood South and Tonkin better meet the needs for a UGB expansion is not required, Metro was still obliged to consider these alternative areas and failed to do so. Before approving bringing in Sherwood West to the existing UGB, Metro should meaningfully evaluate other available urban reserves to determine which area best meets the needs criteria.

B. Viable land exists within the current UGB that meets the housing and job needs of the proposed expansion.

Regardless of Metro's failure to consider alternative areas for UGB expansion, viable land exists within the current UGB to support the growth needs in the region, and thus expanding the UGB would be superfluous. While the City of Sherwood claims that UGB expansion is needed to support the development of housing and jobs for the next 20 years, a recent vacant lands capacity analysis suggests otherwise. In September 2024, West of Sherwood Farm Alliance conducted a capacity analysis of vacant land in the Sherwood Planning Area, which comprises the land inside of Sherwood's city limits, along with Brookman Addition area and Tonquin Employment area that had been previously added to the UGB.[7] The analysis compares Sherwood West with Sherwood Planning Area's vacant lands for meeting the needs of housing and job growth development. According to the analysis, the Sherwood West proposal would result in a 41% expansion of the city's land area, support 3,117 to 5,582 new expensive low-density homes and apartments and 4,524 new jobs, and lead to a $58-$70 million funding shortfall for infrastructure. Alternatively, the vacant lands within the Sherwood Planning Area could support 4,572 new homes that more closely fit housing needs of the area, 5,526 new jobs, and $58-$70 million taxpayer and ratepayer savings saved on unneeded infrastructure.[8] Additionally, the Sherwood Planning Area vacant lands conserves rather than develops precious farmland, forests, streams, and wildlife. Accordingly, there is viable land within the existing UGB to support long-term growth for employment and housing in the region, and therefore no need for a legislative amendment to bring in land to the current UGB.

[8] *Id*.

2. The Metro Council's approval of the proposed UGB expansion goes against its own policies outlined in Metro Code Titles 3 and 13 that aim to protect streams and riparian areas as well as control water quality areas.

Along with Title 14 of Metro's UGMFP, Title 3 ("Water Quality and Flood Management") and Title 13 ("Nature In Neighborhoods") are impliedly at issue. Title 3's stated purpose is to protect the beneficial water uses and functions of resources within the Water Quality and Flood Management Areas.[9] Further, Title 13's stated purposes are: (1) to conserve, protect, and restore a continuous ecologically viable streamside corridor system [...] in a manner integrated with upland wildlife habitat and with the surrounding urban landscape; and (2) to control and prevent water pollution [...] and to maintain and improve water quality throughout the region.[10]

As addressed in the Sherwood West Concept Plan, there are substantial natural resources within Sherwood West that are regulated under Title 3 and Title 13. First, there is a defined 100-year floodplain for a portion of Chicken Creek within Sherwood West.[11] Additionally, there are 31 acres of wetlands within Sherwood West, mapped by the National Wetland and Metro's inventories.[12] These wetlands are most prominently found along the riparian corridor of Chicken Creek and the headwaters of Goose Creek, and additional wetland areas are expected to exist within the project area.[13] Further, Metro Title 13 Habitats are present and depicted in Figure 2 below; the Sherwood West Concept Plan states that the mapping of Title 13 habitat areas will be further refined and protections established once Sherwood West is brought into the UGB. However, in order to adequately evaluate the area as best meeting the need of a UGB amendment, under the criteria outlined in Title 14 above, the Title 13 habitat areas should be properly outlined prior to bringing the land into the UGB.

FIGURE 2: Sherwood West Concept Plan: Natural Resources Existing Condition

Bringing in Sherwood West to the existing UGB goes against Metro's own policies that establish baseline requirements to protect, conserve, and restore Washington County's riparian corridors and wildlife habitat resources, as outlined above in Title 13. Sherwood West contains substantial areas designated as habitat conservation areas, which includes rivers, streams, wetlands, and adjacent resource areas. Metro should consider alternative routes for supporting the region's growth that do not result in irreparable damage to these important, Metro designated habitat areas.

TUALATIN RIVERKEEPERS

3. **The proposed UGB expansion will counter decades of federal and local restoration efforts to realign Chicken Creek to its historic and natural course.**

As mentioned above, Sherwood West contains Metro designated riparian and upland habitat areas. Not only is TRK concerned with how this proposal will significantly impair efforts to protect and conserve the riparian corridors and wildlife habitat resources within the project area, but also on how development of Sherwood West will negatively impact the Tualatin River. The proposed UGB expansion cuts through a significant portion of Chicken Creek and its surrounding riparian and upland habitat areas. Chicken Creek borders the west and north portions of the city of Sherwood and flows through agricultural lands before emptying into the Tualatin River.[14] Beyond Sherwood, Chicken Creek meanders for two and a half miles through the Tualatin River National Wildlife Refuge, which contains wetlands that provide sanctuary for migrating birds on the Pacific Flyway.

In the early 20th century, Chicken Creek's natural course was rerouted to accommodate local agriculture, resulting in erosion issues resulting from streamlining the creek into linear channels.[15] Starting in 1996, Friends of the Tualatin River National Wildlife Refuge, with help from the U.S. Fish and Wildlife Service and Clean Water Services, has led efforts to restore Chicken Creek to its historic path and regenerate its stream, wetland, and floodplain functions.[16] Realignment efforts improved resting and rearing habitat development for a variety of fish, and slower flows have improved water quality by keeping more sediment out of the Creek as well as the Tualatin River.[17] Bringing Sherwood West into the UGB will impact the restoration efforts by threatening the flow of Chicken Creek through the Tualatin River National Wildlife Refuge and, ultimately, into the Tualatin River. Further, impacts from development would contribute to erosion and water quality issues in the riparian areas both within Sherwood West and downstream, and disrupt important wildlife corridors

Conclusion

For the aforementioned reasons, TRK urges the Metro Council to reject the City of Sherwood's proposal for bringing 1291 acres of urban reserves into the existing UGB. Thank you for your time and consideration. Please do not hesitate to contact us if you have any questions regarding these comments.

Sincerely,

Eve Goldman (she/her)
